
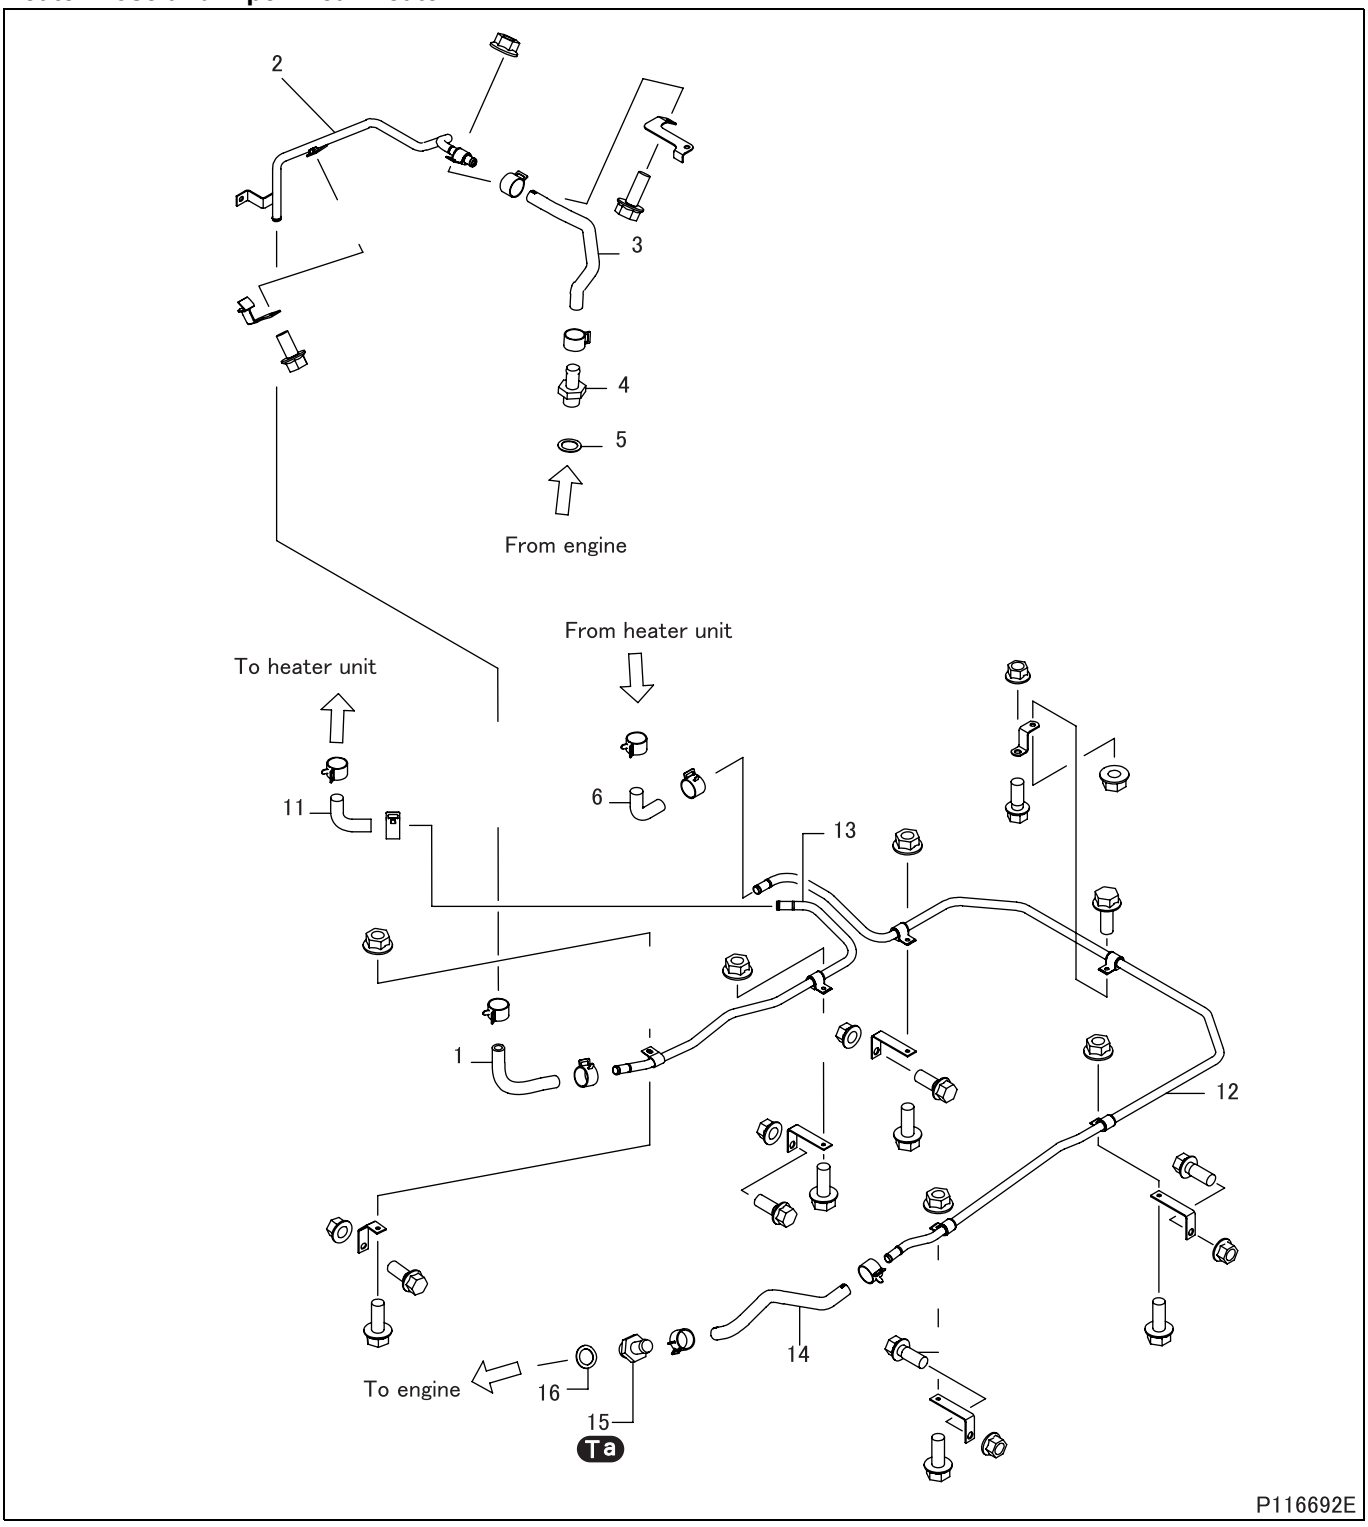
■ **Installation: Heater hose A, heater hose B**

- Install the engine ends of the hoses with the markings facing upward.

Heater Hose and Pipe <Rear Heater>



● **Removal sequence**

1 Heater hose A
2 Heater pipe A
3 Heater hose B
4 Connector
5 Gasket
6 Heater hose C
7 Heater pipe B
8 Heater hose D
9 Heater hose E
10 Heater pipe C
11 Heater hose F
12 Heater pipe D
13 Heater pipe E
14 Heater hose G
15 Connector
16 Gasket

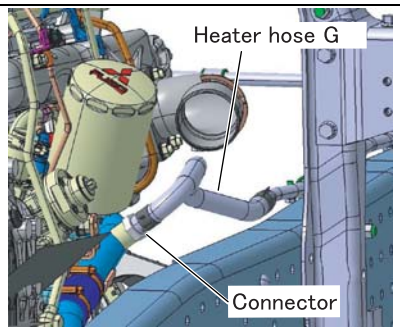
● Installation sequence

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Connector	50 to 60 {37 to 44, 5.1 to 6.1}	–

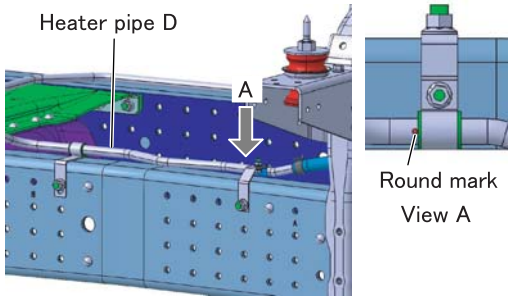
◆Installation procedure◆



P116693E

■ Installation: Connector, heater hose G

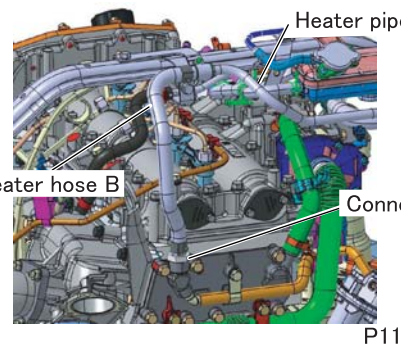
- Install the gasket and connector on the connection fitting on the engine side.
- Connect the heater hose G to the connector with its marking facing upward. Connect the heater hose G to the heater pipe D with the markings on them aligned with each other.



P116697E

■ Installation: Heater pipe D

- Install heater pipe D with its round mark facing upward and aligned with the edge of the clip.



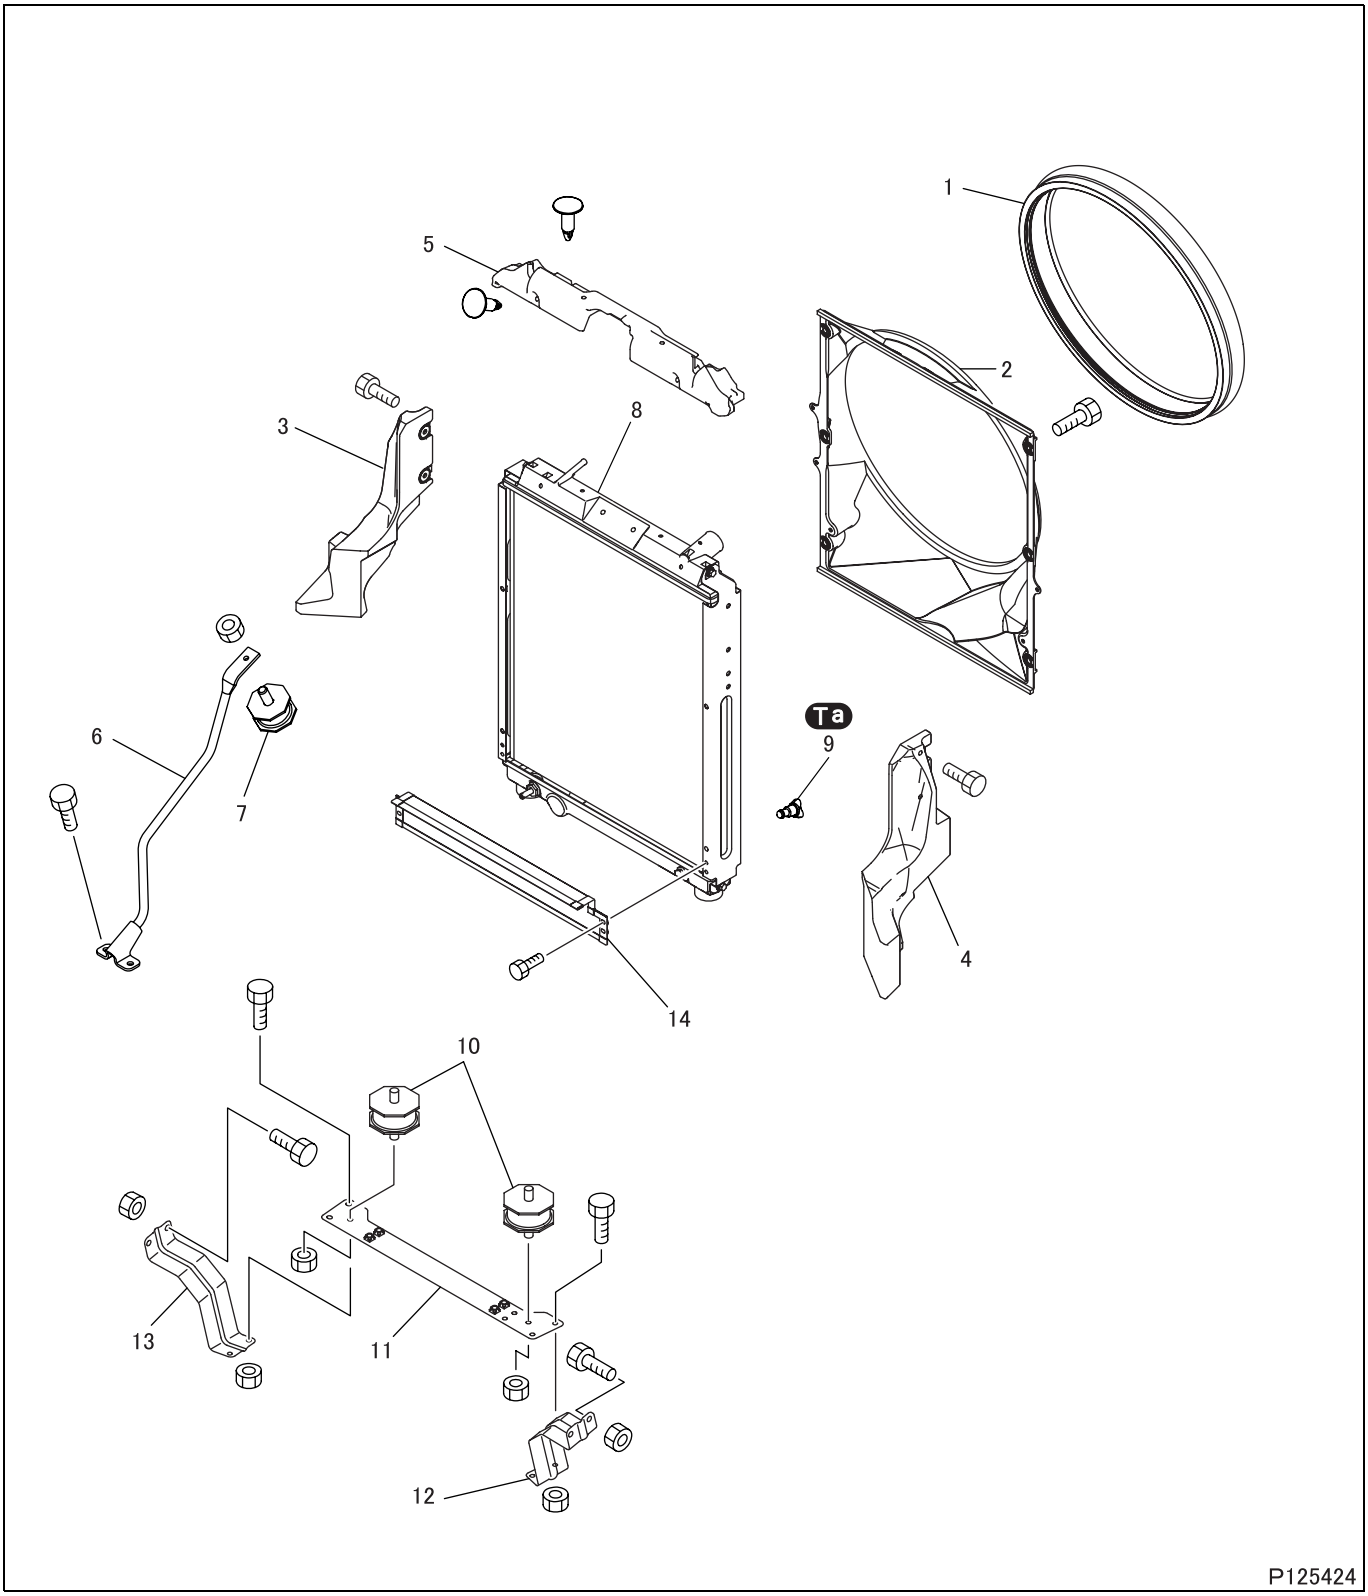
P116698E

■ Installation: Connector, heater hose B

- Install the gasket and connector on the connection fitting on the engine side.
- Connect the heater hose B to the connector with its marking facing the rear of the vehicle. Connect the heater hose B to the heater pipe A with its marking facing upward.

M E M O

RADIATOR



● **Removal sequence**

1 Shroud seal
2 Radiator shroud
3 Baffle plate RH
4 Baffle plate LH
5 Upper baffle plate
6 Support rod
7 Support cushion
8 Radiator
9 Radiator drain cock
10 Support cushion
11 Lower support
12 Side bracket LH
13 Side bracket RH
14 Radiator filter

● Installation sequence

Follow the removal sequence in reverse.

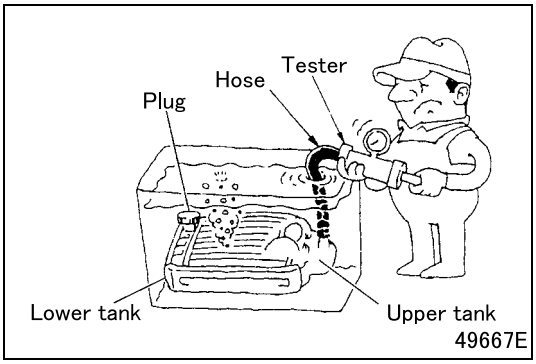
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
8	Air leakage from radiator (air pressure 147 kPa {21 psi, 1.47 kgf/cm^2})	0 cm^3 {0 mL}	–	Repair or replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Radiator drain cock	2.5 ± 0.5 {1.8 ± 0.4, 0.3 ± 0.1}	–

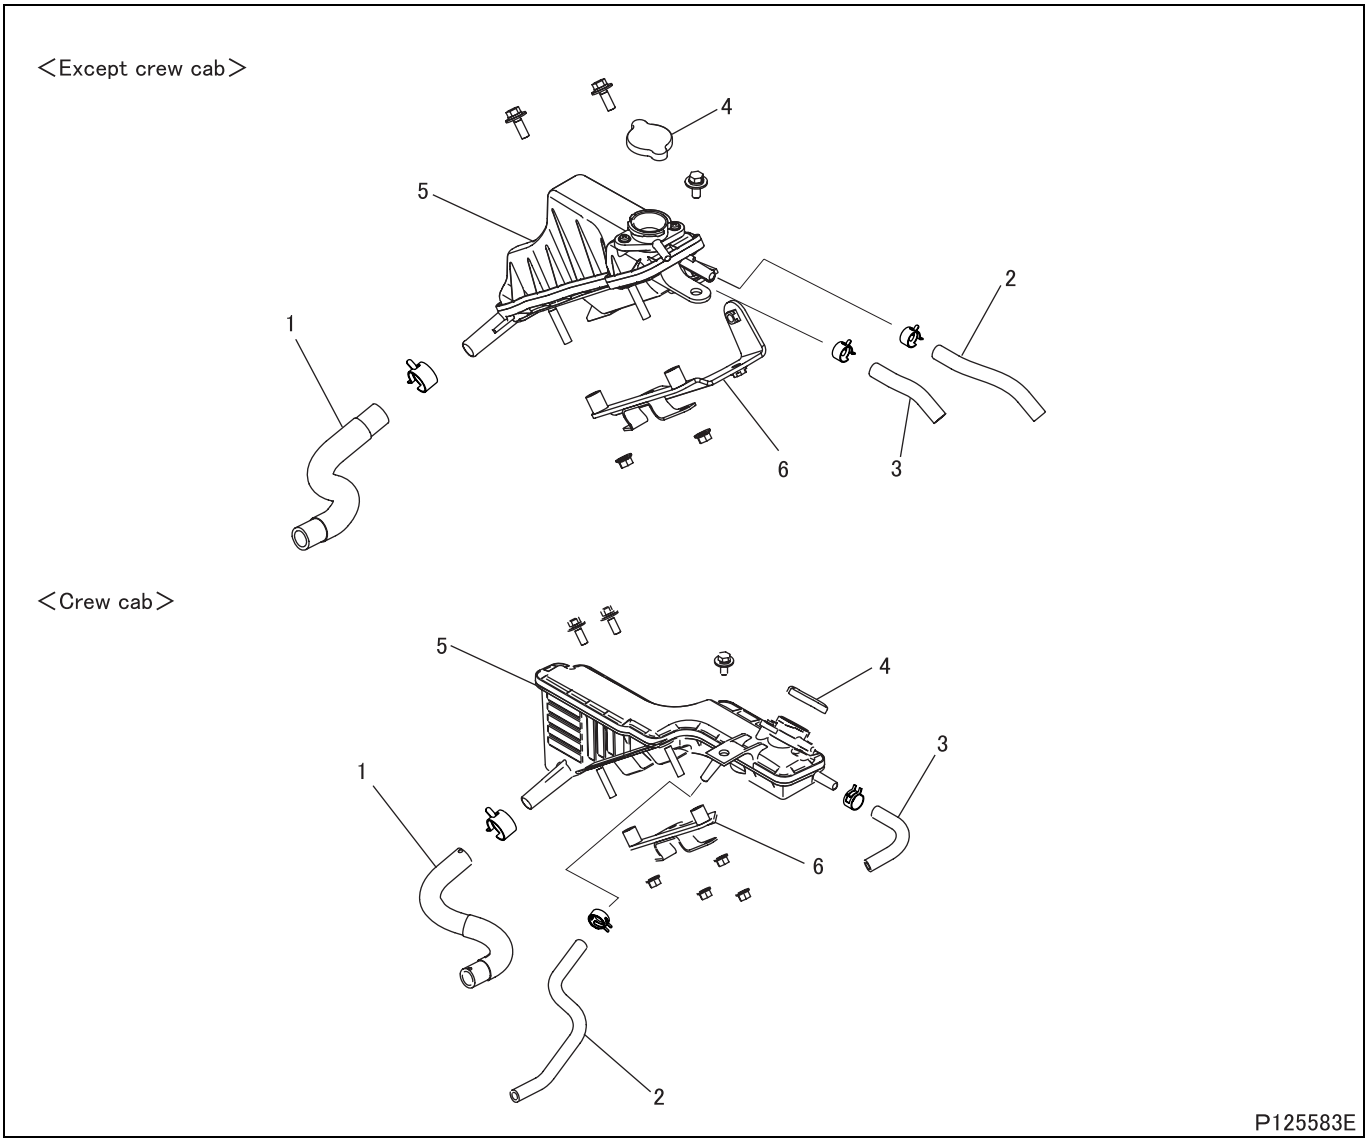
◆Inspection procedure◆



■ Inspection: Radiator air leakage

- Connect a hose and radiator cap tester to the upper tank.
- Plug the lower tank and put the entire radiator into a tank filled with water.
- Use the radiator cap tester to apply an air pressure of 147 kPa {21 psi, 1.47 kgf/cm^2} and check for air leakage.
- If air leakage is found, replace the radiator.

PRESSURE CAP, SURGE TANK



● **Removal sequence**

1 Water hose A
2 Water hose B
3 Water hose C
4 Pressure cap
5 Surge tank
6 Surge tank bracket

● **Installation sequence**

Follow the removal sequence in reverse.

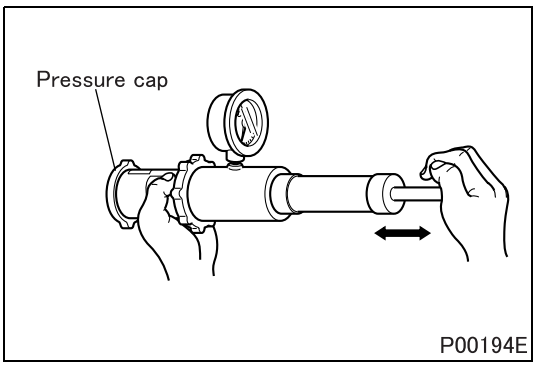
Service standards

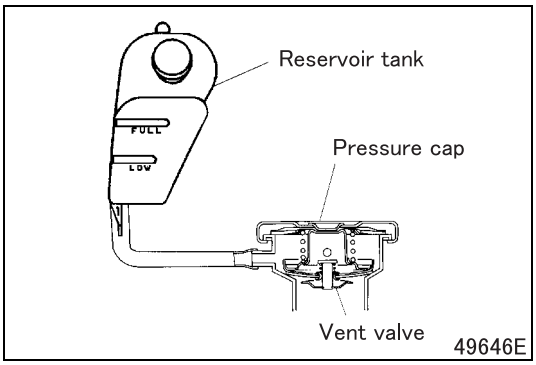
Location	Maintenance item	Standard value	Limit	Remedy
1	Pressure cap valve opening pressure	110 ± 15 kPa {16 ± 2.2 psi, 1.1 ± 0.15 kgf/cm^2}	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Water level sensor	$3\ ^{+1}_{0}$ {$2.2\ ^{+0.7}_{0}$, $0.3\ ^{+0.1}_{0}$}	–

◆Inspection procedure◆





■ Inspection: Pressure cap

(1) Pressure valve opening pressure

- Measure the pressure valve opening pressure using a pressure cap tester.
- Replace the pressure cap if the measured value deviates from the standard value range.

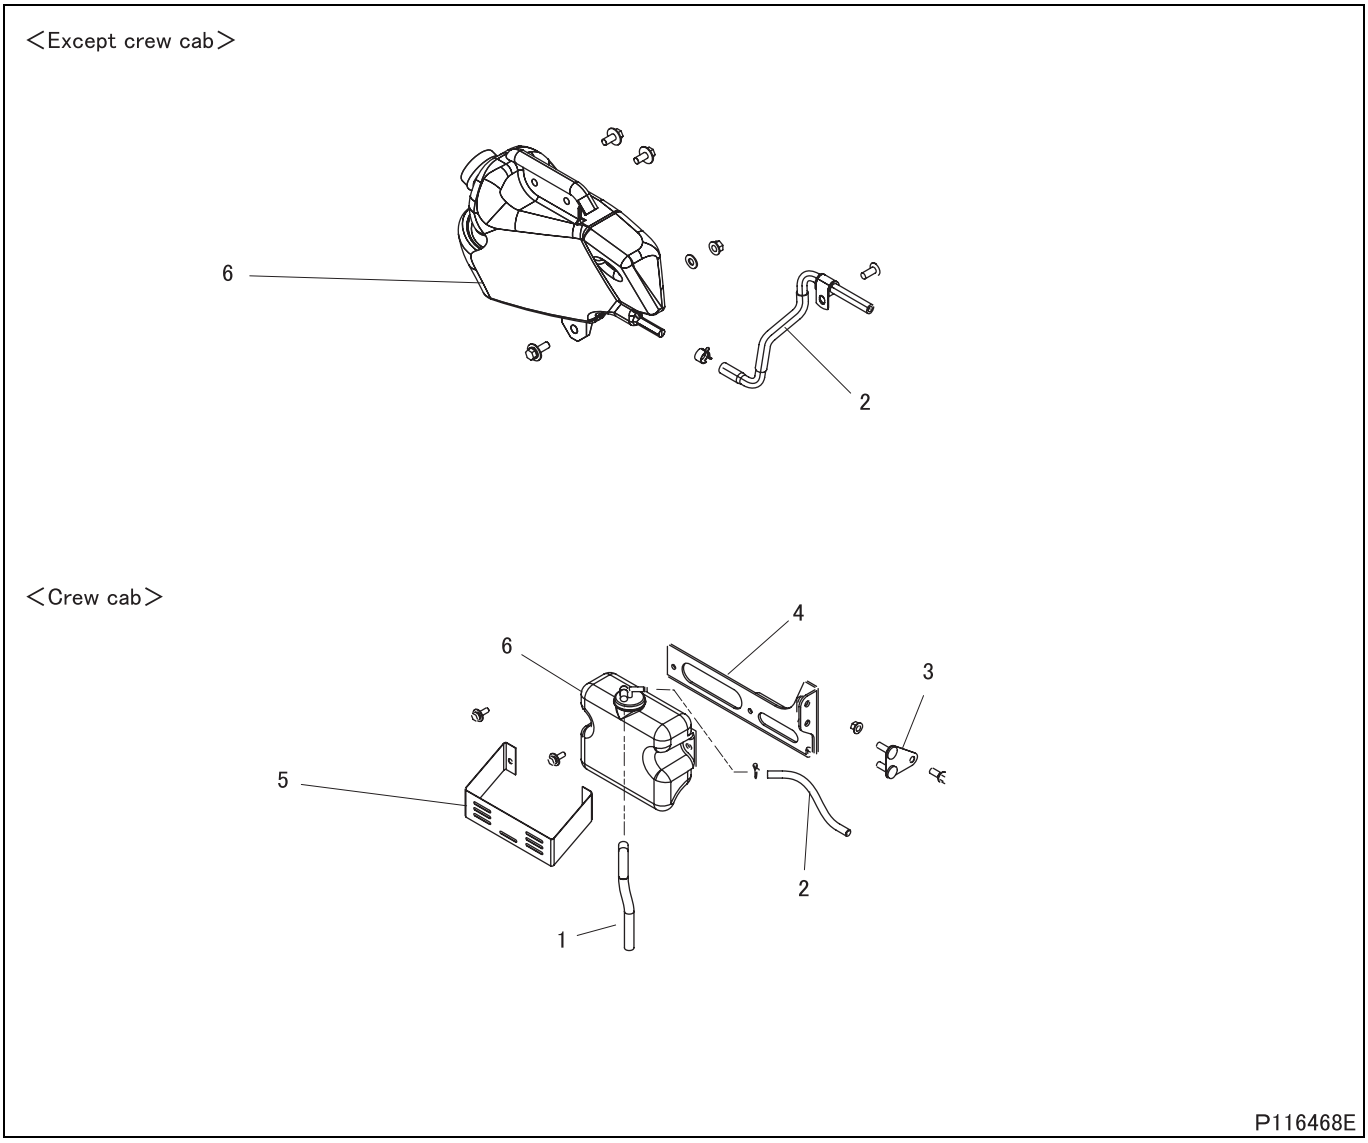
(2) Inspection: Vent valve

- Check the reservoir tank for water level in advance.
- Let the engine run at high speeds and, when a certain amount of coolant overflows to the reservoir tank, stop the engine.
- Leave the unit to stand for some time. When the coolant temperature becomes the atmospheric temperature, check that the water level of the reservoir tank is the same as that before the engine was started.
- If the water level does not lower, the vent valve is faulty. So, replace the pressure cap with a new one.

CAUTION ⚠

- **If the pressure cap is removed before the coolant temperature lowers to the atmospheric level, a vacuum develops inside the radiator, so that the coolant cannot return to the reservoir tank.**

RESERVOIR TANK



● **Removal sequence**

1 Water hose A
2 Water hose B
3 Tank bracket A
4 Tank bracket B
5 Tank protector
6 Reservoir tank

● **Installation sequence**

Follow the removal sequence in reverse.

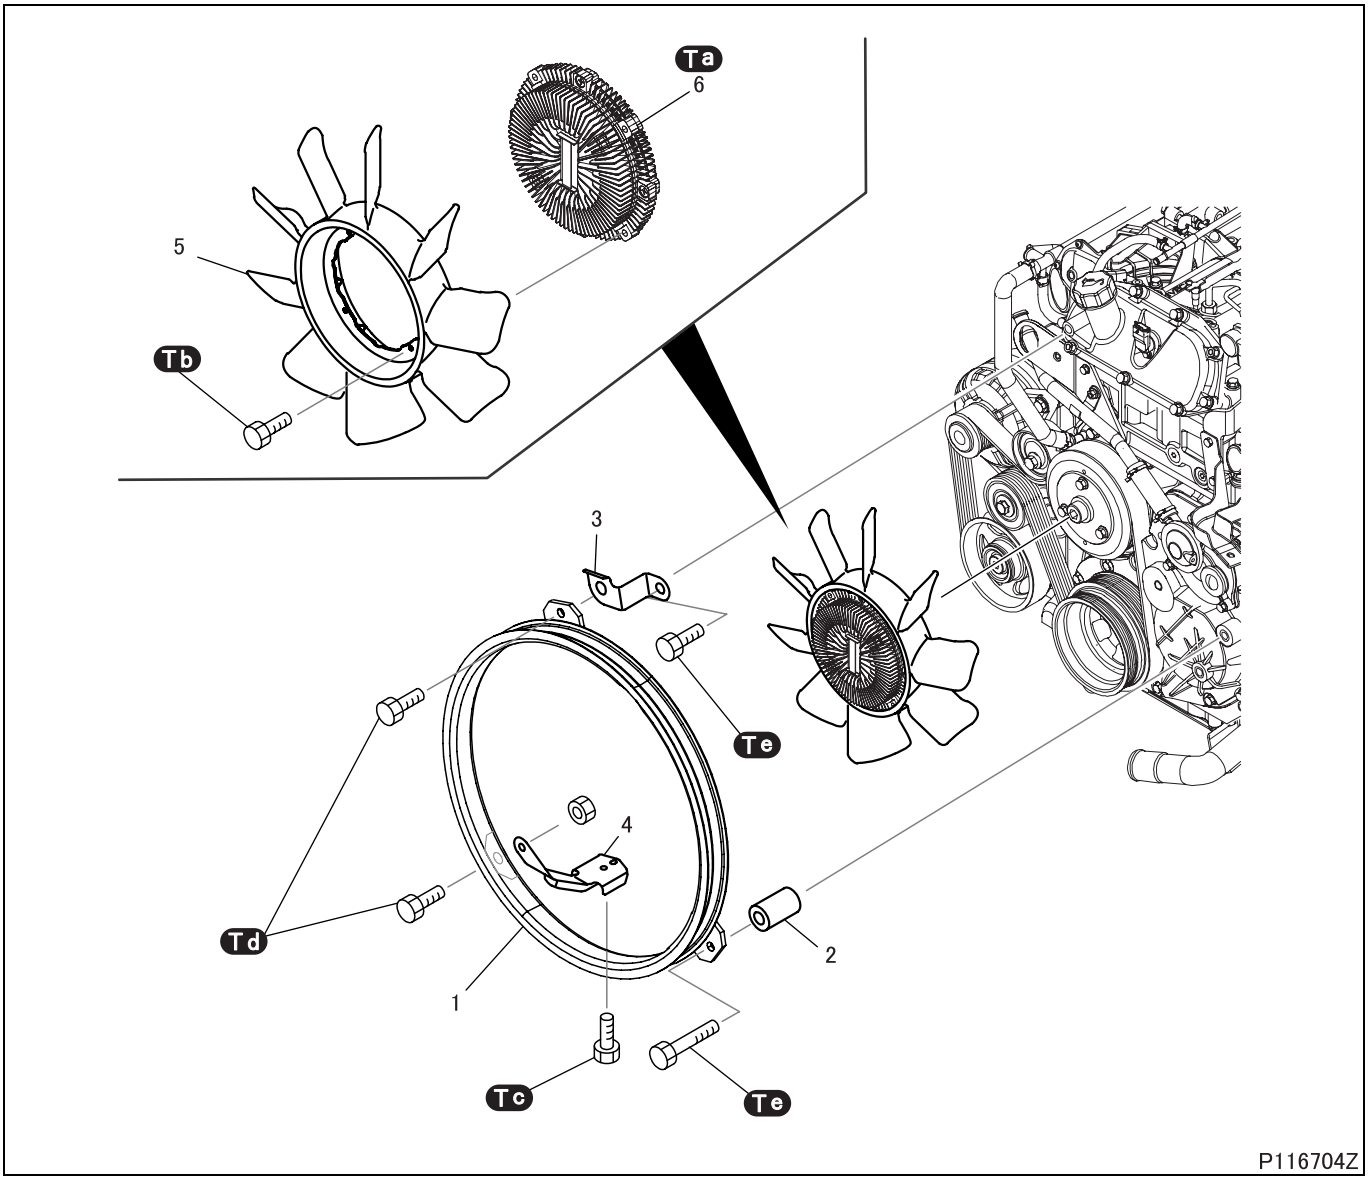
COOLING FAN



● **Removal sequence**

1 Fan shroud
2 Spacer
3 Shroud upper stay
4 Shroud lower stay
5 Cooling fan
6 Automatic cooling fan coupling

● **Installation sequence**

Follow the removal sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Clearance between fan shroud and cooling fan	5.0 to 9.0 {0.20 to 0.35}	–	Correct or replace

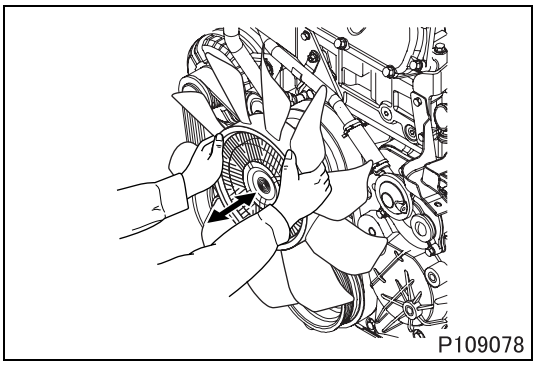
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Automatic cooling fan coupling	90 to 112 {66 to 83, 9.2 to 11}	–
Tb	Bolt (cooling fan mounting)	7 to10 {5.2 to 7.4, 0.7 to 1.0}	–
Tc	Bolt	19 to 28 {14 to 21, 1.9 to 2.8}	–
Td	Bolt	45 to 55 {33 to 41, 4.5 to 5.6}	–
Te	Bolt	32 to 48 {24 to 35, 3.3 to 4.9}	–

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
Ca	Coupling fan attachment tool A: 101 {3.98}, B: 12.7 {0.50}, C: 230 {9.06}  P116718	MH064219	Holding of fan pulley

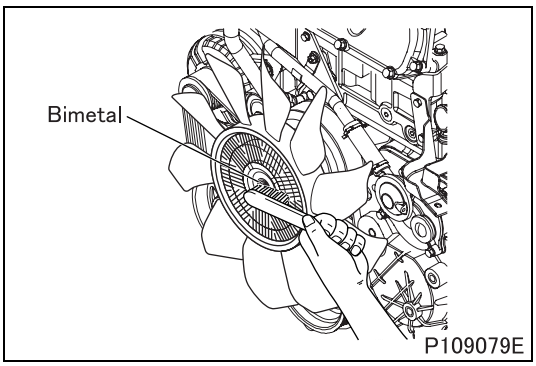
◆Inspection and cleaning procedure◆



P109078

■ **Inspection: Automatic cooling fan coupling**

- Make an inspection of the following points. Replace the automatic cooling fan coupling if defective.
  Check the followings.
  - The hydraulic oil sealed inside the coupling is not leaking.
  - The coupling does not make any abnormal noise or rotate unevenly due to defects in the inside bearing when rotated manually.
  - The automatic cooling fan coupling does not move too much when pushed and pulled in the axial directions when the engine is cold.

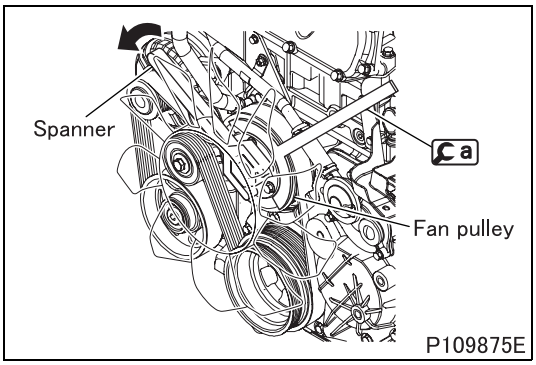


P109079E

■ **Cleaning: Automatic cooling fan coupling**

- When removing foreign matter from the bimetal, be careful not to press too hard against the bimetal.

◆Removal procedure◆



P109875E

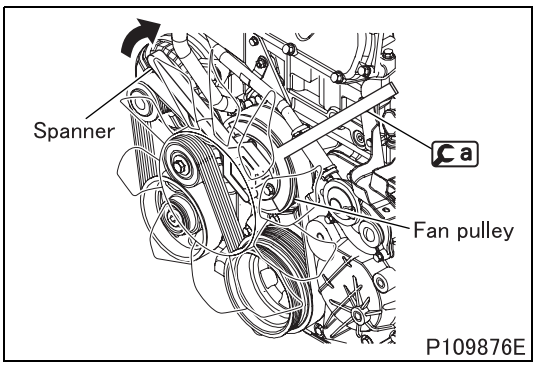
■ **Removal: Automatic cooling fan coupling**

- Fit Ca to the fan pulley.
- While holding Ca, remove the automatic cooling fan coupling.

CAUTION ⚠

- **The automatic cooling fan coupling has left hand thread.**

◆Installation procedure◆

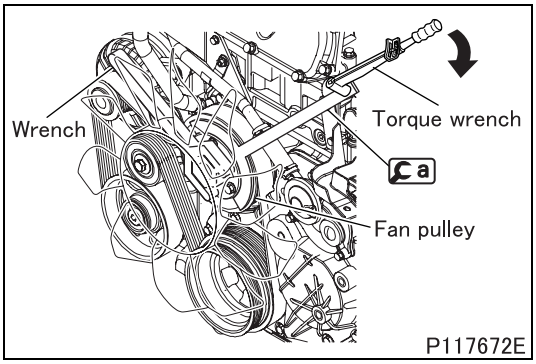


■ **Installation: Automatic cooling fan coupling**

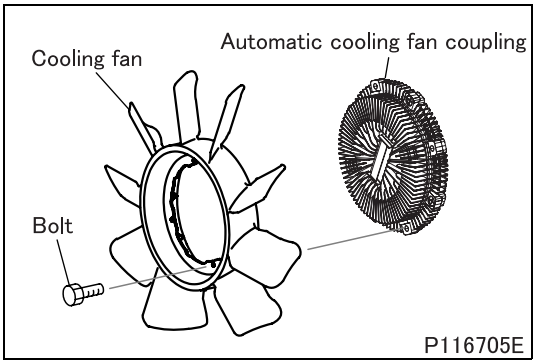
- Fit a to the fan pulley.
- While holding a, tighten the automatic cooling fan coupling to the specified torque.

CAUTION ⚠

- **The automatic cooling fan coupling has left hand thread.**

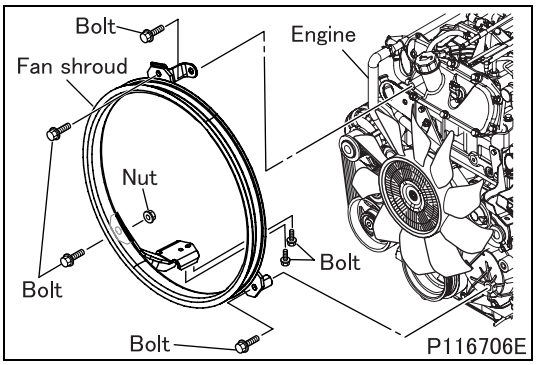


- If it is difficult to check the tightening torque during tightening the automatic cooling fan coupling, perform the following steps: set a torque wrench on a while holding down the automatic cooling fan coupling with a wrench and tighten the automatic cooling fan coupling by turning the fan pulley, to thereby check the tightening torque.
- In this case, the length 230 mm {9.06 in.} of a should be taken into consideration when setting the tightening torque.



■ **Installation: Cooling fan**

- Mount the cooling fan on the automatic cooling fan coupling.

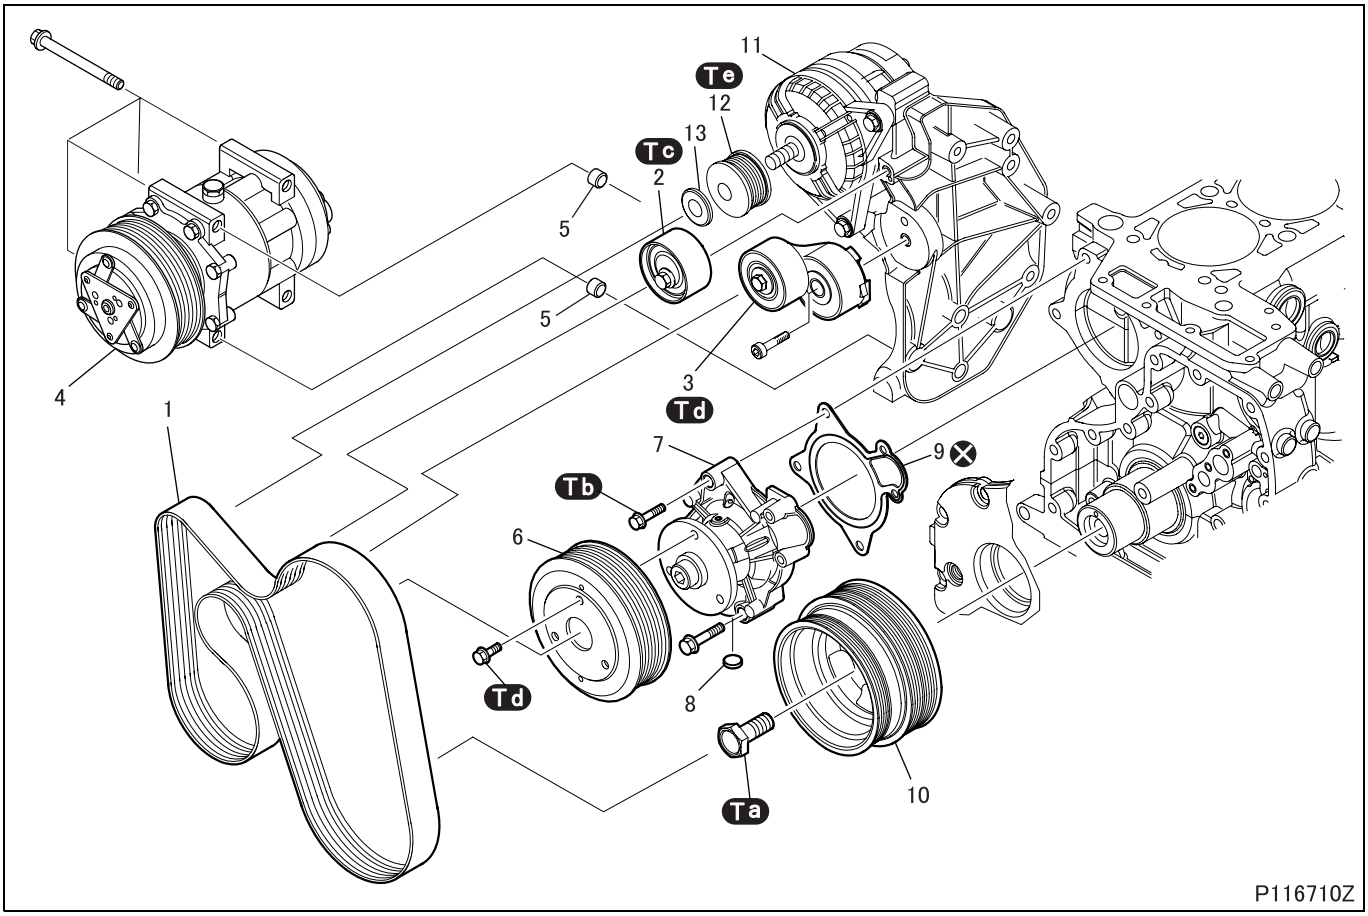


■ **Installation: Fan shroud**

- Install the fan shroud on the engine main body.
- Make sure that, when assembled, there is the specified clearance between the fan shroud and cooling fan throughout the entire periphery.

M E M O

BELT, WATER PUMP, DAMPER PULLEY



● **Removal sequence**

1 Belt
2 Idler pulley
3 Belt tensioner
4 Air conditioner compressor
5 Dowel pin
6 Pulley
7 Water pump
8 Lock plug
9 Gasket
10 Damper pulley
11 Alternator
12 Alternator pulley
13 Cover

⊗: Non-reusable parts

● **Installation sequence**

Follow the removal sequence in reverse.

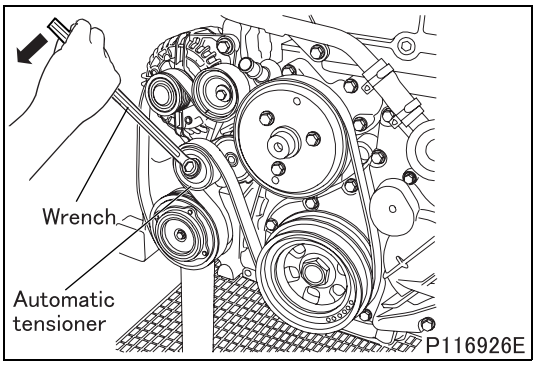
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Bolt (damper pulley mounting)		350 {260, 35}	–
Tb	Bolt (water pump mounting)	M8	25 {18, 2.5}	–
		M10	50 {37, 5}	
Tc	Bolt (belt tensioner mounting)		40 {30, 4}	–
Td	Bolt (belt tensioner mounting)		25 {18, 2.5}	–
	Bolt (pulley mounting)			
	Bolt (support pulley mounting)			
Te	Pulley		60 to 70 {44 to 52, 6.1 to 7.1}	–

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
b	Tool to retain engine flywheel  P116334	MH064205	Stop the rotation of the engine flywheel
c	Coupling fan attachment tool A: 101 {3.98}, B: 12.7 {0.50}, C: 230 {9.06}  P116718	MH064219	Holding of fan pulley

◆Removal procedure◆



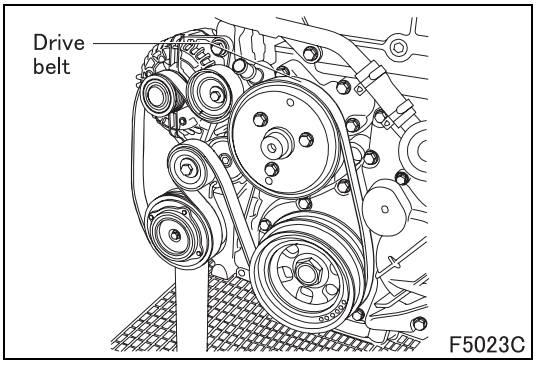
P116926E

■ Removal: Belt

- Using a wrench of an adequate type, operate automatic belt tensioner in the direction of the arrow to loosen the belt.

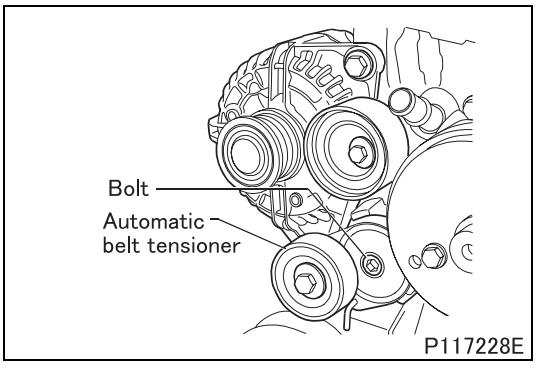
CAUTION ⚠

- **Use care not to allow your finger to be caught between the belt and pulley.**



F5023C

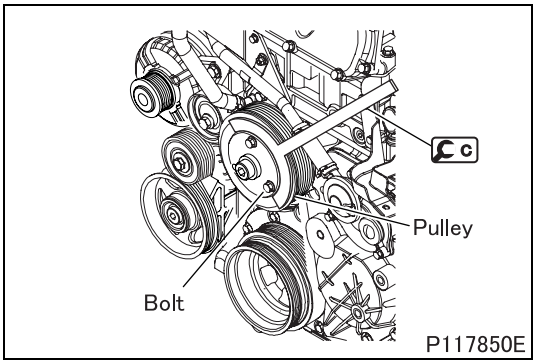
- Remove the auxiliary mechanism drive belt.



P117228E

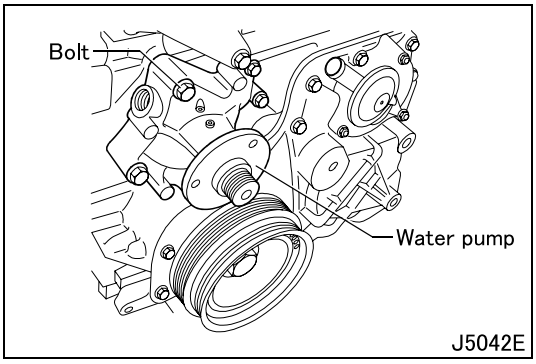
■ Removal: Automatic belt tensioner

- Loosen the bolt and remove the automatic belt tensioner.



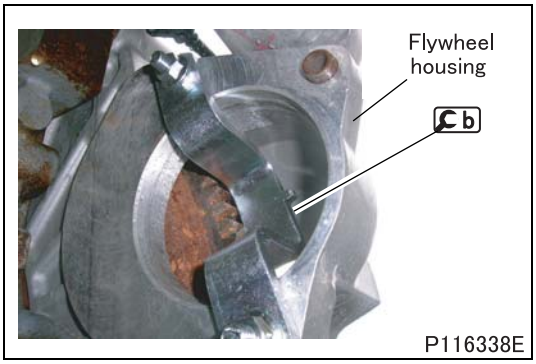
■ **Removal: Pulley**

- Fit c to the fan pulley.
- While holding c, remove the automatic cooling fan coupling.



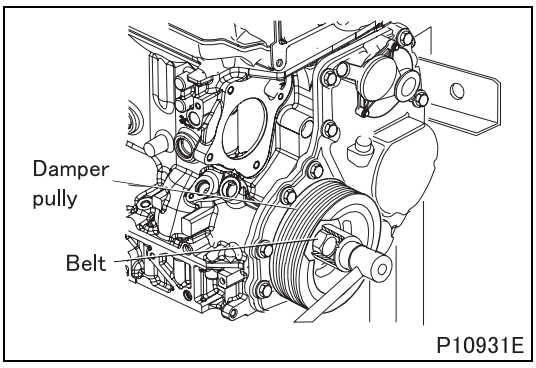
■ **Removal: Water pump**

- Unscrew and remove the attaching bolts; remove the water pump taking care to remove the gasket.

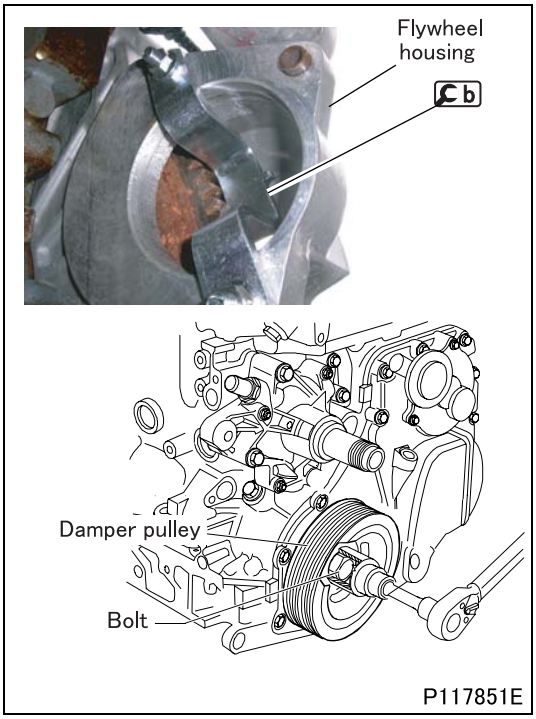


■ **Removal: Damper pulley**

- Using b, block rotation of the engine flywheel.

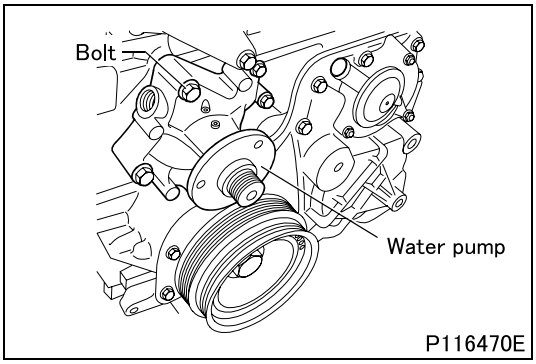


- Take out the bolt and remove the damper pulley.



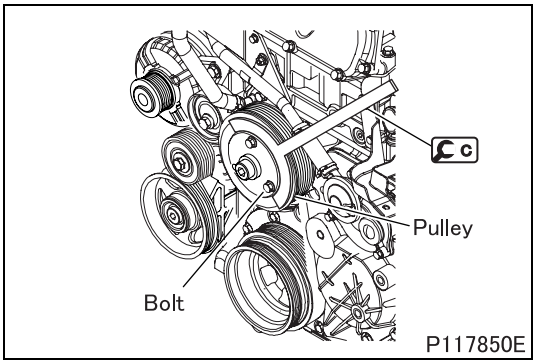
■ **Installation: Damper pulley**

- Stop the rotation of the engine flywheel by means of b.
- Fit the damper pulley. Drive in the screw and tighten it to the prescribed torque.



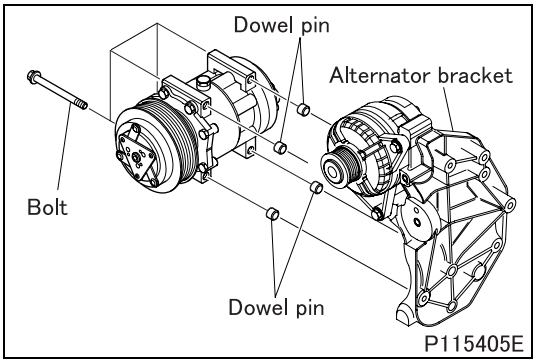
■ **Installation: Water pump**

- Install the water pump with a new gasket.
- Drive in the bolts and tighten them to the prescribed torque.



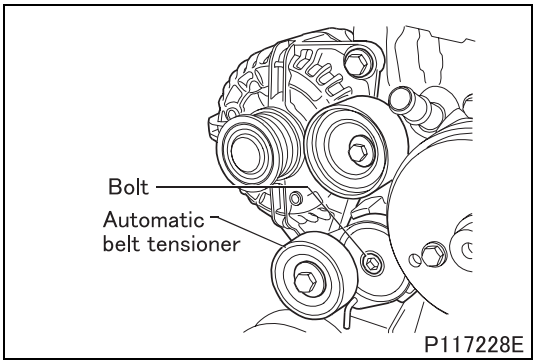
■ **Installation: Pulley**

- Attach c to the fan pulley.
- While holding c, tighten the automatic cooling fan coupling to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



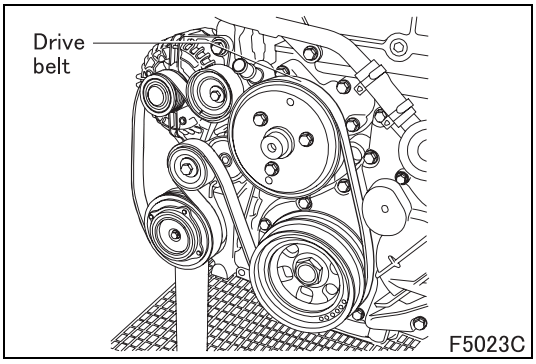
■ **Installation: Air compressor**

- Install the air compressor on the alternator bracket.



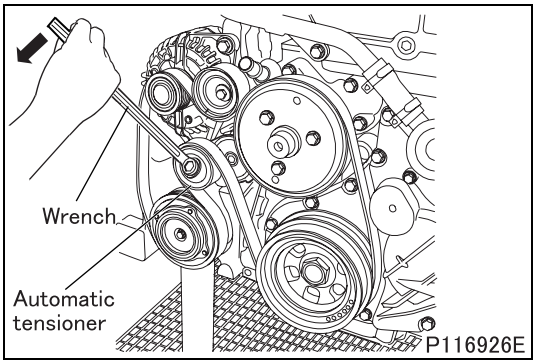
■ **Installation: Automatic belt tensioner**

- Install the automatic belt tensioner and tighten the bolt.



■ **Installation: Belt**

- Position the auxiliary mechanism drive belt.



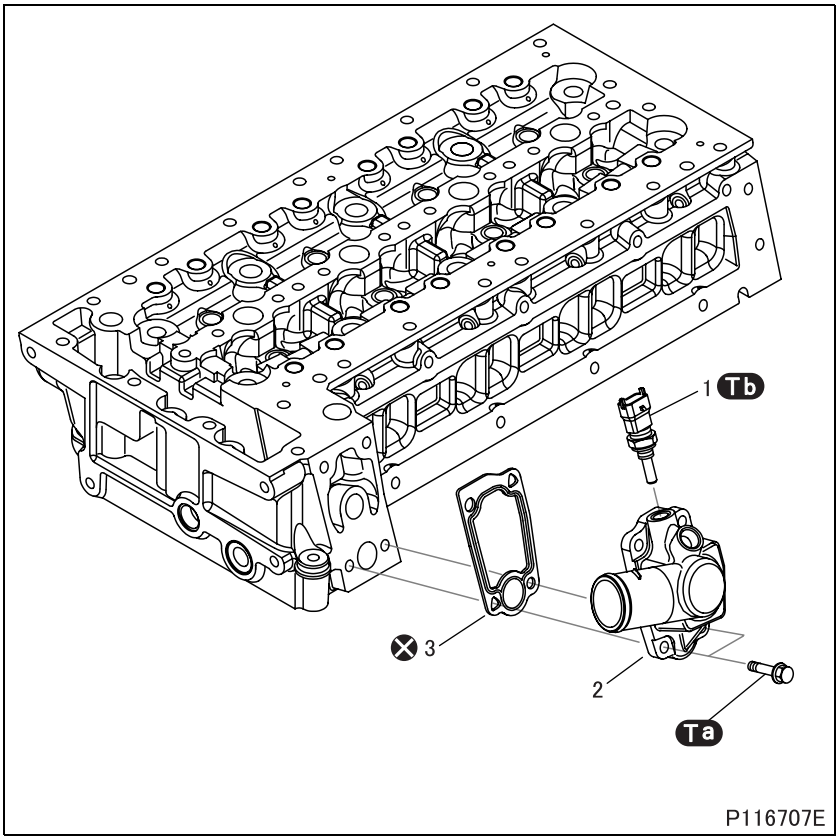
- Using a wrench of an adequate type, operate the automatic belt tensioner in the direction of the arrow to tighten the accessory drive belt.

CAUTION ⚠

- **Use care not to allow your finger to be caught between the belt and pulley.**

M E M O

THERMOSTAT



● **Removal sequence**

1 Water temperature sensor
2 Thermostat
3 Gasket

⊗: Non-reusable parts

● **Installation sequence**

Follow the removal sequence in reverse.

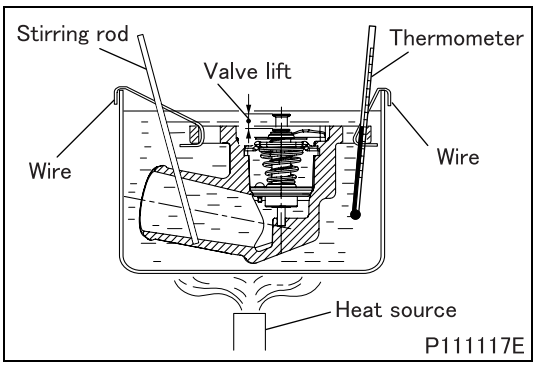
Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
1	Thermostat	Valve opening temperature	79 ± 2°C {174 ± 3.6°F}	–	Replace
		Valve lift / temperature	7.5 or more / 92°C {0.30 or more / 198°F}		

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (thermostat mounting)	25 {18, 2.5}	–
Tb	Water temperature sensor	40 {30, 4.1}	–

◆Inspection procedure◆



■ **Inspection: Thermostat**

- Stir the water using a stirring rod to maintain an even water temperature in the container, then conduct the tests indicated below.
- If the measured values deviate from the standard value ranges, replace the thermostat.

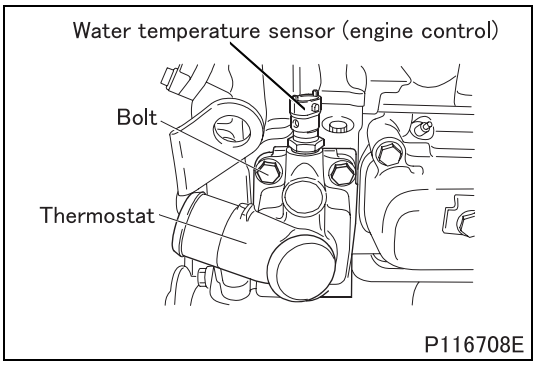
(1) Valve opening temperature

- Hold the thermostat with wire to keep it away from the heat source.
- Heat the water gradually to the valve opening temperature.
- Maintain this temperature for five minutes and make sure that the valve is completely open.
- Make sure that the valve closes completely when the water temperature drops below 77°C {171°F}.

(2) Valve lift

- Heat the water to 94°C {201°F} and keep the temperature for five minutes with the valve opened completely. Measure the amount of the valve lift.

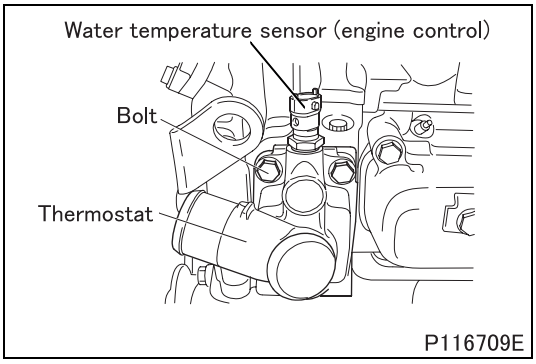
◆Removal procedure◆



■ **Removal: Thermostat, water temperature sensor**

- Remove four bolts and remove the thermostat together with the water temperature sensor.

◆Installation procedure◆



■ **Installation: Thermostat, water temperature sensor**

- Install the thermostat together with the water temperature sensor. Mount a new gasket between the thermostat and cylinder head.

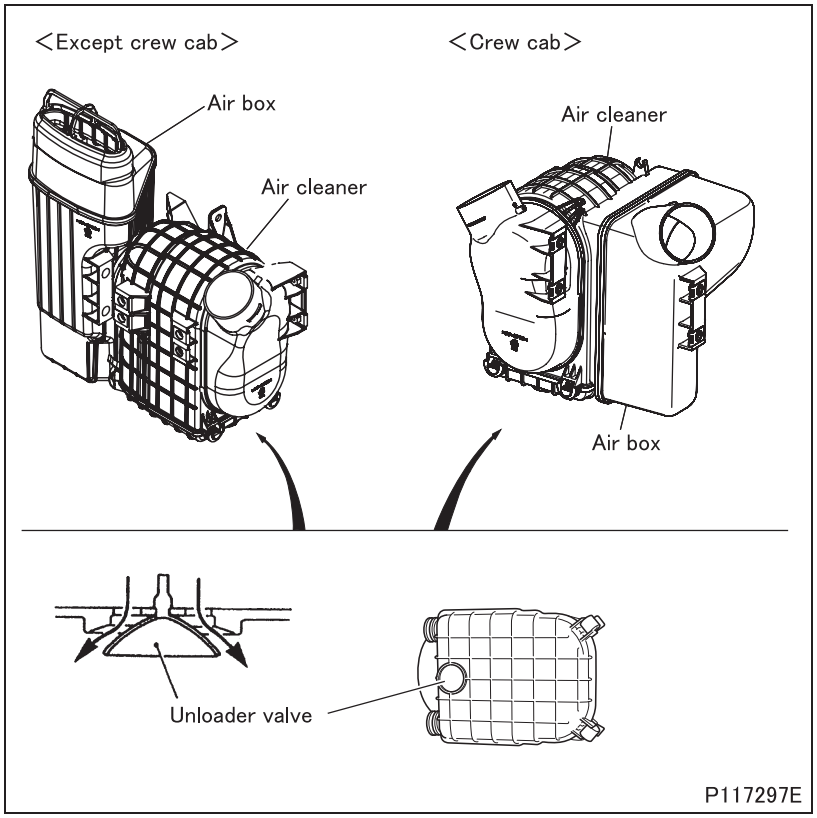
SPECIFICATIONS

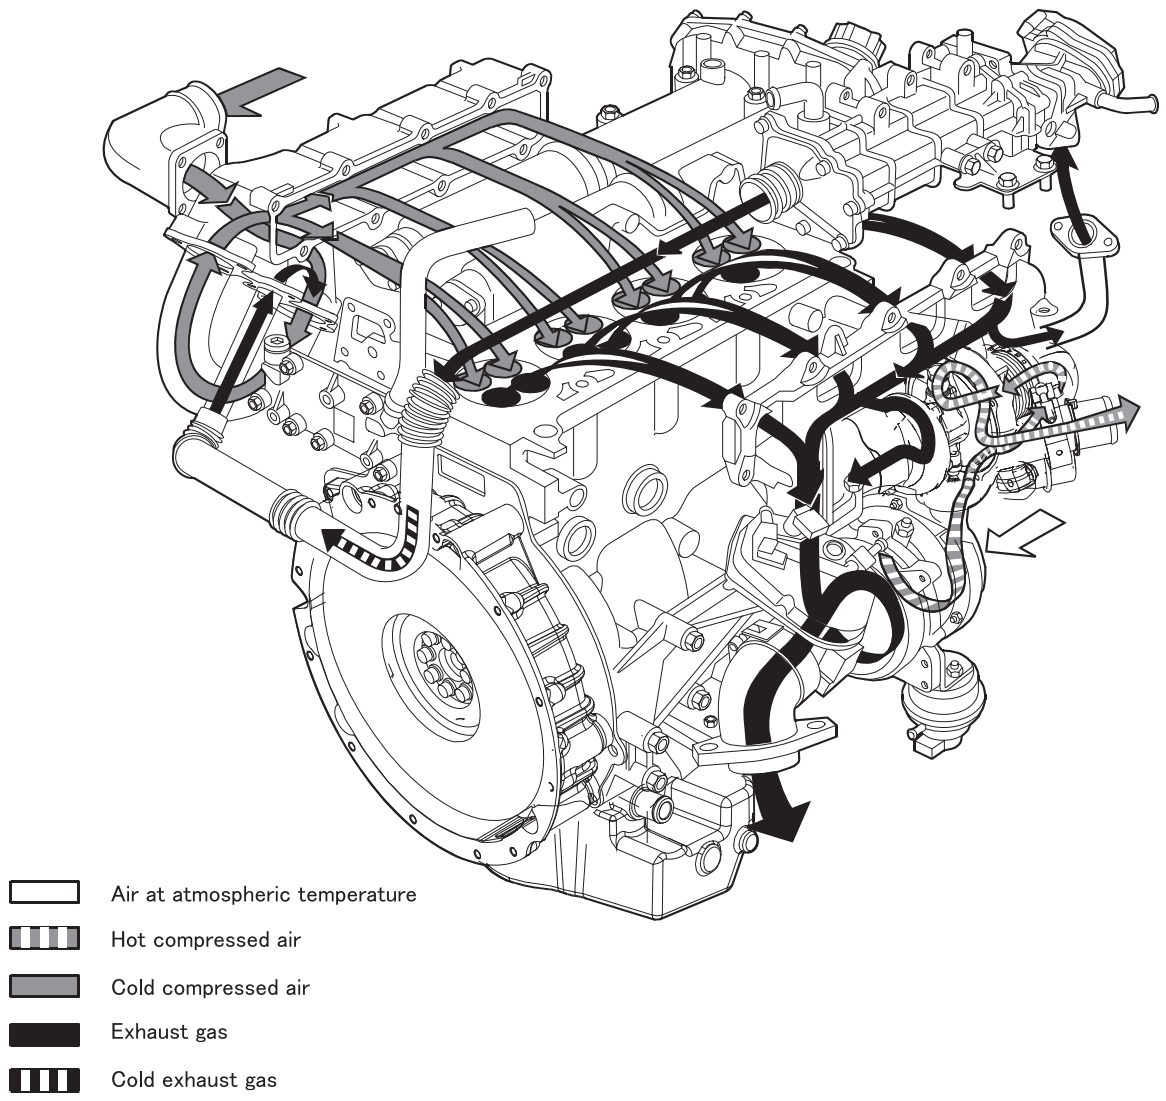
Item		Specifications
Air cleaner element type		Filter paper type
Turbocharger	Type	K03 B2 waste-Gate
	Manufacturer	BORG WARNER
	Turbocharger shaft radial play mm {in.}	0.396 to 0.602 {0.016 to 0.024}
	Turbocharger shaft end float mm {in.}	0.034 to 0.106 {0.0013 to 0.0042}
Intercooler type		Tube and corrugated fin air cooled type

1. Air Cleaner



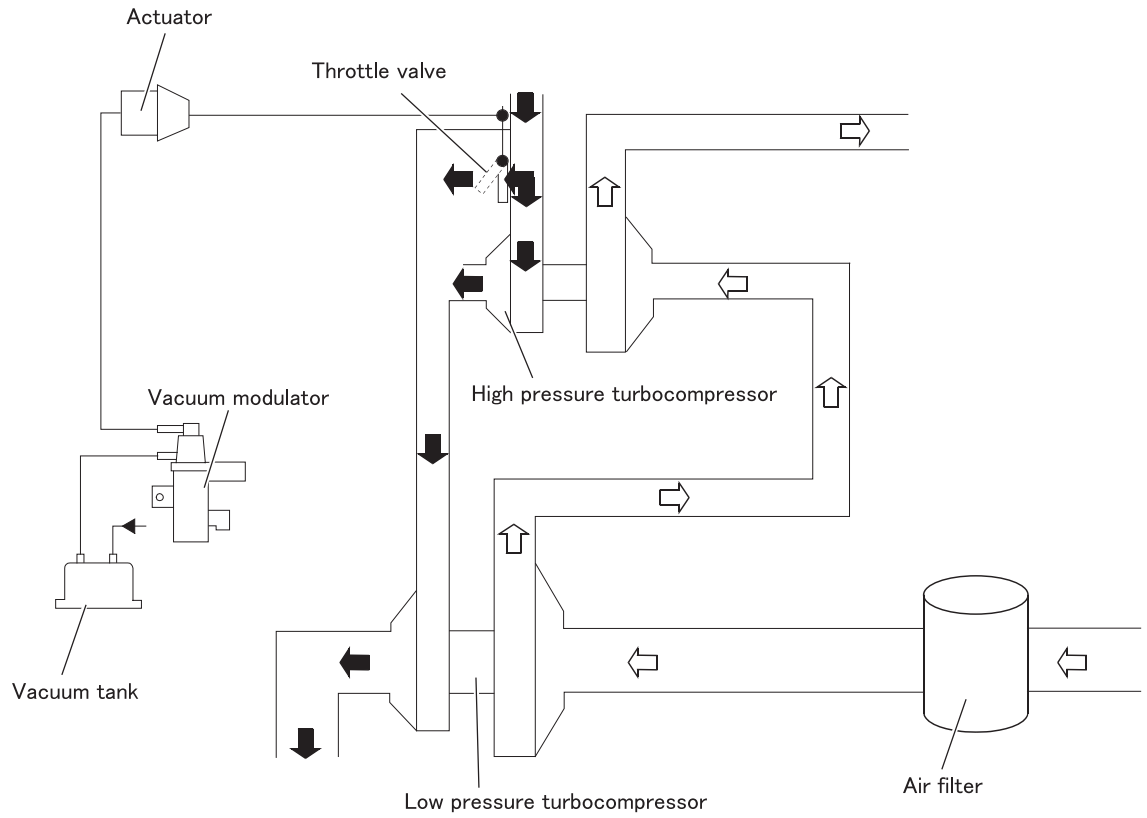
- The air cleaner is a single element type.
- When the engine slows down below the predetermined speed, the level of vacuum in the air cleaner changes and causes the unloader valve to vibrate. Vibration of the unloader valve allows the air cleaner to automatically discharge any water and dust that has accumulated inside.

2. Turbocharging System



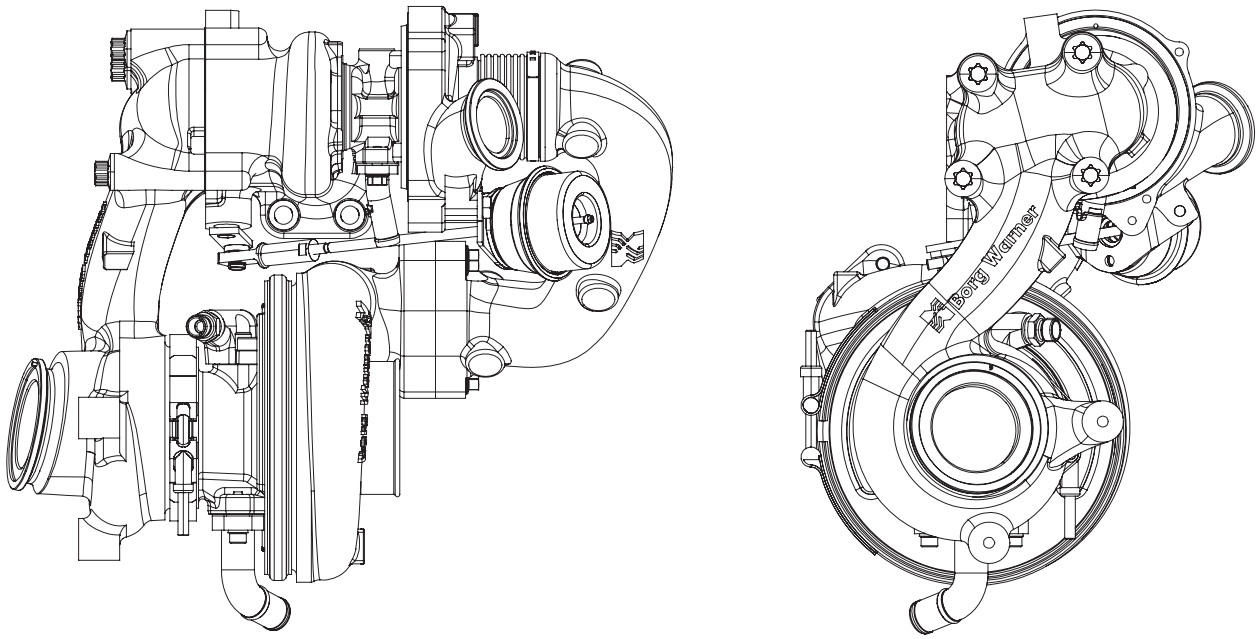
- The turbocharging system is composed of: an air filter, two-stage turbocompressor and intercooler.
- The air filter is the dry type comprising a filtering cartridge to be periodically replaced.
- The function of the two-stage turbocharger is to use the energy of the engine's exhaust gas to send pressurized air to the cylinders.
- The intercooler comprises a radiator included in the engine coolant radiator and its function is to lower the temperature of the air leaving the turbocharger to send it to the cylinders.

2.1 Turbocharger system function diagram



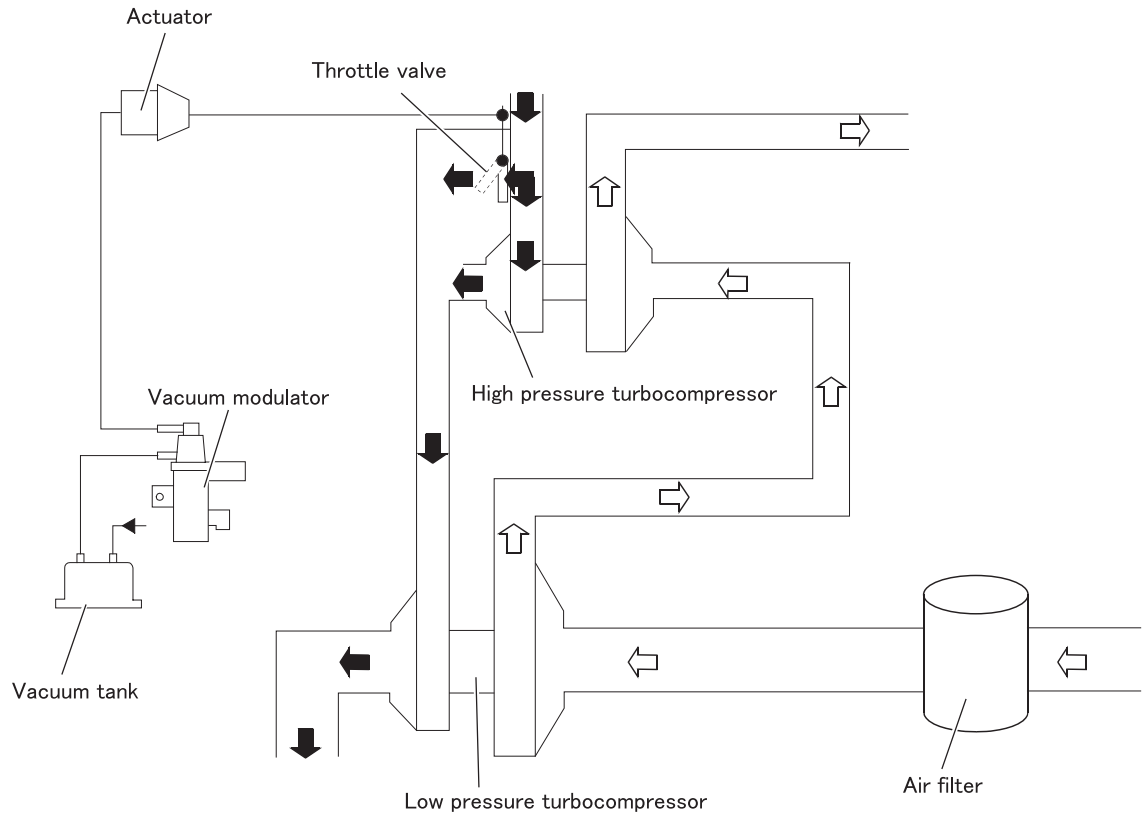
- For electronic control unit connector diagram of turbocharger system, see Gr13.

2.2 Turbocharger



P117300

- The borg warner turbcompressor is of the two-stage type with waste gate. It basically consists of;
  - A primary high-pressure turbocharger consisting of.
    - Central body in which a shaft is fitted, supported by bushings, fitted with the turbine impeller and compressor impeller at opposite ends.
    - A small fixed geometry turbine casing and a compressor casing mounted at the end of the central casing.
- A secondary low-pressure turbocharger consisting of:
  - central casing in which a shaft is fitted, supported by bushings, fitted with the turbine impeller and compressor impeller at opposite ends;
  - a larger fixed geometry turbine casing and a compressor casing mounted at the end of the central casing;
- A gas pipe connecting the two turbines;
- A pipe connecting the compressed air between the two compressors;
- An overpressure relief valve fitted on the high pressure turbine casing. This partialises the exhaust gas outlet and sends part directly to the low pressure turbine via the pipe connecting the two turbines when the supercharging pressure exceeds the set value. The waste gate valve is controlled by a modulator valve which modulates the underpressure taken from the air circuit of the servo brake, according to the information exchanged between the electronic control unit and the sensors: engine speed, throttle pedal position and pressure/temperature fitted on the intake manifold.



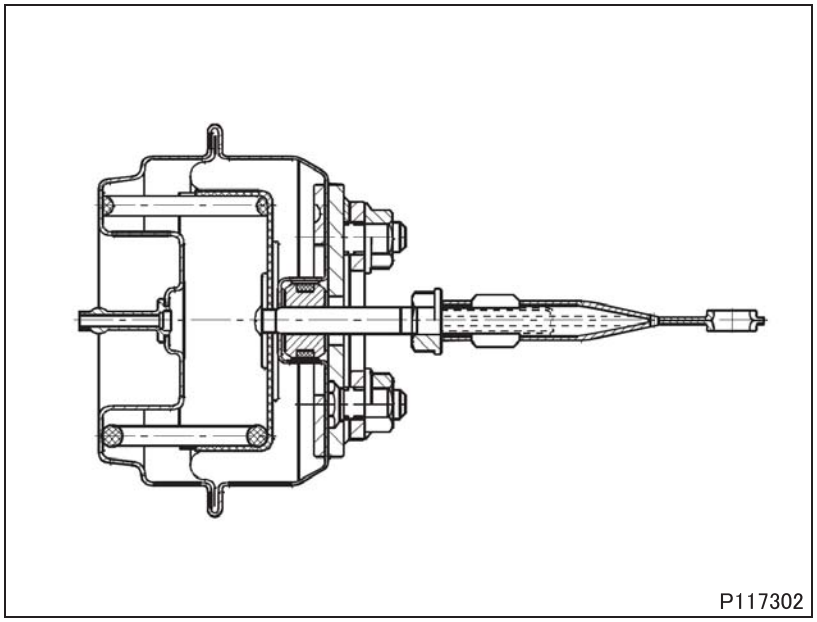
(1) Operation at low speed

- At low engine speed, the WG valve is closed and the exhaust gases from the exhaust manifold offer a weak kinetic energy to rotate the high-pressure turbine slowly. The residual kinetic energy of the exhaust gases flowing out of the high-pressure turbine also rotate the low-pressure turbine slowly, activating both compressors and thus allowing the outside air to be compressed and sent through the connection piping to the intercooler with a limited turbocharge pressure.

(2) Operation at high speed

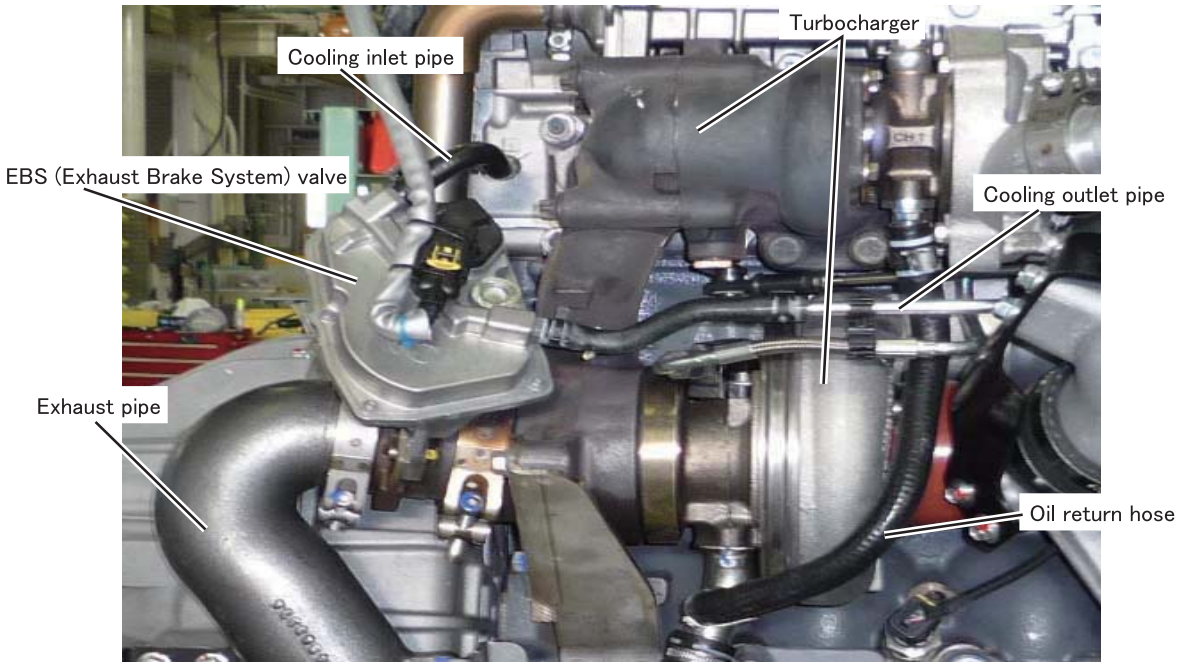
- When the engine speed increases, the kinetic energy of the exhaust gases also increases, therefore the high-pressure turbine speed increases, which in turn causes the WG valve to intervene and create a rise in tubocharging pressure.
- Waste Gate valve intervention allows the part of the exhaust gases with greater kinetic energy to bypass the high-pressure turbine and go directly to the low-pressure turbine, which is rotating more quickly; also, by activating both compressors and thus allowing the outside air to be compressed, it is sent through the connection piping to the intercooler with a limited turbocharge pressure.

2.3 Actuator



- The actuator diaphragm, connected to the control rod, is governed by the low pressure on the top of the actuator.
- The underpressure modulated by the proportional magnetic valve varies the movement of the diaphragm and, as a result, of the rod governing the throttle.

3. EBS (Exhaust Brake System) Valve



P117303E

- The EBS valve fitted on the turbocharger outlet it modulates the pressure of the exhaust gases flowing out of the turbine to increase the “EGR” function in aspiration with the purpose of graduating the value of the exhaust emission. It improves the value of the gaseous emissions bringing it to the parameters required by the norm.
- Following the value of restriction defined by the valve the exhaust gas pressure is increased upstream of the turbine. Greater the pressure determined by the restriction, the greater will be the flow of the exhaust gases that are diverted, upstream of the turbine inlet, toward the EGR (Exhaust Gas Recirculation) unit and recirculated in the inlet.
- The engine electronic control unit is mapped for the management of the gaseous emissions values and following these parameters it controls the opening of the EBS valve.

- The flow of the exhaust gases “not diverted” is sent to the exhaust pipe.

TROUBLESHOOTING <GENERAL>

Possible causes \ Symptoms		Engine hard to start	Black exhaust gas → DPF premature clogging	White exhaust gas	Poor engine power	Excess oil consumption	ECU diagnosis lamp	Reference Gr
Air cleaner	Clogged air cleaner element	O	O		O			
Turbocharger	Defective turbocharger		O	O	O	O

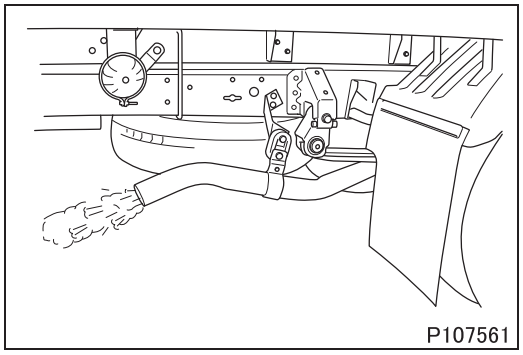
DPF: Diesel particulate filter

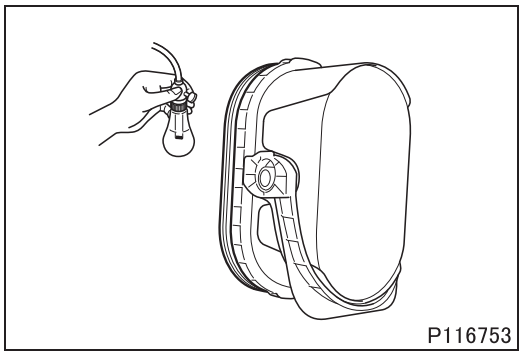
1. Exhaust Emission Condition



P107561

- With the engine warmed up sufficiently, visually check to see if an abnormal black smoke is discharged.
- If an abnormal condition is evident, check different parts and correct or replace any defective part.

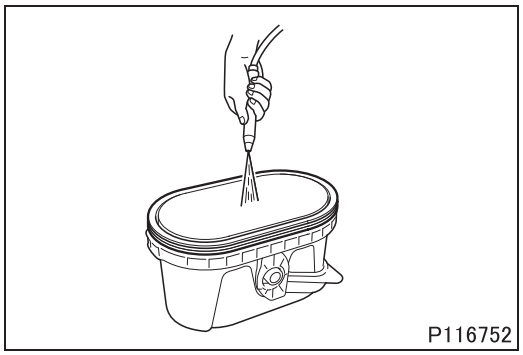
2. Cleaning and Inspection of Air Cleaner Element



P116753

[Inspection]

- Shine light inside the element.
- Replace the element if thin spots or broken parts are evident in the filter paper, or if the packing at the top of the element is damaged.
  Also replace the element if the dust on the element is damp with oily soot, regardless of the replacement schedule.



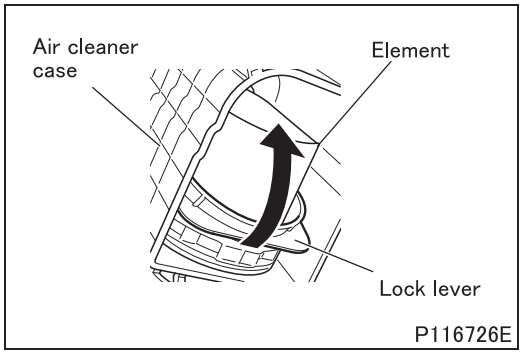
P116752

[Cleaning]

- Blow a jet of compressed air at a pressure not higher than 685 kPa {100 psi, 7 kgf/cm^2} against the inside surfaces of the element.
- Move the compressed air jet up and down along all pleats of the filter paper element.

CAUTION ⚠

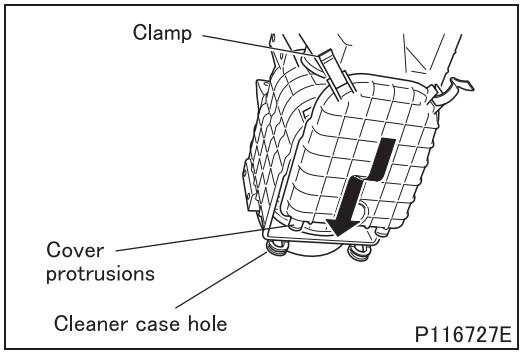
- **For the frequency and timing of cleaning, see the relevant instruction manual. More frequent cleaning than necessary may damage the element, causing dust and foreign matter to be sucked into the engine.**
- **Do not strike the element or hit it against another object to remove dust.**
- **Do not blow compressed air against outside surfaces of the element.**



P116726E

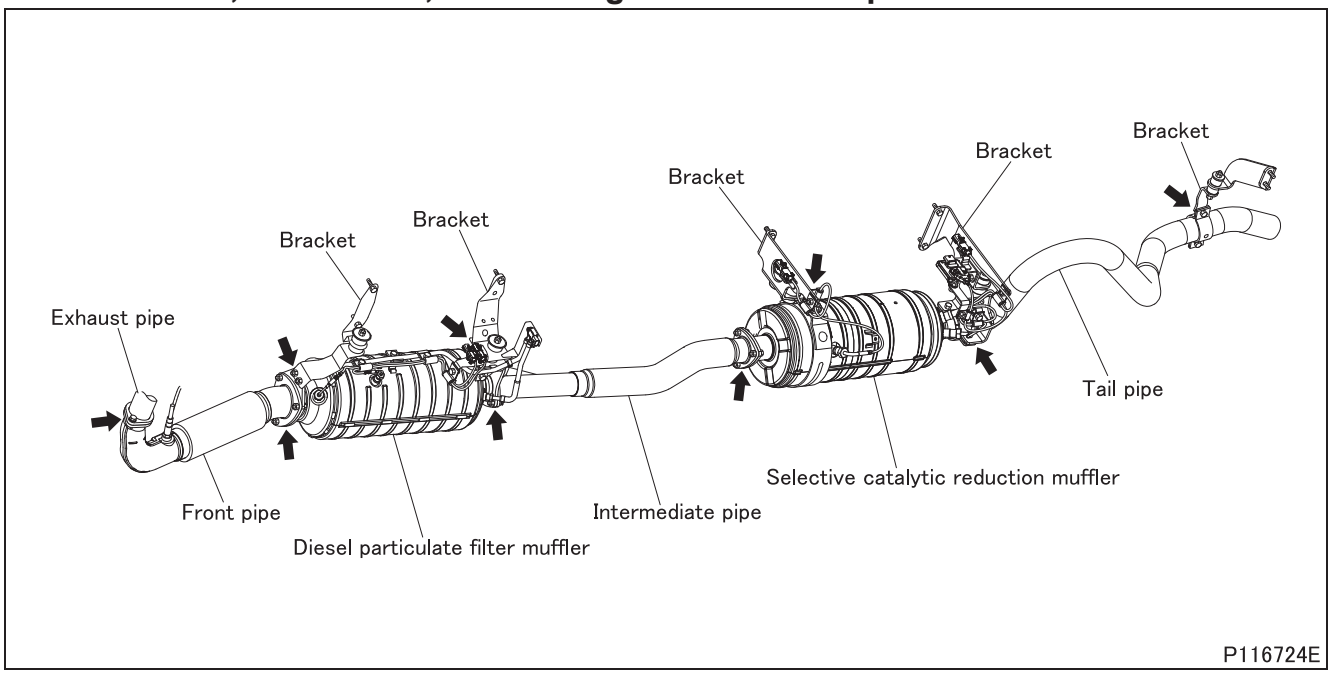
[Installation]

- Insert the air cleaner element straight into the air cleaner case. Then move the lock lever in the air cleaner case to the “LOCK” position.



- Install the cover while inserting its projections into the holes in the air cleaner case.

3. Installation, Looseness, and Damage of Exhaust Pipe and Muffler



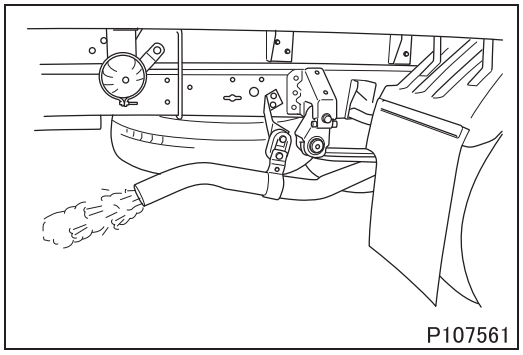
- Check the following and when a loose or faulty part is detected, correct or replace the part.
  - Check the mounting and connecting portions of the exhaust (front) pipe, muffler, DPF, and oxidation catalyst for looseness by shaking them by hand.
  - Using a wrench or similar tool, check the mounting bolts and nuts of the exhaust (front) pipe, muffler, DPF, oxidation catalyst, and heat insulating board (insulator) for looseness.
  - Check the rubber hanger for deterioration, damage, and installed condition.
  - Check the exhaust (front) pipe, muffler, DPF, oxidation catalyst, and heat insulating board (insulator) for damage and corrosion.
  - Check the exhaust (front) pipe, muffler, DPF, and oxidation catalyst for possible contact with other parts.
  - Start the engine (and let it warm up thoroughly) and check for possible leakage of exhaust gas from connections.

CAUTION ⚠

- **Do not touch water that comes out from the DPF or SCR. If such water attaches to your skin, wash it off thoroughly with running water.**

DPF: Diesel particulate filter

4. Functions of Muffler



- Start the engine (and let it warm up thoroughly). Then, change its speed to listen for any unusual exhaust noise.
- If any unusual noise is heard, correct or replace the defective part.

CAUTION ⚠

- **Do not touch water that comes out from the DPF or SCR. If such water attaches to your skin, wash it off thoroughly with running water.**

DPF: Diesel particulate filter
SCR: Selective catalytic reduction

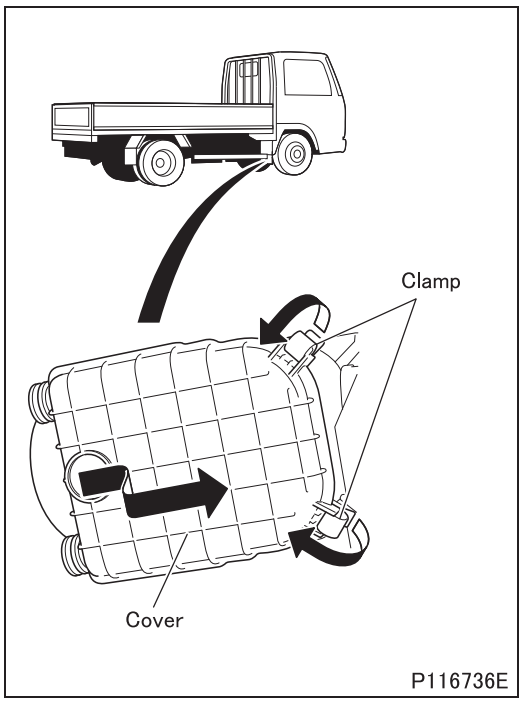
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Clamp	3.0 to 3.4 {2.2 to 2.5, 0.3 to 0.35}	–
Tb	Clamp	9.0 to 11.0 {6.6 to 8.1, 0.9 to 1.1}	–
Tc	Bolt	12 to15 {8.9 to 11, 1.2 to 1.5}	–

Lubricant and/or sealant

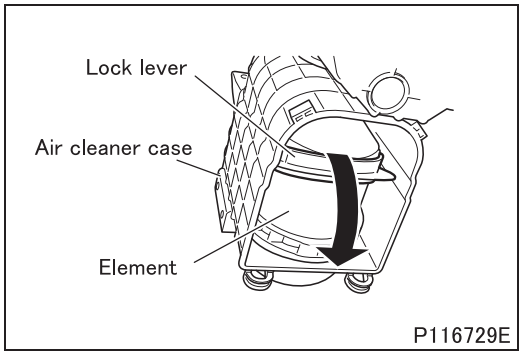
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Humidity and intake air temperature sensor	ThreeBond 1855	As required

◆**Removal procedure**◆

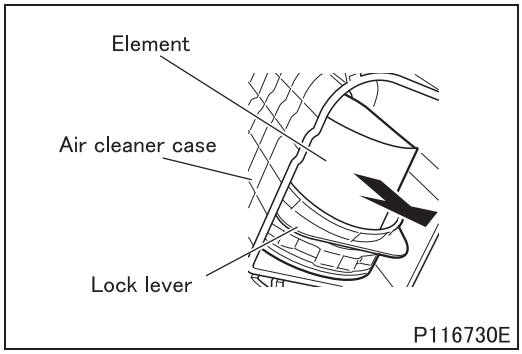


■**Removal: Air cleaner element**

- Make sure the parking brake is firmly applied.
- Chock the wheels.
- Undo the clamps at 2 places, then remove the cover by pulling it in the direction of the clamps.

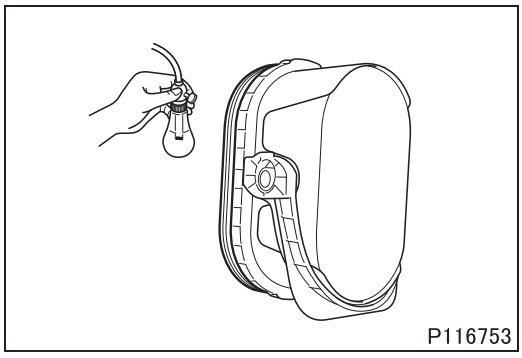


- Move the lock lever in the air cleaner case to the “UNLOCK” position.



- Pull the air cleaner element straight out of the air cleaner case.

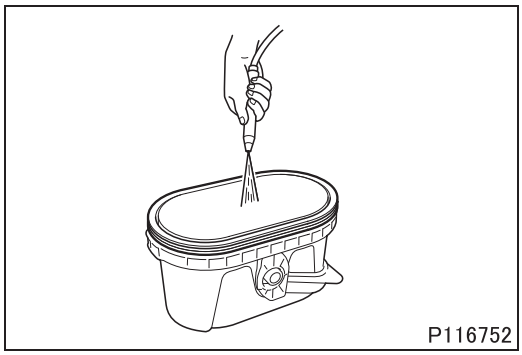
◆Inspection procedure◆



■ Inspection: Element

- Shine light inside the element.
- Replace the element if thin spots or broken parts are evident in the filter paper, or if the packing at the top of the element is damaged.
  Also replace the element if the dust on the element is damp with oily soot, regardless of the replacement schedule.

◆Cleaning procedure◆



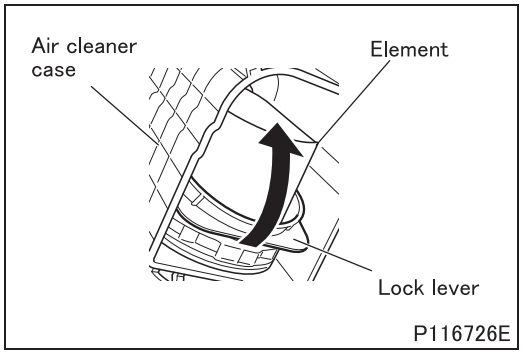
■ Cleaning: Element

- Blow a jet of compressed air at a pressure not higher than 685 kPa {100 psi, 7 kgf/cm^2} against the inside surfaces of the element.
- Move the compressed air jet up and down along all pleats of the filter paper element.

CAUTION ⚠

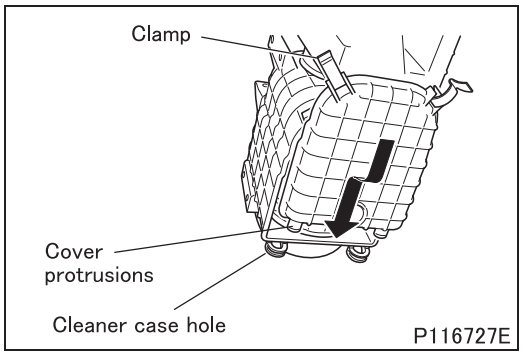
- **For the cleaning interval of the element, refer to the Owner’s Manual. Unnecessarily frequent cleaning may damage the element and can be the cause of dust and foreign objects being trapped in the engine.**
- **Do not strike the element or hit it against another object to remove dust.**
- **Do not blow compressed air against outside surfaces of the element.**

◆Installation procedure◆

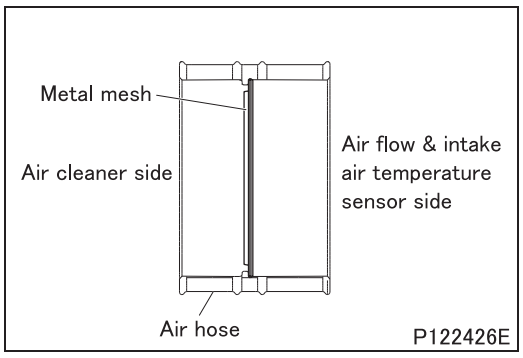


■ **Installation: Air cleaner element, air cleaner cover**

- Insert the air cleaner element straight into the air cleaner case, then move the lock lever in the air cleaner case to the “LOCK” position.

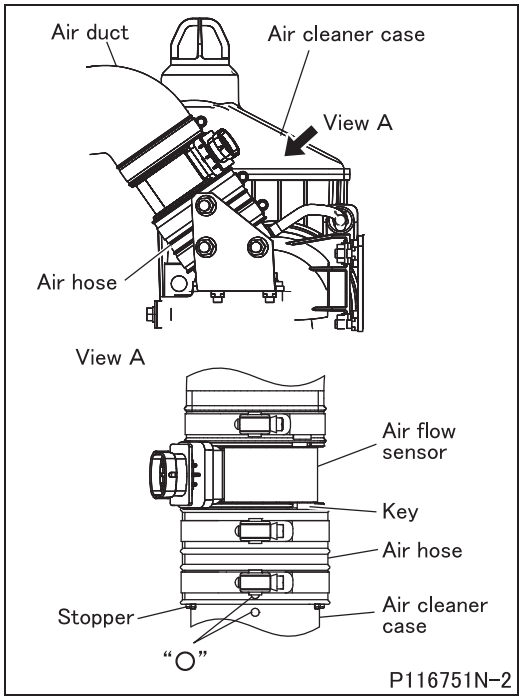


- Install the cover while inserting its protrusions into the holes in the air cleaner case.



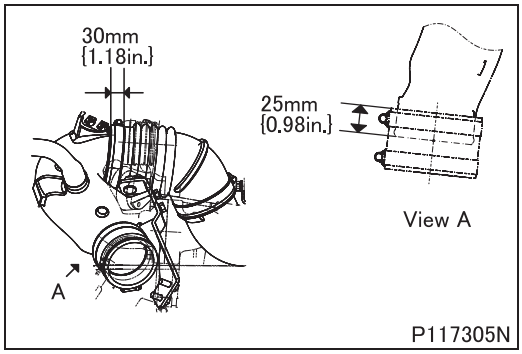
■ **Installation: Metal mesh**

- Install the metal mesh to the air hose in the direction shown in the drawing.



■ **Installation: Air flow sensor**

- Align the marks "o" on air cleaner and air hose and push air hose in until it hits stopper.
- Align the key on air hose and the slot on air flow sensor and push air flow sensor in until it hits stopper.
- Tighten clamps facing in the illustrated direction.

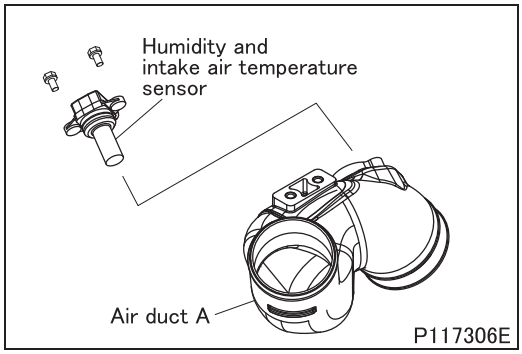


■ **Installation: Air hose B, air duct B**

- Connect the air hose B to the air duct B to the dimensions indicated in the illustration.
- Align the marks "o" on air hose and push it in until it hits stopper.

CAUTION ⚠

- **When assembling the secondary side hose or duct, use water only for smooth installation. Appling soup suds, grease or other lubricating material will cause malfunction of the air flow sensor.**



■ **Installation: Humidity and intake air temperature sensor**

- Apply sealant to the humidity and intake air temperature sensor, then install the sensor on the air duct A.

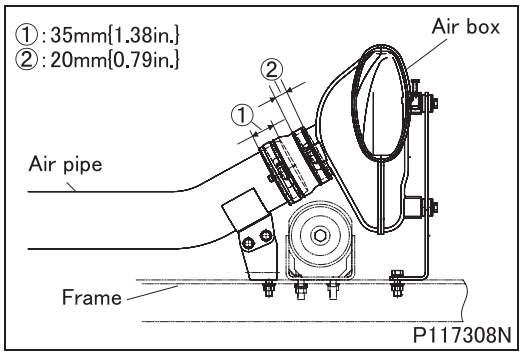
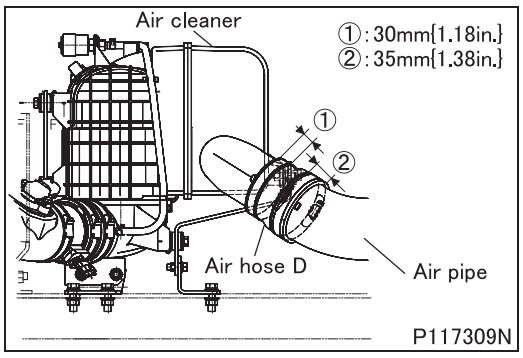
- Install the cover while inserting its protrusions into the holes in the air cleaner case, then fasten the clamps.



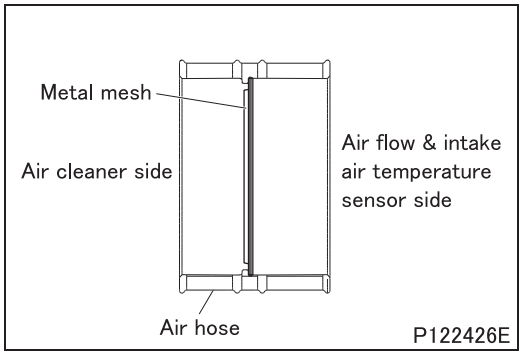
■ **Installation: Air box, air hose, air pipe**

- Connect the air hose E to the air box while respecting the dimensions indicated in the illustration.



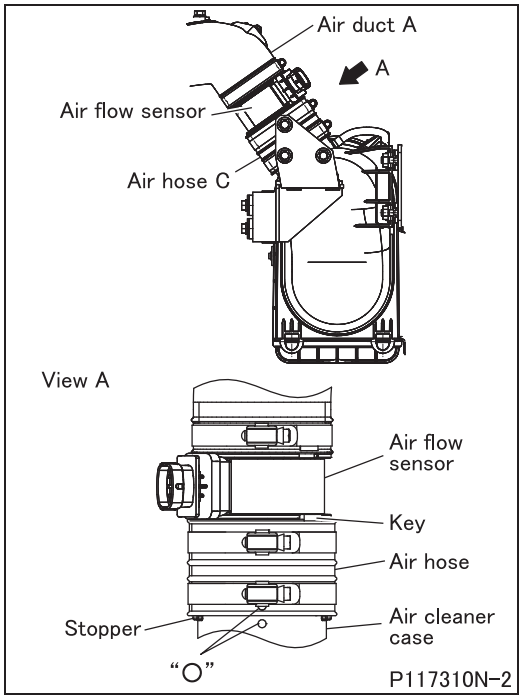
■ **Installation: Air cleaner, air hose D, air pipe**

- Connect the air hose D to the air cleaner while respecting the dimensions indicated in the illustration.



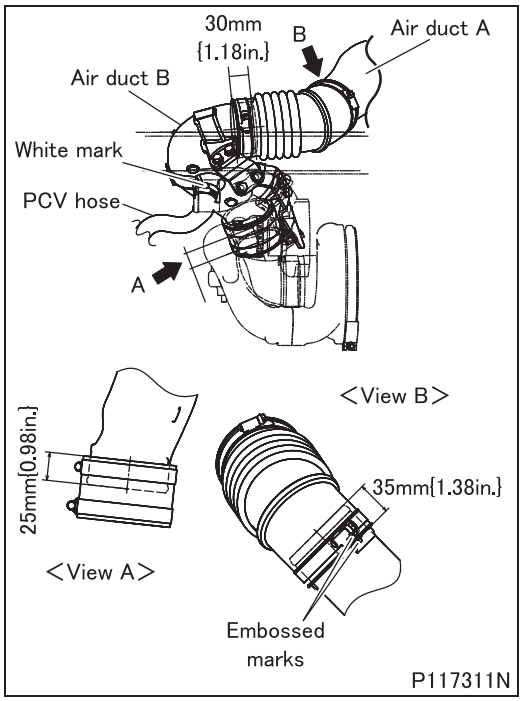
■ **Installation: Metal mesh**

- Install the metal mesh to the air hose in the direction shown in the drawing.



■ **Installation: Air hose C, air flow sensor, air duct A**

- Align the marks "o" on air cleaner and air hose C and push air hose in until it hits stopper.
- Align the key on air hose C and the slot on air flow sensor and push air flow sensor in until it hits stopper.
- Tighten clamps facing in the illustrated direction.



■ **Installation: Air hose A, air duct B, PCV (positive crankcase ventilation) hose**

- Assemble the air hose A, air duct B, and PCV (positive crankcase ventilation) hose together to the dimensions indicated in the illustration.
- Install the PVC hose with the indicated mark facing upward.
- Connect the air hose A to air duct B with the embossed marks aligned.

CAUTION ⚠

- **When assembling the secondary side hose or duct, use water only for smooth installation. Appling soup suds, grease or other lubricating material will cause malfunction of the air flow sensor.**

15 Clamp B
16 Exhaust pipe
17 Clamp A
18 EBS (Exhaust Brake system)
19 Collar
20 Stud bolt
21 Turbocharger
22 Protector

⊗: Non-reusable parts

CAUTION ⚠

- **The turbocharger is a non-disassembly component. When it becomes unsmooth in rotation or has any problems, replace the turbocharger.**

● Installation sequence

Follow the removal sequence.

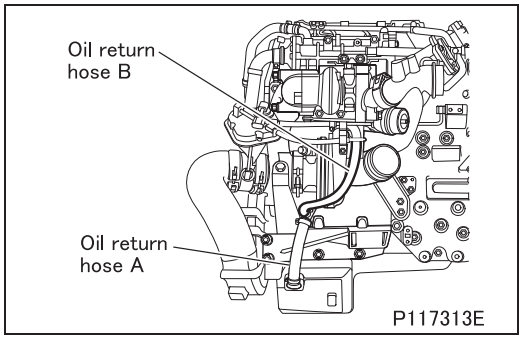
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (exhaust manifold and turbocharger mounting)	25 {18, 2.5}	–
	Nut (exhaust manifold and turbocharger mounting)		
	Bolt (air duct mounting)		
	Bolt (bracket mounting)		
Tb	Bolt (oil return pipe mounting)	10 {7.4, 1.0}	–
Tc	Connector and Eyebolt (pipe mounting)	30 {22, 3.1}	–
Td	Clamp B (exhaust pipe)	12 ± 1 {1.2 ± 0.1}	–
Te	Clamp A (turbocharger)	9 ± 1 {0.9 ± 0.1}	–

■ Work before removal

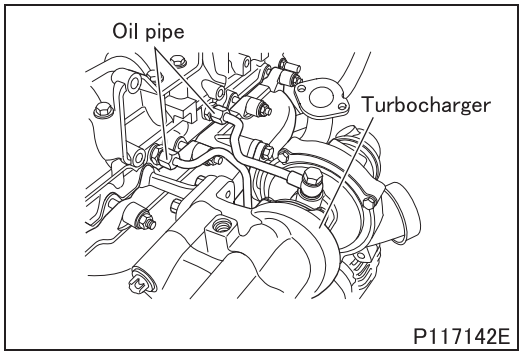
- Open the radiator drain cock to discharge coolant.
- Perform the following steps to make a work space.
  - Remove the air ducts and air hoses.
  - Remove the air inlet hose and air inlet pipe.
  - Remove the surge hose.
  - Remove the heater hose.
  - Remove the PCV hose.
  - Remove the front pipe.
  - Remove the protector.
  - Remove the vacuum modulator.
  - Remove the EGR (Exhaust Gas Recirculation) unit.

◆Removal procedure◆



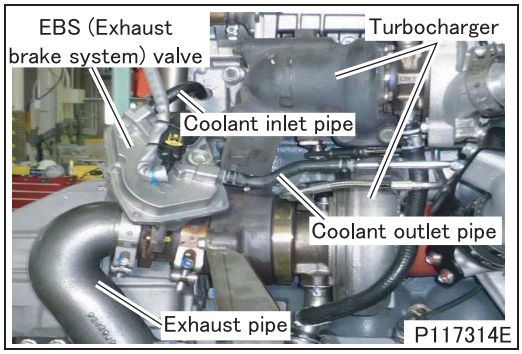
■ Removal: Oil return hose A, oil return hose B

- Disconnect the oil return hose A and oil return hose B from the turbocharger.



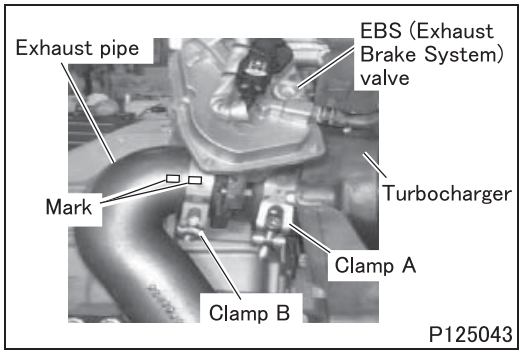
■ **Removal: Oil pipe**

- Remove the oil pipe.

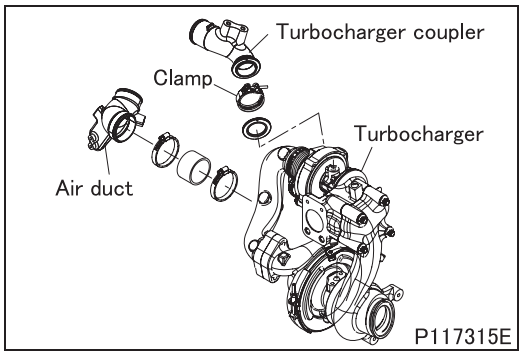


■ **Removal: Exhaust pipe, coolant inlet pipe, coolant outlet pipe, EBS (Exhaust Brake System) valve, bracket**

- Open the clamp and move it away from the position locking the coolant inlet pipe to the union on the EBS (Exhaust Brake System) valve.
- Remove the coolant inlet pipe from the EBS valve.
- Open the clamp and move it away from the position locking the coolant outlet pipe to the union on the EBS valve. Remove the coolant outlet pipe from the EBS valve.

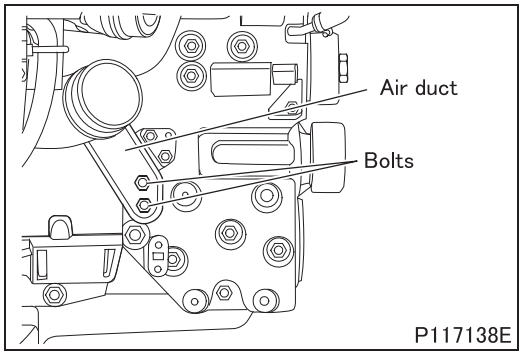


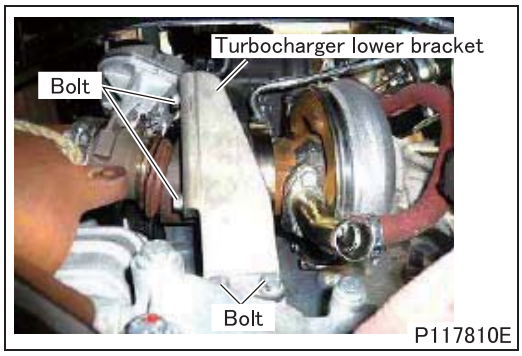
- First remove the EBS valve by loosening the clamp B of the exhaust pipe.
- Before removing clamps, put alignment marks on the exhaust pipe and clamps.
- Loosen the clamp A of the EBS valve and then remove the valve from the turbocharger.



■ **Removal: Turbocharger coupler, air duct**

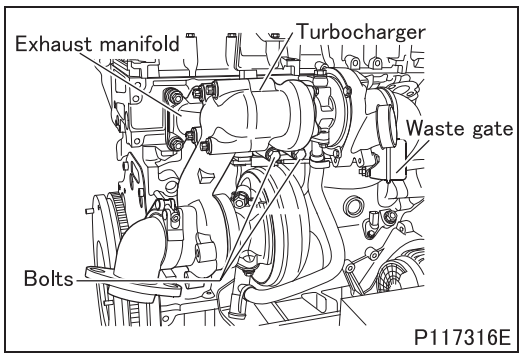
- Unfasten the clamp and remove the turbocharger coupler.
- Remove the air duct after unfastening the clamp.





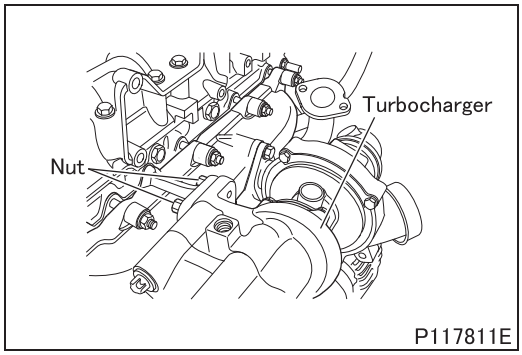
■ **Removal: Bracket**

- Remove the bracket that secures the turbocharger in place.

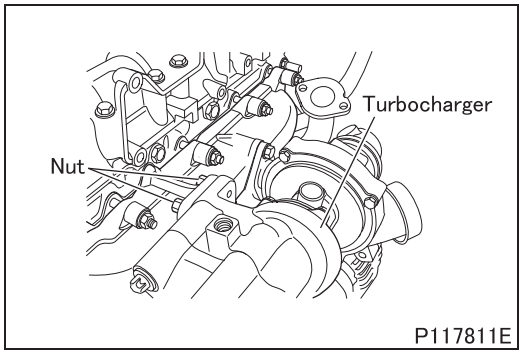


■ **Removal: Turbocharger**

- Remove the turbocharger from the exhaust manifold.

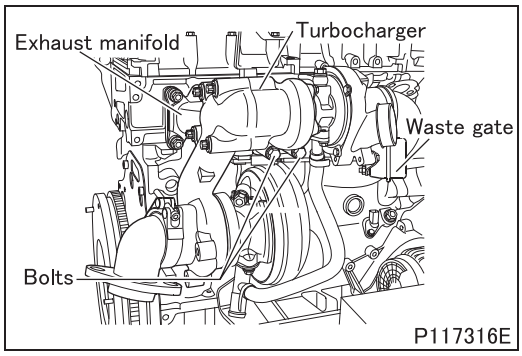


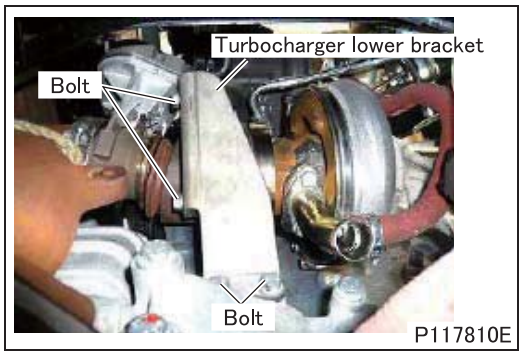
◆Installation procedure◆



■ **Installation: Turbocharger**

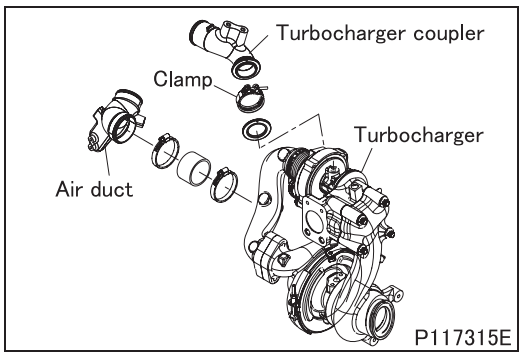
• Install the turbocharger on the exhaust manifold.





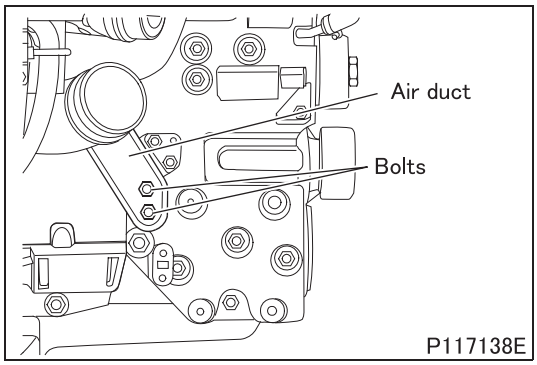
■ **Installation: Bracket**

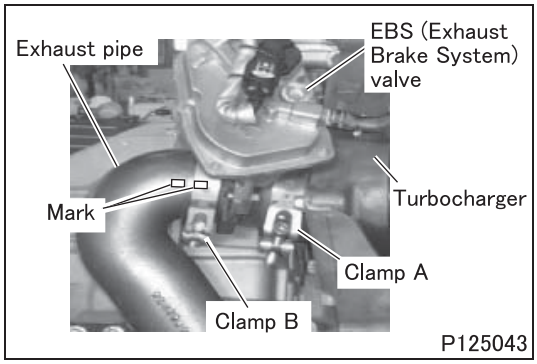
• Fix the turbocharger to the cylinder head using the bracket.



■ **Installation: Turbocharger coupler, air duct**

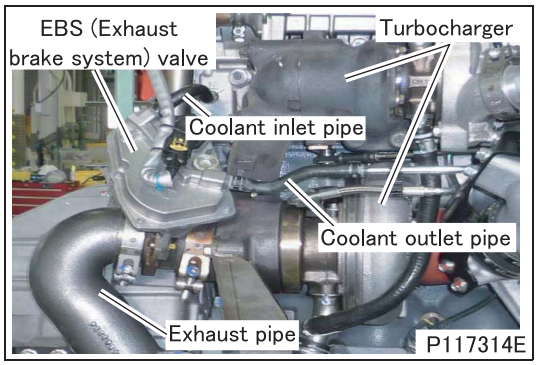
• Install the turbocharger coupler and air duct on the turbocharger.



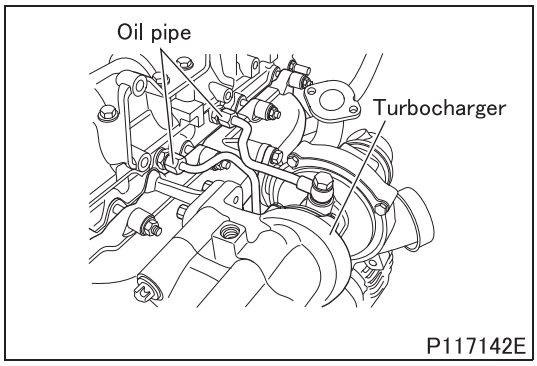


■ **Installation: Exhaust pipe, coolant inlet pipe, coolant outlet pipe, EBS (Exhaust Brake System) valve, bracket**

- Install the EBS valve to the turbocharger with a clamp A.
- Install the exhaust pipe to the EBS valve with a clamp B.
- Install the clamps while aligning their alignment mark with that on the mating part. (Position each clamp such that its bolt may not interfere with the EBS valve when it is operated.)

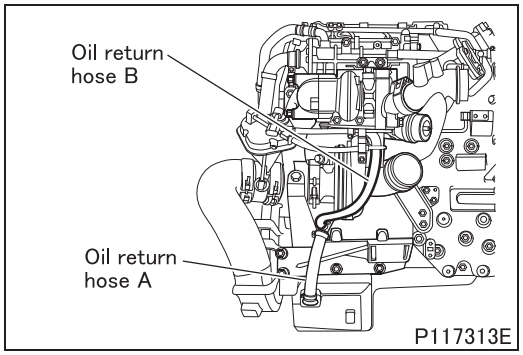


- Insert the coolant inlet pipe for EBS valve in the union. Tighten the clamp to the stop position.
- Insert the coolant outlet pipe for EBS valve in the union. Tighten the clamp to the stop position.



■ **Installation: Oil pipe**

- Install the oil pipe.



■ **Installation: Oil return hose A, Oil return hose B**

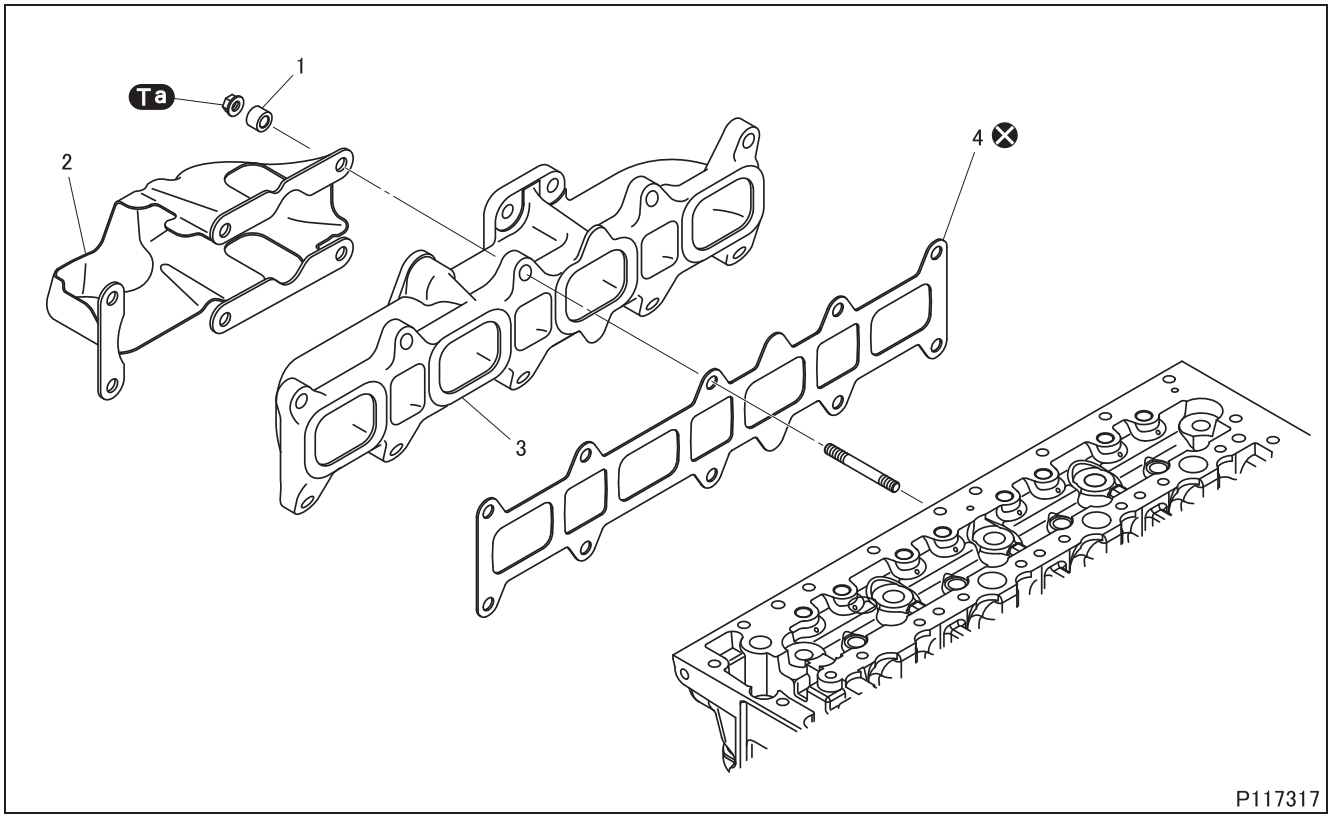
- Connect the oil return hose A and oil return hose B to the turbocharger.

■ **Work after installation**

- Reassemble those parts that have been removed to make the work space.
  - Install the vacuum modulator.
  - Install the exhaust gas recirculation unit.
  - Install the protector.
  - Install the air ducts and air hoses.
  - Install the air inlet hose and air inlet pipe.
  - Install the surge hose.
  - Install the heater hose.
  - Install the PCV hose.
  - Install the front pipe.45

M E M O

EXHAUST MANIFOLD



● **Disassembly sequence**

1 Spacer
2 Insulator
3 Exhaust manifold
4 Gasket
⊗: Non-reusable parts

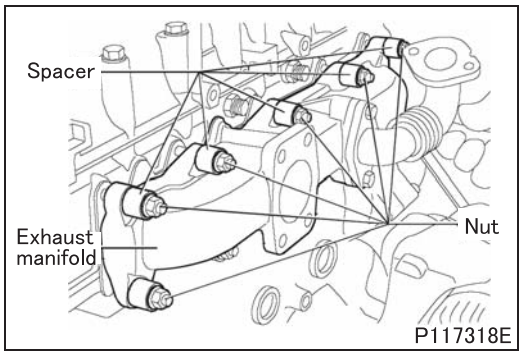
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (exhaust manifold mounting)	25 {18, 2.5}	–

◆Installation procedure◆

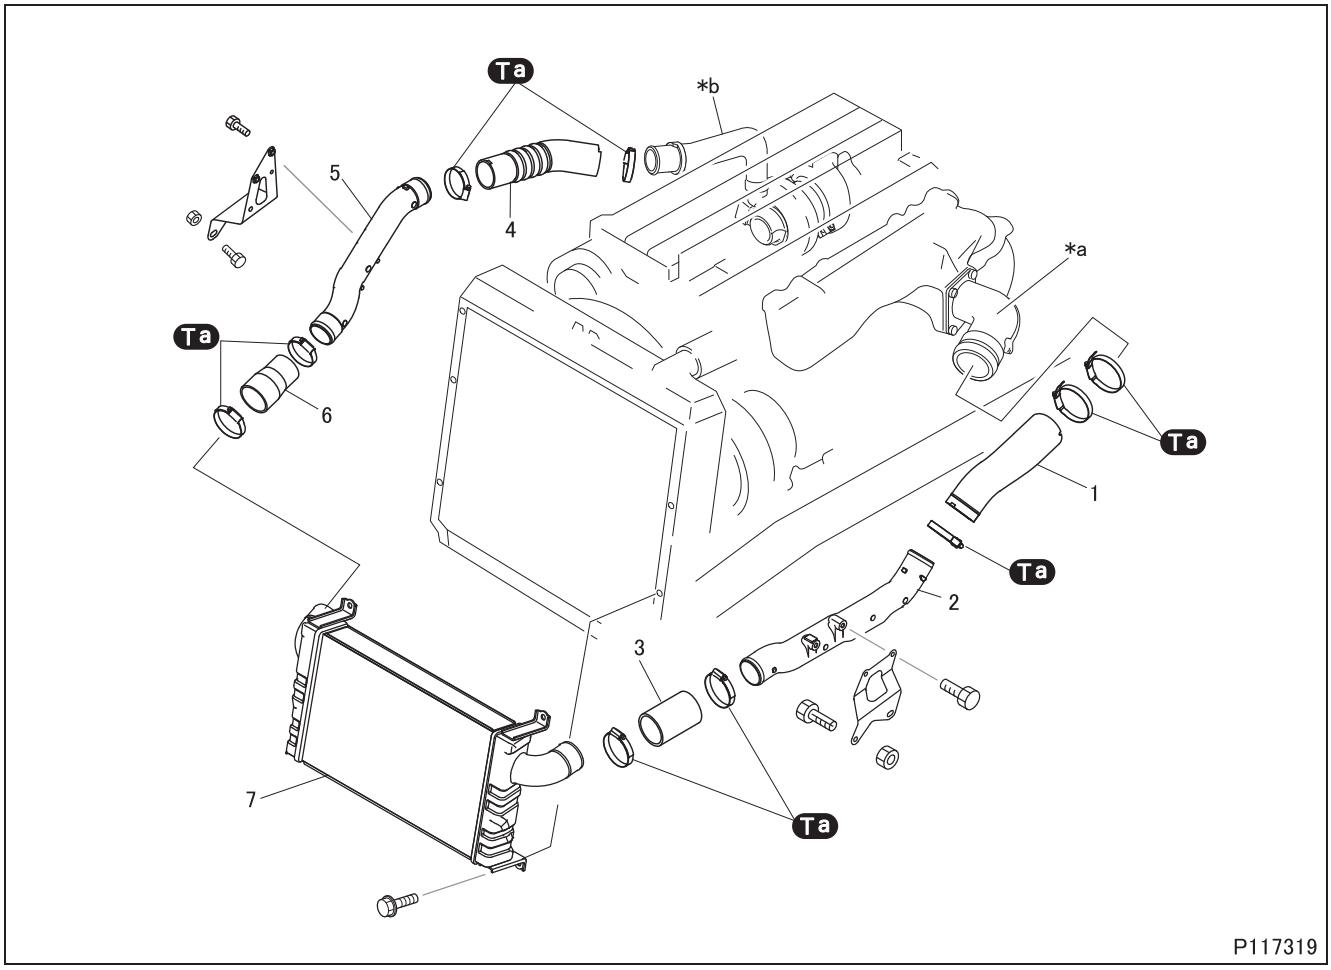


■ **Installation: Gasket**

- Set the exhaust manifold in position together with a new gasket, and fasten them by tightening the nuts via the spacers.

M E M O

INTERCOOLER



● **Disassembly sequence**

1 Air inlet hose A
2 Air inlet pipe LH
3 Air inlet hose B
4 Air inlet hose C
5 Air inlet pipe RH
6 Air inlet hose D
7 Intercooler

***a:** Air inlet pipe
***b:** Turbocharger coupler

CAUTION ⚠

- **When removing the air inlet hose, do not try to pry it off with strong force using a screwdriver or other similar tools. Doing that can damage the fluoro-layer on the inner surface of the hose, possibly compromising the oil resistance of the hose.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

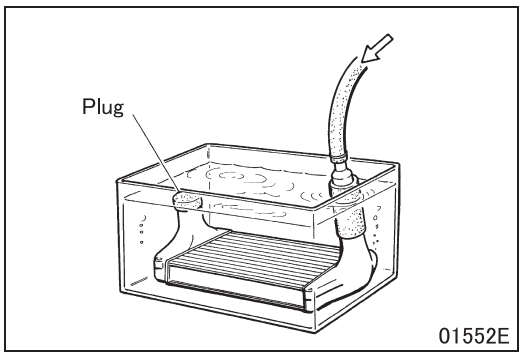
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
7	Intercooler air leakage (air pressure: 150 kPa {22 psi, 1.5 kgf/cm^2} maintained for 30 seconds)	0 cm^3 {0 mL}	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Clamp	Width across flats of bolt : 7mm	8 to 9 {5.9 to 6.6, 0.8 to 0.9}	–
		Width across flats of bolt : 8mm	6.0 to 6.5 {4.4 to 4.8, 0.6 to 0.7}	–

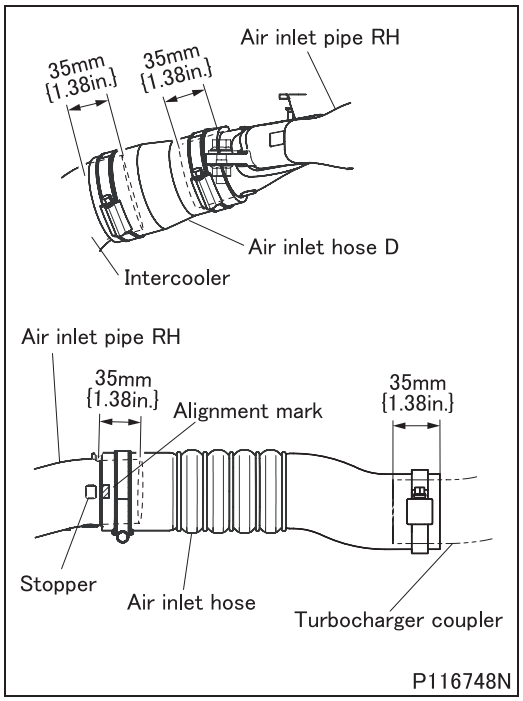
◆Inspection procedure◆



■Inspection: Air leakage from intercooler

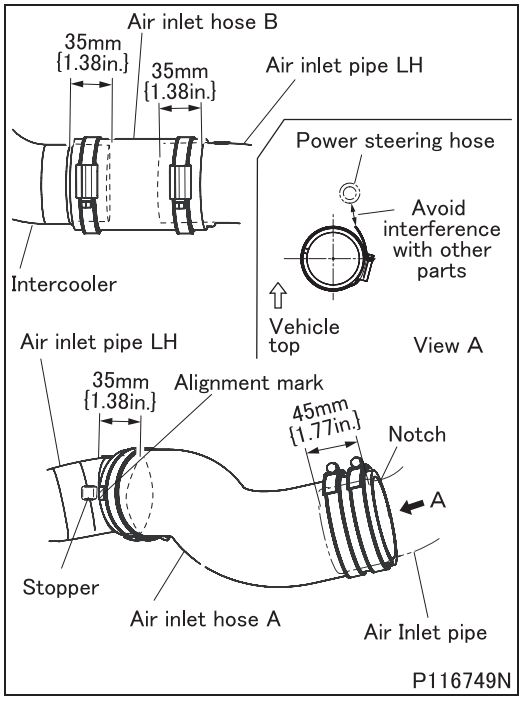
- Plug one of the air ports of the intercooler and immerse it in a tank of water. Apply the specified air pressure to the intercooler through the other air port and retain pressure for 30 seconds.
- Replace the intercooler if any air leakage is evident.

◆Installation procedure◆



■Installation: Air inlet hose

- Install the air inlet hose on air inlet pipe RH so that the alignment mark on the hose is aligned with the stopper on the pipe.
- Connect the air inlet hose to the air turbocharger coupler.
- Install the air inlet hoses to the intercooler, air inlet pipe RH and turbocharger coupler to the illustrated dimensions.



- Install the air inlet hose to the air inlet pipe LH so that the alignment mark on the hose is aligned with the stopper on the pipe.
- Connect the air inlet hose to the air inlet pipe aligning the notches.
- Install the air inlet hoses to the intercooler, air inlet pipe LH and air inlet pipe to the illustrated dimensions.

M E M O

INTAKE MANIFOLD

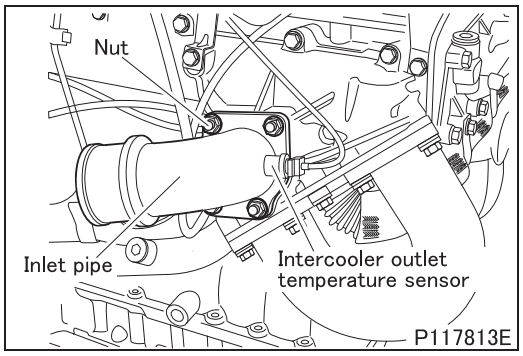
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

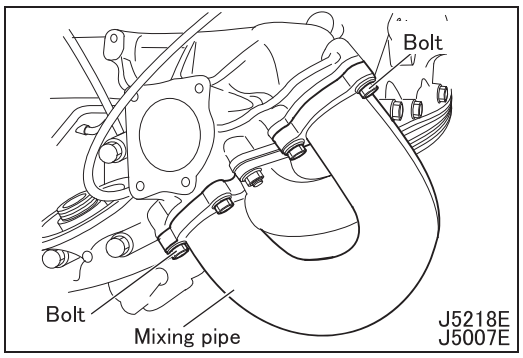
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (intake manifold mounting)	25 {18, 2.5}	–
	Bolt (pipe mounting)		
	Nut (inlet pipe mounting)		
	Nut (connection pipe mounting)		
Tb	Bolt (pressure and temperature sensor mounting)	10 {7.4, 1.0}	–

◆Removal procedure◆



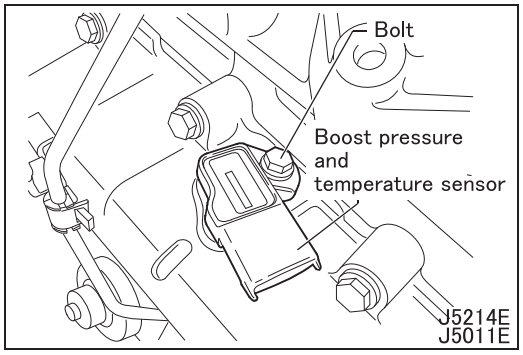
■ Removal: Air inlet pipe

- Remove the nuts and detach the air inlet pipe.



■ Removal: Mixing pipe

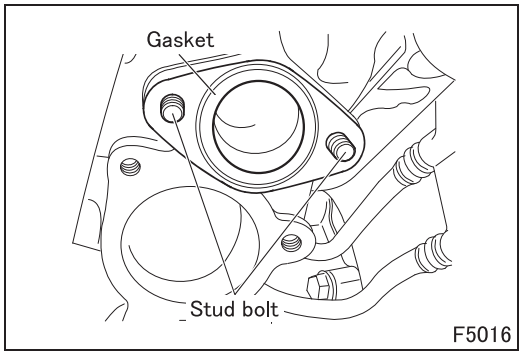
- Remove the bolt and detach the mixing pipe.



■ Removal: Boost pressure and temperature sensor

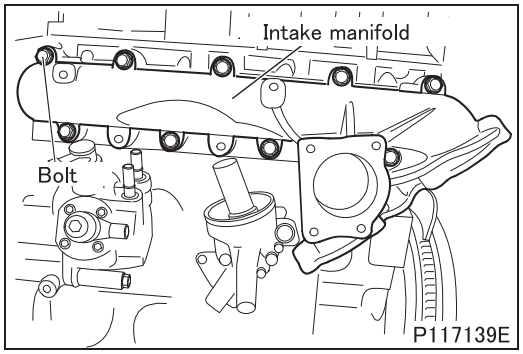
- Unscrew and remove the bolt; remove the boost pressure and temperature sensor from the intake manifold.

INTAKE MANIFOLD



■ **Removal: Gasket, stud bolt**

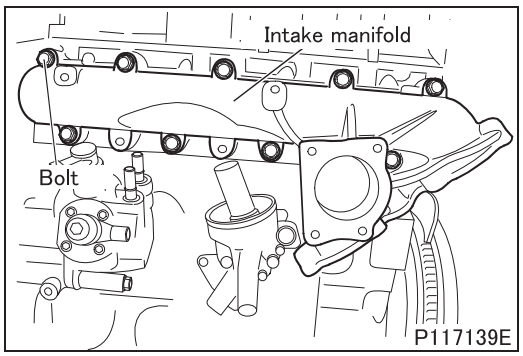
- Remove the gasket after removing the connection pipe.
- Unscrew and remove the stud bolts.



■ **Removal: Intake manifold**

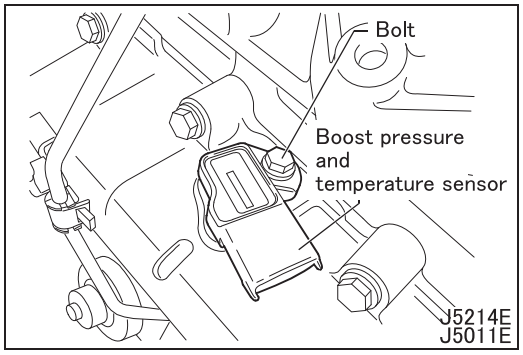
- Unscrew and remove the fixing screws.
- Detach the intake manifold with its gasket.

◆**Installation procedure**◆



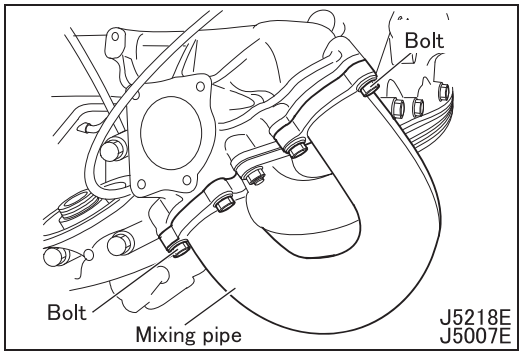
■ **Installation: Intake manifold**

- Install the intake manifold with a new gasket.
- Drive in the screws and tighten them to the prescribed torque: 25 N·m {18 ft.lbs, 2.5 kgf·m}.



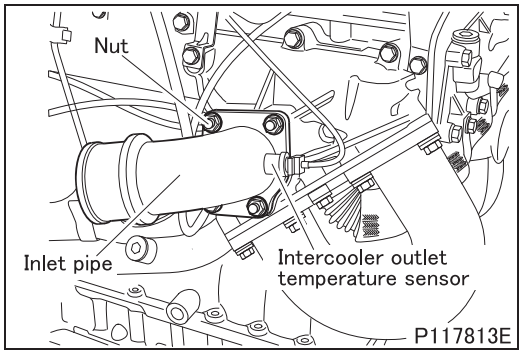
■ **Installation: Boost pressure and temperature sensor**

- Install the boost pressure and temperature sensor on the intake manifold.
- Tighten the bolt to a torque of 10 N·m {7.4 ft.lbs, 10 kgf·m}.



■ **Installation: Mixing pipe**

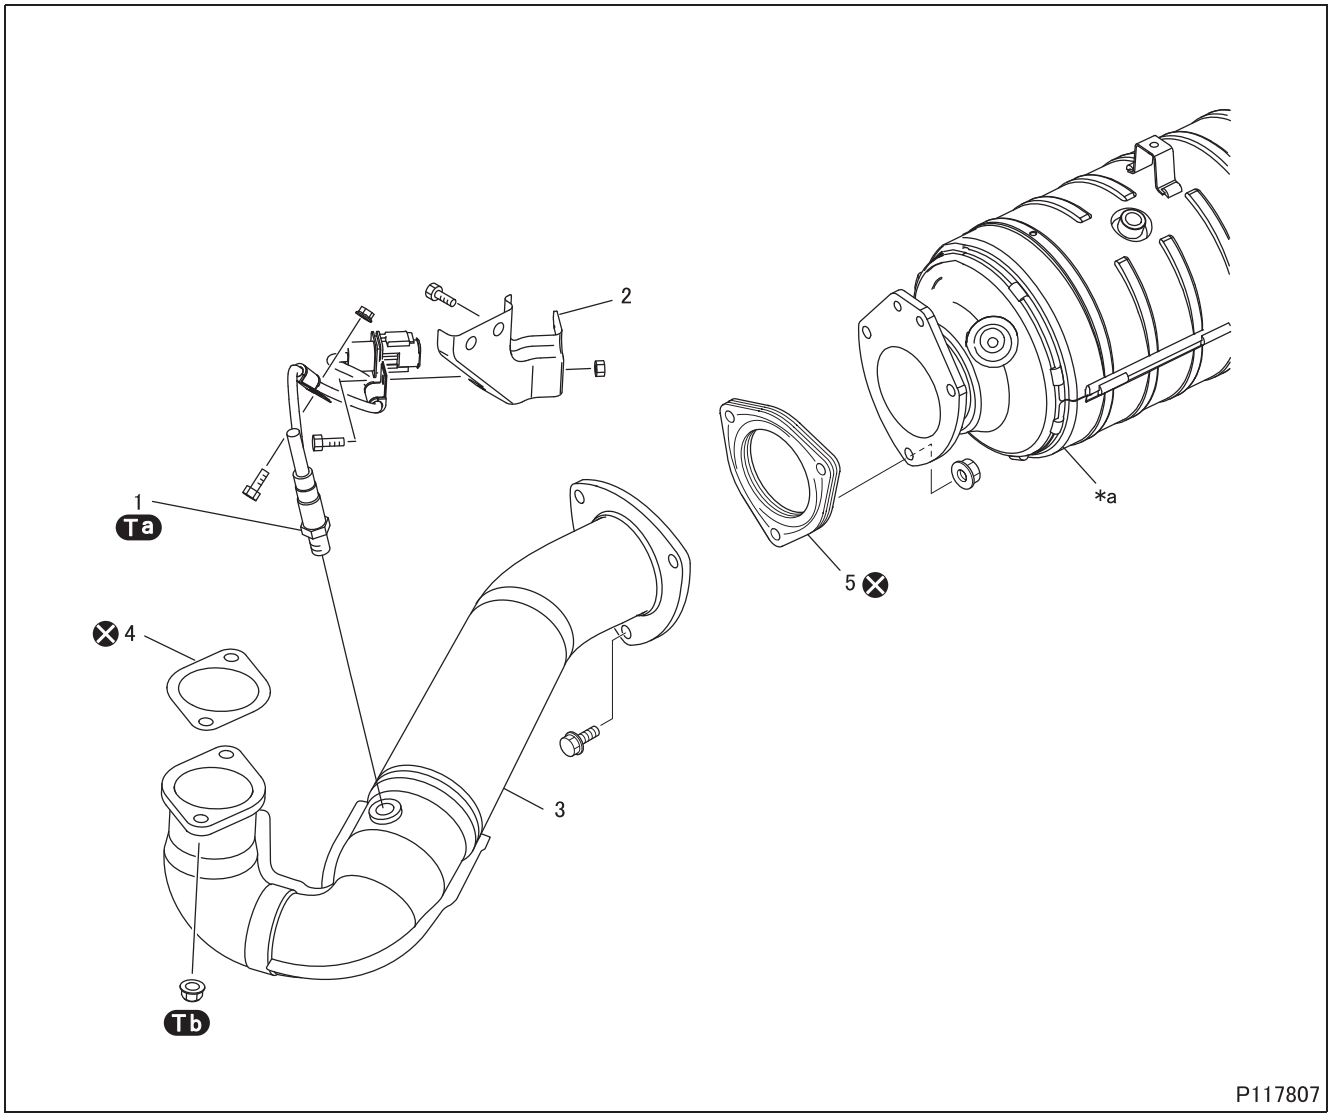
- Fit the pipe with new gaskets.
- Tighten the bolts to a torque of 25 N·m {181 ft.lbs, 2.5 kgf·m}.



■ **Installation: Air inlet pipe**

- Fit the air inlet pipe on the intake manifold with a new gasket. Screw in the fixing nuts and tighten them to a torque of 25 N·m {181 ft.lbs, 2.5 kgf·m}.

FRONT PIPE



● **Removal sequence**

1 Lambda sensor
2 Sensor stay
3 Front pipe
4 Gasket
5 Gasket

***a**: DPF
⊗: Non-reusable parts
DPF: Diesel particulate filter

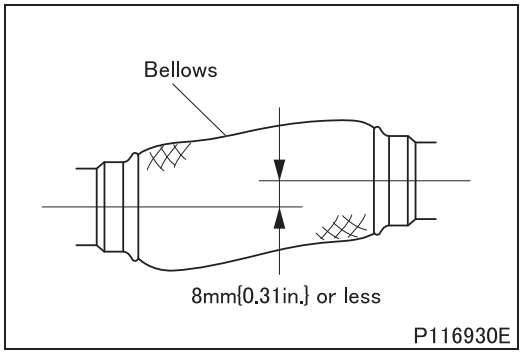
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Lambda sensor	50 ± 10 {37 ± 7.4, 5.1 ± 1.0}	–
Tb	Nut	50 ± 5 {37 ± 0.4, 5.1 ± 0.1}	–

◆Installation procedure◆



■Installation: Front pipe

- Install the front pipe so that the amount of offset in both vertical and horizontal directions between the pipes in front of and behind the bellows are within the specified value.

CAUTION ⚠

- **The function of the bellows on the front pipe is to reduce the vehicle noise level. It is not intended for compensating for misalignment that may result from improper installation of the front pipe. Install the front pipe properly to avoid excessive tension or other stress on the bellows.**

■Installation: Lambda sensor

- Install the lambda sensor on the front pipe.

CAUTION ⚠

- **Make sure that the sensor harness is free of tension, kink, or interference with surrounding parts.**
- **If the tip of the sensor is contaminated with soot, wipe it off with a dry, clean cloth.**

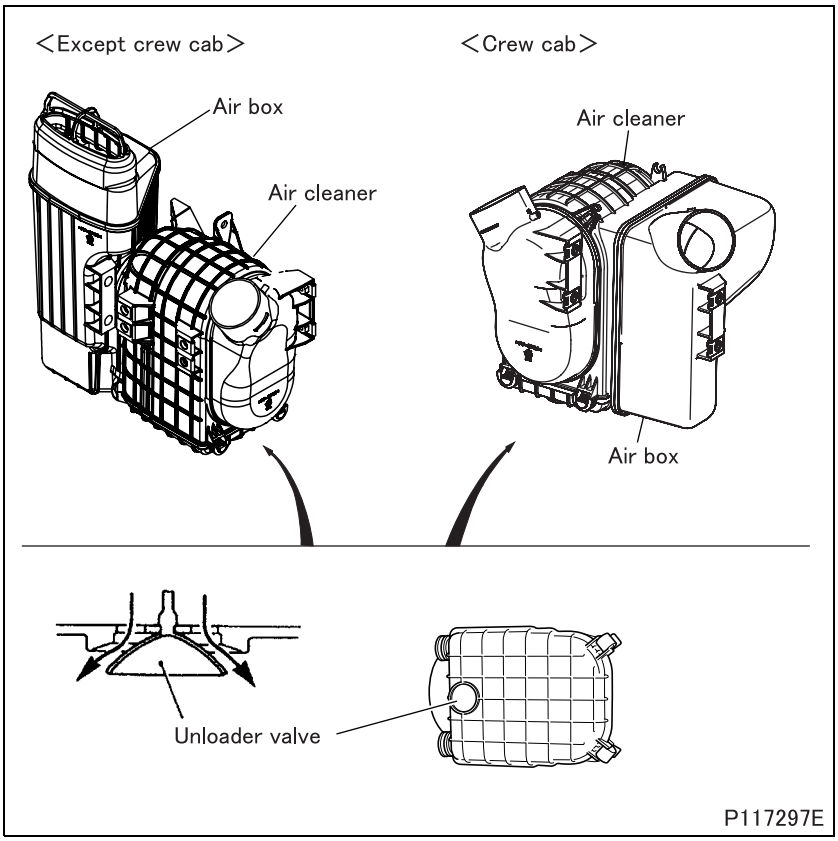
SPECIFICATIONS

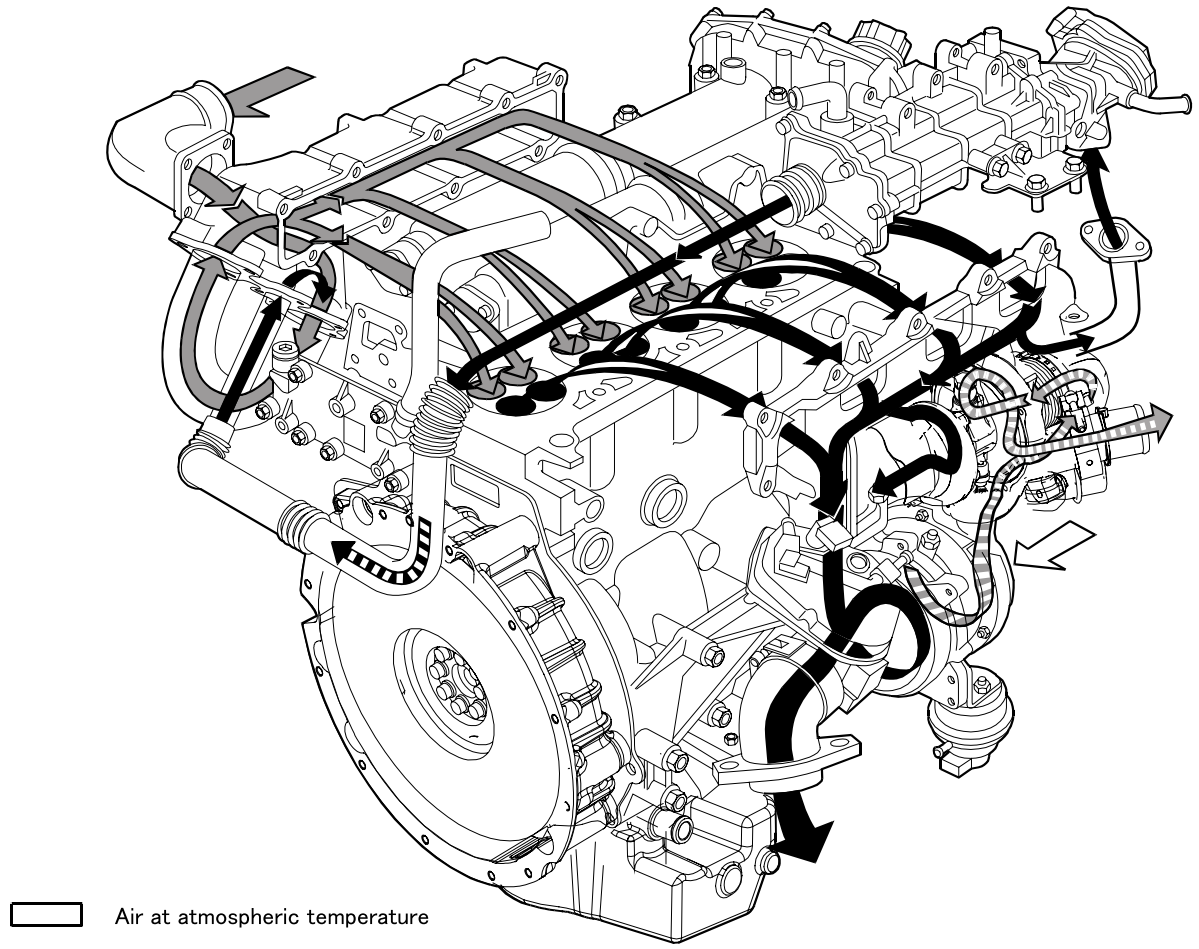
Item		Specifications
Air cleaner element type		Filter paper type
Turbocharger	Type	K03 B2 waste-Gate
	Manufacturer	BORG WARNER
	Turbocharger shaft radial play mm {in.}	0.396 to 0.602 {0.016 to 0.024}
	Turbocharger shaft end float mm {in.}	0.034 to 0.106 {0.0013 to 0.0042}
Intercooler type		Tube and corrugated fin air cooled type

1. Air Cleaner



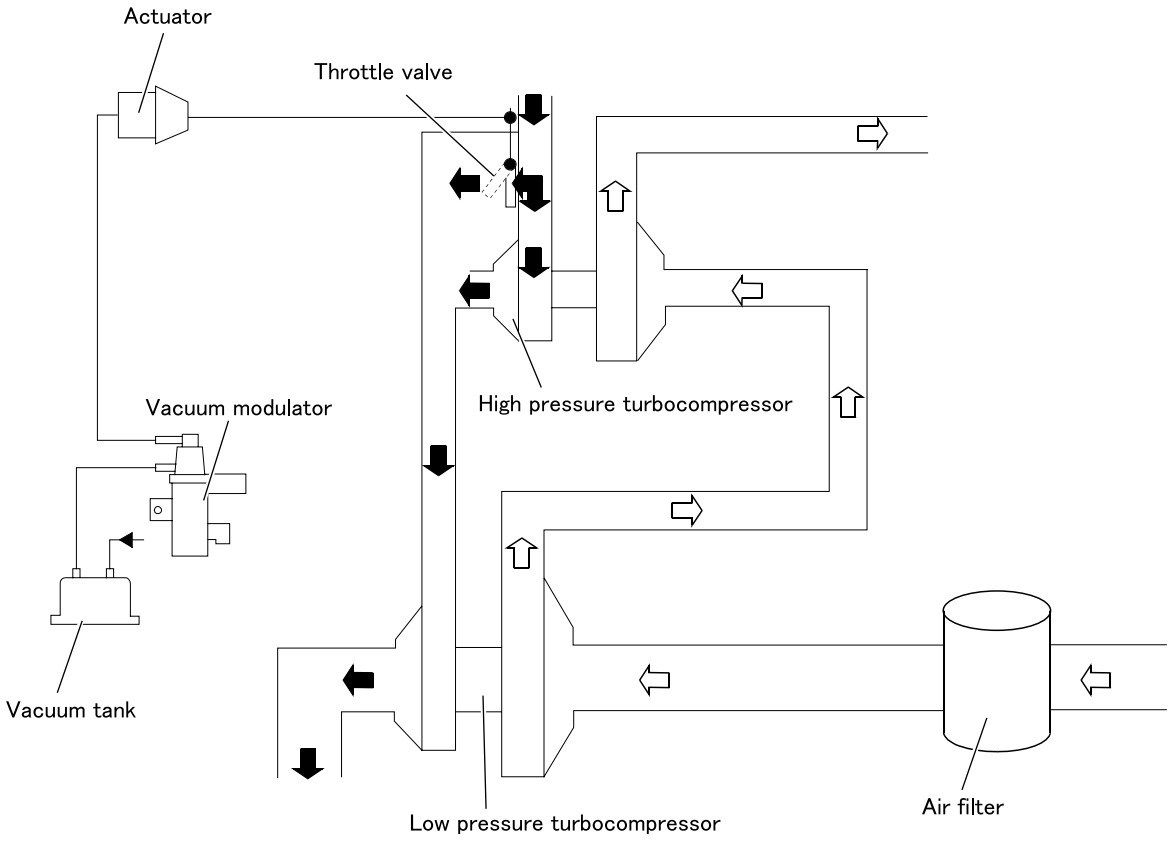
- The air cleaner is a single element type.
- When the engine slows down below the predetermined speed, the level of vacuum in the air cleaner changes and causes the unloader valve to vibrate. Vibration of the unloader valve allows the air cleaner to automatically discharge any water and dust that has accumulated inside.

2. Turbocharging System



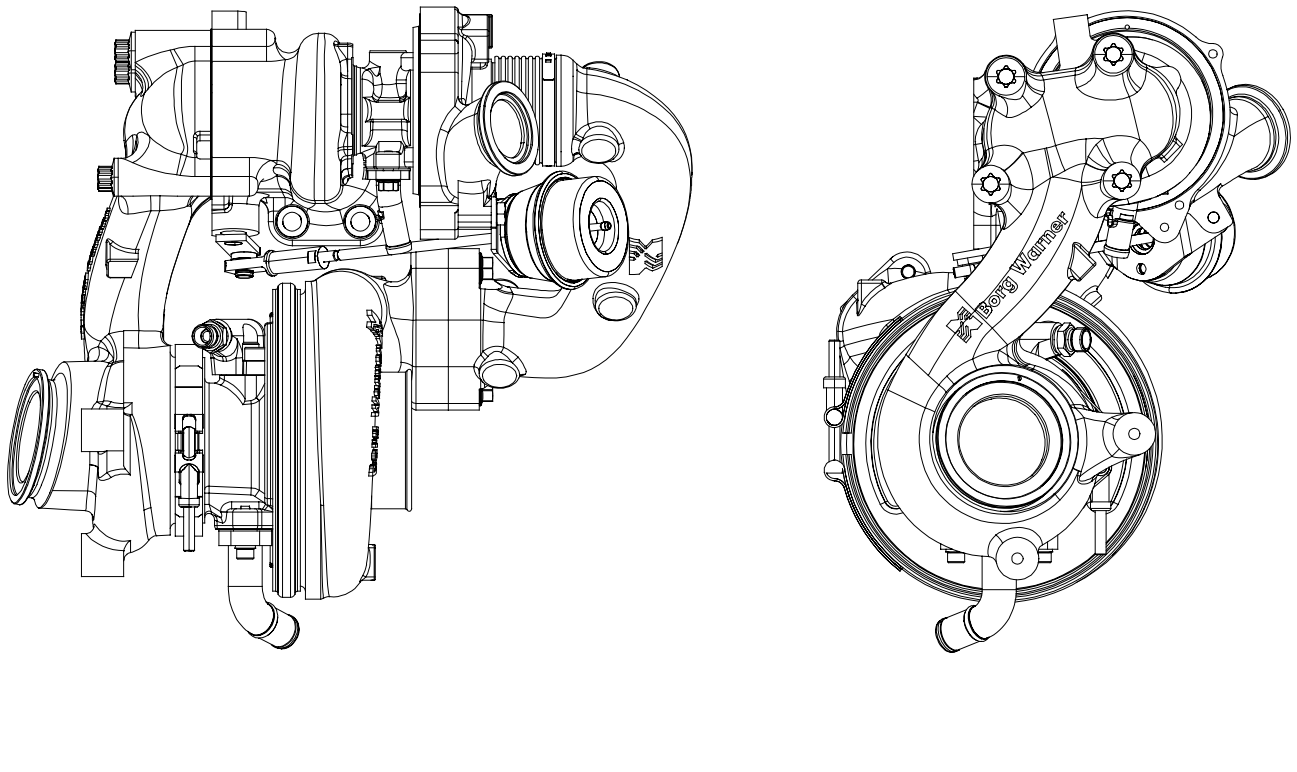
- The turbocharging system is composed of: an air filter, two-stage turbocompressor and intercooler.
- The air filter is the dry type comprising a filtering cartridge to be periodically replaced.
- The function of the two-stage turbocharger is to use the energy of the engine's exhaust gas to send pressurized air to the cylinders.
- The intercooler comprises a radiator included in the engine coolant radiator and its function is to lower the temperature of the air leaving the turbocharger to send it to the cylinders.

2.1 Turbocharger system function diagram



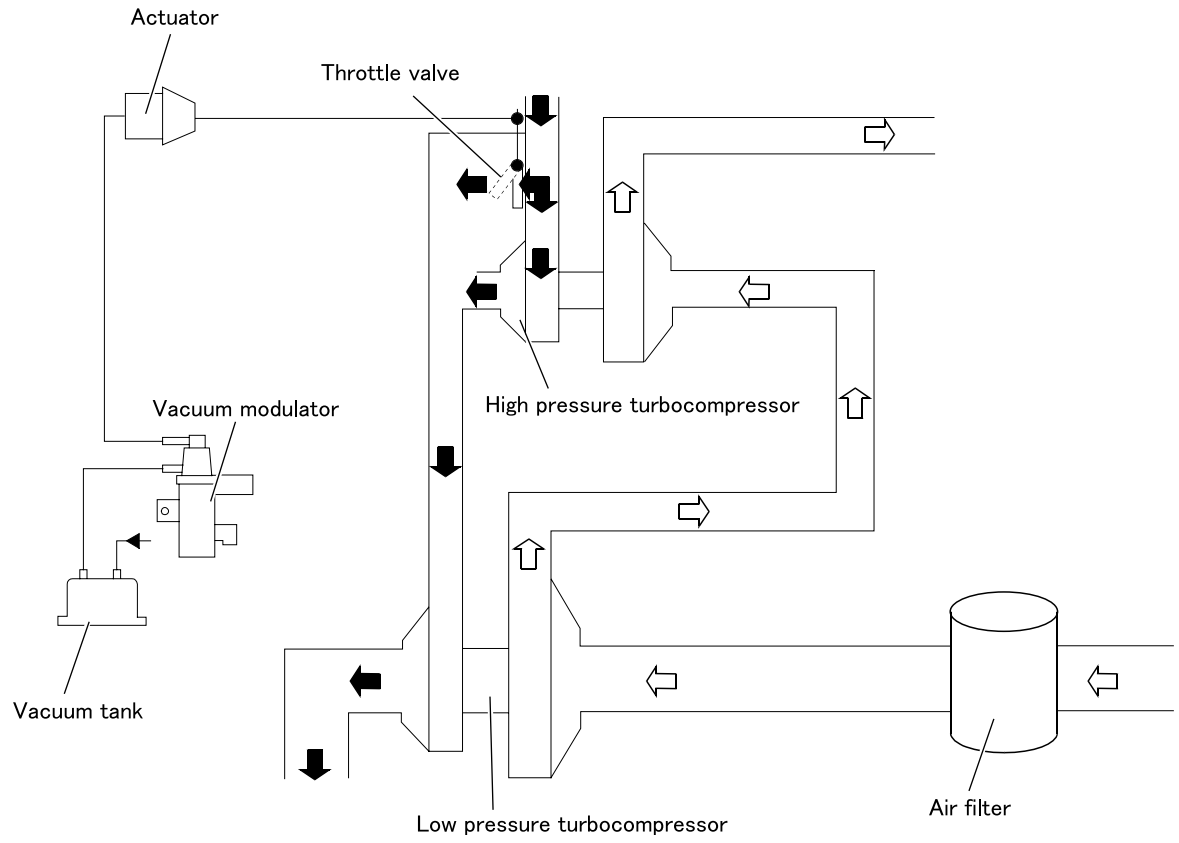
- For electronic control unit connector diagram of turbocharger system, see Gr13.

2.2 Turbocharger



P117300

- The borg warner turbcompressor is of the two-stage type with waste gate. It basically consists of;
  - A primary high-pressure turbocharger consisting of.
    - Central body in which a shaft is fitted, supported by bushings, fitted with the turbine impeller and compressor impeller at opposite ends.
    - A small fixed geometry turbine casing and a compressor casing mounted at the end of the central casing.
- A secondary low-pressure turbocharger consisting of:
  - central casing in which a shaft is fitted, supported by bushings, fitted with the turbine impeller and compressor impeller at opposite ends;
  - a larger fixed geometry turbine casing and a compressor casing mounted at the end of the central casing;
- A gas pipe connecting the two turbines;
- A pipe connecting the compressed air between the two compressors;
- An overpressure relief valve fitted on the high pressure turbine casing. This partialises the exhaust gas outlet and sends part directly to the low pressure turbine via the pipe connecting the two turbines when the supercharging pressure exceeds the set value. The waste gate valve is controlled by a modulator valve which modulates the underpressure taken from the air circuit of the servo brake, according to the information exchanged between the electronic control unit and the sensors: engine speed, throttle pedal position and pressure/temperature fitted on the intake manifold.



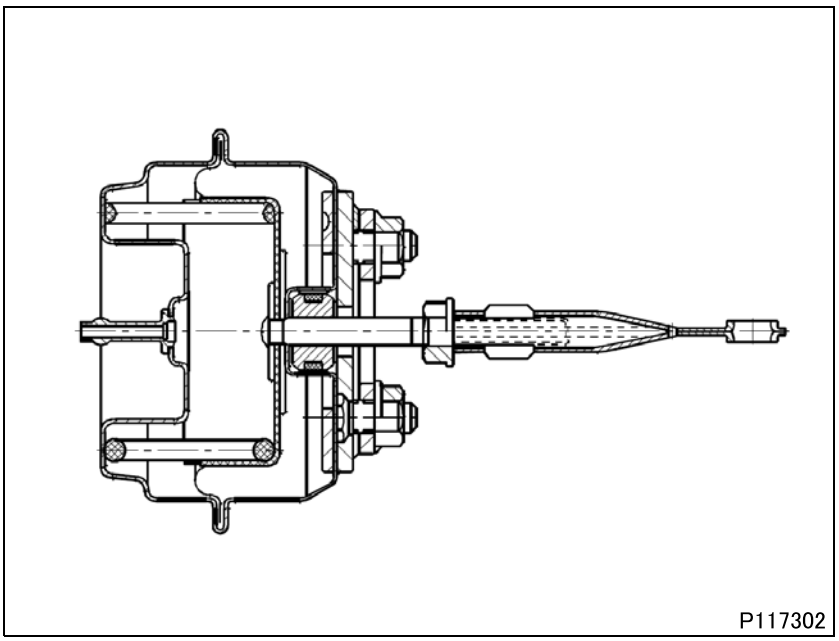
(1) Operation at low speed

- At low engine speed, the WG valve is closed and the exhaust gases from the exhaust manifold offer a weak kinetic energy to rotate the high-pressure turbine slowly. The residual kinetic energy of the exhaust gases flowing out of the high-pressure turbine also rotate the low-pressure turbine slowly, activating both compressors and thus allowing the outside air to be compressed and sent through the connection piping to the intercooler with a limited turbocharge pressure.

(2) Operation at high speed

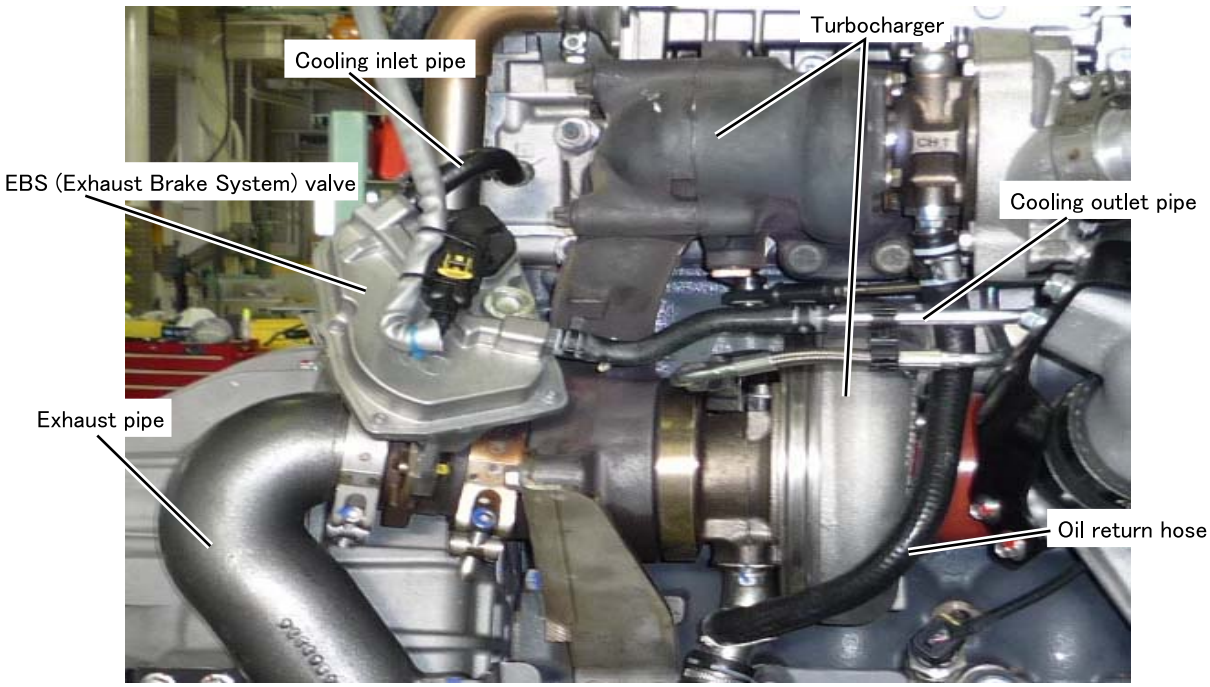
- When the engine speed increases, the kinetic energy of the exhaust gases also increases, therefore the high-pressure turbine speed increases, which in turn causes the WG valve to intervene and create a rise in tubocharging pressure.
- Waste Gate valve intervention allows the part of the exhaust gases with greater kinetic energy to bypass the high-pressure turbine and go directly to the low-pressure turbine, which is rotating more quickly; also, by activating both compressors and thus allowing the outside air to be compressed, it is sent through the connection piping to the intercooler with a limited turbocharge pressure.

2.3 Actuator



- The actuator diaphragm, connected to the control rod, is governed by the low pressure on the top of the actuator.
- The underpressure modulated by the proportional magnetic valve varies the movement of the diaphragm and, as a result, of the rod governing the throttle.

3. EBS (Exhaust Brake System) Valve



P117303E

- The EBS valve fitted on the turbocharger outlet it modulates the pressure of the exhaust gases flowing out of the turbine to increase the “EGR” function in aspiration with the purpose of graduating the value of the exhaust emission. It improves the value of the gaseous emissions bringing it to the parameters required by the norm.
- Following the value of restriction defined by the valve the exhaust gas pressure is increased upstream of the turbine. Greater the pressure determined by the restriction, the greater will be the flow of the exhaust gases that are diverted, upstream of the turbine inlet, toward the EGR (Exhaust Gas Recirculation) unit and recirculated in the inlet.
- The engine electronic control unit is mapped for the management of the gaseous emissions values and following these parameters it controls the opening of the EBS valve.

- The flow of the exhaust gases “not diverted” is sent to the exhaust pipe.

Possible causes / Symptoms		Engine hard to start	Black exhaust gas → DPF premature clogging	White exhaust gas	Poor engine power	Excess oil consumption	ECU diagnosis lamp	Reference Gr

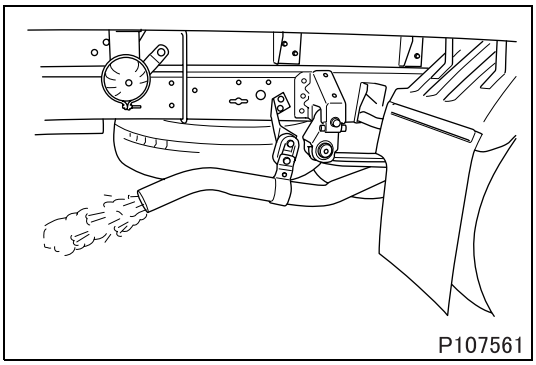
DPF: Diesel particulate filter

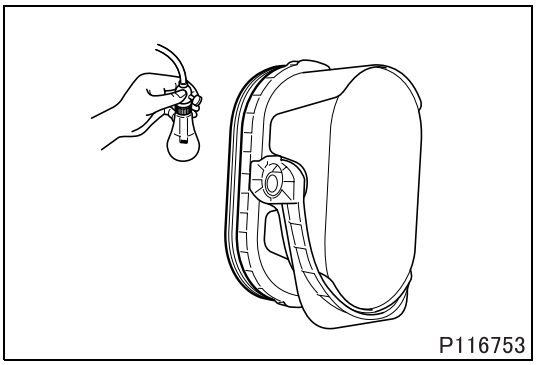
1. Exhaust Emission Condition



P107561

- With the engine warmed up sufficiently, visually check to see if an abnormal black smoke is discharged.
- If an abnormal condition is evident, check different parts and correct or replace any defective part.

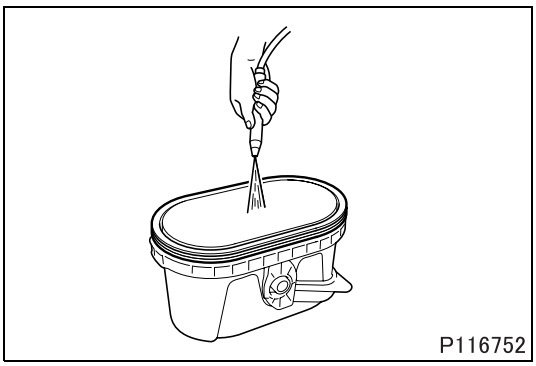
2. Cleaning and Inspection of Air Cleaner Element



P116753

[Inspection]

- Shine light inside the element.
- Replace the element if thin spots or broken parts are evident in the filter paper, or if the packing at the top of the element is damaged.
  Also replace the element if the dust on the element is damp with oily soot, regardless of the replacement schedule.



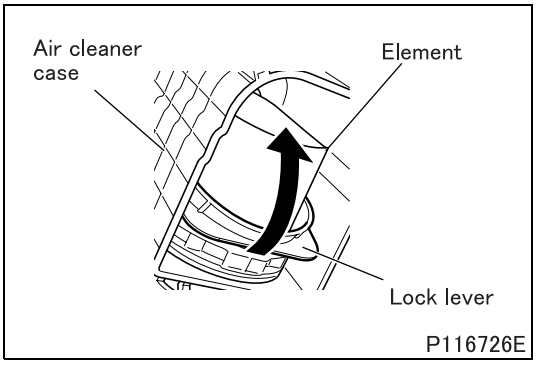
P116752

[Cleaning]

- Blow a jet of compressed air at a pressure not higher than 685 kPa {100 psi, 7 kgf/cm^2} against the inside surfaces of the element.
- Move the compressed air jet up and down along all pleats of the filter paper element.

CAUTION ⚠

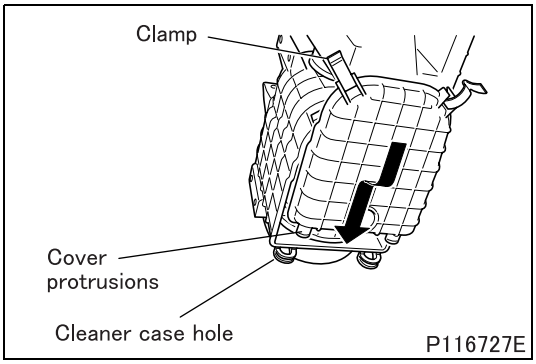
- **For the frequency and timing of cleaning, see the relevant instruction manual. More frequent cleaning than necessary may damage the element, causing dust and foreign matter to be sucked into the engine.**
- **Do not strike the element or hit it against another object to remove dust.**
- **Do not blow compressed air against outside surfaces of the element.**



P116726E

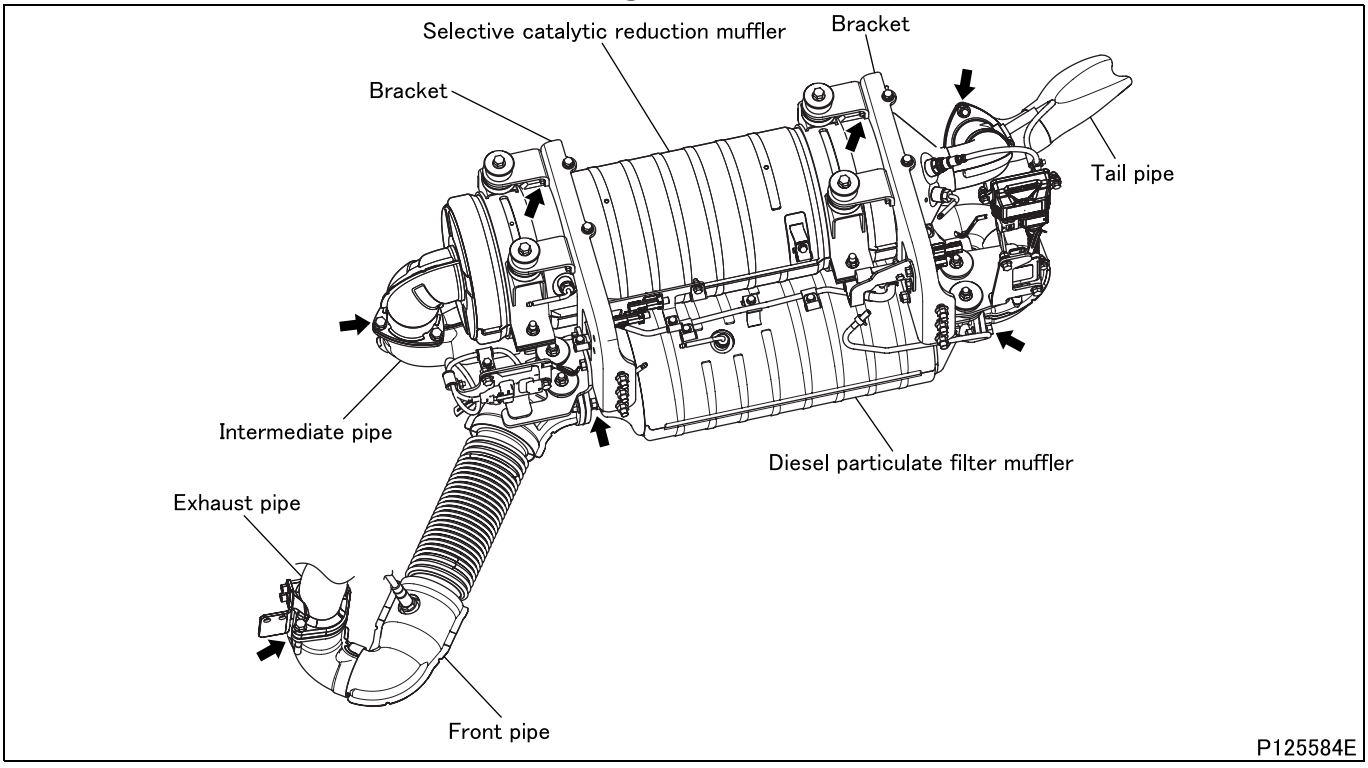
[Installation]

- Insert the air cleaner element straight into the air cleaner case. Then move the lock lever in the air cleaner case to the “LOCK” position.



- Install the cover while inserting its projections into the holes in the air cleaner case.

3. Installation, Looseness, and Damage of Exhaust Pipe and Muffler



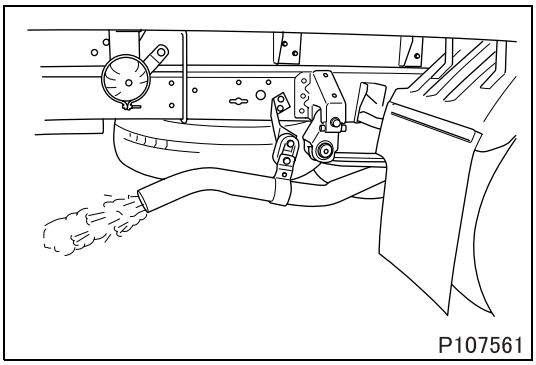
- Check the following and when a loose or faulty part is detected, correct or replace the part.
  - Check the mounting and connecting portions of the exhaust (front) pipe, muffler, DPF, and oxidation catalyst for looseness by shaking them by hand.
  - Using a wrench or similar tool, check the mounting bolts and nuts of the exhaust (front) pipe, muffler, DPF, oxidation catalyst, and heat insulating board (insulator) for looseness.
  - Check the rubber hanger for deterioration, damage, and installed condition.
  - Check the exhaust (front) pipe, muffler, DPF, oxidation catalyst, and heat insulating board (insulator) for damage and corrosion.
  - Check the exhaust (front) pipe, muffler, DPF, and oxidation catalyst for possible contact with other parts.
  - Start the engine (and let it warm up thoroughly) and check for possible leakage of exhaust gas from connections.

CAUTION ⚠

- **Do not touch water that comes out from the DPF or SCR. If such water attaches to your skin, wash it off thoroughly with running water.**

DPF: Diesel particulate filter

4. Functions of Muffler



- Start the engine (and let it warm up thoroughly). Then, change its speed to listen for any unusual exhaust noise.
- If any unusual noise is heard, correct or replace the defective part.

CAUTION ⚠

- **Do not touch water that comes out from the DPF or SCR. If such water attaches to your skin, wash it off thoroughly with running water.**

DPF: Diesel particulate filter
SCR: Selective catalytic reduction

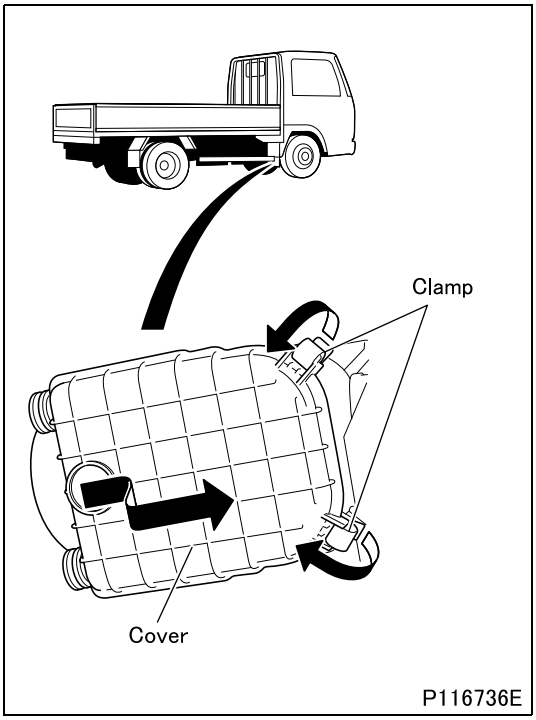
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Clamp	3.0 to 3.4 {2.2 to 2.5, 0.3 to 0.35}	–
Tb	Clamp	9.0 to 11.0 {6.6 to 8.1, 0.9 to 1.1}	–
Tc	Bolt	12 to15 {8.9 to 11, 1.2 to 1.5}	–

Lubricant and/or sealant

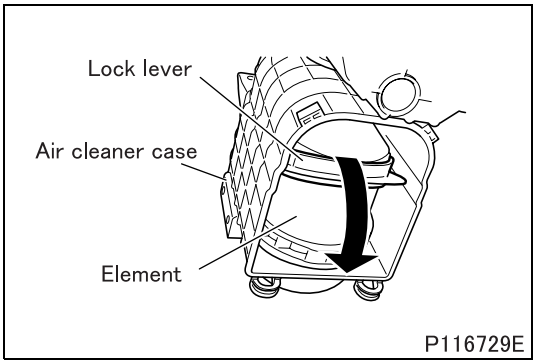
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Humidity and intake air temperature sensor	ThreeBond 1855	As required

◆Removal procedure◆

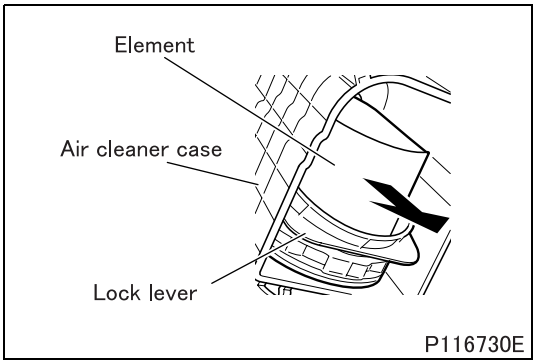


■Removal: Air cleaner element

- Make sure the parking brake is firmly applied.
- Chock the wheels.
- Undo the clamps at 2 places, then remove the cover by pulling it in the direction of the clamps.

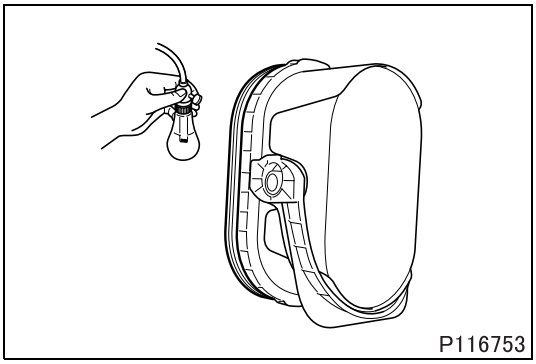


- Move the lock lever in the air cleaner case to the “UNLOCK” position.



- Pull the air cleaner element straight out of the air cleaner case.

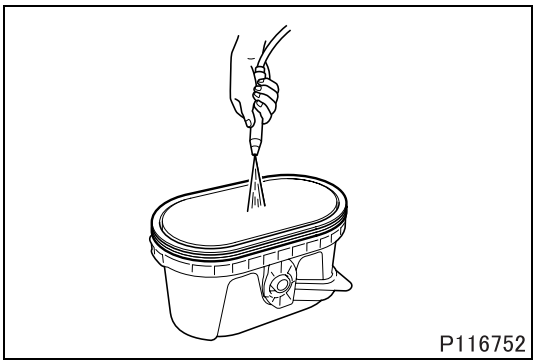
◆Inspection procedure◆



■ Inspection: Element

- Shine light inside the element.
- Replace the element if thin spots or broken parts are evident in the filter paper, or if the packing at the top of the element is damaged.
  Also replace the element if the dust on the element is damp with oily soot, regardless of the replacement schedule.

◆Cleaning procedure◆



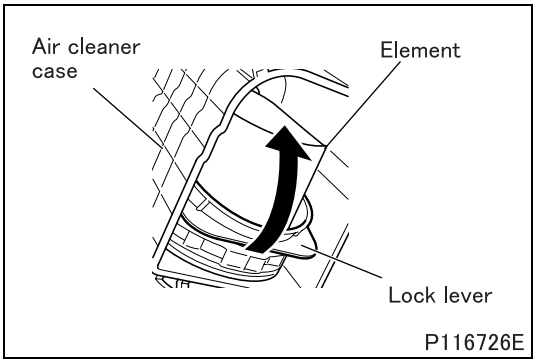
■ Cleaning: Element

- Blow a jet of compressed air at a pressure not higher than 685 kPa {100 psi, 7 kgf/cm^2} against the inside surfaces of the element.
- Move the compressed air jet up and down along all pleats of the filter paper element.

CAUTION ⚠

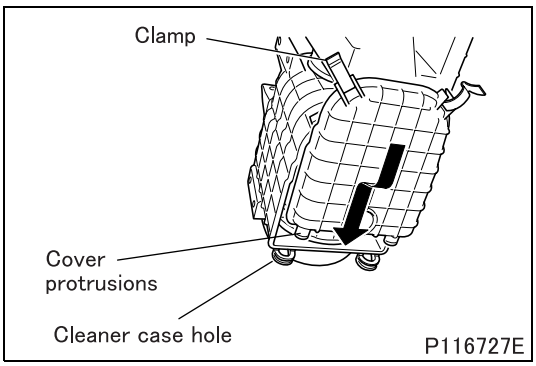
- **For the cleaning interval of the element, refer to the Owner’s Manual. Unnecessarily frequent cleaning may damage the element and can be the cause of dust and foreign objects being trapped in the engine.**
- **Do not strike the element or hit it against another object to remove dust.**
- **Do not blow compressed air against outside surfaces of the element.**

◆Installation procedure◆

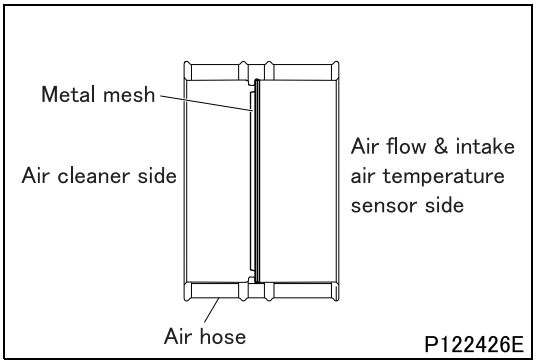


■ **Installation: Air cleaner element, air cleaner cover**

- Insert the air cleaner element straight into the air cleaner case, then move the lock lever in the air cleaner case to the “LOCK” position.

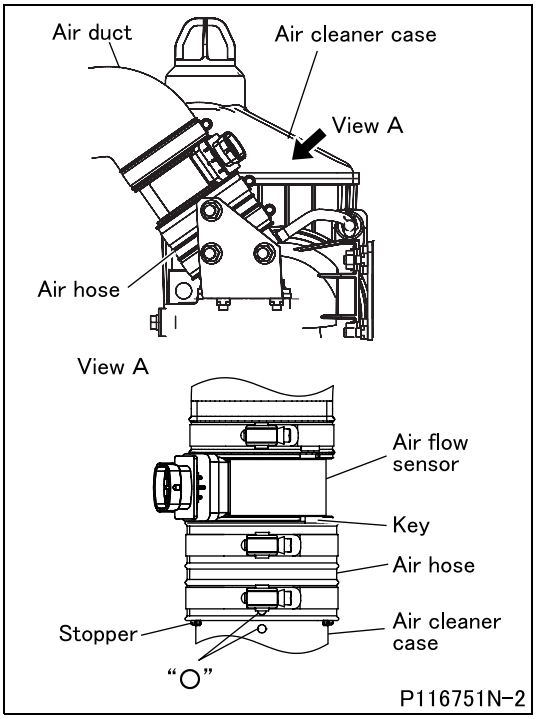


- Install the cover while inserting its protrusions into the holes in the air cleaner case.



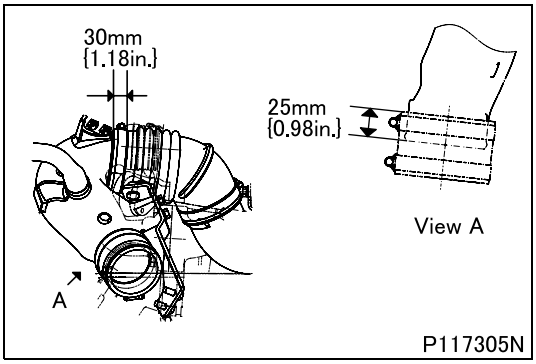
■ **Installation: Metal mesh**

- Install the metal mesh to the air hose in the direction shown in the drawing.



■ **Installation: Air flow sensor**

- Align the marks "o" on air cleaner and air hose and push air hose in until it hits stopper.
- Align the key on air hose and the slot on air flow sensor and push air flow sensor in until it hits stopper.
- Tighten clamps facing in the illustrated direction.

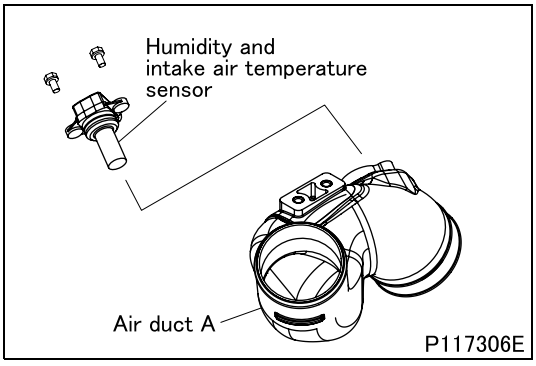


■ **Installation: Air hose B, air duct B**

- Connect the air hose B to the air duct B to the dimensions indicated in the illustration.
- Align the marks "o" on air hose and push it in until it hits stopper.

CAUTION ⚠

- **When assembling the secondary side hose or duct, use water only for smooth installation. Appling soup suds, grease or other lubricating material will cause malfunction of the air flow sensor.**



■ **Installation: Humidity and intake air temperature sensor**

- Apply sealant to the humidity and intake air temperature sensor, then install the sensor on the air duct A.

21 Turbocharger
22 Protector
⊗: Non-reusable parts

CAUTION ⚠

- **The turbocharger is a non-disassembly component. When it becomes unsmooth in rotation or has any problems, replace the turbocharger.**

● **Installation sequence**

Follow the removal sequence.

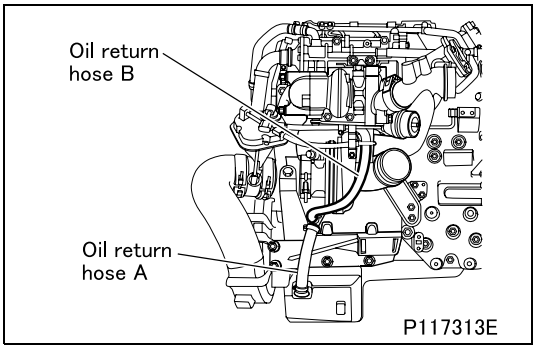
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (exhaust manifold and turbocharger mounting)	25 {18, 2.5}	–
	Nut (exhaust manifold and turbocharger mounting)		
	Bolt (air duct mounting)		
	Bolt (bracket mounting)		
Tb	Bolt (oil return pipe mounting)	10 {7.4, 1.0}	–
Tc	Connector and Eyebolt (pipe mounting)	30 {22, 3.1}	–
Td	Clamp B (exhaust pipe)	12 ± 1 {1.2 ± 0.1}	–
Te	Clamp A (turbocharger)	9 ± 1 {0.9 ± 0.1}	–

■ **Work before removal**

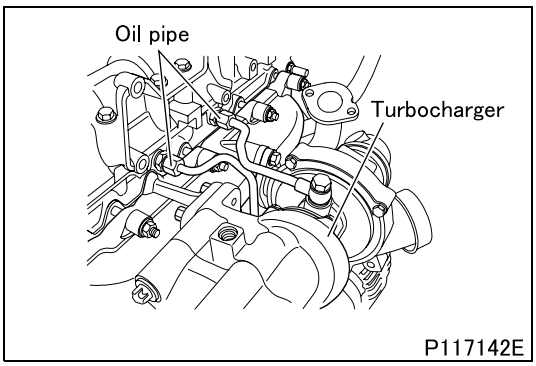
- Open the radiator drain cock to discharge coolant.
- Perform the following steps to make a work space.
  - Remove the air ducts and air hoses.
  - Remove the air inlet hose and air inlet pipe.
  - Remove the surge hose.
  - Remove the heater hose.
  - Remove the PCV hose.
  - Remove the front pipe.
  - Remove the protector.
  - Remove the vacuum modulator.
  - Remove the EGR (Exhaust Gas Recirculation) unit.

◆**Removal procedure**◆



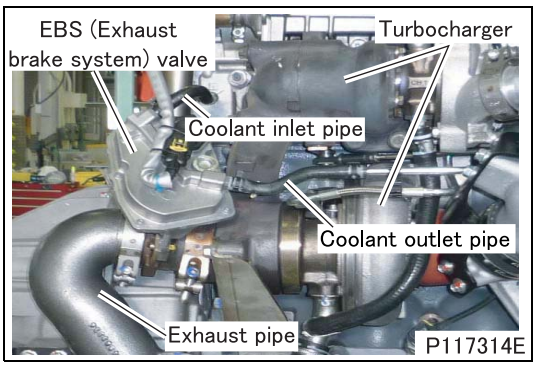
■ **Removal: Oil return hose A, oil return hose B**

- Disconnect the oil return hose A and oil return hose B from the turbocharger.



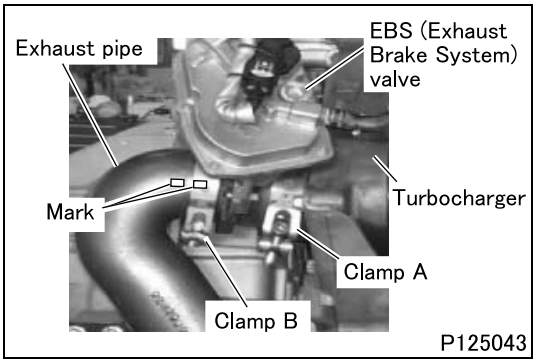
■ **Removal: Oil pipe**

- Remove the oil pipe.

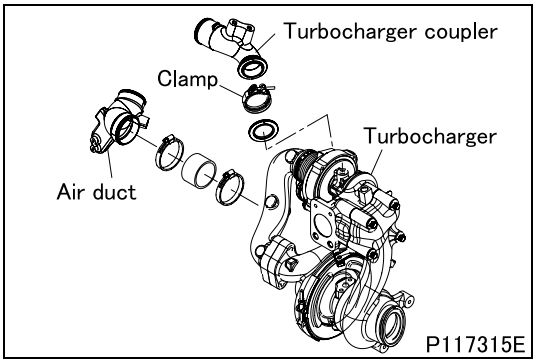


■ **Removal: Exhaust pipe, coolant inlet pipe, coolant outlet pipe, EBS (Exhaust Brake System) valve, bracket**

- Open the clamp and move it away from the position locking the coolant inlet pipe to the union on the EBS (Exhaust Brake System) valve.
- Remove the coolant inlet pipe from the EBS valve.
- Open the clamp and move it away from the position locking the coolant outlet pipe to the union on the EBS valve. Remove the coolant outlet pipe from the EBS valve.

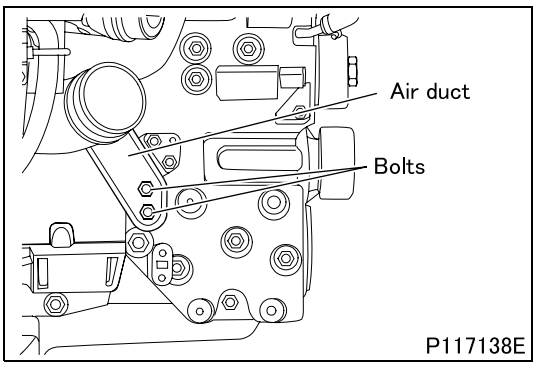


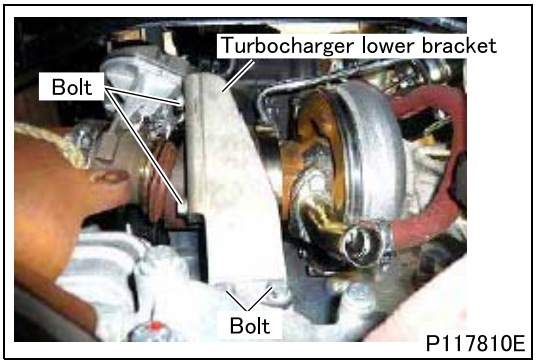
- First remove the EBS valve by loosening the clamp B of the exhaust pipe.
- Before removing clamps, put alignment marks on the exhaust pipe and clamps.
- Loosen the clamp A of the EBS valve and then remove the valve from the turbocharger.



■ **Removal: Turbocharger coupler, air duct**

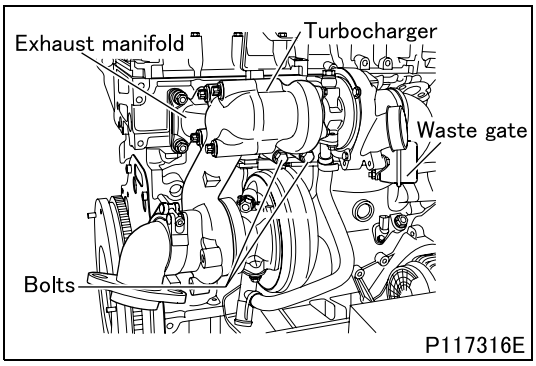
- Unfasten the clamp and remove the turbocharger coupler.
- Remove the air duct after unfastening the clamp.





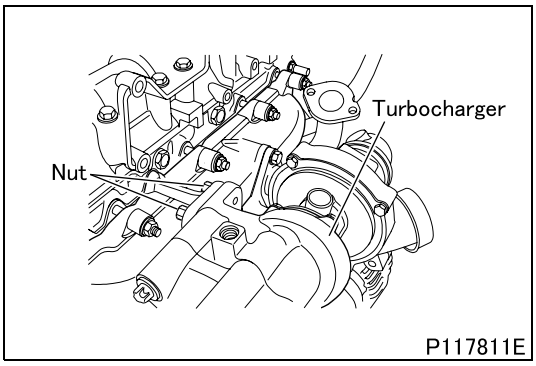
■ **Removal: Bracket**

- Remove the bracket that secures the turbocharger in place.

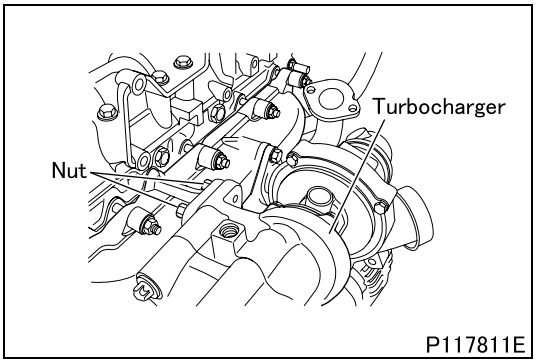


■ **Removal: Turbocharger**

- Remove the turbocharger from the exhaust manifold.

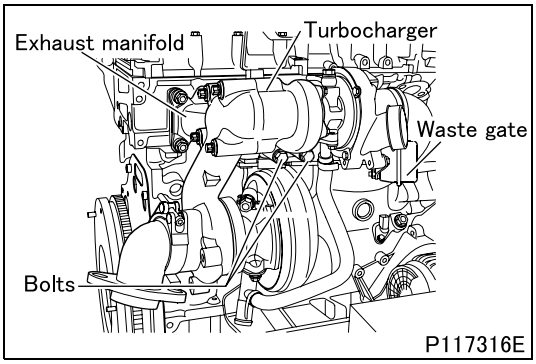


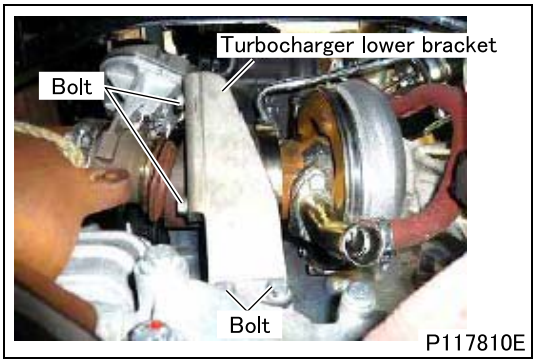
◆Installation procedure◆



■ **Installation: Turbocharger**

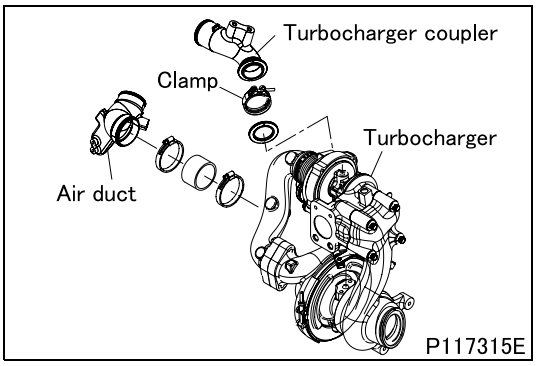
- Install the turbocharger on the exhaust manifold.





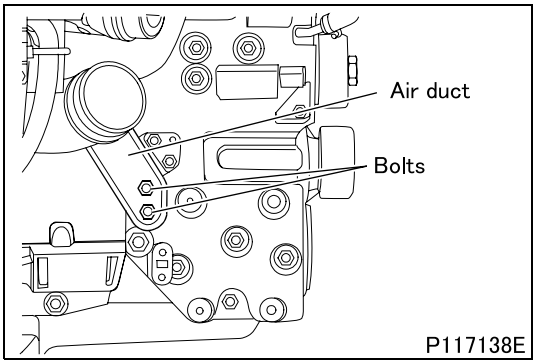
■ **Installation: Bracket**

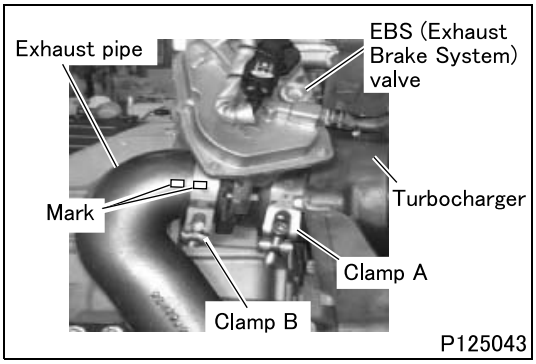
- Fix the turbocharger to the cylinder head using the bracket.



■ **Installation: Turbocharger coupler, air duct**

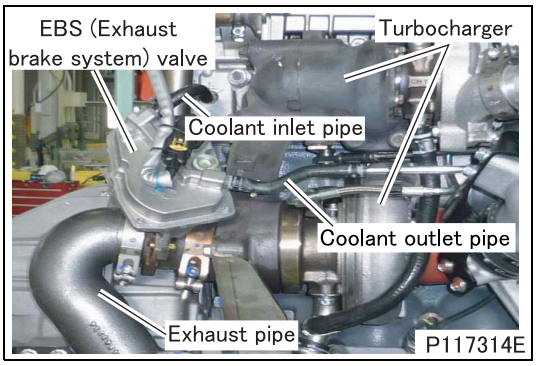
- Install the turbocharger coupler and air duct on the turbocharger.



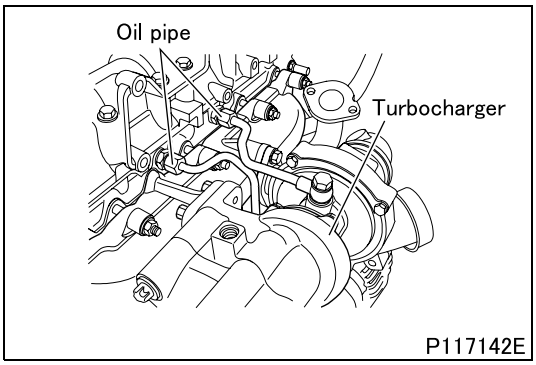


■ **Installation: Exhaust pipe, coolant inlet pipe, coolant outlet pipe, EBS (Exhaust Brake System) valve, bracket**

- Install the EBS valve to the turbocharger with a clamp A.
- Install the exhaust pipe to the EBS valve with a clamp B.
- Install the clamps while aligning their alignment mark with that on the mating part. (Position each clamp such that its bolt may not interfere with the EBS valve when it is operated.)

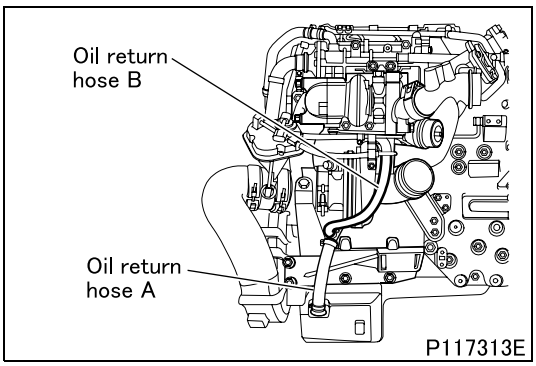


- Insert the coolant inlet pipe for EBS valve in the union. Tighten the clamp to the stop position.
- Insert the coolant outlet pipe for EBS valve in the union. Tighten the clamp to the stop position.



■ **Installation: Oil pipe**

- Install the oil pipe.



■ **Installation: Oil return hose A, Oil return hose B**

- Connect the oil return hose A and oil return hose B to the turbocharger.

■ **Work after installation**

- Reassemble those parts that have been removed to make the work space.
  - Install the vacuum modulator.
  - Install the exhaust gas recirculation unit.
  - Install the protector.
  - Install the air ducts and air hoses.
  - Install the air inlet hose and air inlet pipe.
  - Install the surge hose.
  - Install the heater hose.
  - Install the PCV hose.
  - Install the front pipe.45

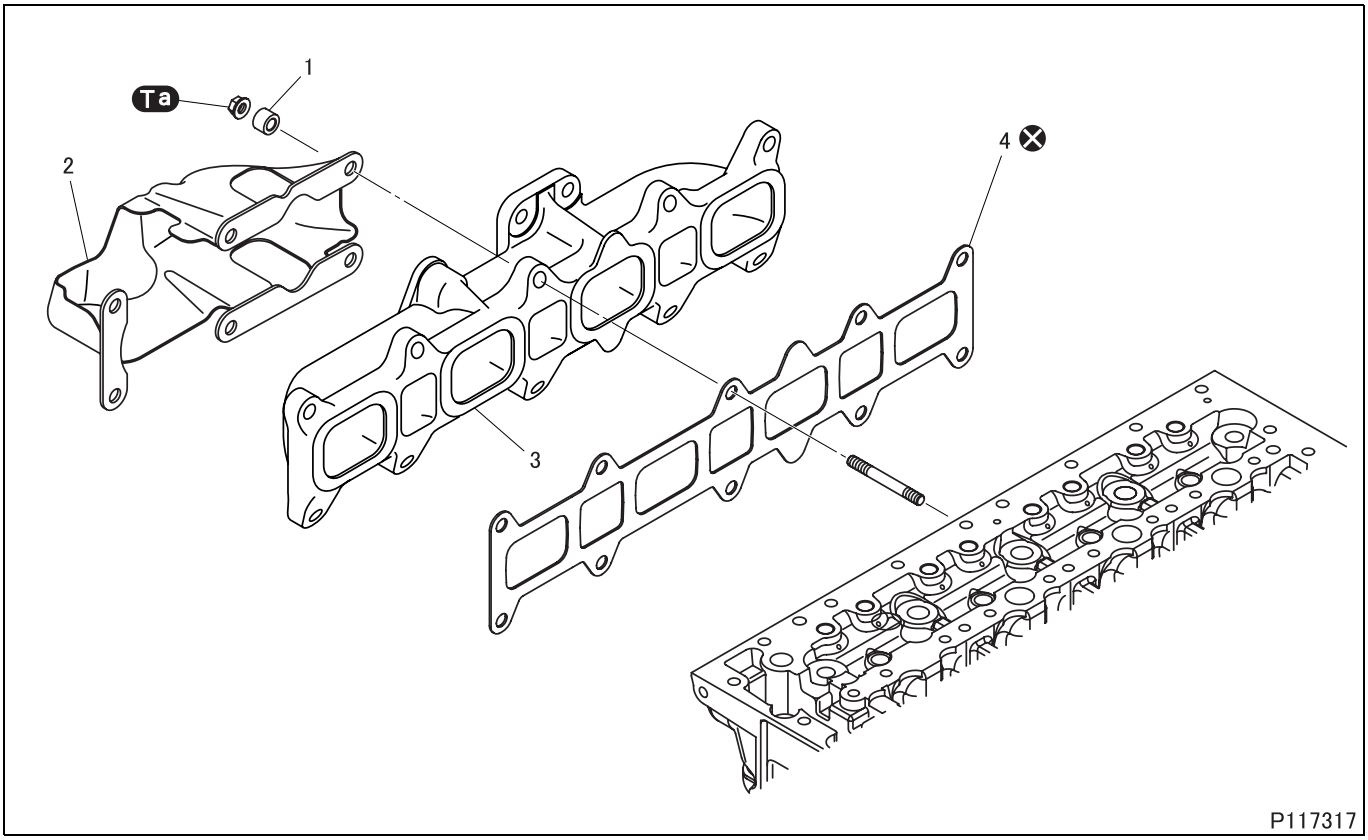
EXHAUST MANIFOLD



● **Disassembly sequence**

1 Spacer
2 Insulator
3 Exhaust manifold
4 Gasket
⊗: Non-reusable parts

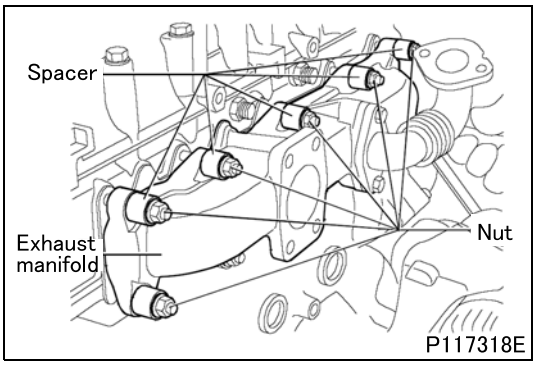
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (exhaust manifold mounting)	25 {18, 2.5}	–

◆**Installation procedure**◆

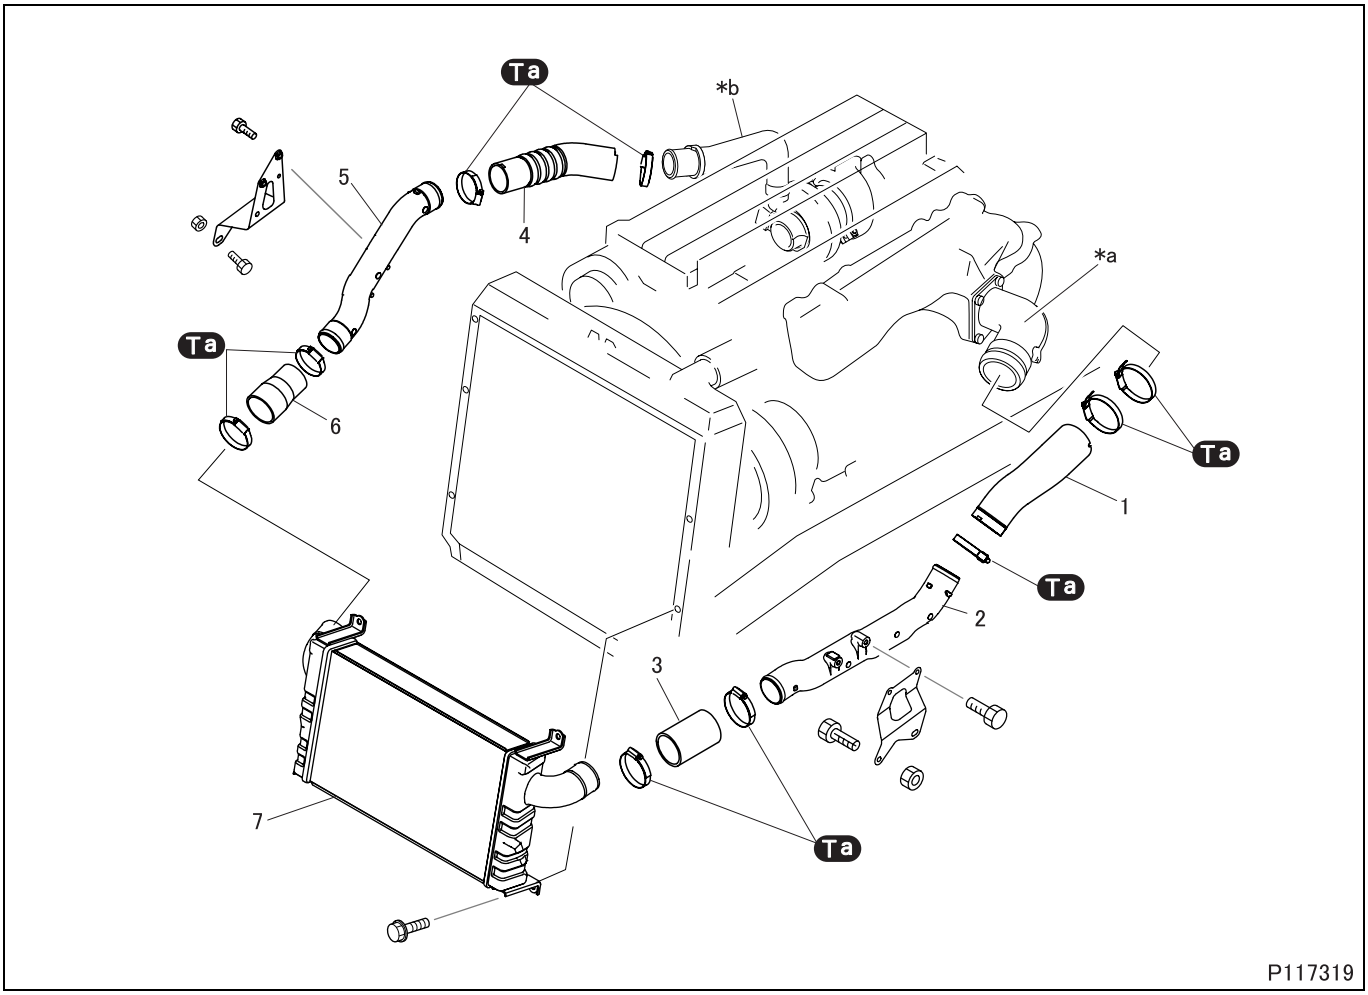


■ **Installation: Gasket**

- Set the exhaust manifold in position together with a new gasket, and fasten them by tightening the nuts via the spacers.

M E M O

INTERCOOLER



● **Disassembly sequence**

1 Air inlet hose A
2 Air inlet pipe LH
3 Air inlet hose B
4 Air inlet hose C
5 Air inlet pipe RH
6 Air inlet hose D
7 Intercooler

***a:** Air inlet pipe
***b:** Turbocharger coupler

CAUTION ⚠

- **When removing the air inlet hose, do not try to pry it off with strong force using a screwdriver or other similar tools. Doing that can damage the fluoro-layer on the inner surface of the hose, possibly compromising the oil resistance of the hose.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
7	Intercooler air leakage (air pressure: 150 kPa {22 psi, 1.5 kgf/cm^2} maintained for 30 seconds)	0 cm^3 {0 mL}	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks

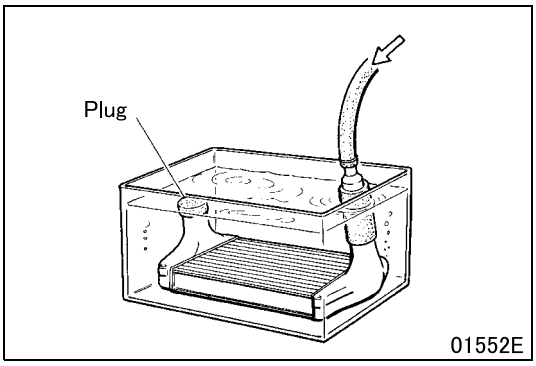
		Width across flats of bolt : 8mm	6.0 to 6.5 {4.4 to 4.8, 0.6 to 0.7}	–

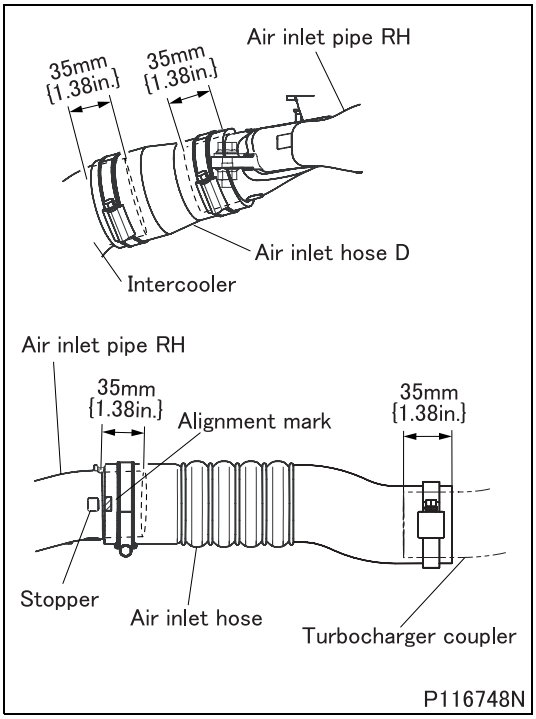
◆Inspection procedure◆



■ Inspection: Air leakage from intercooler

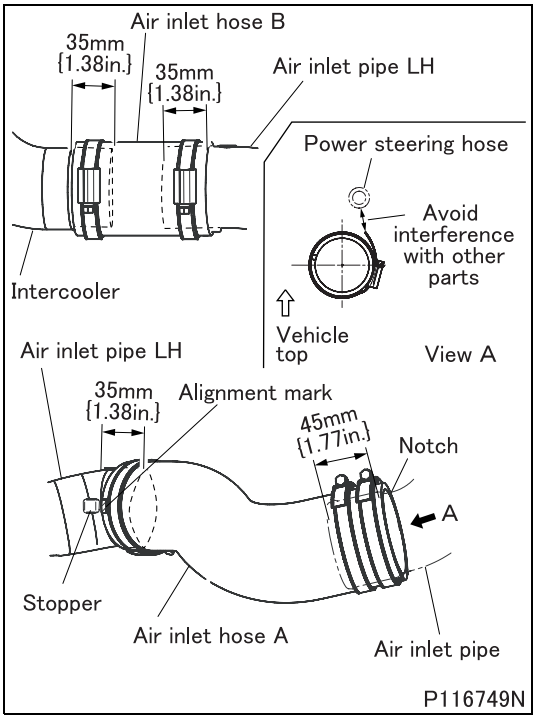
- Plug one of the air ports of the intercooler and immerse it in a tank of water. Apply the specified air pressure to the intercooler through the other air port and retain pressure for 30 seconds.
- Replace the intercooler if any air leakage is evident.

◆Installation procedure◆



■Installation: Air inlet hose

- Install the air inlet hose on air inlet pipe RH so that the alignment mark on the hose is aligned with the stopper on the pipe.
- Connect the air inlet hose to the air turbocharger coupler.
- Install the air inlet hoses to the intercooler, air inlet pipe RH and turbocharger coupler to the illustrated dimensions.



- Install the air inlet hose to the air inlet pipe LH so that the alignment mark on the hose is aligned with the stopper on the pipe.
- Connect the air inlet hose to the air inlet pipe aligning the notches.
- Install the air inlet hoses to the intercooler, air inlet pipe LH and air inlet pipe to the illustrated dimensions.

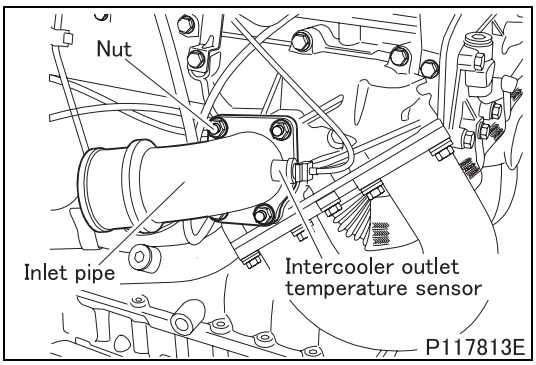
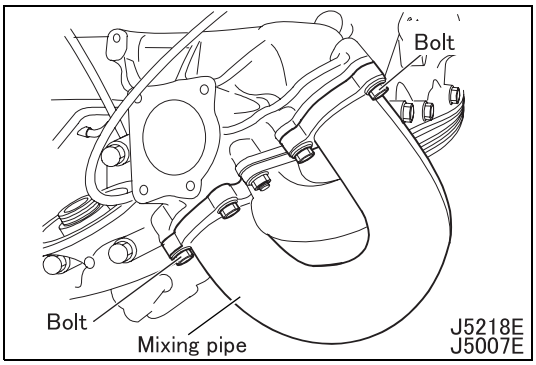
	Nut (connection pipe mounting)		
Tb	Bolt (pressure and temperature sensor mounting)	10 {7.4, 1.0}	–

◆Removal procedure◆



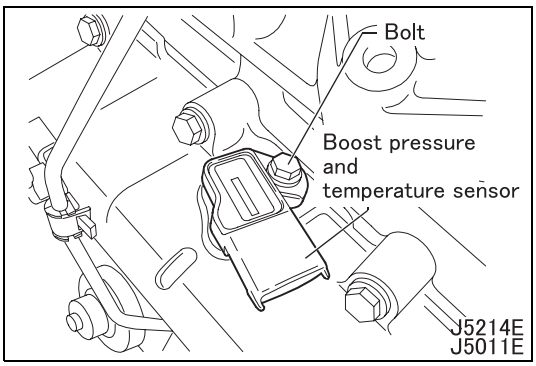
■ Removal: Air inlet pipe

- Remove the nuts and detach the air inlet pipe.



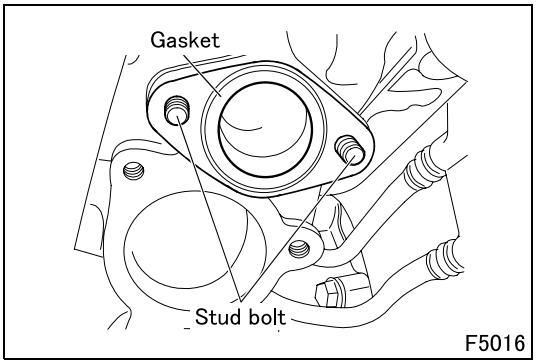
■ Removal: Mixing pipe

- Remove the bolt and detach the mixing pipe.



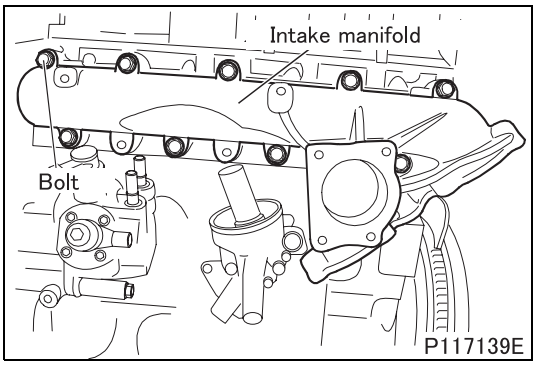
■ Removal: Boost pressure and temperature sensor

- Unscrew and remove the bolt; remove the boost pressure and temperature sensor from the intake manifold.



■ **Removal: Gasket, stud bolt**

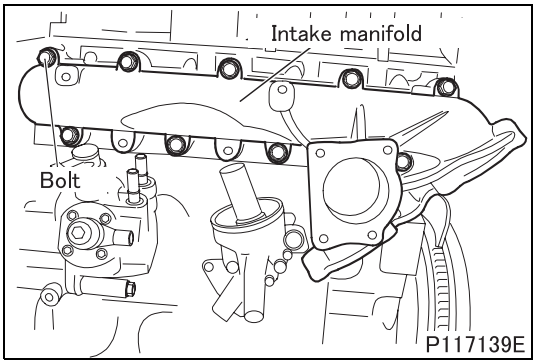
- Remove the gasket after removing the connection pipe.
- Unscrew and remove the stud bolts.



■ **Removal: Intake manifold**

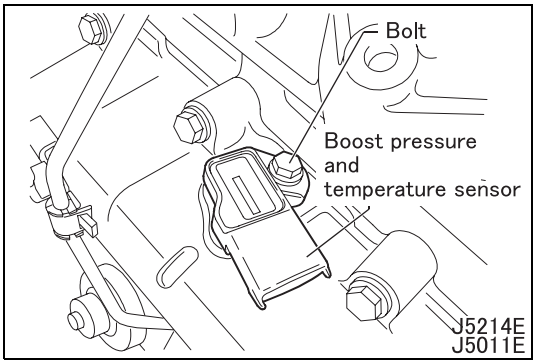
- Unscrew and remove the fixing screws.
- Detach the intake manifold with its gasket.

◆**Installation procedure**◆



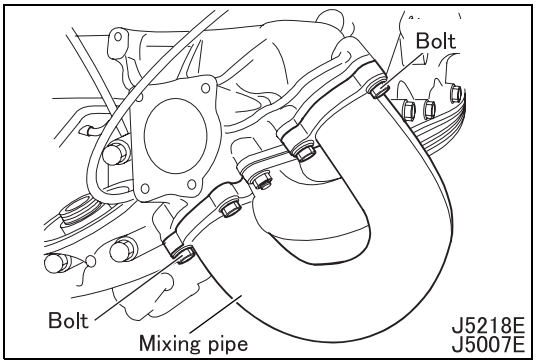
■ **Installation: Intake manifold**

- Install the intake manifold with a new gasket.
- Drive in the screws and tighten them to the prescribed torque: 25 N·m {18 ft.lbs, 2.5 kgf·m}.



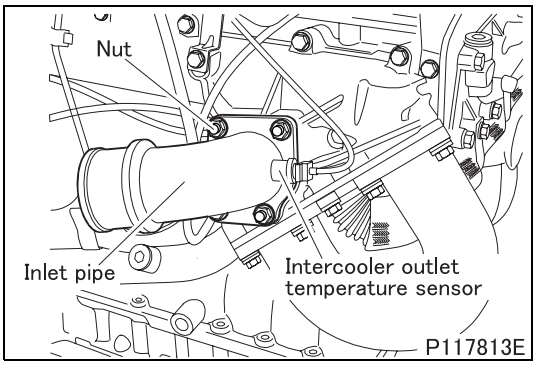
■ **Installation: Boost pressure and temperature sensor**

- Install the boost pressure and temperature sensor on the intake manifold.
- Tighten the bolt to a torque of 10 N·m {7.4 ft.lbs, 10 kgf·m}.



■ **Installation: Mixing pipe**

- Fit the pipe with new gaskets.
- Tighten the bolts to a torque of 25 N·m {181 ft.lbs, 2.5 kgf·m}.



■ **Installation: Air inlet pipe**

- Fit the air inlet pipe on the intake manifold with a new gasket. Screw in the fixing nuts and tighten them to a torque of 25 N·m {181 ft.lbs, 2.5 kgf·m}.

FRONT PIPE

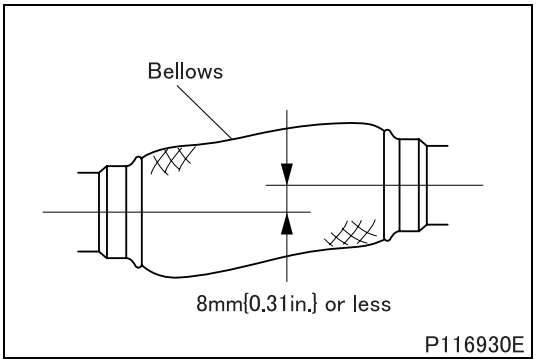
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Lambda sensor	50 ± 10 {37 ± 7.4, 5.1 ± 1.0}	–
Tb	Nut	50 ± 5 {37 ± 0.4, 5.1 ± 0.1}	–

◆Installation procedure◆



■Installation: Front pipe

- Install the front pipe so that the amount of offset in both vertical and horizontal directions between the pipes in front of and behind the bellows are within the specified value.

CAUTION ⚠

- **The function of the bellows on the front pipe is to reduce the vehicle noise level. It is not intended for compensating for misalignment that may result from improper installation of the front pipe. Install the front pipe properly to avoid excessive tension or other stress on the bellows.**

■Installation: Lambda sensor

- Install the lambda sensor on the front pipe.

CAUTION ⚠

- **Make sure that the sensor harness is free of tension, kink, or interference with surrounding parts.**

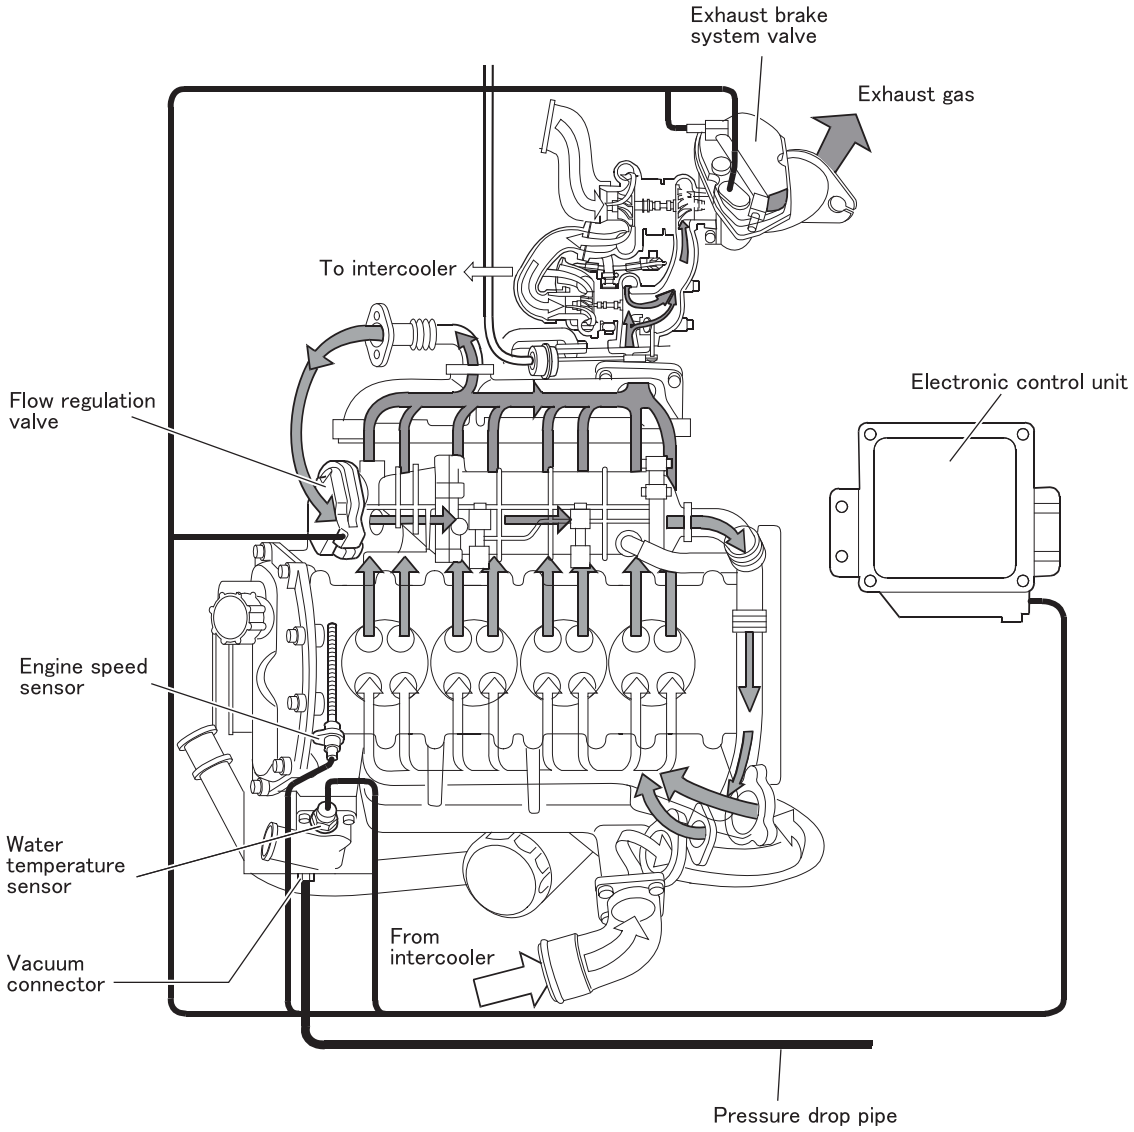
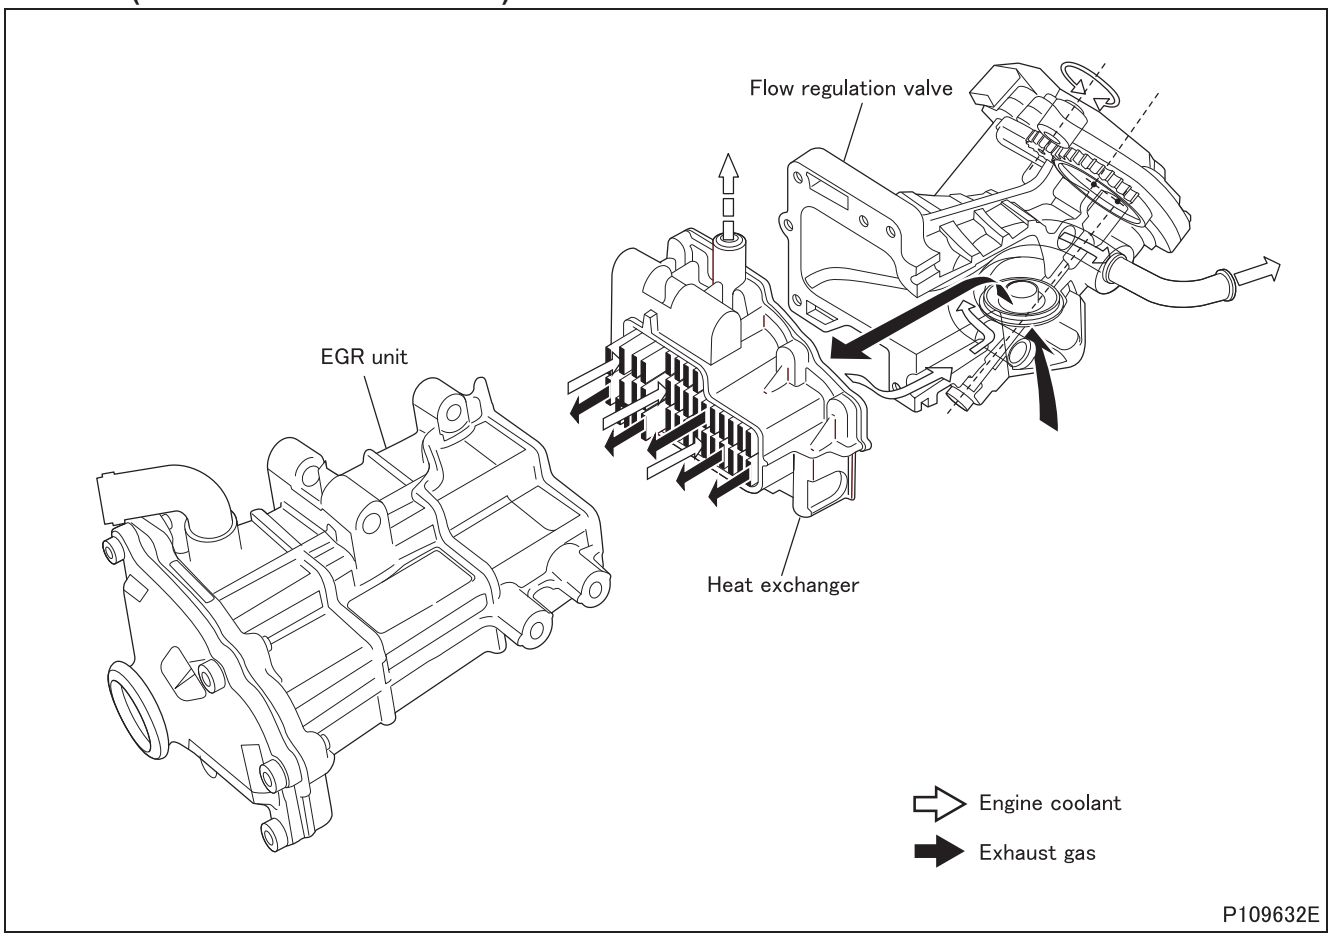
1. EGR (Exhaust Gas Recirculation) System



- The engine electronic control unit processes the information coming from the: atmospheric pressure sensor, water temperature sensor, engine speed sensor, accelerator pedal position sensor and, in accordance with suitably programmed modes in its memory, operate the opening of the plate in the EGR unit by means of a PWM signal.
- In this way, some of the exhaust gases are sent towards the EGR unit where they are cooled and directed to the chamber for the intake manifold to be mixed with the air coming from the intercooler and flow to the intake manifold. If the vehicle is fitted with a DPF (diesel particulate filter) catalytic converter, at the same time, the engine electronic control unit, adapts the flow rate of the fuel to be injected into the cylinders depending on the quantity of “recirculated” exhaust gases.
- When the engine is running and the recirculation of the gases is not required (regeneration of the particulate filter, starting, engine cold, idle speed, load request, high altitude), the engine electronic control unit control signal is cancelled.
- For electronic control unit connection diagram of EGR system, see Gr13.

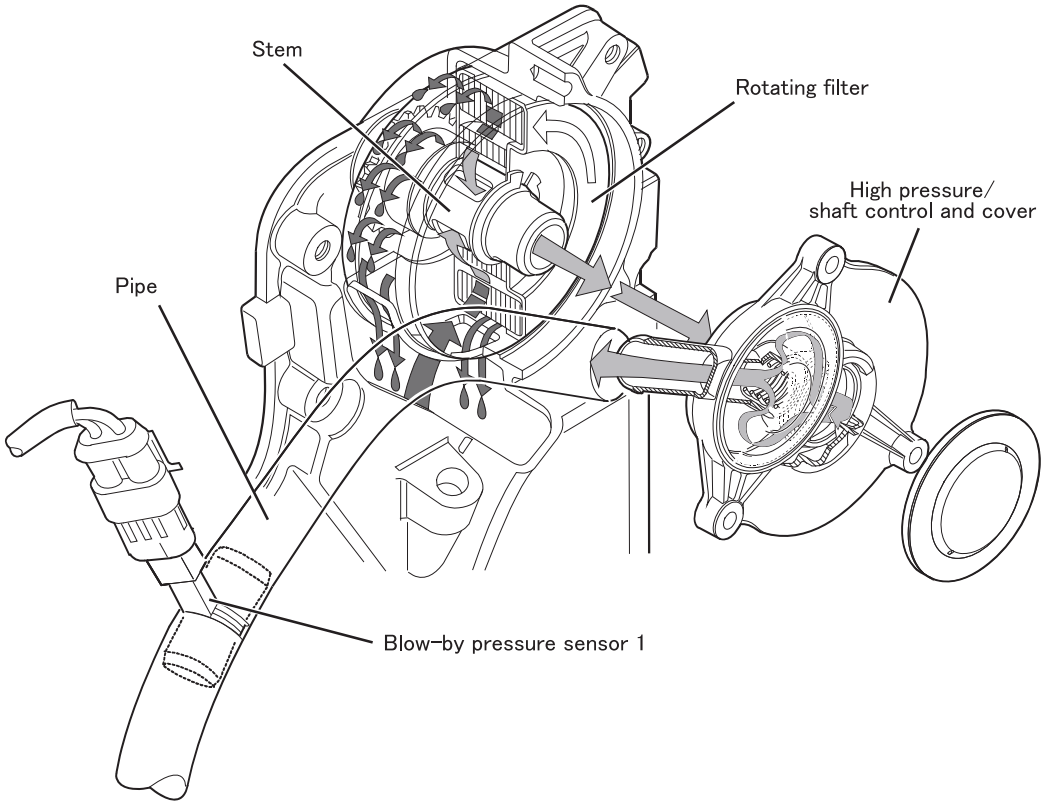
STRUCTURE AND OPERATION

1.1 EGR (Exhaust Gas Recirculation) unit



- The EGR unit comprises a heat exchanger and a flow regulation valve.
- The heat exchanger has the task of lowering the temperature of the exhaust gases which are partly sent to the intake manifold. This operation has only one aim: to lower the combustion temperature of the mixture. This takes place because the exhaust gases, totally inert, mix with the mixture and slow down combustion. Lowering this temperature produces a considerable decrease in NOx (nitrogen oxide) emissions which are harmful to the environment.
- The body of the heat exchanger is composed of a tube bundle cooled on the outside by the coolant fluid circulating in the engine. Some of the exhaust gases destined for “recirculation” pass inside the tube bundle and are cooled.
- The flow regulation valve is fitted on the end of the heat exchanger. The adjustment of the amount of recirculation exhaust gases takes place by means of an electrically operated plate valve.
- The valve is cooled by the engine coolant coming out of the heat exchanger thereby ensuring it is more efficient and lasts longer.

2. Blowby Gas Return System



Gas with oil level above 10 g/h

Gas with oil level ~ 0.2 g/h

Condensed oil returning to the oil sump

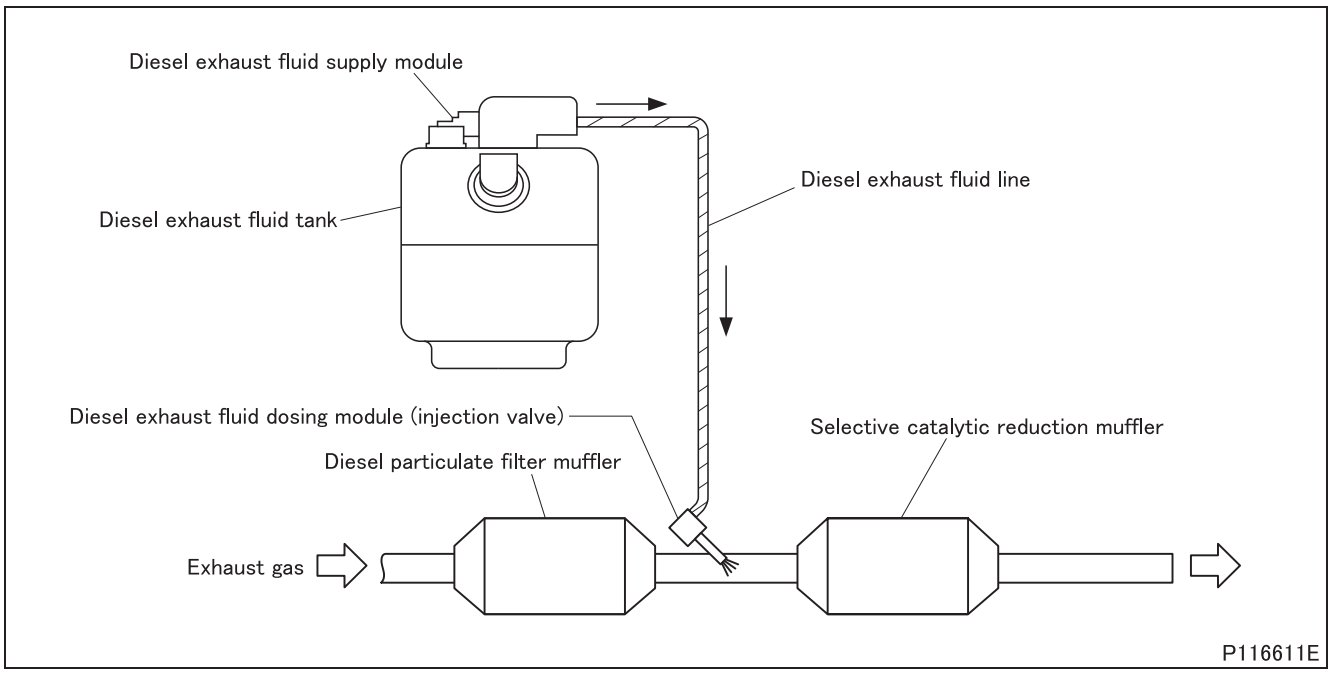
P117105E

- Part of the gas produced by the combustion during the engine operation blows by the piston snap ring ports, in the oil sump, and mixes with the oil vapors present in the oil sump.
  This mixture, conveyed from the chain compartment to the top, is partially separated from the oil by means of a device situated on the top side of the distribution cover and is introduced in the air suction system. This device consists mainly of a rotating filter, fit flush on the stem, a high pressure/shaft control and a cover.
- The mixture which passes through the rotating filter is partially purified from the oil particles, as a result of centrifugation, and so these particles condense on the cover walls to return to the lubrication circuit.
  The resulting purified mixture is let in through the stem holes inside the air vent upstream of the turbocharger.
- The oil still present in the mixture coming from the rotating filter and which condenses in the chamber is drained into the chain.
- This presents the oil vapor solidifying and the water vapor freezing at low external temperatures, which would increase the pressure in the crankcase, thus resulting in oil leaks through the crankcase gaskets.

3. BlueTec® System

3.1 Outline

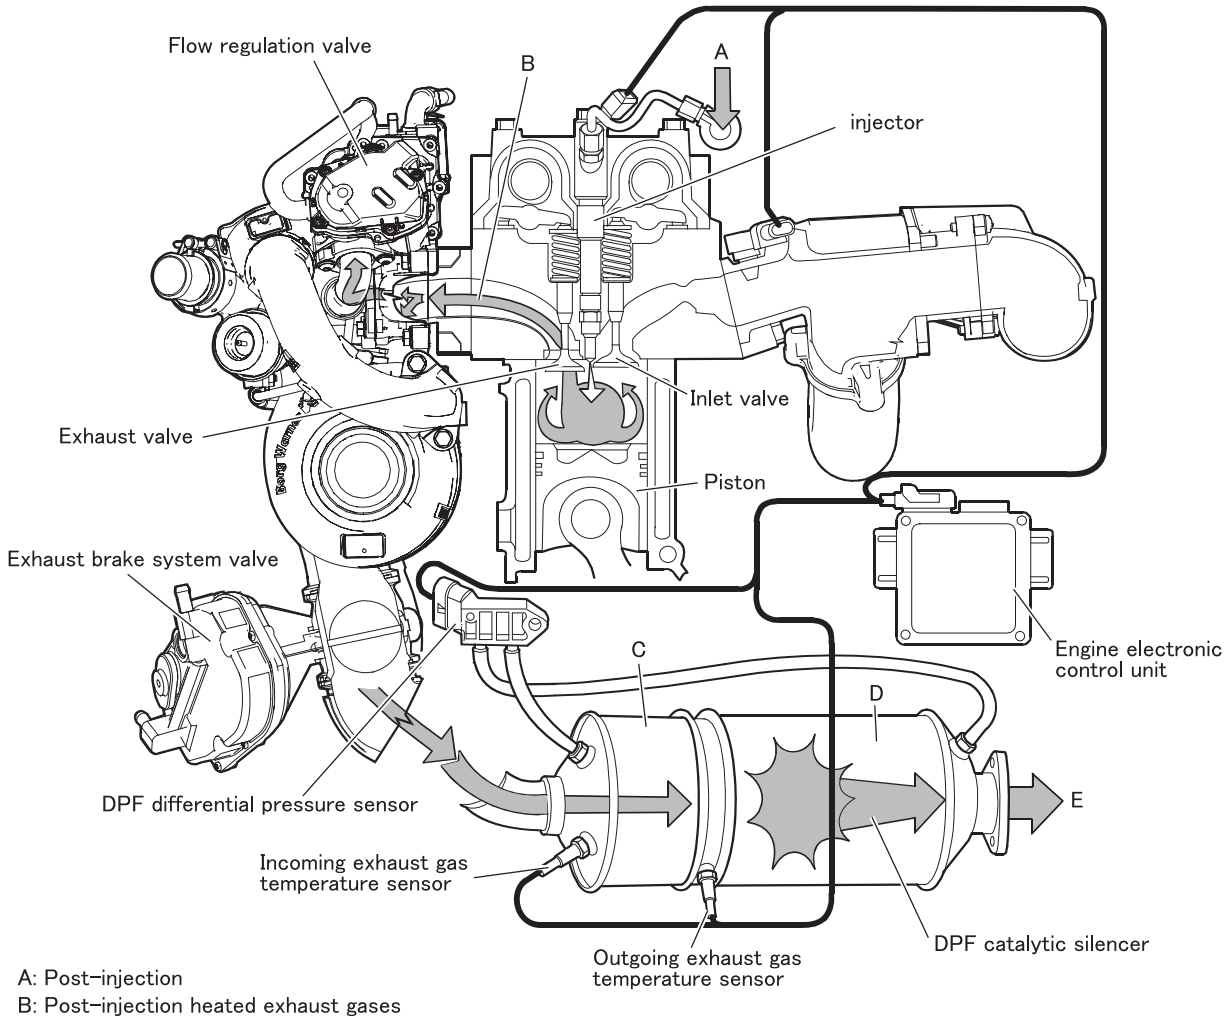
- The BlueTec® system is an exhaust emission aftertreatment combining a regeneration control type DPF (Diesel Particulate Filter) with a BlueTec® exhaust emission aftertreatment device.



- The regeneration control type DPF system captures soot (particulate matters) contained in exhaust gasses by using a ceramic filter incorporated in the muffler, and then burns the soot accumulated on the filter to remove it (regenerates the filter continuously) by making use of the catalytic action of the pre-stage oxidation catalyst.
- When the filter will not be regenerated during driving at low speeds or other conditions, the system performs the regeneration operation of the filter (burning the soot) by raising the exhaust gas temperature forcibly (automatic DPF regeneration). However, it is necessary to perform the filter regeneration manually (parked DPF regeneration) if driving at very low speeds or starting/stopping the engine is repeated so many times that the automatic filter regeneration cannot be executed.
- The BlueTec® exhaust emission aftertreatment device doses (injects) AdBlue® (diesel exhaust fluid) in the exhaust line upstream from the SCR catalyst to decompose NOx into water and nitrogen, reducing NOx emission.
- Be sure to use the AdBlue® in conformity with JIS standards or ISO standards as diesel exhaust fluid in the system.

SCR: Selective Catalytic Reduction

3.2 DPF (Diesel Particulate Filter) regeneration system



- DPF regeneration is managed by the engine electronic control unit. According to the values of the exhaust gas temperature detected by the sensors and the degree of DPF clogging detected by the DPF differential pressure sensor, the engine electronic control unit makes the injector inject small amounts of fuel in the cylinders when the exhaust valve is closing, at approx. 1 to 3° from T.D.C. The combustion of this fuel increases the temperature of the flowing gases.
- At the same time, the engine electronic control unit closes the flow regulation valve to prevent recirculated oil vapors and gases produced by post-injection from being sucked in the cylinders.
- Entering the silencer, the heated exhaust gases flow through the catalytic converter, where their pollutant elements (nitrogen oxides) are reduced or converted into inert substances (CO_2 - water vapor), and then enter the DPF where the regeneration process occurs. The high temperature of the exhaust gases causes combustion of the particulate accumulated in the filter.
- The DPF is regenerated when the following conditions exist.
- Temperature of exhaust gases entering the catalytic converter >230°C {446°F} with the aid of post-injection.
  - Temperature of exhaust gases in the particulate filter >530°C {986°F} with presence of > free oxygen at 8%.
  - Minimum time for the above-mentioned conditions >10 min.

- If the function is not reset after changing the engine oil, the engine electronic control unit will continue to compute the increase in fuel accumulation even with the new oil, with subsequent signalling of engine oil change.
- For electronic control unit connection diagram of DPF regeneration system, see Gr13.

(1) Forced regeneration

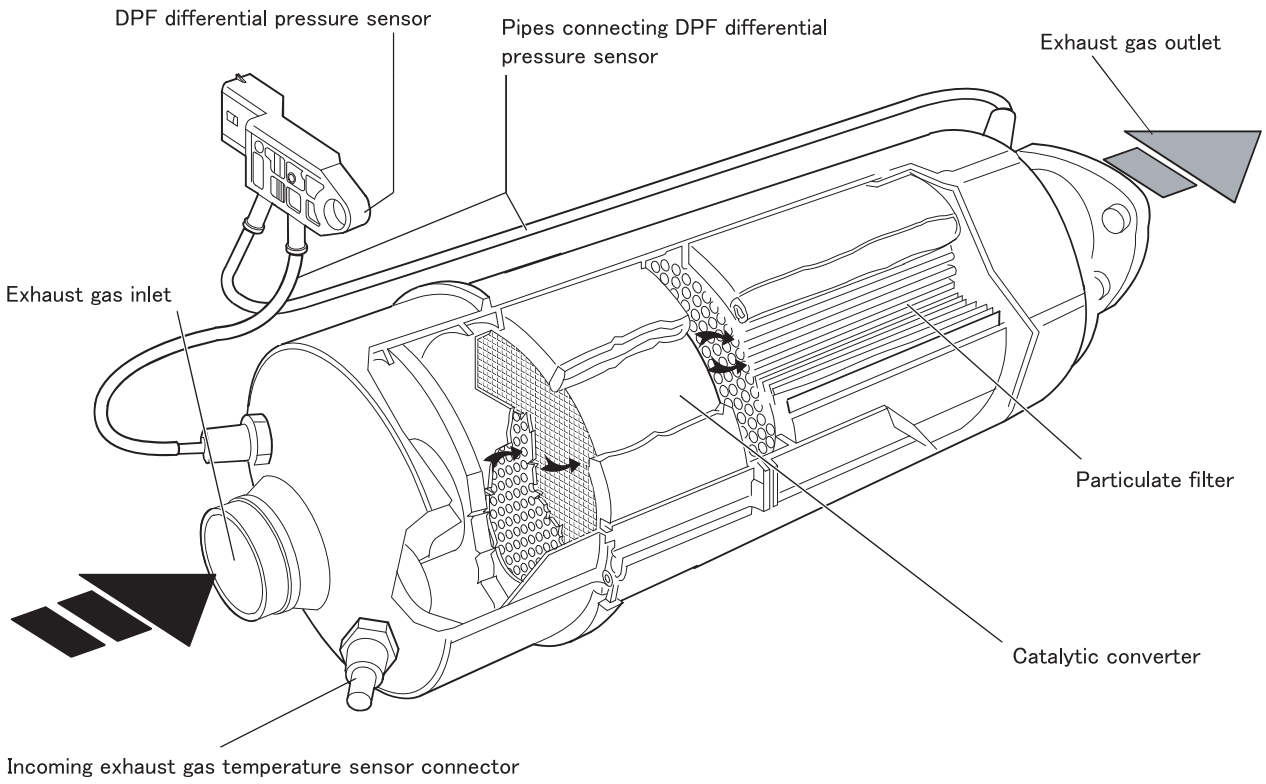
- In many cases of uncertainty regarding the actual cleanness of the DPF and/or the impossibility of its regeneration due to particular vehicle/engine operation conditions (insistence in idling, very low speeds and very frequent stops), it is necessary to carry out forced safety regeneration.
- Independently of all the parameters that activate regeneration, the engine is made to run at a point where the temperature of the exhaust gases (>230°C {446°F}) can activate the reaction in the Oxicat in the presence of post-injection.
- The only limit to this operation is if there is too much particulate in the filter, in any case calculated by the engine electronic control unit and being a condition for the start of regeneration.

(2) Engine oil replacement

- During vehicle use, the engine electronic control unit counts post-injected fuel quantity in order to activate and maintain DPF regeneration.
- A small quantity of this fuel, which is injected into the cylinders after combustion has already taken place and remains partially unburnt, leaks out through pistons spring rings into oil sump, accumulating to lubrication oil.
- Although a part of it, evaporating, will be burnt in the engine through recirculation system, its remaining part can degrade oil characteristics, impairing its functionality.
- Quantity of accumulated fuel may increase in case of catalyst or engine inefficiency, and vehicle use in conditions of low temperature and/or small amounts of miles covered.
- The engine electronic control unit counts the amounts of post-injections and consequently determines the quantity of fuel accumulated in engine oil, and warns about replacement needed.
  If, after replacing engine oil, the function is not reset, the engine electronic control unit will keep on counting fuel accumulation increase even with new oil, with consequent engine oil replacement warning by flashing warning lamp (red).

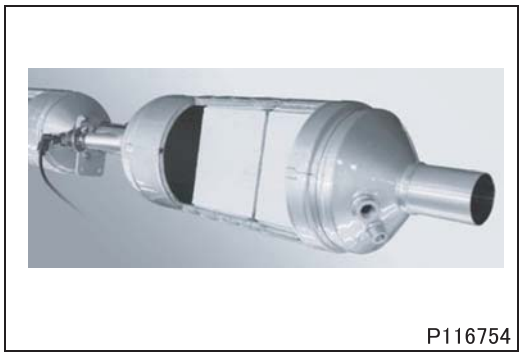
DPF: Diesel particulate filter

(3) DPF (Diesel Particulate Filter)



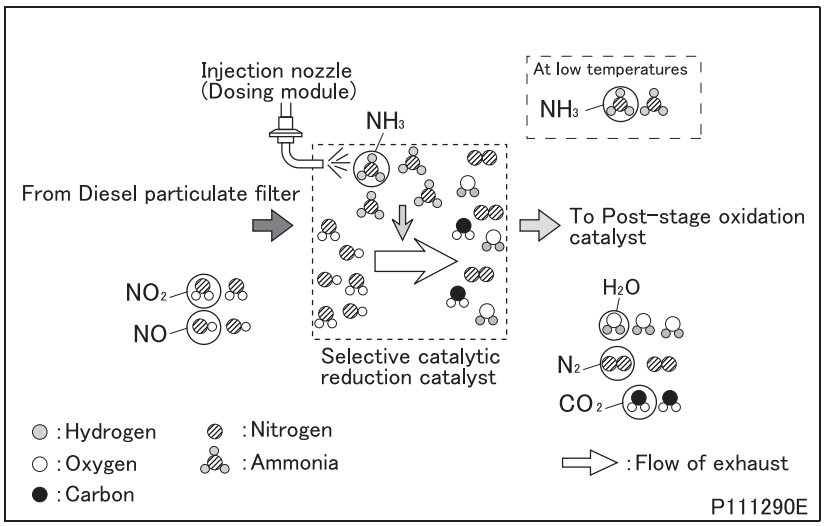
- DPF is made up of a catalytic converter and a particulate filter. Catalytic converter is an exhaust gas post-treatment device.
- Active substances, contained in the catalyst, oxidise, at 250 to 450°C {482 to 842°F} temperature, carbon oxide (CO) and hydrocarbons (HC), turning them into carbon dioxide (CO_2) and steam (H_2O).
- Catalyst module is made up of a ceramic structure impregnated with platinum, as platinum is a catalysing substance in oxidation reactions. Exhaust gasses heat the catalyst, so triggering the conversion of pollutants into inert compounds.
- Particulate filter, connected to the catalyst, has a double task: retaining particulate particles (PM) depositing between the pores of the ceramic structure of which the filter is made up and working as a particulate particles combustion chamber when the filter is being clogged.
- If filter interior is kept at a temperature higher than 530°C {986°F} and oxygen percentage is higher than 8% (oxygen being produced by the decomposition of nitrogen oxide NO_2), then some combustion reactions, boosted by the catalyst put before the filter, burn particulate particles (regeneration), so keeping the filter clean.
- On the contrary, if its temperature is lower, the filter is clogged, with negative effects, on counterpressure, on exhaust gasses generated by the filter.
- In this case, to regenerate the filter, temperature of exhaust gasses is artificially raised (up to 630°C {1166°F}) by fuel post-injection.
- A DPF differential pressure sensor, connected to DPF, as it detects a pressure difference between inlet and outlet, sends a (feed-back) signal to the engine electronic control unit to warn about particulate filter possible clogging.
  - The exhaust gas recirculation quantity controlled by the relative flow regulation valve.

3.3 BlueTec® exhaust emission aftertreatment device



P116754

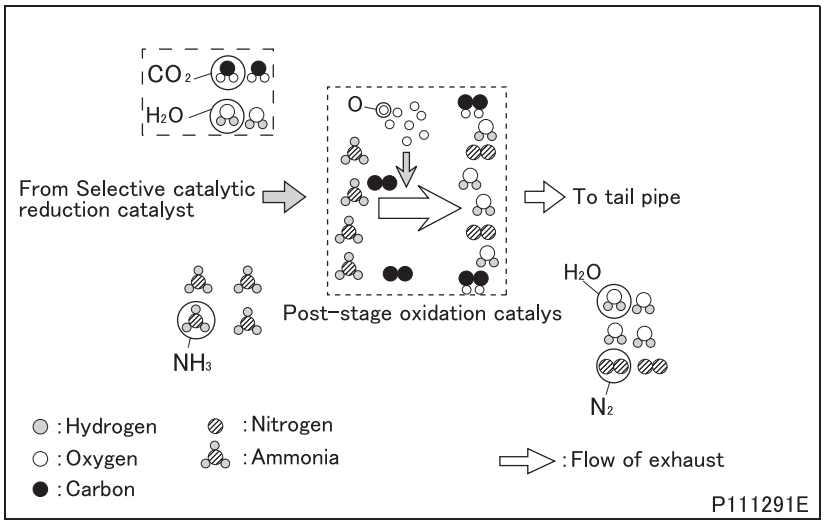
- This is a diesel exhaust fluid SCR system which decomposes NOx into water and nitrogen through the chemical reaction with AdBlue® (diesel exhaust fluid) with a help of SCR catalyst.



P111290E

(1) SCR catalyst

- The diesel exhaust fluid is decomposed into ammonia (NH_3) and carbon dioxide (CO_2) in the exhaust gas.
- Ammonia (NH_3) and nitrogen oxides (NOx) make a chemical reaction if they are exposed to a SCR catalyst, generating water (H_2O) and nitrogen (N_2) both of which are harmless.



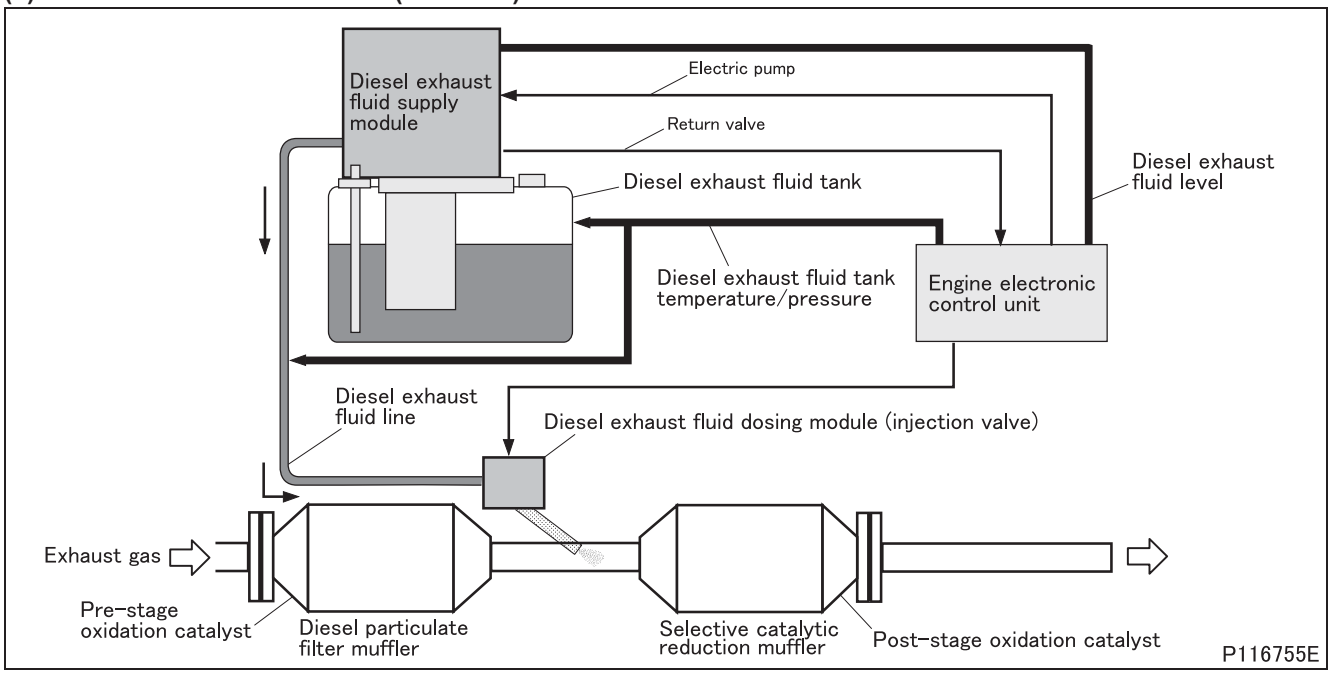
P111291E

(2) Post-stage oxidation catalyst

- The post-stage oxidation catalyst acts as follows:
  - Helps the components (HC, CO) left unprocessed during the DPF regeneration to be oxidized into water and nitrogen.
  - Keeps the excess of diesel exhaust fluid (AdBlue®) dosed (injected) or the amount of ammonia having not made any chemical reaction due to too low a temperature from being exhausted.

DPF: Diesel particulate filter
SCR: Selective catalytic reduction

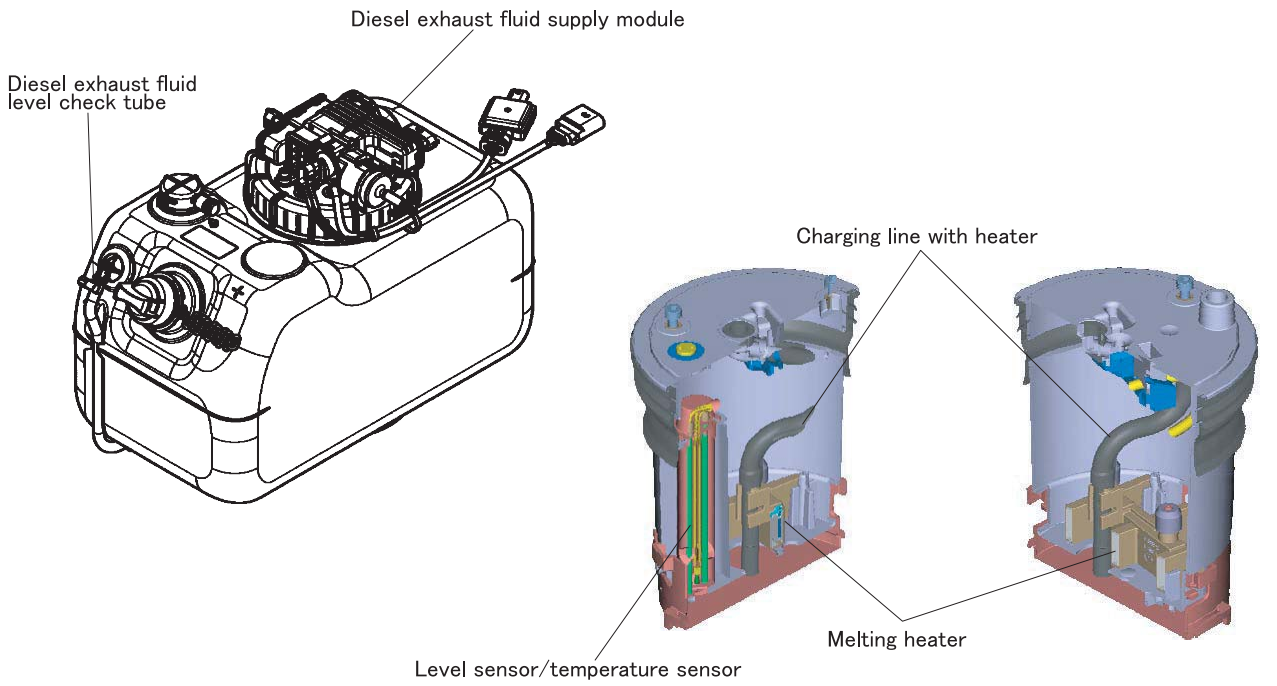
(3) Flow of diesel exhaust fluid (AdBlue®)



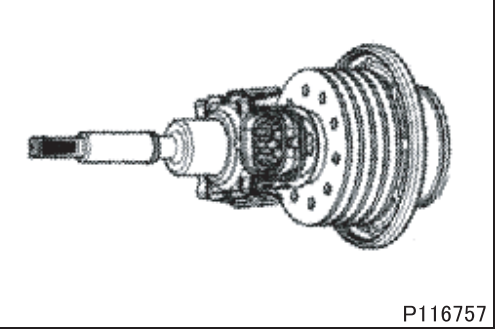
- Diesel exhaust fluid (AdBlue®) needed to reduce the emission of nitrogen oxides is fed from the diesel exhaust fluid tank to the diesel exhaust fluid dosing module through the diesel exhaust fluid supply module.
- The engine electronic control module activates or deactivates the diesel exhaust fluid supply module in such a way that the diesel exhaust fluid pressure is kept within the predetermined range.
- Diesel exhaust fluid (AdBlue®), after sucked up from the diesel exhaust fluid tank by the electric pump in the diesel exhaust fluid supply module, is supplied under pressure to the diesel exhaust fluid dosing module.
- Diesel exhaust fluid (AdBlue®) is injected into the exhaust gas through the diesel exhaust fluid dosing module being controlled by the engine electronic control unit, where it is decomposed into ammonia (NH_3) and carbon dioxide by the heat of the exhaust gas. Thereby, the nitrogen oxides make a chemical reaction with the ammonia inside the SCR, being reduced to water and nitrogen.

SCR: Selective catalytic reduction

(4) Diesel exhaust fluid tank



- Diesel exhaust fluid tank body
  - The diesel exhaust fluid tank body is made of high density polyethylene which features a high corrosion resistance to diesel exhaust fluid (AdBlue®).
  - The diesel exhaust fluid tank is open to the atmosphere through the breather so that it may not be placed under negative pressure due to lowered level of diesel exhaust fluid (AdBlue®).
  - The diesel exhaust fluid tank has a built-in heater which serves for keeping the diesel exhaust fluid solution warm to prevent it from freezing.
- Diesel exhaust fluid level sensor and temperature sensor
  - The diesel exhaust fluid level sensor monitors the level of diesel exhaust fluid (AdBlue®) in the diesel exhaust fluid tank and sends the signals to the electronic control module to have the amount of the remaining solution shown by the diesel exhaust fluid level indicator.
  - If the level of diesel exhaust fluid (AdBlue®) is lowered below the E level, the warning message “Amount of remaining AdBlue® too small” will be displayed on the meter cluster.



(5) Diesel exhaust fluid dosing module

- The diesel exhaust fluid dosing module injects the diesel exhaust fluid (AdBlue®) fed from the diesel exhaust fluid supply module in such a way that it is mixed up uniformly with the exhaust gas.
- It takes some amount of time for the injected solution of diesel exhaust fluid to mix up with the exhaust gas and to convert into ammonia. Therefore, the diesel exhaust fluid dosing module is installed in an accurately calibrated location upstream from the SCR catalyst.

SCR: Selective catalytic reduction

Symptoms / Possible causes		Black exhaust gas → DPF premature clogging	Engine output is insufficient	Fuel consumption is too high	Intake and exhaust system vibrates and/or makes abnormal noises	DPF regeneration is not established	Reference Gr

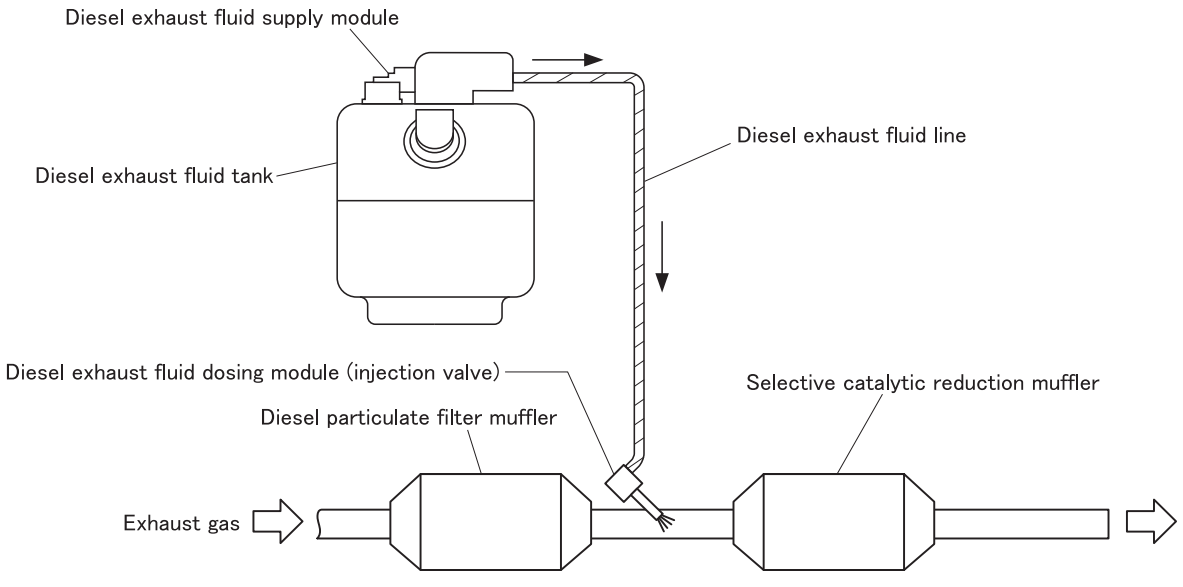
DPF	Clogged filter		O	O		O	
	Damaged diesel particulate filter	O			O	O	
Incoming or outgoing exhaust gas temperature sensor open-circuited or intermittent connection						O	

DPF: Diesel particulate filter

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Leakage of Diesel Exhaust Fluid

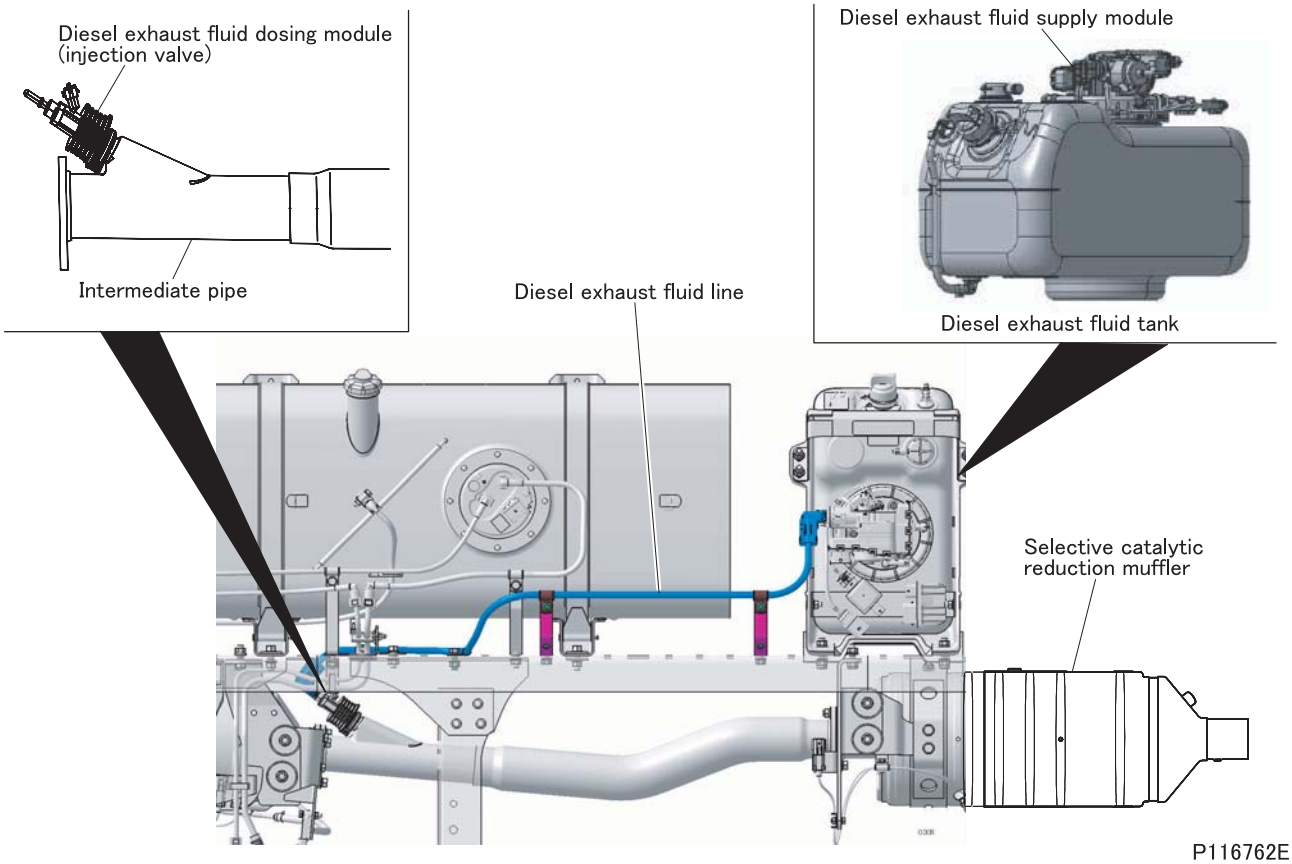


- Check to confirm that there are not found any white crystals or traces of diesel exhaust fluid leakage at the connections of the diesel exhaust fluid lines to the diesel exhaust fluid tank, diesel exhaust fluid dosing module, diesel exhaust fluid pump unit and diesel exhaust fluid dosing nozzle.
- If any trace of diesel exhaust fluid leakage is found, wipe the white crystals off with a cloth moistened with diesel exhaust fluid (AdBlue®) and then check each connection for tightening condition. Retighten any loose connections.

WARNING ⚠

- **If diesel exhaust fluid (AdBlue®) splashes into your eyes, wash it away immediately with plenty of water and seek medical attention as soon as possible.**
- **The diesel exhaust fluid (AdBlue®) is not harmful to the skin. However, if it makes contact with your skin, wash it off with water immediately. If the skin swells or irritates, seek medical attention.**
- **Direct contact with white crystals can cause the skin to inflame. In such a case, wash the affected part thoroughly with plenty of water without delay.**

2. Damage and Improper Installation of Diesel Exhaust Fluid Lines



- Check the diesel exhaust fluid line connections at the diesel exhaust fluid tank (diesel exhaust fluid pump unit) and diesel exhaust fluid dosing nozzle for installation condition.
- If any trace of diesel exhaust fluid leakage is found, wipe the white crystals off with a cloth moistened with diesel exhaust fluid (AdBlue®) and then check each connection for tightening condition. Retighten any loose connections.

WARNING ⚠

- **If diesel exhaust fluid (AdBlue®) splashes into your eyes, wash it away immediately with plenty of water and seek medical attention as soon as possible.**
- **The diesel exhaust fluid (AdBlue®) is not harmful to the skin. However, if it makes contact with your skin, wash it off with water immediately. If the skin swells or irritates, seek medical attention.**
- **Direct contact with white crystals can cause the skin to inflame. In such a case, wash the affected part thoroughly with plenty of water without delay.**

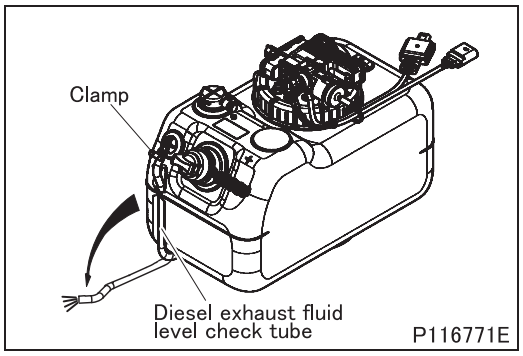
3. Replacement of Diesel Exhaust Fluid (AdBlue®)

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Diesel exhaust fluid level check tube	2 {1.5, 0.2}	–

WARNING ⚠

- **If diesel exhaust fluid (AdBlue®) splashes into your eyes, wash it away immediately with plenty of water and seek medical attention as soon as possible.**
- **The diesel exhaust fluid (AdBlue®) is not harmful to the skin. However, if it makes contact with your skin, wash it off with water immediately. If the skin swells or irritates, seek medical attention.**

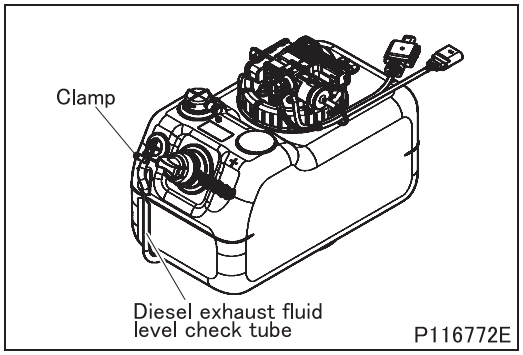


[Removal]

- Remove the diesel exhaust fluid tank cap.
- Undo the clamp of the diesel exhaust fluid level check tube.
- Disconnect the diesel exhaust fluid level check tube to drain the diesel exhaust fluid (AdBlue®).

CAUTION ⚠

- **The drained diesel exhaust fluid (AdBlue®) must be disposed of as an industrial waste.**



[Installation]

- Clamp the diesel exhaust fluid level check tube.
- Tighten the diesel exhaust fluid level check tube to the specified torque. Fill the tank with the specified amount of diesel exhaust fluid (AdBlue®).

CAUTION ⚠

- **Use of diesel exhaust fluid other than AdBlue® can cause the SCR system to malfunction. Always use the diesel exhaust fluid (AdBlue®) conforming to the automotive standards (JIS or ISO).**

- Check to see that two or more segments of diesel exhaust fluid level monitor lamp are illuminated, the warning message disappears and the buzzer stops sounding when the starter switch is turned from the LOCK into ON position.

CAUTION ⚠

- **Neglecting to perform the above procedures in a cold district can cause the diesel exhaust fluid (AdBlue®) to freeze, making it impossible to start the engine.**
  Also note that thawing the diesel exhaust fluid tank with hot water is not allowed.

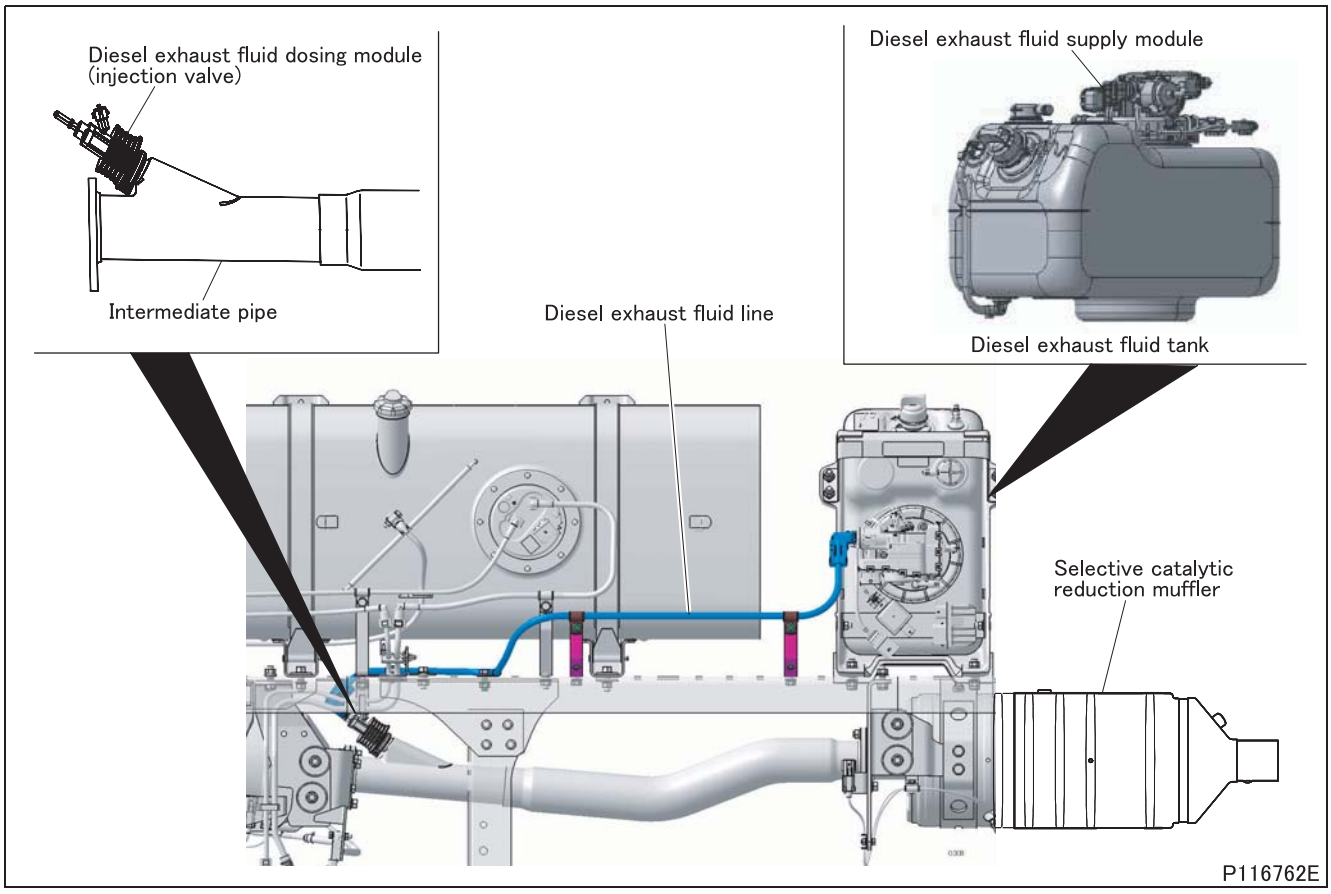
SCR: Selective catalytic reduction

4. Measures to be Taken if Diesel Exhaust Fluid Tank is Filled with Incorrect Diesel Exhaust Fluid Solution

- If the diesel exhaust fluid tank has been filled by mistake with diesel exhaust fluid solution other than AdBlue®, take the appropriate one of the following measures depending on whether or not the starter switch is turned to ON position. This is because the devices through which the diesel exhaust fluid solution has flowed are different case by case.

CAUTION ⚠

- **Incorrect diesel exhaust fluid solution penetrating into harness can cause the harness to corrode, resulting in open or short-circuit.**



1. In the case that the starter switch has not been turned to ON position (stayed in LOCK, OFF or ACC position):
   - Drain the incorrect solution from the diesel exhaust fluid tank through the drain hose. (See 3. Replacement of Diesel Exhaust Fluid (AdBlue®).)
   - Replace the diesel exhaust fluid tank with a new one. (See DEF (Diesel Exhaust Fluid) TANK.)

2. When the starter switch has been placed in ON position (turned to the ON and START):
   - Drain the solution from the diesel exhaust fluid tank through the drain hose. (See 3. Replacement of Diesel Exhaust Fluid (AdBlue®).)
   - Replace the diesel exhaust fluid tank, diesel exhaust fluid line (tube), dosing module, intermediate pipe and SCR (selective catalytic reduction) muffler with new ones. (See DEF (Diesel Exhaust Fluid) TANK, DPF (Diesel Particulate Filter), SCR (Selective Catalytic Reduction).)

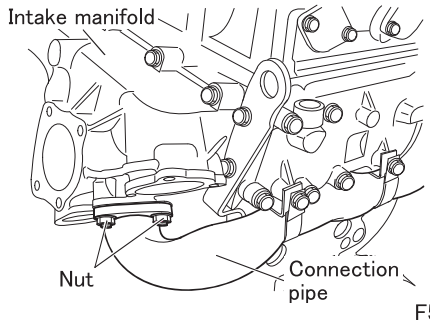
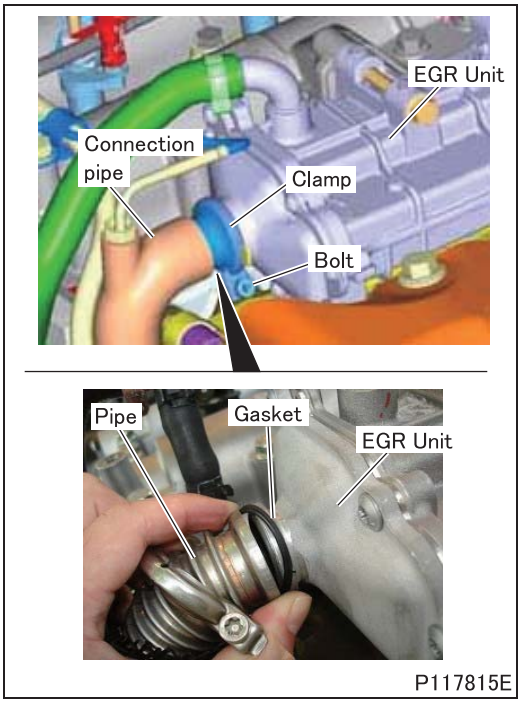
	Bolt (bracket mounting)		
	Bolt (connection pipe mounting)		
	Nut (connection pipe mounting)		
	Nut (cover mounting)		
Tb	Nut (pipe mounting)	30 {22, 3.0}	–

◆Removal procedure◆

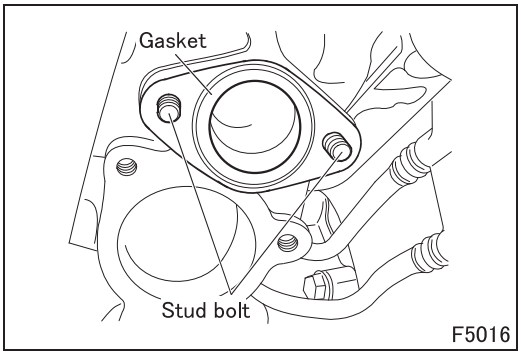


■ Removal: Connection pipe

- Unscrew and remove the two nuts; disconnect the connection pipe from the intake manifold.



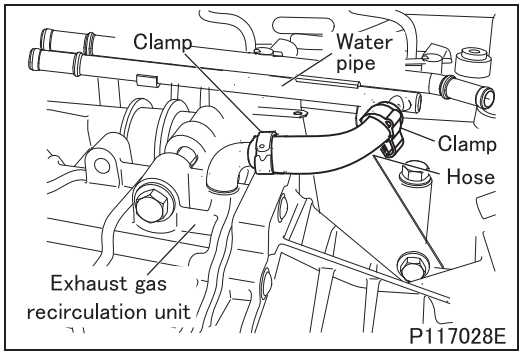
- Unscrew the bolt and remove the clamp.
- Remove the connection pipe and gasket from the exhaust gas recirculation unit.



■ Removal: Gasket, stud bolt

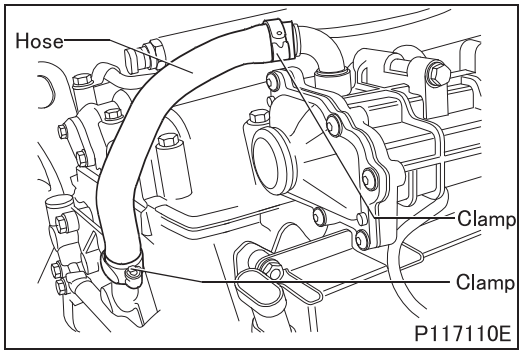
- Remove the gasket.
- Unscrew and remove the stud bolts.

EGR (Exhaust Gas Recirculation) UNIT



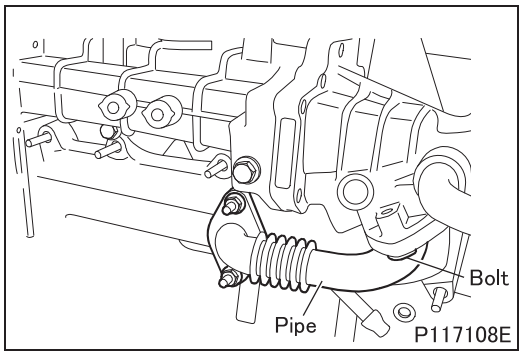
■ **Removal: Hose**

- Open the clamps and move them away from the position locking the pipe to the water pipe and EGR (Exhaust Gas Recirculation) unit.
- Remove the hose.



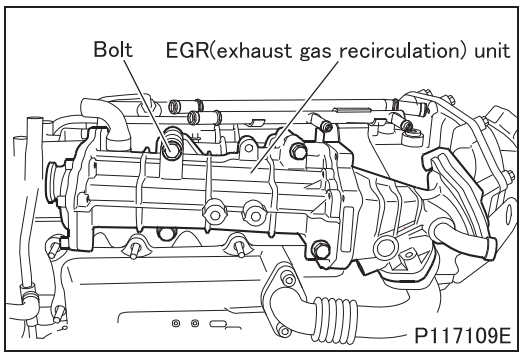
■ **Removal: Hose**

- Remove the retaining clamps.
- Remove the hose from the cooler and from the cover.



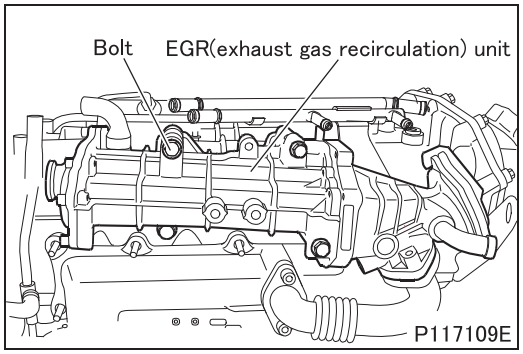
■ **Removal: Protector, EGR unit**

- Remove the protector.
- Remove the bolt that attaches the exhaust gas recirculation unit and EGR valve pipe.



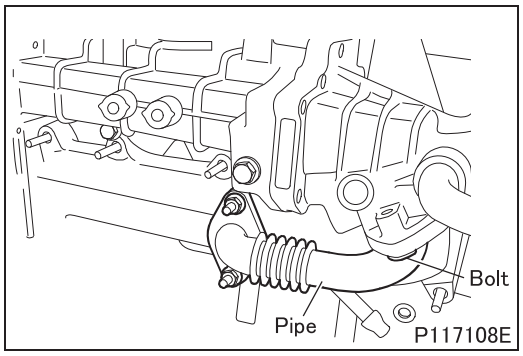
- Unscrew and remove the fixing bolts.
- Remove the EGR unit.

◆Installation procedure◆

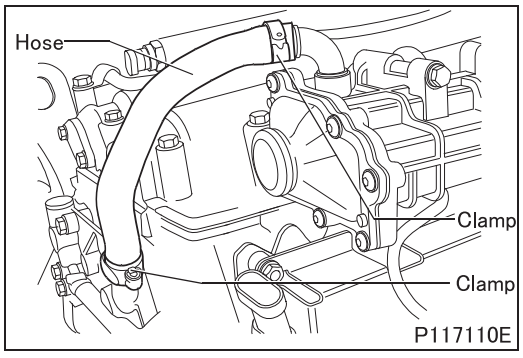


■ **Installation: EGR unit, protector**

- Fit the EGR unit on the overhead and tighten the fixing bolts to a tightening torque of 25 N·m {18.0 ft.lbs, 2.5 kgf·m}.

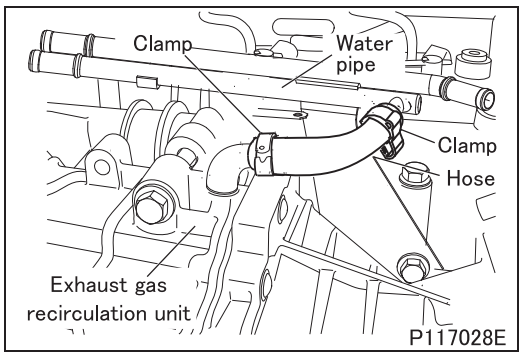


- Install the pipe with a new gasket to the EGR unit.
- Tighten the two bolts.
- Install the protector.



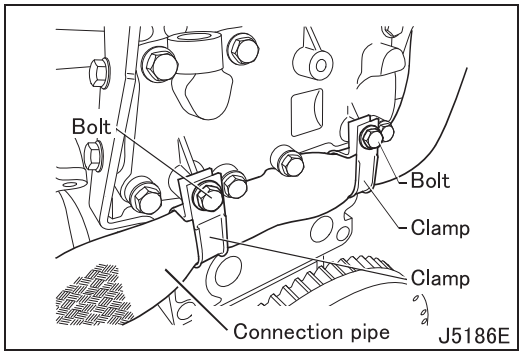
■ **Installation: Cross adapter, hose**

- Connect the hose with the heat exchanger and the cover.
- Retain it by means of the new clamps.



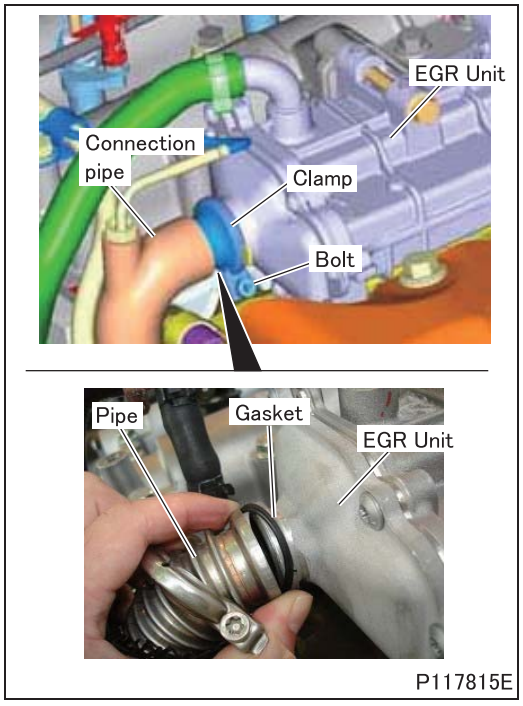
■ **Installation: Hose**

- Connect the hose between the water pipe and the EGR (Exhaust Gas Recirculation) unit.
- Fasten the hose to the adapters by means of the clamps.

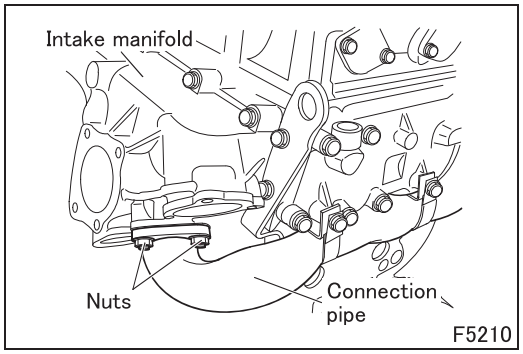


■ **Installation: Connection pipe**

- Assemble the connection pipe on the cylinder head retaining it by means of the clamps.
- Put the bolts and tighten it to a torque of 25 N·m {18.0 ft.lbs, 2.5 kgf·m}.

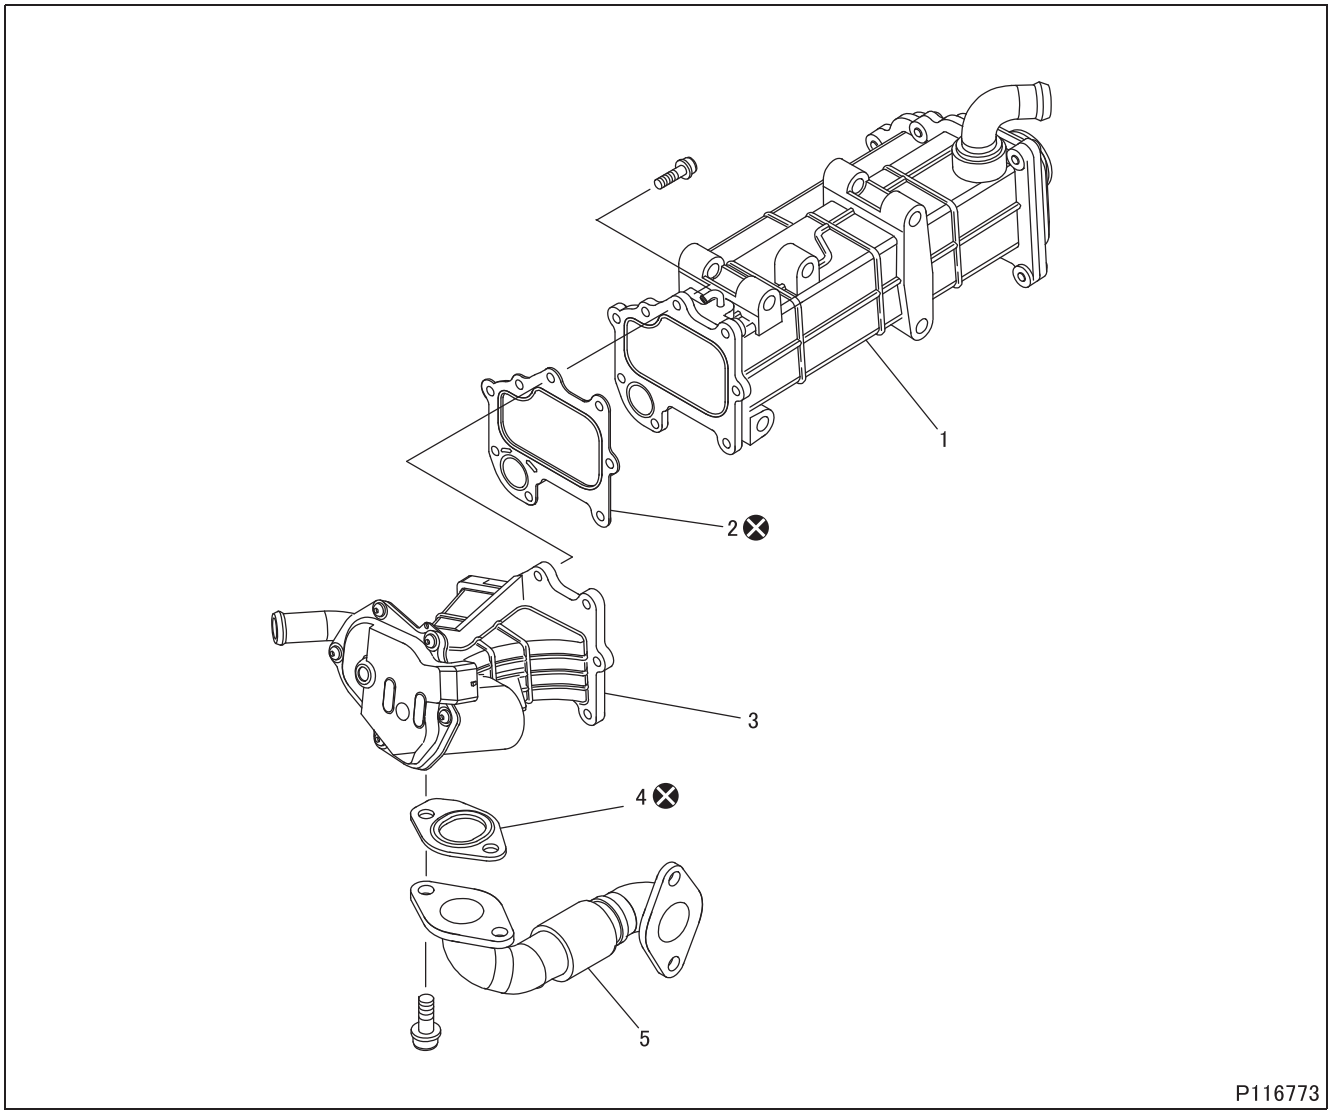


- Install the exhaust gas recirculation connection pipe and gasket on the exhaust gas recirculation unit.
- Install the clamp as shown.
- Tighten the clamp bolt.



- Install the connection pipe with a new gasket on the intake manifold.
- Tighten the nuts to a torque of 25 N·m {18.0 ft.lbs, 2.5 kgf·m}.

EGR Unit



● Removal sequence

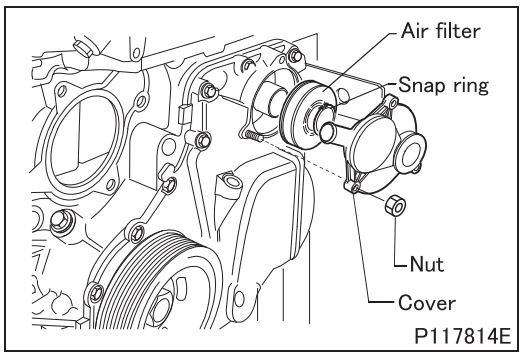
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (cover mounting)	10 {7.4, 1.0}	–
Tb	Clamp	9 to 11 {6.6 to 8.1, 0.9 to 1.1}	–

◆Removal procedure◆



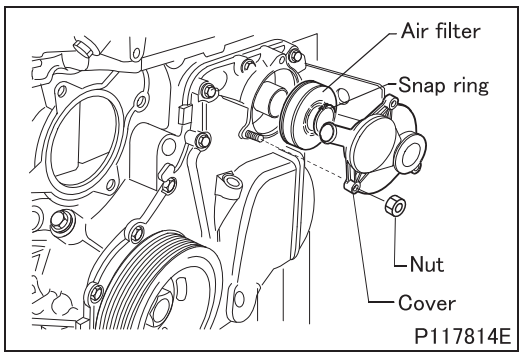
■Removal: Air filter

- Remove the screws and the cover. Take off the snap ring. Pull out the air filter.

NOTE

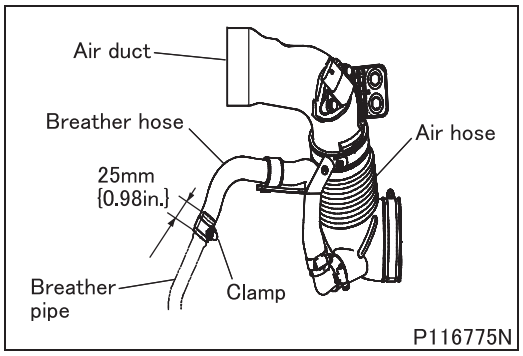
- **The air filter and the seal ring of the cover must be changed at every removal.**

◆Installation procedure◆



■Installation: Air filter

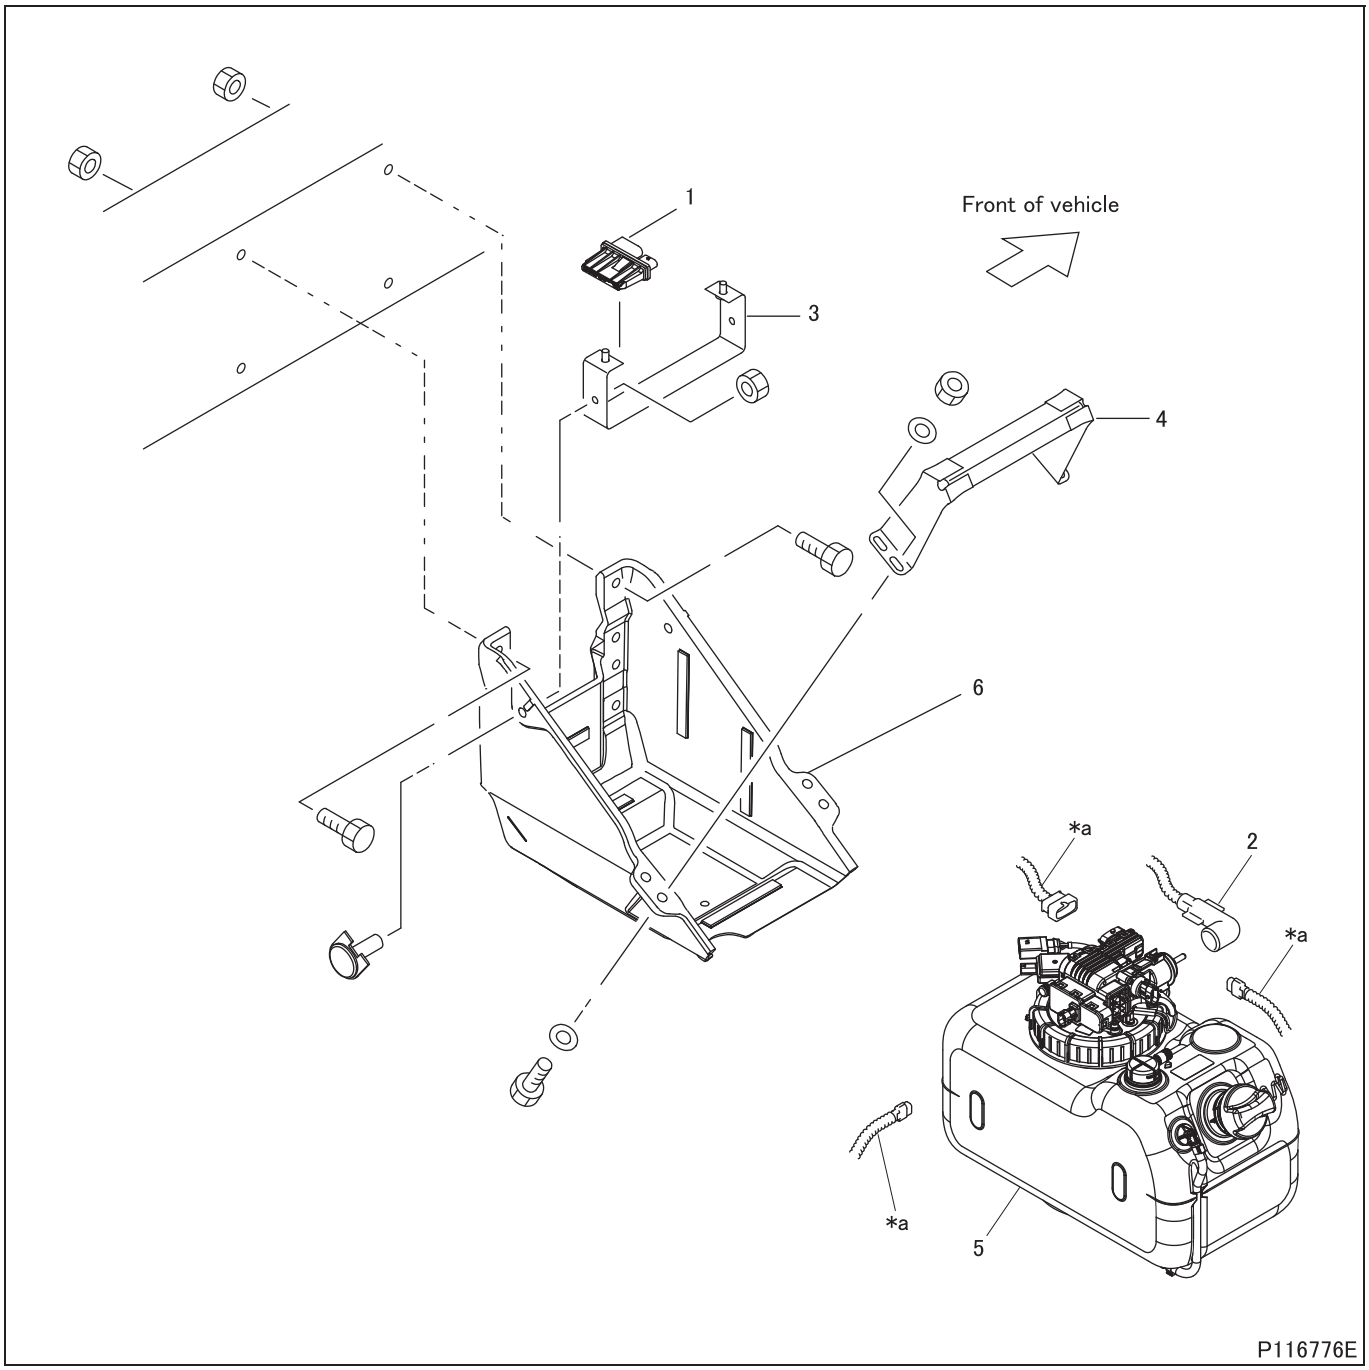
- Fit a new air filter.
- Fit a new snap ring.
- Fit the cover, drive in the screws and tighten them to the prescribed torque (10 N·m {7.4 ft.lbs, 1.0 kgf·m}).



■Installation: Breather hose

- Install the hose as shown and tighten the clamp.

DEF (Diesel Exhaust Fluid) TANK



● **Removal sequence**

1 DEF heater power unit
2 DEF tube
3 Bracket
4 Band
5 DEF tank (See later section.)
6 DEF tank bracket

***a**: DEF tank harness

CAUTION ⚠

- **Be careful not to damage the end of the connector on the DEF tank when removing the DEF tube.**

- Plug the removed DEF tube and connector to prevent dust from entering them.

- Turn the starter switch to OFF, then wait at least 2 minutes to allow time for the BlueTec® system to stop its internal operation completely before starting the removal procedure.

WARNING ⚠

- **If DEF gets in your eye, wash it with plenty of running water immediately and seek medical attention without delay.**
- **DEF is usually harmless to your skin, but in the case of its contact with the skin, it should be removed with running water immediately. Should any change in skin condition or irritation occurs as a result, ask medical attention.**

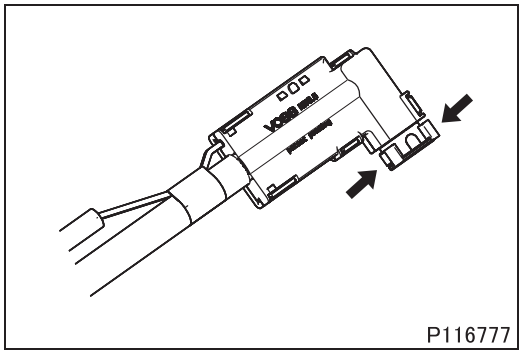
CAUTION ⚠

- **If DEF is splashed over brackets, bolts, nuts, or other similar parts, wash it from them with water. DEF may cause corrosion to these parts.**
- **To prevent corrosion of the harness and eventual open circuit due to DEF that can enter the harness connectors during the work, remove the harness in the last stage of the procedure.**

● Installation sequence

Follow the removal sequence in reverse.

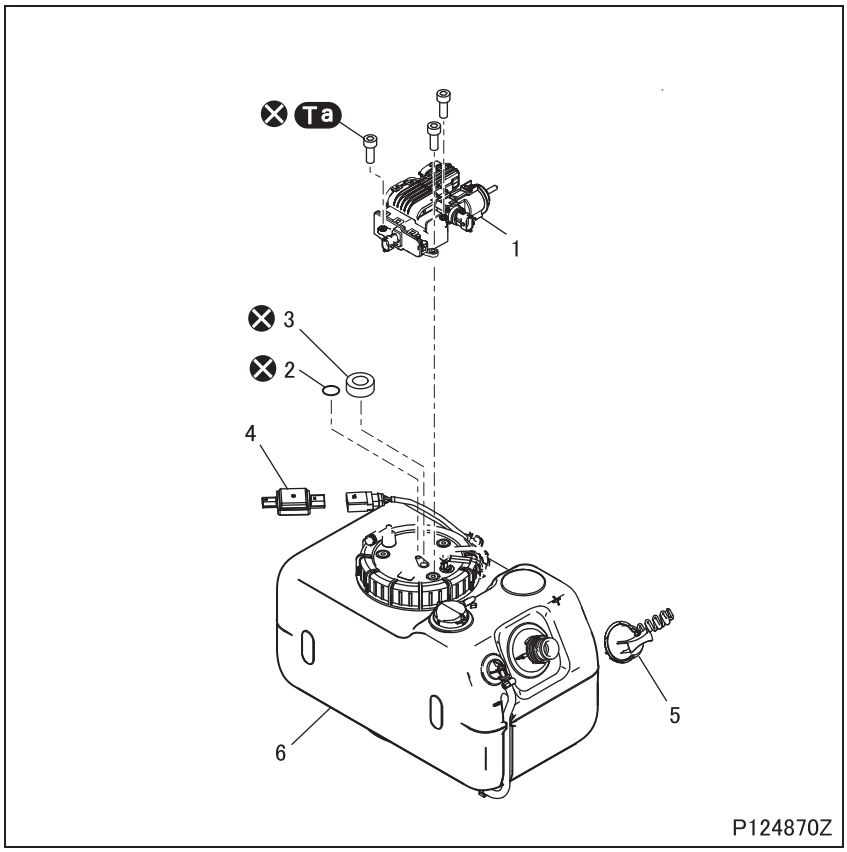
◆Removal procedure◆



■Removal: DEF tube

- Hold the clip to release the stopper and disconnect the tube.

DEF (Diesel Exhaust Fluid) TANK



●Disassembly sequence

1 Urea supply module
2 O-ring
3 Seal

DPF: Diesel Particulate Filter

NOTE

- **The color of the DPF surface may turn brown. This discoloration is due to the inherent characteristics of stainless steel and does not indicate rusting or any other abnormality.**

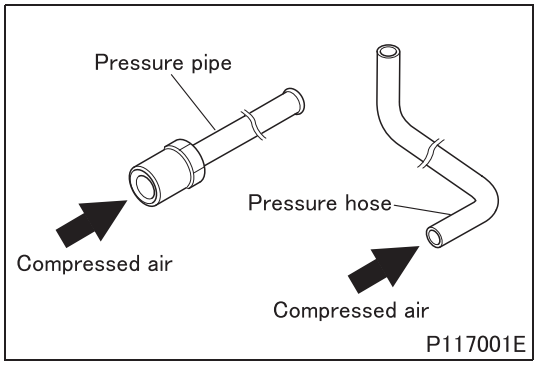
● Installation sequence

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Exhaust gas temperature sensor 1, 2	45 ± 4.5 {33 ± 3.3, 4.6 ± 0.5}	–
Tb	Bolt (DPF differential pressure sensor mounting)	8 ± 0.9 {5.9 ± 0.7, 0.8 ± 0.1}	–

◆Inspection procedure◆



■Inspection: Pressure pipe and hose

- Check the pressure pipe and hose for clogging by blowing compressed air into the pipe and hose.

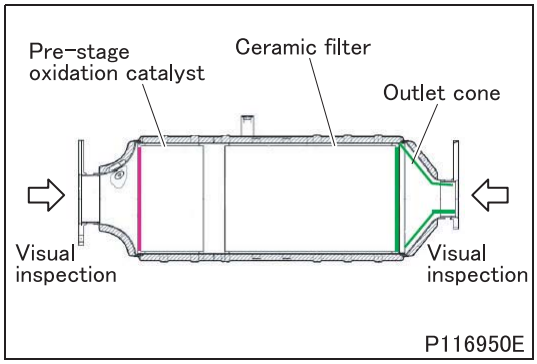
CAUTION ⚠

- **Inspection must be performed on an individual pressure pipe or hose.**
- **If compressed air is blown into the pressure pipe or hose with DPF differential pressure sensor still installed, the sensor may become damaged.**

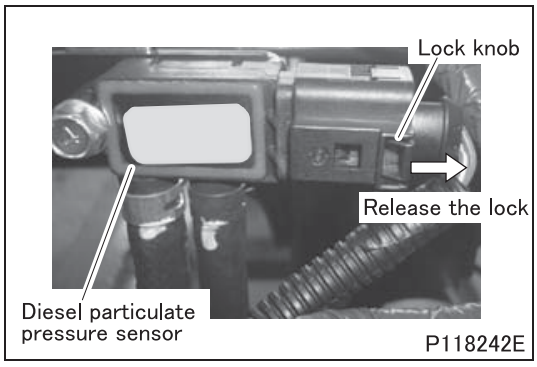
■ Inspection: DPF (Diesel particulate filter)

CAUTION ⚠

- **The DPF is very hot just after the engine is stopped. Wait proceeding to the work until the DPF is cooled down sufficiently to prevent getting burned.**



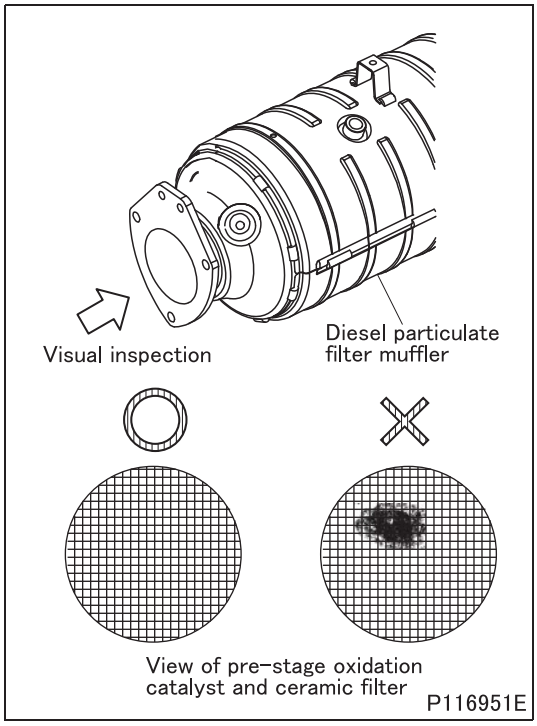
- Inspection of pre-stage oxidation catalyst
  - Check for clogging with foreign matters and damage.
  - If the filter is clogged with foreign matters, replace the DPF muffler with a new one.
  - If any damaged or broken parts are found, replace the DPF muffler with a new one.



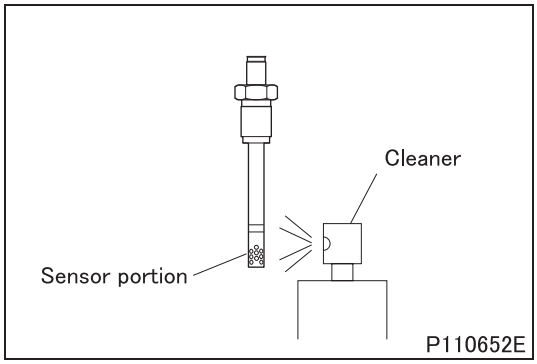
■ Removal: diesel particulate pressure sensor

- Move the connector lock knob in the direction shown in figure to release the lock and disconnect the connector.

DPF (Diesel Particulate Filter)



- Inspection of ceramic filter and outlet cone
  - Check for accumulation of soot and damage.
  - If any damaged or broken parts are found, replace the DPF muffler with a new one.



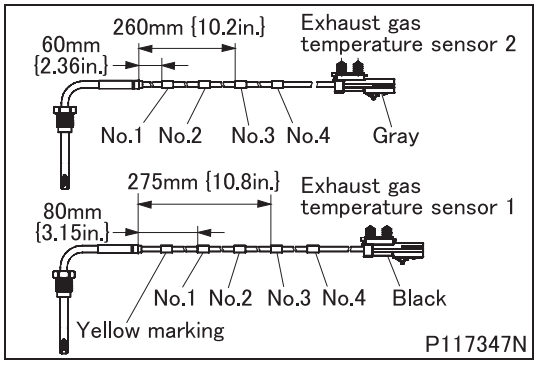
■ Inspection: Exhaust gas temperature sensor

- Check that the sensor portion is free of soot, oily substance, etc.
- If not, clean the sensor portion as follows.
- Spray a cleaner on the sensor portion from 2 or 3 cm {0.79 or 1.18 in.} away.
  Recommended cleaners:
  Nonchlorinated solvent
- In 20 to 30 seconds after spraying, wipe the sensor portion clear of the sprayed cleaner using a soft waste cloth the like.

CAUTION ⚠

- **Be sure to wait for 20 to 30 seconds before wiping. It takes the cleaner that long to dissolve foreign matter.**

◆Installation procedure◆



■Installation: Exhaust gas temperature sensor

- Move the clips to the white tape portions on the exhaust gas temperature sensors and install the sensor using them.

18 SCR muffler

∗a: DPF
∗b: DPF muffler gasket
⊗: Non-reusable parts
DPF: Diesel particulate filter
DEF: Diesel exhaust fluid

CAUTION ⚠

- **Be careful not to damage the end of dosing module when removing the diesel exhaust fluid tube.**

- Plug the removed diesel exhaust fluid tube and dosing module to prevent dust from entering them.

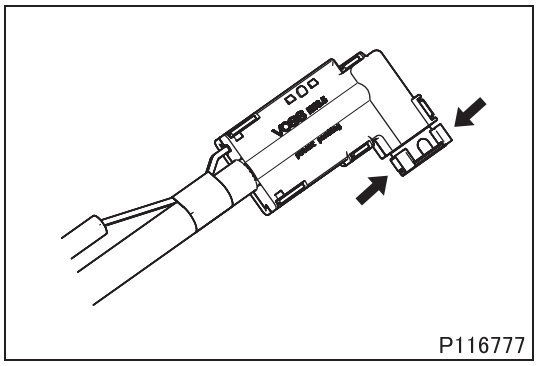
● Installation sequence

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	SCR temperature sensor 1, 2	45 ± 4.5 {33 ± 3.3, 4.6 ± 0.5}	–
Tb	Bolt	95 to 110 {66 to 81, 9.1 to 11}	–
Tc	V-clamp (Dosing module mounting)	4.75 ± 0.25 {3.5 ± 0.2, 0.5 ± 0.025}	–
Td	NOx sensor	50 ± 10 {37 ± 7.4, 5.1 ± 1.0}	–

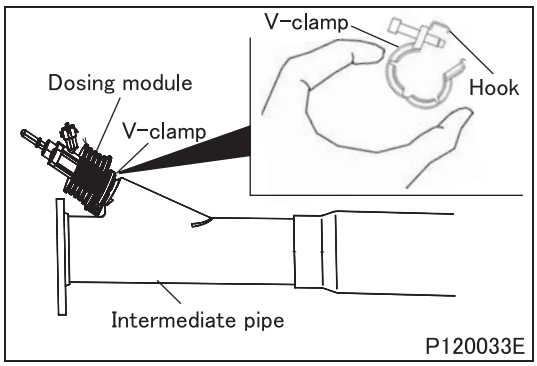
◆Removal procedure◆



■Removal: DEF (Diesel Exhaust Fluid) tube

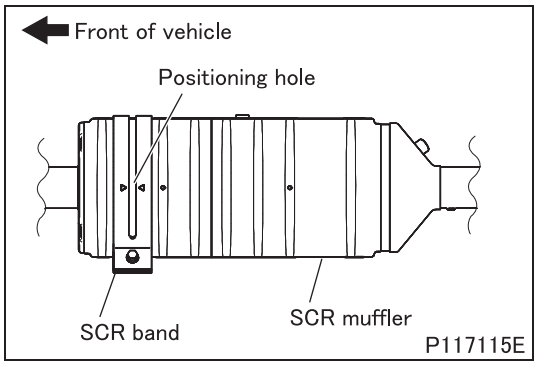
- Hold the clip to release the stopper and disconnect the tube.

◆Installation procedure◆



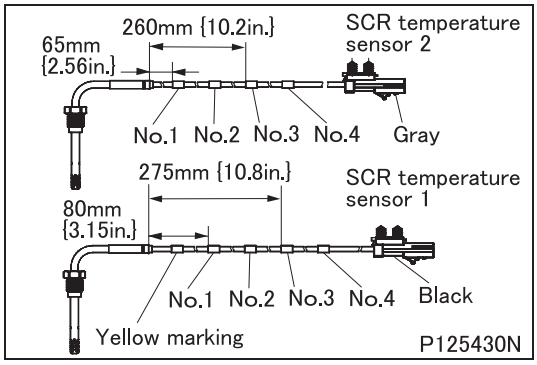
■Installation: Dosing module

- Install the dosing module to intermediate pipe.
- Always press in the middle and if required, against the dosing module until the clamp hook locks. Install the clamp closely to the dosing module.



■Installation: SCR band

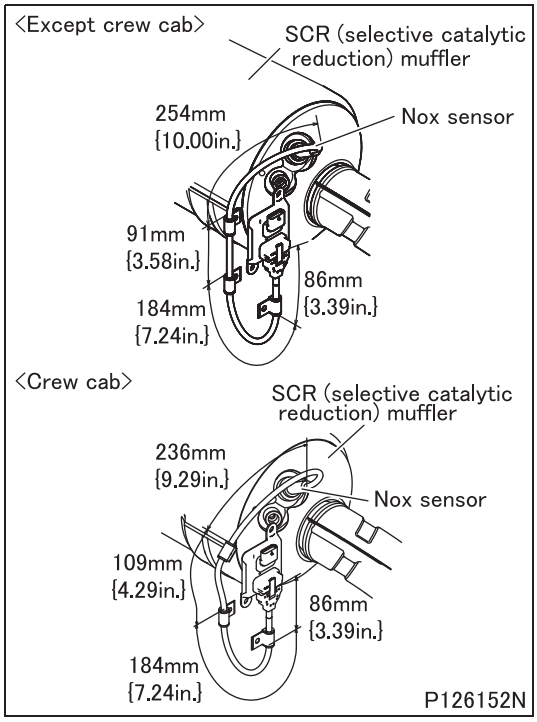
- Align the marks on the SCR band with the positioning hole at the bottom of the SCR.



■Installation: SCR temperature sensor

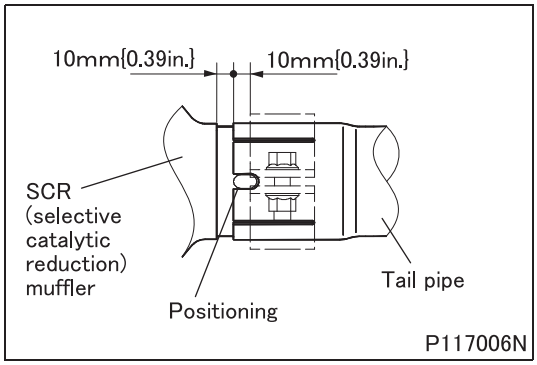
CAUTION ⚠

- **The Selective Catalytic Reduction temperature sensor can be damaged if impacted.**
- **Do not give impact to the sensor (removal/installation using an impact wrench, dropping the Selective Catalytic Reduction temperature sensor, etc.).**
- **Should the Selective Catalytic Reduction sensor be impacted, check the sensor. (See Gr54-#336.)**



■Installation: NOx sensor

- Install the NOx sensor with its harness toward the SCR body.
- Locate and fasten the clip on the NOx sensor harness as shown in the illustration.



■Installation: Tail pipe

- Insert the tail pipe into the Selective Catalytic Reduction muffler to achieve the dimensions shown.

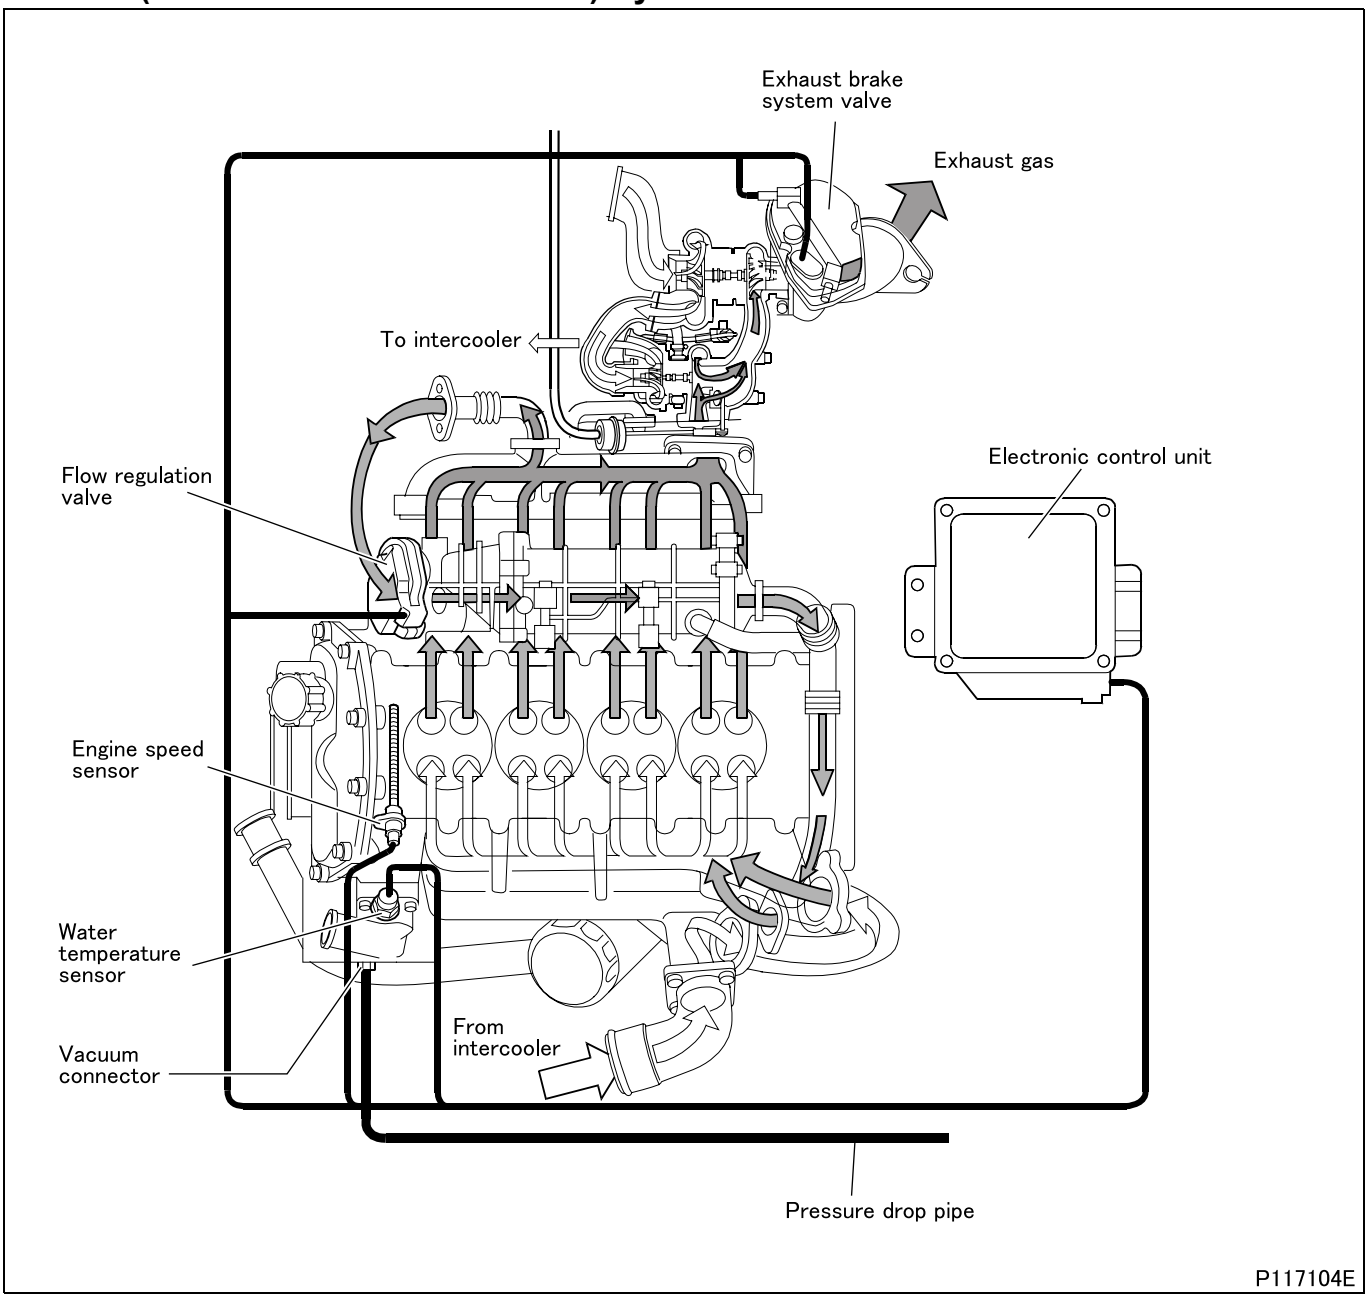
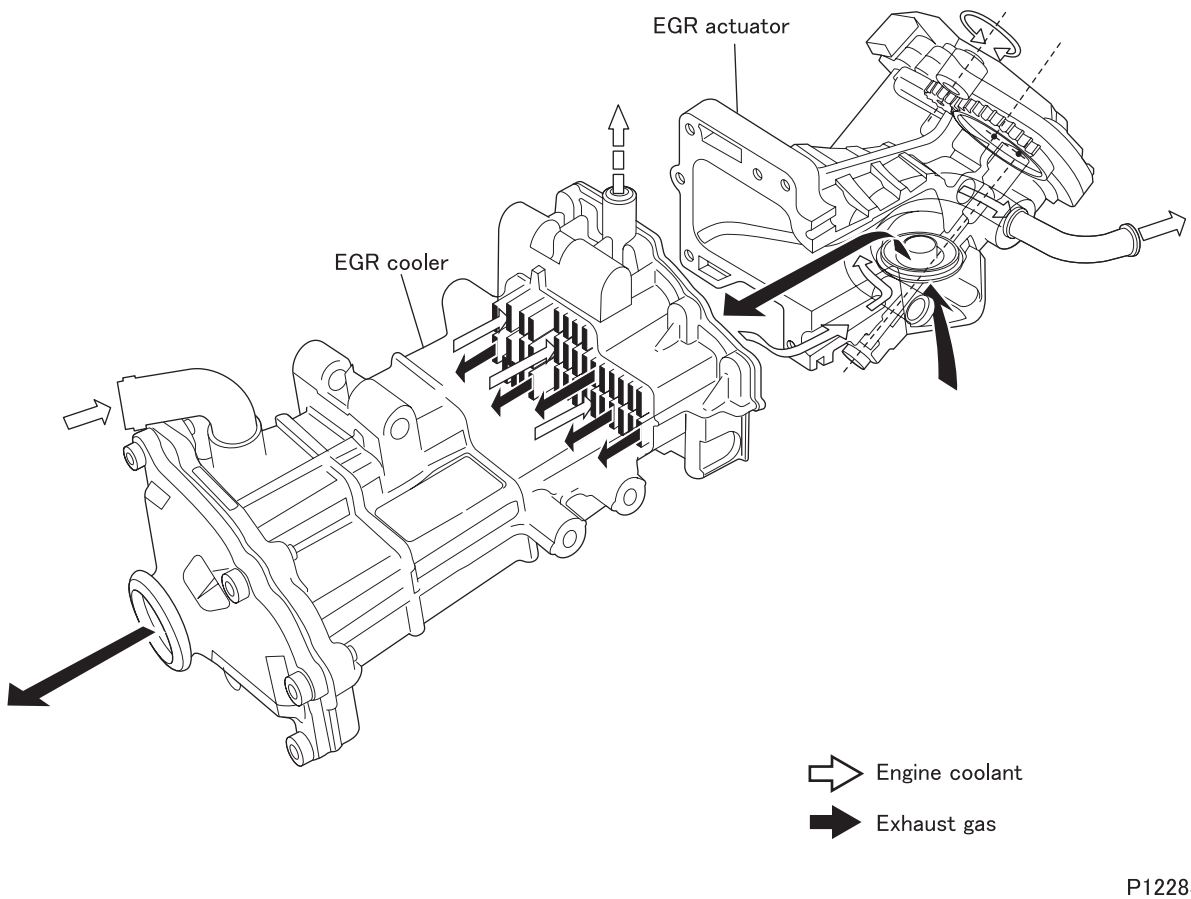
1. EGR (Exhaust Gas Recirculation) System



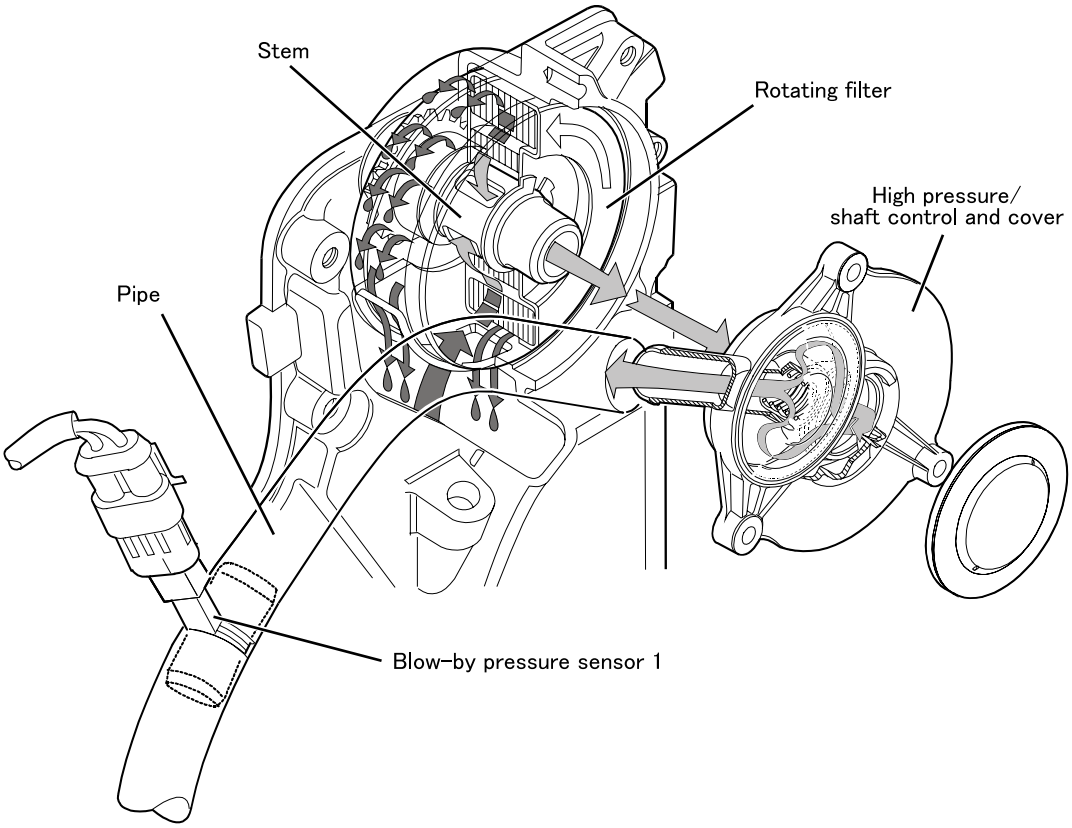
- The engine electronic control unit processes the information coming from the: atmospheric pressure sensor, water temperature sensor, engine speed sensor, accelerator pedal position sensor and, in accordance with suitably programmed modes in its memory, operate the opening of the plate in the EGR unit by means of a PWM signal.
- In this way, some of the exhaust gases are sent towards the EGR unit where they are cooled and directed to the chamber for the intake manifold to be mixed with the air coming from the intercooler and flow to the intake manifold. If the vehicle is fitted with a DPF (diesel particulate filter) catalytic converter, at the same time, the engine electronic control unit, adapts the flow rate of the fuel to be injected into the cylinders depending on the quantity of “recirculated” exhaust gases.
- When the engine is running and the recirculation of the gases is not required (regeneration of the particulate filter, starting, engine cold, idle speed, load request, high altitude), the engine electronic control unit control signal is cancelled.
- For electronic control unit connection diagram of EGR system, see Gr13.

1.1 EGR (Exhaust Gas Recirculation) unit



- The EGR unit comprises a heat exchanger and a flow regulation valve.
- The heat exchanger has the task of lowering the temperature of the exhaust gases which are partly sent to the intake manifold. This operation has only one aim: to lower the combustion temperature of the mixture. This takes place because the exhaust gases, totally inert, mix with the mixture and slow down combustion. Lowering this temperature produces a considerable decrease in NOx (nitrogen oxide) emissions which are harmful to the environment.
- The body of the heat exchanger is composed of a tube bundle cooled on the outside by the coolant fluid circulating in the engine. Some of the exhaust gases destined for “recirculation” pass inside the tube bundle and are cooled.
- The flow regulation valve is fitted on the end of the heat exchanger. The adjustment of the amount of recirculation exhaust gases takes place by means of an electrically operated plate valve.
- The valve is cooled by the engine coolant coming out of the heat exchanger thereby ensuring it is more efficient and lasts longer.

2. Blowby Gas Return System



Gas with oil level above 10 g/h

Gas with oil level ~ 0.2 g/h

Condensed oil returning to the oil sump

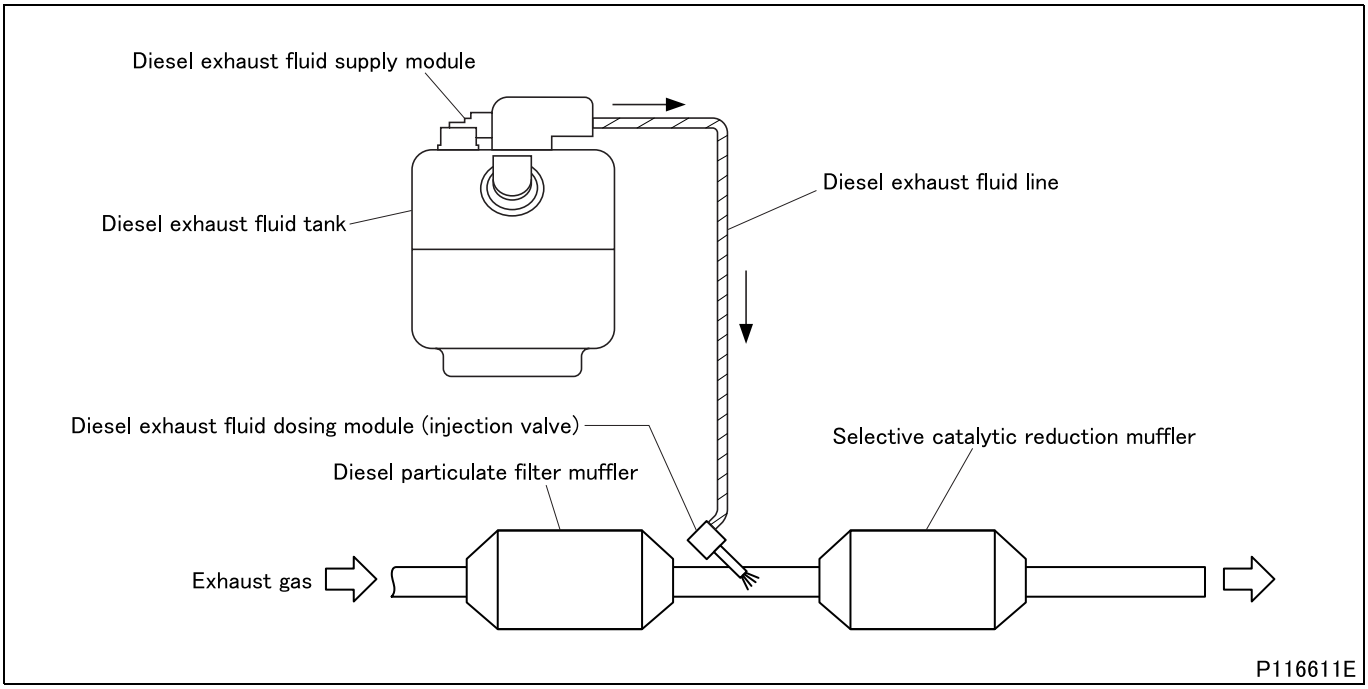
P117105E

- Part of the gas produced by the combustion during the engine operation blows by the piston snap ring ports, in the oil sump, and mixes with the oil vapors present in the oil sump.
  This mixture, conveyed from the chain compartment to the top, is partially separated from the oil by means of a device situated on the top side of the distribution cover and is introduced in the air suction system. This device consists mainly of a rotating filter, fit flush on the stem, a high pressure/shaft control and a cover.
- The mixture which passes through the rotating filter is partially purified from the oil particles, as a result of centrifugation, and so these particles condense on the cover walls to return to the lubrication circuit.
  The resulting purified mixture is let in through the stem holes inside the air vent upstream of the turbocharger.
- The oil still present in the mixture coming from the rotating filter and which condenses in the chamber is drained into the chain.
- This presents the oil vapor solidifying and the water vapor freezing at low external temperatures, which would increase the pressure in the crankcase, thus resulting in oil leaks through the crankcase gaskets.

3. BlueTec® System

3.1 Outline

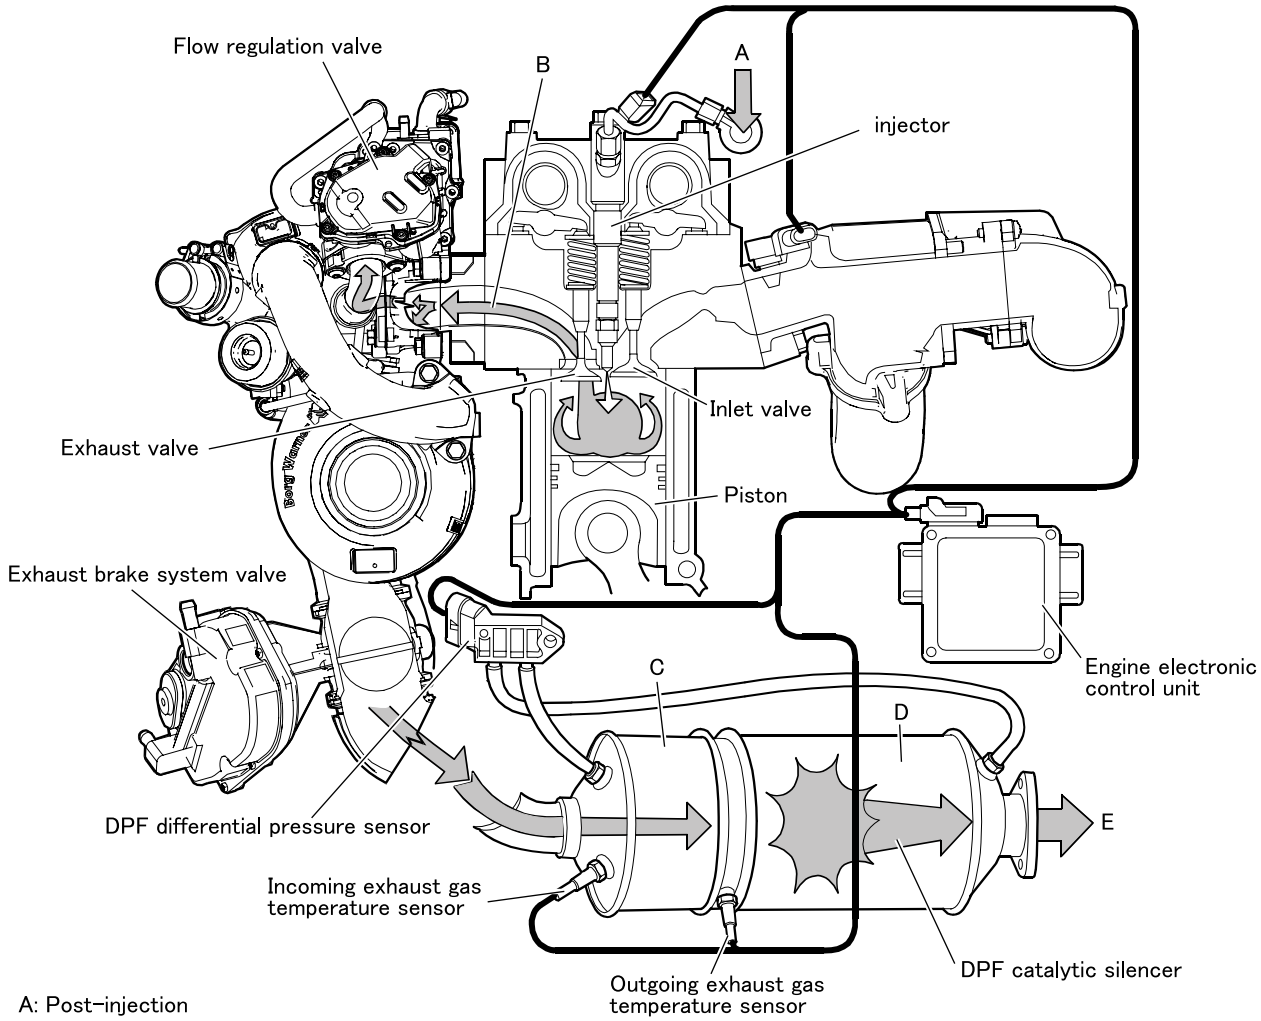
- The BlueTec® system is an exhaust emission aftertreatment combining a regeneration control type DPF (Diesel Particulate Filter) with a BlueTec® exhaust emission aftertreatment device.



- The regeneration control type DPF system captures soot (particulate matters) contained in exhaust gasses by using a ceramic filter incorporated in the muffler, and then burns the soot accumulated on the filter to remove it (regenerates the filter continuously) by making use of the catalytic action of the pre-stage oxidation catalyst.
- When the filter will not be regenerated during driving at low speeds or other conditions, the system performs the regeneration operation of the filter (burning the soot) by raising the exhaust gas temperature forcibly (automatic DPF regeneration). However, it is necessary to perform the filter regeneration manually (parked DPF regeneration) if driving at very low speeds or starting/stopping the engine is repeated so many times that the automatic filter regeneration cannot be executed.
- The BlueTec® exhaust emission aftertreatment device doses (injects) DEF (diesel exhaust fluid) in the exhaust line upstream from the SCR catalyst to decompose NOx into water and nitrogen, reducing NOx emission.
- Be sure to use the DEF in conformity with JIS standards or ISO standards as diesel exhaust fluid in the system.

SCR: Selective Catalytic Reduction

3.2 DPF (Diesel Particulate Filter) regeneration system



- DPF regeneration is managed by the engine electronic control unit. According to the values of the exhaust gas temperature detected by the sensors and the degree of DPF clogging detected by the DPF differential pressure sensor, the engine electronic control unit makes the injector inject small amounts of fuel in the cylinders when the exhaust valve is closing, at approx. 1 to 3° from T.D.C. The combustion of this fuel increases the temperature of the flowing gases.
- At the same time, the engine electronic control unit closes the flow regulation valve to prevent recirculated oil vapors and gases produced by post-injection from being sucked in the cylinders.
- Entering the silencer, the heated exhaust gases flow through the catalytic converter, where their pollutant elements (nitrogen oxides) are reduced or converted into inert substances (CO_2 - water vapor), and then enter the DPF where the regeneration process occurs. The high temperature of the exhaust gases causes combustion of the particulate accumulated in the filter.
- The DPF is regenerated when the following conditions exist.
- Temperature of exhaust gases entering the catalytic converter >230°C {446°F} with the aid of post-injection.
  - Temperature of exhaust gases in the particulate filter >530°C {986°F} with presence of > free oxygen at 8%.
  - Minimum time for the above-mentioned conditions >10 min.

- If the function is not reset after changing the engine oil, the engine electronic control unit will continue to compute the increase in fuel accumulation even with the new oil, with subsequent signalling of engine oil change.
- For electronic control unit connection diagram of DPF regeneration system, see Gr13.

(1) Forced regeneration

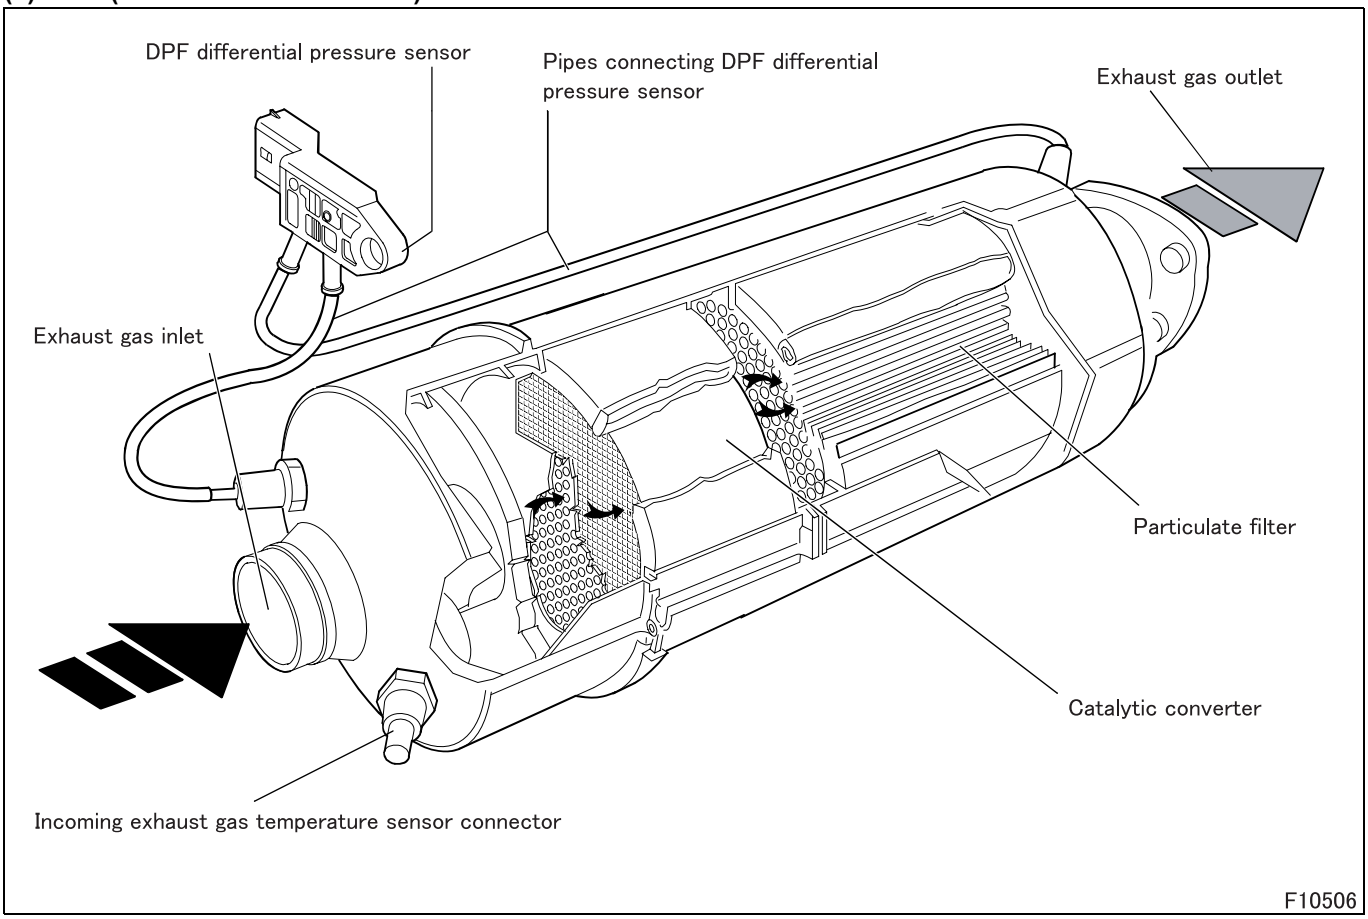
- In many cases of uncertainty regarding the actual cleanness of the DPF and/or the impossibility of its regeneration due to particular vehicle/engine operation conditions (insistence in idling, very low speeds and very frequent stops), it is necessary to carry out forced safety regeneration.
- Independently of all the parameters that activate regeneration, the engine is made to run at a point where the temperature of the exhaust gases (>230°C {446°F}) can activate the reaction in the Oxicat in the presence of post-injection.
- The only limit to this operation is if there is too much particulate in the filter, in any case calculated by the engine electronic control unit and being a condition for the start of regeneration.

(2) Engine oil replacement

- During vehicle use, the engine electronic control unit counts post-injected fuel quantity in order to activate and maintain DPF regeneration.
- A small quantity of this fuel, which is injected into the cylinders after combustion has already taken place and remains partially unburnt, leaks out through pistons spring rings into oil sump, accumulating to lubrication oil.
- Although a part of it, evaporating, will be burnt in the engine through recirculation system, its remaining part can degrade oil characteristics, impairing its functionality.
- Quantity of accumulated fuel may increase in case of catalyst or engine inefficiency, and vehicle use in conditions of low temperature and/or small amounts of miles covered.
- The engine electronic control unit counts the amounts of post-injections and consequently determines the quantity of fuel accumulated in engine oil, and warns about replacement needed.
  If, after replacing engine oil, the function is not reset, the engine electronic control unit will keep on counting fuel accumulation increase even with new oil, with consequent engine oil replacement warning by flashing warning lamp (red).

DPF: Diesel particulate filter

(3) DPF (Diesel Particulate Filter)

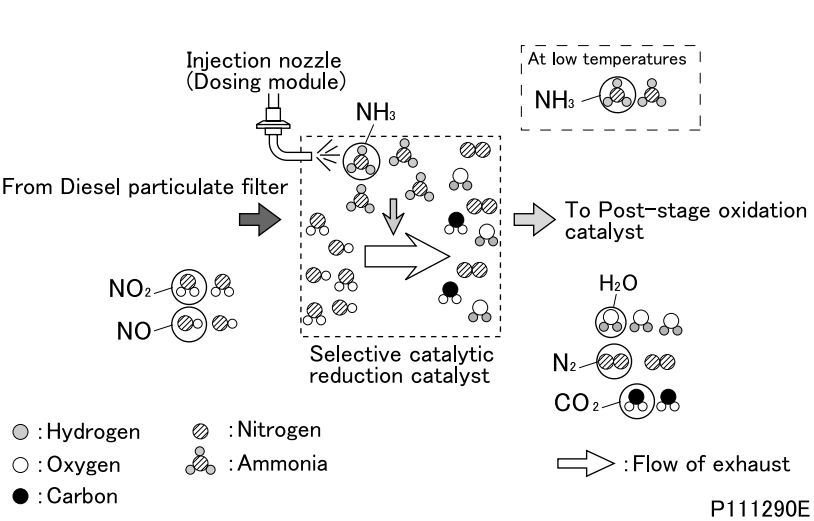


- DPF is made up of a catalytic converter and a particulate filter. Catalytic converter is an exhaust gas post-treatment device.
- Active substances, contained in the catalyst, oxidise, at 250 to 450°C {482 to 842°F} temperature, carbon oxide (CO) and hydrocarbons (HC), turning them into carbon dioxide (CO_2) and steam (H_2O).
- Catalyst module is made up of a ceramic structure impregnated with platinum, as platinum is a catalysing substance in oxidation reactions. Exhaust gasses heat the catalyst, so triggering the conversion of pollutants into inert compounds.
- Particulate filter, connected to the catalyst, has a double task: retaining particulate particles (PM) depositing between the pores of the ceramic structure of which the filter is made up and working as a particulate particles combustion chamber when the filter is being clogged.
- If filter interior is kept at a temperature higher than 530°C {986°F} and oxygen percentage is higher than 8% (oxygen being produced by the decomposition of nitrogen oxide NO_2), then some combustion reactions, boosted by the catalyst put before the filter, burn particulate particles (regeneration), so keeping the filter clean.
- On the contrary, if its temperature is lower, the filter is clogged, with negative effects, on counterpressure, on exhaust gasses generated by the filter.
- In this case, to regenerate the filter, temperature of exhaust gasses is artificially raised (up to 630°C {1166°F}) by fuel post-injection.
- A DPF differential pressure sensor, connected to DPF, as it detects a pressure difference between inlet and outlet, sends a (feed-back) signal to the engine electronic control unit to warn about particulate filter possible clogging.
  - The exhaust gas recirculation quantity controlled by the relative flow regulation valve.

3.3 BlueTec® exhaust emission aftertreatment device

P116754

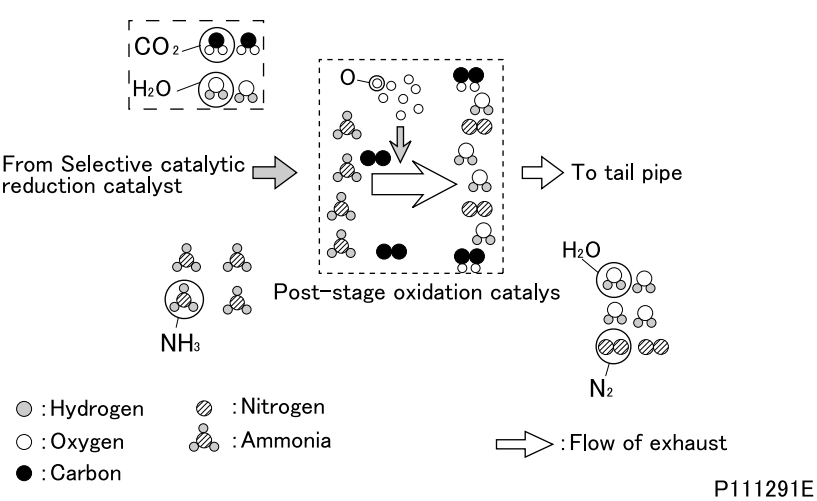
- This is a diesel exhaust fluid SCR system which decomposes NOx into water and nitrogen through the chemical reaction with DEF (diesel exhaust fluid) with a help of SCR catalyst.



P111290E

(1) SCR catalyst

- The diesel exhaust fluid is decomposed into ammonia (NH_3) and carbon dioxide (CO_2) in the exhaust gas.
- Ammonia (NH_3) and nitrogen oxides (NOx) make a chemical reaction if they are exposed to a SCR catalyst, generating water (H_2O) and nitrogen (N_2) both of which are harmless.



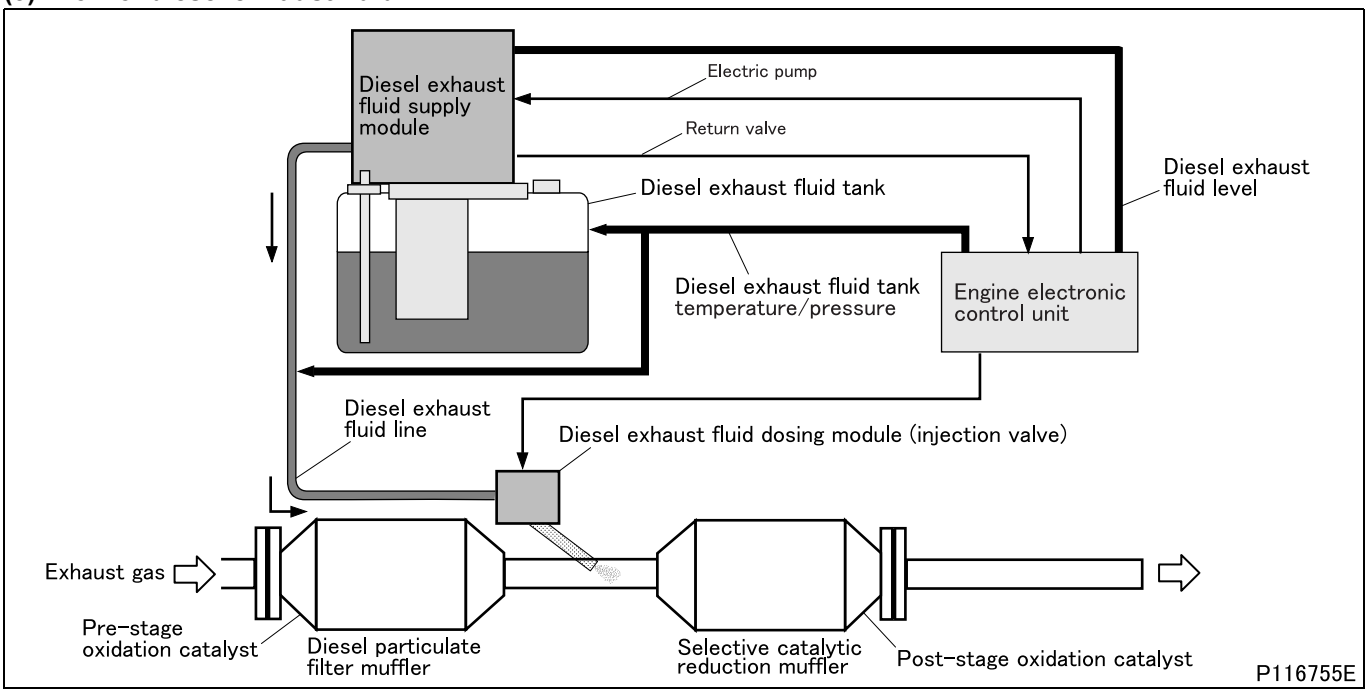
P111291E

(2) Post-stage oxidation catalyst

- The post-stage oxidation catalyst acts as follows:
  - Helps the components (HC, CO) left unprocessed during the DPF regeneration to be oxidized into water and nitrogen.
  - Keeps the excess of diesel exhaust fluid dosed (injected) or the amount of ammonia having not made any chemical reaction due to too low a temperature from being exhausted.

DPF: Diesel particulate filter
SCR: Selective catalytic reduction

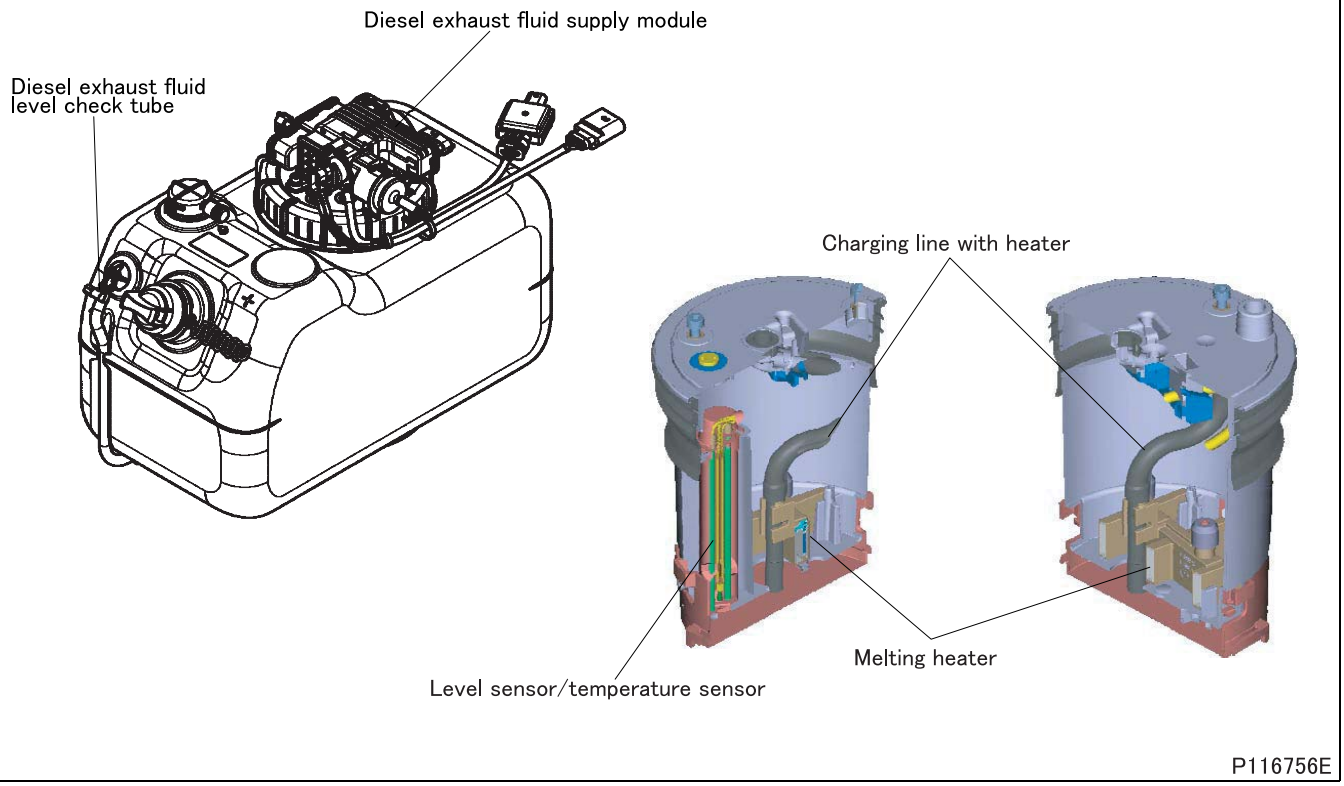
(3) Flow of diesel exhaust fluid



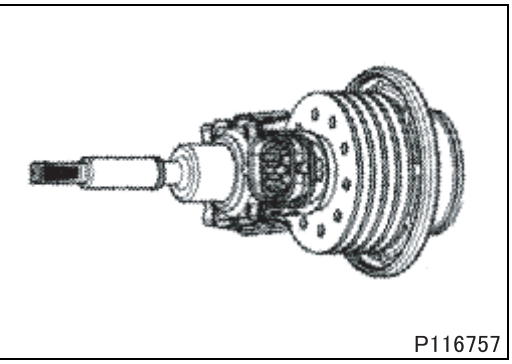
- Diesel exhaust fluid needed to reduce the emission of nitrogen oxides is fed from the diesel exhaust fluid tank to the diesel exhaust fluid dosing module through the diesel exhaust fluid supply module.
- The engine electronic control module activates or deactivates the diesel exhaust fluid supply module in such a way that the diesel exhaust fluid pressure is kept within the predetermined range.
- Diesel exhaust fluid, after sucked up from the diesel exhaust fluid tank by the electric pump in the diesel exhaust fluid supply module, is supplied under pressure to the diesel exhaust fluid dosing module.
- Diesel exhaust fluid is injected into the exhaust gas through the diesel exhaust fluid dosing module being controlled by the engine electronic control unit, where it is decomposed into ammonia (NH_3) and carbon dioxide by the heat of the exhaust gas. Thereby, the nitrogen oxides make a chemical reaction with the ammonia inside the SCR, being reduced to water and nitrogen.

SCR: Selective catalytic reduction

(4) Diesel exhaust fluid tank



- Diesel exhaust fluid tank body
  - The diesel exhaust fluid tank body is made of high density polyethylene which features a high corrosion resistance to diesel exhaust fluid.
  - The diesel exhaust fluid tank is open to the atmosphere through the breather so that it may not be placed under negative pressure due to lowered level of diesel exhaust fluid.
  - The diesel exhaust fluid tank has a built-in heater which serves for keeping the diesel exhaust fluid solution warm to prevent it from freezing.
- Diesel exhaust fluid level sensor and temperature sensor
  - The diesel exhaust fluid level sensor monitors the level of diesel exhaust fluid in the diesel exhaust fluid tank and sends the signals to the electronic control module to have the amount of the remaining solution shown by the diesel exhaust fluid level indicator.
  - If the level of diesel exhaust fluid is lowered below the E level, the warning message “Amount of remaining diesel exhaust fluid too small” will be displayed on the meter cluster.



(5) Diesel exhaust fluid dosing module

- The diesel exhaust fluid dosing module injects the diesel exhaust fluid fed from the diesel exhaust fluid supply module in such a way that it is mixed up uniformly with the exhaust gas.
- It takes some amount of time for the injected solution of diesel exhaust fluid to mix up with the exhaust gas and to convert into ammonia. Therefore, the diesel exhaust fluid dosing module is installed in an accurately calibrated location upstream from the SCR catalyst.

SCR: Selective catalytic reduction

Symptoms / Possible causes		Black exhaust gas → DPF premature clogging	Engine output is insufficient	Fuel consumption is too high	Intake and exhaust system vibrates and/or makes abnormal noises	DPF regeneration is not established	Reference Gr

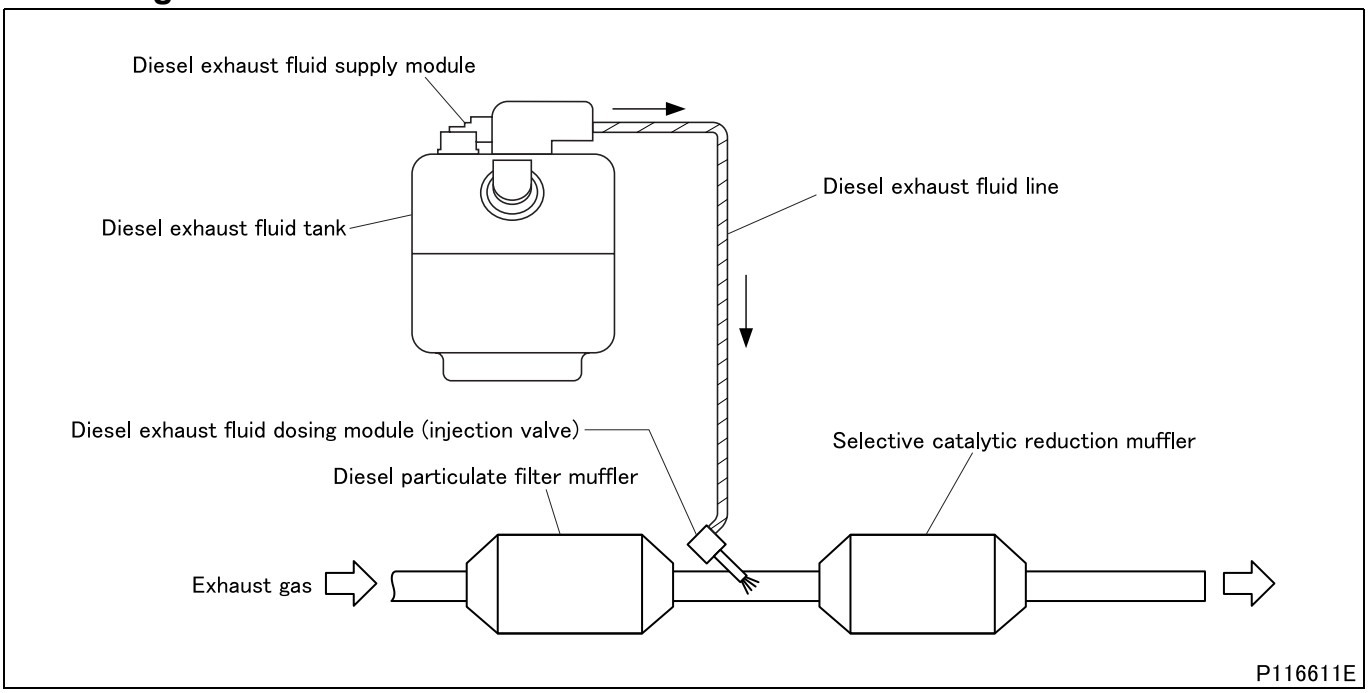
	Damaged diesel particulate filter	O			O	O	
Incoming or outgoing exhaust gas temperature sensor open-circuited or intermittent connection						O	

DPF: Diesel particulate filter

1. Leakage of Diesel Exhaust Fluid

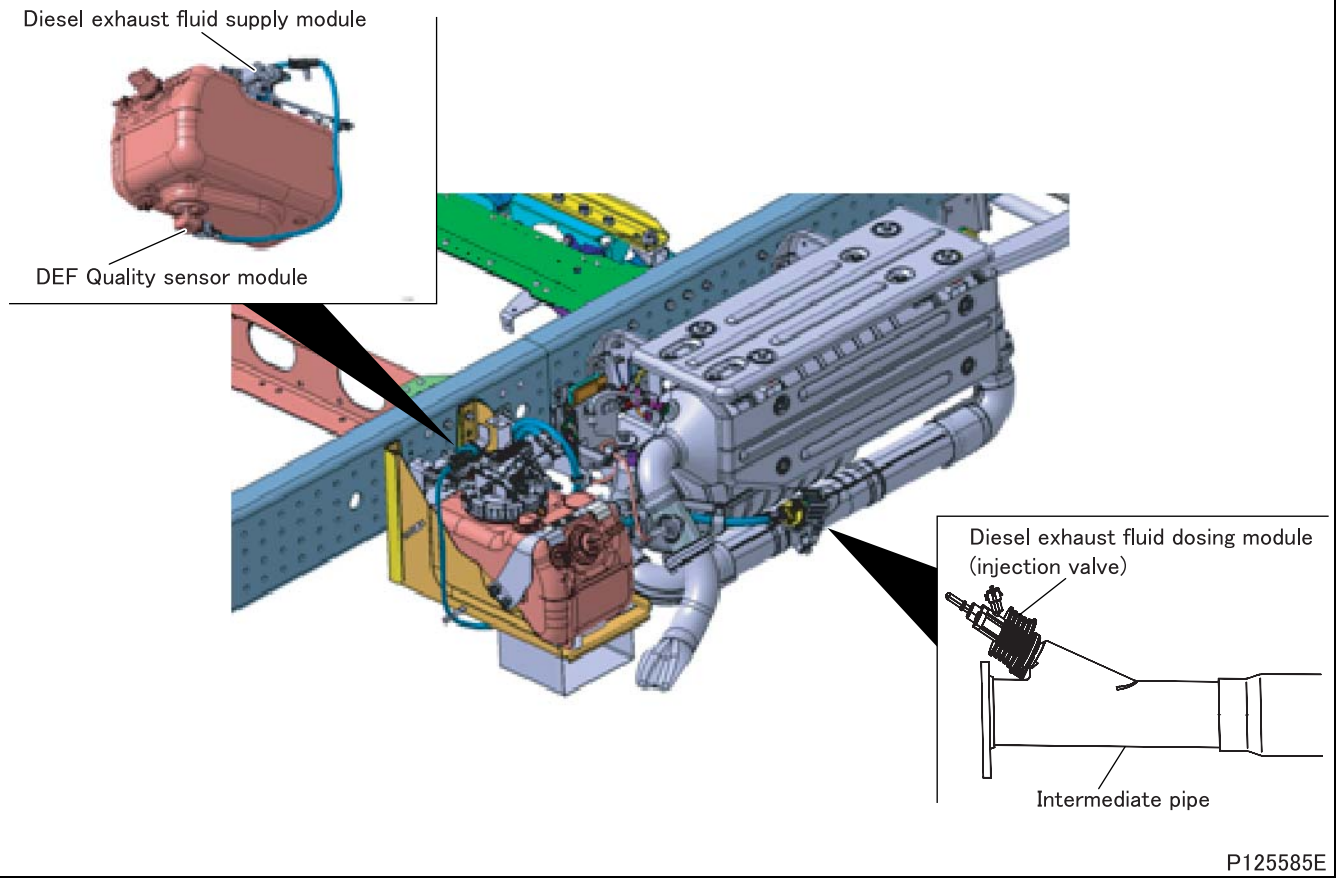


- Check to confirm that there are not found any white crystals or traces of diesel exhaust fluid leakage at the connections of the diesel exhaust fluid lines to the diesel exhaust fluid tank, diesel exhaust fluid dosing module, diesel exhaust fluid pump unit and diesel exhaust fluid dosing nozzle.
- If any trace of diesel exhaust fluid leakage is found, wipe the white crystals off with a cloth moistened with diesel exhaust fluid and then check each connection for tightening condition. Retighten any loose connections.

WARNING ⚠

- **If diesel exhaust fluid splashes into your eyes, wash it away immediately with plenty of water and seek medical attention as soon as possible.**
- **The diesel exhaust fluid is not harmful to the skin. However, if it makes contact with your skin, wash it off with water immediately. If the skin swells or irritates, seek medical attention.**
- **Direct contact with white crystals can cause the skin to inflame. In such a case, wash the affected part thoroughly with plenty of water without delay.**

2. Damage and Improper Installation of Diesel Exhaust Fluid Lines



- Check the diesel exhaust fluid line connections at the diesel exhaust fluid tank (diesel exhaust fluid pump unit) and diesel exhaust fluid dosing nozzle for installation condition.
- If any trace of diesel exhaust fluid leakage is found, wipe the white crystals off with a cloth moistened with diesel exhaust fluid and then check each connection for tightening condition. Retighten any loose connections.

WARNING ⚠

- **If diesel exhaust fluid splashes into your eyes, wash it away immediately with plenty of water and seek medical attention as soon as possible.**
- **The diesel exhaust fluid is not harmful to the skin. However, if it makes contact with your skin, wash it off with water immediately. If the skin swells or irritates, seek medical attention.**
- **Direct contact with white crystals can cause the skin to inflame. In such a case, wash the affected part thoroughly with plenty of water without delay.**

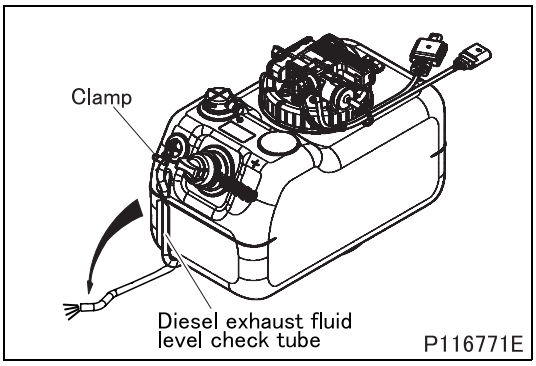
3. Replacement of Diesel Exhaust Fluid

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Diesel exhaust fluid level check tube	2 {1.5, 0.2}	–

WARNING ⚠

- **If diesel exhaust fluid splashes into your eyes, wash it away immediately with plenty of water and seek medical attention as soon as possible.**
- **The diesel exhaust fluid is not harmful to the skin. However, if it makes contact with your skin, wash it off with water immediately. If the skin swells or irritates, seek medical attention.**

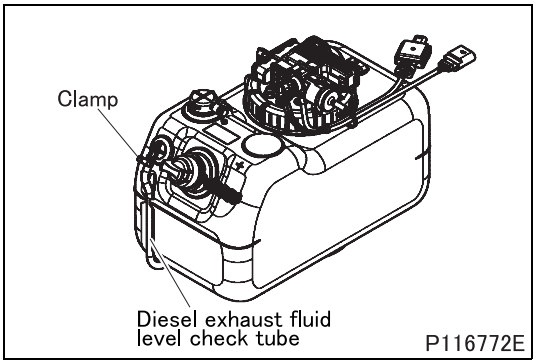


[Removal]

- Remove the diesel exhaust fluid tank cap.
- Undo the clamp of the diesel exhaust fluid level check tube.
- Disconnect the diesel exhaust fluid level check tube to drain the diesel exhaust fluid.

CAUTION ⚠

- **The drained diesel exhaust fluid (AdBlue®) must be disposed of as an industrial waste.**



[Installation]

- Clamp the diesel exhaust fluid level check tube.
- Tighten the diesel exhaust fluid level check tube to the specified torque. Fill the tank with the specified amount of diesel exhaust fluid.

CAUTION ⚠

- **Always use the diesel exhaust fluid conforming to the automotive standards (ISO22241).**

- Check to see that two or more segments of diesel exhaust fluid level monitor lamp are illuminated, the warning message disappears and the buzzer stops sounding when the starter switch is turned from the LOCK into ON position.

CAUTION ⚠

- **Neglecting to perform the above procedures in a cold district can cause the diesel exhaust fluid to freeze, making it impossible to start the engine.**
  Also note that thawing the diesel exhaust fluid tank with hot water is not allowed.

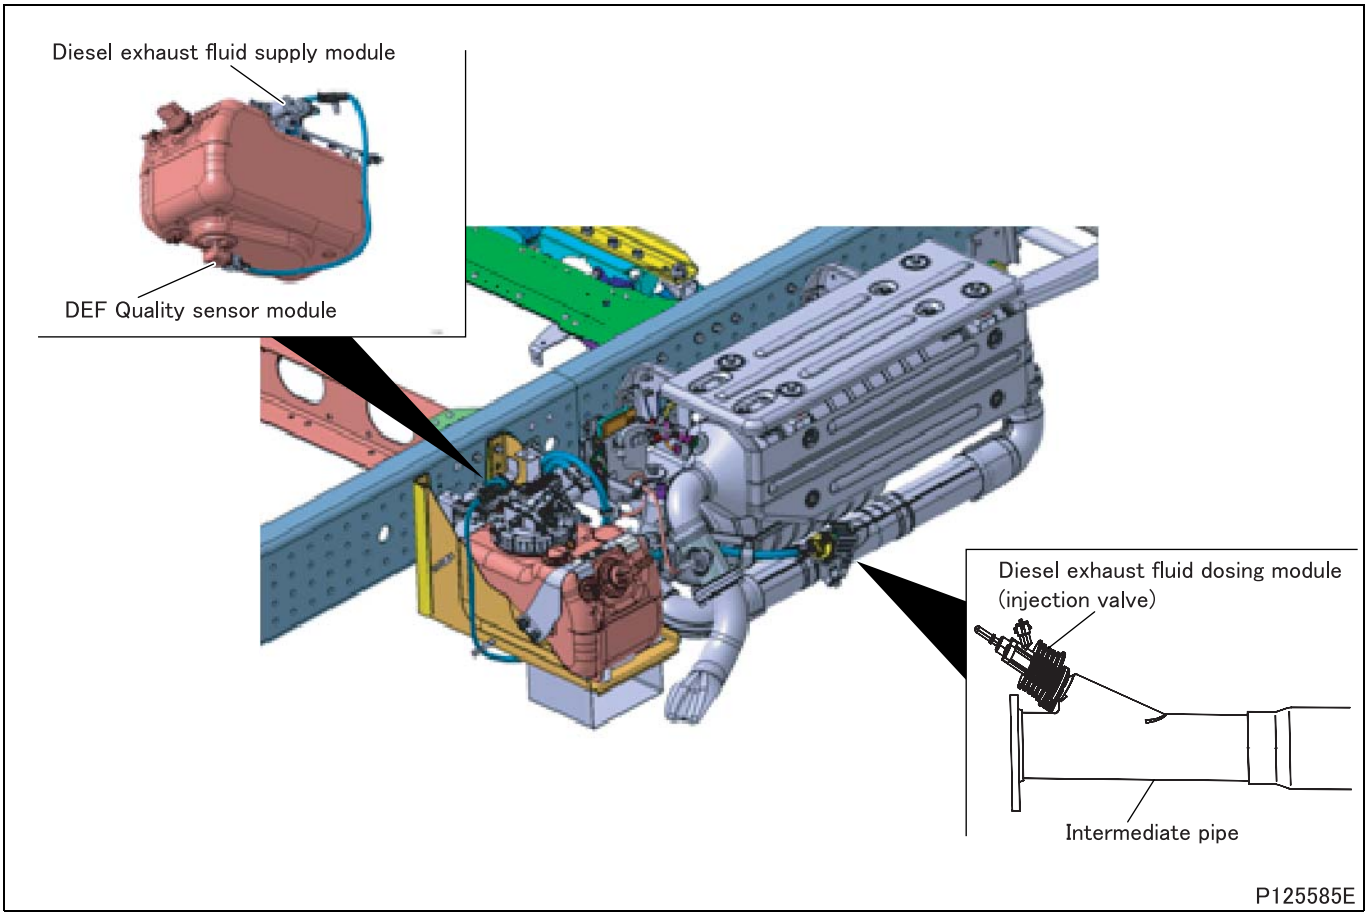
SCR: Selective catalytic reduction

4. Measures to be Taken if Diesel Exhaust Fluid Tank is Filled with Incorrect Diesel Exhaust Fluid Solution

- The remedy when incorrect fluid has been filled to the diesel exhaust fluid tank by mistake differs whether the starter switch has been turned to the ON position or not after filling the incorrect fluid. This is because the devices through which the incorrect fluid has flown are different depending on the starter switch position.

CAUTION ⚠

- **Incorrect diesel exhaust fluid solution penetrating into harness can cause the harness to corrode, resulting in open or short-circuit.**



1. In the case that the starter switch has not been turned to ON position (stayed in LOCK, OFF or ACC position):
   - Drain the incorrect solution from the diesel exhaust fluid tank through the drain hose. (See 3. Replacement of Diesel Exhaust Fluid.)
   - Replace the diesel exhaust fluid tank with a new one. (See DEF (Diesel Exhaust Fluid) TANK.)

2. When the starter switch has been placed in ON position (turned to the ON and START):
   - Drain the solution from the diesel exhaust fluid tank through the drain hose. (See 3. Replacement of Diesel Exhaust Fluid.)
   - Replace the diesel exhaust fluid tank, diesel exhaust fluid line (tube), dosing module, intermediate pipe and SCR (selective catalytic reduction) muffler with new ones. (See DEF (Diesel Exhaust Fluid) TANK, DPF (Diesel Particulate Filter), SCR (Selective Catalytic Reduction).)

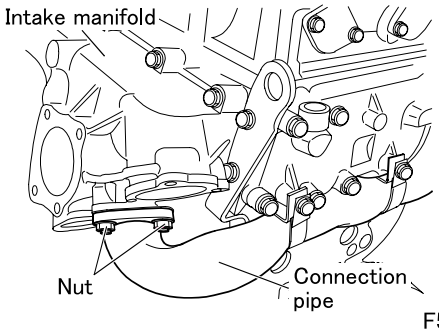
	Bolt (bracket mounting)		
	Bolt (connection pipe mounting)		
	Nut (connection pipe mounting)		
	Nut (cover mounting)		
Tb	Nut (pipe mounting)	30 {22, 3.0}	–

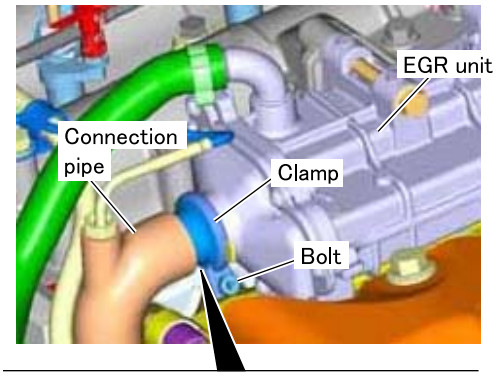
◆Removal procedure◆

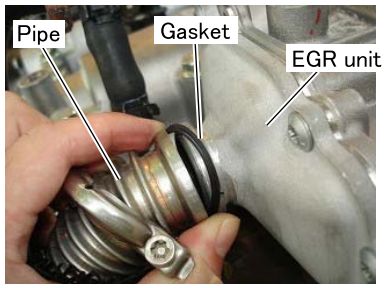


F5015

■ **Removal: Connection pipe**

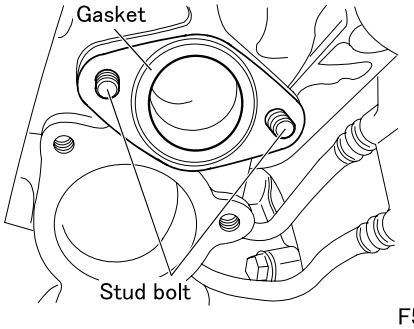
- Unscrew and remove the two nuts; disconnect the connection pipe from the intake manifold.





P117815E

- Unscrew the bolt and remove the clamp.
- Remove the connection pipe and gasket from the exhaust gas recirculation unit.

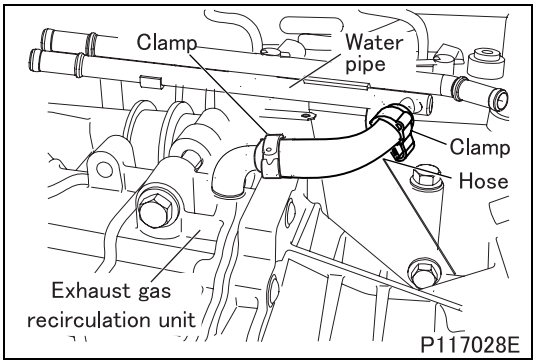


F5016

■ **Removal: Gasket, stud bolt**

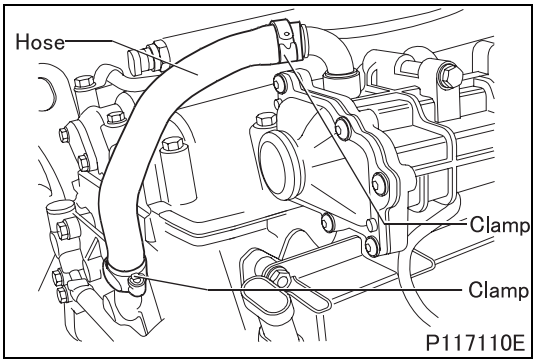
- Remove the gasket.
- Unscrew and remove the stud bolts.

EGR (Exhaust Gas Recirculation) UNIT



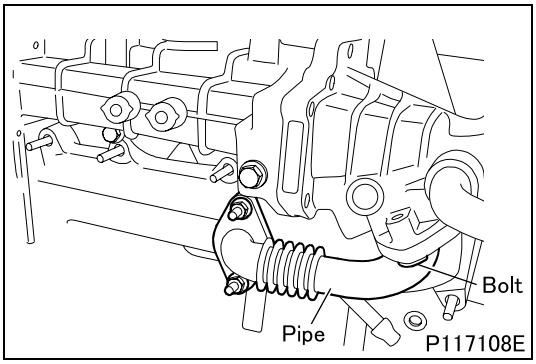
■ **Removal: Hose**

- Open the clamps and move them away from the position locking the pipe to the water pipe and EGR (Exhaust Gas Recirculation) unit.
- Remove the hose.



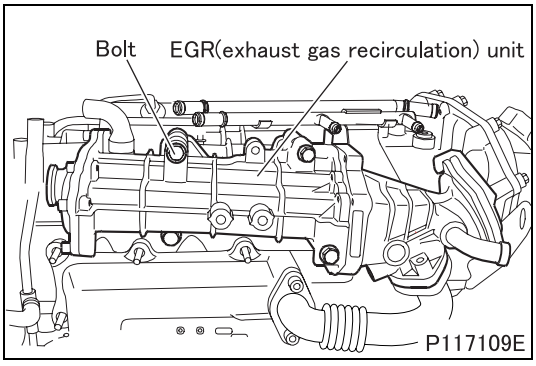
■ **Removal: Hose**

- Remove the retaining clamps.
- Remove the hose from the cooler and from the cover.



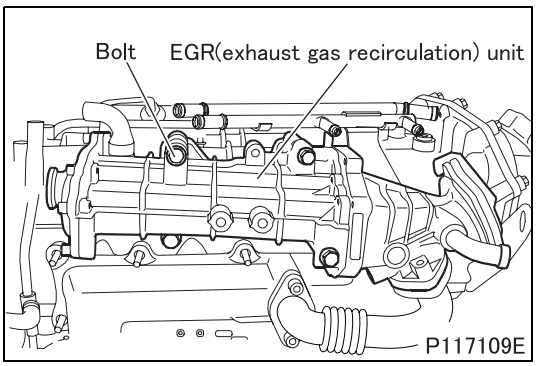
■ **Removal: Protector, EGR unit**

- Remove the protector.
- Remove the bolt that attaches the exhaust gas recirculation unit and EGR valve pipe.



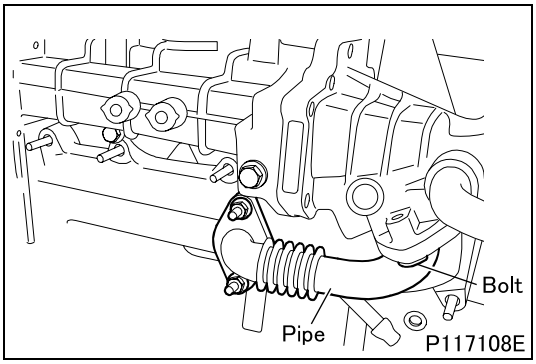
- Unscrew and remove the fixing bolts.
- Remove the EGR unit.

◆Installation procedure◆

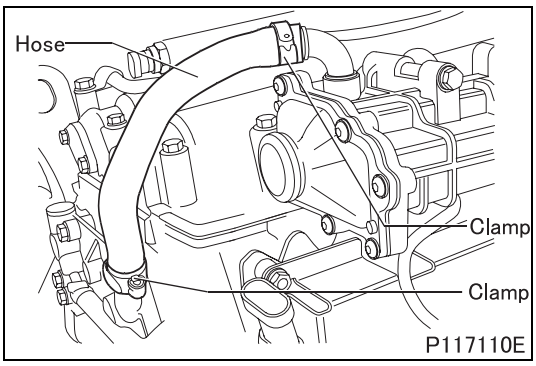


■ Installation: EGR unit, protector

- Fit the EGR unit on the overhead and tighten the fixing bolts to a tightening torque of 25 N·m {18.0 ft.lbs, 2.5 kgf·m}.

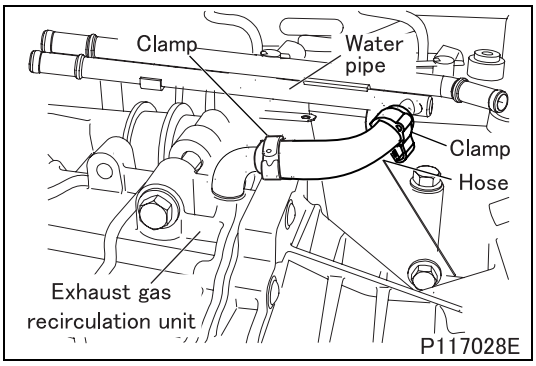


- Install the pipe with a new gasket to the EGR unit.
- Tighten the two bolts.
- Install the protector.



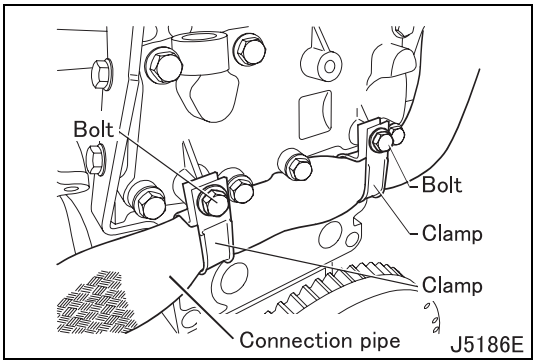
■ Installation: Cross adapter, hose

- Connect the hose with the heat exchanger and the cover.
- Retain it by means of the new clamps.



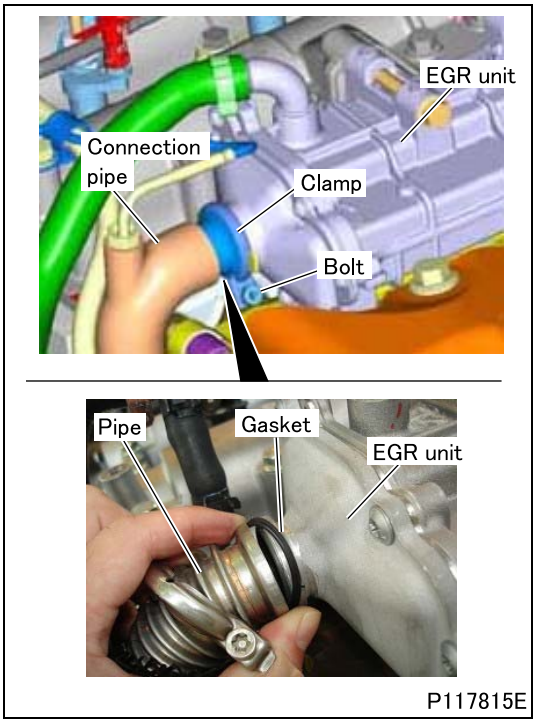
■ Installation: Hose

- Connect the hose between the water pipe and the EGR (Exhaust Gas Recirculation) unit.
- Fasten the hose to the adapters by means of the clamps.

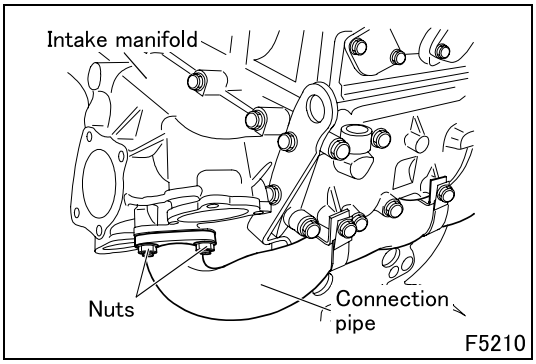


■ **Installation: Connection pipe**

- Assemble the connection pipe on the cylinder head retaining it by means of the clamps.
- Put the bolts and tighten it to a torque of 25 N·m {18.0 ft.lbs, 2.5 kgf·m}.

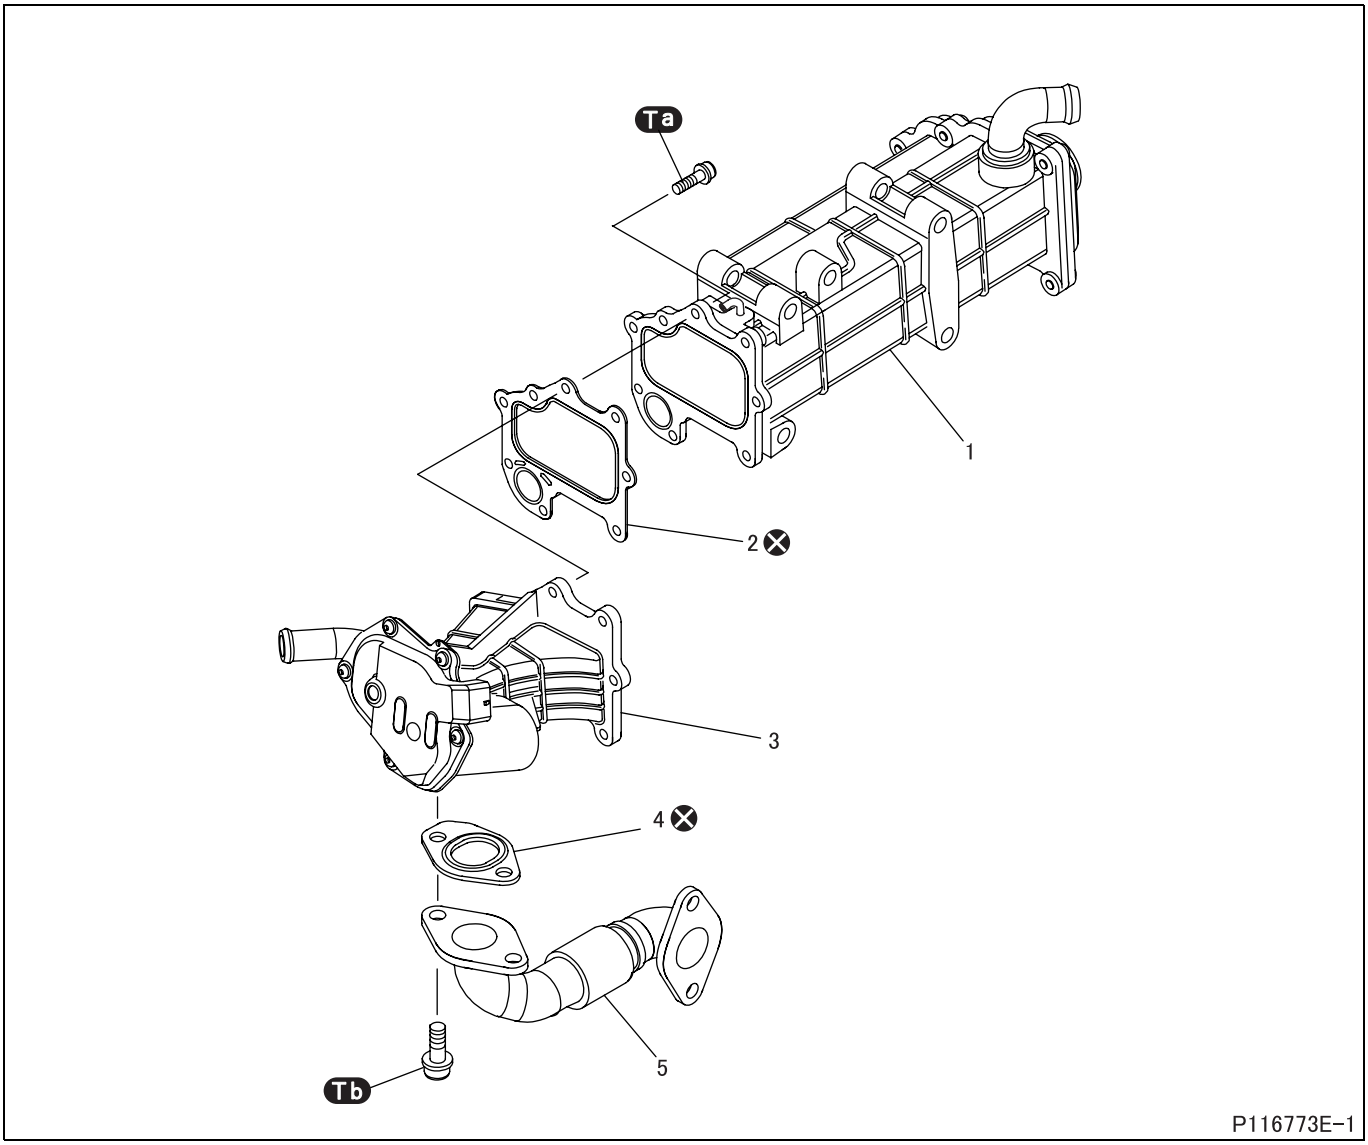


- Install the exhaust gas recirculation connection pipe and gasket on the exhaust gas recirculation unit.
- Install the clamp as shown.
- Tighten the clamp bolt.



- Install the connection pipe with a new gasket on the intake manifold.
- Tighten the nuts to a torque of 25 N·m {18.0 ft.lbs, 2.5 kgf·m}.

EGR Unit



● **Removal sequence**

1 EGR cooler
2 Gasket
3 EGR actuator
4 Gasket
5 EGR valve pipe

EGR: Exhaust gas recirculation
⊗: Non-reusable parts

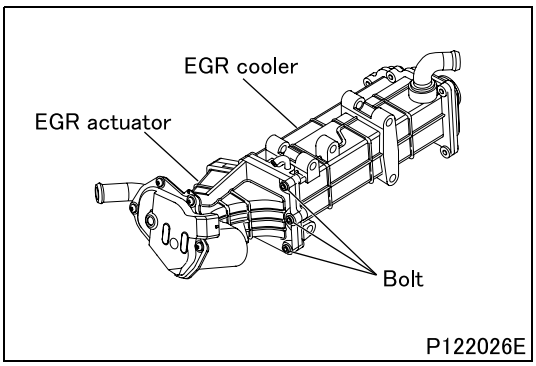
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {kgf·m})

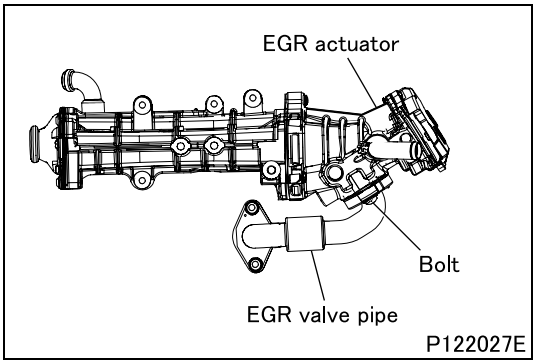
Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Bolt (EGR actuator)	The first	6 ± 1 {0.6 ± 0.1}	–
		The second	8 ± 1 {0.8 ± 0.1}	
		The third	10 ± 1 {1.0 ± 0.1}	
Tb	Bolt (EGR valve pipe)		25 {2.5}	–

◆Installation procedure◆



■ **Installation: EGR actuator, EGR valve pipe**

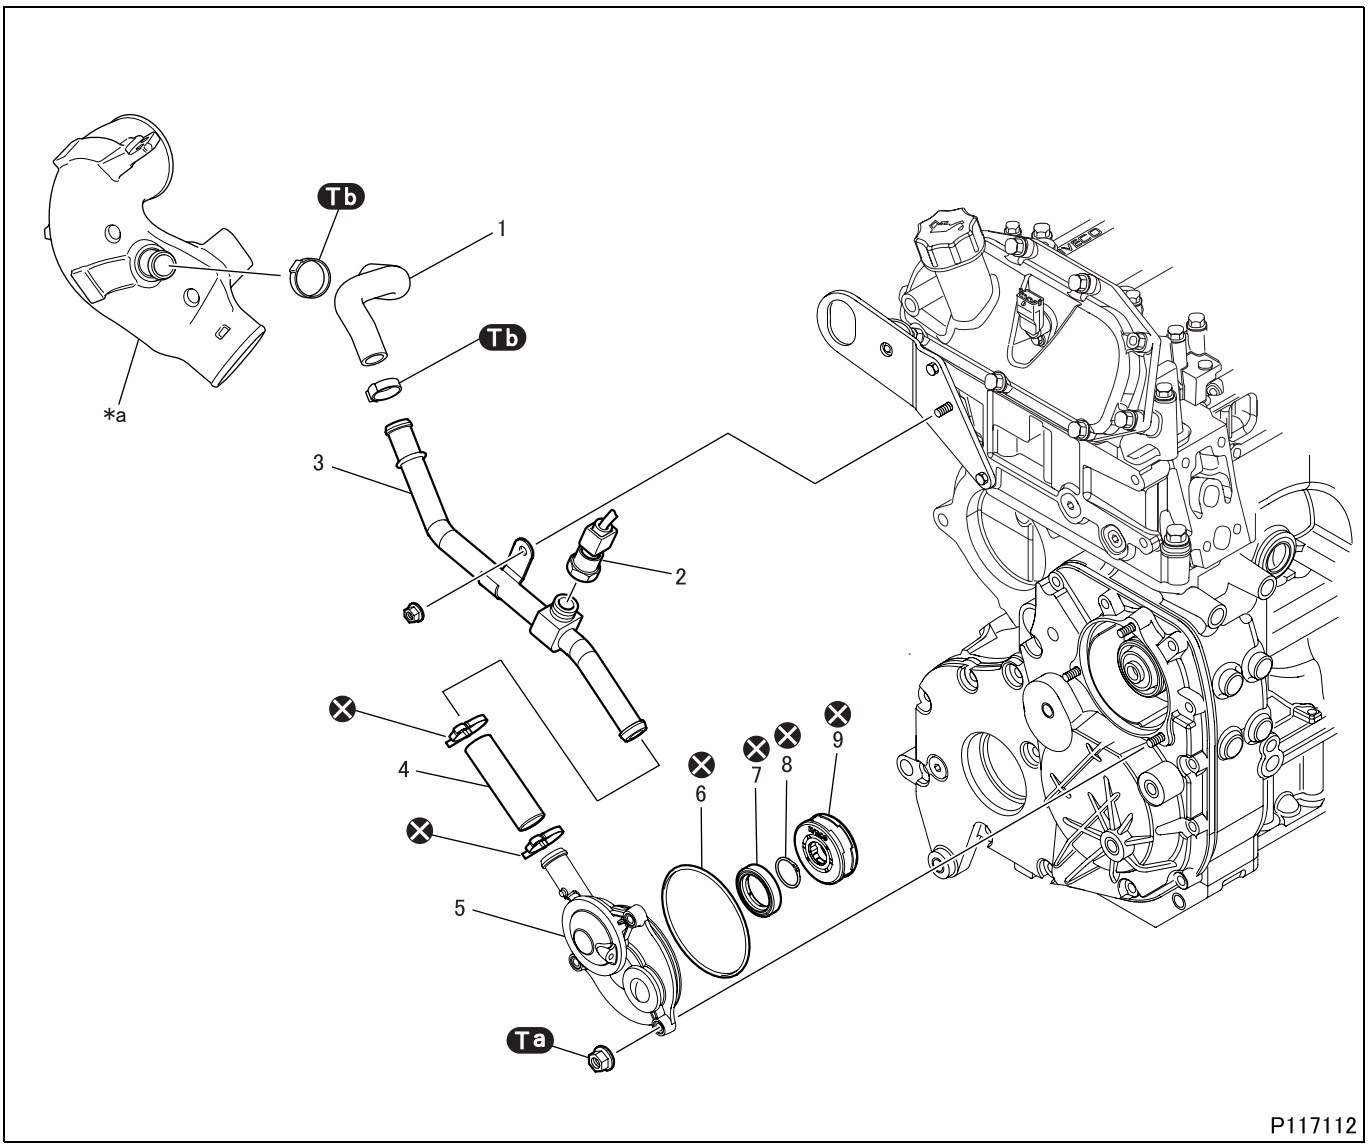
- Install the EGR actuator to the EGR cooler with a new gasket attached.



- Install the EGR valve pipe to the EGR actuator with a new gasket attached.

M E M O

BLOWBY GAS RETURN SYSTEM



● **Removal sequence**

1 Breather hose
2 Blow-by pressure sensor 1
3 Breather pipe
4 Breather hose
5 Cover
6 O-ring
7 Seal ring
8 Snap ring
9 Air filter

***a**: Air duct
⊗: Non-reusable parts

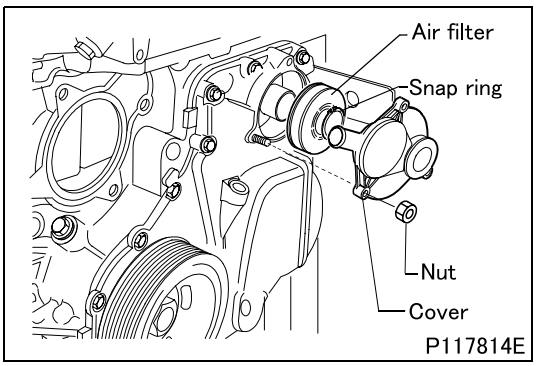
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (cover mounting)	10 {7.4, 1.0}	–
Tb	Clamp	9 to 11 {6.6 to 8.1, 0.9 to 1.1}	–

◆Removal procedure◆



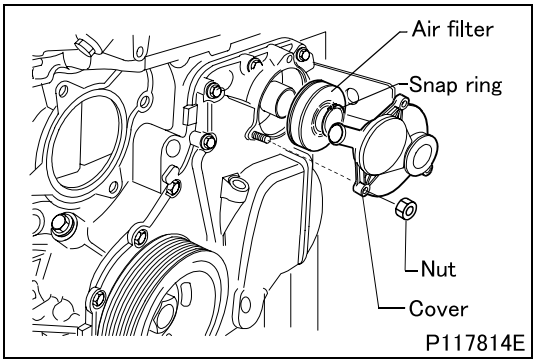
■ Removal: Air filter

- Remove the screws and the cover. Take off the snap ring. Pull out the air filter.

NOTE

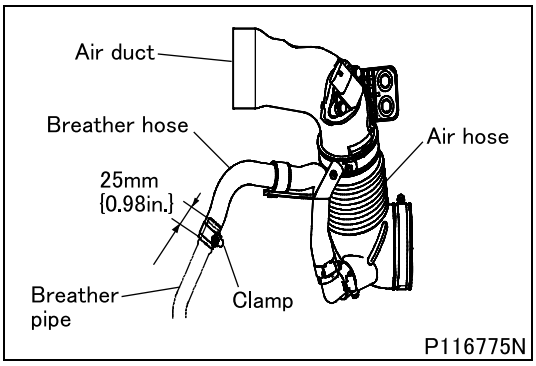
- **The air filter and the seal ring of the cover must be changed at every removal.**

◆Installation procedure◆



■Installation: Air filter

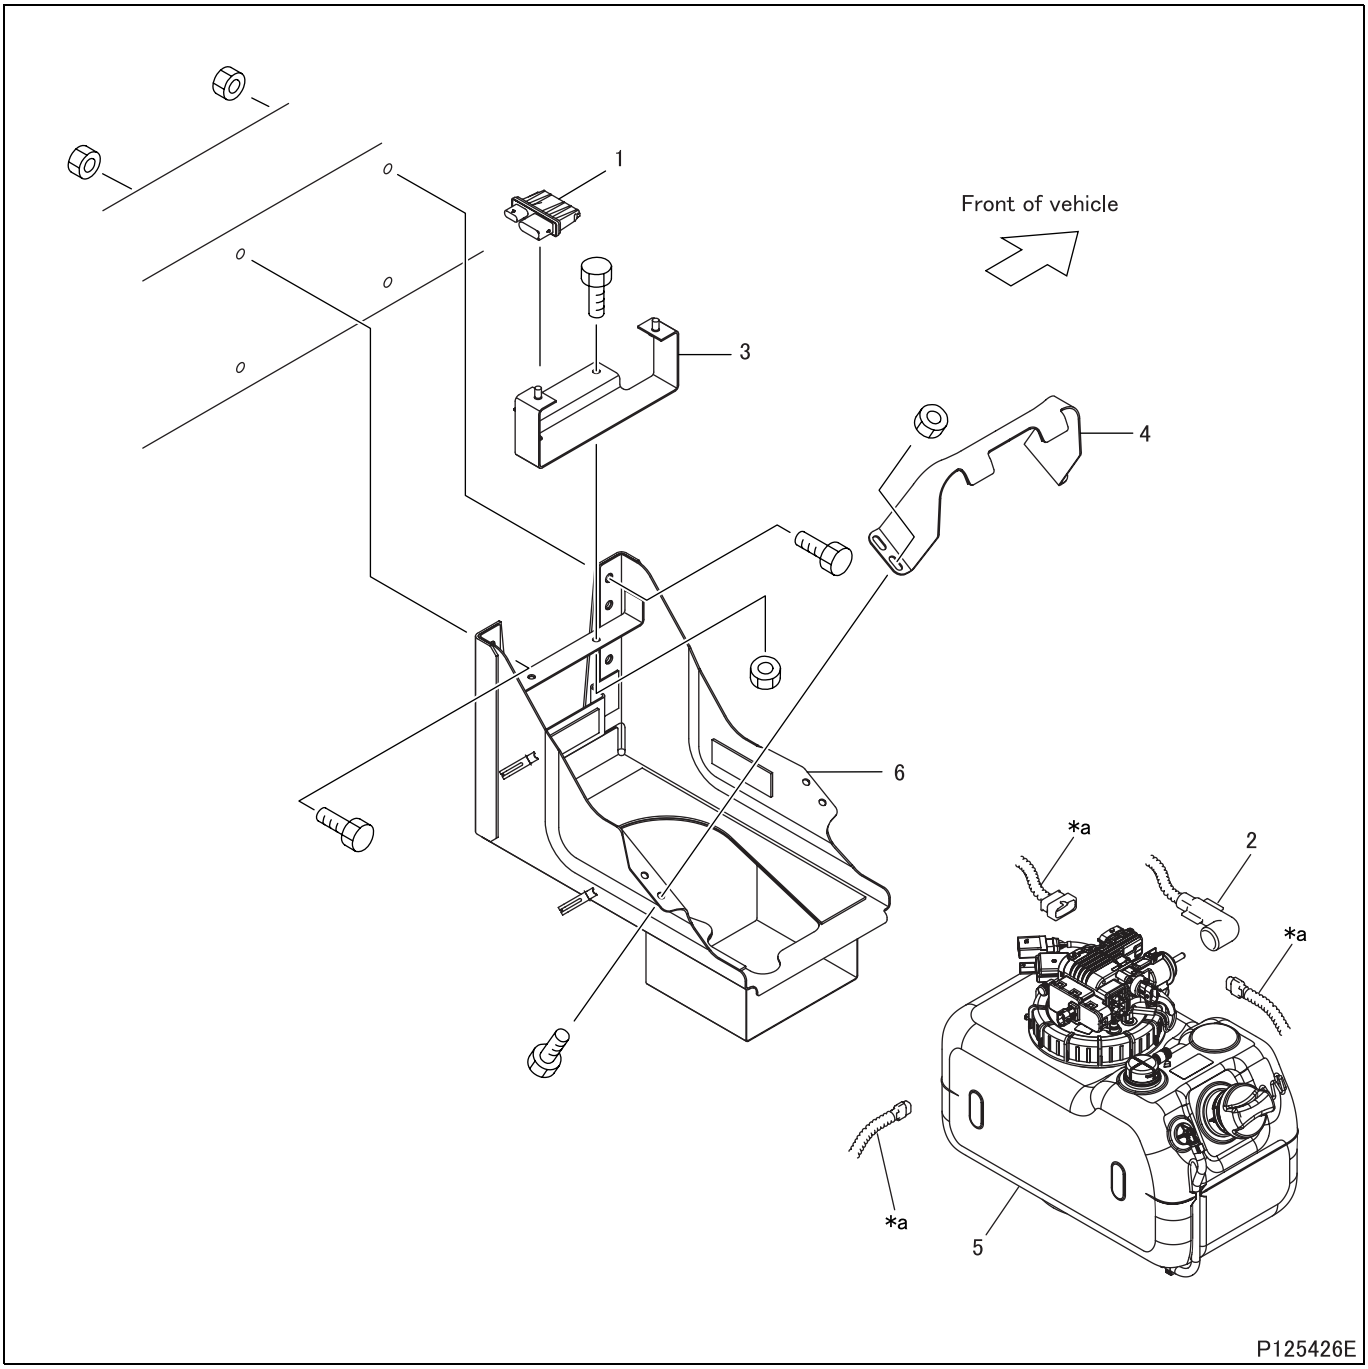
- Fit a new air filter.
- Fit a new snap ring.
- Fit the cover, drive in the screws and tighten them to the prescribed torque (10 N·m {7.4 ft.lbs, 1.0 kgf·m}).



■Installation: Breather hose

- Install the hose as shown and tighten the clamp.

DEF (Diesel Exhaust Fluid) TANK



● **Removal sequence**

1 DEF heater power unit
2 DEF tube
3 Bracket
4 Band
5 DEF tank (See later section.)
6 DEF tank bracket

***a**: DEF tank harness

CAUTION ⚠

- **Be careful not to damage the end of the connector on the DEF tank when removing the DEF tube.**

- Plug the removed DEF tube and connector to prevent dust from entering them.

- Turn the starter switch to OFF, then wait at least 2 minutes to allow time for the BlueTec® system to stop its internal operation completely before starting the removal procedure.

WARNING ⚠

- **If DEF gets in your eye, wash it with plenty of running water immediately and seek medical attention without delay.**
- **DEF is usually harmless to your skin, but in the case of its contact with the skin, it should be removed with running water immediately. Should any change in skin condition or irritation occurs as a result, ask medical attention.**

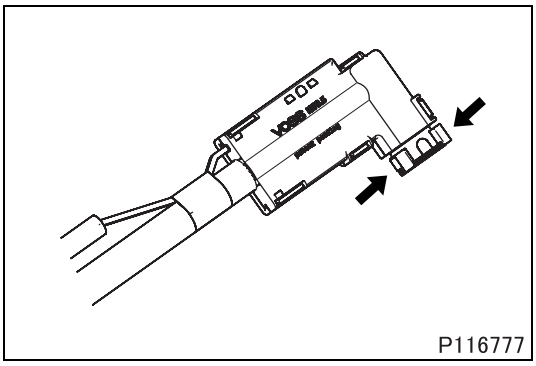
CAUTION ⚠

- **If DEF is splashed over brackets, bolts, nuts, or other similar parts, wash it from them with water. DEF may cause corrosion to these parts.**
- **To prevent corrosion of the harness and eventual open circuit due to DEF that can enter the harness connectors during the work, remove the harness in the last stage of the procedure.**

● Installation sequence

Follow the removal sequence in reverse.

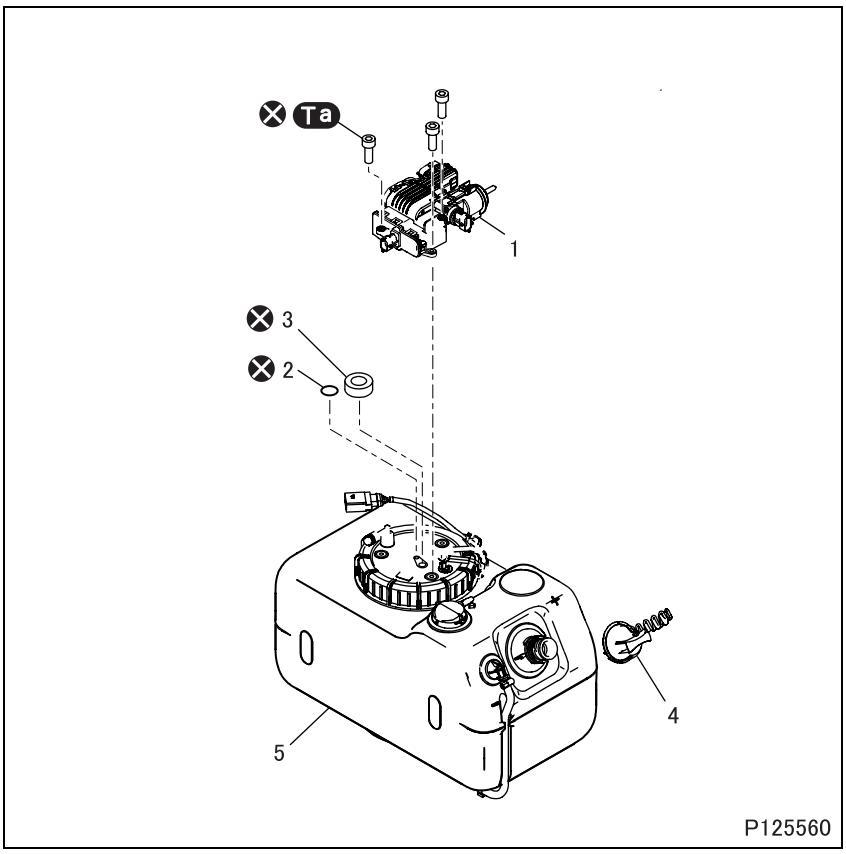
◆Removal procedure◆



■Removal: DEF tube

- Hold the clip to release the stopper and disconnect the tube.

DEF (Diesel Exhaust Fluid) TANK



●Disassembly sequence

1 DEF supply module
2 O-ring
3 Seal
4 DEF tank cap
5 DEF tank

⊗:Non-reusable parts

12 Cushion rubber
13 Gasket
14 Gasket
15 DPF muffler

***a**: Front pipe
***b**: Intermediate pipe
⊗: Non-reusable parts
DPF: Diesel Particulate Filter

NOTE

- **The color of the DPF surface may turn brown. This discoloration is due to the inherent characteristics of stainless steel and does not indicate rusting or any other abnormality.**

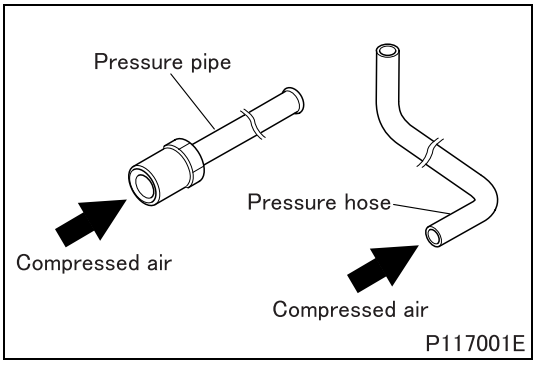
● Installation sequence

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Exhaust gas temperature sensor 1, 2	45 ± 4.5 {33 ± 3.3, 4.6 ± 0.5}	–
Tb	Nut (DPF differential pressure sensor mounting)	8 ± 0.9 {5.9 ± 0.7, 0.8 ± 0.1}	–
Tc	NOx sensor 1	50 ± 10 {37 ± 7.4, 5.1 ± 1.0}	–

◆Inspection procedure◆



■Inspection: Pressure pipe and hose

- Check the pressure pipe and hose for clogging by blowing compressed air into the pipe and hose.

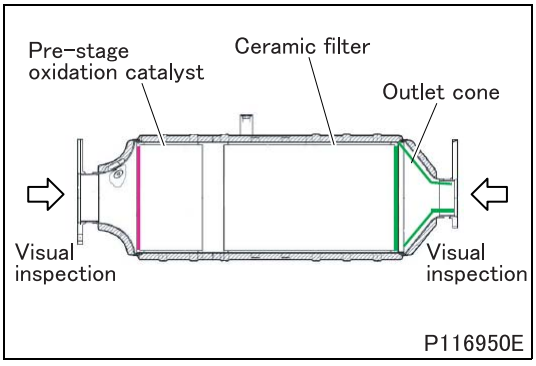
CAUTION ⚠

- **Inspection must be performed on an individual pressure pipe or hose.**
- **If compressed air is blown into the pressure pipe or hose with DPF differential pressure sensor still installed, the sensor may become damaged.**

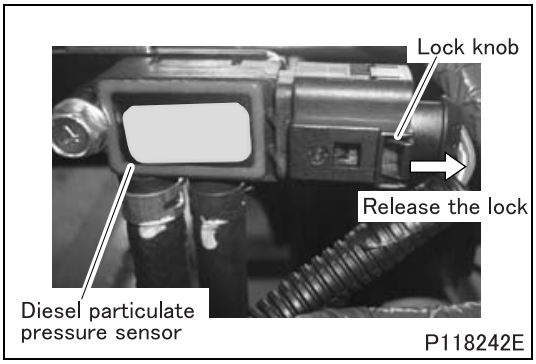
■ Inspection: DPF (Diesel particulate filter)

CAUTION ⚠

- **The DPF is very hot just after the engine is stopped. Wait proceeding to the work until the DPF is cooled down sufficiently to prevent getting burned.**

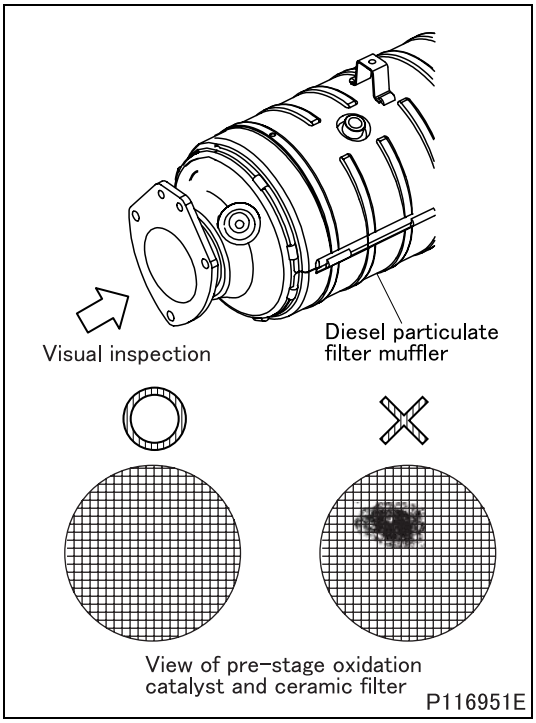


- Inspection of pre-stage oxidation catalyst
  - Check for clogging with foreign matters and damage.
  - If the filter is clogged with foreign matters, replace the DPF muffler with a new one.
  - If any damaged or broken parts are found, replace the DPF muffler with a new one.

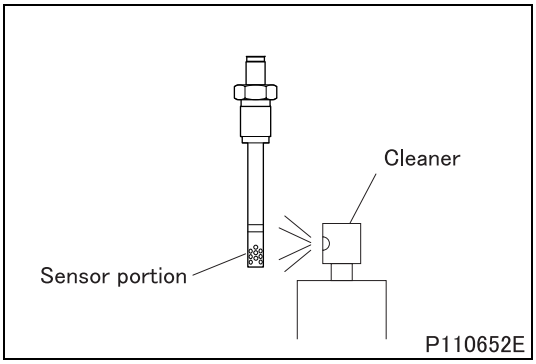


■ **Removal: Diesel particulate pressure sensor**

- Move the connector lock knob in the direction shown in figure to release the lock and disconnect the connector.



- Inspection of ceramic filter and outlet cone
  - Check for accumulation of soot and damage.
  - If any damaged or broken parts are found, replace the DPF muffler with a new one.



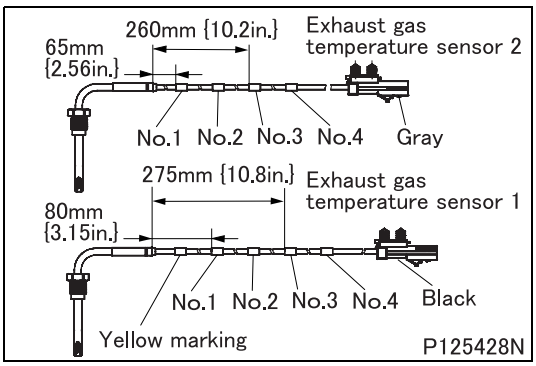
■ **Inspection: Exhaust gas temperature sensor**

- Check that the sensor portion is free of soot, oily substance, etc.
- If not, clean the sensor portion as follows.
- Spray a cleaner on the sensor portion from 2 or 3 cm {0.79 or 1.18 in.} away.
  Recommended cleaners:
  Nonchlorinated solvent
- In 20 to 30 seconds after spraying, wipe the sensor portion clear of the sprayed cleaner using a soft waste cloth the like.

CAUTION ⚠

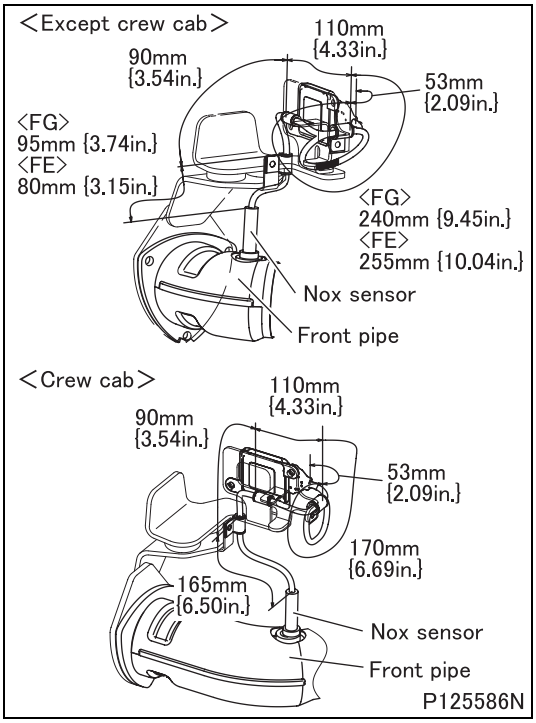
- **Be sure to wait for 20 to 30 seconds before wiping. It takes the cleaner that long to dissolve foreign matter.**

◆Installation procedure◆



■Installation: Exhaust gas temperature sensor

- Move the clips to the white tape portions on the exhaust gas temperature sensors and install the sensor using them.



■Installation: NOx sensor 1

- Install the NOx sensor with its harness toward the front pipe.
- Locate and fasten the clip on the NOx sensor harness as shown in the illustration.

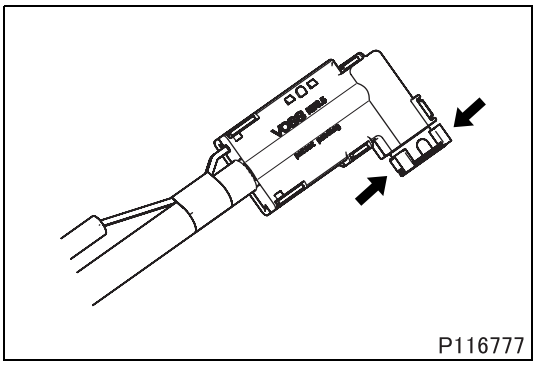
Te	NH_3 sensor	50 ± 10 {37 ± 7.4, 5.1 ± 1.0}	–

◆Removal procedure◆

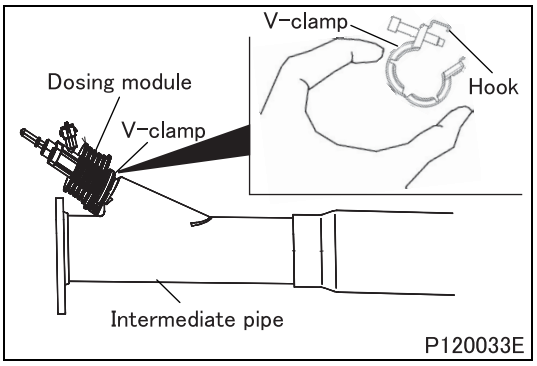


P116777

■Removal: DEF (Diesel Exhaust Fluid) tube

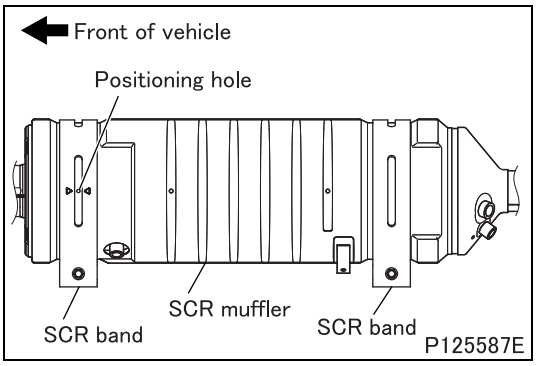
- Hold the clip to release the stopper and disconnect the tube.

◆Installation procedure◆



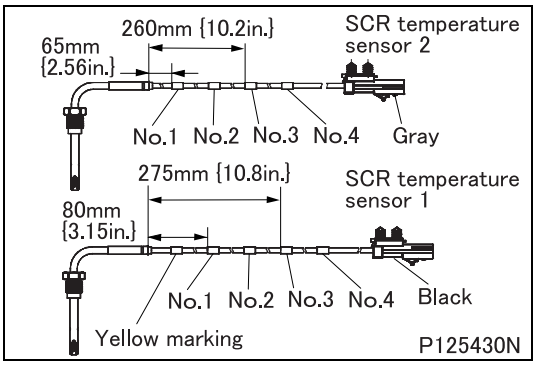
■Installation: Dosing module

- Install the dosing module to intermediate pipe.
- Always press in the middle and if required, against the dosing module until the clamp hook locks. Install the clamp closely to the dosing module.



■Installation: SCR band

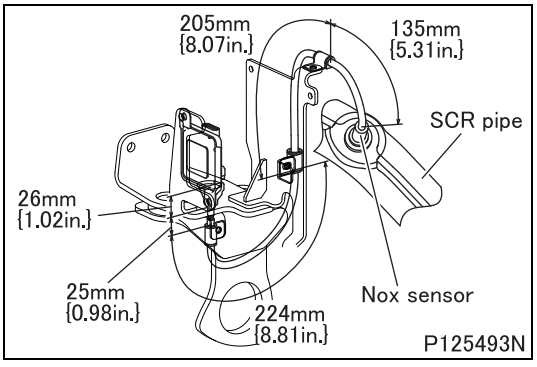
- Align the marks on the SCR band with the positioning hole at the bottom of the SCR.



■Installation: SCR temperature sensor

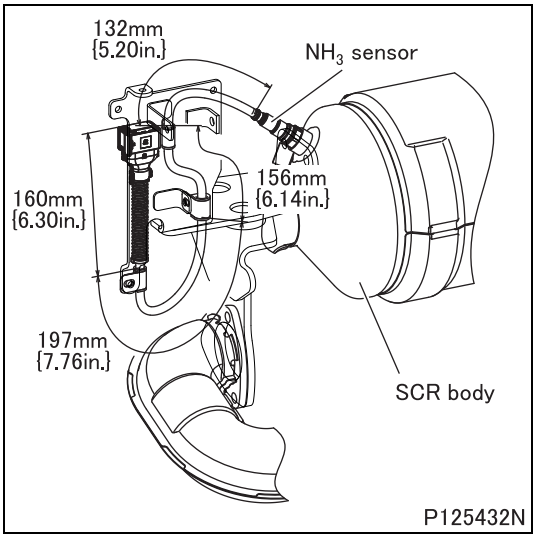
CAUTION ⚠

- **The Selective Catalytic Reduction temperature sensor can be damaged if impacted.**
- **Do not give impact to the sensor (removal/installation using an impact wrench, dropping the Selective Catalytic Reduction temperature sensor, etc.).**
- **Should the Selective Catalytic Reduction sensor be impacted, check the sensor. (See Gr54-#336.)**



■Installation: NOx sensor 2

- Install the NOx sensor with its harness toward the SCR pipe.
- Locate and fasten the clip on the NOx sensor harness as shown in the illustration.



■Installation: NH_3 sensor

- Install the NH_3 sensor with harness to the SCR body.
- Locate and fasten the clip on the NH_3 sensor harness as shown in the illustration.

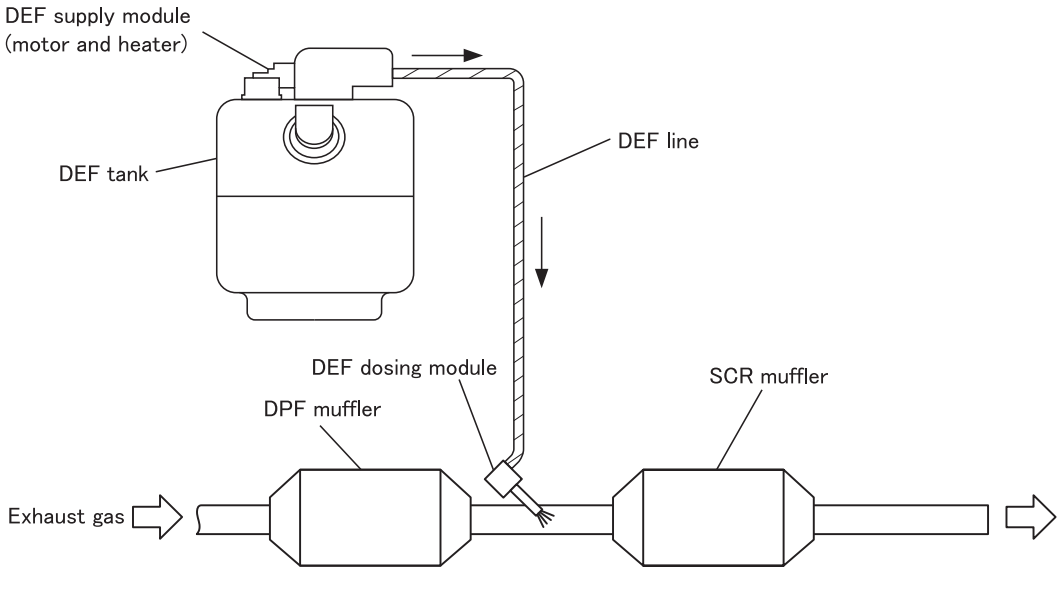
INSTALLED LOCATIONS OF PARTS .....(See Gr13E.)

ELECTRIC CIRCUIT DIAGRAM .....(See Gr13E.)

STRUCTURE AND OPERATION

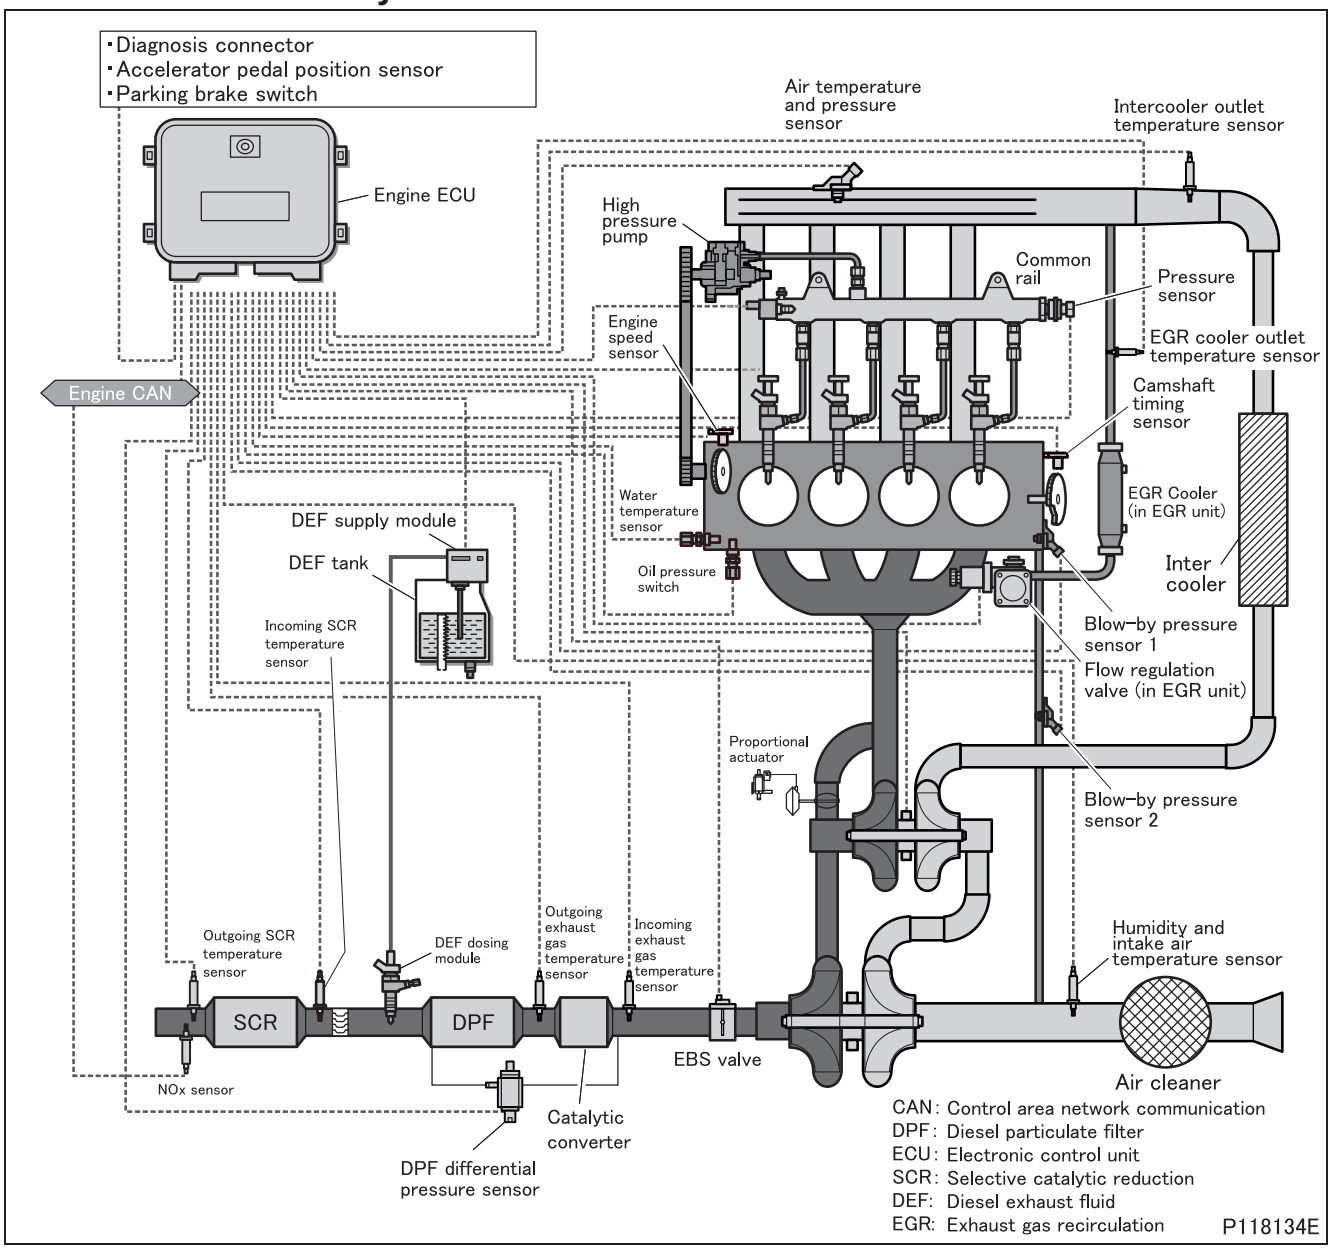
1. Overview

- The BlueTec® system consists of a regeneration-controlled DPF (diesel particulate filter) system combined with BlueTec® exhaust gas aftertreatment.



- The regeneration-controlled DPF system collects the soot (particulate matter) contained in exhaust gas with a ceramic filter incorporated in the muffler and burns soot off the filter (continuous filter regeneration) using front oxidation catalyst.
- If continuous filter regeneration is not possible in a situation such as low speed driving, the exhaust temperature is automatically raised to regenerate the filter (burn off soot) (automatic DPF regeneration). If automatic filter regeneration is not possible under certain conditions, such as when the vehicle is driven extremely slowly or during frequent engine stop-start driving, the vehicle must be parked to perform manual regeneration (burning off soot) (parked DPF regeneration).
- The BlueTec® exhaust gas aftertreatment reduces nitrogen oxides (NOx) by adding (injecting) DEF (diesel exhaust fluid) upstream of the SCR (selective catalytic ruduction) catalyst to decompose NOx into water and nitrogen.

2. Electronic Control System



- The BlueTec® system consists of the following:
  - Engine with its engine electronic control unit and sensors for normal operation.
  - DPF (diesel particulate filter) with oxidation catalyst in one housing for reduction of particulate emissions.
  - Selective catalytic reduction together with a muffler in a housing for NOx emission reduction.
  - Dosing system with a separate tank for DEF.
  - Control area network communication between engine electronic control unit and NOx sensor.

2.1 System for NOx emission control

- The dosing system injects a quantity of DEF (diesel exhaust fluid) in the exhaust stream before the selective catalytic reduction, depending on the temperature of the catalyst and the NOx emissions of the engine.

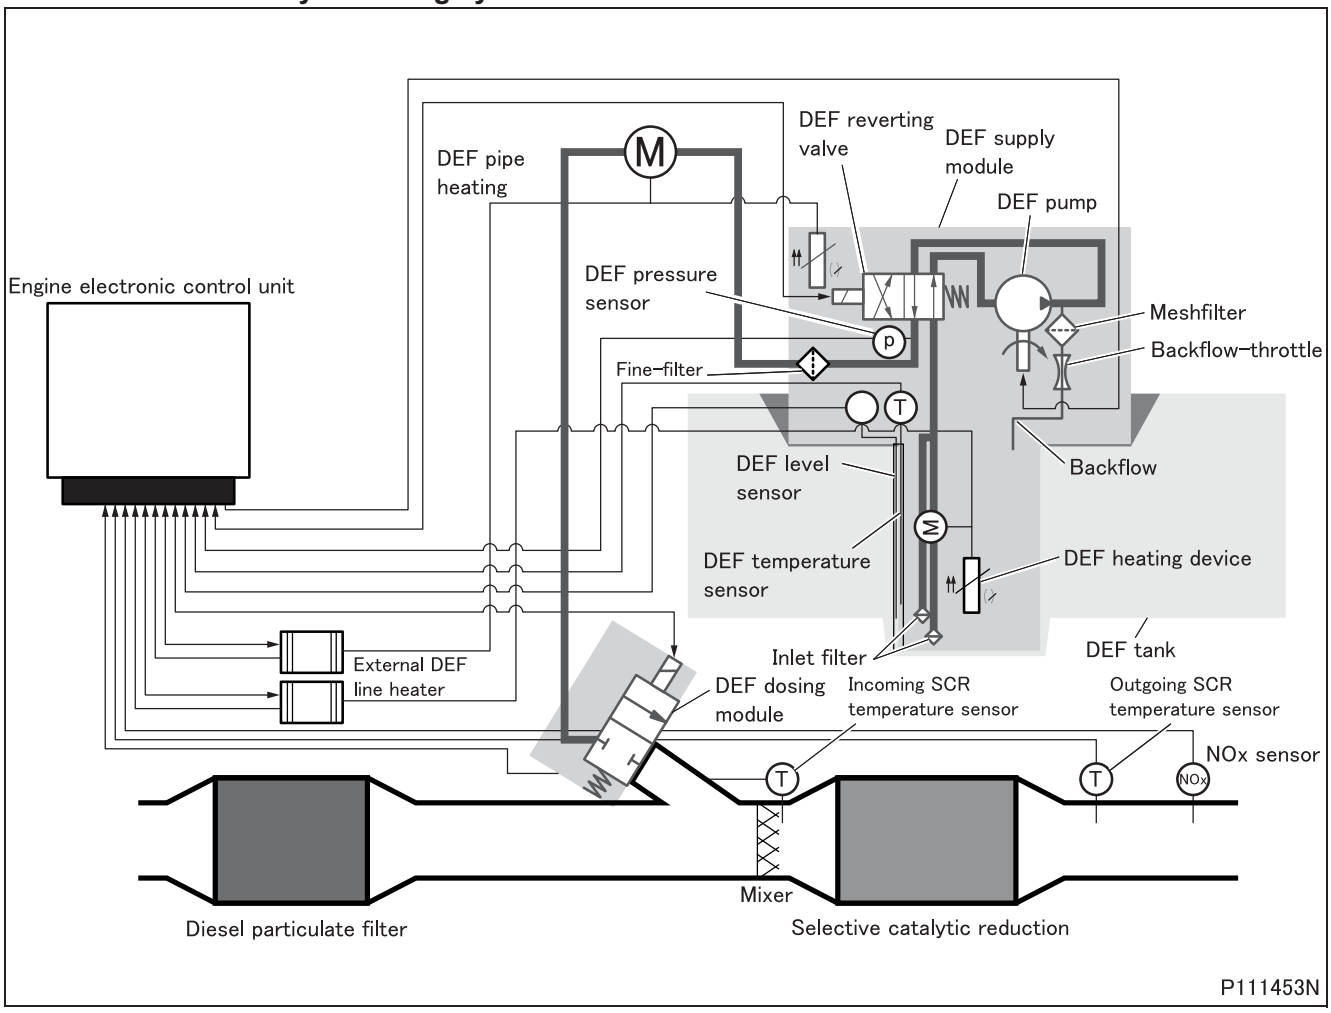
2.2 Calculation of desired DEF quantity

- The NOx emissions of the engine are calculated depending on the actual engine speed and engine load for standard conditions.
- The basic NOx emissions are then corrected depending on the deviation of the standard conditions, which are determined by following sensors:
  - Engine water temperature.
  - Absolute pressure and temperature in intake manifold.
  - Fuel pressure of engine with high pressure electronic injection system.
  - Start of fuel injection.
  - Exhaust gas recirculation humidity (depended on the air humidity sensor).
- In case of a defect of any of the above sensors the NOx calculation takes the nominal values.
- The calculated DEF quantity is then transmitted from the engine electronic control unit to the pump module, which realizes the DEF injection.

(1) Closed loop control:

- The expected NOx concentration after selective catalytic reduction is calculated by the estimated NOx emission of the engine, the actual exhaust flow (by engine speed, boost pressure, air temperature and actual fuel quantity) and the expected catalyst efficiency (calculated by DEF filling state, exhaust flow and actual catalyst temperature).

2.3 Basic functionality of dosing system: PC/LD schema



- The system incorporates heaters. If DEF (diesel exhaust fluid) is frozen, a thawing process is performed and, immediately after that, the dosing system starts operating.
- The system starts the DEF pump and check if the needed DEF pressure is reached.
- The dosing system controls the DEF pressure in a closed loop control with the DEF pressure sensor.
- The dosing system sends to the engine electronic control unit a “ready state signal”. Then the engine electronic control unit sends the requested DEF quantity to the dosing system PC/LD. The system recognizes the requested DEF injection quantity and actuate the corresponding dosing valve.
- The dosing module of the dosing system is placed directly on the exhaust tube and the DEF is injected directly into the exhaust gas. Therefore the dosing module has to be passively cooled with air.

(1) DPF (diesel particulate filter) for particulate control

- The DPF is placed upstream of the SCR (selective catalytic reduction) and works as a passive collection filter.
- The collected soot/particulates are burned continuously by the NO_2 which are formed from the basic NO of the exhaust gas by the oxidation catalyst, which is placed upstream of the filter, but in the same housing.
- There is no active regeneration as long as the filter loading does not exceed a certain level. The loading level of the DPF is monitored by the flow resistance over the filter, i.e. the DPF pressure difference depending on exhaust flow, which is calculated by engine speed and load.
- If the flow resistance exceeds a limit – which happens only in very special cases (long driving times with very light load, e.g. only city cycle) – the active regeneration is activated:
- The injection start is retarded to increase the exhaust temperature, to bring the filter to a level higher than the specified temperature. If the temperature does not reach this limit within a time there is an additional procedure to increase the exhaust temperature again:
  - Reduction of the intake manifold pressure.
  - Reduction of the common rail pressure.
- During forced regeneration, the temperature of the exhaust gas downstream of the DPF increases. This high temperature, which is required to burn off the soot accumulated on the DPF, is achieved by optimizing the fuel injection timing. Forced regeneration is performed until the amount of soot accumulated on the filter reduces to the specified value.
- During the active regeneration the DEF injection is not switched off.

2.4 BlueTec® system warning function

(1) Regeneration-controlled DPF (diesel particulate filter) warning function

- The regeneration-controlled DPF system has a function to issue a warning when a system failure occurs and a function to monitor the amount of particulate matter accumulated on the ceramic filter incorporated in the DPF.
- The meter indication varies depending on the failure, the amount of accumulated particulate matter and whether or not DPF regeneration is active.
- Regardless of the meter reading on the multi-information display, a manual regeneration request ((amber) flashes) could be issued by the DPF function. In such a case, follow the flashing indicator and perform manual regeneration.
- Parked DPF regeneration becomes possible when the DPF cleaning switch is pressed with the engine running until the indicator lamp (amber) changes from flashing to illuminating.
- Parked DPF regeneration is impossible in the following conditions:
  - Within 30 seconds after starting the engine
  - When the coolant indicator shows the temperature by up to 5 segments (Perform parked DPF regeneration after warming up the engine.)
  - When the PTO (power take-off) switch is in the “ON” position (vehicles with a PTO)
  - While the accelerator pedal or brake pedal is being depressed
  - While the vehicle is moving
  - When the gearshift lever is in any position other than “P” or “N”

		Meter cluster display			Remarks
				Multi-information display	
System malfunction		O	–	–	Diesel particulate filter regeneration control system stop.

SW: switch

(2) BlueTec® exhaust gas aftertreatment warning function

- The abnormal conditions detected and alerted of by the BlueTec® exhaust gas aftertreatment are broadly classified into three types (BlueTec® exhaust gas aftertreatment malfunction, low DEF (diesel exhaust fluid) level, and poor DEF quality).
- The combination of warning indicators or buzzer sounding timing varies for each abnormal condition.

	Meter cluster display			Buzzer	Remarks
	DEF level indicator		ENG SYS		
Quantity of DEF in DEF tank has fallen too low.	 P117739E	–	Lights (amber)	–	Engine power is reduced in stages.
Quantity of DEF in DEF tank has fallen further.	P117740	Lights	Lights (red)	Sounds	Engine power is further reduced in stages.
DEF tank has become empty.	P117741	Flash	Lights (red)	Loudly sounds	A driving restriction automatically engages, locking the gear in 1st or reverse, so the vehicle can be driven only slowly. (creep mode)
DEF quality is degraded.	P117742	Lights *1	Lights (amber) *2	– *3	Engine power is reduced in stages. *4
BlueTec® exhaust gas aftertreatment system is faulty.	–	Lights *5	Lights (amber) *2	– *6	Engine power is reduced in stages. *7

*1: If you drive more than another 160 km {100 miles} or additional 2 hours, the warning lamp, which has illuminated, starts flashing.

*2: If you drive more than another 80 km {50 miles} or additional 1 hour, the warning lamp color changes from amber to red.

*3: If you drive more than another 80 km {50 miles} or additional 1 hour, the buzzer starts sounding. If you drive more than another 160 km {100 miles} or additional 2 hours, the buzzer sound becomes louder.

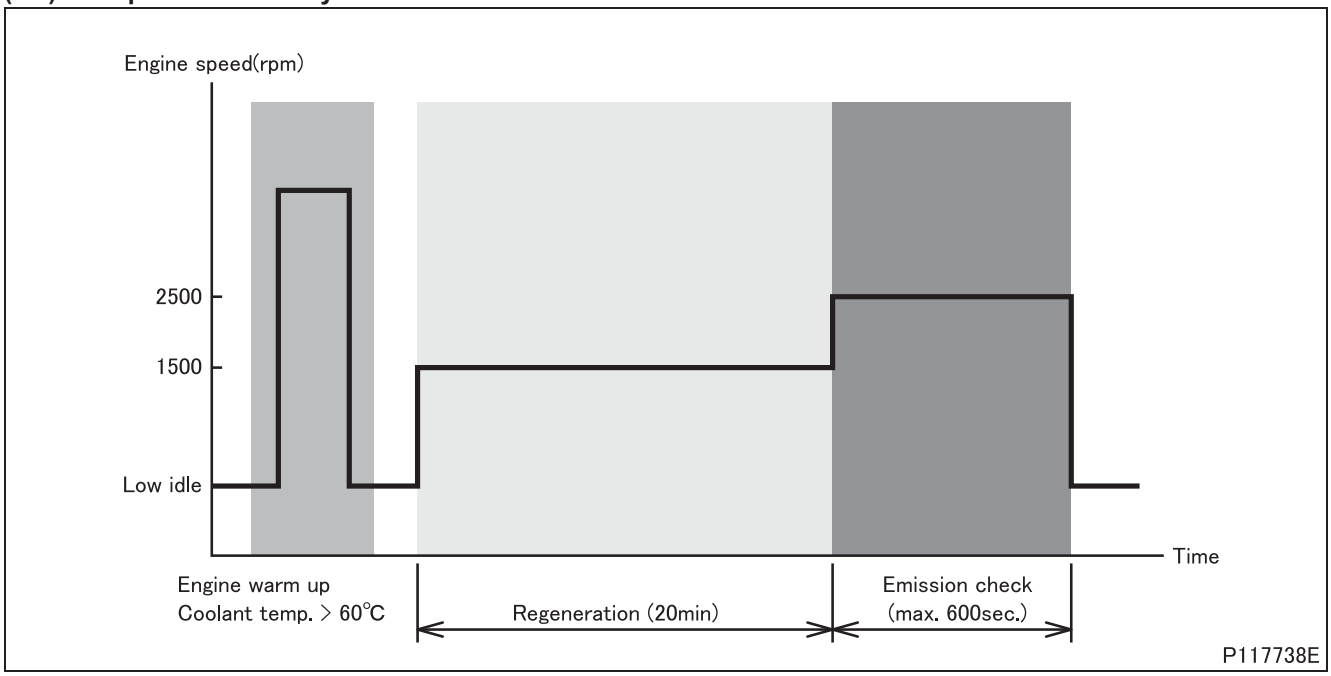
*4: If you drive more than another 80 km {50 miles} or additional 1 hour, the engine power will be further reduced. If you drive more than another 160 km {100 miles} or additional 2 hours, the transmission will be locked in 1st or reverse, limiting the vehicle operation to slow-speed driving. (creep mode)
The engine power will be further reduced in stages if you add any fluid (such as water, low-density DEF, etc.) other than the acceptable DEF within 160 hours of driving after the above condition occurs.

*5: If you drive more than another 320 km {200 miles} or additional 4 hours, the warning lamp, which has illuminated, starts flashing.

*6: If you drive more than another 80 km {50 miles} or additional 1 hour, the buzzer starts sounding. If you drive more than another 320 km {200 miles} or additional 4 hours, the buzzer sound becomes louder.

*7: If you drive more than another 80 km {50 miles} or additional 1 hour, the engine power will be further reduced. If you drive more than another 320 km {200 miles} or additional 4 hours, the transmission will be locked in 1st or reverse, limiting the vehicle operation to slow-speed driving. (creep mode)
If BlueTec® exhaust gas aftertreatment malfunctions again within 160 operation hours, the engine output limit is further lowered from the above-mentioned level gradually.

(2.1) Creep mode recovery



- In case an emission relevant error occurred and the failure was not repaired in time creep mode is activated.
- After repair the driver needs to perform a manual regeneration in order to recover from creep mode.
- Release conditions for creep mode recovery are exactly the same as for a manual regeneration.
- Abortion conditions for creep mode recovery are exactly the same as for a manual regeneration.
- Procedure is different. An additional phase for emission verification is added.
- During regeneration it is not possible to check emissions.
- Therefore the check has to be made after regeneration has finished.
- The engine needs to be run with higher exhaust flow in order to check emission. Therefore an engine speed increase is necessary.
- If all relevant sensors are positively checked, the engine goes immediately to low idle, all driver indications are switched off and creep mode is recovered.
- If the check was faulty, the emission check is aborted after 600 sec., the engine goes to low idle, creep mode is continued and driver indication remains.

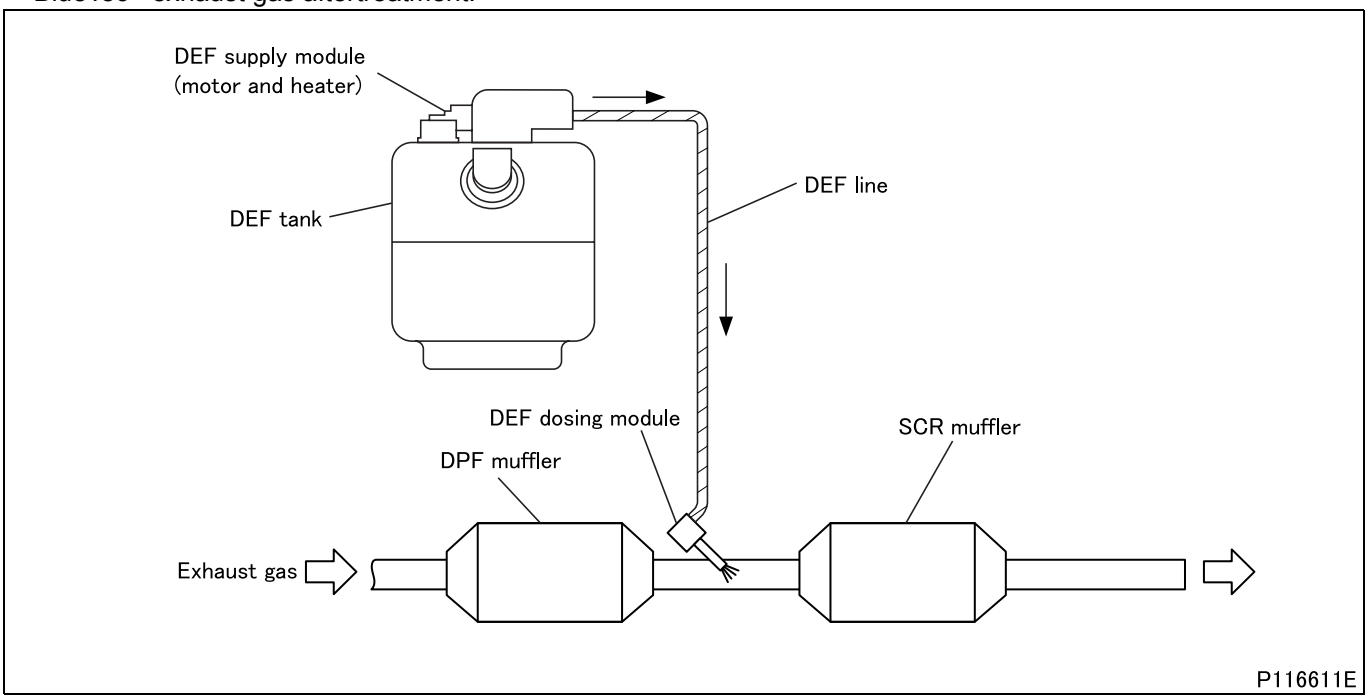
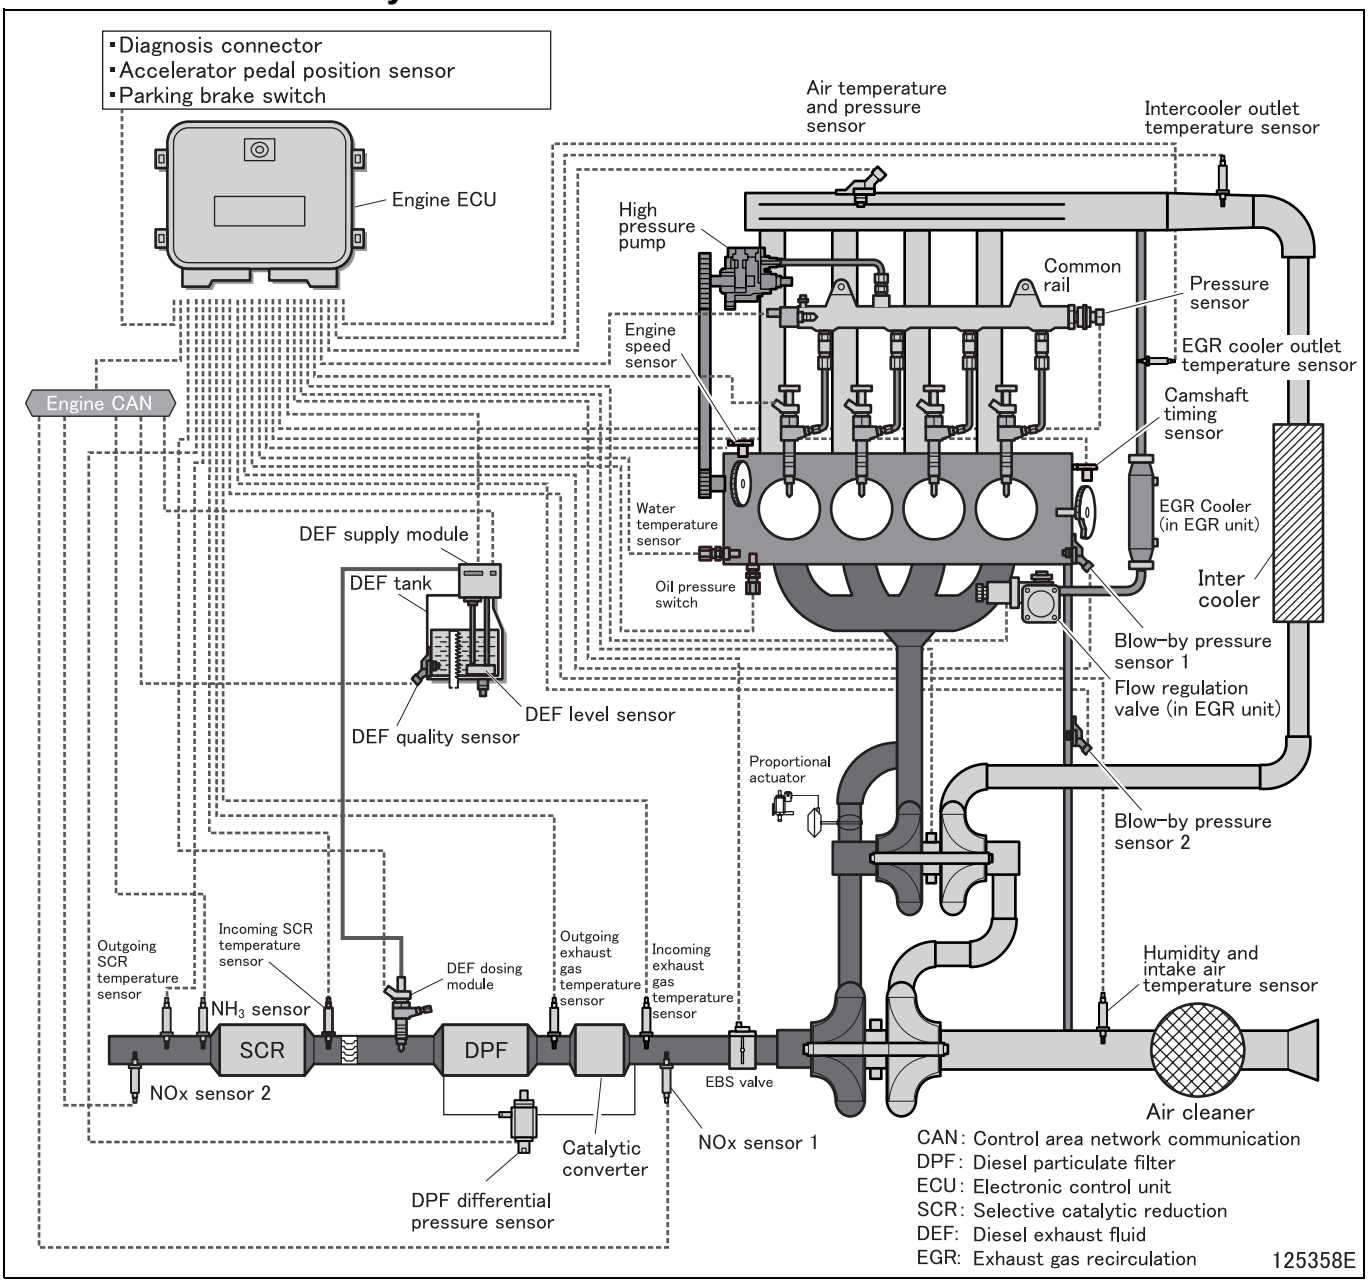
1. Overview

- The BlueTec® system consists of a regeneration-controlled DPF (diesel particulate filter) system combined with BlueTec® exhaust gas aftertreatment.



- The regeneration-controlled DPF system collects the soot (particulate matter) contained in exhaust gas with a ceramic filter incorporated in the muffler and burns soot off the filter (continuous filter regeneration) using front oxidation catalyst.
- If continuous filter regeneration is not possible in a situation such as low speed driving, the exhaust temperature is automatically raised to regenerate the filter (burn off soot) (automatic DPF regeneration). If automatic filter regeneration is not possible under certain conditions, such as when the vehicle is driven extremely slowly or during frequent engine stop-start driving, the vehicle must be parked to perform parked regeneration (burning off soot) (parked DPF regeneration).
- The BlueTec® exhaust gas aftertreatment reduces nitrogen oxides (NOx) by adding (injecting) DEF (diesel exhaust fluid) upstream of the SCR (selective catalytic ruduction) catalyst to decompose NOx into water and nitrogen.

2. Electronic Control System



- The BlueTec® system consists of the following:
  - Engine with its engine electronic control unit and sensors for normal operation.
  - DPF (diesel particulate filter) with oxidation catalyst in one housing for reduction of particulate emissions.
  - Selective catalytic reduction together with a muffler in a housing for NOx emission reduction.
  - Dosing system with a separate tank for DEF (diesel exhaust fluid).
  - Control area network communication between engine electronic control unit and NOx sensor, NH_3 sensor, DEF (diesel exhaust fluid) quality sensor, DEF (diesel exhaust fluid) level sensor.

2.1 System for NOx emission control

- The dosing system injects a quantity of DEF (diesel exhaust fluid) in the exhaust stream before the selective catalytic reduction, depending on the temperature of the catalyst and the NOx emissions of the engine.

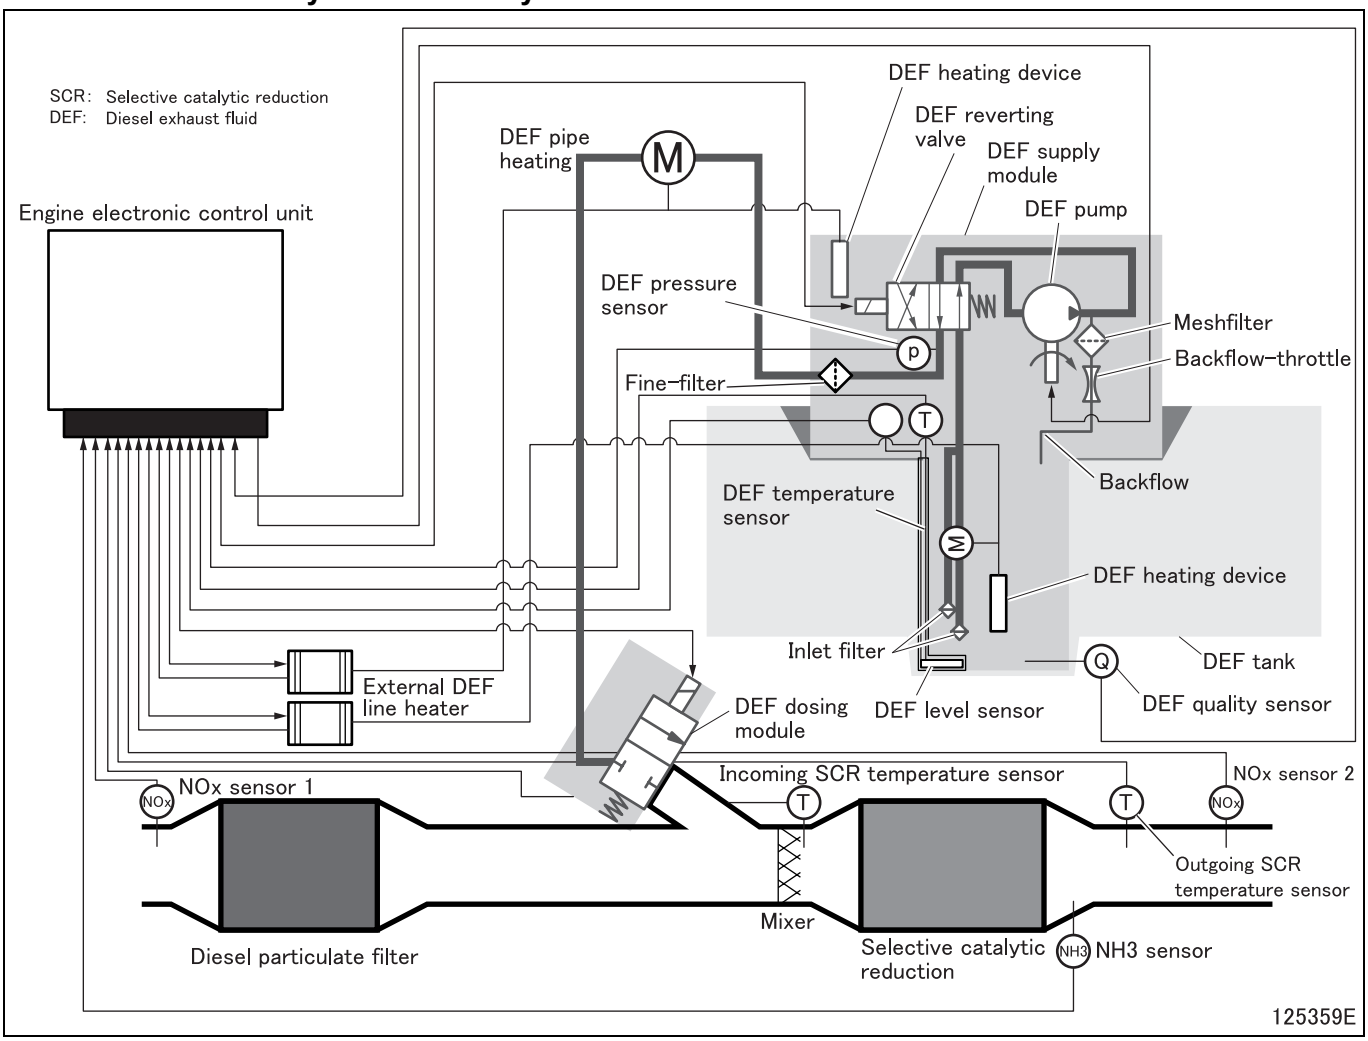
2.2 Calculation of desired DEF (diesel exhaust fluid) quantity

- The NOx emissions of the engine are calculated depending on the actual engine speed and engine load for standard conditions.
- The basic NOx emissions are then corrected depending on the deviation of the standard conditions, which are determined by following sensors:
  - Engine water temperature.
  - Absolute pressure and temperature in intake manifold.
  - Fuel pressure of engine with high pressure electronic injection system.
  - Start of fuel injection.
  - Exhaust gas recirculation humidity (depended on the air humidity sensor).
  - NOx sensor 1
- In case of a defect of any of the above sensors the NOx calculation takes the nominal values.
- The calculated DEF (diesel exhaust fluid) quantity is then transmitted from the engine electronic control unit to the pump module, which realizes the DEF (diesel exhaust fluid) injection.

(1) Closed loop control:

- The expected NOx concentration after selective catalytic reduction is calculated by the NOx emission of the engine, the actual exhaust flow (by engine speed, boost pressure, air temperature and actual fuel quantity) and the expected catalyst efficiency (calculated by DEF (diesel exhaust fluid) filling state, exhaust flow and actual catalyst temperature).

2.3 Basic functionality of BlueTec® system



- The system incorporates heaters. If DEF (diesel exhaust fluid) is frozen, a thawing process is performed and, immediately after that, the dosing system starts operating.
- The system starts the DEF (diesel exhaust fluid) pump and check if the needed DEF (diesel exhaust fluid) pressure is reached.
- The dosing system controls the DEF (diesel exhaust fluid) pressure in a closed loop control with the DEF (diesel exhaust fluid) pressure sensor.
- The dosing system sends to the engine electronic control unit a “ready state signal”. Then the engine electronic control unit sends the requested DEF (diesel exhaust fluid) quantity to the dosing system. The system recognizes the requested DEF (diesel exhaust fluid) injection quantity and actuate the corresponding dosing valve.
- The dosing module of the dosing system is placed directly on the exhaust tube and the DEF (diesel exhaust fluid) is injected directly into the exhaust gas. Therefore the dosing module has to be passively cooled with air.

(1) DPF (diesel particulate filter) for particulate control

- The DPF is placed upstream of the SCR (selective catalytic reduction) and works as a passive collection filter.
- The collected soot/particulates are burned continuously by the NO_2 which are formed from the basic NO of the exhaust gas by the oxidation catalyst, which is placed upstream of the filter, but in the same housing.
- There is no active regeneration as long as the filter loading does not exceed a certain level. The loading level of the DPF is monitored by the flow resistance over the filter, i.e. the DPF pressure difference depending on exhaust flow, which is calculated by engine speed and load.
- If the flow resistance exceeds a limit – which happens only in very special cases (long driving times with very light load, e.g. only city cycle) – the active regeneration is activated:
- The injection start is retarded to increase the exhaust temperature, to bring the filter to a level higher than the specified temperature. If the temperature does not reach this limit within a time there is an additional procedure to increase the exhaust temperature again:
  - Reduction of the intake manifold pressure.
  - Reduction of the common rail pressure.
- During forced regeneration, the temperature of the exhaust gas downstream of the DPF increases. This high temperature, which is required to burn off the soot accumulated on the DPF, is achieved by optimizing the fuel injection timing. Forced regeneration is performed until the amount of soot accumulated on the filter reduces to the specified value.
- During the active regeneration the DEF (diesel exhaust fluid) injection is not switched off.

(2) Engine oil replacement due to DPF regeneration

- During the regeneration of DPF, the engine electronic control unit calculates the post injection amount to maintain the operation of the engine.
- Then, part of the unburnt fuel flows into the oil pan along the oil ring of the piston and is mixed into the engine oil. Part of the mixed fuel will vaporize and will be returned to the combustion chamber through the positive crankcase ventilation system and burnt, but the remaining fuel will degrade the engine oil.
- The quantity of the unburnt/mixed fuel may increase due to the ineffective operation of the catalyst or engine, vehicle operation under low temperature, and the frequent short-distance drives.
- The engine electronic control unit counts the number of the post injection and estimates the quantity of fuel mixed into the engine oil. When it reaches a predetermined level, the control unit turns on the warning lamp to notice the driver that the replacement of the engine oil is necessary.
  After replacing the engine oil, resetting of the oil data in the engine electronic control unit is necessary. If the resetting has not been performed, the engine electronic control unit recognizes that the old oil is still being used, and continues to count up the amount of mixed fuel, and finally the warning lamp will flash to warn the driver to replace the engine oil.

2.4 BlueTec® system warning function

(1) Regeneration-controlled DPF (diesel particulate filter) warning function

- The regeneration-controlled DPF system has a function to issue a warning when a system failure occurs and a function to monitor the amount of particulate matter accumulated on the ceramic filter incorporated in the DPF.
- The meter indication varies depending on the failure, the amount of accumulated particulate matter and whether or not DPF regeneration is active.
- Regardless of the meter reading on the multi-information display, a parked regeneration request ((amber) flashes) could be issued by the DPF function. In such a case, follow the flashing indicator and perform parked regeneration.
- Parked DPF regeneration becomes possible when the DPF cleaning switch is pressed with the engine running until the indicator lamp (amber) changes from flashing to illuminating.
- Parked DPF regeneration is impossible in the following conditions:
  - Within 30 seconds after starting the engine
  - When the coolant indicator shows the temperature by up to 5 segments (Perform parked DPF regeneration after warming up the engine.)
  - When the PTO (power take-off) switch is in the “ON” position (vehicles with a PTO)
  - While the accelerator pedal or brake pedal is being depressed
  - While the vehicle is moving
  - When the gearshift lever is in any position other than “P” or “N”

(2) Warnings of BlueTec® exhaust gas aftertreatment

If the system detects an excessively low DEF (diesel exhaust fluid) level, an abnormality of the quality of DEF (diesel exhaust fluid) or an abnormality of the BlueTec® exhaust gas aftertreatment, the warning lamps will light and blink, a buzzer will sound, and a drive is restricted automatically.

(2.1) Warning of DEF (diesel exhaust fluid) quantity

- If the quantity of DEF (diesel exhaust fluid) in the tank becomes too low, the warning lamps will light and blink, a buzzer will sound, and a drive is restricted automatically.
- If the tank becomes empty, a drive is automatically restricted so you can drive only at low speed.
- Do not let the DEF (diesel exhaust fluid) tank become empty. If the tank becomes empty, the vehicle's operation is automatically restricted so you can drive only at low speed.

Warning level	1	2	3
Quantity of DEF (diesel exhaust fluid)	Too low	Little	Empty
Warning indicator lamp	 ENG SYS (Amber) 125361E	 ENG SYS (Red) 125362E	 ENG SYS (Red) 125363E
	• The DEF (diesel exhaust fluid) level warning lamp ① lights. • The E segment of the DEF (diesel exhaust fluid) level indicator ② starts blinking slowly. • The ENG SYS warning (amber) is shown.	• The DEF (diesel exhaust fluid) level warning lamp ① starts blinking. • The E segment of the DEF (diesel exhaust fluid) level indicator ② starts blinking quickly. • The ENG SYS warning changes from amber to red. • The DEF (diesel exhaust fluid) warning lamp lights.	• The DEF (diesel exhaust fluid) level warning lamp ① continues to blink. • All segments of the DEF (diesel exhaust fluid) level indicator ② starts blinking quickly. • The ENG SYS warning is red. • The DEF (diesel exhaust fluid) warning lamp starts blinking.
Buzzer	No sound	Sounds	Loudly sounds
Drive	Engine power is reduced in stages.	Engine power is further reduced in stages.	Transmission accepts only 1st gear, neutral or reverse gear selection and engine speed is limited, so the vehicle can be driven only slowly. (*1)

*1: The driving restriction is engaged within 30 minutes after being set to the warning level 3, so the vehicle can be driven only slowly.
And if you refuel, set the parking brake, or restart the engine, the driving restriction is engaged immediately.

- For the method for canceling the driving restriction, see the later section.

(2.2) Warning of abnormal detection of DEF (diesel exhaust fluid)

- If the system detects a deterioration in quality of the DEF (diesel exhaust fluid) due to addition of any fluid (water, low-density DEF (diesel exhaust fluid), etc.) other than acceptable DEF (diesel exhaust fluid), the warning lamps will light and blink, a buzzer will sound, and a drive is restricted automatically.

CAUTION ⚠

- **If you continue to drive with the warning lamps lit and/or blinking and a buzzer sounding, the NOx level of exhaust emissions will increase, damaging the environment. In addition, the BlueTec® exhaust gas after-treatment will be damaged. Continuing to drive in this condition also results in reduced engine output and finally in the engagement of driving restrictions after which the vehicle can be driven only at slow speed.**

Warning level	1	2	3
Warning indicator lamp	 ENG SYS (Amber) 125364E	 ENG SYS (Red) 125365E	 ENG SYS (Red) 125366E
	• The DEF (diesel exhaust fluid) level warning lamp ① blinking. • The ENG SYS warning(amber) is shown. • The DEF (diesel exhaust fluid) warning lamp lights.	• The DEF (diesel exhaust fluid) level warning lamp ① continues to blink. • The ENG SYS warning changes from amber to red. • The DEF (diesel exhaust fluid) warning lamp continues to light.	• The DEF (diesel exhaust fluid) level warning lamp ① continues to blink. • The ENG SYS warning is red. • The DEF (diesel exhaust fluid) warning lamp starts blinking.
Buzzer	No sound	Sounds	Loudly sounds
Drive	Engine power is reduced in stages.	Engine power is further reduced in stages.	Transmission accepts only 1st gear, neutral or reverse gear selection and engine speed is limited, so the vehicle can be driven only slowly. (*1)
Driving time	Abnormal detection	1 hour later	2 hours 30 mintutes later

*1: The driving restriction is engaged within 30 minutes after being set to the warning level 3, so the vehicle can be driven only slowly.
And if you refuel, set the parking brake, or restart the engine, the driving restriction is engaged immediately.

- If the system detects an abnormality again within 40 hours, the system is set to the warning level 3 immediately and the driving restriction is engaged.
- The engine warning lamp may also come on if the engine is started when the system has abnormality.
- For the method for canceling the driving restriction, see the later section.

(2.3) Warning of fault of BlueTec® exhaust gas aftertreatment

- If there is a problem with the BlueTec® exhaust gas aftertreatment, the warning lamps will light and blink, a buzzer will sound, and a drive is restricted automatically.

CAUTION ⚠

- **If you continue to drive with the warning lamps lit and/or flashing and a buzzer sounding, the NOx level of exhaust emissions will increase, damaging the environment. In addition, the BlueTec® exhaust gas aftertreatment will be damaged. Continuing to drive in this condition also results in reduced engine output and finally in the engagement of driving restrictions after which the vehicle can be driven only at slow speed.**

Warning level	1	2	3
Warning indicator lamp	 ENG SYS (Amber) 125367E	 ENG SYS (Red) 125368E	 ENG SYS (Red) 125369E
	• The DEF (diesel exhaust fluid) level warning lamp ① doesn't light. • The ENG SYS warning (amber) is shown. • The DEF (diesel exhaust fluid) warning lamp lights.	• The DEF (diesel exhaust fluid) level warning lamp ① doesn't light. • The ENG SYS warning changes from amber to red. • The DEF (diesel exhaust fluid) warning lamp continues to light.	• The DEF (diesel exhaust fluid) level warning lamp ① doesn't light. • The ENG SYS warning is red. • The DEF (diesel exhaust fluid) warning lamp starts blinking.
Buzzer	No sound	Sounds	Loudly sounds
Drive	Engine power is reduced in stages.	Engine power is further reduced in stages.	Transmission accepts only 1st gear, neutral or reverse gear selection and engine speed is limited, so the vehicle can be driven only slowly. (*1)
Driving time	Abnormal detection	1 hour later	3 hours 30 mintutes later

*1: The driving restriction is engaged within 30 minutes after being set to the warning level 3, so the vehicle can be driven only slowly.
And if you refuel, set the parking brake, or restart the engine, the driving restriction is engaged immediately.

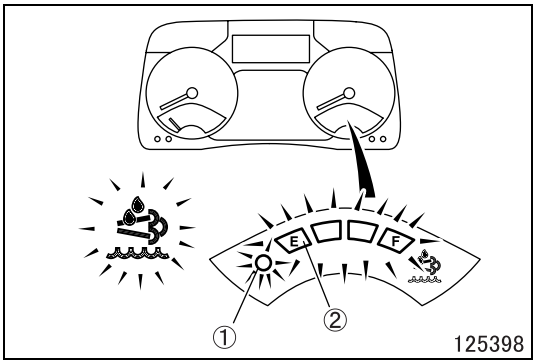
- If the system detects an abnormality again within 40 hours, the system is set to the warning level 3 immediately and the driving restriction is engaged.
- The engine warning lamp may also come on if the engine is started when the system has abnormality.

(3) Precautions for inspection and maintenance

- The DEF (diesel exhaust fluid) dosing system (pump module plus dosing module) continues to operate for about 2 minutes after the starter switch has been put in the “LOCK” position. Wait for at least 2 minutes before disconnecting the battery and electrical system connectors in order to carry out an inspection, maintenance and so on.

(4) Method for canceling the driving restriction that has engaged due to an empty DEF (diesel exhaust fluid) tank

- If the DEF (diesel exhaust fluid) tank becomes empty, a driving restriction automatically engages, locking the gear in first or reverse, so the vehicle can be driven only slowly.
In the event of a driving restriction, replenish the DEF (diesel exhaust fluid) and then disengage the restriction as follows.



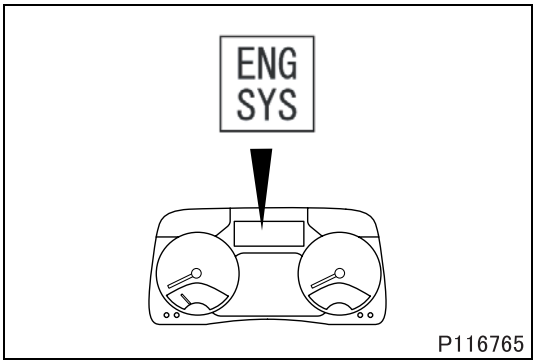
- After refilling the tank with DEF (diesel exhaust fluid), turn the starter switch from “LOCK” to “ON”.
- Wait until the following changes in state have completed.
  - The warning lamp and DEF (diesel exhaust fluid) level warning lamp ① go out.
  - The DEF (diesel exhaust fluid) level indicator lamp ② stops flashing.
  - The buzzer stops sounding.
  - Do not turn the starter switch to the “ACC” or “LOCK” position before all the above changes have completed.

CAUTION ⚠

- **It may take a while after placing the starter switch to “ON” for the warning lamp to go out and for the buzzer to stop sounding.**
- **If the DEF (diesel exhaust fluid) tank becomes empty in cold weather, perform the driving restriction canceling procedure immediately after refilling the tank with DEF (diesel exhaust fluid).**

(5) Replacement procedure of DEF (diesel exhaust fluid) (due to poor quality)

- Set the starter switch to “LOCK” position.
- Drain DEF (diesel exhaust fluid) in the DEF (diesel exhaust fluid) tank completely.
- Fill DEF (diesel exhaust fluid) to the DEF (diesel exhaust fluid) tank up to the full level.
- Set the starter switch to “ON” position.



- Wait a 10 minutes. When the engine warning lamp goes out, the engine can be started.

(6) Operation restriction flowchart for BlueTec® system

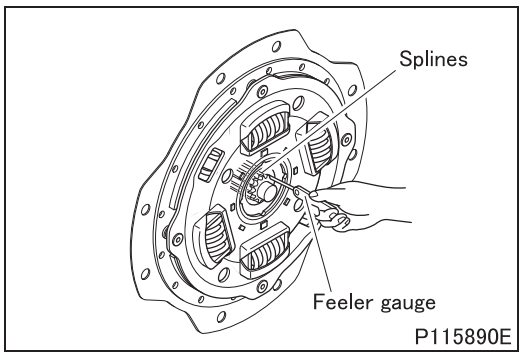
Ta	Bolt (damper mounting)	45 to 55 {33 to 41, 4.6 to 5.6}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Entire surface of splines	Molybdenum disulfide grease [NLGI No. 2 (Li soap)]	As required

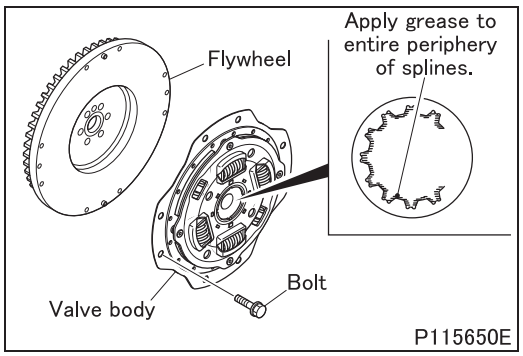
◆Inspection procedure◆



■ **Inspection: Play in revolving direction in splines of damper**

- Reshape a feeler gauge such that it can be inserted into the drive pinion splines. Then, using the gauge, measure the splines for play in revolving direction.
- If the measured value is equal to or exceeds the limit, replace the faulty part.

◆Installation procedure◆



■ Installation: Damper

- Apply thin coat of grease to the entire periphery of the splines in the damper while taking care that any grease does seep out of the spline ends. Then, install the damper to the flywheel with the positioning pin and hole in alignment.

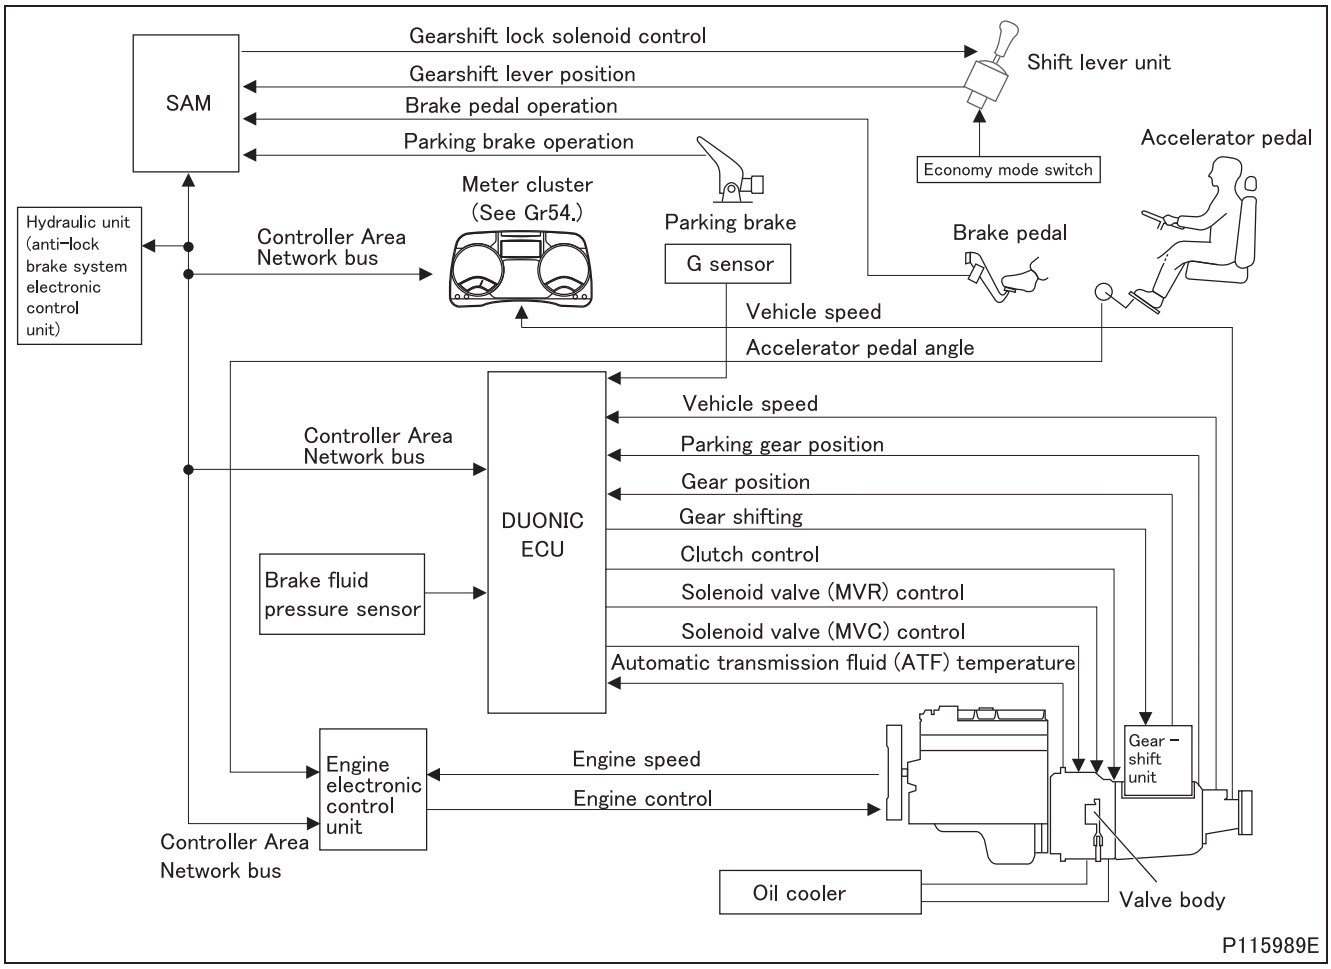
M E M O

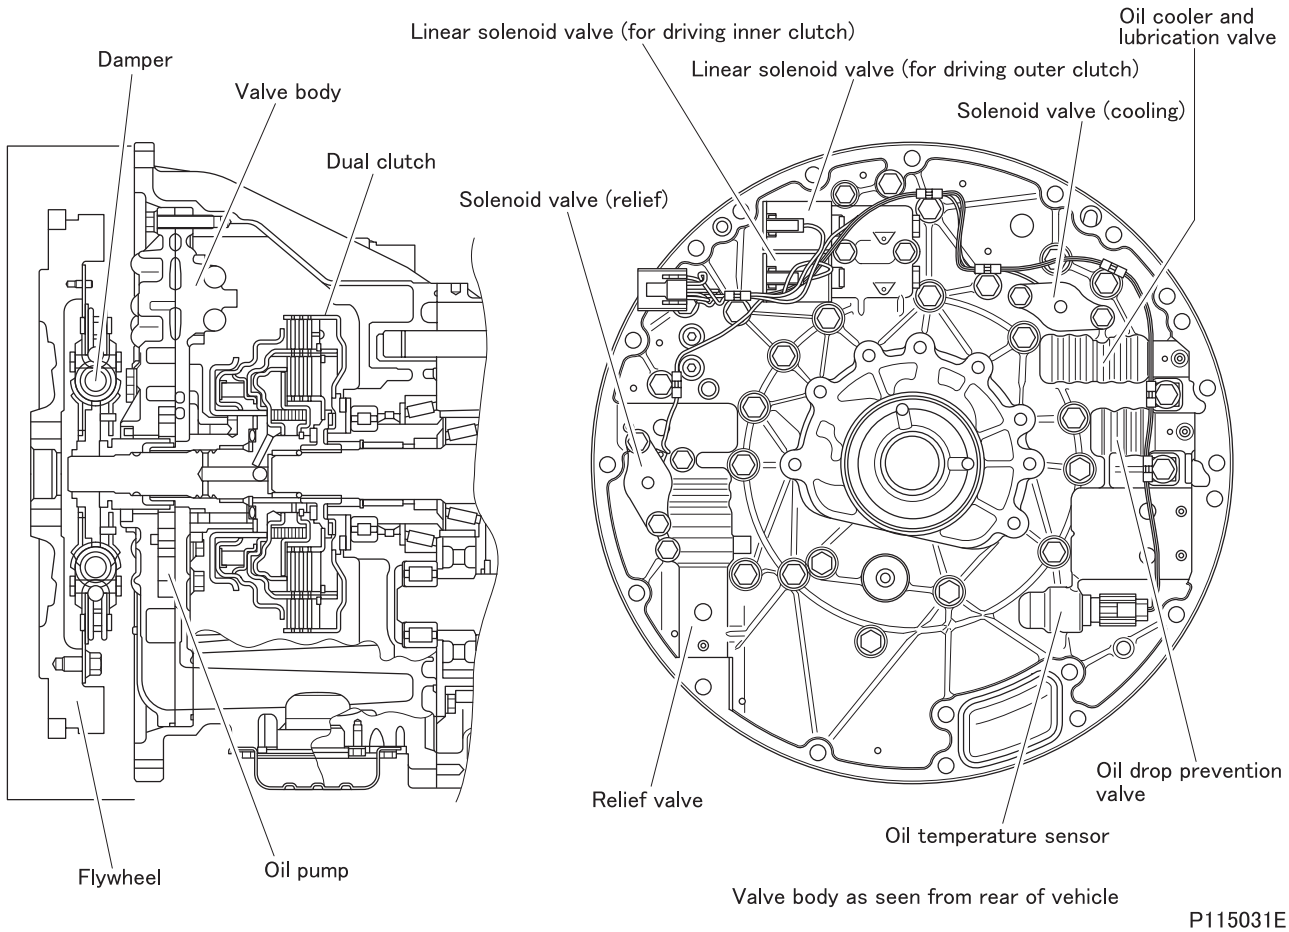
STRUCTURE AND OPERATION

1. Overview



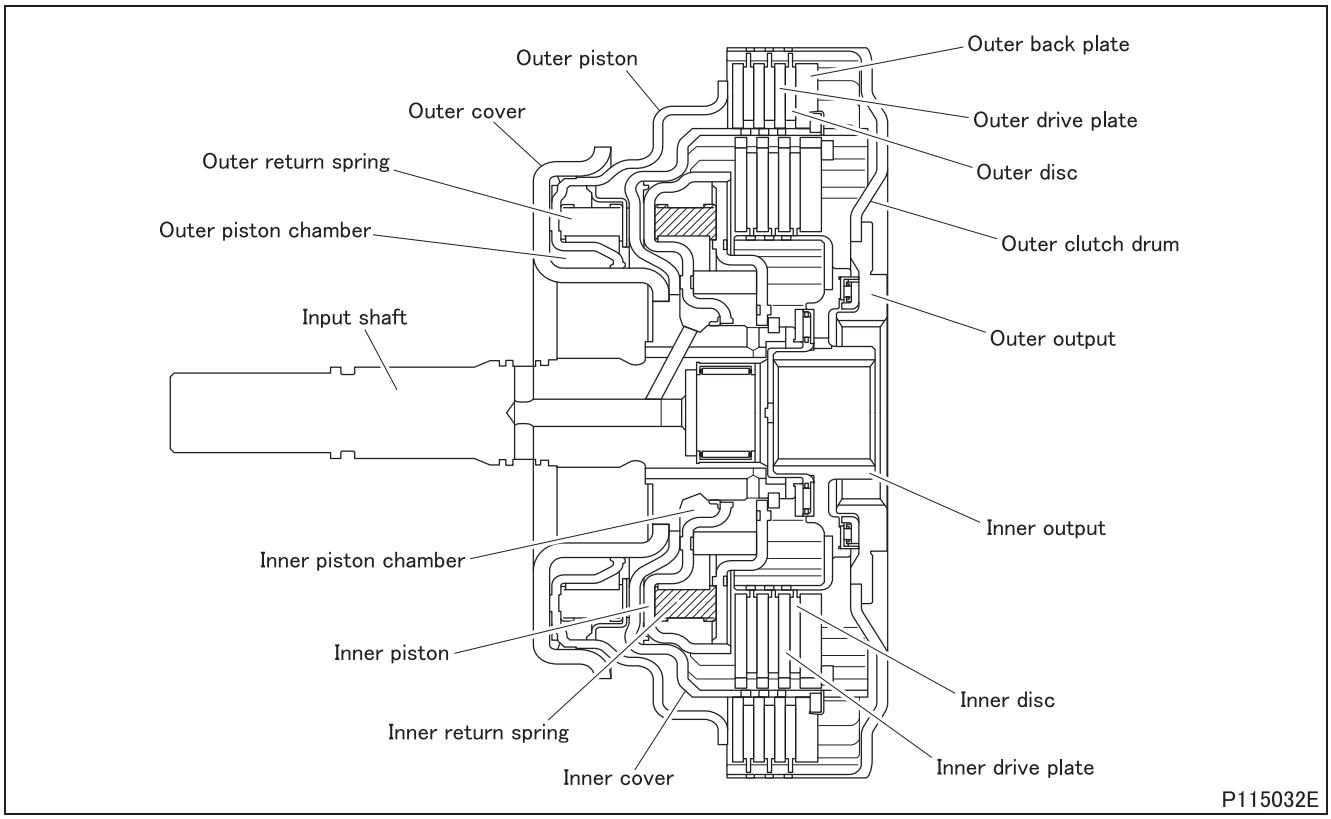
- The DUONIC™ system automates clutch and gear shift operations when starting or driving the vehicle by providing integrated control of the clutch, transmission and engine. This helps to reduce the driver's fatigue from frequent manual gear shift operations while achieving excellent fuel economy equivalent to or better than that of manual transmission vehicles.
- The clutch mechanism consists of two clutching systems (dual clutch) that allow smooth gear shift operations with reduced gear shift shock.
- There is no clutch pedal. Since there are only two pedals (accelerator and brake pedals), the driver can start and drive the vehicle with accelerator operations only. Manual operation can also be selected as required.
- The system consists of a DUONIC™ electronic control unit (that controls the gear shift unit and valve body based on the gear shift lever signals, transmission gear position, throttle opening, vehicle speed, etc.), engine electronic control unit (that controls fuel injection amount and timing based on engine speed, engine timing, coolant temperature, vehicle speed, etc.) and sensors that transmit/receive various signals to and from each electronic control unit.

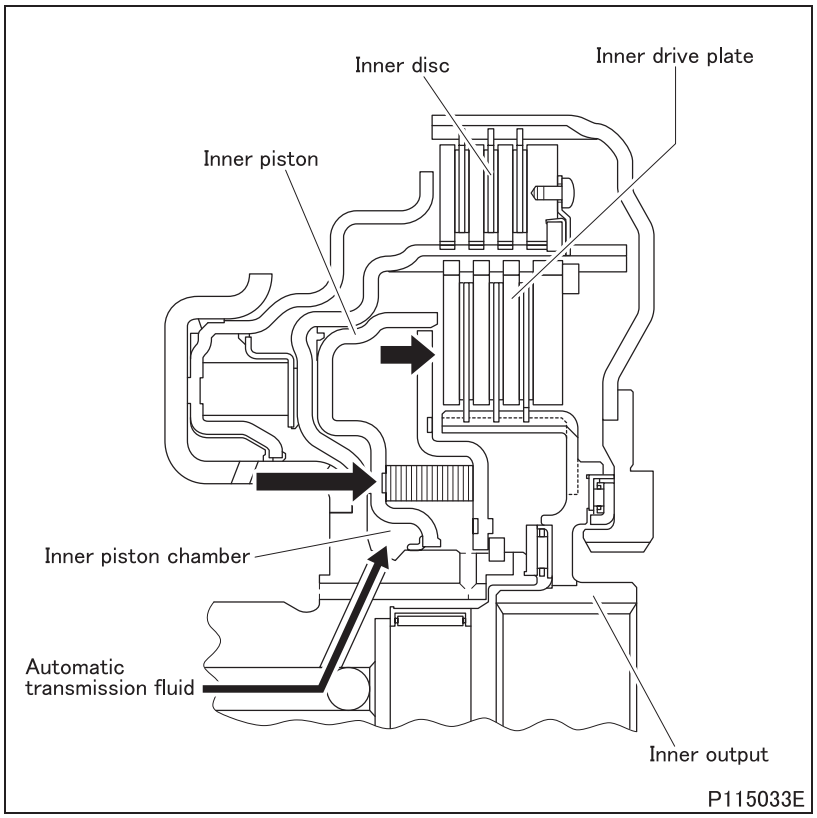
2. Valve Body



- The valve body is an electronically controlled hydraulic control unit.
- The dual clutch is installed inside the transmission and is operated by changing the flow direction of automatic transmission fluid in the dual clutch using the solenoid valve in the valve body.

3. Dual Clutch

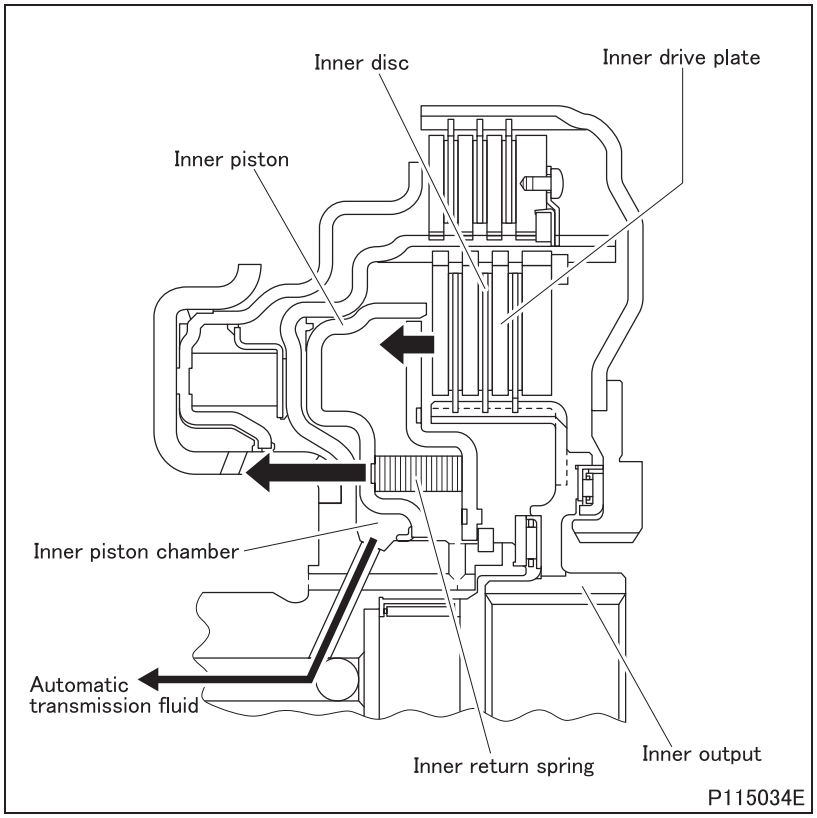




3.1 Inner clutch operation

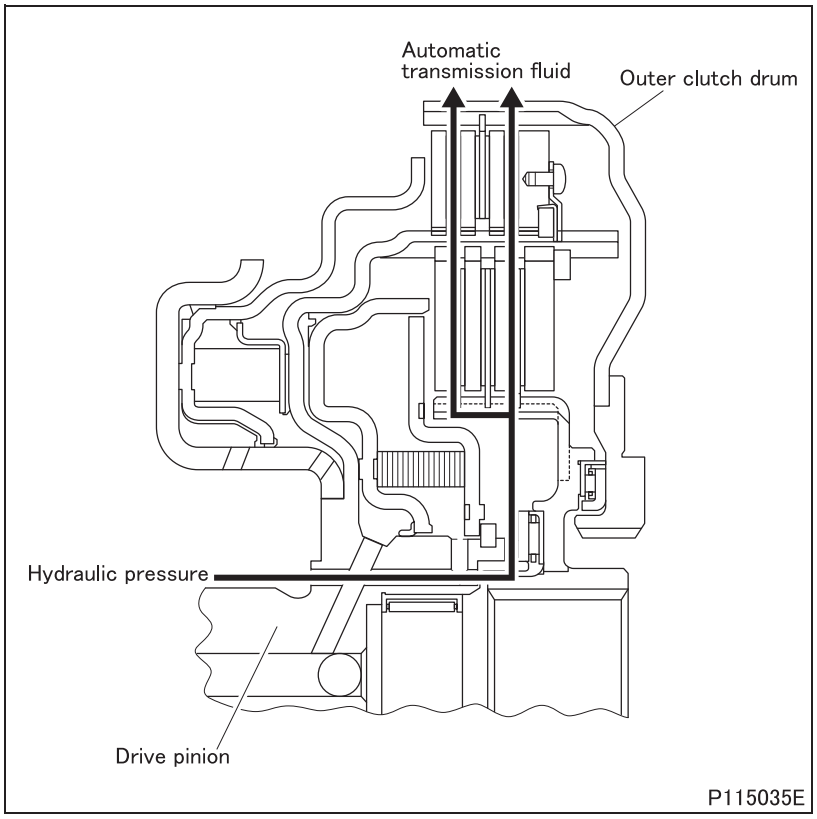
(1) When the clutch engages

- The linear magnetic valve (for driving the inner clutch) in the valve body operates.
- Automatic transmission fluid enters the inner automatic transmission fluid chamber to push the inner piston. The inner drive plates and inner discs are then pressed together to engage the clutch, thereby transmitting torque to the inner output.



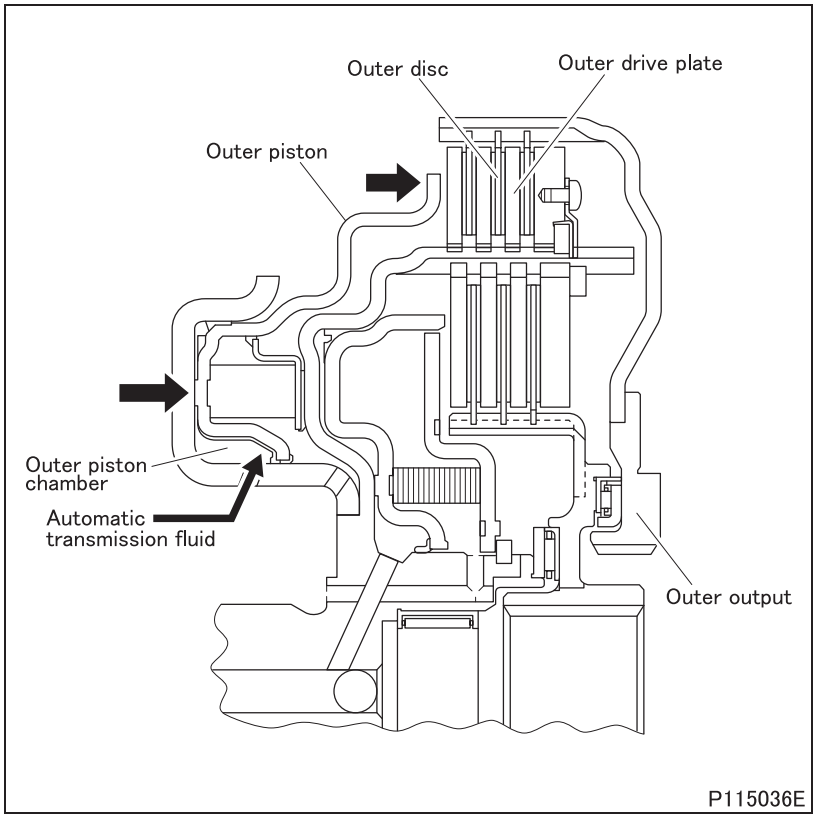
(2) When the clutch disengages

- The linear magnetic valve (for driving the inner clutch) in the valve body operates.
- Automatic transmission fluid is discharged from the inner piston housing and the inner piston is pushed back by the inner return spring. The inner drive plates and inner discs are then released to disengage the clutch.



(3) Clutch cooling

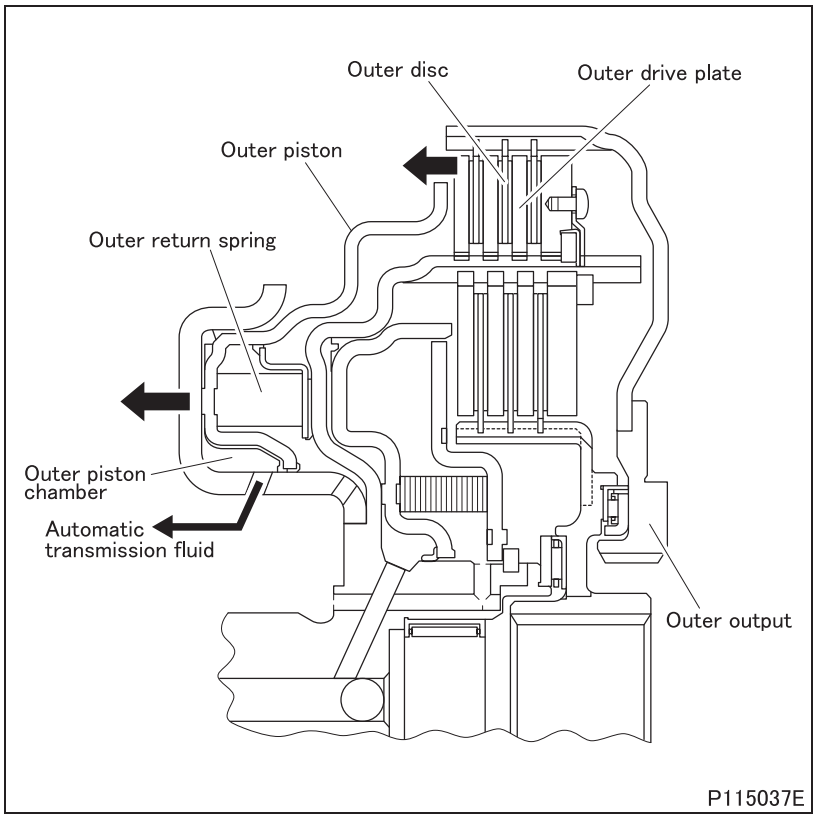
- When the linear magnetic valve (for driving the inner clutch) in the valve body operates, automatic transmission fluid flows from the center of the input shaft and is discharged out of the outer clutch drum by centrifugal force, thereby cooling the clutch.



3.2 Outer clutch operation

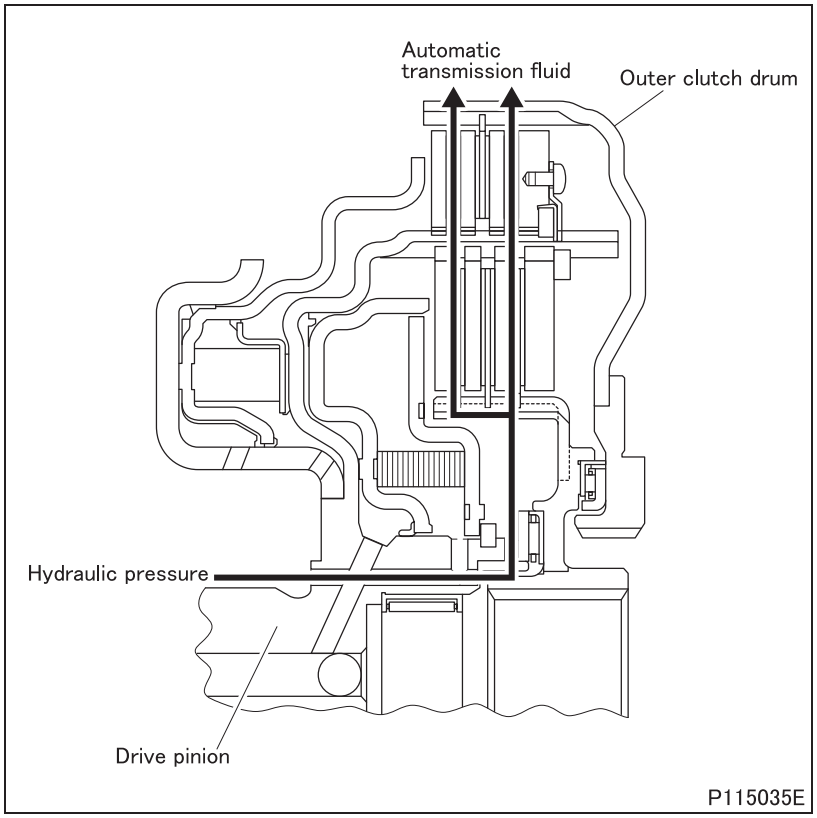
(1) When the clutch engages

- The linear magnetic valve (for driving the outer clutch) in the valve body operates.
- Automatic transmission fluid enters the outer piston housing to push the outer piston. The outer drive plates and outer discs are then pressed together to engage the clutch, thereby transmitting torque to the outer output.



(2) When the clutch disengages

- The linear magnetic valve (for driving the outer clutch) in the valve body operates.
- Automatic transmission fluid is discharged from the outer piston housing and the outer piston is pushed back by the outer return spring. The outer drive plates and outer discs are then released to disengage the clutch.



(3) Clutch cooling

- When the linear magnetic valve (for driving the outer clutch) in the valve body operates, automatic transmission fluid flows from the center of the input shaft and is discharged out of the outer clutch drum by centrifugal force, thereby cooling the clutch.

Shift rail arrangement as seen from above transmission

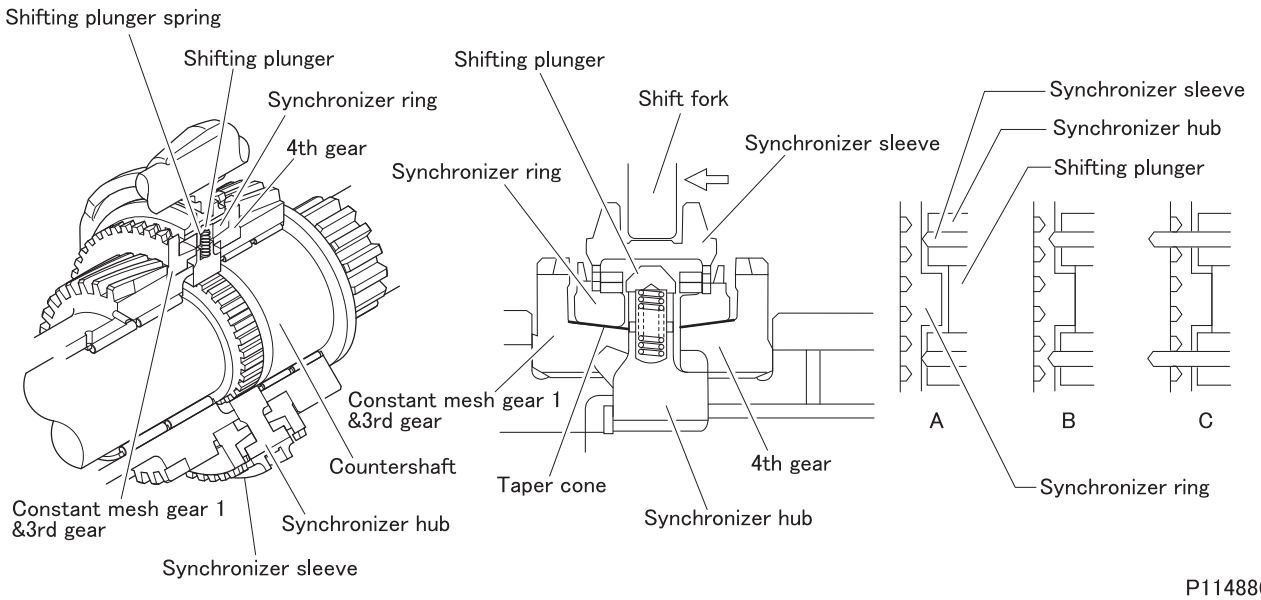
P114885E

- Since all clutches are disengaged when in neutral position, driving force from the pinion gears will not be transmitted to the mainshaft.

5. Synchromesh Mechanism

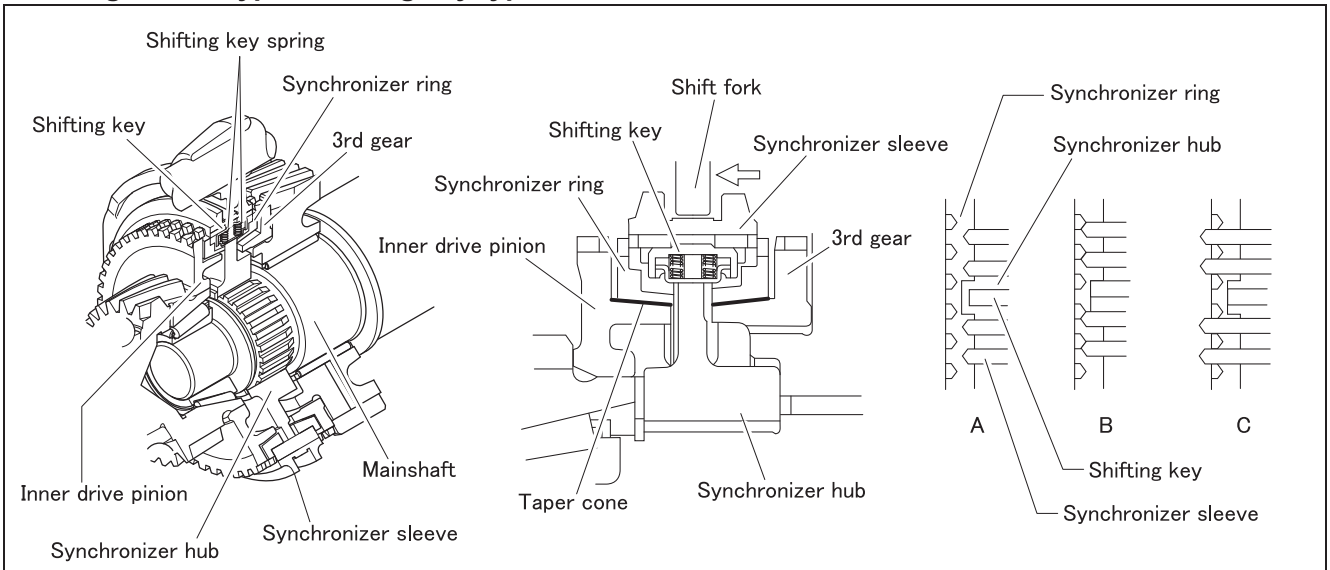
- The synchromesh mechanism, when a shift change is made, synchronizes the rotation speed of the mainshaft, drive pinion and synchronizer hub that rotates integrally with the mainshaft with that of the gear to be shifted.
- The synchromesh mechanism is a Warner synchromesh type, and is used depending on the gear position as single cone type or triple cone type.

5.1 Single cone type <Shifting plunger type>



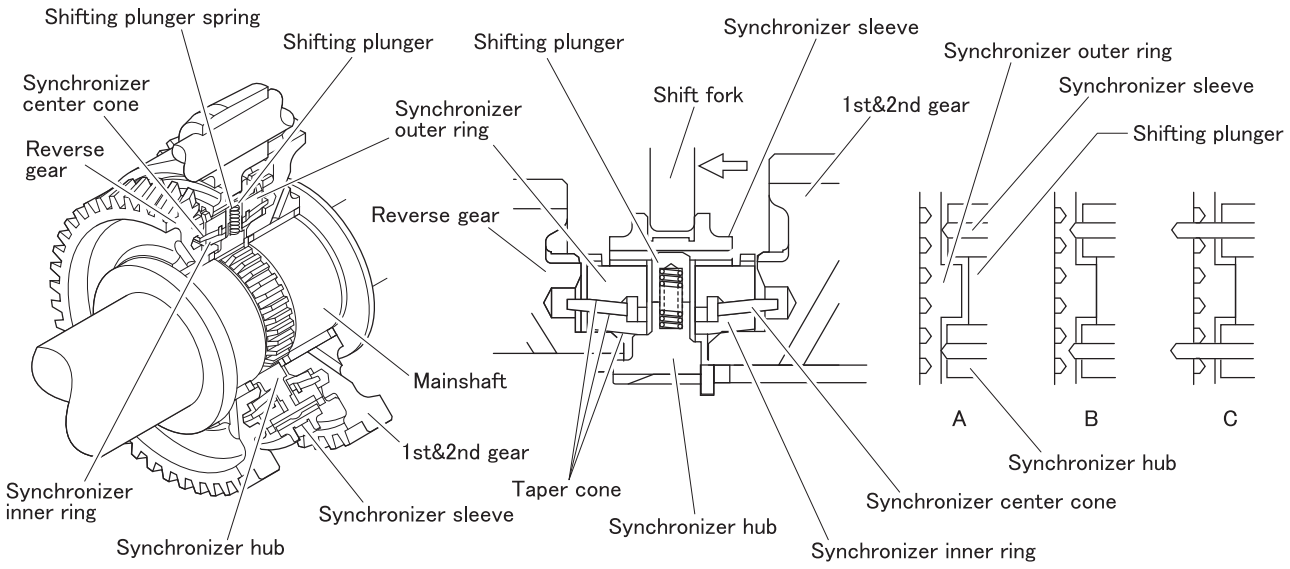
- The inside of the synchronizer hub engages the spline of the mainshaft and rotates with it. The outside of the synchronizer hub has a spline that engages the synchronizer sleeve and three grooves.
- Shifting plungers are inserted into these grooves. When the gear shift is in neutral, the shifting plunger engage grooves in the synchronizer sleeve and are pressed against the inside of the synchronizer sleeve by shifting plunger springs.
- Synchronizer rings are inserted into the respective taper cone of each gear.
- The outer splines of the synchronizer rings engage the synchronizer sleeve. On the synchronizer hub are three grooves in which protrusions of the synchronizer rings are inserted. These grooves are wider than the width of the protrusions of the synchronizer rings.
- Synchronizer rings rotate relative to the synchronizer sleeve by the amount of play (width difference).
- When the gear shift is in neutral (figure A), moving the shift fork in the direction of the arrow as illustrated, moves the synchronizer sleeve slightly to the gear. At the same time, the shifting plunger, the central protrusion of which engages the synchronizer sleeve, moves to the gear and presses the synchronizer ring against the taper cone of the gear (figure B).
- The taper cones of synchronizer rings, which act as cone clutches, generate friction torque and perform synchronous operation.
- The rotation speed of the synchronizer hub becomes gradually closer to that of the gear due to the synchronous operation, and eventually they rotate at the same speed. This allows the synchronizer sleeve to move smoothly to engage the synchronizer hub and gear, completing the shift change (figure C).

5.2 Single cone type <Shifting key type>



- The synchronizer hub is internally splined to the mainshaft and rotates with the mainshaft. The synchronizer hub has external splines that engage with the synchronizer sleeve and three keyways.
- Shifting keys fit in these keyways. With the shift fork in the neutral position, the shifting keys are seated in the grooves in the inside of the synchronizer sleeve and pressed against the inside surface of the synchronizer sleeve by shifting key springs.
- Synchronizer rings are seated on the taper cones of each gear.
- The external splines of synchronizer rings engage with the synchronizer sleeve. On the hub side surface of the synchronizer rings are provided three keyways, in which the ends of the synchronizer rings fit. These keyways are wider than the width of the shifting keys.
- The synchronizer rings are allowed to rotate relative to the synchronizer sleeve as much as this play in the keyways (width difference).
- Shifting the shift fork in the illustrated direction of arrow from the neutral position (figure A) moves the synchronizer sleeve slightly toward the gear. The shifting key, which engages with the synchronizer sleeve at the central projection, is also moved toward the gear to press the synchronizer ring against the taper cone of the gear. (figure B)
- As the taper cone of the synchronizer ring works as a cone clutch, frictional torque rises to make the rotation speed of the synchronizer hub gradually close to the gear speed of the gear.
- When the rotation speeds become equal eventually, the synchronizer sleeve is allowed to smoothly move into mesh with the synchronizer hub and gear, completing the speed change. (figure C)

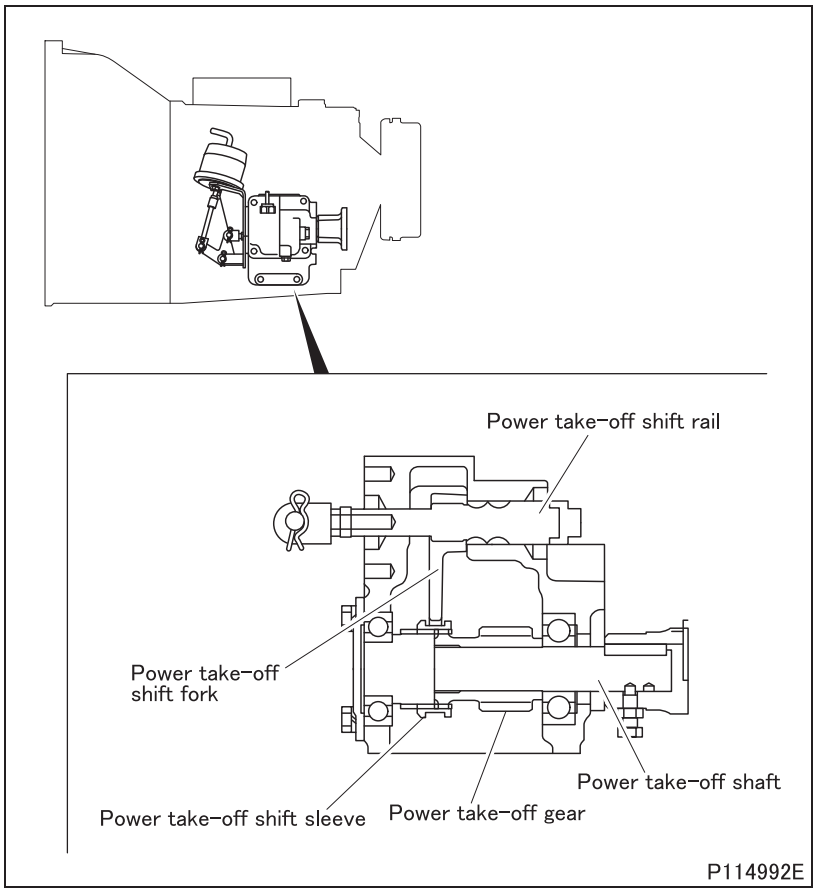
5.3 Triple cone type



- The synchromesh structure and operation of the triple cone type are basically the same as for the single cone type. The synchronizer ring is divided into three parts (synchronizer inner ring, synchronizer center cone and synchronizer outer ring) and the center cone (both the inside and outside surfaces are tapered) and the inner ring (both the inside and outside surfaces are tapered) are sandwiched between the outer ring and the taper cone of each gear to shorten the time required for synchronization with cone clutches at three locations.
- Six protrusions on the outside of the synchronizer center cone fit into corresponding gear holes. As in the taper cone of the single cone type, the center cone and the gear are installed as if integrated.
- The inside of the synchronizer hub engages the spline of the mainshaft and rotates with it. The outside of the synchronizer hub has a spline that engages the synchronizer sleeve and three grooves.
- Shifting plungers are inserted into these keyways. When the gear shift is in neutral, the shifting plungers engage grooves in the synchronizer sleeve and are pressed against the inside of the synchronizer sleeve by shifting plunger springs.
- The synchronizer outer ring and synchronizer inner ring are inserted into synchronizer center cones, respectively.
- The outer spline of the synchronizer outer ring engages the synchronizer sleeve. On the synchronizer hub are three grooves in which protrusions of the synchronizer outer ring are inserted. These grooves are wider than the width of the protrusions of the synchronizer outer ring.
- The synchronizer outer ring rotates relative to the synchronizer sleeve by the amount of play.
- When the gear shift is in neutral (figure A), moving the shift fork in the direction of the arrow as illustrated, moves the synchronizer sleeve slightly to the gear. At the same time, the shifting plunger, the central protrusion of which engages the synchronizer sleeve, moves to the gear and presses the synchronizer outer ring and the center cone against the taper cone of the synchronizer center cone and the synchronizer inner ring, respectively and in addition, presses the inner ring against the gear (figure B).
- The taper cones of synchronizer rings, which act as cone clutches, generate friction torque and perform synchronous operation.
- The rotation speed of the synchronizer hub becomes gradually closer to that of the gear of the gear due to the synchronous operation, and eventually they rotate at the same speed. This allows the synchronizer sleeve to move smoothly to engage the synchronizer hub and gear, completing the shift change (figure C).

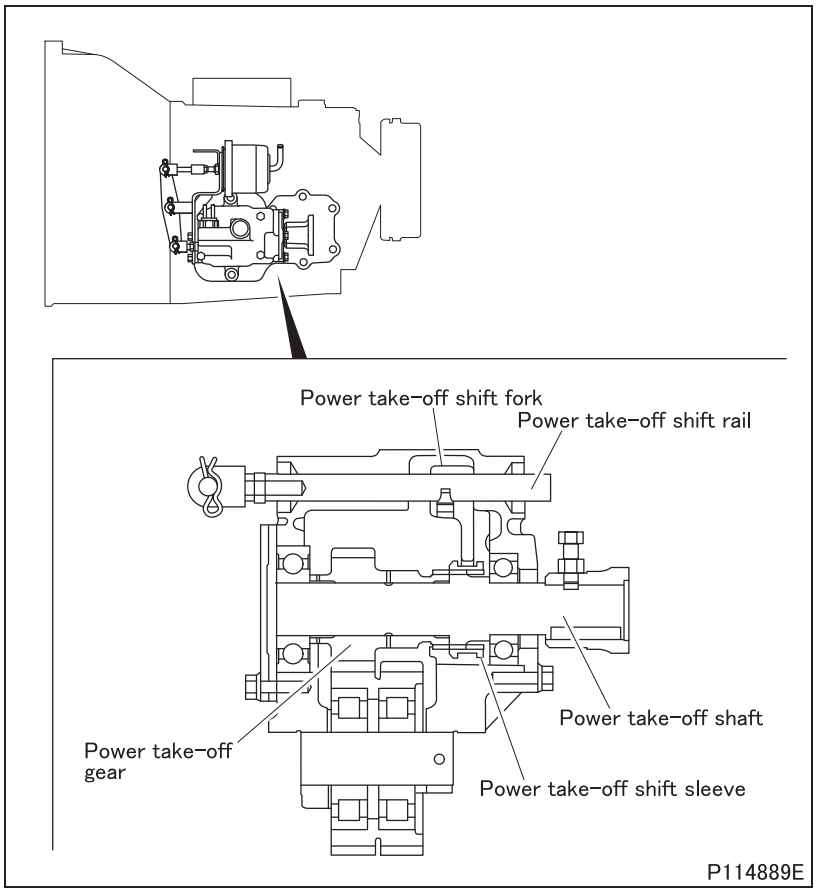
6. Transmission Power Take-off

<Standard transmission power take-off>



- The transmission power take-off takes out the power when the power take-off gear engages the reverse idler gear of the transmission, and delivers the engine power as it is.

<Large-capacity transmission power take-off>



- The transmission power take-off takes out the power when the power take-off idler gear engages the countershaft 3rd gear of the transmission, and transmits the engine power to the power take-off flange.

Possible causes \ Symptoms			Clutch slips	Clutch does not engage smoothly	Clutch does not switched	Gears slip out of engagement	Gears hard to engage	Noise when engine is idling	Noise when cruising	Noise when changing gear	Reference Gr

M E M O

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Transmission Oil Leakage and Oil Quantity

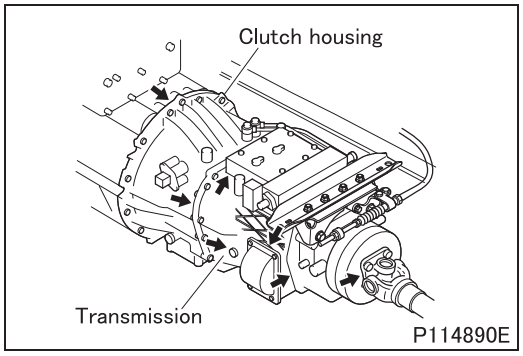
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Inspection plug	68.6 ± 14.7 {51 ± 11, 7.0 ± 1.5}	–
	Drain plug		

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Thread area of inspection plug	ThreeBond 1105	As required
	Thread area of drain plug		
–	Transmission case	API GL-3 SAE80	Approx. 3.5 L {3.7 qts.}
–	Clutch housing	FUSO ATF-SP III	Approx. 4.3 L {4.5 qts.}

- Grease depends on the driving conditions.
- For a model with standard type transmission power take-off, the quantity is increased by approx. 0.2 L {0.2 qts.}.
- For model with large-capacity transmission power take-off, the quantity is increased by approx. 0.3 L {0.3 qts.}.

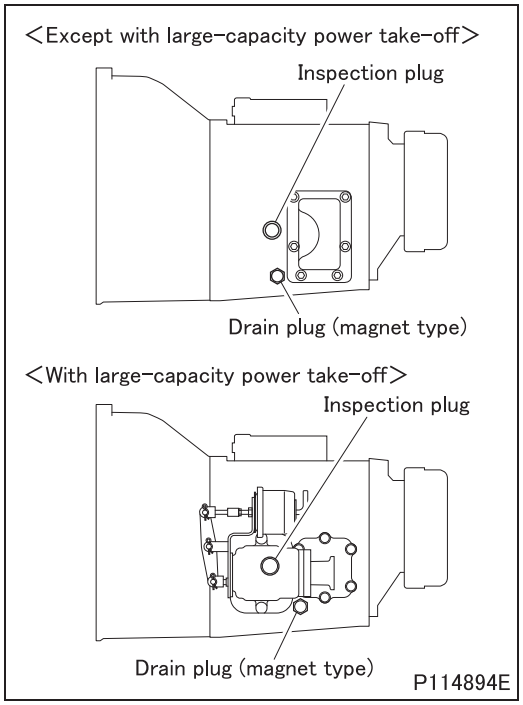


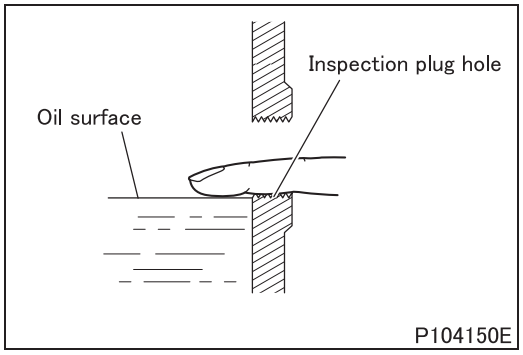
1.1 Inspection of oil leakage at each part of transmission body

- Check the oil leakage at each part of transmission body in visual.
  If the oil leakage is found, replace the defective part.

1.2 Inspection of oil leakage around transmission mounting part

- Check there is not oil stain on transmission mounting part caused by oil leakage from engine.
- If there is the oil stain, remove the transmission and clean the mounting surface of clutch housing and flywheel housing using brake cleaner etc. after repairing oil leakage part. Because the oil stain may loosen the transmission mounting bolts. (See “REMOVAL AND INSTALLATION OF TRANSMISSION”.)





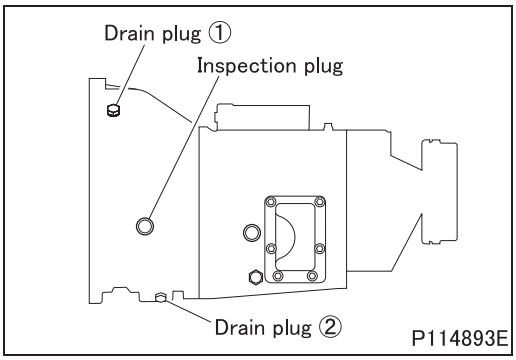
1.3 Inspection of oil quantity

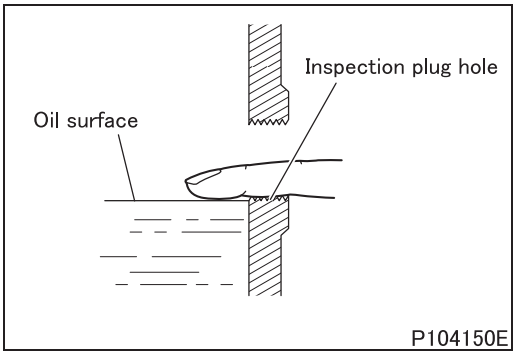
WARNING ⚠

- **Temperature of transmission oil is high immediately after driving. Perform work when oil is cold.**

(1) Transmission case

- Remove the inspection plug, and check that oil is filled up to the neck.
- If oil is not sufficient, fill oil from the inspection plug hole up to the neck.
- After filling, apply sealant to the inspection plug and tighten it to the specified torque.

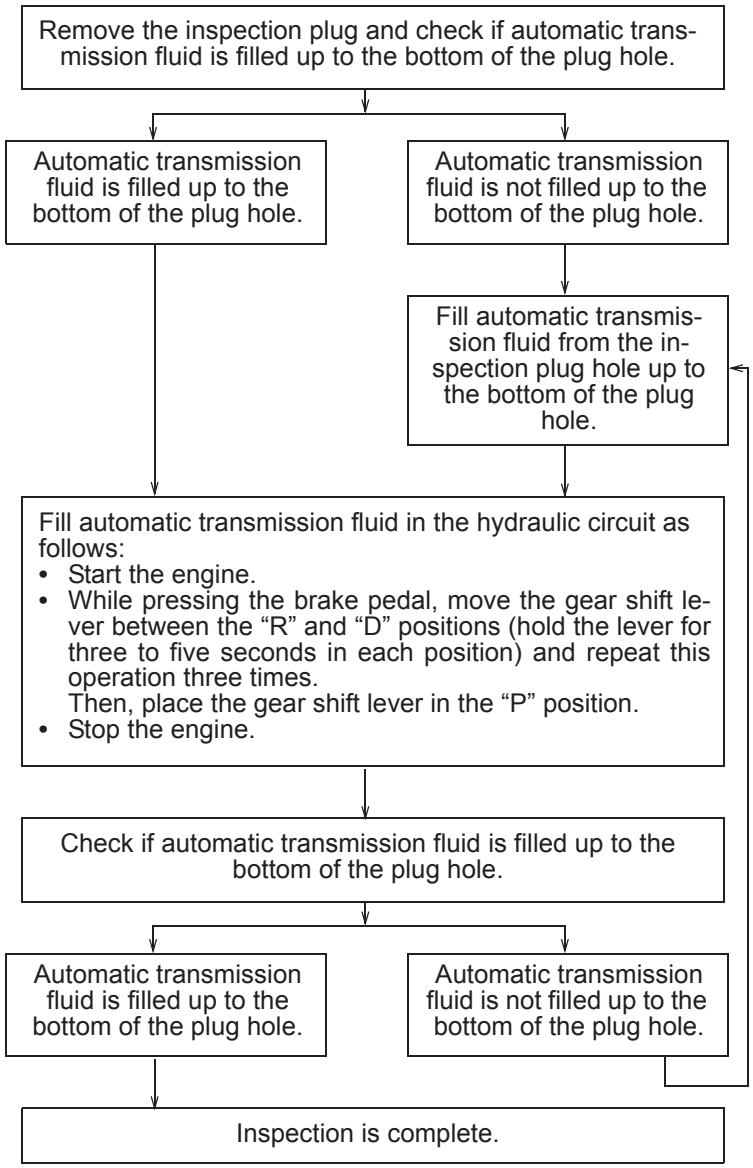




(2) Clutch housing

- Follow the flowchart below to check the automatic transmission fluid level.

Flowchart for checking automatic transmission fluid level



- When the inspection is complete, tighten the inspection plug.

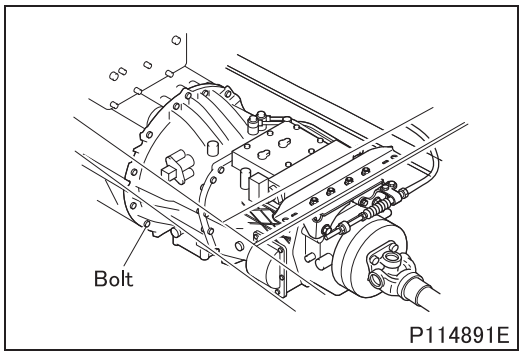
CAUTION ⚠

- **After filling automatic transmission fluid, promptly install the inspection plug to prevent dirt and dust from entering the clutch housing.**

2. Inspection of Looseness in Engine to Clutch Housing Connection

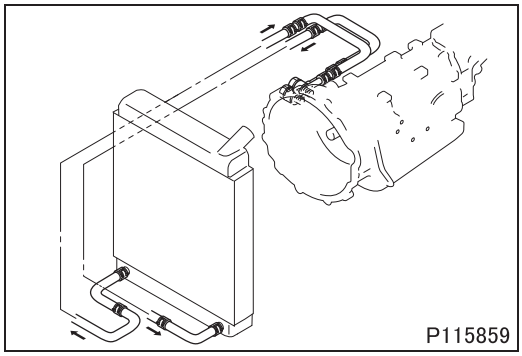
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Bolt (transmission mounting)	47.1 {35, 4.8}	–



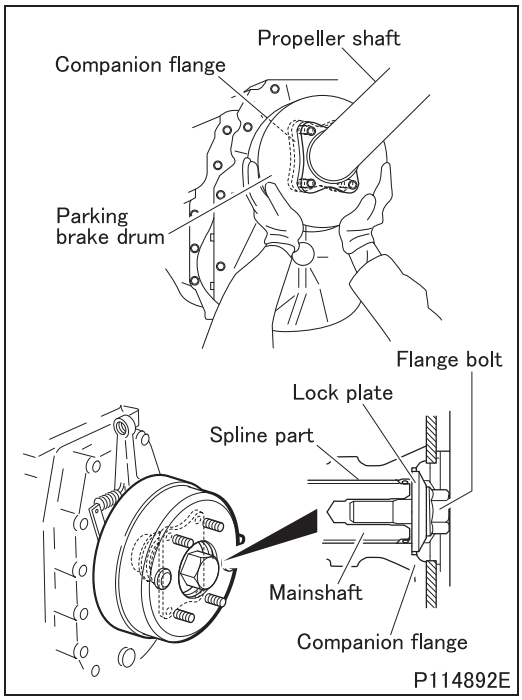
- Check the engine to clutch housing connection for looseness.
- Check the transmission mounting bolts and nuts for looseness.
- Retighten any loose bolt to the specified torque.

3. Inspection of Transmission Cooling System for Leakage, Damage and Installation Condition



- Check the fluid leakage and damage in transmission cooling system. If there is any abnormality, replace the defective part(s). (See “Oil cooler” section.)

4. Inspection of Looseness in Propeller Shaft Connection



- Check the propeller shaft mounting bolts for looseness. (See Gr25.)
- Move the parking brake drum in axial and vertical directions to check for excessive play between the companion flange and mainshaft.
- If excessive play is detected, remove the propeller shaft, then check the companion flange mounting bolt for looseness and the splines on companion flange and mainshaft for abnormalities. If any part is found defective, replace the part. (See “EXTENSION HOUSING” section.)

5. Replacement of Transmission Oil

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Inspection plug	68.6 ± 14.7 {51 ± 11, 7.0 ± 1.5}	–
	Drain plug		

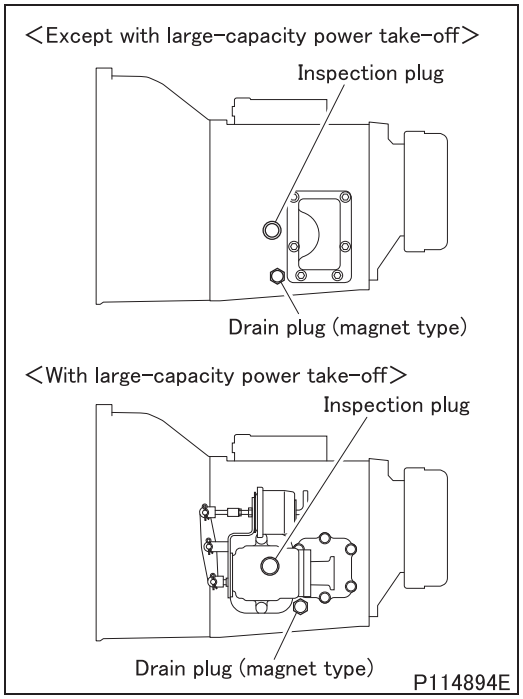
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Thread area of inspection plug	ThreeBond 1105	As required
	Thread area of drain plug		
–	Transmission case	API GL-3 SAE80	Approx. 3.5 L {3.7 qts.}

- Grease depends on the driving conditions.
- For a model with standard type transmission power take-off, the quantity is increased by approx. 0.2 L {0.2 qts.}.
- For a model with large-capacity transmission power take-off, the quantity is increased by approx. 0.3 L {0.3 qts.}

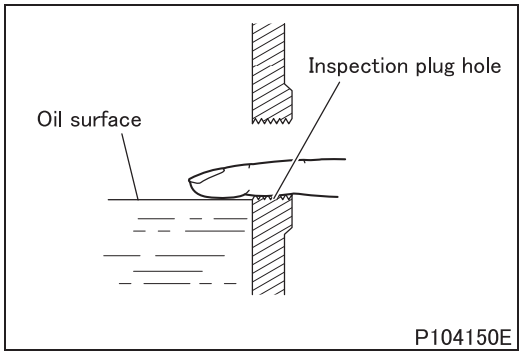
WARNING ⚠

- **Temperature of transmission oil is high immediately after driving. Perform work when oil is cold.**



[Replacement]

- Remove the drain plug to drain transmission oil. Drainage can be made quickly with the inspection plug removed.
- After draining transmission oil, apply sealant to the drain plug and tighten it to the specified torque. Magnet type drain plugs should be cleaned before installation.
- Fill transmission oil in the specified quantity from the inspection plug hole.



- After filling, wait for 1 minute or more to check that oil is filled up to the neck of the inspection plug hole by inserting a finger to the inspection plug hole. If oil is not sufficient, replenish it.
- After completing work, apply sealant to the inspection plug and tighten it to the specified torque.
- When automatic transmission fluid has been replaced, make initial setting of the DUONIC^{TM} system and perform a test drive. (See Gr22E.)
- When transmission oil has been replaced, reset the inspection/service memory of the multi information system. (See “Multi-information system” in chapter 6 of the Owner’s Manual.)

[Inspection]

- When draining transmission oil, check for oil quality, metal chips and metal powder.
- If an abnormally large amount of metal chips and metal powder is found, disassemble the transmission assembly for service, as abnormalities may be caused inside. (See “TRANSMISSION BODY” section.)

6. Replacement of Clutch Control Oil

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

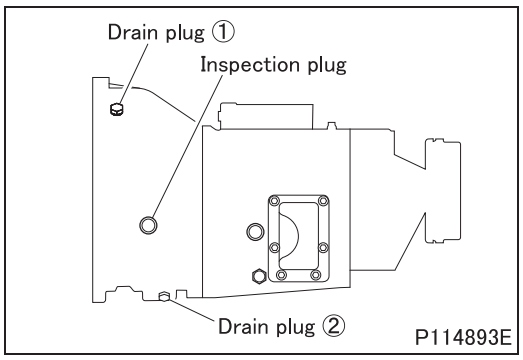
Mark	Parts to be tightened	Tightening torque	Remarks
–	Inspection plug	68.6 ± 14.7 {51 ± 11, 7.0 ± 1.5}	–
	Drain plug (1)	9 to 13 {6.6 to 9.6, 0.9 to 1.3}	–
	Drain plug (2)	39 {2.9, 4.0}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Clutch housing	FUSO ATF-SP III	Approx. 2.0 L {2.1 qts.}

WARNING ⚠

- **Automatic transmission fluid is hot immediately after driving. Perform work when the fluid is cold.**



[Replacement]

- Remove the drain plug to drain automatic transmission fluid. Drainage can be made quickly by removing the inspection plug.
- After draining automatic transmission fluid, tighten the drain plug.

CAUTION ⚠

- **After draining automatic transmission fluid, promptly install the inspection plug to prevent dirt and dust from entering the clutch housing.**

- Fill automatic transmission fluid until it overflows from the inspection plug hole.
- After filling, wait for 1 minute or more to check the automatic transmission fluid level. (See ON-VEHICLE INSPECTION AND ADJUSTMENT.)
- When the work is complete, tighten the inspection plug.

CAUTION ⚠

- **After filling automatic transmission fluid, promptly install the inspection plug to prevent dirt and dust from entering the clutch housing.**

- When automatic transmission fluid has been replaced, make initial setting of the DUONIC^{TM} system and perform a test drive. (See Gr22E.)
- When automatic transmission fluid has been replaced, reset the inspection/service memory of the multi-information system. (See “Multi-information system” in chapter 6 of the Owner’s Manual.)

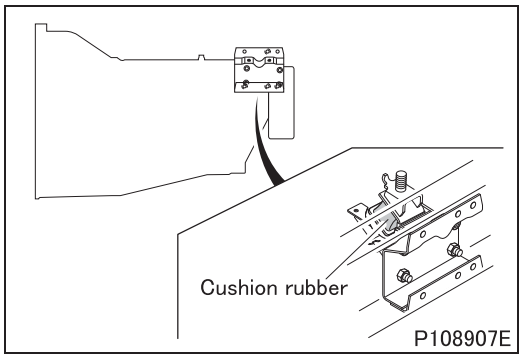
[Inspection]

- When draining automatic transmission fluid, check for fluid quality, metal chips and metal powder.
- If an abnormally large amount of metal chips or metal powder is found, disassemble the transmission assembly for service, as abnormalities may be caused inside. (See VALVE BODY AND DUAL CLUTCH and TRANSMISSION BODY.)
- If there is automatic transmission fluid on the bottom of the transmission, wipe off the fluid and check for leaks from inside. If fluid is leaking, disassemble the transmission assembly for service, as abnormalities may be caused inside. (See VALVE BODY AND DUAL CLUTCH and TRANSMISSION BODY.)
- Since it may not be possible to check for fluid leaks if the air bleed hole in the clutch housing is clogged, add pure water (distilled water) from the inspection hole in the lower part of the flywheel housing and check that the water flows out from the air bleed hole. If the water will not flow out, clean the air bleed hole with a wire or equivalent.

CAUTION ⚠

- **To prevent rust on the components in the flywheel housing, add modest amount of pure water (distilled water) so as not to overflow from the inspection hole.**
- **Be careful not to forget to install the rubber cap on the inspection hole.**

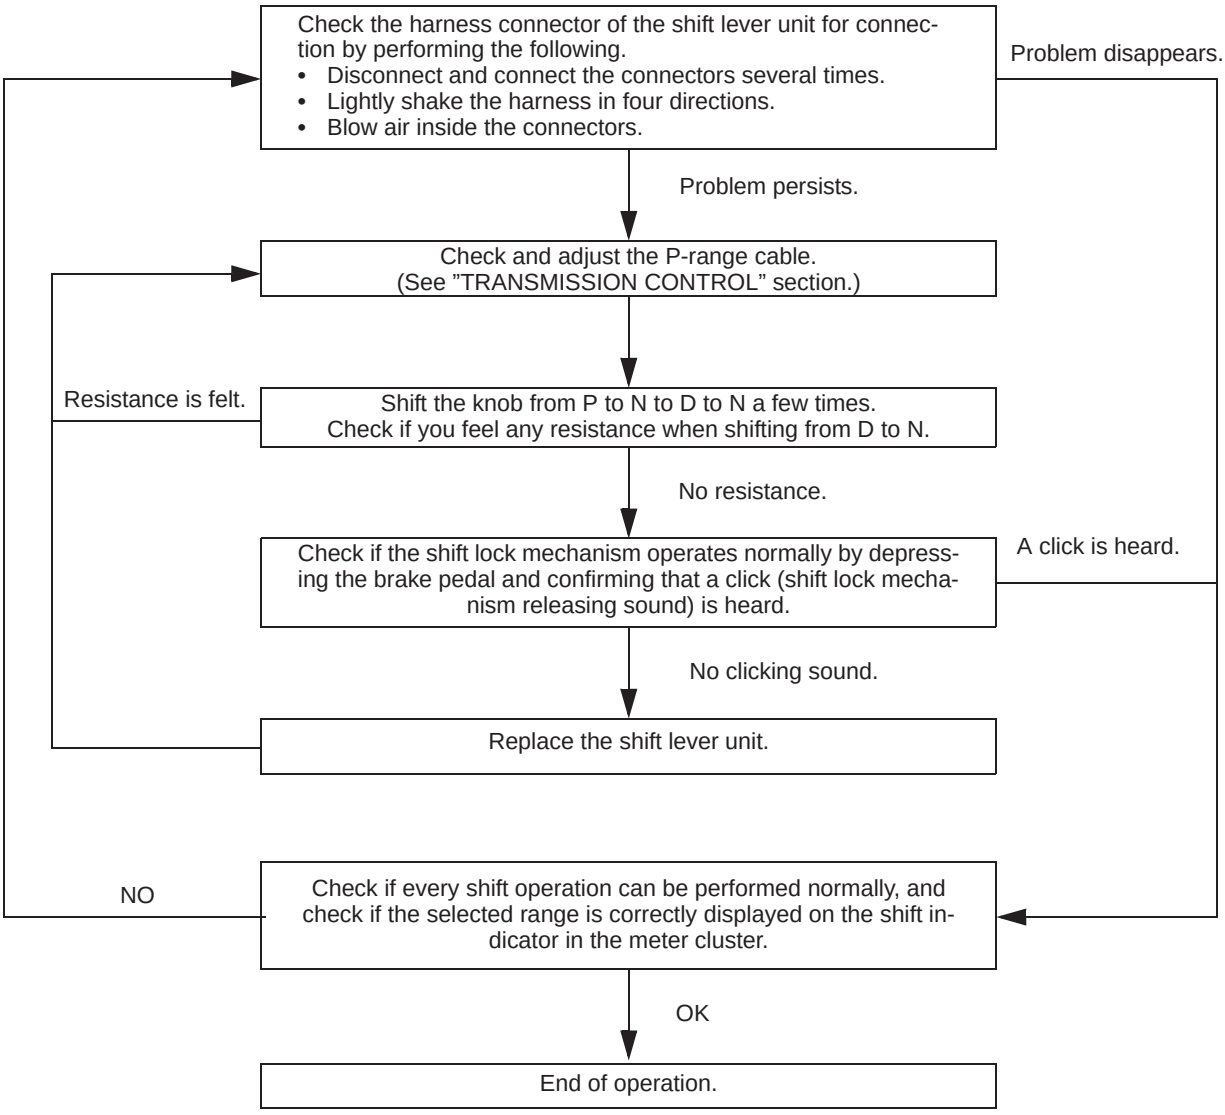
7. Inspection of Transmission Mounting Cushion Rubber



- Check that the cushion rubber on the transmission mounting is free from damage such as scratches, cracks or peeling.
- Use a hand mirror in places that are difficult to see.
- If there is a problem, replace the cushion rubber. (See REMOVAL AND INSTALLATION OF TRANSMISSION.)

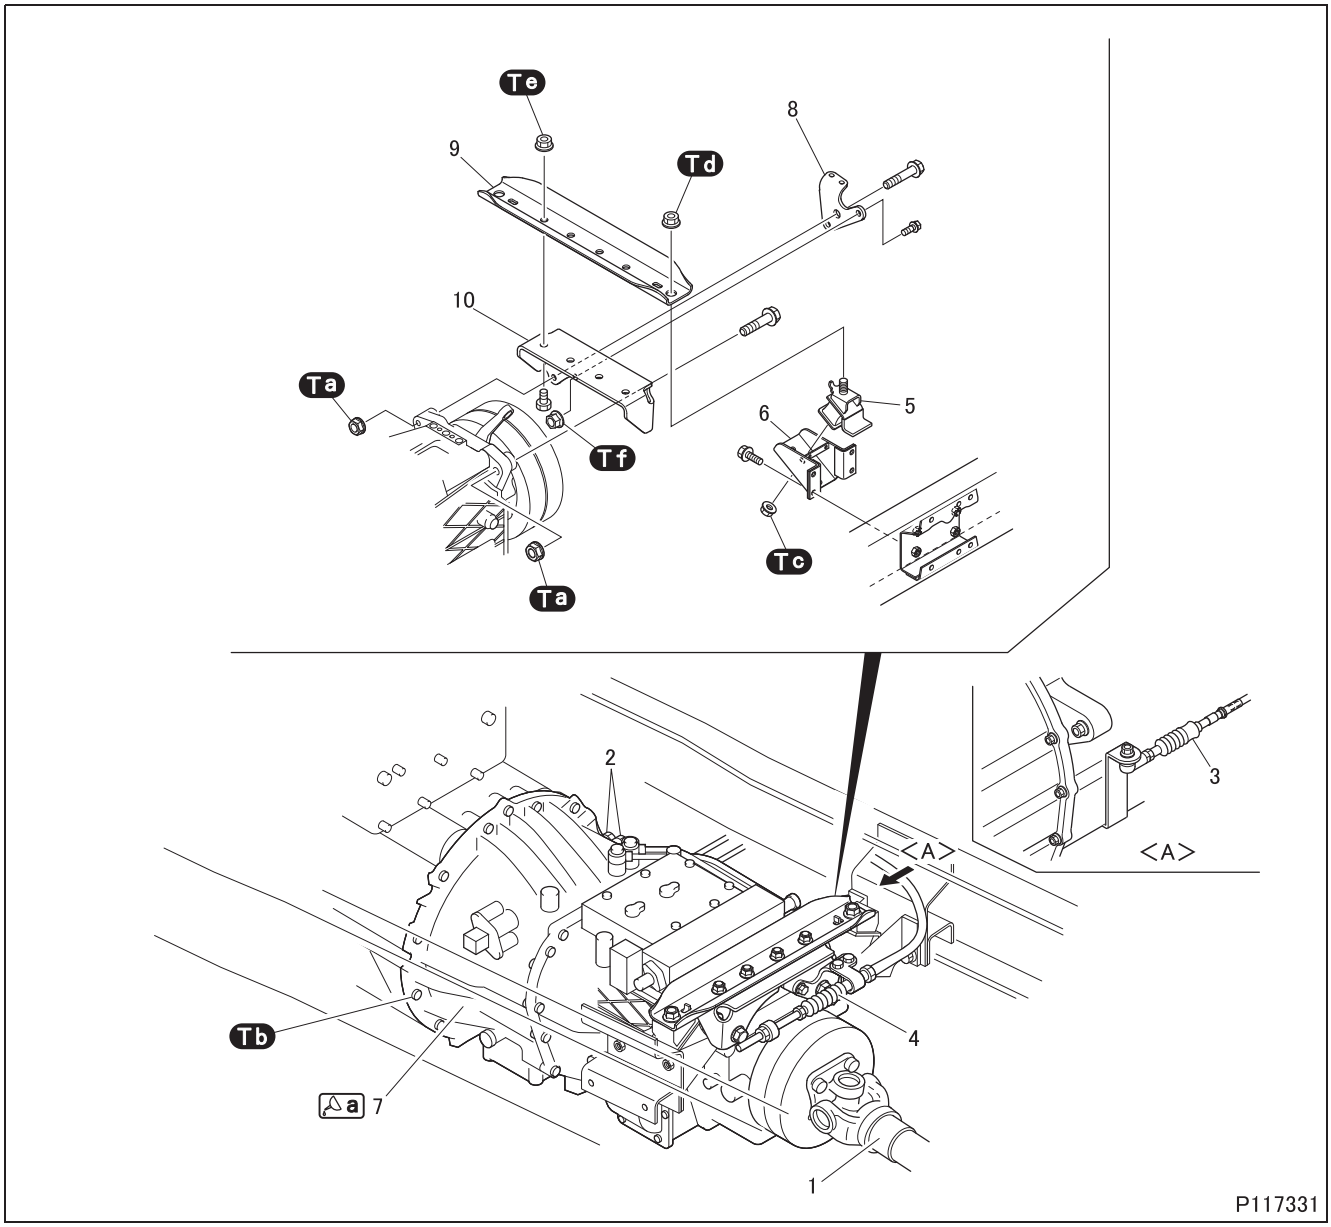
8. Inspection of Transmission control

- If any of the following symptoms occurs when operating the shift knob, perform inspection in the flow chart shown below.
- The shift knob cannot be shifted from D to N.
- The shift lock of the shift lever unit cannot be released so that shifting from P to N, N to P and N to R cannot be performed.
- The selected range is not displayed correctly on the shift indicator in the meter cluster.



M E M O

REMOVAL AND INSTALLATION OF TRANSMISSION



● **Removal sequence**

1 Propeller shaft (See Gr25.)
2 Transmission oil cooler pipe and hose (See later section.)
3 P-range cable (See later section.)
4 Parking brake cable (See Gr36.)
5 Cushion rubber
6 Mounting bracket
7 Transmission
8 Parking brake cable bracket
9 Mounting support
10 Mounting support bracket

● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (transmission mounting)	235 ± 35 {175 ± 26, 24.0 ± 3.6}	–
Tb	Bolt (transmission mounting)	47.1 {35, 4.8}	–
Tc	Nut (cushion rubber mounting)	50.6 {37, 5.2}	–
Td	Nut (cushion rubber mounting)	260 ± 40 {190 ± 30, 27.0 ± 4.1}	–
Te	Nut (mounting support mounting)	145 ± 25 {105 ± 18, 15.0 ± 2.5}	–
Tf	Nut (parking brake cable bracket mounting)	50.6 ± 4.4 {37 ± 3.2, 5.2 ± 0.4}	–

Lubricant and/or sealant

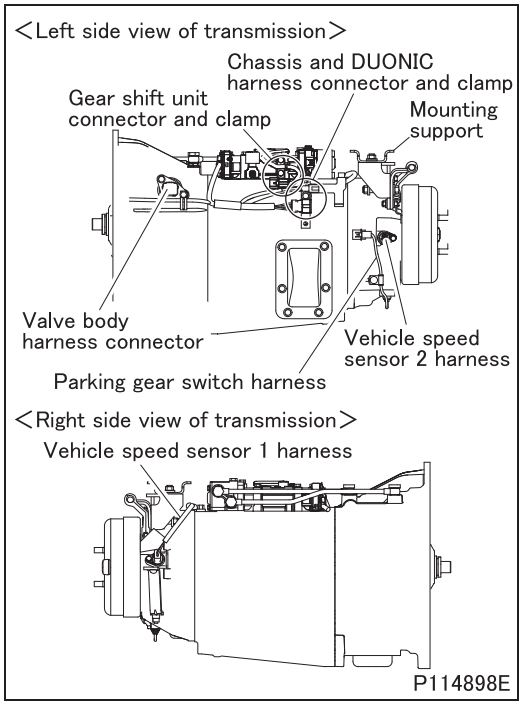
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Mating surface of clutch housing and engine	ThreeBond 1215	As required

◆Work before removal◆

■Removal: Front pipe and diesel particulate filter

- To ensure the clearance for removing the transmission, remove the front pipe and diesel particulate filter. (See Gr15.)

◆Removal procedure◆



■Removal: Harness

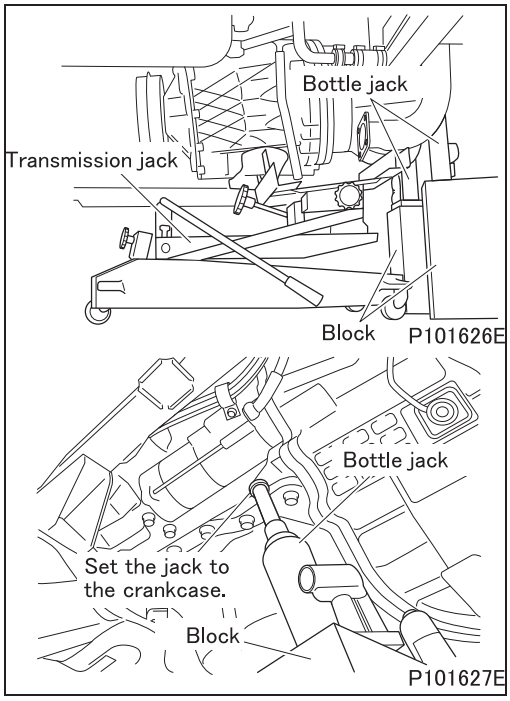
- Remove the harnesses and connectors shown in the drawing from the transmission. If a harness or connector cannot be removed from the bottom of the vehicle, remove it when removing the transmission from the engine.

CAUTION ⚠

- **The harnesses are also clamped to the transmission. Pulling a harness after just removing the connector may cause damage to the harness.**

- Remove the connectors and clamps of the gear shift unit harness as they will interfere with the mounting support when removing the transmission.

REMOVAL AND INSTALLATION OF TRANSMISSION

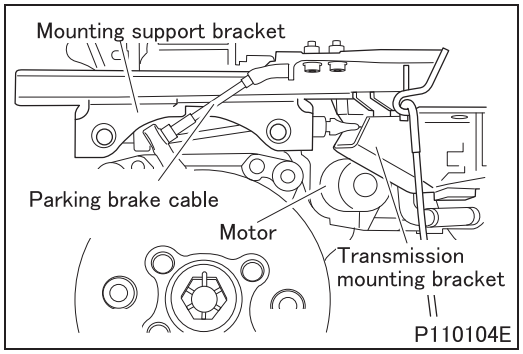


■ **Removal: Transmission**

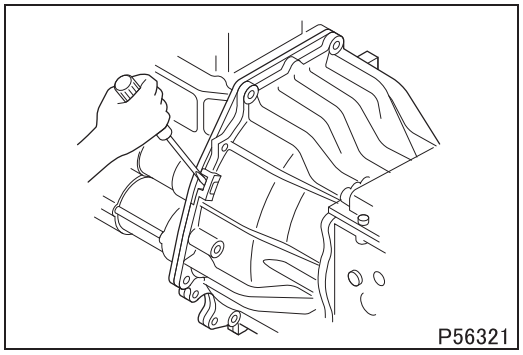
- Apply the transmission jack and two bottle jacks to the transmission and engine block respectively as shown in the drawing before removing the transmission mounting bolts (to the engine and mounting support).
- Place a block under the jacks to apply bottle jacks to the engine block.

CAUTION ⚠

- **If the engine is not supported by the bottle jack, it will fall when the transmission is removed.**



- After removing the transmission mounting bolts, lower the transmission by lowering the transmission jack and bottle jack until it does not interfere with the transmission mounting support bracket.
- Remove the transmission mounting bracket as it will interfere with the gear shift unit motor when removing the transmission.
- Remove the parking brake cable.



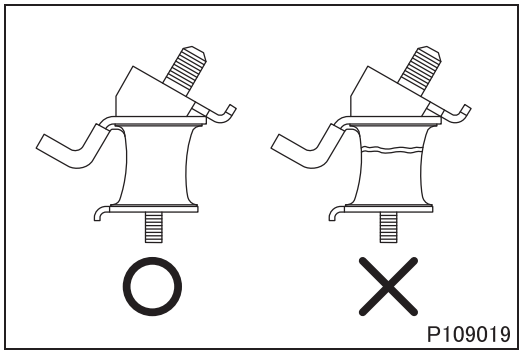
- Insert a screwdriver into the three removal grooves and remove the transmission from the engine.
- Move the transmission backward until the spline of the drive pinion is detached from the clutch.

CAUTION ⚠

- **Make sure that you pull the transmission out in a straight line. If you seesaw the transmission violently, you will damage the spline that connects the drive pinion and the clutch.**

- When the oil stain is found inside of clutch housing after removing the transmission, check the oil leakage portion of transmission or engine and replace the defective part.

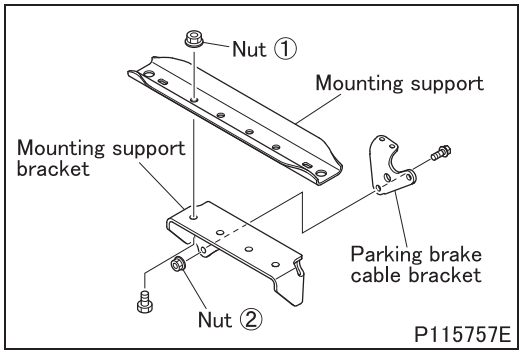
◆Inspection procedure◆



■Inspection: Cushion rubber

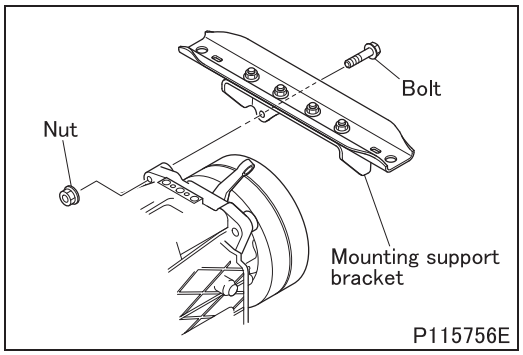
- Inspect the entire circumference of the cushion rubber for cracks, breaks, oil or other problems.
- If a problem is found, replace the cushion rubber.

◆Installation procedure◆



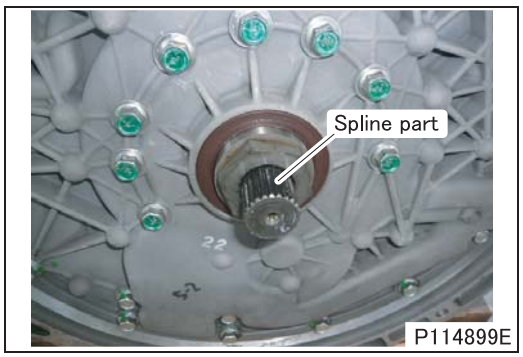
■Installation: Mounting support and parking brake cable bracket

- Install the mounting support and parking brake cable bracket on the mounting support bracket.



■Installation: Mounting support bracket

- Install the mounting support bracket on the transmission.

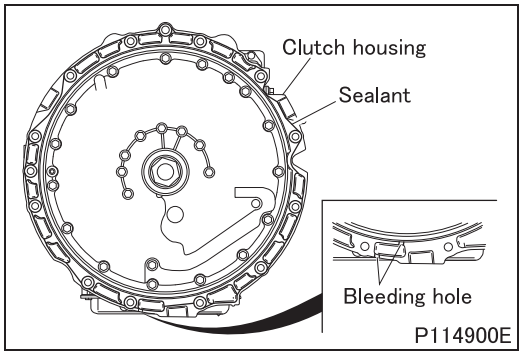


■Installation: Transmission

- Check the spline of the drive pinion of dual clutch for rust.
- If rust is found, remove it using a wire brush.

CAUTION ⚠

- **Do not apply grease to the drive pinion as it may cause abnormal noise.**



[Applying sealant]

- Apply sealant following manners shown below.

CAUTION ⚠

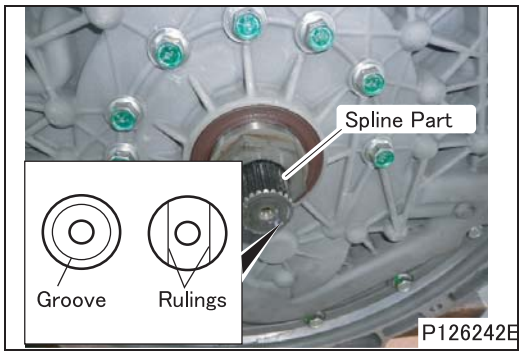
- **Take care not to apply sealant under any of the following conditions. Otherwise it causes water infiltration.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**
- **Use utmost care to prevent the applied sealant from covering the air vent holes on the side of the clutch housing and engine.**

<Case of using nozzle gun>

- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

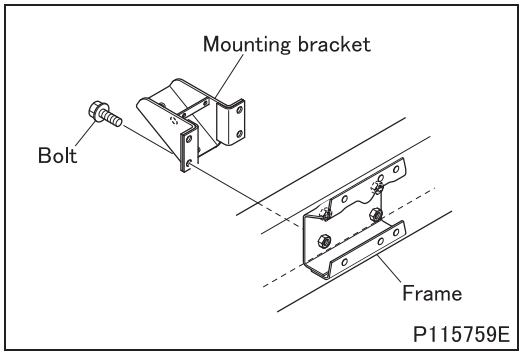
<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.



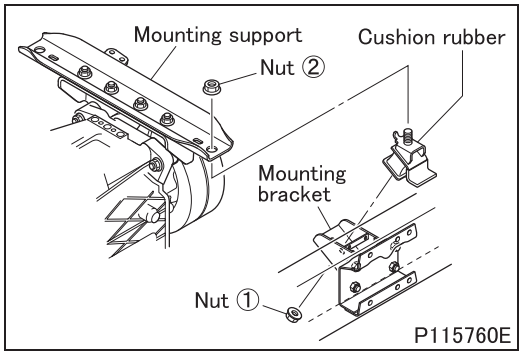
[Installation]

- Before installation, determine a type of the dual clutch used by checking identification marks on the end surface of the clutch spline.
  <Type A> No identification mark
  <Type B> Identification mark (circumferential groove or rulings) provided
- After applying the sealant, install the transmission before the sealant dries. Be sure not to allow the sealant to be displaced.
- Support the transmission on the transmission jack, and insert the transmission into the pilot bearing of the flywheel paying attention to the drive pinion spline.
- Tighten transmission mounting bolts to the specified torque.
- Do not start the engine within one hour after installing the transmission.
- When loosening or removing transmission mounting bolts, be sure to reapply the sealant.



■ Installation: Mounting bracket

- Install the mounting bracket on the frame.



◆Work after installation◆

■ Installation: Cushion rubber

- Install the cushion rubber on the mounting bracket and mounting support.

■ Fill: Automatic transmission fluid

- Fill automatic transmission fluid. (See ON-VEHICLE INSPECTION AND ADJUSTMENT.)
- After filling automatic transmission fluid, make initial setting of the DUONIC™ system and perform a test drive. (See Gr22E.)

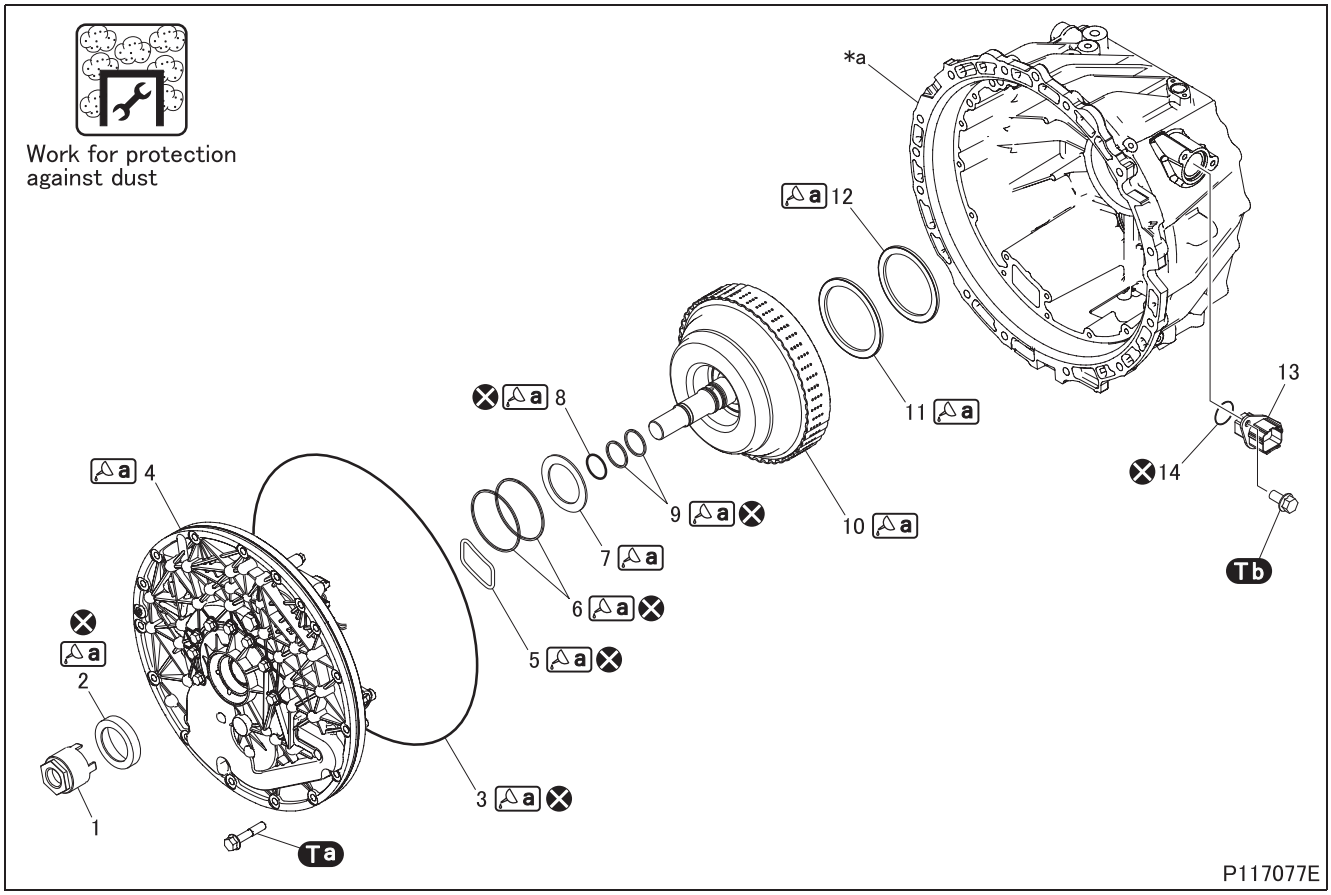
■ Inspection and adjustment: Parking brake lever

- Inspect and adjust the parking brake lever. (See Gr36.)

■ Rewriting conding data : Coding data in electronic control unit

- Check the type of the clutch recorded in the DUONIC™ electronic control unit.Check to see if the type recorded coincides with the one determined in the step before installation. If they do not, rewrite the coding data in the DUONIC™ electronic control unit as appropriate. (See Gr. 22E.)

VALVE BODY, DUAL CLUTCH



● **Removal sequence**

1 Pump driver
2 Oil seal
3 O-ring
4 Valve body
5 O-ring
6 Seal ring
7 Thrust needle bearing A
8 O-ring
9 Seal ring
10 Dual clutch
11 Thrust needle bearing B
12 Bearing thrust washer
13 Bushing connector
14 O-ring

***a**: Transmission (See later section.)

⊗: Non-reusable parts

: This work requires protection against dust. (See Gr00.)

- It is desirable that the job to service portions related to the hydraulic circuit of the transmission (DUONIC™) be performed in an environment comparable to that of a meeting room partitioned from the outside air. If it is not feasible to prepare such an environment, take necessary steps to protect the clutch housing with a vinyl bag for prevention of entry of sand and dust.
- Replace the vinyl bag immediately when it is broken during servicing.

● **Installation sequence**

Follow the removal sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
10	Installed height of dual clutch	12.9 ± 0.4 {0.51 ± 0.016}	–	Replace

◆Work before removal◆

■ Cleaning: Transmission

- Drain automatic transmission fluid. (See ON-VEHICLE INSPECTION AND ADJUSTMENT.)

CAUTION ⚠

- **After draining automatic transmission fluid, promptly install the automatic transmission fluid drain plug and automatic transmission fluid level plug to prevent dirt and dust from entering the clutch housing.**

- Wash the transmission before removal from the vehicle. Thoroughly wash off dirt and dust around the clutch housing.

CAUTION ⚠

- **Be careful not to allow water to enter the transmission from the air bleed hole or other openings.**

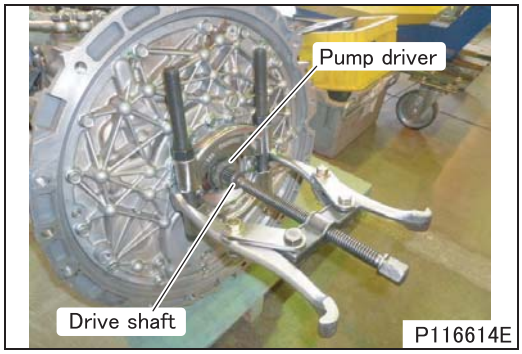
- Remove the transmission. (See REMOVAL AND INSTALLATION OF TRANSMISSION.)
- Check the precautions on washing when servicing. (See Gr00.)
- Use rubber or vinyl gloves that cover hands and arms.
- Use of an apron also is desirable.
- Clean the general tools, special tools, and work benches with a cleaner and a waste cloth before starting the service jobs.

NOTE

- **Do not use cotton work gloves.**
- **Do not use air tools when working inside a plastic bag.**
- **Do not reuse the plastic bag used during the servicing.**

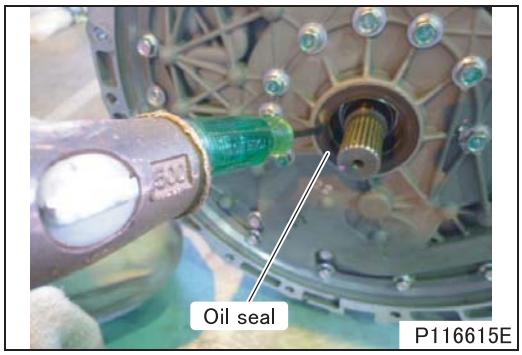
- Wash the transmission once again. After blowing dirt and dust off the clutch housing and valve body, thoroughly wipe them off with a rag, and then perform air blowing once again.

◆Removal procedure◆



■Removal: Pump driver

- Install a commercially available puller on the pump driver grooves and dual clutch drive shaft as shown in the picture and remove the pump driver.

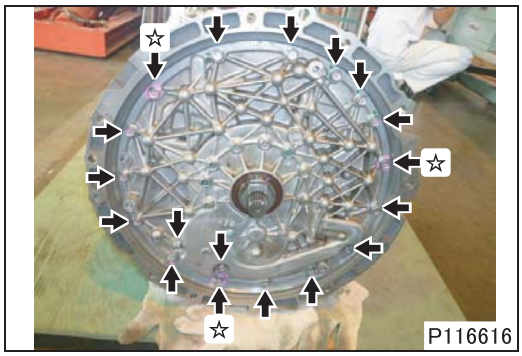


■Removal: Oil seal

- Drive a flat-blade screwdriver into the metal plate part of the oil seal to remove the oil seal.

CAUTION ⚠

- **Be careful not to damage the valve body when driving the screwdriver.**



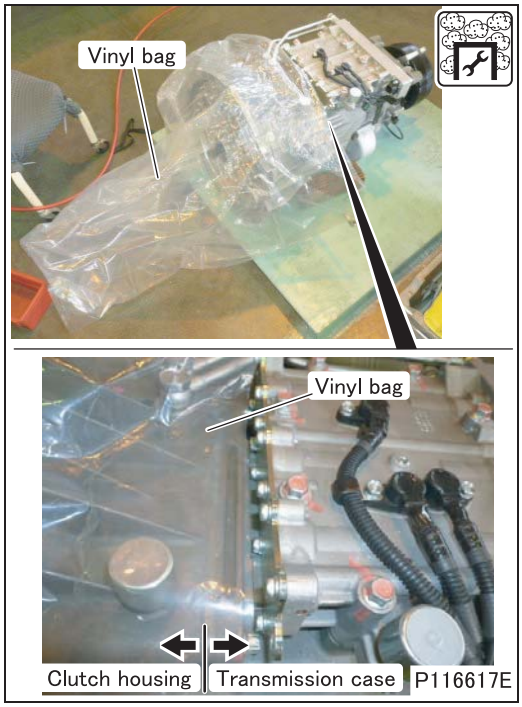
■Removal: Valve body and bushing connector

: This work requires protection against dust.

CAUTION ⚠

- **If the valve body has been removed, the dual clutch may have been displaced; remove and install the dual clutch.**

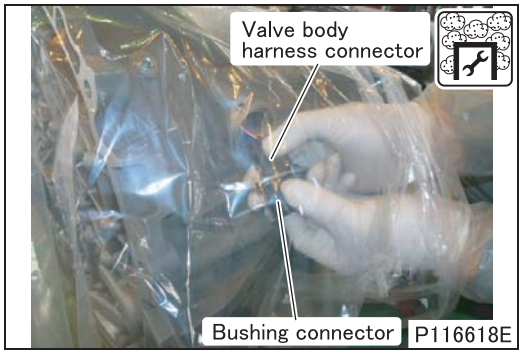
- Remove the mounting bolts except those marked with a "☆" in the picture.
- Loosen the bolts marked with a "☆" in the picture until they can be removed by hand, and then make alignment marks.



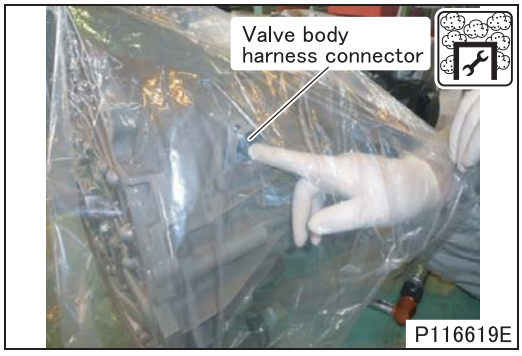
- Cover the clutch housing with a plastic bag.
- Align the open end of the plastic bag with the mating surfaces of the clutch housing and transmission case.
- Use a new plastic bag with a capacity of 90 L {95 qts.} (900 mm {35.4 in.} wide) or more and a thickness of 0.05 mm {0.0020 in.} or more.

NOTE

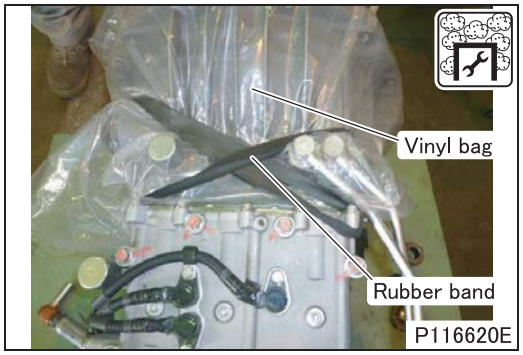
- **Do not use air tools when working inside a plastic bag.**



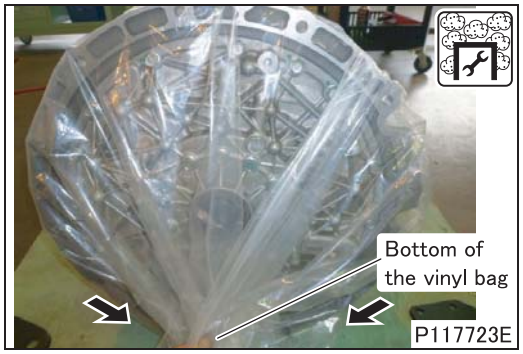
- Remove the busing connector.



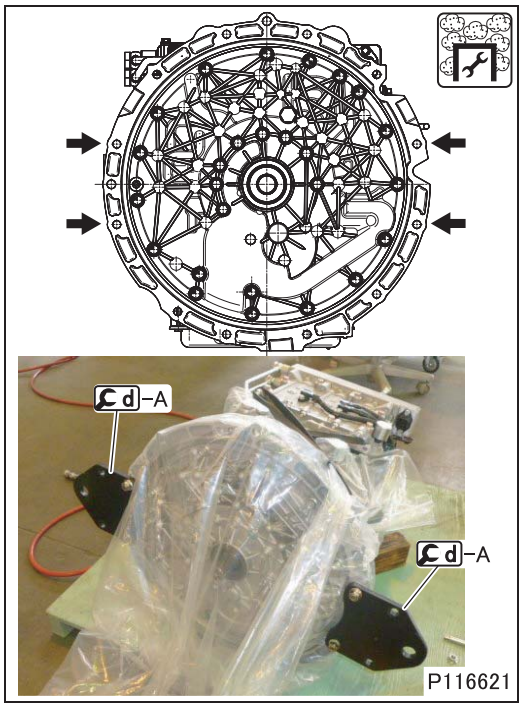
- Push the harness connector of the valve body into the clutch housing.



- Secure the open end of the plastic bag with a rubber band.



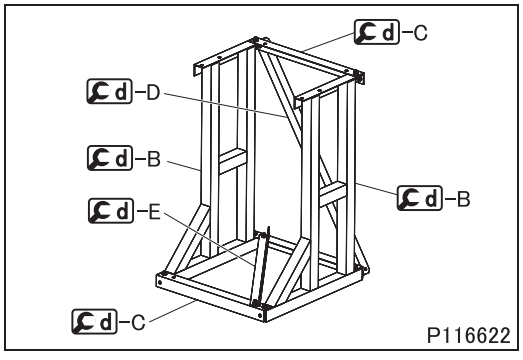
- Pull the bottom of the vinyl bag in the direction shown to eliminate slack.



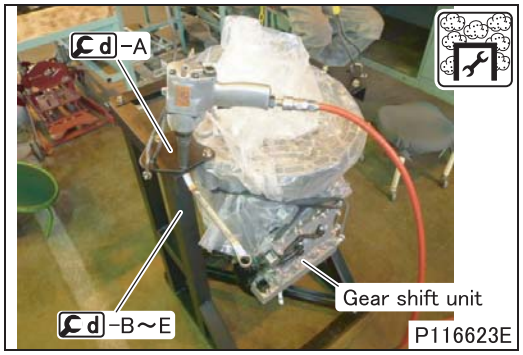
- Install d-A over the plastic bag on the clutch housing at the locations shown in the drawing.

CAUTION ⚠

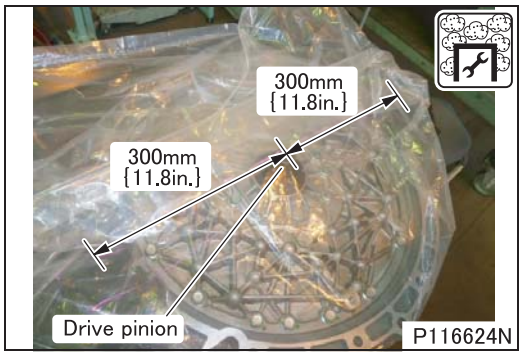
- **Tuck the plastic bag between the clutch housing and d-A to prevent dirt and dust from entering the bag through the mounting bolt holes.**



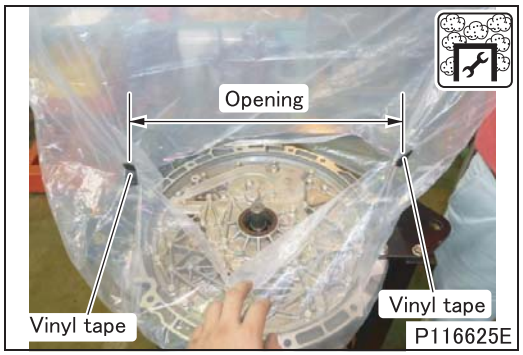
- Assemble d-B to -E.



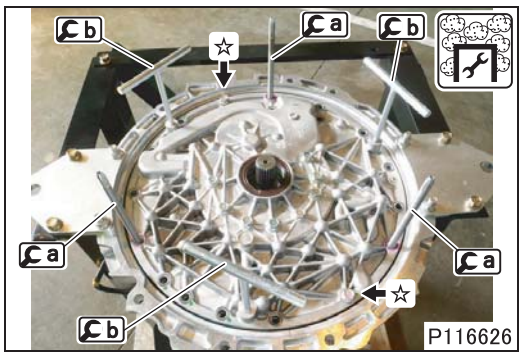
- Lift the transmission with a crane and secure it to d -B to -E in the vertical orientation.
- The gear shift unit side of the transmission should be on the opening side of the assembly of d -B to -E.



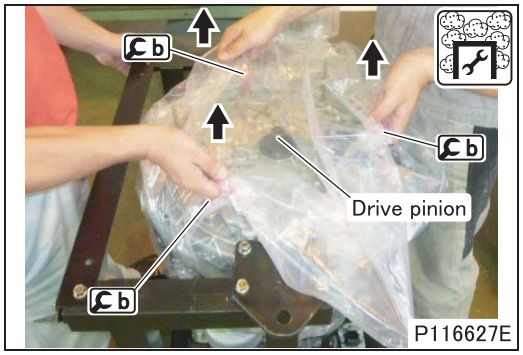
- Remove any slack in the plastic bag, and then draw lines of 300 mm {11.8 in.} long with a marking pen on the left and right sides of the center of the dual clutch drive pinion.



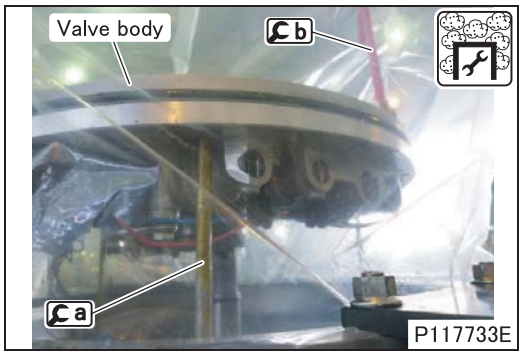
- Cut the plastic bag along the marker lines with a cutter knife to provide a working window.
- Reinforce both ends of the opening with plastic tape or equivalent.



- Remove the three bolts remaining on the valve body by hand, and then install a.
- Install b at the locations shown in the picture.
- Install a bolt at the location marked with ☆ in the figure to prevent the valve body from coming off during the removal procedure.



- When the valve body is lifted, the plastic bag will also be lifted with it; make some slack in the plastic bag in advance.
- Holding b over the plastic bag with your hands, lift the valve body straight up to remove it. At this time, hold the leading end of the drive pinion of the dual clutch in place to prevent the dual clutch from being removed with the valve body.



- Temporarily place the valve body on a and prepare a vinyl bag. At this time, have the maintenance personnel support b, to prevent the valve body from falling.

CAUTION ⚠

- **Do not put your finger under the valve body.**

- Before removing the valve body from the plastic bag, put it in a new plastic bag inside the original plastic bag.

- To prevent dirt and dust from entering the removed valve body, securely close up the opening of the plastic bag.
- Face the vehicle forward side of the valve body downward and place the valve body, to which b is left attached, on the work bench.

■ **Removal: Dual clutch**

: This work requires protection against dust.

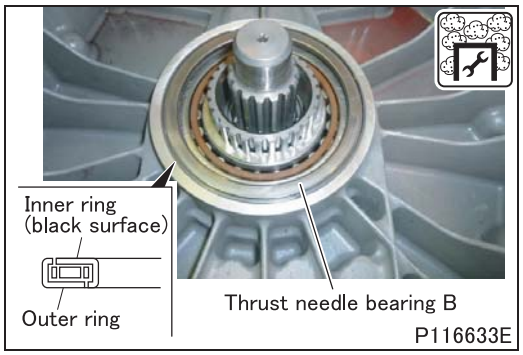
- Before removing the dual clutch, put it in a new plastic bag inside the original plastic bag.
- To prevent dirt and dust from entering the removed dual clutch, securely close up the opening of the plastic bag.

■ **Work after removal**

: This work requires protection against dust.

- Secure the bottom end of the plastic bag with a rubber band to prevent dirt and dust from entering the clutch housing through the opening of the plastic bag.

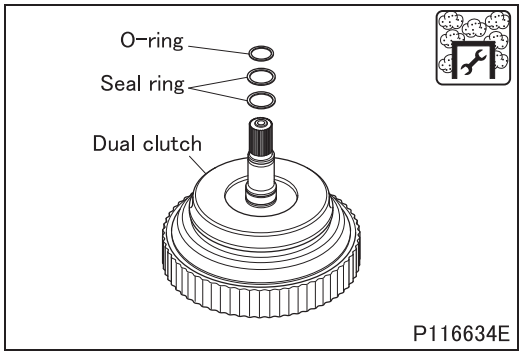
◆**Installation procedure**◆



■ **Installation: Bearing thrust washer and thrust needle bearing B**

: This work requires protection against dust.

- Apply automatic transmission fluid to the sliding surface of each component, and then install thrust needle bearing B so that its black surface is toward the front side of the vehicle.



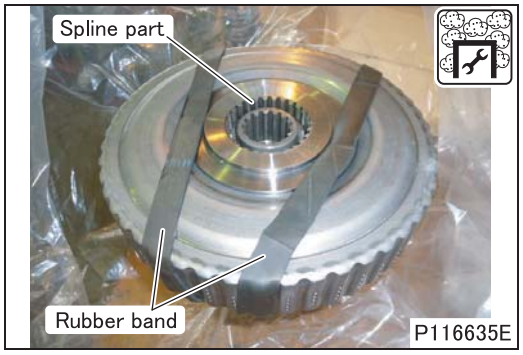
■ **Installation: Seal rings and O-ring**

: This work requires protection against dust.

- Apply automatic transmission fluid to the seal rings and O-ring, and then install them on the dual clutch.

CAUTION ⚠

- **Do not expand the seal ring excessively.**



■ **Installation: Dual clutch**

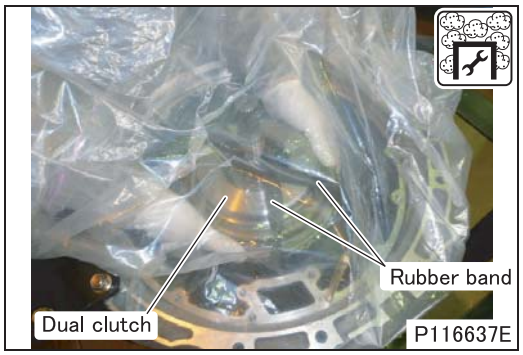
: This work requires protection against dust.

- Degrease and wash the dual clutch to remove automatic transmission fluid from the clutch.
- Install a rubber bands to prevent the dual clutch outer drum from slipping off. Make sure the rubber bands does not catch the spline of the dual clutch outer drum. (When reusing the dual clutch)
- Do not remove the outer drum slipping-off prevention belt attached to a new dual clutch. (When the dual clutch is replaced with a new one)

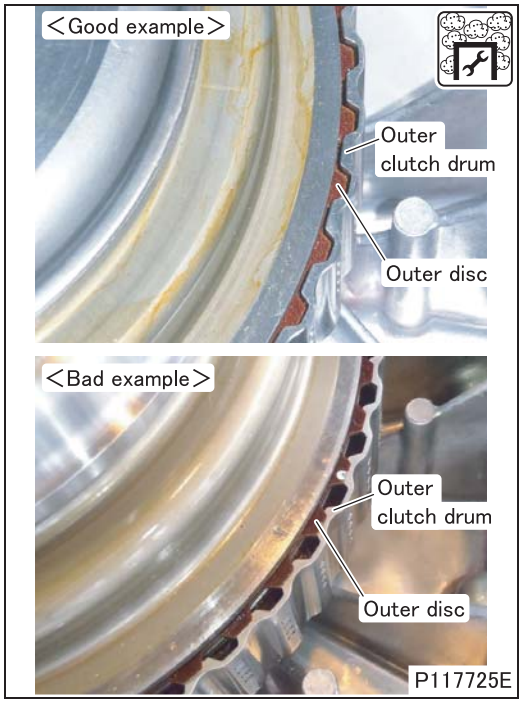
- Replace the plastic bag covering the dual clutch with a new plastic bag.

CAUTION ⚠

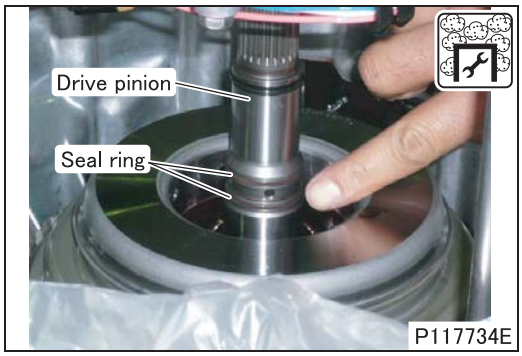
- **Replace the plastic bag immediately before installing the dual clutch on the clutch housing.**



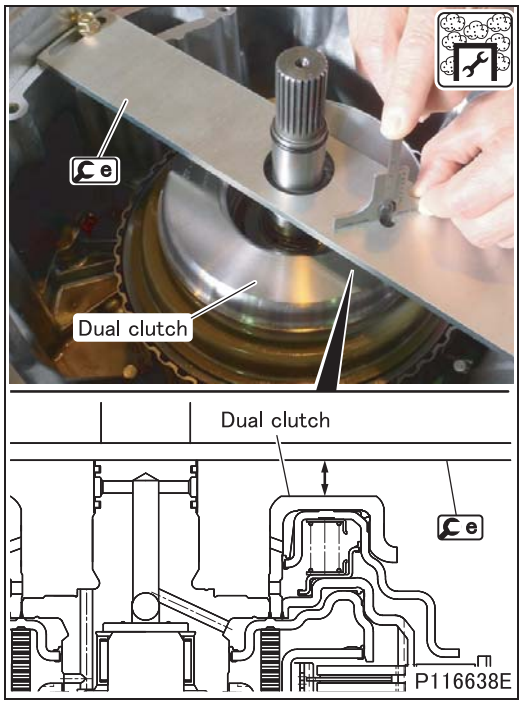
- When the dual clutch is completely inside the plastic bag covering the clutch housing, remove the plastic bag covering the dual clutch and install the dual clutch on the clutch housing.
- After the dual clutch has been installed, turn it clockwise and counterclockwise to make sure that the outer output and outer drive pinion, and the inner output splines and inner drive pinion, are in proper mesh with each other.
- After the check, remove the rubber bands or outer drum slipping-off prevention belt.



- Check that the outer disc does not come off the outer clutch drum.



- Check that the drive pinion of the dual clutch can be turned lightly by hand.
- Make sure that the seal rings are in place in the grooves of the drive pinion of the dual clutch. They should not be unevenly positioned relative to, or protrude from, the grooves.

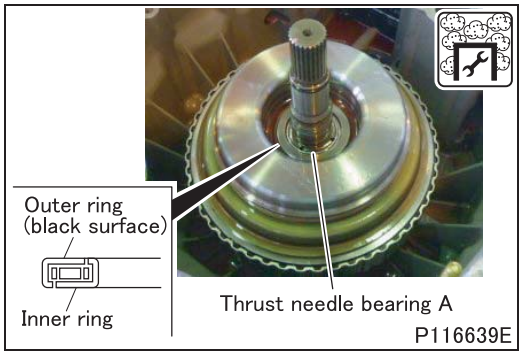


- Install e on the clutch housing.
- Measure the distance between the top surface of the dual clutch and the bottom surface of e. Take measurements at four locations by rotating e in 90° increments.
- If the measurement is deviated from the standard value, reinstall thrust needle bearing B and dual clutch.

CAUTION ⚠

- **If the valve body is installed with the measurement falling outside the standard value, thrust needle roller bearing B may be damaged. Be sure to start the installation procedure over if the standard value is not met.**

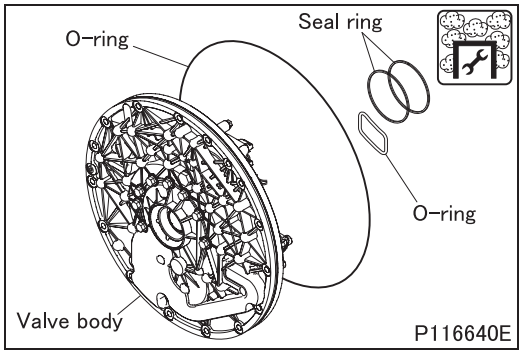
- If the measurement after reinstallation is still deviated from the standard value, replace defective parts.



■ Installation: Thrust needle bearing A

: This work requires protection against dust.

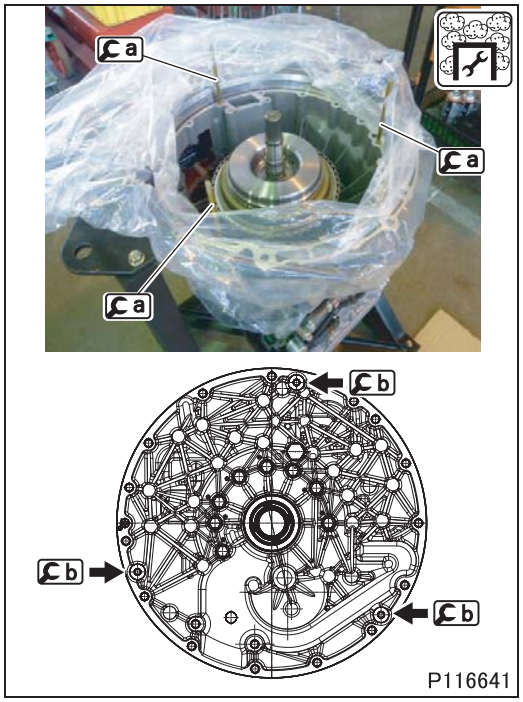
- Apply automatic transmission fluid to the sliding surfaces, and then install thrust needle bearing A so that its black surface is toward the front side of the vehicle.



■ Installation: Seal rings and O-ring

: This work requires protection against dust.

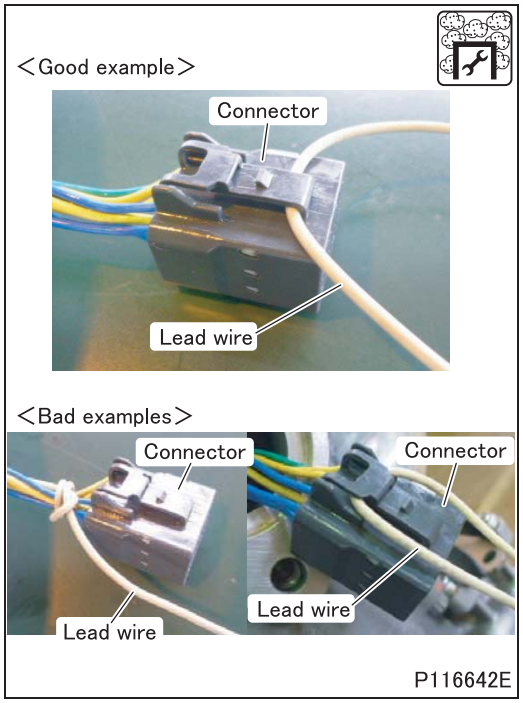
- Apply automatic transmission fluid to the seal rings and O-ring, and then install them on the valve body.



■ Installation: Valve body and bushing connector

: This work requires protection against dust.

- Install a on the clutch housing at the locations shown in the picture.
- Install b on the valve body at the locations shown in the drawing.



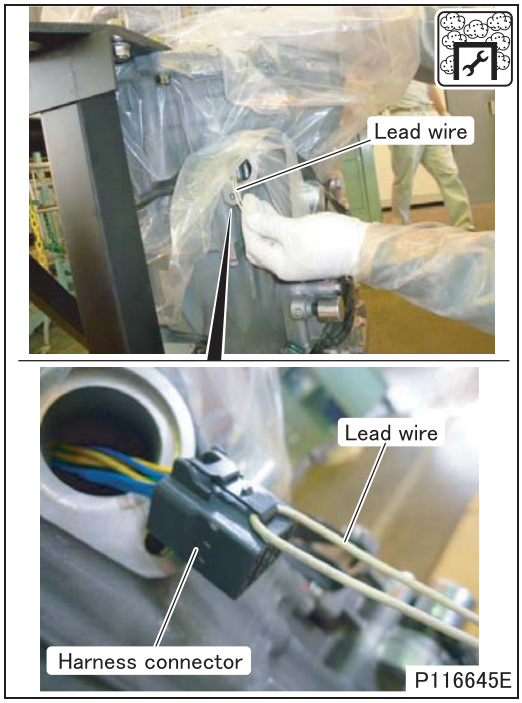
- Install the lead wire harness on the harness connector on the valve body as shown in the picture.

- Replace the plastic bag covering the valve body with a new plastic bag.
- Clean the mating surfaces of the valve body and clutch housing.

CAUTION ⚠

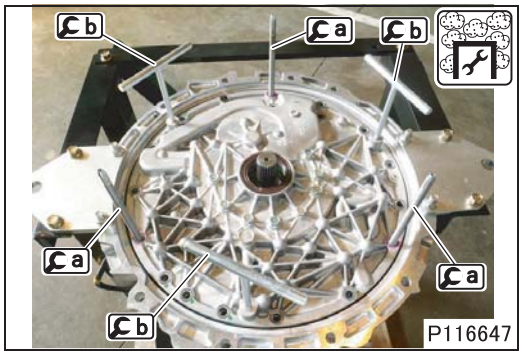
- **Replace the plastic bag and clean the mating surfaces immediately before installing the valve body on the clutch housing.**

- When the valve body is completely inside the plastic bag covering the clutch housing, remove the plastic bag covering the valve body.

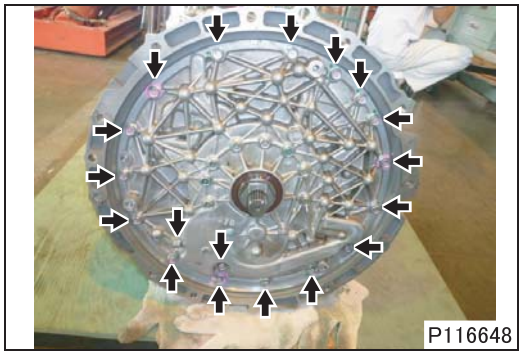


- Pull the lead wire installed on the harness connector on the valve body out of the hole in the bushing connector mount on the clutch housing.
- Remove the lead wire, and then install the bushing connector to the harness connector on the valve body and clutch housing.

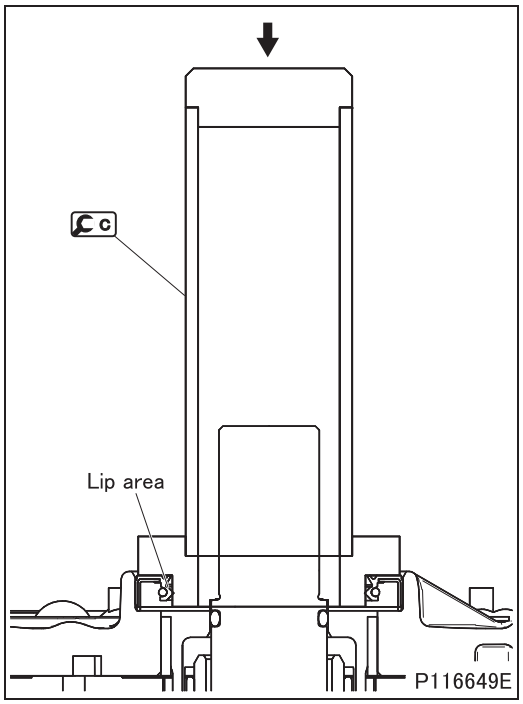
- Install the valve body on the clutch housing.
- Check that the valve body is entirely inside the clutch housing.
- Check that the drive pinion of the dual clutch can be turned by hand.



- Remove a, and then temporarily tighten the valve body mounting bolts by hand.
- Remove b.



- Remove the plastic bag covering the clutch housing.
- Install the valve body mounting bolts.



■ **Installation: Oil seal**

- Apply automatic transmission fluid to the lip area of the oil seal, and then install the oil seal in the illustrated direction using C.

■ **Installation: Pump driver**

- Install the pump driver as follows:

[Heating]

- Heat the pump driver evenly to 110°C {230°F} using one of the following methods.

CAUTION ⚠

- **If the pump driver is too hot, it may cause damage to the oil seal; do not heat the pump driver to higher than 110°C {230°F}.**

<Temperature-controlled chamber>

- Heat the pump driver with a temperature setting of 110°C {230°F} for more than 30 minutes.

<Ring heater>

- Repeat a heating process two to three times with a temperature setting of 110°C {230°F} so that the entire pump driver is evenly heated to 110°C {230°F}.

CAUTION ⚠

- **Repeat the heating process two to three times because sufficient thermal expansion of the pump driver cannot be achieved in a single heating process.**

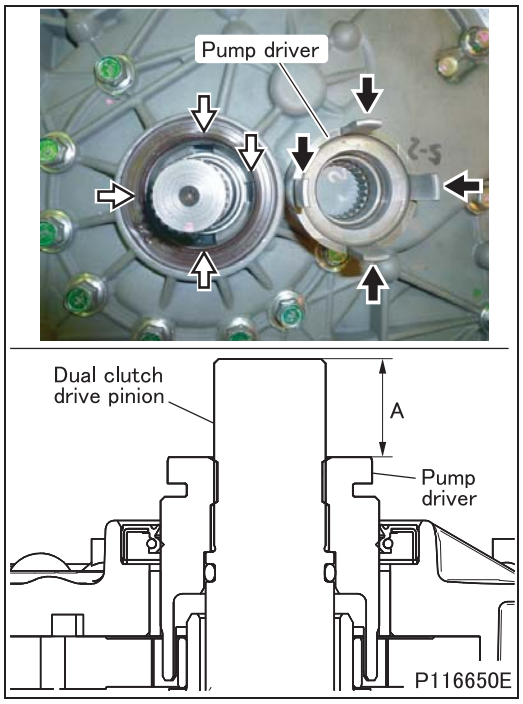
<Oil bath>

- Heat automatic transmission fluid to 110°C {230°F} and immerse the pump driver in the oil bath.

CAUTION ⚠

- **Be sure to use automatic transmission fluid when heating the pump driver in an oil bath.**
- **Be sure to put the pump driver in the oil bath with its protrusions facing up. If the protrusions are facing down, their edges will make direct contact with the heat source, thus heating the pump driver to higher than 110°C {230°F}.**

- Since the automatic transmission fluid temperature drops when the pump driver is immersed in the oil bath, reheat the fluid to 110°C {230°F} and keep the pump driver immersed in the oil bath for more than 20 minutes while maintaining the fluid temperature at 110°C {230°F}.



[Installation]

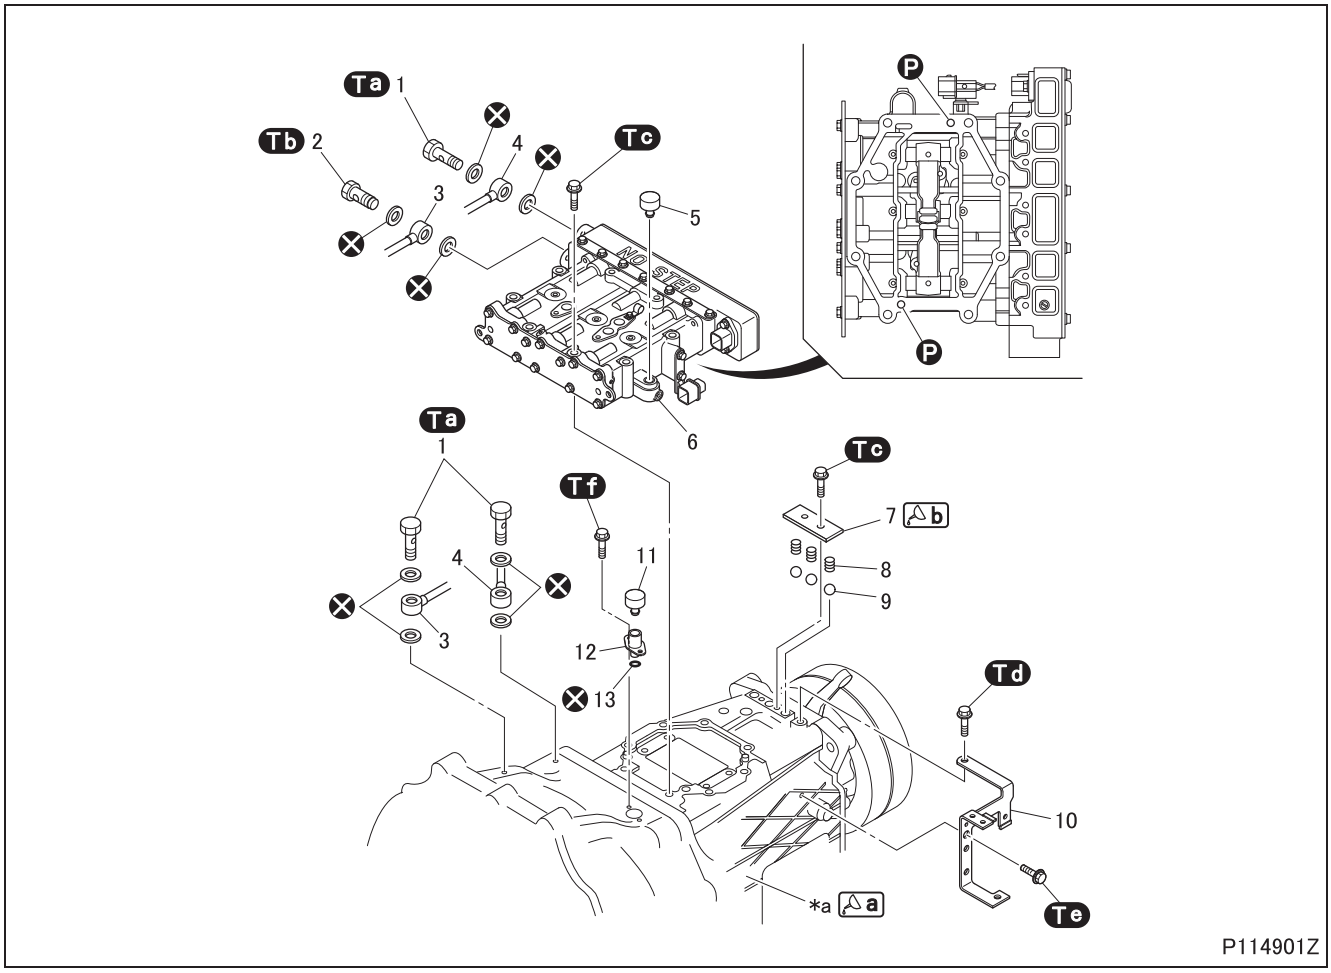
- If the pump driver is heated in an oil bath, wipe ATF completely.
- Install the pump driver by aligning the four protrusions with the valve body.

WARNING ⚠

- **Take care not to burn yourself when installing the hot pump driver.**

- If the pump driver is cool, reheat it before installation.
- After installation, check that distance A shown in the drawing is the following value:
  A: 23.45 mm {0.92 in.}

GEAR SHIFT UNIT



● Removal sequence

1 Eyebolt
2 Eyebolt with oil filter
3 Gear shift unit oil pipe
4 Gear shift unit exhaust oil pipe
5 Air breather
6 Gear shift unit
7 Poppet spring plate
8 Poppet spring
9 Steel ball
10 Harness bracket
11 Air breather
12 Air breather bracket
13 O-ring

***a**: Transmission case
Ⓟ: Locating pin
⊗: Non-reusable parts

● Installation sequence

Follow the removal sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
8	Poppet spring installed load (installed length 21.7 {0.85})	61.2 ± 5.9 N {14 ± 1.3 lbs, 6.24 ± 0.6 kgf}	43 N {9.7lbs, 4.4 kgf}	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Eyebolt	34 to 44 {25 to 32, 3.5 to 4.5}	–
Tb	Eyebolt with oil filter	25 to 29 {18.5 to 21.0, 2.5 to 3.0}	–
Tc	Bolt (gear shift unit mounting)	$23.8^{+4.2}_{-4.8}$ {$17.5^{+3.1}_{-3.5}$, $2.4^{+0.3}_{-0.5}$}	–
	Bolt (poppet spring plate mounting)		
Td	Bolt (harness bracket mounting)	23.8 {17.5, 2.4}	–
Te	Bolt (harness bracket mounting)	12.7 {9.4, 1.3}	–
Tf	Bolt (air breather bracket mounting)	5.45 {4.0, 0.6}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Mating surface of gear shift unit and transmission case	ThreeBond 1194 or ThreeBond 1215 or ThreeBond 1216 or Loctite 5999	As required
b	Mating surface of poppet spring plate and transmission case	ThreeBond 1215	As required

◆Removal procedure◆

■Removal: Gear shift unit oil pipe and gear shift unit exhaust oil pipe

- Store the removed oil pipes in a plastic bag to prevent dirt and dust from entering the pipes.

◆Inspection procedure◆

■Inspection: Eyebolt with oil filter

- Check the eyebolt with oil filter for contamination by foreign objects.
- If contaminated by foreign objects, replace the eyebolt with oil filter with a new one.

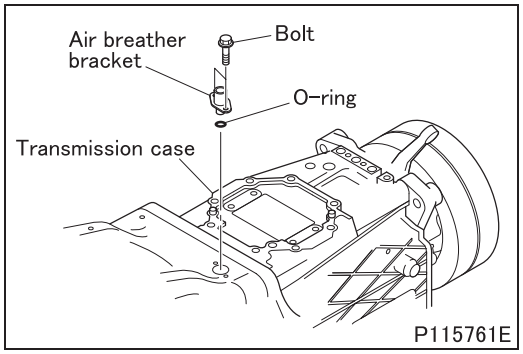
CAUTION ⚠

- **If the oil filter is contaminated by foreign objects, do not reuse the eyebolt by cleaning the filter.**

■Inspection: Poppet spring

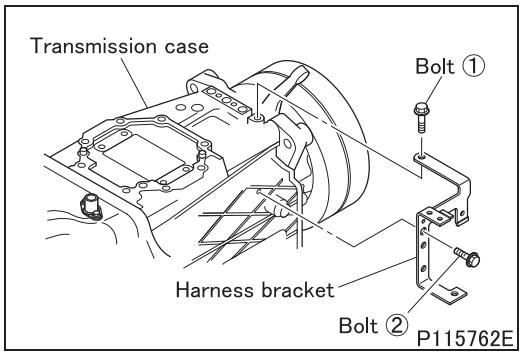
- Measure the installed load at the installed length of the poppet spring.
- If the measurement is below the limit, replace the poppet spring.

◆Installation procedure◆



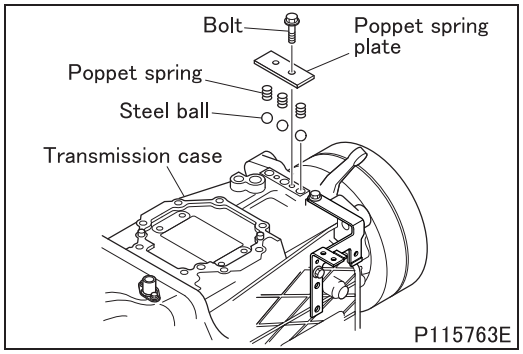
■Installation: Air breather bracket

- Install the air breather bracket on the transmission case.



■Installation: Harness bracket

- Install the harness bracket on the transmission case.

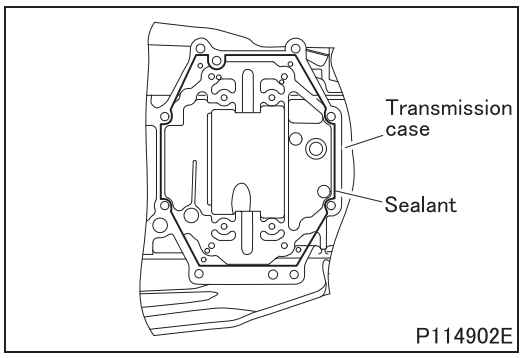


■Installation: Poppet spring plate

- Apply sealant to the mating surfaces of the poppet spring plate and transmission case, and then install the poppet spring plate on the transmission case.

CAUTION ⚠

- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**



■Installation: Gear shift unit

[Applying sealant]

- Apply sealant onto the transmission case, following manners shown below.

CAUTION ⚠

- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**
- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

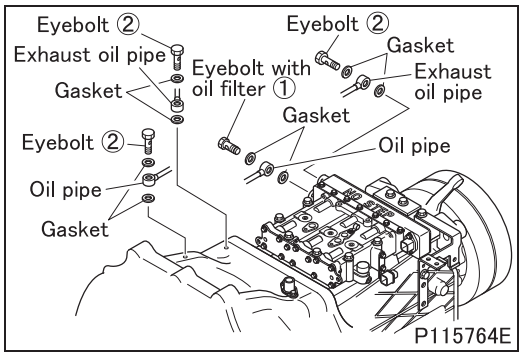
- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

[Installation]

- After applying the sealant, install the gear shift unit before the sealant dries. Be sure not to allow the sealant to be displaced.
- Do not start the engine within one hour after installing the gear shifter upper.
- When loosening or removing gear shift unit mounting bolts, be sure to reapply the sealant.



■ Installation: Oil pipe and exhaust oil pipe

- Install the oil pipes and exhaust oil pipes on the transmission case and gear shift unit using the eyebolt with oil filter and eyebolts.

CAUTION ⚠

- **Be careful not to install the eyebolt with oil filter in a wrong place.**

EXTENSION HOUSING AND PARKING BRAKE <FE>

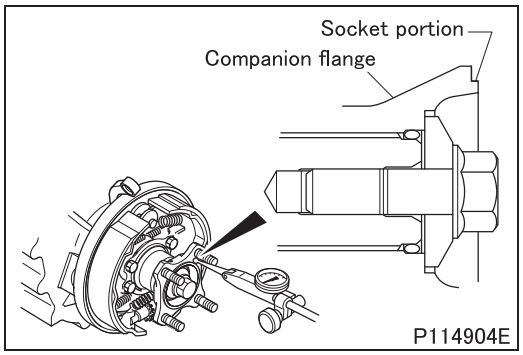
EXTENSION HOUSING AND PARKING BRAKE <FE>

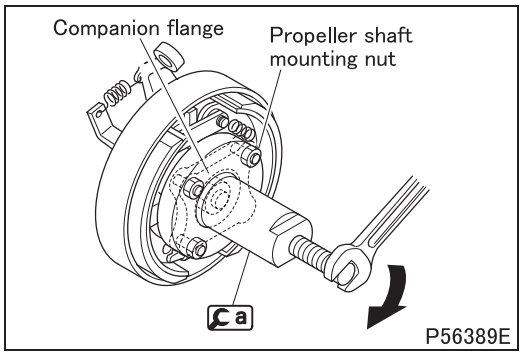
Mark	Tool name and shape	Part No.	Application
[c]	Eyebolt A: M14×1.5  P41198	MH063515	Removal and installation of extension housing

◆Removal procedure◆

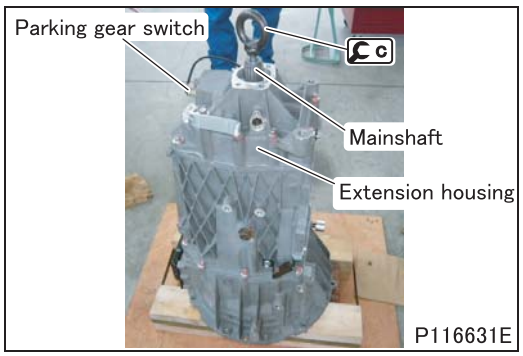


■Inspection: Runout at socket portion of companion flange

- After removing the parking brake drum, measure the runout at the socket portion of the companion flange.
- If the measurement exceeds the limit, replace the companion flange.

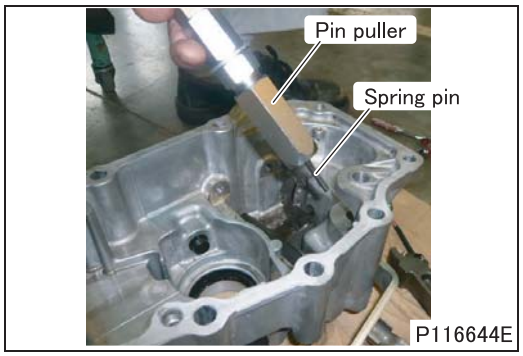


■Removal: Companion flange



■Removal: Parking gear switch and extension housing

- Install [c] on the mainshaft. Lift the mainshaft and set it in the vertical orientation with the clutch housing facing down.
- Remove the parking gear switch.
- Remove the extension housing.



■Removal: Spring pin

- Use a commercially available pin puller and sliding hammer to remove the parking shift lever spring pin.

◆Inspection procedure◆

■Inspection: Parking sprag spring

- Measure the installed load at the installed length of the parking sprag spring.
- If the measurement is below the limit, replace the parking sprag spring.

◆Installation procedure◆

■Installation: Parking gear

- Install the parking gear as follows.

[Heating]

- Heat the parking gear evenly to 150°C {302°F} using one of the following methods.

<Temperature-controlled chamber>

- Heat the parking gear with a temperature setting of 150°C {302°F} for more than 30 minutes.

<Ring heater>

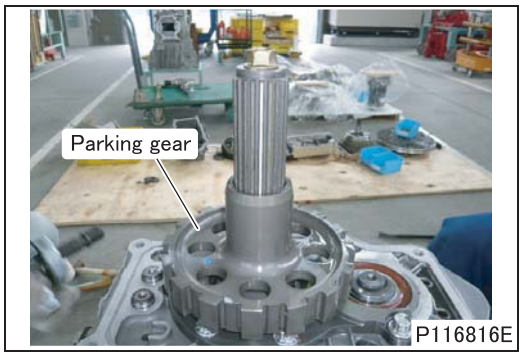
- Repeat a heating process two to three times with a temperature setting of 150°C {302°F} so that the entire parking gear is evenly heated to 150°C {302°F}.

CAUTION ⚠

- **Repeat the heating process two to three times because sufficient thermal expansion of the parking gear cannot be achieved in a single heating process.**

<Oil bath>

- Heat automatic transmission fluid to 150°C {302°F} and immerse the parking gear in the oil bath.
- Since the automatic transmission fluid temperature drops when the parking gear is immersed in the oil bath, reheat the fluid to 150°C {302°F} and keep the parking gear immersed in the oil bath for more than 20 minutes while maintaining the fluid temperature at 150°C {302°F}.

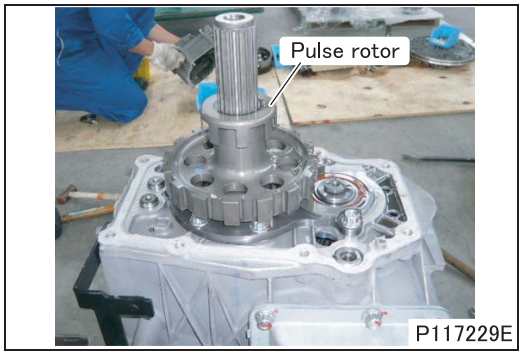


[Installation]

- Install the parking gear.

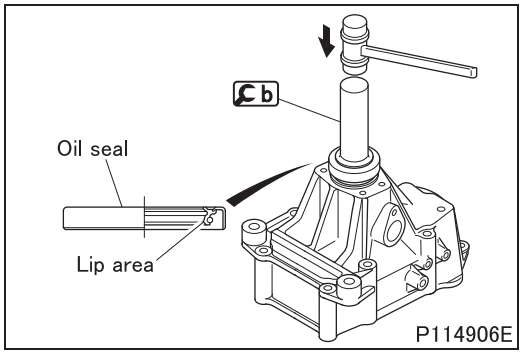
WARNING ⚠

- **Take care not to burn yourself when installing the hot parking gear.**



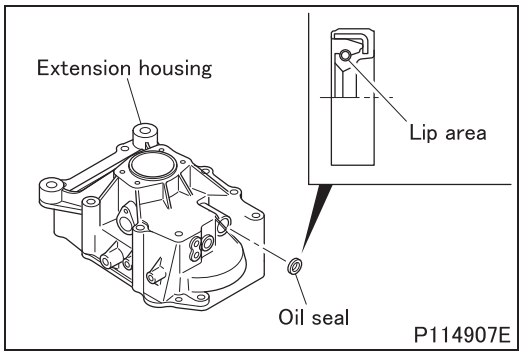
■ **Installation: Pulse rotor**

- Install the pulse rotor in the illustrated orientation.



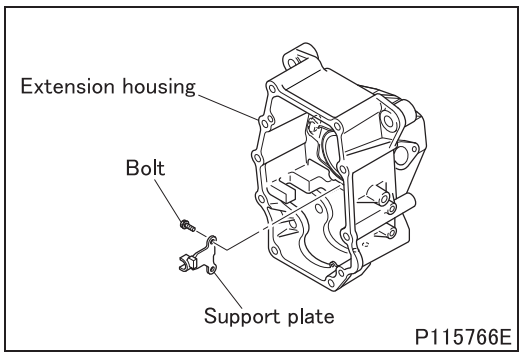
■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal.
- Install the oil seal in the extension housing in the illustrated direction using b.



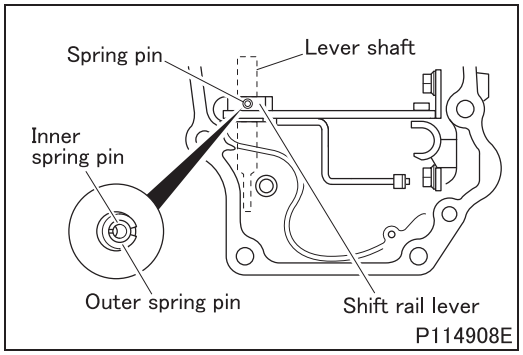
■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal
- Install the oil seal in the extension housing in the illustrated direction using a round bar with an outer diameter of 24 mm {0.94 in.}.



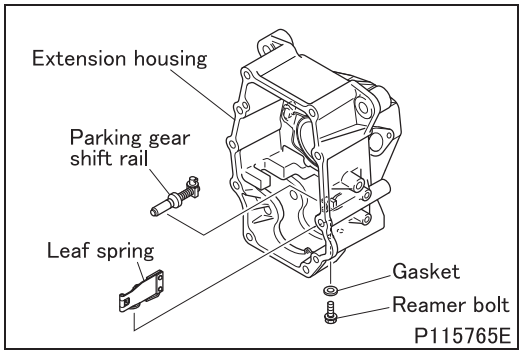
■ **Installation: Support plate**

- Install the support plate on the extension housing.



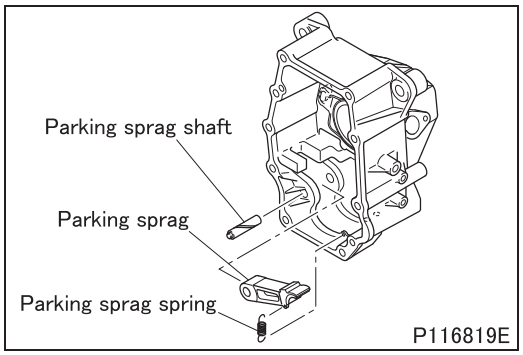
■ **Installation: Shift rail lever, lever shaft and spring pin**

- Install the shift rail lever and lever shaft on the extension housing.
- The spring pin is of a double-pin type with inner and outer springs.
- Drive the spring pin until it touches the shift rail lever to prevent the lever shaft from slipping off.
- After installing the spring pin, check that the spring pin is protruded from the shift rail lever by the following amount.
  Protrusion: 14 ± 1.5 mm {0.55 ± 0.059 in.}



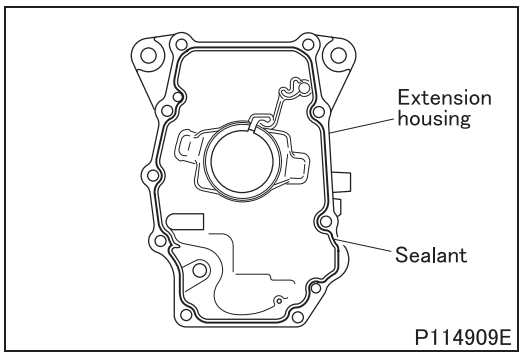
■ **Installation: Parking gear shift rail and leaf spring**

- Install the parking gear shift rail.
- Install the leaf spring on the extension housing using the reamer bolt.



■ **Installation: Parking sprag, parking sprag shaft and parking sprag spring**

- Install each part.



■ **Installation: Extension housing**

[Applying sealant]

- Apply sealant following manners shown below.

CAUTION ⚠

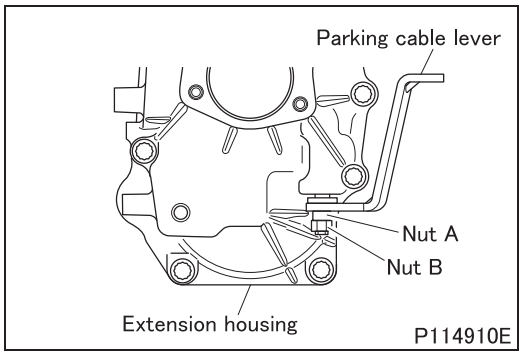
- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**
- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

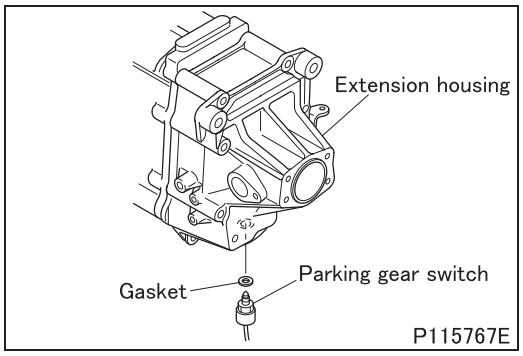
- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>
- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

[Installation]
- After applying the sealant, install the extension housing before the sealant dries. Be sure not to allow the sealant to be displaced.
- Do not start the engine within one hour after installing the extension housing.
- When loosening or removing extension housing mounting bolts, be sure to reapply the sealant.

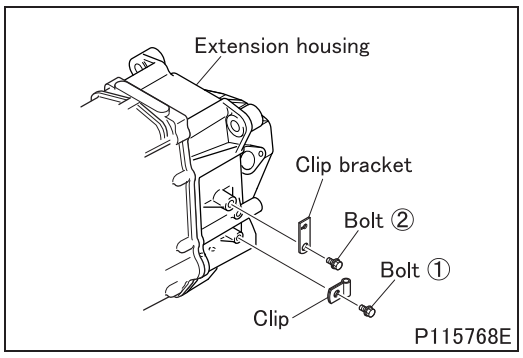


■ Installation: Parking cable lever
- Install the parking cable lever, and then tighten nut A.
- While holding nut A with a wrench or the like, tighten nut B.

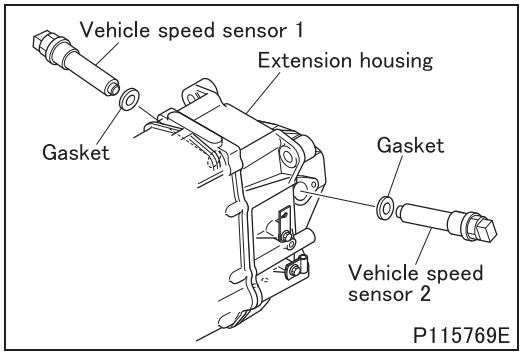


■ Installation: Parking gear switch
- Apply sealant to the threads of the parking gear switch, and then install the switch on the extension housing.

CAUTION ⚠
- **Remove any sealant remaining in the bolt hole before installation. Otherwise damage may result.**

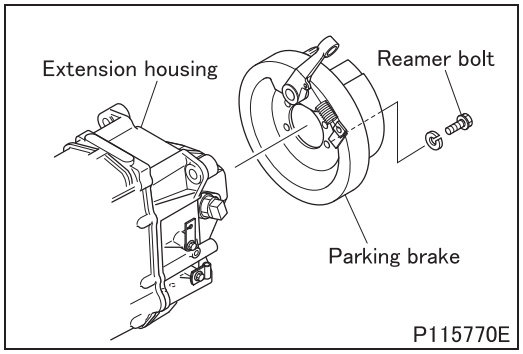


■ Installation: Clip and clip bracket
- Install the clip and clip bracket on the extension housing.



■ **Installation: Vehicle speed sensor**

- Install the vehicle speed sensor on the extension housing.



■ **Installation: Parking brake**

- Install the parking brake on the extension housing using the reamer bolt.

■ **Installation: Companion flange**

- Install the companion flange as follows.

[Heating]

- Heat the companion flange evenly to 140°C {284°F} using one of the following methods.

<Temperature-controlled chamber>

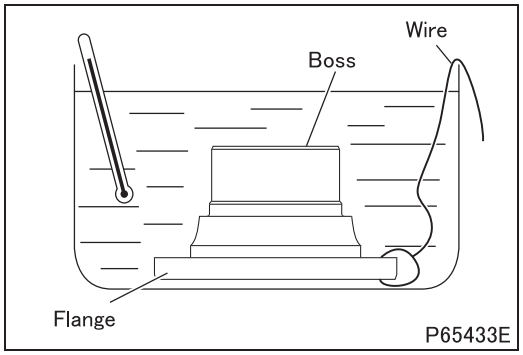
- Heat the companion flange with a temperature setting of 140°C {284°F} for more than 30 minutes.

<Ring heater>

- Repeat a heating process two to three times with a temperature setting of 140°C {284°F} so that the entire companion flange is evenly heated to 140°C {284°F}.
- Measure the temperature on the boss, not on the flange.

CAUTION ⚠

- **Repeat the heating process two to three times because sufficient thermal expansion of the companion flange cannot be achieved in a single heating process.**



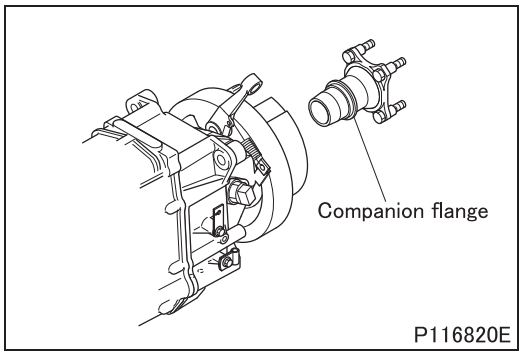
<Oil bath>

- Heat automatic transmission fluid to 140°C {284°F} and immerse the companion flange in the oil bath in the illustrated orientation.

CAUTION ⚠

- **Be sure to put the companion flange in the oil bath with its boss facing up. If the boss is facing down, its edge will make direct contact with the heat source, thus heating the companion flange to higher than 140°C {284°F}.**

- Since the automatic transmission fluid temperature drops when the companion flange is immersed in the oil bath, reheat the fluid to 140°C {284°F} and keep the companion flange immersed in the oil bath for more than 20 minutes while maintaining the fluid temperature at 140°C {284°F}.



[Installation]

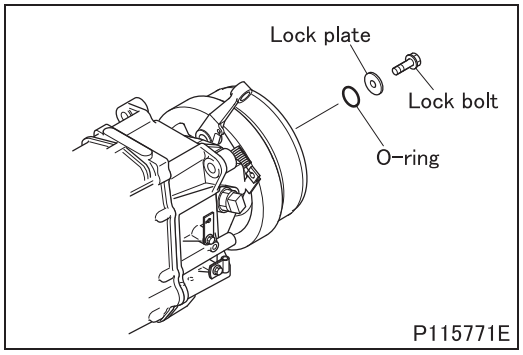
- Install the companion flange.

WARNING ⚠

- **Take care not to burn yourself when installing the hot companion flange**

CAUTION ⚠

- **If the companion flange is too hot, it may cause damage to the oil seal on the extension housing. Do not overheat the companion flange.**



■ Installation: O-ring, lock plate and lock bolt

- Apply grease to the O-ring and install it between the companion flange and mainshaft, and then install the lock plate with the lock bolt.

TRANSFER CASE ADAPTER <FG>

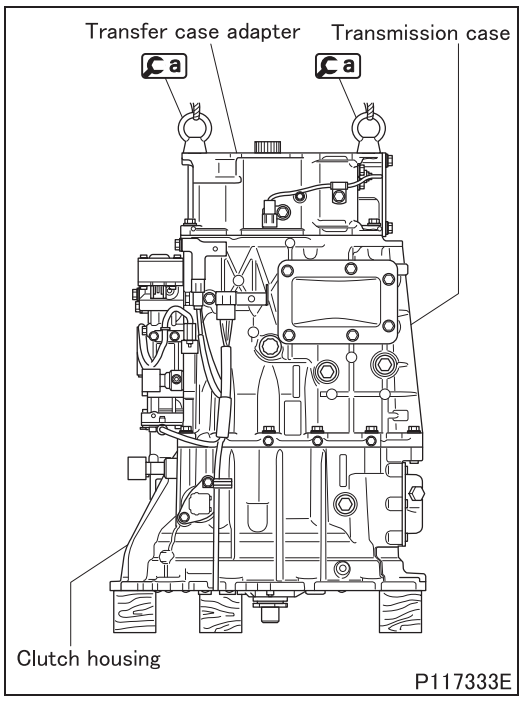
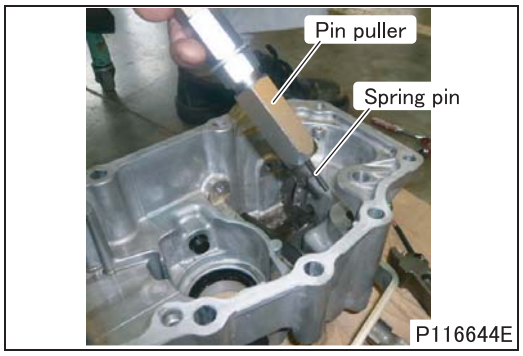
◆Removal procedure◆



■ **Removal: Parking gear switch and transfer case adapter**

- Install Ca on the transfer case adapter. Lift the transmission using the transfer case adapter and set it in the vertical orientation with the clutch housing facing down.
- Remove the parking gear switch.
- Remove the transfer case adapter.



■ **Removal: Spring pin**

- Use a commercially available pin puller and sliding hammer to remove the parking shift lever spring pin.

◆Inspection procedure◆

■ **Inspection: Parking sprag spring**

- Measure the installed load at the installed length of the parking sprag spring.
- If the measurement is below the limit, replace the parking sprag spring.

◆Installation procedure◆

■ **Installation: Parking gear**

- Install the parking gear as follows.

[Heating]

- Heat the parking gear evenly to 150°C {302°F} using one of the following methods.

<Temperature-controlled chamber>

- Heat the parking gear with a temperature setting of 150°C {302°F} for more than 30 minutes.

<Ring heater>

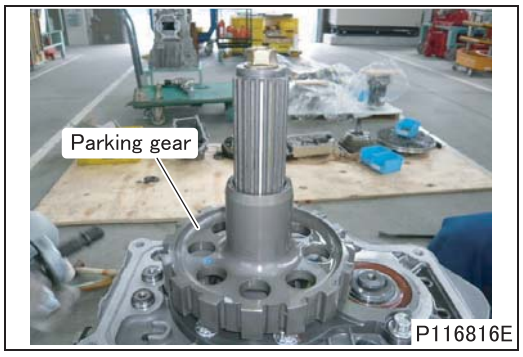
- Repeat a heating process two to three times with a temperature setting of 150°C {302°F} so that the entire parking gear is evenly heated to 150°C {302°F}.

CAUTION ⚠

- **Repeat the heating process two to three times because sufficient thermal expansion of the parking gear cannot be achieved in a single heating process.**

<Oil bath>

- Heat automatic transmission fluid to 150°C {302°F} and immerse the parking gear in the oil bath.
- Since the automatic transmission fluid temperature drops when the parking gear is immersed in the oil bath, reheat the fluid to 150°C {302°F} and keep the parking gear immersed in the oil bath for more than 20 minutes while maintaining the fluid temperature at 150°C {302°F}.

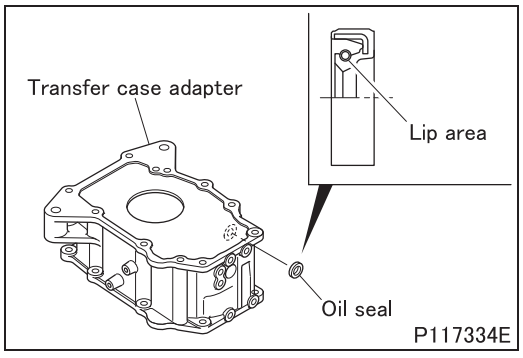


[Installation]

- Install the parking gear.

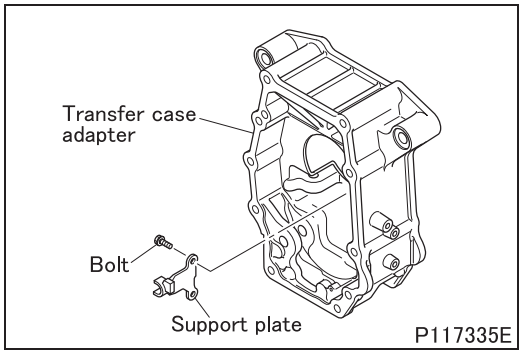
WARNING ⚠

- **Take care not to burn yourself when installing the hot parking gear.**



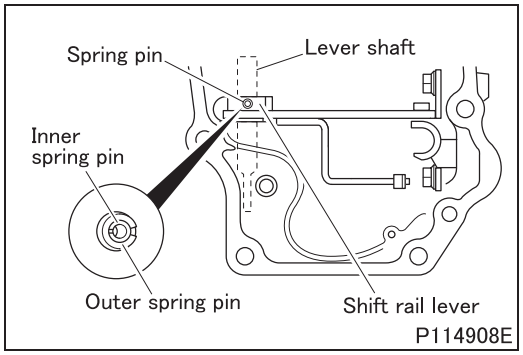
■ Installation: Oil seal

- Apply grease to the lip area of the oil seal.
- Install the oil seal in the transfer case adapter in the illustrated direction using a round bar with an outer diameter of 24 mm {0.94 in.}.



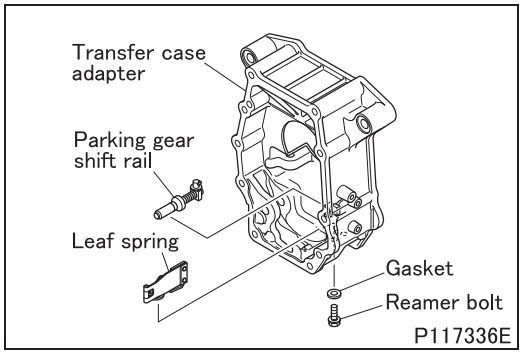
■ Installation: Support plate

- Install the support plate on the transfer case adapter.



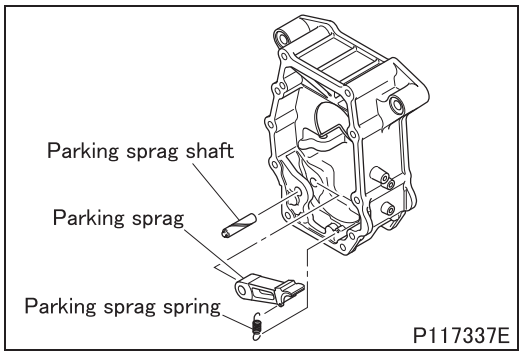
■ **Installation: Shift rail lever, lever shaft and spring pin**

- Install the shift rail lever and lever shaft on the transfer case adapter.
- The spring pin is of a double-pin type with inner and outer springs.
- Drive the spring pin until it touches the shift rail lever to prevent the lever shaft from slipping off.
- After installing the spring pin, check that the spring pin is protruded from the shift rail lever by the following amount.
  Protrusion: 14 ± 1.5 mm {0.55 ± 0.059 in.}



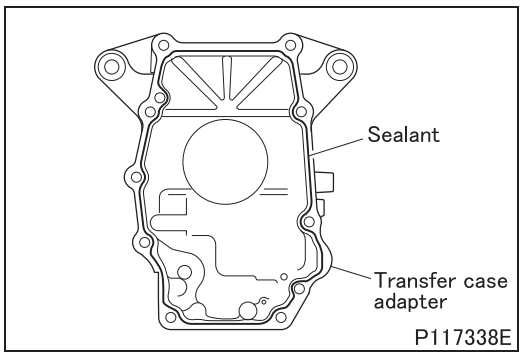
■ **Installation: Parking gear shift rail and leaf spring**

- Install the parking gear shift rail.
- Install the leaf spring on the transfer case adapter using the reamer bolt.



■ **Installation: Parking sprag, parking sprag shaft and parking sprag spring**

- Install each part.



■ **Installation: Transfer case adapter**

[Applying sealant]

- Apply sealant following manners shown below.

CAUTION ⚠

- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**
- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

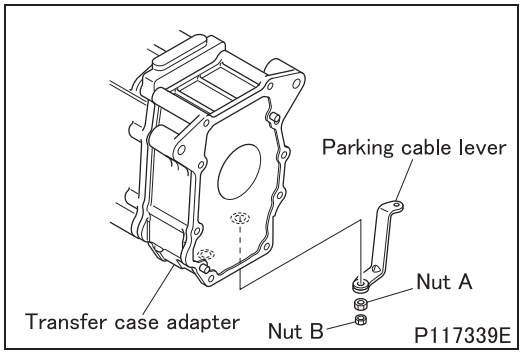
- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

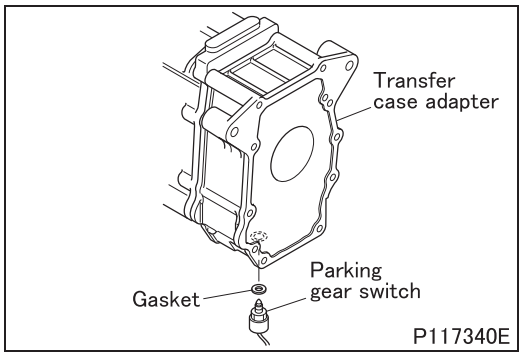
[Installation]

- After applying the sealant, install the transfer case adapter before the sealant dries. Be sure not to allow the sealant to be displaced.
- Do not start the engine within one hour after installing the transfer case adapter.
- When loosening or removing transfer case adapter mounting bolts, be sure to reapply the sealant.



■ Installation: Parking cable lever

- Install the parking cable lever, and then tighten nut A.
- While holding nut A with a wrench or the like, tighten nut B.

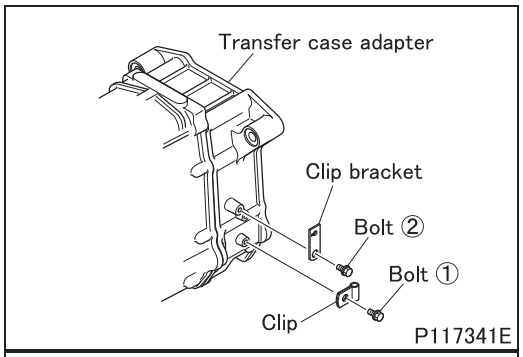


■ Installation: Parking gear switch

- Apply sealant to the threads of the parking gear switch, and then install the switch on the transfer case adapter.

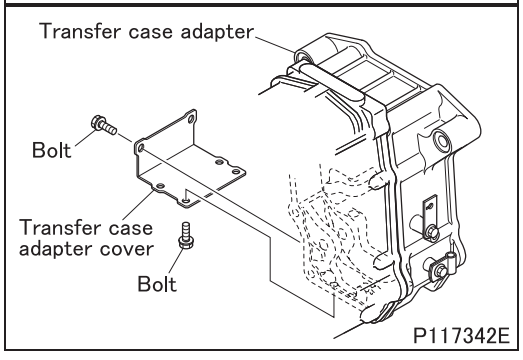
CAUTION ⚠

- **Remove any sealant remaining in the bolt hole before installation. Otherwise damage may result.**



■ Installation: Clip and clip bracket

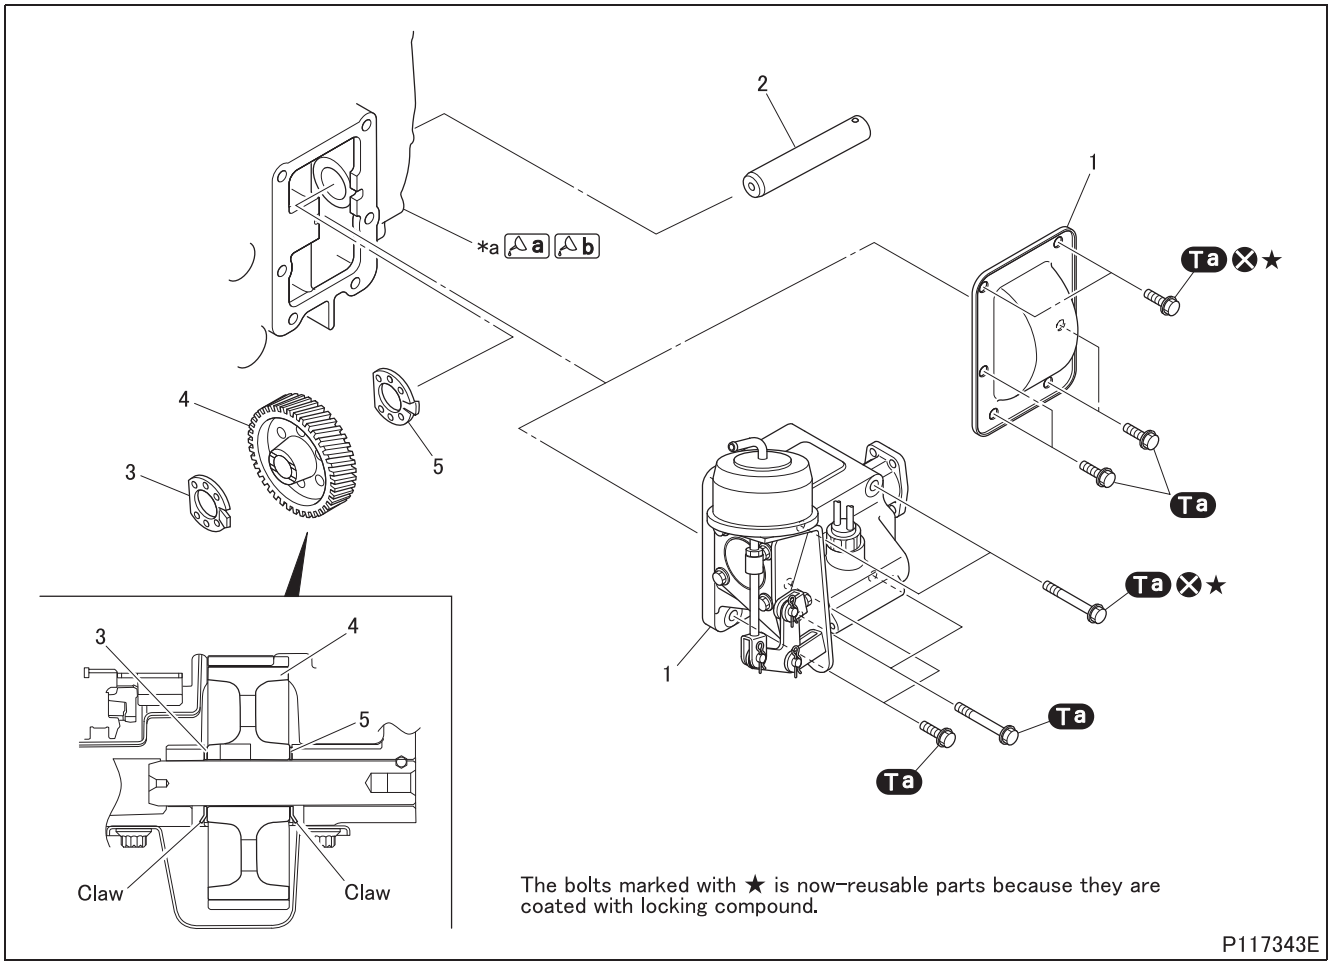
- Install the clip and clip bracket on the transfer case adapter.



■ Installation: Transfer case adapter cover

- Install the transfer case adapter cover on the transfer case adapter.

REVERSE IDLER GEAR <WITHOUT LARGE-CAPACITY POWER TAKE-OFF>



● **Disassembly sequence**

1 Power take-off cover <Without power take-off>
Transmission power take-off
<With power take-off> (See later section.)
2 Reverse idler gear shaft
3 Side washer
4 Reverse idler gear
5 Side washer

***a**: Transmission case
⊗: Non-reusable parts

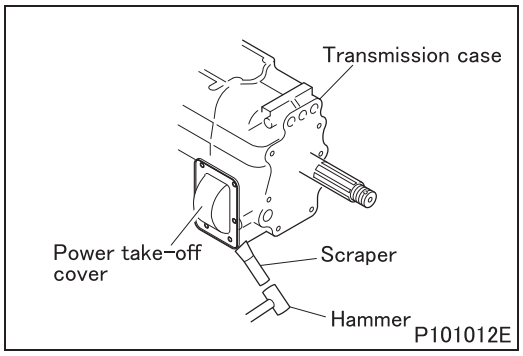
Mark	Tool name and shape	Part No.	Application
a	Reverse shaft puller A: M12 × 1.25  P56398	03726-82000	Removal of reverse idler gear shaft

◆Removal procedure◆



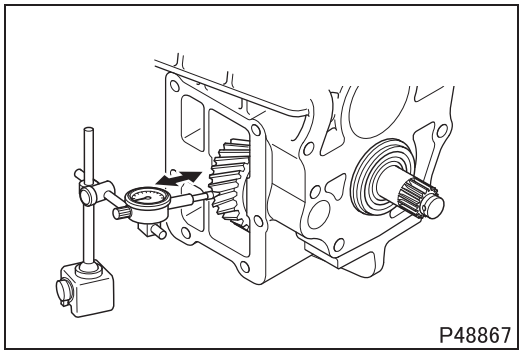
P101012E

■ Removal: Power take-off cover

- Insert a scraper from the lower right or lower left of the power take-off cover to remove the power take-off cover.

CAUTION ⚠

- **Beware that prying the scraper halfway could deform the power take-off cover or damage the transmission case.**

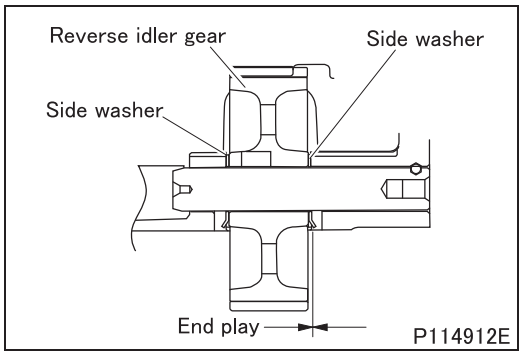


P48867

■ Inspection: Reverse idler gear

- After the power take-off cover or the transmission power take-off is removed, perform the following check. If the measurement exceeds the limit, replace defective parts.
- Check the play again after assembly and make sure it does not exceed the limit.

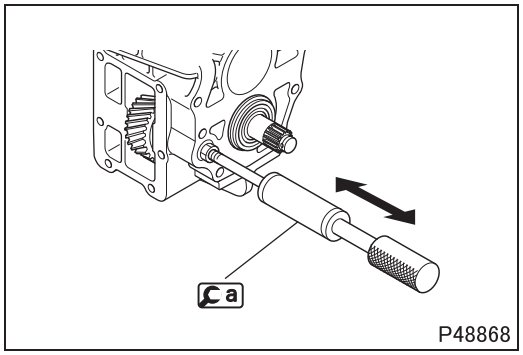
(1) Play in diameter direction



P114912E

(2) End play

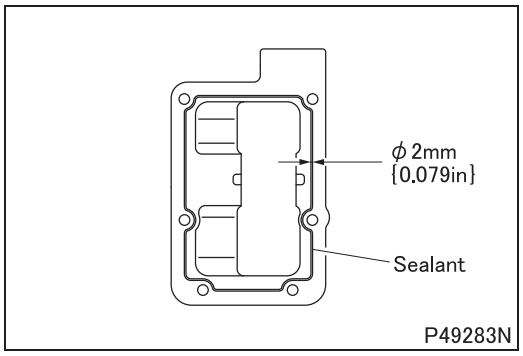
- Measure the end play using feeler gauge.



■ **Removal: Reverse idler gear shaft**

- Draw out the reverse idler gear shaft using a.

◆**Installation procedure**◆



■ **Installation: Power take-off cover or Transmission power take-off**

[Applying sealant]

- Apply sealant onto the transmission case, following manners shown below.

CAUTION ⚠

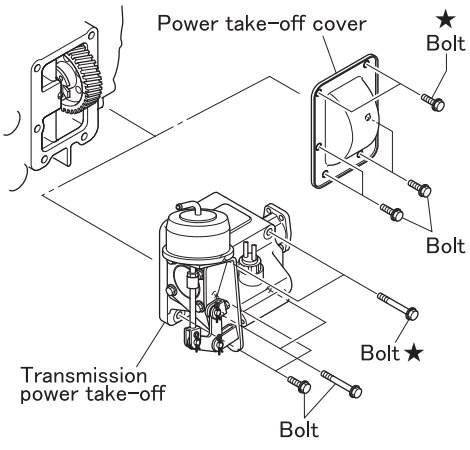
- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**
- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.



The bolts marked with ★ is now–reusable parts because they are coated with locking compound.

P117344E

[Installation]

- Install the power take-off cover or transmission power take-off according the following manners after applying the sealant. Be sure not to allow the sealant to be displaced.
  Power take-off cover: Install in three minutes
  Transmission power take-off: Install before sealant dries
- Do not start the engine within one hour after installing the power take-off cover or transmission power take-off.
- When loosening or removing power take-off cover or transmission power take-off mounting bolts, be sure to reapply the sealant.

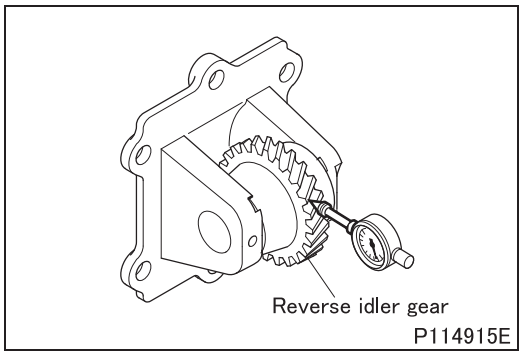
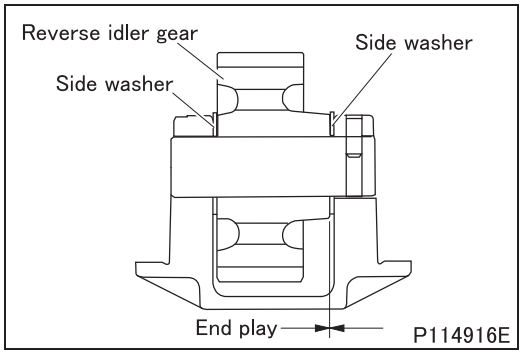
◆Removal procedure◆



■ **Inspection: Reverse idler gear**

- After the reverse idler gear cover is removed, perform the following check. If the measurement exceeds the limit, replace defective parts.
- Check the play again after assembly and make sure it does not exceed the limit.

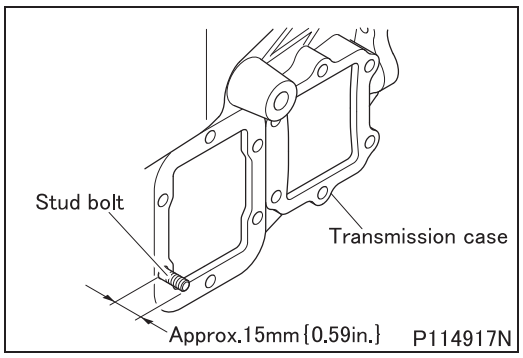
(1) Play in diameter direction



(2) End play

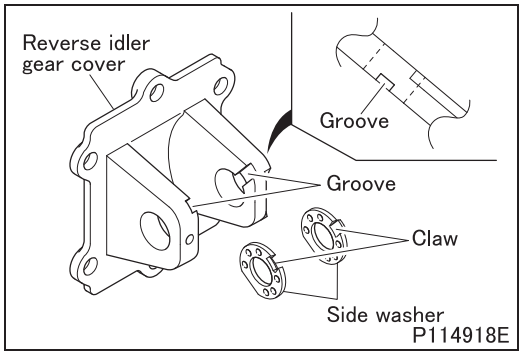
- Measure the end play using feeler gauge.

◆Installation procedure◆



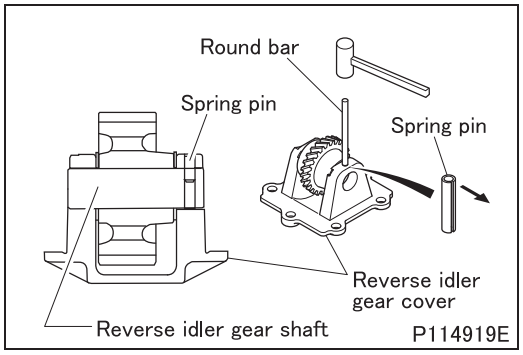
■ **Installation: Stud**

- Apply sealant to the threads of the stud where the transmission case is to be installed.
- Install the stud so that it protrudes from the transmission case by the amount shown in the drawing.



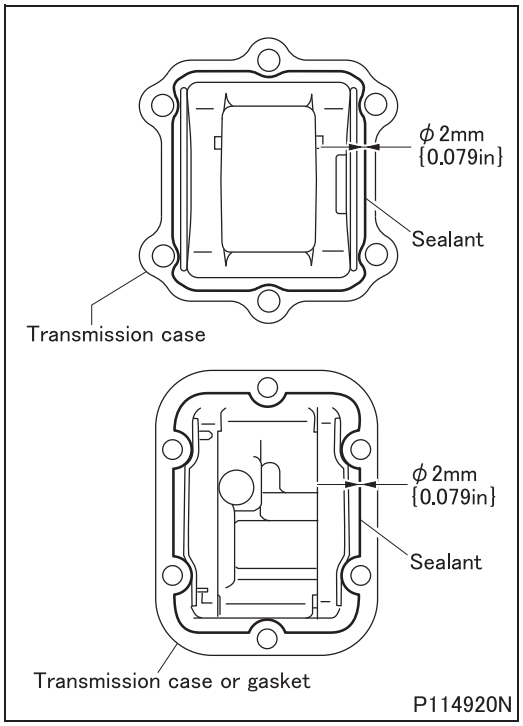
■ **Installation: Side washer**

- Install the side washers by aligning the tabs with the grooves in the reverse idler gear cover.



■ **Installation: Spring pin**

- Install the spring pin using a round bar with an outer diameter of 6 mm {0.24 in.} in the illustrated orientation.



■ **Installation: Reverse idler gear cover or Transmission power take-off**

[Applying sealant]

- Apply sealant onto the transmission case, following manners shown below.

CAUTION ⚠

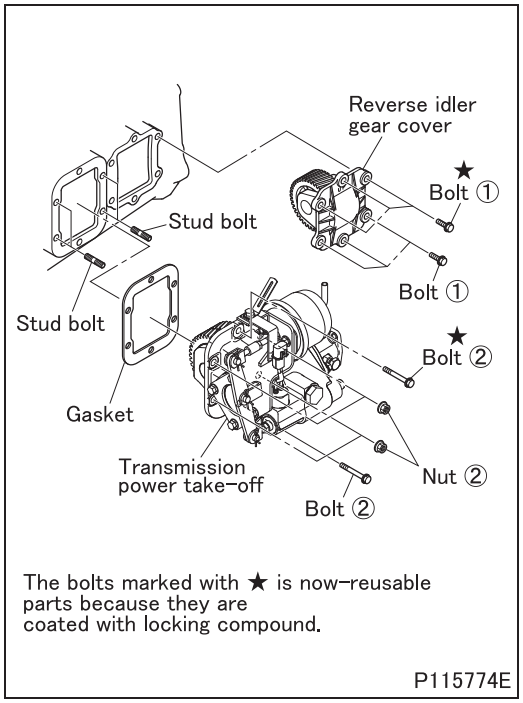
- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**
- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

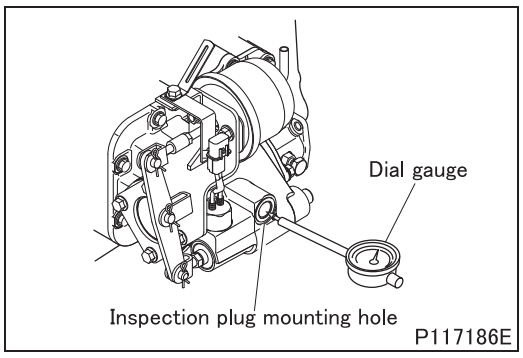
<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.



[Installation]

- Install the reverse idler gear cover or transmission power take-off according the following manners after applying the sealant. Be sure not to allow the sealant to be displaced.
  Reverse idler gear cover: Install in three minutes
  Transmission power take-off: Install before sealant dries
- Do not start the engine within one hour after installing the reverse idler gear cover or transmission power take-off.
- When loosening or removing reverse idler gear cover or transmission power take-off mounting bolts, be sure to reapply the sealant.



■ **Inspection: Backlash between power take-off idler gear of transmission power take-off and countershaft constant mesh 1st and 3rd gears of the transmission body**

- Engage transmission gears to hold the countershaft.
- Install any type of gasket.
  Gasket types: 0.13 ± 0.05, 0.25 ± 0.10 mm {0.0051 ± 0.0020, 0.0098 ± 0.0039 in.} (2 types)
- Insert a dial indicator through the inspection plug hole in the transmission power take-off and bring its tip into contact with the power take-off idler gear.
- Shift the power take-off to ON, and then measure the backlash by moving the power take-off output flange.
- If the measurement is deviated from the standard value, replace defective parts. (See later section.)

26 Oil seal
27 Clutch housing

Ⓟ: Locating pin
⊗: Non-reusable parts

- When disassembling the countershaft, drive pinion and mainshaft, first remove the valve body and dual clutch from the clutch housing. (See VALVE BODY AND DUAL CLUTCH.)
- If the countershaft, drive pinion and mainshaft are not disassembled, the shift rail and shift fork can be removed and disassembled on its own with the valve body and dual clutch mounted on the clutch housing.

: This work requires protection against dust. (See Gr00.)

- It is desirable that the job to service portions related to the hydraulic circuit of the transmission (DUONIC^{TM}) be performed in an environment comparable to that of a meeting room partitioned from the outside air. If it is not feasible to prepare such an environment, take necessary steps to protect the clutch housing with a vinyl bag for prevention of entry of sand and dust.
- Replace the vinyl bag immediately when it is broken during servicing.
- Cover the clutch housing with a plastic bag as described above.

● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
17	Starting torque of mainshaft output side	1.5 N·m {1.1 ft.lbs, 0.15 kgf·m} or less	–	Replace

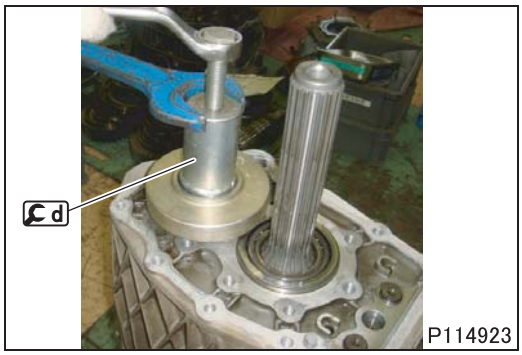
[l]	Bearing puller  P116040	MH064254	Removal of outer drive pinion taper bearing outer race

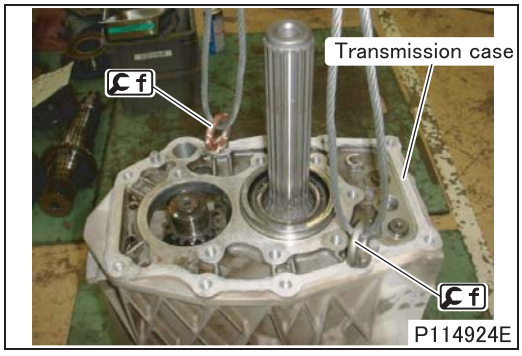
◆Removal procedure◆



P114923

■ **Removal: Snap ring and countershaft rear bearing**

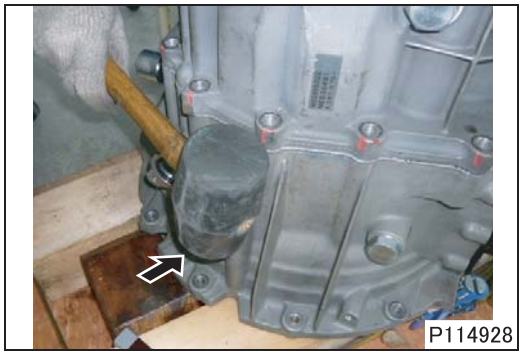
- Remove the snap ring using [a].
- Remove the countershaft rear bearing using [d].



P114924E

■ **Removal: Transmission case**

- Install [f] on the transmission case for lifting it with a crane.
- Install the two [f] diagonally near the center of the transmission case.



P114928

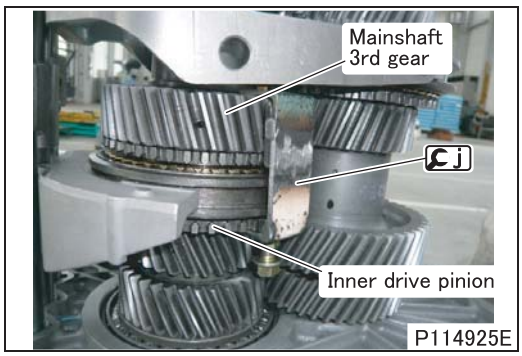
- After removing the bolts, lift the transmission case with a crane while hitting the rear ribs (indicated by an arrow) of the clutch housing with a plastic hammer to remove the transmission case.

CAUTION ⚠

- **Be sure to hit the ribs as illustrated because hitting other areas may break the clutch housing.**

■ Removal: Mainshaft rear bearing outer race

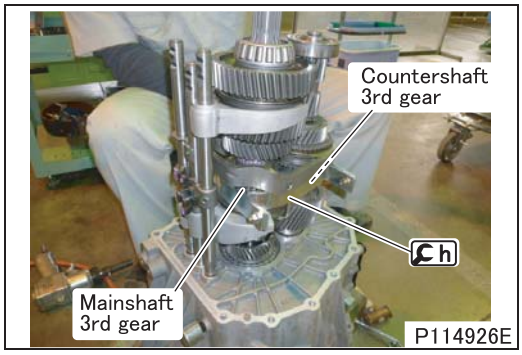
- Remove the mainshaft rear bearing outer race by using a plastic hammer on the inside of the transmission case.



P114925E

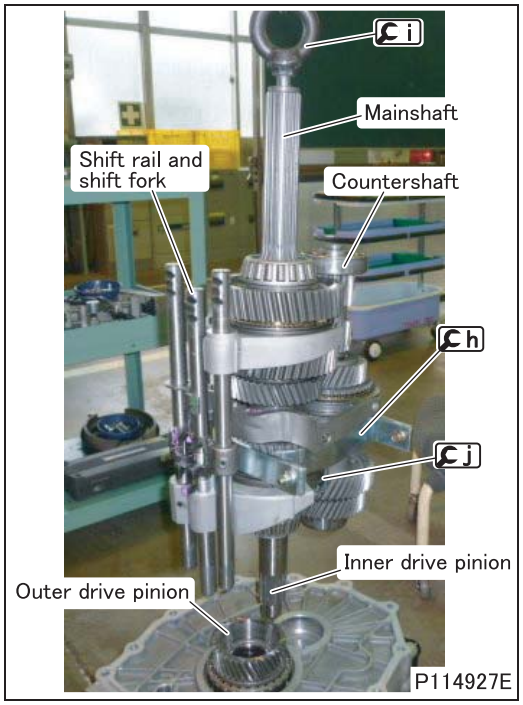
■ Removal: Shift rail and shift fork, countershaft, mainshaft, inner drive pinion and outer drive pinion

- Install j on the mainshaft 3rd gear and inner drive pinion.

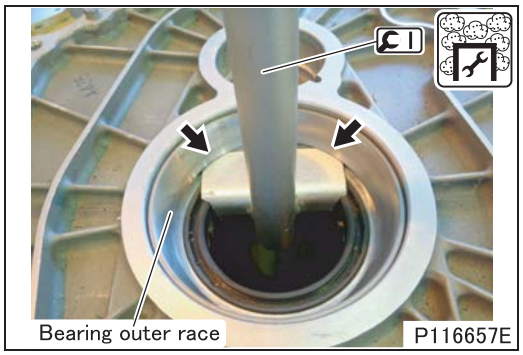


P114926E

- Fasten the 3rd gears of the mainshaft and countershaft with h.



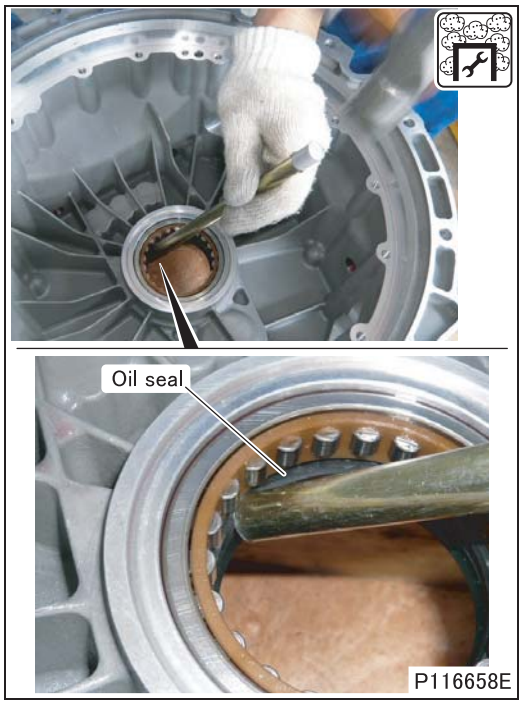
- Install i on the mainshaft for lifting it with a crane.
- Put a piece of wood on the clutch housing, and while hitting the wood with a plastic hammer, lift the mainshaft with a crane to remove it.
- When the mainshaft has been removed from the clutch housing, support the mainshaft with your hands to prevent if from inclining.
- Remove h and j, and then remove the mainshaft, countershaft and inner drive pinion.
- Remove the outer drive pinion.



■ **Removal: Outer drive pinion taper bearing outer race**

: This work requires protection against dust.

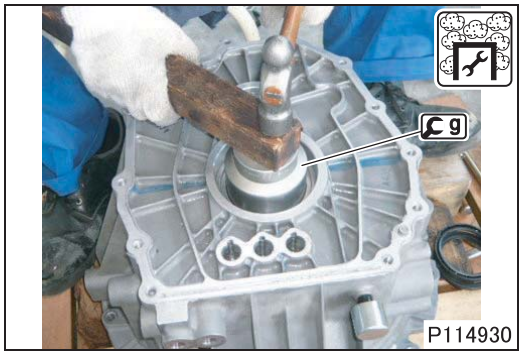
- Hook the catch of l in the notch on the clutch housing, and then remove the outer drive pinion taper bearing outer race by lifting it with a sliding hammer.



■ **Removal: Oil seal**

: This work requires protection against dust.

- Remove the oil seal by hitting it with a bar from the front side of the clutch housing.



■ **Removal: Outer drive pinion roller bearing outer race**

: This work requires protection against dust.

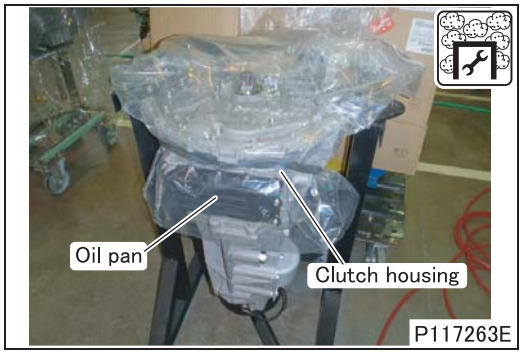
- Remove the outer drive pinion roller bearing outer race from the rear side of the clutch housing using g.

◆Inspection procedure◆

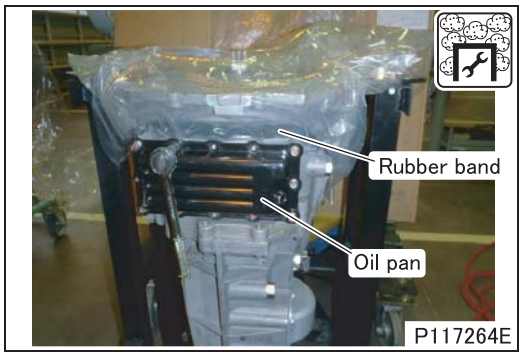
■ **Inspection: Oil filter**

: This work requires protection against dust.

[Inspection]
- Check that the drained automatic transmission fluid is not contaminated.
- If contaminated, inspect the oil filter.

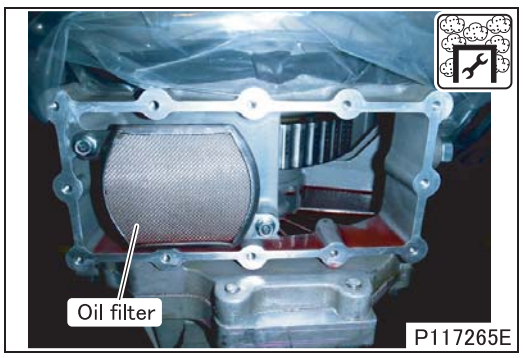


[Removal]
- Clean the clutch housing and the areas around the oil pan.
- Perform work with the transmission positioned vertically as shown. (See VALVE BODY AND DUAL CLUTCH.)



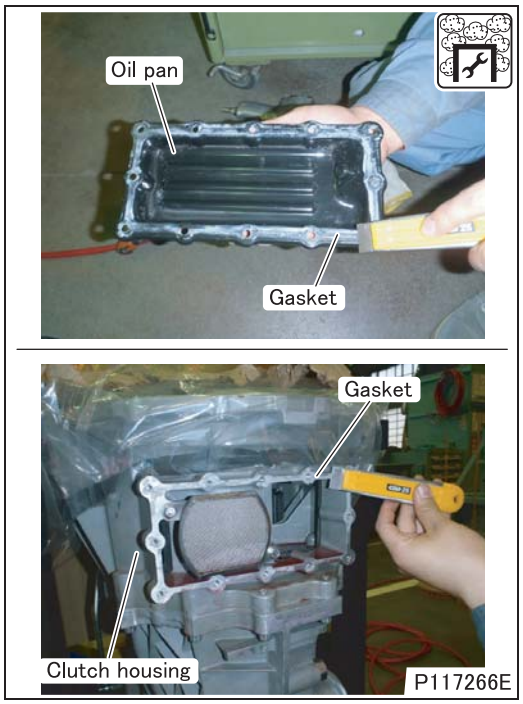
- Displace the rubber band securing the plastic bag to provide working space.
- Remove the oil pan.

NOTE
- **If there is no problem (e.g. no contamination) in automatic transmission fluid, do not remove the oil pan.**
- **Do not use air tools to remove the oil pan.**



- Remove the oil filter.

[Inspection]
- Confirm that the oil filter is not contaminated by foreign objects.
- If contaminated by foreign objects, replace the oil filter with a new one.

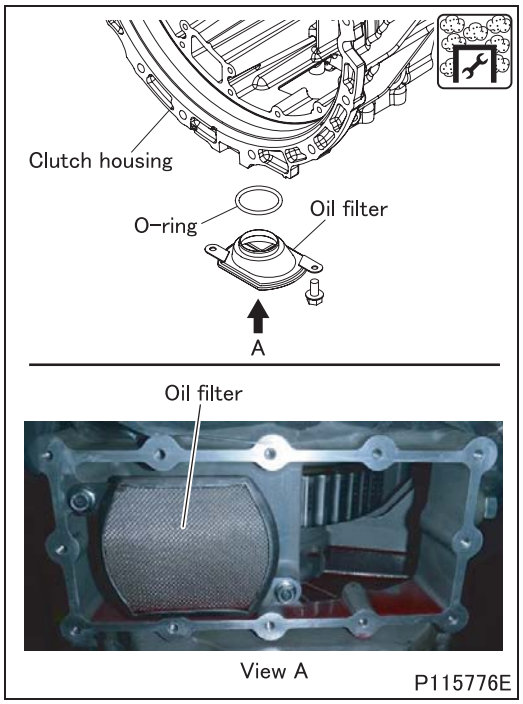


[Installation]
- Remove the gasket remaining on the oil pan and clutch housing with a scraper, and then degrease with brake cleaner.

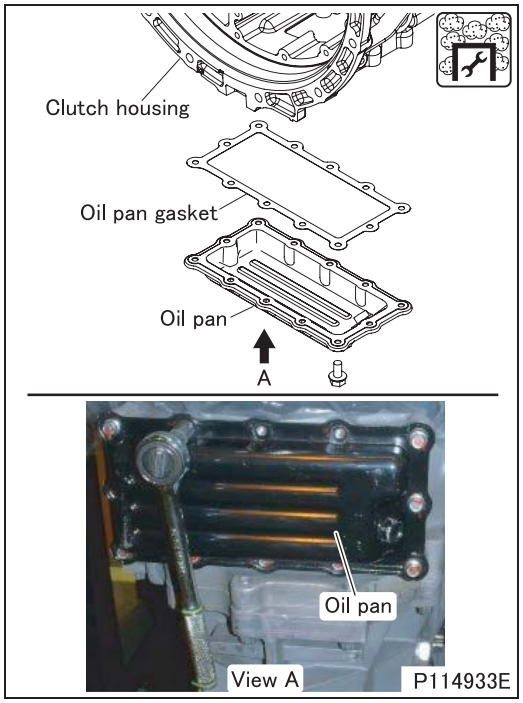
CAUTION ⚠
- **Do not allow the scraped gasket to enter the clutch housing.**

- Wipe off automatic transmission fluid and brake cleaner using a non-woven cloth or paper towel.

CAUTION ⚠
- **Do not use anything other than a non-woven cloth or paper towel.**
- **Do not rub when using a paper towel.**

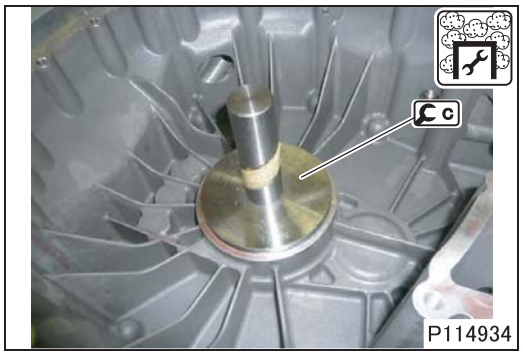


- Apply automatic transmission fluid to the O-ring, and then install the O-ring on the oil filter.
- Install the oil filter on the clutch housing.



- Install the oil pan gasket and oil pan.

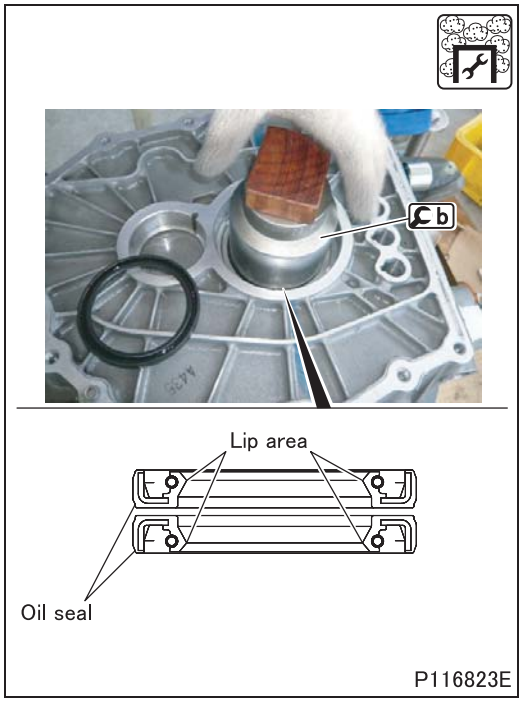
◆Installation procedure◆



■ Installation: Outer drive pinion roller bearing outer race

: This work requires protection against dust.

- Apply automatic transmission fluid to the sliding surface of the outer drive pinion roller bearing outer race.
- Install the outer drive pinion roller bearing outer race from the front side of the clutch housing using C.



■ **Installation: Oil seal**

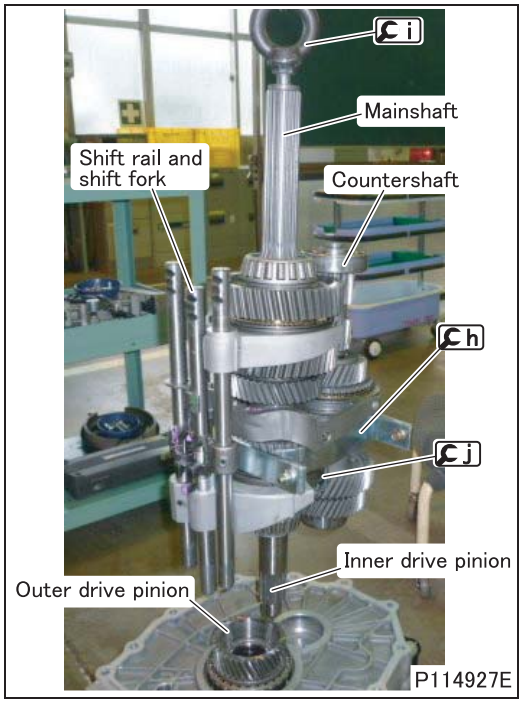
: This work requires protection against dust.

- Apply automatic transmission fluid to the lip areas of the oil seals.
- Install the oil seals in the illustrated orientations from the front side of the clutch housing using b.

■ **Installation: Outer drive pinion taper bearing outer race**

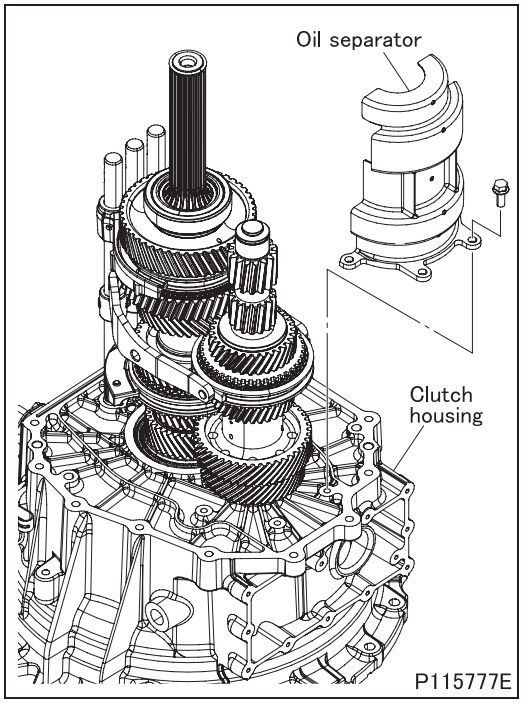
: This work requires protection against dust.

- Install the outer drive pinion taper bearing outer race from the rear side of the clutch housing using c.



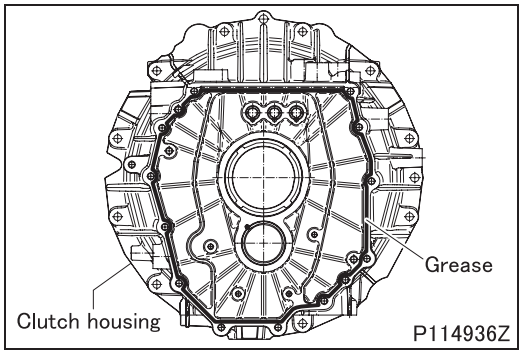
■ **Installation: Outer drive pinion, mainshaft, countershaft, inner drive pinion and shift rail and shift fork**

- Apply automatic transmission fluid to the sliding surface of the outer drive pinion, and then install the pinion on the clutch housing.
- Apply grease between the rollers of the mainshaft pilot bearing, install the inner drive pinion, and then fasten the mainshaft 3rd gear and inner drive pinion using j.
- Fasten the 3rd gears of the mainshaft and countershaft using h.
- Install the shift rail and shift fork on the mainshaft and countershaft.
- Install i on the mainshaft, and then lift the mainshaft with a crane and install it on the clutch housing.
- Be sure to remove all the tools used.



■ **Installation: Oil separator**

- Install the oil separator on the clutch housing.



■ **Installation: Transmission case**

[Applying sealant]

- Applying sealant onto the clutch housing and motor generator, following manners shown below.

CAUTION ⚠

- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**
- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surface so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

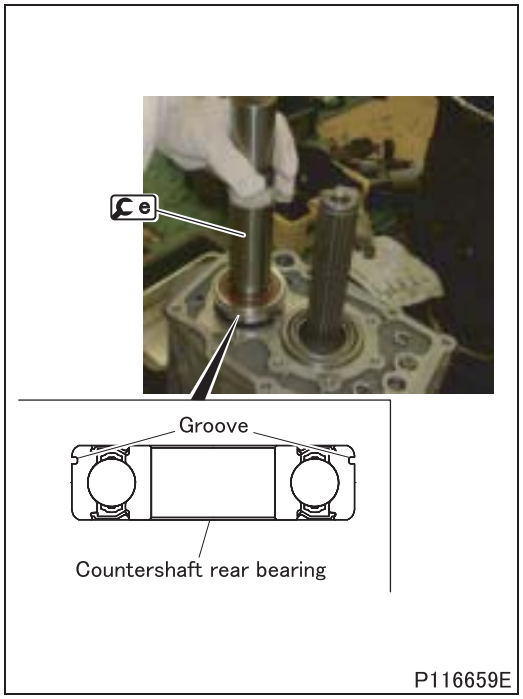
- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

[Installation]

- After applying the sealant, install the transmission case before the sealant dries. Be sure not to allow the sealant to be displaced.
- Do not start the engine within one hour after installing the transmission case.
- When loosening or removing transmission case mounting bolts, be sure to reapply the sealant.

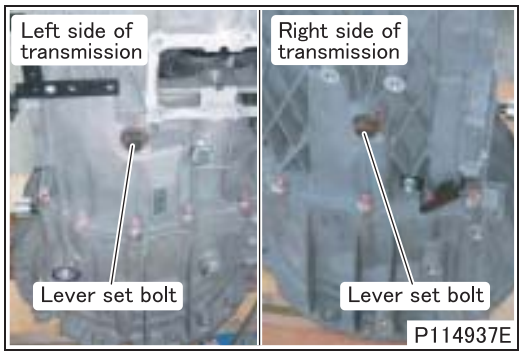
■ **Installation: Mainshaft rear bearing outer race**

- Temporarily install the mainshaft rear bearing outer race from the rear side of the transmission case using a plastic hammer.



■ **Installation: Countershaft rear bearing and snap ring**

- Install the countershaft rear bearing in the illustrated orientation using e.



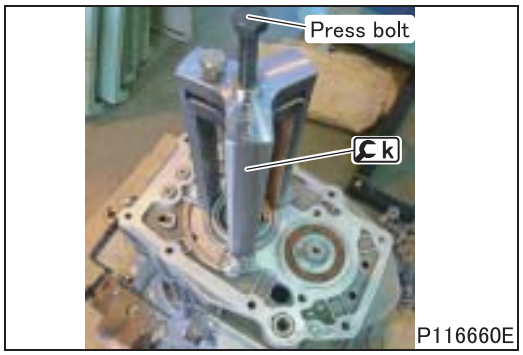
■ **Installation: Lever set bolt**

- Apply locking agent to the threads of the lever set bolts.
- Align the transmission case holes and reverse lever holes, and then secure the reverse lever with the lever set bolts.

CAUTION ⚠

- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**

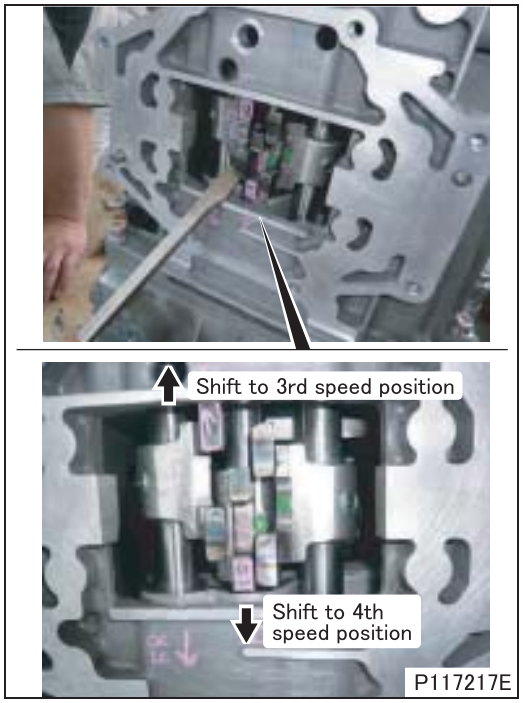
- After installing the lever set bolts, check that gears can be engaged by shifting gear positions.



■ **Installation: Shim and rear bearing retainer**

[Selecting shim]

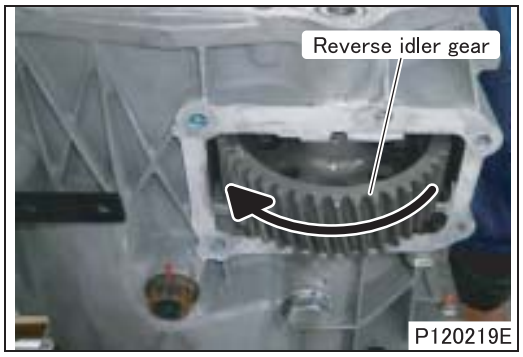
- Before selecting a shim, install the reverse idler gear. (See REVERSE IDLER GEAR.)
- Since a taper roller bearing is used on both ends of the mainshaft, it is necessary to select a shim to apply preload to the bearing.
- Install k on the transmission case, and then tighten the bearing press bolt to a torque of 13.3 N·m {9.8 ft.lbs, 130 kgf·cm}.



- Shift the mainshaft and countershaft to the 3rd and 4th speed positions, respectively.
- With the mainshaft and countershaft in the 3rd and 4th speed positions, respectively, rotate the mainshaft more than ten revolutions. In the way described below. Next, loosen the bearing press bolt and then tighten it again to a torque of 3.2 N·m {2.4 ft.lbs, 32.5 kgf·cm}.

<When rotating the mainshaft>

- Apply a tire bar or the like to the spline of the mainshaft to rotate the shaft manually.

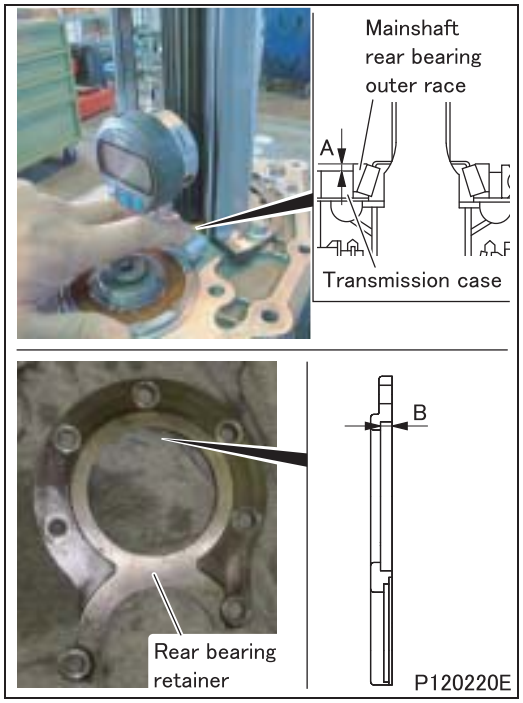


<When rotating the reverse idler gear>

- Applying a tire bar or the like to the spline of the mainshaft, give an initial rotation to the reverse idler gear so that the it will turn by itself in the direction shown in the illustration.

CAUTION ⚠

- **Be careful not to pinch a hand or finger when rotating the reverse idler gear.**
- **Avoid using a tool when rotating the idler gear; otherwise it could damage the transmission case.**



- Measure dimension A from the transmission case end face to the mainshaft rear bearing outer race end face at three locations.
- Measure dimension B of the rear bearing retainer at three locations.
- Calculate clearance C from measured dimensions A and B using the following formula.
  Clearance C = (average of B at 3 locations) – (average of A at 3 locations)

Clearance C (mm {in.})	Shim thickness (mm {in.})	Number of shims	Clearance after installation (reference value: mm {in.})
1.15 to 1.19 {0.0452 to 0.0468}	0.56 ± 0.01 {0.0220 ± 0.00039}	2	0.01 to 0.09 {0.00039 to 0.0035}
l.20 to 1.24 {0.0472 to 0.0488}	1.16 ± 0.01 {0.0456 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}
1.25 to 1.29 {0.0492 to 0.0507}	1.21 ± 0.01 {0.0476 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}
1.30 to 1.34 {0.051 to 0.0527}	1.26 ± 0.01 {0.0496 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}
1.35 to 1.39 {0.0531 to 0.0547}	1.31 ± 0.01 {0.0515 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}
1.40 to 1.44 {0.0551 to 0.0566}	1.36 ± 0.01 {0.0535 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}
1.45 to 1.49 {0.0570 to 0.0586}	1.41 ± 0.01 {0.0555 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}
1.50 to 1.54 {0.0590 to 0.0606}	1.46 ± 0.01 {0.0574 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}
1.55 to 1.59 {0.0610 to 0.0625}	1.51 ± 0.01 {0.0594 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}
1.60 to 1.64 {0.0629 to 0.0645}	1.56 ± 0.01 {0.0614 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}
1.65 to 1.69 {0.0649 to 0.0665}	1.61 ± 0.01 {0.0633 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}
1.70 to 1.73 {0.0669 to 0.0685}	1.66 ± 0.01 {0.0653 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}
1.75 to 1.79 {0.0688 to 0.0704}	1.71 ± 0.01 {0.0673 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}
1.80 to 1.84 {0.0708 to 0.0724}	1.76 ± 0.01 {0.0692 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}

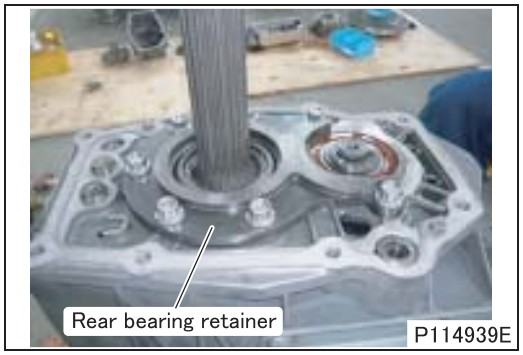
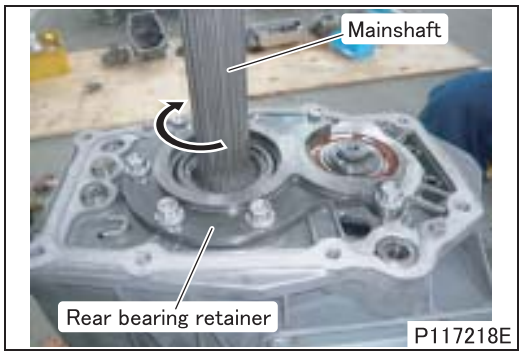
1.95 to 1.99 {0.0767 to 0.0783}	0.56 ± 0.01 {0.0220 ± 0.00039}	1	0.01 to 0.09 {0.00039 to 0.0035}
	1.36 ± 0.01 {0.0535 ± 0.00039}	1	



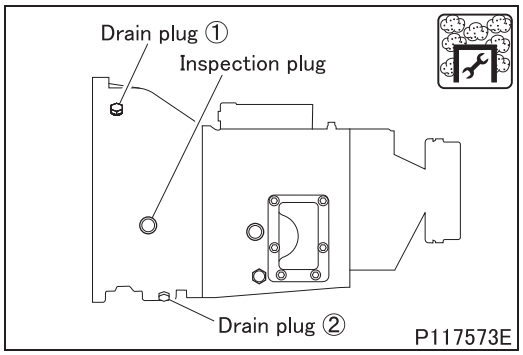
[Installation]

- Remove Ck, and then install the selected shim, rear bearing retainer and tighten the bolts.



■Inspection: Starting torque on the mainshaft output side

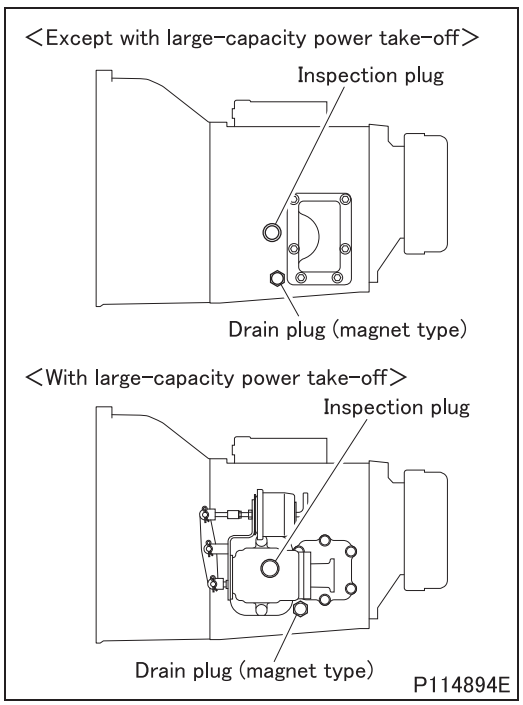
- After installing the shim and rear bearing retainer, check that the starting torque on the mainshaft output side agrees with the standard value.
- If the measurement exceeds the standard value, select a shim again.



■Installation: Automatic transmission fluid drain plugs and automatic transmission fluid inspection plug

: This work requires protection against dust.

- Install the automatic transmission fluid drain plugs on the oil pan.
- Install automatic transmission fluid inspection plug on the clutch housing.



■ Installation: Transmission oil drain plug and transmission oil inspection plug

- Apply sealant to the threads of the transmission oil drain plug and transmission oil inspection plug, and then install the plugs on the transmission case.

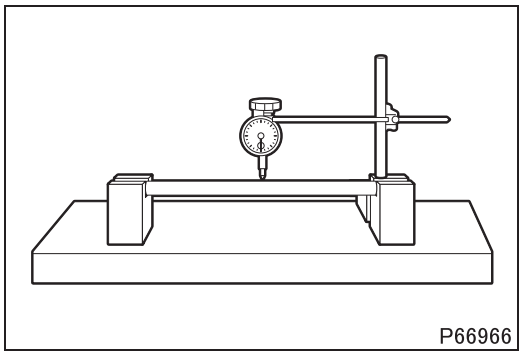
● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
3, 9, 15	Bend of shift rail	0 to 0.04 {0 to 0.0016}	0.05 {0.0020}	Replace
12, *a	Clearance between shift fork piece and synchronizer sleeve of mainshaft	0.3 to 0.6 {0.012 to 0.024}	1.0 {0.039}	Replace
4, 17	Tilt of shift fork claw	0.1 {0.0039} or less	0.2 {0.0079}	Replace
4, 17, *a	Clearance between shift fork and synchronizer sleeve of mainshaft	0.3 to 0.6 {0.012 to 0.024}	1.0 {0.039}	Replace

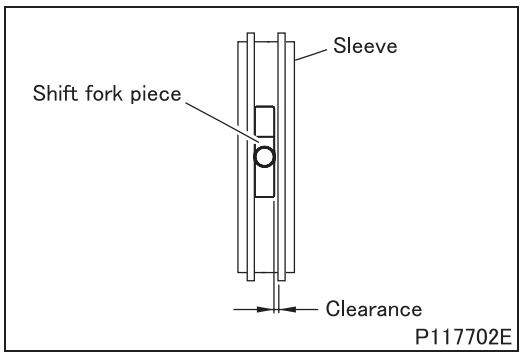
◆Inspection procedure◆



P66966

■ Inspection: Bend of shift rail

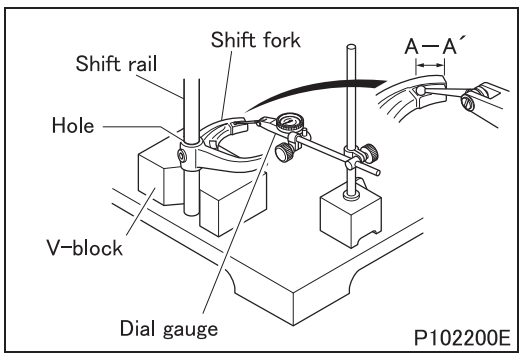
- Measure the extent of bending at the middle of each of shift rail.
- While rotating the shift rail by one revolution, read how much the dial gauge needle will move. A half of the reading observed represents the bend, if any, of the rail.
- If the measurement exceeds the limit, replace the shift rails.



P117702E

■ Inspection: Clearance between shift fork piece and synchronizer sleeve of mainshaft

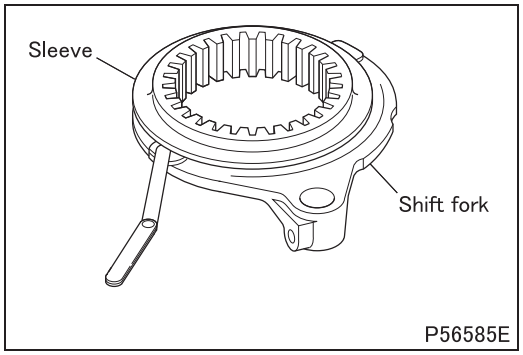
- If the measurement exceeds the limit, replace defective parts.



P102200E

■ Inspection: Tilt of shift fork claw

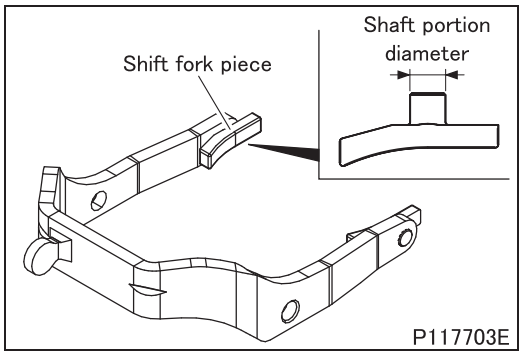
- Measure the tilt (difference between A and A´) of claw A-A´ against the shift rail hole of shift fork with pressing the rail to V-block and standing it vertically.
- If the measurement exceeds the limit, replace the shift fork.



■ **Inspection: Clearance between shift fork and synchronizer sleeve of mainshaft**

- If the measurement exceeds the limit, replace defective part.

◆Installation procedure◆

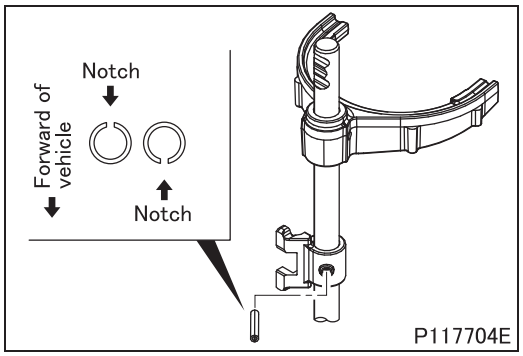


■ **Installation: Shift fork piece**

- Install the shift fork piece on the shift fork as shown in the illustration.

■ **Installation: 4th and 1st/6th/reverse lever**

- Place the synchronizer sleeve of mainshaft in neutral position before installing the reverse lever on the mainshaft.



■ **Installation: Spring pin**

- Install the spring pin in the illustrated direction (the spring pin notch to be positioned forward or rearward of the vehicle). When installing the spring pin, leave 0 to 0.5 mm {0 to 0.020 in.} outside from each shift rail or each gear shift jaw.
- Drive the spring pin carefully so as not to impose too much load on each shift rail and each gear shift jaw.

OUTER DRIVE PINION

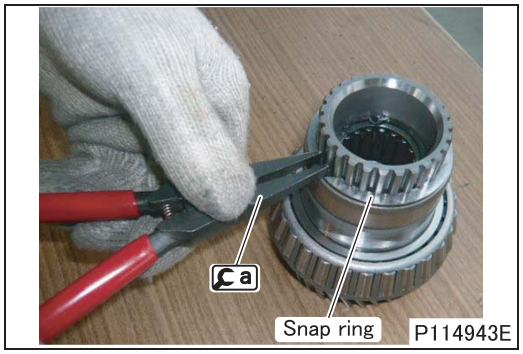
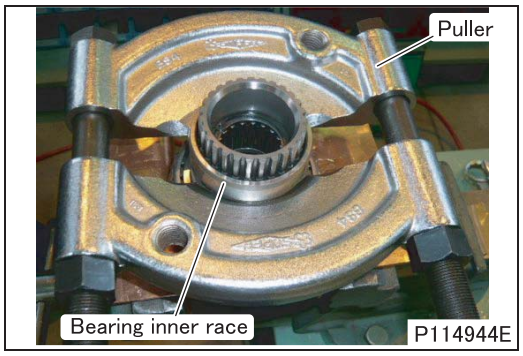
◆Removal procedure◆



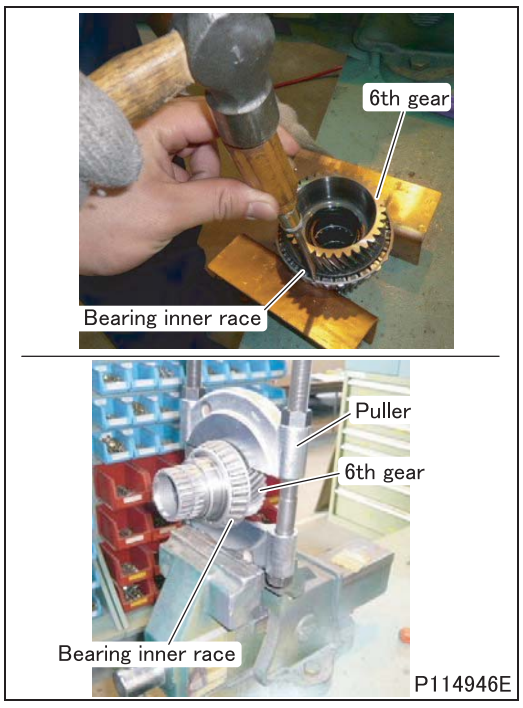
■ **Removal: Snap ring**

- Remove the snap ring using a.



■ **Removal: Outer drive pinion roller bearing inner race**

- Install a commercially available bearing puller on the bottom of the outer drive pinion roller bearing inner race.
- Install g on the end of the outer drive pinion, and then remove the outer drive pinion roller bearing inner race by pushing it out with a press.



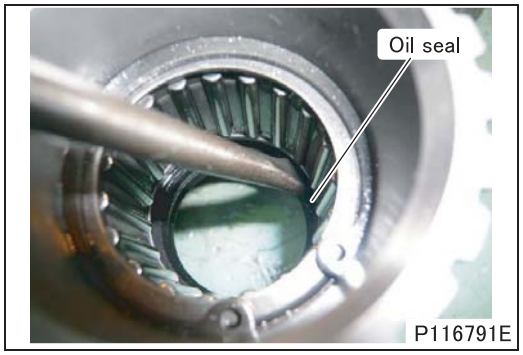
■ **Removal: Outer drive pinion taper bearing inner race**

- Evenly hit the flange of the outer drive pinion taper bearing inner race with a flat-blade screwdriver or the like to provide a clearance from the outer drive pinion 6th gear.
- Install a commercially available bearing puller in the clearance between the outer drive pinion taper bearing inner race and outer drive pinion 6th gear.

CAUTION ⚠

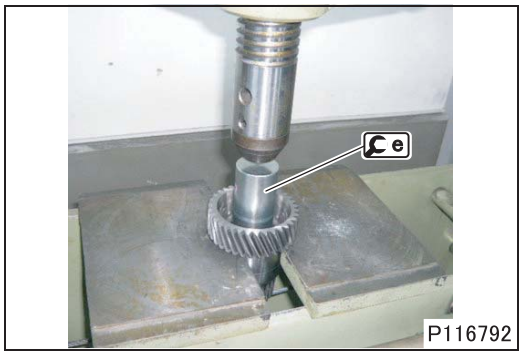
- **Be sure to provide a clearance before installing the bearing puller. Otherwise the outer drive pinion taper bearing inner race may be damaged.**
- **Be sure to install the bearing puller on the 6th gear side. The bearing will be seized if the puller is installed on the outer drive pinion taper bearing inner race side.**

- Install g on the end of the outer drive pinion, and then remove the outer drive pinion taper bearing inner race by pushing it out with a press.



■ **Removal: Oil seal**

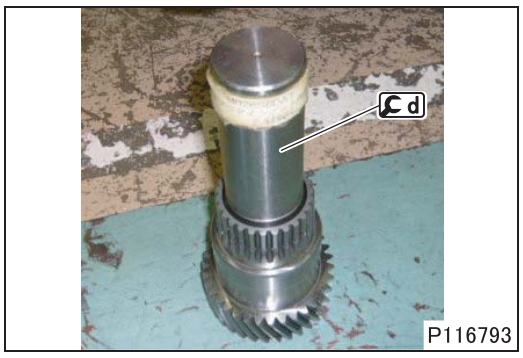
- Remove the oil seal using a screwdriver or the like.



■ **Removal: Snap ring and needle bearing**

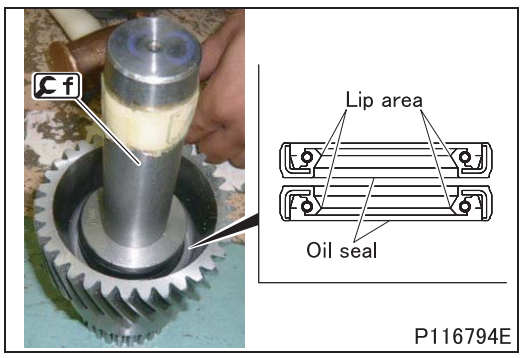
- Remove the snap ring.
- Using e, remove the needle bearing by pushing it out with a press.

◆Installation procedure◆



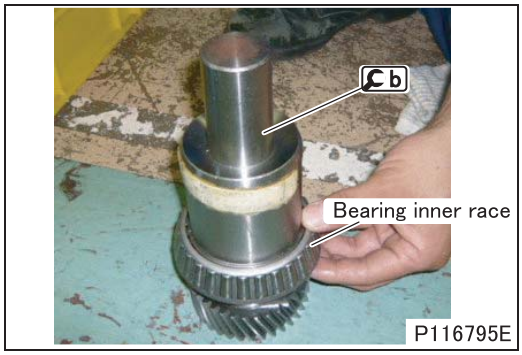
■ **Installation: Needle bearing and snap ring**

- Apply automatic transmission fluid to the needle bearing, and then install it on the outer drive pinion using d.
- Apply automatic transmission fluid to the snap ring, and then install it on the outer drive pinion.



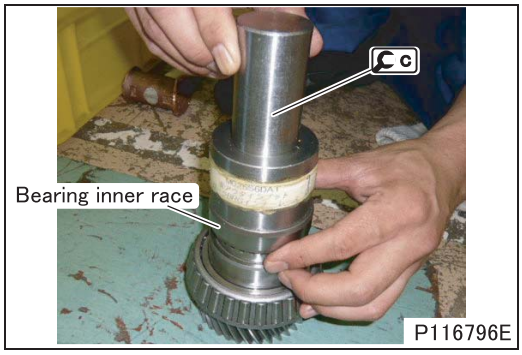
■ **Installation: Oil seal**

- Apply automatic transmission fluid to the lip areas of the oil seals, and then install the oil seals on the outer drive pinion in the illustrated orientations using f.



■ **Installation: Outer drive pinion taper bearing inner race**

- Install the outer drive pinion taper bearing inner race on the outer drive pinion using b.

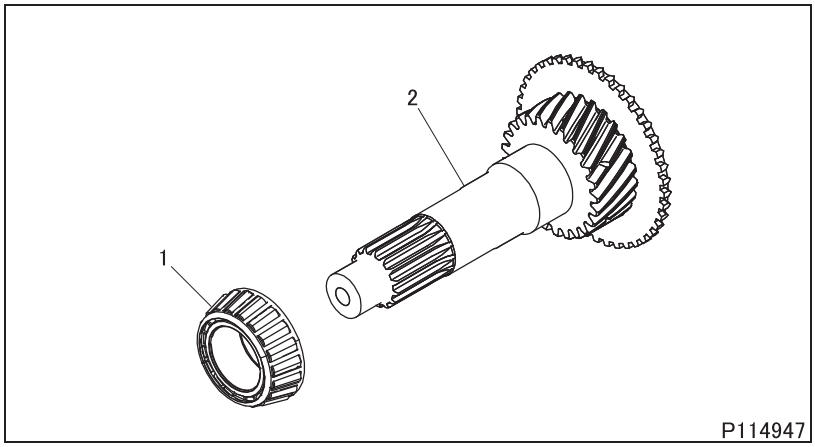


■ **Installation: Outer drive pinion roller bearing inner race and snap ring**

- Apply automatic transmission fluid to the outer drive pinion roller bearing inner race, and then install it on the outer drive pinion using c.
- Apply automatic transmission fluid to the snap ring, and then install it on the outer drive pinion using a.

M E M O

INNER DRIVE PINION



● **Disassembly sequence**

1 Inner drive pinion taper bearing inner race
2 Inner drive pinion

⊗: Non-reusable parts

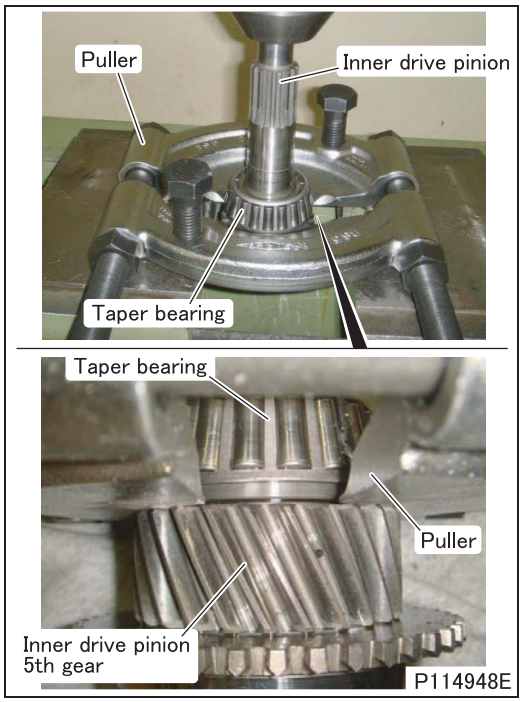
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
⊂a	Bearing installer A: ϕ45 {1.77}, B: ϕ41 {1.61} 	MH064244	Installation of outer drive pinion taper bearing inner race

◆**Removal procedure**◆



■ **Removal: Inner drive pinion taper bearing inner race**

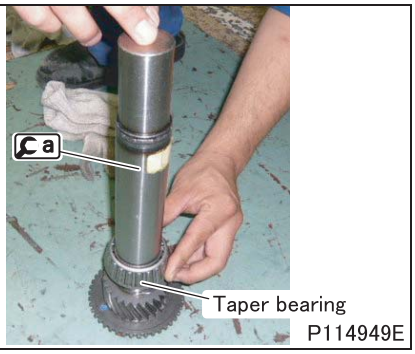
- Install a commercially available bearing puller between the inner drive pinion taper bearing inner race and inner drive pinion 5th gear.
- After installing the bearing puller, check that the rollers on the taper bearing inner race rotate smoothly.

CAUTION ⚠

- **If the rollers do not rotate smoothly, reinstall the bearing puller. Otherwise the inner drive pinion taper bearing inner race may be damaged.**

- Remove the inner drive pinion taper bearing inner race by pushing it out with a press.

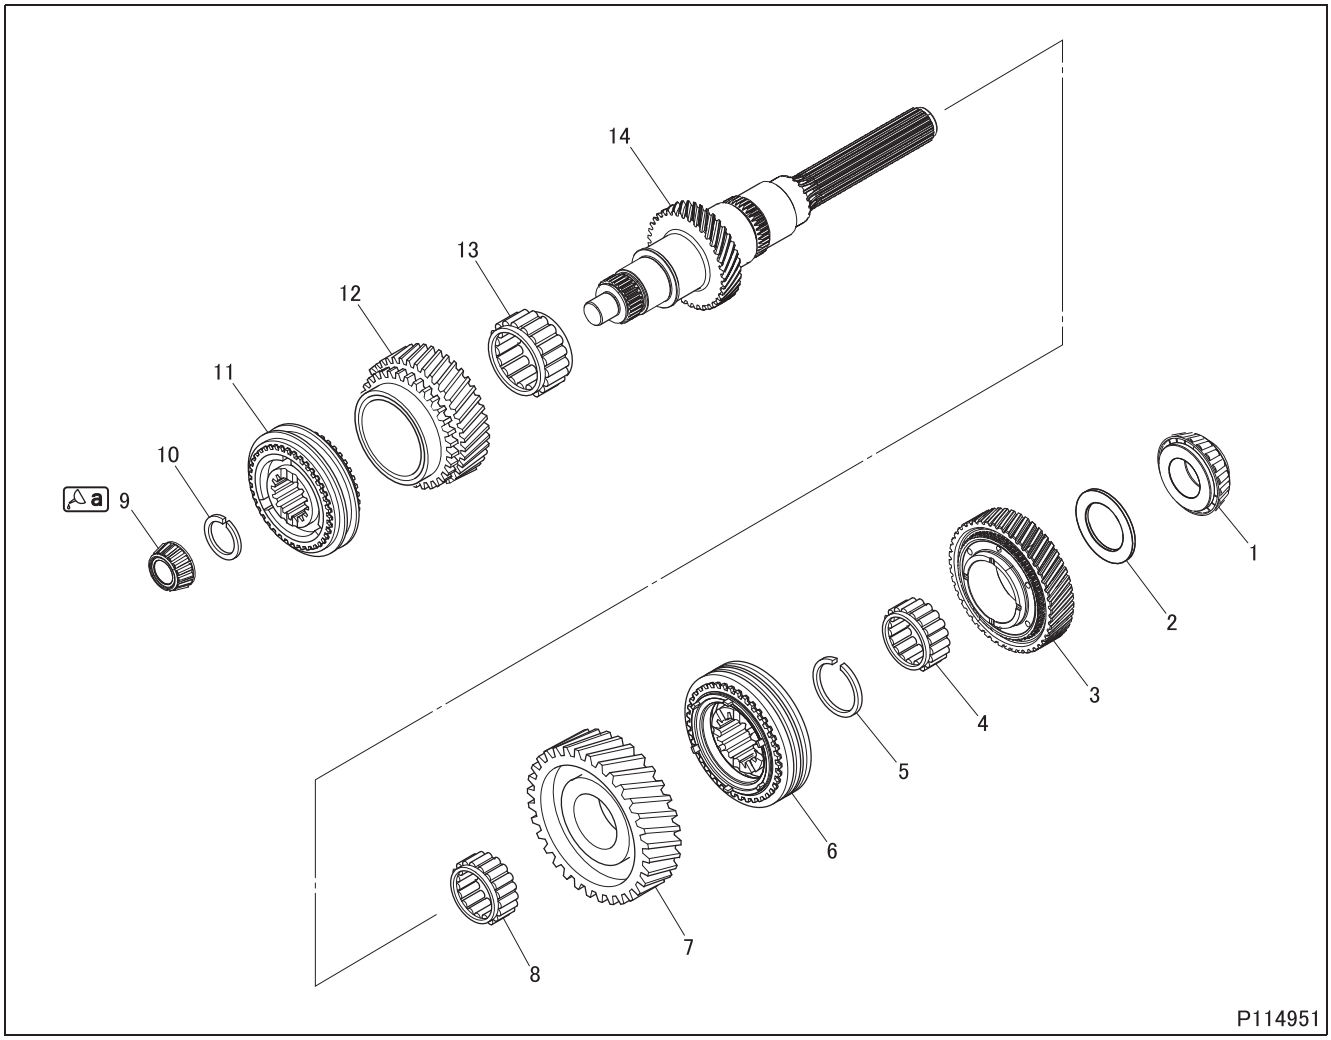
◆Installation procedure◆



■ **Installation: Inner drive pinion taper bearing inner race**

- Install the inner drive pinion taper bearing inner race on the inner drive pinion using a.

MAINSHAFT



● **Disassembly sequence**

1 Mainshaft rear taper bearing inner race
2 1st gear thrust washer
3 1st and 2nd gear
4 Needle bearing
5 Snap ring
6 1st/2nd and reverse synchronizer (See later section.)
7 Reverse gear

		Reverse gear and 1st/2nd and reverse synchronizer	1.07 to 1.43 {0.042 to 0.056}	0.5 {0.020}	
		3rd gear and 3rd and 5th/6th synchronizer	1.17 to 1.53 {0.046 to 0.060}	0.5 {0.020}	
		Inner drive pinion and 3rd and 5th/6th synchronizer	1.10 to 1.60 {0.043 to 0.063}	0.5 {0.020}	

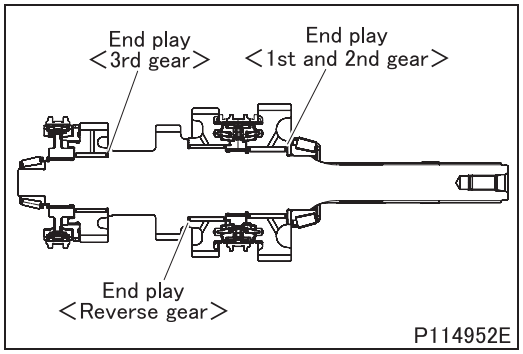
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Entire periphery of pilot bearing roller	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

Special tools (Unit: mm {in.})

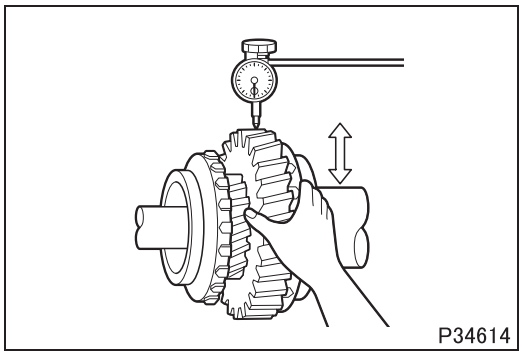
Mark	Tool name and shape	Part No.	Application
a	Snap ring expander  P01137	MH061268	Removal and installation of snap ring
b	Bearing installer A: ϕ30 {1.18} B: ϕ26 {1.02}  P116045	MH064243	Installation of pilot bearing
c	Bearing installer A: ϕ56 {2.20} B: ϕ51 {2.01}  P116046	MH064253	Installation of mainshaft rear taper bearing inner race

◆Work before removal◆



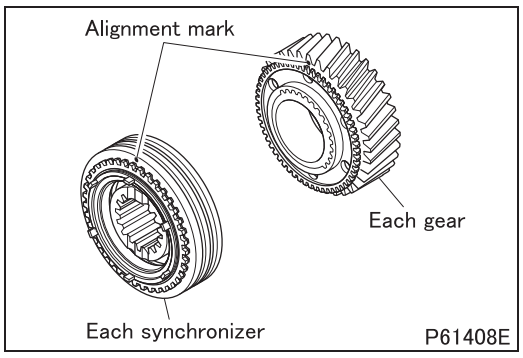
■ **Inspection: End play of each gears**

- Measure the end play using feeler gauge.
- If the measurement exceeds the limit, replace defective parts.



■ **Inspection: Play in diameter direction of each gears**

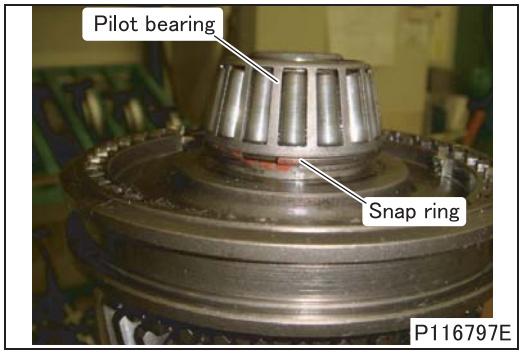
- If the measurement exceeds the limit, replace defective parts.



■ **Alignment marks: Each gear and each synchronizer**

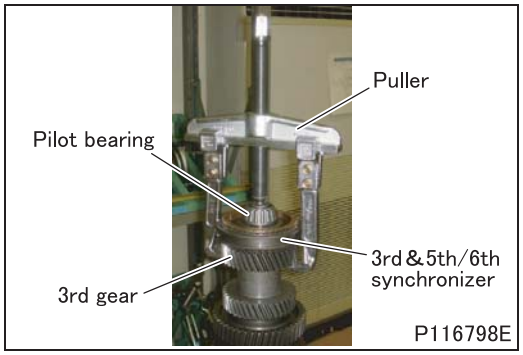
- Put alignment marks on the each gear and the synchronizer sleeve of the each synchronizer so that the combination of their mating surfaces can be maintained when reassembled.

◆Removal procedure◆



■ **Removal: Pilot bearing, snap ring, 3rd and 5th/6th synchronizer and 3rd gear**

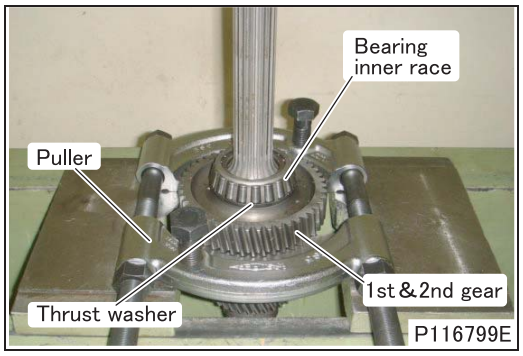
- Remove the snap ring on the 3rd and 5th/6th synchronizer and hook it onto the pilot bearing.



- Using a commercially available gear puller, remove the pilot bearing, snap ring, 3rd and 5th/6th synchronizer and 3rd gear as one unit.

CAUTION ⚠

- **Be sure to hook the gear puller onto the bottom of the 3rd gear; hooking it onto the bottom of the pilot bearing may damage the bearing.**



■ Removal: Mainshaft rear taper bearing inner race, 1st gear thrust washer and 1st and 2nd gears

- Install a commercially available bearing puller on the bottom of the 1st and 2nd gears.
- Remove the mainshaft rear taper bearing inner race, 1st gear thrust washer and 1st and 2nd gears as one unit by pushing them out with a press.

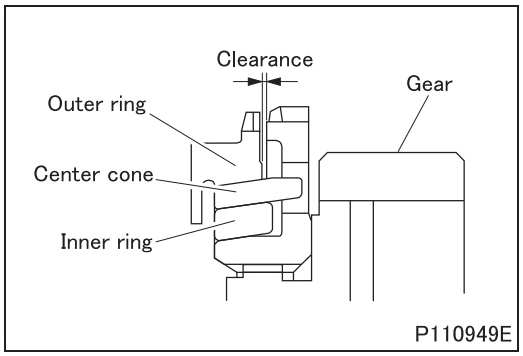
CAUTION ⚠

- **Be sure to install the bearing puller on the bottom of the 1st and 2nd gears; installing it on the bottom of mainshaft rear taper bearing inner race may damage the inner race.**

■ Removal: Snap ring, 1st/2nd and reverse synchronizer and reverse gear

- Remove the snap ring using Ca.
- Remove the 1st/2nd and reverse synchronizer and reverse gear.

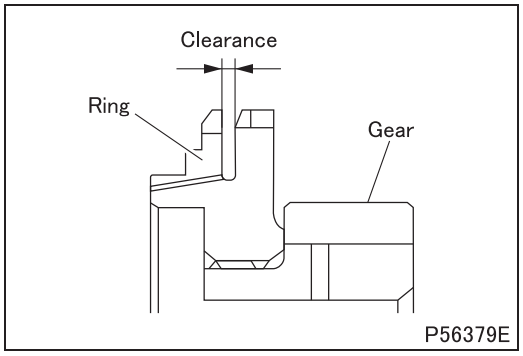
◆Inspection procedure◆



■ Inspection: Clearance between gear and synchronizer ring of synchronizer

<Triple cone type>

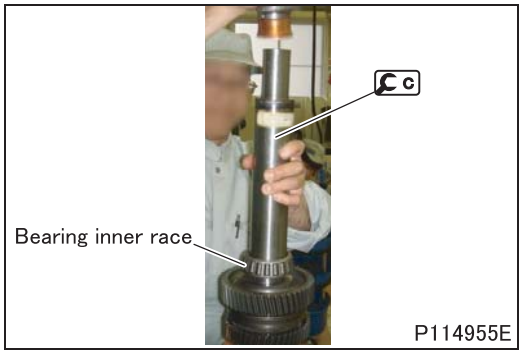
- When measuring the clearance, press the ring and the center cone evenly against the gear and measure all around the circumference.
- If the measurement is less than the limit, replace the ring and gear.



<Single cone type>

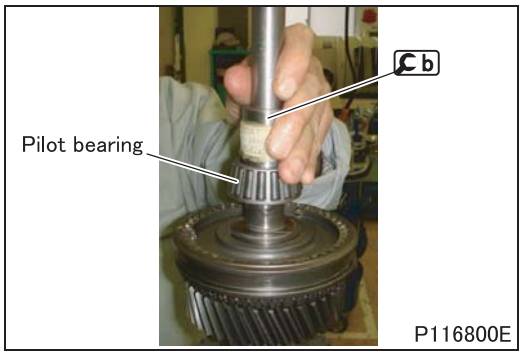
- When measuring the clearance, press the ring evenly against the gear and measure all around the circumference.
- If the measurement is less than the limit, replace the ring and the gear or inner drive pinion.

◆Installation procedure◆



■ **Installation: Mainshaft rear taper bearing inner race**

- Install the mainshaft rear taper bearing inner race on the mainshaft using c.

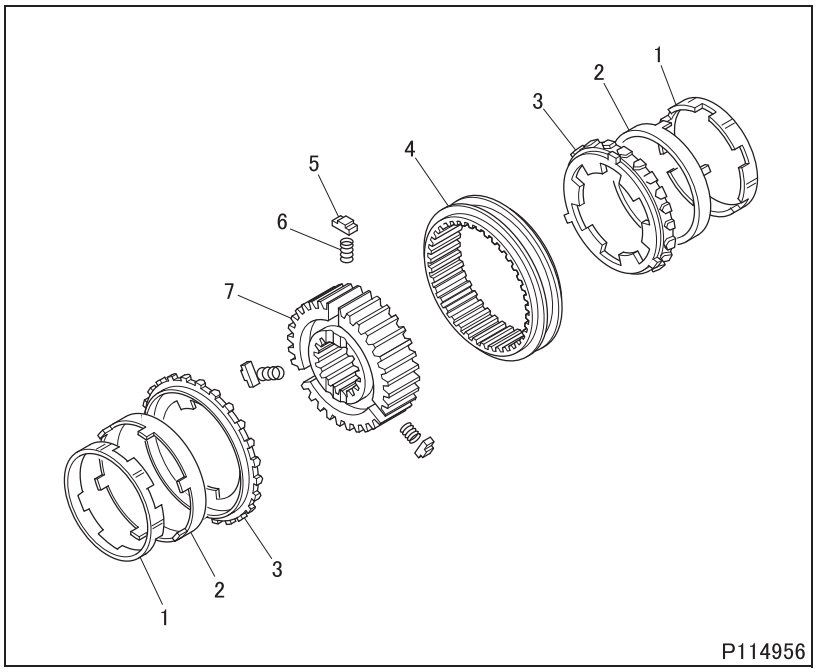


■ **Installation: Pilot bearing**

- Install the pilot bearing on the mainshaft using b.

M E M O

1st/2nd and Reverse Synchronizer



● Disassembly sequence

1 Synchronizer inner ring
2 Synchronizer center cone
3 Synchronizer outer ring
4 Synchronizer sleeve
5 Shifting plunger
6 Shifting plunger spring
7 Synchronizer hub

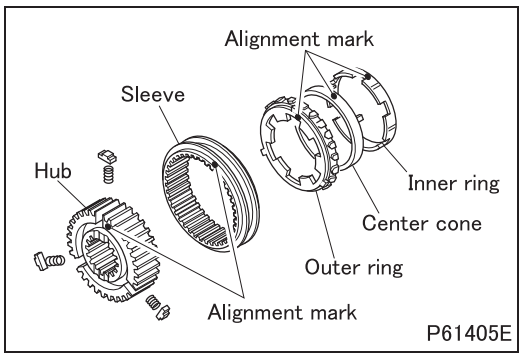
● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
3, 7	Clearance between synchronizer outer ring protrusion and synchronizer hub groove	3.0 to 3.3 {0.12 to 0.13}	4.0 {0.16}	Replace

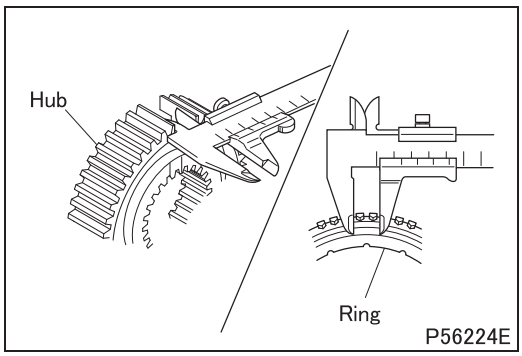
◆Work before removal◆



■ Alignment marks

- Put alignment marks on the synchronizer inner ring, center cone, outer ring and hub, each at one location, aligning with the alignment mark put on the synchronizer sleeve before disassembly.

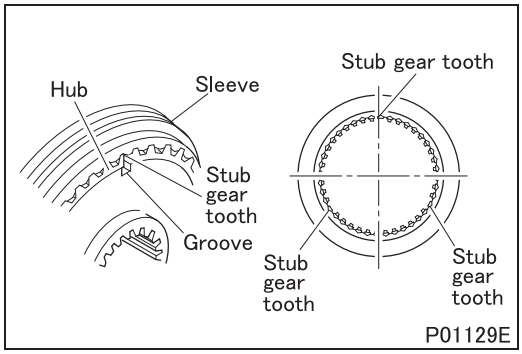
◆Inspection procedure◆



■ Inspection: Clearance between synchronizer outer ring protrusion and synchronizer hub groove

- If the clearance exceeds the limit, replace defective parts.

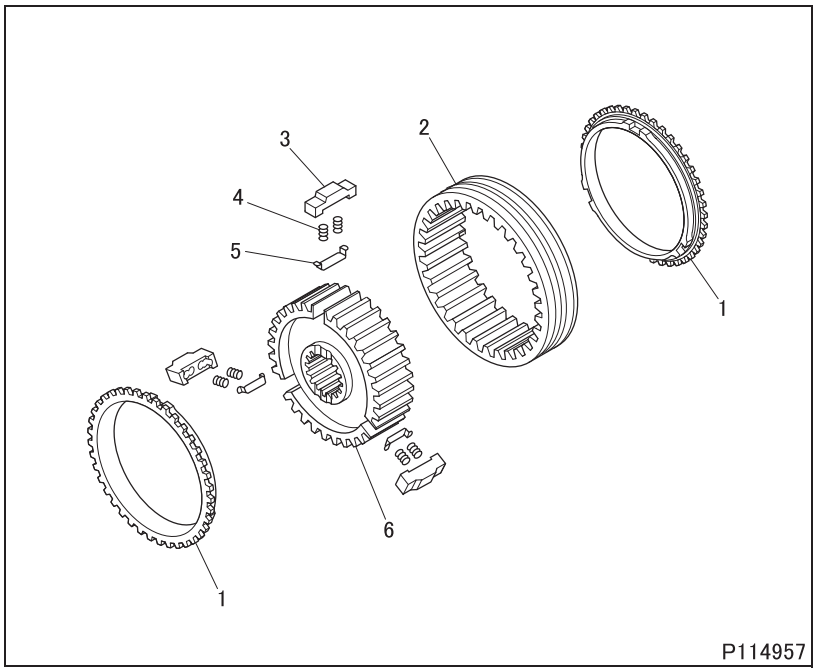
◆Installation procedure◆



■ **Installation: Synchronizer sleeve and synchronizer hub**

- When replacing the synchronizer sleeve or synchronizer hub with a new one, align the three keyways of the synchronizer hub with three locations of the stub gear tooth of the synchronizer sleeve to install.

3rd and 5th/6th Synchronizer



● Disassembly sequence

1 Synchronizer ring
2 Synchronizer sleeve
3 Shifting key
4 Shifting key spring
5 Shifting key retainer
6 Synchronizer hub

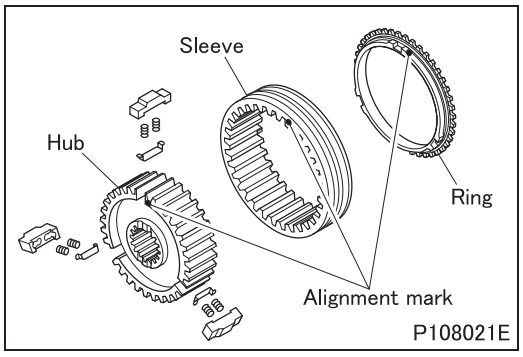
● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
1, 3	Clearance between synchronizer ring keyway and shifting key	4.75 to 4.95 {0.187 to 0.194}	5.7 {0.22}	Replace
3, 6	Clearance between shifting key and synchronizer hub keyway	0.05 to 0.20 {0.0020 to 0.0079}	0.5 {0.020}	Replace
4	Shifting key spring installed load (installed length 3.95 {0.16})	17.16 ± 1.7 N {3.9 ± 0.4 lbs, 1.75 ± 0.2 kgf}	12 N {2.7 lbs, 1.23 kgf}	Replace

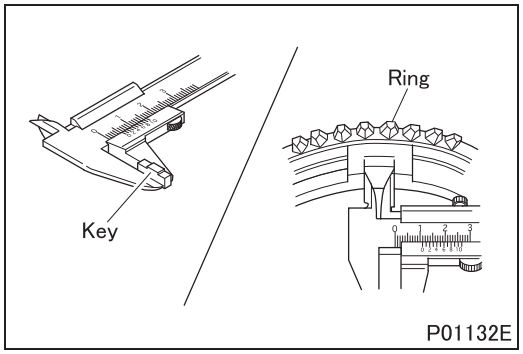
◆Work before removal◆



■ Alignment marks

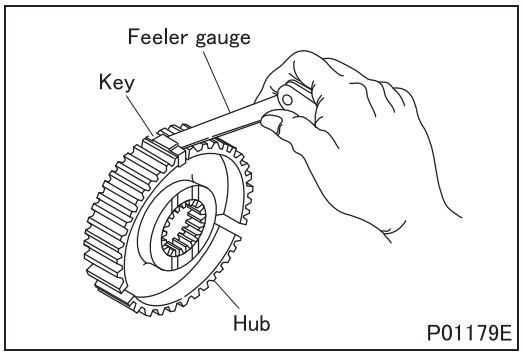
- Put alignment marks on the synchronizer ring and hub, each at one location aligning with the alignment mark put on the synchronizer sleeve before disassembly.

◆Inspection procedure◆



■ **Inspection: Clearance between synchronizer ring and shifting key**

- If the clearance exceeds the limit, replace defective parts.



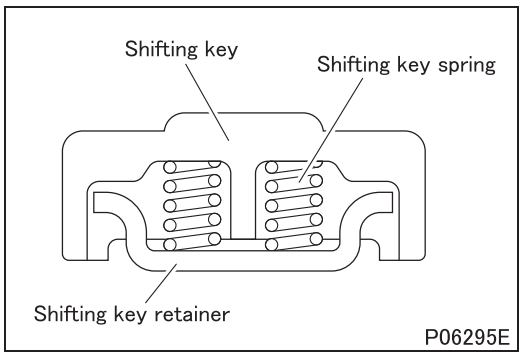
■ **Inspection: Clearance between shifting key and synchronizer hub**

- If the measurement exceeds the limit, replace defective parts.

■ **Inspection: Shifting key spring**

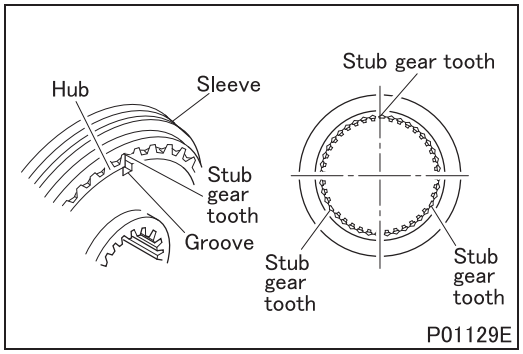
- Measure the installed load at the installed length of the shifting key spring.

◆Installation procedure◆



■ **Installation: Shifting key retainer**

- Install shifting key retainers as illustrated.



■ **Installation: Synchronizer sleeve and synchronizer hub**

- When replacing the synchronizer sleeve or synchronizer hub with a new one, align the three keyways of the synchronizer hub with three locations of the stub gear tooth of the synchronizer sleeve to install.

COUNTERSHAFT

9 4th and 1st/6th/reverse synchronizer (See later section.)
10 4th gear
11 Needle bearing
12 Countershaft gear

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	End play	Constant mesh gear 1 and 3rd gear	0.08 to 0.37 {0.0031 to 0.015}	0.7 {0.028}	Replace
		4th gear	0.15 to 0.46 {0.0059 to 0.018}	0.7 {0.028}	
–	Play in the diameter direction	Constant mesh gear 1	0.02 to 0.06 {0.00079 to 0.0024}	0.12 {0.047}	Replace
		3rd gear	0.02 to 0.06 {0.00079 to 0.0024}	0.12 {0.047}	
		4th gear	0.02 to 0.06 {0.00079 to 0.0024}	0.12 {0.047}	
–	Clearance between gear and synchronizer ring	3rd gear and 4th and 1st/6th/reverse synchronizer	1.16 to 1.49 {0.046 to 0.058}	0.5 {0.020}	Replace
		4th gear and 4th and 1st/6th/reverse synchronizer	1.14 to 1.51 {0.045 to 0.059}	0.5 {0.020}	

Lubricant and/or sealant

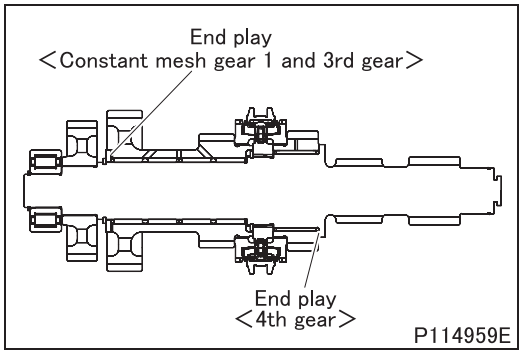
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Circumference of the constant mesh gear 2 mounting section of the countershaft	Loctite 640	As required
b	Sliding area of needle bearing	API GL-3 SAE80	As required
	Sliding area of 4th and 1st/6th/reverse synchronizer		

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Bearing installer A: ϕ30 {1.18}, B: ϕ26 {1.02}  P116045	MH064243	Installation of countershaft front bearing
b	Snap ring expander  P01137	MH061268	Removal and installation of snap ring

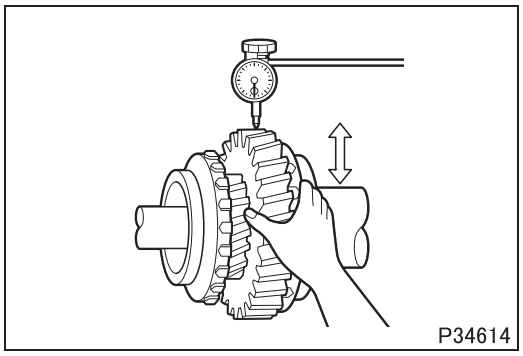
COUNTERSHAFT

◆Work before removal◆



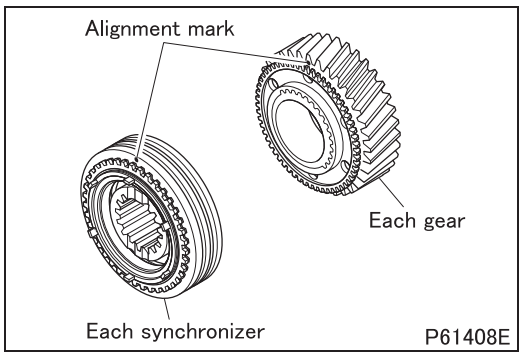
■ **Inspection: End play of each gears**

- Measure the end play using feeler gauge.
- If the measurement exceeds the limit, replace defective parts.



■ **Inspection: Play in diameter direction of each gears**

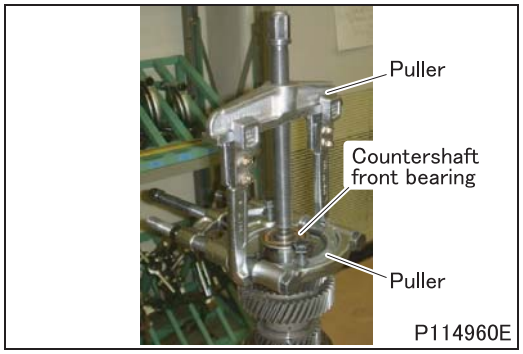
- If the measurement exceeds the limit, replace defective parts.



■ **Alignment marks: Each gear and each synchronizer**

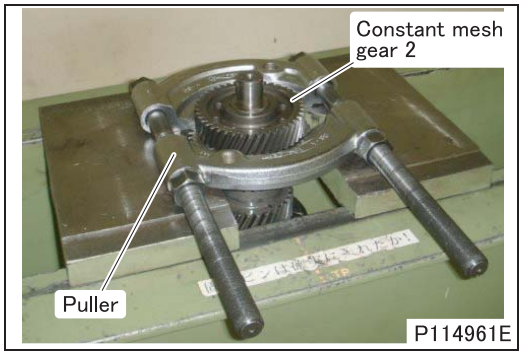
- Put alignment marks on the each gear and the synchronizer sleeve of the each synchronizer so that the combination of their mating surfaces can be maintained when reassembled.

◆Removal procedure◆



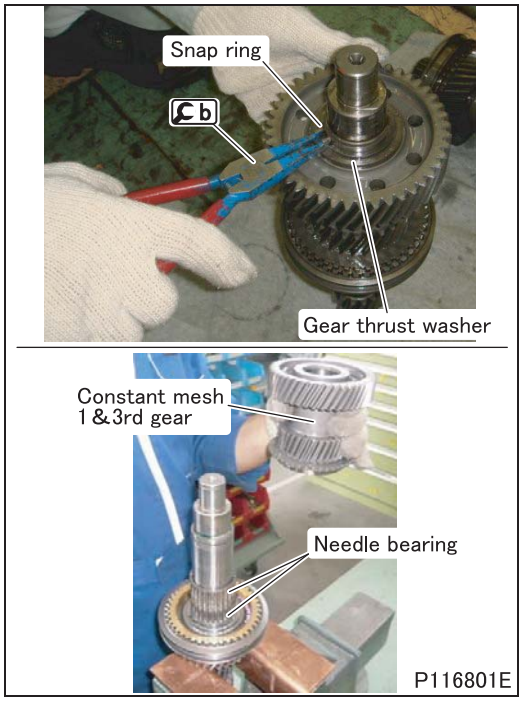
■ **Removal: Snap ring and countershaft front bearing**

- Remove the snap ring using Cb.
- Remove the countershaft front bearing using a commercially available bearing puller and gear puller.



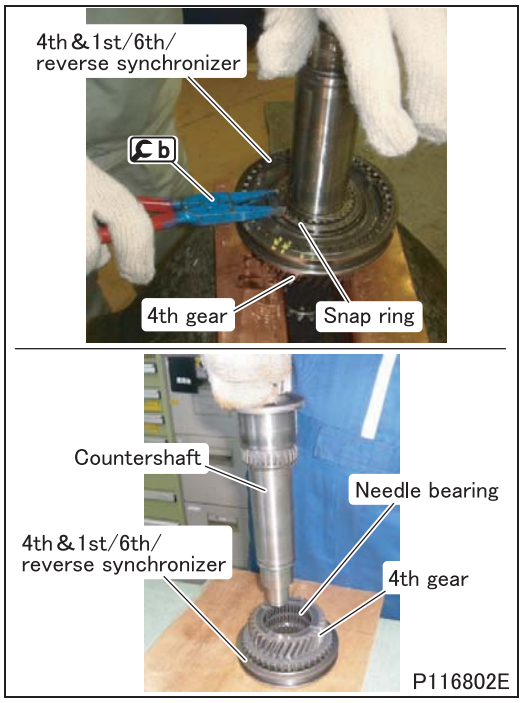
■ **Removal: Constant mesh gear 2**

- Install a commercially available bearing puller on the bottom of constant mesh gear 2, and then remove the gear by pushing it out with a press.



■ **Removal: Snap ring, gear thrust washer, constant mesh gear 1 and 3rd gear and needle bearing**

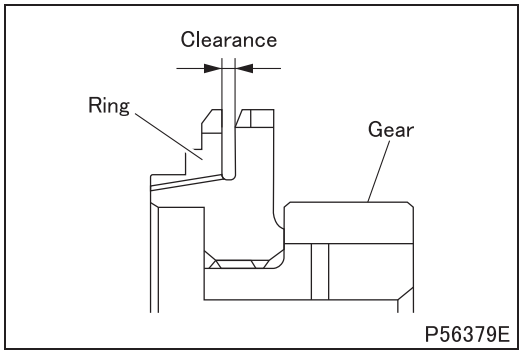
- Remove the snap ring using b.
- Remove each part.



■ **Removal: Snap ring, 4th and 1st/6th/reverse synchronizer, 4th gear and needle bearing**

- Remove the snap ring using b.
- Remove each part.

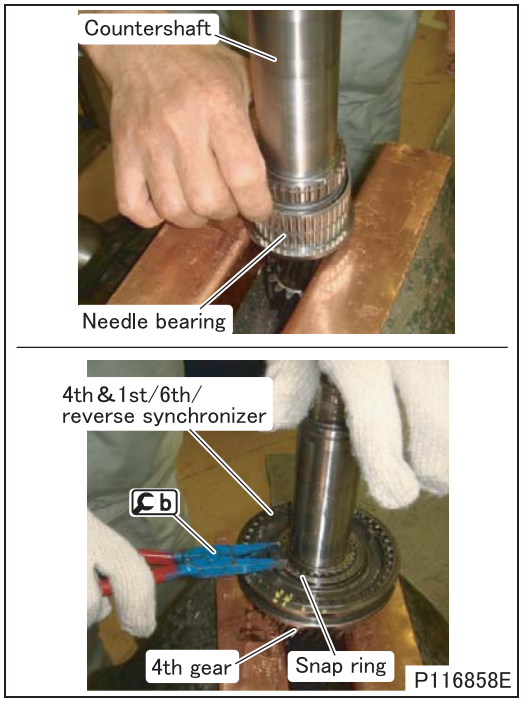
◆Inspection procedure◆



■ **Inspection: Clearance between 4th gear or constant mesh gear 1 and 3rd gear and synchronizer ring of 4th and 1st/6th/reverse synchronizer**

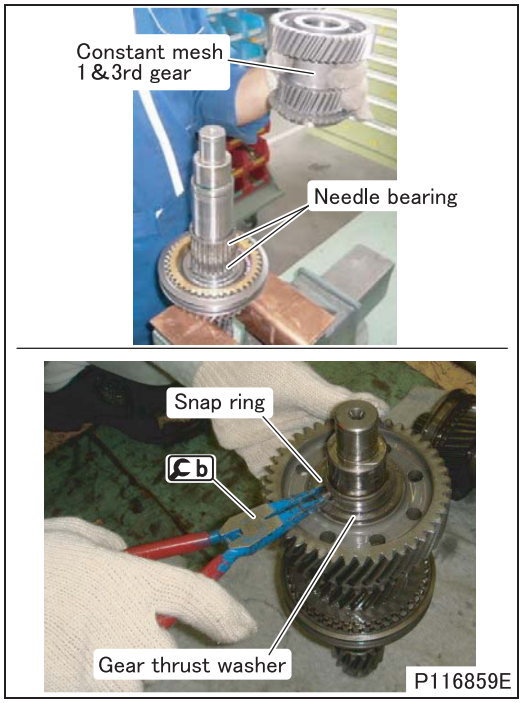
- When measuring the clearance, press the ring evenly against the gear and measure all around the circumference.
- If the measurement is less than the limit, replace the ring and the gear.

◆Installation procedure◆



■ **Installation: Needle bearing, 4th gear, 4th and 1st/6th/reverse synchronizer and snap ring**

- Apply oil to the sliding surfaces of the needle bearing and 4th and 1st/6th/reverse synchronizer.
- Install each part.
- Install the snap ring using b.



■ **Installation: Needle bearing, constant mesh gear 1 and 3rd gear, gear thrust washer and snap ring**

- Apply oil to the sliding surface of the needle bearing.
- Install each part.
- Install the snap ring using b.

■ **Installation: Constant mesh gear 2**

[Heating]

- Heat constant mesh gear 2 evenly to 130°C {266°F} using one of the following methods.

<Temperature-controlled chamber>

- Heat constant mesh gear 2 with a temperature setting of 130°C {266°F} for more than 15 minutes.

<Ring heater>

- Repeat a heating process two to three times with a temperature setting of 130°C {266°F} so that entire constant mesh gear 2 is evenly heated to 130°C {266°F}.

CAUTION ⚠

- **Repeat the heating process two to three times because sufficient thermal expansion of constant mesh gear 2 cannot be achieved in a single heating process.**

<Oil bath>

- Heat gear oil to 130°C {266°F} and immerse constant mesh gear 2 in the oil bath in the orientation shown in the picture.
- Since gear oil temperature drops when constant mesh gear 2 is immersed in the oil bath, reheat the oil to 130°C {266°F} and keep constant mesh gear 2 immersed in the oil bath for more than 15 minutes while maintaining the oil temperature at 130°C {266°F}.

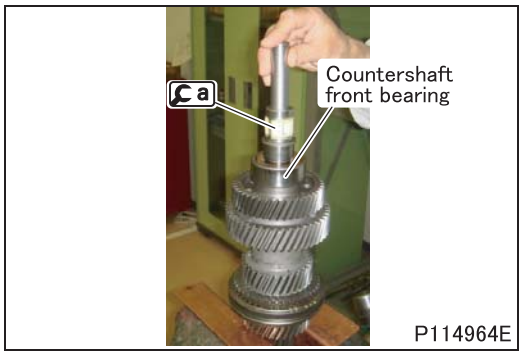
[Installation]

- Apply locking agent to the circumference of the constant mesh gear 2 mounting section of the countershaft.
- Install heated constant mesh gear 2.

WARNING ⚠

- **Take care not to burn yourself when installing the hot constant mesh gear 2.**

- When constant mesh gear 2 has sufficiently cooled down, install the snap ring using [b].

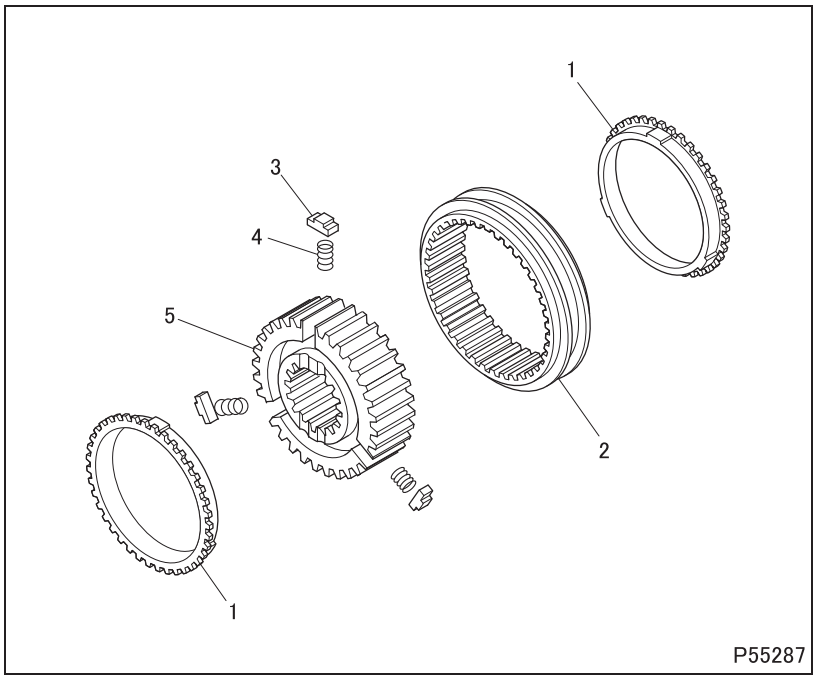


■ Installation: Countershaft front bearing

- Install the countershaft front bearing using [a].

M E M O

4th and 1st/6th/Reverse Synchronizer



● Disassembly sequence

1 Synchronizer ring
2 Synchronizer sleeve
3 Shifting plunger
4 Shifting plunger spring
5 Synchronizer hub

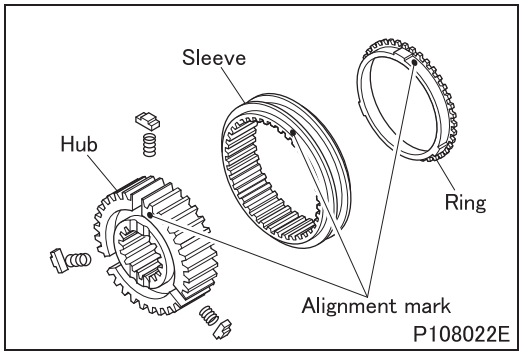
● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
1, 5	Clearance between synchronizer ring protrusion and synchronizer hub groove	4.8 to 5.1 {0.19 to 0.20}	5.8 {0.23}	Replace

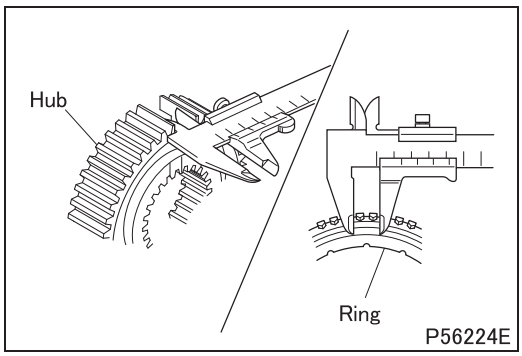
◆Work before removal◆



■ Alignment marks: Synchronizer ring and synchronizer hub

- Put alignment marks on the synchronizer ring and hub, each at one location aligning with the alignment mark put on the synchronizer sleeve before disassembly.

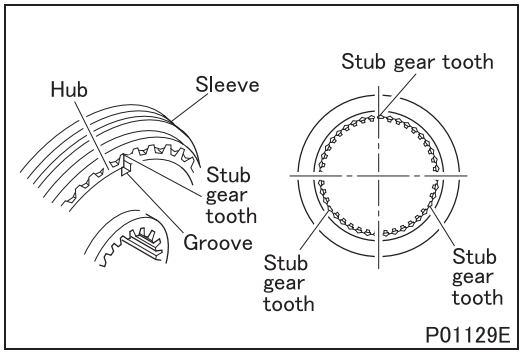
◆Inspection procedure◆



■ Inspection: Clearance between synchronizer ring protrusion and synchronizer hub groove

- If the clearance exceeds the limit, replace defective parts.

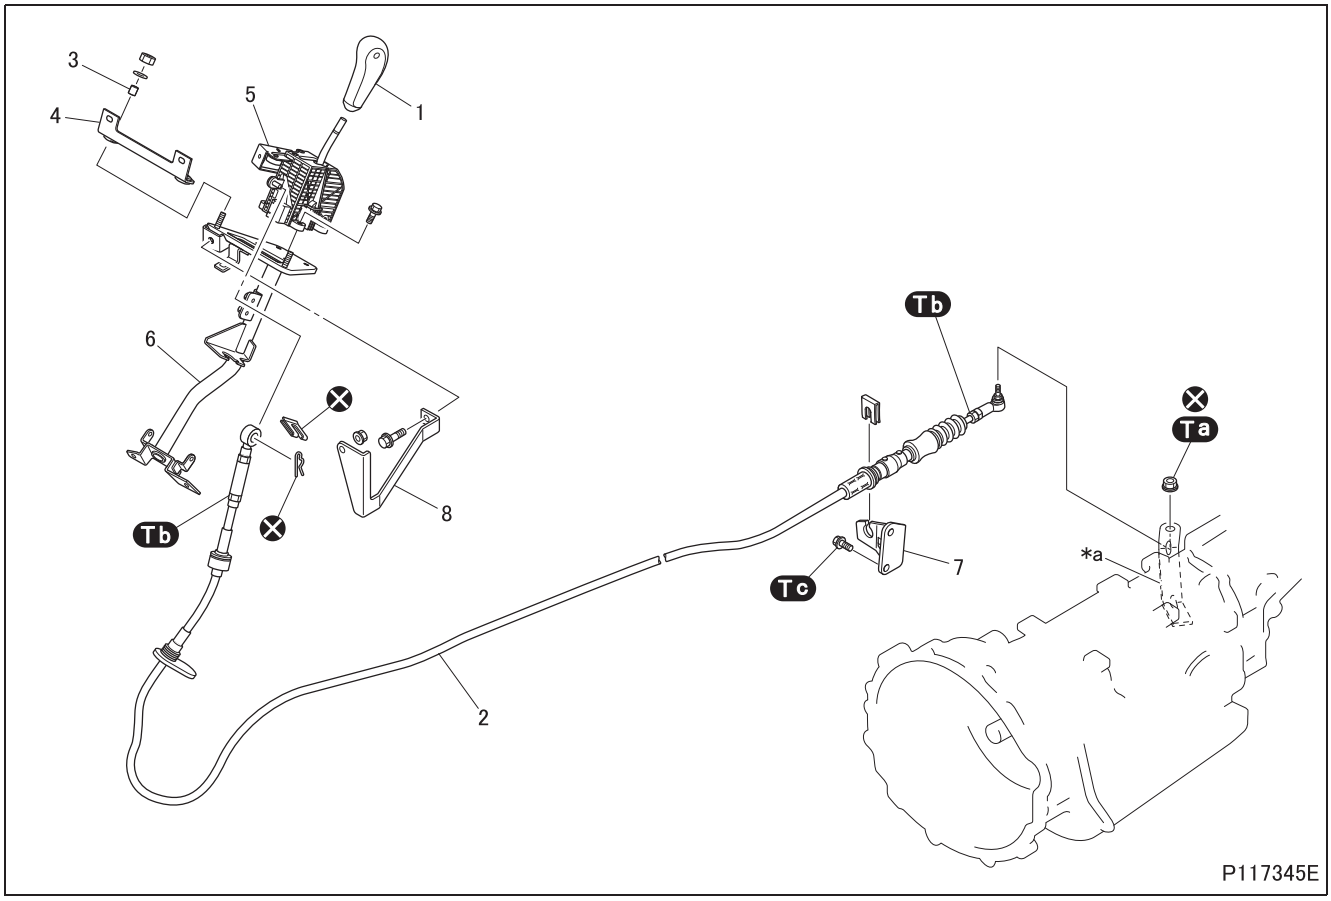
◆Installation procedure◆



■ Installation: Synchronizer sleeve and synchronizer hub

- When replacing the synchronizer sleeve or synchronizer hub with a new one, align the three keyways of the synchronizer hub with three locations of the stub gear tooth of the synchronizer sleeve to install.

TRANSMISSION CONTROL



● **Removal sequence**

1 Shift knob
2 P-range cable
3 Collar
4 Instrument panel bracket
5 Shift lever unit
6 Shift lever bracket
7 Bracket
8 Shift lever stay
***a**: Parking cable lever
⊗: Non-reusable parts

- Place the gear shift lever in the R-range position before starting removal work because installation work will be performed in the N range position.
- If the shift lever is placed into the R range due to a discharged battery or an electric circuit not connected yet, operate the shift lock release lever to place the shift lever into the N range. (See Gr00.)

● **Installation sequence**

Follow the removal sequence in reverse.

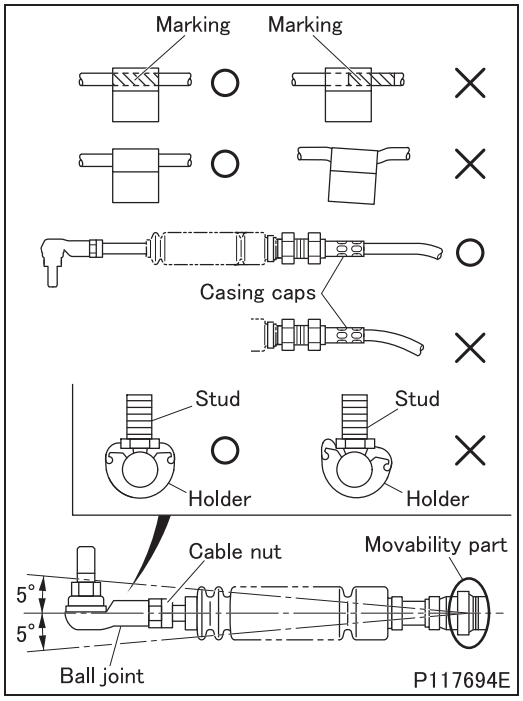
CAUTION ⚠

- **Locking agent is applied to the nuts that are designated as non-reusable. Be sure to replace these nuts if they have been loosened or removed.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Nut (P-range cable mounting)		19 to 24 {14 to 18, 1.9 to 2.4)	–
Tb	P-range cable	Lock nut on transmission side	10 to 15 {7.4 to 11.0, 1.0 to 1.5}	–
		Lock nut on change lever unit side	4 to 6 {3.0 to 4.4, 0.4 to 0.6}	–
Tc	Bolt (bracket mounting}		37 to 53 {27 to 39, 3.8 to 5.4}	–

◆Installation procedure◆



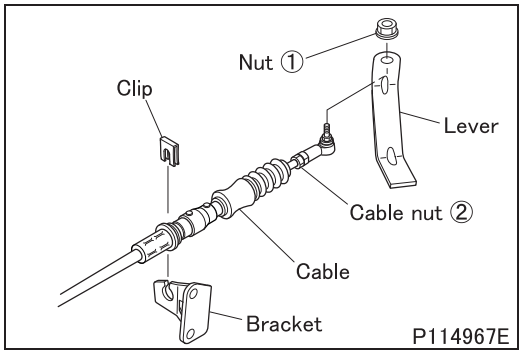
■ Installation: P-range cable

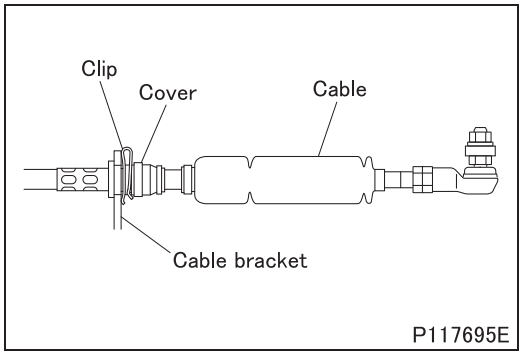
- Install the cable as follows.
  - Before installation, check the orientation and number of the clamps, orientation of the ball joint and other cabling conditions.
  - In places where a cable marking is provided, align the marking and clamp positions to install the cable.
  - Install the clamp at right angles to the cable.
  - Install the casing cap portion as a straight line.
  - Install the cable so that cable boot is not twisted. To eliminate the twist of the cable boot, remove the cable from both the gear shift lever and transmission, and then rotate the inner cable to remove the twist. When slight adjustment is required, loosen the cable nut to make adjustments.
  - Install the ball joint so that its stud does not come into one-sided contact with the boot. If the stud makes one-sided contact, loosen the cable nut to make adjustments.

CAUTION ⚠

- **Do not rotate the cable more than one revolution to eliminate twist or one-sided contact and make sure that the ball joint is screwed on the cable to a depth of 8 mm {0.31 in.} or more. Otherwise damage may result.**

  - Provide a large bending radius to the cable.
  - The bending angle from the movable section of the cable should not exceed 5°.
- Install the cable on the bracket and parking cable lever.

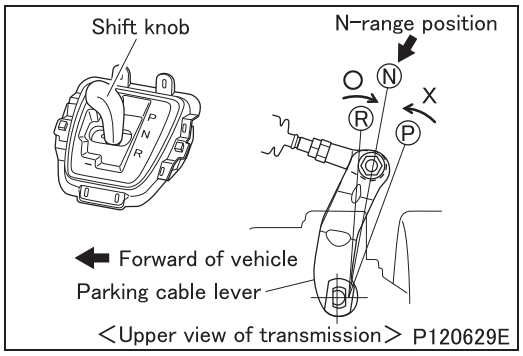




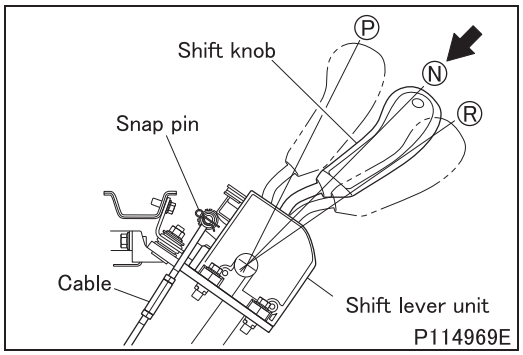
- Fix the cable with a clip with care not to allow an excessive force to be applied to the cable.
- Fit the clip all the way.

CAUTION ⚠

- **Be careful not to damage the cable cover when securing the cable with the clip.**

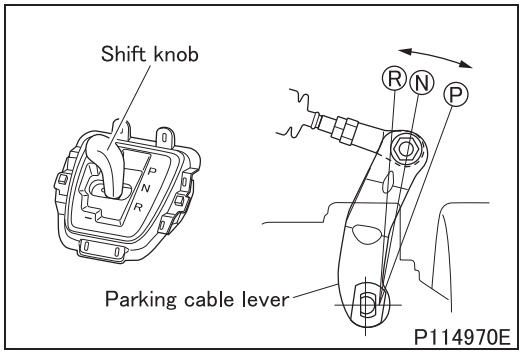


- Place the shift knob and parking cable lever to the N range positions, respectively.Operate the shift lever into the N range position from the R range.If the shift knob cannot be shifted from the D to N range position, operate the shift lock release lever of the shift lever unit to move the lever of the shift lever unit to which the P range cable is connected to the N range. This may dissolve the above problem. (See Gr00.)



- After checking that the shift knob is in the N range position, install the P range cable on the shift lever unit.

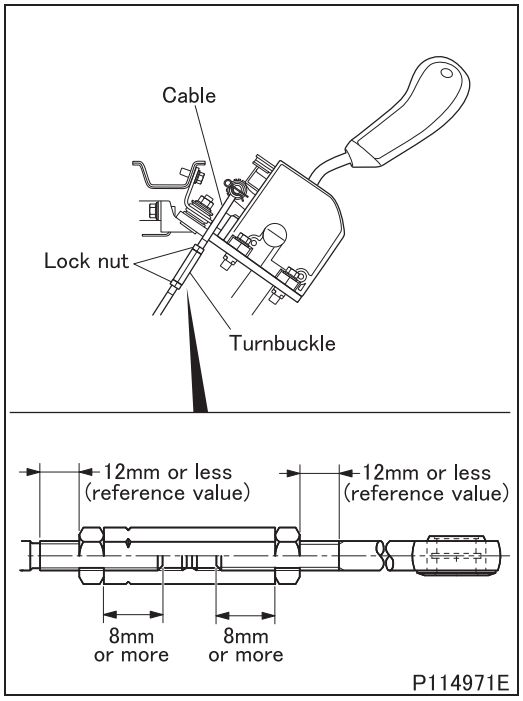
◆Work after installation◆



■ Inspection: Shift knob

[Inspection]

- Operate the shift knob to and fro between the P and R range positions two to three times, and then check the following.
  (1) The parking cable lever is positioned in the range corresponding to the shift knob position without any deviation and the indicator for the selected range in the meter cluster lights up.Then, shift the knob from P to N to D to N range position a few times. Check if you do not feel any resistance when shifting from D to N range position.
  (2) Hard operation or poor detent feel is not observed in any of the ranges.
- If any abnormality is found, or if resistance is felt when operating the shift knob from D to N range position, adjust the P range cable.



[Adjustment]

- Loosen the lock nuts of the P range cable. Adjust the cable length so that no tension is applied to the cable when the lever is in the N-range position by turning the turnbuckle.
- Make sure that the engagement margins of the threads of the turnbuckle comply with the specified dimensions.

CAUTION ⚠

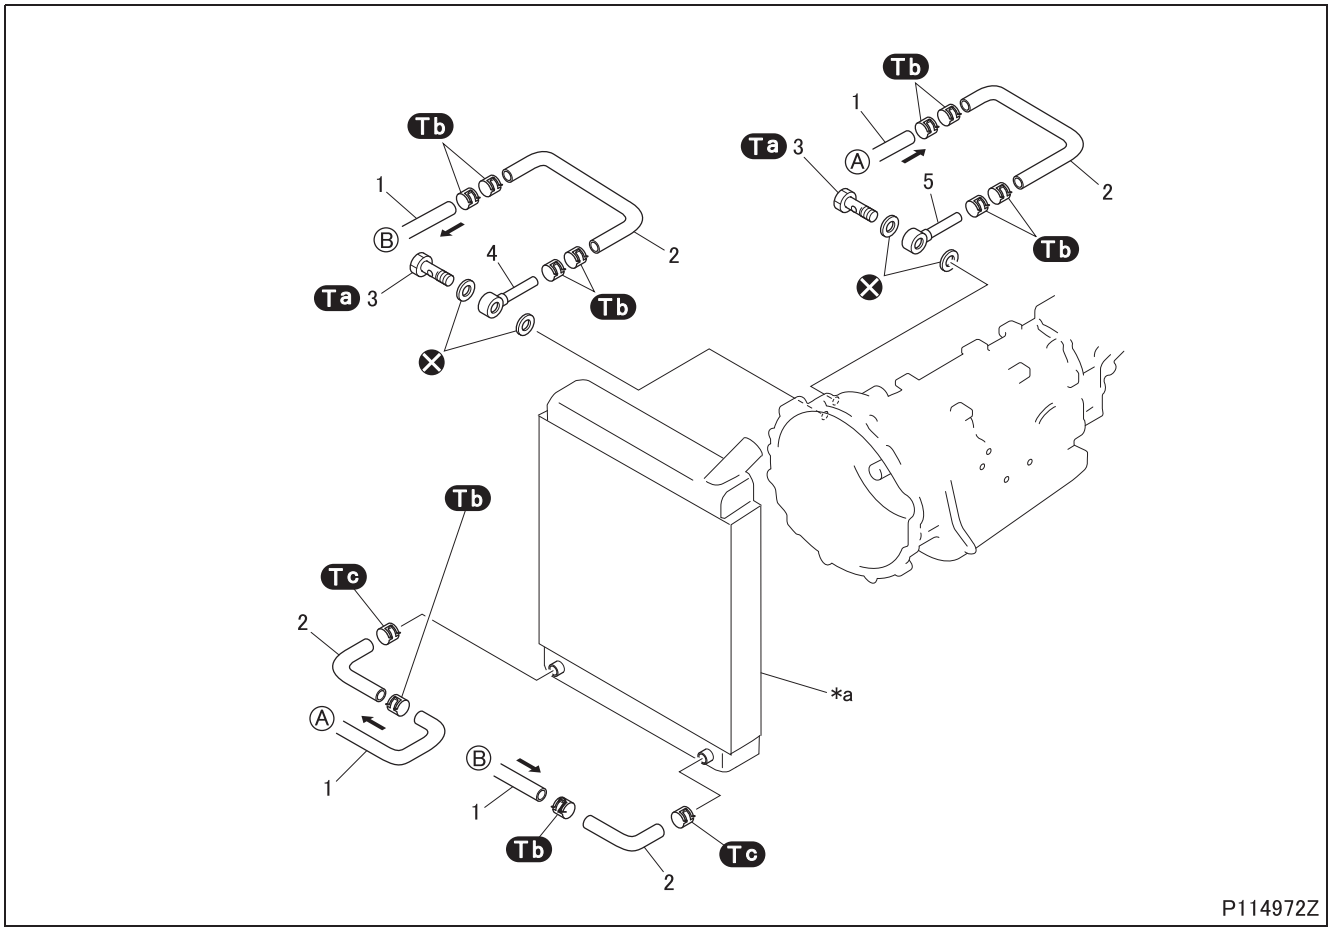
- **Do not adjust the P range cable length on the ball joint side (parking cable lever side).**
- **An engagement margin of the threads of the turnbuckle that falls short of the specified dimension could cause a breakage.**

- Tighten the lock nuts.
- After adjustment, inspect the P range cable again to check that there is no problem.
- If there is a problem that cannot be solved by adjustment, inspect the indicator-related parts in the meter cluster circuit.

CAUTION ⚠

- **If the P range cable is not adjusted correctly, it can be a cause of shift operation failure such as inoperative shifting from D to N range. Adjust the P range cable properly until no resistance is felt when shifting from D to N range position.**

OIL COOLER



● **Removal sequence**

1 Oil cooler tube
2 Oil cooler hose
3 Eyebolt
4 Oil cooler feed tube
5 Oil cooler return tube
∗a: Radiator
⊗: Non-reusable parts

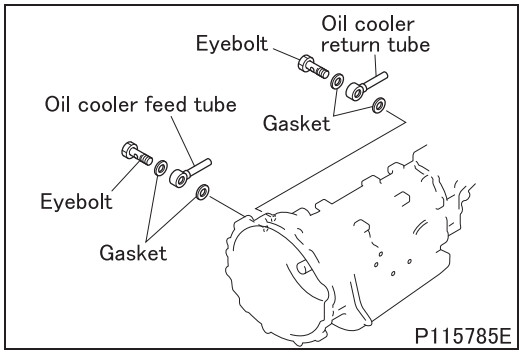
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

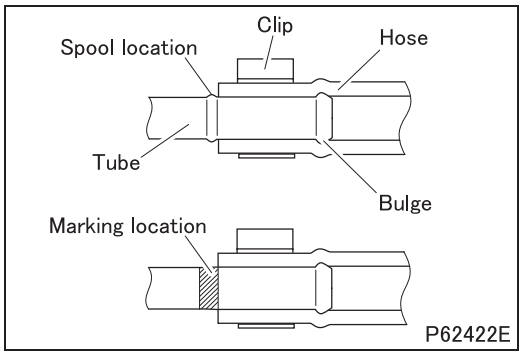
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Eyebolt	43 to 57 {32 to 42, 4.4 to 5.8}	–
Tb	Clip band (oil cooler tube and hose mounting)	2.5 to 3.0 {1.8 to 2.2, 0.25 to 0.30}	–
Tc	Clip band (oil cooler hose mounting)	1.3 to 1.8 {1.0 to 1.3, 0.13 to 0.18}	–

◆Installation procedure◆



■ **Installation: Eyebolt**

- Install the oil cooler feed tube and oil cooler return tube on the transmission with the eyebolts.

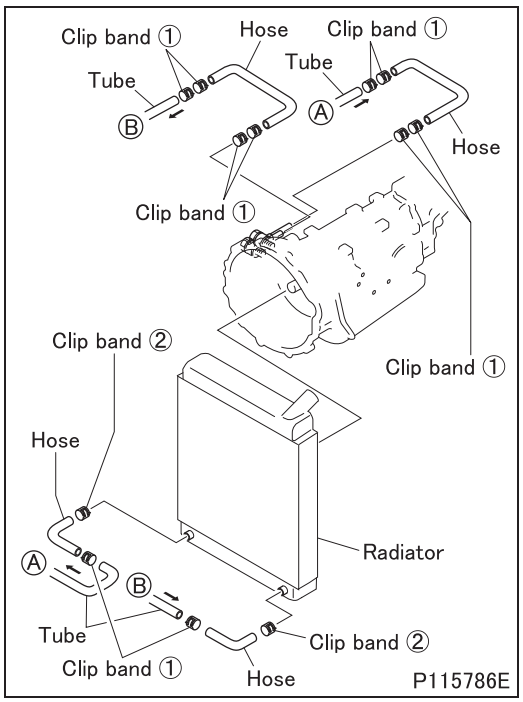


■ **Installation: Oil cooler hose**

- Fit the oil cooler hose all the way to the spool or marking location at the end or the oil cooler tube.
- Fasten the hose with the clip avoiding the bulge.

CAUTION ⚠

- **Install the oil cooler hose without forced bend and twist.**
- **When installing the oil cooler hose, do not apply oil to its joints.**



◆Work after installation◆

■ **Inspection: Automatic transmission fluid quantity**

- After oil line is removed, check the automatic transmission fluid level and replenish the fluid if necessary. (See ON-VEHICLE INSPECTION AND ADJUSTMENT.)

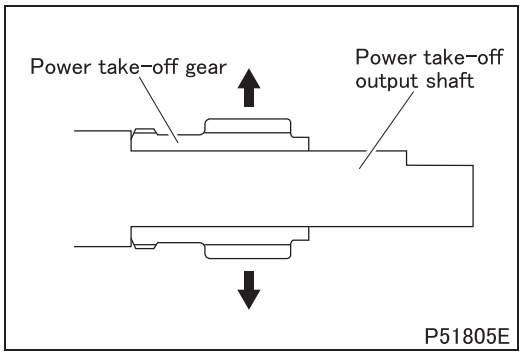
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Threads of power take-off control switch	ThreeBond 1105	As required
b	Sliding section of clevis pin	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
	Oil seal lips		
c	Power take-off case mating surface of front cover	ThreeBond 1194	As required
	Outer circumference of oil seal		

◆Work before removal◆

■ Removal: Transmission power take-off

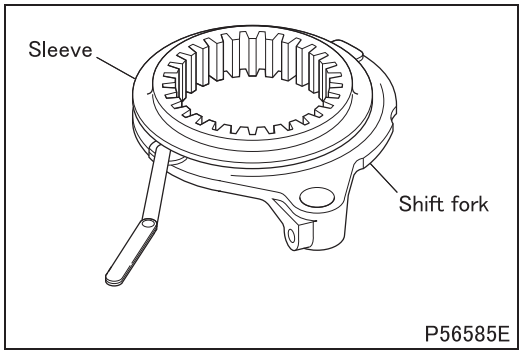
- Remove the transmission power take-off. (See “REVERSE IDLER GEAR”.)



■ Inspection: Play in the diameter direction of power take-off gear

- If the measurement exceeds the limit, replace defective parts.

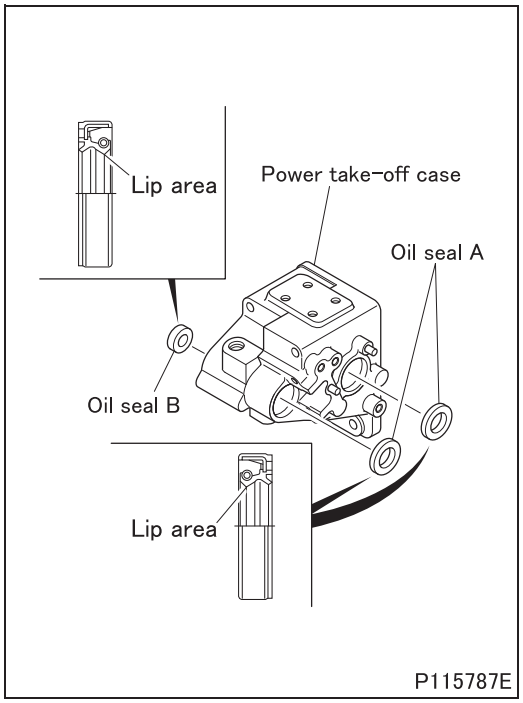
◆Inspection procedure◆



■ **Inspection: Clearance between power take-off shift sleeve and power take-off shift fork**

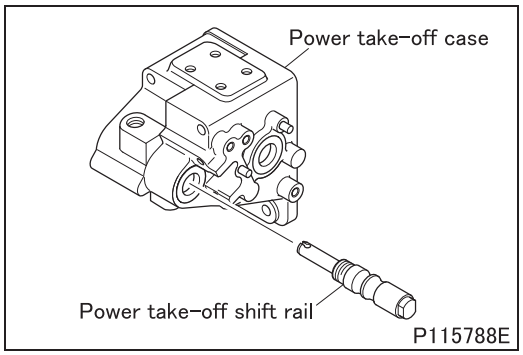
- If the measurement exceeds the limit, replace defective parts.

◆Installation procedure◆



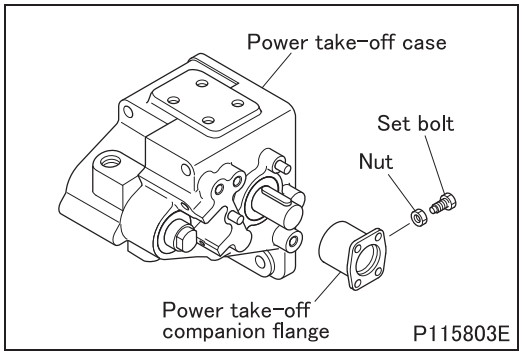
■ **Installation: Oil seal**

- Apply sealant to the outer circumference of the oil seal A.
- Apply grease to the oil seal A, B lips and install the oil seals to the power take-off case.



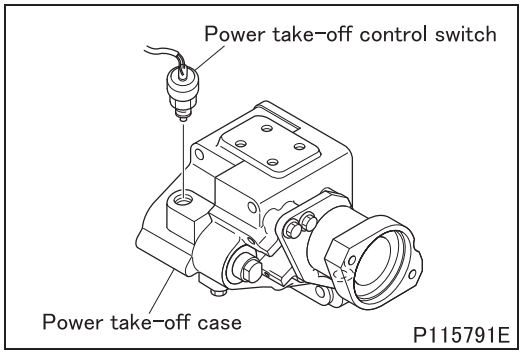
■ **Installation: Power take-off shift rail**

- Install the power take-off shift rail to the power take-off case.



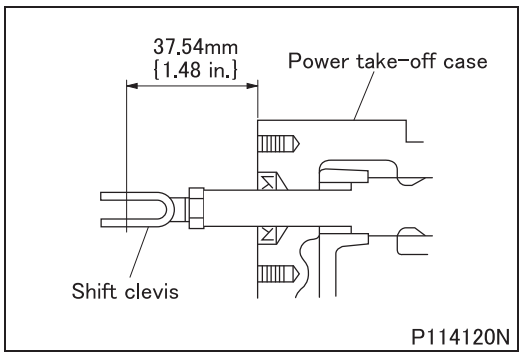
■ **Installation: Power take-off companion flange**

- Install the power take-off companion flange to the power take-off case and install the nut and set bolt.



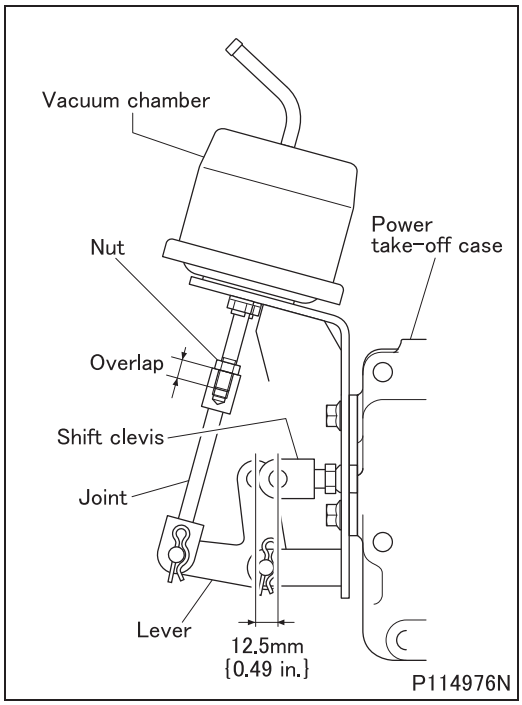
■ **Installation: Power take-off control switch**

- Apply sealant to the threads of the power take-off control switch and install it to the power take-off case.



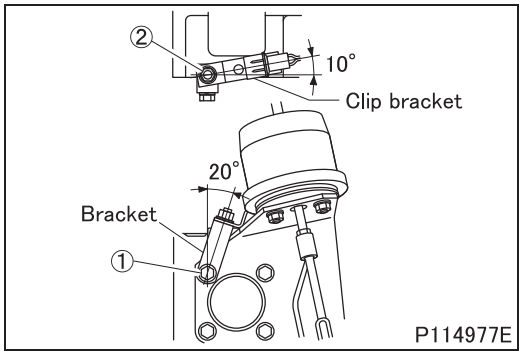
■ **Installation: Shift clevis**

- Install the shift clevis while adjusting the distance from the center of the shift clevis hole to the end surface of the power take-off case as shown in the drawing.



■ **Installation: Vacuum chamber**

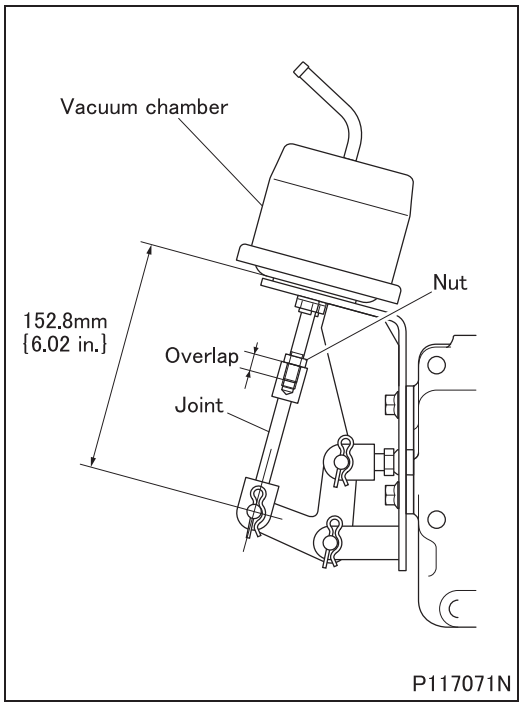
- Apply sealant to the power take-off case mating surface of the front cover. Install the vacuum chamber and front cover to the power take-off case.
- Measure the distance between the centers of the holes in the shift clevis and lever.
- If the measurement does not match the value shown in the drawing, adjust by turning the shift clevis or joint.
- If the adjustment is performed by turning the joint, secure the overlap of the joint and the rod of the vacuum chamber by 8 threads or more.
- After adjustment, tighten the nut to the specified torque.
- Push in the joint to align the holes in the lever and shift clevis and connect them with the clevis pin.
- Apply Cb to the sliding surface of the clevis pin before installing the clevis pin.



■ **Installation: Bracket and clip bracket**

- Install the bracket and clip bracket as shown in the drawing.

◆**Work after installation**◆



■ **Adjustment: Vacuum chamber**

- Measure the distance from the bottom of the vacuum chamber to the center of the hole in the joint.
- If the measurement does not match the value shown in the drawing, adjust by turning the joint. In this case, secure the overlap of the joint and the rod of the vacuum chamber by 8 threads or more.
- After adjustment, tighten the nut to the specified torque.

■ **Installation: Transmission power take-off**

- Install the transmission power take-off. (See “REVERSE IDLER GEAR”.)

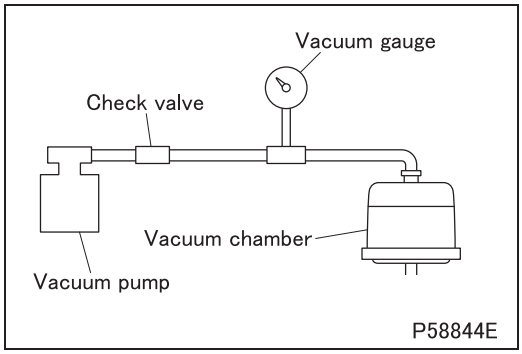
	Nut (mounting vacuum chamber)		

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Mounting threads of vacuum chamber	ThreeBond 1211	As required

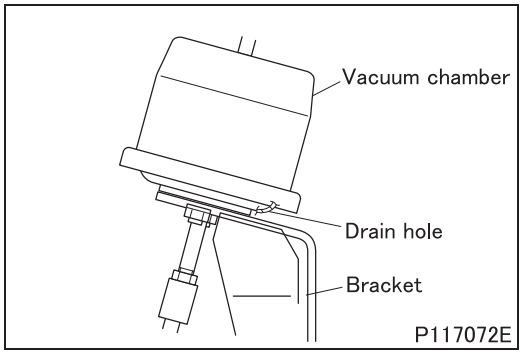
◆Inspection procedure◆



■ **Inspection: Vacuum chamber**

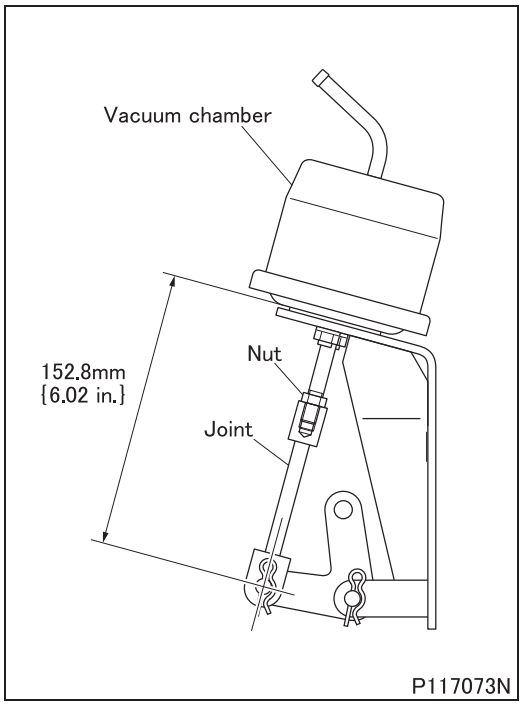
- Connect the vacuum pump, check valve and vacuum gauge to the vacuum chamber as shown in the drawing. Using the vacuum pump, apply specified vacuum to the vacuum chamber.
- After 15 seconds, read the vacuum on the vacuum gauge.
- If the measurement is out of the standard value, replace the vacuum chamber.

◆Installation procedure◆



■ **Installation: Vacuum chamber**

- Apply sealant to the threads of the vacuum chamber and install it to the bracket in the direction shown in the drawing.



■ **Installation: Joint**

- Install the joint so that the distance from the bottom of the vacuum chamber to the center of the hole in the joint should be as shown in the drawing. Then tighten the nut to the specified torque.

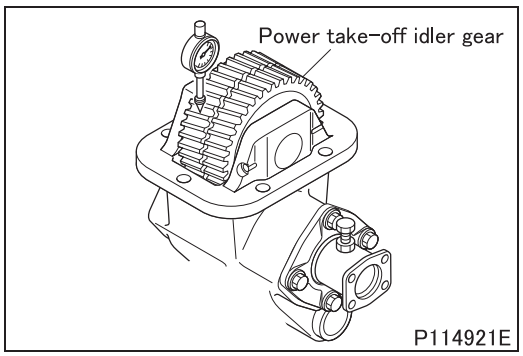
◆**Work before removal**◆

■ **Removal: Transmission power take-off**

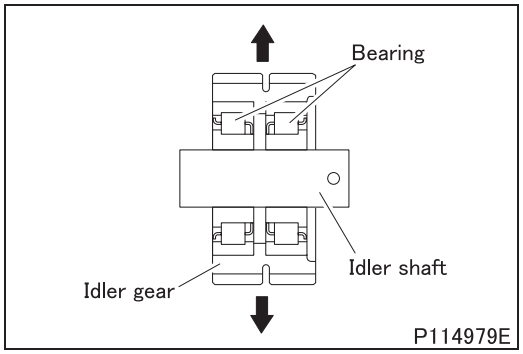
- Remove the transmission power take-off. (See “REVERSE IDLER GEAR”.)



■ **Inspection: Backlash between power take-off idler gear and power take-off output gear**

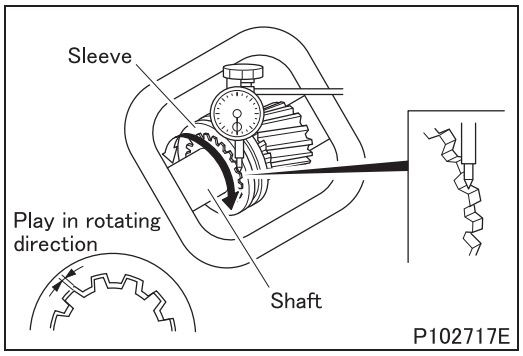
- If measurement exceeds the limit, replace defective parts.

◆Removal procedure◆



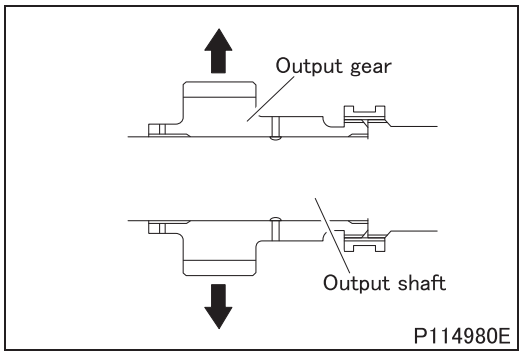
■ **Inspection: Play of power take-off idler gear in diameter direction**

- If measurement exceeds the limit, replace defective parts.



■ **Inspection: Play of power take-off output shaft and power take-off shift sleeve in rotating direction**

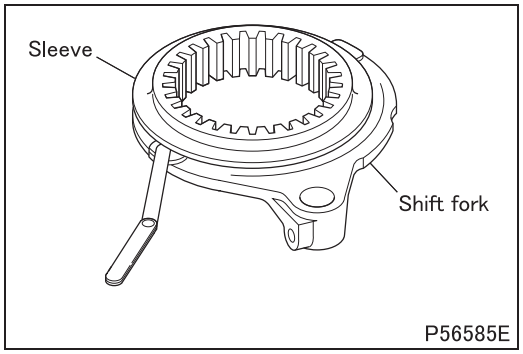
- Measure the play by turning the power take-off output shaft while holding the power take-off shift sleeve in place.
- If measurement exceeds the limit, replace defective parts.



■ **Inspection: Play of power take-off output gear in diameter direction**

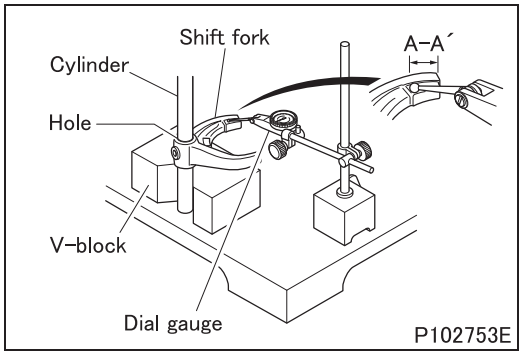
- If measurement exceeds the limit, replace defective parts.

◆Inspection procedure◆



■ **Inspection: Clearance between power take-off shift sleeve and power take-off shift fork**

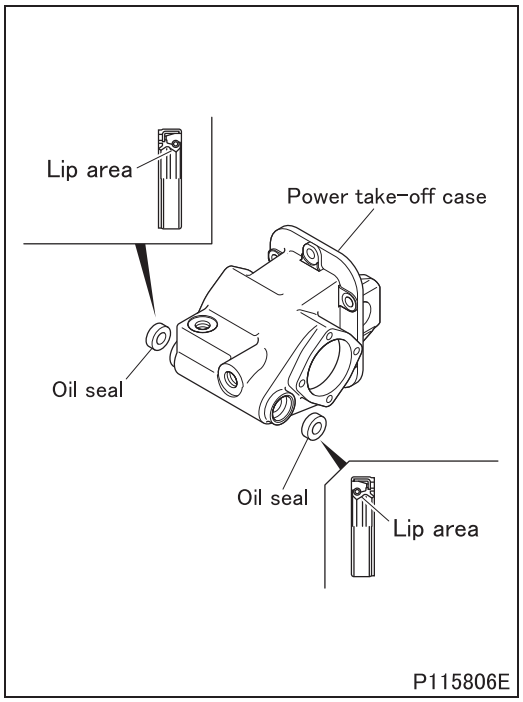
- If the measurement exceeds the limit, replace defective parts.



■ **Inspection: Tilt of power take-off shift fork claw**

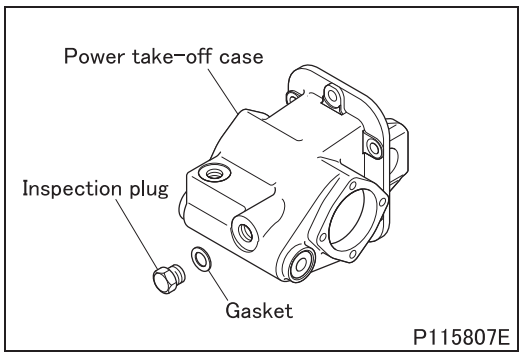
- Measure the tilt (difference between A and A') of claw A-A' against the power take-off air cylinder hole of power take-off shift fork with pressing the air cylinder to the V-rail of the V-block and standing it vertically.
- If the measurement exceeds the limit, replace the power take-off shift fork.

◆Installation procedure◆



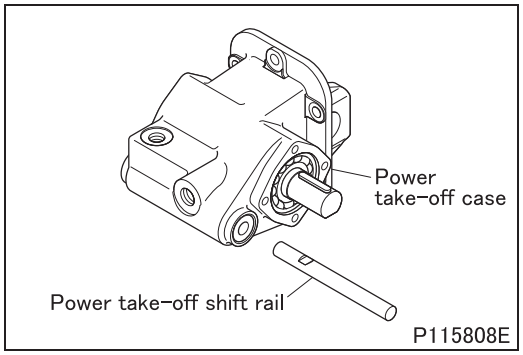
■ **Installation: Oil seal**

- Apply grease to the oil seal lips and install the oil seals to the power take-off case.



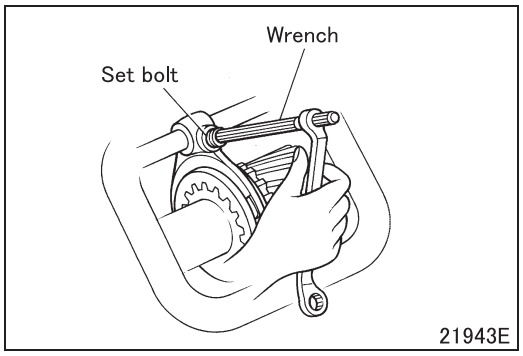
■ **Installation: Inspection plug**

- Apply sealant to the threads of the inspection plug and install it to the power take-off case.



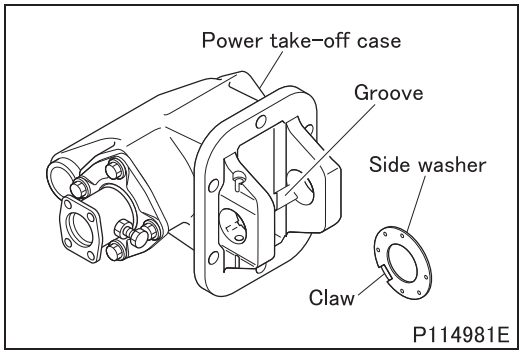
■ **Installation: Power take-off shift rail**

- Apply grease to the sliding section of the power take-off shift rail and install it to the power take-off shift fork.



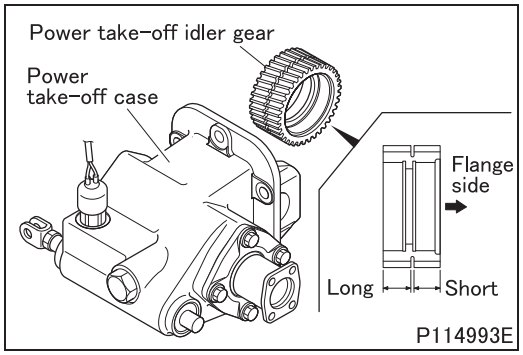
■ **Installation: Set bolt**

- Install the set bolt using a hexagon wrench.
- After tightening the bolt, stake the thread area at three places or more with the punch.



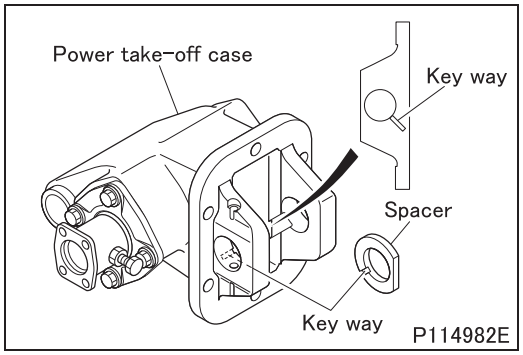
■ **Installation: Side washer**

- Install the side washer so that its claw fits into the groove in the power take-off case.



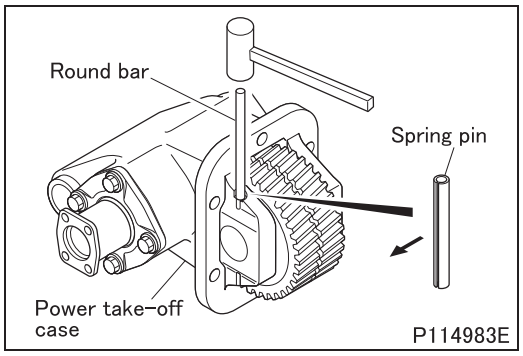
■ **Installation: Power take-off idler gear**

- Install the power take-off idler gear to the power take-off case in the direction shown in the drawing.



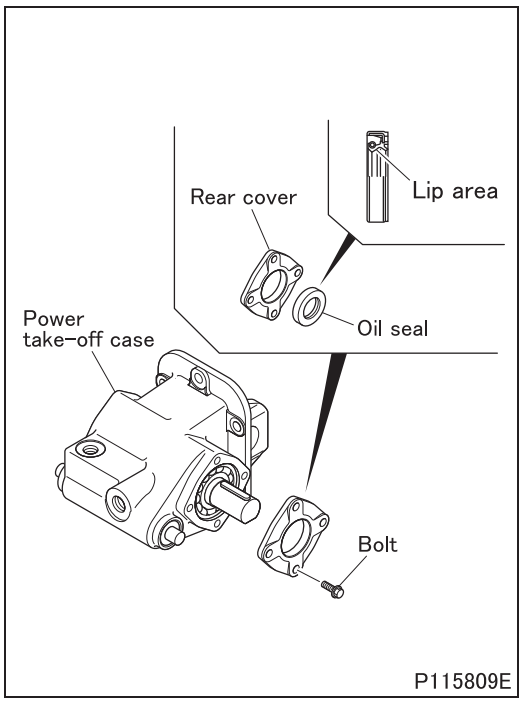
■ **Installation: Spacer**

- Install the spacer while aligning its keyway with that on the power take-off case.



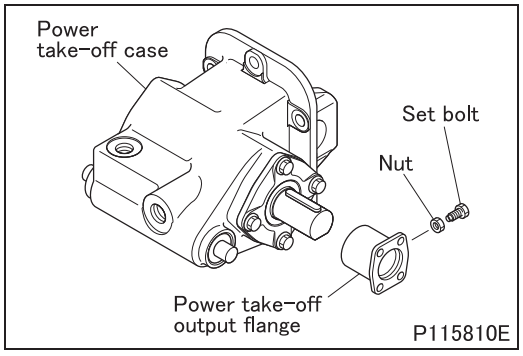
■ **Installation: Spring pin**

- Install the spring pin to the power take-off case in the direction shown in the drawing using a round rod of 6 mm {0.24 in.} in diameter.



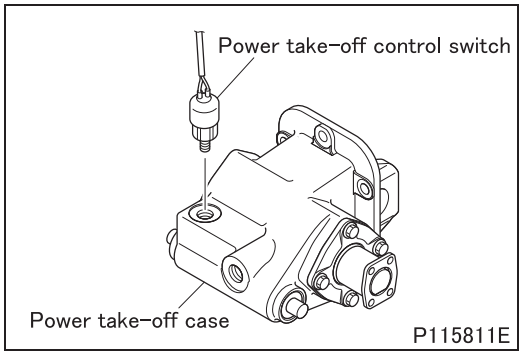
■ **Installation: Oil seal and rear cover**

- Apply grease to the lip of the oil seal and install it to the rear cover.
- Apply sealant to the power take-off case mating surface of the rear cover and install it to the power take-off case.



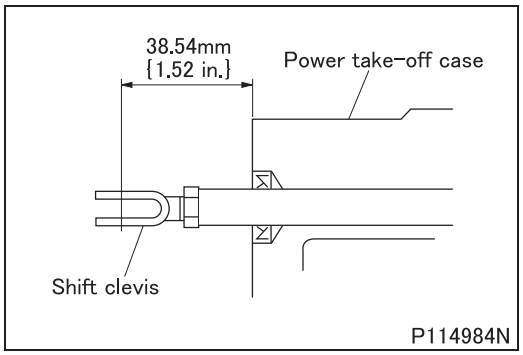
■ **Installation: Power take-off output flange**

- Install the power take-off output flange to the power take-off case, and install the nut and set bolt.



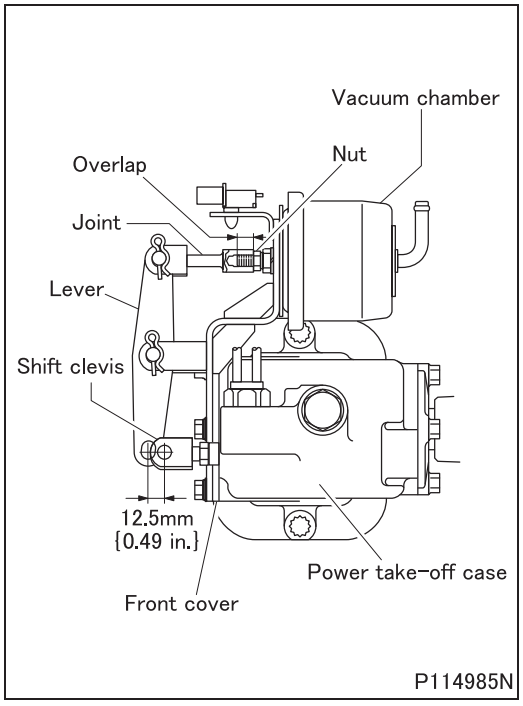
■ **Installation: Power take-off control switch**

- Apply sealant to the threads of the power take-off control switch and install it to the power take-off case.



■ **Installation: Shift clevis**

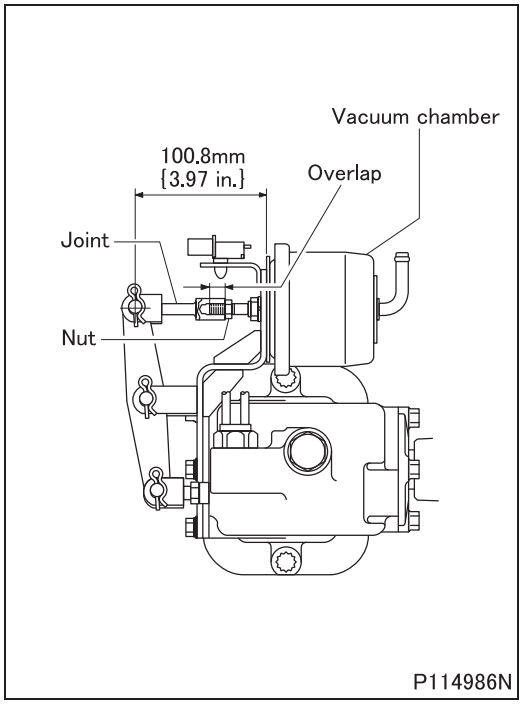
- Install the shift clevis while adjusting the distance from the center of the shift clevis hole to the end surface of the power take-off case as shown in the drawing.



■ **Installation: Vacuum chamber**

- Apply sealant to the power take-off case mating surface of the front cover. Install the vacuum chamber and front cover to the power take-off case.
- Measure the distance between the centers of the holes in the shift clevis and lever.
- If the measurement does not match the value shown in the drawing, adjust by turning the shift clevis or joint.
- If the adjustment is performed by turning the joint, secure the overlap of the joint and the rod of the vacuum chamber by 8 threads or more.
- After adjustment, tighten the nut to the specified torque.
- Push in the joint to align the holes in the lever and shift clevis and connect them with the clevis pin.
- Apply ℄b to the sliding surface of the clevis pin before installing the clevis pin.

◆Work after installation◆



■ Adjustment: Vacuum chamber

- Measure the distance from the bottom of the vacuum chamber to the center of the hole in the joint.
- If the measurement does not match the value shown in the drawing, adjust by turning the joint. In this case, secure the overlap of the joint and the rod of the vacuum chamber by 8 threads or more.
- After adjustment, tighten the nut to the specified torque.

■ Installation: Transmission power take-off

- Install the transmission power take-off. (See “REVERSE IDLER GEAR”.)

• If measurement exceeds the limit, replace defective parts.

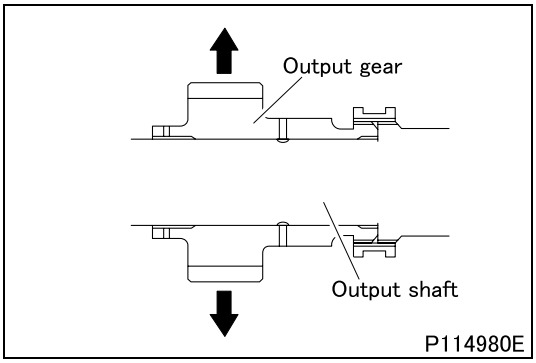
■ **Inspection: Play of power take-off output shaft and power take-off shift sleeve in rotating direction**

• Measure the play by turning the power take-off output shaft while holding the power take-off shift sleeve in place.

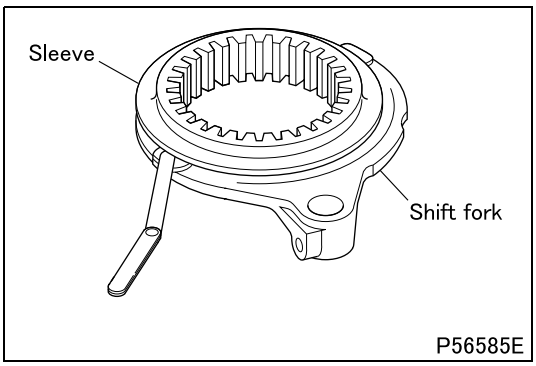
• If measurement exceeds the limit, replace defective parts.



■ **Inspection: Play of power take-off output gear in diameter direction**

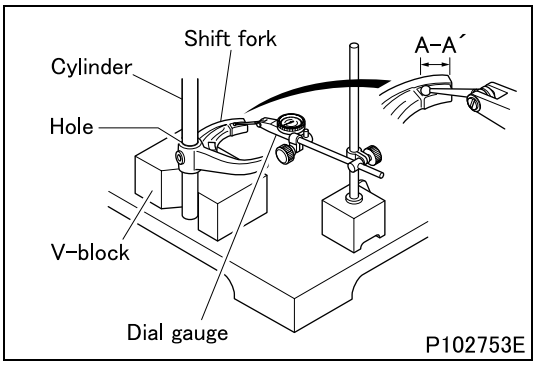
• If measurement exceeds the limit, replace defective parts.

◆Inspection procedure◆



■ **Inspection: Clearance between power take-off shift sleeve and power take-off shift fork**

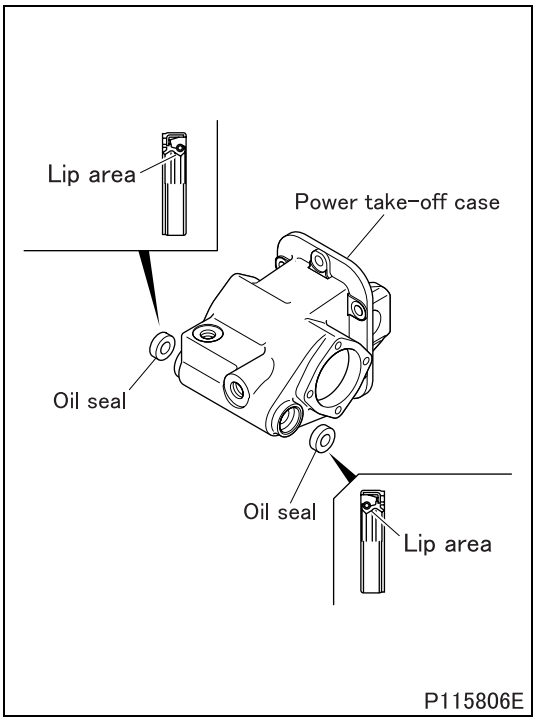
- If the measurement exceeds the limit, replace defective parts.



■ **Inspection: Tilt of power take-off shift fork claw**

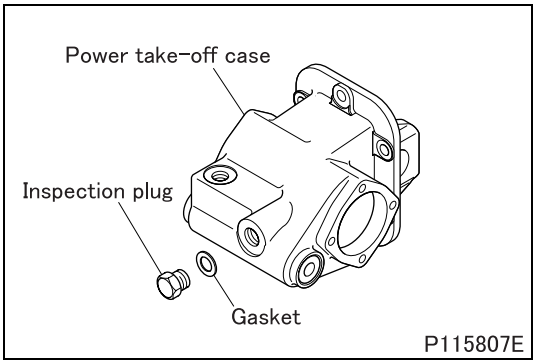
- Measure the tilt (difference between A and A') of claw A-A' against the power take-off air cylinder hole of power take-off shift fork with pressing the air cylinder to the V-rail of the V-block and standing it vertically.
- If the measurement exceeds the limit, replace the power take-off shift fork.

◆Installation procedure◆



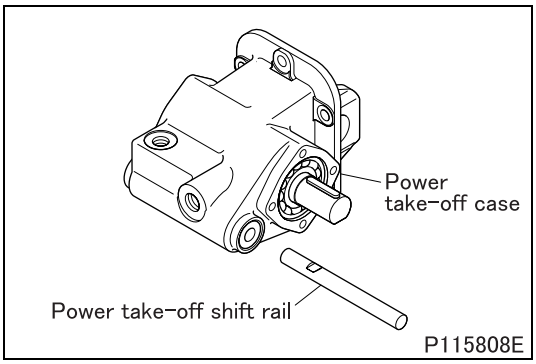
■ **Installation: Oil seal**

- Apply grease to the oil seal lips and install the oil seals to the power take-off case.



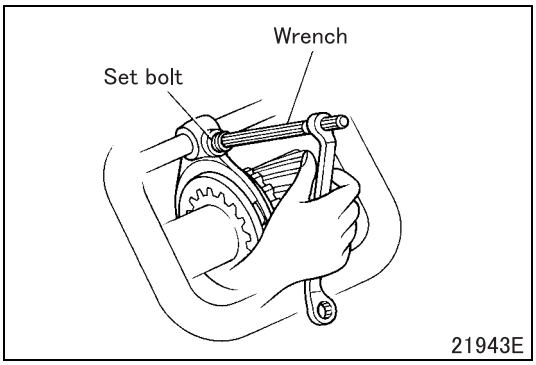
■ **Installation: Inspection plug**

- Apply sealant to the threads of the inspection plug and install it to the power take-off case.



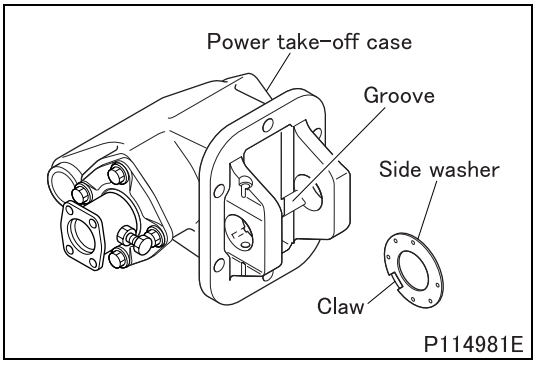
■ **Installation: Power take-off shift rail**

- Apply grease to the sliding section of the power take-off shift rail and install it to the power take-off shift fork.



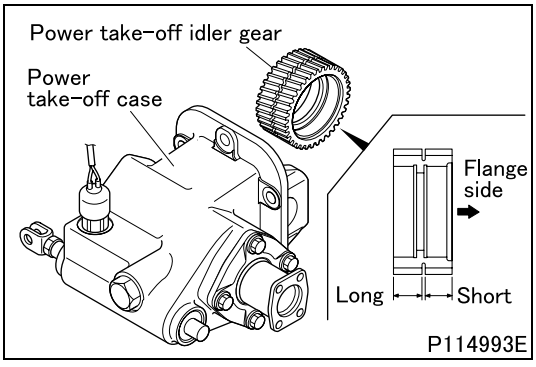
■ **Installation: Set bolt**

- Install the set bolt using a hexagon wrench.
- After tightening the bolt, stake the thread area at three places or more with the punch.



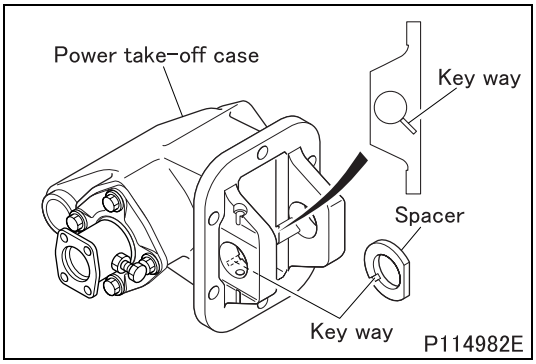
■ **Installation: Side washer**

- Install the side washer so that its claw fits into the groove in the power take-off case.



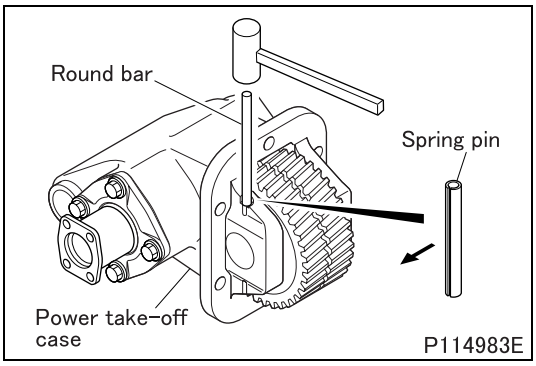
■ **Installation: Power take-off idler gear**

- Install the power take-off idler gear to the power take-off case in the direction shown in the drawing.



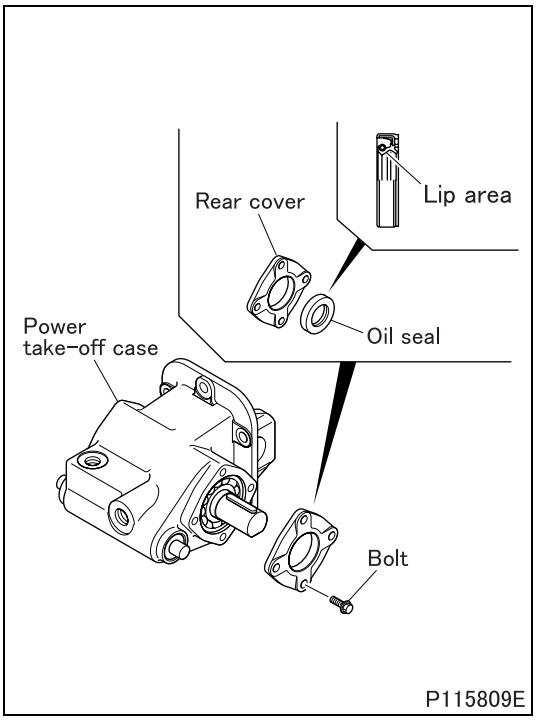
■ **Installation: Spacer**

- Install the spacer while aligning its keyway with that on the power take-off case.



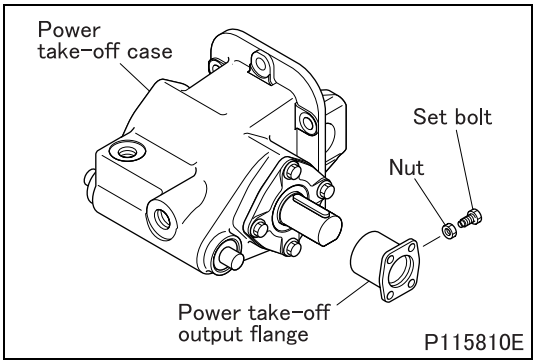
■ **Installation: Spring pin**

- Install the spring pin to the power take-off case in the direction shown in the drawing using a round rod of 6 mm {0.24 in.} in diameter.



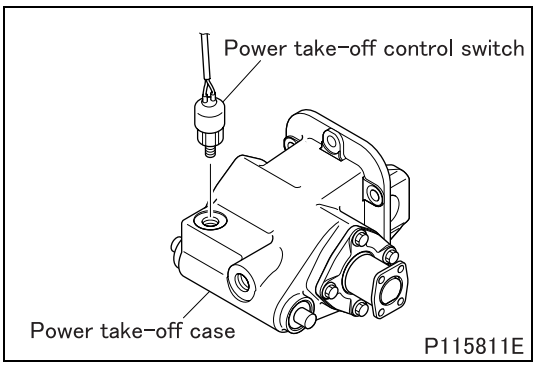
■ **Installation: Oil seal and rear cover**

- Apply grease to the lip of the oil seal and install it to the rear cover.
- Apply sealant to the power take-off case mating surface of the rear cover and install it to the power take-off case.



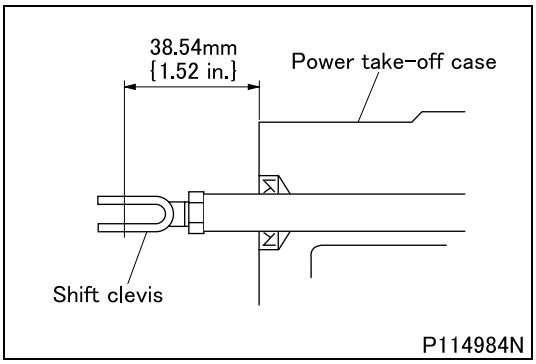
■ **Installation: Power take-off output flange**

- Install the power take-off output flange to the power take-off case, and install the nut and set bolt.



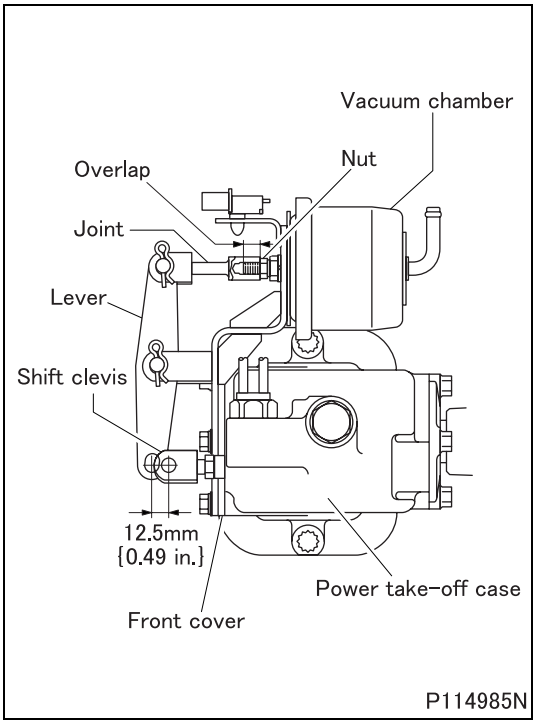
■ **Installation: Power take-off control switch**

- Apply sealant to the threads of the power take-off control switch and install it to the power take-off case.



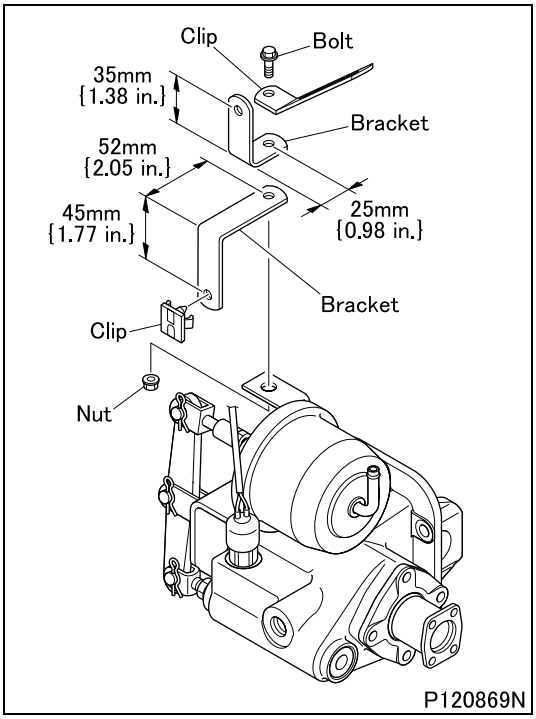
■ **Installation: Shift clevis**

- Install the shift clevis while adjusting the distance from the center of the shift clevis hole to the end surface of the power take-off case as shown in the drawing.



■ **Installation: Vacuum chamber**

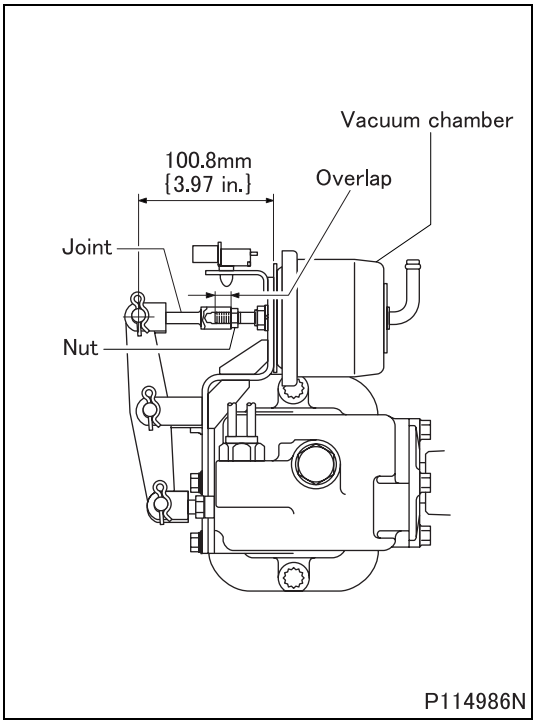
- Apply sealant to the power take-off case mating surface of the front cover. Install the vacuum chamber and front cover to the power take-off case.
- Measure the distance between the centers of the holes in the shift clevis and lever.
- If the measurement does not match the value shown in the drawing, adjust by turning the shift clevis or joint.
- If the adjustment is performed by turning the joint, secure the overlap of the joint and the rod of the vacuum chamber by 8 threads or more.
- After adjustment, tighten the nut to the specified torque.
- Push in the joint to align the holes in the lever and shift clevis and connect them with the clevis pin.
- Apply Cb to the sliding surface of the clevis pin before installing the clevis pin.



■ **Installation: Bracket**

- Install the bracket as shown in the drawing.

◆Work after installation◆



■ **Adjustment: Vacuum chamber**

- Measure the distance from the bottom of the vacuum chamber to the center of the hole in the joint.
- If the measurement does not match the value shown in the drawing, adjust by turning the joint. In this case, secure the overlap of the joint and the rod of the vacuum chamber by 8 threads or more.
- After adjustment, tighten the nut to the specified torque.

■ **Installation: Transmission power take-off**

- Install the transmission power take-off. (See “REVERSE IDLER GEAR”.)

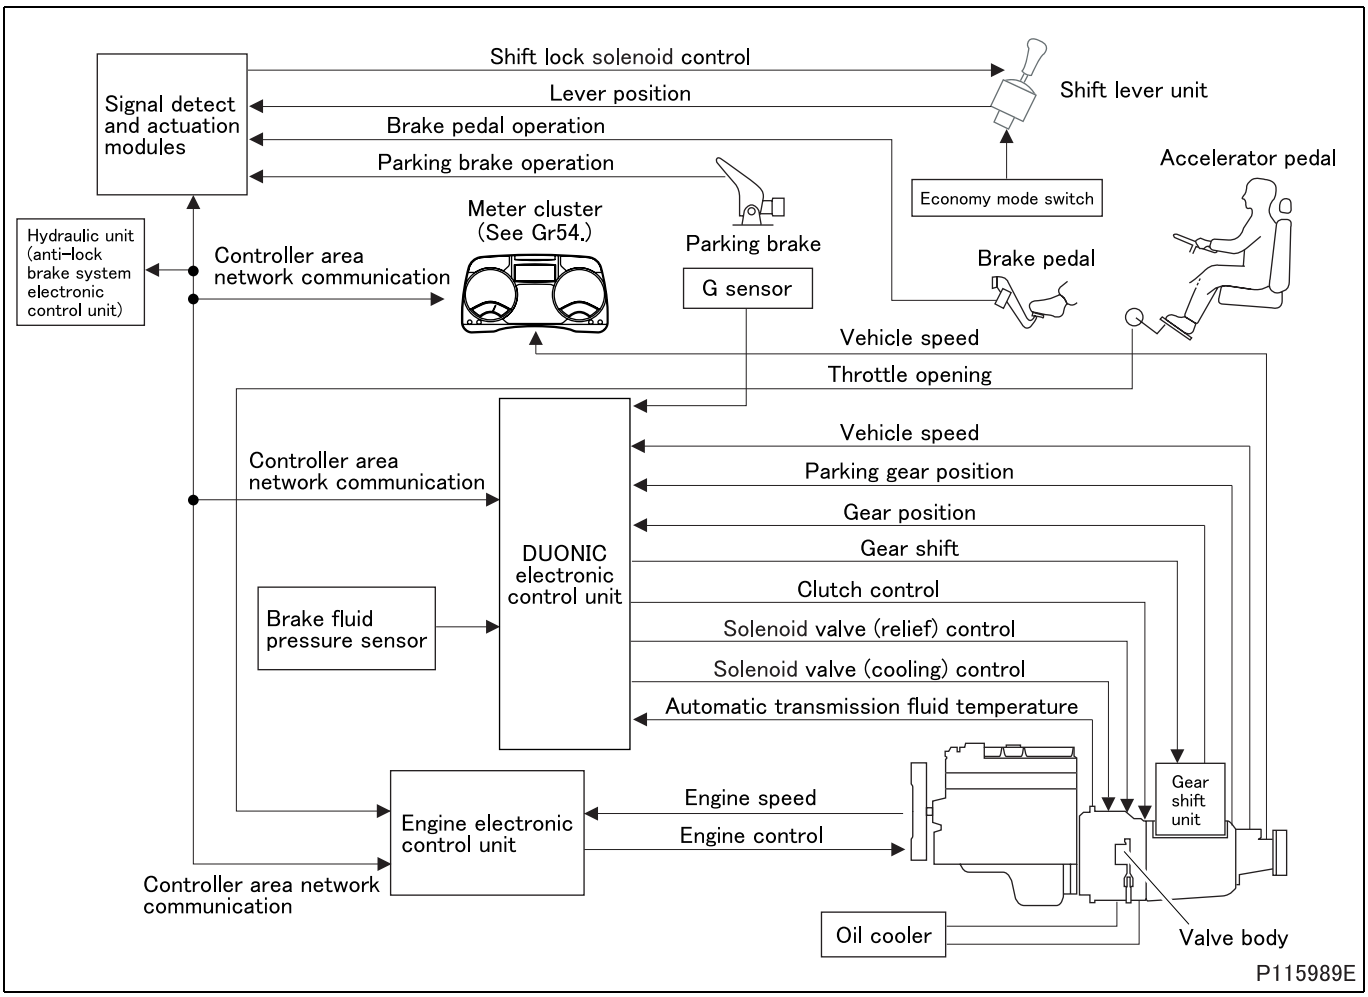
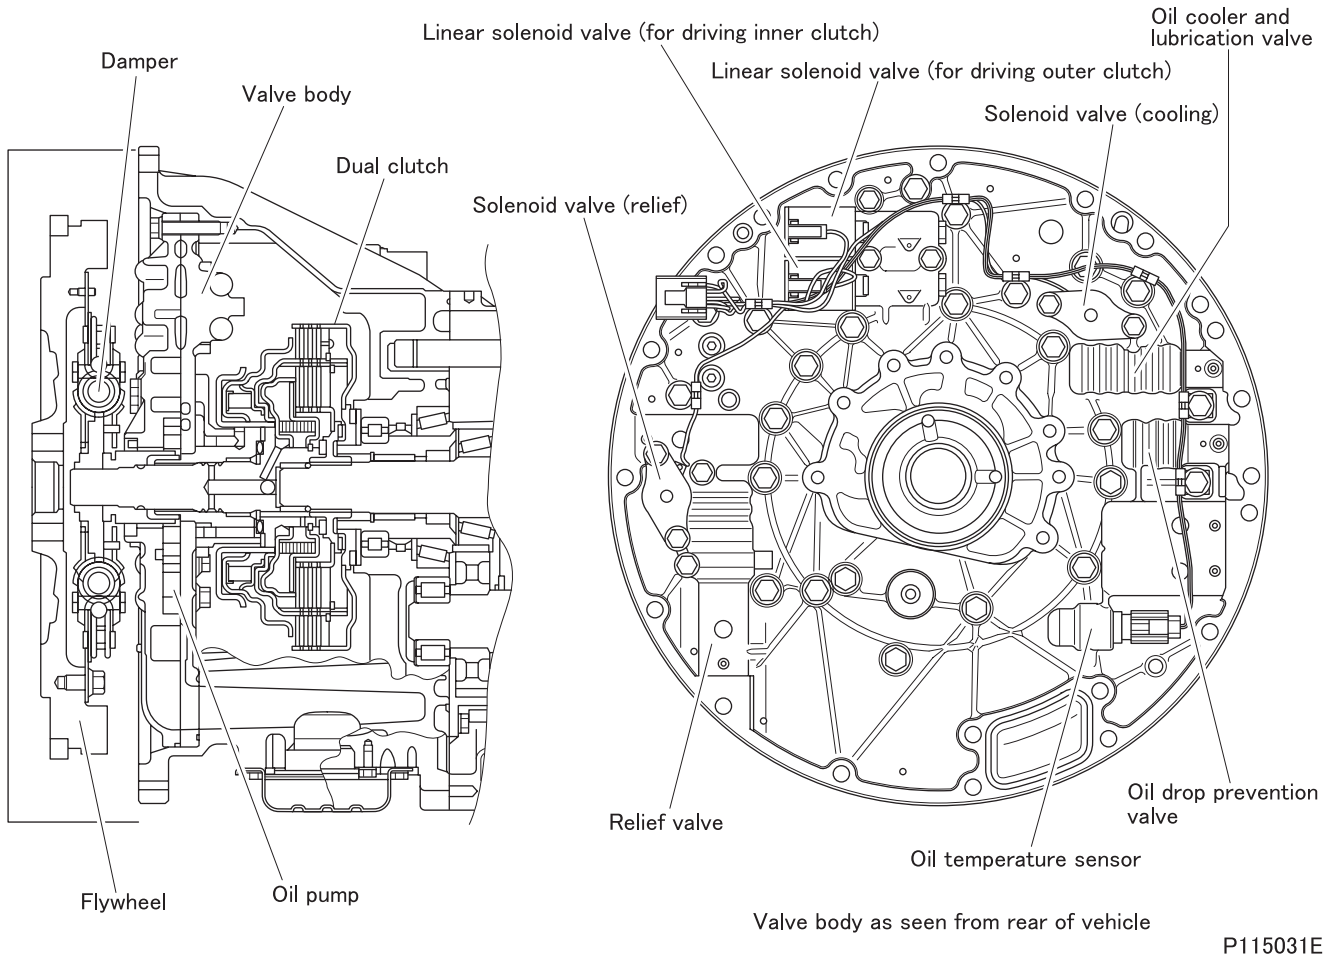
M E M O

1. Overview



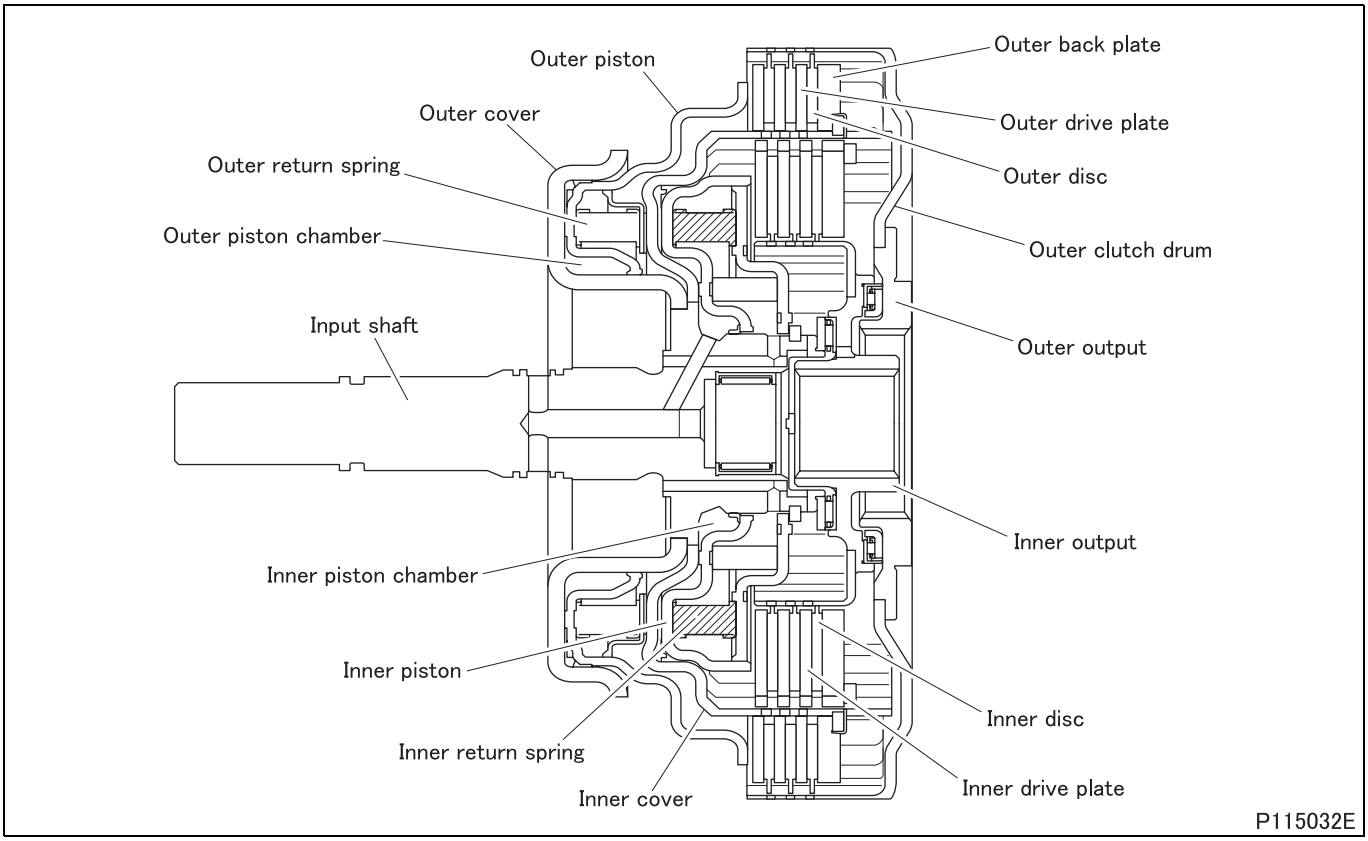
- The DUONIC® system automates clutch and gear shift operations when starting or driving the vehicle by providing integrated control of the clutch, transmission and engine. This helps to reduce the driver's fatigue from frequent manual gear shift operations while achieving excellent fuel economy equivalent to or better than that of manual transmission vehicles.
- The clutch mechanism consists of two clutching systems (dual clutch) that allow smooth gear shift operations with reduced gear shift shock.
- There is no clutch pedal. Since there are only two pedals (accelerator and brake pedals), the driver can start and drive the vehicle with accelerator operations only. Manual operation can also be selected as required.
- The system consists of a DUONIC® electronic control unit (that controls the gear shift unit and valve body based on the gear shift lever signals, transmission gear position, throttle opening, vehicle speed, etc.), engine electronic control unit (that controls fuel injection amount and timing based on engine speed, engine timing, coolant temperature, vehicle speed, etc.) and sensors that transmit/receive various signals to and from each electronic control unit.

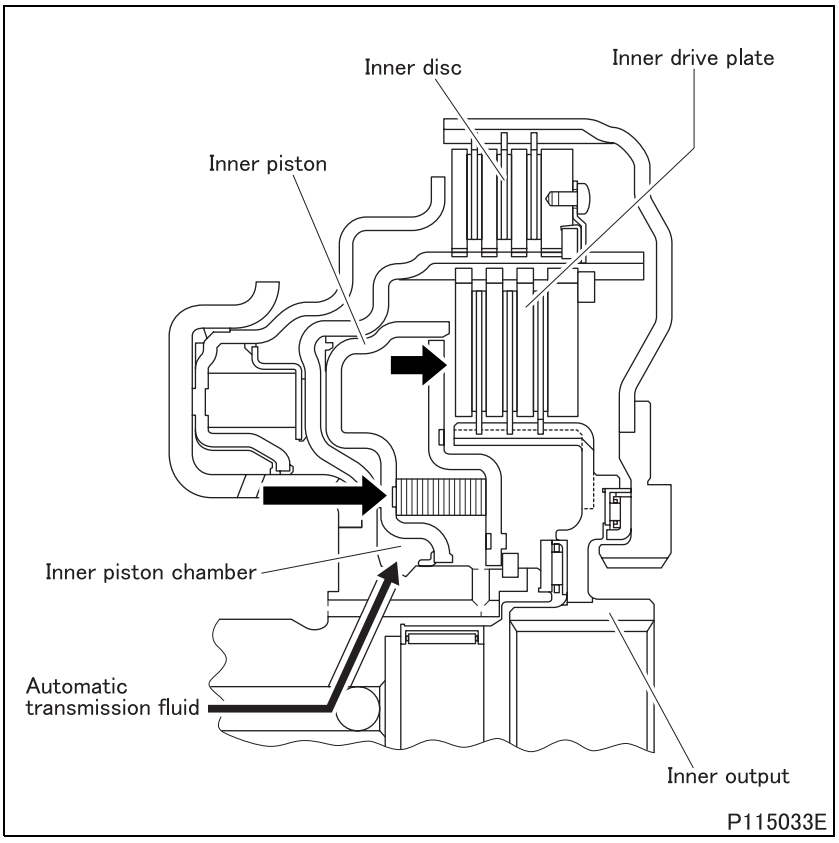
2. Valve Body



- The valve body is an electronically controlled hydraulic control unit.
- The dual clutch is installed inside the transmission and is operated by changing the flow direction of automatic transmission fluid in the dual clutch using the solenoid valve in the valve body.

3. Dual Clutch

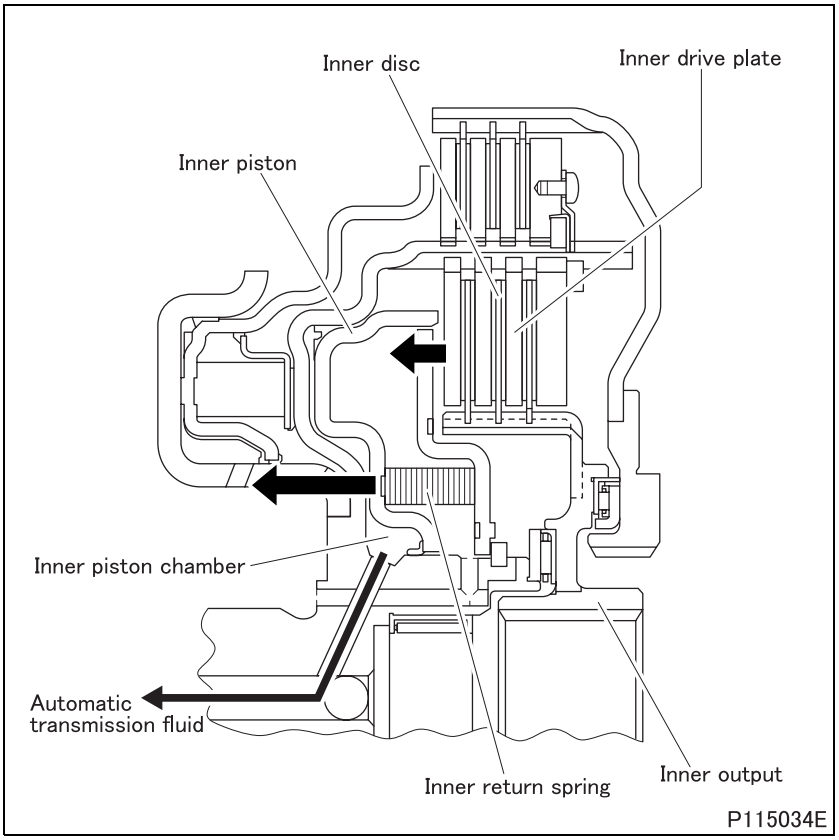




3.1 Inner clutch operation

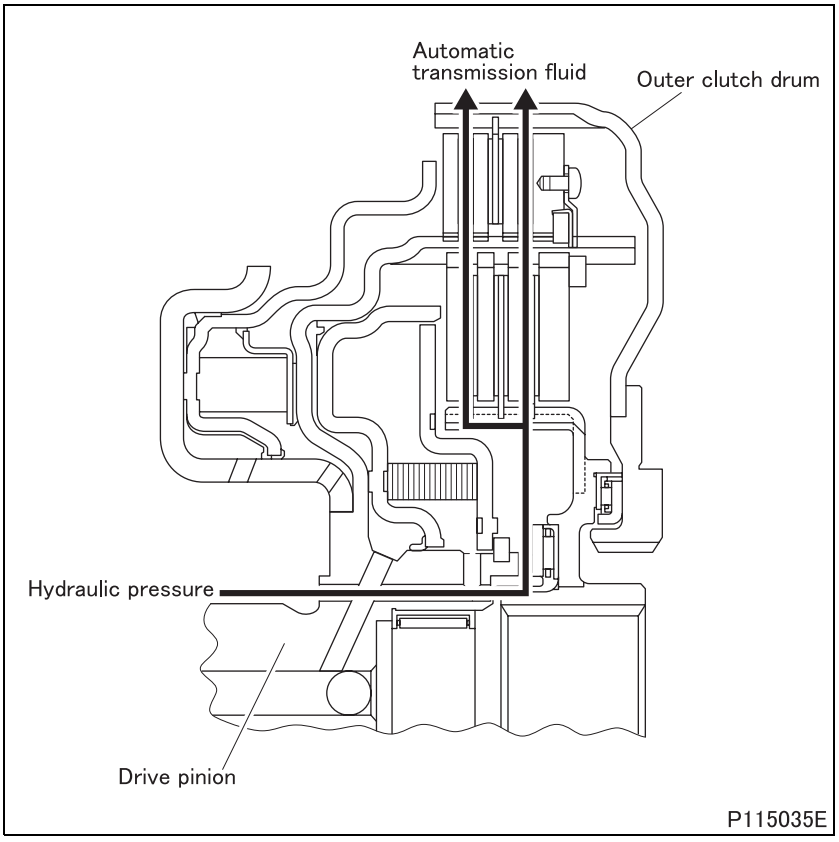
(1) When the clutch engages

- The linear solenoid valve (for driving the inner clutch) in the valve body operates.
- Automatic transmission fluid enters the inner automatic transmission fluid chamber to push the inner piston. The inner drive plates and inner discs are then pressed together to engage the clutch, thereby transmitting torque to the inner output.



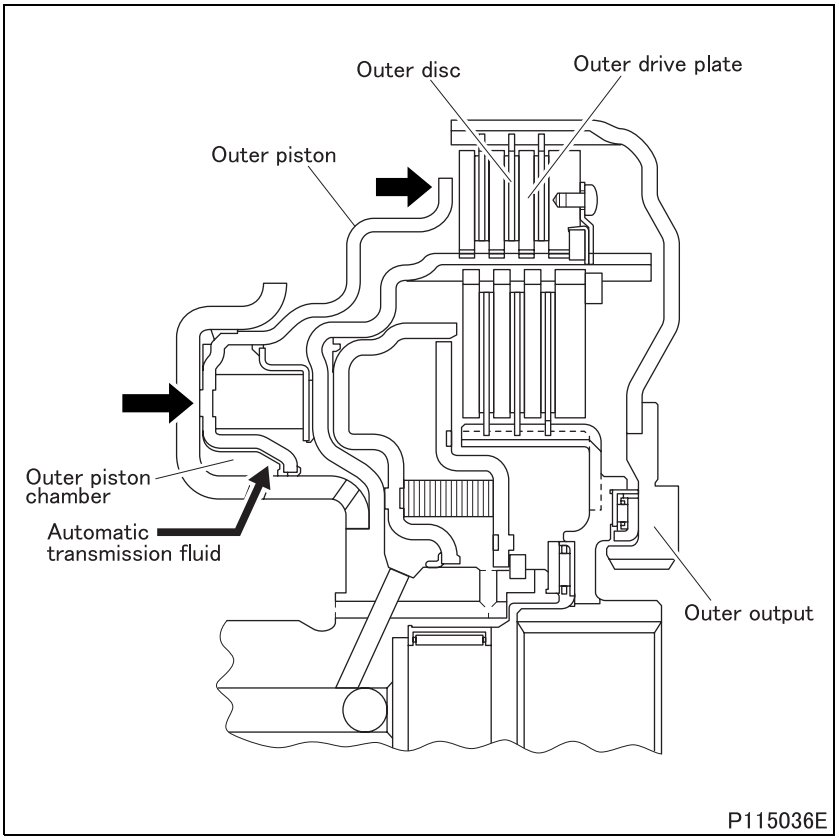
(2) When the clutch disengages

- The linear solenoid valve (for driving the inner clutch) in the valve body operates.
- Automatic transmission fluid is discharged from the inner piston housing and the inner piston is pushed back by the inner return spring. The inner drive plates and inner discs are then released to disengage the clutch.



(3) Clutch cooling

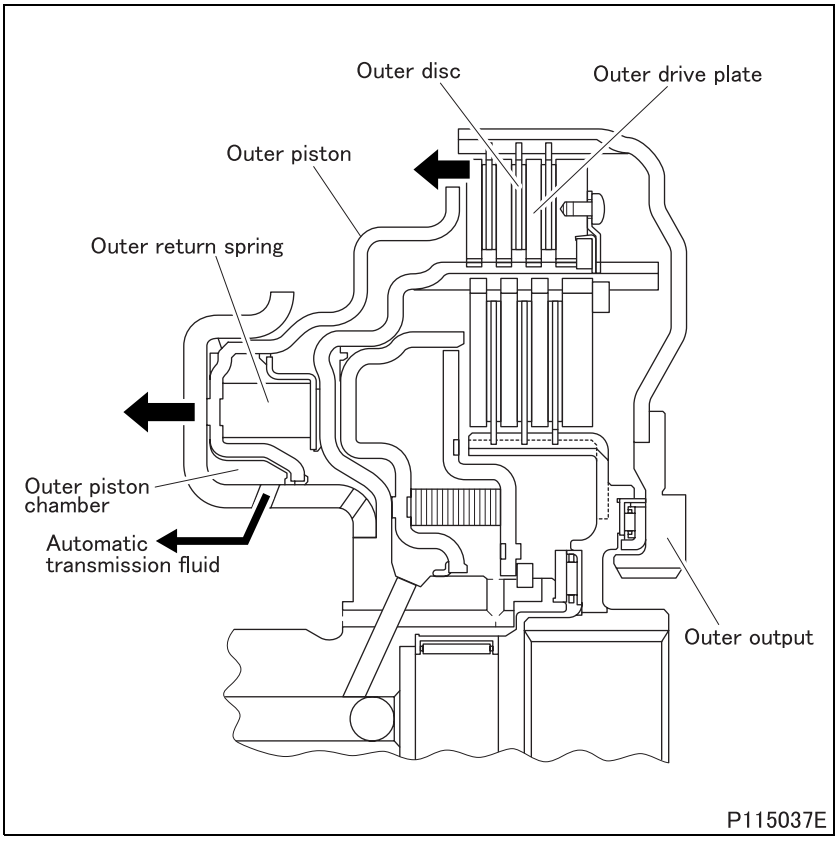
- When the linear solenoid valve (for driving the inner clutch) in the valve body operates, automatic transmission fluid flows from the center of the input shaft and is discharged out of the outer clutch drum by centrifugal force, thereby cooling the clutch.



3.2 Outer clutch operation

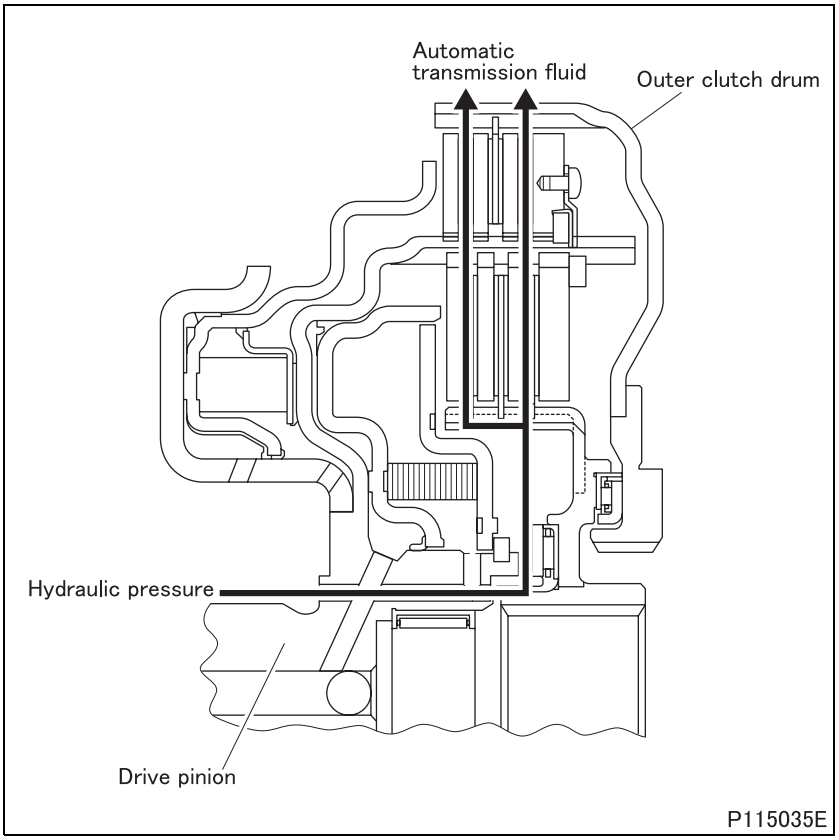
(1) When the clutch engages

- The linear solenoid valve (for driving the outer clutch) in the valve body operates.
- Automatic transmission fluid enters the outer piston housing to push the outer piston. The outer drive plates and outer discs are then pressed together to engage the clutch, thereby transmitting torque to the outer output.



(2) When the clutch disengages

- The linear solenoid valve (for driving the outer clutch) in the valve body operates.
- Automatic transmission fluid is discharged from the outer piston housing and the outer piston is pushed back by the outer return spring. The outer drive plates and outer discs are then released to disengage the clutch.



(3) Clutch cooling

- When the linear solenoid valve (for driving the outer clutch) in the valve body operates, automatic transmission fluid flows from the center of the input shaft and is discharged out of the outer clutch drum by centrifugal force, thereby cooling the clutch.

Shift rail arrangement as seen from above transmission

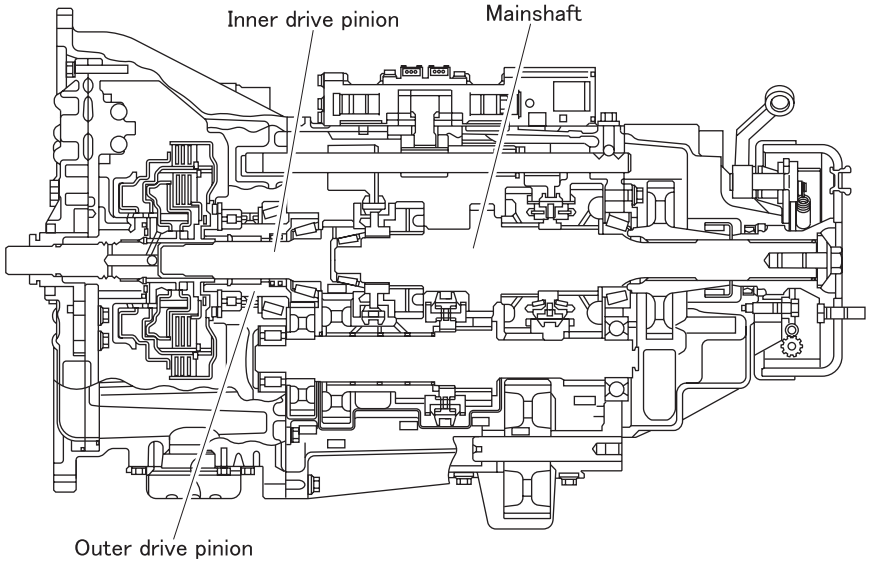
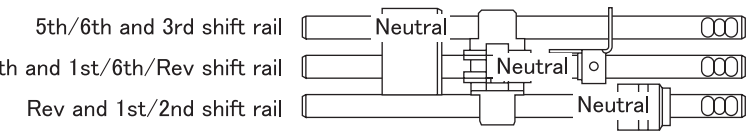
P114884E

4.8 Neutral



Shift rail arrangement as seen from above transmission



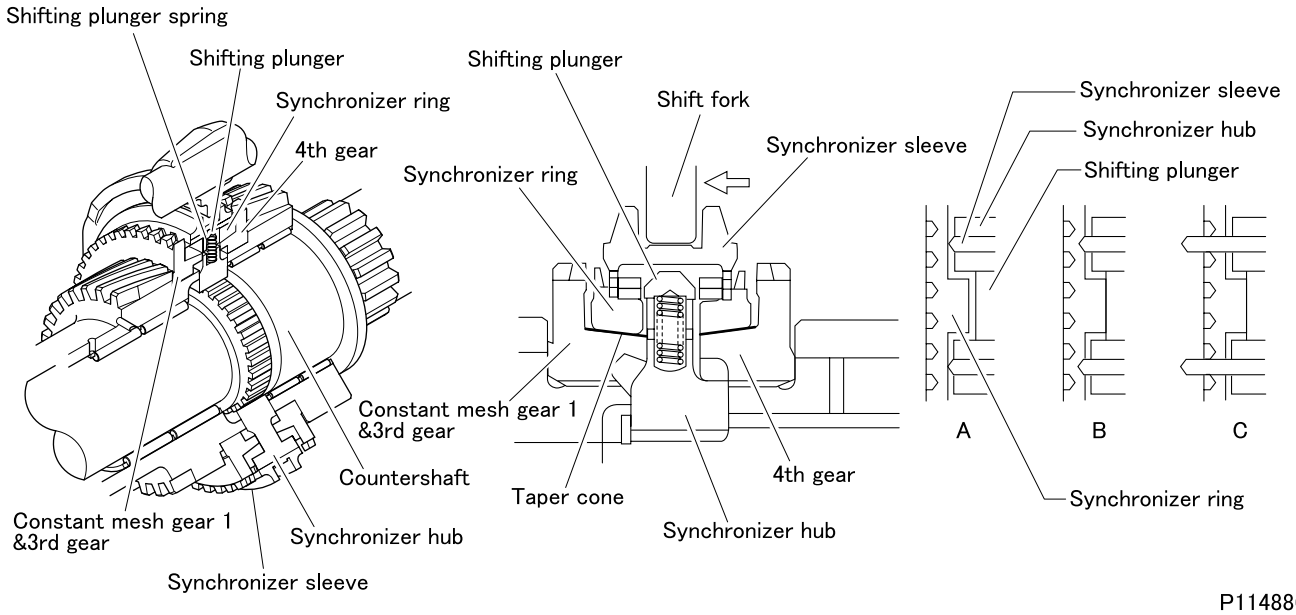
P114885E

- Since all clutches are disengaged when in neutral position, driving force from the pinion gears will not be transmitted to the mainshaft.

5. Synchromesh Mechanism

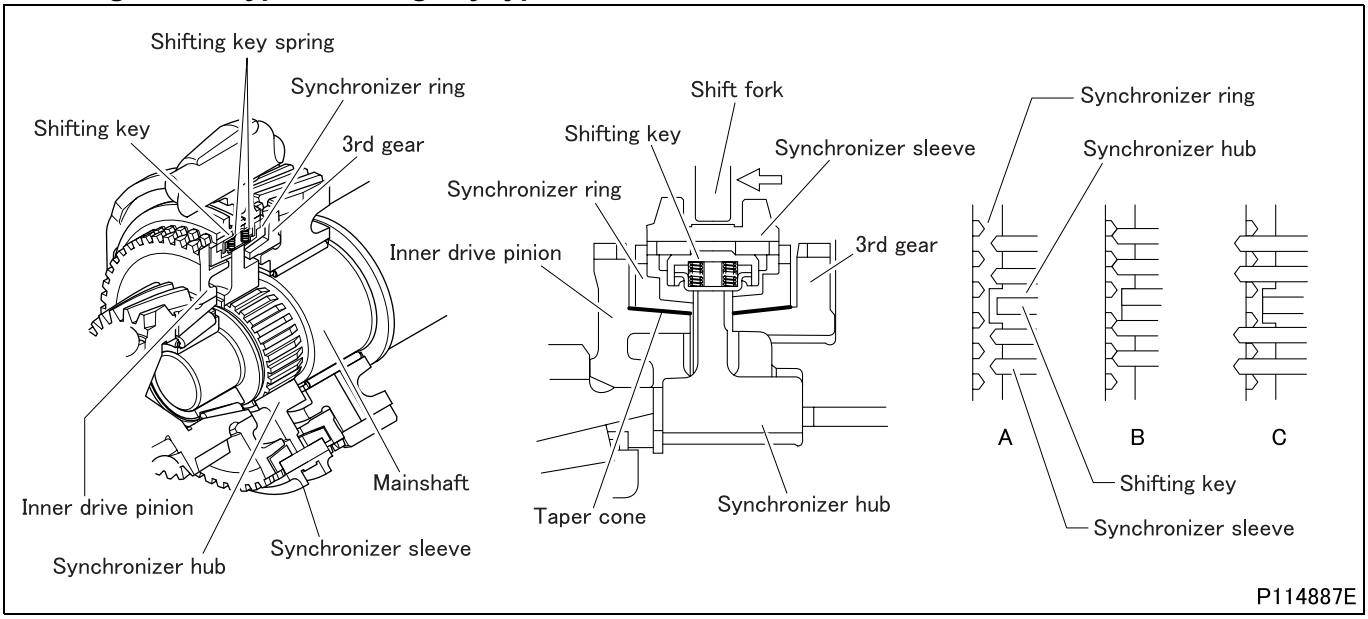
- The synchromesh mechanism, when a shift change is made, synchronizes the rotation speed of the mainshaft, drive pinion and synchronizer hub that rotates integrally with the mainshaft with that of the gear to be shifted.
- The synchromesh mechanism is a Warner synchromesh type, and is used depending on the gear position as single cone type or triple cone type.

5.1 Single cone type <Shifting plunger type>



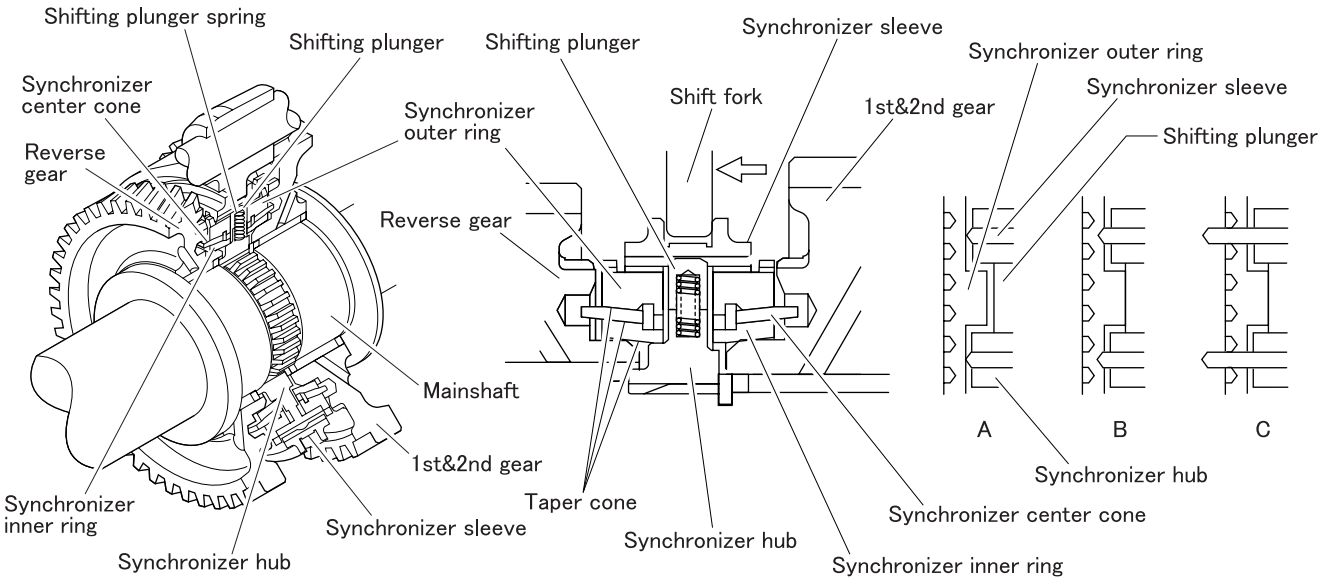
- The inside of the synchronizer hub engages the spline of the mainshaft and rotates with it. The outside of the synchronizer hub has a spline that engages the synchronizer sleeve and three grooves.
- Shifting plungers are inserted into these grooves. When the gear shift is in neutral, the shifting plunger engage grooves in the synchronizer sleeve and are pressed against the inside of the synchronizer sleeve by shifting plunger springs.
- Synchronizer rings are inserted into the respective taper cone of each gear.
- The outer splines of the synchronizer rings engage the synchronizer sleeve. On the synchronizer hub are three grooves in which protrusions of the synchronizer rings are inserted. These grooves are wider than the width of the protrusions of the synchronizer rings.
- Synchronizer rings rotate relative to the synchronizer sleeve by the amount of play (width difference).
- When the gear shift is in neutral (figure A), moving the shift fork in the direction of the arrow as illustrated, moves the synchronizer sleeve slightly to the gear. At the same time, the shifting plunger, the central protrusion of which engages the synchronizer sleeve, moves to the gear and presses the synchronizer ring against the taper cone of the gear (figure B).
- The taper cones of synchronizer rings, which act as cone clutches, generate friction torque and perform synchronous operation.
- The rotation speed of the synchronizer hub becomes gradually closer to that of the gear due to the synchronous operation, and eventually they rotate at the same speed. This allows the synchronizer sleeve to move smoothly to engage the synchronizer hub and gear, completing the shift change (figure C).

5.2 Single cone type <Shifting key type>



- The synchronizer hub is internally splined to the mainshaft and rotates with the mainshaft. The synchronizer hub has external splines that engage with the synchronizer sleeve and three keyways.
- Shifting keys fit in these keyways. With the shift fork in the neutral position, the shifting keys are seated in the grooves in the inside of the synchronizer sleeve and pressed against the inside surface of the synchronizer sleeve by shifting key springs.
- Synchronizer rings are seated on the taper cones of each gear.
- The external splines of synchronizer rings engage with the synchronizer sleeve. On the hub side surface of the synchronizer rings are provided three keyways, in which the ends of the synchronizer rings fit. These keyways are wider than the width of the shifting keys.
- The synchronizer rings are allowed to rotate relative to the synchronizer sleeve as much as this play in the keyways (width difference).
- Shifting the shift fork in the illustrated direction of arrow from the neutral position (figure A) moves the synchronizer sleeve slightly toward the gear. The shifting key, which engages with the synchronizer sleeve at the central projection, is also moved toward the gear to press the synchronizer ring against the taper cone of the gear. (figure B)
- As the taper cone of the synchronizer ring works as a cone clutch, frictional torque rises to make the rotation speed of the synchronizer hub gradually close to the gear speed of the gear.
- When the rotation speeds become equal eventually, the synchronizer sleeve is allowed to smoothly move into mesh with the synchronizer hub and gear, completing the speed change. (figure C)

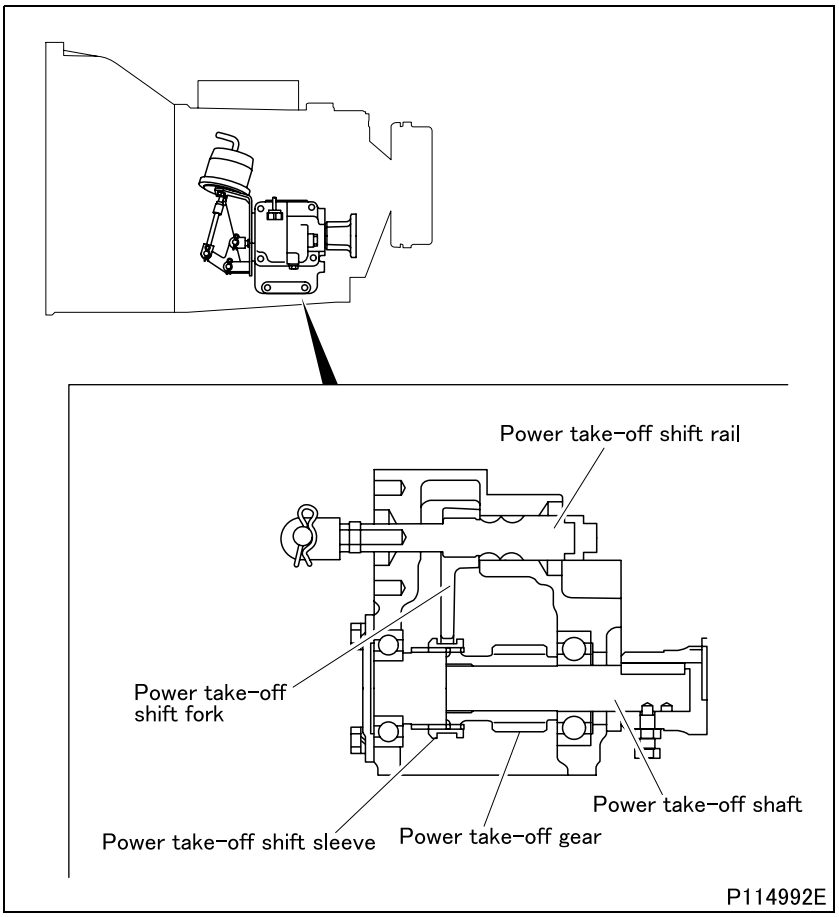
5.3 Triple cone type



- The synchromesh structure and operation of the triple cone type are basically the same as for the single cone type. The synchronizer ring is divided into three parts (synchronizer inner ring, synchronizer center cone and synchronizer outer ring) and the center cone (both the inside and outside surfaces are tapered) and the inner ring (both the inside and outside surfaces are tapered) are sandwiched between the outer ring and the taper cone of each gear to shorten the time required for synchronization with cone clutches at three locations.
- Six protrusions on the outside of the synchronizer center cone fit into corresponding gear holes. As in the taper cone of the single cone type, the center cone and the gear are installed as if integrated.
- The inside of the synchronizer hub engages the spline of the mainshaft and rotates with it. The outside of the synchronizer hub has a spline that engages the synchronizer sleeve and three grooves.
- Shifting plungers are inserted into these keyways. When the gear shift is in neutral, the shifting plungers engage grooves in the synchronizer sleeve and are pressed against the inside of the synchronizer sleeve by shifting plunger springs.
- The synchronizer outer ring and synchronizer inner ring are inserted into synchronizer center cones, respectively.
- The outer spline of the synchronizer outer ring engages the synchronizer sleeve. On the synchronizer hub are three grooves in which protrusions of the synchronizer outer ring are inserted. These grooves are wider than the width of the protrusions of the synchronizer outer ring.
- The synchronizer outer ring rotates relative to the synchronizer sleeve by the amount of play.
- When the gear shift is in neutral (figure A), moving the shift fork in the direction of the arrow as illustrated, moves the synchronizer sleeve slightly to the gear. At the same time, the shifting plunger, the central protrusion of which engages the synchronizer sleeve, moves to the gear and presses the synchronizer outer ring and the center cone against the taper cone of the synchronizer center cone and the synchronizer inner ring, respectively and in addition, presses the inner ring against the gear (figure B).
- The taper cones of synchronizer rings, which act as cone clutches, generate friction torque and perform synchronous operation.
- The rotation speed of the synchronizer hub becomes gradually closer to that of the gear of the gear due to the synchronous operation, and eventually they rotate at the same speed. This allows the synchronizer sleeve to move smoothly to engage the synchronizer hub and gear, completing the shift change (figure C).

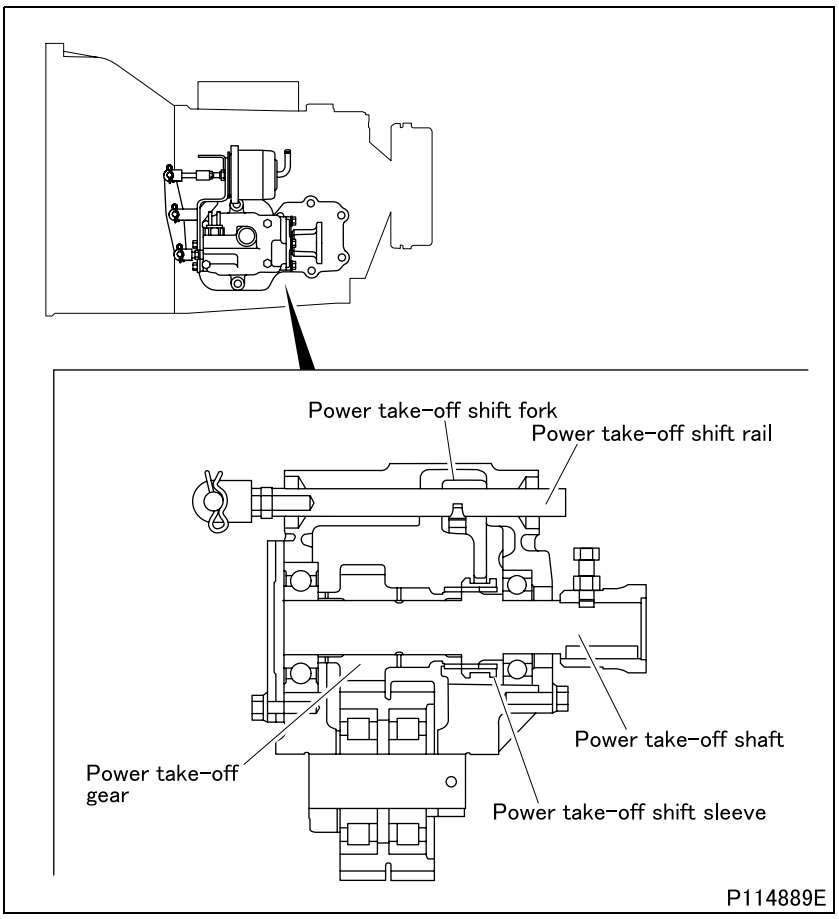
6. Transmission Power Take-off

<Standard transmission power take-off>



- The transmission power take-off takes out the power when the power take-off gear engages the reverse idler gear of the transmission, and delivers the engine power as it is.

<Large-capacity transmission power take-off>



- The transmission power take-off takes out the power when the power take-off idler gear engages the countershaft 3rd gear of the transmission, and transmits the engine power to the power take-off flange.

Possible causes \ Symptoms			Clutch slips	Clutch does not engage smoothly	Clutch does not switched	Gears slip out of engagement	Gears hard to engage	Noise when engine is idling	Noise when cruising	Noise when changing gear	Reference Gr
Transmission body faulty	Mainshaft companion flange mounting bolt loose					O	O				
	Mainshaft thrust washer worn					O	O				
	Mainshaft bearing worn or damaged					O	O		O		
	Synchronizer ring and synchronizer sleeve spline worn					O					
	Synchronizer ring and gears taper cone area worn						O				
	Mainshaft pilot bearing worn or damaged							O	O		
	Outer drive pinion bearing worn or damaged							O			
	Inner drive pinion bearing worn or damaged							O			
	Countershaft thrust washer worn					O	O				
	Countershaft bearing worn or damaged							O	O		
	Needle bearings of gears worn or damaged							O	O		
	Reverse idler gear or countershaft 3rd gear and power take-off gear backlash excessive							O			
	Mainshaft and countershaft gears backlash excessive								O		
	Spline of gears worn									O	
	Gears damaged								O		
	Transmission oil insufficient								O		
	Automatic transmission fluid insufficient		O	O	O	O	O	O	O	O	
Synchronizer faulty	Single cone type	Contacting surface of synchronizer ring and gear taper cone worn					O			O	
	Triple cone type	Contacting surface of synchronizer inner and outer rings and center cone worn					O			O	
		Contacting surface of synchronizer inner ring and gear taper cone worn					O			O	
	Synchronizer ring spline chamfer worn									O	
	Shifting plunger and shifting key worn									O	
	Shifting plunger spring and shifting key spring deteriorated or damaged									O	
	Synchronizer sleeve worn or damaged								O	O	

Possible causes \ Symptoms		Clutch slips	Clutch does not engage smoothly	Clutch does not switched	Gears slip out of engagement	Gears hard to engage	Noise when engine is idling	Noise when cruising	Noise when changing gear	Reference Gr
Control mechanisms faulty	Control cable adjustment faulty					O				
	Control cable routing inadequate					O				
	Control cable length inadequate					O				
	Bushings worn				O	O				
	Steel ball and groove of shift rail worn				O					
	Poppet spring of shift rail fatigued or damaged				O					
	Shift rail sliding movement faulty					O				
	Shift fork jaws worn					O				
	Shift fork bent					O				
Clutch faulty	Clutch disengagement faulty					O			O	
Faulty ATF filter	Clogged filter	O	O	O	O	O	O	O	O	
	Clogged filter in eyebolt for connecting gearshift unit oil pipe				O	O	O	O	O	

Possible causes \ Symptoms		Indicator lights though power take-off is not engaged	Indicator does not light though power take-off is engaged	Power take-off slips out of engagement	Power take-off cannot be disengaged	Power take-off cannot be engaged	Power take-off does not stay engaged	Noise from power take-off	Reference Gr
Power take-off body abnormal	Shift rail bent			O		O

	Vacuum chamber faulty			O	O	O	O		

M E M O

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Transmission Oil Leakage and Oil Quantity

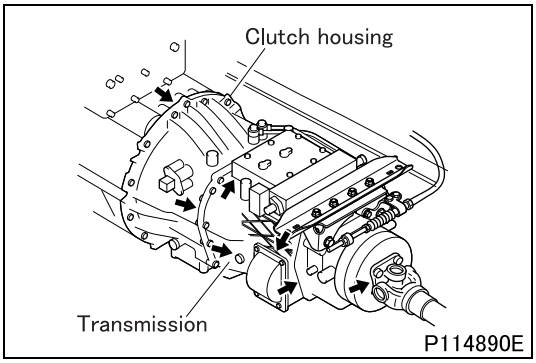
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Inspection plug	20.7 ± 6.2 {15 ± 4.6, 2.1 ± 0.6}	–
	Drain plug	68.6 ± 14.7 {51 ± 11, 7.0 ± 1.5}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Thread area of drain plug	ThreeBond 1105	As required
–	Transmission case	Gear oil: API GL-3 SAE80 (General) SAE90 (Warm region) API GL-4 SAE80 (General) SAE90 (Tropical region)	Approx. 3.5 L {3.7 qts.}
–	Clutch housing	Automatic transmission fluid: FUSO ATF-SP III	Approx. 5.0 L {5.3 qts.} (Total quantity)

- Grease depends on the driving conditions.
- For a model with standard type transmission power take-off, the quantity is increased by approx. 0.2 L {0.2 qts.}.
- For model with large-capacity transmission power take-off, the quantity is increased by approx. 0.3 L {0.3 qts.}.

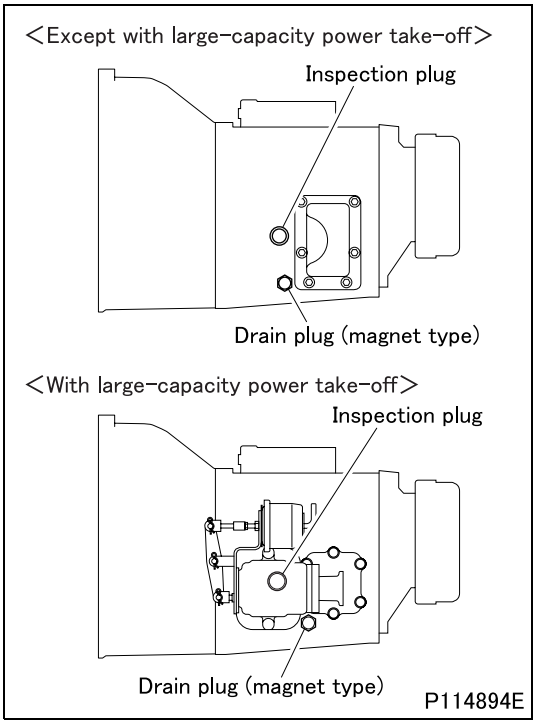


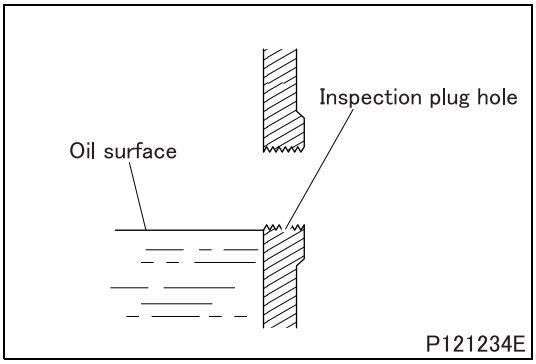
1.1 Inspection of oil leakage at each part of transmission body

- Check the oil leakage at each part of transmission body in visual.
  If the oil leakage is found, replace the defective part.

1.2 Inspection of oil leakage around transmission mounting part

- Check there is not oil stain on transmission mounting part caused by oil leakage from engine.
- If there is the oil stain, remove the transmission and clean the mounting surface of clutch housing and flywheel housing using brake cleaner etc. after repairing oil leakage part. Because the oil stain may loosen the transmission mounting bolts. (See “REMOVAL AND INSTALLATION OF TRANSMISSION”.)





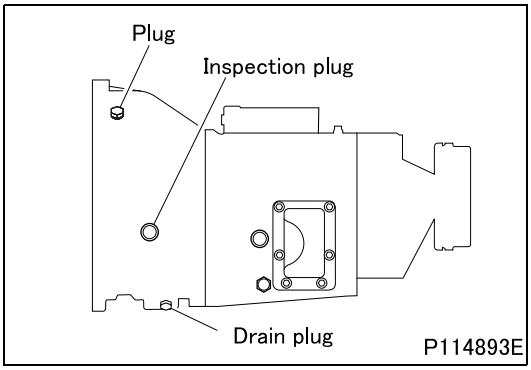
1.3 Inspection of oil quantity

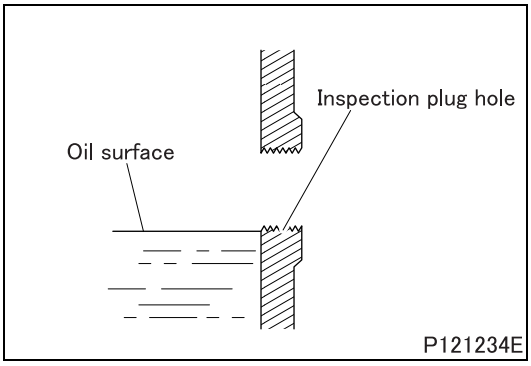
WARNING ⚠

- **Temperature of transmission oil is high immediately after driving. Perform work when oil is cold.**

(1) Transmission case

- Remove the inspection plug, and check that oil is filled up to the neck.
- If oil is not sufficient, fill oil from the inspection plug hole up to the neck.
- After filling, apply sealant to the inspection plug and tighten it to the specified torque.

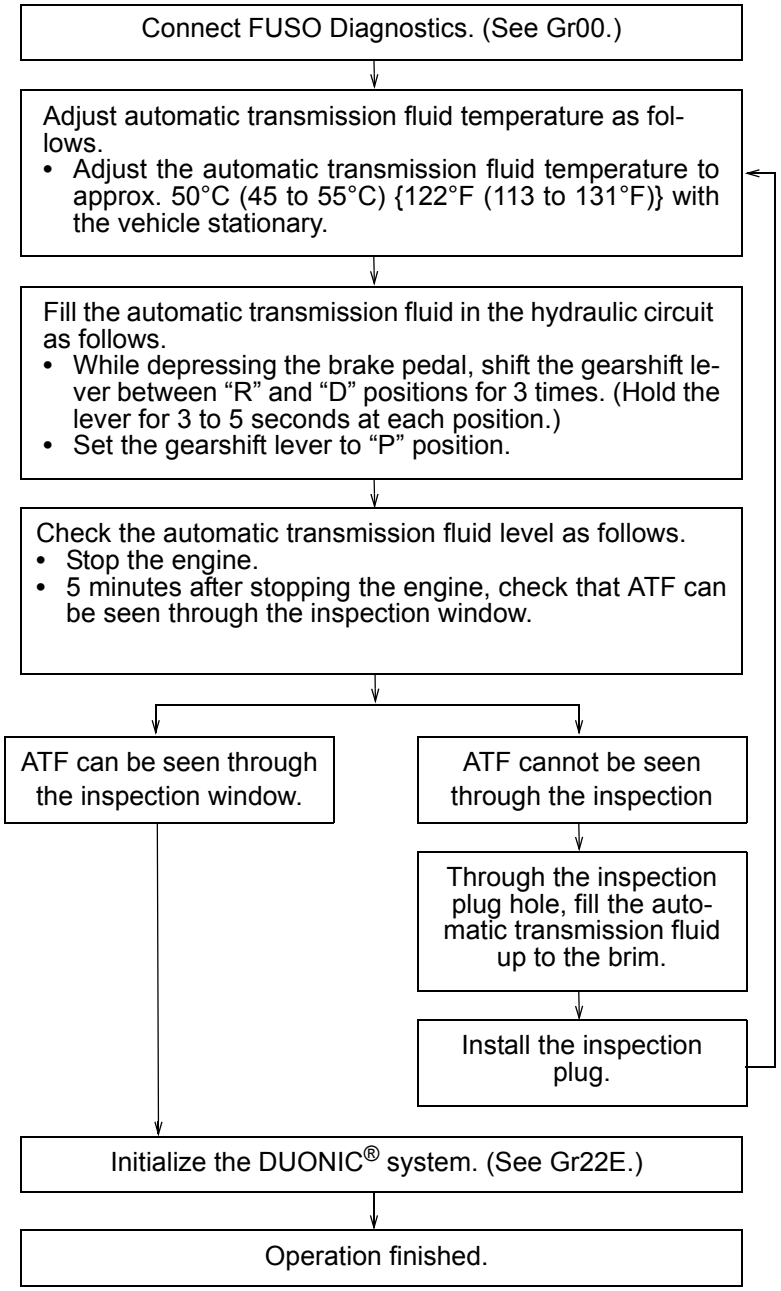




(2) Clutch housing

- Follow the flowchart below to check the automatic transmission fluid level.

Flowchart for checking automatic transmission fluid level



- When the inspection is complete, tighten the inspection plug.

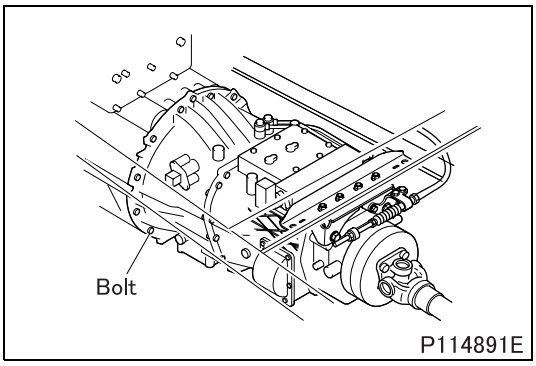
CAUTION ⚠

- **Overtightening the inspection plug may break its window. Be sure to tighten the inspection plug to the specified torque.**
- **After filling automatic transmission fluid, promptly install the inspection plug to prevent dirt and dust from entering the clutch housing.**

2. Inspection of Looseness in Engine to Clutch Housing Connection

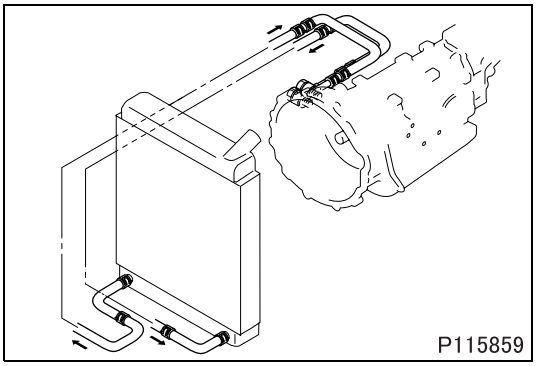
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Bolt (transmission mounting)	47.1 {35, 4.8}	–



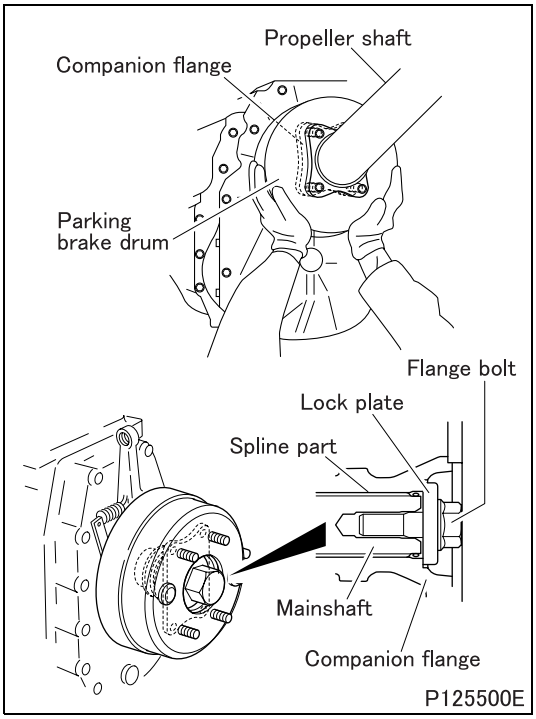
- Check the engine to clutch housing connection for looseness.
- Check the transmission mounting bolts and nuts for looseness.
- Retighten any loose bolt to the specified torque.

3. Inspection of Transmission Cooling System for Leakage, Damage and Installation Condition



- Check the fluid leakage and damage in transmission cooling system. If there is any abnormality, replace the defective part(s). (See “OIL COOLER”.)

4. Inspection of Looseness in Propeller Shaft Connection



- Check the propeller shaft mounting bolts for looseness. (See Gr25.)
- Move the parking brake drum in axial and vertical directions to check for excessive play between the companion flange and mainshaft.
- If excessive play is detected, remove the propeller shaft, then check the companion flange mounting bolt for looseness and the splines on companion flange and mainshaft for abnormalities. If any part is found defective, replace the part. (See “EXTENSION HOUSING”.)

5. Replacement of Transmission Oil

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Inspection plug	68.6 ± 14.7 {51 ± 11, 7.0 ± 1.5}	–
	Drain plug		

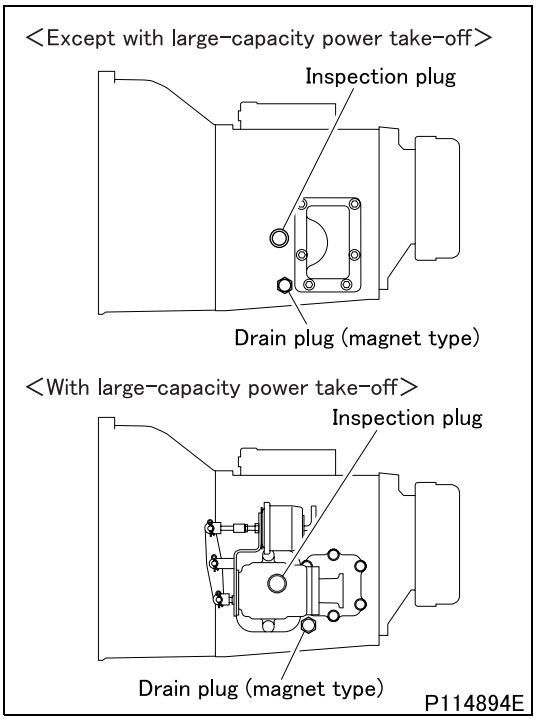
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Thread area of inspection plug	ThreeBond 1105	As required
	Thread area of drain plug		
–	Transmission case	Gear oil: API GL-3 SAE80 (General) SAE90 (Warm region) API GL-4 SAE80 (General) SAE90 (Tropical region)	Approx. 3.5 L {3.7 qts.}

- Grease depends on the driving conditions.
- For a model with standard type transmission power take-off, the quantity is increased by approx. 0.2 L {0.2 qts.}.
- For a model with large-capacity transmission power take-off, the quantity is increased by approx. 0.3 L {0.3 qts.}

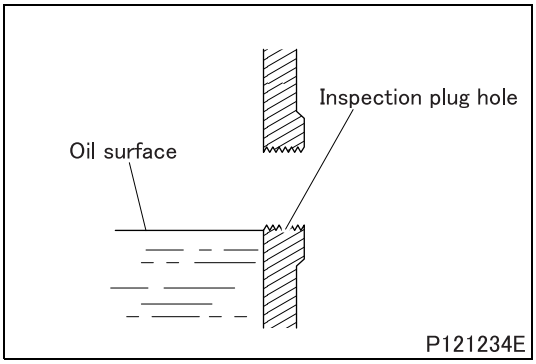
WARNING ⚠

- **Temperature of transmission oil is high immediately after driving. Perform work when oil is cold.**



[Replacement]

- Remove the drain plug to drain transmission oil. Drainage can be made quickly with the inspection plug removed.
- After draining transmission oil, apply sealant to the drain plug and tighten it to the specified torque. Magnet type drain plugs should be cleaned before installation.
- Fill transmission oil in the specified quantity from the inspection plug hole.



- After filling, wait for 1 minute or more to check that oil is filled up to the neck of the inspection plug hole. If oil is not sufficient, replenish it.
- After completing work, apply sealant to the inspection plug and tighten it to the specified torque.
- When automatic transmission fluid has been replaced, make initial setting of the DUONIC® system and perform a test drive. (See Gr22E.)
- When transmission oil has been replaced, reset the inspection/service memory of the multi information system. (See “Multi-information system” in chapter 6 of the Owner’s Manual.)

[Inspection]

- When draining transmission oil, check for oil quality, metal chips and metal powder.
- If an abnormally large amount of metal chips and metal powder is found, disassemble the transmission assembly for service, as abnormalities may be caused inside. (See “TRANSMISSION BODY”.)

6. Replacement of Clutch Control Oil

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

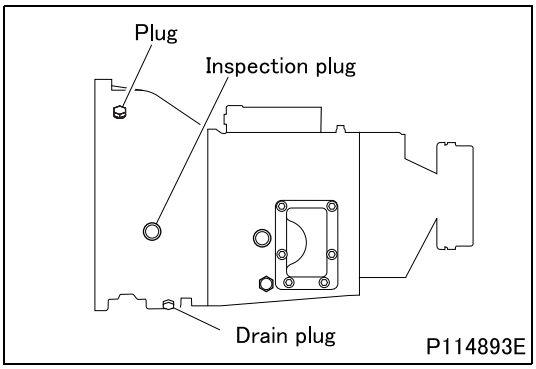
Mark	Parts to be tightened	Tightening torque	Remarks
–	Inspection plug	20.7 ± 6.2 {15 ± 4.6, 2.1 ± 0.6}	–
	Drain plug	39 {2.9, 4.0}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Clutch housing	Automatic transmission fluid: FUSO ATF-SP III	Approx. 2.0 L {2.1 qts.} (Replaceable quantity (quantity which can be drained through drain plug hole))

WARNING ⚠

- **Automatic transmission fluid is hot immediately after driving. Perform work when the fluid is cold.**



[Replacement]

- Remove the drain plug to drain automatic transmission fluid. Drainage can be made quickly by removing the inspection plug.
- After draining automatic transmission fluid, tighten the drain plug.

CAUTION ⚠

- **After draining automatic transmission fluid, promptly install the inspection plug to prevent dirt and dust from entering the clutch housing.**

- Fill automatic transmission fluid until it overflows from the inspection plug hole.
- After filling, wait for 1 minute or more to check the automatic transmission fluid level. (See “ON-VEHICLE INSPECTION AND ADJUSTMENT”.)
- When the work is complete, tighten the inspection plug.

CAUTION ⚠

- **Overtightening the inspection plug may break its window. Be sure to tighten the inspection plug to the specified torque.**
- **After filling automatic transmission fluid, promptly install the inspection plug to prevent dirt and dust from entering the clutch housing.**

- When automatic transmission fluid has been replaced, make initial setting of the DUONIC® system and perform a test drive. (See Gr22E.)
- When automatic transmission fluid has been replaced, reset the inspection/service memory of the multi-information system. (See “Multi-information system” in chapter 6 of the Owner’s Manual.)

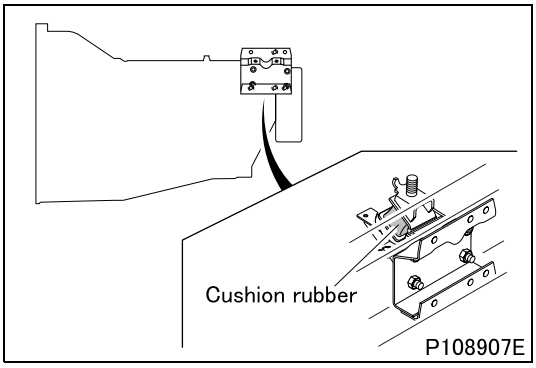
[Inspection]

- When draining automatic transmission fluid, check for fluid quality, metal chips and metal powder.
- If an abnormally large amount of metal chips or metal powder is found, disassemble the transmission assembly for service, as abnormalities may be caused inside. (See “VALVE BODY, DUAL CLUTCH” and “TRANSMISSION BODY”.)
- If there is automatic transmission fluid on the bottom of the transmission, wipe off the fluid and check for leaks from inside. If fluid is leaking, disassemble the transmission assembly for service, as abnormalities may be caused inside. (See “VALVE BODY, DUAL CLUTCH” and “TRANSMISSION BODY”.)
- Since it may not be possible to check for fluid leaks if the air bleed hole in the clutch housing is clogged, add pure water (distilled water) from the inspection hole in the lower part of the flywheel housing and check that the water flows out from the air bleed hole. If the water will not flow out, clean the air bleed hole with a wire or equivalent.

CAUTION ⚠

- **To prevent rust on the components in the flywheel housing, add modest amount of pure water (distilled water) so as not to overflow from the inspection hole.**
- **Be careful not to forget to install the rubber cap on the inspection hole.**

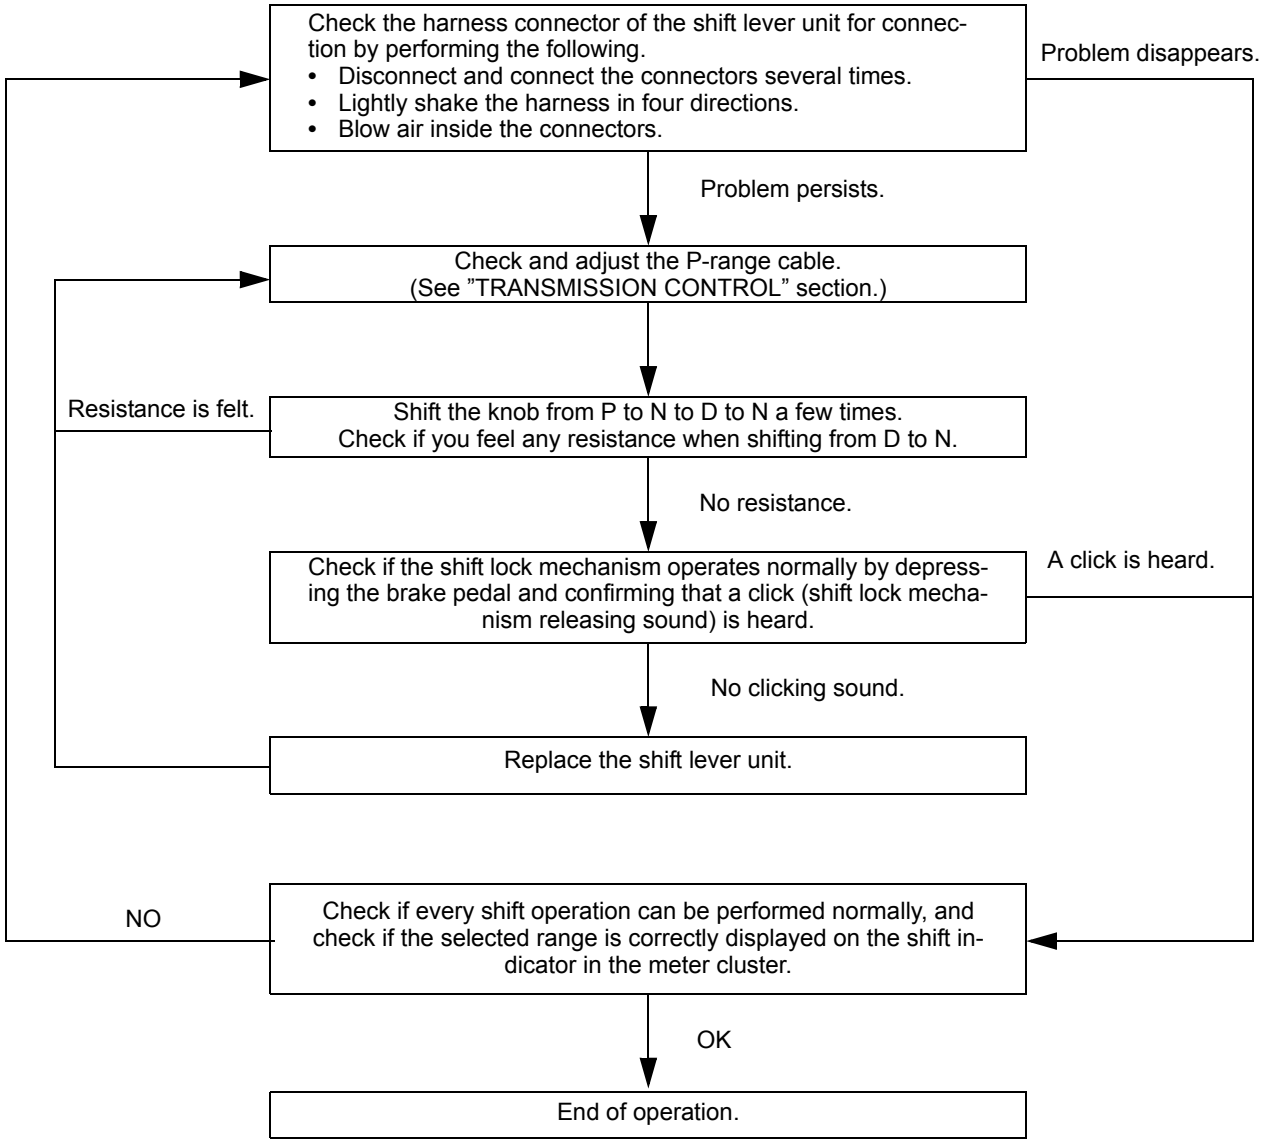
7. Inspection of Transmission Mounting Cushion Rubber



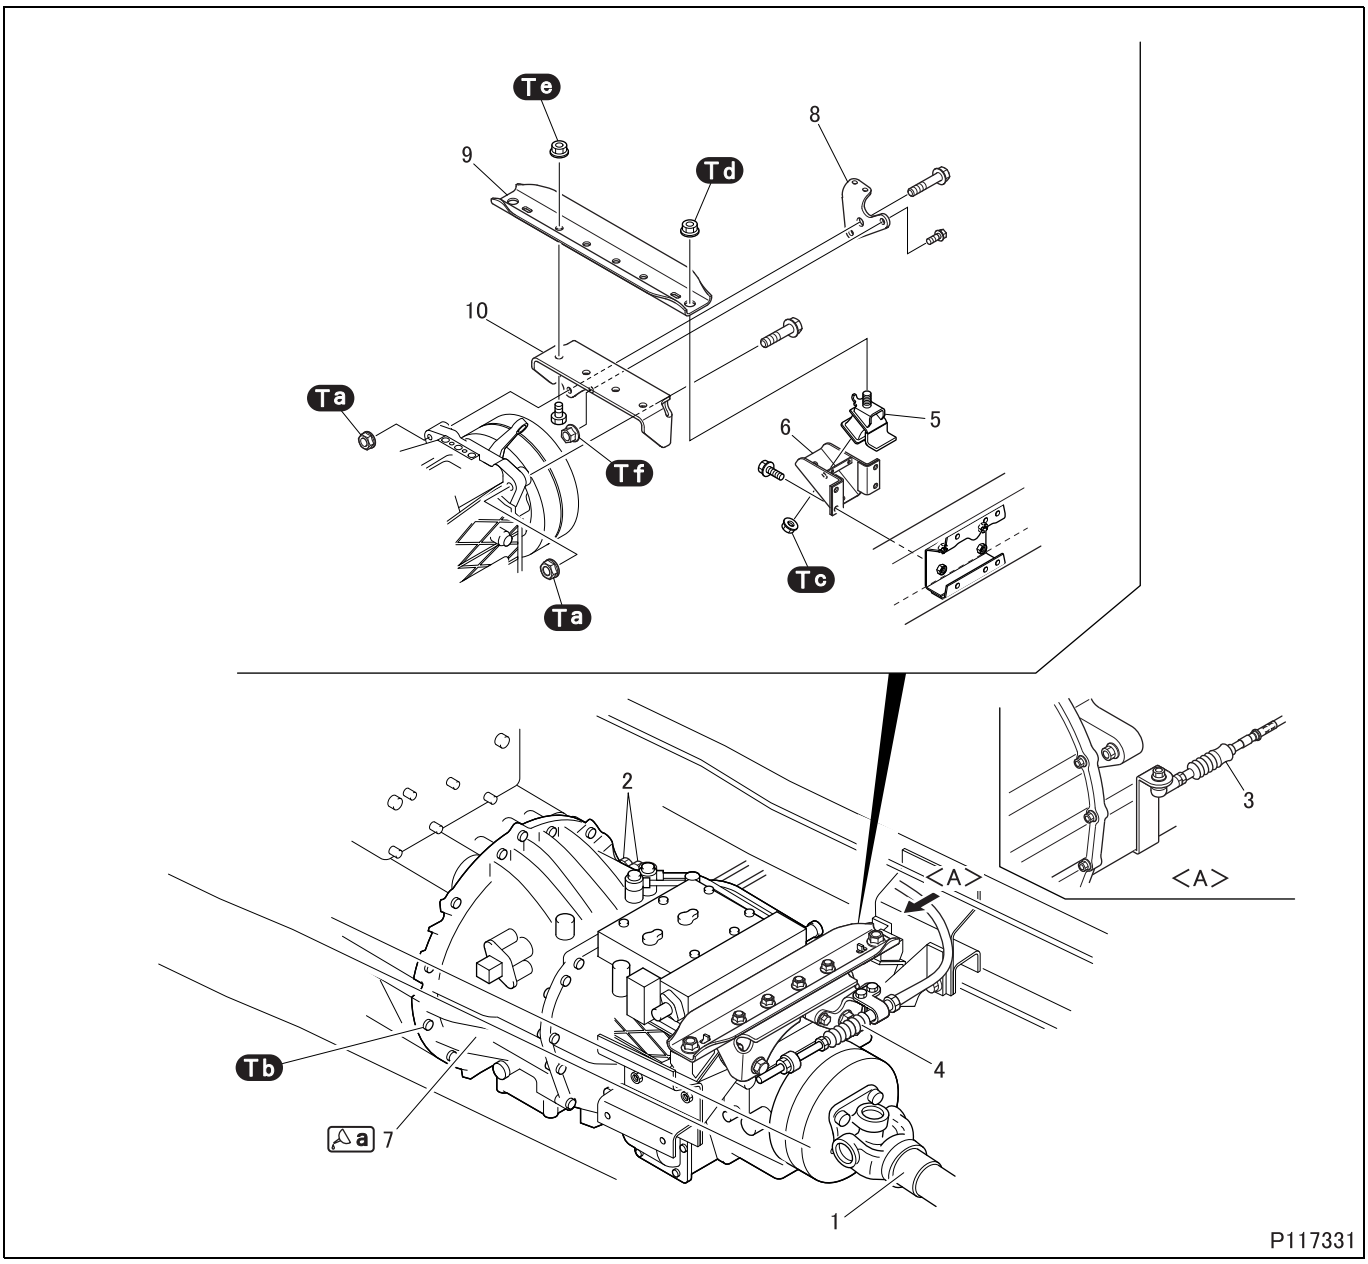
- Check that the cushion rubber on the transmission mounting is free from damage such as scratches, cracks or peeling.
- Use a hand mirror in places that are difficult to see.
- If there is a problem, replace the cushion rubber. (See “REMOVAL AND INSTALLATION OF TRANSMISSION”.)

8. Inspection of Transmission control

- If any of the following symptoms occurs when operating the shift knob, perform inspection in the flow chart shown below.
- The shift knob cannot be shifted from D to N.
- The shift lock of the shift lever unit cannot be released so that shifting from P to N, N to P and N to R cannot be performed.
- The selected range is not displayed correctly on the shift indicator in the meter cluster.



M E M O



● **Removal sequence**

1 Propeller shaft (See Gr25.)
2 Transmission oil cooler pipe and hose (See later section.)
3 P-range cable (See later section.)
4 Parking brake cable (See Gr36.)
5 Cushion rubber
6 Mounting bracket
7 Transmission
8 Parking brake cable bracket
9 Mounting support
10 Mounting support bracket

● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (transmission mounting)	235 ± 35 {175 ± 26, 24.0 ± 3.6}	–
Tb	Bolt (transmission mounting)	47.1 {35, 4.8}	–
Tc	Nut (cushion rubber mounting)	50.6 {37, 5.2}	–
Td	Nut (cushion rubber mounting)	260 ± 40 {190 ± 30, 27.0 ± 4.1}	–
Te	Nut (mounting support mounting)	145 ± 25 {105 ± 18, 15.0 ± 2.5}	–
Tf	Nut (parking brake cable bracket mounting)	50.6 ± 4.4 {37 ± 3.2, 5.2 ± 0.4}	–

Lubricant and/or sealant

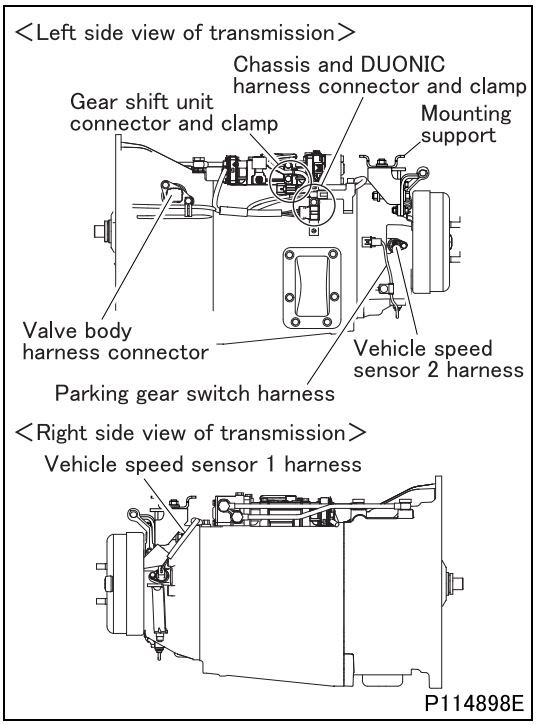
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Mating surface of clutch housing and engine	ThreeBond 1215	As required

◆Work before removal◆

■ Removal: Front pipe and diesel particulate filter

- To ensure the clearance for removing the transmission, remove the front pipe and diesel particulate filter. (See Gr15.)

◆Removal procedure◆



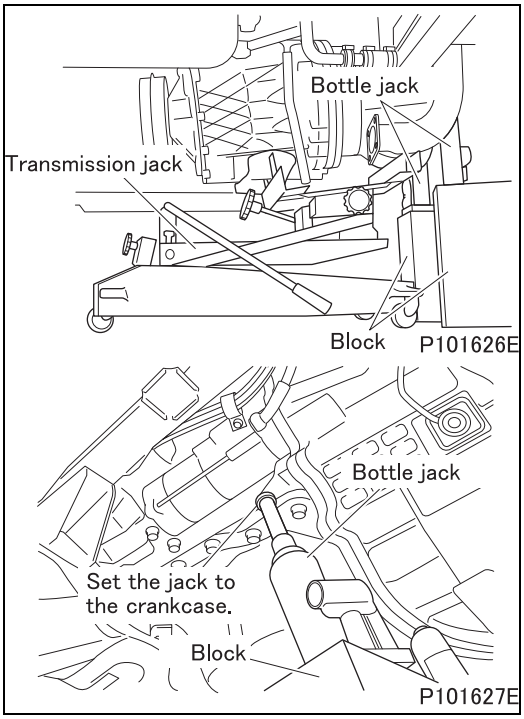
■ Removal: Harness

- Remove the harnesses and connectors shown in the drawing from the transmission. If a harness or connector cannot be removed from the bottom of the vehicle, remove it when removing the transmission from the engine.

CAUTION ⚠

- **The harnesses are also clamped to the transmission. Pulling a harness after just removing the connector may cause damage to the harness.**

- Remove the connectors and clamps of the gear shift unit harness as they will interfere with the mounting support when removing the transmission.



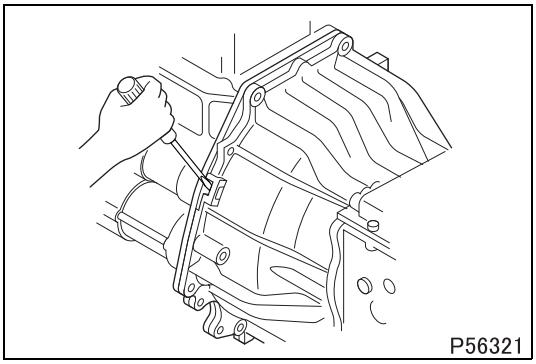
■ **Removal: Transmission**

- Apply the transmission jack and two bottle jacks to the transmission and engine block respectively as shown in the drawing before removing the transmission mounting bolts (to the engine and mounting support).
- Place a block under the jacks to apply bottle jacks to the engine block.

CAUTION ⚠

- **If the engine is not supported by the bottle jack, it will fall when the transmission is removed.**

- After removing the transmission mounting bolts, lower the transmission by lowering the transmission jack and bottle jack until it does not interfere with the transmission mounting support bracket.



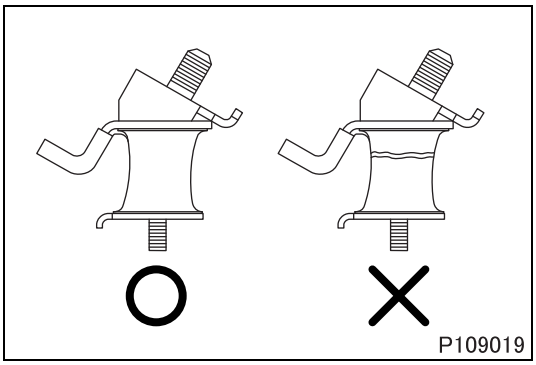
- Insert a screwdriver into the three removal grooves and remove the transmission from the engine.
- Move the transmission backward until the spline of the drive pinion is detached from the clutch.

CAUTION ⚠

- **Make sure that you pull the transmission out in a straight line. If you seesaw the transmission violently, you will damage the spline that connects the drive pinion and the clutch.**

- When the oil stain is found inside of clutch housing after removing the transmission, check the oil leakage portion of transmission or engine and replace the defective part.

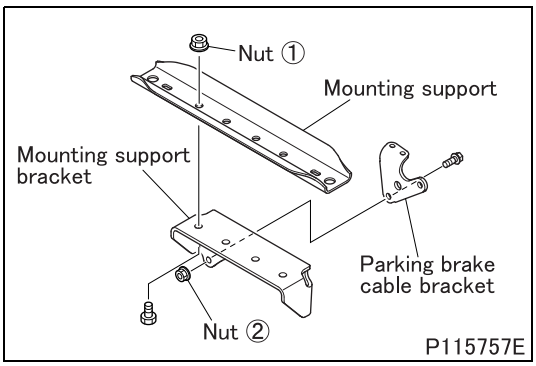
◆Inspection procedure◆



■ **Inspection: Cushion rubber**

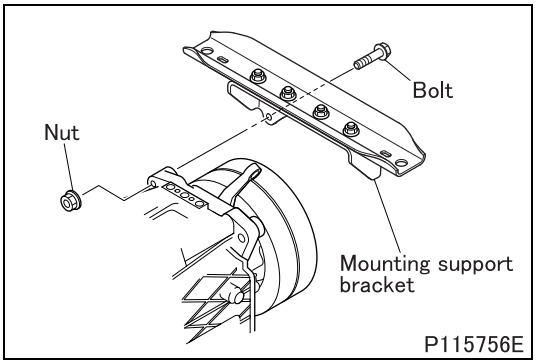
- Inspect the entire circumference of the cushion rubber for cracks, breaks, oil or other problems.
- If a problem is found, replace the cushion rubber.

◆Installation procedure◆



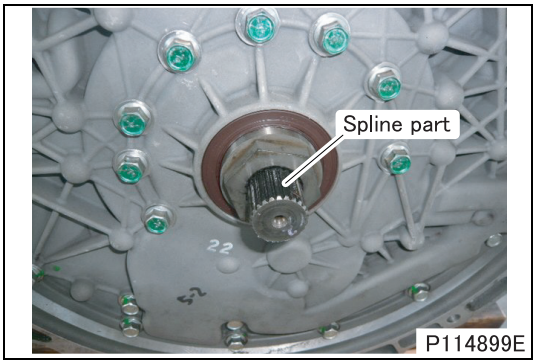
■ Installation: Mounting support and parking brake cable bracket

- Install the mounting support and parking brake cable bracket on the mounting support bracket.



■ Installation: Mounting support bracket

- Install the mounting support bracket on the transmission.

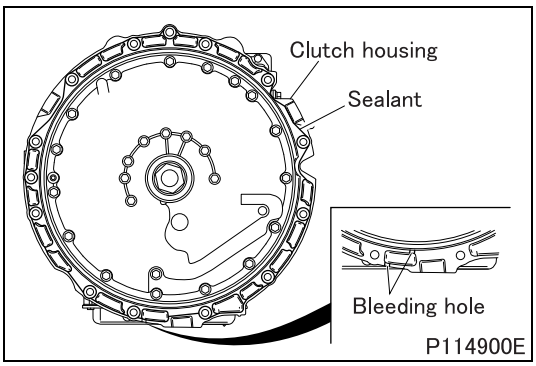


■ Installation: Transmission

- Check the spline of the input shaft of dual clutch for rust.
- If rust is found, remove it using a wire brush.

CAUTION ⚠

- **Do not apply grease to the input shaft as it may cause abnormal noise.**



[Applying sealant]

- Apply sealant following manners shown below.

CAUTION ⚠

- **Take care not to apply sealant under any of the following conditions. Otherwise it causes water infiltration.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**
- **Use utmost care to prevent the applied sealant from covering the air vent holes on the side of the clutch housing and engine.**

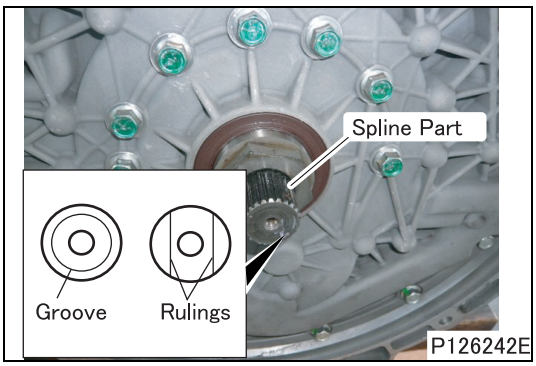
<Case of using nozzle gun>

- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

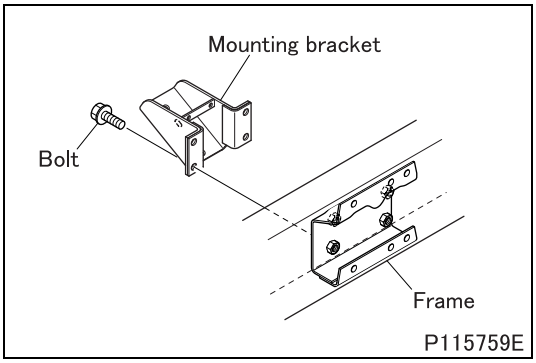
- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

[Installation]



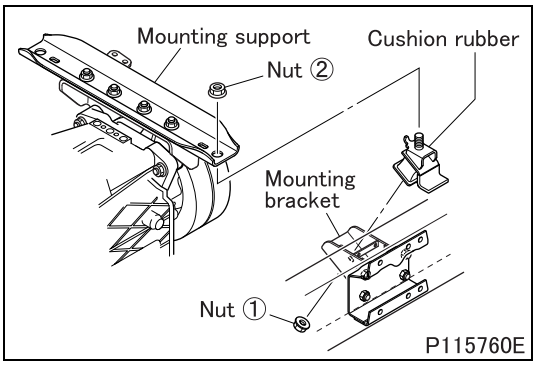
- Before installation, determine a type of the dual clutch used by checking identification marks on the end surface of the clutch spline.
  <Type A> No identification mark
  <Type B> Identification mark (circumferential groove or rulings) provided

- After applying the sealant, install the transmission before the sealant dries. Be sure not to allow the sealant to be displaced.
- Support the transmission on the transmission jack, and insert the transmission into the spline of damper paying attention to the input shaft spline.
- Tighten transmission mounting bolts to the specified torque.
- Do not start the engine within one hour after installing the transmission.
- When loosening or removing transmission mounting bolts, be sure to reapply the sealant.



■ Installation: Mounting bracket

- Install the mounting bracket on the frame.



■ Installation: Cushion rubber

- Install the cushion rubber on the mounting bracket and mounting support.

◆Work after installation◆

■ Fill: Automatic transmission fluid

- Fill automatic transmission fluid. (See “ON-VEHICLE INSPECTION AND ADJUSTMENT”.)
- After filling automatic transmission fluid, make initial setting of the DUONIC® system and perform a test drive. (See Gr22E.)

■ Inspection and adjustment: Parking brake lever

- Inspect and adjust the parking brake lever. (See Gr36.)

■ Adjustment: P-range cable

- Adjustment the P-range cable. (See “TRANSMISSION CONTROL”.)

■ Rewriting coding data: Coding data in electronic control unit

- Check the type of the clutch recorded in the DUONIC® electronic control unit.
  Check to see if the type recorded coincides with the one determined in the step before installation. If they do not, rewrite the coding data in the DUONIC® electronic control unit as appropriate. (See Gr. 22E.)

10 Dual clutch
11 Thrust needle bearing B
12 Bearing thrust washer
13 Bushing connector
14 O-ring

***a**: Transmission (See later section.)

⊗: Non-reusable parts

: This work requires protection against dust. (See Gr00.)

- It is desirable that the job to service portions related to the hydraulic circuit of the transmission (DUONIC®) be performed in an environment comparable to that of a meeting room partitioned from the outside air. If it is not feasible to prepare such an environment, take necessary steps to protect the clutch housing with a plastic bag for prevention of entry of sand and dust.
- Replace the plastic bag immediately when it is broken during servicing.

● Installation sequence

Follow the removal sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy

◆Work before removal◆

■ **Cleaning: Transmission**

- Drain automatic transmission fluid. (See “ON-VEHICLE INSPECTION AND ADJUSTMENT”.)

CAUTION ⚠

- **After draining automatic transmission fluid, promptly install the automatic transmission fluid drain plug and automatic transmission fluid level plug to prevent dirt and dust from entering the clutch housing.**

- Wash the transmission before removal from the vehicle. Thoroughly wash off dirt and dust around the clutch housing.

CAUTION ⚠

- **Be careful not to allow water to enter the transmission from the air bleed hole or other openings.**

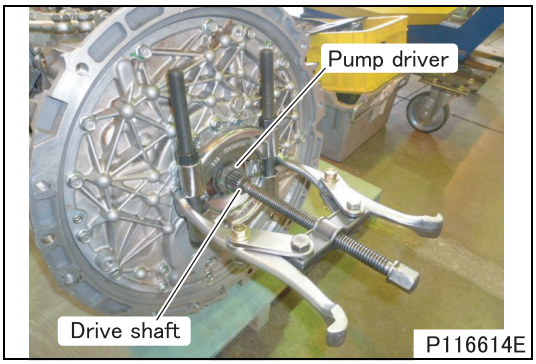
- Remove the transmission. (See “REMOVAL AND INSTALLATION OF TRANSMISSION”.)
- Check the precautions on washing when servicing. (See Gr00.)
- Use rubber or vinyl gloves that cover hands and arms.
- Use of an apron also is desirable.
- Clean the general tools, special tools, and work benches with a cleaner and a waste cloth before starting the service jobs.

NOTE

- **Do not use cotton work gloves.**
- **Do not use air tools when working inside a plastic bag.**
- **Do not reuse the plastic bag used during the servicing.**

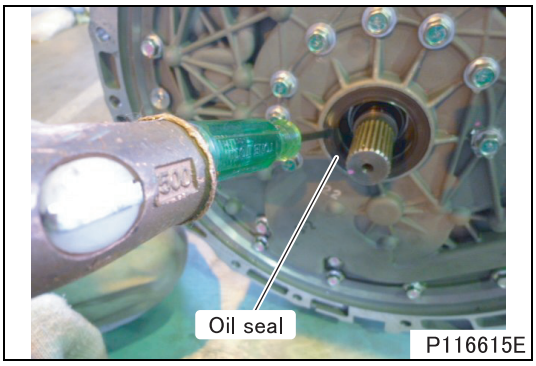
- Wash the transmission once again. After blowing dirt and dust off the clutch housing and valve body, thoroughly wipe them off with a rag, and then perform air blowing once again.

◆Removal procedure◆



■ Removal: Pump driver

- Install a commercially available puller on the pump driver grooves and dual clutch drive shaft as shown in the picture and remove the pump driver.

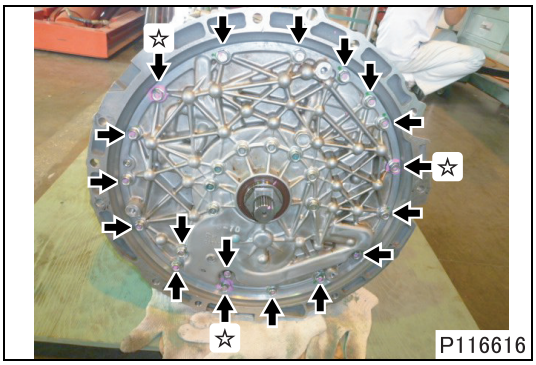


■ Removal: Oil seal

- Drive a flat-blade screwdriver into the metal plate part of the oil seal to remove the oil seal.

CAUTION ⚠

- **Be careful not to damage the valve body when driving the screwdriver.**



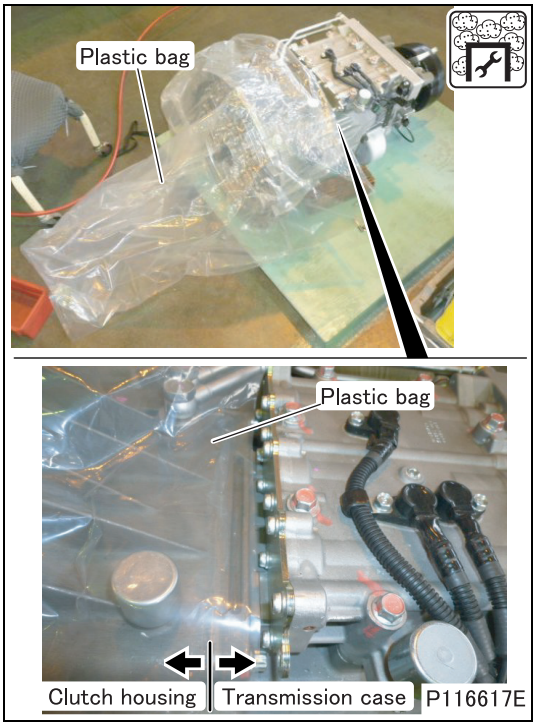
■ Removal: Valve body and bushing connector

: This work requires protection against dust.

CAUTION ⚠

- **If the valve body has been removed, the dual clutch may have been displaced; remove and install the dual clutch.**

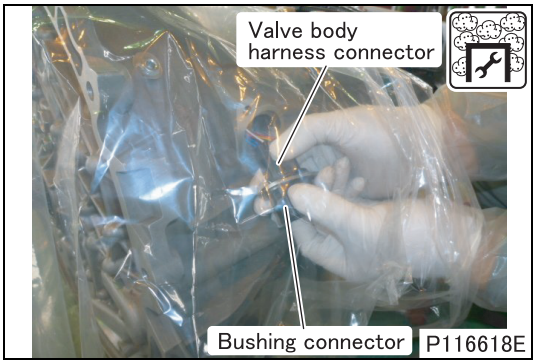
- Remove the mounting bolts except those marked with a "☆" in the picture.
- Loosen the bolts marked with a "☆" in the picture until they can be removed by hand, and then make alignment marks.



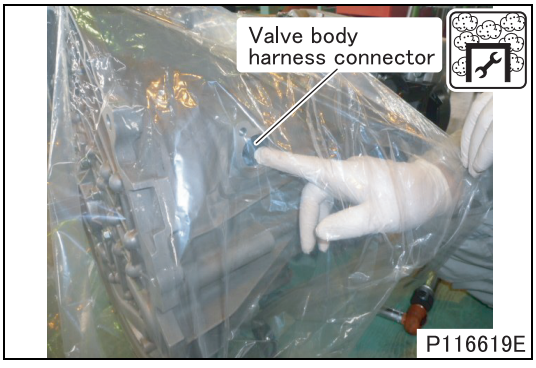
- Cover the clutch housing with a plastic bag.
- Align the open end of the plastic bag with the mating surfaces of the clutch housing and transmission case.
- Use a new plastic bag with a capacity of 90 L {95 qts.} (900 mm {35.4 in.} wide) or more and a thickness of 0.05 mm {0.0020 in.} or more.

NOTE

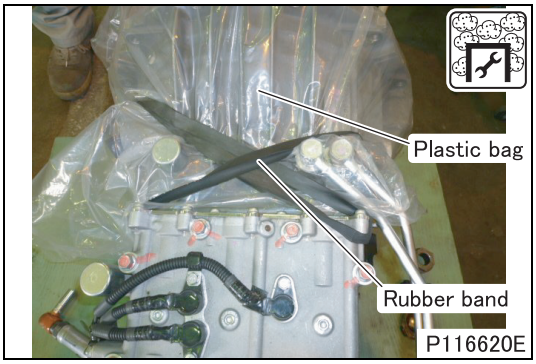
- **Do not use air tools when working inside a plastic bag.**



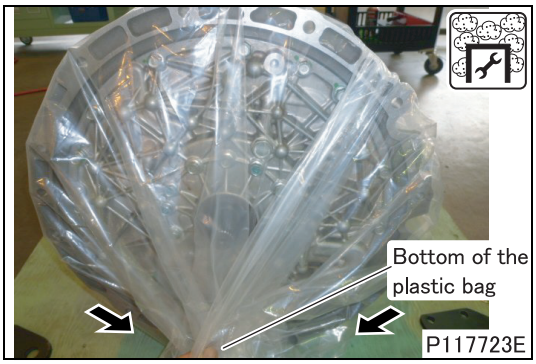
- Remove the busing connector.



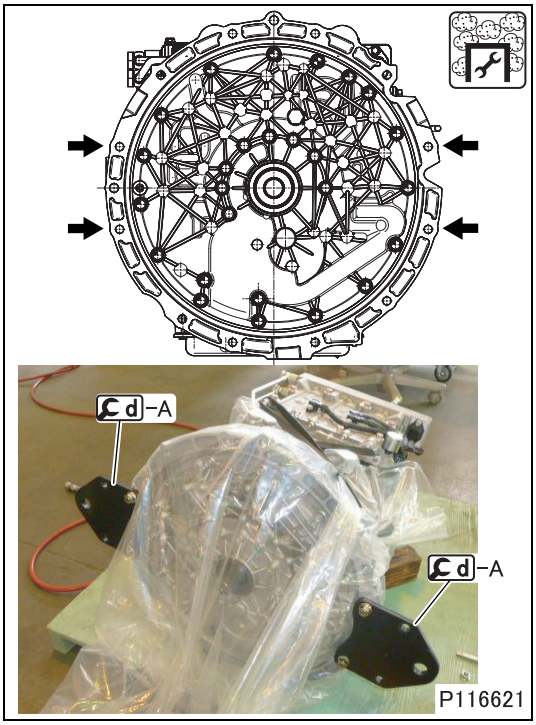
- Push the harness connector of the valve body into the clutch housing.



- Secure the open end of the plastic bag with a rubber band.



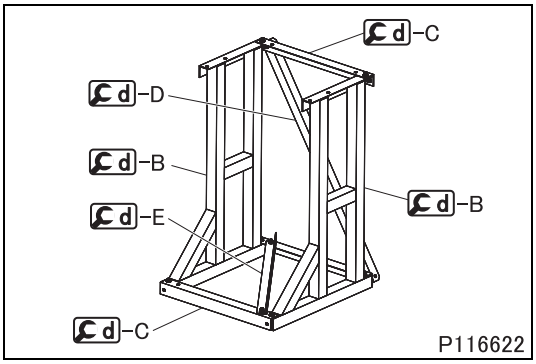
- Pull the bottom of the plastic bag in the direction shown to eliminate slack.



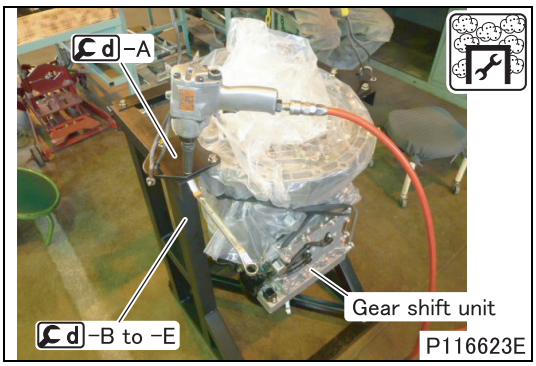
- Install d-A over the plastic bag on the clutch housing at the locations shown in the drawing.

CAUTION ⚠

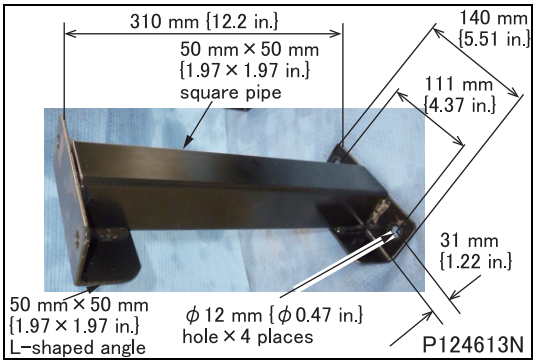
- **Tuck the plastic bag between the clutch housing and d-A to prevent dirt and dust from entering the bag through the mounting bolt holes.**



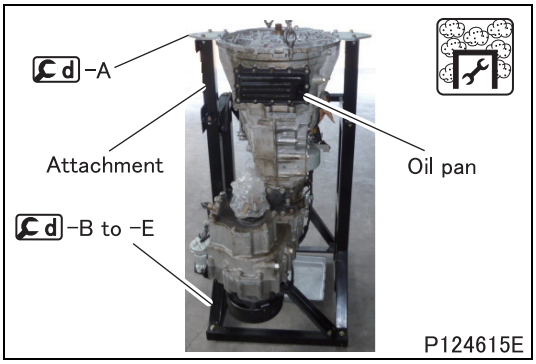
- Assemble d-B to -E.



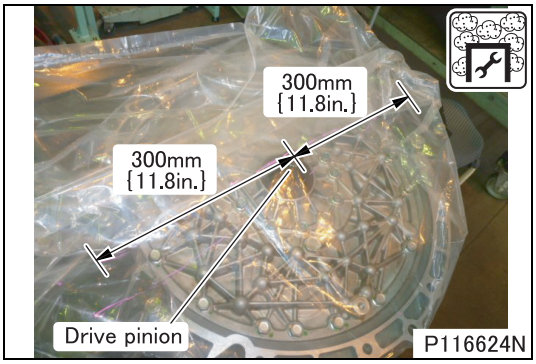
- Lift the transmission with a crane and secure it to -B to -E in the vertical orientation.
- The gear shift unit side of the transmission should be on the opening side of the assembly of -B to -E.



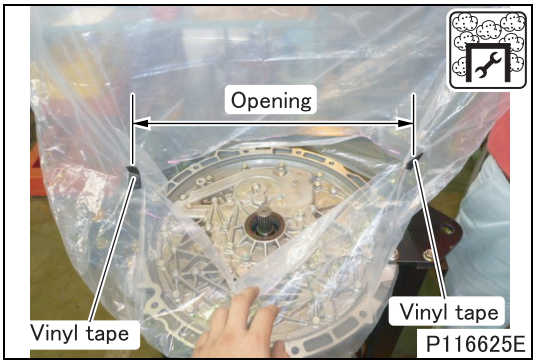
- On 4-wheel drive models, fabricate an attachment shown in the drawing, which should be sufficiently rigid to support the transmission.



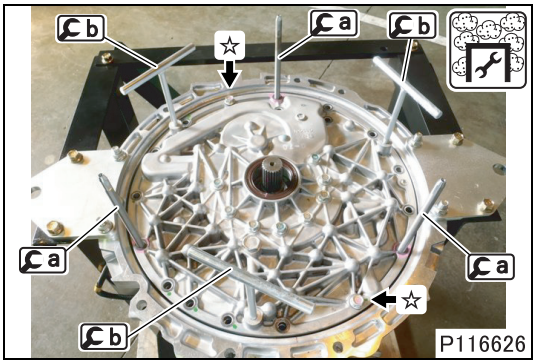
- Install the fabricated attachment to -B to -E with M12 bolts.
- Set the transmission in -B to -E with attachment with its oil pan positioned as shown in the drawing.



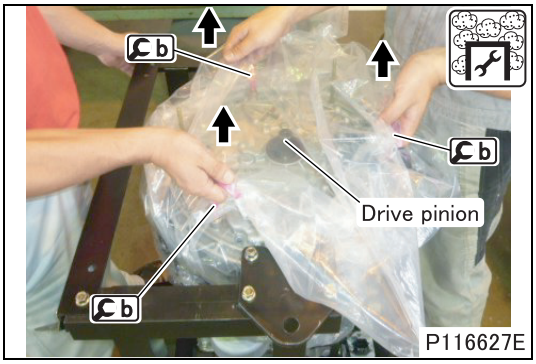
- Remove any slack in the plastic bag, and then draw lines of 300 mm {11.8 in.} long with a marking pen on the left and right sides of the center of the dual clutch drive pinion.



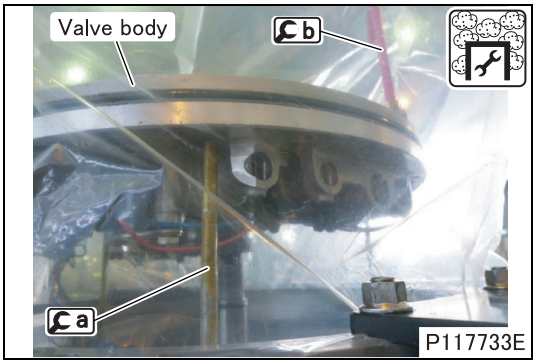
- Cut the plastic bag along the marker lines with a cutter knife to provide a working window.
- Reinforce both ends of the opening with plastic tape or equivalent.



- Remove the three bolts remaining on the valve body by hand, and then install a.
- Install b at the locations shown in the picture.
- Screw in the bolts by 2 to 3 threads at the locations marked with ☆ in the figure to prevent the valve body from coming off during the following removal procedure.



- When the valve body is lifted, the plastic bag will also be lifted with it; make some slack in the plastic bag in advance.
- Holding b over the plastic bag with your hands, lift the valve body straight up to remove it. At this time, hold the leading end of the drive pinion of the dual clutch in place to prevent the dual clutch from being removed with the valve body.
- After removing the valve body, remove the two bolts temporarily installed to prevent coming off of the valve body from the locations marked with ☆ in the previous figure.

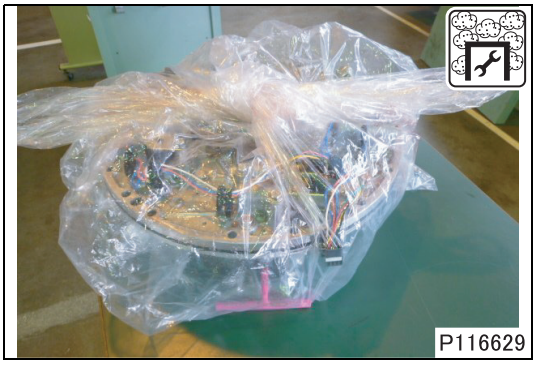


- Temporarily place the valve body on a and prepare a plastic bag. At this time, have the maintenance personnel support b, to prevent the valve body from falling.

CAUTION ⚠

- **Do not put your finger under the valve body.**

- Before removing the valve body from the plastic bag, put it in a new plastic bag inside the original plastic bag.



- To prevent dirt and dust from entering the removed valve body, securely close up the opening of the plastic bag.
- Face the vehicle forward side of the valve body downward and place the valve body, to which b is left attached, on the work bench.

■ **Removal: Dual clutch**

: This work requires protection against dust.

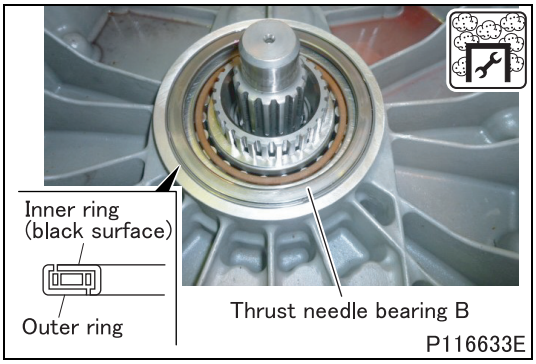
- Before removing the dual clutch, put it in a new plastic bag inside the original plastic bag.
- To prevent dirt and dust from entering the removed dual clutch, securely close up the opening of the plastic bag.

■ **Work after removal**

: This work requires protection against dust.

- Secure the bottom end of the plastic bag with a rubber band to prevent dirt and dust from entering the clutch housing through the opening of the plastic bag.

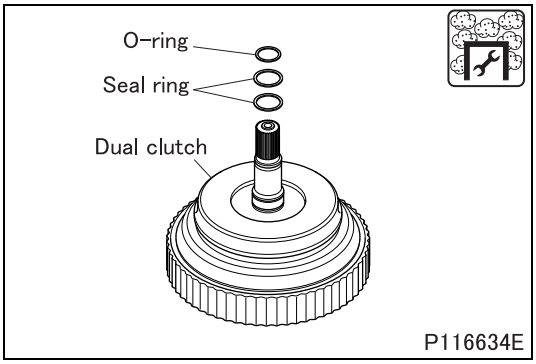
◆**Installation procedure**◆



■ **Installation: Bearing thrust washer and thrust needle bearing B**

: This work requires protection against dust.

- Apply automatic transmission fluid to the sliding surface of each component, and then install thrust needle bearing B so that its black surface is toward the front side of the vehicle.
- If the plastic bag is torn during servicing, replace it quickly.



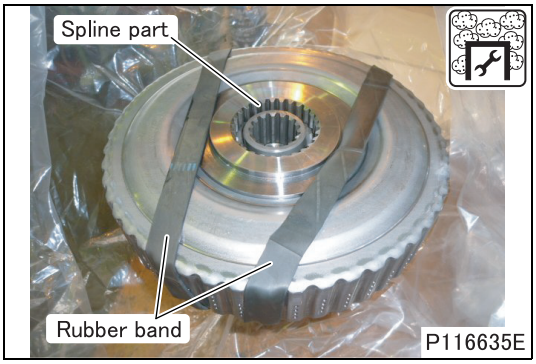
■ Installation: Seal rings and O-ring

: This work requires protection against dust.

- Apply automatic transmission fluid to the seal rings and O-ring, and then install them on the dual clutch.

CAUTION ⚠

- **Do not expand the seal ring excessively.**



■ Installation: Dual clutch

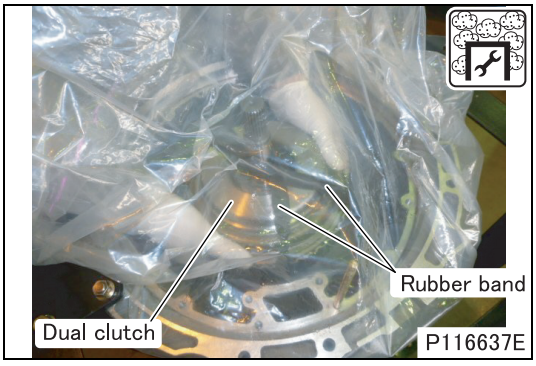
: This work requires protection against dust.

- Using parts cleaner, degrease and wash the dual clutch to remove automatic transmission fluid from the clutch.
- Install a rubber bands to prevent the dual clutch outer drum from slipping off. Make sure the rubber bands does not catch the spline of the dual clutch outer drum. (When reusing the dual clutch)
- Do not remove the outer drum slipping-off prevention belt attached to a new dual clutch. (When the dual clutch is replaced with a new one)

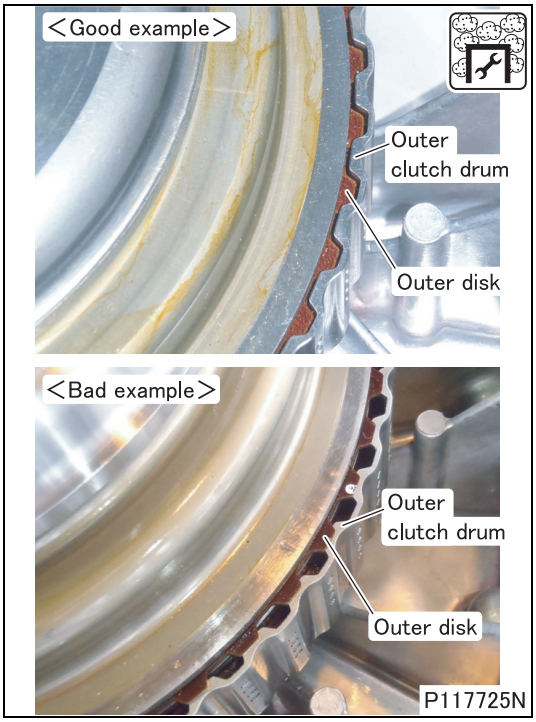
- Replace the plastic bag covering the dual clutch with a new plastic bag.

CAUTION ⚠

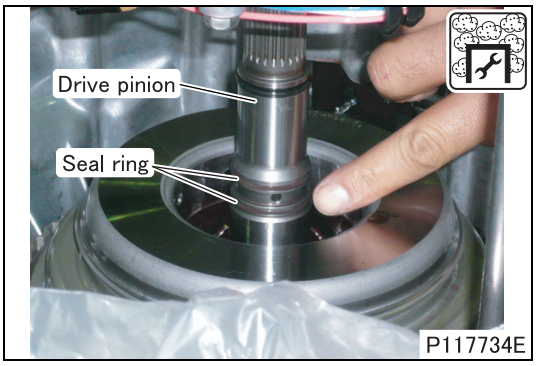
- **Replace the plastic bag immediately before installing the dual clutch on the clutch housing.**



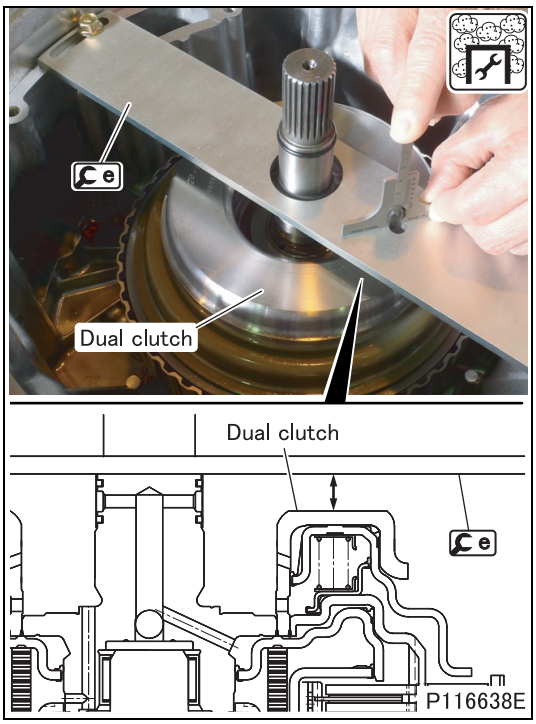
- When the dual clutch is completely inside the plastic bag covering the clutch housing, remove the plastic bag covering the dual clutch and install the dual clutch on the clutch housing.
- After the dual clutch has been installed, turn it clockwise and counterclockwise to make sure that the outer output and outer drive pinion, and the inner output splines and inner drive pinion, are in proper mesh with each other.
- After the check, remove the rubber bands or outer drum slipping-off prevention belt.



- Check that the outer disk does not come off the outer clutch drum.



- Check that the drive pinion of the dual clutch can be turned lightly by hand.
- Make sure that the seal rings are in place in the grooves of the drive pinion of the dual clutch. They should not be unevenly positioned relative to, or protrude from, the grooves.

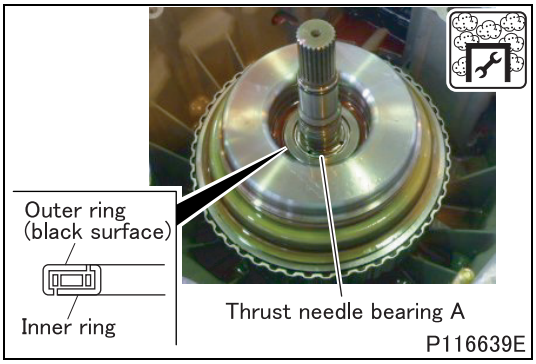


- Install e on the clutch housing.
- Measure the distance between the top surface of the dual clutch and the bottom surface of e. Take measurements at four locations by rotating e in 90° increments.
- If the measurement is deviated from the standard value, reinstall thrust needle bearing B and dual clutch.

CAUTION ⚠

- **If the valve body is installed with the measurement falling outside the standard value, thrust needle roller bearing B may be damaged. Be sure to start the installation procedure over if the standard value is not met.**

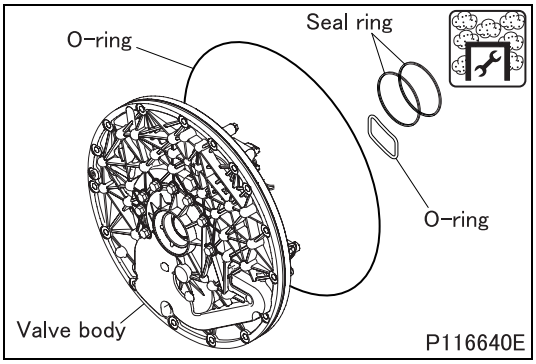
- If the measurement after reinstallation is still deviated from the standard value, replace defective parts.



■ Installation: Thrust needle bearing A

: This work requires protection against dust.

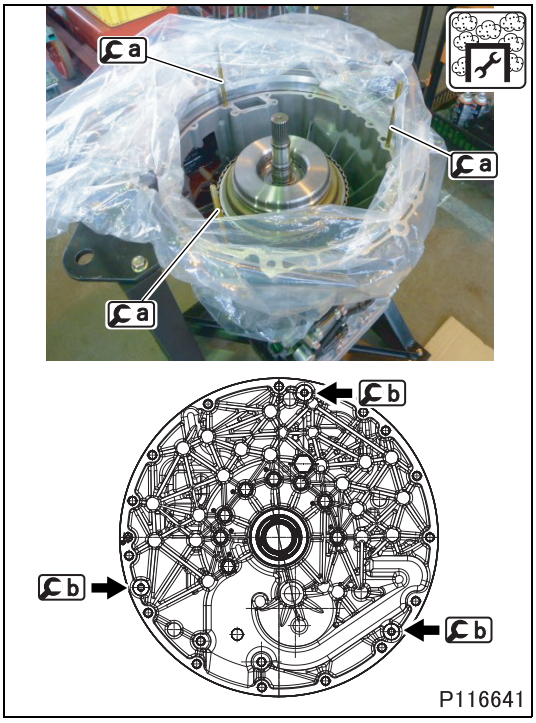
- Apply automatic transmission fluid to the sliding surfaces, and then install thrust needle bearing A so that its black surface is toward the front side of the vehicle.



■ Installation: Seal rings and O-ring

: This work requires protection against dust.

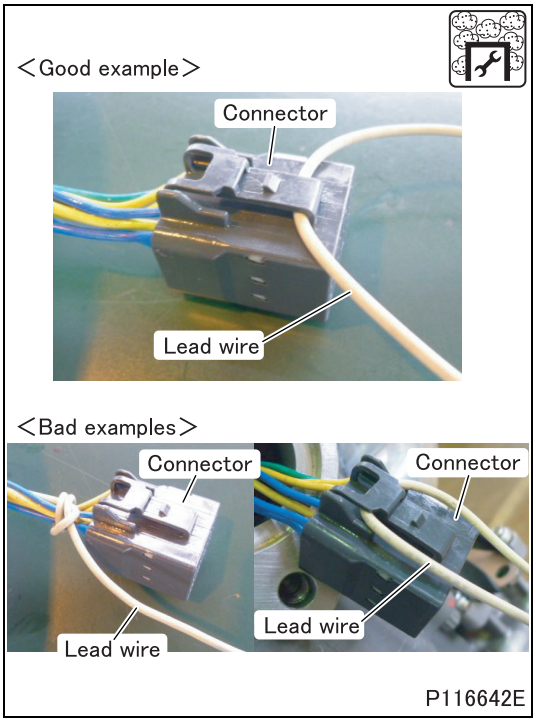
- Apply automatic transmission fluid to the seal rings and O-ring, and then install them on the valve body.



■ Installation: Valve body and bushing connector

: This work requires protection against dust.

- Install a on the clutch housing at the locations shown in the picture.
- Install b on the valve body at the locations shown in the drawing.



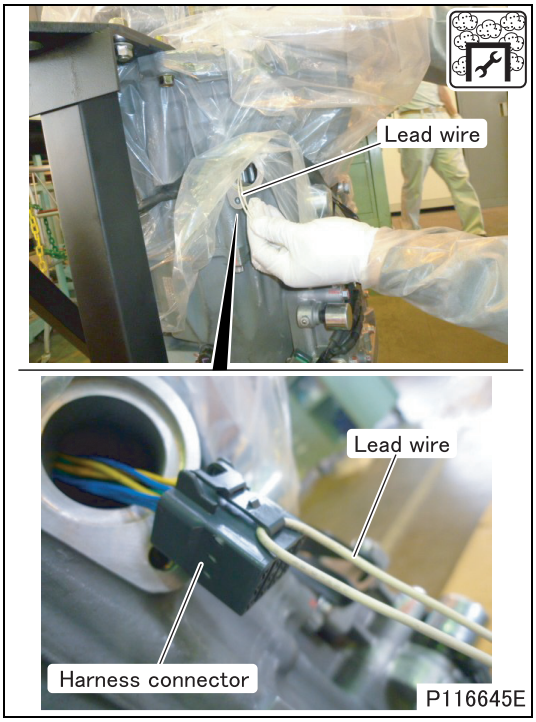
- Install the lead wire harness on the harness connector on the valve body as shown in the picture.

- Replace the plastic bag covering the valve body with a new plastic bag.
- Clean the mating surfaces of the valve body and clutch housing.

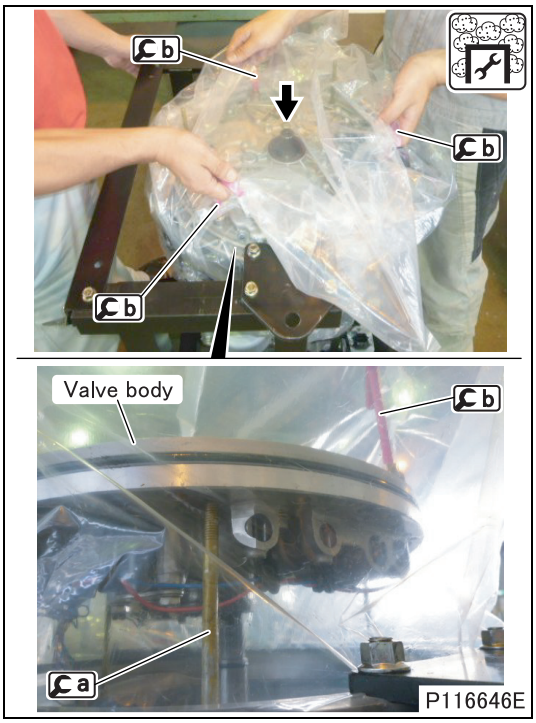
CAUTION ⚠

- **Replace the plastic bag and clean the mating surfaces immediately before installing the valve body on the clutch housing.**

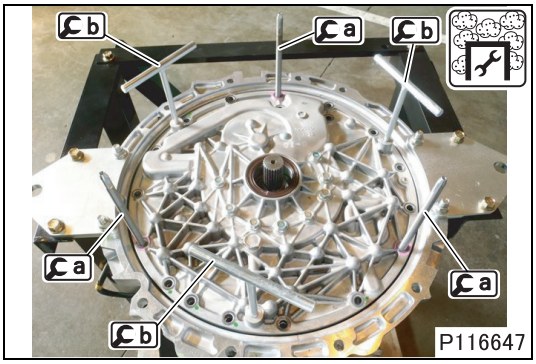
- When the valve body is completely inside the plastic bag covering the clutch housing, remove the plastic bag covering the valve body.



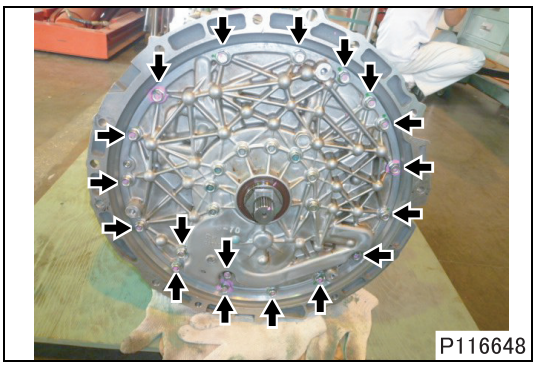
- Pull the lead wire installed on the harness connector on the valve body out of the hole in the bushing connector mount on the clutch housing.
- Apply the automatic transmission fluid to the O-ring and install it to the bushing connector.
- Remove the lead wire, and then install the bushing connector to the harness connector on the valve body and clutch housing.



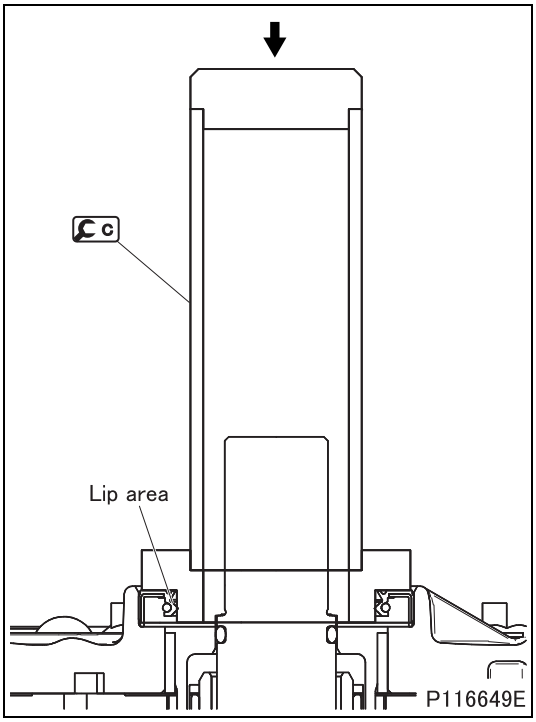
- Install the valve body on the clutch housing.
- Check that the valve body is entirely inside the clutch housing.
- Check that the drive pinion of the dual clutch can be turned by hand.



- Remove a, and then temporarily tighten the valve body mounting bolts by hand.
- Remove b.



- Remove the plastic bag covering the clutch housing.
- Install the valve body mounting bolts.



■ **Installation: Oil seal**

- Apply automatic transmission fluid to the lip area of the oil seal, and then install the oil seal in the illustrated direction using C.

■ **Installation: Pump driver**

- Install the pump driver as follows:

[Heating]

- Heat the pump driver evenly to 110°C {230°F} using one of the following methods.

CAUTION ⚠

- **If the pump driver is too hot, it may cause damage to the oil seal; do not heat the pump driver to higher than 110°C {230°F}.**

<Temperature-controlled chamber>

- Heat the pump driver with a temperature setting of 110°C {230°F} for more than 30 minutes.

<Ring heater>

- Repeat a heating process two to three times with a temperature setting of 110°C {230°F} so that the entire pump driver is evenly heated to 110°C {230°F}.

CAUTION ⚠

- **Repeat the heating process two to three times because sufficient thermal expansion of the pump driver cannot be achieved in a single heating process.**

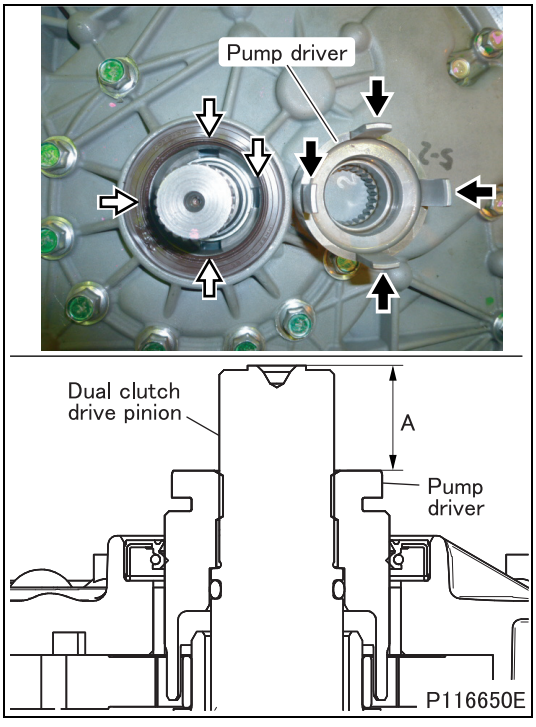
<Oil bath>

- Heat automatic transmission fluid to 110°C {230°F} and immerse the pump driver in the oil bath so that its mating part will be submerged entirely in the fluid.

CAUTION ⚠

- **Be sure to use automatic transmission fluid when heating the pump driver in an oil bath.**
- **Be sure to put the pump driver in the oil bath with its protrusions facing up. If the protrusions are facing down, their edges will make direct contact with the heat source, thus heating the pump driver to higher than 110°C {230°F}.**

- Since the automatic transmission fluid temperature drops when the pump driver is immersed in the oil bath, reheat the fluid to 110°C {230°F} and keep the pump driver immersed in the oil bath for more than 20 minutes while maintaining the fluid temperature at 110°C {230°F}.



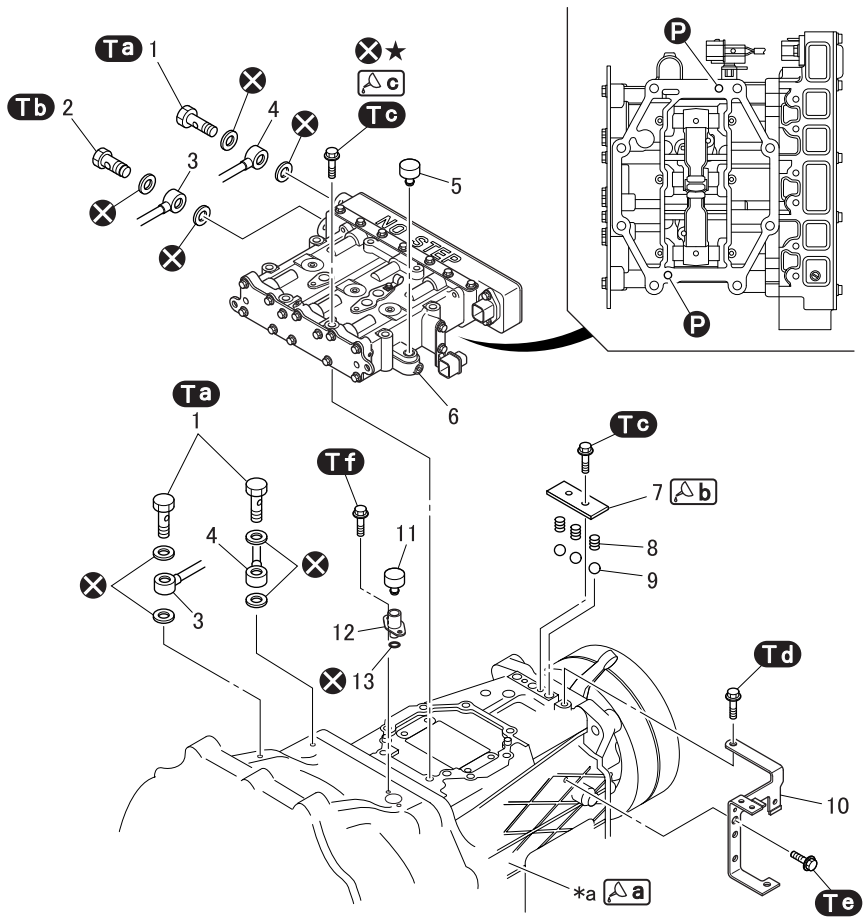
[Installation]

- If the pump driver is heated in an oil bath, wipe ATF completely.
- Install the pump driver by aligning the four protrusions with the valve body.

WARNING ⚠

- **Take care not to burn yourself when installing the hot pump driver.**

- If the pump driver is cool, reheat it before installation.
- After installation, check that distance A shown in the drawing is the following value:
  A: 23.45 ± 0.7 mm {0.92 ± 0.028 in.}



The bolts with ★ mark are non−reusable because they are coated with locking compound.
However, they can be reused if sealant is applied to the thread part of the bolts before reinstallation.

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Mating surface of gear shift unit and transmission case	ThreeBond 1194 or ThreeBond 1215 or ThreeBond 1216 or Loctite 5999	As required
b	Mating surface of poppet spring plate and transmission case	ThreeBond 1215	As required
c	Thread area of bolt (only when reusing the bolts)	Scotch-Grip 2353 (3M™)	As required

◆Removal procedure◆

■ Removal: Gear shift unit oil pipe and gear shift unit exhaust oil pipe

- Store the removed oil pipes in a plastic bag to prevent dirt and dust from entering the pipes.

◆Inspection procedure◆

■ Inspection: Eyebolt with oil filter

- Check the eyebolt with oil filter for contamination by foreign objects.
- If contaminated by foreign objects, replace the eyebolt with oil filter with a new one.

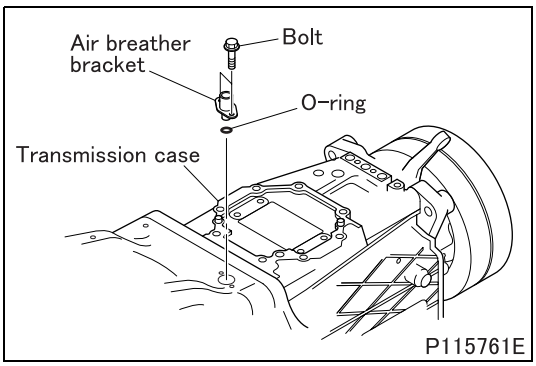
CAUTION ⚠

- **If the oil filter is contaminated by foreign objects, do not reuse the eyebolt by cleaning the filter.**

■ Inspection: Poppet spring

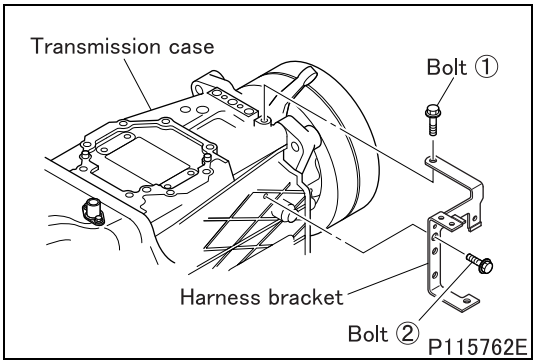
- Measure the installed load at the installed length of the poppet spring.
- If the measurement is below the limit, replace the poppet spring.

◆Installation procedure◆



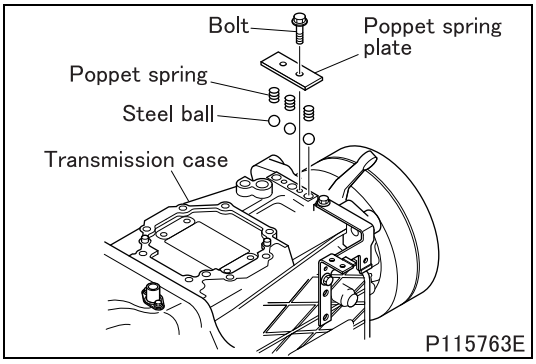
■ **Installation: Air breather bracket**

- Install the air breather bracket on the transmission case.



■ **Installation: Harness bracket**

- Install the harness bracket on the transmission case.

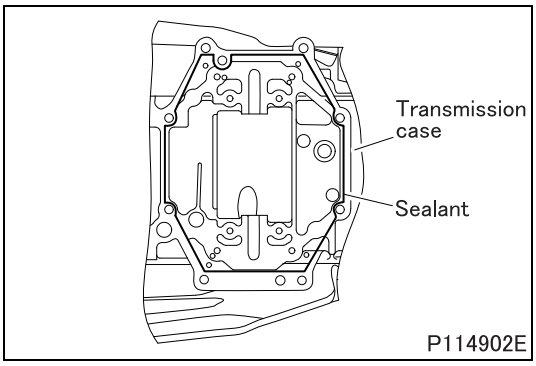


■ **Installation: Poppet spring plate**

- Apply sealant to the mating surfaces of the poppet spring plate and transmission case, and then install the poppet spring plate on the transmission case.

CAUTION ⚠

- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**



■ **Installation: Gear shift unit**

[Applying sealant]

- Apply sealant onto the transmission case, following manners shown below.
- If the mounting bolts are to be reused, apply sealant to their threads.

CAUTION ⚠

- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**
- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

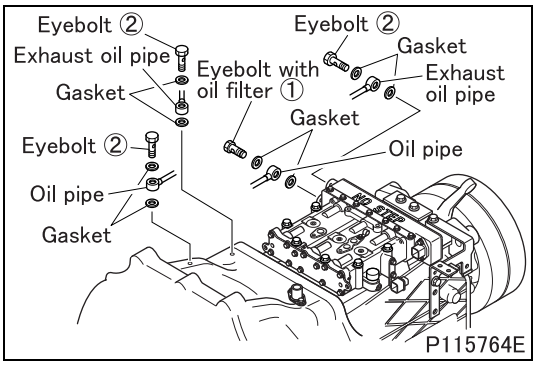
- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

[Installation]

- After applying the sealant, install the gear shift unit before the sealant dries. Be sure not to allow the sealant to be displaced.
- Do not start the engine within one hour after installing the gear shifter upper.
- When loosening or removing gear shift unit mounting bolts, be sure to reapply the sealant.



■ Installation: Oil pipe and exhaust oil pipe

- Install the oil pipes and exhaust oil pipes on the transmission case and gear shift unit using the eyebolt with oil filter and eyebolts.

CAUTION ⚠

- **Be careful not to install the eyebolt with oil filter in a wrong place.**

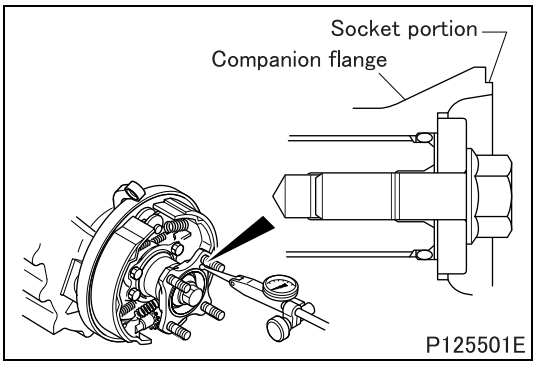
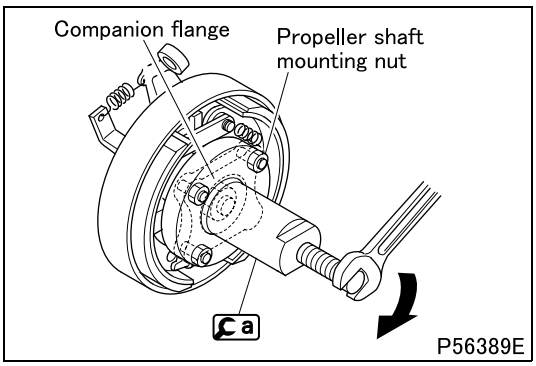
◆Removal procedure◆



P125501E

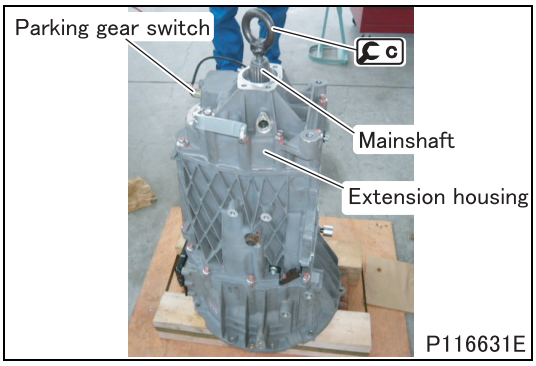
■ **Inspection: Runout at socket portion of companion flange**

- After removing the parking brake drum, measure the runout at the socket portion of the companion flange.
- If the measurement exceeds the limit, replace the companion flange.



P56389E

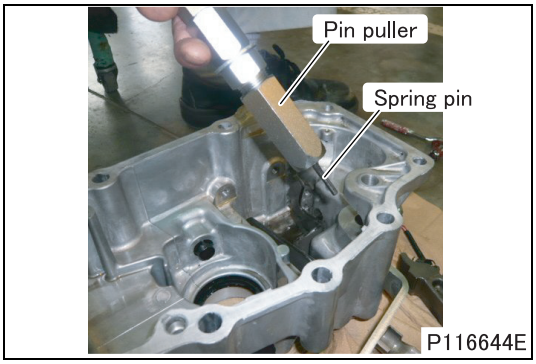
■ **Removal: Companion flange**



P116631E

■ **Removal: Parking gear switch and extension housing**

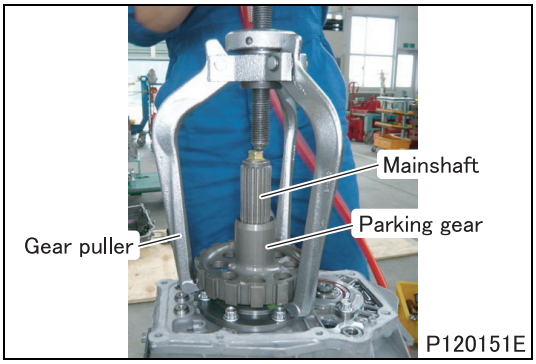
- Install C on the mainshaft. Lift the mainshaft and set it in the vertical orientation with the clutch housing facing down.
- Remove the parking gear switch.
- Remove the extension housing.



P116644E

■ **Removal: Spring pin**

- Use a commercially available pin puller and sliding hammer to remove the parking shift lever spring pin.



■ **Removal: Parking gear**

- Remove the parking gear.
- When the parking gear is fitted so tight, use a commercially available gear puller or the like to remove it.

◆Inspection procedure◆

■ **Inspection: Parking sprag spring**

- Measure the installed load at the installed length of the parking sprag spring.
- If the measurement is below the limit, replace the parking sprag spring.

◆Installation procedure◆

■ **Installation: Parking gear**

- Install the parking gear as follows.

[Heating]

- Heat the parking gear evenly to 150°C {302°F} using one of the following methods.

<Temperature-controlled chamber>

- Heat the parking gear with a temperature setting of 150°C {302°F} for more than 30 minutes.

<Ring heater>

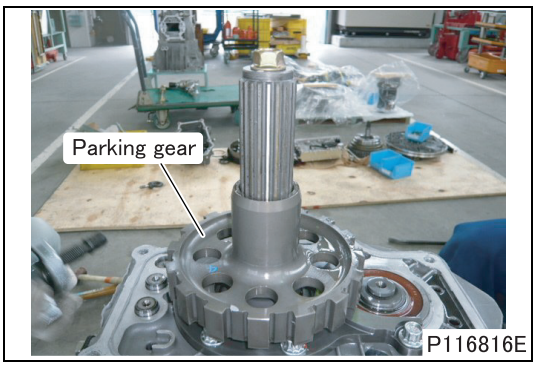
- Repeat a heating process two to three times with a temperature setting of 150°C {302°F} so that the entire parking gear is evenly heated to 150°C {302°F}.

CAUTION ⚠

- **Repeat the heating process two to three times because sufficient thermal expansion of the parking gear cannot be achieved in a single heating process.**

<Oil bath>

- Heat automatic transmission fluid to 150°C {302°F} and immerse the parking gear in the oil bath so that its mating part will be submerged entirely in the oil.
- Since the automatic transmission fluid temperature drops when the parking gear is immersed in the oil bath, reheat the fluid to 150°C {302°F} and keep the parking gear immersed in the oil bath for more than 20 minutes while maintaining the fluid temperature at 150°C {302°F}.

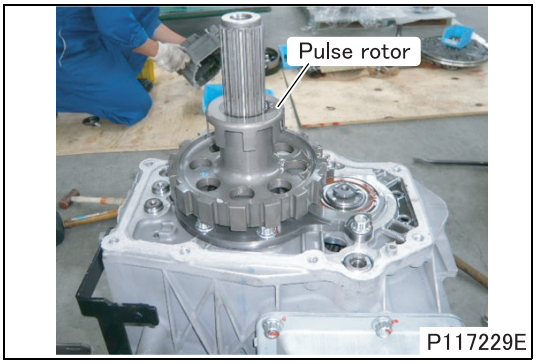


[Installation]

- Install the parking gear.

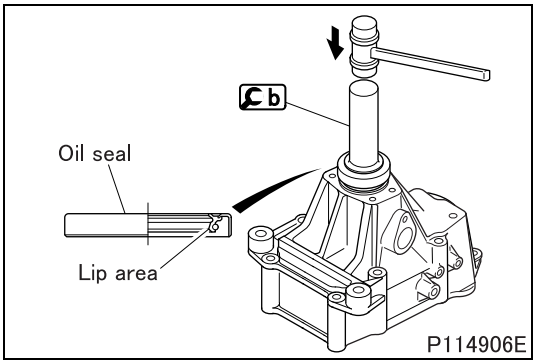
WARNING ⚠

- **Take care not to burn yourself when installing the hot parking gear.**



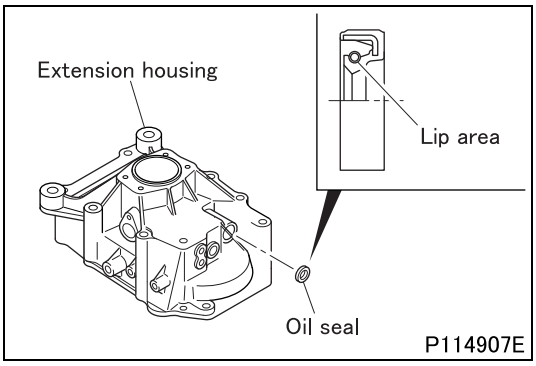
■ Installation: Pulse rotor

- Install the pulse rotor in the illustrated orientation.



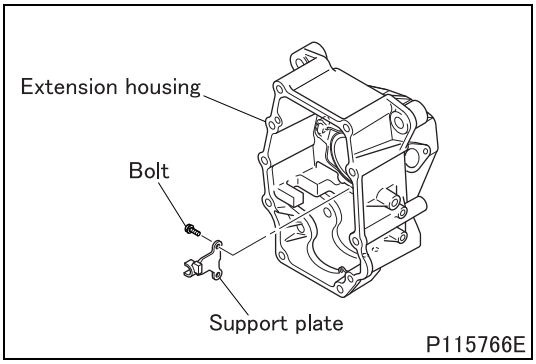
■ Installation: Oil seal

- Apply grease to the lip area of the oil seal.
- Install the oil seal in the extension housing in the illustrated direction using c.



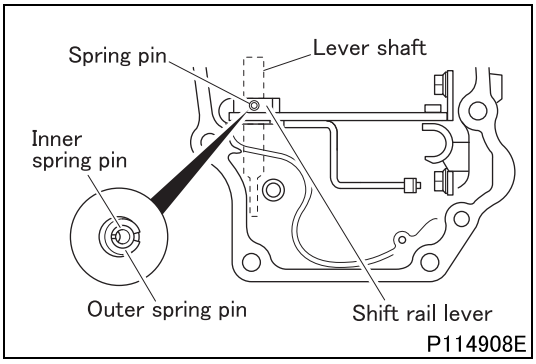
■ Installation: Oil seal

- Apply grease to the lip area of the oil seal
- Install the oil seal in the extension housing in the illustrated direction using a round bar with an outer diameter of 24 mm {0.94 in.}.



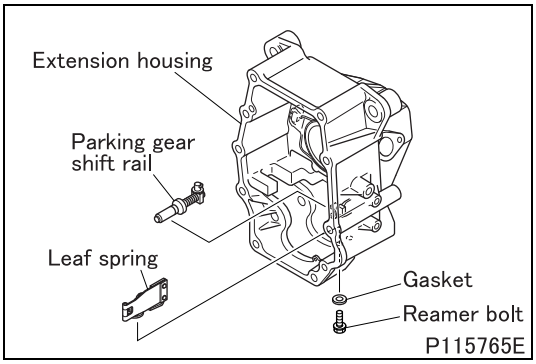
■ **Installation: Support plate**

- Install the support plate on the extension housing.



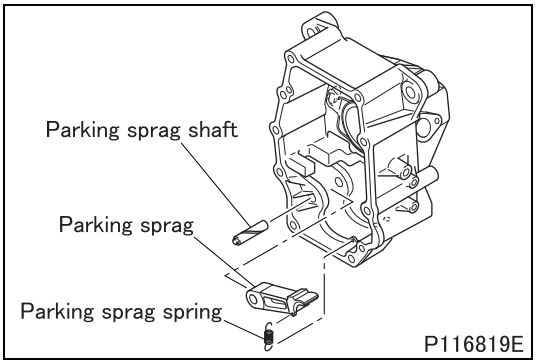
■ **Installation: Shift rail lever, lever shaft and spring pin**

- Install the shift rail lever and lever shaft on the extension housing.
- The spring pin is of a double-pin type with inner and outer springs.
- Drive the spring pin until it touches the shift rail lever to prevent the lever shaft from slipping off.
- After installing the spring pin, check that the spring pin is protruded from the shift rail lever by the following amount.
  Protrusion: 14 ± 1.5 mm {0.55 ± 0.059 in.}



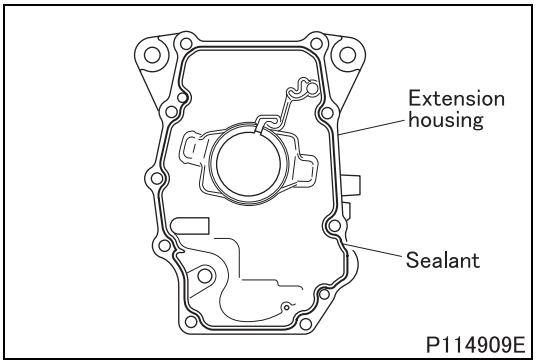
■ **Installation: Parking gear shift rail and leaf spring**

- Install the parking gear shift rail.
- Install the leaf spring on the extension housing using the reamer bolt.



■ **Installation: Parking sprag, parking sprag shaft and parking sprag spring**

- Install each part.



■ **Installation: Extension housing**

[Applying sealant]

- Apply sealant following manners shown below.

CAUTION ⚠

- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**
- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

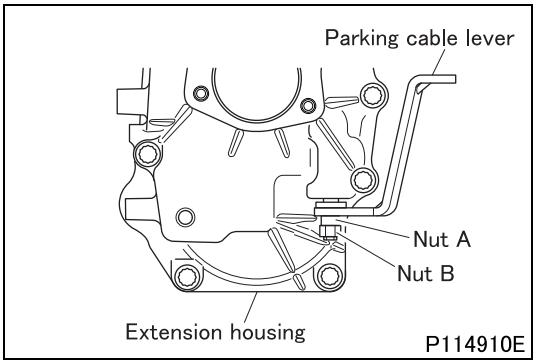
- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

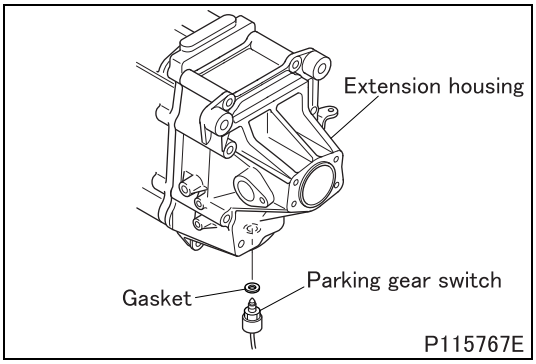
[Installation]

- After applying the sealant, install the extension housing before the sealant dries. Be sure not to allow the sealant to be displaced.
- Do not start the engine within one hour after installing the extension housing.
- When loosening or removing extension housing mounting bolts, be sure to reapply the sealant.



■ **Installation: Parking cable lever**

- Install the parking cable lever, and then tighten nut A.
- While holding nut A with a wrench or the like, tighten nut B.

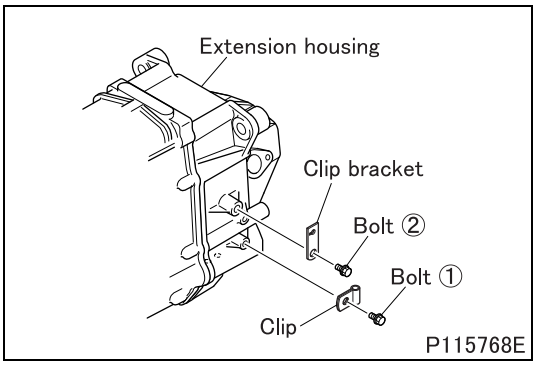


■ **Installation: Parking gear switch**

- Apply sealant to the threads of the parking gear switch, and then install the switch on the extension housing.

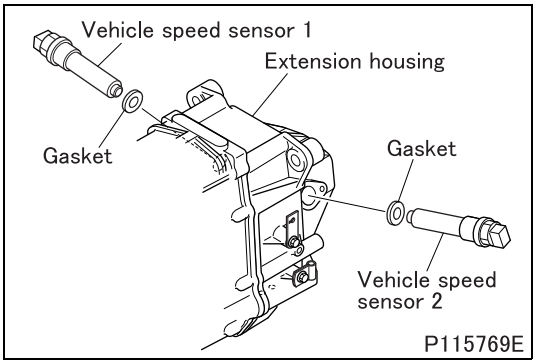
CAUTION ⚠

- **Remove any sealant remaining in the bolt hole before installation. Otherwise damage may result.**



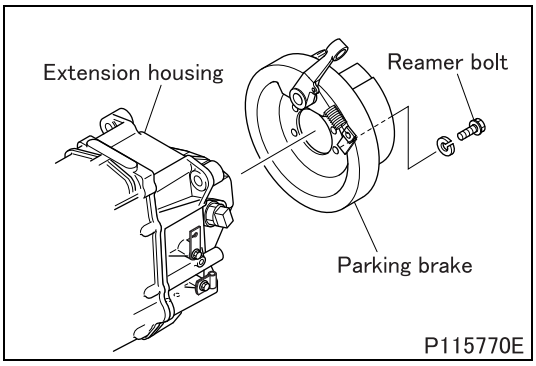
■ **Installation: Clip and clip bracket**

- Install the clip and clip bracket on the extension housing.



■ **Installation: Vehicle speed sensor**

- Install the vehicle speed sensor on the extension housing.



■ **Installation: Parking brake**

- Install the parking brake on the extension housing using the reamer bolt.

■ **Installation: Companion flange**

- Install the companion flange as follows.

[Heating]

- Heat the companion flange evenly to 140°C {284°F} using one of the following methods.

<Temperature-controlled chamber>

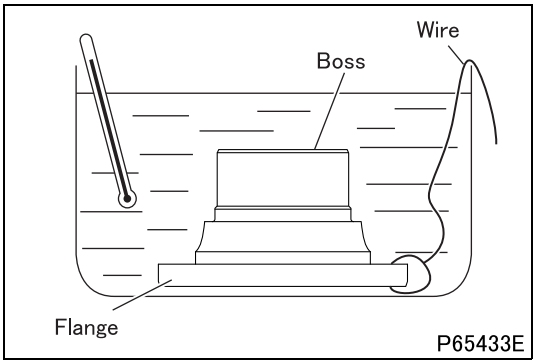
- Heat the companion flange with a temperature setting of 140°C {284°F} for more than 30 minutes.

<Ring heater>

- Repeat a heating process two to three times with a temperature setting of 140°C {284°F} so that the entire companion flange is evenly heated to 140°C {284°F}.
- Measure the temperature on the boss, not on the flange.

CAUTION ⚠

- **Repeat the heating process two to three times because sufficient thermal expansion of the companion flange cannot be achieved in a single heating process.**



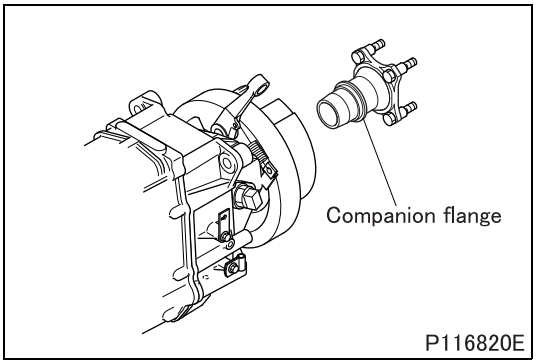
<Oil bath>

- Heat automatic transmission fluid to 140°C {284°F} and immerse the companion flange in the oil bath in the illustrated orientation.

CAUTION ⚠

- **Be sure to put the companion flange in the oil bath with its boss facing up. If the boss is facing down, its edge will make direct contact with the heat source, thus heating the companion flange to higher than 140°C {284°F}.**

- Since the automatic transmission fluid temperature drops when the companion flange is immersed in the oil bath, reheat the fluid to 140°C {284°F} and keep the companion flange immersed in the oil bath for more than 20 minutes while maintaining the fluid temperature at 140°C {284°F}.



[Installation]

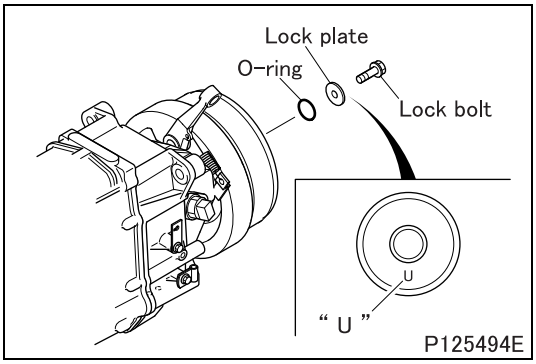
- Install the companion flange.

WARNING ⚠

- **Take care not to burn yourself when installing the hot companion flange**

CAUTION ⚠

- **If the companion flange is too hot, it may cause damage to the oil seal on the extension housing. Do not overheat the companion flange.**



■ Installation: O-ring, lock plate and lock bolt

- Apply grease to the O-ring and install it between the companion flange and mainshaft.
- Install the lock plate with the lock bolt facing the "U"-marked side of the lock plate toward the rear of the vehicle.

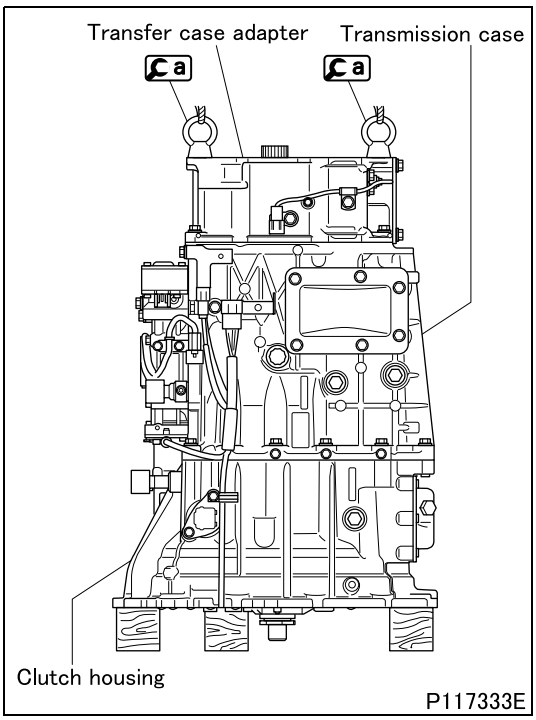
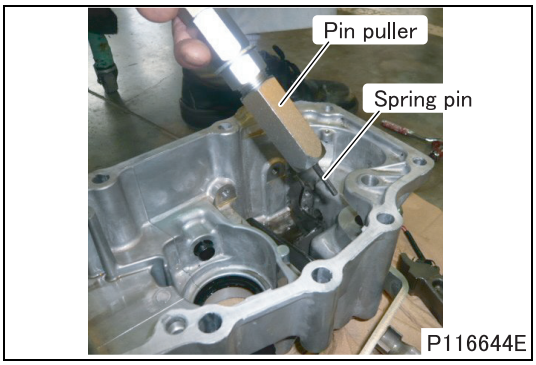
◆Removal procedure◆



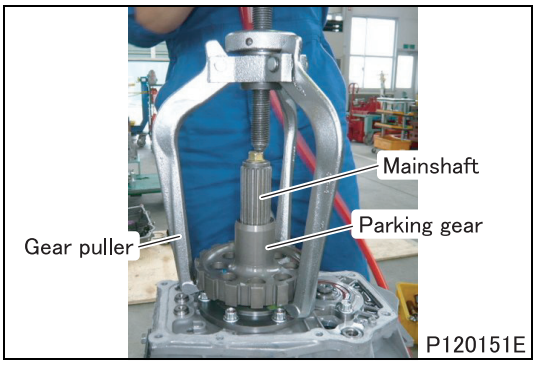
■ Removal: Parking gear switch and transfer case adapter

- Install [a] on the transfer case adapter. Lift the transmission using the transfer case adapter and set it in the vertical orientation with the clutch housing facing down.
- Remove the parking gear switch.
- Remove the transfer case adapter.



■ Removal: Spring pin

- Use a commercially available pin puller and sliding hammer to remove the parking shift lever spring pin.



■ Removal: Parking gear

- Remove the parking gear.
- When the parking gear is fitted so tight, use a commercially available gear puller or the like to remove it.

◆Inspection procedure◆

■ Inspection: Parking sprag spring

- Measure the installed load at the installed length of the parking sprag spring.
- If the measurement is below the limit, replace the parking sprag spring.

◆Installation procedure◆

■ Installation: Parking gear

- Install the parking gear as follows.

[Heating]

- Heat the parking gear evenly to 150°C {302°F} using one of the following methods.

<Temperature-controlled chamber>

- Heat the parking gear with a temperature setting of 150°C {302°F} for more than 30 minutes.

<Ring heater>

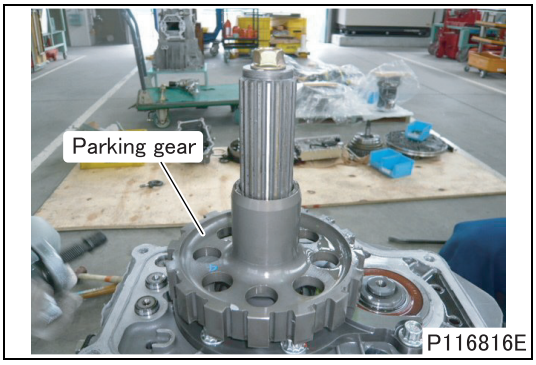
- Repeat a heating process two to three times with a temperature setting of 150°C {302°F} so that the entire parking gear is evenly heated to 150°C {302°F}.

CAUTION ⚠

- **Repeat the heating process two to three times because sufficient thermal expansion of the parking gear cannot be achieved in a single heating process.**

<Oil bath>

- Heat automatic transmission fluid to 150°C {302°F} and immerse the parking gear in the oil bath.
- Since the automatic transmission fluid temperature drops when the parking gear is immersed in the oil bath, reheat the fluid to 150°C {302°F} and keep the parking gear immersed in the oil bath for more than 20 minutes while maintaining the fluid temperature at 150°C {302°F}.

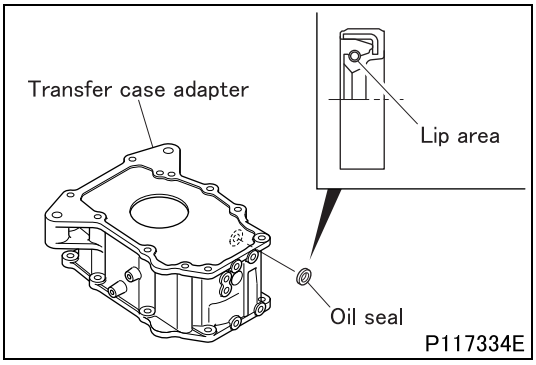


[Installation]

- Install the parking gear.

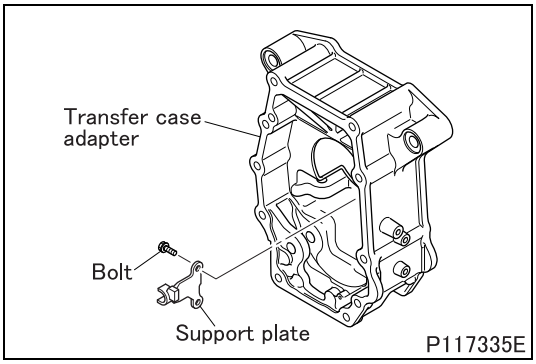
WARNING ⚠

- **Take care not to burn yourself when installing the hot parking gear.**



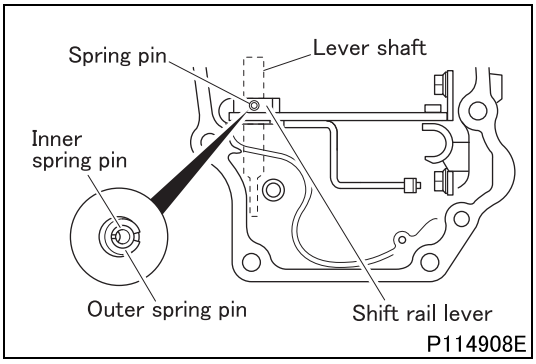
■ Installation: Oil seal

- Apply grease to the lip area of the oil seal.
- Install the oil seal in the transfer case adapter in the illustrated direction using a round bar with an outer diameter of 24 mm {0.94 in.}.



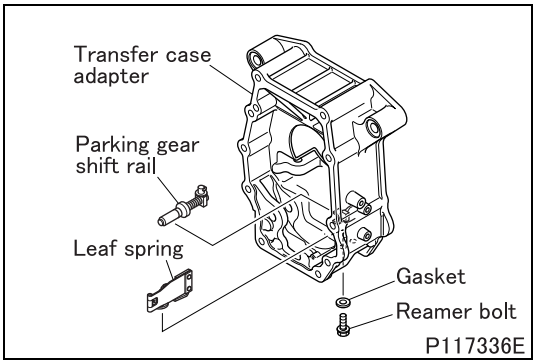
■ **Installation: Support plate**

- Install the support plate on the transfer case adapter.



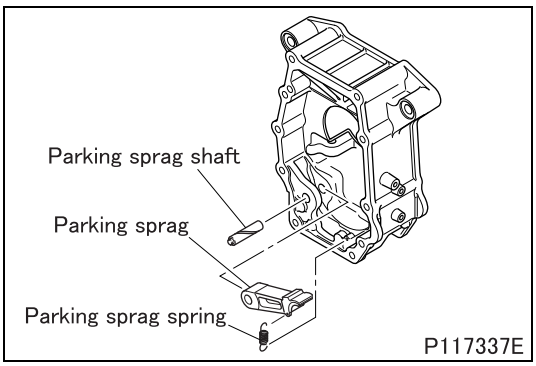
■ **Installation: Shift rail lever, lever shaft and spring pin**

- Install the shift rail lever and lever shaft on the transfer case adapter.
- The spring pin is of a double-pin type with inner and outer springs.
- Drive the spring pin until it touches the shift rail lever to prevent the lever shaft from slipping off.
- After installing the spring pin, check that the spring pin is protruded from the shift rail lever by the following amount.
  Protrusion: 14 ± 1.5 mm {0.55 ± 0.059 in.}



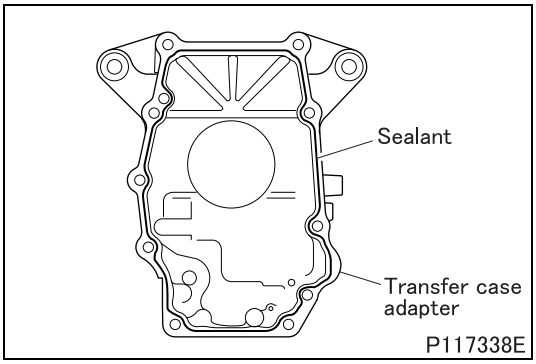
■ **Installation: Parking gear shift rail and leaf spring**

- Install the parking gear shift rail.
- Install the leaf spring on the transfer case adapter using the reamer bolt.



■ **Installation: Parking sprag, parking sprag shaft and parking sprag spring**

- Install each part.



■ **Installation: Transfer case adapter**

[Applying sealant]

- Apply sealant following manners shown below.

CAUTION ⚠

- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**
- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

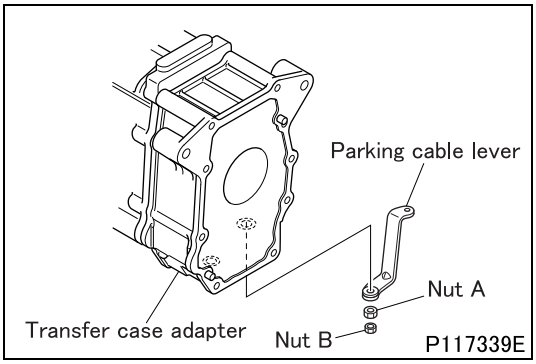
- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

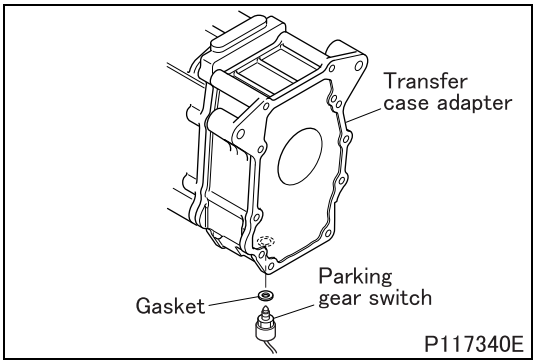
[Installation]

- After applying the sealant, install the transfer case adapter before the sealant dries. Be sure not to allow the sealant to be displaced.
- Do not start the engine within one hour after installing the transfer case adapter.
- When loosening or removing transfer case adapter mounting bolts, be sure to reapply the sealant.



■ **Installation: Parking cable lever**

- Install the parking cable lever, and then tighten nut A.
- While holding nut A with a wrench or the like, tighten nut B.

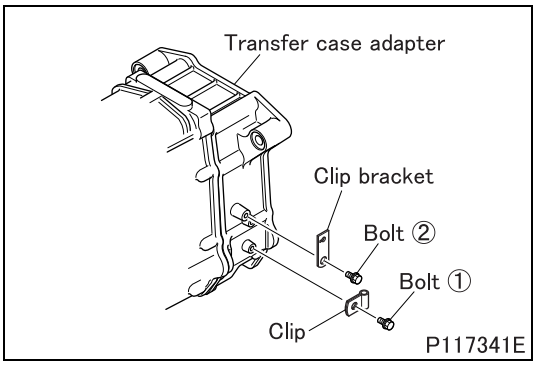


■ **Installation: Parking gear switch**

- Apply sealant to the threads of the parking gear switch, and then install the switch on the transfer case adapter.

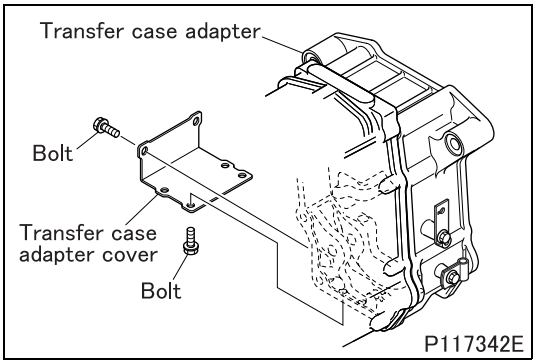
CAUTION ⚠

- **Remove any sealant remaining in the bolt hole before installation. Otherwise damage may result.**



■ **Installation: Clip and clip bracket**

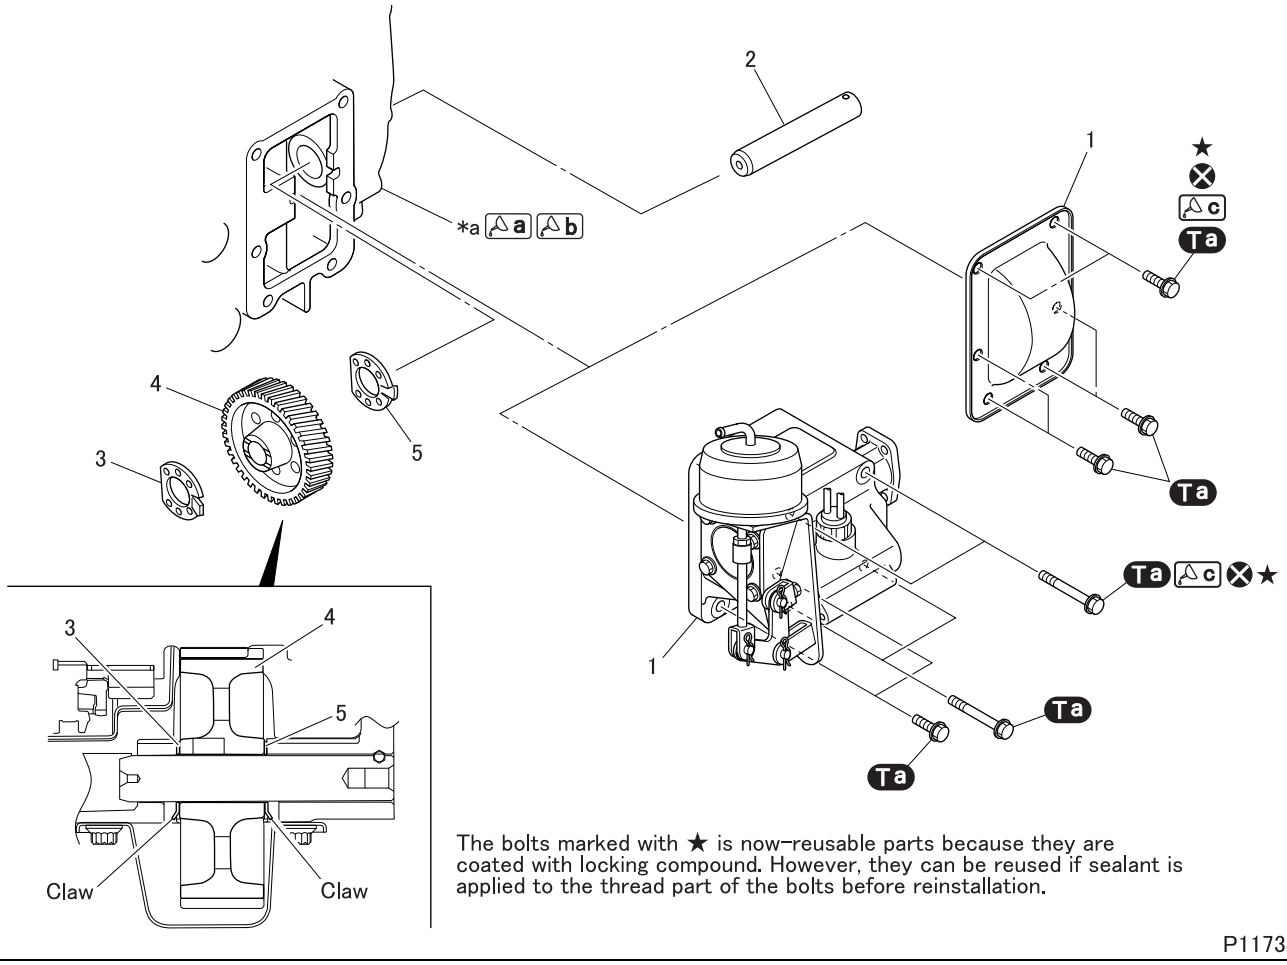
- Install the clip and clip bracket on the transfer case adapter.



■ **Installation: Transfer case adapter cover**

- Install the transfer case adapter cover on the transfer case adapter.

REVERSE IDLER GEAR <WITHOUT LARGE-CAPACITY POWER TAKE-OFF>



● Disassembly sequence

1 Power take-off cover <Without power take-off>
Transmission power take-off
<With power take-off> (See later section.)
2 Reverse idler gear shaft
3 Side washer
4 Reverse idler gear
5 Side washer

***a**: Transmission case
⊗: Non-reusable parts

● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Play in diameter direction of reverse idler gear	0.045 to 0.107 {0.0018 to 0.0042}	0.4 {0.016}	Replace
	End play of reverse idler gear	0.22 to 0.68 {0.0087 to 0.027}	1.0 {0.039}	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (power take-off cover or transmission power take-off mounting)	44.5 {33, 4.54}	–

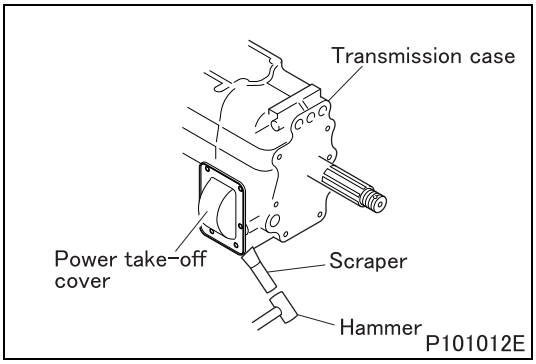
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Power take-off cover mounting surface of transmission case	Loctite 5999	As required
b	Transmission power take-off mounting surface of transmission case	ThreeBond 1215	As required
c	Thread area of bolt (only when reusing the bolts)	Scotch-Grip 2353 (3M™)	As required

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Reverse shaft puller A: M12 × 1.25  P56398	03726-82000	Removal of reverse idler gear shaft

◆Removal procedure◆



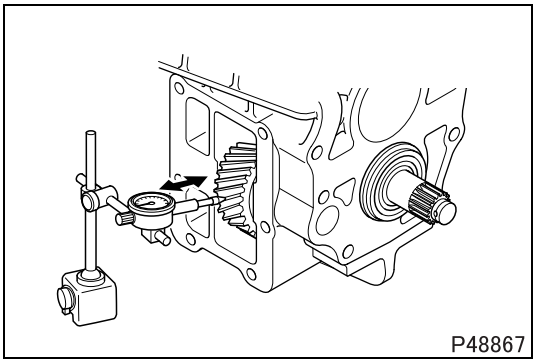
P101012E

■ **Removal: Power take-off cover**

- Insert a scraper from the lower right or lower left of the power take-off cover to remove the power take-off cover.

CAUTION ⚠

- **Beware that prying the scraper halfway could deform the power take-off cover or damage the transmission case.**

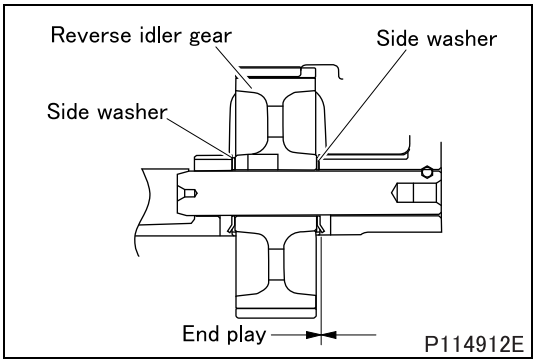


P48867

■ **Inspection: Reverse idler gear**

(1) Play in diameter direction

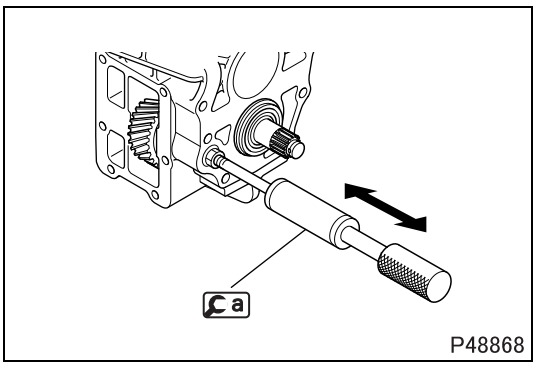
- After the power take-off cover or the transmission power take-off is removed, perform the following check. If the measurement exceeds the limit, replace defective parts.
- Check the play again after assembly and make sure it does not exceed the limit.



P114912E

(2) End play

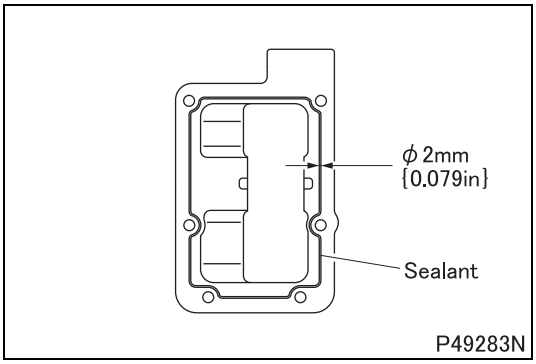
- Measure the end play using feeler gauge.



■ **Removal: Reverse idler gear shaft**

- Draw out the reverse idler gear shaft using a.

◆Installation procedure◆



■ **Installation: Power take-off cover or Transmission power take-off**

[Applying sealant]

- Apply sealant onto the transmission case, following manners shown below.

CAUTION ⚠

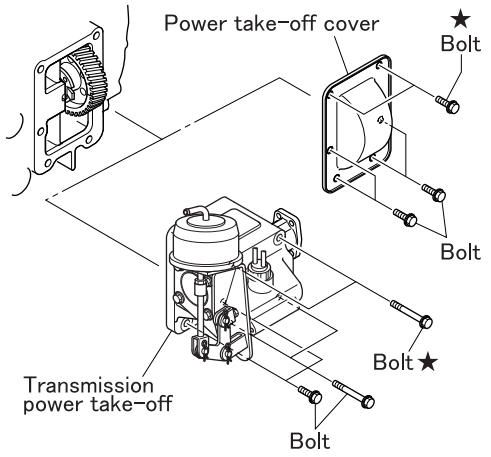
- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**
- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.



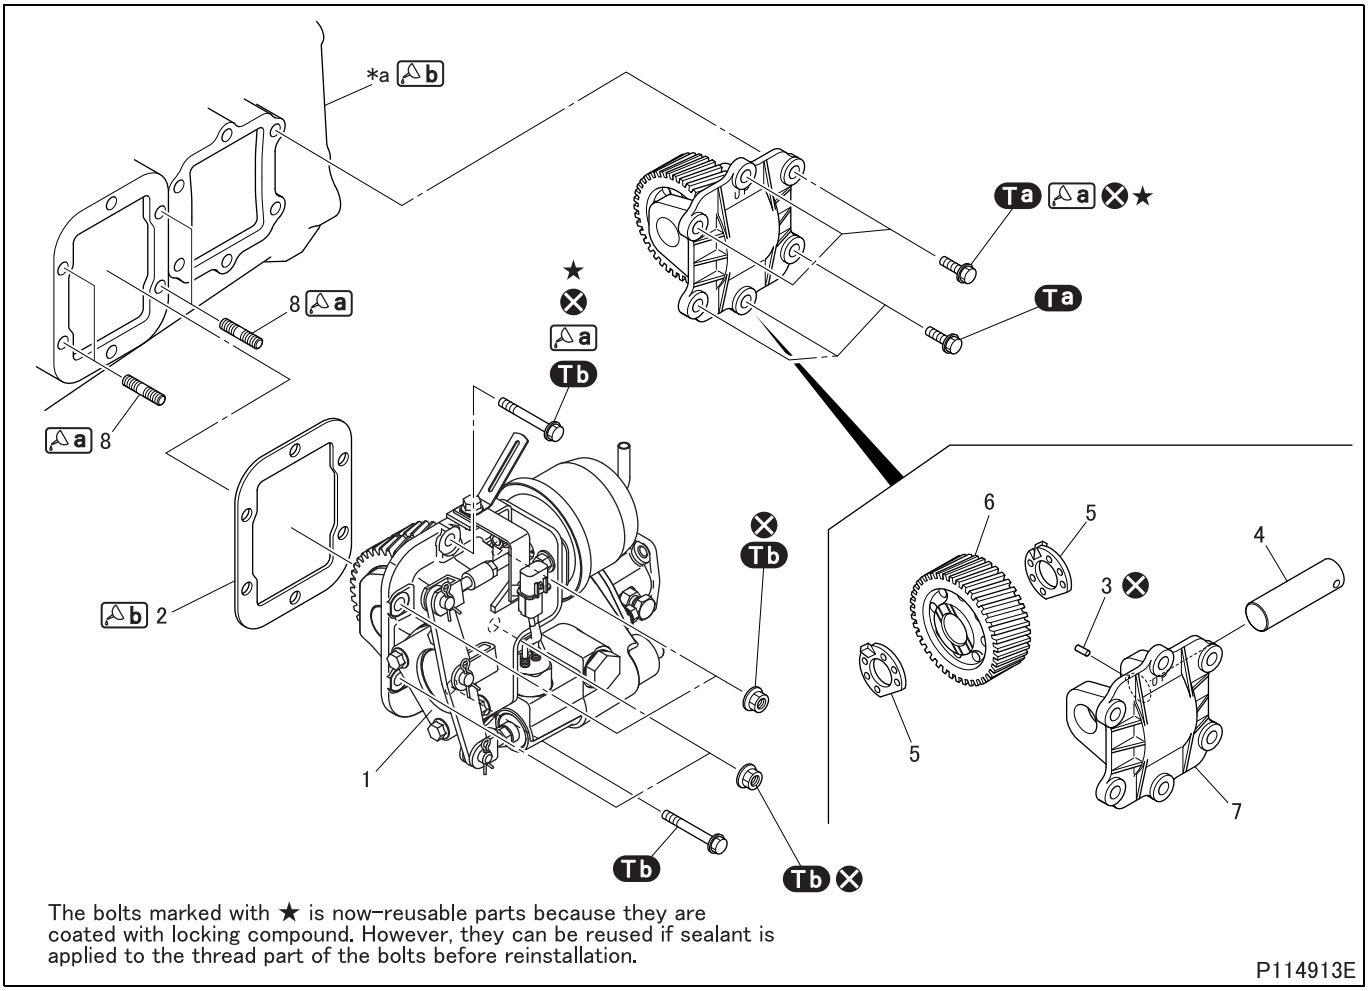
The bolts marked with ★ is now-reusable parts because they are coated with locking compound. However, they can be reused if sealant is applied to the thread part of the bolts before reinstallation.

P117344E

[Installation]

- Install the power take-off cover or transmission power take-off according the following manners after applying the sealant. Be sure not to allow the sealant to be displaced.
  Power take-off cover: Install in three minutes
  Transmission power take-off: Install before sealant dries
- Do not start the engine within one hour after installing the power take-off cover or transmission power take-off.
- When loosening or removing power take-off cover or transmission power take-off mounting bolts, be sure to reapply the sealant.
- If the bolts marked "★" are to be reused, apply sealant to their threads.

REVERSE IDLER GEAR <WITH LARGE-CAPACITY POWER TAKE-OFF>



● Disassembly sequence

1 Transmission power take-off (See later section.)
2 Adjusting gasket
3 Spring pin
4 Reverse idler gear shaft
5 Side washer
6 Reverse idler gear
7 Reverse idler gear cover
8 Stud bolt

***a**: Transmission case
⊗: Non-reusable parts

● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Play in diameter direction of reverse idler gear	0.045 to 0.107 {0.0018 to 0.0042}	0.4 {0.016}	Replace
	End play of reverse idler gear	0.22 to 0.68 {0.0087 to 0.027}	1.0 {0.039}	
1, *a	Backlash between power take-off idler gear of transmission power take-off and countershaft constant mesh gear 1 and 3rd gear of transmission	0.08 to 0.26 {0.0031 to 0.010}	–	Replace

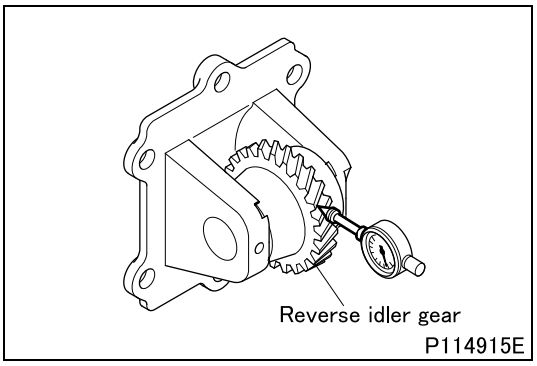
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (reverse idler gear cover mounting)	44.5 {33, 4.54}	–
Tb	Bolt (transmission power take-off mounting)	40.2 {30, 4.1}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Thread area of stud bolt Thread area of "★"-marked bolt (only when reusing the bolt)	Scotch-Grip 2353 (3M™)	As required
b	Transmission power take-off mounting surface of transmission case	ThreeBond 1215	As required
	Transmission power take-off mounting surface of adjusting gasket		

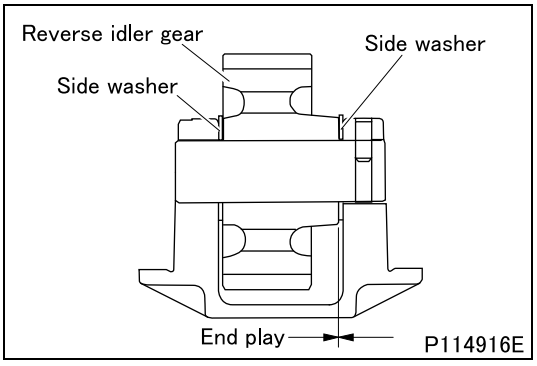
◆Removal procedure◆



■ **Inspection: Reverse idler gear**

(1) Play in diameter direction

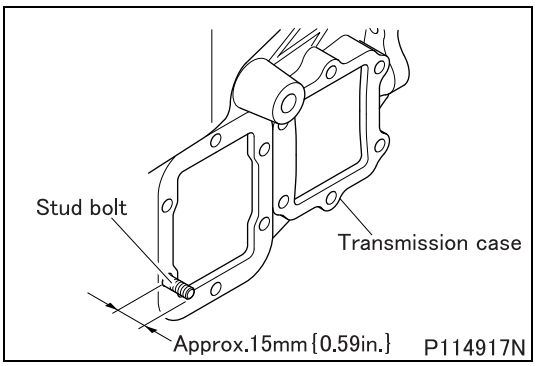
- After the reverse idler gear cover is removed, perform the following check. If the measurement exceeds the limit, replace defective parts.
- Check the play again after assembly and make sure it does not exceed the limit.



(2) End play

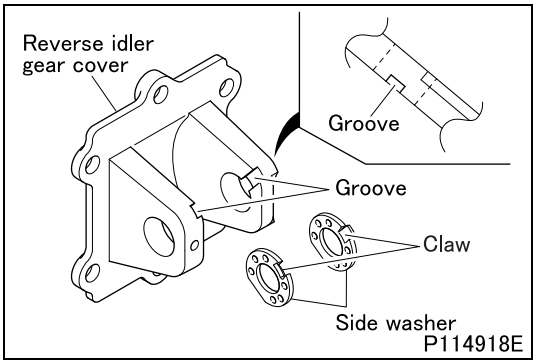
- Measure the end play using feeler gauge.

◆Installation procedure◆



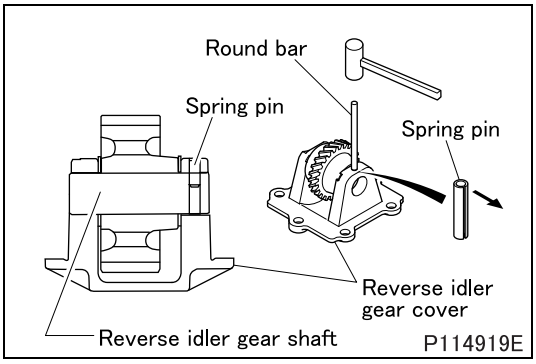
■ **Installation: Stud**

- Apply sealant to the threads of the stud where the transmission case is to be installed.
- Install the stud so that it protrudes from the transmission case by the amount shown in the drawing.



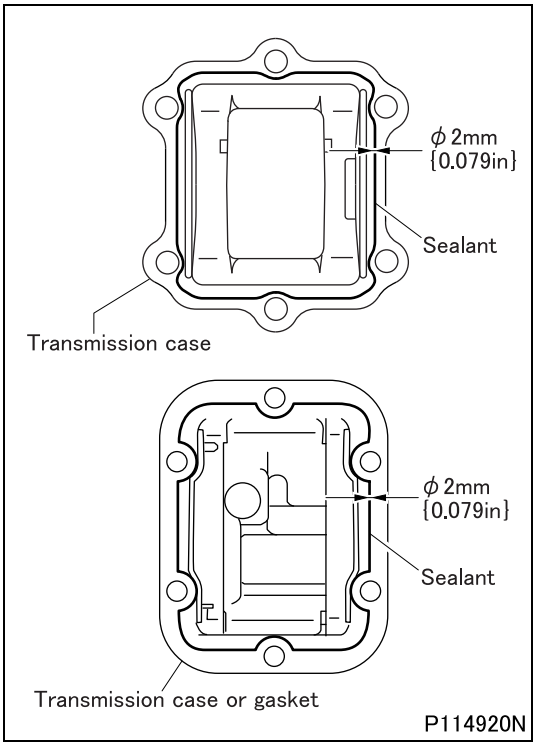
■ **Installation: Side washer**

- Install the side washers by aligning the tabs with the grooves in the reverse idler gear cover.



■ **Installation: Spring pin**

- Install the spring pin using a round bar with an outer diameter of 6 mm {0.24 in.} in the illustrated orientation.



■ **Installation: Reverse idler gear cover or Transmission power take-off**

[Applying sealant]

- Apply sealant onto the transmission case, following manners shown below.

CAUTION ⚠

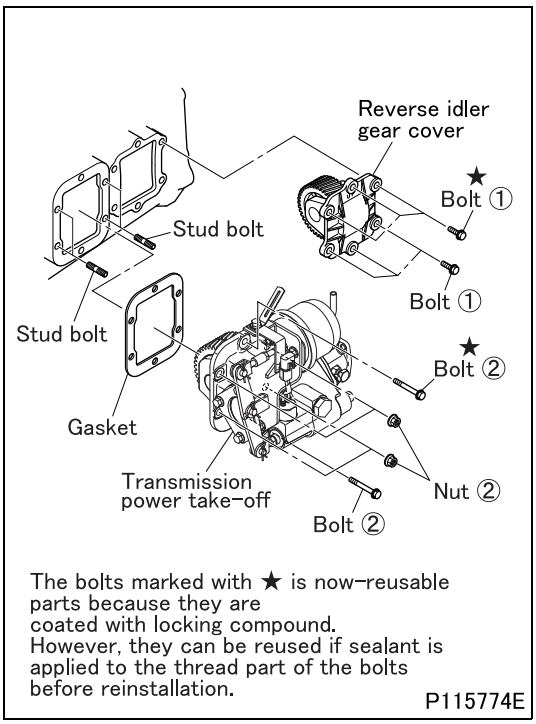
- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**
- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

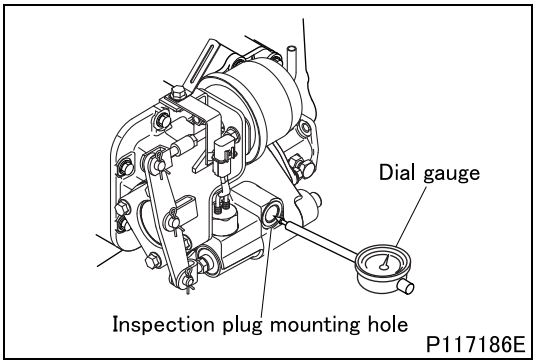
<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.



[Installation]

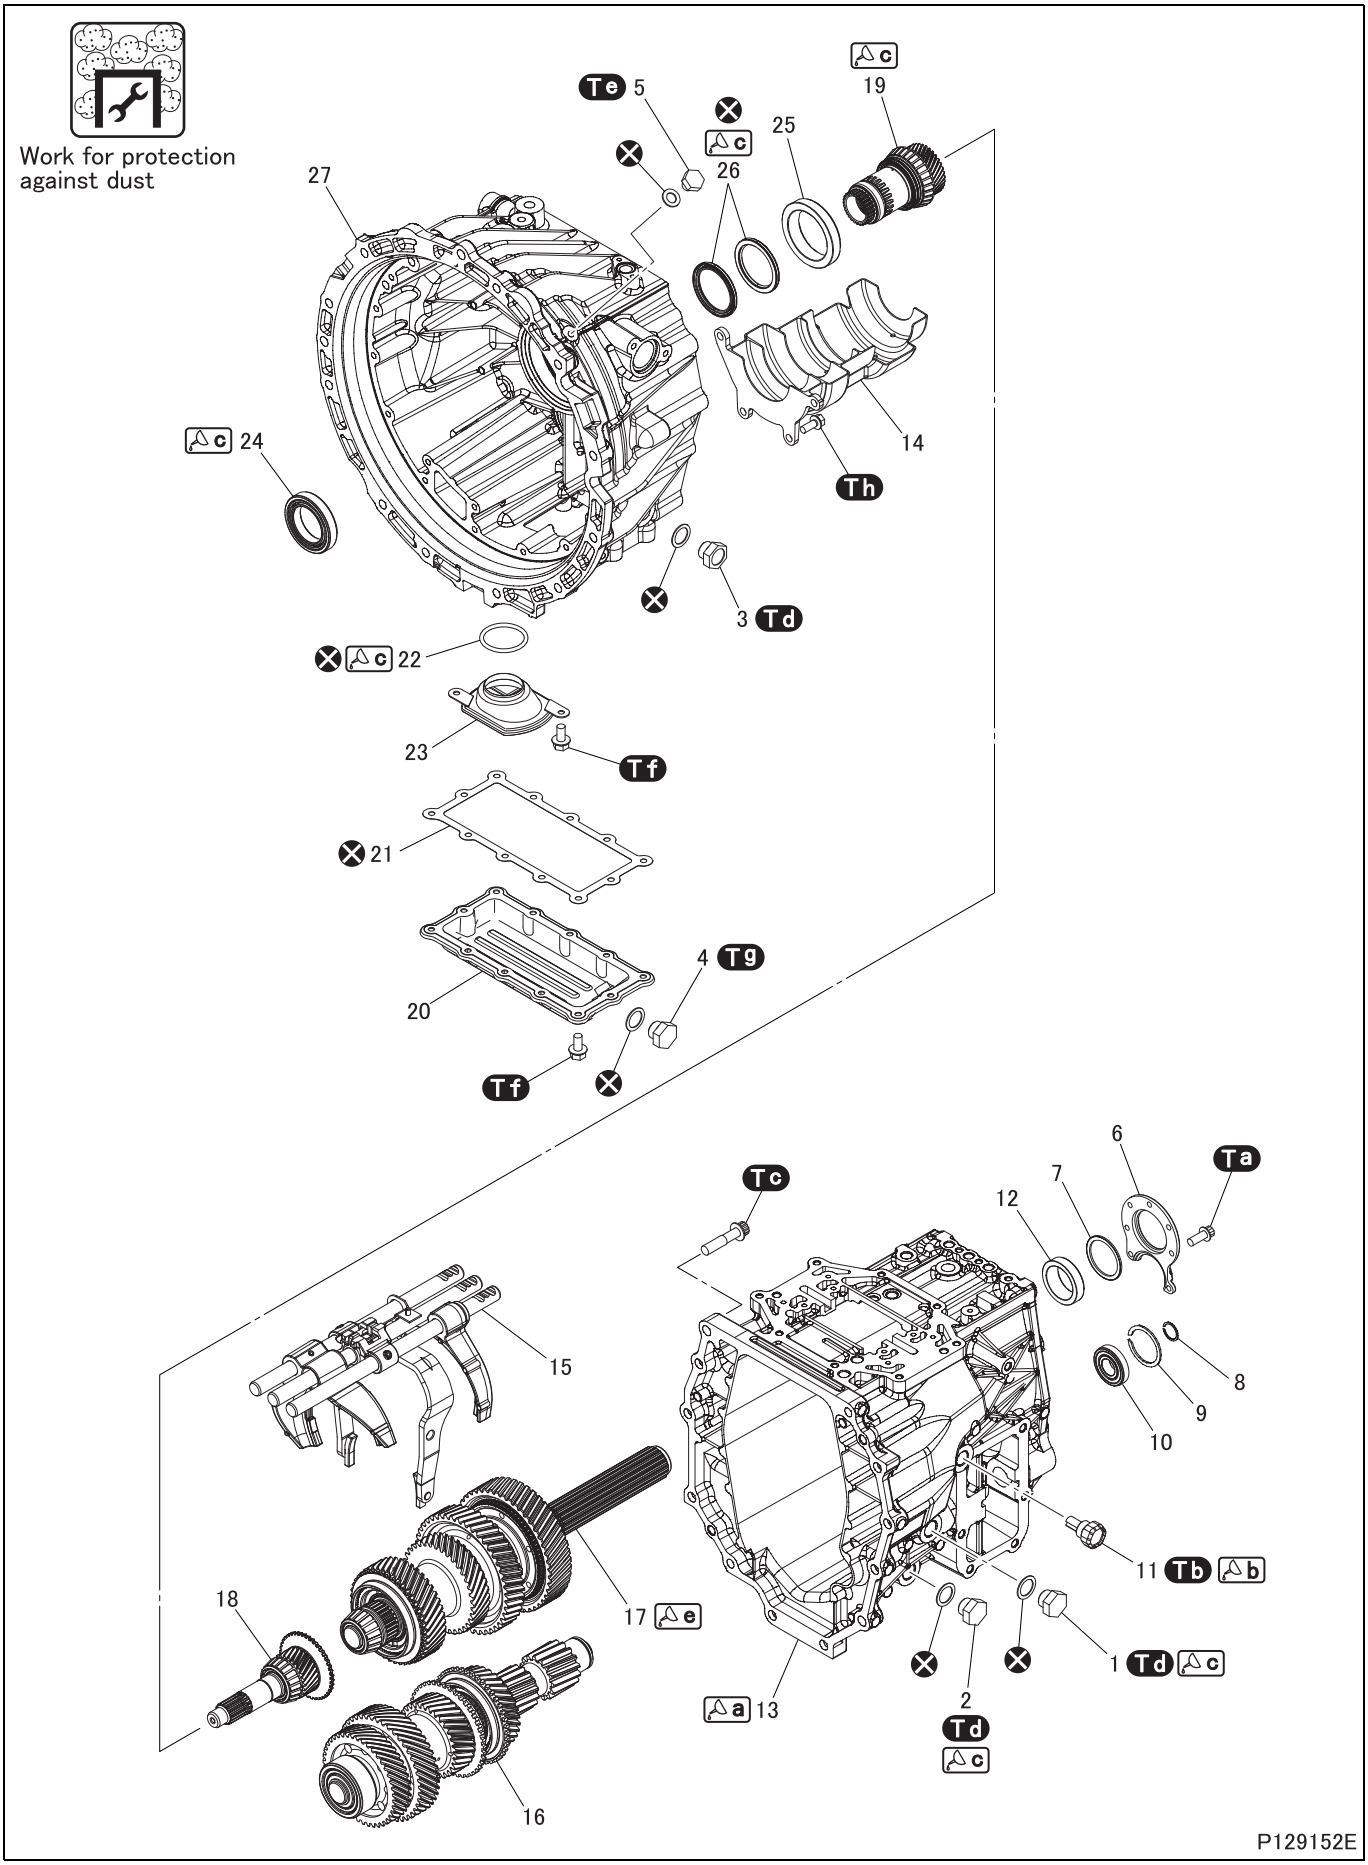
- Install the reverse idler gear cover or transmission power take-off according the following manners after applying the sealant. Be sure not to allow the sealant to be displaced.
  Reverse idler gear cover: Install in three minutes
  Transmission power take-off: Install before sealant dries
- Do not start the engine within one hour after installing the reverse idler gear cover or transmission power take-off.
- When loosening or removing reverse idler gear cover or transmission power take-off mounting bolts, be sure to reapply the sealant.
- If the bolts marked "■" are to be reused, apply sealant to their threads.



■ **Inspection: Backlash between power take-off idler gear of transmission power take-off and countershaft constant mesh 1st and 3rd gears of the transmission body**

- Engage transmission gears to hold the countershaft.
- Install any type of gasket.
  Gasket types: 0.13 ± 0.05, 0.25 ± 0.10 mm {0.0051 ± 0.0020, 0.0098 ± 0.0039 in.} (2 types)
- Insert a dial indicator through the inspection plug hole in the transmission power take-off and bring its tip into contact with the power take-off idler gear.
- Shift the power take-off to ON, and then measure the backlash by moving the power take-off output flange.
- If the measurement is deviated from the standard value, replace defective parts. (See later section.)

TRANSMISSION BODY



● Disassembly sequence

1 Transmission oil inspection plug
2 Transmission oil drain plug
3 Automatic transmission fluid inspection plug
4 Automatic transmission fluid drain plug
5 Plug
6 Rear bearing retainer
7 Shim
8 Snap ring
9 Snap ring
10 Countershaft rear bearing

22 O-ring
23 Oil filter
24 Outer drive pinion roller bearing outer race
25 Outer drive pinion taper bearing outer race
26 Oil seal
27 Clutch housing

Ⓟ: Locating pin
⊗: Non-reusable parts

- When disassembling the countershaft, drive pinion and mainshaft, first remove the valve body and dual clutch from the clutch housing. (See “VALVE BODY, DUAL CLUTCH”.)
- If the countershaft, drive pinion and mainshaft are not disassembled, the shift rail and shift fork can be removed and disassembled on its own with the valve body and dual clutch mounted on the clutch housing.

: This work requires protection against dust. (See Gr00.)

- It is desirable that the job to service portions related to the hydraulic circuit of the transmission (DUONIC®) be performed in an environment comparable to that of a meeting room partitioned from the outside air. If it is not feasible to prepare such an environment, take necessary steps to protect the clutch housing with a plastic bag for prevention of entry of sand and dust.
- Replace the plastic bag immediately when it is broken during servicing.
- Cover the clutch housing with a plastic bag as described above.

● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
17	Starting torque of mainshaft output side	1.5 N·m {1.1 ft.lbs, 0.15 kgf·m} or less	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks

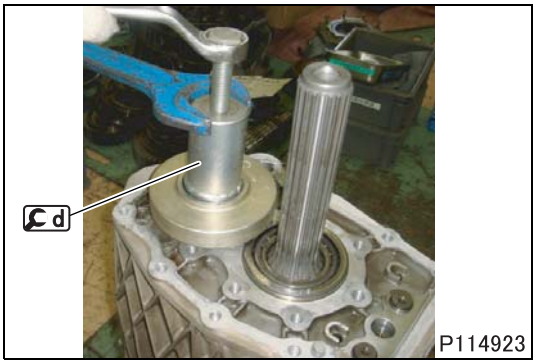
l	Bearing puller  P116040	MH064254	Removal of outer drive pinion taper bearing outer race

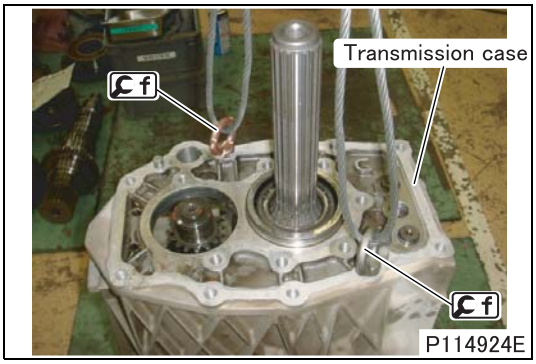
◆Removal procedure◆



P114923

■ **Removal: Snap ring and countershaft rear bearing**

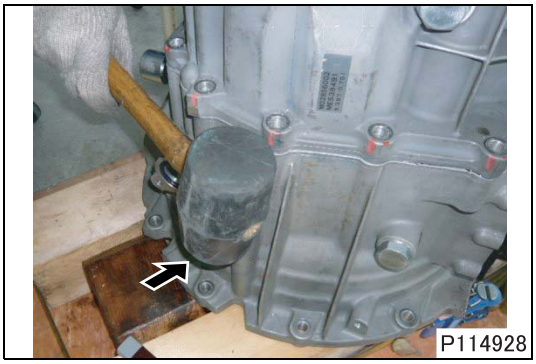
- Remove the snap ring using a.
- Remove the countershaft rear bearing using d.



P114924E

■ **Removal: Transmission case**

- Install f on the transmission case for lifting it with a crane.
- Install the two f diagonally near the center of the transmission case.



P114928

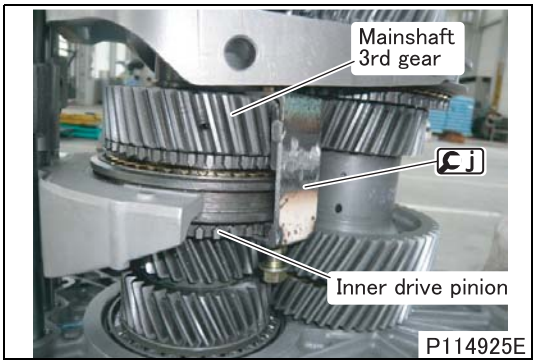
- After removing the bolts, lift the transmission case with a crane while hitting the rear ribs (indicated by an arrow) of the clutch housing with a plastic hammer to remove the transmission case.

CAUTION ⚠

- **Be sure to hit the ribs as illustrated because hitting other areas may break the clutch housing.**

■ **Removal: Mainshaft rear bearing outer race**

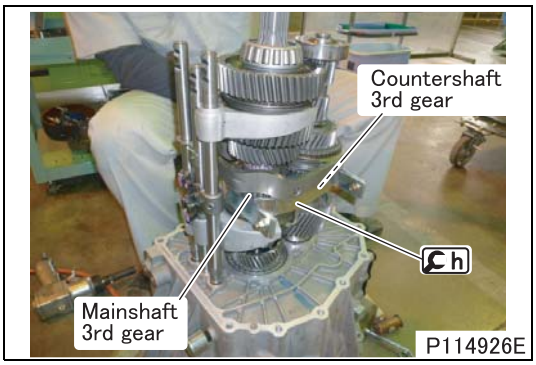
- Remove the mainshaft rear bearing outer race by using a plastic hammer on the inside of the transmission case.



P114925E

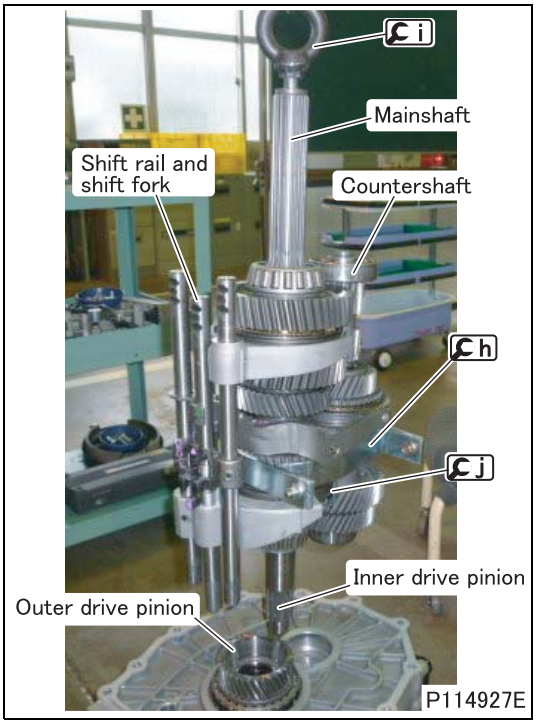
■ **Removal: Shift rail and shift fork, countershaft, mainshaft, inner drive pinion and outer drive pinion**

- Install j on the mainshaft 3rd gear and inner drive pinion.

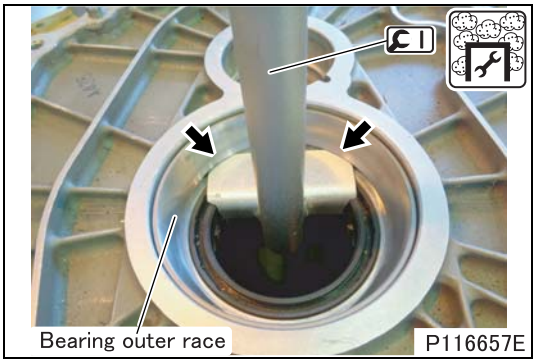


P114926E

- Fasten the 3rd gears of the mainshaft and countershaft with h.



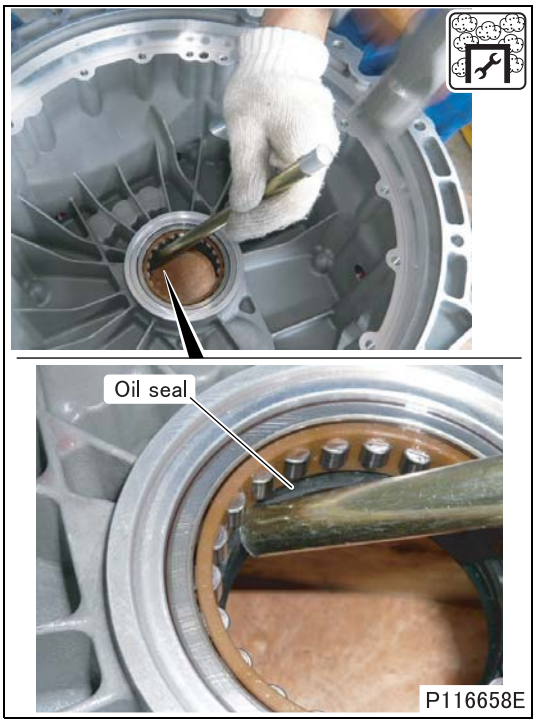
- Install i on the mainshaft for lifting it with a crane.
- Put a piece of wood on the clutch housing, and while hitting the wood with a plastic hammer, lift the mainshaft with a crane to remove it.
- When the mainshaft has been removed from the clutch housing, support the mainshaft with your hands to prevent if from inclining.
- Remove h and j, and then remove the mainshaft, countershaft and inner drive pinion.
- Remove the outer drive pinion.



■ Removal: Outer drive pinion taper bearing outer race

: This work requires protection against dust.

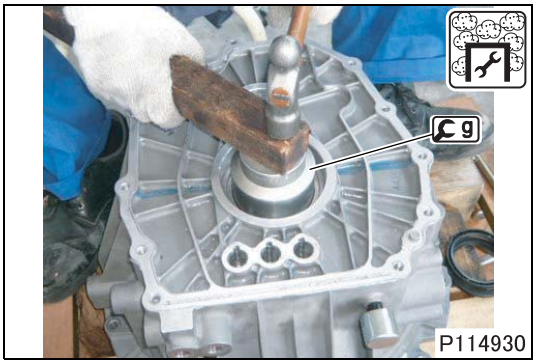
- Hook the catch of l in the notch on the clutch housing, and then remove the outer drive pinion taper bearing outer race by lifting it with a sliding hammer.



■ Removal: Oil seal

: This work requires protection against dust.

- Remove the oil seal by hitting it with a bar from the front side of the clutch housing.



■ **Removal: Outer drive pinion roller bearing outer race**

: This work requires protection against dust.

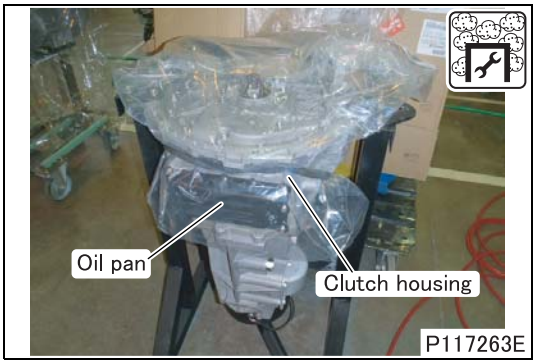
- Remove the outer drive pinion roller bearing outer race from the rear side of the clutch housing using g.

◆Inspection procedure◆

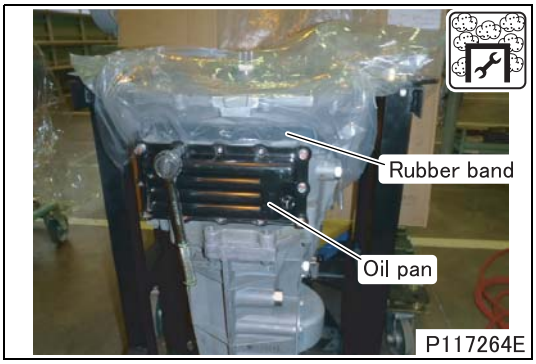
■ **Inspection: Oil filter**

: This work requires protection against dust.

[Inspection]
- Check that the drained automatic transmission fluid is not contaminated.
- If contaminated, inspect the oil filter.

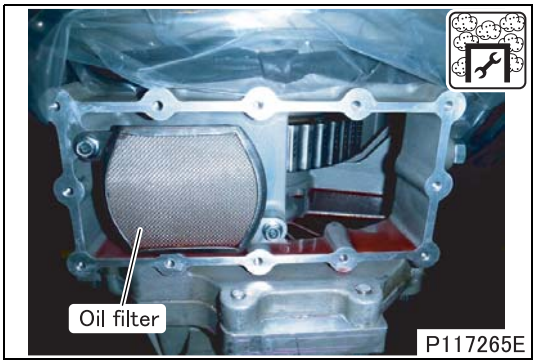


[Removal]
- Clean the clutch housing and the areas around the oil pan.
- Perform work with the transmission positioned vertically as shown. (See “VALVE BODY, DUAL CLUTCH”.)



- Displace the rubber band securing the plastic bag to provide working space.
- Remove the oil pan.

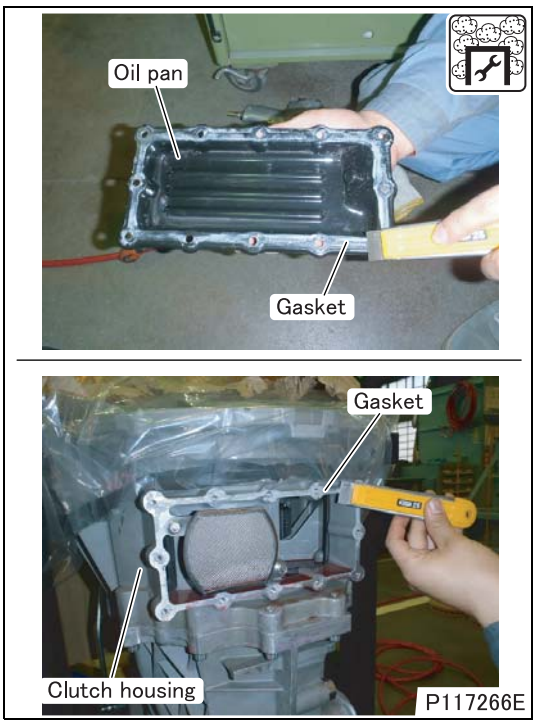
NOTE
- **If there is no problem (e.g. no contamination) in automatic transmission fluid, do not remove the oil pan.**
- **Do not use air tools to remove the oil pan.**



- Remove the oil filter.

[Inspection]

- Confirm that the oil filter is not contaminated by foreign objects.
- If contaminated by foreign objects, replace the oil filter with a new one.



[Installation]

- Remove the gasket remaining on the oil pan and clutch housing with a scraper, and then degrease with brake cleaner.

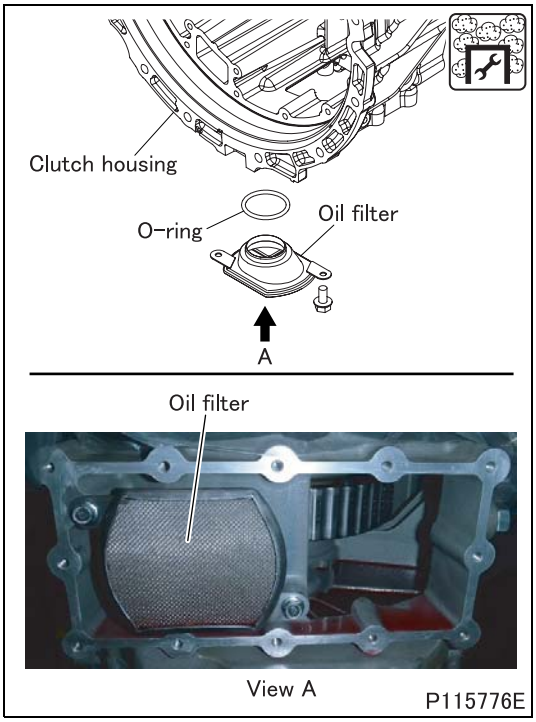
CAUTION ⚠

- **Do not allow the scraped gasket to enter the clutch housing.**

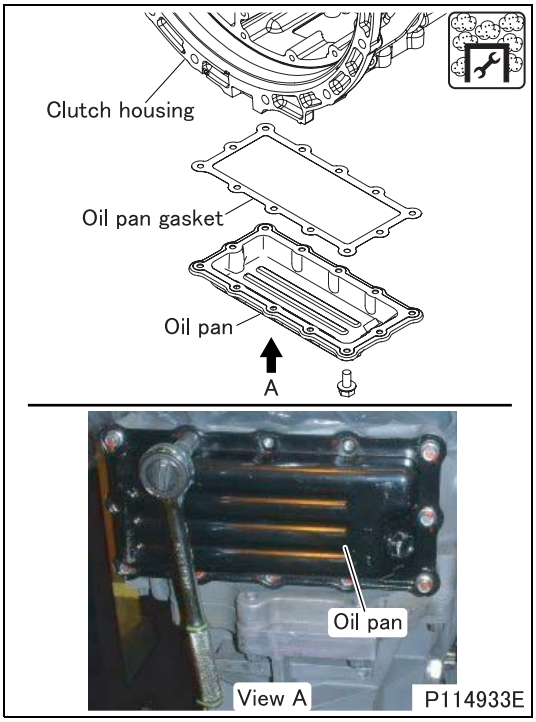
- Wipe off automatic transmission fluid and brake cleaner using a non-woven cloth or paper towel.

CAUTION ⚠

- **Do not use anything other than a non-woven cloth or paper towel.**
- **Do not rub when using a paper towel.**

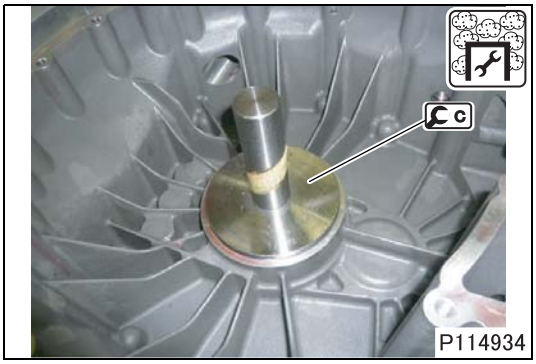


- Apply automatic transmission fluid to the O-ring, and then install the O-ring on the oil filter.
- Install the oil filter on the clutch housing.



- Install the oil pan gasket and oil pan.

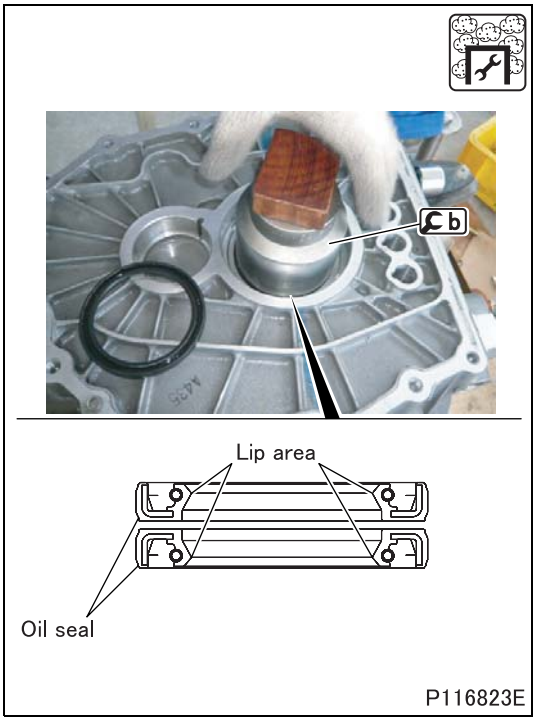
◆Installation procedure◆



■ Installation: Outer drive pinion roller bearing outer race

: This work requires protection against dust.

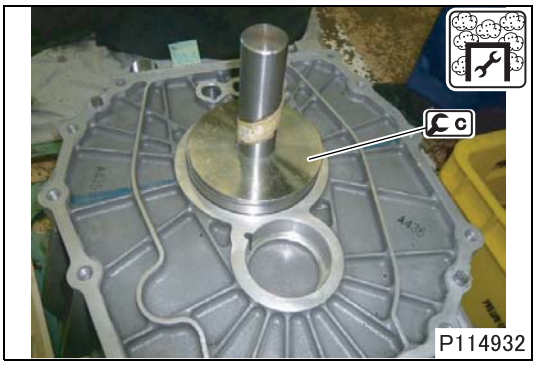
- Apply automatic transmission fluid to the sliding surface of the outer drive pinion roller bearing outer race.
- Install the outer drive pinion roller bearing outer race from the front side of the clutch housing using C.



■ **Installation: Oil seal**

: This work requires protection against dust.

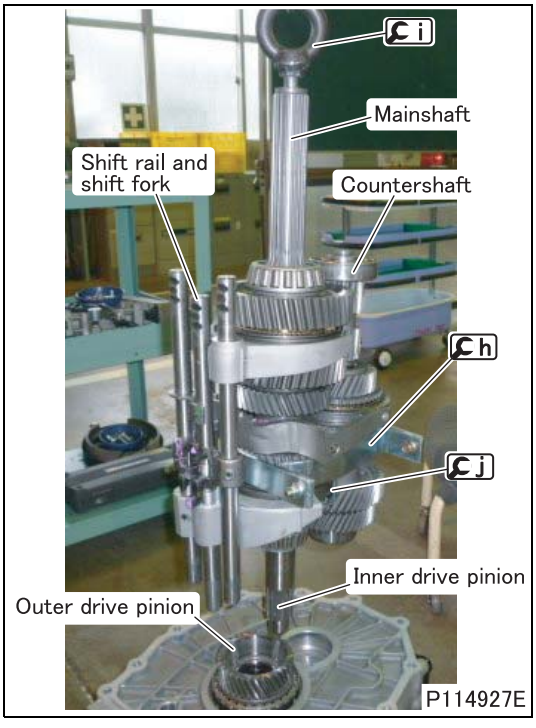
- Apply automatic transmission fluid to the lip areas of the oil seals.
- Install the oil seals in the illustrated orientations from the rear side of the clutch housing using b.



■ **Installation: Outer drive pinion taper bearing outer race**

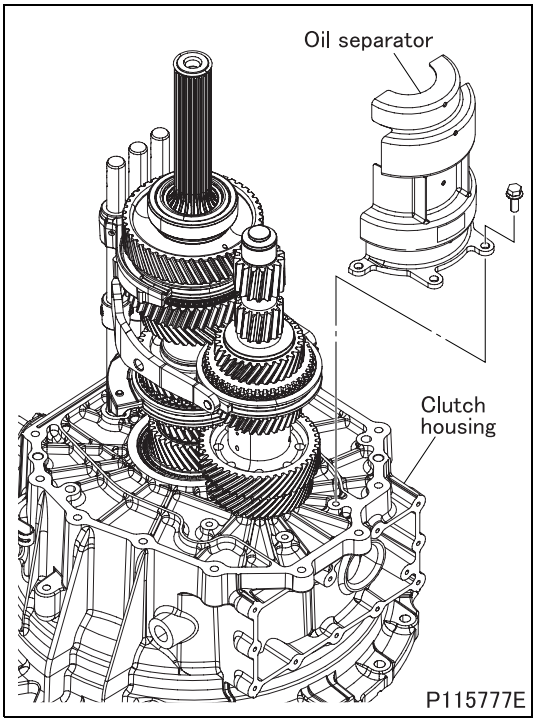
: This work requires protection against dust.

- Install the outer drive pinion taper bearing outer race from the rear side of the clutch housing using c.



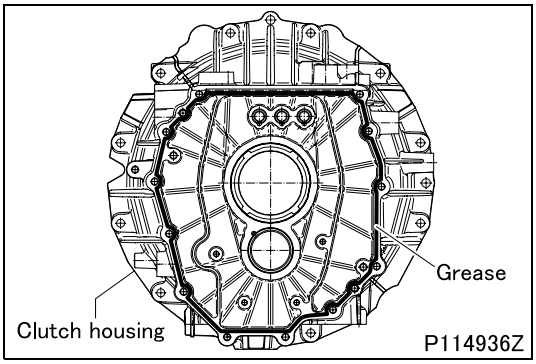
■ **Installation: Outer drive pinion, mainshaft, countershaft, inner drive pinion and shift rail and shift fork**

- Apply automatic transmission fluid to the sliding surface of the outer drive pinion, and then install the pinion on the clutch housing.
- Apply grease between the rollers of the mainshaft pilot bearing, install the inner drive pinion, and then fasten the mainshaft 3rd gear and inner drive pinion using j.
- Fasten the 3rd gears of the mainshaft and countershaft using h.
- Install the shift rail and shift fork on the mainshaft and countershaft.
- Install i on the mainshaft, and then lift the mainshaft with a crane and install it on the clutch housing.
- Be sure to remove all the tools used.



■ **Installation: Oil separator**

- Install the oil separator on the clutch housing.



■ **Installation: Transmission case**

[Applying sealant]

- Applying sealant onto the clutch housing and motor generator, following manners shown below.

CAUTION ⚠

- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**
- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surface so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

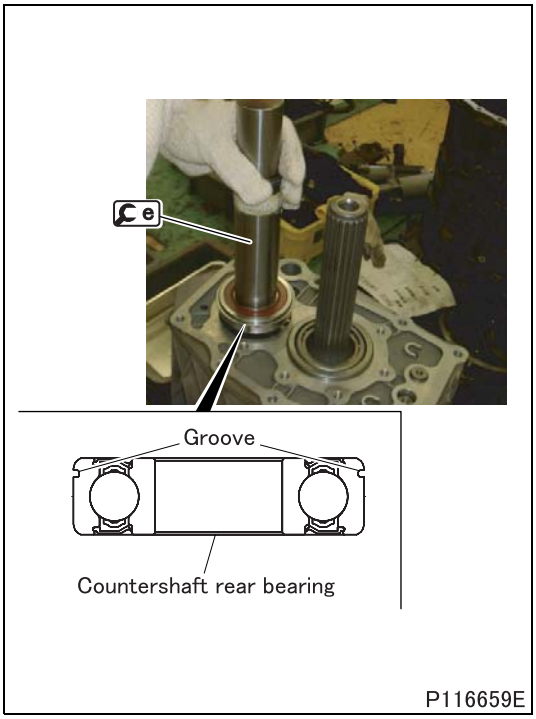
- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

[Installation]

- After applying the sealant, install the transmission case before the sealant dries. Be sure not to allow the sealant to be displaced.
- Do not start the engine within one hour after installing the transmission case.
- When loosening or removing transmission case mounting bolts, be sure to reapply the sealant.

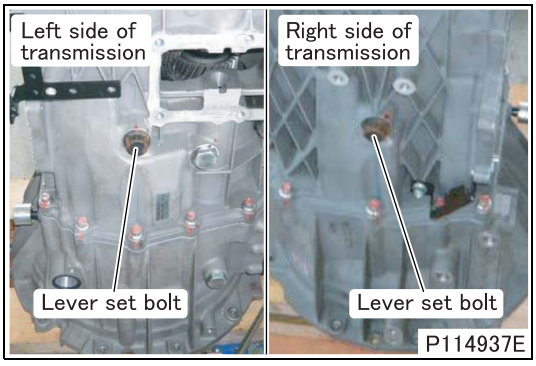
■ **Installation: Mainshaft rear bearing outer race**

- Temporarily install the mainshaft rear bearing outer race from the rear side of the transmission case using a plastic hammer.



■ **Installation: Countershaft rear bearing and snap ring**

- Install the countershaft rear bearing in the illustrated orientation using e.



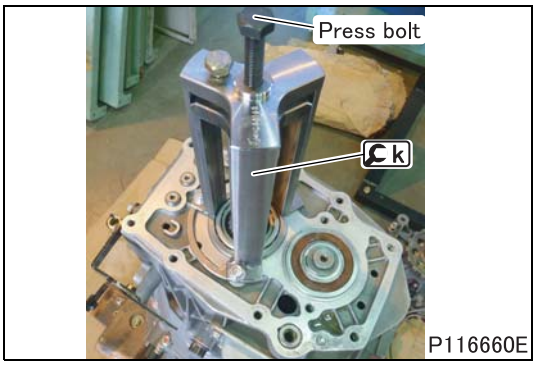
■ **Installation: Lever set bolt**

- Apply locking agent to the threads of the lever set bolts.
- Align the transmission case holes and reverse lever holes, and then secure the reverse lever with the lever set bolts.
- Insert a Phillips screwdriver from one side of the transmission case to align the holes, then install the lever set bolt at the opposite side.

CAUTION ⚠

- **Remove any sealant remaining in the bolt holes before installation. Otherwise damage may result.**

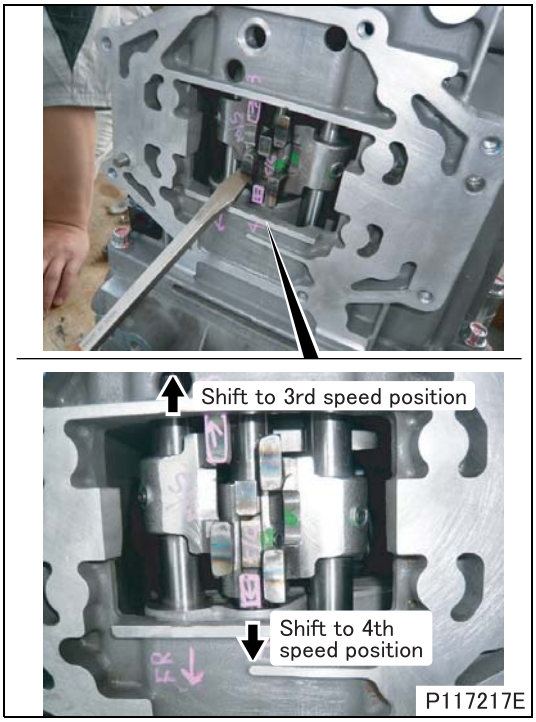
- After installing the lever set bolts, check that gears can be engaged by shifting gear positions.



■ **Installation: Shim and rear bearing retainer**

[Selecting shim]

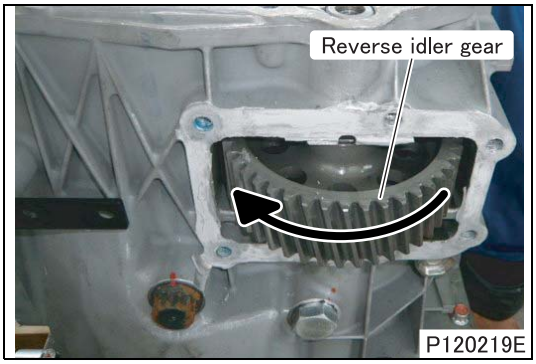
- Before selecting a shim, install the reverse idler gear. (See “REVERSE IDLER GEAR”.)
- Since a taper roller bearing is used on both ends of the mainshaft, it is necessary to select a shim to apply preload to the bearing.
- Install k on the transmission case, and then tighten the bearing press bolt to a torque of 13.3 N·m {9.8 ft.lbs, 130 kgf·cm}.



- Shift the mainshaft and countershaft to the 3rd and 4th speed positions, respectively.
- With the mainshaft and countershaft in the 3rd and 4th speed positions, respectively, rotate the mainshaft more than ten revolutions. In the way described below. Next, loosen the bearing press bolt and then tighten it again to a torque of 3.2 N·m {2.4 ft.lbs, 32.5 kgf·cm}.

<When rotating the mainshaft>

- Apply a tire bar or the like to the spline of the mainshaft to rotate the shaft manually.

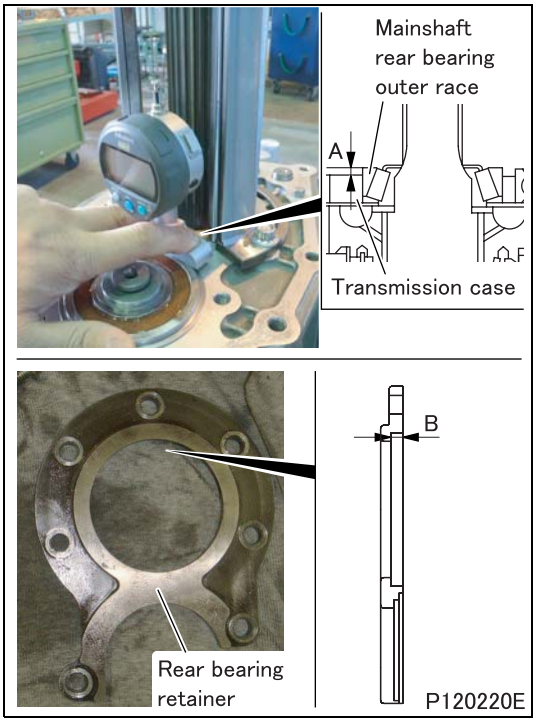


<When rotating the reverse idler gear>

- Applying a tire bar or the like to the spline of the mainshaft, give an initial rotation to the reverse idler gear so that the it will turn by itself in the direction shown in the illustration.

CAUTION ⚠

- **Be careful not to pinch a hand or finger when rotating the reverse idler gear.**
- **Avoid using a tool when rotating the idler gear; otherwise it could damage the transmission case.**



- Measure dimension A from the transmission case end face to the mainshaft rear bearing outer race end face at three locations.
- Measure dimension B of the rear bearing retainer at three locations.
- Calculate clearance C from measured dimensions A and B using the following formula.
  Clearance C = (average of B at 3 locations) – (average of A at 3 locations)

Clearance C (mm {in.})	Shim thickness (mm {in.})	Number of shims	Clearance after installation (reference value: mm {in.})
1.15 to 1.19 {0.0452 to 0.0468}	0.56 ± 0.01 {0.0220 ± 0.00039}	2	0.01 to 0.09 {0.00039 to 0.0035}
l.20 to 1.24 {0.0472 to 0.0488}	1.16 ± 0.01 {0.0456 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}
1.25 to 1.29 {0.0492 to 0.0507}	1.21 ± 0.01 {0.0476 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}
1.30 to 1.34 {0.051 to 0.0527}	1.26 ± 0.01 {0.0496 ± 0.00039}	1	0.03 to 0.09 {0.0012 to 0.0035}

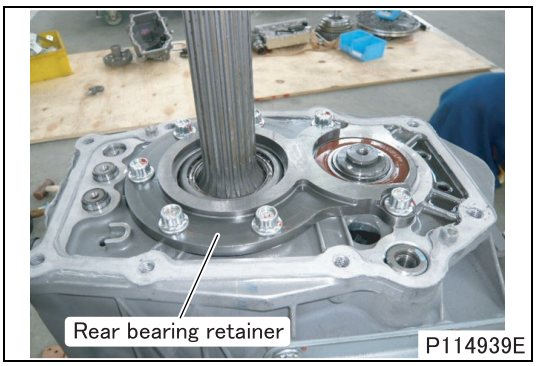
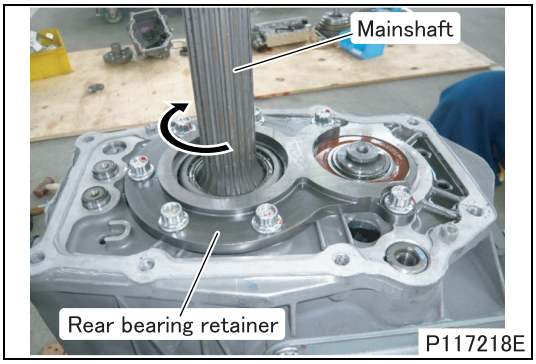
	1.36 ± 0.01 {0.0535 ± 0.00039}	1	



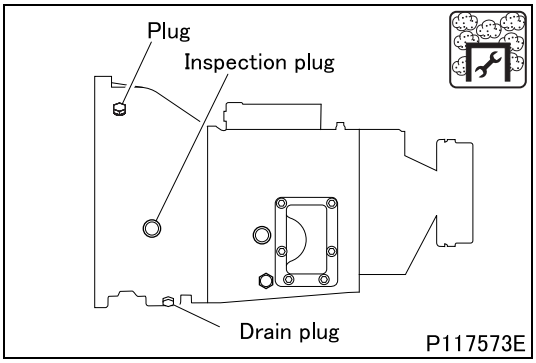
[Installation]

- Remove Ck, and then install the selected shim, rear bearing retainer and tighten the bolts.



■Inspection: Starting torque on the mainshaft output side

- After installing the shim and rear bearing retainer, check that the starting torque on the mainshaft output side agrees with the standard value.Then, measure the starting torque with each shift rail in neutral.
- If the measurement exceeds the standard value, select a shim again.



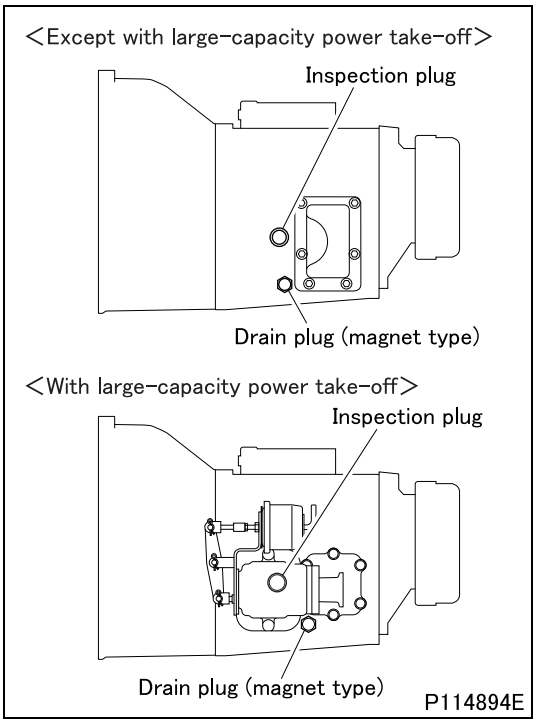
■Installation: Automatic transmission fluid drain plug, automatic transmission fluid inspection plug, and plug

: This work requires protection against dust.

- Install the automatic transmission fluid drain plugs on the oil pan.
- Install automatic transmission fluid inspection plug on the clutch housing.

CAUTION ⚠

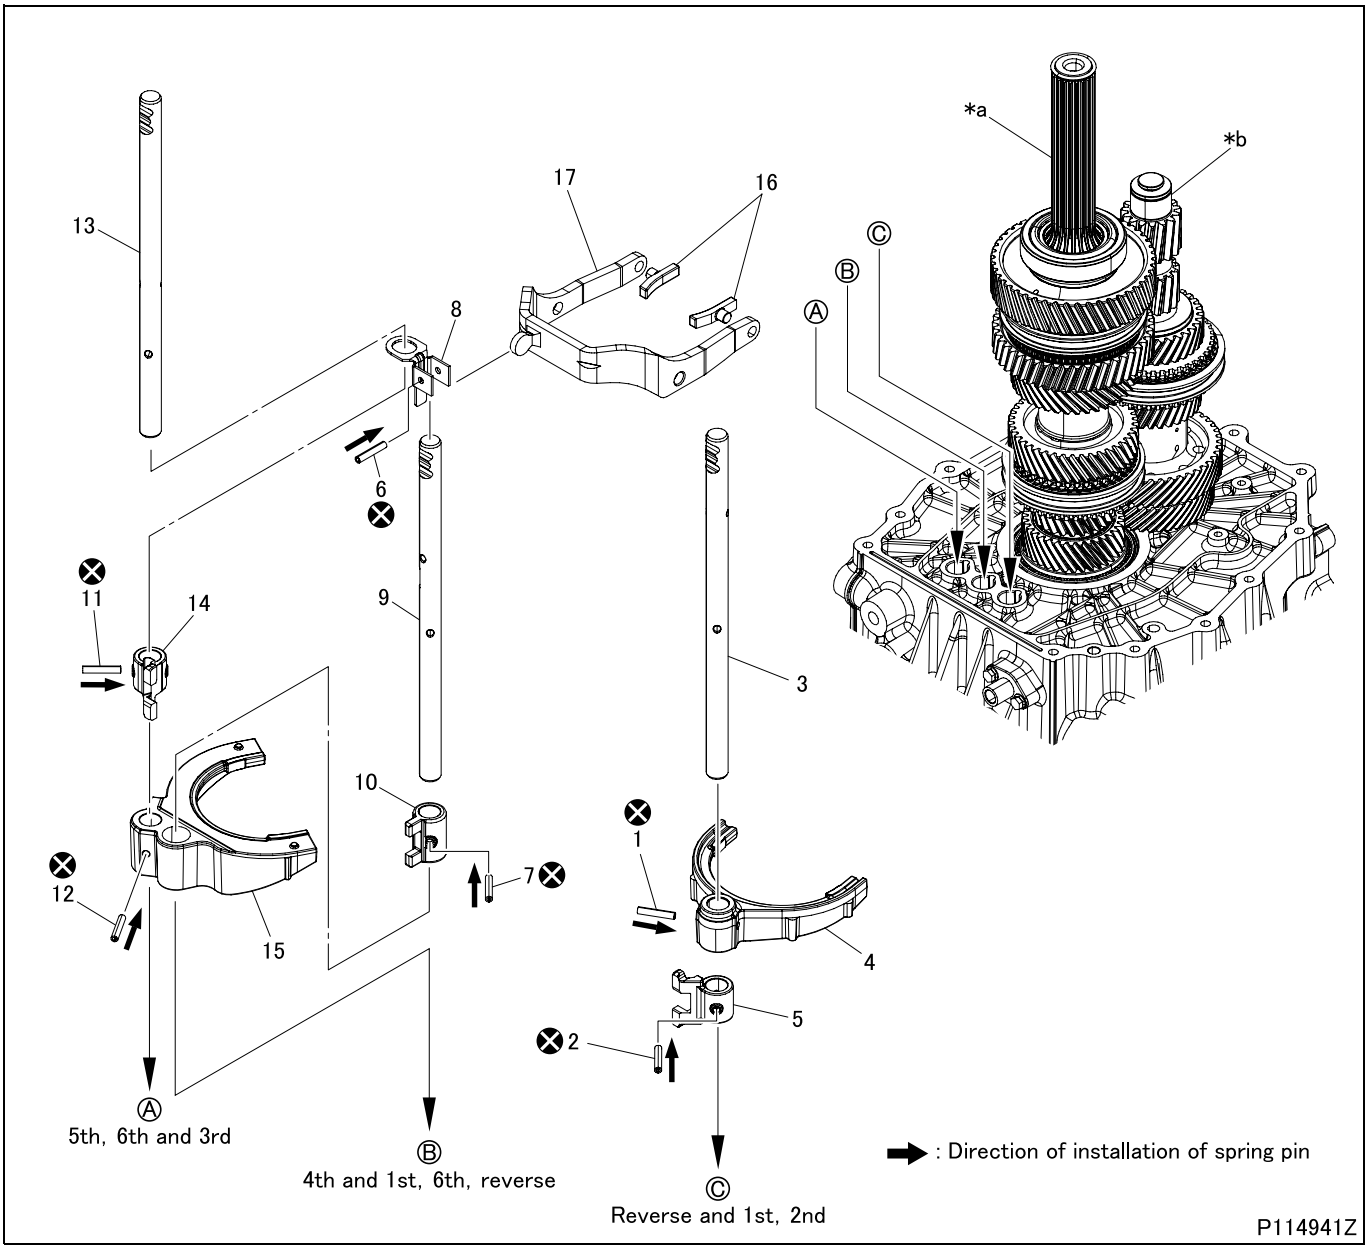
- **Overtightening the inspection plug may break its window. Be sure to tighten the inspection plug to the specified torque.**



■Installation: Transmission oil drain plug and transmission oil inspection plug

- Apply sealant to the threads of the transmission oil drain plug and transmission oil inspection plug, and then install the plugs on the transmission case.

Shift Rail and Shift Fork



● Disassembly sequence

1 Spring pin
2 Spring pin
3 5th/6th and 3rd shift rail
4 5th/6th and 3rd shift fork
5 5th/6th and 3rd shift jaw
6 Spring pin
7 Spring pin

9 4th and 1st/6th/reverse shift rail
10 4th and 1st/6th/reverse shift jaw A
11 4th and 1st/6th/reverse lever
12 Shift fork piece
13 Spring pin
14 Spring pin
15 Reverse and 1st/2nd shift rail
16 Reverse and 1st/2nd shift jaw
17 Reverse and 1st/2nd shift fork

***a**: Mainshaft
***b**: Countershaft
⊗: Non-reusable parts

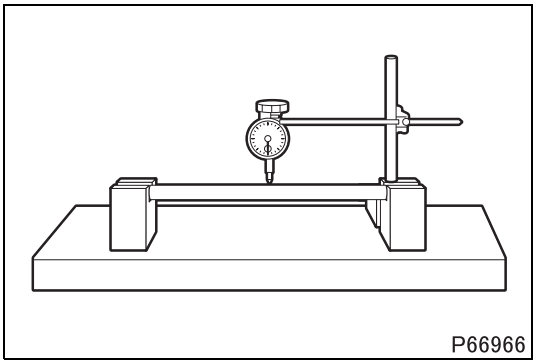
● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
3, 9, 15	Bend of shift rail	0 to 0.04 {0 to 0.0016}	0.05 {0.0020}	Replace
12, *a	Clearance between shift fork piece and synchronizer sleeve of mainshaft	0.3 to 0.6 {0.012 to 0.024}	1.0 {0.039}	Replace
4, 17	Tilt of shift fork claw	0.1 {0.0039} or less	0.2 {0.0079}	Replace
4, 17, *a	Clearance between shift fork and synchronizer sleeve of mainshaft	0.3 to 0.6 {0.012 to 0.024}	1.0 {0.039}	Replace

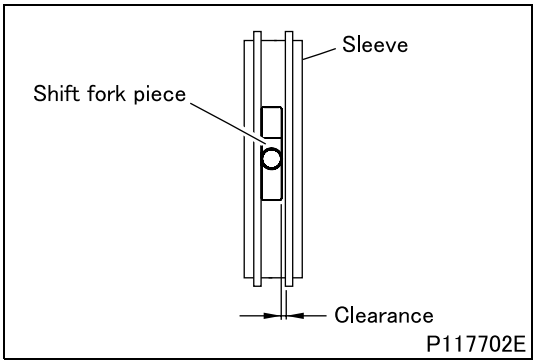
◆Inspection procedure◆



P66966

■ **Inspection: Bend of shift rail**

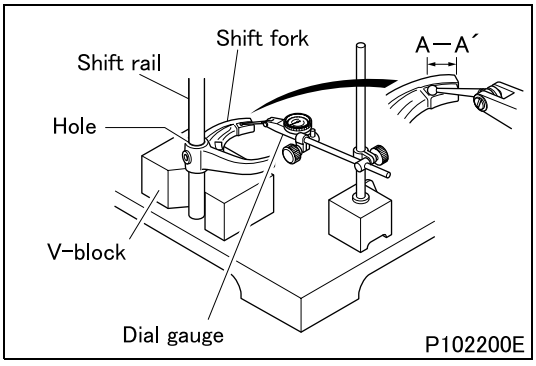
- Measure the extent of bending at the middle of each of shift rail.
- While rotating the shift rail by one revolution, read how much the dial gauge needle will move. A half of the reading observed represents the bend, if any, of the rail.
- If the measurement exceeds the limit, replace the shift rails.



P117702E

■ **Inspection: Clearance between shift fork piece and synchronizer sleeve of mainshaft**

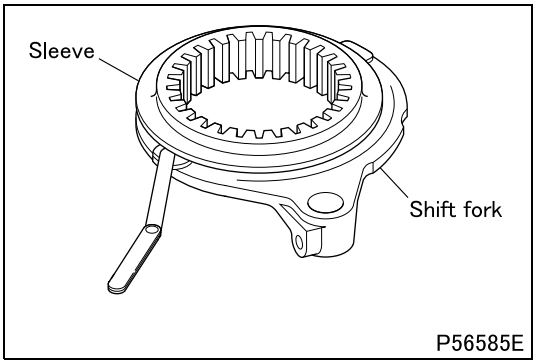
- If the measurement exceeds the limit, replace defective parts.



P102200E

■ **Inspection: Tilt of shift fork claw**

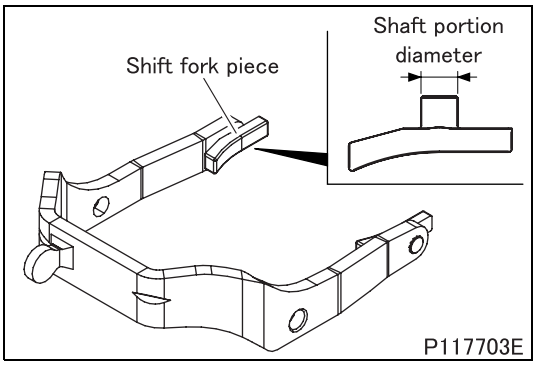
- Measure the tilt (difference between A and A´) of claw A-A´ against the shift rail hole of shift fork with pressing the rail to V-block and standing it vertically.
- If the measurement exceeds the limit, replace the shift fork.



■ **Inspection: Clearance between shift fork and synchronizer sleeve of mainshaft**

- If the measurement exceeds the limit, replace defective part.

◆Installation procedure◆

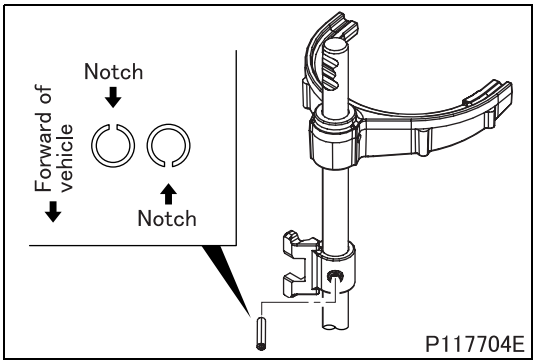


■ **Installation: Shift fork piece**

- Install the shift fork piece on the shift fork as shown in the illustration.

■ **Installation: 4th and 1st/6th/reverse lever**

- Place the synchronizer sleeve of mainshaft in neutral position before installing the reverse lever on the mainshaft.



■ **Installation: Spring pin**

- Install the spring pin in the illustrated direction (the spring pin notch to be positioned forward or rearward of the vehicle). When installing the spring pin, leave 0 to 0.5 mm {0 to 0.020 in.} outside from each shift rail or each gear shift jaw.
- Drive the spring pin carefully so as not to impose too much load on each shift rail and each gear shift jaw.

OUTER DRIVE PINION

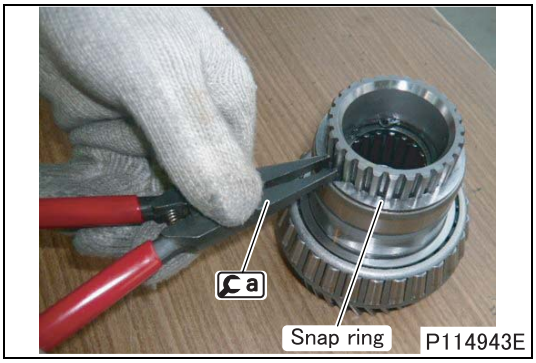
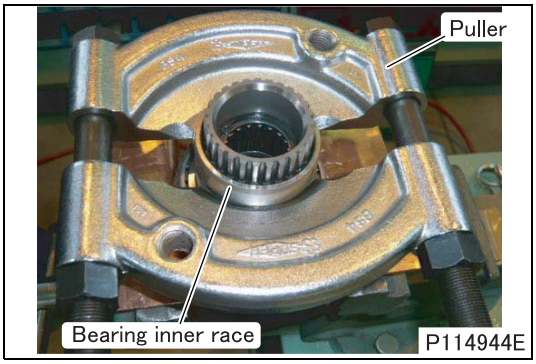
◆Removal procedure◆



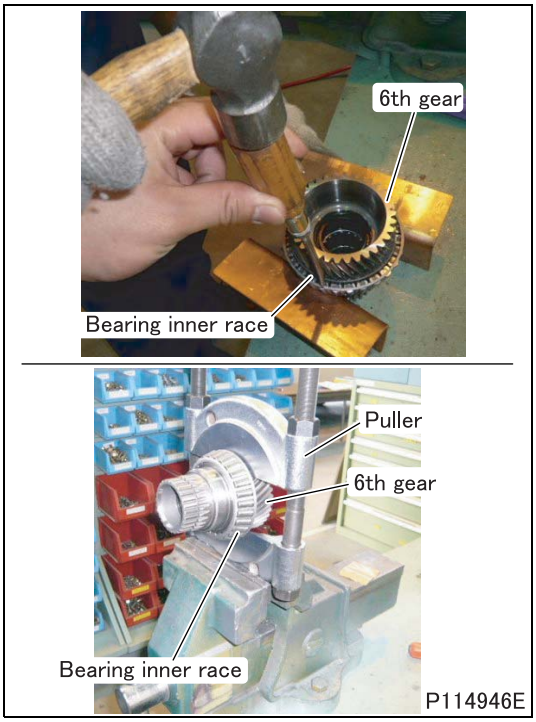
■ **Removal: Snap ring**

- Remove the snap ring using a.



■ **Removal: Outer drive pinion roller bearing inner race**

- Install a commercially available bearing puller on the bottom of the outer drive pinion roller bearing inner race.
- Install g on the end of the outer drive pinion, and then remove the outer drive pinion roller bearing inner race by pushing it out with a press.



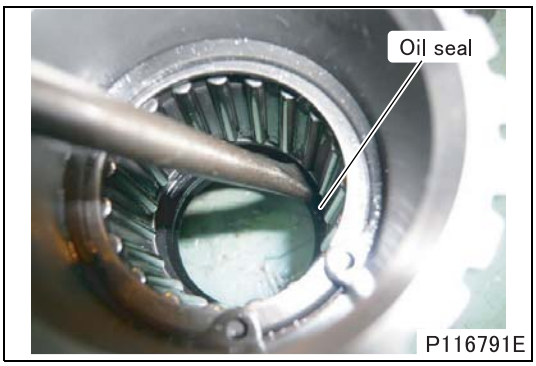
■ **Removal: Outer drive pinion taper bearing inner race**

- Evenly hit the flange of the outer drive pinion taper bearing inner race with a flat-blade screwdriver or the like to provide a clearance from the outer drive pinion 6th gear.
- Install a commercially available bearing puller in the clearance between the outer drive pinion taper bearing inner race and outer drive pinion 6th gear.

CAUTION ⚠

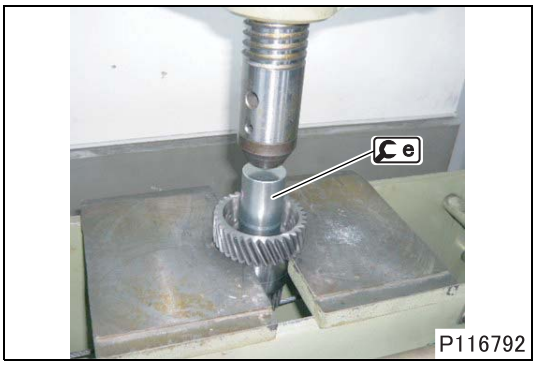
- **Be sure to provide a clearance before installing the bearing puller. Otherwise the outer drive pinion taper bearing inner race may be damaged.**
- **Be sure to install the bearing puller on the 6th gear side. The bearing will be seized if the puller is installed on the outer drive pinion taper bearing inner race side.**

- Install g on the end of the outer drive pinion, and then remove the outer drive pinion taper bearing inner race by pushing it out with a press.



■ **Removal: Oil seal**

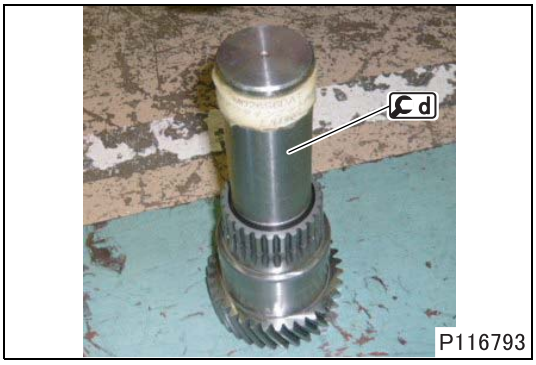
- Remove the oil seal using a screwdriver or the like.



■ **Removal: Snap ring and needle bearing**

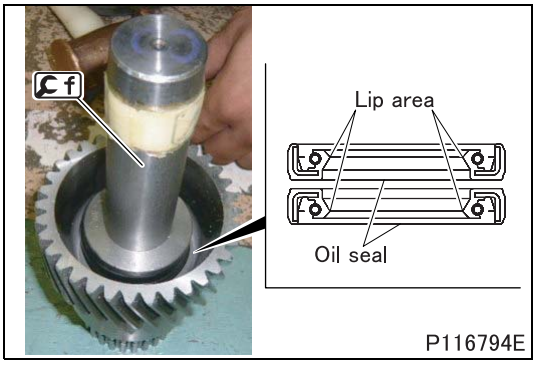
- Remove the snap ring.
- Using e, remove the needle bearing by pushing it out with a press.

◆Installation procedure◆



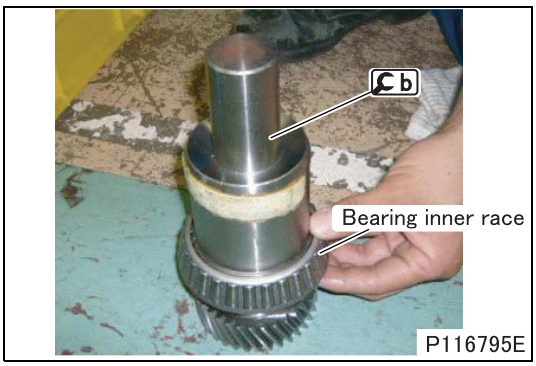
■ **Installation: Needle bearing and snap ring**

- Apply automatic transmission fluid to the needle bearing, and then install it on the outer drive pinion using d.
- Apply automatic transmission fluid to the snap ring, and then install it on the outer drive pinion.



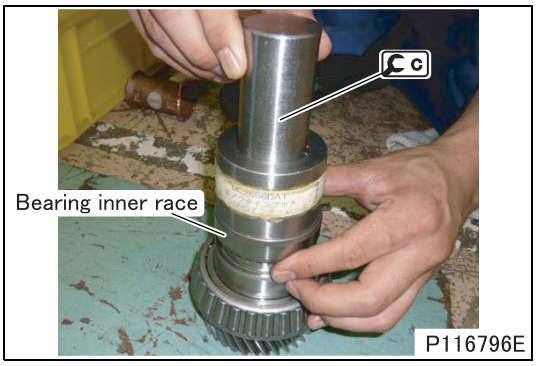
■ **Installation: Oil seal**

- Apply automatic transmission fluid to the lip areas of the oil seals, and then install the oil seals on the outer drive pinion in the illustrated orientations using f.



■ **Installation: Outer drive pinion taper bearing inner race**

- Install the outer drive pinion taper bearing inner race on the outer drive pinion using b.

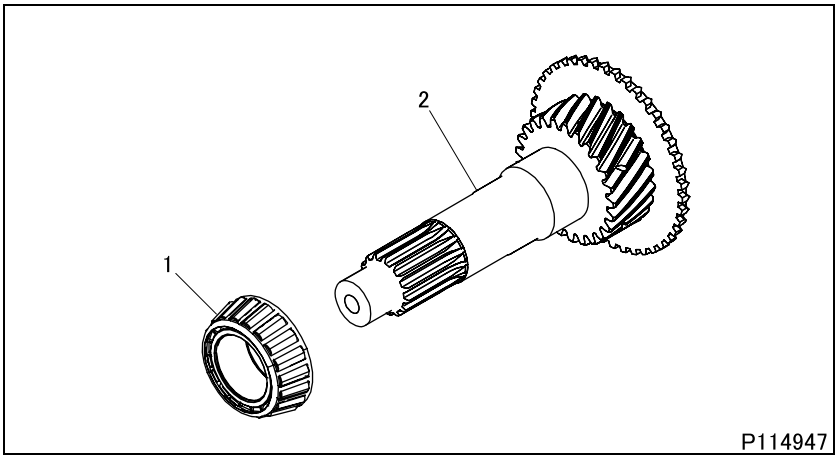


■ **Installation: Outer drive pinion roller bearing inner race and snap ring**

- Apply automatic transmission fluid to the outer drive pinion roller bearing inner race, and then install it on the outer drive pinion using c.
- Apply automatic transmission fluid to the snap ring, and then install it on the outer drive pinion using a.

M E M O

INNER DRIVE PINION



● **Disassembly sequence**

1 Inner drive pinion taper bearing inner race
2 Inner drive pinion

⊗: Non-reusable parts

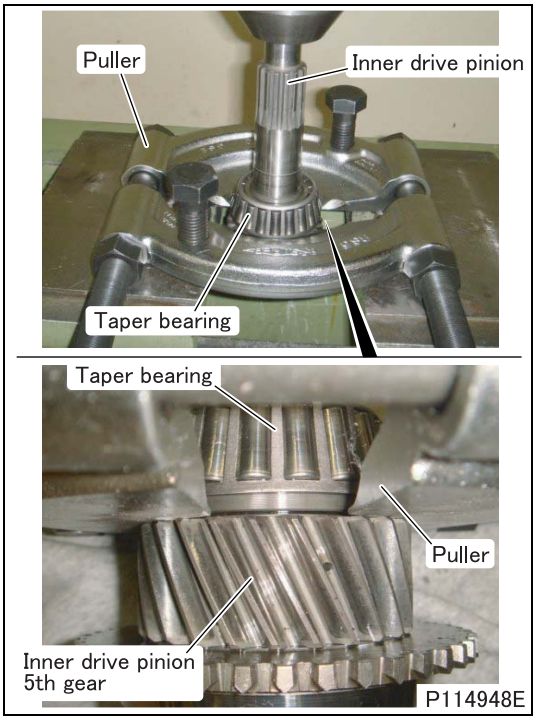
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
ⓒa	Bearing installer  P116039 A: MH064244: ϕ45 {1.77}; MH064378: ϕ45 {1.77} B: MH064244: ϕ41 {1.61}; MH064378: ϕ41 {1.61} C: MH064244: 170 {6.69}; MH064378: 280 {11.0}	MH064244 or MH064378	Installation of outer drive pinion taper bearing inner race

◆**Removal procedure**◆



■ **Removal: Inner drive pinion taper bearing inner race**

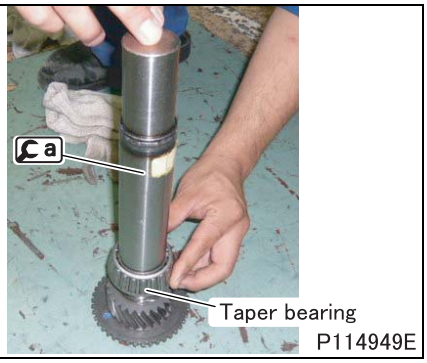
- Install a commercially available bearing puller between the inner drive pinion taper bearing inner race and inner drive pinion 5th gear.
- After installing the bearing puller, check that the rollers on the taper bearing inner race rotate smoothly.

CAUTION ⚠

- **If the rollers do not rotate smoothly, reinstall the bearing puller. Otherwise the inner drive pinion taper bearing inner race may be damaged.**

- Remove the inner drive pinion taper bearing inner race by pushing it out with a press.

◆Installation procedure◆



■ **Installation: Inner drive pinion taper bearing inner race**

- Install the inner drive pinion taper bearing inner race on the inner drive pinion using a.

MAINSHAFT

		3rd gear and 3rd and 5th/6th synchronizer	1.17 to 1.53 {0.046 to 0.060}	0.5 {0.020}	
		Inner drive pinion and 3rd and 5th/6th synchronizer	1.10 to 1.60 {0.043 to 0.063}	0.5 {0.020}	

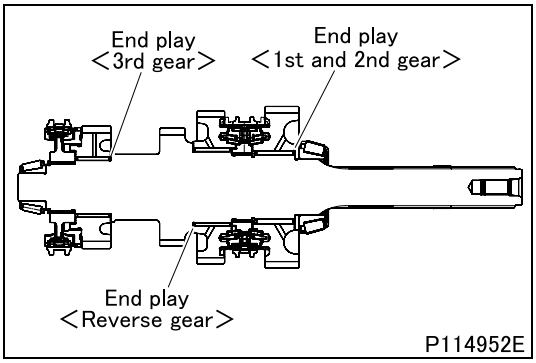
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Entire periphery of pilot bearing roller	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

Special tools (Unit: mm {in.})

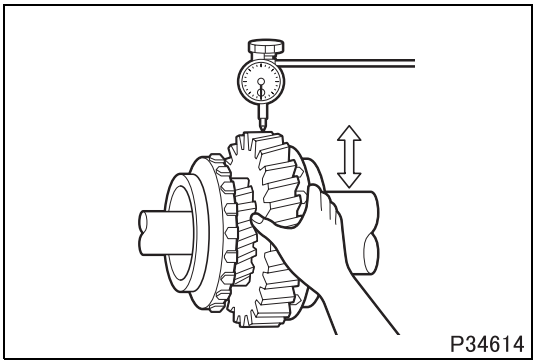
Mark	Tool name and shape	Part No.	Application
a	Snap ring expander  P01137	MH061268	Removal and installation of snap ring
b	Bearing installer A: ϕ30 {1.18} B: ϕ26 {1.02}  P116045	MH064243	Installation of pilot bearing
c	Bearing installer A: ϕ56 {2.20} B: ϕ51 {2.01}  P116046	MH064253	Installation of mainshaft rear taper bearing inner race

◆Work before removal◆



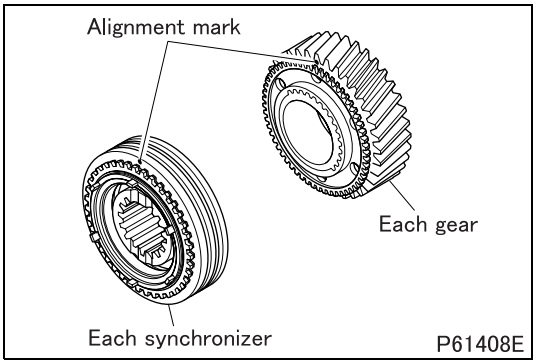
■ **Inspection: End play of each gears**

- Measure the end play using feeler gauge.
- If the measurement exceeds the limit, replace defective parts.



■ **Inspection: Play in diameter direction of each gears**

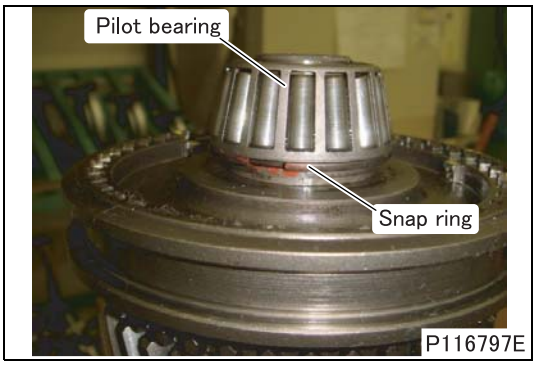
- If the measurement exceeds the limit, replace defective parts.



■ **Alignment marks: Each gear and each synchronizer**

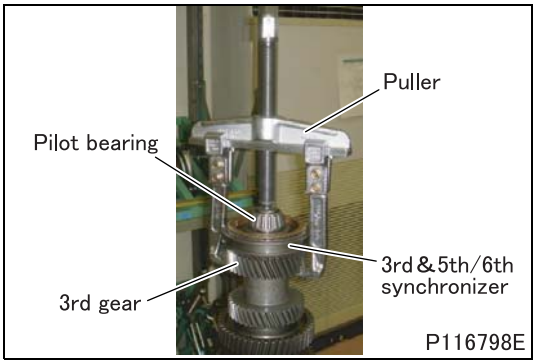
- Put alignment marks on the each gear and the synchronizer sleeve of the each synchronizer so that the combination of their mating surfaces can be maintained when reassembled.

◆Removal procedure◆



■ **Removal: Pilot bearing, snap ring, 3rd and 5th/6th synchronizer and 3rd gear**

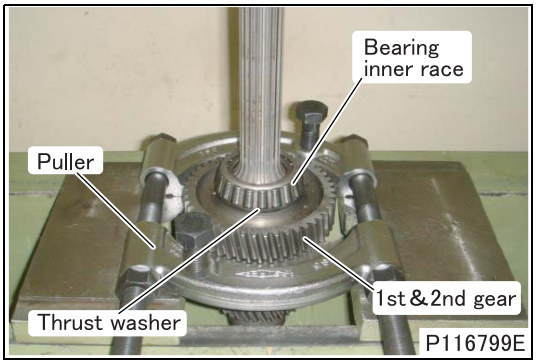
- Remove the snap ring on the 3rd and 5th/6th synchronizer and hook it onto the pilot bearing.



- Using a commercially available gear puller, remove the pilot bearing, snap ring, 3rd and 5th/6th synchronizer and 3rd gear as one unit.

CAUTION ⚠

- **Be sure to hook the gear puller onto the bottom of the 3rd gear; hooking it onto the bottom of the pilot bearing may damage the bearing.**



■ Removal: Mainshaft rear taper bearing inner race, 1st gear thrust washer and 1st and 2nd gears

- Install a commercially available bearing puller on the bottom of the 1st and 2nd gears.
- Remove the mainshaft rear taper bearing inner race, 1st gear thrust washer and 1st and 2nd gears as one unit by pushing them out with a press.

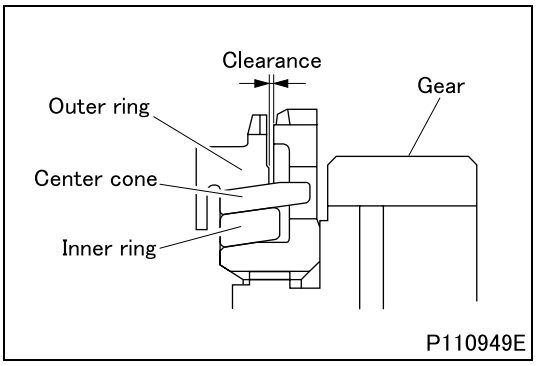
CAUTION ⚠

- **Be sure to install the bearing puller on the bottom of the 1st and 2nd gears; installing it on the bottom of mainshaft rear taper bearing inner race may damage the inner race.**

■ Removal: Snap ring, 1st/2nd and reverse synchronizer and reverse gear

- Remove the snap ring using [ca].
- Remove the 1st/2nd and reverse synchronizer and reverse gear.
- When the 1st/2nd and reverse synchronizer is fitted so tight, use a commercially available gear puller or the like to remove it.

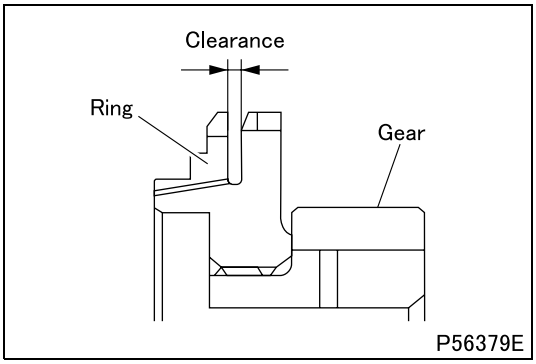
◆Inspection procedure◆



■ Inspection: Clearance between gear and synchronizer ring of synchronizer

<Triple cone type>

- When measuring the clearance, press the ring and the center cone evenly against the gear and measure all around the circumference.
- If the measurement is less than the limit, replace the ring and gear.



<Single cone type>

- When measuring the clearance, press the ring evenly against the gear and measure all around the circumference.
- If the measurement is less than the limit, replace the ring and the gear or inner drive pinion.

◆Installation procedure◆

■ **Installation: 1st/2nd and reverse synchronizer**

- Install the 1st/2nd and reverse synchronizer.
- If the 1st/2nd and reverse synchronizer can not be installed easily, perform the following procedures for installation.

[Heating]

- Heat 1st/2nd and reverse synchronizer evenly to 130°C {266°F} using one of the following methods.

<Temperature-controlled chamber>

- Heat 1st/2nd and reverse synchronizer with a temperature setting of 130°C {266°F} for more than 15 minutes.

<Ring heater>

- Repeat a heating process two to three times with a temperature setting of 130°C {266°F} so that entire 1st/2nd and reverse synchronizer is evenly heated to 130°C {266°F}.

CAUTION ⚠

- **Repeat the heating process two to three times because sufficient thermal expansion of 1st/2nd and reverse synchronizer cannot be achieved in a single heating process.**

<Oil bath>

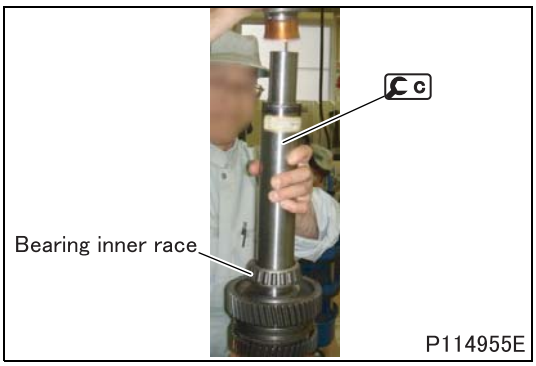
- Heat gear oil to 130°C {266°F} and immerse the 1st/2nd and reverse synchronizer in the oil bath so that its mating part will be submerged entirely in the oil.
- Since gear oil temperature drops when 1st/2nd and reverse synchronizer is immersed in the oil bath, reheat the oil to 130°C {266°F} and keep 1st/2nd and reverse synchronizer immersed in the oil bath for more than 15 minutes while maintaining the oil temperature at 130°C {266°F}.

[Installation]

- Install heated 1st/2nd and reverse synchronizer.

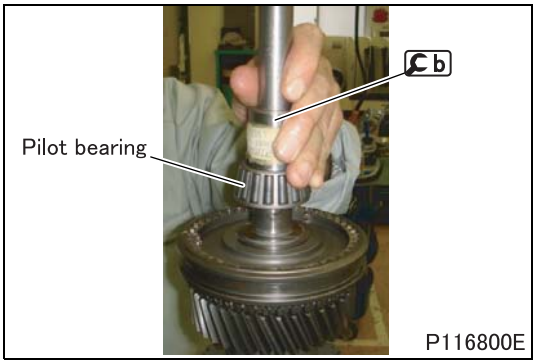
WARNING ⚠

- **Take care not to burn yourself when installing the hot 1st/2nd and reverse synchronizer.**



■ **Installation: Mainshaft rear taper bearing inner race**

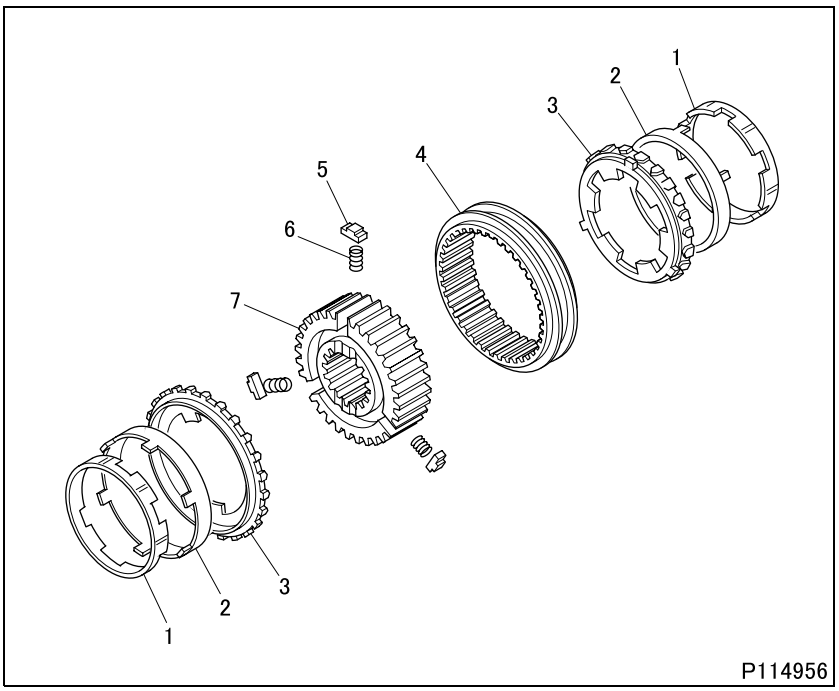
- Install the mainshaft rear taper bearing inner race on the mainshaft using C.



■ **Installation: Pilot bearing**

- Install the pilot bearing on the mainshaft using b.

1st/2nd and Reverse Synchronizer



● Disassembly sequence

1 Synchronizer inner ring
2 Synchronizer center cone
3 Synchronizer outer ring
4 Synchronizer sleeve
5 Shifting plunger
6 Shifting plunger spring
7 Synchronizer hub

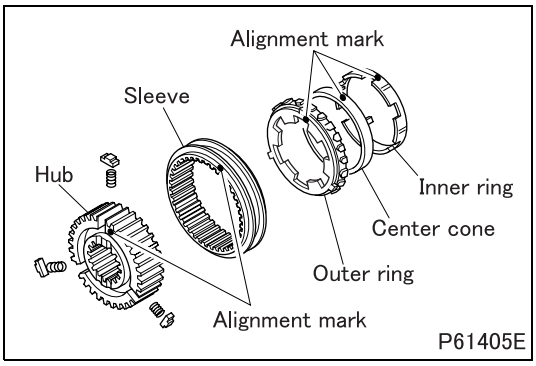
● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
3, 7	Clearance between synchronizer outer ring protrusion and synchronizer hub groove	3.0 to 3.3 {0.12 to 0.13}	4.0 {0.16}	Replace

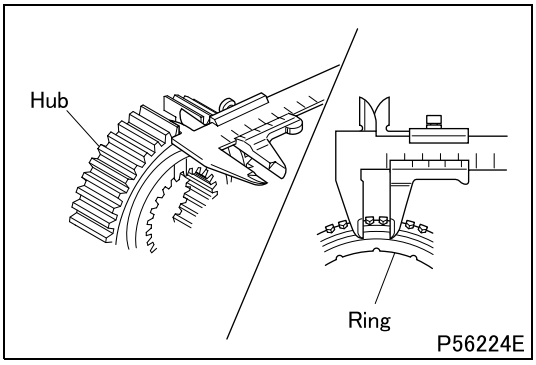
◆Work before removal◆



■ Alignment marks

- Put alignment marks on the synchronizer inner ring, center cone, outer ring and hub, each at one location, aligning with the alignment mark put on the synchronizer sleeve before disassembly.

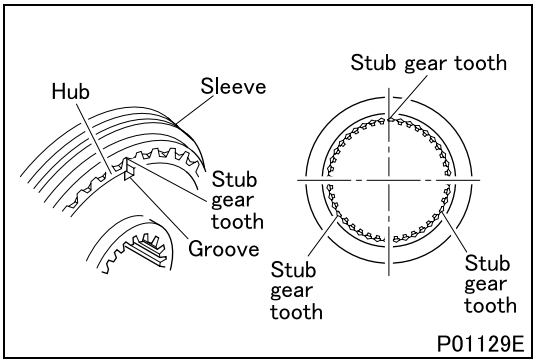
◆Inspection procedure◆



■ Inspection: Clearance between synchronizer outer ring protrusion and synchronizer hub groove

- If the clearance exceeds the limit, replace defective parts.

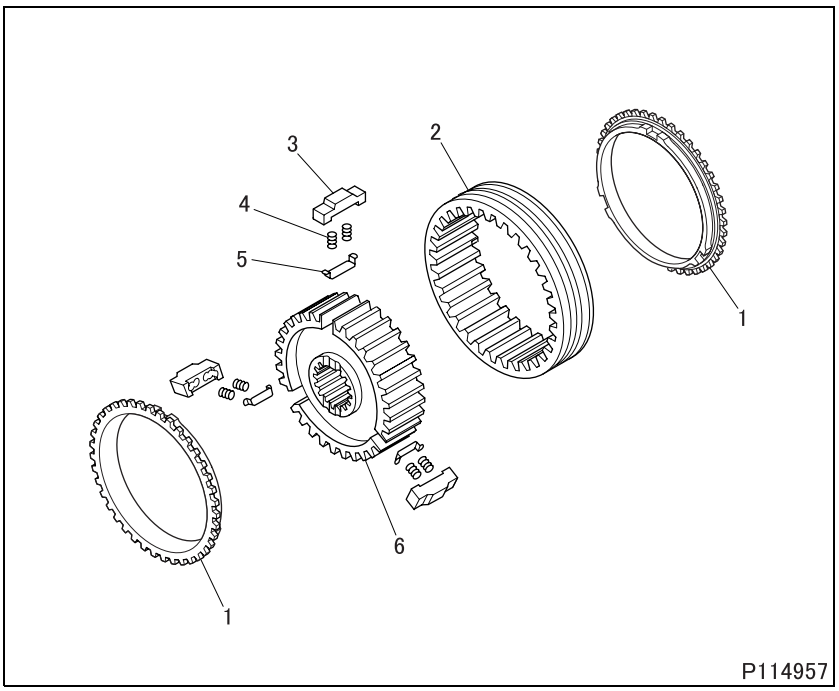
◆Installation procedure◆



■ Installation: Synchronizer sleeve and synchronizer hub

- When replacing the synchronizer sleeve or synchronizer hub with a new one, align the three keyways of the synchronizer hub with three locations of the stub gear tooth of the synchronizer sleeve to install.

3rd and 5th/6th Synchronizer



● Disassembly sequence

1 Synchronizer ring
2 Synchronizer sleeve
3 Shifting key
4 Shifting key spring
5 Shifting key retainer
6 Synchronizer hub

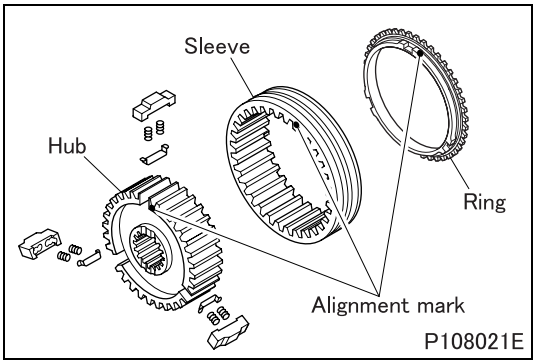
● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
1, 3	Clearance between synchronizer ring keyway and shifting key	4.75 to 4.95 {0.187 to 0.194}	5.7 {0.22}	Replace
3, 6	Clearance between shifting key and synchronizer hub keyway	0.05 to 0.20 {0.0020 to 0.0079}	0.5 {0.020}	Replace
4	Shifting key spring installed load (installed length 3.95 {0.16})	17.16 ± 1.7 N {3.9 ± 0.4 lbs, 1.75 ± 0.2 kgf}	12 N {2.7 lbs, 1.23 kgf}	Replace

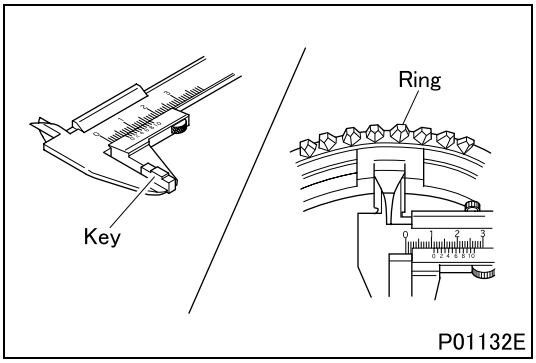
◆Work before removal◆



■ Alignment marks

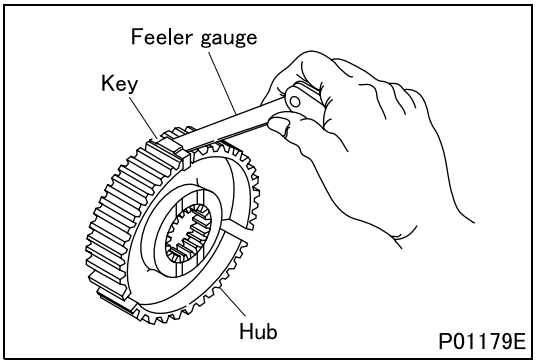
- Put alignment marks on the synchronizer ring and hub, each at one location aligning with the alignment mark put on the synchronizer sleeve before disassembly.

◆Inspection procedure◆



■ **Inspection: Clearance between synchronizer ring and shifting key**

- If the clearance exceeds the limit, replace defective parts.



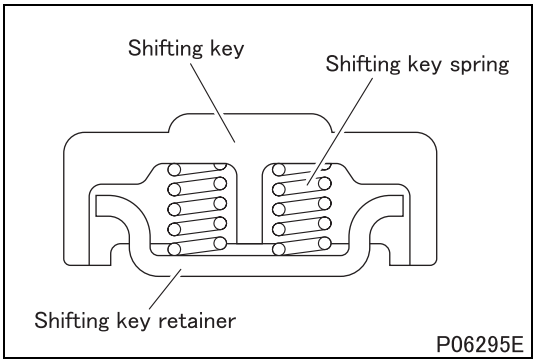
■ **Inspection: Clearance between shifting key and synchronizer hub**

- If the measurement exceeds the limit, replace defective parts.

■ **Inspection: Shifting key spring**

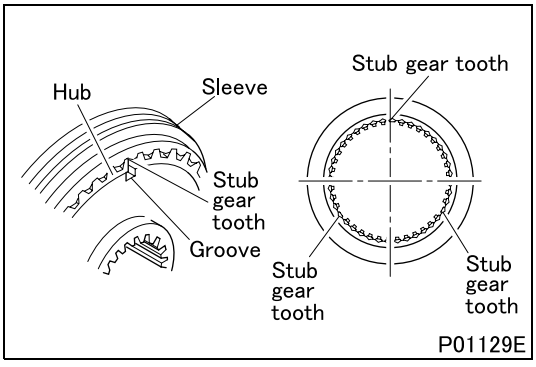
- Measure the installed load at the installed length of the shifting key spring.

◆Installation procedure◆



■ **Installation: Shifting key retainer**

- Install shifting key retainers as illustrated.



■ **Installation: Synchronizer sleeve and synchronizer hub**

- When replacing the synchronizer sleeve or synchronizer hub with a new one, align the three keyways of the synchronizer hub with three locations of the stub gear tooth of the synchronizer sleeve to install.

COUNTERSHAFT

		4th gear	0.02 to 0.06 {0.00079 to 0.0024}	0.12 {0.047}	
–	Clearance between gear and synchronizer ring	3rd gear and 4th and 1st/6th/ reverse synchronizer	1.16 to 1.49 {0.046 to 0.058}	0.5 {0.020}	Replace
		4th gear and 4th and 1st/6th/ reverse synchronizer	1.14 to 1.51 {0.045 to 0.059}	0.5 {0.020}	

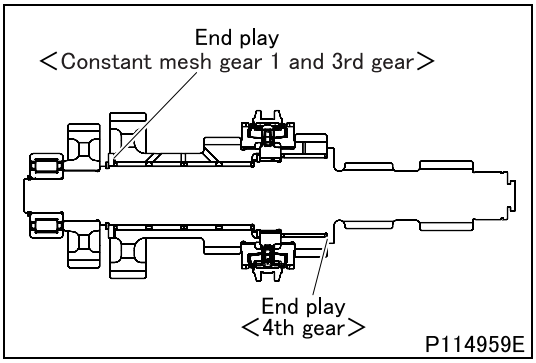
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Circumference of the constant mesh gear 2 mounting section of the countershaft	Loctite 640	As required
b	Sliding area of needle bearing	Transmission oil (API GL-3 SAE80)	As required
	Sliding area of 4th and 1st/6th/reverse synchronizer		

Special tools (Unit: mm {in.})

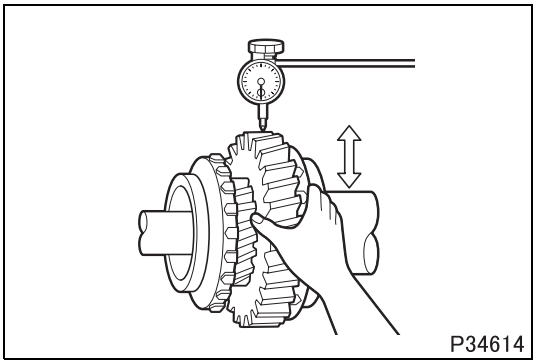
Mark	Tool name and shape	Part No.	Application
a	Bearing installer A: ϕ30 {1.18}, B: ϕ26 {1.02}  P116045	MH064243	Installation of countershaft front bearing
b	Snap ring expander  P01137	MH061268	Removal and installation of snap ring

◆Work before removal◆



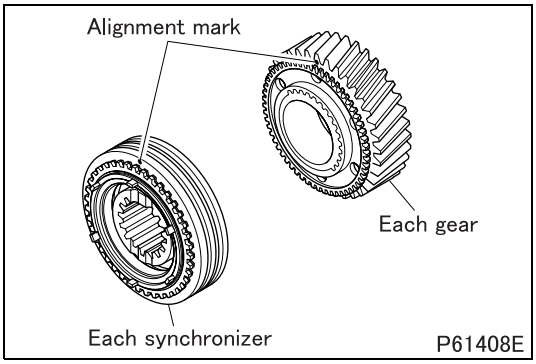
■ **Inspection: End play of each gears**

- Measure the end play using feeler gauge.
- If the measurement exceeds the limit, replace defective parts.



■ **Inspection: Play in diameter direction of each gears**

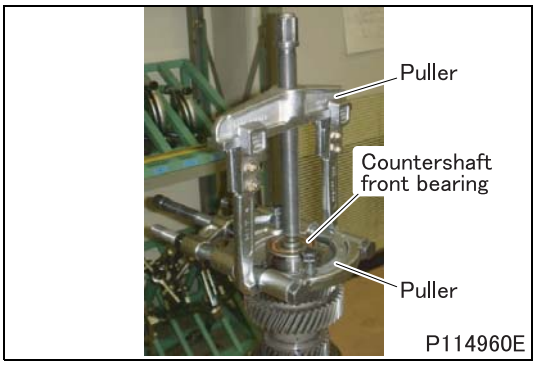
- If the measurement exceeds the limit, replace defective parts.



■ **Alignment marks: Each gear and each synchronizer**

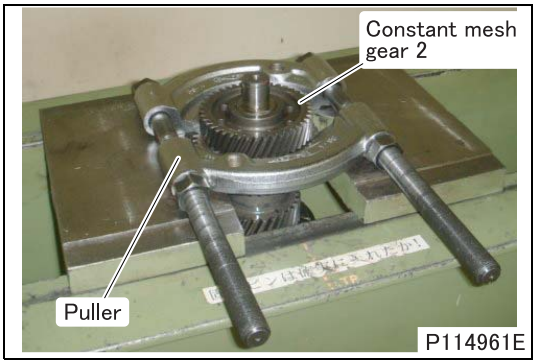
- Put alignment marks on the each gear and the synchronizer sleeve of the each synchronizer so that the combination of their mating surfaces can be maintained when reassembled.

◆Removal procedure◆



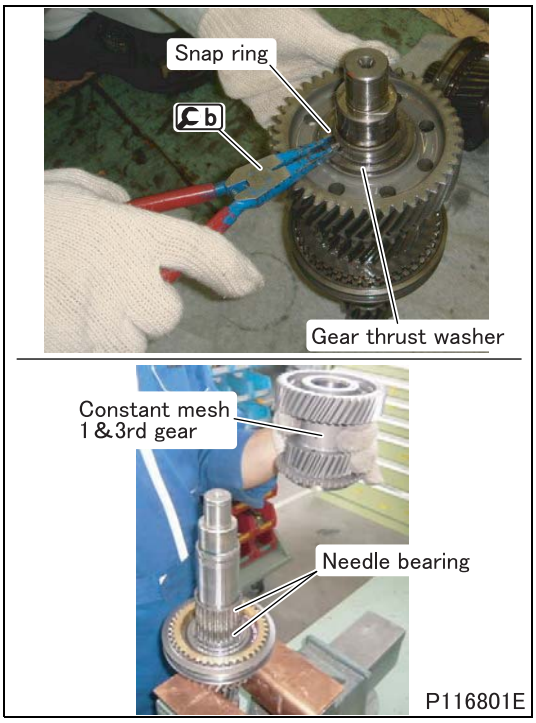
■ **Removal: Snap ring and countershaft front bearing**

- Remove the snap ring using Ⓒb.
- Remove the countershaft front bearing using a commercially available bearing puller and gear puller.



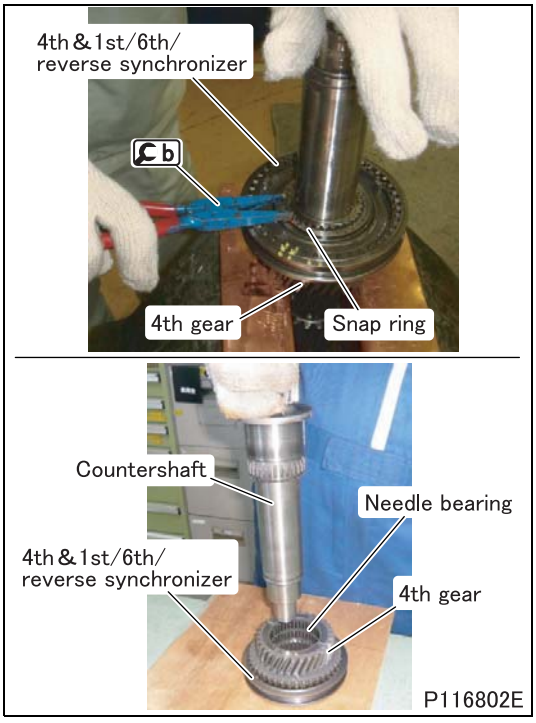
■ **Removal: Constant mesh gear 2**

- If the engagement of the constant mesh gear 2 is too stiff, install a commercially available bearing puller on the bottom of constant mesh gear 2, and then remove the gear by pushing it out with a press.



■ **Removal: Snap ring, gear thrust washer, constant mesh gear 1 and 3rd gear and needle bearing**

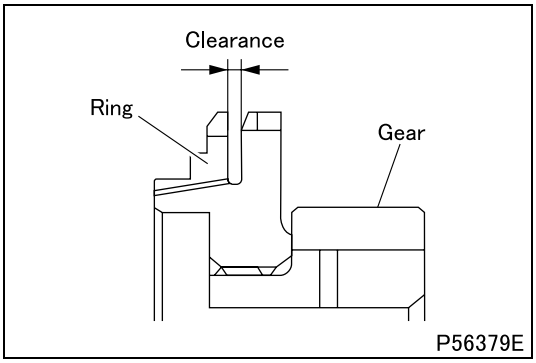
- Remove the snap ring using b.
- Remove each part.



■ **Removal: Snap ring, 4th and 1st/6th/reverse synchronizer, 4th gear and needle bearing**

- Remove the snap ring using b.
- Remove each part.
- When the 4th and 1st/6th/reverse synchronizer is fitted so tight, use a commercially available gear puller or the like to remove it.

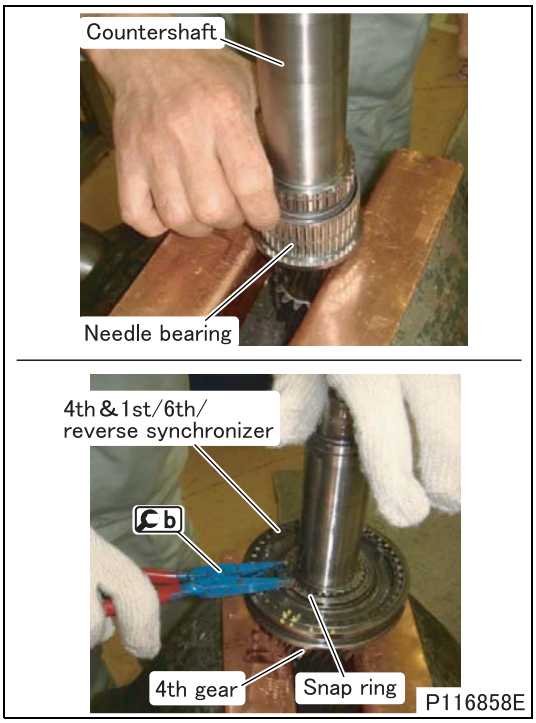
◆Inspection procedure◆



■ **Inspection: Clearance between 4th gear or constant mesh gear 1 and 3rd gear and synchronizer ring of 4th and 1st/6th/reverse synchronizer**

- When measuring the clearance, press the ring evenly against the gear and measure all around the circumference.
- If the measurement is less than the limit, replace the ring and the gear.

◆Installation procedure◆



■ **Installation: Needle bearing, 4th gear, 4th and 1st/6th/reverse synchronizer and snap ring**

- Apply oil to the sliding surfaces of the needle bearing and 4th and 1st/6th/reverse synchronizer.
- Install each part.
- If the 4th and 1st/6th/reverse synchronizer can not be installed easily, perform the following procedures for installation.

[Heating]

- Heat 4th and 1st/6th/reverse synchronizer evenly to 130°C {266°F} using one of the following methods.

<Temperature-controlled chamber>

- Heat 4th and 1st/6th/reverse synchronizer with a temperature setting of 130°C {266°F} for more than 15 minutes.

<Ring heater>

- Repeat a heating process two to three times with a temperature setting of 130°C {266°F} so that entire 4th and 1st/6th/reverse synchronizer is evenly heated to 130°C {266°F}.

CAUTION ⚠

- **Repeat the heating process two to three times because sufficient thermal expansion of 4th and 1st/6th/reverse synchronizer cannot be achieved in a single heating process.**

<Oil bath>

- Heat gear oil to 130°C {266°F} and immerse the 4th and 1st/6th/reverse synchronizer in the oil bath so that its mating part will be submerged entirely in the oil.
- Since gear oil temperature drops when 4th and 1st/6th/reverse synchronizer is immersed in the oil bath, reheat the oil to 130°C {266°F} and keep 4th and 1st/6th/reverse synchronizer immersed in the oil bath for more than 15 minutes while maintaining the oil temperature at 130°C {266°F}.

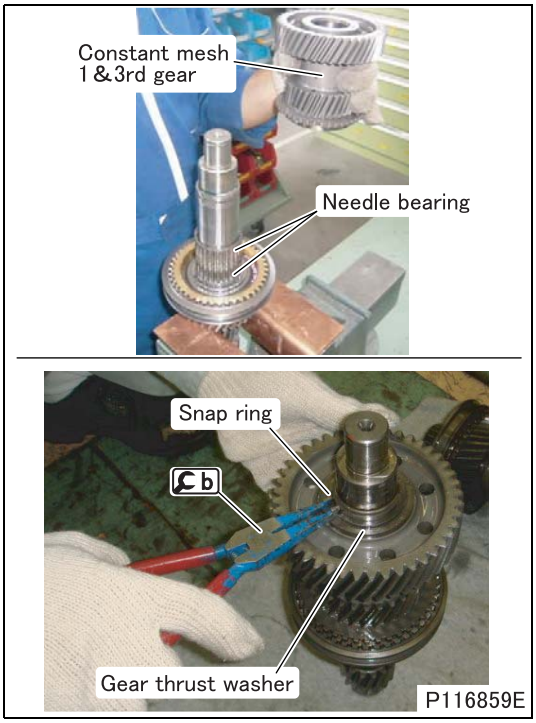
[Installation]

- Install heated 4th and 1st/6th/reverse synchronizer.

WARNING ⚠

- **Take care not to burn yourself when installing the hot 4th and 1st/6th/reverse synchronizer.**

- Install the snap ring using b.



■ Installation: Needle bearing, constant mesh gear 1 and 3rd gear, gear thrust washer and snap ring

- Apply oil to the sliding surface of the needle bearing.
- Install each part.
- Install the snap ring using b.

■ Installation: Constant mesh gear 2

[Heating]

- Heat constant mesh gear 2 evenly to 130°C {266°F} using one of the following methods.

<Temperature-controlled chamber>

- Heat constant mesh gear 2 with a temperature setting of 130°C {266°F} for more than 15 minutes.

<Ring heater>

- Repeat a heating process two to three times with a temperature setting of 130°C {266°F} so that entire constant mesh gear 2 is evenly heated to 130°C {266°F}.

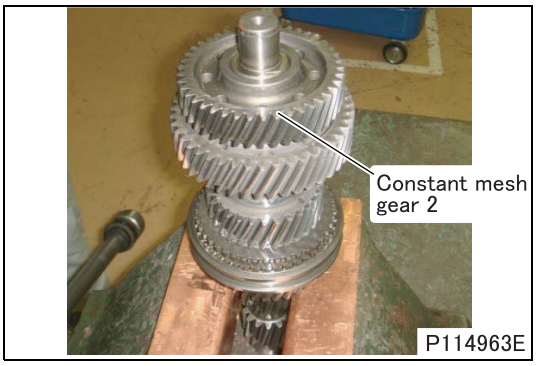
CAUTION ⚠

- **Repeat the heating process two to three times because sufficient thermal expansion of constant mesh gear 2 cannot be achieved in a single heating process.**

<Oil bath>

- Heat gear oil to 130°C {266°F} and immerse constant mesh gear 2 in the oil bath so that its mating part will be submerged entirely in the oil.

- Since gear oil temperature drops when constant mesh gear 2 is immersed in the oil bath, reheat the oil to 130°C {266°F} and keep constant mesh gear 2 immersed in the oil bath for more than 15 minutes while maintaining the oil temperature at 130°C {266°F}.



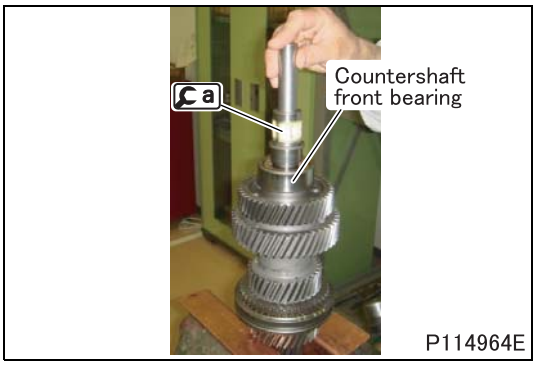
[Installation]

- Apply locking agent to the circumference of the constant mesh gear 2 mounting section of the countershaft.
- Install heated constant mesh gear 2.

WARNING ⚠

- **Take care not to burn yourself when installing the hot constant mesh gear 2.**

- When constant mesh gear 2 has sufficiently cooled down, install the snap ring using [b].

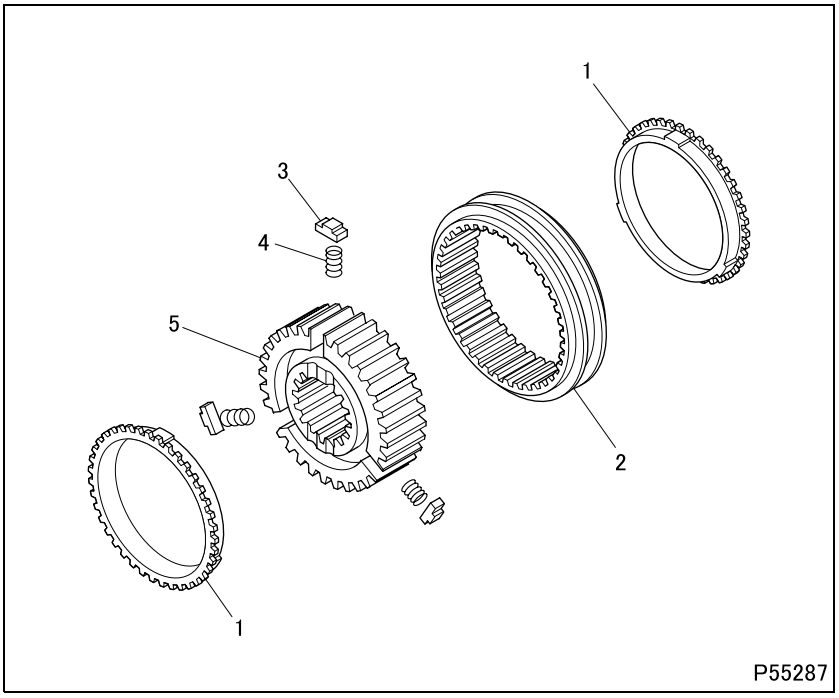


■ Installation: Countershaft front bearing

- Install the countershaft front bearing using [a].

M E M O

4th and 1st/6th/Reverse Synchronizer



● Disassembly sequence

1 Synchronizer ring
2 Synchronizer sleeve
3 Shifting plunger
4 Shifting plunger spring
5 Synchronizer hub

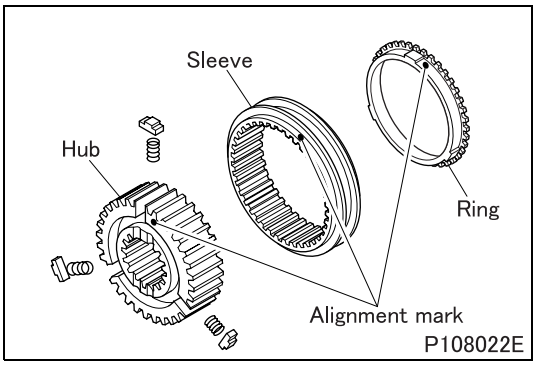
● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
1, 5	Clearance between synchronizer ring protrusion and synchronizer hub groove	4.8 to 5.1 {0.19 to 0.20}	5.8 {0.23}	Replace

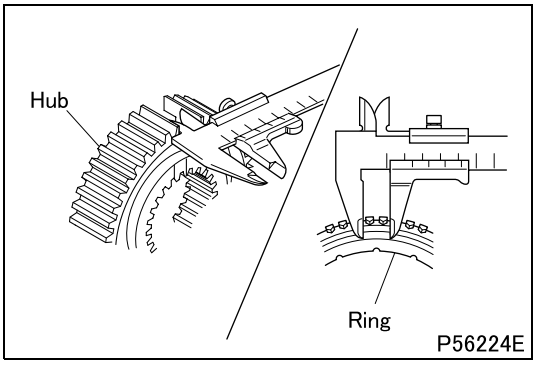
◆Work before removal◆



■ Alignment marks: Synchronizer ring and synchronizer hub

- Put alignment marks on the synchronizer ring and hub, each at one location aligning with the alignment mark put on the synchronizer sleeve before disassembly.

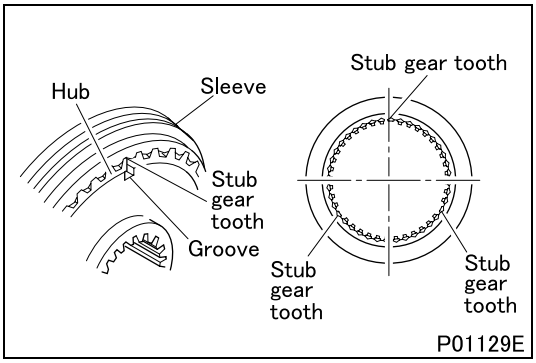
◆Inspection procedure◆



■ Inspection: Clearance between synchronizer ring protrusion and synchronizer hub groove

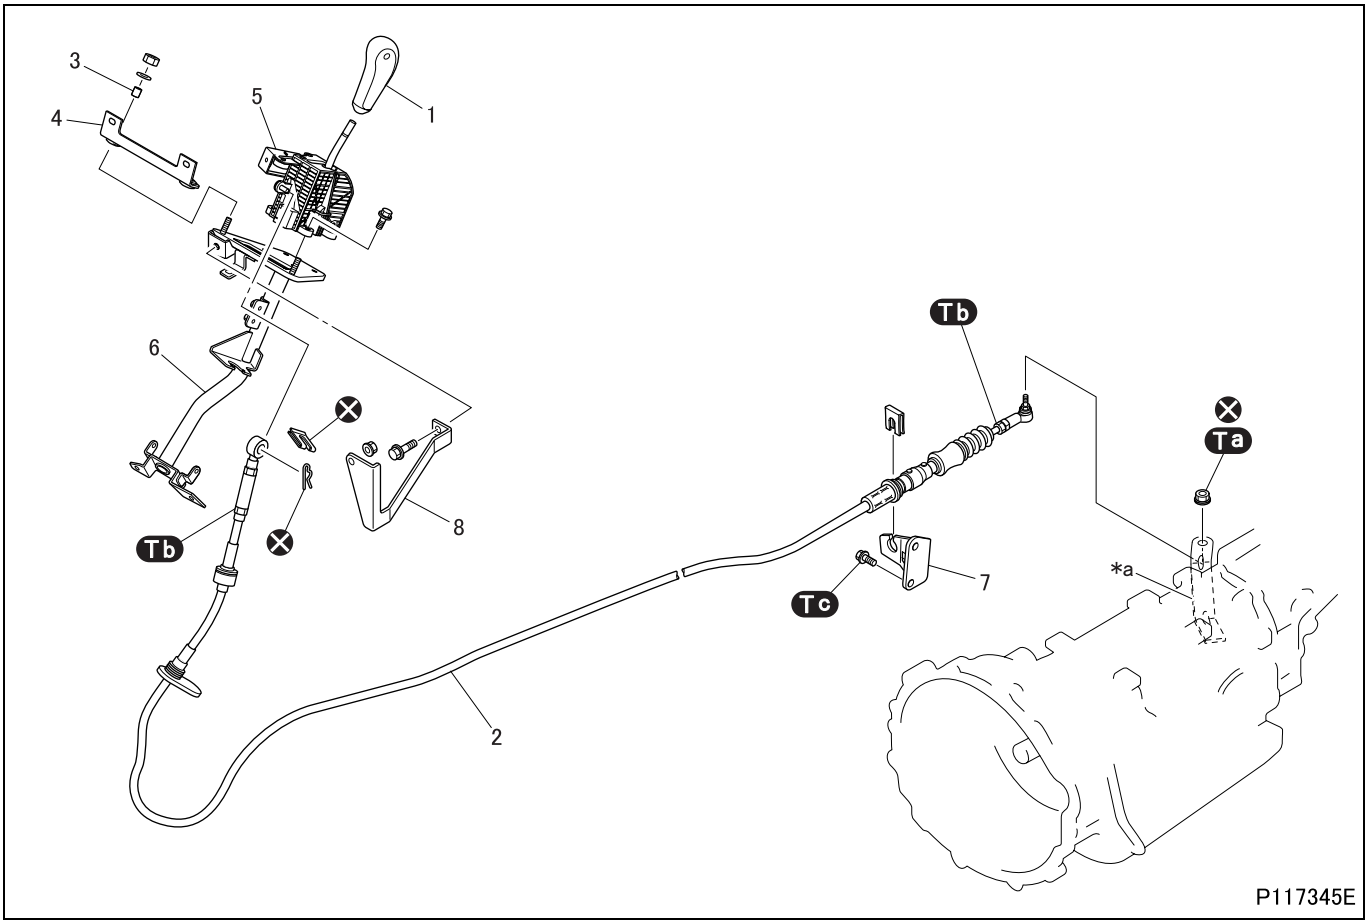
- If the clearance exceeds the limit, replace defective parts.

◆Installation procedure◆



■ Installation: Synchronizer sleeve and synchronizer hub

- When replacing the synchronizer sleeve or synchronizer hub with a new one, align the three keyways of the synchronizer hub with three locations of the stub gear tooth of the synchronizer sleeve to install.



● **Removal sequence**

1 Shift knob
2 P-range cable
3 Collar
4 Instrument panel bracket
5 Shift lever unit
6 Shift lever bracket
7 Bracket
8 Shift lever stay
***a**: Parking cable lever
⊗: Non-reusable parts

● **Installation sequence**

Follow the removal sequence in reverse.

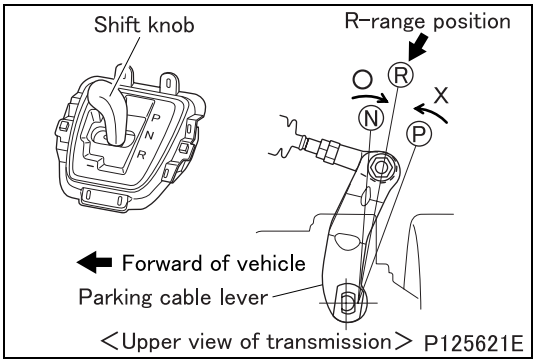
CAUTION ⚠

- **Locking agent is applied to the nuts that are designated as non-reusable. Be sure to replace these nuts if they have been loosened or removed.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Nut (P-range cable mounting)		19 to 24 {14 to 18, 1.9 to 2.4)	–
Tb	P-range cable	Lock nut on transmission side	10 to 15 {7.4 to 11.0, 1.0 to 1.5}	–
		Lock nut on change lever unit side	4 to 6 {3.0 to 4.4, 0.4 to 0.6}	–
Tc	Bolt (bracket mounting}		37 to 53 {27 to 39, 3.8 to 5.4}	–

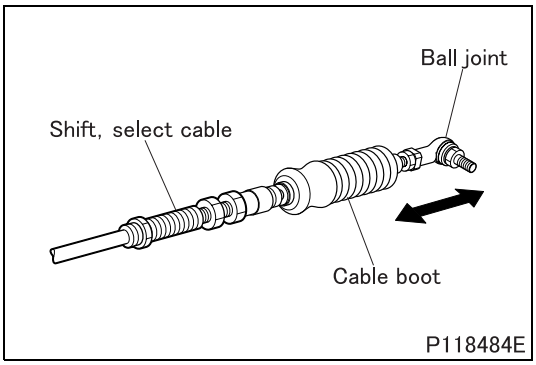
◆Work before removal◆



■ **Adjustment: Gear shift lever**

- Place the gear shift lever in the R-range position before starting removal work because installation work will be performed in the R range position. Operate the shift lever into the R-range position from the N-range.
- If the shift lever is placed into the R-range due to a discharged battery or an electric circuit not connected yet, operate the shift lock release lever to place the shift lever into the R range. (See Gr00.)

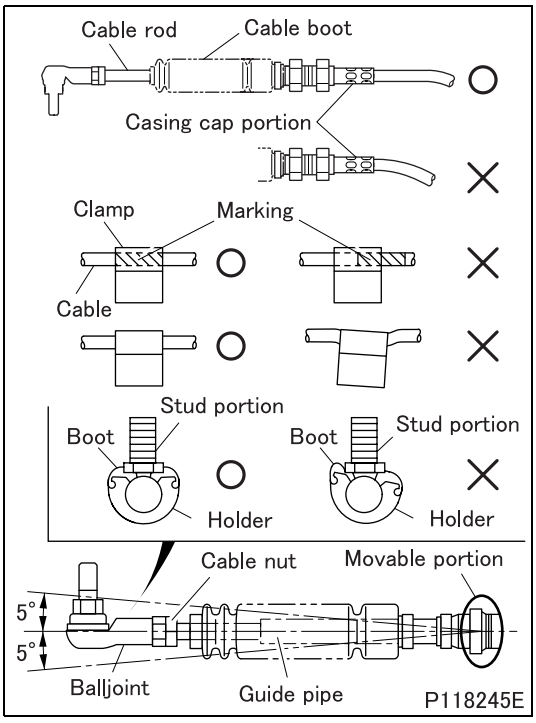
◆Inspection procedure◆



■ **Inspection: P-range cable**

- Check the damage and deformation to the attached parts of clamp and bracket. If any fault is found, replace the fault parts.
- Check the motion of cable, bend of limited parts and damage of the cable. If any fault is found, replace the cable.
- Check the damage to the cable boot and ball joint. If any fault is found, replace the cable.

◆Installation procedure◆

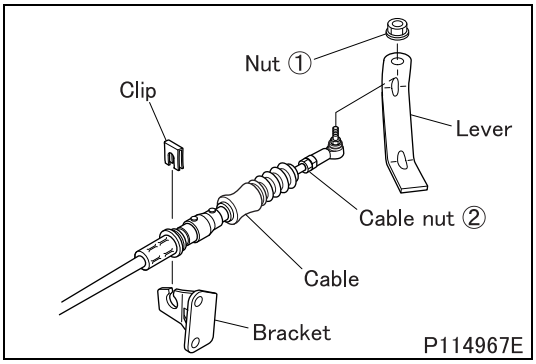


■ **Installation: P-range cable**

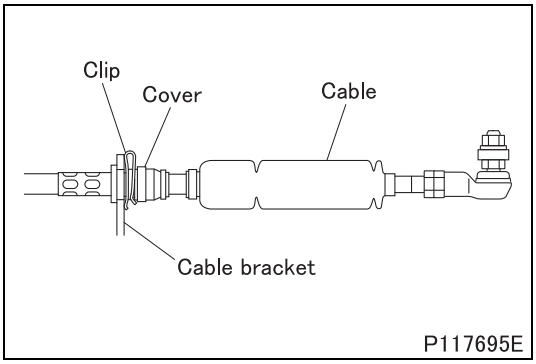
- Allow a bending radius of 260 mm {10.2in} or more during storage and handling of the cables. Keep a bending radius as much as possible even after the cables are installed.
- Install the cable such that only a minimal bending force is applied to the under head portion of the casing cap.
- Avoid subjecting the guide pipe movable portion at the cable end to movement exceeding a permissible angle of 5 degrees.
- Make sure that each clamp is installed with the same orientation as that before removal.
- Where cable clamping positions are identified with a mark, install the clamp in such a way that it covers the marking completely.
- Install each clamp such that it is perpendicular to the cable.
- Make sure that the joint at the cable end is installed with the same orientation as that before removal.
- If there is an uneven contact between the holder portion boot and stud portion of the ball joint at the cable end, or if the cable boot kinks, remove the cable from the levers on both ends of the cable and perform the following adjustment procedure:
  - Rotate the cable rod to remove the kink from the cable boot.
  - Loosen the cable nut and adjust orientation of the ball joint within a half turn.

CAUTION ⚠

- **To prevent damage, check that the engagement margin in threads between the ball joint and cable rod is 8 mm {0.31in} or more.**



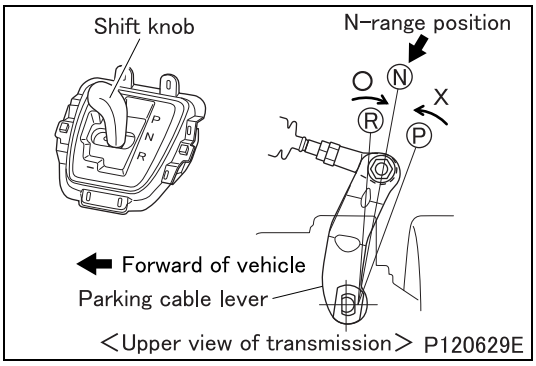
- Install the cable on the bracket and parking cable lever.



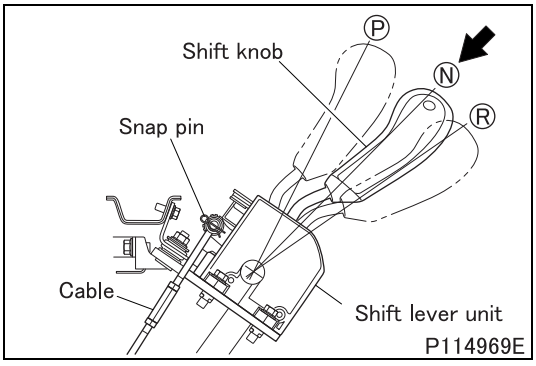
- Fix the cable with a clip with care not to allow an excessive force to be applied to the cable.
- Fit the clip all the way.

CAUTION ⚠

- **Be careful not to damage the cable cover when securing the cable with the clip.**

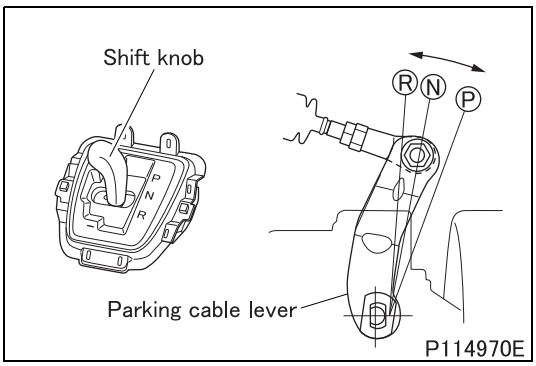


- Place the shift knob and parking cable lever to the N range positions, respectively.Operate the shift lever into the N range position from the R range.If the shift knob cannot be shifted from the D to N range position, operate the shift lock release lever of the shift lever unit to move the lever of the shift lever unit to which the P range cable is connected to the N range. This may dissolve the above problem. (See Gr00.)



- After checking that the shift knob is in the N range position, install the P range cable on the shift lever unit.

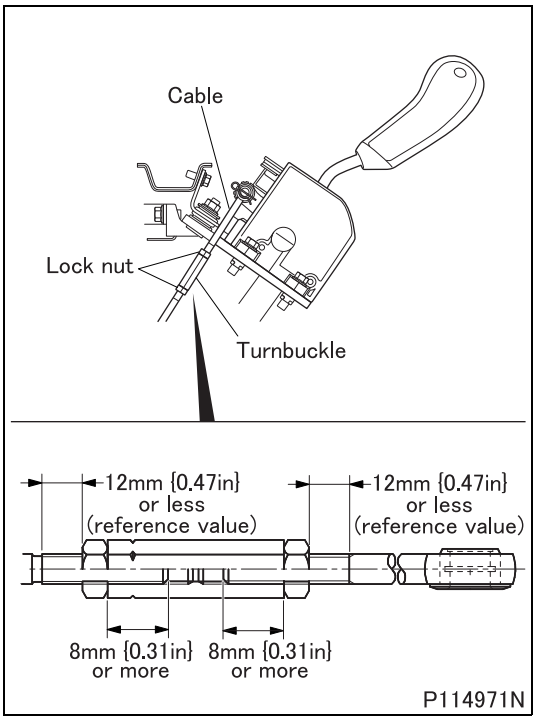
◆Work after installation◆



■ Inspection: Shift knob

[Inspection]

- Operate the shift knob to and fro between the P and R range positions two to three times, and then check the following.
  (1) The parking cable lever is positioned in the range corresponding to the shift knob position without any deviation and the indicator for the selected range in the meter cluster lights up.Then, shift the knob from P to N to D to N range position a few times. Check if you do not feel any resistance when shifting from D to N range position.
  (2) Hard operation or poor detent feel is not observed in any of the ranges.
- If any abnormality is found, or if resistance is felt when operating the shift knob from D to N range position, adjust the P range cable.



[Adjustment]

- Loosen the lock nuts of the P range cable. Adjust the cable length so that no tension is applied to the cable when the lever is in the N range position by turning the turnbuckle.
- Make sure that the engagement margins of the threads of the turnbuckle comply with the specified dimensions.

CAUTION ⚠

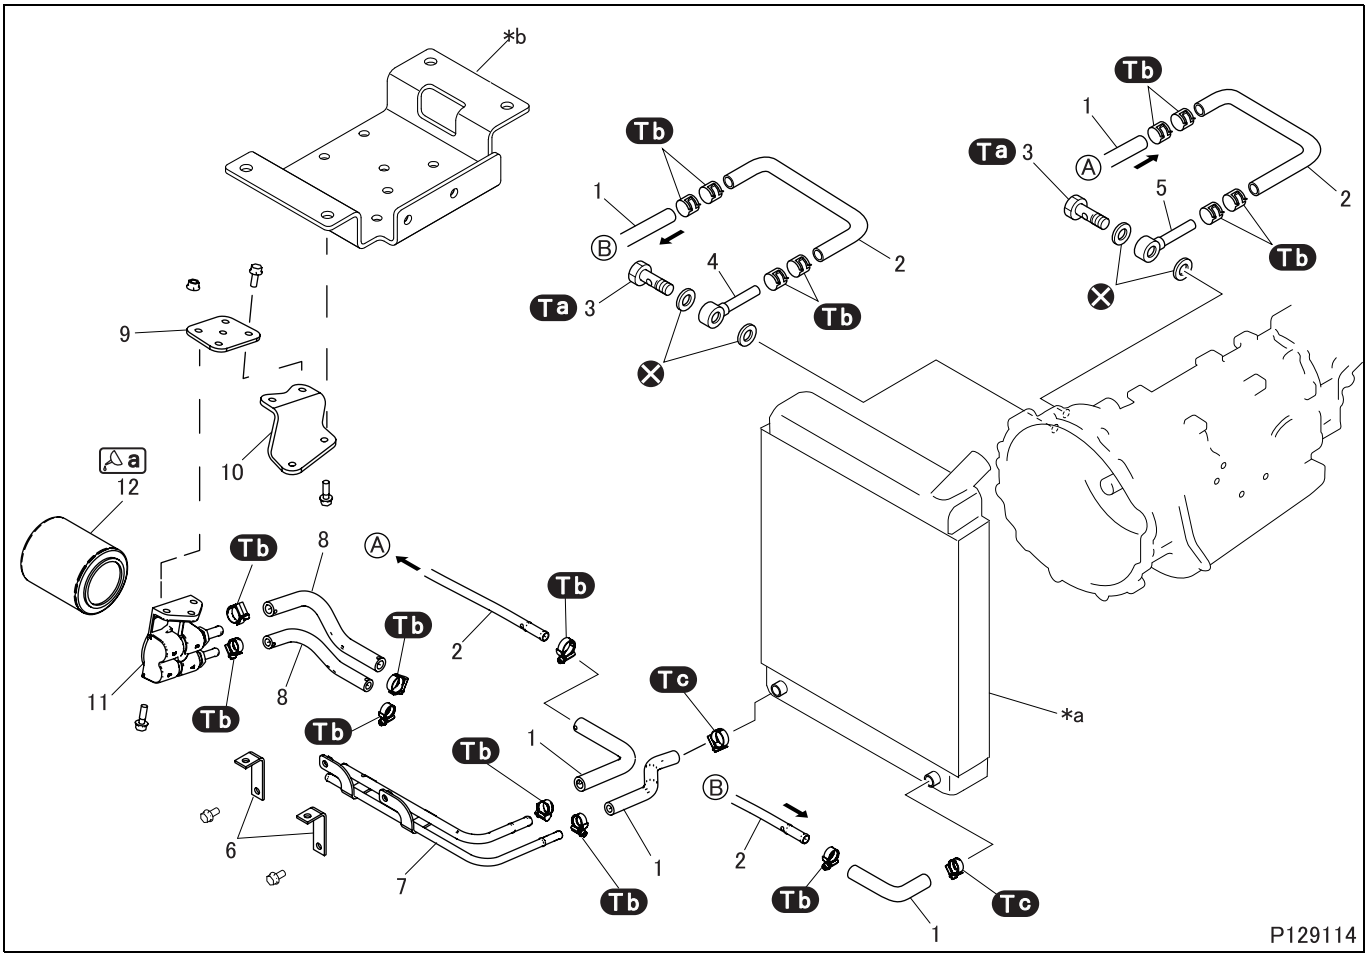
- **Do not adjust the P range cable length on the ball joint side (parking cable lever side).**
- **An engagement margin of the threads of the turnbuckle that falls short of the specified dimension could cause a breakage.**

- Tighten the lock nuts.
- After adjustment, inspect the P range cable again to check that there is no problem.
- If there is a problem that cannot be solved by adjustment, inspect the indicator-related parts in the meter cluster circuit.

CAUTION ⚠

- **If the P range cable is not adjusted correctly, it can be a cause of shift operation failure such as inoperative shifting from D to N range. Adjust the P range cable properly until no resistance is felt when shifting from D to N range position.**

OIL COOLER



● **Removal sequence**

1 Oil cooler tube
2 Oil cooler hose
3 Eyebolt
4 Oil cooler feed tube
5 Oil cooler return tube
6 Oil pipe bracket
7 Oil cooler pipe
8 Oil cooler hose
9 Clutch control fluid filter plate
10 Clutch control fluid filter bracket
11 Clutch control fluid filter head
12 Clutch control fluid filter

***a**: Radiator
⊗: Non-reusable parts

● **Installation sequence**

Follow the removal sequence in reverse.

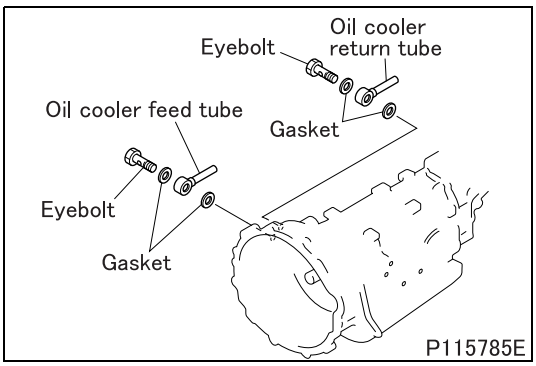
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Eyebolt	43 to 57 {32 to 42, 4.4 to 5.8}	–
Tb	Clip band (oil cooler tube and hose mounting)	2.5 to 3.0 {1.8 to 2.2, 0.25 to 0.30}	–
Tc	Clip band (oil cooler hose mounting)	1.3 to 1.8 {1.0 to 1.3, 0.13 to 0.18}	–

Lubricant and/or sealant

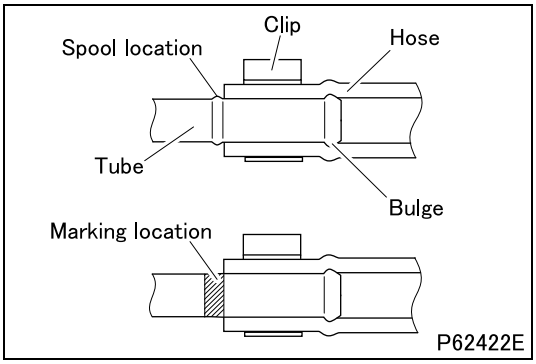
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Apply entire circumference of the gasket for clutch control fluid filter	FUSO ATF-SP III	As required

◆Installation procedure◆



■ Installation: Eyebolt

- Install the oil cooler feed tube and oil cooler return tube on the transmission with the eyebolts.

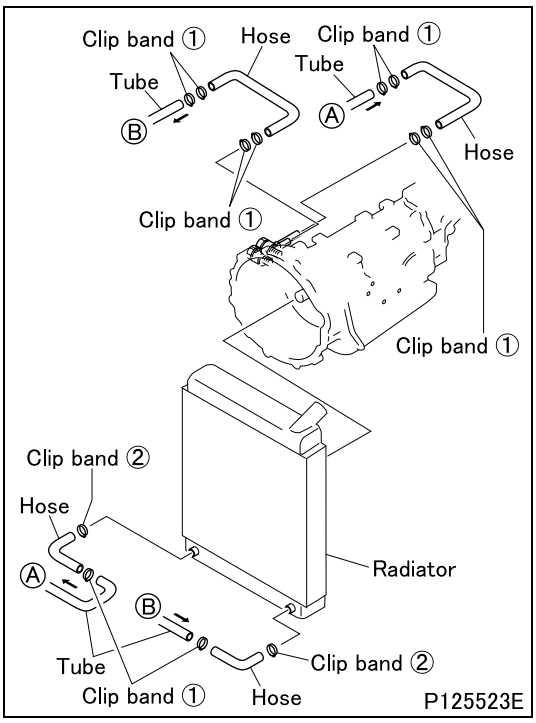


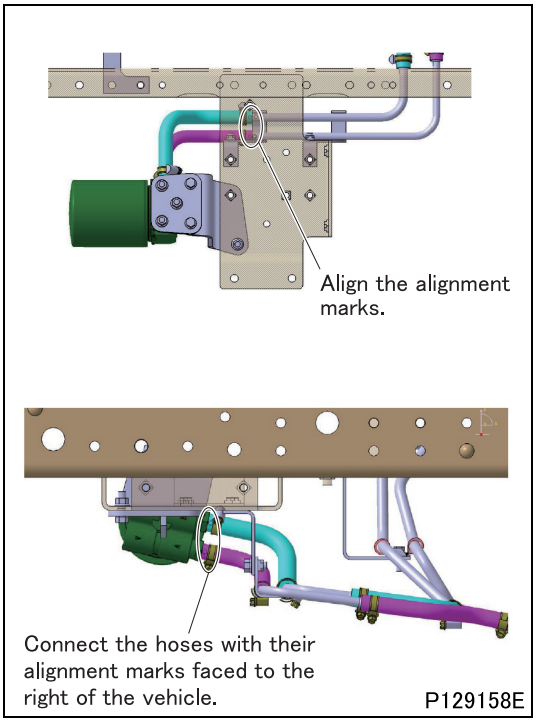
■ Installation: Oil cooler hose

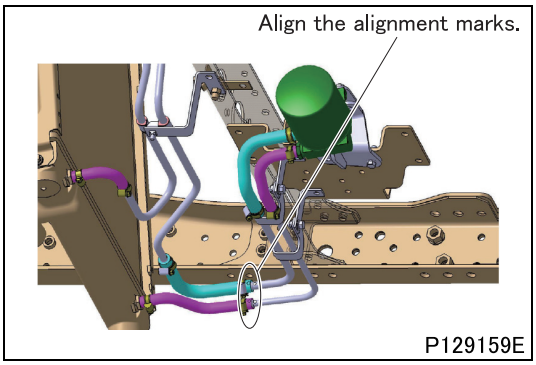
- Fit the oil cooler hose all the way to the spool or marking location at the end or the oil cooler tube.
- Fasten the hose with the clip avoiding the bulge.

CAUTION ⚠

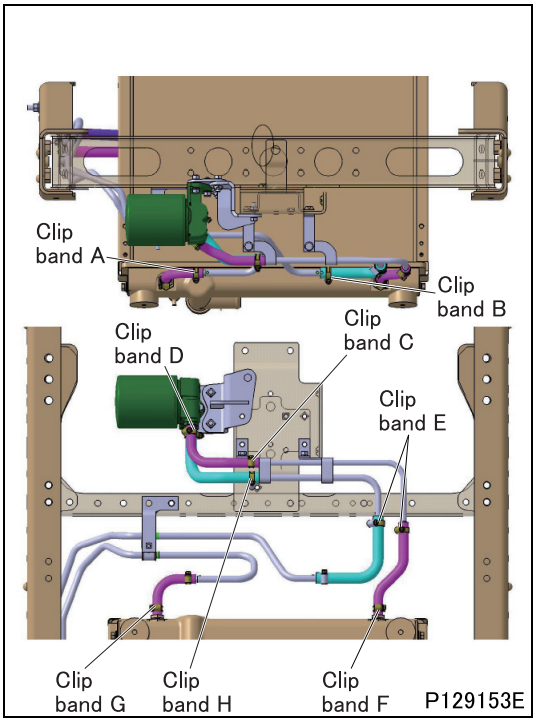
- **Install the oil cooler hose without forced bend and twist.**
- **When installing the oil cooler hose, do not apply oil to its joints.**





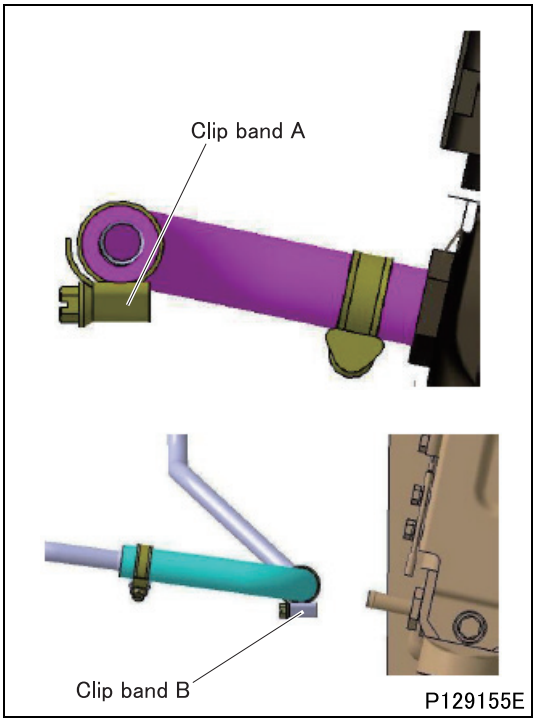


- Connect the hoses with their alignment marks aligned as shown in the drawing.



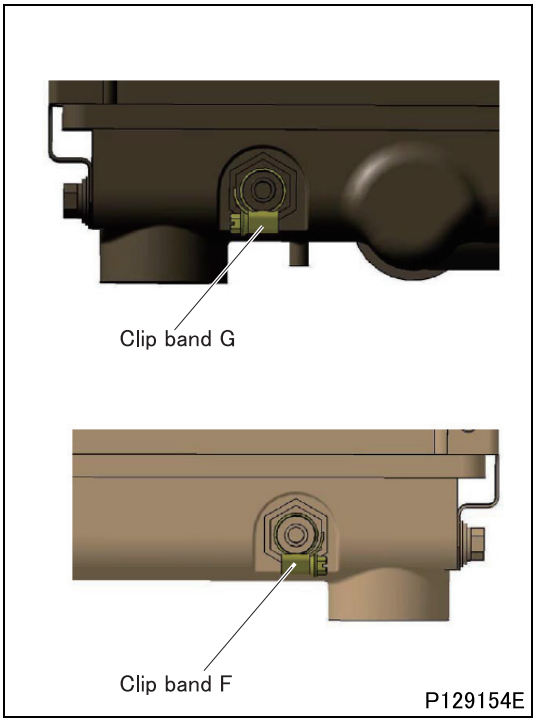
■ **Installation: Clip band**

- Install the clip bands to the positions shown in the drawing.



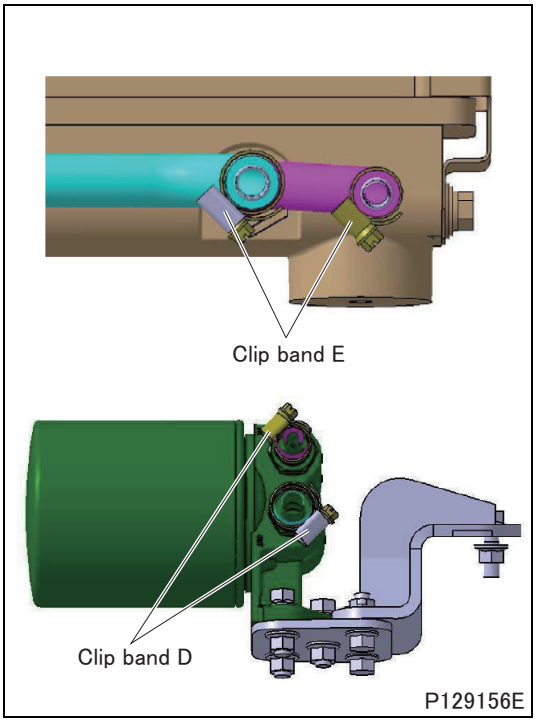
■ **Installation: Clip band A, Clip band B**

- Install each clip band with its screw head faced toward the front of the vehicle.



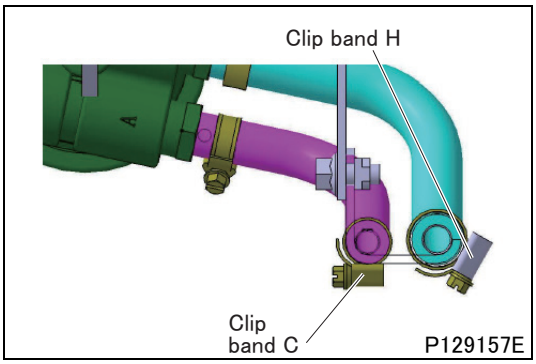
■ **Installation: Clip band F, Clip band G**

- Install the clip band F with its screw head faced toward the left of the vehicle.
- Install the clip band G with its screw head faced toward the right of the vehicle.



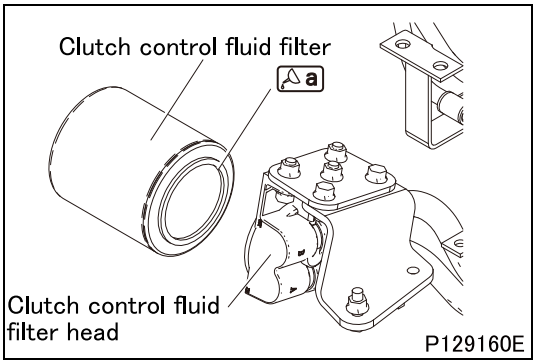
■ **Installation: Clip band D, Clip band E**

- Install the clip bands D and E with their screw heads faced toward the lower left from the vehicle.



■ **Installation: Clip band C, Clip band H**

- Install the clip band C with its screw head faced toward the front of the vehicle.
- Install the clip band H with its screw head faced toward the lower front of the vehicle.



■ **Installation: Clutch control fluid filter**

- Apply a to the entire periphery of the filter gasket.
- Screw in the filter. From the point where the gasket contacts the filter head, tighten the filter further 3/4 to 1 turn.

CAUTION ⚠

- **Do not tighten the filter over the specified limit.**

- Start the engine, set the shift knob to all the ranges and then return to the P range.
- Check the filter for leakage of ATF.

◆Work after installation◆

■ **Inspection: Automatic transmission fluid quantity**

- After oil line is removed, check the automatic transmission fluid level and replenish the fluid if necessary. (See “ON-VEHICLE INSPECTION AND ADJUSTMENT”.)

TRANSMISSION POWER TAKE-OFF <STANDARD TYPE>

● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
13, 14	Play in diameter direction of power take-off gear	0.07 to 0.11 {0.0028 to 0.0043}	0.2 {0.0079}	Replace
15, 17	Clearance between power take-off shift sleeve and power take-off shift fork	0.3 to 0.5 {0.012 to 0.020}	1.0 {0.039}	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (bracket, vacuum chamber and front cover mounting)	23.2 {17, 2.37}	–
Tb	Vacuum chamber joint mounting nut	9.8 to 15.6 {7.2 to 12, 1.0 to 1.6}	–
Tc	Power take-off control switch	49 {36, 5}	Sealant
Td	Power take-off shift fork mounting section on power take-off shift rail	83.4 {62, 8.5}	–
Te	Set bolt	11.2 {8.3, 1.14}	–
	Nut (power take-off companion flange mounting)		
Tf	Nut (clip bracket mounting)	12.7 {9.4, 1.3}	–

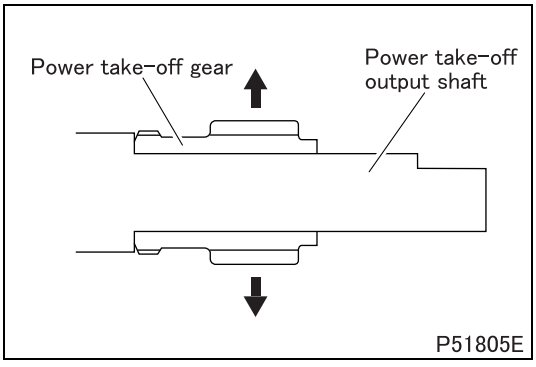
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Threads of power take-off control switch	ThreeBond 1105	As required
b	Sliding section of clevis pin	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
	Oil seal lips		
c	Power take-off case mating surface of front cover	ThreeBond 1194	As required
	Outer circumference of oil seal		

◆Work before removal◆

■ Removal: Transmission power take-off

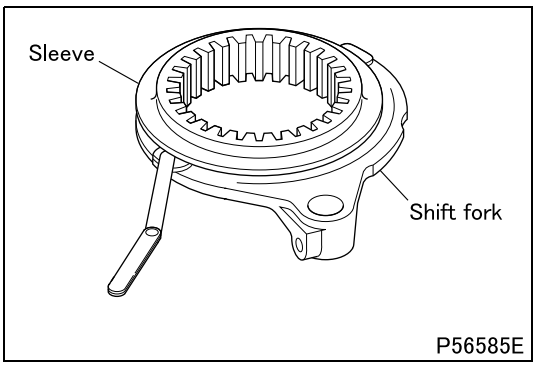
- Remove the transmission power take-off. (See “REVERSE IDLER GEAR”.)



■ Inspection: Play in the diameter direction of power take-off gear

- If the measurement exceeds the limit, replace defective parts.

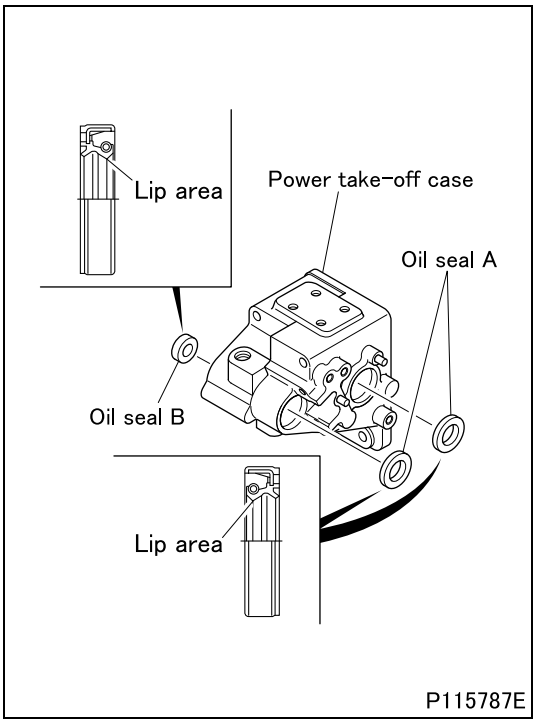
◆Inspection procedure◆



■ **Inspection: Clearance between power take-off shift sleeve and power take-off shift fork**

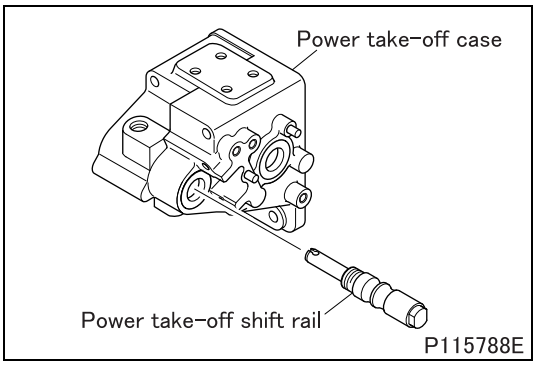
- If the measurement exceeds the limit, replace defective parts.

◆Installation procedure◆



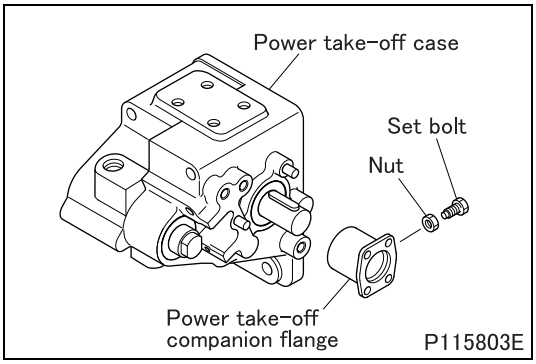
■ **Installation: Oil seal**

- Apply sealant to the outer circumference of the oil seal A.
- Apply grease to the oil seal A, B lips and install the oil seals to the power take-off case.



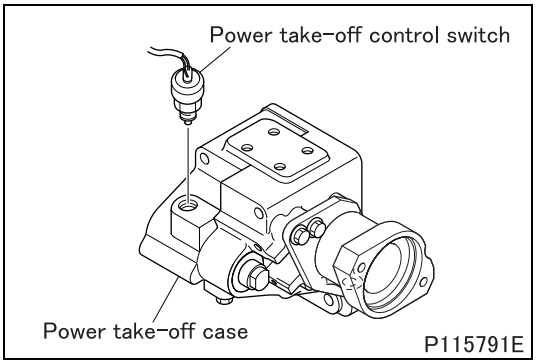
■ **Installation: Power take-off shift rail**

- Install the power take-off shift rail to the power take-off case.



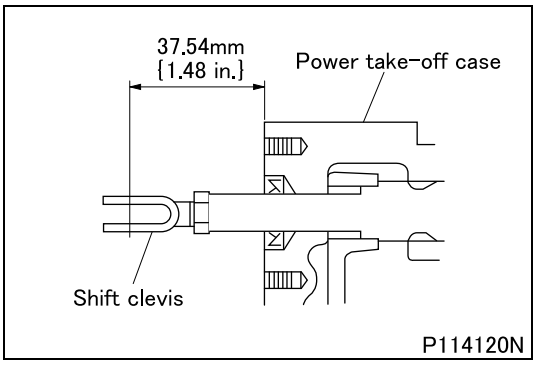
■ **Installation: Power take-off companion flange**

- Install the power take-off companion flange to the power take-off case and install the nut and set bolt.



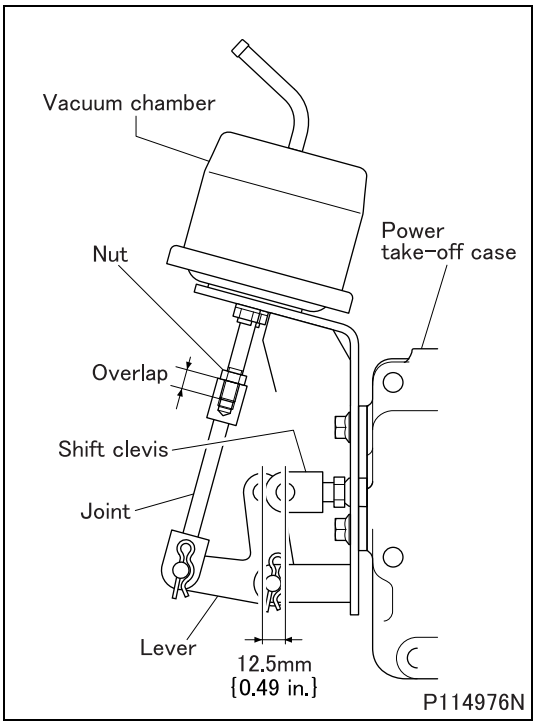
■ **Installation: Power take-off control switch**

- Apply sealant to the threads of the power take-off control switch and install it to the power take-off case.



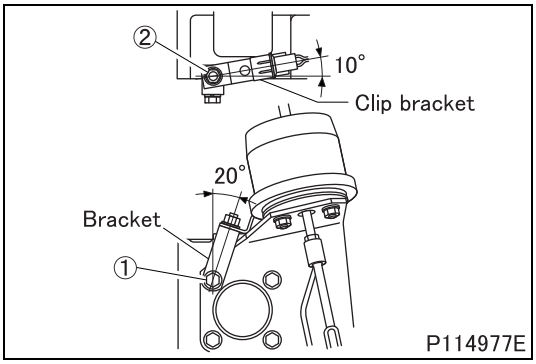
■ **Installation: Shift clevis**

- Install the shift clevis while adjusting the distance from the center of the shift clevis hole to the end surface of the power take-off case as shown in the drawing.



■ **Installation: Vacuum chamber**

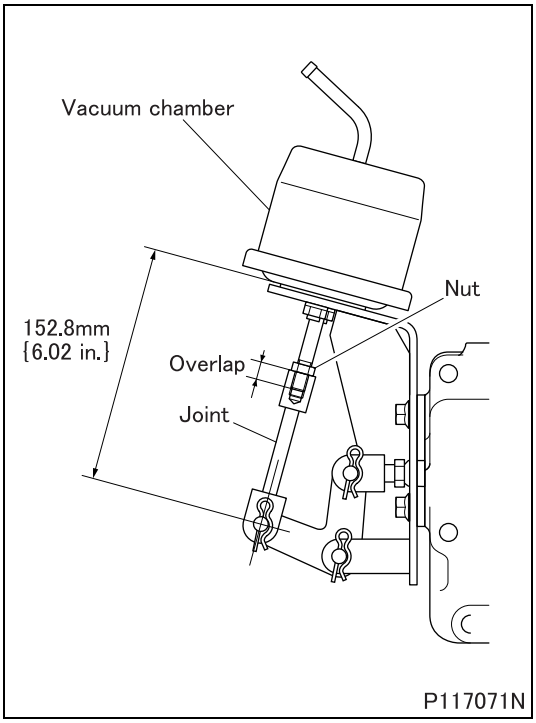
- Apply sealant to the power take-off case mating surface of the front cover. Install the vacuum chamber and front cover to the power take-off case.
- Measure the distance between the centers of the holes in the shift clevis and lever.
- If the measurement does not match the value shown in the drawing, adjust by turning the shift clevis or joint.
- If the adjustment is performed by turning the joint, secure the overlap of the joint and the rod of the vacuum chamber by 8 threads or more.
- After adjustment, tighten the nut to the specified torque.
- Push in the joint to align the holes in the lever and shift clevis and connect them with the clevis pin.
- Apply ℄b to the sliding surface of the clevis pin before installing the clevis pin.



■ **Installation: Bracket and clip bracket**

- Install the bracket and clip bracket as shown in the drawing.

◆Work after installation◆



■ **Adjustment: Vacuum chamber**

- Measure the distance from the bottom of the vacuum chamber to the center of the hole in the joint.
- If the measurement does not match the value shown in the drawing, adjust by turning the joint. In this case, secure the overlap of the joint and the rod of the vacuum chamber by 8 threads or more.
- After adjustment, tighten the nut to the specified torque.

■ **Installation: Transmission power take-off**

- Install the transmission power take-off. (See “REVERSE IDLER GEAR”.)

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
5	Airtightness of vacuum chamber (inspection vacuum: 66.7 kPa {19.7 in.Hg, 500 mmHg}, 15 seconds)	Vacuum: 63 kPa {18.6 in.Hg, 475 mmHg} or more	–	Replace

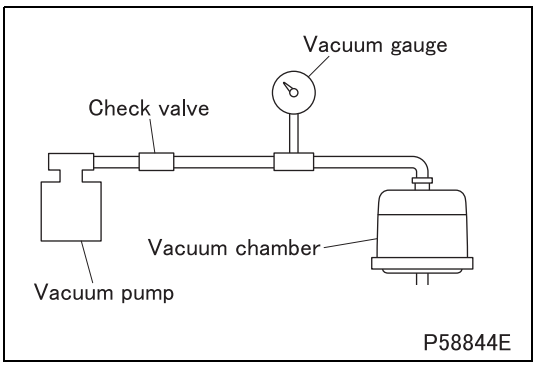
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (mounting joint)	9.8 to 15.6 {7.2 to 12.0, 1.0 to 1.6}	–
	Nut (mounting vacuum chamber)		

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Mounting threads of vacuum chamber	ThreeBond 1211	As required

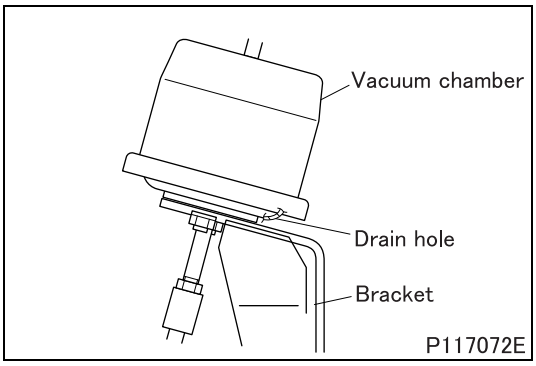
◆Inspection procedure◆



■ Inspection: Vacuum chamber

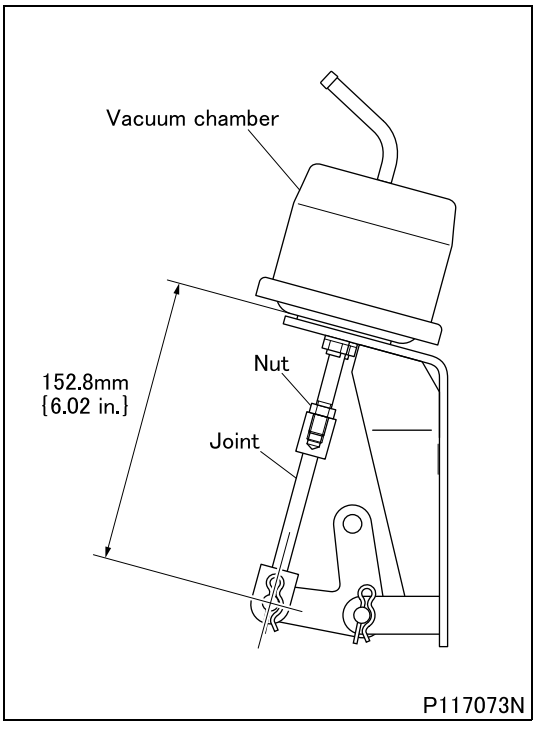
- Connect the vacuum pump, check valve and vacuum gauge to the vacuum chamber as shown in the drawing. Using the vacuum pump, apply specified vacuum to the vacuum chamber.
- After 15 seconds, read the vacuum on the vacuum gauge.
- If the measurement is out of the standard value, replace the vacuum chamber.

◆Installation procedure◆



■ Installation: Vacuum chamber

- Apply sealant to the threads of the vacuum chamber and install it to the bracket in the direction shown in the drawing.



■ Installation: Joint

- Install the joint so that the distance from the bottom of the vacuum chamber to the center of the hole in the joint should be as shown in the drawing. Then tighten the nut to the specified torque.

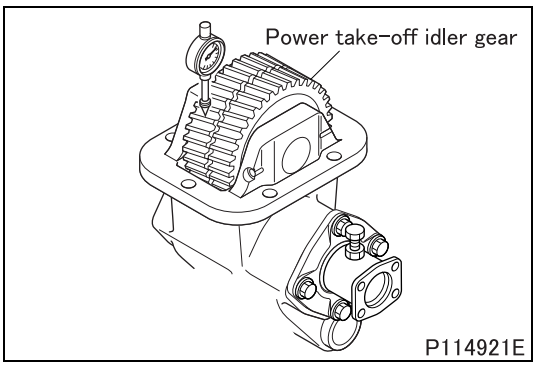
b	Threads of power take-off control switch	ThreeBond 1105	As required
	Threads of inspection plug		
c	Sliding area of clevis pin	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
	Oil seal lips		
	Sliding area of power take-off shift rail		

◆Work before removal◆

■ **Removal: Transmission power take-off**

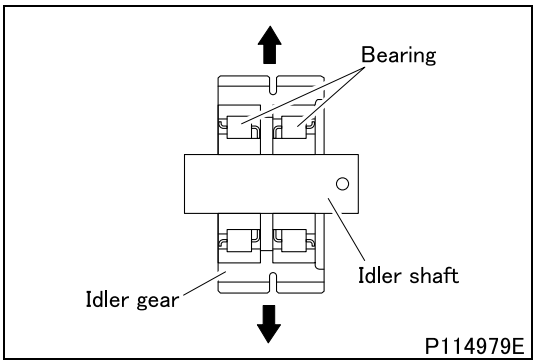
- Remove the transmission power take-off. (See “REVERSE IDLER GEAR”.)



■ **Inspection: Backlash between power take-off idler gear and power take-off output gear**

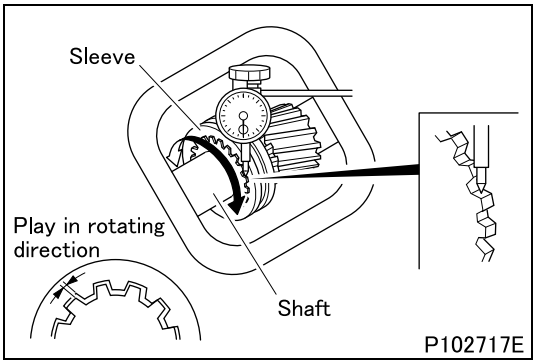
- If measurement exceeds the limit, replace defective parts.

◆Removal procedure◆



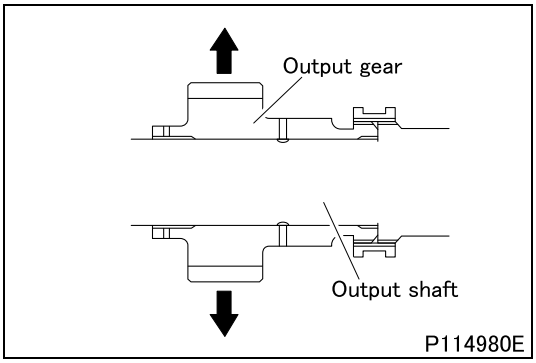
■ **Inspection: Play of power take-off idler gear in diameter direction**

- If measurement exceeds the limit, replace defective parts.



■ **Inspection: Play of power take-off output shaft and power take-off shift sleeve in rotating direction**

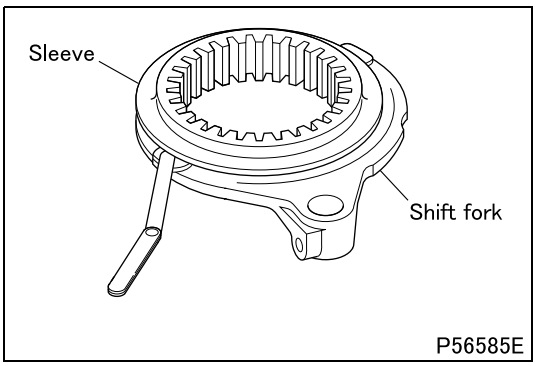
- Measure the play by turning the power take-off output shaft while holding the power take-off shift sleeve in place.
- If measurement exceeds the limit, replace defective parts.



■ **Inspection: Play of power take-off output gear in diameter direction**

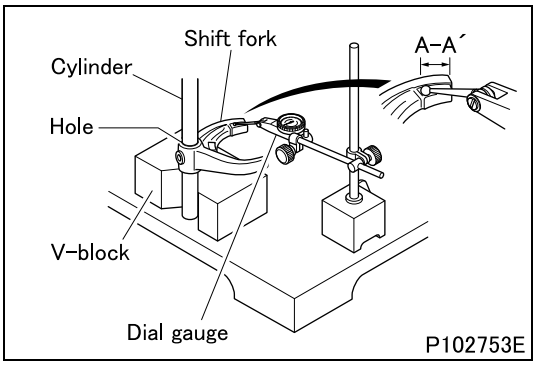
- If measurement exceeds the limit, replace defective parts.

◆Inspection procedure◆



■ **Inspection: Clearance between power take-off shift sleeve and power take-off shift fork**

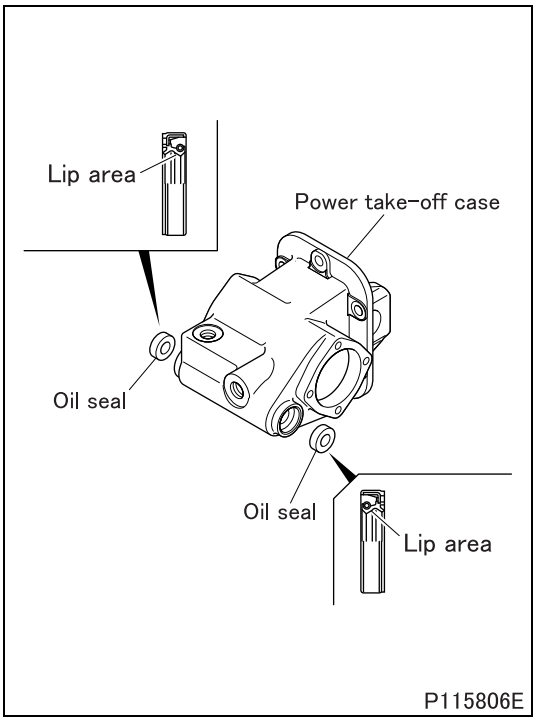
- If the measurement exceeds the limit, replace defective parts.



■ **Inspection: Tilt of power take-off shift fork claw**

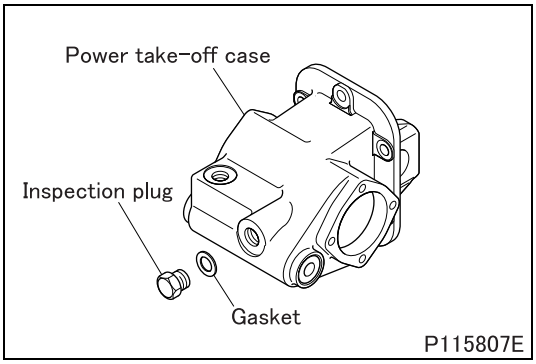
- Measure the tilt (difference between A and A') of claw A-A' against the power take-off air cylinder hole of power take-off shift fork with pressing the air cylinder to the V-rail of the V-block and standing it vertically.
- If the measurement exceeds the limit, replace the power take-off shift fork.

◆Installation procedure◆



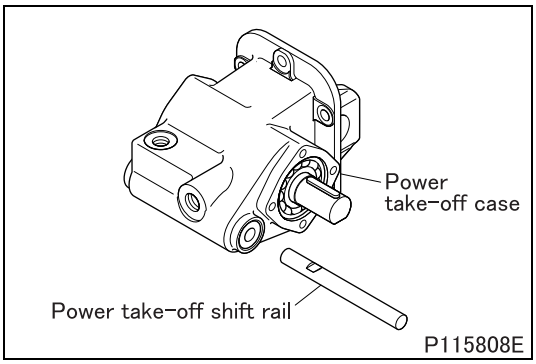
■ **Installation: Oil seal**

- Apply grease to the oil seal lips and install the oil seals to the power take-off case.



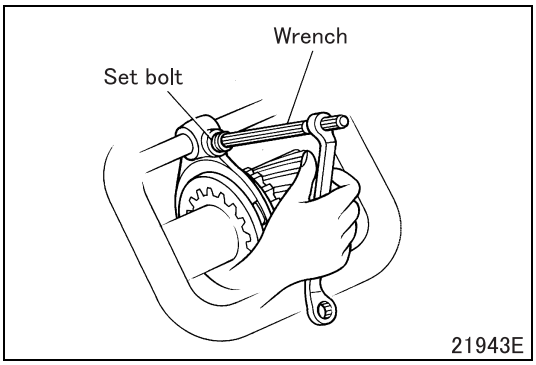
■ **Installation: Inspection plug**

- Apply sealant to the threads of the inspection plug and install it to the power take-off case.



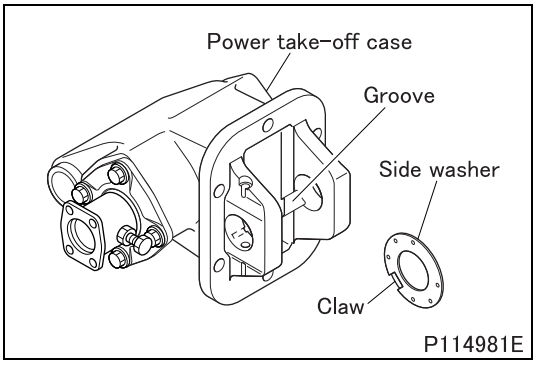
■ **Installation: Power take-off shift rail**

- Apply grease to the sliding section of the power take-off shift rail and install it to the power take-off shift fork.



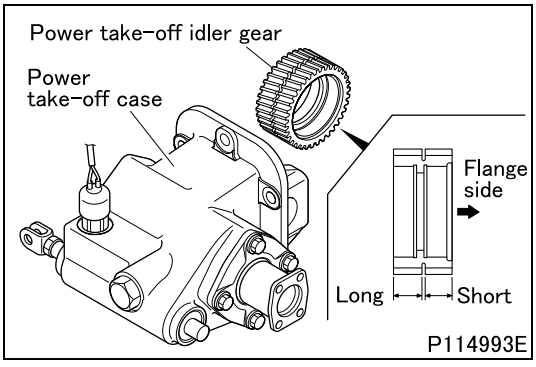
■ **Installation: Set bolt**

- Install the set bolt using a hexagon wrench.
- After tightening the bolt, stake the thread area at three places or more with the punch.



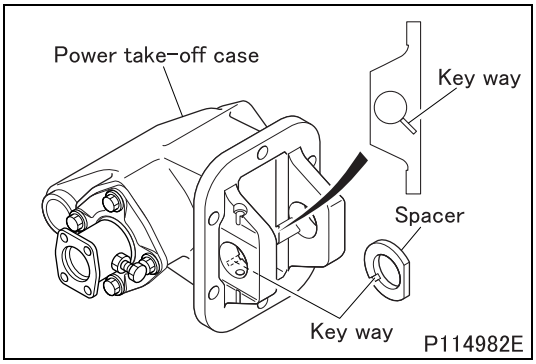
■ **Installation: Side washer**

- Install the side washer so that its claw fits into the groove in the power take-off case.



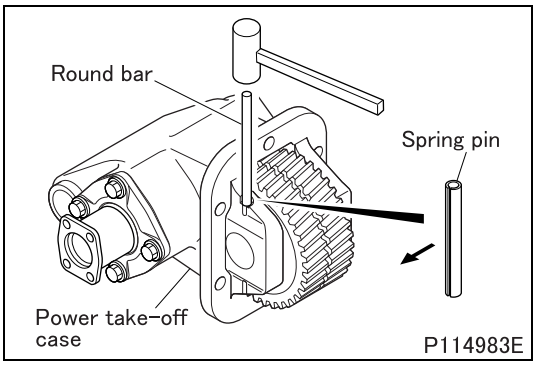
■ **Installation: Power take-off idler gear**

- Install the power take-off idler gear to the power take-off case in the direction shown in the drawing.



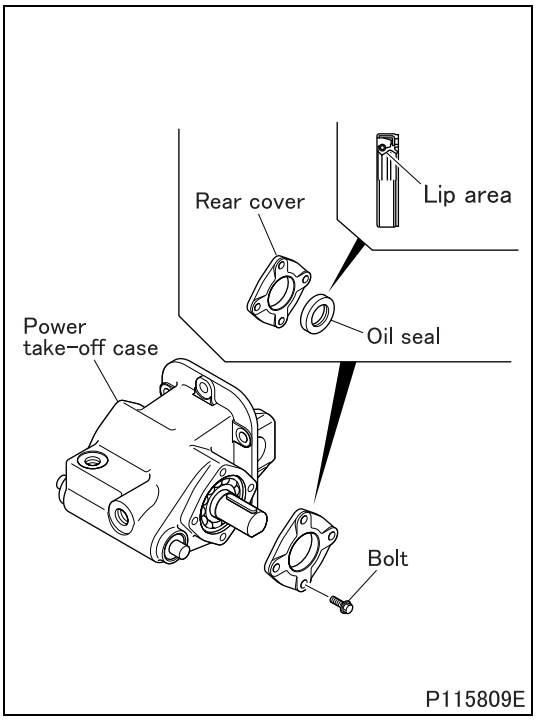
■ **Installation: Spacer**

- Install the spacer while aligning its keyway with that on the power take-off case.



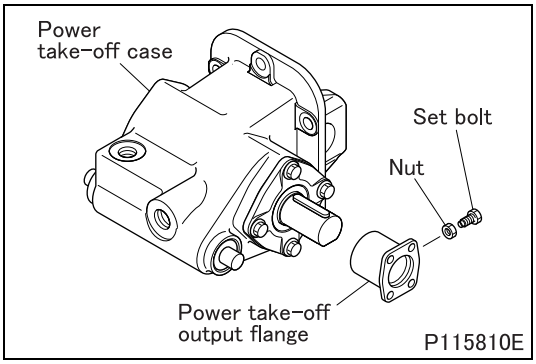
■ **Installation: Spring pin**

- Install the spring pin to the power take-off case in the direction shown in the drawing using a round rod of 6 mm {0.24 in.} in diameter.



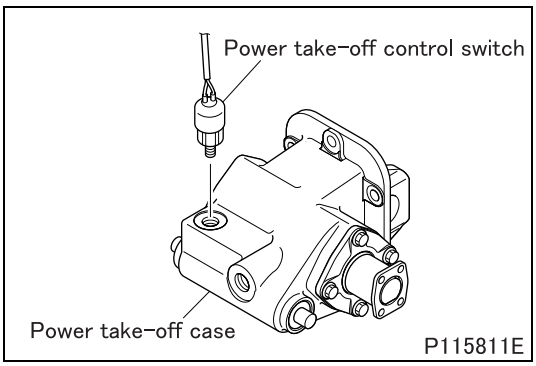
■ **Installation: Oil seal and rear cover**

- Apply grease to the lip of the oil seal and install it to the rear cover.
- Apply sealant to the power take-off case mating surface of the rear cover and install it to the power take-off case.



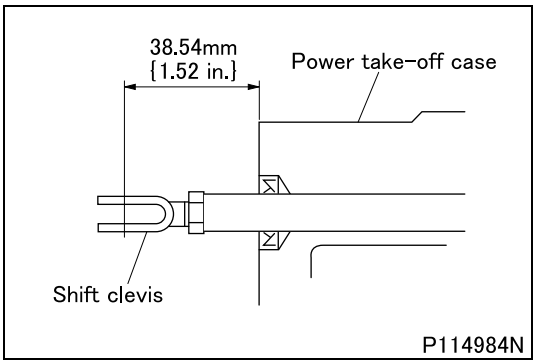
■ **Installation: Power take-off output flange**

- Install the power take-off output flange to the power take-off case, and install the nut and set bolt.



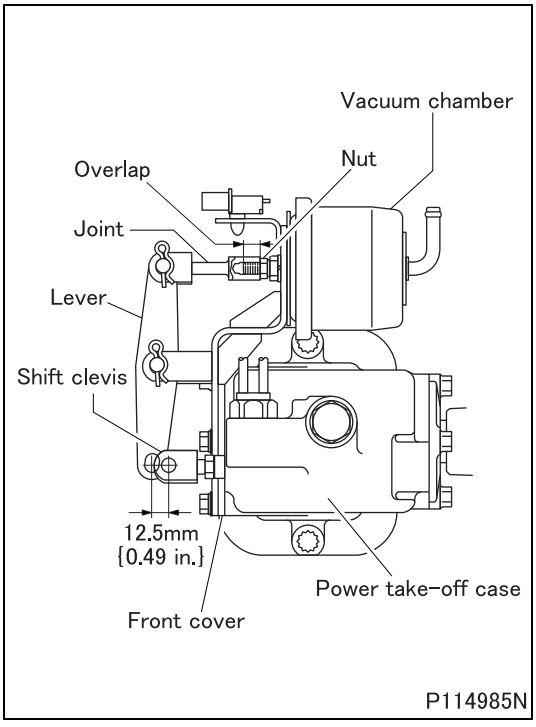
■ **Installation: Power take-off control switch**

- Apply sealant to the threads of the power take-off control switch and install it to the power take-off case.



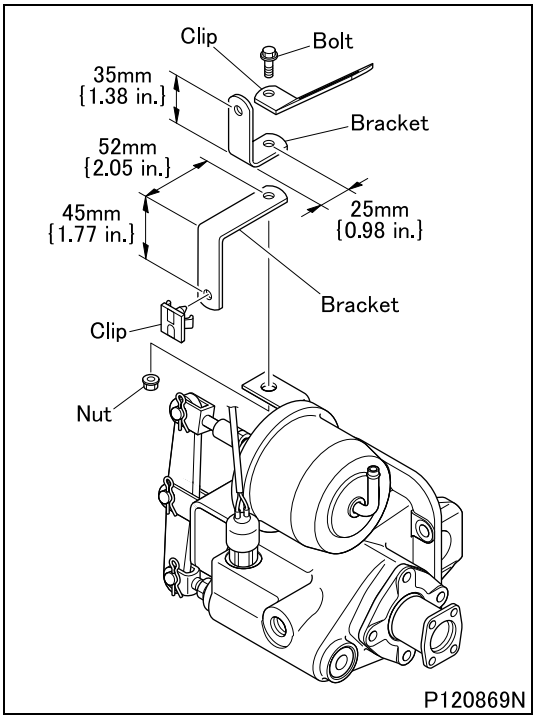
■ **Installation: Shift clevis**

- Install the shift clevis while adjusting the distance from the center of the shift clevis hole to the end surface of the power take-off case as shown in the drawing.



■ **Installation: Vacuum chamber**

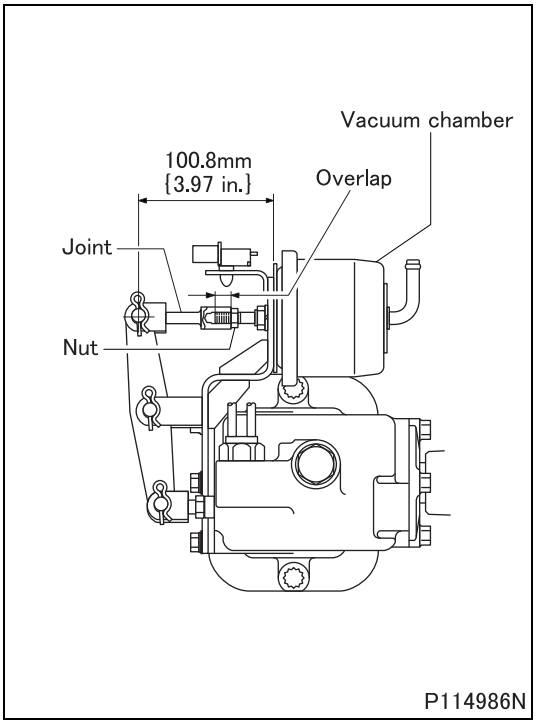
- Apply sealant to the power take-off case mating surface of the front cover. Install the vacuum chamber and front cover to the power take-off case.
- Measure the distance between the centers of the holes in the shift clevis and lever.
- If the measurement does not match the value shown in the drawing, adjust by turning the shift clevis or joint.
- If the adjustment is performed by turning the joint, secure the overlap of the joint and the rod of the vacuum chamber by 8 threads or more.
- After adjustment, tighten the nut to the specified torque.
- Push in the joint to align the holes in the lever and shift clevis and connect them with the clevis pin.
- Apply Cb to the sliding surface of the clevis pin before installing the clevis pin.



■ **Installation: Bracket**

- Install the bracket as shown in the drawing.

◆**Work after installation**◆



■ **Adjustment: Vacuum chamber**

- Measure the distance from the bottom of the vacuum chamber to the center of the hole in the joint.
- If the measurement does not match the value shown in the drawing, adjust by turning the joint. In this case, secure the overlap of the joint and the rod of the vacuum chamber by 8 threads or more.
- After adjustment, tighten the nut to the specified torque.

■ **Installation: Transmission power take-off**

- Install the transmission power take-off. (See “REVERSE IDLER GEAR”.)

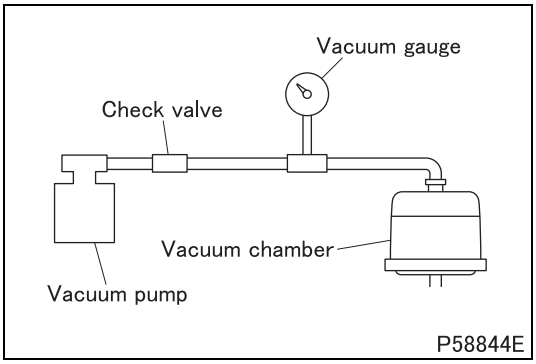
	Nut (mounting vacuum chamber)		

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Mounting threads of vacuum chamber	ThreeBond 1211	As required

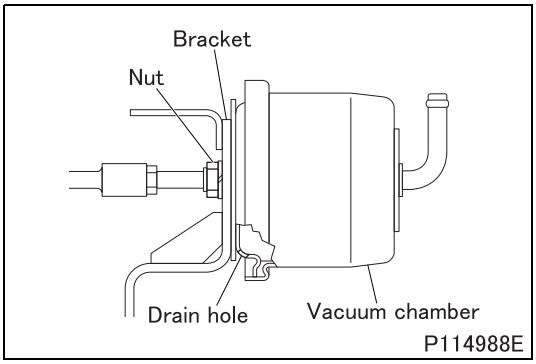
◆Inspection procedure◆



■ **Inspection: Vacuum chamber**

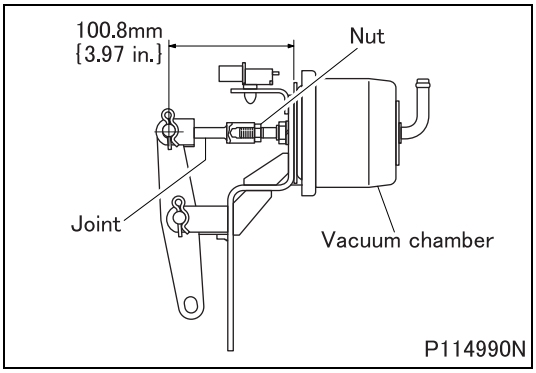
- Connect the vacuum pump, check valve and vacuum gauge to the vacuum chamber as shown in the drawing. Using the vacuum pump, apply specified vacuum to the vacuum chamber.
- After 15 seconds, read the vacuum on the vacuum gauge.
- If the measurement is out of the standard value, replace the vacuum chamber.

◆Installation procedure◆



■ Installation: Vacuum chamber

- Apply sealant to the threads of the vacuum chamber and install it to the bracket in the direction shown in the drawing.



■ Installation: Joint

- Install the joint so that the distance from the bottom of the vacuum chamber to the center of the hole in the joint should be as shown in the drawing. Then tighten the nut to the specified torque.

STRUCTURE AND OPERATION

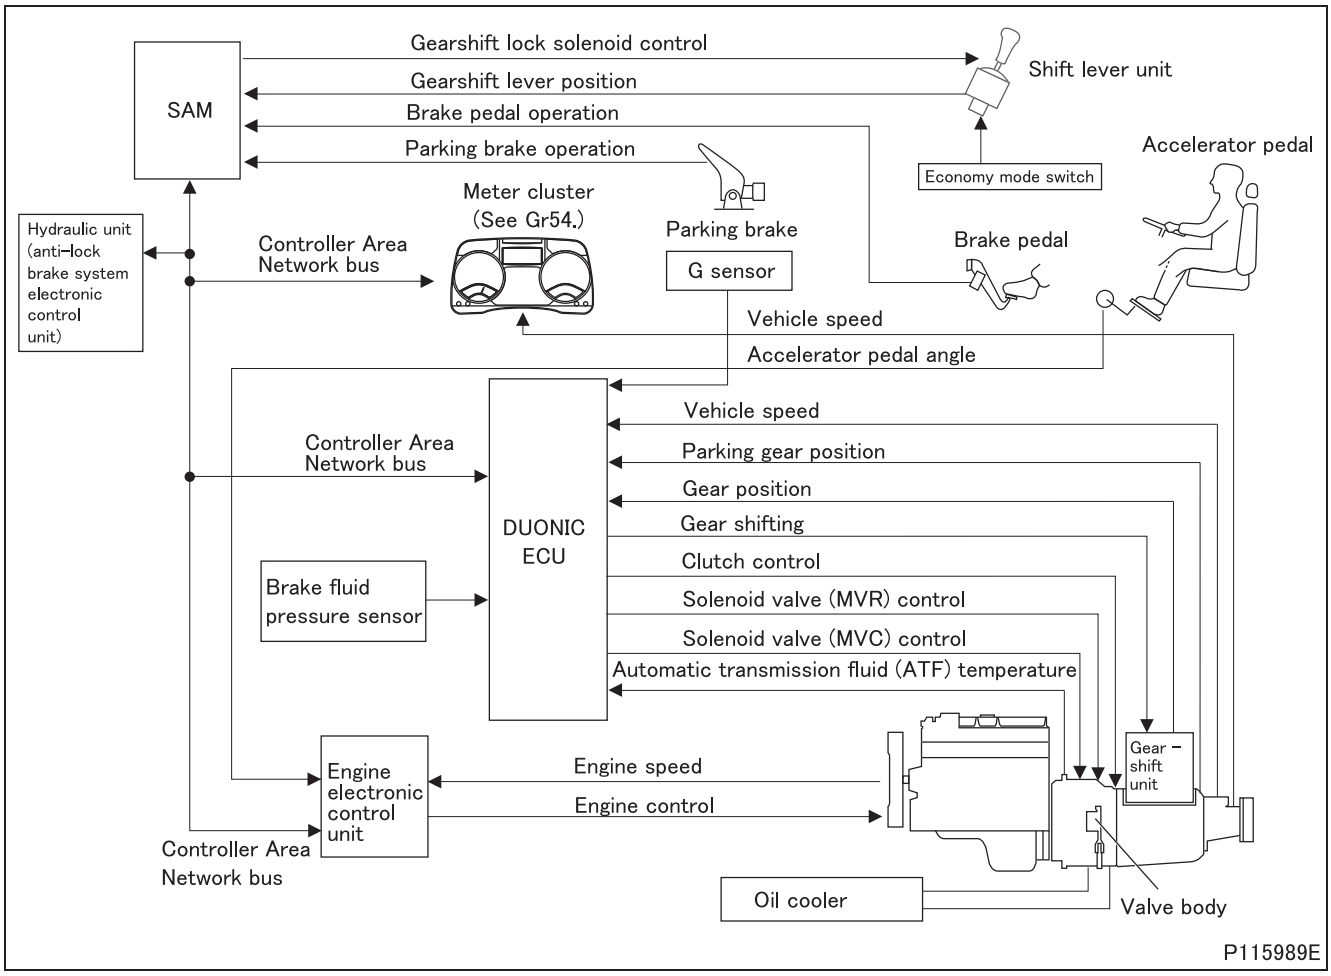
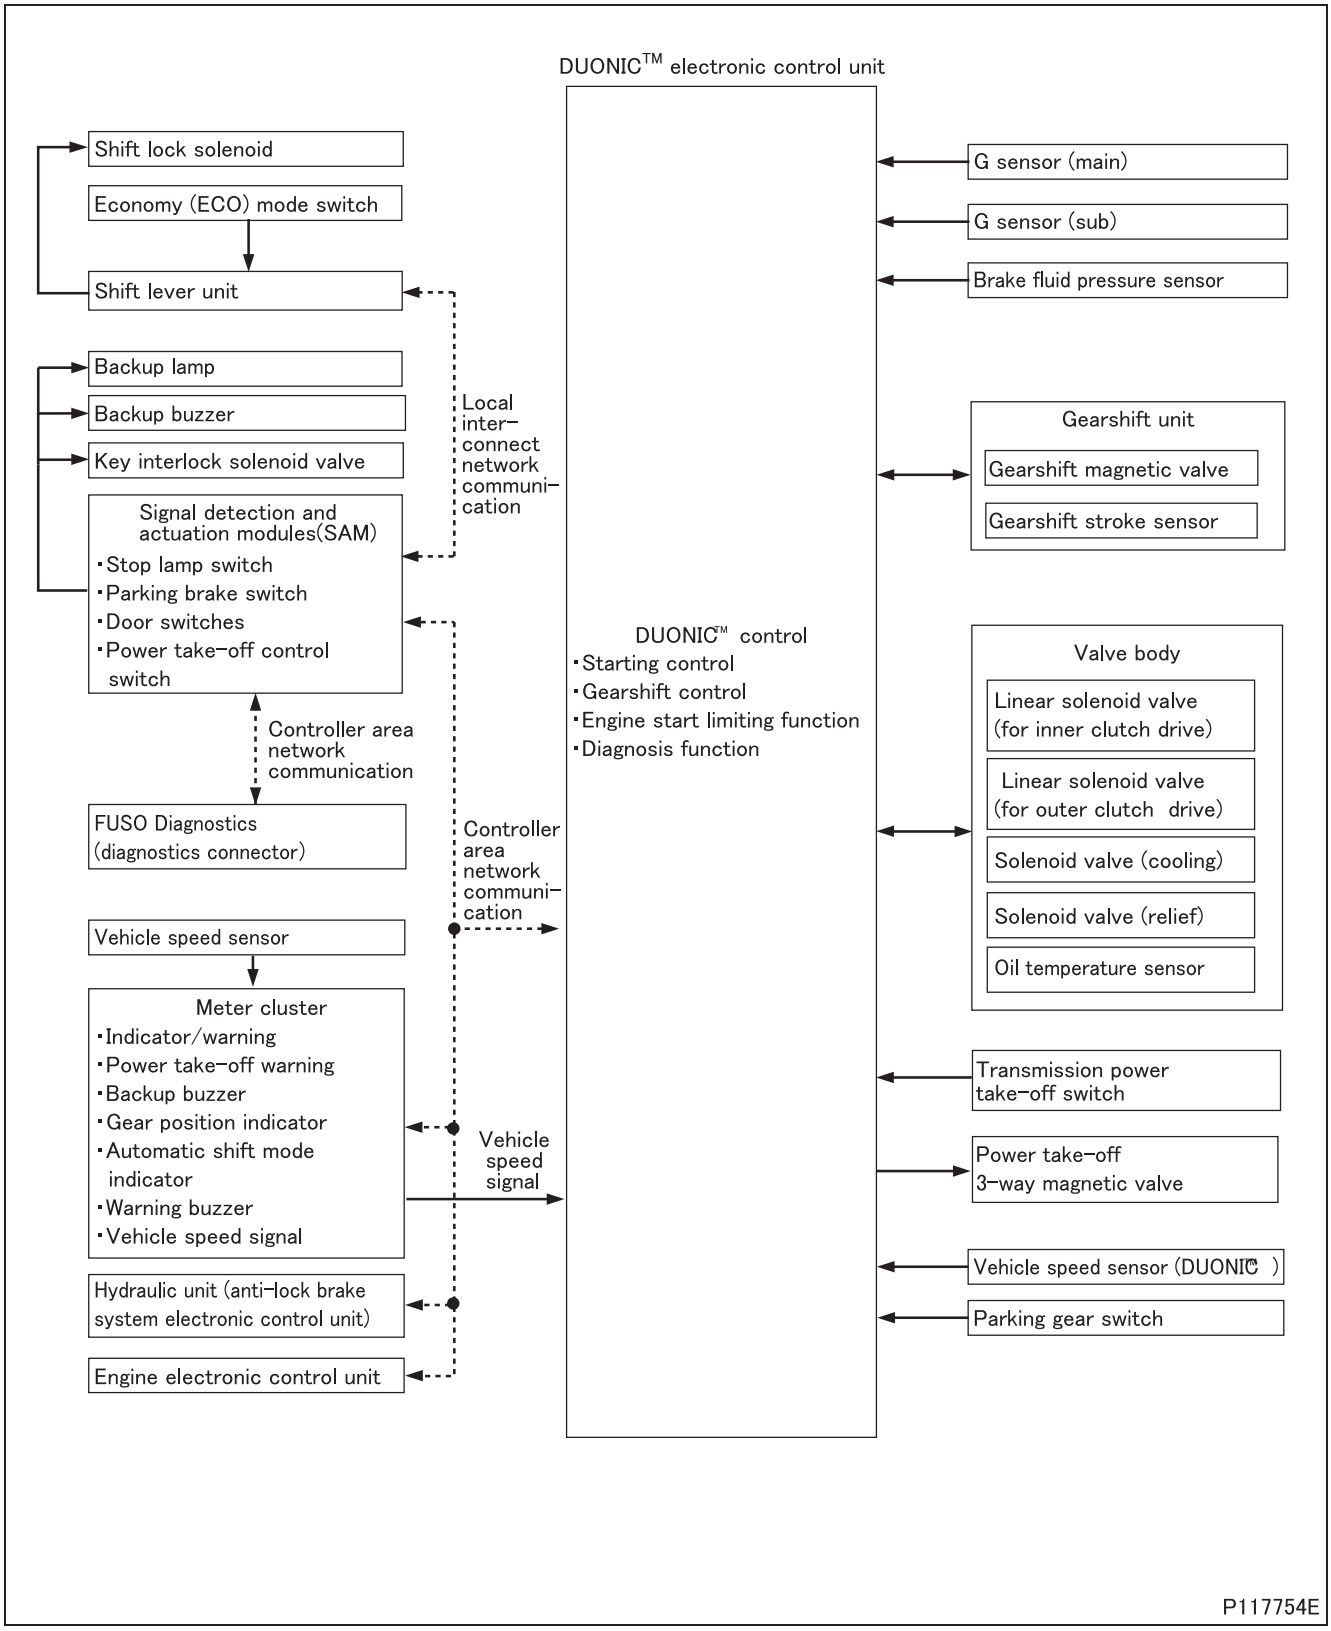
1. Overview



- The DUONIC™ system automates clutch and gear shift operations when starting or driving the vehicle by providing integrated control of the clutch, transmission and engine. This helps to reduce the driver's fatigue from frequent manual gear shift operations while achieving excellent fuel economy equivalent to or better than that of manual transmission vehicles.
- The clutch mechanism consists of two clutching systems (dual clutch) that allow smooth gear shift operations with reduced gear shift shock.
- There is no clutch pedal. Since there are only two pedals (accelerator and brake pedals), the driver can start and drive the vehicle with accelerator operations only. Manual operation can also be selected as required.
- The system consists of a DUONIC electronic control unit (that controls the gear shift unit and valve body based on the gear shift lever signals, transmission gear position, throttle opening, vehicle speed, etc.), engine electronic control unit (that controls fuel injection amount and timing based on engine speed, engine timing, coolant temperature, vehicle speed, etc.) and sensors that transmit/receive various signals to and from each electronic control unit.

2. Electronic Control System

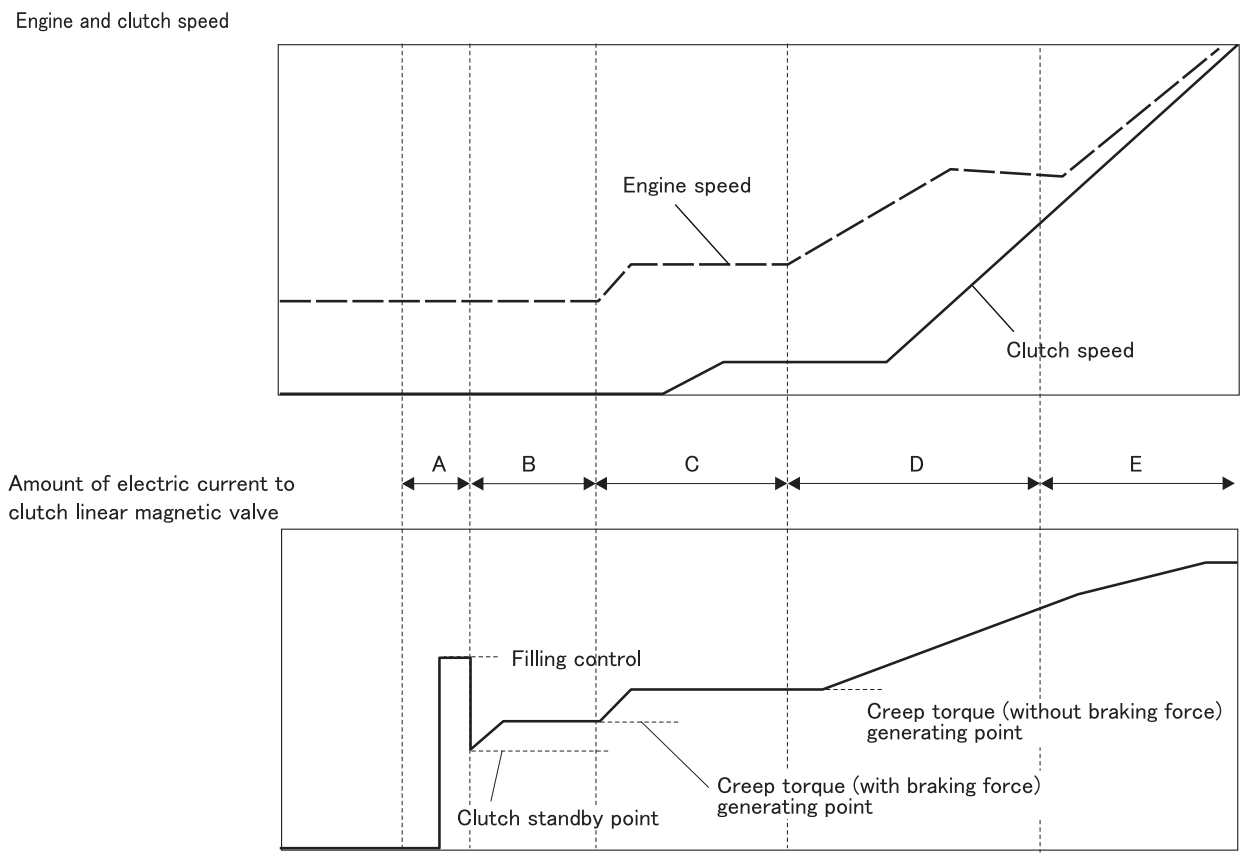
2.1 Block diagram



Component	Main function/operation
Shift lever unit	Detects gearshift lever position.
Oil temperature sensor	Senses temperature of automatic transmission fluid (ATF).
G sensor	Senses acceleration.
Stop lamp switch	Senses brake pedal's pressed/released position.
Brake fluid pressure sensor	Senses extent to which brake pedal is pressed.
Vehicle speed sensor	Senses vehicle speed.
Hydraulic unit (electronic control unit)	Operates of anti-lock brake system (ABS) and its output warning signal.
Parking brake switch	Detects operation of parking brake.
Parking gear switch	Detects operation of parking mechanism.
Door switches	Detects whether each door is open or closed.
Power take-off control switch	Turns on/off power take-off (on power take-off).
Transmission power take-off switch	Turns on/off power take-off (in cab).
Economy (ECO) mode switch	Turn on/off economy mode
Engine electronic control unit	Makes control for smooth gear shifting and driving through exchange of signals with DUONIC electronic control unit.
Gearshift stroke sensor	Senses gearshift position.
Power take-off 3-way magnetic valve	Puts transmission power take-off into motion.
Power take-off indicator	Illuminates when power take-off is in operation.
Gear position indicator	Indicates current gear in engagement and diagnostic codes.
Automatic shift mode indicator	Illuminates when automatic shift mode is selected with gearshift lever in "D".
Economy mode indicator	Indicated when economy mode switch is turned on.
DUONIC^{TM} indicator/warning	Comes on when there is problem with system to warn driver of the condition. It lights in either red or amber. Driving is impossible when the lamp lights in red; driving with minimum necessary control is possible when the lamp lights in amber.
Warning buzzer	Sounds when: • A door is opened with gearshift lever in any position except "P" and "N" while engine is running. • Temperature of automatic transmission fluid is too high. • Vehicle is driven with power take-off switch ON. • Vehicle is driven with Dump lever position rise. • Temperature of clutch is too high.
Linear solenoid valve (for inner clutch drive)	Supplies hydraulic oil to operate inner clutch.
Linear solenoid valve (for outer clutch drive)	Supplies hydraulic oil to operate outer clutch.
Solenoid valve (cooling)	Sends hydraulic oil to oil cooler.
Solenoid valve (relief)	Adjusts hydraulic oil pressure for operating clutch.
Gearshift magnetic valve	Enables gear shifting.
Shift lock solenoid valve	Activates and deactivates gearshift lock function.
Signal detection and actuation modules (SAM)	Manages power supply of component devices.
	Repeats input/output signals that are sent via Controller Area Network communication from/to relevant electronic control units by way of this module.
Key interlock solenoid	Activates/deactivates key interlocking function.

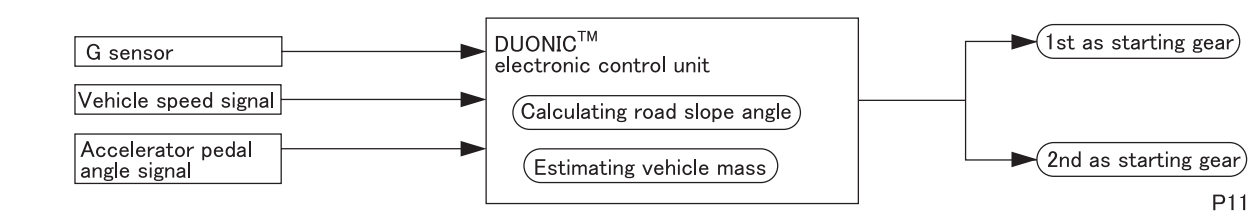
2.2 DUONIC™ control

2.2.1 Starting control



- When the gearshift lever is moved to the “D” position, the control unit starts controlling the inner or outer clutch that is on the starting gear side while applying the filling control (phase A). (See section 2.2.2 (7.2) for explanation of the filling control.)
- When the filling control ends, the control unit brings the clutch first to the clutch standby point and then to the creep torque generating point (phase B).
- When the brake pedal is released, the control unit allows the vehicle to start creeping (phase C).
- As soon as the accelerator pedal is pressed, the control unit makes control to engage the clutch (phase D).
- Once the engine and clutch speeds have synchronized with each other, the system terminates the starting control (phase E).

(1) Control for automatic selection of starting gear



- When the vehicle is brought to a stop with the gearshift lever in the “D” position, the control unit selects the starting gear based on the road slope angle (as determined depending on the G sensor information) and the estimated vehicle mass (as determined depending on the vehicle speed and accelerator pedal angle). Then a shift to the selected gear takes place automatically.

(2) Creep start function

- When the gearshift lever is in the “D” or “R” position, the vehicle starts moving at very low speed without need to press the accelerator pedal as soon as it is freed from braking force (by the service brakes and parking brake).

(2.1) Creep torque in 1st or reverse gear

- Regardless of braking forces, the amount of output creep torque is always varies with the vehicle speed.
- The output creep torque is inversely proportional to the vehicle speed.

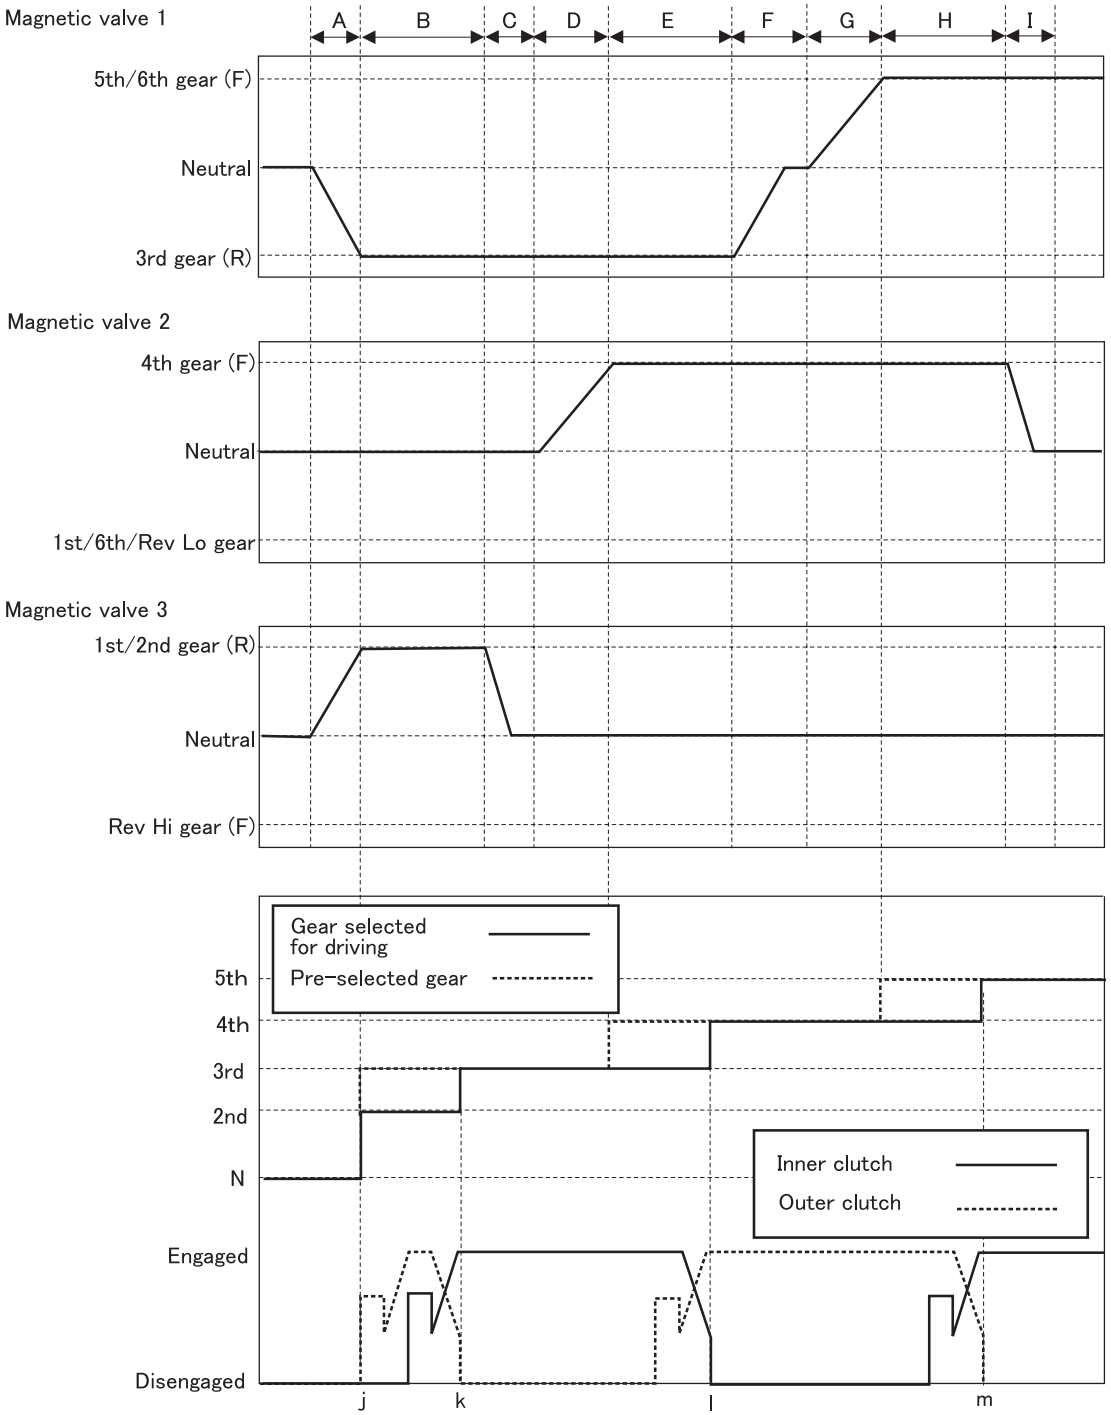
(2.2) Creep torque in 2nd and higher gears

- While a braking force (by the service brakes or parking brake) is working, the output creep torque varies with both the braking force and vehicle speed.
- When the vehicle is free from braking forces, the output creep torque varies with the vehicle speed.
- The output creep torque is inversely proportional to both the braking force and vehicle speed.

CAUTION ⚠

- **During starts on uphill roads, the vehicle may move back even when creep torque is available. In such a case, the parking brake should also be used.**

2.2.2 Gearshift control



P116348E

- The preceding diagram illustrates operation of the gearshift unit during shift-up from 2nd to 5th.
  - The 2nd gear (starting gear) is engaged and the next gear (3rd gear) is pre-selected (phase A).
  - The outer clutch is engaged (point j).
  - Gear shifts up from 2nd to 3rd according to the gearshift map (phase B).
  - The outer clutch disengages and the inner clutch engages (point k).
  - The 2nd gear is disengaged (phase C).
  - The next gear (4th gear) is pre-selected (phase D).
  - Gear shifts up from 3rd to 4th according to the gearshift map (phase E).
  - The inner clutch disengages and the outer clutch engages (point l).
  - The 3rd gear is disengaged (phase F).
  - The next gear (5th gear) is pre-selected (phase G).
  - Gear shifts up from 4th to 5th according to the gearshift map (phase H).
  - The outer clutch disengages and the inner clutch engages (point m).
  - The 4th gear is disengaged (phase I).

- Each gearshift rail has 2 gearshift magnetic valves (MVF and MVR). The magnetic valve that is driven varies depending on the direction of gear engagement as follows.

Gear	Clutch	Magnetic valve 1	Magnetic valve 2	Magnetic valve 3
1st	Inner	–	R	R
2nd	Outer	–	–	R
3rd	Inner	R	–	–
4th	Outer	–	F	–
5th	Inner	F	–	–
6th	Outer	F	R	–
Rev Lo	Inner	–	R	F
Rev Hi	Outer	–	–	F

(1) Automatic shift function

- When the gearshift lever is in the “D” position, this function selects gearshift maps stored in memory of the DUONIC electronic control unit appropriately depending on both the accelerator angle and vehicle speed and makes gear shifting automatically between the 1st and 6th gears according to the maps. The gear currently in engagement is indicated on the gearshift indicator in the meter cluster.
- During automatic gear shifting, the target gear is determined according to the gearshift map and also by applying a fuzzy control scheme. The fuzzy control estimates the driver’s intention from the vehicle load factor (derived from the theoretical acceleration and actual acceleration with an empty vehicle driven on a linear flat road), accelerator pedal angle, rate of change of the accelerator pedal angle, vehicle speed, engine speed, currently selected gear, and brake pedal condition, and reflects the driver’s intention thus estimated on the gearshift control.

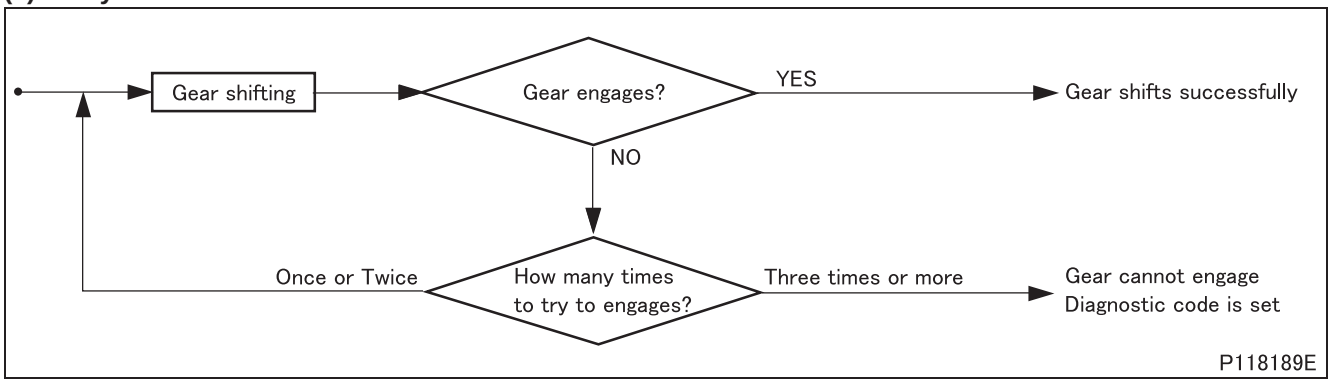
(2) Manual shift function

- This function allows the driver to manually make shift-up by one gear by pushing the gearshift lever from the “D” position toward the “+” position and make shift-down by one gear by pushing the lever toward the “–” position.
- The DUONIC electronic control module is always monitoring the vehicle speed, engine speed, and selected gear. If there is a risk of engine over-revving as a result of manual gear shifting, no shift-down will take place even when the gearshift lever is pushed toward the “–” position. Likewise, if there is a risk of engine stall as a result of manual gear shifting, no shift-up will take place even when the gearshift lever is pushed toward the “+” position.

(3) Hold function

- If the gearshift lever is moved to the “A/M” position while driving in the automatic shift mode or after the lever has returned to the “D” position during manual shift operation, the gear is held in the currently selected gear. No automatic gear shifting takes place in this case. However, the gear automatically shifts up if the engine speed exceeds the limit value (4,300 rpm) and the gear automatically shifts down to the starting gear when the vehicle comes to a stop.

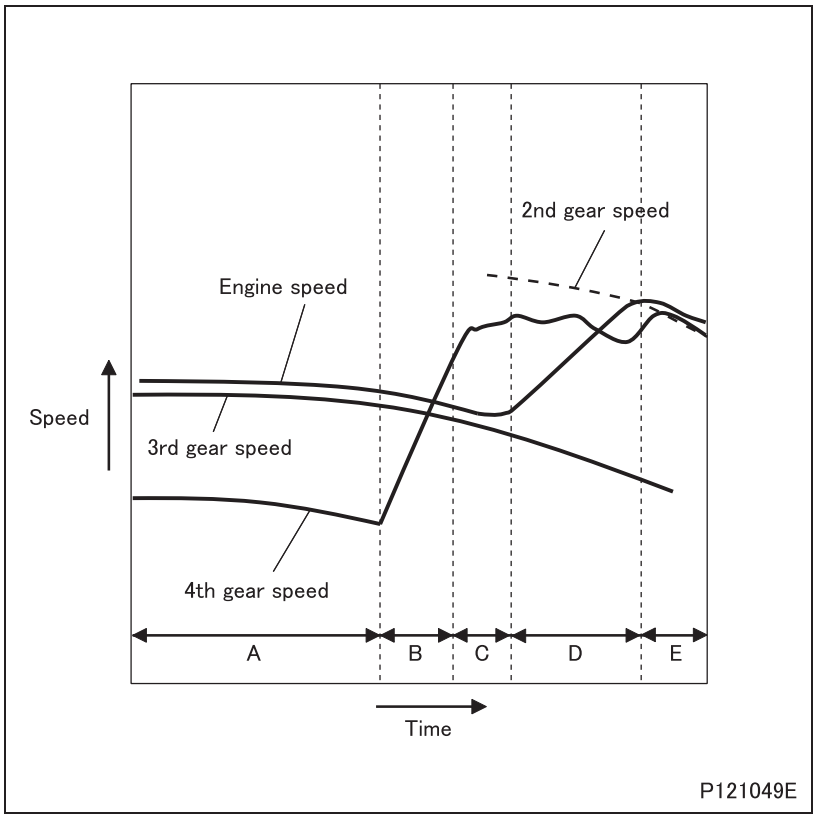
(4) Retry function



- If gear engagement fails to successfully complete, the transmission electronic control unit automatically activates the retry function to retry gear engagement (twice at maximum; three trials if the first normal trial is included). The retry control is applied to the same gear for which the first engagement trial has not successfully completed.

(4.1) Slip double-clutch control

- When the automatic transmission fluid temperature is low (20°C or lower), if it is hard to shift down from 3rd to 2nd, the engine speed is raised to the speed for the 2nd gear at that vehicle speed while the inner clutch is controlled in a slipping condition (still transmitting the driving torque to the 3rd gear), and then the outer clutch is engaged. Thus the outer drive pinion speed is increased to approximately the 2nd gear speed (from the 4th gear speed) when the clutch is engaged to facilitate the shift to the 2nd gear.



- This drawing is to explain the slip double-clutch control when the automatic transmission fluid temperature is low and it is hard to shift down from 3rd to 2nd.
  - When driving in the 3rd gear, the other (not engaged) drive pinion is engaged and driven by the 4th gear. (A)
  - Shifting from 4th gear to 2nd gear (pre-selection) starts. (B)
  - Synchromesh functions but the 2nd gear cannot be synchronized or is synchronized but cannot be engaged due to the rotation resistance at low temperature. (C)
  - The inner (3rd gear side) clutch is slip-controlled and the engine speed is increased while maintaining the driving torque for the 3rd gear. (D)

  - Engaging the outer (2nd gear side) clutch driven by increased engine speed promotes the synchronization and gear engagement. (E)
- The slip double-clutch control is performed when the following conditions are satisfied.
  - When performing the preshift from the 4th gear to the 2nd gear during driving in 3rd gear.
  - Automatic transmission fluid temperature is low (20°C or lower).
  - When it is hard to shift gears. (In case that the normal gearshifting was tried but the gear could not be engaged within the predetermined time.)
  - The 2nd gear speed for the current vehicle speed is higher than the engine idling speed.
  - The 2nd gear speed at automatic shifting or manual shifting is 2,000 rpm or lower.
- The slip double-clutch control is continued until the gear is engaged or the retry function is performed twice. (Gearshifting is tried 3 times including the first try of normal gearshifting.)

(5) Gear pre-selection function

- This function makes preparatory engagement of a gear that is expected to be engaged next. For example, when driving at 3rd (odd-number gear) with the inner clutch engaged, DUONIC^{TM} pre-selects an adjacent even-number gear (2nd or 4th) if the system judges this necessary based on acceleration/deceleration and other conditions. However, the even-number grears do not transmit power since the outer clutch is disengaged.
- With DUONIC^{TM}, the gear pre-selection control takes place as follows:
  - While driving in 1st, 2nd or 6th, the system invariably pre-select the gear indicated below.

Current gear	Pre-selected gear
1st	2nd
2nd	3rd
3rd	2nd or 4th
4th	3rd or 5th
5th	4th or 6th
6th	5th

  - While driving in 3rd, 4th or 5th, the system estimates a gear to be next selected and pre-select that gear.

(6) Control during operation of anti-lock brake system

- While the anti-lock brake system is in operation, the system may sometimes be unable to recognize the vehicle speed accurately. So it prohibits gear shifting down during the automatic shift mode (“D” range) and also a gear change during the manual shift mode to prevent over-revving of the engine.

(7) Clutch control function

- According to vehicle operating conditions, the system automatically controls the clutch to disengage, engage, or partially engage it.

(7.1) Solenoid valve control

- DUONIC^{TM} uses a wet clutch system to which the supply of hydraulic oil is adjusted using a solenoid valve. As the electric current supplied to the solenoid valve increases, the pressure applied to the clutch becomes stronger, so the clutch then can transmit greater torque.

(7.2) Filling control

- This control makes the specified amount of electric current flow for the specified length of time at the beginning of a clutch engagement cycle to quickly reduce the gap between the clutch disc and drive plate (on the engine), thus shortening the clutch engagement time.

(7.3) Micro-slip control

- Except during gear changes, this control keeps the clutch slightly slipping to make it rotate several tens rpm slower than the engine rpm. This allows the clutch to disengage quickly and thus gearshifts to take place smoothly. In addition to reduced gearshift time, this control provides the effect of preventing shock and damping down the vibration transmitted from the engine to the drive train components.

2.2.3 Other functions

(1) Automatic clutch disengagement function

- In both the drive range (“D”) and reverse range (“R”), the system makes a control of disengaging the clutch when the vehicle comes to a stop for the purpose of preventing engine stalls.

(2) Gearshift control during drive using cruise control

- When the driver starts using the cruise control while driving in the manual shift mode, the gearshift mode is automatically changed to the automatic shift mode.
- During the use of the cruise control, the system makes automatic gear shifting depending on the amount of load on vehicle, engine speed, and acceleration of vehicle in order to maintain the target speed.

(3) Economy mode (mode to support low-fuel-consumption driving)

- When the driver turns on the economy mode switch, the system starts using a special map for its gearshift control.
- In the economy mode gear shifting, gear shift-up takes place at a gear lower than that in the standard mode gear shifting.

CAUTION ⚠

- **The economy mode should be used only when the vehicle is carrying a small load (i.e. it is empty or half-loaded) and running on a relatively level road. The mode must not be used when the vehicle is fully loaded or on an uphill/downhill road.**

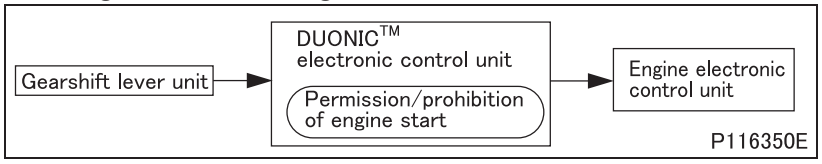
(4) Gearshift lock function during shift to/from “P” or “R” position

- While the service brake pedal is being pressed, the system issues a gearshift lock cancellation signal to enable the gearshift lever to be moved to/from the “P” or “R” position.

(5) Power take-off control function

- When the transmission power take-off switch is turned on with the vehicle parked and the gearshift lever in “P” or “N” position, the system makes necessary controls on the gear and clutch after engaging the power take-off so that power can be delivered from the power take-off.
- The system causes the display of indicator to change according to the engagement state of power take-off.
- If any of the following operations is performed, the system turns on “PTO” on the indicator and causes a buzzer to sound.
  - The transmission power take-off switch is turned on while driving or with the gearshift lever in any position except “P” and “N”.
  - The gearshift lever is moved to any position except “P” and “N” or the vehicle is driven after the transmission power take-off switch has been turned on.
  - The PTO control function can be set through coding parameters settings to be adapted to various equipment installed in factory.

2.3 Engine start limiting function



- To prevent the vehicle from lurching with the transmission in gear, the system permits the engine to be started only when the gearshift lever is in the “P” or “N” position.

2.4 Diagnosis function

- The diagnosis function of the DUONIC electronic control unit is working whenever the starter switch is in the ON position to determine whether the communication condition, each sensor, each relay, etc. is in normal condition or not. If the diagnosis function determines a component to be faulty, it causes the relevant indication to be displayed on the meter cluster to alert the driver to the failure, stores the faulty item in the form of a diagnostic code, and the system starts applying a malfunction mode control.
- During the malfunction mode control, the system functions are limited in order to assure safety of the crew and vehicle. The stored diagnostic codes can be read using FUSO Diagnostics and on the multi-information display in the meter cluster. (See Gr00.)

TROUBLESHOOTING

1. Inspection Based on Diagnosis Codes

- FUSO Diagnostics is regularly updated and, as a result, the latest information may not be in line with the current version of the shop manual. In cases of such disagreement, the information in FUSO Diagnostics must be followed.

1.1 List of diagnosis codes

Diagnosis code	Indications made by FUSO diagnosis	Warning given at occurrence of diagnosis code		Remarks
		T/M SYS (red)	T/M SYS (amber)	
70-19	Out-of-range CAN reception data from component “Parking brake Switches”	–	O	
84-19	Out-of-range CAN reception data from component “Combustion engine Control unit”	–	O	
86-19	Out-of-range CAN reception data from component “Combustion engine Control unit	–	O	
91-19	Out-of-range CAN reception data from component “Position sensor Accelerator pedal”	O	O	Warning shown differs depending on what diagnosis code is active at that time.
110-19	Out-of-range CAN reception data from component “Combustion engine Control unit”	–	O

1.2 Code generation criteria and inspection items

70-19: Out-of-range CAN reception data from component “Parking brake Switches”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • CCVS_SSAM was received. • Parking Brake Switch (CAN) signal out of range (Error/SNA)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained.
Possible causes		• Defective signal detect and actuation modules
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A20 (SAM) side system.

84-19: Out-of-range CAN reception data from component “Combustion engine Control unit”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • CCVS_MCM received & Cruise vehicle speed (CAN) out of range (250.996<Cruise vehicle speed)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Cruise speed change mode is exited. • Cruise termination request is continuously issued.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

86-19: Out-of-range CAN reception data from component “Combustion engine Control unit”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • CCVS_MCM received & Cruise target vehicle speed (CAN) out of range (250<Cruise target vehicle speed (CAN))
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Cruise speed change mode is exited. • Cruise termination request is continuously issued.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

91-19: Out-of-range CAN reception data from component "Position sensor Accelerator pedal"

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EEC2_EEC was received. • Accelerator pedal position (CAN) out of range
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Diagnosis Codes 520732-2 & 512-19 not generated (Warning indication: Amber)] • Service data name: See Driver's Demand Percent Torque as accelerator position. [Diagnosis Code 520732-2 or 12-19 generated (Warning indication: Red)] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority over N.) • Engine control is terminated.
Possible causes		• Defective engine electronic control unit • Defective accelerator position sensor
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

110-19: Out-of-range CAN reception data from component "Combustion engine Control unit"

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • ET1_MCM was received. • Engine coolant temperature out of range for 10 seconds
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

158-2: Battery voltage is either too low or too high.

Generation condition	• Supply voltage 8 to 16 V with starter switch ON • Battery voltage V01 below 8 V or above 16 V • Battery voltage V02 below 8 V or above 16 V
Recoverability	• Supply voltage 8 to 16 V with starter switch ON • System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or if battery voltage V01 or V02 is 8 – 16 V while starter switch is in ON position.
Control effected by electronic control unit	• Both clutches are kept disengaged. • N flashes in meter cluster gear display. (P has priority over N.) • Engine control is terminated.
Possible causes	• Harness between DUONIC electronic control unit and battery open or shorted to ground • Malfunction of battery • Defective alternator • Defective DUONIC electronic control unit

Inspection procedure	Step1	Inspection procedure Use the following procedure to check if the source voltage is excessively high or low. Refer to the results of short test of other ECUs. Insert the tester probes into the A28 (DUONIC Control unit) harness connector on the vehicle side and measure the voltage between A28.X2.40/117 and A28.X2.40/118 and Ground. Is voltage above 12V (high voltage error)? No: Go to Step2 Yes: Go to Step15
	Step2	Inspection procedure Check that the fuse F36 is not blown out. If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Go to Step3
	Step3	Inspection procedure Is this diagnosis code still active? No: Go to Step13 Yes: Go to Step4
	Step4	Inspection procedure Check if any of other ECUs has stored the diagnosis code representing abnormal power supply (power supply without passing through SAM). Are current fault codes present? No: Go to Step5 Yes: Go to Step7
	Step5	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of G1 (Battery). Check electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for open circuit. Test electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for short circuit to ground. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step6
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of G1 (Battery). Check electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for open circuit. Test electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for short circuit to ground. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step14
	Step8	Inspection procedure Measure the battery voltage. Specified value: 12V Is any abnormality recognized? No: Go to Step9 Yes: Go to Step12
	Step9	Inspection procedure Check the function of G2 (Alternator). Is any abnormality recognized? For procedures, refer to the Shop Manual No: Go to Step10 Yes: Go to Step11

Inspection procedure	Step10	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Go to Step13
	Step11	Inspection procedure Replace component “G2 (Alternator)”. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step12	Inspection procedure Replace component “G1 (Battery)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step10
	Step13	Inspection completed
	Step14	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step15	Inspection procedure Replace component “G2 (Alternator)”. Reinstall all the removed connectors. Turn the starter switch in ON.

158-3: The battery voltage is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage V01 or V02 above 16 V
Recoverability		• Supply voltage 8 to 16 V with starter switch ON • System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or if battery voltage V01 or V02 is at or below 16 V while starter switch is in ON position.
Control effected by electronic control unit		• Backup by normal voltage
Possible causes		• Defective alternator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Replace component “G2 (Alternator)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

158-4: The battery voltage is too low.

Generation condition	• Supply voltage 8 to 16 V with starter switch ON • Battery voltage V01 or V02 below 8 V
Recoverability	• Supply voltage 8 to 16 V with starter switch ON • System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or if battery voltage V01 or V02 is at or above 8 V while starter switch is in ON position.
Control effected by electronic control unit	• Backup by normal voltage

Possible causes		• Harness between DUONIC electronic control unit and battery open or shorted to ground • Malfunction of battery • Defective alternator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Check that the fuse F36 is not blown out. If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Go to Step2
	Step2	Inspection procedure Is this diagnosis code still active? No: Go to Step12 Yes: Go to Step3
	Step3	Inspection procedure Check if any of other ECUs has stored the diagnosis code representing abnormal power supply (power supply without passing through SAM). Are current fault codes present? No: Go to Step4 Yes: Go to Step6
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of G1 (Battery). Check electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for open circuit. Test electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for short circuit to ground. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step5
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of G1 (Battery). Check electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for open circuit. Test electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for short circuit to ground. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step13
	Step7	Inspection procedure Measure the battery voltage. Specified value: 12V Is any abnormality recognized? No: Go to Step8 Yes: Go to Step11
	Step8	Inspection procedure Check the function of G2 (Alternator). Is any abnormality recognized? For procedures, refer to the Shop Manual No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Go to Step12

Inspection procedure	Step10	Inspection procedure Replace component “G2 (Alternator)”. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step11	Inspection procedure Replace component “G1 (Battery)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step9
	Step12	Inspection completed
	Step13	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.

177-2: Component Oil temperature sensor has an electrical fault.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Oil temperature sensor signal voltage above 0.04V and below 4.96 V • Input difference of 18.0°C {64.4°F} or more from previous input occurring 3 times over 5 seconds
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• TM oil temperature sensor substitute value 70°C {158°F} • Fixed to high oil temperature cooler bypass control • Creep torque cut
Possible causes		• Defective harness between oil temperature sensor and DUONIC electronic control unit • Defective oil temperature sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B48 (Oil temperature sensor). Measure the resistance between terminals 5 and 6. Specified value: 2.31 - 2.59k (20°C {68°F}) Is any abnormality recognized? Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No: Go to Step2 Yes: Go to Step4
	Step2	Inspection procedure Inspect or verify the following items. Repair or replace faulty items as necessary. Replace B48 (Oil temperature sensor) with a normal one and check to see if the fault code occurs. Measure resistance of the harness across A28 (DUONIC Control unit) and B48 (Oil temperature sensor) to check for a faulty harness (e.g., incomplete open circuit). Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Replace component “B48 (Oil temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3

177-3: The signal voltage of component Oil temperature sensor is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Oil temperature sensor signal voltage at or above 4.96 V
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or if oil temperature sensor voltage is at or below 4.90 V while starter switch is in ON position.
Control effected by electronic control unit		• TM oil temperature sensor substitute value 70°C {158°F} • Fixed to high oil temperature cooler bypass control • Creep torque cut
Possible causes		• Signal or ground harness between TM oil temperature sensor and DUONIC electronic control unit open • Signal harness between TM oil temperature sensor and DUONIC electronic control unit shorted to battery • Defective TM oil temperature sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B48 (Oil temperature sensor). Make a visual check on each connector. Measure the resistance between B48 (Oil temperature sensor) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B48 (Oil temperature sensor)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/46 and B48.X5.12/8 for open circuit. Check electrical line between pins A28.X1.81/65 and B48.X5.12/7 for open circuit. Check electrical line between pins A28.X1.81/46 and B48.X5.12/8 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

177-4: The signal voltage of component Oil temperature sensor is too low.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Oil temperature sensor signal voltage at or below 0.04V
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or if oil temperature sensor voltage is at or above 0.10 V while starter switch is in ON position.
Control effected by electronic control unit		• TM oil temperature sensor substitute value 70°C {158°F} • Fixed to high oil temperature cooler bypass control • Creep torque cut
Possible causes		• Signal harness between oil temperature sensor and DUONIC electronic control unit shorted to ground • Defective oil temperature sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B48 (Oil temperature sensor). Make a visual check on each connector. Measure the resistance between B48 (Oil temperature sensor) and ground or each terminal to check for short-circuit and electrical leakage. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B48 (Oil temperature sensor)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check harness between A28 (DUONIC Control unit) and B48 (Oil temperature sensor) for short-circuit to another line. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

177-9: Component Oil temperature sensor has an electrical fault.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Oil temperature sensor signal voltage above 0.04 V and below 4.96 V • No generation of Diagnosis code 191-8, 191-2, 191-7, 191-10, 191-12, 1619-2, 1619-8 & Vehicle traveling at 40 km/h {24.9 mph} or more for a total of 300 seconds or more • Increase in transmission oil temperature 41°F or less after starter switch turned ON
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Transmission oil temperature sensor substitute value 70°C {158°F} • Fixed to high oil temperature cooler bypass control • Creep torque cut
Possible causes		• Defective harness between oil temperature sensor and DUONIC electronic control unit • Defective oil temperature sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B48 (Oil temperature sensor). Measure the resistance between terminals 5 and 6. Specified value: 2.31 - 2.59k (20°C {68°F}) Is any abnormality recognized? Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No: Go to Step2 Yes: Go to Step4
	Step2	Inspection procedure Inspect or verify the following items. Repair or replace faulty items as necessary. Replace B48 (Oil temperature sensor) with a normal one and check to see if the fault code occurs. Measure resistance of the harness across A28 (DUONIC Control unit) and B48 (Oil temperature sensor) to check for a faulty harness (e.g., incomplete open circuit). Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Replace component “B48 (Oil temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3

188-19: Out-of-range CAN reception data from component "Combustion engine Control unit"

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • Electronic control was received & Out-of-range Engine idle speed (CAN) for 10 seconds
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. • 650 rpm retained if data last received are out of range. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority over N.) • Engine control is terminated.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

190-19: Out-of-range CAN reception data from component "Combustion engine Control unit"

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EEC1_EEC was received. • Engine speed (CAN) out of range
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority over N.) • Engine control is terminated.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Make a system diagnosis at the ECU2 on the transmission side. Make a system diagnosis at the A4 (Combustion engine Control unit) on the transmission side. Go to step3

Inspection procedure	Step3	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step4 Yes: Go to step9
	Step4	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step8
	Step5	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step6 Yes: Go to step7
	Step6	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

Inspection procedure	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step9	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step10
	Step10	Inspection procedure Is this diagnosis code still active? No:nGo to step11 Yes:nGo to step3
	Step11	Inspection completed

191-2: Component 'Rpm sensor Transmission' has an electrical fault.

Generation condition		• Anti-lock brake system-equipped vehicle: ABS Cooperative Control • Supply voltage 8 to 16 V with starter switch ON • Normal anti-lock brake system vehicle speed received • No generation of Diagnosis Code 191-8 • Abnormal condition based on comparison between vehicle speed sensor 1 and Front Axle Speed (CAN)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Reference made to vehicle speed sensor 2 input • Creep torque cut
Possible causes		• Defective harness between DUONIC speed sensor and DUONIC electronic control unit • Defective DUONIC speed sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B41 (Rpm sensor Transmission). Apply DC {0} to {1} V between terminals B41.4/3 and B41.4/1. Rotate the shaft of B41 (Rpm sensor Transmission). Check terminals B41.4/2 and B41.4/4 for signals and, if no signals are outputted, replace B41 (Rpm sensor Transmission). Is any abnormality recognized? Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No: Go to Step2 Yes: Go to Step4
	Step2	Inspection procedure Inspect or verify the following items. Repair or replace faulty items as necessary. Replace B41 (Rpm sensor Transmission) with a normal one and check to see if the fault code occurs. Measure resistance of the harness across A28 (DUONIC Control unit) and B41 (Rpm sensor Transmission) to check for a faulty harness (e.g., incomplete open circuit). Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Replace component “B41 (Rpm sensor Transmission)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3

191-7: Component Vehicle speed Sensors, Rpm sensor Transmission has an electrical fault

Generation condition		• Simultaneous occurrences of Diagnosis Code 191-8 or 191-2 and Diagnosis Code 1619-8 or 1619-2
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged. • Gear shift unit is kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective vehicle speed sensor and DUONIC speed sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

191-8: The signal voltage of component Rpm sensor Transmission is too low.

Generation condition		• Anti-lock brake system-equipped vehicle: ABS Cooperative Control • Supply voltage 8 – 16 V with starter switch ON • Normal Front Axle Speed (CAN) received • Vehicle speed sensor 1 = 0 rpm
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or vehicle speed sensor 1 is 100 rpm or more with starter switch in ON position
Control effected by electronic control unit		• Reference made to vehicle speed sensor 2 input • Creep torque cut
Possible causes		• Signal harness between DUONIC speed sensor and DUONIC electronic control unit open, shorted to ground or shorted to battery • Ground harness between DUONIC speed sensor and DUONIC electronic control unit open or shorted to ground • DUONIC speed sensor power supply harness open or shorted to ground • Defective DUONIC speed sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B41 (Rpm sensor Transmission). Make a visual check on each connector. Measure the resistance between B41 (Rpm sensor Transmission) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B41 (Rpm sensor Transmission) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B41 (Rpm sensor Transmission)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B41 (Rpm sensor Transmission) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

191-10: Component Vehicle speed Sensors, Rpm sensor Transmission has an electrical fault.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • Diagnosis Code 191-8, 191-2 not generated or Diagnosis Code 1619-8, 1619-2 not generated • Continuous 15 km/h {9.32 mph} or above & Vehicle speed dropped from 15 km/h {9.32 mph} or above to 0 mph in 0.01 seconds
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit), or Diagnosis Code 191-7 generated or vehicle speed of 2 km/h {1.24 mph} or more continued for 1 second or more with starter switch in ON position
Control effected by electronic control unit		• Both clutches are kept disengaged. • Gear shift unit is kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective vehicle speed sensor and DUONIC speed sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

191-12: Component Vehicle speed Sensors, Rpm sensor Transmission has an electrical fault.

Generation condition		• Non-anti-lock brake system vehicle: ABS Cooperative Control • Supply voltage 8 to 16 V with starter switch ON • Difference of 200 rpm or more between vehicle speed sensor 1 and vehicle speed sensor 2 & Abnormal comparative input of vehicle speed sensor 1 and vehicle speed sensor 2
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Reference made to vehicle speed sensor 1 or 2 input, whichever is higher • Creep torque cut
Possible causes		• Defective vehicle speed sensor and DUONIC speed sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

512-19: Out-of-range CAN reception data from component "Combustion engine Control unit"

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EEC1_EEC received & Driver's Demand Percent Torque (CAN) out of range (125<Driver's Demand Percent Torque (CAN))
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

513-19: Out-of-range CAN reception data from component "Combustion engine Control unit"

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EEC1_EEC received & Actual Engine Percent Torque (CAN) out of range (125<Actual Engine Percent Torque (CAN))
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8

Inspection procedure	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC^{TM} *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC^{TM} *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9

Inspection procedure	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

514-19: Out-of-range CAN reception data from component "Combustion engine Control unit"

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EEC3_EEC received & Friction Percent Torque (CAN) out of range
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective controller area network resistor • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7

Inspection procedure	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

522-7: Inner clutch slip

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Diagnosis Code 788-4, 788-3 (ON, OFF STUCK error) not generated • Diagnosis Code 785-3 (Magnetic valve (relief) shorted to battery) not generated • Inner clutch current reading 1.15 A or above • Odd gear engaged • Difference of 200 rpm or more for 10 seconds between engine speed (CAN) and inner clutch speed (CAN)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Incorrect setting of transfer gear ratio • Defective inner linear magnetic valve • Defective clutch system • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

526-2: Gear ratio double failure

Generation condition		• Simultaneous occurrences of Diagnosis Code 520719-2 or 520721-2 or 520723-2 or 520725-2 and Diagnosis Code 520720-2 or 520722-2 or 520724-2 or 520726-2
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or Diagnosis Code 520719-2, 520721-2, 520723-2, 520725-2 not generated or Diagnosis Code 520720-2, 520722-2, 520724-2, 520726-2 not generated while starter switch is in ON position
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

544-19: Out-of-range CAN reception data from component “Combustion engine Control unit”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EC received & Engine Reference Torque (CAN) out of range (Engine Reference Torque (CAN)<100 or 1000<Engine Reference Torque (CAN)) for 10 seconds
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. • 400 Nm is retained if data last received are out of range. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

563-19: Out-of-range CAN reception data from component “Antilock brake system Control unit”

Generation condition		• Anti-lock brake system-equipped vehicle (ABS Cooperative Control Equipped) • Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EBC1_BS received & ABS Control (CAN) out of range (Reserved, SNA)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Auto downshifting not permitted <in Auto Mode> • Shifting to roll-off gear temporarily permitted after detection of vehicle stationary for 3 seconds <in Auto Mode> • Normal gear shifting permitted <in Manual Mode>
Possible causes		• Defective hydraulic unit (electronic control unit)
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A1 (Antilock brake system Control unit) side system.

595-19: Out-of-range CAN reception data from component “Combustion engine Control unit”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • CCVS_MCM received & Cruise control status (CAN) out of range (Cruise control status (CAN) = 2)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Cruise control status (CAN) = 2, 3 (Reserved, SNA)] • Cruise control status (CAN) = 0 detection retained [Upon error judgment] • Cruise speed change mode is exited. • Cruise termination request is continuously issued.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

597-19: Out-of-range CAN reception data from component “Brake light Switches”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON • CCVS_SSAM received • Brake switch (CAN) out of range (Error, SNA)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective signal detect and actuation modules
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A20 (SAM) side system.

600-19: Out-of-range CAN reception data from component “Combustion engine Control unit”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON • CCVS_MCM received & Cruise deceleration switch (CAN) out of range (Cruise deceleration switch (CAN) = Error)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Cruise deceleration switch (CAN) = Error, SNA] • Cruise deceleration switch (CAN) = OFF detection retained [Upon error judgment] • Cruise speed change mode is exited. • Cruise termination request is continuously issued.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

602-19: Out-of-range CAN reception data from component “Combustion engine Control unit”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON • CCVS_MCM received & Cruise acceleration switch (CAN) out of range (Cruise acceleration switch (CAN) = Error)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Cruise acceleration switch (CAN) = Error, SNA)] • Cruise acceleration switch (CAN) = OFF detection retained [Upon error judgment] • Cruise speed change mode is exited. • Cruise termination request is continuously issued.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

681-12: Out-of-range CAN reception data from component “Shift lock solenoid”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON • ETC2_SSAM received • Change lever unit in P • SSAM_A01 received • Disagreement between Shift lever unit lock cancellation output (CAN) and Shift lock cancellation feedback
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or feedback agrees for 3 seconds while starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Defective signal detect and actuation modules
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A20 (SAM) side system.

684-7: Outer clutch slip

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Diagnosis Code 520718-4, 520718-3 (ON, OFF STUCK error) not generated • Diagnosis Code 785-3 (magnetic valve (relief) shorted to battery) not generated • Outer clutch current reading 1.15 A or above • Even gear engaged • Difference of 200 rpm or more for 10 seconds between engine speed and outer clutch speed
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-1st/R-Lo
Possible causes		• Incorrect setting of transfer gear ratio • Defective outer linear magnetic valve • Defective clutch • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

740-7: No response of outer clutch torque

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Diagnosis Code 788-4, 788-3 (driver stuck ON, OFF) not generated • Diagnosis Code 785-3 (magnetic valve (relief) shorted to battery) not generated • Even gear engaged • Engine speed higher by 500 rpm or more than inner clutch speed • Despite correct outer clutch current reading, torque output is incorrect for 5 seconds.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-1st/R-Lo
Possible causes		• Defective outer clutch control linear magnetic valve • Defective clutch • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

772-3: Component Gear shift unit magnet valve(MV1F) is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck ON detected (C1F Failure status ON stuck (MV1F) = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or no detection of magnetic valve stuck on while starter switch is in ON position. (C1F Failure status ON stuck (MV1F) = No Detection)
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Harness between DUONIC electronic control unit and gear shift unit magnetic valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/24 and Y22.6/3 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

772-4: Component “Gear shift unit magnet valve(MV1F)” is always OFF.

Generation condition	• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck OFF detected (C1F Failure status OFF stuck (MV1F) = Fail)
Recoverability	• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit	[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Control of relevant gear shift rail unit is terminated. • Vehicle continuously driven in F-2nd/R-Hi
Possible causes	• Harness between DUONIC electronic control unit and gear shift unit magnetic valve open or shorted • Defective actuator • Defective DUONIC electronic control unit

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/24 and Y22.6/3 for short circuit to ground. Check electrical line between pins A28.X1.81/24 and Y22.6/3 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

781-7: Gear shift not possible due to low pressure binding of Line pressure control solenoid valve

Generation condition		• Diagnosis Code 785-3 (magnetic valve (relief) pressure too low) generated • 3 attempts to engage gear have failed on gear shift unit cylinder on which rail control is not suspended.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Diagnosis Code 785-3 was generated, preventing gear from being engaged.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.Yes: Go to Step3

783-3: Component Gear shift unit magnet valve(MV1R) is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck ON detected (C1B Failure status ON stuck (MV1R) = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or no detection of magnetic valve stuck on while starter switch is in ON position. (C1B Failure status ON stuck (MV1R) = No Detection)
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between DUONIC electronic control unit and gear shift unit magnetic valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/62 and Y22.6/6 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

783-4: Component “Gear shift unit magnet valve(MV1R)” is always OFF.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck OFF detected (C1B Failure status OFF stuck (MV1R) = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Control of relevant gear shift rail unit is terminated. • Vehicle continuously driven in F-2 nd/R-Hi
Possible causes		• Signal harness between DUONIC electronic control unit and gear shift unit magnetic valve open or shorted • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/62 and Y22.6/6 for short circuit to ground. Check electrical line between pins A28.X1.81/62 and Y22.6/6 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

Inspection procedure	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

785-3: Component Line pressure control solenoid valve is constantly on.

Generation condition		• Battery voltage 8 to 16 V • Supply voltage with starter switch ON 8 to 16 V • Magnetic valve stuck ON detected (MVR failure status ON stuck = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or no detection of magnetic valve stuck on while starter switch is in ON position. (MVR failure status ON = No Detection)
Control effected by electronic control unit		• None
Possible causes		• Harness between DUONIC electronic control unit and line pressure control valve shorted to battery • Defective actuator • Defective electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y25 (Line pressure control solenoid valve). Make a visual check on each connector. Measure the resistance between Y25 (Line pressure control solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y25 (Line pressure control solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y25 (Line pressure control solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/20 and Y25.X5.12/4 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

785-4: Component “Line pressure control solenoid valve” is always OFF.

Generation condition		• Battery voltage 8 to 16 V • Supply voltage with starter switch ON 8 to 16 V • Magnetic valve stuck OFF detected (MVR failure status OFF stuck = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or no detection of magnetic valve stuck off while starter switch is in ON position.
Control effected by electronic control unit		• None (System stays under normal control) (MVR failure status OFF stuck = No Detection)
Possible causes		• Harness between DUONIC electronic control unit and line pressure control valve open or shorted to ground • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y25 (Line pressure control solenoid valve). Make a visual check on each connector. Measure the resistance between Y25 (Line pressure control solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y25 (Line pressure control solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y25 (Line pressure control solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/20 and Y25.X5.12/4 for short circuit to ground. Check electrical line between pins A28.X1.81/20 and Y25.X5.12/4 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

788-3: Component Inner clutch control linear solenoid valve is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck ON detected (MVC failure status ON stuck = Fail)
Recoverability		• No detection of magnetic valve stuck ON when starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position (MVC failure status ON stuck = No Detection)
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Minus harness between DUONIC electronic control unit and inner clutch control linear magnetic valve shorted to ground • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y23 (Inner clutch control linear solenoid valve). Make a visual check on each connector. Measure the resistance between Y23 (Inner clutch control linear solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y23 (Inner clutch control linear solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step2 Yes: Go to step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y23 (Inner clutch control linear solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/4 and Y23.X5.12/2 for short circuit to ground. Is any abnormality recognized? No: Go to step4 Yes: Go to step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

788-4: Component “Inner clutch control linear solenoid valve” is always OFF.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck OFF detected (MVC failure status OFF stuck = Fail)
Recoverability		• No detection of magnetic valve stuck OFF when starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position (MVC failure status OFF stuck = No Detection)
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Plus harness between DUONIC electronic control unit and inner clutch linear magnetic valve open or shorted to ground • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y23 (Inner clutch control linear solenoid valve). Make a visual check on each connector. Measure the resistance between Y23 (Inner clutch control linear solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y23 (Inner clutch control linear solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step2 Yes: Go o step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y23 (Inner clutch control linear solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check harness between A28 (DUONIC Control unit) and Y23 (Inner clutch control linear solenoid valve) for short-circuit to another line. Check electrical line between pins A28.X1.81/4 and Y23.X5.12/2 for short circuit to positive. Check electrical line between pins A28.X1.81/4 and Y23.X5.12/2 for open circuit. Check electrical line between pins A28.X1.81/1 and Y23.X5.12/6 for open circuit. Is any abnormality recognized? No: Go to step4 Yes: Go o step
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

Inspection procedure	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

788-7: No response of inner clutch torque

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Diagnosis Code 788-4, 788-3 (driver stuck ON, OFF) not generated • Diagnosis Code 785-3 (magnetic valve (relief) shorted to battery) not generated • Odd gear engaged • Engine speed higher by 500 rpm or more than inner clutch speed • Despite correct inner clutch current reading, torque output is incorrect for 5 seconds.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Defective inner clutch control linear magnetic valve • Defective clutch • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

788-12: Faulty component Inner clutch control linear solenoid valve, Outer clutch control linear solenoid valve

Generation condition		• Simultaneous occurrences of Diagnosis Code 788-4 or 788-3 or 522-7 or 788-7 and Diagnosis Code 520718-4 or 520718-3 or 684-7 or 740-7
Recoverability		• Diagnosis Code 788-4, 788-3, 522-7, 788-7 not generated or Diagnosis Code 520718-4, 520718-3, 684-7, 740-7 not generated when starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective outer or inner linear magnetic valve • Defective clutch • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

904-19: Out-of-range CAN reception data from component “Antilock brake system Control unit”

Generation condition		• Anti-lock brake system-equipped vehicle (ABS Cooperative Control equipped) • Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EBC2_BS received & Front Axle Speed (CAN) out of range (250.996<Front Axle Speed (CAN))
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Defective hydraulic unit (electronic control unit)
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A1 (Antilock brake system Control unit) side system.

907-19: Out-of-range CAN reception data from component “Antilock brake system Control unit”

Generation condition		• Anti-lock brake system-equipped vehicle (ABS Cooperative Control equipped) • Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EBC2_BS received & Driving Wheel Relative Speed Left Side out of range (7.8125<Driving Wheel Relative Speed Left Side)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Defective hydraulic unit (electronic control unit)
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A1 (Antilock brake system Control unit) side system.

908-19: Out-of-range CAN reception data from component “Antilock brake system Control unit”

Generation condition		• Anti-lock brake system-equipped vehicle (ABS Cooperative Control equipped) • Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EBC2_BS received & Driving Wheel Relative Speed Right Side out of range (7.8125<Driving Wheel Relative Speed Right Side)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Defective hydraulic unit (electronic control unit)
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A1 (Antilock brake system Control unit) side system.

973-19: Out-of-range CAN reception data from component “Combustion engine Control unit”

Generation condition	• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EBC1_EEC received & Engine Retarder Section (CAN) out of range (100<Engine Retarder Selection (CAN))
Recoverability	• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit	[Upon receiving out-of-range signal] • Normal data last received are retained.
Possible causes	• Defective engine electronic control unit

Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

1438-12: Component Antilock brake system Control unit reports a fault.

Generation condition		• Anti-lock brake system-equipped vehicle (ABS Cooperative Control equipped) • Supply voltage 8 to 16 V with starter switch ON • 5 seconds have elapsed since starter switch was turned ON. • EBC1_BS received & ABS warning lamp (CAN) not OFF
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or upon receiving ABS warning lamp (CAN) OFF signal while starter switch is in ON position.
Control effected by electronic control unit		If the software of DUONIC ECU is old In case of <In Auto Mode> • Auto downshifting not permitted • Shifting to roll-off gear temporarily permitted after detection of vehicle stationary for 3 seconds <In Manual Mode> • Normal gear shifting permitted
		If the software of DUONIC ECU is newer <In Auto Mode> • Auto upshifting not permitted • Automatic shift down to 4 speed • Automatic shift down not permitted in 4-speed or less • Shifting to roll-off gear temporarily permitted after detection of vehicle stationary for 3 seconds <In Manual Mode> • Normal gear shifting permitted <In Cruise control> • Cruise control variable speed mode release • Cruise control release request continuation output
Possible causes		• Anti-lock brake system/AMB warning being displayed (which is not a fault) • Defective hydraulic unit (electronic control unit)
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A1 (Antilock brake system Control unit) side system.

1619-2: Component Vehicle speed Sensors has an electrical fault.

Generation condition	• Anti-lock brake system-equipped vehicle (Anti-lock Brake System Cooperative Control Equipped Information = 1) • Supply voltage 8 to 16 V with starter switch ON • Normal vehicle speed received from Front Axle speed (CAN) • Normal status Front Axle speed (CAN) and Driving Wheel Relative speed (CAN) • Diagnosis Code 1619-8 not generated • Abnormal status in the vehicle speed sensor 2 signal in comparison with the front axle speed (CAN) signal.
Recoverability	• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit	• Reference made to vehicle speed sensor 1 input • Creep torque cut
Possible causes	• Defective harness between vehicle speed sensor and DUONIC electronic control unit • Malfunction of vehicle speed sensor • Defective DUONIC electronic control unit

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B11 (Vehicle speed Sensors). Apply DC {0} to {1} V between terminals B11.4/3 and B11.4/1. Rotate the shaft of B11 (Vehicle speed Sensors). Check terminals B11.4/2 and B11.4/4 for signals and, if no signals are outputted, replace B41 (Rpm sensor Transmission). Is any abnormality recognized? Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No: Go to Step2 Yes: Go to Step4
	Step2	Inspection procedure Inspect or verify the following items. Repair or replace faulty items as necessary. Replace B11 (Vehicle speed Sensors) with a normal one and check to see if the fault code occurs. Measure resistance of the harness across A28 (DUONIC Control unit) and B11 (Vehicle speed Sensors) to check for a faulty harness (e.g., incomplete open circuit). Go to Step3
Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Replace component “B11 (Vehicle speed Sensors)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3

1619-8: The signal voltage of component Vehicle speed Sensors is too low.

Generation condition	• Anti-lock brake system-equipped vehicle (Anti-lock Brake System Cooperative Control Equipped Information = 1) • Supply voltage 8 to 16 V with starter switch ON • Normal vehicle speed received from Front Axle Speed (CAN) • Normal status indicated by comparison between Driving Wheel Relative Speed (CAN) (left and right) and Front Axle Speed (CAN) • Vehicle speed sensor 2 = 0rpm
Recoverability	• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or vehicle speed sensor 2 input is 100 rpm or above while starter switch is in ON position
Control effected by electronic control unit	• Reference made to vehicle speed sensor 1 input • Creep torque cut
Possible causes	• Signal (between DUONIC electronic control unit and meter cluster) harness between vehicle speed sensor and DUONIC electronic control unit open, shorted to ground, or shorted to battery • Signal (between meter cluster and vehicle speed sensor) harness between vehicle speed sensor and DUONIC electronic control unit open or shorted to ground • Ground harness between vehicle speed sensor and DUONIC electronic control unit open or shorted to battery • Malfunction of vehicle speed sensor • Defective meter cluster • Defective DUONIC electronic control unit

Inspection procedure	Step1	Inspection procedure Has a fault code associated with B11 (Vehicle speed Sensors) occurred in any other systems, or is the vehicle speed indication on the meter correct? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B11 (Vehicle speed Sensors). Remove the connector of A28 (DUONIC Control unit). Check electrical line between pins A11.18/16 and A28.X2.40/94 for open circuit. Test electrical line between pins A11.18/16 and A28.X2.40/94 for short circuit to ground. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Go to Step5
Inspection procedure	Step4	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Special features Run vehicle Go to Step3
	Step5	Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of B11 (Vehicle speed Sensors). Remove the connector of A11 (Meter cluster). Check electrical line between pins B11.4/2 and A11.18/12 for open circuit. Test electrical line between pins B11.4/2 and A11.18/12 for short circuit to ground. Check electrical line between pins B11.4/3 and A11.18/3 for open circuit. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step9
	Step7	Inspection procedure Turn the starter switch in OFF. Remove B11 (Vehicle speed Sensors) from Transmission. Apply DC 12 V between terminals B11.4/3 and B11.4/1. Rotate the shaft of B11 (Vehicle speed Sensors). Check terminals B11.4/2 and B11.4/4 for signals and, if no signals are outputted, replace B11 (Vehicle speed Sensors). Is any abnormality recognized? No: Go to Step3 Yes: Go to Step8
	Step8	Inspection procedure Replace component “B11 (Vehicle speed Sensors)”. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step9	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.

1810-2: Component Acceleration sensor has an electrical fault.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • None of diagnosis codes 119 (1810-3), 120 (1810-4), 122 (520745-3) and 123 (520745-4) generated. • Period during which signal voltage difference between G-sensor and G-sensor 2 is not larger than -0.3 V or not smaller than 0.3 V has lasted for 5 seconds.
Recoverability		• The system recovers if any normal signal is input when starter switch is turned OFF and then ON again (electronic control unit is reenergized).
Control effected by electronic control unit		• Road gradient is always deemed to be 0%. • 2-1 downshift control is not effected even if sudden braking is applied during uphill driving. • Automatic gear selection at starting off is fixed at 1st gear. • Vehicle weight calculation function is disabled. • On vehicles without ABS, half-lock detection function is disabled.
Possible causes		• Faulty harness between G-sensor and DUONIC electronic control unit • Defective G-sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B43 (Acceleration sensor). Apply DC 12 V between terminals B43.3/3 and B43.3/1. Measure the output voltage when B43 (Acceleration sensor) is as illustrated across terminals B43.3/2 and B43.3/1. Standard value Horizontal condition: 2.3 - 2.7V Vertical condition: 3.3 - 3.7V Is any abnormality recognized? Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No: Go to Step2 Yes: Go to Step4
	Step2	Inspection procedure Inspect or verify the following items. Repair or replace faulty items as necessary. Replace B43 (Acceleration sensor) with a normal one and check to see if the fault code occurs. Measure resistance of the harness across A28 (DUONIC Control unit) and B43 (Acceleration sensor) to check for a faulty harness (e.g., incomplete open circuit). Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Replace component “B43 (Acceleration sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Wait for 5 seconds after the starter switch is set to ON. Go to Step3

1810-3: The signal voltage of component Acceleration sensor is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • G sensor signal voltage 4.55 V or above
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or G sensor signal voltage is 4.50 V or bellow while starter switch is in ON position
Control effected by electronic control unit		• Road gradient substitute value 0% • 2^{nd} to 1^{st} shift down control disabled in braking on the steep climbing slope • Automatic selection of roll-off gear fixed to 1^{st} • Vehicle weight calculation is terminated. • Half lock detection not permitted on non anti-lock brake system-equipped vehicle (ABS Cooperative Control not equipped)
Possible causes		• Signal harness between G sensor and DUONIC electronic control unit shorted to battery • Ground harness between G sensor and DUONIC electronic control unit open • Defective G sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B43 (Acceleration sensor). Make a visual check on each connector. Measure the resistance between B43 (Acceleration sensor) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B43 (Acceleration sensor) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B43 (Acceleration sensor)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B43 (Acceleration sensor) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

1810-4: The signal voltage of component Acceleration sensor is too low.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • G sensor signal voltage 0.45 V or below
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or G sensor signal voltage is 0.50 V or above while starter switch is in ON position.
Control effected by electronic control unit		• Road gradient substitute value 0% • 2nd to 1st shift down control disabled in braking on steep climbing slope • Automatic selection of starting gear fixed to 1st • Vehicle weight calculation is terminated. • Half lock detection not permitted on non anti-lock brake system-equipped vehicle (ABS Cooperative Control not equipped)
Possible causes		• Signal harness between G sensor and DUONIC electronic control unit open or shorted to ground • Power harness between G sensor and DUONIC electronic control unit open • Defective G sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B43 (Acceleration sensor). Make a visual check on each connector. Measure the resistance between B43 (Acceleration sensor) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B43 (Acceleration sensor) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B43 (Acceleration sensor)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B43 (Acceleration sensor) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

1852-19: Out-of-range CAN reception data from component “Combustion engine Control unit”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • There are TC1_MCM inputs but low gear hold data 1st, Rev Hold Request (CAN) = Reserved, SNA) is out of normal range.
Recoverability		• The system recovers if any normal signal is input when starter switch is turned OFF and then ON again (electronic control unit is reenergized) or as soon as any normal data is received when starter switch is turned ON.
Control effected by electronic control unit		[Immediately after data out of effective range is received] • The last normal data is retained.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

1852-31: Internal error: The data record is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 1st, Rev Hold Request (CAN) = Enable
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or TC1_MCM received & no 1st, Rev Hold Request (CAN) = Disable while starter switch is in ON position.
Control effected by electronic control unit		• Starting gear fixed to 1st • Upshifting in D range not permitted • Upshifting in M range not permitted
Possible causes		• Diesel exhaust fluid level too low
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

2580-2: Component Brake pressure sensor has an electrical fault.

Generation condition		• Accelerator opening more than 30% • Vehicle running forward at 20 km/h{12.4 mph} or higher • Supply voltage 8 to 16 V with starter switch ON • Engine speed 400 rpm or above • Status of function 'Lock Brake' (CAN): OFF • EGZO_A01_CAN Reception quality: NO RECEPTION • Brake fluid pressure sensor input 2.3 MPa or above for 10 seconds with Stop lamp switch (CAN) OFF (Brake pedal Released)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or brake fluid pressure sensor input 0.5 MPa or below for 10 seconds with Stop lamp switch (CAN) OFF (Brake pedal Released) while starter switch is in ON position.
Control effected by electronic control unit		• Brake fluid pressure substitute value 0 MPa
Possible causes		• Defective brake fluid pressure sensor • Defective harness between brake fluid pressure sensor and DUONIC electronic control unit • Malfunction of stop lamp switch • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check to see if Brake light Switches system is fully operational. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B42 (Brake pressure sensor). Apply DC 5 V between terminals B42.3/3 and B42.3/1. Measure the output voltage between terminals B42.3/3 and B42.3/2. Specified value: 0.5V Is any abnormality recognized? Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No: Go to Step3 Yes: Go to Step5
	Step3	Inspection procedure Inspect or verify the following items. Repair or replace faulty items as necessary. Replace B42 (Brake pressure sensor) with a normal one and check to see if the fault code occurs. Measure resistance of the harness across A28 (DUONIC Control unit) and B42 (Brake pressure sensor) to check for a faulty harness (e.g., incomplete open circuit). Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Replace component “B42 (Brake pressure sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Wait for 10 seconds after the starter switch is set to ON. Go to Step4

2580-3: The signal voltage of component Brake pressure sensor is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Brake fluid pressure sensor signal voltage 4.8 V or above
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or brake fluid pressure sensor signal voltage is 4.5 V or below while starter switch is in ON position.
Control effected by electronic control unit		• Brake fluid pressure substitute value 0 MPa
Possible causes		• Signal harness between brake fluid pressure sensor and DUONIC electronic control unit shorted to battery or open • Ground/power harness between brake fluid pressure sensor and DUONIC electronic control unit open • Defective brake fluid pressure sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B42 (Brake pressure sensor). Make a visual check on each connector. Measure the resistance between B42 (Brake pressure sensor) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B42 (Brake pressure sensor) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B42 (Brake pressure sensor)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B42 (Brake pressure sensor) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

2580-4: The signal voltage of component Brake pressure sensor is too low.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Brake fluid pressure sensor signal voltage 0.2 V or below
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or brake fluid pressure sensor voltage is 0.5 V or above while starter switch is in ON position.
Control effected by electronic control unit		• Brake fluid pressure substitute value 0 MPa
Possible causes		• Signal harness between brake fluid pressure sensor and DUONIC electronic control unit shorted to ground • Defective brake fluid pressure sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B42 (Brake pressure sensor). Make a visual check on each connector. Measure the resistance between B42 (Brake pressure sensor) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B42 (Brake pressure sensor) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B42 (Brake pressure sensor)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B42 (Brake pressure sensor) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

2910-3: Component Transmission power take-off 3-way magnetic valve is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck ON detected (PTOCS failure status ON stuck = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or no detection of magnetic valve stuck ON while starter switch is in ON position. (PTOCS failure status ON stuck = No Detection)
Control effected by electronic control unit		• When the power-take off is operated with the gear is in the other position than P and N. • “PTO” flashes on meter • Buzzer ON/OFF (every second)
Possible causes		• Harness between DUONIC electronic control unit and power take-off 3-way magnetic valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y28 (Transmission power take-off 3-way magnetic valve). Make a visual check on each connector. Measure the resistance between Y28 (Transmission power take-off 3-way magnetic valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y28 (Transmission power take-off 3-way magnetic valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y28 (Transmission power take-off 3-way magnetic valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/58 and Y28.2/1 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

2910-4: Component “Transmission power take-off 3-way magnetic valve” is always OFF.

Generation condition		• Vehicle equipped with power take-off (Power take-off Equipped Information=1) • Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck OFF detected (PTOCS failure status OFF stuck = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or no detection of magnetic valve stuck OFF while starter switch is in ON position. (PTOCS failure status OFF stuck = No Detection)
Control effected by electronic control unit		• None (System stays under normal control)
Possible causes		• Signal harness between DUONIC electronic control unit and power take-off 3-way magnetic valve open or shorted to ground • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y28 (Transmission power take-off 3-way magnetic valve). Make a visual check on each connector. Measure the resistance between Y28 (Transmission power take-off 3-way magnetic valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y28 (Transmission power take-off 3-way magnetic valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y28 (Transmission power take-off 3-way magnetic valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/58 and Y28.2/1 for short circuit to ground. Check electrical line between pins A28.X1.81/58 and Y28.2/1 for open circuit. Check electrical line between pins Y28.2/2 and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

3187-19: Out-of-range CAN reception data from component “Selector lever”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • ETC2_SSAM received • Shift lever unit signal controller area network out-of-range data (excluding 9, 25, 17, 49, 33, 35, 19, 10, 26, 18, 50, 34, 22, 20) (0: NoError judged as abnormal)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective signal detect and actuation modules
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A20 (SAM) side system.

3452-19: Out-of-range CAN reception data from component “Power take-off control switch”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • PTO_SSAM received & Power take-off switch data out of range (error)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained.
Possible causes		• Defective signal detect and actuation modules
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A20 (SAM) side system.

3453-19: Out-of-range CAN reception data from component “Transmission power take-off indicator lamp switch”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • SSAM_A01 received & Power take-off switch data out of range (error)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained.
Possible causes		• Defective signal detect and actuation modules
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A20 (SAM) side system.

520704-2: M contact voltage is either too low or too high.

Generation condition		• Starter switch in ON position being detected • Battery voltage V01 or V02 8 to 16 V • Starter switch ON power V1 below 8 V or above 16 V
Recoverability		• Battery voltage V01 or V02 8 to 16 V • System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or starter switch ON power V1 is 8 to 16 V while starter switch is in ON position.
Control effected by electronic control unit		• Backup with V2, V3, V01, V02
Possible causes		• Harness between DUONIC electronic control unit and SSAM open or shorted to ground • Defective alternator • Defective signal detect and actuation module relay • Defective starter switch • Defective signal detect and actuation modules • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Use the following procedure to check if the source voltage is excessively high or low. Refer to the results of short test of other ECUs. Insert the tester probes into the A28 (DUONIC Control unit) harness connector on the vehicle side and measure the voltage between A28.X2.40/119 and Ground. Is voltage above 12V (high voltage error)? No: Go to Step2 Yes: Go to Step12
	Step2	Inspection procedure Check that the fuse F24,HF01 is not blown out. If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Go to Step3
	Step3	Inspection procedure Is this diagnosis code still active? No: Go to Step14 Yes: Go to Step4
	Step4	Inspection procedure Make a system diagnosis if a diagnosis code representing abnormal power supply directly from the battery has occurred. Go to Step5
	Step5	Inspection procedure Check if this ECU or other ECU has stored any of the diagnosis codes associated with the identical power supply system (switched ON through starter switch or for accessories). Are current fault codes present? No: Go to Step6 Yes: Go to Step8
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of A20 (SAM). Check electrical line between pins A28.X2.40/119 and A20.X9.14/11 for open circuit. Test electrical line between pins A28.X2.40/119 and A20.X9.14/11 for short circuit to ground. Is any abnormality recognized? No: Go to Step13 Yes: Go to Step7
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.

Inspection procedure	Step8	Make the following inspections. K23 (Starter signal Relays (IGN)) S7 (Starter Switches) For procedures, refer to the Shop Manual. Replace faulty electrical devices. Is this diagnosis code still active? No: Go to Step14 Yes: Go to Step9
	Step9	Inspection procedure Turn the starter switch in OFF. Remove the connector of A20 (SAM). Remove the connector of S7 (Starter Switches). Check electrical line between pins A20.X8.28/3 and S7.6/6 for open circuit. Test electrical line between pins A20.X8.28/3 and S7.6/6 for short circuit to ground. Check electrical line between pins S7.6/4 and A20.X3.14/3 for open circuit. Test electrical line between pins S7.6/4 and A20.X3.14/3 for short circuit to ground. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM).
	Step11	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step12	Inspection procedure Replace component “Alternator”. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step13	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit).
	Step14	Inspection completed

520705-2: M contact voltage is either too low or too high.

Generation condition	• Starter switch in ON position being detected • Battery voltage V01 or V02 8 to 16 V • Starter switch ON power V2 below 8 V or above 16 V
Recoverability	• Battery voltage V01 or V02 8 to 16 V • System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or starter switch ON power V2 is 8 to 16 V while starter switch is in ON position.
Control effected by electronic control unit	• Backup with V1, V3, V01, V02
Possible causes	• Harness between DUONIC electronic control unit and SSAM open or shorted to ground • Defective alternator • Defective signal detect and actuation module relay • Defective starter switch • Defective signal detect and actuation modules • Defective DUONIC electronic control unit

Inspection procedure	Step1	Inspection procedure Use the following procedure to check if the source voltage is excessively high or low. Refer to the results of short test of other ECUs. Insert the tester probes into the A28 (DUONIC Control unit) harness connector on the vehicle side and measure the voltage between A28.X2.40/120 and Ground. Is voltage above 12V (high voltage error)? No: Go to Step2 Yes: Go to Step12
	Step2	Inspection procedure Check that the fuse F24,HF01 is not blown out. If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Go to Step3
	Step3	Inspection procedure Is this diagnosis code still active? No: Go to Step14 Yes: Go to Step4
	Step4	Inspection procedure Make a system diagnosis if a diagnosis code representing abnormal power supply directly from the battery has occurred. Go to Step5
	Step5	Inspection procedure Check if this ECU or other ECU has stored any of the diagnosis codes associated with the identical power supply system (switched ON through starter switch or for accessories). Are current fault codes present? No: Go to Step6 Yes: Go to Step8
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of A20 (SAM). Check electrical line between pins A28.X2.40/120 and A20.X9.14/9 for open circuit. Test electrical line between pins A28.X2.40/120 and A20.X9.14/9 for short circuit to ground. Is any abnormality recognized? No: Go to Step13 Yes: Go to Step7
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step8	Make the following inspections. K23 (Starter signal Relays (IGN)) S7 (Starter Switches) For procedures, refer to the Shop Manual. Replace faulty electrical devices. Is this diagnosis code still active? No: Go to Step14 Yes: Go to Step9

Inspection procedure	Step9	Inspection procedure Turn the starter switch in OFF. Remove the connector of A20 (SAM). Remove the connector of S7 (Starter Switches). Check electrical line between pins A20.X8.28/3 and S7.6/6 for open circuit. Test electrical line between pins A20.X8.28/3 and S7.6/6 for short circuit to ground. Check electrical line between pins S7.6/4 and A20.X3.14/3 for open circuit. Test electrical line between pins S7.6/4 and A20.X3.14/3 for short circuit to ground. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM).
	Step11	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step12	Inspection procedure Replace component “G2 (Alternator)”. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step13	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit).
	Step14	Inspection completed

520706-2: ACC contact voltage is either too low or too high.

Generation condition	• Starter switch in ON position being detected • Battery voltage V01 or V02 8 to 16 V • Starter switch ACC power V3 below 8 V or above 16 V
Recoverability	• Battery voltage V01 or V02 8 to 16 V • System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or starter switch ACC power thus reenergizing electronic control unit V3 is 8 to 16 V.
Control effected by electronic control unit	• None
Possible causes	• Harness between DUONIC electronic control unit and SSAM open or shorted to ground • Defective alternator • Defective signal detect and actuation module relay • Defective starter switch • Defective signal detect and actuation modules • Defective DUONIC electronic control unit

Inspection procedure	Step1	Inspection procedure Use the following procedure to check if the source voltage is excessively high or low. Refer to the results of short test of other ECUs. Insert the tester probes into the A28 (DUONIC Control unit) harness connector on the vehicle side and measure the voltage between A28.X2.40/121 and Ground. Is voltage above 12V (high voltage error)? No: Go to Step2 Yes: Go to Step12
	Step2	Inspection procedure Check that the fuse F24,HF01 is not blown out. If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Go to Step3
	Step3	Inspection procedure Is this diagnosis code still active? No: Go to Step14 Yes: Go to Step4
	Step4	Inspection procedure Make a system diagnosis if a diagnosis code representing abnormal power supply directly from the battery has occurred. Go to Step5
	Step5	Inspection procedure Check if this ECU or other ECU has stored any of the diagnosis codes associated with the identical power supply system (switched ON through starter switch or for accessories). Are current fault codes present? No: Go to Step6 Yes: Go to Step8
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of A20 (SAM). Check electrical line between pins A28.X2.40/121 and A20.X10.14/8 for open circuit. Test electrical line between pins A28.X2.40/121 and A20.X10.14/8 for short circuit to ground. Is any abnormality recognized? No: Go to Step13 Yes: Go to Step7
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step8	Make the following inspections. K24 (Starter signal Relays (ACC)) S7 (Starter Switches) For procedures, refer to the Shop Manual. Replace faulty electrical devices. Is this diagnosis code still active? No: Go to Step14 Yes: Go to Step9

Inspection procedure	Step9	Inspection procedure Turn the starter switch in OFF. Remove the connector of A20 (SAM). Remove the connector of S7 (Starter Switches). Check electrical line between pins A20.X8.28/17 and S7.6/5 for open circuit. Test electrical line between pins A20.X8.28/17 and S7.6/5 for short circuit to ground. Check electrical line between pins S7.6/4 and A20.X3.14/3 for open circuit. Test electrical line between pins S7.6/4 and A20.X3.14/3 for short circuit to ground. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM).
	Step11	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step12	Inspection procedure Replace component “G2 (Alternator)”. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step13	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit).
	Step14	Inspection completed

520707-3: Component Oil cooler flow control solenoid valve is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck ON detected (MVC failure status ON stuck = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or no detection of magnetic valve stuck ON while starter switch in ON position. (MVC failure status ON stuck = No Detection)
Control effected by electronic control unit		• None
Possible causes		• Harness between DUONIC electronic control unit and oil cooler flow control magnetic valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y26 (Oil cooler flow control solenoid valve). Make a visual check on each connector. Measure the resistance between Y26 (Oil cooler flow control solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y26 (Oil cooler flow control solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y26 (Oil cooler flow control solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/21 and Y26.X5.12/3 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520707-4: Component “Oil cooler flow control solenoid valve” is always OFF.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck OFF detected (MVC failure status OFF stuck = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or no detection of magnetic valve stuck OFF while starter switch in ON position. (MVC failure status OFF stuck = No Detection)
Control effected by electronic control unit		• Both clutches are kept disengaged. • Gear shift kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Harness between DUONIC electronic control unit and oil cooler flow control magnetic valve open or shorted to ground • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y26 (Oil cooler flow control solenoid valve). Make a visual check on each connector. Measure the resistance between Y26 (Oil cooler flow control solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y26 (Oil cooler flow control solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y26 (Oil cooler flow control solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/21 and Y26.X5.12/3 for short circuit to ground. Check electrical line between pins A28.X1.81/21 and Y26.X5.12/3 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520708-7: Neutral control not possible(MV1F, MV1R)

Generation condition		• Gear shift unit rail 1 neutral control for 10 seconds
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Control of relevant gear shift rail unit is terminated. • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Defective actuator harness • Defective actuator • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520709-7: Neutral control not possible(MV2F, MV2R)

Generation condition		• Gear shift unit rail 2 neutral control for 10 seconds
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective actuator harness • Defective actuator • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520710-7: Neutral control not possible(MV3F, MV3R)

Generation condition		• Gear shift unit rail 3 neutral control for 10 seconds
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective actuator harness • Defective actuator • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520714-3: Component “Gear shift unit magnet valve(MV2F)” is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck ON detected (C2F Failure status ON stuck (MV2F) = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or no detection of magnetic valve stuck on while starter switch in ON position. (C2F Failure status ON stuck (MV2F) = No Detection)
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Harness between DUONIC electronic control unit and gear shift unit magnetic valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: GO to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/23 and Y22.6/2 for short circuit to positive. Is any abnormality recognized? No: GO to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit).
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit).

520714-4: Component “Gear shift unit magnet valve(MV2F)” is always OFF.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck OFF detected (C2F Failure status OFF stuck (MV2F) = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Control of relevant gear shift rail unit is terminated. • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Harness between DUONIC electronic control unit and gear shift unit magnetic valve shorted or open • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/23 and Y22.6/2 for short circuit to ground. Check electrical line between pins A28.X1.81/23 and Y22.6/2 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520715-3: Component Gear shift unit magnet valve(MV2R) is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck ON detected (C2B Failure status ON stuck (MV2R) = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or no detection of magnetic valve stuck on while starter switch in ON position. (C2B Failure status ON stuck (MV2R) = No Detection)
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Harness between DUONIC electronic control unit and gear shift unit magnetic valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/61 and Y22.6/5 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520715-4: Component “Gear shift unit magnet valve(MV2R)” is always OFF.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck OFF detected (C2B Failure status OFF stuck (MV2R) = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Control of relevant gear shift rail unit is terminated. • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Harness between DUONIC electronic control unit and gear shift unit magnetic valve shorted or open • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/61 and Y22.6/5 for short circuit to ground. Check electrical line between pins A28.X1.81/61 and Y22.6/5 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520716-3: Component Gear shift unit magnet valve(MV3F) is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck ON detected (C3F Failure status ON stuck (MV3F) = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or no detection of magnetic valve stuck on while starter switch in ON position. (C3F Failure status ON stuck (MV3F) = No Detection)
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Harness between DUONIC electronic control unit and gear shift unit magnetic valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/22 and Y22.6/1 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520716-4: Component “Gear shift unit magnet valve(MV3F)” is always OFF.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck OFF detected (C3F Failure status OFF stuck (MV3F) = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Harness between DUONIC electronic control unit and gear shift unit magnetic valve open or shorted • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/22 and Y22.6/1 for short circuit to ground. Check electrical line between pins A28.X1.81/22 and Y22.6/1 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520717-3: Component Gear shift unit magnet valve(MV3R) is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck ON detected (C3B Failure status ON stuck (MV3R) = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or no detection of magnetic valve stuck on while starter switch in ON position. (C3B Failure status ON stuck (MV3R) = No Detection)
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Harness between DUONIC electronic control unit and gear shift unit magnetic valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/60 and Y22.6/4 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520717-4: Component “Gear shift unit magnet valve(MV3R)” is always OFF.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck OFF detected (C3B Failure status OFF stuck (MV3R) = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Harness between DUONIC electronic control unit and gear shift unit magnetic valve open or shorted • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/60 and Y22.6/4 for short circuit to ground. Check electrical line between pins A28.X1.81/60 and Y22.6/4 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520718-3: Component Outer clutch control linear solenoid valve is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck ON detected (Outer Clutch Solenoid Valve Failure Status ON Stuck = Fail)
Recoverability		• No detection of magnetic valve stuck ON when starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position (Outer Clutch Solenoid Valve Failure Status ON Stuck = No Detection)
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Minus harness between DUONIC electronic control unit and outer clutch control linear magnetic valve shorted to ground • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y27 (Outer clutch control linear solenoid valve). Make a visual check on each connector. Measure the resistance between Y27 (Outer clutch control linear solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y27 (Outer clutch control linear solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step2 Yes: Go to step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y27 (Outer clutch control linear solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/5 and Y27.X5.12/1 for short circuit to ground. Is any abnormality recognized? No: Go to step4 Yes: Go to step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520718-4: Component “Outer clutch control linear solenoid valve” is always OFF.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Magnetic valve stuck OFF detected (Outer Clutch Solenoid Valve Failure Status OFF Stuck = Fail)
Recoverability		• No detection of magnetic valve stuck OFF when starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position (Outer Clutch Solenoid Valve Failure Status OFF Stuck = No Detection)
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-1 st/R-Lo
Possible causes		• Plus harness between DUONIC electronic control unit and outer clutch linear magnetic valve open or shorted • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y27 (Outer clutch control linear solenoid valve). Make a visual check on each connector. Measure the resistance between Y27 (Outer clutch control linear solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y27 (Outer clutch control linear solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step2 Yes: Go to step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y27 (Outer clutch control linear solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check harness between A28 (DUONIC Control unit) and Y27 (Outer clutch control linear solenoid valve) for short-circuit to another line. Check electrical line between pins A28.X1.81/5 and Y27.X5.12/1 for short circuit to positive. Check electrical line between pins A28.X1.81/5 and Y27.X5.12/1 for open circuit. Check electrical line between pins A28.X1.81/2 and Y27.X5.12/5 for open circuit. Is any abnormality recognized? No: Go to step4 Yes: Go to step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

Inspection procedure	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520719-2: Incorrect 1st gear ratio

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of magnetic valve (relief) shorted to battery • Inner clutch current reading 1.15 A or above • Continuation for 10 seconds in 1st gear of difference of ± 200 rpm or more between engine speed and 1st gear input (inner clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520720-2: Incorrect 2nd gear ratio

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of magnetic valve (relief) shorted to battery • Outer clutch current reading 1.15 A or above • Continuation for 10 seconds in 2nd gear of difference of ± 200 rpm or more between engine speed and 2nd gear input (outer clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-1st/R-Lo
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520721-2: Incorrect 3rd gear ratio

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of magnetic valve (relief) shorted to battery • Inner clutch current reading 1.15 A or above • Continuation for 10 seconds in 3rd gear of difference of ± 200 rpm or more between engine speed and 3rd gear input (inner clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520722-2: Incorrect 4th gear ratio

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of magnetic valve (relief) shorted to battery • Outer clutch current reading 1.15 A or above • Continuation for 10 seconds in 4th gear of difference of ± 200 rpm or more between engine speed and 4th gear input (outer clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-1st/R-Lo
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520723-2: Incorrect 5th gear ratio

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of magnetic valve (relief) shorted to battery • Inner clutch current reading 1.15 A or above • Continuation for 10 seconds in 5th gear of difference of ± 200 rpm or more between engine speed and 5th gear input (inner clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520724-2: Incorrect 6th gear ratio

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of magnetic valve (relief) shorted to battery • Outer clutch current reading 1.15 A or above • Continuation for 10 seconds in 6th gear of difference of ± 200 rpm or more between engine speed and 6th gear input (outer clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-1st/R-Lo
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520725-2: Incorrect RevLo gear ratio

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of magnetic valve (relief) shorted to battery • Inner clutch current reading 1.15 A or above • Continuation for 10 seconds in RevLo gear of difference of ± 200 rpm or more between engine speed and RevLo gear input (inner clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520726-2: Incorrect RevHi gear ratio

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of magnetic valve (relief) shorted to battery • Outer clutch current reading 1.15 A or above • Continuation for 10 seconds in RevHi gear of difference of ± 200 rpm or more between engine speed and RevHi gear input (outer clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-1st/R-Lo
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520727-2: Error in CAN reception from Component “SAM”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • ETC2_SSAM not received (Unreceived)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position. (Received)
Control effected by electronic control unit		• Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective controller area network resistor • Defective signal detect and actuation modules • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6

	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520728-2: Error in CAN reception from Component "SAM"

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • CCVS_SSAM nor received (Unreceived)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.(Received)
Control effected by electronic control unit		• Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective controller area network resistor • Defective signal detect and actuation modules • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all Ictus connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6

	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520729-2: Error in CAN reception from component “SAM”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • PTO_SSAM not received (Unreceived)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position. (Received)
Control effected by electronic control unit		• None

Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective controller area network resistor • Defective signal detect and actuation modules • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6

Inspection procedure	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU.
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520731-19: Out-of-range CAN reception data from component “Economy mode switch”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • SSAM_A01 received & economy mode switch (CAN) data out of range (Error, SNA)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained.
Possible causes		• Defective signal detect and actuation modules
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A20 (SAM) side system.

520732-2: Error in CAN reception from component “Combustion engine Control unit”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EEC1_EEC not received (Unreceived)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position. (Received)
Control effected by electronic control unit		• Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective controller area network resistor • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8

Inspection procedure	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC^{TM} *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC^{TM} *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9

Inspection procedure	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520733-2: Error in CAN reception from component “Combustion engine Control unit”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EEC2_EEC not received (Unreceived)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position. (Received)
Control effected by electronic control unit		[Diagnosis Codes 520732-2 and 512-19 not generated (Warning indication: Amber)] • Service data name: See Driver’s Demand Percent Torque as accelerator position. [Diagnosis Code 520732-2 or 512-19 generated (Warning indication: Red)] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective controller area network resistor • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7

Inspection procedure	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520734-2: Out-of-range CAN reception data from component “Combustion engine Control unit”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EEC3_EEC not received (Unreceived)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position. (Received)
Control effected by electronic control unit		• Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective controller area network resistor • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7

	Step10	Inspection completed

520739-2: Error in CAN reception from component “Antilock brake system Control unit”

Generation condition		• Anti-lock brake system-equipped vehicle (ABS Cooperative Control Equipped) • Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • TSC1_AREX_BS not received (Unreceived)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position. (Received)
Control effected by electronic control unit		• Auto downshifting not permitted <in Auto Mode> • Shifting to roll-off gear temporarily permitted after detection of vehicle stationary for 3 seconds <in Auto Mode> • Normal gear shifting permitted <in Manual Mode>
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective controller area network resistor • Defective hydraulic unit (electronic control unit) • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6

Inspection procedure	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520740-3: Component Parking gear switch is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Change lever out of P • Parking gear switch ON
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or parking gear switch OFF while starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Wire between shift change lever and control lever out of adjustment • Harness between parking gear switch and DUONIC electronic control unit shorted to battery of open • Defective parking gear switch • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Wire between A26 (Selector lever) and Control lever For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of S20 (Parking gear switch). Make a visual check on each connector. Measure the resistance between S20 (Parking gear switch) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “S20 (Parking gear switch)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X2.40/108 and S20.2/1 for open circuit. Check electrical line between pins S20.2/2 and Ground for open circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step7
	Step5	Inspect or verify the following items. Repair or replace faulty items as necessary. Transmission For procedures, refer to the Shop Manual Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

Inspection procedure	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520740-4: Component “Parking gear switch” is always OFF.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Change lever in P • Parking gear switch OFF
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or parking gear switch ON while starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Wire between shift change lever and control lever out of adjustment • Harness between parking gear switch and DUONIC electronic control unit shorted to ground • Defective parking gear switch • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Wire between A26 (Selector lever) and Control lever For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of S20 (Parking gear switch). Make a visual check on each connector. Measure the resistance between S20 (Parking gear switch) and ground or each terminal to check for short-circuit and electrical leakage. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “S20 (Parking gear switch)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X2.40/108 and S20.2/1 for short circuit to ground. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step7
	Step5	Inspect or verify the following items. Repair or replace faulty items as necessary. Transmission For procedures, refer to the Shop Manual Go to Step6

Inspection procedure	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520741-2: Error in CAN reception from component “Antilock brake system Control unit”

Generation condition		• Anti-lock brake system-equipped vehicle (ABS Cooperative Control Equipped) • Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EBC2_BS not received (Unreceived)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position. (Received)
Control effected by electronic control unit		• None
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective controller area network resistor • Defective hydraulic unit (electronic control unit) • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to Step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to Step7

Inspection procedure	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to Step6
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520742-2: Error in CAN reception from component "Combustion engine Control unit"

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • CCVS_MCM not received (Unreceived)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position. (Received)
Control effected by electronic control unit		• Cruise speed change mode is exited. • Cruise termination request is continuously issued.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective controller area network resistor • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6

	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. 	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520744-31:Default setting failed to be executed.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 5 seconds have elapsed since starter switch was turned ON.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or initialization completed while starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Initialization not completed yet • Incorrect initialization
Inspection procedure	Step1	Inspection procedure Perform the appropriate settings. Set items Default settings of the DUONIC system. For procedures, refer to the Shop Manual. Inspection completed

520745-3: The signal voltage of component Acceleration sensor2 is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Signal voltage of G-sensor 2 has been higher than 4.55 V at least for 3 seconds.
Recoverability		• The system recovers if any normal signal is input when starter switch is turned OFF and then ON again (electronic control unit is reenergized) or if signal voltage of G-sensor 2 lowers below 4.50 V when starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Signal harness between G-sensor 2 and DUONIC electronic control unit shorted to battery • Ground harness between G-sensor 2 and DUONIC electronic control unit open • Defective G-sensor 2 • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to step2
	Srep2	Srep2 Inspection procedure Turn the starter switch in OFF. Remove the connector of B49 (Acceleration sensor2). Make a visual check on each connector. Measure the resistance between B49 (Acceleration sensor2) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B49 (Acceleration sensor2) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B49 (Acceleration sensor2)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B49 (Acceleration sensor2) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520745-4: The signal voltage of component Acceleration sensor2 is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Signal voltage of G-sensor 2 has been lower than 0.45 V at least for 3 seconds.
Recoverability		• The system recovers if any normal signal is input when starter switch is turned OFF and then ON again (electronic control unit is reenergized) or if signal voltage of G-sensor 2 rises to 0.50 V or higher when starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Signal harness between G-sensor 2 and DUONIC electronic control unit open or shorted to ground • Power harness between G-sensor 2 and DUONIC electronic control unit open • Defective G-sensor 2 • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B49 (Acceleration sensor2). Make a visual check on each connector. Measure the resistance between B49 (Acceleration sensor2) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B49 (Acceleration sensor2) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B49 (Acceleration sensor2)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B49 (Acceleration sensor2) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520746-3: The signal voltage of component Gear shift unit shift stroke sensor1 is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Shift Position of cylinder 1 96% or above
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or Shift Position of cylinder 1 92% or below while starter switch is in ON position.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between gear shift unit shift stroke sensor 1 and DUONIC electronic control unit shorted to battery or open • Ground/power harness between gear shift unit shift stroke sensor 1 and DUONIC electronic control unit open • Defective gear shift unit shift stroke sensor 1 • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B45 (Gear shift unit shift stroke sensor1). Make a visual check on each connector. Measure the resistance between B45 (Gear shift unit shift stroke sensor1) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B45 (Gear shift unit shift stroke sensor1) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B45 (Gear shift unit shift stroke sensor1)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B45 (Gear shift unit shift stroke sensor1) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520746-4: The signal voltage of component Gear shift unit shift stroke sensor1 is too low.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Shift Position of cylinder 1 4% or below
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or Shift Position of cylinder 1 8% or above while starter switch is in ON position.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between gear shift unit shift stroke sensor 1 and DUONIC electronic control unit shorted to ground • Defective gear shift unit shift stroke sensor 1 • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B45 (Gear shift unit shift stroke sensor1). Make a visual check on each connector. Measure the resistance between B45 (Gear shift unit shift stroke sensor1) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B45 (Gear shift unit shift stroke sensor1) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B45 (Gear shift unit shift stroke sensor1)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B45 (Gear shift unit shift stroke sensor1) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520747-3: The signal voltage of component Gear shift unit shift stroke sensor2 is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Shift Position of cylinder 2 96% or above
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or Shift Position of cylinder 2 92% or below while starter switch is in ON position.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between gear shift unit shift stroke sensor 2 and DUONIC electronic control unit shorted to battery or open • Ground / power harness between gear shift unit shift stroke sensor 2 and DUONIC electronic control unit open • Defective gear shift unit shift stroke sensor 2 • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B46 (Gear shift unit shift stroke sensor2). Make a visual check on each connector. Measure the resistance between B46 (Gear shift unit shift stroke sensor2) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B46 (Gear shift unit shift stroke sensor2) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B46 (Gear shift unit shift stroke sensor2)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B46 (Gear shift unit shift stroke sensor2) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520747-4: The signal voltage of component Gear shift unit shift stroke sensor2 is too low.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Shift Position of cylinder 2 4% or below
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or Shift Position of cylinder 2 8% or above while starter switch is in ON position.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between gear shift unit shift stroke sensor 2 and DUONIC electronic control unit shorted to ground • Defective gear shift unit shift stroke sensor 2 • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B46 (Gear shift unit shift stroke sensor2). Make a visual check on each connector. Measure the resistance between B46 (Gear shift unit shift stroke sensor2) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B46 (Gear shift unit shift stroke sensor2) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B46 (Gear shift unit shift stroke sensor2)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B46 (Gear shift unit shift stroke sensor2) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520748-3: The signal voltage of component Gear shift unit shift stroke sensor3 is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Shift Position of cylinder 3 96% or above
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or Shift Position of cylinder 3 92% or below while starter switch is in ON position.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between gear shift unit shift stroke sensor 3 and DUONIC electronic control unit shorted to battery or open • Ground/power harness between gear shift unit shift stroke sensor 3 and DUONIC electronic control unit open • Defective gear shift unit shift stroke sensor 3 • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B47 (Gear shift unit shift stroke sensor3). Make a visual check on each connector. Measure the resistance between B47 (Gear shift unit shift stroke sensor3) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B47 (Gear shift unit shift stroke sensor3) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B47 (Gear shift unit shift stroke sensor3)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B47 (Gear shift unit shift stroke sensor3) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520748-4: The signal voltage of component Gear shift unit shift stroke sensor3 is too low.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Shift Position of cylinder 3 4% or below
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or Shift Position of cylinder 3 8% or above while starter switch is in ON position.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between gear shift unit shift stroke sensor 3 and DUONIC electronic control unit shorted to ground • Defective gear shift unit shift stroke sensor 3 • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B47 (Gear shift unit shift stroke sensor3). Make a visual check on each connector. Measure the resistance between B47 (Gear shift unit shift stroke sensor3) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B47 (Gear shift unit shift stroke sensor3) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B47 (Gear shift unit shift stroke sensor3)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B47 (Gear shift unit shift stroke sensor3) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520749-2: Error in CAN reception from component “Combustion engine Control unit”

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • There are no TC1_MCM inputs. (Unreceived)
Recoverability		• The system recovers if any normal signal is input when starter switch is turned OFF and then ON again (electronic control unit is reenergized) or if the relevant signal is received when starter switch is in ON position. (Received)
Control effected by electronic control unit		• None
Possible causes		• CAN communication line open or shorted to battery, ground or another circuit • Defective CAN resistor • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6

Inspection procedure	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC™ *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520750-2: Faulty component DUONIC Control unit

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • EEPROM checksum error (EEPROM failure status = Fail)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Abnormal checksum data are replaced with normal data. • Initialization if both main and sub memory regions are abnormal.
Possible causes		• Harness between DUONIC electronic control unit and battery open or shorted to ground • Malfunction of battery • Defective alternator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Check that the fuse F36 is not blown out. If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Go to Step2
	Step2	Inspection procedure Is this diagnosis code still active? No: Go to Step12 Yes: Go to Step3
	Step3	Inspection procedure Check if any of other ECUs has stored the diagnosis code representing abnormal power supply (power supply without passing through SAM). Are current fault codes present? No: Go to Step4 Yes: Go to Step6
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of G1 (Battery). Check electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for open circuit. Test electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for short circuit to ground. Is any abnormality recognized No: Go to Step9 Yes: Go to Step5
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of G1 (Battery). Check electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for open circuit. Test electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for short circuit to ground. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step13
	Step7	Inspection procedure Measure the battery voltage. Specified value: 12V Is any abnormality recognized? No: Go to Step8 Yes: Go to Step11

Inspection procedure	Step8	Inspection procedure Check the function of G2 (Alternator). Is any abnormality recognized? For procedures, refer to the Shop Manual No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Go to Step12
	Step10	Inspection procedure Replace component “G2 (Alternator)”. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step11	Inspection procedure Replace component “G1 (Battery)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step9
	Step12	Inspection completed
	Step13	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.

520751-7: Forward gear shift not possible(5^{th},6^{th})

Generation condition		• Diagnosis Code 785-3 not generated • 3 attempts to engage 5^{th}/6^{th} gear on cylinder 1 failed.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2^{nd}/R-Hi
Possible causes		• Gear position initialization not completed yet • Defective gear shift unit magnetic valve • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520752-7: Backward gear shift not possible(3rd)

Generation condition		• Diagnosis Code 785-3 not generated • 3 attempts to engage 3rd gear on cylinder 1 failed.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Gear position initialization not completed yet • Defective gear shift unit magnetic valve • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520753-7: Forward gear shift not possible(1st,6th,RevLo)

Generation condition		• Diagnosis Code 785-3 not generated • 3 attempts to engage 1st/6th RevLo gear on cylinder 2 failed.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Gear position initialization not completed yet • Defective gear shift unit magnetic valve • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520754-7: Backward gear shift not possible(4th)

Generation condition		• Diagnosis Code 785-3 not generated • 3 attempts to engage 4th gear on cylinder 2 failed.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Gear position initialization not completed yet • Defective gear shift unit magnetic valve • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520755-7: Forward gear shift not possible(Rev)

Generation condition		• Diagnosis Code 785-3 not generated • 3 attempts to engage Rev gear on cylinder 3 failed.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Gear position initialization not completed yet • Defective gear shift unit magnetic valve • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520756-7: Backward gear shift not possible(1st,2nd)

Generation condition		• Diagnosis Code 785-3 not generated • 3 attempts to engage 1st/2nd gear on cylinder 3 failed.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Gear position initialization not completed yet • Defective gear shift unit magnetic valve • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520757-0: High temperature of inner clutch is recorded.

Generation condition		• The inner clutch temperature presumed by the calculation of DUONIC electronic control unit exceeds the predetermined temperature.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• None
Possible causes		• Overloaded operation was continued under the clutch high temperature warning.
Inspection procedure	Step1	• None

520758-0: High temperature of outer clutch is recorded.

Generation condition		• The outer clutch temperature presumed by the calculation of DUONIC electronic control unit exceeds the predetermined temperature.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• None
Possible causes		• Overloaded operation was continued under the clutch high temperature warning.
Inspection procedure	Step1	• None

520759-19: The CAN message from component 'Hill Start Assist Control unit' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON • EGZO_A01_CAN: received and Status of function 'Lock Brake' (CAN): data out of range.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• None
Possible causes		• Defective hydraulic unit (electronic control unit)
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

2. Service Data (Actual Measurements) of FUSO Diagnostics

- The data given or the expressions used by the FUSO Diagnostics may be different from those shown in the Service Manual since the contents of the FUSO Diagnostics are updated periodically. If any discrepancies are found, always use the information from the FUSO Diagnostics which is the latest.

Actual values	Description	Value	Remarks
Voltages	Power Supply 1 M Contact Voltage V1	8 to 16 V	Power supply voltage across M contact (V1) is indicated. (Supply voltage 8 to 16 V with starter switch ON)
	Power Supply 1 M Contact Voltage V2	8 to 16 V	Power supply voltage across M contact (V2) is indicated. (Supply voltage 8 to 16 V with starter switch ON)
	Power Supply 2 Power Supply Voltage V01	8 to 16 V	Voltage of power supplied directly from battery (V01) is indicated.
	Power Supply 2 Power Supply Voltage V02	8 to 16 V	Voltage of power supplied directly from battery (V02) is indicated.
	Power Supply 3 ACC Contact Voltage	8 to 16 V	Power supply voltage across ACC contact is indicated.
	Power Supply 3 TCU Activated Status	Not Active/ Active	ECU-activated status hold command output is indicated.
	Power Supply 3 Key ON Status	Key ON/Key OFF	Key ON status recognition information is indicated.
	Measured Voltage of Temperature Sensor for Transmission Oil	0.16 to 4.93 V	Transmission oil temperature (calculated from signal voltage) is indicated.
	Measured Voltage of G Sensor	0.45 to 4.55 V	G acting on vehicle in longitudinal direction (calculated from G-sensor 1 signal voltage) is indicated.
	Measured Voltage of G Sensor2	0.45 to 4.55 V	G acting on vehicle in longitudinal direction (calculated from G-sensor 2 signal voltage) is indicated.
Positions of switches	Shift Lever Position	P Position: 9 P to R Position: 25 R Position: 33 or 35 N to R Position: 49 N Position: 17 N to D Position: 19 D Position: 18 + to D Position: 26 + Position: 10 D to - Position: 50 - Position: 34 D-A/M Position: 22 A/M Position: 20	Selected shift lever position is indicated.
	Parking Brake Switch	Parking Brake Not Set/ Parking Brake Set/ Error/ SNA	Parking brake operation status (applied/released) is indicated.
	Brake Switch	Brake Pedal Released/ Brake Pedal Depressed/ Error/ SNA	Foot brake switch status (ON/OFF) is indicated.
	Driver Door Status	Close/ Open/ Error/ SNA	Driver door status (open/closed) is indicated.
	Passenger Door Status	Close/ Open/ Error/ SNA	Assistant driver door status (open/closed) is indicated.
	PTO Operation Switch Status	ON/OFF	PTO operation switch status (information on truck side) is indicated.

Actual values	Description	Value	Remarks
Positions of switches	PTO Switch Status (CAN)	PTO Disengage/Error PTO Engage/SNA	PTO switch status (information on PTO proper) is indicated.
	ECO Mode Switch Status (CAN)	OFF/ ON/ Error/ SNA	ECO mode switch status is indicated. (for meter)
	Switching Activation Status of PTO	PTO Not Active Not Active	PTO activation output is indicated.
	Door Status Information for Bus	Close/Open	Door status (open/closed) information (for bus) is indicated.
Brake	Braking Force of Service Brake	0 to 2530 psi	Braking force is indicated
	Measured Voltage of Pressure Sensor for Service Brake	0.5 to 4.6 V	Braking force (signal voltage measurements) is indicated.
Operating statuses	D Lamp Indicator Status (CAN)	ON/OFF	D lamp indicator output is indicated.
	Oil Temperature Warning Status (CAN)	ON/OFF	Oil temperature warning output is indicated.
	PTO Lamp Indicator Status (CAN)	Non Display/ “PTO Lock” Display/ “PTO Unlock” Display/ “PTO” Display	PTO indicator output is indicated.
	PTO Ready Lamp Status (CAN)	ON/OFF	[PTO ready] indicator output is indicated.
	Buzzer Status (CAN)	Inactive/ Active ON/ Active OFF	Warning buzzer output is indicated.
	ECO Mode Lamp Status (CAN)	ON/OFF	ECO mode indicator output is indicated. (for meter)
	Red Warning Lamp Status	ON/OFF	Red warning lamp output is indicated.
	Amber Warning Lamp Status	ON/OFF	Amber warning lamp output is indicated.
	1^{st} Rev Hold Request	Disable/ Enable/ Reserved/ SNA	1^{st}/Rev Hold request information is indicated.
	Demand of Idle Up Cancel (CAN)	ON/OFF	Idle-up cancel request output is indicated.
	GSU Duty Output shift duty 16rl	0.0 %	Gear-in MV duty output “shift_duty_16rl” (coding data) is indicated.
	GSU Duty Output shift duty 4^{th}	0.0 %	Gear-in MV duty output “shift_duty_4^{th}” (coding data) is indicated.
	GSU Duty Output shift duty rev	0.0 %	Gear-in MV duty output “shift_duty_rev” (coding data) is indicated.
	GSU Duty Output shift duty 12	0.0 %	Gear-in MV duty output “shift_duty_12” (coding data) is indicated.
	GSU Duty Output shift duty 56	0.0 %	Gear-in MV duty output “shift_duty_56” (coding data) is indicated.
	GSU Duty Output shift duty 3^{rd}	0.0 %	Gear-in MV duty output “shift_duty_3^{rd}” (coding data) is indicated.
	Truck Bus Identification	Truck/Bus	Truck/bus identification (coding data) is indicated.

Actual values	Description	Value	Remarks
Operating statuses	PTO Equipped Information	Not Equipped PTO/ Equipped PTO	“With/without PTO” information (coding data) is indicated.
	ABS Cooperative Control Equipped Information	Not Equipped Cooperative Control/Equipped Cooperative Control	Availability of ABS cooperative control (coding data) is indicated.
	Final Gear Ratio(HEX)	00 00	Final gear ratio (coding data of hexadecimal) is indicated.
	GSU Duty Output shift duty 16rl(HEX)	00 00	Gear-in MV duty output “shift_duty_16rl” (coding data of hexadecimal) is indicated.
	GSU Duty Output shift duty 4th(HEX)	00 00	Gear-in MV duty output “shift_duty_4th” (coding data of hexadecimal) is indicated.
	GSU Duty Output shift duty rev(HEX)	00 00	Gear-in MV duty output “shift_duty_rev” (coding data of hexadecimal) is indicated.
	GSU Duty Output shift duty 12(HEX)	00 00	Gear-in MV duty output “shift_duty_12” (coding data of hexadecimal) is indicated.
	GSU Duty Output shift duty 56(HEX)	00 00	Gear-in MV duty output “shift_duty_56” (coding data of hexadecimal) is indicated.
	GSU Duty Output shift duty 3rd(HEX)	00 00	Gear-in MV duty output “shift_duty_3rd” (coding data of hexadecimal) is indicated.
Status	Received condition of ETC2 SSAM CAN	Unreceived/ Received	Receiving condition of ETC2_SSAM through CAN communication is indicated.
	Received condition of CCVS SSAM CAN	Unreceived/ Received	Receiving condition of CCVS_SSAM through CAN communication is indicated.

Engine speeds	Output Shaft Speed Speed Sensor 1	0 to 8032 rpm	Transmission output shaft speed (measurements by vehicle speed sensor 1) is indicated.
	Output Shaft Speed Speed Sensor 2	0 to 8032 rpm	Transmission output shaft speed (measurements by vehicle speed sensor 2) is indicated.
	Output Shaft Speed with Direction of Vehicle Movement	-8032 to 8032 rpm	Transmission output shaft speed (with sign of driving direction) is indicated.
	Output Shaft Speed (CAN)	0 to 8031.875 rpm	Output shaft speed (output through CAN communication) is indicated.
	Inner Clutch Speed	0rpm	Inner clutch speed is indicated.
	Outer Clutch Speed	0rpm	Outer clutch speed is indicated.
	Engine Speed	0 to 8031.875 rpm	Engine speed is indicated.
	Engine Idle Speed	400 to 5000 rpm	Engine idle speed is indicated.
Vehicle speeds	Front Axle Speed	0 to 156.0 mph	Front axle speed sent from ABS ECU is indicated.
	Driving Wheel Relative Speed Left Side	-4.8545 to 4.8545 km/h	Relative speed of left driving wheel sent from ABS ECU is indicated.
	Driving Wheel Relative Speed Right Side	-4.8545 to 4.8545 km/h	Relative speed of right driving wheel sent from ABS ECU is indicated.
Transmission	Odd gear engage status	Gear in engagement	Selected odd-numbered gear is indicated.
	Even gear engage status	Gear in engagement	Selected even-numbered gear is indicated.
	Driven gear position	Gear in engagement	Selected gear is indicated.
	Current gear position (CAN) (For engine electronic control unit)	R (Reverse) N (Neutral) 1st/ 2nd/ 3rd/ 4th/ 5th/ 6th/ P(Parking)	Current gear position determined based on CAN communication outputs is indicated.
	Current gear ratio (CAN)	0 to 64.255	Currently selected gear ratio determined based on CAN communication outputs is indicated.
	Position of cylinder 1 front	78.2 to 96 %	Learned front gear position of cylinder 1 is indicated.
	Position of cylinder 1 rear	6 to 21.8 %	Learned rear gear position of cylinder 1 is indicated.
	Position of cylinder 2 front	78.2 to 96 %	Learned front gear position of cylinder 2 is indicated.
	Position of cylinder 2 rear	6 to 21.8 %	Learned rear gear position of cylinder 2 is indicated.
	Position of cylinder 3 front	78.2 to 96 %	Learned front gear position of cylinder 3 is indicated.
	Position of cylinder 3 rear	6 to 21.8 %	Learned rear gear position of cylinder 3 is indicated.
	Shift position of cylinder 1	6 to 94 %	Shift position of cylinder 1 is indicated.
	Shift position of cylinder 2	6 to 94 %	Shift position of cylinder 2 is indicated.
	Shift position of cylinder 3	6 to 94 %	Shift position of cylinder 3 is indicated.

Actual values	Description	Value	Remarks
Transmission	Current gear position (CAN) (For meter)	R (Reverse)/ N (Neutral)/ 1st/ 2nd/ 3rd/ 4th/ 5th/ 6th/ P (Parking)/	Gear position output for indication on meter cluster is indicated.
Temperatures	Temperature of Transmission Oil	-40 to 140 °C	Transmission oil temperature is indicated.
	Engine Coolant Temperature	-40 to 210 °C	Engine coolant temperature is indicated.
Clutch	Time for Filling Learning Value Inner Clutch	0 sec	Learned value of inner clutch filling time is indicated.
	Time for Filling Learning Value Outer Clutch	0 sec	Learned value of outer clutch filling time is indicated.
	Inner Clutch Current at 5kgfm Clutch Torque	0 A	Current flow at an inner clutch torque of 5 kgfm is indicated.
	Inner Clutch Current at 25kgfm Clutch Torque	0 A	Current flow at an inner clutch torque of 25 kgfm is indicated.
	Outer Clutch Current at 5kgfm Clutch Torque	0 A	Current flow at an outer clutch torque of 5 kgfm is indicated.
	Outer Clutch Current at 25kgfm Clutch Torque	0 A	Current flow at an outer clutch torque of 25 kgfm is indicated.
	Inner Clutch Current at Kiss Point	0 A	Current flow at a point where inner clutch is put in partial engagement is indicated.
	Outer Clutch Current at Kiss Point	0 A	Current flow at a point where outer clutch is put in partial engagement is indicated.
	Demand Current Output for Inner Clutch	0 to 1.2 A	Command value of current applied to inner clutch is indicated.
	Demand Current Output for Outer Clutch	0 to 1.2 A	Command value of current applied to outer clutch is indicated.
	Inner Clutch Torque	0 kgf·m	Torque of inner clutch is indicated.
	Outer Clutch Torque	0 kgf·m	Torque of outer clutch is indicated.
	Time for Filling Inner Clutch	0 sec	Time required for filling inner clutch with oil is indicated.
	Time for Filling Outer Clutch	0 sec	Time required for filling outer clutch with oil is indicated.
Torques	Drivers Demand Percent Torque	0 to 125 %	Torque demanded by driver is indicated in percentage.
	Actual Engine Percent Torque (CAN)	0 to 125 %	Engine torque actually being generated is indicated in percentage.
	Friction Percent Torque (CAN)	0 to 125 %	Friction torque actually being generated is indicated in percentage.
Accelerator pedal	Accelerator Pedal Position (CAN)	0 to 100 %	Accelerator opening is indicated in percentage.
Retarder	Engine Reference Torque (CAN)	100 to 1000 N·m	Engine reference torque (torque data used as a reference when calculating engine torque) is indicated.
Acceleration	Longitudinal Acceleration of Vehicle	-2.05 to 2.05 G	G acting on vehicle in longitudinal direction is indicated.
	Road Incline	Road Incline %	Road gradient is indicated in percentage.
Calibration values	Tire Radius	0.000 m	Tire radius (coding data) is indicated.
	Final Ratio	0.000	Final drive gear ratio (coding data) is indicated.
	Transfer Ratio	0.000	Transfer gear ratio (coding data) is indicated.

Actual values	Description	Value	Remarks
Calibration values	Transfer Ratio(HEX)	00 00	Transfer gear ratio (coding data of hexadecimal) is indicated.
	PTO Warning	INVALID/VALID	The information of settings (coding data) recorded in the DUONIC electronic control unit for the warning functions occurring during PTO operation is indicated. • VALID: This option should be selected when an operator desires to cancel the warning activated in running the vehicle while engaging PTO or in an erroneous operation. • INVALID: This option should be selected when an operator desires to activate the warning at the time the gearshift lever is moved to any driving gear position or when a vehicle is moved with the PTO switched on or with the PTO gear engaged. [Related parts] DUONIC electronic control unit

	PTO Gear	VALID 1/
		VALID 2/
		VALID 3/
		VALID 4/
		INVALID
			The information of settings (coding data) recorded in the DUONIC electronic control unit for the PTO gear engagement control is indicated.
			If the personnel set these options erroneously, it can damage the equipped components or the vehicle.
			• VALID 1: This option should be selected when an operator desires to suppress a gear noise at the time of PTO gear engagement (A PTO gear engagement can fail (When the load on the equipped components are small, the PTO gear engagement failure will rarely occur with this setting.)
			• VALID 2: This option should be selected when an operator desires to suppress a PTO gear engagement failure* (A gear noise may occur.) [To select this option when the load on the equipped components is small.)
			• VALID 3: This option should be selected when an operator desires to suppress a PTO gear engagement failure* (When PTO gear engagement failures frequently occurred if the “Gear noise reduction function” (VALID 1) is selected)
			  • This should be selected when the load on the equipped components such as a directly driven large capacity PTO is large.
			  • This will facilitate PTO gear engagement if an operator engages PTO gear when cancelling the gear noise suppression function at the same time.
			  • A gear noise may occur at the time of the PTO gear engagement.
			• VALID 4: This option should be selected when an operator desires to suppress a PTO gear engagement failure (When PTO gear engagement failures occasionally occurred if the “Gear noise reduction function” (VALID 1) is selected)
			  • This should be selected when the load on the equipped components such as a directly driven large capacity PTO is large.
			  • When it is impossible to engage PTO gear, the personnel can cancel the gear noise suppression function to facilitate PTO gear engagement.
			• INVALID: This option should be selected when an operator desires to start PTO operation before stopping a vehicle.
			• When the personnel have set to engage PTO at low speeds, be sure to select this option.
			• If this option is not selected when the personnel have set to engage PTO at low speeds, there will be a risk of damaging a vehicle and equipped components.
			[Related parts]
			DUONIC electronic control unit

Actual values	Description	Value	Remarks
Calibration values	PTO Actuation of clutch	QUICK Connecting/ SLOW Connecting1/ SLOW Connecting2	The information of settings (coding data) recorded in the DUONIC electronic control unit for the PTO clutch engagement control is indicated. • QUICK Connecting: This option should be selected when an operator desires to start PTO operation as soon as possible after switching on the PTO switch. (This should not be selected when the load on the equipped components such as a directly driven large capacity PTO is large. • Slow Connecting 1: This option should be selected when the engine stalls or shows hunting after switching on the PTO main switch with the “Quick Connecting” option selected. • Slow Connecting 2: This option should be selected when engine stall or hunting is not removed after switching on the PTO main switch with the “Quick Connecting” option selected. [Related parts] DUONIC electronic control unit

	PTO Operating restrictions	STOP (P/N)/ STOP (P)/ Trip (1st,2nd,R)/ Trip (2nd,3rd,R)	The information of settings (coding data) recorded in the DUONIC electronic control unit for the PTO clutch engagement control is indicated.
			• STOP (P/N): This option should be selected when an operator desires to restrict the PTO operation to be activated only when the gearshift lever is placed in P or N position.
			• STOP (P): This option should be selected when an operator desires to restrict the PTO operation to be activated only when the gearshift lever is placed in P position. It will inhibit the use of PTO when the gearshift lever is placed any position other than P or N.
			  • It will inhibit the use of PTO when the gearshift lever is placed any position other than P.
			  • When the PTO switch is pressed down, the gearshift lever cannot be moved from the P position.
			  • When the PTO switch is pressed down with the gearshift lever in any position other than P, the gearshift lever cannot be moved to the P position.
			• Trip (1st, 2nd, and R): This option should be selected when an operator desires to drive a vehicle while operating the PTO (The gearshift lever should be restrained to the 1st, 2nd or reverse position.
			• Trip (2nd, 3rd and R): This option should be selected when an operator desires to drive a vehicle while operating the PTO (The gearshift lever should be restrained to the 2nd, 3rd or reverse position.
			[Related parts]
			DUONIC electronic control unit

Actual values	Description	Value	Remarks

Calibration values	PTO Connecting When stopping	STOP/
		LOW Vehiclespeed 1/
		LOW Vehiclespeed 2
			The information of settings (coding data) recorded in the DUONIC electronic control unit for the PTO engagement control before stopping a vehicle is indicated.
			There is a risk of damaging the equipped components or vehicle if an erroneous setting is selected.
			• STOP: This option should be selected when an operator desires to restrain the PTO operation to be activated after the stopping of a vehicle only
			• Low vehicle speed 1: This option should be selected when an operator desires to start the PTO operation before stopping a vehicle (Vehicle speed under 10 km/h).
			• Low vehicle speed 2: This option should be selected when an operator desires to start the PTO operation before stopping a vehicle (Vehicle speed under 15 km/h).
			  • The “Vehicle stopped” option is recommended to avoid damaging the transmission with gear noise and any unintended activation of an equipped component.
			  • Even when it is obliged to select this option, it is necessary to advise a customer to operate PTO by stopping a vehicle whenever possible.
			  • When reselecting this option instead of other settings, it is imperative to set the PTO gear engagement control to select invalid in “Gear noise suppression function.”
			  • Failure to observe the above precautions can damage a vehicle or equipped components.

3. Actuator tests available in FUSO Diagnostics

- The data given or the expressions used by the FUSO Diagnostics may be different from those shown in the Service Manual since the contents of the FUSO Diagnostics are updated periodically. If any discrepancies are found, always use the information from the FUSO Diagnostics which is the latest.
- The actuator tests must be performed with the vehicle stationary, the engine stopped and the starter switch in ON position unless otherwise specified.

Item	Description
Gear shift	Cancels the limitation of manual shifting into forward gears with vehicle stationary (allows selection of every forward gear including 6th gear when starting).
Line pressure high control	Forces the line pressure to be held high.
Line pressure low control	Forces the line pressure to be held low.
Oil cooler control ON	Forces the cooler lubrication to be held ON.
Oil cooler control OFF	Forces the cooler lubrication to be held OFF.
Inner clutch ON	Forces the clutch 1 power to be held ON (1.2 A).
Outer clutch ON	Forces the clutch 2 power to be held ON (1.2 A).
Shift lock OFF	Issues a command requesting shift lock release.

4. Inputs and Outputs to/from Electronic Control Unit

- For positions of each signal terminal and grounding terminal, refer to the ECU connection diagram.

Devices to be connected	Terminal	Input/output	Voltage and wave form
Power Supply	B36-Ground B37-Ground	Input	Continuously: About 12 V (battery voltage)
Power Supply 1 M Contact	B38-Ground B39-Ground	Input	Starter switch ON: About 12 V (battery voltage) Starter switch OFF: 0 V
Parking gear switch	B27-Ground	Input	Parking gear switch ON (Other range): 0 V Parking gear switch OFF (P range): About 12 V (battery voltage)
Transmission power take-off switch	B19-Ground	Input	Transmission PTO switch ON: About 12 V (battery voltage) Transmission PTO switch OFF: 0 V
Vehicle speed sensor	B29-B21	Input	When sensor shaft is rotated: Low pulse: 0 V High pulse: 5 V
Oil temperature	A46-Ground	Input	20°C{68°F}: 2.31 to 2.59 kΩ
G Sensor (main)	B10-Ground	Input	When vehicle is parked on a level ground: 2.3 to 2.7 V
G Sensor (sub)	A66-Ground	Input	When vehicle is parked on a level ground: 2.3 to 2.7 V
Brake fluid pressure sensor	B25-Ground	Output	5 V
	B9-Ground	Input	0.5 V
Geat shift solenoid	A24-Ground (MV1F)	Output	0 to 100%
	A62-Ground (MV1R)	Output	0 to 100%
	A23-Ground (MV2F)	Output	0 to 100%
	A61-Ground (MV2R)	Output	0 to 100%
	A22-Ground (MV3F)	Output	0 to 100%
	A60-Ground (MV3R)	Output	0 to 100%

5. Coding Data in Electronic Control Unit

5.1 General

- Each electronic control unit of a vehicle contains information of the vehicle including component configurations, which is collectively called coding data.
- When an electronic control unit is replaced with a new part or one that has been used on another vehicle, or when the vehicle specifications are changed, relevant data must be downloaded and/or coding data rewritten using FUSO Diagnostics.

5.2 Rewriting coding data

- When electronic control units are replaced or the vehicle specifications are changed, the following coding data must be rewritten. For details about rewriting operation, contact your nearest authorized dealer or distributor.

Coding data / Treatment	Gear ratio of rear axle	Tyre size	Ratio of gear	Equipment power take-off	Model of clutch	PTO Warning	PTO Gear	PTO Actuation of clutch	PTO Operating restrictions	PTO Connecting When stopping	Vehicle determination (Truck/Bus)	Switching threshold of activated pressure regulator	Equipment ABS	Pulse width modulated signal 'Solenoid valve' Gearshift" during the shift operation	EOL Shiftmap Type
Replace DUONIC electronic control unit	O	O	O	O	O	O	O	O	O	O	O	O	O	O	O
Final gear ratio is change	O														
Tyre diameter change		O													
Transfer gear ratio change			O												
Clutch type change					O										
Replace power take-off				O		O	O	O	O	O					

6. Initialization of DUONIC™ System

- In the initialization of the DUONIC™ system, the following initial settings are memorized by the DUONIC electronic control unit: gear shift unit's gear position, clutch fill time, learned clutch torque value, and G sensor equal pressure value on flat road. All of these settings are initialized with a single initialization operation, which must be performed every time the vehicle is serviced.
- Initialization of the DUONIC™ system may help improve degradation of roll-off, creep or gear shift quality if that is experienced.
- The vehicle must be warmed up before performing initialization. With a cold engine or transmission, initialization may not be successfully completed when attempted.

- If any of the following service is performed, initialization must be performed following the procedure described.

Service	Initialization procedure
Replacement of automatic transmission fluid	After replacement of automatic transmission fluid, start the engine and cycle the shift lever to D and R several times to sufficiently circulate automatic transmission fluid before performing initialization. After initialization, test drive the vehicle.
Replacement of gear oil	After replacement of gear oil, perform initialization followed by test drive.
Work on engine or transmission	After any service on the engine or transmission, the DUONIC™ system must be initialized to prevent any possible degradation of driving quality due to possible change in the engine or transmission characteristics.

6.1 Preparation before initialization of DUONIC™ system

- Measure the automatic transmission fluid temperature in the transmission using the FUSO Diagnostics.(SeeGr00.)
- Adjust the automatic transmission fluid temperature to approximately 50°C {120°F} by the method recommended below.
- Repeat initialization several times. (With each time of initialization, the temperature rises by 10 to 12°C {50 to 54°F}.)
- Actually drive the vehicle to increase the automatic transmission fluid temperature up to the required level.
- When initialization is performed to eliminate feeling-related symptom, record initial setting reference values shown below. Comparison pre- and post-initialization values with these referent values can lead to the identification of the causes of symptoms.
- If feeling is not improved despite initialization of the DUONIC™ system, check automatic transmission fluid level and repeat the initialization of DUONIC™ system. Chances are that feeling will be improved this way.
- If driving quality or feeling is not improved despite initialization of the DUONIC™ system, check automatic transmission fluid level, then repeat the initialization of the DUONIC™ system. It can sometimes improve the feeling.

NOTE

- **DUONIC™ system may make driving feeling bad if automatic transmission fluid level is not right.**
- **Every vehicle is different from each other. Thus, all vehicles do not necessarily show actual values within the reference values shown below.**

Initial setting reference values

No	Actual values	Description	value
157	DUONIC Basic setting	Oil temperature of transmission	45 to 55 ℃
148	DUONIC Basic setting	Learned value of component 'Shift valve '1' FORWARD'	87.2 to 88.3%
149	DUONIC Basic setting	Learned value of component 'Shift valve '1' Rear view'	11.6 to 12.7%
150	DUONIC Basic setting	Learned value of component 'Shift valve '2' FORWARD'	11.3 to 12.8%
151	DUONIC Basic setting	Learned value of component 'Shift valve '2' Rear view'	87.0 to 88.7%
152	DUONIC Basic setting	Learned value of component 'Shift valve '3' FORWARD'	10.7 to 12.6%
153	DUONIC Basic setting	Learned value of component 'Shift valve '3' Rear view'	87.8 to 89.8%
159	DUONIC Basic setting	Duration of control current application for filling of coupling Learned value (Internal clutch plate)	0.15 to 0.27sec
160	DUONIC Basic setting	Duration of control current application for filling of coupling Learned value (External clutch plate)	0.08 to 0.22sec
161	DUONIC Basic setting	Torque of clutch 5kgfm (Internal clutch plate)	341 to 412mA
162	DUONIC Basic setting	Torque of clutch 25kgfm (Internal clutch plate)	570 to 663mA
163	DUONIC Basic setting	Torque of clutch 5kgfm (External clutch plate)	369 to 435mA
164	DUONIC Basic setting	Torque of clutch 25kgfm (External clutch plate)	552 to 659mA
165	DUONIC Basic setting	Clutch grip point (Internal clutch plate)	301 to 376mA
166	DUONIC Basic setting	Clutch grip point (External clutch plate)	296 to 366mA

6.2 Initialization standby mode

- Prior to starting initialization, the vehicle must be placed in the initialization standby mode.

Ensure that the vehicle meets all of the following conditions.

- Software installation and coding have been completed on the engine and DUONIC electronic control units.
- The engine is stopped.
- The vehicle is stationary (with the brakes released) on a flat road and unloaded.
- The tire pressure has been set to specification.
- The cab tilt is locked.
- The starter key is in the ON position.
- The accelerator pedal is in the ON (50% or above) position.
- The foot brake is applied.
- The systems that are powered by the engine such as the air conditioner, the compressor for the freezer and the exhaust brake are stopped.
- The change lever is moved to D for one second and then set to A/M. (Make sure that the change lever is held in the A/M position.)
- The parking brake is applied for one second, then released for one second and then applied (pulled rather hard) again.

↓

Make sure that "1" flashes on the gear shift indicator only and that "D" does not flash on the auto mode indicator.

Initialization (See “6.3 Initialization”)

↓

The vehicle goes back to the normal mode if the parking brake is released or the starter key is turned to the OFF position.

6.3 Initialization

Operator action	Vehicle action

With the vehicle in the initialization standby mode, set the accelerator pedal to OFF and the change lever to P before starting the engine.	• The progress of initialization process is indicated on the gear shift indicator as a flashing “2”, “3”, “4”, “5” and “N”.
	• Initialization progress indicated on the gear shift indicator is as follows:
	  • “2”: The gear shift unit’s gear position is being detected.
	  • “3”: Clutch is being warmed up. G sensor voltage value is being corrected.
	  • “4”: Clutch fill time is being learned.
	  • “5”: Clutch torque is being learned.
	  • “N”: Initialization is completed.

–	• Gearshift indicator “R” flashes on and off. → Initialization unsatisfactory. → Return to normal mode with parking brake off or key off, then repeat initialization. • If gearshift indicator changes flashing from “2” to “R”, gear shifting by gearshift unit may be difficult, in which case the vehicle is moved once, then initialization is performed. Chances are that problem will be solved this way. • If gearshift indicator changes flashing from “3” to “R”, G sensor may be installed out of place or G sensor signal may be abnormal. • If gearshift indicator changes flashing from “4” to “R”, clutch may be out of order. • If gearshift indicator changes flashing from “5” to “R”, engine may not be warm enough or clutch may be out of order. • If initialization ends in failure again, check clutch and transmission. (See Gr21A and Gr22A)

CAUTION ⚠

- **When "1" and "D" flashes alternately on the gear shift indicator and auto mode indicator respectively after the completion of initialization, put the starter switch in the OFF position or disengage the parking brake, and then restart the initialization for DUONIC™ system.**

Initial setting reference values

No.	Description	Value	Remarks
1	Intermediate of Position of cylinder 1 front and rear	49.4 to 50.5%	(Position of cylinder 1 front + Position of cylinder 1 rear)/2
2	Intermediate of Position of cylinder 2 front and rear	49.2 to 50.8%	(Position of cylinder 2 front + Position of cylinder 2 rear)/2
3	Intermediate of Position of cylinder 3 front and rear	49.3 to 51.2%	(Position of cylinder 3 front + Position of cylinder 3 rear)/2

- After initialization is completed, check the above values (not indicated in the FUSO Diagnostics). If any post-initialization values largely deviate from above values (3% or more), repeat the initialization.
- If pre- and post-re-initialization values are the same, nothing is abnormal.
- Test run after initialization is completed and check that there is no feeling problem during driving and at speed change. If there is a shock or an abnormal sound at speed change, perform initialization of the DUONIC™ system again.

CAUTION ⚠

- **For safety, keep the foot brake applied after the engine is started.**

6.4 Resetting the initialization

- The DUONIC™ system offers the possibility to reset the initialization values of gear shift unit’s gear position, clutch fill time, learned clutch torque, and G sensor voltage on flat road so that these values are defaulted to those before the initialization. (This feature is designed to be used such as when driving quality has deteriorated after initialization.)

Operator action	Vehicle action
With the vehicle in the initialization standby mode, set the change lever to “-”.	“6” flashes on the gear shift indicator, meaning that the reset process has been completed.

7. Troubleshooting by Symptom

If a trouble occurred but no diagnosis code has been stored, or any diagnosis code has been stored but the cause of the trouble could not identified, the following check may help to identify the cause.

Faulty vehicle is received. • Check the diagnosis code, and software part No. and the learning value of DUONIC electronic control unit.		
Check 1	• Abnormal noise (growling) on all 1st, 3rd and 5th gears	
	Noise occurs	Replace clutch housing, inner drive pinion and pilot bearing (main shaft). Adjust shims.
	No noise	Go to Check 2.
Check 2	• Unable to drive in 2nd, 4th, and 6th gears	
	Unable to drive	Go to Check 3.
	Able to drive	Go to Check 6.
Check 3	• Transmission serial No. is earlier than ZE99241	
	Earlier than ZE99241	Go to Check 4.
	ZE99242 and after	Go to Check 9.
Check 4	• Gearshifting possible	
	Possible	Go to Check 5.
	Impossible	Go to Check 9.
Check 5	• Initializing of DUONIC™ system completed / failed	
	Completed	Go to Check 7.
	Failed (“4” (flashing) → “R” (flashing))	Replace valve body and dual clutch.

Check 6	• Either of the following occurred
	  • Shock on shifting
	  • Shift flare of 500 rpm or higher	

	Occurred	Go to Check 7.
	Not occurred	Go to Check 8.
Check 7	• Initializing of DUONIC™ system was completed and the failure was cleared.	
	Cleared	Repair completed
	Not cleared	Replace valve body and dual clutch.
Check 8	• Oil leakage from between engine and transmission	
	Oil leaks	Go to Check 10.
	No oil leaks	Go to Check 9.

Check 9	• All the following conditions are satisfied.
	  • Failure occurred in warm condition.
	  • 200 cc {12.2 cu. in} or more decrease of automatic transmission fluid (Fluid level is not at the brim of the inspection plug hole.)
	  • Any one of the following diagnosis codes is stored: 520708-7, 520709-7, 520710-7, 520752-7, 520755-7, 520756-7, or 520753-7	

	Satisfied	Replace valve body and dual clutch. (Worn spool)
	Not satisfied	Go to Check 10.
Check 10	• Any one of the following diagnosis codes is stored: 520751-7, 520752-7, or 520753-7	
	Stored	Replace valve body and dual clutch. (Seizure of inner clutch)
	Not stored	Go to Check 11.

<table>
<tr><td rowspan="3">Check 11</td><td colspan="2">• Either of following Condition 1 or Condition 2 is satisfied.
• Condition 1: Inspection of faulty outer clutch linear solenoid
  • Failure occurred only at even gears.
  • Initializing of DUONIC™ system failed
  • Any one of the following diagnosis codes is stored: 684-7, 740-7, 520753-7, 520754-7, 520755-7, or 520756-7

• Condition 2: Inspection of faulty outer clutch linear solenoid
  • Failure occurred only at odd gears.
  • Initializing of DUONIC™ system failed
  • Any one of the following diagnosis codes is stored: 522-7, 788-7, 520751-7, 520752-7, or 520753-7</td></tr>
<tr><td>Satisfied</td><td>Replace valve body and dual clutch. (Faulty linear solenoid valve)</td></tr>
<tr><td>Not satisfied</td><td>Go to Check 12.</td></tr>

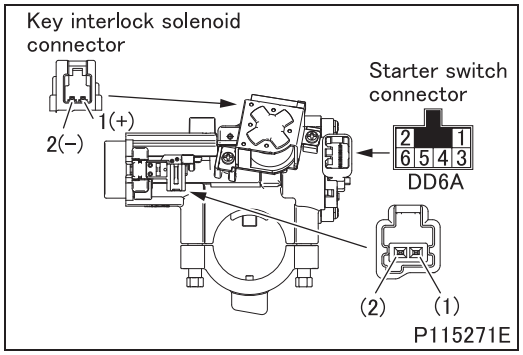
  • Initializing of DUONIC™ system failed (“2” (flashing) → “R” (flashing)).
  • Any diagnosis codes mentioned in Condition 2 and Condition 3 is not stored.

• Condition 2: Faulty 4th and 1st/6th/R shift rail
  • Any one of the following diagnosis codes is stored: 520709-7, 520753-7, or 520754-7.
  • Initializing of DUONIC™ system failed (“2” (flashing) → “R” (flashing)).
  • Any diagnosis codes mentioned in Condition 1 and Condition 3 is not stored.

• Condition 3: Faulty R and 1st/2nd shift rail
  • Any one of the following diagnosis codes is stored: 520710-7, 520755-7, or 520756-7.
  • Initializing of DUONIC™ system failed (“2” (flashing) → “R” (flashing)).
  • Any diagnosis codes mentioned in Condition 1 and Condition 2 is not stored.</td></tr>
<tr><td>Satisfied</td><td>Faulty gear shift unit</td></tr>
<tr><td>Not satisfied</td><td>Replace DUONIC™ assembly.</td></tr>
</table>



#002 Inspection of starter switch

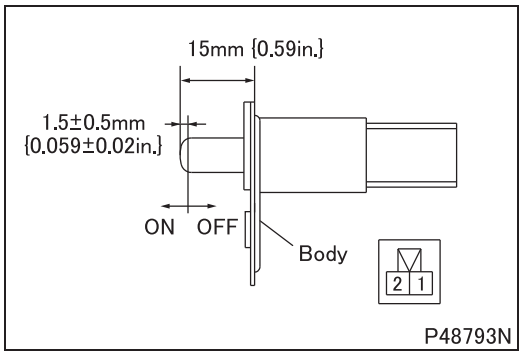
- Perform the following checks, and if any fault is found, replace the switch. (See Gr37.)

(1) Starter switch

Switch position		Continuity terminal
LOCK	without key	–
	with key	(1)–(2)
ACC		(1)–(2), 4–5
ON		(1)–(2), 4–5–6
START		(1)–(2), 3–4–5–6

(2) Key interlock solenoid

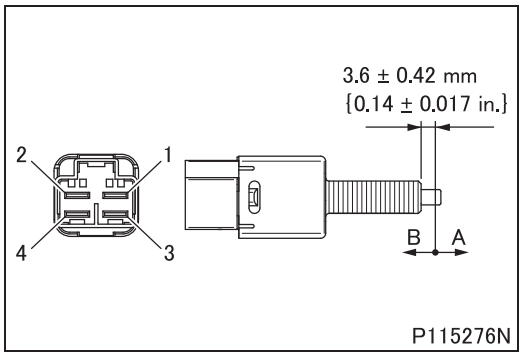
- Check that the key will not turn in the “LOCK” direction when the battery voltage is applied between terminals 1 and 2.



#035 Inspection of door switch

Switch position	Continuity terminal
OFF	–
ON	1-body, 2-body

- If any fault is found, replace the switch. (See Gr43.)



#042 Inspection of stop lamp switch

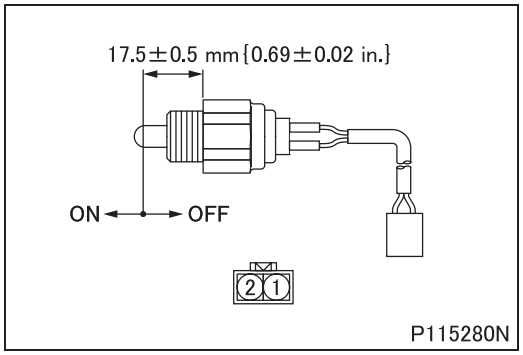
Switch position	Continuity terminal
A	1–2
B	3–4

- If any fault is found, replace the switch. (See Gr35A.)

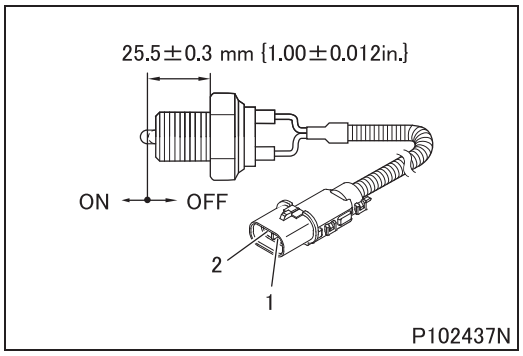
#054 Inspection of switch

- Perform the following checks, and if any fault is found, replace the switch.

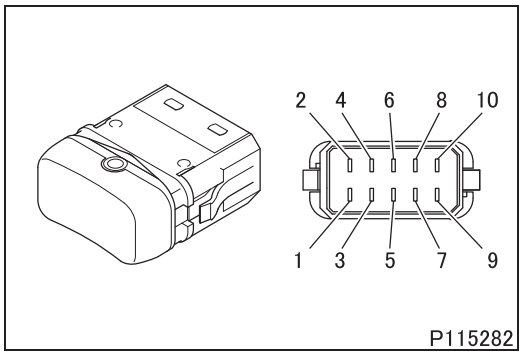
Switch position	Continuity terminal
OFF	–
ON	1–2



- Parking gear switch. (See Gr22.)



- Power take-off control switch. (See Gr22.)



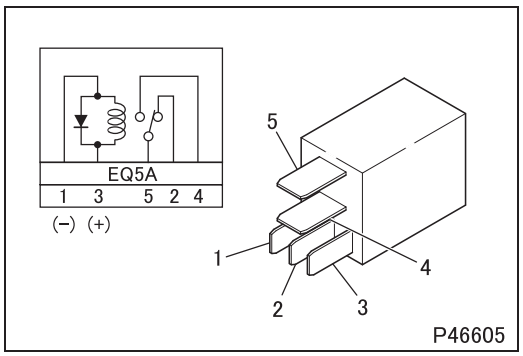
#089 Inspection of switch

- Perform the following checks, and if any fault is found, replace the switch.
  - Transmission power take-off switch

Switch position	Continuity terminal	Night illumination
OFF	–	(+) 1–10 (–)
ON	3–7	

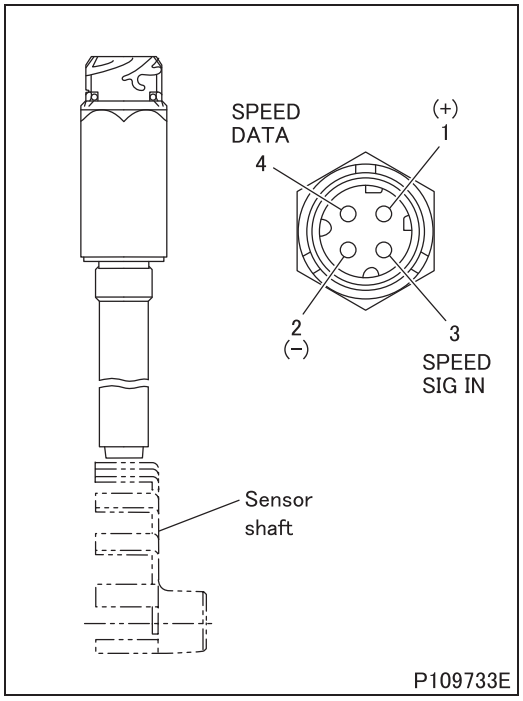
  - ECO mode switch

Switch position	Continuity terminal	Night illumination
OFF	5–7	(+) 1–10 (–)
ON	3–7	



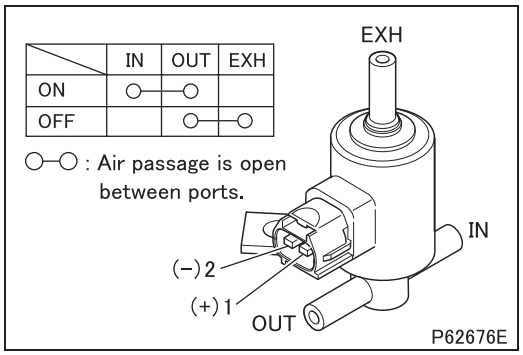
#201 Inspection of relay (normally open type 5 pin)

- Perform continuity check and operation check, and if any fault is found, replace the relay.



#265 Inspection of vehicle speed sensor

- While applying a voltage of 6.5 to 9 V between terminals 1 and 2, rotate the sensor shaft.
- Check the signals of terminal 3 (SPEED SIG IN) and terminal 4 (SPEED DATA). If no signals are found, replace the sensor. (See Gr22.)



#565 Inspection of 3-way magnetic valve

- Perform the following checks, and if any fault is found, replace the 3-way magnetic valve.

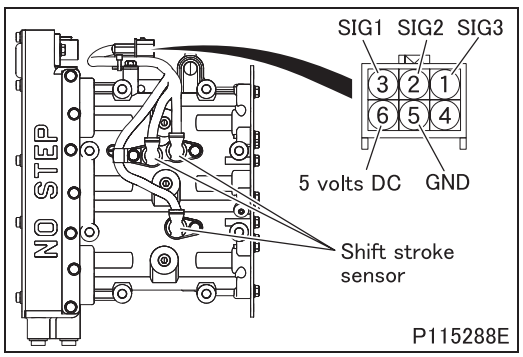
(1) Operation check

- Gradually apply DC current between each terminal starting from 0 V.
- Measure the voltage at which the 3-way magnetic valve operates. (Determine ON/OFF of the magnetic valve by operating noises.)

Standard value (minimum operating voltage)	11 V or less

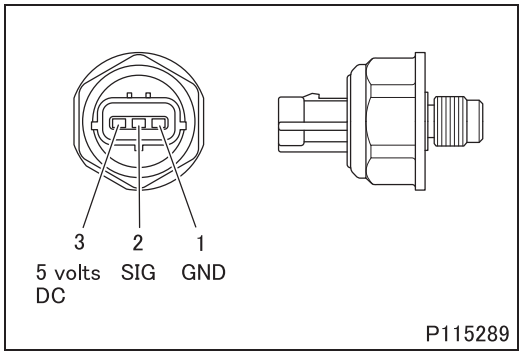
(2) Inspection of continuity and air tightness

- Negative pressure when inspected: –99.99 kPa {–29.5 in.Hg, –750 mmHg}



#296 Inspection of shift stroke sensor

- Because it is not easy to independently check the sensor for the functions, check the FUSO Diagnostics service data using the FUSO Diagnostics.
- Replace the gear shift unit if there is any fault in the sensor.

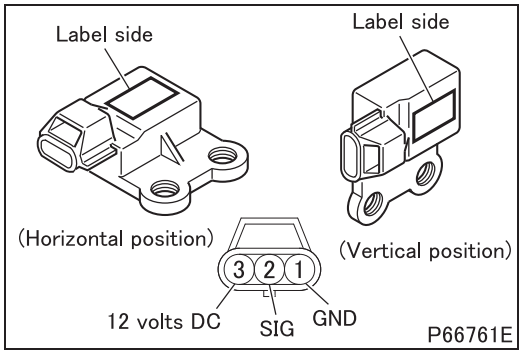


#302 Inspection of brake fluid pressure sensor

- Apply 5 volts DC to terminals 1 and 3.
- Measure the output voltage occurring at terminals 2 and 3.

Standard value	0.5 V

- If the measured value deviates from the standard value, replace the sensor.

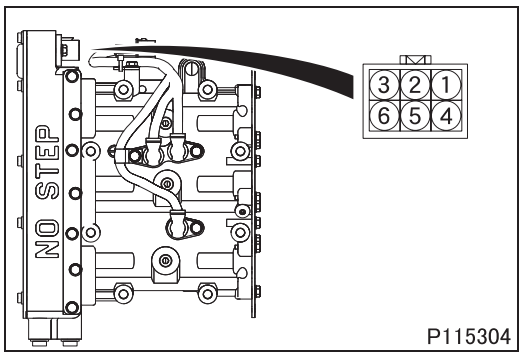


#327 Inspection of G sensor

- Apply a 12 volts DC across terminals 3 and 1 of the G sensor.
- Measure the G sensor output voltage between terminals 2 and 1 for both when the sensor is in a horizontal position and when it is in a vertical position.

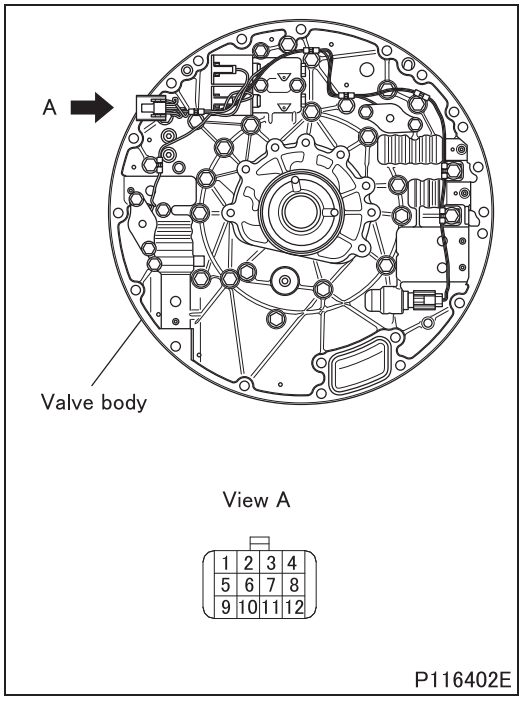
Standard value	Horizontal position	2.3 to 2.7 V
	Vertical position	3.3 to 3.7 V

- If any of the measurements is not within the standard value range, replace the sensor.



#534 Inspection of gear shift unit

- Because it is not easy to independently check the sensor for the functions, check the FUSO Diagnostics service data using the FUSO Diagnostics. (See Gr22.)
- Replace the gear shift unit if there is any fault in the sensor. (See Gr22.)



#535 Inspection of valve body (connector)

(1) Inspection of solenoid valve 1, 2

- Measure the resistance between terminals 3 and 7, and terminals 4 and 8.

Standard value (at 20°C {68°F})	5.3 ± 0.5 Ω

- If the measured value deviates from the standard value, replace the valve body. (See Gr22.)

(2) Inspection of solenoid valve (cooling) and solenoid valve (relief)

- Gradually apply DC current between each terminals starting from 0 V.
- Measure the voltage at which the cooling valve and relief valve operates.

Standard value (minimum operating voltage)	Solenoid valve (cooling)	1-body	8 V or less
	Solenoid valve (relief)	2-body	

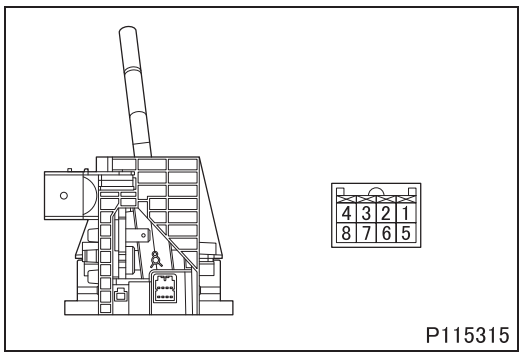
- If the measured value deviates from the standard value, replace the valve body.

(3) Inspection of oil temperature sensor

- Measure the resistance between terminals 5 and 6.

Standard value (at 20°C {68°F})	2.31 to 2.59 kΩ

- If the measured value deviates from the standard value, replace the valve body. (See Gr22.)



#825 Inspection of shift lever unit

- Because it is not easy to check these shift lever unit individually, determine quality of shift lever unit indirectly by checking related parts, such as harnesses, etc. in the system.
- If any fault is not found in the related parts, and the problem still remains in the system, replace the shift lever unit. (See Gr22.)

	Power voltage	V	12

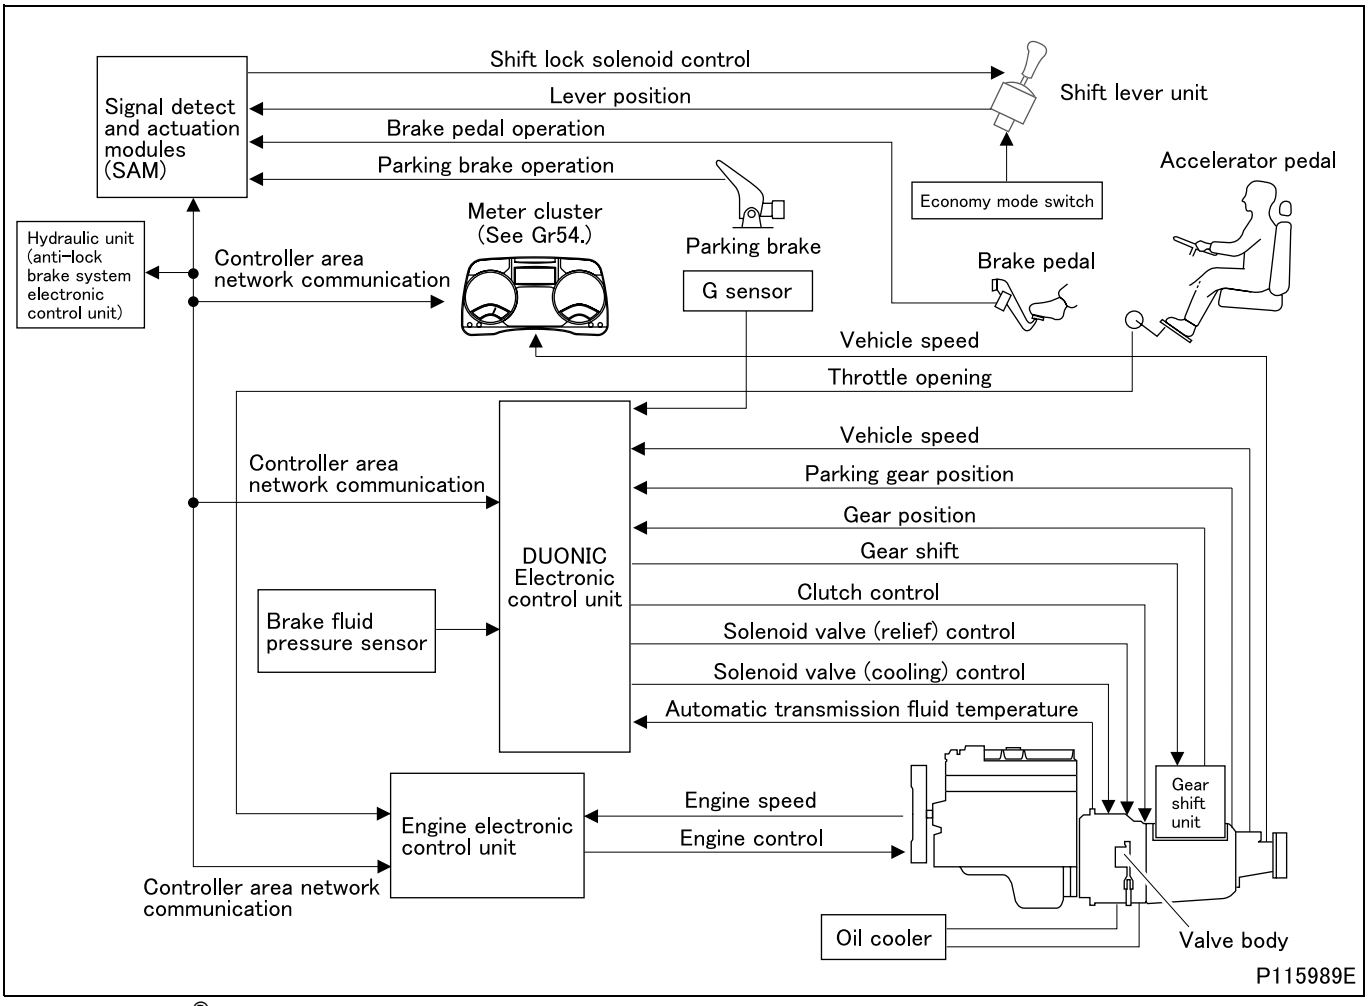
See Gr22 for the specifications of the transmission itself.

M E M O

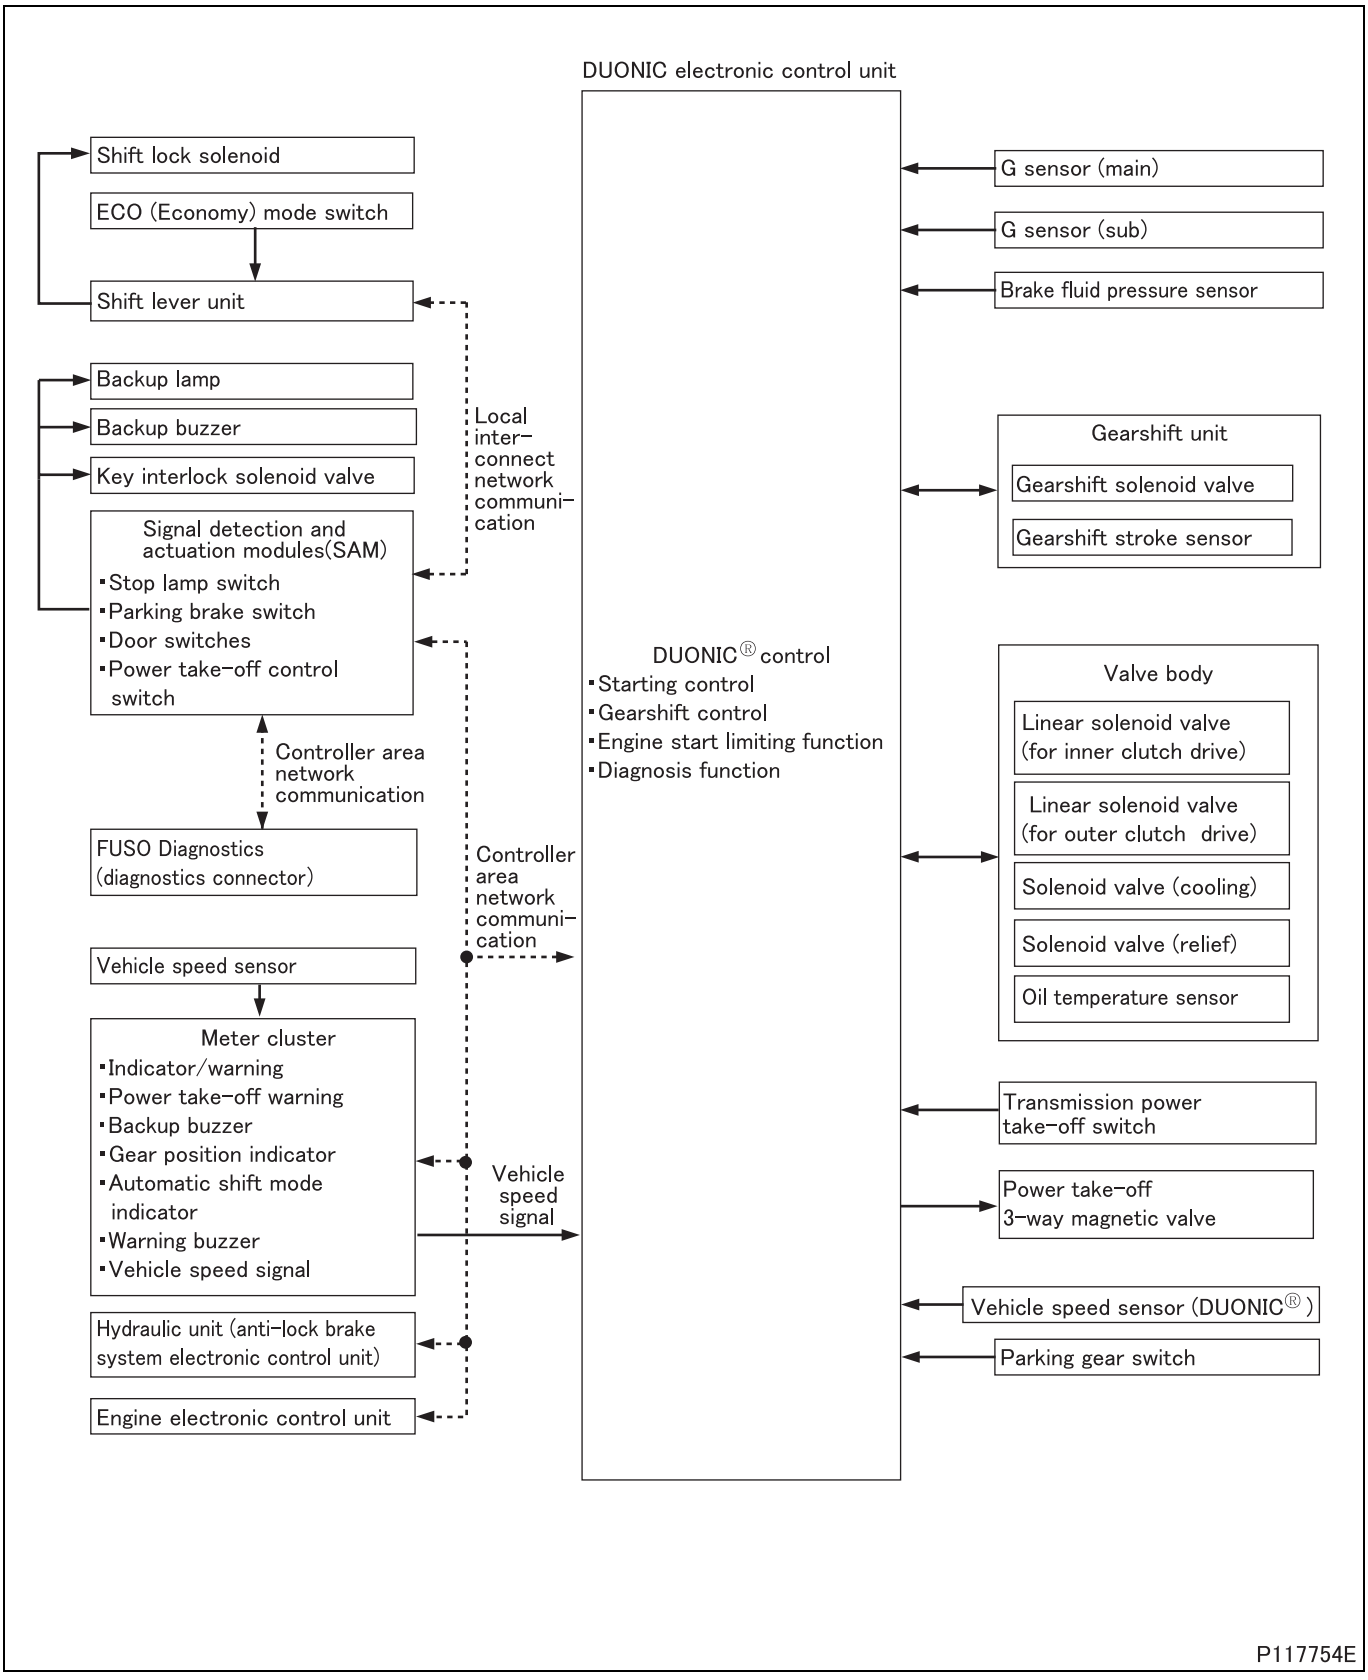
1. Overview



- The DUONIC® system automates clutch and gear shift operations when starting or driving the vehicle by providing integrated control of the clutch, transmission and engine. This helps to reduce the driver's fatigue from frequent manual gear shift operations while achieving excellent fuel economy equivalent to or better than that of manual transmission vehicles.
- The clutch mechanism consists of two clutching systems (dual clutch) that allow smooth gear shift operations with reduced gear shift shock.
- There is no clutch pedal. Since there are only two pedals (accelerator and brake pedals), the driver can start and drive the vehicle with accelerator operations only. Manual operation can also be selected as required.
- The system consists of a DUONIC electronic control unit (that controls the gear shift unit and valve body based on the gear shift lever signals, transmission gear position, throttle opening, vehicle speed, etc.), engine electronic control unit (that controls fuel injection amount and timing based on engine speed, engine timing, coolant temperature, vehicle speed, etc.) and sensors that transmit/receive various signals to and from each electronic control unit.

2. Electronic Control System

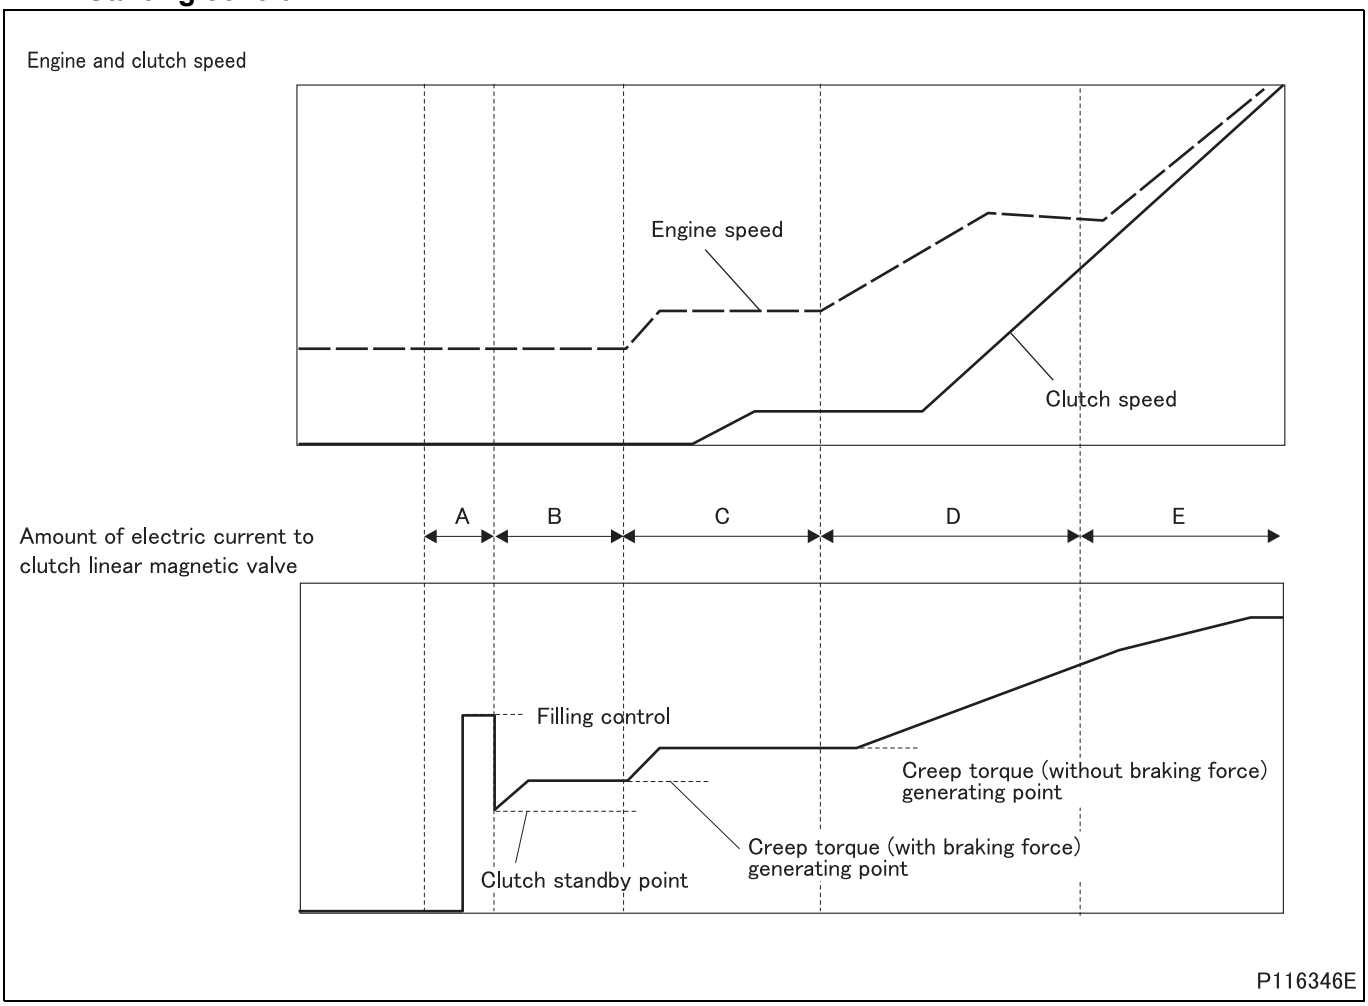
2.1 Block diagram



Component	Main function/operation
Shift lever unit	Detects gearshift lever position.
Oil temperature sensor	Senses temperature of automatic transmission fluid (ATF).
G sensor	Senses acceleration.
Stop lamp switch	Senses brake pedal's pressed/released position.
Brake fluid pressure sensor	Senses extent to which brake pedal is pressed.
Vehicle speed sensor	Senses vehicle speed.
Hydraulic unit (electronic control unit)	Operates of anti-lock brake system (ABS) and its output warning signal.
Parking brake switch	Detects operation of parking brake.
Parking gear switch	Detects operation of parking mechanism.
Door switches	Detects whether each door is open or closed.
Power take-off control switch	Turns on/off power take-off (on power take-off).
Transmission power take-off switch	Turns on/off power take-off (in cab).
ECO (Economy) mode switch	Turn on/off economy mode
Engine electronic control unit	Makes control for smooth gear shifting and driving through exchange of signals with DUONIC electronic control unit.
Gearshift stroke sensor	Senses gearshift position.
Power take-off 3-way magnetic valve	Puts transmission power take-off into motion.
Power take-off indicator	Illuminates when power take-off is in operation.
Gear position indicator	Indicates current gear in engagement and diagnostic codes.
Automatic shift mode indicator	Illuminates when automatic shift mode is selected with gearshift lever in "D".
Economy mode indicator	Indicated when economy mode switch is turned on.
DUONIC indicator/warning	Comes on when there is problem with system to warn driver of the condition. It lights in either red or amber. Driving is impossible when the lamp lights in red; driving with minimum necessary control is possible when the lamp lights in amber.
Warning buzzer	Sounds when: • A door is opened with gearshift lever in any position except "P" and "N" while engine is running. • Temperature of automatic transmission fluid is too high. (Beeps three times) • Temperature of clutch is too high. <With the clutch temperature alarm function> • Vehicle is driven with power take-off switch ON. • Vehicle is driven with Dump lever position rise. • Temperature of clutch is too high.
Linear solenoid valve (for inner clutch drive)	Supplies hydraulic oil to operate inner clutch.
Linear solenoid valve (for outer clutch drive)	Supplies hydraulic oil to operate outer clutch.
Solenoid valve (cooling)	Sends hydraulic oil to oil cooler.
Solenoid valve (relief)	Adjusts hydraulic oil pressure for operating clutch.
Gearshift solenoid valve	Enables gear shifting.
Shift lock solenoid valve	Activates and deactivates gearshift lock function.
Signal detection and actuation modules (SAM)	Manages power supply of component devices.
	Repeats input/output signals that are sent via Controller Area Network communication from/to relevant electronic control units by way of this module.
Key interlock solenoid	Activates/deactivates key interlocking function.

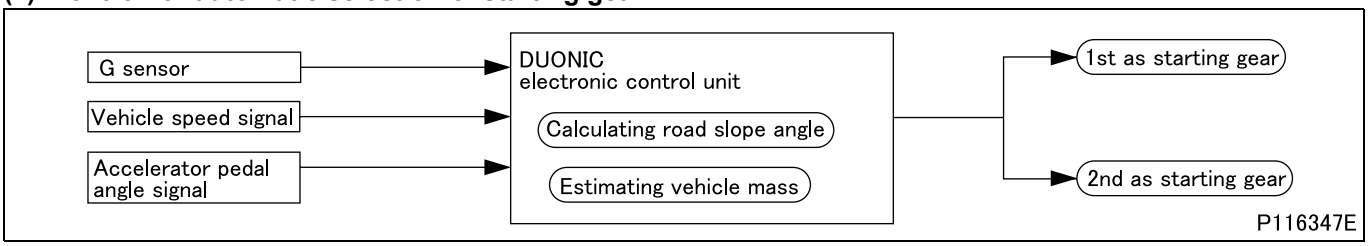
2.2 DUONIC® control

2.2.1 Starting control



- When the gearshift lever is moved to the “D” position, the control unit starts controlling the inner or outer clutch that is on the starting gear side while applying the filling control (phase A). (See section 2.2.2 (7.2) for explanation of the filling control.)
- When the filling control ends, the control unit brings the clutch first to the clutch standby point and then to the creep torque generating point (phase B).
- When the brake pedal is released, the control unit allows the vehicle to start creeping (phase C).
- As soon as the accelerator pedal is pressed, the control unit makes control to engage the clutch (phase D).
- Once the engine and clutch speeds have synchronized with each other, the system terminates the starting control (phase E).

(1) Control for automatic selection of starting gear



- When the vehicle is brought to a stop with the gearshift lever in the “D” position, the control unit selects the starting gear based on the road slope angle (as determined depending on the G sensor information) and the estimated vehicle mass (as determined depending on the vehicle speed and accelerator pedal angle). Then a shift to the selected gear takes place automatically.

(2) Creep start function

- When the gearshift lever is in the “D” or “R” position, the vehicle starts moving at very low speed without need to press the accelerator pedal as soon as it is freed from braking force (by the service brakes and parking brake).

(2.1) Creep torque in 1st or reverse gear

- Regardless of braking forces, the amount of output creep torque is always varies with the vehicle speed.
- The output creep torque is inversely proportional to the vehicle speed.

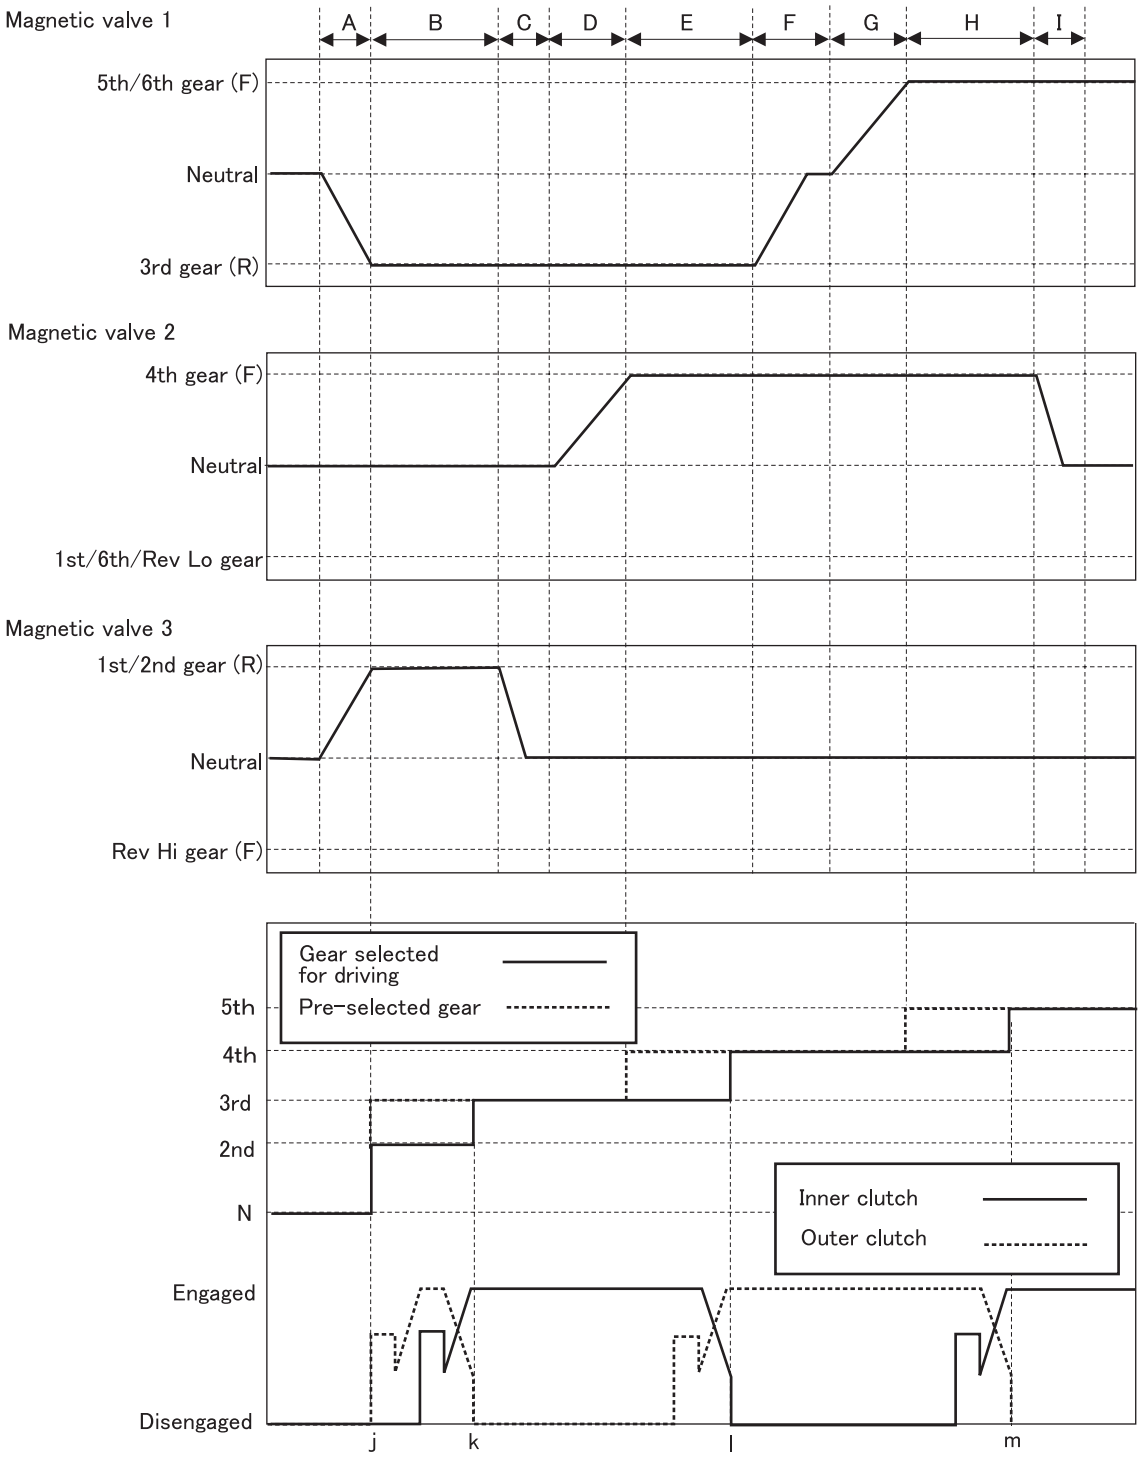
(2.2) Creep torque in 2nd and higher gears

- While a braking force (by the service brakes or parking brake) is working, the output creep torque varies with both the braking force and vehicle speed.
- When the vehicle is free from braking forces, the output creep torque varies with the vehicle speed.
- The output creep torque is inversely proportional to both the braking force and vehicle speed.

CAUTION ⚠

- **During starts on uphill roads, the vehicle may move back even when creep torque is available. In such a case, the parking brake should also be used.**

2.2.2 Gearshift control



P116348E

- The preceding diagram illustrates operation of the gearshift unit during shift-up from 2nd to 5th.
  - The 2nd gear (starting gear) is engaged and the next gear (3rd gear) is pre-selected (phase A).
  - The outer clutch is engaged (point j).
  - Gear shifts up from 2nd to 3rd according to the gearshift map (phase B).
  - The outer clutch disengages and the inner clutch engages (point k).
  - The 2nd gear is disengaged (phase C).
  - The next gear (4th gear) is pre-selected (phase D).
  - Gear shifts up from 3rd to 4th according to the gearshift map (phase E).
  - The inner clutch disengages and the outer clutch engages (point l).
  - The 3rd gear is disengaged (phase F).
  - The next gear (5th gear) is pre-selected (phase G).
  - Gear shifts up from 4th to 5th according to the gearshift map (phase H).
  - The outer clutch disengages and the inner clutch engages (point m).
  - The 4th gear is disengaged (phase I).

- Each gearshift rail has 2 gearshift solenoid valves (MVF and MVR). The magnetic valve that is driven varies depending on the direction of gear engagement as follows.

Gear	Clutch	Solenoid valve 1	Solenoid valve 2	Solenoid valve 3
1st	Inner	–	R	R
2nd	Outer	–	–	R
3rd	Inner	R	–	–
4th	Outer	–	F	–
5th	Inner	F	–	–
6th	Outer	F	R	–
Rev Lo	Inner	–	R	F
Rev Hi	Outer	–	–	F

(1) Automatic shift function

- When the gearshift lever is in the “D” position, this function selects gearshift maps stored in memory of the DUONIC electronic control unit appropriately depending on both the accelerator angle and vehicle speed and makes gear shifting automatically between the 1st and 6th gears according to the maps. The gear currently in engagement is indicated on the gearshift indicator in the meter cluster.
- During automatic gear shifting, the target gear is determined according to the gearshift map and also by applying a fuzzy control scheme. The fuzzy control estimates the driver’s intention from the vehicle load factor (derived from the theoretical acceleration and actual acceleration with an empty vehicle driven on a linear flat road), accelerator pedal angle, rate of change of the accelerator pedal angle, vehicle speed, engine speed, currently selected gear, and brake pedal condition, and reflects the driver’s intention thus estimated on the gearshift control.

(2) Manual shift function

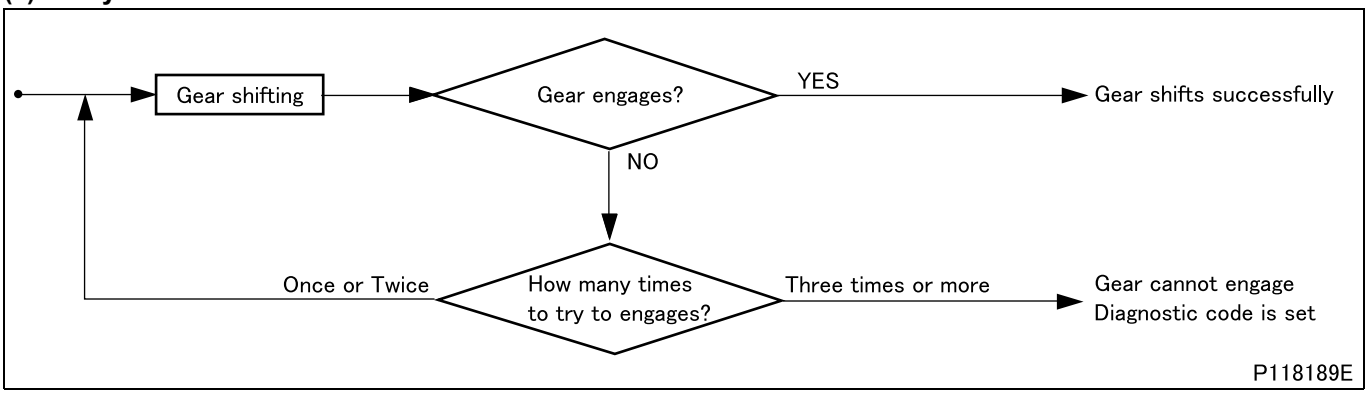
- This function allows the driver to manually make shift-up by one gear by pushing the gearshift lever from the “D” position toward the “+” position and make shift-down by one gear by pushing the lever toward the “–” position.
- The DUONIC electronic control unit is always monitoring the vehicle speed, engine speed, and selected gear. If there is a risk of engine over-revving as a result of manual gear shifting, no shift-down will take place even when the gearshift lever is pushed toward the “–” position. Likewise, if there is a risk of engine stall as a result of manual gear shifting, no shift-up will take place even when the gearshift lever is pushed toward the “+” position.

(3) Hold function

- If the gearshift lever is moved to the “A/M” position while driving in the automatic shift mode or after the lever has returned to the “D” position during manual shift operation, the gear is held in the currently selected gear. No automatic gear shifting takes place in this case. However, the gear automatically shifts up if the engine speed exceeds

the limit value (4,300 rpm) and the gear automatically shifts down to the starting gear when the vehicle comes to a stop.

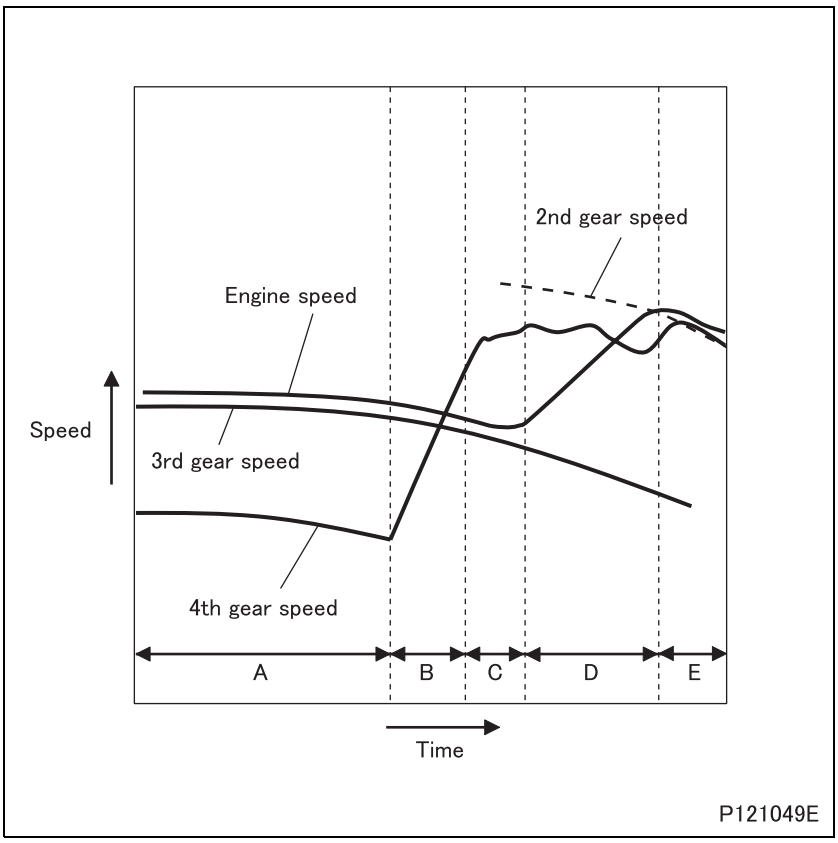
(4) Retry function



- If gear engagement fails to successfully complete, the transmission electronic control unit automatically activates the retry function to retry gear engagement (twice at maximum; three trials if the first normal trial is included). The retry control is applied to the same gear for which the first engagement trial has not successfully completed.

(4.1) Slip double-clutch control

- When the automatic transmission fluid temperature is low (20°C or lower), if it is hard to shift down from 3rd to 2nd, the engine speed is raised to the speed for the 2nd gear at that vehicle speed while the inner clutch is controlled in a slipping condition (still transmitting the driving torque to the 3rd gear), and then the outer clutch is engaged. Thus the outer drive pinion speed is increased to approximately the 2nd gear speed (from the 4th gear speed) when the clutch is engaged to facilitate the shift to the 2nd gear.



- This drawing is to explain the slip double-clutch control when the automatic transmission fluid temperature is low and it is hard to shift down from 3rd to 2nd.
  - When driving in the 3rd gear, the other (not engaged) drive pinion is engaged and driven by the 4th gear. (A)

  - Shifting from 4th gear to 2nd gear (pre-selection) starts. (B)
  - Synchromesh functions but the 2nd gear cannot be synchronized or is synchronized but cannot be engaged due to the rotation resistance at low temperature. (C)
  - The inner (3rd gear side) clutch is slip-controlled and the engine speed is increased while maintaining the driving torque for the 3rd gear. (D)
  - Engaging the outer (2nd gear side) clutch driven by increased engine speed promotes the synchronization and gear engagement. (E)
- The slip double-clutch control is performed when the following conditions are satisfied.
  - When performing the preshift from the 4th gear to the 2nd gear during driving in 3rd gear.
  - Automatic transmission fluid temperature is low (20°C or lower).
  - When it is hard to shift gears. (In case that the normal gearshifting was tried but the gear could not be engaged within the predetermined time.)
  - The 2nd gear speed for the current vehicle speed is higher than the engine idling speed.
  - The 2nd gear speed at automatic shifting or manual shifting is 2,000 rpm or lower.
- The slip double-clutch control is continued until the gear is engaged or the retry function is performed twice. (Gearshifting is tried 3 times including the first try of normal gearshifting.)

(5) Gear pre-selection function

- This function makes preparatory engagement of a gear that is expected to be engaged next. For example, when driving at 3rd (odd-number gear) with the inner clutch engaged, DUONIC® pre-selects an adjacent even-number gear (2nd or 4th) if the system judges this necessary based on acceleration/deceleration and other conditions. However, the even-number grears do not transmit power since the outer clutch is disengaged.
- With DUONIC®, the gear pre-selection control takes place as follows:
  - While driving in 1st, 2nd or 6th, the system invariably pre-select the gear indicated below.

Current gear	Pre-selected gear
1st	2nd
2nd	3rd
3rd	2nd or 4th
4th	3rd or 5th
5th	4th or 6th
6th	5th

  - While driving in 3rd, 4th or 5th, the system estimates a gear to be next selected and pre-select that gear.

(6) Control during operation of anti-lock brake system

- While the anti-lock brake system is in operation, the system may sometimes be unable to recognize the vehicle speed accurately. So it prohibits gear shifting down during the automatic shift mode (“D” range) and also a gear change during the manual shift mode to prevent over-revving of the engine.

(7) Clutch control function

- According to vehicle operating conditions, the system automatically controls the clutch to disengage, engage, or partially engage it.

(7.1) Solenoid valve control

- DUONIC® uses a wet clutch system to which the supply of hydraulic oil is adjusted using a solenoid valve. As the electric current supplied to the solenoid valve increases, the pressure applied to the clutch becomes stronger, so the clutch then can transmit greater torque.

(7.2) Filling control

- This control makes the specified amount of electric current flow for the specified length of time at the beginning of a clutch engagement cycle to quickly reduce the gap between the clutch disc and drive plate (on the engine), thus shortening the clutch engagement time.

(7.3) Micro-slip control

- Except during gear changes, this control keeps the clutch slightly slipping to make it rotate several tens rpm slower than the engine rpm. This allows the clutch to disengage quickly and thus gearshifts to take place smoothly. In addition to reduced gearshift time, this control provides the effect of preventing shock and damping down the vibration transmitted from the engine to the drive train components.

2.2.3 Other functions

(1) Automatic clutch disengagement function

- In both the drive range (“D”) and reverse range (“R”), the system makes a control of disengaging the clutch when the vehicle comes to a stop for the purpose of preventing engine stalls.

(2) Gearshift control during drive using cruise control

- When the driver starts using the cruise control while driving in the manual shift mode, the gearshift mode is automatically changed to the automatic shift mode.
- During the use of the cruise control, the system makes automatic gear shifting depending on the amount of load on vehicle, engine speed, and acceleration of vehicle in order to maintain the target speed.

(3) Economy mode (mode to support low-fuel-consumption driving)

- When the driver turns on the economy mode switch, the system starts using a special map for its gearshift control.
- In the economy mode gear shifting, gear shift-up takes place at a gear lower than that in the standard mode gear shifting.

CAUTION ⚠

- **The economy mode should be used only when the vehicle is carrying a small load (i.e. it is empty or half-loaded) and running on a relatively level road. The mode must not be used when the vehicle is fully loaded or on an uphill/downhill road.**

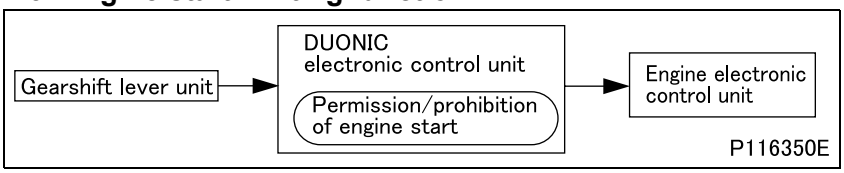
(4) Gearshift lock function during shift to/from “P” or “R” position

- While the service brake pedal is being pressed, the system issues a gearshift lock cancellation signal to enable the gearshift lever to be moved to/from the “P” or “R” position.

(5) Power take-off control function

- When the transmission power take-off switch is turned on with the vehicle parked and the gearshift lever in “P” or “N” position, the system makes necessary controls on the gear and clutch after engaging the power take-off so that power can be delivered from the power take-off.
- The system causes the display of indicator to change according to the engagement state of power take-off.
- If any of the following operations is performed, the system turns on “PTO” on the indicator and causes a buzzer to sound.
  - The transmission power take-off switch is turned on while driving or with the gearshift lever in any position except “P” and “N”.
  - The gearshift lever is moved to any position except “P” and “N” or the vehicle is driven after the transmission power take-off switch has been turned on.
  - The PTO control function can be set through coding parameters settings to be adapted to various equipment installed in factory.

2.3 Engine start limiting function



- To prevent the vehicle from lurching with the transmission in gear, the system permits the engine to be started only when the gearshift lever is in the “P” or “N” position.

2.4 Diagnosis function

- The diagnosis function of the DUONIC electronic control unit is working whenever the starter switch is in the ON position to determine whether the communication condition, each sensor, each relay, etc. is in normal condition or not. If the diagnosis function determines a component to be faulty, it causes the relevant indication to be displayed on the meter cluster to alert the driver to the failure, stores the faulty item in the form of a diagnostic code, and the system starts applying a malfunction mode control.
- During the malfunction mode control, the system functions are limited in order to assure safety of the crew and vehicle. The stored diagnostic codes can be read using FUSO Diagnostics and on the multi-information display in the meter cluster. (See Gr00.)

520758-0	High temperature of outer clutch is recorded.	–	–	
520759-19	The CAN message from component 'Hill Start Assist Control unit' is faulty.	-	O	

1.2 Code generation criteria and inspection items

70-19: The CAN message from component 'Parking brake Switches' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • CCVS_SSAM was received. • Parking Brake Switches (CAN) signal out of range (Error/SNA)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or while starter switch is in ON position
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • None
Possible causes		• Defective signal detect and actuation modules
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A20 (SAM) side system.

84-19: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • CCVS_MCM received & Vehicle speed (CRUISE CONTROL) (CAN) out of range (250.996<Cruise vehicle speed)
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Cruise speed change mode is exited. • Cruise termination request is continuously issued.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

86-19: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • CCVS_MCM received & Stored speed for cruise control (CAN) out of range (250<Stored speed for cruise control (CAN))
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Cruise speed change mode is exited. • Cruise termination request is continuously issued.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

91-19: The CAN message from component 'Position sensor 'Accelerator pedal'' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EEC2_EEC was received. • Position of accelerator pedal (CAN) out of range
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Diagnosis Codes 520732-2 & 512-19 not generated (Warning indication: Amber)] • Service data name: See Driver's Demand Percent Torque as accelerator position. [Diagnosis Code 520732-2 or 12-19 generated (Warning indication: Red)] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority over N.) • Engine control is terminated.
Possible causes		• Defective engine electronic control unit • Defective accelerator pedal position sensor
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

110-19: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • ET1_MCM was received. • Engine coolant temperature out of range for 10 seconds
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• None
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

158-2: The on-board electrical system voltage is implausible.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage V01 below 8 V or above 16 V • Battery voltage V02 below 8 V or above 16 V
Recoverability		• Supply voltage 8 to 16 V with starter switch ON • System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or if battery voltage V01 or V02 is 8 – 16 V while starter switch is in ON position.
Control effected by electronic control unit		• Both clutches are kept disengaged. • N flashes in meter cluster gear display. (P has priority over N.) • Engine control is terminated.
Possible causes		• Harness between DUONIC electronic control unit and battery open or shorted to ground • Malfunction of battery • Defective alternator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Use the following procedure to check if the source voltage is excessively high or low. Refer to the results of short test of other ECUs. Insert the tester probes into the A28 (DUONIC Control unit) harness connector on the vehicle side and measure the voltage between A28.X2.40/117 and A28.X2.40/118 and Ground. Is voltage above 12V (high voltage error)? No: Go to Step2 Yes: Go to Step15

Inspection procedure	Step2	Inspection procedure Check that the fuse F36 is not blown out. If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Go to Step3
	Step3	Inspection procedure Is this diagnosis code still active? No: Go to Step13 Yes: Go to Step4
	Step4	Inspection procedure Check if any of other ECUs has stored the diagnosis code representing abnormal power supply (power supply without passing through SAM). Are current fault codes present? No: Go to Step5 Yes: Go to Step7
	Step5	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of G1 (Battery). Check electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for open circuit. Test electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for short circuit to ground. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step6
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step7	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of G1 (Battery). Check electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for open circuit. Test electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for short circuit to ground. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step14
	Step8	Inspection procedure Measure the battery voltage. Specified value: 12V Is any abnormality recognized? No: Go to Step9 Yes: Go to Step12
	Step9	Inspection procedure Check the function of G2 (Alternator). Is any abnormality recognized? For procedures, refer to the Shop Manual No: Go to Step10 Yes: Go to Step11
	Step10	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Go to Step13
	Step11	Inspection procedure Replace component “G2 (Alternator)”. Reinstall all the removed connectors. Turn the starter switch in ON.

Inspection procedure	Step12	Inspection procedure Replace component “G1 (Battery)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step10
	Step13	Inspection completed
	Step14	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step15	Inspection procedure Replace component “G2 (Alternator)”. Reinstall all the removed connectors. Turn the starter switch in ON.

158-3: The battery voltage is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage V01 or V02 above 16 V
Recoverability		• Supply voltage 8 to 16 V with starter switch ON • System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or if battery voltage V01 or V02 is at or below 16 V while starter switch is in ON position.
Control effected by electronic control unit		• Backup by normal voltage
Possible causes		• Defective alternator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Replace component “G2 (Alternator)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

158-4: The battery voltage is too low.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage V01 or V02 below 8 V
Recoverability		• Supply voltage 8 to 16 V with starter switch ON • System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or if battery voltage V01 or V02 is at or above 8 V while starter switch is in ON position.
Control effected by electronic control unit		• Backup by normal voltage
Possible causes		• Harness between DUONIC electronic control unit and battery open or shorted to ground • Malfunction of battery • Defective alternator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Check that the fuse F36 is not blown out. If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Go to Step2
	Step2	Inspection procedure Is this diagnosis code still active? No: Go to Step12 Yes: Go to Step3

Inspection procedure	Step3	Inspection procedure Check if any of other ECUs has stored the diagnosis code representing abnormal power supply (power supply without passing through SAM). Are current fault codes present? No: Go to Step4 Yes: Go to Step6
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of G1 (Battery). Check electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for open circuit. Test electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for short circuit to ground. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step5
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of G1 (Battery). Check electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for open circuit. Test electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for short circuit to ground. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step13
	Step7	Inspection procedure Measure the battery voltage. Specified value: 12V Is any abnormality recognized? No: Go to Step8 Yes: Go to Step11
	Step8	Inspection procedure Check the function of G2 (Alternator). Is any abnormality recognized? For procedures, refer to the Shop Manual No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Go to Step12
	Step10	Inspection procedure Replace component “G2 (Alternator)”. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step11	Inspection procedure Replace component “G1 (Battery)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step9
	Step12	Inspection completed

Inspection procedure	Step13	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.

177-2: Component 'Oil temperature sensor' has an electrical fault.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Oil temperature sensor signal voltage above 0.04V and below 4.96 V • Input difference of 18.0°C {64.4°F} or more from previous input occurring 3 times over 5 seconds
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• TM oil temperature sensor substitute value 70°C {158°F} • Fixed to high oil temperature cooler bypass control • Creep torque cut
Possible causes		• Defective harness between oil temperature sensor and DUONIC electronic control unit • Defective oil temperature sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B48 (Oil temperature sensor). Measure the resistance between terminals 5 and 6. Specified value: 2.31 - 2.59k (20°C {68°F}) Is any abnormality recognized? Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No: Go to Step2 Yes: Go to Step4
	Step2	Inspection procedure Inspect or verify the following items. Repair or replace faulty items as necessary. Replace B48 (Oil temperature sensor) with a normal one and check to see if the fault code occurs. Measure resistance of the harness across A28 (DUONIC Control unit) and B48 (Oil temperature sensor) to check for a faulty harness (e.g., incomplete open circuit). Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Replace component “B48 (Oil temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3

177-3: The signal voltage of component 'Oil temperature sensor' is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Oil temperature sensor signal voltage at or above 4.96 V
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or if oil temperature sensor voltage is at or below 4.90 V while starter switch is in ON position.
Control effected by electronic control unit		• Oil temperature sensor substitute value 70°C {158°F} • Fixed to high oil temperature cooler bypass control • Creep torque cut
Possible causes		• Signal or ground harness between oil temperature sensor and DUONIC electronic control unit open • Signal harness between oil temperature sensor and DUONIC electronic control unit shorted to battery • Defective TM oil temperature sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B48 (Oil temperature sensor). Make a visual check on each connector. Measure the resistance between B48 (Oil temperature sensor) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B48 (Oil temperature sensor)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/46 and B48.X5.12/8 for open circuit. Check electrical line between pins A28.X1.81/65 and B48.X5.12/7 for open circuit. Check electrical line between pins A28.X1.81/46 and B48.X5.12/8 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

177-4: The signal voltage of component 'Oil temperature sensor' is too low.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Oil temperature sensor signal voltage at or below 0.04V
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or if oil temperature sensor voltage is at or above 0.10 V while starter switch is in ON position.
Control effected by electronic control unit		• Oil temperature sensor substitute value 70°C {158°F} • Fixed to high oil temperature cooler bypass control • Creep torque cut
Possible causes		• Signal harness between oil temperature sensor and DUONIC electronic control unit shorted to ground • Defective oil temperature sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B48 (Oil temperature sensor). Make a visual check on each connector. Measure the resistance between B48 (Oil temperature sensor) and ground or each terminal to check for short-circuit and electrical leakage. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B48 (Oil temperature sensor)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check harness between A28 (DUONIC Control unit) and B48 (Oil temperature sensor) for short-circuit to another line. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

177-9: Component 'Oil temperature sensor' has an electrical fault.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Oil temperature sensor signal voltage above 0.04 V and below 4.96 V • Vehicle traveling at 40 km/h {24.9 mph} or more for a total of 300 seconds or more • Increase in transmission oil temperature 41°F or less after starter switch turned ON
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Oil temperature sensor substitute value 70°C {158°F} • Fixed to high oil temperature cooler bypass control • Creep torque cut
Possible causes		• Defective harness between oil temperature sensor and DUONIC electronic control unit • Defective oil temperature sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B48 (Oil temperature sensor). Measure the resistance between terminals 5 and 6. Specified value: 2.31 - 2.59k (20°C {68°F}) Is any abnormality recognized? Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No: Go to Step2 Yes: Go to Step4
	Step2	Inspection procedure Inspect or verify the following items. Repair or replace faulty items as necessary. Replace B48 (Oil temperature sensor) with a normal one and check to see if the fault code occurs. Measure resistance of the harness across A28 (DUONIC Control unit) and B48 (Oil temperature sensor) to check for a faulty harness (e.g., incomplete open circuit). Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Replace component “B48 (Oil temperature sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3

188-19: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • Electronic control was received & Out-of-range Engine idle speed (CAN) for 10 seconds
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. • 650 rpm retained if data last received are out of range. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority over N.) • Main control section retains the safe mode. (Engine control is terminated.)
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

190-19: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EEC1_EEC was received. • Engine speed (CAN) out of range
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority over N.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective resistor in DUONIC electronic control unit • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Make a system diagnosis at the ECU2 on the transmission side. Make a system diagnosis at the A4 (Combustion engine Control unit) on the transmission side. Go to step3

Inspection procedure	Step3	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step4 Yes: Go to step9
	Step4	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step8
	Step5	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step6 Yes: Go to step7
	Step6	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

Inspection procedure	Step8	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step9	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step10
	Step10	Inspection procedure Is this diagnosis code still active? No:nGo to step11 Yes:nGo to step3
	Step11	Inspection completed

191-2: Component 'Rpm sensor 'Transmission'' has an electrical fault.

Generation condition		• Anti-lock brake system-equipped vehicle: ABS Cooperative Control • Supply voltage 8 to 16 V with starter switch ON • Normal Front Axle speed (CAN) received • No generation of Diagnosis Code 191-8 • Abnormal condition based on comparison between vehicle speed sensor <DUONIC> and speed at front axle (CAN)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Reference made to vehicle speed sensor input • Creep torque cut
Possible causes		• Defective harness between vehicle speed sensor <DUONIC> and DUONIC electronic control unit • Defective vehicle speed sensor <DUONIC> • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B41 (Rpm sensor Transmission). Apply DC {0} to {1} V between terminals B41.4/3 and B41.4/1. Rotate the shaft of B41 (Rpm sensor Transmission). Check terminals B41.4/2 and B41.4/4 for signals and, if no signals are outputted, replace B41 (Rpm sensor Transmission). Is any abnormality recognized? Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No: Go to Step2 Yes: Go to Step4
	Step2	Inspection procedure Inspect or verify the following items. Repair or replace faulty items as necessary. Replace B41 (Rpm sensor Transmission) with a normal one and check to see if the fault code occurs. Measure resistance of the harness across A28 (DUONIC Control unit) and B41 (Rpm sensor Transmission) to check for a faulty harness (e.g., incomplete open circuit). Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Replace component “B41 (Rpm sensor Transmission)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3

191-7: Component 'Vehicle speed Sensors, Rpm sensor 'Transmission'' has an electrical fault

Generation condition		• Simultaneous occurrences of Diagnosis Code 191-8 or 191-2 and Diagnosis Code 1619-8 or 1619-2
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged. • Gear shift unit is kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective vehicle speed sensor and vehicle speed sensor <DUONIC> • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

191-8: The signal voltage of component 'Rpm sensor 'Transmission'' is too low.

Generation condition		• Anti-lock brake system-equipped vehicle: ABS Cooperative Control • Supply voltage 8 – 16 V with starter switch ON • Normal Speed at front axle (CAN) received • Vehicle speed sensor <DUONIC> = 0 rpm
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or vehicle speed sensor 1 is 100 rpm or more with starter switch in ON position
Control effected by electronic control unit		• Reference made to vehicle speed sensor input • Creep torque cut
Possible causes		• Signal harness between vehicle speed sensor <DUONIC> and DUONIC electronic control unit open, shorted to ground or shorted to battery • Ground harness between vehicle speed sensor <DUONIC> and DUONIC electronic control unit open or shorted to ground • Vehicle speed sensor <DUONIC> power supply harness open or shorted to ground • Defective vehicle speed sensor <DUONIC> • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point '' for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B41 (Rpm sensor Transmission). Make a visual check on each connector. Measure the resistance between B41 (Rpm sensor Transmission) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B41 (Rpm sensor Transmission) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B41 (Rpm sensor Transmission)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B41 (Rpm sensor Transmission) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

191-10: Component 'Vehicle speed Sensors, Rpm sensor 'Transmission" has an electrical fault.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • Diagnosis Code 191-8, 191-2 not generated or Diagnosis Code 1619-8, 1619-2 not generated • Continuous 15 km/h {9.32 mph} or above & Vehicle speed dropped from 15 km/h {9.32 mph} or above to 0 mph in 0.01 seconds
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit), or Diagnosis Code 191-7 generated or vehicle speed of 2 km/h {1.24 mph} or more continued for 1 second or more with starter switch in ON position
Control effected by electronic control unit		• Both clutches are kept disengaged. • Gear shift unit is kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective vehicle speed sensor and vehicle speed sensor <DUONIC> • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

191-12: Component 'Vehicle speed Sensors, Rpm sensor 'Transmission" has an electrical fault.

Generation condition		• Non-anti-lock brake system vehicle: ABS Cooperative Control • Supply voltage 8 to 16 V with starter switch ON • Difference of 200 rpm or more between vehicle speed sensor <DUONIC> and vehicle speed sensor & Abnormal comparative input of vehicle speed sensor <DUONIC> and vehicle speed sensor
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Reference made to vehicle speed sensor <DUONIC> or vehicle speed sensor input, whichever is higher • Creep torque cut
Possible causes		• Defective vehicle speed sensor and vehicle speed sensor <DUONIC> • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

512-19: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EEC1_EEC received & Requested engine torque (CAN) out of range (125<Requested engine torque (CAN))
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective resistor in DUONIC electronic control unit • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

513-19: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EEC1_EEC received & Current engine torque (CAN) out of range (125<Current engine torque (CAN))
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective resistor in DUONIC electronic control unit • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2

Inspection procedure	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

514-19: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EEC3_EEC received & Engine drag torque (CAN) out of range
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective resistor in DUONIC electronic control unit • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2

Inspection procedure	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed

Inspection procedure	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

522-7: Slip at inner clutch plate

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Diagnosis Code 788-4, 788-3 (ON, OFF STUCK error) not generated • Diagnosis Code 785-3 (Magnetic valve (relief) shorted to battery) not generated • Inner clutch current reading 1.15 A or above • Odd gear engaged • Difference of 200 rpm or more for 10 seconds between Engine speed (CAN) and Rpm of component Internal clutch plate
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Incorrect setting of transfer gear ratio (coding) • Defective linear solenoid valve (for inner clutch drive) • Defective clutch system • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

526-2: Incorrect gear ratio in at least two gears

Generation condition		• Simultaneous occurrences of Diagnosis Code 520719-2 or 520721-2 or 520723-2 or 520725-2 and Diagnosis Code 520720-2 or 520722-2 or 520724-2 or 520726-2
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or Diagnosis Code 520719-2, 520721-2, 520723-2, 520725-2 not generated or Diagnosis Code 520720-2, 520722-2, 520724-2, 520726-2 not generated while starter switch is in ON position
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Incorrect gear ratio (coding) setting due to incorrect transmission assembly • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

544-19: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EC received & Reference torque (CAN) out of range (Reference torque (CAN)<100 or 1000<Reference torque (CAN)) for 10 seconds
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. • 400 Nm is retained if data last received are out of range. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

563-19: The CAN message from component 'Antilock brake system Control unit' is faulty.

Generation condition		• Anti-lock brake system-equipped vehicle (ABS Cooperative Control Equipped) • Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EBC1_BS received & Status of function ‘ABS’ ((CAN)) out of range (Reserved, SNA)
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Auto downshifting not permitted <in Auto Mode> • Shifting to roll-off gear temporarily permitted after detection of vehicle stationary for 3 seconds <in Auto Mode> • Normal gear shifting permitted <in Manual Mode>
Possible causes		• Defective hydraulic unit (electronic control unit)
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A1 (Antilock brake system Control unit) side system.

595-19: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • CCVS_MCM received & Status of cruise control (CAN) out of range = ON
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Cruise control status (CAN) = ON/OFF] • Cruise control status (CAN) = OFF detection retained [Upon error judgment] • Cruise speed change mode is exited. • Cruise termination request is continuously issued.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

597-19: The CAN message from component 'Brake light Switches' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON • CCVS_SSAM received • Brake light switches out of range (Error, SNA)
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective signal detect and actuation modules
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A20 (SAM) side system.

600-19: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON • CCVS_MCM received & CRUISE CONTROL lever in position ‘Decelerate’ (CAN) out of range (CRUISE CONTROL lever in position ‘Decelerate’ (CAN) = Error)
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[CRUISE CONTROL lever in position ‘Decelerate’ (CAN) = Error, SNA] • CRUISE CONTROL lever in position ‘Decelerate’ (CAN) = OFF detection retained [Upon error judgment] • Cruise speed change mode is exited. • Cruise termination request is continuously issued.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

602-19: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON • CCVS_MCM received & CRUISE CONTROL lever in position 'Accelerate' (CAN) out of range (CRUISE CONTROL lever in position 'Accelerate' (CAN) = Error)
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[CRUISE CONTROL lever in position 'Accelerate' (CAN) = Error, SNA)] • CRUISE CONTROL lever in position 'Accelerate' (CAN) = OFF detection retained [Upon error judgment] • Cruise speed change mode is exited. • Cruise termination request is continuously issued.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

681-12: The CAN message from component 'Selector lever' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON • ETC2_SSAM received • Shift lever unit in P • SSAM_A01 received • Disagreement between Shift lock Solenoid (Outputs) and Status of component Shift lock Solenoid (CAN)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or feedback agrees for 3 seconds while starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Defective signal detect and actuation modules
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A20 (SAM) side system.

684-7: Slip at outer clutch plate

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Diagnosis Code 520718-4, 520718-3 (ON, OFF STUCK error) not generated • Diagnosis Code 785-3 (magnetic valve (relief) shorted to battery) not generated • Outer clutch current reading 1.15 A or above • Even gear engaged • Difference of 200 rpm or more for 10 seconds between engine speed and outer clutch speed
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-1st/R-Lo
Possible causes		• Incorrect setting of transfer gear ratio (coding) • Defective linear solenoid valve (for outer clutch drive) • Defective clutch • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

740-7: The outer clutch plate does not engage. (When moving off)

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Diagnosis Code 788-4, 788-3 (driver stuck ON, OFF) not generated • Diagnosis Code 785-3 (magnetic valve (relief) shorted to battery) not generated • Even gear engaged • Engine speed higher by 500 rpm or more than inner clutch speed • Despite correct outer clutch current reading, torque output is incorrect for 5 seconds.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-1st/R-Lo
Possible causes		• Defective linear solenoid valve (for outer clutch drive) • Defective clutch • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

772-3: Component 'Solenoid valve 'Gearshift'(MV1F)' is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Gear shift solenoid valve stuck to ON failure (Fault status: The component 'Solenoid valve Gearshift (MV1F)' remains in the state 'ON') detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit). • Gear shift solenoid valve stuck to ON failure (Fault status: The component 'Solenoid valve Gearshift (MV1F)' remains in the state 'ON') not detected.
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Harness between DUONIC electronic control unit and gear shift unit magnetic valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3

Inspection procedure	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/24 and Y22.6/3 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

772-4: Component 'Solenoid valve 'Gearshift'(MV1F)' is switched off permanently.

Generation condition	• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Gear shift solenoid valve stuck to OFF failure (Fault status: The component 'Solenoid valve Gearshift (MV1F)' remains in the state 'OFF') detected.
Recoverability	• System recovers if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit). • Gear shift solenoid valve stuck to OFF failure (Fault status: The component 'Solenoid valve Gearshift (MV1F)' remains in the state 'OFF') not detected.
Control effected by electronic control unit	[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Control of relevant gear shift rail unit is terminated. • Vehicle continuously driven in F-2nd/R-Hi
Possible causes	• Harness between DUONIC electronic control unit and gear shift unit magnetic valve open or shorted • Defective actuator • Defective DUONIC electronic control unit

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/24 and Y22.6/3 for short circuit to ground. Check electrical line between pins A28.X1.81/24 and Y22.6/3 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

781-7: The gear change is not possible due to insufficient pressure. (Component Y25 (Solenoid valve Pressure regulator) is stuck.)

Generation condition		• Diagnosis Code 785-3 (Component 'Solenoid valve 'Pressure regulator'' is constantly on.) generated • 3 attempts to engage gear have failed on gear shift unit cylinder on which rail control is not suspended.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Faulty gear engagement due to the diagnosis code 785-3.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.Yes: Go to Step3

783-3: Component 'Solenoid valve 'Gearshift'(MV1R)' is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • "Fault status: The component 'Solenoid valve Gearshift (MV1R)' remains in the state 'ON'" detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit). • "Fault status: The component 'Solenoid valve Gearshift (MV1R)' remains in the state 'ON'" not detected.
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between DUONIC electronic control unit and gear shift unit magnetic valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/62 and Y22.6/6 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

783-4: Component 'Solenoid valve 'Gearshift'(MV1R)' is switched off permanently.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Gearshift solenoid valve stuck to OFF failure (Fault status: The component 'Solenoid valve Gearshift (MV1R)' remains in the state 'OFF') detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit). • "Fault status: The component 'Solenoid valve Gearshift (MV1R)' remains in the state 'OFF'" not detected.
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Control of relevant gear shift rail unit is terminated. • Vehicle continuously driven in F-2 nd/R-Hi
Possible causes		• Signal harness between DUONIC electronic control unit and gear shift unit magnetic valve open or shorted • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/62 and Y22.6/6 for short circuit to ground. Check electrical line between pins A28.X1.81/62 and Y22.6/6 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

Inspection procedure	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

785-3: Component 'Solenoid valve 'Pressure regulator'' is constantly on.

Generation condition		• Battery voltage V1 is 8 to 16 V or the battery voltage V2 is 8 to 16 V. • Solenoid valve (MVR) stuck to ON failure (Fault status: The component 'Solenoid valve Pressure regulator (MVR)' remains in the state 'ON') detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit). • Solenoid valve (MVR) stuck to ON failure (Fault status: The component 'Solenoid valve Pressure regulator (MVR)' remains in the state 'ON') not detected.
Control effected by electronic control unit		• None
Possible causes		• Harness between DUONIC electronic control unit and line pressure control valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y25 (Line pressure control solenoid valve). Make a visual check on each connector. Measure the resistance between Y25 (Line pressure control solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y25 (Line pressure control solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y25 (Line pressure control solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/20 and Y25.X5.12/4 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

Inspection procedure	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

785-4: Component 'Solenoid valve 'Pressure regulator'' is switched off permanently.

Generation condition		• Battery voltage V1 is 8 to 16 V or the battery voltage V2 is 8 to 16 V. • Solenoid valve (MVR) stuck to OFF failure (Fault status: The component 'Solenoid valve Pressure regulator (MVR)' remains in the state 'OFF') detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned to ON. • Solenoid valve (MVR) stuck to OFF failure (Fault status: The component 'Solenoid valve Pressure regulator (MVR)' remains in the state 'OFF') not detected.
Control effected by electronic control unit		• None (System stays under normal control)
Possible causes		• Harness between DUONIC electronic control unit and solenoid valve (relief) open or shorted to ground • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y25 (Line pressure control solenoid valve). Make a visual check on each connector. Measure the resistance between Y25 (Line pressure control solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y25 (Line pressure control solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y25 (Line pressure control solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/20 and Y25.X5.12/4 for short circuit to ground. Check electrical line between pins A28.X1.81/20 and Y25.X5.12/4 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

Inspection procedure	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

788-3: Component 'Solenoid valve 'Clutch control (inner)'' is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • "Fault status: The component 'Solenoid valve Clutch control (inner)' remains in the state 'ON'" detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned to ON. • "Fault status: The component 'Solenoid valve Clutch control (inner)' remains in the state 'ON'" not detected.
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Judged as: GSU shift position is in normal (*) status, vehicle speed information is normal, and vehicle is stopping] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Ground harness between DUONIC electronic control unit and linear solenoid valve (for inner clutch drive) shorted to ground • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y23 (Inner clutch control linear solenoid valve). Make a visual check on each connector. Measure the resistance between Y23 (Inner clutch control linear solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y23 (Inner clutch control linear solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step2 Yes: Go to step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y23 (Inner clutch control linear solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/4 and Y23.X5.12/2 for short circuit to ground. Is any abnormality recognized? No: Go to step4 Yes: Go to step5

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

788-4: Component 'Solenoid valve 'Clutch control (inner)" is switched off permanently.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • "Fault status: The component 'Solenoid valve Clutch control (inner)' remains in the state 'OFF'" detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned to ON. • "Fault status: The component 'Solenoid valve Clutch control (inner)' remains in the state 'OFF'" not detected.
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Judged as: GSU shift position is in normal (*) status, vehicle speed information is normal, and vehicle is stopping] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Signal harness between DUONIC electronic control unit and linear solenoid valve (for inner clutch drive) open, shorted to battery, shorted to ground or shorted otherwise. • Power harness between DUONIC electronic control unit and linear solenoid valve (for inner clutch drive) open or shorted to ground • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y23 (Inner clutch control linear solenoid valve). Make a visual check on each connector. Measure the resistance between Y23 (Inner clutch control linear solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y23 (Inner clutch control linear solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step2 Yes: Go o step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y23 (Inner clutch control linear solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

Inspection procedure	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check harness between A28 (DUONIC Control unit) and Y23 (Inner clutch control linear solenoid valve) for short-circuit to another line. Check electrical line between pins A28.X1.81/4 and Y23.X5.12/2 for short circuit to positive. Check electrical line between pins A28.X1.81/4 and Y23.X5.12/2 for open circuit. Check electrical line between pins A28.X1.81/1 and Y23.X5.12/6 for open circuit. Is any abnormality recognized? No: Go to step4 Yes: Go o step
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

788-7: The inner clutch plate does not engage. (When moving off)

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • Diagnosis Code 788-4, 788-3 (driver stuck ON, OFF) not generated • Diagnosis Code 785-3 (solenoid valve (relief) shorted to battery) not generated • Odd gear engaged • Engine speed higher by 500 rpm or more than inner clutch speed • Despite correct inner clutch current reading, torque output is incorrect for 5 seconds.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Defective linear solenoid valve (for inner clutch drive) • Defective clutch • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

788-12: Faulty component 'Solenoid valve 'Clutch control (inner)',Solenoid valve 'Clutch control (outer)"

Generation condition		• Simultaneous occurrences of Diagnosis Code 788-4 or 788-3 or 522-7 or 788-7 and Diagnosis Code 520718-4 or 520718-3 or 684-7 or 740-7
Recoverability		• System recovers if signal becomes normal after starter switch is turned to ON. • Diagnosis code 788-4, 788-3, 522-7 and 788-7 not generated or diagnosis code 520718-4, 520718-3, 684-7 and 740-7 not generated.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Main control section retains the safe mode. (Engine control is terminated.)
Possible causes		• Defective linear solenoid valve (for inner clutch drive or outer clutch drive) • Defective clutch • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

904-19: The CAN message from component 'Antilock brake system Control unit' is faulty.

Generation condition		• Anti-lock brake system-equipped vehicle (Support for ABS control: INSTALLED) • Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EBC2_BS received & Speed at front axle (CAN) out of range (250.996<Speed at front axle (CAN))
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• None
Possible causes		• Defective hydraulic unit (electronic control unit)
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A1 (Antilock brake system Control unit) side system.

907-19: The CAN message from component 'Antilock brake system Control unit' is faulty.

Generation condition		• Anti-lock brake system-equipped vehicle (Support for ABS control: INSTALLED) • Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EBC2_BS received & Relative speed of component Wheel speeds (Left) (CAN) out of range (7.8125<Relative speed of component Wheel speeds (Left) (CAN))
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• None
Possible causes		• Defective hydraulic unit (electronic control unit)
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A1 (Antilock brake system Control unit) side system.

908-19: The CAN message from component 'Antilock brake system Control unit' is faulty.

Generation condition		• Anti-lock brake system-equipped vehicle (Support for ABS control: INSTALLED) • Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EBC2_BS received & Relative speed of component Wheel speeds (Right) (CAN) out of range (7.8125<Relative speed of component Wheel speeds (Right) (CAN))
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• None
Possible causes		• Defective hydraulic unit (electronic control unit)
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A1 (Antilock brake system Control unit) side system.

973-19: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EBC1_EEC received & Status of engine brake out of range (100<Status of engine brake)
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Retains the last normal status data of the exhaust brake.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

1438-12: Component 'Antilock brake system Control unit' reports a fault.

Generation condition		• Anti-lock brake system-equipped vehicle (Support for ABS control: INSTALLED) • Supply voltage 8 to 16 V with starter switch ON • 5 seconds have elapsed since starter switch was turned ON. • EBC1_BS received & ABS Warning lamp (CAN) not OFF
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or upon receiving ABS Warning lamp (CAN) OFF signal while starter switch is in ON position.
Control effected by electronic control unit		If the software of DUONIC ECU is old In case of <In Auto Mode> • Auto downshifting not permitted • Shifting to roll-off gear temporarily permitted after detection of vehicle stationary for 3 seconds <In Manual Mode> • Normal gear shifting permitted
		If the software of DUONIC ECU is newer <In Auto Mode> • Auto upshifting not permitted • Automatic shift down to 4 speed • Automatic shift down not permitted in 4-speed or less • Shifting to roll-off gear temporarily permitted after detection of vehicle stationary for 3 seconds <In Manual Mode> • Normal gear shifting permitted <In Cruise control> • Cruise control variable speed mode release • Cruise control release request continuation output
Possible causes		• Anti-lock brake system/AMB warning being displayed (which is not a fault) • Defective hydraulic unit (electronic control unit)
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A1 (Antilock brake system Control unit) side system.

1619-2: Component 'Vehicle speed Sensors' has an electrical fault.

Generation condition		• Anti-lock brake system-equipped vehicle (Support for ABS control: INSTALLED) • Supply voltage 8 to 16 V with starter switch ON • Normal vehicle speed received from Speed at front axle (CAN) • "Relative speed of component Wheel speeds (Left) (CAN)" and "Relative speed of component Wheel speeds (Right) (CAN)" are compared with "Speed at front axle (CAN)" and judged as "Relative speed of component Wheel speeds (Left) (CAN)" and "Relative speed of component Wheel speeds (Right) (CAN)" are normal. • Diagnosis code 1619-8 not generated. • Abnormal status in the vehicle speed sensor signal in comparison with the Speed at front axle (CAN) signal.
Recoverability		• System recovers if signal becomes normal after starter switch is turned to ON or if the vehicle speed sensor <DUONIC> input is 100 rpm or higher.
Control effected by electronic control unit		• Reference made to vehicle speed sensor <DUONIC> input • Retains the recognition that the vehicle is forwarding. • Creep torque cut
Possible causes		• Defective harness between vehicle speed sensor and DUONIC electronic control unit • Malfunction of vehicle speed sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B11 (Vehicle speed Sensors). Apply DC {0} to {1} V between terminals B11.4/3 and B11.4/1. Rotate the shaft of B11 (Vehicle speed Sensors). Check terminals B11.4/2 and B11.4/4 for signals and, if no signals are outputted, replace B41 (Rpm sensor Transmission). Is any abnormality recognized? Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No: Go to Step2 Yes: Go to Step4
	Step2	Inspection procedure Inspect or verify the following items. Repair or replace faulty items as necessary. Replace B11 (Vehicle speed Sensors) with a normal one and check to see if the fault code occurs. Measure resistance of the harness across A28 (DUONIC Control unit) and B11 (Vehicle speed Sensors) to check for a faulty harness (e.g., incomplete open circuit). Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Replace component “B11 (Vehicle speed Sensors)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3

1619-8: The signal voltage of component 'Vehicle speed Sensors' is too low.

Generation condition		• Anti-lock brake system-equipped vehicle (Support for ABS control: INSTALLED) • Supply voltage 8 to 16 V with starter switch ON • Normal vehicle speed received from Speed at front axle (CAN) • "Relative speed of component Wheel speeds (Left) (CAN)" and "Relative speed of component Wheel speeds (Right) (CAN)" are compared with "Speed at front axle (CAN)" and judged as "Relative speed of component Wheel speeds (Left) (CAN)" and "Relative speed of component Wheel speeds (Right) (CAN)" are normal. • Vehicle speed sensor = 0rpm
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or vehicle speed sensor input is 100 rpm or above while starter switch is in ON position
Control effected by electronic control unit		• Reference made to vehicle speed sensor <DUONIC> input • Retains the recognition that the vehicle is forwarding. • Creep torque cut
Possible causes		• Signal (between DUONIC electronic control unit and meter cluster) harness between vehicle speed sensor and DUONIC electronic control unit open or shorted to ground • Signal (between meter cluster and vehicle speed sensor) harness between vehicle speed sensor and DUONIC electronic control unit open or shorted to ground • Power supply harness between vehicle speed sensor and DUONIC electronic control unit open or shorted to ground • Ground harness between vehicle speed sensor and DUONIC electronic control unit open or shorted to battery • Malfunction of vehicle speed sensor • Defective meter cluster • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Has a fault code associated with B11 (Vehicle speed Sensors) occurred in any other systems, or is the vehicle speed indication on the meter correct? No: Go to Step2 Yes: Go to Step6
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B11 (Vehicle speed Sensors). Remove the connector of A28 (DUONIC Control unit). Check electrical line between pins A11.18/16 and A28.X2.40/94 for open circuit. Test electrical line between pins A11.18/16 and A28.X2.40/94 for short circuit to ground. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Go to Step5

Inspection procedure	Step4	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Special features Run vehicle Go to Step3
	Step5	Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of B11 (Vehicle speed Sensors). Remove the connector of A11 (Meter cluster). Check electrical line between pins B11.4/2 and A11.18/12 for open circuit. Test electrical line between pins B11.4/2 and A11.18/12 for short circuit to ground. Check electrical line between pins B11.4/3 and A11.18/3 for open circuit. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step9
	Step7	Inspection procedure Turn the starter switch in OFF. Remove B11 (Vehicle speed Sensors) from Transmission. Apply DC 12 V between terminals B11.4/3 and B11.4/1. Rotate the shaft of B11 (Vehicle speed Sensors). Check terminals B11.4/2 and B11.4/4 for signals and, if no signals are outputted, replace B11 (Vehicle speed Sensors). Is any abnormality recognized? No: Go to Step3 Yes: Go to Step8
	Step8	Inspection procedure Replace component “B11 (Vehicle speed Sensors)”. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step9	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.

1810-2: Component 'Acceleration sensor' has an electrical fault.

Generation condition	• Supply voltage 8 to 16 V with starter switch ON • None of diagnosis codes 119 (1810-3), 120 (1810-4), 122 (520745-3) and 123 (520745-4) generated.
Recoverability	• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit	• Road gradient is always deemed to be 0%. • 2^{nd} to 1^{st} shift down control disabled in braking on the steep climbing slope • Automatic gear selection at starting off is fixed at 1^{st} gear. • Vehicle weight calculation function is disabled. • On vehicles without ABS, half-lock detection function is disabled.
Possible causes	• Faulty harness between G-sensor and DUONIC electronic control unit • Defective G-sensor • Defective DUONIC electronic control unit

Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B43 (Acceleration sensor). Apply DC 12 V between terminals B43.3/3 and B43.3/1. Measure the output voltage when B43 (Acceleration sensor) is as illustrated across terminals B43.3/2 and B43.3/1. Standard value Horizontal condition: 2.3 - 2.7V Vertical condition: 3.3 - 3.7V Is any abnormality recognized? Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No: Go to Step2 Yes: Go to Step4
	Step2	Inspection procedure Inspect or verify the following items. Repair or replace faulty items as necessary. Replace B43 (Acceleration sensor) with a normal one and check to see if the fault code occurs. Measure resistance of the harness across A28 (DUONIC Control unit) and B43 (Acceleration sensor) to check for a faulty harness (e.g., incomplete open circuit). Go to Step3
	Step3	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Replace component “B43 (Acceleration sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Wait for 5 seconds after the starter switch is set to ON. Go to Step3

1810-3: The signal voltage of component 'Acceleration sensor' is too high.

Generation condition	• Supply voltage 8 to 16 V with starter switch ON • G sensor signal voltage 4.55 V or above
Recoverability	• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or G sensor signal voltage is 4.50 V or bellow while starter switch is in ON position
Control effected by electronic control unit	• Road gradient substitute value 0% • 2^{nd} to 1^{st} shift down control disabled in braking on the steep climbing slope • Automatic selection of roll-off gear fixed to 1^{st} • Vehicle weight calculation is terminated. • Half lock detection not permitted on non anti-lock brake system-equipped vehicle (Support for ABS control: NOT INSTALLED)
Possible causes	• Signal harness between G sensor and DUONIC electronic control unit shorted to battery • Ground harness between G sensor and DUONIC electronic control unit open • Defective G sensor • Defective DUONIC electronic control unit

Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B43 (Acceleration sensor). Make a visual check on each connector. Measure the resistance between B43 (Acceleration sensor) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B43 (Acceleration sensor) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B43 (Acceleration sensor)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B43 (Acceleration sensor) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

1810-4: The signal voltage of component 'Acceleration sensor' is too low.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • G sensor signal voltage 0.45 V or below
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or G sensor signal voltage is 0.50 V or above while starter switch is in ON position.
Control effected by electronic control unit		• Road gradient substitute value 0% • 2nd to 1st shift down control disabled in braking on steep climbing slope • Automatic selection of starting gear fixed to 1st • Vehicle weight calculation is terminated. • Half lock detection not permitted on non anti-lock brake system-equipped vehicle (Support for ABS control: NOT INSTALLED)
Possible causes		• Signal harness between G sensor and DUONIC electronic control unit open or shorted to ground • Power harness between G sensor and DUONIC electronic control unit open • Defective G sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B43 (Acceleration sensor). Make a visual check on each connector. Measure the resistance between B43 (Acceleration sensor) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B43 (Acceleration sensor) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B43 (Acceleration sensor)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B43 (Acceleration sensor) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

1852-19: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Starter switch ON • TC1_MCM was received & HOLD function request to hold gear 1st, Rev. (CAN): VALID
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Immediately after data out of effective range is received] • The last normal data is retained.
Possible causes		• Defective engine electronic control unit
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A4 (Combustion engine Control unit) side system.

1852-31: The AdBlue® tank is empty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • HOLD function request to hold gear 1st, Rev. (CAN) = Enable
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• Starting gear fixed to 1st • Upshifting in D range not permitted • Upshifting in M range not permitted
Possible causes		• Diesel exhaust fluid level too low
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

2580-2: Component 'Brake pressure sensor' has an electrical fault.

Generation condition		• Accelerator opening more than 30% • Vehicle running forward at 20 km/h{12.4 mph} or higher • Supply voltage 8 to 16 V with starter switch ON • Engine speed 400 rpm or above • Status of function 'Lock Brake' (CAN): OFF • EGZO_A01_CAN Reception quality: NO RECEPTION • Brake fluid pressure sensor input 2.3 MPa or above for 10 seconds with Brake light switches OFF (Do not operate brake pedal)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or brake fluid pressure sensor input 0.5 MPa or below for 10 seconds with Brake light switches OFF (Do not operate brake pedal) while starter switch is in ON position.
Control effected by electronic control unit		• Brake fluid pressure substitute value 0 MPa
Possible causes		• Defective brake fluid pressure sensor • Defective harness between brake fluid pressure sensor and DUONIC electronic control unit • Malfunction of stop lamp switch • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check to see if Brake light Switches system is fully operational. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B42 (Brake pressure sensor). Apply DC 5 V between terminals B42.3/3 and B42.3/1. Measure the output voltage between terminals B42.3/3 and B42.3/2. Specified value: 0.5V Is any abnormality recognized? Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No: Go to Step3 Yes: Go to Step5
	Step3	Inspection procedure Inspect or verify the following items. Repair or replace faulty items as necessary. Replace B42 (Brake pressure sensor) with a normal one and check to see if the fault code occurs. Measure resistance of the harness across A28 (DUONIC Control unit) and B42 (Brake pressure sensor) to check for a faulty harness (e.g., incomplete open circuit). Go to Step4
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Replace component “B42 (Brake pressure sensor)”. Reinstall all the removed connectors. Turn the starter switch in ON. Wait for 10 seconds after the starter switch is set to ON. Go to Step4

2580-3: The signal voltage of component 'Brake pressure sensor' is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Brake fluid pressure sensor signal voltage 4.8 V or above
Recoverability		• Brake fluid pressure sensor signal voltage is 4.5 V or below while starter switch is in ON position.
Control effected by electronic control unit		• Brake fluid pressure substitute value 0 MPa
Possible causes		• Signal harness between brake fluid pressure sensor and DUONIC electronic control unit shorted to battery or open • Ground harness between brake fluid pressure sensor and DUONIC electronic control unit open • Defective brake fluid pressure sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B42 (Brake pressure sensor). Make a visual check on each connector. Measure the resistance between B42 (Brake pressure sensor) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B42 (Brake pressure sensor) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B42 (Brake pressure sensor)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B42 (Brake pressure sensor) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

2580-4: The signal voltage of component 'Brake pressure sensor' is too low.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Brake fluid pressure sensor signal voltage 0.2 V or below
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or brake fluid pressure sensor voltage is 0.5 V or above while starter switch is in ON position.
Control effected by electronic control unit		• Brake fluid pressure substitute value 0 MPa
Possible causes		• Signal harness between brake fluid pressure sensor and DUONIC electronic control unit shorted to ground • Power harness between brake fluid pressure sensor and DUONIC electronic control unit open • Defective brake fluid pressure sensor • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of B42 (Brake pressure sensor). Make a visual check on each connector. Measure the resistance between B42 (Brake pressure sensor) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B42 (Brake pressure sensor) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “B42 (Brake pressure sensor)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B42 (Brake pressure sensor) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

2910-3: Component '3/2-way valve 'Power take-off" is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • "Fault status: The component '3/2-way valve Power take-off (PTOCS)' remains in the state 'ON'" detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or "Fault status: The component '3/2-way valve Power take-off (PTOCS)' remains in the state 'ON'" is not detected.
Control effected by electronic control unit		<When the power-take off is operated with the gear is in the other position than P and N.> • “PTO” flashes on meter • Buzzer ON/OFF (every second)
Possible causes		• Harness between DUONIC electronic control unit and power take-off 3-way magnetic valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y28 (Transmission power take-off 3-way magnetic valve). Make a visual check on each connector. Measure the resistance between Y28 (Transmission power take-off 3-way magnetic valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y28 (Transmission power take-off 3-way magnetic valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y28 (Transmission power take-off 3-way magnetic valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/58 and Y28.2/1 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

2910-4: Component '3/2-way valve 'Power take-off" is switched off permanently.

Generation condition		• Vehicle equipped with power take-off (Power take-off: INSTALLED) • Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • "Fault status: The component '3/2-way valve Power take-off (PTOCS)' remains in the state 'OFF'" detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or "Fault status: The component '3/2-way valve Power take-off (PTOCS)' remains in the state 'OFF'" is not detected.
Control effected by electronic control unit		• None (System stays under normal control)
Possible causes		• Signal harness between DUONIC electronic control unit and power take-off 3-way magnetic valve open or shorted • Power harness between DUONIC electronic control unit and power take-off 3-way magnetic valve open • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y28 (Transmission power take-off 3-way magnetic valve). Make a visual check on each connector. Measure the resistance between Y28 (Transmission power take-off 3-way magnetic valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y28 (Transmission power take-off 3-way magnetic valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y28 (Transmission power take-off 3-way magnetic valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/58 and Y28.2/1 for short circuit to ground. Check electrical line between pins A28.X1.81/58 and Y28.2/1 for open circuit. Check electrical line between pins Y28.2/2 and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

Inspection procedure	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

3187-19: The CAN message from component 'Selector lever' is faulty.

Generation condition		• Starter switch ON • ETC2_SSAM received • Shift lever unit signal controller area network out-of-range data (excluding 9, 25, 17, 49, 33, 35, 19, 10, 26, 18, 50, 34, 22, 20) (0: NoError judged as abnormal)
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained. [Upon error judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Main control section retains the safe mode. (Engine control is terminated.)
Possible causes		• Defective signal detect and actuation modules
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A20 (SAM) side system.

3452-19: The CAN message from component 'Actuation of power take-off Switches' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • PTO_SSAM received & Power take-off Switches data out of range (error)
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained.
Possible causes		• Defective signal detect and actuation modules
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A20 (SAM) side system.

3453-19: The CAN message from component 'Indicator lamps Switches (Power take-off)' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • SSAM_A01 received & Power take-off Operating lever (Dumper vehicle) (CAN) data out of range (error)
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained.
Possible causes		• Defective signal detect and actuation modules
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A20 (SAM) side system.

520704-2: The battery voltage is either too high or too low. (Ignition lock ON Voltages)

Generation condition		• Starter switch in ON position being detected • Battery voltage V01 or V02 8 to 16 V • Starter switch ON power V1 below 8 V or above 16 V
Recoverability		• Battery voltage V01 or V02 8 to 16 V • System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or starter switch ON power V1 is 8 to 16 V while starter switch is in ON position.
Control effected by electronic control unit		• Backup with V2, V3, V01, V02
Possible causes		• Harness between DUONIC electronic control unit and SSAM open or shorted to ground • Defective alternator • Defective signal detect and actuation module relay • Defective starter switch • Defective signal detect and actuation modules • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Use the following procedure to check if the source voltage is excessively high or low. Refer to the results of short test of other ECUs. Insert the tester probes into the A28 (DUONIC Control unit) harness connector on the vehicle side and measure the voltage between A28.X2.40/119 and Ground. Is voltage above 12V (high voltage error)? No: Go to Step2 Yes: Go to Step12
	Step2	Inspection procedure Check that the fuse F24,HF01 is not blown out. If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Go to Step3
	Step3	Inspection procedure Is this diagnosis code still active? No: Go to Step14 Yes: Go to Step4
	Step4	Inspection procedure Make a system diagnosis if a diagnosis code representing abnormal power supply directly from the battery has occurred. Go to Step5
	Step5	Inspection procedure Check if this ECU or other ECU has stored any of the diagnosis codes associated with the identical power supply system (switched ON through starter switch or for accessories). Are current fault codes present? No: Go to Step6 Yes: Go to Step8
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of A20 (SAM). Check electrical line between pins A28.X2.40/119 and A20.X9.14/11 for open circuit. Test electrical line between pins A28.X2.40/119 and A20.X9.14/11 for short circuit to ground. Is any abnormality recognized? No: Go to Step13 Yes: Go to Step7
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.

Inspection procedure	Step8	Make the following inspections. K23 (Starter signal Relays (IGN)) S7 (Starter Switches) For procedures, refer to the Shop Manual. Replace faulty electrical devices. Is this diagnosis code still active? No: Go to Step14 Yes: Go to Step9
	Step9	Inspection procedure Turn the starter switch in OFF. Remove the connector of A20 (SAM). Remove the connector of S7 (Starter Switches). Check electrical line between pins A20.X8.28/3 and S7.6/6 for open circuit. Test electrical line between pins A20.X8.28/3 and S7.6/6 for short circuit to ground. Check electrical line between pins S7.6/4 and A20.X3.14/3 for open circuit. Test electrical line between pins S7.6/4 and A20.X3.14/3 for short circuit to ground. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM).
	Step11	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step12	Inspection procedure Replace component “Alternator”. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step13	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit).
	Step14	Inspection completed

520705-2: The battery voltage is either too high or too low. (Ignition lock ON Voltages)

Generation condition	• Starter switch in ON position being detected • Battery voltage V01 or V02 8 to 16 V • Starter switch ON power V2 below 8 V or above 16 V
Recoverability	• Battery voltage V01 or V02 8 to 16 V • System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or starter switch ON power V2 is 8 to 16 V while starter switch is in ON position.
Control effected by electronic control unit	• Backup with V1, V3, V01, V02
Possible causes	• Harness between DUONIC electronic control unit and SSAM open or shorted to ground • Defective alternator • Defective signal detect and actuation module relay • Defective starter switch • Defective signal detect and actuation modules • Defective DUONIC electronic control unit

Inspection procedure	Step1	Inspection procedure Use the following procedure to check if the source voltage is excessively high or low. Refer to the results of short test of other ECUs. Insert the tester probes into the A28 (DUONIC Control unit) harness connector on the vehicle side and measure the voltage between A28.X2.40/120 and Ground. Is voltage above 12V (high voltage error)? No: Go to Step2 Yes: Go to Step12
	Step2	Inspection procedure Check that the fuse F24,HF01 is not blown out. If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Go to Step3
	Step3	Inspection procedure Is this diagnosis code still active? No: Go to Step14 Yes: Go to Step4
	Step4	Inspection procedure Make a system diagnosis if a diagnosis code representing abnormal power supply directly from the battery has occurred. Go to Step5
	Step5	Inspection procedure Check if this ECU or other ECU has stored any of the diagnosis codes associated with the identical power supply system (switched ON through starter switch or for accessories). Are current fault codes present? No: Go to Step6 Yes: Go to Step8
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of A20 (SAM). Check electrical line between pins A28.X2.40/120 and A20.X9.14/9 for open circuit. Test electrical line between pins A28.X2.40/120 and A20.X9.14/9 for short circuit to ground. Is any abnormality recognized? No: Go to Step13 Yes: Go to Step7
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step8	Make the following inspections. K23 (Starter signal Relays (IGN)) S7 (Starter Switches) For procedures, refer to the Shop Manual. Replace faulty electrical devices. Is this diagnosis code still active? No: Go to Step14 Yes: Go to Step9

Inspection procedure	Step9	Inspection procedure Turn the starter switch in OFF. Remove the connector of A20 (SAM). Remove the connector of S7 (Starter Switches). Check electrical line between pins A20.X8.28/3 and S7.6/6 for open circuit. Test electrical line between pins A20.X8.28/3 and S7.6/6 for short circuit to ground. Check electrical line between pins S7.6/4 and A20.X3.14/3 for open circuit. Test electrical line between pins S7.6/4 and A20.X3.14/3 for short circuit to ground. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM).
	Step11	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step12	Inspection procedure Replace component “G2 (Alternator)”. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step13	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit).
	Step14	Inspection completed

520706-2: The battery voltage is either too high or too low. (ACC Voltages)

Generation condition	• Starter switch in ON position being detected • Battery voltage V01 or V02 8 to 16 V • Starter switch ACC power V3 below 8 V or above 16 V
Recoverability	• Battery voltage V01 or V02 8 to 16 V • System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or starter switch ACC power thus reenergizing electronic control unit V3 is 8 to 16 V.
Control effected by electronic control unit	• None
Possible causes	• Harness between DUONIC electronic control unit and SSAM open or shorted to ground • Defective alternator • Defective signal detect and actuation module relay • Defective starter switch • Defective signal detect and actuation modules • Defective DUONIC electronic control unit

Inspection procedure	Step1	Inspection procedure Use the following procedure to check if the source voltage is excessively high or low. Refer to the results of short test of other ECUs. Insert the tester probes into the A28 (DUONIC Control unit) harness connector on the vehicle side and measure the voltage between A28.X2.40/121 and Ground. Is voltage above 12V (high voltage error)? No: Go to Step2 Yes: Go to Step12
	Step2	Inspection procedure Check that the fuse F24,HF01 is not blown out. If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Go to Step3
	Step3	Inspection procedure Is this diagnosis code still active? No: Go to Step14 Yes: Go to Step4
	Step4	Inspection procedure Make a system diagnosis if a diagnosis code representing abnormal power supply directly from the battery has occurred. Go to Step5
	Step5	Inspection procedure Check if this ECU or other ECU has stored any of the diagnosis codes associated with the identical power supply system (switched ON through starter switch or for accessories). Are current fault codes present? No: Go to Step6 Yes: Go to Step8
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of A20 (SAM). Check electrical line between pins A28.X2.40/121 and A20.X10.14/8 for open circuit. Test electrical line between pins A28.X2.40/121 and A20.X10.14/8 for short circuit to ground. Is any abnormality recognized? No: Go to Step13 Yes: Go to Step7
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step8	Make the following inspections. K24 (Starter signal Relays (ACC)) S7 (Starter Switches) For procedures, refer to the Shop Manual. Replace faulty electrical devices. Is this diagnosis code still active? No: Go to Step14 Yes: Go to Step9

Inspection procedure	Step9	Inspection procedure Turn the starter switch in OFF. Remove the connector of A20 (SAM). Remove the connector of S7 (Starter Switches). Check electrical line between pins A20.X8.28/17 and S7.6/5 for open circuit. Test electrical line between pins A20.X8.28/17 and S7.6/5 for short circuit to ground. Check electrical line between pins S7.6/4 and A20.X3.14/3 for open circuit. Test electrical line between pins S7.6/4 and A20.X3.14/3 for short circuit to ground. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM).
	Step11	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step12	Inspection procedure Replace component “G2 (Alternator)”. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step13	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit).
	Step14	Inspection completed

520707-3: Component 'Control valve 'Oil cooler'' is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • "Fault status: The component 'Control valve Oil cooler (MCV)' remains in the state 'ON'" detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit). • "Fault status: The component 'Control valve Oil cooler (MCV)' remains in the state 'ON'" not detected.
Control effected by electronic control unit		• None
Possible causes		• Harness between DUONIC electronic control unit and oil cooler flow control solenoid valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y26 (Oil cooler flow control solenoid valve). Make a visual check on each connector. Measure the resistance between Y26 (Oil cooler flow control solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y26 (Oil cooler flow control solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y26 (Oil cooler flow control solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/21 and Y26.X5.12/3 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520707-4: Component 'Control valve 'Oil cooler'' is switched off permanently.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • "Fault status: The component 'Control valve Oil cooler (MCV)' remains in the state 'OFF'" detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit). • "Fault status: The component 'Control valve Oil cooler (MCV)' remains in the state 'OFF'" not detected.
Control effected by electronic control unit		• Both clutches are kept disengaged. • Gear shift kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Main control section retains the safe mode. (Engine control is terminated.)
Possible causes		• Harness between DUONIC electronic control unit and oil cooler flow control magnetic valve open or shorted to ground • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y26 (Oil cooler flow control solenoid valve). Make a visual check on each connector. Measure the resistance between Y26 (Oil cooler flow control solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y26 (Oil cooler flow control solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y26 (Oil cooler flow control solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/21 and Y26.X5.12/3 for short circuit to ground. Check electrical line between pins A28.X1.81/21 and Y26.X5.12/3 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520708-7: Shifting the transmission to neutral is not possible.(MV1F, MV1R)

Generation condition		• Gear shift unit rail 1 neutral control for 10 seconds
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Control of relevant gear shift rail unit is terminated. • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Defective actuator harness • Defective actuator • Defective transmission • Defective DUONIC electronic control unit • Incorrect initialization
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520709-7: Shifting the transmission to neutral is not possible.(MV2F, MV2R)

Generation condition		• Gear shift unit rail 2 neutral control for 10 seconds
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Main control section retains the safe mode. (Engine control is terminated.)
Possible causes		• Defective actuator harness • Defective actuator • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520710-7: Shifting the transmission to neutral is not possible.(MV3F, MV3R)

Generation condition		• Gear shift unit rail 3 neutral control for 10 seconds
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Defective actuator harness • Defective actuator • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520714-3: Component 'Solenoid valve 'Gearshift'(MV2F)' is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • "Fault status: The component 'Solenoid valve Gearshift (MV2F)' remains in the state 'ON'" detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit). • "Fault status: The component 'Solenoid valve Gearshift (MV2F)' remains in the state 'ON'" not detected.
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between DUONIC electronic control unit and gear shift unit magnetic valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: GO to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/23 and Y22.6/2 for short circuit to positive. Is any abnormality recognized? No: GO to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit).
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit).

520714-4: Component 'Solenoid valve 'Gearshift'(MV2F)' is switched off permanently.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • "Fault status: The component 'Solenoid valve Gearshift (MV2F)' remains in the state 'OFF'" detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit). • "Fault status: The component 'Solenoid valve Gearshift (MV2F)' remains in the state 'OFF'" not detected.
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Main control section retains the safe mode. (Engine control is terminated.) [Upon vehicle stationary judgment] • Gear pre-select not permitted • Control of relevant gear shift rail unit is terminated. • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Signal harness between DUONIC electronic control unit and gear shift unit magnetic valve shorted or open • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/23 and Y22.6/2 for short circuit to ground. Check electrical line between pins A28.X1.81/23 and Y22.6/2 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

Inspection procedure	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520715-3: Component 'Solenoid valve 'Gearshift'(MV2R)' is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • "Fault status: The component 'Solenoid valve Gearshift (MV2R)' remains in the state 'ON'" detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit). • "Fault status: The component 'Solenoid valve Gearshift (MV2R)' remains in the state 'ON'" not detected.
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between DUONIC electronic control unit and gear shift unit magnetic valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/61 and Y22.6/5 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520715-4: Component 'Solenoid valve 'Gearshift'(MV2R)' is switched off permanently.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • "Fault status: The component 'Solenoid valve Gearshift (MV2R)' remains in the state 'OFF'" detected.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/22 and Y22.6/1 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520716-4: Component 'Solenoid valve 'Gearshift'(MV3F)' is switched off permanently.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • "Fault status: The component 'Solenoid valve Gearshift (MV3F)' remains in the state 'OFF'" detected.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between DUONIC electronic control unit and gear shift unit magnetic valve open or shorted • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/22 and Y22.6/1 for short circuit to ground. Check electrical line between pins A28.X1.81/22 and Y22.6/1 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520717-3: Component 'Solenoid valve 'Gearshift'(MV3R)' is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • "Fault status: The component 'Solenoid valve Gearshift (MV3R)' remains in the state 'ON'" detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit). • "Fault status: The component 'Solenoid valve Gearshift (MV3R)' remains in the state 'ON'" not detected.
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between DUONIC electronic control unit and gear shift unit magnetic valve shorted to battery • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X1.81/60 and Y22.6/4 for short circuit to positive. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520717-4: Component 'Solenoid valve 'Gearshift'(MV3R)' is switched off permanently.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • "Fault status: The component 'Solenoid valve Gearshift (MV3R)' remains in the state 'OFF'" detected.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged. • Control of relevant gear shift rail unit is terminated. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between DUONIC electronic control unit and gear shift unit magnetic valve open or shorted • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y22 (Gear shift unit magnet valve). Make a visual check on each connector. Measure the resistance between Y22 (Gear shift unit magnet valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y22 (Gear shift unit magnet valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y22 (Gear shift unit magnet valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/60 and Y22.6/4 for short circuit to ground. Check electrical line between pins A28.X1.81/60 and Y22.6/4 for open circuit. Check electrical line between pins Ground and Ground for open circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520718-3: Component 'Solenoid valve 'Clutch control (outer)'' is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • "Fault status: The component 'Solenoid valve Clutch control (outer)' remains in the state 'ON'" detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned to ON. • "Fault status: The component 'Solenoid valve Clutch control (outer)' remains in the state 'ON'" not detected.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between DUONIC electronic control unit and linear solenoid valve (for outer clutch drive) shorted to battery or shorted to ground • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y27 (Outer clutch control linear solenoid valve). Make a visual check on each connector. Measure the resistance between Y27 (Outer clutch control linear solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y27 (Outer clutch control linear solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step2 Yes: Go to step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y27 (Outer clutch control linear solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X1.81/5 and Y27.X5.12/1 for short circuit to ground. Is any abnormality recognized? No: Go to step4 Yes: Go to step5
	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520718-4: Component 'Solenoid valve 'Clutch control (outer)" is switched off permanently.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • "Fault status: The component 'Solenoid valve Clutch control (outer)' remains in the state 'OFF'" detected.
Recoverability		• System recovers if signal becomes normal after starter switch is turned to ON. • "Fault status: The component 'Solenoid valve Clutch control (outer)' remains in the state 'OFF'" not detected.
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged. • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-1 st/R-Lo
Possible causes		• Signal harness between DUONIC electronic control unit and linear solenoid valve (for outer clutch drive) open, shorted to battery, shorted to ground or shorted otherwise • Power harness between DUONIC electronic control unit and linear solenoid valve (for outer clutch drive) open • Defective actuator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Turn the starter switch in OFF. Remove the connector of Y27 (Outer clutch control linear solenoid valve). Make a visual check on each connector. Measure the resistance between Y27 (Outer clutch control linear solenoid valve) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between Y27 (Outer clutch control linear solenoid valve) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step2 Yes: Go to step3
	Step2	Inspection procedure Turn the starter switch in OFF. Replace component “Y27 (Outer clutch control linear solenoid valve)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step3	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check harness between A28 (DUONIC Control unit) and Y27 (Outer clutch control linear solenoid valve) for short-circuit to another line. Check electrical line between pins A28.X1.81/5 and Y27.X5.12/1 for short circuit to positive. Check electrical line between pins A28.X1.81/5 and Y27.X5.12/1 for open circuit. Check electrical line between pins A28.X1.81/2 and Y27.X5.12/5 for open circuit. Is any abnormality recognized? No: Go to step4 Yes: Go to step5

Inspection procedure	Step4	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520719-2: Incorrect gear ratio in gear 1st

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of solenoid valve (relief) shorted to battery • Inner clutch current reading 1.15 A or above • Continuation for 10 seconds in 1st gear of difference of ± 200 rpm or more between engine speed and 1st gear input (inner clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit • Defective vehicle speed sensor • Slipping inner clutches
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520720-2: Incorrect gear ratio in gear 2nd

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of solenoid valve (relief) shorted to battery • Outer clutch current reading 1.15 A or above • Continuation for 10 seconds in 2nd gear of difference of ± 200 rpm or more between engine speed and 2nd gear input (outer clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-1st/R-Lo
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit • Defective vehicle speed sensor • Slipping outer clutches
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520721-2: Incorrect gear ratio in gear 3rd

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of solenoid valve (relief) shorted to battery • Inner clutch current reading 1.15 A or above • Continuation for 10 seconds in 3rd gear of difference of ± 200 rpm or more between engine speed and 3rd gear input (inner clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit • Defective vehicle speed sensor • Slipping inner clutches
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520722-2: Incorrect gear ratio in gear 4th

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of solenoid valve (relief) shorted to battery • Outer clutch current reading 1.15 A or above • Continuation for 10 seconds in 4th gear of difference of ± 200 rpm or more between engine speed and 4th gear input (outer clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-1st/R-Lo
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit • Defective vehicle speed sensor • Slipping outer clutches
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520723-2: Incorrect gear ratio in gear 5th

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of solenoid valve (relief) shorted to battery • Inner clutch current reading 1.15 A or above • Continuation for 10 seconds in 5th gear of difference of ± 200 rpm or more between engine speed and 5th gear input (inner clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit • Defective vehicle speed sensor • Slipping inner clutches
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520724-2: Incorrect gear ratio in gear 6th

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of solenoid valve (relief) shorted to battery • Outer clutch current reading 1.15 A or above • Continuation for 10 seconds in 6th gear of difference of ± 200 rpm or more between engine speed and 6th gear input (outer clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-1st/R-Lo
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit • Defective vehicle speed sensor • Slipping outer clutches
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520725-2: Incorrect gear ratio in gear RevLo

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of solenoid valve (relief) shorted to battery • Inner clutch current reading 1.15 A or above • Continuation for 10 seconds in RevLo gear of difference of ± 200 rpm or more between engine speed and RevLo gear input (inner clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit • Defective vehicle speed sensor • Slipping inner clutches
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520726-2: Incorrect gear ratio in gear RevHi

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Battery voltage 8 to 16 V • No generation of solenoid valve (relief) shorted to battery • Outer clutch current reading 1.15 A or above • Continuation for 10 seconds in RevHi gear of difference of ± 200 rpm or more between engine speed and RevHi gear input (outer clutch) speed and difference of less than ± 200 rpm between engine speed and input speed from other gears calculated by electronic control unit (where gear input speed = gear ratio x vehicle speed sensor input)
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-1st/R-Lo
Possible causes		• Incorrect gear ratio setting due to incorrect transmission assembly • Defective DUONIC electronic control unit • Defective vehicle speed sensor • Slipping outer clutches
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520727-2: No CAN message received from component 'Signal & ActuatorModule'.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • ETC2_SSAM_CAN Reception quality: NO RECEPTION
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective resistor in DUONIC electronic control unit • Defective signal detect and actuation modules • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6

Inspection procedure	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520728-2: No CAN message received from component 'Signal & ActuatorModule'.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • CCVS_SSAM_CAN Reception quality: NO RECEPTION
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective resistor in DUONIC electronic control unit • Defective signal detect and actuation modules • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all Ictus connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6

Inspection procedure	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520729-2: No CAN message received from component 'Signal & ActuatorModule'.

Generation condition		• Starter switch ON • PTO_SSAM_CAN Reception quality: NO RECEPTION
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• None
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective resistor in DUONIC electronic control unit • Defective signal detect and actuation modules • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520730-2: No CAN message received from component 'Signal & ActuatorModule'.

Generation condition		• Starter switch ON • SSAM_A01_CAN Reception quality: NO RECEPTION
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• None
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective resistor in DUONIC electronic control unit • Defective signal detect and actuation modules • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6

Inspection procedure	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU.
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520731-19: The CAN message from component 'Energy save mode Switches' is faulty.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • SSAM_A01_CAN Reception quality: RECEIVED & Energy save mode Switches (CAN) data out of range (Error, SNA)
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Upon receiving out-of-range signal] • Normal data last received are retained.
Possible causes		• Defective signal detect and actuation modules
Inspection procedure	Step1	Inspection procedure Perform a diagnosis on the A20 (SAM) side system.

520732-2: No CAN message received from component 'Combustion engine Control unit'.

Generation condition		• Starter switch ON • EEC1_EEC_CAN Reception quality: NO RECEPTION
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective resistor in DUONIC electronic control unit • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7

Inspection procedure	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520733-2: No CAN message received from component 'Combustion engine Control unit'.

Generation condition		• Starter switch ON • EEC2_EEC_CAN Reception quality: NO RECEPTION
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		[Diagnosis Codes 520732-2 and 512-19 not generated (Warning indication: Amber)] • Service data name: See Requested engine torque (CAN) as accelerator position. [Diagnosis Code 520732-2 or 512-19 generated (Warning indication: Red)] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective resistor in DUONIC electronic control unit • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7

Inspection procedure	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520734-2: The CAN message from component 'Combustion engine Control unit' is faulty.

Generation condition		• Starter switch ON • EEC3_EEC_CAN Reception quality: NO RECEPTION
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective resistor in DUONIC electronic control unit • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6

Inspection procedure	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. 520740-3: Component 'Park position Switches' is constantly on.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Change lever out of P • Parking gear switch ON
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or parking gear switch OFF while starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Wire between shift change lever and control lever out of adjustment • Signal harness between parking gear switch and DUONIC electronic control unit shorted to ground, shorted to battery, or shorted otherwise • Defective parking gear switch • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Wire between A26 (Selector lever) and Control lever For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of S20 (Parking gear switch). Make a visual check on each connector. Measure the resistance between S20 (Parking gear switch) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “S20 (Parking gear switch)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Check electrical line between pins A28.X2.40/108 and S20.2/1 for open circuit. Check electrical line between pins S20.2/2 and Ground for open circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step7
	Step5	Inspect or verify the following items. Repair or replace faulty items as necessary. Transmission For procedures, refer to the Shop Manual Go to Step6
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

Inspection procedure	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520740-4: Component 'Park position Switches' is switched off permanently.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • ETC2_SSAM_CAN Reception quality: RECEIVED • Shift lever unit in P position received • Parking gear switch OFF
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or parking gear switch ON while starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Wire between shift change lever and control lever out of adjustment • Signal harness between parking gear switch and DUONIC electronic control unit shorted to ground • Defective parking gear switch • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Wire between A26 (Selector lever) and Control lever For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of S20 (Parking gear switch). Make a visual check on each connector. Measure the resistance between S20 (Parking gear switch) and ground or each terminal to check for short-circuit and electrical leakage. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “S20 (Parking gear switch)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A1 ECU. Test electrical line between pins A28.X2.40/108 and S20.2/1 for short circuit to ground. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step7
	Step5	Inspect or verify the following items. Repair or replace faulty items as necessary. Transmission For procedures, refer to the Shop Manual Go to Step6

Inspection procedure	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step7	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520741-2: No CAN message received from component 'Antilock brake system Control unit'.

Generation condition		• Anti-lock brake system-equipped vehicle (Support for ABS control: INSTALLED) • Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • EBC2_BS_CAN Reception quality: NO RECEPTION
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• None
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective resistor in DUONIC electronic control unit • Defective hydraulic unit (electronic control unit) • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to Step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to Step7

Inspection procedure	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to Step6
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520742-2: No CAN message received from component 'Combustion engine Control unit'.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • CCVS_MCM_CAN Reception quality: NO RECEPTION
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• Cruise speed change mode is exited. • Cruise termination request is continuously issued.
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective resistor in DUONIC electronic control unit • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6

	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520743-2: No CAN message received from component 'Combustion engine Control unit'.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON. • ET1_MCM_CAN Reception quality: NO RECEPTION continues for 10 seconds.
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• None
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground, or shorted otherwise • Defective resistor in DUONIC electronic control unit • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6

Inspection procedure	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520744-31: The default settings have not yet been applied.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • 5 seconds have elapsed since starter switch was turned ON. • Initialization not completed yet.
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• None
Possible causes		• Initialization not completed yet • Incorrect initialization (Initialization not completed correctly.)
Inspection procedure	Step1	Inspection procedure Perform the appropriate settings. Set items Default settings of the DUONIC® system. For procedures, refer to the Shop Manual. Inspection completed

520745-3: The signal voltage of component 'Acceleration sensor2' is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Signal voltage of G-sensor (sub) has been higher than 4.55 V.
Recoverability		• Signal voltage GRVT2 is 4.50 V or lower when starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Signal harness between G-sensor (sub) and DUONIC electronic control unit shorted to battery • Ground harness between G-sensor (sub) and DUONIC electronic control unit open • Defective G-sensor (sub) • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to step2
	Srep2	Srep2 Inspection procedure Turn the starter switch in OFF. Remove the connector of B49 (Acceleration sensor2). Make a visual check on each connector. Measure the resistance between B49 (Acceleration sensor2) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B49 (Acceleration sensor2) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B49 (Acceleration sensor2)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B49 (Acceleration sensor2) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520745-4: The signal voltage of component 'Acceleration sensor2' is too low.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Signal voltage of G-sensor (sub) has been lower than 0.45 V.
Recoverability		• Signal voltage GRVT2 is 0.50 V or higher when starter switch is in ON position.
Control effected by electronic control unit		• None
Possible causes		• Signal harness between G-sensor (sub) and DUONIC electronic control unit open or shorted to ground • Power harness between G-sensor (sub) and DUONIC electronic control unit open • Defective G-sensor (sub) • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B49 (Acceleration sensor2). Make a visual check on each connector. Measure the resistance between B49 (Acceleration sensor2) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B49 (Acceleration sensor2) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to step3 Yes: Go to step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component “B49 (Acceleration sensor2)”. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B49 (Acceleration sensor2) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520746-3: The signal voltage of component 'Gear recognition sensor1' is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Position of component 'Gear recognition sensor 1': 96% or above
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or Position of component 'Gear recognition sensor 1' 92% or below.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between shift stroke sensor 1 (gear shift unit) and DUONIC electronic control unit shorted to battery or open • Ground harness between shift stroke sensor 1 (gear shift unit) and DUONIC electronic control unit open • Defective shift stroke sensor 1 (gear shift unit) • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B45 (Gear shift unit shift stroke sensor1). Make a visual check on each connector. Measure the resistance between B45 (Gear shift unit shift stroke sensor1) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B45 (Gear shift unit shift stroke sensor1) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B45 (Gear shift unit shift stroke sensor1)". Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B45 (Gear shift unit shift stroke sensor1) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520746-4: The signal voltage of component 'Gear recognition sensor1' is too low.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Position of component 'Gear recognition sensor1': 4% or below
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or Position of component 'Gear recognition sensor 1' 8% or above for 3 seconds.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between shift stroke sensor 1 (gear shift unit) and DUONIC electronic control unit open or shorted to ground • Power harness between shift stroke sensor 1 (gear shift unit) and DUONIC electronic control unit open • Defective shift stroke sensor 1 (gear shift unit) • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B45 (Gear shift unit shift stroke sensor1). Make a visual check on each connector. Measure the resistance between B45 (Gear shift unit shift stroke sensor1) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B45 (Gear shift unit shift stroke sensor1) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B45 (Gear shift unit shift stroke sensor1)". Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B45 (Gear shift unit shift stroke sensor1) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520747-3: The signal voltage of component 'Gear recognition sensor2' is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Position of component 'Gear recognition sensor2': 96% or above
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or Position of component 'Gear recognition sensor 2' 92% or below.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between shift stroke sensor 2 (gear shift unit) and DUONIC electronic control unit shorted to battery • Ground harness between shift stroke sensor 2 (gear shift unit) and DUONIC electronic control unit open • Defective shift stroke sensor 2 (gear shift unit) • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B46 (Gear shift unit shift stroke sensor2). Make a visual check on each connector. Measure the resistance between B46 (Gear shift unit shift stroke sensor2) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B46 (Gear shift unit shift stroke sensor2) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B46 (Gear shift unit shift stroke sensor2)". Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B46 (Gear shift unit shift stroke sensor2) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520747-4: The signal voltage of component 'Gear recognition sensor2' is too low.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Position of component 'Gear recognition sensor2': 4% or below
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or Position of component 'Gear recognition sensor 2' 8% or above for 3 seconds.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• Signal harness between shift stroke sensor 2 (gear shift unit) and DUONIC electronic control unit open or shorted to ground • Power harness between shift stroke sensor 2 (gear shift unit) and DUONIC electronic control unit open • Defective shift stroke sensor 2 (gear shift unit) • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B46 (Gear shift unit shift stroke sensor2). Make a visual check on each connector. Measure the resistance between B46 (Gear shift unit shift stroke sensor2) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B46 (Gear shift unit shift stroke sensor2) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B46 (Gear shift unit shift stroke sensor2)". Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B46 (Gear shift unit shift stroke sensor2) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520748-3: The signal voltage of component 'Gear recognition sensor3' is too high.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Position of component 'Gear recognition sensor3': 96% or above
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or Position of component 'Gear recognition sensor 3' 92% or below.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Main control section retains the safe mode. (Engine control is terminated.)
Possible causes		• Signal harness between shift stroke sensor 3 (gear shift unit) and DUONIC electronic control unit shorted to battery • Ground harness between shift stroke sensor 3 (gear shift unit) and DUONIC electronic control unit open • Defective shift stroke sensor 3 (gear shift unit) • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point " for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B47 (Gear shift unit shift stroke sensor3). Make a visual check on each connector. Measure the resistance between B47 (Gear shift unit shift stroke sensor3) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B47 (Gear shift unit shift stroke sensor3) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B47 (Gear shift unit shift stroke sensor3)". Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B47 (Gear shift unit shift stroke sensor3) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520748-4: The signal voltage of component 'Gear recognition sensor3' is too low.

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • Position of component 'Gear recognition sensor3': 4% or below
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit) or Position of component 'Gear recognition sensor 3' 8% or above for 3 seconds.
Control effected by electronic control unit		• Both clutches are kept disengaged. • All gear shift rails but relevant gear shift rail are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Main control section retains the safe mode. (Engine control is terminated.)
Possible causes		• Signal harness between shift stroke sensor 3 (gear shift unit) and DUONIC electronic control unit shorted to ground • Power harness between shift stroke sensor 3 (gear shift unit) and DUONIC electronic control unit open • Defective shift stroke sensor 3 (gear shift unit) • Defective DUONIC electronic control unit
Inspection procedure	Step1	If corresponding fault codes are also present on other components, check the common power supply and common ground point '' for open circuit and short circuit. Go to Step2
	Step2	Inspection procedure Turn the starter switch in OFF. Remove the connector of B47 (Gear shift unit shift stroke sensor3). Make a visual check on each connector. Measure the resistance between B47 (Gear shift unit shift stroke sensor3) and ground or each terminal to check for short-circuit and electrical leakage. Measure the resistance between B47 (Gear shift unit shift stroke sensor3) terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step3 Yes: Go to Step4
	Step3	Inspection procedure Turn the starter switch in OFF. Replace component "B47 (Gear shift unit shift stroke sensor3)". Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Check the circuit across B47 (Gear shift unit shift stroke sensor3) and A28 (DUONIC Control unit) for open or short circuit. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed
	Step6	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Inspection completed

520749-2: No CAN message received from component 'Combustion engine Control unit'.

Generation condition		• Starter switch ON • TC1_MCM_CAN Reception quality: NO RECEPTION
Recoverability		• System recovers if signal becomes normal with starter switch in ON position.
Control effected by electronic control unit		• None
Possible causes		• Controller area network communication line open, shorted to battery, shorted to ground or shorted otherwise • Defective engine electronic control unit • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If all ECUs connected to the common CAN communication line are unable to communicate, check the common CAN communication line for shorting. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Turn the starter switch in OFF. Remove the ECU connector attached to CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Inspection procedure Insert the multimeter probe in the A20 (SAM) connector and measure resistance across A20.X7.18/1 and A20.X7.18/11. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Inspection procedure Insert the multimeter probe in the A4 (Combustion engine Control unit) connector and measure resistance across A4.X2.94/62 and A4.X2.94/61. Special features Be sure to check the ECU with its connection removed from the connector. Is any abnormality recognized? No: Go to step5 Yes: Go to step6

Inspection procedure	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure The harness from the ECU to CAN communication line is probably faulty or the ECU may have an internal fault. Identify the faulty spot by using the following procedure and repair or replace the faulty part. Use the short test to check for a fault code of the CAN communication failure of the entire vehicle. Remove all related ECUs one at a time and use the short test to check for a fault code of the CAN communication failure. With all related ECUs removed, mount one ECU at a time and check for a defective harness within the ECU. Inspection completed
	Step6	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A4 (Combustion engine Control unit). Inspection completed
	Step7	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A20 (SAM). Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to step9
	Step9	Inspection procedure Is this diagnosis code still active? No: Go to step10 Yes: Go to step2
	Step10	Inspection completed

520750-2: Faulty component DUONIC Control unit

Generation condition		• Supply voltage 8 to 16 V with starter switch ON • EEPROM error: RECOGNIZED
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• EEPROM failure (checksum error) data are replaced with normal data. • Initialization if both main and sub memory regions are abnormal.
Possible causes		• Harness between DUONIC electronic control unit and battery open or shorted to ground • Malfunction of battery • Defective alternator • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Check that the fuse F36 is not blown out. If any visible damage is found, repair or replace the affected part and interrupt the inspection process. Go to Step2
	Step2	Inspection procedure Is this diagnosis code still active? No: Go to Step12 Yes: Go to Step3
	Step3	Inspection procedure Check if any of other ECUs has stored the diagnosis code representing abnormal power supply (power supply without passing through SAM). Are current fault codes present? No: Go to Step4 Yes: Go to Step6
	Step4	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of G1 (Battery). Check electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for open circuit. Test electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for short circuit to ground. Is any abnormality recognized No: Go to Step9 Yes: Go to Step5
	Step5	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step6	Inspection procedure Turn the starter switch in OFF. Remove the connector of A28 (DUONIC Control unit). Remove the connector of G1 (Battery). Check electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for open circuit. Test electrical line between pins A28.X2.40/117 and A28.X2.40/118 and Battery terminal + pole for short circuit to ground. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step13
	Step7	Inspection procedure Measure the battery voltage. Specified value: 12V Is any abnormality recognized? No: Go to Step8 Yes: Go to Step11

Inspection procedure	Step8	Inspection procedure Check the function of G2 (Alternator). Is any abnormality recognized? For procedures, refer to the Shop Manual No: Go to Step9 Yes: Go to Step10
	Step9	Inspection procedure Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a test drive. If the diagnosis code has occurred even during the test drive, start the operation and then replace the A28 (DUONIC Control unit). Go to Step12
	Step10	Inspection procedure Replace component “G2 (Alternator)”. Reinstall all the removed connectors. Turn the starter switch in ON.
	Step11	Inspection procedure Replace component “G1 (Battery)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step9
	Step12	Inspection completed
	Step13	Inspection procedure Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON.

520751-7: Shifting to gear range '5th,6th' is not possible.

Generation condition		• Diagnosis Code 785-3 not generated • 3 attempts to engage 5^{th}/6^{th} gear on cylinder 1 failed.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2^{nd}/R-Hi
Possible causes		• DUONIC electronic control unit initialization not completed yet • Defective gear shift unit magnetic valve • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520752-7: Shifting to gear range '3rd' is not possible.

Generation condition		• Diagnosis Code 785-3 not generated • 3 attempts to engage 3rd gear on cylinder 1 failed.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• DUONIC electronic control unit initialization not completed yet • Defective gear shift unit magnetic valve • Defective transmission • Defective DUONIC electronic control unit • Automatic transmission fluid quantity is too much or too short.
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520753-7: Shifting to gear range '1st,6th,RevLo' is not possible.

Generation condition		• Diagnosis Code 785-3 not generated • 3 attempts to engage 1st/6th RevLo gear on cylinder 2 failed.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• DUONIC electronic control unit initialization not completed yet • Defective gear shift unit magnetic valve • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520754-7: Shifting to gear range '4th' is not possible.

Generation condition		• Diagnosis Code 785-3 not generated • 3 attempts to engage 4th gear on cylinder 2 failed.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		[Prior to vehicle stationary judgment] • Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated. [Upon vehicle stationary judgment] • Gear pre-select not permitted • Vehicle continuously driven in F-2nd/R-Hi
Possible causes		• DUONIC electronic control unit initialization not completed yet • Defective gear shift unit magnetic valve • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520755-7: Shifting to gear range 'Rev' is not possible.

Generation condition		• Diagnosis Code 785-3 not generated • 3 attempts to engage Rev gear on cylinder 3 failed.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• DUONIC electronic control unit initialization not completed yet • Defective gear shift unit magnetic valve • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520756-7: Shifting to gear range '1st,2nd' is not possible.

Generation condition		• Diagnosis Code 785-3 not generated • 3 attempts to engage 1st/2nd gear on cylinder 3 failed.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• Both clutches are kept disengaged • All gear shift rails are kept in N. (Target gear locked in N.) • N flashes in meter cluster gear display. (P has priority display.) • Engine control is terminated.
Possible causes		• DUONIC electronic control unit initialization not completed yet • Defective gear shift unit magnetic valve • Defective transmission • Defective DUONIC electronic control unit
Inspection procedure	Step1	Inspection procedure Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520757-0: High temperature of inner clutch is recorded.

Generation condition		• The inner clutch temperature presumed by the calculation of DUONIC electronic control unit exceeds the predetermined temperature.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• None
Possible causes		• Overloaded operation was continued under the clutch high temperature warning.
Inspection procedure	Step1	None

520758-0: High temperature of outer clutch is recorded.

Generation condition		• The outer clutch temperature presumed by the calculation of DUONIC electronic control unit exceeds the predetermined temperature.
Recoverability		• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit		• None
Possible causes		• Overloaded operation was continued under the clutch high temperature warning.
Inspection procedure	Step1	None

520759-19: The CAN message from component 'Hill Start Assist Control unit' is faulty.

Generation condition	• Supply voltage 8 to 16 V with starter switch ON • 3 seconds or more have elapsed since starter switch was turned ON • EGZO_A01_CAN: received and Status of function 'Lock Brake' (CAN): data out of range.
Recoverability	• System has recovered if signal becomes normal after starter switch is turned OFF and then ON (thus reenergizing electronic control unit).
Control effected by electronic control unit	• None
Possible causes	• Defective hydraulic unit (electronic control unit)

2. FUSO Diagnostics Service Data (Actual values)

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.

[Current value group: Voltages]

No.	Description	Value	Comment
000	Battery voltage (Ignition lock ON Voltages) (V1)	■■■■ V	M terminal power voltage (starter switch ON power) (V1) is indicated. • Standard value: 8 to 16 V [Related parts] • Starter switch • Fuse box • Battery
001	Battery voltage (Ignition lock ON Voltages) (V2)	■■■■ V	M terminal power voltage (starter switch ON power) (V2) is indicated. • Standard value: 8 to 16 V [Related parts] • Starter switch • Fuse box • Battery
002	Battery voltage (V01)	■■■■ V	Voltage of power supplied directly from battery (V01) is indicated. • Standard value: 8 to 16 V [Related parts] • Battery • Fuse box
003	Battery voltage (V02)	■■■■ V	Voltage of power supplied directly from battery (V02) is indicated. • Standard value: 8 to 16 V [Related parts] • Battery • Fuse box
004	Battery voltage (ACC Voltages)	■■■■ V	Power supply voltage across ACC contact is indicated. • Standard value: 8 to 16 V [Related parts] • Battery • Fuse box
005	Control unit Activation of HOLD function	IS ACTUATED/ NOT ACTIVATED	Control status of electronic control unit by direct battery power (control status of electronic control unit after starter switch OFF) is indicated. • Activated: Electronic control unit is controlled after starter switch OFF • Not activated: Electronic control unit is not controlled after starter switch OFF [Related parts] • DUONIC electronic control unit
006	Ignition lock status	ON/ OFF	Key ON recognition information is indicated by ON/OFF. • ON: Stater switch ON • OFF: Stater switch OFF
007	Signal voltage of component ‘Oil temperature sensor’	■■■■ V	Transmission oil temperature (calculated from signal voltage) is indicated. • Range: 0.16 to 4.93 V [Related parts] • Oil temperature sensor (valve body)
008	Signal voltage of component ‘Acceleration sensor’	■■■■ V	G acting on vehicle in longitudinal direction (calculated from G-sensor 1 signal voltage) is indicated. • Range: 0.45 to 4.55 V [Related parts] • G sensor
009	Signal voltage of component ‘Acceleration sensor 2’	■■■■ V	Unused

[Current value group: Engine speeds]

No.	Description	Value	Comment
010	Transmission output speed (Rpm sensor Transmission)	■■■■ 1/min	Transmission output shaft speed (measurements by vehicle speed sensor 1) is indicated. • Range: 0 to 8032 1/min [Related parts] • Vehicle speed sensor <DUONIC®>
011	Transmission output speed (Vehicle speed Sensors)	■■■■ 1/min	Transmission output shaft speed (measurements by vehicle speed sensor 2) is indicated. • Range: 0 to 8032 1/min [Related parts] • Vehicle speed sensor • Meter cluster
012	Transmission output speed (Wheel rotation direction)	■■■■ 1/min	Transmission output shaft speed (With forward/backward judgment) is indicated. • Range: -8032 to 8032 1/min [Related parts] • Vehicle speed sensor <DUONIC®> • Vehicle speed sensor • Meter cluster
013	Transmission output speed (CAN)	■■■■ 1/min	Transmission output shaft speed (measurements by vehicle speed sensor 2) is indicated. • Range: 0 to 8032 1/min [Related parts] • Vehicle speed sensor <DUONIC®> • Vehicle speed sensor • Meter cluster
014	Rpm of component Internal clutch plate	■■■■ 1/min	Inner clutch speed is indicated. • Range: 0 to 8192 1/min [Related parts] • DUONIC electronic control unit • Vehicle speed sensor <DUONIC®> • Vehicle speed sensor • Meter cluster
015	Rpm of component External clutch plate	■■■■ 1/min	Outer clutch speed is indicated. • Range: 0 to 8192 1/min [Related parts] • DUONIC electronic control unit • Vehicle speed sensor <DUONIC®> • Vehicle speed sensor • Meter cluster
016	Engine speed (CAN)	■■■■ 1/min	Engine speed received from engine electronic control unit via CAN is indicated. [Related parts] • Engine electronic control unit
017	Idle speed (CAN)	■■■■ 1/min	Engine idle speed received from engine electronic control unit via CAN is indicated. [Related parts] • Engine electronic control unit

[Current value group: Vehicle speeds]

No.	Description	Value	Comment
018	Speed at front axle (CAN)	■■■■ mph	Front axle speed from the hydraulic unit (ECU) is indicated. • Range: 0 to 250.996 km/h {0 to 156.0 mph} [Related parts] • Hydraulic unit (electronic control unit)
019	Relative speed of component Wheel speeds (Left) (CAN)	■■■■ mph	Relative speed of left drive wheel as compared to the vehicle speed sent from the hydraulic unit (ECU) is indicated. • Range: -7.8125 to 7.8125 km/h {-4.9 to 4.85 mph} [Related parts] • Hydraulic unit (electronic control unit)
020	Relative speed of component Wheel speeds (Right) (CAN)	■■■■ mph	Relative speed of right drive wheel as compared to the vehicle speed sent from the hydraulic unit (ECU) is indicated. • Range: -7.8125 to 7.8125 km/h {-4.9 to 4.85 mph} [Related parts] • Hydraulic unit (electronic control unit)

[Current value group: Positions of switches]

No.	Description	Value	Comment
021	Selector lever (CAN)	9/ 10/ 17/ 18/ 19/ 20/ 22/ 25/ 26/ 33/ 34/ 35/ 49/ 50	Selected shift lever position is indicated. 9: P Position 10: + Position 17: N Position 18: D Position 19: N to D Position 20: A/M Position 22: D-A/M Position 25: P to R Position 26: + to D Position 33 or 35: R Position 34: - Position 49: N to R Position 50: D to - Position [Related parts] • Shift lever unit • Signal detect and actuation modules
022	Parking brake Switches (CAN)	IS ACTUATED/ NOT ACTIVATED	Parking brake operation status is indicated. • Parking Brake Not Set: Parking brake lever released • Parking Brake Set: Parking brake lever pulled [Related parts] • Parking brake switch
023	Brake light Switches	Do not operate brake pedal./The brake pedal is operated	Foot brake switch status (ON/OFF) is indicated. [Related parts] • Stop lamp switch
024	Driver door Switches (CAN)	CLOSED/OPEN	Driver door status (open/closed) is indicated. • CLOSED: Driver's door closed • OPEN: Driver's door opened [Related parts] • Door switch (driver's) • Signal detect and actuation modules
025	Passenger door Switches (CAN)	CLOSED/OPEN	Passenger door status (open/closed) is indicated. • CLOSED: Passenger's door closed • OPEN: Passenger's door opened [Related parts] • Door switch (passenger's) • Signal detect and actuation modules
026	Power take-off Switches	ON/OFF	PTO control switch information is indicated. • OFF: PTO control switch is OFF. • ON: PTO control switch is ON. [Related parts] • PTO control switch • Signal detect and actuation modules

No.	Description	Value	Comment
027	Actuation of power take-off Switches (CAN)	Connection NOT ESTABLISHED/ Connection	T/M PTO switch information (for truck) is indicated. • Connection NOT ESTABLISHED: T/M PTO switch is OFF. • Connection: T/M PTO switch is ON. [Related parts] • T/M PTO SW
028	Power take-off Operating lever (Dumper vehicle) (CAN)	Connection NOT ESTABLISHED/ Connection	Unused
029	Energy save mode Switches (CAN)	ON/OFF	Operation information of ECO mode switch is indicated. • OFF: ECO mode switch is OFF. • ON: ECO mode switch is ON. [Related parts] • ECO mode switch • Shift lever unit • Signal detect and actuation modules
030	3/2-way valve Power take-off	IS ACTUATED/ NOT ACTIVATED	Operation output of the transmission power take-off 3-Way magnetic valve is indicated. *Only for vacuum type NOT ACTIVATED: No PTO operation output IS ACTUATED: PTO operation output exists. [Related parts] • Transmission power take-off 3-Way magnetic valve
031	Passenger door (Bus)	CLOSED/OPEN	Unused

[Current value group: Brake]

No.	Description	Value	Comment
032	Brake pressure (Brake pressure sensor)	■■■■ Mpa	Braking force (hydraulic pressure) from brake hydraulic pressure sensor is indicated. • Range: 0 to 17.425 Mpa [Related parts] • Brake fluid pressure sensor
033	Signal voltage of component ‘Brake pressure sensor’	■■■■ V	Braking force (measured signal voltage) from brake hydraulic pressure sensor is indicated. • Range: 0.5 to 4.6 V [Related parts] • Brake fluid pressure sensor

[Current value group: Operation statuses]

No.	Description	Value	Comment
034	D Indicator lamp	ON/OFF	Output to display D lamp on meter cluster is indicated. • ON: D indicator lamp illuminates. • OFF: D indicator lamp goes out. [Related parts] • Meter cluster
035	Display of symbol 'Warning Oil temperature'	ON/OFF	Output to display oil temperature warning is indicated by ON/OFF. • ON: Oil temperature warning illuminates. • OFF: Oil temperature warning goes out. [Related parts] • Meter cluster
036	Display of symbol 'PTO'	View NOT PRESENT/Power take-off DEACTIVATED/Power take-off/Power take-off DISABLED	Output for "PTO" display on the meter cluster [Related parts] • DUONIC electronic control unit • Meter cluster
037	Display of symbol 'PTO ready'	ON/OFF	Output for display of "PTO ready" on the meter cluster is indicated by ON/OFF. • ON: PTO READY illuminates. • OFF: PTO READY does not illuminate. [Related parts] • Meter cluster
038	Warning buzzer	OFF/ON/ NOT ACTIVATED	Warning buzzer output is indicated. • Not activated: Warning buzzer does not sound • Activated: Warning buzzer sounds [Related parts] • Meter cluster
039	Display of symbol 'Energy save mode'	ON/OFF	ECO mode display status is indicated. • ON: ECO mode indicator illuminates. • OFF: ECO mode indicator does not illuminate. [Related parts] • Meter cluster
040	Warning lamp (Red)	ON/OFF	Output to display warning lamp "red" is indicated by ON/OFF. • ON: DUONIC warning lamp "red" illuminates. • OFF: DUONIC warning lamp "red" goes out. [Related parts] • Meter cluster
041	Warning lamp (Orange)	ON/OFF	Output to display DUONIC warning lamp "orange" is indicated by ON/OFF. • ON: DUONIC warning lamp "orange" illuminates. • OFF: DUONIC warning lamp "orange" goes out. [Associated parts] • Meter cluster
042	HOLD function request to hold gear 1st, Rev. (CAN)	INVALID/VALID	Request to hold 1st or Rev. gear information • INVALID: Requested to hold 1st or Rev. gear • VALID: No request to hold 1st or Rev. gear [Related parts] • Engine electronic control unit
043	End request for signal Idle speed increase.	ON/OFF	Idle up cancel request output information is indicated by ON/OFF • ON: Idle-up cancel is requested. • OFF: No idle-up cancel request [Related parts] • DUONIC electronic control unit
044	Vehicle determination (Truck/Bus)	Truck/Bus	Identification of truck/bus registered in DUONIC electronic control unit is indicated. (Coding data) [Related parts] • DUONIC electronic control unit

No.	Description	Value	Comment
045	Power take-off	NOT INSTALLED/ INSTALLED	PTO installed/not installed information in DUONIC electronic control unit is displayed. (Coding data) [Related parts] • DUONIC electronic control unit
046	Support for ABS control	NOT INSTALLED/ INSTALLED	ABS coordination control installed/not installed information registered in DUONIC electronic control unit is displayed. (Coding data) [Related parts] • DUONIC electronic control unit
047	Vehicle determination (Truck/Bus) (HEX)	■■■■	Identification of truck/bus registered in DUONIC electronic control unit is indicated. (Hexadecimal coding data) [Related parts] • DUONIC electronic control unit
048	Power take-off (HEX)	■■■■	PTO installed/not installed information registered in DUONIC electronic control unit is displayed. (Hexadecimal coding data) [Related parts] • DUONIC electronic control unit
049	Support for ABS control (HEX)	■■■■	ABS coordination control installed/not installed information registered in DUONIC electronic control unit is displayed. (Hexadecimal coding data) [Related parts] • DUONIC electronic control unit
050	PWM signal of (MV1F) component ‘Solenoid valve ‘Gearshift”	■■■■ %	Duty output to drive shift cylinder 1 gearshift magnetic valve (MV1F) from DUONIC electronic control unit is indicated. Range: 0 to 100 % [Related parts] • DUONIC electronic control unit • Gear shift unit
051	PWM signal of (MV1R) component ‘Solenoid valve ‘Gearshift”	■■■■ %	Duty output to drive shift cylinder 1 gearshift magnetic valve (MV1R) from DUONIC electronic control unit is indicated. Range: 0 to 100 % [Related parts] • DUONIC electronic control unit • Gear shift unit
052	PWM signal of (MV2F) component ‘Solenoid valve ‘Gearshift”	■■■■ %	Duty output to drive shift cylinder 2 gearshift magnetic valve (MV2F) from DUONIC electronic control unit is indicated. Range: 0 to 100 % [Related parts] • DUONIC electronic control unit • Gear shift unit
053	PWM signal of (MV2R) component ‘Solenoid valve ‘Gearshift”	■■■■ %	Duty output to drive shift cylinder 2 gearshift magnetic valve (MV2R) from DUONIC electronic control unit is indicated. Range: 0 to 100 % [Related parts] • DUONIC electronic control unit • Gear shift unit
054	PWM signal of (MV3F) component ‘Solenoid valve ‘Gearshift”	■■■■ %	Duty output to drive shift cylinder 3 gearshift magnetic valve (MV3F) from DUONIC electronic control unit is indicated. Range: 0 to 100 % [Related parts] • DUONIC electronic control unit • Gear shift unit
055	PWM signal of (MV3R) component ‘Solenoid valve ‘Gearshift”	■■■■ %	Duty output to drive shift cylinder 3 gearshift magnetic valve (MV3R) from DUONIC electronic control unit is indicated. Range: 0 to 100 % [Related parts] • DUONIC electronic control unit • Gear shift unit

No.	Description	Value	Comment
056	Pulse width modulated signal Solenoid valve Gearshift' during the shift operation [shift_duty_16rl]	■■■■ %	PWM signal (drive duty output) of gearshift magnetic valve MV2R on gear IN registered in DUONIC electronic control unit is indicated. (Coding data) [Related parts] • DUONIC electronic control unit
057	Pulse width modulated signal Solenoid valve Gearshift' during the shift operation [shift_duty_4th]	■■■■ %	PWM signal (drive duty output) of gearshift magnetic valve MV2F on gear IN registered in DUONIC electronic control unit is indicated. (Coding data) [Related parts] • DUONIC electronic control unit
058	Pulse width modulated signal Solenoid valve Gearshift' during the shift operation [shift_duty_rev]	■■■■ %	PWM signal (drive duty output) of gearshift magnetic valve MV3R on gear IN registered in DUONIC electronic control unit is indicated. (Coding data) [Related parts] • DUONIC electronic control unit
059	Pulse width modulated signal Solenoid valve Gearshift' during the shift operation [shift_duty_12]	■■■■ %	PWM signal (drive duty output) of gearshift magnetic valve MV3F on gear IN registered in DUONIC electronic control unit is indicated. (Coding data) [Related parts] • DUONIC electronic control unit
060	Pulse width modulated signal Solenoid valve Gearshift' during the shift operation [shift_duty_56]	■■■■ %	PWM signal (drive duty output) of gearshift magnetic valve MV1F on gear IN registered in DUONIC electronic control unit is indicated. (Coding data) [Related parts] • DUONIC electronic control unit
061	Pulse width modulated signal Solenoid valve Gearshift' during the shift operation [shift_duty_3rd]	■■■■ %	PWM signal (drive duty output) of gearshift magnetic valve MV1R on gear IN registered in DUONIC electronic control unit is indicated. (Coding data) [Related parts] • DUONIC electronic control unit
062	Pulse width modulated signal Solenoid valve Gearshift' during the shift operation [shift_duty_16rl] (HEX)	■■■■	PWM signal (drive duty output) of gearshift magnetic valve MV2R on gear IN registered in DUONIC electronic control unit is indicated. (Hexadecimal coding data) [Related parts] • DUONIC electronic control unit
063	Pulse width modulated signal Solenoid valve Gearshift' during the shift operation [shift_duty_4th] (HEX)	■■■■	PWM signal (drive duty output) of gearshift magnetic valve MV2F on gear IN registered in DUONIC electronic control unit is indicated. (Hexadecimal coding data) [Related parts] • DUONIC electronic control unit
064	Pulse width modulated signal Solenoid valve Gearshift' during the shift operation [shift_duty_rev] (HEX)	■■■■	PWM signal (drive duty output) of gearshift magnetic valve MV3R on gear IN registered in DUONIC electronic control unit is indicated. (Hexadecimal coding data) [Related parts] • DUONIC electronic control unit
065	Pulse width modulated signal Solenoid valve Gearshift' during the shift operation [shift_duty_12] (HEX)	■■■■	PWM signal (drive duty output) of gearshift magnetic valve MV3F on gear IN registered in DUONIC electronic control unit is indicated. (Hexadecimal coding data) [Related parts] • DUONIC electronic control unit

No.	Description	Value	Comment
066	Pulse width modulated signal Solenoid valve Gearshift' during the shift operation [shift_duty_56] (HEX)	■■■■	PWM signal (drive duty output) of gearshift magnetic valve MV1F on gear IN registered in DUONIC electronic control unit is indicated. (Hexadecimal coding data) [Related parts] • DUONIC electronic control unit
067	Pulse width modulated signal Solenoid valve Gearshift' during the shift operation [shift_duty_3rd] (HEX)	■■■■	PWM signal (drive duty output) of gearshift magnetic valve MV1R on gear IN registered in DUONIC electronic control unit is indicated. (Hexadecimal coding data) [Related parts] • DUONIC electronic control unit

[Current value group: Status]

No.	Description	Value	Comment
068	ETC2_SSAM_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of ETC2_SSAM through CAN communication is indicated. (This information is sent from meter cluster.) [Related parts] • Signal detect and actuation modules
069	CCVS_SSAM_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of CCVS_SSAM through CAN communication is indicated. (This information is sent from meter cluster.) [Related parts] • Signal detect and actuation modules
070	EEC1_EEC_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of EEC1_EEC through CAN communication is indicated. [Related parts] • Engine electronic control unit
071	ET1_MCM_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of ET1_MCM through CAN communication is indicated. [Related parts] • Engine electronic control unit
072	EBC2_BS_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of EBC2_BS through CAN communication is indicated. [Related parts] • Hydraulic unit (electronic control unit)
073	DC2_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of DC2 through CAN communication is indicated. [Related parts] • Signal detect and actuation modules
074	PTO_SSAM_CAN Reception quality	RECEIVED/ NO RECEPTION	Reception condition of CAN communication PTO_SSAM is displayed. [Related parts] • Signal detect and actuation modules
075	SSAM_A01_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of SSAM_A01 through CAN communication is indicated. (This information is sent from meter cluster.) [Related parts] • Signal detect and actuation modules
076	EBC1_EEC_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of EBC1_EEC through CAN communication is indicated. [Related parts] • Engine electronic control unit
077	EC_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of EC through CAN communication is indicated. [Related parts] • Engine electronic control unit
078	EEC2_EEC_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of EEC2_EEC through CAN communication is indicated. [Related parts] • Engine electronic control unit
079	EEC3_EEC_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of EEC3_EEC through CAN communication is indicated. [Related parts] • Engine electronic control unit
080	EBC1_BS_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of EBC1_BS through CAN communication is indicated. [Related parts] • Hydraulic unit (electronic control unit)
081	TSC1_AREX_BS_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of TSC1_AREX_BS through CAN communication is indicated. [Related parts] • Hydraulic unit (electronic control unit)
082	ISS_A01_CAN Reception quality	RECEIVED/ NO RECEPTION	Unused

No.	Description	Value	Comment
083	CCVS_MCM_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of CCVS_MCM through CAN communication is indicated. [Related parts] • Engine electronic control unit
084	TC1_MCM_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of TC1_MCM through CAN communication is indicated. [Related parts] • Engine electronic control unit
085	Status of component Shift lock Solenoid (CAN)	IS ACTUATED/ NOT ACTIVATED	Shift lock released state information is indicated. • NOT ACTIVATED: Shift lock condition (shift lock magnetic valve not activated) • IS ACTUATE: Shift lock released condition (shift lock magnetic valve activated) [Related parts] • DUONIC electronic control unit
086	Shift lock Solenoid (Outputs)	IS ACTUATED/ NOT ACTIVATED	Shift lock release output is indicated. NOT ACTIVATED: Shift lock IS ACTUATED: Shift lock release [Related parts] • Signal detect and actuation modules • Shift lever unit
087	The gear change is in the state'.	IS ACTUATED/ NOT ACTIVATED	On gearshifting or not is indicated. NOT ACTIVATED: Not gearshifting IS ACTUATED: Gearshifting [Related parts] • DUONIC electronic control unit
088	POWER TRANSMISSION Status	Connection NOT ESTABLISHED/ Connection	Torque transferring or not is indicated. Connection NOT ESTABLISHED: No torque transfer Connection: Torque transferring [Related parts] • DUONIC electronic control unit
089	Park position Switches	ON/OFF	Parking gear selection information is indicated. ON: Gear in parking position OFF: Gear in other than parking position [Related parts] • Parking gear switch
090	Fault status: The component 'Solenoid valve Pressure regulator (MVR)' remains in the state 'OFF'.	RECOGNIZED/ NOT DETECTED	Magnetic valve (MVR) failure (stuck OFF) detection is indicated. [Related parts] • Valve body
091	Fault status: The component 'Solenoid valve Pressure regulator (MVR)' remains in the state 'ON'.	RECOGNIZED/ NOT DETECTED	Magnetic valve (MVR) failure (stuck ON) detection is indicated. [Related parts] • Valve body
092	Fault status: The component 'Control valve Oil cooler (MCV)' remains in the state 'OFF'.	RECOGNIZED/ NOT DETECTED	Magnetic valve (MVC) failure (stuck OFF) detection is indicated. [Related parts] • Valve body
093	Fault status: The component 'Control valve Oil cooler (MCV)' remains in the state 'ON'.	RECOGNIZED/ NOT DETECTED	Magnetic valve (MVC) failure (stuck ON) detection is indicated. [Related parts] • Valve body
094	Fault status: The component '3/2-way valve Power take-off (PTOCS)' remains in the state 'OFF'.	RECOGNIZED/ NOT DETECTED	Faulty PTO control switch (seized OFF) detection information is displayed. [Related parts] • Transmission power take-off 3-Way magnetic valve
095	Fault status: The component '3/2-way valve Power take-off (PTOCS)' remains in the state 'ON'.	RECOGNIZED/ NOT DETECTED	Faulty PTO control switch (seized ON) detection information is displayed. [Related parts] • Transmission power take-off 3-Way magnetic valve

No.	Description	Value	Comment
096	Fault status: The component 'Solenoid valve Gearshift (MV1F)' remains in the state 'OFF'.	RECOGNIZED/ NOT DETECTED	Gearshift magnetic valve (MV1F) failure (stuck OFF) detection is indicated. [Related parts] • Gear shift unit
097	Fault status: The component 'Solenoid valve Gearshift (MV1F)' remains in the state 'ON'.	RECOGNIZED/ NOT DETECTED	Gearshift magnetic valve (MV1F) failure (stuck ON) detection is indicated. [Related parts] • Gear shift unit
098	Fault status: The component 'Solenoid valve Gearshift (MV1R)' remains in the state 'OFF'.	RECOGNIZED/ NOT DETECTED	Gearshift magnetic valve (MV1R) failure (stuck OFF) detection is indicated. [Related parts] • Gear shift unit
099	Fault status: The component 'Solenoid valve Gearshift (MV1R)' remains in the state 'ON'.	RECOGNIZED/ NOT DETECTED	Gearshift magnetic valve (MV1R) failure (stuck ON) detection is indicated. [Related parts] • Gear shift unit
100	Fault status: The component 'Solenoid valve Gearshift (MV2F)' remains in the state 'OFF'.	RECOGNIZED/ NOT DETECTED	Gearshift magnetic valve (MV2F) failure (stuck OFF) detection is indicated. [Related parts] • Gear shift unit
101	Fault status: The component 'Solenoid valve Gearshift (MV2F)' remains in the state 'ON'.	RECOGNIZED/ NOT DETECTED	Gearshift magnetic valve (MV2F) failure (stuck ON) detection is indicated. [Related parts] • Gear shift unit
102	Fault status: The component 'Solenoid valve Gearshift (MV2R)' remains in the state 'OFF'.	RECOGNIZED/ NOT DETECTED	Gearshift magnetic valve (MV2F) failure (stuck OFF) detection is indicated. [Related parts] • Gear shift unit
103	Fault status: The component 'Solenoid valve Gearshift (MV2R)' remains in the state 'ON'.	RECOGNIZED/ NOT DETECTED	Gearshift magnetic valve (MV2F) failure (stuck ON) detection is indicated. [Related parts] • Gear shift unit
104	Fault status: The component 'Solenoid valve Gearshift (MV3F)' remains in the state 'OFF'.	RECOGNIZED/ NOT DETECTED	Gearshift magnetic valve (MV3F) failure (stuck OFF) detection is indicated. [Related parts] • Gear shift unit
105	Fault status: The component 'Solenoid valve Gearshift (MV3F)' remains in the state 'ON'.	RECOGNIZED/ NOT DETECTED	Gearshift magnetic valve (MV3F) failure (stuck ON) detection is indicated. [Related parts] • Gear shift unit
106	Fault status: The component 'Solenoid valve Gearshift (MV3R)' remains in the state 'OFF'.	RECOGNIZED/ NOT DETECTED	Gearshift magnetic valve (MV3R) failure (stuck OFF) detection is indicated. [Related parts] • Gear shift unit
107	Fault status: The component 'Solenoid valve Gearshift (MV3R)' remains in the state 'ON'.	RECOGNIZED/ NOT DETECTED	Gearshift magnetic valve (MV3R) failure (stuck ON) detection is indicated. [Related parts] • Gear shift unit
108	Request for regulation of combustion engine by component 'DUONIC Control unit'	Torque control/ OFF/Torques/ Rpm limitation/ Speed control	Information on engine control mode requested by DUONIC is indicated. Torque control: Engine torque is controlled from DUONIC OFF: DUONIC is not controlling engine Limited speed/Torque: DUONIC limits engine torque and speed Speed control: Engine speed is controlled from DUONIC [Related parts] • DUONIC electronic control unit

No.	Description	Value	Comment
109	Request for regulation of secondary brake system by component 'DUONIC Control unit'	Torque control/ OFF/Torques/ Rpm limitation/ Speed control	Information on auxiliary brake (retarder) control mode requested by DUONIC is indicated. Torque control: Engine torque is controlled from DUONIC OFF: DUONIC is not controlling engine Limited speed/Torque: DUONIC limits engine torque and speed Speed control: Engine speed is controlled from DUONIC [Related parts] • DUONIC electronic control unit
110	Solenoid valve Pressure regulator	Normal level/ Low pressure	Operation information of magnetic valve (MVR) is indicated. Normal level: Normal line pressure Low pressure: Line pressure decreased [Related parts] • Solenoid valve (MVR) (valve body)
111	Control valve Oil cooler	IS ACTUATED/ NOT ACTIVATED	Operation information of magnetic valve (MVC) is indicated. IS ACTUATED: Automatic transmission fluid is circulating through oil cooler. NOT ACTIVATED: Automatic transmission fluid is not circulating through oil cooler. [Related parts] • Solenoid valve (MVR) (valve body)
112	Reprogramming, Reset of coding PERMISSIBLE	PERMISSIBLE/ NOT PERMISSIBLE	Information on prohibition/permission of reprogramming and electronic control unit resetting is indicated. PERMISSIBLE: Reprogramming and resetting of electronic control unit permitted. NOT PERMISSIBLE: Reprogramming and resetting of electronic control unit not permitted. [Related parts] • DUONIC electronic control unit
113	EEPROM error	RECOGNIZED/ NOT DETECTED	Information on EEPROM failure is indicated. Detected: EEPROM failure detected Not detected: EEPROM failure not detected [Related parts] • DUONIC electronic control unit
114	Actuation Test mode	Test mode ***	Information on actuator test modes is indicated. [Related parts] • DUONIC electronic control unit
115	OBD	OBD NOT PRESENT/OBD	Information on compatibility with OBD is indicated. [Related parts] • DUONIC electronic control unit
116	Shift valve '1' Gear information	-1/ 0 / 1/ 0.5	Positional information of gearshift magnetic valves (MV1F and MV1R) of shift cylinder 1 is indicated. -1: Rear side gear in engagement 0: Neutral condition 1: Front side gear in engagement 0.5: No appropriate gear position [Related parts] • Gear shift unit
117	Shift valve '2' Gear information	-1/ 0 / 1/ 0.5	Positional information of gearshift magnetic valves (MV2F and MV2R) of shift cylinder 2 is indicated. -1: Rear side gear in engagement 0: Neutral condition 1: Front side gear in engagement 0.5: No appropriate gear position [Related parts] • Gear shift unit
118	Shift valve '3' Gear information	-1/ 0 / 1/ 0.5	Positional information of gearshift magnetic valves (MV3F and MV3R) of shift cylinder 3 is indicated. -1: Rear side gear in engagement 0: Neutral condition 1: Front side gear in engagement 0.5: No appropriate gear position [Related parts] • Gear shift unit

No.	Description	Value	Comment
119	Fault status: The component 'Solenoid valve Clutch control (inner)' remains in the state 'OFF'.	RECOGNIZED/ NOT DETECTED	Information on linear magnetic valve (for inner clutch drive) failure (stuck OFF) detection is indicated. [Related parts] • Valve body
120	Fault status: The component 'Solenoid valve Clutch control (inner)' remains in the state 'ON'.	RECOGNIZED/ NOT DETECTED	Information on linear magnetic valve (for inner clutch drive) failure (stuck ON) detection is indicated. [Related parts] • Valve body
121	Fault status: The component 'Solenoid valve Clutch control (outer)' remains in the state 'OFF'.	RECOGNIZED/ NOT DETECTED	Information on linear magnetic valve (for outer clutch drive) failure (stuck OFF) detection is indicated. [Related parts] • Valve body
122	Fault status: The component 'Solenoid valve Clutch control (outer)' remains in the state 'ON'.	RECOGNIZED/ NOT DETECTED	Information on linear magnetic valve (for outer clutch drive) failure (stuck ON) detection is indicated. [Related parts] • Valve body
123	Position of clutch	Connection NOT ESTABLISHED/ Connection PRESENT	Clutch engagement/disengagement information is indicated. [Related parts] • DUONIC electronic control unit
124	Status of engine brake	■■■■ %	Operation information of exhaust brake switch is indicated. Range: 0 to 100 % [Related parts] • Engine electronic control unit
125	Engine start enable	INVALID/VALID	Engine start permission output from DUONIC electronic control unit is indicated. INVALID: Engine start permitted VALID: No engine start permission [Related parts] • DUONIC electronic control unit
126	Status of function 'AUS' (CAN)	ON/OFF	Unused
127	Engine stop enable (ISS)	IS ACTUATED/ NOT ACTIVATED	Unused
128	Engine start request (ISS)	IS ACTUATED/ NOT ACTIVATED	Unused
129	Deactivation request of function 'ISS'	IS ACTUATED/ NOT ACTIVATED	Unused
130	Request for function 'AUS'	IS ACTUATED/ NOT ACTIVATED	Unused
131	Deactivation request of function 'AUS'	IS ACTUATED/ NOT ACTIVATED	Unused

No.	Description	Value	Comment
132	Status of function 'ISS' (CAN)	auto engine stop instruct mode 2/ auto engine stop instruct mode 1/ SNA/auto engine stop timer mode/ Fault/engine stop standby mode/ engine stop hold mode/auto engine stop mode 1/auto engine stop mode 2/ normal mode/ Error/auto engine start mode/ engine start standby mode/auto engine start instruct mode/Fault	Unused
133	CRUISE CONTROL lever in position 'Accelerate' (CAN)	ON/OFF	"RESUME" switch information of the SET/RESUME switch is displayed. • ON: Auto cruise SET/RESUME switch is in RESUME side. • OFF: Auto cruise SET/RESUME switch is in other than RESUME side. [Related parts] • Engine electronic control unit
134	CRUISE CONTROL lever in position 'Decelerate' (CAN)	ON/OFF	"SET" switch information of the SET/RESUME switch is displayed. • ON: Auto cruise SET/RESUME switch is in SET side. • OFF: Auto cruise SET/RESUME switch is in other than SET side. [Related parts] • Engine electronic control unit
135	Status of cruise control (CAN)	ON/OFF	Operation condition of the auto cruise system is indicated. ON: Auto cruise function is in operation OFF: Auto cruise function is not in operation [Related parts] • Engine electronic control unit
136	Shutoff of cruise control	ON/OFF	Temporary release condition of the cruise control function is displayed. ON: Auto cruise function is temporary released. OFF: Auto cruise function is in operation. [Related parts] • Engine electronic control unit
137	Stored speed for cruise control (CAN)	■■■■ mph	Vehicle speed set to the auto cruise system is indicated. Range: 0 to 250 km/h {0 to 155.4 mph} [Related parts] • Engine electronic control unit
138	Vehicle speed (CRUISE CONTROL) (CAN)	■■■■ mph	Vehicle speed information from engine electronic control unit is displayed. Range: 0 to 250 km/h {0 to 155.4 mph} [Related parts] • Engine electronic control unit
139	Status of function 'ABS' ((CAN))	PASSIVE/ ACTIVE	ABS operation information is indicated. PASSIVE: ABS operation is not detected. ACTIVE: ABS operation is detected. [Related parts] • Hydraulic unit (electronic control unit)
140	ABS Warning lamp (CAN)	ON/OFF	ABS warning lamp status is indicated. ON: ABS warning lamp is lit. OFF: ABS warning lamp is off. [Related parts] • Meter cluster

No.	Description	Value	Comment
141	Wheel slip	RECOGNIZED/ NOT DETECTED	Information on wheel slip detection is indicated. Detected: Wheel slip is detected. Not detected: Wheel slip is not detected. [Related parts] • Hydraulic unit (electronic control unit)
141-1	Status of function 'Lock Brake' (CAN)	ON/OFF	Lock Brake' operation information is indicated. • ON: 'Lock Brake' is active • OFF: 'Lock Brake' is inactive [Related parts] • Defective hydraulic unit (electronic control unit)
141-2	EGZO_A01_CAN Reception quality	RECEIVED/ NO RECEPTION	Receiving condition of EZO_A01through CAN communication isindicated • RECEIVED: received • NO RECEPTION: not received [Related parts] • Defective hydraulic unit (electronic control unit)

[Current value group: Transmission]

No.	Description	Value	Comment
142	Gear engaged (Odd gears)	1st/3rd/5th/R/N	Selected gear or preselected gear (odd gear) is indicated. [Related parts] • DUONIC electronic control unit
143	Gear engaged (Even gears)	2nd/4th/6th/R/N	Selected gear or preselected gear (even gear) is indicated. [Related parts] • DUONIC electronic control unit
144	Gear engaged	R/ N/ 1st/ 2nd/ 3rd/ 4th/ 5th/ 6th/ P	Selected gear is indicated. [Related parts] • DUONIC electronic control unit
145	Gear engaged (CAN Combustion engine Control unit)	R/ N/ 1st/ 2nd/ 3rd/ 4th/ 5th/ 6th/ P	Current gear position determined based on CAN communication outputs is indicated. [Related parts] • DUONIC electronic control unit
146	Gear engaged (CAN Instrument panel)	R/ N/ 1st/ 2nd/ 3rd/ 4th/ 5th/ 6th/ P	Output of CAN (Gear information displayed on meter is indicated.) [Related parts] • Meter cluster • DUONIC electronic control unit
147	Transmission ratio with gear engaged	■■■■	Currently selected gear ratio determined based on CAN communication outputs is indicated. [Related parts] • DUONIC electronic control unit
148	Learned value of component 'Shift valve '1' FORWARD'	■■■■ %	Learning value of drive duty output of gearshift magnetic valve (MV1F) of shift cylinder 1 stored in DUONIC electronic control unit is indicated. Range: 78.2 to 96 % [Related parts] • DUONIC electronic control unit

No.	Description	Value	Comment
149	Learned value of component 'Shift valve '1' Rear view'	■■■■ %	Learning value of drive duty output of gearshift magnetic valve (MV1R) of shift cylinder 1 stored in DUONIC electronic control unit is indicated. Range: 6 to 21.8 % [Related parts] • DUONIC electronic control unit
150	Learned value of component 'Shift valve '2' FORWARD'	■■■■ %	Learning value of drive duty output of gearshift magnetic valve (MV2F) of shift cylinder 2 stored in DUONIC electronic control unit is indicated. Range: 6 to 21.8 % [Related parts] • DUONIC electronic control unit
151	Learned value of component 'Shift valve '2' Rear view'	■■■■ %	Learning value of drive duty output of gearshift magnetic valve (MV2R) of shift cylinder 2 stored in DUONIC electronic control unit is indicated. Range: 78.2 to 96 % [Related parts] • DUONIC electronic control unit
152	Learned value of component 'Shift valve '3' FORWARD'	■■■■ %	Learning value of drive duty output of gearshift magnetic valve (MV3F) of shift cylinder 3 stored in DUONIC electronic control unit is indicated. Range: 6 to 21.8 % [Related parts] • DUONIC electronic control unit
153	Learned value of component 'Shift valve '3' Rear view'	■■■■ %	Learning value of drive duty output of gearshift magnetic valve (MV3R) of shift cylinder 3 stored in DUONIC electronic control unit is indicated. Range: 78.2 to 96 % [Related parts] • DUONIC electronic control unit
154	Position of component 'Gear recognition sensor 1'	■■■■ %	Output of gearshift magnetic valve received from shift stroke sensor 1 (gearshift unit) is indicated as duty ratio (%). [Related parts] • Gear shift unit
155	Position of component 'Gear recognition sensor 2'	■■■■ %	Output of gearshift magnetic valve received from shift stroke sensor 2 (gearshift unit) is indicated as duty ratio (%). [Related parts] • Gear shift unit
156	Position of component 'Gear recognition sensor 3'	■■■■ %	Output of gearshift magnetic valve received from shift stroke sensor 3 (gearshift unit) is indicated as duty ratio (%). [Related parts] • Gear shift unit

[Current value group: Temperatures]

No.	Description	Value	Comment
157	Oil temperature of transmission	■■■■ °F	Automatic transmission fluid temperature is indicated. Range: -40 to 140°C {72 to 252°F} [Related parts] • Oil temperature sensor (valve body)
158	Engine Coolant temperature	■■■■ °F	Engine coolant temperature received from engine electronic control unit is indicated. [Related parts] • Engine electronic control unit

[Current value group: Clutch]

No.	Description	Value	Comment
159	Duration of control current application for filling of coupling Learned value (Internal clutch plate)	■■■■ s	Learned value of inner clutch filling time is indicated. • Range: 0 to 1.5 sec. [Related parts] • DUONIC electronic control unit
160	Duration of control current application for filling of coupling Learned value (External clutch plate)	■■■■ s	Learned value of outer clutch filling time is indicated. • Range: 0 to 1.5 sec. [Related parts] • DUONIC electronic control unit
161	Torque of clutch 5kgfm (Internal clutch plate)	■■■■ A	Current applied to linear magnetic valve (for driving inner clutch) when generating clutch torque of 5 kgfm is indicated. • Range: 0 to 1.2 A [Related parts] • DUONIC electronic control unit • Valve body
162	Torque of clutch 25kgfm (Internal clutch plate)	■■■■ A	Current applied to linear magnetic valve (for driving inner clutch) when generating clutch torque of 25 kgfm is indicated. • Range: 0 to 1.2 A [Related parts] • DUONIC electronic control unit • Valve body
163	Torque of clutch 5kgfm (External clutch plate)	■■■■ A	Current applied to linear magnetic valve (for driving outer clutch) when generating clutch torque of 5 kgfm is indicated. • Range: 0 to 1.2 A [Related parts] • DUONIC electronic control unit • Valve body
164	Torque of clutch 25kgfm (External clutch plate)	■■■■ A	Current applied to linear magnetic valve (for driving outer clutch) when generating clutch torque of 25 kgfm is indicated. • Range: 0 to 1.2 A [Related parts] • DUONIC electronic control unit • Valve body
165	Clutch grip point (Internal clutch plate)	■■■■ A	Current applied to linear magnetic valve (for driving inner clutch) when starting clutch slipping is indicated. • Range: 0 to 1.2 A [Related parts] • DUONIC electronic control unit • Valve body
166	Clutch grip point (External clutch plate)	■■■■ A	Current applied to linear magnetic valve (for driving outer clutch) when starting clutch slipping is indicated. • Range: 0 to 1.2 A [Related parts] • DUONIC electronic control unit • Valve body
167	Output current (Internal clutch plate)	■■■■ A	Current applied to linear magnetic valve (for driving inner clutch) is indicated. • Range: 0 to 1.2 A [Related parts] • DUONIC electronic control unit • Valve body
168	Output current (External clutch plate)	■■■■ A	Current applied to linear magnetic valve (for driving outer clutch) is indicated. • Range: 0 to 1.2 A [Related parts] • DUONIC electronic control unit • Valve body
169	Torque (Internal clutch plate)	■■■■ Nm	Torque of inner clutch is indicated. • Range: 0 to 255 kgfm {0 to 2500 N·m} [Related parts] • DUONIC electronic control unit

No.	Description	Value	Comment
170	Torque (External clutch plate)	■■■■ Nm	Torque of outer clutch is indicated. • Range: 0 to 255 kgfm {0 to 2500 N·m} [Related parts] • DUONIC electronic control unit
171	Duration of control current application for filling of coupling (Internal clutch plate)	■■■■ s	Duration of applying current to inner clutch for filling control is indicated. • Range: 0 to 2.0 sec. [Related parts] • DUONIC electronic control unit
172	Duration of control current application for filling of coupling (External clutch plate)	■■■■ s	Duration of applying current to outer clutch for filling control is indicated. • Range: 0 to 2.0 sec. [Related parts] • DUONIC electronic control unit

[Current value group: Accelerator pedal]

No.	Description	Value	Comment
173	Position of accelerator pedal (CAN)	■■■■ %	Accelerator pedal opening angle received from engine electronic control unit via CAN is indicated. [Related parts] • Engine electronic control unit

[Current value group: Torques]

No.	Description	Value	Comment
174	Requested engine torque (CAN)	■■■■ %	Engine torque responding to driver's accelerator pedal operation received from engine electronic control unit via CAN is indicated. [Related parts] • Engine electronic control unit
175	Current engine torque (CAN)	■■■■ %	Engine torque received from engine electronic control unit via CAN is indicated. [Related parts] • Engine electronic control unit
176	Engine drag torque (CAN)	■■■■ %	Loss of torque due to engine friction received from engine electronic control unit via CAN is indicated. [Related parts] • Engine electronic control unit
177	Reference torque (CAN)	■■■■ Nm	Reference torque to calculate engine torque received from engine electronic control unit via CAN is indicated. [Related parts] • Engine electronic control unit

[Current value group: Acceleration]

No.	Description	Value	Comment
178	Longitudinal acceleration	■■■■ G	G acting on vehicle in longitudinal direction is indicated. Range: -2.05 to 2.05 G [Related parts] • G sensor
179	Road surface inclination	■■■■ %	Road gradient is indicated in percentage. Range: -128 to 128 % [Related parts] • G sensor

[Current value group: Calibration values]

No.	Description	Value	Comment
180	Tire size	■■■■ m	Tire diameter registered in DUONIC electronic control unit is indicated. (Coding data) [Related parts] • DUONIC electronic control unit
181	Gear ratio of rear axle	■■■■	Gear ratio of rear axle registered in DUONIC electronic control unit is indicated. (Coding data) [Related parts] • DUONIC electronic control unit
182	Ratio of gear	■■■■	Transfer gear ratio registered in DUONIC electronic control unit is indicated. (Coding data) [Related parts] • DUONIC electronic control unit
183	Tire size (HEX)	■■■■	Tire diameter registered in DUONIC electronic control unit is indicated. (Hexadecimal coding data) [Related parts] • DUONIC electronic control unit
184	Gear ratio of rear axle (HEX)	■■■■	Gear ratio of rear axle registered in DUONIC electronic control unit is indicated. (Hexadecimal coding data) [Related parts] • DUONIC electronic control unit
185	Ratio of gear (HEX)	■■■■	Transfer gear ratio registered in DUONIC electronic control unit is indicated. (Hexadecimal coding data) [Related parts] • DUONIC electronic control unit
185-1	PTO Warning	INVALID/VALID	The information of settings (coding data) recorded in the DUONIC? electronic control unit for the warning functions occurring during PTO operation is indicated. • VALID: This option should be selected when an operator desires to cancel the warning activated in running the vehicle while engaging PTO or in an erroneous operation. • INVALID: This option should be selected when an operator desires to activate the warning at the time the gearshift lever is moved to any driving gear position or when a vehicle is moved with the PTO switched on or with the PTO gear engaged. [Related parts] DUONIC? electronic control unit

No.	Description	Value	Comment

185-2	PTO Gear	VALID 1/
		VALID 2/
		VALID 3/
		VALID 4/
		INVALID
			The information of settings (coding data) recorded in the DUONIC? electronic control unit for the PTO gear engagement control is indicated.
			If the personnel set these options erroneously, it can damage the equipped components or the vehicle.
			• VALID 1: This option should be selected when an operator desires to suppress a gear noise at the time of PTO gear engagement (A PTO gear engagement can fail (When the load on the equipped components are small, the PTO gear engagement failure will rarely occur with this setting.)
			• VALID 2: This option should be selected when an operator desires to suppress a PTO gear engagement failure* (A gear noise may occur.) [To select this option when the load on the equipped components is small.)
			• VALID 3: This option should be selected when an operator desires to suppress a PTO gear engagement failure* (When PTO gear engagement failures frequently occurred if the "Gear noise reduction function" (VALID 1) is selected)
			  • This should be selected when the load on the equipped components such as a directly driven large capacity PTO is large.
			  • This will facilitate PTO gear engagement if an operator engages PTO gear when cancelling the gear noise suppression function at the same time.
			  • A gear noise may occur at the time of the PTO gear engagement.
			• VALID 4: This option should be selected when an operator desires to suppress a PTO gear engagement failure (When PTO gear engagement failures occasionally occurred if the "Gear noise reduction function" (VALID 1) is selected)
			  • This should be selected when the load on the equipped components such as a directly driven large capacity PTO is large.
			  • When it is impossible to engage PTO gear, the personnel can cancel the gear noise suppression function to facilitate PTO gear engagement.
			• INVALID: This option should be selected when an operator desires to start PTO operation before stopping a vehicle.
			• When the personnel have set to engage PTO at low speeds, be sure to select this option.
			• If this option is not selected when the personnel have set to engage PTO at low speeds, there will be a risk of damaging a vehicle and equipped components.

185-3	PTO Actuation of clutch	QUICK Connecting/ SLOW Connecting1/ SLOW Connecting2	The information of settings (coding data) recorded in the DUONIC? electronic control unit for the PTO clutch engagement control is indicated. • QUICK Connecting: This option should be selected when an operator desires to start PTO operation as soon as possible after switching on the PTO switch. (This should not be selected when the load on the equipped components such as a directly driven large capacity PTO is large. • Slow Connecting 1: This option should be selected when the engine stalls or shows hunting after switching on the PTO main switch with the "Quick Connecting" option selected. • Slow Connecting 2: This option should be selected when engine stall or hunting is not removed after switching on the PTO main switch with the "Quick Connecting" option selected. [Related parts] DUONIC? electronic control unit

No.	Description	Value	Comment

185-4	PTO Operating restrictions	STOP (P/N)/ STOP (P)/ Trip (1st,2nd,R)/ Trip (2nd,3rd,R)	The information of settings (coding data) recorded in the DUONIC? electronic control unit for the PTO clutch engagement control is indicated.
			• STOP (P/N): This option should be selected when an operator desires to restrict the PTO operation to be activated only when the gearshift lever is placed in P or N position.
			• STOP (P): This option should be selected when an operator desires to restrict the PTO operation to be activated only when the gearshift lever is placed in P position. It will inhibit the use of PTO when the gearshift lever is placed any position other than P or N.
			  • It will inhibit the use of PTO when the gearshift lever is placed any position other than P.
			  • When the PTO switch is pressed down, the gearshift lever cannot be moved from the P position.
			  • When the PTO switch is pressed down with the gearshift lever in any position other than P, the gearshift lever cannot be moved to the P position.
			• Trip (1st, 2nd, and R): This option should be selected when an operator desires to drive a vehicle while operating the PTO (The gearshift lever should be restrained to the 1st, 2nd or reverse position.
			• Trip (2nd, 3rd and R): This option should be selected when an operator desires to drive a vehicle while operating the PTO (The gearshift lever should be restrained to the 2nd, 3rd or reverse position.
			[Related parts]
			DUONIC? electronic control unit

185-5	PTO Connecting When stopping	STOP/ LOW Vehiclespeed 1/ LOW Vehiclespeed 2	The information of settings (coding data) recorded in the DUONIC? electronic control unit for the PTO engagement control before stopping a vehicle is indicated.
			There is a risk of damaging the equipped components or vehicle if an erroneous setting is selected.
			• STOP: This option should be selected when an operator desires to restrain the PTO operation to be activated after the stopping of a vehicle only.
			• Low vehicle speed 1: This option should be selected when an operator desires to start the PTO operation before stopping a vehicle
			(Vehicle speed under 10 km/h).
			• Low vehicle speed 2: This option should be selected when an operator desires to start the PTO operation before stopping a vehicle
			(Vehicle speed under 15 km/h).
			  • The “Vehicle stopped” option is recommended to avoid damaging the transmission with gear noise and any unintended activation of an equipped component.
			  • Even when it is obliged to select this option, it is necessary to advise a customer to operate PTO by stopping a vehicle whenever possible.
			  • When reselecting this option instead of other settings, it is imperative to set the PTO gear engagement control to select invalid in “Gear noise suppression function.”
			  • Failure to observe the above precautions can damage a vehicle or equipped components.

3. FUSO Diagnostics Actuator Test (Actuations)

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.
- The actuator tests must be performed with the vehicle stationary, the engine stopped and the starter switch in ON position unless otherwise specified.

No.	Item	Description
000	Shift gear	Cancels the limitation of manual shifting into forward gears with vehicle stationary (allows selection of every forward gear including 6th gear when starting). [Can be executed when the following conditions are satisfied] • Engine idling • Shift lever in P position
001	Pressure line High	Forces the line pressure to be held high. [Can be executed when the following conditions are satisfied] • Engine idling • Shift lever in P position
002	Pressure line Low	Forces the line pressure to be held low. [Can be executed when the following conditions are satisfied] • Engine idling • Shift lever in P position
003	Oil cooler ON	Forces the cooler lubrication to be held ON. [Can be executed when the following conditions are satisfied] • Engine idling • Shift lever in P position
004	Oil cooler OFF	Forces the cooler lubrication to be held OFF. [Can be executed when the following conditions are satisfied] • Engine idling • Shift lever in P position
005	Internal clutch plate ON	Forces the clutch 1 power to be held ON (1.2 A). [Can be executed when the following conditions are satisfied] • Engine idling • Shift lever in P position • No abnormality in shift stroke sensor
006	External clutch plate ON	Forces the clutch 2 power to be held ON (1.2 A). [Can be executed when the following conditions are satisfied] • Engine idling • Shift lever in P position • No abnormality in shift stroke sensor
007	Deactivation of shift lock	Issues a command requesting shift lock release.

4. Electronic Control Unit Input/Output Table

- For positions of each signal terminal and grounding terminal, see the Engine Control Unit connection diagram.

Devices to be connected	Terminal	Input/output	Voltage and wave form
Power Supply	B36-Ground B37-Ground	Input	Continuously: About 12 V (battery voltage)
Power Supply 1 M Contact	B38-Ground B39-Ground	Input	Starter switch ON: About 12 V (battery voltage) Starter switch OFF: 0 V
Parking gear switch	B27-Ground	Input	Parking gear switch ON (Other range): 0 V Parking gear switch OFF (P range): About 12 V (battery voltage)
Transmission power take-off switch	B19-Ground	Input	Transmission PTO switch ON: About 12 V (battery voltage) Transmission PTO switch OFF: 0 V
Vehicle speed sensor	B29-B21	Input	When sensor shaft is rotated:  P122088E Low pulse: 0 V High pulse: 5 V
Oil temperature	A46-Ground	Input	20°C {68°F}: 2.31 to 2.59 kΩ
G Sensor (main)	B10-Ground	Input	When vehicle is parked on a level ground: 2.3 to 2.7 V
G Sensor (sub)	A47-Ground	Input	When vehicle is parked on a level ground: 2.3 to 2.7 V
Brake fluid pressure sensor	B25-Ground	Output	5 V
	B9-Ground	Input	0.5 V
Geat shift solenoid	A24-Ground (MV1F)	Output	Gearshift solenoid duty output: 0 - 100% P122121E • Duty output 0%  P122122E • Duty output 100%
	A62-Ground (MV1R)	Output	
	A23-Ground (MV2F)	Output	
	A61-Ground (MV2R)	Output	
	A22-Ground (MV3F)	Output	
	A60-Ground (MV3R)	Output	

5. Coding Data in Electronic Control Unit

5.1 General

- Each electronic control unit of a vehicle contains information of the vehicle including component configurations, which is collectively called coding data.
- When an electronic control unit is replaced with a new part or one that has been used on another vehicle, or when the vehicle specifications are changed, relevant data must be downloaded and/or coding data rewritten using FUSO Diagnostics.

5.2 Rewriting coding data

- When electronic control units are replaced or the vehicle specifications are changed, the following coding data must be rewritten. For details about rewriting operation, contact your nearest authorized dealer or distributor.

Coding data / Treatment	Gear ratio of rear axle	Tyre size	Ratio of gear	Equipment power take-off	Model of clutch	PTO Warning	PTO Gear	PTO Actuation of clutch	PTO Operating restrictions	PTO Connecting When stopping	Vehicle determination (Truck/Bus)	Switching threshold of activated pressure regulator	Equipment ABS	Pulse width modulated signal 'Solenoid valve' Gearshift" during the shift operation	EOL Shiftmap Type
Replace DUONIC® electronic control unit	O	O	O	O	O	O	O	O	O	O	O	O	O	O	O
Final gear ratio is change	O														
Tyre diameter change		O													
Transfer gear ratio change			O												
Clutch type change					O										
Replace power take-off				O		O	O	O	O	O					

6. Initialization of DUONIC® System

- In the initialization of the DUONIC® system, the following initial settings are memorized by the DUONIC electronic control unit: gear shift unit's gear position, clutch fill time, learned clutch torque value, and G sensor signal voltage on flat road. All of these settings are initialized with a single initialization operation, which must be performed every time the vehicle is serviced.
- Initialization of the DUONIC® system may help improve degradation of roll-off, creep or gear shift quality if that is experienced.
- The vehicle must be warmed up before performing initialization. With a cold engine or transmission, initialization may not be successfully completed when attempted.

- If any of the following service is performed, initialization must be performed following the procedure described.

Service	Initialization procedure
Replacement of automatic transmission fluid	After replacement of automatic transmission fluid, start the engine and cycle the shift lever to D and R several times to sufficiently circulate automatic transmission fluid before performing initialization. After initialization, test drive the vehicle.
Replacement of gear oil	After replacement of gear oil, perform initialization followed by test drive.
Work on engine or transmission	After any service on the engine or transmission, the DUONIC® system must be initialized to prevent any possible degradation of driving quality due to possible change in the engine or transmission characteristics.

6.1 Preparation before initialization of DUONIC® system

- Measure the automatic transmission fluid temperature in the transmission using the FUSO Diagnostics. (See Gr00.)
- Adjust the automatic transmission fluid temperature to approximately 50°C {122°F} by the method recommended below.
- Repeat initialization several times. (With each time of initialization, the temperature rises by 10°C to 12°C {50°F to 54°F}.)
- Actually drive the vehicle to increase the automatic transmission fluid temperature up to the required level.
- When initialization is performed to eliminate feeling-related symptom, record initial setting reference values shown below. Comparison pre- and post-initialization values with these referent values can lead to the identification of the causes of symptoms.
- If feeling is not improved despite initialization of the DUONIC® system, check automatic transmission fluid level and repeat the initialization of DUONIC® system. Chances are that feeling will be improved this way.
- If driving quality or feeling is not improved despite initialization of the DUONIC® system, check automatic transmission fluid level, then repeat the initialization of the DUONIC® system. It can sometimes improve the feeling.

NOTE

- **DUONIC® system may make driving feeling bad if automatic transmission fluid level is not right.**
- **Every vehicle is different from each other. Thus, all vehicles do not necessarily show actual values within the reference values shown below.**

Initial setting reference values

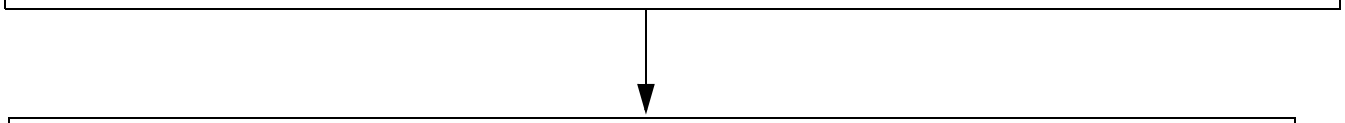
No.	Actual values	Description	Value
157	DUONIC® Basic setting	Oil temperature of transmission	45 to 55°C
148	DUONIC® Basic setting	Learned value of component ‘Shift valve ‘1’ FORWARD’	87.2 to 88.3%
149	DUONIC® Basic setting	Learned value of component ‘Shift valve ‘1’ Rear view’	11.6 to 12.7%
150	DUONIC® Basic setting	Learned value of component ‘Shift valve ‘2’ FORWARD’	11.3 to 12.8%
151	DUONIC® Basic setting	Learned value of component ‘Shift valve ‘2’ Rear view’	87.0 to 88.7%
152	DUONIC® Basic setting	Learned value of component ‘Shift valve ‘3’ FORWARD’	10.7 to 12.6%
153	DUONIC® Basic setting	Learned value of component ‘Shift valve ‘3’ Rear view’	87.8 to 89.8%
159	DUONIC® Basic setting	Duration of control current application for filling of coupling Learned value (Internal clutch plate)	0.15 to 0.27 sec
160	DUONIC® Basic setting	Duration of control current application for filling of coupling Learned value (External clutch plate)	0.08 to 0.22 sec
161	DUONIC® Basic setting	Torque of clutch 5 kgfm (Internal clutch plate)	341 to 412 mA
162	DUONIC® Basic setting	Torque of clutch 25 kgfm (Internal clutch plate)	570 to 663 mA
163	DUONIC® Basic setting	Torque of clutch 5 kgfm (External clutch plate)	369 to 435 mA
164	DUONIC® Basic setting	Torque of clutch 25 kgfm (External clutch plate)	552 to 659 mA
165	DUONIC® Basic setting	Clutch grip point (Internal clutch plate)	301 to 376 mA
166	DUONIC® Basic setting	Clutch grip point (External clutch plate)	296 to 366 mA

6.2 Initialization standby mode

- Prior to starting initialization, the vehicle must be placed in the initialization standby mode.

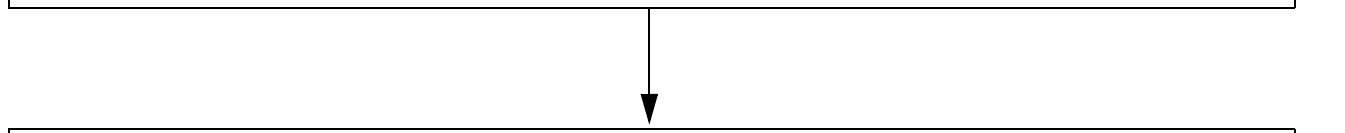
Ensure that the vehicle meets all of the following conditions.

- Software installation and coding have been completed on the engine and DUONIC electronic control units.
- The engine is stopped.
- The vehicle is stationary (with the brakes released) on a flat road and unloaded.
- The tire pressure has been set to specification.
- The cab tilt is locked.
- The starter key is in the ON position.
- The accelerator pedal is in the ON (50% or above) position.
- The foot brake is applied.
- The systems that are powered by the engine such as the air conditioner, the compressor for the freezer and the exhaust brake are stopped.
- The change lever is moved to D for one second and then set to A/M. (Make sure that the lever is securely held in A/M position.)
- The parking brake is applied for one second, then released for one second and then applied (pulled rather hard) again.



Check that only the gear shift indicator “1” is flashing and the auto mode indicator “D” is not flashing.

Initialization (See “6.3 Initialization”)



The vehicle goes back to the normal mode if the parking brake is released or the starter key is turned to the OFF position.

6.3 Initialization

Operator action	Vehicle action

With the vehicle in the initialization standby mode, set the accelerator pedal to OFF and the change lever to P before starting the engine.	• The progress of initialization process is indicated on the gear shift indicator as a flashing “2”, “3”, “4”, “5” and “N”.
	• Initialization progress indicated on the gear shift indicator is as follows:
	  • “2”: The gear shift unit’s gear position is being detected.
	  • “3”: Clutch is being warmed up. G sensor voltage value is being corrected.
	  • “4”: Clutch fill time is being learned.
	  • “5”: Clutch torque is being learned.
	  • “N”: Initialization is completed.

–	• Gearshift indicator “R” flashes on and off. → Initialization unsatisfactory. → Return to normal mode with parking brake off or key off, then repeat initialization. • If gearshift indicator changes flashing from “2” to “R”, gear shifting by gearshift unit may be difficult, in which case the vehicle is moved once, then initialization is performed. Chances are that problem will be solved this way. • If gearshift indicator changes flashing from “3” to “R”, G sensor may be installed out of place or G sensor signal may be abnormal. • If gearshift indicator changes flashing from “4” to “R”, clutch may be out of order. • If gearshift indicator changes flashing from “5” to “R”, engine may not be warm enough or clutch may be out of order. • If initialization ends in failure again, check clutch and transmission. (See Gr21A and Gr22A)

CAUTION ⚠

- **After initialization, if the gear shift indicator “1” and the auto mode indicator “D” flash alternately, turn the starter switch to OFF or release the parking brake and perform the initialization of the DUONIC® system again.**

Initial setting reference values

No.	Description	Value	Remarks
1	Intermediate of Position of cylinder 1 front and rear	49.4 to 50.5%	(Position of cylinder 1 front + Position of cylinder 1 rear)/2
2	Intermediate of Position of cylinder 2 front and rear	49.2 to 50.8%	(Position of cylinder 2 front + Position of cylinder 2 rear)/2
3	Intermediate of Position of cylinder 3 front and rear	49.3 to 51.2%	(Position of cylinder 3 front + Position of cylinder 3 rear)/2

- After initialization is completed, check the above values (not indicated in the FUSO Diagnostics). If any post-initialization values largely deviate from above values (3% or more), repeat the initialization.
- If pre- and post-re-initialization values are the same, nothing is abnormal.
- Test run after initialization is completed and check that there is no feeling problem during driving and at speed change. If there is a shock or an abnormal sound at speed change, perform initialization of the DUONIC® system again.

CAUTION ⚠

- **For safety, keep the foot brake applied after the engine is started.**

6.4 Resetting the initialization

- The DUONIC® system offers the possibility to reset the initialization values of gear shift unit’s gear position, clutch fill time, learned clutch torque, and G sensor voltage on flat road so that these values are defaulted to those before the initialization. (This feature is designed to be used such as when driving quality has deteriorated after initialization.)

Operator action	Vehicle action
With the vehicle in the initialization standby mode, set the change lever to “-”.	“6” flashes on the gear shift indicator, meaning that the reset process has been completed.

7. Troubleshooting by Symptom

If a trouble occurred but no diagnosis code has been stored, or any diagnosis code has been stored but the cause of the trouble could not identified, the following check may help to identify the cause.

<table>
<tr><td colspan="3">Faulty vehicle is received.
• Check the diagnosis code, and software part No. and the learning value of DUONIC electronic control unit.</td></tr>
<tr><td rowspan="4">Check 1</td><td colspan="2">• Abnormal noise (growling) on all 1st, 3rd and 5th gears</td></tr>
<tr><td>Noise occurs</td><td>Replace clutch housing, inner drive pinion and pilot bearing (main shaft). Adjust shims.</td></tr>

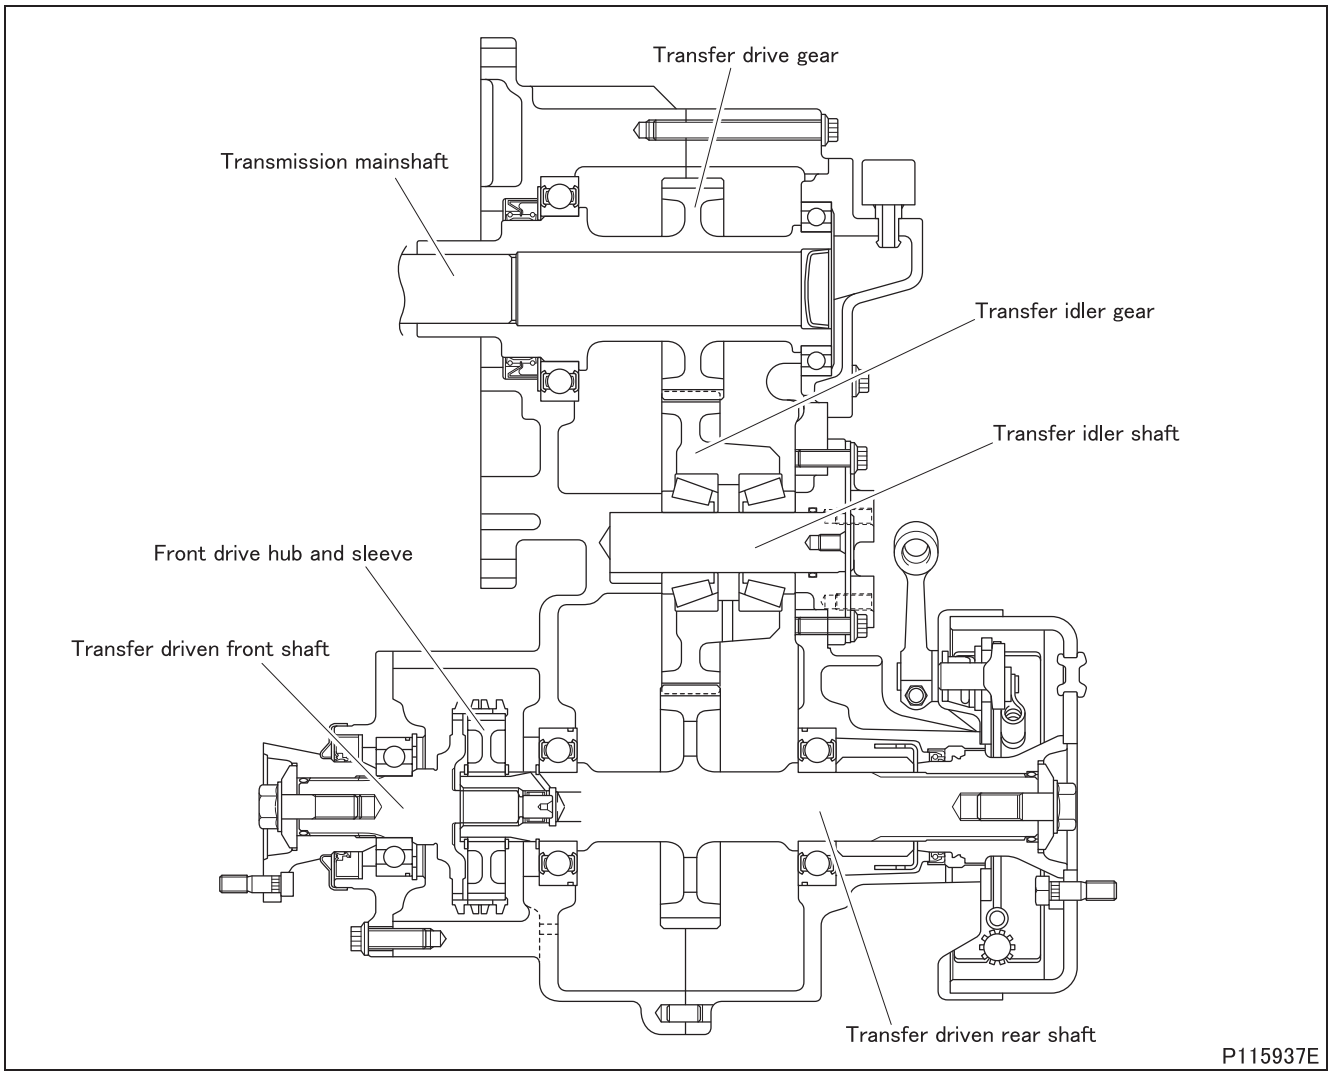
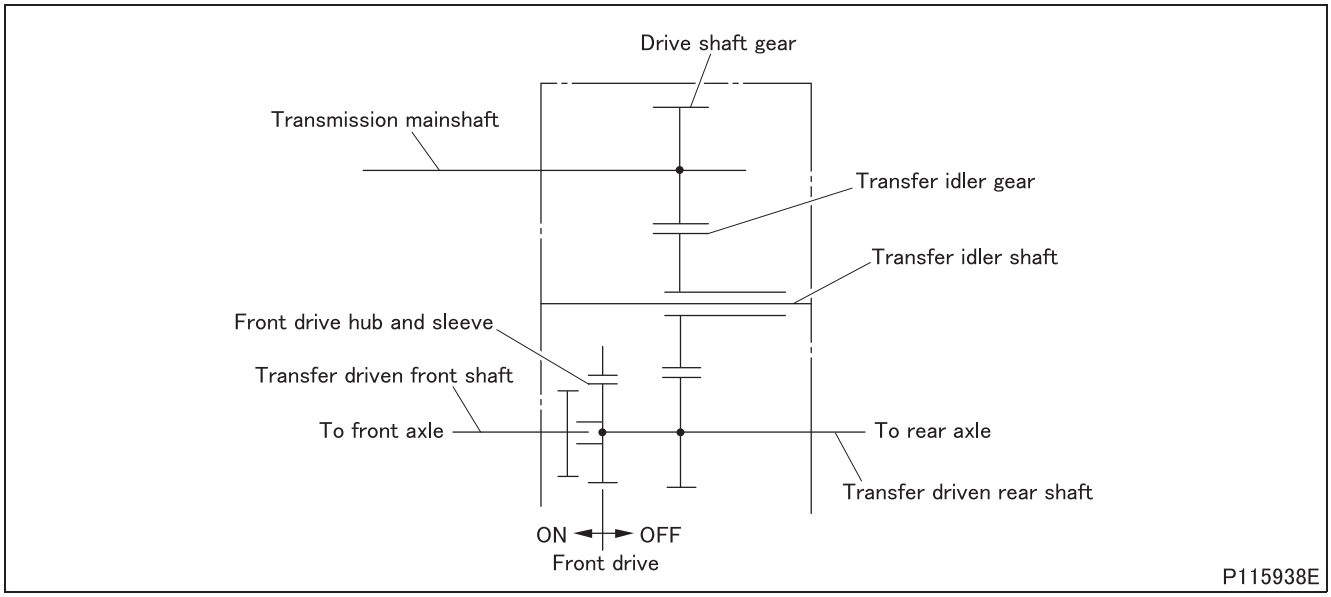
SPECIFICATIONS

Item			Specifications
Model			TF3
Transfer type			Part-time
Drive type			Gear
Gear ratio			1.090
Transfer oil	Gear oil		API GL-3 SAE 80
	Oil quantity	L {qts.}	Approx. 3.6 {3.8}
Mass (including transmission body)		kg {lb}	Approx. 189 {417}
Control			Electric and vacuum type

1. Transfer





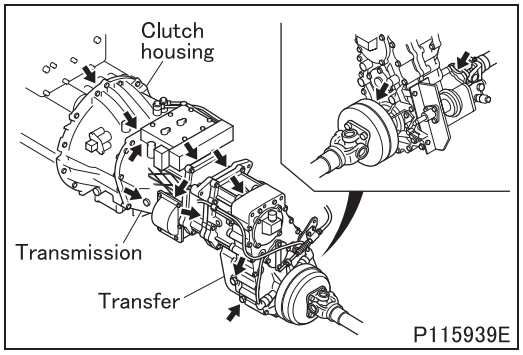
- The transfer has two functions of distribution of all-wheel drive and a sub transmission with a reduction gear.
- The transfer is of a three-shaft constant-mesh type.
- The switch of a driver seat enables switching between engagement and disengagement of the front drive.

Possible causes \ Symptoms		Noise when cruising	Gears cannot be engaged when switching to front drive	Gears slip out of engagement during driving with front drive engaged	Gears slip out of engagement during driving	Gears cannot be disengaged when switching to front drive	Indicator does not light though front drive is engaged	Indicator lights though front drive is not engaged
Transfer body faulty	Transfer driven front shaft and spline of synchronizer sleeve worn			O				
	Hub and spline of high and low constant sleeve worn				O			
	Transfer idler bearing worn or damaged	O						
	Transfer drive gear bearing worn or damaged	O						
	Transfer driven rear shaft bearing worn or damaged	O						
	Transfer driven rear shaft needle bearing worn or damaged	O						
	Gears damaged	O						
	Backlash of drive shaft gear and transfer idler gear excessive	O						
	Transfer oil insufficient	O						
	Transfer oil viscosity inadequate	O						
	Synchronizer sleeve and dog clutch broken		O	O				
	Synchronizer sleeve and hub broken				O			
Control mechanism faulty	Shift rail bent		O					
	Shift rail sliding movement faulty		O					
	Shift fork bent		O					
	Shift fork claws worn		O					
Transfer control system faulty	Transfer four-wheel drive switch faulty						O	O
	Blowout of fuse and high-current fuse		O				O	
	Battery overcharge		O					
	3-way magnet valve faulty		O	O		O		
	Broken wire, poor connection						O	
	Air leakage in vacuum piping		O	O				
	Vacuum actuator faulty		O	O		O		

M E M O

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection of Transmission and Transfer Oil Leakage



1.1 Inspection of oil leakage at each part of transmission body and transfer

- Check the oil leakage at each part of transmission body and transfer in visual.
  If the oil leakage is found, replace the defective part.

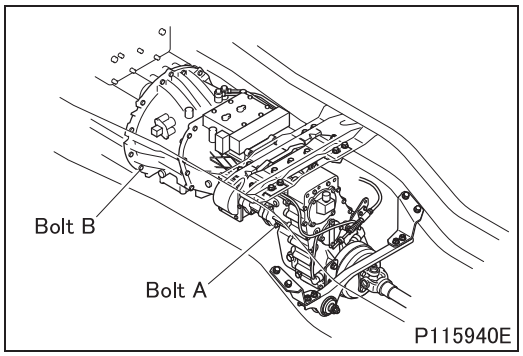
1.2 Inspection of oil leakage around transmission mounting part

- Check there is not oil stain on transmission mounting part caused by oil leakage from engine.
- If there is the oil stain, remove the transmission and clean the mounting surface of clutch housing and flywheel housing using brake cleaner etc. after repairing oil leakage part. Because the oil stain may loosen the transmission mounting bolts. (See “REMOVAL AND INSTALLATION OF TRANSMISSION (WITH TRANSFER)”.)

2. Inspection of Looseness in Transmission and Transfer Mounting Bolts

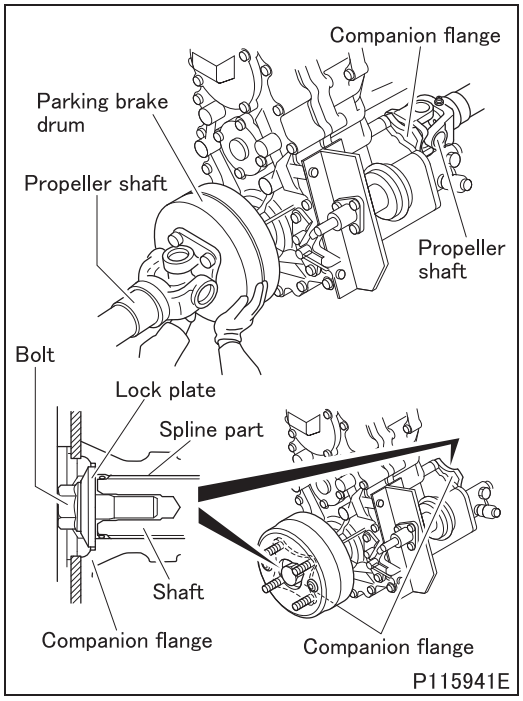
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Bolt A (transfer mounting)	45.8 {34, 4.7}	–
–	Bolt B (transmission mounting)	47.1 {35, 4.8}	–



- Check the transmission and transfer mounting bolts for looseness.
- Retighten any loose bolt to the specified torque.

3. Inspection of Play and Looseness in Companion Flange



- Check for looseness in the propeller shaft mounting bolts. (See Gr25.)
- Move the parking brake drum (on the rear drive side) and the companion flange (on the front drive side) in axial and vertical directions to check for excessive play between the companion flange and the shaft.
- If excessive play is detected, remove the propeller shaft, then check the companion flange mounting bolts for looseness and the splines on companion flange and shaft for abnormalities. If any part is found defective, replace the part. (See FRONT DRIVE and REAR DRIVE sections.)

4. Inspection and Replacement of Transfer Oil

WARNING ⚠

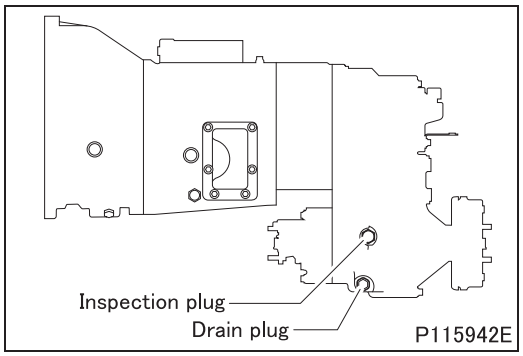
- **Temperature of transfer oil is high immediately after driving. Perform work when oil is cold.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Inspection plug	68.6 ± 14.7 {51 ± 11, 7.0 ± 1.5}	–
	Drain plug (magnet type)		

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Thread area of inspection plug	ThreeBond 1105	As required
	Thread area of drain plug		
–	Transfer case	General: API GL-3 SAE 80 Warm region: API GL-3 SAE 90 Tropical region: API GL-4 SAE 90	3.6 L {3.8 qts.}



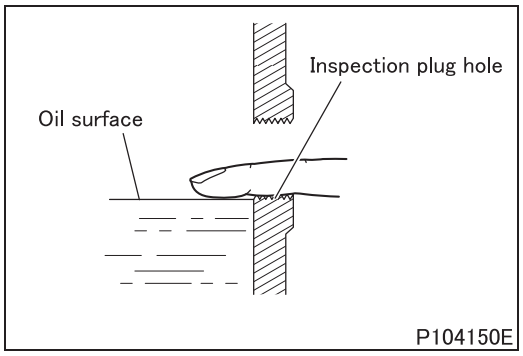
[Inspection]

(1) Inspection of oil quantity

- Remove the inspection plug, and check that transfer oil is filled up to the neck.
- If oil is not sufficient, fill oil from the inspection plug hole up to the neck.
- After filling, apply sealant to the inspection plug and tighten it to the specified torque.

(2) Inspection of oil quality and inclusions

- When draining transfer oil, check for oil quality, metal chips and metal powder.
- If an abnormally large amount of metal chips and metal powder is found, disassemble the transfer assembly for service, as abnormalities may be caused inside.

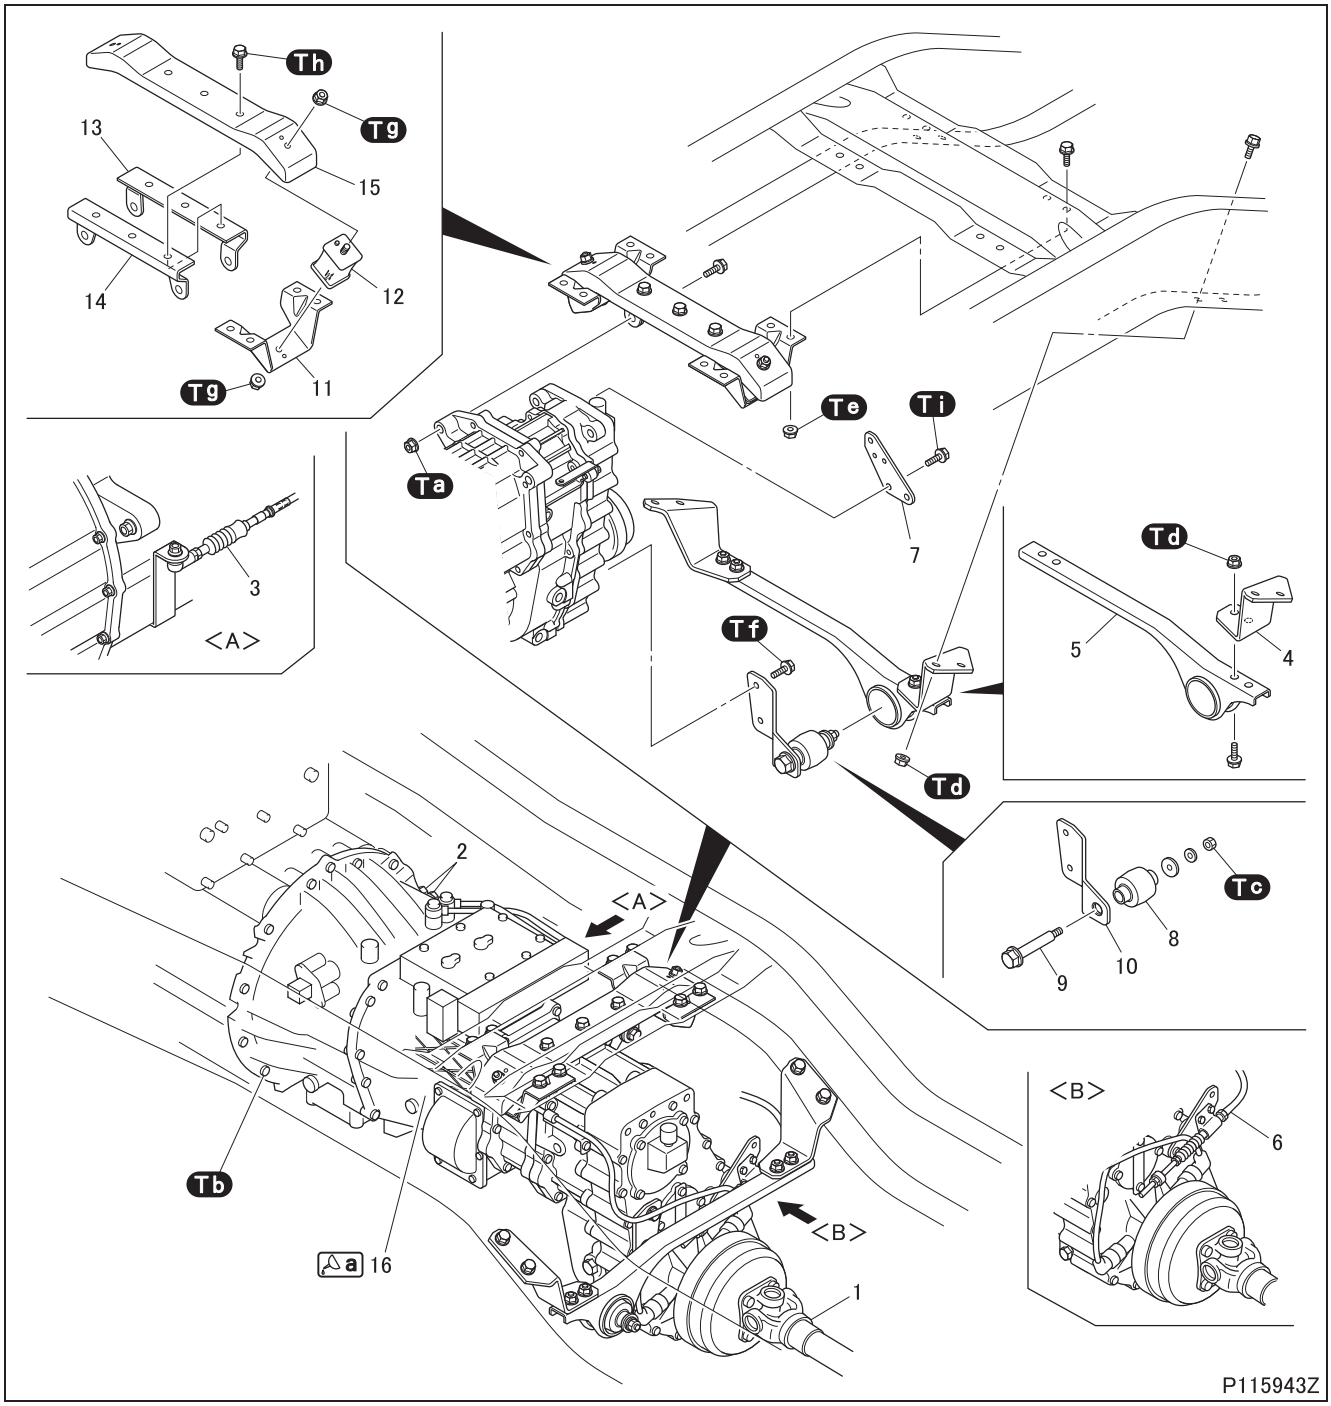


[Replacement]

- Remove the drain plug to drain transfer oil. Drainage can be made quickly with the inspection plug removed.
- After draining transfer oil, apply sealant to the drain plug and tighten it to the specified torque. In case of the drain plug of magnet type, clean it before installation.
- Fill transfer oil in the specified quantity from the inspection plug hole.
- After filling, wait for 1 minute or more to check that oil is filled up to the neck of the inspection plug hole by inserting a finger to the inspection plug hole. If oil is not sufficient, replenish it.
- After completing work, apply sealant to the inspection plug and tighten it to the specified torque.

M E M O

REMOVAL AND INSTALLATION OF TRANSMISSION (WITH TRANSFER)



● **Removal sequence**

1 Propeller shaft (See Gr25.)
2 Transmission oil cooler hose (See Gr22.)
3 P-range cable (See Gr22.)
4 Frame under bracket
5 Roll stopper cross member
6 Parking brake cable (See Gr36.)
7 Parking brake cable bracket
8 Insulator
9 Shaft bolt
10 Roll stopper bracket
11 Rear engine mounting bracket
12 Cushion rubber
13 Transfer mounting support C
14 Transfer mounting support B
15 Transfer mounting support A
16 Transmission

- Do not remove the insulator unless it is defective.
- When the oil stain is found inside of clutch housing after removing the transmission, check the oil leakage portion of transmission or engine and replace the defective part.

● Installation sequence

Follow the removal sequence in reverse.

- Check and adjust the parking brake lever after the installation. (See Gr36.)

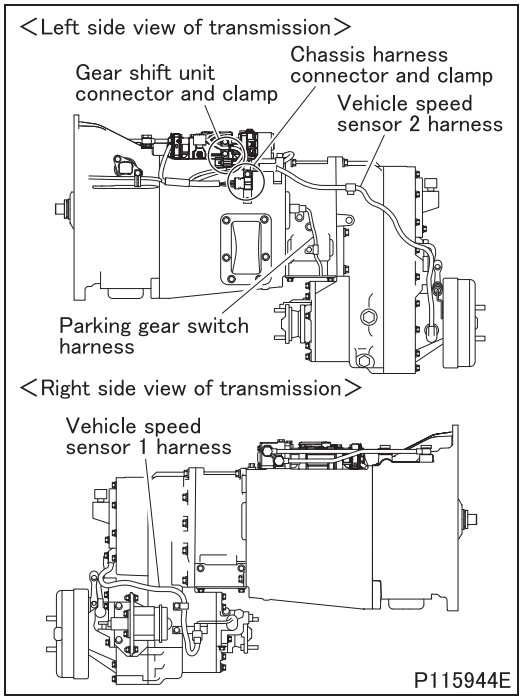
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (transmission mounting)	235 ± 35 {175 ± 26, 24.0 ± 3.6}	–
Tb	Bolt (transmission mounting)	47.1 {35, 4.8}	–
Tc	Nut (insulator mounting)	46 ± 8 {34.0 ± 5.9, 4.7 ± 0.8}	–
Td	Nut (frame under bracket mounting)	146.5 ± 13.5 {110 ± 10, 15.0 ± 1.4}	–
	Nut (roll stopper cross member mounting)		
Te	Nut (rear engine mounting bracket mounting)	$58.7^{+6.3}_{-8.7}$ {$43^{+4.6}_{-6.4}$, $6.0^{+0.6}_{-0.9}$}	–
Tf	Bolt (roll stopper bracket mounting)	55 ± 10 {41.0 ± 7.4, 5.6 ± 1.0}	–
Tg	Nut (cushion rubber mounting)	50 ± 5 {37.0 ± 3.7, 5.1 ± 0.5}	–
Th	Bolt (transfer mounting support mounting)	145 ± 25 {105 ± 18, 15.0 ± 2.5}	–
Ti	Bolt (parking brake cable bracket mounting)	75 ± 10 {55 ± 7.4, 7.6 ± 1.0}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Mating surface of clutch housing and engine	ThreeBond 1215	As required

◆Removal procedure◆



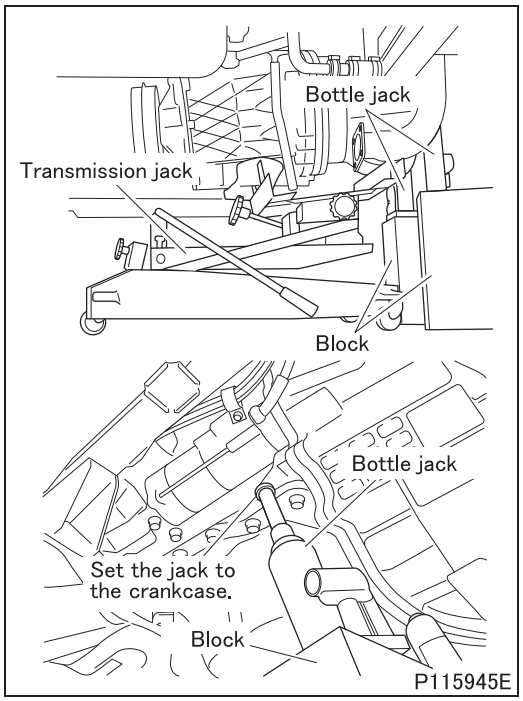
■ Removal: Harness

- Remove the harnesses shown in the illustrations from the transmission. As to the portion of harness that cannot be removed from under the vehicle, remove it in the process of removal of the transmission from the engine.

CAUTION ⚠

- **The harnesses are clamped to the transmission at places. An attempt to remove them by pulling with connector only removed could result in a damaged harness.**

- Remove the gear shift unit harness connector and clamp.

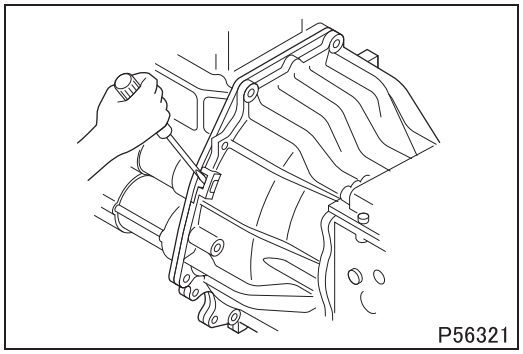


■ Removal: Transmission

- Apply the transmission jack and two bottle jacks to the transmission and engine block respectively as shown in the drawing before removing the transmission mounting bolts (to the engine and mounting support).
- Place a block under the jacks to apply bottle jacks to the engine block.

CAUTION ⚠

- **If the engine is not supported by the bottle jack, it will fall when the transmission is removed.**

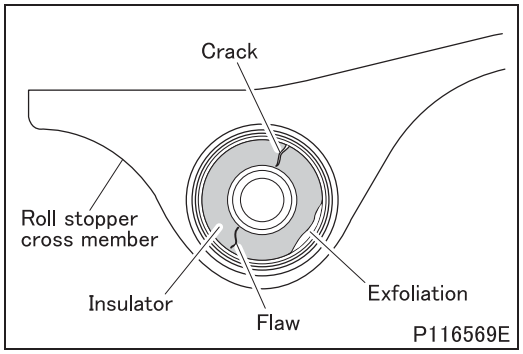


- Insert a screwdriver into the three removal grooves and pry the transmission from the engine.
- Move the transmission backward until the spline of the drive pinion is detached from the clutch.

CAUTION ⚠

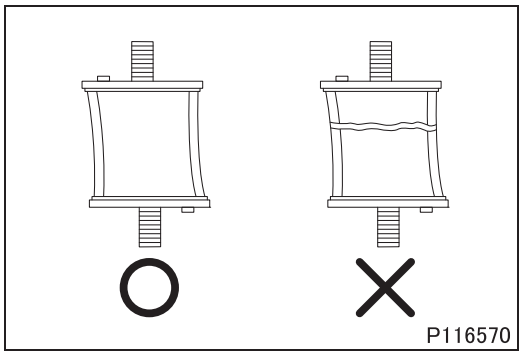
- **Make sure that you pull the transmission out in a straight line. If you seesaw the transmission violently, you will damage the spline that connects the drive pinion and the clutch.**

◆Inspection procedure◆



■ Inspection: Insulator

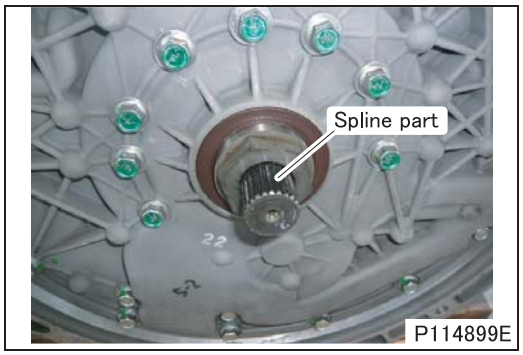
- Inspect the insulator, as fitted to the roll stopper bracket, for flaw, crack, exfoliation or any other defect in the rubber. Replace the insulator if it is defective.



■ Inspection: Cushion rubber

- Check the entire periphery of the cushion rubber for crack, breakage, oily stains or any other defect.
- Replace the cushion rubber if it is defective.

◆Installation procedure◆

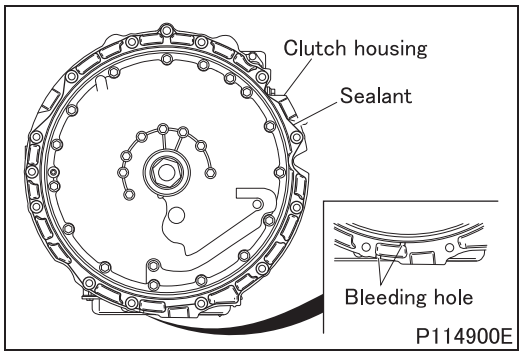


■ Installation: Transmission

- Check the spline of the drive pinion of dual clutch for rust.
- If rust is found, remove it using a wire brush.

CAUTION ⚠

- **Do not apply grease to the drive pinion as it may cause abnormal noise.**



[Applying sealant]

- Apply sealant following manners shown below.

CAUTION ⚠

- **Take care not to apply sealant under any of the following conditions. Otherwise it causes water infiltration.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**
  - **The applied sealant covers the bleeding hole of the clutch housing and engine parts.**

<Case of using nozzle gun>

- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

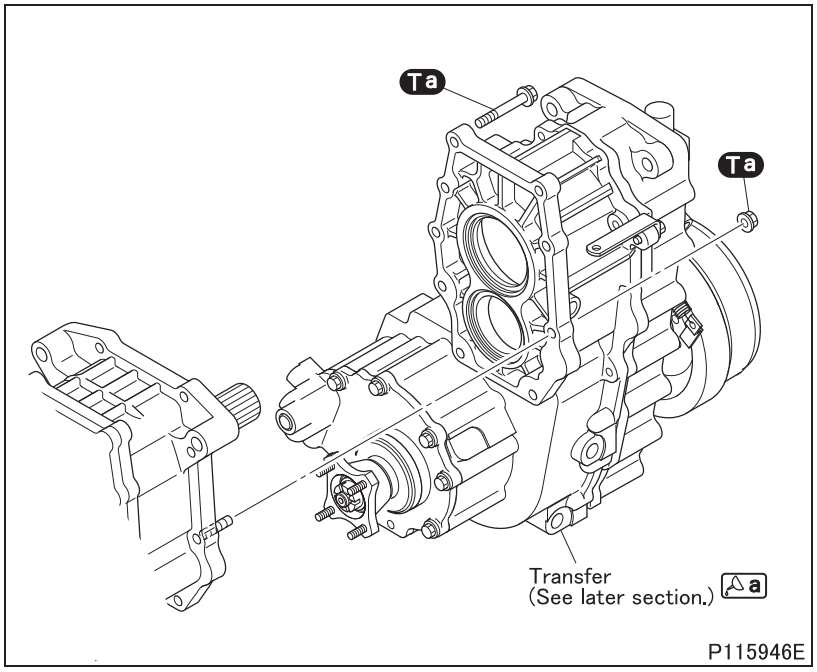
[Installation]

- After applying the sealant, install the transmission before the sealant dries. Be sure not to allow the sealant to be displaced.
- Do not start the engine within one hour after installing the transmission.
- When loosing or removing transmission mounting bolts, be sure to reapply the sealant.

- Support the transmission on the transmission jack, and insert the transmission into the pilot bearing of the flywheel paying attention to the drive pinion spline.
- Tighten transmission mounting bolts to the specified torque.

M E M O

REMOVAL AND INSTALLATION OF TRANSFER



CAUTION ⚠

- **Do not shake the transmission violently when removing the transfer from it, as doing so may damage the mainshaft end and gears.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks

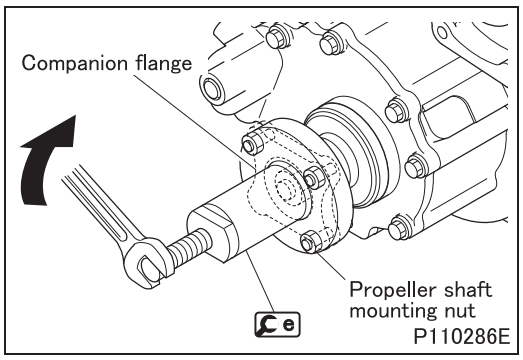
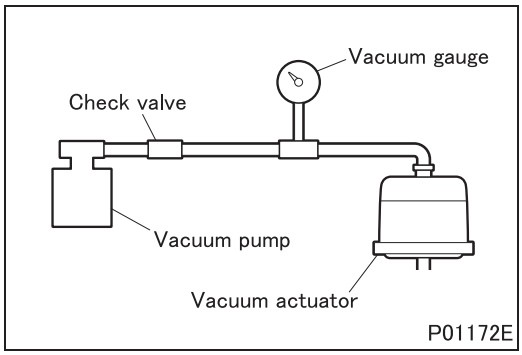
◆Removal procedure◆



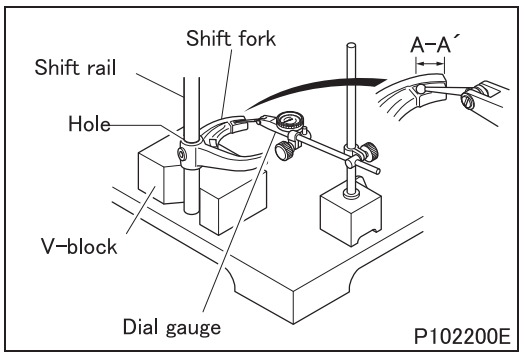
■ **Removal: Companion flange**

◆Inspection procedure◆



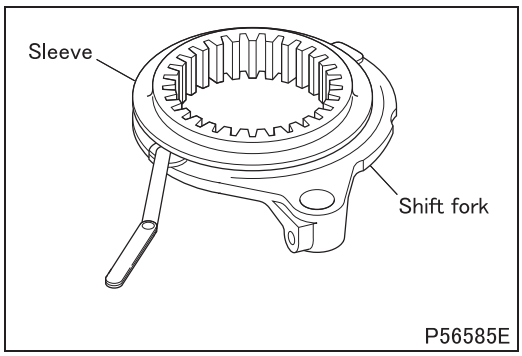
■ **Inspection: Vacuum actuator**

- Pipe the vacuum pump, check valve and vacuum gauge, apply negative pressure of 66.7 kPa {19.7 in.Hg, 500 mmHg} to the vacuum actuator, and stop the vacuum pump. After 15 seconds, measure the negative pressure with the vacuum gauge.
- If the measured value deviates from the standard value, replace the vacuum actuator.



■ **Inspection: Tilt of front drive shift fork claws**

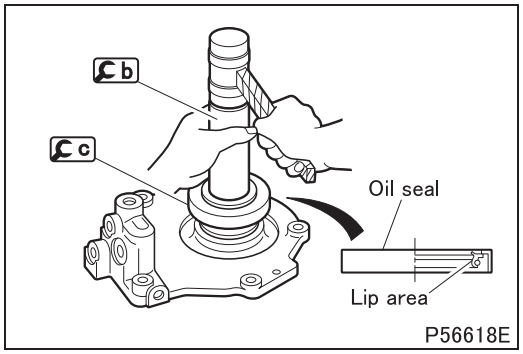
- Measure the tilt (difference between A and A') of claw A–A' against the front drive shift rail hole of front drive shift fork with pressing the rail to V-block and standing it vertically.
- If the measurement exceeds the limit, replace the front drive shift fork.



■ **Inspection: Clearance between front drive shift fork and synchronizer sleeve**

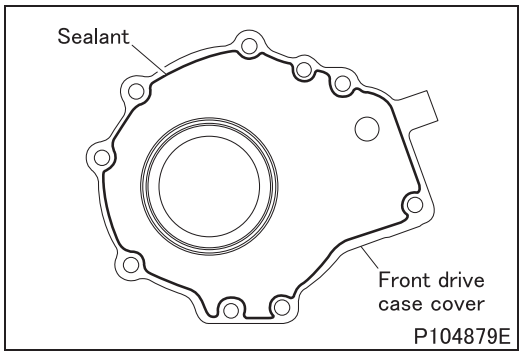
- If the measured value exceeds the limit, replace defective parts.

◆Installation procedure◆



■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install it on the front drive case cover in the illustrated direction.



■ **Installation: Front drive case cover**

[Applying sealant]

- Apply sealant following manners shown below.

CAUTION ⚠

- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

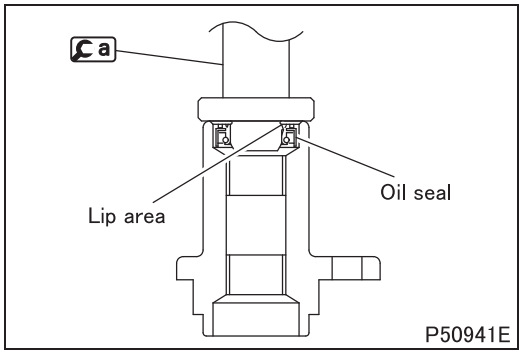
- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

[Installation]

- After applying the sealant, install the front drive case cover before the sealant dries. Be sure not to allow the sealant to be displaced.
- Do not start the engine within one hour after installing the front drive case cover.
- When loosing or removing front drive case cover mounting bolts, be sure to reapply the sealant.



■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install it in the illustrated direction.

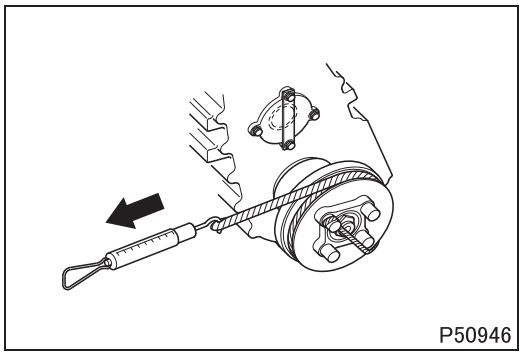
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Transfer mating surface of idler rear cover	ThreeBond 1215	As required
	Transfer mating surface of input rear cover		
b	O-ring	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Flange puller A: ϕ95 {3.74} B: ϕ100 {3.94} C: ϕ90 {3.54}  P56577	MH061848	Removal of companion flange

◆Work before removal◆

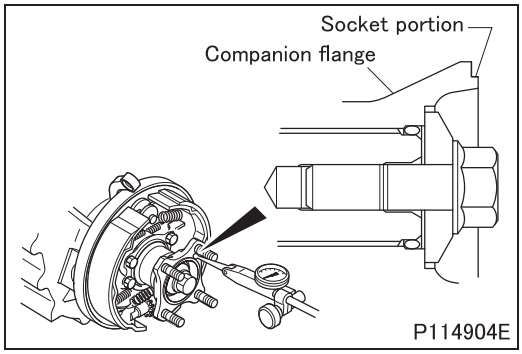


P50946

■ **Inspection: Startup torque of idler gear bearing**

- Measure the tangential force at the outer diameter of the parking brake drum using a spring balance.

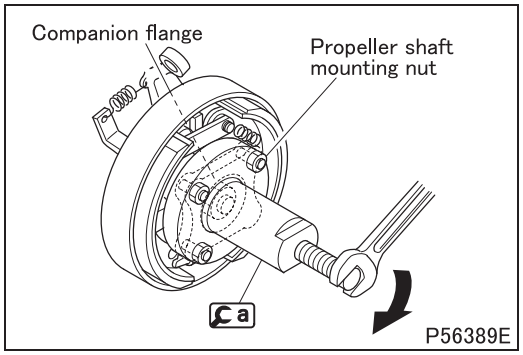
◆Removal procedure◆



P114904E

■ **Inspection: Runout at socket portion of companion flange**

- After removing the parking brake drum, measure runouts of the companion flange at its socket portion.
- If the measurement exceeds the specified limit, replace the companion flange.



■ **Removal: Companion flange**

◆**Installation procedure**◆

■ **Installation: Companion flange**

- Install the companion flange as follows.

[Heating]

- Heat the companion flange evenly to 140°C {284°F} using one of the following methods.

<Temperature-controlled chamber>

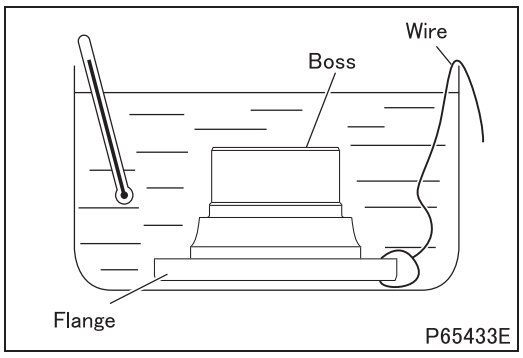
- Heat the companion flange with a temperature setting of 140°C {284°F} for more than 30 minutes.

<Ring heater>

- Repeat a heating process two to three times with a temperature setting of 140°C {284°F} so that the entire companion flange is evenly heated to 140°C {284°F}.
- Measure the temperature on the boss, not on the flange.

CAUTION ⚠

- **Repeat the heating process two to three times because sufficient thermal expansion of the companion flange cannot be achieved in a single heating process.**



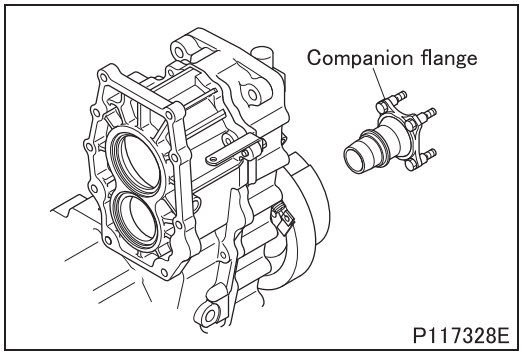
<Oil bath>

- Heat transfer fluid to 140°C {284°F} and immerse the companion flange in the oil bath in the illustrated orientation.

CAUTION ⚠

- **Be sure to put the companion flange in the oil bath with its boss facing up. If the boss is facing down, its edge will make direct contact with the heat source, thus heating the companion flange to higher than 140°C {284°F}.**

- Since the transfer fluid temperature drops when the companion flange is immersed in the oil bath, reheat the fluid to 140°C {284°F} and keep the companion flange immersed in the oil bath for more than 20 minutes while maintaining the fluid temperature at 140°C {284°F}.



[Installation]

- Install the companion flange.

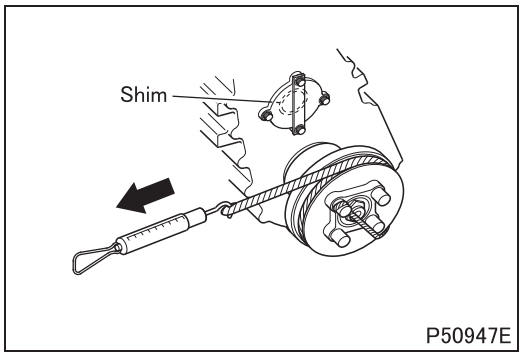
WARNING ⚠

- **Take care not to burn yourself when installing the hot companion flange.**

CAUTION ⚠

- **If the companion flange is too hot, it may cause damage to the oil seal on the transfer cover. Do not overheat the companion flange.**

◆Work after installation◆



■ Inspection: Starting torque of pinion bearing

- Measure the tangential force at the outer diameter of the parking brake drum using a spring balance.
- If the tangential force meets the specified value, the startup torque becomes the standard value.
- If the measured value deviates from the standard value, adjust by changing thickness of the shim.
  Kinds of shim: 0.10, 0.15, 0.20, 0.50 mm {0.0039, 0.0059, 0.0079, 0.020 in.}

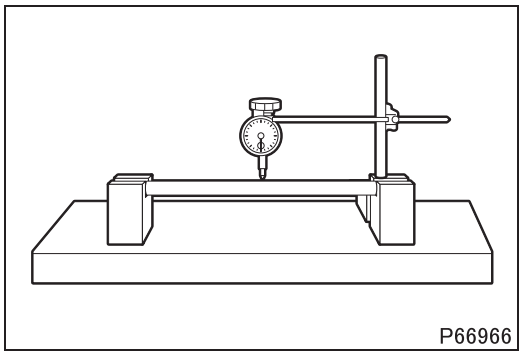
◆Inspection procedure◆

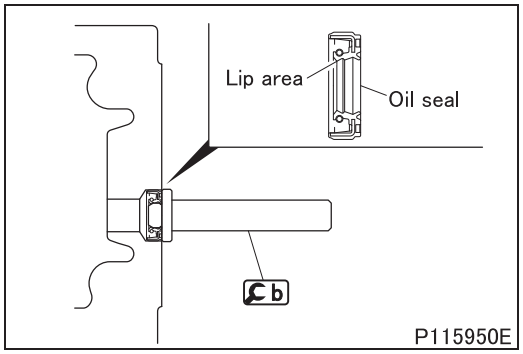


P66966

■ Inspection: Bend of front drive shift rail

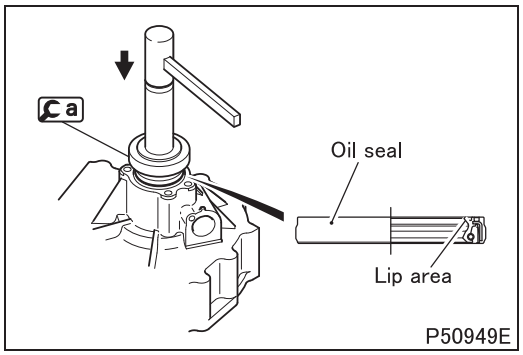
- Measure the extent of bending at the middle of the front drive shift rail.
- While rotating the front drive shift rail by one revolution, read how much the dial gauge needle will move. A half of the reading observed represents the bend, if any, of the shaft.
- If measurement exceeds the limit, correct or replace the front drive shift rail.

◆Installation procedure◆



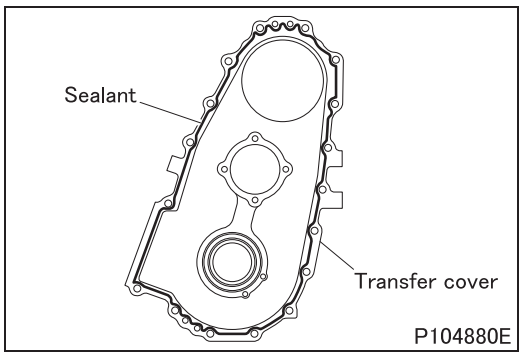
■ **Installation: Oil seal**

• Apply grease to the lip area of the oil seal and install it on the transfer cover in the illustrated direction.



■ **Installation: Oil seal**

• Apply grease to the lip area of the oil seal and install it on the transfer cover in the illustrated direction.



■ **Installation: Transfer cover**

[Applying sealant]

• Apply sealant following manners shown below.

CAUTION ⚠

- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

• Clean the mating surfaces of each part.
• Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

• Clean the mating surfaces of each part.
• Apply sealant evenly on the entire mating surfaces.

[Installation]

• After applying the sealant, install the transfer cover before the sealant dries. Be sure not to allow the sealant to be displaced.
• Do not start the engine within one hour after installing the transfer cover.
• When loosing or removing transfer cover mounting bolts, be sure to reapply the sealant.

STRUCTURE AND OPERATION

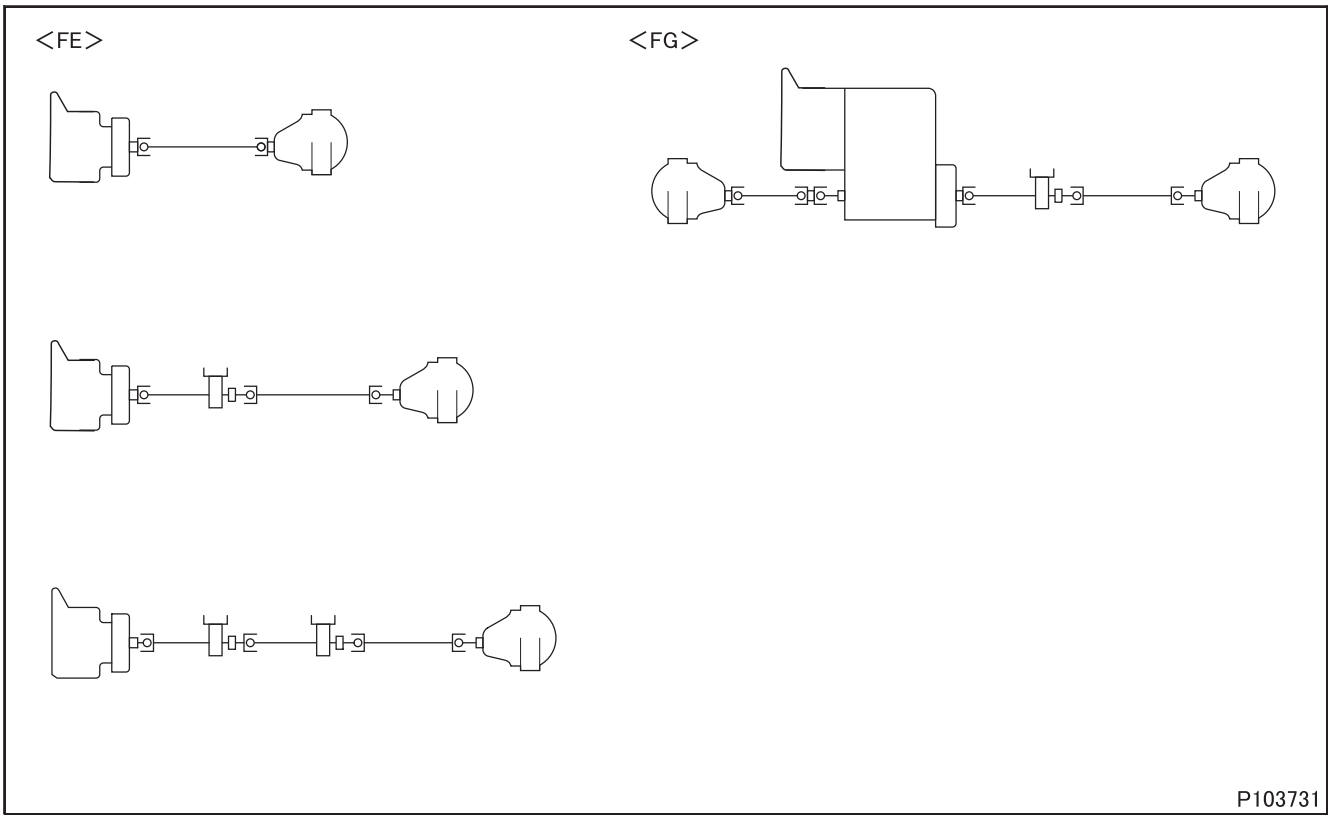
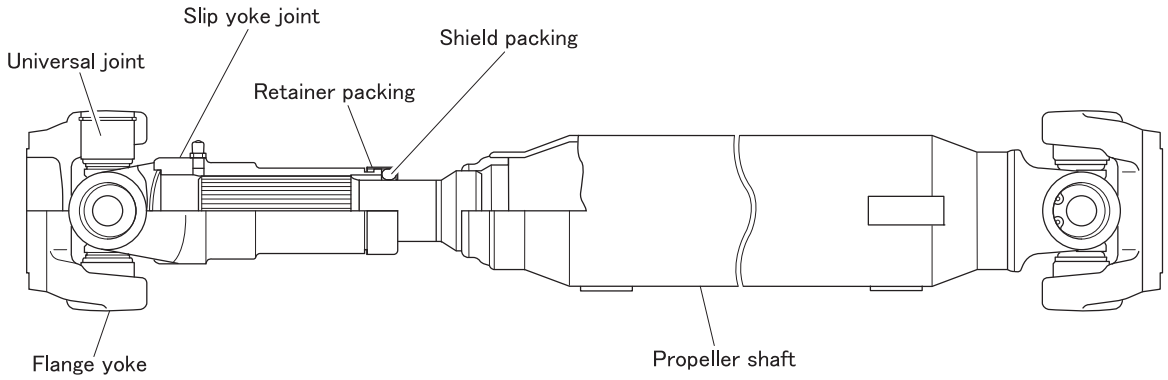
1. Configuration of Propeller Shaft Connection

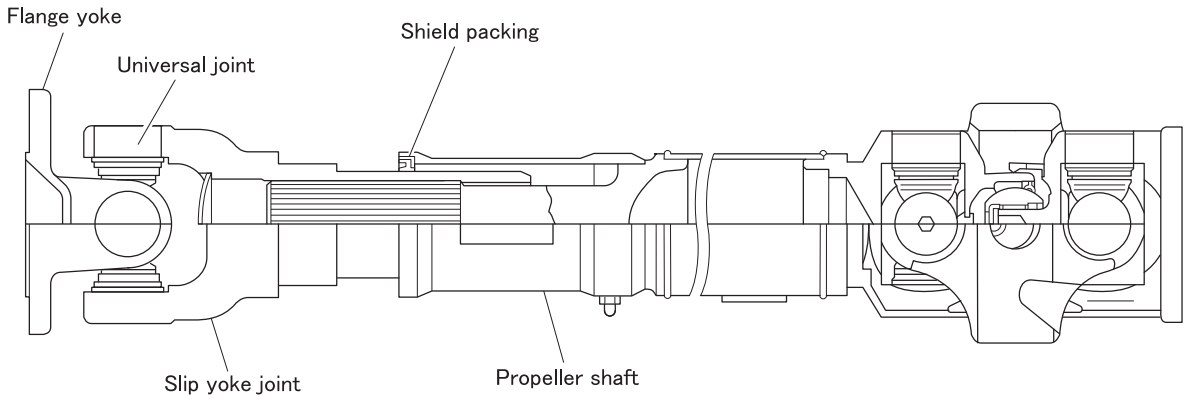


2. Propeller Shaft <Without Center Bearing>

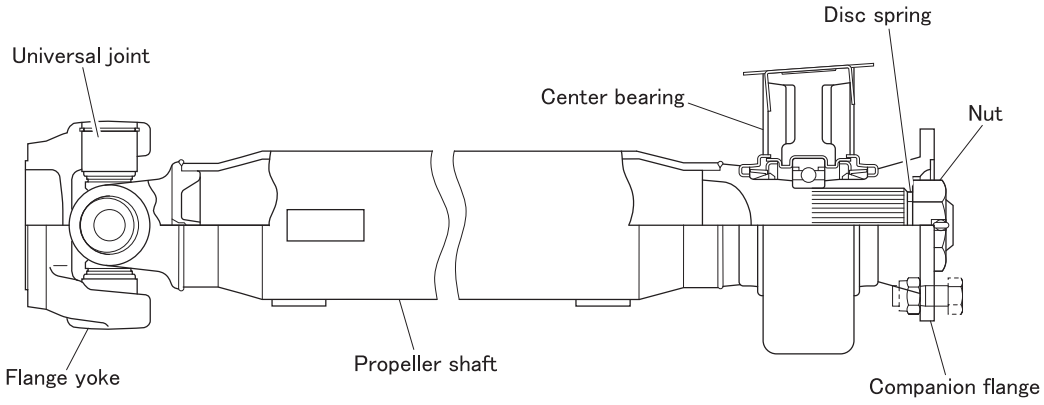
<Without center bearing (except double cardan type)>



<Without center bearing (double cardan type)>

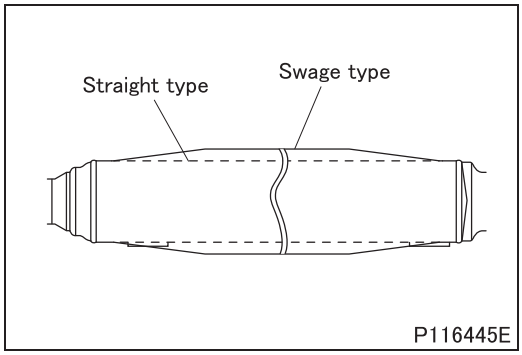


<With center bearing>

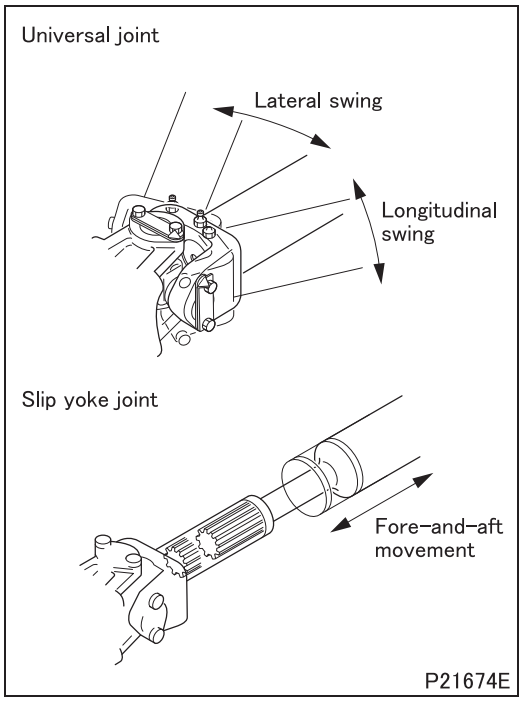


P116444E

- Propeller shafts used with FG front axles are of double cardan type suited for suppressing vibrations caused by angle changes in the universal joint.



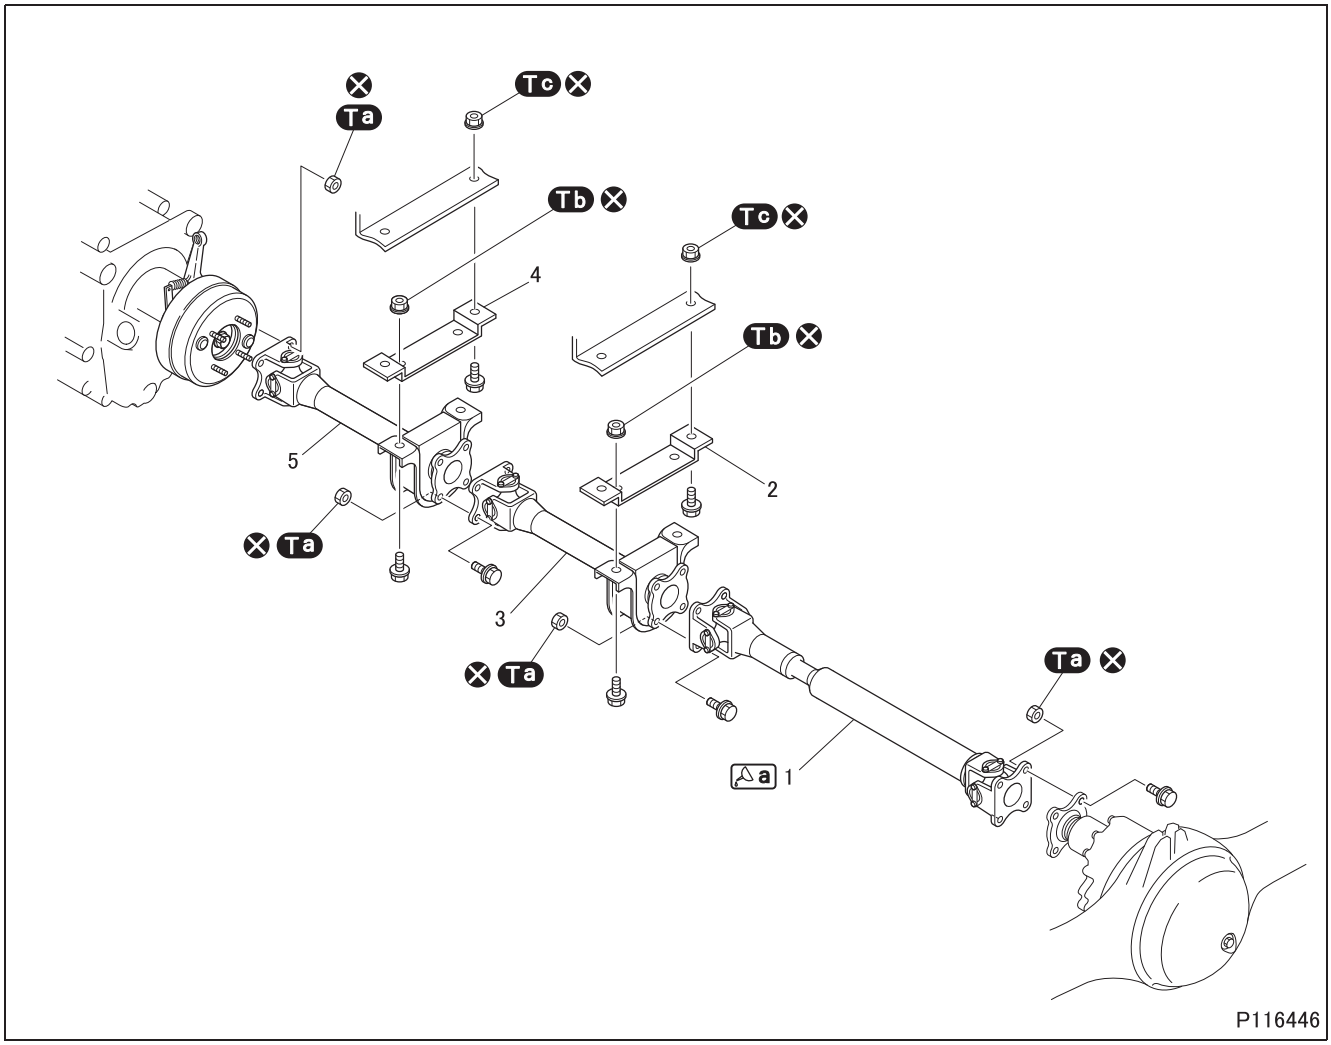
- Propeller shafts are available in straight type and swage type.



- Relative positions of the transmission and rear axle vary depending upon the unevenness of the road surface and the vibration and load fluctuations that occur during vehicle operation. The universal joint and the slip yoke joint are provided to absorb these influences.

Symptoms / Possible causes		Propeller shaft vibrates		Abnormal noise from propeller shaft	
		Vibration at high speed	Vibration at low speed	Abnormal noise at acceleration from zero or at coasting	Abnormal noise at a constant speed
Wrong combination of flange yoke directions		O			
Slip yoke joint	Insufficient grease				O
	Excessive play at spline		O	O	
Universal joint	Excessive clearance in axial direction of spider shaft		O		O
	Insufficient needle bearing greasing				O
	Worn out needle bearing	O		O	O
Center bearing	Insufficient grease				O
	Seizure, wear or improper rotation	O			O
	Deteriorated or deformed cushion rubber			O	
	Loose hanger mounting bolt			O	
Propeller shaft	Loose mounting bolts	O		O	
	Bent	O			
	Dynamic balance improper	O			
Transmission in high speed gear			O		

REMOVAL AND INSTALLATION OF PROPELLER SHAFT <BETWEEN T/M (OR TRANSFER) AND REAR AXLE>



- Shown above is the removal and installation of two-section propeller shaft for FE. The same service procedure applies to other propeller shafts.

● Removal sequence

1 Propeller shaft <Without center bearing> (See later section.)
2 Center bearing bracket <With center bearing>
3 Propeller shaft <With center bearing> (See later section.)
4 Center bearing bracket <With center bearing>
5 Propeller shaft <With center bearing> (See later section.)

⊗: Non-reusable parts

CAUTION ⚠

- **Securely chock the wheels so that the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**

● Installation sequence

Follow the removal sequence in reverse.

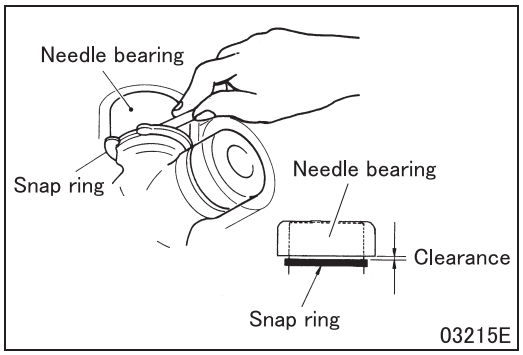
Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Universal joint tool set A: Yoke assembly B: Push rod C: Guide D: ϕ29 {1.14}, E: ϕ29 {1.14}, F: ϕ27.7 {1.09} 	MB999024 A: MB999025 B: MB999026 C: MB999010	Removal and installation of needle bearing

◆Work before removal◆

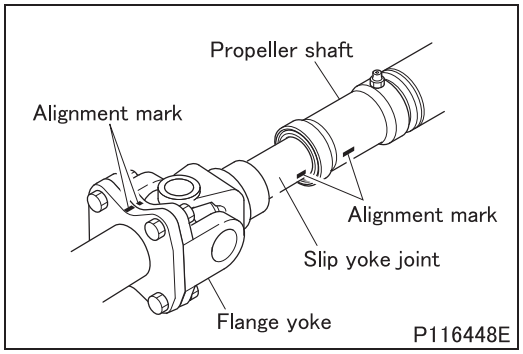


■ Inspection: Axial clearance of spider

- Press down on the needle bearing, and measure clearances between snap ring and flange yoke, slip yoke joint and propeller shaft.
- If the measured value exceeds the standard value, change snap ring thickness for adjustment.
  To adjust, use snap rings for both ends with the same thickness. Select an optimal combination of snap rings from the table below if necessary.

Variety and combination of snap rings (solid line indicates best combination)

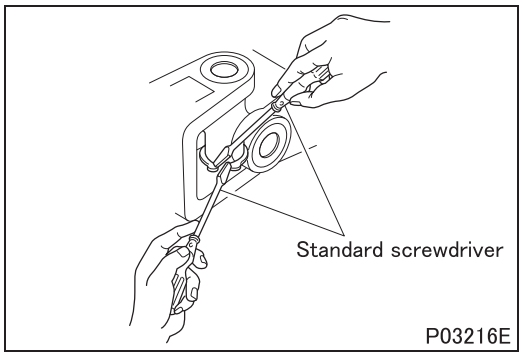
Thickness	Identification color	Combination	Thickness	Identification color
1.5 mm {0.059 in.}	None		1.5 mm {0.059 in.}	None
1.55 mm {0.061 in.}	Yellow		1.55 mm {0.061 in.}	Yellow
1.6 mm {0.063 in.}	Blue		1.6 mm {0.063 in.}	Blue
1.65 mm {0.065 in.}	Purple		1.65 mm {0.065 in.}	Purple



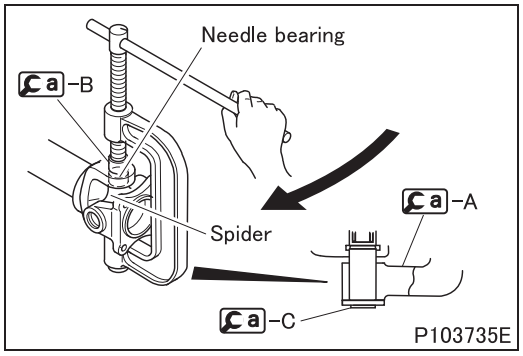
■ **Alignment mark: Propeller shaft**

- To prevent assembly of wrong parts, make alignment marks on the flange yoke, slip yoke joint and propeller shaft.

◆Removal procedure◆



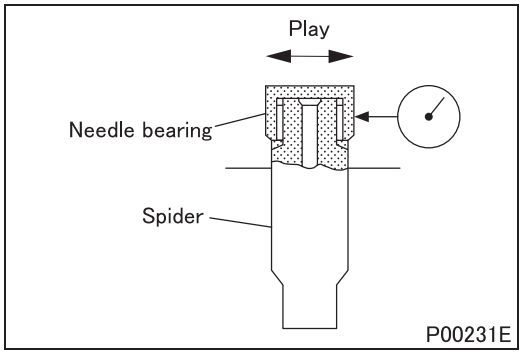
■ **Removal: Snap ring**



■ **Removal: Needle bearing**

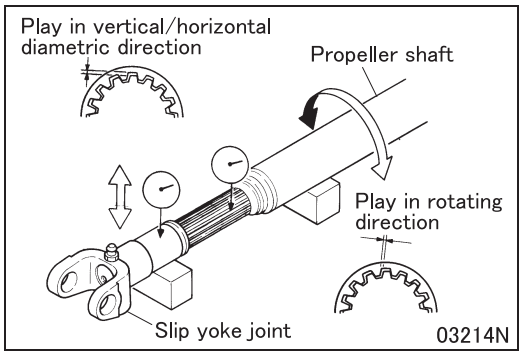
- Fit a-C into a-A from outside.
- Apply a-B to the spider, screw a-A to force out spider and remove needle bearing.

◆Inspection procedure◆



■ **Inspection: Clearance between needle bearing and spider**

- If the measurement exceeds the limit, replace with the universal joint spider kit.

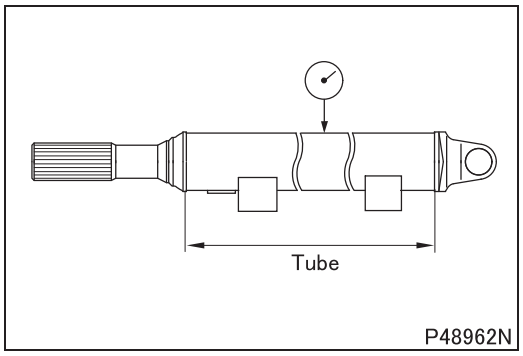


■ **Inspection: Play between slip yoke joint and propeller shaft spline**

- Check the following, and if the measurement is higher than the limit, replace the faulty part.

(1) Play of spline in rotating direction

(2) Play of spline in vertical/horizontal diametric direction



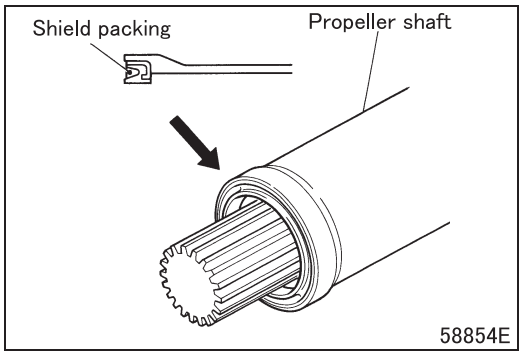
■ **Inspection: Bend of propeller shaft**

- Measure bend of propeller shaft at the center of its tube.
- If the measurement is higher than the limit, correct the bend with a press or replace the propeller shaft.

NOTE

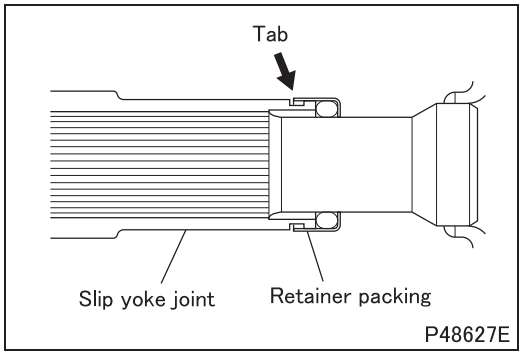
- **To measure the bend of propeller shaft, turn it fully once and read the dial gauge indicator. The bend is one half of the indicated value.**
- **Check the propeller shaft for cracks in the welded area after correcting the bend using a press. If cracking is found, replace the shaft.**

◆Installation procedure◆



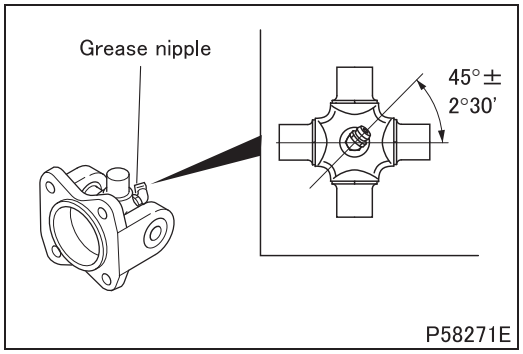
■ **Installation: Shield packing**

- Install shield packing flush onto propeller shaft in the illustrated direction.



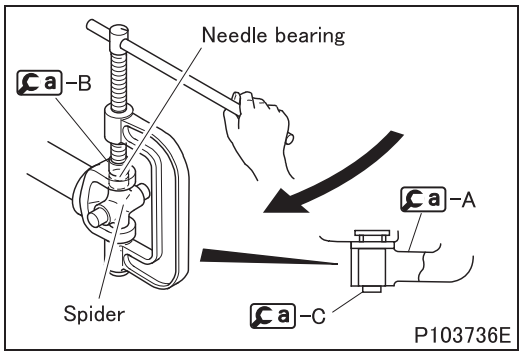
■ **Installation: Retainer packing <Except double Cardan type>**

- Hold the retainer packing against the slip yoke joint and crimp the tabs (in eight places).



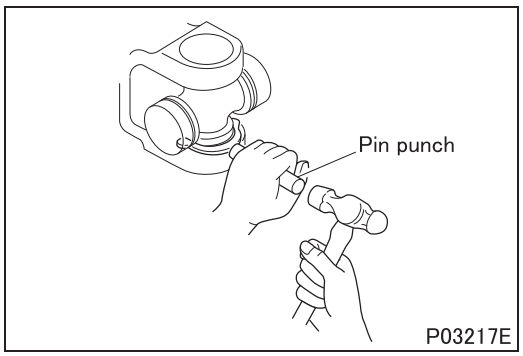
■ **Installation: Grease nipple**

- Install the grease nipple on the spider at an angle conforming to the indication in the illustration.



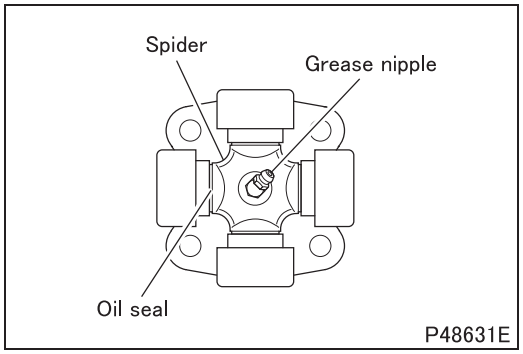
■ **Installation: Needle bearing**

- Fit a-C into a-A from inside.
- Apply a-B to the spider, screw a-A to install needle bearing into place.



■ **Installation: Snap ring**

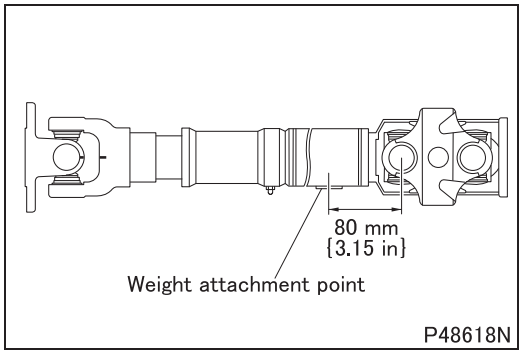
◆Work after installation◆



■ **Lubrication: Grease nipple**

- Fill grease through grease nipple until clean grease overflows from all of the four oil seals of the spider.
- If grease does not overflow from all of the four oil seals or rust, water and dirt come out with the grease, replace the spider with a spider kit.

◆Inspection procedure◆



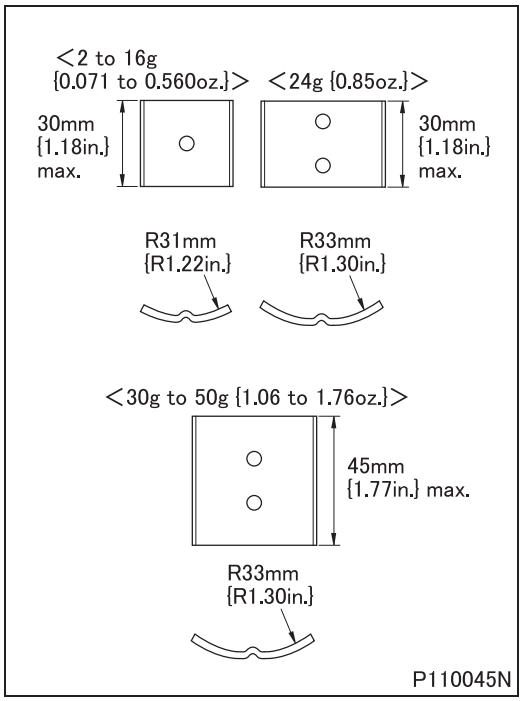
■ **Inspection: Propeller shaft**

[Inspection]

- Measure the amount of balance (dynamic balance) of completed propeller shaft assembly on a balancing machine.
- If the measured value exceeds the standard value, make adjustments as follows.

[Adjustment]

- Attach appropriate weights at the illustrated points so that the amount of unbalance comes within the specified standard value.
- Maximum weight allowance for one point is 100 g {3.53 oz.}.
- Use a combination that keeps the number of balance pieces to a minimum.



- Available weights

Mass
2 g {0.071 oz.}
4 g {0.14 oz.}
6 g {0.21 oz.}
8 g {0.28 oz.}
10 g {0.35 oz.}

	Outer diameters of right and left tires remarkably different							O		
	Handling of tires inadequate								O	

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection and Adjustment of Wheel Alignment

Before carrying out inspection and adjustment of wheel alignment, set the vehicle to the following condition.

- Park the vehicle unloaded on a level surface.
- The vehicle needs to be equipped with proper size tires.
- If the wear condition of tires on the right is remarkably different from that of tires on the left, replace tires.
- Inflate tires to specified pressure.
- Correct if the vehicle tilts due to faulty suspension.
- Service all parts of the front axle and ensure that there is no fault such as the following.
  - Play at or loose kingpin
  - Loose front wheel hub
  - Bolts used for tightening various parts of tie rod arm, knuckle arm and tie rod are loose
  - Bend of knuckle and front axle
- Adjust play at steering wheel properly.
- For wheel alignment, which is related to the side slip amount, both wheel alignment and the side slip amount must conform to the standard values.

Service standards (Unit: mm {in.})

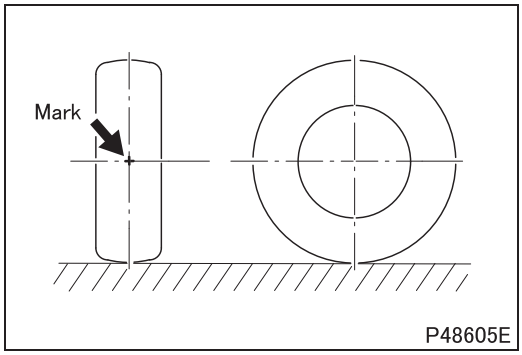
Location	Maintenance item	Standard value	Limit	Remedy
–	Toe-in	0 to 6 (3 ± 3) {0 to 0.24 (0.12 ± 0.12)}	–	Adjust
	Camber	0°15' ± 1°00'	–	Replace
	Caster	1°15' ± 1°00'	–	Replace
	Kingpin inclination angle	8°45' ± 30'	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Clamp nut (tie rod end clamp fastening)	25 ± 5 {18 ± 3.6, 2.5 ± 0.5}	–
–	Alignment gauge adapter	113 ± 15 {83 ± 11, 11.5 ± 1.5}	–

Special tools (Unit: mm {in.})

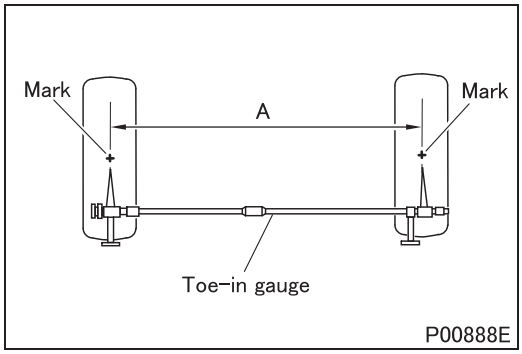
Mark	Tool name and shape	Part No.	Application
a	Hubcap wrench  P49261 A: 0.5 {0.020} B: 78°	MB999108	Removal of hubcap
b	Alignment gauge adapter  P48604 A: ϕ80 {3.15} B: 69 {2.72} C: ϕ45 {1.77} D: M24 × 1.5	MH063428	Measurement of camber, caster and kingpin inclination angle



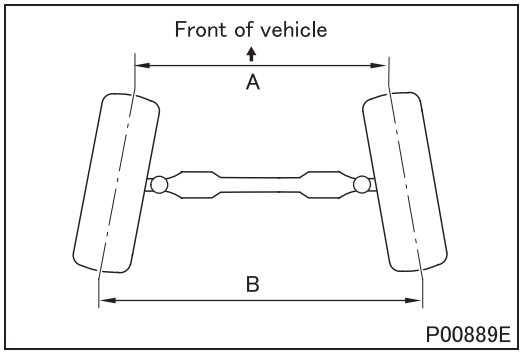
1.1 Inspection and adjustment of toe-in

[Inspection]

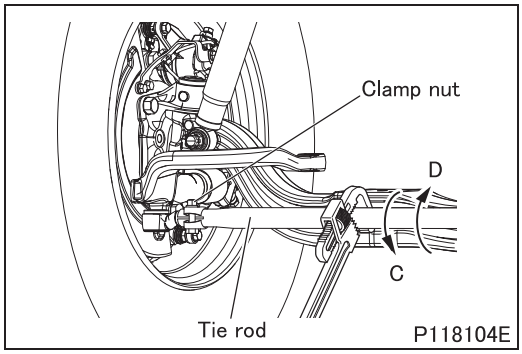
- Position the front wheels exactly to forward running position.
- Mark each tire at the center height in the middle of the tire tread.



- Align the two points of the toe-in gauge with respective marks and measure distance A between the marks.

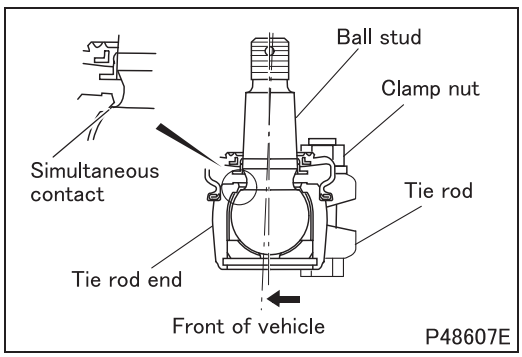


- Push the vehicle to roll the tires 180 degrees.
- Measure distance B between the marks that are now facing the rear of the vehicle.
- If toe-in (difference between A and B) deviates from the standard value, adjust.



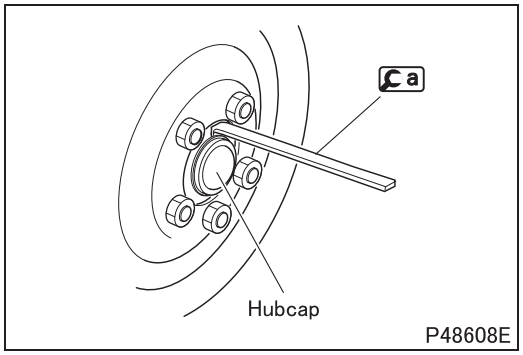
[Adjustment]

- Loosen the clamp nuts on the right and left.
- Turn the tie rod with a pipe wrench to adjust the toe-in.
  C: When adjusting to the toe-out direction
  D: When adjusting to the toe-in direction
- After adjustment, tighten the clamp nut to the specified torque.



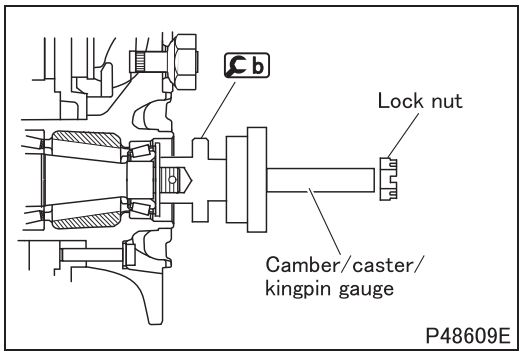
CAUTION ⚠

- **Hold down the tie rod end toward the front of the vehicle with the front wheels positioned to forward running position so that the right and left tie rod ends are in contact with the ball studs at the same time. In this state adjust so that the specified toe-in is achieved and tighten the clamp nut to secure the tie rod.**



1.2 Inspection of camber

- Position the front wheels exactly to forward running position.
- Remove the hubcap using a.

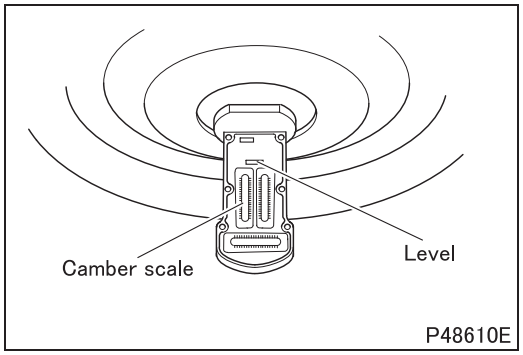


- Remove the lock nut.

CAUTION ⚠

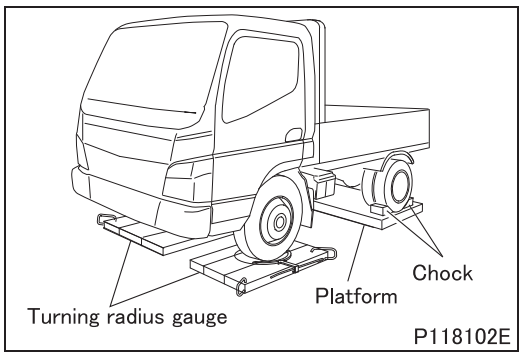
- **Do not apply vehicle weight to the hub bearing with the lock nut loosened.**

- Wipe off grease from the knuckle end, attach b and tighten it to the specified torque.
- Attach the camber/caster/kingpin gauge.

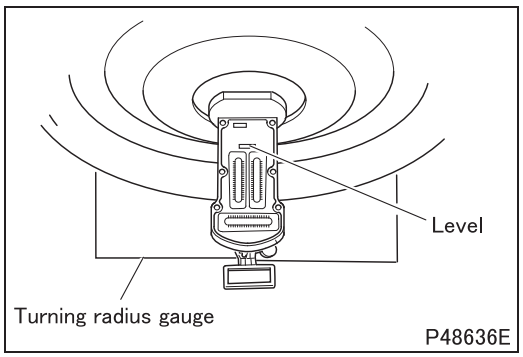


- Place the level in order to have bubble stay in the middle.
- Read center of bubble on camber scale to find the camber. Do the same way for the right and left front tires.
- If the measured value deviates from the standard value, abnormalities such as wear of kingpin and kingpin bushing, loose hub bearing, and bend of knuckle and front axle are suspected. Inspect each part and replace defective parts.

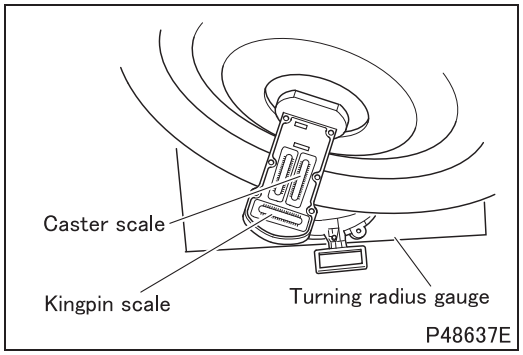
1.3 Inspection of caster and kingpin inclination angle



- Prepare a platform with the same height as the turning radius gauge and place it under the rear wheels so that the vehicle may be placed level.
- Apply chocks to the rear wheels.
- Keep the turning radius gauge locked.
- Jack up the vehicle, and set the right and left front wheels so that respective ground contact area centers of two wheels and turn table centers may meet.



- Unfasten locking of the turning radius gauge, and set the scale to 0 degrees.
- In the same manner as in case of measuring camber in Section **1.2**, attach the camber/caster/kingpin gauge, and set the level so that the bubble comes in the middle.



- With the brake pedal depressed turn steering wheel slowly from the point of 0 degrees on the turning radius gauge, until the direction is changed by 20 degrees each to the right side in case of the right front wheel and to the left in case of the left front wheel.

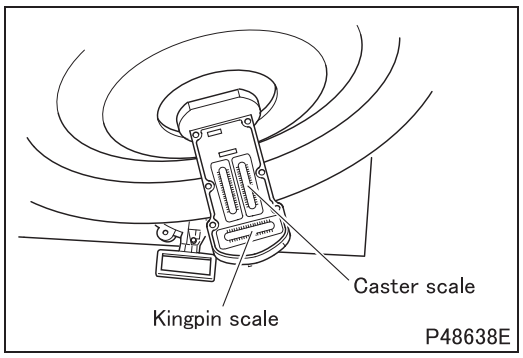
NOTE

- **It is not possible to make exact measurement unless brake is kept applied, because otherwise wheels will turn slightly.**

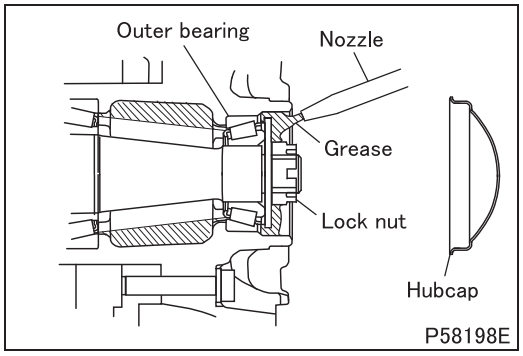
- At the point where the wheel has been turned 20 degrees, set the caster scale and the center of the bubble of the kingpin scale to 0 degrees by turning the adjuster.

NOTE

- **Pay attention to the kingpin scale because it has scales for right and left: align the right kingpin scale in case of the right front wheel, and left kingpin scale in case of the left front wheel.**



- Reverse this position, turn the steering wheel slowly until the direction of the front wheels changes by 20 degrees in the opposite direction.
- Read the center of bubbles at this position at the caster scale and kingpin scale to find caster and kingpin inclination angles.
- If the measured value deviates from the standard value, disassemble the front axle for service.



- After inspection, install the lock nut and measure the starting torque of the wheel hub bearing. (See later section.)
- If the starting torque deviates from the standard value, check the wheel bearings and perform the necessary adjustment. (See later section.)
- Fill the specified amount of grease into wheel hub using a nozzle so that the outer bearing is covered with the grease and then install a new hubcap. (See later section.)

2. Inspection and Adjustment of Steering Angle

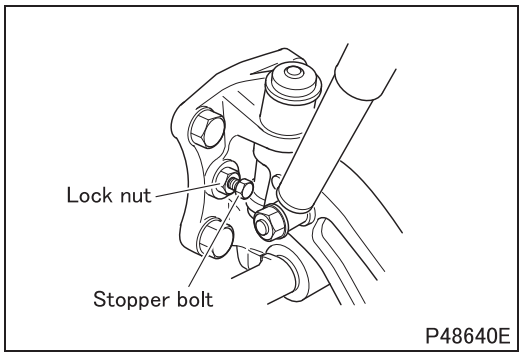
- Perform steering angle inspection and adjustment only after wheel alignment inspection and adjustment has been completed.

Service standards

Location	Maintenance item			Standard value	Limit	Remedy
–	Steering angle	Inside (outside steering angle is for reference only)	FEC5	49° $^{+0°}_{-2°}$ (36°)	–	Adjust
			FEC7, FEC9	45° $^{+0°}_{-2°}$ (34°)	–	Adjust

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut (knuckle stopper bolt mounting)	46.5 ± 7 {34 ± 5.4, 4.75 ± 0.75}	–



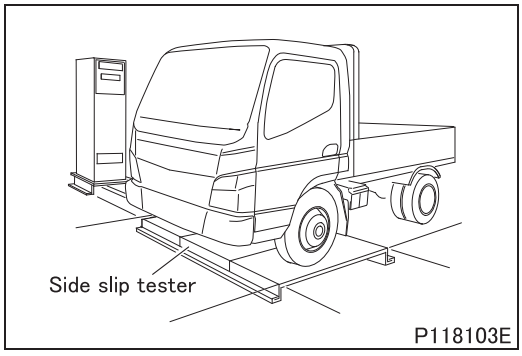
- Set the turning radius gauge and a platform on the vehicle in the same manner as the caster and kingpin inclination angle measurement performed in Section **1.3**.
- Turn the steering wheel right or left completely from the position where the turning radius gauge is set to 0 degrees, and read the scale of the turning radius gauge to measure the steering angle.
- If the measured value deviates from the standard value, adjust with the knuckle stopper bolt and tighten the lock nut to the specified torque.

3. Inspection of Side Slip

- Perform side slip inspection only after wheel alignment inspection and adjustment has been completed.
- For the side slip amount, which is related to wheel alignment, both the side slip amount and wheel alignment must conform to the standard values.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Side slip amount (per 1 m {39.4})	0 to 3 {0 to 0.12}	–	Adjust



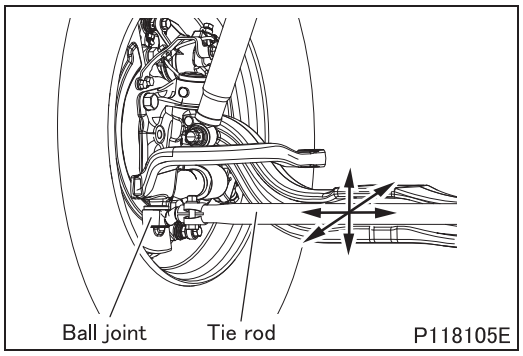
- Position the front wheels exactly to forward running position.
- Move the vehicle forward past the side slip tester as slowly as possible to inspect side slip.

NOTE

- **Pay attention to the following when moving over the side slip tester.**
- **Be sure to hold steering exactly at the forward running position, and make no turns.**
- **Do not apply the brakes.**
- **Keep the speed constant.**

- If the measured value deviates from the standard value, inspect and adjust wheel alignment.

4. Inspection of Tie Rod End Ball Joint



4.1 Play of tie rod end ball joint

- Hold the tie rod section of the tie rod with the vehicle kept stationary, and move it back-and-forth, up-and-down and right-and-left to check for play at the ball joints of the tie rod end.

NOTE

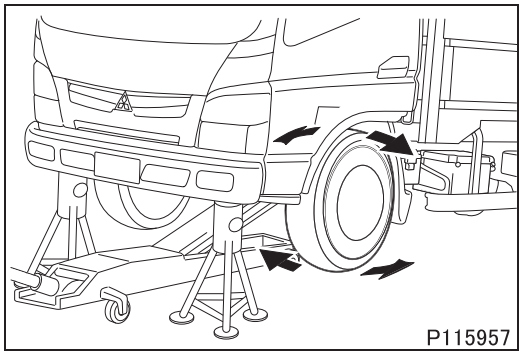
- **Be sure to check for play at ball joints of both right and left sides of the tie rod.**

- If there is any play, replace the tie rod end of the tie rod.

4.2 Dust cover

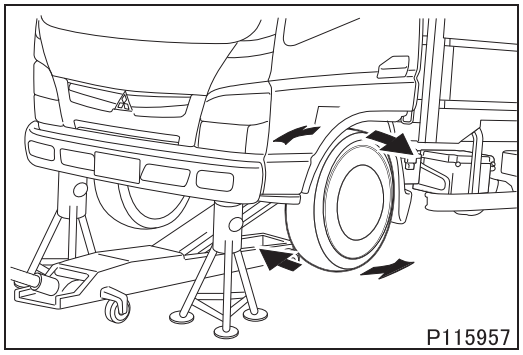
- Check that there is no wear, cracking or damage. Any such abnormalities can cause water to enter the ball joint, resulting in premature wear.
- If wear, cracking, or damage is present, inspect for traces of water entry and rust in the ball joint. If any abnormality is found, replace the tie rod end. If no abnormality is found, replace the dust cover and reapply grease.

5. Inspection of Wheel Bearing for Play



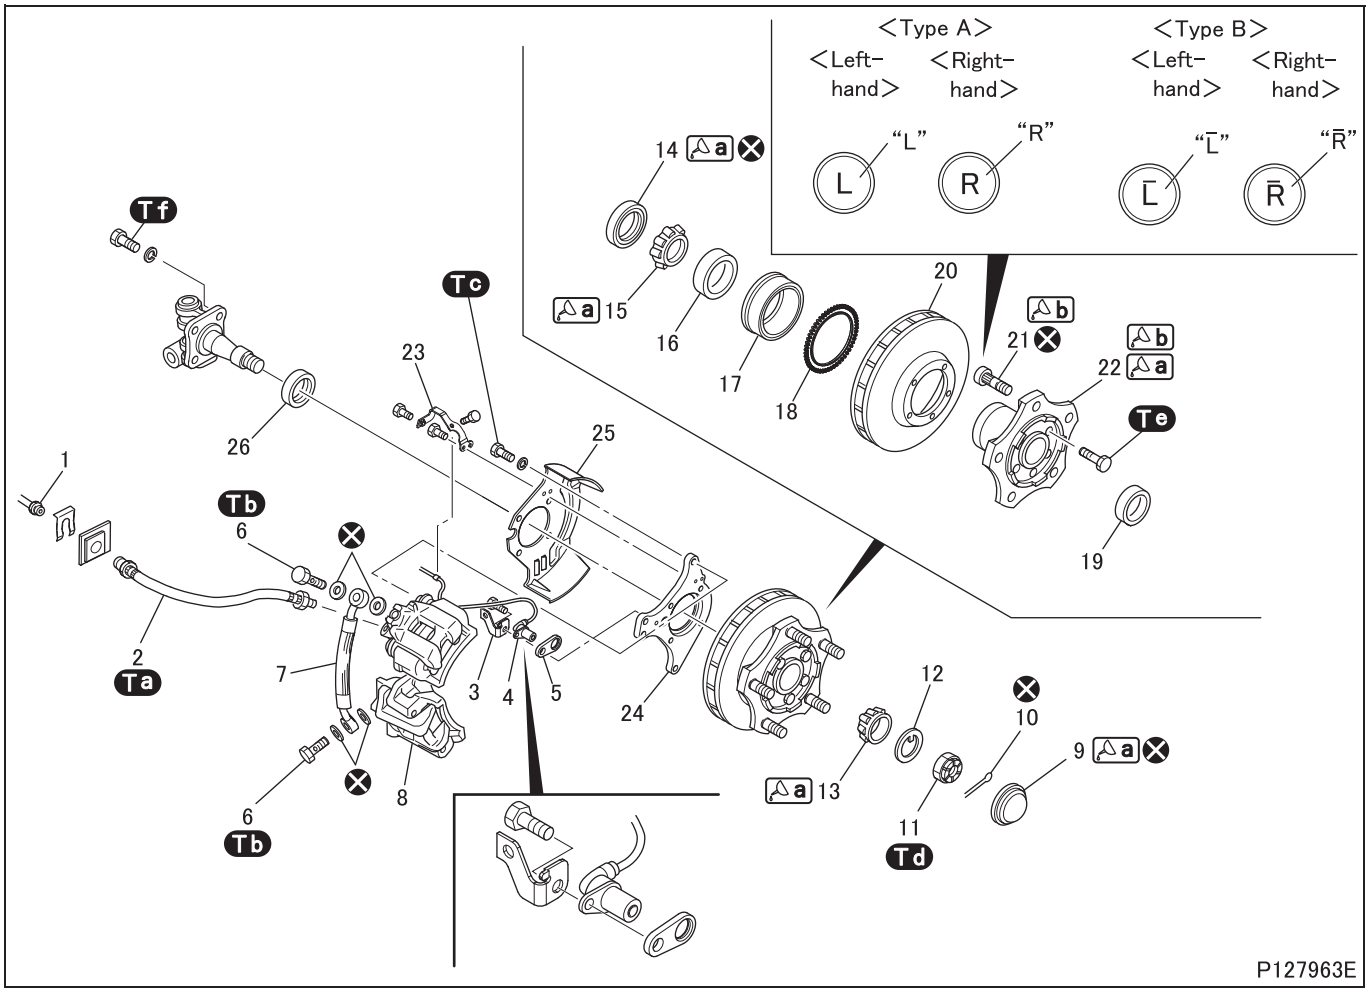
- Jack up the vehicle.
- Try to move the top and bottom of the front tire by hand in the illustrated directions to inspect the wheel bearing for play.
- If play is found with the feel of hands, repeat the inspection procedure while having the brake pedal depressed by another person. When the play is eliminated by applying the brake pedal, the symptom indicates that there is play in the wheel bearing. Then inspect the turning torque of the wheel bearing and adjust it as required. (See “WHEEL HUB AND ROTOR”.)
- If the turning torque of the wheel bearing cannot be adjusted correctly or play still remains after the adjustment, replace the wheel bearing with a new one. (See “WHEEL HUB AND ROTOR”.)

6. Inspection of Knuckle Joint for Play



- Jack up the vehicle.
- Try to move the top and bottom of the front tire by hand in the illustrated directions to inspect the knuckle joint for play.
- If play is found with the feel of hands, repeat the inspection procedure while having the brake pedal depressed by another person. If there is any play, it may be caused by play in the knuckle joint. Check each part and replace a defective part. (See “KNUCKLE AND KING PIN, FRONT AXLE”.)

WHEEL HUB AND ROTOR



● **Disassembly sequence**

1 Brake pipe
2 Brake hose A
3 Sensor bracket
4 Wheel speed sensor
5 Spacer
6 Eyebolt
7 Brake hose B
8 Front disc brake (See Gr35A.)
9 Hubcap
10 Split pin
11 Lock nut
12 Lock washer
13 Outer bearing inner race
14 Oil seal
15 Inner bearing inner race
16 Inner bearing outer race
17 Anti-lock brake system rotor flange
18 Anti-lock brake system rotor
19 Outer bearing outer race
20 Disc rotor
21 Hub bolt
22 Wheel hub
23 Bracket
24 Adapter
25 Dust cover
26 Spacer

⊗: Non-reusable parts

CAUTION ⚠

- **Plug the brake hose to prevent entry of dust and dirt after it has been removed.**
- **When removing the wheel speed sensor, do not apply excessive force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in the open-circuit of the sensor.**
- **Be careful not to damage the tip of the wheel speed sensor after removing it.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Make sure that the disc rotor surface and disc brake pad surface are free from grease to avoid malfunction of the brakes.**
- **Make sure that dust does not enter the brake hose when installing the hose.**
- **Make sure that the brake hose is not twisted when installing it.**
- **Make sure that the brake hose does not interfere with any of surrounding parts when installed.**

- Inspect the drag torque of disc brakes after assembly. (See Gr35.)
- Bleed air from the brake system after assembly. (See Gr35.)

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Starting torque of wheel hub bearing (tangential force at hub bolt position with oil seal assembled)	1 to 3.5 N·m {0.7 to 2.6 ft.lbs, 0.10 to 0.35 kgf·m} (tangential force: 8.8 to 28.4 N {2.0 to 6.4 lbs., 0.9 to 2.9 kgf})	–	Adjust or replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Brake hose		13 to 17 {9.6 to 13, 1.3 to 1.7}	–
Tb	Eyebolt		22 ± 2 {16 ± 1.5, 2.25 ± 0.25}	–
Tc	Bolt (front disc brake mounting)		152 ± 25 {112 ± 18, 15.5 ± 2.5}	–
Td	Lock nut	Primary tightening	113 ± 15 {83 ± 11, 11.5 ± 1.5}	–
		Secondary tightening after primary tightening	59 {44, 6}	Back-off angle 45° (1/8 of a turn)
Te	Bolt (wheel hub and disc rotor mounting)		85.8 ± 12 {63 ± 8.9, 8.75 ± 1.25}	–
Tf	Bolt (adapter mounting)		118 ± 20 {87 ± 1.5, 12 ± 2}	–

Lubricant and/or sealant

Mark	Points of application		Specified lubricant and/or sealant	Quantity
a	Pack outside of wheel hub	5 studs	Wheel bearing grease [NLGI No. 2 (Li soap)]	※65 ± 10 g {2.29 ± 0.35 oz}
		6 studs		※90 ± 10 g {3.17 ± 0.35 oz}
	Pack inside of wheel hub	5 studs		※210 ± 20 g {7.41 ± 0.71 oz}
		6 studs		※155 ± 10 g {5.47 ± 0.35 oz}
	Pack space between rollers of outer bearing inner race and inner bearing inner race			As required
	Lip area of oil seal			
b	Chamfered part of hub bolt holes in wheel hub and knurled part of hub bolts <Type B>		Engine oil	As required

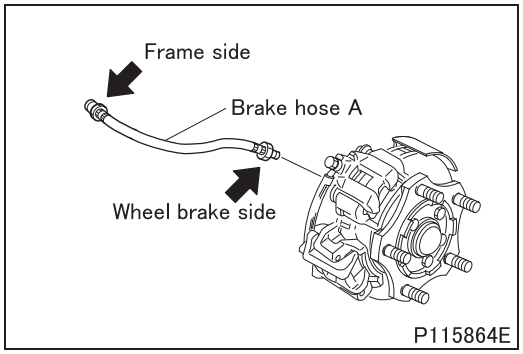
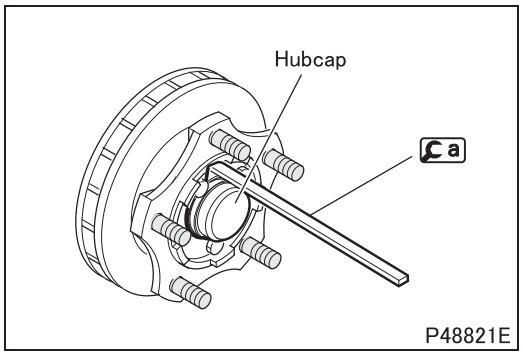
◆Removal procedure◆

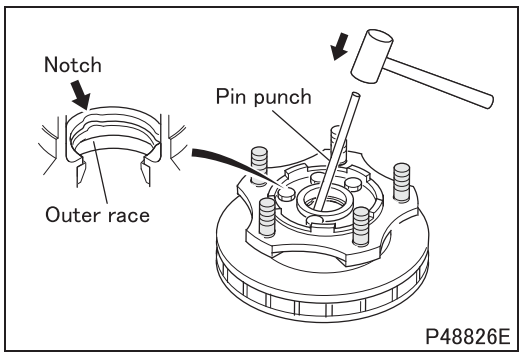


■ **Removal: Brake hose**

• When removing brake hose A, remove it from the frame side first, and then from the wheel brake side.

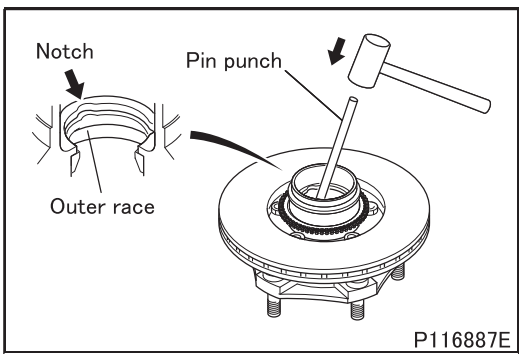


■ **Removal: Hubcap**



■ **Removal: Inner bearing outer race**

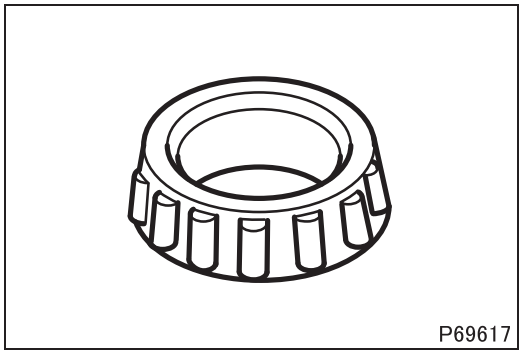
• Drive out the inner bearing outer race by tapping evenly at the three notches in the wheel hub.



■ **Removal: Outer bearing outer race**

• Drive out the outer bearing outer race by tapping evenly at the three notches in the wheel hub.

◆Inspection procedure◆

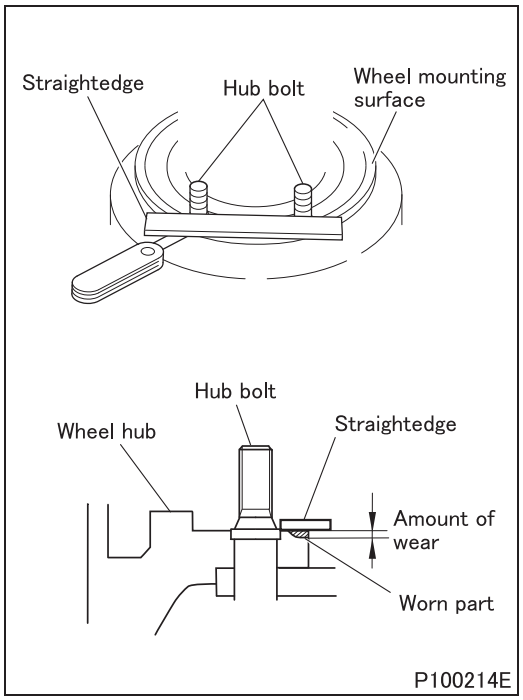


■ Inspection: Outer bearing inner race

- Inspect the outer bearing inner race after cleaning the bearing to remove grease completely.
- If any damage, wear, or a poor rotating conditions are evident in the inner race, replace it with a new one.
- The inner race and outer race should be replaced as a set.

■ Inspection: Inner bearing inner race

- Inspect the inner bearing inner race in the same manner as the outer bearing inner race.
  (See **"■ Inspection: Outer bearing inner race".**)



■ Inspection: Wheel hub

(1) Visual inspection

- Visually and physically inspect the disc wheel mounting surface. If there is damage or cracking on it, replace the wheel hub.
- Make sure that there is no rust, dust, paint or foreign material on the disc wheel mounting surface of the wheel hub to prevent the wheel nut from becoming loose.
- If any abnormality is found, remove it with sandpaper.

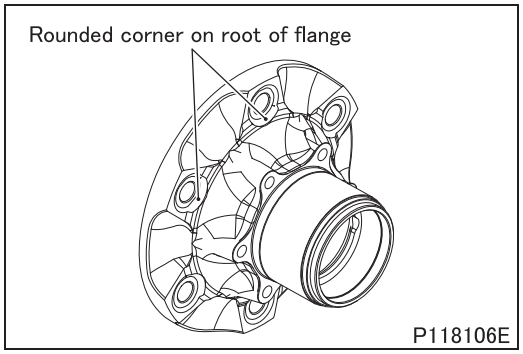
(2) Wear in disc wheel mounting part of wheel hub

- Clean the wheel mounting surface of the wheel hub before inspection.
- Place a straightedge against two hub bolts on the disc wheel mounting surface.

CAUTION ⚠

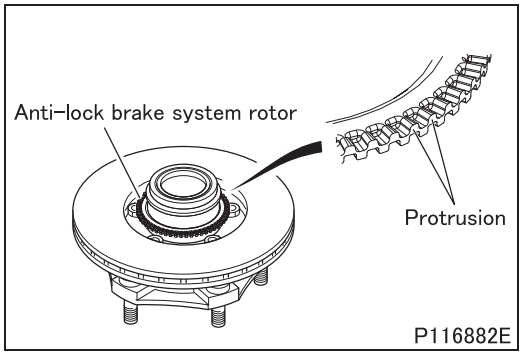
- **Make sure that the straightedge does not run onto the hub bolt.**

- Use feeler gauges to measure the amount of wear at the outer periphery of the wheel hub.
  Measure the amount of wear at every hub bolt.
- If the amount of wear at any point exceeds the following standard value, inspect the wheel hub for cracks.
  Wear standard value: 0.8 mm {0.0031 in.}



(3) Crack check

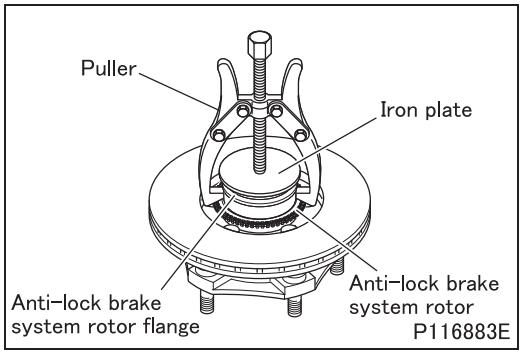
- Inspect for any cracks in the rounded corner on the root of the flange using magnetic particle or liquid penetrant testing. If any cracks are found, replace the wheel hub.
- If any cracks are found in a wheel hub bolt, replace it.
- If there is cracking or stepped wear on the wheel hub mounting surface of the wheel disc, replace it. (See Gr31.)



■ **Inspection: Anti-lock brake system rotor**

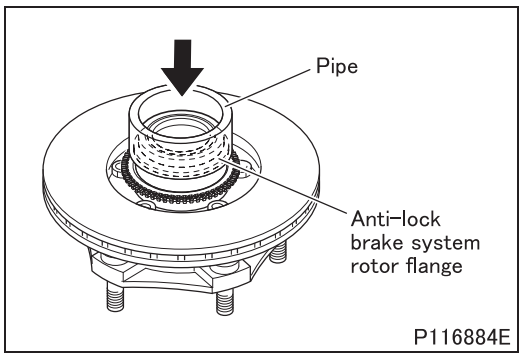
[Inspection]

- Check the protrusions of the anti-lock brake system rotor for chipping and flattening.
- If any abnormality is found, replace the anti-lock brake system rotor.



[Removal]

- Hook the puller on the ABS rotor flange and remove the flange and the ABS rotor.
- Remove the ABS rotor from the ABS rotor flange.



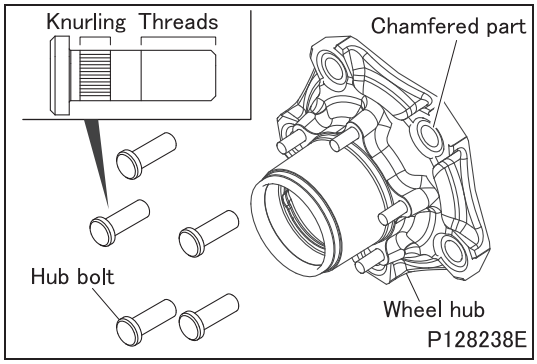
[Installation]

- Install the ABS rotor on the ABS rotor flange.
- Warm the anti-lock brake system rotor flange to approximately 150°C {302°F}.
- Install the anti-lock brake system rotor flange and wheel hub evenly using a pipe so as not to allow them to tilt.

WARNING ⚠

- **Handling the warmed rotor with bare hands may cause burns.**

◆Installation procedure◆

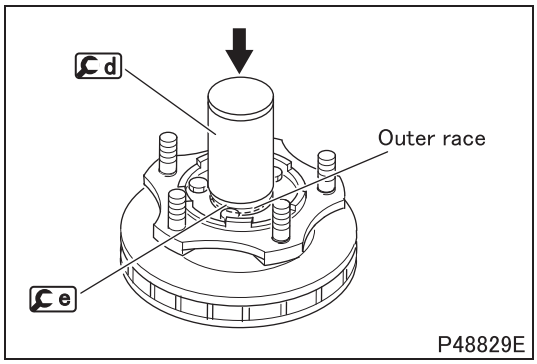


■ **Installation: Hub bolt <Type B>**

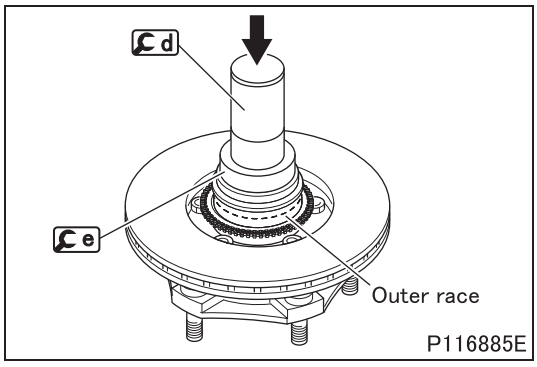
- Apply engine oil over the chamfered part of hub bolt holes in the wheel hub and the knurled part of the hub bolts.

CAUTION ⚠

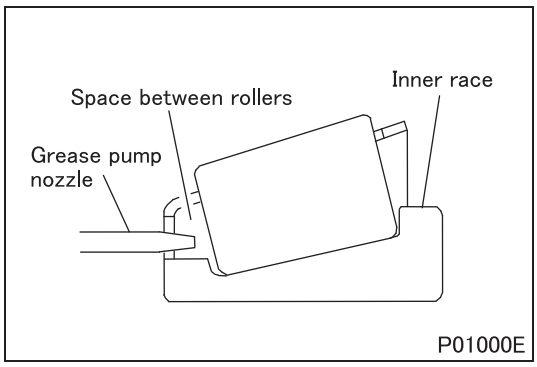
- **Be careful not apply engine oil over the hub bolt threads.**



■ **Installation: Outer bearing outer race**

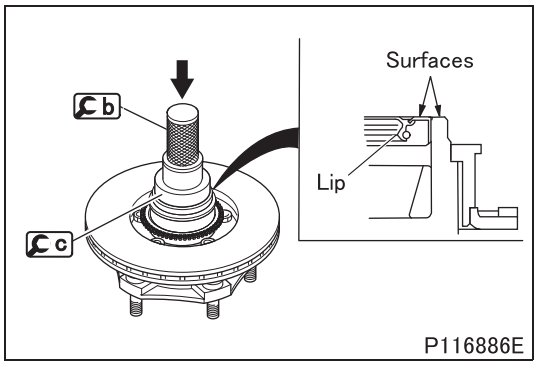


■ **Installation: Inner bearing outer race**



■ **Installation: Packing grease in inner bearing inner race**

- Insert the grease pump nozzle into the space between the rollers of the inner bearing inner race to pack grease sufficiently.

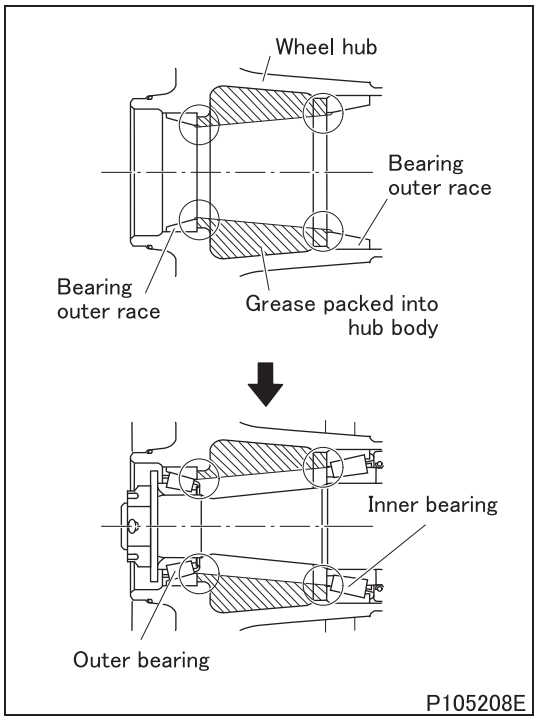


■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install it on the wheel hub as illustrated.

■ **Installation: Packing grease in outer bearing inner race**

- Follow the same procedure as packing the inner bearing inner race with grease.
  (See **"■ Installation: Packing grease in inner bearing inner race".**)

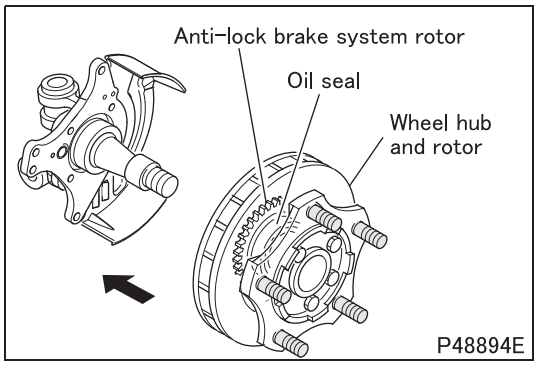


■ **Installation: Packing grease inside of wheel hub**

CAUTION ⚠

- **The wheel bearing may seize if these instructions are not followed.**
- **Apply the specified amount of grease.**

- As shown in the illustration at the left, fill grease inside of the hub body in such a manner that grease covers the outer bearing and inner bearing outer races. Make sure that grease reaches the outer bearing and inner bearing.

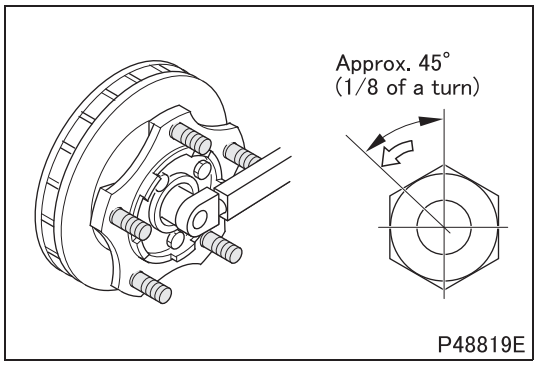


■ **Installation: Wheel hub and rotor**

- Slowly install the wheel hub and rotor assembly so as not to cause damage to the oil seal and anti-lock brake system rotor.

CAUTION ⚠

- **If the anti-lock brake system rotor is damaged, wheel speed sensor signals become abnormal, causing the anti-lock brake system to malfunction.**



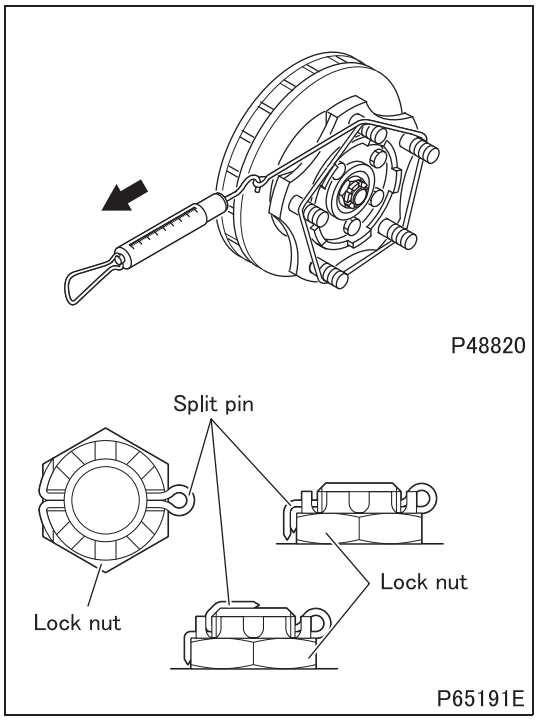
■ **Adjustment: Starting torque of wheel hub bearing**

CAUTION ⚠

- **Unless this adjustment procedure is performed, the wheel bearing may seize.**

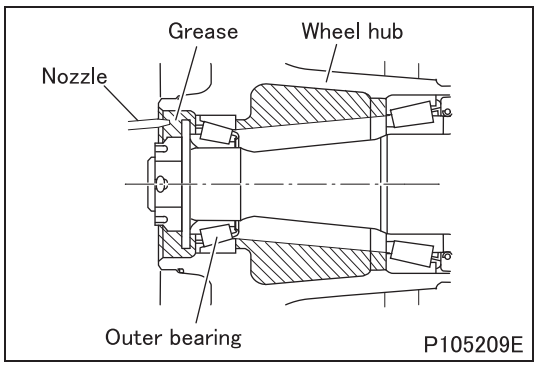
[Adjustment]

- Tighten the lock nut to the specified torque (primary tightening) while turning the wheel hub and rotor, and then loosen it completely.
- Ensure smooth operation of the outer bearing and inner bearing by turning the wheel hub and rotor several times, and then tighten the lock nut to the specified torque (secondary tightening).
- Loosen the lock nut by approximately 45 degrees (1/8 of a turn) and secure it with a split pin. If pin holes do not align, align them while loosening. Make sure that there is no play in the axial direction.



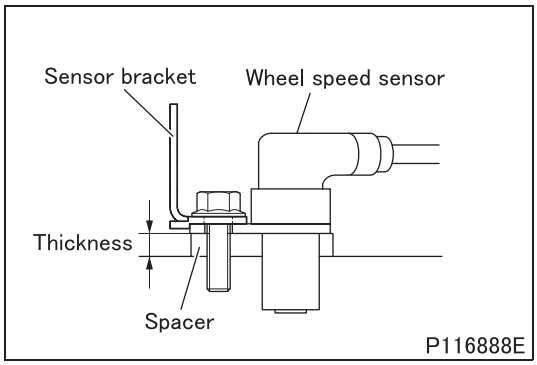
[Inspection]

- After installing the lock nut, perform the following inspection.
- Measure the tangential force at the hub bolt position using a spring gauge.
- If the tangential force is within the specified value, the starting torque conforms to the standard value. When the measured value is the specified value, install the split pin following either of method in the illustration.
- If the measured value deviates from the specified value, repeat the adjustment of the lock nut as it may be insufficient.
- If the result is found to be abnormal, replace the outer and inner bearings.



■ **Installation: Packing grease outside of wheel hub**

- After installing the lock nut, insert the grease pump nozzle into the outside of the wheel hub and fill specified amount of grease, making a grease barrier on the outside of the outer bearing.

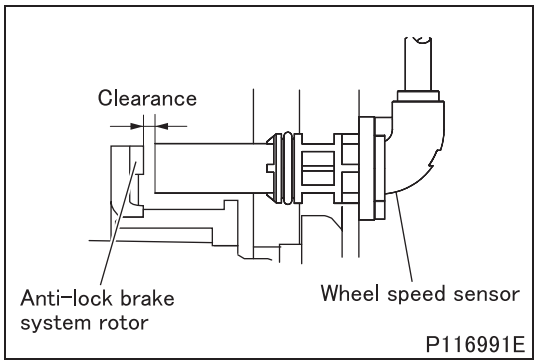


■ **Installation: Spacer, sensor bracket, wheel speed sensor**

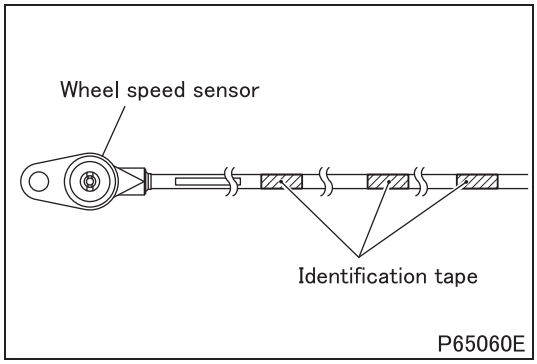
- Install a spacer, sensor bracket and wheel speed sensor in the position shown in the illustration.
  Thickness of spacer: 4.5 mm {0.18 in.}

CAUTION ⚠

- **When installing the wheel speed sensor, never apply a force to it such as tapping it with a hammer, prying it with a screwdriver and pulling the harness, as doing so may damage the wiring.**
- **Be sure to install the specified spacer in the correct place. Using a spacer of an incorrect thickness or installing the spacer in an incorrect place could cause the ABS to malfunction.**
- **Be careful not to damage the O-ring of the wheel speed sensor when installing the sensor.**



- After installing the wheel speed sensor, check that the clearance between the end of the sensor and ABS rotor is the following dimension.
  Clearance: 1 ± 0.7 mm {0.039 ± 0.028 in.}



- Using clips, secure the wheel speed sensor harness in place at the identification tape portions, ensuring that the harness is free of kinks, slack and/or interference with other parts.

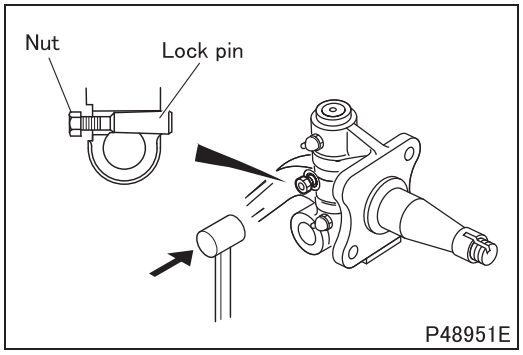
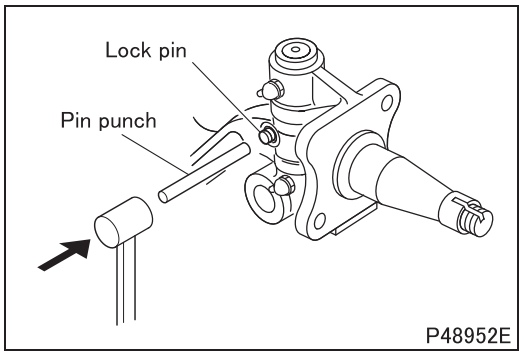
◆Removal procedure◆



P48951E

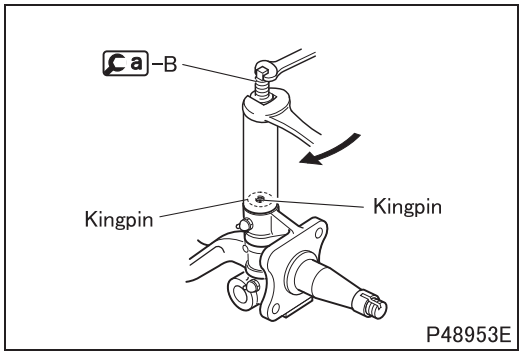
■ **Removal: Lock pin**

- Remove the nut, spring washer and washer.
- Screw in the nut again until just before it is flush with the lock pin, and lightly tap the nut to loosen the lock pin.



P48952E

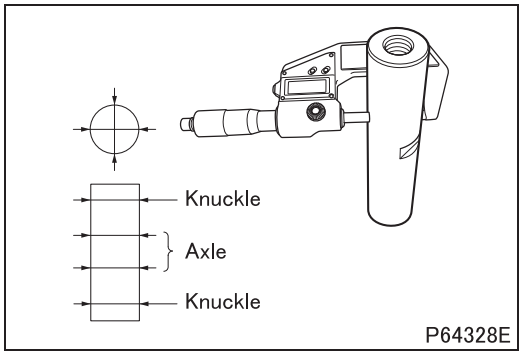
- Remove the nut, apply a pin punch to the lock pin and lightly tap it to remove.



■ **Removal: Kingpin**

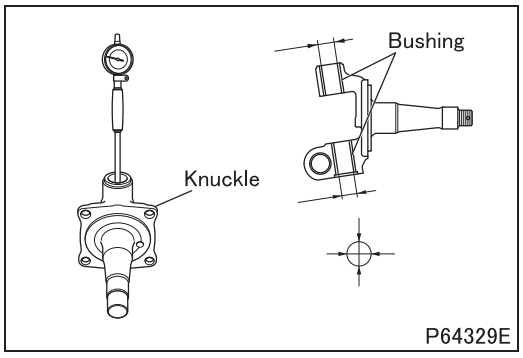
- Screw a -B into the kingpin threads to remove the kingpin.

◆Inspection procedure◆



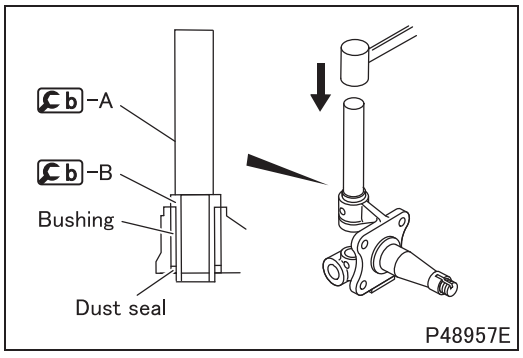
■ **Inspection: Outer diameter of kingpin**

- Take measurement at a total of four levels on the kingpin: two levels for the axle fitting portion and one level each for the upper and lower knuckle fitting portions.
- If the measured value is under the limit, replace the kingpin with a new one.



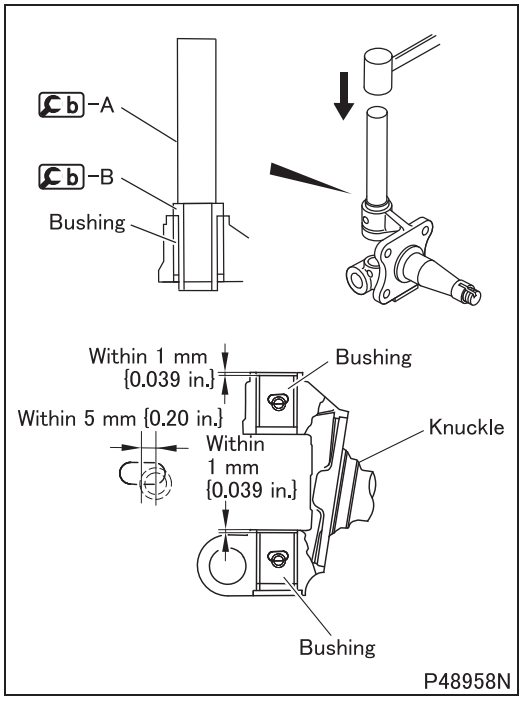
■ **Inspection: Clearance between kingpin and bushing**

- Measure the inner diameter of the upper and lower bushings using a cylinder gauge and calculate the clearance by subtracting the outer diameter of the kingpin from the inner diameter of the bushing.
  If the clearance exceeds the limit, replace the bushings with new ones.



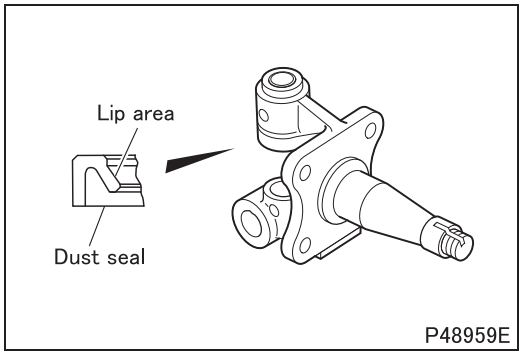
Replacement of bushing
[Removal]

- Remove the bushing and the dust seal at the same time using b.

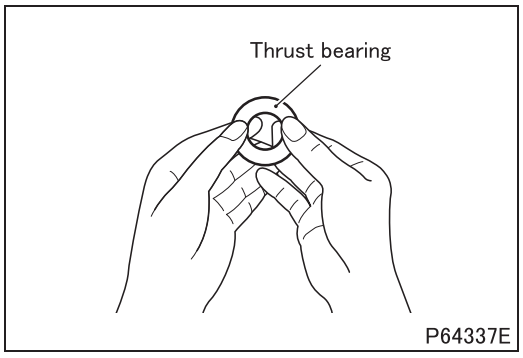


[Installation]

- Install the bushing using Cb so that a step height between the bushing and knuckle is within 1 mm {0.039 in.}.
- The oil hole of the bushing must not deviate from the screw hole of the knuckle more than 5 mm {0.20 in.}.

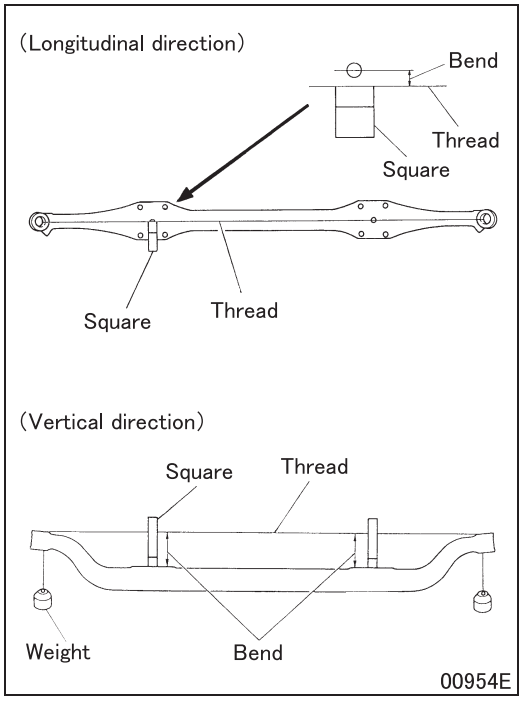


- Apply grease to the lip area of the dust seal and install it on the knuckle in the illustrated direction.



■ Inspection: Thrust bearing

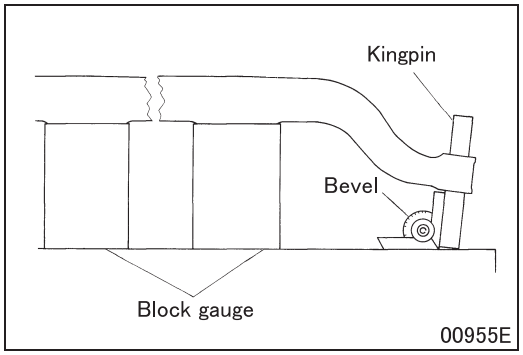
- Inspect the condition and turning of the thrust bearing. If any cracks, damage, or rough turning is found, replace the thrust bearing with a new one.



■ Inspection: Front axle

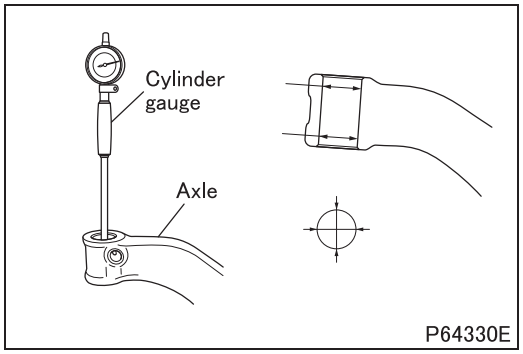
(1) Bend of front axle in the back-and-forth direction and vertical direction

- Put a piece of thread through kingpin holes of the front axle and hang weights at both ends.
- Use a square to find bend to each of back-and-forth and vertical directions.
- If the measured value exceeds the limit, replace the front axle.



(2) Kingpin inclination angle

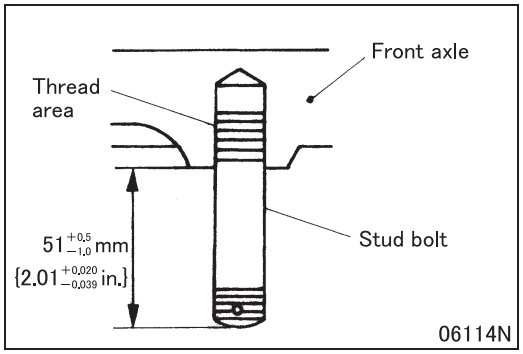
- Set the kingpin on the front axle as illustrated to measure the angle.
- If the measured value deviates from the standard value, replace the front axle.



(3) Clearance between kingpin and front axle

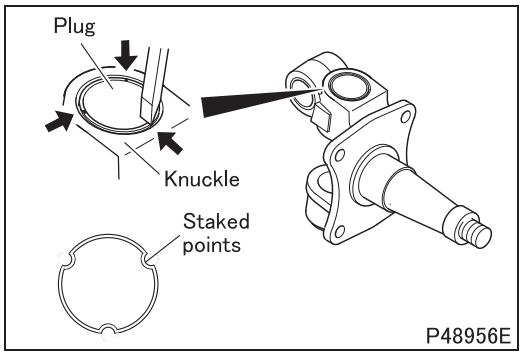
- Measure the inner diameter of the axle's hole where the kingpin is inserted using a cylinder gauge and calculate the clearance by subtracting the outer diameter of the kingpin from the inner diameter.
  If the clearance exceeds the limit, replace the axle or the kingpin with a new one.

◆Installation procedure◆



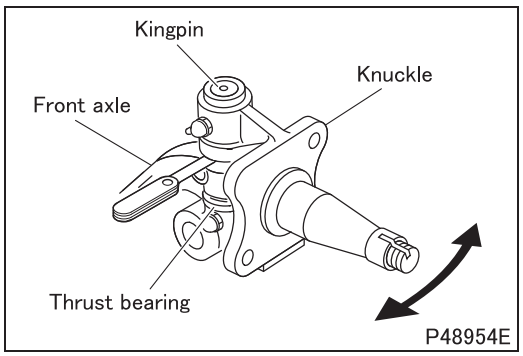
■ Installation: Stud bolt

- Apply Loctite to the front axle mounting threads of the stud bolt.
- Install the stud bolt according to the dimension specified in the illustration.



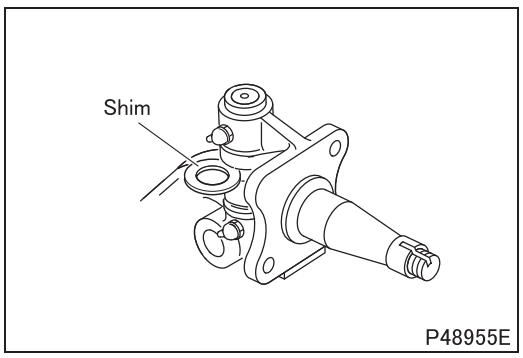
■ Installation: Plug

- After installing the plug, stake the knuckle at three evenly spaced points of the plug circumference avoiding previously staked points.



■ Installation: Knuckle

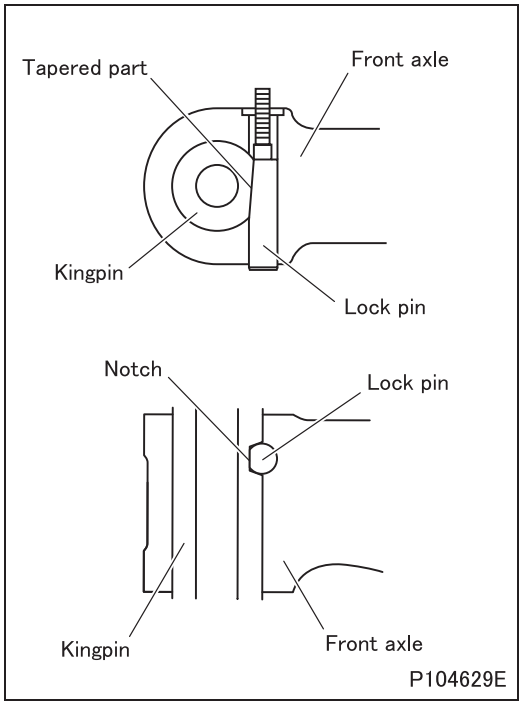
- After temporarily assembling the thrust bearing, knuckle and kingpin into the front axle, move the knuckle several times to smooth its operation.
- Measure clearance between the front axle top face and the knuckle bottom.



- If the measured value exceeds the limit, adjust with a kingpin shim.
  Thickness of kingpin shims available
  0.15, 0.40, 0.50, 0.60, 0.70 mm
  {0.0059, 0.016, 0.020, 0.023, 0.028 in.} (five thickness)

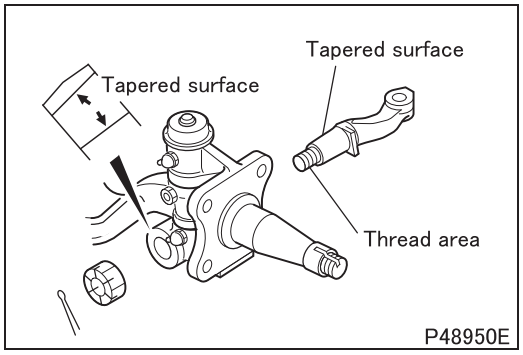
CAUTION ⚠

- **Select a kingpin shim so that the clearance is as small as possible within the range of the standard value.**
- **After assembly, make sure that the knuckle moves smoothly.**



■ **Installation: Lock pin**

- Install the lock pin so that the tapered part of the lock pin is aligned with the notch of the kingpin.



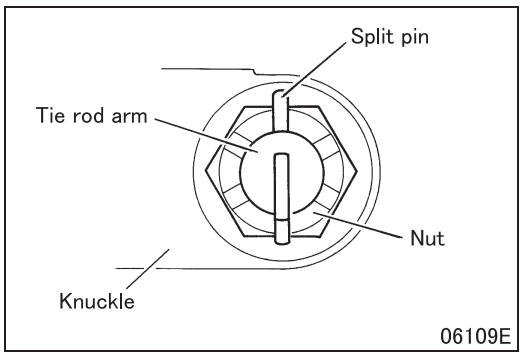
■ **Installation: Tie rod arm and knuckle**

(1) When the tie rod arm and knuckles are reassembled using existing parts

- Remove all rust and corrosion from the tapered surfaces of the tie rod arm and knuckle using 120-glit sandpaper or finer. (This does not apply to new replacement parts.)
- Clean the tapered surfaces and thread areas of the tie rod arm and knuckle.

NOTE

- **Use acetone, cleaning fluid for color check, or equivalent as solvent.**



- Apply grease to the thread area of the tie rod arm and install it.

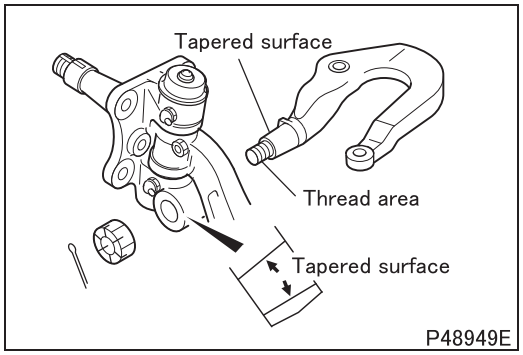
CAUTION ⚠

- **When installing the tie rod arm, make sure that the tapered surfaces of the tie rod arm and knuckle are free from grease.**

- Tighten the nut to the specified torque. Be sure to align the pin holes when tightening and insert the split pin as illustrated.

(2) When the tie rod arm and knuckles are assembled using new parts

- Clean the tapered surfaces and thread areas of the tie rod arm and knuckle.
- Tighten the nut to the specified torque. Be sure to align the pin holes when tightening and insert the split pin as illustrated.



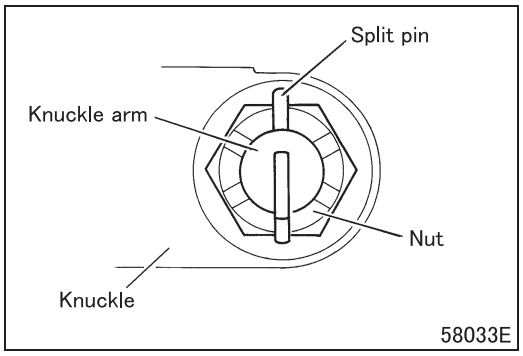
■ **Installation: Knuckle arm and knuckle**

(1) When the knuckle arms and knuckles are reassembled using existing parts

- Remove all rust and corrosion from the tapered surfaces of the knuckle arm and knuckle using 120-glit sandpaper or finer. (This does not apply to new replacement parts.)
- Clean the tapered surfaces and thread areas of the knuckle arm and knuckle.

NOTE

- **Use acetone, cleaning fluid for color check, or equivalent as solvent.**



- Apply grease to the thread area of the knuckle arm and install it.

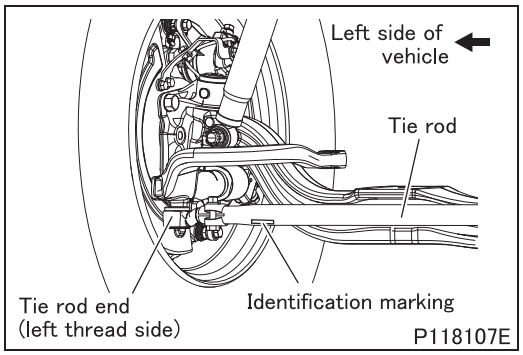
CAUTION ⚠

- **When installing the knuckle arm, make sure that the tapered surfaces of the knuckle arm and knuckle are free from grease.**

- Tighten the nut to the specified torque. Be sure to align the pin holes when tightening and insert the split pin as illustrated.

(2) When the knuckle arms and knuckles are assembled using new parts

- Clean the tapered surfaces and thread areas of the knuckle arm and knuckle.
- Tighten the nut to the specified torque. Be sure to align the pin holes when tightening and insert the split pin as illustrated.

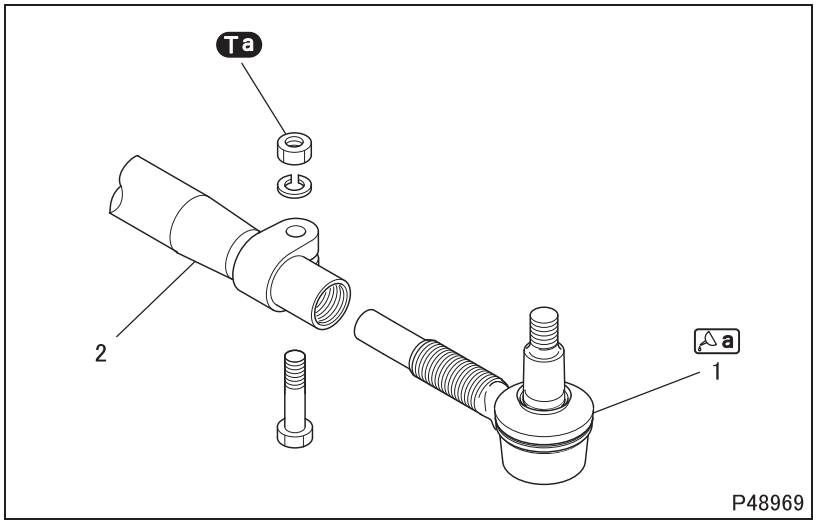


■ **Installation: Tie rod**

- Install the tie rod with its identification marking, which is applied to the left thread tie rod end side of the rod, toward the left side of the vehicle.
- Identification marking: Blue

M E M O

TIE ROD



● **Disassembly sequence**

1 Tie rod end
2 Tie rod

CAUTION ⚠

- **If any abnormality such as tearing is found in the dust boot of the tie rod end, replace the tie rod end.**

NOTE

- **Do not disassemble the tie rod end, as it is of non-disassembly type.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
1	Ball joint of tie rod end	Play (± 980 N {± 220 lbs, ± 100 kgf} loaded)	0 to 0.15 {0 to 0.0059}	–	Replace
		Rotation torque	1.0 to 5.9 N·m {0.7 to 4.4 ft.lbs, 0.1 to 0.6 kgf·m}	–	
2	Bend of tie rod		–	1 {0.039}	Correct or replace

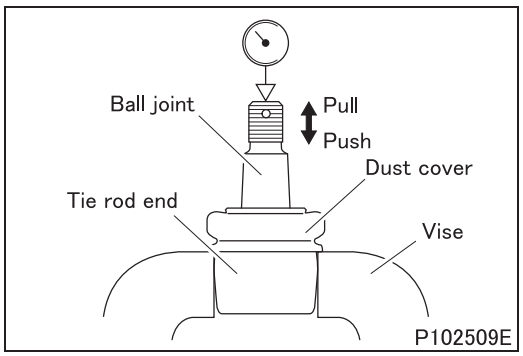
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (tie rod end tightening)	25 ± 5 {18 ± 3.7, 2.5 ± 0.5}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Lip area of dust cover of tie rod end	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

◆Inspection procedure◆



■ **Inspection: Tie rod end**

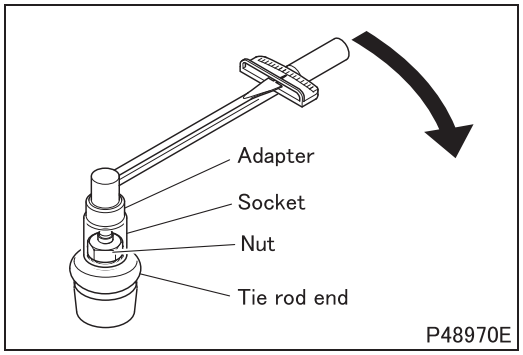
(1) Play

- Secure the tie rod end with a vise.

CAUTION ⚠

- **Take care not to deform or damage the dust cover when fixing it with a vise.**

- If the measured value deviates from the standard value when applying the specified load (push and pull) to the ball joint, replace the tie rod end.

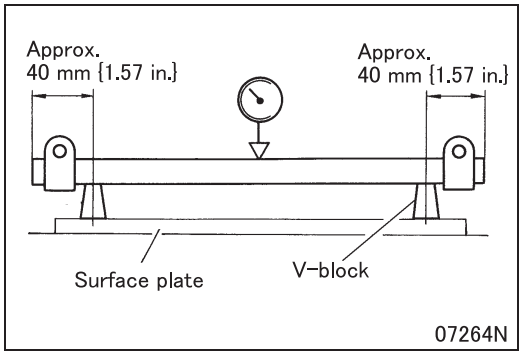


(2) Rotation torque

- Install the tie rod mounting nut on the tie rod end.
- Install the socket, adapter and torque wrench to measure the rotation torque.
- If the measured value deviates from the standard value, replace the tie rod end.

(3) Dust cover

- Check the dust cover for wear, cracks and other damage. These abnormalities may cause water infiltration to the ball joint and result in premature wear.
- If wear, crack, or damage is present, inspect traces of water entry and occurrence of rust in the ball joint. If any abnormality is found, replace the tie rod end. If no abnormality is found, replace the dust cover and reapply grease.



■ Inspection: Bend of tie rod

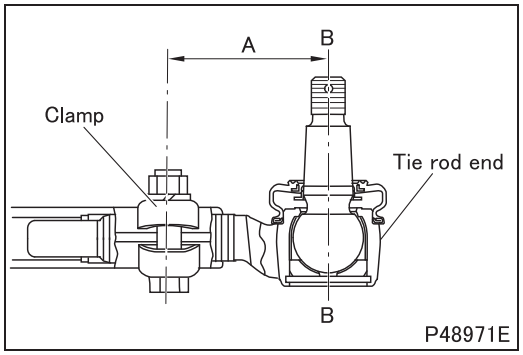
- Measure the bend of the tie rod at its center.

NOTE

- **Give the tie rod one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

- If the measured value exceeds the limit, correct or replace the tie rod.

◆Installation procedure◆



■ Installation: Tie rod end

- Screw in the tie rod end so that the difference of dimension A between the tie rod end and the clamp is within 1.5 mm {0.059 in.} between right and left.
  A: Approximately 74 mm {2.91 in.}

CAUTION ⚠

- **Ensure that the number of turns needed to install the right and left tie rod ends are within one turn of each other.**
- **Secure the tie rod ends so that the illustrated axis B-B on the right is parallel to that on the left.**

SPECIFICATIONS / STRUCTURE AND OPERATION

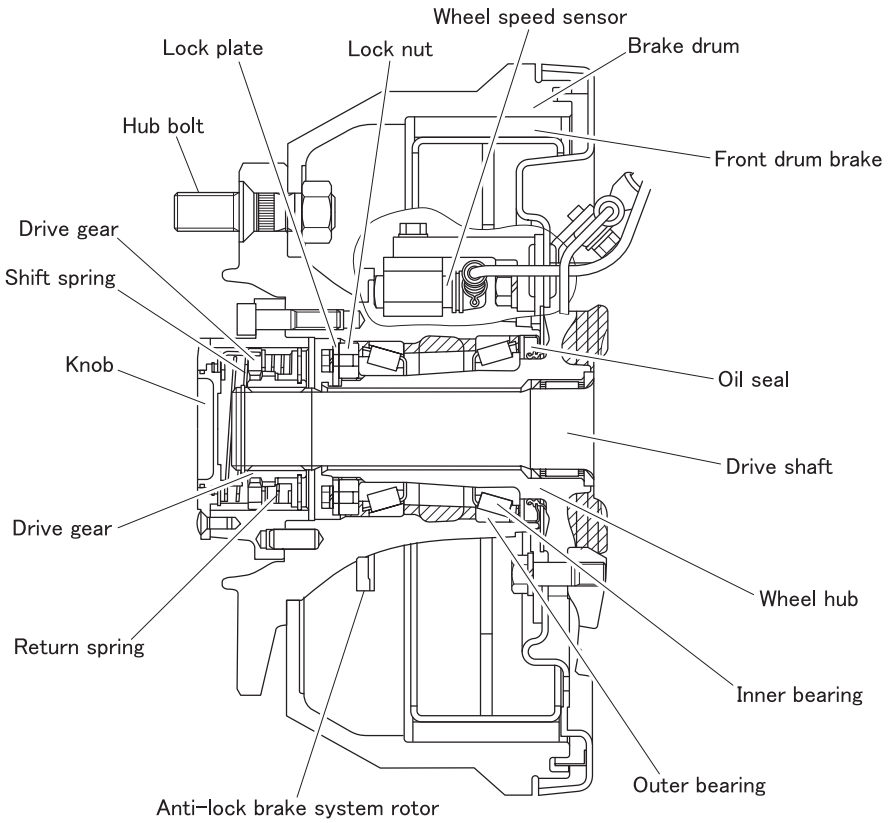
SPECIFICATIONS

Item		Specifications
Front axle	Model	F200TW
	Type	Banjo type, full floating, with Birfield joint
Tread (dimension notified to the authorities) mm {in.}		1650 {65.0}
Reduction	Model	D1H modified
	Type	Single-reduction hypoid gear
	Gear ratio	5.285 5.714
Differential	Tooth shape	Straight bevel gear
Gear oil	Grade	Normal: Maximum air temperature during operation below 40°C {104°F} API GL-5 SAE 90 Hot area: Maximum air temperature during operation above 40°C {104°F} API GL-5 SAE 140
	Quantity L {qts.}	3.0 {3.2}
Mass kg {lb.}		Approx. 250 {550}

- Use gear oil with a SAE viscosity grade of 140 when a vehicle is used under heavily-loaded, severe conditions such as continuous driving on uphill grades. However, the air temperature must be above 10°C {50°F}.

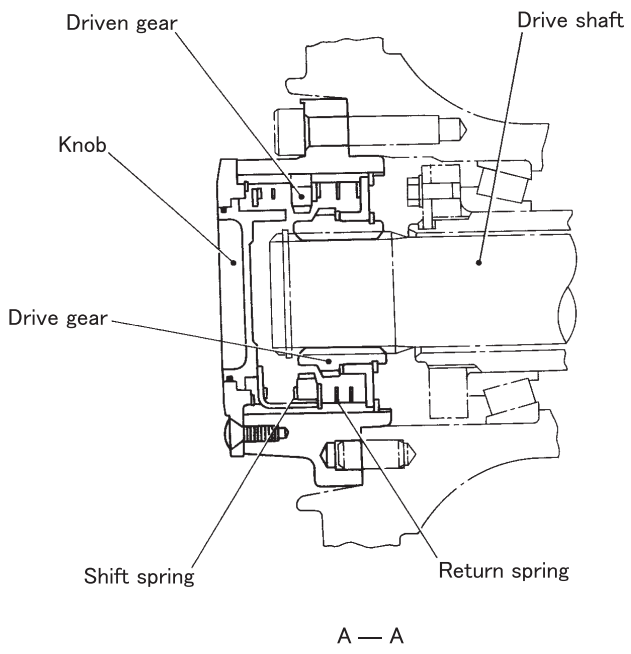
STRUCTURE AND OPERATION

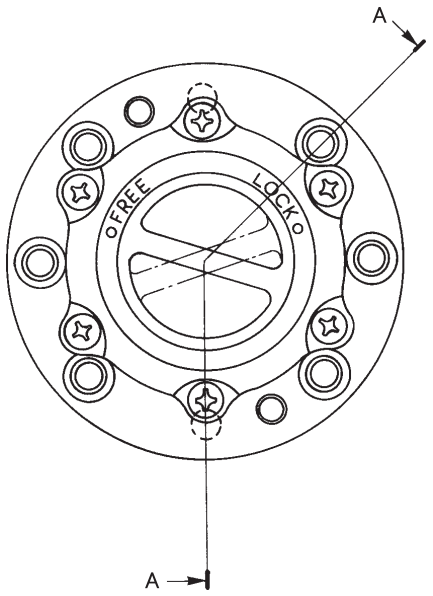
1. Wheel Hub and Brake Drum



P114076E

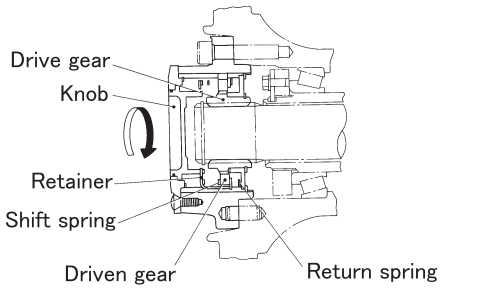
2. Free Wheel Hub





P58301E

- In the case of a four-wheel drive vehicle, even when it is running in rear-wheel drive only, the drive shaft, differential, propeller shaft, and driving parts of the transfer front drive shaft continue to run due to transmission of rotation from the wheels. This subjects the vehicle drive to a load, and it causes loss of driving power.
  Now, with a free wheel hub, transmission of rotation from the front wheels to the drive shaft is cut, reducing driving loss when running in rear-wheel drive only. This improves fuel efficiency and reduces vibration and noise.
- With a free wheel hub, FREE (cutting of driving power) ↔ LOCK (transmission of driving power) is made easily by manual operation.

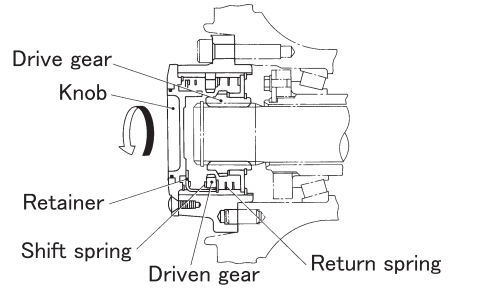


P58302E

Operating mechanism

● From FREE to LOCK

When knob is turned to LOCK, retainer shifts to the inside along with the shape of the knob, pressing return spring. At this instance, driven gear, being pressed by shift spring, engages with drive gear at the spline, and transmits the driving power.

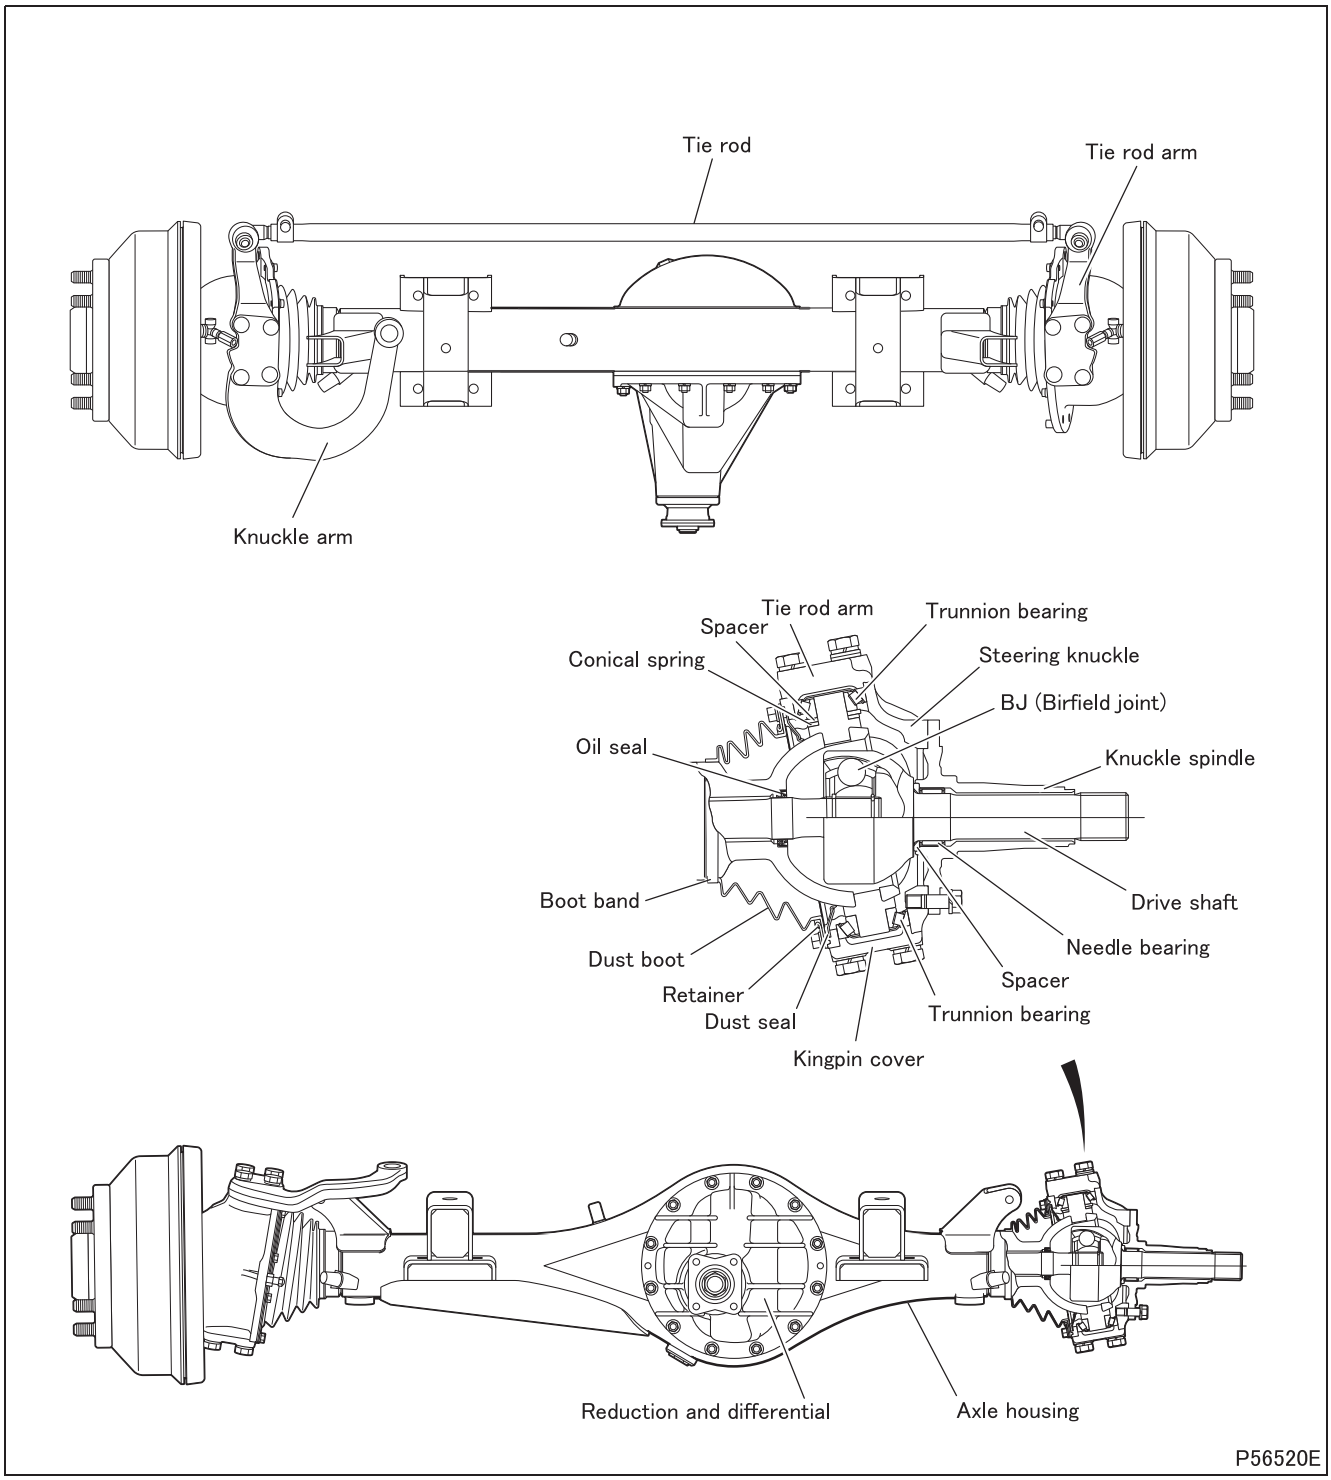


P58303E

● From LOCK to FREE

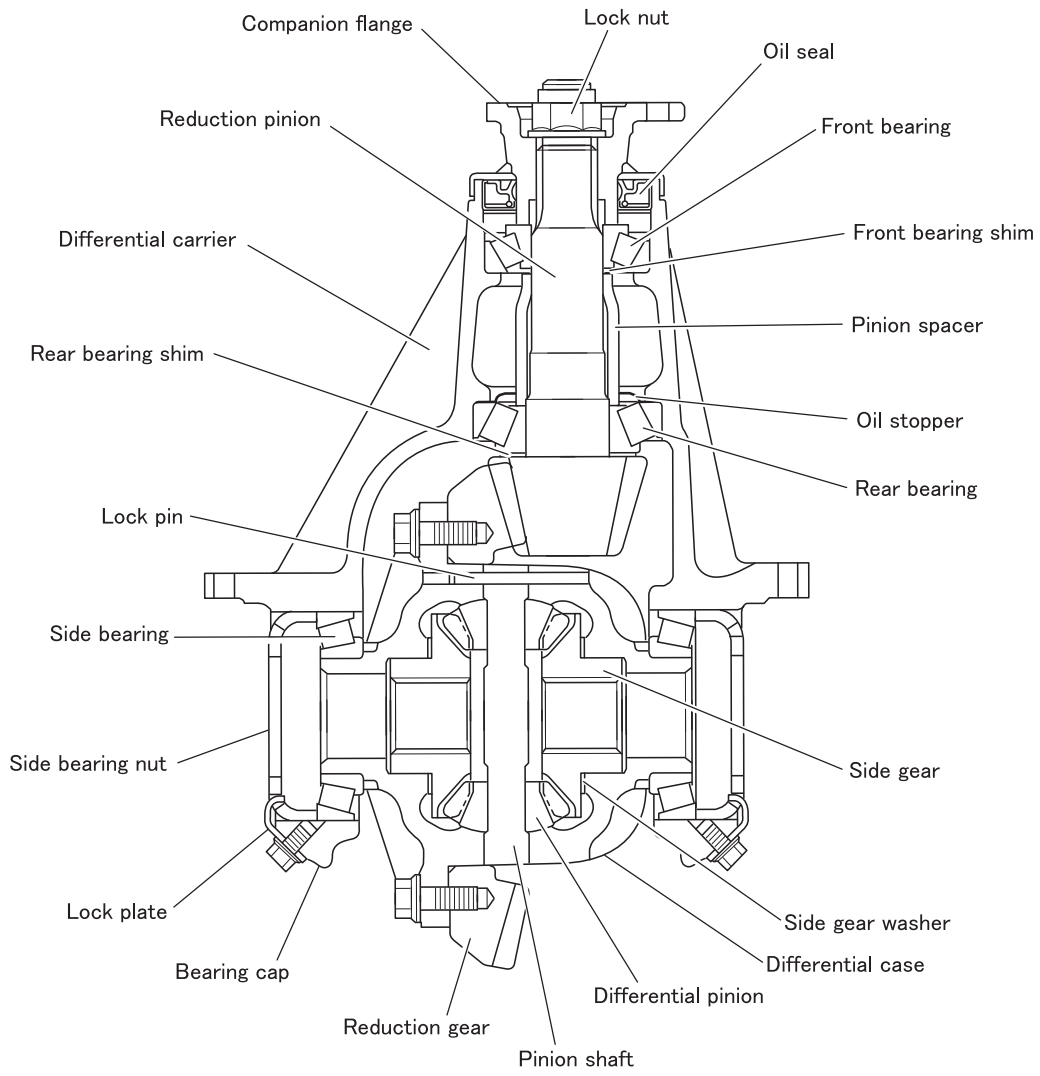
When knob is turned to FREE, the action is the reverse of FREE to LOCK, and the driving power is disengaged.

3. Drive Shaft and Steering Knuckle, Axle Housing



- The drive shaft must transfer power according to rotation speed fluctuations caused by change of steering angle when a vehicle is steered. Therefore, a constant velocity universal joint, which eliminates rotation speed fluctuations between the drive shaft and the driven shaft and transfers power evenly, is used for the Birfield joint of the drive shaft.

4. Reduction and Differential



TROUBLESHOOTING

Possible causes \ Symptoms		Power transmission insufficient						Oil leakage from companion flange	Oil leakage from differential carrier and axle housing	Oil leakage from drive shaft	Steering wheel shakes	Steering feels stiff	Steering wheel return poor	Unable to steer the steering wheel	Steering pulls to one side	Uneven wear or early wear of front tires	Reference Gr

M E M O

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection and Adjustment of Wheel Alignment

Before performing inspection and adjustment of wheel alignment, set the vehicle to the following condition.

- Park the vehicle unloaded on a level surface.
- The vehicle needs to be equipped with proper size tires.
- If the wear condition of tires on the right is remarkably different from that of tires on the left, replace tires.
- Inflate tires to specified pressure.
- Correct if the vehicle tilts due to faulty suspension.
- Service all parts of the front axle and ensure that there is no fault such as the following.
  - Loose trunnion bearing
  - Loose front wheel hub
  - Bolts used for tightening various parts of tie rod arm, knuckle arm and tie rod are loose
  - Bend of knuckle spindle and axle housing
- Adjust play at steering wheel properly
- For wheel alignment, which is related to the side slip amount, both wheel alignment and the side slip amount must conform to the standard values.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Toe-in	0 to 6 (3 ± 3) {0 to 0.24 (0.12 ± 0.12)}	–	Adjust
	Camber	1°00' ± 1°00'	–	*
	Caster	0°30' ± 1°00'	–	Replace
	Kingpin inclination angle	9°30' ± 30'	–	Replace

*: If the measured value deviates from the standard value, abnormalities such as loose trunnion bearing, loose hub bearing and bend of knuckle and front axle housing are suspected. Inspect each part and replace defective parts.

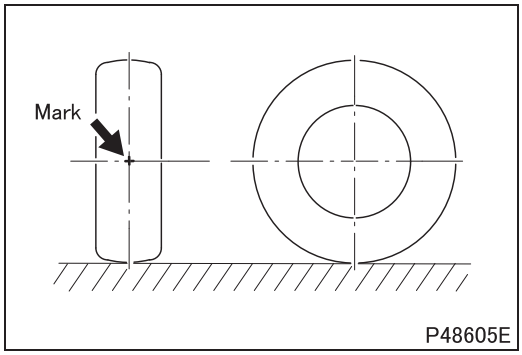
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Clamp nut (tie rod end clamp fastening)	25 ± 5 {18 ± 3.7, 2.5 ± 0.5}	–

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
Ca	Alignment gauge adapter  60697	MH062337 or MH061994	Measurement of camber, caster and kingpin inclination angle

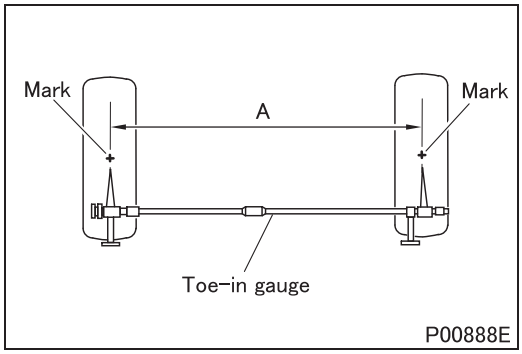
Part No.	A	B	C
MH062337	ϕ56.5 {2.22}	ϕ95 {3.74}	M10 × 1.25
MH061994	ϕ75.2 {2.96}		



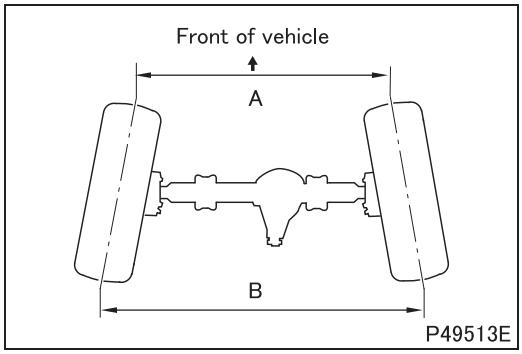
1.1 Inspection and adjustment of toe-in

[Inspection]

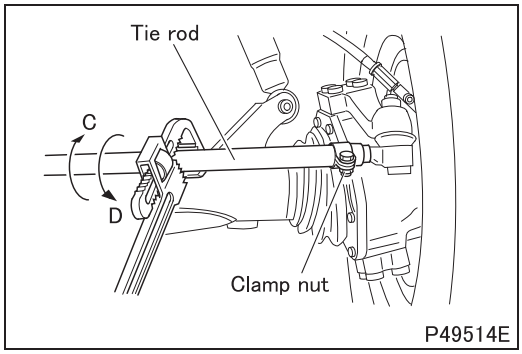
- Position the front wheels exactly to forward running position.
- Mark each tire at the center height in the middle of the tire tread.



- Align the two points of the toe in gauge with respective marks and read distance A between the marks.

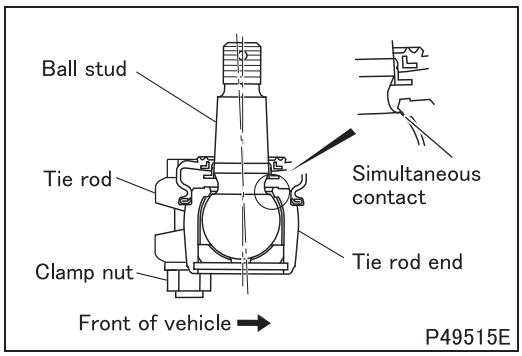


- Push the vehicle to roll the tires 180 degrees.
- Measure distance B between the marks that are now facing the rear of the vehicle.
- If toe-in (difference between A and B) deviates from the standard value, adjust.



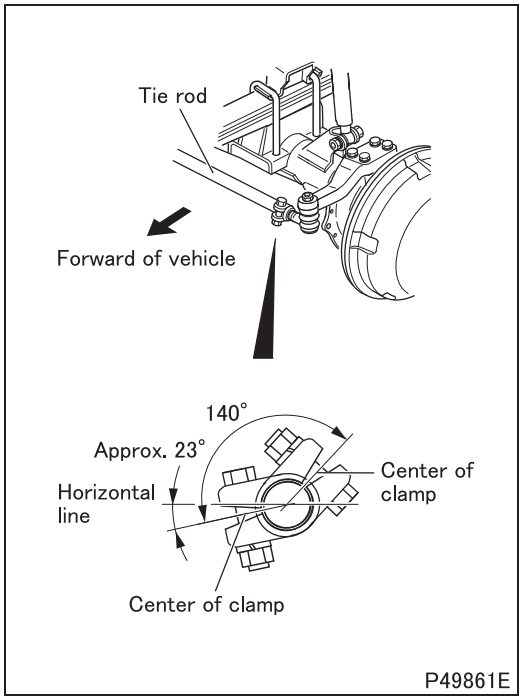
[Adjustment]

- Loosen the clamp nuts on the right and left.
- Turn the tie rod with a pipe wrench to adjust the toe-in.
  C: When adjusting to the toe-out direction
  D: When adjusting to the toe-in direction
- After adjustment, tighten the clamp nut to the specified torque.

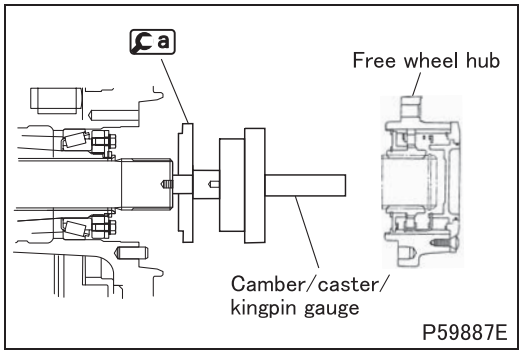


CAUTION ⚠

- **Hold down the tie rod end toward the front of the vehicle with the front wheels positioned to forward running position so that the right and left tie rod ends are in contact with the ball studs at the same time. In this state adjust so that the specified toe-in is achieved and tighten the clamp nut to secure the tie rod.**

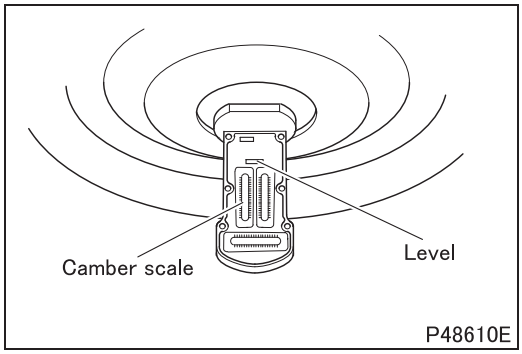


- Make sure that the center of the tie rod clamp is within the illustrated range.
- If it is out of the illustrated range, change the center position of the clamp.

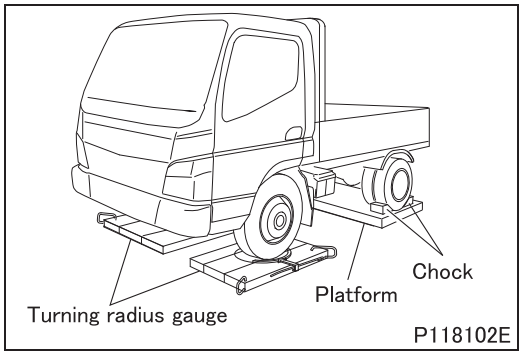


1.2 Inspection of camber

- Position the front wheels exactly to forward running position.
- Remove the free wheel hub.
- Install Ca on the drive shaft tip.
- Install the camber/caster/kingpin gauge.

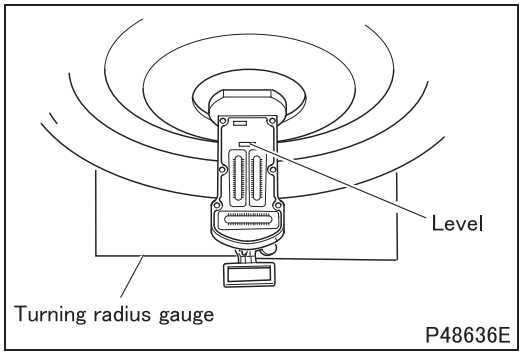


- Place the level in order to have bubble stay in the middle.
- Read center of bubble on camber scale to find the camber. Do the same way for the right and left front tires.
- If the measured value deviates from the standard value, disassemble the front axle for service.

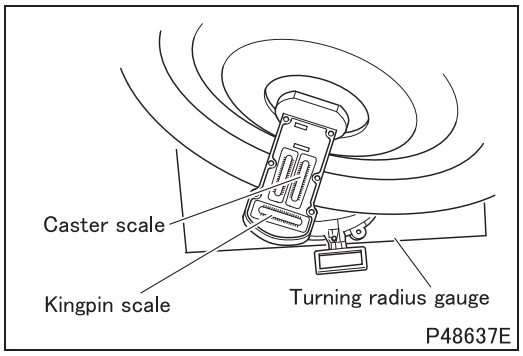


1.3 Inspection of caster and kingpin inclination angle

- Prepare a platform with the same height as the turning radius gauge and place it under the rear wheels so that the vehicle may be placed level.
- Apply chocks to the rear wheels.
- Keep the turning radius gauge locked.
- Jack up the vehicle, and set the right and left front wheels so that respective ground contact area centers of two wheels and turntable centers may meet.



- Unfasten locking of the turning radius gauge, and set the scale to 0 degrees.
- In the same manner as in case of measuring camber in Section **1.2**, attach the camber/caster/kingpin gauge, and set the level so that the bubble comes in the middle.



- With the brake pedal depressed, turn steering wheel slowly from the point of 0 degrees on the turning radius gauge, until the direction is changed by 20 degrees each to the right side in case of the right front wheel and to the left in case of the left front wheel.

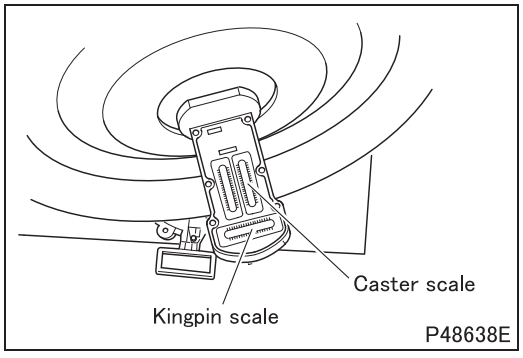
NOTE

- **It is not possible to make exact measurement unless brake is kept applied, because otherwise wheels will turn slightly.**

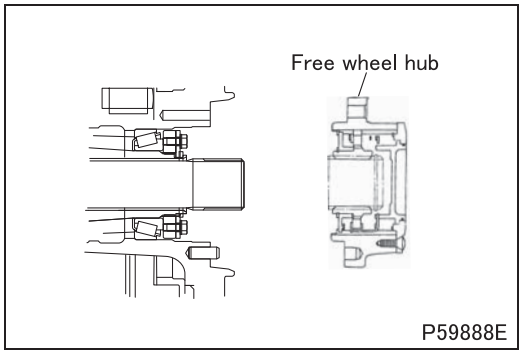
- At the point where the wheel has been turned 20 degrees, set the caster scale and the center of the bubble of the kingpin scale to 0 degrees by turning the adjuster.

NOTE

- **Pay attention to the kingpin scale because it has scales for right and left: align the right kingpin scale in case of the right front wheel, and left kingpin scale in case of the left front wheel.**



- Reverse this position, turn the steering wheel slowly until the direction of the front wheels changes by 20 degrees in the opposite direction.
- Read the center of bubbles at this position at the caster scale and kingpin scale to find caster and kingpin inclination angles.
- If the measured value deviates from the standard value, disassemble the front axle for service.



- After inspection, install the free wheel hub.

2. Inspection and Adjustment of Steering Angle

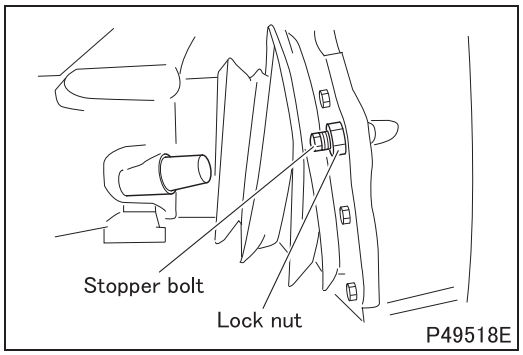
- Perform steering angle inspection and adjustment only after wheel alignment inspection and adjustment has been completed.

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Steering angle	Inside (outside steering angle is for reference only)	35° $^{0}_{-2^\circ}$ (34°)	–	Adjust

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut (knuckle stopper bolt tightening)	96 ± 12 {71 ± 9, 9.75 ± 1.25}	–



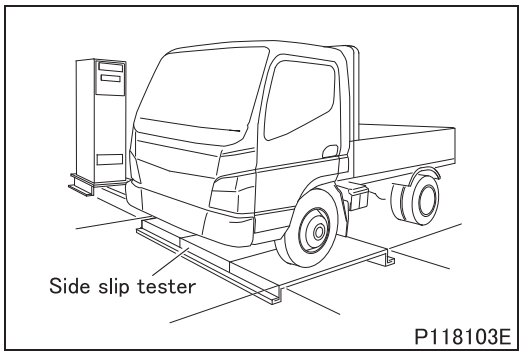
- Set the turning radius gauge and a platform on the vehicle in the same manner as the caster and kingpin inclination angle measurement performed in Section **1.3**.
- Turn the steering wheel right or left completely from the position where the turning radius gauge is set to 0 degrees, and measure the steering angle, reading the scale of the turning radius gauge.
- If the measured value deviates from the standard value, adjust with the knuckle stopper bolt and tighten the lock nut to the specified torque.

3. Inspection of Side Slip

- Perform side slip inspection only after wheel alignment inspection and adjustment has been completed.
- For the side slip amount, which is related to wheel alignment, both the side slip amount and wheel alignment must conform to the standard values.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Side slip amount (per 1 m {3.3 ft})	3 {0.12} or less	–	Adjust



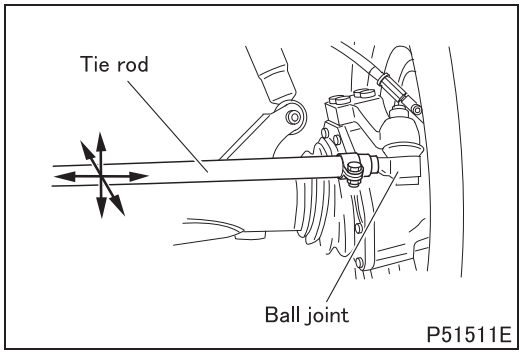
- Position the front wheels exactly to forward running position.
- Move the vehicle forward past the side slip tester as slowly as possible to inspect side slip.

NOTE

- **Pay attention to the following when moving over the side slip tester.**
- **Be sure to hold steering exactly at the forward running position, and make no turns.**
- **Do not apply the brakes.**
- **Keep the speed constant.**

- If the measured value deviates from the standard value, inspect and adjust wheel alignment.

4. Inspection of Tie Rod End Ball Joint



4.1 Play

- Hold the tie rod section of the tie rod with the vehicle kept stationary, and move it back-and-forth, up-and-down and right-and-left to check for play at the ball joints of the tie rod end.

NOTE

- **Be sure to check for play at ball joints of both right and left sides of the tie rod.**

- If there is any play, replace the tie rod end of the tie rod.

4.2 Dust cover

- Check that there is no wear, cracking or damage. Any such abnormalities can cause water to enter the ball joint, resulting in premature wear.
- If wear, cracking or damage is present, inspect for traces of water entry and rust in the ball joint. If any abnormality is found, replace the tie rod end. If no abnormality is found, replace the dust cover and reapply grease.

5. Inspection and Replacement of Differential Oil

WARNING ⚠

- **The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.**

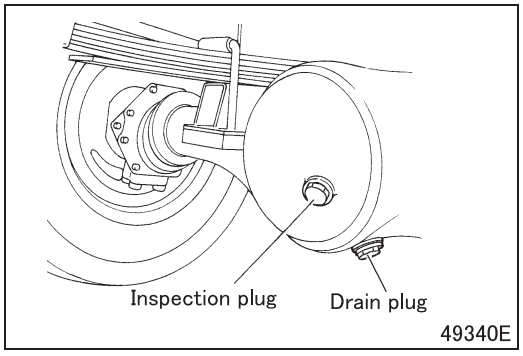
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Inspection plug	110 ± 10 {81 ± 7.4, 11 ± 1}	–
	Drain plug		

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Axle housing	Normal: Maximum air temperature during operation below 40°C {104°F} API GL-5 SAE 90 Hot area: Maximum air temperature during operation above 40°C {104°F} API GL-5 SAE 140	3 L {3.2 qts.}

- Use gear oil with a SAE viscosity grade of 140 when a vehicle is used under heavily-loaded, severe conditions such as continuous driving on uphill grades. However, the air temperature must be above 10°C {50°F}.



[Inspection]

(1) Inspection of oil quantity

- Remove the inspection plug, and check that gear oil is filled up to the neck.
- If gear oil is not sufficient, fill oil from the inspection plug hole up to the neck.

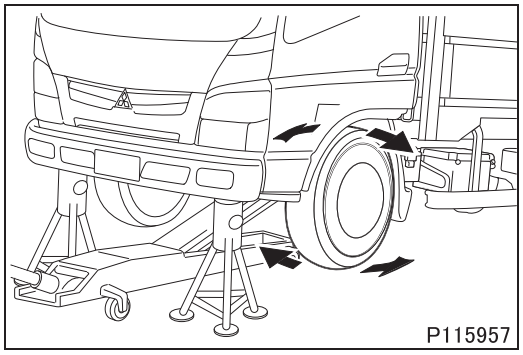
(2) Inspection of oil quality and contaminants

- When draining gear oil, check for oil quality, metal chips and metal powder.
- If an abnormally large amount of metal chips and metal powder is found, disassemble the assembly for service, as abnormalities may be caused inside.

[Replacement]

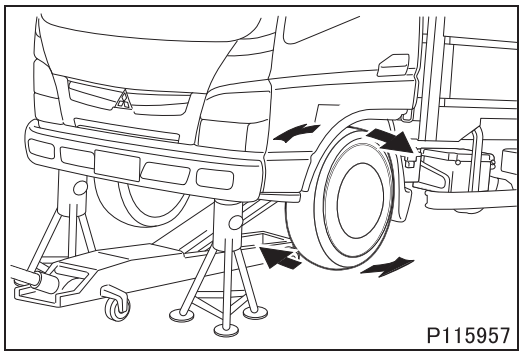
- Remove the drain plug to drain gear oil. Drainage can be made quickly with the inspection plug removed.
- As the drain plug is a magnet, clean it before installation.
- Fill the specified quantity of gear oil from the inspection plug hole.
- After filling, check that gear oil is filled up to the neck. If oil is not sufficient, replenish it.

6. Inspection of Wheel Bearing for Play



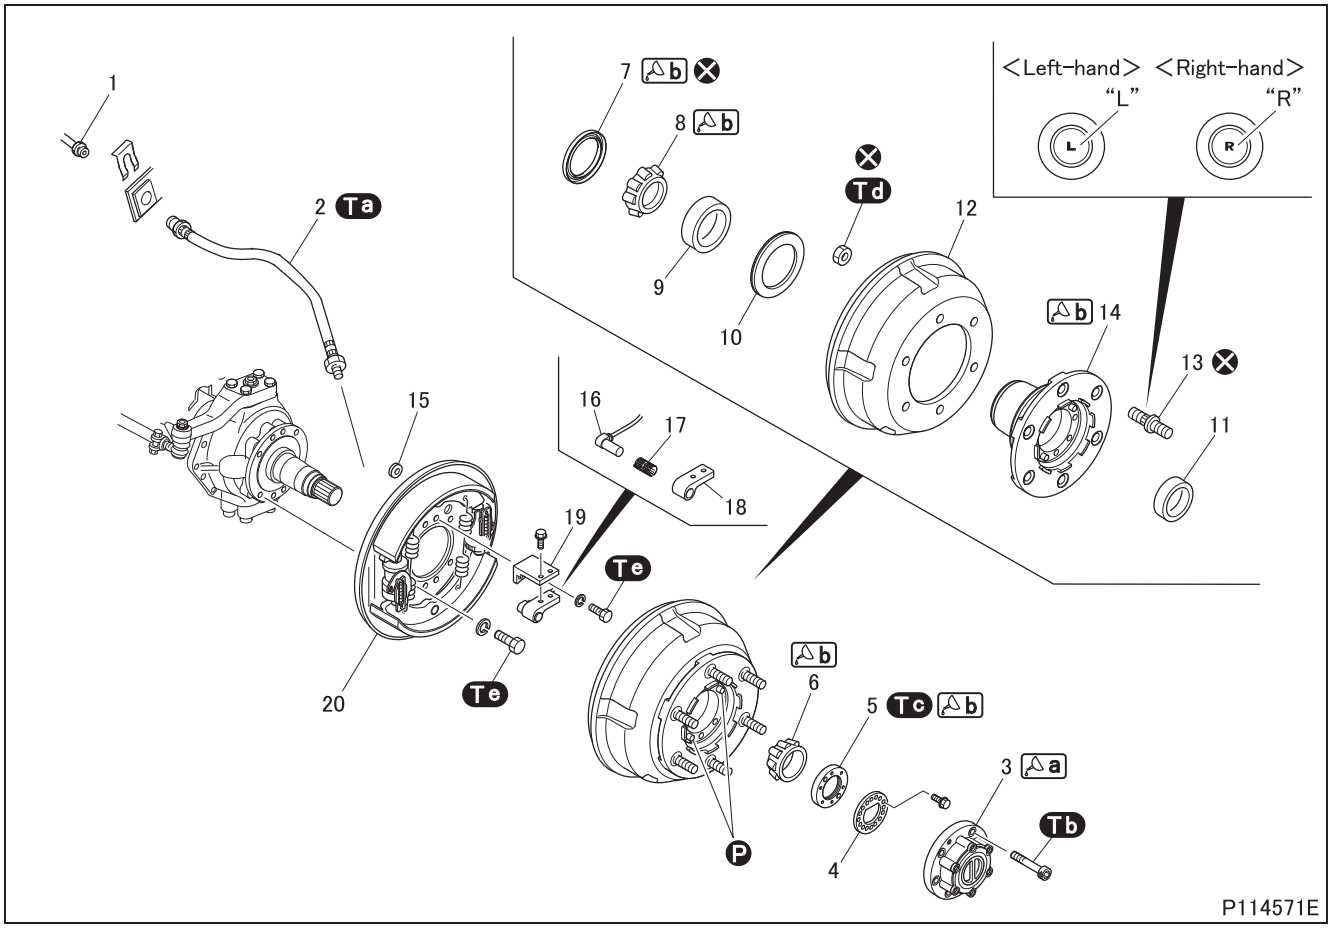
- Jack up the vehicle.
- Try to move the top and bottom of the front tire by hands in the illustrated directions to inspect the wheel bearing for play.
- If play is found with the feel of hands, repeat the inspection procedure while having the brake pedal pressed by another personnel. When the play is removed by operating the brake pedal, the symptom indicates that there is play in the wheel bearing, not in the suspension or other related parts. Then inspect the turning torque of the wheel bearing and adjust it as required. (See “WHEEL HUB AND BRAKE DRUM”.)
- If the turning torque of the wheel bearing cannot be adjusted correctly or the play still remains after the adjustment, replace the wheel bearing with a new one. (See “WHEEL HUB AND BRAKE DRUM”.)

7. Inspection of Knuckle Joint for Play



- Jack up the vehicle.
- Try to move the top and bottom of the front tire by hands in the illustrated directions to inspect the knuckle joint for play.
- If play is found with the feel of hands, repeat the inspection procedure while having the brake pedal pressed by another personnel. If there is any play, it may be caused by the play in the knuckle joint. Check each part and replace a defective part. (See “KNUCKLE AND KING PIN, FRONT AXLE”.)

WHEEL HUB AND BRAKE DRUM



● **Disassembly sequence**

1 Brake pipe
2 Brake hose
3 Free wheel hub (See later section.)
4 Lock washer
5 Lock nut

7 Oil seal
8 Inner bearing inner race
9 Inner bearing outer race
10 Anti-lock brake system rotor
11 Outer bearing outer race
12 Brake drum
13 Hub bolt
14 Wheel hub
15 Grommet
16 Wheel speed sensor
17 Spring spacer
18 Sensor holder
19 Bracket
20 Front drum brake (See Gr35.)

Ⓟ: Locating pin
⊗: Non-reusable parts

CAUTION ⚠

- **Plug the brake hose to prevent entry of dust and dirt after it has been removed.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Make sure that the brake lining surface of the front drum brake and the inner surface of the brake drum are free from grease to avoid malfunction of the brakes.**
- **Make sure that the brake hose is not twisted when installing it.**
- **Make sure that the brake hose does not interfere with any of surrounding parts when installed.**

- Adjust brake shoe clearance after assembly. (See Gr35.)
- Bleed air from the brake system after assembly. (See Gr35.)

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Starting torque of wheel hub bearing (tangential force at hub bolt position with oil seal assembled)	3 ± 1 N·m {2.2 ± 0.7 ft.lbs, 0.3 ± 0.1 kgf·m} (tangential force: 25.3 ± 7.7 N {5.7 ± 1.7 lbs., 2.5 ± 0.7 kgf})	–	Adjust or replace

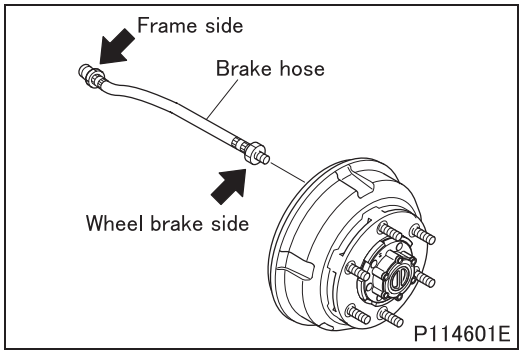
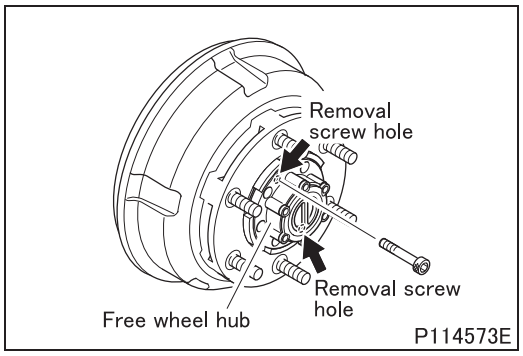
◆Removal procedure◆



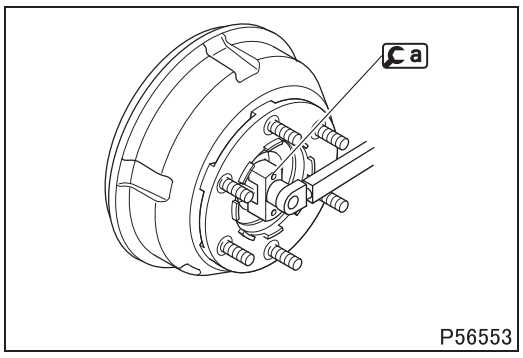
■ Removal: Brake hose

- When removing brake hose, remove it from the frame side first, and then from the brake wheel brake side.

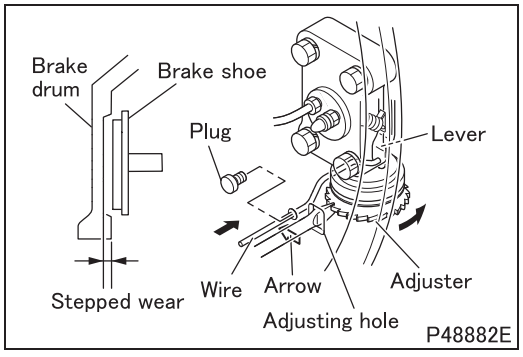


■ Removal: Free wheel hub

- Screw two bolts evenly into the free wheel hub removal screw holes to remove the free wheel hub.



■ Removal: Lock nut

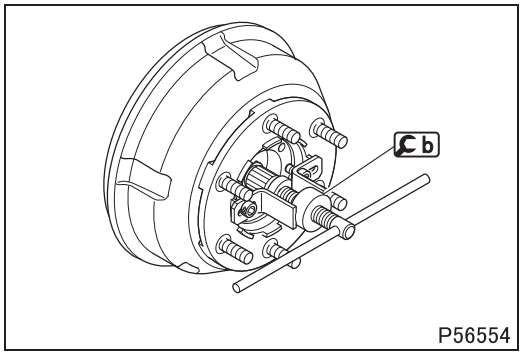


■ Removal: Wheel hub and brake drum

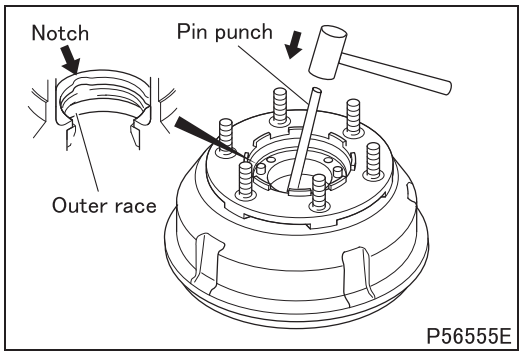
- If the brake drum has stepped wear and the wear prevents the wheel hub and brake drum from being removed, removal can still be performed with the following procedure.
  - Insert a wire of approx. ϕ2 mm {0.079 in.} into the hole from which the plug has been removed, and lift up the adjust lever of the wheel cylinder.
  - Turn the adjuster from the adjust hole in the opposite direction to the arrow on the backing plate to increase the clearance between the brake drum and the brake shoe. Then, remove the wheel hub and brake drum.

CAUTION ⚠

- **Correct or replace the brake drum if any fault is found.**

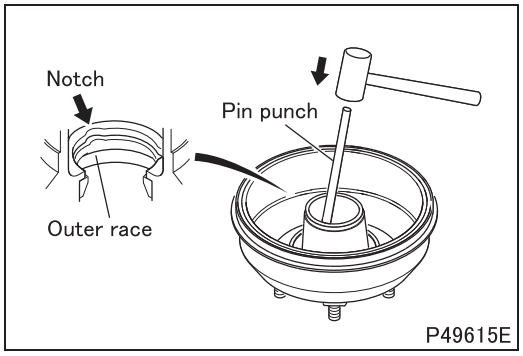


- Install b using free wheel hub mounting bolts to remove the wheel hub and brake drum.



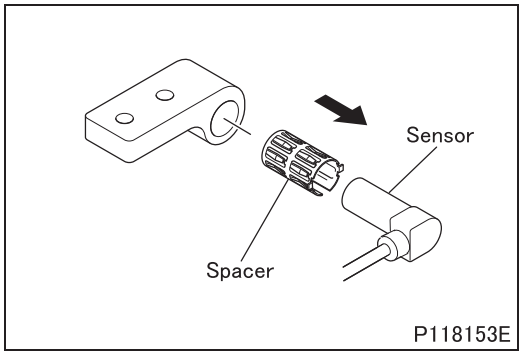
■ **Removal: Inner bearing outer race**

- Drive out the inner bearing outer race by tapping evenly at the three notches in the wheel hub.



■ **Removal: Outer bearing outer race**

- Drive out the outer bearing outer race by tapping evenly at the three notches in the wheel hub.

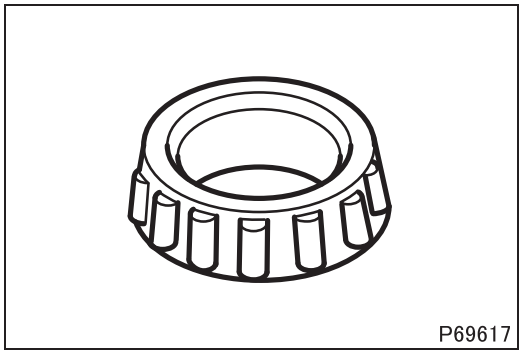


■ **Removal: Wheel speed sensor**

CAUTION ⚠

- **When removing the wheel speed sensor, do not apply excessive force on the sensor, such as hitting it with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in an open-circuit of the sensor.**
- **If the wheel speed sensor can be removed easily, replace the spring spacer.**

◆Inspection procedure◆



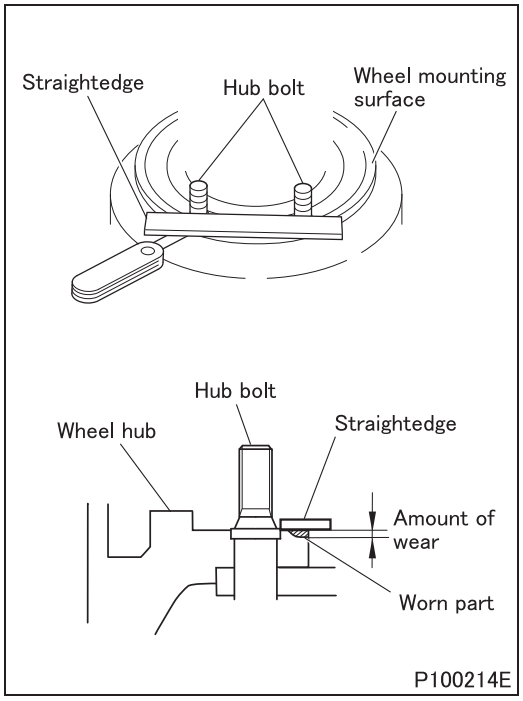
P69617

■ **Inspection: Outer bearing inner race**

- Inspect the outer bearing inner race after cleaning the bearing to remove grease completely.
- If any damage, wear, or a poor rotating conditions are evident in the inner race, replace it with a new one.
- The inner race and outer race should be replaced as a set.

■ **Inspection: Inner bearing inner race**

- Inspect the inner bearing inner race in the same manner as the outer bearing inner race.
  (See **"■ Inspection: Outer bearing inner race".**)



P100214E

■ **Inspection: Wheel hub**

(1) Visual inspection

- Visually and physically inspect the disc wheel mounting surface. If there is damage or cracking on it, replace the wheel hub.
- Make sure that there is no rust, dust, paint or foreign material on the disc wheel mounting surface of the wheel hub to prevent the wheel nut from becoming loose.
- If any abnormality is found, remove it with sandpaper.

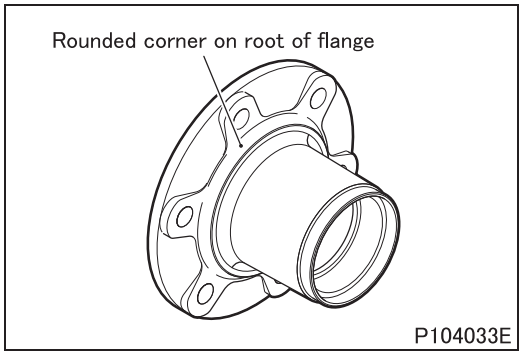
(2) Wear in disc wheel mounting part of wheel hub

- Clean the wheel mounting surface of the wheel hub before inspection.
- Place a straightedge against two hub bolts on the disc wheel mounting surface.

CAUTION ⚠

- **Make sure that the straightedge does not run onto the hub bolt.**

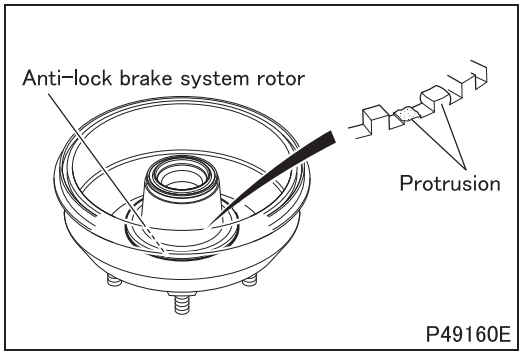
- Use feeler gauges to measure the amount of wear at the outer periphery of the wheel hub.
  Measure the amount of wear at every hub bolt.
- If the amount of wear at any point exceeds the following standard value, inspect the wheel hub for cracks.
  Wear standard value: 0.8 mm



P104033E

(3) Crack check

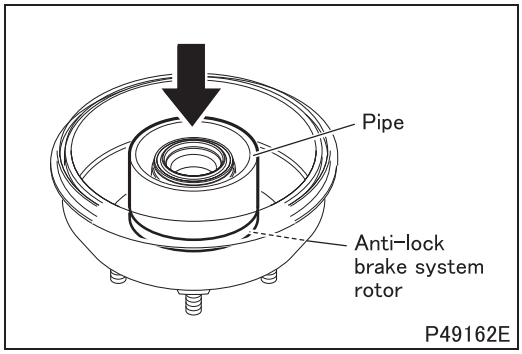
- Inspect for any cracks in the rounded corner on the root of the flange using magnetic particle or liquid penetrant testing. If any cracks are found, replace the wheel hub.
- If any cracks are found in a wheel hub bolt, replace it.
- If there is cracking or stepped wear on the wheel hub mounting surface of the wheel disc, replace it. (See Gr31.)



■ **Inspection: Anti-lock brake system rotor**

[Inspection]

- Check the protrusions of the anti-lock brake system rotor for chipping and flattening.
- If any abnormality is found, replace the anti-lock brake system rotor.



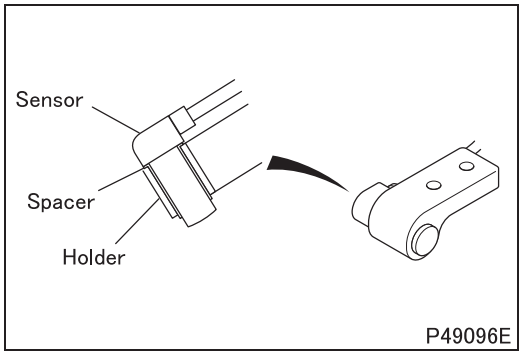
[Installation]

- Warm the anti-lock brake system rotor to approximately 150°C {302°F}.
- Install the anti-lock brake system rotor and wheel hub evenly using a pipe so as not to allow them to tilt.

WARNING ⚠

- **Handling the warmed rotor with bare hands may cause burns.**

◆Installation procedure◆

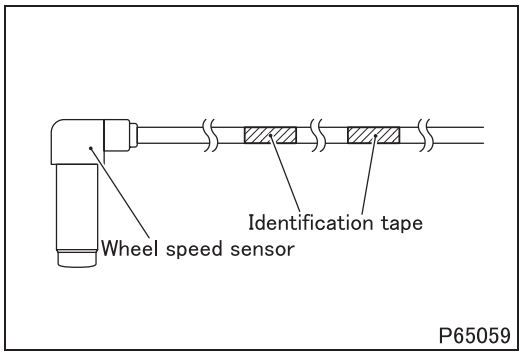


■ **Installation: Wheel speed sensor**

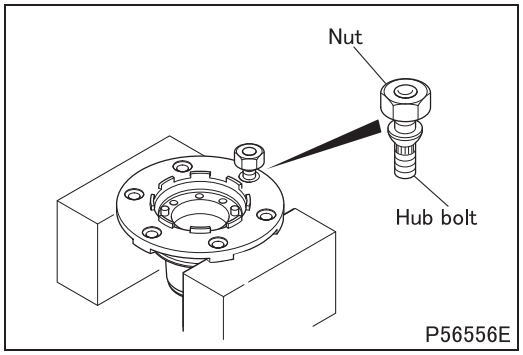
- Install the wheel speed sensor so that it securely contacts the sensor holder together with the spring spacer.

CAUTION ⚠

- **When installing the wheel speed sensor, never apply a force to it such as tapping it with a hammer, prying it with a screwdriver and pulling the harness, as doing so causes the wire to be broken.**

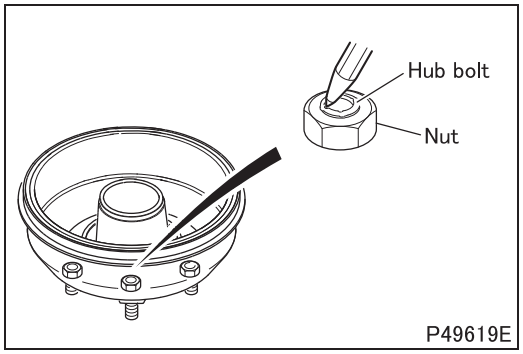


- Using clips, secure the wheel speed sensor harness in place at the identification tape portions, ensuring that the harness is free of kinks, slack and/or interference with other parts.

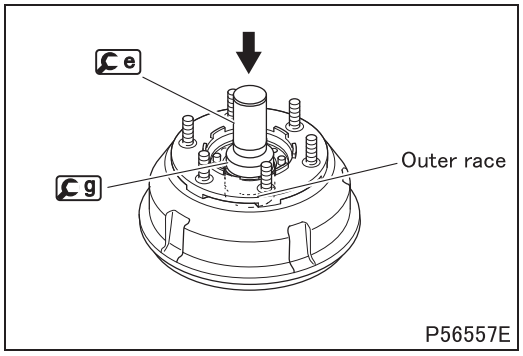


■ **Installation: Hub bolt**

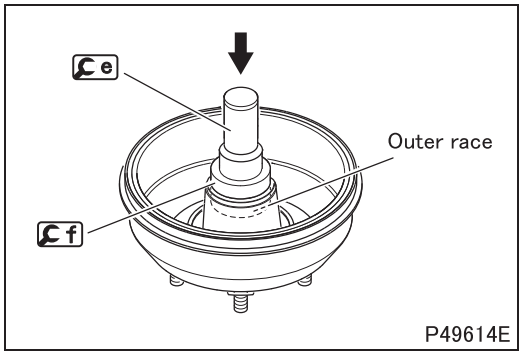
- Screw the nut into the hub bolt until just before they become flush.
- Drive the hub bolt into the wheel hub vertically by hitting the end face of the nut.



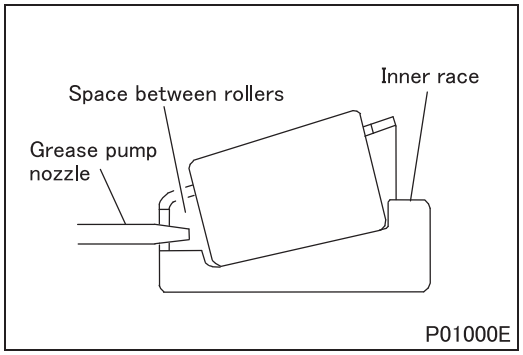
- Assemble the brake drum and wheel hub with the hub bolt. After tightening the nut to the specified torque, stake it with a punch.



■ **Installation: Outer bearing outer race**

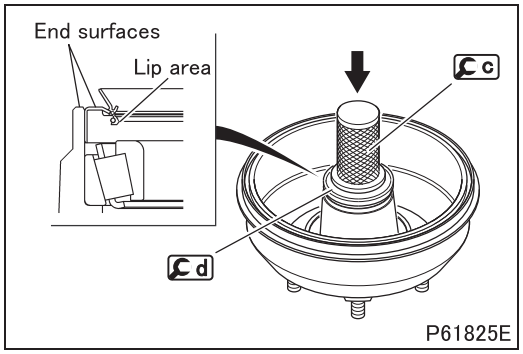


■ **Installation: Inner bearing outer race**



■ **Installation: Packing grease in inner bearing inner race**

- Insert the grease pump nozzle into the space between the rollers of the inner bearing inner race to pack grease sufficiently.

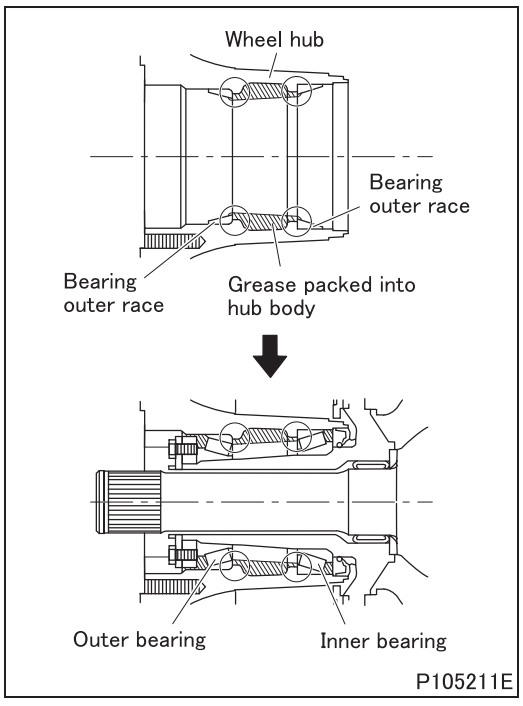


■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and insert it onto the wheel hub until the end surface of the oil seal is flush with the end surface of the wheel hub.

■ **Installation: Packing grease in outer bearing inner race**

- Follow the same procedure as packing the inner bearing inner race with grease.
  (See **"■ Installation: Packing grease in inner bearing inner race".**)

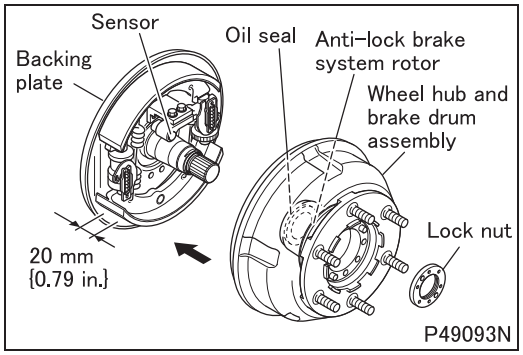


■ **Installation: Packing grease inside of wheel hub**

CAUTION ⚠

- **The wheel bearing may seize if these instructions are not followed.**
- **Apply the specified amount of grease.**

- As shown in the illustrations at the left, fill grease inside of the hub body in such a manner that grease covers the outer bearing and inner bearing outer races. Make sure that grease reaches the outer bearing and inner bearing.



■ **Installation: Wheel hub and brake drum**

- Slowly install the wheel hub and brake drum assembly so as not to cause damage to the oil seal and anti-lock brake system rotor.

CAUTION ⚠

- **If the anti-lock brake system rotor is damaged, wheel speed sensor signals become abnormal, causing the anti-lock brake system to malfunction.**

- Position the wheel hub and brake drum assembly only 20 mm {0.79 in.} before the backing plate, and hereafter slowly tighten the lock nut to install the wheel hub and brake drum assembly.

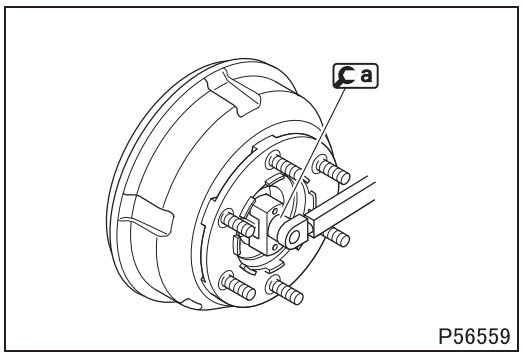
CAUTION ⚠

- **Be careful that installing the wheel hub and brake drum assembly without leaving a clearance with the backing plate may damage the wheel speed sensor.**

■ **Adjustment: Starting torque of wheel hub bearing**

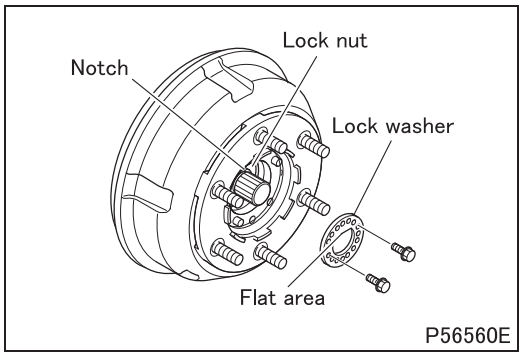
CAUTION ⚠

- **Unless this adjustment procedure is performed, the wheel bearing may seize.**

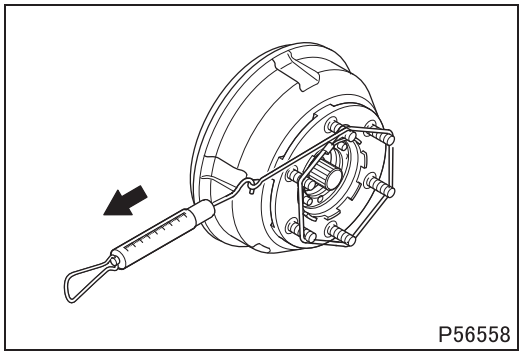


[Adjustment]

- Tighten the lock nut to the specified torque (primary tightening) while turning the wheel hub and brake drum assembly, and then loosen it completely.
- Ensure smooth operation of the outer bearing and inner bearing by turning the wheel hub and brake drum assembly several times, and then tighten the lock nut to the specified torque (secondary tightening).



- Insert the flat area of the lock washer, aligning it with the notch of the knuckle spindle, and mount two bolts diagonally to the lock nut.
- If the lock nut does not align with a screw hole of the lock washer, align by loosening the lock nut. Make sure that there is no play in the axial direction.



P56558

[Inspection]

- Make sure that there is no drag in the brake lining and brake drum.
- If any abnormality is found, adjust the brake shoe clearance.
- Measure the tangential force at the hub bolt position using a spring gauge.

CAUTION ⚠

- **Do not assemble the free wheel hub when inspecting.**

- If the tangential force is within the specified value, the starting torque conforms to the standard value. If the measured value deviates from the specified value, repeat adjustment because the adjustment of the lock nut may be insufficient.
- If the result is found to be abnormal, replace the outer and inner bearings.

■ Installation: Brake hose

- To install the brake hose, follow the removal procedure in reverse. (See "■ **Removal: Brake hose**".)
- After installing, make sure that the brake hose does not interfere in the peripheral parts.

CAUTION ⚠

- **Make sure that the brake hose is not twisted when installing it.**

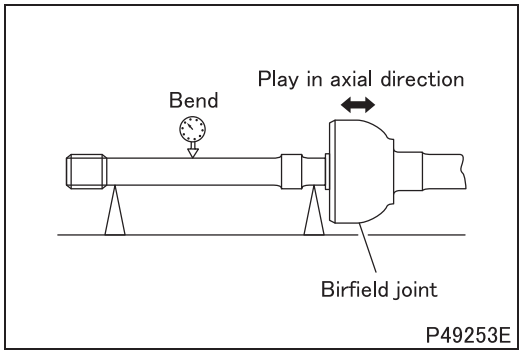
Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
ⓐ	Oil seal installer A: ϕ55 {2.17}, B: ϕ34 {1.34}  51042	MB999152	Installation of oil seal

◆Inspection procedure◆



P49253E

■ Inspection: Drive shaft

- Carry out the following inspections. If any abnormality is found, replace the drive shaft.

(1) Bend of drive shaft

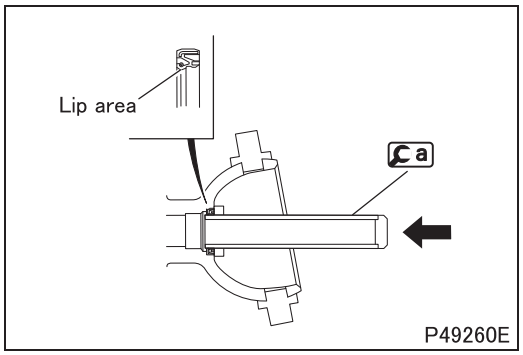
- Measure the bend at the center of the inner shaft of the drive shaft.

NOTE

- **Give the drive shaft one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

(2) Play in Birfield joint axial direction

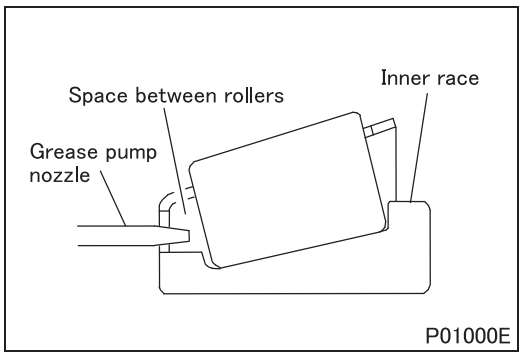
◆Installation procedure◆



P49260E

■ Installation: Oil seal

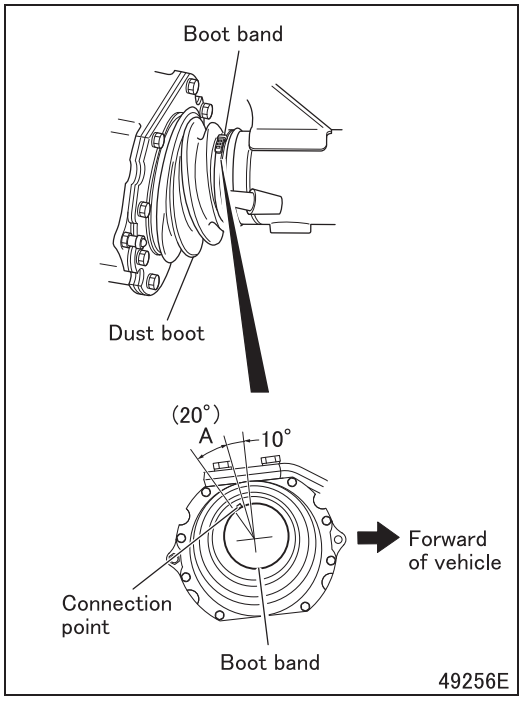
- Apply grease to the lip area of the oil seal and install it on the axle housing in the illustrated direction.



P01000E

■ Installation: Packing grease in trunnion bearing inner race

- Insert the grease pump nozzle into the space between rollers of the trunnion bearing inner race to pack grease sufficiently.

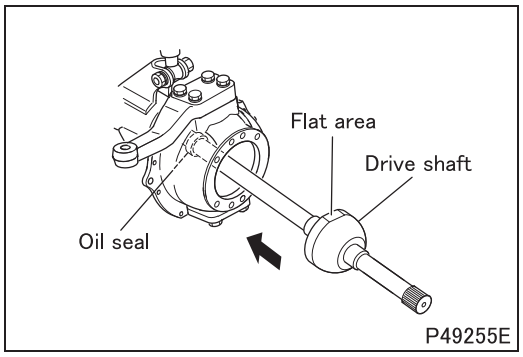


■ **Installation: Boot band**

- Install the boot band within illustrated range A.

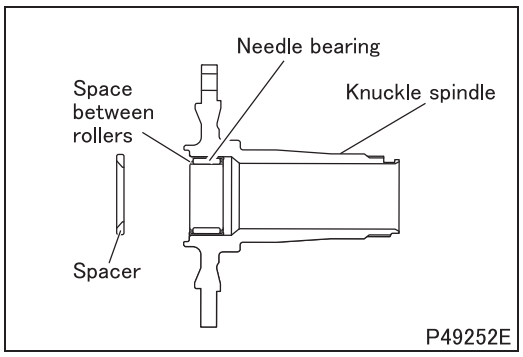
CAUTION ⚠

- **When installing the boot band, do not tighten the dust boot excessively so as not to allow the dust boot to stick out of the mating surface remarkably.**



■ **Installation: Drive shaft**

- Install the drive shaft with the flat area of the Birfield joint of the drive shaft placed in a vertical direction.
- Slowly install the drive shaft to avoid damage to the oil seal.



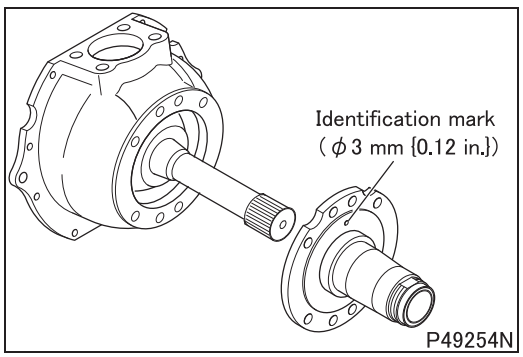
■ **Installation: Spacer and needle bearing**

- Pack grease sufficiently in the space between rollers of the needle bearing, and install the needle bearing so that it is flush with the end face of the knuckle spindle.

CAUTION ⚠

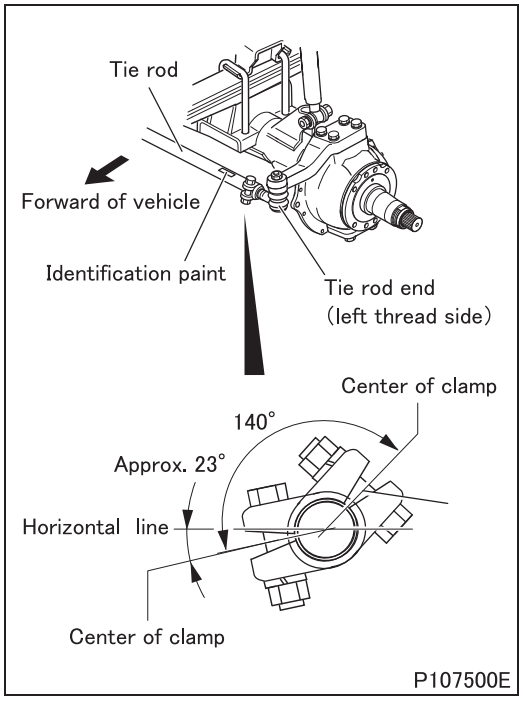
- **Do not drive in the needle bearing excessively.**

- Install the spacer on the knuckle spindle in the illustrated direction.



■ **Installation: Knuckle spindle**

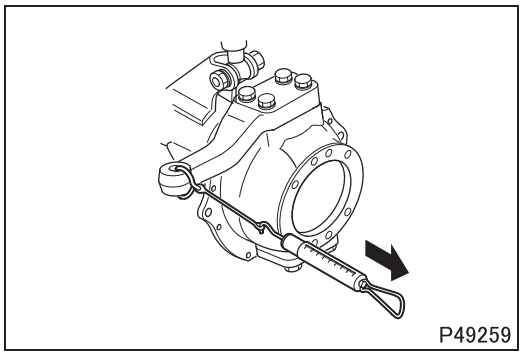
- Install the knuckle spindle on the steering knuckle in the illustrated direction.



■ Installation: Tie rod

- Install the tie rod with its identification marking, which is applied to the left thread side tie rod end, coming to the left side of the vehicle.
  Identification marking: White
- If it is out of the illustrated range, change the center position by loosening the clamp.

◆Work after installation◆



■ Inspection: Starting torque of steering knuckle

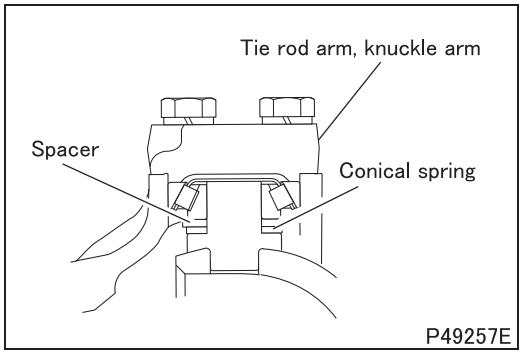
[Inspection]

- Measure the tangential force at the tie rod arm and knuckle arm end on the tie rod side using a spring balancer.

CAUTION ⚠

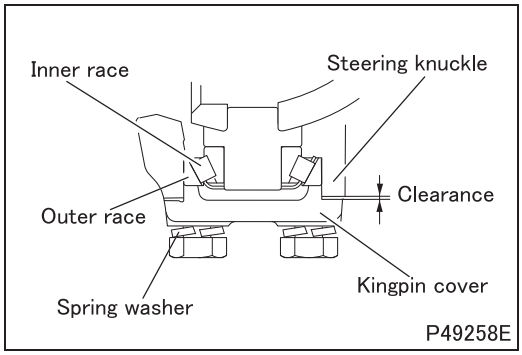
- **Do not assemble the dust boot and dust seal when measuring.**

- If the tangential force is within the specified value, the starting torque conforms to the standard value.
  If the measured value deviates from the specified value, adjust.
- Perform measurement again after adjustment. If any fault is found, replace the trunnion bearing.



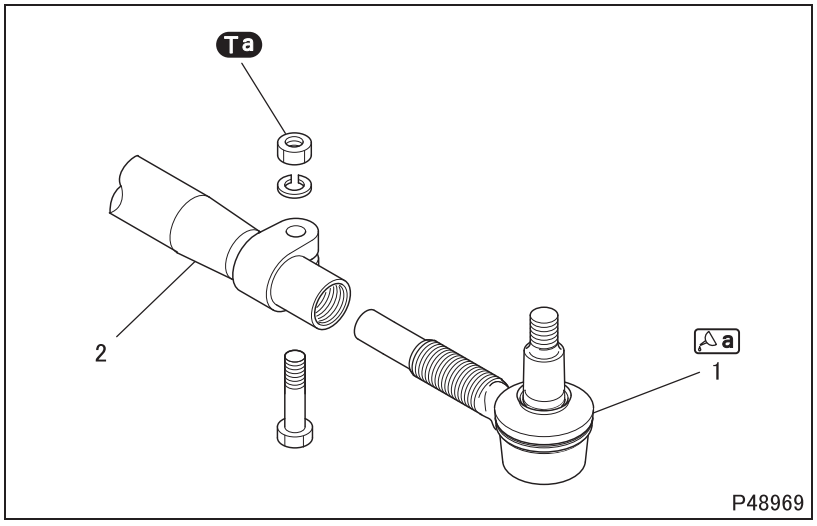
[Adjustment]

- Insert the conical spring and spacer (t = 3.2 mm {0.13 in.}) as illustrated and assemble the tie rod arm and knuckle arm as illustrated. Then, temporarily tighten them with bolts.



- Install the kingpin cover on the steering knuckle and tighten bolts to such extent that no tension is applied to the spring washers.
- Lift up the kingpin cover by hand until it securely contacts the trunnion bearing outer race and trunnion bearing inner race.
- Measure clearance between the steering knuckle and kingpin cover and select a spacer.
  When clearance is 0.6 mm {0.024 in.} or more: Spacer of 3.2 mm {0.13 in.}
  When clearance is less than 0.6 mm {0.024 in.}: Spacer of 3.6 mm {0.14 in.}
- Install the selected spacer and tighten bolts to the specified torque.

TIE ROD



● **Disassembly sequence**

1 Tie rod end
2 Tie rod

CAUTION ⚠

- **If any abnormality such as tearing is found in the dust boot of the tie rod end, replace the tie rod end.**

NOTE

- **Do not disassemble the tie rod end, as it is of non-disassembly type.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
1	Ball joint of tie rod end	Play (± 980 N {± 220 lbs, ± 100 kgf} loaded)	0 to 0.15 {0 to 0.0059}	–	Replace
		Rotation torque	1.0 to 5.9 N·m {0.7 to 4.4 ft.lbs, 0.1 to 0.6 kgf·m}	–	
2	Bend of tie rod		–	1 {0.039}	Correct or replace

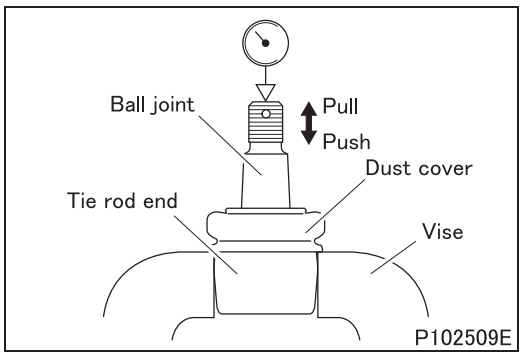
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (tie rod end tightening)	25 ± 5 {18 ± 3.7, 2.5 ± 0.5}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Lip area of dust cover of tie rod end	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

◆Inspection procedure◆



■ **Inspection: Tie rod end**

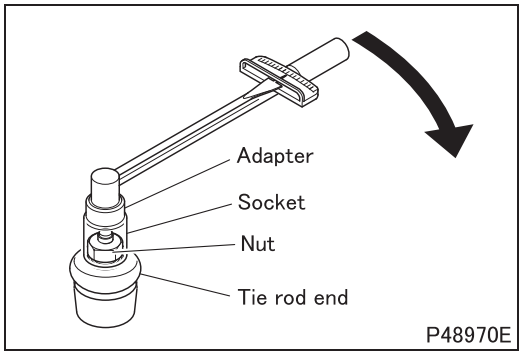
(1) Play

- Secure the tie rod end with a vise.

CAUTION ⚠

- **Take care not to deform or damage the dust cover when fixing it with a vise.**

- If the measured value deviates from the standard value when applying the specified load (push and pull) to the ball joint, replace the tie rod end.

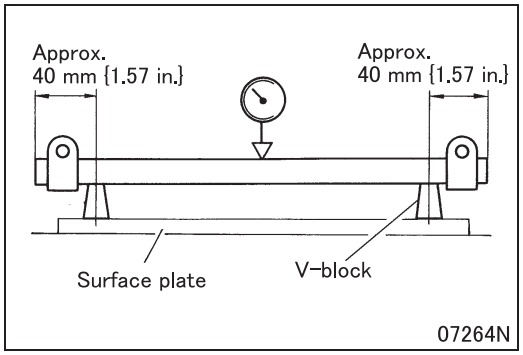


(2) Rotation torque

- Install the tie rod mounting nut on the tie rod end.
- Install the socket, adapter and torque wrench to measure the rotation torque.
- If the measured value deviates from the standard value, replace the tie rod end.

(3) Dust cover

- Check the dust cover for wear, cracks and other damage. These abnormalities may cause water infiltration to the ball joint and result in premature wear.
- If wear, crack, or damage is present, inspect traces of water entry and occurrence of rust in the ball joint. If any abnormality is found, replace the tie rod end. If no abnormality is found, replace the dust cover and reapply grease.



■ Inspection: Bend of tie rod

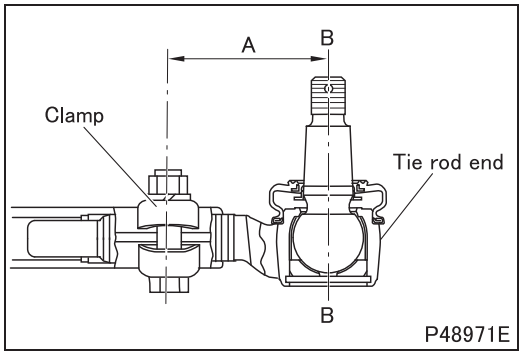
- Measure the bend of the tie rod at its center.

NOTE

- **Give the tie rod one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

- If the measured value exceeds the standard value, correct or replace the tie rod.

◆Installation procedure◆



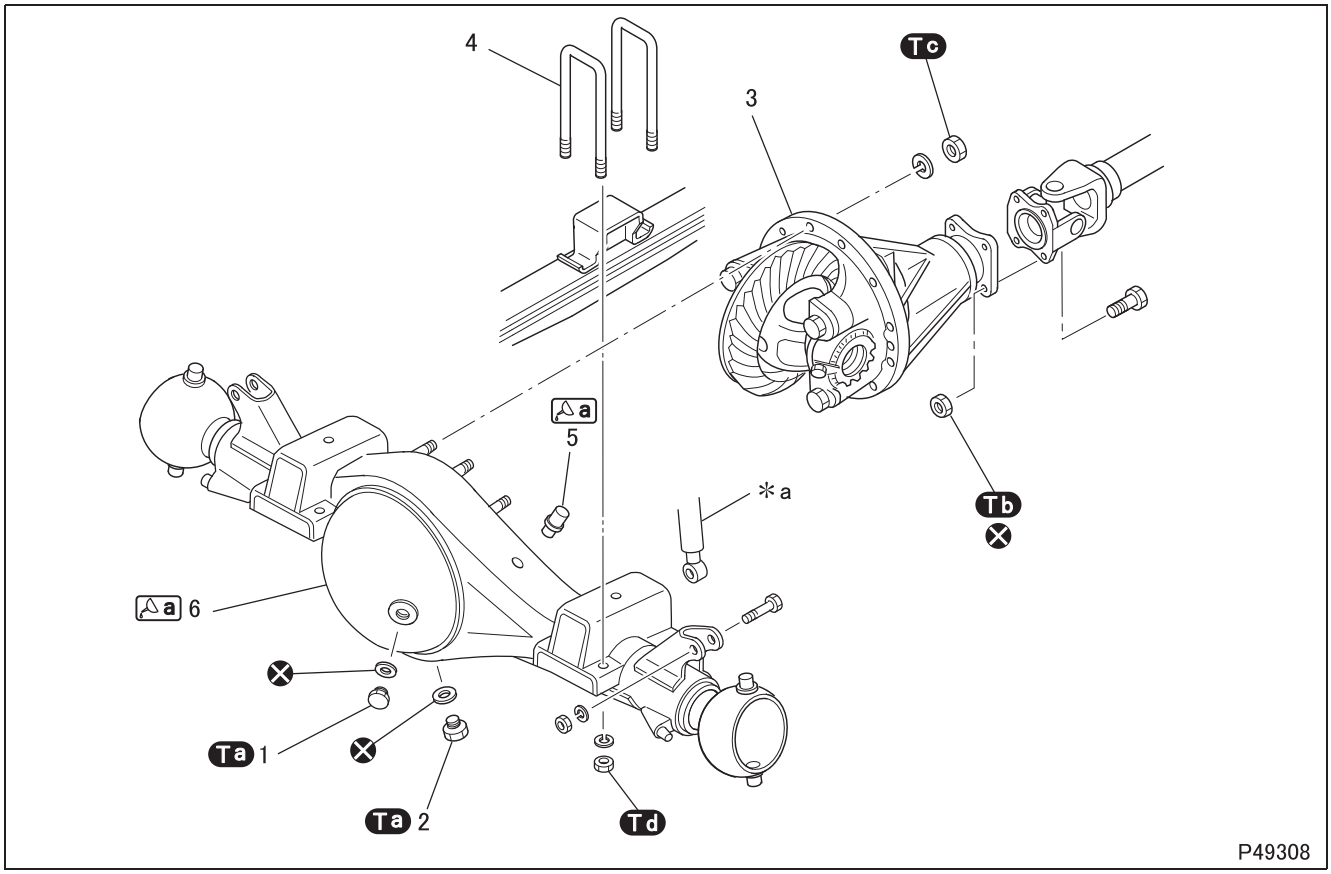
■ Installation: Tie rod end

- Screw in the tie rod end so that the difference of dimension A between the tie rod end and the clamp is within 1.5 mm {0.059 in.} between right and left.
  A: Approximately 74 mm {2.91 in.}

CAUTION ⚠

- **Ensure that the number of turns needed to install the right and left tie rod ends are within one turn of each other.**
- **Secure the tie rod ends so that the illustrated axis B-B on the right is parallel to that on the left.**

AXLE HOUSING



● **Disassembly sequence**

1 Inspection plug
2 Drain plug
3 Reduction and differential (See later section.)
4 U-bolt
5 Vent plug
6 Axle housing

***a**: Shock absorber
⊗: Non-reusable parts

NOTE

- **Do not remove the axle housing unless any abnormality is found.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
5	Injection-valve opening pressure of vent plug	4.9 kPa {0.7 psi, 0.05 kgf/cm^2} or less	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks

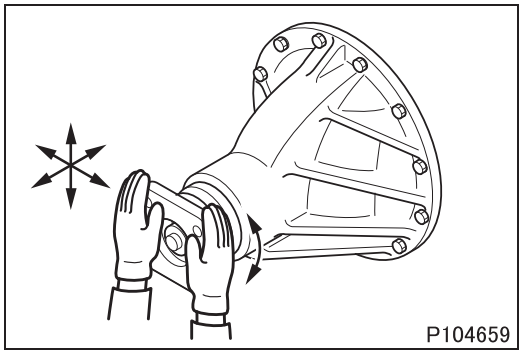
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Axle housing mounting surface of vent plug	ThreeBond 1215	As required
	Reduction and differential mounting surface of axle housing		

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Differential carrier base A: ϕ28 {1.1}  06679	MB999102	Removal and installation of reduction and differential assembly

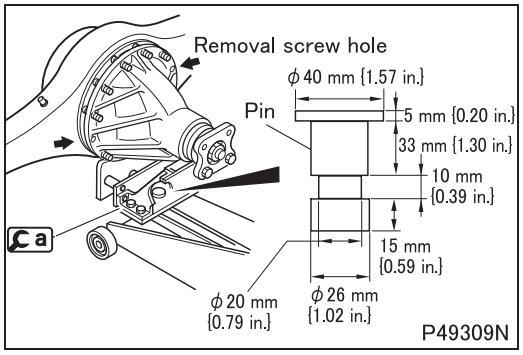
◆Work before removal◆



■ **Inspection: Play at companion flange**

- Move the companion flange in the back-and-forth, up-and-down, right-and-left and rotation direction to check for play.
- If there is play in either of directions, replace the following all parts.
  - Front bearing and rear bearing
  - Pinion spacer
  - Reduction gear set (reduction pinion and reduction gear)
  - Companion flange

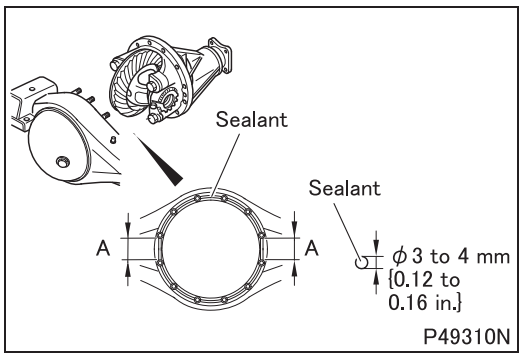
◆Removal procedure◆



■ **Removal: Reduction and differential**

- Remove the saucer of the garage jack and place a on it. Fabricate the pin as illustrated, insert and fix it with bolts that have fixed the saucer.
- Screw two M10 × 1.25 mm bolts evenly into the reduction and differential removal screw holes (as shown in illustration) to remove the reduction and differential.

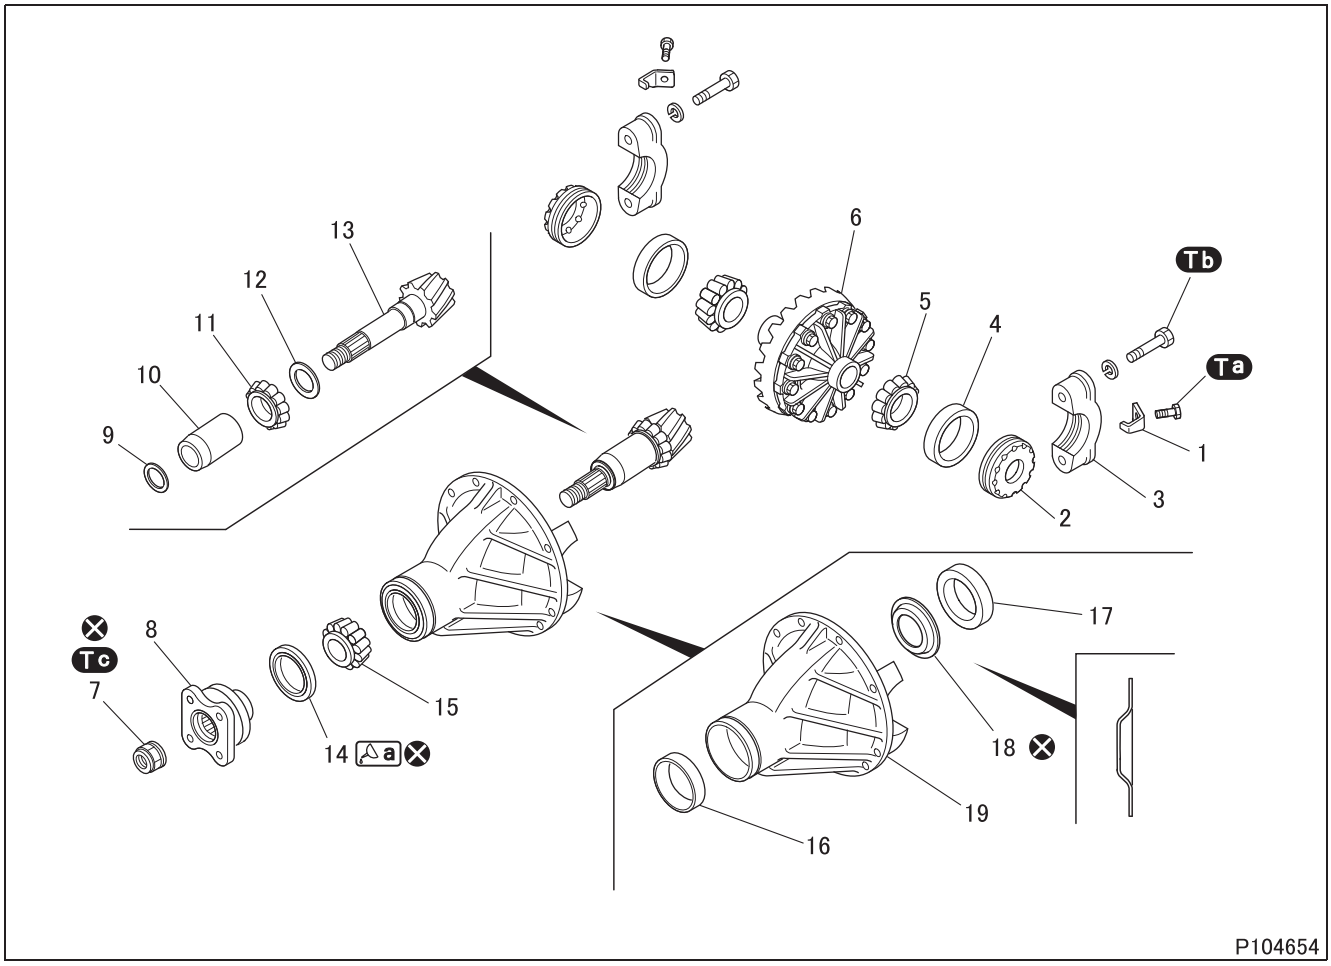
◆Installation procedure◆



■ **Installation: Reduction and differential**

- Clean a seal surface of each part.
- Apply sealant to the reduction and differential mounting surface of the axle housing evenly and without breaks. Apply sealant in a straight line direction for illustrated position A.

REDUCTION AND DIFFERENTIAL



● **Disassembly sequence**

1 Lock plate
2 Side bearing nut
3 Bearing cap
4 Side bearing outer race
5 Side bearing inner race
6 Differential (See later section.)
7 Lock nut
8 Companion flange

13 Reduction pinion
14 Oil seal
15 Front bearing inner race
16 Front bearing outer race
17 Rear bearing outer race
18 Oil stopper
19 Differential carrier

⊗: Non-reusable parts

CAUTION ⚠

- **Be sure to replace the bearing cap, differential carrier and bolts as a differential carrier set.**
- **Be sure to replace the reduction pinion and the reduction gear of the differential as a reduction gear set.**

- Keep side bearings that have been removed separated from each other and ensure that during installation each one is placed back in its original position.
- Record the number, thickness and height of the front bearing shims, pinion spacers and rear bearing shims to use them as a reference at assembly.

● **Assembly sequence**

Follow the disassembly sequence in reverse except the following sequence.
16 → 13 → 12 → 11 → 10 → 9 → 15 → 14 → 8

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Starting torque of pinion bearing (with no oil seal installed)	0.69 to 1.27 N·m {0.5 to 0.94 ft.lbs, 0.07 to 0.13 kgf·m}	–	Adjust or replace
6	Wobble at back face of reduction gear	0 to 0.1 {0 to 0.0039}	–	Replace
6, 13	Backlash between reduction gear and reduction pinion	0.15 to 0.20 {0.0059 to 0.0079}	–	Adjust or replace

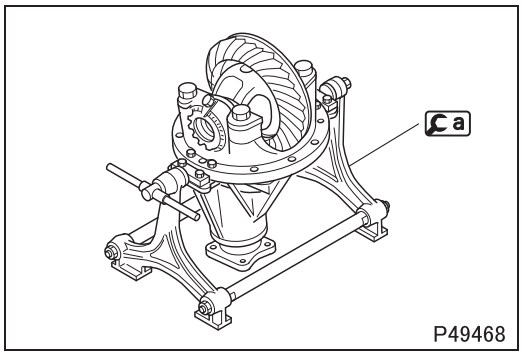
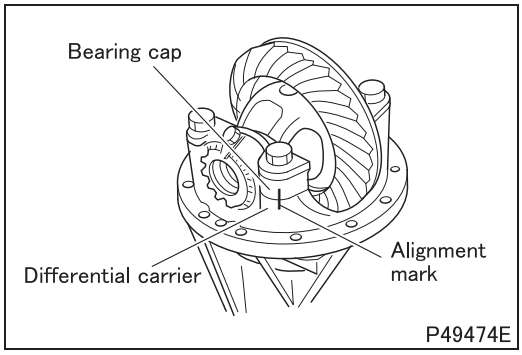
◆Work before removal◆



P49468

■ **Preparatory work: Installation of differential working base assembly**

- Install the reduction and differential on ca.

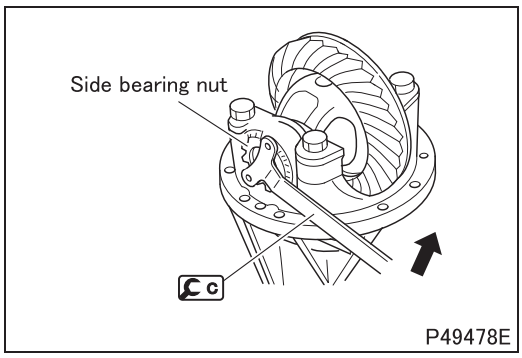


P49474E

■ **Alignment marks: Bearing cap and differential carrier**

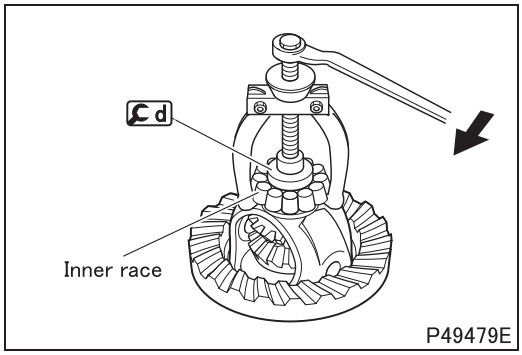
- Put alignment marks on the bearing cap and differential carrier for correct identification of right and left parts.

◆Removal procedure◆

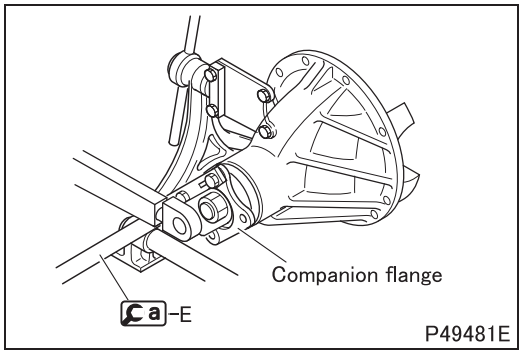


P49478E

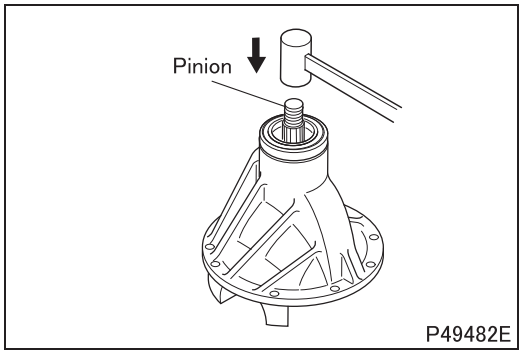
■ **Removal: Side bearing nut**



■ **Removal: Side bearing inner race**

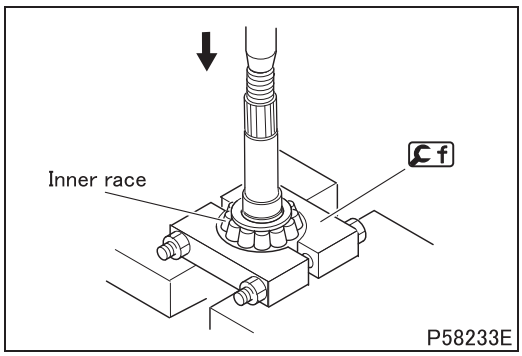


■ **Removal: Companion flange**

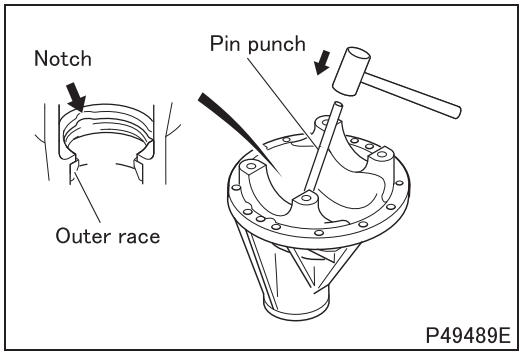


■ **Removal: Reduction pinion**

- Tap the reduction pinion with a plastic hammer and hold the reduction pinion with your hand to prevent it from falling.

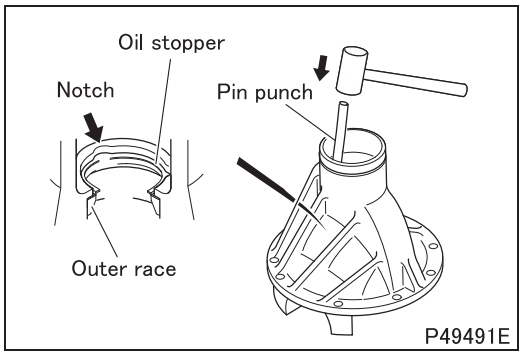


■ **Removal: Rear bearing inner race**



■ **Removal: Front bearing outer race**

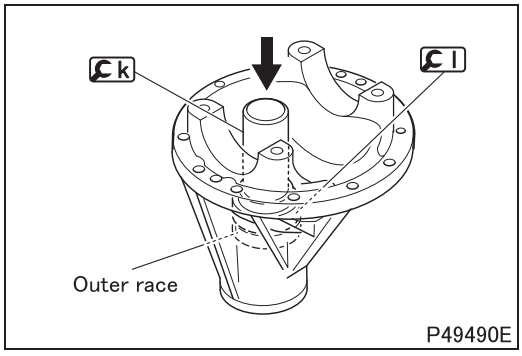
- Drive out the front bearing outer race by tapping evenly at three indented parts in the differential carrier.



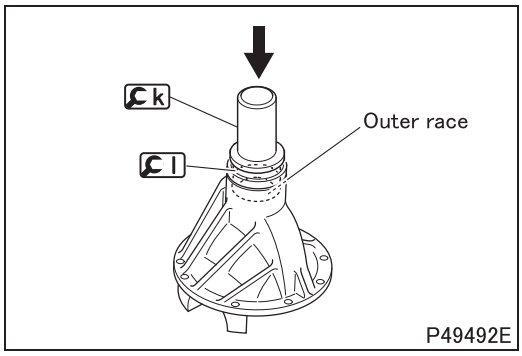
■ **Removal: Rear bearing outer race**

- Drive out the rear bearing outer race, together with the oil stopper, by tapping evenly at three indented parts in the differential carrier.

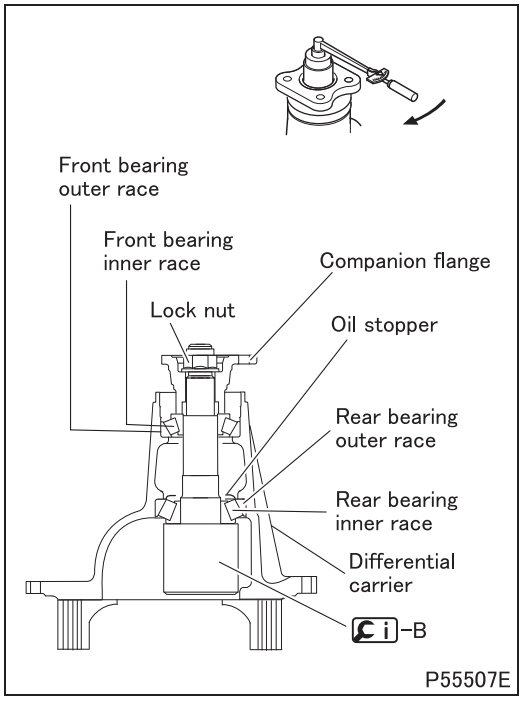
◆**Installation procedure**◆



■ **Installation: Rear bearing outer race**



■ **Installation: Front bearing outer race**



■ **Installation: Rear bearing shim**

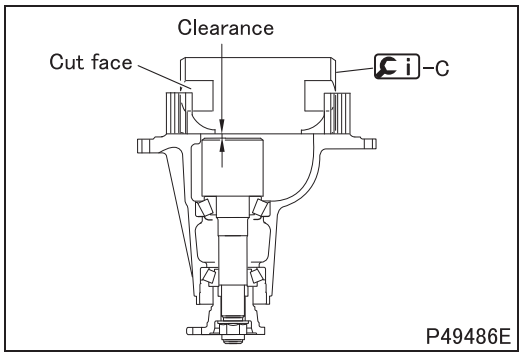
[Selection (pinion height adjustment)]

- After installing the front bearing outer race, temporarily assemble i -B together with the illustrated parts into the differential carrier.

CAUTION ⚠

- **Do not assemble parts except the illustrated ones.**

- Tighten the lock nut so that the starting torque of the pinion bearing at i -B conforms to the standard value.



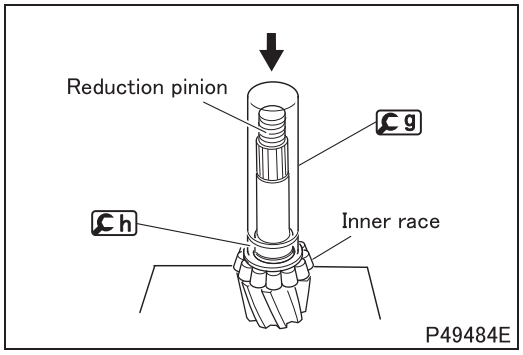
- Set i -C in the illustrated direction and measure clearance as illustrated.
- Select shims so that clearance becomes 1.5 mm {0.059 in.}.
  Thickness of shims available
  0.30 and 1.38 to 1.65 mm {0.012 and 0.054 to 0.065 in.} (10 thickness in 0.03 mm {0.012 in.} increments)

CAUTION ⚠

- **Select the number of rear bearing shims as least as possible.**

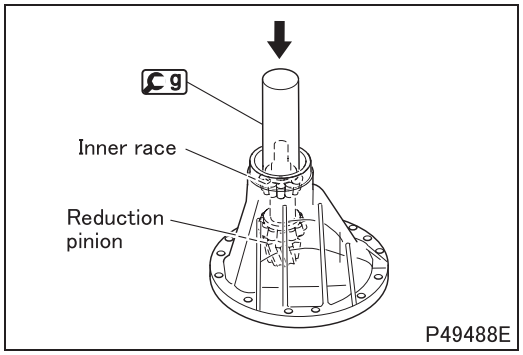
[Installation]

- If using a shim of 0.30 mm {0.012 in.} in thickness in combination with a shim of other thickness for installing rear bearing shims, install a shim of 0.30 mm {0.012 in.} in thickness on the rear bearing inner race to prevent wear-out.



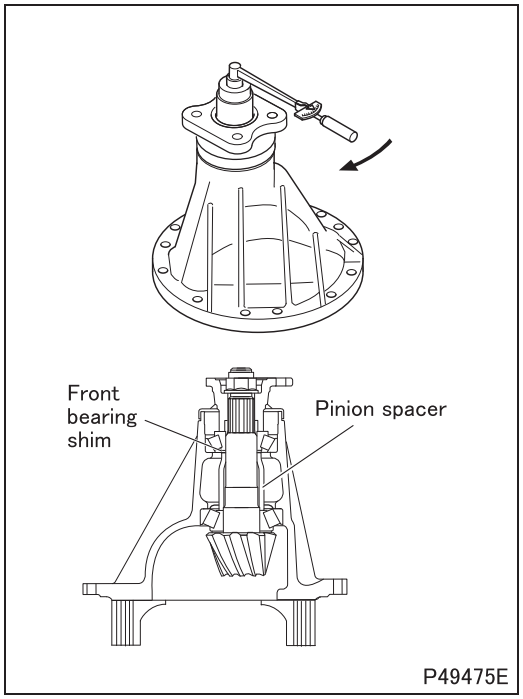
■ **Installation: Rear bearing inner race**

- Install the rear bearing inner race with the shim selected by the pinion height adjustment.



■ **Installation: Front bearing inner race**

- Install the front bearing inner race with the reduction pinion assembled into the differential carrier.

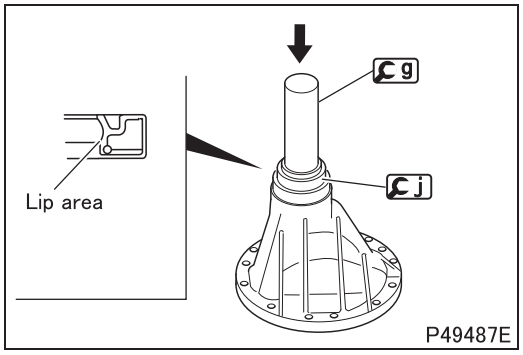


■ **Inspection: Starting torque of pinion bearing**

- After installing front bearing shims, measure the starting torque of the pinion bearing with no oil seal assembled.
- If the measured value deviates from the standard value, adjust by changing a pinion spacer and front bearing shims.
  Thickness of pinion spacers available
  64.07, 64.40 mm {2.52, 2.54 in.} (painted in white)
  Thickness of front bearing shims available
  0.03 and 2.00 to 2.33 mm {0.0012 and 0.079 to 0.092 in.} (12 thickness in 0.03 mm {0.012 in.} increments)

CAUTION ⚠

- **Select a pinion spacer so that the number of front bearing shims becomes as least as possible.**

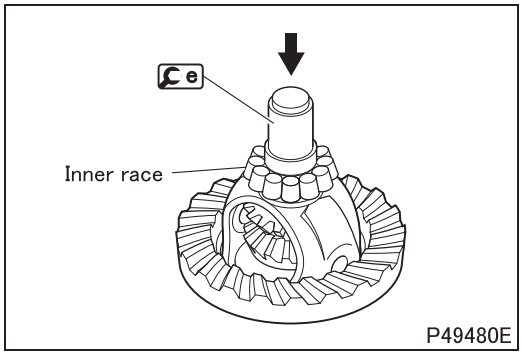


■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install it on the differential carrier in the illustrated direction.

■ **Installation: Companion flange**

- Install the companion flange in the same manner as for removal. (See **"■ Removal: Companion flange"**.)

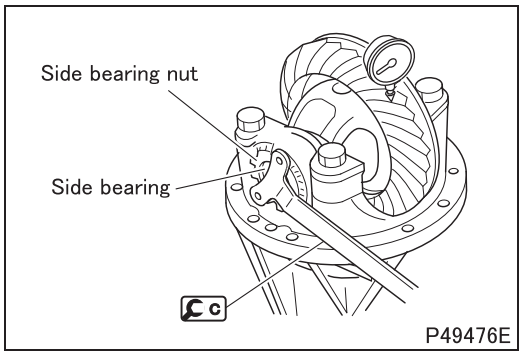


■ **Installation: Side bearing inner race**

■ **Installation: Side bearing nut**

- Install the side bearing nut in the same manner as for removal. (See **"■ Removal: Side bearing nut"**.)

◆Work after installation◆

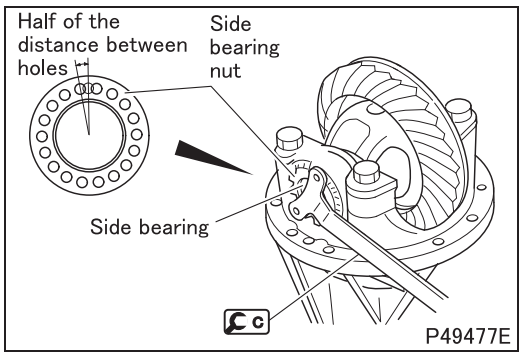


■ **Adjustment: Backlash between reduction gear and reduction pinion**

- Tighten the side bearing nut for adjustment to such extent that no preload is applied to the side bearing.

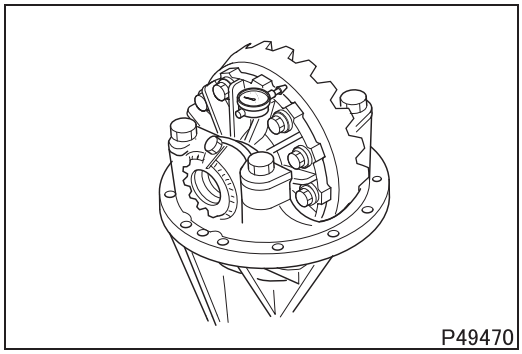
CAUTION ⚠

- **When one side bearing nut is loosened, be sure to tighten the other one the same amount to prevent the side bearing preload from changing.**



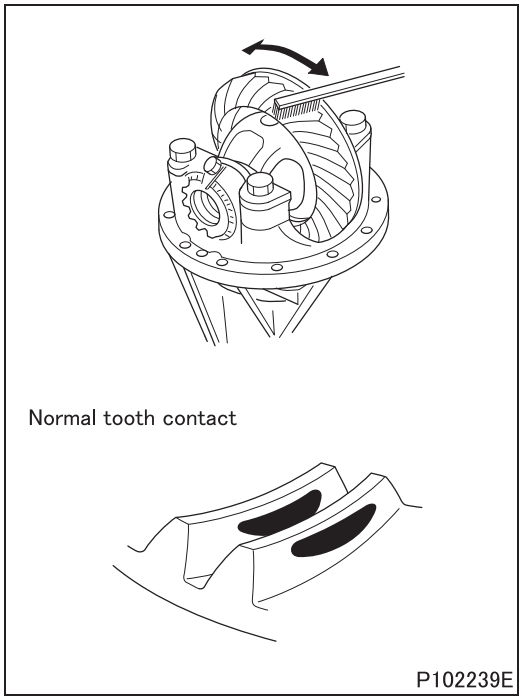
■ **Adjustment: Side bearing preload**

- After adjusting backlash between the reduction gear and reduction pinion, further tighten both of the side bearing nuts within the range of backlash to provide preload to the side bearing.
- The tightening amount of preload must be limited to the distance between two holes for combination of right and left sides.



■ **Inspection: Wobble at back face of reduction gear**

- Measure wobble at the illustrated position of the reduction gear.
- If the measured value deviates from the standard value, replace the reduction gear and reduction pinion of the differential as a set.



■ **Inspection: Tooth contact of reduction gear**

[Inspection]

- Apply red lead to three to four teeth at three equally spaced points of the reduction gear.
- Turn the reduction gear several times to ensure proper tooth contact.
  Tooth contact off-center to the small end side under no load moves toward to the center under a load.
- Adjust tooth contact if it is remarkably offset.

[Adjustment]

- Optimize tooth contact by increasing or decreasing shim thickness or adjusting backlash between reduction gear and reduction pinion (using the side bearing nut).

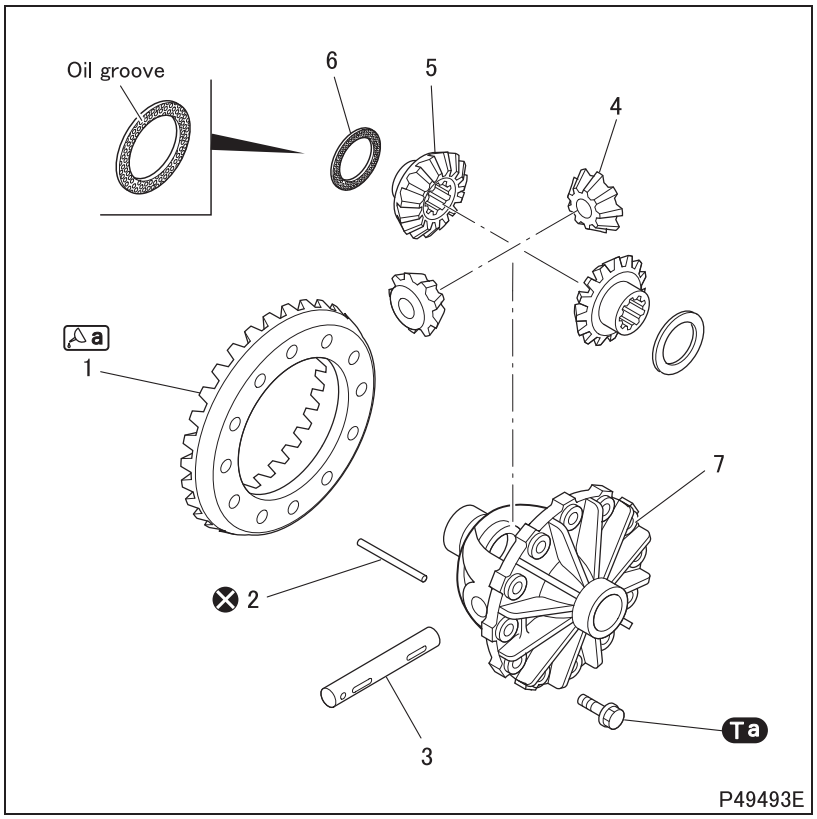
CAUTION ⚠

- **If teeth are abnormally worn or tooth contact is excessively concentrated at the large end or small end side, always replace both the reduction gear and reduction pinion as a reduction gear set.**

Tooth contact on reduction gear	Adjustment procedure
Concentrated at addendum  P102240	Advance reduction pinion to reduction gear (shims are added)  P55497
Concentrated at dedendum P102241	Retard reduction pinion from reduction gear (shims are reduced)  P55498
Concentrated at large end side  P102242	Advance reduction gear to reduction pinion center (less backlash)  P55499
Concentrated at small end side  P102243	Retard reduction gear from reduction pinion center (more backlash)  P55500

REDUCTION AND DIFFERENTIAL

Differential



● Disassembly sequence

1 Reduction gear
2 Lock pin
3 Pinion shaft
4 Differential pinion
5 Side gear
6 Side gear washer
7 Differential case

⊗: Non-reusable parts

CAUTION ⚠

- **Be sure to replace the differential pinion and the side gear as a side gear set.**

● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
4, 5	Backlash between differential pinion and side gear	0.15 to 0.20 {0.0059 to 0.0078}	0.3 {0.012}	Adjust or replace
5	Backlash between side gear and spline of drive shaft	0.07 to 0.16 {0.0028 to 0.0063}	0.5 {0.020}	Replace

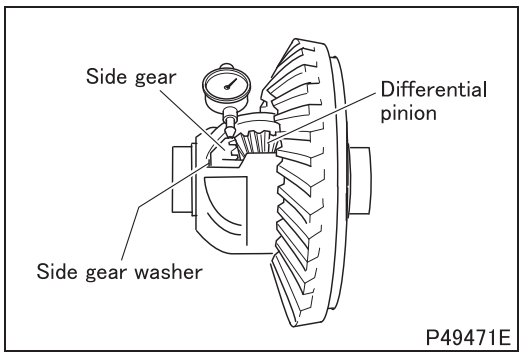
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (reduction gear mounting)	137.2 to 166.6 {101 to 122, 14 to 17}	–

Lubricant and/or sealant

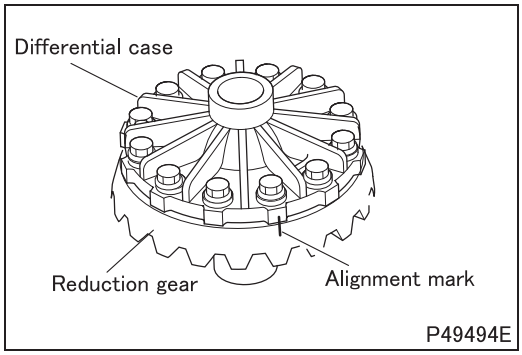
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Bolt threads of reduction gear	Loctite 271	As required

◆Work before removal◆



■ Inspection: Backlash between differential pinion and side gear

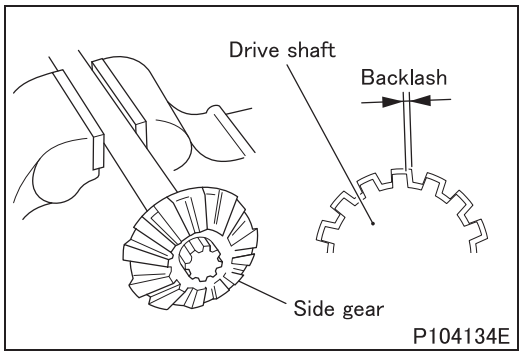
- If backlash is found faulty, thickness of the side gear washer is probably inappropriate.



■ **Alignment marks: Reduction gear and differential case**

- Put alignment marks on the reduction gear and the differential case.

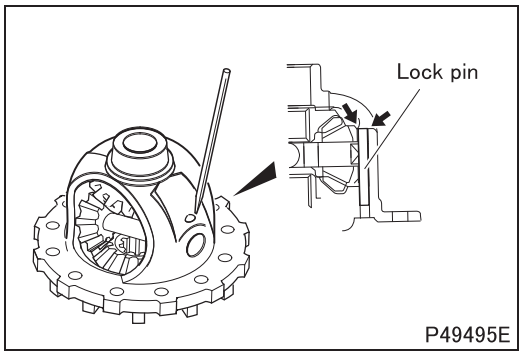
◆Inspection procedure◆



■ **Inspection: Backlash between side gear and spline of drive shaft**

- If the measured value exceeds the limit, replace defective parts.

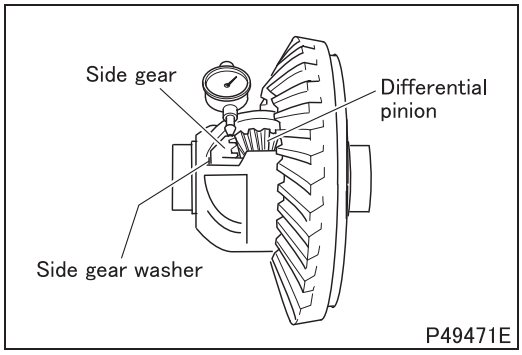
◆Installation procedure◆



■ **Installation: Lock pin**

- After installing the lock pin, caulk it with a punch (two locations).

◆Work after installation◆



■ **Inspection: Backlash between differential pinion and side gear**

- If the measured value deviates from the standard value, adjust by changing thickness of the side gear washer.
  Thickness of side gear washers available
  1.4, 1.5, 1.6 mm {0.055, 0.059, 0.063 in.} (three thickness)

CAUTION ⚠

- **Use side gear washers of the same thickness for the right and left sides.**

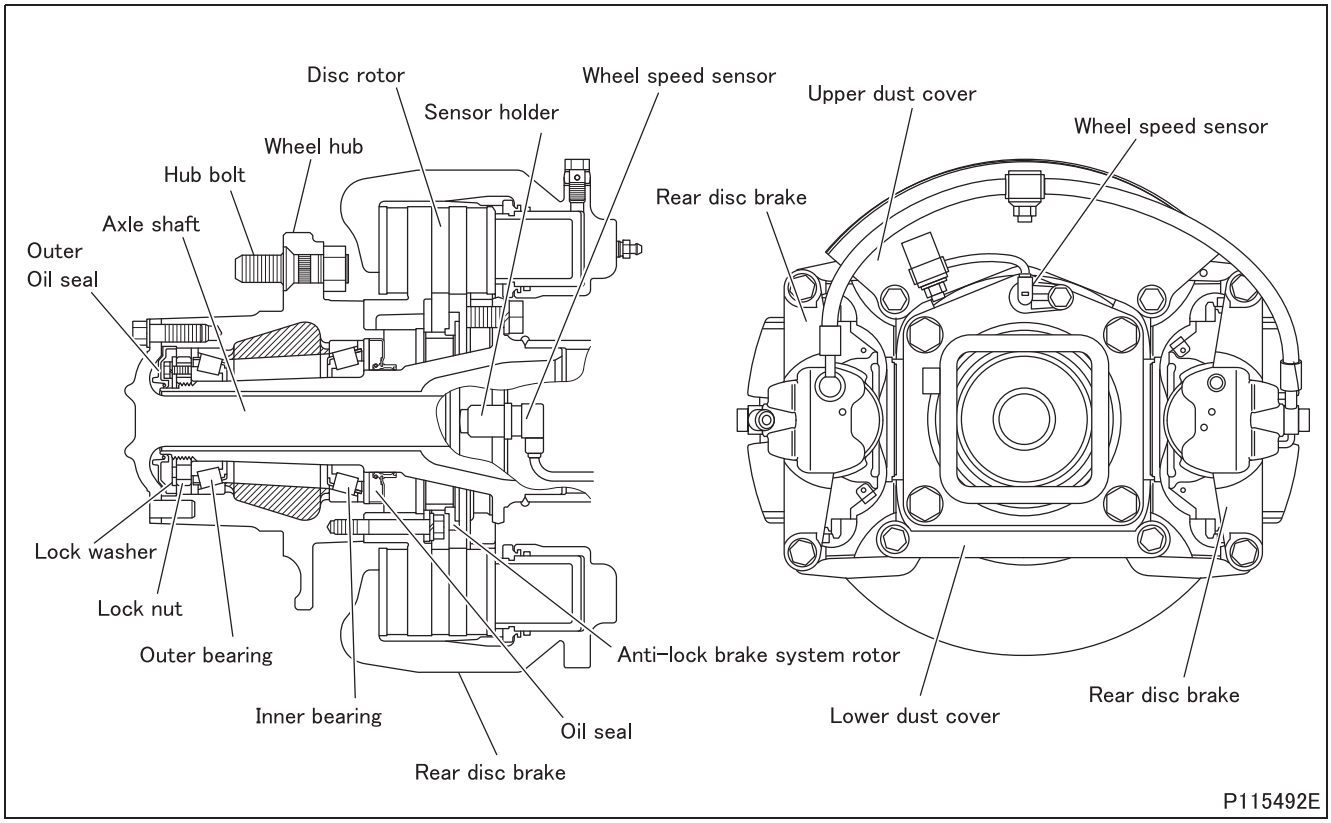
SPECIFICATIONS

Item		Specifications		
		FEC5	FEC7, FG	FEC9
Rear axle	Model	R033T	R035T	
	Type	Banjo type, full floating		
Reduction	Model	D033H	D035H	
	Type	Single-reduction hypoid gear		
	Gear ratio	4.875 5.285	5.285 5.714	6.166
Differential	Tooth shape	Straight bevel gear		
Gear oil	Grade	Normal: Maximum air temperature during operation below 40°C {104°F} API GL-5 SAE 90 Hot area: Maximum air temperature during operation above 40°C {104°F} API GL-5 SAE 140		
	Quantity L {qts}	4.5 {4.8}		
Mass kg {lb}		225 {495} (approximately)	250 {550} (approximately)	

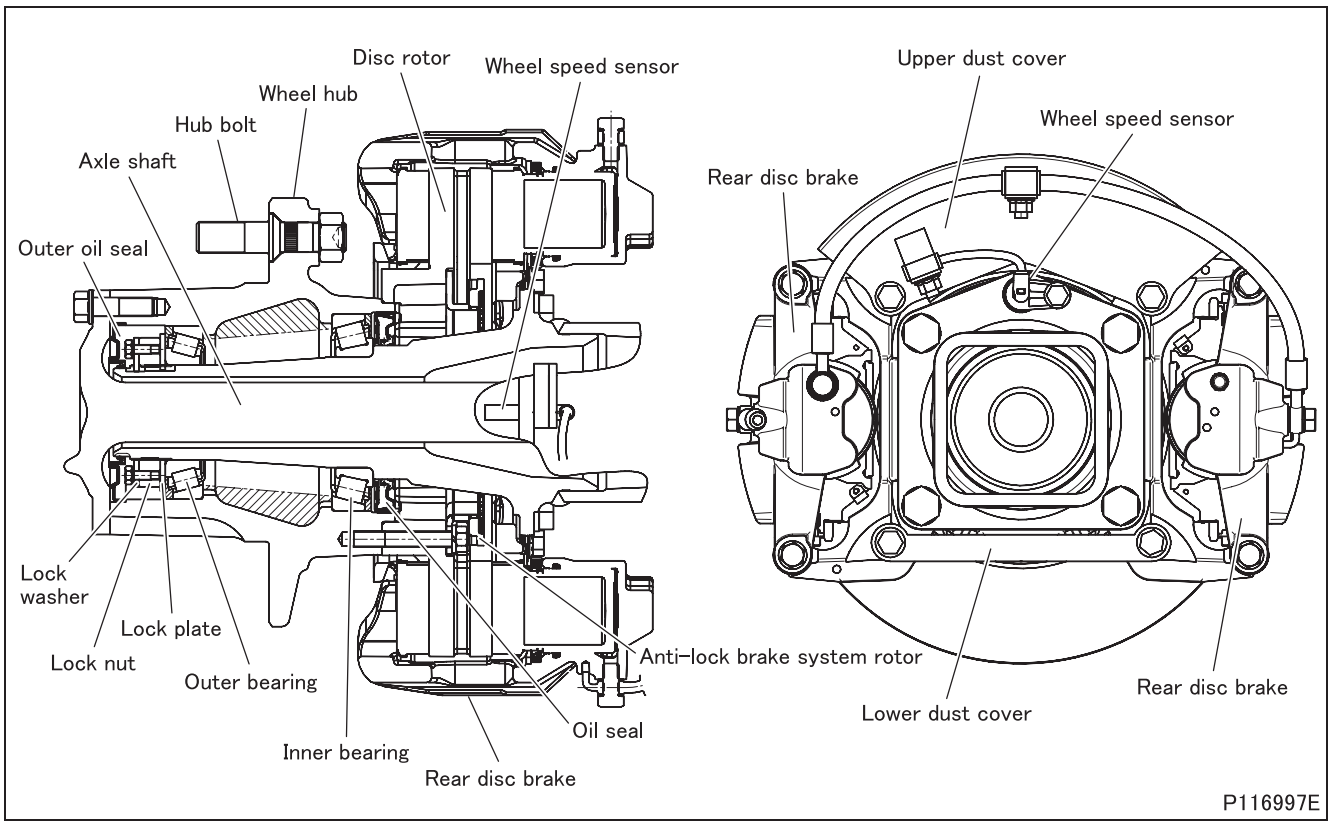
- Use gear oil with a SAE viscosity of 140 when a vehicle is used under heavily-loaded, severe conditions such as continuous driving on uphill grades. However, the air temperature must be above 10°C {50°F}.
- Limited slip differential oil API GL-5 SAE 90 is used for models with a LSD (Limited Slip Differential).
- The mass differs between vehicle models.

1. Wheel Hub and Rotor

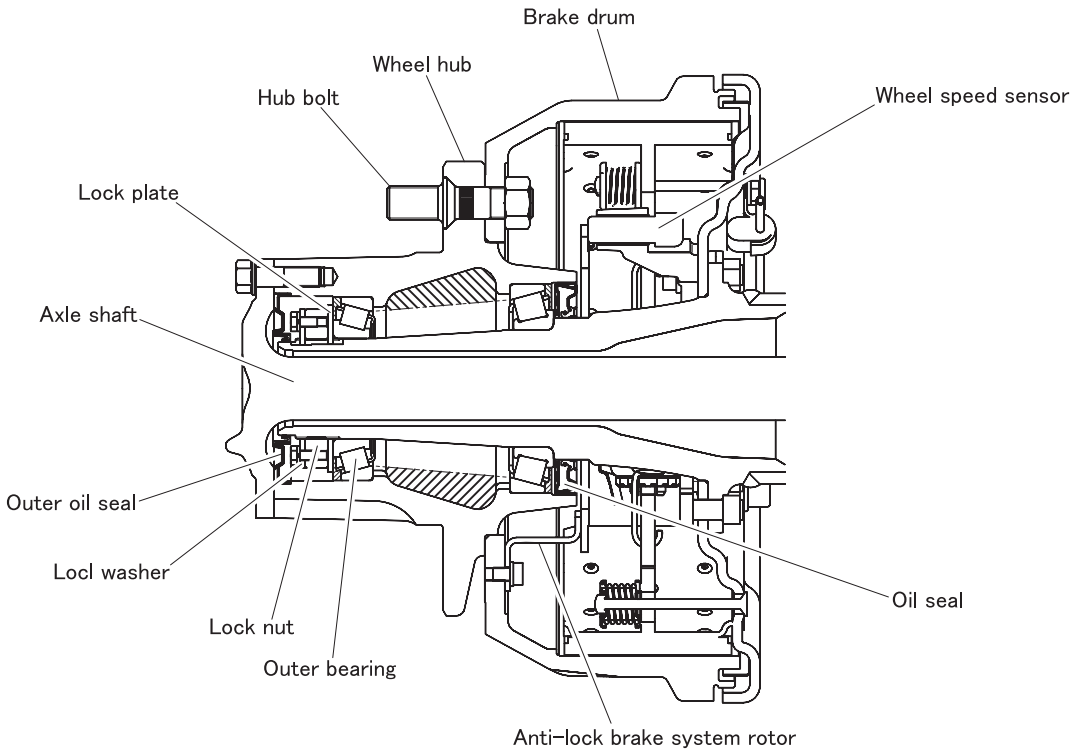
<FEC5>



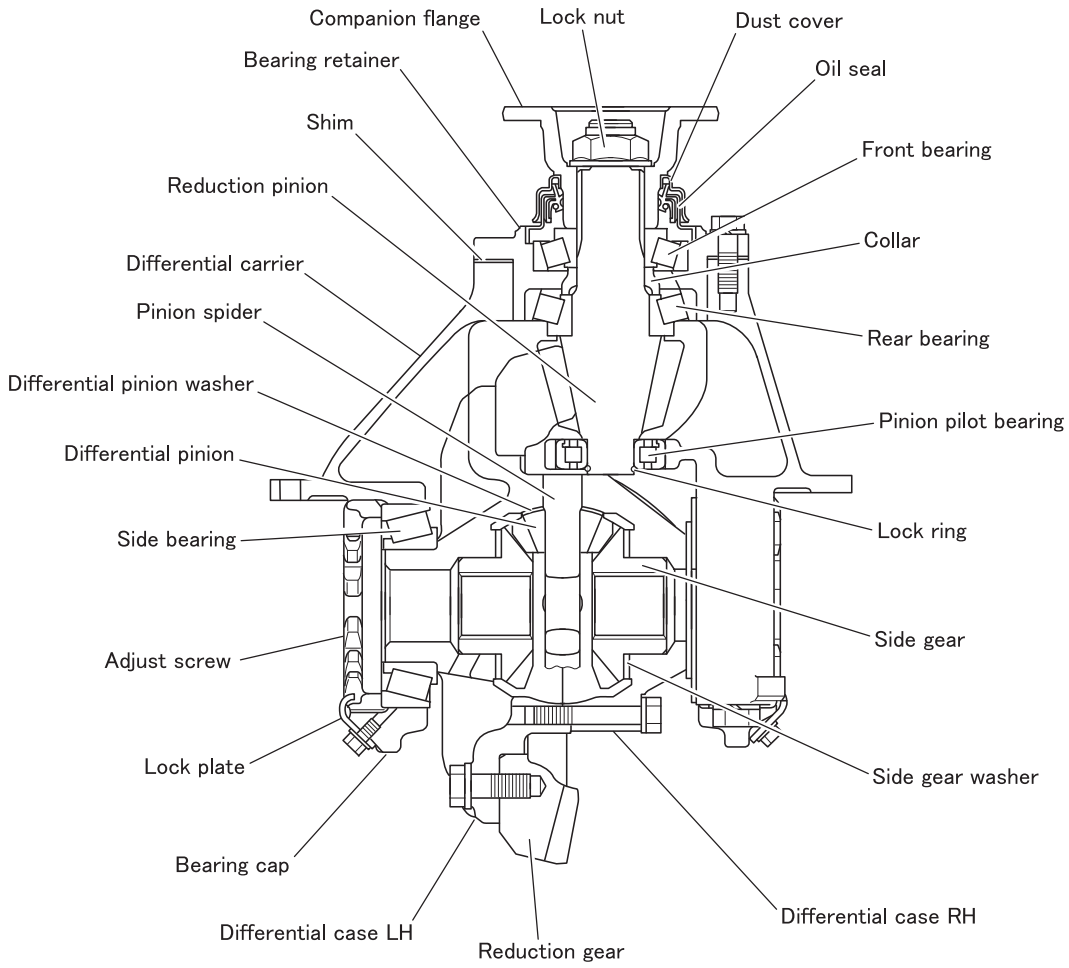
<FEC7, FEC9>



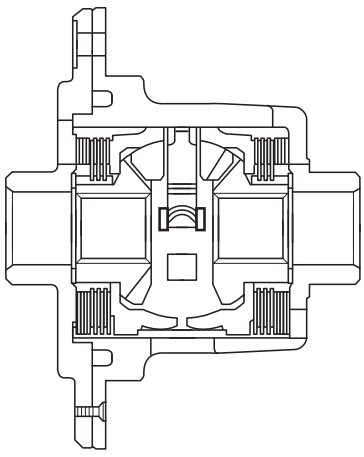
2. Wheel Hub and Brake Drum



3. Reduction and Differential

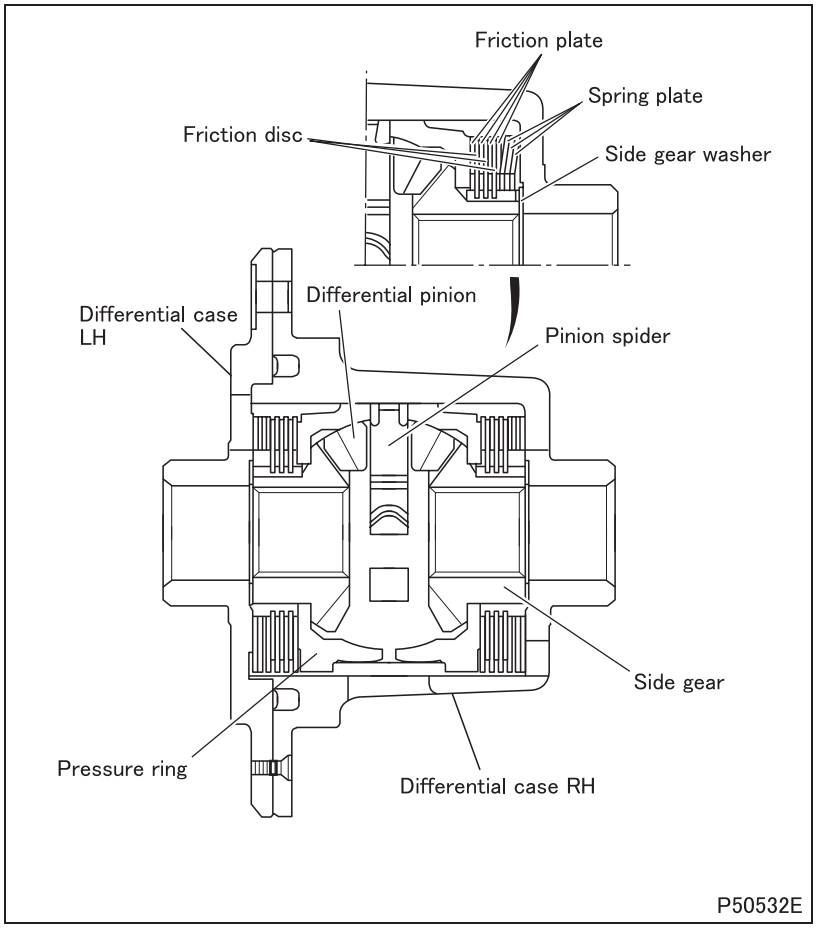


Limited slip differential



P58332E

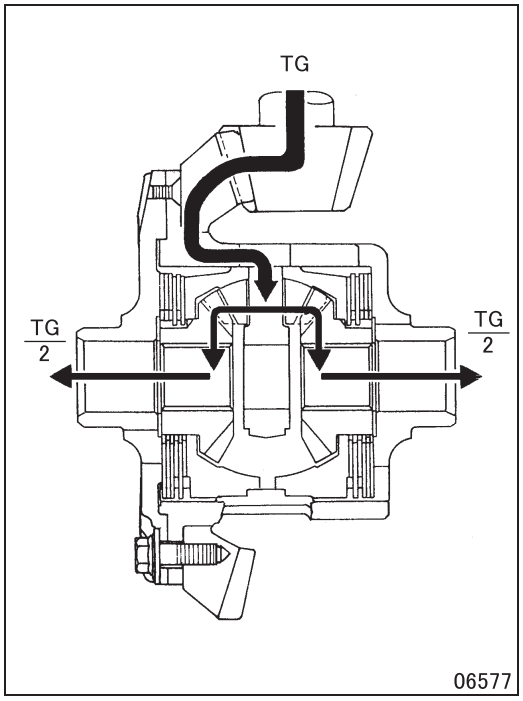
4. Limited Slip Differential



- The friction discs and spring discs, which are fitted in the side gears, and the friction plates, which are fitted in the differential case RH, are pushed against the pressure rings by the spring plates.
- The pressure rings fit in the groove inside the differential case RH and always rotate at the same speed.

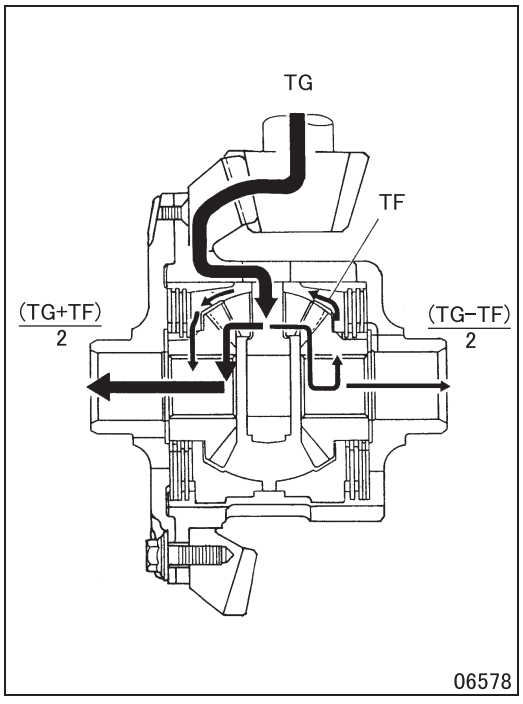
4.1 Operating mechanism

- When one wheel spins, a difference in the revolution speed generates between the side gear and the differential case, LH and RH, which causes the friction discs, spring discs and friction plates to revolve relative to each other. This relative revolution produces a friction torque between the friction discs and friction plates.



4.2 Operation during straight driving

- During straight driving, the right and left axle shafts rotate at the same speed, and no friction torque generates.
  TG: input torque



4.3 Operation when there is a difference in rotation speed between right and left wheels

- If one wheel is on a slippery surface such as mud and the other wheel is not, the differential function becomes effective due to a difference in surface resistance. In this state, friction torque TF is generated and this torque works in such a manner as to reduce the difference in rotations between right and left wheels. That is, the faster axle shaft is forced to slow down, and the slower axle shaft is forced to turn faster.
  If one wheel spins on a slippery surface, a large friction torque generates because such spinning makes a large rotational speed difference. Accordingly, a small torque is distributed to the spinning wheel while a large torque is distributed to the non-spinning wheel, which makes it easier for the vehicle to drive over the slippery surface.

$\frac{TG-TF}{2}$ High-speed side (spinning side)

$\frac{TG+TF}{2}$ Low-speed side

TROUBLESHOOTING

Possible causes	Symptoms	Power transmission insufficient									
		Noise when starting and changing gears	Continuous noise while at a constant speed	Intermittent noise while at a constant speed	Noise while cornering	Tires drag while comering	Propeller shaft turns but vehicle does not move	Oil leakage from companion flange assembly	Oil leakage from differential carrier and axle housing	Oil leakage from axle shaft	Reference Gr
Wheel hub, axle shaft, axle housing	Wheel hub bearing seized, worn or rotation faulty		O								
	Wheel hub bearing broken			O							
	Axle shaft mounting bolts loose			O						O	
	Axle shaft broken						O				
	Axle shaft slips out of spline of side gear						O

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection and Replacement of Axle Oil

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Inspection plug	110 ± 10 {81 ± 7.4, 11 ± 1}	–
	Drain plug		

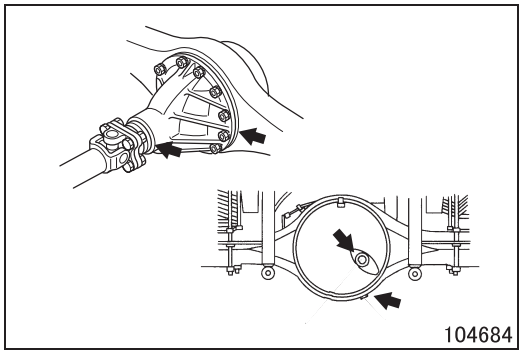
Lubricant and/or sealant

Mark	Points of application		Specified lubricant and/or sealant	Quantity
–	Axle housing	D033H, D035H	Gear oil: Normal: Maximum air temperature during operation below 40°C {104°F} API GL-5 SAE 90 Hot area: Maximum air temperature during operation above 40°C {104°F} API GL-5 SAE 140	4.5 L {4.8 qts}

- Use the gear oil with a SAE viscosity of 140 under heavily-loaded, severe conditions such as continuous driving on uphill grades. However, the air temperature must be above 10°C {50°F}.
- Limited slip differential oil API GL-5 SAE 90 is used for models with limited slip differential.

WARNING ⚠

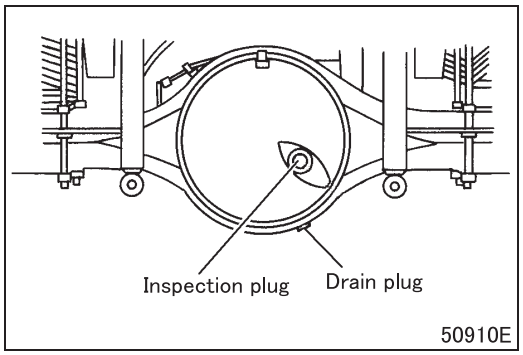
- **The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.**



[Inspection]

(1) Inspection of oil quantity

- Remove the inspection plug, and check that oil is filled up to the neck.
- If oil is not sufficient, fill oil from the inspection plug hole up to the neck.



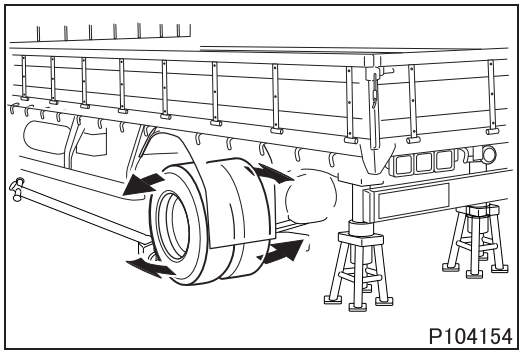
(2) Inspection of oil quality and contaminants

- When draining gear oil, check for oil quality, metal chips and metal powder.
- If an abnormally large amount of metal chips and metal powder is found, disassemble the assembly for service, as abnormalities may be caused inside.

[Replacement]

- Remove the drain plug to drain gear oil. Drainage can be made quickly with the inspection plug removed.
- As the drain plug (magnet type) is a magnet, clean it before installation.
- Fill the specified quantity of gear oil from the inspection plug hole.
- After filling, check that oil is filled up to the neck. If oil is not sufficient, replenish it.

2. Inspection of Wheel Bearing for Play



- Jack up the vehicle.
- Try to move the top and bottom of the rear tire by hand in the illustrated directions to inspect the wheel bearing for play.
- If play is found with the feel of hands, repeat the inspection procedure while having the brake pedal depressed by another person. When play is eliminated by applying the brake pedal, the symptom indicates that there is play in the wheel bearing. Then inspect the turning torque of the wheel bearing and adjust it as required. (See “WHEEL HUB AND BRAKE DRUM”.)
- If the turning torque of the wheel bearing cannot be adjusted correctly or play still remains after the adjustment, replace the wheel bearing with a new one. (See “WHEEL HUB AND BRAKE DRUM”.)

WHEEL HUB AND ROTOR <FE52>

20 Anti-lock brake system rotor flange
21 Outer bearing outer race
22 Disc rotor
23 Hub bolt
24 Wheel hub

Ⓟ: Locating pin
⊗: Non-reusable parts

CAUTION ⚠

- **Plug the brake hose and brake pipe to prevent entry of dust and dirt after it has been removed.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Make sure that the disc rotor surface and disc brake pad surface are free from grease to avoid malfunction of the brakes.**
- **When installing the brake hose, take necessary steps to prevent entry of dust and dirt into the hose.**
- **Make sure that the brake hose is not twisted when installing it.**
- **Make sure that the brake hose does not interfere with any of surrounding parts when installed.**

- Inspect the drag torque of the disc brakes after assembly. (See Gr35.)
- Bleed air from the brake system after assembly. (See Gr35.)

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Starting torque of wheel hub bearing (tangential force at hub bolt position with oil seal assembled)		2.0 to 3.9 N·m {1.4 to 2.9 ft.lbs, 0.2 to 0.4 kgf·m} (tangential force: 17.5 to 34.2 N {3.9 to 7.7 lbs, 1.8 to 3.5 kgf})	–	Adjust or replace
12	Axle shaft	Bend	0 to 1 {0 to 0.039}	2 {0.079}	Replace
		Bend at flange face	0 to 0.03 {0 to 0.0012}	0.05 {0.0020}	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Eyebolt		22 ± 2 {16 ± 1.5, 2.24 ± 0.20}	–
Tb	Bolt (rear disc brake mounting)		98 to 140 {72 to 103, 10 to 14}	–
Tc	Bolt (axle shaft mounting)		98 to 120 {72 to 87, 10 to 12}	–
Td	Lock nut	Primary tightening	98 to 130 {72 to 96, 10 to 13}	–
		Secondary tightening after primary tightening	30 to 40 {22 to 29, 3 to 4}	–
Te	Bolt (wheel hub and disc rotor mounting)		45 to 60 {33 to 44, 4.6 to 6.1}	–
Tf	Nut (hub bolt mounting)		340 ± 40 {251 ± 30, 35 ± 4}	–

Lubricant and/or sealant

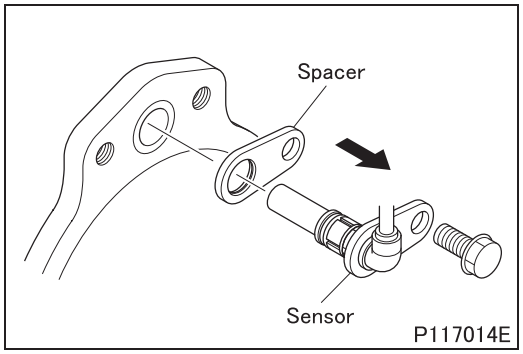
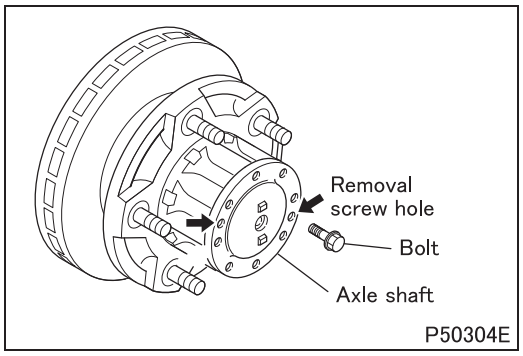
◆Removal procedure◆



■ **Removal: Wheel speed sensor**

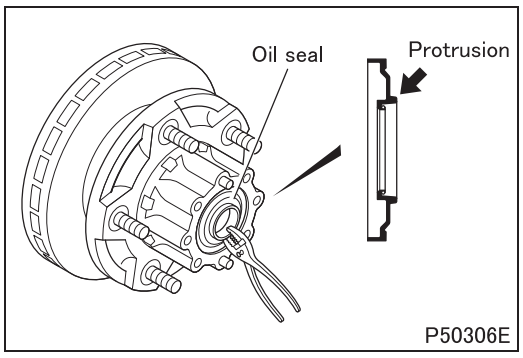
CAUTION ⚠

- **When removing the wheel speed sensor, never apply a force to it such as tapping it with a hammer, prying it with a screwdriver and pulling the harness, as doing so may damage the wiring.**
- **Be careful not to damage the tip of the wheel speed sensor after removing it.**



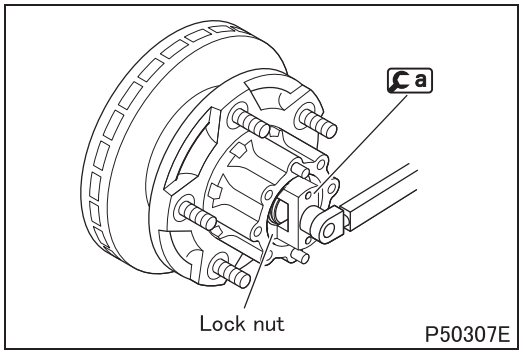
■ **Removal: Axle shaft**

- Screw two axle shaft mounting bolts evenly into the axle shaft removal screw holes to remove the axle shaft.

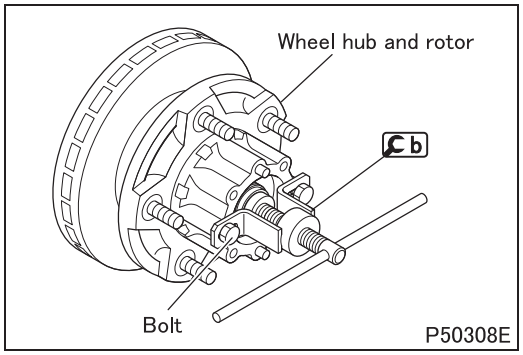


■ **Removal: Outer oil seal**

- To remove the outer oil seal, pull the protrusion on the outer periphery of the outer oil seal evenly around the whole circumference with pliers.



■ **Removal: Lock nut**

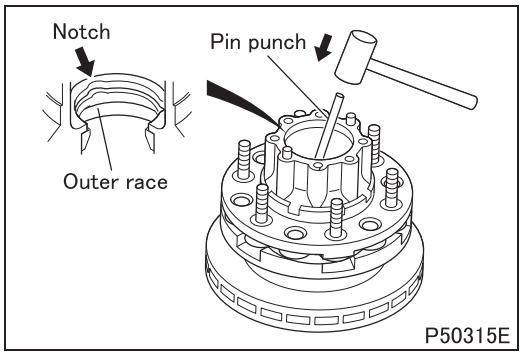


■ **Removal: Wheel hub and rotor**

• Install Cb using axle shaft mounting bolts and remove the wheel hub and rotor assembly.

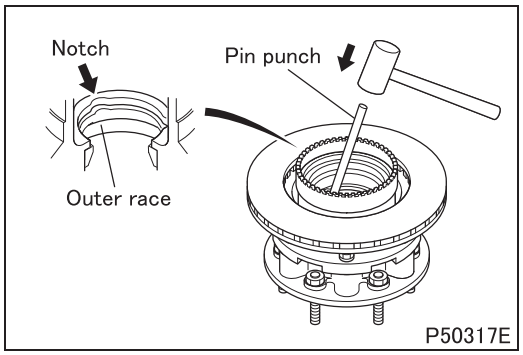
CAUTION ⚠

• **If the wheel hub and rotor assembly was removed from the axle housing, replace the oil seal with a new one.**



■ **Removal: Inner bearing outer race**

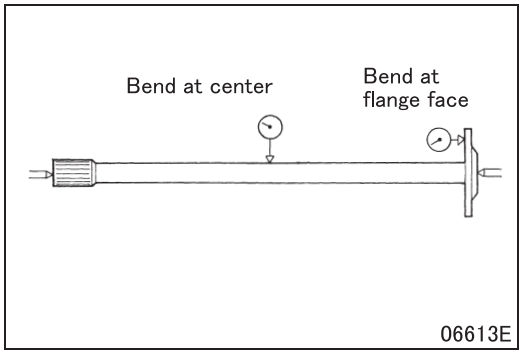
• Drive out the inner bearing outer race by tapping evenly at the three notches in the wheel hub.



■ **Removal: Outer bearing outer race**

• Drive out the outer bearing outer race by tapping evenly at the three notches in the wheel hub.

◆Inspection procedure◆



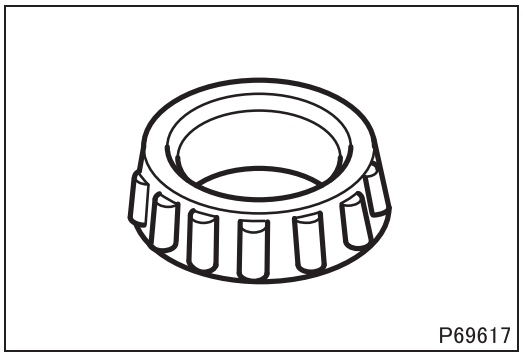
■ **Inspection: Axle shaft**

• Measure the bend of the axle shaft at its center.

NOTE

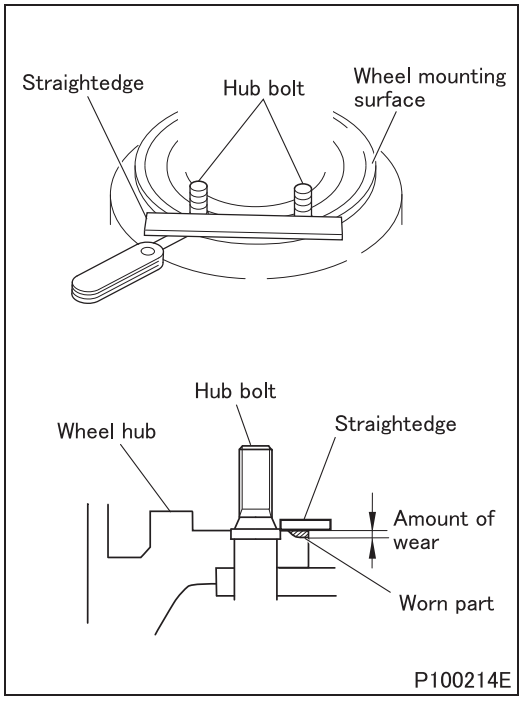
• **Give the axle shaft one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

• If the measured value exceeds the limit, replace the axle shaft.
• Measure the bend of the flange face of the axle shaft.
• If the measured value exceeds the limit, replace the axle shaft.



■ **Inspection: Outer bearing inner race**

• Inspect the outer bearing inner race after cleaning the bearing to remove grease completely.
• If any damage, wear, or a poor rotating conditions are evident in the inner race, replace it with a new one.
• The inner race and outer race should be replaced as a set.



■ **Inspection: Wheel hub**

(1) Visual inspection

- Visually and physically inspect the disc wheel mounting surface. If there is damage or cracking on it, replace the wheel hub.
- Make sure that there is no rust, dust, paint or foreign material on the disc wheel mounting surface of the wheel hub to prevent the wheel nut from becoming loose.
- If any abnormality is found, remove it with sandpaper.

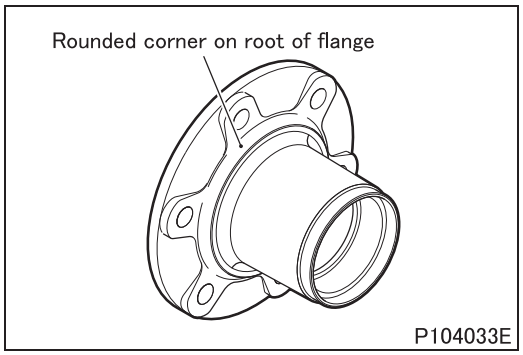
(2) Wear in disc wheel mounting part of wheel hub

- Clean the wheel mounting surface of the wheel hub before inspection.
- Place a straightedge against two hub bolts on the disc wheel mounting surface.

CAUTION ⚠

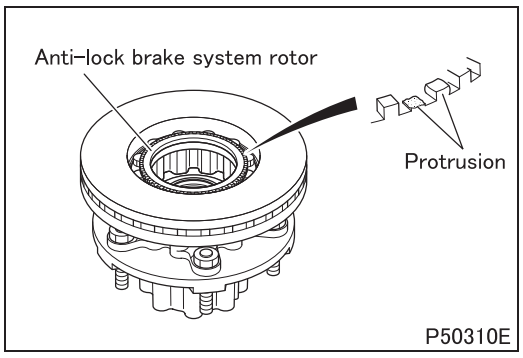
- **Make sure that the straightedge does not run onto the hub bolt.**

- Use feeler gauges to measure the amount of wear at the outer periphery of the wheel hub.
  Measure the amount of wear at every hub bolt.
- If the amount of wear at any point exceeds the following standard value, inspect the wheel hub for cracks.
  Wear standard value: 0.8 mm {0.031 in.}



(3) Crack check

- Inspect for any cracks in the rounded corner on the root of the flange using magnetic particle or liquid penetrant testing.
  If any cracks are found, replace the wheel hub.
- If any cracks are found in a wheel hub bolt, replace it.
- If there is cracking or stepped wear on the wheel hub mounting surface of the wheel disc, replace it. (See Gr31.)



■ **Inspection: Anti-lock brake system rotor**

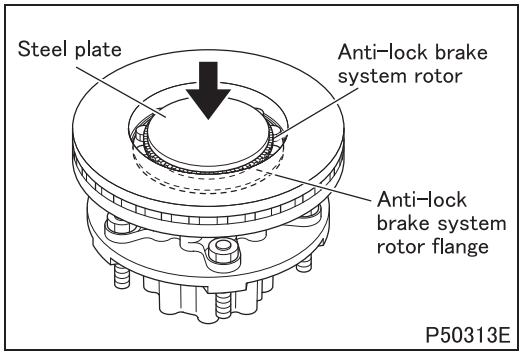
[Inspection]

- Remove any debris on the anti-lock brake system rotors and check the protrusions of the anti-lock brake system rotor for chipping and flattening.
- If any abnormality is found, replace the anti-lock brake system rotor.

Replacement of anti-lock brake system rotor

[Removal]

- Remove the wheel hub and disc rotor, taking care not to damage them.



[Installation]

- Warm the anti-lock brake system rotor to approximately 150°C {302°F}.
- Install the anti-lock brake system rotor and anti-lock brake system rotor flange evenly using a steel plate so as not to allow them to tilt.

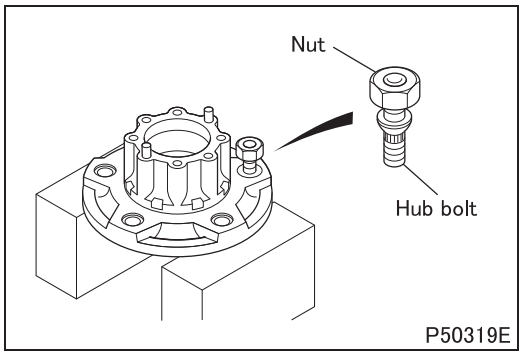
WARNING ⚠

- **Handling the warmed rotor with bare hands may cause burns.**

■ Inspection: Inner bearing inner race

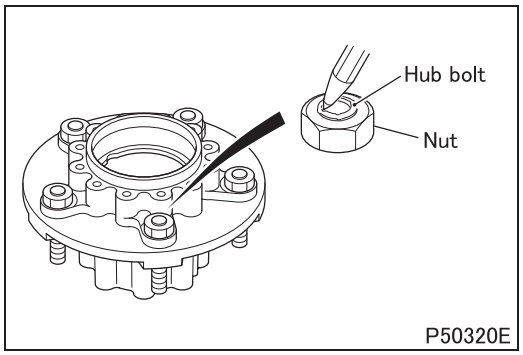
- Inspect the inner bearing inner race in the same manner as the outer bearing inner race.
  (See **"■ Inspection: Outer bearing inner race".**)

◆Installation procedure◆

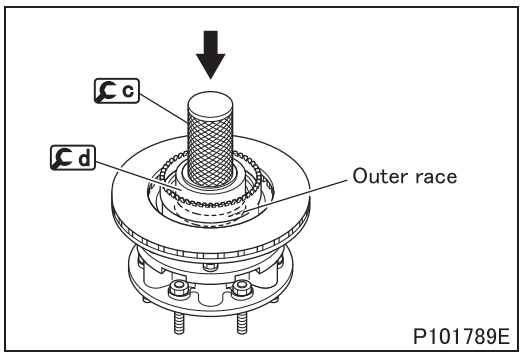


■ Installation: Hub bolt

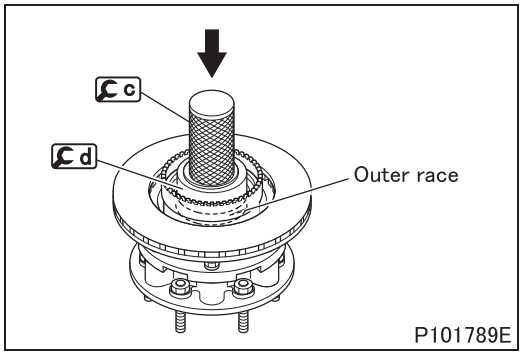
- Screw the nut into the hub bolt until just before they become flush.
- Drive the hub bolt into the wheel hub vertically by hitting the end face of the nut with a brass punch or the like.



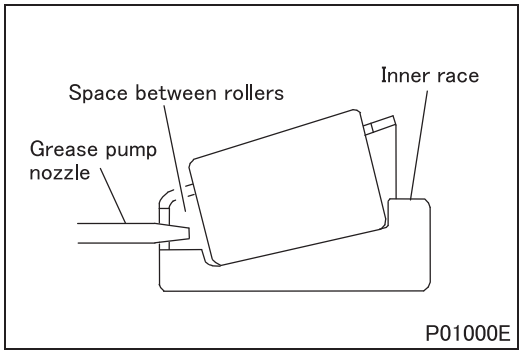
- After tightening the nut to the specified torque, stake it with a punch.



■ Installation: Outer bearing outer race

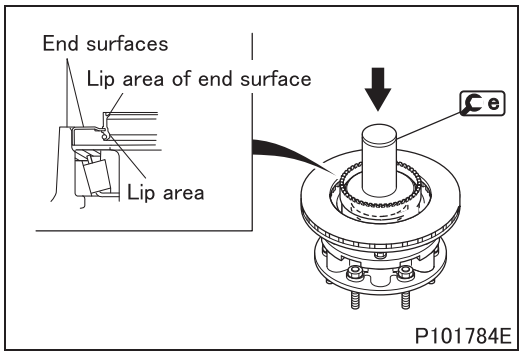


■ **Installation: Inner bearing outer race**



■ **Installation: Packing grease in inner bearing inner race**

- Insert the grease pump nozzle into the space between the rollers of the inner bearing inner race to pack grease sufficiently.

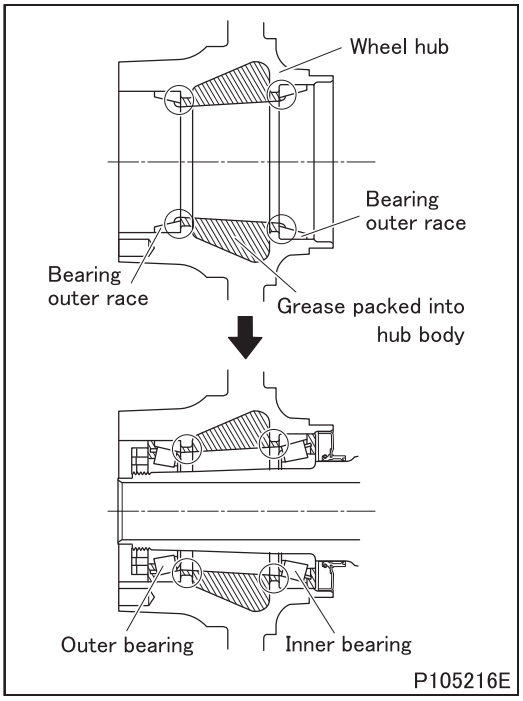


■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install the oil seal in the wheel hub so that the oil seal faces the illustrated direction and the end surface of the oil seal is flush with the end surface of the wheel hub.

■ **Installation: Packing grease in outer bearing inner race**

- Follow the same procedure as packing the inner bearing inner race with grease.
  (See **"■ Installation: Packing grease in inner bearing inner race"**.)

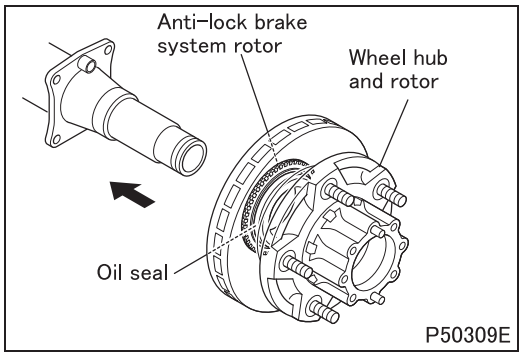


■ **Installation: Packing grease in wheel hub**

CAUTION ⚠

- **The wheel bearing may seize if these instructions are not followed.**
- **Apply the specified amount of grease.**

- As shown in the illustrations at the left, fill grease inside of the hub body in such a manner that grease covers the outer bearing and inner bearing outer races. Make sure that grease reaches the outer bearing and inner bearing.



■ **Installation: Wheel hub and rotor**

- Slowly install the wheel hub and rotor assembly so as not to cause damage to the oil seal and anti-lock brake system rotor.

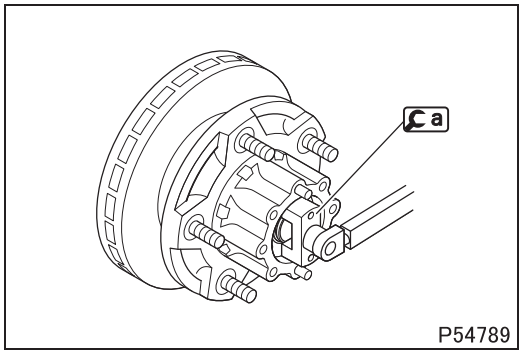
CAUTION ⚠

- **If the anti-lock brake system rotor is damaged, wheel speed sensor signals become abnormal, causing the anti-lock brake system to malfunction.**

■ **Adjustment: Starting torque of wheel hub bearing**

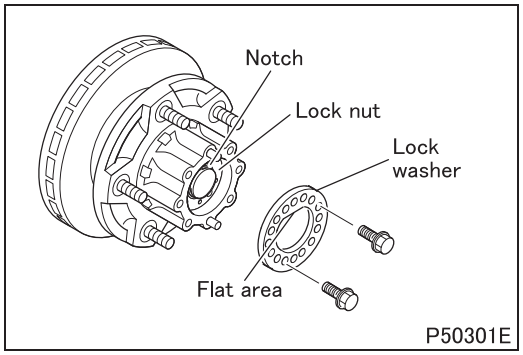
CAUTION ⚠

- **Unless this adjustment procedure is performed, the wheel bearing may seize.**

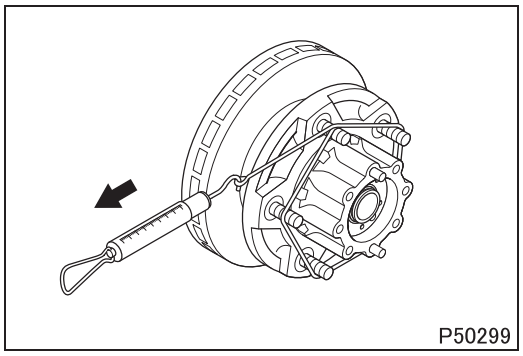


[Adjustment]

- Tighten the lock nut to the specified torque (primary tightening) while turning the wheel hub and rotor, and then loosen it completely.
- Smooth operation of the outer bearing and inner bearing by turning the wheel hub and rotor several times, and then tighten the lock nut to the specified torque (secondary tightening).

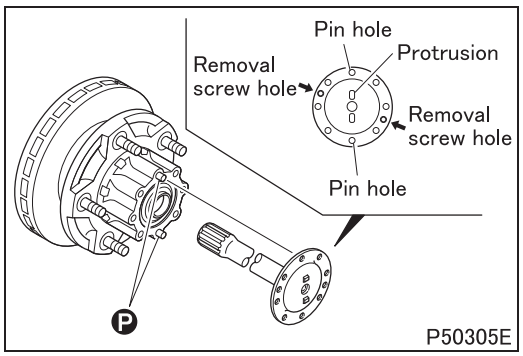


- Insert the flat area of the lock washer, aligning it with the notch of the axle housing, and mount two bolts diagonally to the lock nut.
- If the lock nut does not align with a screw hole of the lock washer, align by loosening the lock nut. Make sure that there is no play in the axial direction.



[Inspection]

- After installing the lock washer, carry out the following inspections.
- Measure the tangential force at the hub bolt position using a spring gauge.
- If the tangential force is within the specified value, the starting torque conforms to the standard value. If the measured value deviates from the specified value, repeat adjustment because the adjustment of the lock nut may be insufficient.
- If the result is found to be abnormal, replace the outer and inner bearings.

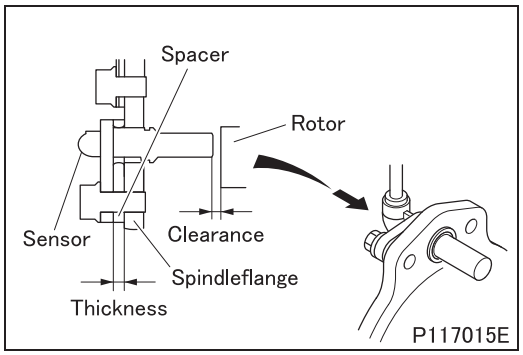


■ Installation: Axle shaft

- Align the pin hole of the locating pin with that of the axle shaft to install the axle shaft.

NOTE

- **A pin hole is not necessarily located at the position of a protrusion on the axle shaft flange face as illustrated. The second hole from a removal screw hole clockwise is a pin hole.**

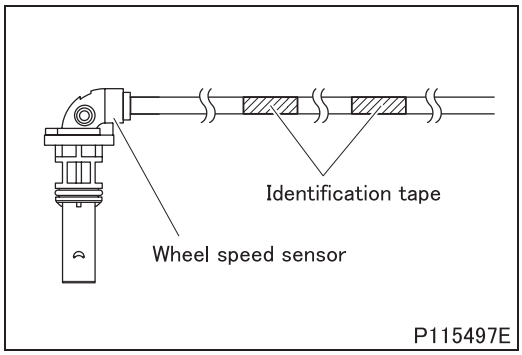


■ Installation: Wheel speed sensor

- Install the wheel speed sensor so that the sensor and spacer are firmly in contact with the holder.
  Spacer thickness: 8 mm {0.31 in.}

CAUTION ⚠

- **Be sure to install the specified spacer in the correct position. Using a spacer with an incorrect thickness or installing the spacer in an incorrect position could cause ABS malfunction.**
- **When installing the wheel speed sensor, be careful not to damage the O-ring of the sensor.**
- **When installing the wheel speed sensor, never apply a force to it such as tapping it with a hammer, prying it with a screwdriver and pulling the harness, as doing so may damage the wiring.**

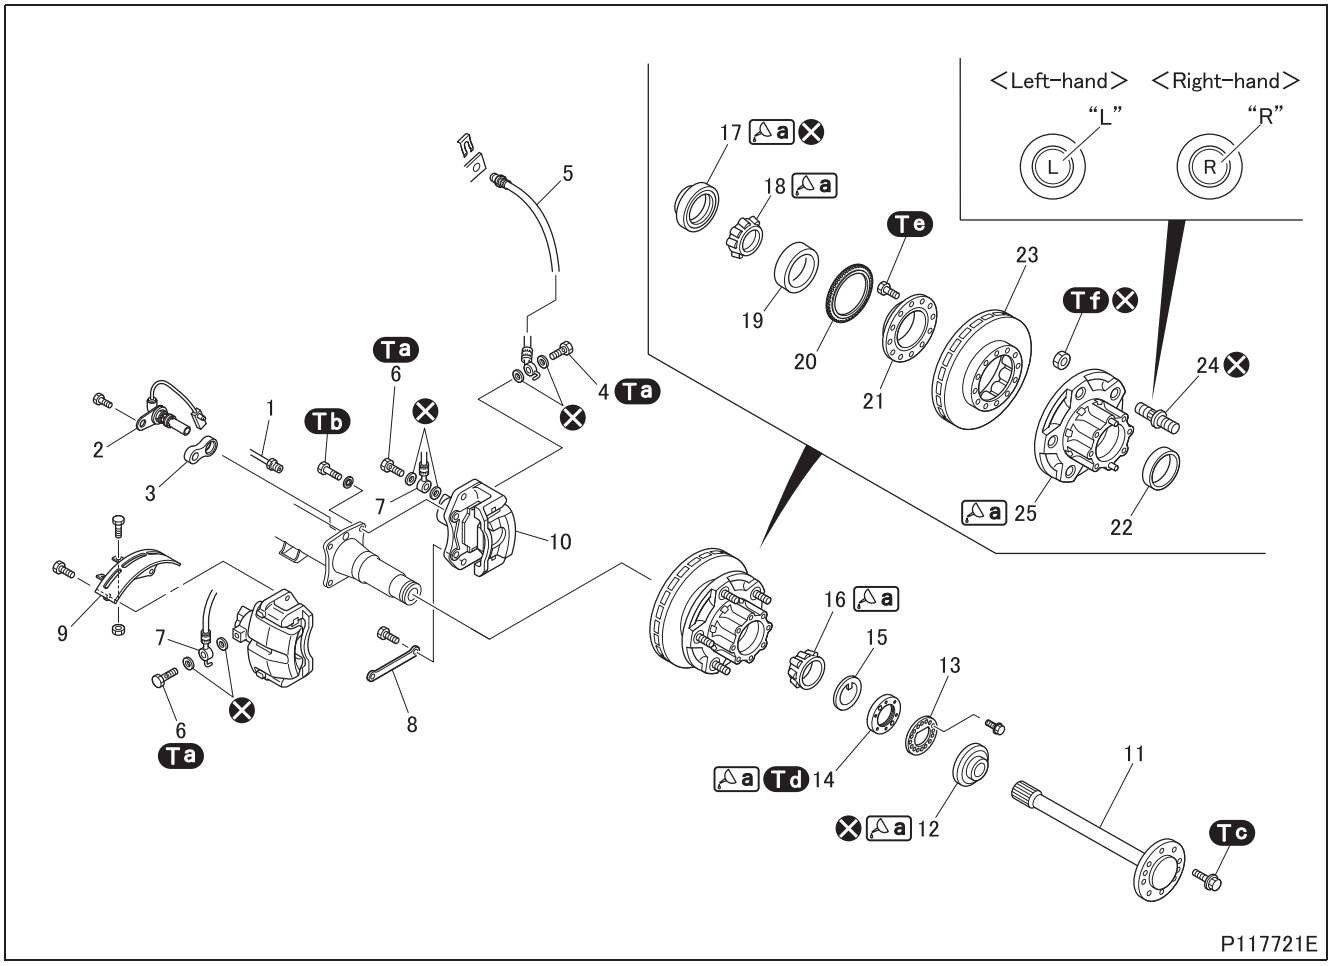


- After installing the wheel speed sensor, check that the clearance between the end of the sensor and the ABS rotor is the following dimension:
  Clearance: 1 ± 0.7 mm {0.039 ± 0.028 in.}

- Using clips, secure the wheel speed sensor harness in place at the identification tape portions, ensuring that the harness is free of kinks, slack and/or interference with other parts.

M E M O

WHEEL HUB AND ROTOR <FEC7, FEC9>



● **Disassembly sequence**

24 Hub bolt
25 Wheel hub

Ⓟ: Locating pin
⊗: Non-reusable parts

CAUTION ⚠

- **Plug the brake hose and brake pipe to prevent entry of dust and dirt after it has been removed.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Make sure that the disc rotor surface and disc brake pad surface are free from grease to avoid malfunction of the brakes.**
- **When installing the brake hose, take necessary steps to prevent entry of dust and dirt into the hose.**
- **Make sure that the brake hose is not twisted when installing it.**
- **Make sure that the brake hose does not interfere with any of surrounding parts when installed.**

- Inspect the drag torque of the disc brakes after assembly. (See Gr35.)
- Bleed air from the brake system after assembly. (See Gr35.)

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Starting torque of wheel hub bearing (tangential force at hub bolt position with oil seal assembled)		2.0 to 3.9 N·m {1.4 to 2.9 ft.lbs, 0.2 to 0.4 kgf·m} (tangential force: 16.5 to 32.2 N {3.7 to 7.2 lbs, 1.7 to 3.3 kgf})	–	Adjust or replace
11	Axle shaft	Bend	0 to 1 {0 to 0.039}	2 {0.079}	Replace
		Bend at flange face	0 to 0.03 {0 to 0.0012}	0.05 {0.0020}	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

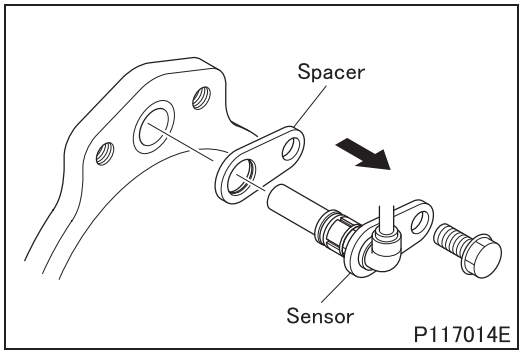
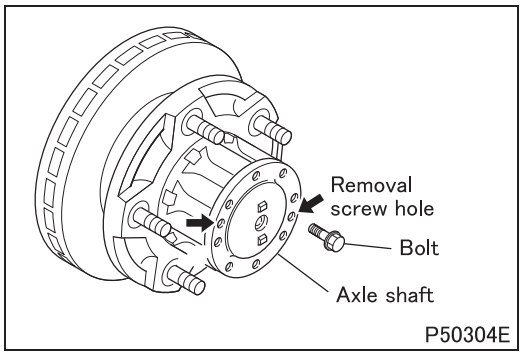
◆Removal procedure◆



■ **Removal: Wheel speed sensor**

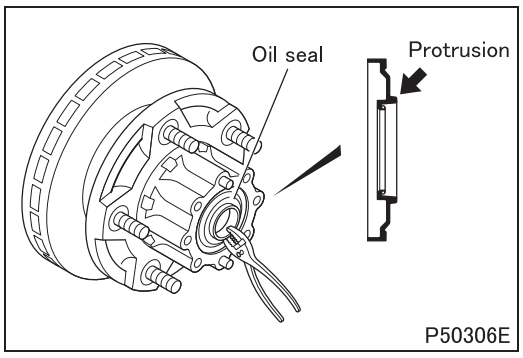
CAUTION ⚠

- **When removing the wheel speed sensor, never apply a force to it such as tapping it with a hammer, prying it with a screwdriver and pulling the harness, as doing so may damage the wiring.**
- **Be careful not to damage the tip of the wheel speed sensor after removing it.**



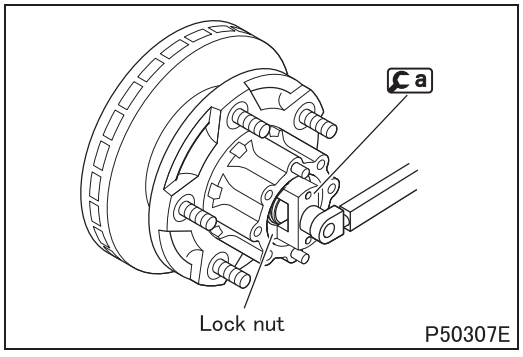
■ **Removal: Axle shaft**

- Screw two axle shaft mounting bolts evenly into the axle shaft removal screw holes to remove the axle shaft.



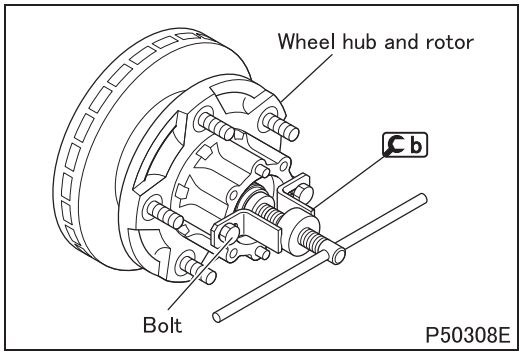
■ **Removal: Outer oil seal**

- To remove the outer oil seal, pull the protrusion on the outer periphery of the outer oil seal evenly around the whole circumference with pliers.



■ **Removal: Lock nut**

WHEEL HUB AND ROTOR <FEC7, FEC9>

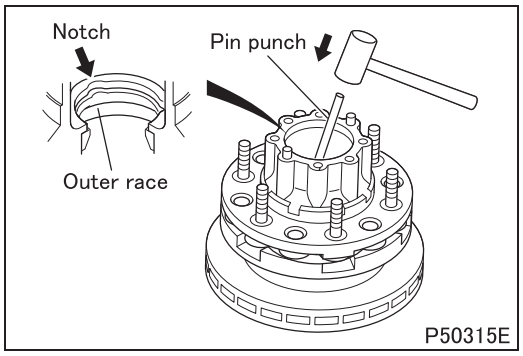


■ **Removal: Wheel hub and rotor**

• Install b using axle shaft mounting bolts and remove the wheel hub and rotor assembly.

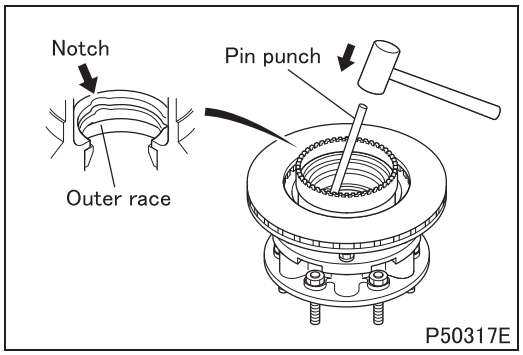
CAUTION ⚠

• **If the wheel hub and rotor assembly was removed from the axle housing, replace the oil seal with a new one.**



■ **Removal: Inner bearing outer race**

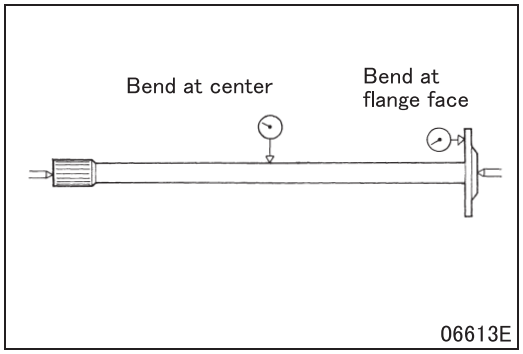
• Drive out the inner bearing outer race by tapping evenly at the three notches in the wheel hub.



■ **Removal: Outer bearing outer race**

• Drive out the outer bearing outer race by tapping evenly at the three notches in the wheel hub.

◆Inspection procedure◆



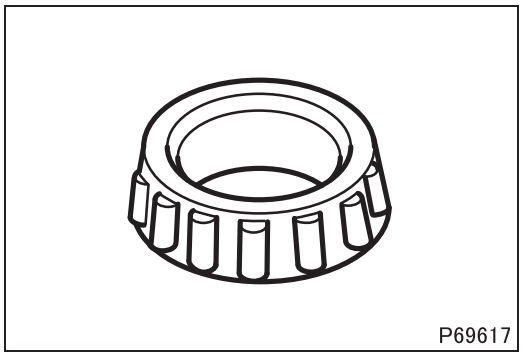
■ **Inspection: Axle shaft**

• Measure the bend of the axle shaft at its center.

NOTE

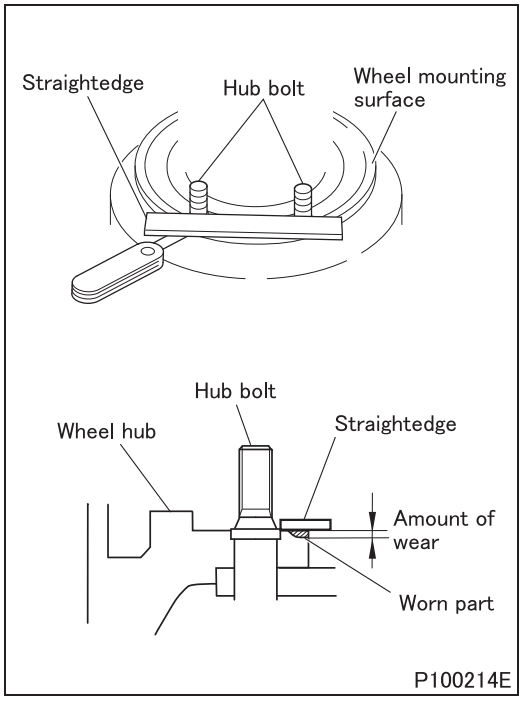
• **Give the axle shaft one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

• If the measured value exceeds the limit, replace the axle shaft.
• Measure the bend of the flange face of the axle shaft.
• If the measured value exceeds the limit, replace the axle shaft.



■ **Inspection: Outer bearing inner race**

• Inspect the outer bearing inner race after cleaning the bearing to remove grease completely.
• If any damage, wear, or a poor rotating conditions are evident in the inner race, replace it with a new one.
• The inner race and outer race should be replaced as a set.



■ **Inspection: Wheel hub**

(1) Visual inspection

- Visually and physically inspect the disc wheel mounting surface. If there is damage or cracking on it, replace the wheel hub.
- Make sure that there is no rust, dust, paint or foreign material on the disc wheel mounting surface of the wheel hub to prevent the wheel nut from becoming loose.
- If any abnormality is found, remove it with sandpaper.

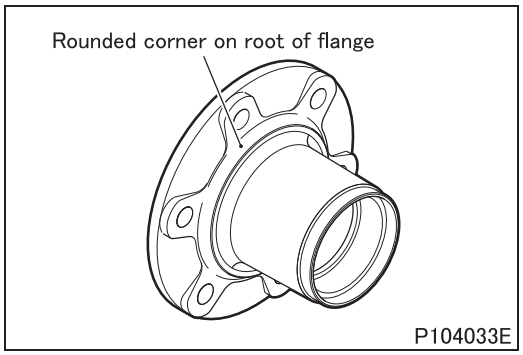
(2) Wear in disc wheel mounting part of wheel hub

- Clean the wheel mounting surface of the wheel hub before inspection.
- Place a straightedge against two hub bolts on the disc wheel mounting surface.

CAUTION ⚠

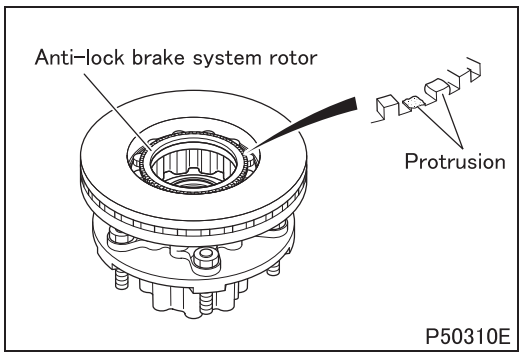
- **Make sure that the straightedge does not run onto the hub bolt.**

- Use feeler gauges to measure the amount of wear at the outer periphery of the wheel hub.
  Measure the amount of wear at every hub bolt.
- If the amount of wear at any point exceeds the following standard value, inspect the wheel hub for cracks.
  Wear standard value: 0.8 mm {0.031 in.}



(3) Crack check

- Inspect for any cracks in the rounded corner on the root of the flange using magnetic particle or liquid penetrant testing.
  If any cracks are found, replace the wheel hub.
- If any cracks are found in a wheel hub bolt, replace it.
- If there is cracking or stepped wear on the wheel hub mounting surface of the wheel disc, replace it. (See Gr31.)



■ **Inspection: Anti-lock brake system rotor**

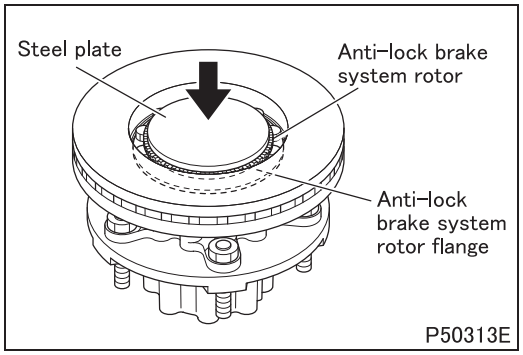
[Inspection]

- Remove any debris on the anti-lock brake system rotors and check the protrusions of the anti-lock brake system rotor for chipping and flattening.
- If any abnormality is found, replace the anti-lock brake system rotor.

Replacement of anti-lock brake system rotor

[Removal]

- Remove the wheel hub and disc rotor, taking care not to damage them.



[Installation]

- Warm the anti-lock brake system rotor to approximately 150°C {302°F}.
- Install the anti-lock brake system rotor and anti-lock brake system rotor flange evenly using a steel plate so as not to allow them to tilt.

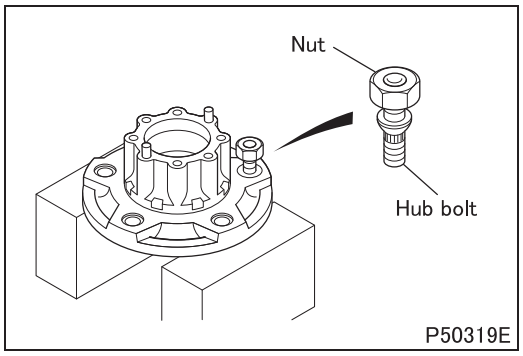
WARNING ⚠

- **Handling the warmed rotor with bare hands may cause burns.**

■ Inspection: Inner bearing inner race

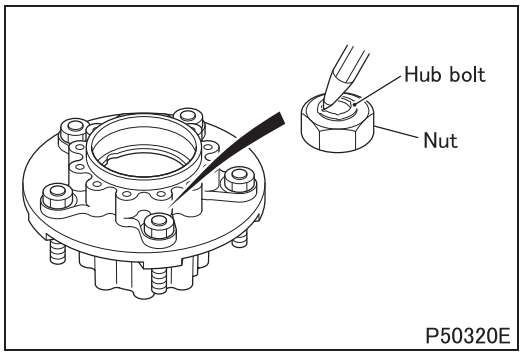
- Inspect the inner bearing inner race in the same manner as the outer bearing inner race.
  (See **"■ Inspection: Outer bearing inner race".**)

◆Installation procedure◆

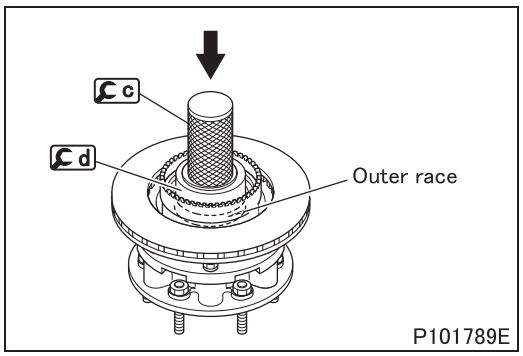


■ Installation: Hub bolt

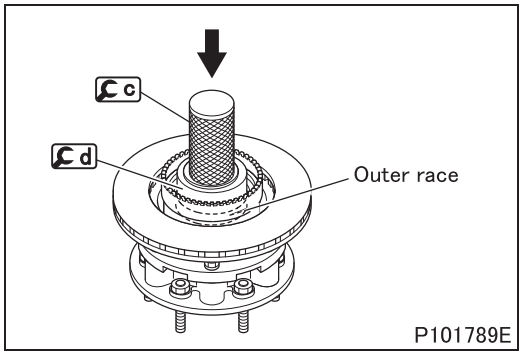
- Screw the nut into the hub bolt until just before they become flush.
- Drive the hub bolt into the wheel hub vertically by hitting the end face of the nut with a brass punch or the like.



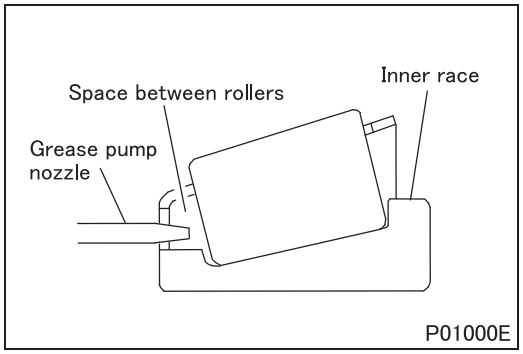
- After tightening the nut to the specified torque, stake it with a punch.



■ Installation: Outer bearing outer race

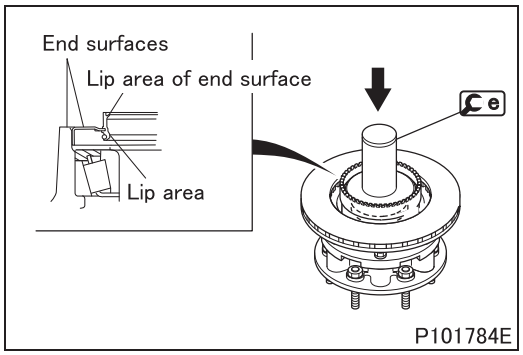


■ **Installation: Inner bearing outer race**



■ **Installation: Packing grease in inner bearing inner race**

- Insert the grease pump nozzle into the space between the rollers of the inner bearing inner race to pack grease sufficiently.

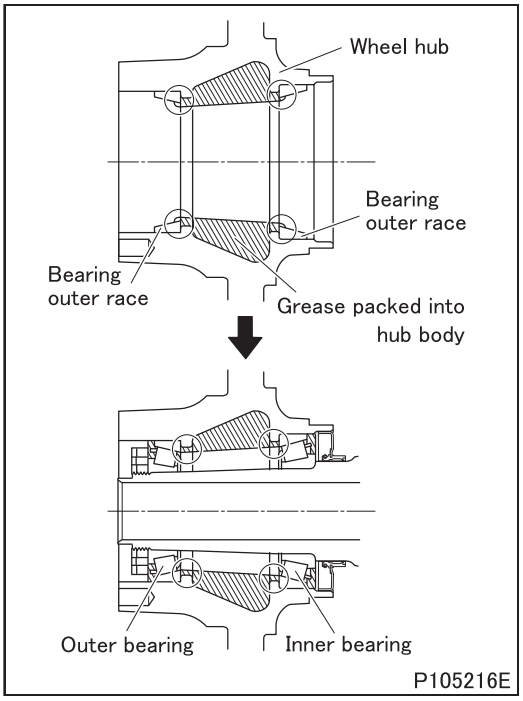


■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install the oil seal in the wheel hub so that the oil seal faces the illustrated direction and the end surface of the oil seal is flush with the end surface of the wheel hub.

■ **Installation: Packing grease in outer bearing inner race**

- Follow the same procedure as packing the inner bearing inner race with grease.
  (See **"■ Installation: Packing grease in inner bearing inner race"**.)

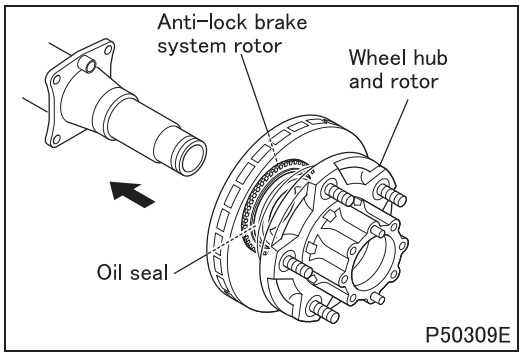


■ **Installation: Packing grease in wheel hub**

CAUTION ⚠

- **The wheel bearing may seize if these instructions are not followed.**
- **Apply the specified amount of grease.**

- As shown in the illustrations at the left, fill grease inside of the hub body in such a manner that grease covers the outer bearing and inner bearing outer races. Make sure that grease reaches the outer bearing and inner bearing.



■ **Installation: Wheel hub and rotor**

- Slowly install the wheel hub and rotor assembly so as not to cause damage to the oil seal and anti-lock brake system rotor.

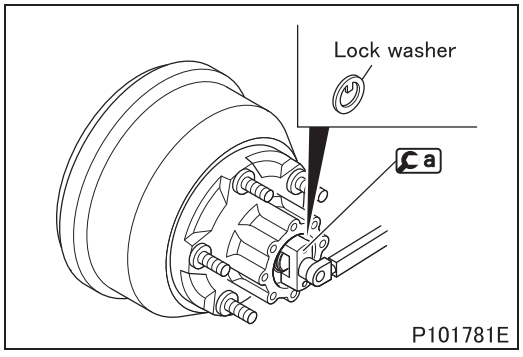
CAUTION ⚠

- **If the anti-lock brake system rotor is damaged, wheel speed sensor signals become abnormal, causing the anti-lock brake system to malfunction.**

■ **Adjustment: Starting torque of wheel hub bearing**

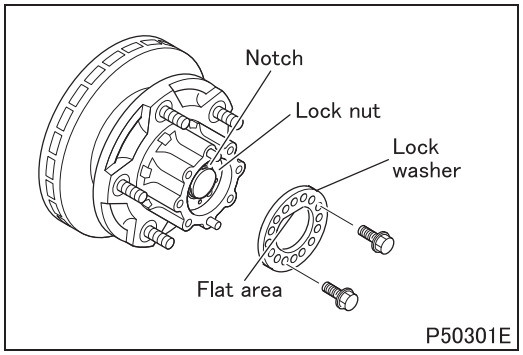
CAUTION ⚠

- **Unless this adjustment procedure is performed, the wheel bearing may seize.**

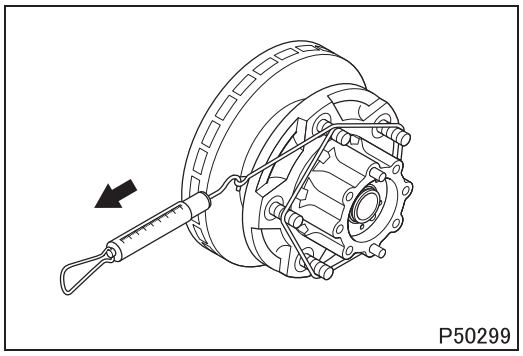


[Adjustment]

- Mount the lock washer.
- Tighten the lock nut to the specified torque (primary tightening) while turning the wheel hub and rotor, and then loosen it completely.
- Smooth operation of the outer bearing and inner bearing by turning the wheel hub and rotor several times, and then tighten the lock nut to the specified torque (secondary tightening).

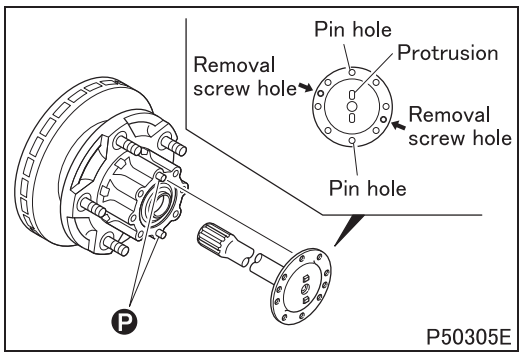


- Insert the flat area of the lock washer, aligning it with the notch of the axle housing, and mount two bolts diagonally to the lock nut.
- If the lock nut does not align with a screw hole of the lock washer, align by loosening the lock nut. Make sure that there is no play in the axial direction.



[Inspection]

- After installing the lock washer, carry out the following inspections.
- Measure the tangential force at the hub bolt position using a spring gauge.
- If the tangential force is within the specified value, the starting torque conforms to the standard value. If the measured value deviates from the specified value, repeat adjustment because the adjustment of the lock nut may be insufficient.
- If the result is found to be abnormal, replace the outer and inner bearings.

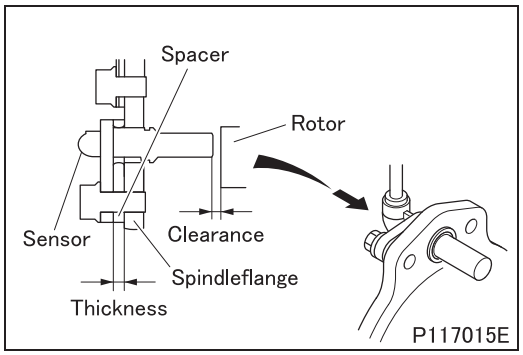


■ Installation: Axle shaft

- Align the pin hole of the locating pin with that of the axle shaft to install the axle shaft.

NOTE

- **A pin hole is not necessarily located at the position of a protrusion on the axle shaft flange face as illustrated. The second hole from a removal screw hole clockwise is a pin hole.**

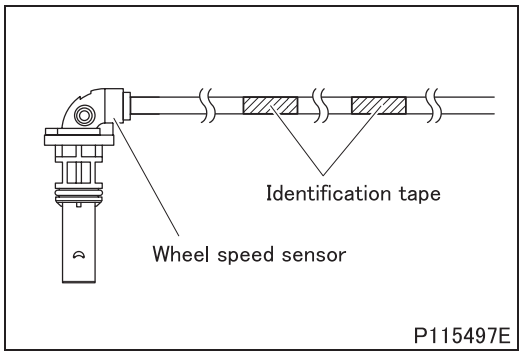


■ Installation: Wheel speed sensor

- Install the wheel speed sensor so that the sensor and spacer are firmly in contact with the holder.
  Spacer thickness: 9.5 mm {0.37 in.}

CAUTION ⚠

- **Be sure to install the specified spacer in the correct position. Using a spacer with an incorrect thickness or installing the spacer in an incorrect position could cause ABS malfunction.**
- **When installing the wheel speed sensor, be careful not to damage the O-ring of the sensor.**
- **When installing the wheel speed sensor, never apply a force to it such as tapping it with a hammer, prying it with a screwdriver and pulling the harness, as doing so may damage the wiring.**



- After installing the wheel speed sensor, check that the clearance between the end of the sensor and the ABS rotor is the following dimension:
  Clearance: 1 ± 0.7 mm {0.039 ± 0.028 in.}

- Using clips, secure the wheel speed sensor harness in place at the identification tape portions, ensuring that the harness is free of kinks, slack and/or interference with other parts.

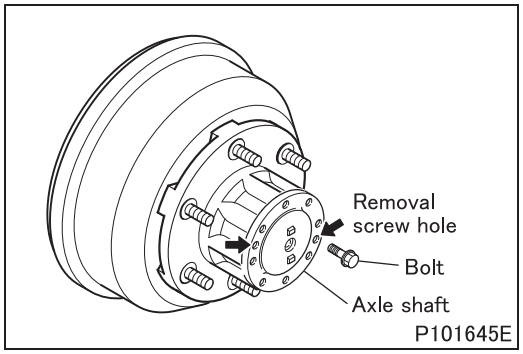
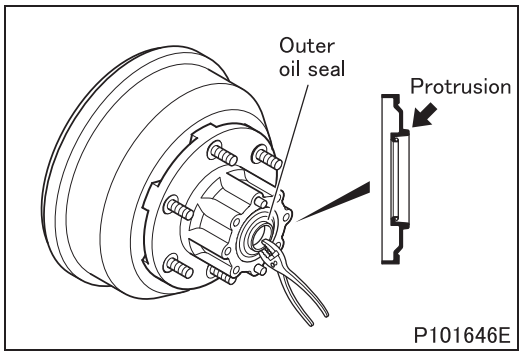
◆Removal procedure◆



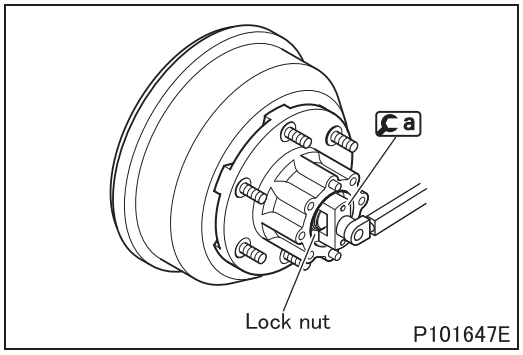
■ **Removal: Axle shaft**

- Screw two axle shaft mounting bolts evenly into the axle shaft removal screw holes to remove the axle shaft.

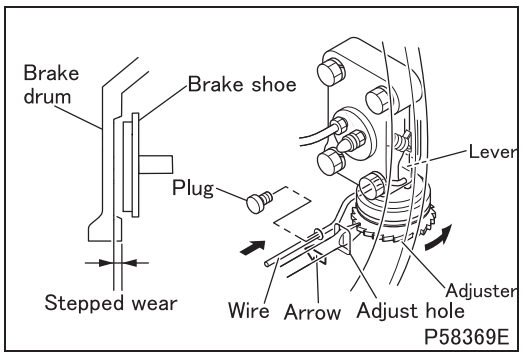


■ **Removal: Outer oil seal**

- To remove the outer oil seal, pull the protrusion on the outer periphery of the outer oil seal evenly around the whole circumference with pliers.



■ **Removal: Lock nut**

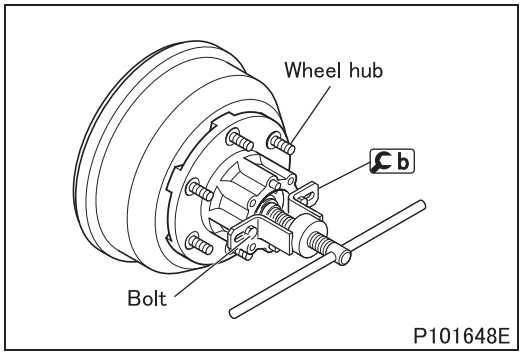


■ **Removal: Wheel hub and brake drum**

- If the brake drum has stepped wear and the wear prevents the wheel hub and brake drum assembly from being removed, removal can still be performed with the following procedure.
- Insert a wire of approx. ϕ2 mm {0.079 in.} into the hole from which the plug has been removed, and lift up the adjust lever of the wheel cylinder.
- Turn the adjuster from the adjust hole in the opposite direction to the arrow on the backing plate to increase the clearance between the brake drum and the brake shoe. Then, remove the wheel hub and brake drum assembly.

CAUTION ⚠

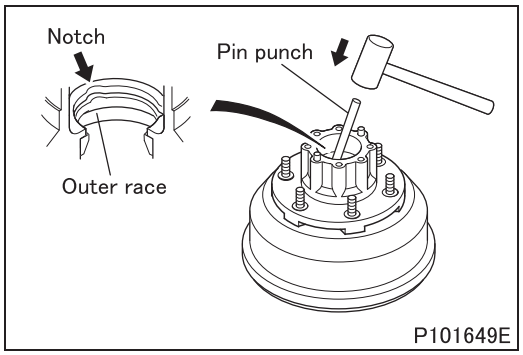
- **Correct or replace the brake drum if any fault is found.**



• Install b using axle shaft mounting bolts to remove the wheel hub and brake drum assembly.

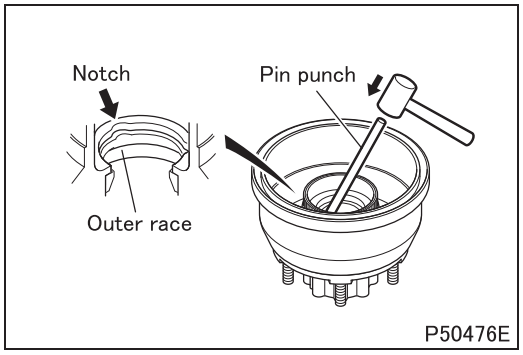
CAUTION ⚠

- **If the wheel hub and brake drum assembly was removed from the axle housing, replace the oil seal with a new one.**



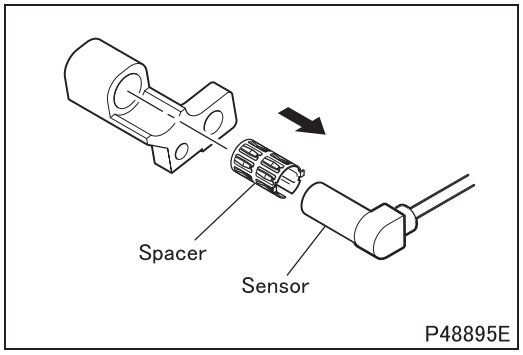
■ Removal: Inner bearing outer race

• Drive out the inner bearing outer race by tapping evenly at the three or four notches in the wheel hub.



■ Removal: Outer bearing outer race

• Drive out the outer bearing outer race by tapping evenly at the three or four notches in the wheel hub.

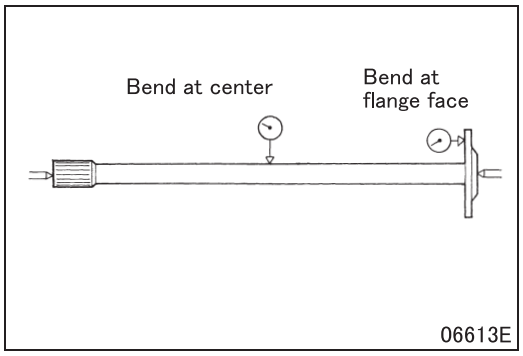


■ Removal: Wheel speed sensor

CAUTION ⚠

- **When removing the wheel speed sensor, do not apply excessive force on the sensor, such as hitting it with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in an open-circuit of the sensor.**
- **If the wheel speed sensor can be removed easily, replace the spring spacer.**

◆Inspection procedure◆



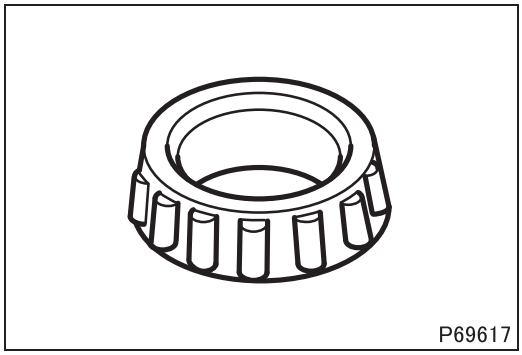
■ Inspection: Axle shaft

• Perform the following inspection. If the measurement is out of the standard value, replace the axle shaft.

(1) Bend at shaft center

• Give the axle shaft one complete turn and read the dial gauge at this time. The bend is one half of the reading.

(2) Lateral runout at flange face



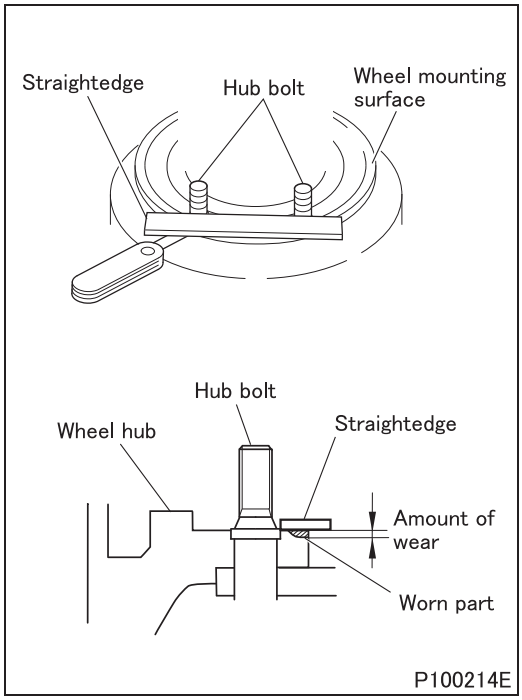
P69617

■ **Inspection: Outer bearing inner race**

- Inspect the outer bearing inner race after cleaning the bearing to remove grease completely.
- If any damage, wear, or a poor rotating conditions are evident in the inner race, replace it with a new one.
- The inner race and the outer race should be replaced as a set.

■ **Inspection: Inner bearing inner race**

- Inspect the inner bearing inner race in the same manner as the outer bearing inner race.
  (See **"■ Inspection: Outer bearing inner race"**.)



P100214E

■ **Inspection: Wheel hub**

(1) Visual inspection

- Visually and physically inspect the disc wheel mounting surface. If there is damage or cracking on it, replace the wheel hub.
- Make sure that there is no rust, dust, paint or foreign material on the disc wheel mounting surface of the wheel hub to prevent the wheel nut from becoming loose.
- If any abnormality is found, remove it with sandpaper.

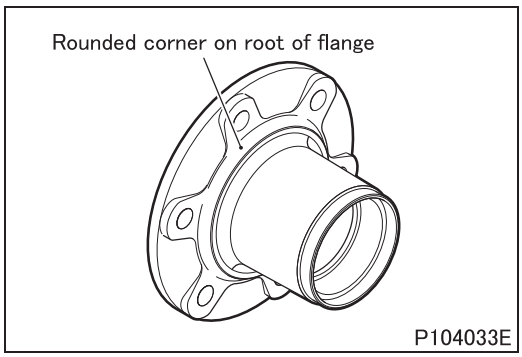
(2) Wear in disc wheel mounting part of wheel hub

- Clean the wheel mounting surface of the wheel hub before inspection.
- Place a straightedge against two hub bolts on the disc wheel mounting surface.

CAUTION ⚠

- **Make sure that the straightedge does not run onto the hub bolt.**

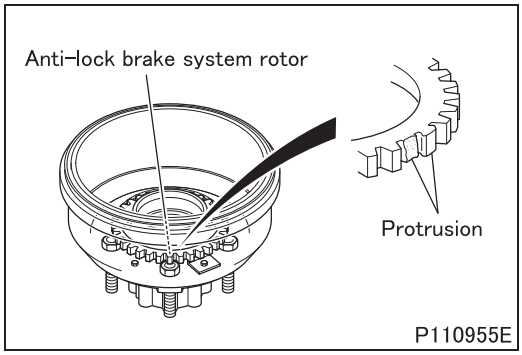
- Use feeler gauges to measure the amount of wear at the outer periphery of the wheel hub.
  Measure the amount of wear at every hub bolt.
- If the amount of wear at any point exceeds the following standard value, inspect the wheel hub for cracks.
  Wear standard value: 0.8 mm {0.031 in.}



P104033E

(3) Crack check

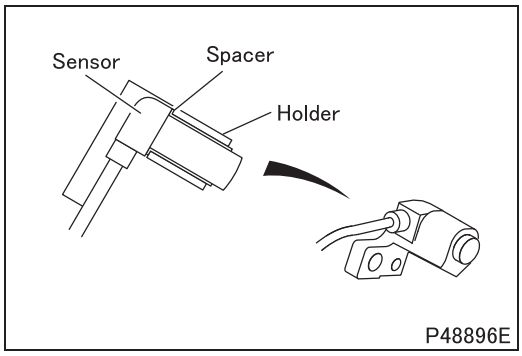
- Inspect for any cracks in the rounded corner on the root of the flange using magnetic particle or liquid penetrant testing.
  If any cracks are found, replace the wheel hub.
- If any cracks are found in a wheel hub bolt, replace it.
- If there is cracking or stepped wear on the wheel hub mounting surface of the wheel disc, replace it. (See Gr31.)



■ **Inspection: Anti-lock brake system rotor**

- Check the protrusions of the anti-lock brake system rotor for chipping and flattening.
- If any abnormality is found, replace the anti-lock brake system rotor.

◆Installation procedure◆

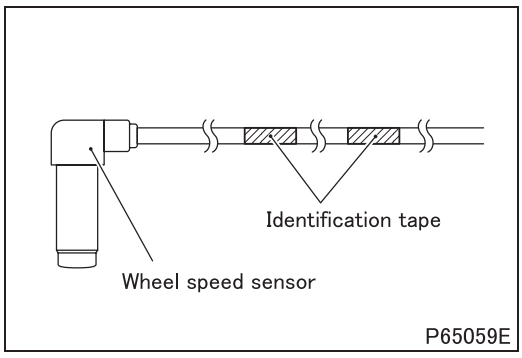


■ **Installation: Wheel speed sensor**

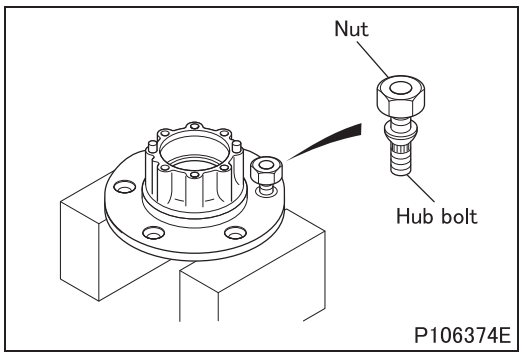
- Insert the wheel speed sensor with the spring spacer into the holder until they are seated firmly in the holder.

CAUTION ⚠

- **When installing the wheel speed sensor, do not apply excessive force on the sensor, such as hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in an open-circuit of the sensor.**

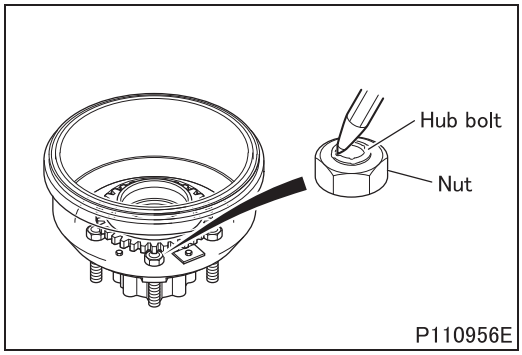


- Using clips, secure the wheel speed sensor harness in place at the identification tape portions, ensuring that the harness is free of kinks, slack and/or interference with other parts.

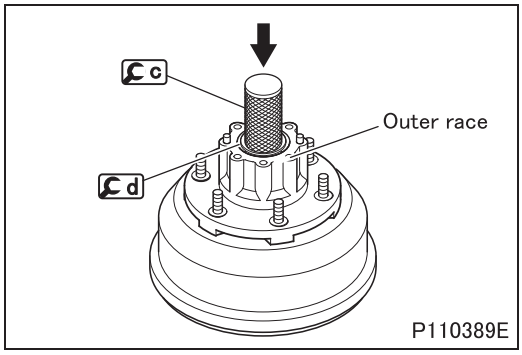


■ **Installation: Hub bolt**

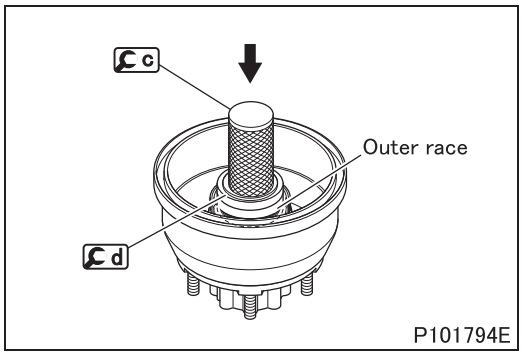
- Screw the nut into the hub bolt until just before they become flush.
- Drive the hub bolt into the wheel hub vertically by hitting the end face of the nut.



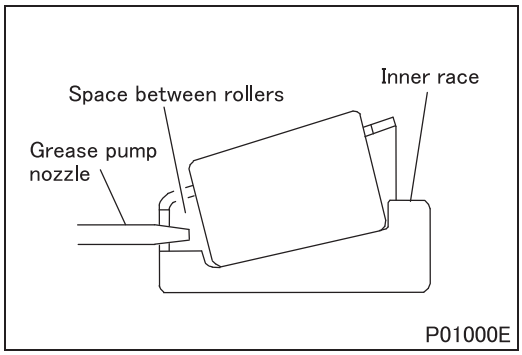
- Assemble the brake drum and wheel hub with the hub bolt. After tightening the nut to the specified torque, stake it with a punch.



■ **Installation: Outer bearing outer race**

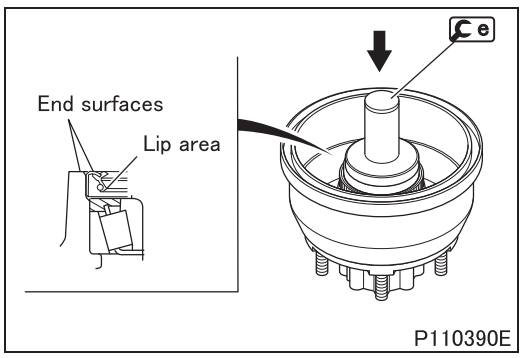


■ **Installation: Inner bearing outer race**



■ **Installation: Packing grease in inner bearing inner race**

- Insert the grease pump nozzle into the space between the rollers of the inner bearing inner race to pack grease sufficiently.

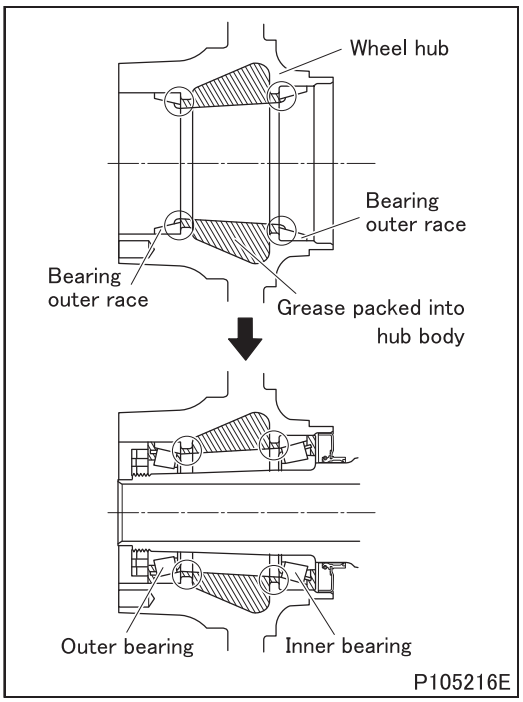


■ **Installation: Oil seal**

- Apply grease to the lip area of oil seal and install the oil seal in the wheel hub so that the oil seal faces in the illustrated direction and the end surface of oil seal is flush with the end surface of wheel hub.

■ **Installation: Packing grease in outer bearing inner race**

- Follow the same procedure as packing the inner bearing inner race with grease.
  (See **"■ Installation: Packing grease in inner bearing inner race"**.)

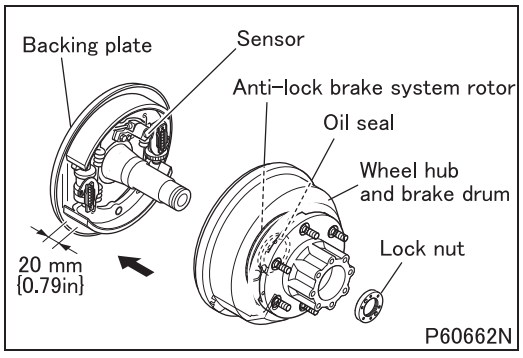


■ **Installation: Parking grease in wheel hub**

CAUTION ⚠

- **The wheel bearing may seize if these instructions are not followed.**
- **Apply the specified amount of grease.**

- As shown in the illustrations at the left, fill grease inside of the hub body in such a manner that grease covers the outer bearing and inner bearing outer races. Make sure that grease reaches the outer bearing and inner bearing.



■ **Installation: Wheel hub and brake drum**

- Slowly install the wheel hub and brake drum so as not to cause damage to the oil seal and anti-lock brake system rotor.

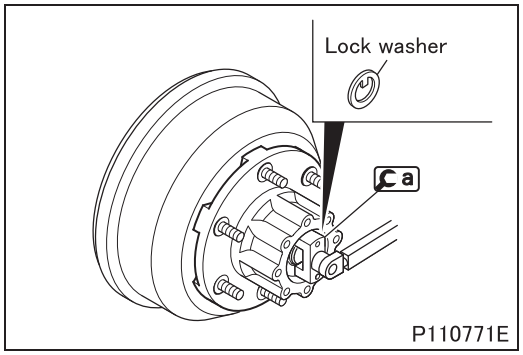
CAUTION ⚠

- **If the anti-lock brake system rotor is damaged, the wheel speed sensor signals become abnormal, causing the anti-lock brake system to malfunction.**

- Mount the wheel hub and brake drum without jiggling until the backing plate extends 20 mm {0.79 in.} from the edge of the brake drum. Then, tighten the lock nut slowly.

CAUTION ⚠

- **Do not install the wheel hub and the brake drum without adjusting the clearance between the drum and backing plate, since it can damage the wheel speed sensor.**



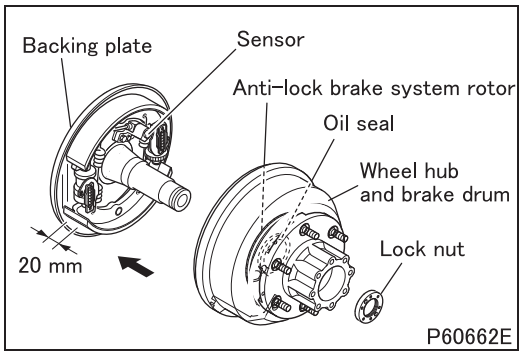
■ **Adjustment: Starting torque of wheel hub bearing**

CAUTION ⚠

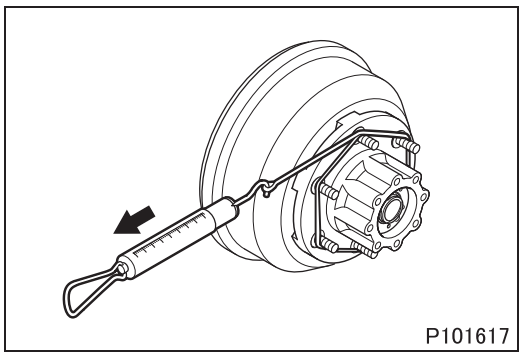
- **Unless this adjustment procedure is performed, the wheel bearing may seize.**

[Adjustment]

- Tighten the lock nut to the specified torque (primary tightening) while turning the wheel hub and rotor, and then loosen it completely.
- Smooth operation of the outer bearing and inner bearing by turning the wheel hub and rotor several times, and then tighten the lock nut to the specified torque (secondary tightening).



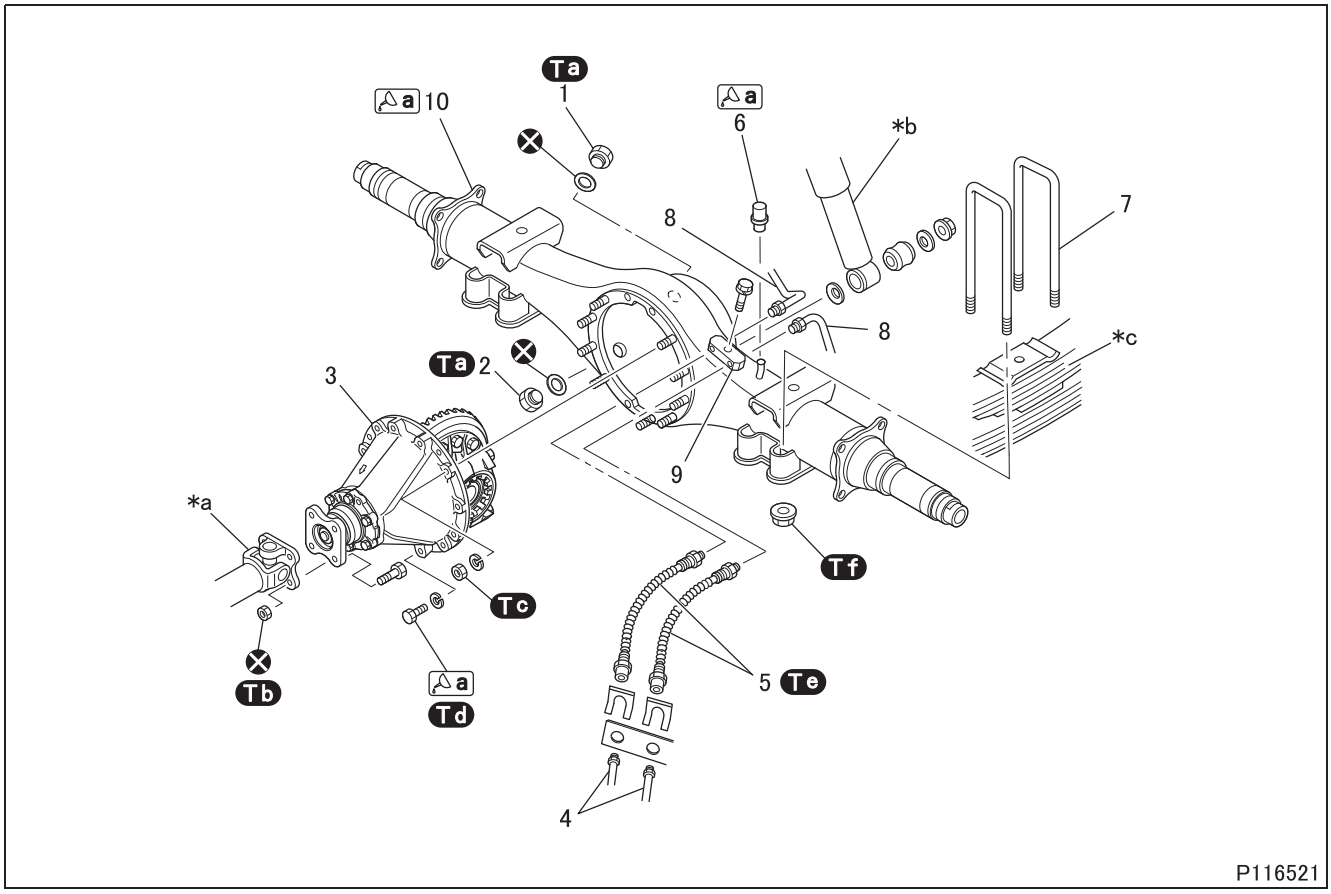
- Insert the flat area of the lock plate, aligning it with the notch of the axle housing, and mount two bolts diagonally to the lock nut.
- If the lock nut does not align with a screw hole of the lock plate, align by loosening the lock nut. Make sure that there is no play in the axial direction.



[Inspection]

- After installing the lock plate, carry out the following inspections.
- Make sure that there is no drag in the brake lining and brake drum.
- If any abnormality is found, adjust the brake shoe clearance.
- Measure the tangential force at the hub bolt position using a spring gauge.
- If the tangential force is within the specified value, the starting torque conforms to the standard value. If the measured value deviates from the specified value, repeat adjustment because the adjustment of the lock nut may be insufficient.
- If the result is found to be abnormal, replace the outer and inner bearings.

AXLE HOUSING



● **Removal sequence**

1 Inspection plug
2 Drain plug
3 Reduction and differential (See later sections.)
4 Brake pipe
5 Brake hose
6 Vent plug
7 U-bolt
8 Brake pipe
9 Connector
10 Axle housing

***a**: Propeller shaft
***b**: Shock absorber
***c**: Leaf spring

⊗: Non-reusable parts

CAUTION ⚠

- **Plug the brake hose and the brake pipe to prevent entry of dust and dirt after they have been removed.**
- **When installing and removing the axle housing, take care not to damage the brake hose, brake pipe and anti-lock brake system wheel speed sensor harness.**

NOTE

- **Do not remove the axle housing unless it is found faulty.**

● **Installation sequence**

Follow the removal sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
6	Injection-valve opening pressure of vent plug		4.9 kPa {0.7 psi, 0.05 kgf/cm^2} or less	–	Replace
10	Axle housing	Runout at outer bearing portion	0 to 0.5 {0 to 0.020}	1 {0.039}	Replace
		Difference between before and after rotation at center	0 to 1 {0 to 0.039}	5 {0.20}	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Inspection plug		110 ± 10 {81 ± 7.4, 11 ± 1}	–
	Drain plug			
Tb	Nut (propeller shaft mounting)		100 to 120 {74 to 89, 10 to 12}	M12
Tc	Nut (reduction and differential mounting)		69 to 93 {51 to 69, 7 to 9.5}	–
Td	Bolt (reduction and differential mounting)		83 to 108 {61 to 80, 8.5 to 11}	–
Te	Brake hose		25.5 to 34.3 {18.8 to 25.3, 2.6 to 3.5}	–
Tf	Nut (U-bolt mounting)	M16	240 ± 15 {175 ± 11, 24.5 ± 1.5}	–
		M18	340 ± 50 {250 ± 37, 34.6 ± 5.2}	–

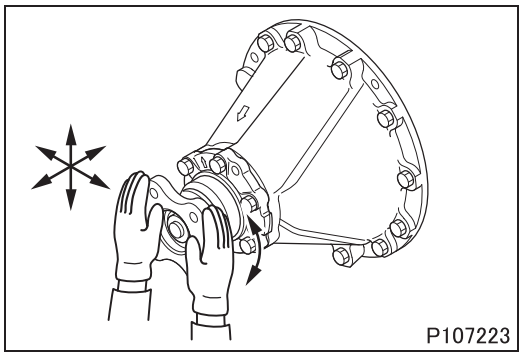
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Thread area of bolt	ThreeBond 1215	As required
	Reduction and differential mounting surface of axle housing		
b	Axle housing mounting surface of vent plug		

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Differential carrier base A: ϕ28 {1.10}  P06679	MB999102	Removal and installation of reduction and differential

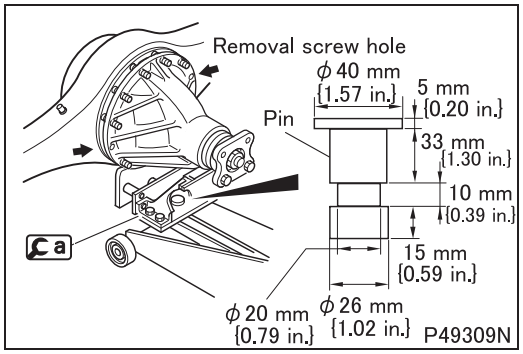
◆Work before removal◆



■ Inspection: Play of companion flange

- If there is play in the forward, backward, vertical, lateral or rotating direction, replace all of the following parts.
  - Front bearing and rear bearing
  - Pinion pilot bearing
  - Pinion bearing collar
  - Reduction gear set <Reduction pinion and reduction gear>
  - Companion flange

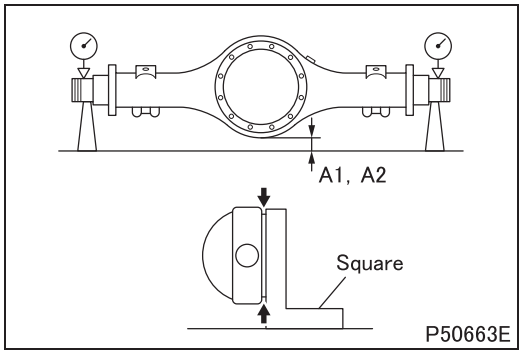
◆Removal procedure◆



■ **Removal: Reduction and differential**

- Remove the saucer of the garage jack and place [a] on it. Fabricate the pin as illustrated, insert and fix it with bolts that have fixed the saucer.
- Screw two bolts evenly into the reduction and differential removal screw holes (as shown in illustration) to remove the reduction and differential.
  Bolt size: M12 × 1.25 mm

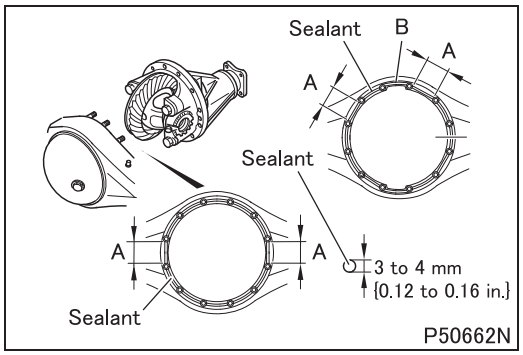
◆Inspection procedure◆



■ **Inspection: Axle housing**

- Horizontally support the inner bearing fittings at both ends of the housing spindle of the axle housing.
- Apply a dial gauge to the outer bearing fitting and turn it 360 degrees to measure runout.
- For measurement of A1 and A2, place the axle housing at right angles to the floor using a square and measure A1. Then, turn it 180 degrees and measure A2.
- If the measured value exceeds the limit, replace the axle housing.

◆Installation procedure◆

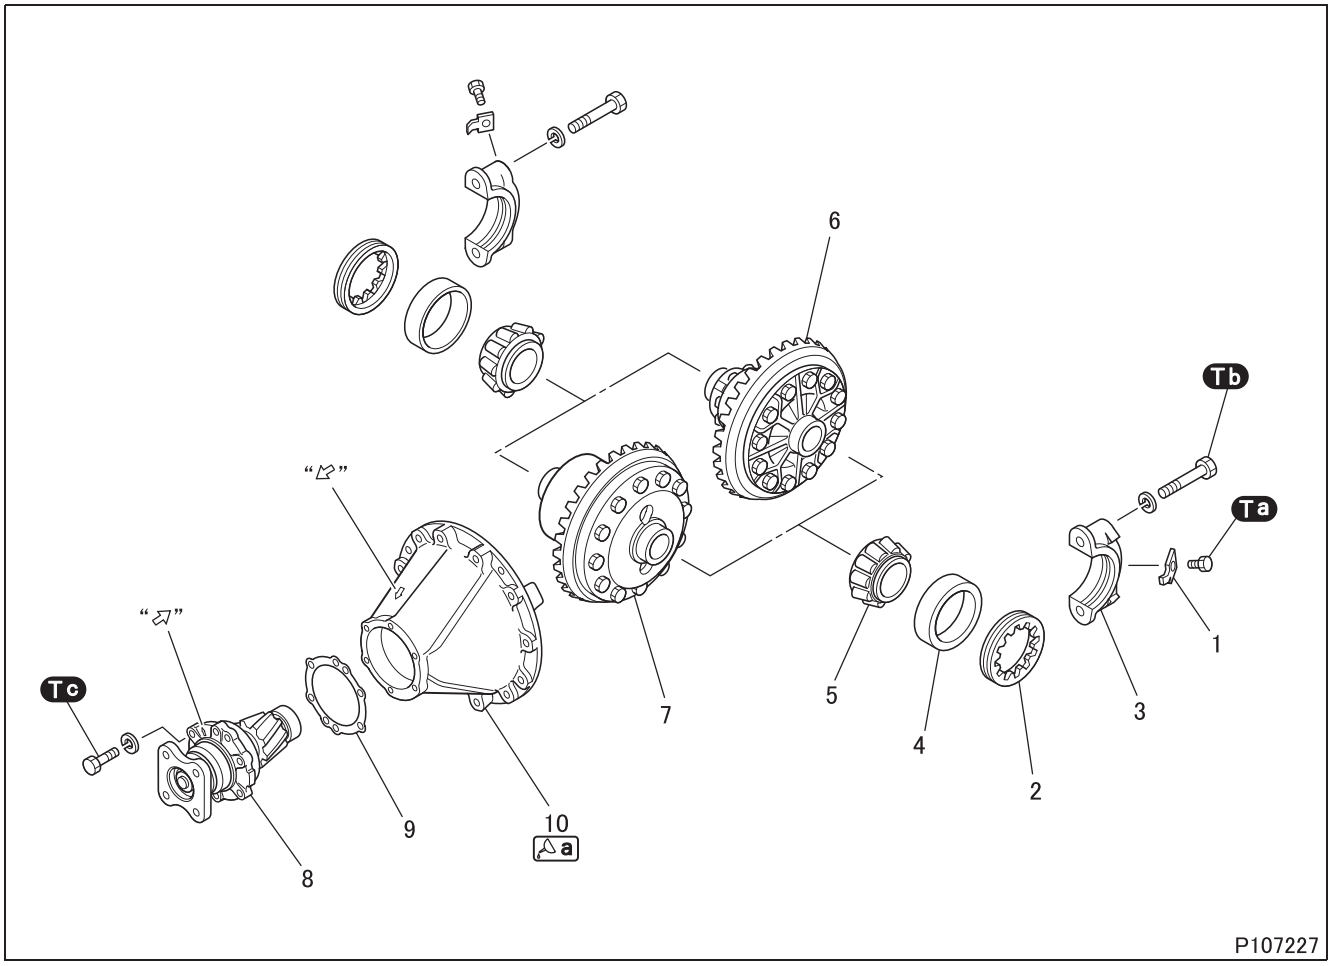


■ **Installation: Reduction and differential**

- Clean the sealing surface of each part.
- Apply sealant to the reduction and differential mounting surface of the axle housing evenly and without any gaps. Apply sealant in a straight line direction for illustrated position A and along the outer periphery for notches of illustrated position B.

M E M O

REDUCTION AND DIFFERENTIAL



● **Disassembly sequence**

1 Lock plate
2 Side bearing nut
3 Bearing cap
4 Side bearing outer race
5 Side bearing inner race
6 Differential (See later sections.)
7 Limited slip differential (See later sections.)
8 Reduction pinion (See later sections.)
9 Shim
10 Differential carrier

CAUTION ⚠

- **Be sure to replace the bearing cap, differential carrier and bolts as a differential carrier set.**
- **Be sure to replace the reduction pinion and the reduction gear of the differential as a reduction gear set.**

- Keep side bearings that have been removed separated from each other and ensure that during installation each one is placed back in its original position.
- Record the number and thickness of the shims to use them as a reference at assembly.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
8, 9	Starting torque of side bearing	2.0 to 2.9 N·m {1.4 to 2.2 ft.lbs, 0.2 to 0.3 kgf·m}	–	Adjust
10	Wobble at back face of reduction gear	0 to 0.1 {0 to 0.0039}	–	Replace
	Backlash between reduction gear and reduction pinion	0.20 to 0.28 {0.0079 to 0.011}	0.5 {0.020}	Adjust or replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (lock plate mounting)	19.6 to 26.5 {14 to 20, 2.0 to 2.7}	–

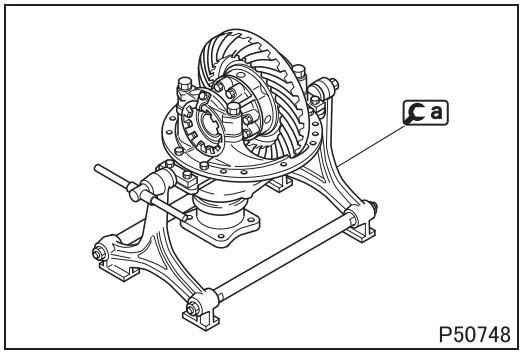
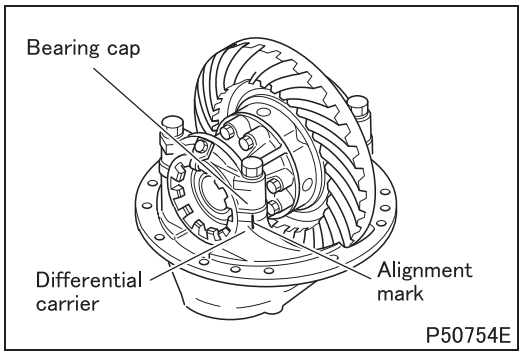
◆Work before removal◆



■ **Preparatory work: Installation of differential working base assembly**

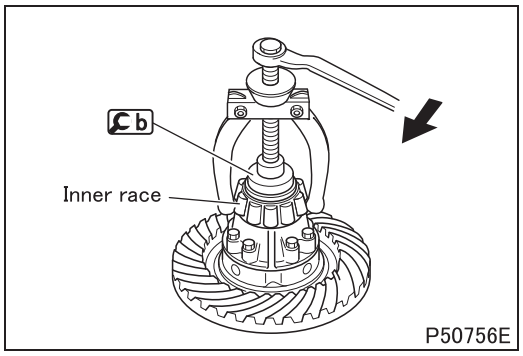
• Install the reduction and differential on a.



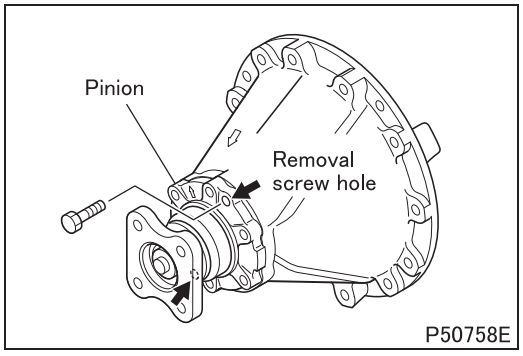
■ **Alignment marks: Bearing cap and differential carrier**

• Put alignment marks on the bearing cap and differential carrier for correct identification of right and left parts.

◆Removal procedure◆



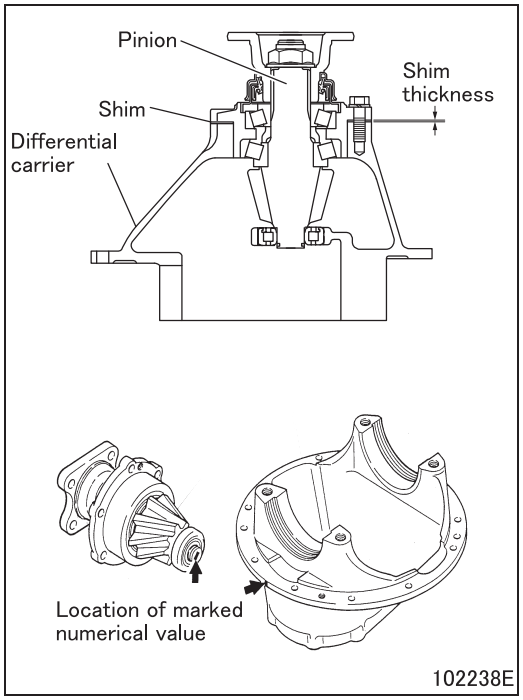
■ **Removal: Side bearing inner race**



■ **Removal: Pinion**

• Screw two bolts evenly into the pinion removal screw holes to remove the pinion.

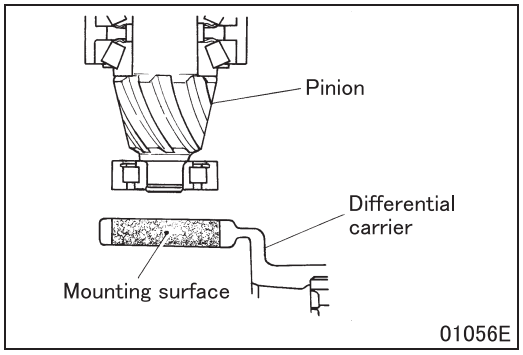
◆Adjustment procedure◆



■ **Selection: Shim**

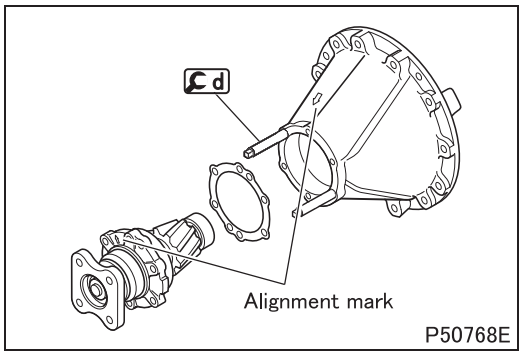
- Calculate shim thickness by using the following formula based on the machining error data stamped on pinion and differential carrier.
- Formula: Shim thickness = 0.5 mm {0.020 in.} − a + b + 0.2 mm {0.0079 in.}
  a: 1/100 of numeral stamped on outer periphery of flange of differential carrier flange
  b: Numeral stamped on top of pinion
- Select the shim(s) based on the calculated shim thickness.
  Thickness of shims available: 0.1 and 0.2 mm {0.0039 and 0.0079 in.} (2 types)

◆Installation procedure◆



■ **Installation: Reduction pinion**

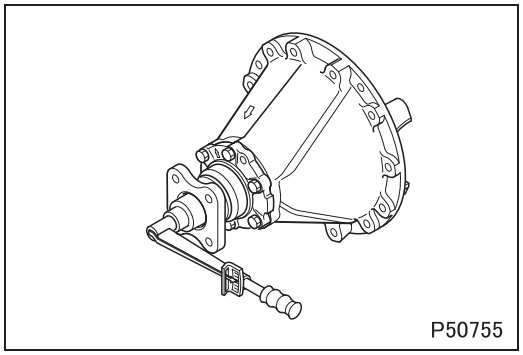
- Apply sealant to the pilot bearing mounting surface of the differential carrier.



- Aligning the embossed alignment mark on the bearing retainer of the pinion assembly with that on the differential carrier, mount the pinion assembly.

CAUTION ⚠

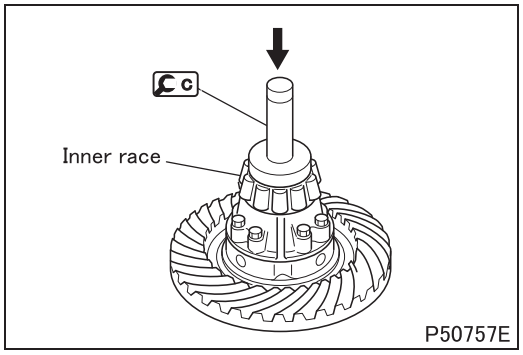
- **Leave for 30 minutes to 2 hours after installation to let the sealant harden.**
- **Wait at least three hours or, if feasible 24 hours, before running the vehicle to let the sealant harden.**



P50755

■ **Inspection: Starting torque of pinion bearing**

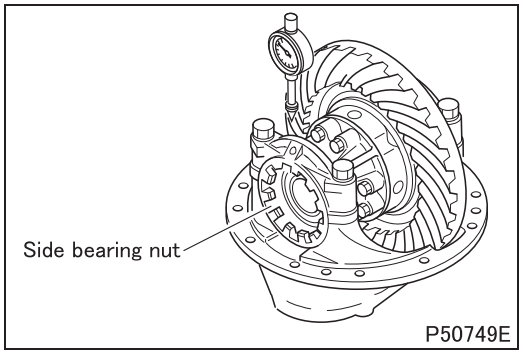
- The starting torque of the pinion in single unit should be the standard value.
- With the pinion installed, measure the starting torque of the pinion bearing using a torque wrench installed at the pinion.
- Record the measured starting torque for reference when the starting torque of the side bearing calculated.



P50757E

■ **Installation: Side bearing inner race**

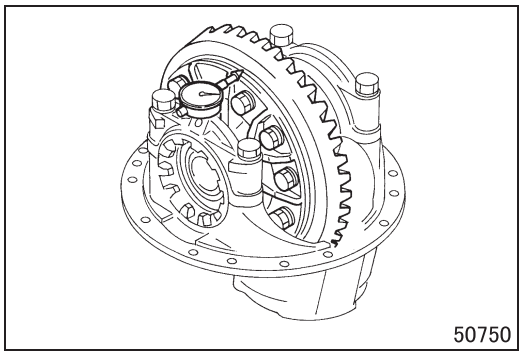
◆Work after installation◆



P50749E

■ **Adjustment: Backlash between reduction gear and reduction pinion**

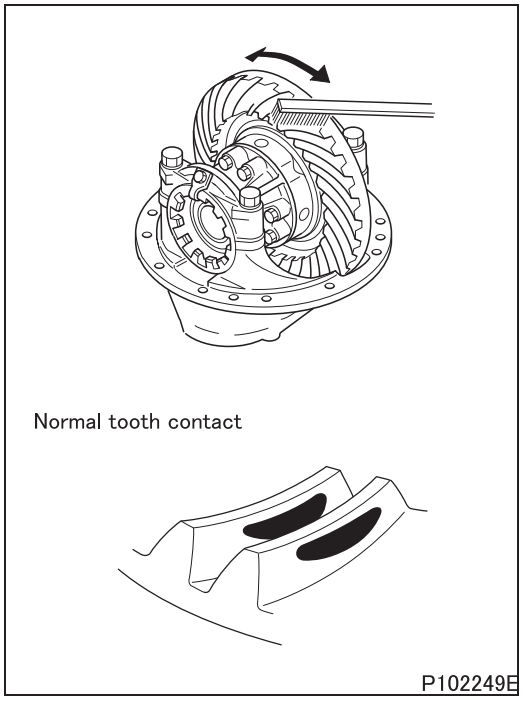
- Adjust backlash with the side bearing nut, taking care not to allow the side bearing starting torque to change.
- When one side bearing nut is loosened, be sure to tighten the other one by the same amount to prevent the side bearing starting torque from changing.



50750

■ **Inspection: Wobble at back face of reduction gear**

- Measure wobble at the illustrated position of the reduction gear.
- If the measured value deviates from the standard value, replace the reduction gear and reduction pinion of the differential as a set.



■ **Inspection: Tooth contact of reduction gear**

[Inspection]

- Apply red lead to three to four teeth at three equally spaced points of the reduction gear.
- Turn the reduction gear several times to ensure proper tooth contact.
- Tooth contact off-center to the small end side under no load moves toward to the center under a load.
- Adjust tooth contact if it is remarkably offset.

[Adjustment]

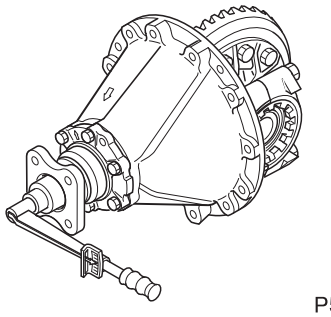
- Optimize tooth contact by increasing or decreasing shim thickness or adjusting backlash between reduction gear and reduction pinion (using the side bearing nut).

CAUTION ⚠

- **If teeth are abnormally worn or tooth contact is excessively concentrated at the large end or small end side, always replace both the reduction gear and reduction pinion as a reduction gear set.**

Tooth contact on reduction gear	Adjustment procedure
Concentrated at addendum  P102240	Advance reduction pinion to reduction gear (shims are reduced)  P55497
Concentrated at dedendum P102241	Retard reduction pinion from reduction gear (shims are added)  P55498

Tooth contact on reduction gear	Adjustment procedure
Concentrated at large end side  P102242	Advance reduction gear to reduction pinion center (less backlash)  P55499
Concentrated at small end side  P102243	Retard reduction gear from reduction pinion center (more backlash)  P55500



P50752

■ **Inspection: Starting torque of side bearing**

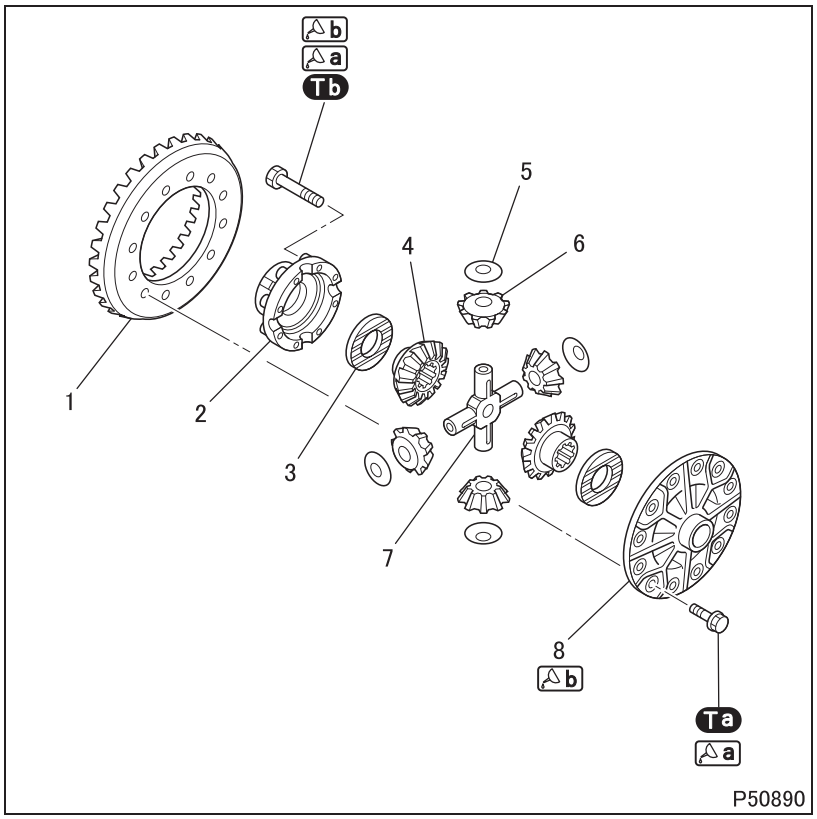
[Inspection]

- Measure the total starting torque of the pinion assembly using a torque wrench and calculate the starting torque of the side bearing using the following formula. The pinion bearing starting torque is the value obtained at the earlier measurement of the pinion bearing starting torque.
  (Total starting torque – Starting torque of the pinion bearing) × Final ratio = Starting torque of side bearing
- If the calculated value of the side bearing starting torque deviates from the standard value, adjust.

[Adjustment]

- Adjust by means of the right- and left-hand adjusting screws.
- Always adjust both adjusting screws by the same amount.
- The starting torque must be adjusted without causing the backlash between the reduction gear and reduction pinion to deviate from the standard value.

Differential



● **Disassembly sequence**

1. Reduction gear
2. Differential case RH
3. Side gear washer
4. Side gear
5. Pinion washer
6. Differential pinion
7. Pinion spider
8. Differential case LH

CAUTION ⚠

- **Be sure to replace the differential case RH and the differential case LH as a differential case set.**
- **Be sure to replace the side gear and the differential pinion as a side gear set.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
4	Backlash between side gear and spline of axle shaft	0.05 to 0.15 {0.0020 to 0.0059}	0.5 {0.020}	Replace
4, 6	Backlash between side gear and differential pinion	0.15 to 0.20 {0.0059 to 0.0079}	0.5 {0.020}	Replace
6, 7	Clearance between differential pinion and pinion spider	0.17 to 0.27 {0.0067 to 0.011}	0.5 {0.020}	Replace

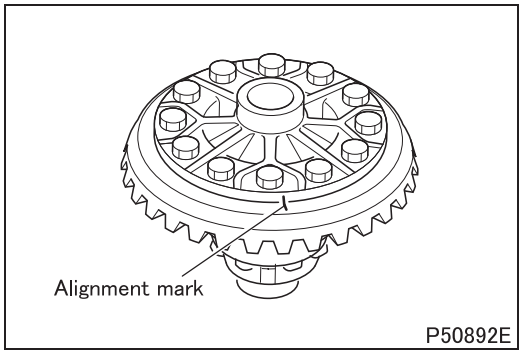
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (reduction gear mounting)	166.6 to 225.4 {120 to 165, 17 to 23}	–
Tb	Bolt (differential case RH and differential case LH mounting)	83.3 to 112.7 {61 to 83, 8.5 to 11.5}	–

Lubricant and/or sealant

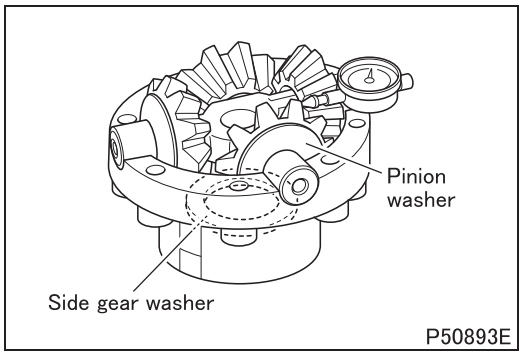
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Entire bolt	Rust preventive	As required
b	Thread area of bolt	Loctite 271	As required
	Bolt tip of differential case LH		

◆Work before removal◆



■ **Alignment marks: Reduction gear and differential case LH**

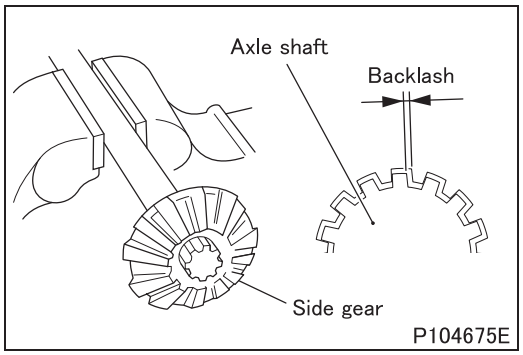
- Put alignment marks on the reduction gear and differential case LH.



■ **Inspection: Backlash between side gear and differential pinion**

- If backlash is found faulty, the thickness of the side gear washer and pinion washer may be inappropriate.

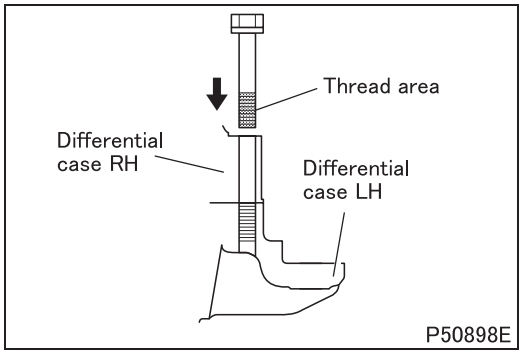
◆Inspection procedure◆



■ **Inspection: Backlash between side gear and axle shaft**

- If the measured value exceeds the limit, replace defective parts.

◆Installation procedure◆

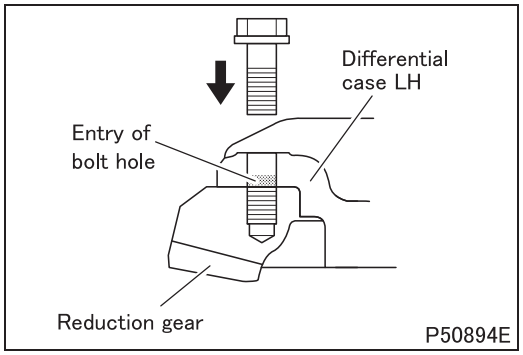


■ **Installation: Differential case RH and differential case LH**

- Apply rust preventive to the entire surface of the bolt. After applying it, blow off the excess rust preventive on the bolt using compressed air.
- Apply thread lock cement to the bolt threads.
- Tighten the bolt to the specified torque.

CAUTION ⚠

- **Make sure to apply rust preventive when tightening the bolt to the specified torque.**
- **Wait at least one hour after installation before actually running the vehicle to let the thread lock cement harden.**
- **Wait at least four hours after installation before operating the vehicle at full torque to let the thread lock cement harden.**



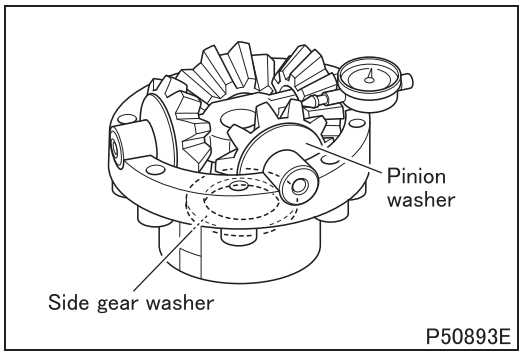
■ **Installation: Reduction gear and differential case LH**

- Apply rust preventive to the entire surface of the bolt. After applying it, blow off the excess rust preventive on the bolt using compressed air.
- Apply thread lock cement at the entry of bolt holes on differential case LH.
- Tighten the bolt to the specified torque.

CAUTION ⚠

- **Make sure to apply rust preventive when tightening the bolt to the specified torque.**
- **Wait at least one hour after installation before actually running the vehicle to let the thread lock cement harden.**
- **Wait at least four hours after installation before operating the vehicle at full torque to let the thread lock cement harden.**

◆Work after installation◆



■ **Inspection: Backlash between side gear and differential pinion**

- If the measured value deviates from the standard value, replace the side gear washer and pinion washer.
  Thickness of side gear washers available
  3.0 mm {0.11 in.} (one thickness)
  Thickness of pinion washers available
  1.6 mm {0.063 in.} (one thickness)

CAUTION ⚠

- **Use side gear washers of the same thickness for the right and left sides.**
- **Use pinion washers of the same thickness at four locations.**

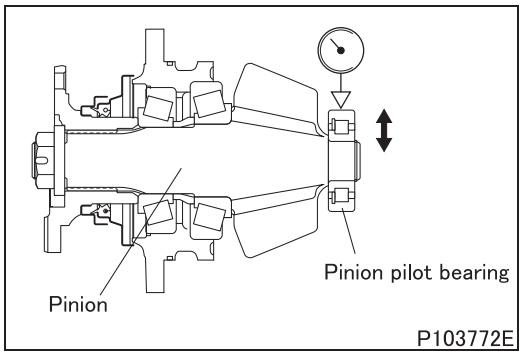
c	Pinion pilot bearing installer A: ϕ45.2 {1.78}, B: ϕ39.2 {1.54}  01081	MH061976	Installation of pinion pilot bearing
d	Oil seal installer A: ϕ112 {4.41}, B: ϕ88 {3.46}  01076	MH061750	Installation of oil seal
e	Pinion bearing installer A: ϕ89 {3.50}, B: ϕ78 {3.07}  01078	MH061977	Installation of front bearing outer race
f	Pinion bearing installer A: ϕ99 {3.90}, B: ϕ88 {3.46}  01078	MH061264	Installation of rear bearing outer race

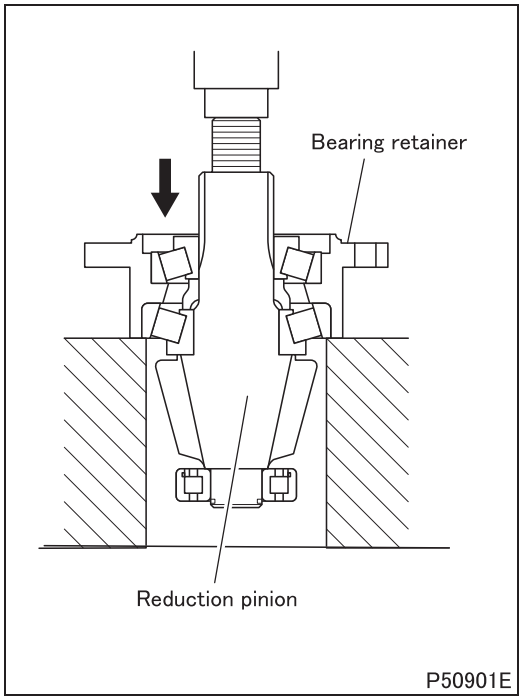
◆Work before removal◆



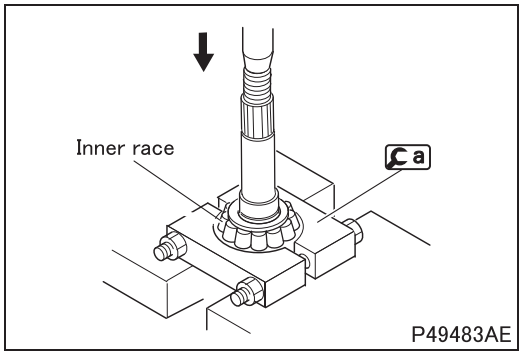
■ **Inspection: Play in radial direction of pinion pilot bearing**

- Hold the pinion and measure the play when moving the pinion pilot bearing in a radial direction.
- If the measured value exceeds the limit, replace the pinion pilot bearing.

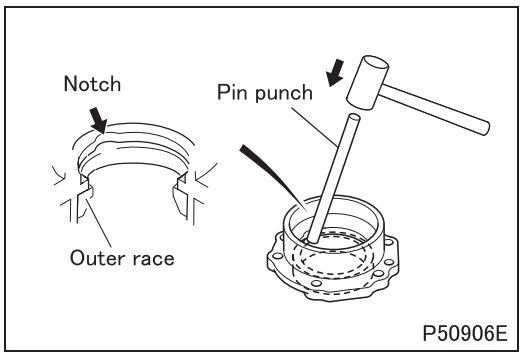
◆Removal procedure◆



■ **Removal: Reduction pinion**

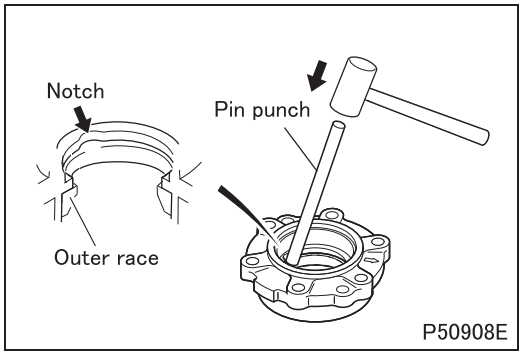


■ **Removal: Rear bearing inner race**



■ **Removal: Front bearing outer race**

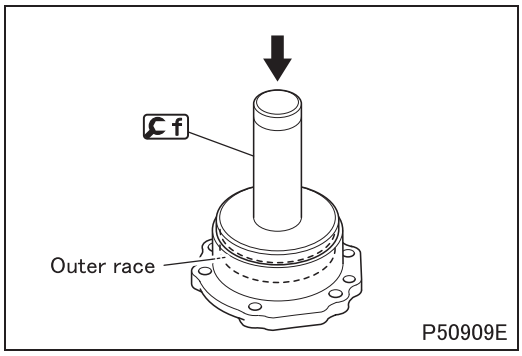
- Drive out the front bearing outer race by tapping evenly at the three notches in the bearing retainer.



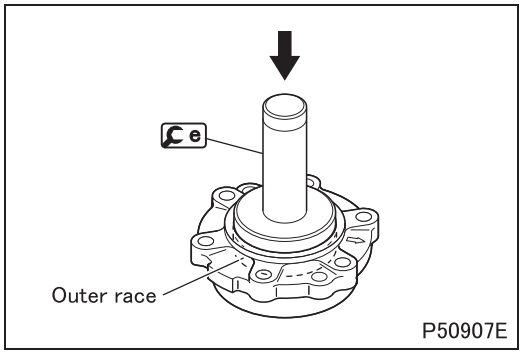
■ **Removal: Rear bearing outer race**

- Drive out the rear bearing outer race by tapping evenly at the three notches in the bearing retainer.

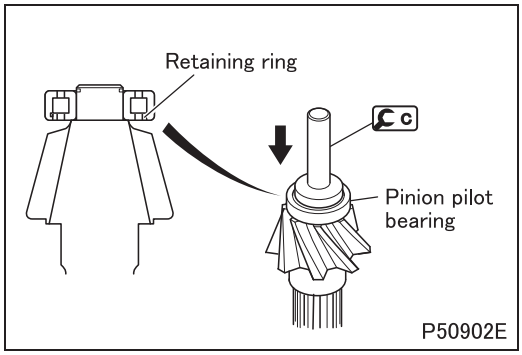
◆Installation procedure◆



■ **Installation: Rear bearing outer race**

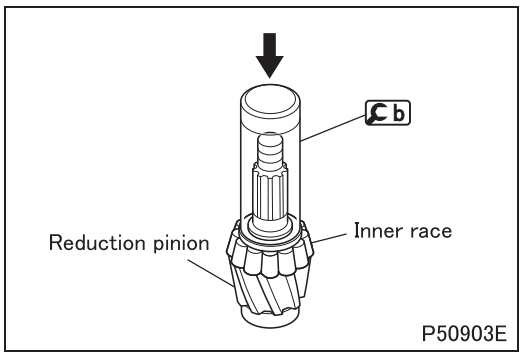


■ **Installation: Front bearing outer race**

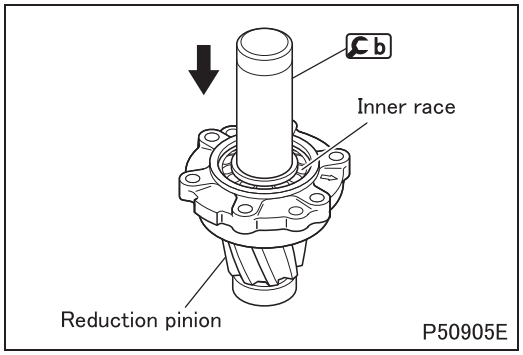


■ **Installation: Pinion pilot bearing**

- Install the pinion pilot bearing with its retaining ring placed on the gear.

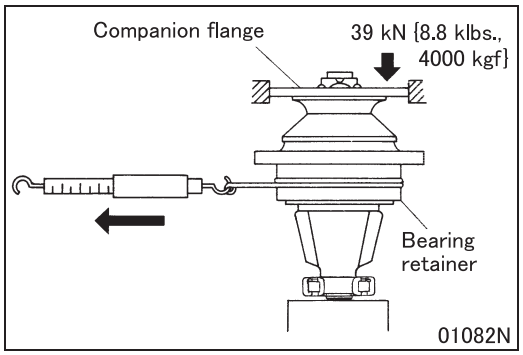


■ **Installation: Rear bearing inner race**



■ **Installation: Front bearing inner race**

- Install the front bearing inner race with the pinion assembled into the bearing retainer.



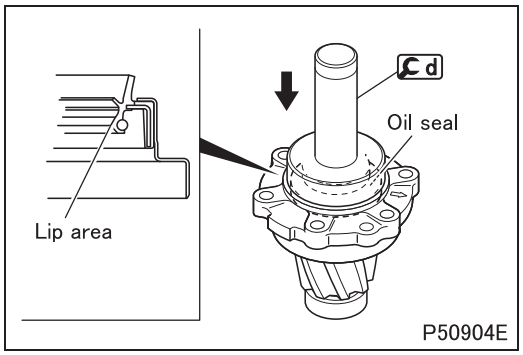
■ **Inspection: Starting torque of pinion bearing**

- Apply the specified load to the companion flange or tighten the lock nut to the specified torque.
- Measure the tangential force at outer periphery point of the bearing retainer using a spring gauge.

CAUTION ⚠

- **Secure the companion flange to measure.**
- **Do not assemble the oil seal when measuring the tangential force.**

- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the standard value, adjust by changing a collar.
  Thickness of collars available
  15.600 to 16.200 mm {0.61 to 0.64 in.} (25 thicknesses in 0.025 mm {0.00098 in.} increments)



■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install it on the bearing retainer in the illustrated direction.

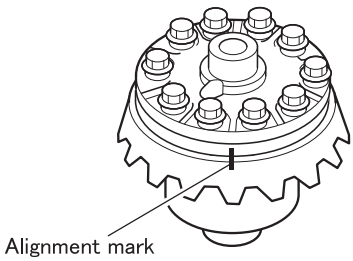
◆Work before removal◆

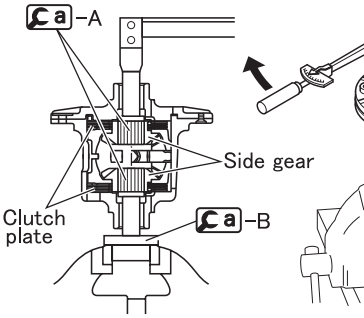


P50492E

■ **Alignment marks: Reduction gear and limited slip differential**

- Put alignment marks on the reduction gear and limited slip differential.

◆Inspection procedure◆



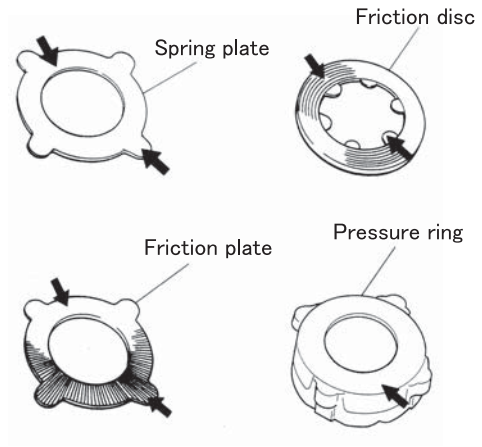
P50491E

■ **Inspection: Rotation torque of LSD clutch plate**

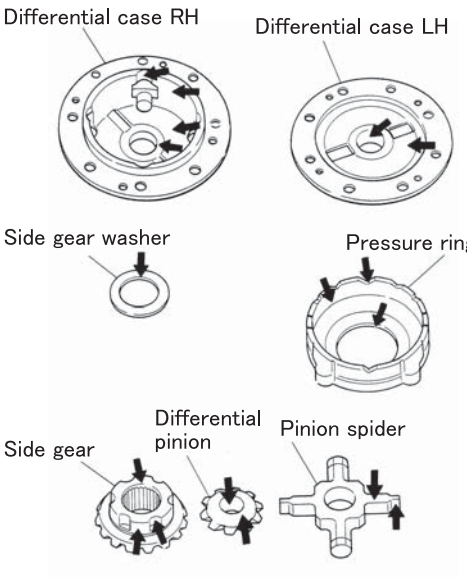
- After removing the reduction gear, carry out the following inspection.
- Measure the rotation torque to check for the friction force of the clutch plate.

NOTE

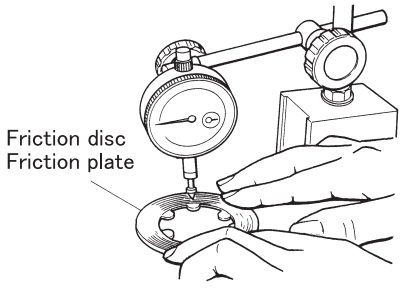
- **For measurement of the rotation torque, rotate the side gears to sufficiently smooth their operation and measure the value during their rotation.**



06734E



06735E



51686E

■ **Inspection: Limited slip differential**

(1) Inspection of contacting and sliding surfaces

- If heat discoloration and remarkable wear are found on friction surfaces and sliding surfaces of the spring plates, spring discs, friction discs and friction plates, replace defective parts.

NOTE

- **Strong contact on the inner periphery of friction surfaces is caused by the spring force of each plate and disc. Do not mistake that it is caused by abnormal wear.**

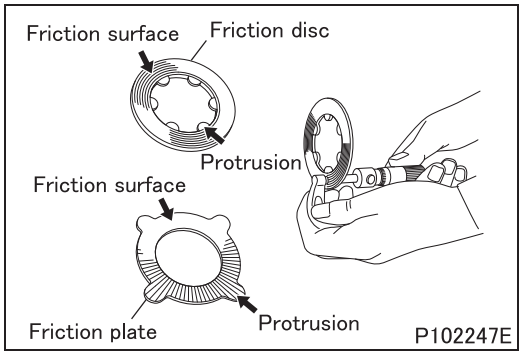
- If cracks and damage are found on the protrusions on the inside and outside periphery of the spring plates, friction discs and friction plates, replace defective parts.
- If dents and damage are found on the friction surfaces and sliding surfaces of the pressure rings to friction discs, polish them with an oilstone, and lap and correct them with a compound on a surface plate.

NOTE

- **Strong contact on the inner periphery of friction surfaces is caused by the spring force of each plate and disc. Do not mistake that it is caused by abnormal wear.**
- Inspect contacting and sliding areas ⬅ of the differential case LH, side gear washers, pressure rings, side gears, differential pinion, pinion spider and differential case RH, and correct burrs and dents with an oilstone.

(2) Inspection of distortion

- Apply a dial gauge to the friction disc and friction plate on a surface plate and measure their distortion (flatness) while turning them. If the measured value exceeds the limit, replace.



(3) Inspection of thickness

- Measure thickness of the friction surfaces and protrusions ⬅ of the spring plate, friction disc and friction plate, and find the difference. If it exceeds the limit, replace defective parts.

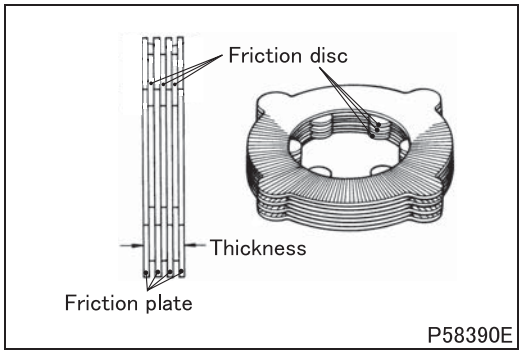
NOTE

- **Take measurements at several points for each part.**

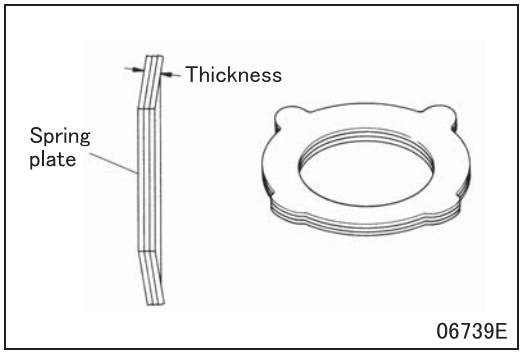
◆Work before assembly◆

■ Adjustment: Dimensional difference and clearance

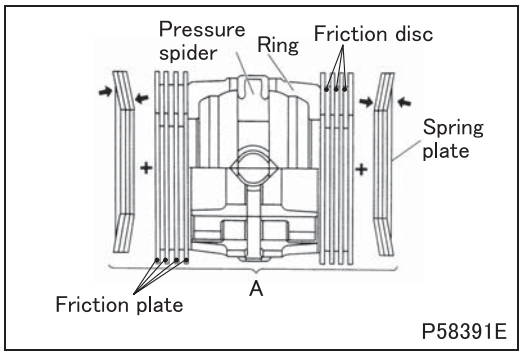
- Before assembling the limited slip differential, adjust the dimensional difference (friction force of clutch plate) in the axial direction and the clearance in the side gear axial direction, when assembling integral parts of the differential cases LH and RH, in the following procedure.



- Stack the friction discs and friction plates as illustrated and measure thickness with a micrometer. Select the combination so that the difference in thickness between the right and left combination falls within the range of the standard value.
  Thickness of friction discs available
  1.9, 2.0, 2.1 mm {0.075, 0.079, 0.083 in.} (three sizes)
  Thickness of friction plates available
  2.0 mm {0.079 in.} (one size)



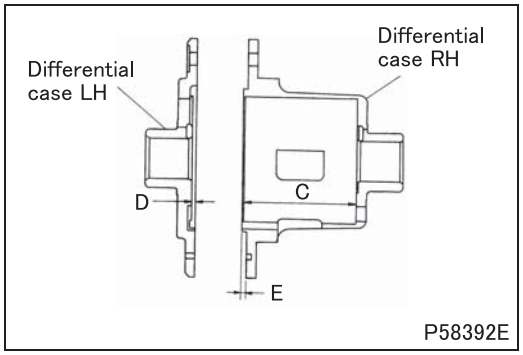
- Stack a spring plate and a spring disc as illustrated and measure the thickness with a micrometer. Select the combination so that the difference in thickness between the right and left combination is as small as possible.
  Thickness of spring plates available
  2.0 mm {0.079 in.} (one size)



- Assemble the pressure rings, pinion spiders, friction discs, friction plates, spring plates and spring discs and measure overall width A with a micrometer.

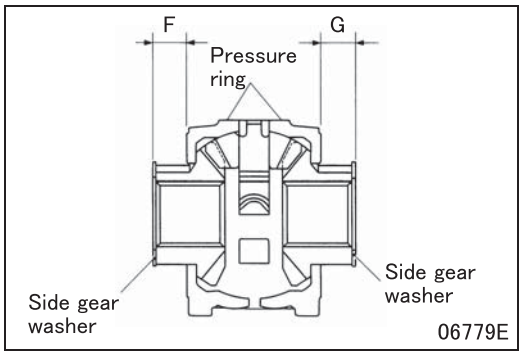
NOTE

- **Measure the overall width with the V-shaped groove of the pressure ring pressed against the pinion spider from both sides to obtain secure contact.**



- Find dimension B between the spring plate contact faces when the differential cases LH and RH are combined.
  B=C+D–E

- If overall width A measured in the previous item and the clearance (B-A) between the differential cases LH and RH deviate from the standard value, adjust by changing a friction plate.
  Thickness of friction plates available
  1.9, 2.0, 2.1 mm {0.075, 0.079, 0.083 in.} (three sizes)

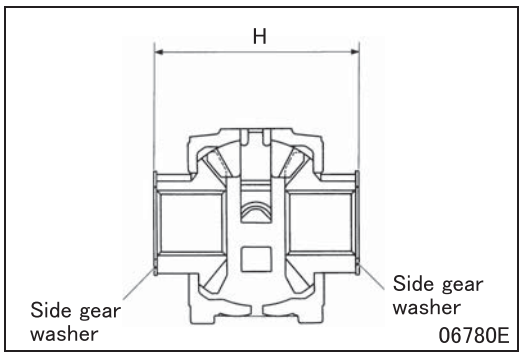


- After installing the side gear washers as illustrated, make sure that the difference between F and G dimensions from the back face of the pressure rings to the end face of the side gear washers falls within the range of the standard value.

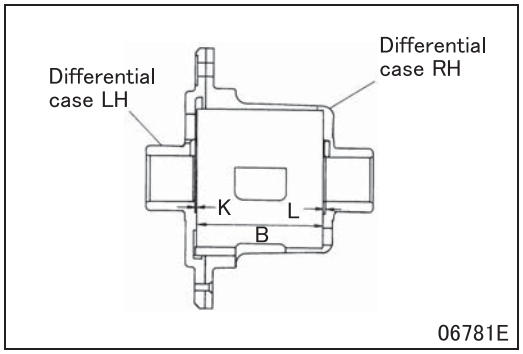
NOTE

- **Measure the dimensions with the V-shaped groove of the pressure ring pressed against the pinion spider from both sides to obtain secure contact.**

- If the difference in dimension deviates from the standard value, adjust by changing the side gear washer.
  Thickness of side gear washers available
  1.5, 1.6, 1.7 mm {0.059, 0.063, 0.067 in.} (three sizes)



- Measure overall width H.



- Find dimension J between side gear washer contact faces when the differential cases LH and RH are combined.
  J=B+K+L

NOTE

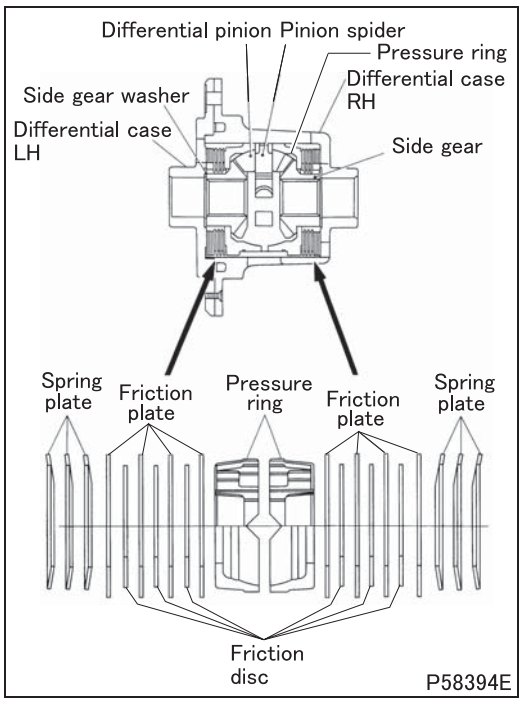
- **For dimension B, refer to the difference between spring plate contact surfaces found in the previous item when the differential cases LH and RH are combined.**

- Check that clearance in the side gear axial direction is within the range of the standard value.
- If the clearance deviates from the standard value, adjust by changing the side gear washer.
  Thickness of side gear washers available
  1.5, 1.6, 1.7 mm {0.059, 0.063, 0.067 in.} (three sizes)

NOTE

- **Select side gear washers so that the right and left dimensional difference from the back face of the pressure rings to the end face of the side gear washers conforms to the standard value.**

◆Assembly procedure◆

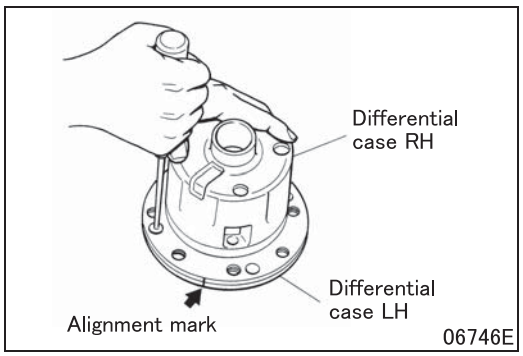


■ **Assembly: LSD (Limited Slip Differential)**

- Assemble each part into the differential case RH in the illustrated direction.

NOTE

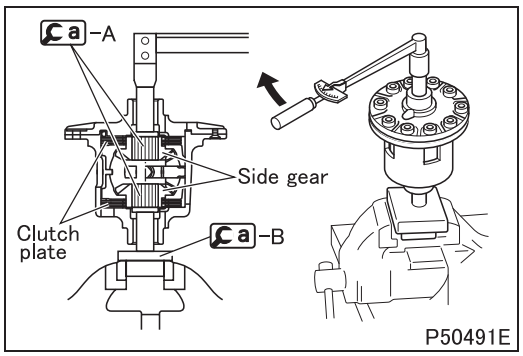
- **Take care not to install the friction discs and friction plates in a wrong sequence and the spring plates in a wrong direction.**
- **When assembling, apply gear oil to each part. Especially, apply gear oil carefully to contact surfaces and sliding surfaces.**



- Aligning the alignment mark (the same Arabic numeral) of the differential case LH with that of the differential case RH, tighten the screws in the diagonal sequence gradually and evenly.

NOTE

- **If the differential cases LH and RH do not align properly with each other even after the screws have been tightened fully, improperly assembled side gear washers and spring plates are suspected. In that case, reassemble these parts.**



■ **Inspection: Rotation torque of limited slip differential clutch plate**

- After assembling LSD, carry out the following inspection.
- Measure the rotation torque to check for the friction force of the clutch plate.

NOTE

- **For measurement of rotation torque, rotate the side gears to sufficiently smooth their operation and measure the value during their rotation.**

- If the measured value deviates from the standard value, replace defective parts of the internal components.

Group 27

Rear Axle

2015 to 2016 Model Years

MITSUBISHI FUSO TRUCK OF AMERICA, Inc.

Pub.No.00ELT0059-27

INDEX

SPECIFICATIONS 27-2

STRUCTURE AND OPERATION
1. Wheel Hub and Rotor 27-3

WHEEL HUB AND ROTOR
<FE52> 27-4
<FEC7, FEC9, FECX> 27-16

SPECIFICATIONS

Item		Specifications		
		FEC5	FEC7, FG	FEC9, FECX
Rear axle	Model	R033T	R035T	
	Type	Banjo type, full floating		
Reduction	Model	D033H	D035H	
	Type	Single-reduction hypoid gear		
	Gear ratio	4.875 5.285	5.285 5.714	6.166
Differential	Tooth shape	Straight bevel gear		
Gear oil	Grade	Normal: Maximum air temperature during operation below 40°C {104°F} API GL-5 SAE 90 Hot area: Maximum air temperature during operation above 40°C {104°F} API GL-5 SAE 140		
	Quantity L {qts}	4.5 {4.8}		
Mass kg {lb}		225 {495} (approximately)	250 {550} (approximately)	

- Use gear oil with a SAE viscosity of 140 when a vehicle is used under heavily-loaded, severe conditions such as continuous driving on uphill grades. However, the air temperature must be above 10°C {50°F}.
- Limited slip differential oil API GL-5 SAE 90 is used for models with a LSD (Limited Slip Differential).
- The mass differs between vehicle models.

1. Wheel Hub and Rotor

24 Wheel hub

Ⓟ: Locating pin
⊗: Non-reusable parts

CAUTION ⚠

- **Plug the brake hose and brake pipe to prevent entry of dust and dirt after it has been removed.**

● Assembly sequence

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Make sure that the disk rotor surface and disk brake pad surface are free from grease to avoid malfunction of the brakes.**
- **When installing the brake hose, take necessary steps to prevent entry of dust and dirt into the hose.**
- **Make sure that the brake hose is not twisted when installing it.**
- **Make sure that the brake hose does not interfere with any of surrounding parts when installed.**

- Inspect the drag torque of the disk brakes after assembly. (See Gr35.)
- Bleed air from the brake system after assembly. (See Gr35.)

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Starting torque of wheel hub bearing (tangential force at hub bolt position with oil seal assembled)		2.0 to 3.9 N·m {1.4 to 2.9 ft.lbs, 0.2 to 0.4 kgf·m} (tangential force: 17.5 to 34.2 N {3.9 to 7.7 lbs, 1.8 to 3.5 kgf})	–	Adjust or replace
12	Axle shaft	Bend	0 to 1 {0 to 0.039}	2 {0.079}	Replace
		Bend at flange face	0 to 0.03 {0 to 0.0012}	0.05 {0.0020}	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Eyebolt		22 ± 2 {16 ± 1.5, 2.24 ± 0.20}	–
Tb	Bolt (rear disk brake mounting)		98 to 140 {72 to 103, 10 to 14}	–
Tc	Bolt (axle shaft mounting)		98 to 120 {72 to 87, 10 to 12}	–
Td	Lock nut	Primary tightening	98 to 130 {72 to 96, 10 to 13}	–
		Secondary tightening after primary tightening	30 to 40 {22 to 29, 3 to 4}	–
Te	Bolt (wheel hub and disk rotor mounting)		45 to 60 {33 to 44, 4.6 to 6.1}	–

Lubricant and/or sealant

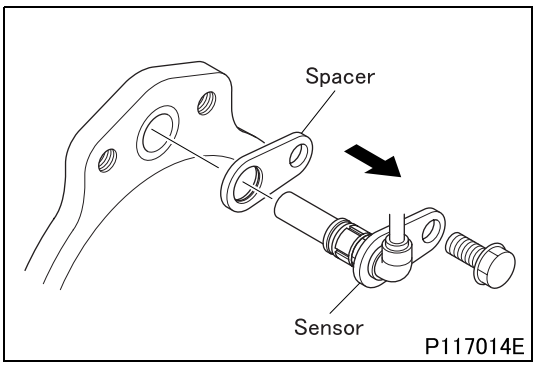
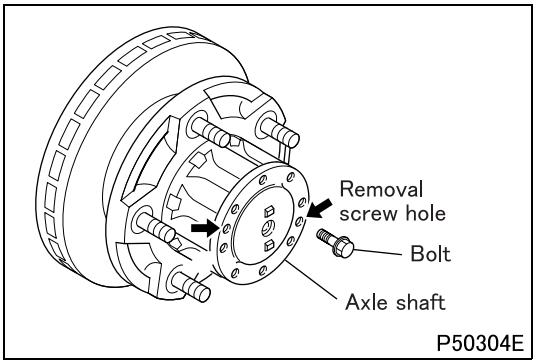
◆Removal procedure◆



■ **Removal: Wheel speed sensor**

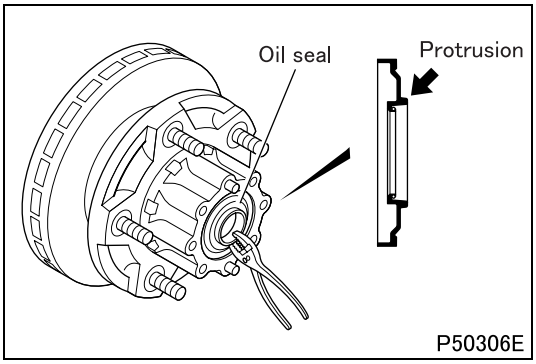
CAUTION ⚠

- **When removing the wheel speed sensor, never apply a force to it such as tapping it with a hammer, prying it with a screwdriver and pulling the harness, as doing so may damage the wiring.**
- **Be careful not to damage the tip of the wheel speed sensor after removing it.**



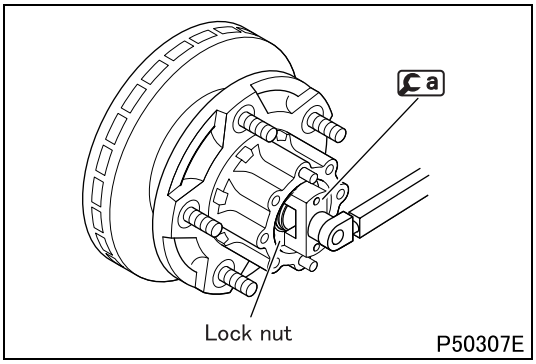
■ **Removal: Axle shaft**

- Screw two axle shaft mounting bolts evenly into the axle shaft removal screw holes to remove the axle shaft.

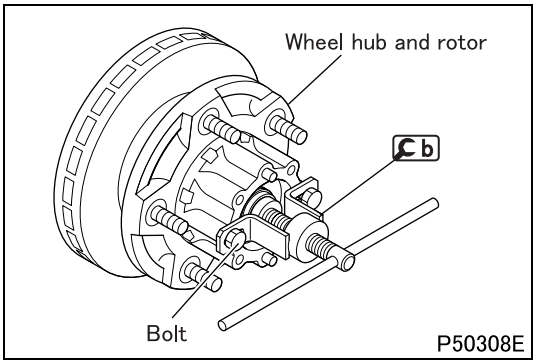


■ **Removal: Outer oil seal**

- To remove the outer oil seal, pull the protrusion on the outer periphery of the outer oil seal evenly around the whole circumference with pliers.



■ **Removal: Lock nut**

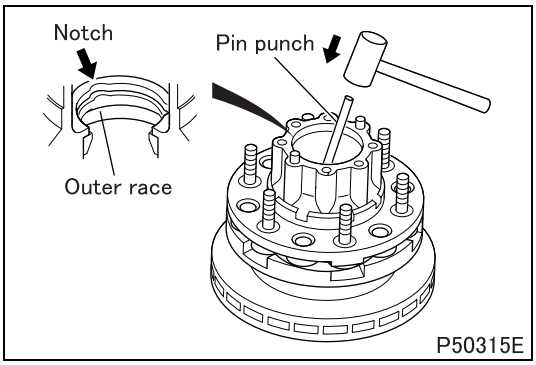


■ **Removal: Wheel hub and rotor**

- Install Cb using axle shaft mounting bolts and remove the wheel hub and rotor assembly.

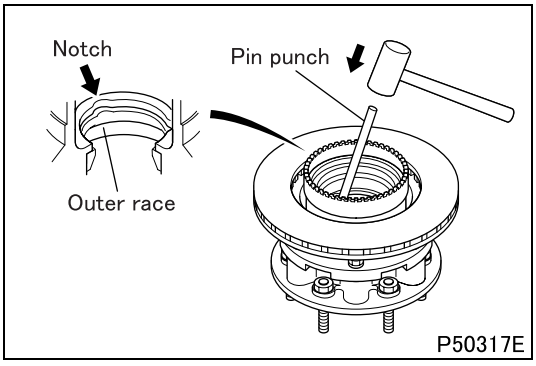
CAUTION ⚠

- **If the wheel hub and rotor assembly was removed from the axle housing, replace the oil seal with a new one.**



■ **Removal: Inner bearing outer race**

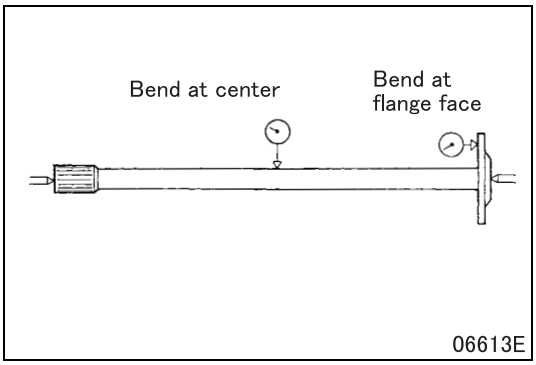
- Drive out the inner bearing outer race by tapping evenly at the three notches in the wheel hub.



■ **Removal: Outer bearing outer race**

- Drive out the outer bearing outer race by tapping evenly at the three notches in the wheel hub.

◆Inspection procedure◆



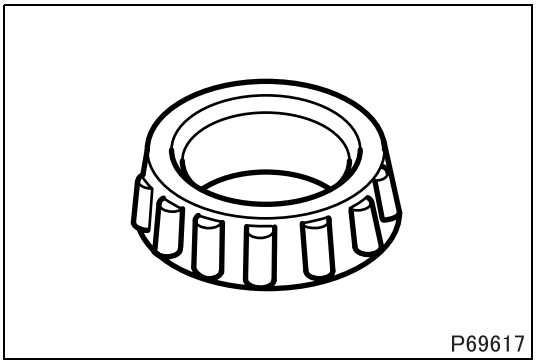
■ **Inspection: Axle shaft**

- Measure the bend of the axle shaft at its center.

NOTE

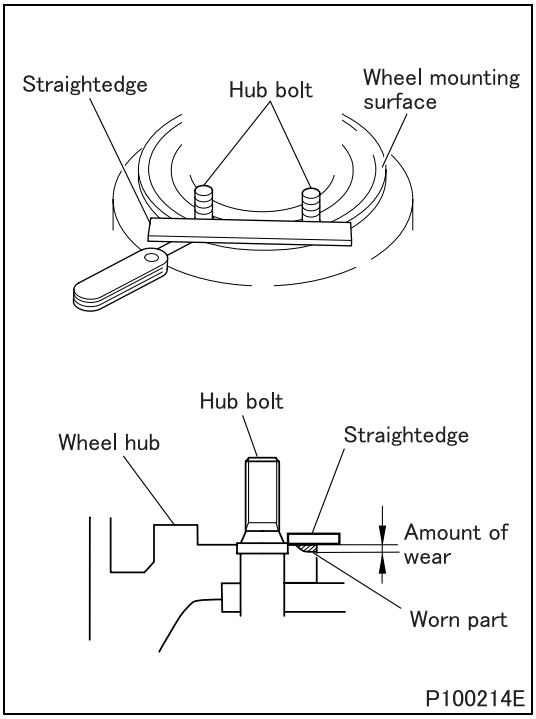
- **Give the axle shaft one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

- If the measured value exceeds the limit, replace the axle shaft.
- Measure the bend of the flange face of the axle shaft.
- If the measured value exceeds the limit, replace the axle shaft.



■ **Inspection: Outer bearing inner race**

- Inspect the outer bearing inner race after cleaning the bearing to remove grease completely.
- If any damage, wear, or a poor rotating conditions are evident in the inner race, replace it with a new one.
- The inner race and outer race should be replaced as a set.



■ **Inspection: Wheel hub**

(1) Visual inspection

- Visually and physically inspect the disk wheel mounting surface. If there is damage or cracking on it, replace the wheel hub.
- Make sure that there is no rust, dust, paint or foreign material on the disk wheel mounting surface of the wheel hub to prevent the wheel nut from becoming loose.
- If any abnormality is found, remove it with sandpaper.

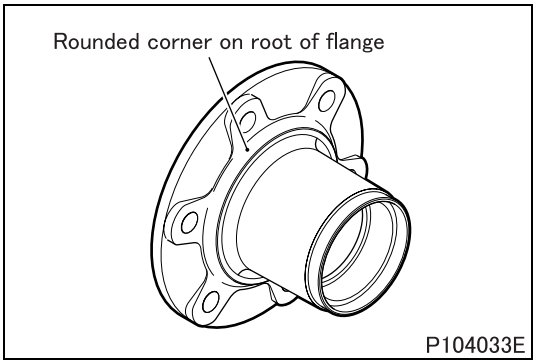
(2) Wear in disk wheel mounting part of wheel hub

- Clean the wheel mounting surface of the wheel hub before inspection.
- Place a straightedge against two hub bolts on the disk wheel mounting surface.

CAUTION ⚠

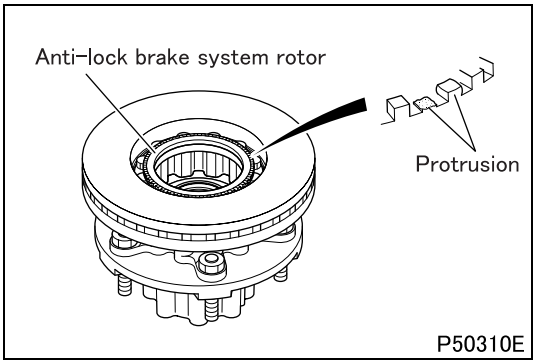
- **Make sure that the straightedge does not run onto the hub bolt.**

- Use feeler gauges to measure the amount of wear at the outer periphery of the wheel hub.
  Measure the amount of wear at every hub bolt.
- If the amount of wear at any point exceeds the following standard value, inspect the wheel hub for cracks.
  Wear standard value: 0.8 mm {0.031 in.}



(3) Crack check

- Inspect for any cracks in the rounded corner on the root of the flange using magnetic particle or liquid penetrant testing.
  If any cracks are found, replace the wheel hub.
- If any cracks are found in a wheel hub bolt, replace it.
- If there is cracking or stepped wear on the wheel hub mounting surface of the wheel disk, replace it. (See Gr31.)



■ **Inspection: Anti-lock brake system rotor**

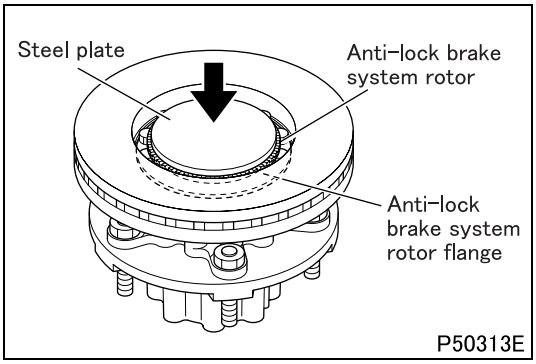
[Inspection]

- Remove any debris on the anti-lock brake system rotors and check the protrusions of the anti-lock brake system rotor for chipping and flattening.
- If any abnormality is found, replace the anti-lock brake system rotor.

Replacement of anti-lock brake system rotor

[Removal]

- Remove the wheel hub and disk rotor, taking care not to damage them.



[Installation]

- Warm the anti-lock brake system rotor to approximately 150°C {302°F}.
- Install the anti-lock brake system rotor and anti-lock brake system rotor flange evenly using a steel plate so as not to allow them to tilt.

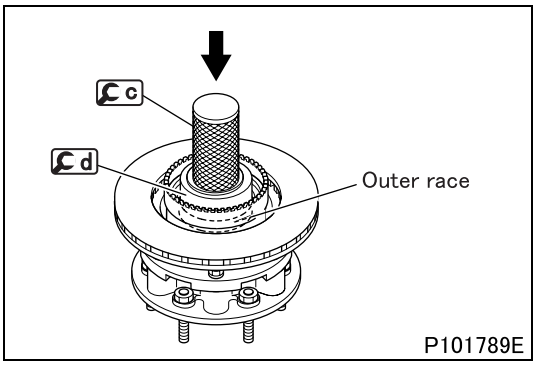
WARNING ⚠

- **Handling the warmed rotor with bare hands may cause burns.**

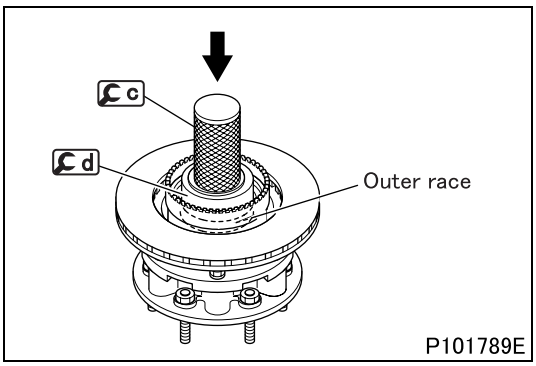
■ Inspection: Inner bearing inner race

- Inspect the inner bearing inner race in the same manner as the outer bearing inner race.
  (See **"■ Inspection: Outer bearing inner race".**)

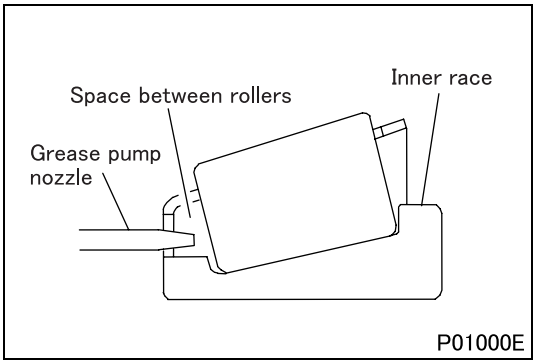
◆Installation procedure◆



■ Installation: Outer bearing outer race

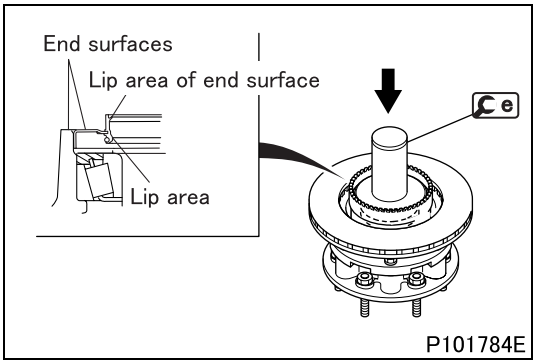


■ Installation: Inner bearing outer race



■ Installation: Packing grease in inner bearing inner race

- Insert the grease pump nozzle into the space between the rollers of the inner bearing inner race to pack grease sufficiently.

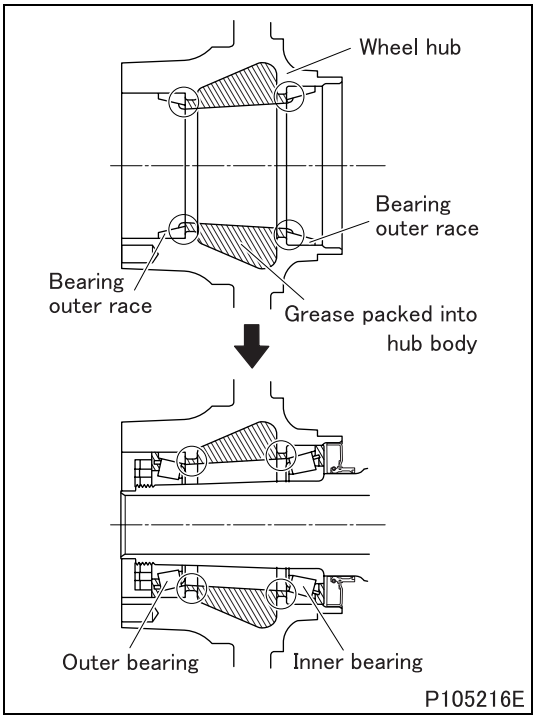


■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install the oil seal in the wheel hub so that the oil seal faces the illustrated direction and the end surface of the oil seal is flush with the end surface of the wheel hub.

■ **Installation: Packing grease in outer bearing inner race**

- Follow the same procedure as packing the inner bearing inner race with grease.
  (See **"■ Installation: Packing grease in inner bearing inner race"**.)

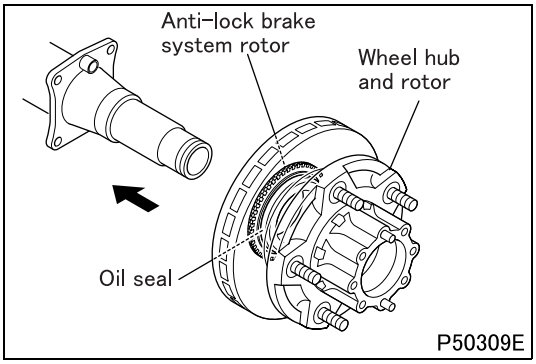


■ **Installation: Packing grease in wheel hub**

CAUTION ⚠

- **The wheel bearing may seize if these instructions are not followed.**
- **Apply the specified amount of grease.**

- As shown in the illustrations at the left, fill grease inside of the hub body in such a manner that grease covers the outer bearing and inner bearing outer races. Make sure that grease reaches the outer bearing and inner bearing.



■ **Installation: Wheel hub and rotor**

- Slowly install the wheel hub and rotor assembly so as not to cause damage to the oil seal and anti-lock brake system rotor.

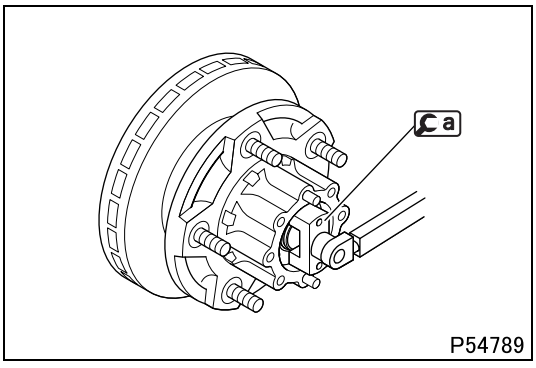
CAUTION ⚠

- **If the anti-lock brake system rotor is damaged, wheel speed sensor signals become abnormal, causing the anti-lock brake system to malfunction.**

■ **Adjustment: Starting torque of wheel hub bearing**

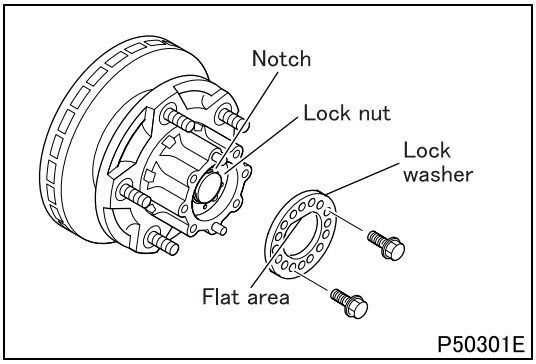
CAUTION ⚠

- **Unless this adjustment procedure is performed, the wheel bearing may seize.**

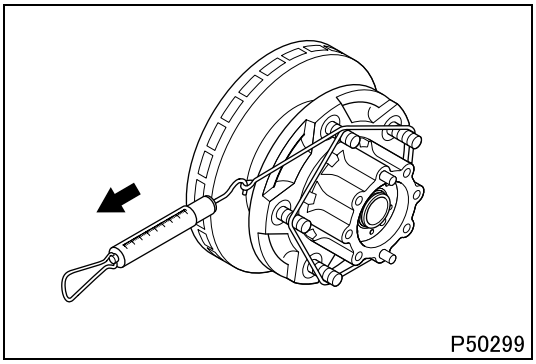


[Adjustment]

- Tighten the lock nut to the specified torque (primary tightening) while turning the wheel hub and rotor, and then loosen it completely.
- Smooth operation of the outer bearing and inner bearing by turning the wheel hub and rotor several times, and then tighten the lock nut to the specified torque (secondary tightening).

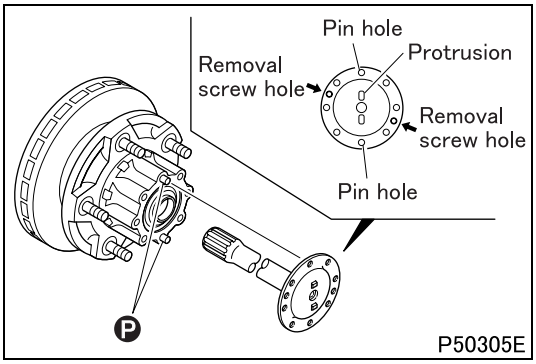


- Insert the flat area of the lock washer, aligning it with the notch of the axle housing, and mount two bolts diagonally to the lock nut.
- If the lock nut does not align with a screw hole of the lock washer, align by loosening the lock nut. Make sure that there is no play in the axial direction.



[Inspection]

- After installing the lock washer, carry out the following inspections.
- Measure the tangential force at the hub bolt position using a spring gauge.
- If the tangential force is within the specified value, the starting torque conforms to the standard value. If the measured value deviates from the specified value, repeat adjustment because the adjustment of the lock nut may be insufficient.
- If the result is found to be abnormal, replace the outer and inner bearings.

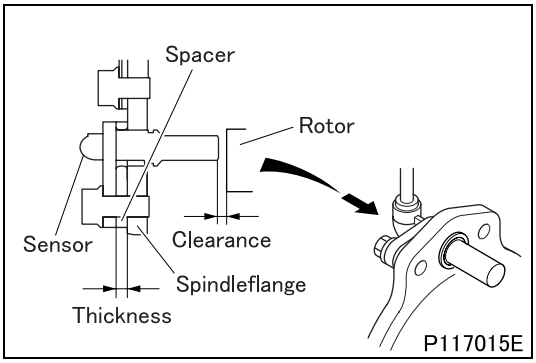


■ Installation: Axle shaft

- Align the pin hole of the locating pin with that of the axle shaft to install the axle shaft.

NOTE

- **A pin hole is not necessarily located at the position of a protrusion on the axle shaft flange face as illustrated. The second hole from a removal screw hole clockwise is a pin hole.**

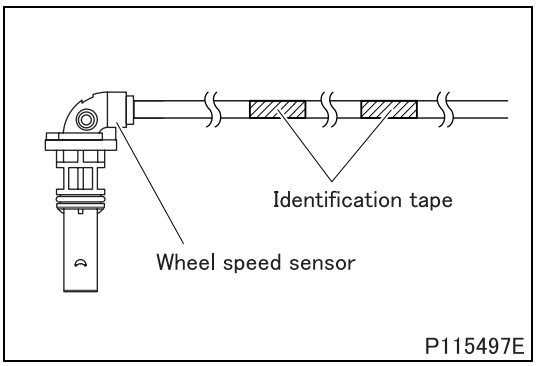


■ Installation: Wheel speed sensor

- Install the wheel speed sensor so that the sensor and spacer are firmly in contact with the holder.
  Spacer thickness: 8 mm {0.31 in.}

CAUTION ⚠

- **Be sure to install the specified spacer in the correct position. Using a spacer with an incorrect thickness or installing the spacer in an incorrect position could cause anti-lock brake system malfunction.**
- **When installing the wheel speed sensor, be careful not to damage the O-ring of the sensor.**
- **When installing the wheel speed sensor, never apply a force to it such as tapping it with a hammer, prying it with a screwdriver and pulling the harness, as doing so may damage the wiring.**



- After installing the wheel speed sensor, check that the clearance between the end of the sensor and the anti-lock brake system rotor is the following dimension:
  Clearance: 1 ± 0.7 mm {0.039 ± 0.028 in.}

- Using clips, secure the wheel speed sensor harness in place at the identification tape portions, ensuring that the harness is free of kinks, slack and/or interference with other parts.

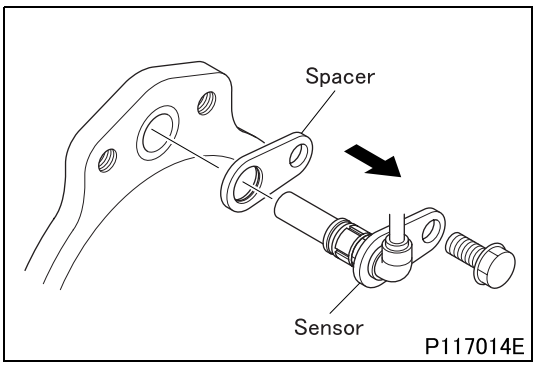
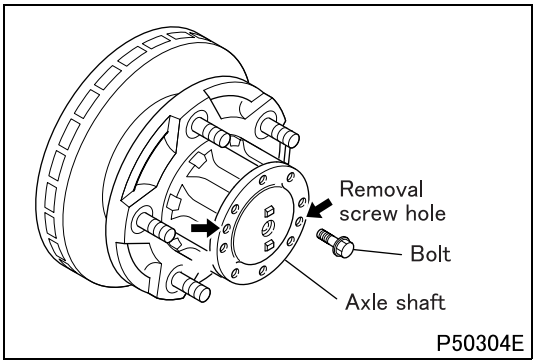
◆Removal procedure◆



■ **Removal: Wheel speed sensor**

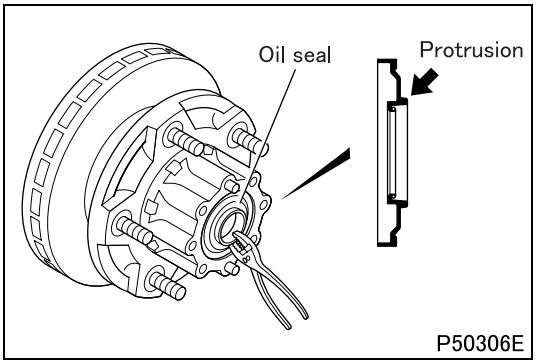
CAUTION ⚠

- **When removing the wheel speed sensor, never apply a force to it such as tapping it with a hammer, prying it with a screwdriver and pulling the harness, as doing so may damage the wiring.**
- **Be careful not to damage the tip of the wheel speed sensor after removing it.**



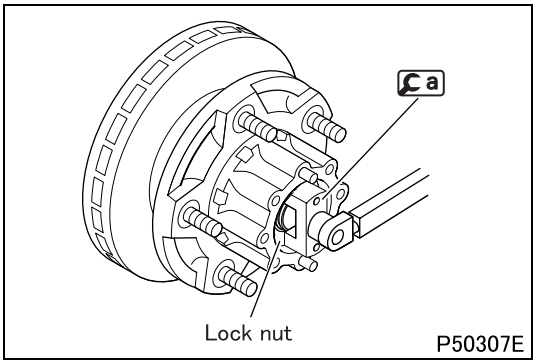
■ **Removal: Axle shaft**

- Screw two axle shaft mounting bolts evenly into the axle shaft removal screw holes to remove the axle shaft.

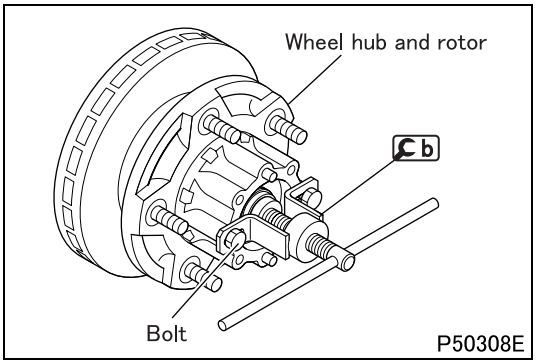


■ **Removal: Outer oil seal**

- To remove the outer oil seal, pull the protrusion on the outer periphery of the outer oil seal evenly around the whole circumference with pliers.



■ **Removal: Lock nut**

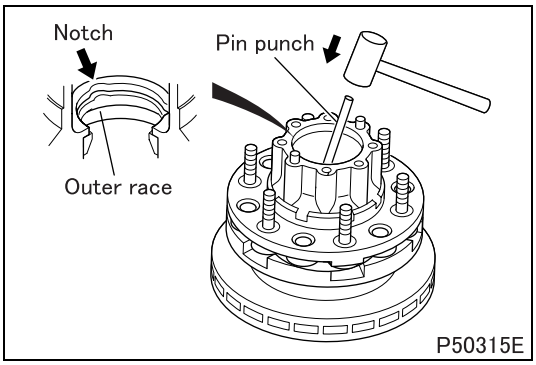


■ **Removal: Wheel hub and rotor**

- Install b using axle shaft mounting bolts and remove the wheel hub and rotor assembly.

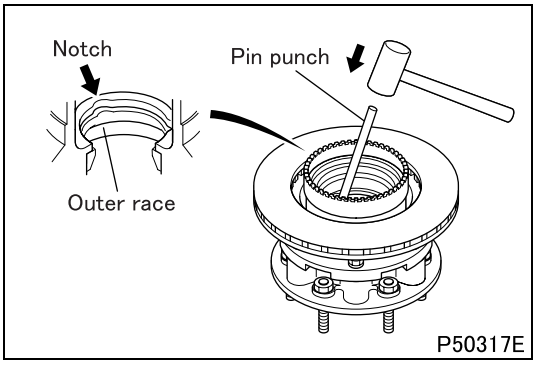
CAUTION ⚠

- **If the wheel hub and rotor assembly was removed from the axle housing, replace the oil seal with a new one.**



■ **Removal: Inner bearing outer race**

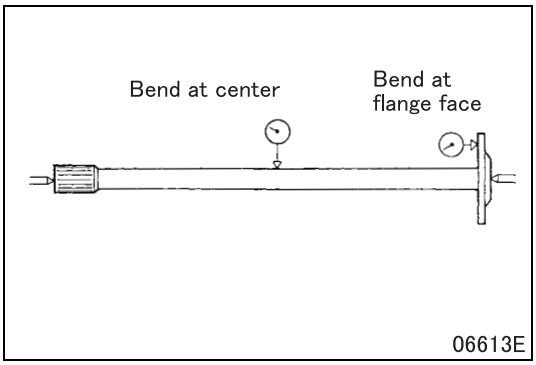
- Drive out the inner bearing outer race by tapping evenly at the three notches in the wheel hub.



■ **Removal: Outer bearing outer race**

- Drive out the outer bearing outer race by tapping evenly at the three notches in the wheel hub.

◆Inspection procedure◆



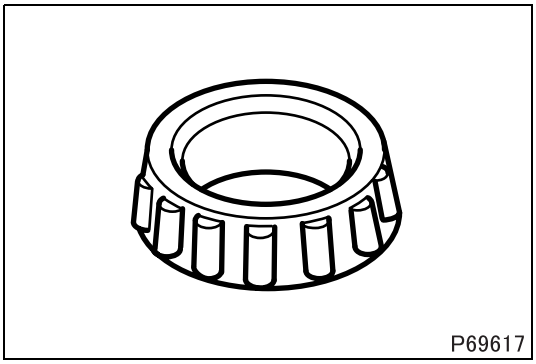
■ **Inspection: Axle shaft**

- Measure the bend of the axle shaft at its center.

NOTE

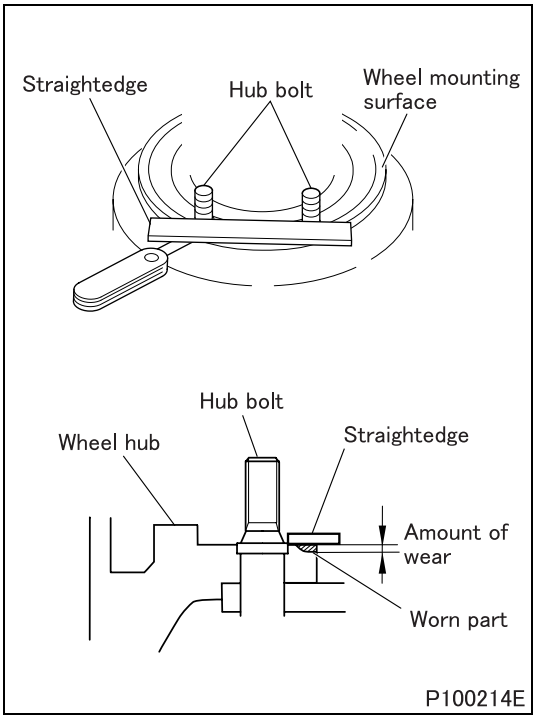
- **Give the axle shaft one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

- If the measured value exceeds the limit, replace the axle shaft.
- Measure the bend of the flange face of the axle shaft.
- If the measured value exceeds the limit, replace the axle shaft.



■ **Inspection: Outer bearing inner race**

- Inspect the outer bearing inner race after cleaning the bearing to remove grease completely.
- If any damage, wear, or a poor rotating conditions are evident in the inner race, replace it with a new one.
- The inner race and outer race should be replaced as a set.



■ **Inspection: Wheel hub**

(1) Visual inspection

- Visually and physically inspect the disk wheel mounting surface. If there is damage or cracking on it, replace the wheel hub.
- Make sure that there is no rust, dust, paint or foreign material on the disk wheel mounting surface of the wheel hub to prevent the wheel nut from becoming loose.
- If any abnormality is found, remove it with sandpaper.

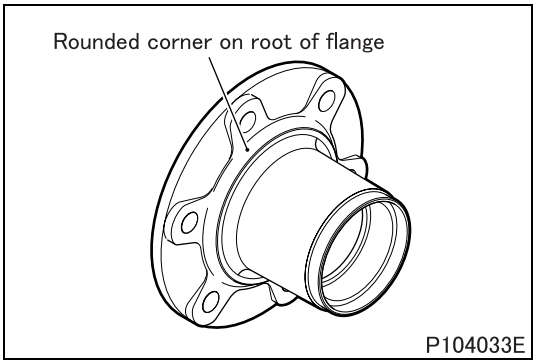
(2) Wear in disk wheel mounting part of wheel hub

- Clean the wheel mounting surface of the wheel hub before inspection.
- Place a straightedge against two hub bolts on the disk wheel mounting surface.

CAUTION ⚠

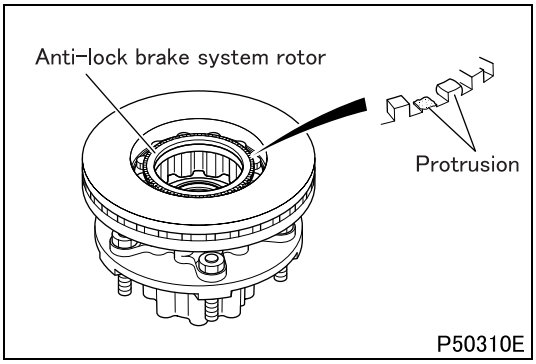
- **Make sure that the straightedge does not run onto the hub bolt.**

- Use feeler gauges to measure the amount of wear at the outer periphery of the wheel hub.
  Measure the amount of wear at every hub bolt.
- If the amount of wear at any point exceeds the following standard value, inspect the wheel hub for cracks.
  Wear standard value: 0.8 mm {0.031 in.}



(3) Crack check

- Inspect for any cracks in the rounded corner on the root of the flange using magnetic particle or liquid penetrant testing.
  If any cracks are found, replace the wheel hub.
- If any cracks are found in a wheel hub bolt, replace it.
- If there is cracking or stepped wear on the wheel hub mounting surface of the wheel disk, replace it. (See Gr31.)



■ **Inspection: Anti-lock brake system rotor**

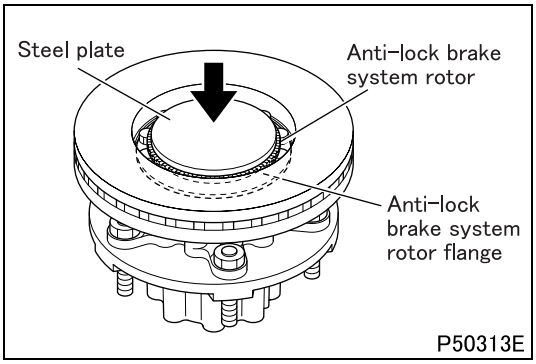
[Inspection]

- Remove any debris on the anti-lock brake system rotors and check the protrusions of the anti-lock brake system rotor for chipping and flattening.
- If any abnormality is found, replace the anti-lock brake system rotor.

Replacement of anti-lock brake system rotor

[Removal]

- Remove the wheel hub and disk rotor, taking care not to damage them.



[Installation]

- Warm the anti-lock brake system rotor to approximately 150°C {302°F}.
- Install the anti-lock brake system rotor and anti-lock brake system rotor flange evenly using a steel plate so as not to allow them to tilt.

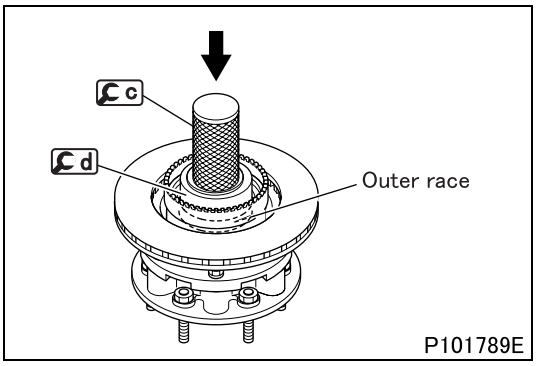
WARNING ⚠

- **Handling the warmed rotor with bare hands may cause burns.**

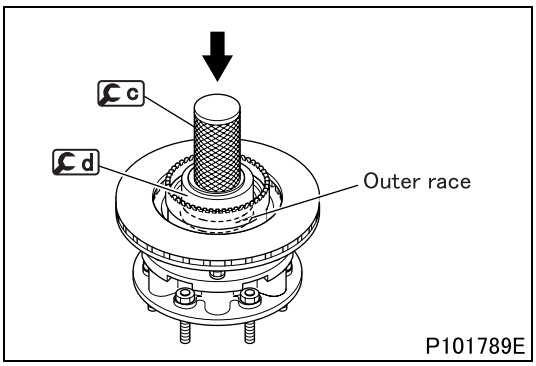
■ Inspection: Inner bearing inner race

- Inspect the inner bearing inner race in the same manner as the outer bearing inner race.
  (See **"■ Inspection: Outer bearing inner race".**)

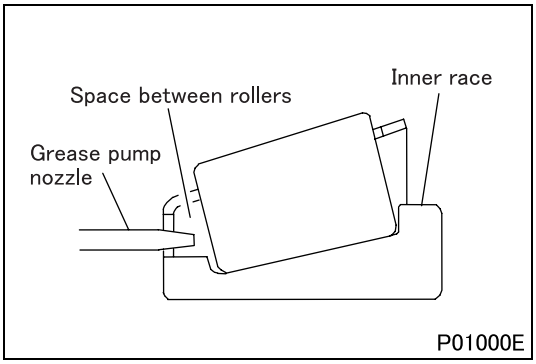
◆Installation procedure◆



■ Installation: Outer bearing outer race

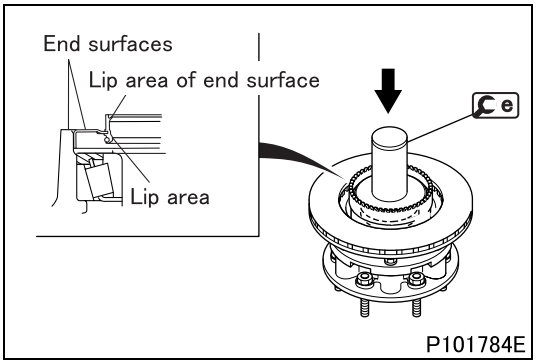


■ Installation: Inner bearing outer race



■ Installation: Packing grease in inner bearing inner race

- Insert the grease pump nozzle into the space between the rollers of the inner bearing inner race to pack grease sufficiently.

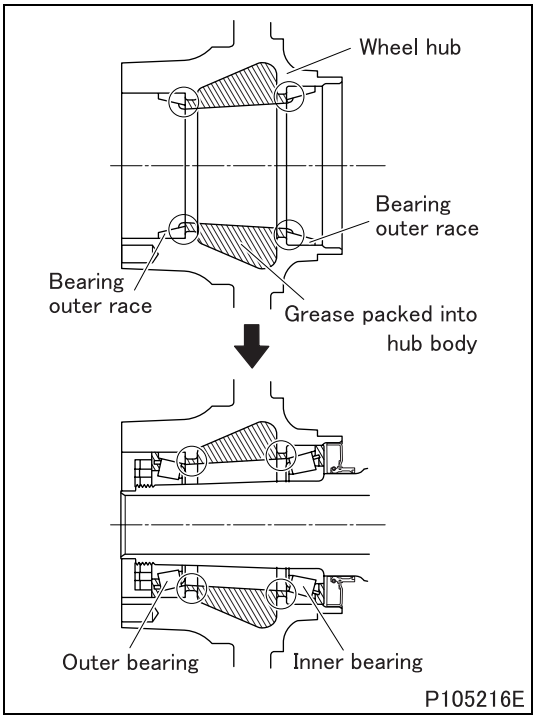


■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install the oil seal in the wheel hub so that the oil seal faces the illustrated direction and the end surface of the oil seal is flush with the end surface of the wheel hub.

■ **Installation: Packing grease in outer bearing inner race**

- Follow the same procedure as packing the inner bearing inner race with grease.
  (See **"■ Installation: Packing grease in inner bearing inner race"**.)

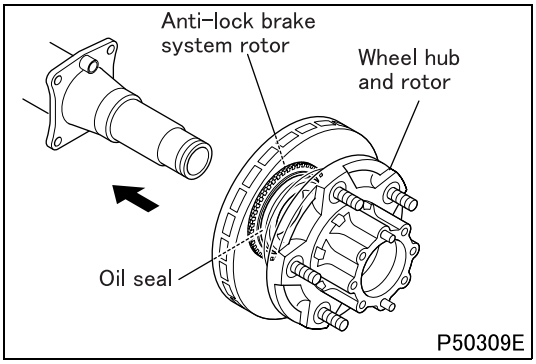


■ **Installation: Packing grease in wheel hub**

CAUTION ⚠

- **The wheel bearing may seize if these instructions are not followed.**
- **Apply the specified amount of grease.**

- As shown in the illustrations at the left, fill grease inside of the hub body in such a manner that grease covers the outer bearing and inner bearing outer races. Make sure that grease reaches the outer bearing and inner bearing.



■ **Installation: Wheel hub and rotor**

- Slowly install the wheel hub and rotor assembly so as not to cause damage to the oil seal and anti-lock brake system rotor.

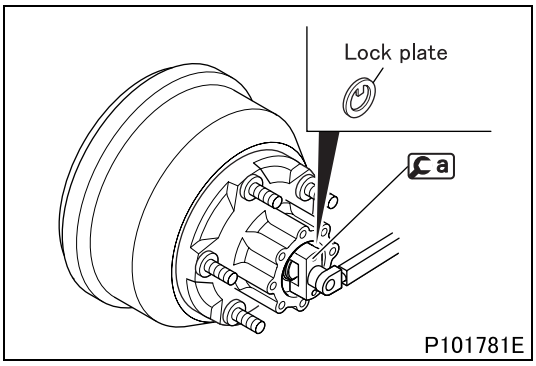
CAUTION ⚠

- **If the anti-lock brake system rotor is damaged, wheel speed sensor signals become abnormal, causing the anti-lock brake system to malfunction.**

■ **Adjustment: Starting torque of wheel hub bearing**

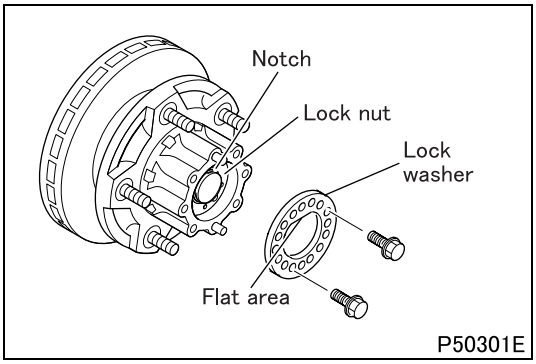
CAUTION ⚠

- **Unless this adjustment procedure is performed, the wheel bearing may seize.**

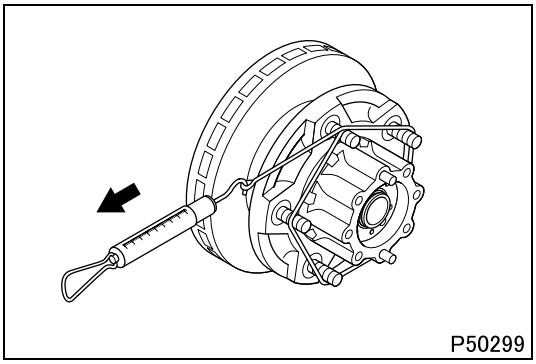


[Adjustment]

- Mount the lock plate.
- Tighten the lock nut to the specified torque (primary tightening) while turning the wheel hub and rotor, and then loosen it completely.
- Smooth operation of the outer bearing and inner bearing by turning the wheel hub and rotor several times, and then tighten the lock nut to the specified torque (secondary tightening).

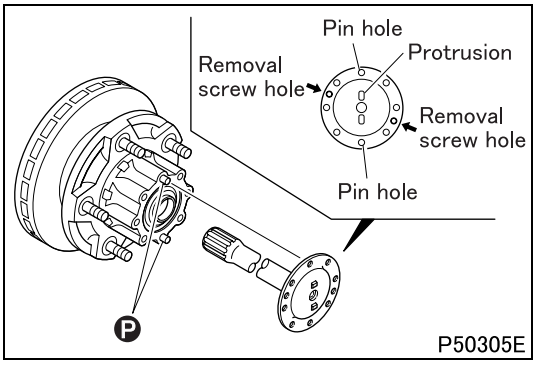


- Insert the flat area of the lock washer, aligning it with the notch of the axle housing, and mount two bolts diagonally to the lock nut.
- If the lock nut does not align with a screw hole of the lock washer, align by loosening the lock nut. Make sure that there is no play in the axial direction.



[Inspection]

- After installing the lock washer, carry out the following inspections.
- Measure the tangential force at the hub bolt position using a spring gauge.
- If the tangential force is within the specified value, the starting torque conforms to the standard value. If the measured value deviates from the specified value, repeat adjustment because the adjustment of the lock nut may be insufficient.
- If the result is found to be abnormal, replace the outer and inner bearings.

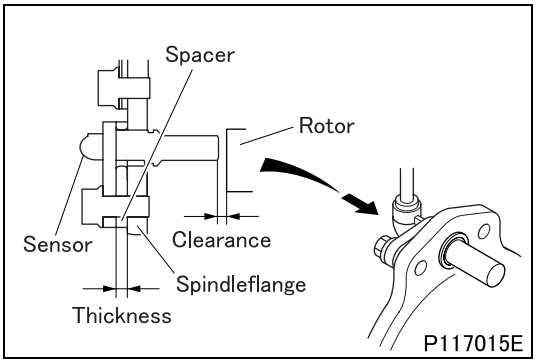


■ Installation: Axle shaft

- Align the pin hole of the locating pin with that of the axle shaft to install the axle shaft.

NOTE

- **A pin hole is not necessarily located at the position of a protrusion on the axle shaft flange face as illustrated. The second hole from a removal screw hole clockwise is a pin hole.**

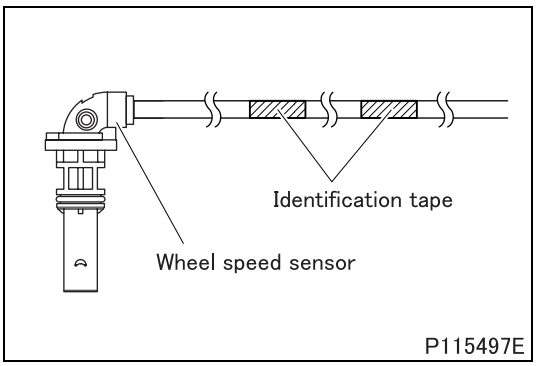


■ Installation: Wheel speed sensor

- Install the wheel speed sensor so that the sensor and spacer are firmly in contact with the holder.
  Spacer thickness: 9.5 mm {0.37 in.}

CAUTION ⚠

- **Be sure to install the specified spacer in the correct position. Using a spacer with an incorrect thickness or installing the spacer in an incorrect position could cause anti-lock brake system malfunction.**
- **When installing the wheel speed sensor, be careful not to damage the O-ring of the sensor.**
- **When installing the wheel speed sensor, never apply a force to it such as tapping it with a hammer, prying it with a screwdriver and pulling the harness, as doing so may damage the wiring.**



- After installing the wheel speed sensor, check that the clearance between the end of the sensor and the anti-lock brake system rotor is the following dimension:
  Clearance: 1 ± 0.7 mm {0.039 ± 0.028 in.}

- Using clips, secure the wheel speed sensor harness in place at the identification tape portions, ensuring that the harness is free of kinks, slack and/or interference with other parts.

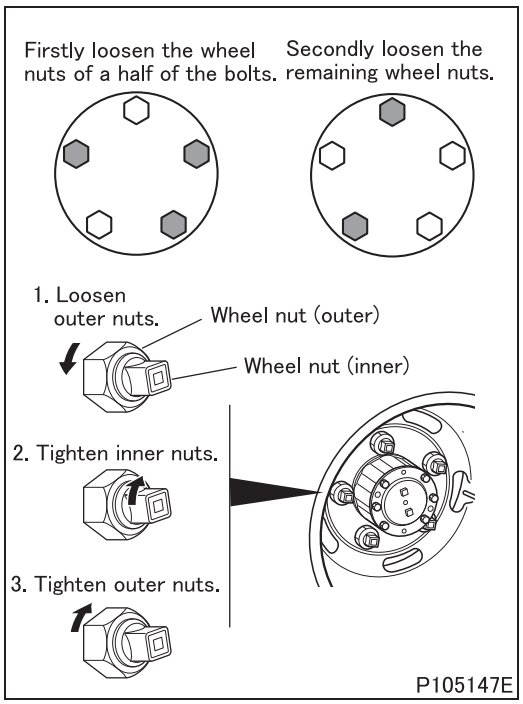
–	Wheel nut	490 ± 49 {360 ± 36, 50 ± 5}	–



(1) Single tire

- Tighten the wheel nuts to the specified torque using a torque wrench.
- If frequent loosening of tightened wheel nuts or other similar abnormalities are found, check the wheel nuts, hub bolts, and disc wheel for cracks or other damage which may cause the abnormal condition. (See “WHEEL AND TIRE.”)

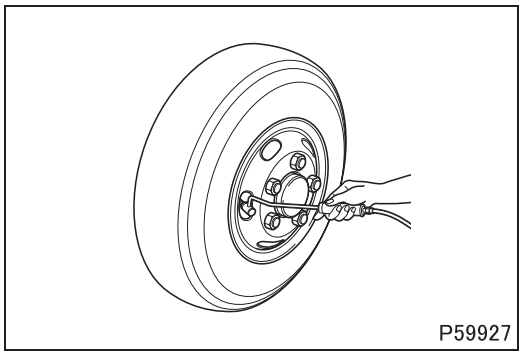
(2) Double tire

- Loosen outer wheel nuts of half of the wheel bolts (alternately) and then tighten the inner wheel nuts to the specified torque using a torque wrench. Only the 5-stud type wheel is shown in the drawing.
- Retighten the loosened outer wheel nut to the specified torque using a torque wrench.
- Follow the same procedure for the remaining outer wheel nuts and inner wheel nuts of half of the wheel bolts.
- If frequent loosening of tightened wheel nuts or other similar abnormalities are found, check the wheel nuts, hub bolts, and disc wheel for cracks or other damage which may cause the abnormal condition. (See “WHEEL AND TIRE.”)

2. Inspection of Tire

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Depth of tire tread grooves	–	1.6 {0.063}	Replace



P59927

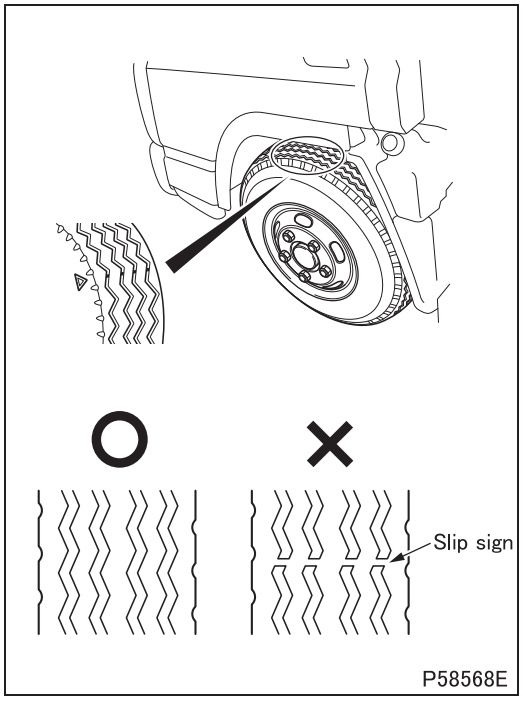
2.1 Air pressure

Tire air pressure should be checked before the vehicle is driven, while the tires are still cool.

Item / Vehicle model	Tire size	Air pressure kPa {psi, kgf/cm^2}
FEC5	LT215/85R16-10PR (load range E)	550 {80, 5.5}
FEC7 FEC9	215/75R17.5 124/123L (load range F)	690 {100, 7.0}
FG	LT235/85R16-10PR (load range E)	550 {80, 5.5}

CAUTION ⚠

- **Make certain that there is no difference in the air pressure between the inner and outer rear tires.**
- **Make certain you use valve caps on the air valves.**
- **It is not necessary to increase the air pressure for high-speed driving.**



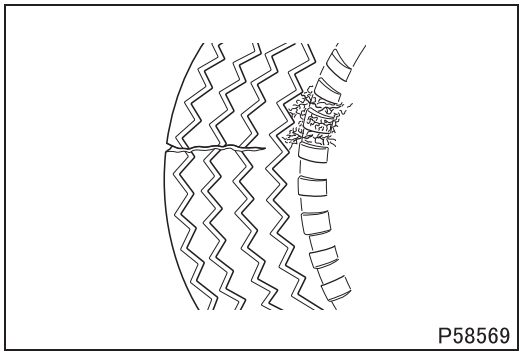
P58568E

2.2 Checking tread depth

- Check all around the tire treads to make sure that the depth of the tread grooves is above the wear limit.
- If the tread grooves are not deep enough, slip sign appears at the position of the ⧋ mark, where the tread groove has worn away.

WARNING ⚠

- **If the depth of the tread grooves is not adequate, the tires will slip on wet roads and present a hazard. Such tires are also extremely dangerous because they are more susceptible to hydroplaning when the vehicle is running at high speeds in the rain. Such tires must be replaced with new ones as soon as possible.**



P58569

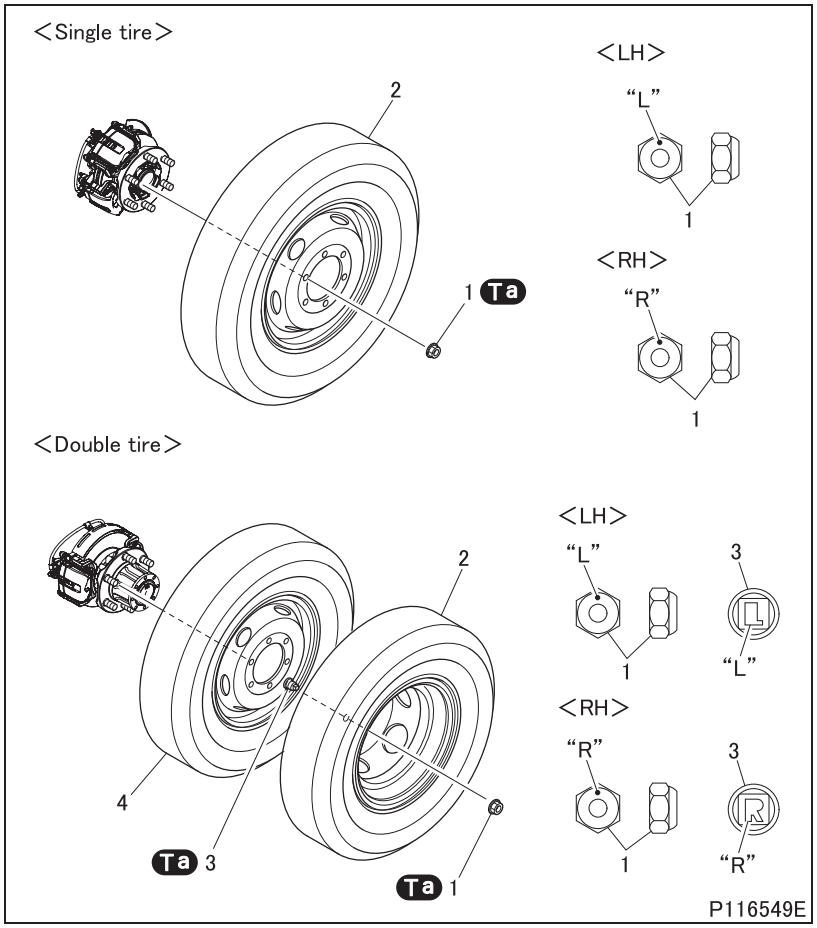
2.3 Checking for cracks, damage, and objects embedded in the treads

- Check the tire treads and walls for cracks and damage.
- Check tire treads for uneven wear or other abnormal wear.
- Check if metal objects or nails have penetrated the tires.
- Check for stones embedded between double tires.

WARNING ⚠

- **Badly damaged or worn tires are extremely dangerous, because they can be punctured more easily when the vehicle is running, they must be replaced with new ones as soon as possible.**

M E M O



CAUTION ⚠

- **Use right-hand threaded wheel nuts marked "R" for right side wheels and left-hand threaded wheel nuts marked "L" for left side wheels.**

●Removal sequence

1 Wheel nut <Single tire>
Wheel nut (outer) <Double tire>
2 Tire (See later section.)
3 Wheel nut (inner) <Double tire>
4 Tire <Double tire>
(See later section.)

●Installation sequence

Follow the removal sequence in reverse.

CAUTION ⚠

- **The wheel nuts are designed to be tightened without any coating of grease. Never grease the wheel nuts. Even if tightened to the specified torques, greased wheel nuts can loosen.**
- **Always use genuine replacement wheel nuts and tighten them to the specified torque to prevent damage to hub bolts and loosening of wheel nuts.**

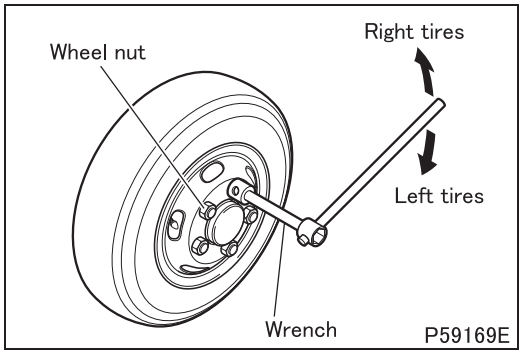
Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
2, 4	Tire lateral runout (sideway deflection)	3.5 {0.14} or less	–	Correct or replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Wheel nut	490 ± 49 {360 ± 36, 50 ± 5.0}	–

◆Removal procedure◆



■Removal: Tires

- Loosen wheel nuts slightly. The wheel nuts for right tires have right-hand threads “R”, and the wheel nuts for left tires have left-hand threads “L”.

WARNING ⚠

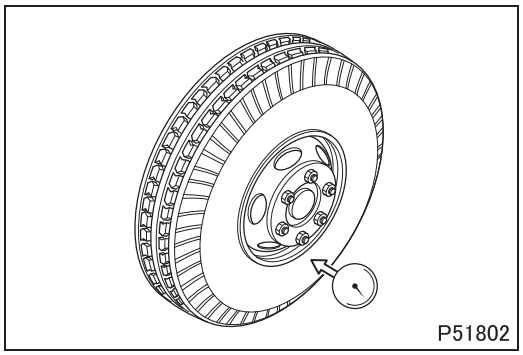
- **Make certain that wheel nut wrench is fully engaged, all the way to the back of nuts. If it is not, it could slip.**

CAUTION ⚠

- **Only loosen wheel nuts slightly. Do not remove them.**

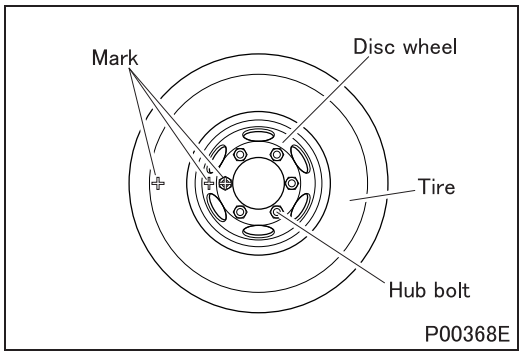
- Jack up the vehicle carefully, until the tire is slightly off the ground.
  Remove wheel nuts, then remove the tire.
- When working on the double tires at the rear of the vehicle, first remove the outside tire, then lower the vehicle and loosen the nuts on the inside tire. After doing this, jack the vehicle back up and remove the tire.

◆Inspection procedure◆



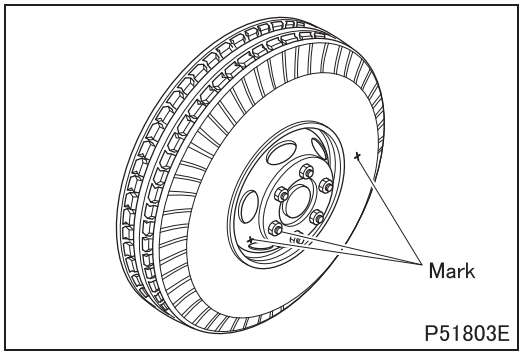
■Inspection: Tire

- Measure the tire for lateral runout (sideway deflection).
- If the measured value is equal to or exceeds the standard value, correct as follows.



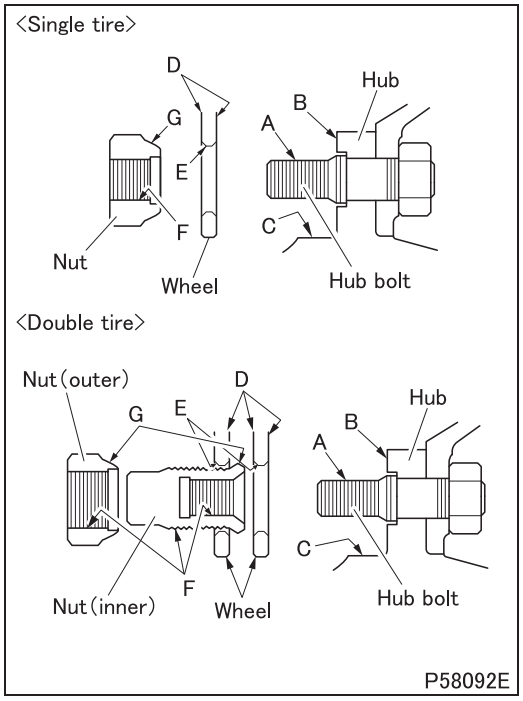
■Correction: Tire

- Mark the tire, disc wheel, and one of the hub bolts in the illustrated locations.
- Remove the tire from the disc wheel.



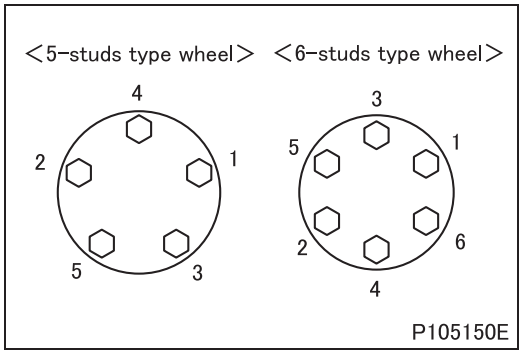
- Measure the disc wheel for lateral runout.
- If the disc wheel's maximum runout is located near the mark on the wheel, install the tire such that the mark on the tire is 180° away from the mark on the disc wheel.
- Measure the tire again for lateral runout.
- If the measured value still does not conform to the standard value, replace the tire.

◆Installation procedure◆



■ Installation: Tire

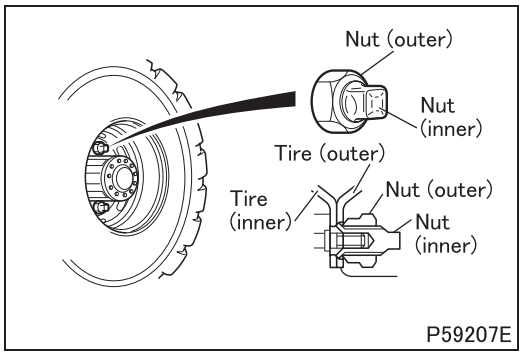
- To prevent hardware and parts from becoming loose and/or damaged, thoroughly clean the following areas, removing rust, dirt, paint and foreign material, before installing the tire.
  - A: Threaded portion of hub bolt
  - B: Wheel mounting surface of hub
  - C: Wheel alignment area of hub
  - D: Mating surfaces of disc wheel
  - E: Wheel nut mounting surface of disc wheel
  - F: Threaded portion of wheel nut
  - G: Spherical portion of wheel nut



- Install the wheel nuts by hand, tightening them as far as they go to ensure that they turn smoothly. If there is any abnormality such as a sticking point, replace the hub bolt. (See Gr26A, B and 27.)
- The wheel nuts should be tightened in the diagonal sequence in a few steps. Lastly, use a torque wrench to retighten them to the specified torque.
- When tightening the nuts with an impact wrench, be aware of tightening duration, compressed air pressure intensity, etc. to prevent overtightening and use a torque wrench to retighten them in the final step.

WARNING ⚠

- **Always use the specified torque when tightening the wheel nuts. If the wheel nuts are not tightened properly, the wheels could come loose while the vehicle is being driven, which could result in life threatening accidents or the truck being disabled.**



CAUTION ⚠

- **Over-tightening the wheel nuts can damage them.**

- Install the dual rear tires as follows:
  - After mounting inner tire and fully tightening inner wheel nuts, jack the vehicle up and mount on outer tire, then tighten outer wheel nuts.
  - Even if only outside tire is to be changed, do not mount it until inner wheel nuts have been fastened at the specified torque.
  - Slide the air valves on the inside and outside tires down when mounting the tires.

WARNING ⚠

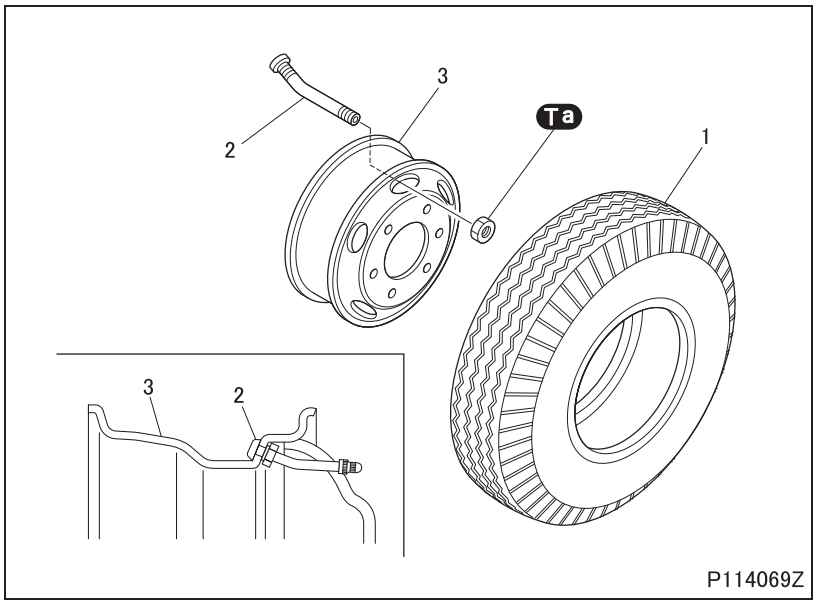
- **If the threads are scored, or the disc wheel is deformed or cracked, change bolts, nuts and disc. Driving the truck before correcting such problems can cause the tire in question to come loose, which could be the source of major accidents.**

CAUTION ⚠

- **Check hub bolt threads carefully for damage before putting the tire on.**

- Place the tapered end of wheel nuts towards the disc wheel and fasten temporarily. Center so that there is no eccentricity between bolts and the disc wheel bolt holes.
- Lower the vehicle.

Tire



●Disassembly sequence

1 Tire
2 Air valve
3 Disc wheel

●Assembly sequence

Follow the disassembly sequence in reverse.

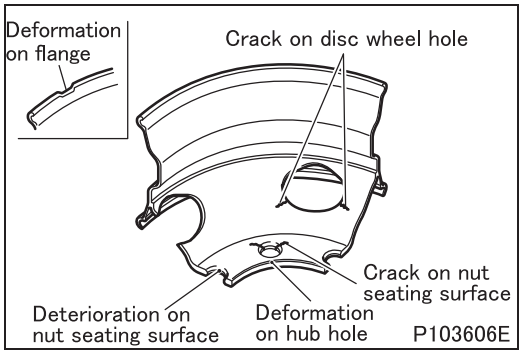
Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Tire assembly static unbalance tolerance		70 g {2.47 oz} or less	–	Correct
3	Disc wheel	Flatness (at hub surface)	0.4 {0.016} or less	–	Replace
		Lateral runout (sideway deflection)	1.5 {0.059} or less	–	
		Radial runout (vertical deflection)	1.5 {0.059} or less	–	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut	12.8 ± 1.4 {9.4 ± 1.0, 1.3 ± 0.14}	–

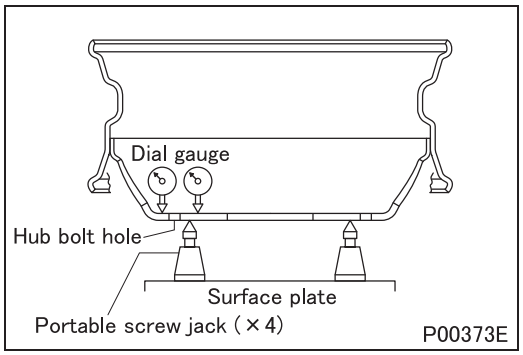
◆Inspection procedure◆



■ Inspection: Disc wheel

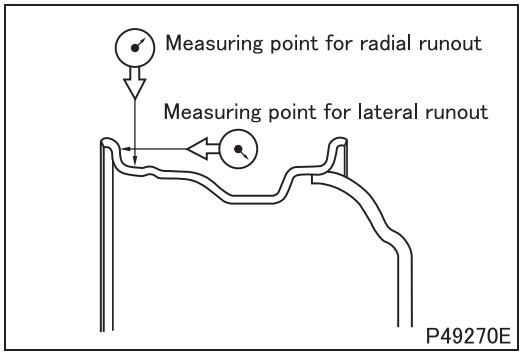
(1) Visual inspection

- Visually inspect the disc wheel for deformation, crack, deterioration, stepped wear on the wheel hub mounting surface. If any abnormality is found, replace the disc wheel with a new one.
- If any abnormality is found on the disc wheel, inspect the wheel hub. (See Gr26A, B and 27.)



(2) Flatness

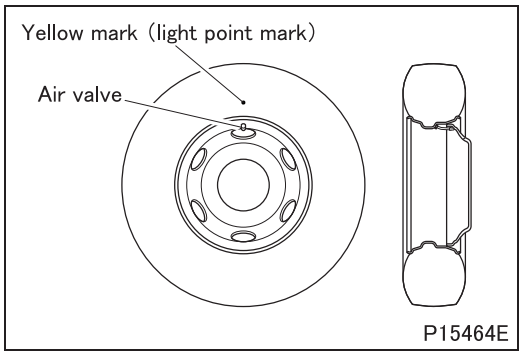
- Measure flatness around the inner and outer circumferences of hub bolt holes in the disc wheel.
- If the measured value is equal to or exceeds the standard value, replace the disc wheel.



(3) Runout

- If the measured value is equal to or exceeds the standard value, replace the disc wheel.

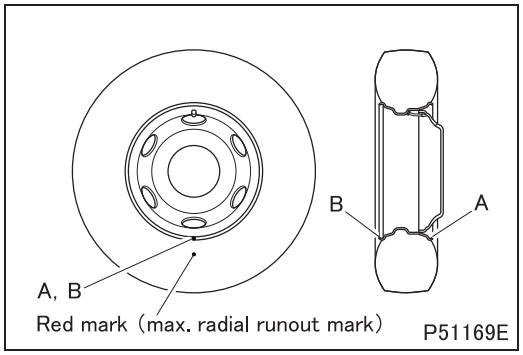
◆Installation procedure◆



■ Installation: Tire

<Tire with no red mark>

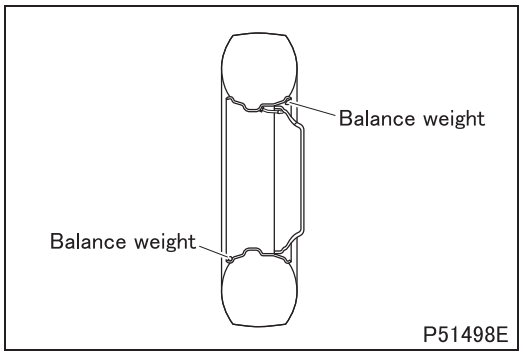
- Install the tire such that the yellow mark (light point mark) on the tire is aligned with the air valve on the disc wheel.



<Tire with red mark>

- Install the tire such that the red mark (max. radial runout mark) on the tire is aligned with mark A or B on the disc wheel.
  A: Front face of disc wheel <16-inch wheel>
  B: Back face of disc wheel <17.5-inch wheel>

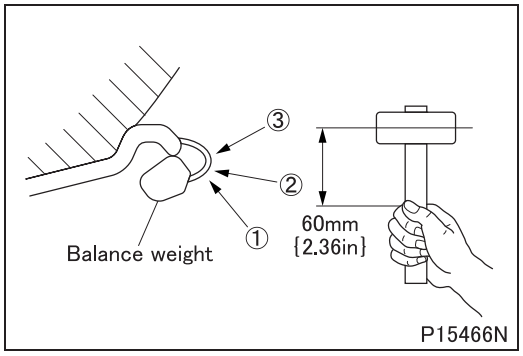
◆Installation procedure◆



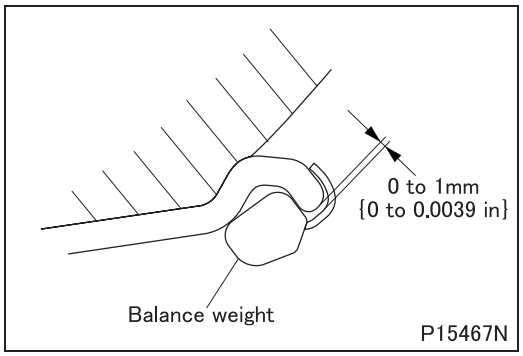
■ Installation: Balance weight

- Install balance weights onto the front and back sides of the disc of the tires listed in the table below. Ensure that the static unbalance of the tire being balanced remains within the standard value.

Tires being balanced	Vehicle model
Tires on front axle	FE
Tires on front axle, tires on rear axle	FG



- Use a 1-pound plastic resin hammer to drive balance weights into position.
- To install a balance weight, tap the clip of the weight in the center at 1, 2 and 3 in that order.



- Leave a clearance of approx. 0 to 1 mm {0 to 0.039 in.} between the clip and the disc wheel. Ensure that the balance weight is not loose after installation.
- Do not use a balance weight that has been improperly tapped or dropped to the floor during installation attempt.
- When 2 weights are being installed, these weights should be as much equal to each other as possible in weight. Also remember that the center point between the weights will become the support point for a balancer.

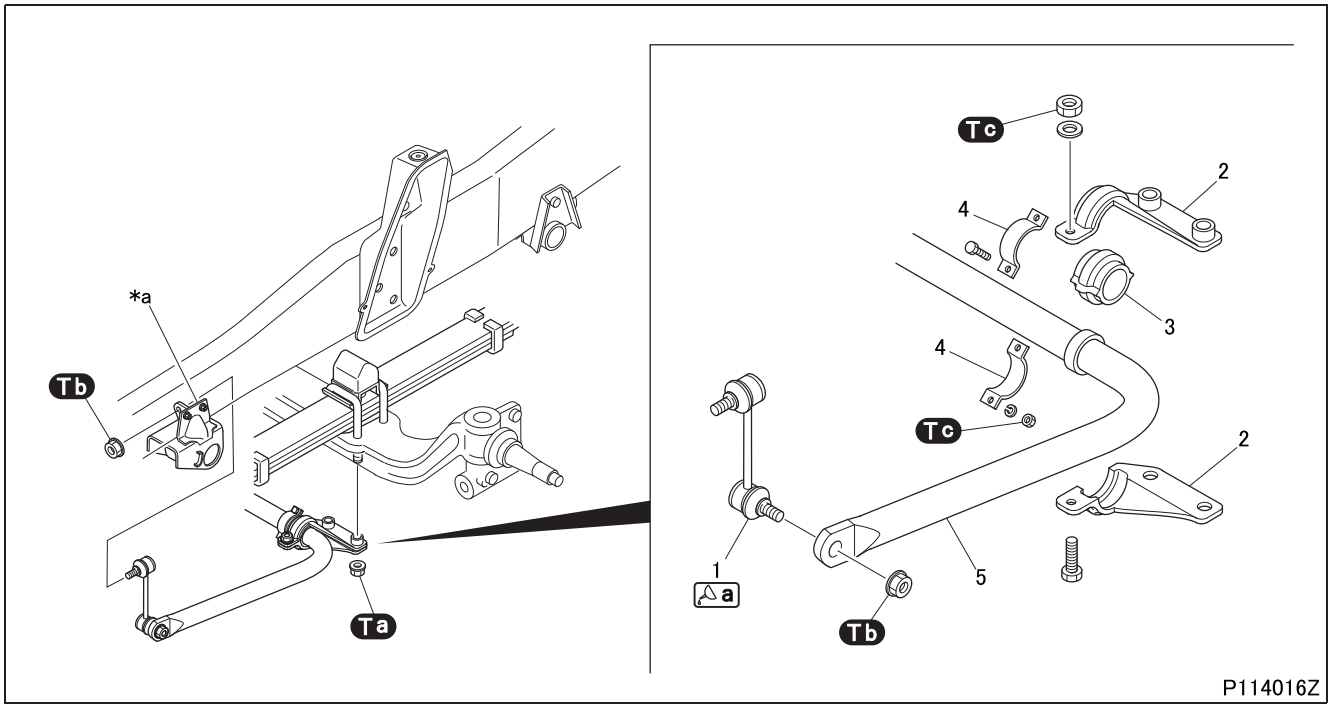
STABILIZER <FE>



● **Removal sequence**

1 Stabilizer link
2 Stabilizer clamp
3 Stabilizer bushing
4 Stabilizer retainer
5 Stabilizer bar

***a**: Front spring hanger

● **Installation sequence**

Follow the removal sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
1	Stabilizer link	Starting torque	0.68 to 1.96 N·m {0.5 to 1.4 ft.lbs, 0.07 to 0.2 kgf·m}	0.5 N·m {0.4 ft.lbs, 0.05 kgf·m}	Replace
		Play	0 to 0.1 {0 to 0.0039}	0.2 {0.0079}	

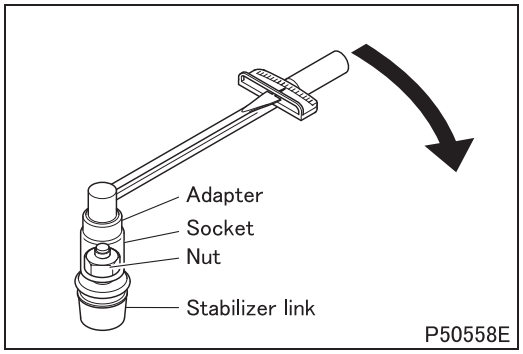
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (U-bolt mounting)	162 ± 15 {120 ± 11, 16.5 ± 1.5}	–
Tb	Nut (stabilizer mounting)	90 to 120 {66 to 89, 9.0 to 12}	–
	Nut (stabilizer link mounting)		
Tc	Nut (stabilizer clamp mounting)	35 to 55 {26 to 41, 3.5 to 5.5}	–
	Nut (stabilizer retainer mounting)		

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Dust cover lips on stabilizer link	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

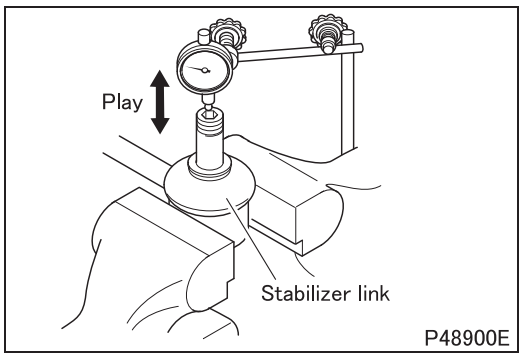
◆Inspection procedure◆



■ **Inspection: Stabilizer link**

(1) Starting torque

- Install a nut onto the stabilizer link.
- Install a socket, an adapter and a torque wrench onto the nut. Measure the starting torque of the stabilizer link.
- If the measured value does not conform to the standard value, replace the stabilizer link.



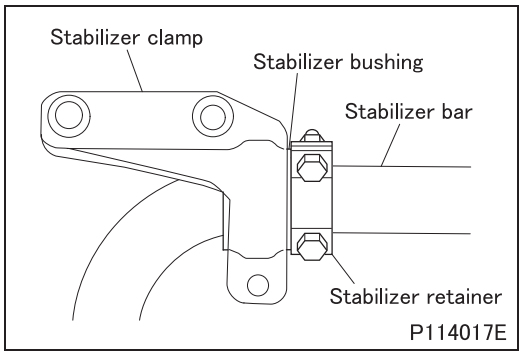
(2) Play

- If the measured value does not conform to the standard value, replace the stabilizer link.

(3) Dust cover

- Check the dust cover for wear, cracks, and damage. These abnormalities can cause water to enter the ball joint, resulting in premature wear.
- If any abnormality is found, replace the stabilizer link.

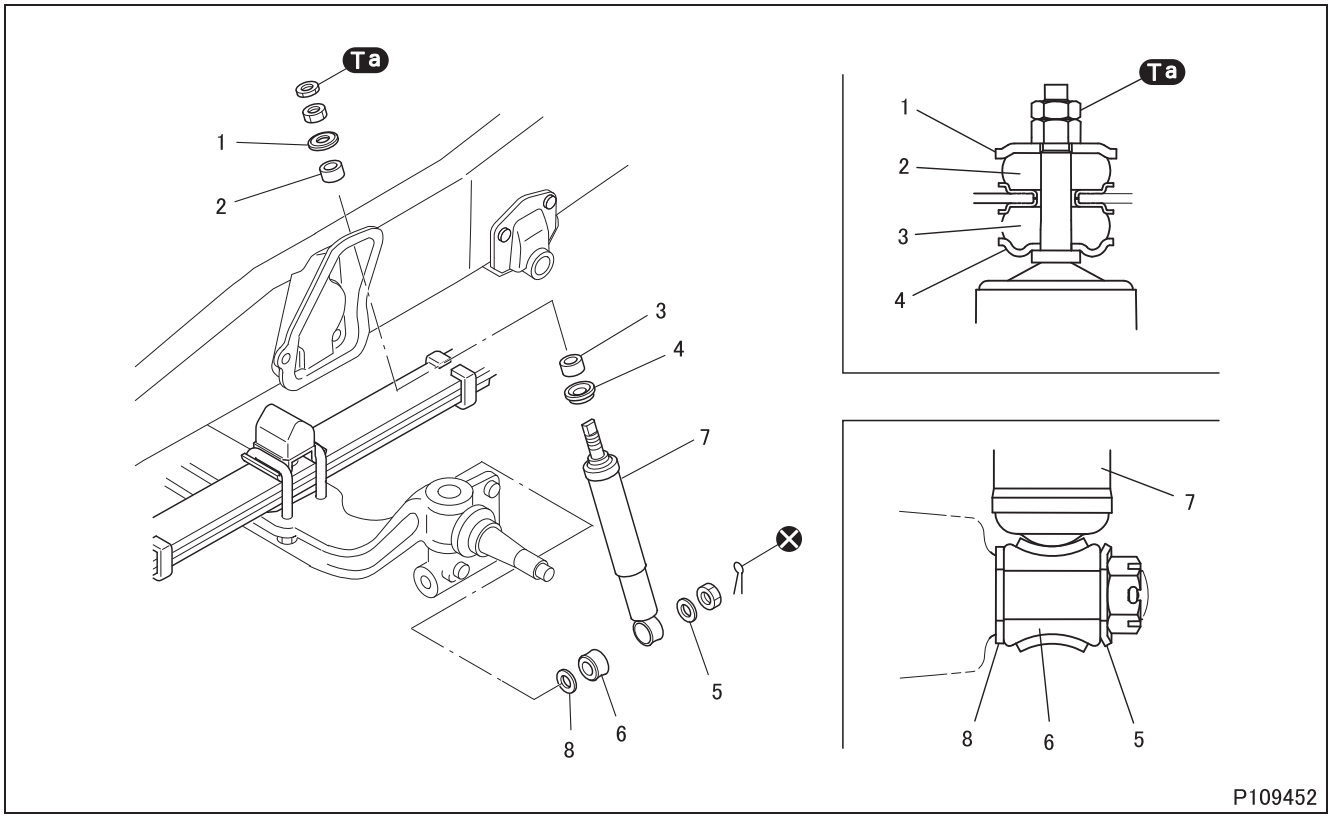
◆Installation procedure◆



■ **Installation: Stabilizer clamp and bushing**

- Install the stabilizer bushing so that its end surface is aligned with the stabilizer retainer and clamp them in place with the stabilizer clamp.

SHOCK ABSORBER <FE>



●Removal sequence

1 Washer

2 Front axle bumper
3 Spring pin
4 Rubber bushing
5 Rubber bushing
6 Shackle plate
7 Spring shackle
8 Rubber bushing
9 Rubber bushing
10 Rubber bushing
11 Rubber bushing
12 Leaf spring (See later section.)

***a**: Front spring hanger

●Installation sequence

Follow the removal sequence in reverse.

CAUTION ⚠

- **Make sure to jack the vehicle up when tightening the U-bolt mounting nut to specified torque.**
- **Make sure to install the U-bolt mounting nuts dry. Never put oil or solvent on the nuts.**

NOTE

- **The right-hand and left-hand leaf spring assemblies have different cambers from each other. Ensure that both assemblies are installed correctly. Reversed installation results in a slanted vehicle.**

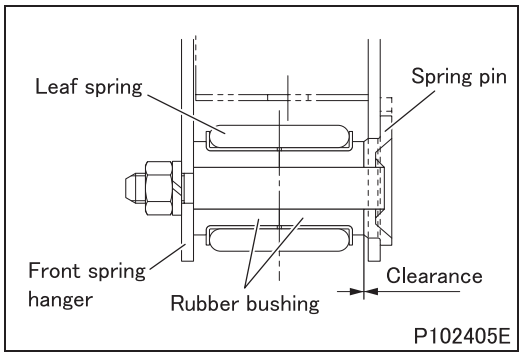
Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
3 to 5	Radial clearance between spring pin and rubber bushings	0 to 0.04 {0 to 0.0016}	0.5 {0.020}	Replace
3 to 5, *a	Axial clearance between spring pin, rubber bushings and front spring hanger	0 {0}	0.5 {0.020}	Replace
6 to 11	Axial clearance between shackle plate, spring shackle and rubber bushings	0 {0}	0.5 {0.020}	Replace
7 to 11	Radial clearance between spring shackle and rubber bushings	0 to 0.04 {0 to 0.0016}	0.5 {0.020}	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

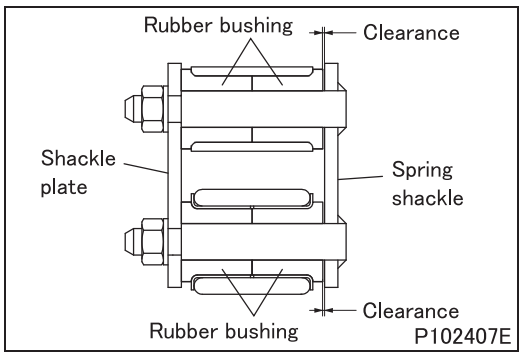
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (U-bolt mounting)	162 ± 15 {119 ± 11, 16.5 ± 1.5}	–
Tb	Nut (spring pin mounting)	93 to 127 {69 to 94, 9.5 to 13.0}	–
	Nut (spring shackle mounting)		–

◆Work before removal◆



■ **Inspection: Axial clearance between spring pin, rubber bushings and front spring hanger**

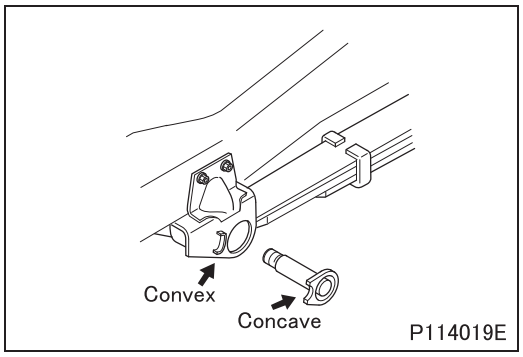
- Measure the indicated clearances using a feeler gauge.
- If the measurement exceeds the limit, replace the rubber bushing.



■ **Inspection: Axial clearance between shackle plate, spring shackle and rubber bushings**

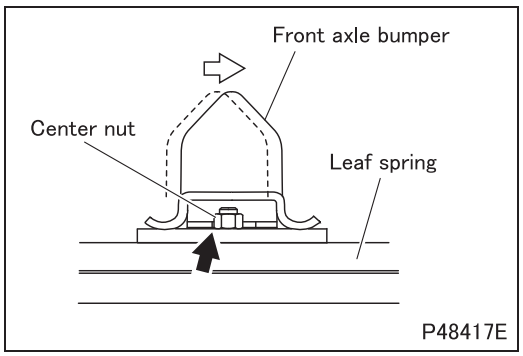
- Measure the indicated clearances using a feeler gauge.
- If the measurement exceeds the limit, replace the rubber bushing.

◆Installation procedure◆



■ **Installation: Spring pin**

- Install the spring pin so that the concave side of the pin engages with the convex on the frame.

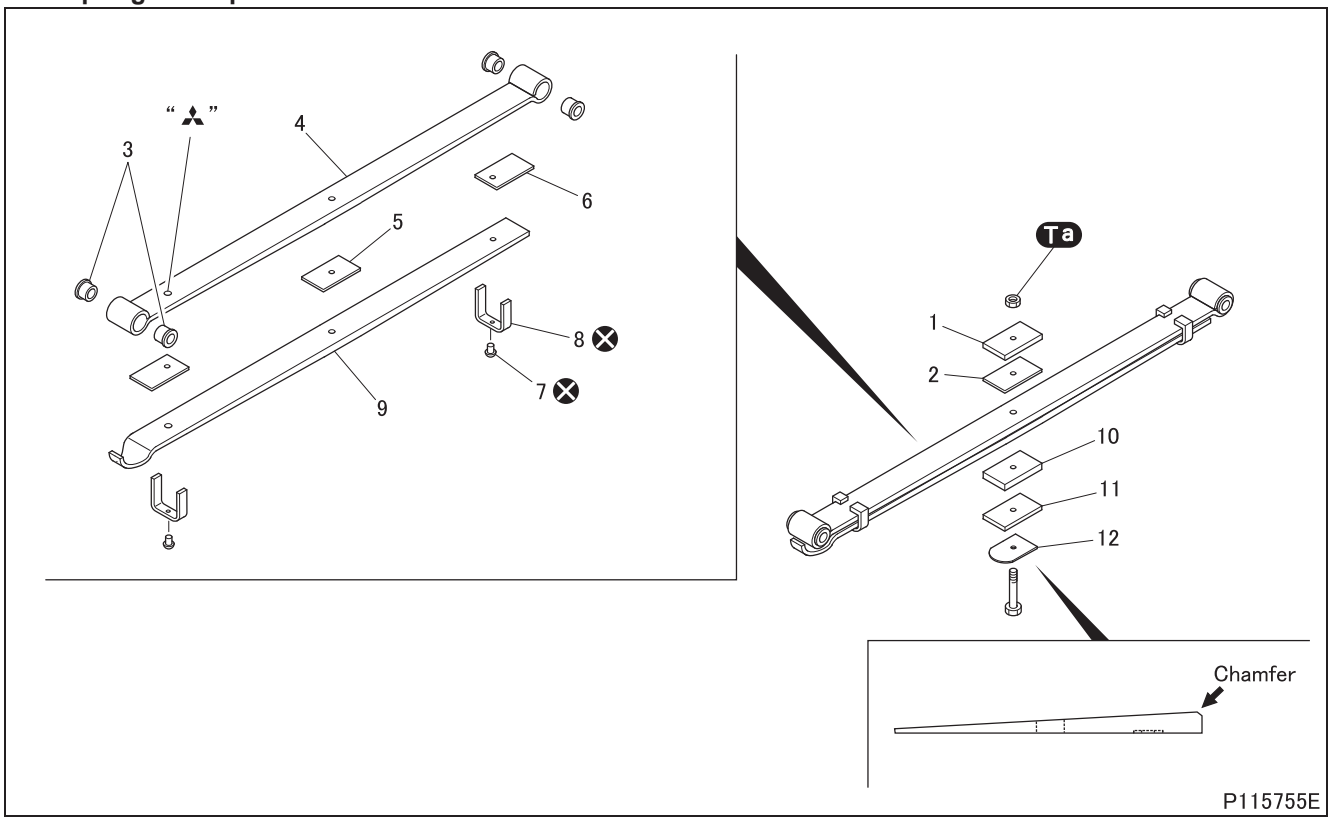


■ **Installation: Front axle bumper**

- With the vehicle unloaded, slide the front axle bumper on the leaf spring to the rear of the vehicle until it is against the center nut of the leaf spring. Then, install the bumper using U-bolts.

LEAF SPRING <FE>

Leaf Spring <Except Crew Cab>



●Disassembly sequence

1 Spacer (thickness: 8 mm {0.31 in.})

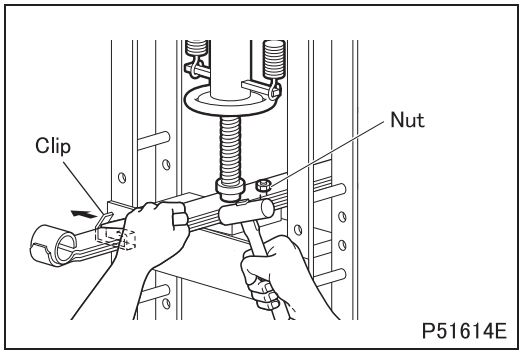
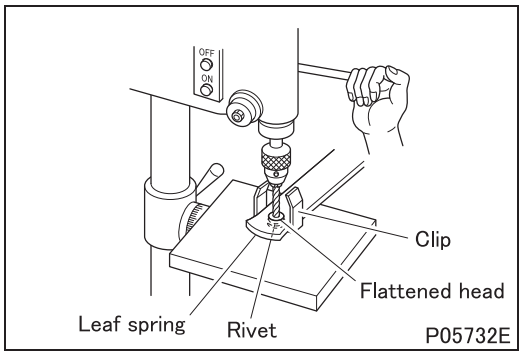
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (assembly of leaf spring)	35 to 52 {26 to 38, 3.5 to 5.5}	–

◆Removal procedure◆



■ **Compression: Leaf spring**

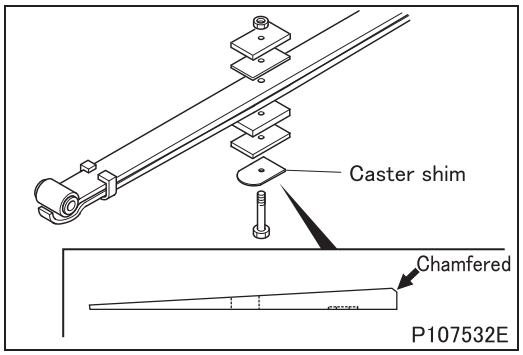
- Using a press, compress the leaf spring as illustrated for subsequent operations.
- Using a chisel or equivalent, open the ends of the clip.



■ **Removal: Clip**

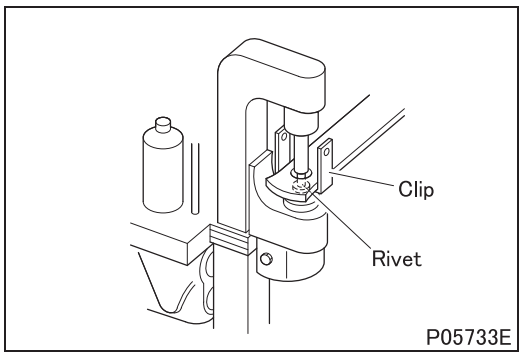
- Using a drill press, break the flattened head of the rivet and remove the clip from the leaf spring (No. 2).

◆Installation procedure◆



■ **Installation: Caster shim**

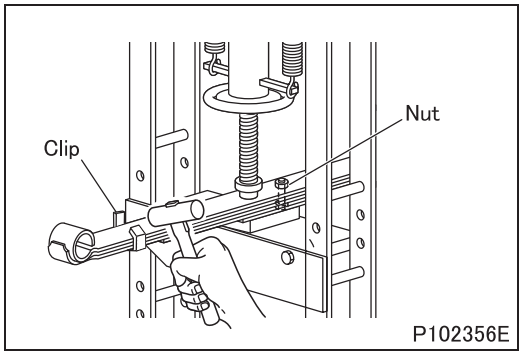
- Install the caster shim with the chamfered (or rounded) portion facing upward in order not to damage the seat and spring.



■ **Installation: Clip**

- Using a riveting machine, rivet a clip onto the leaf spring.

LEAF SPRING <FE>



■ **Installation: Leaf spring**

- Temporarily tighten the leaf spring with the bolt.
- Compress the leaf spring using a press and tighten the nut to the specified torque.
- After installing the nut, bend the clip with a hammer.
