   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0121-THROTTLE POSITION SENSOR 1 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 81: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Throttle Position Sensor

1 circuit input voltage is implausible.

POSSIBLE CAUSES

POSSIBLE CAUSES
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K22) TP SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K22) TP SIGNAL 1 CIRCUIT SHORTED TO GROUND
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K22) TP SIGNAL 1 CIRCUIT
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K922) TP SENSOR GROUND CIRCUIT
(K22) TP SIGNAL 1 CIRCUIT SHORTED TO THE (K922) TP SENSOR GROUND CIRCUIT
(F855) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K22) TP SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(K922) TP SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
THROTTLE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Start the engine and allow it to idle.

      WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

   2. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 82: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Throttle Body harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F855) 5-Volt Supply circuit in the Throttle Body harness connector.

Is the voltage between 4.8 and 5.2 volts?

Yes

- Go To 3

No

- Repair the (F855) 5-Volt Supply circuit for an open or short circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K922) TPS SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Measure the resistance of the (K922) TPS Sensor Ground circuit between the Throttle Body harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K922) TPS Sensor Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

4. **CHECK THE (K22) TPS SIGNAL 1 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K22) TPS Signal 1 circuit between the Throttle Body harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5.

      No

      - Repair the (K22) TPS Signal 1 circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
5. **CHECK THE (K122) TPS SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K122) TPS Signal 2 circuit between the Throttle Body harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (K122) TPS Signal 2 circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
6. **THROTTLE BODY**
   1. Replace the Throttle Body in accordance with the service information. Refer to **THROTTLE BODY, REMOVAL** .
   2. Turn the ignition on

3. With the scan tool, erase DTCs.
4. Start the engine and allow it to idle.
5. With the scan tool, view DTCs.

   Did the DTC return?

   Yes

   - Go To 7

   No

   - Repair complete.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in

accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0122-THROTTLE POSITION SENSOR 1 CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 83: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Throttle Position Sensor

1 input voltage is below the minimum acceptable value.

POSSIBLE CAUSES

POSSIBLE CAUSES
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K22) TP SIGNAL 1 CIRCUIT SHORTED TO GROUND
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K922) TP SENSOR GROUND CIRCUIT

(K22) TP SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
THROTTLE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Start the engine and allow it to idle.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   2. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 84: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Throttle Body harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F855) 5-Volt Supply circuit in the Throttle Body harness connector.

   Is the voltage above 4.9 volts?

Yes

- Go To 3

No

- Repair the (F855) 5-Volt Supply circuit for an open or shorted circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K22) TPS SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND**

Fig. 85: Checking TP Signal 1 Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (K22) TPS Signal 1

circuit in the Throttle Body harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To 4

No

- Repair the (K22) TPS Signal 1 circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK FOR THE (K22) TPS SIGNAL 1 CIRCUIT SHORTED TO THE (K922) TPS SENSOR GROUND CIRCUIT**

Fig. 86: Checking TP Sensor Signal 1 Circuit For Short To TP Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K22) TPS Signal 1 circuit and the (K922) TPS Sensor Ground circuit in the Throttle Body harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the (K22) TPS Signal 1 circuit for a short to the (K922) TPS Sensor Ground circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK FOR THE (K22) TPS SIGNAL 1 CIRCUIT SHORTED TO THE (K124) ETC MOTOR (+) CIRCUIT**

Fig. 87: Checking TP Signal 1 Circuit For Short To ETC Motor (+)

Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K22) TPS Signal 1 circuit and the (K124) ETC Motor (+) in the Throttle Body harness connector.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short between the (K124) ETC Motor (+) circuit and the (K22) TP Signal 1 circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 6

6. **CHECK FOR THE (K22) TPS SIGNAL 1 CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT**

Fig. 88: Checking TP Signal 1 Circuit For Short To ETC Motor (-) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K22) TPS Signal 1 circuit and the (K126) ETC Motor (-) in the Throttle Body harness connector.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short between the (K22) TPS Signal 1 circuit and the (K126) ETC Motor (-) circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 7

7. **CHECK THE (K22) TPS SIGNAL 1 CIRCUIT FOR AN OPEN/HIGH**

RESISTANCE

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K22) TPS Signal 1 circuit between the Throttle Body harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 8

   No

   - Repair the (K22) TPS Signal 1 circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **THROTTLE BODY**

Fig. 89: Throttle Body Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the PCM C2 harness connector.
3. Connect a jumper between the (F855) 5-Volt Supply circuit and the (K22) TPS Signal 1 circuit in the Throttle Body harness connector.
4. Turn the ignition on.
5. With the scan tool, read the TPS Signal 1 circuit voltage.

   Is the voltage above 4.9 volts with the jumper in place?

   Yes

   - Replace the Throttle Body in accordance with the service information. Refer to **THROTTLE BODY, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 9

9. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.
    6. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0123-THROTTLE POSITION SENSOR 1 CIRCUIT HIGH

Fig. 94: Checking TP Signal 1 Circuit For Short To ETC Motor (+) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K22) TPS Signal 1 circuit and the (K124) ETC Motor (+) in the Throttle Body harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the (K124) ETC Motor (+) circuit for a short to the (F855) 5-Volt Supply circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K22) TPS SIGNAL 1 CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT**

Fig. 95: Checking TP Signal 1 Circuit For Short To ETC Motor (-) Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K22) TPS Signal 1 circuit and the (K126) ETC Motor (-) in the Throttle Body harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 7

   No

   - Repair the (K22) TPS Signal 1 circuit for a short to the (K126) ETC Motor (-) circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K22) TPS SIGNAL 1 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

   CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   2. Measure the resistance of the (K22) TPS Signal 1 between the Throttle Body harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 8

      No

      - Repair the (K22) TPS Signal 1 for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

8. **CHECK THE (K922) TPS SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K922) TPS Sensor Ground circuit between the Throttle Body harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 9

      No

      - Repair the (K922) TPS Sensor Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
9. **THROTTLE BODY**

Fig. 96: Throttle Body Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the PCM C2 harness connector.
3. Connect a jumper wire between the (K922) TPS Sensor Ground circuit and the (K22) TPS Signal 1 circuit in the Throttle Body harness connector.
4. Turn the ignition on.
5. With the scan tool, read the TPS Signal 1 circuit voltage.

   Is the voltage below 0.1 volts with the jumper in place?

   Yes

   - Replace the Throttle Body in accordance with the service information. Refer to **THROTTLE BODY, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Go To 10

10. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.
    6. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0125-INSUFFICIENT COOLANT TEMP FOR CLOSE - LOOP FUEL CONTROL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on, battery voltage greater than 10.4 volts, and no Engine Coolant Temperature (ECT) sensor circuit DTCs present.

SET CONDITION

The Powertrain Control Module (PCM) detects that the engine coolant temperature is below the calibrated pass value when the engine run time is greater than the calibrated value based on start up coolant temperature. Two trip fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
ENGINE COOLANT TEMPERATURE (ECT) SENSOR WIRING OR CONNECTORS
ENGINE COOLANT LEVEL AND CONDITION
THERMOSTAT
ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION.

NOTE: Diagnose and repair any engine coolant temperature sensor circuit DTCs before proceeding with this test.

NOTE: Extremely cold ambient temperatures may cause this DTC to set.

1. Perform the diagnostic procedure for CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

P0128-THERMOSTAT RATIONALITY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running, start up coolant temperature between -8° C (17.6° F) and 50° C (122° F), the difference between ambient temperature and coolant temperature less than 10° C (50° F) and average vehicle speed greater than 16 kph (10 mph) for more than 18% of vehicle run time.

SET CONDITION

The Powertrain Control Module (PCM) detects that the actual engine coolant temperature does not reach the predicted engine coolant temperature within a specific time. Two trip fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
TEMPERATURE SENSOR WIRING OR CONNECTORS
ENGINE COOLANT LEVEL AND CONDITION
THERMOSTAT
TEMPERATURE SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **CHECKING THE TEMPERATURE SENSORS.**

NOTE: Diagnose and repair any ambient air temperature (AAT), intake air temperature (IAT), or engine coolant temperature (ECT) sensor circuit or rationality DTCs before continuing with this test.

NOTE: Diagnose and repair any crankshaft (CKP) or camshaft (CMP) sensor circuit or rationality DTCs before continuing with this test.

NOTE: Diagnose and repair any communication DTCs before continuing with this test.

NOTE: Verify that the Pinion Factor has been programmed correctly into the PCM.

1. Perform the diagnostic procedure for CHECKING THE TEMPERATURE SENSORS. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 2

2. **CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION.**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

P0129-BAROMETRIC PRESSURE OUT OF RANGE LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 97: Manifold Absolute Pressure Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With engine speed within 64 RPM of target idle, MAP sensor voltage between 0.04 of a volt and 4.96 volts, no vehicle speed, and the throttle closed.

SET CONDITION

Each time the Powertrain Control Module (PCM) detects that the MAP sensor value is greater than a calibrated value for BARO, a counter is incremented. If the counter reaches a calibrated limit, the test fails. One trip fault. Three good

trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
MAP SENSOR WIRING OR CONNECTORS
(F856) 5 VOLT SUPPLY CIRCUIT HIGH RESISTANCE
(K1) MAP SIGNAL CIRCUIT HIGH RESISTANCE
(K900) SENSOR GROUND CIRCUIT HIGH RESISTANCE
MAP SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

CHECKING THE MAP SENSOR OPERATION

NOTE: Diagnose and repair any MAP sensor circuit DTCs before continuing with this test.

1. Perform the diagnostic procedure for CHECKING THE MAP SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

P0131-O2 SENSOR 1/1 CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article .

Fig. 98: Oxygen Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Oxygen Sensors (O2 Sensor) are used for fuel control and catalyst monitoring. Each O2 Sensor measures the oxygen content of the exhaust stream. When the engine is started, the Powertrain Control Module (PCM) operates in an Open Loop mode, ignoring the O2 Sensor signal voltage while calculating the air-to-fuel ratio. The heating elements inside each O2 Sensor heats the sensor to bring it to operating conditions faster. This allows the system to enter Closed Loop earlier and the PCM to calculate the air-to-fuel ratio sooner. While the

engine runs, the O2 Sensor heats up and begins to generate a voltage within a range of 0-1, 275 mV. Once sufficient O2 Sensor voltage fluctuation is observed by the PCM, Closed Loop is entered. The PCM uses the O2 Sensor voltage to determine the air-to-fuel ratio. An O2 Sensor voltage that increases toward 1, 000 mV indicates a rich fuel mixture. An O2 Sensor voltage that decreases toward 0 mV indicates a lean fuel mixture. The Powertrain Control Module (PCM) makes short term and long term fuel corrections to maintain stoichiometric fuel/air ratio for best catalytic converter efficiency. Short term fuel correction is based on upstream O2 Sensor output and is designed for quick engine response. The long term fuel correction compensated for variations in the engine specifications, sensor tolerances and component aging and is designed to correct rich and lean conditions over a longer period of time.

For an aged O2 Sensor, the response rate to the air/fuel change is slower than when it was new. The O2 Sensor tends to move less with the same air/fuel changes in a given time frame. Therefore by observing the activity of voltage readings from the upstream O2 Sensor, the quality of the O2 Sensor can be detected.

WHEN MONITORED

With the engine running for less than 30 seconds, the Oxygen Sensor 1/1 heater temperature less than 251° C (484° F) and the battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Oxygen Sensor 1/1 signal voltage is below 2.5196 volts for 6 seconds after engine startup. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES

DIAGNOSTIC TEST

1. **OXYGEN SENSOR 1/1 VOLTAGE**
   1. Start the engine and allow it to reach normal operating temperature.

      WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

   2. With a scan tool, monitor the O2 Sensor 1/1 volts.

      Is the voltage less than 2.52 volts?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .
2. **CHECK THE (K41) O2 SENSOR 1/1 SIGNAL CIRCUIT VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Oxygen Sensor 1/1 harness connector.
   3. Turn the ignition on.
   4. With a scan tool, monitor the O2 Sensor 1/1 volts.

      Is the voltage above 4.8 volts?

Yes

- Go To 3

No

- Go To 5

3. **OXYGEN SENSOR 1/1**

8. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor 1/1 and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins (TSBs) that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0132-O2 SENSOR 1/1 CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 104: Oxygen Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Oxygen Sensors (O2 Sensor) are used for fuel control and catalyst monitoring. Each O2 Sensor measures the oxygen content of the exhaust stream. When the engine is started, the Powertrain Control Module (PCM) operates in an Open Loop mode, ignoring the O2 Sensor signal voltage while calculating the

air-to-fuel ratio. The heating elements inside each O2 Sensor heats the sensor to bring it to operating conditions faster. This allows the system to enter Closed Loop earlier and the PCM to calculate the air-to-fuel ratio sooner. While the engine runs, the O2 Sensor heats up and begins to generate a voltage within a range of 0-1, 275 mV. Once sufficient O2 Sensor voltage fluctuation is observed by the PCM, Closed Loop is entered. The PCM uses the O2 Sensor voltage to determine the air-to-fuel ratio. An O2 Sensor voltage that increases toward 1, 000 mV indicates a rich fuel mixture. An O2 Sensor voltage that decreases toward 0 mV indicates a lean fuel mixture. The Powertrain Control Module (PCM) makes short term and long term fuel corrections to maintain stoichiometric fuel/air ratio for best catalytic converter efficiency. Short term fuel correction is based on upstream O2 Sensor output and is designed for quick engine response. The long term fuel correction compensated for variations in the engine specifications, sensor tolerances and component aging and is designed to correct rich and lean conditions over a longer period of time.

For an aged O2 Sensor, the response rate to the air/fuel change is slower than when it was new. The O2 Sensor tends to move less with the same air/fuel changes in a given time frame. Therefore by observing the activity of voltage readings from the upstream O2 Sensor, the quality of the O2 Sensor can be detected.

WHEN MONITORED

With the Oxygen Sensor 1/1 heater temperature greater than 496° C (925° F) and the battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Oxygen Sensor 1/1 voltage is greater than 3.99 volts for 40 seconds. One Trip Fault. Three good trips to turn off the MIL.

P0133-O2 SENSOR 1/1 SLOW RESPONSE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 109: Oxygen Sensor Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Oxygen Sensors (O2 Sensor) are used for fuel control and catalyst monitoring. Each O2 Sensor measures the oxygen content of the exhaust stream. When the engine is started, the Powertrain Control Module (PCM) operates in an Open Loop mode, ignoring the O2 Sensor signal voltage while calculating the air-to-fuel ratio. The heating elements inside each O2 Sensor heats the sensor to bring it to operating conditions faster. This allows the system to enter Closed Loop earlier and the PCM to calculate the air-to-fuel ratio sooner. While the engine runs, the O2 Sensor heats up and begins to generate a voltage within a range of 0-1, 275 mV. Once sufficient O2 Sensor voltage fluctuation is observed by the PCM, Closed Loop is entered. The PCM uses the O2 Sensor voltage to determine the air-to-fuel ratio. An O2 Sensor voltage that increases toward 1, 000 mV indicates a rich fuel mixture. An O2 Sensor voltage that decreases toward 0 mV indicates a lean fuel mixture. The Powertrain Control Module (PCM) makes short term and long term fuel corrections to maintain stoichiometric fuel/air ratio for best catalytic converter efficiency. Short term fuel correction is based on upstream O2 Sensor output and is designed for quick engine response. The long term fuel correction compensated for variations in the engine specifications, sensor tolerances and component aging and is designed to correct rich and lean conditions over a longer period of time.

For an aged O2 Sensor, the response rate to the air/fuel change is slower than when it was new. The O2 Sensor tends to move less with the same air/fuel changes in a given time frame. Therefore by observing the activity of voltage readings from the upstream O2 Sensor, the quality of the O2 Sensor can be detected.

WHEN MONITORED

With the ECT above 70 C (158 F), engine RPM between 1400 and 2300, the vehicle speed between 64 and 96 kph (40 and 60 mph), and the engine run time greater than 3 minutes.

SET CONDITION

The Powertrain Control Module (PCM) detects that the oxygen sensor signal does not switch adequately during monitoring. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
EXHAUST LEAK
(K41) O2 1/1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K902) O2 1/1 RETURN CIRCUIT SHORTED TO VOLTAGE
(K41) O2 1/1 SIGNAL CIRCUIT SHORTED TO GROUND

(K41) O2 1/1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K902) O2 1/1 RETURN CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR 1/1
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **EXHAUST LEAK**
   1. Perform the diagnostic procedure for CHECKING THE EXHAUST SYSTEM FOR LEAKS. Refer to **DIAGNOSIS AND TESTING** .

      Were any exhaust leaks found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 2
2. **ACTIVE DTC**

   NOTE: Check for contaminants that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

1. Start the engine and allow it to reach operating temperature.

   WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 3

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

3. **CHECK THE (K41) O2 Sensor 1/1 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 110: Checking O2 Sensor 1/1 Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Oxygen Sensor 1/1 harness connector.
3. Turn the ignition on.
4. Measure the voltage on the (K41) O2 Sensor 1/1 Signal circuit in the Oxygen Sensor 1/1 harness connector.

NOTE: Measure the voltage in reference to ground, not the (K902) O2 Sensor 1/1 Return circuit.

Is the voltage above 5.2 volts?

Yes

- Repair the (K41) O2 Sensor 1/1 Signal circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Go To 4

4. **CHECK THE (K902) O2 SENSOR 1/1 RETURN CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 111: Checking O2 Sensor 1/1 Return Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Turn the ignition on.
4. Measure the voltage on the (K902) O2 Sensor 1/1 Return circuit in the Oxygen Sensor 1/1 harness connector.

   Is there any voltage present?

Yes

- Repair the (K902) O2 Sensor 1/1 Return circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **CHECK THE (K41) O2 SENSOR 1/1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 112: Checking O2 Sensor 1/1 Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K41) O2 Sensor 1/1 Signal circuit in the Oxygen Sensor 1/1 harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To 6

No

- Repair the (K41) O2 Sensor 1/1 Signal circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K902) O2 SENSOR 1/1 RETURN CIRCUIT FOR A SHORT TO GROUND**

Fig. 113: Checking 1/1 O2 Sensor Return Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (K902) O2 Sensor 1/1 Return circuit in the Oxygen Sensor 1/1 harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To 7

No

- Repair the (K902) O2 Sensor 1/1 Return circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K41) O2 SENSOR 1/1 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K41) O2 Sensor 1/1 Signal circuit between the Oxygen Sensor 1/1 harness connector to the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 8

No

- Repair the (K41) O2 Sensor 1/1 Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

OPEN/HIGH RESISTANCE

1. Measure the resistance of the (K902) O2 Sensor 1/1 Return circuit between the Oxygen Sensor 1/1 harness connector to the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 9

   No

   - Repair the (K902) O2 Sensor 1/1 Return circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **OXYGEN SENSOR 1/1**

NOTE: Prior to replacing the O2 sensor, verify that the correct part number is being used in order to prevent improper O2 heater control.

1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor 1/1 and the Powertrain Control Module (PCM).
   - Look for any chafed, pierced, pinched or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Replace the Oxygen Sensor 1/1 in accordance with the service information. Refer to **SENSOR, OXYGEN, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0135-O2 SENSOR 1/1 HEATER PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 114: Oxygen Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

For the 02 Sensor to deliver accurate readings the sensing element must be heated. A Positive Temperature Coefficient (PTC) element inside the O2 Sensor heats up as current passes through it. This allows the system to enter Closed Loop quickly. The Powertrain Control Module (PCM) turns on this circuit based on Engine Coolant Temperature (ECT) and engine loads. During operation the heater circuit is momentarily disabled to allow a resistance measurement to be taken to infer heater temperature. The current delivery to the heater is duty cycled to maintain a specific target temperature. The error from the target temperature is continuously monitored to assess heater performance. If a malfunction occurs the circuit is turned off and a DTC will set.

WHEN MONITORED

With the engine running, O2 sensor heater duty cycle greater than 0% and the battery voltage greater than 11.0 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects no O2 sensor output when the heater is powered up. Two trip fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
(K99) O2 1/1 HEATER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR 1/1
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **OXYGEN SENSOR 1/1 HEATER CONTROL OPERATION**
    1. Turn the ignition off.

NOTE: Wait a minimum of eight minutes to allow the sensor to cool down before continuing. The

sensor voltage should stabilize between 2.47 and 2.52 volts.

2. Turn the ignition on.
3. With a scan tool, actuate the Oxygen Sensor 1/1 heater control.
4. With the scan tool, monitor 1/1 O2 Sensor Volts for at least two minutes.

   Does the voltage stay between 2.47 and 2.52 volts?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **OXYGEN SENSOR 1/1**
   1. Turn the ignition off.

      NOTE: Wait a minimum of 8 minutes to allow the sensor to cool down before continuing.

   2. Disconnect the Oxygen Sensor 1/1 harness connector.
   3. Measure the resistance of the O2 sensor heater element across the Oxygen Sensor 1/1 connector between the heater control terminal and the ground terminal.

      NOTE: The O2 heater element resistance should be measured at 70°F (21.1°C). The resistance value will vary at different temperatures.

      Is the resistance between 2.0 and 30.0 Ohms?

      Yes

      - Go To 3

No

- Replace the Oxygen Sensor 1/1 in accordance with the service information. Refer to **SENSOR, OXYGEN, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K99) O2 1/1 HEATER CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Disconnect the PCM C2 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   2. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   3. Measure the resistance of the (K99) O2 1/1 Heater Control circuit from the Oxygen Sensor 1/1 harness connector to the GPEC Adaptor.

      Is the resistance below 0.5 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K99) O2 1/1 Heater Control circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 115: Checking Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12 volt test light connected to 12 volts, check the Ground circuit in the Oxygen Sensor 1/1 harness connector.

   NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

   Is the test light illuminated and bright?

   Yes

   - Go To 5

   No

   - Repair the Ground circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

5. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor 1/1 and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins (TSBs) that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

THEORY OF OPERATION

The Oxygen Sensors (O2 Sensor) are used for fuel control and catalyst monitoring. Each O2 Sensor measures the oxygen content of the exhaust stream. When the engine is started, the Powertrain Control Module (PCM) operates in an Open Loop mode, ignoring the O2 Sensor signal voltage while calculating the air-to-fuel ratio. The heating elements inside each O2 Sensor heats the sensor to bring it to operating conditions faster. This allows the system to enter Closed Loop earlier and the PCM to calculate the air-to-fuel ratio sooner. While the engine runs, the O2 Sensor heats up and begins to generate a voltage within a range of 0-1, 275 mV. Once sufficient O2 Sensor voltage fluctuation is observed

by the PCM, Closed Loop is entered. The PCM uses the O2 Sensor voltage to determine the air-to-fuel ratio. An O2 Sensor voltage that increases toward 1, 000 mV indicates a rich fuel mixture. An O2 Sensor voltage that decreases toward 0 mV indicates a lean fuel mixture. The Powertrain Control Module (PCM) makes short term and long term fuel corrections to maintain stoichiometric fuel/air ratio for best catalytic converter efficiency. Short term fuel correction is based on upstream O2 Sensor output and is designed for quick engine response. The long term fuel correction compensated for variations in the engine specifications, sensor tolerances and component aging and is designed to correct rich and lean conditions over a longer period of time.

For an aged O2 Sensor, the response rate to the air/fuel change is slower than when it was new. The O2 Sensor tends to move less with the same air/fuel changes in a given time frame. Therefore by observing the activity of voltage readings from the upstream O2 Sensor, the quality of the O2 Sensor can be detected.

WHEN MONITORED

With the engine running for less than 30 seconds, the Oxygen Sensor 1/2 heater temperature less than 251° C (484° F) and the battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Oxygen Sensor 1/2 signal voltage is below 2.5196 volts for six seconds after engine startup. One Trip Fault. Three good trips to turn off the MIL.

OXYGEN SENSOR 1/2
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **EXHAUST LEAK**

NOTE: A thorough exhaust leak test must be completed before removing an O2 Sensor or any other part from the exhaust system. Do not remove any parts before an exhaust leak check has been completed.

NOTE: An exhaust leak may cause downstream fuel adaptives to cap out, resulting in a false O2 Sensor failure

1. Perform the diagnostic procedure for CHECKING THE EXHAUST SYSTEM FOR LEAKS. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Go To 10

   No

   - Go To 2

2. **ACTIVE DTC**

NOTE: Check for contaminants that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

1. Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 3

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

3. **CHECK THE (K141) O2 SENSOR 1/2 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 128: Checking O2 Sensor Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Oxygen Sensor 1/2 harness connector.
3. Turn the ignition on.
4. Measure the voltage on the (K141) O2 Sensor 1/2 Signal circuit in the Oxygen Sensor 1/2 harness connector.

NOTE: Measure the voltage in reference to ground, not the (K904) O2 Sensor 1/2 Return circuit.

Is the voltage above 5.2 volts?

Yes

- Repair the (K141) O2 Sensor 1/2 Signal circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Go To 4

4. **CHECK THE (K904) O2 SENSOR 1/2 RETURN CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 129: Checking O2 Sensor Return Circuit For Short To Voltage

1. Measure the resistance between ground and the (K904) O2 Sensor 1/2 Return circuit in the Oxygen Sensor 1/2 harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To 7

No

- Repair the (K904) O2 Sensor 1/2 Return circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K141) O2 SENSOR 1/2 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K141) O2 Sensor 1/2 Signal circuit between the Oxygen Sensor 1/2 harness connector to the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 8

No

- Repair the (K141) O2 Sensor 1/2 Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (K904) O2 SENSOR 1/2 RETURN CIRCUIT FOR AN**

OPEN/HIGH RESISTANCE

1. Measure the resistance of the (K904) O2 Sensor 1/2 Return circuit between the Oxygen Sensor 1/2 harness connector to the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 9

   No

   - Repair the (K904) O2 Sensor 1/2 Return circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **OXYGEN SENSOR 1/2**

NOTE: Prior to replacing the O2 sensor, verify that the correct part number is being used in order to prevent improper O2 heater control.

1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor 1/2 and the Powertrain Control Module (PCM).
   - Look for any chafed, pierced, pinched or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Replace the Oxygen Sensor 1/2 in accordance with the SERVICE INFORMATION. Refer to **SENSOR, OXYGEN, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **EXHAUST LEAK**
    1. Repair the exhaust leak(s) as necessary.
    2. Start the engine and allow it to reach operating temperature.
    3. Test drive the vehicle for at least 5 minutes.
    4. During the test drive, accelerate from 64 kph (40 mph) to 80 kph (50 mph), then release the accelerator pedal for at least 3 seconds. Repeat this procedure a minimum of 10 times.
    5. Stop the vehicle and turn the ignition off for 5 seconds.
    6. Test drive the vehicle again for at least 5 minutes.
    7. During the test drive, accelerate from 64 kph (40 mph) to 80 kph (50 mph), then release the accelerator pedal for at least 3 seconds. Repeat this procedure a minimum of 10 times.
    8. Stop the vehicle.
    9. With the scan tool, select View DTCs.

       Does this DTC reset as a pending or stored DTC?

       Yes

       - Retest. Go To 1

       No

       - Test Complete.
       - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0140-O2 SENSOR 1/2 SIGNAL INACTIVE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 132: Oxygen Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Oxygen Sensors (O2 Sensor) are used for fuel control and catalyst monitoring. Each O2 Sensor measures the oxygen content of the exhaust stream. When the engine is started, the Powertrain Control Module (PCM) operates in an Open Loop mode, ignoring the O2 Sensor signal voltage while calculating the air-to-fuel ratio. The heating elements inside each O2 Sensor heats the sensor to bring it to operating conditions faster. This allows the system to enter Closed Loop earlier and the PCM to calculate the air-to-fuel ratio sooner. While the engine runs, the O2 Sensor heats up and begins to generate a voltage within a range of 0-1, 275 mV. Once sufficient O2 Sensor voltage fluctuation is observed

by the PCM, Closed Loop is entered. The PCM uses the O2 Sensor voltage to determine the air-to-fuel ratio. An O2 Sensor voltage that increases toward 1, 000 mV indicates a rich fuel mixture. An O2 Sensor voltage that decreases toward 0 mV indicates a lean fuel mixture. The Powertrain Control Module (PCM) makes short term and long term fuel corrections to maintain stoichiometric fuel/air ratio for best catalytic converter efficiency. Short term fuel correction is based on upstream O2 Sensor output and is designed for quick engine response. The long term fuel correction compensated for variations in the engine specifications, sensor tolerances and component aging and is designed to correct rich and lean conditions over a longer period of time.

For an aged O2 Sensor, the response rate to the air/fuel change is slower than when it was new. The O2 Sensor tends to move less with the same air/fuel changes in a given time frame. Therefore by observing the activity of voltage readings from the upstream O2 Sensor, the quality of the O2 Sensor can be detected.

WHEN MONITORED

For six minutes after engine start up and the vehicle speed between 20 and 55 MPH.

SET CONDITION

The O2 signal voltage does not switch lean or rich during monitoring for at least 2 to 4 minutes. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
EXHAUST LEAK
(K141) O2 1/2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K904) O2 1/2 RETURN CIRCUIT SHORTED TO VOLTAGE
(K141) O2 1/2 SIGNAL CIRCUIT SHORTED TO GROUND
(K904) O2 1/2 RETURN CIRCUIT SHORTED TO GROUND
(K141) O2 1/2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K904) O2 1/2 RETURN CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR 1/2
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **EXHAUST LEAK**

NOTE: A thorough exhaust leak test must be completed before removing an O2 Sensor or any other part from the exhaust system. Do not remove any parts before an exhaust leak check has been completed.

NOTE: An exhaust leak may cause downstream fuel adaptives to cap out, resulting in a false O2 Sensor failure.

1. Turn the ignition off.
2. Inspect the exhaust system for leaks between the engine and the 1/1 Oxygen Sensor.
3. Perform a leak test with the Evaporative Emissions Leak Detector (EELD) (special tool #8404C, Kit, EELD And Accessory), even if an audible leak is not heard. Pay particular attention to the exhaust manifold to head surface, exhaust pipe to manifold connection, and the O2 Sensor boss for leaks.
4. Connect the SMOKE supply tip (black hose) to the exhaust cone adapter (if equipped) and place it into the tail pipe.
5. Set the smoke/air control switch to SMOKE.
6. Press the remote smoke/air start button.
7. While still holding the remote smoke/air start button, use the white light (special tool #8404-CLL, Light, White) to follow the exhaust system path and look for a leak, indicated by exiting smoke.
8. If a leak is concealed from view, release the remote smoke/air start button and use the ultraviolet (UV) black light (special tool #8404-UVL, Light, UV) and the yellow goggles (special tool #8404-20, Goggles, Yellow) to look for residual traces of dye that is left behind by the smoke.
9. The exiting smoke deposits a residual fluid that is either bright green or

bright yellow in color when viewed with a UV light.

Were any exhaust leaks found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 2

2. **ACTIVE DTC**

NOTE: Check for contaminants that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

1. Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 3

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

3. **CHECK THE (K141) O2 SENSOR 1/2 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 133: Checking O2 Sensor Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Start the engine and allow it to idle.
2. Disconnect the Oxygen Sensor 1/2 harness connector.
3. Measure the voltage on the (K141) O2 Sensor 1/2 Signal circuit in the Oxygen Sensor 1/2 harness connector.

NOTE: Measure the voltage in reference to ground, not the (K904) O2 Sensor 1/2 Return circuit.

Is the voltage above 5.2 volts?

Yes

- Repair the (K141) O2 Sensor 1/2 Signal circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE (K904) O2 SENSOR 1/2 RETURN CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 134: Checking O2 Sensor Return Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Turn the ignition on.

4. Measure the voltage on the (K904) O2 Sensor 1/2 Return circuit in the Oxygen Sensor 1/2 harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K904) O2 Sensor 1/2 Return circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **CHECK THE (K141) O2 SENSOR 1/2 SIGNAL CIRCUIT SHORTED TO GROUND**

Fig. 135: Checking O2 Sensor Signal Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K141) O2 Sensor 1/2 Signal circuit in the Oxygen Sensor 1/2 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the (K141) O2 Sensor 1/2 Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K904) O2 SENSOR 1/2 RETURN CIRCUIT FOR A SHORT TO GROUND**

Fig. 136: Checking O2 Sensor 1/2 Return Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (K904) O2 Sensor 1/2 Return circuit in the Oxygen Sensor 1/2 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 7

   No

   - Repair the (K904) O2 Sensor 1/2 Return circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K141) O2 SENSOR 1/2 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K141) O2 Sensor 1/2 Signal circuit between the Oxygen Sensor 1/2 harness connector to the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 8

   No

   - Repair the (K141) O2 Sensor 1/2 Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (K904) O2 SENSOR 1/2 RETURN CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K904) O2 Sensor 1/2 Return circuit between the Oxygen Sensor 1/2 harness connector to the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 9

      No

      - Repair the (K904) O2 Sensor 1/2 Return circuit for an open circuit or high resistance.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **OXYGEN SENSOR 1/2**

NOTE: Prior to replacing the O2 sensor, verify that the correct part number is being used in order to prevent improper O2 heater control.

1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor 1/2 and the Powertrain Control Module (PCM).
2. Look for any chafed, pierced, pinched or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Perform any Technical Service Bulletins (TSBs) that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace the Oxygen Sensor 1/2 in accordance with the service information. Refer to **SENSOR, OXYGEN, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0141-O2 SENSOR 1/2 HEATER PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 137: Oxygen Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

For the 02 Sensor to deliver accurate readings the sensing element must be heated. A Positive Temperature Coefficient (PTC) element inside the O2 Sensor heats up as current passes through it. This allows the system to enter Closed Loop quickly. The Powertrain Control Module (PCM) turns on this circuit based on Engine Coolant Temperature (ECT) and engine loads. During operation the heater circuit is momentarily disabled to allow a resistance measurement to be taken to infer heater temperature. The current delivery to the heater is duty cycled to maintain a specific target temperature. The error from the target temperature is continuously monitored to assess heater performance. If a

malfunction occurs the circuit is turned off and a DTC will set.

WHEN MONITORED

With the engine running, O2 sensor heater duty cycle greater than 0% and battery voltage greater than 11.0 volts.

SET CONDITION

The PCM detects no O2 sensor output when the heater is powered up. Two trip fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
(K299) O2 1/2 HEATER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR 1/2
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **OXYGEN SENSOR 1/2 HEATER CONTROL OPERATION**
    1. Turn the ignition off.

    NOTE: Wait A Minimum Of 8 minutes to allow the sensor to cool down before continuing. The sensor voltage should stabilize between 2.47 and 2.52 volts.

    2. Turn the ignition on.
    3. With a scan tool, actuate the Oxygen Sensor 1/1 heater control.
    4. With the scan tool, monitor 1/1 O2 Sensor Volts for at least two minutes.

    Does the voltage stay between 2.47 and 2.52 volts?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **OXYGEN SENSOR 1/2**
   1. Turn the ignition off.

      NOTE: Wait a minimum of eight minutes to allow the sensor to cool down before continuing.

   2. Disconnect the Oxygen Sensor 1/2 harness connector.
   3. Measure the resistance of the O2 sensor heater element across the Oxygen Sensor 1/2 connector between the heater control terminal and the ground terminal.

      NOTE: The O2 heater element resistance should be measured at 21.1°C (70°F). The resistance value will vary at different temperatures.

      Is the resistance between 2.0 and 30.0 Ohms?

      Yes

      - Go To 3

      No

      - Replace the Oxygen Sensor 1/2 in accordance with the service information. Refer to **SENSOR, OXYGEN, REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K299) O2 1/2 HEATER CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Disconnect the PCM harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

2. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
3. Measure the resistance of the (K299) O2 1/2 Heater Control circuit from the Oxygen Sensor 1/2 harness connector to the GPEC Adaptor.

   Is the resistance below 0.5 Ohms?

   Yes

   - Go To 4

   No

   - Repair the (K299) O2 1/2 Heater Control circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 138: Checking Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12 volt test light connected to 12 volts, check the Ground circuit in the Oxygen Sensor 1/2 harness connector.

   NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

   Is the test light illuminated and bright?

   Yes

   - Go To 5

   No

   - Repair the Ground circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

5. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor 1/2 and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins (TSBs) that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0171-FUEL SYSTEM 1/1 LEAN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The fuel feedback system will maintain a stoichiometric fuel/air mixture, 14.7:1, by modifying the injector pulse width according to the oxygen content of the exhaust gas. The Powertrain Control Module (PCM) makes short term and long term fuel corrections to maintain stoichiometric fuel/air ratio for best Catalytic Converter efficiency. Short term fuel correction is based on upstream O2 Sensor output and is designed for quick engine response. The long term fuel correction compensated for variations in the engine specifications, sensor tolerances and

component aging and is designed to correct rich and lean conditions over a longer period of time.

WHEN MONITORED

With the engine running in closed loop, the ambient/battery temperature above -7° C (20° F) and altitude below 8500 ft.

SET CONDITION

The Powertrain Control Module (PCM) monitors the Adaptive Memory factor (a combination of Short Term Adaptive and Long Term Adaptive). If the total fuel addition exceeds a calibrated threshold for an extended period, a fuel system lean fault is stored. If the total fuel subtraction exceeds a calibrated threshold, a fuel system rich fault is stored. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
EXHAUST SYSTEM LEAK
FUEL DELIVERY SYSTEM
ECT SENSOR, WIRING, OR CONNECTORS
MAP SENSOR, WIRING, OR CONNECTORS
O2 SENSOR, WIRING, OR CONNECTORS
ENGINE MECHANICAL SYSTEM
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Diagnose and repair any other active component or circuit DTCs before continuing with this procedure.
    2. Turn the ignition on.
    3. With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.
    4. Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

5. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE EXHAUST SYSTEM FOR LEAKS**
   1. Perform the diagnostic procedure for CHECKING THE EXHAUST SYSTEM FOR LEAKS. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

- Go To 3

3. **CHECK THE FUEL DELIVERY SYSTEM**
   1. Perform the diagnostic procedures for FUEL PRESSURE LEAK DOWN and FUEL DELIVERY SYSTEM OUTPUT - FLOW TEST. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 4

4. **CHECK THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 5

5. **CHECK THE MAP SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE MAP SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

P0196-ENGINE OIL TEMPERATURE SENSOR PERFORMANCE

Fig. 139: Temperature Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With engine off time greater than 480 minutes and ambient temperature greater than -7°C (19.4°F).

SET CONDITION

After a calibrated amount of cool down time, the PCM compares the AAT, ECT, and IAT Sensor values. If the general temperature rationality passes, the PCM compares the Oil Temperature Sensor value to a threshold based on the other temp sensor values. If the difference is greater than a calibrated value, the diagnostic fails.

POSSIBLE CAUSES

POSSIBLE CAUSES
(G24) EOT SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K915) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE OIL TEMPERATURE (EOT) SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **COMPARE THE TEMPERATURE SENSOR READINGS**

   NOTE: Diagnose any CAN - C Communication DTCs before continuing.

   1. Turn the ignition off.
   2. Allow the vehicle to sit with the ignition off in an environment where the temperature is consistent and above -7°C (19.4°F) until the engine coolant temperature is equal to ambient temperature.
   3. Turn the ignition on.
   4. With a scan tool, compare the Engine Oil Temperature Sensor value to the AAT, ECT, and IAT Sensor values.

      Is the Engine Oil Temperature Sensor value within 10°C (18°F) of the other sensor values?

      Yes

      - Perform the INTERMITTENT CONDITION diagnostic procedure.

Refer to **INTERMITTENT CONDITION** .

No

- Refer to 2.

2. **ACTIVE DTC**

NOTE: If possible, allow the vehicle to sit with the ignition off for more than 480 minutes in an environment where the temperature is consistent and above -7°C (19.4°F).

1. Test drive the vehicle. The vehicle must exceed 48 km/h (30 mph) during the test drive. Do not cycle the ignition off when the test drive is completed.
2. With a scan tool, select View DTCs.

   Is the status Active or Pending for this DTC?

   Yes

   - Go To 3

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

3. **CHECK THE (G24) EOT SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the EOT Sensor harness connector.
   3. Disconnect the PCM C1 and C2 harness connectors.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

4. Connect the (special tool #10436, Adapter, GPEC Diagnostic) to the PCM C2 harness connector.
5. Measure the resistance of the (G24) EOT Signal circuit between the Engine Oil Temperature Sensor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the (G24) EOT Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (K915) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

   CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic) to the PCM C1 harness connector.
2. Measure the resistance of the (K915) Sensor Ground circuit between the EOT Sensor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

- Repair the (K915) Sensor Ground for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **ENGINE OIL TEMPERATURE SENSOR**

Fig. 140: Engine Oil Temperature Sensor Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the PCM C1 and C2 harness connectors.
3. Connect a jumper between the (K915) Sensor Ground circuit and the (G24) EOT Signal circuit in the Engine Oil Temperature Sensor harness

connector.

4. Turn the ignition on.
5. With the scan tool, read the Engine Oil Temperature Sensor signal voltage.

   Is the voltage below 0.1 volts with the jumper in place?

   Yes

   - Replace the Engine Oil Temperature Sensor in accordance with the service information. Refer to **2.0L SENSOR, OIL TEMPERATURE, REMOVAL** or **2.4L SENSOR, OIL TEMPERATURE, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 6

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Oil Temperature Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0197-ENGINE OIL TEMPERATURE SENSOR CIRCUIT LOW

Fig. 141: Temperature Sensors Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Engine Oil Temperature (EOT) Sensor input voltage is below the minimum acceptable value.

POSSIBLE CAUSES

POSSIBLE CAUSES
(G24) EOT SIGNAL CIRCUIT SHORTED TO GROUND
(G24) EOT SIGNAL CIRCUIT SHORTED TO THE (K915) SENSOR GROUND CIRCUIT
(G24) EOT SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE OIL TEMPERATURE (EOT) SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Turn the ignition on.

        WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

    2. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (G24) EOT SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 142: Checking Engine Oil Temperature Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the EOT Sensor harness connector.
3. Disconnect the PCM C1 and C2 harness connectors.

4. Measure the resistance between ground and the (G24) EOT Signal circuit in the EOT Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 3

   No

   - Repair the (G24) EOT Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK FOR THE (G24) EOT SIGNAL CIRCUIT SHORTED TO THE (K915) SENSOR GROUND CIRCUIT**

Fig. 143: Checking Engine Oil Temperature Sensor Signal Circuit For Short To Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (G24) EOT Signal circuit and the (K915) Sensor Ground circuit in the EOT Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the (G24) EOT Signal circuit for a short to the (K915) Sensor Ground circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **ENGINE OIL TEMPERATURE SENSOR**
   1. Turn the ignition off.
   2. Reconnect the PCM C1 and C2 harness connectors.
   3. Turn the ignition on.
   4. With the scan tool, read the Engine Oil Temperature Sensor signal voltage.

      Is the voltage above 4.9 volts with the Engine Oil Temperature Sensor harness disconnected?

      Yes

      - Replace the Engine Oil Temperature Sensor in accordance with the service information. Refer to **2.0L SENSOR, OIL TEMPERATURE, REMOVAL** or **2.4L SENSOR, OIL TEMPERATURE, REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 5

5. **POWERTRAIN CONTROL MODULE (PCM)**

1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Oil Temperature Sensor and the Powertrain Control Module (PCM).
2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform the Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0198-ENGINE OIL TEMPERATURE SENSOR CIRCUIT HIGH

Fig. 144: Temperature Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Engine Oil Temperature (EOT) Sensor input voltage is above the maximum acceptable value.

POSSIBLE CAUSES

POSSIBLE CAUSES
(G24) EOT SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G24) EOT SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K915) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE OIL TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

1. Turn the ignition on.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (G24) EOT SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 145: Checking Engine Oil Temperature Sensor Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Engine Oil Temperature Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (G24) EOT Signal circuit in the Engine Oil Temperature Sensor harness connector.

   Is the voltage above 5.2 volts?

Yes

- Repair the (G24) EOT Signal circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECK THE (G24) EOT SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 and C2 harness connectors.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic) to the PCM C2 harness connector.
   4. Measure the resistance of the (G24) EOT Signal circuit between the EOT Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (G24) EOT Signal circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (K915) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic) to the PCM C1 harness connector.
2. Measure the resistance of the (K915) Sensor Ground circuit between the EOT Sensor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the (K915) Sensor Ground 3 circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **ENGINE OIL TEMPERATURE SENSOR**

Fig. 146: Engine Oil Temperature Sensor Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the PCM C1 and C2 harness connectors.
3. Connect a jumper between the (G24) EOT Signal circuit and the (K915) Sensor Ground in the EOT Sensor harness connector.
4. Turn the ignition on.
5. With the scan tool, read the Engine Oil Temperature Sensor signal voltage.

   Is the voltage below 0.1 volts with the jumper in place?

Yes

- Replace the Engine Oil Temperature Sensor in accordance with the service information. Refer to **2.0L SENSOR, OIL TEMPERATURE, REMOVAL** or **2.4L SENSOR, OIL TEMPERATURE, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Oil Temperature Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

P0201-FUEL INJECTOR 1 CIRCUIT/OPEN

Fig. 147: Fuel Injector Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With battery voltage greater than 10.0 volts, ASD relay energized, and engine speed less than 3000 RPM.

SET CONDITION

The Powertrain Control Module (PCM) monitors the continuity of the injector circuits as well as the voltage spike created by the collapse of the magnetic field in the injector coil. Any condition that reduces the maximum current flow or the magnitude of the voltage spike can cause this DTC to set.

POSSIBLE CAUSES

POSSIBLE CAUSES
FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
INJECTOR 1 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
INJECTOR 1 CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR 1
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

1. Start the engine and allow it to idle.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F343) FUSED ASD RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 148: Checking Fused Main Relay Output Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the Fuel Injector 1 harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F343) Fused ASD Relay Output circuit in the Fuel Injector 1 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 3

No

- Repair the (F343) Fused ASD Relay Output circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K11) INJECTOR 1 CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Measure the resistance of the (K11) Injector 1 Control circuit between the Fuel Injector 1 harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (K11) Injector 1 Control circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **FUEL INJECTOR 1**
   1. Turn the ignition off.
   2. Measure the resistance between the terminals of Fuel Injector 1.

NOTE: The resistance of the circuit will vary according to the temperature of the injector coil. Use the table below to determine the resistance range of the injector.

Fuel Injector Coil Resistance Based on Engine Temperature	
Temperature	**Resistance**
-20° C (-4° F)	10 Ohms (+/- 0.6 Ohm)
20° C (68° F)	12 Ohms (+/- 0.6 Ohm)
60° C (140° F)	14 Ohms (+/- 0.6 Ohm)
100° C (212° F)	16 Ohms (+/- 0.6 Ohm)

Is the resistance of the injector within the specified range?

Yes

- Go To 5

No

- Replace Fuel Injector 1 in accordance with the service information. Refer to **INJECTOR(S), FUEL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (K11) INJECTOR 1 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 149: Checking Injector Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K11) Injector 1 Control circuit in the Fuel Injector 1 harness connector.

   Is the resistance above 10k Ohms?

Yes

- Go To 6

No

- Repair the (K11) Injector 1 Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between Fuel Injector 1 and the Powertrain Control Module (PCM).
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
      - Look for the data to change or for the DTC to reset during the wiggle test.
      - Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0202-FUEL INJECTOR 2 CIRCUIT/OPEN

Fig. 150: Fuel Injector Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With battery voltage greater than 10 volts, ASD relay energized, and engine speed less than 3000 RPM.

SET CONDITION

The Powertrain Control Module (PCM) monitors the continuity of the injector circuits as well as the voltage spike created by the collapse of the magnetic field in the injector coil. Any condition that reduces the maximum current flow or the magnitude of the voltage spike can cause this DTC to set.

POSSIBLE CAUSES

POSSIBLE CAUSES
FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
INJECTOR 2 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
INJECTOR 2 CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR 2
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

1. Start the engine and allow it to idle.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F343) FUSED ASD RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 151: Checking Fused Main Relay Output Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Fuel Injector 2 harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F343) Fused

ASD Relay Output circuit in the Fuel Injector 2 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 3

No

- Repair the (F343) Fused ASD Relay Output circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K12) INJECTOR 2 CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Measure the resistance of the (K12) Injector 2 Control circuit between the Fuel Injector 2 harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

No

- Repair the (K12) Injector 2 Control circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **FUEL INJECTOR 2**
   1. Turn the ignition off.
   2. Measure the resistance between the terminals of Fuel Injector 2.

NOTE: The resistance of the circuit will vary according to the temperature of the injector coil. Use the table below to determine the resistance range of the injector.

Fuel Injector Coil Resistance Based on Engine Temperature	
Temperature	**Resistance**
-20° C (-4° F)	10 Ohms (+/- 0.6 Ohm)
20° C (68° F)	12 Ohms (+/- 0.6 Ohm)
60° C (140° F)	14 Ohms (+/- 0.6 Ohm)
100° C (212° F)	16 Ohms (+/- 0.6 Ohm)

Is the resistance of the injector within the specified range?

Yes

- Go To 5

No

- Replace Fuel Injector 2 in accordance with the service information. Refer to **INJECTOR(S), FUEL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (K12) INJECTOR 2 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 152: Checking Injector Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K12) Injector 2 Control circuit in the Fuel Injector 2 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

No

- Repair the (K12) Injector 2 Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between Fuel Injector 2 and the Powertrain Control Module (PCM).
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
      - Look for the data to change or for the DTC to reset during the wiggle test.
      - Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0203-FUEL INJECTOR 3 CIRCUIT/OPEN

Fig. 153: Fuel Injector Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With battery voltage greater than 10.0 volts, ASD relay energized, and engine speed less than 3000 RPM.

SET CONDITION

The Powertrain Control Module (PCM) monitors the continuity of the injector circuits as well as the voltage spike created by the collapse of the magnetic field in the injector coil. Any condition that reduces the maximum current flow or the magnitude of the voltage spike can cause this DTC to set.

POSSIBLE CAUSES

POSSIBLE CAUSES
FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
INJECTOR 3 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
INJECTOR 3 CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR 3
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

1. Start the engine and allow it to idle.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F343) FUSED ASD RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 154: Checking Fused Main Relay Output Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Fuel Injector 3 harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F343) Fused

ASD Relay Output circuit in the Fuel Injector 3 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 3

No

- Repair the (F343) Fused ASD Relay Output circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K13) INJECTOR 3 CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Measure the resistance of the (K13) Injector 3 Control circuit between the Fuel Injector 3 harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

No

- Repair the (K13) Injector 3 Control circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **FUEL INJECTOR 3**
   1. Turn the ignition off.
   2. Measure the resistance between the terminals of Fuel Injector 3.

NOTE: The resistance of the circuit will vary according to the temperature of the injector coil. Use the table below to determine the resistance range of the injector.

Fuel Injector Coil Resistance Based on Engine Temperature	
Temperature	**Resistance**
-20° C (-4° F)	10 Ohms (+/- 0.6 Ohm)
20° C (68° F)	12 Ohms (+/- 0.6 Ohm)
60° C (140° F)	14 Ohms (+/- 0.6 Ohm)
100° C (212° F)	16 Ohms (+/- 0.6 Ohm)

Is the resistance of the injector within the specified range?

Yes

- Go To 5

No

- Replace Fuel Injector 3 in accordance with the service information. Refer to **INJECTOR(S), FUEL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (K13) INJECTOR 3 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 155: Checking Injector Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K13) Injector 3 Control circuit in the Fuel Injector 3 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

No

- Repair the (K13) Injector 3 Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between Fuel Injector 3 and the Powertrain Control Module (PCM).
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
      - Look for the data to change or for the DTC to reset during the wiggle test.
      - Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0204-FUEL INJECTOR 4 CIRCUIT/OPEN

Fig. 156: Fuel Injector Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram. **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With battery voltage greater than 10.0 volts, ASD Relay energized, and engine speed less than 3000 RPM.

SET CONDITION

The Powertrain Control Module (PCM) monitors the continuity of the injector circuits as well as the voltage spike created by the collapse of the magnetic field in the injector coil. Any condition that reduces the maximum current flow or the magnitude of the voltage spike can cause this DTC to set.

POSSIBLE CAUSES

POSSIBLE CAUSES
FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
INJECTOR 4 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
INJECTOR 4 CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR 4
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

1. Start the engine and allow it to idle.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F343) FUSED ASD RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 157: Checking Fused Main Relay Output Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Fuel Injector 4 harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F343) Fused

ASD Relay Output circuit in the Fuel Injector 4 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 3

No

- Repair the (F343) Fused ASD Relay Output circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K14) INJECTOR 4 CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Measure the resistance of the (K14) Injector 4 Control circuit between the Fuel Injector 4 harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

No

- Repair the (K14) Injector 4 Control circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **FUEL INJECTOR 4**
   1. Turn the ignition off.
   2. Measure the resistance between the terminals of Fuel Injector 4.

NOTE: The resistance of the circuit will vary according to the temperature of the injector coil. Use the table below to determine the resistance range of the injector.

Fuel Injector Coil Resistance Based on Engine Temperature	
Temperature	**Resistance**
-20° C (-4° F)	10 Ohms (+/- 0.6 Ohm)
20° C (68° F)	12 Ohms (+/- 0.6 Ohm)
60° C (140° F)	14 Ohms (+/- 0.6 Ohm)
100° C (212° F)	16 Ohms (+/- 0.6 Ohm)

Is the resistance of the injector within the specified range?

Yes

- Go To 5

No

- Replace Fuel Injector 4 in accordance with the service information. Refer to **INJECTOR(S), FUEL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (K14) INJECTOR 4 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 158: Checking Injector Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K14) Injector 4 Control circuit in the Fuel Injector 4 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

No

- Repair the (K14) Injector 4 Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between Fuel Injector 4 and the Powertrain Control Module (PCM).
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
      - Look for the data to change or for the DTC to reset during the wiggle test.
      - Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0218-HIGH TEMPERATURE OPERATION ACTIVATED

For a complete wiring diagram. **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This DTC will set to indicate an overheating transmission or engine cooling system. Extended transmission operation above 115° C (240° F) will reduce the durability of the transmission and should be avoided. Correcting the cooling system operation or installing an additional transmission oil cooler will improve transmission durability, especially under extreme conditions such as city/construction stop and go traffic, trailer towing, aggressive driving in low gear, or operation in mountainous areas.

WHEN MONITORED

With the engine running.

SET CONDITION

The transmission overheat shift schedule is activated when the transmission oil temperature reaches 115° C (240° F).

POSSIBLE CAUSES

POSSIBLE CAUSES
DTC ACTIVE IN TRANSMISSION CONTROL MODULE
TRANSMISSION OVERHEATING
ENGINE OVERHEATING
HIGH TEMPERATURE OPERATIONS ACTIVATED

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC ACTIVE IN TRANSMISSION CONTROL MODULE**
    1. This is an informational DTC that indicates that the transmission has been operating in the "Overheat" shift schedule.
    2. With the scan tool, select View DTCs in the Transmission Control Module.

       Are any DTCs set in the Transmission Control Module?

       Yes

- Refer to the Service Information for the related diagnostic or repair procedures.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 2

2. **TRANSMISSION OVERHEATING**
   1. With the scan tool, review the Freeze Frame information to help identify the conditions in which the DTC was set.
   2. Attempt to drive the vehicle under the conditions in which the DTC was set.
   3. Transmission overheating may indicate the need for an additional transmission oil cooler.
   4. Check the transmission oil cooler flow in accordance with the Service Information.
   5. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary. If the transmission oil cooler is plugged, repair the cause of the plugged oil cooler
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **ENGINE OVERHEATING**
   1. Check the engine cooling system operation in accordance with the Service Information.

   Were any problems found?

   Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

P0221-THROTTLE POSITION SENSOR 2 CIRCUIT PERFORMANCE

Fig. 159: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Throttle Position Sensor (TPS) 2 circuit input voltage is implausible.

POSSIBLE CAUSES

POSSIBLE CAUSES
(F855) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K122) TPS SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(K922) TPS GROUND CIRCUIT OPEN OR HIGH RESISTANCE
THROTTLE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: If there are any 5-Volt Reference DTCs present along with this DTC, diagnose and repair that DTC before continuing with this test procedure.

1. Start the engine and allow it to idle.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 160: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Throttle Body harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F855) 5-Volt Supply circuit in the Throttle Body harness connector.

   Is the voltage between 4.8 and 5.2 volts?

Yes

- Go To 3

No

- Repair the (F855) 5-Volt Supply circuit for an open or shorted circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K122) TPS SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Measure the resistance of the (K122) TPS Signal 2 circuit between the Throttle Body harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K122) TPS Signal 2 circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (K922) TPS SENSOR GROUND CIRCUIT FOR AN**

OPEN/HIGH RESISTANCE

1. Measure the resistance of the (K922) TPS Sensor Ground circuit between the Throttle Body harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the (K922) TPS Sensor Ground circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **THROTTLE BODY**
   1. Replace the Throttle Body Assembly in accordance with the service information. Refer to **THROTTLE BODY, REMOVAL** .
   2. Turn the ignition on.
   3. With the scan tool, erase DTCs.
   4. Start the engine and allow it to idle.
   5. With the scan tool, view DTCs.

      Did the DTC return?

      Yes

      - Go To 6

      No

      - Repair is complete.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control

Module (PCM).

2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0222-THROTTLE POSITION SENSOR 2 CIRCUIT LOW

Fig. 161: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Throttle Position Sensor (TPS) 2 input voltage is below the minimum acceptable value.

POSSIBLE CAUSES

POSSIBLE CAUSES
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K122) TP SIGNAL 2 CIRCUIT SHORTED TO GROUND
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K922) TP SENSOR GROUND CIRCUIT
(K122) TP SIGNAL 2 CIRCUIT SHORTED TO THE (K922) TP SENSOR GROUND CIRCUIT
(K122) TP SIGNAL 2 CIRCUIT SHORTED TO THE (K124) ETC MOTOR (+) CIRCUIT
(K122) TP SIGNAL 2 CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT
(F855) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K122) TP SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
THROTTLE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST.

1. **ACTIVE DTC**

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

1. Start the engine and allow it to idle.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put

your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 162: Checking 5-Volt Supply Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Throttle Body harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F855) 5-Volt Supply circuit in the Throttle Body harness connector.

   Is the voltage above 4.8 volts?

   Yes

   - Go To 6

   No

   - Go To 3

3. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 163: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (F855) 5-Volt Supply circuit in the Throttle Body harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the (F855) 5-Volt Supply circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K922) TPS SENSOR GROUND CIRCUIT**

Fig. 164: Checking 5-Volt Supply Circuit For Short To TP Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (F855) 5 Volt Supply circuit and the (K922) TPS Sensor Ground circuit in the Throttle Body harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the (F855) 5-Volt Supply circuit for a short to the (K922) TPS Sensor Ground circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (F855) 5-Volt Supply circuit between the Throttle Body harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 12

No

- Repair the (F855) 5-Volt Supply circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K122) TPS SIGNAL 2 CIRCUIT FOR A SHORT TO GROUND**

Fig. 165: Checking TP Signal 2 Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (K122) TPS Signal 2 circuit in the Throttle Body harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 7

   No

   - Repair the (K122) TPS Signal 2 circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK FOR THE (K122) TPS SIGNAL 2 CIRCUIT SHORTED TO THE (K922) TPS SENSOR GROUND CIRCUIT**

Fig. 166: Checking TP Signal 2 Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K122) TPS Signal 2 circuit and the (K922) TPS Sensor Ground circuit in the Throttle Body harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 8

   No

   - Repair the (K122) TPS Signal 2 circuit for a short to the (K922)

TPS Sensor Ground circuit.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK FOR THE (K122) TPS SIGNAL 2 CIRCUIT SHORTED TO THE (K124) ETC MOTOR (+) CIRCUIT**

Fig. 167: Checking TP Signal 2 Circuit For Short To ETC Motor (+) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K122) TPS Signal 2 circuit and the (K124) ETC Motor (+) in the Throttle Body harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 9

   No

- Repair the (K122) TPS Signal 2 Circuit for a short to the (K124) ETC Motor (+) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **CHECK FOR THE (K122) TPS SIGNAL 2 CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT**

Fig. 168: Checking TP Signal 2 Circuit For Short To ETC Motor (-) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K122) TPS Signal 2 circuit and the (K126) ETC Motor (-) in the Throttle Body harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 10

No

- Repair the (K122) TPS Signal 2 circuit for a short to the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **CHECK THE (K122) TPS SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
    1. Measure the resistance of the (K122) TPS Signal 2 circuit between the Throttle Body harness connector and the PCM C2 harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Go To 11

    No

    - Repair the (K122) TPS Signal 2 circuit for an open or high resistance.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **THROTTLE BODY**

Fig. 169: Throttle Body Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the PCM C2 harness connector.
3. Connect a jumper between the (F855) 5-Volt Supply circuit and the (K122) TPS Signal 2 circuit in the Throttle Body harness connector.
4. Turn the ignition on.
5. With the scan tool, read the TPS Signal 2 circuit voltage.

   Is the voltage above 4.9 volts with the jumper in place?

   Yes

   - Replace the Throttle Body in accordance with the service information. Refer to **THROTTLE BODY, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 12

12. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle Test.
    6. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0223-THROTTLE POSITION SENSOR 2 CIRCUIT HIGH

Fig. 170: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram. **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Throttle Position Sensor (TPS) 2 input voltage is above the maximum acceptable value.

POSSIBLE CAUSES

POSSIBLE CAUSES
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K122) TP SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(K122) TP SIGNAL 2 CIRCUIT SHORTED TO THE (F855) 5 VOLT SUPPLY CIRCUIT
(K122) TP SIGNAL 2 CIRCUIT SHORTED TO THE (K124) ETC MOTOR (+) CIRCUIT
(K122) TP SIGNAL 2 CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT
(K122) TP SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(K922) TP SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
THROTTLE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST.

1. **ACTIVE DTC**

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

1. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to

follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 171: Checking 5-Volt Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Throttle Body harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F855) 5-Volt Supply circuit in the Throttle Body harness connector.

   Is the voltage above 5.2 volts?

   Yes

   - Repair the (F855) 5-Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **CHECK THE (K122) TPS SIGNAL 2 CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 172: Checking TP Signal 2 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K122) TPS Signal 2 circuit in the Throttle Body harness connector.

   Is the voltage above 5.2 volts?

   Yes

   - Repair the (K122) TPS Signal 2 circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **CHECK FOR THE (K122) TPS SIGNAL 2 CIRCUIT SHORTED TO THE (F855) 5-VOLT SUPPLY CIRCUIT**

Fig. 173: Checking 5-Volt Supply Circuit For Short To TP Sensor Signal 2 Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between the (K122) TPS Signal 2 circuit and the (F855) 5-Volt Supply in the Throttle Body harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the (K122) TPS Signal 2 circuit for a short to the (F855) 5-Volt Supply circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

5. **CHECK FOR THE (K122) TPS SIGNAL 2 CIRCUIT SHORTED TO THE (K124) ETC MOTOR (+) CIRCUIT**

Fig. 174: Checking TP Signal 2 Circuit For Short To ETC Motor (+) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K122) TPS Signal 2 circuit and the (K124) ETC Motor (+) in the Throttle Body harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the (K124) ETC Motor (+) circuit for a short to the (K122) TPS Signal circuit.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK FOR THE (K122) TPS SIGNAL 2 CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT**

Fig. 175: Checking TP Signal 2 Circuit For Short To ETC Motor (-) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K122) TPS Signal 2 circuit and the (K126) ETC Motor (-) in the Throttle Body harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 7

   No

- Repair the (K122) TPS Signal 2 circuit for a short to the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K122) TPS SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   2. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   3. Measure the resistance of the (K122) TPS Signal 2 between the Throttle Body harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 8

      No

      - Repair the (K122) TPS Signal 2 for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (K922) TPS SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K922) TP Sensor Ground circuit between the Throttle Body harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

- Go To 9

No

- Repair the (K922) TP Sensor Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **THROTTLE BODY**

Fig. 176: Throttle Body Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Connect the PCM C2 harness connector.
3. Connect a jumper between the (K922) TPS Sensor Ground circuit and the (K122) TPS Signal 2 circuit in the Throttle Body harness connector.
4. Turn the ignition on.
5. With the scan tool, read the TPS Signal 2 circuit voltage.

Is the voltage below 0.1 volts with the jumper in place?

Yes

- Replace the Throttle Body in accordance with the service information. Refer to **THROTTLE BODY, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 10

10. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle Test.
    6. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

P0298-ENGINE OIL TEMPERATURE TOO HIGH

Fig. 177: Temperature Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

The engine oil temperature has dropped below a calibrated value. Engine start up.

SET CONDITION

The Engine Oil temperature rises faster than a calibrated modeled temperature. When the actual oil temperature exceeds the calibrated modeled temperature for three minutes the fault is set.

POSSIBLE CAUSES

POSSIBLE CAUSES
(G24) EOT SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G24) EOT SIGNAL CIRCUIT SHORTED TO GROUND
(G24) EOT SIGNAL CIRCUIT SHORTED TO THE (K915) SENSOR GROUND CIRCUIT
(G24) EOT SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K915) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE OIL TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose any CAN - C Communication DTCs before continuing.

1. Turn the ignition off.
2. If possible, allow the vehicle to sit with the ignition off for more than 60 minutes in an environment where the temperature will allow the oil temperature to cool down.
3. Start the engine and allow it to reach normal operating conditions.
4. With a scan tool, select View DTCs.

Is the status Active or Pending for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **ENGINE OIL**
   1. The following conditions must be checked:
      - OEM recommended oil viscosity is being used.
      - Customer is following the oil change schedule.
      - Check the engine oil for contamination. (i.e., fuel and/or engine coolant)
      - Internal engine condition that may effect oil pressure.

   Were any of the above conditions found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **CHECK THE (G24) EOT SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 178: Checking Engine Oil Temperature Sensor Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Engine Oil Temperature Sensor harness connector.
3. Disconnect the PCM harness connectors.
4. Turn the ignition on.
5. Measure the voltage of the (G24) EOT Signal circuit in the Engine Oil Temperature Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (G24) EOT Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE (G24) EOT SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 179: Checking Engine Oil Temperature Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (G24) EOT Signal circuit in the Engine Oil Temperature Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

No

- Repair the (G24) EOT Signal circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK FOR THE (G24) EOT SIGNAL CIRCUIT SHORTED TO THE (K915) SENSOR GROUND CIRCUIT**

Fig. 180: Checking Engine Oil Temperature Sensor Signal Circuit For Short To Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (G24) EOT Signal circuit and the (K915) Sensor Ground circuit in the Engine Oil Temperature Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

- Go To 6

No

- Repair the (G24) EOT Signal circuit for a short to the (K915) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (G24) EOT SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic) to the PCM C2 harness connector.
2. Measure the resistance of the (G24) EOT Signal circuit between the Engine Oil Temperature Sensor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7

   No

   - Repair the (G24) EOT Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K915) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will

damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic) to the PCM C1 harness connector.
2. Measure the resistance of the (K915) Sensor Ground circuit between the Engine Oil Temperature Sensor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 8

   No

   - Repair the (K915) Sensor Ground for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **ENGINE OIL TEMPERATURE SENSOR**

Fig. 181: Engine Oil Temperature Sensor Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the PCM harness connectors.
3. Connect a jumper between the (K915) Sensor Ground circuit and the (G24) EOT Signal circuit in the Engine Oil Temperature Sensor harness connector.
4. Turn the ignition on.
5. With the scan tool, read the Engine Oil Temperature Sensor signal voltage.

Is the voltage below 0.1 volts with the jumper in place?

Yes

- Replace the Engine Oil Temperature Sensor in accordance with the service information. Refer to **2.0L SENSOR, OIL TEMPERATURE, REMOVAL** or **2.4L SENSOR, OIL TEMPERATURE, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Oil Temperature Sensor and the Powertrain Control Module (PCM).
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to this circuit and wiggle the wiring and connectors.
      - Look for the data to change or for the DTC to reset during the wiggle test.
      - Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE,**

POWERTRAIN CONTROL, REMOVAL .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0300-MULTIPLE CYLINDER MISFIRE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Any time the engine is running and the adaptive numerator has been successfully updated.

SET CONDITION

If the Powertrain Control Module (PCM) detects that the variation in crankshaft speed between each cylinder exceeds a calibrated value, based on engine RPM and load, a fault is set.

POSSIBLE CAUSES

POSSIBLE CAUSES
FUEL DELIVERY SYSTEM
IGNITION COIL, WIRING, OR CONNECTORS
ECT SENSOR, WIRING, OR CONNECTORS
MAP SENSOR, WIRING, OR CONNECTORS
O2 SENSOR, WIRING, OR CONNECTORS
ENGINE MECHANICAL SYSTEM
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Diagnose and repair any other active component or circuit DTCs before continuing with this procedure.

2. Turn the ignition on.
3. With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.
4. Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

5. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **DIAGNOSTIC INSPECTION**

NOTE: Anything that affects the speed of the crankshaft can cause this DTC to set.

NOTE: When a misfire is detected, the PCM will shut down the injector control circuit for the misfiring cylinder.

NOTE: Misfire may occur and may not be caused by component failure. Any of the following conditions can cause a misfire:

1. Inspect the engine for any of the following conditions:
   - Worn serpentine belt
   - Misalignment or binding water pump, P/S pump or A/C compressor pulleys
   - Improper CKP, CMP, MAP, or TP Sensor mounting.
   - Poor connector/terminal to component connection for CKP sensor, CMP sensor, MAP sensor, TP sensor, fuel injector, ignition coil, etc.
   - Corroded PCM power or ground circuits.
   - Vacuum leaks.
   - Restriction in the air induction or exhaust system.
   - Internal engine component malfunction.
   - Moisture on ignition system components
   - Insufficient fuel
   - Low quality fuel
   - Manual transmission bog
   - Towing overload

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **CHECKING THE FUEL DELIVERY SYSTEM**
   1. Perform the diagnostic procedures for FUEL PRESSURE LEAK DOWN and FUEL DELIVERY SYSTEM OUTPUT - FLOW TEST.

Refer to **DIAGNOSIS AND TESTING** .

Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECKING THE IGNITION COIL OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE IGNITION COIL OPERATION. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Go To 6

6. **CHECKING THE MAP SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE MAP SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 7

7. **CHECKING THE OXYGEN SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE OXYGEN SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 8

8. **CHECKING THE ENGINE MECHANICAL SYSTEM**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE MECHANICAL SYSTEM. Refer to **DIAGNOSIS AND TESTING** .

Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors relative to the components tested in this procedure.
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
      - Look for the data to change or for the DTC to reset during the wiggle test.
      - Perform any technical service bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0301-CYLINDER 1 MISFIRE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Any time the engine is running and the adaptive numerator has been successfully updated.

SET CONDITION

If the Powertrain Control Module (PCM) detects that the variation in crankshaft speed between each cylinder exceeds a calibrated value, based on engine RPM and load, a fault is set.

POSSIBLE CAUSES

POSSIBLE CAUSES
FUEL DELIVERY SYSTEM
IGNITION COIL, WIRING, OR CONNECTORS
ECT SENSOR, WIRING, OR CONNECTORS
MAP SENSOR, WIRING, OR CONNECTORS
O2 SENSOR, WIRING, OR CONNECTORS
ENGINE MECHANICAL SYSTEM
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Diagnose and repair any other active component or circuit DTCs before continuing with this procedure.
    2. Turn the ignition on.
    3. With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.
    4. Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not

stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

5. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **DIAGNOSTIC INSPECTION**

NOTE: Anything that affects the speed of the crankshaft can cause this DTC to set.

NOTE: When a misfire is detected, the PCM will shut down the injector control circuit for the misfiring cylinder.

NOTE: Misfire may occur and may not be caused by component failure. Any of the following conditions can cause a misfire:

- **Worn serpentine belt.**
- **Misalignment or binding water pump, P/S pump**

or A/C compressor pulleys.
- **Improper CKP, CMP, MAP, or TP Sensor mounting.**
- **Poor connector/terminal to component connection for CKP sensor, CMP sensor, MAP sensor, TP sensor, fuel injector, ignition coil, etc.**
- **Corroded PCM power or ground circuits.**
- **Vacuum leaks.**
- **Restriction in the air induction or exhaust system.**
- **Internal engine component malfunction.**
- **Moisture on ignition system components.**
- **Insufficient fuel.**
- **Low quality fuel.**
- **Manual transmission bog.**
- **Towing overload.**

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECKING THE FUEL DELIVERY SYSTEM**
   1. Perform the diagnostic procedures for FUEL PRESSURE LEAK DOWN and FUEL DELIVERY SYSTEM OUTPUT - FLOW TEST. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

- Repair as necessary in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECKING THE IGNITION COIL OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE IGNITION COIL OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 5

5. **CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 6

6. **CHECKING THE MAP SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE MAP SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 7
7. **CHECKING THE OXYGEN SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE OXYGEN SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 8
8. **CHECKING THE ENGINE MECHANICAL SYSTEM**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE MECHANICAL SYSTEM. Refer to **DIAGNOSIS AND TESTING** .

5. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **DIAGNOSTIC INSPECTION**

NOTE: Anything that affects the speed of the crankshaft can cause this DTC to set.

NOTE: When a misfire is detected, the PCM will shut down the injector control circuit for the misfiring cylinder.

- Worn serpentine belt
- Misalignment or binding water pump, P/S pump or A/C compressor pulleys
- Improper CKP, CMP, MAP, or TP Sensor mounting.
- Poor connector/terminal to component connection for CKP sensor, CMP sensor, MAP sensor, TP sensor, fuel injector, ignition coil, etc.
- Corroded PCM power or ground circuits.
- Vacuum leaks.
- Restriction in the air induction or exhaust system.
- Internal engine component malfunction.

NOTE: Misfire may occur and may not be caused by component failure. Any of the following conditions can cause a misfire:

- Moisture on ignition system components
- Insufficient fuel
- Low quality fuel
- Manual transmission bog
- Towing overload

Were any problems found?

Yes

- Repair as necessary.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECKING THE FUEL DELIVERY SYSTEM**
   1. Perform the diagnostic procedures for FUEL PRESSURE LEAK DOWN and FUEL DELIVERY SYSTEM OUTPUT - FLOW TEST. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 4

4. **CHECKING THE IGNITION COIL OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE IGNITION COIL OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 6

6. **CHECKING THE MAP SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE MAP SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 7

7. **CHECKING THE OXYGEN SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE OXYGEN SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 8

8. **CHECKING THE ENGINE MECHANICAL SYSTEM**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE MECHANICAL SYSTEM. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 9

9. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors relative to the components tested in this procedure.
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

- Look for the data to change or for the DTC to reset during the wiggle test.
- Perform any technical service bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0304-CYLINDER 4 MISFIRE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Any time the engine is running and the adaptive numerator has been successfully updated.

SET CONDITION

If the Powertrain Control Module (PCM) detects that the variation in crankshaft speed between each cylinder exceeds a calibrated value, based on engine RPM and load, a fault is set.

POSSIBLE CAUSES

POSSIBLE CAUSES
FUEL DELIVERY SYSTEM
IGNITION COIL, WIRING, OR CONNECTORS

ECT SENSOR, WIRING, OR CONNECTORS
MAP SENSOR, WIRING, OR CONNECTORS
O2 SENSOR, WIRING, OR CONNECTORS
ENGINE MECHANICAL SYSTEM
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Diagnose and repair any other active component or circuit DTCs before continuing with this procedure.
   2. Turn the ignition on.
   3. With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.
   4. Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

   5. With a scan tool, select View DTCs.

      Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **DIAGNOSTIC INSPECTION**

NOTE: Anything that affects the speed of the crankshaft can cause this DTC to set.

NOTE: When a misfire is detected, the PCM will shut down the injector control circuit for the misfiring cylinder.

NOTE: Misfire may occur and may not be caused by component failure. Any of the following conditions can cause a misfire:

- **Worn serpentine belt**
- **Misalignment or binding water pump, P/S pump or A/C compressor pulleys**
- **Improper CKP, CMP, MAP, or TP Sensor mounting.**
- **Poor connector/terminal to component connection for CKP sensor, CMP sensor, MAP sensor, TP sensor, fuel injector, ignition coil, etc.**
- **Corroded PCM power or ground circuits.**
- **Vacuum leaks.**
- **Restriction in the air induction or exhaust system.**
- **Internal engine component malfunction.**
- **Moisture on ignition system components**
- **Insufficient fuel**
- **Low quality fuel**

- **Manual transmission bog**
- **Towing overload**

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECKING THE FUEL DELIVERY SYSTEM**
   1. Perform the diagnostic procedures for FUEL PRESSURE LEAK DOWN and FUEL DELIVERY SYSTEM OUTPUT - FLOW TEST. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 4

4. **CHECKING THE IGNITION COIL OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE IGNITION COIL OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 6

6. **CHECKING THE MAP SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE MAP SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 7

7. **CHECKING THE OXYGEN SENSOR OPERATION**

1. Perform the diagnostic procedure for CHECKING THE OXYGEN SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 8

8. **CHECKING THE ENGINE MECHANICAL SYSTEM**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE MECHANICAL SYSTEM. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 9

9. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors relative to the components tested in this procedure.
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
      - Look for the data to change or for the DTC to reset during the wiggle test.

- Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

2014 ENGINE PERFORMANCE

Powertrain Control Module (PCM) - Electrical Diagnostics, 2.0L & 2.4L - Compass & Patriot

DIAGNOSIS AND TESTING

P0315-NO CRANK SENSOR LEARNED

Fig. 1: Camshaft Position Solenoids, Sensors & Crankshaft Position Sensor

Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At closed throttle decel, with the A/C off, ECT greater than 75° C (167° F) and engine run time greater than 50 seconds.

SET CONDITION

One of the Crankshaft Position (CKP) Sensor target windows has more than 2.86% variance from the reference. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

possible causes
CRANKSHAFT POSITION SENSOR CIRCUIT WIRING OR CONNECTORS
CRANKSHAFT POSITION SENSOR
CRANKSHAFT, TONE WHEEL OR FLEX PLATE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool select View DTCs.
    3. Record the related Freeze Frame data.
    4. Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan.

Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: If the DTC does not reset it may be necessary to test drive the vehicle.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CRANKSHAFT POSITION SENSOR CIRCUIT WIRING OR CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Crankshaft Position Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Inspect the Crankshaft Position Sensor for conditions such as loose mounting screws, damage, or cracks.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **CRANKSHAFT POSITION SENSOR IRREGULAR SIGNAL**

Fig. 2: Crankshaft Position Sensor Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Using a lab scope and the probing tool (special tool #6801, Terminal Probe), backprobe the (K24) CKP Signal circuit in the Crankshaft Position Sensor harness connector.
3. Ignition on, engine not running.
4. Wiggle the related wire harness and lightly tap on the Crankshaft Position Sensor while monitoring the lab scope screen.
5. Start the engine.
6. Monitor the Crankshaft Position Sensor signal on the lab scope screen.

   Were any Crankshaft Position Sensor signals irregular or missing?

Yes

- Go To 4

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

4. **CRANKSHAFT, TONE WHEEL OR FLEX PLATE**
   1. Turn the ignition off.
   2. Remove the Crankshaft Position Sensor.
   3. Inspect the Crankshaft Position Sensor and mounting area for any condition that would result in an incorrect signal, such as damage, foreign material, or excessive movement.

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **CRANKSHAFT POSITION SENSOR**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Crankshaft Position Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Replace the Crankshaft Position Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0325-KNOCK SENSOR 1 CIRCUIT

Fig. 3: Knock Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine run time greater than 30 seconds, engine speed greater than 2700 RPM, and engine coolant temperature greater than 0 C (32 F).

SET CONDITION

The Powertrain Control Module (PCM) detects that the Knock Sensor input voltage is:

above 4.0 volts

less than or equal to 1.0 volt with engine RPM at or above 2200

equal to 0.0 volts with engine RPM below 2200

POSSIBLE CAUSES

POSSIBLE CAUSES
(K42) KS SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K42) KS SIGNAL CIRCUIT SHORTED TO GROUND
(K42) KS SIGNAL CIRCUIT SHORTED TO (K942) KS RETURN
(K42) KS SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K942) KS RETURN CIRCUIT OPEN OR HIGH RESISTANCE
KNOCK SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to reset.

2. Raise the engine speed to 2700 RPM for a minimum of 30 seconds.
3. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (K42) KS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 4: Checking KS Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Knock Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (K42) KS Signal circuit in the Knock Sensor harness connector.

   Is the voltage above 5.2 volts?

   Yes

   - Repair the (K42) KS Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **CHECK THE (K42) KS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 5: Checking KS Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (K42) KS Signal circuit in the Knock Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the (K42) KS Signal circuit for a short to ground.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK FOR THE (K42) KS SIGNAL CIRCUIT SHORTED TO THE (K942) KS RETURN CIRCUIT**

Fig. 6: Checking KS Signal Circuit For Short To KS Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K42) KS Signal circuit and the (K942) KS Return circuit in the Knock Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the (K42) KS Signal circuit for a short to the (K942) KS

Return circuit.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (K42) KS SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K42) KS Signal circuit between the Knock Sensor harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 6

No

- Repair the (K42) KS Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K942) KS RETURN CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

1. Measure the resistance of the (K942) KS Return circuit between the Knock Sensor harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 7

No

- Repair the (K942) KS Return for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **KNOCK SENSOR**
   1. Turn the ignition off.
   2. Connect the PCM C2 harness connector.
   3. Replace the Knock Sensor in accordance with the service information.
   4. Start the engine and allow it to reach normal operating temperature.
   5. With the scan tool, select View DTCs.

      Is status Active for this DTC?

      Yes

      - Go To 8

      No

      - Test Complete.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Knock Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0335-CRANKSHAFT POSITION SENSOR CIRCUIT

Fig. 7: Camshaft Position Solenoids, Sensors & Crankshaft Position Sensor Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine cranking.

SET CONDITION

The Powertrain Control Module (PCM) receives either no signal or an incorrect signal from the Crankshaft Position Sensor.

POSSIBLE CAUSES

Possible Causes
5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5-VOLT SUPPLY CIRCUIT SHORTED TO THE CKP SENSOR GROUND CIRCUIT
5-VOLT SUPPLY CIRCUIT OPEN/HIGH RESISTANCE
CKP SIGNAL CIRCUIT SHORTED TO VOLTAGE
CKP SIGNAL CIRCUIT SHORTED TO GROUND
CKP SIGNAL CIRCUIT SHORTED TO THE CKP SENSOR GROUND CIRCUIT
CKP SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
CKP SENSOR GROUND CIRCUIT OPEN/HIGH RESISTANCE
CRANKSHAFT POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR APPLICABLE TSB**
    1. Check for any applicable TSBs that may apply for this issue.

       Were any TSBs applicable?

       Yes

       - Perform the applicable TSB. Erase the DTC and perform the verification test.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 2

2. **ACTIVE DTC**
   1. Turn the ignition on.
   2. Read and copy the DTC's and Freeze Frame Data.
   3. Start the engine, or crank the engine for 10 seconds.

NOTE: If the vehicle starts and runs, wiggle test the wiring and see if problem duplicates or the fault sets.

Is the status Active for this DTC?

Yes

- Go To 5

No

- Go To 3

3. **WIRE HARNESS/CKP SENSOR INSPECTION**
   1. Turn the ignition off.
   2. Disconnect the harness connectors at the PCM and Crank Sensor and inspect for wire chaffing or rub conditions, terminals pushed out on the wiring connector, bent terminals at the PCM and Crank Sensor, water in the connector cavities, presence of corrosion on the terminals of the connectors or components.
   3. Visually inspect the mounting area of Crank Sensor for debris/damage or a loose sensor. Remove the Crank Sensor and inspect the end of the sensor for signs of damage or debris. Rotate the engine and if possible, inspect the target wheel for any signs of damage. Reinstall the Crank Sensor and ensure that the sensor is properly installed and torqued to proper specification.

NOTE: Due to the fact that this DTC is set by an intermittent loss of the signal, the most likely cause is a poor connection at the Crank Sensor or PCM terminals, or a poor signal between the Crank Sensor and target wheel. Because of this, unplugging and reconnecting the harness connectors, or repositioning the Crank Sensor will often repair the condition that set the DTC.

Were any problems found?

Yes

- Perform the appropriate repair.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE VEHICLE'S REPAIR HISTORY**
   1. Check the history of the vehicle for previous crank sensor related DTCs within the past 90 days.

      Did the repair history show that the vehicle was in dealership for a crank sensor fault within the past 90 days?

      Yes

      - Replace the Crank Sensor in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Test complete. Reconnect the harness connectors, and erase the DTC. The most likely cause was a poor connection at one of the harness connectors. Verify the DTC does not return.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 8: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the CKP Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F855) 5-Volt Supply circuit at the CKP Sensor harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 6

No, voltage is below 4.8 volts:

- Repair the 5-Volt Supply circuit for an open or short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No, voltage is above 5.2 volts:

- Repair the 5-Volt Supply circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K24) CKP SIGNAL CIRCUIT VOLTAGE**

Fig. 9: Checking CKP Signal Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K24) CKP Signal circuit at the CKP Sensor harness connector.

Is the voltage between 4.8 and 5.2 volts?

Yes

- Go To 7

No

- Go To 9

No

- Repair the CKP Sensor Signal circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K925) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Measure the resistance of the (K925) CKP Sensor Ground circuit between the CKP Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 8

      No

      - Repair the (K925) CKP Sensor Ground circuit for an open or high

resistance.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **TONE WHEEL/PULSE RING INSPECTION**
   1. Turn the ignition off.
   2. Disconnect the battery ground cable.
   3. Remove the CKP Sensor.
   4. Visually inspect the sensor mounting location for damage, foreign material.
   5. Rotate the engine and if possible inspect the target wheel for any signs of damage.

   Were any problems found?

   Yes

   - Repair Issues in mounting location. Repair or replace the Tone Wheel/Pulse Ring as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace the Crank Position Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **CHECK THE (K24) CKP SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 10: Checking CKP Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (K24) CKP Signal circuit at the Crankshaft Position Sensor harness connector.

   Is the resistance above 10K Ohms?

   Yes

   - Go To 10

   No

   - Repair the (K24) CKP Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **CHECK THE (K24) CKP SIGNAL CIRCUIT FOR AN OPEN/HIGH**

RESISTANCE

1. Measure the resistance of the (K24) CKP Signal circuit between the Crankshaft Position Sensor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 11

   No

   - Repair the (K24) CKP Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Crankshaft Position Sensor and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the CKP Sensor and Powertrain Control Module connectors.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.

    NOTE: Due to the fact that this DTC is set by an intermittent loss of the signal, the most likely cause is a poor connection at the Crank Sensor or PCM terminals, or a poor signal between the Crank Sensor and target wheel. Because of this, unplugging and reconnecting the harness connectors, or repositioning the Crank Sensor will often repair the condition that set the DTC.

    Were any problems found?

Yes

- Perform the appropriate repair.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0339-CRANKSHAFT POSITION SENSOR INTERMITTENT

Fig. 11: Camshaft Position Solenoids, Sensors & Crankshaft Position Sensor Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Crankshaft Position (CKP) Sensor circuits consist of a Powertrain Control Module (PCM) supplied 5-Volt reference circuit, low reference circuit and an output signal circuit. The CKP Sensor is an internally magnetic biased digital output integrated circuit sensing device. The sensor detects magnetic flux changes between the peaks and valleys of a tone wheel on the crankshaft. Each tooth on the tone wheel is spaced with missing teeth for the reference gap. The CKP Sensor produces an ON/OFF DC voltage of varying frequency, reference output pulses per crankshaft revolution. The frequency of the CKP Sensor output depends on the velocity of the crankshaft. The CKP Sensor sends a digital signal, which represents an image of the crankshaft tone wheel, to the PCM as each tooth on the wheel rotates past the CKP Sensor. The PCM uses each CKP signal pulse to determine crankshaft speed and decodes the crankshaft tone wheel reference gap to identify crankshaft position. This information is then used to sequence the ignition timing and fuel injection events for the engine. The PCM also uses CKP Sensor output information to determine the crankshaft relative position to the camshaft, to detect cylinder misfire and to control the CMP actuator if equipped.

WHEN MONITORED

With the engine cranking or running.

SET CONDITION

The Powertrain Control Module (PCM) detects that CKP Sensor failure counter has reached 20. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5-VOLT SUPPLY CIRCUIT SHORTED TO THE CKP SENSOR GROUND CIRCUIT
5-VOLT SUPPLY CIRCUIT OPEN/HIGH RESISTANCE
CKP SIGNAL CIRCUIT SHORTED TO VOLTAGE
CKP SIGNAL CIRCUIT SHORTED TO GROUND
CKP SIGNAL CIRCUIT SHORTED TO THE CKP SENSOR GROUND CIRCUIT

CKP SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
CKP SENSOR GROUND CIRCUIT OPEN/HIGH RESISTANCE
CRANKSHAFT POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR APPLICABLE TSB**
   1. Check for any applicable TSBs that may apply for this issue.

      Were any TSBs applicable?

      Yes

      - Perform the applicable TSB. Erase the DTC and perform the verification test.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 2
2. **ACTIVE DTC**
   1. Turn the ignition on.
   2. Read and copy the DTC's and Freeze Frame Data.
   3. Start the engine, or crank the engine for 10 seconds.

      NOTE: If the vehicle starts and runs, wiggle test the wiring and see if problem duplicates or the fault sets.

      Is the status Active for this DTC?

      Yes

- Go To 5

No

- Go To 3

3. **WIRE HARNESS/CKP SENSOR INSPECTION**
   1. Turn the ignition off.
   2. Disconnect the harness connectors at the PCM and Crank Sensor and inspect for wire chaffing or rub conditions, terminals pushed out on the wiring connector, bent terminals at the PCM and Crank Sensor, water in the connector cavities, presence of corrosion on the terminals of the connectors or components.
   3. Visually inspect the mounting area of Crank Sensor for debris/damage or a loose sensor. Remove the Crank Sensor and inspect the end of the sensor for signs of damage or debris. Rotate the engine and if possible, inspect the target wheel for any signs of damage. Reinstall the Crank Sensor and ensure that the sensor is properly installed and torqued to proper specification.

NOTE: Due to the fact that this DTC is set by an intermittent loss of the signal, the most likely cause is a poor connection at the Crank Sensor or PCM terminals, or a poor signal between the Crank Sensor and target wheel. Because of this, unplugging and reconnecting the harness connectors, or repositioning the Crank Sensor will often repair the condition that set the DTC.

Were any problems found?

Yes

- Perform the appropriate repair.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE VEHICLE'S REPAIR HISTORY**
   1. Check the history of the vehicle for previous crank sensor related DTCs within the past 90 days.

      Did the repair history show that the vehicle was in dealership for a crank sensor fault within the past 90 days?

      Yes

      - Replace the Crank Sensor in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Test complete. Reconnect the harness connectors, and erase the DTC. The most likely cause was a poor connection at one of the harness connectors. Verify the DTC does not return.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
5. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT VOLTAGE**
   1.
   2. Turn the ignition off.
   3. Disconnect the CKP Sensor harness connector.
   4. Turn the ignition on.
   5. Measure the voltage of the (F855) 5-Volt Supply circuit at the CKP Sensor harness connector.

      Is the voltage between 4.8 and 5.2 volts?

      Yes

      - Go To 6

      No, voltage is below 4.8 volts:

- Repair the 5-Volt Supply circuit for an open or short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No, voltage is above 5.2 volts:

- Repair the 5-Volt Supply circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K24) CKP SIGNAL CIRCUIT VOLTAGE**
   1.
   2. Measure the voltage of the (K24) CKP Signal circuit at the CKP Sensor harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 7

   No

   - Go To 9

   No

   - Repair the CKP Sensor Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K925) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the

GPEC Diagnostic Adaptor to perform the diagnosis.

3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
4. Measure the resistance of the (K925) CKP Sensor Ground circuit between the CKP Sensor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 8

   No

   - Repair the (K925) CKP Sensor Ground circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **TONE WHEEL/PULSE RING INSPECTION**
   1. Turn the ignition off.
   2. Disconnect the battery ground cable.
   3. Remove the CKP Sensor.
   4. Visually inspect the sensor mounting location for damage, foreign material.
   5. Rotate the engine and if possible inspect the target wheel for any signs of damage.

      Were any problems found?

      Yes

      - Repair Issues in mounting location. Repair or replace the Tone Wheel/Pulse Ring as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

- Replace the Crank Position Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **CHECK THE (K24) CKP SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1.
   2. Turn the ignition off.
   3. Disconnect the PCM C2 harness connector.
   4. Measure the resistance between ground and the (K24) CKP Signal circuit at the Crankshaft Position Sensor harness connector.

   Is the resistance above 10K Ohms?

   Yes

   - Go To 10

   No

   - Repair the (K24) CKP Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **CHECK THE (K24) CKP SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
    1. Measure the resistance of the (K24) CKP Signal circuit between the Crankshaft Position Sensor harness connector and the GPEC Adaptor.

    Is the resistance below 5.0 Ohms?

    Yes

    - Go To 11

    No

    - Repair the (K24) CKP Signal circuit for an open or high resistance.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Crankshaft Position Sensor and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the CKP Sensor and Powertrain Control Module connectors.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.

NOTE: Due to the fact that this DTC is set by an intermittent loss of the signal, the most likely cause is a poor connection at the Crank Sensor or PCM terminals, or a poor signal between the Crank Sensor and target wheel. Because of this, unplugging and reconnecting the harness connectors, or repositioning the Crank Sensor will often repair the condition that set the DTC.

Were any problems found?

Yes

- Perform the appropriate repair.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0340-CAMSHAFT POSITION SENSOR CIRCUIT - BANK 1 SENSOR 1

Fig. 12: Camshaft Position Solenoids, Sensors & Crankshaft Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED

With the engine cranking or running.

SET CONDITION

The Powertrain Control Module (PCM) receives either no signal or an incorrect signal from the Camshaft 1/1 Position Sensor.

POSSIBLE CAUSES

POSSIBLE CAUSES
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K44) CMP 1/1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K44) CMP 1/1 SIGNAL CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K44) CMP 1/1 SIGNAL CIRCUIT
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT
(K44) CMP 1/1 SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT
(F856) 5-VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K44) CMP 1/1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K900) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CAMSHAFT 1/1 POSITION SENSOR (EXHAUST)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR APPLICABLE TSB**

NOTE: Diagnose and repair any 5-Volt Reference DTCs that are present before continuing with this test procedure.

1. Check for any applicable TSBs that may apply for this issue.

   Were there any applicable TSBs?

   Yes

   - Perform the applicable TSB. Erase the DTC and perform the verification test.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 2

2. **ACTIVE DTC**
   1. Turn the ignition on.
   2. Read and copy the DTCs and freeze frame data.
   3. Start the engine or crank the engine for at least ten seconds.
   4. With the scan tool, select View DTCs.

      Is the status Active or pending for this DTC?

      Yes

      - Go To 5

      No

      - Go To 3

3. **WIRE HARNESS/CMP SENSOR INSPECTION**
   1. Turn the ignition off.

      NOTE: The Camshaft 1/1 Position Sensor is located on the Exhaust Camshaft side of the Cylinder Head.

   2. Disconnect the harness connectors at the PCM and Cam Sensor and inspect for wire chaffing or rub conditions, terminals pushed out on the wiring connector, bent terminals at the PCM and Cam Sensor, water in the connector cavities, presence of corrosion on the terminals of the

connectors or components.

3. Visually inspect the mounting area of Cam Sensor for debris/damage, proper machining, or a loose sensor. Remove the Cam Sensor and inspect the end of the sensor for signs of damage or debris (contact marks, etc.). Rotate the engine and if possible, inspect the target wheel for any signs of damage. Reinstall the Cam Sensor and ensure that the sensor is properly installed and torqued to proper specification.

NOTE: Due to the fact that this DTC is set by an intermittent loss of the signal, the most likely cause is a poor connection at the Cam Sensor or PCM terminals, or a poor signal between the Cam Sensor and target wheel. Because of this, unplugging and reconnecting the harness connectors, or repositioning the Cam Sensor will often repair the condition that set the DTC.

Were any problems found?

Yes

- Perform the appropriate repair.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE VEHICLE'S REPAIR HISTORY**
   1. Check the history of the vehicle for previous Cam Sensor related DTCs within the past 90 days.

      Did the repair history show that the vehicle was in dealership for a Cam Sensor fault within the past 90 days?

      Yes

      - Replace the Exhaust Cam Sensor in accordance with the service information.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Test complete. Reconnect the harness connectors and ensure that the Cam Sensor connector is locked properly. Erase the DTC. The most likely cause was a poor connection at one of the harness connectors. Verify the DTC does not return.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 13: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Camshaft 1/1 Position Sensor harness connector.

NOTE: The Camshaft 1/1 Position Sensor is located on the Exhaust Camshaft side of the Cylinder Head.

3. Turn the ignition on.
4. Measure the voltage on the (F856) 5-Volt Supply circuit in the Camshaft 1/1 Position Sensor harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 6

   No, voltage is below 4.8 volts:

   - Repair the 5-Volt Supply circuit for an open or short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No, voltage is above 5.2 volts:

   - Repair the 5-Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K44) CMP 1/1 SIGNAL CIRCUIT VOLTAGE**

Fig. 14: Checking CMP 1/1 Signal Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K44) CMP 1/1 Signal circuit in the Camshaft 1/1 Position Sensor harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 7

   No, voltage is below 4.8 volts:

   - Go To 11

   No, voltage is above 5.2 volts:

   - Repair the CMP sensor signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

7. **CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.
   3. Measure the resistance of the (K900) Sensor Ground circuit between the Camshaft Position Sensor harness connector and the PCM C2 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 8

      No

      - Repair the (K900) Sensor Ground circuit for an open circuit or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
8. **TONE WHEEL/PULSE RING INSPECTION**
   1. Turn the ignition off.
   2. Remove the CMP Sensor.
   3. Visually inspect the sensor mounting location for damage, foreign material.
   4. Manually rotate the engine and if possible inspect the target wheel for any signs of damage.

      Were any problems found?

      Yes

      - Repair Issues in mounting location. Repair or replace the Tone Wheel/Pulse Ring as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **CAMSHAFT POSITION SENSOR**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft Position Sensor and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Replace the Camshaft Position Sensor in accordance with the service information.
    5. Turn the ignition on.
    6. With the scan tool, erase DTCs.
    7. Start the engine or crank the engine for ten seconds.

    Did the DTC return?

    Yes

    - Go To 10

    No

    - Repair complete.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **TONE WHEEL/PULSE RING**
    1. Turn the ignition off.
    2. Replace the Target Wheel assembly.
    3. Turn the ignition on.
    4. With the scan tool, erase DTCs.
    5. Start the engine or crank the engine for ten seconds.

    Did the DTC return?

    Yes

- Go To 14

No

- Repair is complete.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **CHECK THE (K44) CMP 1/1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 15: Checking CMP 1/1 Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (K44) CMP 1/1 Signal circuit in the Camshaft 1/1 Position Sensor harness connector.

   Is the resistance above 10k Ohms?

Yes

- Go To 12

No

- Repair the (K44) CMP 1/1 Signal circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

12. **CHECK FOR THE (K44) CMP 1/1 SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT**

Fig. 16: Checking CMP 1/1 Signal Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K44) CMP 1/1 Signal circuit and the (K900) Sensor Ground circuit in the Camshaft 1/1 Position Sensor harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To 13

No

- Repair the (K44) CMP 1/1 Signal circuit for a short to the (K900) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

13. **CHECK THE (K44) CMP 1/1 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K44) CMP 1/1 Signal circuit between the Camshaft 1/1 Position Sensor harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 14

No

- Repair the (K44) CMP 1/1 Signal circuit for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

14. **POWERTRAIN CONTROL MODULE (PCM)**

1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft 1/1 Position Sensor and the Powertrain Control Module (PCM).
2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.

NOTE: Due to the fact that this DTC may have set from an intermittent loss of the signal, the most likely cause is a poor connection at the Crank Sensor or PCM terminals, or a poor signal between the Crank Sensor and target wheel. Because of this, unplugging and reconnecting the harness connectors, or repositioning the Crank Sensor will often repair the condition that set the DTC.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0344-CAMSHAFT POSITION SENSOR INTERMITTENT - BANK 1 SENSOR 1

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine cranking or running.

SET CONDITION

The Powertrain Control Module (PCM) detects an intermittent signal error from the Camshaft 1/1 Position Sensor. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K44) CMP SENSOR SIGNAL 1/1 CIRCUIT SHORTED TO VOLTAGE
(K44) CMP SENSOR SIGNAL 1/1 CIRCUIT OPEN
(K44) CMP SENSOR SIGNAL 1/1 CIRCUIT SHORTED TO GROUND
(K44) CMP SENSOR SIGNAL 1/1 CIRCUIT SHORTED TO THE (F856) 5-VOLT SUPPLY CIRCUIT
TONE WHEEL/PULSE RING
CAMSHAFT POSITION SENSOR 1/1 (EXHAUST)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR APPLICABLE TSB**

NOTE: Diagnose and repair any 5-Volt Reference DTCs that are present before continuing with this test procedure.

1. Check for any applicable TSBs that may apply for this issue.

   Were there any applicable TSBs?

   Yes

- Perform the applicable TSB. Erase the DTC and perform the verification test.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 2

2. **ACTIVE DTC**
   1. Turn the ignition on.
   2. Read and copy the DTCs and freeze frame data.
   3. Start the engine or crank the engine for at least ten seconds.
   4. With the scan tool, select View DTCs.

   Is the status Active or pending for this DTC?

   Yes

   - Go To 5

   No

   - Go To 3

3. **WIRE HARNESS/CMP SENSOR INSPECTION**
   1. Turn the ignition off.

   NOTE: The Camshaft 1/1 Position Sensor is located on the Exhaust Camshaft side of the Cylinder Head.

   2. Disconnect the harness connectors at the PCM and Cam Sensor and inspect for wire chaffing or rub conditions, terminals pushed out on the wiring connector, bent terminals at the PCM and Cam Sensor, water in the connector cavities, presence of corrosion on the terminals of the connectors or components.
   3. Visually inspect the mounting area of Cam Sensor for debris/damage, proper machining, or a loose sensor. Remove the Cam Sensor and inspect the end of the sensor for signs of damage or debris (contact marks, etc.). Rotate the engine and if possible, inspect the target wheel

for any signs of damage. Reinstall the Cam Sensor and ensure that the sensor is properly installed and torqued to proper specification.

NOTE: Due to the fact that this DTC is set by an intermittent loss of the signal, the most likely cause is a poor connection at the Cam Sensor or PCM terminals, or a poor signal between the Cam Sensor and target wheel. Because of this, unplugging and reconnecting the harness connectors, or repositioning the Cam Sensor will often repair the condition that set the DTC.

Were any problems found?

Yes

- Perform the appropriate repair.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE VEHICLE'S REPAIR HISTORY**
   1. Check the history of the vehicle for previous Cam Sensor related DTCs within the past 90 days.

   Did the repair history show that the vehicle was in dealership for a Cam Sensor fault within the past 90 days?

   Yes

   - Replace the Exhaust Cam Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Test complete. Reconnect the harness connectors and ensure that the Cam Sensor connector is locked properly. Erase the DTC. The most likely cause was a poor connection at one of the harness connectors. Verify the DTC does not return.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 18: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Camshaft 1/1 Position Sensor harness connector.

NOTE: The Camshaft 1/1 Position Sensor is located on the Exhaust Camshaft side of the Cylinder Head.

3. Turn the ignition on.
4. Measure the voltage on the (F856) 5-Volt Supply circuit in the

Camshaft 1/1 Position Sensor harness connector.

Is the voltage between 4.8 and 5.2 volts?

Yes

- Go To 6

No, voltage is below 4.8 volts:

- Repair the 5-Volt Supply circuit for an open or short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No, voltage is above 5.2 volts:

- Repair the 5-Volt Supply circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K44) CMP 1/1 SIGNAL CIRCUIT VOLTAGE**

Fig. 19: Checking CMP 1/1 Signal Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K44) CMP 1/1 Signal circuit in the Camshaft 1/1 Position Sensor harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 7

   No, voltage is below 4.8 volts:

   - Go To 11

   No, voltage is above 5.2 volts:

   - Repair the CMP sensor signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

7. **CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 20: Checking Sensor Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance of the (K900) Sensor Ground circuit between the Camshaft Position Sensor harness connector and the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 8

   No

- Repair the (K900) Sensor Ground circuit for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **TONE WHEEL/PULSE RING INSPECTION**
   1. Turn the ignition off.
   2. Remove the CMP Sensor.
   3. Visually inspect the sensor mounting location for damage, foreign material.
   4. Manually rotate the engine and if possible inspect the target wheel for any signs of damage.

   Were any problems found?

   Yes

   - Repair Issues in mounting location. Repair or replace the Tone Wheel/Pulse Ring as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 9

9. **CAMSHAFT POSITION SENSOR**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft Position Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Replace the Camshaft Position Sensor in accordance with the service information.
   5. Turn the ignition on.
   6. With the scan tool, erase DTCs.
   7. Start the engine or crank the engine for ten seconds.

Did the DTC return?

Yes

- Go To 10

No

- Repair complete.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **TONE WHEEL/PULSE RING**
    1. Turn the ignition off.
    2. Replace the Target Wheel assembly.
    3. Turn the ignition on.
    4. With the scan tool, erase DTCs.
    5. Start the engine or crank the engine for ten seconds.

    Did the DTC return?

    Yes

    - Go To 14

    No

    - Repair is complete.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **CHECK THE (K44) CMP 1/1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 21: Checking CMP 1/1 Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (K44) CMP 1/1 Signal circuit in the Camshaft 1/1 Position Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 12

   No

   - Repair the (K44) CMP 1/1 Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

12. **CHECK FOR THE (K44) CMP 1/1 SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT**

Fig. 22: Checking CMP 1/1 Signal Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K44) CMP 1/1 Signal circuit and the (K900) Sensor Ground circuit in the Camshaft 1/1 Position Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 13

   No

   - Repair the (K44) CMP 1/1 Signal circuit for a short to the (K900)

Sensor Ground circuit.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

13. **CHECK THE (K44) CMP 1/1 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K44) CMP 1/1 Signal circuit between the Camshaft 1/1 Position Sensor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 14

   No

   - Repair the (K44) CMP 1/1 Signal circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

14. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft 1/1 Position Sensor and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

5. Look for the data to change or for the DTC to reset during the wiggle test.

NOTE: Due to the fact that this DTC may have set from an intermittent loss of the signal, the most likely cause is a poor connection at the Crank Sensor or PCM terminals, or a poor signal between the Crank Sensor and target wheel. Because of this, unplugging and reconnecting the harness connectors, or repositioning the Crank Sensor will often repair the condition that set the DTC.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0365-CAMSHAFT POSITION SENSOR CIRCUIT - BANK 1 SENSOR 2

Fig. 23: Camshaft Position Solenoids, Sensors & Crankshaft Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running or cranking.

SET CONDITION

The Powertrain Control Module (PCM) receives either no signal or an incorrect signal from the Camshaft 1/2 Position Sensor.

POSSIBLE CAUSES

POSSIBLE CAUSES
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K441) CMP 1/2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K441) CMP 1/2 SIGNAL CIRCUIT SHORTED TO GROUND
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K441) CMP 1/2 SIGNAL CIRCUIT
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K915) SENSOR GROUND CIRCUIT
(K441) CMP 1/2 SIGNAL CIRCUIT SHORTED TO THE (K915) SENSOR GROUND CIRCUIT
(F855) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K441) CMP 1/2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K915) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CAMSHAFT 1/2 POSITION SENSOR (INTAKE)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR APPLICABLE TSB**

NOTE: Diagnose and repair any 5-Volt Reference DTCs that are present before continuing with this test procedure.

1. Check for any applicable TSBs that may apply for this issue.

Were there any applicable TSBs?

Yes

- Perform the applicable TSB. Erase the DTC and perform the verification test.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 2

2. **ACTIVE DTC**
   1. Turn the ignition on.
   2. Read and copy the DTCs and freeze frame data.
   3. Start the engine or crank the engine for at least ten seconds.
   4. With the scan tool, select View DTCs.

   Is the status Active or pending for this DTC?

   Yes

   - Go To 5

   No

   - Go To 3

3. **WIRE HARNESS/CMP SENSOR INSPECTION**
   1. Turn the ignition off.

      NOTE: The Camshaft 1/2 Position Sensor is located on the Intake Camshaft side of the Cylinder Head.

   2. Disconnect the harness connectors at the PCM and Cam Sensor and inspect for wire chaffing or rub conditions, terminals pushed out on the wiring connector, bent terminals at the PCM and Cam Sensor, water in the connector cavities, presence of corrosion on the terminals of the connectors or components.

3. Visually inspect the mounting area of Cam Sensor for debris/damage, proper machining, or a loose sensor. Remove the Cam Sensor and inspect the end of the sensor for signs of damage or debris (contact marks, etc.). Rotate the engine and if possible, inspect the target wheel for any signs of damage. Reinstall the Cam Sensor and ensure that the sensor is properly installed and torqued to proper specification.

NOTE: Due to the fact that this DTC is set by an intermittent loss of the signal, the most likely cause is a poor connection at the Cam Sensor or PCM terminals, or a poor signal between the Cam Sensor and target wheel. Because of this, unplugging and reconnecting the harness connectors, or repositioning the Cam Sensor will often repair the condition that set the DTC.

Were any problems found?

Yes

- Perform the appropriate repair.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE VEHICLE'S REPAIR HISTORY**
   1. Check the history of the vehicle for previous Cam Sensor related DTCs within the past 90 days.

      Did the repair history show that the vehicle was in dealership for a Cam Sensor fault within the past 90 days?

      Yes

      - Replace the Exhaust Cam Sensor in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Test complete. Reconnect the harness connectors and ensure that the Cam Sensor connector is locked properly. Erase the DTC. The most likely cause was a poor connection at one of the harness connectors. Verify the DTC does not return.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 24: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Camshaft 1/2 Position Sensor harness connector.

NOTE: The Camshaft 1/2 Position Sensor is located on

the Intake Camshaft side of the Cylinder Head.

3. Turn the ignition on.
4. Measure the voltage of the (F855) 5-Volt Supply circuit in the Camshaft 1/2 Position Sensor harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 6

   No, voltage is below 4.8 volts:

   - Repair the (F855) 5-Volt Supply circuit for an open or short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No, voltage is above 5.2 volts:

   - Repair the (F855) 5-Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K441) CMP 1/2 SIGNAL CIRCUIT VOLTAGE**

Fig. 25: Checking CMP 1/2 Signal Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K441) CMP 1/2 Signal circuit in the Camshaft 1/2 Position Sensor harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 7

   No, voltage is below 4.8 volts:

   - Go To 11

   No, voltage is above 5.2 volts:

   - Repair the (K441) CMP 1/2 Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

7. **CHECK THE (K915) SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.
   3. Measure the resistance of the (K900) Sensor Ground circuit between the Camshaft Position Sensor harness connector and the PCM C2 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 8

      No

      - Repair the (K900) Sensor Ground circuit for an open circuit or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
8. **TONE WHEEL/PULSE RING INSPECTION**
   1. Turn the ignition off.
   2. Remove the CMP Sensor.
   3. Visually inspect the sensor mounting location for damage, foreign material.
   4. Manually rotate the engine and if possible inspect the target wheel for any signs of damage.

      Were any problems found?

      Yes

      - Repair Issues in mounting location. Repair or replace the Tone Wheel/Pulse Ring as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **CAMSHAFT POSITION SENSOR**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft Position Sensor and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Replace the Camshaft Position Sensor in accordance with the service information.
    5. Turn the ignition on.
    6. With the scan tool, erase DTCs.
    7. Start the engine or crank the engine for ten seconds.

    Did the DTC return?

    Yes

    - Go To 10

    No

    - Repair complete.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **TONE WHEEL/PULSE RING**
    1. Turn the ignition off.
    2. Replace the Target Wheel assembly.
    3. Turn the ignition on.
    4. With the scan tool, erase DTCs.
    5. Start the engine or crank the engine for ten seconds.

    Did the DTC return?

    Yes

- Go To 14

No

- Repair is complete.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **CHECK THE (K441) CMP 1/2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 26: Checking CMP 1/2 Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (K441) CMP 1/2 Signal circuit in the Camshaft 1/2 Position Sensor harness connector.

   Is the resistance above 10k Ohms?

Yes

- Go To 12

No

- Repair the (K441) CMP 1/2 Signal circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

12. **CHECK FOR THE (K441) CMP 1/2 SIGNAL CIRCUIT SHORTED TO (K915) SENSOR GROUND CIRCUIT**

Fig. 27: Checking CMP 1/2 Signal Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K441) CMP 1/2 Signal circuit and the (K915) Sensor Ground circuit in the Camshaft 1/2 Position Sensor harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To 13

No

- Repair the (K441) CMP 1/2 Signal circuit for a short to the (K915) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

13. **CHECK THE (K441) CMP 1/2 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K441) CMP 1/2 Signal circuit between the Camshaft 1/2 Position Sensor harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 14

No

- Repair the (K441) CMP 1/2 Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

14. **POWERTRAIN CONTROL MODULE (PCM)**

1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft 1/2 Position Sensor and the Powertrain Control Module (PCM).
2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0369-CAMSHAFT POSITION SENSOR INTERMITTENT - BANK 1 SENSOR 2

Fig. 28: Camshaft Position Solenoids, Sensors & Crankshaft Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine cranking or running.

SET CONDITION

The Powertrain Control Module (PCM) detects an intermittent signal error from the Camshaft 1/2 Position Sensor. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
(F855) 5-VOLT SUPPLY CIRCUIT OPEN
(F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K441) CMP SENSOR SIGNAL 1/2 CIRCUIT SHORTED TO VOLTAGE
(K441) CMP SENSOR SIGNAL 1/2 CIRCUIT OPEN
(K441) CMP SENSOR SIGNAL 1/2 CIRCUIT SHORTED TO GROUND
(K441) CMP SENSOR SIGNAL 1/2 CIRCUIT SHORTED TO THE (F855) 5-VOLT SUPPLY CIRCUIT
TONE WHEEL/PULSE RING
CAMSHAFT POSITION SENSOR 1/1 (INTAKE)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR APPLICABLE TSB**

NOTE: Diagnose and repair any 5-Volt Reference DTCs that are present before continuing with this test procedure.

1. Check for any applicable TSBs that may apply for this issue.

   Were there any applicable TSBs?

   Yes

- Perform the applicable TSB. Erase the DTC and perform the verification test.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 2

2. **ACTIVE DTC**
   1. Turn the ignition on.
   2. Read and copy the DTCs and freeze frame data.
   3. Start the engine or crank the engine for at least ten seconds.
   4. With the scan tool, select View DTCs.

   Is the status Active or pending for this DTC?

   Yes

   - Go To 5

   No

   - Go To 3

3. **WIRE HARNESS/CMP SENSOR INSPECTION**
   1. Turn the ignition off.

   NOTE: The Camshaft 1/2 Position Sensor is located on the Intake Camshaft side of the Cylinder Head.

   2. Disconnect the harness connectors at the PCM and Cam Sensor and inspect for wire chaffing or rub conditions, terminals pushed out on the wiring connector, bent terminals at the PCM and Cam Sensor, water in the connector cavities, presence of corrosion on the terminals of the connectors or components.
   3. Visually inspect the mounting area of Cam Sensor for debris/damage, proper machining, or a loose sensor. Remove the Cam Sensor and inspect the end of the sensor for signs of damage or debris (contact marks, etc.). Rotate the engine and if possible, inspect the target wheel

for any signs of damage. Reinstall the Cam Sensor and ensure that the sensor is properly installed and torqued to proper specification.

NOTE: Due to the fact that this DTC is set by an intermittent loss of the signal, the most likely cause is a poor connection at the Cam Sensor or PCM terminals, or a poor signal between the Cam Sensor and target wheel. Because of this, unplugging and reconnecting the harness connectors, or repositioning the Cam Sensor will often repair the condition that set the DTC.

Were any problems found?

Yes

- Perform the appropriate repair.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE VEHICLE'S REPAIR HISTORY**
   1. Check the history of the vehicle for previous Cam Sensor related DTCs within the past 90 days.

      Did the repair history show that the vehicle was in dealership for a Cam Sensor fault within the past 90 days?

      Yes

      - Replace the Exhaust Cam Sensor in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

- Test complete. Reconnect the harness connectors and ensure that the Cam Sensor connector is locked properly. Erase the DTC. The most likely cause was a poor connection at one of the harness connectors. Verify the DTC does not return.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 29: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Camshaft 1/2 Position Sensor harness connector.

NOTE: The Camshaft 1/2 Position Sensor is located on the Intake Camshaft side of the Cylinder Head.

3. Turn the ignition on.
4. Measure the voltage of the (F855) 5-Volt Supply circuit in the

Camshaft 1/2 Position Sensor harness connector.

Is the voltage between 4.8 and 5.2 volts?

Yes

- Go To 6

No, voltage is below 4.8 volts:

- Repair the (F855) 5-Volt Supply circuit for an open or short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No, voltage is above 5.2 volts:

- Repair the (F855) 5-Volt Supply circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K441) CMP 1/2 SIGNAL CIRCUIT VOLTAGE**

Fig. 30: Checking CMP 1/2 Signal Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K441) CMP 1/2 Signal circuit in the Camshaft 1/2 Position Sensor harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 7

   No, voltage is below 4.8 volts:

   - Go To 11

   No, voltage is above 5.2 volts:

   - Repair the (K441) CMP 1/2 Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

7. **CHECK THE (K915) SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.
   3. Measure the resistance of the (K900) Sensor Ground circuit between the Camshaft Position Sensor harness connector and the PCM C2 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 8

      No

      - Repair the (K900) Sensor Ground circuit for an open circuit or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
8. **TONE WHEEL/PULSE RING INSPECTION**
   1. Turn the ignition off.
   2. Remove the CMP Sensor.
   3. Visually inspect the sensor mounting location for damage, foreign material.
   4. Manually rotate the engine and if possible inspect the target wheel for any signs of damage.

      Were any problems found?

      Yes

      - Repair Issues in mounting location. Repair or replace the Tone Wheel/Pulse Ring as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **CAMSHAFT POSITION SENSOR**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft Position Sensor and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Replace the Camshaft Position Sensor in accordance with the service information.
    5. Turn the ignition on.
    6. With the scan tool, erase DTCs.
    7. Start the engine or crank the engine for ten seconds.

    Did the DTC return?

    Yes

    - Go To 10

    No

    - Repair complete.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **TONE WHEEL/PULSE RING**
    1. Turn the ignition off.
    2. Replace the Target Wheel assembly.
    3. Turn the ignition on.
    4. With the scan tool, erase DTCs.
    5. Start the engine or crank the engine for ten seconds.

    Did the DTC return?

    Yes

- Go To 14

No

- Repair is complete.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **CHECK THE (K441) CMP 1/2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 31: Checking CMP 1/2 Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (K441) CMP 1/2 Signal circuit in the Camshaft 1/2 Position Sensor harness connector.

   Is the resistance above 10k Ohms?

Yes

- Go To 12

No

- Repair the (K441) CMP 1/2 Signal circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

12. **CHECK FOR THE (K441) CMP 1/2 SIGNAL CIRCUIT SHORTED TO (K915) SENSOR GROUND CIRCUIT**

Fig. 32: Checking CMP 1/2 Signal Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K441) CMP 1/2 Signal circuit and the (K915) Sensor Ground circuit in the Camshaft 1/2 Position Sensor harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To 13

No

- Repair the (K441) CMP 1/2 Signal circuit for a short to the (K915) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

13. **CHECK THE (K441) CMP 1/2 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K441) CMP 1/2 Signal circuit between the Camshaft 1/2 Position Sensor harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 14

No

- Repair the (K441) CMP 1/2 Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

14. **POWERTRAIN CONTROL MODULE (PCM)**

1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft 1/2 Position Sensor and the Powertrain Control Module (PCM).
2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0420-CATALYST EFFICIENCY (BANK 1)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The State of Change (SOC) catalyst monitor uses the signals from both the upstream and downstream O2 Sensors to detect aging of the catalyst. Based on the fact that when a catalyst ages, it loses some of its Oxygen Storage Capacity (OSC). As a result, part of the untreated exhaust gases can breakthrough the catalyst and causes the downstream O2 Sensor to deviate from its neutral (Stoichiometric) position. By observing the activities in the downstream O2 Sensor signal, located in the exhaust path behind the Catalytic Converter, the degradation level of catalyst can be detected. In general, the higher the downstream O2 Sensor SOC value, the more exhaust gas breakthrough and the lower the Oxygen Storage Capacity of the Catalytic Converter. The Downstream

O2 Sensor response monitor is intended to diagnose a Downstream O2 Sensor that is not moving or stuck in a voltage window and to insure accurate information for catalyst monitor diagnosis.

WHEN MONITORED

With the ECT above 70 C (158 F), engine RPM between 1400 and 2300, vehicle speed between 64 and 96 kph (40 and 60 mph), and engine run time greater than 3 minutes.

SET CONDITION

If the final state of change index is within the calibrated fail threshold. Two trip fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
EXHAUST SYSTEM LEAK
ENGINE MECHANICAL CONDITION
AGING OR CONTAMINATED O2 SENSOR
O2 SENSOR WIRING AND CONNECTORS
CATALYTIC CONVERTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any O2 Sensor DTCs before continuing with this test.

NOTE: A new downstream O2 Sensor along with an aging upstream O2 Sensor may cause the DTC to set. Review the vehicle repair history before continuing.

NOTE: It may be necessary to test drive the vehicle within

the DTC monitoring conditions in order for this DTC to set.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set. Refer to Freeze Frame information.

1. Start the engine and allow it to reach operating temperature.

   WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CATALYTIC CONVERTER**
   1. Thoroughly inspect the catalytic converter for any of the following conditions:
      - Damage, dents, or holes
      - Severe discoloration caused by overheating
      - Internal damage

      Were any problems found?

      Yes

- Replace the Catalytic Converter. Repair the condition that may have caused the failure.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECKING THE EXHAUST SYSTEM FOR LEAKS**
   1. Perform the diagnostic procedure for CHECKING THE EXHAUST SYSTEM FOR LEAKS. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 4

4. **CHECKING THE OXYGEN SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE OXYGEN SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 5

5. **ENGINE MECHANICAL CONDITION**

NOTE: Check for signs of contamination that may have damaged the O2 Sensor(s) and Catalytic Converter, such as: contaminated fuel, unapproved silicone, evidence of oil, coolant or anti-seize compound. Repair as necessary.

1. Check the exhaust for excessive smoke caused by an internal engine problem.

   Were any problems found?

   Yes

   - Repair the engine mechanical condition in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 6

6. **UPSTREAM O2 SENSOR**
   1. A new downstream O2 Sensor along with an aging upstream O2 Sensor may cause this DTC to set.
   2. Review the vehicle repair history.

      Has the downstream O2 Sensor been replaced without replacing the upstream O2 Sensor?

      Yes

      - Replace the upstream O2 Sensor as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 7

7. **CATALYTIC CONVERTER**

If there are no possible causes remaining, view repair.

Repair

- Replace the Catalytic Converter.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0440-GENERAL EVAP SYSTEM FAILURE

Fig. 33: EVAP Purge Monitor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Evap Purge Monitor tests the integrity of the hoses/tube between the throttle

body/intake and the fuel tank. The monitor is a two stage test and runs only after the Evap system passes the small leak test. Stage one is non-intrusive. The Powertrain Control Module (PCM) monitors the purge vapor ratio and the Evaporative System Integrity Monitor (ESIM) Switch closed ratio. If the purge vapor ratio is above a calculated value, the monitor passes. If the ESIM switch closed ratio is greater than calculated value when purge flow is greater than a minimum value, the monitor passes. Stage two is an intrusive test and runs only if stage one does not pass. The PCM commands the purge solenoid to flow at a specified rate to force the purge vapor ratio to update. The ratio is compared to a calibrated specification. If it is less than specified, a one trip failure is recorded. This test can detect if the purge hose is off, obstructed, or the purge valve is not operational.

WHEN MONITORED

With the engine running after a cold start, difference between ECT and AAT less than 10°C (18°F), fuel level between 12% and 88%, manifold vacuum greater than a minimum value, ambient temperature between 4°C and 37°C (39°F and 89°F), and altitude less than 8500 feet.

SET CONDITION

When the monitor conditions are met, the PCM will ramp in purge flow. If the PCM does not sense an ESIM Switch closure after a calculated amount of purge flow accumulation, an error is detected. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
EVAP PURGE SOLENOID VACUUM SUPPLY
EVAP SYSTEM LEAK
EVAP PURGE HOSE/TUBE OBSTRUCTION
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(K107) ESIM SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
EVAP PURGE SOLENOID
EVAPORATIVE SYSTEM INTEGRITY MONITOR (ESIM) SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before

proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **VEHICLE HISTORY AND SERVICE BULLETIN INVESTIGATION**
   1. Turn the ignition on.
   2. Using the scan tool, read DTCs. Record the related Freeze Frame data if any DTCs are present.
   3. Check the following items which may assist in repairing the customer's complaint successfully:
      - Check the vehicles repair history. If the vehicle has a repair history that pertains to the customer's current complaint, review the repair.
      - Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.
      - Check for any service bulletin(s) related to the customer's complaint or DTCs. If a service bulletin applies, follow the instructions of the service bulletin.

   Choose the following scenario that best applies:

   The vehicle inspection or service bulletin repaired the customer's complaint.

   - Testing complete.

   A DTC is present, the vehicle inspection revealed no concerns, no service bulletins apply, or the service bulletin did not repair the customer's complaint.

   - Go To 2
2. **ACTIVE DTC**

NOTE: Because a hot vehicle can conceal a potential leak, allow the vehicle to reach ambient temperature before continuing with this procedure.

NOTE: A loose gas cap could caused this DTC to set. Make sure the gas cap is tight and in good condition.

NOTE: If the customer is experiencing an early fuel shut off during the fuel filling process in addition to DTC P0440, P0441, or P0452, check for restrictions in the EVAP Purge tubes/hoses as well as the Fresh Air Filter before continuing.

1. Start the engine.
2. Allow the engine to idle.
3. Using the scan tool, perform the ESIM FORCED MONITOR TEST. Allow the test to complete.
4. Using the scan tool, read DTCs.

   Is the DTC Active or Pending at this time?

   Yes

   - Go To 3

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

3. **EVAP SYSTEM INSPECTION**
   1. Visually and physically Inspect the entire Evaporative Emission System for any of the following conditions:
      - Holes or cracks
      - Loose seal points
      - Damaged or missing components
      - Incorrect routing of hoses and tubes
      - Loose or missing Fuel Filler Cap or seal
      - Damaged locking tabs on the Fuel Filler Cap and/or filler tube
      - Damaged seal points on the Fuel Filler Cap and/or filler tube

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **EVAP VACUUM SUPPLY HOSE INSPECTION**
   1. Inspect the Evap Purge Solenoid vacuum supply hose for proper routing and installation.
   2. Check for a pinched or plugged hose from the throttle body or intake manifold to the Purge Solenoid.
   3. Make sure the vacuum port at the throttle body or intake manifold is free from any contamination, obstruction, or blockage.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **EVAP PURGE SOLENOID**

   WARNING: **Keep lit cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated. Failure to do so may result in possible serious or fatal injury.**

   NOTE: After disconnecting the Evap Purge Solenoid vacuum

connections, inspect the lines and solenoid for signs of contamination.

1. Disconnect the vacuum hoses at the Evap Purge Solenoid.
2. Using a hand vacuum pump, apply 10 in. Hg. to the "CAN" side of the Evap Purge Solenoid.

NOTE: The solenoid should hold vacuum for a minimum of 15 seconds.

3. Turn the ignition on.
4. Using the scan tool, actuate the Evap Purge Solenoid to the ON position.

NOTE: The vacuum should drop when the solenoid is actuated.

Does the solenoid function as described above?

Yes

- Go To 6

No

- Verify that there is good pin to terminal contact in the Solenoid and PCM harness connectors. Replace the Evap Purge Solenoid if no problems were found in the connectors. Refer to **SOLENOID, EVAPORATIVE EMISSIONS PURGE, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **ESIM SWITCH STATE**

Fig. 34: ESIM Switch Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the ESIM Switch harness connector.
3. Turn the ignition on.
4. Using the scan tool, read the ESIM Switch state.
5. Connect a jumper between the (K107) ESIM Signal circuit and the Ground circuit in the ESIM Switch harness connector.
6. Using the scan tool, read the ESIM Switch state.

   Does the ESIM Switch state change from OPEN to CLOSED when the jumper is installed?

Yes

- Go To 9

No

- Go To 7

7. **CHECK THE (K107) ESIM SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Measure the resistance of the (K107) ESIM Signal between the ESIM Switch harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 8

      No

      - Repair the (K107) ESIM Signal circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 35: Checking Ground Circuit For Open Or Excessive Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12-volt test light connected to 12 volts, check the Ground circuit in the ESIM Switch harness connector.

   NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Does the test lamp illuminate brightly?

   Yes

   - Go To 14

No

- Repair the Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **VERIFY EVAPORATIVE EMISSION LEAK**

WARNING: Keep lit cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated. Failure to do so may result in possible serious or fatal injury.

1. Turn the ignition off.
2. To continue testing, you will need Evaporative Emission Leak Detector (EELD) (special tool #8404C, Kit, EELD And Accessory).

NOTE: The fuel tank should have between 20% and 80% of fuel tank capacity to properly test the Evap system.

3. Connect the red power lead of EELD to the battery positive terminal and the black ground lead to battery negative terminal.
4. Block the vent hose of the Evap Canister.
5. Connect shop air to the EELD.
6. Set the smoke/air control switch to AIR.
7. Insert the tester's AIR supply tip (clear hose) into the 0.040 orifice on the tester's control panel.
8. Press the remote smoke/air start button.
9. Position the red flag on the air flow meter so it is aligned with the indicator ball.
10. When the calibration is complete, release the remote button. The EELD flow meter is now calibrated in liters per minute.
11. Install the service port adapter (special tool #8404-14, Adapter, Evaporative Service Port) on the vehicle's service port (if equipped) or install the service adapter (special tool #8404-ADP, Smoke Machine Adapters) into the filter line.

12. Connect the AIR supply hose from the EELD to the service port (if equipped) or to the adapter (special tool #8404-ADP, Smoke Machine Adapters).
13. Press the remote button to activate AIR flow.

NOTE: Larger volume fuel tanks, lower fuel levels, or vehicles equipped with a Flow Management Valve may indicate high flow and will require four to five minutes to fill.

14. Compare the flow meter indicator ball reading to the red flag.
15. ABOVE the red flag indicates a leak present.
16. BELOW the red flag indicates a sealed system.

Is the indicator ball above the red flag?

Yes

- Go To 10

No

- Go To 12

10. **EVAPORATIVE EMISSION LEAK DETECTION**

NOTE: A thorough visual inspection of the Evap system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.

1. Remove the Air supply hose from the service port or the adapter (special tool #8404-ADP, Smoke Machine Adapters).
2. Connect the SMOKE supply tip (black hose) to the service port (if equipped) or to the adapter (special tool #8404-ADP, Smoke Machine Adapters).
3. Set the smoke/air control switch to SMOKE.

NOTE: The flow meter indicator ball will not move at this point.

4. Press the remote smoke/air start button.

NOTE: Make sure that smoke has filled the Evap System by continuing to press the remote smoke/air start button, remove the vehicle fuel cap, and wait for the smoke to exit. Once smoke is indicated reinstall the fuel cap.

NOTE: For optimal performance, introduce smoke into the system for an additional 60 seconds; continue introducing smoke at 15 second intervals, as necessary.

5. While still holding the remote smoke/air start button, use the white light (special tool #8404-CLL, Light, White) to follow the Evap system path, and look for the source of the leak indicated by exiting smoke.
6. If a leak is concealed from view (i.e., top of fuel tank), release the remote smoke/air start button, and use the ultraviolet (UV) black light (special tool #8404-UVL, Light, UV) and the yellow goggles (special tool #8404-20, Goggles, Yellow) to look for residual traces of dye that are left behind by the smoke.
7. The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light.

NOTE: The Evap System is divided into three zones. A leak from any of these zones can cause this DTC to set. The lists below specify the possible leak points in that specific zone. For further assistance see the ZONE IDENTIFICATION CHARTS below.

Fig. 36: EVAP System Components Zone 1

4. Chassis Purge Line
5. Evap Purge Vacuum Line
6. Connection to Evap Purge Harness
7. Chassis Evap Purge Line connection to Engine Vacuum
8. Evap Purge Valve
9. Service Port

NOTE: Carefully inspect the vent side of the Evap Canister. Due to the filtering system in the canister the smoke or dye may or may not be visible. Introducing smoke into the filtered side of the canister may assist in locating the leak.

Select the appropriate response from the list below:

A leak was found at the gas cap or fuel filler tube

- Go To 11

A leak was found in one or more of the Evap System zones

- If the leak is at a hose connection, remove the hose then reconnect the hose and check for a leak again. All other leaks repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No leaks were detected

- Go To 12

11. **LEAK AT FUEL FILLER CAP**
    1. Remove the SMOKE supply tip (black hose) from the service port (if equipped) or to the (special tool #8404-ADP, Smoke Machine Adapters) adapter.
    2. Install Leak Check Adapter (special tool #8382, Adapter, Leak Check)

(1/4 turn cap) or Fuel Tank Adapter (special tool #6922, Adapter, Fuel Tank) (screw on cap) and Leak Check Adapter (special tool #8399, Adapter, Leak Check) (secondary seal depressor) and repeat step 10.

NOTE: The gas cap adapter is being used as a known good cap.

Was a leak found at the gas cap adapter?

Yes

- Replace the Fuel Filler tube assembly.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace the gas cap.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

12. **EVAP PURGE HOSE/TUBE AND FRESH AIR FILTER OBSTRUCTION**
    1. Inspect the Evap Purge hose/tube for proper routing and installation between the Evap Purge Solenoid and the Fuel Tank between the Fuel Tank and the Evap Purge Canister
    2. Make sure the hose/tube and fresh air filter are not damaged, kinked, and free from any obstructions.

    Were any problems found?

    Yes

    - Repair or replace as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Go To 13

13. **ESIM SWITCH**
    1. Use the wiring diagram/schematic as a guide, inspect the wiring and connections between the ESIM Switch and the PCM.
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for any broken, bent, pushed out, or corroded terminals.
    4. Verify that there is good pin to terminal contact in the ESIM Switch and the Powertrain Control Module harness connectors.
    5. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair and Replace as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Verify that there is good pin to terminal contact in the ESIM Switch and PCM harness connectors. Replace the ESIM Switch in accordance with the service information if no problems were found in the connectors.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
14. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the ESIM Switch and the PCM.
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0441-EVAP PURGE SYSTEM PERFORMANCE

Fig. 39: EVAP Purge Monitor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Evap Purge Monitor tests the integrity of the hoses/tube between the throttle

body/intake and the fuel tank. The monitor is a two stage test and runs only after the Evap system passes the small leak test. Stage one is non-intrusive. The Powertrain Control Module (PCM) monitors the purge vapor ratio and the Evaporative System Integrity Monitor (ESIM) Switch closed ratio. If the purge vapor ratio is above a calculated value, the monitor passes. If the ESIM switch closed ratio is greater than calculated value when purge flow is greater than a minimum value, the monitor passes. Stage two is an intrusive test and runs only if stage one does not pass. The PCM commands the purge solenoid to flow at a specified rate to force the purge vapor ratio to update. The ratio is compared to a calibrated specification. If it is less than specified, a one trip failure is recorded. This test can detect if the purge hose is off, obstructed, or the purge valve is not operational.

WHEN MONITORED

With the engine running, after the Evap System small leak test has passed.

SET CONDITION

If the PCM detects that the purge vapor ratio and the ESIM switch closed ratio are below a calculated value, the PCM commands the purge solenoid to flow at a specified rate to update the purge vapor ratio. If the ratio remains below a specified value, a one trip failure is recorded. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
FUEL TANK PRESSURE (FTP) SENSOR 5-VOLT SUPPLY OPEN CIRCUIT OR EXCESSIVE RESISTANCE
EVAP PURGE SOLENOID VACUUM SUPPLY
EVAP PURGE HOSE/TUBE OBSTRUCTION
FUEL TANK PRESSURE SENSOR
EVAP PURGE SOLENOID
EVAPORATIVE SYSTEM INTEGRITY MONITOR SWITCH (ESIM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **VEHICLE HISTORY AND SERVICE BULLETIN INVESTIGATION**
   1. Turn the ignition on.
   2. Using the scan tool, read DTCs. Record the related Freeze Frame data if any DTCs are present.
   3. Check the following items which may assist in repairing the customer's complaint successfully:
      - Check the vehicle's repair history. If the vehicle has a repair history that pertains to the customer's current complaint, review the repair.
      - Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.
      - Check for any service bulletin(s) related to the customer's complaint or DTCs. If a service bulletin applies, follow the instructions of the service bulletin.

   Choose the following scenario that best applies:

   The vehicle inspection or service bulletin repaired the customer's complaint.

   - Testing complete.

   A DTC is present, the vehicle inspection revealed no concerns, no service bulletins apply, or the service bulletin did not repair the customer's complaint.

   - Go To 2
2. **ACTIVE DTC**

   NOTE: Because a hot vehicle can conceal a potential leak, allow the vehicle to reach ambient temperature before continuing with this procedure.

   NOTE: A loose fuel filler cap could caused this DTC to set. Make sure the fuel filler cap is tight and in good condition.

NOTE: If the customer is experiencing an early fuel shut off during the fuel filling process in addition to DTC P0440, P0441, or P0452, check for restrictions in the Evap Purge tubes/hoses as well as the Fresh Air Filter before continuing.

1. Start the engine.
2. Allow the engine to idle.
3. Using the scan tool, perform the ESIM FORCED MONITOR TEST. Allow the test to complete.
4. Using the scan tool, read DTCs.

   Is the DTC Active or Pending at this time?

   Yes

   - Go To 3

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

3. **CHECK THE FUEL TANK PRESSURE (FTP) SENSOR 5-VOLT SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTC's before continuing with this test.

Turn the ignition off.

1. Disconnect the FTP Sensor harness connector.
2. Ignition on, engine not running.
3. Measure the voltage on the FTP Sensor 5-Volt Supply circuit at the

FTP Sensor harness connector.

Is the voltage between 4.8 to 5.2 volts?

Yes

- Go To 4

No

- Repair the Fuel Tank Pressure Sensor 5-Volt Supply circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **FUEL TANK PRESSURE (FTP) SENSOR**
   1. Turn the ignition off.
   2. Reconnect the FTP Sensor harness connector.
   3. Remove the fuel filler cap.
   4. Turn the ignition on, engine not running.
   5. With a voltmeter, back probe the FTP Sensor Signal circuit at the FTP Sensor harness connector.

   Is the voltage between 2.3 and 2.7 volts?

   Yes

   - Go To 5

   No

   - Verify that there is good pin to terminal contact in the Fuel Tank Pressure Sensor and Powertrain Control Module connectors. If no problems were found with the connectors, replace the Fuel Tank Pressure Sensor according to the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
5. **EVAP SYSTEM INSPECTION**
   1. Visually and physically Inspect the entire Evaporative Emission System

for any of the following conditions:

- Holes or cracks
- Loose seal points
- Damaged or missing components
- Incorrect routing of hoses and tubes
- Loose or missing Fuel Filler Cap or seal
- Damaged locking tabs on the Fuel Filler Cap and/or filler tube
- Damaged seal points on the Fuel Filler Cap and/or filler tube

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 6

6. **INSUFFICIENT VACUUM SUPPLY TO THE EVAP PURGE SOLENOID**
   1. Inspect the Evap Purge Solenoid vacuum supply hose for proper routing and installation.
   2. Make sure the vacuum supply hose between the throttle body or intake manifold and the Evap Purge Solenoid is free from any obstructions or blockage.
   3. Make sure the vacuum port at the throttle body or intake manifold is free from any obstructions or blockage.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 7

7. **EVAP PURGE HOSE/TUBE OBSTRUCTION**
   1. Inspect the Evap Purge hose/tube for proper routing and installation between the Evap Purge Solenoid and the Fuel Tank and between the Fuel Tank and the Evap Purge Canister.
   2. Make sure the hose/tube is not damaged or kinked and is free from any obstructions or blockage.

   Were any problems found?

   Yes

   - Repair or replace as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 8

8. **EVAP PURGE SOLENOID**

   WARNING: **Keep lit cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated. Failure to do so may result in possible serious or fatal injury.**

   NOTE: **After disconnecting the Evap Purge Solenoid vacuum connections, inspect the lines and solenoid for signs of contamination.**

   1. Disconnect the vacuum hoses at the Evap Purge Solenoid.
   2. Using a hand vacuum pump, apply 10 in. Hg. to the "CAN" side of the Evap Purge Solenoid.

   NOTE: **The solenoid should hold vacuum for a minimum**

of 15 seconds.

3. Turn the ignition on.
4. Using the scan tool, actuate the Evap Purge Solenoid to the ON position.

NOTE: The vacuum should drop when the solenoid is actuated.

Does the solenoid function as described above?

Yes

- Go To 9

No

- Verify that there is good pin to terminal contact in the solenoid and PCM harness connectors. Replace the Evap Purge Solenoid if no problems were found in the connectors.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the ESIM Switch and the PCM.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0443-EVAP PURGE SOLENOID CIRCUIT

Fig. 40: EVAP Purge Monitor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Evap Purge Monitor tests the integrity of the hoses/tube between the throttle body/intake and the fuel tank. The monitor is a two stage test and runs only after the Evap system passes the small leak test. Stage one is non-intrusive. The Powertrain Control Module (PCM) monitors the purge vapor ratio and the Evaporative System Integrity Monitor (ESIM) Switch closed ratio. If the purge vapor ratio is above a calculated value, the monitor passes. If the ESIM switch closed ratio is greater than calculated value when purge flow is greater than a minimum value, the monitor passes. Stage two is an intrusive test and runs only if stage one does not pass. The PCM commands the purge solenoid to flow at a specified rate to force the purge vapor ratio to update. The ratio is compared to a calibrated specification. If it is less than specified, a one trip failure is recorded. This test can detect if the purge hose is off, obstructed, or the purge valve is not operational.

WHEN MONITORED

With the engine run time above a calibrated value, battery voltage greater than 10.4 Volts, ECT within a specific range, and the Evap Purge Solenoid control active.

SET CONDITION

This PCM compares the circuit feedback to a calibrated closed range when the circuit is de-energized or to a calibrated open range when the circuit is energized. If the value is determined to be out of the calibrated range in either the de-energized or energized state for more than a calibrated amount of time, this DTC will set.

POSSIBLE CAUSES

Possible Causes
EVAP PURGE CONTROL CIRCUIT SHORTED TO VOLTAGE
EVAP PURGE CONTROL CIRCUIT SHORTED TO GROUND

EVAP PURGE CONTROL CIRCUIT OPEN/HIGH RESISTANCE
EVAP PURGE RETURN CIRCUIT OPEN/HIGH RESISTANCE
EVAP PURGE RETURN CIRCUIT SHORTED TO GROUND
EVAP PURGE SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **VEHICLE HISTORY AND SERVICE BULLETIN INVESTIGATION**
    1. Turn the ignition on.
    2. Using the scan tool, read DTCs. Record the related Freeze Frame data if any DTCs are present.
    3. Check the following items which may assist in repairing the customer's complaint successfully:
        - Check the vehicle's repair history. If the vehicle has a repair history that pertains to the customer's current complaint, review the repair.
        - Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.
        - Check for any service bulletin(s) related to the customer's complaint or DTCs. If a service bulletin applies, follow the instructions per the service bulletin.

    Choose the following scenario that best applies:

    The vehicle inspection or service bulletin repaired the customer's complaint.

    - Testing complete.

    A DTC is present, the vehicle inspection revealed no concerns, no service bulletins apply, or the service bulletin did not repair the customer's complaint.

    - Go To 2

2. **ACTIVE DTC**
   1. Turn the ignition on.
   2. Using the scan tool, read the active DTCs.

      Does the scan tool display P0443-EVAP PURGE CONTROL CIRCUIT?

      Yes

      - Go To 3

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .
3. **CHECK THE (K52) EVAP PURGE CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Evap Purge Solenoid harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Measure the resistance between the (K52) Evap Purge Control circuit and all other circuits at the PCM C1 harness connector.

      Is the resistance above 10k Ohms between the (K52) Evap Purge Control circuit and all other circuits?

      Yes

      - Go To 4

      No

      - Repair the short to between the (K52) Evap Purge Control circuit and the circuit that measured below 10k Ohms.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (K70) EVAP PURGE RETURN CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (K70) Evap Purge Return circuit at the Evap Purge Solenoid harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K70) Evap Purge Return circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
5. **CHECK THE (K52) EVAP PURGE CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 41: Checking EVAP Purge Control Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (K52) Evap Purge Control circuit at the Evap Purge Solenoid harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the (K52) Evap Purge Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K52) EVAP PURGE CONTROL CIRCUIT FOR AN OPEN/EXCESSIVE RESISTANCE**

   CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   2. Measure the resistance of the (K52) Evap Purge Control circuit between the Evap Purge Solenoid harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

      - Repair the (K52) Evap Purge Control circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

7. **CHECK THE (K70) EVAP PURGE RETURN CIRCUIT FOR AN OPEN/EXCESSIVE RESISTANCE**
   1. Measure the resistance of the (K70) Evap Purge Return circuit between the Evap Purge Solenoid harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 8

      No

      - Repair the (K70) Evap Purge Return circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
8. **EVAP PURGE SOLENOID**

Fig. 42: Checking EVAP Purge Solenoid
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the PCM C1 harness connector.
2. Turn the ignition on.

NOTE: If the DTC is active, the actuation test may not be allowed by the PCM. If may be necessary to clear the DTCs before starting the actuation.

3. Using the scan tool, actuate the Evaporative Purge Valve Solenoid Duty Cycle.
4. Using a 12-volt test light connected to ground, probe the (K52) Evap Purge Control circuit in the Evap Purge Solenoid harness connector.

NOTE: The voltage supplied to the solenoid circuit during the actuation may be less than battery voltage. The test light should be illuminated, but may not be as bright as a direct connection to the battery.

Is the test light illuminated during the actuation?

Yes

- Replace the Evap Purge Solenoid in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Evap Purge Solenoid and the PCM.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.

4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0452-EVAP PRESSURE SWITCH STUCK CLOSED

Fig. 43: EVAP Purge Monitor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Evap Purge Monitor tests the integrity of the hoses/tube between the throttle

body/intake and the fuel tank. The monitor is a two stage test and runs only after the Evap system passes the small leak test. Stage one is non-intrusive. The Powertrain Control Module (PCM) monitors the purge vapor ratio and the Evaporative System Integrity Monitor (ESIM) Switch closed ratio. If the purge vapor ratio is above a calculated value, the monitor passes. If the ESIM switch closed ratio is greater than calculated value when purge flow is greater than a minimum value, the monitor passes. Stage two is an intrusive test and runs only if stage one does not pass. The PCM commands the purge solenoid to flow at a specified rate to force the purge vapor ratio to update. The ratio is compared to a calibrated specification. If it is less than specified, a one trip failure is recorded. This test can detect if the purge hose is off, obstructed, or the purge valve is not operational.

WHEN MONITORED

Immediately after key off.

SET CONDITION

At key off, the PCM energizes the Purge Solenoid for a calibrated amount of time (30 seconds maximum) and stores the state of the ESIM switch. The state is evaluated again at the next key on. If the PCM does not detect that the ESIM switch is open, an error is detected. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
EVAP PURGE HOSE/TUBE OBSTRUCTION
(K107) ESIM SIGNAL CIRCUIT SHORTED TO GROUND
(K52) EVAP PURGE CONTROL CIRCUIT SHORTED TO GROUND
EVAPORATIVE SYSTEM INTEGRITY MONITOR (ESIM) SWITCH
EVAP PURGE SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **VEHICLE HISTORY AND SERVICE BULLETIN INVESTIGATION**
    1. Turn the ignition on.
    2. Using the scan tool, read DTCs. Record the related Freeze Frame data if any DTCs are present.
    3. Check the following items which may assist in repairing the customer's complaint successfully:
        - Check the vehicle's repair history. If the vehicle has a repair history that pertains to the customer's current complaint, review the repair.
        - Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.
        - Check for any service bulletin(s) related to the customer's complaint or DTCs. If a service bulletin applies, follow the instructions of the service bulletin.

    Choose the following scenario that best applies:

    The vehicle inspection or service bulletin repaired the customer's complaint.

    - Testing complete.

    A DTC is present, the vehicle inspection revealed no concerns, no service bulletins apply, or the service bulletin did not repair the customer's complaint.

    - Go To 2
2. **ACTIVE DTC**

NOTE: Because a hot vehicle can conceal a potential leak, allow the vehicle to reach ambient temperature before continuing with this procedure.

NOTE: A loose gas cap could caused this DTC to set. Make sure the gas cap is tight and in good condition.

NOTE: If the customer is experiencing an early fuel shut off during the fuel filling process in addition to DTC P0440, P0441, or P0452, check for restrictions in the

EVAP Purge tubes/hoses as well as the Fresh Air Filter before continuing.

1. Start the engine.
2. Allow the engine to idle.
3. Using the scan tool, perform the ESIM FORCED MONITOR TEST. Allow the test to complete.
4. Using the scan tool, read DTCs.

   Is the DTC Active or Pending at this time?

   Yes

   - Go To 3

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

3. **ESIM SWITCH STATE**
   1. With a scan tool, read the ESIM Switch state.
   2. Disconnect the purge hose at the EVAP canister.

      Does the ESIM Switch state change from 'Closed' to 'Open' when the purge hose was disconnected?

      Yes

      - Go To 4

      No

      - Go To 7

4. **EVAP PURGE HOSE/TUBE OBSTRUCTION**

1. Inspect the Evap Purge hose/tube between the Evap Purge Solenoid and the Fuel Tank and between the Fuel Tank and the Evap Purge Canister for proper routing and installation.
2. Make sure the hoses and tubes are not damaged, kinked, or blocked.

   Were any problems found?

   Yes

   - Repair or replace as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **CHECK THE (K52) EVAP PURGE CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 44: Checking EVAP Purge Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the PCM C1 harness connector.
3. Measure the resistance between ground and the (K52) Evap Purge Control circuit in the Evap Purge Solenoid harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the (K52) Evap Purge Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **EVAP PURGE SOLENOID**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Evap Purge Solenoid and the PCM.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace the Evap Purge Solenoid in accordance with the service information. Refer to **SOLENOID, EVAPORATIVE EMISSIONS PURGE, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **ESIM SWITCH**

1. With a scan tool, read the ESIM Switch state.
2. Disconnect the ESIM Switch harness connector.

   Does the ESIM Switch state change from CLOSED to OPEN when the switch is disconnected?

   Yes

   - Replace the ESIM Switch in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 8

8. **CHECK THE (K107) ESIM SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 45: Checking ESIM Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C1 harness connector.
3. Measure the resistance between ground and the (K107) ESIM Signal circuit in the ESIM Switch harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 9

   No

- Repair the (K107) ESIM Signal circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Evap Purge Solenoid and the Powertrain Control Module (PCM) and between the ESIM Switch and the PCM.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0455-EVAP SYSTEM LARGE LEAK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Evap Purge Monitor tests the integrity of the hoses/tube between the throttle body/intake and the fuel tank. The monitor is a two stage test and runs only after the Evap system passes the small leak test. Stage one is non-intrusive. The Powertrain Control Module (PCM) monitors the purge vapor ratio and the Evaporative System Integrity Monitor (ESIM) Switch closed ratio. If the purge

vapor ratio is above a calculated value, the monitor passes. If the ESIM switch closed ratio is greater than calculated value when purge flow is greater than a minimum value, the monitor passes. Stage two is an intrusive test and runs only if stage one does not pass. The PCM commands the purge solenoid to flow at a specified rate to force the purge vapor ratio to update. The ratio is compared to a calibrated specification. If it is less than specified, a one trip failure is recorded. This test can detect if the purge hose is off, obstructed, or the purge valve is not operational.

WHEN MONITORED

With the engine running, during a cold start test with the fuel level above 12%, ambient temperature between 4°C and 32°C (39°F and 89°F) and the fuel system in closed loop. The test runs when the small leak test is maturing.

SET CONDITION

The PCM activates the Evap Purge Solenoid to pull the Evap system into a vacuum to close the ESIM Switch. Once the ESIM Switch is closed, the PCM turns the Evap Purge solenoid off to seal the Evap system. If the ESIM Switch reopens before the calibrated amount of time, a large leak error is detected. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
EVAP PURGE SOLENOID VACUUM SUPPLY
EVAP PURGE HOSE/TUBE OBSTRUCTION
EVAP SYSTEM LEAK
EVAPORATIVE SYSTEM INTEGRITY MONITOR (ESIM) SWITCH

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **VEHICLE HISTORY AND SERVICE BULLETIN INVESTIGATION**
    1. Turn the ignition on.
    2. Using the scan tool, read DTCs. Record the related Freeze Frame data if

any DTCs are present.

3. Check the following items which may assist in repairing the customer's complaint successfully:
   - Check the vehicle's repair history. If the vehicle has a repair history that pertains to the customer's current complaint, review the repair.
   - Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.
   - Check for any service bulletin(s) related to the customer's complaint or DTCs. If a service bulletin applies, follow the instructions of the service bulletin.

   Choose the following scenario that best applies:

   The vehicle inspection or service bulletin repaired the customer's complaint.

   - Testing complete.

   A DTC is present, the vehicle inspection revealed no concerns, no service bulletins apply, or the service bulletin did not repair the customer's complaint.

   - Go To 2

2. **ACTIVE DTC**

   NOTE: Because a hot vehicle can conceal a potential leak, allow the vehicle to reach ambient temperature before continuing with this procedure.

   1. Start the engine.
   2. Allow the engine to idle.
   3. Using the scan tool, perform the ESIM FORCED MONITOR TEST. Allow the test to complete.
   4. Using the scan tool, read DTCs.

   Is the DTC Active or Pending at this time?

   Yes

- Go To 3

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

3. **EVAP SYSTEM INSPECTION**
   1. Visually and physically Inspect the entire Evaporative Emission System for any of the following conditions:
      - Holes or cracks
      - Damaged or missing components
      - Incorrect routing of hoses and tubes
      - Loose or missing Fuel Filler Cap (if applicable) or flap
      - Damaged locking tabs on the Fuel Filler Cap (if applicable) and/or filler tube flap
      - Damaged seal points on the Fuel Filler Cap (if applicable) and/or filler tube flap

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 4
4. **VERIFY EVAPORATIVE EMISSION LEAK**

   WARNING: Keep lit cigarettes, sparks, flames, and other

ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated. Failure to do so may result in possible serious or fatal injury.

1. To continue testing you will need the (special tool #8404C, Kit, EELD And Accessory).

NOTE: The fuel tank should have between 20% and 80% of fuel tank capacity to properly test the Evap system.

2. Connect the red power lead of the EELD to the battery positive terminal and the black ground lead to battery negative terminal.
3. Connect shop air to the EELD.
4. Set the smoke/air control switch to AIR.
5. Insert the tester's AIR supply tip (clear hose) into the appropriate calibration orifice on the tester's control panel (based on DTC leak size).
6. Press the remote smoke/air start button.
7. Position the red flag on the air flow meter so it is aligned with the indicator ball.
8. When the calibration is complete, release the remote button. The EELD flow meter is now calibrated in liters per minute to the size leak indicated by the DTC set in the PCM.
9. Remove the Vent Filter and install the service adapter (special tool #8404-ADP, Smoke Machine Adapters) into the vent line.
10. Connect the AIR supply hose from the EELD to the adapter.
11. Press the remote button to activate AIR flow.

NOTE: Larger volume fuel tanks, lower fuel levels, or vehicles equipped with a Flow Management Valve may indicate high flow and will require four to five minutes to fill.

12. Compare the flow meter indicator ball reading to the red flag.

13. ABOVE the red flag indicates a leak present.
14. BELOW the red flag indicates a sealed system.

Is the indicator ball above the red flag?

Yes

- Go To 5

No

- Review the Freeze Frame data recorded in step 1. If the data indicates that the vehicle was in motion when the DTC was set, verify that all hoses are properly connected.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **EVAPORATIVE EMISSION LEAK DETECTION**

NOTE: A thorough visual inspection of the Evap system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.

1. Remove the Air supply hose from the adapter.
2. Connect the SMOKE supply tip (black hose) to the adapter.
3. Set the smoke/air control switch to SMOKE.

NOTE: The flow meter indicator ball will not move in the smoke mode.

4. Press the remote smoke/air start button.

NOTE: Make sure that smoke has filled the Evap System by continuing to press the remote smoke/air start button, remove the vehicle fuel cap (if applicable) or open the flap (capless), and wait for the smoke to exit. Once smoke is indicated reinstall the fuel

cap or close the flap.

NOTE: For optimal performance, introduce smoke into the system for an additional 60 seconds; continue introducing smoke at 15 second intervals, as necessary.

5. While still holding the remote smoke/air start button, use the white light (special tool #8404-CLL, Light, White) to follow the Evap system path, and look for the source of the leak indicated by exiting smoke.
6. If a leak is concealed from view (i.e., top of fuel tank), release the remote smoke/air start button, and use the ultraviolet (UV) black light (special tool #8404-UVL, Light, UV) and the yellow goggles (special tool #8404-20, Goggles, Yellow) to look for residual traces of dye that is left behind by the smoke.
7. The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light.

NOTE: The Evap System is divided into three zones. A leak from any of these zones can cause this DTC to set. The lists below specify the possible leak points in that specific zone. For further assistance see the ZONE IDENTIFICATION CHARTS below.

NOTE: Carefully inspect the vent side of the Evap Canister. Due to the filtering system in the canister the smoke may not be as thick. Introducing smoke into the filtered side of the canister may assist in locating the leak.

Select the appropriate response from the list below:

A leak was found at the Fuel Cap (if applicable) or Fuel Filler Tube Assembly

- Perform the appropriate repair by replacing the Fuel Filler Tube Assembly and/or the Fuel Cap (if applicable).
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

A leak was found in one or more of the Evap System zones

- If the leak is at a hose connection, remove the hose then reconnect the hose and check for a leak again. All other leaks repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No leaks were detected

- Go To 6

6. **EVAP PURGE SOLENOID**

NOTE: After disconnecting the Evap Purge Solenoid vacuum connections, inspect the lines and solenoid for signs of contamination.

1. Disconnect the vacuum hoses at the Evap Purge Solenoid.
2. Using a hand vacuum pump, apply 10 in. Hg. to the "CAN" side of the Evap Purge Solenoid purge solenoid.

NOTE: The solenoid should hold vacuum for a minimum of 15 seconds.

3. Turn the ignition on.
4. Using the scan tool, actuate the Evap Purge Solenoid to the ON position.

NOTE: The vacuum should drop when the solenoid is actuated.

Does the solenoid function as described above?

Yes

- Go To 7

No

- Verify that there is good pin to terminal contact in the Solenoid and PCM harness connectors. Replace the Evap Purge Solenoid in accordance with the service information if no problems were found in the connectors. Refer to **SOLENOID, EVAPORATIVE EMISSIONS PURGE, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **ESIM SWITCH**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and

connectors between the ESIM Switch and the PCM.

2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Verify that there is good pin to terminal contact in the ESIM Switch and PCM harness connectors. Replace the ESIM Switch in accordance with the service information if no problems were found in the connectors.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0456-EVAP SYSTEM SMALL LEAK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Fig. 49: EVAP System Components
Courtesy of CHRYSLER GROUP, LLC

EVAP SYSTEM COMPONENTS	
CALLOUT	**DESCRIPTION**
1	Filter
2	ESIM Switch
3	Evaporative Canister
4	Fuel Tank Vent (Check Valve)
5	Control Valve
6	Inlet Check Valve
7	Fuel Tank Pressure Sensor
8	To Purge System
9	Fuel Fill Tube

This diagnostic tests the evaporative emission (EVAP) system for a small leak when the ignition is turned OFF and the correct conditions are met. Heat is transferred from operating the vehicle and ambient conditions into a vehicle fuel

tank during normal operation. When the ignition is turned OFF and the EVAP system is sealed, a change in the fuel tank vapor temperature occurs, which results in corresponding pressure changes in the fuel tank vapor space. This change is monitored by the Powertrain Control Module (PCM) using the fuel tank pressure sensor input. The PCM then makes a judgment on the integrity of the system. With a 0.51 mm (0.02 in) leak in the system, the amount of pressure change observed is significantly less than that of a sealed system.

WHEN MONITORED

With the ignition off, fuel level less than 88%, ambient temperature between 4°C and 43°C (39°F and 109°F).

SET CONDITION

As temperatures change, a vacuum is created in the fuel tank and Evap system. With the Evap system sealed, the Powertrain Control Module (PCM) monitors the ESIM switch. If the ESIM switch does not close within a calibrated time, an error is detected by the PCM. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
EVAP PURGE SOLENOID VACUUM SUPPLY
EVAP PURGE HOSE/TUBE OBSTRUCTION
EVAP SYSTEM LEAK

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **VEHICLE HISTORY AND SERVICE BULLETIN INVESTIGATION**
    1. Turn the ignition on.
    2. Using the scan tool, read DTCs. Record the related Freeze Frame data if any DTCs are present.
    3. Check the following items which may assist in repairing the customer's complaint successfully:

- Check the vehicle's repair history. If the vehicle has a repair history that pertains to the customer's current complaint, review the repair.
- Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.
- Check for any service bulletin(s) related to the customer's complaint or DTCs. If a service bulletin applies, follow the instructions of the service bulletin.

Choose the following scenario that best applies:

The vehicle inspection or service bulletin repaired the customer's complaint.

- Testing complete.

A DTC is present, the vehicle inspection revealed no concerns, no service bulletins apply, or the service bulletin did not repair the customer's complaint.

- Go To 2

2. **ACTIVE DTC**

NOTE: Because a hot vehicle can conceal a potential leak, allow the vehicle to reach ambient temperature before continuing with this procedure.

NOTE: A loose gas cap could have caused this DTC to set. Make sure the gas cap is tight and in good condition.

1. Start the engine.
2. Allow the engine to reach normal operating temperature.
3. With a scan tool, read DTCs.

Is the DTC Active or Pending at this time?

Yes

- Go To 3

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

3. **EVAP SYSTEM INSPECTION**
   1. Visually and physically Inspect the entire Evaporative Emission System for any of the following conditions:
      - Holes or cracks
      - Loose seal points
      - Damaged or missing components
      - Incorrect routing of hoses and tubes
      - Loose or missing Fuel Filler Cap or seal
      - Damaged locking tabs on the Fuel Filler Cap and/or filler tube
      - Damaged seal points on the Fuel Filler Cap and/or filler tube

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 4
4. **VERIFY EVAPORATIVE EMISSION LEAK**

   WARNING: **Keep lit cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated. Failure to do so**

may result in possible serious or fatal injury.

1. To continue testing, you will need Evaporative Emission Leak Detector (EELD) 8404C.

NOTE: The fuel tank should have between 20% and 80% of fuel tank capacity to properly test the Evap system.

2. Connect the red power lead of EELD to the battery positive terminal and the black ground lead to battery negative terminal.
3. Block the vent hose of the Evap Canister.
4. Connect shop air to the EELD.
5. Set the smoke/air control switch to AIR.
6. Insert the tester's AIR supply tip (clear hose) into the 0.040 orifice on the tester's control panel.
7. Press the remote smoke/air start button.
8. Position the red flag on the air flow meter so it is aligned with the indicator ball.
9. When the calibration is complete, release the remote button. The EELD flow meter is now calibrated in liters per minute.
10. Install the service port adapter (special tool #8404-14, Adapter, Evaporative Service Port) on the vehicle's service port (if equipped) or install the service adapter (special tool #8404-ADP, Smoke Machine Adapters) into the filter line.
11. Connect the AIR supply hose from the EELD to the service port (if equipped) or to the adapter (special tool #8404-ADP, Smoke Machine Adapters).
12. Press the remote button to activate AIR flow.

NOTE: Larger volume fuel tanks, lower fuel levels, or vehicles equipped with a Flow Management Valve may indicate high flow and will require four to five minutes to fill.

13. Compare the flow meter indicator ball reading to the red flag.

14. ABOVE the red flag indicates a leak present.
15. BELOW the red flag indicates a sealed system.

Is the indicator ball above the red flag?

Yes

- Go To 5

No

- Review the Freeze Frame data recorded in step 1. If the data indicates that the vehicle was in motion when the DTC was set, verify that all hoses are properly connected.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **EVAPORATIVE EMISSION LEAK DETECTION**

NOTE: A thorough visual inspection of the Evap system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.

1. To continue testing, you will need Evaporative Emissions Leak Detector (EELD) (special tool #8404C, Kit, EELD And Accessory).
2. Remove the Air supply hose from the service port (if equipped) or from the adapter (special tool #8404-ADP, Smoke Machine Adapters).
3. Connect the SMOKE supply tip (black hose) to the service port (if equipped) or to the adapter (special tool #8404-ADP, Smoke Machine Adapters).
4. Set the smoke/air control switch to SMOKE.

NOTE: The flow meter indicator ball will not move in the smoke mode.

5. Press the remote smoke/air start button.

NOTE: Make sure that smoke has filled the Evap system by continuing to press the remote smoke/air start button, remove the vehicle fuel cap, and wait for the smoke to exit. Once smoke is indicated reinstall the fuel cap.

NOTE: For optimal performance, introduce smoke into the system for an additional 60 seconds; continue introducing smoke at 15 second intervals, as necessary.

6. While still holding the remote smoke/air start button, use the white light (special tool #8404-CLL, Light, White) to follow the Evap system path, and look for the source of the leak indicated by exiting smoke.
7. If a leak is concealed from view (i.e., top of fuel tank), release the remote smoke/air start button, and use the ultraviolet (UV) black light (special tool #8404-UVL, Light, UV) and the yellow goggles (special tool #8404-20, Goggles, Yellow) to look for residual traces of dye that is left behind by the smoke.
8. The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light.

NOTE: The Evap System is divided into three zones. A leak from any of these zones can cause this DTC to set. The lists below specify the possible leak points in that specific zone. For further assistance see the ZONE IDENTIFICATION CHARTS below.

Fig. 50: EVAP System Components Zone 1

ZONE 3 EVAP SYSTEM COMPONENTS	

CALLOUT	DESCRIPTION
1	Evap Purge Vacuum Line
2	Connection to Chassis Line
3	Connection to Canister
4	Chassis Purge Line
5	Evap Purge Vacuum Line
6	Connection to Evap Purge Harness
7	Chassis Evap Purge Line connection to Engine Vacuum
8	Evap Purge Valve
9	Service Port

NOTE: Carefully inspect the vent side of the Evap Canister. Due to the filtering system in the canister the smoke may not be as thick. Introducing smoke into the filtered side of the canister may assist in locating the leak.

Select the appropriate response from the list below:

A leak was found at the gas cap or fuel filler tube

- Go To 6

A leak was found in one or more of the Evap System zones

- If the leak is at a hose connection, remove the hose then reconnect the hose and check for a leak again. All other leaks repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No leaks were detected

- Go To 7

6. **LEAK AT GAS CAP**
   1. Remove the SMOKE supply tip (black hose) from the service port (if equipped) or to the adapter (special tool #8404-ADP, Smoke Machine

Adapters).

2. Install Leak Check Adapter (special tool #8382, Adapter, Leak Check) (1/4 turn cap) or Fuel Tank Adapter (special tool #6922, Adapter, Fuel Tank) (screw on cap) and Leak Check Adapter (special tool #8399, Adapter, Leak Check) (secondary seal depressor) and repeat step 5.

NOTE: The gas cap adapter is being used as a known good cap.

Was a leak found at the gas cap adapter?

Yes

- Replace the Fuel Filler tube assembly.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace the gas cap.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **EVAP PURGE SOLENOID**

NOTE: After disconnecting the Evap Purge Solenoid vacuum connections, inspect the lines and solenoid for signs of contamination.

1. Disconnect the vacuum hoses at the Evap Purge Solenoid.
2. Using a hand vacuum pump, apply 10 in. Hg. to the "CAN" side of the Evap Purge Solenoid.

NOTE: The solenoid should hold vacuum for a minimum of 15 seconds.

3. Turn the ignition on.
4. Using the scan tool, actuate the Evap Purge Solenoid to the ON position.

NOTE: The vacuum should drop when the solenoid is actuated.

Does the solenoid function as described above?

Yes

- Go To 8

No

- Verify that there is good pin to terminal contact in the Solenoid and PCM harness connectors. Replace the Evap Purge Solenoid in accordance with the service information if no problems were found in the connectors. Refer to **SOLENOID, EVAPORATIVE EMISSIONS PURGE, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **ESIM SWITCH**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the ESIM Switch and the PCM.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Verify that there is good pin to terminal contact in the ESIM Switch and PCM harness connectors. Replace the ESIM Switch in accordance with the service information if no problems were found in the connectors.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0457-EVAP SYSTEM - LOOSE FUEL CAP

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Fuel level is recorded when the ignition key is turned off and is compared to the fuel level when the ignition key is turned back on. The Powertrain Control Module (PCM) recognizes a 25% increase in fuel level and will fail the Large leak test because the Fuel Filler Cap is faulty or not installed properly, or the Capless Fuel Filler Assembly flap did not seal properly after fueling. A LOOSE GAS CAP message will be displayed on the cluster to inform the customer.

WHEN MONITORED

After the ignition is switched on, the Powertrain Control Module (PCM) detects a 25% increase in fuel level from the previous ignition off state.

SET CONDITION

The Powertrain Control Module (PCM) initiated an intrusive test after a 25% fuel level increase and the switch either opened before the maximum calibrated time, which is determined to be a large leak or the switch did not close at all, which is determined to be a general evaporative system failure. One good trip turns off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOOSE OR MISSING FUEL FILLER CAP

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **FUEL FILLER CAP/CAPLESS FUEL FILLER VISUAL**

INSPECTION

1. Remove the Fuel Filler Cap (if applicable) and visually inspect for the following:
   - Loose or missing Fuel Filler Cap or seal
   - Damaged locking tabs on the Fuel Filler Cap and/or filler tube
   - Damaged seal points on the Fuel Filler Cap and/or filler tube
2. If the vehicle is equipped with the Capless Fuel Filler Assembly, visually inspect the flap and seal for proper sealing.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 2

2. **FUEL FILLER CAP**
   1. Reinstall the Fuel Filler Cap if equipped.
   2. Start the engine.
   3. Allow the engine to idle.
   4. Using the scan tool, perform the ESIM FORCED MONITOR TEST. Allow the test to complete.

      Did the test pass the ESIM FORCED MONITOR TEST leak test?

      Yes

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.
      - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

- Replace the Fuel Filler Cap or Capless Fuel Filler Assembly in accordance with the service information.
- Perform the CHECKING FOR AN INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

P0461-FUEL LEVEL SENSOR 1 PERFORMANCE

Fig. 53: Fuel Pump Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With engine run time greater than 128 seconds.

SET CONDITION

The Powertrain Control Module (PCM) detects no change in the Fuel Level Sensor 1 circuit voltage over time during monitoring.

POSSIBLE CAUSES

Possible Causes
FUEL PUMP MODULE WIRING OR CONNECTORS
INTERIOR OR EXTERIOR FUEL TANK DAMAGE
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO GROUND
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
FUEL LEVEL SENSOR 1
INSTRUMENT CLUSTER (CCN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**
    1. Turn the ignition on.
    2. Using the scan tool, read DTCs and review the DTC environmental information.

       Is the good trip counter greater than 0?

       Yes

       - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
       - Perform the INTERMITTENT CONDITION diagnostic procedure.

Refer to **INTERMITTENT CONDITION** .

No

- Go To 2

2. **EXTERIOR FUEL TANK DAMAGE**
   1. Inspect the exterior of the fuel tank for any damage that may restrict the movement of the fuel level sensor floats.

      Were any problems found?

      Yes

      - Replace the fuel tank as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **FUEL PUMP MODULE WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Pump Module harness connector and the Instrument Cluster (CCN).
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **(N4) FUEL LEVEL SIGNAL 1 CIRCUIT VOLTAGE**

Fig. 54: Fuel Pump Module Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Fuel Pump Module harness connector.

3. Turn the ignition on.
4. Using the scan tool, read the Fuel Level Sensor 1 circuit voltage.

NOTE: The sensor voltage should be approximately 5.0 Volts (plus or minus 0.1 Volt) with the connector disconnected.

5. Turn the ignition off.
6. Connect a jumper wire between the (N4) Fuel Level Signal 1 circuit and ground in the Fuel Pump Module harness connector.
7. Turn the ignition on.
8. Using the scan tool, read the Fuel Level Sensor 1 circuit voltage.

NOTE: The sensor voltage should be approximately 0.0 Volts (plus or minus 0.1 Volt) with the jumper wire in place.

Does the scan tool display the voltage as described above?

Yes

- Go To 5

No

- Go To 8

5. **(Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 55: Checking Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (Z906) Ground circuit in the Fuel Pump Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 6

No

- Repair the open or high resistance in the (Z906) Ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **FUEL TANK WIRING HARNESS INSPECTION**

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in possible serious or fatal injury.

1. Remove the fuel tank in accordance with the Service Information.
2. Inspect the wiring and connectors between the Fuel Pump Module harness connector and the Fuel Level Sensor.
3. Look for any chafed, pierced, pinched or partially broken wires.
4. Look for broken, bent, pushed out or corroded terminals.

Were any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 7

7. **FUEL LEVEL SENSOR 1 INSPECTION**

1. Remove the Fuel Level Sensor 1 sensor.
2. Inspect the Fuel Level Sensor 1 and the inside of the fuel tank for any condition that would restrict the movement of the fuel level sensor float.

Were any problems found?

Yes

- Repair or replace the fuel tank components as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Fuel Level Sensor 1.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **(N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE**

Fig. 56: Checking Fuel Level Signal 1 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Instrument Cluster (CCN) C2 harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (N4) Fuel Level Signal 1 circuit in the Fuel Level Sensor 1 harness connector.

   Is there any voltage present?

Yes

- Repair the short to voltage in the (N4) Fuel Level Signal 1 circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 9

9. **(N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO GROUND**

Fig. 57: Checking Fuel Level Signal 1 Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (N4) Fuel Level Signal 1 circuit in the Fuel Level Sensor 1 harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 10

   No

   - Repair the short to ground in the (N4) Fuel Level Signal 1 circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

10. **(N4) FUEL LEVEL SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 58: Checking Fuel Level Signal 1 Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (N4) Fuel Level Signal 1 circuit between the Fuel Pump Module harness connector and the Instrument Cluster (CCN) C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 11

   No

   - Repair the open or high resistance in the (N4) Fuel Level Signal 1 circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

11. **INSTRUMENT CLUSTER (CCN)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Pump Module and the Instrument Cluster (CCN).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the Instrument Cluster (CCN) in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0462-FUEL LEVEL SENSOR 1 LOW CIRCUIT

Fig. 59: Fuel Pump Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Fuel Level Sensor input voltage is below the minimum acceptable value.

POSSIBLE CAUSES

Possible Causes
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO GROUND
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
FUEL LEVEL SENSOR
INSTRUMENT CLUSTER (CCN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**
   1. Start the engine and allow it to reach normal operating temperature.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   2. Using the scan tool, read the active DTCs.

      Does the scan tool display P0462-FUEL LEVEL SENSOR 1 LOW CIRCUIT?

      Yes

      - Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **(N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO GROUND**

Fig. 60: Checking Fuel Level Signal 1 Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Fuel Pump Module harness connector.
3. Disconnect the Instrument Cluster (CCN) C2 harness connector.
4. Measure the resistance between ground and the (N4) Fuel Level Signal 1 circuit in the Fuel Level Sensor harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 3

   No

   - Repair the short to ground in the (N4) Fuel Level Signal 1 circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(N4) FUEL LEVEL SIGNAL 1 CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE**

Fig. 61: Checking Fuel Level Signal 1 Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (N4) Fuel Level Signal 1 circuit between the Fuel Pump Module harness connector and the Instrument Cluster (CCN) C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the open circuit or high resistance in the (N4) Fuel Level Signal 1 circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **FUEL LEVEL SENSOR**
   1. Turn the ignition off.
   2. Connect the Instrument Cluster (CCN) C2 harness connector.
   3. Turn the ignition on.
   4. Using the scan tool, read the Fuel Level Sensor 1 signal voltage.

      Is the voltage above 4.5 Volts with the Fuel Level Sensor harness disconnected?

      Yes

      - Replace the Fuel Level Sensor in accordance with the service information. Refer to **SENDING UNIT AND SENSOR, FUEL LEVEL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **INSTRUMENT CLUSTER (CCN)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and

connectors between the Fuel Level Sensor and the Instrument Cluster (CCN).

2. Look for any chafed, pierced, pinched or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace and program the Instrument Cluster (CCN) in accordance with the Service Information. Refer to **REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0463-FUEL LEVEL SENSOR 1 HIGH CIRCUIT

Fig. 62: Fuel Pump Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the battery voltage greater than 10.4 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Fuel Level Sensor input voltage is above the maximum acceptable value.

POSSIBLE CAUSES

Possible Causes
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
FUEL LEVEL SENSOR
INSTRUMENT CLUSTER (CCN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE**
   1. Start the engine and allow it to reach normal operating temperature.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   2. Using the scan tool, read the active DTCs.

      Does the scan tool display P0463-FUEL LEVEL SENSOR 1 HIGH CIRCUIT?

      Yes

      - Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **(N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE**

Fig. 63: Checking Fuel Level Signal 1 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Fuel Pump Module harness connector.
3. Disconnect the Instrument Cluster (CCN) C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (N4) Fuel Level Signal 1 circuit in the Fuel Level Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (N4) Fuel Level Signal 1 circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **(N4) FUEL LEVEL SIGNAL 1 OPEN OR HIGH RESISTANCE**

Fig. 64: Checking Fuel Level Signal 1 Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance of the (N4) Fuel Level Signal 1 circuit between the Fuel Level Sensor harness connector and the Instrument Cluster (CCN) harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the open circuit or high resistance in the (N4) Fuel Level Signal 1 circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **(Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 65: Checking Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (Z906) Ground circuit in the Fuel Level Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

No

- Repair the open or high resistance in the (Z906) Ground circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **FUEL LEVEL SENSOR**

Fig. 66: Fuel Pump Module Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Connect the Instrument Cluster (CCN) C2 harness connector.
3. Connect a jumper wire between ground and the (N4) Fuel Level Signal 1 circuit in the Fuel Level Sensor harness connector.
4. Turn the ignition on.
5. Using the scan tool, read the Fuel Level Sensor 1 signal voltage.

   Is the voltage below 1.0 Volt with the jumper wire in place?

   Yes

   - Replace the Fuel Level Sensor in accordance with the Service Information. Refer to **SENDING UNIT AND SENSOR, FUEL LEVEL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **INSTRUMENT CLUSTER (CCN)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Level Sensor and the Instrument Cluster (CCN).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace and program the Instrument Cluster (CCN) in accordance with the Service Information. Refer to **REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0480-COOLING FAN 1 CONTROL CIRCUIT

Fig. 67: Cooling Fan Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on. Battery voltage greater than 10 volts.

SET CONDITION

An open or shorted circuit is detected in the Low/High Rad Fan Control circuit. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
(A16) FUSED (B+) CIRCUITS
(N201) LOW/HIGH/HIGH RAD FAN CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE
(N201) LOW/HIGH RAD FAN CONTROL CIRCUIT OPEN
(N201) LOW/HIGH RAD FAN CONTROL CIRCUIT SHORTED TO GROUND
LOW/HIGH RAD FAN RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **RADIATOR COOLING FAN MODULE OPERATION**
    1. Ignition on, engine not running.
    2. With a scan tool, select Radiator Cooling Fan Relay #1 Control State to actuate the Cooling Fan (Low/High).

       Is the one Cooling Fan operating?

       Yes

       - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

No

- Go To 2

2. **(A16) FUSED B+ CIRCUIT**

RELAY-
RADIATOR
FAN-LOW/
HIGH
(IN F/RB)

257704

Fig. 68: Checking Fused B+ Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on.
2. Disconnect the Low/High Rad Relay harness connector.
3. Using a 12-volt test light connected to ground, probe the (A16) Fused B+ circuit in the Low/High Rad Relay harness connector.

Does the test light illuminate brightly?

Yes

- Go To 3

No

- Repair the (A16) Fused B+ circuit. Inspect the related fuse and repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(N201) LOW/HIGH RAD FAN CONTROL CIRCUIT**

Fig. 69: Checking Low/High Rad Fan Control Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on, engine not running.
2. With a scan tool, select Radiator Cooling Fan Relay 1 Control State, Toggle, to actuate the Cooling Fan (Low/High).
3. Using a 12-volt test light connected to battery voltage, probe the (N201) Low/High Rad Fan Control circuit in the Low/High Rad Relay harness connector.

   Does the test light illuminate brightly and flash on and off?

   Yes

- Replace the Low/High Rad Fan Relay.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **(N201) LOW/HIGH RAD FAN CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE**

Fig. 70: Checking Low/High Rad Fan Control Circuit For Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the TIPM C11 harness connector.
2. Using a voltmeter, measure the voltage of the (N201) Low/High Rad Fan Control circuit in the Low/High Rad Relay harness connector.

   Is there voltage present?

   Yes

   - Repair the short to voltage in the (N201) Low/High Rad Fan Control circuit
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **(N201) LOW/HIGH RAD FAN CONTROL CIRCUIT OPEN**

Fig. 71: Checking Low/High Rad Fan Control Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (N201) Low/High Rad Fan Control circuit from the Low/High Rad Relay harness connector to the TIPM C11 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 6

No

- Repair the open in the (N201) Low/High Rad Fan Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **(N201) LOW/HIGH RAD FAN CONTROL CIRCUIT SHORTED TO GROUND**

Fig. 72: Checking Low/High Rad Fan Relay Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (N201) Low/High Rad Fan Control circuit in the TIPM C11 harness connector.

   Is the resistance below 100 Ohms?

   Yes

   - Repair the short to ground in the (N201) Low/High Rad Fan Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Totally Integrated Power Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0481-COOLING FAN 2 CONTROL CIRCUIT

Fig. 73: Cooling Fan Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on. Battery voltage greater than 10 volts.

SET CONDITION

An open or shorted circuit is detected in the High Speed Rad Fan Control circuit. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
(A16) FUSED (B+) CIRCUITS
(N112) RAD FAN RELAY CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE
(N112) RAD FAN RELAY CONTROL CIRCUIT OPEN
(N112) RAD FAN RELAY CONTROL CIRCUIT SHORTED TO GROUND
MED/HIGH RAD FAN RELAY
SERIES/PARALLEL RAD FAN RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **RADIATOR COOLING FAN MODULE OPERATION**
    1. Ignition on, engine not running.
    2. With a scan tool, actuate both the Radiator Cooling Fan Relays #1 and #2.

    Are both cooling fan operating at medium speed?

    Yes

    - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

    No

    - Go To 2
2. **(A16) FUSED B+ CIRCUIT**

Fig. 74: Checking Fused B+ Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Ignition on.
2. Disconnect the Med/High Rad Fan Relay from the Fuse/Relay Block.
3. Disconnect the Series/Parallel Rad Fan Relay from the Fuse/Relay Block.
4. Using a 12-volt test light connected to ground, probe the (A16) Fused B+ circuit at both the Med/High Rad Fan Relay and the Series/Parallel Rad Fan Relay connectors.

   Does the test light illuminate brightly at each terminal?

Yes

- Go To 3

No

- Repair the (A16) Fused B+ circuit. Inspect the related fuse and repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **MED/HIGH RAD FAN RELAY**

Fig. 75: Checking Med/High Rad Fan Control Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Install the Series/Parallel Rad Fan Relay.
2. Turn the ignition on, engine not running.
3. With a scan tool, select Radiator Cooling Fan Relay 2 Control State, Toggle, to actuate the Cooling Fan (Med/High Rad Fan Relay).
4. Using a 12-volt test light connected to battery voltage, probe the (N112) Rad Fan Relay Control circuit at the Med/High Rad Fan Relay.

   Does the test light illuminate brightly and flash on and off?

   Yes

   - Replace the Med/High Rad Fan Relay.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **SERIES/PARALLEL RAD FAN RELAY)**

Fig. 76: Checking Series/Parallel Rad Fan Relay
Courtesy of CHRYSLER GROUP, LLC

1. Remove the Series/Parallel Rad Fan Relay.
2. Install the Med/High Rad Fan Relay.
3. Turn the ignition on, engine not running.
4. With a scan tool, select Radiator Cooling Fan Relay 2 Control State, Toggle, to actuate the Cooling Fan (Series/Parallel Rad Fan Relay).
5. Using a 12-volt test light connected to battery voltage, probe the (N112) Rad Fan Relay Control circuit at the Series/Parallel Rad Fan Relay.

   Does the test light illuminate brightly and flash on and off?

Yes

- Replace the Series/Parallel Rad Fan Relay.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **(N112) RAD FAN RELAY CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE**

Fig. 77: Checking Radiator Fan Relay Control Circuit For Short To Battery
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the TIPM C11 harness connector.
2. Using a voltmeter, measure the voltage of the (N112) Rad Fan Relay Control circuit in the Med/High Rad Fan Relay harness connector.

   Is there voltage present?

Yes

- Repair the short to voltage in the (N112) Rad Fan Relay Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6

6. **(N112) RAD FAN RELAY CONTROL CIRCUIT OPEN**

Fig. 78: Checking Rad Fan Relay Control Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (N112) Rad Fan Relay Control circuit from the Med/High Rad Fan Relay harness connector to the TIPM C11 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7

   No

   - Repair the open in the (N112) Rad Fan Relay Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **(N112) RAD FAN RELAY CONTROL CIRCUIT SHORTED TO GROUND**

Fig. 79: Checking Rad Fan Relay Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (N112) Rad Fan Relay Control circuit in the TIPM C11 harness connector.

   Is the resistance below 100 Ohms?

   Yes

   - Repair the short to ground in the (N112) Rad Fan Relay Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to

STANDARD PROCEDURE .

No

- Replace the Totally Integrated Power Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0501-VEHICLE SPEED SENSOR 1 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The vehicle speed sensor rationality is a continuous test that monitors the vehicle speed sensor for lack of activity. The rationality will not run if a limp-in exists for MAP, Throttle Position, and Engine Coolant Temperature. If vehicle speed sensor is below a minimum threshold for a period of time after the vehicle is operated at a sufficient load, a failure will be indicated.

WHEN MONITORED

With the engine running, transmission not in park or neutral, brakes not applied, and engine RPM greater than 1500.

SET CONDITION

This code will set if no vehicle speed signal is received from the ABS Module for more than 11 seconds for two consecutive trips. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
ACTIVE BUS OR COMMUNICATION DTCS
TIRE CIRCUMFERENCE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING

PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Ignition on, engine not running.

      NOTE: Check for any Bus Communication DTCs. If no Bus or Communication DTCs are set, check for active DTCs in the Anti-Lock Brake Module. Any bus, communication, or VSS DTCs in the Anti-Lock Brake Module must be properly diagnosed before continuing.

   2. With a scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **VISUAL INSPECTION**

   NOTE: This code can set due to tire circumference differences and from the front or rear wheels being on a slippery surface while the opposite tires are not.

   1. This code may also set on a hard acceleration on loose gravel or during other off road driving conditions.
   2. Check tire pressure of all the tires.
   3. Check tire wear on all the tires.
   4. Ask the customer what the road and driving conditions were like when the fault set.

      Were any problems found?

Yes

- Repair as necessary. If the code set during a front OR rear wheel spin condition, no repair is necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors related to this circuit.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0501-VEHICLE SPEED SENSOR 1 PERFORMANCE (MTX NON-ABS)

Fig. 80: Vehicle Speed Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects an implausible voltage on the Vehicle Speed Sensor circuit.

POSSIBLE CAUSES

POSSIBLE CAUSES
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO VOLTAGE
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO GROUND
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K75) VEHICLE SPEED SIGNAL CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K975) SENSOR GROUND CIRCUIT
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO THE (K975) SENSOR GROUND CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K75) VEHICLE SPEED SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K975) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
VEHICLE SPEED SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Start the engine.
   2. Allow the engine to reach normal operating temperature.

      NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

      NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

   3. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **(F856) 5 VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 81: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Vehicle Speed Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.

   Is the voltage between 4.5 and 5.5 volts?

Yes

- Go To 3

No

- Go To 7

3. **(K75) VEHICLE SPEED SIGNAL CIRCUIT VOLTAGE**

Fig. 82: Checking Vehicle Speed Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

   Is the voltage between 4.5 and 5.5 volts?

   Yes

   - Go To 4

No

- Go To 11

4. **(K975) SENSOR GROUND CIRCUIT TEST**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12 volts, check the (K975) Sensor Ground circuit in the Vehicle Speed Sensor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 5

No

- Go To 15

5. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K75) VEHICLE SPEED SIGNAL CIRCUIT**

Fig. 83: Checking 5 Volt Supply Circuit For Short To Vehicle Speed Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Powertrain Control Module (PCM) C1 harness connector.
3. Measure the resistance between the (F856) 5 Volt Supply circuit and the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 6

   No

   - Repair the (F856) 5 Volt Supply circuit for a short to the (K75)

Vehicle Speed Signal circuit.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **VEHICLE SPEED SENSOR**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Vehicle Speed Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Inspect the Vehicle Speed Sensor for any condition that would result in an incorrect signal, such as damage, corrosion, or contamination.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace the Vehicle Speed Sensor.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Fig. 84: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Powertrain Control Module (PCM) C2 harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (F856) 5 Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 8

8. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND**

Fig. 85: Checking VSS 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 9

   No

   - Repair the (F856) 5 Volt Supply circuit for a short to ground.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K975) SENSOR GROUND CIRCUIT**

Fig. 86: Checking VSS 5-Volt Supply Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (F856) 5 Volt Supply circuit and the (K975) Sensor Ground circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 10

   No

- Repair the (F856) 5 Volt Supply circuit for a short to the (K975) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **(F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 87: Checking 5 Volt Supply Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (F856) 5 Volt Supply circuit between the Vehicle Speed Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 16

No

- Repair the (F856) 5 Volt Supply circuit for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO VOLTAGE**

Fig. 88: Checking Vehicle Speed Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C1 harness connector.

3. Turn the ignition on.
4. Measure the voltage of the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K75) Vehicle Speed Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 12

12. **(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO GROUND**

Fig. 89: Checking VSS Signal Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 13

   No

   - Repair the (K75) Vehicle Speed Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

13. **(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO THE (K975) SENSOR GROUND CIRCUIT**

Fig. 90: Checking VSS Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K75) Vehicle Speed Signal circuit and the (K975) Sensor Ground circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 14

   No

   - Repair the (K75) Vehicle Speed Signal circuit for a short to the (K975) Sensor Ground circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

14. **(K75) VEHICLE SPEED SIGNAL CIRCUIT OPEN OR HIGH**

RESISTANCE

Fig. 91: Checking Vehicle Speed Signal Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (K75) Vehicle Speed Signal circuit between the Vehicle Speed Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 16

   No

   - Repair the (K75) Vehicle Speed Signal circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

15. **(K975) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 92: Checking Vehicle Speed Sensor Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C1 harness connector.

3. Measure the resistance of the (K975) Sensor Ground circuit between the Vehicle Speed Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 16

   No

   - Repair the circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

16. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Vehicle Speed Sensor and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.
    6. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in

accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0503-VEHICLE SPEED SENSOR 1 ERRATIC (EXC MTX NON-ABS)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The vehicle speed sensor rationality is a continuous test that monitors the vehicle speed sensor for lack of activity. The rationality will not run if a limp-in exists for MAP, Throttle Position, and Engine Coolant Temperature. If vehicle speed sensor is below a minimum threshold for a period of time after the vehicle is operated at a sufficient load, a failure will be indicated.

WHEN MONITORED

With the engine running, transmission not in park or neutral, brakes not applied, and engine RPM greater than 1500.

SET CONDITION

This code will set if no vehicle speed signal is received from the ABS Module for more than 11 seconds for 2 consecutive trips. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
ACTIVE BUS OR COMMUNICATION DTCS
TIRE CIRCUMFERENCE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST.

1. **ACTIVE DTC**
   1. Ignition on, engine not running.

      NOTE: Check for any Bus Communication DTCs. If no Bus or Communication DTCs are set, check for active DTCs in the Anti-Lock Brake Module. Any bus, communication, or VSS DTCs in the Anti-Lock Brake Module must be properly diagnosed before continuing.

   2. With a scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. Refer to **INTERMITTENT CONDITION** .
2. **VISUAL INSPECTION**

   NOTE: This code can set due to tire circumference differences and from the front or rear wheels being on a slippery surface while the opposite tires are not.

   1. This code may also set on a hard acceleration on loose gravel or during other off road driving conditions.
   2. Check tire pressure of all the tires.
   3. Check tire wear on all the tires.
   4. Ask the customer what the road and driving conditions were like when the fault set.

      Were any problems found?

      Yes

- Repair as necessary. If the code set during a front OR rear wheel spin condition, no repair is necessary.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors related to this circuit.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Refer to any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0503-VEHICLE SPEED SENSOR 1 ERRATIC (MTX NON-ABS)

Fig. 93: Vehicle Speed Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects an implausible voltage on the Vehicle Speed Sensor circuit.

POSSIBLE CAUSES

POSSIBLE CAUSES
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO VOLTAGE
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO GROUND
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K75) VEHICLE SPEED SIGNAL CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K75) VEHICLE SPEED SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K914) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
VEHICLE SPEED SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Start the engine.
   2. Allow the engine to reach normal operating temperature.

      NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

      NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

   3. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **(F856) 5 VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 94: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Vehicle Speed Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.

   Is the voltage between 4.5 and 5.5 volts?

Yes

- Go To 3

No

- Go To 7

3. **(K75) VEHICLE SPEED SIGNAL CIRCUIT VOLTAGE**

Fig. 95: Checking Vehicle Speed Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

   Is the voltage between 4.5 and 5.5 volts?

   Yes

   - Go To 4

No

- Go To 11

4. **(K914) SENSOR GROUND CIRCUIT TEST**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12 volts, check the (K914) Sensor Ground in the Vehicle Speed Sensor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 5

No

- Go To 15

5. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K75) VEHICLE SPEED SIGNAL CIRCUIT**

Fig. 96: Checking 5 Volt Supply Circuit For Short To Vehicle Speed Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Powertrain Control Module (PCM) C1 and C2 harness connectors.
3. Measure the resistance between the (F856) 5 Volt Supply circuit and the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 6

   No

   - Repair the (F856) 5 Volt Supply circuit for a short to the (K75)

Vehicle Speed Signal circuit.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **VEHICLE SPEED SENSOR**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Vehicle Speed Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Inspect the Vehicle Speed Sensor for any condition that would result in an incorrect signal, such as damage, corrosion, or contamination.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace the Vehicle Speed Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Fig. 97: Checking 5 Volt Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Powertrain Control Module (PCM) C2 harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (F856) 5 Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 8

8. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND**

Fig. 98: Checking VSS 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 9

   No

   - Repair the (F856) 5 Volt Supply circuit for a short to ground.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT**

Fig. 99: Checking VSS 5-Volt Supply Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (F856) 5 Volt Supply circuit and the (K914) Sensor Ground circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 10

   No

- Repair the (F856) 5 Volt Supply circuit for a short to the (K914) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **(F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 100: Checking 5 Volt Supply Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (F856) 5 Volt Supply circuit between the Vehicle Speed Sensor harness connector and the PCM C2 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 16

No

- Repair the (F856) 5 Volt Supply circuit for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO VOLTAGE**

Fig. 101: Checking Vehicle Speed Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C1 harness connector.

3. Turn the ignition on.
4. Measure the voltage of the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K75) Vehicle Speed Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 12

12. **(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO GROUND**

Fig. 102: Checking VSS Signal Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 13

   No

   - Repair the (K75) Vehicle Speed Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

13. **(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT**

Fig. 103: Checking VSS Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K75) Vehicle Speed Signal circuit and the (K914) Sensor Ground circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 14

   No

   - Repair the (K75) Vehicle Speed Signal circuit for a short to the (K914) Sensor Ground circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

14. **(K75) VEHICLE SPEED SIGNAL CIRCUIT OPEN OR HIGH**

RESISTANCE

Fig. 104: Checking Vehicle Speed Signal Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (K75) Vehicle Speed Signal circuit between the Vehicle Speed Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 16

   No

   - Repair the (K75) Vehicle Speed Signal circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

15. **(K975) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 105: Checking Vehicle Speed Signal Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C1 harness connector.

3. Measure the resistance of the (K975) Sensor Ground circuit between the Vehicle Speed Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 16

   No

   - Repair the circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

16. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Vehicle Speed Sensor and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.
    6. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in

accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0506-IDLE SPEED PERFORMANCE LOWER THAN EXPECTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The objective of the Idle "Speed Rationality" is to monitor the ability to achieve and maintain a steady idle condition. The Engine Speed Error is calculated by comparing the difference between the Idle Set Speed from the Engine Speed and filtering the result. If engine speed does not come within a calibrated threshold of target idle speed, a timer is started. If the timer reaches its maximum threshold without the idle set speed returning inside of its calibrated threshold, a soft failure is generated.

WHEN MONITORED

With the engine running at idle, MAF < 250 mg/tdc, air temp > -17.8°C (0°F) and < -7°C (19.4°F) enable after coolant temp > 70°C (158°F) or air temp > -7° C (19.4°F), coolant temp > -7°C (19.4°F) < 130°C (266°F), canister purge <100% duty cycle, and no VSS, MAF/MAP, ECT, TPS, ETC, CKP Sensor, Fuel Injector, Fuel System or ABS DTCs.

SET CONDITION

Engine speed is 100 RPM or more below idle speed for 30.0 seconds. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
AIR INDUCTION SYSTEM RESTRICTIONS
PCV SYSTEM RESTRICTIONS
THROTTLE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

   NOTE: If any other IAC Motor or Throttle Body DTCs are present, they must be diagnosed and repaired before continuing this test.

   1. Start the engine and allow it to reach operating temperature.

      WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

   2. With a scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **AIR INDUCTION SYSTEM**

   1. Inspect the air induction system for the following problems:
      - Restrictions - dirty air cleaner, foreign material trapped in the air intake tube, etc.

      Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **PCV SYSTEM**
   1. Inspect the PCV system for the following problems:
      - Restrictions - sticking valve, collapsed hoses or tubes, obstructed passages or ports, etc.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **THROTTLE BODY OPERATION**

   WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Inspect the throttle body for carbon build up or other restrictions.
   2. Using a straight edge, verify that the throttle plate is not bent. If the throttle plate is bent, the throttle body must be replaced.
   3. Start the engine.

4. While the vehicle is running, lightly tap on ETC Motor with your hand, and listen for the idle to raise.

   Were any problems found or did the idle fluctuate while tapping on the ETC Motor?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the throttle body and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0507-IDLE SPEED PERFORMANCE HIGHER THAN EXPECTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The objective of the Idle "Speed Rationality" is to monitor the ability to achieve and maintain a steady idle condition. The Engine Speed Error is calculated by comparing the difference between the Idle Set Speed from the Engine Speed and filtering the result. If engine speed does not come within a calibrated threshold of target idle speed, a timer is started. If the timer reaches its maximum threshold without the idle set speed returning inside of its calibrated threshold, a soft failure is generated.

THEORY OF OPERATION

The objective of the Idle "Speed Rationality" is to monitor the ability to achieve and maintain a steady idle condition. The Engine Speed Error is calculated by comparing the difference between the Idle Set Speed from the Engine Speed and filtering the result. If engine speed does not come within a calibrated threshold of target idle speed, a timer is started. If the timer reaches its maximum threshold without the idle set speed returning inside of its calibrated threshold, a soft failure is generated.

WHEN MONITORED

With the engine running at idle, MAF < 250 mg/tdc, air temp > -17.8°C (0°F) and < -7°C (19.4°F) enable after coolant temp > 70°C (158°F) or air temp > -7° C (19.4°F), coolant temp > -7°C (19.4°F) < 130°C (266°F), canister purge <100% duty cycle, and no VSS, MAF/MAP, ECT, TPS, ETC, CKP Sensor, Fuel Injector, Fuel System or ABS DTCs.

SET CONDITION

Engine speed is 200 RPM or more above idle speed for 30.0 seconds. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
PCV SYSTEM LEAKS

INTERNAL OR EXTERNAL ENGINE VACUUM LEAKS
LOSS OF COMMUNICATION WITH ABS MODULE
THROTTLE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: If any other Throttle Body DTCs are present, they must be diagnosed and repaired before continuing this test.

NOTE: If there is a loss of communication with the ABS Module or implausible data from the ABS Module DTC present, diagnose and repair those faults before proceeding. A Loss of communication w/ABS will default vehicle speed to zero while driving and false fail the idle speed rationality diagnostics, setting this code.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

1. Start the engine.
2. Allow the engine to reach normal operating temperature, road test the vehicle.
3. With a scan tool, select View DTCs.

   Is the DTC Active or Pending at this time?

   Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **PCV SYSTEM**
   1. Inspect the PCV system for the following problems:
   2. Leaks - cracked or damaged hoses or tubes, poor hose or tube connections, PCV valve stuck open, etc.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **VACUUM LEAKS**

   WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in possible serious or fatal injury.

   1. Start the engine.
   2. Inspect the engine for internal leaks.
   3. Inspect any external components that can create a vacuum leak. Inspect the following items, but not limited too:
      - Vacuum supply lines
      - Brake Booster
      - Purge Solenoid

- Engine seals

Were any vacuum leaks found?

Yes

- Repair the vacuum leak as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **THROTTLE BODY OPERATION**
   1. Inspect the throttle body for carbon build up, other restrictions, and a bent throttle plate using a straight edge.
   2. If the throttle plate does not close entirely it may be bent and needs to be replaced.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in possible serious or fatal injury.**

   3. While the vehicle is running, perform a wire and connector wiggle test on the ETC Motor wiring and connections, and listen for idle to raise.

      Were any problems found or did the idle fluctuate while performing a wire and connector wiggle test?

      Yes

      - Verify that there is good pin to terminal contact at the Throttle Body and the Powertrain Control Module connectors. Replace the Throttle Body Assembly if no problems were found in the connectors. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and

select the Throttle Body Self Learn.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE (PCM)**

NOTE: Before replacing PCM, verify that there are no vacuum leaks. The most common cause for this DTC is an internal or external vacuum leak.

1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Throttle Body and Powertrain Control Module harness connectors.
4. Perform any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P050B-COLD START IGNITION TIMING PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Spark adjustment during a cold start is intended to provide quick response to idle speed variations. The spark adjust diagnostics monitors spark advance on a cold start over a period of time, then compares the average spark advance to a threshold.

WHEN MONITORED

During a cold start condition, with the difference between the AAT and ECT at startup below 10°C, and the engine running at idle.

SET CONDITION

The Powertrain Control Module (PCM) detects that engine speed is 50 RPM or more (depending on vehicle specifications) below target idle speed for more than three seconds, and the average spark advance is above the failure threshold for more than the specified limit. Two trip fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
RESTRICTED INTAKE AIR SYSTEM
LOW BATTERY VOLTAGE
FUEL CONTAMINATION
EXCESSIVE RESISTANCE IN THE (K124) ETC MOTOR (+)
EXCESSIVE RESISTANCE IN THE (K126) ETC MOTOR (-)
THROTTLE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Low battery voltage can cause excessive current draw in very hot and very cold ambient temperatures. Look closely at the temperatures at which this DTC set and make sure the battery can pass a load test before continuing.

NOTE: Diagnose and repair any other DTCs set in the PCM before proceeding with this test.

1. Turn the ignition on.
2. With the scan tool, select View DTCs and review the DTC environmental information.

   Is the DTC Active at this time?

   Yes

   - Go To 2

   No

   - The DTC is not active at this time. Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **THROTTLE PLATE INSPECTION**
   1. Turn the ignition off.
   2. Remove the air cleaner assembly.
   3. Check for any signs of a foreign material (ice, dirt, or excessive carbon build up) on the throttle plate or in the bore causing the throttle plate to stick.

      Were any problems found?

      Yes

      - Remove the debris if possible or replace the Throttle Body. Disconnect the battery when replacing the Throttle Body. After installation is complete, use a scan tool and perform the ETC RELEARN function.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **DIRTY AIR FILTER**
   1. Remove and inspect the air filter.

      Were any problems found?

      Yes

      - Replace the air filter.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 4

4. **CONTAMINATED FUEL**
   1. Inspect the fuel for contamination. (dirt, water, or other foreign material)

      Were any problems found?

      Yes

      - Drain the fuel from the fuel tank into an approved gas holding tank and add clean fuel. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK FOR EXCESSIVE RESISTANCE IN THE (K124) ETC MOTOR (+) CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

3. Connect the (special tool #10436, Adapter, GPEC Diagnostic) in line with the PCM C2 harness connector.
4. Using a voltmeter, perform a voltage drop test by back probing the (K124) ETC Motor (+) circuit at the Throttle Body harness connector and by probing the GPEC Adaptor. Make sure the voltmeter leads are connected so that positive polarity is displayed on the voltmeter.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

5. Start the engine.

   Is the voltage below 0.2 volts?

   Yes

   - Go To 6

   No

   - Repair the (K124) ETC Motor (+) for excessive resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK FOR EXCESSIVE RESISTANCE IN THE (K126) ETC MOTOR (-) CIRCUIT**
   1. Turn the ignition off.
   2. Using a voltmeter, perform a voltage drop test by back probing the

(K126) ETC Motor (-) circuit at the Throttle Body harness connector and by probing the GPEC Adaptor. Make sure the voltmeter leads are connected so that positive polarity is displayed on the voltmeter.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

3. Start the engine.

   Is the voltage below 0.2 volts?

   Yes

   - Go To 7

   No

   - Repair the (K126) ETC Motor (-) for excessive resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **THROTTLE BODY**
   1. Turn the ignition off.
   2. Measure the resistance of the ETC Motor by probing the appropriate terminals of the PCM C2 harness connector for the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

      Is the resistance between 2.5 and 25 Ohms at closed throttle?

      Yes

      - Go To 8

      No

      - Replace the Throttle Body. Disconnect the battery when replacing the Throttle Body. After installation is complete, use a scan tool

and perform the ETC RELEARN function.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0513-INVALID SKIM KEY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an invalid ignition key. One Trip Fault.

POSSIBLE CAUSES

POSSIBLE CAUSES
INCORRECT VIN PROGRAMMED IN THE PCM
NO COMMUNICATION WITH SKREEM/WCM
NO VIN PROGRAMMED IN THE PCM
IGNITION KEY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: An external Radio-Frequency Identification (RFID) key (and/or pass/radio key), such as one used to gain access to a 24 hour gym, can cause this DTC to set and create a no start condition. Inspect the customer's key chain for any type of RFID key. If one is not found, question the customer to see if a spare key chain has this RFID key on it or if it was removed from the original key chain before the vehicle was released for service. If a RFID key is present, remove the ignition key from the vehicle and remove the RFID key from the key chain. For GPEC equipped vehicles, disconnect the battery and wait a minimum of 5 minutes, reconnect and attempt to start the vehicle. For NGC equipped vehicles, turn the ignition on a minimum for one hour, and then attempt to start the vehicle. If the vehicle does not start, continue with the diagnostic test.

1. Ignition on, engine not running.
2. With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Go To 6

2. **NO COMMUNICATION WITH SKREEM/WCM**

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

1. With the scan tool, attempt to communicate with the WCM.

   Can the scan tool communicate with the WCM?

   Yes

   - Go To 3

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the No Response from WCM diagnostic procedure.

3. **SKREEM/WCM TROUBLE CODES SET**

1. With the scan tool, check for WCM DTCs.

   Are any DTCs present in the WCM?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

- Go To 4

4. **VIN PROGRAMMED INTO PCM**
   1. With the scan tool, display the VIN that is programmed in the PCM.

      Has a VIN been programmed into the PCM?

      Yes

      - Go To 5

      No

      - Program the correct VIN into the PCM and retest.
      - Perform the WCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Turn the ignition off.
   2. Replace and program the SKREEM/WCM in accordance with the Service Information.
   3. Ignition on, engine not running.
   4. With the scan tool, erase all WCM and PCM DTCs.
   5. Attempt to start the engine.
   6. With a scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

      - Replace and program the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Test Complete.

6. **IGNITION KEY**

NOTE: This DTC could have been set if the WCM harness connector was disconnected, or if the WCM was replaced recently.

NOTE: All of the ignition keys for this vehicle must be tested to verify proper operation.

NOTE: If this DTC cannot be reset, it could have been an actual theft attempt.

1. Ignition on, engine not running.
2. Verify that the correct VIN is programmed into the PCM and WCM.
3. Turn the ignition off.
4. Using each vehicle key, turn the ignition on and start the engine.
5. With a scan tool, View DTCs for each key.

Is the status Active for this DTC?

Yes

- Replace the ignition key.
- Perform the WCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test Complete.

P0522-ENGINE OIL PRESSURE SWITCH CIRCUIT LOW

Fig. 106: Engine Oil Pressure Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Oil Pressure Sensor input voltage is below the minimum acceptable value.

POSSIBLE CAUSES

Possible Causes
(G6) EOP SIGNAL CIRCUIT SHORTED TO GROUND
ENGINE OIL PRESSURE SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Start the engine and allow it to reach normal operating temperature.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   2. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .
2. **(G6) EOP SIGNAL CIRCUIT SHORTED TO GROUND**

Fig. 107: Checking EOP Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Engine Oil Pressure Switch harness connector.
3. Disconnect the Powertrain Control Module C2 harness connector.
4. Measure the resistance between ground and the (G6) EOP Signal circuit in the Engine Oil Pressure Switch harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (G6) EOP Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

3. **ENGINE OIL PRESSURE SWITCH**
   1. Turn the ignition off.
   2. Connect the PCM C2 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, select View DTCs.

   NOTE: The PCM should display an Engine Oil Pressure Sensor Circuit High DTC with the switch disconnected.

   Is the status Active for an Engine Oil Pressure Sensor Circuit High DTC with the switch disconnected?

   Yes

   - Replace the Engine Oil Pressure Switch in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4
4. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Oil Pressure Switch and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0523-ENGINE OIL PRESSURE SWITCH CIRCUIT HIGH

Fig. 108: Engine Oil Pressure Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Oil Pressure Sensor input voltage is above the maximum acceptable value.

POSSIBLE CAUSES

Possible Causes
(G6) EOP SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G6) EOP SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE OIL PRESSURE SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DT**

   NOTE: A low engine oil pressure condition may cause this DTC to set. Verify correct engine oil pressure in accordance with the Service Information before proceeding with the diagnostic procedure.

   1. Start the engine and allow it to reach normal operating temperature.

      WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

   2. Using the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (G6) EOP SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 109: Checking EOP Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Engine Oil Pressure Switch harness connector.
3. Disconnect the PCM C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (G6) EOP Signal circuit in the Engine Oil Pressure Switch harness connector.

   Is there any voltage present?

   Yes

- Repair the (G6) EOP Signal circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECK THE (G6) EOP SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   2. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   3. Measure the resistance of the (G6) EOP Signal circuit between the Engine Oil Pressure Switch harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (G6) EOP Signal circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **ENGINE OIL PRESSURE SWITCH**

Fig. 110: Engine Oil Pressure Switch Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the PCM C2 harness connector.
3. Connect a jumper between ground and the (G6) EOP Signal circuit at the Engine Oil Pressure Switch harness connector.
4. Turn the ignition on.

NOTE: The PCM should display an Engine Oil Pressure Sensor Circuit Low DTC with the jumper in place.

Is the status Active for an Engine Oil Pressure Sensor Circuit High DTC with the jumper in place?

Yes

- Replace the Engine Oil Pressure Switch in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Oil Pressure Switch and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0532-A/C PRESSURE SENSOR CIRCUIT LOW

Fig. 111: A/C Pressure Transducer Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The A/C pressure transducer monitors the pressures in the high side of the A/C

refrigerant system through its connection to a fitting on the A/C discharge line and its internal resistance changes in response to the pressures it monitors. The Totally Integrated Power Module (TIPM) provides a five Volt reference signal and a sensor ground to the A/C pressure transducer, then monitors the output voltage of the transducer on a sensor return circuit to determine refrigerant pressure the TIPM busses the reads to PCM. The PCM is programmed to respond to this and other sensor inputs by controlling the operation of the A/C clutch and the radiator cooling fan to help optimize A/C system performance and to protect the A/C system components from damage. The PCM will request disengagement of the A/C clutch when high side pressure rises above 3219 kPa (476 psi) and re-engage the clutch when high side pressure drops below 2937 kPa (426 psi). The PCM will also disengage the A/C clutch if the high side pressure drops below 110 kPa (16 psi) and will re-engage the clutch when the high side pressure rises above 220 kPa (32 psi). When the refrigerant pressure rises above 1655 kPa (240 psi), the PCM will actuate the cooling fan.

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the A/C Pressure Sensor input voltage is below the minimum acceptable value.

POSSIBLE CAUSES

Possible Causes
(C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
(C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO THE (C918) A/C PRESSURE SENSOR GROUND CIRCUIT
(C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (C918) A/C PRESSURE SENSOR GROUND CIRCUIT
(C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

A/C PRESSURE TRANSDUCER

TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: Diagnose and repair any CAN C Bus, system voltage, or sensor reference voltage DTCs before continuing with this test.

   1. Start the engine and allow it to reach normal operating temperature.

      WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

   2. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **(C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Fig. 121: Checking A/C Pressure Sensor Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the A/C Pressure Transducer connector.
3. Disconnect the Totally Integrated Power Module (TIPM) C5 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (C818) A/C Pressure Sensor Supply circuit in the A/C Pressure Transducer harness connector.

   Is there any voltage present?

   Yes

   - Repair the (C818) A/C Pressure Sensor Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **(C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**

Fig. 122: Checking A/C Pressure Sensor Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (C18) A/C Pressure Sensor Signal circuit in the A/C Pressure Transducer harness connector.

   Is there any voltage present?

   Yes

   - Repair the (C18) A/C Pressure Sensor Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **(C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT**

Fig. 123: Checking A/C Pressure Sensor Signal Circuit For Short To A/C Pressure Sensor Supply Circuit

1. Turn the ignition off.
2. Measure the resistance of the (C18) A/C Pressure Sensor Signal circuit

between the A/C Pressure Transducer harness connector and the Totally Integrated Power Module (TIPM) harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 6

No

- Repair the (C18) A/C Pressure Sensor Signal circuit for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **(C918) A/C PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 125: Checking A/C Pressure Sensor Ground Circuit For Open Or

High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (C918) A/C Pressure Sensor Ground circuit between the A/C Pressure Transducer harness connector and the TIPM C5 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7

   No

   - Repair the (C918) A/C Pressure Sensor Ground circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **A/C PRESSURE TRANSDUCER**

Fig. 126: A/C Pressure Transducer Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Connect the TIPM C5 harness connector.
3. Connect a jumper wire between the (C918) A/C Pressure Sensor Ground circuit and the (C18) A/C Pressure Sensor Signal circuit in the A/C Pressure Transducer harness connector.
4. Turn the ignition on.
5. With the scan tool, read the A/C Pressure Transducer signal voltage.

   Is the voltage below 1.0 volt with the jumper wire in place?

   Yes

- Replace the A/C Pressure Transducer in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 8

8. **TOTALLY INTEGRATED POWER MODULE (TIPM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the A/C Pressure Transducer and the Totally Integrated Power Module (TIPM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace and program the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0562-BATTERY/SYSTEM VOLTAGE LOW

Fig. 127: Charging System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With engine running for more than 30 seconds.

SET CONDITION

Battery voltage at the Powertrain Control Module (PCM) is less than 11.7 volts for a set period of time. One Trip Fault.

POSSIBLE CAUSES

POSSIBLE CAUSES
BATTERY POSITIVE CIRCUIT HIGH RESISTANCE
GENERATOR CASE GROUND HIGH RESISTANCE
(A931) FUSED B+ CIRCUIT HIGH RESISTANCE
(Z925) GROUND CIRCUIT(S) HIGH RESISTANCE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any charging system DTCs before proceeding with this test.

NOTE: Inspect and test the battery in accordance with the Service Information before continuing with this test.

NOTE: Inspect the generator drive belt before continuing with this test.

NOTE: Inspect the vehicle for aftermarket accessories that may exceed the Generator System output.

NOTE: Inspect the fuses in the IPM. If an open fuse is found, use the wire diagram/schematic as a guide and inspect the wiring and connectors for damage.

1. Start the engine and allow it to reach operating temperature.
2. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE BATTERY POSITIVE (+) CIRCUIT FOR HIGH RESISTANCE**

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Make sure all testing equipment and cables are clear of any engine parts before starting the engine.

1. Start the engine.
2. Measure the voltage between the B (+) Terminal at the Generator and the Battery Positive (+) Post.

Is the voltage above 0.1 volts?

Yes

- Repair the Battery Positive (+) circuit for high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECK THE GENERATOR CASE GROUND FOR HIGH**

RESISTANCE

NOTE: Make sure all testing equipment and cables are clear of any engine parts before starting the engine.

1. Start the engine and allow it to reach operating temperature.
2. Measure the voltage between the Generator case and the Battery Negative (-) post.

   Is the voltage above 0.1 volts?

   Yes

   - Repair the Generator Case ground for high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To4

4. **CHECK THE (A931) FUSED B+ CIRCUIT FOR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (A931) Fused B+ circuit in the PCM C1 harness connector.

      NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

      Is the test light illuminated and bright?

      Yes

      - Go To 5

      No

- Repair the (A931) Fused B+ circuit for high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (Z925) GROUND CIRCUIT(S) FOR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12 volts, check the (Z925) Ground circuits in the PCM C1 harness connector.

      NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

      Is the test light illuminated and bright?

      Yes

      - Go To 6

      No

      - Repair the (Z925) Ground circuit(s) for high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0563-BATTERY/SYSTEM VOLTAGE HIGH

Fig. 128: Charging System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running for more than 30 seconds.

SET CONDITION

Battery voltage is 1 volt greater than desired voltage for more than five seconds. One Trip Fault.

POSSIBLE CAUSES

POSSIBLE CAUSES
(A804) GEN SENSE CIRCUIT OPEN OR HIGH RESISTANCE
(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any charging system or generator DTCs before continuing with this test.

NOTE: Inspect and test the battery in accordance with the Service Information before continuing with this test.

NOTE: Inspect the generator drive belt before continuing with this test.

NOTE: Inspect the vehicle for aftermarket accessories that may exceed the Generator System output.

NOTE: Inspect the fuses in the TIPM. If an open fuse is found, use the wire diagram/schematic as a guide and inspect the wiring and connectors for damage.

1. Start the engine and allow it to reach operating temperature.
2. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (A804) GENERATOR SENSE CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (A804) Generator Sense circuit in the Generator harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 3

No

- Repair the (A804) Generator Sense circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage on the (K20) Generator Field Control circuit in the Generator harness connector.

Is there any voltage present?

Yes

- Repair the (K20) Generator Field Control circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0571-BRAKE SWITCH 1 PERFORMANCE

Fig. 129: Brake Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the states of Brake Signal 1 and Brake Signal 2 do not match for more than 50 ms.

POSSIBLE CAUSES

Possible Causes
(B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, monitor the states of Brake Signal 1 and Brake Signal 2 while pressing and releasing the brake pedal several times.

       Do the states change from Pressed when the pedal is pressed to Not Pressed when the pedal is released?

       Yes

       - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

       No

       - Go To 2

2. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Using a 12-volt test light connected to 12 Volts, check the (B15) Brake Signal 1 circuit in the GPEC Adaptor while pressing and releasing the brake pedal several times.

      Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

      Yes

      - Go To 3

      No

      - Go To 4
3. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (B16) Brake Signal 2 circuit in the GPEC Adaptor while pressing and releasing the brake pedal several times.

      Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

      Yes

      - Go To 11

No

- Go To 7

4. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 130: Checking Stop Lamp Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Stop Lamp Switch harness connector.
3. Using a 12-volt test light connected to 12 volts, check the (Z906) Ground circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 5

No

- Repair the (Z906) Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND**

Fig. 131: Checking Brake Signal 1 Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (B15) Brake Signal 1 circuit in the Stop Lamp Switch harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To 6

No

- Repair the (B15) Brake Signal 1 circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (B15) Brake Signal 1 circuit between the Stop Lamp Switch harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 10

   No

   - Repair the (B15) Brake Signal 1 circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 132: Checking Fused Ignition Switch Output (Run-Start) Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Stop Lamp Switch harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 8

No

- Repair the (F202) Fused Ignition Switch Output (Run-Start) circuit for an open or high resistance. Inspect the related fuse. If the fuse is open, check the circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 133: Checking Brake Signal 2 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

   Is there any voltage present?

Yes

- Repair the (B16) Brake Signal 2 circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (B16) Brake Signal 2 circuit between the Stop Lamp Switch harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 10

      No

      - Repair the (B16) Brake Signal 2 circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **STOP LAMP SWITCH**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.
    6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace the Stop Lamp Switch in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0572-BRAKE SWITCH 1 STUCK ON

Fig. 134: Brake Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on, battery voltage greater than 10.4 Volts and ambient

temperature above -23 C.

SET CONDITION

The Powertrain Control Module (PCM) detects that the state of Brake Signal 1 does not change as expected.

POSSIBLE CAUSES

Possible Causes
(B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, monitor the states of Brake Signal 1 and Brake Signal 2 while pressing and releasing the brake pedal several times.

       Do the states change from Pressed when the pedal is pressed to Not Pressed when the pedal is released?

       Yes

       - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

       No

- Go To 2

2. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Using a 12-volt test light connected to 12 Volts, check the (B15) Brake Signal 1 circuit in the GPEC Adaptor while pressing and releasing the brake pedal several times.

      Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

      Yes

      - Go To 3

      No

      - Go To 4

3. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (B16) Brake Signal 2 circuit in the GPEC Adaptor while pressing and releasing the brake pedal several times.

      Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

      Yes

- Go To 11

No

- Go To 7

4. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 135: Checking Stop Lamp Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Stop Lamp Switch harness connector.
3. Using a 12-volt test light connected to 12 volts, check the (Z906) Ground circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct

connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 5

No

- Repair the (Z906) Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND**

Fig. 136: Checking Brake Signal 1 Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (B15) Brake Signal 1

circuit in the Stop Lamp Switch harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To 6

No

- Repair the (B15) Brake Signal 1 circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (B15) Brake Signal 1 circuit between the Stop Lamp Switch harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 10

   No

   - Repair the (B15) Brake Signal 1 circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 137: Checking Fused Ignition Switch Output (Run-Start) Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Stop Lamp Switch harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 8

No

- Repair the (F202) Fused Ignition Switch Output (Run-Start) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 138: Checking Brake Signal 2 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

   Is there any voltage present?

   Yes

- Repair the (B16) Brake Signal 2 circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (B16) Brake Signal 2 circuit between the Stop Lamp Switch harness connector and the PCM C1 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 10

No

- Repair the (B16) Brake Signal 2 circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **STOP LAMP SWITCH**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.

3. Look for broken, bent, pushed out or corroded terminals.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace the Stop Lamp Switch in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the powertrain verification test. Refer to **POWERTRAIN VERIFICATION TEST** .

P0573-BRAKE SWITCH 1 STUCK OFF

Fig. 139: Brake Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on, battery voltage greater than 10.4 Volts, ambient temperature above -23 C.

SET CONDITION

The Powertrain Control Module (PCM) detects that the state of Brake Signal 1 does not change as expected.

POSSIBLE CAUSES

Possible Causes
(B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, monitor the states of Brake Signal 1 and Brake Signal 2 while pressing and releasing the brake pedal several times.

Do the Brake Signal states change appropriately as the pedal is pressed and released?

Yes

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

No

- Go To 2

2. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Using a 12-volt test light connected to 12 Volts, check the (B15) Brake Signal 1 circuit in the GPEC Adaptor while pressing and releasing the brake pedal several times.

      Does the test light change from illuminated to not illuminated as the brake pedal is pressed and released?

      Yes

      - Go To 3

      No

      - Go To 4

3. **CHECK HE (B16) BRAKE SIGNAL 2 CIRCUIT**
   1. Turn the ignition on.

2. Using a 12-volt test light connected to ground, check the (B16) Brake Signal 2 circuit in the GPEC Adaptor while pressing and releasing the brake pedal several times.

   Does the test light change from illuminated to not illuminated as the brake pedal is pressed and released?

   Yes

   - Go To 11

   No

   - Go To 7

4. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 140: Checking Stop Lamp Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Stop Lamp Switch harness connector.
3. Using a 12-volt test light connected to 12 volts, check the (Z906) Ground circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 5

No

- Repair the (Z906) Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND**

Fig. 141: Checking Brake Signal 1 Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (B15) Brake Signal 1 circuit in the Stop Lamp Switch harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the (B15) Brake Signal 1 circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (B15) Brake Signal 1 circuit between the

Stop Lamp Switch harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 10

No

- Repair the (B15) Brake Signal 1 circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 142: Checking Fused Ignition Switch Output (Run-Start) Circuit For Open Or High Resistance

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Stop Lamp Switch harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 8

No

- Repair the (F202) Fused Ignition Switch Output (Run-Start) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 143: Checking Brake Signal 2 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

   Is there any voltage present?

   Yes

   - Repair the (B16) Brake Signal 2 circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 9

9. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (B16) Brake Signal 2 circuit between the

Stop Lamp Switch harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 10

No

- Repair the (B16) Brake Signal 2 circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **STOP LAMP SWITCH**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.
    6. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace the Stop Lamp Switch in accordance with the service information.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0579-SPEED CONTROL SWITCH 1 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition switch on and no other S/C Switch DTCs present.

SET CONDITION

The S/C Switch Signal 2 voltage is not within a valid switch signal range.

POSSIBLE CAUSES

Possible Causes
HIGH RESISTANCE IN THE (V72) S/C SIGNAL 2 CIRCUIT
HIGH RESISTANCE IN THE (V937) S/C SWITCH GROUND CIRCUIT
SPEED CONTROL SWITCH
STEERING WHEEL JUMPER HARNESS
CLOCKSPRING
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.

      NOTE: This DTC is a two trip fault. If the scan tool indicates a one trip failure, the possible cause may have been the customer pressing switches simultaneously. Test drive the vehicle and activate the Speed Control system. If the DTC matures to an active fault a repair is necessary.

   3. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK FOR HIGH RESISTANCE IN THE SPEED CONTROL SWITCH CIRCUITS**
   1. Turn the ignition off.
   2. Disconnect the Speed Control Switch harness connector.

3. Disconnect the PCM C1 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

4. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
5. Measure the resistance of the (V72) S/C Signal 2 circuit between the GPEC Adaptor and Speed Control Switch harness connector.
6. Measure the resistance of the (V937) Switch Ground circuit between the GPEC Adaptor and Speed Control Switch harness connector.

   Is the resistance below 5.0 Ohms for both measurements?

   Yes

   - Go To 3

   No

   - Go To 5

3. **SPEED CONTROL SWITCH**
   1. Turn the ignition off.
   2. Disconnect the Speed Control Switch harness connector in accordance with the service information.
   3. Measure the resistance between the (V72) S/C Signal 2 terminal and the (V937) S/C Switch Ground terminal at the Speed Control Switch, not the harness connector.
   4. Monitor the Ohmmeter while pressing each function button on each switch.
   5. The following resistance specs are taken between terminals (V72) S/C Signal 2 terminal and the (V937) Switch Ground terminal of the switch when holding the switch button in the following position:
      - Not pressing any switch - 20.5k Ohms

- On/Off - 0.47k Ohms
- Set/Decel - 4.34k Ohms
- Cancel - 1.24k Ohms
- Resume/Accel - 8.80k Ohms

Does the function on the Speed Control Switch have the correct resistance value +/- 0.2 Ohm?

Yes

- Go To 4

No

- Replace the Speed Control Switch in accordance with the Service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE,**

POWERTRAIN CONTROL, REMOVAL .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **STEERING WHEEL JUMPER HARNESS**
   1. Turn the ignition off.
   2. Disconnect the Clockspring C4 harness connector.
   3. Measure the resistance of the (V72) S/C Signal 2 circuit between the Clockspring C4 harness connector and Speed Control Switch harness connector.
   4. Measure the resistance of the (V937) Switch Ground circuit between the Clockspring C4 harness connector and Speed Control Switch harness connector.

   Is the resistance below 5.0 Ohms for both measurements?

   Yes

   - Go To 6

   No

   - Replace the Steering Wheel Jumper harness in accordance with the service information.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CLOCKSPRING**
   1. Disconnect the Clockspring C1 harness connector in accordance with the Service Information.
   2. Measure the resistance of the (V72) S/C Signal 2 circuit between the C1 Clockspring connector and the GPEC Adaptor.
   3. Measure the resistance of the (V937) Switch Ground circuit between the C1 Clockspring connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms for both measurements?

   Yes

   - Replace the Clockspring in accordance with the service

information.

- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Repair the circuit that measured above 5.0 Ohms for an open or high resistance.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0580-SPEED CONTROL SWITCH 1 CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 Volts.

SET CONDITION

The S/C Signal 1 voltage is below a calibrated threshold for 0.06 second.

POSSIBLE CAUSES

Possible Causes
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO GROUND
CLOCKSPRING
STEERING WHEEL JUMPER HARNESS
SPEED CONTROL SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.

      NOTE: This DTC is a two trip fault. If the scan tool indicates a one trip failure, the possible cause may have been the customer pressing switches simultaneously. Test drive the vehicle and activate the Speed Control system. If the DTC matures to an active fault a repair is necessary.

   3. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **SPEED CONTROL SWITCH**
   1. Turn the ignition off.
   2. Turn the ignition on, engine not running.
   3. Disconnect the Speed Control Switch harness connector.
   4. Measure the voltage of the (V71) S/C Signal 1 circuit at the Speed Control Switch harness connector.

      Does the (V71) S/C Signal 1 circuit voltage read 5.0 Volts with the Speed Control Switch harness connector unplugged?

      Yes

      - Replace the Speed Control Switch in accordance with the service information.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **STEERING WHEEL JUMPER HARNESS**
   1. Disconnect the Clockspring C4 harness connector.
   2. Measure the voltage of the (V71) S/C Signal 1 circuit at the Clockspring terminal, not the harness connector.

      Does the (V71) S/C Signal 1 circuit voltage read 5.0 Volts with the Clockspring C4 harness connector unplugged?

      Yes

      - Replace the Steering Wheel Jumper harness in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 4

4. **CLOCKSPRING**
   1. Disconnect the Clockspring C1 harness connector in accordance with the Service Information.
   2. Measure the voltage of the (V71) S/C Signal 1 circuit at the Clockspring C1 harness connector.

      Does the (V71) S/C Signal 1 circuit voltage read 5.0 Volts with the Clockspring C1 harness connector unplugged?

      Yes

      - Replace the Clockspring in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **CHECK FOR THE (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit at the Clockspring C1 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the short between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the wiring harness.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (V71) S/C SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (V71) S/C Signal 1 circuit at the Clockspring C1 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 7

   No

   - Repair the (V71) S/C Signal 1 circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **POWERTRAIN CONTROL MODULE**

1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module.
2. Look for any chafed, pierced, pinched or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0581-SPEED CONTROL SWITCH 1 CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The S/C Signal 1 is above a calibrated threshold for 0.06 second.

POSSIBLE CAUSES

Possible Causes
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(V71) S/C SIGNAL 1 CIRCUIT OPEN/HIGH RESISTANCE

(V937) S/C SWITCH GROUND CIRCUIT OPEN/HIGH RESISTANCE
CLOCKSPRING
STEERING WHEEL JUMPER HARNESS
SPEED CONTROL SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.

      NOTE: This DTC is a two trip fault. If the scan tool indicates a one trip failure, the possible cause may have been the customer pressing switches simultaneously. Test drive the vehicle and activate the Speed Control system. If the DTC matures to an active fault a repair is necessary.

   3. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .
2. **CHECK THE (V71) S/C SIGNAL 1 CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.

2. Disconnect the Speed Control Switch harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (V71) S/C Signal 1 circuit in the Speed Control Switch harness connector.

   Is the voltage above 5.2 volts?

   Yes

   - Repair the (V71) S/C Signal 1 circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **SPEED CONTROL SWITCH**
   1. Connect a jumper between the (V71) S/C Signal 1 circuit and the (V937) Switch Ground circuit at the Speed Control Switch harness connector.
   2. With the scan tool, select View DTCs.

      Does the P0580-SPEED CONTROL SWITCH 1 CIRCUIT LOW set as active or pending with the jumper in place?

      Yes

      - Replace the Speed Control Switch in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 4

4. **STEERING WHEEL JUMPER HARNESS**
   1. Turn the ignition off.
   2. Disconnect the Clockspring C4 harness connector.

3. Connect a jumper between the (V71) S/C Signal 1 circuit and the (V937) Switch Ground circuit at the Clockspring terminals, not the harness connector.
4. Turn the ignition on.
5. With the scan tool, select View DTCs.

   Does the P0580-SPEED CONTROL SWITCH 1 CIRCUIT LOW set as active or pending with the jumper in place?

   Yes

   - Replace the Steering Wheel Jumper Harness in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **CLOCKSPRING**
   1. Turn the ignition off.
   2. Disconnect the Clockspring C1 harness connector.
   3. Connect a jumper between the (V71) S/C Signal 1 circuit and the (V937) Switch Ground circuit at the Clockspring C1 harness connector.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

      Does the P0580-SPEED CONTROL SWITCH 1 CIRCUIT LOW set as active or pending with the jumper in place?

      Yes

      - Replace the Clockspring harness in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

- Go To 6

6. **CHECK THE (V71) S/C SIGNAL 1 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Measure the resistance of the (V71) S/C Signal 1 circuit between the Clockspring C1 harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

      - Repair the (V71) S/C Signal 1 circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (V937) S/C SWITCH GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (V937) Switch Ground circuit between the Clockspring C1 harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

- Go To 8

No

- Repair the (V937) S/C Switch Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0585-SPEED CONTROL SWITCH 1/2 CORRELATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and no other S/C Switch DTCs present.

SET CONDITION

The (V71) S/C Signal 1 and (V72) S/C Signal 2 do not indicate the same S/C Switch position.

POSSIBLE CAUSES

Possible Causes
SPEED CONTROL SWITCH

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

SPEED CONTROL SWITCH STATUS

1. Turn the ignition on.
2. With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.
3. Using the scan tool, monitor the Speed Control Switch status.
4. Press each button while noting the Speed Control Switch status for both switches on the scan tool.

   Did the Speed Control Switch 1 status and Speed Control Switch 2 status match when each button is pressed?

   Yes

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

   No

   - Replace the Speed Control Switch in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0591-SPEED CONTROL SWITCH 2 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

P0591-SPEED CONTROL SWITCH 2 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Speed Control signal voltage is implausible.

POSSIBLE CAUSES

Possible Causes
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO GROUND
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT
(V72) S/C SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CLOCKSPRING
SPEED CONTROL SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.

2. With the scan tool, clear DTCs in the PCM.
3. Start the engine and test drive the vehicle.
4. During the test drive select each of the speed control switch positions.
5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK FOR HIGH RESISTANCE IN THE SPEED CONTROL SWITCH CIRCUITS**
   1. Turn the ignition off.
   2. Disconnect the Speed Control Switch harness connector.
   3. Disconnect the PCM C1 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   4. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   5. Measure the resistance of the (V72) S/C Signal 2 circuit between the GPEC Adaptor and Speed Control Switch harness connector.
   6. Measure the resistance of the (V937) Switch Ground circuit between the GPEC Adaptor and Speed Control Switch harness connector.

      Is the resistance below 5.0 Ohms for both measurements?

      Yes

- Go To 3

No

- Go To 5

3. **SPEED CONTROL SWITCH**
   1. Turn the ignition off.
   2. Disconnect the Speed Control Switch harness connector in accordance with the service information.
   3. Measure the resistance between the (V72) S/C Signal 2 terminal and the (V937) S/C Switch Ground terminal at the Speed Control Switch, not the harness connector.
   4. Monitor the Ohmmeter while pressing each function button on each switch.
   5. The following resistance specs are taken between terminals (V72) S/C Signal 2 terminal and the (V937) Switch Ground terminal of the switch when holding the switch button in the following position:
      - Not pressing any switch - 20.5k Ohms
      - On/Off - 0.47k Ohms
      - Set/Decel - 4.34k Ohms
      - Cancel - 1.24k Ohms
      - Resume/Accel - 8.80k Ohms

      Does the function on the Speed Control Switch have the correct resistance value +/- 0.2 Ohm?

      Yes

      - Go To 4

      No

      - Replace the Speed Control Switch in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
4. **POWERTRAIN CONTROL MODULE**

1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module.
2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **STEERING WHEEL JUMPER HARNESS**
   1. Turn the ignition off.
   2. Disconnect the Clockspring C4 harness connector.
   3. Measure the resistance of the (V72) S/C Signal 2 circuit between the Clockspring C4 harness connector and Speed Control Switch harness connector.
   4. Measure the resistance of the (V937) Switch Ground circuit between the Clockspring C4 harness connector and Speed Control Switch harness connector.

      Is the resistance below 5.0 Ohms for both measurements?

      Yes

      - Go To 6

No

- Replace the Steering Wheel Jumper harness in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CLOCKSPRING**
   1. Disconnect the Clockspring C1 harness connector in accordance with the Service Information.
   2. Measure the resistance of the (V72) S/C Signal 2 circuit between the Clockspring C1 harness connector and the GPEC Adaptor.
   3. Measure the resistance of the (V937) Switch Ground circuit between the Clockspring C1 harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms for both measurements?

   Yes

   - Replace the Clockspring in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Repair the circuit that measured above 5.0 Ohms for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0592-SPEED CONTROL SWITCH 2 CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The S/C Signal 2 voltage is below a calibrated threshold for 0.06 second.

POSSIBLE CAUSES

Possible Causes
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO GROUND
CLOCKSPRING
STEERING WHEEL JUMPER HARNESS
SPEED CONTROL SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.

    NOTE: This DTC is a two trip fault. If the scan tool indicates a one trip failure, the possible cause may have been the customer pressing switches simultaneously. Test drive the vehicle and activate the Speed Control system. If the DTC matures to an active fault a repair is necessary.

    3. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **SPEED CONTROL SWITCH**
   1. Turn the ignition off.
   2. Disconnect the Speed Control Switch harness connector.
   3. Turn the ignition on, engine not running.
   4. Measure the voltage of the (V72) S/C Signal 2 circuit at the Speed Control Switch harness connector.

      Does the (V72) S/C Signal 2 voltage read 5.0 Volts with the Speed Control Switch harness connector unplugged?

      Yes

      - Replace the Speed Control Switch in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 3

3. **STEERING WHEEL JUMPER HARNESS**
   1. Turn the ignition off.
   2. Disconnect the Clockspring C4 harness connector.
   3. Turn the ignition on, engine not running.
   4. Measure the voltage of the (V72) S/C Signal 2 circuit at the Clockspring terminal, not the harness connector.

      Does the (V72) S/C Signal 2 voltage read 5.0 Volts with the Clockspring C4 harness connector unplugged?

      Yes

      - Replace the Steering Wheel Jumper harness in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Go To 4

4. **CLOCKSPRING**
   1. Turn the ignition off.
   2. Disconnect the Clockspring C1 harness connector in accordance with the Service Information.
   3. Turn the ignition on, engine not running.
   4. Measure the voltage of the (V72) S/C Signal 2 circuit at the Clockspring C1 harness connector.

   Does the (V72) S/C Signal 2 voltage read 5.0 Volts with the Clockspring C1 harness connector unplugged?

   Yes

   - Replace the Clockspring in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **CHECK FOR THE (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit at the Clockspring C1 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

No

- Repair the short between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the wiring harness.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (V72) S/C SIGNAL 2 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (V72) S/C Signal 2 circuit at the Clockspring C1 harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 7

      No

      - Repair the (V72) S/C Signal 2 circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
7. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0593-SPEED CONTROL SWITCH 2 CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The S/C Signal 2 is above a calibrated threshold for 0.06 second.

POSSIBLE CAUSES

Possible Causes
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(V72) S/C SIGNAL 2 CIRCUIT OPEN/HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN/HIGH RESISTANCE
CLOCKSPRING
STEERING WHEEL JUMPER HARNESS
SPEED CONTROL SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, select View DTCs. Copy DTC and Freeze Frame

information.

NOTE: This DTC is a two trip fault. If the scan tool indicates a one trip failure, the possible cause may have been the customer pressing switches simultaneously. Test drive the vehicle and activate the Speed Control system. If the DTC matures to an active fault a repair is necessary.

NOTE: It may be necessary to test drive the vehicle and operate the speed control in order for this DTC to set.

3. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (V72) S/C SIGNAL 2 CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Speed Control Switch harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (V72) S/C Signal 2 circuit in the Speed Control Switch harness connector.

   Is the voltage above 5.2 Volts?

   Yes

   - Repair the (V72) S/C Signal 2 circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Go To 3

3. **SPEED CONTROL SWITCH**
   1. Connect a jumper between the (V72) S/C Signal 2 circuit and the (V937) Switch Ground circuit at the Speed Control Switch harness connector.
   2. With the scan tool, select View DTCs.

   Does the P0592-SPEED CONTROL SWITCH 2 CIRCUIT LOW set as active or pending with the jumper in place?

   Yes

   - Replace the Speed Control Switch in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **STEERING WHEEL JUMPER HARNESS**
   1. Turn the ignition off.
   2. Disconnect the Clockspring C4 harness connector.
   3. Connect a jumper between the (V72) S/C Signal 2 circuit and the (V937) Switch Ground circuit at the Clockspring terminals, not the harness connector.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

   Does the P0592-SPEED CONTROL SWITCH 2 CIRCUIT LOW set as active or pending with the jumper in place?

   Yes

- Replace the Steering Wheel Jumper harness in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **CLOCKSPRING**
   1. Turn the ignition off.
   2. Disconnect the Clockspring C1 harness connector.
   3. Connect a jumper between the (V72) S/C Signal 2 circuit and the (V937) Switch Ground circuit at the Clockspring C1 harness connector.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

   Does the P0592-SPEED CONTROL SWITCH 2 CIRCUIT LOW set as active or pending with the jumper in place?

   Yes

   - Replace the Clockspring in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 6

6. **CHECK THE (V72) S/C SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in

poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
4. Measure the resistance of the (V72) S/C Signal 2 circuit between the Clockspring C1 harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7

   No

   - Repair the (V72) S/C Signal 2 circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (V937) S/C SWITCH GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (V937) Switch Ground circuit between the Clockspring C1 harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 8

      No

      - Repair the (V937) S/C Switch Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and

connectors between the Speed Control Switch and the Powertrain Control Module.

2. Look for any chafed, pierced, pinched or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0600-SERIAL COMMUNICATION LINK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an internal failure.

POSSIBLE CAUSES

POSSIBLE CAUSES
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before

proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST.

1. **DTC IS ACTIVE**

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Ignition on, engine not running.
2. With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).
3. Monitor the scan tool for at least two minutes.
4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
5. Start the engine and allow it to reach operating temperature.
6. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the Powertrain Control Module (PCM) wiring and connectors.

2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0601-INTERNAL MEMORY CHECKSUM INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an internal failure.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P060B-ETC A/D GROUND PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

When the A/D reading does not return to ground within a set period of time during test activation, this DTC will set. Reprogramming the module may not fix this DTC. ETC lamp will flash.

POSSIBLE CAUSES

POSSIBLE CAUSES
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Turn the ignition on.
2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
3. Verify the Powertrain Control Module (PCM) is at the latest calibration (flash level). If necessary, update the Powertrain Control Module (PCM) in accordance with the Service Information.
4. Start the engine and allow it to reach operating temperature.
5. Increase engine speed by pressing the accelerator pedal. Do not exceed 3500 RPM.
6. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **POWERTRAIN CONTROL MODULE (PCM)**

1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

P0615-STARTER CONTROL CIRCUIT/OPEN

Fig. 144: Starter Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the actual state of the starter control does not match the intended state.

POSSIBLE CAUSES

POSSIBLE CAUSES
(T752) STARTER CONTROL CIRCUIT SHORTED TO VOLTAGE
(T752) STARTER CONTROL CIRCUIT SHORTED TO GROUND
(T752) STARTER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Attempt to start the engine. If the engine will not crank, turn the ignition switch to the crank position for 5 seconds.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   2. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (T752) STARTER CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 145: Checking Starter Control Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Totally Integrated Power Module (TIPM) C2 harness connector.
3. Disconnect the PCM C1 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (T752) Starter Control circuit in the TIPM C2 harness connector.

   Is there any voltage present?

Yes

- Repair the (T752) Starter Control circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECK THE (T752) STARTER CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 146: Checking Starter Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (T752) Starter Control circuit in the TIPM C2 harness connector.

   Is the resistance above 10k Ohms?

Yes

- Go To 4

No

- Repair the (T752) Starter Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (T752) STARTER CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (T752) Starter Control circuit between the TIPM C2 harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 5

No

- Repair the (T752) Starter Control circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **TOTALLY INTEGRATED POWER MODULE (TIPM)**

Fig. 147: Checking Starter Control Circuit In TIPM Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Connect the PCM C1 harness connector.
2. Turn the ignition on.
3. Using a 12-volt test light connected to 12 volts, check the (T752) Starter Control circuit in the TIPM C2 harness connector.

NOTE: The test light should not be illuminated.

4. While monitoring the test light, move the ignition to the start position.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light not illuminated with the ignition in the run position and illuminated and bright with the ignition in the start position?

Yes

- Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Totally Integrated Power Module (TIPM) and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P061A-LEVEL 2 TORQUE PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

When secondary software determines that the requested output is not being achieved by the engine for a period of time. ETC lamp will flash.

POSSIBLE CAUSES

POSSIBLE CAUSES
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Turn the ignition on.
2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
3. Verify the Powertrain Control Module (PCM) is at the latest calibration (flash level). If necessary, update the Powertrain Control Module (PCM) in accordance with the Service Information.

4. Start the engine and allow it to reach operating temperature.
5. Increase engine speed by pressing the accelerator pedal. Do not exceed 3500 RPM.
6. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P061C-ETC LEVEL 2 RPM PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

When secondary software determines that the engine speed is implausible for a period of time. ETC lamp will flash.

POSSIBLE CAUSES

POSSIBLE CAUSES
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Turn the ignition on.

2. With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).
3. Verify the Powertrain Control Module (PCM) is at the latest calibration (flash level). If necessary, update the Powertrain Control Module (PCM) in accordance with the Service Information.
4. Start the engine and allow it to reach operating temperature.

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

2014 ENGINE PERFORMANCE

Powertrain Control Module (PCM) - Electrical Diagnostics, 2.0L & 2.4L - Compass & Patriot

DIAGNOSIS AND TESTING

P0622-GENERATOR FIELD CONTROL CIRCUIT

Fig. 1: Charging System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article .

WHEN MONITORED

With the engine running and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the actual state of the generator field control does not match the intended state.

POSSIBLE CAUSES

POSSIBLE CAUSES
(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE
(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO GROUND
(K20) GEN FIELD CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Start the engine and allow it to reach normal operating temperature.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   2. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 2: Checking Generator Field Control Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Generator harness connector.
3. Disconnect the PCM C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (K20) Generator Field Control circuit in the Generator harness connector.

Is there any voltage present?

Yes

- Repair the (K20) Generator Field Control circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 3: Checking Generator Field Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K20) Generator Field

Control circuit in the Generator harness connector.

Is the resistance above 10k Ohms?

Yes

- Repair the (K20) Generator Field Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K20) Generator Field Control circuit between the Generator harness connector and the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the (K20) Generator Field Control circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
5. **GENERATOR**

Fig. 4: Checking Generator Field Control Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Connect the PCM C2 harness connector.
2. Turn the ignition on.
3. With the scan tool, actuate the Generator field control to the ON (100%) position.
4. Using a 12-volt test light connected to ground, check the (K20) Generator Field Control circuit in the Generator harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

5. With the scan tool, actuate the Generator field control to the OFF (0%) position.
6. Using a 12-volt test light connected to ground, check the (K20) Generator Field Control circuit in the Generator harness connector.

NOTE: The test light should not be illuminated.

Is the test light illuminated and bright with the actuation ON (100%) and not illuminated with the actuation OFF (0%)?

Yes

- Replace the Generator in accordance with the Service Information. Refer to **GENERATOR, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0627-FUEL PUMP CONTROL CIRCUIT OPEN

Fig. 5: Fuel Pump Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running and the battery voltage greater than 10.4 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the actual state of the fuel pump control does not match the intended state.

POSSIBLE CAUSES

Possible Causes
(K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO VOLTAGE
(K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND
(K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Attempt to start the engine. If the engine will not start, crank the engine for five seconds.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   2. Using the scan tool, read the active DTCs.

      Does the scan tool display P0627-FUEL PUMP CONTROL CIRCUIT/OPEN?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (K31) FUEL PUMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 6: Checking Fuel Pump Control Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the TIPM C2 harness connector.
3. Disconnect the PCM C1 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (K31) Fuel Pump Control circuit in the TIPM C2 harness connector.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (K31) Fuel Pump Control circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **CHECK THE (K31) FUEL PUMP CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 7: Checking Fuel Pump Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K31) Fuel Pump Control circuit in the TIPM C2 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the (K31) Fuel Pump Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (K31) FUEL PUMP CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K31) Fuel Pump Control circuit between the TIPM C2 harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the open or high resistance in the (K31) Fuel Pump Control circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **TOTALLY INTEGRATED POWER MODULE (TIPM)**
   1. Reconnect the PCM C1 harness connector.
   2. Connect a jumper between ground and the (K31) Fuel Pump Control circuit in the TIPM C2 harness connector.
   3. Turn the ignition on.
   4. Using the scan tool, select View DTCs.

      Is the status Active for the Fuel Pump Control circuit shorted low DTC?

      Yes

      - Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Totally Integrated Power Module (TIPM) and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P062C-ETC LEVEL 2 MPH PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

When secondary software determines that the vehicle speed is implausible for a period of time. ETC lamp will flash.

POSSIBLE CAUSES

POSSIBLE CAUSES
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Turn the ignition on.
2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
3. Verify the Powertrain Control Module (PCM) is at the latest calibration (flash level). If necessary, update the Powertrain Control Module (PCM) in accordance with the Service Information.
4. Start the engine and allow it to reach operating temperature.
5. Increase engine speed by pressing the accelerator pedal. Do not exceed 3500 RPM.
6. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0630-VIN NOT PROGRAMMED IN PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At initialization.

SET CONDITION

The VIN has not been programmed into the Powertrain Control Module (PCM). One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
VIN NOT PROGRAMMED IN THE POWERTRAIN CONTROL MODULE (PCM) POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

VIN NOT PROGRAMMED IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Ignition on, engine not running.
2. Using the scan tool, program the VIN into the Powertrain Control Module (PCM).
3. Start the engine and allow it to reach normal operating temperature.

   NOTE: If the engine will not start, crank the engine for 15 seconds. Crank at least 2 times with the ignition switch returning to the off position each time.

4. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Test complete.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0632-ODOMETER NOT PROGRAMMED IN PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The vehicle mileage is not programed into the Powertrain Control Module (PCM). One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
MILEAGE NOT PROGRAMMED IN THE POWERTRAIN CONTROL MODULE (PCM) POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

MILEAGE NOT PROGRAMMED IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Ignition on, engine not running.
2. With a scan tool, clear DTCs.
3. Using the scan tool, program the vehicle mileage into the Powertrain Control Module (PCM).

4. Start the engine and allow it to reach normal operating temperature.
5. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Test complete.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

P0633-SKIM SECRET KEY NOT STORED IN PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Secret Key information has not been programmed into the Powertrain Control Module (PCM). One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
SECRET KEY INFORMATION NOT PROGRAMMED IN THE POWERTRAIN CONTROL MODULE (PCM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before

proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

SECRET KEY INFORMATION NOT PROGRAMMED IN THE POWERTRAIN CONTROL MODULE (PCM)

1. Ignition on, engine not running.
2. Using the scan tool, program the Secret Key information into the Powertrain Control Module (PCM) using the PCM Replaced function in the WCM.
3. Start the engine and allow it to reach normal operating temperature.

NOTE: If the engine will not start, crank the engine for 15 seconds. Crank at least two times with the ignition switch returning to the off position each time.

4. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Test complete.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

P063A-GENERATOR VOLTAGE SENSE CIRCUIT

Fig. 8: Charging System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects no change when attempting to regulate the generator output.

POSSIBLE CAUSES

POSSIBLE CAUSES
(A804) GEN SENSE CIRCUIT SHORTED TO VOLTAGE
(A804) GEN SENSE CIRCUIT SHORTED TO GROUND
(A804) GEN SENSE CIRCUIT OPEN OR HIGH RESISTANCE
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Start the engine and allow it to reach normal operating temperature.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   2. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. CHECK THE (A804) GENERATOR SENSE CIRCUIT FOR A SHORT TO VOLTAGE

Fig. 9: Checking Generator Sense Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Generator harness connector.
3. Disconnect the PCM C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (A804) Generator Sense circuit in the Generator harness connector.

   Is there any voltage present?

   Yes

   - Repair the (A804) Generator Sense circuit for a short to voltage.
   - Perform the PCM VERIFICATION Test. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Go To 3

3. **CHECK THE (A804) GENERATOR SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 10: Checking Generator Sense Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (A804) Generator Sense circuit in the Generator harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

No

- Repair the (A804) Generator Sense circuit for a short to ground.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (A804) GENERATOR SENSE CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (A804) Generator Sense circuit between the Generator harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 5

No

- Repair the (A804) Generator Sense circuit for an open or high resistance.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **GENERATOR**

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Connect the Generator harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

2. Connect the (special tool #10436, Adapter, GPEC Diagnostic) in line with the PCM C2 harness connector.
3. Turn the ignition on.
4. measure the voltage of the (K20) Generator Field Control circuit at the GPEC Adaptor.
5. Start the engine.
6. With the scan tool, perform the Generator Full Field test.
7. Monitor the voltage of the (K20) Generator Field Control circuit with the Generator Full Field test actuated.

NOTE: The voltage should increase more than 1.0 volt.

Does the voltage increase by at least 1.0 volt with the Generator Full Field Test on?

Yes

- Go To 6

No

- Replace the Generator in accordance with the service information.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).

2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

P0642-SENSOR REFERENCE VOLTAGE 1 CIRCUIT LOW

Fig. 11: Sensor Reference Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects low voltage on the 5-Volt supply circuit.

POSSIBLE CAUSES

Possible Causes
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
ACCELERATOR PEDAL POSITION SENSOR
CAMSHAFT 2 POSITION SENSOR
CRANKSHAFT POSITION SENSOR
THROTTLE POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Attempt to start the engine. If the engine will not start, crank the engine for five seconds.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   2. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F855) PRIMARY 5-VOLT SUPPLY VOLTAGE**

Fig. 12: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Throttle Body harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F855) 5-Volt Supply circuit in the Throttle Body harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 3

No

- Go To 4

3. **THROTTLE BODY**

Fig. 13: Checking Camshaft 1/2 Position Sensor 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Connect the Throttle Body harness connector.
3. Disconnect the Camshaft 1/2 Position Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (F855) 5-Volt Supply circuit at the Camshaft 1/2 Position Sensor harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

- Replace the Throttle Body in accordance with the service information because the Throttle Body is pulling the 5-Volt supply low.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 8

4. **CAMSHAFT 1/2 POSITION SENSOR**

Fig. 14: Checking Camshaft 1/2 Position Sensor 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Camshaft 1/2 Position Sensor harness connector.
3. Turn the ignition on.
4. Continue measuring the voltage of the (F855) 5-Volt Supply circuit at the Throttle Body harness connector.

Is the voltage between 4.8 and 5.2 volts?

Yes

- Replace the Camshaft 1/2 Position Sensor.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **CRANKSHAFT POSITION SENSOR**

Fig. 15: Checking CKP Sensor 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Crankshaft Position Sensor harness connector.
3. Turn the ignition on.

4. Continue measuring the voltage of the (F855) 5-Volt Supply circuit at the Throttle Body harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Replace the Crankshaft Position Sensor.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 6

6. **ACCELERATOR PEDAL POSITION SENSOR**

Fig. 16: Checking APP Sensor 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the APP Sensor harness connector.
3. Turn the ignition on.
4. Continue measuring the voltage of the (F855) 5-Volt Supply circuit at the Throttle Body harness connector.

   Is the voltage between 4.8 and 5.2 Volts?

   Yes

   - Replace the Throttle Body in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 7

7. **CHECK THE 5-VOLT SUPPLY CIRCUITS FOR A SHORT TO GROUND**

Fig. 17: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM harness connectors.
3. Measure the resistance between ground and the (F855) 5-Volt Supply circuit.
4. Measure the resistance between ground and the (K852) 5-Volt Supply circuit.

   Is the resistance above 10k Ohms for both circuits?

   Yes

   - Go To 8

   No

   - Repair the 5-Volt Supply circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

8. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Inspect the (F855) 5-Volt Supply circuit between the Camshaft 1/2 Position Sensor harness connector and the PCM harness connector.
   2. Inspect the (F855) 5-Volt Supply circuit between the Crankshaft Position Sensor harness connector and the PCM harness connector.
   3. Inspect the (F855) 5-Volt Supply circuit between the Throttle Body harness connector and the PCM harness connector.
   4. Inspect the (K852) 5-Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the PCM harness connector.
   5. If the vehicle is equipped with a manual transmission, inspect the (F856) 5-Volt Supply circuit between the Vehicle Speed Sensor harness connector and the PCM harness connector.
   6. Look for any chafed, pierced, pinched, or partially broken wires.
   7. Look for broken, bent, pushed out or corroded terminals.
   8. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0643-SENSOR REFERENCE VOLTAGE 1 CIRCUIT HIGH

Fig. 18: Sensor Reference Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to voltage on the 5-Volt supply circuit.

POSSIBLE CAUSES

Possible Causes
(F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K856) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Attempt to start the engine. If the engine will not start, crank the engine for five seconds.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   2. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .
2. **(K852) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Fig. 19: Checking 5-Volt Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Accelerator Pedal Position Sensor harness connector.
3. Disconnect the PCM harness connectors.
4. Measure the voltage on the (K852) 5-Volt Supply circuit.

   Is there any voltage present?

   Yes

   - Repair the (K856) 5-Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **(F855) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Fig. 20: Checking 5-Volt Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Throttle Body harness connector.
3. Turn the ignition on.
4. Measure the voltage on the (F855) 5-Volt Supply circuit.

   Is there any voltage present?

   Yes

   - Repair the (F855) 5-Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Turn the ignition off.
    2. Inspect the (F855) 5-Volt Supply circuit between the Camshaft 1/2 Position Sensor harness connector and the PCM harness connector.
    3. Inspect the (F855) 5-Volt Supply circuit between the Crankshaft Position Sensor harness connector and the PCM harness connector.
    4. Inspect the (F855) 5-Volt Supply circuit between the Throttle Body harness connector and the PCM harness connector.
    5. Inspect the (K852) 5-Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the PCM harness connector.
    6. Look for any chafed, pierced, pinched, or partially broken wires.
    7. Look for broken, bent, pushed out or corroded terminals.
    8. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0645-A/C CONTROL CIRCUIT/OPEN

Fig. 21: A/C Pressure Transducer Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the A/C Compressor control circuit voltage is not within an acceptable range.

POSSIBLE CAUSES

Possible Causes
(C27) A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO VOLTAGE
(C27) A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO GROUND
(C27) A/C COMPRESSOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(Z909) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
A/C COMPRESSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Start the engine and allow it to reach normal operating temperature.
    2. Turn the Air Conditioning on.

    WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

    3. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (Z909) GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 22: Checking Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the A/C Compressor harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to 12 volts, check the (Z909) Ground circuit in the A/C Compressor harness connector.

NOTE: The test light should be illuminated and bright.

Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 3

No

- Repair the (Z909) Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (C27) A/C COMPRESSOR CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 23: Checking A/C Compressor Control Circuit For Short To Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (C27) A/C Compressor Control circuit in the A/C Compressor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (C27) A/C Compressor Control circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **CHECK THE (C27) A/C COMPRESSOR CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 24: Checking A/C Compressor Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (C27) A/C Compressor Control circuit in the A/C Compressor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the (C27) A/C Compressor Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (C27) A/C COMPRESSOR CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (C27) A/C Compressor Control circuit between the A/C Compressor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 6

   No

   - Repair the (C27) A/C Compressor Control circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **A/C COMPRESSOR**

Fig. 25: Checking A/C Compressor Control Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the PCM C2 harness connector.
2. Turn the ignition on.
3. With the scan tool, actuate the A/C Compressor control to the ON position.
4. Using a 12-volt test light connected to ground, check the (C27) A/C Compressor Control circuit in the A/C Compressor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

5. With the scan tool, actuate the A/C Compressor control to the OFF position.
6. Using a 12-volt test light connected to ground, check the (C27) A/C Compressor Control circuit in the A/C Compressor harness connector.

NOTE: The test light should not be illuminated.

Is the test light illuminated and bright with the actuation ON (100%) and not illuminated with the actuation OFF (0%)?

Yes

- Replace the A/C Compressor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 7

7. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the A/C Compressor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0652-SENSOR REFERENCE VOLTAGE 2 CIRCUIT LOW

Fig. 26: Sensor Reference Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects low voltage on the 5-Volt supply circuit.

POSSIBLE CAUSES

Possible Causes
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
ACCELERATOR PEDAL POSITION SENSOR
CAMSHAFT 1/1 POSITION SENSOR
MANIFOLD FLOW VALVE
MAP SENSOR
VEHICLE SPEED SENSOR (MTX ONLY)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Start the engine and allow it to reach normal operating temperature.

        WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

    2. With the scan tool, select View DTCs.

        Is the status Active for this DTC?

        Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **(F856) SECONDARY 5 VOLT SUPPLY VOLTAGE CHECK**

Fig. 27: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Camshaft 1/1 Position Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5-Volt Supply circuit in the Camshaft 1/1 Position Sensor harness connector.

   Is the voltage between 4.7 and 5.2 volts?

   Yes

- Go To 3

No

- Go To 4

3. **CAMSHAFT 1/1 POSITION SENSOR**

Fig. 28: Checking Manifold Flow Valve 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Connect the Camshaft 1/1 Position Sensor harness connector.
3. Disconnect the Manifold Flow Valve harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (F856) 5-Volt Supply circuit at the Manifold Flow Valve harness connector.

   Is the voltage between 4.7 and 5.2 Volts?

Yes

- Go To 10

No

- Replace the Camshaft 1/1 Position Sensor in accordance with the Service Information because it is the sensor pulling the 5 volt reference low.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **MANIFOLD FLOW VALVE**

Fig. 29: Checking Camshaft 1/1 Position Sensor 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Manifold Flow Valve harness connector.
3. Turn the ignition on.

4. Continue measuring the voltage of the (F856) 5-Volt Supply circuit at the Camshaft 1/1 Position Sensor harness connector.

   Is the voltage above 4.6 Volts?

   Yes

   - Replace the Manifold Flow Valve in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **MAP SENSOR**

Fig. 30: Checking Camshaft 1/1 Position Sensor 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the MAP Sensor harness connector.
3. Turn the ignition on.
4. Continue measuring the voltage of the (F856) 5-Volt Supply circuit at the Camshaft 1/1 Position Sensor harness connector.

   Is the voltage above 4.6 Volts?

   Yes

   - Replace the MAP Sensor in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 7

6. **APP SENSOR**

Fig. 31: Checking Camshaft 1/1 Position Sensor 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the APP Sensor harness connector.
3. Turn the ignition on.
4. Continue measuring the voltage of the (F856) 5-Volt Supply circuit at the Camshaft 1/1 Position Sensor harness connector.

   Is the voltage above 4.6 Volts?

   Yes

   - Replace the APP Sensor in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 7

7. **VEHICLE EQUIPPED WITH MANUAL TRANSMISSION**

Is the vehicle equipped with a manual transmission?

Yes

- Go To 8

No

- Go To 9

8. **VEHICLE SPEED SENSOR**

Fig. 32: Checking Camshaft 1/1 Position Sensor 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

NOTE: Only vehicles equipped with a manual transmission will use a Vehicle Speed Sensor.

1. Turn the ignition off.
2. Disconnect the Vehicle Speed Sensor harness connector.
3. Turn the ignition on.
4. Continue measuring the voltage of the (F856) 5 Volt Supply circuit at the Camshaft 1/1 Position Sensor harness connector.

   Is the voltage above 4.6 Volts?

   Yes

   - Replace the Vehicle Speed Sensor.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 9

9. **5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND**

Fig. 33: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM harness connectors.
3. Measure the resistance between ground and the (F856) 5-Volt Supply circuit.
4. Measure the resistance between ground and the (K854) 5-Volt Supply circuit.

   Is the resistance above 1000 Ohms for both circuits?

   Yes

   - Go To 10

   No

   - Repair the 5 Volt Supply circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Inspect the (K854) 5-Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the PCM harness connector.
    2. Inspect the (F856) 5-Volt Supply circuit between the Camshaft 1/1 Position Sensor harness connector and the PCM harness connector.
    3. Inspect the (F856) 5-Volt Supply circuit between the Manifold Flow Valve harness connector and the PCM harness connector.
    4. Inspect the (F856) 5-Volt Supply circuit between the MAP Sensor harness connector and the PCM harness connector.
    5. If the vehicle is equipped with a manual transmission, inspect the (F856) 5-Volt Supply circuit between the Vehicle Speed Sensor harness connector and the PCM harness connector.
    6. Look for any chafed, pierced, pinched, or partially broken wires.
    7. Look for broken, bent, pushed out or corroded terminals.
    8. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0653-SENSOR REFERENCE VOLTAGE 2 CIRCUIT HIGH

Fig. 34: Sensor Reference Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to voltage on the 5-Volt supply circuit.

POSSIBLE CAUSES

Possible Causes
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K854) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Start the engine and allow it to reach normal operating temperature.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   2. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .
2. **(K854) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Fig. 35: Checking 5-Volt Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Accelerator Pedal Position Sensor harness connector.
3. Disconnect the PCM harness connectors.
4. Measure the voltage on the (K854) 5-Volt Supply circuit.

   Is there any voltage present?

   Yes

   - Repair the (K854) 5-Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Fig. 36: Checking MAP Sensor 5-Volt Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the MAP Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage on the (F856) 5-Volt Supply circuit.

   Is there any voltage present?

   Yes

   - Repair the (F856) 5-Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Turn the ignition off.
   2. Inspect the (K854) 5-Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the PCM harness connector.
   3. Inspect the (F856) 5-Volt Supply circuit between the Camshaft 1/1 Position Sensor harness connector and the PCM harness connector.
   4. Inspect the (F856) 5-Volt Supply circuit between the Manifold Flow Valve harness connector and the PCM harness connector.
   5. Inspect the (F856) 5-Volt Supply circuit between the MAP Sensor harness connector and the PCM harness connector.
   6. If the vehicle is equipped with a manual transmission, inspect the (F856) 5-Volt Supply circuit between the Vehicle Speed Sensor harness connector and the PCM harness connector.
   7. Look for any chafed, pierced, pinched, or partially broken wires.
   8. Look for broken, bent, pushed out or corroded terminals.
   9. Refer to any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0685-ASD CONTROL CIRCUIT

Fig. 37: ASD Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

When the ignition is turned off, during after-run mode of operation.

SET CONDITION

The Powertrain Control Module (PCM) determines that the ASD Relay has shut off before the AFTER-RUN mode of operation has been completed.

POSSIBLE CAUSES

POSSIBLE CAUSES
(K51) ASD RELAY CONTROL CIRCUIT OPEN
(K51) ASD RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
(K51) ASD RELAY CONTROL CIRCUIT SHORTED TO GROUND
LOSS OF POWERTRAIN CONTROL MODULE POWERS OR GROUNDS
ASD RELAY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR OTHER DTCS**
   1. Turn the ignition on.
   2. With the scan tool, check for additional DTCs.

      Are other DTCs present?

      Yes

      - Perform the diagnostics for the other DTCs before continuing.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 2
2. **CLEAR CODE AND CHECK IF THE DTC RESETS**
   1. With the scan tool, erase PCM DTCs.
   2. Perform several ignition key cycles, pausing for at least 10 seconds between each cycle.

3. Turn the ignition on.
4. With the scan tool, read PCM DTCs.

   Did this DTC Return?

   Yes

   - Go To 3

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

3. **SUBSTITUTE THE ASD RELAY**
   1. Turn the ignition off.
   2. Install a known good relay in place of the ASD Relay.
   3. Turn the ignition on.
   4. With the scan tool, erase PCM DTCs.
   5. Perform several ignition key cycles, pausing for at least 10.0 seconds between each cycle.
   6. Turn the ignition on.
   7. With the scan tool, read PCM DTCs.

      Did this DTC return?

      Yes

      - Go To 4

      No

      - Replace the ASD Relay in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK PCM POWER AND GROUNDS**
   1. Using the wiring information, check the PCM battery, ignition feed and ground circuits.

Were any problem found with the PCM powers and grounds?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **CHECK THE (K51) ASD RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Reconnect the PCM harness connectors.
   2. Turn the ignition off.
   3. Remove the ASD Relay.
   4. Turn the ignition on.
   5. Measure the voltage an the (K51) ASD Relay Control circuit at terminal 85 of the ASD Relay connector.

   Is there any voltage present?

   Yes

   - Repair the (K51) ASD Relay Control circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 6

6. **CHECK THE (K51) ASD RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Remove the ASD Relay.
   3. Disconnect the PCM C1 harness connector.
   4. Measure the resistance an the (K51) ASD Relay Control circuit at

terminal 85 of the ASD Relay connector.

Is the resistance above 10k Ohms?

Yes

- Go To 7

No

- Repair the (K51) ASD Relay Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K51) ASD RELAY CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K51) ASD Relay Control circuit between the GPEC Adaptor and the ASD Relay connector.

Is the resistance below 5.0 Ohms?

Yes

- Repair the ASD Relay Control circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0688-ASD RELAY CONTROL SENSE

Fig. 38: ASD Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

For specific relay location and type. Refer to **FUSE - RELAY LOCATIONS AND TYPES, SPECIFICATIONS** .

WHEN MONITORED

With ignition key on. Battery voltage greater than 10.0 Volts.

SET CONDITION

No voltage sensed at the Powertrain Control Module (PCM) when the ASD relay is energized. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
FUSED B+ ASD SUPPLY CIRCUITS/FUSES
ASD RELAY OUTPUT CIRCUIT OPEN/HIGH RESISTANCE
ASD RELAY OUTPUT CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Verify that there are no concerns with the circuits and fuses that supply power to the ASD relay. If equipped with a removable relay, Look for broken, bent, pushed out or corroded terminals. Verify that the ASD relay is not defective (exchange with known good relay to check operation).

NOTE: If any of the following component DTCs have set along with P0688, diagnose them first before continuing: Ignition Coil(s), Fuel Injector(s), ASD

Control Circuit.

1. Ignition on, engine not running.
2. With the scan tool, select View DTCs.

   Is the DTC Active at this time?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Turn the Ignition off.
   2. Connect the appropriate PCM pinout adaptor in line with the PCM connector and harness.
   3. Turn the Ignition on, engine not running.
   4. Using the wiring diagram/schematic as a guide, Measure the voltage at each of the (F342) ASD Control Output circuits at PCM.

      Were there any problems found with the voltage readings?

      Yes

      - Go To 3

      No

      - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Powertrain Control Module connectors.
      - Check for any Technical Service Bulletins that may apply.
      - If no concerns are found, Replace and program the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **(F342) ASD CONTROL OUTPUT CIRCUIT(S) SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.
   3. Disconnect the appropriate TIPM harness connector.
   4. Measure the resistance between ground and each of the (F342) ASD Control Output circuits in the TIPM harness connector.

   Is the resistance below 100 Ohms?

   Yes

   - Repair the short to ground in the (F342) ASD Control Output circuit(s).
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **(F342) ASD CONTROL OUTPUT CIRCUIT(S) OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of each (F342) ASD Control Output circuits from the TIPM harness connector to the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the open in the (F342) ASD Control Output circuit(s).
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **TOTALLY INTEGRATED POWER MODULE**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the related TIPM harness connector and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the TIPM harness connector and Powertrain Control Module connectors.
    4. Perform any Technical Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace and program the Totally Integrated Power Module in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0703-BRAKE SWITCH 2 PERFORMANCE

Fig. 39: Brake Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the states of Brake Signal 1 and Brake Signal 2 do not match for more than 50 ms.

POSSIBLE CAUSES

Possible Causes
(B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, monitor the states of Brake Signal 1 and Brake Signal 2 while pressing and releasing the brake pedal several times.

       Do the states change from Pressed when the pedal is pressed to Not Pressed when the pedal is released?

       Yes

       - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

       No

       - Go To 2

2. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Using a 12-volt test light connected to 12 volts, check the (B15) Brake Signal 1 circuit in the GPEC Adaptor while pressing and releasing the brake pedal several times.

      Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

      Yes

      - Go To 3

      No

      - Go To 4
3. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (B16) Brake Signal 2 circuit in the GPEC Adaptor while pressing and releasing the brake pedal several times.

      Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

      Yes

      - Go To 11

No

- Go To 7

4. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 40: Checking Stop Lamp Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Stop Lamp Switch harness connector.
3. Using a 12-volt test light connected to 12 Volts, check the (Z906) Ground circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 5

No

- Repair the (Z906) Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND**

Fig. 41: Checking Brake Signal 1 Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (B15) Brake Signal 1 circuit in the Stop Lamp Switch harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To 6

No

- Repair the (B15) Brake Signal 1 circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (B15) Brake Signal 1 circuit between the Stop Lamp Switch harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 10

   No

   - Repair the (B15) Brake Signal 1 circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 42: Checking Fused Ignition Switch Output (Run-Start) Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Stop Lamp Switch harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 8

No

- Repair the (F202) Fused Ignition Switch Output (Run-Start) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 43: Checking Brake Signal 2 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

   Is there any voltage present?

   Yes

- Repair the (B16) Brake Signal 2 circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (B16) Brake Signal 2 circuit between the Stop Lamp Switch harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 10

      No

      - Repair the (B16) Brake Signal 2 circuit for an open circuit or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **STOP LAMP SWITCH**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

       Were any problems found?

       Yes

       - Repair as necessary.
       - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Replace the Stop Lamp Switch in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P0850-PARK/NEUTRAL SWITCH PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the transmission in Park, Neutral, or Drive and not in Limp-in

mode.

SET CONDITION

This code will set if the Powertrain Control Module (PCM) detects an irrational Park/Neutral switch state. Two trip fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
P/N SIGNAL CIRCUIT SHORTED TO VOLTAGE OR GROUND DTCS PRESENT IN THE TRANSMISSION CONTROL MODULE (TCM) POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Start the engine and allow it to reach normal operating temperature.

        WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

        NOTE: **It may be necessary to test drive the vehicle in order to get this DTC to reset.**

    2. With the scan tool, select View DTCs.

        Is the status Active for this DTC?

        Yes

        - Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **DTCS PRESENT IN THE TRANSMISSION CONTROL MODULE (TCM)**

NOTE: If the scan tool is unable to communicate with the TCM, or if there are related communication DTCs present, refer to the Communication Diagnostic Information and perform the appropriate diagnostic procedure.

1. Turn the ignition on.
2. With the scan tool, select View DTCs in the TCM.

Are there any DTCs present in the TCM?

Yes

- Perform the appropriate diagnostic procedure.

No

- Go To 3

3. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Inspect the P/N signal circuit for a short to ground, or a short to voltage with the shifter in Drive or Reverse. Perform the appropriate diagnostic procedures in the Transmission diagnostic information .
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Transmission Range Sensor, the TCM, and the PCM.
   3. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Look for broken, bent, pushed out or corroded terminals.
   5. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1115-GENERAL TEMPERATURE RATIONALITY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10 volts.

SET CONDITION

AAT, ECT, and IAT sensor inputs are compared during a cold start. After start up, the values are monitored. If one of the readings is not plausible for two consecutive trips, a DTC is stored. Three good trips turns off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
SENSOR SIGNAL CIRCUIT HIGH RESISTANCE
SENSOR GROUND CIRCUIT HIGH RESISTANCE
TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST.

1. **ACTIVE DTC**
   1. Turn the ignition on.
   2. With a scan tool, select View DTCs.

NOTE: Diagnose and repair any AAT, ECT, and IAT sensor DTCs before continuing with this test.

NOTE: Diagnose and repair P1607 PCM INTERNAL SHUTDOWN TIMER SLOW RATIONALITY or P2610 PCM INTERNAL SHUTDOWN TIMER FAST RATIONALITY if either code is set before continuing with this test.

NOTE: Using an unapproved block heater in cold temperatures may cause this DTC to set. No repair is required.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. Refer to **INTERMITTENT CONDITION** .

2. **TEMPERATURE SENSOR CIRCUIT VALUE IMPLAUSIBLE**

NOTE: Allow the engine sit for 6 - 8 hours before testing.

1. With a scan tool, monitor the AAT, ECT, and IAT sensor values.
2. Start the engine.
3. Allow the engine to reach normal operating temperature.

Does the value for each of the sensors increase smoothly and as

expected?

Yes

- Perform the CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. Refer to **INTERMITTENT CONDITION** .

No

- Go To 3

3. **TEMPERATURE SENSOR**

NOTE: If it is necessary to replace the AAT sensor, be sure to drive the vehicle over 30 MPH for at least 5 minutes to update the AAT value.

1. Turn the ignition on.
2. Disconnect the harness connector for the sensor that had a value which did not increase smoothly and as expected.
3. With the scan tool, read the sensor voltage with the connected disconnected.

NOTE: The sensor voltage should be approximately 5.0 volts with the connector disconnected.

4. Connect a jumper wire between the sensor signal circuit and the sensor ground circuit in the harness connector.
5. With the scan tool, read the sensor voltage with the jumper wire in place.

NOTE: The sensor voltage should be approximately 0 volts with the jumper wire in place.

Does the sensor voltage change as described?

Yes

- Replace the sensor.

- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **SENSOR SIGNAL CIRCUIT HIGH RESISTANCE**
   1. Turn the ignition off.
   2. For the AAT sensor, disconnect the TIPM harness connector. Otherwise disconnect the PCM harness connector.
   3. Measure the resistance of the sensor signal circuit from the sensor harness connector to the module harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the sensor signal circuit for high resistance.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **SENSOR GROUND CIRCUIT HIGH RESISTANCE**
   1. Measure the resistance of the sensor ground circuit from the sensor harness connector to the module harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the sensor ground circuit for high resistance.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 6

6. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the sensor and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle Test. the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle Test.
    6. Refer to any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module per Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1128-CLOSED LOOP FUELING NOT ACHIEVED - BANK 1 UPSTREAM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With engine run time and coolant temperature above a calibrated value.

SET CONDITION

The Powertrain Control Module (PCM) detects a condition where the vehicle has

remained in open loop fuel control, from a start-up condition, longer than a calibrated amount of time, when conditions would have otherwise expected closed loop operation. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
FUEL DELIVERY SYSTEM
ECT SENSOR, WIRING, OR CONNECTORS
MAP SENSOR, WIRING, OR CONNECTORS
O2 SENSOR, WIRING, OR CONNECTORS
ENGINE MECHANICAL SYSTEM
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Diagnose and repair any other active component or circuit DTCs before continuing with this procedure.
    2. Turn the ignition on.
    3. With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.
    4. Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

5. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECKING THE FUEL DELIVERY SYSTEM**
   1. Perform the diagnostic procedures for FUEL PRESSURE LEAK DOWN and FUEL DELIVERY SYSTEM OUTPUT - FLOW TEST. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 3

3. **CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECKING THE MAP SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE MAP SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **CHECKING THE OXYGEN SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE OXYGEN SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 6

6. **CHECKING THE ENGINE MECHANICAL SYSTEM**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE MECHANICAL SYSTEM. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 7
7. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors relative to the components tested in this procedure.
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to the components tested in this procedure and wiggle test the wiring and connectors.
      - Look for the data to change or for a DTC to set during the wiggle test.
      - Perform any technical service bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE,**

POWERTRAIN CONTROL, REMOVAL .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1212-ENGINE OIL TEMPERATURE HIGH - RPM LIMITED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

The engine oil temperature has dropped below a calibrated value. Engine start up.

SET CONDITION

The engine oil temperature rises faster than a calibrated modeled temperature. When the actual oil temperature exceeds the calibrated modeled temperature for three minutes the fault is set.

POSSIBLE CAUSES

Possible Causes
(G24) EOT SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G24) EOT SIGNAL CIRCUIT SHORTED TO GROUND
(G24) EOT SIGNAL CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT
(G24) EOT SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K915) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE OIL TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose any CAN - C Communication DTCs before

continuing.

1. Turn the ignition off.
2. If possible, allow the vehicle to sit with the ignition off for more than 60 minutes in an environment where the ambient temperature will allow the oil temperature to cool.
3. Start the engine and allow it to reach normal operating conditions.
4. With the scan tool, select View DTCs.

   Is the status Active or Pending for this DTC?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the CHECKING FOR AN INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **ENGINE OIL**
   1. The following conditions must be checked:
      - OEM recommended oil viscosity is being used.
      - Customer is following the oil change schedule.
      - Check the engine oil for contamination. (i.e., fuel and/or engine coolant).
      - Internal engine condition that may effect oil pressure.

      Were any of the above conditions found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Go To 3

3. **CHECK THE (G24) EOT SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 44: Checking EOT Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Engine Oil Temperature Sensor connector.

3. Disconnect the PCM C2 connector.
4. Turn the ignition on.
5. Measure the voltage of the (G24) EOT Signal circuit in the Engine Oil Temperature Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (G24) EOT Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **CHECK THE (G24) EOT SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 45: Checking EOT Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (G24) EOT Signal circuit in the Engine Oil Temperature Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

No

- Repair the (G24) EOT Signal circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK FOR THE (G24) EOT SIGNAL CIRCUIT SHORTED TO THE (K915) SENSOR GROUND CIRCUIT**

Fig. 46: Checking EOT Signal Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (G24) EOT Signal circuit and the (K915) Sensor Ground circuit in the Engine Oil Temperature Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the (G24) EOT Signal circuit for a short to the (K915) Sensor Ground circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (G24) EOT SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

   CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   2. Measure the resistance of the (G24) EOT Signal circuit between the Engine Oil Temperature Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

      - Repair the (G24) EOT Signal circuit for an open or high resistance.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K915) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Disconnect the PCM C1 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   2. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   3. Measure the resistance of the (K915) Sensor Ground circuit between the Engine Oil Temperature Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 8

      No

      - Repair the (K915) Sensor Ground for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **ENGINE OIL TEMPERATURE SENSOR**

Fig. 47: Engine Oil Temperature Sensor Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Connect the PCM harness connectors.
3. Connect a jumper between the (K915) Sensor Ground circuit and the (G24) EOT Signal circuit in the Engine Oil Temperature Sensor harness

connector.

4. Turn the ignition on.
5. With the scan tool, read the Engine Oil Temperature Sensor signal voltage.

   Is the voltage below 0.1 volts with the jumper in place?

   Yes

   - Replace the Engine Oil Temperature Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 9

9. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Oil Temperature Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1239-ENGINE OIL TEMPERATURE TOO LOW

Fig. 48: Temperature Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

The engine oil temperature has dropped below a calibrated value. Engine start up.

SET CONDITION

The Powertrain Control Module (PCM) detects that oil temperature is not within the calibrated modeled temperature.

POSSIBLE CAUSES

POSSIBLE CAUSES
(G24) EOT SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G24) EOT SIGNAL CIRCUIT SHORTED TO GROUND
(G24) EOT SIGNAL CIRCUIT SHORTED TO (K915) SENSOR GROUND CIRCUIT
(G24) EOT SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K915) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE OIL TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

   NOTE: Diagnose any CAN - C Communication DTCs before continuing.

   1. Turn the ignition off.
   2. If possible, allow the vehicle to sit with the ignition off for more than 60 minutes in an environment where the temperature will allow the oil temperature to cool down.

3. Start the engine and allow it to reach normal operating conditions.
4. With a scan tool, select View DTCs.

   Is the status Active or Pending for this DTC?

   Yes

   - Go To 2

   No

   - Perform the CHECKING FOR AN INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **ENGINE OIL**
   1. The following conditions must be checked:
      - OEM recommended oil viscosity is being used.
      - Customer is following the oil change schedule.
      - Check the engine oil for contamination. (i.e., fuel and/or engine coolant)
      - Internal engine condition that may effect engine temperature.

      Were any of the above conditions found?

      Yes

      - Repair as necessary.
      - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 3

3. **CHECK THE (G24) EOT SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 49: Checking Engine Oil Temperature Sensor Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Engine Oil Temperature Sensor connector.
3. Disconnect the PCM harness connectors.
4. Turn the ignition on.
5. Measure the voltage of the (G24) EOT Signal circuit in the Engine Oil Temperature Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (G24) EOT Signal circuit for a short to voltage.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE (G24) EOT SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 50: Checking Engine Oil Temperature Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (G24) EOT Signal circuit in the Engine Oil Temperature Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

No

- Repair the (G24) EOT Signal circuit for a short to ground.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK FOR THE (G24) EOT SIGNAL CIRCUIT SHORTED TO THE (K915) SENSOR GROUND CIRCUIT**

Fig. 51: Checking Engine Oil Temperature Sensor Signal Circuit For Short To Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (G24) EOT Signal circuit and the (K915) Sensor Ground circuit in the Engine Oil Temperature Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

- Go To 6

No

- Repair the (G24) EOT Signal circuit for a short to the (K915) Sensor Ground circuit.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (G24) EOT SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic) in line with the PCM C2 harness connector.
2. Measure the resistance of the (G24) EOT Signal circuit between the Engine Oil Temperature Sensor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7

   No

   - Repair the (G24) EOT Signal circuit for an open or high resistance.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K915) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will

damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic) in line with the PCM C1 harness connector.
2. Measure the resistance of the (K915) Sensor Ground circuit between the Engine Oil Temperature Sensor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 8

   No

   - Repair the (K915) Sensor Ground for an open or high resistance.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **ENGINE OIL TEMPERATURE SENSOR SIGNAL VOLTAGE**

Fig. 52: Engine Oil Temperature Sensor Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Connect the PCM harness connectors.
3. Connect a jumper between the (K915) Sensor Ground circuit and the (G24) EOT Signal circuit in the Engine Oil Temperature Sensor harness connector.
4. Turn the ignition on.
5. With the scan tool, read the Engine Oil Temperature Sensor signal voltage.

Is the voltage below 0.1 volts with the jumper in place?

Yes

- Go To 9

No

- Go To 10

9. **ENGINE OIL TEMPERATURE SENSOR**
   1. Turn the ignition off.
   2. Inspect the wiring and connectors between the Engine Oil Temperature Sensor and the Powertrain Control Module (PCM).
   3. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related connectors.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace the Engine Oil Temperature Sensor in accordance with the service information.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Oil Temperature Sensor and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the

wiring and connectors.

5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1456-FUEL TANK PRESSURE SENSOR CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 53: Fuel Tank Pressure Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Ignition Key on. Battery voltage greater than 10.38 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Fuel Tank Pressure Sensor (FTP) input voltage is below the minimum acceptable value. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
5-VOLT SUPPLY CIRCUIT OPEN/HIGH RESISTANCE
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
FTP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
FTP SENSOR SIGNAL CIRCUIT SHORTED TO THE SENSOR RETURN CIRCUIT
FUEL TANK PRESSURE SENSOR (FTP)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      NOTE: Diagnose and repair any system voltage or 5-Volt Sensor Reference DTCs before continuing with this test.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .
2. **CHECK THE (K856) 5-VOLT SUPPLY CIRCUIT VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the FTP Sensor harness connector.
   3. Turn the ignition on.

4. Measure the voltage on the (K856) 5-Volt Supply circuit at the FTP Sensor harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 3

   No

   - Repair the (K856) 5-Volt Supply circuit for an open circuit or short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE FTP SENSOR**
   1. With the scan tool, view DTCs.

      NOTE: The P1457-FUEL TANK PRESSURE SENSOR CIRCUIT HIGH should be active or pending with the connector disconnected.

      Does the scan tool display as described above?

      Yes

      - Verify that there is good pin to terminal contact in the FTP Sensor and Powertrain Control Module connectors. Replace the FTP Sensor if no problems were found with the connectors.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 4

4. **CHECK THE (N7) FTP SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

3. Measure the resistance between ground and the (N7) FTP Sensor Signal circuit at the FTP Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the short to ground in the (N7) FTP Sensor Signal circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK FOR THE (N7) FTP SENSOR SIGNAL CIRCUIT SHORTED TO THE (K975) FTP SENSOR RETURN CIRCUIT**
   1. Measure the resistance between the (N7) FTP Sensor Signal circuit and the (K975) FTP Sensor Return circuit at the FTP Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 6

      No

      - Repair the short between the (N7) FTP Sensor Signal circuit and the (K975) FTP Sensor Return circuit.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1457-FUEL TANK PRESSURE SENSOR CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 54: Fuel Tank Pressure Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Ignition Key on. Battery voltage greater than 10.38 volts.

SET CONDITION

The Fuel Tank Pressure Sensor (FTP) signal voltage is greater than the maximum allowable voltage. One trip fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
FTP SIGNAL CIRCUIT SHORTED TO VOLTAGE
FTP SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
FTP SIGNAL CIRCUIT SHORTED TO THE 5-VOLT SUPPLY CIRCUIT
SENSOR RETURN CIRCUIT OPEN/HIGH RESISTANCE
FUEL TANK PRESSURE (FTP) SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Start the engine and allow it to reach normal operating temperature.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

      NOTE: **Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.**

   2. With the scan tool, select View DTCs.

      Is the DTC Active at this time

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure.

Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (N7) FTP SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the FTP Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage on the (N7) FTP Signal circuit at the FTP harness connector.

      Is there any voltage reading above 5.2 volts?

      Yes

      - Repair the (N7) FTP Signal circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 3
3. **CHECK THE (N7) FTP SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Measure the resistance of the (N7) FTP Signal circuit between the FTP harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (N7) FTP Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK FOR THE (N7) FTP SIGNAL CIRCUIT SHORTED TO THE (K856) 5-VOLT SUPPLY CIRCUIT**
   1. Measure the resistance between the (N7) FTP Signal circuit and the (K856) 5-Volt Supply circuit at the FTP harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 5

      No

      - Repair the short between the (K856) 5-Volt Supply circuit and the (N7) FTP Signal circuit.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
5. **CHECK THE (K975) SENSOR RETURN CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K975) Sensor Return circuit from the FTP harness connector to the appropriate terminal the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (K975) Sensor Return circuit for an open or high

resistance.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **FTP SENSOR**
   1. Turn the ignition off.
   2. Reconnect the PCM C1 harness connector.
   3. Connect a jumper between the (N7) FTP Signal circuit and the (K975) Sensor Return circuit in the Sensor harness connector.
   4. Turn the ignition on.
   5. With the scan tool, view DTCs.

NOTE: The P1456-FUEL TANK PRESSURE SENSOR CIRCUIT LOW should be active or pending with the jumper in place.

Does the scan tool display as described above?

Yes

- Verify that there is good pin to terminal contact in the FTP and Powertrain Control Module connectors. Replace the FTP if no problems were found with the connectors.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 7

7. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the FTP and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the FTP and Powertrain Control Module connectors.
   4. Perform any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1501-VEHICLE SPEED SENSOR 1/2 CORRELATION - DRIVE WHEELS

Fig. 55: Vehicle Speed Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects an implausible voltage on the Vehicle Speed Sensor circuit.

POSSIBLE CAUSES

POSSIBLE CAUSES
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO VOLTAGE
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K75) VEHICLE SPEED SIGNAL CIRCUIT
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT
(F856) 5-VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K75) VEHICLE SPEED SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K914) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
VEHICLE SPEED SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Start the engine.

2. Allow the engine to reach normal operating temperature.

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

NOTE: Check for any Bus Communication DTCs. If no Bus or Communication DTCs are set, check for active Vehicle Speed Sensor DTCs in the Totally Integrated Power Module. Any bus, communication, or VSS DTCs in the TIPM must be properly diagnosed before continuing.

NOTE: This code may set after a hard acceleration on loose gravel, during other off road driving conditions, or by any condition that causes a wheel speed difference between the front and rear wheels.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

3. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 56: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Vehicle Speed Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5-Volt Supply circuit in the Vehicle Speed Sensor harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 3

   No

   - Go To 7

3. **CHECK THE (K75) VEHICLE SPEED SIGNAL CIRCUIT VOLTAGE**

Fig. 57: Checking Vehicle Speed Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 4

   No

   - Go To 11

4. **CHECK THE (K914) SENSOR GROUND CIRCUIT**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12 volts, check the (K914) Sensor Ground circuit in the Vehicle Speed Sensor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 5

No

- Go To 15

5. **CHECK FOR THE (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K75) VEHICLE SPEED SIGNAL CIRCUIT**

Fig. 58: Checking 5 Volt Supply Circuit For Short To Vehicle Speed Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Powertrain Control Module (PCM) C2 harness connector.
3. Measure the resistance between the (F856) 5-volt Supply circuit and the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the (F856) 5-Volt Supply circuit for a short to the (K75) Vehicle Speed Signal circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **VEHICLE SPEED SENSOR**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Vehicle Speed Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Inspect the Vehicle Speed Sensor for any condition that would result in an incorrect signal, such as damage, corrosion, or contamination.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

- Replace the Vehicle Speed Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Fig. 59: Checking 5 Volt Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Powertrain Control Module (PCM) C2 harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5-Volt Supply circuit in the Vehicle Speed Sensor harness connector.

   Is there any voltage present?

   Yes

- Repair the (F856) 5-Volt Supply circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 8

8. **(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND**

Fig. 60: Checking VSS 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (F856) 5-Volt Supply circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

- Go To 9

No

- Repair the (F856) 5-Volt Supply circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **CHECK FOR THE (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT**

Fig. 61: Checking VSS 5-Volt Supply Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (F856) 5-Volt Supply circuit and the (K914) Sensor Ground circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 10k Ohms?

Yes

- Go To 10

No

- Repair the (F856) 5-Volt Supply circuit for a short to the (K914) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (F856) 5-Volt Supply circuit between the Vehicle Speed Sensor harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 16

No

- Repair the (F856) 5-Volt Supply circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **CHECK THE (K75) VEHICLE SPEED SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 62: Checking Vehicle Speed Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C1 harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K75) Vehicle Speed Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 12

12. **CHECK THE (K75) VEHICLE SPEED SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 63: Checking VSS Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 10K Ohms?

   Yes

   - Go To 13

   No

   - Repair the (K75) Vehicle Speed Signal circuit for a short to

ground.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

13. **CHECK FOR THE (K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT**

Fig. 64: Checking VSS Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K75) Vehicle Speed Signal circuit and the (K914) Sensor Ground circuit in the Vehicle Speed Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 14

   No

- Repair the (K75) Vehicle Speed Signal circuit for a short to the (K914) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

14. **CHECK THE (K75) VEHICLE SPEED SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
    1. Measure the resistance of the (K75) Vehicle Speed Signal circuit between the Vehicle Speed Sensor harness connector and the GPEC Adaptor.

       Is the resistance below 5.0 Ohms?

       Yes

       - Go To 16

       No

       - Repair the (K75) Vehicle Speed Signal circuit for an open or high resistance.
       - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

15. **CHECK THE (K914) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
    1. Turn the ignition off.
    2. Disconnect the PCM C1 harness connector.
    3. Measure the resistance of the (K914) Sensor Ground circuit between the Vehicle Speed Sensor harness connector and the GPEC Adaptor.

       Is the resistance below 5.0 Ohms?

       Yes

       - Go To 16

       No

       - Repair the (K914) Sensor Ground circuit for an open or high resistance.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

16. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Vehicle Speed Sensor and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.
    6. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1502-VEHICLE SPEED SENSOR 1/2 CORRELATION - NON-DRIVE WHEELS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running, transmission not neutral, brakes not applied, and engine RPM greater than 1500.

SET CONDITION

This code will set if the Powertrain Control Module (PCM) receives an implausible vehicle speed signal from the Totally Integrated Power Module (TIPM).

POSSIBLE CAUSES

POSSIBLE CAUSES
ACTIVE BUS OR COMMUNICATION DTCS
DIFFERENCE IN TIRE CIRCUMFERENCE
WHEEL SPEED SENSOR, WIRING, CONNECTORS, OR HARDWARE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Ignition on, engine not running.

      NOTE: Check for any Bus Communication DTCs. If no Bus or Communication DTCs are set, check for active Vehicle Speed Sensor DTCs in the Totally Integrated Power Module. Any bus, communication, or VSS DTCs in the TIPM must be properly diagnosed before continuing.

   2. With a scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure.

Refer to **INTERMITTENT CONDITION** .

2. **VISUAL INSPECTION**

NOTE: This code may set after a hard acceleration on loose gravel, during other off road driving conditions, or by any condition that causes a wheel speed difference between the front and rear wheels.

1. Perform a thorough inspection of the rear Wheel Speed Sensor, wiring, connector, attaching hardware, and tone wheel.
2. Check tire pressure of all the tires.
3. Check tire wear on all the tires.
4. Ask the customer what the road and driving conditions were like when the fault set.

Were any problems found?

Yes

- Repair as necessary. If the code set during a front OR rear wheel spin condition, no repair may be necessary. Perform a thorough road test to verify proper operation.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **POWERTRAIN CONTROL MODULE (PCM)**

1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors related to this circuit.
2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1513-STARTER REQUEST SWITCH STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects voltage on the (F963) Start Enable circuit for a specified time after the engine is running.

POSSIBLE CAUSES

POSSIBLE CAUSES
(F963) START ENABLE CIRCUIT SHORTED TO VOLTAGE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.

NOTE: This DTC can set by holding the ignition switch in the start position after the engine starts.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **(F963) START ENABLE CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Powertrain Control Module (PCM) harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (F963) Start Enable circuit in the Powertrain Control Module (PCM) harness connector.

      Is there any voltage present?

      Yes

      - Repair the (F963) Start Enable circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 3

3. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the ignition switch and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.

3. Look for broken, bent, pushed out or corroded terminals.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1572-BRAKE PEDAL STUCK ON

Fig. 65: Brake Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the state of brake switch does not change as expected.

POSSIBLE CAUSES

Possible Causes
(B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, monitor the states of Brake Signal 1 and Brake Signal 2 while pressing and releasing the brake pedal several times.

       Do the states change from Pressed when the pedal is pressed to Not Pressed when the pedal is released?

       Yes

       - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

       No

       - Go To 2

2. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.
   3. Using a 12-volt test light connected to 12 volts, check the (B15) Brake Signal 1 circuit in the GPEC Adaptor while pressing and releasing the brake pedal several times.

      Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

      Yes

      - Go To 3

      No

      - Go To 4
3. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (B16) Brake Signal 2 circuit in the GPEC Adaptor while pressing and releasing the brake pedal several times.

      Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

      Yes

      - Go To 11

      No

      - Go To 7
4. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 66: Checking Stop Lamp Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Stop Lamp Switch harness connector.
3. Using a 12-volt test light connected to 12 volts, check the (Z906) Ground circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 5

No

- Repair the (Z906) Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND**

Fig. 67: Checking Brake Signal 1 Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (B15) Brake Signal 1 circuit in the Stop Lamp Switch harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

- Repair the (B15) Brake Signal 1 circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (B15) Brake Signal 1 circuit between the Stop Lamp Switch harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 10

   No

   - Repair the (B15) Brake Signal 1 circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 68: Checking Fused Ignition Switch Output (Run-Start) Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Stop Lamp Switch harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 8

No

- Repair the (F202) Fused Ignition Switch Output (Run-Start) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 69: Checking Brake Signal 2 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

   Is there any voltage present?

   Yes

- Repair the (B16) Brake Signal 2 circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (B16) Brake Signal 2 circuit between the Stop Lamp Switch harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 10

      No

      - Repair the (B16) Brake Signal 2 circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **STOP LAMP SWITCH**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

       Were any problems found?

       Yes

       - Repair as necessary.
       - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Replace the Stop Lamp Switch in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1573-BRAKE PEDAL STUCK OFF

Fig. 70: Brake Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the state of Brake Signal 2 does not change as expected.

POSSIBLE CAUSES

Possible Causes
(B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, monitor the states of Brake Signal 1 and Brake Signal 2 while pressing and releasing the brake pedal several times.

       Do the states change from Pressed when the pedal is pressed to Not Pressed when the pedal is released?

       Yes

       - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

       No

       - Go To 2

2. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Using a 12-volt test light connected to 12 Volts, check the (B15) Brake Signal 1 circuit in the GPEC Adaptor while pressing and releasing the brake pedal several times.

      Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

      Yes

      - Go To 3

      No

      - Go To 4
3. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (B16) Brake Signal 2 circuit in the GPEC Adaptor while pressing and releasing the brake pedal several times.

      Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

      Yes

      - Go To 11

No

- Go To 7

4. **CHECK THE (Z906) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 71: Checking Stop Lamp Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Stop Lamp Switch harness connector.
3. Using a 12-volt test light connected to 12 volts, check the (Z906) Ground circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 5

No

- Repair the (Z906) Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND**

Fig. 72: Checking Brake Signal 1 Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (B15) Brake Signal 1 circuit in the Stop Lamp Switch harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To 6

No

- Repair the (B15) Brake Signal 1 circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (B15) BRAKE SIGNAL 1 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (B15) Brake Signal 1 circuit between the Stop Lamp Switch harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 10

   No

   - Repair the (B15) Brake Signal 1 circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 73: Checking Fused Ignition Switch Output (Run-Start) Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Stop Lamp Switch harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 8

No

- Repair the (F202) Fused Ignition Switch Output (Run-Start) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 74: Checking Brake Signal 2 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

   Is there any voltage present?

   Yes

- Repair the (B16) Brake Signal 2 circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **CHECK THE (B16) BRAKE SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (B16) Brake Signal 2 circuit between the Stop Lamp Switch harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 10

      No

      - Repair the (B16) Brake Signal 2 circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **STOP LAMP SWITCH**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

       Were any problems found?

       Yes

       - Repair as necessary.
       - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Replace the Stop Lamp Switch in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1593-SPEED CONTROL SWITCH 1/2 STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (V71) S/C Signal 1 voltage does not match the (V72) S/C Signal 2 voltage.

POSSIBLE CAUSES

Possible Causes
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO GROUND
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO GROUND
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT
(V71) S/C SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(V72) S/C SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CLOCKSPRING
SPEED CONTROL SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Refer to the following table when diagnosing speed control switch voltage DTCs.

	Switch 1 voltage	Switch 2 voltage
On/Off - Min.	0.5882	3.5294
On/Off - Max.	1.1373	3.9216

Set - Min.	3.1569	1.1765
Set - Max.	3.5686	1.5686
Cancel - Min.	1.5882	2.8431
Cancel - Max.	2.0000	3.2549
Accel - Min.	3.8824	2.0392
Accel - Max.	4.1765	2.4706

1. Start the engine and allow it to idle for at least 60 seconds.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: It may be necessary to test drive the vehicle and operate the speed control in order for this DTC to set.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **SPEED CONTROL SWITCH**
   1. Turn the ignition off.
   2. Remove the Speed Control Switch in accordance with the Service Information.
   3. Turn the ignition on.
   4. With the scan tool, read the (V71) S/C Signal 1 and (V72) S/C Signal 2

voltages.

NOTE: The voltages should be above 4.8 volts with the Speed Control Switch connector disconnected.

5. Connect a jumper wire between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the Speed Control Switch harness connector.
6. With the scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be below 0.2 volts with the jumper wire in place.

7. Connect a jumper wire between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Speed Control Switch harness connector.
8. With the scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be below 0.2 volts with the jumper wire in place.

Are the Speed Control voltages displayed as described?

Yes

- Replace the Speed Control Switch in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CLOCKSPRING**

Fig. 75: Clockspring Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Clockspring C2 harness connector.
3. Turn the ignition on.
4. With the scan tool, read the (V71) S/C Signal 1 and (V72) S/C Signal 2 voltages.

NOTE: The voltages should be above 4.8 volts with the connector disconnected.

5. Connect a jumper wire between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the Clockspring C2 harness connector.
6. With the scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be below 0.2 volts with the jumper wire in place.

7. Connect a jumper wire between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Clockspring C2 harness connector.
8. With the scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be below 0.2 volts with the jumper wire in place.

Are the Speed Control voltages displayed as described?

Yes

- Replace the Clockspring in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE**

Fig. 76: Checking S/C Signal 1 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (V71) S/C Signal 1 circuit in the Clockspring C2 harness connector.

   Is there any voltage present?

   Yes

   - Repair the (V71) S/C Signal 1 circuit for a short to voltage.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE**

Fig. 77: Checking S/C Signal 2 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (V72) S/C Signal 2 circuit in the Clockspring C2 harness connector.

   Is there any voltage present?

Yes

- Repair the (V72) S/C Signal 2 circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 6

6. **(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO GROUND**

Fig. 78: Checking S/C Signal 1 Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Measure the resistance between ground and the (V71) S/C Signal 1 circuit in the Clockspring C2 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 7

   No

   - Repair the (V71) S/C Signal 1 circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO GROUND**

Fig. 79: Checking S/C Signal 2 Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (V72) S/C Signal 2 circuit in the Clockspring C2 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 8

   No

- Repair the (V72) S/C Signal 2 circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT**

Fig. 80: Checking S/C Signal 1 Circuit For Short To S/C Switch Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the C2 Clockspring harness connector.

   Is the resistance above 10k Ohms?

Yes

- Go To 9

No

- Repair the (V71) S/C Signal 1 circuit for a short to the Clockspring circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT**

Fig. 81: Checking S/C Signal 2 Circuit For Short To S/C Switch Ground Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Clockspring C2 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 10

   No

   - Repair the (V72) S/C Signal 2 circuit for a short to the (V937) S/C Switch Ground circuit.
   - Perform the POWERTRAIN VERIFICATION TEST.

10. **(V71) S/C SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (V71) S/C Signal 1 circuit between the Clockspring C2 harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 11

   No

   - Repair the (V71) S/C Signal 1 circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

11. **(V72) S/C SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (V72) S/C Signal 2 circuit between the Clockspring C2 harness connector and the GPEC Adaptor.

       Is the resistance below 5.0 Ohms?

       Yes

       - Go To 12

       No

       - Repair the (V72) S/C Signal 2 circuit for an open or high resistance.
       - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
12. **(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (V937) S/C Switch Ground circuit between the Clockspring C2 harness connector and the GPEC Adaptor.

       Is the resistance below 5.0 Ohms?

       Yes

       - Go To 13

       No

       - Repair the (V937) S/C Switch Ground circuit for an open or high resistance.
       - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
13. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module (PCM).
       - Look for any chafed, pierced, pinched or partially broken wires,

- Look for broken, bent, pushed out or corroded terminals.
- Perform any technical service bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1607-PCM INTERNAL SHUTDOWN TIMER SLOW RATIONALITY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) compares actual shutdown time to a calculated shutdown time value. The calculated shut down time value is based on the amount of shutdown time necessary for the ECT to drop a specific amount after a completely warmed up engine is shut down. If the difference between actual shutdown time and the calculated shut down time is greater than a maximum value, a one trip failure will set. The shutdown time is measured again after 1 hour of ignition off time following the next engine warm up cycle. The PCM compares the shutdown time to a calculated value. If the difference is greater than a maximum value, the MIL is illuminated and a DTC will set.

WHEN MONITORED

The Powertrain Control Module (PCM) internal timer is continuously monitored.

SET CONDITION

Upon power up, the Powertrain Control Module (PCM) compares the change in engine coolant temp sensor since last engine shut down and compares it to the amount of time the engine was turned off. If not enough time has occurred to account for the difference in engine coolant temperature then the fault will set. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
PENDING TEMPERATURE SENSOR DTCS
STUCK ENGINE OFF TIMER
LOW OR NO BATTERY VOLTAGE AT PCM DIRECT BATTERY FEED CIRCUIT
FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **PENDING TEMPERATURE SENSOR DTCS**
    1. Turn the ignition on.
    2. Start the engine and allow it to reach operating temperature.
    3. With the scan tool, select View DTCs.

    Are there any pending Engine Coolant Temperature sensor, Ambient Air Temperature sensor, or general temperature DTCs?

    Yes

    - Diagnose and repair any temperature sensor DTCs and retest.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

- Go To 2

2. **ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, select View DTCs and review the DTC environmental information for this DTC.

      Is the good trip counter greater than 0?

      Yes

      - The DTC is not active at this time. Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

      No

      - Go To 3

3. **STUCK ENGINE OFF TIMER**
   1. Using the scan tool under the PCM Data menu, read and record the IGNITION OFF TIME.
   2. Start and allow the engine to idle.
   3. Turn key off and remove from ignition switch for exactly three minutes and 15 seconds.
   4. Turn key on but leave engine off.
   5. Using the scan tool read the IGNITION OFF TIME.

      Does the most recent IGNITION OFF TIME equal three minutes?

      Yes

      - Go To 5

      No

      - Go To 4

4. **IGNITION OFF TIME**
   1. Compare the IGNITION OFF TIME written down with the IGNITION OFF TIME after the 3 minute 15 second shutdown.

Did it change?

Yes

- Go To 5

No

- Go To 7

5. **LOW BATTERY VOLTAGE AT PCM**

NOTE: A loss of battery voltage to the module while the module is powered down is the most likely cause of this DTC.

1. Inspect all PCM power and ground circuits.
2. Inspect and test the battery in accordance with the service information.
3. Inspect the generator drive belt for proper alignment and adjustment.
4. Inspect the vehicle for aftermarket accessories that may exceed the generator system output.
5. Inspect the fuses in the IPM. If an open fuse is found, use the wire diagram/schematics as a guide and inspect the wiring and connectors for a damaged or shorted circuit.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 6

6. **CHECK THE FUSED B+ CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors.

Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. With a 12-volt test light connected to ground, check the Fused B+ circuit at the GPEC Adaptor.
3. Check the circuit with the ignition switch in the OFF, ON, and START positions.

   NOTE: The test light should be illuminated and bright regardless of the position of the ignition switch. Compare the brightness to that of a direct connection to the battery.

4. Wiggle test the circuits while checking with the test light to check the circuit for an intermittent problem.

   Is the test light illuminated and bright in each of the ignition switch positions?

   Yes

   - Go To 8

   No

   - Repair the Fused B+ circuit as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **RESET STUCK TIMER**
   1. Turn the ignition off.
   2. Disconnect the PCM harness connectors for five minutes.
   3. Reconnect the PCM harness connectors.
   4. Start and allow the vehicle to Idle for 30 seconds.
   5. Turn key off and remove from ignition switch for exactly two minutes and 15 seconds.

6. Ignition on, engine not running.
7. Using the scan tool go into PCM DATA menu, read the IGNITION OFF TIME.

   Did the timer equal two minutes?

   Yes

   - Test Complete.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 8

8. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect Powertrain Control Module power and ground circuits.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data and wiggle test the wiring and connectors.
   5. Look for the any data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1618-SENSOR REFERENCE VOLTAGE 1 CIRCUIT ERRATIC

Fig. 82: Sensor Reference Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an excessive voltage variation on the 5-Volt supply circuit.

POSSIBLE CAUSES

Possible Causes
5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5-VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
CAMSHAFT 2 POSITION SENSOR
THROTTLE POSITION SENSOR
CRANKSHAFT POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Start the engine and allow it to reach normal operating temperature.

        WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

    2. With the scan tool, select View DTCs.

        Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 83: Checking 5-Volt Supply Circuit Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the APP Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F855) 5-Volt Supply circuit.

Select the appropriate response from the list below:

Voltage more than 5.2 Volts

- Repair the (F855) 5-Volt Supply circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

Voltage between 4.8 and 5.2 volts

- Go To 3

Voltage below 4.8 volts

- Go To 4

3. **ACCELERATOR PEDAL POSITION SENSOR**

Fig. 84: Checking Camshaft 1/2 Position Sensor 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the APP Sensor harness connector.

3. Disconnect the Camshaft 1/2 Position Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (F855) 5-Volt Supply circuit in the Camshaft 1/2 Position Sensor harness connector.

   Is the voltage below 4.8 Volts?

   Yes

   - Replace the Accelerator Pedal Position Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 9

4. **CAMSHAFT 1/2 POSITION SENSOR**

Fig. 85: Checking 5-Volt Supply Circuit Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Camshaft 1/2 Position Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F855) 5-Volt Supply circuit in the APP Sensor harness connector.

   Is the voltage above 4.8 volts?

   Yes

   - Replace the Camshaft 1/2 Position Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **THROTTLE POSITION SENSOR**

Fig. 86: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Throttle Body harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F855) 5 Volt Supply circuit.

   Is the voltage above 4.8 volts?

   Yes

   - Replace the Throttle Body in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 6

6. CRANKSHAFT POSITION SENSOR

Fig. 87: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Crankshaft Position Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F855) 5-Volt Supply circuit.

   Is the voltage above 4.8 volts?

   Yes

   - Replace the Crankshaft Position Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 7

7. **CHECK THE 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 88: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

NOTE: All sensors connected to the (F855) 5-Volt supply circuit and the (F855) 5-Volt supply circuit must be disconnected.

1. Turn the ignition off.
2. Disconnect the PCM harness connectors.
3. Measure the resistance between ground and the (F855) 5-Volt Supply circuit.
4. Measure the resistance between ground and the (K852) 5-Volt Supply circuit.

Is the resistance above 10k Ohms for both circuits?

Yes

- Go To 8

No

- Repair the 5-Volt Supply circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE 5-VOLT SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

NOTE: All sensors connected to the (F855) 5-Volt supply circuit and the (K852) 5-Volt supply circuit must be disconnected.

1. Turn the ignition off.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

2. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
3. Measure the resistance of the (F855) 5-Volt Supply circuit between the Camshaft 1/2 Position Sensor harness connector and the GPEC Adaptor.
4. Measure the resistance of the (F855) 5-Volt Supply circuit between the Crankshaft Position Sensor harness connector and the GPEC Adaptor.
5. Measure the resistance of the (F855) 5-Volt Supply circuit between the Throttle Body harness connector and the GPEC Adaptor.
6. Measure the resistance of the (K852) 5-Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

7. If the vehicle is equipped with a manual transmission, measure the resistance of the (K856) 5-Volt Supply circuit between the Vehicle Speed Sensor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms for all of the circuits?

   Yes

   - Go To 9

   No

   - Repair the 5-Volt Supply circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Inspect the (F855) 5-Volt Supply circuit between the Camshaft 1/2 Position Sensor harness connector and the PCM harness connector.
   2. Inspect the (F855) 5-Volt Supply circuit between the Crankshaft Position Sensor harness connector and the PCM harness connector.
   3. Inspect the (F855) 5-Volt Supply circuit between the Throttle Body harness connector and the PCM harness connector.
   4. Inspect the (K852) 5-Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the PCM harness connector.
   5. If the vehicle is equipped with a manual transmission, inspect the (F856) 5-Volt Supply circuit between the Vehicle Speed Sensor harness connector and the PCM harness connector.
   6. Inspect all PCM power and ground circuits.
   7. Look for any chafed, pierced, pinched, or partially broken wires.
   8. Look for broken, bent, pushed out or corroded terminals.
   9. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1621-O2 SENSOR REFERENCE VOLTAGE CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously after 15 seconds of engine runtime, no O2 Sensor Heater DTCs present and battery voltage greater than 10.4 volts.

SET CONDITION

The Oxygen Sensor reference voltage is below 0.9 volts for 60 seconds. The DTC will set as Pending after one trip and Active after two trips. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
O2 SENSOR RETURN CIRCUIT SHORTED TO GROUND
O2 SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: The most likely cause of this DTC is a short to ground in one of the O2 Sensor Return circuits.

1. Turn the ignition on, engine not running.
2. With the scan tool select the Data tab and monitor all of the O2 Sensor voltage readings.

   NOTE: Do not use the O2 Volts (0-1) data.

3. Start the engine and allow it to idle long enough for the O2 Sensors to enter closed loop operation (approximately two minutes).

   NOTE: The O2 Sensor voltages should be switching between approximately 2.5 - 3.5 volts with the engine idling. If an O2 Sensor or reference circuit is shorted low, the voltage readings will be less than one volt.

   Are all of the O2 Sensor voltage readings approximately 2.5 - 3.5 volts?

   Yes

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

   No

   - Go To 2

2. **CHECK FOR A SHORTED O2 SENSOR**

   WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect one of the O2 Sensor harness connectors.
2. With the scan tool, monitor the voltage readings of the O2 Sensors that

are still connected. Reconnect the O2 Sensor connector and repeat this step for each of the O2 Sensors on the vehicle.

NOTE: If the fault is caused by an O2 Sensor that is internally shorted, the other sensors should change from below one volt to switching between 2.5 - 3.5 volts with the faulty sensor disconnected.

Did the voltages change to approximately 2.5 - 3.5 volts for the O2 Sensors STILL CONNECTED when disconnecting any one of the sensors?

Yes

- Verify that there is good pin to terminal contact in the O2 Sensor connector. Replace the faulty O2 Sensor if no problems were found with the connections. Refer to **SENSOR, OXYGEN, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECK THE (K902) O2 SENSOR RETURN CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.
   3. Disconnect the O2 Sensor 1/1 harness connector.
   4. Disconnect the O2 Sensor 2/1 harness connector.
   5. Measure the resistance between ground and the (K902) O2 Sensor Return circuit at the O2 Sensor 1/1 or 2/1 harness connector.

   Is the resistance above 10k Ohms?

   Yes

- Go To 4

No

- Repair the (K902) O2 Sensor Return circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (K904) O2 SENSOR RETURN CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the O2 Sensor 1/2 harness connector.
   2. Disconnect the O2 Sensor 2/2 harness connector.
   3. Measure the resistance between ground and the (K904) O2 Sensor Return circuit at the O2 Sensor 1/2 or 2/2 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the (K904) O2 Sensor Return circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensors and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Oxygen Sensors and Control Module connectors.
   4. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1622-O2 SENSOR REFERENCE VOLTAGE CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Engine running for 15 seconds, O2 Sensors at operating temperature and battery voltage greater 10.4 volts.

SET CONDITION

The PCM detects that the Reference Signal voltage is greater than 3.7 volts for nine seconds.

POSSIBLE CAUSES

Possible Causes
O2 SENSOR RETURN CIRCUIT SHORTED TO VOLTAGE
O2 SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Ignition on, engine not running.
   2. With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.
   3. Start the engine.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Allow the engine to reach normal operating temperature.
   5. Monitor the scan tool for at least two minutes.
   6. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (K902) O2 SENSOR RETURN CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.
   3. Disconnect the O2 Sensor 1/1 harness connector.
   4. Disconnect the O2 Sensor 2/1 harness connector.
   5. Turn the ignition on.
   6. Measure the voltage of the (K902) O2 Sensor Return circuit at the O2 Sensor 1/1 or 2/1 harness connector.

Is there any voltage present?

Yes

- Repair the (K902) O2 Sensor Signal circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECK THE (K904) O2 SENSOR RETURN CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the O2 Sensor 1/2 harness connector.
   3. Disconnect the O2 Sensor 2/2 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage of the (K904) O2 Sensor Return circuit at the O2 Sensor 1/2 or 2/2 harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K904) O2 Sensor Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **CHECK THE (K902) O2 SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in

poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

2. Connect the (special tool #10436, Adapter, GPEC Diagnostic) to the PCM C2 harness connector.
3. Measure the resistance of the (K902) O2 Sensor Return circuit between the O2 Sensor 1/1 and 2/1 harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the (K902) 02 Sensor 1/1 or 2/1 Return circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (K904) O2 SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K904) O2 Sensor Return circuit between the O2 Sensor 1/2 and 2/2 harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (K904) 02 Sensor 1/2 or 2/2 Signal circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **O2 SENSOR**

1. Reconnect the PCM C2 harness connector.
2. Ignition on, engine not running.
3. With the scan tool, monitor the O2 Sensor 1/1 voltage.
4. Connect a jumper between the O2 Sensor 1/1 Signal circuit and the O2 Sensor Return circuit at the O2 Sensor 1/1 harness connector.
5. Perform this same procedure for all of the O2 Sensors.

   Is the voltage reading between 2.3 and 2.7 volts on the scan tool with the jumper installed for each O2 Sensor?

   Yes

   - Verify that there is good pin to terminal contact in the O2 Sensors and Powertrain Control Module connectors. Replace the O2 Sensor not indicating the specified voltage if no problems were found with the connections. Refer to **SENSOR, OXYGEN, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 7

   NOTE: Remove the jumper before continuing.

7. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensors and the PCM.
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace the Powertrain Control Module in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1628-SENSOR REFERENCE VOLTAGE CIRCUIT ERRATIC

Fig. 89: Sensor Reference Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an excessive voltage variation on the 5-Volt supply circuit.

POSSIBLE CAUSES

Possible Causes
5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5-VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
CAMSHAFT 1/1 POSITION SENSOR
MAP SENSOR
MANIFOLD FLOW VALVE
VEHICLE SPEED SENSOR (MTX ONLY)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Start the engine and allow it to reach normal operating temperature.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   2. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 90: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the APP Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (K854) 5-Volt Supply circuit in the APP Sensor harness connector.

   Select the appropriate response from the list below:

Voltage above 5.2 volts

- Repair the 5-Volt Supply circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

Voltage between 4.8 and 5.2 volts

- Go To 3

Voltage below 4.8 volts

- Go To 4

3. **ACCELERATOR PEDAL POSITION SENSOR**

Fig. 91: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the APP Sensor harness connector.

3. Disconnect the Camshaft 1/1 Position Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (F856) 5-Volt Supply circuit in the Camshaft 1/1 Position Sensor harness connector.

   Is the voltage below 4.8 volts?

   Yes

   - Replace the Accelerator Pedal Position Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 11

4. **CAMSHAFT 1/1 POSITION SENSOR**

Fig. 92: Checking 5-Volt Supply Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Camshaft 1/1 Position Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5-Volt Supply circuit at the Camshaft 1/1 Position Sensor harness connector.

   Is the voltage above 4.8 volts?

   Yes

   - Replace the Camshaft 1/1 Position Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **MAP SENSOR**

Fig. 93: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the MAP Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5-Volt Supply circuit at the MAP Sensor harness connector.

   Is the voltage above 4.8 volts?

   Yes

   - Replace the MAP Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 6

6. **MANIFOLD FLOW VALVE**

Fig. 94: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Manifold Flow Valve harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5-Volt Supply circuit at the Manifold Flow Valve harness connector.

   Is the voltage above 4.8 volts?

   Yes

   - Replace the Manifold Flow Valve in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Go To 7

7. **VEHICLE EQUIPPED WITH MANUAL TRANSMISSION**

NOTE: Only vehicles equipped with a manual transmission use a Vehicle Speed Sensor.

Is the vehicle equipped with a manual transmission?

Yes

- Go To 8

No

- Go To 9

8. **VEHICLE SPEED SENSOR**

NOTE: Only vehicles equipped with a manual transmission use a Vehicle Speed Sensor.

1. Turn the ignition off.
2. Disconnect the Vehicle Speed Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5-Volt Supply circuit.

Is the voltage above 4.8 volts?

Yes

- Replace the Vehicle Speed Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **CHECK THE 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 95: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

NOTE: All sensors connected to the (F856) 5-Volt supply circuit and the (F856) 5-Volt supply circuit must be disconnected.

1. Turn the ignition off.
2. Disconnect the PCM harness connectors.
3. Measure the resistance between ground and the (F856) 5-Volt Supply circuit.
4. Measure the resistance between ground and the (F856) 5-Volt Supply circuit.

   Is the resistance above 10k Ohms for both circuits?

Yes

- Go To 10

No

- Repair the 5-Volt Supply circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **CHECK THE 5-VOLT SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

NOTE: All sensors connected to the (F856) 5-Volt supply circuit and the (F856) 5-Volt supply circuit must be disconnected.

1. Turn the ignition off.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

2. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
3. Measure the resistance of the (F856) 5-Volt Supply circuit between the Camshaft 1/1 Position Sensor harness connector and the GPEC Adaptor.
4. Measure the resistance of the (F856) 5-Volt Supply circuit between the MAP Sensor harness connector and the GPEC Adaptor.
5. Measure the resistance of the (F856) 5-Volt Supply circuit between the Manifold Flow Valve harness connector and the GPEC Adaptor.
6. Measure the resistance of the (F856) 5-Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.
7. If the vehicle is equipped with a manual transmission, inspect the (F856) 5-Volt Supply circuit between the Vehicle Speed Sensor harness

connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms for all of the circuits?

Yes

- Go To 11

No

- Repair the 5-Volt Supply circuit that measured above 5.0 Ohms for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Inspect the (F856) 5-Volt Supply circuit between the Camshaft 1/1 Position Sensor harness connector and the PCM harness connector.
    2. Inspect the (F856) 5-Volt Supply circuit between the MAP Sensor harness connector and the PCM harness connector.
    3. Inspect the (F856) 5-Volt Supply circuit between the Manifold Flow Valve harness connector and the PCM harness connector.
    4. Inspect the (F856) 5-Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the PCM harness connector.
    5. Inspect all PCM power and ground circuits.
    6. Look for any chafed, pierced, pinched, or partially broken wires.
    7. Look for broken, bent, pushed out or corroded terminals.
    8. Peform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1696-EEPROM MEMORY WRITE DENIED/INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

An attempt to program/write to the internal EEPROM failed. Also checks at power down. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
PCM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **SCAN TOOL DISPLAYS A WRITE FAILURE**
    1. With a scan tool, perform the SRI Memory Test.

       Does scan tool display Write Failure?

       Yes

       - Replace and program the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
       - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Go To 2

2. **SCAN TOOL DISPLAYS A WRITE REFUSED**
   1. With the a scan tool, perform the SRI Memory Test.

      Does the scan tool display Write Refused?

      Yes

      - Go To 3

      No

      - Go To 4

3. **PCM REFUSED 2ND TEST**
   1. With a scan tool, perform the SRI Memory Test a third time.

      NOTE: Retest the SRI Memory two more times.

      Does the scan tool display Write Refused again?

      Yes

      - Replace and program the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Test Complete.

4. **SCAN TOOL DISPLAYS SRI MILEAGE INVALID**
   1. With a scan tool, perform the SRI Memory Test.

      Does the scan tool display SRI Mileage Invalid?

Yes

- Update the mileage and retest the SRI Memory.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **COMPARE SRI MILEAGE WITH ODOMETER**
   1. Compare the SRI Mileage stored with the Instrument Panel Odometer.

      Is the mileage within the specified range displayed on the scan tool?

      Yes

      - Test Complete.

      No

      - Update the mileage and retest the SRI Memory.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1697-EMR (SRI) MILEAGE NOT STORED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on and battery voltage greater than 10 volts.

SET CONDITION

The SRI Mileage has not been programmed into the PCM.

POSSIBLE CAUSES

POSSIBLE CAUSES
SRI MILEAGE NOT PROGRAMMED INTO THE PCM POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

SRI MILEAGE NOT PROGRAMMED INTO THE PCM

1. Ignition on, engine not running.
2. With the scan tool, attempt to program the SRI mileage into the PCM.
3. With the scan tool, clear DTCs in the PCM.
4. Start the engine.
5. Allow the engine to reach normal operating temperature.
6. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Replace and program the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - The SRI mileage has been successfully programmed into the PCM. Test is complete.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P1718-EEPROM INTEGRITY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

An attempt to program/write to the internal EEPROM failed, Also checks at power down. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
POWERTRAIN CONTROL MODULE (PCM) SOFTWARE UPDATE EXCESSIVE RESISTANCE IN THE PCM POWER OR GROUND CIRCUITS POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any other DTCs set in the PCM before proceeding with this test.

1. Turn the ignition on.
2. With the scan tool, clear DTCs.
3. Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: It may be necessary to test drive the vehicle in order for this DTC to set.

4. With the scan tool, select View DTCs.

Is the DTC Active at this time?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **PCM ODOMETER MILEAGE NOT PROGRAMMED**
   1. Turn the ignition on.
   2. With the scan tool, attempt to perform the Program PCM Odometer function.
   3. With the scan tool, Clear DTCs.
   4. Start the engine.
   5. Allow the engine to reach normal operating temperature.
   6. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 3

   No

   - The SRI mileage has been successfully programmed into the PCM. Test is complete.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECKING THE PCM POWER AND GROUND CIRCUITS**
   1. Perform the CHECKING THE PCM POWER AND GROUND CIRCUITS diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .
   2. Using the wiring diagram/schematic as a guide, inspect the Powertrain Control Module (PCM) wiring and connectors.
   3. Look for any chafed, pierced, pinched or partially broken wires.

4. Look for broken, bent, pushed out or corroded terminals.
5. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Turn the ignition on.
   2. With the scan tool, attempt to perform the Program PCM Odometer function.
   3. With the scan tool, Clear DTCs.
   4. Start the engine.
   5. Allow the engine to reach normal operating temperature.
   6. With the scan tool, select View DTCs.

   Is the DTC Active at this time?

   Yes

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - The SRI mileage has been successfully programmed into the PCM. Test is complete.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

P1D83-IMPLAUSIBLE ENGINE OIL TEMPERATURE SIGNAL RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 96: Temperature Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With engine off time greater than 480 minutes and ambient temperature greater than -7°C (19.4°F).

SET CONDITION

After a calibrated amount of cool down time, the Powertrain Control Module (PCM) compares the AAT, ECT and IAT Sensor values. If the general temperature rationality passes, the PCM compares the Engine Oil Temperature (EOT) Sensor value to a threshold based on the other temp sensor values. If the difference is greater than a calibrated value, the diagnostic fails.

POSSIBLE CAUSES

Possible Causes
EXCESSIVE RESISTANCE IN THE EOT SENSOR SIGNAL CIRCUIT
EXCESSIVE RESISTANCE IN THE EOT SENSOR GROUND CIRCUIT
ENGINE OIL TEMPERATURE (EOT) SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ENGINE OIL TEMPERATURE**
    1. Turn the ignition off.
    2. Allow the vehicle to sit with the ignition off in an environment where the temperature is consistent and above -7°C (19.4°F) and cold soak until the engine coolant temperature is equal to ambient temperature.
    3. Turn the ignition on.
    4. With the scan tool, compare the EOT sensor value to the AAT, ECT and IAT sensor values.

    Is the Engine Oil Temperature Sensor value within 10°C (18°F) of the other sensor values?

    Yes

    - Perform the INTERMITTENT CONDITION diagnostic procedure.

Refer to **INTERMITTENT CONDITION** .

No

- Go To 2

2. **CHECK FOR HIGH RESISTANCE IN THE (G24) ENGINE OIL TEMP SIGNAL CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Engine Oil Temperature Sensor harness connector.
   3. Disconnect the PCM C2 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   4. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   5. Measure the resistance of the (G24) Engine Oil Temperature Signal circuit between the Engine Oil Temp Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 3

      No

      - Repair the (G24) Engine Oil Temp Signal circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK FOR HIGH RESISTANCE IN THE (K900) SENSOR GROUND CIRCUIT**
   1. Measure the resistance of the (K900) Sensor ground circuit between the

Engine Oil Temp Sensor harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the open or excessive resistance in the (G24) Engine Oil Temp Signal circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **ENGINE OIL TEMPERATURE SENSOR**
   1. Turn the ignition off.
   2. Reconnect the PCM C2 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read the Engine Oil Temperature Sensor voltage.

      NOTE: The sensor voltage should be approximately 5.0 volts (plus or minus 0.1 volts) with the connector disconnected.

   5. Connect a jumper between the (G24) EOT Signal circuit and the (K900) Sensor Ground circuit at the Engine Oil Temperature Sensor harness connector.

      NOTE: The sensor voltage should be approximately 0.0 volts (plus or minus 0.1 volt) with the jumper in place.

      Does the scan tool display the voltage as described above?

      Yes

      - Verify that there is good pin to terminal contact in the Engine Oil Temperature Sensor and Powertrain Control Module connectors. Replace the Engine Oil Temperature Sensor if no problems were

found with the connectors. Refer to **2.0L SENSOR, OIL TEMPERATURE, REMOVAL** or **2.4L SENSOR, OIL TEMPERATURE, REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Oil Temperature Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the EOT Sensor and Control Module connectors.
   4. Perform any Technical Service Bulletins (TSBs) that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2004-INTAKE MANIFOLD RUNNER CONTROL STUCK OPEN

Fig. 97: Manifold Flow Valve Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running, when the valve closes, below a calibrated RPM, depending upon pedal position.

SET CONDITION

The Powertrain Control Module (PCM) detects that the position feedback of the Manifold Flow Valve Position Sensor is not within range of the adapted value learned during in-plant initialization or after a non volatile memory reset (adaptive memory clear).

POSSIBLE CAUSES

Possible Causes
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K602) MFV SIGNAL CIRCUIT SHORTED TO VOLTAGE
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K602) MFV SIGNAL CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT
(K602) MFV SIGNAL CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT
(K602) MFV SIGNAL CIRCUIT SHORTED TO THE (F856) 5-VOLT SUPPLY CIRCUIT
(F856) 5-VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K900) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(Z909) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
MANIFOLD FLOW VALVE
INTAKE MANIFOLD
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Turn the ignition on.

2. With the scan tool, clear DTCs.
3. Start the engine and allow it to reach operating temperature.

NOTE: It may be necessary to test drive the vehicle to get this DTC to reset.

4. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 98: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Manifold Flow Valve harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5-Volt Supply circuit in the Manifold Flow Valve harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 7

   No

   - Go To 3

3. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 99: Checking Manifold Flow Valve 5-Volt Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5-Volt Supply circuit in the Manifold Flow Valve harness connector.

   Is there any voltage present?

   Yes

   - Repair the (F856) 5-Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 4

4. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 100: Checking MFV Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-Volt Supply circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the (F856) 5-Volt Supply circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK FOR THE (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT**

Fig. 101: Checking 5-Volt Supply Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (F856) 5-Volt Supply circuit and the (K900) Sensor Ground circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the (F856) 5-Volt Supply circuit for a short to the (K900)

Sensor Ground circuit.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (F856) 5-Volt Supply circuit between the Manifold Flow Valve harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 16

No

- Repair the (F856) 5-Volt Supply circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K602) MFV SIGNAL CIRCUIT VOLTAGE**

Fig. 102: Checking MFV Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 12

   No

   - Go To 8

8. **CHECK THE (K602) MFV SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 103: Checking MFV Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K602) MFV Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 9

9. **CHECK THE (K602) MFV SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 104: Checking MFV Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 10

   No

   - Repair the (K602) MFV Signal circuit for a short to ground.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **CHECK FOR THE (K602) MFV SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT**

Fig. 105: Checking MFV Signal Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K602) MFV Signal circuit and the (K900) Sensor Ground circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 11

   No

- Repair the (K602) MFV Signal circuit for a short to the (K900) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **CHECK THE (K602) MFV SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K602) MFV Signal circuit between the Manifold Flow Valve harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 16

No

- Repair the (K602) MFV Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

12. **CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

1. Measure the resistance of the (K900) Sensor Ground circuit between the Manifold Flow Valve harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 13

No

- Repair the (K900) Sensor Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

13. **CHECK FOR THE (K602) MFV SIGNAL CIRCUIT SHORTED TO THE (F856) 5-VOLT SUPPLY CIRCUIT**

Fig. 106: Manifold Flow Valve Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K602) MFV Signal circuit and the

(F856) 5-volt Supply in the Manifold Flow Valve harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To 14

No

- Repair the (K602) MFV Signal circuit for a short to the (F856) 5-Volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

14. **CHECK THE (Z909) GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 107: Checking MFV Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12-volt test light connected to 12 volts, check the (Z909) Ground circuit in the Manifold Flow Valve harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 15

No

- Repair the (Z909) Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

15. **MANIFOLD FLOW VALVE**
    1. Turn the ignition off.
    2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).
    3. Look for any chafed, pierced, pinched, or partially broken wires.
    4. Look for broken, bent, pushed out or corroded terminals.
    5. Perform any Technical Service Bulletins that may apply.
    6. Remove the Manifold Flow Valve.
    7. Inspect the return spring and the valve blade assembly for debris stuck in the path or for frozen/seized blades.

NOTE: Manifold Flow Valve over travel or under travel can cause this DTC to set.

NOTE: If the Manifold Flow Valve blades are seized in the intake manifold, the manifold will have to be replaced.

NOTE: If the Manifold Flow Valve is replaced, a non volatile memory reset must be performed to learn the new port flap adaptive values.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace the Manifold Flow Valve in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

16. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE,**

POWERTRAIN CONTROL, REMOVAL .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2006-INTAKE MANIFOLD RUNNER CONTROL STUCK CLOSED

Fig. 108: Manifold Flow Valve Position Sensor Circuit Diagram

Always perform the Pre-Diagnostic Troubleshooting procedure before

proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, clear DTCs.
   3. Start the engine and allow it to reach operating temperature.

      NOTE: It may be necessary to test drive the vehicle to get this DTC to reset.

   4. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .
2. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 109: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Manifold Flow Valve harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5-Volt Supply circuit in the Manifold Flow Valve harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 7

   No

   - Go To 3

3. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO**

VOLTAGE

Fig. 110: Checking Manifold Flow Valve 5-Volt Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5-Volt Supply circuit in the Manifold Flow Valve harness connector.

   Is there any voltage present?

   Yes

   - Repair the (F856) 5-Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 111: Checking MFV Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (F856) 5-Volt Supply circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the (F856) 5-Volt Supply circuit for a short to ground.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK FOR THE (F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT**

Fig. 112: Checking 5-Volt Supply Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (F856) 5-Volt Supply circuit and the (K900) Sensor Ground circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

- Repair the (F856) 5-Volt Supply circuit for a short to the (K900) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (F856) 5-Volt Supply circuit between the Manifold Flow Valve harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 16

No

- Repair the (F856) 5-Volt Supply circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K602) MFV SIGNAL CIRCUIT VOLTAGE**

Fig. 113: Checking MFV Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 12

   No

   - Go To 8

8. **CHECK THE (K602) MFV SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 114: Checking MFV Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K602) MFV Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 9

9. **CHECK THE (K602) MFV SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 115: Checking MFV Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 10

   No

   - Repair the (K602) MFV Signal circuit for a short to ground.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **CHECK FOR THE (K602) MFV SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT**

Fig. 116: Checking MFV Signal Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K602) MFV Signal circuit and the (K900) Sensor Ground circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 11

   No

- Repair the (K602) MFV Signal circuit for a short to the (K900) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **CHECK THE (K602) MFV SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K602) MFV Signal circuit between the Manifold Flow Valve harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 16

No

- Repair the (K602) MFV Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

12. **CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

1. Measure the resistance of the (K900) Sensor Ground circuit between the Manifold Flow Valve harness connector and the PCM C2 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 13

No

- Repair the (K900) Sensor Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

13. **CHECK FOR THE (K602) MFV SIGNAL CIRCUIT SHORTED TO THE (F856) 5-VOLT SUPPLY CIRCUIT**

Fig. 117: Checking MFV Signal Circuit For Short To 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K602) MFV Signal circuit and the (F856) 5-Volt Supply in the Manifold Flow Valve harness connector.

   Is the resistance above 10k Ohms?

Yes

- Go To 14

No

- Repair the (K602) MFV Signal circuit for a short to the (F856) 5-Volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

14. **CHECK THE (Z909) GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 118: Checking MFV Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Using a 12-volt test light connected to 12 volts, check the (Z909) Ground circuit in the Manifold Flow Valve harness connector.

NOTE: The test light should be illuminated and bright.

Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 15

No

- Repair the (Z909) Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

15. **MANIFOLD FLOW VALVE**
    1. Turn the ignition off.
    2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).
    3. Look for any chafed, pierced, pinched, or partially broken wires.
    4. Look for broken, bent, pushed out or corroded terminals.
    5. Perform any Technical Service Bulletins that may apply.
    6. Remove the Manifold Flow Valve.
    7. Inspect the return spring and the valve blade assembly for debris stuck in the path or for frozen/seized blades.

NOTE: **Manifold Flow Valve over travel or under travel can cause this DTC to set.**

NOTE: **If the Manifold Flow Valve blades are seized in the intake manifold, the manifold will have to be replaced.**

NOTE: **If the Manifold Flow Valve is replaced, a non volatile memory reset must be performed to learn the new port flap adaptive values.**

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace the Manifold Flow Valve in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

16. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2008-INTAKE MANIFOLD RUNNER (SWIRL) CONTROL CIRCUIT/OPEN

Fig. 119: Manifold Flow Valve Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Manifold Flow Valve control circuit voltage is not within an acceptable range.

POSSIBLE CAUSES

Possible Causes
(K601) MFV CONTROL CIRCUIT SHORTED TO VOLTAGE
(K601) MFV CONTROL CIRCUIT SHORTED TO GROUND
(K601) MFV CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(Z909) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
MANIFOLD FLOW VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).
    3. Start the engine and allow it to reach normal operating temperature.

    WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

    4. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (Z909) GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 120: Checking MFV Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Manifold Flow Valve harness connector.
3. Using a 12-volt test light connected to 12 volts, check the (Z909) Ground circuit in the Manifold Flow Valve harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 3

No

- Repair the (Z909) Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K601) MFV CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 121: Checking Control Circuit For Short To Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (K601) MFV Control circuit in the Manifold Flow Valve harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K601) MFV Control circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **CHECK THE (K601) MFV CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 122: Checking Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K601) MFV Control circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the (K601) MFV Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (K601) MFV CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K601) MFV Control circuit between the Manifold Flow Valve harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 6

   No

   - Repair the (K601) MFV Control circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **MANIFOLD FLOW VALVE**

Fig. 123: Checking MFV Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the PCM C2 harness connector.
2. Turn the ignition on.
3. With the scan tool, actuate the Manifold Flow Valve control to the ON (100%) position.
4. Using a 12-volt test light connected to ground, check the (K601) MFV Control circuit in the Manifold Flow Valve harness connector.

NOTE: The test light should be illuminated and bright with the control actuated ON (100%). Compare the brightness to that of a direct connection to the battery.

5. With the scan tool, actuate the Manifold Flow Valve control to OFF (0%).
6. Using a 12-volt test light connected to 12 ground, check the (K601)

MFV Control circuit in the Manifold Flow Valve harness connector.

NOTE: The test light should not be illuminated with the control actuated OFF (0%).

Is the test light illuminated and bright with the control actuated ON and not illuminated with the control actuated OFF?

Yes

- Replace the Manifold Flow Valve in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 7

7. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2015-INTAKE MANIFOLD RUNNER POSITION SENSOR PERFORMANCE

Fig. 124: Manifold Flow Valve Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects an implausible voltage on the Manifold Flow Valve circuit.

POSSIBLE CAUSES

Possible Causes
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K602) MFV SIGNAL CIRCUIT SHORTED TO VOLTAGE
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K602) MFV SIGNAL CIRCUIT SHORTED TO GROUND
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K602) MFV SIGNAL CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT
(K602) MFV SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K900) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
MANIFOLD FLOW VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Start the engine.

2. Allow the engine to reach normal operating temperature.

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

3. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **(F856) 5 VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 125: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Manifold Flow Valve harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.

   Is the voltage between 4.5 and 5.5 volts?

   Yes

   - Go To 3

   No

   - Go To 7

3. **(K602) MFV SIGNAL CIRCUIT VOLTAGE**

Fig. 126: Checking MFV Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

   Is the voltage between 4.5 and 5.5 volts?

   Yes

   - Go To 4

   No

   - Go To 11

4. **(K900) SENSOR GROUND CIRCUIT TEST**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12 volts, check the (K900) Sensor Ground in the Manifold Flow Valve harness connector.

      NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

      Is the test light illuminated and bright?

      Yes

      - Go To 5

      No

      - Go To 15

5. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K602) MFV SIGNAL CIRCUIT**

Fig. 127: Checking MFV Signal Circuit For Short To 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between the (F856) 5 Volt Supply circuit and the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 6

   No

   - Repair the (F856) 5 Volt Supply circuit for a short to the (K602) MFV Signal circuit.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **MANIFOLD FLOW VALVE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Inspect the Manifold Flow Valve for any condition that would result in an incorrect signal, such as damage or contamination.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace the Manifold Flow Valve in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Fig. 128: Checking Manifold Flow Valve 5-Volt Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.

   Is there any voltage present?

   Yes

   - Repair the (F856) 5 Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 8

8. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND**

Fig. 129: Checking MFV Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (F856) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 9

   No

   - Repair the (F856) 5 Volt Supply circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

9. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT**

Fig. 130: Checking 5-Volt Supply Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (F856) 5 Volt Supply circuit and the (K900) Sensor Ground circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 10

   No

- Repair the (F856) 5 Volt Supply circuit for a short to the (K900) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **(F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 131: Checking 5-Volt Supply Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (F856) 5 Volt Supply circuit between the Manifold Flow Valve harness connector and the PCM C2 harness

connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 16

No

- Repair the (F856) 5 Volt Supply circuit for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **(K602) MFV SIGNAL CIRCUIT SHORTED TO VOLTAGE**

Fig. 132: Checking MFV Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the PCM C2 harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K602) MFV Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 12

12. **(K602) MFV SIGNAL CIRCUIT SHORTED TO GROUND**

Fig. 133: Checking MFV Signal Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 13

   No

   - Repair the (K602) MFV Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

13. **(K602) MFV SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT**

Fig. 134: Checking MFV Signal Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K602) MFV Signal circuit and the (K900) Sensor Ground circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 14

   No

   - Repair the (K602) MFV Signal circuit for a short to the (K900) Sensor Ground circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

14. **(K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 135: Checking MFV Signal Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (K602) MFV Signal circuit between the Manifold Flow Valve harness connector and the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 16

   No

   - Repair the (K602) MFV Signal circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

15. **(K900) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 136: Checking Sensor Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the PCM C2 harness connector.
3. Measure the resistance of the (K900) Sensor Ground circuit between the Manifold Flow Valve harness connector and the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 16

   No

   - Repair the circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

16. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.
    6. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2016-INTAKE MANIFOLD RUNNER POSITION SENSOR CIRCUIT LOW

Fig. 137: Manifold Flow Valve Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Manifold Flow Valve (MFV) Position Sensor input voltage is below the minimum acceptable value.

POSSIBLE CAUSES

Possible Causes
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K602) MFV SIGNAL CIRCUIT SHORTED TO GROUND
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT
(K602) MFV SIGNAL CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
MANIFOLD FLOW VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

1. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in

possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **(F856) 5 VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 138: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the Manifold Flow Valve harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F856) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.

   Is the voltage above 4.5 volts?

   Yes

   - Go To 6

   No

   - Go To 3

3. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND**

Fig. 139: Checking MFV Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.

2. Disconnect the Powertrain Control Module (PCM) C2 harness connector.
3. Measure the resistance between ground and the (F856) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 1000 Ohms?

   Yes

   - Go To 4

   No

   - Repair the (F856) 5 Volt Supply circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT**

Fig. 140: Checking 5-Volt Supply Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (F856) 5 Volt Supply circuit and the (K900) Sensor Ground circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the (F856) 5 Volt Supply circuit for a short to the (K900) Sensor Ground circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **(F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 141: Checking 5-Volt Supply Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (F856) 5 Volt Supply circuit between the Manifold Flow Valve harness connector and the PCM C2 harness

connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 10

No

- Repair the (F856) 5 Volt Supply circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **(K602) MFV SIGNAL CIRCUIT SHORTED TO GROUND**

Fig. 142: Checking MFV Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 100 Ohms?

   Yes

   - Go To 7

   No

   - Repair the (K602) MFV Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **(K602) MFV SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT**

Fig. 143: Checking MFV Signal Circuit For Short To Sensor Ground

Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K602) MFV Signal circuit and the (K900) Sensor Ground circuit in the Manifold Flow Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 8

   No

   - Repair the (K602) MFV Signal circuit for a short to the (K900) Sensor Ground circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **(K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 144: Checking MFV Signal Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (K602) MFV Signal circuit between the Manifold Flow Valve harness connector and the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 9

   No

   - Repair the (K602) MFV Signal circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **MANIFOLD FLOW VALVE**

Fig. 145: Manifold Flow Valve Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Connect the PCM C2 harness connector.
3. Connect a jumper wire between the (F856) 5 Volt Supply circuit and the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.
4. Turn the ignition on.
5. With the scan tool, read the Manifold Flow Valve signal voltage.

   Is the voltage above 4.5 volts with the jumper wire in place?

Yes

- Replace the Manifold Flow Valve in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 10

10. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.
    6. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the MFV Position Sensor input voltage is above the maximum acceptable value.

POSSIBLE CAUSES

Possible Causes
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K602) MFV SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K602) MFV SIGNAL CIRCUIT SHORTED TO THE (F856) 5 VOLT SUPPLY CIRCUIT
(K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K900) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
MANIFOLD FLOW VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

1. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not

stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Fig. 147: Checking Manifold Flow Valve 5-Volt Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Manifold Flow Valve harness connector.
3. Disconnect the PCM C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (F856) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.

   Is there any voltage present?

   Yes

   - Repair the (F856) 5 Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **(K602) MFV SIGNAL CIRCUIT SHORTED TO VOLTAGE**

Fig. 148: Checking MFV Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K602) MFV Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **(K602) MFV SIGNAL CIRCUIT SHORTED TO THE (F856) 5 VOLT SUPPLY CIRCUIT**

Fig. 149: Checking MFV Signal Circuit For Short To 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K602) MFV Signal circuit and the (F856) 5 Volt Supply in the Manifold Flow Valve harness connector.

   Is the resistance below 100 Ohms?

   Yes

   - Repair the (K602) MFV Signal circuit for a short to the (F856) 5 Volt Supply circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **(K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 150: Checking MFV Signal Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance of the (K602) MFV Signal circuit between the Manifold Flow Valve harness connector and the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 6

   No

   - Repair the (K602) MFV Signal circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **(K900) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE**

Fig. 151: Checking Sensor Ground Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (K900) Sensor Ground circuit between

the Manifold Flow Valve harness connector and the PCM C2 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 7

No

- Repair the (K900) Sensor Ground circuit for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **MANIFOLD FLOW VALVE**

Fig. 152: Manifold Flow Valve Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Connect the PCM C2 harness connector.
3. Connect a jumper wire between the (K900) Sensor Ground circuit and the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.
4. Turn the ignition on.
5. With the scan tool, read the Manifold Flow Valve signal voltage.

   Is the voltage below 1.0 volt with the jumper wire in place?

Yes

- Replace the Manifold Flow Valve in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 8

8. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2066-FUEL LEVEL SENSOR 2 PERFORMANCE

Fig. 153: Fuel Pump Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The fuel level sensor information is a bussed message to the Powertrain Control Module (PCM) from the Cabin Compartment Node (CCN). The fuel level rationality will set a fault for a fuel level reading that does not change over an accumulated mileage threshold to keep stuck high or stuck low fuel levels from disabling OBD monitors. If the vehicle is fitted with a saddle tank fuel system this feature includes diagnostics for both of the sending units and diagnostics for a siphon tube that has become disconnected or plugged. The power up test looks to see a large enough fuel level voltage change from the last key-off to the following engine run. The engine run test looks to see a fuel level voltage change over an accumulated mileage.

Vehicles fitted with saddle fuel tank configurations have two fuel level sending units. The primary side of the tank has the filler tube inlet near the bottom and contains the fuel pump module. During fuel tank fills, fuel must overflow the primary side to reach the secondary side of the tank. As fuel is consumed, a siphon tube is used to draw fuel from the secondary side to the primary side. Because the siphon tube flow rate exceeds the fuel consumption rate, the secondary side of the tank will be empty before fuel is depleted from the primary side. Fuel level sensor 1 is located on the primary side of the tank. Fuel level sensor 2 is located on the secondary side of the tank.

WHEN MONITORED

With engine run time greater than three minutes and Fuel Level Sensor 1 reading high.

SET CONDITION

The Powertrain Control Module (PCM) detects no change in Fuel Level Sensor 2 circuit voltage after a significant amount of fuel should have been consumed based on a calculated value and the vehicle operating conditions.

POSSIBLE CAUSES

Possible Causes
CAN BUS FAILURE
FUEL LEVEL SENSOR CIRCUIT DTCS SET IN THE CCN
FUEL TANK
OBSTRUCTION TO THE FUEL LEVEL SENSOR

POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any CAN bus, communication or implausible signal DTCs before proceeding with this test.

NOTE: Diagnose P2067 or P2068 first, if set along with P2066.

1. Start the engine.
2. Allow the engine to reach normal operating temperature.
3. With the scan tool, select View DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **VISUALLY INSPECT FUEL TANK**
   1. Visually inspect the Fuel Tank for damage that may restrict the Fuel Sending Unit float from moving.

Is the Fuel Tank OK?

Yes

- Go To 3

No

- Replace the Fuel Tank as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **FUEL LEVEL SENSOR CIRCUIT DTCS SET IN THE CCN**

Are any Fuel Level Sensor Circuit DTCs set in the CCN?

Yes

- Diagnose the appropriate Fuel Level Sensor Circuit DTC in the CCN. Refer to **DIAGNOSIS AND TESTING** .

No

- Go To 4

4. **INTERNAL INSPECTION OF THE FUEL TANK**

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in possible serious or fatal injury.

1. Remove the Fuel Tank in accordance with the Service Information.
2. Remove the Fuel Pump Module.
3. Visually inspect the inside of the Fuel Tank for any obstructions or deformities.
4. Inspect the Fuel Pump Module Float arm for damage.

Were any problems found?

Yes

- Repair or replace as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Cabin Compartment Node (CCN) and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Sensor and Powertrain Control Module connectors.
   4. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2067-FUEL LEVEL SENSOR 2 CIRCUIT LOW

Fig. 154: Fuel Pump Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The fuel level sensor information is a bussed message to the Powertrain Control Module (PCM) from the Cabin Compartment Node (CCN). The fuel level rationality will set a fault for a fuel level reading that does not change over an accumulated mileage threshold to keep stuck high or stuck low fuel levels from disabling OBD monitors. If the vehicle is fitted with a saddle tank fuel system this feature includes diagnostics for both of the sending units and diagnostics for a siphon tube that has become disconnected or plugged. The power up test looks to see a large enough fuel level voltage change from the last key-off to the following engine run. The engine run test looks to see a fuel level voltage change over an accumulated mileage.

Vehicles fitted with saddle fuel tank configurations have two fuel level sending units. The primary side of the tank has the filler tube inlet near the bottom and contains the fuel pump module. During fuel tank fills, fuel must overflow the primary side to reach the secondary side of the tank. As fuel is consumed, a siphon tube is used to draw fuel from the secondary side to the primary side. Because the siphon tube flow rate exceeds the fuel consumption rate, the secondary side of the tank will be empty before fuel is depleted from the primary side. Fuel level sensor 1 is located on the primary side of the tank. Fuel level sensor 2 is located on the secondary side of the tank.

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 Volts.

SET CONDITION

The Fuel Level Sensor 2 input voltage is below the minimum acceptable value.

POSSIBLE CAUSES

Possible Causes
CAN BUS FAILURE
FUEL LEVEL SENSOR CIRCUIT DTCS SET IN THE CCN
FUEL TANK
OBSTRUCTION TO THE FUEL LEVEL SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING

PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

   NOTE: Diagnose and repair any CAN bus, communication or implausible signal DTCs before proceeding with this test.

   1. Start the engine.
   2. Allow the engine to reach normal operating temperature.
   3. With the scan tool, select View DTCs.

      NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

   Is the DTC Active or Pending at this time?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **VISUALLY INSPECT FUEL TANK**
   1. Visually inspect the Fuel Tank for damage that may restrict the Fuel Sending Unit float from moving.

   Is the Fuel Tank OK?

   Yes

   - Go To 3

   No

- Replace the Fuel Tank as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **FUEL LEVEL SENSOR CIRCUIT DTCS SET IN THE CCN**

Are any Fuel Level Sensor Circuit DTCs set in the CCN?

Yes

- Diagnose the appropriate Fuel Level Sensor circuit DTC in the CCN. Refer to **DIAGNOSIS AND TESTING** .

No

- Go To 4

4. **INTERNAL INSPECTION OF THE FUEL TANK**

WARNING: **The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in possible serious or fatal injury.**

1. Remove the Fuel Tank in accordance with the Service Information.
2. Remove the Fuel Pump Module.
3. Visually inspect the inside of the Fuel Tank for any obstructions or deformities.
4. Inspect the Fuel Pump Module Float arm for damage.

Were any problems found?

Yes

- Repair or replace as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Cabin Compartment Node (CCN) and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Sensor and Powertrain Control Module connectors.
   4. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.

   No

   - Replace and program the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2072-ELECTRONIC THROTTLE CONTROL SYSTEM - ICE BLOCKAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the throttle plate is stuck during extremely cold ambient temperature operation. The PCM will initiate a

throttle de-icing procedure, and if the throttle blade still doesn't move, this DTC will set. The MIL will not illuminate. The vehicle will be in Limp home condition, limiting RPM and vehicle speed.

POSSIBLE CAUSES

POSSIBLE CAUSES
THROTTLE PLATE OBSTRUCTION

DIAGNOSTIC TEST

THROTTLE BODY INSPECTION

1. Ignition on, engine not running.
2. With a scan tool, select View DTCs. Record the related Freeze Frame data.

   NOTE: Diagnose any other DTCs before continuing.

   NOTE: P2110 will set with P2072. P2118 may also set and the customer will experience a Limp-in condition. If either of these two faults are set, it indicates that the ice blockage software has run and no repair is necessary.

   NOTE: This DTC will set in extreme cold ambient temperatures when the PCM detects that the throttle plate is stuck. By the time the vehicle is serviced, the condition may be corrected.

3. Turn the ignition off.
4. Remove the air cleaner assembly.
5. Check for any signs of a foreign material (ice or dirt) on the throttle plate or in the throttle bore that can cause the throttle plate to stick.

   Were any problems found?

   Yes

   - Repair as necessary. If the throttle blade is frozen, allow the throttle body to thaw naturally in a warm location.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Test complete.

P2096-DOWNSTREAM FUEL TRIM SYSTEM 1 LEAN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running in closed loop, the ambient/battery temperature above -7° C (20° F) and altitude below 8500 ft.

SET CONDITION

The conditions that cause this diagnostic to fail is when the upstream O2 sensor becomes biased from an exhaust leak, O2 sensor contamination, or some other extreme operating condition. The downstream O2 sensor is considered to be protected from extreme environments by the catalyst. The Powertrain Control Module (PCM) monitors the downstream O2 sensor feedback control, called downstream fuel trim, to detect any shift in the upstream O2 sensor target voltage from nominal target voltage. The value of the downstream fuel trim is compared with the lean thresholds. Every time the value exceeds the calibrated threshold, a fail timer is incremented and mass flow through the exhaust is accumulated. If the fail timer and accumulated mass flow exceed the fail thresholds, the test fails and the diagnostic stops running for that trip. If the test fails on consecutive trips, a DTC is set.

POSSIBLE CAUSES

POSSIBLE CAUSES
EXHAUST LEAK
FUEL DELIVERY SYSTEM
O2 SENSOR, WIRING, OR CONNECTORS
ENGINE MECHANICAL SYSTEM
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **EXHAUST LEAK**

   NOTE: A thorough exhaust leak test must be completed before removing an O2 Sensor or any other part from the exhaust system. Do not remove any parts before an exhaust leak check has been completed.

   NOTE: An exhaust leak may cause downstream fuel adaptives to rail out, resulting in a false O2 Sensor failure

   1. Perform the diagnostic procedure for CHECKING THE EXHAUST SYSTEM FOR LEAKS. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Go To 7

      No

      - Go To 2

2. **DTC IS ACTIVE**
   1. Diagnose and repair any other active component or circuit DTCs before continuing with this procedure.
   2. Turn the ignition on.
   3. With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.
   4. Start the engine and allow it to reach operating temperature.

      WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put

your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

5. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 3

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

3. **CHECKING THE FUEL DELIVERY SYSTEM**
   1. Perform the diagnostic procedures for FUEL PRESSURE LEAK DOWN and FUEL DELIVERY SYSTEM OUTPUT - FLOW TEST. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 4

4. **CHECKING THE OXYGEN SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE OXYGEN SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 5
5. **CHECKING THE ENGINE MECHANICAL SYSTEM**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE MECHANICAL SYSTEM. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 6
6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors relative to the components tested in this procedure.
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to the components tested in this procedure and wiggle test the wiring and connectors.
      - Look for the data to change or for a DTC to set during the wiggle

test.

- Perform any technical service bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the PCM in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **EXHAUST LEAK**
   1. Repair the exhaust leak(s) as necessary.
   2. Start the engine and allow it to reach operating temperature.
   3. Test drive the vehicle at a steady 80 kph (50 mph) to 97 kph (60 mph) for at least 10 minutes.
   4. Stop the vehicle and turn the ignition off for 5 seconds.
   5. Test drive the vehicle again at a steady 80 kph (50 mph) to 97 kph (60 mph) for at least 10 minutes.
   6. Stop the vehicle.
   7. With the scan tool, select View DTCs.

   Does this DTC reset as a pending or stored DTC?

   Yes

   - Retest. Go To 1

   No

   - Test Complete.

- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2097-DOWNSTREAM FUEL TRIM SYSTEM 1 RICH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running in closed loop, the ambient/battery temperature above -7° C (20° F) and altitude below 8500 ft.

SET CONDITION

The conditions that cause this diagnostic to fail is when the upstream O2 sensor becomes biased from an exhaust leak, O2 sensor contamination, or some other extreme operating condition. The downstream O2 sensor is considered to be protected from extreme environments by the catalyst. The Powertrain Control Module (PCM) monitors the downstream O2 sensor feedback control, called downstream fuel trim, to detect any shift in the upstream O2 sensor target voltage from nominal target voltage. The value of the downstream fuel trim is compared with the rich thresholds. Every time the value exceeds the calibrated threshold, a fail timer is incremented and mass flow through the exhaust is accumulated. If the fail timer and accumulated mass flow exceed the fail thresholds, the test fails and the diagnostic stops running for that trip. If the test fails on consecutive trips, a DTC is set.

POSSIBLE CAUSES

POSSIBLE CAUSES
EXHAUST LEAK
FUEL DELIVERY SYSTEM
O2 SENSOR, WIRING, OR CONNECTORS
ENGINE MECHANICAL SYSTEM
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **EXHAUST LEAK**

NOTE: A thorough exhaust leak test must be completed before removing an O2 Sensor or any other part from the exhaust system. Do not remove any parts before an exhaust leak check has been completed.

NOTE: An exhaust leak may cause downstream fuel adaptives to rail out, resulting in a false O2 Sensor failure

1. Perform the diagnostic procedure for CHECKING THE EXHAUST SYSTEM FOR LEAKS. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Go To 7

   No

   - Go To 2

2. **DTC IS ACTIVE**
   1. Diagnose and repair any other active component or circuit DTCs before continuing with this procedure.
   2. Turn the ignition on.
   3. With the scan tool, select View DTCs. Copy DTC and Freeze Frame information.
   4. Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Attempt to operate the vehicle under conditions similar to which the DTC was set.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

5. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 3

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

3. **CHECKING THE FUEL DELIVERY SYSTEM**
   1. Perform the diagnostic procedures for FUEL PRESSURE LEAK DOWN and FUEL DELIVERY SYSTEM OUTPUT - FLOW TEST. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the Service Information.
      - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 4

4. **CHECKING THE OXYGEN SENSOR OPERATION**
   1. Perform the diagnostic procedure for CHECKING THE OXYGEN SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **CHECKING THE ENGINE MECHANICAL SYSTEM**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE MECHANICAL SYSTEM. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 6

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors relative to the components tested in this procedure.
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to the components tested in this procedure and wiggle test the wiring and connectors.
      - Look for the data to change or for a DTC to set during the wiggle test.
      - Perform any technical service bulletins that may apply.

   Were any problems found?

Yes

- Repair as necessary.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the PCM in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **EXHAUST LEAK**
   1. Repair the exhaust leak(s) as necessary.
   2. Start the engine and allow it to reach operating temperature.
   3. Test drive the vehicle at a steady 80 kph (50 mph) to 97 kph (60 mph) for at least 10 minutes.
   4. Stop the vehicle and turn the ignition off for 5 seconds.
   5. Test drive the vehicle again at a steady 80 kph (50 mph) to 97 kph (60 mph) for at least 10 minutes.
   6. Stop the vehicle.
   7. With the scan tool, select View DTCs.

   Does this DTC reset as a pending or stored DTC?

   Yes

   - Retest. Go To 1

   No

   - Test Complete.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2100-ELECTRONIC THROTTLE CONTROL MOTOR CIRCUIT

Fig. 155: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the ETC Motor not in Limp Home mode.

SET CONDITION

When the Powertrain Control Module (PCM) detects an internal error or short between the ETC Motor (-) and ETC Motor (+) circuits in the ETC Motor Driver. One trip fault. ETC light is flashing.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW BATTERY VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT
(K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE
(K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE
ETC MOTOR/THROTTLE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST.

1. **ACTIVE DTC**

NOTE: If this DTC sets intermittently, it is possible that the controller is overheating in extremely hot temperatures. This is considered a normal protection operation. No repair is necessary.

NOTE: Low battery voltage can cause excessive current draw in very hot and cold ambient temperatures. Make sure the battery can pass a load test before continuing. Review Freeze Frame information to determine the ambient temperature when the DTC

set.

1. Start the engine and allow it to reach normal operating temperature.

   WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **THROTTLE PLATE INSPECTION**
   1. Turn the ignition off.
   2. Remove the air cleaner assembly.
   3. Check for any signs of a foreign material (ice or dirt) on the throttle plate or in the throttle bore that can cause the throttle plate to stick.

      Were any problems found?

      Yes

      - Remove the debris if possible or replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 156: Checking ETC Motor (+) Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Throttle Body harness connector.
3. Disconnect the PCM C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (K124) ETC Motor (+) circuit.

   Is there any voltage present?

   Yes

- Repair the (K124) ETC Motor (+) circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 157: Checking ETC Motor (-) Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K126) ETC Motor (-) circuit.

   Is there any voltage present?

   Yes

   - Repair the (K126) ETC Motor (-) circuit for a short to voltage.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **CHECK FOR THE (K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT**

Fig. 158: Checking ETC Motor (+) Circuit For Short To ETC Motor (-) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

   Is the resistance above 10k Ohms?

   Yes

- Go To 6

No

- Repair the short to between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 159: Checking ETC Motor Circuit (+) For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (K124) ETC Motor (+) circuit.

   Is the resistance above 10k Ohms?

   Yes

- Go To 7

No

- Repair the (K124) ETC Motor (+) circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 160: Checking ETC Motor Circuit (-) For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (K126) ETC Motor (-) circuit.

   Is the resistance above 10k Ohms?

   Yes

- Go To 8

No

- Repair the (K126) ETC Motor (-) circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K126) ETC Motor (-) circuit between the Throttle Body harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 9

No

- Repair the (K126) ETC Motor (-) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

1. Measure the resistance of the (K124) ETC Motor (+) circuit between the Throttle Body harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 10

No

- Repair the (K124) ETC Motor (+) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **ETC MOTOR**
    1. Replace the Throttle Body Assembly in accordance with the service information. After installation is complete, use a scan tool and perform the ETC RELEARN function.
    2. Turn the ignition on.
    3. With the scan tool, erase DTCs.
    4. Cycle the ignition off, and back to the on position.
    5. With the scan tool, view DTCs.

    Did the DTC return?

    Yes

    - Go To 11

    No

    - Repair is complete.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2101-ELECTRONIC THROTTLE CONTROL MOTOR PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running, ETC motor not in limp home mode, and TPS adaptation complete.

SET CONDITION

The Powertrain Control Module (PCM) detects too large of an error between the actual position of the throttle plate and the desired set point. One trip fault. The DTC will set within 5 seconds. Three good trips to turn off the MIL ETC light is flashing.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW SYSTEM VOLTAGE
THROTTLE BODY ASSEMBLY

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING

PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If this DTC sets intermittently, it is possible that the controller is overheating in extremely hot temperatures. This is considered a normal protection operation. No repair is necessary.

NOTE: Low system voltage can cause excessive current draw in very hot and cold ambient temperatures. Make sure the battery can pass a load test before continuing. Review Freeze Frame information to determine the ambient temperature when the DTC set.

1. Start the engine and allow it to reach normal operating temperature.

WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **THROTTLE PLATE STICKING OR OBSTRUCTED**

1. Turn the ignition off.
2. Remove the air cleaner assembly.
3. Check for any signs of a foreign material (ice or dirt) on the throttle plate or in the throttle bore that can cause the throttle plate to stick.

   Were any problems found?

   Yes

   - Remove the debris if possible or replace the Throttle Body Assembly. Disconnect the battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and perform the ETC Relearn function.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **THROTTLE PLATE NOT WITHIN DESIRED POSITION**
   1. Start the engine and allow it to reach normal operating temperature.
   2. With a scan tool, monitor the Actual Throttle Position and Desired Throttle Position.

      Is the Actual Throttle Position within 2 degrees of the Desired Throttle Position?

      Yes

      - Go To 4

      No

      - Replace the Throttle Body Assembly. Disconnect the battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and perform the ETC Relearn function.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **ELECTRONIC THROTTLE CONTROL MOTOR**

1. Turn the ignition on.
2. With a scan tool, actuate the Electronic Throttle Control Motor and observe the movement of the throttle blade.

NOTE: It may be necessary to use a mirror to see the throttle blade.

NOTE: Make sure the motion of the throttle blade is smooth and that it opens and closes.

Did the ETC motor operate properly?

Yes

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

No

- Replace the Throttle Body Assembly. Disconnect the battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and perform the ETC Relearn function.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2107-ELECTRONIC THROTTLE CONTROL MODULE PROCESSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Internal Powertrain Control Module (PCM) failure. Module will attempt to reset, so you will be able to hear the throttle relearning. If the condition is continuous, the vehicle may not be drivable. One trip fault. ETC light is flashing.

POSSIBLE CAUSES

POSSIBLE CAUSES
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Turn the ignition on.
2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
3. Verify the Powertrain Control Module (PCM) is at the latest calibration (flash level). If necessary, update the Powertrain Control Module (PCM) in accordance with the Service Information.
4. Start the engine and allow it to reach operating temperature.
5. Increase engine speed by pressing the accelerator pedal. Do not exceed 3500 RPM.
6. Test drive the vehicle for 10 miles on a flat road surface.
7. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2110-ELECTRONIC THROTTLE CONTROL - FORCED LIMITED RPM

Fig. 161: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on and ETC motor is working.

SET CONDITION

When the Powertrain Control Module (PCM) requests to limit engine speed if PWM is too high for 20.5 seconds and before P2118 sets. One trip fault and the code will set within 5 seconds. ETC light is illuminated.

POSSIBLE CAUSES

POSSIBLE CAUSES
THROTTLE PLATE STUCK OR OBSTRUCTED
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT
(K124) ETC POSITIVE CIRCUIT SHORTED TO GROUND
(K126) ETC NEGATIVE CIRCUIT SHORTED TO GROUND
(K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE
(K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE
ETC MOTOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Turn the ignition on.

NOTE: **If this DTC sets intermittently, it is possible that the controller is overheating in extremely hot temperatures. This is considered a normal protection operation. No repair is necessary.**

NOTE: **Low battery voltage can cause excessive current draw in very hot and cold ambient temperatures. Make sure the battery can pass a load test before continuing. Review Freeze Frame information to**

determine the ambient temperature when the DTC set.

NOTE: If P2072 is also set, this indicates that the cold weather ice blockage routine has run. No repair action is required.

NOTE: Diagnose and repair any Throttle Position sensor, system voltage, or 5-Volt Supply DTCs before continuing with this test.

2. Start the engine and allow it to reach normal operating temperature.

   WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **THROTTLE PLATE INSPECTION**
   1. Turn the ignition off.
   2. Remove the air cleaner assembly.
   3. Check for any signs of a foreign material (ice or dirt) on the throttle plate or in the throttle bore that can cause the throttle plate to stick.
   4. Attempt to manually open the throttle plate. Use an appropriate tool that

will not damage or mar the throttle body.

Were any problems found?

Yes

- Remove the debris if possible or replace the Throttle Body Assembly. Disconnect the battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC Relearn function.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 162: Checking ETC Motor (+) Circuit For Short To Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Throttle Body harness connector.
3. Disconnect the PCM C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (K124) ETC Motor (+) circuit.

   Is there any voltage present?

   Yes

   - Repair the (K124) ETC Motor (+) circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 163: Checking ETC Motor (-) Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K126) ETC Motor (-) circuit.

   Is there any voltage present?

   Yes

   - Repair the (K126) ETC Motor (-) circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **CHECK FOR THE (K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT**

Fig. 164: Checking ETC Motor (+) Circuit For Short To ETC Motor (-) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the short to between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 165: Checking ETC Motor Circuit (+) For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (K124) ETC Motor (+) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 7

   No

   - Repair the short to ground in the (K124) ETC Motor (+) circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 166: Checking ETC Motor Circuit (-) For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (K126) ETC Motor (-) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Repair the short to ground in the (K126) ETC Motor (-) circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 8

8. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K126) ETC Motor (-) circuit between the Throttle Body harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 9

   No

   - Repair the (K126) ETC Motor (-) circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR AN OPEN /HIGH RESISTANCE**

1. Measure the resistance of the (K124) ETC Motor (+) circuit between the Throttle Body harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 10

   No

   - Repair the (K124) ETC Motor (+) circuit for an open circuit or

high resistance.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **ETC MOTOR**
    1. Replace the Throttle Body Assembly in accordance with the service information. After installation is complete, use a scan tool and perform the ETC RELEARN function.
    2. Turn the ignition on.
    3. With the scan tool, erase DTCs.
    4. Cycle the ignition off, and back to the on position.
    5. With the scan tool, view DTCs.

    Did the DTC return?

    Yes

    - Go To 11

    No

    - Repair is complete.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Refer to any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Replace and program the Powertrain Control Module in accordance service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2111-ELECTRONIC THROTTLE CONTROL - UNABLE TO CLOSE

Fig. 167: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on and battery voltage greater than 10 volts.

SET CONDITION

Just after key on, the throttle is opened and closed to test the system. If the Powertrain Control Module (PCM) detects that the TP Sensor does not return to Limp Home Position, this DTC will set. One trip fault. The DTC will set within five seconds. ETC light is flashing.

POSSIBLE CAUSES

POSSIBLE CAUSES
THROTTLE PLATE STICKING OR OBSTRUCTED
TP SENSOR CIRCUIT(S) HIGH RESISTANCE OR SHORTED
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT
(K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE
(K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND
THROTTLE BODY ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose any TPS or 5-Volt Supply DTCs before continuing.

NOTE: Maximum engine speed could be reduced while this fault is active, based on where the throttle plate is stuck.

NOTE: The PCM tests the ETC Motor by opening and closing the throttle plate before starting the engine. If the throttle plate does not return to the closed position this DTC will set.

1. Start the engine and allow it to reach normal operating temperature.

   WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **THROTTLE PLATE INSPECTION**
   1. Turn the ignition off.
   2. Remove the air cleaner assembly.
   3. Check for any signs of a foreign material (ice or dirt) on the throttle plate or in the throttle bore that can cause the throttle plate to stick or not fully close.
   4. Attempt to manually open the throttle plate and allow it to close. Use an appropriate tool that will not damage or mar the throttle body.

      Were any problems found?

      Yes

- Repair as necessary or replace the Throttle Body Assembly. Disconnect the battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC Relearn function.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **TPS 1 AND TPS 2 BOTH EQUAL 2.5 VOLTS**
   1. With a scan tool, perform the Throttle Follower test and monitor both TPS voltages.

      Are both TPS readings stuck at 2.5 volts?

      Yes

      - Check the TPS Signal circuits for excessive resistance, being shorted together, or shorted to the Sensor Ground circuit.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 4

4. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 168: Checking ETC Motor (+) Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Throttle Body harness connector.
3. Disconnect the PCM C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (K124) ETC Motor (+) circuit.

   Is there any voltage present?

   Yes

   - Repair the (K124) ETC Motor (+) circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 5

5. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 169: Checking ETC Motor (-) Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K126) ETC Motor (-) circuit.

   Is there any voltage present?

   Yes

   - Repair the (K126) ETC Motor (-) circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 6

6. **CHECK FOR THE (K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT**

Fig. 170: Checking ETC Motor (+) Circuit For Short To ETC Motor (-) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Repair the short to between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 7

7. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 171: Checking ETC Motor Circuit (+) For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (K124) ETC Motor (+) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 8

   No

   - Repair the short to ground in the (K124) ETC Motor (+) circuit.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 172: Checking ETC Motor Circuit (-) For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (K126) ETC Motor (-) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 9

   No

   - Repair the short to ground in the (K126) ETC Motor (-) circuit.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K126) ETC Motor (-) circuit between the Throttle Body harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 10

No

- Repair the (K126) ETC Motor (-) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

1. Measure the resistance of the (K124) ETC Motor (+) circuit between the Throttle Body harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 11

No

- Repair the (K124) ETC Motor (+) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2112-ELECTRONIC THROTTLE CONTROL - UNABLE TO OPEN

Fig. 173: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on and battery voltage greater than 10 volts.

SET CONDITION

Just after key on, the throttle is opened and closed to test the system. If the Powertrain Control Module (PCM) detects that the TP Sensor does not move from Limp Home Position, this DTC will set. One trip fault. The DTC will set within five seconds. ETC light is flashing.

POSSIBLE CAUSES

POSSIBLE CAUSES
THROTTLE PLATE STICKING OR OBSTRUCTED
TP SENSOR CIRCUIT(S) HIGH RESISTANCE OR SHORTED
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT
(K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE
(K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND
THROTTLE BODY ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose any TPS or 5-Volt Supply DTCs before continuing.

1. Turn the ignition on.
2. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put

your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **THROTTLE PLATE INSPECTION**
   1. Turn the ignition off.
   2. Remove the air cleaner assembly.
   3. Check for any signs of a foreign material (ice or dirt) on the throttle plate or in the throttle bore that can cause the throttle plate to stick or not open.
   4. Attempt to manually open the throttle plate. Use an appropriate tool that will not damage or mar the throttle body.

      Were any problems found?

      Yes

      - Repair as necessary or replace the Throttle Body Assembly. Disconnect the battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC Relearn function.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

- Go To 3

3. **TPS 1 AND TPS 2 BOTH EQUAL 2.5 VOLTS**
   1. With a scan tool, perform the Throttle Follower test and monitor both TPS voltages.

      Are both TPS readings stuck at 2.5 volts?

      Yes

      - Check the TPS Signal circuits for excessive resistance, being shorted together, or being shorted to the Sensor Ground circuit.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 4

4. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 174: Checking ETC Motor (+) Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Throttle Body harness connector.
3. Disconnect the PCM C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (K124) ETC Motor (+) circuit.

   Is there any voltage present?

   Yes

   - Repair the (K124) ETC Motor (+) circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 5

5. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 175: Checking ETC Motor (-) Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K126) ETC Motor (-) circuit.

   Is there any voltage present?

   Yes

   - Repair the (K126) ETC Motor (-) circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 6

6. **CHECK FOR THE (K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT**

Fig. 176: Checking ETC Motor (+) Circuit For Short To ETC Motor (-) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Repair the short to between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 7

7. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 177: Checking ETC Motor Circuit (+) For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (K124) ETC Motor (+) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 8

   No

   - Repair the (K124) ETC Motor (+) circuit for a short to ground.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 178: Checking ETC Motor Circuit (-) For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (K126) ETC Motor (-) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 9

   No

   - Repair the short to ground in the (K126) ETC Motor (-) circuit.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K126) ETC Motor (-) circuit between the Throttle Body harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 10

No

- Repair the (K126) ETC Motor (-) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

1. Measure the resistance of the (K124) ETC Motor (+) circuit between the Throttle Body harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 11

No

- Repair the (K124) ETC Motor (+) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2115-ACCELERATOR PEDAL POSITION SENSOR 1 MINIMUM STOP PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the igniting on. During in-plant testing, the APPS is checked to make sure the minimum and maximum values can be reached. The PCM performs the diagnostic test for this DTC after the diagnostic test for P2166 has passed.

SET CONDITION

APPS 1 has failed to achieve the required minimum value during In-Plant testing. One trip fault and the code will set within 5 seconds. Engine will only idle.

POSSIBLE CAUSES

POSSIBLE CAUSES
ETC RELEARN ACCELERATOR PEDAL POSITION SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Turn the ignition on.

        NOTE: This DTC is set when the APPS values are learned in-plant but do not reach the minimum or maximum voltage range.

        NOTE: Diagnose any APP Sensor out of range and 5-Volt Supply DTCs before continuing.

    2. With the scan tool, clear DTCs.
    3. Start the engine.
    4. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go to 2

    No

    - Perform the INTERMITTENT CONDITION diagnostic procedure.

Refer to **INTERMITTENT CONDITION** .

2. **ACCELERATOR PEDAL POSITION SENSOR**
   1. With a scan tool perform the ETC RELEARN function.
   2. With the scan tool, clear DTCs.
   3. Start the engine.
   4. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Replace the Accelerator Pedal Position Sensor in accordance with the service information. After installation is complete, perform the ETC RELEARN function.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Test Complete.

2014 ENGINE PERFORMANCE

Powertrain Control Module (PCM) - Electrical Diagnostics, 2.0L & 2.4L - Compass & Patriot

DIAGNOSIS AND TESTING

P2116-ACCELERATOR PEDAL POSITION SENSOR 2 MINIMUM STOP PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the igniting on. During in-plant testing, the APPS is checked to make sure the minimum and maximum values can be reached. The PCM performs the diagnostic test for this DTC after the diagnostic test for P2167 has passed.

SET CONDITION

APPS 2 has failed to achieve the required minimum value during In-Plant testing. One trip fault and the code will be stored within 5 seconds. Engine will only idle.

POSSIBLE CAUSES

POSSIBLE CAUSES
ETC RELEARN ACCELERATOR PEDAL POSITION SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Turn the ignition on.

NOTE: This DTC is set when the APPS values are learned in-plant but do not reach the minimum or maximum voltage range.

NOTE: Diagnose any APPS out of range and 5-Volt supply DTCs before continuing.

2. With the scan tool, clear DTCs.
3. Start the engine.
4. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go to 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **ACCELERATOR PEDAL POSITION SENSOR**
   1. With a scan tool perform the ETC RELEARN function.

   3. Start the engine.
   4. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Replace the Accelerator Pedal Position Sensor in accordance with the Service Information. After installation is complete, perform the ETC RELEARN function.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Test Complete.

P2118-ELECTRONIC THROTTLE CONTROL MOTOR CURRENT PERFORMANCE

Fig. 1: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on and ETC motor is not in the Limp Home Position.

SET CONDITION

When the Powertrain Control Module (PCM) detects an internal error or a short between the ETC Motor (-) and ETC Motor (+) circuits in the ETC Motor Driver. One trip fault. ETC light is flashing.

POSSIBLE CAUSES

POSSIBLE CAUSES
THROTTLE PLATE STUCK OR OBSTRUCTED
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT
(K124) ETC POSITIVE CIRCUIT SHORTED TO GROUND
(K126) ETC NEGATIVE CIRCUIT SHORTED TO GROUND
(K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE
(K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE
ETC MOTOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: **If this DTC sets intermittently, it is possible that the controller is overheating in extremely hot temperatures. This is considered a normal protection operation. No repair is necessary.**

NOTE: **Low battery voltage can cause excessive current draw in very hot and cold ambient temperatures. Make sure the battery can pass a load test before continuing. Review Freeze Frame information to determine the ambient temperature when the DTC**

set.

NOTE: If P2072 is also set, this indicates that the cold weather ice blockage routine has run. No repair action is necessary.

NOTE: Diagnose and repair any Throttle Position sensor, system voltage, or 5-Volt supply DTCs before continuing with this test.

1. Start the engine and allow it to reach normal operating temperature.

   WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **THROTTLE PLATE INSPECTION**
   1. Turn the ignition off.
   2. Remove the air cleaner assembly.
   3. Check for any signs of a foreign material (ice or dirt) on the throttle plate or in the throttle bore that can cause the throttle plate to stick.
   4. Attempt to manually open the throttle plate. Use an appropriate tool that will not damage or mar the throttle body.

Were any problems found?

Yes

- Remove the debris if possible or replace the Throttle Body Assembly. Disconnect the battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC Relearn function.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 2: Checking ETC Motor (+) Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Throttle Body harness connector.
3. Disconnect the PCM C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (K124) ETC Motor (+) circuit.

   Is there any voltage present?

   Yes

   - Repair the (K124) ETC Motor (+) circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 3: Checking ETC Motor (-) Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K126) ETC Motor (-) circuit.

   Is there any voltage present?

   Yes

   - Repair the (K126) ETC Motor (-) circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 5

5. **CHECK FOR THE (K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT**

Fig. 4: Checking ETC Motor (+) Circuit For Short To ETC Motor (-) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the short to between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 5: Checking ETC Motor Circuit (+) For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (K124) ETC Motor (+) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 7

   No

   - Repair the (K124) ETC Motor (+) circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 6: Checking ETC Motor Circuit (-) For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (K126) ETC Motor (-) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 8

   No

   - Repair the (K126) ETC Motor (-) circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (K126) ETC MOTOR (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K126) ETC Motor (-) circuit between the Throttle Body harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 9

No

- Repair the (K126) ETC Motor (-) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **CHECK THE (K124) ETC MOTOR (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

1. Measure the resistance of the (K124) ETC Motor (+) circuit between the Throttle Body harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 10

No

- Repair the (K124) ETC Motor (+) circuit for an open or high

resistance.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **ETC MOTOR**
    1. Replace the Throttle Body Assembly in accordance with the service information. After installation is complete, use a scan tool and perform the ETC RELEARN function.
    2. Turn the ignition on.
    3. With the scan tool, erase DTCs.
    4. Cycle the ignition off, and back to the on position.
    5. With the scan tool, view DTCs.

    Did the DTC return?

    Yes

    - Go To 11

    No

    - Repair is complete.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Replace and program the Powertrain Control Module in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2122-ACCELERATOR PEDAL POSITION SENSOR 1 CIRCUIT LOW

Fig. 7: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Electronic Throttle Control (ETC) system uses two Accelerator Pedal

Position (APP) Sensors to monitor the accelerator pedal position. The APP Sensors 1 and 2 are integrated into one assembly located at the pedal assembly. Each sensor has a 5-volt reference circuit, a low reference circuit, and a signal circuit. The Powertrain Control Module (PCM) reads the two signals individually and then compares the two signals as a redundant check of the throttle position. One of the sensors will fluctuate between 0 volts and 5.0 volts and the other sensor will fluctuate between 0 volts and 2.5 volts. The fluctuation of the two sensors should move proportionately. E.G. When operating properly, the voltage reading of the sensor operating on the 5.0 volt scale will always approximately two time the voltage reading of the sensor on the 2.5 volts scale.

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the APP Sensor 1 input voltage is below the minimum acceptable value. Acceleration rate and Engine output are limited. One trip fault and the code will set within 5 seconds. ETC light is flashing

POSSIBLE CAUSES

POSSIBLE CAUSES
5-VOLT SUPPLY APP SENSOR 1 CIRCUIT OPEN OR SHORTED TO GROUND
APP SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND
APP SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE APP SENSOR 1 GROUND CIRCUIT
APP SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE APP SENSOR 2 GROUND CIRCUIT
APP SENSOR 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
APP SENSOR 1 GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

   NOTE: Diagnose and repair any 5-Volt Sensor supply voltage DTCs before continuing with this test.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

   Is the DTC Active or Pending at this time?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (K852) 5-VOLT SUPPLY CIRCUIT VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Accelerator Pedal Position Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (K852) 5-Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

   Is the voltage between 4.9 and 5.2 volts?

   Yes

   - Go To 3

   No

   - Repair the (K852) 5-Volt Supply circuit for an open or short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K23) APP SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the PCM C1 harness connector.
   2. Measure the resistance between ground and the (K23) APP Sensor 1 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K23) APP Sensor 1 Signal circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
4. **CHECK FOR THE (K23) APP SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE SENSOR GROUND CIRCUITS**
   1. Measure the resistance between the (K23) APP Sensor 1 Signal circuit and the:
      - (K400) Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.
      - (K167) Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K23) APP Signal 1 circuit for a short to the Sensor Ground circuit that measured below 10k Ohms.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (K23) APP SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

   CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   2. Measure the resistance of the (K23) APP Sensor 1 Signal circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (K23) APP Sensor 1 Signal circuit for an open circuit or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K167) APP SENSOR GROUND 1 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

   1. Measure the resistance of the (K167) APP Sensor Ground 1 circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

- Repair the (K167) APP Sensor Ground 1 circuit for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE ACCELERATOR PEDAL POSITION SENSOR**
   1. Reconnect the PCM C1 harness connector.
   2. Connect a jumper between the (K852) 5-Volt Supply circuit and the (K23) APP Sensor 1 Signal circuit in the Accelerator Pedal Position Sensor harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read the Accelerator Pedal Position Sensor signal voltage.

      Is the voltage above 4.9 volts with the jumper in place?

      Yes

      - Replace the Accelerator Pedal Position Sensor in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 8

8. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2123-ACCELERATOR PEDAL POSITION SENSOR 1 CIRCUIT HIGH

Fig. 8: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the APP Sensor 1 input voltage is above the maximum acceptable value.

POSSIBLE CAUSES

POSSIBLE CAUSES
(K852) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K23) APP SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(K23) APP SIGNAL 1 CIRCUIT SHORTED TO THE (F856) 5 VOLT SUPPLY CIRCUIT
(K23) APP SIGNAL 1 CIRCUIT SHORTED TO THE (K858) 5 VOLT SUPPLY CIRCUIT
(K23) APP SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(K167) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE**

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

1. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 9: Checking 5-Volt Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Accelerator Pedal Position Sensor harness connector.
3. Disconnect the PCM C1 harness connector.
4. Turn the ignition on.

5. Measure the voltage of the (K852) 5-Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K852) 5-Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **CHECK THE (K23) APP SIGNAL 1 CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 10: Checking APP Signal 1 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K23) APP Signal 1 circuit in the Accelerator Pedal Position Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K23) APP Signal 1 circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **CHECK FOR THE (K23) APP SIGNAL 1 CIRCUIT SHORTED TO THE (K852) 5-VOLT SUPPLY CIRCUIT**

Fig. 11: Checking APP Signal 1 Circuit For Short To 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K23) APP Signal 1 circuit and the (K852) 5-Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the (K23) APP Signal 1 circuit for a short to the (K852) 5-Volt Supply circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK FOR THE (K23) APP SIGNAL 1 CIRCUIT SHORTED TO THE (K854) 5-VOLT SUPPLY CIRCUIT**

Fig. 12: Checking APP Signal 1 Circuit For Short To 5-Volt Supply

Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K23) APP Signal 1 circuit and the (K854) 5-Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the (K23) APP Signal 1 circuit for a short to the (K854) 5-Volt Supply circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K23) APP SIGNAL 1 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

   CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   2. Turn the ignition off.
   3. Measure the resistance of the (K23) APP Signal 1 circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

No

- Repair the (K23) APP Signal 1 circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K167) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K167) Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 8

      No

      - Repair the (K167) Sensor Ground circuit for an open circuit or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
8. **ACCELERATOR PEDAL POSITION SENSOR**

Fig. 13: Accelerator Pedal Position Sensor Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Connect the PCM C1 harness connector.
3. Connect a jumper between the (K167) Sensor Ground circuit and the (K23) APP Signal 1 circuit in the Accelerator Pedal Position Sensor harness connector.
4. Turn the ignition on.
5. With the scan tool, read the Accelerator Pedal Position Sensor signal voltage.

   Is the voltage below 0.1 volts with the jumper in place?

Yes

- Replace the Accelerator Pedal Position Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2127-ACCELERATOR PEDAL POSITION SENSOR 2 CIRCUIT LOW

Fig. 14: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Electronic Throttle Control (ETC) system uses two Accelerator Pedal Position (APP) Sensors to monitor the accelerator pedal position. The APP Sensors 1 and 2 are integrated into one assembly located at the pedal assembly. Each sensor has a 5-volt reference circuit, a low reference circuit, and a signal circuit. The Powertrain Control Module (PCM) reads the two signals individually and then compares the two signals as a redundant check of the throttle position. One of the sensors will fluctuate between 0 volts and 5.0 volts and the other sensor will fluctuate between 0 volts and 2.5 volts. The fluctuation of the two sensors should move proportionately. E.G. When operating properly, the voltage reading of the sensor operating on the 5.0 volt scale will always approximately two time the voltage reading of the sensor on the 2.5 volts scale.

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the APP Sensor 2 input voltage is below the minimum acceptable value. One trip fault. If the vehicle is equipped with the stop/start feature, the system will be disabled when this DTC is active.

POSSIBLE CAUSES

Possible Causes
5-VOLT SUPPLY CIRCUIT OPEN OR SHORTED TO GROUND
APP SENSOR 2 SIGNAL CIRCUIT OPEN
APP SENSOR 2 SIGNAL CIRCUIT SHORTED TO GROUND
APP SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE APP SENSOR 1 RETURN CIRCUIT
APP SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE APP SENSOR 2 RETURN CIRCUIT
APP SENSOR 2 GROUND CIRCUIT OPEN OR HIGH RESISTANCE
APP SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

   NOTE: Diagnose and repair any 5-Volt Sensor supply voltage DTCs before continuing with this test.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

   Is the DTC Active or Pending at this time?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (K854) 5-VOLT SUPPLY CIRCUIT VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Accelerator Pedal Position Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (K854) 5-Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

   Is the voltage between 4.9 and 5.2 volts?

   Yes

   - Go To 3

   No

   - Repair the (K854) 5-Volt Supply circuit for an open or short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K29) APP SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the PCM C1 harness connector.
   2. Measure the resistance between ground and the (K29) APP Sensor 2 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K29) APP Sensor 2 Signal circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
4. **CHECK FOR THE (K29) APP SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE SENSOR GROUND CIRCUITS**
   1. Measure the resistance between the (K29) APP Sensor 2 Signal circuit and the:
      - (K400) Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.
      - (K167) Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K29) APP Signal 2 circuit for a short to the Sensor Ground circuit that measured below 10k Ohms.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (K29) APP SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

   CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   2. Measure the resistance of the (K29) APP Sensor 2 Signal circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (K29) APP Sensor 2 Signal circuit for an open circuit or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K400) APP SENSOR GROUND 2 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (K400) APP Sensor Ground 2 circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

- Repair the (K400) APP Sensor Ground 2 circuit for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE ACCELERATOR PEDAL POSITION SENSOR**
   1. Reconnect the PCM C1 harness connector.
   2. Connect a jumper between the (K854) 5-Volt Supply circuit and the (K29) APP Sensor 2 Signal circuit in the Accelerator Pedal Position Sensor harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read the Accelerator Pedal Position Sensor signal voltage.

      Is the voltage above 4.9 volts with the jumper in place?

      Yes

      - Replace the Accelerator Pedal Position Sensor in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 8

8. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2128-ACCELERATOR PEDAL POSITION SENSOR 2 CIRCUIT HIGH

Fig. 15: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the APP Sensor 2 input voltage is above the maximum acceptable value.

POSSIBLE CAUSES

POSSIBLE CAUSES
(K854) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K29) APP SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(K29) APP SIGNAL 2 CIRCUIT SHORTED TO THE (K858) 5 VOLT SUPPLY CIRCUIT
(K29) APP SIGNAL 2 CIRCUIT SHORTED TO THE (K856) 5 VOLT SUPPLY CIRCUIT
(K29) APP SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(K400) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

1. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (K854) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 16: Checking 5-Volt Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Accelerator Pedal Position Sensor harness connector.
3. Disconnect the PCM C1 harness connector.

4. Turn the ignition on.
5. Measure the voltage of the (K854) 5-Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K854) 5-Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **CHECK THE (K29) APP SIGNAL 2 CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 17: Checking APP Signal 2 Circuit For Short To Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K29) APP Signal 2 circuit in the Accelerator Pedal Position Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K29) APP Signal 2 circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **CHECK FOR THE (K29) APP SIGNAL 2 CIRCUIT SHORTED TO THE (K854) 5-VOLT SUPPLY CIRCUIT**

Fig. 18: Checking APP Signal 2 Circuit For Short To 5-Volt Supply

Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K29) APP Signal 2 circuit and the (K854) 5-Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the (K29) APP Signal 2 circuit for a short to the (K854) 5-Volt Supply circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK FOR THE (K29) APP SIGNAL 2 CIRCUIT SHORTED TO THE (K852) 5-VOLT SUPPLY CIRCUIT**

Fig. 19: Checking APP Signal 2 Circuit For Short To 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K29) APP Signal 2 circuit and the (K852) 5-Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the (K29) APP Signal 2 circuit for a short to the (K852) 5-Volt Supply circuit.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K29) APP SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Turn the ignition off.
3. Measure the resistance of the (K29) APP Signal 2 circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7

   No

   - Repair the (K29) APP Signal 2 circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K400) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

1. Measure the resistance of the (K400) Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 8

No

- Repair the (K400) Sensor Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **ACCELERATOR PEDAL POSITION SENSOR**

Fig. 20: Accelerator Pedal Position Sensor Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Reconnect the PCM C1 harness connector.
3. Connect a jumper between the (K400) Sensor Ground circuit and the

(K29) APP Signal 2 circuit in the Accelerator Pedal Position Sensor harness connector.

4. Turn the ignition on.
5. With the scan tool, read the Accelerator Pedal Position Sensor signal voltage.

   Is the voltage below 0.1 volts with the jumper in place?

   Yes

   - Replace the Accelerator Pedal Position Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 9

9. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2135-THROTTLE POSITION SENSOR 1/2 CORRELATION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

NOTE: Diagnose and repair any Throttle Position Sensor Low or High DTCs before continuing.

1. Turn the ignition on.
2. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT VOLTAGE**

Fig. 22: Checking 5-Volt Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Throttle Body harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F855) 5-Volt Supply circuit in the Throttle Body harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 3

   No

   - Repair the (F855) 5-Volt Supply circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

3. **CHECK THE (K22) TPS SIGNAL 1 CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 23: Checking TP Signal 1 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K22) TPS Signal 1 circuit in the Throttle Body harness connector.

   Is the voltage above 5.2 volts?

   Yes

   - Go To 10

   No

   - Go To 4

4. **CHECK THE (K122) TPS SIGNAL 2 CIRCUIT FOR A SHORT TO**

VOLTAGE

Fig. 24: Checking TP Signal 2 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K122) TPS Signal 2 circuit in the Throttle Body harness connector.

   Is there any voltage present?

   Yes

   - Go To 11

   No

   - Go To 5

5. **CHECK THE (K922) TPS GROUND CIRCUIT**

Fig. 25: Checking TP Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Using a 12-volt test light connected to 12 volts, check the (K922) TPS Ground circuit in the Throttle Body harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 6

No

- Repair the (K922) TPS Ground circuit for an open or high

resistance.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK FOR THE (K22) TPS SIGNAL 1 CIRCUIT SHORTED TO (K922) TPS GROUND CIRCUIT**

Fig. 26: Checking TP Sensor Signal 1 Circuit For Short To TP Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the PCM C2 harness connector.
2. Measure the resistance between the (K22) TPS Signal 1 circuit and the (K922) TPS Ground circuit in the Throttle Body harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 7

No

- Repair the (K22) TPS Signal 1 circuit for a short to the (K922) TPS Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K22) TPS SIGNAL 1 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K22) TPS Signal 1 circuit between the Throttle Body harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 8

No

- Repair the (K22) TPS Signal 1 circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (K122) TPS SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

1. Measure the resistance of the (K122) TPS Signal 2 circuit between the Throttle Body harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 9

No

- Repair the (K122) TPS Signal 2 circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **THROTTLE BODY**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Inspect the Throttle Body for any condition that would result in an incorrect signal, such as damage or contamination.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace the Throttle Body in accordance with the service information. Refer to **THROTTLE BODY, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

10. **CHECK FOR THE (K22) TPS SIGNAL 1 CIRCUIT SHORTED TO ANOTHER VOLTAGE SUPPLY CIRCUIT**
    1. Disconnect the PCM C2 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will

damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

2. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
3. Measure the resistance between the (K22) TPS Signal 1 circuit and all other voltage supply circuits at the GPEC Adaptor.

   Is the resistance above 10k Ohms between the (K22) TPS Signal 1 circuit and all other voltage supply circuits?

   Yes

   - Go To 12

   No

   - Repair the (K22) TPS Signal 1 circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

11. **CHECK FOR THE (K122) TPS SIGNAL 2 CIRCUIT SHORTED TO ANOTHER VOLTAGE SUPPLY CIRCUIT**
    1. Disconnect the PCM C2 harness connector.

       CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

    2. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
    3. Measure the resistance between the (K122) TPS Signal 2 circuit and all other voltage supply circuits at the GPEC Adaptor.

       Is there any voltage present?

       Yes

- Go To 12

No

- Repair the (K122) TPs Signal 2 circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

12. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.
    6. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2138-ACCELERATOR PEDAL POSITION SENSOR 1/2 CORRELATION

Fig. 27: Throttle Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on, battery voltage greater than 10.4 volts, and no APPS 1 and

APPS 2 DTCs present.

SET CONDITION

The Powertrain Control Module (PCM) detects that the correlation between APPS 1 and APPS 2 is not plausible. Idle may be affected when the brake pedal is pressed or if a brake switch circuit error is present. Acceleration rate and engine output are limited. One trip fault and the code will set within five seconds. ETC light is flashing.

POSSIBLE CAUSES

POSSIBLE CAUSES
(K852) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K23) APP SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(K167) APP SENSOR GROUND 1 CIRCUIT OPEN OR HIGH RESISTANCE
(K854) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K29) APP SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(K400) APP SENSOR GROUND 2 CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any APP Sensor, system voltage, or sensor supply voltage DTCs before continuing with this test.

1. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put

your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (K852) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Accelerator Pedal Position Sensor harness connector.
   3. Disconnect the PCM C1 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   4. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   5. Measure the resistance of the (K852) 5-Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

- Go To 3

No

- Repair the (K852) 5-Volt Supply circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K23) APP SIGNAL 1 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K23) APP Signal 1 circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K23) APP Signal 1 circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
4. **CHECK THE (K167) APP SENSOR GROUND 1 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K167) APP Sensor Ground 1 circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

- Repair the (K167) APP Sensor Ground 1 circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (K854) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K854) 5-Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (K854) 5-Volt Supply circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
6. **CHECK THE (K29) APP SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K29) APP Signal 2 circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

      - Repair the (K29) APP Signal 2 circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to

POWERTRAIN VERIFICATION TEST .

7. **CHECK THE (K400) APP SENSOR GROUND 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K400) APP Sensor Ground 2 circuit between the Accelerator Pedal Position Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 8

      No

      - Repair the (K400) APP Sensor Ground 2 circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
8. **ACCELERATOR PEDAL POSITION SENSOR**
   1. Turn the ignition off.
   2. Connect the Accelerator Pedal Position Sensor harness connector.
   3. Reconnect the PCM C1 harness connector.
   4. Turn the ignition on.
   5. Set up a lab scope to view two graphs simultaneously.
   6. Using one channel on the lab scope, back probe the (K23) APP Signal 1 circuit at the APP Sensor harness connector.
   7. Using the other channel on the lab scope, back probe the (K29) APP Signal 2 circuit at the APP Sensor harness connector.
   8. Slowly press and release the Accelerator Pedal while monitoring the lab scope screen.

      Does the scope pattern show any missing or erratic signals?

      Yes

      - Replace the Accelerator Pedal Position Sensor in accordance with the service information.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.
    6. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2161-VEHICLE SPEED SENSOR 2 ERRATIC (WITH ABS)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With engine run time greater than 5 seconds, ECT above -8° C (17.6° F), transmission not in park or neutral, brakes not applied, engine RPM greater than 1500, and no ECT, MAP, TPS, ETC, or brake switch stuck DTCs present.

SET CONDITION

The Powertrain Control (PCM) receives an erratic vehicle speed signal. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
INTERMITTENT DTC
ACTIVE BUS OR COMMUNICATION DTCS
EXCESSIVE WHEEL SPEED VARIATION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any communication DTCs before continuing with this test.

NOTE: Diagnose and repair any DTCs set in the ABS Module before continuing with this test.

NOTE: Verify that the correct Pinion Factor and tire size are programmed into the ABS module before continuing. If necessary, update and retest.

1. Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put

your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **TIRE INSPECTION**

NOTE: This DTC can set as a result of excessive wheel speed variation, caused by unequal tire circumference or by front or rear wheels slipping (on loose gravel or ice, due to hard acceleration, etc.)

1. Inspect all tires for proper inflation and excessive wear.
2. Review Freeze Frame information to determine road and driving conditions when the fault set.

   Were any problems found?

   Yes

   - Repair as necessary. If the DTC set during a front or rear wheel spin condition, no repair is necessary.
   - Perform the PCM VERIFICATION Test. Refer to

POWERTRAIN VERIFICATION TEST .

No

- Go To 3

3. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Anti-lock Brake Module and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

P2166-ACCELERATOR PEDAL POSITION SENSOR 1 MAXIMUM STOP PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the igniting on. During in-plant testing, the APP Sensor is checked to make sure the minimum and maximum values can be reached.

SET CONDITION

APPS 1 has failed to achieve the required maximum value during In-Plant testing. One trip fault and the code will set within five seconds. Engine will only idle.

POSSIBLE CAUSES

POSSIBLE CAUSES
ETC RELEARN ACCELERATOR PEDAL POSITION SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: This DTC is set when the APPS values are learned in-plant but do not reach the minimum or maximum voltage range.

NOTE: Diagnose any APPS or 5 volt supply DTCs before continuing.

1. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **ACCELERATOR PEDAL POSITION SENSOR**
   1. With a scan tool perform the ETC RELEARN function.
   2. With the scan tool, clear DTCs.
   3. Start the engine.
   4. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Replace the Accelerator Pedal Position Sensor in accordance with the Service Information. After installation is complete, perform the ETC RELEARN function.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Test. Complete.

P2167-ACCELERATOR PEDAL POSITION SENSOR 2 MAXIMUM STOP PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the igniting on. During in-plant testing, the APP Sensors need to be checked to make sure the minimum and maximum values can be reached.

SET CONDITION

APPS 2 has failed to achieve the required maximum value during In-Plant testing. One trip fault and the code will be stored within five seconds. Engine

will only idle.

POSSIBLE CAUSES

POSSIBLE CAUSES
ETC RELEARN ACCELERATOR PEDAL POSITION SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC ACTIVE**

NOTE: This DTC is set when the APP Sensor values are learned in-plant but do not reach the minimum or maximum voltage range.

NOTE: Diagnose any APPS out of range and 5 volt supply DTCs before continuing.

1. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **ACCELERATOR PEDAL POSITION SENSOR**
   1. With a scan tool perform the ETC RELEARN function.
   2. With the scan tool, clear DTCs.
   3. Start the engine.
   4. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Replace the Accelerator Pedal Position Sensor in accordance with the Service Information. After installation is complete, perform the ETC RELEARN function.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Test. complete.

P2172-HIGH AIRFLOW/VACUUM LEAK DETECTED (INSTANTANEOUS ACCUMULATION)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on and engine running with no MAP Sensor DTCs.

SET CONDITION

A large vacuum leak has been detected or the signal voltage for both TP Sensors is stuck at 2.5 volts and calculated MAP is less than actual MAP minus an offset value. One trip fault and the code will set within five seconds. ETC light will flash.

POSSIBLE CAUSES

POSSIBLE CAUSES

VACUUM LEAK
MAP SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
THROTTLE POSITION SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
MAP SENSOR
THROTTLE POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: This fault code could be present if any Cam/Crank DTCs are set (P0335, P0365, P0366). No repair is necessary for P2172.

NOTE: Diagnose and repair any TP Sensor or MAP Sensor DTCs before continuing.

NOTE: Diagnose and repair any VSS or 5-Volt supply circuit DTCs before continuing.

NOTE: The throttle plate and linkage should be free from binding and carbon build up.

NOTE: Make sure the throttle plate is at the idle position.

1. Start the engine and allow it to reach normal operating temperature.

WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in**

possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **VACUUM LEAK**

NOTE: This code is enabled on engines equipped with a plastic intake manifold to limit engine operation if a large vacuum leak should occur.

NOTE: A large vacuum leak is the most probable cause of this DTC.

1. Inspect the intake manifold, power brake booster, and PCV system for any vacuum leaks.
2. Inspect the throttle plate. If the throttle blade is bent or will not close, the throttle body may need to be replaced.
3. Inspect the MAP Sensor and Throttle Body for proper installation.
4. Inspect the engine for any mechanical conditions that can cause low engine vacuum.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **MAP SENSOR OPERATION**
   1. Start the engine.
   2. With a scan tool, monitor the MAP Sensor voltage.
   3. Snap the throttle.

   Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at wide open throttle?

   Yes

   - Go To 5

   No

   - Go To 4

4. **MAP SENSOR**
   1. Turn the ignition off.
   2. Disconnect the MAP Sensor harness connector.
   3. Disconnect the PCM harness connector.
   4. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor and the Powertrain Control Module (PCM).
   5. Look for any chafed, pierced, pinched, or partially broken wires.
   6. Look for broken, bent, pushed out or corroded terminals.
   7. Check each of the MAP Sensor circuits for high resistance or a shorted condition.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace the MAP Sensor.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **THROTTLE FOLLOWER Test.**
   1. Ignition on, engine not running.
   2. With a scan tool, perform the Throttle Follower Test. and monitor the TP Sensor 1 and TP Sensor 2 voltages.
   3. Slowly press the throttle pedal down.
   4. The voltage for TP Sensor 1 should start at approximately 0.5 volts and increase to approximately 3.3 volts.
   5. The voltage for TP Sensor 2 should start at approximately 4.4 volts and decrease to approximately 1.7 volts.

   Is the voltage within the range specified for each sensor?

   Yes

   - Go To 7

   No

   - Go To 6

6. **THROTTLE BODY**
   1. Turn the ignition off.
   2. Disconnect the Throttle Body harness connector.
   3. Disconnect the PCM harness connector.
   4. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
   5. Look for any chafed, pierced, pinched, or partially broken wires.
   6. Look for broken, bent, pushed out or corroded terminals.
   7. Check each of the Throttle Body circuits for high resistance or a shorted condition.

   Were any problems found?

Yes

- Repair as necessary.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace the Throttle Body in accordance with the Service Information.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM) and between the MAP Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

P2173-HIGH AIRFLOW/VACUUM LEAK DETECTED (SLOW ACCUMULATION)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on and engine running with no MAP Sensor DTCs.

SET CONDITION

A large vacuum leak has been detected or the signal voltage for both TP Sensors is stuck at 2.5 Volts and calculated MAP is less than the Gas Flow Adaptation value. One trip fault; the DTC will set within five seconds. ETC light will flash.

POSSIBLE CAUSES

POSSIBLE CAUSES
VACUUM LEAK
MAP SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
MAP SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any ETC, MAP Sensor, VSS, or 5-Volt supply circuit DTCs before continuing.

1. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. Using the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the CHECKING FOR AN INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **VACUUM LEAK**

NOTE: This DTC is enabled on engines equipped with a plastic intake manifold to limit engine operation if a large vacuum leak should occur.

NOTE: A large vacuum leak is the most probable cause of this DTC.

1. Inspect the intake manifold, power brake booster, and PCV system for any vacuum leaks.
2. Inspect the MAP Sensor and Throttle Body for proper installation.
3. Inspect the engine for any mechanical conditions that can cause low engine vacuum.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **MAP SENSOR OPERATION**

1. Start the engine.
2. With a scan tool, monitor the MAP Sensor voltage.
3. Snap the throttle.

   Does the MAP Sensor voltage vary from below 2.0 Volts at idle to above 3.5 Volts at wide open throttle?

   Yes

   - Go To 5

   No

   - Go To 4

4. **MAP SENSOR**
   1. Turn the ignition off.
   2. Disconnect the MAP Sensor harness connector.
   3. Disconnect the PCM harness connector.
   4. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor and the Powertrain Control Module (PCM).
   5. Look for any chafed, pierced, pinched, or partially broken wires.
   6. Look for broken, bent, pushed out or corroded terminals.
   7. Check each of the MAP Sensor circuits for high resistance or a shorted condition.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace the MAP Sensor.
   - Perform the PCM VERIFICATION Test. Refer to

POWERTRAIN VERIFICATION TEST .

5. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

P2174-LOW AIRFLOW/RESTRICTION DETECTED (INSTANTANEOUS ACCUMULATION)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on and engine running with no MAP Sensor DTCs.

SET CONDITION

The Powertrain Control Module (PCM) detects that calculated MAP is greater than actual MAP plus an offset value. One trip fault and the code will set within 5 seconds. Three good trips to turn of the MIL. ETC light will flash.

POSSIBLE CAUSES

POSSIBLE CAUSES
AIR INTAKE SYSTEM OBSTRUCTION
VACUUM LEAK
MAP SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
THROTTLE POSITION SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
MAP SENSOR
THROTTLE POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST.

1. **ACTIVE DTC**

NOTE: Diagnose and repair any TP Sensor or MAP Sensor DTCs before continuing.

NOTE: Diagnose and repair any VSS or 5-Volt supply circuit DTCs before continuing.

NOTE: The throttle plate and linkage should be free from binding and carbon build up.

NOTE: Make sure the throttle plate is at the idle position.

1. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **VACUUM LEAK**
   1. Inspect the intake manifold, power brake booster, and PCV system for any vacuum leaks.
   2. Inspect the throttle plate. If the throttle blade is bent or will not close, the throttle body may need to be replaced.
   3. Inspect the MAP Sensor and Throttle Body for proper installation.
   4. Inspect the air intake system for any restrictions or obstructions.
   5. Inspect the engine for any mechanical conditions that can cause low engine vacuum.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 3

3. **MAP SENSOR OPERATION**
   1. Start the engine.
   2. With a scan tool, monitor the MAP Sensor voltage.
   3. Snap the throttle.

Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at wide open throttle?

Yes

- Go To 5

No

- Go To 4

4. **MAP SENSOR**
   1. Turn the ignition off.
   2. Disconnect the MAP Sensor harness connector.
   3. Disconnect the PCM harness connector.
   4. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor and the Powertrain Control Module (PCM).
   5. Look for any chafed, pierced, pinched, or partially broken wires.
   6. Look for broken, bent, pushed out or corroded terminals.
   7. Check each of the MAP Sensor circuits for high resistance or a shorted condition.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace the MAP Sensor.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **THROTTLE FOLLOWER TEST**
   1. Ignition on, engine not running.

2. With a scan tool, perform the Throttle Follower Test. and monitor the TP Sensor 1 and TP Sensor 2 voltages.
3. Slowly press the throttle pedal down.
4. The voltage for TP Sensor 1 should start at approximately 0.5 volts and increase to approximately 3.3 volts.
5. The voltage for TP Sensor 2 should start at approximately 4.4 volts and decrease to approximately 1.7 volts.

   Is the voltage within the range specified for each sensor?

   Yes

   - Go To 7

   No

   - Go To 6

6. **THROTTLE BODY**
   1. Turn the ignition off.
   2. Disconnect the Throttle Body harness connector.
   3. Disconnect the PCM harness connector.
   4. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
   5. Look for any chafed, pierced, pinched, or partially broken wires.
   6. Look for broken, bent, pushed out or corroded terminals.
   7. Check each of the Throttle Body circuits for high resistance or a shorted condition.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace the Throttle Body in accordance with the Service Information.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM) and between the MAP Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

P2175-LOW AIRFLOW/RESTRICTION DETECTED (SLOW ACCUMULATION)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on and engine running with no MAP Sensor DTCs.

SET CONDITION

The Powertrain Control Module (PCM) detects that calculated MAP is greater than actual MAP plus an offset value. One trip fault and the code will set within 5 seconds. Three good trips to turn off the MIL. ETC light will flash.

POSSIBLE CAUSES

POSSIBLE CAUSES
AIR INTAKE SYSTEM OBSTRUCTION
VACUUM LEAK
MAP SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
THROTTLE POSITION SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
MAP SENSOR
THROTTLE POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any TP Sensor or MAP Sensor DTCs before continuing.

NOTE: Diagnose and repair any VSS or 5-Volt supply circuit DTCs before continuing.

NOTE: The throttle plate and linkage should be free from binding and carbon build up.

NOTE: Make sure the throttle plate is at the idle position.

1. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **VACUUM LEAK**
   1. Inspect the intake manifold, power brake booster, and PCV system for any vacuum leaks.
   2. Inspect the throttle plate. If the throttle blade is bent or will not close, the throttle body may need to be replaced.
   3. Inspect the MAP Sensor and Throttle Body for proper installation.
   4. Inspect the air intake system for any restrictions or obstructions.
   5. Inspect the engine for any mechanical conditions that can cause low engine vacuum.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 3

3. **MAP SENSOR OPERATION**
   1. Start the engine.
   2. With a scan tool, monitor the MAP Sensor voltage.
   3. Snap the throttle.

   Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at wide open throttle?

   Yes

   - Go To 5

   No

   - Go To 4

4. **MAP SENSOR**
   1. Turn the ignition off.
   2. Disconnect the MAP Sensor harness connector.
   3. Disconnect the PCM harness connector.
   4. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor and the Powertrain Control Module (PCM).
   5. Look for any chafed, pierced, pinched, or partially broken wires.
   6. Look for broken, bent, pushed out or corroded terminals.
   7. Check each of the MAP Sensor circuits for high resistance or a shorted condition.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Replace the MAP Sensor.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **THROTTLE FOLLOWER TEST**
   1. Ignition on, engine not running.
   2. With a scan tool, perform the Throttle Follower Test. and monitor the TP Sensor 1 and TP Sensor 2 voltages.
   3. Slowly press the throttle pedal down.
   4. The voltage for TP Sensor 1 should start at approximately 0.5 volts and increase to approximately 3.3 volts.
   5. The voltage for TP Sensor 2 should start at approximately 4.4 volts and decrease to approximately 1.7 volts.

   Is the voltage within the range specified for each sensor?

   Yes

   - Go To 7

   No

   - Go To 6

6. **THROTTLE BODY**
   1. Turn the ignition off.
   2. Disconnect the Throttle Body harness connector.
   3. Disconnect the PCM harness connector.
   4. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).
   5. Look for any chafed, pierced, pinched, or partially broken wires.
   6. Look for broken, bent, pushed out or corroded terminals.
   7. Check each of the Throttle Body circuits for high resistance or a shorted condition.

   Were any problems found?

Yes

- Repair as necessary.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace the Throttle Body in accordance with the Service Information.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM) and between the MAP Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

P2181-COOLING SYSTEM PERFORMANCE

Fig. 28: Temperature Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on, engine running, and no ECT DTCs present.

SET CONDITION

The coolant temperature should change at a specific rate. If this rate is too slow or too fast this fault will set. Two trip fault. Three good trips to clear MIL. ETC light will illuminate on first trip failure.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW COOLANT LEVEL
THERMOSTAT
(K2) ECT 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K2) ECT 1 SIGNAL CIRCUIT SHORTED TO GROUND
(K2) ECT 1 SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND 1 CIRCUIT
(K2) ECT 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K900) SENSOR GROUND 1 CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE COOLANT TEMPERATURE SENSOR 1
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose and repair any Engine Coolant Temperature (ECT) sensor DTCs before proceeding with this test.

NOTE: Inspect the ECT sensor and related PCM connector terminals for corrosion or damage.

NOTE: Extremely cold ambient temperatures may cause this DTC to set.

1. Turn the ignition on.
2. With the scan tool, select View DTCs.
3. Review DTC information.

Is the Good Trip Counter greater than zero?

Yes

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

No

- Go To 2

2. **LOW ENGINE COOLANT LEVEL**
   1. Ignition on, engine not running.

      WARNING: **Allow the engine to cool before opening the cooling system. The system may be under pressure. Extreme burns or scalding may result. Failure to follow these instructions can result in possible serious or fatal injury.**

   2. Inspect the cooling system for proper coolant level and condition.

      Were any problems found?

      Yes

      - Inspect the vehicle for a coolant leak. Repair as necessary in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To 3

3. **THERMOSTAT**
   1. Ignition on, engine not running.

      NOTE: Allow the engine to cool to ambient temperature before proceeding with this test.

2. Using the appropriate service information, determine the proper opening temperature of the thermostat.
3. With a scan tool, read the ECT sensor value. If the engine was allowed to cool completely, the value should be approximately equal to the ambient temperature.
4. Start the engine and allow it to reach operating temperature while monitoring the ECT sensor value. The sensor value change should be a smooth transition from start up to normal operating temperature. Monitor the actual coolant temperature with a thermometer.

NOTE: As the engine warms up to operating temperature, the actual coolant temperature (thermometer reading) and the coolant temperature value on the scan tool should be relatively close. The thermostat should not open until the engine reaches the temperature specified in the Service Information.

Does the thermostat open at the temperature specified in the Service Information?

Yes

- Go To 4

No

- Replace the thermostat in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (K2) ECT SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 29: Checking ECT Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Engine Coolant Temperature Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (K2) ECT Signal circuit in the Engine Coolant Temperature Sensor harness connector.

   Is the voltage above 5.2 volts?

   Yes

   - Repair the (K2) ECT Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 5

5. **CHECK THE (K2) ECT SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 30: Checking ECT Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (K2) ECT Signal circuit in the Engine Coolant Temperature Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

- Repair the (K2) ECT Signal circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK FOR THE (K2) ECT SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT**

Fig. 31: Checking ECT Sensor Signal Circuit For Short To Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (K2) ECT Signal circuit and the (K900) Sensor Ground circuit in the Engine Coolant Temperature Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 7

No

- Repair the (K2) ECT Signal circuit for a short to the (K900) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (K2) ECT SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K2) ECT Signal circuit between the Engine Coolant Temperature Sensor harness connector and the GPEC Adaptor.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 8

   No

   - Repair the (K2) ECT Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K900) Sensor Ground circuit between the Engine Coolant Temperature Sensor harness connector and the GPEC Adaptor.

      Is the resistance below 5.0 Ohms?

Yes

- Go To 9

No

- Repair the (K900) Sensor Ground for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

9. **ENGINE COOLANT TEMPERATURE SENSOR**

Fig. 32: Engine Coolant Temperature Sensor Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Reconnect the PCM C2 harness connector.
3. Connect a jumper between the (K900) Sensor Ground circuit and the (K2) ECT Signal circuit in the Engine Coolant Temperature Sensor harness connector.
4. Turn the ignition on.
5. With the scan tool, read the Engine Coolant Temperature Sensor signal voltage.

   Is the voltage below 0.1 volts with the jumper in place?

   Yes

   - Replace the Engine Coolant Temperature Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 10

10. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Coolant Temperature Sensor and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.
    6. Perform any Technical Service Bulletins that may apply.

       Were any problems found?

       Yes

       - Repair as necessary.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P219A-AIR-FUEL RATIO CYLINDER IMBALANCE BANK 1

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Engine Coolant Temperature (ECT) is greater than 70°C (158°F), Engine run time of 90 seconds, engine RPM 1000 - 2700, engine load 30 - 90% and in flex fuel vehicles the Fuel Adaptive Learned must be completed.

SET CONDITION

DTC P113D is not set and the high frequency content of the O2 sensor exceeds a calibrated amount. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
O2 SENSOR HEATER OPERATION
EVAP PURGE SOLENOID OPERATION
O2 SIGNAL CIRCUIT
O2 RETURN CIRCUIT
O2 SENSOR
MAP SENSOR
ECT SENSOR
ENGINE MECHANICAL
FUEL FILTER/PRESSURE REGULATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Check for contaminates that may have damaged an O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.

1. Start the engine.
2. Allow the engine to reach normal operating temperature.
3. With the scan tool, read DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault originally set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **ECT SENSOR OPERATION**

NOTE: For this test to be valid, the thermostat must be operating correctly.

NOTE: For best results, perform this step on a cold engine (cold soak) if possible.

1. Ignition on, engine not running.

2. With the scan tool, read the Engine Coolant Temperature Sensor value. If the engine was allowed to sit overnight (cold soak), the temperature value should be a sensible value that is somewhere close to the ambient temperature.

   NOTE: If engine coolant temperature is above 82°C (180° F), allow the engine to cool until 65°C (150°F) is reached.

3. Start the engine.
4. During engine warm-up, monitor the Engine Coolant Temperature value. The temperature value change should be a smooth transition from start up to normal operating temperature 82°C (180°F). The value should reach at least 82°C (180°F).

   Did the ECT value increase smoothly and reach at least 82°C (180°F)?

   Yes

   - Go To 3

   No

   - Verify that there is good pin to terminal contact in the ECT Sensor and Powertrain Control Module connectors. Replace the Engine Coolant Temperature Sensor if no problems were found with the connectors.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK FUEL PRESSURE**
   1. Perform the CHECKING THE FUEL DELIVERY SYSTEM test procedure. Refer to **DIAGNOSIS AND TESTING** .

      NOTE: Fuel pressure specification is 400 kPa +/- 14 kPa (58 psi +/- 2 psi).

   2. Turn the ignition off.

      Were any fuel system issues found ?

Yes

- Perform the appropriate repairs.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **O2 SENSOR OPERATION**
   1. Start the engine.
   2. Allow the engine to reach normal operating temperature.

NOTE: **If one of the O2 Sensor Signal or Return circuits is shorted to ground or voltage, all the other O2 Sensor voltage readings will be affected.**

NOTE: **After the repairs have been made, verify proper O2 Sensor operation. If all the O2 Sensor voltage readings have not returned to normal, follow the diagnostic procedure for the remaining O2 Sensors.**

   3. Using the scan tool, monitor the O2 Sensor 1/1 voltage readings.

      Is the voltage switching between 2.5 and 3.4 volts?

Yes

- Go To 5

No

- Go To 9

5. **O2 SENSOR 1/1 HEATER OPERATION**
   1. Turn the ignition off.

NOTE: **Wait a minimum of 10 minutes to allow the O2 Sensor to cool down before continuing the test.**

Allow the O2 Sensor voltage to stabilize at 5.0 volts.

2. Ignition on, engine not running.
3. Using the scan tool, perform the O2 Sensor 1/1 Heater Test.
4. Using the scan tool, monitor the O2 Sensor 1/1 voltage while performing the Heater test for at least two minutes.

   Does the voltage stay above 4.5 volts during the Heater test?

   Yes

   - Verify that there is good pin to terminal contact in the O2 Sensor and Powertrain Control Module connectors. Replace the O2 Sensor if no problems were found with the connectors.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 6

6. **MAP SENSOR OPERATION**
   1. Ignition on, engine not running.
   2. With the scan tool, read the Barometric Pressure.

      NOTE: The Barometric Pressure should be approximately equal to the actual barometric pressure. If necessary, compare the barometric pressure value of this vehicle to the value of a known good vehicle of a similar make and model.

   3. Turn the ignition off.
   4. Connect a Vacuum Gauge to a Manifold Vacuum source.
   5. Start the engine.
   6. Allow the engine to idle.

      NOTE: If engine will not idle, maintain a constant RPM

above idle.

7. With the scan tool, read the MAP Sensor vacuum value.

   Is the scan tool reading for MAP Vacuum within 1 inch of the Vacuum Gauge reading and is the Barometric Pressure reading of the vehicle the approximately the same as actual Barometric Pressure?

   Yes

   - Go To 7

   No

   - Verify that there is good pin to terminal contact in the MAP Sensor and Powertrain Control Module connectors. Replace the MAP Sensor if no problems were found with the connectors.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   NOTE: Remove the vacuum gauge before continuing.

7. **EVAP PURGE SOLENOID OPERATION**

NOTE: After disconnecting the Evap Purge Solenoid vacuum connections, inspect the lines and solenoid for signs of contamination.

1. Disconnect the vacuum hoses at the Evap Purge Solenoid.
2. Using a hand vacuum pump, apply 1.0 in. Hg. to the "ENGINE" side of the Evap Purge Solenoid.

   NOTE: The solenoid should hold vacuum for a minimum of 15 seconds.

3. Turn the ignition on.
4. Using the scan tool, actuate the Evap Purge Solenoid to the ON position.

NOTE: The vacuum should drop when the solenoid is actuated.

Does the solenoid function as described above?

Yes

- Go To 8

No

- Verify that there is good pin to terminal contact in the Evap Purge Solenoid and Powertrain Control Module connectors. Replace the Evap Purge Solenoid if no problems were found with the connectors.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

NOTE: Connect the vacuum hoses before continuing.

8. **ENGINE MECHANICAL**
   1. Check for any of the following conditions/mechanical problems:
      - AIR INDUCTION SYSTEM - must be free from leaks
      - ENGINE VACUUM - must be at least 13 inches in neutral
      - ENGINE VALVE TIMING - must be within specifications
      - ENGINE COMPRESSION - must be within specifications
      - ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks
      - ENGINE PCV SYSTEM - must flow freely
      - TORQUE CONVERTER STALL SPEED - must be within specifications
      - POWER BRAKE BOOSTER - no internal vacuum leaks
      - FUEL - must be free of contamination
      - FUEL INJECTOR - plugged or restricted injector; control wire not connected to correct injector

Are there any engine mechanical problems?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 12

9. **O2 SENSOR 1/1**
   1. Ignition on, engine not running.
   2. Disconnect the O2 Sensor 1/1 harness connector.
   3. With the scan tool, monitor the O2 Sensor voltage.
   4. O2 Sensor voltage should read between 4.1 and 5.0 volts on the scan tool with the connector disconnected.
   5. Connect a jumper between the (K99) O2 Sensor 1/1 Signal circuit and the (K902) O2 Sensor 1/1 Return circuit in the O2 Sensor harness connector.

NOTE: The voltage should drop from between 4.1 and 5.0 volts down to 2.5 volts with the jumper connected.

Did the O2 Sensor voltage drop from between 4.1 and 5.0 volts to 2.5 volts when the jumper was installed?

Yes

- Verify that there is good pin to terminal contact in the O2 Sensor and Powertrain Control Module connectors. Replace the O2 Sensor if no problems were found with the connectors.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 10

NOTE: Remove the jumper before continuing.

10. **CHECK THE (K99) O2 SENSOR 1/1 SIGNAL CIRCUIT**
    1. Measure the voltage on the (K99) O2 Sensor 1/1 Signal circuit in the O2 Sensor harness connector.

       Is the voltage between 4.1 and 5.0 volts?

       Yes

       - Go To 11

       No

       - Check the (K99) O2 Sensor 1/1 Signal circuit for damage, short to ground, open or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
       - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .
11. **CHECK THE (K902) O2 SENSOR 1/1 RETURN CIRCUIT**
    1. Measure the voltage on the (K902) O2 Sensor 1/1 Return circuit in the 1/1 O2 Sensor harness connector.

       Is the voltage at 2.5 volts?

       Yes

       - Go To 12

       No

       - Check the (K902) O2 Sensor 1/1 Return circuit for damage, short to ground, open or short to voltage. Inspect the O2 Sensor connector and the PCM harness connector. If OK, replace and program the Powertrain Control Module in accordance with the

Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

NOTE: Turn the ignition off before continuing.

12. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Sensors and the Powertrain Control Module (PCM).
       - Look for any chafed, pierced, pinched or partially broken wires.
       - Look for broken, bent, pushed out or corroded terminals.
       - Verify that there is good pin to terminal contact in the O2 Sensor and Powertrain Control Module connectors.
       - Perform any Technical Service Bulletins that may apply.

       Were there any problems found?

       Yes

       - Repair as necessary.
       - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

       No

       - Replace and program the Powertrain Control Module in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
       - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2245-O2 SENSOR 1/1 REFERENCE VOLTAGE CIRCUIT LOW

Fig. 33: Oxygen Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Oxygen Sensors (O2 Sensor) are used for fuel control and catalyst monitoring. Each O2 Sensor measures the oxygen content of the exhaust stream. When the engine is started, the Powertrain Control Module (PCM) operates in an Open Loop mode, ignoring the O2 Sensor signal voltage while calculating the air-to-fuel ratio. The heating elements inside each O2 Sensor heats the sensor to bring it to operating conditions faster. This allows the system to enter Closed

Loop earlier and the PCM to calculate the air-to-fuel ratio sooner. While the engine runs, the O2 Sensor heats up and begins to generate a voltage within a range of 0-1, 275 mV. Once sufficient O2 Sensor voltage fluctuation is observed by the PCM, Closed Loop is entered. The PCM uses the O2 Sensor voltage to determine the air-to-fuel ratio. An O2 Sensor voltage that increases toward 1, 000 mV indicates a rich fuel mixture. An O2 Sensor voltage that decreases toward 0 mV indicates a lean fuel mixture. The Powertrain Control Module (PCM) makes short term and long term fuel corrections to maintain stoichiometric fuel/air ratio for best catalytic converter efficiency. Short term fuel correction is based on upstream O2 Sensor output and is designed for quick engine response. The long term fuel correction compensated for variations in the engine specifications, sensor tolerances and component aging and is designed to correct rich and lean conditions over a longer period of time.

For an aged O2 Sensor, the response rate to the air/fuel change is slower than when it was new. The O2 Sensor tends to move less with the same air/fuel changes in a given time frame. Therefore by observing the activity of voltage readings from the upstream O2 Sensor, the quality of the O2 Sensor can be detected.

WHEN MONITORED

With the ignition on and the O2 1/1 Sensor at operating temperature.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to ground on the (K41) O2 Sensor 1/1 Reference Signal circuit for 2.0 seconds.

POSSIBLE CAUSES

Possible Causes
(K41) O2 SENSOR 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO GROUND
OXYGEN SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
   3. Start the engine.
   4. Allow the engine to reach normal operating temperature.
   5. Monitor the scan tool for at least five minutes.
   6. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .
2. **CHECK THE (K41) O2 SENSOR 1/1 REFERENCE SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Oxygen Sensor harness connector.
   3. Disconnect the Powertrain Control Module harness connector.
   4. Measure the resistance between ground and the (K41) O2 Sensor 1/1 Reference Signal circuit in the Oxygen Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K41) O2 Sensor 1/1 Reference Signal circuit for a short to ground.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **OXYGEN SENSOR**
   1. Turn the ignition off.
   2. Reconnect the Powertrain Control Module C2 harness connector.
   3. Replace the Oxygen Sensor in accordance with the service information.
   4. Turn the ignition on.
   5. With the scan tool, navigate to Miscellaneous Functions and perform the O2 Sensor Replaced procedure.
   6. Start the engine.
   7. Allow the engine to reach normal operating temperature.
   8. Monitor the scan tool for at least five minutes.
   9. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 4

   No

   - Test Complete.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.

6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace the Powertrain Control Module in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2246-O2 SENSOR 1/1 REFERENCE VOLTAGE CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 34: Oxygen Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Oxygen Sensors (O2 Sensor) are used for fuel control and catalyst monitoring. Each O2 Sensor measures the oxygen content of the exhaust stream. When the engine is started, the Powertrain Control Module (PCM) operates in an Open Loop mode, ignoring the O2 Sensor signal voltage while calculating the air-to-fuel ratio. The heating elements inside each O2 Sensor heats the sensor to bring it to operating conditions faster. This allows the system to enter Closed Loop earlier and the PCM to calculate the air-to-fuel ratio sooner. While the engine runs, the O2 Sensor heats up and begins to generate a voltage within a range of 0-1, 275 mV. Once sufficient O2 Sensor voltage fluctuation is observed

by the PCM, Closed Loop is entered. The PCM uses the O2 Sensor voltage to determine the air-to-fuel ratio. An O2 Sensor voltage that increases toward 1, 000 mV indicates a rich fuel mixture. An O2 Sensor voltage that decreases toward 0 mV indicates a lean fuel mixture. The Powertrain Control Module (PCM) makes short term and long term fuel corrections to maintain stoichiometric fuel/air ratio for best catalytic converter efficiency. Short term fuel correction is based on upstream O2 Sensor output and is designed for quick engine response. The long term fuel correction compensated for variations in the engine specifications, sensor tolerances and component aging and is designed to correct rich and lean conditions over a longer period of time.

For an aged O2 Sensor, the response rate to the air/fuel change is slower than when it was new. The O2 Sensor tends to move less with the same air/fuel changes in a given time frame. Therefore by observing the activity of voltage readings from the upstream O2 Sensor, the quality of the O2 Sensor can be detected.

WHEN MONITORED

With the ignition on and the O2 Sensor 1/1 at operating temperature.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to voltage on the (K41) O2 Sensor 1/1 Reference Signal circuit for 2.0 seconds.

POSSIBLE CAUSES

Possible Causes
(K41) O2 SENSOR 1/1 REFERENCE SIGNAL CIRCUIT SHORTED TO VOLTAGE
OXYGEN SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Start the engine.
4. Allow the engine to reach normal operating temperature.
5. Monitor the scan tool for at least five minutes.
6. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (K41) O2 SENSOR 1/1 REFERENCE SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Oxygen Sensor connector.
   3. Disconnect the Powertrain Control Module C2 harness connector.
   4. Remove the ASD Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the ASD Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K41) O2 Sensor 1/1 Reference Signal circuit at the Oxygen Sensor harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K41) O2 1/1 Reference Signal circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **OXYGEN SENSOR**
   1. Turn the ignition off.
   2. Reconnect the Powertrain Control Module C2 harness connector.
   3. Replace the Oxygen Sensor in accordance with the service information.
   4. Turn the ignition on.
   5. With the scan tool, navigate to Miscellaneous Functions and perform the O2 Sensor Replaced procedure.
   6. Start the engine.
   7. Allow the engine to reach normal operating temperature.
   8. Monitor the scan tool for at least five minutes.
   9. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 4

   No

   - Test Complete.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.

6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2271-O2 SENSOR 1/2 SIGNAL BIASED RICH

Fig. 35: Oxygen Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

For an aged Upstream O2 Sensor, the response rate to the air/fuel change is slower than when it was new. The O2 Sensor tends to move less with the same air/fuel changes in a given time frame. Therefore by observing the activity of voltage readings from the Upstream O2 Sensor, the quality of the O2 Sensor can be detected. The Downstream O2 Sensor is located in the exhaust path behind the Catalytic Converter, and is monitored for proper response to assure optimum

Catalytic Converter efficiency. The Downstream O2 Sensor response monitor is intended to diagnose a Downstream O2 Sensor that is not moving or stuck in a voltage window and to insure accurate information for catalyst monitor diagnosis.

WHEN MONITORED

With the engine running, the odometer greater than the minimum mileage allowable for catalyst break-in, and no global or monitor conflicts or disabling conditions present. The test will only run if the monitor has not already run and passed or failed.

SET CONDITION

The Powertrain Control Module (PCM) detects that the sensor does not output a voltage greater than a calibrated high voltage value and less than a calibrated low voltage value within a specific time period. If the voltage pass values are not achieved after the total accumulated test time, a pending fault will be set. An active fault is matured on a second trip failure. Three good trips will turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
EXHAUST LEAK
OXYGEN SENSOR WIRING OR CONNECTORS
O2 SENSOR SIGNAL CIRCUIT
O2 SENSOR RETURN CIRCUIT
1/2 OXYGEN SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECKING THE EXHAUST SYSTEM FOR LEAKS**
   1. Perform the diagnostic procedure for CHECKING THE EXHAUST SYSTEM FOR LEAKS. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Go To3

3. **CHECKING THE OXYGEN SENSOR OPERATION**

NOTE: Check for signs of contaminants that may have damaged the O2 Sensor, such as contaminated fuel, unapproved silicone, oil and coolant.

1. Perform the diagnostic procedure for CHECKING THE OXYGEN SENSOR OPERATION. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 4

4. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the 1/2 Oxygen Sensor and the Powertrain Control Module (PCM).
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Perform any technical service bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2299-BRAKE PEDAL POSITION/ACCELERATOR PEDAL POSITION INCOMPATIBLE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and no brake or Accelerator Pedal Position (APP) sensor DTCs present.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Brake Switch and the Accelerator Pedal are both pressed for a calculated amount of time. One trip fault and the code will be set within five seconds. ETC light will illuminate, the light will only stay illuminated while DTC is active.

POSSIBLE CAUSES

Possible Causes
CUSTOMER PRESSING ACCELERATOR PEDAL, THEN PRESSING BRAKE PEDAL, AND CONTINUES HOLDING THEM DOWN SIMULTANEOUSLY
STOP LAMP SWITCH
ACCELERATOR PEDAL POSITION SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **DTC INFORMATION**

NOTE: If a pedal assembly becomes mechanically stuck the voltage output will stay fixed, if this is also Followed by a long application of the brakes this code will set.

NOTE: When this code sets the pedal position in the PCM software will ramp to idle. If the Pedal voltage changes OR the brake pedal is released, the pedal position in the PCM software will ramp up to the pedal position and the ETC light will go out.

1. With the scan tool, read DTCs and record the related Freeze Frame data.
2. Diagnose all other Stop Lamp Switch and APP sensor codes before continuing.
3. This code can be set by a driver who uses both feet while driving, one for the Accelerator Pedal and the other for the Brake Pedal.

NOTE: The most likely cause of this DTC is caused by the customer Brake Torquing the engine by pressing the Accelerator pedal and the pressing the Brake Pedal.

4. Ask the driver of the vehicle if these conditions apply to their driving habits.

   Are the listed conditions part of the customers driving habits?

   Yes

   - Advise the customer of what caused the DTC. This is normal operation of a ETC equipped vehicle because of safety issues.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Go To 2

2. **STOP LAMP SWITCH**
   1. With the scan tool, monitor the status of brake switch 1 and brake switch 2.
   2. Pressed and release the brake pedal.

NOTE: The status for each switch should change from Not Pressed to Pressed when the brake switch is pressed.

Does the status change as described above?

Yes

- Go To 3

No

- Check the Stop Lamp Switch for proper adjustment and installation. Check all related circuits for an open or shorted condition using the appropriate wiring diagram. If no other problems are found, replace the Stop Lamp Switch in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **ACCELERATOR PEDAL POSITION SENSOR**
   1. Ignition on, engine not running.
   2. With the scan tool, monitor both APP sensor voltage readings.
   3. Slowly press the accelerator pedal from idle until it reaches the end stop near the floor.
   4. The APP sensor 1 voltage should start at approximately 0.875 Volts and increase to approximately 4.5 Volts with a smooth transition.
   5. The APP sensor 2 voltage should start at approximately 0.45 Volts and increase to approximately 2.3 Volts with a smooth transition.

   Does the sensor voltage change as described above when the accelerator pedal was pressed.

   Yes

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

   No

- Check the appropriate APP sensor circuits for an open and shorted condition. If no problems are found, replace the APP sensor Assembly in accordance with the Service Information. After installation, with a scan tool, perform the ETC RELEARN function.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2302-IGNITION COIL 1 SECONDARY CIRCUIT - INSUFFICIENT IONIZATION

Fig. 36: Ignition Coil Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary winding of each coil-on-plug Ignition Coil is supplied power via the Fused Automatic Shut Down (ASD) Relay Output circuit. The Powertrain Control Module (PCM) completes the circuit to ground internally (low side driver) allowing the energy that is stored in the magnetic field of the primary coil to be transferred to the spark plug via the secondary coil. The PCM determines spark timing by monitoring engine operating parameters via various sensors and then calculating the appropriate moment to initiate the spark event. The PCM manages spark advance depending on engine RPM, manifold absolute pressure, engine coolant and oil temperature.

WHEN MONITORED

With the engine running and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the secondary ignition burn time is incorrect or not present. One Trip Fault.

POSSIBLE CAUSES

Possible Causes
(K344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K19) COIL 1 CONTROL CIRCUIT SHORTED TO GROUND
(K19) COIL 1 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
IGNITION COIL 1
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
   3. Start the engine and allow it to reach normal operating temperature.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .
2. **CHECK THE (F344) FUSED ASD OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 37: Checking Fused ASD Output Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Ignition Coil 1 harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F344) Fused ASD Relay Output circuit in the Ignition Coil 1 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 3

No

- Repair the (F344) Fused ASD Relay Output circuit for an open circuit or short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K19) COIL 1 CONTROL CIRCUIT SHORTED TO GROUND**

Fig. 38: Checking Coil Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (K19) Coil 1 Control circuit in the Ignition Coil 1 harness connector.

   Is the resistance above 10k Ohms?

Yes

- Go To 4

No

- Repair the (K19) Coil 1 Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (K19) COIL 1 CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K19) Coil 1 Control circuit between the Ignition Coil 1 harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 5

No

- Repair the (K19) Coil 1 Control circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **IGNITION COIL 1**

Fig. 39: Checking Ignition Coil Control Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Reconnect the PCM C2 harness connector.
2. Using a 12-volt test light connected to 12 volts, check the (K19) Coil 1 Control circuit in the Ignition Coil 1 harness connector.
3. Crank the engine for five seconds.

NOTE: The test light should blink each time the circuit is activated by the PCM.

Does the test light blink each time the circuit is activated by the PCM?

Yes

- Replace the Ignition Coil 1 in accordance with the service information. Refer to **COIL, IGNITION, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil 1 and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2305-IGNITION COIL 2 SECONDARY CIRCUIT - INSUFFICIENT IONIZATION

Fig. 40: Ignition Coil Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary winding of each coil-on-plug Ignition Coil is supplied power via the Fused Automatic Shut Down (ASD) Relay Output circuit. The Powertrain Control Module (PCM) completes the circuit to ground internally (low side

driver) allowing the energy that is stored in the magnetic field of the primary coil to be transferred to the spark plug via the secondary coil. The PCM determines spark timing by monitoring engine operating parameters via various sensors and then calculating the appropriate moment to initiate the spark event. The PCM manages spark advance depending on engine RPM, manifold absolute pressure, engine coolant and oil temperature.

WHEN MONITORED

With the engine running and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the secondary ignition burn time is incorrect or not present. One Trip Fault.

POSSIBLE CAUSES

Possible Causes
(K344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K17) COIL 2 CONTROL CIRCUIT SHORTED TO GROUND
(K17) COIL 2 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
IGNITION COIL 2
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).
    3. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put

your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

4. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F344) FUSED ASD RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 41: Checking Fused ASD Relay Output Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Ignition Coil 2 harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F344) Fused ASD Relay Output circuit in the Ignition Coil 2 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 3

No

- Repair the (F344) Fused ASD Relay Output circuit for an open circuit or short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K17) COIL 2 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 42: Checking Coil 2 Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (K17) Coil 2 Control circuit in the Ignition Coil 2 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the (K17) Coil 2 Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (K17) COIL 2 CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K17) Coil 2 Control circuit between the Ignition Coil 2 harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 5

No

- Repair the (K17) Coil 2 Control circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **IGNITION COIL 2**

Fig. 43: Checking Ignition Coil 2 Control Circuit

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Connect the PCM C2 harness connector.
2. Using a 12-volt test light connected to 12 volts, check the (K17) Coil 2 Control circuit in the Ignition Coil 2 harness connector.
3. Crank the engine for five seconds.

NOTE: The test light should blink each time the circuit is activated by the PCM.

Does the test light blink each time the circuit is activated by the PCM?

Yes

- Replace the Ignition Coil 2 in accordance with the service information. Refer to **COIL, IGNITION, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil 2 and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2308-IGNITION COIL 3 SECONDARY CIRCUIT - INSUFFICIENT IONIZATION

Fig. 44: Ignition Coil Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary winding of each coil-on-plug Ignition Coil is supplied power via the Fused Automatic Shut Down (ASD) Relay Output circuit. The Powertrain Control Module (PCM) completes the circuit to ground internally (low side

driver) allowing the energy that is stored in the magnetic field of the primary coil to be transferred to the spark plug via the secondary coil. The PCM determines spark timing by monitoring engine operating parameters via various sensors and then calculating the appropriate moment to initiate the spark event. The PCM manages spark advance depending on engine RPM, manifold absolute pressure, engine coolant and oil temperature.

WHEN MONITORED

With the engine running and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the secondary ignition burn time is incorrect or not present. One Trip Fault.

POSSIBLE CAUSES

Possible Causes
(K344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K18) COIL 3 CONTROL CIRCUIT SHORTED TO GROUND
(K18) COIL 3 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
IGNITION COIL 3
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).
    3. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put

your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

4. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F344) FUSED ASD RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 45: Checking Fused ASD Relay Output Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Ignition Coil 3 harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F344) Fused ASD Relay Output circuit in the Ignition Coil 3 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 3

No

- Repair the (F344) Fused ASD Relay Output circuit for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K18) COIL 3 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 46: Checking Coil 3 Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (K18) Coil 3 Control circuit in the Ignition Coil 3 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the (K18) Coil 3 Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (K18) COIL 3 CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K18) Coil 3 Control circuit between the Ignition Coil 3 harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 5

No

- Repair the (K18) Coil 3 Control circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **IGNITION COIL 3**

Fig. 47: Check Ignition Coil Control Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Reconnect the PCM C2 harness connector.
2. Using a 12-volt test light connected to 12 volts, check the (K18) Coil 3 Control circuit in the Ignition Coil 3 harness connector.
3. Crank the engine for five seconds.

NOTE: The test light should blink each time the circuit is activated by the PCM.

Does the test light blink each time the circuit is activated by the PCM?

Yes

- Replace the Ignition Coil 3 in accordance with the service information. Refer to **COIL, IGNITION, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil 3 and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2311-IGNITION COIL 4 SECONDARY CIRCUIT - INSUFFICIENT IONIZATION

Fig. 48: Ignition Coil Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary winding of each coil-on-plug Ignition Coil is supplied power via the Fused Automatic Shut Down (ASD) Relay Output circuit. The Powertrain

Control Module (PCM) completes the circuit to ground internally (low side driver) allowing the energy that is stored in the magnetic field of the primary coil to be transferred to the spark plug via the secondary coil. The PCM determines spark timing by monitoring engine operating parameters via various sensors and then calculating the appropriate moment to initiate the spark event. The PCM manages spark advance depending on engine RPM, manifold absolute pressure, engine coolant and oil temperature.

WHEN MONITORED

With the engine running and battery voltage greater than 10.4 volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the secondary ignition burn time is incorrect or not present. One Trip Fault.

POSSIBLE CAUSES

Possible Causes
(K344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K15) COIL 4 CONTROL CIRCUIT SHORTED TO GROUND
(K15) COIL 4 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
IGNITION COIL 4
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).
    3. Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not

stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

4. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK THE (F344) FUSED ASD RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

Fig. 49: Checking Fused ASD Relay Output Circuit For Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Ignition Coil 4 harness connector.
3. Turn the ignition on.
4. Using a 12-volt test light connected to ground, check the (F344) Fused ASD Relay Output circuit in the Ignition Coil 4 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go to 3

No

- Repair the (F344) Fused ASD Relay Output circuit for an open circuit or short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (K15) COIL 4 CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 50: Checking Coil 4 Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the PCM C2 harness connector.
3. Measure the resistance between ground and the (K15) Coil 4 Control circuit in the Ignition Coil 4 harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To 4

No

- Repair the (K15) Coil 4 Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (K15) COIL 4 CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K15) Coil 4 Control circuit between the Ignition Coil 4 harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 5

No

- Repair the (K15) Coil 4 Control circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **IGNITION COIL 4**

Fig. 51: Check Ignition Coil Control Circuit
Courtesy of CHRYSLER GROUP, LLC

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Reconnect the PCM C2 harness connector.
2. Using a 12-volt test light connected to 12 volts, check the (K15) Coil 4 Control circuit in the Ignition Coil 4 harness connector.
3. Crank the engine for five seconds.

NOTE: The test light should blink each time the circuit is activated by the PCM.

Does the test light blink each time the circuit is activated by the PCM?

Yes

- Replace the Ignition Coil 4 in accordance with the service information. Refer to **COIL, IGNITION, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go to 6

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil 4 and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

   - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2503-CHARGING SYSTEM OUTPUT LOW

Fig. 52: Charging System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine speed greater than 1157 RPM.

SET CONDITION

The Powertrain Control Module (PCM) detects that battery voltage is 1 volt below charging goal voltage for 13.47 seconds. The PCM compares sensed battery voltage with the field driver on and off. If the voltages are the same, this code will set. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
EXCESSIVE RESISTANCE IN THE B(+) CIRCUIT BETWEEN THE GENERATOR AND THE BATTERY
EXCESSIVE RESISTANCE BETWEEN THE GENERATOR CASE AND GROUND
(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE
(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO GROUND
(K20) GEN FIELD CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(A804) GEN SENSE CIRCUIT OPEN OR HIGH RESISTANCE
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Inspect the vehicle for aftermarket accessories that may exceed the generator system output.

NOTE: Inspect the condition and tension of the generator belt before continuing.

NOTE: Inspect the battery before continuing.

1. Ignition on, engine not running.
2. With a scan tool, select View DTCs. Record DTC and Freeze Frame information

3. With a scan tool, clear DTCs.
4. Start the engine and allow it to reach operating temperature.
5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the CHECKING FOR AN INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK FOR EXCESSIVE RESISTANCE IN THE B+ CIRCUIT**

   WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

   NOTE: **Make sure all test equipment and cables are clear of any belts, pulleys, or other moving parts.**

   1. Monitor the voltage between the Generator B+ output terminal and the battery positive (+) post.
   2. Start the engine.

      Is the voltage above 0.1 volts?

      Yes

      - Repair the battery positive (+) circuit between the generator and battery for high resistance.
      - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECK FOR EXCESSIVE RESISTANCE BETWEEN THE GENERATOR CASE AND GROUND**

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Make sure all Test. equipment and cables are clear of any belts, pulleys, or other moving parts.

1. Monitor the voltage between the generator case and battery ground (-) post.
2. Start the engine and allow it to reach operating temperature.

Is the voltage above 0.1 volts?

Yes

- Repair the excessive resistance in the Generator Case Ground.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 53: Checking Generator Field Control Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Generator harness connector.
3. Disconnect the PCM C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (K20) Generator Field Control circuit.

   Is there any voltage present?

   Yes

   - Repair the (K20) Generator Field Control circuit for a short to voltage.
   - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 5

5. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR A SHORT TO GROUND**

Fig. 54: Checking Generator Field Control Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (K20) Generator Field Control circuit in the Generator harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

No

- Repair the (K20) Generator Field Control circuit for a short to ground.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

1. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
2. Measure the resistance of the (K20) Generator Field Control circuit between the Generator harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 7

No

- Repair the (K20) Generator Field Control circuit for an open or high resistance.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (A804) GENERATOR SENSE CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

1. Measure the resistance of the (A804) Generator Sense between the Generator harness connector and the GPEC Adaptor.

Is the resistance below 5.0 Ohms?

Yes

- Go To 8

No

- Repair the (A804) Generator Sense circuit for an open or high resistance.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

8. **GENERATOR**
   1. Turn the ignition off.
   2. Reconnect the PCM C2 harness connector.
   3. Turn the ignition on.
   4. With a scan tool, actuate the Generator Field to toggle on and off.
   5. Using a 12-volt test light connected to ground, check the (K20) Generator Field Control in the Generator harness connector.

NOTE: The test light should be illuminated and bright when toggled on. Compare the brightness to that of a direct connection to the battery.

Does the test light toggle on and off correctly during the actuator test?

Yes

- Replace the Generator in accordance with the service information.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 9

9. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.

4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

P2504-CHARGING SYSTEM OUTPUT HIGH

Fig. 55: Charging System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine speed greater than 1157 RPM.

SET CONDITION

The Powertrain Control Module (PCM) compares sensed battery voltage with the Generator Sense circuit voltage. If the Generator Sense circuit voltage if greater than sensed battery voltage, this DTC will set. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
EXCESSIVE RESISTANCE IN THE B(+) CIRCUIT BETWEEN THE GENERATOR AND THE BATTERY
EXCESSIVE RESISTANCE BETWEEN THE GENERATOR CASE AND GROUND
(A804) GEN SENSE CIRCUIT SHORTED TO VOLTAGE
(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Inspect the vehicle for aftermarket accessories that may exceed the Generator system output.

NOTE: Inspect the Generator harness connector and the Generator eyelet for corrosion or damage before continuing.

NOTE: Inspect the condition and tension of the Generator belt before continuing.

NOTE: Inspect the battery before continuing.

1. Ignition on, engine not running.
2. With a scan tool, select View DTCs. Record DTC and Freeze Frame

information.

3. With a scan tool, clear DTCs.
4. Start the engine and allow it to reach operating temperature.
5. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CHECK FOR EXCESSIVE RESISTANCE IN THE B+ CIRCUIT**

WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Make sure all Test. equipment and cables are clear of any belts, pulleys, or other moving parts.**

1. Monitor the voltage between the generator B+ output terminal and the battery positive (+) post.
2. Start the engine.

Is the voltage above 0.1 volts?

Yes

- Repair the battery positive (+) circuit between the generator and battery for high resistance.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 3

3. **CHECK FOR EXCESSIVE RESISTANCE BETWEEN THE GENERATOR CASE AND GROUND**

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Make sure all Test. equipment and cables are clear of any belts, pulleys, or other moving parts.

1. Monitor the voltage between the generator case and battery ground (-) post.
2. Start the engine and allow it to reach operating temperature.

Is the voltage above 0.1 volt?

Yes

- Repair the excessive resistance in the Generator case ground.
- Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE (A804) GENERATOR SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 56: Checking Generator Sense Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Generator harness connector.
3. Disconnect the PCM C2 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (A804) Generator Sense circuit.

   Is there any voltage present?

   Yes

   - Repair the (A804) Generator Sense circuit for a short to voltage.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 5

5. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 57: Checking Generator Field Control Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage of the (K20) Generator Field Control circuit.

   Is there any voltage present?

   Yes

   - Repair the (K20) Generator Field Control circuit for a short to voltage.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

   No

- Go To 6

6. **GENERATOR**

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Turn the ignition off.
2. Connect the Generator harness connector.
3. Reconnect the PCM C2 harness connector.

NOTE: Make sure all Test equipment and cables are clear of any belts, pulleys, or other moving parts.

4. Measure the voltage between the Generator Eyelet terminal and the (A804) Generator Sense circuit in the Generator harness connector.
5. Start the engine and allow it to reach operating temperature.

Is the voltage above 0.1 volts?

Yes

- Replace the Generator in accordance with the service information.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 7

7. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.

4. Monitor the scan tool data relative to this circuit and wiggle the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

P2610-PCM INTERNAL ENGINE OFF TIMER PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Powertrain Control Module (PCM) has detected an interruption in the supplied battery voltage while the module is powered down. Two Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

Possible Causes
AMBIENT AIR TEMPERATURE SENSOR

COOLANT TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM) SOFTWARE UPDATE
EXCESSIVE RESISTANCE IN THE PCM POWER OR GROUND CIRCUITS
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **PENDING TEMPERATURE SENSOR DTCS**

NOTE: An incorrect temperature reading from the Cool Temperature Sensor or Ambient Temperature Sensor could cause this DTC to set. Verify that both temperature sensors are reading correctly before proceeding with this test.

1. Turn the ignition on.

NOTE: If any temperature sensor DTCs are present, allow the vehicle to cool completely before proceeding with this test.

2. Start the engine and allow it to reach operating temperature.
3. With the scan tool, select View DTCs.

Are there any pending Engine Coolant Temperature sensor, Ambient Air Temperature sensor, or general temperature DTCs?

Yes

- Diagnose and repair any temperature sensor DTCs and retest.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 2

2. **ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, select View DTCs and review the DTC environmental information for this DTC.

      Is the good trip counter greater than 0?

      Yes

      - The DTC is not active at this time. Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

      No

      - Go To 3

3. **CHECK FOR LOW BATTERY VOLTAGE AT PCM**

   NOTE: A loss of battery voltage to the module while the module is powered down is the most likely cause of this DTC.

   1. Inspect all PCM power and ground circuits.
   2. Inspect and Test. the battery in accordance with the Service Information.
   3. Inspect the generator drive belt for proper alignment and adjustment.
   4. Inspect the vehicle for aftermarket accessories that may exceed the generator system output.
   5. Inspect the fuses in the TIPM. If an open fuse is found, use the wire diagram/schematics as a guide and inspect the wiring and connectors for a damaged or shorted circuit.

      Were any problems found?

      Yes

      - Repair as necessary.

- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Go To 4

4. **CHECK THE (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM harness connector.
   3. With a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit.
   4. Check the circuit with the ignition switch in the OFF, ON, and START positions.

      NOTE: The test light should be illuminated and bright with the ignition switch in the ON and START positions. Compare the brightness to that of a direct connection to the battery.

   5. Wiggle the circuit while checking with the test light to check the circuit for an intermittent problem.

      Does the test light illuminate as expected in each of the ignition switch positions?

      Yes

      - Go To 5

      No

      - Repair the circuit as necessary. If an open fuse is found, inspect the circuit for a short to ground.
      - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (A931) FUSED B+ CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

1. With a 12-volt test light connected to ground, check the (A931) Fused B+ circuit.
2. Check the circuit with the ignition switch in the OFF, ON, and START positions.

   NOTE: The test light should be illuminated and bright regardless of the position of the ignition switch. Compare the brightness to that of a direct connection to the battery.

3. Wiggle the circuits while checking with the test light to check the circuit for an intermittent problem.

   Is the test light illuminated and bright in each of the ignition switch positions?

   Yes

   - Go To 6

   No

   - Repair the circuit as necessary.
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **POWERTRAIN CONTROL MODULE (PCM)**
   1. Using the wiring diagram/schematic as a guide, inspect Powertrain Control Module power and ground circuits.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data and wiggle the wiring and connectors.
   5. Look for the any data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

- Repair as necessary.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

U0001-CAN C BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition run time is greater than one second. Battery voltage between 9 and 16 volts. Engine run time greater than three seconds.

SET CONDITION

The Powertrain Control Module (PCM) loses communication over the CAN C Bus circuit. The circuit is continuously monitored.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN C BUS OPEN OR SHORTED CONDITION POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

1. Ignition on, engine not running.
2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Refer to the **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0001-Can C Bus diagnostic procedure.

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

U0002-CAN C BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on, the battery voltage between 9 and 16 volts and engine run time greater than three seconds.

SET CONDITION

The Powertrain Control Module (PCM) doesn't receive any CAN C bus messages for a specific amount of time.

POSSIBLE CAUSES

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

1. Turn the ignition on.
2. With a scan tool, read the active DTCs.

   Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE?

   Yes

   - Refer to the **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0001-Can C Bus diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0101-LOST COMMUNICATION WITH TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition run time is greater than one second. Battery voltage between 9 and 16 volts. Engine run time greater than three seconds.

SET CONDITION

The Powertrain Control Module (PCM) doesn't receive a Bus Message from the Transmission Control Module for seven consecutive seconds. The circuit is continuously monitored.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN C BUS OPEN OR SHORTED CONDITION POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

1. Ignition on, engine not running.
2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Refer to **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0101-Lost Communication with TCM diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition run time is greater than one second. Battery voltage between 9 and 16 volts. Engine run time greater than three seconds.

SET CONDITION

The Powertrain Control Module (PCM) doesn't receive an ABS message over the CAN C circuit for seven consecutive seconds. The circuit is continuously monitored.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN C BUS OPEN OR SHORTED CONDITION
ANTI-LOCK BRAKE (ABS) MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

ACTIVE DTC

1. Ignition on, engine not running.
2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Refer to **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0121-Lost Communication with Anti-Lock Brake Module diagnostic procedure.

   No

- Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0140-LOST COMMUNICATION WITH BODY CONTROL MODULE (TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition run time is greater than one second. Battery voltage between 9 and 16 volts.

SET CONDITION

The Powertrain Control Module (PCM) doesn't receive a Totally Integrated Power Module (TIPM) message over the CAN C bus for seven consecutive seconds. The circuit is continuously monitored.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN C BUS OPEN OR SHORTED CONDITION
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

1. Ignition on, engine not running.

2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Refer to **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition run time is greater than one second. Battery voltage between 9 and 16 volts.

SET CONDITION

The Powertrain Control Module (PCM) doesn't receive a message from the Totally Integrated Power Module (TIPM) over the CAN C circuit for seven consecutive seconds. The circuit is continuously monitored.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN C BUS OPEN OR SHORTED CONDITION
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

1. Ignition on, engine not running.
2. With a scan tool, read the active DTCs.

   Does the scan tool display U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)?

   Yes

   - Refer to **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTC diagnostic procedure.

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition run time is greater than one second. Battery voltage between 9 and 16 volts. Engine run time greater than three seconds.

SET CONDITION

The Powertrain Control Module (PCM) doesn't receive an Occupant Restraint Controller (ORC) message over the CAN C circuit for seven consecutive seconds. The circuit is continuously monitored.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN C BUS OPEN OR SHORTED CONDITION
OCCUPANT RESTRAINT CONTROLLER (ORC)
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

ACTIVE DTC

1. Turn the ignition on.
2. With a scan tool, read the active DTCs.

   Does the scan tool display U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)?

   Yes

   - Refer to **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0151-Lost Communication with Occupant Restraint Controller (ORC) diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTC diagnostic procedure.

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY MODULE (SKREEM/WCM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition run time is greater than one second. Battery voltage between 9 and 16

volts. Engine run time greater than three seconds.

SET CONDITION

The Powertrain Control Module (PCM), doesn't receive a SKREEM message over the CAN C circuit for seven consecutive seconds. The circuit is continuously monitored.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN C BUS OPEN OR SHORTED CONDITION
SKREEM/WCM
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

1. Ignition on, engine not running.
2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Refer to **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0168-Lost Communication with Vehicle Security Module (WCM) diagnostic procedure.

No

- Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTC diagnostic procedure.

U0300-INTERNAL CONTROL MODULE SOFTWARE INCOMPATIBILITY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on and battery voltage greater than 10 volts.

SET CONDITION

The Powertrain Control Module (PCM) software is incorrect.

POSSIBLE CAUSES

POSSIBLE CAUSES
PCM PROGRAMMED WITH INCORRECT SOFTWARE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

PCM PROGRAMMED WITH INCORRECT SOFTWARE

1. Ignition on, engine not running.
2. Program the PCM in accordance with the Service Information. Refer to **STANDARD PROCEDURE - PCM/ECM REPROGRAMMING - GAS** .
3. Start the engine.
4. Allow the engine to reach normal operating temperature.
5. With a scan tool, select read the active DTCs.

   Does the scan tool display U0300-INTERNAL CONTROL MODULE SOFTWARE INCOMPATIBILITY?

Yes

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- The Powertrain Control Module (PCM) has been successfully programmed. Test is complete.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

U0402-IMPLAUSIBLE DATA RECEIVED FROM TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously while the system is active.

SET CONDITION

Implausible data has been received over the bus from the Transmission Control Module (TCM).

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN BUS OPEN OR SHORTED CONDITION
TRANSMISSION CONTROL MODULE (TCM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose all CAN B and C communication DTCs before continuing.

1. Turn the ignition on.
2. With a scan tool, view DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **TCM COMMUNICATION RELATED DTCS IN OTHER MODULES**

1. With a scan tool check for TCM communication related DTCs in other modules on the CAN Bus.

Are there any TCM communication related DTCs in other modules on the CAN Bus at this time?

Yes

- Replace and program the Transmission Control Module (TCM) in accordance with the Service Information.
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

U0415-IMPLAUSIBLE DATA RECEIVED FROM ABS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously while the system is active.

SET CONDITION

Implausible data has been received over the bus from the Anti-lock Brake Module.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN BUS OPEN OR SHORTED CONDITION
ANTI-LOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose all CAN B and C communication DTCs before continuing.

1. Turn the ignition on.
2. With a scan tool, view DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Performing the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **ABS COMMUNICATION RELATED DTCS IN OTHER MODULES**
   1. With a scan tool check for ABS communication related DTCs in other modules on the CAN Bus.

      Are there any ABS communication related DTCs in other modules on the CAN Bus at this time?

      Yes

      - Replace and program the Anti-Lock Brake Module in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the PCM VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

U0416-IMPLAUSIBLE DATA RECEIVED FROM ESP

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously while the system is active.

SET CONDITION

Implausible data has been received over the bus from the Electronic Stability Program (ESP) in the ABS Module.

POSSIBLE CAUSES

POSSIBLE CAUSES

CAN BUS OPEN OR SHORTED CONDITION
ELECTRONIC STABILITY PROGRAM (ESP)/ANTILOCK BRAKE MODULE (ABS)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

   NOTE: Diagnose all CAN B and C communication DTCs before continuing.

   1. Turn the ignition on.
   2. With a scan tool, view DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

2. **ABS/ESP COMMUNICATION RELATED DTCS IN OTHER MODULES**
   1. With a scan tool check for ABS/ESP communication related DTCs in other modules on the CAN Bus.

      Are there any ESP communication related DTCs in other modules on the CAN Bus at this time?

      Yes

      - Replace and program the ABS Module in accordance with the

Service Information.

- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

U0431-IMPLAUSIBLE DATA RECEIVED FROM FCM (TIPM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously while the system is active.

SET CONDITION

Implausible data has been received over the bus from the Totally Integrated Power Module (TIPM).

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN BUS OPEN OR SHORTED CONDITION
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: Diagnose all CAN B and C communication DTCs

before continuing.

1. Turn the ignition on.
2. With a scan tool, view DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **TIPM COMMUNICATION RELATED DTCS IN OTHER MODULES**
   1. With a scan tool check for TIPM communication related DTCs in other modules on the CAN Bus.

      Are there any TIPM communication related DTCs in other modules on the CAN Bus at this time?

      Yes

      - Replace and program the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
      - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

U110A-LOST COMMUNICATION WITH SCM (SAS)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article .

WHEN MONITORED

Ignition run time is greater than one second. Battery voltage between 9 and 16 Volts. Engine run time greater than three seconds.

SET CONDITION

The Powertrain Control Module (PCM) doesn't receive a Steering Angle Sensor (SAS) message over the CAN C circuit for seven consecutive seconds. The circuit is continuously monitored. One Trip fault.

POSSIBLE CAUSES

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
STEERING COLUMN CONTROL MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

ACTIVE DTC

1. Ignition on, engine not running.
2. With the scan tool, View PCM DTCs.

   Is the DTC Active at this time?

   Yes

   - Refer to **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0212-Lost Communication with SCM diagnostic procedure.

   No

- Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U110C-LOST FUEL LEVEL MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The fuel level signal is a direct input to the Cluster. The fuel level signal is sent to the Totally Integrated Power Module (TIPM) over the CAN B bus circuit. The Powertrain Control Module (PCM) receives the fuel level signal from the TIPM over the CAN C bus circuit.

WHEN MONITORED

Ignition on.

SET CONDITION

When the Powertrain Control Module (PCM) does not receive a fuel level signal over the CAN C circuit. The circuit is constantly monitored.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN C BUS CIRCUIT OPEN OR SHORTED
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle

network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

1. Ignition on, engine not running.
2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM) ALSO ACTIVE**
   1. With the scan tool read DTCs.

      Is the DTC U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM) also set?

      Yes

      - Refer to **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure.

      No

      - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

U110E-LOST AMBIENT TEMPERATURE MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The ambient temperature sensor signal is a direct input to the Totally Integrated Power Module (TIPM). The TIPM sends the Powertrain Control Module (PCM) the ambient temperature signal over the CAN C bus.

WHEN MONITORED

Ignition on.

SET CONDITION

The Powertrain Control Module (PCM) doesn't receive the ambient temperature signal over the CAN C bus from the Totally Integrated Power Module (TIPM). The circuit is continuously monitored.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN C BUS CIRCUIT OPEN OR SHORTED
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

1. Ignition on, engine not running.

2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM) ALSO ACTIVE**
   1. With the scan tool read DTCs.

      Is the DTC U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM) also set?

      Yes

      - Refer to **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure.

      No

      - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

U1110-LOST VEHICLE SPEED MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) receives the vehicle speed signal over the CAN C bus from the Anti-lock Brake Module.

WHEN MONITORED

Ignition on.

SET CONDITION

The PCM doesn't receive a vehicle speed signal from the Anti-Lock Brake Module over the CAN C bus.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN C BUS CIRCUIT OPEN OR SHORTED
ANTI-LOCK BRAKE (ABS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

1. Ignition on, engine not running.
2. With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE ALSO SET**
   1. With a scan tool, select View DTCs.

      Is the DTC U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE also set?

      Yes

      - Refer to **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure.

      No

      - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

U1113-LOST A/C PRESSURE MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The A/C Pressure Transducer signal is a direct input to the Totally Integrated Power Module (TIPM). The TIPM sends the Powertrain Control Module (PCM) the A/C pressure signal over the CAN C bus.

WHEN MONITORED

Ignition on.

SET CONDITION

The PCM doesn't receive the A/C Pressure signal over the CAN C bus from the TIPM. The circuit is continuously monitored.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN C BUS CIRCUIT OPEN OR SHORTED
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

1. Ignition on, engine not running.
2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure.

Refer to **INTERMITTENT CONDITION** .

2. **U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM) ALSO ACTIVE**
   1. With the scan tool read DTCs.

      Is the DTC U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM) also set?

      Yes

      - Refer to **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure.

      No

      - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

U1120-LOST WHEEL DISTANCE MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) receives the vehicle speed signal over the CAN C bus from the Anti-lock Brake Module.

WHEN MONITORED

Ignition on.

SET CONDITION

The Powertrain Control module (PCM) doesn't receive a vehicle speed signal from the Anti-Lock Brake Module over the CAN C bus.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN C BUS CIRCUIT OPEN OR SHORTED
ANTI-LOCK BRAKE (ABS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

   NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

   1. Ignition on, engine not running.
   2. With a scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE ALSO SET**
   1. With a scan tool, select View DTCs.

      Is the DTC U0121-LOST COMMUNICATION WITH ANTI-LOCK

BRAKE MODULE also set?

Yes

- Refer to **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0141-Lost Communication with IPM (FCM/TIPM) diagnostic procedure.

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

U1403-IMPLAUSIBLE FUEL LEVEL SIGNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Totally Integrated Power Module (TIPM) receives a fuel level signal over CAN B from the Cluster. The TIPM transmits the fuel level message to the PCM over the CAN C bus.

WHEN MONITORED

Ignition on.

SET CONDITION

The fuel level message that the Powertrain Control Module (PCM) is receiving is implausible. The circuit is continuously monitored.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN B OPEN OR SHORTED
INSTRUMENT CLUSTER (CCN)

TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

   NOTE: Diagnose all CAN B and C communication DTCs before continuing.

   NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

   1. Ignition on, engine not running.
   2. With a scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **CAN B BUS COMMUNICATION DTCS ALSO ACTIVE**
   1. With a scan tool select View DTCs in the TIPM.

      Are any CAN B Bus DTCs active?

      Yes

- Refer to **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** for diagnostic procedures and for further possible causes.

No

- Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

U1412-IMPLAUSIBLE VEHICLE SPEED SIGNAL RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The ABS Module sends vehicle speed information over the CAN C Bus circuit to the Powertrain Control Module (PCM).

WHEN MONITORED

Ignition on.

SET CONDITION

The Powertrain Control Module (PCM) gets an implausible signal over the CAN C circuit from the ABS Module. The circuit is continuously monitored.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN C BUS CIRCUIT SHORTED
CAN C BUS CIRCUIT OPEN
ANTI-LOCK BRAKE (ABS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING

PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

   NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

   1. Ignition on, engine not running.
   2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **DTC U0001-CAN C BUS IS ACTIVE IN THE PCM**
   1. With a scan tool, select View DTCs.

   Is the DTC U0001-CAN C BUS Active in the PCM?

   Yes

   - Refer to **TOTALLY INTEGRATED POWER MODULE (TIPM) - DIAGNOSTIC CODE INDEX** and perform the U0001-Can C Bus diagnostic procedure.

   No

   - Go To 3

3. **ABS MODULE IS ACTIVE ON THE CAN C BUS**
   1. Using the Network Review Screen on the scan tool, verify that the ABS Module is active on the bus.

      Is the ABS Module active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the No Response from ABS diagnostic procedure.
4. **DTC U0001-CAN C BUS ACTIVE IN THE TIPM**
   1. With the scan tool, select View DTCs in the TIPM.

      Is the DTC U0001-CAN C BUS Active in the TIPM?

      Yes

      - Replace the ABS Module in accordance with the Service Information.
      - Perform the ABS Verification Test. Refer to **STANDARD PROCEDURE** .

      No

      - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

U1417-IMPLAUSIBLE LEFT WHEEL DISTANCE SIGNAL RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Anti-Lock Brake (ABS) Module sends an implausible distance signal over the CAN C Bus circuit to the Powertrain Control Module (PCM).

WHEN MONITORED

Ignition on.

SET CONDITION

The Powertrain Control Module (PCM) gets an implausible signal over the CAN C circuit from the ABS Module. The circuit is continuously monitored.

POSSIBLE CAUSES

POSSIBLE CAUSES
VEHICLE SPEED SENSOR DTC ACTIVE IN ANTI-LOCK BRAKE MODULE
CAN C BUS CIRCUIT SHORTED
CAN C BUS CIRCUIT OPEN
ANTI-LOCK BRAKE (ABS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

1. Ignition on, engine not running.
2. With a scan tool, select View DTCs.

   Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **ABS MODULE IS ACTIVE ON THE CAN C BUS**
   1. Using the Network Review Screen on the scan tool, verify that the ABS Module is active on the bus.

      Is the ABS Module active on the bus?

      Yes

      - Go To 3

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the No Response from ABS diagnostic procedure.

3. **DTCS STORED OR ACTIVE IN THE ABS MODULE**
   1. With the scan tool, select View DTCs in the ABS Module.

      Are any DTCs active or stored in the ABS Module?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 4

4. **ACTIVE DTCS IN THE TIPM**
   1. With the scan tool, select ECU View and select the TIPM.
   2. With the scan tool, select View DTCs in the TIPM.

      Are any ABS related DTCs active or stored in the TIPM?

Yes

- Replace the ABS Module in accordance with the Service Information
- Perform the ABS Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Replace and program the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

U1418-IMPLAUSIBLE RIGHT WHEEL DISTANCE SIGNAL RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The ABS Module sends an implausible distance signal over the CAN C Bus circuit to the Powertrain Control Module (PCM).

WHEN MONITORED

Ignition on.

SET CONDITION

The Powertrain Control Module (PCM) gets an implausible signal over the CAN C circuit from the Anti-Lock Brake (ABS) Module. The circuit is continuously monitored.

POSSIBLE CAUSES

POSSIBLE CAUSES
VEHICLE SPEED SENSOR DTC ACTIVE IN ANTI-LOCK BRAKE MODULE
CAN C BUS CIRCUIT SHORTED
CAN C BUS CIRCUIT OPEN

ANTI-LOCK BRAKE (ABS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE .

DIAGNOSTIC TEST

1. **ACTIVE DTC**

   NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

   1. Ignition on, engine not running.
   2. With a scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the CHECKING FOR AN INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION** .

2. **ABS MODULE IS ACTIVE ON THE CAN C BUS**
   1. Using the Network Review Screen on the scan tool, verify that the ABS Module is active on the bus.

      Is the ABS Module active on the bus?

      Yes

      - Go To 3

No

- Refer to **DIAGNOSIS AND TESTING** and perform the No Response from ABS diagnostic procedure.

3. **DTCS STORED OR ACTIVE IN THE ABS MODULE**
   1. With the scan tool, select View DTCs in the ABS Module.

   Are any DTCs active or stored in the ABS Module?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - Go To 4

4. **ACTIVE DTCS IN THE TIPM**
   1. With the scan tool, select ECU View and select the TIPM.
   2. With the scan tool, select View DTCs in the TIPM.

   Are any ABS related DTCs active or stored in the TIPM?

   Yes

   - Replace the ABS Module in accordance with the Service Information
   - Perform the ABS Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Replace and program the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the PCM VERIFICATION Test. Refer to **POWERTRAIN VERIFICATION TEST** .

2014 ENGINE PERFORMANCE

Powertrain Control Module (PCM) - Electrical Diagnostics, 2.2L Diesel - Compass & Patriot

STANDARD PROCEDURE

INTERMITTENT CONDITION - 2.2L DIESEL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

INTERMITTENT DTC

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. The conditions necessary to set this DTC are not present at this time.
2. Review the scan tool environmental data. If possible, try to duplicate the conditions under which the DTC set.
3. If applicable, actuate the component with the scan tool.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change, the actuation to be interrupted, or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins (TSBs) that may apply.
7. Turn the ignition off.
8. Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.
9. Perform a voltage drop test on the related circuits between the suspected component and the PCM.
10. Inspect and clean all PCM, engine, and chassis grounds that are related to the most current DTC.
11. If numerous trouble codes were set, use a schematic and inspect any

common ground or supply circuits.

12. For intermittent Misfire DTCs check for restrictions in the intake and exhaust system, proper installation of sensors, vacuum leaks, and binding components that are run by the accessory drive belt.
13. Use the scan tool to perform a System Test if one applies to the component.
14. A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

    Were any problems found during the above inspections?

    Yes

    - Perform the necessary repairs.
    - Perform the PCM VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

    No

    - Test Complete.

PCM REPLACEMENT PROCEDURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

PCM REPLACEMENT PROCEDURE

1. The PCM has several learned values and information stored in it. If the old PCM is still responsive, this information can be pulled from the PCM and integrated into the New PCM to save time after replacement.

   Is the old PCM still responsive?

   Yes

   - With the scan tool, navigate to Miscellaneous Functions and select the Engine ECU Replacement routine and follow the on screen directions.
   - Perform the PCM VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. Go to **SECTION 2 - ADDITIONAL PCM/ECM/TCM REPLACEMENT PROCEDURES** , and perform the necessary routines. .

PCM/ECM/TCM PROGRAMMING

PCM/ECM/TCM FLASH PROGRAMING

This procedure will need to be done when one or more of the following situations are true:

1. A vehicle's Powertrain Control Module/Engine Control Module (PCM/ECM) has been replaced.
2. A diagnostic trouble code (DTC) is set P1602 - PCM/ECM Not Programmed.
3. An updated calibration or software release is available for either the PCM/ECM or TCM ECUs.

This procedure assumes that the wiTECH™ Vehicle Connection Interface (VCI) pod, StarSCAN® and StarMOBILE® devices are configured to your dealership's network with either a wired or wireless connection. The wiTECH™ VCI pod, StarSCAN® and StarMOBILE® must also be running at the latest operating system and software release level. For more help on how to network your StarSCAN® or StarMOBILE® reference the StarSCAN®/StarMOBILE® Quick Start Networking Guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Online Documentation' or at www.dcctools.com, under the Download Center. For the wiTECH™ VCI pod use the "HELP" tab in the wiTECH™ Diagnostic Application.

TABLE OF CONTENTS

1. SECTION 1 - PCM/ECM/TCM FLASH PROCEDURE Refer to **SECTION 1 - PCM/ECM/TCM FLASH PROCEDURE**.
2. REQUIRED TOOLS/EQUIPMENT Refer to **REQUIRED TOOLS/EQUIPMENT:**.
3. TECH TIPS and INFORMATION Refer to **TECH TIPS AND INFORMATION:**.
4. PARTS REQUIRED Refer to **PARTS REQUIRED**.

SECTION 1 - PCM/ECM/TCM FLASH PROCEDURE

If using StarSCAN® or StarMOBILE® Desktop Client. Refer to REPAIR PROCEDURE - Using StarSCAN® or StarMOBILE® Desktop Client.

If using wiTECH™ Diagnostic Application. Refer to REPAIR PROCEDURE - wiTECH™ Diagnostic Application.

REPAIR PROCEDURE - USING STARSCAN® OR STARMOBILE® DESKTOP CLIENT

NOTE: If this flash process is interrupted or aborted, the flash should be restarted.

1. Open the hood of the vehicle and install a battery charger. Verify that the charging rate provides a continuous charge of 13.2 - 13.5 Volts.
2. Connect the StarSCAN® or StarMOBILE® to the vehicle data link connector located under the steering column and turn the ignition key to the "RUN" position.
3. Power on the StarSCAN® or StarMOBILE®. If the StarMOBILE® is being used, launch the StarMOBILE® Desktop Client and connect to the appropriate StarMOBILE® device.
4. Retrieve the old ECU part number. From the tool's Home screen,
   a. Select "ECU View"
   b. Select "PCM/ECM"
   c. Select "More Options"
   d. Select "ECU Flash"
   e. Record the part number at the top of the Flash PCM/ECM screen for later reference.
   f. Program the ECU as follows:
   g. Using the StarSCAN®/StarMOBILE® at the Home screen, select "ECU View"
   h. Select "PCM/ECM"
   i. Select "More Options"
   j. Select "ECU Flash"
   k. Select "Browse for New File" and follow the on screen instructions
   l. Highlight the appropriate calibration based on the part number recorded in Step 4e , or by using Year/Model/Engine and appropriate emissions

selection for the vehicle being worked on

m. Select "Download to Client/Scantool"
n. Once the download is complete, select "Close" and then "Back"
o. Highlight the listed calibration, select "Update Controller" and follow the on screen instructions
p. When the PCM/ECM update is complete, select "OK"
q. Verify that the part number at the top of the Flash PCM/ECM screen has updated to the new part number

NOTE: If this flash process is interrupted or aborted, the flash should be restarted.

5. Continue to complete the process if the ECU has been replaced.
6. Type the necessary information on the "Authorized Modification Label" (p/n 04275086AB) and attach near the VECI label (See for details). Refer to **SECTION 3 - AUTHORIZED MODIFICATION LABEL**.

REPAIR PROCEDURE - WITECH™ DIAGNOSTIC APPLICATION

NOTE: If this flash process is interrupted or aborted, the flash should be restarted.

1. Open the hood of the vehicle and install a battery charger. Verify that the charging rate provides a continuous charge of 13.2 - 13.5 Volts.
2. Connect the wiTECH™ Vehicle Connection Interface (VCI) pod to the vehicle data link connector located under the steering column and turn the ignition key to the "RUN" position.
3. Launch the wiTECH™ Diagnostic Application and connect to the appropriate wiTECH™ device.
4. From the wiTECH™ Diagnostic Application Home screen,
   a. Select "HELP"
   b. Select "HELP CONTENTS"
   c. Follow the "HELP TOPIC" for flashing an ECU.

SECTION 2 - ADDITIONAL PCM/ECM/TCM REPLACEMENT PROCEDURES

NOTE: Find the PCM/ECM/TCM Type for the vehicle, read and

write down the steps, and then go to the step by step instructions for additional information on how to perform these procedures. Refer to STEP-BY-STEP INSTRUCTIONS.

If a 2.0L Controller was replaced, navigate to "Misc. Functions" and perform all applicable routines:

NOTE: The available routines may vary depending on model and year of vehicle.

1. PCM/ECM Replaced - Located within the Security Module
2. ECU Replacement With Value Transfer - if the ECU to be replaced is still responsive

NOTE: If the PCM/ECM data transfer is able to be completed, it may not be necessary to perform routines 7 - 9 .

3. ECU Replacement Without Value Transfer - if the ECU to be replaced is NOT responsive
4. Verify PCM/ECM VIN
5. Injector Quantity Adjustment (For 2012 and older applications only)
6. Program Variant Code
7. Service Diesel Particulate Filter Regeneration
8. Reset Zero Fuel
9. Reset of Lambda Values

If a PT Cruiser, 2.2L Controller was replaced, navigate to "Misc. Functions" and perform all applicable routines:

NOTE: The available routines may vary depending on model and year of vehicle.

1. PCM/ECM Replaced - Located within the Security Module
2. Injector Quantity Adjustment - Only on 06 PT AND up
3. IMA Rapid Calibration Test - Only on 06 PT AND up

If a 3.0L Controller was replaced, navigate to "Misc. Functions" and perform all applicable routines:

NOTE: The available routines may vary depending on model and year of vehicle.

1. PCM/ECM Replaced - Located within the Security Module
2. ECU Replacement With Value Transfer - if the ECU to be replaced is still responsive

NOTE: If the PCM/ECM data transfer is able to be completed, it may not be necessary to perform routines 7 - 12 .

3. ECU Replacement Without Value Transfer - if the ECU to be replaced is NOT responsive
4. Injector Quantity Adjustment
5. Program Variant Code
6. Verify PCM/ECM VIN
7. Diesel Particulate Filter (Used) Learning
8. Reset of Lambda Values
9. Reset Zero Fuel
10. NOx Catalyst (New) Initialization
11. IMA Rapid Calibration Test
12. Fuel Mean Value Adaptation Initialization
13. Exhaust Throttle Plate Adaptive Learn Position

If a 2.8L Controller was replaced, navigate to "Misc. Functions" and perform all applicable routines:

NOTE: The available routines may vary depending on model and year of vehicle.

1. PCM/ECM Replaced - Located within the Security Module
2. ECU Replacement With Value Transfer - if the ECU to be replaced is still responsive

NOTE: If the PCM/ECM data transfer is able to be completed, it may not be necessary to perform routines 6 - 8 .

3. ECU Replacement Without Value Transfer - if the ECU to be replaced is NOT responsive
4. Injector Quantity Adjustment
5. Program Variant Code
6. Fuel Mean Value Adaptation Initialization
7. IMA Rapid Calibration Test
8. Set Oil Dilution Mass Value

If a PM/MK, 2.2L Controller was replaced, navigate to "Misc. Functions" and perform all applicable routines:

NOTE: The available routines may vary depending on model and year of vehicle.

1. PCM/ECM Replaced - Located within the Security Module
2. Engine ECU Replacement

NOTE: If the PCM/ECM data transfer is able to be completed, it may not be necessary to perform routines 5 - 10 .

3. Injector Quantity Adjustment
4. Program Variant Code
5. Swirl Control Learn
6. Throttle Valve Learn
7. VGT Learn
8. MAF Sensor Replace
9. O2 Sensor Replace
10. Used DPF initialize

If a 5.9L Controller was replaced, navigate to "Misc. Functions" and perform all applicable routines:

NOTE: The available routines may vary depending on model and

year of vehicle.

1. PCM/ECM Replaced - Located within the Security Module
2. Check PCM/ECM VIN - if NOT WCM equipped

If a 6.7L Controller was replaced, navigate to "Misc. Functions" and perform all applicable routines:

NOTE: The available routines may vary depending on model and year of vehicle.

1. PCM/ECM Replaced - Located within the Security Module
2. Injector Quantity Adjustment
3. Enable/Disable Vehicle Features - need to enable features
4. Set max vehicle speed
5. Set max cruise speed
6. Idle shutdown timer
7. PTO RPM adjustment
8. Set PTO Max vehicle speed

NOTE: The numbers can be retrieved from the old PCM/ECM using the scan tool if the PCM/ECM is still functional or they may be retrieved from the Fuel Injectors themselves. The numbers are stamped on the intake manifold side of the injectors.

9. Reset Regenerative Filter Timers

If an Aisin TCM was replaced, perform the following additional steps and/or routines:

If an EATX TCM was replaced, perform the following additional steps and/or routines:

If an NGC3 TCM ONLY was replaced, perform the following additional steps and/or routines:

If an NGC4 TCM ONLY was replaced, perform the following additional

steps and/or routines:

1. Quicklearn

If an EGS TCM was replaced, perform the following additional steps and/or routines:

1. Initialize EGS

STEP-BY-STEP INSTRUCTIONS

PCM/ECM Replaced

The vehicle pin (Personal Identification Number) will be required to complete the routine. This information may be obtained in three ways:

1. The original selling invoice
2. DealerCONNECT > Parts > Key Codes
3. Contacting the District Manager.

From the "Home" screen, select "ECU View"

- Select the applicable Security Module
- Select "Misc. Functions"
- Select "PCM/ECM Replaced" and follow the on screen instructions.
- When complete, select "Finish"

Check PCM VIN

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "Check PCM/ECM VIN" and follow the on screen instructions.
- When complete, select "Finish"

Diesel Particulate Filter (Used) Learning

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "Diesel Particulate Filter (Used) Learning" and follow the on screen instructions.
- When complete, select "Finish"

ECU Replacement with Value Transfer

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "ECU Replacement with Value Transfer" and follow the on screen instructions.
- When complete, select "Finish"

ECU Replacement without Value Transfer

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "ECU Replacement without Value Transfer" and follow the on screen instructions.
- When complete, select "Finish"

Enable/Disable Vehicle Features

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "Enable/Disable Vehicle Features" and follow the on screen instructions.
- When complete, select "Finish"

Exhaust Throttle Plate Adaptive Learn Position

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "Exhaust Throttle Plate Adaptive Learn Position" and follow the on screen instructions.
- When complete, select "Finish"

Fuel Mean Value Adaptation Initialization

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "Fuel Mean Value Adaptation Initialization" and follow the on screen instructions.
- When complete, select "Finish"

IMA Rapid Calibration

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "IMA Rapid Calibration Test" and follow the on screen instructions.
- When complete, select "Finish"

Initialize EGS

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "Initialize EGS" and follow the on screen instructions.
- When complete, select "Finish"

Injector Quantity Adjustment

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "Injector Quantity Adjustment" and follow the on screen instructions.
- When complete, select "Finish"

Mobile DeSoot - NO Minimum Required Soot Load

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "Mobile DeSoot - NO Minimum Required Soot Load" and follow the on screen instructions.
- When complete, select "Finish"

NOx Catalyst (New) Initialization

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "NOx Catalyst (New) Initialization" and follow the on screen instructions.
- When complete, select "Finish"

Program Variant Code

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "Program Variant Code" and follow the on screen instructions.
- When complete, select "Finish"

Quicklearn

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "Quicklearn" and follow the on screen instructions.
- When complete, select "Finish"

Reset Regenerative Filter Timers

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "Reset Regenerative Filter Times" and follow the on screen instructions.
- When complete, select "Finish"

Set Oil Dilution Mass Value

From the "Home" screen, select "ECU View"

- Select "PCM/ECM"
- Select "Misc. Functions"
- Select "Set Oil Dilution Mass Value" and follow the on screen instructions.
- When complete, select "Finish"

SECTION 3 - AUTHORIZED MODIFICATION LABEL

NOTE: The following step is required by law when reprogramming a PCM/ECM and/or TCM.

Type the necessary information on the "Authorized Modification Label" and attach near the VECI label.

Fig. 1: Authorized Modification Label
Courtesy of CHRYSLER GROUP, LLC

1. Powertrain Control/Transmission Control Module Part Numbers (Insert P/Ns) Used
2. Change Authority: TSB XX--XX
3. Dealer Code: XXXXX
4. Date: XX-XX-XX

REQUIRED TOOLS/EQUIPMENT:

StarSCAN®	StarMOBILE®	wiTECH™
Battery Charger	Battery Charger	Battery Charger
StarSCAN® Tool Kit	StarMOBILE® Tool Kit	wiTECH™ Tool Kit
StarSCAN® Vehicle Cable	StarMOBILE® Vehicle Cable	wiTECH™ Vehicle Cable
	TechCONNECT PC or equivalent	TechCONNECT PC or equivalent
		wiTECH™ Diagnostic Application

TECH TIPS AND INFORMATION:

CAUTION: Extreme care must be taken when programming a calibration into a generic PCM. Do not randomly select a calibration. Once a calibration is selected and programmed, the controller cannot be reprogrammed to a different calibration. The module can only be reprogrammed to a more recent version of that calibration.

1. The wiTECH™ Diagnostic Application is the preferred method for flashing

any Chrysler vehicle ECU. For more information, training tutorials are available under the "HELP" tab in the wiTECH™ Diagnostic Application or at www.dcctools.com, under the 'Training Aids' link.

2. To use the StarMOBILE® in Pass-Through Mode requires that your StarMOBILE® is connected to the dealerships network via a wired or wireless connection. For more information on how to use the StarMOBILE in Pass-Through Mode see the StarMOBILE® training tutorials available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Training Aids' link or at www.dcctools.com, under the 'Training Aids' link.
3. If the flash process is interrupted or aborted, the flash should be restarted.
4. Due to the PCM/ECM/TCM programming procedure, a DTC may be set in other ECUs within the vehicle. Some DTCs may cause the MIL to illuminate. From the "Home" screen select "System View". Then select "All DTCs". Press "Clear All Stored DTCs" if there are any DTCs shown on the list.
5. Do not allow the battery charger to time out or the charging rate to climb above 13.5 Volts during the flash process.
6. The StarSCAN® and StarMOBILE® diagnostic tools fully support Internet connectivity and must be configured for your dealership's network. For help on setting up your StarSCAN®/StarMOBILE® for the dealership's network, refer to the StarSCAN®/StarMOBILE® Quick Start Networking Guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Online Documentation' or at www.dcctools.com, under the download center.
7. The operating software in the StarSCAN® and StarMOBILE® must be programmed with the latest software release level. The software level is visible in the blue header at the top of the StarSCAN® and StarMOBILE® Desktop Client screens. For instructions on how to update your scan tool, refer to the StarSCAN®/StarMOBILE® Software Update guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Online Documentation' or at www.dcctools.com, under the download center.

PARTS REQUIRED

Qty	Part Number	DESCRIPTION
1	04275086AB	Label, Authorized Modification

PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. **NO RESPONSE**

   NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red.

   Does the scan tool display a Vehicle Network problem or NO RESPONSE condition?

   Yes

   - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   No

   - Go To 2
2. **NO START**

   Does the vehicle have a NO START condition?

   Yes

   - Check the vehicle for any DTCs, including Vehicle Theft Security related DTCs, that may cause a no-start condition.
   - If no DTCs are present that relate to a no-start condition, refer to the Non DTC Diagnostic Procedures that relate to Fuel and Starting. Refer to **DIAGNOSIS AND TESTING** .

   No

   - Go To 3
3. **VEHICLE REPAIR HISTORY AND TSBs**
   1. Check the vehicle repair history for repairs that may relate to the

current condition.

2. Inspect the vehicle for aftermarket accessories that may have been installed incorrectly.
3. Check for any TSBs related to the condition or DTCs.
4. If a TSB applies, follow the procedure outlined in the TSB.

Select the appropriate response for the condition that applies:

Performing a TSB procedure repaired the condition.

- Test Complete.
- Perform the PCM VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

A DTC is present, no TSB applies, or the TSB didn't repair the condition.

- Go To 4

No DTCs or conditions are present.

- Refer to the INTERMITTENT CONDITION Diagnostic Procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

4. **VEHICLE INSPECTION**

WARNING: When the engine is operating, do not stand in a direct line with the fan. Do not put your hands near pulleys, belts or fan. Do not wear loose clothing.

1. Based on the diagnostic condition that applies, review the following list and perform any tests that relate to the condition:
2. If multiple DTCs are set in the ECM, review the wiring schematics for problems in any shared supply or ground circuits. Refer to the diagnostic procedure for **CHECKING THE PCM POWER AND GROUND CIRCUITS** .
3. Inspect the air intake system and turbocharger related tubes for damage,

restriction, or poor connection.

4. Inspect the exhaust system and related tubes for damage, restriction, or poor connection.
5. Remove and inspect the Air Filter for soiling or excessive dirt and debris which may cause an air flow restriction.
6. If the ECM detects and stores a DTC, the ECM also stores the environmental conditions under which the DTC was set.
7. Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.
8. With the scan tool, Clear the stored DTC(s).
9. Attempt to duplicate the environmental conditions under which the DTC was set.
10. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the vehicle conditions under which the DTC conditions will be monitored. Operate the vehicle under those conditions.
11. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the component and the module.
12. If the DTC(s) are fuel or air related, check the fuel level and quality.

Were any repairs made that corrected the DTC or condition?

Yes

- Test complete.
- Perform the PCM VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Refer to the diagnostic test procedure related to the DTC. Refer to the **DTC INDEX** .

PCM VERIFICATION TEST - 2.2L DIESEL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. **SELECT THE PROPER VERIFICATION TEST**

   Select the verification test for the repair that has been completed:

   For a Speed Control repair

   - Go To 2

   For a Charging System repair

   - Go To 3

   For a No Start repair

   - Go To 4

   For DTC and all other repairs

   - Go To 5

2. **SPEED CONTROL VERIFICATION TEST**

   NOTE: If the battery was disconnected for any reason, you must perform the Battery Reconnection procedure in the appropriate Service Information.

   1. Inspect the vehicle to make sure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
   2. With the scan tool, erase all diagnostic trouble codes (DTCs).
   3. Road test the vehicle at a speed above 60 km/h (35 MPH).
   4. Turn the speed control ON/OFF switch on.
   5. Depress and release the SET switch. If the speed control does not engage, the repair is not complete, continue with step 12.
   6. Quickly depress and release the RESUME/ACCEL switch. If the vehicle speed does not increase by 3 km/h (2 MPH), the repair is not complete, continue with step 12.
   7. Using caution, depress and release the brake pedal. If the speed control does not disengage, the repair is not complete, continue with step 12.

8. With the vehicle speed at least 60 km/h (35 MPH), depress the RESUME/ACCEL switch. If the speed control does not resume at the previously set speed, the repair is not complete, continue with step 12.
9. Hold down the COAST switch. If the vehicle does not decelerate, the repair is not complete, continue with step 12.
10. While still holding down the COAST switch, make sure the vehicle speed is at least 60 km/h (35 MPH) and release the COAST switch. If the vehicle does not adjust and set a new vehicle speed, the repair is not complete, continue with step 12.
11. With the speed control engaged, depress the ON/OFF switch. If the speed control does not disengage, the repair is not complete, continue with step 12.
12. If the vehicle did not successfully perform all of the previous steps, perform any Technical Service Bulletins (TSBs) that pertain to this speed control problem and then, if necessary, return to the DTC List.
13. If the vehicle successfully performed all of the previous steps, the speed control system is now functioning as designed. The repair is now complete.

    Are any DTCs or symptoms remaining?

    Yes

    - Repair is not complete, perform the appropriate diagnostic procedure.

    No

    - Repair is complete.

3. **CHARGING SYSTEM VERIFICATION TEST**

NOTE: If the battery was disconnected for any reason, you must perform the Battery Reconnection procedure in the appropriate Service Information.

1. Inspect the vehicle to make sure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.

2. With the scan tool, erase all diagnostic trouble codes (DTCs).
3. Start the engine.
4. Raise the engine speed to 2000 RPM for at least 30 seconds.
5. Allow the engine to idle.
6. Turn the ignition off for 20 seconds.
7. Turn the ignition on.
8. With the scan tool, read PCM DTCs.
9. If this DTC has set again, or another DTC has set, look for any Technical Service Bulletins (TSBs) that may relate to this condition. Return to the DTC List if necessary.
10. If the charging system is functioning correctly and there are no DTCs, the repair is now complete.

    Are any DTCs or symptoms remaining?

    Yes

    - Repair is not complete, perform the appropriate diagnostic procedure.

    No

    - Repair is complete.

4. **NO START VERIFICATION TEST**

NOTE: If the battery was disconnected for any reason, you must perform the Battery Reconnection procedure in the appropriate Service Information.

NOTE: If the Wireless Control Module/Wireless Ignition Node has been replaced, make sure the programming procedure for the module has been performed in accordance with the Service Information.

NOTE: If the Powertrain Control Module (PCM) has been replaced, Go to SECTION 2 - ADDITIONAL PCM/ECM/TCM REPLACEMENT PROCEDURES , and

perform the necessary routines. .

1. Inspect the vehicle to make sure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
2. Inspect the engine oil for contamination. If it is contaminated, change the oil and filter.
3. With the scan tool, erase all diagnostic trouble codes (DTCs).
4. Turn the ignition off for at least 10 seconds.
5. Attempt to start the engine.
6. If the engine is unable to start, look for any Technical Service Bulletins (TSBs) that may relate to this condition. Return to the DTC List if necessary.
7. If the engine starts and continues to run, the repair is now complete.

   Are any DTCs or symptoms remaining?

   Yes

   - Repair is not complete, perform the appropriate diagnostic procedure.

   No

   - Repair is complete.

5. **ROAD TEST VERIFICATION TEST**

NOTE: If the battery was disconnected for any reason, you must perform the Battery Reconnection procedure in the appropriate Service Information.

1. Inspect the vehicle to make sure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
2. If this verification procedure is being performed after a non-DTC test, perform steps 3 and 4. If not, proceed to step 5.
3. Check to see if the initial symptom still exists. If there are no trouble codes and the symptom no longer exists, the repair was successful and

testing is now complete.

4. If the initial or another symptom exists, the repair is not complete. Check all pertinent Technical Service Bulletins (TSBs) and return to the DTC List if necessary.
5. For previously read DTCs that have not been dealt with, return to the DTC List and follow the diagnostic path for that DTC; otherwise, continue to step 6.
6. If the Powertrain Control Module (PCM) has been replaced, Go to **SECTION 2 - ADDITIONAL PCM/ECM/TCM REPLACEMENT PROCEDURES** , and perform the necessary routines. . Then continue to step 7.
7. If equipped with a Transfer Case Position Switch, perform step 8, otherwise, continue with step 9.
8. With the ignition switch on, place the Transfer Case Shift Lever in each gear position, stopping for 15 seconds in each position.
9. With the scan tool, erase all diagnostic trouble codes (DTCs).
10. Road test the vehicle. Drive the vehicle under various driving conditions. Attempt to duplicate the conditions in the Freeze Frame Data under which the DTC was set if possible. If this test is for an A/C Relay Control Circuit, drive the vehicle for at least five minutes with the A/C on.
11. At some point, stop the vehicle and turn the engine off for at least 10 seconds, then restart the engine and continue driving.
12. Upon completion of the road test, check for DTCs with the scan tool.
13. If the repaired DTC has set again, the repair is not complete. Check for any related Technical Service Bulletins (TSBs) and return to the DTC List. If there are no DTCs, the repair was successful and is now complete.

Are any DTCs or symptoms remaining?

Yes

- Repair is not complete, perform the appropriate diagnostic procedure.

No

- Repair is complete.

2014 ENGINE PERFORMANCE

Powertrain Control Module (PCM) - Electrical Diagnostics, 2.2L Diesel - Compass & Patriot

DIAGNOSIS AND TESTING

B10B3-CABIN HEATER 1 CONTROL CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

A Cabin Heater (PTC) 1 error message has been received over the CAN bus from the Totally Integrated Power Module (TIPM).

POSSIBLE CAUSES

Possible Causes
CABIN HEATER RELAY
DTC SET IN TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: This DTC will set if the Powertrain Control Module (PCM) receives a message from the TIPM indicating that a PTC Heater Relay DTC is present.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. With the scan tool, actuate the PTC Heater Relay 1.

4. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **POWERTRAIN CONTROL MODULE**
   1. With the scan tool, select View DTCs in the Totally Integrated Power Module.

      Is there a stored or active PTC Heater Control circuit DTC present in the TIPM?

      Yes

      - Refer to the **DTC INDEX** for diagnostic procedures and for further possible causes.

      No

      - Replace and program the Powertrain Control Module in accordance with the service information. Refer to **REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

B10B7-CABIN HEATER 2 CONTROL CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

A Cabin Heater (PTC) 2 error message has been received over the CAN bus from the Totally Integrated Power Module (TIPM).

POSSIBLE CAUSES

Possible Causes
DTC SET IN TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: This DTC will set if the Powertrain Control Module (PCM) receives a message from the Totally Integrated Power Module indicating that a PTC Heater Relay DTC is present.

   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. With the scan tool, actuate the PTC Heater Relay 2.
   4. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **POWERTRAIN CONTROL MODULE**
   1. With the scan tool, select View DTCs in the Totally Integrated Power Module.

Is there a stored or active PTC Heater Relay DTC present in the Totally Integrated Power Module?

Yes

- Refer to the **DTC INDEX** for diagnostic procedures and for further possible causes.

No

- Replace the Powertrain Control Module in accordance with the Service Information. Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0001-FUEL QUANTITY REGULATOR CONTROL CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Fuel System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Fuel Quantity Solenoid (FQS) is located on the High Pressure Delivery Pump. The Powertrain Control Module (PCM) sends a Pulse Width Modulated (PWM) signal to the FQS to control the amount of fuel that is directed to the

pumping chambers in the High Pressure Delivery Pump. The FQS is normally closed when not being controlled by the PCM. The Fuel Quantity Solenoid works in tandem with the Fuel Pressure Regulator (FPR) to control the fuel pressure in the Fuel Rail. During engine cranking, the FQS is fully opened to allow maximum fuel flow and the FPR is closed to allow pressure to build quickly. After the engine starts, the FPR is primarily closed and the high side pressure is regulated using the FQS. The FPR is primarily used to help control spikes in the high pressure side during deceleration or if the FQS is not able to react quickly enough to the demands of the system.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an open circuit on the (K365) Fuel Quantity Solenoid Control circuit for 0.167 of a second.

POSSIBLE CAUSES

Possible Causes
(K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT OPEN/HIGH RESISTANCE
FUEL QUANTITY SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
    3. Start the engine and allow it to idle.
    4. With the scan tool, select View DTCs.
    5. Monitor the scan tool for at least two minutes.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Fuel Quantity Solenoid harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Measure the resistance of the (K365) Fuel Quantity Solenoid Control circuit between the Fuel Quantity Solenoid harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K365) Fuel Quantity Solenoid Control circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE FUEL QUANTITY SOLENOID**
   1. Reconnect the PCM C1 harness connector.
   2. Replace the Fuel Quantity Solenoid in accordance with the service information.
   3. Turn the ignition on.

4. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
5. Start the engine and allow it to idle.
6. With the scan tool, select View DTCs.
7. Monitor the scan tool for at least two minutes.

   Did the DTC return?

   Yes

   - Go To 4

   No

   - Repair is complete.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Quantity Solenoid and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Replace the Powertrain Control Module in accordance with the

service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0003-FUEL QUANTITY REGULATOR CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Fuel System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Fuel Quantity Solenoid (FQS) is located on the High Pressure Delivery Pump. The Powertrain Control Module (PCM) sends a Pulse Width Modulated (PWM) signal to the FQS to control the amount of fuel that is directed to the

pumping chambers in the High Pressure Delivery Pump. The FQS is normally closed when not being controlled by the PCM. The Fuel Quantity Solenoid works in tandem with the Fuel Pressure Regulator (FPR) to control the fuel pressure in the fuel rail. During engine cranking, the FQS is fully opened to allow maximum fuel flow and the FPR is closed to allow pressure to build quickly. After the engine starts, the FPR is primarily closed and the high side pressure is regulated using the FQS. The FPR is primarily used to help control spikes in the high pressure side during deceleration or if the FQS is not able to react quickly enough to the demands of the system.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to ground on the (K365) Fuel Quantity Solenoid Control circuit for 0.167 of a second.

POSSIBLE CAUSES

Possible Causes
(K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
FUEL QUANTITY SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
    3. Start the engine and allow it to idle.
    4. With the scan tool, select View DTCs.
    5. Monitor the scan tool for at least two minutes.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Fuel Quantity Solenoid harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Measure the resistance between ground and the (K365) Fuel Quantity Solenoid Control circuit at the Fuel Quantity Solenoid harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K365) Fuel Quantity Solenoid Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE FUEL QUANTITY SOLENOID FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (K365) Fuel Quantity Solenoid Control circuit terminal of the Fuel Quantity Solenoid.

   Is the resistance above 10k Ohms?

Yes

- Go To 4

No

- Replace the Fuel Quantity Solenoid in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Quantity Solenoid and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0004-FUEL QUANTITY REGULATOR CONTROL CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Fuel System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Fuel Quantity Solenoid (FQS) is located on the High Pressure Delivery Pump. The Powertrain Control Module (PCM) sends a Pulse Width Modulated (PWM) signal to the FQS to control the amount of fuel that is directed to the pumping chambers in the High Pressure Delivery Pump. The FQS is normally closed when not being controlled by the PCM. The Fuel Quantity Solenoid works in tandem with the Fuel Pressure Regulator (FPR) to control the fuel pressure in the fuel rail. During engine cranking, the FQS is fully opened to allow maximum fuel flow and the FPR is closed to allow pressure to build quickly. After the engine starts, the FPR is primarily closed and the high side pressure is regulated using the FQS. The FPR is primarily used to help control spikes in the high pressure side during deceleration or if the FQS is not able to react quickly enough to the demands of the system.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to voltage on the (K365) Fuel Quantity Solenoid Control circuit for 0.167 of a second.

POSSIBLE CAUSES

Possible Causes
(K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE
(K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD/MAIN RELAY OUTPUT CIRCUIT
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.

3. Start the engine and allow it to idle.
4. Monitor the scan tool for at least two minutes.
5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Fuel Quantity Solenoid harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Remove the ASD/Main Relay.
   5. Connect a jumper wire between cavity 30 and cavity 87 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K365) Fuel Quantity Solenoid Control circuit at the Fuel Quantity Solenoid harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K365) Fuel Quantity Solenoid Control circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Go To 3

3. **CHECK FOR A SHORT BETWEEN THE (K365) FUEL QUANTITY SOLENOIDCONTROL CIRCUIT AND THE (F344) FUSED ASD/MAIN RELAY OUTPUT CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (K365) Fuel Quantity Solenoid Control circuit and the (F344) Fused ASD/Main Relay Output circuit at the Fuel Quantity Solenoid harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the short circuit between the (K365) Fuel Quantity Solenoid Control circuit and the (F344) Fused ASD/Main Relay Output circuit.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Quantity Solenoid and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0045-TURBOCHARGER BOOST CONTROL CIRCUIT/OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Boost Pressure Actuator is part of the Turbocharger assembly. The Boost Pressure Actuator is supplied with a fused ignition power and ground circuit, as well as a Pulse Width Modulated (PWM) signal form the Powertrain Control Module (PCM) to control how much boost pressure is generated. The higher the voltage that is supplied to the actuator, the greater the variable veins of the Turbocharger are opened. The greater the veins are opened, the greater the boost that is generated. The boost pressure is monitored by the Powertrain Control Module (PCM) using the Boost Pressure Sensor, which is located in the Intake Manifold. The Boost Pressure Sensor is supplied 5 Volts and ground by the PCM. The Boost Pressure Sensor sends feedback to the PCM on the sensor signal wire.

WHEN MONITORED

With the ignition on, Boost Pressure Actuator commanded on, and the Starter Relay commanded off.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (K137) Boost Pressure Actuator Control circuit is open for 2.0 seconds.

POSSIBLE CAUSES

Possible Causes
(F342) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN/HIGH RESISTANCE
(F343) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN/HIGH RESISTANCE
(K137) BOOST PRESSURE CONTROL CIRCUIT OPEN/HIGH RESISTANCE
TURBOCHARGER ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
   3. With the scan tool, actuate the Boost Pressure at 100%.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (F343) FUSED MAIN RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.

2. Disconnect the PCM C2 harness connector.
3. Remove the ASD/Main Relay.
4. Connect a jumper wire between cavity 30 and cavity 87 of the Main Relay Connector.
5. Turn the ignition on.
6. Using a 12-Volt test light connected to ground, check the (F343) Fused Main Relay Output circuit at the PCM C2 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 3

No

- Repair the (F343) Fused Main Relay Output circuit for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (F342) FUSED MAIN RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Using a 12-Volt test light connected to ground, check the (F342) Fused Main Relay Output circuit in the Boost Pressure Actuator harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 4

No

- Repair the (F342) Fused Main Relay Output circuit for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE (K137) BOOST PRESSURE ACTUATOR CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.
   3. Measure the resistance of the (K137) Boost Pressure Actuator Control circuit between the Boost Pressure Actuator harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K137) Boost Pressure Actuator Control circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **TURBOCHARGER ASSEMBLY**
   1. Reconnect the PCM harness connectors.
   2. Turn the ignition on.
   3. With the scan tool, actuate the Boost Pressure (Boost Pressure Actuator) to 100%.
   4. Using a 12-Volt test light connected to 12 Volts, check the (K137) Boost Pressure Control circuit in Boost Pressure Actuator harness

connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

5. With the scan tool, actuate the Boost Pressure (Boost Pressure Actuator) to 0%.
6. Using a 12-Volt test light connected to 12 Volts, check the (K137) Boost Pressure Control circuit in the Boost Pressure Actuator harness connector.

NOTE: The test light should not be illuminated.

Is the test light illuminated and bright with the actuation at 100% and not illuminated with the actuation at 0%?

Yes

- Replace the Turbocharger assembly in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Boost Pressure Actuator and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.

4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0046-TURBOCHARGER BOOST CONTROL CIRCUIT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Boost Pressure Actuator is part of the Turbocharger assembly. The Boost Pressure Actuator is supplied with a fused ignition power and ground circuit, as well as a Pulse Width Modulated (PWM) signal form the Powertrain Control Module (PCM) to control how much boost pressure is generated. The higher the voltage that is supplied to the actuator, the greater the variable veins of the Turbocharger are opened. The greater the veins are opened, the greater the boost that is generated. The boost pressure is monitored by the Powertrain Control Module (PCM) using the Boost Pressure Sensor, which is located in the Intake Manifold. The Boost Pressure Sensor is supplied 5 Volts and ground by the PCM. The Boost Pressure Sensor sends feedback to the PCM on the sensor signal wire.

WHEN MONITORED

With the ignition on, Boost Pressure Actuator commanded on, and the Starter Relay commanded off.

SET CONDITION

The Boost Pressure Actuator reports an internal error to the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
(F342) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN/HIGH RESISTANCE
(F343) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN/HIGH RESISTANCE
(K137) BOOST PRESSURE CONTROL CIRCUIT SHORTED TO GROUND
TURBOCHARGER MECHANICAL PROBLEM
TURBOCHARGER ASSEMBLY

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK THE (F343) FUSED MAIN RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.
   3. Remove the ASD/Main Relay.
   4. Connect a jumper wire between cavity 30 and cavity 87 of the Main Relay Connector.
   5. Turn the ignition on.
   6. Using a 12-Volt test light connected to ground, check the (F343) Fused Main Relay Output circuit at the PCM C2 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct

connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 2

No

- Repair the (F343) Fused Main Relay Output circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

2. **CHECK THE (F342) FUSED MAIN RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Using a 12-Volt test light connected to ground, check the (F342) Fused Main Relay Output circuit in the Boost Pressure Actuator harness connector.

      NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

      Is the test light illuminated and bright?

      Yes

      - Go To 3

      No

      - Repair the (F342) Fused Main Relay Output circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K137) BOOST PRESSURE ACTUATOR CONTROL**

CIRCUIT FOR A SHORT TO GROUND

1. Turn the ignition off.
2. Disconnect the Boost Pressure Actuator harness connector.
3. Disconnect the PCM C1 harness connector.
4. Measure the resistance between ground and the (K137) Boost Pressure Actuator Control circuit at the Boost Pressure Actuator harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the (K137) Boost Pressure Actuator Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **TURBOCHARGER MECHANICAL PROBLEM**

   1. Inspect the Turbocharger and Boost Pressure Actuator linkage for damage, debris and other problems that could effect Turbocharger vane movement.

      Were any problems found?

      Yes

      - Repair or replace the Turbocharger in accordance with the service information. If the Turbocharger is replaced, navigate to System Test with the scan tool and perform the VGT Learn routine.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

P0047-TURBOCHARGER BOOST CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Boost Pressure Actuator is part of the Turbocharger assembly. The Boost Pressure Actuator is supplied with a fused ignition power and ground circuit, as well as a Pulse Width Modulated (PWM) signal form the Powertrain Control Module (PCM) to control how much boost pressure is generated. The higher the voltage that is supplied to the actuator, the greater the variable veins of the Turbocharger are opened. The greater the veins are opened, the greater the boost that is generated. The boost pressure is monitored by the Powertrain Control Module (PCM) using the Boost Pressure Sensor, which is located in the Intake Manifold. The Boost Pressure Sensor is supplied 5 Volts and ground by the PCM. The Boost Pressure Sensor sends feedback to the PCM on the sensor signal wire.

WHEN MONITORED

With the ignition on, Boost Pressure Actuator commanded on, and the Starter Relay commanded off.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (K137) Boost Pressure Actuator Control circuit is shorted to ground for 5.3 seconds.

POSSIBLE CAUSES

Possible Causes
(F342) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN/HIGH RESISTANCE
(F343) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN/HIGH RESISTANCE
(F344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH

RESISTANCE
(K137) BOOST PRESSURE CONTROL CIRCUIT SHORTED TO GROUND

POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. With the scan tool, actuate the Boost Pressure at 100%.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (F344) FUSED MAIN RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Boost Pressure Actuator harness connector.
   3. Turn the ignition on.
   4. Using a 12-Volt test light connected to ground, check the (F344) Fused Main Relay Output circuits in the Boost Pressure Actuator harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 3

No

- Repair the (F344) Fused Main Relay Output circuit(s) for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (F343) FUSED MAIN RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.
   3. Remove the ASD/Main Relay.
   4. Connect a jumper wire between cavity 30 and cavity 87 of the Main Relay Connector.
   5. Turn the ignition on.
   6. Using a 12-Volt test light connected to ground, check the (F343) Fused Main Relay Output circuit at the PCM C2 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 4

No

- Repair the (F343) Fused Main Relay Output circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE (F342) FUSED MAIN RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Using a 12-Volt test light connected to ground, check the (F342) Fused Main Relay Output circuit in the Boost Pressure Actuator harness connector.

      NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

      Is the test light illuminated and bright?

      Yes

      - Go To 5

      No

      - Repair the (F342) Fused Main Relay Output circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE (K137) BOOST PRESSURE ACTUATOR CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.
   3. Measure the resistance between ground and the (K137) Boost Pressure Actuator Control circuit in the Boost Pressure Actuator harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To6

No

- Repair the (K137) Boost Pressure Actuator Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **TURBOCHARGER ASSEMBLY**
   1. Reconnect the PCM harness connectors.
   2. Turn the ignition on.
   3. With the scan tool, actuate the Boost Pressure (Boost Pressure Actuator) to 100%.
   4. Using a 12-Volt test light connected to 12 Volts, check the (K137) Boost Pressure Control circuit in the Boost Pressure Actuator harness connector.

      NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

      NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

   5. With the scan tool, actuate the Boost Pressure (Boost Pressure Actuator) to 0%.
   6. Using a 12-Volt test light connected to 12 Volts, check the (K137) Boost Pressure Control circuit in the Boost Pressure Actuator harness connector.

      NOTE: The test light should not be illuminated.

Is the test light illuminated and bright with the actuation at 100% and not illuminated with the actuation at 0%?

Yes

- Replace the Turbocharger assembly in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 7

7. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Boost Pressure Actuator and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

P0048-TURBOCHARGER BOOST CONTROL CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Boost Pressure Actuator is part of the Turbocharger assembly. The Boost Pressure Actuator is supplied with a fused ignition power and ground circuit, as well as a Pulse Width Modulated (PWM) signal form the Powertrain Control Module (PCM) to control how much boost pressure is generated. The higher the voltage that is supplied to the actuator, the greater the variable veins of the Turbocharger are opened. The greater the veins are opened, the greater the boost that is generated. The boost pressure is monitored by the Powertrain Control Module (PCM) using the Boost Pressure Sensor, which is located in the Intake Manifold. The Boost Pressure Sensor is supplied 5 Volts and ground by the PCM. The Boost Pressure Sensor sends feedback to the PCM on the sensor signal wire.

WHEN MONITORED

With the ignition on and the Boost Pressure command on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (K137) Boost Pressure Actuator Control circuit is shorted to voltage for 2.0 seconds.

POSSIBLE CAUSES

Possible Causes
(K137) BOOST PRESSURE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K137) BOOST PRESSURE CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD/MAIN RELAY OUTPUT CIRCUIT
TURBOCHARGER ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before

proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
   3. With the scan tool, actuate the Boost Pressure at 100%.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K137) BOOST PRESSURE ACTUATOR CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Boost Pressure Actuator harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 30 and cavity 87 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage on the (K137) Boost Pressure Actuator Control circuit in the Boost Pressure Actuator harness connector.

      Is there any voltage present?

Yes

- Repair the (K137) Boost Pressure Control circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK FOR THE (K137) BOOST PRESSURE ACTUATOR CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD/MAIN RELAY OUTPUT CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (K137) Boost Pressure Actuator Control circuit and the (F344) Fused ASD/Main Relay Output circuit at the Boost Pressure Actuator harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the short circuit between the (K137) Boost Pressure Actuator Control circuit and the (F344) Fused ASD/Main Relay Output circuit.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **TURBOCHARGER ASSEMBLY**
   1. Reconnect the PCM C1 harness connector.
   2. Turn the ignition on.
   3. With the scan tool, actuate the Boost Pressure (Boost Pressure Actuator) to 100%.

4. Using a 12-Volt test light connected to 12 Volts, check the (K137) Boost Pressure Actuator Control circuit in the Boost Pressure Actuator harness connector.

   NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

   NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

   Is the test light illuminated and bright with the actuation at 100%?

   Yes

   - Replace the Turbocharger assembly in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Boost Pressure Actuator and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0072-AMBIENT AIR TEMPERATURE SENSOR CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Ambient Air Temperature (AAT) Sensor is located in the front of the vehicle near the grill. The AAT Sensor is supplied 5.0 Volts and a ground from the Totally Integrated Power Module (TIPM). The TIPM broadcasts the ambient air temperature over the CAN bus. The Cluster uses this information to display the ambient air temperature. The Powertrain Control Module (PCM) uses this information to determine when to switch on the Crank Case Ventilation Heater and the Cabin Heaters. If the ambient air temperature is below 40°F and heat is selected, the cabin heaters will switch on.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Totally Integrated Power Module (TIPM) detects that the Ambient Air Temperature Sensor signal is below 0.21 Volts for 6.4 seconds.

POSSIBLE CAUSES

Possible Causes

(G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT SHORTED TO THE (G931) SENSOR GROUND
AMBIENT AIR TEMPERATURE SENSOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, erase TIPM DTCs.
    3. Turn the ignition off for 10 seconds.
    4. Turn the ignition on.
    5. Monitor the scan tool for TIPM DTCs.

    Did this DTC return?

    Yes

    - Go To 2

    No

    - Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **AMBIENT AIR TEMPERATURE SENSOR**
    1. Turn the ignition off.
    2. Disconnect the Ambient Air Temperature Sensor harness connector.
    3. Turn the ignition on.
    4. Monitor the scan tool for TIPM DTCs for at least two minutes.

    Does the scan tool display P0073 AMBIENT AIR TEMP SENSOR

SIGNAL VOLTAGE TOO HIGH?

Yes

- Replace the Ambient Air Temperature Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE (G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the TIPM C4 harness connector.
   3. Measure the resistance between ground and the (G31) Ambient Air Temperature Sensor Signal circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the (G31) Ambient Air Temperature Sensor Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK FOR THE (G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT SHORTED TO THE (G931) SENSOR GROUND**
   1. Measure the resistance between the (G31) Ambient Air Temperature Sensor Signal circuit and the (G931) Sensor Ground circuit.

   Is the resistance above 10k Ohms?

Yes

- Replace and program the Totally Integrated Power Module (TIPM) in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (G31) Ambient Air Temperature Sensor Signal circuit for a short to the (G931) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0073-AMBIENT AIR TEMPERATURE SENSOR CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Ambient Air Temperature (AAT) Sensor is located in the front of the vehicle near the grill. The AAT Sensor is supplied 5.0 Volts and a ground from the Totally Integrated Power Module (TIPM). The TIPM broadcasts the ambient air temperature over the CAN bus. The Cluster uses this information to display the ambient air temperature. The Powertrain Control Module (PCM) uses this information to determine when to switch on the Crank Case Ventilation Heater and the Cabin Heaters. If the ambient air temperature is below 40°F and heat is selected, the cabin heaters will switch on.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Totally Integrated Power Module (TIPM) detects that the Ambient Air Temperature Sensor signal is above 4.9 Volts for 6.4 seconds.

POSSIBLE CAUSES

Possible Causes
(D65) CAN BUS + CIRCUIT INTERMITTENT OPEN
(D64) CAN BUS - CIRCUIT INTERMITTENT OPEN
(D64) CAN BUS - CIRCUIT SHORT TO VOLTAGE
(G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G931) AMBIENT AIR TEMP SENSOR GROUND CIRCUIT OPEN
(G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT OPEN
AMBIENT AIR TEMPERATURE SENSOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

   NOTE: If there are any communication DTCs present, repair those DTCs before proceeding with this test procedure.

   1. Turn the ignition on.
   2. With the scan tool, erase TIPM DTCs.
   3. Turn the ignition off for 10.0 seconds.
   4. Turn the ignition on.
   5. Monitor the scan tool for TIPM DTCs.

   Did this DTC return?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

1. Turn the ignition off.
2. Disconnect the Ambient Air Temperature Sensor harness connector.
3. Disconnect the TIPM C4 harness connector.
4. Remove the Main Relay.
5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay connector.
6. Turn the ignition on.
7. Measure the voltage on the (G31) Ambient Air Temperature Sensor Signal circuit.

   Is there any voltage present?

   Yes

   - Repair the (G31) Ambient Air Temperature Sensor Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE (G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

   NOTE: Remove the jumper wire.

   1. Turn the ignition off.
   2. Measure the resistance of the (G31) Ambient Air Temperature Sensor Signal circuit between TIPM C4 harness connector and the Ambient Air Temperature Sensor harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

No

- Repair the (G31) Ambient Air Temperature Sensor Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE (G931) AMBIENT AIR TEMP SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (G931) Ambient Air Temperature Sensor Ground circuit between the TIPM C4 harness connector and the Ambient Air Temperature Sensor harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (G931) Ambient Air Temperature Sensor Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **CHECK THE AMBIENT AIR TEMPERATURE SENSOR**
   1. Reconnect the TIPM C4 harness connector.
   2. Connect a jumper wire between the (G31) Ambient Temperature Sensor Signal and the (G931) Sensor Ground circuit in the Ambient Temperature Sensor harness connector.
   3. Turn the ignition on.
   4. Monitor the scan tool for TIPM DTCs.

      Does the scan tool display P0072 AMBIENT AIR TEMP SENSOR CIRCUIT SIGNAL VOLTAGE TOO LOW?

      Yes

- Replace the Ambient Air Temperature Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace and program the Totally Integrated Power Module (TIPM) in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0087-FUEL RAIL PRESSURE TOO LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Fuel Quantity Solenoid (FQS) is located on the High Pressure Delivery Pump. The Powertrain Control Module (PCM) sends a Pulse Width Modulated (PWM) signal to the FQS to control the amount of fuel that is directed to the pumping chambers in the High Pressure Delivery Pump. The FQS is normally closed when not being controlled by the PCM. The Fuel Quantity Solenoid works in tandem with the Fuel Pressure Regulator (FPR) to control the fuel pressure in the fuel rail. During engine cranking, the FQS is fully opened to allow maximum fuel flow and the FPR is closed to allow pressure to build quickly. After the engine starts, the FPR is primarily closed and the high side pressure is regulated using the FQS. The FPR is primarily used to help control spikes in the high pressure side during deceleration or if the FQS is not able to react quickly enough to the demands of the system.

WHEN MONITORED

With the engine running and the fuel level not near empty.

SET CONDITION

The Powertrain Control Module (PCM) detects that the rail pressure feedback is at least 100 BAR (1450 PSI) below the rail pressure demand for six seconds.

POSSIBLE CAUSES

Possible Causes
LOW FUEL
(K31) FUEL LIFT PUMP SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K31) FUEL LIFT PUMP SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K350) FUEL RAIL PRESSURE SENSOR 5-VOLT SUPPLY SHORTED TO GROUND
FUEL LINES LEAKING OR RESTRICTED
FUEL FILTER PLUGGED OR RESTRICTED
FUEL CONTROL ACTUATOR STUCK CLOSED
PRESSURE REGULATOR STUCK OPEN
RAIL PRESSURE SENSOR FAILED IN RANGE
FUEL LIFT PUMP
HIGH PRESSURE FUEL PUMP
FUEL INJECTOR LEAKING

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are any Fuel Quantity Solenoid, Fuel Pressure Regulator, Fuel Pressure Sensor Fuel Pump Control circuit or 5-Volt Reference DTCs present, diagnose those DTCs before proceeding with this test procedure.

1. Ignition on, engine not running.
2. With the scan tool, check and record Freeze Frame Data.
3. With the scan tool, clear DTCs in the Powertrain Control Module.
4. Start the engine and test drive the vehicle. Attempt to duplicate the conditions recorded in the Freeze Frame Data.
5. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **FUEL DELIVERY SYSTEM TEST**
   1. Perform the CHECKING THE FUEL DELIVERY SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   View repair

   Yes

   - Perform the appropriate repair of the fuel system.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0088-FUEL RAIL PRESSURE TOO HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Fuel System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running and the fuel level not near empty.

SET CONDITION

The Powertrain Control Module (PCM) detects that the rail pressure feedback is at least 100 BAR (1450 PSI) above the rail pressure demand for two seconds.

POSSIBLE CAUSES

Possible Causes
(K350) FUEL RAIL PRESSURE SENSOR 5-VOLT SUPPLY SHORTED TO VOLTAGE
(K852) ACCELERATOR PEDAL POSITION SENSOR 1 5-VOLT SUPPLY SHORTED TO VOLTAGE
FUEL RETURN LINE RESTRICTED
FUEL FILTER PLUGGED OR RESTRICTED
FUEL CONTROL ACTUATOR STUCK OPEN
PRESSURE REGULATOR STUCK CLOSED
RAIL PRESSURE SENSOR FAILED IN RANGE
FUEL LIFT PUMP
HIGH PRESSURE FUEL PUMP

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are any Fuel Control actuator, Fuel Pressure Regulator, Fuel Pressure Sensor or 5-Volt Reference DTCs present, diagnose those DTCs before proceeding with this test procedure.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
3. With the scan tool, actuate the Fuel Pump.
4. Monitor the scan tool for at least two minutes.
5. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **FUEL DELIVERY SYSTEM TEST**
   1. Perform the CHECKING THE FUEL DELIVERY SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   View repair

   Yes

   - Perform the appropriate repair of the fuel system.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0089-00-FUEL PRESSURE 1 CONTROL PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Fuel System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Fuel Pressure Regulator (FPR) is located on the end of the Fuel Rail. The Powertrain Control Module (PCM) sends a Pulse Width Modulated (PWM) signal to the FPR to control the pressure in the Fuel Rail. The FPR is normally

open when not being controlled by the PCM. The Fuel Quantity Solenoid (FQS) works in tandem with the Fuel Pressure Regulator to control the fuel pressure in the Fuel Rail. During engine cranking, the FQS is fully opened to allow maximum fuel flow and the FPR is closed to allow pressure to build quickly. After the engine starts, the FPR is primarily closed and the high side pressure is regulated using the FQS. The FPR is primarily used to help control spikes in the high pressure side during deceleration or if the FQS is not able to react quickly enough to the demands of the system.

WHEN MONITORED

Fuel rail pressure is being controlled in closed loop by the Fuel Pressure Regulator.

SET CONDITION

The Powertrain Control Module (PCM) detects that the difference between the actual and estimated current of the Fuel Pressure Regulator is more than 300 mA.

POSSIBLE CAUSES

Possible Causes
(K646) FUEL PRESSURE REGULATOR CONTROL CIRCUIT SHORTED TO GROUND
(K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
HIGH RESISTANCE IN THE (K646) FUEL PRESSURE REGULATOR CONTROL CIRCUIT
(K31) FUEL LIFT PUMP SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K31) FUEL LIFT PUMP SIGNAL CIRCUIT SHORTED TO VOLTAGE
FUEL RETURN LINE RESTRICTED
FUEL FILTER PLUGGED OR RESTRICTED
FUEL QUANTITY SOLENOID STUCK OPEN
PRESSURE REGULATOR STUCK CLOSED
RAIL PRESSURE SENSOR FAILED IN RANGE
FUEL LIFT PUMP
HIGH PRESSURE FUEL PUMP
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the PCM.
   3. Start and test drive the vehicle.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K31) FUEL PUMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the TIPM C2 harness connector.
   3. Disconnect the PCM C2 harness connector.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K31) Fuel Pump Control circuit in the TIPM harness connector.

      Is there any voltage present?

Yes

- Repair the (K31) Fuel Pump Control circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE (K31) FUEL PUMP CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Measure the resistance of the (K31) Fuel Pump Control circuit between the TIPM harness connector and the PCM harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K31) Fuel Pump Control circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK THE (K646) FUEL PRESSURE REGULATOR CONTROL CIRCUIT SHORTED TO GROUND**
   1. Disconnect the PCM C1 harness connector.
   2. Disconnect the Fuel Control Actuator harness connector.
   3. Measure the resistance between ground and the (K646) Fuel Pressure Regulator Control circuit at the Fuel Control Actuator harness connector.

      Is the resistance above 10k Ohms?

Yes

- Go To 5

No

- Repair the (K646) Fuel Pressure Regulator Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE (K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT SHORTED TO GROUND**
   1. Measure the resistance between ground and the (K365) Fuel Quantity Solenoid Control circuit at the Fuel Control Actuator harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 6

      No

      - Repair the (K365) Fuel Quantity Solenoid Control circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
6. **CHECK FOR HIGH RESISTANCE IN THE (K646) FUEL PRESSURE REGULATOR CONTROL CIRCUIT**
   1. Measure the resistance of the (K646) Fuel Pressure Regulator Control circuit between the Fuel Control Actuator harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

- Go To 7

No

- Repair the (K646) Fuel Pressure Regulator Control circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **CHECK THE FUEL PRESSURE REGULATOR FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the Fuel Pressure Regulator.

      NOTE: The resistance will vary slightly with temperature. The resistance should be approximately 2.2 Ohms at 77°F (25°C).

      Does the resistance reading appear to be correct?

      Yes

      - Go To 8

      No

      - Replace the Fuel Pressure Regulator Control in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

8. **FUEL DELIVERY SYSTEM TEST**
   1. Perform the CHECKING THE FUEL DELIVERY SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found with the Fuel Delivery System?

      Yes

      - Perform the appropriate repair of the fuel system.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0090-FUEL PRESSURE REGULATOR 1 CONTROL CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Fuel System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Fuel Pressure Regulator (FPR) is located on the end of the Fuel Rail. The Powertrain Control Module (PCM) sends a Pulse Width Modulated (PWM) signal to the FPR to control the pressure in the Fuel Rail. The FPR is normally

open when not being controlled by the PCM. The Fuel Quantity Solenoid (FQS) works in tandem with the Fuel Pressure Regulator to control the fuel pressure in the Fuel Rail. During engine cranking, the FQS is fully opened to allow maximum fuel flow and the FPR is closed to allow pressure to build quickly. After the engine starts, the FPR is primarily closed and the high side pressure is regulated using the FQS. The FPR is primarily used to help control spikes in the high pressure side during deceleration or if the FQS is not able to react quickly enough to the demands of the system.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an open circuit on the (K646) Fuel Pressure Regulator Control circuit for 0.167 of a second.

POSSIBLE CAUSES

Possible Causes
(K646) FUEL PRESSURE REGULATOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL PRESSURE REGULATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
    3. Monitor the scan tool for at least two minutes.
    4. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K646) FUEL PRESSURE REGULATOR CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Fuel Pressure Regulator harness connector.
   3. Disconnect the Powertrain Control Module C1 harness connector.
   4. Measure the resistance of the (K646) Fuel Pressure Regulator Control circuit between the Fuel Pressure Regulator harness connector and the Powertrain Control Module C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K646) Fuel Pressure Regulator Control circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
3. **CHECK THE FUEL PRESSURE REGULATOR**
   1. Reconnect the Powertrain Control Module C1 harness connector.
   2. Connect a jumper between ground and the (K646) Fuel Pressure Regulator Control circuit at the Fuel Pressure Regulator harness connector.
   3. Turn the ignition on.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

Did DTC P0091-FUEL PRESSURE REGULATOR 1 CONTROL CIRCUIT LOW become active?

Yes

- Replace the Fuel Pressure Regulator in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0091-FUEL PRESSURE REGULATOR 1 CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: Fuel System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Fuel Pressure Regulator (FPR) is located on the end of the Fuel Rail. The Powertrain Control Module (PCM) sends a Pulse Width Modulated (PWM) signal to the FPR to control the pressure in the Fuel Rail. The FPR is normally

open when not being controlled by the PCM. The Fuel Quantity Solenoid (FQS) works in tandem with the Fuel Pressure Regulator to control the fuel pressure in the Fuel Rail. During engine cranking, the FQS is fully opened to allow maximum fuel flow and the FPR is closed to allow pressure to build quickly. After the engine starts, the FPR is primarily closed and the high side pressure is regulated using the FQS. The FPR is primarily used to help control spikes in the high pressure side during deceleration or if the FQS is not able to react quickly enough to the demands of the system.

WHEN MONITORED

With the ignition on and the Fuel Pump command off.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to ground on the (K646) Fuel Pressure Regulator Control circuit for 0.167 seconds.

POSSIBLE CAUSES

Possible Causes
(K646) FUEL PRESSURE REGULATOR CONTROL CIRCUIT SHORTED TO GROUND
FUEL PRESSURE REGULATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
    3. Monitor the scan tool for at least two minutes.
    4. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K646) FUEL PRESSURE REGULATOR CONTROL CIRCUIT FOR A SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Fuel Pressure Regulator harness connector.
   3. Disconnect the Powertrain Control Module C1 harness connector.
   4. Measure the resistance between ground and the (K646) Fuel Pressure Regulator Control circuit at the Fuel Pressure Regulator harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K646) Fuel Pressure Regulator Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE FUEL PRESSURE REGULATOR**
   1. Turn the ignition off.
   2. Reconnect the Powertrain Control Module C1 harness connector.
   3. Turn the ignition on.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

   Did DTC P0090-FUEL PRESSURE REGULATOR 1 CONTROL

CIRCUIT OPEN become active?

Yes

- Replace the Fuel Pressure Regulator in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0092-FUEL PRESSURE REGULATOR 1 CONTROL CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: Fuel System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Fuel Pressure Regulator (FPR) is located on the end of the Fuel Rail. The Powertrain Control Module (PCM) sends a Pulse Width Modulated (PWM) signal to the FPR to control the pressure in the Fuel Rail. The FPR is normally

open when not being controlled by the PCM. The Fuel Quantity Solenoid (FQS) works in tandem with the Fuel Pressure Regulator to control the fuel pressure in the Fuel Rail. During engine cranking, the FQS is fully opened to allow maximum fuel flow and the FPR is closed to allow pressure to build quickly. After the engine starts, the FPR is primarily closed and the high side pressure is regulated using the FQS. The FPR is primarily used to help control spikes in the high pressure side during deceleration or if the FQS is not able to react quickly enough to the demands of the system.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to voltage on the (K646) Fuel Pressure Regulator Control circuit for 0.167 seconds.

POSSIBLE CAUSES

Possible Causes
(K646) FUEL PRESSURE REGULATOR CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL PRESSURE REGULATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
    3. Monitor the scan tool for at least two minutes.
    4. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K646) FUEL PRESSURE REGULATOR CONTROL CIRCUIT FOR A SHORTED TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Fuel Pressure Regulator harness connector.
   3. Disconnect the Powertrain Control Module C1 harness connector.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K646) Fuel Pressure Regulator Control circuit in the Fuel Pressure Regulator harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K646) Fuel Pressure Regulator Control circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE FUEL PRESSURE REGULATOR**
   1. Turn the ignition off.
   2. Reconnect the Powertrain Control Module C1 harness connector.
   3. Turn the ignition on.

4. Monitor the scan tool for at least two minutes.
5. With the scan tool, select View DTCs.

   Did DTC P0090-FUEL PRESSURE REGULATOR 1 CONTROL CIRCUIT OPEN become active?

   Yes

   - Replace the Fuel Pressure Regulator in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0096-INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Intake Air Temperature (IAT) Sensor is located on the Intake Manifold. The IAT Sensor is supplied a 5-Volt signal and a sensor ground from the Powertrain Control Module (PCM). The PCM uses the feedback information to determine the temperature of the charge air entering the Intake Manifold, which is used to help in determining how much fuel should be injected.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (K48) Intake Air Temperature Sensor 2 signal is implausible.

POSSIBLE CAUSES

Possible Causes
HIGH RESISTANCE IN THE (K48) INTAKE AIR TEMPERATURE SENSOR 2 SIGNAL CIRCUIT
HIGH RESISTANCE IN THE (K916) SENSOR GROUND CIRCUIT
INTAKE AIR TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, erase PCM DTCs.
    3. Turn the ignition off for 10.0 seconds.
    4. Turn the ignition on.
    5. With the scan tool, view PCM DTCs.

    Did this DTC set again?

    Yes

    - Go To 2

    No

    - Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK FOR HIGH RESISTANCE IN THE (K48) INTAKE AIR TEMPERATURE SENSOR 2 SIGNAL CIRCUIT**
    1. Turn the ignition off.

2. Disconnect the Intake Air Temperature Sensor 2 harness connector.
3. Disconnect the PCM C1 harness connector.
4. Measure the resistance of the (K48) Intake Air Temperature Sensor 2 Signal circuit between PCM C1 harness connector and the Intake Air Temperature Sensor 2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K48) Intake Air Temperature Sensor 2 Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK FOR HIGH RESISTANCE IN THE (K916) SENSOR GROUND CIRCUIT**
   1. Measure the resistance of the (K916) Sensor Ground circuit between the PCM C1 harness connector and the Intake Air Temperature Sensor 2 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K916) Sensor Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK THE INTAKE AIR TEMPERATURE SENSOR 2**

1. Turn the ignition off.
2. Reconnect the Intake Air Temperature Sensor 2 harness connector.
3. Reconnect the PCM C1 harness connector.
4. Turn the ignition on.
5. With the scan tool, erase PCM DTCs.
6. Turn the ignition off.
7. Disconnect the Intake Air Temperature Sensor 2 harness connector.
8. Turn the ignition on.
9. With the scan tool, view PCM DTCs.

NOTE: The scan tool should display the P0098-INTAKE AIR TEMPERATURE SENSOR 2 HIGH DTC as active with the harness connector disconnected.

10. With the ignition on, connect a jumper wire between the (K48) Intake Air Temperature Sensor 2 Signal circuit and the (K916) Sensor Ground circuit in the Intake Air Temperature Sensor 2 harness connector.

NOTE: Be careful not to spread the terminals in the connector.

11. With the scan tool, view PCM DTCs.

NOTE: The scan tool should display the P0097-INTAKE AIR TEMPERATURE SENSOR 2 LOW DTC as active with the circuits shorted together.

Does the scan tool display P0098 with connector disconnected and P0097 with the circuits shorted together?

Yes

- Replace the Intake Air Temperature Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0097-INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Intake Air Temperature (IAT) Sensor is located on the Intake Manifold. The IAT Sensor is supplied 5-Volt signal and a sensor ground from the Powertrain Control Module (PCM). The PCM uses the feedback information to determine the temperature of the charge air entering the Intake Manifold, which is used to help in determining how much fuel should be injected.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Intake Air Temperature Sensor 2 signal is below 0.17 Volts for two seconds.

POSSIBLE CAUSES

Possible Causes
(K48) INTAKE AIR TEMPERATURE SENSOR 2 SIGNAL CIRCUIT SHORTED TO GROUND
(K48) INTAKE AIR TEMPERATURE SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE (K916) SENSOR GROUND
INTAKE AIR TEMPERATURE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, erase PCM DTCs.
   3. Turn the ignition off for 10.0 seconds.
   4. Turn the ignition on.
   5. With the scan tool, view PCM DTCs.

   Did this DTC return?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE INTAKE AIR TEMPERATURE SENSOR**
   1. Turn the ignition off.
   2. Disconnect the Intake Air Temperature Sensor 2 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, view PCM DTCs.

   Does the scan tool display P0098-Intake Air Temperature Sensor 2 HIGH DTC as active?

   Yes

   - Replace the Intake Air Temperature Sensor 2 in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L

DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE (K48) INTAKE AIR TEMPERATURE SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.
   3. Measure the resistance between ground and the (K48) Intake Air Temperature Sensor 2 Signal circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Go To 4

   No

   - Repair the (K48) Intake Air Temperature Sensor 2 Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK FOR THE (K48) INTAKE AIR TEMPERATURE SENSOR 2 SIGNAL CIRCUIT SHORTED TO (K916) SENSOR GROUND**
   1. Measure the resistance between the (K48) Intake Air Temperature Sensor 2 Signal circuit and the (K931) Sensor Ground circuit at the Intake Air Temperature Sensor 2 harness connector.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the (K48) Intake Air Temperature Sensor 2 Signal circuit for a short to the (K916) Sensor Ground circuit.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L

DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0098-INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Intake Air Temperature (IAT) Sensor is located on the Intake Manifold. The IAT Sensor is supplied 5-Volt signal and a sensor ground from the Powertrain Control Module (PCM). The PCM uses the feedback information to determine the temperature of the charge air entering the Intake Manifold, which is used to help in determining how much fuel should be injected.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K48) Intake Air Temperature Sensor 2 signal is above 4.97 Volts.

POSSIBLE CAUSES

Possible Causes
(K48) INTAKE AIR TEMPERATURE SENSOR 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K48) INTAKE AIR TEMPERATURE SENSOR 2 SIGNAL CIRCUIT OPEN
(K916) SENSOR GROUND CIRCUIT OPEN

INTAKE AIR TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, erase PCM DTCs.
    3. Turn the ignition off for 10.0 seconds.
    4. Turn the ignition on.
    5. With the scan tool, View PCM DTCs.

    Did this DTC return?

    Yes

    - Go To 2

    No

    - Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K48) INTAKE AIR TEMPERATURE SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the Intake Air Temperature Sensor 2 harness connector.
    3. Disconnect the PCM C1 harness connector.
    4. Remove the Main Relay.
    5. Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.
    6. Turn the ignition on.
    7. Measure the voltage on the (K48) Intake Air Temperature Sensor 2 Signal circuit at the Intake Air Temperature Sensor 2 harness connector.

    Is there any voltage present?

Yes

- Repair the (K48) Intake Air Temperature Sensor 2 Signal circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE (K48) INTAKE AIR TEMPERATURE SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Remove the jumper.
   3. Reinstall the Main Relay.
   4. Measure the resistance of the (K48) Intake Air Temperature Sensor 2 Signal circuit between PCM C1 harness connector and the Intake Air Temperature Sensor 2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the (K48) Intake Air Temperature Sensor 2 Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK THE (K916) SENSOR GROUND CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (K916) Sensor Ground circuit between the PCM C1 harness connector and the Intake Air Temperature Sensor 2 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 5

No

- Repair the (K916) Sensor Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE INTAKE AIR TEMPERATURE SENSOR**
   1. Connect a jumper wire between the (K48) Intake Air Temperature Sensor 2 Signal circuit and the (K916) Sensor Ground circuit in the Intake Air Temperature Sensor 2 harness connector.

      NOTE: Be careful not to spread the terminals in the connector.

   2. Turn the ignition on.
   3. Monitor the scan tool for PCM DTCs.

      Does the scan tool display the P0097-INTAKE AIR TEMPERATURE SENSOR 2 LOW DTC as active?

      Yes

      - Replace the Intake Air Temperature Sensor in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the**

"Replace PCM" routine in the Miscellaneous Functions tab of the scan tool. . Refer to **REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0100-MASS AIR FLOW SENSOR "A"

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: O2 & MAF Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mass Air Flow (MAF) Sensor is located near the air filter box. The MAF Sensor is used to measure the volume of air flowing into the Intake Manifold. It does this by heating an element in the path of the air flow. The heated element is cooled more rapidly as more air flows past. The current required to maintain the temperature of the sensor element is used as an indicator of the air mass flowing

past the element. Integrated electronics evaluate this measurement, making it possible to precisely determine the air volume flow rate.

WHEN MONITORED

Ignition on and engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects a Mass Air Flow electrical fault or if the signal is implausible.

POSSIBLE CAUSES

Possible Causes
MASS AIR FLOW SENSOR HIGH OR LOW DTC PRESENT
INTAKE AIR SYSTEM LEAK OR RESTRICTION
MASS AIR FLOW SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. Start the engine and allow it to reach normal operating temperature.
    4. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

    - Perform the INTERMITTENT CONDITION - 2.2L Diesel

diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK FOR A MASS AIR FLOW SENSOR HIGH OR LOW DTC PRESENT**
   1. With the scan tool, select View DTCs.

      Are there any Mass Air Flow Sensor circuit DTCs that are active ?

      Yes

      - Repair the Mass Air Flow Sensor circuit DTCs before continuing with this test procedure.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3
3. **CHECK THE INTAKE SYSTEM**
   1. Turn the ignition off.
   2. Inspect the air filter for excessive dirt, soiling or other problems that may cause restricted air flow.
   3. Inspect all air intake and Turbocharger related hoses/tubes and connections.

      Were any leaks or restrictions found in the intake or Turbocharger systems?

      Yes

      - Repair the Intake or Turbocharger system as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 4

4. **MASS AIR FLOW SENSOR**
    1. Turn the ignition off.
    2. Connect the Powertrain Control Module connector.
    3. Replace the Mass Air Flow Sensor in accordance with the service information.
    4. Turn the ignition on.
    5. With the scan tool, clear DTCs.
    6. With the scan tool, navigate to Miscellaneous Functions and perform the MAF Sensor Replacement Initialization routine.
    7. Start the engine and allow it to reach normal operating temperature.
    8. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 5

    No

    - Test Complete.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **POWERTRAIN CONTROL MODULE**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Mass Air Flow Sensor and the Powertrain Control Module.
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.
    6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0102-MASS AIR FLOW SENSOR CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: O2 & MAF Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mass Air Flow (MAF) Sensor is located near the air filter box. The MAF Sensor is used to measure the volume of air flowing into the Intake Manifold. It does this by heating an element in the path of the air flow. The heated element is cooled more rapidly as more air flows past. The current required to maintain the temperature of the sensor element is used as an indicator of the air mass flowing

past the element. Integrated electronics evaluate this measurement, making it possible to precisely determine the air volume flow rate.

WHEN MONITORED

No reference Voltage DTCs present. With the engine running and engine speed below 5100 RPM.

SET CONDITION

The Mass Air Flow Sensor digital signal period is below the valid operating range for 0.5 seconds.

POSSIBLE CAUSES

Possible Causes
(K157) MAF SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K157) MAF SENSOR SIGNAL CIRCUIT SHORTED TO THE (K900) MAF SENSOR GROUND CIRCUIT
MASS AIR FLOW (MAF) SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. Start the engine and allow it to reach normal operating temperature.
    4. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

- Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Mass Air Flow Sensor harness connector.
   3. Disconnect the Powertrain Control Module harness connector.
   4. Measure the resistance between ground and the (K157) Mass Air Flow Sensor Signal circuit at the Mass Air Flow Sensor harness connector.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK FOR THE (K157) MAF SENSOR SIGNAL CIRCUIT SHORTED TO THE (K900) MAF SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (K157) MAF Sensor Signal circuit and the (K900) MAF Sensor Ground circuit at the MAF Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the (K157) MAF Sensor Signal circuit for a short to the

(K957) MAF Sensor Ground circuit.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **MASS AIR FLOW SENSOR**
   1. Turn the ignition off.
   2. Connect the Powertrain Control Module connector.
   3. Replace the Mass Air Flow Sensor in accordance with the service information.
   4. Turn the ignition on.
   5. With the scan tool, Clear DTCs.
   6. With the scan tool, navigate to Miscellaneous Functions and perform the MAF Sensor Replacement Initialization routine.
   7. Start the engine and allow it to reach normal operating temperature.
   8. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 5

   No

   - Test Complete.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Mass Air Flow Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0103-MASS AIR FLOW SENSOR CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: O2 & MAF Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mass Air Flow (MAF) Sensor is located near the air filter box. The MAF Sensor is used to measure the volume of air flowing into the Intake Manifold. It does this by heating an element in the path of the air flow. The heated element is cooled more rapidly as more air flows past. The current required to maintain the temperature of the sensor element is used as an indicator of the air mass flowing

past the element. Integrated electronics evaluate this measurement, making it possible to precisely determine the air volume flow rate.

WHEN MONITORED

Ignition on.

SET CONDITION

The Mass Air Flow Sensor digital signal period is above the valid operating range for 0.5 seconds.

POSSIBLE CAUSES

Possible Causes
(F344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN/HIGH RESISTANCE
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K900) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN/HIGH RESISTANCE
MASS AIR FLOW SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If DTC P0652 or P0653 is present with this DTC, diagnose DTCs P0652 or P0653 before diagnosing this DTC.

1. Ignition on, engine not running.
2. With the scan tool, Clear DTCs in the Powertrain Control Module.

3. Start the engine and allow it to reach normal operating temperature.
4. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (F344) FUSED MAIN RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Mass Air Flow Sensor harness connector.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (F344) Fused Main Relay Output circuit at the Mass Air Flow Sensor harness connector.

      NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

      Is the test light illuminated and bright?

      Yes

      - Go To 3

      No

      - Repair the (F344) Fused Main Relay Output circuit for an open circuit or short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

3. **CHECK THE (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Measure the voltage on the (K157) MAF Sensor Signal circuit at the MAF Sensor harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K157) MAF Sensor Signal circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 4
4. **CHECK THE (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Powertrain Control Module C1 harness connector.
   3. Measure the resistance of the (K157) Mass Air Flow Sensor Signal circuit between the Mass Air Flow Sensor connector and the Powertrain Control Module C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K157) Mass Air Flow Sensor Signal circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

5. **MASS AIR FLOW SENSOR**
   1. Replace the Mass Air Flow Sensor in accordance with the service information.
   2. Reconnect the Mass Air Flow Sensor harness connector.
   3. Reconnect the Powertrain Control Module C1 harness connector.
   4. Turn the ignition on.
   5. With the scan tool, Clear DTCs.
   6. With the scan tool, navigate to Miscellaneous Functions and perform the MAF Sensor Replacement Initialization routine.
   7. Start the engine and allow it to reach normal operating temperature.
   8. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 6

      No

      - Test Complete.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Mass Air Flow Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0105-ATMOSPHERIC PRESSURE/BAROMETRIC PRESSURE SENSOR CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At ignition on, engine not running.

SET CONDITION

The Intake Air Pressure Sensor Signal is above 4.8 Volts or below 0.19 of a Volt for 0.3 of a second.

POSSIBLE CAUSES

Possible Causes
INTAKE AIR PRESSURE SENSOR HIGH OR LOW DTC PRESENT
INTAKE AIR PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before

proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR AN INTAKE AIR PRESSURE SENSOR HIGH OR LOW DTC PRESENT**
   1. Ignition on, engine not running.
   2. With the scan tool, select View DTCs.

   Are there any Intake Air Pressure Sensor circuit DTCs that are active ?

   Yes

   - Repair the Intake Air Pressure Sensor circuit DTCs before continuing with this test procedure.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 2
2. **CHECK THE INTAKE AIR PRESSURE SENSOR**
   1. Ignition on, engine not running.
   2. With the scan tool, select Data Display and compare the readings of the Intake Air Pressure Sensor to the BARO Sensor.

   NOTE: With the engine not running the Intake Air Pressure Sensor should read approximately the same as the BARO Sensor.

   Do the values of the Intake Air Pressure Sensor and BARO Sensor read approximately the same?

   Yes

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

No

- Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Turn the ignition off.
   2. Replace the Intake Air Pressure Sensor in accordance with the service information.
   3. Turn the ignition on, engine not running.
   4. With the scan tool, erase DTCs.
   5. Leave the ignition on for up to five minutes.

   Did the DTC return?

   Yes

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Test complete.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0106-MANIFOLD ABSOLUTE PRESSURE SENSOR PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Intake Air Pressure Sensor is located between the air filter box and the Intake Manifold. The Intake Air Pressure Sensor is used to measure the pressure

of the air entering into the Intake Manifold. It uses this measurement, along with other sensor inputs, to determine how much fuel should be injected as well as to help in determining a restricted air filter.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Intake Air Pressure Sensor signal is implausible.

POSSIBLE CAUSES

Possible Causes
HIGH RESISTANCE IN THE (K68) INTAKE AIR PRESSURE SENSOR CIRCUIT
HIGH RESISTANCE IN THE (K915) SENSOR GROUND CIRCUIT
INTAKE AIR PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: If there are any sensor reference voltage DTCs present, repair those before proceeding with this test.

   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine.
   4. With the scan tool, select View DTCs.

   Did this DTC return?

   Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK FOR HIGH RESISTANCE IN THE (K68) INTAKE AIR PRESSURE SENSOR CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Intake Air Pressure Sensor harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Turn the ignition on.
   5. Measure the resistance of the (K68) Intake Air Pressure Sensor Signal circuit between the Intake Air Pressure Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K68) Intake Air Pressure Sensor Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK FOR HIGH RESISTANCE IN THE (K915) SENSOR GROUND CIRCUIT**
   1. Measure the resistance of the (K915) Sensor Ground circuit between the Intake Air Pressure Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (K915) Sensor Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE INTAKE AIR PRESSURE SENSOR**
   1. Reconnect the PCM C1 harness connector.
   2. Reconnect the Intake Air Pressure Sensor harness connector.
   3. Turn the ignition on.
   4. With the scan tool, clear DTCs.
   5. Turn the ignition off.
   6. Disconnect the Intake Air Pressure Sensor harness connector.
   7. Connect a jumper between the (K68) Intake Air Pressure Sensor Signal circuit and the (F856) Intake Air Pressure Sensor 5-Volt Supply circuit at the Intake Air Pressure Sensor harness connector.

      NOTE: Be careful not to spread the terminals in the connector.

   8. Turn the ignition on.
   9. With the scan tool, select View DTCs.

      Does the DTC P0108-MANIFOLD ABSOLUTE PRESSURE SENSOR CIRCUIT HIGH display as active?

      Yes

      - Replace the Intake Air Pressure Sensor in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Intake Air Pressure Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0107-MANIFOLD ABSOLUTE PRESSURE SENSOR CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article .

THEORY OF OPERATION

The Intake Air Pressure Sensor is located between the air filter box and the Intake Manifold. The Intake Air Pressure Sensor is used to measure the pressure of the air entering into the Intake Manifold. It uses this measurement, along with other sensor inputs, to determine how much fuel should be injected as well as to help in determining a restricted air filter.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K68) Intake Air Pressure Sensor Signal circuit is below the valid operating range for 0.2 seconds.

POSSIBLE CAUSES

Possible Causes
(K354) DIFFERENTIAL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT OPEN/HIGH RESISTANCE
(K68) INTAKE AIR PRESSURE SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K68) INTAKE AIR PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
INTAKE AIR PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are any 5-Volt reference DTCs present, repair those DTCs before proceeding with this test.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Start the engine.
4. With the scan tool, select View DTCs.

   Did this DTC reset?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (F586) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Intake Air Pressure Sensor harness connector.
   3. Disconnect the Powertrain Control Module C1 harness connector.
   4. Measure the resistance of the (F586) 5-Volt Supply circuit between the Intake Air Pressure Sensor harness connector and the Powertrain Control Module C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 3

      No

      - Repair the (F586) 5-Volt Supply circuit for an circuit or high resistance.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K68) INTAKE AIR PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K68) Intake Air Pressure Sensor Signal circuit between the Intake Air Pressure Sensor harness connector and the Powertrain Control Module C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K68) Intake Air Pressure Sensor Signal circuit for an circuit or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK THE (K68) INTAKE AIR PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (K68) Intake Air Pressure Sensor Signal circuit at the Intake (K68) Intake Air Pressure Sensor harness connector.

      Is the resistance below 10k Ohms?

      Yes

      - Repair the (K68) Intake Air Pressure Sensor Signal circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Go To 5

5. **CHECK THE INTAKE AIR PRESSURE SENSOR**
   1. Reconnect the Powertrain Control Module C1 harness connector.
   2. Reconnect the Intake Air Pressure Sensor harness connector.
   3. Turn the ignition on.
   4. With the scan tool, Clear DTCs.
   5. Turn the ignition off.
   6. Disconnect the Intake Air Pressure Sensor harness connector.
   7. Connect a jumper between the (K68) Intake Air Pressure Sensor Signal circuit and the (F856) Intake Air Pressure Sensor 5-Volt Supply circuit at the Intake Air Pressure Sensor harness connector.

      NOTE: Be careful not to spread the terminals in the connector.

   8. Turn the ignition on.
   9. With the scan tool, select View DTCs.

      Does the DTC P0108-MANIFOLD ABSOLUTE PRESSURE SENSOR HIGH display as active?

      Yes

      - Replace the Intake Air Pressure Sensor in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 6

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Intake Air Pressure Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.

3. Look for broken, bent, pushed out or corroded terminals.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0108-MANIFOLD ABSOLUTE PRESSURE SENSOR CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Intake Air Pressure Sensor is located between the air filter box and the Intake Manifold. The Intake Air Pressure Sensor is used to measure the pressure of the air entering into the Intake Manifold. It uses this measurement, along with other sensor inputs, to determine how much fuel should be injected as well as to help in determining a restricted air filter.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K68) Intake Air Pressure Sensor Signal circuit is above the valid operating range for 0.2 seconds.

POSSIBLE CAUSES

Possible Causes
(K354) DIFFERENTIAL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K68) INTAKE AIR PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K68) INTAKE AIR PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (F856) INTAKE AIR PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT
(K915) SENSOR GROUND CIRCUIT OPEN/HIGH RESISTANCE
INTAKE AIR PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: If there are 5-Volt reference DTCs present, repair those DTCs before proceeding with this test.

   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine.
   4. With the scan tool, select View DTCs.

   Did this DTC reset?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION - 2.2L Diesel diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K68) INTAKE AIR PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Intake Air Pressure Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (K68) Intake Air Pressure Sensor Signal circuit at the Intake Air Pressure Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K68) Intake Air Pressure Sensor Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK FOR THE (K68) INTAKE AIR PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (F856) INTAKE AIR PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.
   3. Measure the resistance between the (K68) Intake Air Pressure Sensor Signal circuit and the (F856) Intake Air Pressure Sensor 5-Volt Supply circuit at the Intake Air Pressure Sensor harness connector.

Is the resistance below 10k Ohms?

Yes

- Repair the short between the (K68) Intake Air Pressure Sensor Signal circuit and the (F856) Intake Air Pressure Sensor 5-Volt Supply circuit.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **CHECK THE (K915) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K915) Sensor Ground circuit between the Intake Air Pressure Sensor harness connector and the Powertrain Control Module C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K915) Sensor Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **CHECK THE INTAKE AIR PRESSURE SENSOR**
   1. Reconnect the Intake Air Pressure Sensor harness connector.
   2. Reconnect the PCM C1 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, Clear DTCs.

5. Turn the ignition off.
6. Disconnect the Intake Air Pressure Sensor harness connector.
7. Turn the ignition on.
8. With the scan tool, view DTCs.

   Does the DTC P0107-MANIFOLD ABSOLUTE PRESSURE SENSOR CIRCUIT LOW display as active?

   Yes

   - Replace the Intake Air Pressure Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 6

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Intake Air Pressure Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L

DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module in accordance with the service information. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0111-INTAKE AIR TEMPERATURE SENSOR 1 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Mass Air Flow Sensor and Intake Air Temperature Sensor 1 are combined into one sensor. The Intake Air Temperature Sensor 1 is used by the Powertrain Control Module to sense the temperature of the air entering the intake system. The Intake Air Temperature Sensor functions as a typical 5-Volt sensor.

WHEN MONITORED

Battery voltage above 10.5 Volts, not in power latch phase, ASD/Main Relay on for 0.095 seconds, and Starter Relay off for 0.095 seconds.

SET CONDITION

The Powertrain Control Module detects that the (K21) Intake Air Temperature Sensor 1 signal is implausible.

POSSIBLE CAUSES

Possible Causes
(K21) INTAKE AIR TEMPERATURE SENSOR 1 SIGNAL CIRCUIT INTERMITTENT
HIGH RESISTANCE IN THE (K21) INTAKE AIR TEMPERATURE SENSOR 1 SIGNAL CIRCUIT

HIGH RESISTANCE IN THE (K900) SENSOR GROUND CIRCUIT
MASS AIR FLOW SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: If there are any 5-Volt reference DTCs present, repair those DTCs before proceeding with this test.

   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine.
   4. With the scan tool, select View DTCs.

   Did this DTC reset?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK FOR HIGH RESISTANCE IN THE (K21) INTAKE AIR TEMPERATURE SENSOR 1 SIGNAL CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Mass Air Flow Sensor harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Turn the ignition on.
   5. Measure the resistance of the (K21) Intake Air Temperature Sensor 1 Signal circuit between the Mass Air Flow Sensor harness connector and

the PCM C1 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 3

No

- Repair the (K21) Intake Air Temperature Sensor 1 Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK FOR HIGH RESISTANCE IN THE (K900) SENSOR GROUND CIRCUIT**
   1. Measure the resistance of the (K900) Sensor Ground circuit between the Mass Air Flow Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K900) Sensor Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **MASS AIR FLOW SENSOR**
   1. Turn the ignition off.
   2. Reconnect the PCM C1 harness connector.
   3. Reconnect the Mass Air Flow Sensor harness connector.
   4. Turn the ignition on.

5. With the scan tool, clear DTCs.
6. Turn the ignition off.
7. Disconnect the Mass Air Flow Sensor harness connector.
8. With the scan tool, view DTCs.

   Does the DTC P0112-INTAKE AIR TEMPERATURE SENSOR CIRCUIT LOW display as active?

   Yes

   - Replace the Mass Air Flow Sensor in accordance with the service information. With the scan tool, navigate to Miscellaneous Functions and perform the MAF Sensor Replacement Initialization routine.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Mass Air Flow Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0112-INTAKE AIR TEMPERATURE SENSOR 1 CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Mass Air Flow Sensor and Intake Air Temperature Sensor 1 are combined into one sensor. The two sensors use the same 5-Volt supply and sensor ground circuits. The Intake Air Temperature Sensor 1 is used by the Powertrain Control Module to sense the temperature of the air entering the intake system. The Intake Air Temperature Sensor functions as a typical 5-Volt sensor.

WHEN MONITORED

Battery voltage above 10.5 Volts, not in power latch phase, ASD/Main Relay on for 0.095 of a second, and Starter Relay off for 0.095 of a second.

SET CONDITION

The Powertrain Control Module detects that the (K21) Intake Air Temperature Sensor 1 signal is below 0.14 of a Volt for two seconds.

POSSIBLE CAUSES

Possible Causes
(K21) INTAKE AIR TEMPERATURE SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND

(K21) INTAKE AIR TEMPERATURE SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND
MASS AIR FLOW SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: If there are any sensor reference voltage DTCs present, repair those DTCs before proceeding with this test.

   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine.
   4. With the scan tool, select View DTCs.

   Did this DTC reset?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K21) INTAKE AIR TEMPERATURE SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Mass Air Flow Sensor harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Measure the resistance between ground and the (K21) Intake Air

Temperature Sensor 1 Signal circuit at the Mass Air Flow Sensor harness connector.

Is the resistance below 10k Ohms?

Yes

- Repair the (K21) Intake Air Temperature Sensor 1 Signal circuit a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK FOR THE (K21) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (K900) SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (K21) Intake Air Temperature Sensor 1 Signal circuit and the (K900) Sensor Ground circuit at the Mass Air Flow Sensor harness connector.

      Is the resistance below 10k Ohms?

      Yes

      - Repair the short circuit between the (K21) Intake Air Temperature Sensor 1 Signal circuit and the (K656) Sensor Ground circuit.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 4

4. **CHECK THE MASS AIR FLOW SENSOR**
   1. Turn the ignition off.
   2. Reconnect the PCM C1 harness connector.

3. Reconnect the Mass Air Flow Sensor harness connector.
4. Turn the ignition on.
5. With the scan tool, Clear DTCs.
6. Turn the ignition off.
7. Disconnect the Mass Air Flow Sensor harness connector.
8. Connect a jumper between the (F344) Fused Main Relay Output circuit and the (K21) Intake Air Temperature Sensor 1 Signal circuit at the Mass Air Flow Sensor harness connector.

NOTE: Be careful not to spread the terminals in the connector.

9. Turn the ignition on.
10. With the scan tool, view DTCs.

Does the DTC P0113-INTAKE AIR TEMPERATURE SENSOR CIRCUIT HIGH display as active?

Yes

- Replace the Mass Air Flow Sensor in accordance with the service information. With the scan tool, navigate to Miscellaneous Functions and perform the MAF Sensor Replacement Initialization routine.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Mass Air Flow Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.

4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0113-INTAKE AIR TEMPERATURE SENSOR 1 CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Mass Air Flow Sensor and Intake Air Temperature Sensor 1 are combined into one sensor. The two sensors use the same 5-Volt supply and sensor ground circuits. The Intake Air Temperature Sensor 1 is used by the Powertrain Control Module to sense the temperature of the air entering the intake system. The Intake Air Temperature Sensor functions as a typical 5-Volt sensor.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K21) Intake Air Temperature Sensor 1 Signal circuit voltage is above 4.9 Volts for two seconds.

POSSIBLE CAUSES

Possible Causes
(K21) INTAKE AIR TEMPERATURE SENSOR 1 SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K21) INTAKE AIR TEMPERATURE SENSOR 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K900) SENSOR GROUND CIRCUIT OPEN/HIGH RESISTANCE
MASS AIR FLOW SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are any 5-Volt reference DTCs present, repair those before proceeding with this test.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Start the engine.
4. With the scan tool, select View DTCs.

Did this DTC reset?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K21) INTAKE AIR TEMPERATURE SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Mass Air Flow Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (K21) Intake Air Temperature Sensor 1 Signal circuit at the Mass Air Flow Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K21) Intake Air Temperature Sensor 1 Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE (K21) INTAKE AIR TEMPERATURE SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.
   3. Measure the resistance of the (K21) Intake Air Temperature Sensor 1 Signal circuit between the Mass Air Flow Sensor harness connector harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

- Repair the (K21) Intake Air Temperature Sensor 1 Signal circuit for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE (K900) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.
   3. Measure the resistance of the (K900) Sensor Ground circuit between the Mass Air Flow Sensor harness connector harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K900) Sensor Ground circuit for an open circuit or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **CHECK THE MASS AIR FLOW SENSOR**
   1. Turn the ignition off.
   2. Reconnect the PCM C1 harness connector.
   3. Reconnect the Mass Air Flow Sensor harness connector.
   4. Turn the ignition on.
   5. With the scan tool, Clear DTCs.
   6. Turn the ignition off.
   7. Disconnect the Mass Air Flow Sensor harness connector.
   8. Turn the ignition on.
   9. With the scan tool, view DTCs.

Does the DTC P0112-INTAKE AIR TEMPERATURE SENSOR CIRCUIT LOW display as active?

Yes

- Replace the Mass Air Flow Sensor in accordance with the service information. With the scan tool, navigate to Miscellaneous Functions and perform the MAF Sensor Replacement Initialization routine.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Mass Air Flow Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0116-ENGINE COOLANT TEMPERATURE SENSOR PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Engine Coolant Temperature (ECT) Sensor is located on the Thermostat Housing. The ECT is supplied a 5-Volt signal and a sensor ground from the Powertrain Control Module (PCM). The PCM uses the feedback information to determine the temperature of the engine coolant. This information is used by the PCM to determine when to cycle on the cooling fans. The low speed fan is cycled on at 98°C (208°F). The high speed fan is cycled on at 108°C (226°F). When the coolant temperature reaches 121°C (250°F), the Cluster coolant temperature warning lamp turns on and the Cluster chimes continuously. The A/C compressor is shut off at this coolant temperature.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The (K2) Engine Coolant Temperature Sensor (ECT) Signal is invalid for 0.1 seconds.

POSSIBLE CAUSES

Possible Causes
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K914) ENGINE COOLANT TEMPERATURE SENSOR RETURN CIRCUIT OPEN/HIGH RESISTANCE

ENGINE COOLANT TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine and allow it to reach normal operating temperature.
   4. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Engine Coolant Temperature Sensor harness connector.
   3. Disconnect the Powertrain Control Module harness connector.
   4. Measure the resistance of the (K2) Engine Coolant Temperature Sensor Signal circuit between the ECT Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 3

No

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K914) ENGINE COOLANT TEMPERATURE SENSOR RETURN CIRCUIT AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K914) Engine Coolant Temperature Sensor Return circuit between the ECT Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K914) Engine Coolant Temperature Sensor Return circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **POWERTRAIN CONTROL MODULE**
   1. Reconnect the PCM C1 harness connector.
   2. Reconnect the ECT Sensor harness connector.
   3. Turn the ignition on.
   4. With the scan tool, clear DTCs in the Powertrain Control Module.
   5. Disconnect the ECT Sensor harness connector.

      NOTE: With the ECT Sensor disconnected a P0118 ECT Sensor High DTC should set.

   6. Connect a jumper across the ECT Sensor harness connector.

      NOTE: With the ECT Sensor circuits shorted together a P0117 ECT Sensor Low DTC should set.

Did the scan tool display the proper DTC with the ECT Sensor disconnected and circuits shorted together?

Yes

- Replace the Engine Coolant Temperature Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0117-ENGINE COOLANT TEMPERATURE SENSOR CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Engine Coolant Temperature (ECT) Sensor is located on the Thermostat Housing. The ECT is supplied a 5-Volt signal and a sensor ground from the Powertrain Control Module (PCM). The PCM uses the feedback information to determine the temperature of the engine coolant. This information is used by the PCM to determine when to cycle on the cooling fans. The low speed fan is cycled on at 98°C (208°F). The high speed fan is cycled on at 108°C (226°F). When the coolant temperature reaches 121°C (250°F), the Cluster coolant temperature warning lamp turns on and the Cluster chimes continuously. The A/C compressor is shut off at this coolant temperature.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K2) Engine Coolant Temperature Sensor Signal circuit voltage is below 0.25 Volts for 0.48 seconds.

POSSIBLE CAUSES

Possible Causes
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT
ENGINE COOLANT TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the PCM.
    3. Cycle the ignition key off and on several times, leaving the ignition on for at least 10.0 seconds at a time.
    4. With the scan tool, select View DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

1. Turn the ignition off.
2. Disconnect the Engine Coolant Temperature Sensor harness connector.
3. Disconnect the Powertrain Control Module harness connector.
4. Measure the resistance between ground and the (K2) Engine Coolant Temperature Sensor Signal circuit in the Engine Coolant Temperature Sensor harness connector.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK FOR THE (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (K2) Engine Coolant Temperature Sensor Signal circuit and the (K914) Engine Coolant Temperature Sensor Ground circuit in the Engine Coolant Temperature Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for a short to the (K914) Engine Coolant Temperature Sensor Ground circuit.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **ENGINE COOLANT TEMPERATURE SENSOR**
   1. Reconnect the Powertrain Control Module harness connector.
   2. Turn the ignition on.
   3. With the scan tool, Clear DTCs.
   4. With the scan tool, select View DTCs.

NOTE: The scan tool should display the P0118-ENGINE COOLANT TEMPERATURE SENSOR CIRCUIT HIGH DTC with the connector disconnected.

Does the scan tool display the DTCs as described above?

Yes

- Replace the Engine Coolant Temperature Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Coolant Temperature Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.

6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0118-ENGINE COOLANT TEMPERATURE SENSOR CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Engine Coolant Temperature (ECT) Sensor is located on the Thermostat Housing. The ECT is supplied a 5-Volt signal and a sensor ground from the Powertrain Control Module (PCM). The PCM uses the feedback information to determine the temperature of the engine coolant. This information is used by the PCM to determine when to cycle on the cooling fans. The low speed fan is cycled on at 98°C (208°F). The high speed fan is cycled on at 108°C (226°F). When the coolant temperature reaches 121°C (250°F), the Cluster coolant temperature warning lamp turns on and the Cluster chimes continuously. The A/C compressor is shut off at this coolant temperature.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K2) Engine Coolant Temperature Sensor Signal circuit voltage is above 4.98 Volts for 0.48 seconds.

POSSIBLE CAUSES

Possible Causes
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT OPEN/HIGH RESISTANCE
ENGINE COOLANT TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. Cycle the ignition key off and on several times, leaving the ignition on for at least 10.0 seconds at a time.
    4. With the scan tool, View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

    - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL FOR A CIRCUIT SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Engine Coolant Temperature Sensor connector.
   3. Disconnect the PCM C1 harness connector.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K2) Engine Coolant Temperature Sensor Signal circuit in the Engine Coolant Temperature Sensor harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3
3. **CHECK THE (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.

      NOTE: Remove the jumper and reinstall the Main Relay.

   2. Measure the resistance of the (K2) Engine Coolant Temperature Sensor Signal circuit between the Engine Coolant Temperature Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE (K914) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K914) Engine Coolant Temperature Sensor Ground circuit between the Engine Coolant Temperature Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K915) Engine Coolant Temperature Sensor Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **CHECK THE ENGINE COOLANT TEMPERATURE SENSOR**
   1. Turn the ignition off.
   2. Reconnect the PCM C1 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, clear DTCs.
   5. Turn the ignition off.
   6. Connect a jumper wire between the (K914) Engine Coolant Temperature Sensor Ground circuit and the (K2) Engine Coolant

Temperature Sensor Signal circuit at the Engine Coolant Temperature Sensor harness connector.

NOTE: Be careful not to spread the terminals in the connector.

7. Turn the ignition on.
8. With the scan tool, view DTCs.

NOTE: The scan tool should display the P0117-ENGINE COOLANT TEMPERATURE SENSOR CIRCUIT LOW DTC with the jumper wire in place.

Does the scan tool display the DTC as described above?

Yes

- Replace the Engine Coolant Temperature Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Coolant Temperature Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0122-THROTTLE POSITION SENSOR 1 CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 12: APPS & EGR Airflow Control Valve Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Powertrain Control Module (PCM) actuates the EGR Airflow Control Valve via the Pulse Width Modulated (PWM) control circuits. The EGR Airflow Control Valve is actuated to control the air volume and the mixing ratio of the charge air and the recirculated exhaust gases to the Intake Manifold. This is accomplished by creating a vacuum which draws the recirculated exhaust gases

into the manifold. The position sensor is integrated into the EGR Airflow Control Valve, and is not serviceable separately. The EGR Airflow Control Valve Position Sensor functions as a typical three wire 5-Volt sensor. The PCM receives feedback as to the position of the valve from the position sensor via the signal wire. The EGR Airflow Control Valve is closed when the ignition is turned off to help provide a smooth engine shut down.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (K312) EGR Airflow Control Valve Position Sensor circuit is below 0.3 Volts for 0.08 seconds.

POSSIBLE CAUSES

Possible Causes
(K312) EGR AIRFLOW CONTROL VALVE POSITION SENSOR CIRCUIT SHORTED TO GROUND
EGR AIRFLOW CONTROL VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the PCM.
    3. Cycle the ignition key off and on several times, leaving the ignition on for at least 10.0 seconds at a time.
    4. With the scan tool, select View DTCs.

    Did the DTC return?

    Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K312) EGR AIRFLOW CONTROL VALVE POSITION SENSOR CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the EGR Airflow Control Valve harness connector.
   3. Disconnect the Powertrain Control Module C1 harness connector.
   4. Measure the resistance between ground and the (K312) EGR Airflow Control Valve Position Sensor circuit at the EGR Airflow Control Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K312) EGR Airflow Control Valve Position Sensor circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE EGR AIRFLOW CONTROL VALVE**
   1. Reconnect the Powertrain Control Module C1 harness connector.
   2. Turn the ignition on.
   3. With the scan tool, clear DTCs.
   4. With the scan tool, select View DTCs.

   Did DTC P0122 become stored and P0123-THROTTLE POSITION SENSOR 1 CIRCUIT HIGH become active?

   Yes

- Replace the EGR Airflow Control Valve in accordance with the service information. With the scan tool, navigate to Miscellaneous Functions and perform the Throttle Valve Learn procedure.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Airflow Control Valve and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L

DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0123-THROTTLE POSITION SENSOR 1 CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: APPS & EGR Airflow Control Valve Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Powertrain Control Module (PCM) actuates the EGR Airflow Control Valve via the Pulse Width Modulated (PWM) control circuits. The EGR Airflow Control Valve is actuated to control the air volume and the mixing ratio of the charge air and the recirculated exhaust gases to the Intake Manifold. This is accomplished by creating a vacuum which draws the recirculated exhaust gases into the manifold. The position sensor is integrated into the EGR Airflow Control Valve, and is not serviceable separately. The EGR Airflow Control Valve Position Sensor functions as a typical three wire 5-Volt sensor. The PCM receives feedback as to the position of the valve from the position sensor via the signal wire. The EGR Airflow Control Valve is closed when the ignition is turned off to help provide a smooth engine shut down.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (K312) EGR Airflow Control Valve Position Sensor circuit is above 4.6 Volts for 0.08 seconds.

POSSIBLE CAUSES

Possible Causes
(K844) 5-VOLT SUPPLY CIRCUIT OPEN/HIGH RESISTANCE
(K844) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K844) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K854) ACCELERATOR PEDAL POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K854) ACCELERATOR PEDAL POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K914) SENSOR GROUND CIRCUIT OPEN/HIGH RESISTANCE
(K312) EGR AIRFLOW CONTROL VALVE POSITION SENSOR CIRCUIT SHORTED TO VOLTAGE
(K312) EGR AIRFLOW CONTROL VALVE POSITION SENSOR CIRCUIT OPEN/HIGH RESISTANCE
EGR AIRFLOW CONTROL VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: If there are any 5-Volt Reference DTCs present, repair those DTCs before proceeding with this procedure.

   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the PCM.
   3. Cycle the ignition key off and on several times, leaving the ignition on for at least 10.0 seconds at a time.
   4. With the scan tool, select View DTCs.

   Did the DTC return?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K312) EGR AIRFLOW CONTROL VALVE POSITION SENSOR CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the EGR Airflow Control Valve harness connector.
   3. Disconnect the Powertrain Control Module C1 harness connector.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage on the (K312) EGR Airflow Control Valve Position Sensor circuit at the EGR Airflow Control Valve harness

connector.

Is there any voltage present?

Yes

- Repair the (K312) EGR Airflow Control Valve Position Sensor circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE (K312) EGR AIRFLOW CONTROL VALVE POSITION SENSOR CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K312) EGR Airflow Control Valve Position Sensor circuit at the EGR Airflow Control Valve harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K312) EGR Airflow Control Valve Position Sensor circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK THE (K914) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K914) Sensor Ground circuit at the EGR Airflow Control Valve harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 5

No

- Repair the (K914) Sensor Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE EGR AIRFLOW CONTROL VALVE**
   1. Reconnect the Powertrain Control Module C1 harness connector.
   2. Turn the ignition on.
   3. With the scan tool, Clear DTCs.
   4. Turn the ignition off.
   5. Connect a jumper between ground and the (K312) EGR Airflow Control Valve Position Sensor circuit at the EGR Airflow Control Valve harness connector.

      NOTE: Be careful not to spread the terminals in the connector.

   6. Turn the ignition on.
   7. With the scan tool, select View DTCs.

      Did DTC P0123 become stored and P0122-THROTTLE POSITION SENSOR 1 CIRCUIT LOW become active?

      Yes

      - Replace the EGR Airflow Control Valve in accordance with the service information. With the scan tool, navigate to Miscellaneous Functions and perform the Throttle Valve Learn procedure.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Airflow Control Valve and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0130-O2 SENSOR 1/1 CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article .

Fig. 14: O2 & MAF Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Powertrain Control Module (PCM) receives feedback from the Oxygen Sensor to monitor the oxygen content in the diesel engine exhaust. The PCM uses this information, along with input from other sensors to vary the rich/lean

fuel mixture of the intake air fuel mixture to adjust the system and meet emission standards.

WHEN MONITORED

With the ignition on and the O2 Sensor 1/1 at operating temperature.

SET CONDITION

The Powertrain Control Module (PCM) detects an open on the (K41) O2 Sensor 1/1 Signal circuit for 2.0 seconds.

POSSIBLE CAUSES

Possible Causes
(K41) O2 SENSOR 1/1 SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
OXYGEN SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, Clear DTCs in the Powertrain Control Module.
    3. Start the engine.
    4. Allow the engine to reach normal operating temperature.
    5. Monitor the scan tool for at least five minutes.
    6. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K41) O2 SENSOR 1/1 SIGNAL CIRCUIT CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the O2 Sensor 1/1 harness connector.
   3. Disconnect the Powertrain Control Module harness connector.
   4. Measure the resistance of the (K41) O2 Sensor 1/1 Signal circuit between the O2 Sensor harness connector and the Powertrain Control Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 3

      No

      - Repair the (K41) O2 Sensor 1/1 Signal circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **OXYGEN SENSOR**
   1. Connect the Powertrain Control Module harness connector.
   2. Replace the Oxygen Sensor in accordance with the service information.
   3. Turn the ignition on.
   4. With the scan tool, navigate to Miscellaneous Functions and perform the O2 Sensor Replaced procedure.
   5. Start the engine.
   6. Allow the engine to reach normal operating temperature.
   7. Monitor the scan tool for at least five minutes.
   8. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

Yes

- Go To 4

No

- Test Complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L

DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0133-O2 SENSOR 1/1 SLOW RESPONSE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: O2 & MAF Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Powertrain Control Module (PCM) receives feedback from the Oxygen Sensor to monitor the oxygen content in the diesel engine exhaust. The PCM uses this information, along with input from other sensors to vary the rich/lean fuel mixture of the intake air fuel mixture to adjust the system and meet emission standards.

WHEN MONITORED

With the ignition on and the O2 Sensor 1/1 at operating temperature.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to voltage on the (K902) O2 Sensor 1/1 Negative Current Control circuit for 2.0 seconds.

POSSIBLE CAUSES

Possible Causes
(K902) O2 SENSOR 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO VOLTAGE
(K902) O2 SENSOR 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT
(K902) O2 SENSOR 1/1 NEGATIVE CURRENT CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K89) O2 SENSOR 1/1 POSITIVE CURRENT CONTROL SHORTED TO VOLTAGE
(K103) O2 SENSOR 1/1 PUMP CELL CURRENT TRIM OPEN OR HIGH RESISTANCE
INTAKE AIR SYSTEM LEAK
EGR SYSTEM LEAK
EXHAUST SYSTEM LEAK
OXYGEN SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, Clear DTCs in the Powertrain Control Module.
   3. Start the engine.
   4. Allow the engine to reach normal operating temperature.
   5. Monitor the scan tool for at least five minutes.
   6. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K902) O2 SENSOR 1/1 NEGATIVE CURRENT CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Oxygen Sensor harness connector.
   3. Disconnect the PCM harness connector.
   4. Remove the ASD Relay from the TIPM.
   5. Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K902) O2 Sensor 1/1 Negative Current Control circuit in the Oxygen Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K902) O2 Sensor 1/1 Negative Current Control circuit for a short to voltage.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE (K89) O2 SENSOR 1/1 POSITIVE CURRENT CONTROL FOR A SHORT TO VOLTAGE**
   1. Measure voltage on the (K89) O2 Sensor 1/1 Positive Current Control circuit in the Oxygen Sensor harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K89) O2 Sensor 1/1 Positive Current Control circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      Go To 4

4. **CHECK FOR THE (K902) O2 SENSOR 1/1 NEGATIVE CURRENT CONTROL CIRCUIT SHORTED TO THE (F344) FUSED ASD RELAY OUTPUT 2 CIRCUIT**
   1. Turn the ignition off.
   2. Remove the jumper wire and install the ASD Relay.
   3. Measure the resistance between the (K902) O2 Sensor 1/1 Negative Current Control circuit and the (F344) Fused ASD Relay Output 2 circuit in the Oxygen Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

- Go To 5

No

- Repair the (K902) O2 Sensor 1/1 Negative Current Control circuit for a short to the (F344) Fused ASD Relay Output 2 circuit.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE (K902) O2 SENSOR 1/1 NEGATIVE CURRENT CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K902) O2 Sensor 1/1 Negative Current Control circuit between the Oxygen Sensor harness connector and the PCM harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (K902) O2 Sensor 1/1 Negative Current Control circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
6. **CHECK THE (K103) O2 SENSOR 1/1 PUMP CELL CURRENT TRIM FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K103) O2 Sensor 1/1 Pump Cell Current Trim circuit between the Oxygen Sensor harness connector and the PCM harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

No

- Repair the (K103) O2 Sensor 1/1 Pump Cell Current Trim circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **CHECK THE INTAKE AIR SYSTEM**
   1. Check the Intake Air System for any signs of a leak or restriction.

   Were any Intake System problems found?

   Yes

   - Perform the appropriate repairs to the Intake Air System.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 8

8. **CHECK THE EXHAUST SYSTEM FOR LEAKS**
   1. Check the Exhaust System for any signs of a leak or restriction.

   Were any Exhaust System problems found?

   Yes

   - Perform the appropriate repairs to the Exhaust System.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 9

9. **CHECK FOR AN EGR LEAK**
   1. Look for visible signs (soot streaks) of an external EGR leak.

   Were any EGR leaks found?

Yes

- Perform the appropriate repairs to the EGR system.
- Perform the POWERTRAIN VERIFICATION TEST 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 10

10. **OXYGEN SENSOR**
    1. Reconnect the PCM harness connector.
    2. Replace the Oxygen Sensor in accordance with the service information.
    3. Turn the ignition on.
    4. With the scan tool, navigate to Miscellaneous Functions and perform the O2 Sensor Replace procedure.
    5. Start the engine.
    6. Allow the engine to reach normal operating temperature.
    7. Monitor the scan tool for at least five minutes.
    8. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 11

    No

    - Test Complete.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

11. **POWERTRAIN CONTROL MODULE**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Powertrain Control Module.
    2. Look for any chafed, pierced, pinched, or partially broken wires.

3. Look for broken, bent, pushed out or corroded terminals.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0135-O2 SENSOR 1/1 HEATER PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: O2 & MAF Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Powertrain Control Module (PCM) receives feedback from the Oxygen Sensor to monitor the oxygen content in the diesel engine exhaust. The PCM uses this information, along with input from other sensors to vary the rich/lean fuel mixture of the intake air fuel mixture to adjust the system and meet emission standards.

WHEN MONITORED

With the ignition on and the Oxygen Sensor Heater commanded on.

SET CONDITION

The Powertrain Control Module (PCM) detects an implausible voltage on the (K79) O2 1/1 Heater Control circuit for 2.0 seconds.

POSSIBLE CAUSES

Possible Causes
(K79) O2 SENSOR 1/1 HEATER CONTROL CIRCUIT SHORTED TO VOLTAGE
(K79) O2 SENSOR 1/1 HEATER CONTROL CIRCUIT SHORTED TO GROUND
(K79) O2 SENSOR 1/1 HEATER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K103) O2 SENSOR 1/1 PUMP CELL CURRENT TRIM SHORTED TO GROUND
(K89) O2 SENSOR 1/1 POSITIVE CURRENT CONTROL SHORTED TO GROUND
(F344) FUSED ASD RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. With the scan tool, actuate the Oxygen Sensor Heater.
    4. Monitor the scan tool for at least two minutes.
    5. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K79) O2 SENSOR 1/1 HEATER CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Oxygen Sensor harness connector.
   3. Disconnect the Powertrain Control Module harness connector.
   4. Remove the ASD Relay from the TIPM.
   5. Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K79) O2 Sensor 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K79) O2 Sensor 1/1 Heater Control circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE (K79) O2 SENSOR 1/1 HEATER CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.

2. Remove the jumper wire and install the ASD Relay.
3. Measure the resistance between ground and the (K79) O2 Sensor 1/1 Heater Control circuit in the Oxygen Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the (K79) O2 Sensor 1/1 Heater Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE (K103) O2 SENSOR 1/1 PUMP CELL CURRENT TRIM CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (K103) O2 Sensor 1/1 Pump Cell Current Trim circuit in the Oxygen Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K79) O2 Sensor 1/1 Heater Control circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE (K89) O2 SENSOR 1/1 POSITIVE CURRENT CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (K89) O2 Sensor 1/1

Positive Current Control circuit in the Oxygen Sensor harness connector.

Is the resistance above 10k Ohms?

Yes

- Go To 6

No

- Repair the (K89) O2 Sensor 1/1 Positive Current Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **CHECK THE (K79) O2 SENSOR 1/1 HEATER CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K79) O2 Sensor 1/1 Heater Control circuit between the Oxygen Sensor harness connector and the Powertrain Control Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

      - Repair the (K79) O2 Sensor 1/1 Heater Control circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
7. **CHECK THE (F344) FUSED ASD RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (F344) Fused ASD Relay Output circuit between the Oxygen Sensor harness connector and the TIPM C10

harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 8

No

- Repair the (F344) Fused ASD Relay Output circuit for an open circuit or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

8. **CHECK THE OXYGEN SENSOR**
   1. Connect the Powertrain Control Module harness connector.
   2. Replace the Oxygen Sensor in accordance with the service information.
   3. Turn the ignition on.
   4. With the scan tool, navigate to Actuator Tests and perform the O2 Sensor Replace procedure.
   5. Start the engine.
   6. Allow the engine to reach normal operating temperature.
   7. Monitor the scan tool for at least two minutes.
   8. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 9

   No

   - Test Complete.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

9. **POWERTRAIN CONTROL MODULE**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Powertrain Control Module.
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

    No

    - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P015A-O2 SENSOR 1/1 DELAYED RESPONSE - RICH TO LEAN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 17: O2 & MAF Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Powertrain Control Module (PCM) receives feedback from the Oxygen Sensor to monitor the oxygen content in the diesel engine exhaust. The PCM uses this information, along with input from other sensors to vary the rich/lean fuel mixture of the intake air fuel mixture to adjust the system and meet emission standards.

WHEN MONITORED

With the engine running, sufficient exhaust flow, in fuel cut off mode.

SET CONDITION

The Powertrain Control Module (PCM) detects that the time for the O2 Sensor pump current to change from 1.0 mA to 2.25 mA in more than 0.77 seconds.

POSSIBLE CAUSES

Possible Causes
FUEL DELIVERY SYSTEM FAILURE
INTAKE AIR SYSTEM LEAK
EGR SYSTEM LEAK
EXHAUST SYSTEM LEAK
OXYGEN SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are any cylinder misfire, Crank Sensor, MAF Sensor, or Fuel Injector DTCs stored with this fault, perform the diagnostics for those DTCs before proceeding with this test.

1. Ignition on, engine not running.
2. With the scan tool, Clear DTCs in the Powertrain Control Module.
3. With the scan tool, actuate the Oxygen Sensor Heater.
4. Monitor the scan tool for at least five minutes.
5. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perfrom the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE FUEL DELIVERY SYSTEM**
   1. Perform the CHECKING THE FUEL DELIVERY SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   Were any fuel system problems found?

   Yes

   - Perform the appropriate repairs to the fuel system.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE INTAKE AIR SYSTEM**
   1. Check the Intake Air System for any signs of a leak or restriction.

   Were any Intake System problems found?

   Yes

   - Perform the appropriate repairs to the Intake Air System.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4

4. **CHECK THE EXHAUST SYSTEM FOR LEAKS**
   1. Check the Exhaust System for any signs of a leak or restriction.

Were any Exhaust System problems found?

Yes

- Perform the appropriate repairs to the Exhaust System.
- Perform the POWERTRAIN VERIFICATION TEST 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **CHECK FOR AN EGR LEAK**
   1. Look for visible signs (soot streaks) of an external EGR leak.

   Were any EGR leaks found?

   Yes

   - Perform the appropriate repairs to the EGR system.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 6

6. **CHECK THE OXYGEN SENSOR**
   1. Connect the Powertrain Control Module harness connector.
   2. Replace the Oxygen Sensor in accordance with the service information.
   3. Turn the ignition on.
   4. With the scan tool, navigate to Miscellaneous Functions and perform the O2 Sensor Replace procedure.
   5. Start the engine.
   6. Allow the engine to reach normal operating temperature.
   7. Monitor the scan tool for at least five minutes.
   8. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

Yes

- Go To 7

No

- Test Complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0181-FUEL TEMPERATURE SENSOR PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Fuel Temperature Sensor (FTS) is located next to the fuel feed line on the High Pressure Pump. The FTS is supplied a 5-Volt signal and a sensor ground from the Powertrain Control Module (PCM). The PCM uses the feedback information to determine the temperature of the fuel flowing through the High Pressure Pump. Diesel fuel becomes more dense as the temperature of the fuel decreases and the PCM uses this information to adjust the fuel quantity in the system.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K156) Fuel Temperature Sensor Signal changes by more than 140°F (60°C) in one second.

POSSIBLE CAUSES

Possible Causes
(K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K914) FUEL TEMPERATURE SENSOR RETURN CIRCUIT OPEN/HIGH RESISTANCE
FUEL TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **CHECK THE FUEL TEMPERATURE SENSOR CONNECTOR**
    1. Turn the ignition off.
    2. Disconnect the Fuel Temperature Sensor harness connector.
    3. Inspect the connector for poor terminal contact, corrosion, damage or other problems.

    Is there any evidence of connector problems?

Yes

- Repair or replace as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 2

2. **CHECK THE (K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Disconnect the PCM C1 harness connector.
   2. Measure the resistance of the (K156) Fuel Temperature Sensor Signal circuit between the Fuel Temperature Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K156) Fuel Temperature Sensor Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K914) FUEL TEMPERATURE SENSOR RETURN CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K914) Fuel Temperature Sensor Return circuit between the Fuel Temperature Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

- Go To 4

No

- Repair the (K914) Fuel Temperature Sensor Return circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE FUEL TEMPERATURE SENSOR**

NOTE: Allow the engine to completely cool to ambient temperature.

1. Reconnect the PCM C1 harness connector.
2. Reconnect the Fuel Temperature Sensor harness connector.
3. Turn the ignition on.
4. With the scan tool, read and note the engine coolant temperature.
5. With the scan tool, read the fuel temperature and compare it to the engine coolant temperature reading.

Are the readings within 7°C (13°F) of each other?

Yes

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

No

- Go To 5

5. **CHECK THE POWERTRAIN CONTROL MODULE**
   1. Replace the Fuel Temperature Sensor in accordance with the service information.
   2. With the scan tool, erase DTCs.
   3. Start the engine and allow it to reach operating temperature.
   4. With the scan tool, read DTCs.

Did DTC P0181 return?

Yes

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Test complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0182-FUEL TEMPERATURE SENSOR CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Fuel Temperature Sensor (FTS) is located next to the fuel feed line on the High Pressure Pump. The FTS is supplied a 5-Volt signal and a sensor ground from the Powertrain Control Module (PCM). The PCM uses the feedback information to determine the temperature of the fuel flowing through the High Pressure Pump. Diesel fuel becomes more dense as the temperature of the fuel decreases and the PCM uses this information to adjust the fuel quantity in the system.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K156) Fuel Temperature Sensor Signal circuit voltage is below 0.1 Volts for two seconds.

POSSIBLE CAUSES

Possible Causes
(K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (K914) FUEL TEMPERATURE SENSOR RETURN CIRCUIT
FUEL TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Cycle the ignition key off and on several times, leaving the ignition on for at least 10.0 seconds at a time.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Fuel Temperature Sensor harness connector.

3. Disconnect the Powertrain Control Module C1 harness connector.
4. Measure the resistance between ground and the (K156) Fuel Temperature Sensor Signal circuit in the Fuel Temperature Sensor harness connector.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the (K156) Fuel Temperature Sensor Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK FOR THE (K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (K914) FUEL TEMPERATURE SENSOR RETURN CIRCUIT**
   1. Measure the resistance between the (K156) Fuel Temperature Sensor Signal circuit and the (K914) Fuel Temperature Sensor Return circuit at the Fuel Temperature Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K156) Fuel Temperature Sensor Signal circuit for a short to the (K914) Fuel Temperature Sensor Return circuit.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK THE FUEL TEMPERATURE SENSOR**

1. Reconnect the Fuel Temperature Sensor harness connector.
2. Reconnect the Powertrain Control Module C1 harness connector.
3. Turn the ignition on.
4. With the scan tool, clear DTCs.
5. Turn the ignition off.
6. Disconnect the Fuel Temperature Sensor harness connector.
7. Turn the ignition on.
8. With the scan tool, select View DTCs.

NOTE: The scan tool should display a P0183-Fuel Temperature Sensor Circuit High DTC with the Fuel Temperature Sensor connector disconnected.

Does the scan tool display the DTCs as described above?

Yes

- Replace the Fuel Temperature Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Temperature Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle

test.

6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0183-FUEL TEMPERATURE SENSOR CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Fuel Temperature Sensor (FTS) is located next to the fuel feed line on the High Pressure Pump. The FTS is supplied a 5-Volt signal and a sensor ground from the Powertrain Control Module (PCM). The PCM uses the feedback information to determine the temperature of the fuel flowing through the High Pressure Pump. Diesel fuel becomes more dense as the temperature of the fuel decreases and the PCM uses this information to adjust the fuel quantity in the system.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K156) Fuel Temperature Sensor Signal circuit voltage is above 4.94 Volts for two seconds.

POSSIBLE CAUSES

Possible Causes
(K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K916) FUEL TEMPERATURE SENSOR RETURN CIRCUIT SHORTED TO VOLTAGE
(K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K916) FUEL TEMPERATURE SENSOR RETURN CIRCUIT OPEN/HIGH RESISTANCE
FUEL TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. Cycle the ignition key off and on several times, leaving the ignition on for at least 10.0 seconds at a time.
    4. Monitor the scan tool for at least two minutes.
    5. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Fuel Temperature Sensor harness connector.
   3. Disconnect the Powertrain Control Module C1 harness connector.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K156) Fuel Temperature Sensor Signal circuit at the Fuel Temperature Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K156) Fuel Temperature Sensor Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE (K916) FUEL TEMPERATURE SENSOR RETURN CIRCUIT FOR A SHORT TO VOLTAGE**

   NOTE: The jumper wire should still be in place.

   1. Measure the voltage of the (K916) Fuel Temperature Sensor Return circuit at the Fuel Temperature Sensor harness connector.

   Is there any voltage present?

Yes

- Repair the (K916) Fuel Temperature Sensor Return circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **CHECK THE (K156) FUEL TEMPERATURE SENSOR SIGNAL FOR AN OPEN/HIGH RESISTANCE**

NOTE: Remove the jumper wire.

1. Turn the ignition off.
2. Reinstall the Main Relay.
3. Measure the resistance of the (K156) Fuel Temperature Sensor Signal circuit between the Fuel Temperature Sensor harness connector and the Powertrain Control Module C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the (K156) Fuel Temperature Sensor Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE (K916) FUEL TEMPERATURE SENSOR RETURN CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K916) Fuel Temperature Sensor Return circuit between the Fuel Temperature Sensor harness connector and the

Powertrain Control Module C1 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 6

No

- Repair the (K916) Fuel Temperature Sensor Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **CHECK THE FUEL TEMPERATURE SENSOR**

NOTE: Remove the jumper wire.

1. Connect the Powertrain Control Module harness connector.
2. Connect a jumper wire between the (K916) Fuel Temperature Sensor Return circuit and the (K156) Fuel Temperature Sensor Signal circuit at the Fuel Temperature Sensor harness connector.
3. Turn the ignition on.
4. With the scan tool, Clear DTCs.
5. With the scan tool, select View DTCs.

NOTE: The scan tool should display a P0182-Fuel Temperature Sensor Circuit Low DTC with the jumper wire in place.

Does the scan tool display the DTCs as described above?

Yes

- Replace the Fuel Temperature Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

No

- Go To 7

7. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Temperature Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0190-FUEL RAIL PRESSURE SENSOR "A" CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article .

THEORY OF OPERATION

The Fuel Rail Pressure Sensor is located on the High Pressure Fuel Rail. The Fuel Rail Pressure Sensor functions as a typical three wire 5-Volt sensor. The PCM uses the feedback information to determine and adjust the pressure in the high side of the fuel system. At light engine loads the high side fuel pressure will operate at approximately 250 bar (3626 psi). At higher engine loads the high side fuel pressure can reach 1800 bar (26107 psi).

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Fuel Rail Pressure Sensor Supply voltage or the Accelerator Pedal Position 1 Sensor is either shorted to voltage or ground.

POSSIBLE CAUSES

Possible Causes
(K350) FUEL RAIL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K852) ACCELERATOR PEDAL POSITION 1 SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K350) FUEL RAIL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K852) ACCELERATOR PEDAL POSITION 1 SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
ACCELERATOR PEDAL POSITION SENSOR
FUEL RAIL PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are any 5-Volt Reference DTCs present, repair

those DTCs before proceeding with this test.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Cycle the ignition off for 10.0 seconds.
4. Turn the ignition on.
5. With the scan tool, view DTCs.

   Did this DTC return?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE FUEL RAIL PRESSURE SENSOR**
   1. With the scan tool, clear DTCs in the Powertrain Control Module.
   2. Cycle the ignition off.
   3. Disconnect the Fuel Rail Pressure Sensor harness connector.
   4. Turn the ignition on.
   5. Measure the voltage on the (K350) Fuel Rail Pressure Sensor 5-Volt Supply circuit at the Fuel Rail Pressure Sensor harness connector.

      Does the voltage measure between 4.9 Volts and 5.1 Volts?

      Yes

      - Replace the Fuel Rail Pressure Sensor in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Go To 3

3. **CHECK THE ACCELERATOR PEDAL POSITION SENSOR**
   1. With the scan tool, clear DTCs in the Powertrain Control Module.
   2. Cycle the ignition off.
   3. Disconnect the Accelerator Pedal Position Sensor harness connector.
   4. Turn the ignition on.
   5. Measure the voltage on the (K852) Accelerator Pedal Position 1 Sensor 5-Volt Supply circuit at the Accelerator Pedal Position Sensor harness connector.

      Does the voltage measure between 4.9 Volts and 5.1 Volts?

      Yes

      - Replace the Accelerator Pedal Position Sensor in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 4

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Rail Pressure Sensor, Accelerator Pedal Position and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0191-FUEL RAIL PRESSURE SENSOR "A" CIRCUIT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 18: Fuel System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Fuel Rail Pressure Sensor is located on the High Pressure Fuel Rail. The Fuel Rail Pressure Sensor functions as a typical three wire 5-Volt sensor. The PCM uses the feedback information to determine and adjust the pressure in the

high side of the fuel system. At light engine loads the high side fuel pressure will operate at approximately 250 bar (3626 psi). At higher engine loads the high side fuel pressure can reach 1800 bar (26107 psi).

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Fuel Rail Pressure Sensor Signal is implausible for 0.4 seconds.

POSSIBLE CAUSES

Possible Causes
HIGH RESISTANCE IN THE (K181) FUEL RAIL PRESSURE SENSOR SIGNAL CIRCUIT
HIGH RESISTANCE IN THE (K350) FUEL RAIL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT
HIGH RESISTANCE IN THE (K359) FUEL RAIL PRESSURE SENSOR RETURN CIRCUIT
FUEL DELIVERY SYSTEM FAILURE
FUEL RAIL PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. Start the engine.
    4. With the scan tool, view DTCs.

    Did this DTC return?

    Yes

    - Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK FOR HIGH RESISTANCE IN THE FUEL RAIL PRESSURE SENSOR CIRCUITS**
   1. Turn the ignition off.
   2. Disconnect the Fuel Rail Pressure Sensor harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Measure the resistance of the:
      - (K181) Fuel Rail Pressure Sensor Signal circuit between the Fuel Rail Pressure Sensor harness connector and the PCM C1 harness connector.
      - (K350) Fuel Rail Pressure Sensor 5-Volt Supply circuit between the Fuel Rail Pressure Sensor harness connector and the PCM C1 harness connector.
      - (K359) Fuel Rail Pressure Sensor Return circuit between the Fuel Rail Pressure Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms on all circuits?

   Yes

   - Go To 3

   No

   - Repair the Fuel Rail Pressure Sensor circuit that has more than 5.0 Ohms for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE FUEL DELIVERY SYSTEM**
   1. Reconnect the Powertrain Control Module C1 connector.
   2. Reconnect the Fuel Rail Pressure Sensor harness connector.
   3. Perform the CHECKING THE FUEL DELIVERY SYSTEM diagnostic

procedure. Refer to **DIAGNOSIS AND TESTING** .

Were any problems found with the Fuel Delivery System?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **FUEL RAIL PRESSURE SENSOR**
   1. Turn the ignition on.
   2. With the scan tool, Clear DTCs.
   3. Turn the ignition off.
   4. Disconnect the Fuel Rail Pressure Sensor harness connector.
   5. Turn the ignition on.
   6. With the scan tool, view DTCs.

NOTE: The scan tool should display a P0193-FUEL RAIL PRESSURE SENSOR "A" CIRCUIT HIGH DTC with the jumper wire in place.

Does the scan tool display P0193-FUEL RAIL PRESSURE SENSOR "A" CIRCUIT HIGH DTC as active?

Yes

- Replace the Fuel Rail Pressure Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Rail Pressure Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0192-FUEL RAIL PRESSURE SENSOR "A" CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 19: Fuel System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Fuel Rail Pressure Sensor is located on the High Pressure Fuel Rail. The Fuel Rail Pressure Sensor functions as a typical three wire 5-Volt sensor. The PCM uses the feedback information to determine and adjust the pressure in the

high side of the fuel system. At light engine loads the high side fuel pressure will operate at approximately 250 bar (3626 psi). At higher engine loads the high side fuel pressure can reach 1800 bar (26107 psi).

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K181) Fuel Rail Pressure Sensor Signal circuit voltage is below 0.19 Volts for 0.4 seconds.

POSSIBLE CAUSES

Possible Causes
(K181) FUEL RAIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K181) SIGNAL CIRCUIT SHORTED TO THE (K359) FUEL RAIL PRESSURE SENSOR RETURN CIRCUIT
FUEL RAIL PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. Start the engine.
    4. With the scan tool, view DTCs.

    Did this DTC return?

    Yes

    - Go To 2

    No

    - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K181) FUEL RAIL PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Fuel Rail Pressure Sensor harness connector.
   2. Disconnect the PCM C1 harness connector.
   3. Measure the resistance between ground and the (K181) Fuel Rail Pressure Sensor Signal circuit at the Fuel Rail Pressure Sensor harness connector.

      Is the resistance below 10k Ohms?

      Yes

      - Repair the (K181) Fuel Rail Pressure Sensor Signal circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3
3. **CHECK FOR THE (K181) FUEL RAIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (K359) FUEL RAIL PRESSURE SENSOR RETURN CIRCUIT**
   1. Measure the resistance between the (K181) Fuel Rail Pressure Sensor Signal circuit and the (K359) Fuel Rail Pressure Sensor Return circuit at the Fuel Rail Pressure Sensor harness connector.

      Is the resistance below 10k Ohms?

      Yes

      - Repair the short circuit between the (K181) Fuel Rail Pressure Sensor Signal circuit and the (K359) Fuel Rail Pressure Sensor Return circuit.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **CHECK THE FUEL RAIL PRESSURE SENSOR**
   1. Reconnect the Fuel Rail Pressure Sensor harness connector.
   2. Reconnect the PCM C1 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, erase PCM DTCs.
   5. Turn the ignition off.
   6. Disconnect the Fuel Rail Pressure Sensor harness connector.
   7. Turn the ignition on.
   8. With the scan tool, view DTCs.

   NOTE: The scan tool should display a P0193-FUEL RAIL PRESSURE SENSOR "A" CIRCUIT HIGH DTC with the sensor disconnected.

   Does the scan tool display P0193-FUEL RAIL PRESSURE SENSOR "A" CIRCUIT HIGH DTC as active?

   Yes

   - Replace the Fuel Rail Pressure Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Rail Pressure Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.

4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0193-FUEL RAIL PRESSURE SENSOR "A" CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 20: Fuel System Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Fuel Rail Pressure Sensor is located on the High Pressure Fuel Rail. The Fuel Rail Pressure Sensor functions as a typical three wire 5-Volt sensor. The PCM uses the feedback information to determine and adjust the pressure in the

high side of the fuel system. At light engine loads the high side fuel pressure will operate at approximately 250 bar (3626 psi). At higher engine loads the high side fuel pressure can reach 1800 bar (26107 psi).

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K181) Fuel Rail Pressure Sensor Signal circuit voltage is above 4.8 Volts for 0.4 seconds.

POSSIBLE CAUSES

Possible Causes
(K181) FUEL RAIL PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K181) FUEL RAIL PRESSURE SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K350) FUEL RAIL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT OPEN/HIGH RESISTANCE
(K359) FUEL RAIL PRESSURE SENSOR RETURN CIRCUIT OPEN/HIGH RESISTANCE
FUEL RAIL PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. Start the engine.
    4. With the scan tool, view DTCs.

    Did this DTC return?

    Yes

    - Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K181) FUEL RAIL PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Fuel Rail Pressure Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (K181) Fuel Rail Pressure Sensor Signal circuit at the Fuel Rail Pressure Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K181) Fuel Rail Pressure Sensor Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE (K181) FUEL RAIL PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.
   3. Measure the resistance of the (K181) Fuel Rail Pressure Sensor Signal circuit between the Fuel Rail Pressure Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

No

- Repair the (K181) Fuel Rail Pressure Sensor Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE (K350) FUEL RAIL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K350) Fuel Rail Pressure Sensor 5-Volt Supply circuit between the Fuel Rail Pressure Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K350) Fuel Rail Pressure Sensor 5-Volt Supply circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **CHECK THE (K359) FUEL RAIL PRESSURE SENSOR RETURN FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K359) Fuel Rail Pressure Sensor Return circuit between the Fuel Rail Pressure Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

- Repair the (K359) Fuel Rail Pressure Sensor Return circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **CHECK THE FUEL RAIL PRESSURE SENSOR**
   1. Reconnect the PCM C1 harness connector.
   2. Connect a jumper between the (K181) Fuel Rail Pressure Sensor Signal circuit and the (K359) Fuel Rail Pressure Sensor Return circuit at the Fuel Rail Pressure Sensor harness connector.
   3. Turn the ignition on.
   4. With the scan tool, View active DTCs.

      Does the scan tool display DTC P0192 as active or pending and P0193 as stored with the jumper in place?

      Yes

      - Replace the Fuel Rail Pressure Sensor in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 7

7. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Rail Pressure Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle

test.

6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0196-ENGINE OIL TEMPERATURE SENSOR CIRCUIT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an invalid Engine Oil Temperature Sensor Signal.

POSSIBLE CAUSES

POSSIBLE CAUSES
(G24) OIL TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN INTERMITTENTLY

HIGH RESISTANCE IN THE (G24) OIL TEMPERATURE SENSOR SIGNAL CIRCUIT
HIGH RESISTANCE IN THE (K914) SENSOR GROUND CIRCUIT
ENGINE OIL TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, erase DTCs in the PCM.
   3. Monitor the scan tool for at least two minutes.
   4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
   5. Start the engine.
   6. With the scan tool, view DTCs.

      Is the status active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK FOR HIGH RESISTANCE IN THE (G24) ENGINE OIL TEMPERATURE SENSOR SIGNAL CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Engine Oil Temperature Sensor harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Measure the resistance between of the (G24) Engine Oil Temperature

Sensor Signal circuit between the Engine Oil Temperature Sensor harness connector and the PCM C1 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 3

No

- Repair the (G24) Oil Temperature Sensor Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK FOR HIGH RESISTANCE IN THE (K914) SENSOR GROUND CIRCUIT**
   1. Measure the resistance of the (K914) Sensor Ground circuit between the Engine Oil Temperature Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K914) Oil Temperature Sensor Signal circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK THE ENGINE OIL TEMPERATURE SENSOR**
   1. Reconnect the Engine Oil Temperature Sensor harness connector.
   2. Reconnect the PCM C1 harness connector.
   3. Turn the ignition on.

4. With the scan tool, erase DTCs in the PCM.
5. Turn the ignition off.
6. Disconnect the Engine Oil Temperature Sensor harness connector.
7. Connect a jumper between the (G24) Oil Temperature Sensor Signal circuit and the (K914) Oil Temperature Sensor Signal circuit at the Engine Oil Temperature Sensor harness connector.

   NOTE: Be careful not to spread the terminals in the connector.

8. Turn the ignition on.
9. With the scan tool, view DTCs.

   Does the scan tool display P0197-ENGINE OIL TEMPERATURE SENSOR CIRCUIT LOW DTC as active?

   Yes

   - Replace the Engine Oil Temperature Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Oil Temperature Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.

6. Perform any technical service bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0197-ENGINE OIL TEMPERATURE SENSOR CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The (G24) Oil Temperature Sensor Signal circuit voltage is below 0.19 Volts for two seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
(G24) ENGINE OIL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(G24) ENGINE OIL TEMPERATURE SENSOR SIGNAL CIRCUIT

SHORTED TO THE (K914) SENSOR GROUND CIRCUIT
ENGINE OIL TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the PCM.
   3. Turn the ignition on.
   4. With the scan tool, view DTCs.

   Is the status active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE ENGINE OIL TEMPERATURE SENSOR**
   1. With the scan tool, clear DTCs.
   2. Turn the ignition off.
   3. Disconnect the Engine Oil Temperature Sensor harness connector.
   4. Turn the ignition on.
   5. With the scan tool, view DTCs.

   NOTE: The scan tool should display a P0198-ENGINE OIL TEMPERATURE SENSOR CIRCUIT HIGH DTC with the Engine Oil Temperature Sensor harness connector disconnected.

Does the scan tool display P0198 as active or pending and P0197 as stored with the connector disconnected?

Yes

- Replace the Engine Oil Temperature Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE (G24) OIL TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Powertrain Control Module harness connector.
   3. Measure the resistance between ground and the (G24) Engine Oil Temperature Sensor Signal circuit at the Engine Oil Temperature Sensor harness connector.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the (G24) Oil Temperature Sensor Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4

4. **CHECK FOR THE (G24) OIL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K914) OIL TEMPERATURE SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (G24) Oil Temperature Sensor

signal circuit and the (K914) Sensor Ground circuit at the Engine Oil Temperature Sensor harness connector.

Is the resistance below 10k Ohms?

Yes

- Repair the short between the (G24) Oil Temperature Sensor Signal circuit and the (K914) Sensor Ground circuit.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Oil Temperature Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any technical service bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0198-ENGINE OIL TEMPERATURE SENSOR CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The (G24) Oil Temperature Sensor Signal circuit voltage is above 4.95 Volts for two seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
(G24) ENGINE OIL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G24) ENGINE OIL TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K914) SENSOR GROUND CIRCUIT OPEN/HIGH RESISTANCE
ENGINE OIL TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.

2. With the scan tool, clear DTCs in the PCM.
3. Turn the ignition on.
4. With the scan tool, view DTCs.

   Is the status active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (G24) OIL TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Oil Temperature Sensor harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Remove the ASD relay from the PDC.
   5. Connect a jumper wire between cavity 30 and cavity 87 of the ASD relay connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (G24) Oil Temperature Sensor Signal circuit in the Engine Oil Temperature Sensor harness connector.

      Is there any voltage present?

      Yes

      - Repair the (G24) Engine Oil Temperature Sensor Signal circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Go To 3

3. **CHECK THE ENGINE OIL TEMPERATURE SENSOR**
   1. Turn the ignition off.
   2. Remove the jumper wire and install the ASD relay.
   3. Reconnect the PCM C1 harness connector.
   4. Connect a jumper wire between the (K914) Sensor Ground circuit and the (G24) Engine Oil Temperature Sensor Signal circuit at the Engine Oil Temperature Sensor harness connector.

      NOTE: Be careful not to spread the terminals in the connector.

   5. Turn the ignition on.
   6. With the scan tool, clear DTCs.
   7. With the scan tool, view DTCs.

      NOTE: The scan tool should display a P0197-ENGINE OIL TEMPERATURE SENSOR CIRCUIT LOW DTC with the jumper wire in place.

   Does the scan tool display P0197-ENGINE OIL TEMPERATURE SENSOR CIRCUIT LOW DTC as active?

   Yes

   - Replace the Engine Oil Temperature Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4

4. **CHECK THE (G24) ENGINE OIL TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.

2. Disconnect the PCM C1 harness connector.
3. Measure the resistance of the (G24) Engine Oil Temperature Sensor Signal circuit between the Engine Oil Temperature Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the (G24) Engine Oil Temperature Sensor Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE (K914) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K914) Sensor Ground circuit between the Engine Oil Temperature Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (K914) Sensor Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and

connectors between the Engine Oil Temperature Sensor and the Engine Control Module.

- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals.
- Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
- Look for the data to change or for the DTC to reset during the wiggle test.
- Perform any technical service bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0201-FUEL INJECTOR 1 CIRCUIT/OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 21: Fuel Injector Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running, battery voltage between 6.0 Volts and 16.0 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects an open in the Fuel Injector 1 circuit.

POSSIBLE CAUSES

Possible Causes
(K11) FUEL INJECTOR 1 LOW-SIDE CONTROL CIRCUIT OPEN/HIGH RESISTANCE
(K611) FUEL INJECTOR 1 HIGH-SIDE CONTROL CIRCUIT OPEN/HIGH RESISTANCE
FUEL INJECTOR 1
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, erase DTCs in the PCM.
   3. Attempt to start the engine and test drive the vehicle.
   4. With the scan tool, view DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K11) FUEL INJECTOR 1 LOW-SIDE SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Disconnect the Fuel Injector 1 harness connector.
   2. Disconnect the PCM C1 harness connector.
   3. Measure the resistance of the (K11) Fuel Injector 1 Low-Side Supply circuit between the Fuel Injector 1 harness connector and the PCM C1 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 3

No

- Repair the (K11) Fuel Injector Low-Side 1 Supply circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K611) FUEL INJECTOR 1 HIGH-SIDE CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K611) Fuel Injector 1 High-Side Control circuit between the Fuel Injector 1 harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K611) Fuel Injector 1 High-Side Control circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK THE FUEL INJECTOR**
   1. Measure the resistance through Fuel Injector 1.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

No

- Replace Fuel Injector 1 in accordance with the service information. Program the new Fuel Injector 1 correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L

DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0202-FUEL INJECTOR 2 CIRCUIT/OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 22: Fuel Injector Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running, battery voltage between 6.0 Volts and 16.0 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects an open in the Fuel Injector 2 circuit.

POSSIBLE CAUSES

Possible Causes
(K12) FUEL INJECTOR 2 LOW-SIDE SUPPLY CIRCUIT OPEN/HIGH RESISTANCE
(K612) FUEL INJECTOR 2 HIGH-SIDE CONTROL CIRCUIT OPEN/HIGH RESISTANCE
FUEL INJECTOR 2
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, erase DTCs in the PCM.
   3. Attempt to start the engine and test drive the vehicle.
   4. With the scan tool, view DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K12) FUEL INJECTOR LOW-SIDE SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Disconnect the Fuel Injector 2 harness connector.

2. Disconnect the PCM C1 harness connector.
3. Measure the resistance of the (K12) Fuel Injector Low-Side Supply circuit between the Fuel Injector 2 harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K12) Fuel Injector 2 Low-Side Supply circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K612) FUEL INJECTOR 2 HIGH-SIDE CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K612) Fuel Injector 2 High-Side Control circuit between the Fuel Injector 2 harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K612) Fuel Injector 2 High-Side Control circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE FUEL INJECTOR**
   1. Measure the resistance through Fuel Injector 2.

Is the resistance below 5.0 Ohms?

Yes

- Go To 5

No

- Replace Fuel Injector 2 in accordance with the service information. Program the new Fuel Injector 2 correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0203-FUEL INJECTOR 3 CIRCUIT/OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 23: Fuel Injector Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running, battery voltage between 6.0 Volts and 16.0 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects an open in the Fuel Injector 3 circuit.

POSSIBLE CAUSES

Possible Causes
(K13) FUEL INJECTOR 3 LOW-SIDE SUPPLY CIRCUIT OPEN/HIGH RESISTANCE
(K613) FUEL INJECTOR 3 HIGH-SIDE CONTROL CIRCUIT OPEN/HIGH RESISTANCE
FUEL INJECTOR 3
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, erase DTCs in the PCM.
    3. Attempt to start the engine and test drive the vehicle.
    4. With the scan tool, view DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K13) FUEL INJECTOR 3 LOW-SIDE SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Disconnect the Fuel Injector 3 harness connector.
   2. Disconnect the PCM C1 harness connector.
   3. Measure the resistance of the (K13) Fuel Injector Low-Side Supply circuit between the Fuel Injector 3 harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 3

      No

      - Repair the (K13) Fuel Injector Low-Side Supply circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K613) FUEL INJECTOR 3 HIGH-SIDE CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K613) Fuel Injector 3 High-Side Control circuit between the Fuel Injector 1 harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K613) Fuel Injector 3 High-Side Control circuit for an open or high resistance.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE FUEL INJECTOR**
   1. Measure the resistance through Fuel Injector 3.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Replace Fuel Injector 3 in accordance with the service information. Program the new Fuel Injector 3 correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0204-FUEL INJECTOR 4 CIRCUIT/OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 24: Fuel Injector Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running, battery voltage between 6.0 Volts and 16.0 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects an open in the Fuel Injector 4 circuit.

POSSIBLE CAUSES

Possible Causes
(K14) FUEL INJECTOR 4 LOW-SIDE CONTROL CIRCUIT OPEN/HIGH RESISTANCE
(K614) FUEL INJECTOR 4 HIGH-SIDE CONTROL CIRCUIT OPEN/HIGH RESISTANCE
FUEL INJECTOR 4
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, erase DTCs in the PCM.
   3. Attempt to start the engine and test drive the vehicle.
   4. With the scan tool, view DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K14) FUEL INJECTOR 4 LOW-SIDE SUPPLY CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Disconnect the Fuel Injector 4 harness connector.
   2. Disconnect the PCM C1 harness connector.
   3. Measure the resistance of the (K14) Fuel Injector 4 Low-Side Supply circuit between the Fuel Injector 4 harness connector and the PCM C1 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 3

No

- Repair the (K14) Fuel Injector 4 Low-Side Supply circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K614) FUEL INJECTOR 4 HIGH-SIDE CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K614) Fuel Injector 4 High-Side Control circuit between the Fuel Injector 4 harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K614) Fuel Injector 4 High-Side Control circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK THE FUEL INJECTOR**
   1. Measure the resistance through Fuel Injector 4.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

No

- Replace Fuel Injector 4 in accordance with the Service Information. Program the new Fuel Injector 4 correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L

DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0219-ENGINE OVERSPEED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects that engine speed is above 6000 RPM for 0.64 of a second.

POSSIBLE CAUSES

Possible Causes
INCORRECT GEAR CHOSEN FOR VEHICLE SPEED
ENGINE OIL LEVEL TOO HIGH
EXCESSIVE OIL BEING INTRODUCED INTO INTAKE SYSTEM
LOSS OF SYNCHRONIZATION BETWEEN CRANK AND CAM SENSORS CAUSING INCORRECT SPEED CALCULATION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK ENGINE OIL LEVEL**
    1. Turn the ignition off.
    2. Check the engine oil level.

    Is the engine oil overfilled?

    Yes

    - Adjust oil to the proper level.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 2

2. **CHECK CRANK/CAM SENSOR SYNCHRONIZATION**

NOTE: If there are any DTCs stored for the Crank Sensor or Cam Sensor, perform those diagnostics before proceeding with this test procedure.

1. Start the engine.
2. With the scan tool, check the Crank/Cam Sensor Sync.
3. Wiggle test the wiring harness and connectors while observing the scan tool.

Did the Crank Sensor and Cam Sensor lose Sync while wiggle testing the wiring?

Yes

- Repair the intermittent connection.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK FOR EXCESSIVE OIL BEING INTRODUCED INTO INTAKE SYSTEM**

NOTE: If excessive oil is introduced into the intake system due to an engine mechanical failure, a runaway condition may result causing loss of control of the engine speed.

1. Remove the air intake hose.
2. Inspect the intake system for signs of excessive oil in the intake system.

   Was excessive oil found?

   Yes

   - Diagnose and repair the engine for point of entry of excessive oil.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

P0236-TURBO BOOST PRESSURE SENSOR PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Boost Pressure Actuator is part of the Turbocharger assembly. The Boost Pressure Actuator is supplied with a fused ignition power and ground circuit, as well as a Pulse Width Modulated (PWM) signal form the Powertrain Control Module (PCM) to control how much boost pressure is generated. The higher the voltage that is supplied to the actuator, the greater the variable veins of the Turbocharger are opened. The greater the veins are opened, the greater the boost that is generated. The boost pressure is monitored by the Powertrain Control Module (PCM) using the Boost Pressure Sensor, which is located in the Intake Manifold. The Boost Pressure Sensor is supplied 5 Volts and ground by the PCM. The Boost Pressure Sensor sends feedback to the PCM on the sensor signal wire. The PCM uses this information to make adjustments to the position of the Boost Pressure Actuator.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (K37) Boost Pressure Sensor Signal circuit is implausible for one second.

POSSIBLE CAUSES

Possible Causes
HIGH RESISTANCE IN THE (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT
HIGH RESISTANCE IN THE (F586) 5-VOLT SUPPLY CIRCUIT
HIGH RESISTANCE IN THE (K915) SENSOR GROUND CIRCUIT
BOOST PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, erase PCM DTCs.
   3. Turn the ignition off, wait 30 seconds, then start and idle the engine for at least 30 seconds.
   4. With the scan tool, read PCM DTCs.

   Did this DTC return?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK FOR HIGH RESISTANCE IN THE (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT**

1. Turn the ignition off.
2. Disconnect the Boost Pressure Sensor harness connector.
3. Disconnect the PCM C1 harness connector.
4. Measure the resistance of the (K37) Boost Pressure Sensor Signal circuit between the Boost Pressure Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K37) Boost Pressure Sensor Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK FOR HIGH RESISTANCE IN THE (F586) 5-VOLT SUPPLY CIRCUIT**
   1. Measure the resistance of the (F586) 5-Volt Supply circuit between the Boost Pressure Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (F586) 5-Volt Supply circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK FOR HIGH RESISTANCE IN THE (K915) SENSOR GROUND CIRCUIT**
   1. Measure the resistance of the (K915) Sensor Ground circuit between the Boost Pressure Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K915) Sensor Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **CHECK THE BOOST PRESSURE SENSOR**
   1. Reconnect the Boost Pressure Sensor harness connector.
   2. Reconnect the PCM C1 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, erase PCM DTCs.
   5. Turn the ignition off.
   6. Disconnect the Boost Pressure Sensor harness connector.
   7. Connect a jumper between the (K37) Boost Pressure Sensor Signal circuit and the (F856) 5-Volt Supply circuit.

      NOTE: Be careful not to spread the terminals.

   8. Turn the ignition on.
   9. With the scan tool, view PCM DTCs.

      NOTE: The scan tool should display the P0238-TURBO BOOST PRESSURE SENSOR CIRCUIT HIGH DTC with the jumper connected.

Does the scan tool display P0238-TURBO BOOST PRESSURE SENSOR CIRCUIT HIGH DTC as active?

Yes

- Replace the Boost Pressure Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Boost Pressure Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any technical service bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the**

PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool. . Refer to **REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0237-TURBO BOOST PRESSURE SENSOR CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 25: Boost, Exhaust & Exhaust Diff Pressure Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Boost Pressure Actuator is part of the Turbocharger assembly. The Boost Pressure Actuator is supplied with a fused ignition power and ground circuit, as well as a Pulse Width Modulated (PWM) signal form the Powertrain Control Module (PCM) to control how much boost pressure is generated. The higher the voltage that is supplied to the actuator, the greater the variable veins of the Turbocharger are opened. The greater the veins are opened, the greater the boost that is generated. The boost pressure is monitored by the Powertrain Control Module (PCM) using the Boost Pressure Sensor, which is located in the Intake Manifold. The Boost Pressure Sensor is supplied 5 Volts and ground by the PCM. The Boost Pressure Sensor sends feedback to the PCM on the sensor signal wire. The PCM uses this information to make adjustments to the position of the Boost Pressure Actuator.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K37) Boost Pressure Sensor Signal circuit voltage is below 0.20 Volts for 0.48 seconds.

POSSIBLE CAUSES

Possible Causes
(K354) DIFFERENTIAL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT OPEN
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
BOOST PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING

PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: If there are any 5-Volt Reference DTCs present, repair those DTCs before proceeding with this test.

   1. Turn the ignition on.
   2. With the scan tool, erase PCM DTCs.
   3. Turn the ignition off, wait 30 seconds, then start and idle the engine for at least two minutes.
   4. With the scan tool, view PCM DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Boost Pressure Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (F856) 5-Volt Supply circuit at the Boost Pressure Sensor harness connector.

   Does the measurement read 5.0 Volts?

   Yes

   - Go To 3

   No

- Repair the (F856) 5-Volt Supply circuit for an open or short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.
   3. Measure the resistance between ground and the (K37) Boost Pressure Sensor Signal circuit at the Boost Pressure Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K37) Boost Pressure Sensor Signal circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK THE (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K37) Boost Pressure Sensor Signal circuit between the Intake Air Temp/Boost Pressure Sensor harness connector and the Powertrain Control Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

- Repair the (K37) Boost Pressure Sensor Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE BOOST PRESSURE SENSOR**
   1. Reconnect the Boost Pressure Sensor harness connector.
   2. Reconnect the PCM C1 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, Clear DTCs.
   5. Turn the ignition off.
   6. Disconnect the Boost Pressure Sensor harness connector.
   7. Connect a jumper between the (K37) Boost Pressure Sensor Signal circuit and the (F856) 5-Volt Supply circuit.

      NOTE: Be careful not to spread the terminals.

   8. Turn the ignition on.
   9. With the scan tool, view PCM DTCs.

      NOTE: The scan tool should display the P0238-TURBO BOOST PRESSURE SENSOR CIRCUIT HIGH DTC with the jumper connected.

      Does the scan tool display P0238-TURBO BOOST PRESSURE SENSOR CIRCUIT HIGH DTC as active?

      Yes

      - Replace the Boost Pressure Sensor in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Go To 6

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Boost Pressure Sensor and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0238-TURBO BOOST PRESSURE SENSOR CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 26: Boost, Exhaust & Exhaust Diff Pressure Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Boost Pressure Actuator is part of the Turbocharger assembly. The Boost Pressure Actuator is supplied with a fused ignition power and ground circuit, as well as a Pulse Width Modulated (PWM) signal form the Powertrain Control Module (PCM) to control how much boost pressure is generated. The higher the voltage that is supplied to the actuator, the greater the variable veins of the Turbocharger are opened. The greater the veins are opened, the greater the boost that is generated. The boost pressure is monitored by the Powertrain Control Module (PCM) using the Boost Pressure Sensor, which is located in the Intake Manifold. The Boost Pressure Sensor is supplied 5 Volts and ground by the PCM. The Boost Pressure Sensor sends feedback to the PCM on the sensor

signal wire. The PCM uses this information to make adjustments to the position of the Boost Pressure Actuator.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K37) Boost Pressure Sensor Signal circuit voltage is above 4.85 Volts for 0.5 seconds.

POSSIBLE CAUSES

Possible Causes
(F586) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K354) DIFFERENTIAL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (F856) 5-VOLT SUPPLY CIRCUIT
(K915) SENSOR GROUND CIRCUIT OPEN/HIGH RESISTANCE
BOOST PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are any 5-Volt Reference DTCs present, repair those DTCs before proceeding with this test.

1. Turn the ignition on.
2. With the scan tool, erase PCM DTCs.
3. Turn the ignition off, wait 30 seconds, then start and idle the engine for

at least two minutes.

4. With the scan tool, view PCM DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Boost Pressure Sensor harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (F856) 5-Volt Supply circuit at the Boost Pressure Sensor harness connector.

      Is there any voltage present?

      Yes

      - Repair the (F856) 5-Volt Supply circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3

3. **(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**

NOTE: The jumper wire should still be in place.

1. Measure the voltage of the (K37) Boost Pressure Sensor Signal circuit at the Boost Pressure Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K37) Boost Pressure Sensor Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4

4. **CHECK THE (K915) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Remove the jumper wire and install the Main Relay.
   3. Measure the resistance of the (K915) Ground circuit at the Boost Pressure Sensor harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (K915) Sensor Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 5

5. **CHECK THE BOOST PRESSURE SENSOR**

1. Reconnect the Boost Pressure Sensor harness connector.
2. Reconnect the PCM C1 harness connector.
3. Turn the ignition on.
4. With the scan tool, clear DTCs.
5. Turn the ignition off.
6. Disconnect the Boost Pressure Sensor harness connector.
7. Connect a jumper between the (K915) Ground circuit and the (K37) Boost Pressure Sensor Signal circuit at the Boost Pressure Sensor harness connector.

NOTE: Be careful not to spread the terminals.

8. Turn the ignition on.
9. With the scan tool, clear DTCs.
10. With the scan tool, select View DTCs.

NOTE: The scan tool should display the P0237-TURBO BOOST PRESSURE SENSOR CIRCUIT LOW DTC with the jumper connected.

Does the scan tool display P0237-TURBO BOOST PRESSURE SENSOR CIRCUIT LOW DTC as active?

Yes

- Replace the Boost Pressure Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Boost Pressure Sensor and the Powertrain

Control Module.

2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0252-INJECTION PUMP METERING CONTROL CIRCUIT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Fuel Quantity Solenoid (FQS) is located on the High Pressure Delivery Pump. The Powertrain Control Module (PCM) sends a Pulse Width Modulated (PWM) signal to the FQS to control the amount of fuel that is directed to the pumping chambers in the High Pressure Delivery Pump. The FQS is normally closed when not being controlled by the PCM. The Fuel Quantity Solenoid

works in tandem with the Fuel Pressure Regulator (FPR) to control the fuel pressure in the fuel rail. During engine cranking, the FQS is fully opened to allow maximum fuel flow and the FPR is closed to allow pressure to build quickly. After the engine starts, the FPR is primarily closed and the high side pressure is regulated using the FQS. The FPR is primarily used to help control spikes in the high pressure side during deceleration or if the FQS is not able to react quickly enough to the demands of the system.

WHEN MONITORED

With the engine running and the Powertrain Control Module (PCM) attempting to govern the Fuel Quantity Solenoid.

SET CONDITION

The Powertrain Control Module (PCM) determines that the Fuel Control Actuator current demand is 250 mA above or below a calculated amount.

POSSIBLE CAUSES

Possible Causes
HIGH RESISTANCE IN THE (K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT
FUEL SYSTEM LEAK OR RESTRICTION
RESTRICTED FUEL FILTER
LEAKING FUEL PRESSURE REGULATOR
LEAKING FUEL INJECTOR
FUEL QUANTITY SOLENOID STICKING

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.
    2. Crank or start the engine.
    3. With the scan tool, View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK FOR HIGH RESISTANCE IN THE (K365) FUEL QUANTITY SOLENOID CONTROL CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Fuel Quantity Solenoid harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Measure the resistance of the (K365) Fuel Quantity Solenoid Control circuit between the Fuel Quantity Solenoid harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K365) Fuel Quantity Solenoid Control circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE FUEL DELIVERY SYSTEM**
   1. Perform the CHECKING THE FUEL DELIVERY SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   View repair

- Repair as necessary

P0261-FUEL INJECTOR 1 CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 27: Fuel Injector Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running and the battery voltage between 6.0 Volts and 16.0 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects a short circuit between the (K11) Fuel Injector 1 Low-Side Control circuit and the (K611) Fuel Injector 1 High-Side Control circuit.

POSSIBLE CAUSES

Possible Causes
(K11) FUEL INJECTOR 1 LOW-SIDE CONTROL SHORTED TO THE (K611) FUEL INJECTOR 1 HIGH-SIDE CONTROL
FUEL INJECTOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Turn the ignition off for 10 seconds.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK FOR THE (K11) FUEL INJECTOR 1 HIGH-SIDE CONTROL SHORTED TO THE (K611) FUEL INJECTOR 1 LOW-SIDE CONTROL**

1. Turn the ignition off.
2. Disconnect the Fuel Injector 1 harness connector.
3. Disconnect the PCM C1 harness connector.
4. Measure the resistance between the (K11) Fuel Injector 1 High-Side Control circuit and the (K611) Fuel Injector 1 Low-Side Control circuit at the Fuel Injector 1 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 3

   No

   - Repair the short between the (K11) Fuel Injector 1 High-Side Control circuit and the (K611) Fuel Injector 1 Low-Side Control circuit.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE FUEL INJECTOR**
   1. Reconnect the Fuel Injector 1 harness connector.
   2. Reconnect the PCM C1 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, clear DTCs in the Powertrain Control Module.
   5. Turn the ignition off.
   6. Disconnect the Fuel Injector 1 harness connector.
   7. Turn the ignition on.
   8. With the scan tool, select View DTCs.

   NOTE: DTC P0261 will not return with the harness connector disconnected if the Fuel Injector is shorted internally.

   Does DTC P0261 return?

Yes

- Go To 4

No

- Replace Fuel Injector 1 in accordance with the service information. Program the new Fuel Injector 1 correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any technical service bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the**

PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool. . Refer to **REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0263-CYLINDER 1 CONTRIBUTION/BALANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 28: Fuel Injector Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running for at least five seconds.

SET CONDITION

The Powertrain Control Module (PCM) detects that the total Fuel Injector circuit resistance is either above 0.37 Ohms or below 0.14 Ohms for 0.16 seconds.

POSSIBLE CAUSES

Possible Causes
FUEL INJECTOR CORRECTION CODE NOT ENTERED CORRECTLY INTO PCM
HIGH RESISTANCE IN THE (K11) FUEL INJECTOR 1 HIGH-SIDE CONTROL CIRCUIT
HIGH RESISTANCE IN THE (K611) FUEL INJECTOR 1 LOW-SIDE CONTROL CIRCUIT
(K11) FUEL INJECTOR 1 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K611) FUEL INJECTOR 1 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR
FUEL SYSTEM FAILURE
INTAKE SYSTEM LEAK OR RESTRICTION
ENGINE MECHANICAL FAILURE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK THE FUEL INJECTOR CORRECTION CODES IN THE PCM**

NOTE: If there are any Fuel Injector DTCs present, perform

the diagnostics for those DTCs before proceeding with this test procedure.

1. Turn the ignition off.
2. Locate and record the correction codes for the Fuel Injectors. The injector correction codes are located on top of the injectors and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
3. Turn the ignition on, engine not running.
4. With the scan tool, read the Fuel Injector correction codes stored in the PCM.
5. Compare Fuel Injector correction codes with the codes programmed in the scan tool.

   Are the Fuel Injectors calibrated correctly?

   Yes

   - Go To 2

   No

   - Program the Fuel Injector correction codes with the scan tool into the PCM. The Fuel Injector correction codes are located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

2. **CHECK THE TOTAL CIRCUIT RESISTANCE OF FUEL INJECTOR 1**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   3. Measure the circuit resistance of Fuel Injector 1 from the (K11) Fuel

Injector 1 Low-Side Control circuit to the (K611) Fuel Injector 1 High-Side Control circuit at the PCM C1 harness connector.

NOTE: The total circuit resistance through the Fuel Injector and wiring should be between 0.14 of an Ohm and 0.37 of an Ohm.

What is the total circuit resistance reading?

Total resistance is above 0.37 of an Ohm.

- Go To 3

Total resistance is below 0.14 of an Ohm.

- Go To 5

Total resistance is between 0.14 of an Ohm and 0.37 of an Ohm.

- Wiggle test the wiring harness and connectors while observing the Ohmmeter. If the resistance changes below 0.14 Ohms or above 0.37 Ohms, repair the intermittent connection in the wiring harness. If the wiring checks out OK, replace and program the Powertrain Control Module in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE FUEL INJECTOR CONTROL CIRCUITS FOR HIGH RESISTANCE**
   1. Disconnect the Fuel Injector 1 harness connector.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure the resistance of the:
      - (K11) Fuel Injector 1 Low-Side Control circuit between the Fuel Injector 1 harness connector and the PCM C1 harness connector.
      - (K611) Fuel Injector 1 High-Side Control circuit between the Fuel

Injector 1 harness connector and the PCM C1 harness connector.

Is the resistance below 0.1 of an Ohm for both circuits?

Yes

- Go To 4

No

- Repair the high resistance in the Fuel Injector circuit that measured above 0.1 of an Ohm.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE FUEL INJECTOR RESISTANCE**
   1. Disconnect all of the Fuel Injector harness connectors.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure and record the resistance through each Fuel Injector.

      NOTE: The resistance should be the same through all four injectors (Approximately 0.25 Ohms).

   Is the resistance reading the same for all four Fuel Injectors?

   Yes

   - Go To 7

   No

   - Replace the Fuel Injector that did not match the others in accordance with the service information. Program the new Fuel Injector correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE FUEL INJECTOR CONTROL CIRCUITS FOR SHORT TO GROUND**
   1. Disconnect the Fuel Injector 1 harness connector.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure the resistance between ground and the:
      - (K11) Fuel Injector 1 Low-Side Control circuit at the Fuel Injector 1 harness connector.
      - (K611) Fuel Injector 1 High-Side Control circuit at the Fuel Injector 1 harness connector.

      NOTE: Their should be no continuity.

      Is there any continuity to ground?

      Yes

      - Repair the Fuel Injector circuit that measured continuity to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 6

6. **CHECK THE FUEL INJECTOR RESISTANCE**
   1. Disconnect all of the Fuel Injector harness connectors.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure the resistance through each Fuel Injector.

NOTE: The resistance should be the same through all four injectors (Approximately 0.25 of an Ohm).

Is the resistance reading the same for all four Fuel Injectors?

Yes

- Go To 7

No

- Replace the Fuel Injector that did not match the others in accordance with the service information. Program the new Fuel Injector correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **CHECK THE INTAKE SYSTEM FOR LEAKS OR RESTRICTIONS**
   1. Check the entire intake system for a leak or restriction.

   Were any problems found?

   Yes

   - Perform the appropriate repair in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 8

8. **CHECK THE FUEL DELIVERY SYSTEM**
   1. Perform the CHECKING THE FUEL DELIVERY SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

Were any problems found?

Yes

- Perform the appropriate repair in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 9

9. **CHECK THE ENGINE MECHANICAL SYSTEM**
   1. Perform the CHECKING THE ENGINE MECHANICAL SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Perform the appropriate repair in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 10

10. **POWERTRAIN CONTROL MODULE**
    1. Turn the ignition off.
    2. Replace the Fuel Injector in accordance with the service information. Program the correction code for this injector into the Powertrain Control Module.

    NOTE: The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10

alphanumeric characters.

3. Turn the ignition on.
4. With the scan tool, Erase DTCs.
5. Start the engine. Allow the engine to reach normal operating
6. Monitor the scan tool for at least two minutes.
7. With the scan tool, View DTCs.

Did the DTC return as active?

Yes

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Repair is complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0264-FUEL INJECTOR 2 CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running and the battery voltage between 6.0 Volts and 16.0 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects a short circuit between the (K12)

Fuel Injector 2 Low-Side Control circuit and the (K612) Fuel Injector 2 High-Side Control circuit.

POSSIBLE CAUSES

Possible Causes
(K12) FUEL INJECTOR 2 LOW-SIDE CONTROL SHORTED TO THE (K612) FUEL INJECTOR 2 HIGH-SIDE CONTROL
FUEL INJECTOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Turn the ignition off for 10 seconds.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK FOR THE (K12) FUEL INJECTOR 2 LOW-SIDE CONTROL SHORTED TO THE (K612) FUEL INJECTOR 2 HIGH-SIDE CONTROL**
   1. Disconnect the PCM C1 harness connector.
   2. Disconnect the Fuel Injector 2 harness connector.

3. Measure the resistance between the (K12) Fuel Injector 2 Low-Side Control circuit and the (K612) Fuel Injector 2 High-Side Control circuit at the Fuel Injector 2 harness connector.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short between the (K12) Fuel Injector 2 Low-Side Control circuit and the (K612) Fuel Injector 2 High-Side Control circuit.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE FUEL INJECTOR**
   1. With the scan tool, clear DTCs in the Powertrain Control Module.
   2. Turn the ignition off.
   3. Disconnect the Fuel Injector 2 harness connector.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

   NOTE: DTC P0264 will not return with the harness connector disconnected if the Fuel Injector is shorted internally.

   Does DTC P0264 return?

   Yes

   - Go To 4

   No

   - Replace Fuel Injector 2 in accordance with the Service Information. Program the new Fuel Injector 2 correction code with

the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any technical service bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0266-CYLINDER 2 CONTRIBUTION/BALANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running for at least five seconds.

SET CONDITION

The Powertrain Control Module (PCM) detects that the total Fuel Injector circuit resistance is either above 0.37 Ohms or below 0.14 Ohms for 0.16 seconds.

POSSIBLE CAUSES

Possible Causes
FUEL INJECTOR CORRECTION CODE NOT ENTERED CORRECTLY INTO PCM
HIGH RESISTANCE IN THE (K12) FUEL INJECTOR 2 HIGH-SIDE CONTROL CIRCUIT
HIGH RESISTANCE IN THE (K612) FUEL INJECTOR 2 LOW-SIDE CONTROL CIRCUIT
(K12) FUEL INJECTOR 2 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K612) FUEL INJECTOR 2 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR
FUEL SYSTEM FAILURE
INTAKE SYSTEM LEAK OR RESTRICTION
ENGINE MECHANICAL FAILURE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK THE FUEL INJECTOR CORRECTION CODES IN THE PCM**

NOTE: If there are any Fuel Injector DTCs present, perform the diagnostics for those DTCs before proceeding with this test procedure.

1. Turn the ignition off.
2. Locate and record the correction codes for the Fuel Injectors. The injector correction codes are located on top of the injectors and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
3. Turn the ignition on, engine not running.
4. With the scan tool, read the Fuel Injector correction codes stored in the PCM.
5. Compare Fuel Injector correction codes with the codes programmed in the scan tool.

   Are the Fuel Injectors calibrated correctly?

   Yes

   - Go To 2

   No

   - Program the Fuel Injector correction codes with the scan tool into the PCM. The Fuel Injector correction codes are located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

2. **CHECK THE TOTAL CIRCUIT RESISTANCE OF FUEL INJECTOR 2**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

   NOTE: Be sure to zero your Ohmmeter before the next step.

3. Measure the circuit resistance of Fuel Injector 2 from the (K12) Fuel Injector 2 Low-Side Control circuit to the (K612) Fuel Injector 2 High-Side Control circuit at the PCM C1 harness connector.

NOTE: The total circuit resistance through the Fuel Injector and wiring should be between 0.14 of an Ohm and 0.37 of an Ohm.

What is the total circuit resistance reading?

Total resistance is above 0.37 of an Ohm.

- Go To 3

Total resistance is below 0.14 of an Ohm.

- Go To 5

Total resistance is between 0.14 of an Ohm and 0.37 of an Ohm.

- Wiggle test the wiring harness and connectors while observing the Ohmmeter. If the resistance changes below 0.14 of an Ohm or above 0.37 of an Ohm, repair the intermittent connection in the wiring harness. If the wiring checks out OK, replace and program the Powertrain Control Module in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE FUEL INJECTOR CONTROL CIRCUITS FOR HIGH RESISTANCE**
   1. Disconnect the Fuel Injector 2 harness connector.

NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure the resistance of the:
      - (K12) Fuel Injector 2 Low-Side Control circuit between the Fuel Injector 2 harness connector and the PCM C1 harness connector.

- (K612) Fuel Injector 2 High-Side Control circuit between the Fuel Injector 2 harness connector and the PCM C1 harness connector.

Is the resistance below 0.1 of an Ohm for both circuits?

Yes

- Go To 4

No

- Repair the high resistance in the Fuel Injector circuit that measured above of an 0.1 Ohm.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE FUEL INJECTOR RESISTANCE**
   1. Disconnect all of the Fuel Injector harness connectors.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure and record the resistance through each Fuel Injector.

      NOTE: The resistance should be the same through all four injectors (Approximately 0.25 of an Ohm).

   Is the resistance reading the same for all four Fuel Injectors?

   Yes

   - Go To 7

   No

   - Replace the Fuel Injector that did not match the others in accordance with the service information. Program the new Fuel Injector correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10

alphanumeric characters.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE FUEL INJECTOR CONTROL CIRCUITS FOR SHORT TO GROUND**
   1. Disconnect the Fuel Injector 2 harness connector.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure the resistance between ground and the:
      - (K12) Fuel Injector 2 Low-Side Control circuit at the Fuel Injector 2 harness connector.
      - (K612) Fuel Injector 2 High-Side Control circuit at the Fuel Injector 2 harness connector.

      NOTE: Their should be no continuity.

      Is there any continuity to ground?

      Yes

      - Repair the Fuel Injector circuit that measured continuity to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 6

6. **CHECK THE FUEL INJECTOR RESISTANCE**
   1. Disconnect all of the Fuel Injector harness connectors.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure the resistance through each Fuel Injector.

NOTE: The resistance should be the same through all four injectors (Approximately 0.25 of an Ohm).

Is the resistance reading the same for all four Fuel Injectors?

Yes

- Go To 7

No

- Replace the Fuel Injector that did not match the others in accordance with the service information. Program the new Fuel Injector correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **CHECK THE INTAKE SYSTEM FOR LEAKS OR RESTRICTIONS**
   1. Check the entire intake system for a leak or restriction.

   Were any problems found?

   Yes

   - Perform the appropriate repair in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 8

8. **CHECK THE FUEL DELIVERY SYSTEM**
   1. Perform the CHECKING THE FUEL DELIVERY SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

Were any problems found?

Yes

- Perform the appropriate repair in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 9

9. **CHECK THE ENGINE MECHANICAL SYSTEM**
   1. Perform the CHECKING THE ENGINE MECHANICAL SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Perform the appropriate repair in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 10

10. **POWERTRAIN CONTROL MODULE**
    1. Turn the ignition off.
    2. Replace the Fuel Injector in accordance with the service information. Program the correction code for this injector into the Powertrain Control Module.

    NOTE: The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10

alphanumeric characters.

3. Turn the ignition on.
4. With the scan tool, Erase DTCs.
5. Start the engine. Allow the engine to reach normal operating
6. Monitor the scan tool for at least two minutes.
7. With the scan tool, View DTCs.

Did the DTC return as active?

Yes

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Repair is complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0267-FUEL INJECTOR 3 CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 29: Fuel Injector Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running and the battery voltage between 6.0 Volts and 16.0 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects a short circuit between the (K13) Fuel Injector 3 Low-Side Control circuit and the (K613) Fuel Injector 3 High-Side Control circuit.

POSSIBLE CAUSES

Possible Causes
(K13) FUEL INJECTOR 3 LOW-SIDE CONTROL SHORTED TO THE (K613) FUEL INJECTOR 3 HIGH-SIDE CONTROL
FUEL INJECTOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Turn the ignition off for 10 seconds.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK FOR THE (K13) FUEL INJECTOR 3 LOW-SIDE CONTROL SHORTED TO THE (K613) FUEL INJECTOR 3 HIGH-SIDE CONTROL**
   1. Disconnect the PCM C1 harness connector.
   2. Disconnect the Fuel Injector 3 harness connector.
   3. Measure the resistance between the (K13) Fuel Injector 3 Low-Side Control circuit and the (K613) Fuel Injector 3 High-Side Control circuit

at the Fuel Injector 3 harness connector.

Is the resistance below 10k Ohms?

Yes

- Repair the short between the (K13) Fuel Injector 3 Low-Side Control circuit and the (K613) Fuel Injector 3 High-Side Control circuit.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE FUEL INJECTOR**
   1. With the scan tool, clear DTCs in the Powertrain Control Module.
   2. Turn the ignition off.
   3. Disconnect the Fuel Injector 3 harness connector.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

NOTE: DTC P0267 will not return with the harness connector disconnected if the Fuel Injector is shorted internally.

Does DTC P0267 return?

Yes

- Go To 4

No

- Replace Fuel Injector 3 in accordance with the Service Information. Program the new Fuel Injector 3 correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric

characters in two lines of 10 alphanumeric characters.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any technical service bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0269-CYLINDER 3 CONTRIBUTION/BALANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article .

Fig. 30: Fuel Injector Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running for at least five seconds.

SET CONDITION

The Powertrain Control Module (PCM) detects that the total Fuel Injector circuit resistance is either above 0.37 Ohms or below 0.14 Ohms for 0.16 seconds.

POSSIBLE CAUSES

Possible Causes
FUEL INJECTOR CORRECTION CODE NOT ENTERED CORRECTLY INTO PCM
HIGH RESISTANCE IN THE (K13) FUEL INJECTOR 3 HIGH-SIDE CONTROL CIRCUIT
HIGH RESISTANCE IN THE (K613) FUEL INJECTOR 3 LOW-SIDE CONTROL CIRCUIT
(K13) FUEL INJECTOR 3 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K613) FUEL INJECTOR 3 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR
FUEL SYSTEM FAILURE
INTAKE SYSTEM LEAK OR RESTRICTION
ENGINE MECHANICAL FAILURE
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK THE FUEL INJECTOR CORRECTION CODES IN THE PCM**

   NOTE: If there are any Fuel Injector DTCs present, perform the diagnostics for those DTCs before proceeding with this test procedure.

   1. Turn the ignition off.
   2. Locate and record the correction codes for the Fuel Injectors. The injector correction codes are located on top of the injectors and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
   3. Turn the ignition on, engine not running.

4. With the scan tool, read the Fuel Injector correction codes stored in the PCM.
5. Compare Fuel Injector correction codes with the codes programmed in the scan tool.

   Are the Fuel Injectors calibrated correctly?

   Yes

   - Go To 2

   No

   - Program the Fuel Injector correction codes with the scan tool into the PCM. The Fuel Injector correction codes are located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

2. **CHECK THE TOTAL CIRCUIT RESISTANCE OF FUEL INJECTOR 2**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   3. Measure the circuit resistance of Fuel Injector 3 from the (K13) Fuel Injector 3 Low-Side Control circuit to the (K613) Fuel Injector 3 High-Side Control circuit at the PCM C1 harness connector.

      NOTE: The total circuit resistance through the Fuel Injector and wiring should be between 0.14 of an Ohm and 0.37 of an Ohm.

      What is the total circuit resistance reading?

      Total resistance is above 0.37 Ohms.

- Go To 3

Total resistance is below 0.14 Ohms.

- Go To 5

Total resistance is between 0.14 Ohms and 0.37 Ohms.

- Wiggle test the wiring harness and connectors while observing the Ohmmeter. If the resistance changes below 0.14 of an Ohm or above 0.37 of an Ohm, repair the intermittent connection in the wiring harness. If the wiring checks out OK, replace and program the Powertrain Control Module in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE FUEL INJECTOR CONTROL CIRCUITS FOR HIGH RESISTANCE**
   1. Disconnect the Fuel Injector 3 harness connector.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure the resistance of the:
      - (K13) Fuel Injector 3 Low-Side Control circuit between the Fuel Injector 3 harness connector and the PCM C1 harness connector.
      - (K613) Fuel Injector 3 High-Side Control circuit between the Fuel Injector 3 harness connector and the PCM C1 harness connector.

      Is the resistance below 0.1 of an Ohm for both circuits?

      Yes

      - Go To 4

      No

      - Repair the high resistance in the Fuel Injector circuit that measured

above 0.1 Ohm.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE FUEL INJECTOR RESISTANCE**
   1. Disconnect all of the Fuel Injector harness connectors.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure and record the resistance through each Fuel Injector.

      NOTE: The resistance should be the same through all four injectors (Approximately 0.25 Ohms.

      Is the resistance reading the same for all four Fuel Injectors?

      Yes

      - Go To 7

      No

      - Replace the Fuel Injector that did not match the others in accordance with the service information. Program the new Fuel Injector correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE FUEL INJECTOR CONTROL CIRCUITS FOR SHORT TO GROUND**
   1. Disconnect the Fuel Injector 3 harness connector.

      NOTE: Be sure to zero your Ohmmeter before the next step.

2. Measure the resistance between ground and the:
   - (K13) Fuel Injector 3 Low-Side Control circuit at the Fuel Injector 3 harness connector.
   - (K613) Fuel Injector 3 High-Side Control circuit at the Fuel Injector 3 harness connector.

NOTE: Their should be no continuity.

Is there any continuity to ground?

Yes

- Repair the Fuel Injector circuit that measured continuity to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 6

6. **CHECK THE FUEL INJECTOR RESISTANCE**
   1. Disconnect all of the Fuel Injector harness connectors.

NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure the resistance through each Fuel Injector.

NOTE: The resistance should be the same through all four injectors (Approximately 0.25 Ohms.

Is the resistance reading the same for all four Fuel Injectors?

Yes

- Go To 7

No

- Replace the Fuel Injector that did not match the others in accordance with the service information. Program the new Fuel Injector correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **CHECK THE INTAKE SYSTEM FOR LEAKS OR RESTRICTIONS**
   1. Check the entire intake system for a leak or restriction.

      Were any problems found?

      Yes

      - Perform the appropriate repair in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 8
8. **CHECK THE FUEL DELIVERY SYSTEM**
   1. Perform the CHECKING THE FUEL DELIVERY SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Perform the appropriate repair in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 9

9. **CHECK THE ENGINE MECHANICAL SYSTEM**
   1. Perform the CHECKING THE ENGINE MECHANICAL SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Perform the appropriate repair in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 10

10. **POWERTRAIN CONTROL MODULE**
    1. Turn the ignition off.
    2. Replace the Fuel Injector in accordance with the service information. Program the correction code for this injector into the Powertrain Control Module.

    NOTE: The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.

    3. Turn the ignition on.
    4. With the scan tool, Erase DTCs.
    5. Start the engine. Allow the engine to reach normal operating
    6. Monitor the scan tool for at least two minutes.
    7. With the scan tool, View DTCs.

    Did the DTC return as active?

Yes

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Repair is complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0270-FUEL INJECTOR 4 CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 31: Fuel Injector Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running and the battery voltage between 6.0 Volts and 16.0 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects a short circuit between the (K14) Fuel Injector 4 Low-Side Control circuit and the (K614) Fuel Injector 4 High-Side Control circuit.

POSSIBLE CAUSES

Possible Causes
(K14) FUEL INJECTOR 4 LOW-SIDE CONTROL SHORTED TO THE (K614) FUEL INJECTOR 4 HIGH-SIDE CONTROL
FUEL INJECTOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Turn the ignition off for 10 seconds.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK FOR THE (K14) FUEL INJECTOR 4 LOW-SIDE CONTROL SHORTED TO THE (K614) FUEL INJECTOR 4 HIGH-SIDE CONTROL**
   1. Disconnect the PCM C1 harness connector.
   2. Disconnect the Fuel Injector 4 harness connector.
   3. Measure the resistance between the (K14) Fuel Injector 4 Low-Side Control circuit and the (K614) Fuel Injector 4 High-Side Control circuit

at the Fuel Injector 4 harness connector.

Is the resistance below 10k Ohms?

Yes

- Repair the short between the (K14) Fuel Injector 4 Low-Side Control circuit and the (K614) Fuel Injector 4 High-Side Control circuit.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE FUEL INJECTOR**
   1. With the scan tool, clear DTCs in the Powertrain Control Module.
   2. Turn the ignition off.
   3. Disconnect the Fuel Injector 4 harness connector.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

NOTE: DTC P0270 will not return with the harness connector disconnected if the Fuel Injector is shorted internally.

Does DTC P0270 return?

Yes

- Go To 4

No

- Replace Fuel Injector 4 in accordance with the service information. Program the new Fuel Injector 4 correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in

two lines of 10 alphanumeric characters.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injector and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any technical service bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0272-CYLINDER 4 CONTRIBUTION/BALANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article .

WHEN MONITORED

With the engine running for at least five seconds.

SET CONDITION

The Powertrain Control Module (PCM) detects that the total Fuel Injector circuit resistance is either above 0.37 Ohms or below 0.14 Ohms for 0.16 seconds.

POSSIBLE CAUSES

Possible Causes
FUEL INJECTOR CORRECTION CODE NOT ENTERED CORRECTLY INTO PCM
HIGH RESISTANCE IN THE (K14) FUEL INJECTOR 4 HIGH-SIDE CONTROL CIRCUIT
HIGH RESISTANCE IN THE (K614) FUEL INJECTOR 4 LOW-SIDE CONTROL CIRCUIT
(K14) FUEL INJECTOR 4 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K614) FUEL INJECTOR 4 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR
FUEL SYSTEM FAILURE
INTAKE SYSTEM LEAK OR RESTRICTION
ENGINE MECHANICAL FAILURE
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK THE FUEL INJECTOR CORRECTION CODES IN THE PCM**

NOTE: If there are any Fuel Injector DTCs present, perform

the diagnostics for those DTCs before proceeding with this test procedure.

1. Turn the ignition off.
2. Locate and record the correction codes for the Fuel Injectors. The injector correction codes are located on top of the injectors and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
3. Turn the ignition on, engine not running.
4. With the scan tool, read the Fuel Injector correction codes stored in the PCM.
5. Compare Fuel Injector correction codes with the codes programmed in the scan tool.

   Are the Fuel Injectors calibrated correctly?

   Yes

   - Go To 2

   No

   - Program the Fuel Injector correction codes with the scan tool into the PCM. The Fuel Injector correction codes are located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

2. **CHECK THE TOTAL CIRCUIT RESISTANCE OF FUEL INJECTOR 4**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   3. Measure the circuit resistance of Fuel Injector 4 from the (K14) Fuel

Injector 4 Low-Side Control circuit to the (K614) Fuel Injector 4 High-Side Control circuit at the PCM C1 harness connector.

NOTE: The total circuit resistance through the Fuel Injector and wiring should be between 0.14 of an Ohm and 0.37 of an Ohm.

What is the total circuit resistance reading?

Total resistance is above 0.37 of an Ohm.

- Go To 3

Total resistance is below 0.14 of an Ohm.

- Go To 5

Total resistance is between 0.14 of an Ohm and 0.37 of an Ohm.

- Wiggle test the wiring harness and connectors while observing the Ohmmeter. If the resistance changes below 0.14 of an Ohm or above 0.37 of an Ohm, repair the intermittent connection in the wiring harness. If the wiring checks out OK, replace and program the Powertrain Control Module in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE FUEL INJECTOR CONTROL CIRCUITS FOR HIGH RESISTANCE**
   1. Disconnect the Fuel Injector 4 harness connector.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure the resistance of the:
      - (K14) Fuel Injector 4 Low-Side Control circuit between the Fuel Injector 4 harness connector and the PCM C1 harness connector.
      - (K614) Fuel Injector 4 High-Side Control circuit between the Fuel

Injector 4 harness connector and the PCM C1 harness connector.

Is the resistance below 0.1 of an Ohm for both circuits?

Yes

- Go To 4

No

- Repair the high resistance in the Fuel Injector circuit that measured above 0.1 of an Ohm.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE FUEL INJECTOR RESISTANCE**
   1. Disconnect all of the Fuel Injector harness connectors.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure and record the resistance through each Fuel Injector.

      NOTE: The resistance should be the same through all four injectors (Approximately 0.25 of an Ohm).

   Is the resistance reading the same for all four Fuel Injectors?

   Yes

   - Go To 7

   No

   - Replace the Fuel Injector that did not match the others in accordance with the service information. Program the new Fuel Injector correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE FUEL INJECTOR CONTROL CIRCUITS FOR SHORT TO GROUND**
   1. Disconnect the Fuel Injector 4 harness connector.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure the resistance between ground and the:
      - (K14) Fuel Injector 4 Low-Side Control circuit at the Fuel Injector 4 harness connector.
      - (K614) Fuel Injector 4 High-Side Control circuit at the Fuel Injector 4 harness connector.

      NOTE: Their should be no continuity.

      Is there any continuity to ground?

      Yes

      - Repair the Fuel Injector circuit that measured continuity to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 6

6. **CHECK THE FUEL INJECTOR RESISTANCE**
   1. Disconnect all of the Fuel Injector harness connectors.

      NOTE: Be sure to zero your Ohmmeter before the next step.

   2. Measure the resistance through each Fuel Injector.

NOTE: The resistance should be the same through all four injectors (Approximately 0.25 of an Ohm).

Is the resistance reading the same for all four Fuel Injectors?

Yes

- Go To 7

No

- Replace the Fuel Injector that did not match the others in accordance with the service information. Program the new Fuel Injector correction code with the scan tool into the PCM. The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **CHECK THE INTAKE SYSTEM FOR LEAKS OR RESTRICTIONS**
   1. Check the entire intake system for a leak or restriction.

   Were any problems found?

   Yes

   - Perform the appropriate repair in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 8

8. **CHECK THE FUEL DELIVERY SYSTEM**
   1. Perform the CHECKING THE FUEL DELIVERY SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

Were any problems found?

Yes

- Perform the appropriate repair in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 9

9. **CHECK THE ENGINE MECHANICAL SYSTEM**
   1. Perform the CHECKING THE ENGINE MECHANICAL SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Perform the appropriate repair in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 10

10. **POWERTRAIN CONTROL MODULE**
    1. Turn the ignition off.
    2. Replace the Fuel Injector in accordance with the service information. Program the correction code for this injector into the Powertrain Control Module.

    NOTE: The new Fuel Injector correction code is located on top of the injector and consists of 20 alphanumeric characters in two lines of 10

alphanumeric characters.

3. Turn the ignition on.
4. With the scan tool, erase DTCs.
5. Start the engine. Allow the engine to reach normal operating
6. Monitor the scan tool for at least two minutes.
7. With the scan tool, View DTCs.

Did the DTC return as active?

Yes

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Repair is complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P029A-CYLINDER 1 - FUEL TRIM AT MAX LIMIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Fuel Injector beyond it's maximum correctable limit.

POSSIBLE CAUSES

Possible Causes
FUEL INJECTOR CORRECTION CODE NOT ENTERED CORRECTLY INTO PCM
KNOCK SENSOR 1 NOT TORQUED CORRECTLY
POOR CONNECTION AT THE KNOCK SENSOR 1 HARNESS CONNECTOR
LOW CYLINDER COMPRESSION
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Turn the ignition off for 10.0 seconds.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE FUEL INJECTOR CORRECTION CODES IN THE PCM**

NOTE: If there are any Fuel Injector DTCs present, perform the diagnostics for those DTCs before proceeding

with this test procedure.

1. Turn the ignition off.
2. Locate and record the correction codes for the Fuel Injectors. The injector correction codes are located on top of the injectors and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
3. Turn the ignition on, engine not running.
4. With the scan tool, read the Fuel Injector correction codes stored in the PCM.
5. Compare Fuel Injector correction codes with the codes programmed in the scan tool.

   Are the Fuel Injectors calibrated correctly?

   Yes

   - Go To 3

   No

   - Program the Fuel Injector correction codes with the scan tool into the PCM. The Fuel Injector correction codes are located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE KNOCK SENSOR CONNECTOR**
   1. Disconnect the Knock Sensor 1 harness connector.
   2. Visually inspect the harness connector and sensor for corroded, spread, or damaged terminals.

      Were any problems found?

      Yes

      - Repair as necessary.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **CHECK THE KNOCK SENSOR TORQUE**
   1. Check the torque on the Knock Sensor 1 retaining bolt.

      NOTE: The Knock Sensor torque spec, is 20 Nm +/- 1.6 Nm.

      Is the Knock Sensor bolt torque correct?

      Yes

      - Go To 5

      No

      - Torque the Knock Sensor retaining bolt to proper specification in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE ENGINE MECHANICAL SYSTEM**
   1. Perform the CHECKING THE ENGINE MECHANICAL SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Perform the appropriate repair in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Fuel Injector in accordance with the service information. Program the Fuel Injector correction code with the scan tool into the PCM. The Fuel Injector correction code is located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P029B-CYLINDER 1- FUEL TRIM AT MIN LIMIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Fuel Injector beyond it's maximum correctable limit.

POSSIBLE CAUSES

Possible Causes
FUEL INJECTOR CORRECTION CODE NOT ENTERED CORRECTLY INTO PCM
KNOCK SENSOR 1 NOT TORQUED CORRECTLY
POOR CONNECTION AT THE KNOCK SENSOR 1 HARNESS CONNECTOR
HIGH CYLINDER COMPRESSION DUE TO EXCESSIVE SOOT BUILD-UP
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Turn the ignition off for 10.0 seconds.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE FUEL INJECTOR CORRECTION CODES IN THE PCM**

   NOTE: If there are any Fuel Injector DTCs present, perform the diagnostics for those DTCs before proceeding with this test procedure.

   1. Turn the ignition off.
   2. Locate and record the correction codes for the Fuel Injectors. The injector correction codes are located on top of the injectors and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
   3. Turn the ignition on, engine not running.
   4. With the scan tool, read the Fuel Injector correction codes stored in the PCM.
   5. Compare Fuel Injector correction codes with the codes programmed in the scan tool.

   Are the Fuel Injectors calibrated correctly?

Yes

- Go To 3

No

- Program the Fuel Injector correction codes with the scan tool into the PCM. The Fuel Injector correction codes are located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE KNOCK SENSOR CONNECTOR**
   1. Disconnect the Knock Sensor 1 harness connector.
   2. Visually inspect the harness connector and sensor for corroded, spread, or damaged terminals.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4
4. **CHECK THE KNOCK SENSOR TORQUE**
   1. Check the torque on the Knock Sensor 1 retaining bolt.

   NOTE: The Knock Sensor torque spec, is 20 Nm +/- 1.6 Nm.

   Is the Knock Sensor bolt torque correct?

   Yes

- Go To 5

No

- Torque the Knock Sensor retaining bolt to proper specification in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE ENGINE MECHANICAL SYSTEM**
   1. Perform the CHECKING THE ENGINE MECHANICAL SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Perform the appropriate repair in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Fuel Injector in accordance with the service information. Program the Fuel Injector correction code with the scan tool into the PCM. The Fuel Injector correction code is located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P029E-CYLINDER 2- FUEL TRIM AT MAX LIMIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Fuel Injector beyond it's maximum correctable limit.

POSSIBLE CAUSES

Possible Causes
FUEL INJECTOR CORRECTION CODE NOT ENTERED CORRECTLY INTO PCM
KNOCK SENSOR 1 NOT TORQUED CORRECTLY
POOR CONNECTION AT THE KNOCK SENSOR 1 HARNESS CONNECTOR
LOW CYLINDER COMPRESSION
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. Turn the ignition off for 10.0 seconds.
    4. Turn the ignition on.
    5. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

    - Perform the INTERMITTENT CONDITION diagnostic procedure.

Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE FUEL INJECTOR CORRECTION CODES IN THE PCM**

NOTE: If there are any Fuel Injector DTCs present, perform the diagnostics for those DTCs before proceeding with this test procedure.

1. Turn the ignition off.
2. Locate and record the correction codes for the Fuel Injectors. The injector correction codes are located on top of the injectors and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
3. Turn the ignition on, engine not running.
4. With the scan tool, read the Fuel Injector correction codes stored in the PCM.
5. Compare Fuel Injector correction codes with the codes programmed in the scan tool.

Are the Fuel Injectors calibrated correctly?

Yes

- Go To 3

No

- Program the Fuel Injector correction codes with the scan tool into the PCM. The Fuel Injector correction codes are located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE KNOCK SENSOR CONNECTOR**
   1. Disconnect the Knock Sensor 1 harness connector.
   2. Visually inspect the harness connector and sensor for corroded, spread, or damaged terminals.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **CHECK THE KNOCK SENSOR TORQUE**
   1. Check the torque on the Knock Sensor 1 retaining bolt.

      NOTE: The Knock Sensor torque spec, is 20 Nm +/- 1.6 Nm.

      Is the Knock Sensor bolt torque correct?

      Yes

      - Go To 5

      No

      - Torque the Knock Sensor retaining bolt to proper specification in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE ENGINE MECHANICAL SYSTEM**
   1. Perform the CHECKING THE ENGINE MECHANICAL SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

- Perform the appropriate repair in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Fuel Injector in accordance with the service information. Program the Fuel Injector correction code with the scan tool into the PCM. The Fuel Injector correction code is located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P029F-CYLINDER 2- FUEL TRIM AT MIN LIMIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Fuel Injector beyond it's maximum correctable limit.

POSSIBLE CAUSES

Possible Causes
FUEL INJECTOR CORRECTION CODE NOT ENTERED CORRECTLY INTO PCM
KNOCK SENSOR 1 NOT TORQUED CORRECTLY
POOR CONNECTION AT THE KNOCK SENSOR 1 HARNESS CONNECTOR
HIGH CYLINDER COMPRESSION DUE TO EXCESSIVE SOOT

BUILD-UP
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Turn the ignition off for 10.0 seconds.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE FUEL INJECTOR CORRECTION CODES IN THE PCM**

   NOTE: If there are any Fuel Injector DTCs present, perform the diagnostics for those DTCs before proceeding with this test procedure.

   1. Turn the ignition off.
   2. Locate and record the correction codes for the Fuel Injectors. The injector correction codes are located on top of the injectors and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.

3. Turn the ignition on, engine not running.
4. With the scan tool, read the Fuel Injector correction codes stored in the PCM.
5. Compare Fuel Injector correction codes with the codes programmed in the scan tool.

   Are the Fuel Injectors calibrated correctly?

   Yes

   - Go To 3

   No

   - Program the Fuel Injector correction codes with the scan tool into the PCM. The Fuel Injector correction codes are located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE KNOCK SENSOR CONNECTOR**
   1. Disconnect the Knock Sensor 1 harness connector.
   2. Visually inspect the harness connector and sensor for corroded, spread, or damaged terminals.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 4
4. **CHECK THE KNOCK SENSOR TOROUE**

1. Check the torque on the Knock Sensor 1 retaining bolt.

NOTE: The Knock Sensor torque spec, is 20 Nm +/- 1.6 Nm.

Is the Knock Sensor bolt torque correct?

Yes

- Go To 5

No

- Torque the Knock Sensor retaining bolt to proper specification in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE ENGINE MECHANICAL SYSTEM**
   1. Perform the CHECKING THE ENGINE MECHANICAL SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Perform the appropriate repair in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Fuel Injector in accordance with the service information. Program the Fuel Injector correction code with the scan tool into the PCM. The Fuel Injector correction code is located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P02A2-CYLINDER 3- FUEL TRIM AT MAX LIMIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Fuel Injector beyond it's maximum correctable limit.

POSSIBLE CAUSES

Possible Causes
FUEL INJECTOR CORRECTION CODE NOT ENTERED CORRECTLY INTO PCM
KNOCK SENSOR 2 NOT TORQUED CORRECTLY
POOR CONNECTION AT THE KNOCK SENSOR 2 HARNESS CONNECTOR
LOW CYLINDER COMPRESSION
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. Turn the ignition off for 10.0 seconds.
    4. Turn the ignition on.

5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE FUEL INJECTOR CORRECTION CODES IN THE PCM**

   NOTE: If there are any Fuel Injector DTCs present, perform the diagnostics for those DTCs before proceeding with this test procedure.

   1. Turn the ignition off.
   2. Locate and record the correction codes for the Fuel Injectors. The injector correction codes are located on top of the injectors and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
   3. Turn the ignition on, engine not running.
   4. With the scan tool, read the Fuel Injector correction codes stored in the PCM.
   5. Compare Fuel Injector correction codes with the codes programmed in the scan tool.

      Are the Fuel Injectors calibrated correctly?

      Yes

      - Go To 3

      No

      - Program the Fuel Injector correction codes with the scan tool into

the PCM. The Fuel Injector correction codes are located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE KNOCK SENSOR CONNECTOR**
   1. Disconnect the Knock Sensor 2 harness connector.
   2. Visually inspect the harness connector and sensor for corroded, spread, or damaged terminals.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4

4. **CHECK THE KNOCK SENSOR TORQUE**
   1. Check the torque on the Knock Sensor 2 retaining bolt.

   NOTE: The Knock Sensor torque spec, is 20 Nm +/- 1.6 Nm.

   Is the Knock Sensor bolt torque correct?

   Yes

   - Go To 5

   No

   - Torque the Knock Sensor retaining bolt to proper specification in accordance with the service information.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE ENGINE MECHANICAL SYSTEM**
   1. Perform the CHECKING THE ENGINE MECHANICAL SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Perform the appropriate repair in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Replace the Fuel Injector in accordance with the service information. Program the Fuel Injector correction code with the scan tool into the PCM. The Fuel Injector correction code is located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P02A3-CYLINDER 3- FUEL TRIM AT MIN LIMIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Fuel Injector beyond it's maximum correctable limit.

POSSIBLE CAUSES

Possible Causes
FUEL INJECTOR CORRECTION CODE NOT ENTERED CORRECTLY INTO PCM
KNOCK SENSOR 2 NOT TORQUED CORRECTLY
POOR CONNECTION AT THE KNOCK SENSOR 2 HARNESS CONNECTOR
HIGH CYLINDER COMPRESSION DUE TO EXCESSIVE SOOT BUILD-UP
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Turn the ignition off for 10.0 seconds.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE FUEL INJECTOR CORRECTION CODES IN THE PCM**

NOTE: If there are any Fuel Injector DTCs present, perform

the diagnostics for those DTCs before proceeding with this test procedure.

1. Turn the ignition off.
2. Locate and record the correction codes for the Fuel Injectors. The injector correction codes are located on top of the injectors and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
3. Turn the ignition on, engine not running.
4. With the scan tool, read the Fuel Injector correction codes stored in the PCM.
5. Compare Fuel Injector correction codes with the codes programmed in the scan tool.

   Are the Fuel Injectors calibrated correctly?

   Yes

   - Go To 3

   No

   - Program the Fuel Injector correction codes with the scan tool into the PCM. The Fuel Injector correction codes are located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE KNOCK SENSOR CONNECTOR**
   1. Disconnect the Knock Sensor 2 harness connector.
   2. Visually inspect the harness connector and sensor for corroded, spread, or damaged terminals.

      Were any problems found?

      Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **CHECK THE KNOCK SENSOR TORQUE**
   1. Check the torque on the Knock Sensor 2 retaining bolt.

      NOTE: The Knock Sensor torque spec, is 20 Nm +/- 1.6 Nm.

      Is the Knock Sensor bolt torque correct?

      Yes

      - Go To 5

      No

      - Torque the Knock Sensor retaining bolt to proper specification in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE ENGINE MECHANICAL SYSTEM**
   1. Perform the CHECKING THE ENGINE MECHANICAL SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

      Yes

      - Perform the appropriate repair in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

No

- Replace the Fuel Injector in accordance with the service information. Program the Fuel Injector correction code with the scan tool into the PCM. The Fuel Injector correction code is located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P02A6-CYLINDER 4- FUEL TRIM AT MAX LIMIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module detects that the Fuel Injector beyond it's maximum correctable limit.

POSSIBLE CAUSES

Possible Causes
FUEL INJECTOR CORRECTION CODE NOT ENTERED CORRECTLY INTO PCM
KNOCK SENSOR 2 NOT TORQUED CORRECTLY
POOR CONNECTION AT THE KNOCK SENSOR 2 HARNESS CONNECTOR
LOW CYLINDER COMPRESSION
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Turn the ignition off for 10.0 seconds.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE FUEL INJECTOR CORRECTION CODES IN THE PCM**

   NOTE: If there are any Fuel Injector DTCs present, perform the diagnostics for those DTCs before proceeding with this test procedure.

   1. Turn the ignition off.
   2. Locate and record the correction codes for the Fuel Injectors. The injector correction codes are located on top of the injectors and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
   3. Turn the ignition on, engine not running.
   4. With the scan tool, read the Fuel Injector correction codes stored in the PCM.
   5. Compare Fuel Injector correction codes with the codes programmed in the scan tool.

   Are the Fuel Injectors calibrated correctly?

Yes

- Go To 3

No

- Program the Fuel Injector correction codes with the scan tool into the PCM. The Fuel Injector correction codes are located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE KNOCK SENSOR CONNECTOR**
   1. Disconnect the Knock Sensor 2 harness connector.
   2. Visually inspect the harness connector and sensor for corroded, spread, or damaged terminals.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4
4. **CHECK THE KNOCK SENSOR TORQUE**
   1. Check the torque on the Knock Sensor 2 retaining bolt.

   NOTE: The Knock Sensor torque spec, is 20 Nm +/- 1.6 Nm.

   Is the Knock Sensor bolt torque correct?

   Yes

- Go To 5

No

- Torque the Knock Sensor retaining bolt to proper specification in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE ENGINE MECHANICAL SYSTEM**
   1. Perform the CHECKING THE ENGINE MECHANICAL SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found?

   Yes

   - Perform the appropriate repair in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Fuel Injector in accordance with the service information. Program the Fuel Injector correction code with the scan tool into the PCM. The Fuel Injector correction code is located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P02A7-CYLINDER 4- FUEL TRIM AT MIN LIMIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Fuel Injector beyond it's minimum correctable limit.

POSSIBLE CAUSES

Possible Causes
FUEL INJECTOR CORRECTION CODE NOT ENTERED CORRECTLY INTO PCM
KNOCK SENSOR 1 NOT TORQUED CORRECTLY
POOR CONNECTION AT THE KNOCK SENSOR 2 HARNESS CONNECTOR
HIGH CYLINDER COMPRESSION DUE TO EXCESSIVE SOOT BUILD-UP
FUEL INJECTOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. Turn the ignition off for 10.0 seconds.
    4. Turn the ignition on.
    5. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE FUEL INJECTOR CORRECTION CODES IN THE PCM**

NOTE: If there are any Fuel Injector DTCs present, perform the diagnostics for those DTCs before proceeding with this test procedure.

1. Turn the ignition off.
2. Locate and record the correction codes for the Fuel Injectors. The injector correction codes are located on top of the injectors and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
3. Turn the ignition on, engine not running.
4. With the scan tool, read the Fuel Injector correction codes stored in the PCM.
5. Compare Fuel Injector correction codes with the codes programmed in the scan tool.

Are the Fuel Injectors calibrated correctly?

Yes

- Go To 3

No

- Program the Fuel Injector correction codes with the scan tool into the PCM. The Fuel Injector correction codes are located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE KNOCK SENSOR CONNECTOR**
   1. Disconnect the Knock Sensor 2 harness connector.

2. Visually inspect the harness connector and sensor for corroded, spread, or damaged terminals.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4

4. **CHECK THE KNOCK SENSOR TORQUE**
   1. Check the torque on the Knock Sensor 2 retaining bolt.

      NOTE: The Knock Sensor torque spec, is 20 Nm +/- 1.6 Nm.

      Is the Knock Sensor bolt torque correct?

      Yes

      - Go To 5

      No

      - Torque the Knock Sensor retaining bolt to proper specification in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE ENGINE MECHANICAL SYSTEM**
   1. Perform the CHECKING THE ENGINE MECHANICAL SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found?

Yes

- Perform the appropriate repair in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Fuel Injector in accordance with the service information. Program the Fuel Injector correction code with the scan tool into the PCM. The Fuel Injector correction code is located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0326-KNOCK SENSOR 1 CIRCUIT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The two Knock Sensors, located on the engine near the below the Intake Manifold are used by the Powertrain Control Module (PCM) to monitor the fuel injectors. The PCM uses the feedback information to determine that the Fuel Injectors are injecting at the correct time. The feedback from the Knock Sensors can also help the PCM determine injector drift for each injector and adjust the injector on time accordingly. Knock Sensor 1 monitors injectors one and two. Knock Sensor 2 monitors injectors three and four.

WHEN MONITORED

With the engine running and the battery voltage is between 10.0 Volts and 16.0 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (K42) Knock Sensor 1 Signal circuit is implausible.

POSSIBLE CAUSES

Possible Causes
FUEL INJECTOR CORRECTION CODE NOT ENTERED CORRECTLY INTO PCM
KNOCK SENSOR 1 NOT TORQUED CORRECTLY
(K42) KNOCK SENSOR 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K942) KNOCK SENSOR 1 RETURN CIRCUIT SHORTED TO VOLTAGE
(K42) KNOCK SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND
(K942) KNOCK SENSOR 1 RETURN CIRCUIT SHORTED TO GROUND
(K42) KNOCK SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (K942) KNOCK SENSOR 1 RETURN CIRCUIT
(K42) KNOCK SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (K147) KNOCK SENSOR 1 SHIELD CIRCUIT
(K42) KNOCK SENSOR 1 SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K942) KNOCK SENSOR 1 RETURN CIRCUIT OPEN/HIGH RESISTANCE
(K147) KNOCK SENSOR 1 SHIELD CIRCUIT OPEN/HIGH RESISTANCE
KNOCK SENSOR
POWERTRAIN CONTROL MODULE (PCM)
FUEL QUALITY OR DELIVERY SYSTEM FAILURE
BASE ENGINE FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

NOTE: If there are any fuel system, Crank Sensor, or Fuel Injector DTCs present, perform the diagnostics for those DTCs before proceeding with this test procedure.

1. Turn the ignition on.
2. With the scan tool, clear DTCs in the PCM.
3. Test drive the vehicle.
4. With the scan tool, view DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE FUEL INJECTOR CORRECTION CODES IN THE PCM**

NOTE: If there are any Fuel Injector DTCs present, perform the diagnostics for those DTCs before proceeding with this test procedure.

1. Turn the ignition off.
2. Locate and record the correction codes for the Fuel Injectors. The injector correction codes are located on top of the injectors and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
3. Turn the ignition on, engine not running.
4. With the scan tool, read the Fuel Injector correction codes stored in the PCM.
5. Compare Fuel Injector correction codes with the codes programmed in the scan tool.

Are the Fuel Injectors calibrated correctly?

Yes

- Go To 3

No

- Program the Fuel Injector correction codes with the scan tool into the PCM. The Fuel Injector correction codes are located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE KNOCK SENSOR TORQUE**
   1. Check the torque on the Knock Sensor 2 retaining bolt.

NOTE: The Knock Sensor torque spec, is 20 Nm +/- 1.6 Nm.

Is the Knock Sensor bolt torque correct?

Yes

- Go To 4

No

- Torque the Knock Sensor retaining bolt to proper specification in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE (K42) KNOCK SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Knock Sensor 1 harness connector.

3. Turn the ignition on.
4. Measure the voltage on the (K42) Knock Sensor 1 Signal circuit at the Knock Sensor 1 harness connector.

   Is the voltage reading above 5.1 Volts?

   Yes

   - Repair the (K42) Knock Sensor 1 Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 5

5. **CHECK THE (K942) KNOCK SENSOR 1 RETURN CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Measure the voltage on the (K942) Knock Sensor 1 Return circuit at the Knock Sensor 1 harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K942) Knock Sensor 1 Return circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 6

6. **CHECK THE (K42) KNOCK SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

3. Measure the resistance between ground and the (K42) Knock Sensor 1 Signal circuit at the Knock Sensor 1 harness connector.

   Is the resistance reading below 10k Ohms?

   Yes

   - Repair the (K42) Knock Sensor 1 Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 7

7. **CHECK THE (K942) KNOCK SENSOR 1 RETURN CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (K942) Knock Sensor 1 Return circuit at the Knock Sensor 1 harness connector.

      Is the resistance reading below 10k Ohms?

      Yes

      - Repair the (K942) Knock Sensor 1 Return circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 8

8. **CHECK FOR THE (K42) KNOCK SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (K942) KNOCK SENSOR 1 RETURN CIRCUIT**
   1. Measure the resistance between the (K42) Knock Sensor 1 Signal circuit and the (K942) Knock Sensor 1 Return circuit at the Knock Sensor 1 harness connector.

Is the resistance reading above 10k Ohms?

Yes

- Go To 9

No

- Repair the short between the (K42) Knock Sensor 1 Signal circuit and the (K942) Knock Sensor 1 Return circuit.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

9. **CHECK FOR THE (K42) KNOCK SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (K147) KNOCK SENSOR 1 SHIELD CIRCUIT**
   1. Measure the resistance between the (K42) Knock Sensor 1 Signal circuit and the (K147) Knock Sensor 1 Shield circuit at the Knock Sensor 1 harness connector.

      Is the resistance reading above 10k Ohms?

      Yes

      - Go To 10

      No

      - Repair the short between the (K42) Knock Sensor 1 Signal circuit and the (K147) Knock Sensor 1 Shield circuit.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
10. **CHECK THE (K42) KNOCK SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
    1. Measure the resistance of the (K42) Knock Sensor 1 Signal circuit between the Knock Sensor 1 harness connector and the PCM C1 harness connector.

       Is the resistance below 5.0 Ohms?

Yes

- Go To 11

No

- Repair the (K42) Knock Sensor 1 Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

11. **CHECK THE (K942) KNOCK SENSOR 1 RETURN CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
    1. Measure the resistance of the (K942) Knock Sensor 1 Return circuit between the Knock Sensor 1 harness connector and the PCM C1 harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Go To 12

    No

    - Repair the (K942) Knock Sensor 1 Return circuit for an open or high resistance.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

12. **CHECK THE (K147) KNOCK SENSOR 1 SHIELD CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
    1. Measure the resistance of the (K147) Knock Sensor 1 Shield circuit between the Knock Sensor 1 harness connector and the PCM C1 harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

- Go To 13

No

- Repair the (K147) Knock Sensor 1 Shield circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

13. **CHECK THE INTAKE SYSTEM**
    1. Turn the ignition off.
    2. Inspect the air filter for excessive dirt, soiling or other problems that may cause restricted air flow.
    3. Inspect all air intake and Turbocharger related hoses/tubes and connections.

    Were any leaks or restrictions found in the intake or Turbocharger systems?

    Yes

    - Repair the Intake or Turbocharger system as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

    No

    - Go To 14

14. **CHECK THE SUPPLY SIDE FUEL DELIVERY SYSTEM**
    1. Perform the CHECKING THE FUEL DELIVERY SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    Were there any problems with the Fuel Delivery System?

    Yes

    - Repair as necessary in accordance with the service information.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 15

15. **BASE ENGINE**
    1. Check for any base engine mechanical failures such as:
        - Cylinder Compression Test. Refer to **COMPRESSION TESTING ENGINE** .
        - engine valves worn or sticking
        - weak or broken valve springs
        - valve timing/timing belt alignment
        - leaking Fuel Injectors
        - damaged Crankshaft Position Sensor or intermittent connection.

    Were any base engine failure found?

    Yes

    - Repair as necessary in accordance with the service information.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

    No

    - Go To 16

16. **KNOCK SENSOR**
    1. Replace the Knock Sensor in accordance with the service information.
    2. Reconnect the Knock Sensor harness connector.
    3. Reconnect the PCM C1 harness connector.
    4. Turn the ignition on.
    5. With the scan tool, clear DTCs in the PCM.
    6. Test drive the vehicle.

7. With the scan tool, view DTCs.

   Did the DTC return?

   Yes

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Test complete.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P032B-KNOCK SENSOR 3 CIRCUIT/RANGE PERFORMANCE - BANK 1

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The two Knock Sensors, located on the engine near the below the Intake Manifold are used by the Powertrain Control Module (PCM) to monitor the fuel injectors. The PCM uses the feedback information to determine that the Fuel Injectors are injecting at the correct time. The feedback from the Knock Sensors can also help the PCM determine injector drift for each injector and adjust the injector on time accordingly. Knock Sensor 1 monitors injectors one and two. Knock Sensor 2 monitors injectors three and four.

WHEN MONITORED

With the engine running and the battery voltage is between 10.0 Volts and 16.0 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (K242) Knock Sensor 2 Signal circuit is implausible.

POSSIBLE CAUSES

Possible Causes
FUEL INJECTOR CORRECTION CODE NOT ENTERED CORRECTLY INTO PCM
KNOCK SENSOR 2 NOT TORQUED CORRECTLY
(K242) KNOCK SENSOR 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K924) KNOCK SENSOR 2 RETURN CIRCUIT SHORTED TO VOLTAGE
(K242) KNOCK SENSOR 2 SIGNAL CIRCUIT SHORTED TO GROUND
(K924) KNOCK SENSOR 2 RETURN CIRCUIT SHORTED TO GROUND
(K242) KNOCK SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE (K924) KNOCK SENSOR 2 RETURN CIRCUIT
(K242) KNOCK SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE (K148) KNOCK SENSOR 2 SHIELD CIRCUIT
(K242) KNOCK SENSOR 2 SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K924) KNOCK SENSOR 2 RETURN CIRCUIT OPEN/HIGH RESISTANCE
(K148) KNOCK SENSOR 2 SHIELD CIRCUIT OPEN/HIGH RESISTANCE
KNOCK SENSOR
POWERTRAIN CONTROL MODULE (PCM)
FUEL QUALITY OR DELIVERY SYSTEM FAILURE
BASE ENGINE FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

NOTE: If there are any fuel system, Crank Sensor, or Fuel Injector DTCs present, perform the diagnostics for those DTCs before proceeding with this test procedure.

1. Turn the ignition on.
2. With the scan tool, clear DTCs in the PCM.
3. Test drive the vehicle.
4. With the scan tool, view DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE FUEL INJECTOR CORRECTION CODES IN THE PCM**

NOTE: If there are any Fuel Injector DTCs present, perform the diagnostics for those DTCs before proceeding with this test procedure.

1. Turn the ignition off.
2. Locate and record the correction codes for the Fuel Injectors. The injector correction codes are located on top of the injectors and consists of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
3. Turn the ignition on, engine not running.
4. With the scan tool, read the Fuel Injector correction codes stored in the PCM.
5. Compare Fuel Injector correction codes with the codes programmed in

the scan tool.

Are the Fuel Injectors calibrated correctly?

Yes

- Go To 3

No

- Program the Fuel Injector correction codes with the scan tool into the PCM. The Fuel Injector correction codes are located on top of the injectors and consist of 20 alphanumeric characters in two lines of 10 alphanumeric characters.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE KNOCK SENSOR TORQUE**
   1. Check the torque on the Knock Sensor 2 retaining bolt.

NOTE: The Knock Sensor torque spec, is 20 Nm +/- 1.6 Nm.

Is the Knock Sensor bolt torque correct?

Yes

- Go To 4

No

- Torque the Knock Sensor retaining bolt to proper specification in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE (K242) KNOCK SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.

2. Disconnect the Knock Sensor 2 harness connector.
3. Turn the ignition on.
4. Measure the voltage on the (K242) Knock Sensor 2 Signal circuit at the Knock Sensor 2 harness connector.

   Is the voltage reading above 5.1 Volts?

   Yes

   - Repair the (K242) Knock Sensor 2 Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 5

5. **CHECK THE (K924) KNOCK SENSOR 2 RETURN CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Measure the voltage on the (K924) Knock Sensor 2 Return circuit at the Knock Sensor 2 harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K924) Knock Sensor 2 Return circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 6

6. **CHECK THE (K242) KNOCK SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.

2. Disconnect the PCM C1 harness connector.
3. Measure the resistance between ground and the (K242) Knock Sensor 2 Signal circuit at the Knock Sensor 2 harness connector.

   Is the resistance reading above 10k Ohms?

   Yes

   - Go To 7

   No

   - Repair the (K242) Knock Sensor 2 Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **CHECK THE (K924) KNOCK SENSOR 2 RETURN CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (K924) Knock Sensor 2 Return circuit at the Knock Sensor 2 harness connector.

      Is the resistance reading above 10k Ohms?

      Yes

      - Go To 8

      No

      - Repair the (K924) Knock Sensor 2 Return circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

8. **CHECK FOR THE (K242) KNOCK SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE (K924) KNOCK SENSOR 2 RETURN CIRCUIT**
   1. Measure the resistance between the (K242) Knock Sensor 2 Signal circuit and the (K924) Knock Sensor 2 Return circuit at the Knock

Sensor 2 harness connector.

Is the resistance reading above 10k Ohms?

Yes

- Go To 9

No

- Repair the short between the (K242) Knock Sensor 2 Signal circuit and the (K924) Knock Sensor 2 Return circuit.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

9. **CHECK FOR THE (K242) KNOCK SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE (K148) KNOCK SENSOR 2 SHIELD CIRCUIT**
   1. Measure the resistance between the (K242) Knock Sensor 2 Signal circuit and the (K148) Knock Sensor 2 Shield circuit at the KNOCK SENSOR 2 harness connector.

      Is the resistance reading above 10k Ohms?

      Yes

      - Go To 10

      No

      - Repair the short between the (K242) Knock Sensor 2 Signal circuit and the (K148) Knock Sensor 2 Shield circuit.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
10. **CHECK THE (K242) KNOCK SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
    1. Measure the resistance of the (K242) Knock Sensor 2 Signal circuit between the Knock Sensor 2 harness connector and the PCM C1 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 11

No

- Repair the (K242) Knock Sensor 2 Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

11. **CHECK THE (K924) KNOCK SENSOR 2 RETURN CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
    1. Measure the resistance of the (K924) Knock Sensor 2 Return circuit between the Knock Sensor 2 harness connector and the PCM C1 harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Go To 12

    No

    - Repair the (K924) KNOCK Sensor 2 Return circuit for an open or high resistance.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

12. **CHECK THE (K148) KNOCK SENSOR 2 SHIELD CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
    1. Measure the resistance of the (K148) Knock Sensor 2 Shield circuit between the Knock Sensor 2 harness connector and the PCM C1 harness connector.

    Is the resistance below 5.0 Ohms?

Yes

- Go To 13

No

- Repair the (K148) Knock Sensor 2 Shield circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

13. **CHECK THE INTAKE SYSTEM**
    1. Turn the ignition off.
    2. Inspect the air filter for excessive dirt, soiling or other problems that may cause restricted air flow.
    3. Inspect all air intake and Turbocharger related hoses/tubes and connections.

    Were any leaks or restrictions found in the intake or Turbocharger systems?

    Yes

    - Repair the Intake or Turbocharger system as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

    No

    - Go To 14
14. **CHECK THE SUPPLY SIDE FUEL DELIVERY SYSTEM**
    1. Perform the CHECKING THE FUEL DELIVERY SYSTEM diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    Were there any problems with the Fuel Delivery System?

    Yes

- Repair as necessary in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 15

15. **BASE ENGINE**
    1. Check for any base engine mechanical failures such as:
        - Cylinder Compression Test. Refer to **COMPRESSION TESTING ENGINE** .
        - engine valves worn or sticking.
        - weak or broken valve springs.
        - valve timing/timing belt alignment.
        - leaking Fuel Injectors.
        - damaged Crankshaft Position Sensor or intermittent connection.

    Were any base engine failure found?

    Yes

    - Repair as necessary in accordance with the service information.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

    No

    - Go To 16

16. **KNOCK SENSOR**
    1. Replace the Knock Sensor in accordance with the service information.
    2. Reconnect the Knock Sensor harness connector.
    3. Reconnect the PCM C1 harness connector.
    4. Turn the ignition on.
    5. With the scan tool, clear DTCs in the PCM.

6. Test drive the vehicle.
7. With the scan tool, view DTCs.

   Did the DTC return?

   Yes

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Test complete.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0335-CRANKSHAFT POSITION SENSOR CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine cranking or running.

SET CONDITION

The Powertrain Control Module (PCM) does not receive a signal from the Crankshaft Position Sensor (CKP) when the Camshaft Position Sensor (CMP) indicates engine RPM.

POSSIBLE CAUSES

Possible Causes
(K24) CKP SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

(K925) CKP SENSOR RETURN CIRCUIT SHORTED TO VOLTAGE
(K925) CKP SENSOR RETURN CIRCUIT OPEN
(K24) CKP SENSOR SIGNAL CIRCUIT OPEN
CRANKSHAFT POSITION (CKP) SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

NOTE: The Timing Belt/Chain must be correctly installed and operational before diagnosis can be made. Refer to the Service Information to ensure the timing belt is properly installed.

NOTE: If the PCM detects and stores a DTC, the PCM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

1. Turn the ignition on.
2. With the scan tool, erase the PCM DTCs.
3. Turn the ignition off for 10.0 seconds.
4. Start the engine or crank for at least seven seconds.
5. With the scan tool, view PCM DTCs.

Does the scan tool display this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.
   3. Disconnect the CKP Sensor harness connector.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K24) CKP Sensor Signal circuit at the CKP Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K24) CKP Sensor Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE (K925) CRANKSHAFT POSITION SENSOR RETURN CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Measure the voltage of the (K925) CKP Sensor Return circuit at the CKP Sensor harness connector.

   Is there any voltage present?

   Yes

- Repair the (K925) CKP Sensor Return circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **CHECK THE (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off
   2. Remove the jumper and reinstall the Main Relay.
   3. Measure the resistance of the (K24) CKP Sensor Signal circuit between the CKP Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K24) CKP Sensor Signal circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE (K925) CRANKSHAFT POSITION SENSOR RETURN CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K925) CKP Sensor Return circuit between the CKP Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

- Go To 6

No

- Repair the (K925) CKP Sensor Return circuit for an open.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **DAMAGED CRANKSHAFT POSITION SENSOR OR FLYWHEEL/FLEXPLATE**
   1. Remove the CKP Sensor.
   2. Inspect the CKP Sensor for conditions such as loose mounting screws, damage, or cracks.
   3. Inspect the Flywheel/Flexplate for conditions such as damaged, bent, debris or cracked teeth.

   Is there any evidence of these conditions?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 7
7. **CRANKSHAFT POSITION SENSOR**
   1. Replace the CKP Sensor in accordance with the Service Information.
   2. With the scan tool, erase the PCM DTCs.
   3. Start the engine or crank for at least seven seconds.
   4. With the scan tool, view PCM DTCs.

   Does the scan tool display this DTC?

   Yes

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Test Complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0336-CRANKSHAFT POSITION SENSOR PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 32: Camshaft & Crankshaft Position Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine cranking or running.

SET CONDITION

The Powertrain Control Module (PCM) detects that the CKP Sensor Signal is missing.

POSSIBLE CAUSES

Possible Causes
(K24) CKP SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K925) CKP SENSOR RETURN CIRCUIT OPEN/HIGH RESISTANCE
DAMAGED OR MISSING TEETH ON CRANKSHAFT
CRANKSHAFT POSITION (CKP) SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, erase the PCM DTCs.
   3. Start the engine or crank for at least seven seconds.
   4. With the scan tool, read the PCM DTCs.

      Does the scan tool display this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K24) CKP SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the CKP Sensor harness connector.
   3. Disconnect the PCM C1 harness connectors.
   4. Measure the resistance of the (K24) CKP Sensor Signal circuit between the CKP Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

Yes

- Go To 3

No

- Repair the (K24) CKP Sensor Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K925) CRANKSHAFT POSITION SENSOR RETURN CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off
   2. Measure the resistance of the (K925) CKP Sensor Return circuit between the CKP Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the (K925) CKP Sensor Return circuit for an open.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **DAMAGED CRANKSHAFT POSITION SENSOR OR FLYWHEEL/FLEXPLATE**
   1. Remove the CKP Sensor.
   2. Inspect the CKP Sensor for conditions such as loose mounting screws, damage, debris on magnet or cracks.
   3. Inspect the Flywheel/Flexplate for conditions such as damaged, bent, debris or cracked teeth.

Is there any evidence of these conditions?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **CRANKSHAFT POSITION SENSOR**
   1. Replace the CKP Sensor in accordance with the Service Information.
   2. With the scan tool, erase the PCM DTCs.
   3. Start the engine or crank for at least seven seconds.
   4. With the scan tool, view PCM DTCs.

   Does the scan tool display this DTC?

   Yes

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Test Complete.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0339-CRANKSHAFT POSITION SENSOR INTERMITTENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 33: Camshaft & Crankshaft Position Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Crankshaft Position (CKP) Sensor circuits consist of a Powertrain Control Module (PCM) supplied 5-Volt reference circuit, low reference circuit and an output signal circuit. The CKP Sensor is an internally magnetic biased digital output integrated circuit sensing device. The sensor detects magnetic flux

changes between the peaks and valleys of a tone wheel on the crankshaft. Each tooth on the tone wheel is spaced with missing teeth for the reference gap. The CKP Sensor produces an ON/OFF DC voltage of varying frequency, reference output pulses per crankshaft revolution. The frequency of the CKP Sensor output depends on the velocity of the crankshaft. The CKP Sensor sends a digital signal, which represents an image of the crankshaft tone wheel, to the PCM as each tooth on the wheel rotates past the CKP Sensor. The PCM uses each CKP signal pulse to determine crankshaft speed and decodes the crankshaft tone wheel reference gap to identify crankshaft position. This information is then used to sequence the ignition timing and fuel injection events for the engine. The PCM also uses CKP Sensor output information to determine the crankshaft relative position to the camshaft, to detect cylinder misfire and to control the CMP actuator if equipped.

WHEN MONITORED

With the engine cranking or running.

SET CONDITION

The Powertrain Control Module (PCM) detects a gap in the signal from the Crankshaft Position Sensor.

POSSIBLE CAUSES

Possible Causes
5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5-VOLT SUPPLY CIRCUIT SHORTED TO THE CKP SENSOR GROUND CIRCUIT
5-VOLT SUPPLY CIRCUIT OPEN/HIGH RESISTANCE
CKP SIGNAL CIRCUIT SHORTED TO VOLTAGE
CKP SIGNAL CIRCUIT SHORTED TO GROUND
CKP SIGNAL CIRCUIT SHORTED TO THE CKP SENSOR GROUND CIRCUIT
CKP SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
CKP SENSOR GROUND CIRCUIT OPEN/HIGH RESISTANCE
CRANKSHAFT POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR APPLICABLE TSB**
   1. Check for any applicable TSBs that may apply for this issue.

      Were any TSBs applicable?

      Yes

      - Perform the applicable TSB. Erase the DTC and perform the verification test.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 2
2. **DTC IS ACTIVE**
   1. Turn the ignition on.
   2. Read and copy the DTC's and Freeze Frame Data.
   3. Start the engine, or crank the engine for 10 seconds.

      NOTE: If the vehicle starts and runs, wiggle test the wiring and see if problem duplicates or the fault sets.

      Is the status Active for this DTC?

      Yes

      - Go To 5

      No

      - Go To 3

3. **WIRE HARNESS/CKP SENSOR INSPECTION**
   1. Turn the ignition off.
   2. Disconnect the harness connectors at the PCM and Crank Sensor and inspect for wire chaffing or rub conditions, terminals pushed out on the wiring connector, bent terminals at the PCM and Crank Sensor, water in the connector cavities, presence of corrosion on the terminals of the connectors or components.
   3. Visually inspect the mounting area of Crank Sensor for debris/damage or a loose sensor. Remove the Crank Sensor and inspect the end of the sensor for signs of damage or debris. Rotate the engine and if possible, inspect the target wheel for any signs of damage. Reinstall the Crank Sensor and ensure that the sensor is properly installed and torqued to proper specification.

   NOTE: Due to the fact that this DTC is set by an intermittent loss of the signal, the most likely cause is a poor connection at the Crank Sensor or PCM terminals, or a poor signal between the Crank Sensor and target wheel. Because of this, unplugging and reconnecting the harness connectors, or repositioning the Crank Sensor will often repair the condition that set the DTC.

   Were any problems found?

   Yes

   - Perform the appropriate repair.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4
4. **CHECK THE VEHICLE'S REPAIR HISTORY**
   1. Check the history of the vehicle for previous crank sensor related DTCs within the past 90 days.

Did the repair history show that the vehicle was in dealership for a crank sensor fault within the past 90 days?

Yes

- Replace the Crank Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Test complete. Reconnect the harness connectors, and erase the DTC. The most likely cause was a poor connection at one of the harness connectors. Verify the DTC does not return.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE (F855) 5-VOLT SUPPLY CIRCUIT VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the CKP Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (F855) 5-Volt Supply circuit at the CKP Sensor harness connector.

   Is the voltage between 4.8 and 5.2 volts?

   Yes

   - Go To 6

   No, voltage is below 4.8 volts:

   - Repair the 5-Volt Supply circuit for an open or short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No, voltage is above 5.2 volts:

- Repair the 5-Volt Supply circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **CHECK THE (K24) CKP SIGNAL CIRCUIT VOLTAGE**
   1. Measure the voltage of the (K24) CKP Signal circuit at the CKP Sensor harness connector.

      Is the voltage between 4.8 and 5.2 volts?

      Yes

      - Go To 7

      No

      - Go To 9

      No

      - Repair the CKP Sensor Signal circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
7. **CHECK THE (K925) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.
   3. Measure the resistance of the (K925) CKP Sensor Ground circuit between the CKP Sensor harness connector and the PCM C2 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 8

No

- Repair the (K925) CKP Sensor Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

8. **TONE WHEEL/PULSE RING INSPECTION**
   1. Turn the ignition off.
   2. Disconnect the battery ground cable.
   3. Remove the CKP Sensor.
   4. Visually inspect the sensor mounting location for damage, foreign material.
   5. Rotate the engine and if possible inspect the target wheel for any signs of damage.

   Were any problems found?

   Yes

   - Repair Issues in mounting location. Repair or replace the Tone Wheel/Pulse Ring as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Crank Position Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

9. **CHECK THE (K24) CKP SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.

3. Measure the resistance between ground and the (K24) CKP Signal circuit at the Crankshaft Position Sensor harness connector.

   Is the resistance above 10K Ohms?

   Yes

   - Go To 10

   No

   - Repair the (K24) CKP Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

10. **CHECK THE (K24) CKP SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
    1. Measure the resistance of the (K24) CKP Signal circuit between the Crankshaft Position Sensor harness connector and the PCM C2 harness connector.

       Is the resistance below 5.0 Ohms?

       Yes

       - Go To 11

       No

       - Repair the (K24) CKP Signal circuit for an open circuit or high resistance.
       - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

11. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Crankshaft Position Sensor and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.

3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the CKP Sensor and Powertrain Control Module connectors.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.

NOTE: Due to the fact that this DTC is set by an intermittent loss of the signal, the most likely cause is a poor connection at the Crank Sensor or PCM terminals, or a poor signal between the Crank Sensor and target wheel. Because of this, unplugging and reconnecting the harness connectors, or repositioning the Crank Sensor will often repair the condition that set the DTC.

Were any problems found?

Yes

- Perform the appropriate repair.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0341-CAMSHAFT POSITION SENSOR PERFORMANCE - BANK 1 SENSOR 1

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article .

Fig. 34: Camshaft & Crankshaft Position Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine cranking or running. Engine speed above 50 RPM. No Sensor Supply DTCs present.

SET CONDITION

The Powertrain Control Module (PCM) does not receive a signal from the

Camshaft Position Sensor (CMP) when the Crankshaft Position Sensor indicates engine RPM.

POSSIBLE CAUSES

Possible Causes
(K844) CMP 5-VOLT SUPPLY CIRCUIT INTERMITTENTLY OPEN/SHORTED TO GROUND/SHORTED TO VOLTAGE
(K44) CMP SIGNAL CIRCUIT INTERMITTENTLY OPEN/SHORTED TO GROUND/SHORTED TO VOLTAGE
(K900) CMP GROUND CIRCUIT INTERMITTENTLY OPEN/SHORTED TO VOLTAGE
DAMAGED CMP SENSOR OR CAMSHAFT
CAMSHAFT POSITION (CMP) SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK THE WIRING HARNESS**

NOTE: If DTC P0697-SENSOR REFERENCE VOLTAGE 3 is present, perform the diagnostic procedure for that test before proceeding.

NOTE: The Timing Belt/Chain must be correctly installed and operational before diagnosis can be made. Refer to the Service Information to ensure the timing belt is properly installed.

1. Turn the ignition on.
2. With the scan tool, erase the PCM DTCs.
3. Start the engine.
4. While observing the scan tool, wiggle test the wiring harness and connectors.

Does the scan tool display this DTC?

Yes

- Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the CMP Sensor and the Powertrain Control Module for an intermittent open, short to ground, or short to voltage. If no problems are found, Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE CAMSHAFT AND CMP SENSOR**
   1. Turn the ignition of.
   2. Remove the CMP Sensor.
   3. Inspect the CMP Sensor for conditions such as loose mounting screws, debris, or cracks.
   4. Inspect the camshaft for conditions such as damage, debris or cracked teeth.

   Is there any evidence of these conditions?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Replace the Camshaft Position Sensor.
   2. With the scan tool, erase the PCM DTCs.
   3. Start the engine.
   4. While observing the scan tool, wiggle test the wiring harness and

connectors.

Does the scan tool display this DTC?

Yes

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Test complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0344-CAMSHAFT POSITION SENSOR INTERMITTENT - BANK 1 SENSOR 1

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 35: Camshaft & Crankshaft Position Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine cranking or running.

SET CONDITION

The Powertrain Control Module (PCM) does not receive a signal from the Camshaft Position Sensor (CMP) when the Crankshaft Position Sensor indicates engine RPM.

POSSIBLE CAUSES

Possible Causes
(K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K44) CMP SENSOR SIGNAL CIRCUIT OPEN
(K44) CMP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K844) CMP 5-VOLT SUPPLY CIRCUIT OPEN
(K844) CMP 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K900) CMP SENSOR GROUND CIRCUIT OPEN
(K844) CMP 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K944) CMP SENSOR GROUND CIRCUIT
(K44) CMP SENSOR SIGNAL CIRCUIT SHORTED TO THE (K944) CMP SENSOR GROUND CIRCUIT
DAMAGED CMP SENSOR OR CAMSHAFT
CAMSHAFT POSITION (CMP) SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

NOTE: If DTC P0697-SENSOR REFERENCE VOLTAGE 3 is present, perform the diagnostic procedure for that test before proceeding.

NOTE: The Timing Belt/Chain must be correctly installed and operational before diagnosis can be made. Refer to the Service Information to ensure the timing belt is properly installed.

1. Turn the ignition on.
2. With the scan tool, erase the PCM DTCs.
3. Start or crank the engine for at least seven seconds.

4. With the scan tool, read the PCM DTCs.

   Does the scan tool display this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECKING THE (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the CMP Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (K844) CMP Sensor 5-Volt Supply circuit at the CMP Sensor harness connector.

   NOTE: The (K844) CMP Sensor 5-Volt Supply circuit should read 5.0 Volts +/-.05 of a Volt with the connector disconnected and the ignition on.

   Is the voltage measuring 5.0 Volts?

   Voltage is above 5.0 Volts:

   - Repair the (K844) CMP 5-Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   Voltage is below 5.0 Volts:

   - Repair the (K844) CMP 5-Volt Supply circuit for an open circuit or short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L

DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

Voltage measurement is 5.0 Volts:

- Go To 3

3. **CHECK THE (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.
   3. Remove the Main Relay.
   4. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay connector.
   5. Turn the ignition on.
   6. Measure the voltage of the (K44) CMP Position Sensor Signal circuit at the CMP Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K44) Camshaft Position Sensor Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4

4. **CHECK THE (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**

   NOTE: Remove the jumper and reinstall the Main Relay.

   1. Turn the ignition off.
   2. Measure the resistance of the (K44) CMP Sensor Signal circuit between the CMP Sensor harness connector and the PCM C1 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 5

No

- Repair the (K44) CMP Sensor Signal circuit for an open
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE (K900) CAMSHAFT POSITION SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K900) CMP Sensor Ground circuit between the CMP Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (K900) CMP Sensor Ground circuit for an open.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
6. **CHECK THE (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (K44) CMP Sensor Signal circuit at the CMP Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 7

No

- Repair the (K44) CMP Sensor Signal circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **CHECK FOR THE (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO THE (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (K44) CMP Sensor Signal circuit and the (K944) CMP Sensor Ground circuit at the CMP Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 8

      No

      - Repair the (K44) CMP Sensor Signal circuit and the (K944) CMP Sensor Ground circuit for a short together.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

8. **CHECK FOR THE (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (K844) CMP Sensor 5-Volt Supply circuit and the (K944) CMP Sensor Ground circuit at the CMP Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 9

No

- Repair the (K844) CMP Sensor 5-Volt Supply Circuit and (K944) CMP Sensor Ground circuits for a short together.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

9. **CHECK FOR A DAMAGED CAMSHAFT POSITION SENSOR OR CAMSHAFT**
   1. Remove the CMP Sensor.
   2. Inspect the CMP Sensor for conditions such as loose mounting screws, debris, or cracks.
   3. Inspect the camshaft for conditions such as damage, debris or cracked teeth.

   Is there any evidence of these conditions?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 10

10. **POWERTRAIN CONTROL MODULE**
    1. Replace the Camshaft Position Sensor in accordance with the Service Information.
    2. Reconnect the CMP Sensor harness connector.
    3. Reconnect the PCM C1 harness connector.
    4. Turn the ignition on.
    5. With the scan tool, erase the PCM DTCs.
    6. Start or crank the engine for at least seven seconds.
    7. With the scan tool, read the PCM DTCs.

    Does the scan tool display this DTC?

Yes

- Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the CMP Sensor and the Powertrain Control Module. If no problems are found, replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Test complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0400-EGR SYSTEM FLOW MALFUNCTION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) actuates the EGR Valve via the Pulse Width Modulated (PWM) control circuits. The EGR Airflow Control Valve is actuated to control the air volume and the mixing ratio of the charge air and the recirculated exhaust gases to the Intake Manifold. This is accomplished by creating a vacuum which draws the recirculated exhaust gases into the manifold. The EGR Position Sensor is integrated into the EGR Valve, and is not serviceable separately. The EGR Position Sensor functions as a typical three wire 5-Volt sensor. The PCM receives feedback as to the position of the valve from the position sensor via the signal wire.

WHEN MONITORED

With the engine running, EGR Valve activated, EGR Cooler Bypass off, and DPF regeneration is not active.

SET CONDITION

The Powertrain Control Module (PCM) detects that the EGR flow rate is not within a calibrated range.

POSSIBLE CAUSES

Possible Causes
HIGH RESISTANCE IN THE (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT
HIGH RESISTANCE IN THE (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT
LEAK OR RESTRICTION IN THE INTAKE AIR SYSTEM OR EXHAUST SYSTEM
EGR VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, view and record the Freeze Frame Data in the Powertrain Control Module.
    3. With the scan tool, clear DTCs in the Powertrain Control Module.
    4. Start the engine and test drive the vehicle. Attempt to duplicate the conditions recorded in the Freeze Frame Data.
    5. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK FOR HIGH RESISTANCE IN THE (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Mass Air Flow Sensor harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Measure the resistance of the (K157) Mass Air Flow Sensor Signal circuit between the Mass Air Flow Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 3

      No

      - Repair the (K157) Mass Air Flow Sensor Signal circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK FOR HIGH RESISTANCE IN THE (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT**
   1. Measure the resistance of the (K37) Boost Pressure Sensor Signal circuit between the Mass Air Flow Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K157) Boost Pressure Sensor Signal circuit for an open

or high resistance.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK FOR INTAKE AND EXHAUST SYSTEM LEAKS OR RESTRICTIONS**
   1. Inspect the exhaust system for damaged components that could cause exhaust flow blockage.
   2. Inspect all air intake, crankcase vent and turbocharger related hoses/tubes and connections for damage, air leaks or blockage.
   3. Inspect the air filter for excessive dirt, soiling or other problems that may cause restricted air flow.

   Were any problems found?

   Yes

   - Repair or replace as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 5

5. **EGR VALVE ASSEMBLY**
   1. Turn the ignition off.
   2. Reconnect the Powertrain Control Module C1 harness connector.
   3. Replace the EGR Valve Assembly in accordance with the service information.
   4. Ignition on, engine not running.
   5. With the scan tool, clear DTCs in the Powertrain Control Module.
   6. Start the engine and test drive the vehicle. Attempt to duplicate the conditions recorded in the Freeze Frame Data.
   7. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

Yes

- Go To 6

No

- Test complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Valve Assembly and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L

DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0403-EGR CONTROL CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

THEORY OF OPERATION

The Powertrain Control Module (PCM) actuates the EGR Valve via the Pulse Width Modulated (PWM) control circuits. The EGR Airflow Control Valve is actuated to control the air volume and the mixing ratio of the charge air and the recirculated exhaust gases to the Intake Manifold. This is accomplished by creating a vacuum which draws the recirculated exhaust gases into the manifold. The EGR Position Sensor is integrated into the EGR Valve, and is not serviceable separately. The EGR Position Sensor functions as a typical three wire 5-Volt sensor. The PCM receives feedback as to the position of the valve from the position sensor via the signal wire.

WHEN MONITORED

With the ignition on and the EGR Solenoid command off.

SET CONDITION

The Powertrain Control Module (PCM) does not detect voltage on either the EGR Valve Control circuit for 2.0 seconds.

POSSIBLE CAUSES

Possible Causes
(K682) EGR VALVE CONTROL (+) CIRCUIT OPEN OR HIGH RESISTANCE
(K684) EGR VALVE CONTROL (-) CIRCUIT OPEN OR HIGH RESISTANCE
EGR VALVE ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING

PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine and test drive the vehicle.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K682) EGR VALVE CONTROL (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Disconnect the EGR Valve Assembly harness connector.
   2. Disconnect the Powertrain Control Module C1 harness connector.
   3. Measure the resistance of the (K682) EGR Valve Control (+) circuit between the EGR Valve Assembly harness connector and the Powertrain Control Module C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K682) EGR Valve Control (+) circuit for an open circuit or high resistance.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K684) EGR VALVE CONTROL (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K684) EGR Valve Control (-) circuit between the EGR Valve Assembly harness connector and the Powertrain Control Module C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K684) EGR Valve Control (-) circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **EGR VALVE ASSEMBLY**
   1. Turn the ignition off.
   2. Reconnect the Powertrain Control Module C1 harness connector.
   3. Replace the EGR Valve Assembly in accordance with the service information.
   4. Ignition on, engine not running.
   5. With the scan tool, clear DTCs in the Powertrain Control Module.
   6. Start the engine and test drive the vehicle.
   7. Monitor the scan tool for at least two minutes.
   8. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

- Go To 5

No

- Test complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Valve Assembly and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0404-EGR POSITION SENSOR PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) actuates the EGR Valve via the Pulse Width Modulated (PWM) control circuits. The EGR Airflow Control Valve is actuated to control the air volume and the mixing ratio of the charge air and the recirculated exhaust gases to the Intake Manifold. This is accomplished by creating a vacuum which draws the recirculated exhaust gases into the manifold. The EGR Position Sensor is integrated into the EGR Valve, and is not serviceable separately. The EGR Position Sensor functions as a typical three wire 5-Volt sensor. The PCM receives feedback as to the position of the valve from the position sensor via the signal wire.

WHEN MONITORED

With the engine running and the EGR Valve Control commanded on.

SET CONDITION

The Powertrain Control Module (PCM) detects an implausible voltage on the EGR Control circuit for 0.5 seconds.

POSSIBLE CAUSES

Possible Causes
(K682) EGR CONTROL (+) CIRCUIT SHORTED TO VOLTAGE
(K684) EGR CONTROL (-) CIRCUIT SHORTED TO VOLTAGE
(K682) EGR CONTROL (+) CIRCUIT SHORTED TO GROUND
(K684) EGR CONTROL (-) CIRCUIT SHORTED TO GROUND
(K682) EGR CONTROL (+) CIRCUIT OPEN OR HIGH RESISTANCE
(K684) EGR CONTROL (-) CIRCUIT OPEN OR HIGH RESISTANCE
EGR VALVE ASSEMBLY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.

2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Start the engine and test drive the vehicle.
4. Monitor the scan tool for at least two minutes.
5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K682) EGR CONTROL (+) CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the EGR Valve Assembly harness connector.
   3. Disconnect the Powertrain Control Module C1 harness connector.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K682) EGR Control (+) circuit in the EGR Valve Assembly harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K682) EGR Control (+) circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Go To 3

3. **CHECK THE (K684) EGR CONTROL (-) CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Measure the voltage of the (K684) EGR Control (-) circuit in the EGR Valve Assembly harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K684) EGR Control (-) circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 4

4. **CHECK THE (K682) EGR CONTROL (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between ground and the (K682) EGR Control (+) circuit in the EGR Valve Assembly harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K682) EGR Control (+) circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE (K684) EGR CONTROL (-) CIRCUIT FOR A SHORT TO GROUND**

1. Measure the resistance between ground and the (K684) EGR Control (-) circuit in the EGR Valve Assembly harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the (K684) EGR Control (-) circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **CHECK THE (K682) EGR CONTROL (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K682) EGR Control (+) circuit between the EGR Valve Assembly harness connector and the Powertrain Control Module C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

      - Repair the (K682) EGR Control (+) circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **CHECK THE (K684) EGR CONTROL (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K684) EGR Control (-) circuit between the EGR Valve Assembly harness connector and the Powertrain Control Module C1 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 8

No

- Repair the (K684) EGR Control (-) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

8. **EGR VALVE ASSEMBLY**
   1. Turn the ignition off.
   2. Connect the Powertrain Control Module C1 harness connector.
   3. Replace the EGR Valve Assembly in accordance with the service information.
   4. Ignition on, engine not running.
   5. With the scan tool, Clear DTCs in the Powertrain Control Module.
   6. Start the engine and test drive the vehicle.
   7. Monitor the scan tool for at least two minutes.
   8. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 9

   No

   - Test complete.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
9. **POWERTRAIN CONTROL MODULE**

1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Valve Assembly and the Powertrain Control Module.
2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0426-CATALYST TEMPERATURE SENSOR CIRCUIT PERFORMANCE - BANK 1 SENSOR 1

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) monitors the exhaust gas temperatures in the aftertreatment system by receiving feedback from the Exhaust Gas

Temperature (EGT) Sensors. The Exhaust Gas Temperature Sensors function as typical two wire 5-Volt sensor. The PCM uses this information to monitor the temperatures during normal engine operation as well as during regeneration of the Diesel Particulate Filter (DPF) so as not to cause any damage to the exhaust aftertreatment system components.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (K372) Exhaust Gas Temperature Sensor 2 Signal circuit is implausible.

POSSIBLE CAUSES

Possible Causes
HIGH RESISTANCE IN THE (K372) EXHAUST GAS TEMPERATURE SENSOR 2 SIGNAL CIRCUIT
HIGH RESISTANCE IN THE (K951) SENSOR GROUND CIRCUIT
EXHAUST GAS TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, Clear DTCs in the PCM.
    3. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
    4. Start the engine.
    5. Allow the engine to reach normal operating temperature.
    6. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK FOR HIGH RESISTANCE IN THE (K372) EXHAUST GAS TEMPERATURE SENSOR 2 SIGNAL CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Exhaust Gas Temperature Sensor harness connector.
   3. Disconnect the PCM C2 harness connector.
   4. Measure the resistance of the (K372) Exhaust Gas Temperature Sensor 2 Signal circuit between the Exhaust Gas Temperature Sensor harness connector and the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K372) Exhaust Gas Temperature Sensor 2 Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK FOR HIGH RESISTANCE IN THE (K951) SENSOR GROUND CIRCUIT**
   1. Measure the resistance of the (K951) Sensor Ground circuit between the Exhaust Gas Temperature Sensor harness connector and the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

- Go To 4

No

- Repair the (K951) Sensor Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE EXHAUST GAS TEMPERATURE SENSOR**
   1. Reconnect the Exhaust Gas Temperature Sensor harness connector.
   2. Reconnect the PCM C2 harness connector.
   3. With the scan tool, Clear DTCs in the PCM.
   4. Disconnect the Exhaust Gas Temperature Sensor harness connector.
   5. Connect a jumper between the (K372) Exhaust Gas Temperature Sensor 2 Signal circuit and the (K951) Sensor Ground circuit at the Exhaust Gas Temperature Sensor harness connector.

      NOTE: Be careful not to spread the terminals in the connector.

   6. Turn the ignition on.
   7. With the scan tool, view DTCs.

      NOTE: The scan tool should display a P0427-CATALYST TEMPERATURE SENSOR CIRCUIT LOW DTC with the jumper in place.

   Does the scan tool should display the P0427-CATALYST TEMPERATURE SENSOR CIRCUIT LOW DTC as active?

   Yes

   - Replace the Exhaust Gas Temperature Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors at the Exhaust Gas Temperature Sensor and the Powertrain Control Module.
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
      - Look for the data to change or for the DTC to reset during the wiggle test.
      - Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0427-CATALYST TEMPERATURE SENSOR CIRCUIT LOW - BANK 1 SENSOR 1

For a complete wiring diagram **refer to appropriate SYSTEM WIRING**

DIAGRAMS article

THEORY OF OPERATION

The Powertrain Control Module (PCM) monitors the exhaust gas temperatures in the aftertreatment system by receiving feedback from the Exhaust Gas Temperature (EGT) Sensors. The Exhaust Gas Temperature Sensors function as typical two wire 5-Volt sensor. The PCM uses this information to monitor the temperatures during normal engine operation as well as during regeneration of the Diesel Particulate Filter (DPF) so as not to cause any damage to the exhaust aftertreatment system components.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K372) Exhaust Gas Temperature Sensor 2 Signal circuit is below 0.2 Volts for two seconds.

POSSIBLE CAUSES

Possible Causes
(K372) EXHAUST GAS TEMPERATURE SENSOR 2 SIGNAL CIRCUIT SHORTED TO GROUND
(K372) EXHAUST GAS TEMPERATURE SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE (K951) SENSOR GROUND CIRCUIT
EXHAUST GAS TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the PCM.
    3. Cycle the ignition key off and on several times, leaving the ignition on

for at least 10 seconds at a time.

4. Start the engine.
5. Allow the engine to reach normal operating temperature.
6. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K372) EXHAUST GAS TEMPERATURE SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Exhaust Gas Temperature Sensor harness connector.
   2. Disconnect the PCM C2 harness connector.
   3. Measure the resistance between ground and the (K372) Exhaust Gas Temperature Sensor 2 Signal circuit at the Exhaust Gas Temperature Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K372) Exhaust Gas Temperature Sensor 2 Signal circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK FOR THE (K372) EXHAUST GAS TEMPERATURE SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE (K951) SENSOR GROUND CIRCUIT**

1. Measure the resistance between the (K372) Exhaust Gas Temperature Sensor 2 Signal circuit and the (K951) Sensor Ground circuit at the Exhaust Gas Temperature Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the short between the (K372) Exhaust Gas Temperature Sensor 2 Signal circuit and the (K951) Sensor Ground circuit.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE EXHAUST GAS TEMPERATURE SENSOR**
   1. Reconnect the Exhaust Gas Temperature Sensor harness connector.
   2. Reconnect the PCM C2 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, Clear DTCs in the PCM.
   5. Turn the ignition off.
   6. Disconnect the Exhaust Gas Temperature Sensor harness connector.
   7. Turn the ignition on.
   8. With the scan tool, view DTCs.

   NOTE: The scan tool should display the P0428-CATALYST TEMPERATURE SENSOR CIRCUIT HIGH DTC with the connector disconnected.

   Does the scan tool should display P0428-CATALYST TEMPERATURE SENSOR CIRCUIT HIGH DTC as active?

   Yes

   - Replace the Exhaust Gas Temperature Sensor in accordance with the service information.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors at the Exhaust Gas Temperature Sensor and the Powertrain Control Module.
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
      - Look for the data to change or for the DTC to reset during the wiggle test.
      - Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0428-CATALYST TEMPERATURE SENSOR CIRCUIT HIGH - BANK 1 SENSOR 1

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) monitors the exhaust gas temperatures in the aftertreatment system by receiving feedback from the Exhaust Gas Temperature (EGT) Sensors. The Exhaust Gas Temperature Sensors function as typical two wire 5-Volt sensor. The PCM uses this information to monitor the temperatures during normal engine operation as well as during regeneration of the Diesel Particulate Filter (DPF) so as not to cause any damage to the exhaust aftertreatment system components.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K372) Exhaust Gas Temperature Sensor 2 Signal circuit is above 4.8 Volts for two seconds.

POSSIBLE CAUSES

Possible Causes
(K372) EXHAUST GAS TEMPERATURE SENSOR 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K372) EXHAUST GAS TEMPERATURE SENSOR 2 SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K951) SENSOR GROUND CIRCUIT OPEN/HIGH RESISTANCE
EXHAUST GAS TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

1. Ignition on, engine not running.
2. With the scan tool, Clear DTCs in the PCM.
3. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
4. Start the engine.
5. Allow the engine to reach normal operating temperature.
6. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K372) EXHAUST GAS TEMPERATURE SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Exhaust Gas Temperature Sensor harness connector.
   3. Disconnect the PCM C2 harness connector.
   4. Remove the ASD Relay from the PDC.
   5. Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K372) Exhaust Gas Temperature Sensor 2 Signal circuit at the Exhaust Gas Temperature Sensor harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K372) Exhaust Gas Temperature Sensor 2 Signal circuit for a short to voltage.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE (K372) EXHAUST GAS TEMPERATURE SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Measure the resistance of the (K372) Exhaust Gas Temperature Sensor 2 Signal circuit between the Exhaust Gas Temperature Sensor harness connector and the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the (K372) Exhaust Gas Temperature Sensor 2 Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK THE (K951) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K951) Sensor Ground circuit between the Exhaust Gas Temperature Sensor harness connector and the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

No

- Repair the (K951) Sensor Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE EXHAUST GAS TEMPERATURE SENSOR**
   1. Reconnect the Exhaust Gas Temperature Sensor harness connector.
   2. Reconnect the PCM C2 harness connector.
   3. With the scan tool, Clear DTCs in the PCM.
   4. Disconnect the Exhaust Gas Temperature Sensor harness connector.
   5. Connect a jumper between the (K372) Exhaust Gas Temperature Sensor 2 Signal circuit and the (K951) Sensor Ground circuit at the Exhaust Gas Temperature Sensor harness connector.

      NOTE: Be careful not to spread the terminals in the connector.

   6. Turn the ignition on.
   7. With the scan tool, view DTCs.

      NOTE: The scan tool should display a P0427-CATALYST TEMPERATURE SENSOR CIRCUIT LOW DTC with the jumper in place.

   Does the scan tool should display the P0427-CATALYST TEMPERATURE SENSOR CIRCUIT LOW DTC as active?

   Yes

   - Replace the Exhaust Gas Temperature Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

- Go To 6

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors at the Exhaust Gas Temperature Sensor and the Powertrain Control Module.
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
      - Look for the data to change or for the DTC to reset during the wiggle test.
      - Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P042F-EXHAUST GAS RECIRCULATION CONTROL STUCK CLOSED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) actuates the EGR Valve via the Pulse Width Modulated (PWM) control circuits. The EGR Airflow Control Valve is actuated to control the air volume and the mixing ratio of the charge air and the recirculated exhaust gases to the Intake Manifold. This is accomplished by creating a vacuum which draws the recirculated exhaust gases into the manifold. The EGR Position Sensor is integrated into the EGR Valve, and is not serviceable separately. The EGR Position Sensor functions as a typical three wire 5-Volt sensor. The PCM receives feedback as to the position of the valve from the position sensor via the signal wire.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the EGR Valve Control circuit is not within a calibrated range.

POSSIBLE CAUSES

Possible Causes
(K852) ACCELERATOR PEDAL POSITION SENSOR 1 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K350) FUEL RAIL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K682) EGR VALVE CONTROL (+) CIRCUIT SHORTED TO VOLTAGE
(K684) EGR VALVE CONTROL (-) CIRCUIT SHORTED TO VOLTAGE
(K682) EGR VALVE CONTROL (+) CIRCUIT OPEN/HIGH RESISTANCE
(K684) EGR CONTROL (-) CIRCUIT OPEN/HIGH RESISTANCE
(K682) EGR VALVE CONTROL (+) CIRCUIT SHORTED TO GROUND
(K684) EGR VALVE CONTROL (-) CIRCUIT SHORTED TO GROUND
EGR VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING

PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: If there are any 5-Volt Reference DTCs present, repair those DTCs before proceeding with this test procedure.

   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine and test drive the vehicle.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K684) EGR CONTROL (-) CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the EGR Valve Assembly harness connector.
   3. Disconnect the Powertrain Control Module C1 harness connector.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K684) EGR Control (-) circuit in the EGR Valve Assembly harness connector.

Is there any voltage present?

Yes

- Repair the (K684) EGR Control (-) circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE (K682) EGR CONTROL (+) CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Measure the voltage of the (K682) EGR Control (+) circuit in the EGR Valve Assembly harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K682) EGR Control (+) circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4

4. **CHECK THE (K684) EGR CONTROL (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Remove the jumper wire.
   3. Measure the resistance of the (K684) EGR Control (-) circuit between the EGR Valve Assembly harness connector and the Powertrain Control Module C1 harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 5

No

- Repair the (K684) EGR Control (-) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE (K682) EGR CONTROL (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K682) EGR Control (+) circuit between the EGR Valve Assembly harness connector and the Powertrain Control Module C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (K682) EGR Control (+) circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **CHECK THE (K684) EGR CONTROL (-) CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between ground and the (K684) EGR Control (-) circuit at the EGR Valve Assembly harness connector.

      Is the resistance above 10k Ohms?

      Yes

- Go To 7

No

- Repair the (K684) EGR Control (-) circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **CHECK THE (K682) EGR CONTROL (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (K682) EGR Control (+) circuit at the EGR Valve Assembly harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 8

      No

      - Repair the (K682) EGR Control (+) circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
8. **EGR VALVE ASSEMBLY**
   1. Turn the ignition off.
   2. Reconnect the Powertrain Control Module C1 harness connector.
   3. Replace the EGR Valve Assembly in accordance with the service information.
   4. Ignition on, engine not running.
   5. With the scan tool, Clear DTCs in the Powertrain Control Module.
   6. Start the engine and test drive the vehicle.
   7. Monitor the scan tool for at least two minutes.
   8. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

Yes

- Go To 9

No

- Test complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

9. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Valve Assembly and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L

DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

2014 ENGINE PERFORMANCE

Powertrain Control Module (PCM) - Electrical Diagnostics, 2.2L Diesel - Compass & Patriot

DIAGNOSIS AND TESTING

P0461-FUEL LEVEL SENSOR 1 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an implausible fuel level signal over the CAN BUS from the Cluster for 3.2 seconds.

POSSIBLE CAUSES

Possible Causes
(N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(Z210) FUEL LEVEL SENSOR GROUND CIRCUIT OPEN/HIGH RESISTANCE
FUEL LEVEL SENSOR
CLUSTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.

2. With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).
3. Monitor the scan tool for at least two minutes.
4. With the scan tool, select View DTCs.

   Is the status active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Fuel Pump Module Assembly harness connector.
   3. Disconnect the Cluster C2 harness connector.
   4. Remove the ASD Relay from the PDC.
   5. Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (N4) Fuel Level Sensor Signal circuit at the Fuel Pump Module Assembly harness connector.

      Is there any voltage present?

      Yes

      - Repair the (N4) Fuel Level Sensor Signal circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Go To 3

3. **CHECK THE (N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Cluster C2 harness connector.
   3. Measure the resistance between ground and the (N4) Fuel Level Sensor Signal circuit at the Fuel Pump Module Assembly harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the (N4) Fuel Level Sensor Signal circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE (N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (N4) Fuel Level Sensor Signal circuit between the Fuel Pump Module Assembly harness connector and the Cluster C2 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (N4) Fuel Level Sensor Signal circuit for an open circuit or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

5. **CHECK THE (Z210) FUEL LEVEL SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (Z210) Fuel Level Sensor Ground circuit between the Fuel Pump Module Assembly harness connector and the Cluster C2 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (Z210) Fuel Level Sensor Ground circuit for an open circuit or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
6. **FUEL LEVEL SENSOR**
   1. Replace the Fuel Level Sensor in accordance with the service information.
   2. Turn the ignition on, engine not running.
   3. With the scan tool, clear DTCs in the Powertrain Control Module.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

      Did the DTC return?

      Yes

      - Replace the Cluster in accordance with the service information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Repair is complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P046C-EXHAUST GAS RECIRCULATION SENSOR 1 PERFORMANCE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) actuates the EGR Valve via the Pulse Width Modulated (PWM) control circuits. The EGR Airflow Control Valve is actuated to control the air volume and the mixing ratio of the charge air and the recirculated exhaust gases to the Intake Manifold. This is accomplished by creating a vacuum which draws the recirculated exhaust gases into the manifold. The EGR Position Sensor is integrated into the EGR Valve, and is not serviceable separately. The EGR Position Sensor functions as a typical three wire 5-Volt sensor. The PCM receives feedback as to the position of the valve from the position sensor via the signal wire.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module detects that the (K683) EGR Valve Position Sensor Signal circuit is either above 4.89 Volts or below 0.24 Volts for 0.10 seconds.

POSSIBLE CAUSES

Possible Causes
(K844) 5-VOLT SUPPLY CIRCUIT OPEN
(K844) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K844) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K854) ACCELERATOR PEDAL POSITION SENSOR 2 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K854) ACCELERATOR PEDAL POSITION SENSOR 2 5-VOLT

SUPPLY CIRCUIT SHORTED TO GROUND
(K683) EGR VALVE POSITION SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K683) EGR VALVE POSITION SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K683) EGR VALVE POSITION SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K683) EGR VALVE POSITION SENSOR SIGNAL FAILED IN RANGE
(K914) SENSOR GROUND CIRCUIT OPEN/HIGH RESISTANCE
EGR VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are any 5-Volt Reference DTCs present, diagnose those DTCs before proceeding with this test procedure.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Monitor the scan tool for at least two minutes.
4. Cycle the ignition key off for 30 seconds.
5. Turn the ignition on.
6. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K683) EGR VALVE POSITION SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the EGR Valve harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Remove the ASD/Main Relay from the PDC.
   5. Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K683) EGR Valve Position Sensor Signal circuit at the EGR Valve harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K683) EGR Valve Position Sensor Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE (K683) EGR VALVE POSITION SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between ground and the (K683) EGR Valve Position Sensor Signal circuit at the EGR Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

- Go To 4

No

- Repair the (K683) EGR Valve Position Sensor Signal circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE (K683) EGR VALVE POSITION SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Measure the resistance of the (K683) EGR Valve Position Sensor Signal circuit between the EGR Valve harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K683) EGR Valve Position Sensor Signal circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **CHECK THE (K914) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K914) Sensor Ground circuit between the EGR Valve harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

No

- Repair the (K914) Sensor Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **CHECK THE EGR VALVE ASSEMBLY**
   1. Reconnect the Powertrain Control Module C1 harness connector.
   2. Turn the ignition on.
   3. With the scan tool, actuate the EGR Positioner to 100%.
   4. Using a 12-Volt test light connected to 12 Volts, check both the (K682) EGR Control (+) circuit and the (K684) EGR Control (-) circuit in the EGR Valve Assembly harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuits will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

Is the test light illuminated and bright when checking both circuits?

Yes

- Replace the EGR Valve Assembly in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 7

7. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and

connectors between the EGR Valve and the Powertrain Control Module.

- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals.
- Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
- Look for the data to change or for the DTC to reset during the wiggle test.
- Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0471-EXHAUST PRESSURE SENSOR 1 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Boost, Exhaust & Exhaust Diff Pressure Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Exhaust Gas Pressure Sensor is located at the left rear on the EGR pipe and functions as a typical three wire sensor. The Powertrain Control Module (PCM) monitors the exhaust back pressure information from the Exhaust Gas Pressure Sensor at the sensor signal circuit. The information is used to protect the engine and Turbocharger assembly.

WHEN MONITORED

With the ignition on, or with engine running under a low load.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Exhaust Gas Pressure Sensor Signal is implausible.

POSSIBLE CAUSES

Possible Causes
HIGH RESISTANCE IN THE (F856) 5-VOLT SUPPLY CIRCUIT
HIGH RESISTANCE IN THE (K373) EXHAUST GAS PRESSURE SENSOR SIGNAL CIRCUIT
HIGH RESISTANCE IN THE (K915) SENSOR GROUND CIRCUIT
LEAKING OR RESTRICTED EXHAUST DIFFERENTIAL PRESSURE SENSOR HOSES OR TUBES
EXHAUST PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If P0641-SENSOR REFERENCE VOLTAGE 1 is present, perform the diagnostics for P0641 to repair the (F856) 5-Volt Supply circuit for an open or short to ground before proceeding with this test procedure.

1. Ignition on, engine not running.
2. With the scan tool, Clear DTCs in the PCM.
3. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
4. Start the engine.
5. Allow the engine to reach normal operating temperature.
6. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK FOR HIGH RESISTANCE IN THE (K373) EXHAUST GAS PRESSURE SENSOR SIGNAL CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Exhaust Gas Pressure Sensor harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Measure the resistance of the (K373) Exhaust Gas Pressure Sensor Signal circuit between the Exhaust Gas Pressure Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K373) Exhaust Gas Pressure Sensor Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK FOR HIGH RESISTANCE IN THE (K915) SENSOR GROUND CIRCUIT**
   1. Measure the resistance of the (K915) Sensor Ground circuit between the Exhaust Gas Pressure Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

No

- Repair the (K915) Sensor Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **EXHAUST GAS PRESSURE SENSOR**
   1. Turn the ignition off.
   2. Reconnect the Exhaust Gas Pressure Sensor harness connector.
   3. Reconnect the PCM C1 harness connector.
   4. Turn the ignition on.
   5. With the scan tool, Clear DTCs.
   6. Turn the ignition off.
   7. Disconnect the Exhaust Gas Pressure Sensor harness connector.
   8. Connect a jumper wire between the (K373) Exhaust Gas Pressure Sensor Signal circuit and the (K915) Sensor Ground circuit in the Exhaust Gas Pressure Sensor harness connector.
   9. Turn the ignition on.
   10. With the scan tool, Clear DTCs.
   11. With the scan tool, select View DTCs.

NOTE: The scan tool should display the P0472-EXHAUST GAS PRESSURE SENSOR LOW DTC with the jumper in place.

Does the scan tool display P0472-EXHAUST GAS PRESSURE SENSOR LOW DTC as active?

Yes

- Replace the Exhaust Gas Pressure Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors at the Exhaust Gas Pressure Sensor and the Powertrain Control Module.
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
      - Look for the data to change or for the DTC to reset during the wiggle test.
      - Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0472-EXHAUST PRESSURE SENSOR 1 LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Boost, Exhaust & Exhaust Diff Pressure Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Exhaust Gas Pressure Sensor is located at the left rear on the EGR pipe and functions as a typical three wire sensor. The Powertrain Control Module (PCM) monitors the exhaust back pressure information from the Exhaust Gas Pressure Sensor at the sensor signal circuit. The information is used to protect the engine and Turbocharger assembly.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K373) Exhaust Gas Pressure Sensor Signal circuit is below 0.2 Volts for 0.20 seconds.

POSSIBLE CAUSES

Possible Causes
(F856) 5-VOLT SUPPLY 2 CIRCUIT OPEN/HIGH RESISTANCE
(F856) 5-VOLT SUPPLY 2 CIRCUIT SHORTED TO GROUND
(K354) 5-VOLT SUPPLY 1 CIRCUIT SHORTED TO GROUND
(K373) EXHAUST GAS PRESSURE SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(K373) EXHAUST GAS PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K373) EXHAUST GAS PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (K915) SENSOR GROUND CIRCUIT
EXHAUST PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: Repair any SENSOR REFERENCE VOLTAGE DTCs that are present before proceeding with this test procedure.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the PCM.
3. Cycle the ignition key off and on several times, leaving the ignition on.
4. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K373) EXHAUST GAS PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Exhaust Gas Pressure Sensor harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Measure the resistance of the (K373) Exhaust Gas Pressure Sensor Signal circuit between the Exhaust Gas Pressure Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K373) Exhaust Gas Pressure Sensor Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K373) EXHAUST GAS PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (K373) Exhaust Gas Pressure Sensor Signal circuit at the Exhaust Gas Pressure Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

No

- Repair the (K373) Exhaust Gas Pressure Sensor Signal circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK FOR THE (K373) EXHAUST GAS PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (K915) SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (K373) Exhaust Gas Pressure Sensor Signal circuit and the (K915) Sensor Ground circuit at the Exhaust Gas Pressure Sensor harness connector.

      Is the resistance below 10k Ohms?

      Yes

      - Go To 5

      No

      - Repair the short between the (K373) Exhaust Gas Pressure Sensor Signal circuit and the (K915) Sensor Ground circuit.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **EXHAUST GAS PRESSURE SENSOR**
   1. Turn the ignition off.
   2. Reconnect the Exhaust Gas Pressure Sensor harness connector.
   3. Reconnect the PCM C1 harness connector.
   4. Turn the ignition on.
   5. With the scan tool, clear DTCs.
   6. Turn the ignition off.
   7. Disconnect the Exhaust Gas Pressure Sensor harness connector.
   8. Turn the ignition on.
   9. With the scan tool, select View DTCs.

NOTE: The scan tool should display the P0472-EXHAUST GAS PRESSURE SENSOR HIGH DTC with the connector disconnected.

Does the scan tool display P0473-EXHAUST GAS PRESSURE SENSOR HIGH DTC as active?

Yes

- Replace the Exhaust Gas Pressure Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors at the Exhaust Gas Pressure Sensor and the Powertrain Control Module.
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
      - Look for the data to change or for the DTC to reset during the wiggle test.
      - Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0473-EXHAUST PRESSURE SENSOR 1 HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Boost, Exhaust & Exhaust Diff Pressure Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Exhaust Gas Pressure Sensor is located at the left rear on the EGR pipe and functions as a typical three wire sensor. The Powertrain Control Module (PCM) monitors the exhaust back pressure information from the Exhaust Gas Pressure Sensor at the sensor signal circuit. The information is used to protect the engine and Turbocharger assembly.

WHEN MONITORED

With the ignition on.

SET CONDITION

The (K373) Exhaust Gas Pressure Sensor Signal circuit is above 4.8 Volts for 0.20 seconds.

POSSIBLE CAUSES

Possible Causes
(F856) 5-VOLT SUPPLY 2 CIRCUIT SHORTED TO VOLTAGE
(K354) 5-VOLT SUPPLY 1 CIRCUIT SHORTED TO VOLTAGE
(K373) EXHAUST GAS PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K915) SENSOR GROUND CIRCUIT OPEN/HIGH RESISTANCE
EXHAUST PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: Repair any SENSOR REFERENCE VOLTAGE DTCs that are present before proceeding with this test

procedure.

1. Ignition on, engine not running.
2. With the scan tool, Clear DTCs in the PCM.
3. Cycle the ignition key off and on several times, leaving the ignition on.
4. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K373) EXHAUST GAS PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Exhaust Gas Pressure Sensor harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Remove the ASD/Main Relay from the PDC.
   5. Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K373) Exhaust Gas Pressure Sensor Signal circuit at the Exhaust Gas Pressure Sensor harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K373) Exhaust Gas Pressure Sensor Signal circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

No

- Go To 3

3. **CHECK THE (K915) SENSOR GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Remove the jumper wire and reinstall the ASD/Main Relay.
   3. Measure the resistance of the (K915) Sensor Ground circuit between the Exhaust Gas Pressure Sensor harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the (K915) Sensor Ground circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE EXHAUST GAS PRESSURE SENSOR**
   1. Reconnect the Exhaust Gas Pressure Sensor harness connector.
   2. Reconnect the PCM C1 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, Clear DTCs.
   5. Turn the ignition off.
   6. Disconnect the Exhaust Gas Pressure Sensor harness connector.
   7. Connect a jumper between the (K373) Exhaust Gas Pressure Sensor Signal circuit and the (K915) Sensor Ground circuit in the Exhaust Gas Pressure Sensor harness connector.

NOTE: Be careful not to spread the terminals in the connector.

8. Turn the ignition on.
9. With the scan tool, select View DTCs.

NOTE: The scan tool should display the P0472-EXHAUST GAS PRESSURE SENSOR LOW DTC with the jumper in place.

Does the scan tool display P0472-EXHAUST GAS PRESSURE SENSOR LOW DTC as active?

Yes

- Replace the Exhaust Gas Pressure Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors at the Exhaust Gas Pressure Sensor and the Powertrain Control Module.
      - Look for any chafed, pierced, pinched, or partially broken wires.
      - Look for broken, bent, pushed out or corroded terminals.
      - Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
      - Look for the data to change or for the DTC to reset during the wiggle test.
      - Perform any Technical Service Bulletins that may apply.

   Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0483-FAN PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on. Battery voltage greater than 10.0 Volts.

SET CONDITION

The Powertrain Control Module (PCM) receives a CAN Bus message from the Totally Integrated Power Module (TIPM) indicating an open or shorted circuit on the Radiator Fan Medium/High Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
FUSED B+ CIRCUITS
(N112) RADIATOR FAN RELAY CONTROL CIRCUIT OPEN
(N112) RADIATOR FAN RELAY CONTROL CIRCUIT SHORTED TO GROUND
RADIATOR FAN MEDIUM/HIGH RELAY
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **RADIATOR FAN MEDIUM/HIGH RELAY OPERATION**
   1. Ignition on, engine not running.
   2. With a scan tool, select Radiator Cooling Fan Relay 2 Control State, to actuate the Radiator Fan Medium/High Relay.

      Is the Cooling Fan Relay operating?

      Yes

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

      No

      - Go To 2
2. **FUSED B+ CIRCUITS**
   1. Turn the ignition off.
   2. Remove the Radiator Medium/High Fan Relay.
   3. Turn the ignition on.
   4. Using a 12-Volt test light connected to ground, probe the (A935) and (A16) Fused B+ circuits in the Relay connection.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Go To 3
3. **RADIATOR FAN LOW/HIGH CONTROL RELAY SHORTED INTERNALLY**

1. With the test light still at the Fused B+ circuits (Radiator Medium/High Fan Relay), remove the Radiator Fan Low/High Control Relay.

   When the relay is removed, does the test light illuminate brightly?

   Yes

   - Replace the Radiator Fan Low/High Control Relay.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or short to ground in the Fused B+ circuits. Inspect the related fuse and repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (N112) RADIATOR FAN RELAY CONTROL CIRCUIT**
   1. Disconnect the TIPM C-11 harness connector.
   2. Turn the ignition on, engine not running.
   3. With a scan tool, select Radiator Cooling Fan Relay 2 Control State and then Toggle, to actuate the Radiator Fan Medium/High Relay.
   4. Using a 12-Volt test light connected to battery voltage, probe the (N112) Radiator Fan High Relay Control circuit in the TIPM C-11 harness connector.

      Does the test light illuminate and flash on and off?

      Yes

      - Replace the Radiator Fan Medium/High Relay.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (N112) RADIATOR FAN RELAY CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Measure the resistance of the (N112) Radiator Fan Relay Control circuit from the Relay connection to the TIPM C-11 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Replace the Power Distribution Center (PDC) in accordance with the service information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
6. **CHECK THE (N112) RADIATOR FAN RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (N112) Radiator Fan Relay Control circuit at the Relay connection.

      Is the resistance above 10k Ohms?

      Yes

      - Replace the Totally Integrated Power Module in accordance with the service information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 7
7. **RADIATOR FAN LOW/HIGH CONTROL RELAY SHORTED INTERNALLY**
   1. With the probe still at the (N112) Radiator Fan Control circuit, remove the Radiator Fan Low/High Control Relay.

Is the resistance above 10k Ohms?

Yes

- Replace the Radiator Fan Low/High Control Relay.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the short to ground in the (N112) Radiator Fan High Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0489-EXHAUST GAS RECIRCULATION CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) actuates the EGR Valve via the Pulse Width Modulated (PWM) control circuits. The EGR Airflow Control Valve is actuated to control the air volume and the mixing ratio of the charge air and the recirculated exhaust gases to the Intake Manifold. This is accomplished by creating a vacuum which draws the recirculated exhaust gases into the manifold. The EGR Position Sensor is integrated into the EGR Valve, and is not serviceable separately. The EGR Position Sensor functions as a typical three wire 5-Volt sensor. The PCM receives feedback as to the position of the valve from the position sensor via the signal wire.

WHEN MONITORED

With the engine running and the EGR Valve command on.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to ground in the EGR Valve Control circuit for 0.1 seconds.

POSSIBLE CAUSES

Possible Causes
(K682) EGR VALVE CONTROL (+) CIRCUIT SHORTED TO GROUND
(K684) EGR VALVE CONTROL (-) CIRCUIT SHORTED TO GROUND
EGR VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine and test drive the vehicle.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K682) EGR VALVE CONTROL (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the EGR Valve harness connector.
   3. Disconnect the Powertrain Control Module C1 harness connector.
   4. Measure the resistance between ground and the (K682) EGR Valve Control (+) circuit at the EGR Valve harness connector.

   Is the resistance above 10k Ohms?

Yes

- Go To 3

No

- Repair the (K682) EGR Valve Control (+) circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K684) EGR VALVE CONTROL (-) CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (K684) EGR Valve Control (-) circuit at the EGR Valve harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K684) EGR Valve Control (-) circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **EGR VALVE ASSEMBLY**
   1. Turn the ignition off.
   2. Connect the Powertrain Control Module C1 harness connector.
   3. Replace the EGR Valve Assembly in accordance with the service information.
   4. Ignition on, engine not running.
   5. With the scan tool, Clear DTCs in the Powertrain Control Module.
   6. Start the engine and test drive the vehicle.
   7. Monitor the scan tool for at least two minutes.

8. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 5

   No

   - Test complete.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Valve Assembly and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the**

PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool. . Refer to **REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0490-EXHAUST GAS RECIRCULATION CONTROL CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) actuates the EGR Valve via the Pulse Width Modulated (PWM) control circuits. The EGR Airflow Control Valve is actuated to control the air volume and the mixing ratio of the charge air and the recirculated exhaust gases to the Intake Manifold. This is accomplished by creating a vacuum which draws the recirculated exhaust gases into the manifold. The EGR Position Sensor is integrated into the EGR Valve, and is not serviceable separately. The EGR Position Sensor functions as a typical three wire 5-Volt sensor. The PCM receives feedback as to the position of the valve from the position sensor via the signal wire.

WHEN MONITORED

With the engine running and the EGR Valve command on.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to voltage in the EGR Valve Control circuit for 0.1 seconds.

POSSIBLE CAUSES

Possible Causes
(K682) EGR VALVE CONTROL (+) CIRCUIT SHORTED TO VOLTAGE
(K684) EGR VALVE CONTROL (-) CIRCUIT SHORTED TO VOLTAGE
EGR VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine and test drive the vehicle.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K684) EGR VALVE CONTROL (-) CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the EGR Valve harness connector.
   3. Disconnect the Powertrain Control Module (PCM) harness connector.
   4. Remove the ASD/Main Relay from the PDC.
   5. Connect a jumper wire between cavity 30 and cavity 87 of the ASD Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage on the (K684) EGR Valve Control (-) circuit at the EGR Valve harness connector.

      Is there any voltage present?

      Yes

- Repair the (K684) EGR Valve Control (-) circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE (K682) EGR VALVE CONTROL (+) CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Measure the voltage on the (K682) EGR Valve Control (+) circuit between the EGR Valve harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K682) EGR Valve Control (+) circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 4

4. **EGR VALVE ASSEMBLY**
   1. Turn the ignition off.
   2. Reconnect the Powertrain Control Module C1 harness connector.
   3. Replace the EGR Valve Assembly in accordance with the service information.
   4. Ignition on, engine not running.
   5. With the scan tool, clear DTCs in the Powertrain Control Module.
   6. Start the engine and test drive the vehicle.
   7. Monitor the scan tool for at least two minutes.
   8. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 5

No

- Test complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Valve Assembly and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to

REMOVAL .

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0500-00-VEHICLE SPEED SENSOR 1 CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously while the system is active.

SET CONDITION

There is an error in the vehicle speed message received over the CAN Bus from the Anti-lock Brake Module.

POSSIBLE CAUSES

Possible Causes
CAN BUS OPEN OR SHORTED CONDITION
ANTI-LOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **VEHICLE SPEED SIGNAL DTC SET IN PCM**
    1. Turn the ignition on.
    2. With the scan tool, select view DTCs in the Powertrain Control Module (PCM).

    Is the status Active for P0500?

    Yes

    - Refer to the **DTC INDEX** and perform the appropriate diagnostic

procedure.

No

- Go To 2

2. **ANTI-LOCK BRAKE MODULE DTCS PRESENT**
   1. With the scan tool, select view DTCs in the Anti-Lock Brake Module.

      Are there any DTCs present in the Anti-lock Brake Module?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **INTERMITTENT VEHICLE SPEED SIGNAL**
   1. At this time, no DTCs are present.
   2. Inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   4. Using the schematics as a guide, wiggle test the related circuit(s) while monitoring the scan tool data relative to the vehicle speed sensor circuit (s). Look for the data to change or for a DTC to set.
   5. Perform any technical service bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Test Complete.

P0504-BRAKE SWITCH "A"/"B" CORRELATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

The vehicle must be driven from 0 mph to 25 mph (40 km/h) and then brake back to 0 mph. The accelerator pedal must be greater than 20% during acceleration.

SET CONDITION

When one of the Brake Switch inputs to the PCM does not change for four consecutive drive cycles in the enable condition.

POSSIBLE CAUSES

Possible Causes
(F202) IGNITION RUN/START CIRCUIT OPEN
(B16) BRAKE SWITCH SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(B16) BRAKE SWITCH SIGNAL 2 CIRCUIT OPEN
(B15) BRAKE SWITCH SIGNAL 1 CIRCUIT SHORTED TO GROUND
(B15) BRAKE SWITCH SIGNAL 1 CIRCUIT OPEN
(Z906) BRAKE SWITCH GROUND CIRCUIT OPEN
BRAKE SWITCH
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK THE (F202) IGNITION RUN/START CIRCUIT FOR AN OPEN**

Fig. 4: Checking Ignition Run/Start Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Brake Switch harness connector.
3. Turn the ignition on.
4. Using a 12-Volt test light connected to ground, check the (F202) Ignition Run/Start circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 2

No

- Repair the (F202) Ignition Run/Start circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

2. **CHECK THE (B16) BRAKE SWITCH SIGNAL 2 CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 5: Checking Brake Switch Signal 2 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (B16) Brake Switch Signal 2 circuit and ground at the Brake Switch harness connector.

Is the voltage above 9.0 Volts?

Yes

- Repair the (B16) Brake Switch Signal 2 circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE (Z906) STOP LAMP SWITCH GROUND CIRCUIT FOR AN OPEN**

Fig. 6: Checking Stop Lamp Switch Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (Z906) Stop Lamp Switch Ground circuit at the Stop Lamp Switch harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

- Repair the (Z906) Stop Lamp Switch Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE (B15) BRAKE SWITCH SIGNAL 1 CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the PCM C2 harness connector.
   3. Measure the resistance between ground and the (B15) Brake Switch Signal 1 circuit at the Brake Switch harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (B15) Brake Switch Signal 1 circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **CHECK THE (B16) BRAKE SWITCH SIGNAL 2 CIRCUIT FOR AN OPEN**
   1. Measure the resistance between ground and the (B16) Brake Switch Signal 2 circuit at the Brake Switch harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (B16) Brake Switch Signal 2 circuit for an open or high

resistance.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **CHECK THE (B15) BRAKE SWITCH SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (B15) Brake Switch Signal 1 circuit at the Stop Lamp Switch harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 7

      No

      - Repair the (B15) Brake Switch Signal 1 circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
7. **POWERTRAIN CONTROL MODULE**
   1. Replace the Brake Switch in accordance with the service information.
   2. Reconnect the Brake Switch harness connector.
   3. Reconnect the PCM C2 harness connector.
   4. Turn the ignition on.
   5. With the scan tool, Erase DTCs.
   6. Test drive the vehicle according to the When Monitored conditions in this test.
   7. With the scan tool, View DTCs.

      Did the DTC return?

      Yes

      - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the**

Miscellaneous Functions tab of the scan tool. . Refer to **REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Repair complete.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0532-A/C PRESSURE SENSOR CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) receives a message from the Totally Integrated Power Module (TIPM) over the CAN BUS that the A/C Pressure Sensor signal is below 0.06 of a Volt for 1.28 seconds.

POSSIBLE CAUSES

Possible Causes
(C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
A/C PRESSURE SENSOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Start the engine and turn on the A/C system.
4. Monitor the scan tool for at least two minutes.
5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the A/C Pressure Sensor harness connector.
   3. Disconnect the TIPM C5 harness connector.
   4. Measure the resistance between ground and the (C18) A/C Pressure Sensor Signal circuit at the A/C Pressure Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 3

      No

      - Repair the (C18) A/C Pressure Sensor Signal circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **A/C PRESSURE SENSOR**

1. Turn the ignition off.
2. Reconnect the TIPM C5 harness connector.
3. Reconnect the Pressure Sensor harness connector.
4. Turn the ignition on.
5. With the scan tool, Clear DTCs.
6. Disconnect the Pressure Sensor harness connector.
7. With the scan tool, select View DTCs.
8. The scan tool should display P0533-A/C PRESSURE SENSOR CIRCUIT LOW DTC with the A/C Pressure Sensor harness connector disconnected.

   Is the P0533-A/C PRESSURE SENSOR CIRCUIT LOW DTC Active with the A/C Pressure Sensor harness connector disconnected?

   Yes

   - Replace the A/C Pressure Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4

4. **TOTALLY INTEGRATED CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the A/C Pressure Sensor and the Totally Integrated Power Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Totally Integrated Power Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0533-A/C PRESSURE SENSOR CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) receives a message from the Totally Integrated Power Module (TIPM) over the CAN BUS that the A/C Pressure Sensor signal is above 4.94 Volts for 1.28 seconds.

POSSIBLE CAUSES

Possible Causes
(C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
A/C PRESSURE SENSOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine and turn on the A/C system.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the A/C Pressure Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage on the (C18) A/C Pressure Sensor Signal circuit at the A/C Pressure Sensor harness connector.

   Is the voltage reading above 5.1 Volts?

   Yes

   - Repair the (C18) A/C Pressure Sensor Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

- Go To 3

3. **CHECK THE (C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the TIPM C5 harness connector.
   3. Measure the resistance of the (C18) A/C Pressure Sensor Signal circuit between the A/C Pressure Sensor harness connector and the TIPM C5 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (C18) A/C Pressure Sensor Signal circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE A/C PRESSURE SENSOR**
   1. Reconnect the TIPM C5 harness connector.
   2. Reconnect the A/C Pressure Sensor harness connector.
   3. Turn the ignition on.
   4. With the scan tool, Clear DTCs.
   5. Turn the ignition off.
   6. Disconnect the A/C Pressure Sensor harness connector.
   7. Connect a jumper between ground and the (C18) A/C Pressure Sensor Signal circuit at the A/C Pressure Sensor harness connector.
   8. Turn the ignition on.
   9. With the scan tool, select View DTCs.
   10. The scan tool should display P0533-A/C PRESSURE SENSOR CIRCUIT LOW DTC with the jumper wire in place.

Is the P0533-A/C PRESSURE SENSOR CIRCUIT LOW DTC active with the jumper wire in place?

Yes

- Replace the A/C Pressure Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **TOTALLY INTEGRATED CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the A/C Pressure Sensor and the Totally Integrated Power Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Totally Integrated Power Module in accordance with the service information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P053A-CRANKCASE VENT HEATER CONTROL CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects an open on the (N116) Crankcase Vent Heater Control circuit for 40.0 seconds.

POSSIBLE CAUSES

Possible Causes
(N116) CRANKCASE VENT HEATER CONTROL CIRCUIT OPEN
CRANKCASE VENT HEATER
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. Start the engine.
    4. Monitor the scan tool for at least five minutes.
    5. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

    - Perform the INTERMITTENT CONDITION diagnostic procedure.

Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (N116) CRANKCASE VENT HEATER CONTROL CIRCUIT FOR AN OPEN**
   1. Disconnect the Crankcase Vent Heater harness connector.
   2. Disconnect the Powertrain Control Module C1 harness connector.
   3. Measure the resistance of the (N116) Crankcase Vent Heater Control circuit between the Crankcase Vent Heater harness connector and the Powertrain Control Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 3

      No

      - Repair the (N116) Crankcase Vent Heater Control circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
3. **CHECK THE CRANKCASE VENT HEATER FOR AN OPEN**
   1. Measure the resistance across the terminals of the Crankcase Vent Heater.

      Is the resistance below 100.0 Ohms?

      Yes

      - Go To 4

      No

      - Replace the Crankcase Vent Heater in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **POWERTRAIN CONTROL MODULE**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Crankcase Vent Heater and the Powertrain Control Module.
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    5. Look for the data to change or for the DTC to reset during the wiggle test.
    6. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

    No

    - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P053B-CRANKCASE VENT HEATER CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to ground on the (N116) Crankcase Vent Heater Control circuit for 40.0 seconds.

POSSIBLE CAUSES

Possible Causes
(N116) CRANKCASE VENT HEATER CONTROL CIRCUIT SHORTED TO GROUND
(F344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN/HIGH RESISTANCE
CRANKCASE VENT HEATER
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: Diagnose and repair any system voltage or Main Relay DTCs before continuing with this test.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Start the engine.
4. Monitor the scan tool for at least five minutes.
5. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (F344) FUSED MAIN RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Piston Cooling Valve harness connector.
   3. Turn the ignition on.
   4. Using a 12-Volt test light connected to ground, check the (F344) Fused Main Relay Output circuit at the Piston Cooling Valve harness connector.

   NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

   Is the test light illuminated and bright?

   Yes

   - Go To 3

   No

   - Repair the (F344) Fused Main Relay Output circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (N116) CRANKCASE VENT HEATER CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Crankcase Vent Heater harness connector.
   2. Disconnect the Powertrain Control Module C1 harness connector.
   3. Measure the resistance between ground and the (N116) Crankcase Vent Heater Control circuit.

   Is the resistance above 10k Ohms?

Yes

- Go To 4

No

- Repair the (N116) Crankcase Vent Heater Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE CRANKCASE VENT HEATER FOR AN INTERNAL SHORT TO GROUND**
   1. Measure the resistance between ground and either terminal of the Crankcase Vent Heater.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 5

      No

      - Replace the Crankcase Vent Heater in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Crankcase Vent Heater and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle

test.

6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P053C-CRANKCASE VENT HEATER CONTROL CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to battery voltage on the (N116) Crankcase Vent Heater Control circuit for 40.0 seconds.

POSSIBLE CAUSES

Possible Causes
(N116) CRANKCASE VENT HEATER CONTROL CIRCUIT SHORTED TO VOLTAGE

POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: Diagnose and repair any system voltage or Main Relay DTCs before continuing with this test.

   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine.
   4. Monitor the scan tool for at least five minutes.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (N116) CRANKCASE VENT HEATER CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the engine off.
   2. Disconnect the Crankcase Vent Heater harness connector.
   3. Remove the Main Relay.
   4. Connect a jumper wire between cavity 30 and cavity 87 of the Main Relay connector.
   5. Turn the ignition on.
   6. Measure for voltage on the (N116) Crankcase Vent Heater Control

circuit at the Crankcase Vent Heater harness connector.

Is there any voltage present?

Yes

- Repair the (N116) Crankcase Vent Heater Control circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Crankcase Vent Heater and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the**

PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool. . Refer to **REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0545-EXHAUST GAS TEMPERATURE SENSOR CIRCUIT LOW - BANK 1 SENSOR 1

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) monitors the exhaust gas temperatures in the aftertreatment system by receiving feedback from the Exhaust Gas Temperature (EGT) Sensors. The Exhaust Gas Temperature Sensors function as typical two wire 5-Volt sensors. The PCM uses this information to monitor the temperatures during normal engine operation as well as during regeneration of the Diesel Particulate Filter (DPF) so as not to cause any damage to the exhaust aftertreatment system components.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (K353) Exhaust Temperature Sensor 1/1 Signal circuit is below 0.5 Volts for 2.0 seconds.

POSSIBLE CAUSES

Possible Causes
(K353) EXHAUST TEMPERATURE SENSOR 1/1 SIGNAL CIRCUIT SHORTED TO GROUND
(K353) EXHAUST TEMPERATURE SENSOR 1/1 SIGNAL CIRCUIT SHORTED TO (K916) EXHAUST TEMPERATURE SENSOR 1/1 GROUND
EXHAUST TEMPERATURE SENSOR 1/1
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, Clear DTCs in the Powertrain Control Module.
   3. Monitor the scan tool for at least two minutes.
   4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
   5. Start the engine.
   6. Allow the engine to reach normal operating temperature.
   7. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K353) EXHAUST TEMPERATURE SENSOR 1/1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Exhaust Temperature Sensor 1/1 harness connector.
   3. Disconnect the Powertrain Control Module harness connector.
   4. Measure the resistance between ground and the (K353) Exhaust Temperature Sensor 1/1 Signal circuit in the Exhaust Temperature Sensor 1/1 harness connector.

      Is the resistance above 10k Ohms?

      Yes

- Go To 3

No

- Repair the (K353) Exhaust Temperature Sensor 1/1 Signal circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK FOR THE (K353) EXHAUST TEMPERATURE SENSOR 1/1 SIGNAL CIRCUIT SHORTED TO (K916) EXHAUST TEMPERATURE SENSOR 1/1 GROUND CIRCUIT**
   1. Measure the resistance between the (K353) Exhaust Temperature Sensor 1/1 Signal circuit and the (K916) Exhaust Temperature Sensor 1/1 Ground circuit in the Exhaust Temperature Sensor 1/1 harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K353) Exhaust Temperature Sensor 1/1 Signal circuit for a short to the (K916) Exhaust Temperature Sensor 1/1 Ground circuit.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK THE EXHAUST TEMPERATURE SENSOR 1/1**
   1. Reconnect the Powertrain Control Module connector.
   2. Turn the ignition on.
   3. With the scan tool, clear DTCs.
   4. With the scan tool, select View DTCs.
   5. Monitor the scan tool for at least two minutes.

NOTE: The scan tool should display the Exhaust Temperature Sensor 1/1 high voltage or open circuit DTC with the Exhaust Temperature Sensor 1/1 connector disconnected.

Does the scan tool display the DTC as described above?

Yes

- Replace the Exhaust Temperature Sensor 1/1 in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Exhaust Temperature Sensor 1/1 and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0546-EXHAUST GAS TEMPERATURE SENSOR CIRCUIT HIGH - BANK 1 SENSOR 1

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) monitors the exhaust gas temperatures in the aftertreatment system by receiving feedback from the Exhaust Gas Temperature (EGT) Sensors. The Exhaust Gas Temperature Sensors function as typical two wire 5-Volt sensors. The PCM uses this information to monitor the temperatures during normal engine operation as well as during regeneration of the Diesel Particulate Filter (DPF) so as not to cause any damage to the exhaust aftertreatment system components.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Exhaust Temperature Sensor 1/1 Signal is open or shorted to voltage.

POSSIBLE CAUSES

Possible Causes
(K353) EXHAUST TEMPERATURE SENSOR 1/1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K353) EXHAUST TEMPERATURE SENSOR 1/1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

(K916) EXHAUST TEMPERATURE SENSOR 1/1 GROUND CIRCUIT OPEN OR HIGH RESISTANCE
EXHAUST TEMPERATURE SENSOR 1/1
POWERTRAIN CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, Clear DTCs in the Powertrain.
   3. Monitor the scan tool for at least two minutes.
   4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
   5. Start the engine.
   6. Allow the engine to reach normal operating temperature.
   7. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K353) EXHAUST TEMPERATURE SENSOR 1/1 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Exhaust Temperature Sensor 1/1 harness connector.
   3. Disconnect the Powertrain Control Module harness connector.
   4. Remove the Main Relay.

5. Connect a jumper wire between cavity 30 and cavity 87 of the Main Relay connector.
6. Turn the ignition on.
7. Measure the voltage of the (K353) Exhaust Temperature Sensor 1/1 Signal circuit in the Exhaust Temperature Sensor 1/1 harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K353) Exhaust Temperature Sensor 1/1 Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE (K353) EXHAUST TEMPERATURE SENSOR 1/1 SIGNAL FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Remove the jumper wire and install the Main Relay.
   3. Measure the resistance of the (K353) Exhaust Temperature Sensor 1/1 Signal circuit between the Exhaust Temperature Sensor 1/1 harness connector and the Powertrain Control Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K353) Exhaust Temperature Sensor 1/1 Signal circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

4. **CHECK THE (K916) EXHAUST TEMPERATURE SENSOR 1/1 GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K916) Sensor Ground circuit between the Exhaust Temperature Sensor 1/1 harness connector and the Powertrain Control Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K916) Exhaust Temperature Sensor 1/1 Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **EXHAUST TEMPERATURE SENSOR 1/1**
   1. Connect the Powertrain Control Module harness connector.
   2. Connect a jumper wire between the (K353) Exhaust Temperature Sensor 1/1 Signal circuit and the (K916) Exhaust Temperature Sensor 1/1 Ground circuit in the Exhaust Temperature Sensor 1/1 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, Clear DTCs.
   5. With the scan tool, select View DTCs.

      NOTE: The scan tool should display a P0545-EXHAUST TEMPERATURE SENSOR 1/1 LOW DTC with the jumper wire in place.

      Does the scan tool display the DTC as described above?

      Yes

- Replace the Exhaust Temperature Sensor 1/1 in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Exhaust Temperature Sensor 1/1 and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

P0560-BATTERY SYSTEM VOLTAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on or the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects a fault on the analog to digital conversion circuit.

POSSIBLE CAUSES

Possible Causes
(K20) GENERATOR FIELD CONTROL CIRCUIT OPEN
(K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO GROUND
CORRODED BATTERY TERMINALS/CABLES
BATTERY
PCM POWER OR GROUND CIRCUITS OPEN
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

NOTE: This DTC may be caused by a charging system problem. Refer to the Service Information and verify proper charging system operation before continuing. If there are Generator DTCs present, perform the diagnostics for the Generator DTCs before

proceeding with this test procedure.

1. Turn the ignition on.
2. With the scan tool, erase PCM DTCs.
3. Start the engine and allow it to idle.
4. Monitor the scan tool for at least two minutes.
5. With the scan tool, read PCM DTCs.

   Did this DTC return?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE BATTERY TERMINALS/CABLES**
   1. Turn the ignition off.
   2. Remove the battery cables from the battery terminals.
   3. Visually inspect the battery cables and terminals for signs of corrosion or poor connection.

      Was there any signs of corrosion present?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3

3. **CHECK THE BATTERY**
   1. Test the battery with an approved Mopar Midtronics battery tester.

Did the battery pass?

Yes

- Go To 4

No

- Replace the battery in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK PCM POWER AND GROUND CIRCUITS**
   1. Perform the CHECKING THE PCM POWER AND GROUND CIRCUITS diagnostic proecdure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problems found with the PCM powers and grounds?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 5
5. **GENERATOR**
   1. Turn the ignition off.
   2. Replace the Generator in accordance with the service information.
   3. Turn the ignition on.
   4. With the scan tool, erase PCM DTCs.
   5. Test drive the vehicle.
   6. With the scan tool, read PCM DTCs.

      Did the DTC return?

Yes

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Repair is complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0562-BATTERY/SYSTEM VOLTAGE LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the actual Battery voltage is one Volt below setpoint.

POSSIBLE CAUSES

Possible Causes
(K20) GENERATOR FIELD CONTROL CIRCUIT OPEN
(K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO GROUND
CORRODED BATTERY TERMINALS/CABLES
BATTERY
CHECKING PCM POWER AND GROUNDS

GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

   NOTE: This DTC may be caused by a charging system problem. Refer to the Service Information and verify proper charging system operation before continuing. If there are Generator DTCs present, perform the diagnostics for the Generator DTCs before proceeding with this test procedure.

   1. Turn the ignition on.
   2. With the scan tool, erase PCM DTCs.
   3. Start the engine and allow it to idle.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, read PCM DTCs.

   Did this DTC return?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE BATTERY TERMINALS/CABLES**
   1. Turn the ignition off.
   2. Remove the battery cables from the battery terminals.
   3. Visually inspect the battery cables and terminals for signs of corrosion

or poor connection.

Was there any signs of corrosion present?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE BATTERY**
   1. Test the battery with an approved Mopar Midtronics battery tester.

   Did the battery pass?

   Yes

   - Go To 4

   No

   - Replace the battery in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK PCM POWER AND GROUND CIRCUITS**
   1. Reconnect the battery cables.
   2. Reconnect the Generator harness connector.
   3. Perform the CHECKING THE PCM POWER AND GROUND CIRCUITS diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   Were any problems found with the PCM powers and grounds?

   Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **GENERATOR**
   1. Turn the ignition off.
   2. Replace the Generator in accordance with the service information.
   3. Turn the ignition on.
   4. With the scan tool, erase PCM DTCs.
   5. Test drive the vehicle.
   6. With the scan tool, read PCM DTCs.

   Did the DTC return?

   Yes

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Repair is complete.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0563-BATTERY/SYSTEM VOLTAGE HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the actual Battery voltage is one Volt above the setpoint for two seconds.

POSSIBLE CAUSES

Possible Causes
(K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO BATTERY
CHECKING PCM POWER AND GROUNDS
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

   NOTE: This DTC may be caused by a charging system problem. Refer to the Service Information and verify proper charging system operation before continuing.

   1. Turn the ignition on.
   2. With the scan tool, erase PCM DTCs.
   3. Test drive the vehicle.
   4. With the scan tool, read PCM DTCs.

   Did this DTC return?

   Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND CIRCUITS diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problem found with the PCM powers and grounds?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3

3. **GENERATOR**
   1. Turn the ignition off.
   2. Replace the Generator in accordance with the service information.
   3. Turn the ignition on.
   4. With the scan tool, erase PCM DTCs.
   5. Test drive the vehicle.
   6. With the scan tool, read PCM DTCs.

      Did the DTC return?

      Yes

      - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to

REMOVAL .

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Repair is complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0565-SPEED CONTROL ON SIGNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the On/Off Control Switch is stuck in the On position for one minute.

POSSIBLE CAUSES

Possible Causes
SPEED CONTROL SWITCH ON/OFF BUTTON PHYSICALLY STUCK

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

CHECK FOR ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, erase PCM DTCs.
3. Test drive the vehicle for at least two minutes.

4. Turn the ignition on.
5. With the scan tool, read PCM DTCs.

   Did this DTC return?

   Yes

   - Replace the Speed Control Switch in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

P0567-SPEED CONTROL RESUME SIGNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Resume Control Switch is stuck in the On position for one minute.

POSSIBLE CAUSES

Possible Causes
SPEED CONTROL SWITCH RESUME BUTTON PHYSICALLY STUCK

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

CHECK FOR ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, erase PCM DTCs.
3. Test drive the vehicle for at least two minutes.
4. Turn the ignition on.
5. With the scan tool, read PCM DTCs.

   Did this DTC return?

   Yes

   - Replace the Speed Control Switch in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

P0571-BRAKE SWITCH 1 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the vehicle has stopped and no brake switch signal was received.

POSSIBLE CAUSES

Possible Causes
(B15) BRAKE SWITCH SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(B15) BRAKE SWITCH SIGNAL 1 CIRCUIT SHORTED TO GROUND

(B15) BRAKE SWITCH SIGNAL 1 CIRCUIT OPEN
(B16) BRAKE SWITCH SIGNAL 2 OPEN
(B16) BRAKE SWITCH SIGNAL 2 SHORTED TO GROUND
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK THE BRAKE SWITCH SIGNAL 1 STATUS**
   1. Turn the ignition on.
   2. While observing the BRAKE SWITCH SIGNAL 1 status on the scan tool display, press and release the brake pedal several times.

      Does the scan tool display BRAKE SWITCH SIGNAL 1: PRESSED and RELEASED for the appropriate pedal position?

      Yes

      - Go To 2

      No

      - Go To 7
2. **CHECK THE BRAKE SWITCH SIGNAL 2 STATUS**
   1. While observing the BRAKE SWITCH SIGNAL 2 status on the scan tool display, press and release the brake pedal several times.

      Does the scan tool display BRAKE SWITCH SIGNAL 2: PRESSED and RELEASED for the appropriate pedal position?

      Yes

      - Go To 3

      No

      - Go To 4

3. **INTERMITTENT CONDITION**

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing.

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

1. With the engine running at normal operating temperature, monitor the scan tool parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set.
2. Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set.
3. Perform any Technical Service Bulletins (TSB) that may apply.
4. Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
5. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any of the above conditions present?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Test Complete.

4. **CHECK THE (B16) BRAKE SWITCH SIGNAL 2 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Stop Lamp Switch harness connector.

3. Disconnect the PCM harness connector.
4. Measure the resistance of the (B16) Brake Switch Signal 2 circuit between the Stop Lamp Switch harness connector and the PCM harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the (B16) Brake Switch Signal 2 circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE (B16) BRAKE SWITCH SIGNAL 2 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (B16) Brake Switch Signal 2 circuit at the Stop Lamp Switch harness connector.

      Is the resistance above 10K Ohms?

      Yes

      - Go To 6

      No

      - Repair the (B16) Brake Switch Signal 2 circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **CHECK THE BRAKE SWITCH**
   1. Measure the resistance between terminal 3 and terminal 4 of the Stop Lamp Switch harness connector with the brake pedal depressed.

Is the resistance below 10.0 Ohms?

Yes

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace Stop Lamp Switch in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **CHECK THE (B15) BRAKE SWITCH SIGNAL 1 CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the PCM harness connectors.
   3. Remove the Main Relay.
   4. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay connector.
   5. Turn the ignition on.
   6. Measure the voltage between the (B15) Brake Switch Signal 1 circuit and ground.

   Is there any voltage present?

   Yes

   - Repair the (B15) Brake Switch Signal 1 circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

No

- Go To 8

8. **CHECK THE (B15) BRAKE SWITCH SIGNAL 1 CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Stop Lamp Switch harness connector.
   3. Measure the resistance of the (B15) Brake Switch Signal 1 circuit between the Stop Lamp Switch harness connector and the PCM harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 9

   No

   - Repair the (B15) Brake Switch Signal 1 circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

9. **CHECK THE (B15) BRAKE SWITCH SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (B15) Brake Switch Signal 1 circuit at the Stop Lamp Switch harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 10

   No

- Repair the (B15) Brake Switch Signal 1 circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

10. **CHECK THE BRAKE SWITCH**
    1. Measure the resistance between terminal 5 and terminal 6 of the Stop Lamp Switch harness connector with the brake pedal depressed.

       Is the resistance below 10.0 Ohms?

       Yes

       - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
       - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

       No

       - Replace the Stop Lamp Switch in accordance with the service information.
       - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0579-SPEED CONTROL SWITCH 1 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The S/C Switch 1 Signal is above 4.98 Volts for 0.16 of a second.

POSSIBLE CAUSES

Possible Causes
(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(V71) S/C SWITCH 1 SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN/HIGH RESISTANCE
SPEED CONTROL SWITCH
CLOCKSPRING
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK THE (V937) S/C SWITCH GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition on.
   2. With the scan tool, View DTCs.

NOTE: If DTCs P0581-SPEED CONTROL SWITCH 1 CIRCUIT HIGH and P0593-SPEED CONTROL SWITCH 2 CIRCUIT HIGH are both active, the (V937) S/C Switch Ground circuit is open.

Are DTCs P0581 and P0593 both active together?

Yes

- Repair the (V937) S/C Switch Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 2

2. **(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Powertrain Control Module harness connector.
   3. Remove the Main Relay.
   4. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay connector.
   5. Turn the ignition on.
   6. Measure the voltage on the (V71) S/C Switch 1 Signal circuit.

   Is there any voltage present?

   Yes

   - Repair the (V71) S/C Switch 1 Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE SPEED CONTROL SWITCH**
   1. Turn the ignition off.
   2. Disconnect the Speed Control Switch harness connector.
   3. Reconnect the Powertrain Control Module harness connector.
   4. Connect a jumper wire between the (V71) S/C Switch 1 Signal circuit and the (V937) S/C Switch Ground circuit at the Speed Control Switch harness connector.
   5. Turn the ignition on.
   6. With the scan tool, View DTCs.

   Does the scan tool display P0580-SPEED CONTROL SWITCH 1 CIRCUIT LOW AS ACTIVE?

   Yes

   - Replace the Speed Control Switches in accordance with the service

information.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **CHECK THE CLOCKSPRING**
   1. Turn the ignition off.
   2. Disconnect the Clockspring harness connector.
   3. Connect a jumper wire between the (V71) S/C Switch 1 Signal circuit and the (V937) S/C Switch Ground circuit at the Clockspring harness connector.
   4. Turn the ignition on.
   5. With the scan tool, View DTCs.

   Does the scan tool display P0580-SPEED CONTROL SWITCH 1 CIRCUIT LOW AS ACTIVE?

   Yes

   - Replace the Clockspring in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 5

5. **CHECK THE (V71) S/C SWITCH 1 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Powertrain Control Module harness connector.
   3. Measure the resistance of the (V71) S/C Switch 1 Signal circuit between the Speed Control Switch harness connector and the Powertrain Control Module harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 6

No

- Repair the (V71) S/C Switch 1 Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0580-SPEED CONTROL SWITCH 1 CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The S/C Switch 1 Signal is below 0.05 of a Volt for 0.16 of a second.

POSSIBLE CAUSES

Possible Causes
(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO GROUND
SPEED CONTROL SWITCH
CLOCKSPRING
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **S/C SWITCH VOLTAGES OUT OF RANGE**

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HIGH LIMIT	LO LIMIT	HIGH LIMIT
RELEASED	4.32	4.79	4.32	4.79
ON-OFF	0.89	1.00	3.58	3.98
SET/DECEL	3.24	3.60	1.34	1.50
RESUME-ACCEL	3.86	4.29	2.18	2.44
CANCEL	1.74	1.95	2.94	3.28

   1. Turn the ignition on.
   2. Using the scan tool, monitor the S/C Switch 1 Signal voltages.
   3. Press each button while noting the voltage readings for each circuit.

   Are the S/C Switch 1 Signal voltages within the ranges specified in the table when each button is pressed?

Yes

Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

No

- Go To 2

2. **CHECK THE SPEED CONTROL SWITCH**
   1. Turn the ignition off.
   2. Disconnect the Speed Control Switch harness connector.
   3. Turn the ignition on.
   4. Using the scan tool, monitor the S/C Switch 1 Signal Voltage.

   Does the scan tool display 5.0 Volts with the Speed Control Switch disconnected?

   Yes

   - Replace the Speed Control Switch in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE CLOCKSPRING**
   1. Turn the ignition off.
   2. Disconnect the Clockspring harness connector.
   3. Turn the ignition on.
   4. Using the scan tool, monitor the S/C Switch 1 Signal Voltage.

   Does the scan tool display 5.0 Volts with the Clockspring disconnected?

   Yes

- Replace the Clockspring in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **CHECK THE (V71) S/C SWITCH 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the PCM harness connector.
   3. Measure the resistance between ground and the (V71) S/C Switch 1 Signal circuit at the Clockspring harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 5

      No

      - Repair the (V71) S/C Switch 1 Signal circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0581-SPEED CONTROL SWITCH 1 CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The S/C Switch 1 Signal is above 4.98 Volts for 0.16 of a second.

POSSIBLE CAUSES

Possible Causes
(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(V71) S/C SWITCH 1 SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN/HIGH RESISTANCE
SPEED CONTROL SWITCH
CLOCKSPRING
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before

proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK THE (V937) S/C SWITCH GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition on.
   2. With the scan tool, View DTCs.

      NOTE: If DTCs P0581-SPEED CONTROL SWITCH 1 CIRCUIT HIGH and P0593-SPEED CONTROL SWITCH 2 CIRCUIT HIGH are both active, the (V937) S/C Switch Ground circuit is open.

      Are DTCs P0581 and P0593 both active together?

      Yes

      - Repair the (V937) S/C Switch Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 2
2. **(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Powertrain Control Module harness connector.
   3. Remove the Main Relay.
   4. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay connector.
   5. Turn the ignition on.
   6. Measure the voltage on the (V71) S/C Switch 1 Signal circuit.

      Is there any voltage present?

Yes

- Repair the (V71) S/C Switch 1 Signal circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE SPEED CONTROL SWITCH**
   1. Turn the ignition off.
   2. Disconnect the Speed Control Switch harness connector.
   3. Reconnect the Powertrain Control Module harness connector.
   4. Connect a jumper wire between the (V71) S/C Switch 1 Signal circuit and the (V937) S/C Switch Ground circuit at the Speed Control Switch harness connector.
   5. Turn the ignition on.
   6. With the scan tool, View DTCs.

   Does the scan tool display P0580-SPEED CONTROL SWITCH 1 CIRCUIT LOW AS ACTIVE?

   Yes

   - Replace the Speed Control Switches in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4

4. **CHECK THE CLOCKSPRING**
   1. Turn the ignition off.
   2. Disconnect the Clockspring harness connector.
   3. Connect a jumper wire between the (V71) S/C Switch 1 Signal circuit and the (V937) S/C Switch Ground circuit at the Clockspring harness

connector.

4. Turn the ignition on.
5. With the scan tool, View DTCs.

   Does the scan tool display P0580-SPEED CONTROL SWITCH 1 CIRCUIT LOW AS ACTIVE?

   Yes

   - Replace the Clockspring in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 5

5. **CHECK THE (V71) S/C SWITCH 1 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Powertrain Control Module harness connector.
   3. Measure the resistance of the (V71) S/C Switch 1 Signal circuit between the Speed Control Switch harness connector and the Powertrain Control Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (V71) S/C Switch 1 Signal circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **POWERTRAIN CONTROL MODULE**

1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module.
2. Look for any chafed, pierced, pinched or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0585-SPEED CONTROL SWITCH 1/2 CORRELATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and no other S/C Switch DTCs present.

SET CONDITION

The (V71) S/C Switch 1 Signal and (V72) S/C Switch 2 Signal do not indicate the same S/C Switch position for 0.16 of a second.

POSSIBLE CAUSES

Possible Causes

HIGH RESISTANCE IN THE (V71) S/C SWITCH 1 SIGNAL CIRCUIT
HIGH RESISTANCE IN THE (V72) S/C SWITCH 2 SIGNAL CIRCUIT
HIGH RESISTANCE IN THE (V937) S/C SWITCH GROUND CIRCUIT
CLOCKSPRING
SPEED CONTROL SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **S/C SWITCH VOLTAGES OUT OF RANGE**

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HIGH LIMIT	LO LIMIT	HIGH LIMIT
RELEASED	4.32	4.79	4.32	4.79
ON-OFF	0.89	1.00	3.58	3.98
SET/DECEL	3.24	3.60	1.34	1.50
RESUME-ACCEL	3.86	4.29	2.18	2.44
CANCEL	1.74	1.95	2.94	3.28

1. Turn the ignition on.
2. With the scan tool, monitor the S/C Switch signal voltages.
3. Press each button while noting the voltage readings for each circuit.

   Do the S/C Switch voltages fall within the ranges specified in the table when each button is pressed?

   Yes

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

   NOTE: If P0585-SPEED CONTROL SWITCH 1/2 CORRELATION DTC is not active, it is

possible that the customer accidentally partially pressed a cruise control switch, activating only one of the cruise switches. If only one of the two cruise control switches is pressed for 0.16 seconds, then P0585 will be set.

No

- Go To 2

2. **CHECK FOR HIGH RESISTANCE IN THE SPEED CONTROL SWITCH CIRCUITS**
   1. Turn the ignition off.
   2. Disconnect the Speed Control Switch harness connector.
   3. Disconnect the Powertrain Control Module harness connector.
   4. Measure the resistance of the (V71) S/C Switch 1 Signal circuit between the Speed Control Switch harness connector and the Powertrain Control Module harness connector.
   5. Measure the resistance of the (V72) S/C Switch 2 Signal circuit between the Speed Control Switch harness connector and the Powertrain Control Module harness connector.
   6. Measure the resistance of the (V937) S/C Switch Ground circuit between the Speed Control Switch harness connector and the Powertrain Control Module harness connector.

   Is the resistance below 5.0 Ohms for ALL measurements?

   Yes

   - Go To 4

   No

   - Go To 3

3. **CHECK THE CLOCKSPRING**
   1. Disconnect the Clockspring harness connector.
   2. Measure the resistance of the circuit that measured above 5.0 Ohms

between the Speed Control Switch harness connector and the Powertrain Control Module harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Replace the Clockspring in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Repair the circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE SPEED CONTROL SWITCH**
   1. Turn the ignition off.
   2. Reconnect the Powertrain Control Module harness connector.
   3. Turn the ignition on.
   4. With the scan tool, monitor the S/C Switch Voltage.
   5. While monitoring the scan tool, connect a jumper wire between the (V71) S/C Switch 1 Signal circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.
   6. While monitoring the scan tool, connect a jumper wire between the (V72) S/C Switch 2 Signal circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

   Does the scan tool display below 0.1 Volt for each circuit with the jumper wire in place?

   Yes

   - Replace the Speed Control Switch in accordance with the service information.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0589-SPEED CONTROL SWITCH 2

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The S/C Switch 2 Signal is above 4.98 Volts for 0.16 of a second.

POSSIBLE CAUSES

Possible Causes
(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(V72) S/C SWITCH 2 SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN/HIGH RESISTANCE
SPEED CONTROL SWITCH
CLOCKSPRING
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK THE (V937) S/C SWITCH GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition on.
   2. With the scan tool, View DTCs.

NOTE: If DTCs P0581-SPEED CONTROL SWITCH 1 CIRCUIT HIGH and P0593-SPEED CONTROL SWITCH 2 CIRCUIT HIGH are both active, the (V937) S/C Switch Ground circuit is open.

Are DTCs P0581 and P0593 both active together?

Yes

- Repair the (V937) S/C Switch Ground circuit for an open or high resistance.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 2

2. **(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Powertrain Control Module harness connector.
   3. Remove the Main Relay.
   4. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay connector.
   5. Turn the ignition on.
   6. Measure the voltage on the (V72) S/C Switch 2 Signal circuit.

   Is there any voltage present?

   Yes

   - Repair the (V72) S/C Switch 2 Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE SPEED CONTROL SWITCH**
   1. Turn the ignition off.
   2. Disconnect the Speed Control Switch harness connector.
   3. Reconnect the Powertrain Control Module harness connector.
   4. Connect a jumper wire between the (V72) S/C Switch 2 Signal circuit and the (V937) S/C Switch Ground circuit at the Speed Control Switch harness connector.
   5. Turn the ignition on.
   6. With the scan tool, View DTCs.

   Does the scan tool display P0592-SPEED CONTROL SWITCH 2

CIRCUIT LOW AS ACTIVE?

Yes

- Replace the Speed Control Switches in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **CHECK THE CLOCKSPRING**
   1. Turn the ignition off.
   2. Disconnect the Clockspring harness connector.
   3. Connect a jumper wire between the (V72) S/C Switch 2 Signal circuit and the (V937) S/C Switch Ground circuit at the Clockspring harness connector.
   4. Turn the ignition on.
   5. With the scan tool, View DTCs.

   Does the scan tool display P0592-SPEED CONTROL SWITCH 2 CIRCUIT LOW AS ACTIVE?

   Yes

   - Replace the Clockspring in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 5

5. **CHECK THE (V72) S/C SWITCH 2 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Powertrain Control Module harness connector.

3. Measure the resistance of the (V72) S/C Switch 2 Signal circuit between the Speed Control Switch harness connector and the Powertrain Control Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 6

   No

   - Repair the (V72) S/C Switch 2 Signal circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer

to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0590-SPEED CONTROL SWITCH 2 STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module PCM detects that the S/C Switch 2 is physically stuck for one minute.

POSSIBLE CAUSES

Possible Causes
SPEED CONTROL SWITCH

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, View DTCs.

   Is the DTC active?

   Yes

   - This DTC indicates that the Speed Control Switch is physically stuck in the On position.
   - Replace the Speed Control Switch in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

P0592-SPEED CONTROL SWITCH 2 CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The S/C Switch 2 Signal is below 0.05 Volts for 0.16 of a second.

POSSIBLE CAUSES

Possible Causes
(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO GROUND
SPEED CONTROL SWITCH
CLOCLKSPRING
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **S/C SWITCH VOLTAGES OUT OF RANGE**

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HIGH LIMIT	LO LIMIT	HIGH LIMIT
RELEASED	4.32	4.79	4.32	4.79
ON-OFF	0.89	1.00	3.58	3.98
SET/DECEL	3.24	3.60	1.34	1.50
RESUME-ACCEL	3.86	4.29	2.18	2.44

CANCEL	1.74	1.95	2.94	3.28

1. Turn the ignition on.
2. Using the scan tool, monitor the S/C Switch 2 Signal voltages.
3. Press each button while noting the voltage readings for each circuit.

   Are the S/C Switch 1 Signal voltages within the ranges specified in the table when each button is pressed?

   Yes

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

   No

   - Go To 2

2. **CHECK THE SPEED CONTROL SWITCH**
   1. Turn the ignition off.
   2. Disconnect the Speed Control Switch harness connector.
   3. Turn the ignition on.
   4. Using the scan tool, monitor the (V72) S/C Switch 2 Signal Voltage.

      Does the scan tool display 5.0 Volts with the Speed Control Switch disconnected?

      Yes

      - Replace the Speed Control Switch in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3

3. **CHECK THE CLOCKSPRING**

1. Turn the ignition off.
2. Disconnect the Clockspring harness connector.
3. Turn the ignition on.
4. Using the scan tool, monitor the (V72) S/C Switch 2 Signal Voltage.

   Does the scan tool display 5.0 Volts with the Clockspring disconnected?

   Yes

   - Replace the Clockspring in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4

4. **CHECK THE (V72) S/C SWITCH 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the PCM harness connector.
   3. Measure the resistance between ground and the (V72) S/C Switch 2 Signal circuit at the Clockspring harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 5

      No

      - Repair the (V72) S/C Switch 2 Signal circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **POWERTRAIN CONTROL MODULE**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module.
    2. Look for any chafed, pierced, pinched or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

    No

    - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0593-SPEED CONTROL SWITCH 2 CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The S/C Switch 2 Signal is above 4.98 Volts for 0.16 of a second.

POSSIBLE CAUSES

Possible Causes
(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(V72) S/C SWITCH 2 SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN/HIGH RESISTANCE
SPEED CONTROL SWITCH
CLOCKSPRING
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK THE (V937) S/C SWITCH GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition on.
   2. With the scan tool, View DTCs.

      NOTE: If DTCs P0581-SPEED CONTROL SWITCH 1 CIRCUIT HIGH and P0593-SPEED CONTROL SWITCH 2 CIRCUIT HIGH are both active, the (V937) S/C Switch Ground circuit is open.

      Are DTCs P0581 and P0593 both active together?

      Yes

      - Repair the (V937) S/C Switch Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 2
2. **(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition off.

2. Disconnect the Powertrain Control Module harness connector.
3. Remove the Main Relay.
4. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay connector.
5. Turn the ignition on.
6. Measure the voltage on the (V72) S/C Switch 2 Signal circuit.

   Is there any voltage present?

   Yes

   - Repair the (V72) S/C Switch 2 Signal circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE SPEED CONTROL SWITCH**
   1. Turn the ignition off.
   2. Disconnect the Speed Control Switch harness connector.
   3. Reconnect the Powertrain Control Module harness connector.
   4. Connect a jumper wire between the (V72) S/C Switch 2 Signal circuit and the (V937) S/C Switch Ground circuit at the Speed Control Switch harness connector.
   5. Turn the ignition on.
   6. With the scan tool, View DTCs.

      Does the scan tool display P0592-SPEED CONTROL SWITCH 2 CIRCUIT LOW AS ACTIVE?

      Yes

      - Replace the Speed Control Switches in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **CHECK THE CLOCKSPRING**
   1. Turn the ignition off.
   2. Disconnect the Clockspring harness connector.
   3. Connect a jumper wire between the (V72) S/C Switch 2 Signal circuit and the (V937) S/C Switch Ground circuit at the Clockspring harness connector.
   4. Turn the ignition on.
   5. With the scan tool, View DTCs.

   Does the scan tool display P0592-SPEED CONTROL SWITCH 2 CIRCUIT LOW AS ACTIVE?

   Yes

   - Replace the Clockspring in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 5

5. **CHECK THE (V72) S/C SWITCH 2 SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Powertrain Control Module harness connector.
   3. Measure the resistance of the (V72) S/C Switch 2 Signal circuit between the Speed Control Switch harness connector and the Powertrain Control Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 6

No

- Repair the (V72) S/C Switch 2 Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0597-THERMOSTAT HEATER CONTROL CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects an open on the (K223) Cooling Thermostat Actuator Control circuit for five seconds.

POSSIBLE CAUSES

Possible Causes
(K223) COOLING THERMOSTAT ACTUATOR CONTROL CIRCUIT OPEN
COOLING THERMOSTAT ACTUATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine.
   4. Monitor the scan tool for at least five minutes.
   5. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K223) COOLING THERMOSTAT ACTUATOR CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Disconnect the Cooling Thermostat Actuator harness connector.

2. Disconnect the Powertrain Control Module C1 harness connector.
3. Measure the resistance of the (K223) Cooling Thermostat Actuator Control circuit between the Cooling Thermostat Actuator harness connector and the Powertrain Control Module C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K223) Cooling Thermostat Actuator Control circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE COOLING THERMOSTAT ACTUATOR FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance across the terminals of the Cooling Thermostat Actuator.

      Is the resistance below 100.0 Ohms?

      Yes

      - Go To 4

      No

      - Replace the Cooling Thermostat Actuator in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Cooling Thermostat Actuator and the

Powertrain Control Module.

2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0598-THERMOSTAT HEATER CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to ground on the (K223)

Cooling Thermostat Actuator Control circuit for five seconds.

POSSIBLE CAUSES

Possible Causes
(F344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN/HIGH RESISTANCE
(K223) COOLING THERMOSTAT ACTUATOR CONTROL CIRCUIT SHORTED TO GROUND
COOLING THERMOSTAT ACTUATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: Diagnose and repair any system voltage or Main Relay DTCs before continuing with this test.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Start the engine.
4. Monitor the scan tool for at least five minutes.
5. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (F344) FUSED MAIN RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Cooling Thermostat Actuator harness connector.
   3. Turn the ignition on, engine not running.
   4. Using a 12-Volt test light connected to ground, check the (F344) Fused Main Relay Output circuit at the Cooling Thermostat Actuator harness connector.

      NOTE: The test light should illuminate brightly. Compare the brightness to that of a connection of direct battery.

      Is the test light illuminated brightly?

      Yes

      - Go To 3

      No

      - Repair the (F344) Fused Main Relay Output circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
3. **CHECK THE (K223) COOLING THERMOSTAT ACTUATOR CONTROL CIRCUIT FOR SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Powertrain Control Module C1 harness connector.
   3. Measure the resistance between ground and the (K223) Cooling Thermostat Actuator Control circuit at the Cooling Thermostat Actuator harness connector.

      Is the resistance above 10k Ohms?

      Yes

- Go To 4

No

- Repair the (K223) Cooling Thermostat Actuator Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE COOLING THERMOSTAT ACTUATOR FOR SHORT TO GROUND**
   1. Measure the resistance between ground and either terminal of the Cooling Thermostat Actuator.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 5

      No

      - Replace the Cooling Thermostat Actuator in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Cooling Thermostat Actuator and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.

6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0599-THERMOSTAT HEATER CONTROL CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to voltage on the (K223) Cooling Thermostat Actuator Control circuit for five seconds.

POSSIBLE CAUSES

Possible Causes
(K223) COOLING THERMOSTAT ACTUATOR CONTROL CIRCUIT SHORTED TO VOLTAGE
(K223) COOLING THERMOSTAT ACTUATOR CONTROL CIRCUIT

SHORTED TO THE (F344) ASD/MAIN RELAY OUTPUT CIRCUIT
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: Diagnose and repair any system voltage or Main Relay DTCs before continuing with this test.

   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine.
   4. Monitor the scan tool for at least five minutes.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K223) COOLING THERMOSTAT ACTUATOR CONTROL CIRCUIT FOR SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Cooling Thermostat Actuator harness connector.
   3. Turn the ignition on.
   4. Measure the voltage at the (K223) Cooling Thermostat Actuator Control circuit at the Cooling Thermostat Actuator harness connector.

Is there any voltage present?

Yes

- Repair the (K223) Cooling Thermostat Actuator Control circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE (K223) COOLING THERMOSTAT ACTUATOR CONTROL CIRCUIT FOR SHORT TO THE (F344) ASD/MAIN RELAY OUTPUT CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Powertrain Control Module C1 harness connector.
   3. Measure the resistance between the (K223) Cooling Thermostat Actuator Control circuit and the (F344) ASD/Main Relay Output circuit at the Cooling Thermostat Actuator harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the short between the (K223) Cooling Thermostat Actuator Control circuit and the (F344) ASD/Main Relay Output circuit.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Cooling Thermostat Actuator and the Powertrain Control Module.

2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0601-INTERNAL MEMORY CHECKSUM INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects a calculation error.

POSSIBLE CAUSES

Possible Causes
CHECKING PCM POWER AND GROUNDS POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If the PCM detects and stores a DTC, the PCM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed. Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

NOTE: If there are other DTCs set with this DTC, repair other DTCs before continuing with this diagnostic procedure.

NOTE: This code can be caused by an intermittent problem in the wiring and connectors to the Powertrain Control Module. Inspect the Powertrain Control Module harness connector and associated wiring for signs of poor terminal contact.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Monitor the scan tool for at least two minutes.
4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
5. Start the engine.
6. Perform several engine run cycles, turning the ignition off for at least

20 seconds between each engine run cycle leaving the ignition on.

7. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problem found with the PCM powers and grounds?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.

6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0604-INTERNAL CONTROL MODULE RAM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an internal failure. A byte in RAM cannot be set and reset.

POSSIBLE CAUSES

Possible Causes
CHECK THE PCM POWERS AND GROUNDS POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If the PCM detects and stores a DTC, the PCM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed. Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

NOTE: If there are other DTCs set with this DTC, repair other DTCs before continuing with this diagnostic procedure.

NOTE: This code can be caused by an intermittent problem in the wiring and connectors to the Powertrain Control Module. Inspect the Powertrain Control Module harness connector and associated wiring for signs of poor terminal contact.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Monitor the scan tool for at least two minutes.
4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
5. Start the engine.
6. Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.
7. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   Were any problem found with the PCM powers and grounds?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0605-INTERNAL CONTROL MODULE ROM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an internal failure. PCM memory corrupt or defective.

POSSIBLE CAUSES

Possible Causes
CHECKING PCM POWER AND GROUNDS POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If the PCM detects and stores a DTC, the PCM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed. Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

NOTE: If there are other DTCs set with this DTC, repair other DTCs before continuing with this diagnostic procedure.

NOTE: This code can be caused by an intermittent problem in the wiring and connectors to the Powertrain Control Module. Inspect the Powertrain Control Module harness connector and associated wiring for signs of poor terminal contact.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Monitor the scan tool for at least two minutes.
4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
5. Start the engine.
6. Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.
7. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT DTC diagnostic procedure. Refer to

INTERMITTENT CONDITION - 2.2L DIESEL .

2. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problem found with the PCM powers and grounds?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3
3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0607-ECU INTERNAL PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an internal failure.

POSSIBLE CAUSES

Possible Causes
CHECKING PCM POWER AND GROUNDS POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If the PCM detects and stores a DTC, the PCM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed. Before erasing stored DTCs, record these conditions. Attempting to duplicate these

conditions may assist when checking for an active DTC.

NOTE: If there are other DTCs set with this DTC, repair other DTCs before continuing with this diagnostic procedure.

NOTE: This code can be caused by an intermittent problem in the wiring and connectors to the Powertrain Control Module. Inspect the Powertrain Control Module harness connector and associated wiring for signs of poor terminal contact.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Monitor the scan tool for at least two minutes.
4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
5. Start the engine.
6. Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.
7. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problem found with the PCM powers and grounds?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

P060A-INTERNAL CONTROL MODULE MONITORING PROCESSOR PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Powertrain Control Module (PCM) calculation error or memory corruption.

POSSIBLE CAUSES

Possible Causes
CHECKING PCM POWER AND GROUNDS POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If the PCM detects and stores a DTC, the PCM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed. Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

NOTE: If there are other DTCs set with this DTC, repair other DTCs before continuing with this diagnostic procedure.

NOTE: This code can be caused by an intermittent problem in the wiring and connectors to the Powertrain Control Module. Inspect the Powertrain Control Module harness connector and associated wiring for signs of poor terminal contact.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Monitor the scan tool for at least two minutes.
4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
5. Start the engine.
6. Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.
7. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problem found with the PCM powers and grounds?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P060B-ETC A/D GROUND PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and DTC P0641 not set.

SET CONDITION

Powertrain Control Module (PCM) detects that the internal reference voltage in below 4.5 Volts or above 5.5 Volts.

POSSIBLE CAUSES

Possible Causes
(K852) APP SENSOR 1 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K350) FUEL RAIL PRESSURE SENSOR 5-VOLT SUPPLY SHORTED TO GROUND
CHECKING PCM POWER AND GROUNDS
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are any 5-Volt Reference DTCs set with this DTC, diagnose the 5-Volt Reference DTCs before continuing with this diagnostic procedure.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Monitor the scan tool for at least two minutes.
4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
5. Start the engine.
6. Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.
7. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problem found with the PCM powers and grounds?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P060D-INTERNAL CONTROL MODULE ACCELERATOR PEDAL POSITION PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and no speed control DTCs set.

SET CONDITION

The Powertrain Control Module (PCM) detects an internal calculation error.

POSSIBLE CAUSES

Possible Causes
CHECKING PCM POWER AND GROUNDS POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are other DTCs set with this DTC, repair other DTCs before continuing with this diagnostic procedure.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Monitor the scan tool for at least two minutes.
4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
5. Start the engine.
6. Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.
7. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK PCM POWER AND GROUNDS**

1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

Were any problem found with the PCM powers and grounds?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P060F-INTERNAL CONTROL MODULE ECT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an internal failure.

POSSIBLE CAUSES

Possible Causes
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
CHECKING PCM POWER AND GROUNDS
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are other DTCs set with this DTC, repair other DTCs before continuing with this diagnostic procedure.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Monitor the scan tool for at least two minutes.
4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
5. Start the engine.
6. Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.
7. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problem found with the PCM powers and grounds?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3

3. **CHECK THE (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Disconnect the Engine Coolant Temperature Sensor harness connector.
   2. Disconnect the Powertrain Control Module (PCM) C1 harness connector.
   3. Measure the resistance of the (K2) Engine Coolant Temperature Sensor Signal circuit between the Engine Coolant Temperature Sensor harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

- Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0615-STARTER CONTROL CIRCUIT/OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article .

WHEN MONITORED

With the ignition on and the Starter command off.

SET CONDITION

The Powertrain Control Module (PCM) does not detect voltage on the (T752) Engine Starter Control circuit for one second.

POSSIBLE CAUSES

Possible Causes
(T752) STARTER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. Attempt to start the engine several times.
    4. Monitor the scan tool for at least two minutes.
    5. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

    - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (T752) STARTER CONTROL CIRCUIT FOR AN**

OPEN/HIGH RESISTANCE

1. Measure the resistance of the (T752) Starter Control circuit between the TIPM C2 harness connector and the PCM harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace and program the TIPM in accordance with the service information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (T752) Starter Control circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0616-STARTER CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the Starter command off.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to ground on the (T752) Engine Starter Control circuit for one second.

POSSIBLE CAUSES

Possible Causes
(T752) STARTER CONTROL CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Attempt to start the engine several times.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (T752) STARTER CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the TIPM C2 harness connector.
   3. Disconnect the Powertrain Control Module harness connectors.
   4. Measure the resistance between ground and the (T752) Starter Control circuit in the TIPM harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Replace and program the TIPM in accordance with the service information.
   - Perform the BODY VERIFICATION TEST. Refer to

STANDARD PROCEDURE .

No

- Repair the (T752) Starter Control circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0617-STARTER CONTROL CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the Starter command on.

SET CONDITION

The Powertrain Control Module (PCM) detects a short circuit on the (T752) Engine Starter Control circuit for at 0.5 of a second.

POSSIBLE CAUSES

Possible Causes
(T752) STARTER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. Attempt to start the engine several times.
    4. Monitor the scan tool for at least two minutes.

5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (T752) STARTER CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the TIPM C2 harness connector.
   3. Disconnect the PCM harness connectors.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (T752) Starter Control circuit in the TIPM harness connector.

      Is there any voltage present?

      Yes

      - Repair the (T752) Starter Control circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Replace and program the TIPM in accordance with the service information.
      - Perform the BODY VERIFICATION TEST. Refer to

STANDARD PROCEDURE .

P061B-INTERNAL CONTROL MODULE TORQUE CALCULATION PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects a difference between the calculated torque curve and the torque demand calculation.

POSSIBLE CAUSES

Possible Causes
(K852) ACCELERATOR PEDAL POSITION SENSOR 1 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K852) ACCELERATOR PEDAL POSITION SENSOR 1 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K350) RAIL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K350) RAIL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are any 5-Volt reference or fuel system DTCs set with this DTC, repair those DTCs before continuing with this diagnostic procedure.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Monitor the scan tool for at least two minutes.
4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
5. Start the engine.
6. Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.
7. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problem found with the PCM powers and grounds?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and

connectors for the Powertrain Control Module.
2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P061C-INTERNAL CONTROL MODULE RPM PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects an internal failure. The Crank

Sensor and Cam Sensor signals are missing or erratic.

POSSIBLE CAUSES

Possible Causes
CHECKING PCM POWER AND GROUNDS POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are other DTCs set with this DTC, repair other DTCs before continuing with this diagnostic procedure.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Monitor the scan tool for at least two minutes.
4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
5. Start the engine.
6. Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.
7. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT DTC diagnostic procedure. Refer to

INTERMITTENT CONDITION - 2.2L DIESEL .

2. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problem found with the PCM powers and grounds?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3
3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0627-FUEL PUMP CONTROL CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the engine not running.

SET CONDITION

The Powertrain Control Module (PCM) detects an open on the (K31) Fuel Pump Control circuit for 0.32 of a second.

POSSIBLE CAUSES

Possible Causes
(K31) FUEL PUMP CONTROL CIRCUIT OPEN/HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. With the scan tool, actuate the Fuel Pump.
    4. Monitor the scan tool for at least two minutes.
    5. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K31) FUEL PUMP CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the TIPM C2 harness connector.
   3. Disconnect the Powertrain Control Module C2 harness connector.
   4. Measure the resistance of the (K31) Fuel Pump Control circuit between the TIPM harness connector and the PCM harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace and program the TIPM in accordance with the service information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (K31) Fuel Pump Control circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0628-FUEL PUMP CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the engine not running.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to ground on the (K31) Fuel Pump Control circuit for 0.32 of a second.

POSSIBLE CAUSES

Possible Causes
(K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. With the scan tool, actuate the Fuel Pump.
    4. Monitor the scan tool for at least two minutes.
    5. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

    - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K31) FUEL PUMP CONTROL CIRCUIT FOR A SHORT TO GROUND**

1. Turn the ignition off.
2. Disconnect the TIPM C2 harness connector.
3. Disconnect the Powertrain Control Module C2 harness connectors.
4. Measure the resistance between ground and the (K31) Fuel Pump Control circuit in the TIPM harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Replace and program the TIPM in accordance with the service information.
   - Perform the BODY VERIFICATION TEST - 2.2L DIESEL. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (K31) Fuel Pump Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0629-FUEL PUMP CONTROL CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the engine not running.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to voltage on the (K31) Fuel Pump Relay Control circuit for 0.32 of a second.

POSSIBLE CAUSES

Possible Causes
(K31) FUEL PUMP RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE

TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, Clear DTCs in the Powertrain Control Module.
   3. Monitor the scan tool for at least two minutes.
   4. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K31) FUEL PUMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the TIPM C2 harness connector.
   3. Disconnect the PCM C2 harness connector.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K31) Fuel Pump Control circuit in the TIPM harness connector.

      Is there any voltage present?

Yes

- Repair the (K31) Fuel Pump Control circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace and program the TIPM in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P062B-INTERNAL CONTROL MODULE FUEL INJECTOR CONTROL PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects an error in fuel injection timing or quantity

POSSIBLE CAUSES

Possible Causes
CHECKING PCM POWER AND GROUNDS POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are other DTCs set with this DTC, repair other DTCs before continuing with this diagnostic procedure.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Monitor the scan tool for at least two minutes.
4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
5. Start the engine.
6. Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.
7. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problem found with the PCM powers and grounds?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P062C-ETC LEVEL 2 MPH PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module detects an internal failure.

POSSIBLE CAUSES

Possible Causes
CHECKING PCM POWER AND GROUNDS POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are other DTCs set with this DTC, repair other DTCs before continuing with this diagnostic procedure.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Monitor the scan tool for at least two minutes.
4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
5. Start the engine.
6. Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.
7. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problem found with the PCM powers and grounds?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P062D-FUEL INJECTOR DRIVER CIRCUIT PERFORMANCE BANK 1

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: Fuel Injector Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and the engine running.

SET CONDITION

The Powertrain Control Module detects that the cylinder balancing correction for any injector is not within range.

POSSIBLE CAUSES

Possible Causes
CHECKING PCM POWER AND GROUNDS POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: If there are other DTCs set with this DTC repair other DTCs before continuing with this diagnostic procedure.

   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Monitor the scan tool for at least two minutes.
   4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
   5. Start the engine.
   6. Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.
   7. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND

diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

Were any problem found with the PCM powers and grounds?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to

REMOVAL .

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P062F-INTERNAL CONTROL MODULE EEPROM ERROR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module detects an internal failure.

POSSIBLE CAUSES

Possible Causes
CHECKING PCM POWER AND GROUNDS FUEL INJECTOR CORRECTION CODES NOT PROGRAMMED INTO THE POWERTRAIN CONTROL MODULE POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are other DTCs set with this DTC, repair other DTCs before continuing with this diagnostic procedure.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Monitor the scan tool for at least two minutes.

4. Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
5. Start the engine.
6. Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.
7. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK FOR FUEL INJECTOR CORRECTION CODES NOT PROGRAMMED INTO THE POWERTRAIN CONTROL MODULE**
   1. With the scan tool, check for the Fuel Injector correction codes programmed into the Powertrain Control Module for each Fuel Injector.

      Are the correction codes for the Fuel Injectors programmed into the Powertrain Control Module?

      Yes

      - Go To 3

      No

      - Using the scan tool, program the Fuel Injector correction codes into the PCM.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
3. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

Were any problem found with the PCM powers and grounds?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0633-SKIM SECRET KEY NOT STORED IN PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on, mileage above 13 km (8 miles).

SET CONDITION

The secret key code is not stored in the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
POWERTRAIN CONTROL MODULE (PCM) WAS REPLACED AND TRANSFER OF SECRET KEY CODE FROM THE WIRELESS CONTROL MODULE WAS NOT COMPLETED

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

POWERTRAIN CONTROL MODULE PROGRAMMING

1. This DTC will set if the PCM is replaced and the secret key code is not transferred from into the PCM from the WCM.

   Information only

   View repair

   - With the scan tool, transfer the secret key code from the WCM to the PCM.

P0638-ELECTRONIC THROTTLE CONTROL PERFORMANCE-BANK 1

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: APPS & EGR Airflow Control Valve Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Powertrain Control Module (PCM) actuates the EGR Airflow Control Valve via the Pulse Width Modulated (PWM) control circuits. The EGR Airflow Control Valve is actuated to control the air volume and the mixing ratio of the

charge air and the recirculated exhaust gases to the Intake Manifold. This is accomplished by creating a vacuum which draws the recirculated exhaust gases into the manifold. The position sensor is integrated into the EGR Airflow Control Valve, and is not serviceable separately. The EGR Airflow Control Valve Position Sensor functions as a typical three wire 5-Volt sensor. The PCM receives feedback as to the position of the valve from the position sensor via the signal wire. The EGR Airflow Control Valve is closed when the ignition is turned off to help provide a smooth engine shut down.

WHEN MONITORED

With the ignition on and the EGR Air Flow Control Valve learning complete.

SET CONDITION

The Powertrain Control Module (PCM) detects that the EGR Air Flow Control Valve current draw is above 2.8 Amps or that the EGR Air Flow Control Valve has exceeded it's learned value limits.

POSSIBLE CAUSES

Possible Causes
EGR AIR FLOW CONTROL VALVE STICKING/BINDING
(K315) EGR AIR FLOW CONTROL VALVE (-) CONTROL CIRCUIT OPEN/HIGH RESISTANCE
(K314) EGR AIR FLOW CONTROL VALVE (+) CONTROL CIRCUIT OPEN/HIGH RESISTANCE
(K315) EGR AIR FLOW CONTROL VALVE (-) CONTROL CIRCUIT FOR A SHORT TO GROUND
(K312) EGR AIR FLOW CONTROL VALVE POSITION SIGNAL CIRCUIT OPEN/HIGH RESISTANCE
EGR AIR FLOW CONTROL VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. With the scan tool, actuate the EGR Air Flow Control Valve.
    4. Monitor the scan tool for at least two minutes.
    5. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

    - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE EGR AIR FLOW CONTROL VALVE**
    1. Stop actuation of the EGR Air Flow Control Valve.
    2. Turn the ignition off.
    3. Remove the Air intake hose at the EGR Air Flow Control Valve.
    4. Check the EGR Air Flow Control Valve for binding or obstructions.

    Were any problems found?

    Yes

    - Perform the appropriate repair.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

    No

    - Go To 3
3. **CHECK FOR HIGH RESISTANCE IN THE (K315) EGR AIR FLOW CONTROL VALVE (-) CONTROL CIRCUIT**

1. Disconnect the EGR Air Flow Control Valve harness connector.
2. Disconnect the Powertrain Control Module C1 harness connector.
3. Measure the resistance of the (K315) EGR Air Flow Control Valve (-) Control circuit between the EGR Air Flow Control Valve harness connector and the Powertrain Control Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the (K315) EGR Air Flow Control Valve (-) Control circuit for high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK FOR HIGH RESISTANCE IN THE (K314) EGR AIR FLOW CONTROL VALVE (+) CONTROL CIRCUIT**
   1. Measure the resistance of the (K314) EGR Air Flow Control Valve (+) Control circuit between the EGR Air Flow Control Valve harness connector and the Powertrain Control Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K314) EGR Air Flow Control Valve (+) Control circuit for high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK FOR HIGH RESISTANCE IN THE (K312) EGR AIR FLOW**

CONTROL VALVE POSITION SIGNAL CIRCUIT

1. Measure the resistance of the (K312) EGR Air Flow Control Valve Position Signal circuit between the EGR Air Flow Control Valve harness connector and the Powertrain Control Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To6

   No

   - Repair the (K312) EGR Air Flow Control Valve Position Signal circuit for high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **CHECK THE (K315) EGR AIR FLOW CONTROL VALVE (-) CONTROL CIRCUIT FOR A SHORT TO GROUND**

   1. Measure the resistance between ground and the (K315) EGR Air Flow Control Valve (-) Control circuit at the EGR Air Flow Control Valve harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 7

      No

      - Repair the (K315) EGR Air Flow Control Valve (-) Control circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **EGR AIR FLOW CONTROL VALVE**

1. Reconnect the Powertrain Control Module C1 harness connector.
2. Replace the EGR Air Flow Control Valve in accordance with the service information.
3. Turn the ignition on.
4. With the scan tool, navigate to Misc. Functions and perform the Throttle Valve Learn procedure.
5. With the scan tool, clear DTCs in the Powertrain Control Module.
6. With the scan tool, actuate the EGR Air Flow Control Valve.
7. Monitor the scan tool for at least two minutes.
8. With the scan tool, select View DTCs.

   Did the DTC return?

   Yes

   - Go To 8

   No

   - Repair is complete.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

8. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Air Flow Control Valve and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L

DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P063A-GENERATOR VOLTAGE SENSE CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects a two Volt difference between the (A804) Generator Feedback Sense circuit voltage and Battery voltage.

POSSIBLE CAUSES

Possible Causes
(A804) GENERATOR FEEDBACK SENSE CIRCUIT OPEN/HIGH RESISTANCE
(A804) GENERATOR FEEDBACK SENSE CIRCUIT SHORTED TO GROUND
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (A804) GENERATOR FEEDBACK SENSE CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Disconnect the Generator C2 harness connector.
   2. Disconnect the Powertrain Control Module C1 harness connector.
   3. Measure the resistance of the (A804) Generator Feedback Sense circuit between the Generator C2 harness connector and the Powertrain Control Module C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (A804) Generator Feedback Sense circuit for an open circuit or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (A804) GENERATOR FEEDBACK SENSE CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (A804) Generator Feedback Sense circuit at the Powertrain Control Module C1 harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the (A804) Generator Feedback Sense circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **GENERATOR**
   1. Turn the ignition off.
   2. Replace the Generator in accordance with the service information.
   3. Turn the ignition on.
   4. With the scan tool, erase PCM DTCs.
   5. Test drive the vehicle.
   6. With the scan tool, read PCM DTCs.

      Did the DTC return?

      Yes

      - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Repair is complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P063D-GENERATOR VOLTAGE SENSE HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (A804) Generator Feedback Sense circuit is 2.0 Volts greater than Battery voltage for three seconds.

POSSIBLE CAUSES

Possible Causes
CORRODED BATTERY TERMINALS/CABLES
(K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE
(A804) GENERATOR FEEDBACK SENSE CIRCUIT SHORTED TO VOLTAGE
BATTERY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.

2. With the scan tool, erase PCM DTCs.
3. Test drive the vehicle.
4. With the scan tool, read PCM DTCs.

   Did this DTC return?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE BATTERY TERMINALS/CABLES**
   1. Turn the ignition off.
   2. Remove the battery cables from the battery terminals.
   3. Visually inspect the battery cables and terminals for signs of corrosion or poor connection.

      Was there any signs of corrosion present?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3

3. **CHECK THE BATTERY**
   1. Test the battery with an approved Mopar Midtronics battery tester.

      Did the battery pass the load test?

      Yes

- Go To 4

No

- Replace the battery in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Reconnect the battery cables to the battery terminals.
   3. Disconnect the Generator C2 harness connector.
   4. Disconnect the PCM C1 harness connector.
   5. Remove the Main Relay.
   6. Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.
   7. Turn the ignition on.
   8. Measure the voltage on the (K20) Generator Field Control circuit at the Generator C2 harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K20) Generator Field Control circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 5

5. **CHECK THE (A804) GENERATOR FEEDBACK SENSE CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Reconnect the PCM C1 harness connector.

2. Start the engine.
3. Measure the voltage on the (A804) Generator Feedback Sense circuit at the Generator harness connector.

   Is there any voltage present?

   Yes

   - Repair the (A804) Generator Feedback Sense circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 6

6. **CHECK PCM POWER AND GROUND CIRCUITS**
   1. Turn the ignition off.
   2. Reconnect the Generator C2 harness connector.
   3. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problem found with the PCM powers and grounds?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 7

7. **GENERATOR**
   1. Turn the ignition off.
   2. Replace the Generator in accordance with the service information.

3. Turn the ignition on.
4. With the scan tool, erase PCM DTCs.
5. Test drive the vehicle.
6. With the scan tool, read PCM DTCs.

Did the DTC return?

Yes

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Repair is complete.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0641-SENSOR REFERENCE VOLTAGE 1 CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) contains 3 internal 5-Volt Sensor Supply sources. Each 5-Volt Supply source is split into parallel circuits to provide 5.0 Volts to multiple sensors. Sensor Supply 1 provides 5.0 Volts to the Accelerator Pedal Position Sensor 1 and the Rail Pressure Sensor.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the voltage on the 5-Volt Sensor Supply 1 circuit is below 4.7 Volts or above 5.3 Volts for 0.16 of a second.

POSSIBLE CAUSES

Possible Causes
(K852) ACCELERATOR PEDAL POSITION SENSOR 1 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K852) ACCELERATOR PEDAL POSITION SENSOR 1 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K350) RAIL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K350) RAIL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
ACCELERATOR PEDAL POSITION SENSOR
RAIL PRESSURE SENSOR
POWERTRTAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, erase PCM DTCs.
    3. Turn the ignition off for 10 seconds.
    4. Turn the ignition on.
    5. With the scan tool, View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE ACCELERATOR PEDAL POSITION SENSOR**
   1. Turn the ignition off.
   2. Disconnect the Accelerator Pedal Position Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage on the (K852) 5-Volt Supply circuit at the Accelerator Pedal Position Sensor harness connector.

   Is the voltage between 4.7 and 5.3 Volts?

   Yes

   - Replace the Accelerator Pedal Position Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE RAIL PRESSURE SENSOR**
   1. Turn the ignition off.
   2. Disconnect the Rail Pressure Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage on the (K350) 5-Volt Supply circuit at the Rail Pressure Sensor harness connector.

   Is the voltage between 4.7 and 5.3 Volts?

   Yes

   - Replace the Rail Pressure Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

No, voltage is below 4.7 Volts,

- Go To 4

No, voltage is above 5.3 Volts,

- Go To 6

4. **CHECK THE (K852) ACCELERATOR PEDAL POSITION SENSOR 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the PCM harness connectors.
   3. Measure the resistance between ground and the (K852) Accelerator Pedal Position Sensor 5-Volt Supply circuit at the PCM C2 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the (K852) Accelerator Pedal Position Sensor 5-Volt Supply circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **CHECK THE (K350) RAIL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (K350) Rail Pressure Sensor 5-Volt Supply circuit at the PCM C1 harness connector.

   Is the resistance above 10k Ohms?

   Yes

- Go To 8

No

- Repair the (K350) Rail Pressure Sensor 5-Volt Supply circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

6. **CHECK THE (K852) ACCELERATOR PEDAL POSITION SENSOR 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Remove the Main Relay.
   3. Connect a jumper wire between cavity 30 and cavity 87 of the Main Relay connector.
   4. Turn the ignition on.
   5. Measure the voltage on the (K852) Accelerator Pedal Position Sensor 5-Volt Supply circuit at the PCM C2 harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K852) Accelerator Pedal Position Sensor 5-Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 7
7. **CHECK THE (K350) RAIL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Measure the voltage on the (K350) Rail Pressure Sensor 5-Volt Supply circuit at the PCM C1 harness connector.

   Is there any voltage present?

Yes

- Repair the (K350) Rail Pressure Sensor 5-Volt Supply circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 8

8. **POWERTRAIN CONTROL MODULE**
   1. Turn the ignition off.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0645-A/C CONTROL CIRCUIT/OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article .

WHEN MONITORED

With the ignition on, Powertrain Control Module (PCM) powered up, battery voltage above 10.5 Volts, and starter relay inactive.

SET CONDITION

The Powertrain Control Module (PCM) detects an open circuit on the pulse width modulated (C28) A/C Clutch Control circuit for 0.32 seconds.

POSSIBLE CAUSES

Possible Causes
(F343) FUSED ASD/MAIN RELAY SUPPLY CIRCUIT OPEN
(C28) A/C CLUTCH CONTROL CIRCUIT OPEN/HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are any ASD/Main Relay DTCs present, diagnose those DTCs before proceeding with this test procedure.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. With the scan tool, actuate the A/C Compressor.
4. Monitor the scan tool for at least two minutes.
5. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (C28) A/C CLUTCH CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Disconnect the TIPM C1 harness connector.
   2. Disconnect the PCM C2 harness connector.
   3. Measure the resistance of the (C28) A/C Clutch Control circuit between the TIPM harness connector and the PCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (C28) A/C Clutch Control circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **TOTALLY INTEGRATED POWER MODULE**
   1. Turn the ignition off.
   2. Reconnect the PCM C2 harness connector.
   3. Disconnect the TIPM C1 harness connector.
   4. Backprobe the (C28) A/C Clutch Control circuit at the TIPM C1 harness connector and connect a jumper to ground.

   NOTE: Take caution not to spread the terminals.

   5. Turn the ignition on.
   6. With the scan tool, Clear DTCs.

7. With the scan tool, select View DTCs.

NOTE: The scan tool should display DTC P0646-A/C CLUTCH CONTROL CIRCUIT LOW with the (C28) A/C Compressor Control circuit shorted to ground.

Is the DTC P0645 Active with the (C28) A/C Compressor Control circuit shorted to ground?

Yes

- Replace the Totally Integrated Power Module in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Totally Integrated Power Module and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0646-A/C CLUTCH CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on, Powertrain Control Module (PCM) powered up, battery voltage above 10.5 Volts, and starter relay inactive.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to ground on the pulse width modulated (C28) A/C Compressor Control circuit for 0.32 seconds.

POSSIBLE CAUSES

Possible Causes
(C28) A/C CLUTCH CONTROL CIRCUIT SHORTED TO GROUND
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.

3. With the scan tool, actuate the A/C Compressor.
4. Monitor the scan tool for at least two minutes.
5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (C28) A/C CLUTCH CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the TIPM C1 harness connector.
   3. Disconnect the PCM C2 harness connector.
   4. Measure the resistance between ground and the (C28) A/C Clutch Control circuit at the A/C Compressor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 3

      No

      - Repair the (C28) A/C Clutch Control circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE TOTALLY INTEGRATED POWER MODULE**
   1. Reconnect the PCM C2 harness connector.
   2. Turn the ignition on.
   3. With the scan tool, Erase DTCs.

4. With the scan tool, select View DTCs.

NOTE: The scan tool should display P0645-A/C CLUTCH CONTROL CIRCUIT OPEN DTC with the TIPM C1 harness connector disconnected.

Is the P0645 DTC Active with the TIPM C1 harness connector disconnected?

Yes

- Replace the Totally Integrated Power Module in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Totally Integrated Power Module and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0647-A/C CONTROL CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on, PCM powered up, battery voltage above 10.5 Volts, and starter relay inactive.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to voltage on the pulse width modulated (C28) A/C Clutch Control circuit for 0.32 seconds.

POSSIBLE CAUSES

Possible Causes
(C28) A/C CLUTCH CONTROL CIRCUIT SHORTED TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module.
    3. With the scan tool, actuate the A/C Compressor.

4. Monitor the scan tool for at least two minutes.
5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (C28) A/C CLUTCH CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the TIPM C1 harness connector.
   3. Disconnect the PCM C2 harness connector.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (C28) A/C Clutch Control circuit at the TIPM C1 harness connector.

      Is there any voltage present?

      Yes

      - Repair the (C28) A/C Clutch Control circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3

3. **CHECK THE TOTALLY INTEGRATED POWER MODULE**

1. Reconnect the PCM C2 harness connector.
2. Turn the ignition on.
3. With the scan tool, clear DTCs.
4. With the scan tool, select View DTCs.

NOTE: The scan tool should display P0645-A/C CLUTCH CONTROL CIRCUIT OPEN DTC with the TIPM C1 harness connector disconnected.

Is the P0645 DTC active with the TIPM C1 harness connector disconnected?

Yes

- Replace the Totally Integrated Power Module in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 4

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Totally Integrated Power Module and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0651-SENSOR REFERENCE VOLTAGE 2 CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) contains 2 internal 5-Volt Sensor Supply sources. Each 5-Volt Supply source is split into parallel circuits to provide 5.0 Volts to multiple sensors. Sensor Supply 2 provides 5.0 Volts to the Intake Air Pressure Sensor, the Boost Pressure Sensor, Exhaust Gas Pressure Sensor, and the Differential Pressure Sensor.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the voltage on the 5-Volt Sensor Supply 2 circuit is below 4.7 Volts or above 5.3 Volts for 0.16 of a second.

POSSIBLE CAUSES

Possible Causes
(K354) DIFFERENTIAL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K354) DIFFERENTIAL PRESSURE SENSOR 5-VOLT SUPPLY

CIRCUIT SHORTED TO GROUND
(F856) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
DIFFERENTIAL PRESSURE SENSOR
INTAKE AIR PRESSURE SENSOR
BOOST PRESSURE SENSOR
EXHAUST GAS PRESSURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, erase PCM DTCs.
   3. Turn the ignition off for 10.0 seconds.
   4. Turn the ignition on.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE DIFFERENTIAL PRESSURE SENSOR**
   1. Turn the ignition off.
   2. Disconnect the Differential Pressure Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage on the (K354) Differential Pressure Sensor 5-Volt Supply circuit at the Differential Pressure Sensor harness connector.

Is the voltage between 4.7 and 5.3 Volts?

Yes

- Replace the Differential Pressure Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 3

3. **CHECK THE INTAKE AIR PRESSURE SENSOR**
   1. Turn the ignition off.
   2. Disconnect the Intake Air Pressure Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage on the (F856) 5-Volt Supply circuit at the Intake Air Pressure Sensor harness connector.

   Is the voltage between 4.7 and 5.3 Volts?

   Yes

   - Replace the Intake Air Pressure Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4

4. **CHECK THE BOOST PRESSURE SENSOR**
   1. Turn the ignition off.
   2. Disconnect the Boost Pressure Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage on the (F856) 5-Volt Supply circuit at the Intake

Air Pressure Sensor harness connector.

Is the voltage between 4.7 and 5.3 Volts?

Yes

- Replace the Boost Pressure Sensor in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **CHECK THE EXHAUST GAS PRESSURE SENSOR**
   1. Turn the ignition off.
   2. Disconnect the Exhaust Gas Pressure Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage on the (F856) 5-Volt Supply circuit at the Exhaust Gas Pressure Sensor harness connector.

   Is the voltage between 4.7 and 5.3 Volts?

   Yes

   - Replace the Exhaust Gas Pressure Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No, voltage is below 4.7 Volts,

   - Go To 8

   No, voltage is above 5.3 Volts,

   - Go To 6

6. **CHECK THE (K354) DIFFERENTIAL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the PCM harness connectors.
   3. Remove the Main Relay.
   4. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay connector.
   5. Turn the ignition on.
   6. Measure the voltage of the (K354) Differential Pressure Sensor 5-Volt Supply circuit at the Differential Pressure Sensor harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K354) Differential Pressure Sensor 5-Volt Supply circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 7
7. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Measure the voltage of the (F856) 5-Volt Supply circuit at the Intake Air Pressure Sensor harness connector.

      Is there any voltage present?

      Yes

      - Repair the (F856) 5-Volt Supply circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Go To 10

8. **CHECK THE (K354) DIFFERENTIAL PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between ground and the (K354) Differential Pressure Sensor 5-Volt Supply circuit at the Differential Pressure Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 9

      No

      - Repair the (K354) Differential Pressure Sensor 5-Volt Supply circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
9. **CHECK THE (F856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (F856) 5-Volt Supply circuit at the Intake Air Pressure Sensor harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 10

      No

      - Repair the (F856) 5-Volt Supply circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
10. **POWERTRAIN CONTROL MODULE**

1. Turn the ignition off.
2. Inspect the (F856) 5-Volt Supply circuit between the Boost Pressure Sensor and the PCM.
3. Inspect the (F856) 5-Volt Supply circuit between the Intake Air Temperature and the PCM.
4. Inspect the (F856) 5-Volt Supply circuit between the Exhaust Gas Pressure Sensor and the PCM.
5. Inspect the (K354) Differential Pressure Sensor 5-Volt Supply circuit between the Differential Pressure Sensor and the PCM.
6. Look for any chafed, pierced, pinched, or partially broken wires.
7. Look for broken, bent, pushed out or corroded terminals.
8. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0670-GLOW PLUG CONTROL MODULE CONTROL CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: Glow Plug Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) receives a signal from the Glow Plug Module Control that the (A29) Battery 12-Volt Supply circuit is open.

POSSIBLE CAUSES

Possible Causes
(A29) BATTERY 12-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(A29) BATTERY 12-VOLT SUPPLY CIRCUIT OPEN
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. With the scan tool, actuate the Glow Plugs.
   4. Monitor the scan tool for at least two minutes.
   5. Cycle the ignition key off and on several times, leaving the ignition on for at least 10.0 seconds at a time.
   6. Start the engine.
   7. Allow the engine to reach normal operating temperature.
   8. Test drive the vehicle.
   9. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (A29) BATTERY 12-VOLT SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Glow Plug Module harness connector.

3. Measure the voltage on the (A29) Battery 12-Volt Supply circuit at the Glow Plug Module harness connector.

   Is the voltage reading equal to battery voltage?

   Yes

   - Replace the Glow Plug Control Module in accordance with service information.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Repair the (A29) Battery 12-Volt Supply circuit for an open circuit. If the Fuse is blown, check for a short to ground and repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0671-CYLINDER 1 GLOW PLUG CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: Glow Plug Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and the Glow Plug Module Glow Plug command on.

SET CONDITION

The Powertrain Control Module (PCM) receives a signal from the Glow Plug Module Control that the (A202) Glow Plug 1 Control circuit open or shorted to

ground.

POSSIBLE CAUSES

Possible Causes
(A202) GLOW PLUG 1 CONTROL CIRCUIT OPEN
(A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO GROUND
GLOW PLUG 1
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
   3. With the scan tool, Actuate the Glow Plugs for 30 seconds.
   4. With the scan tool, read the PCM DTCs.

   Did this DTC return?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (A202) GLOW PLUG 1 CONTROL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the Glow Plug 1 harness connector.
   3. Disconnect the Glow Plug Module harness connector.

4. Measure the resistance of the (A202) Glow Plug 1 Control circuit between the Glow Plug 1 harness connector and the Glow Plug Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (A202) Glow Plug 1 Control circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (A202) GLOW PLUG 1 CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (A202) Glow Plug 1 Control circuit at the Glow Plug 1 harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the (A202) Glow Plug 1 Control circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **GLOW PLUG 1**
   1. Measure the resistance through the Glow Plug 1 by measuring between ground and the Glow Plug terminal.

Is the resistance between 0.2 and 1.0 Ohm?

Yes

- Go To 5

No

- Replace Glow Plug 1 in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **GLOW PLUG MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plug and the Glow Plug Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Glow Plug Module in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0672-CYLINDER 2 GLOW PLUG CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article .

Fig. 11: Glow Plug Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and the Glow Plug Module Glow Plug command on.

SET CONDITION

The Powertrain Control Module (PCM) receives a signal from the Glow Plug Module Control that the (A203) Glow Plug 2 Control circuit open or shorted to ground.

POSSIBLE CAUSES

Possible Causes
(A203) GLOW PLUG 2 CONTROL CIRCUIT OPEN
(A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO GROUND
GLOW PLUG 2
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
   3. With the scan tool, Actuate the Glow Plugs for 30 seconds.
   4. With the scan tool, read the PCM DTCs.

      Did this DTC set again?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (A203) GLOW PLUG 2 CONTROL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the Glow Plug 2 harness connector.

3. Disconnect the Glow Plug Module harness connector.
4. Measure the resistance of the (A203) Glow Plug 2 Control circuit between the Glow Plug 2 harness connector and the Glow Plug Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (A203) Glow Plug 2 Control circuit for an open/high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (A203) GLOW PLUG 2 CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (A203) Glow Plug 2 Control circuit at the Glow Plug 2 harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the (A203) Glow Plug 2 Control circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **GLOW PLUG 2**
   1. Measure the resistance through the Glow Plug 2 by measuring between ground and the Glow Plug terminal.

Is the resistance between 0.2 and 1.0 Ohm?

Yes

- Go To 5

No

- Replace Glow Plug 2 in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **GLOW PLUG MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plug and the Glow Plug Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Glow Plug Module in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0673-CYLINDER 3 GLOW PLUG CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article ,

Fig. 12: Glow Plug Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and the Glow Plug Module Glow Plug command on.

SET CONDITION

The Powertrain Control Module (PCM) receives a signal from the Glow Plug Module Control that the (A204) Glow Plug 3 Control circuit open or shorted to ground.

POSSIBLE CAUSES

Possible Causes
(A204) GLOW PLUG 3 CONTROL CIRCUIT OPEN
(A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO GROUND
GLOW PLUG3
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
    3. With the scan tool, Actuate the Glow Plugs for 30 seconds.
    4. With the scan tool, read the PCM DTCs.

    Did this DTC set again?

    Yes

    - Go To 2

    No

    - Refer to the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **(A204) GLOW PLUG 3 CONTROL CIRCUIT OPEN**
    1. Turn the ignition off.
    2. Disconnect the Glow Plug 3 harness connector.
    3. Disconnect the Glow Plug Module harness connector.

4. Measure the resistance of the (A204) Glow Plug 3 Control circuit between the Glow Plug 3 harness connector and the Glow Plug Module harness connector.

   Is the resistance below 5.0 ohms?

   Yes

   - Go To 3

   No

   - Repair the (A204) Glow Plug 3 Control circuit for an open.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **(A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO GROUND**
   1. Measure the resistance between ground and the (A204) Glow Plug 3 Control circuit at the Glow Plug 3 harness connector.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (A204) Glow Plug 3 Control circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 4

4. **GLOW PLUG 3**
   1. Measure the resistance through the Glow Plug 3 by measuring between ground and the Glow Plug terminal.

      Is the resistance between 0.2 and 1.0 Ohm?

Yes

- Go To 5

No

- Replace Glow Plug 3 in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **GLOW PLUG MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plug and the Glow Plug Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Glow Plug Module in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0674-CYLINDER 4 GLOW PLUG CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: Glow Plug Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and the Glow Plug Module Glow Plug command on.

SET CONDITION

The Powertrain Control Module (PCM) receives a signal from the Glow Plug Module Control that the (A208) Glow Plug 4 Control circuit open or shorted to

ground.

POSSIBLE CAUSES

Possible Causes
(A208) GLOW PLUG 4 CONTROL CIRCUIT OPEN
(A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO GROUND
GLOW PLUG 4
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
   3. With the scan tool, Actuate the Glow Plugs for 30 seconds.
   4. With the scan tool, read the PCM DTCs.

      Did this DTC set again?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **(A208) GLOW PLUG 4 CONTROL CIRCUIT OPEN**
   1. Turn the ignition off.
   2. Disconnect Glow Plug 4 harness connector.
   3. Disconnect the Glow Plug Module harness connector.
   4. Measure the resistance of the (A208) Glow Plug Control circuit

between the Glow Plug 4 harness connector and the Glow Plug Module harness connector.

Is the resistance below 5.0 Ohms for each circuit?

Yes

- Go To 3

No

- Repair the (A208) Glow Plug 4 Control circuit for an open.
- Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **(A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO GROUND**
   1. Measure the resistance between ground and the (A208) Glow Plug Control circuit at the Glow Plug 4 harness connector.

      Is the resistance above 10k Ohms for any of the measurements?

      Yes

      - Go To 4

      No

      - Repair the (A208) Glow Plug 4 Control circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **GLOW PLUG 4**
   1. Measure the resistance through the Glow Plug 4 by measuring between ground and the Glow Plug terminal.

      Is the resistance between 0.2 and 1.0 Ohm?

      Yes

- Go To 5

No

- Replace Glow Plug 4 in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **GLOW PLUG MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plug and the Glow Plug Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Glow Plug Module in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0685-ASD/MAIN CONTROL CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

When the ignition is turned off, during after-run mode of operation.

SET CONDITION

The Powertrain Control Module (PCM) determines that the Main Relay has shut off before the AFTER-RUN mode of operation has been completed.

POSSIBLE CAUSES

Possible Causes
(K51) MAIN RELAY CONTROL CIRCUIT OPEN
(K51) MAIN RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
(K51) MAIN RELAY CONTROL CIRCUIT SHORTED TO GROUND
LOSS OF POWERTRAIN CONTROL MODULE POWERS OR GROUNDS
MAIN RELAY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR OTHER DTCS**
    1. Turn the ignition on.
    2. With the scan tool, check for additional DTCs.

    Are other DTCs present?

    Yes

    - Perform the diagnostics for the other DTCs before continuing.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

    No

    - Go To 2

2. **CLEAR CODE AND CHECK IF THE DTC RESETS**
   1. With the scan tool, erase PCM DTCs.
   2. Perform several ignition key cycles, pausing for at least 10 seconds between each cycle.
   3. Turn the ignition on.
   4. With the scan tool, read PCM DTCs.

   Did this DTC Return?

   Yes

   - Go To 3

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
3. **SUBSTITUTE THE MAIN RELAY**
   1. Turn the ignition off.
   2. Install a known good relay in place of the Main Relay.
   3. Turn the ignition on.
   4. With the scan tool, erase PCM DTCs.
   5. Perform several ignition key cycles, pausing for at least 10.0 seconds between each cycle.
   6. Turn the ignition on.
   7. With the scan tool, read PCM DTCs.

   Did this DTC return?

   Yes

   - Go To 4

   No

   - Replace the Main Relay in accordance with the service information.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      Were any problem found with the PCM powers and grounds?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 5

5. **CHECK THE (K51) MAIN RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Reconnect the PCM harness connectors.
   2. Turn the ignition off.
   3. Remove the Main Relay.
   4. Turn the ignition on.
   5. Measure the voltage an the (K51) Main Relay Control circuit at terminal 85 of the Main Relay connector.

      Is there any voltage present?

      Yes

      - Repair the (K51) Main Relay Control circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Go To 6

6. **CHECK THE (K51) MAIN RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Remove the Main Relay.
   3. Disconnect the PCM C2 harness connector.
   4. Measure the resistance between ground and the (K51) Main Relay Control circuit at terminal 85 of the Main Relay connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 7

      No

      - Repair the (K51) Main Relay Control circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **CHECK THE (K51) MAIN RELAY CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K51) Main Relay Control circuit between the PCM harness connector and the Main Relay connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the Main Relay Control circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0688-ASD/MAIN RELAY CONTROL SENSE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With ignition key on. Battery voltage greater than 10.0 Volts.

SET CONDITION

The Powertrain Control Module (PCM) detects an open or short to ground in the ASD Relay control circuit. One Trip Fault. Three good trips to turn off the MIL.

POSSIBLE CAUSES

POSSIBLE CAUSES
FUSED B+ CIRCUITS
ASD RELAY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR OTHER DTCS**
    1. Turn the ignition on.
    2. With the scan tool, check for additional DTCs.

    Are other DTCs present?

Yes

- Perform the diagnostics for the other DTCs before continuing.
- Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 2

2. **CLEAR CODE AND CHECK IF THE DTC RESETS**
   1. With the scan tool, erase PCM DTCs.
   2. Perform several ignition key cycles, pausing for at least 10.0 seconds between each cycle.
   3. Turn the ignition on.
   4. With the scan tool, read PCM DTCs.

   Did this DTC return?

   Yes

   - Go To 3

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

3. **MAIN RELAY**
   1. Turn the ignition off.
   2. Install a known good relay in place of the Main Relay.
   3. Turn the ignition on.
   4. With the scan tool, erase PCM DTCs.
   5. Perform several ignition key cycles, pausing for at least 10 seconds between each cycle.
   6. Turn the ignition on.
   7. With the scan tool, read PCM DTCs.

Did this DTC set again?

Yes

- Go To 4

No

- Replace the Main Relay in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK PCM POWER AND GROUNDS**
   1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   Were any problem found with the PCM powers and grounds?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0697-SENSOR REFERENCE VOLTAGE 3 CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Powertrain Control Module (PCM) contains 3 internal 5-Volt Sensor Supply sources. Each 5-Volt Supply source is split into parallel circuits to provide 5.0 Volts to multiple sensors. Sensor Supply 3 provides 5.0 Volts to the Accelerator Pedal Position Sensor 2, Camshaft Position Sensor, EGR Airflow Control Valve Position Sensor, EGR Valve Position Sensor, and the Intake Swirl Valve Position Sensor.

WHEN MONITORED

With the ignition on.

SET CONDITION

The PCM detects that the voltage on the 5-Volt Sensor Supply 3 circuit is below 4.7 Volts or above 5.3 Volts for 0.16 seconds.

POSSIBLE CAUSES

Possible Causes
(K854) ACCELERATOR PEDAL POSITION SENSOR 2 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K844) 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K854) ACCELERATOR PEDAL POSITION SENSOR 2 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K844) 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
ACCELERATOR PEDAL POSITION SENSOR
CAMSHAFT POSITION SENSOR (CMP)
EGR AIRFLOW CONTROL VALVE
EGR VALVE
INTAKE SWIRL VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

1. Turn the ignition on.
2. With the scan tool, erase PCM DTCs.
3. Turn the ignition off for 10.0 seconds.
4. Turn the ignition on.
5. With the scan tool, View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE ACCELERATOR PEDAL POSITION SENSOR**
   1. Turn the ignition off.
   2. Disconnect the Accelerator Pedal Position Sensor (APPS) harness connector.
   3. Turn the ignition on.
   4. Measure the voltage on the (K854) APPS 2 5-Volt Supply circuit at the Accelerator Pedal Position Sensor harness connector.

      Is the voltage between 4.7 and 5.3 Volts?

      Yes

      - Replace the Accelerator Pedal Position Sensor in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 3
3. **CHECK THE CAMSHAFT POSITION SENSOR**

1. Turn the ignition off.
2. Disconnect the Camshaft Position Sensor (CMP) harness connector.
3. Turn the ignition on.
4. Measure the voltage on the (K844) 5-Volt Supply circuit at the CMP Sensor harness connector.

   Is the voltage between 4.7 and 5.3 Volts?

   Yes

   - Replace the Camshaft Position Sensor in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 4

4. **CHECK THE EGR AIRFLOW CONTROL VALVE**
   1. Turn the ignition off.
   2. Disconnect the EGR Airflow Control Valve harness connector.
   3. Turn the ignition on.
   4. Measure the voltage on the (K844) 5-Volt Supply circuit at the EGR Airflow Control Valve harness connector.

      Is the voltage between 4.7 and 5.3 Volts?

      Yes

      - Replace the EGR Airflow Control Valve in accordance with the service information. With the scan tool, navigate to Miscellaneous Procedures and perform the Throttle Valve Learn procedure.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Go To 5

5. **CHECK THE EGR VALVE**
   1. Turn the ignition off.
   2. Disconnect the EGR Valve harness connector.
   3. Turn the ignition on.
   4. Measure the voltage on the (K844) 5-Volt Supply circuit at the EGR Valve harness connector.

      Is the voltage between 4.7 and 5.3 Volts?

      Yes

      - Replace the EGR Valve in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 6

6. **CHECK THE INTAKE SWIRL VALVE**
   1. Turn the ignition off.
   2. Disconnect the Intake Swirl Valve harness connector.
   3. Turn the ignition on.
   4. Measure the voltage on the (K844) 5-Volt Supply circuit at the Intake Swirl Valve harness connector.

      Is the voltage between 4.7 and 5.3 Volts?

      Yes

      - Replace the Intake Swirl Valve in accordance with the service information. With the scan tool, navigate to Miscellaneous Procedures and perform the Throttle Valve Learn procedure.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

No, voltage is below 4.7 Volts,

- Go To 7

No, voltage is above 5.3 Volts,

- Go To 9

7. **CHECK THE (K854) ACCELERATOR PEDAL POSITION SENSOR 5-VOLT SUPPLY FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Powertrain Control Module harness connectors.
   3. Measure the resistance between ground and the (K854) APPS 2 5-Volt Supply circuit at the APPS harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 8

   No

   - Repair the (K854) APPS 2 5-Volt Supply circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

8. **CHECK THE (K844) 5-VOLT SUPPLY FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Powertrain Control Module harness connectors.
   3. Measure the resistance between ground and the (K844) 5-Volt Supply circuit at the CMP Sensor harness connector.

   Is the resistance above 10k Ohms?

   Yes

- Go To 9

No

- Repair the (K844) 5-Volt Supply circuit for a short to ground.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

9. **CHECK THE (K854) ACCELERATOR PEDAL POSITION SENSOR 5-VOLT SUPPLY FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Remove the Main Relay.
   3. Connect a jumper wire between cavity 30 and cavity 87 of the Main Relay connector.
   4. Turn the ignition on.
   5. Measure the voltage on the (K854) APPS 2 5-Volt Supply circuit at the APPS harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K854) APPS 2 5-Volt Supply circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 10

10. **CHECK THE (K844) 5-VOLT SUPPLY FOR A SHORT TO VOLTAGE**
    1. Measure the voltage on the (K844) 5-Volt Supply circuit at the APPS harness connector.

    Is there any voltage present?

Yes

- Repair the (K844) 5-Volt Supply circuit for a short to voltage.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 11

11. **POWERTRAIN CONTROL MODULE**
    1. Turn the ignition off.
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

    No

    - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0703-BRAKE SWITCH 2 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to voltage on the (B16) Brake Switch 2 Signal circuit. Fault sets immediately.

POSSIBLE CAUSES

Possible Causes
(B16) BRAKE SWITCH 2 CIRCUIT SHORTED TO VOLTAGE
BRAKE SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, erase PCM DTCs.
    3. Turn the ignition off for 10.0 seconds.
    4. Turn the ignition on.
    5. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

    - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE BRAKE SWITCH**

1. Turn the ignition off.
2. Disconnect the Brake Switch harness connector.
3. Turn the ignition on.
4. With the scan tool, select View DTCs.

   Did the status change to stored for this DTC?

   Yes

   - Replace the Brake Switch in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE (B16) BRAKE SWITCH 2 CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition on.
   2. Measure for voltage on the (B16) Brake Switch 2 circuit at the Brake Switch harness connector.

      Is there any voltage present?

      Yes

      - Repair the (B16) Brake Switch 2 circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 4

4. **POWERTRAIN CONTROL MODULE**
   1. Turn the ignition off.

2. Inspect the (B16) Brake Switch 2 circuit between the Brake Switch and the Powertrain Control Module.
3. Look for any chafed, pierced, pinched, or partially broken wires.
4. Look for broken, bent, pushed out or corroded terminals.
5. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0730-INCORRECT GEAR RATIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

When the vehicle is driven over 15 km/h and when engine speed is greater than 1000 RPM.

SET CONDITION

When the Powertrain Control Module detects a change in the vehicle to engine speed ratio.

POSSIBLE CAUSES

Possible Causes
TIRE/WHEEL SIZES DO NOT MATCH THE PROGRAMMED TIRE/WHEEL SIZE FOR THE VEHICLE
ABS MODULE IS TRANSMITTING INCORRECT WHEEL SPEED
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE PROGRAMMING OF THE TIRE SIZES**
   1. With the scan tool, record the tire size programmed into the TIPM.
   2. Record the size of all four tires on the vehicle.

   Do all four tires match the size programmed into the TIPM?

   Yes

   - Go To 3

   No

- Program the correct tire size into the TIPM. If the tires are different sizes, replace the tires as needed to make all tires the same size and program the correct tire size into the TIPM.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE ABS WHEEL SPEED**
   1. With the scan tool, View DTCs in the ABS Module.

      Are there any DTCs present in the ABS Module?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4
4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors at the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0830-CLUTCH PEDAL SWITCH CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an incoherent Clutch Interlock Switch Signal for 0.16 seconds.

POSSIBLE CAUSES

Possible Causes
(T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
(T26) CLUTCH UPSTOP SIGNAL CIRCUIT SHORTED TO GROUND
(Z932) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CLUTCH INTERLOCK SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Press and hold the clutch pedal for 10 seconds.
   4. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **(Z925) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Clutch Interlock Switch harness connector.
   3. Using a 12-Volt test light connected to 12 Volts, check the (Z925) Ground circuit between the Clutch Interlock Switch harness connector.

   NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

   Is the test light illuminated and bright?

   Yes

   - Go To 3

   No

   - Repair the (Z925) Ground for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

3. **(T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT SHORTED TO GROUND**
   1. Measure the resistance between ground and the (T141) Clutch Interlock Switch Signal circuit at the Clutch Interlock Switch harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the (T141) Clutch Interlock Switch Signal circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **CHECK THE (T26) CLUTCH UPSTOP SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T26) Clutch Upstop Switch Signal circuit at the Clutch Interlock Switch harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 5

      No

      - Repair the (T141) Clutch Interlock Switch Signal circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
5. **CLUTCH INTERLOCK SWITCH**
   1. Connect a jumper wire between the (Z925) Ground circuit and the

(T141) Clutch Interlock Switch Signal circuit in the Clutch Interlock Switch harness connector.

2. Turn the ignition on.
3. With the scan tool, monitor the Clutch Interlock status.

NOTE: The scan tool should display the Clutch Interlock status as pressed with the jumper wire in place and not pressed with the jumper wire removed.

Does the scan tool display the status as described above?

Yes

- Replace the Clutch Interlock Switch in accordance with the Service Information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 6

6. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Clutch Interlock Switch and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0A5B-GENERATOR CURRENT SENSOR CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (K20) Generator Field Control circuit voltage is below 0.07 Volts for 0.16 seconds.

POSSIBLE CAUSES

Possible Causes
(K20) GENERATOR FIELD CONTROL CIRCUIT OPEN
(K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO GROUND
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, erase PCM DTCs.
   3. Test drive the vehicle.
   4. With the scan tool, read PCM DTCs.

   Did this DTC return?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Generator C2 harness connector.
   3. Disconnect the PCM C1 harness connector.
   4. Measure the resistance between ground and the (K20) Generator Field Control circuit at the Generator C2 harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K20) Generator Field Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K20) Generator Field Control circuit between the Generator C2 harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K20) Generator Field Control circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **GENERATOR**
   1. Replace the Generator in accordance with the service information.
   2. Reconnect the Generator C2 harness connector.
   3. Reconnect the PCM C1 harness connector.
   4. Turn the ignition on.
   5. With the scan tool, erase PCM DTCs.
   6. Test drive the vehicle.
   7. With the scan tool, read PCM DTCs.

      Did this DTC return?

      Yes

      - Go To 5

      No

      - Repair is complete.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L

DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the Powertrain Control Module wiring and connectors.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Check for proper PCM power supply from the ignition switch and the Main relay. Check the PCM for proper ground supply.
   7. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P0A5C-GENERATOR CURRENT SENSOR CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects that the (K20) Generator Field Control circuit is shorted to voltage.

POSSIBLE CAUSES

Possible Causes
(K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, erase PCM DTCs.
   3. Test drive the vehicle.
   4. With the scan tool, read PCM DTCs.

   Did this DTC return?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

1. Turn the ignition off.
2. Disconnect the Generator C2 harness connector.
3. Disconnect the PCM C1 harness connector.
4. Remove the Main Relay.
5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay connector.
6. Turn the ignition on.
7. Measure the voltage on the (K20) Generator Field Control circuit at the Generator C2 harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K20) Generator Field Control circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **CHECK THE GENERATOR**
   1. Measure the voltage on the (K20) Generator Field Control circuit at the Generator terminal.

      Is there any voltage present?

      Yes

      - Replace the Generator in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

- Go To 4

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the Powertrain Control Module wiring and connectors.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Check for proper PCM power supply from the ignition switch and the Main relay. Check the PCM for proper ground supply.
   7. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P1614-ECU RESET/RECOVERY OCCURRED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on, engine running.

SET CONDITION

A reset has been triggered by the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
LOSS OF POWERTRAIN CONTROL MODULE POWERS OR GROUNDS
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: Diagnose and repair any system voltage or Main Relay DTCs before continuing with this test.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.
3. Start the engine and test drive the vehicle.
4. With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes

- Go To 2

No

- Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK PCM POWER AND GROUNDS**

NOTE: Diagnose and repair any system voltage or Main Relay DTCs before continuing with this test.

1. Perform the CHECKING THE PCM POWER AND GROUND diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   Were any problem found with the PCM powers and grounds?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P1649-GLOW PLUG MODULE POWER SUPPLY CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Glow Plug Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Glow Plug Control Module reports a power supply circuit fault to the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
(F343) FUSED ASD/MAIN RELAY OUTPUT CIRCUIT OPEN/HIGH RESISTANCE
(A29) FUSED B+ CIRCUIT OPEN/HIGH RESISTANCE
(Z924) GROUND CIRCUIT OPEN/HIGH RESISTANCE
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: Diagnose and repair any system voltage or Main Relay DTCs before continuing with this test.

   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. With the scan tool, actuate the Glow Plugs.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (F343) FUSED ASD/MAIN RELAY OUTPUT CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.

2. Disconnect the Glow Plug Module harness connector.
3. Turn the ignition on.
4. Using a 12-Volt test light connected to ground, check the (K343) Fused ASD/Main Relay Output circuit in the Glow Plug Module harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 3

No

- Repair the (K343) Fused ASD/Main Relay Output circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (A29) FUSED B+ CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Using a 12-Volt test light connected to ground, check the (A29) Fused B+ circuit in the Glow Plug Module harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 4

No

- Repair the (A29) Fused B+ circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **CHECK THE (Z924) GROUND CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Using a 12-Volt test light connected to B+, check the (Z924) Ground circuit in the Glow Plug Module harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Replace the Glow Plug Module in accordance with the service information.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Repair the (Z924) Ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P1946-CRASH EVENT DETECTED - ENGINE SHUTDOWN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Airbag Control Module reported a crash event to the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
A CRASH EVENT OCCURRED

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

DTC IS ACTIVE

1. Ignition on, engine not running.
2. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Perform the appropriate repairs and erase the DTC. **Fault codes U0100, and U0106 will set with this DTC. Do not attempt to repairs these faults as they are erroneously set.**

   No

   - Perform the INTERMITTENT DTC diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

P1961-PISTON COOLING CONTROL CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects an open in the (K549) Piston Cooling Valve Control circuit.

POSSIBLE CAUSES

Possible Causes
(K549) PISTON COOLING VALVE CONTROL CIRCUIT OPEN/HIGH RESISTANCE
PISTON COOLING VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine.
   4. Monitor the scan tool for up to five minutes.
   5. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K549) PISTON COOLING VALVE CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.

2. Disconnect the Piston Cooling Valve harness connector.
3. Disconnect the PCM C1 harness connector.
4. Measure the resistance of the (K549) Piston Cooling Valve Control circuit between the Piston Cooling Valve harness connector and the PCM C1 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K549) Piston Cooling Valve Control circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE PISTON COOLING VALVE FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance across the terminals of the Piston Cooling Valve.

      Is the resistance below 100.0 Ohms?

      Yes

      - Go To 4

      No

      - Replace the Piston Cooling Valve in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and

connectors between the Piston Cooling Valve and the Powertrain Control Module.

2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals.
4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P1962-PISTON COOLING CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to ground in the (K549) Piston Cooling Valve Control circuit.

POSSIBLE CAUSES

Possible Causes
(K549) PISTON COOLING VALVE CONTROL CIRCUIT SHORTED TO GROUND
PISTON COOLING VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine.
   4. Monitor the scan tool for up to five minutes.
   5. With the scan tool, select View DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K549) PISTON COOLING VALVE CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Piston Cooling Valve harness connector.
   3. Disconnect the PCM C1 harness connector.

4. Measure the resistance between ground and the (K549) Piston Cooling Valve Control circuit at the Piston Cooling Valve harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K549) Piston Cooling Valve Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE PISTON COOLING VALVE**
   1. Measure the resistance between ground and either terminal of the Piston Cooling Valve.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Replace the Piston Cooling Valve in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Piston Cooling Valve and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.

4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
5. Look for the data to change or for the DTC to reset during the wiggle test.
6. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P1963-PISTON COOLING CONTROL CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

The Powertrain Control Module (PCM) detects a short to voltage in the (K549) Piston Cooling Valve Control circuit.

POSSIBLE CAUSES

Possible Causes
(K549) PISTON COOLING VALVE CONTROL CIRCUIT SHORTED TO VOLTAGE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

   NOTE: Diagnose and repair any system voltage or Main Relay DTCs before continuing with this test.

   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. Start the engine.
   4. Monitor the scan tool for up to five minutes.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K549) PISTON COOLING VALVE CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Piston Cooling Valve harness connector.
   3. Remove the Main Relay.
   4. Connect a jumper wire between cavity 30 and cavity 87 of the Main

Relay connector.

5. Turn the ignition on.
6. Measure for voltage on the (K549) Piston Cooling Valve Control circuit at the Piston Cooling Valve harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K549) Piston Cooling Valve Control circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Go To 3

3. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Piston Cooling Valve and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
   5. Look for the data to change or for the DTC to reset during the wiggle test.
   6. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P2006-INTAKE MANIFOLD RUNNER (SWIRL) CONTROL STUCK CLOSED - BANK 1

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the Intake Swirl Valve Actuator is not in learning mode.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Intake Swirl Valve Actuator duty cycle is above 98% or below -48% for 0.48 of a second indicating a Intake Swirl Valve Actuator that is stuck.

POSSIBLE CAUSES

Possible Causes
(K603) INTAKE SWIRL VALVE ACTUATOR (+) CONTROL CIRCUIT SHORTED TO VOLTAGE
(K601) INTAKE SWIRL VALVE ACTUATOR (-) CONTROL CIRCUIT SHORTED TO VOLTAGE
(K603) INTAKE SWIRL VALVE ACTUATOR (+) CONTROL CIRCUIT OPEN/HIGH RESISTANCE
(K601) INTAKE SWIRL VALVE ACTUATOR (-) CONTROL CIRCUIT OPEN/HIGH RESISTANCE
(K603) INTAKE SWIRL VALVE ACTUATOR (+) CONTROL CIRCUIT SHORTED TO GROUND
(K601) INTAKE SWIRL VALVE ACTUATOR (-) CONTROL CIRCUIT SHORTED TO GROUND

INTAKE SWIRL VALVE ACTUATOR IS PHYSICALLY STUCK
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, clear DTCs in the Powertrain Control Module (PCM).
    3. With the scan tool, actuate the Intake Swirl Valve Actuator.
    4. Monitor the scan tool for at least two minutes.
    5. With the scan tool, select View DTCs.

    Is the status Active for this DTC?

    Yes

    - Go To 2

    No

    - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **OTHER DTCS**
    1. With the scan tool, select View DTCs.

    Are there any other Intake Swirl Valve Actuator DTCs present?

    Yes

    - Repair the other Swirl Valve Actuator DTCs before proceeding.

    No

    - Go To 3

3. **CHECK THE INTAKE SWIRL VALVE ACTUATOR**
   1. Turn the ignition off.
   2. Physically check the Intake Swirl Servo Motor operation.

      Does the Intake Swirl Valve Actuator move freely?

      Yes

      - Go To 4

      No

      - Replace the Intake Swirl Valve Actuator in accordance with the service information. With the scan tool, navigate to Miscellaneous Procedures and perform the Swirl Control Learn routine.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
4. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Intake Swirl Valve Actuator and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Replace the Powertrain Control Module. **Before removing the**

PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool. . Refer to **REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P2008-INTAKE MANIFOLD RUNNER (SWIRL) CONTROL CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the Intake Swirl Valve Actuator commanded off.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Intake Swirl Valve Actuator Control circuit is open for 0.1 of a second.

POSSIBLE CAUSES

Possible Causes
(K603) INTAKE SWIRL VALVE ACTUATOR (+) CONTROL CIRCUIT SHORTED TO VOLTAGE
(K601) INTAKE SWIRL VALVE ACTUATOR (-) CONTROL CIRCUIT SHORTED TO VOLTAGE
(K603) INTAKE SWIRL VALVE ACTUATOR (+) CONTROL CIRCUIT OPEN/HIGH RESISTANCE
(K601) INTAKE SWIRL VALVE ACTUATOR (-) CONTROL CIRCUIT OPEN/HIGH RESISTANCE
INTAKE SWIRL VALVE ACTUATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. With the scan tool, actuate the Intake Swirl Valve Actuator.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K603) INTAKE SWIRL VALVE ACTUATOR (+) CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Intake Swirl Valve Actuator harness connector.
   3. Disconnect the Powertrain Control Module C1 harness connector.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K603) Intake Swirl Valve Actuator (+) Control circuit in the Intake Swirl Valve Actuator harness connector.

   Is there any voltage present?

   Yes

   - Repair the (K603) Intake Swirl Valve Actuator (+) Control circuit for a short to voltage.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L**

DIESEL .

No

- Go To 3

3. **CHECK THE (K601) INTAKE SWIRL VALVE ACTUATOR (-) CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Measure the voltage of the (K601) Intake Swirl Valve Actuator (-) Control circuit in the Intake Swirl Valve Actuator harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K601) Intake Swirl Valve Actuator (-) Control circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

      No

      - Go To 4

4. **CHECK THE (K603) INTAKE SWIRL VALVE ACTUATOR (+) CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Measure the resistance of the (K603) Intake Swirl Valve Actuator Control circuit between the Intake Swirl Valve Actuator harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (K603) Intake Swirl Valve Actuator Control circuit for an open or high resistance.

- Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

5. **CHECK THE (K601) INTAKE SWIRL VALVE ACTUATOR (-) CONTROL CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (K601) Intake Swirl Valve Actuator Control circuit between the Intake Swirl Valve Actuator harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (K601) Intake Swirl Valve Actuator Control circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .
6. **CHECK THE INTAKE SWIRL VALVE ACTUATOR**
   1. Measure the resistance through the Intake Swirl Valve Actuator.

      Is the resistance below 15.0 Ohms?

      Yes

      - Go To 7

      No

      - Replace the Intake Swirl Valve Actuator in accordance with the service information. With the scan tool, navigate to Miscellaneous Procedures and perform the Swirl Control Learn routine.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

7. **POWERTRAIN CONTROL MODULE**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Intake Swirl Valve Actuator and the Powertrain Control Module.
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

    No

    - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST - 2.2L DIESEL. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P2009-INTAKE MANIFOLD RUNNER (SWIRL) CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Intake Swirl Valve Actuator Control circuit is shorted to ground for 0.1 of a second.

POSSIBLE CAUSES

Possible Causes
(K603) INTAKE SWIRL VALVE ACTUATOR (+) CONTROL CIRCUIT SHORTED TO GROUND
(K601) INTAKE SWIRL VALVE ACTUATOR (-) CONTROL CIRCUIT SHORTED TO GROUND
INTAKE SWIRL VALVE ACTUATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, clear DTCs in the Powertrain Control Module.
   3. With the scan tool, actuate the Intake Swirl Valve Actuator.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .
2. **CHECK THE (K603) INTAKE SWIRL VALVE ACTUATOR (+) CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Intake Swirl Valve Actuator harness connector.
   3. Disconnect the Powertrain Control Module C1 harness connector.

4. Measure the resistance between ground and the (K603) Intake Swirl Valve Actuator (+) Control circuit at the Intake Swirl Valve Actuator harness connector.

   Is the resistance above 10K Ohms?

   Yes

   - Go To 3

   No

   - Repair the (K603) Intake Swirl Valve Actuator (+) Control circuit for a short to ground.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

3. **CHECK THE (K601) INTAKE SWIRL VALVE ACTUATOR (-) CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (K601) Intake Swirl Valve Actuator (-) Control circuit at the Intake Swirl Valve Actuator harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the (K601) Intake Swirl Valve Actuator (-) Control circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

4. **INTAKE SWIRL VALVE ACTUATOR**
   1. Measure the resistance between ground and either terminal of the Intake Swirl Valve Actuator.

      Is the resistance above 10k Ohms?

Yes

- Replace the Intake Swirl Valve Actuator in accordance with the service information. With the scan tool, navigate to Miscellaneous Procedures and perform the Swirl Control Learn routine.
- Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

No

- Go To 5

5. **POWERTRAIN CONTROL MODULE**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Intake Swirl Valve Actuator and the Powertrain Control Module.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

   No

   - Replace the Powertrain Control Module. **Before removing the PCM, perform the "Replace PCM" routine in the Miscellaneous Functions tab of the scan tool.** . Refer to **REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST - 2.2L. Refer to **PCM VERIFICATION TEST - 2.2L DIESEL** .

P2010-INTAKE MANIFOLD RUNNER (SWIRL) CONTROL CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING**

DIAGRAMS article .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Powertrain Control Module (PCM) detects that the Intake Swirl Valve Actuator Control circuit is shorted to voltage for 0.1 of a second.

POSSIBLE CAUSES

Possible Causes
FUSED ASD/MAIN RELAY POWER SUPPLY TO PCM CIRCUITS OPEN
(K603) INTAKE SWIRL VALVE ACTUATOR (+) CONTROL CIRCUIT SHORTED TO VOLTAGE
(K601) INTAKE SWIRL VALVE ACTUATOR (-) CONTROL CIRCUIT SHORTED TO VOLTAGE
(K603) INTAKE SWIRL VALVE ACTUATOR (+) CONTROL CIRCUIT OPEN/HIGH RESISTANCE
(K601) INTAKE SWIRL VALVE ACTUATOR (-) CONTROL CIRCUIT OPEN/HIGH RESISTANCE
INTAKE SWIRL VALVE ACTUATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE - 2.2L DIESEL .

DIAGNOSTIC TEST

1. **DTC IS ACTIVE**

NOTE: If there are Main Relay DTCs present, diagnose those DTCs before proceeding with this test procedure.

1. Ignition on, engine not running.
2. With the scan tool, clear DTCs in the Powertrain Control Module.

3. With the scan tool, actuate the Intake Swirl Valve Actuator.
4. Monitor the scan tool for at least two minutes.
5. With the scan tool, select View DTCs.

   Is the status Active for this DTC?

   Yes

   - Go To 2

   No

   - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **INTERMITTENT CONDITION - 2.2L DIESEL** .

2. **CHECK THE (K603) INTAKE SWIRL VALVE ACTUATOR (+) CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Intake Swirl Valve Actuator harness connector.
   3. Disconnect the Powertrain Control Module C1 harness connector.
   4. Remove the Main Relay.
   5. Connect a jumper wire between cavity 87 and cavity 30 of the Main Relay Connector.
   6. Turn the ignition on.
   7. Measure the voltage of the (K603) Intake Swirl Valve Actuator (+) Control circuit in the Intake Swirl Valve Actuator harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K603) Intake Swirl Valve Actuator (+) Control circuit for a short to voltage.
