CIRCUIT DESCRIPTION

The Heated Oxygen Sensor (HO2S) is used to monitor oxygen concentration in the exhaust gas. For optimum catalytic converter operation, the air-fuel mixture must be maintained near the ideal stoichiometric ratio. The HO2S output voltage changes suddenly in the vicinity of the stoichiometric ratio. The ECM adjusts the fuel injection time so that the air-fuel ratio is nearly stoichiometric.

If the oxygen concentration in the exhaust gas increases, the air-fuel ratio is LEAN. The HO2S voltage drops below 0.45 V and the HO2S informs the ECM of the LEAN condition.

If oxygen is not in the exhaust gas, the air-fuel ratio is RICH. The HO2S voltage increases above 0.45 V and the HO2S informs the ECM of the RICH condition.

HINT:

The ECM provides a pulse width modulated control circuit to adjust current through the heater. The HO2S heater circuit uses a relay on the +B side of the circuit.

DTC No.	DTC Detection Condition	Trouble Area
P0031 P0037 P0051 P0057	HO2S heater current is below 0.25 A when heater operates with +B greater than 11.5 V (1 trip detection logic)	• Open or short in HO2S heater circuit • HO2S heater • EFI MAIN relay • ECM
P0032 P0038 P0052 P0058	HO2S heater current exceeds 2 A when heater operates (1 trip detection logic)	• Open or short in HO2S heater circuit • HO2S heater • EFI MAIN relay • ECM

MONITOR DESCRIPTION

The sensing portion of the HO₂S has a zirconia element which is used to detect oxygen concentration in the exhaust. If the zirconia element is at the proper temperature and difference of the oxygen concentration between the inside and outside surface of the sensor is large, the zirconia element will generate voltage signals. In order to increase the oxygen concentration detecting capacity in the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor. When current in the HO₂S heater is out of the standard operating range, the ECM interprets this as a fault in the HO₂S heater. The ECM illuminates the MIL and sets a DTC.

Normally, the HO₂S heater current is 0.4 to 1.0 A.

Example:

The ECM will set a high current DTC if the current in the sensor is more than 2 A. Similarly, the ECM will set a low current DTC if the current is less than 0.25 A.

The monitor runs if the engine is started and run at idle for 9 minutes or more.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the Intelligent Tester II. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.
