Ground Distribution

Circuit Identification (LHD)

NOTE: See pages 16-9 and 10 for illustrated ground locations.

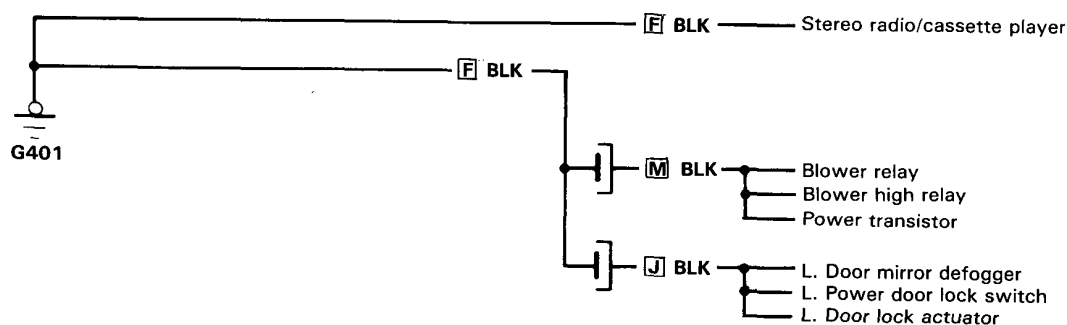

- F**: Right side wire harness
- G**: Left side wire harness
- J**: Passenger's door wire harness
- M**: Blower wire harness

(RHD)

NOTE: See pages 16-9, 11 and 13 for illustrated ground locations.

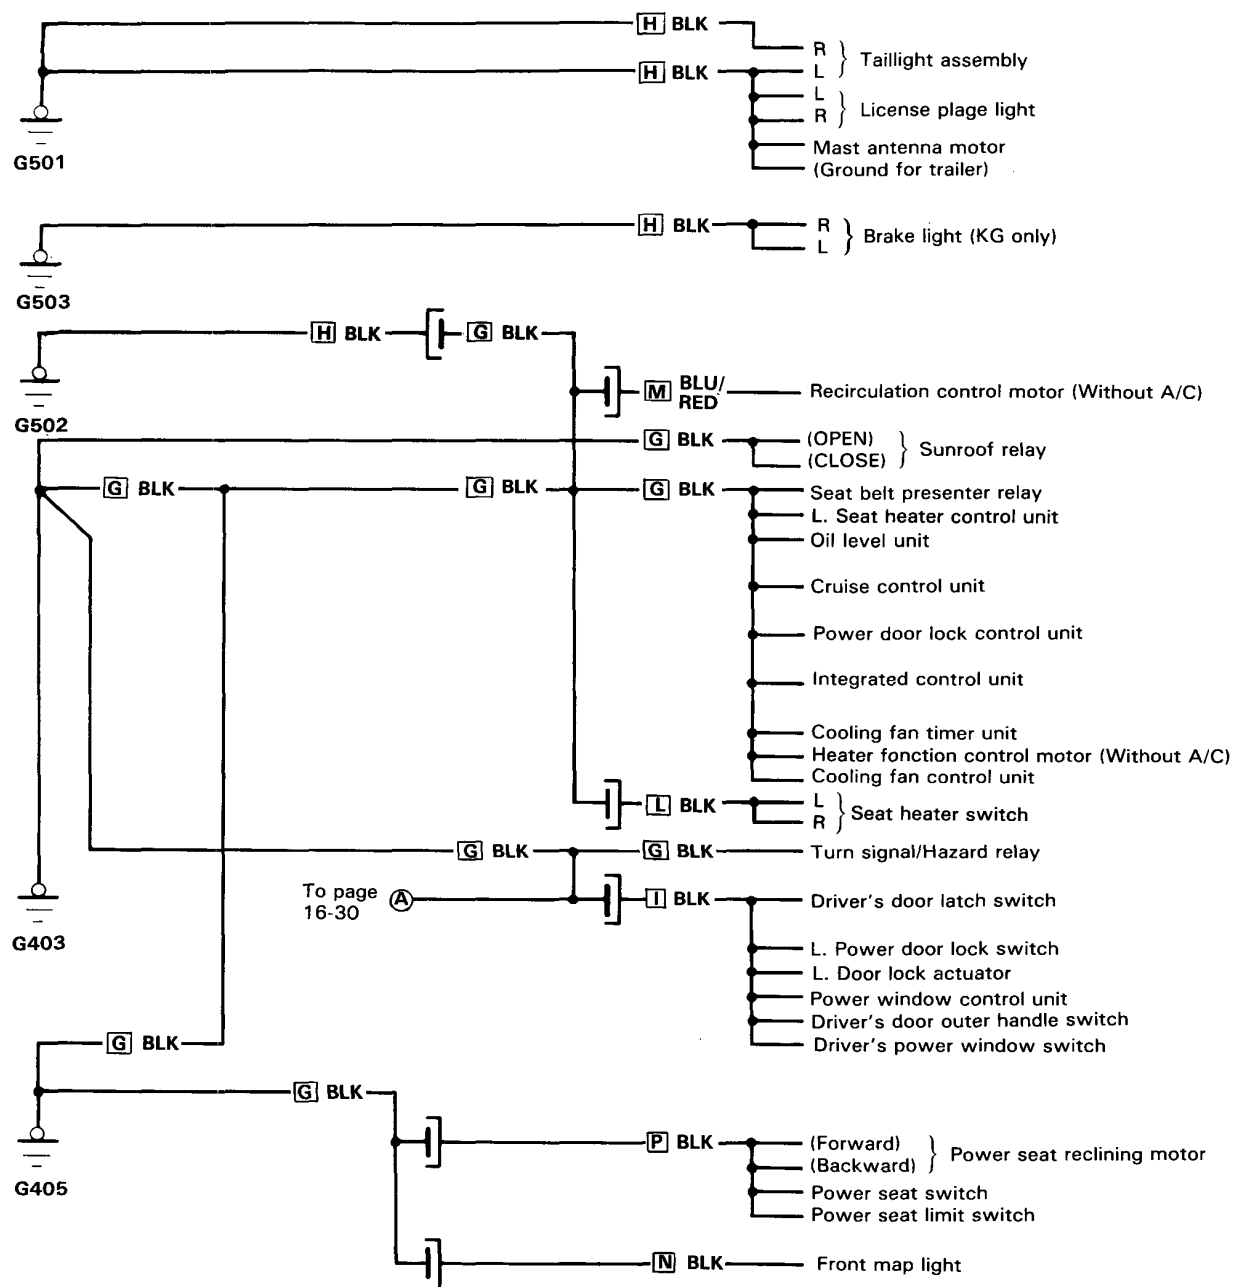

- F: Right side wire harness
G: Left side wire harness
H: Rear wire harness
J: Passenger's door wire harness
M: Blower wire harness
N: Roof wires

(cont'd)

Ground Distribution

Circuit Identification (LHD)

NOTE: See pages 16-10 and 12 for illustrated ground locations.

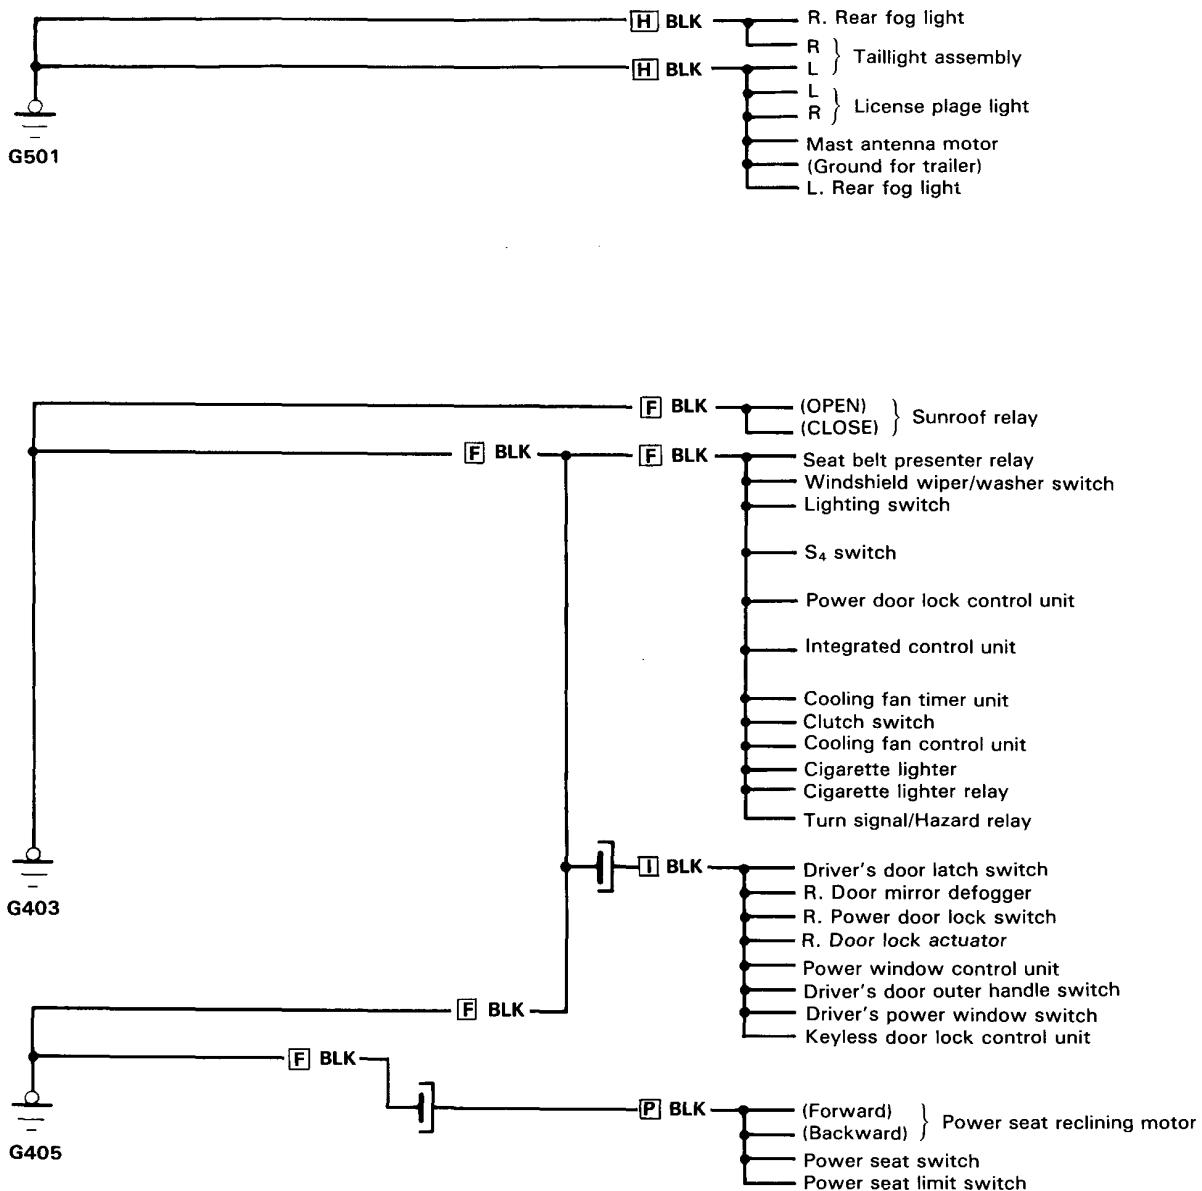

- [G]: Left side wire harness
- [H]: Rear wire harness
- [I]: Driver's door wire harness
- [L]: Console wires
- [M]: Blower wire harness
- [N]: Roof wires
- [P]: Power seat wire harness

(RHD)

NOTE: See pages 16-11 and 13 for illustrated ground locations.

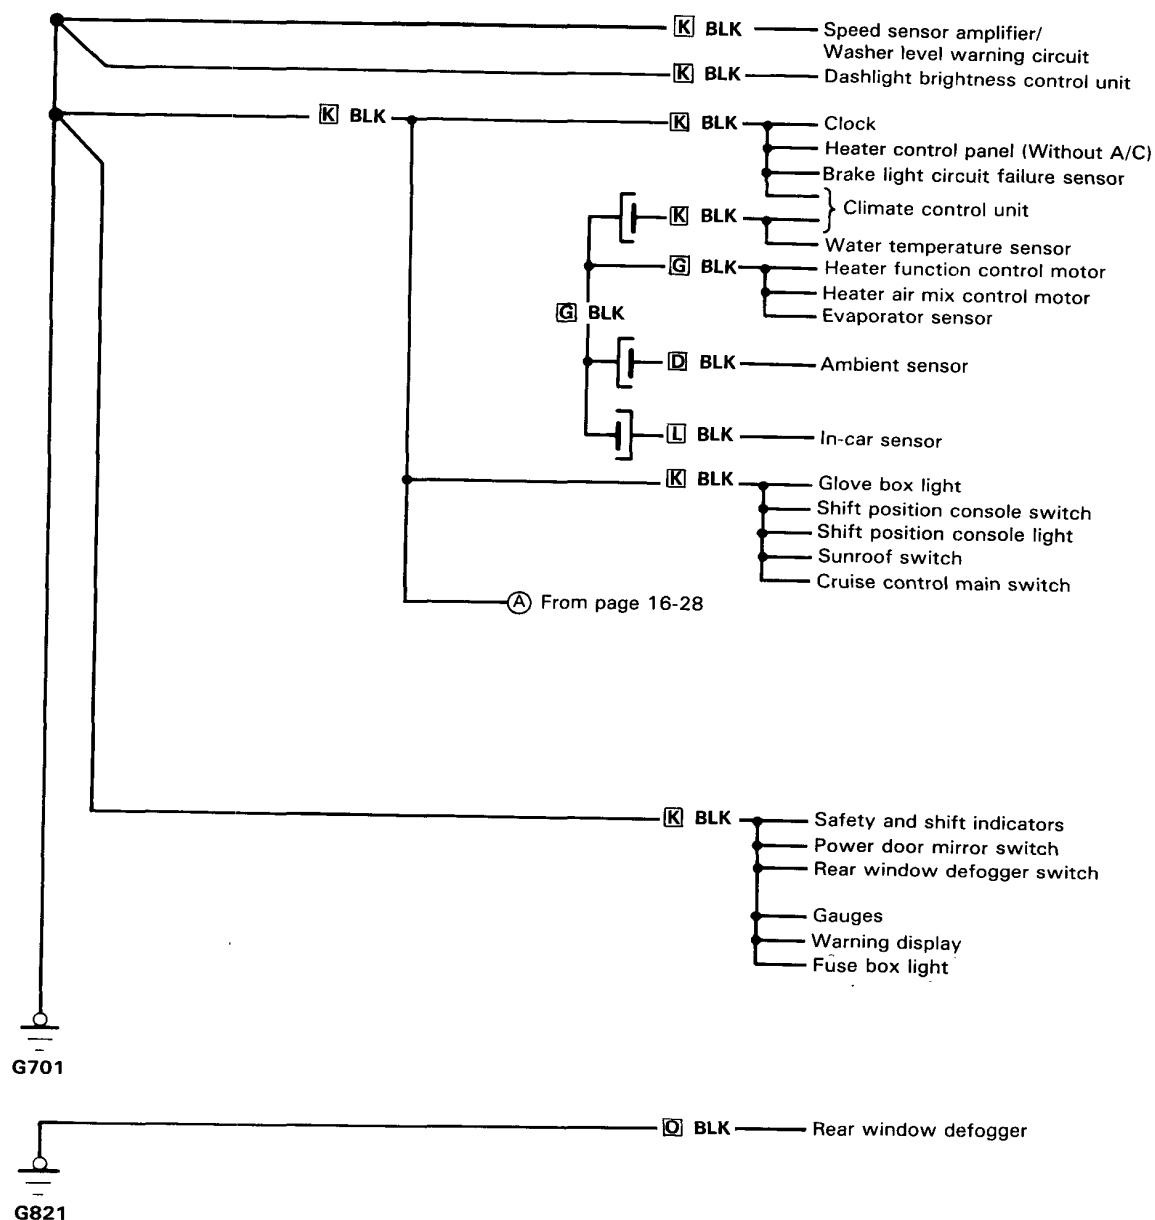

[F]: Right side wire harness
[H]: Rear wire harness
[I]: Driver's door wire harness
[P]: Power seat wire harness

(cont'd)

Ground Distribution

Circuit Identification (LHD)

NOTE: See pages 16-12 and 14 for illustrated ground locations.

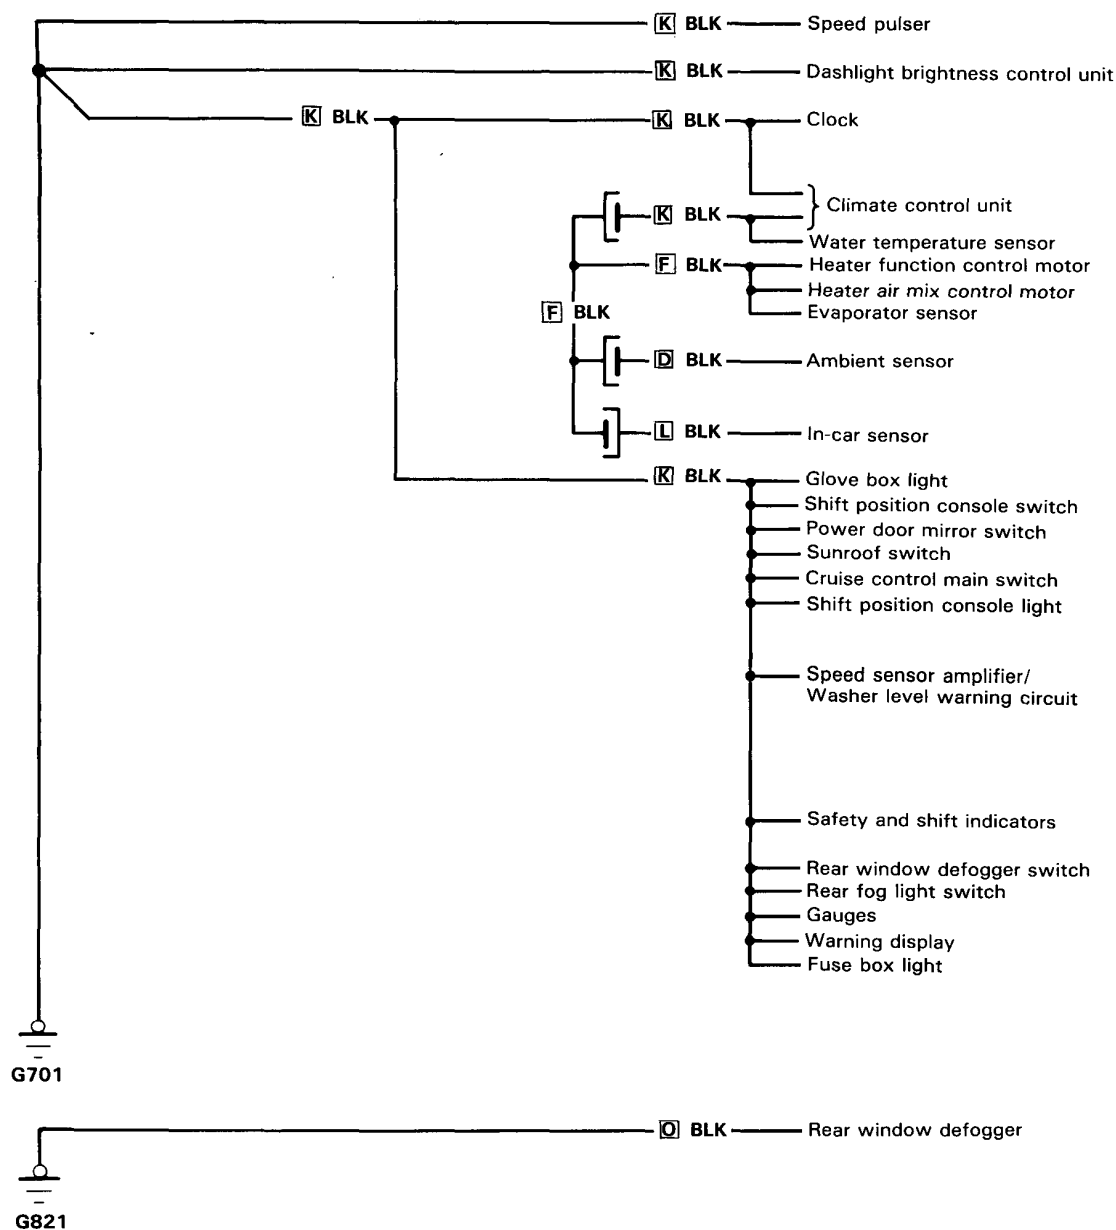

- [D]: Engine compartment wire harness
- [G]: Left side wire harness
- [K]: Dashboard wire harness
- [L]: Console wires
- [Q]: Defogger ground wire

(RHD)

NOTE: See pages 16-13 and 15 for illustrated ground locations.

- [D]: Engine compartment wire harness
[F]: Right side wire harness
[K]: Dashboard wire harness
[L]: Console wires
[Q]: Defogger ground wire

Battery

Test

NOTE: To get accurate results, the temperature of the electrolyte must be between 15 and 38°C (59 and 100°F) before testing.

Test Equipment Required:

- Battery tester with:
Voltmeter with 0–18 V scale, Ammeter with 0–100 A and 0–500 A scales, and a carbon pile with 0–300 W.
- 12 V Battery Charger:
Fast charge capability of 50 A and slow charge capability of 5 A.

Test Procedure:

WARNING Keep sparks, flames and cigarettes away while charging battery.

CAUTION: Battery electrolyte is a sulfuric acid solution.

- If it spills on painted surfaces, clothing, or skin, rinse it off with water immediately to minimize the damage.
 - Always wear safety goggles or a face shield when servicing a battery.
1. Check for damage: If the case is cracked or the posts are loose, replace the battery.
 2. Check indicator (for basic charge condition): Blue or Green is OK. If the indicator is red, peel the tape off, remove the caps, and add distilled water; then reinstall the caps and tape. If the indicator is clear, go to step 3.

3. Test battery load capacity by connecting a battery tester, and applying a load of 3 times the battery ampere hour rating.

When the load has been applied for exactly 15 seconds, the battery voltage reading should stay above 9.6 V.

- If the reading stays above 9.6 V, the battery is OK; clean its terminals and case, and reinstall it.
- If the reading is between 6.5 and 9.6 V, fast charge the battery by connecting a battery charger, for 3 minutes at an initial rate of 40 amps.

CAUTION: Amperage will drop as voltage increases; do not increase the amperage to compensate or you may damage the battery.

Watch the battery voltage during the entire 3 minutes; the highest reading should stay below 15.5 V.

- If the reading stays below 15.5 V, the battery is OK; clean its terminals and case, and reinstall it.
- If the reading exceeds 15.5 V any time during the 3 minutes of fast charge, the battery is no good; replace it.
- If the reading drops below 6.5 V, slow charge the battery by connecting a battery and charge at 5 amps for no more than 24 hours, (or until the indicator shows full charge, or the specific gravity of the electrolyte is at least 1.250). Then test load capacity again.
 - If the voltage stays above 9.6 V, the battery is OK; clean its terminals and case, and reinstall it.
 - If the voltage still drops below 6.5 V, the battery is no good; replace it.
