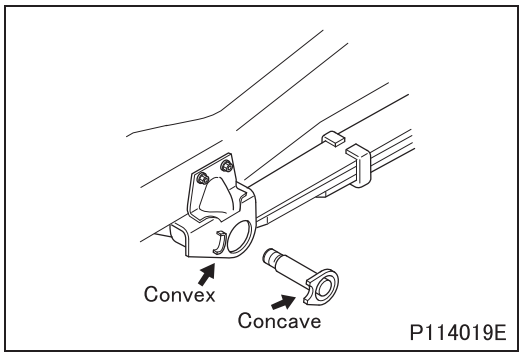
- Measure the indicated clearances using a feeler gauge.
- If the measurement exceeds the limit, replace the rubber bushing.

◆Installation procedure◆



■ **Installation: Spring pin**

- Install the spring pin so that the concave side of the pin engages with the convex on the frame.

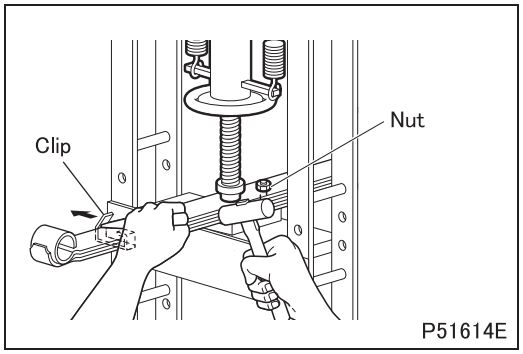
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

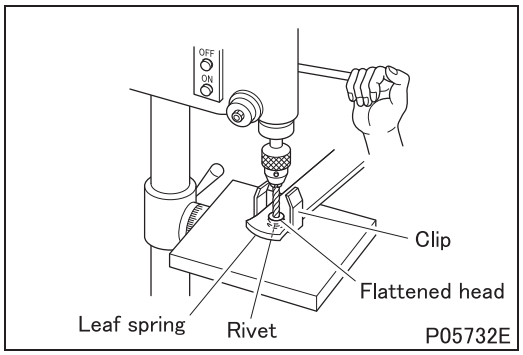
Location	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (assembly of leaf spring)	35 to 52 {26 to 38, 3.5 to 5.5}	–

◆Removal procedure◆



■ **Compression: Leaf spring**

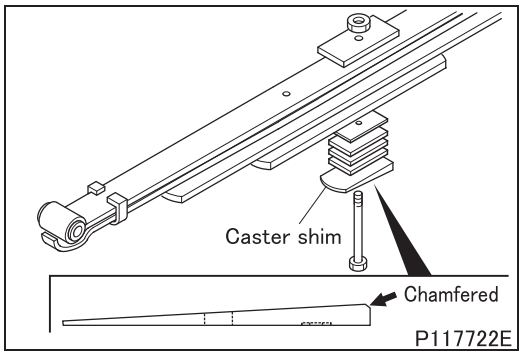
- Using a press, compress the leaf spring as illustrated for subsequent operations.
- Using a chisel or equivalent, open the ends of the clip.



■ **Removal: Clip**

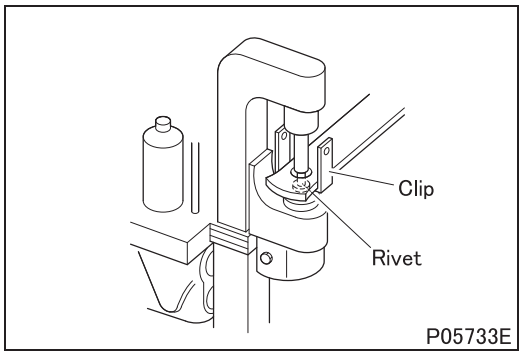
- Using a drill press, break the flattened head of the rivet and remove the clip from the leaf spring (No. 3 or 4).

◆Installation procedure◆



■ **Installation: Caster shim**

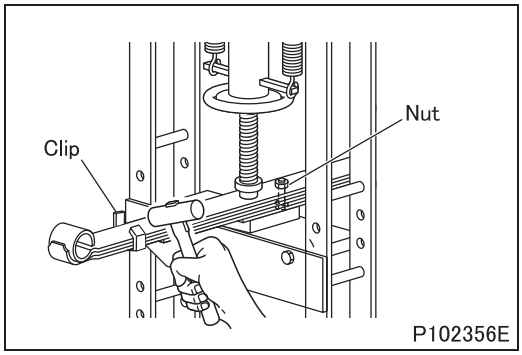
- Install the caster shim with the chamfered (or rounded) portion facing upward in order not to damage the seat and spring.



■ **Installation: Clip**

- Using a riveting machine, rivet a clip onto the leaf spring.

LEAF SPRING <FG>



■ **Installation: Leaf spring**

- Temporarily tighten the leaf spring with the bolt.
- Compress the leaf spring using a press and tighten the nut to the specified torque.
- After installing the nut, bend the clip with a hammer.

Pub.No.00ELT0059-33

INDEX

STRUCTURE AND OPERATION

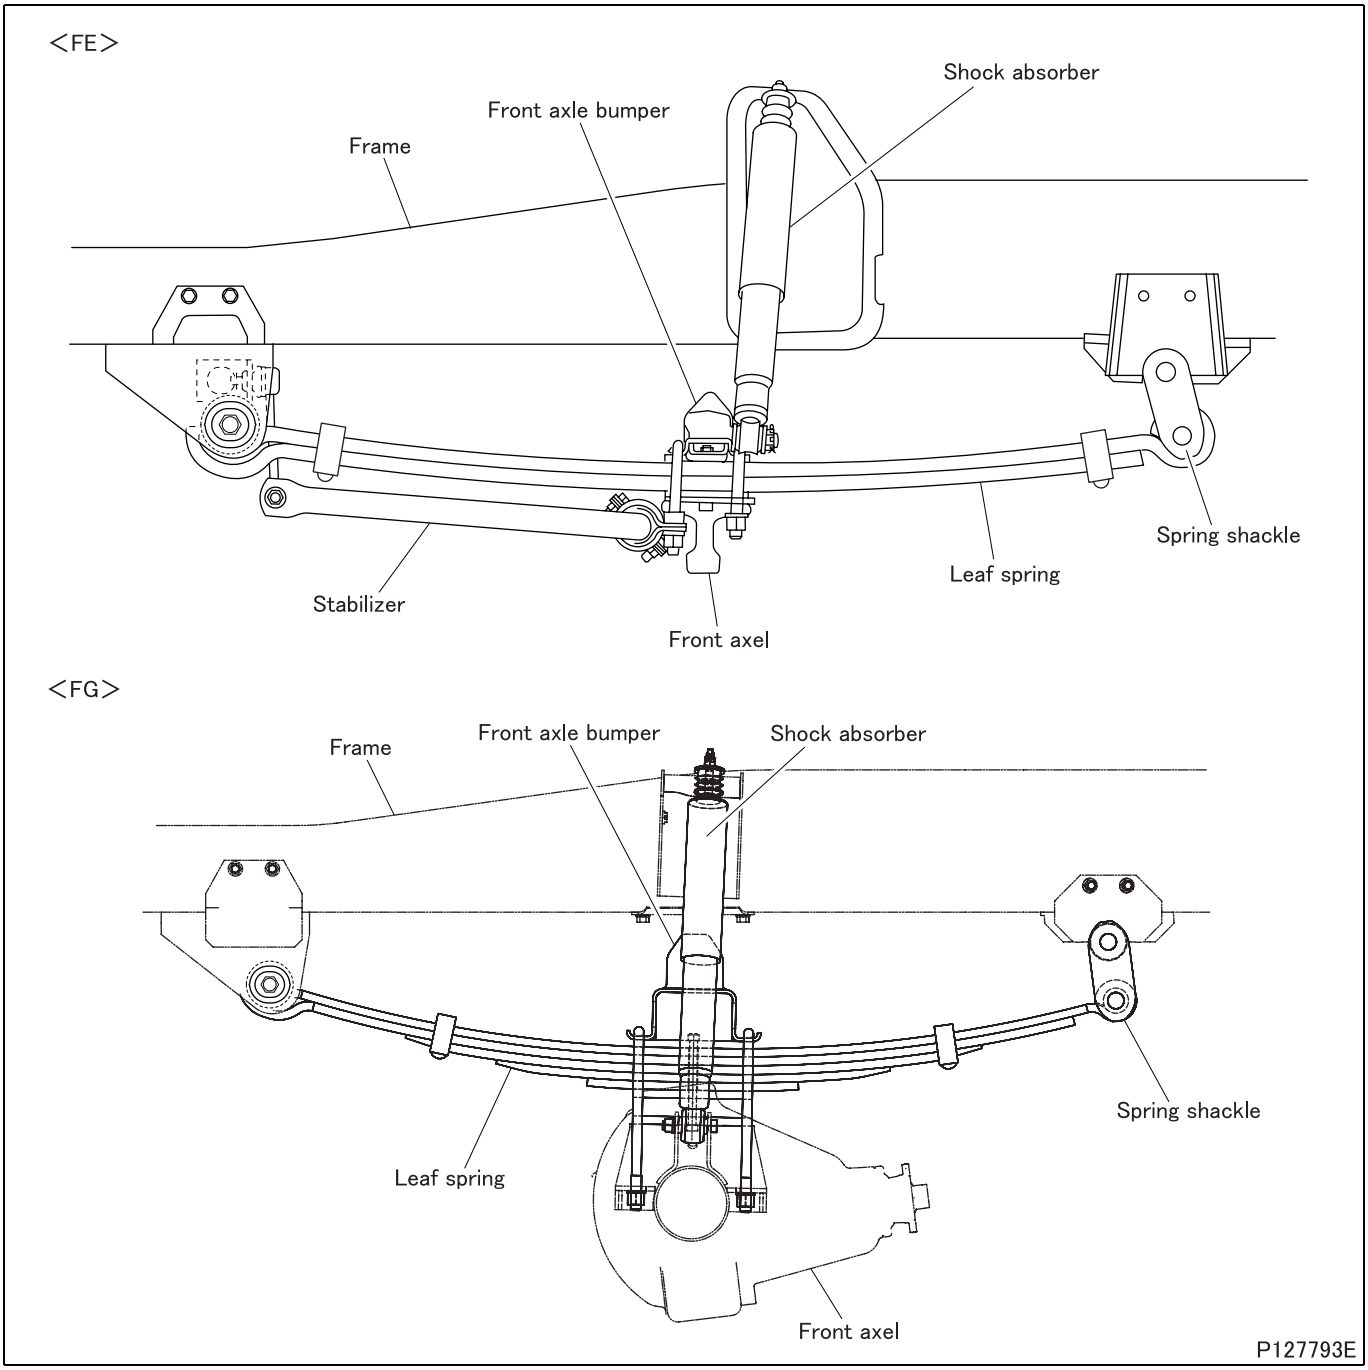
1. Front Suspension Elements 33-2

LEAF SPRING

<FE> 33-4

<FG> 33-12

1. Front Suspension Elements



- The front suspensions shown above both use a spring shackle connected to the rear end of the leaf spring (shackle-link type suspension).
- The stabilizer prevents the vehicle from pitching, keeping it parallel with the ground. <FE>

◆Work before removal◆

■ **Inspection: Clearance between spring shackle and each part**

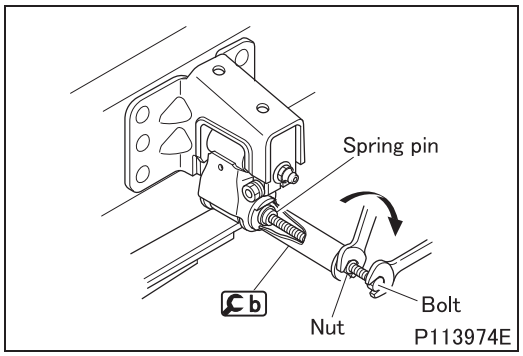
- Measure the clearance using feeler gauge.
- If the measurement exceeds the limit, replace defective parts.

(1) Axial clearance between spring shackle and rear shackle hanger

(2) Axial clearance between spring shackle and leaf spring

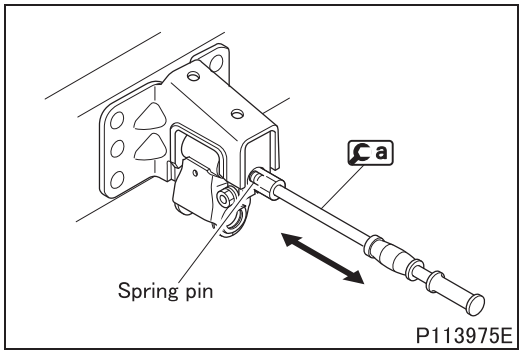
LEAF SPRING

◆Removal procedure◆



■ **Removal: Spring pin**

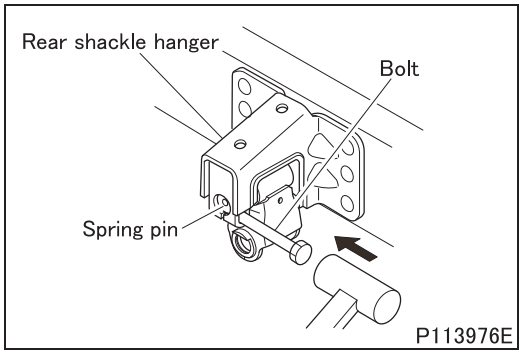
- Install the bolt of b in the grease nipple fitting hole.
- Hold the bolt of b, and extract the spring pin while screwing in the nut.



■ **Removal: Spring pin**

- Attach a to the grease nipple fitting hole in the spring pin, and remove the spring pin while hitting it with the slide hammer part of a.

◆Installation procedure◆



■ **Installation: Spring pin**

- Using proper bolt, align the bolt hole in the shackle hanger with the bolt groove in the spring pin.

CAUTION ⚠

- **Do not use the spring pin mounting bolt for this purpose.**

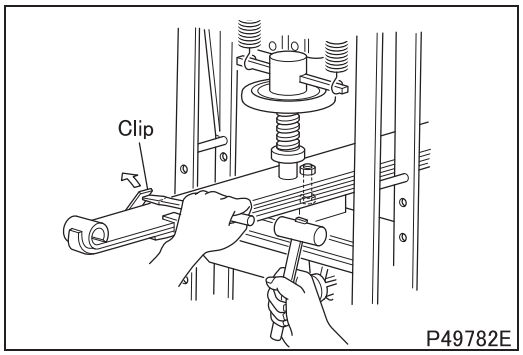
◆Work before removal◆

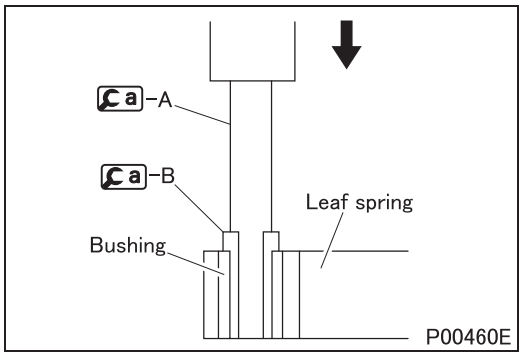


P49782E

■ **Compression: Leaf spring**

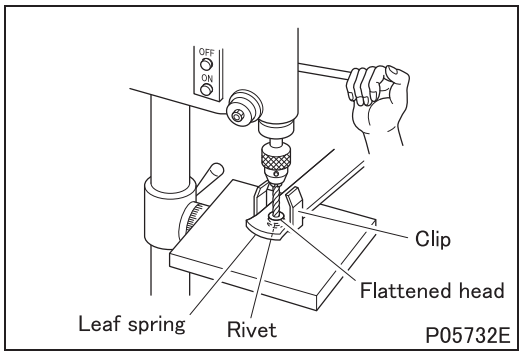
- Using a press, compress the leaf spring as illustrated for subsequent operations.
- Using a chisel or equivalent, open the ends of the clip.

◆Removal procedure◆



P00460E

■ **Removal: Metal bushing**

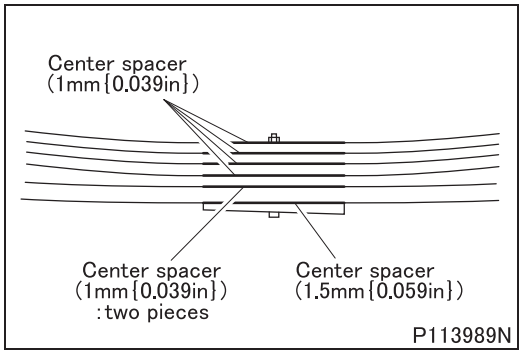


P05732E

■ **Removal: Clip**

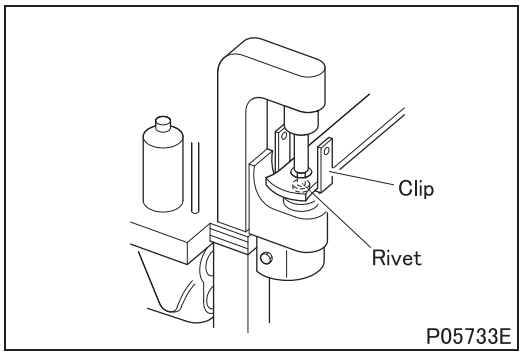
- Using a drill press, break the flattened head of the rivet and remove the clip from the leaf spring.

◆Installation procedure◆



■ Installation: Center spacer

- The center spacers are of two types that are different in thickness. They should be installed in the correct locations as shown in the illustration.

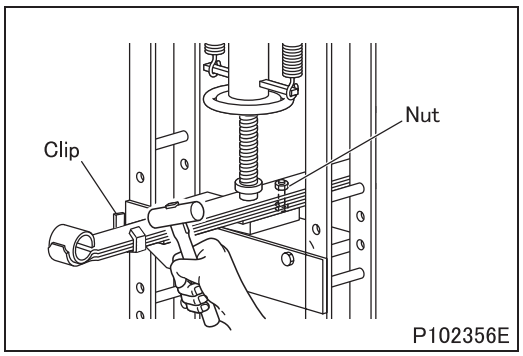


■ Installation: Clip

- Using a riveting machine, rivet a clip onto the leaf spring.

■ Installation: Metal bushing

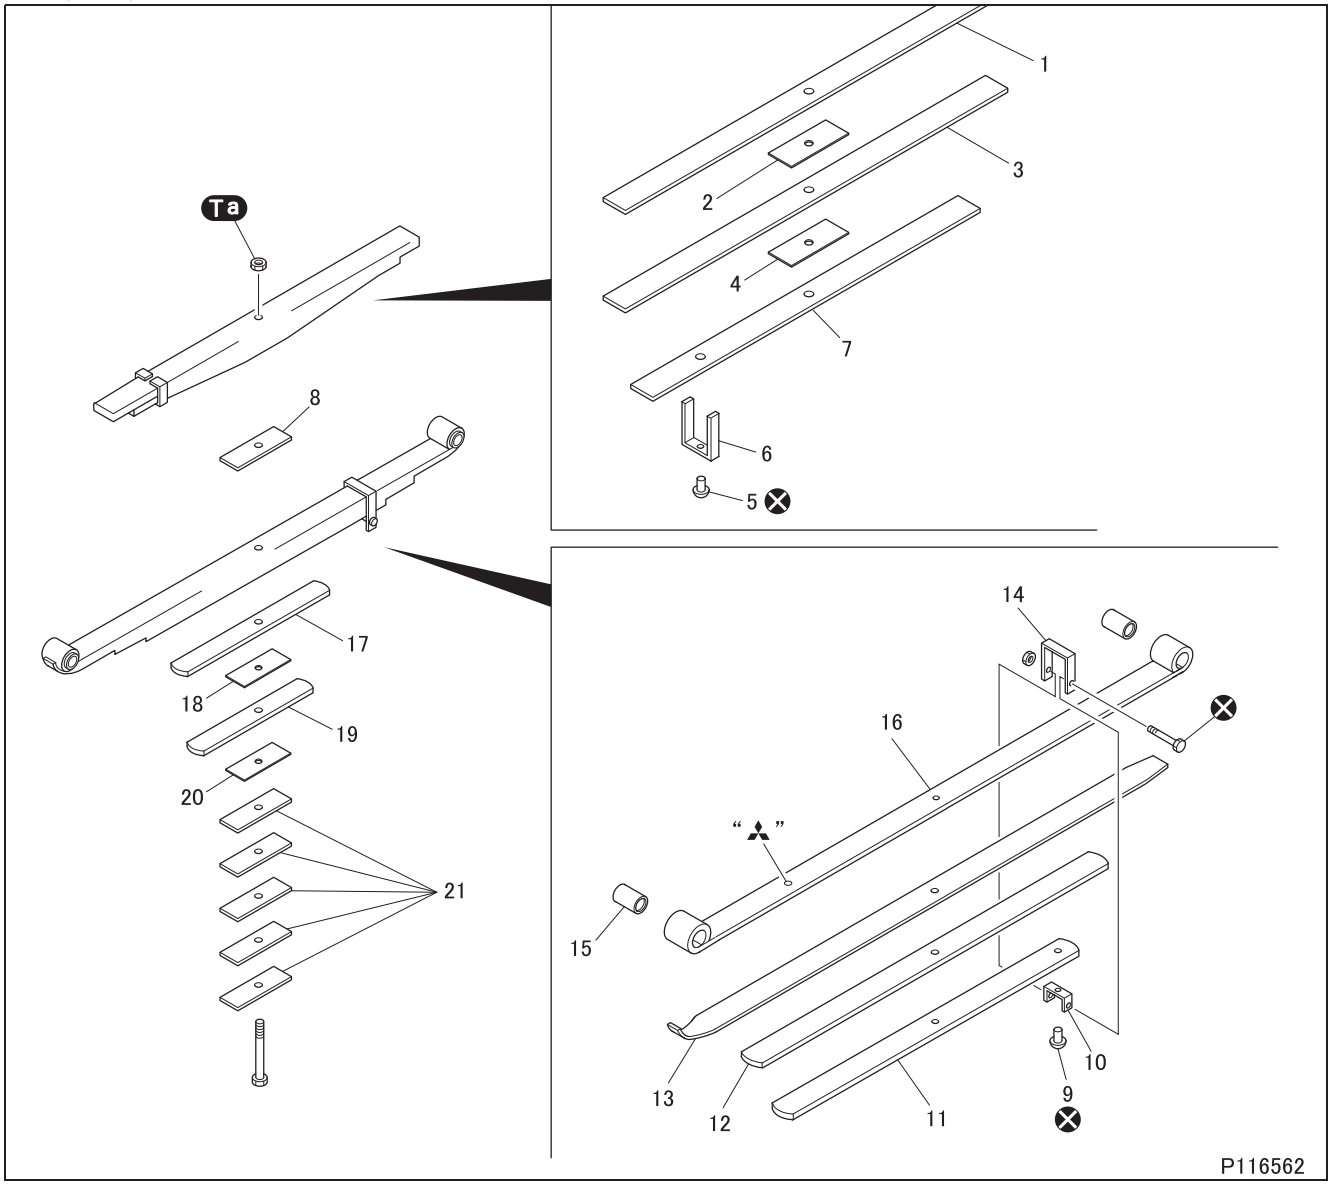
- Install the metal bushing in a manner similar to that of removal. (See **"■Removal: Metal bushing"**.)



■ Installation: Leaf spring

- Temporarily tighten the leaf spring with the bolt.
- Compress the leaf spring using press and tighten the nut to the specified torque.
- Bend the clip with a hammer.

<FE7, FE9, FG>



- The above schematic is only an example. Details may differ depending on vehicle models, such as the number of spring leaves, spacers, and the parts used.

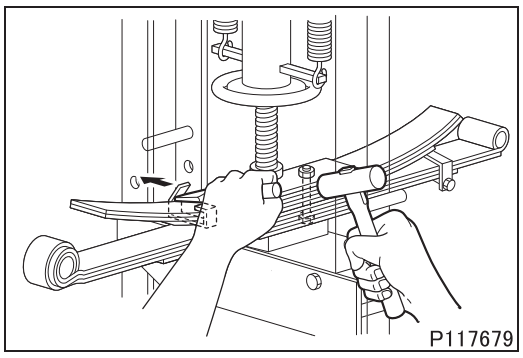
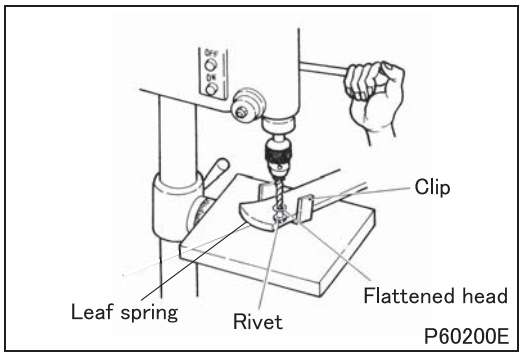
◆Work before removal◆



■ Compression: Leaf spring

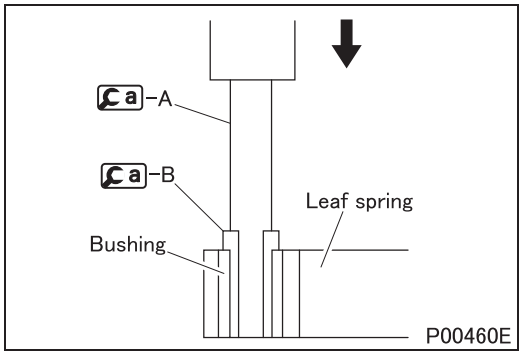
- Using a press, compress the leaf spring as illustrated for subsequent operations.
- Using a chisel or equivalent, open the ends of the clip. <Bent type>

◆Removal procedure◆



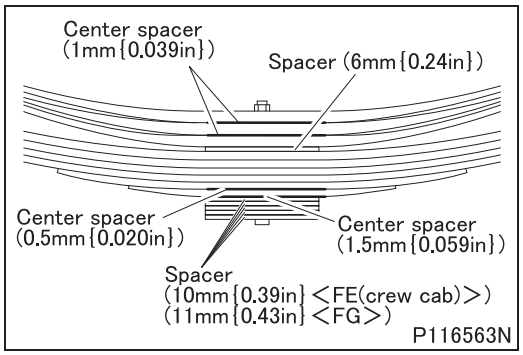
■ Removal: Clip

- Using a drill press, break the flattened head of the rivet and remove the clip from the leaf spring.



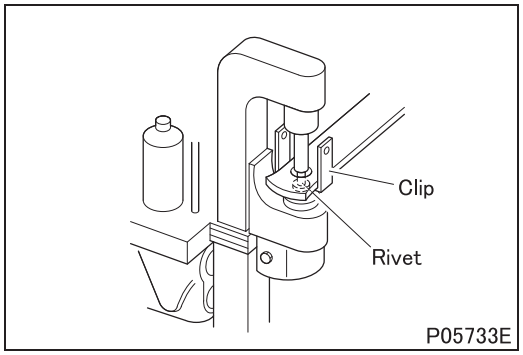
■ **Removal: Metal bushing**

◆Installation procedure◆



■ **Installation: Center spacer**

- The center spacers are of three types that are different in thickness. They should be installed in the correct locations as shown in the illustration.
- The spacers are of two types that are different in thickness. They should be installed in the correct locations as shown in the illustration.

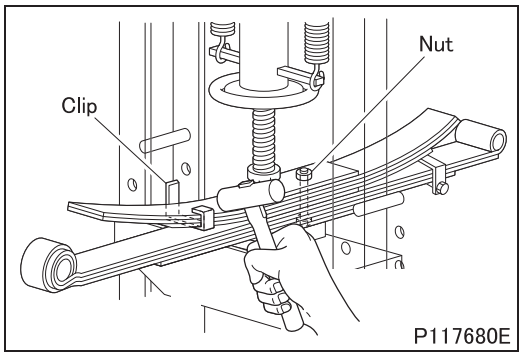


■ **Installation: Clip**

- Using a riveting machine, rivet a clip onto the leaf spring.

■ **Installation: Metal bushing**

- Install the metal bushing in a manner similar to that for removal. (See **"■Removal: Metal bushing"**.)



■ **Installation: Leaf spring**

- Temporarily tighten the leaf spring with the bolt.
- Compress the leaf spring using press and tighten the nut to the specified torque.
- Bend the clip with a hammer.

SPECIFICATIONS

Vacuum Booster and Brake Master Cylinder

Item				Specifications
Vacuum booster	Boosting type			Vacuum type
	Diaphragm diameter		inch	ϕ10.5
	Manufacturer			Bosch
Brake master cylinder	Inner diameter		mm {in.}	ϕ25.4 {1.00}
	Stroke	Front	mm {in.}	25 {0.98}
		Rear	mm {in.}	25 {0.98}
	Manufacturer			Bosch

Front Disc Brake

Item		Specifications	
		FEC52	FEC72, FEC92
Brake type		Twin caliper type	
Effective diameter for braking	mm {in.}	ϕ235 {9.25}	ϕ252 {9.92}
Disc rotor outer diameter × thickness	mm {in.}	ϕ293 × 40 {11.5 × 1.57}	ϕ310 × 40 {12.2 × 1.57}
Caliper piston inner diameter	mm {in.}	ϕ51.1 {2.01}	ϕ54 {2.13}
Thickness of pad	mm {in.}	14 {0.55}	14 {0.55}

Front Drum Brake

Item		Specifications
		FG
Brake type		2-leading type (with auto adjuster)
Wheel cylinder inner diameter	mm {in.}	ϕ31.75 {1.25}
Brake drum inner diameter	mm {in.}	ϕ320 {12.6}
Brake lining width × thickness	mm {in.}	75 × 8.8 {2.95 × 0.35}

Rear Disc Brake

Item		Specifications	
		FEC52	FEC72, FEC92
Brake type		Twin caliper type	
Effective diameter for braking	mm {in.}	ϕ235 {9.25}	ϕ252 {9.92}
Disc rotor outer diameter × thickness	mm {in.}	ϕ293 × 40 {11.5 × 1.57}	ϕ310 × 40 {12.2 × 1.57}
Caliper piston inner diameter	mm {in.}	ϕ51.1 {2.01}	ϕ54 {2.13}
Thickness of pad	mm {in.}	14 {0.55}	14 {0.55}

Rear Drum Brake

Item		Specifications
		FG
Brake type		Dual 2-leading type (with auto adjuster)
Wheel cylinder inner diameter	mm {in.}	ϕ31.75 {1.25}
Brake drum inner diameter	mm {in.}	ϕ320 {12.6}
Brake lining width × thickness	mm {in.}	110 × 10.4 {4.33 × 0.41}

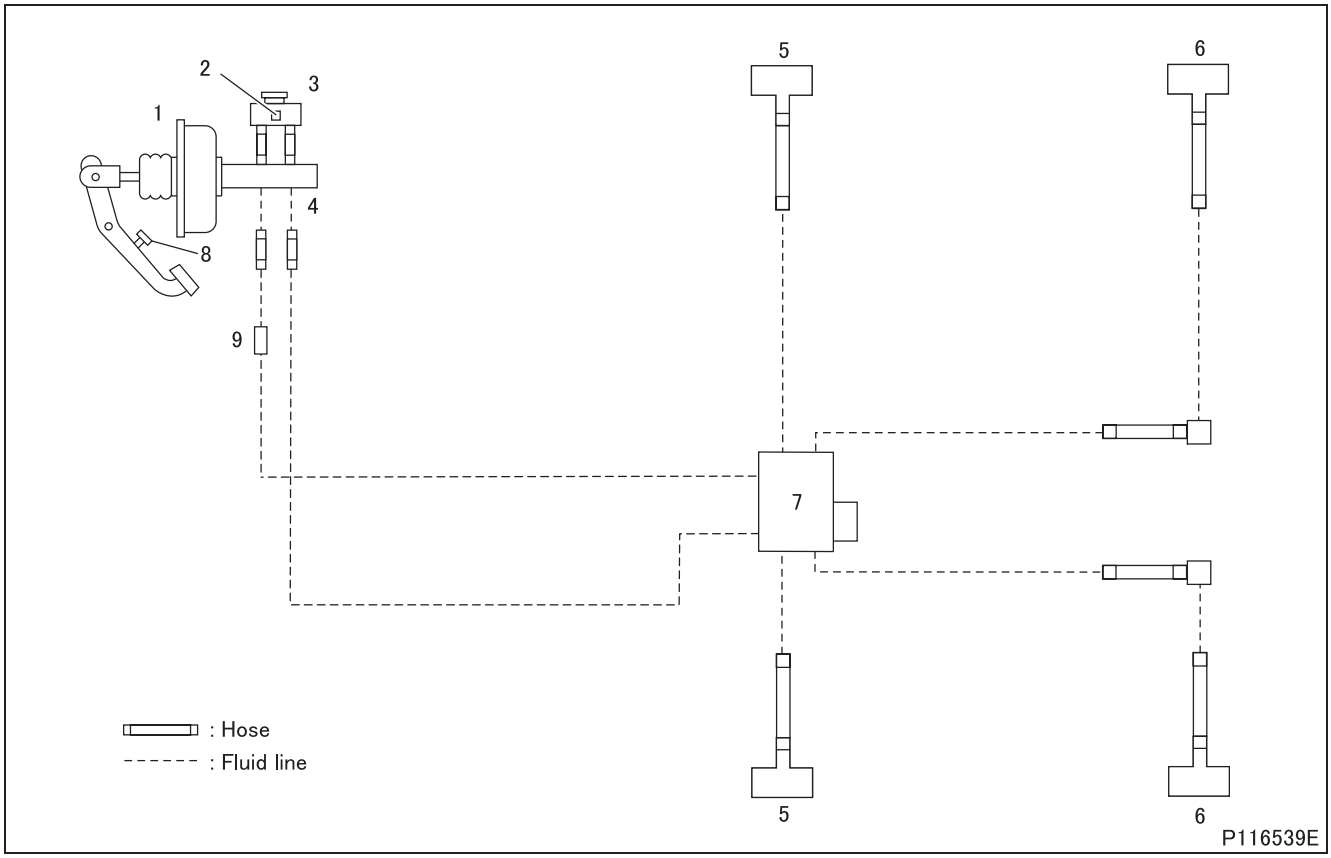
Vacuum Pump

Item		Specifications
Type		Radial blades type
Output	cm^3 {cu.in.}/rev.	150 {9.15}

STRUCTURE AND OPERATION

1. Brake System

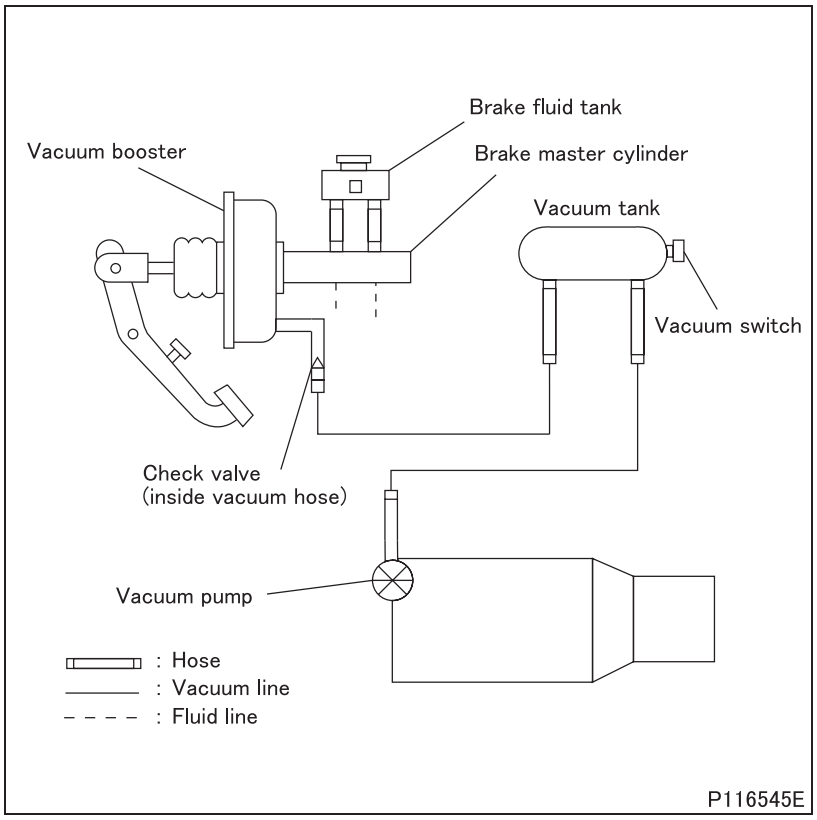
1.1 Brake fluid line



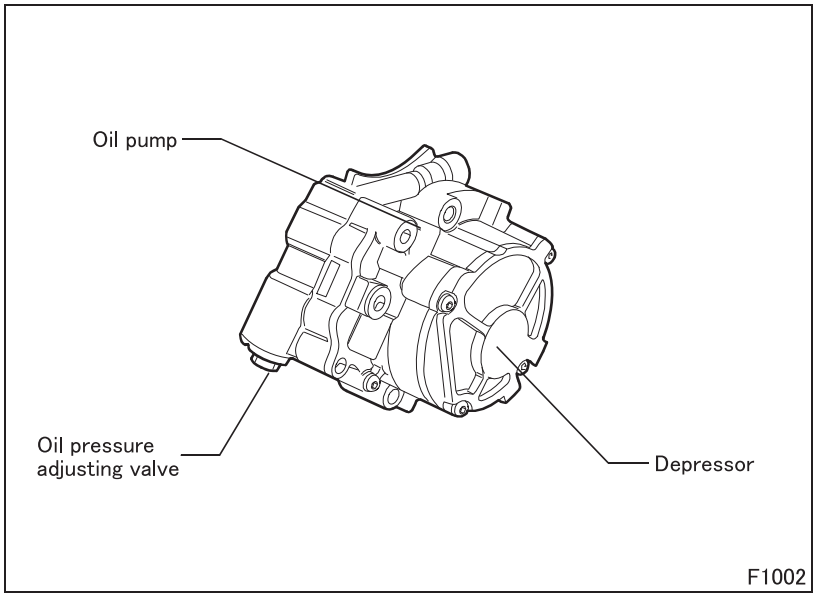
1 Vacuum booster
2 Brake fluid level switch
3 Brake fluid tank
4 Brake master cylinder
5 Front wheel brake
6 Rear wheel brake
7 Hydraulic unit (anti-lock brake system)
8 Stop lamp switch
9 Brake fluid pressure sensor

- The brake system incorporating the vacuum booster uses vacuum to provide servo-assisted braking to all wheels of the vehicle onto which it is mounted.

1.2 Vacuum booster line

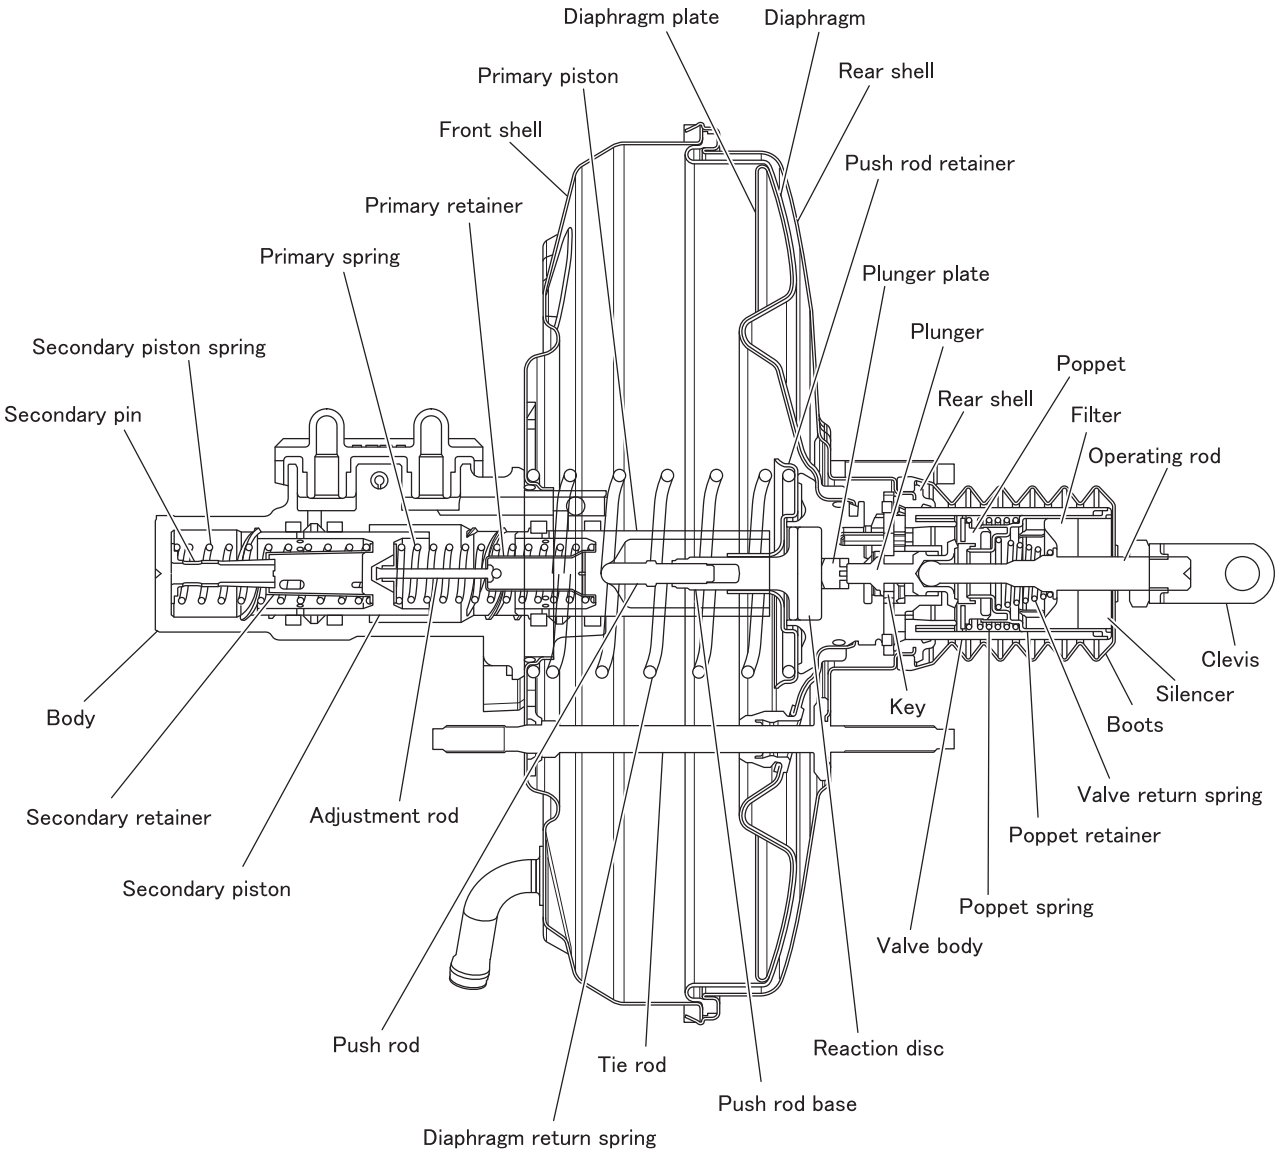


2. Vacuum Pump

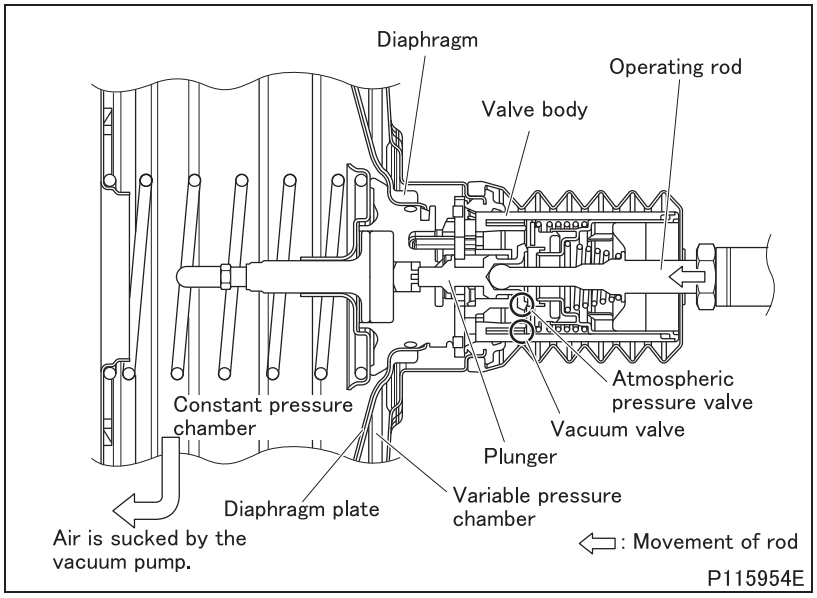


- The vacuum pump (Depressor), with radial blades, is also incorporated in the Gear of oil pump with built-in depressor (GPOD). It is driven directly by the oil pump.

3. Vacuum Booster and Brake Master Cylinder

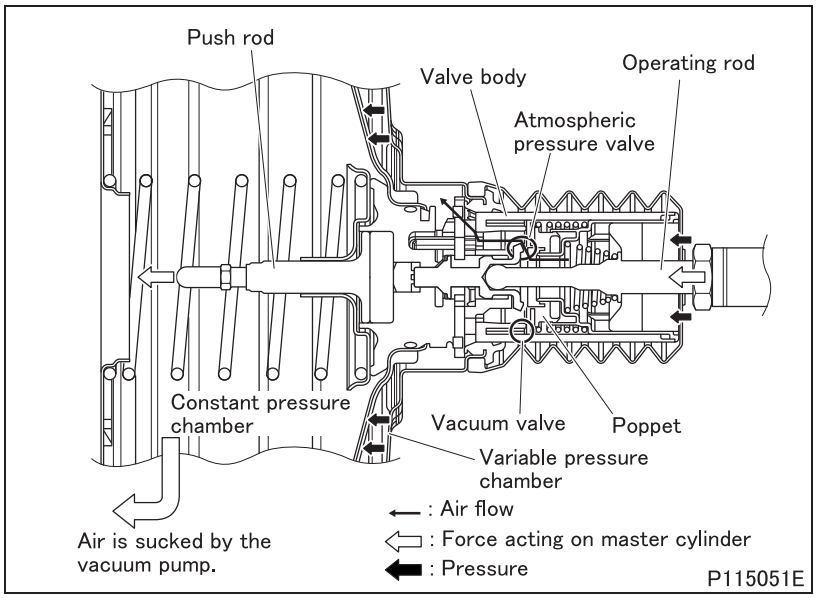


- The vacuum booster boosts the brake force exerted at the brake pedal using pressure created by the difference between the vacuum generated and atmospheric pressure, thereby reducing the operator's pedal effort.
- The brake master cylinder serves both the front and rear brake systems that are independent of each other. Should fluid leakage occur in either the front or rear brake system, stopping power can still be provided by the intact system.



3.1 When brake pedal is not operative

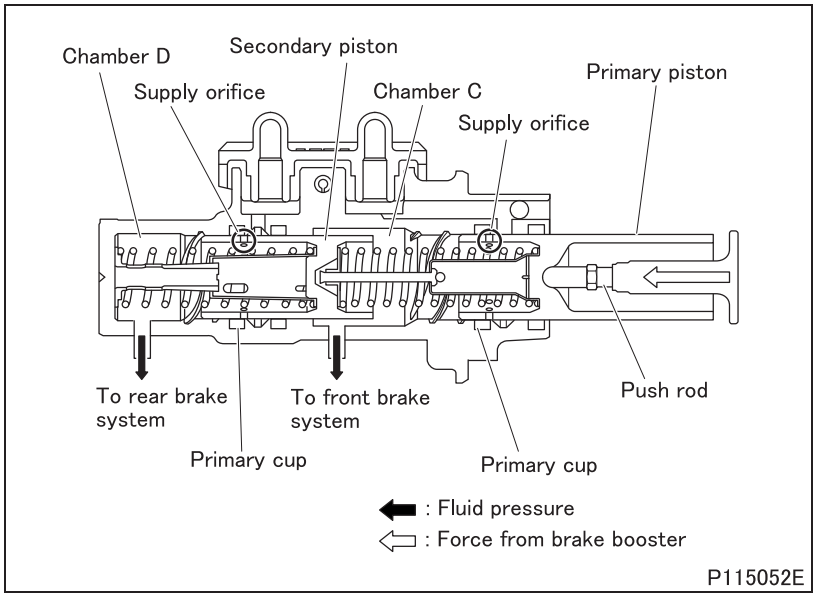
- With vacuum supplied to the constant pressure and variable pressure chambers and no brake pedal force, both the atmospheric pressure valve and vacuum valve close. The vacuum booster system balances and provides no boosting action.



3.2 When brake pedal is depressed

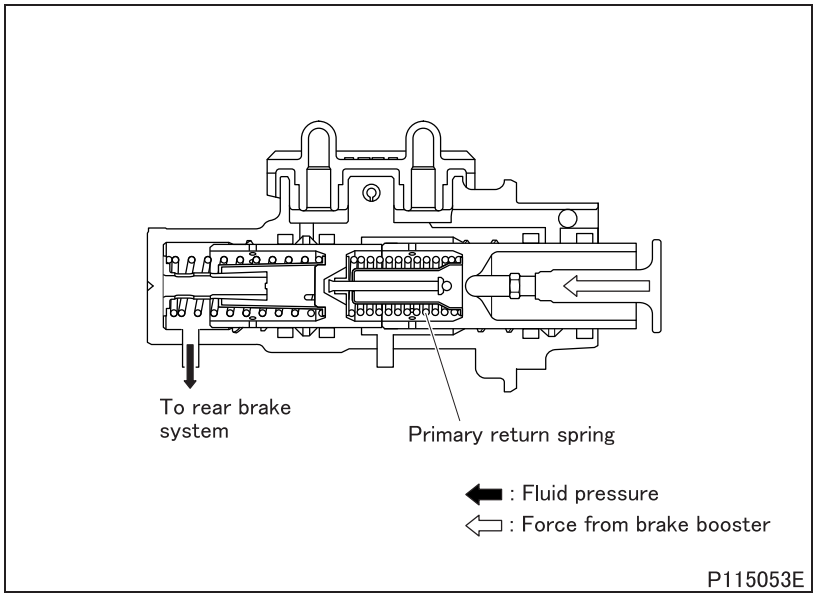
3.2.1 Vacuum booster operation

- As the brake pedal is depressed, the pedal force acts on the operating rod. This opens the atmospheric pressure valve, allowing outside air into the variable pressure chamber. There is now a pressure difference between the constant and variable pressure chambers. The pedal force, which is boosted as a result of the pressure difference between the chambers works on the brake master cylinder via the push rod.



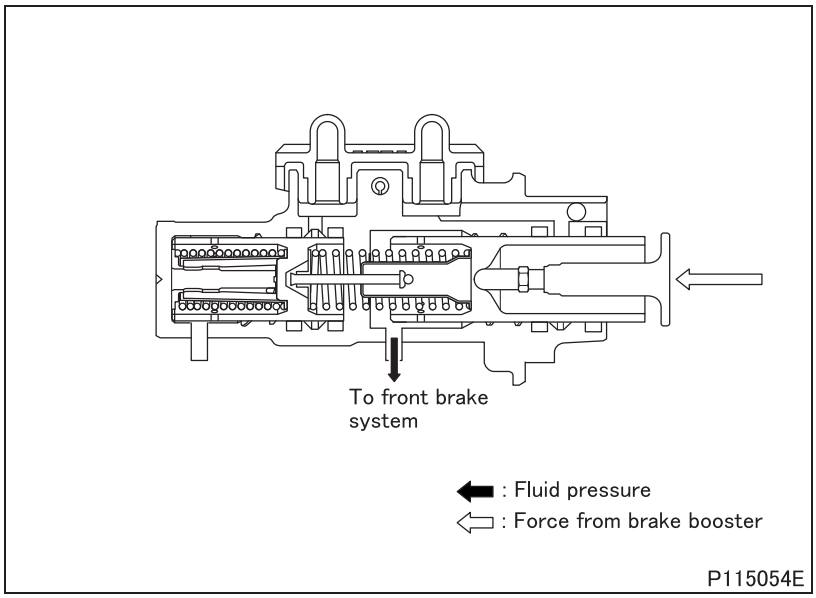
3.2.2 Brake master cylinder operation

- The push rod moves to push in the primary and secondary pistons. The supply orifice of the secondary piston goes over the primary cup and the fluid passage to the reservoir tank is blocked. As a result, fluid pressure builds up in the chamber D in front of the secondary piston.
- The fluid pressure is sent to the rear brake system.
- At the same time, the supply orifice of the primary piston goes over the primary cup and the fluid passage to the reservoir tank is blocked. As a result, fluid pressure builds up in the chamber C. The fluid pressure is sent to the front brake system.



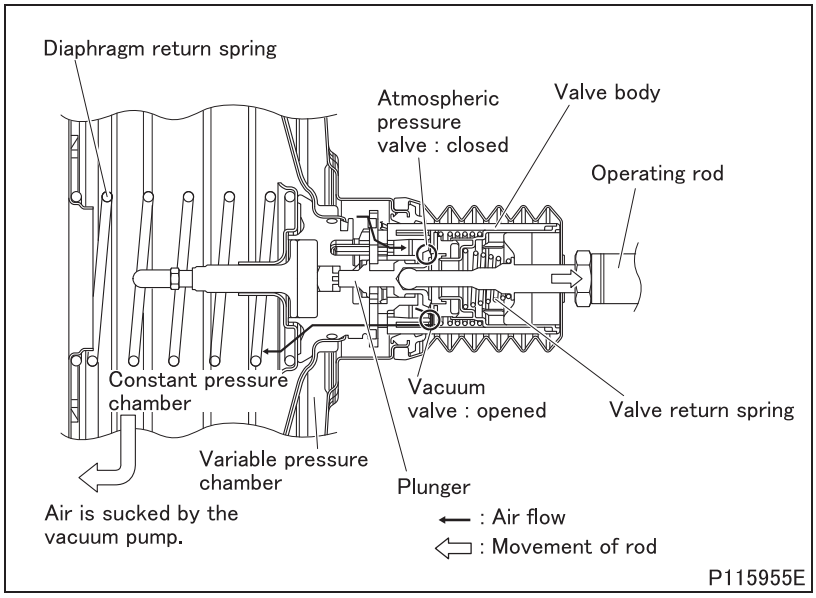
3.3 When fluid leaks in the front brake system

- As the brake pedal is depressed, the push rod moves to push in the primary piston. Due to fluid leakage in the front brake system, however, no fluid pressure builds up in that system.
- As the brake pedal is further depressed, the primary piston overcomes the force of the primary piston return spring and pushes the secondary piston via the primary retainer. As a result, fluid pressure is sent to the rear brake system only.



3.4 When fluid leaks in the rear brake system

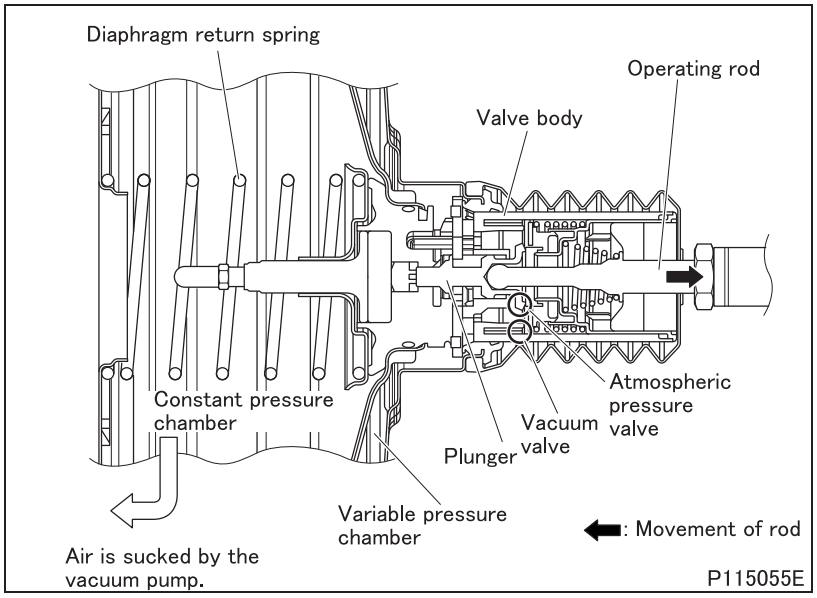
- As the brake pedal is depressed, the push rod moves to push in the primary and secondary pistons. Due to fluid leakage in the rear brake system, however, no pressure builds up in that system.
- As the brake pedal is further depressed, the end of the secondary piston contacts the cylinder body. When the primary piston continues to be pushed, fluid pressure builds up further in the front brake system only.



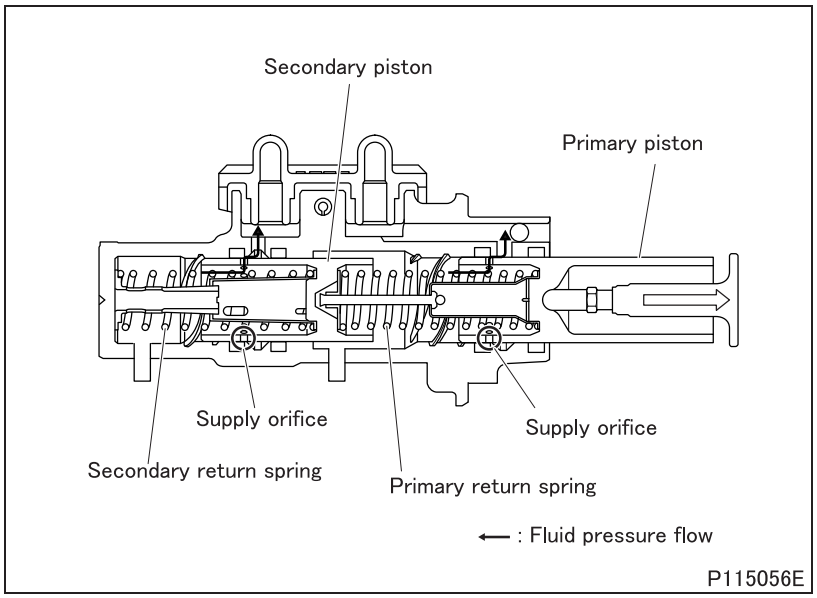
3.5 When brake pedal is released

3.5.1 Vacuum booster operation

- With the brake pedal released, the operating rod and the plunger are pushed back by the force of the valve return spring, closing the atmospheric pressure valve and opening the vacuum valve.
  This lets vacuum into the variable pressure chamber, reducing the pressure difference between the constant and variable pressure chambers.



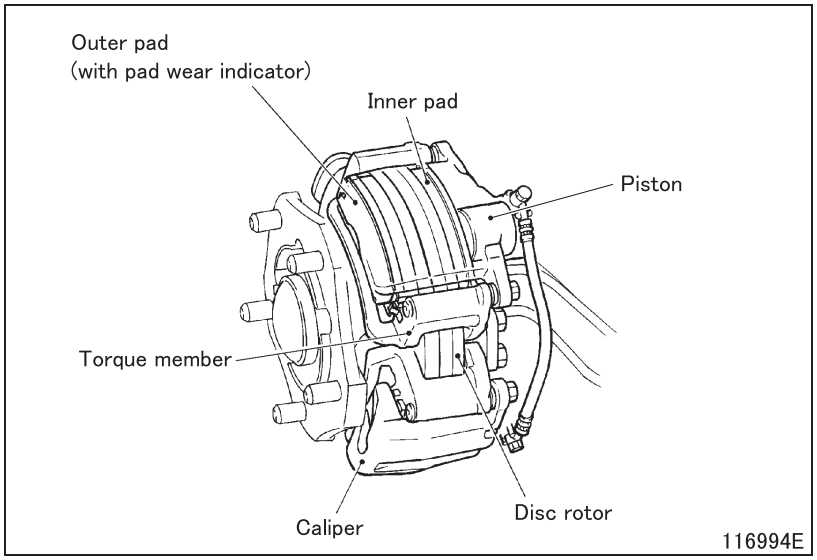
- With the pressure difference reduced between constant and variable pressure chambers, the valve body is pushed back by the force of the diaphragm return spring until it reaches a set position to come when the brake pedal is not operated. In that position, both the atmospheric pressure and vacuum valves are closed and the system is maintained in a balanced condition.



3.5.2 Brake master cylinder operation

- With the brake pedal released, the primary piston starts to be pushed back by the force of the primary return spring. The supply orifice of the primary piston moves back to the primary cup to open the fluid flow to the fluid passage to the reservoir tank, allowing the fluid pressure in the brake line to return into the reservoir tank.
- At the same time, the secondary piston starts to be pushed as well by the force of the secondary return spring. The supply orifice of the secondary piston moves back to the primary cup to open fluid flow to the fluid passage to the reservoir tank, allowing the fluid pressure in the brake line to return into the reservoir tank.

4. Front Disc Brake <FE>

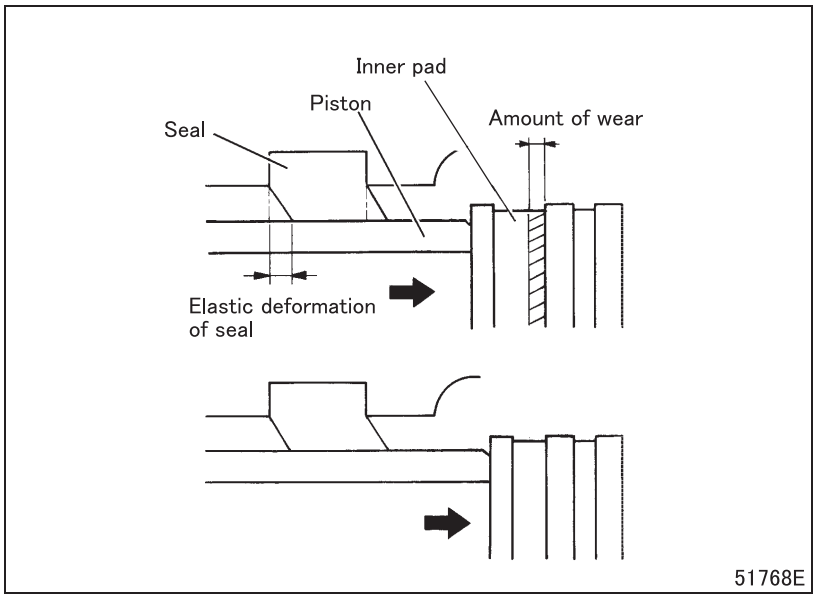


- The front disc brake uses twin floating-type calipers.
- Each caliper houses a cylinder and piston.
- The disc brake generates braking force by pushing two pads onto the disc rotor from both sides. The inner pad is pushed by the piston while the outer pad is pressed against the disc rotor in reaction.
- The outer pad is fitted with a pad wear indicator. A sound occurs when the pad wear indicator contacts the disc rotor to tell the operator that the pads need replacement.
- The front disc brake is equipped with a self-adjusting mechanism that compensates for pad wear to maintain correct clearance between the disc rotor and the outer and inner pads each time the brake is operated.

4.1 Self-adjusting mechanism

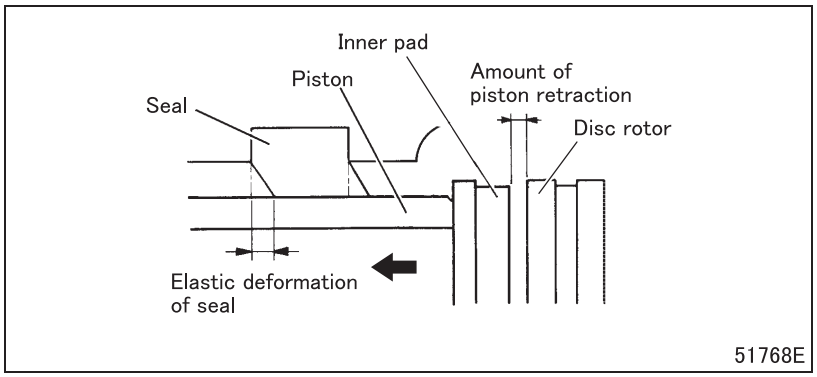
4.1.1 Operation

(1) When brake pedal is depressed

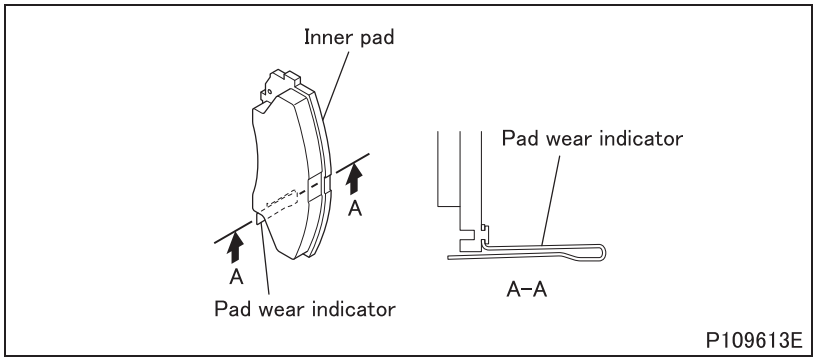


- The piston extends in excess of the seal's elastic deformation by the amount of inner pad wear (shown hatched).

(2) When brake pedal is released



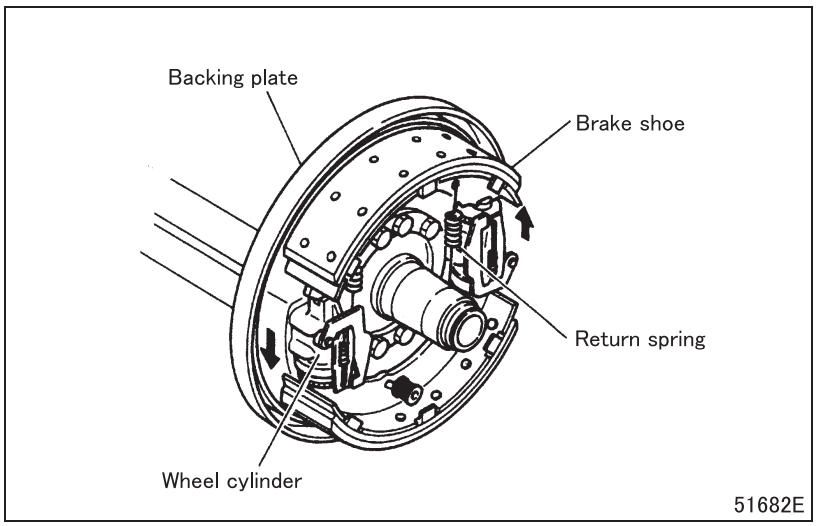
- The piston retracts as much as the amount of the seal's elastic deformation, thus maintaining the correct clearance between the disc rotor and the inner pad.



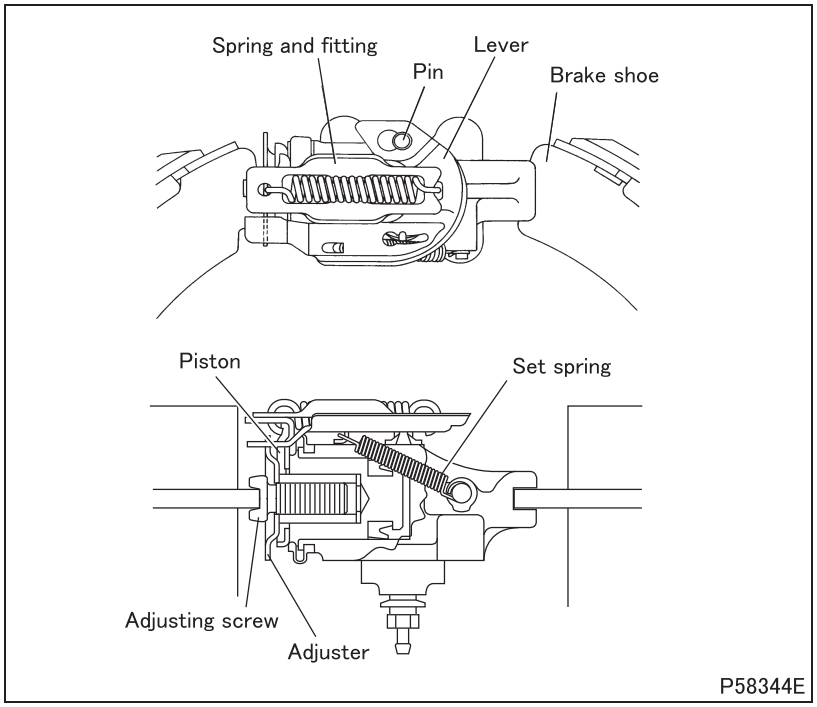
4.2 Pad wear indicator

- The pad wear indicator is affixed to the outer pad.
- When pad wear reaches the limit, the pad wear indicator and the disc rotor contact to give off the warning sound.

5. Front Drum Brake <FG>

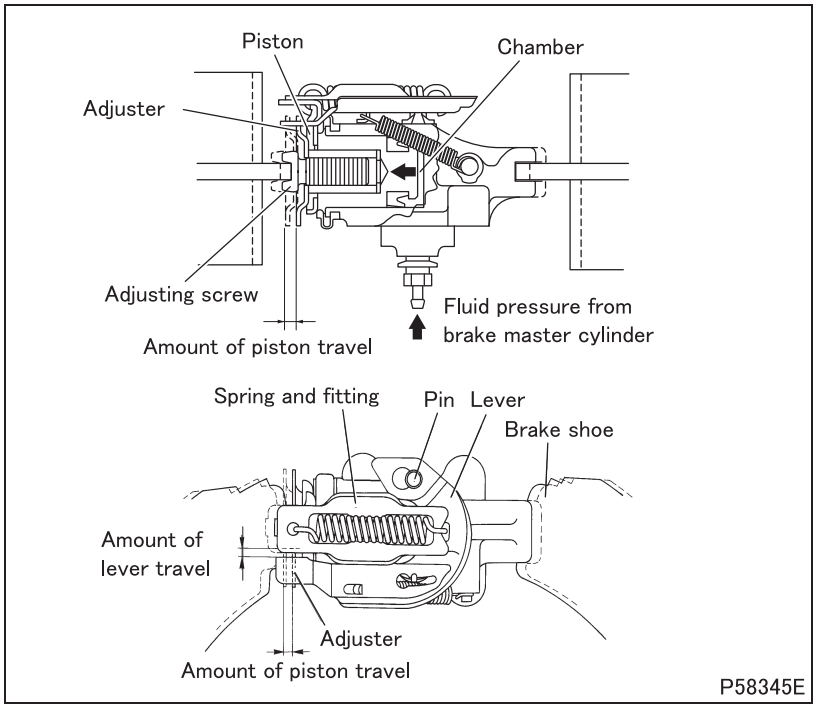


- The front drum brake is of a 2-leading type.
- Single-acting wheel cylinders activate brake shoes, both as a leading shoe, in forward-travel braking. By self-boosting effect, the 2-leading shoe brake generates appropriate stopping power.



5.1 Wheel cylinder

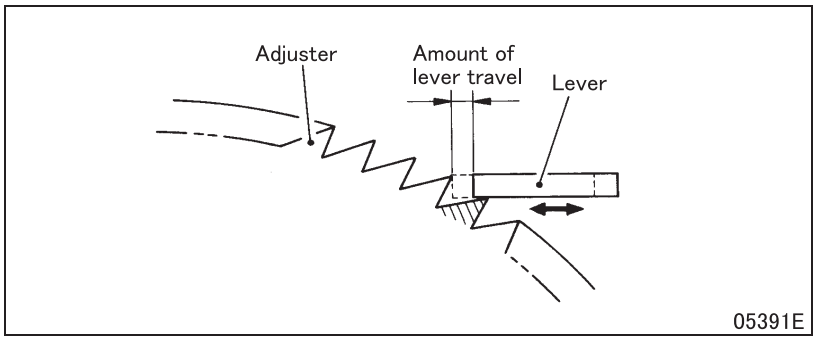
- The wheel cylinder is equipped with a self-adjusting mechanism to compensate for lining wear and maintain the correct clearance between the lining and the drum. The adjustment is made each time braking is performed.



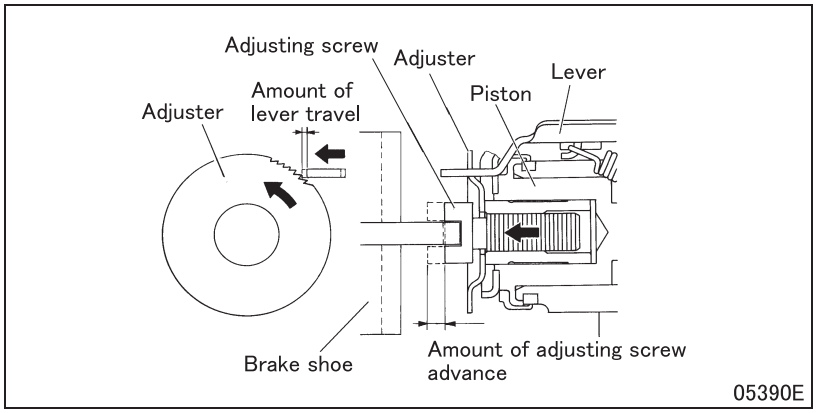
5.2 Self-adjusting mechanism

(1) Operation

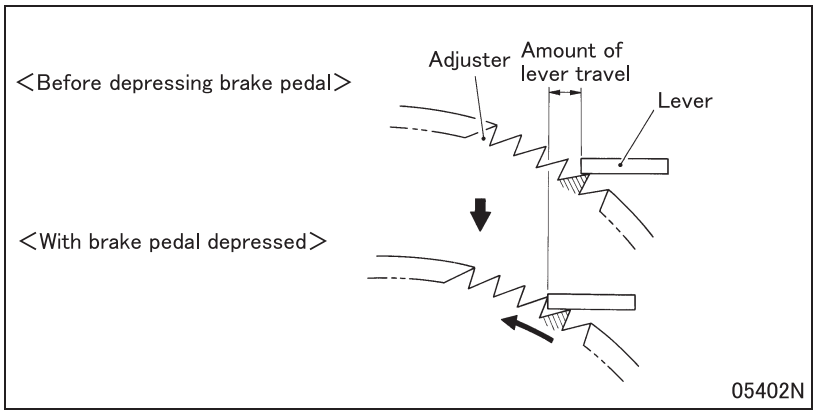
- When the brake pedal is depressed, fluid pressure from the brake master cylinder enters into the chamber and pushes the piston, which then extends the spring and fitting. The lever, which is connected to the spring and fitting, pivots on the pin.

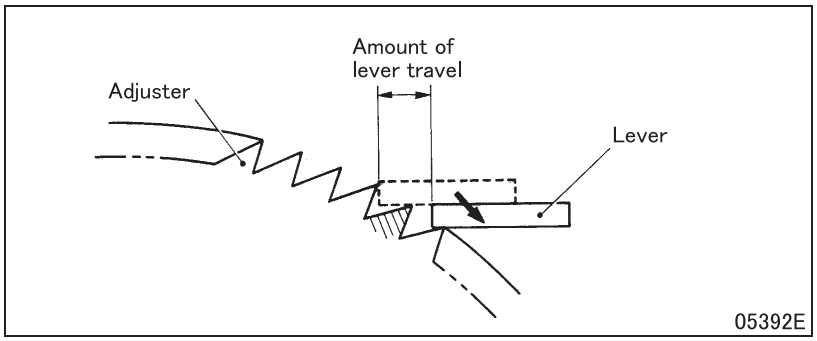


- When the brake drum-to-lining clearance is correct, the amount of lever travel when the brake pedal is depressed is not enough to turn the adjuster which therefore remains in the same place.



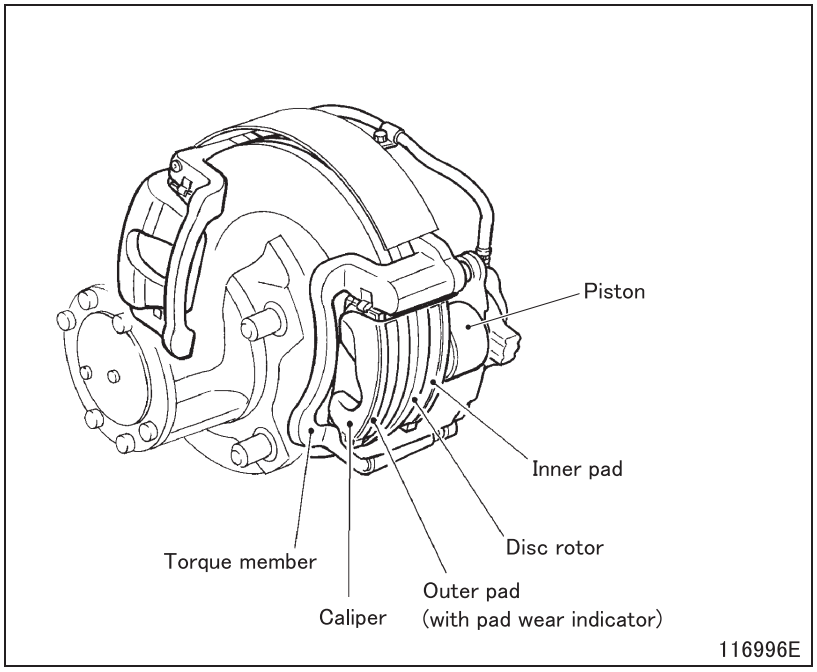
- As the brake drum-to-lining clearance grows, the amount of piston travel, and therefore the amount of lever travel, becomes greater.
- When the lever travels far enough to turn the adjuster, the threads on the adjuster causes the adjusting screw to advance. As a result, the brake shoe extends.



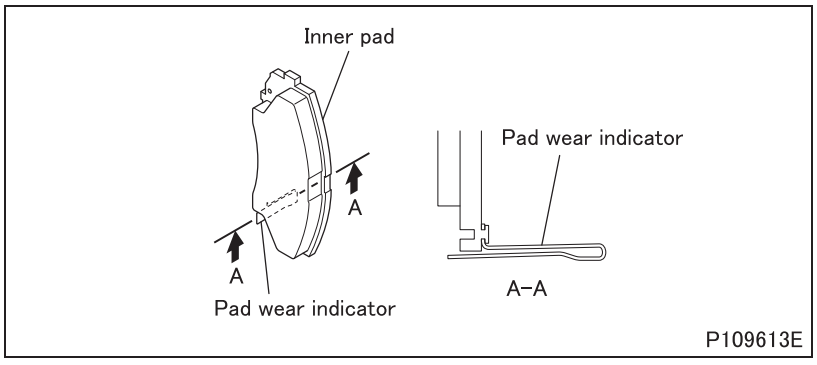


- As the brake pedal is released, the adjuster remains in the new position while the lever retracts by one tooth. The brake drum-to-lining clearance is now correctly adjusted.

6. Rear Disc Brake <FE>



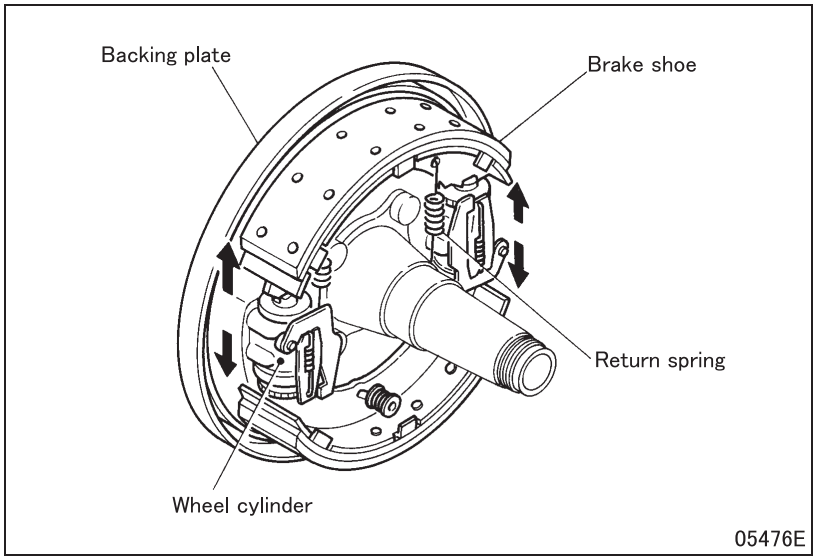
- The rear disc brake uses a twin floating-type calipers.
- The caliper houses one each of cylinder and piston.
- The disc brake generates braking force by pushing two pads onto the disc rotor from both sides. The inner pad is pushed by the piston while the outer pad is pressed against the disc rotor in reaction.
- The outer pad is fitted with a pad wear indicator. A sound occurs when the pad wear indicator contacts the disc rotor to tell the operator that the each caliper houses a cylinder and piston need replacement.
- The rear disc brake is equipped with a self-adjusting mechanism to compensate for pad wear and maintain the correct clearances between the disc rotor and the inner and outer pads. The adjustment is made each time braking is performed.
- The self-adjusting mechanism operates in the same manner as that of the front disc brake.



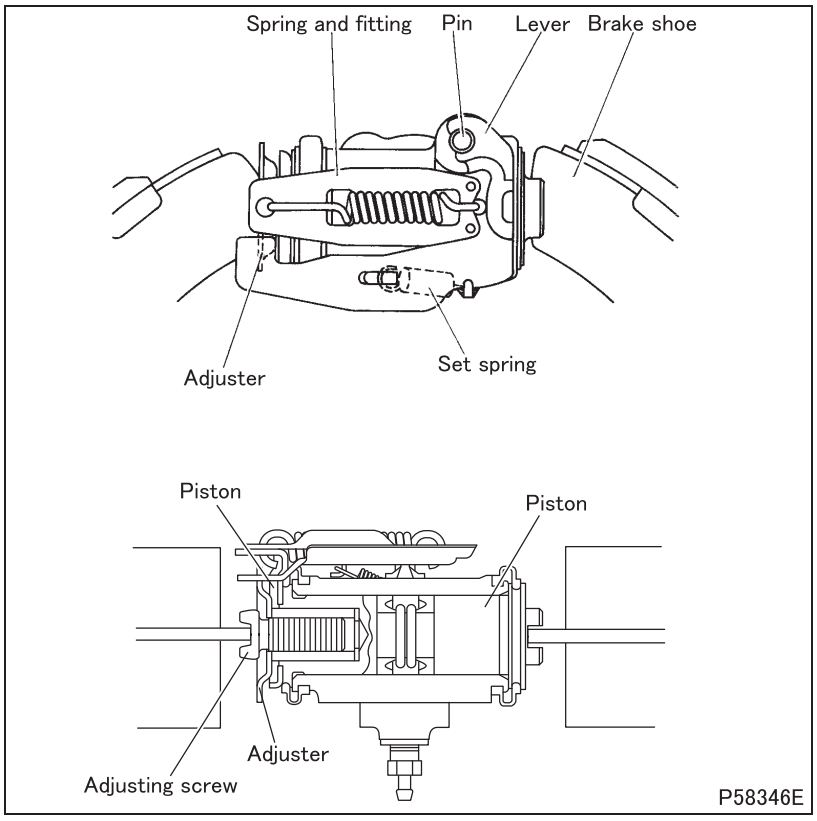
6.1 Pad wear indicator

- The pad wear indicator is affixed to the outer pad.
- When pad wear reaches the limit, the pad wear indicator and disc rotor contact to give off the warning sound.

7. Rear Drum Brake <FG>



- The rear drum brake is of a dual 2-leading type.
- Double-acting wheel cylinders activate brake shoes, both as a leading shoe, in forward- and rearward-travel braking. By self-boosting effect, the dual 2-leading shoe brake generates appropriate stopping power.



7.1 Wheel cylinder

- The wheel cylinder is equipped with a self-adjusting mechanism to compensate for lining wear and maintain the correct clearance between the lining and the drum. The adjustment is made each time braking is performed.
- The self-adjusting mechanism operates in the same manner as the front drum brake.

Wheel Brake

Possible causes \ Symptoms		Brake drag (slow disengagement after pedal release)	Brake application one sided: Stopping power different from right to left	Brake application one sided: Unstable stopping power	Brake application one sided: Locking point varies	Brake application one sided: Other	Insufficient stopping power	Reduced pedal travel	Noise and shock when brake pedal depressed: Noise generated when wheels are turned with vehicle jacked up	Noise and shock when brake pedal depressed: Continuous noise during brake application (at low vehicle speed)	Noise and shock when brake pedal depressed: Other	Reference Gr
Wheel brake	Backing plate surface rough			O								
	Backing plate deformed or incorrectly installed			O								
	Lubricant or moisture on brake pad/lining surface		O		O							
	Deterioration or incorrect material used for brake pad/lining		O									
	Brake pad/lining unevenly worn or with rough surface		O									
	Fade (pad/lining surface deterioration)				O							
	Brake pad/lining worn to limit									O		
	Incorrect contact of brake pad/lining		O		O		O					
	Brake lining worn radius uneven				O							
	Wheel cylinder malfunction	O	O					O	O			
	Shoe return spring fatigued or broken	O							O			
	Disc rotor/brake drum worn unevenly		O									
	Disc rotor/brake drum deformed			O								
	Disc rotor/brake drum worn				O							
	Disc rotor/brake drum surface rough						O					
	Disc rotor/brake drum inaccurately machined										O	
	Brake drum cracked										O	
	Foreign material in brake drum							O				
	Brake shoe deformed or damaged							O				
	Shoe hold cup broken								O			
	Movable parts insufficiently lubricated										O	

Possible causes	Symptoms	Brake application one sided							Noise and shock when brake pedal pressed			Reference Gr
		Brake drag (slow disengagement after pedal release)	Stopping power different from right to left	Unstable stopping power	Locking point varies	Other	Insufficient stopping power	Reduced pedal travel	Noise generated when wheels are turned with vehicle jacked up	Continuous noise during brake application (at low vehicle speed)	Other	
Brake pedal	Incorrect pedal travel						O					
	Incorrectly adjusted, too much play							O				
Brake fluid	Fluid level low							O				
	Fluid leakage							O				
	Air entry							O

	Incorrect wheel alignment					O						Gr26A, B

TROUBLESHOOTING

Possible causes	Symptoms	Brake drum/ disc rotor overheating		Brake noise						Reference Gr
		Overheating on all wheels	Overheating on specific wheel(s)	Noisy when vehicle is new, or after brake lining/pad replacement	Brakes used under severe conditions	Other	Brake shudder	Abnormal brake pedal return	Brake drag	
Wheel brake	Backing plate surface rough								O	
	Shoe trapped on backing plate surface		O							
	Backing plate deformed or incorrectly installed				O					
	Brake pad/lining surface deterioration				O					
	Wear powder attached on brake pad/lining					O				
	Brake pad/lining worn					O				
	Incorrect contact of brake pad/lining			O						
	Wheel cylinder malfunction		O						O	
	Faulty wheel cylinder piston cup		O						O	
	Shoe return spring fatigued or broken		O						O	
	Disc rotor/brake drum glazed				O					Gr26A, B, 27
	Brake drum deformed or center deviation						O			Gr26B, 27
	Disc rotor thickness uneven						O			Gr26A, 27
	Brake shoe deformed or damaged				O					
	Brake shoe twisted or sagged		O							
Brake pedal	Abnormal pedal return	O								
	Pedal play insufficient								O	
	Linkage rusted or deformed							O		
	Return spring fatigued or broken							O		
	Vacuum booster operating rod thrust							O		
Brake fluid	Brake pipe over-tightened, resulting in poor fluid return		O							
Vacuum booster	Faulty	O								
Brake master cylinder	Faulty piston cup								O	
	Clogged return port	O								
Axle	Wheel hub bearing incorrectly adjusted		O			O	O			Gr26A, B, 27
	King pin bushing worn						O			Gr26A
	Trunnion bearing worn						O			Gr26B

M E M O

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Replacement of Brake Fluid

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
–	Air bleeder	Disc brake	8.8 to 12.7 {6.5 to 9.4, 0.9 to 1.3}	–
		Drum brake	6.86 to 8.83 {5.1 to 6.5, 0.7 to 0.9}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Brake fluid tank	Brake fluid (SAE J1703 or FMVSS No. 116 DOT3)	As required

WARNING ⚠

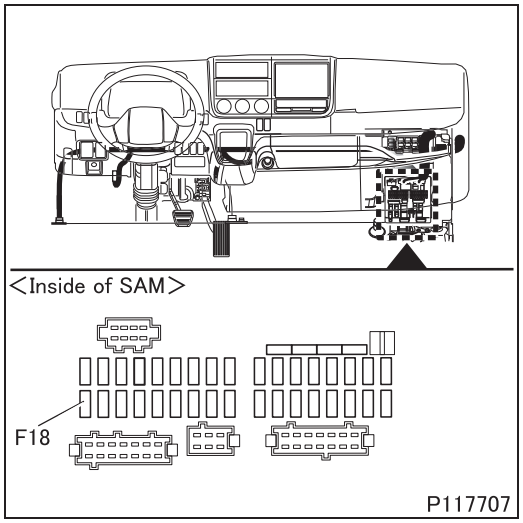
- **Be sure to use new brake fluid. Do not mix it with brake fluid of different properties or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.). This will alter the original properties of FUSO Brake Fluid, causing the boiling point to drop as well as the brake rubber parts to swell. Faulty operation of the brake system will result.**
- **Ensure that no foreign matter or water enter into the brake fluid when refilling it, as they will cause faulty brake operation.**
- **Use a container used exclusively for the specified brake fluid. This ensures that no brake fluid of different properties or mineral oil enter into the system.**

CAUTION ⚠

- **Brake fluid is corrosive on paintwork. Be careful not to spill it onto the paintwork. If brake fluid is spilled onto the paintwork, immediately wipe it off.**

NOTE

- **During brake fluid replacement operation, a change in color of the brake fluid being discharged indicates that the old brake fluid in the system has been replaced with new brake fluid.**
- **During the replacement, be sure to keep the brake fluid level at the “MAX” mark on the tank.**



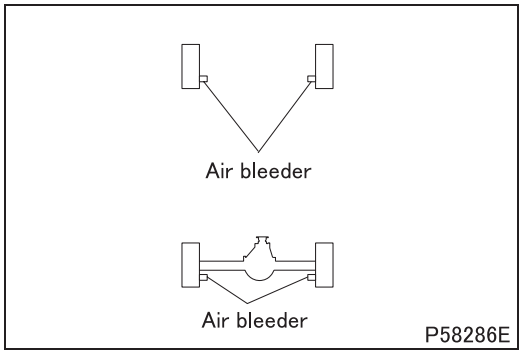
1.1 Work before replacement

- Remove the power fuse (F18) for the electronic control unit of anti-lock brake system.

WARNING ⚠

- **Do not install the power fuse until after the brake fluid replacement is completed. Otherwise, the initial system check starts, possibly causing air to enter into the secondary system (anti-lock brake system operating circuit).**

- In order to ensure that the vacuum booster functions properly, start the engine and keep it running at idle until the replacement is completed.



- Install one end of a vinyl pipe onto each air bleeder. Place the loose end into a container.

1.2 Replacement of brake fluid

- Loosen each bleeder screw, and depress and release the brake pedal repetitively until brake fluid is no longer discharged from the pipes.
- While filling the brake fluid tank with new brake fluid up to the “MAX” mark, cycle the brake pedal repetitively until the old brake fluid being discharged is replaced with new brake fluid. Tighten each air bleeder to the specified torque.
- Proceed to Air Bleeding of Brake System.

2. Air Bleeding of Brake System

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
–	Air bleeder	Disc brake	8.8 to 12.7 {6.5 to 9.4, 0.9 to 1.3}	–
		Drum brake	6.86 to 8.83 {5.1 to 6.5, 0.7 to 0.9}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Brake fluid tank	Brake fluid (SAE J1703 or FMVSS No. 116 DOT3)	As required

WARNING ⚠

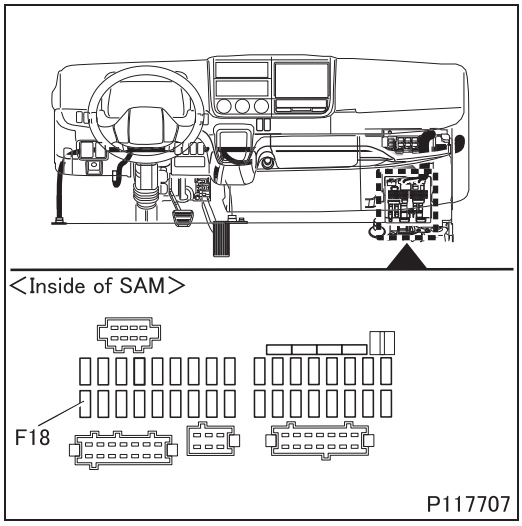
- **Be sure to use new brake fluid. Do not mix it with brake fluid of different properties or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.). This will alter the original properties of FUSO Brake Fluid, causing the boiling point to drop as well as the brake rubber parts to swell. Faulty operation of the brake will result.**
- **Ensure that no foreign material or water enter into the brake fluid when refilling it, as they will cause faulty brake operation.**
- **Use a container used exclusively for the specified brake fluid. This ensures that no brake fluid of different properties or mineral oil enter into the system.**
- **If the hydraulic unit was replaced, perform air bleeding of both the primary and secondary brake systems.**

CAUTION ⚠

- **Brake fluid is corrosive on paintwork. Be careful not to spill it onto the paintwork. If brake fluid is spilled onto the paintwork, immediately wipe it off.**

NOTE

- **Brake fluid level drops during the air bleeding operation. Be sure to keep the brake fluid level at the "MAX" mark on the tank.**



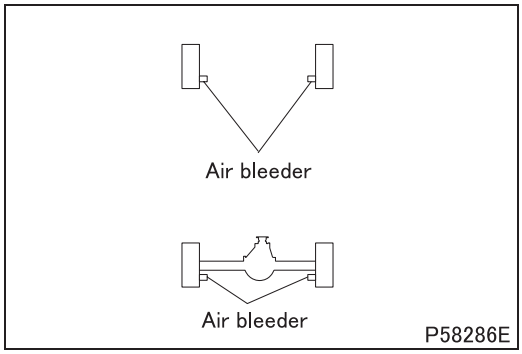
2.1 Work before replacement

- Remove the power fuse (F18) for the electronic control unit of anti-lock brake system.

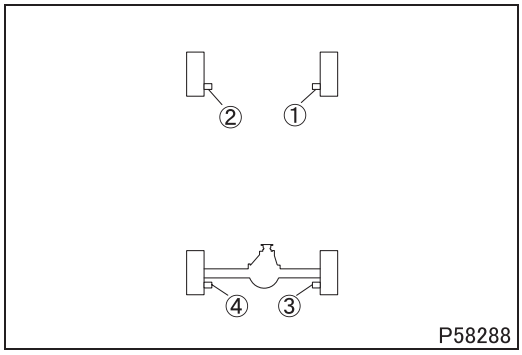
WARNING ⚠

- **Do not install the power fuse until after the air bleeding of the primary brake system (normal circuit) is completed. Otherwise, the initial system check starts, possibly causing air to enter into the secondary system (anti-lock brake system operating circuit).**

- In order to ensure that the vacuum booster functions properly, start the engine and keep it running at idle until the replacement is completed.



- Install one end of a vinyl pipe onto each air bleeder. Place the loose end into a container.



2.2 Air bleeding of brake system

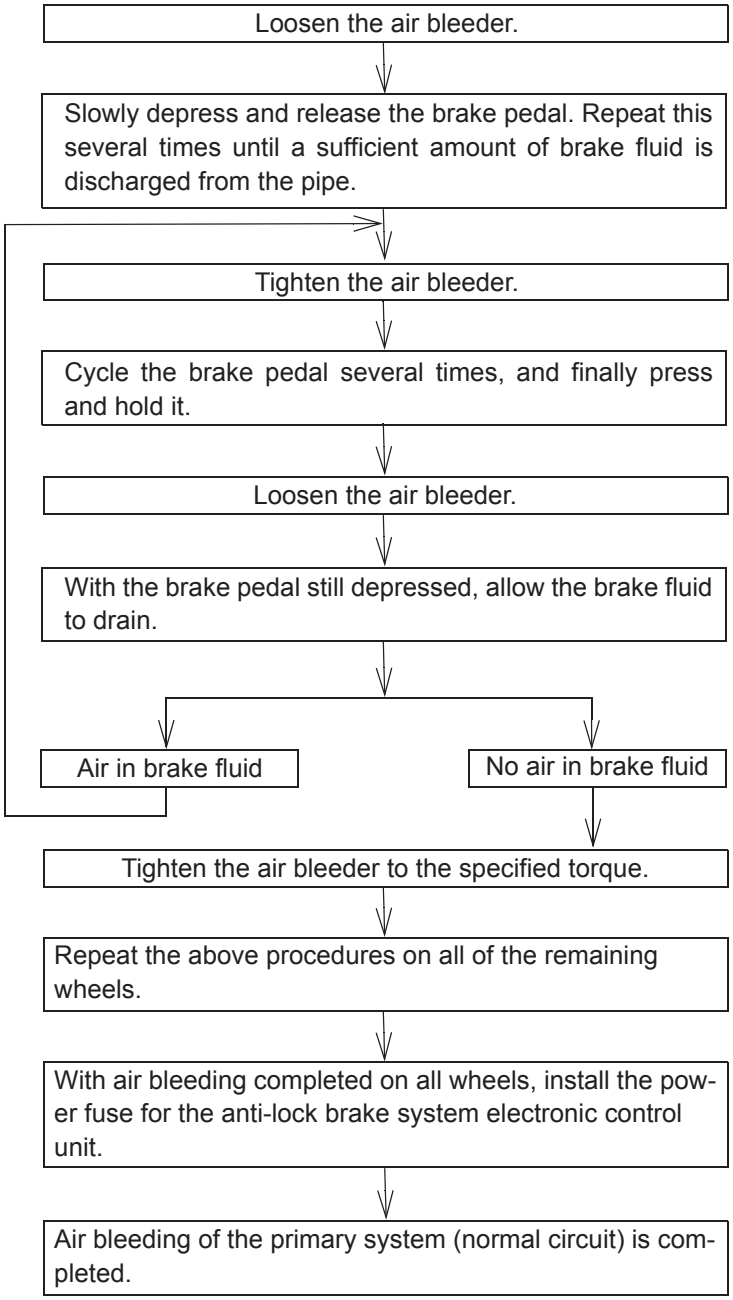
(1) Air bleeding of primary brake system (normal circuit)

- Perform the air bleeding sequence described below on each of the 4 wheels in the order of the following table.

Order of air bleeding	Brake system	Wheel
(1)	Front	Front right
(2)		Front left
(3)	Rear	Rear right
(4)		Rear left

CAUTION ⚠

- **If air has entered into the secondary brake system (anti-lock brake system operating circuit), bleed air from the secondary system after completing the air bleeding of the primary system (normal circuit).**
- **Normally, during air bleeding operation, air cannot enter into the secondary system (anti-lock brake system operating circuit) which is filled with brake fluid and is closed off. Therefore, only the primary system (anti-lock brake system operating circuit) needs to be bled of air.**

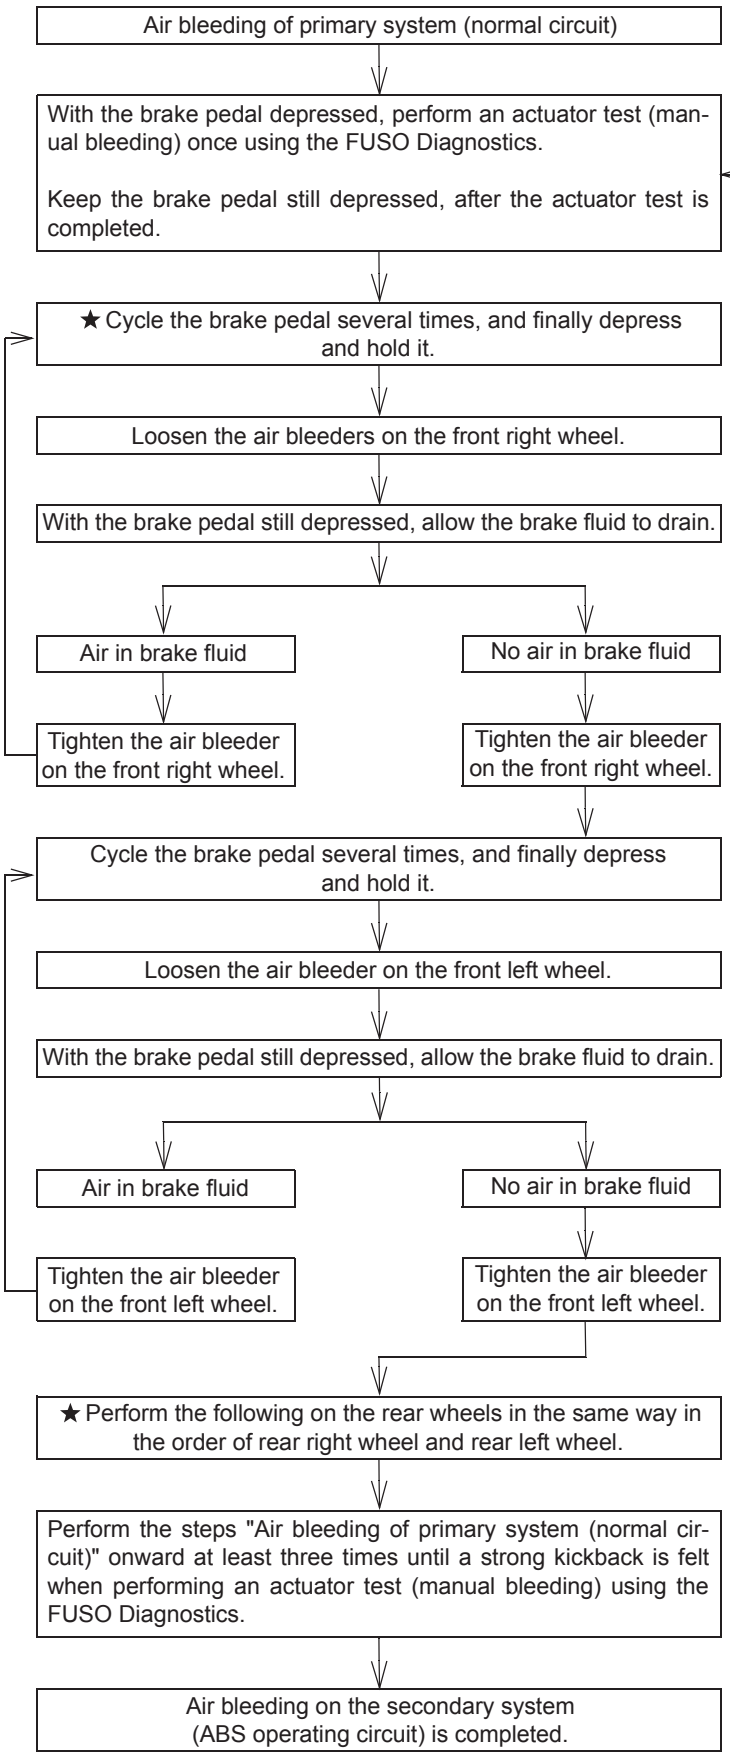


(2) Air bleeding of secondary brake system (ABS operating circuit)

- Perform a FUSO diagnostics actuator test (manual air bleeding) as part of the air bleeding procedures. (See Gr 35E.)

CAUTION ⚠

- **If the ABS system activates with air still remaining in the primary brake system, air can enter the secondary brake system (ABS operating circuit).**
- **If air has entered the secondary brake system (ABS operating circuit), that air can also flow into the primary system (normal circuit) when the ABS system activates, possibly causing the brake pedal stroke to extend.**



CAUTION ⚠

- **Do not repeat the test more than once in a row. Otherwise, air purged from the secondary system (ABS operating circuit) and sent into the primary system (normal circuit) can return to the secondary system.**

ON-VEHICLE INSPECTION AND ADJUSTMENT

3. Inspection and Adjustment of Brake Pedal

CAUTION ⚠

- **Securely chock the wheels so that the vehicle does not move. Do not remove the chocks until the entire operation is completed.**

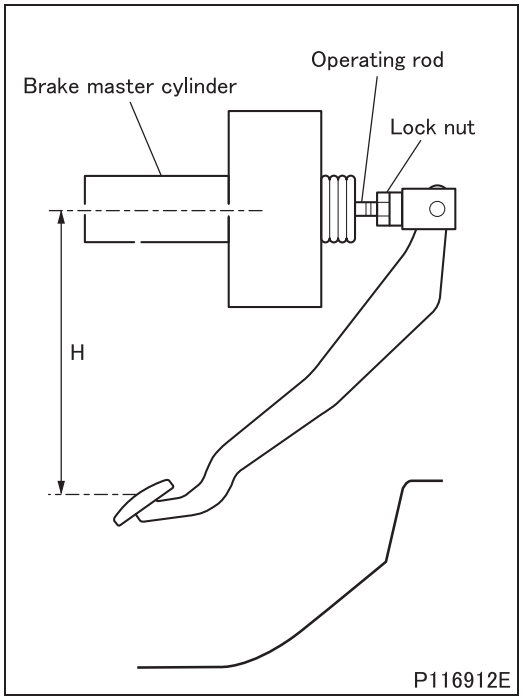
- Inspection and adjustment of the brake pedal must be carried out after those of the following are completed.
  - Bleeding of brake system
  - Measurement of drag torque of disc brake

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Installed height of brake pedal	169 to 177	–	Adjust
–	Clearance between floor and brake pedal (when depressed with a force of 490 N {110 lbs, 50 kgf})	10 {0.39} or more	–	Adjust
–	Brake pedal free play	0.1 to 3 {0.0034 to 0.12}	–	Adjust
–	Clearance between threaded end of stop lamp switch and brake pedal	1.5 to 2.5 {0.059 to 0.098}	–	Adjust

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut (operating rod securing)	20.4 to 30.6 {15 to 23, 2.1 to 3.1}	–



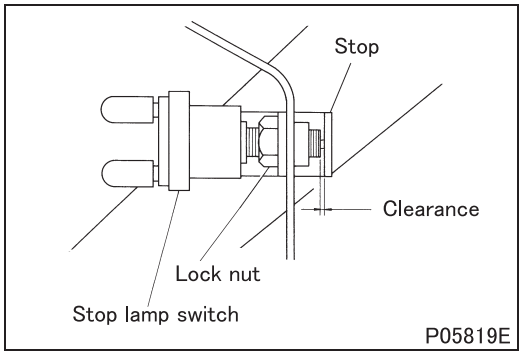
3.1 Brake pedal installed height

[Inspection]

- Remove the center lower cover of the instrument panel so that measurement can be performed.
- With the engine stopped and the brake pedal released, measure the height (H) from the center of the brake master cylinder to the center of the brake pedal.
  H: 228 ± 3 mm {8.98 ± 0.12 in.}
- If the measurement deviates from the standard value, adjust the height by turning the operating rod of the vacuum booster.

[Adjustment]

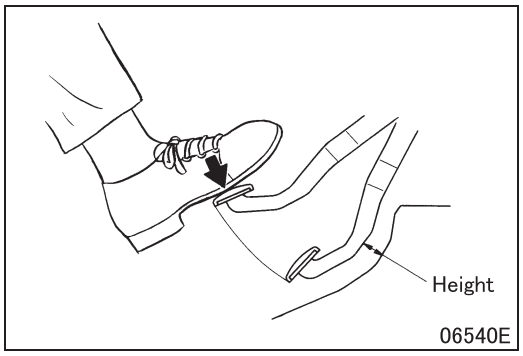
- Loosen the lock nut and turn the operating rod to bring the installed height of the brake pedal into the standard value range.
- Tighten the lock nut to the specified torque.
- After tightening the lock nut, press the brake pedal and check the brake pedal play and clearance between the brake pedal and floor.



- After adjustment, check the clearance between the threaded end of the stop lamp switch and brake pedal.

CAUTION ⚠

- **When the pedal is fully depressed, the vacuum booster operating rod functions as a stopper for the brake pedal.**



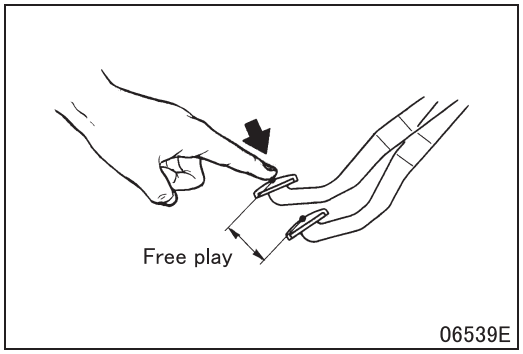
3.2 Clearance between depressed brake pedal and floor

[Inspection]

- Remove the floor mat to prepare for the measurement.
- With the engine idling, depress the brake pedal with a force of 490N {110 lbs, 50kgf} and measure the clearance between the brake pedal and floor.
- If the measurement deviates from the standard value, adjust the brake pedal height by turning the operating rod of the vacuum booster.

[Adjustment]

- See “3.1 Brake pedal installed height”.



3.3 Brake pedal play

- Check the brake pedal play with the vehicle in the following state.
- Stop the engine and set the starter switch to ON.
- With the parking brake applied, depress the brake pedal several times until the pedal requires too much efforts.
- Depress the brake pedal several more times.

[Inspection]

- Depress the center of the brake pedal pad with a finger until you feel resistance to measure the brake pedal play.
- If the measurement deviates from the standard value, adjust the installed height of the brake pedal.

[Adjustment]

- See “3.1 Brake pedal installed height”.

4. Inspection and Replacement of Disc Brake Pad <FE>

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Thickness of outer/inner pad	14 {0.55}	4 {0.16}	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

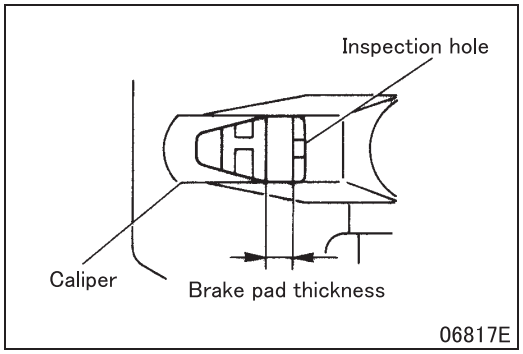
Mark	Parts to be tightened	Tightening torque	Remarks
–	Pin bolt	40 to 50 {30 to 37, 4.0 to 5.0}	–

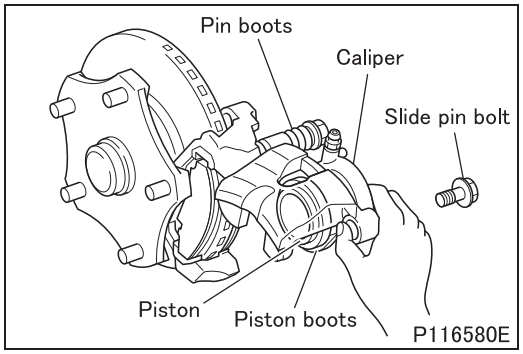
Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
☆a	Piston expander A: 50 {1.97}, B: 5 {0.20}  06815	MB990520	Pressing piston during brake pad replacement

[Inspection]

- When a brake pad has worn down to a thickness of approximately 4 mm {0.16 in.}, the pad wear indicator contacts the disc rotor. A squeaking sound is given off as the wheels rotate to indicate the operator that the brake pads need replacement.
- Through the inspection hole in the caliper, measure the brake pad thickness. If the measured value is less than the limit, replace all of the brake pads on that axle with a new kit.





[Replacement]

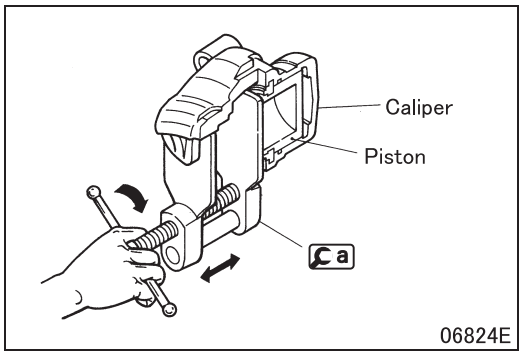
- Remove the slide pin bolt. Then, rotate the caliper and fix it at a place away from the disc rotor using a wire or similar device. Following show the specific slide pin bolt to be removed and the direction of rotation of the caliper.

Brake	Front/rear wheels		Pin bolt to be removed	Direction of rotation of caliper
235, 252 disc	Front wheels	Upper side	Upper side	Downward
		Lower side	Lower side	Upward
	Rear wheels	Front side	Lower side	Upward
		Rear side	Lower side	Upward

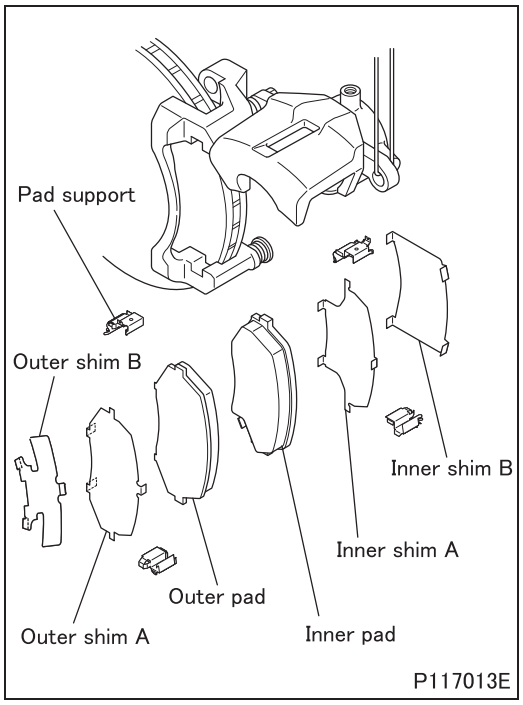
CAUTION ⚠

- **The caliper needs to be suspended firmly in place so that it does not drop, without stretching, squeezing or otherwise forcing the brake hosing or harness.**

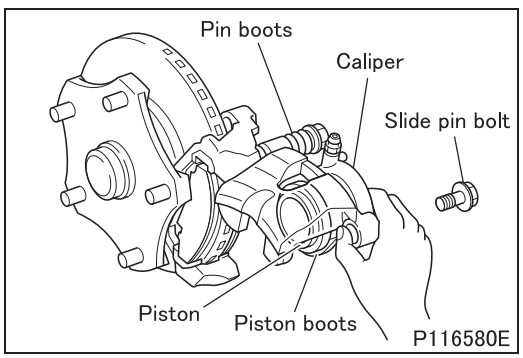
- Inspect the piston for fluid leakage. Inspect the piston boots for damage. Faulty parts must be replaced.
- Using [a], screw in the piston of the caliper until it bottoms on the back of the caliper.



- For removal and installation of the pads, see FRONT DISC BRAKE and REAR DISC BRAKE.



- Move the caliper back to the original position while taking care not to damage the piston boots.
- Bleed the pin boots of air.
- Ensure that the pin boots are firmly attached into the groove on the slide pin.
- Tighten the pin bolt to the specified torque.
- Measure the drag torque of the disc brake.
- Cycle the brake pedal several times, and check the brake fluid level in the tank. The fluid level should be at the “MAX” mark on the tank. Add brake fluid as required.



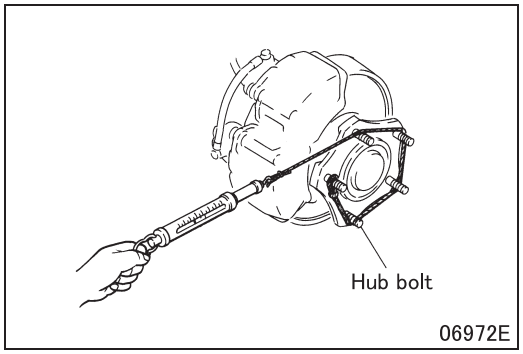
5. Measurement of Disc Brake Drag Torque <FE>

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Disc brake drag torque (tangential force at hub bolts)	Approx. 5 sec. after releasing brake pedal	9.8 N·m {7.2 ft.lbs, 1.0 kgf·m} or less	–	Inspect
		After turning disc rotor 10 revolutions	6.9 N·m {5.1 ft.lbs, 0.7 kgf·m} or less	–	

Table of tangential forces

	Approx. 5 sec. after releasing brake pedal	After turning disc rotor 10 revolutions
ϕ235 mm {9.25 in.} disc	94 N {21 lbs, 9.6 kgf}	66 N {15 lbs, 6.7 kgf}
ϕ252 mm {9.92 in.} disc	88 N {20 lbs, 9 kgf}	62 N {14 lbs, 6.3 kgf}



- Ensure that the starting torque of the wheel hub bearings conforms to the standard value.
- Using a spring gauge, measure the tangential force at the hub bolts.
- The tangential force is calculated by the following formula.
  Tangential force = Dragging torque / (hub bolt P.C.D. / 2)
- If the measured tangential force conforms to the specified value, this means that the drag torque of the disc brake conforms to the standard value.
- If the measured value does not conform to the specified torque, check the sliding portions of the piston and piston seal.

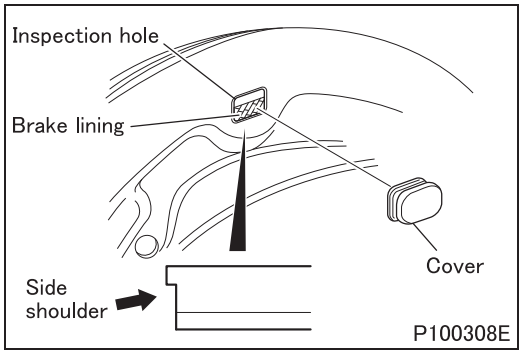
6. Inspection of Drum Brake Lining Thickness <FG>

CAUTION ⚠

- **To ensure correct operation of the brakes, be sure to inspect both linings on each wheel.**

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Brake lining thickness	–	4.0 {0.16} (side shoulder means wear limit)	Replace



- Remove the cover from the backing plate. Through the inspection hole, check the thickness of the brake lining.
- If any lining is worn down to the step on the side face, replace all linings on that axle.
- After the inspection, be sure to install the cover.

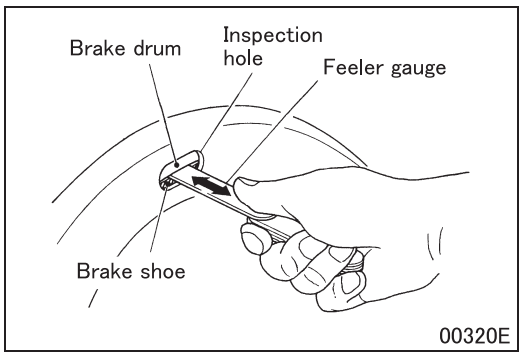
7. Initial Setting of Clearance between Brake Drum and Shoe <FG>

CAUTION ⚠

- **To ensure correct operation of the brakes, be sure to inspect both shoes on each wheel.**

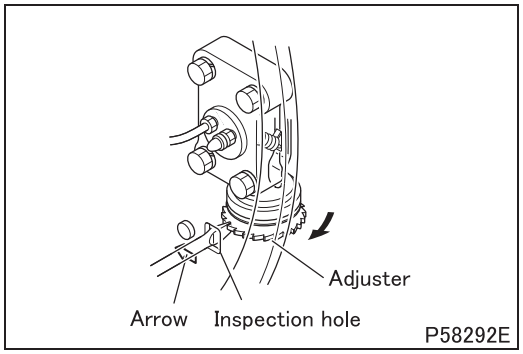
Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Clearance between brake drum and shoe	0.2 {0.0079}	–	Inspect, and adjust as required



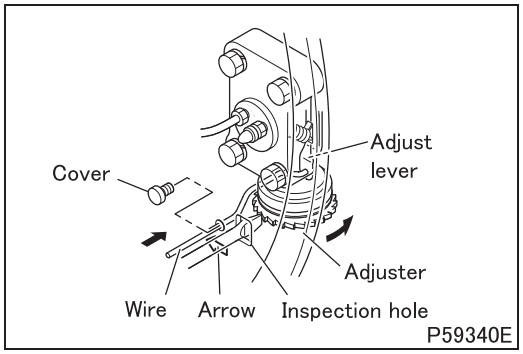
[Inspection]

- Cycle the brake pedal a couple of times to bring the brake shoes to conditions appropriate for the inspection.
- Through the inspection hole, insert a feeler gauge between the brake drum and lining. The gauge should be able to be inserted and removed with slight resistance.
- If the clearance does not conform to the standard value, perform the following adjustment.



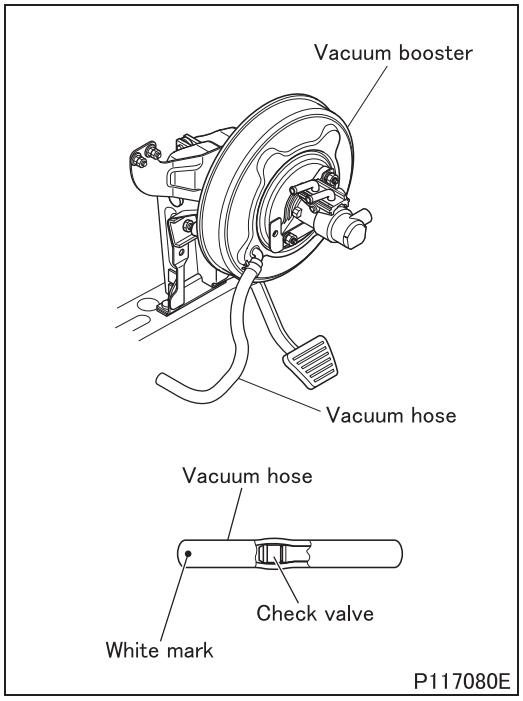
[Adjustment]

- Jack up the wheel being adjusted. Ensure that the wheel hub bearings are not loose.
- With a 0.2 mm {0.0079 in.} feeler gauge inserted through the inspection hole, adjust the drum-to-lining clearance in the following manners such that the gauge can be inserted and removed with slight resistance.
- If the feeler gauge can be inserted and removed with no resistance, turn the adjuster through the inspection hole in the direction of the arrow on the backing plate.

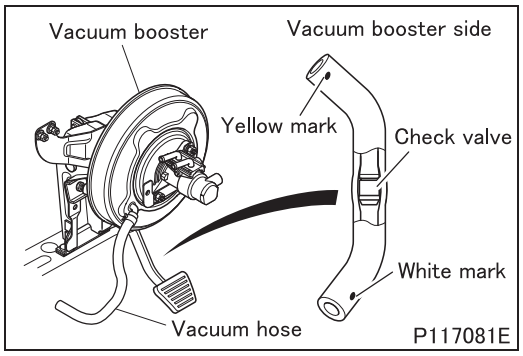


- If the clearance is too small to insert the feeler gauge or there is considerable resistance when inserting the gauge, remove the cover and insert a ϕ2 mm {0.079 in.} wire through the hole to lift the adjust lever for the wheel cylinder. Then, through the inspection hole turn the adjuster in the direction opposite to the arrow on the backing plate to increase the clearance between the brake drum and shoe.
- Then, cycle the brake pedal a couple of times. This will automatically bring the brake drum-to-shoe clearance to 0.2 mm {0.0079 in.}.
- Insert a 0.2 mm {0.0079 in.} feeler gauge between the brake drum and lining. It should be able to be inserted and removed with slight resistance.
- Check the disc brake for normal operation. If faulty, disassemble and inspect the wheel cylinders.

8. Inspection of Check Valve in Vacuum Line Hose



- Remove the vacuum hose from the vacuum booster and check the vacuum hose as follows. Replace the vacuum hose (check valve incorporated) if it is faulty.
  - Blow air into the hose from its marked end. Confirm the air will not pass through the hose.
  - Apply suction to the hose from its marked end. Confirm the air will pass through the hose.



- Attach the yellow-marked end of the vacuum hose to the vacuum booster. Connect the white-marked end of the vacuum hose to the piping in alignment with the match marking on the piping.

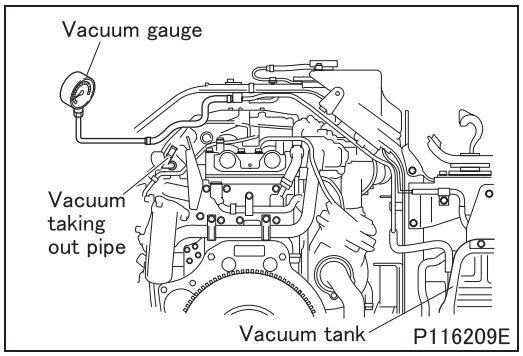
CAUTION ⚠

- **Make sure that the brake hose is not twisted when you install it.**

9. Inspection of Vacuum Pump

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Time to reach vacuum of 50 kPa {14.7 in.Hg, 375 mmHg}	Within 4.5 sec.	–	Replace
	Time to reach vacuum of 80 kPa {23.6 in.Hg, 600 mmHg}	Within 12.5 sec.	–	



- Install a vacuum gauge between the vacuum tank and the vacuum removal pipe in the back of engine.
- Start the engine and measure the time taken to reach the specified level of vacuum at an engine speed of 780 rpm (994 rpm in pump speed).
- If the measured time does not conform to the standard value, replace the vacuum pump.

10. Inspection of Vacuum Booster

- The vacuum booster can be inspected in 2 ways: one without using any tester and the other using a simplified tester. Either way, ensure that the brake piping and hosing and their connections are free of leakage, damage, or other faults.

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Fluid pressure at vacuum of 67 kPa {19.8 in.Hg, 500 mmHg}	FEC5 FEC7	5380 kPa {780 psi, 55 kgf/cm^2} (pedal depressed with a force of 98 N {22.0 lbs, 10 kgf})	–	Replace
			8560 kPa {1240 psi, 87kgf/cm^2} (pedal depressed with a force of 295 N {66.3 lbs, 30 kgf})	–	
		FEC9 FG	6070 kPa {880 psi, 62 kgf/cm^2} (pedal depressed with a force of 98 N {22.0 lbs, 10 kgf})	–	
			8790 kPa {1270 psi, 90/cm^2} (pedal depressed with a force of 295 N {66.3 lbs, 30 kgf})	–	
–	Fluid pressure at vacuum of 0 kPa {0 in.Hg, 0 mmHg}	FEC5 FEC7	90 Pa {13 psi, 0.9 cm^2} (pedal depressed with a force of 98 N {22.0 lbs, 10 kgf})	–	Replace
			1330 kPa {190 psi, 14 kgf/cm^2} (pedal depressed with a force of 295 N {66.3 lbs, 30 kgf})	–	
		FEC9 FG	160 kPa {23 psi, 1.6 kgf/cm^2} (pedal depressed with a force of 98 N {22.0 lbs, 10 kgf})	–	
			1560 kPa {225 psi, 16 kgf/cm^2} (pedal depressed with a force of 295 N {66.3 lbs, 30 kgf})	–	

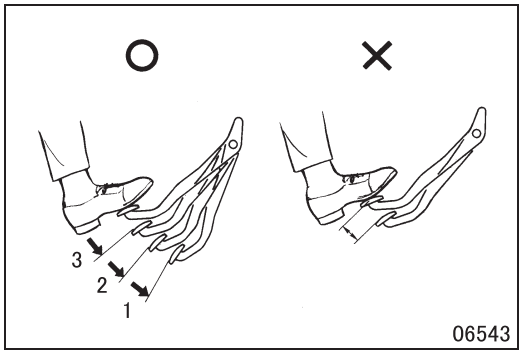
10.1 Operational check of vacuum booster

CAUTION ⚠

- **The vacuum booster operational checks described below are only of summary nature. If the vacuum booster continues to malfunction, perform a bench test specified by a service station of the manufacturer on the vacuum booster after removing it from the vehicle.**
- **If the vacuum booster is found to be faulty during the specified testing, ask the service station of the manufacturer for repair.**

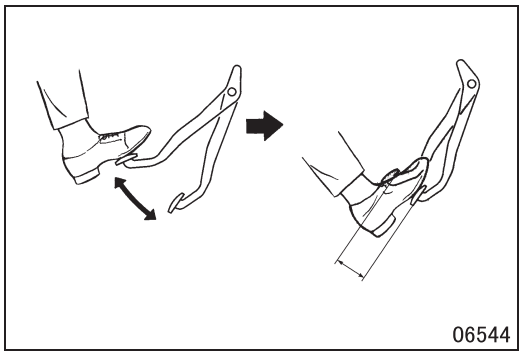
(1) Operational check without any tester

- Inspect the check valve in the vacuum hose for normal operation.
- Perform the checks described below. If any fault is found during these checks, inspect the following parts.
  - Vacuum booster
  - Vacuum pump



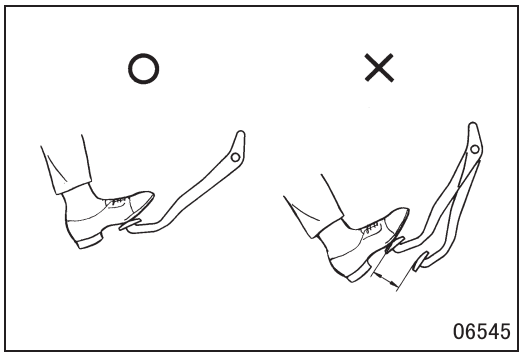
[Check 1]

- Start the engine and run it for 1 to 2 minutes. Stop the engine.
- Depress the brake pedal repetitively with the normal depressing force.
- The pedal stroke should become shorter each time the pedal is depressed.



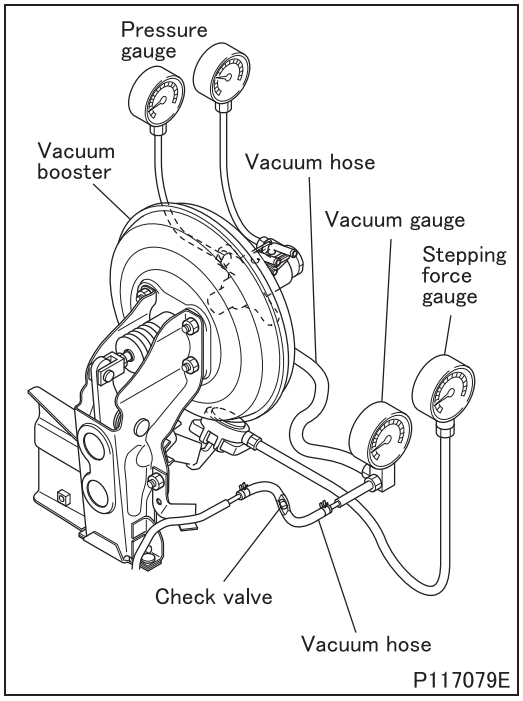
[Check 2]

- With the engine stationary, depress the brake pedal several times.
- With the brake pedal depressed, start the engine. The pedal should sink slightly.



[Check 3]

- With the engine running and the brake pedal depressed, stop the engine.
- The brake pedal should maintain the same height for approximately 30 seconds.



(2) Operational check with a simplified tester

(2.1) Airtightness check

- Inspect the check valve in the vacuum hose for normal operation.
- Remove the vacuum hose from the vacuum booster and connect it to the vacuum gauge.
- Connect another hose (not equipped with a check valve) onto the vacuum booster and the vacuum gauge.
- Install 2 pressure gauges and 1 stepping-force gauge as illustrated. Bleed the pressure gauges of air.
- Perform the following checks. If any fault is encountered during these checks, inspect the vacuum booster.

[Check 1]

- Start the engine. When the reading on the vacuum gauge has reached 67 kPa {19.8 in.Hg, 500 mmHg}, stop the engine.
- The vacuum lost in approximately 15 seconds of the engine stop should conform to the standard value.

[Check 2]

- Start the engine, and depress the brake pedal. When the reading on the vacuum gauge has reached 67 kPa {19.8 in.Hg, 500 mmHg}, stop the engine.
- The vacuum lost in approximately 15 seconds of the engine stop should conform to the standard value.

(2.2) System characteristics check

- Perform the following system characteristics checks after the airtightness check described above is completed.
- Perform the following checks. If any fault is encountered during these checks, inspect the vacuum booster.

[Check 1]

- Start the engine. When the reading on the vacuum gauge has reached 67 kPa {19.8 in.Hg, 500 mmHg}, depress the brake pedal with the specified depressing forces.
- The fluid pressures indicated on the pressure gauges should conform to the specified values.

[Check 2]

- Start the engine. When the reading on the vacuum gauge has reached 0 kPa {0 in.Hg, 0 mmHg}, press the brake pedal with the specified stepping forces.
- The fluid pressures indicated on the pressure gauges should conform to the specified values.

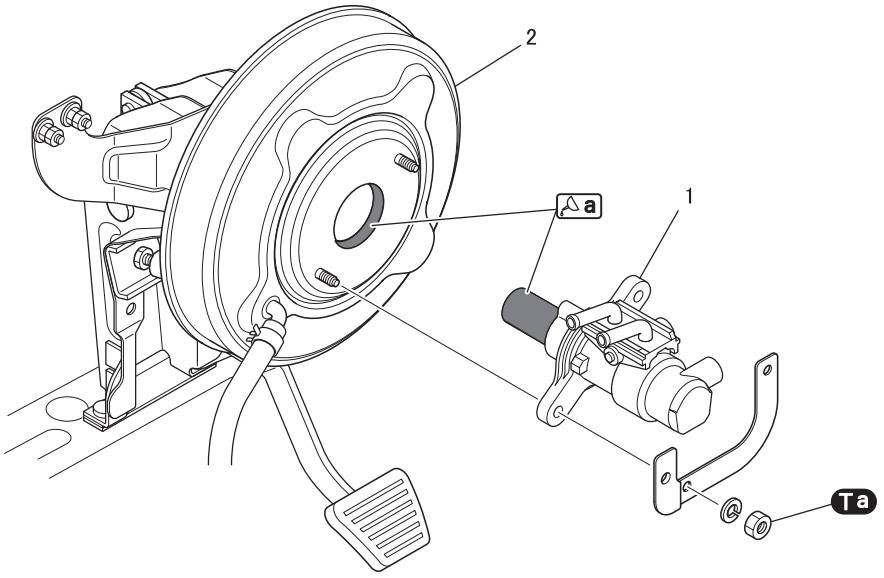
BRAKE MASTER CYLINDER



P116575

● **Disassembly sequence**

1 Brake master cylinder

2 Vacuum booster

● **Assembly sequence**

Follow the disassembly sequence in reverse.

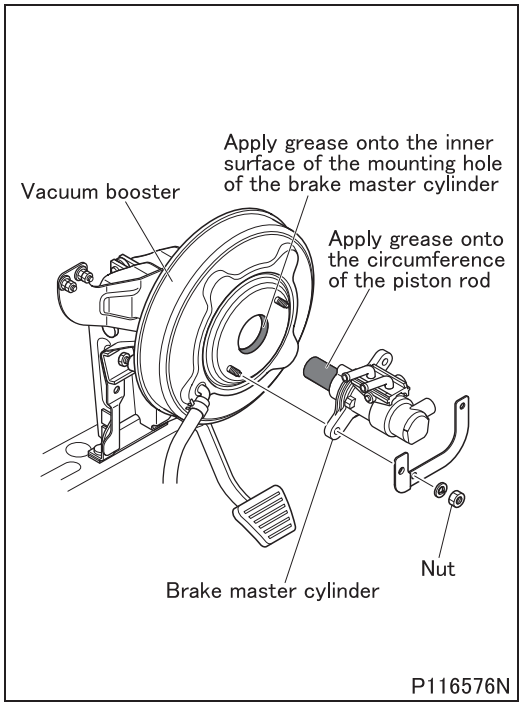
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (brake master cylinder mounting)	9.8 to 15.7 {7.2 to 12, 1 to 1.6}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Inner surface of mounting hole of the brake master cylinder in the vacuum booster	Rubber grease	As required
	Periphery of piston rod of brake master cylinder		

◆Installation procedure◆



■Installation: Brake master cylinder

- Apply grease onto the circumference of the piston rod of the brake master cylinder and the inner surface of the mounting hole of the brake master cylinder in the vacuum booster.

CAUTION ⚠

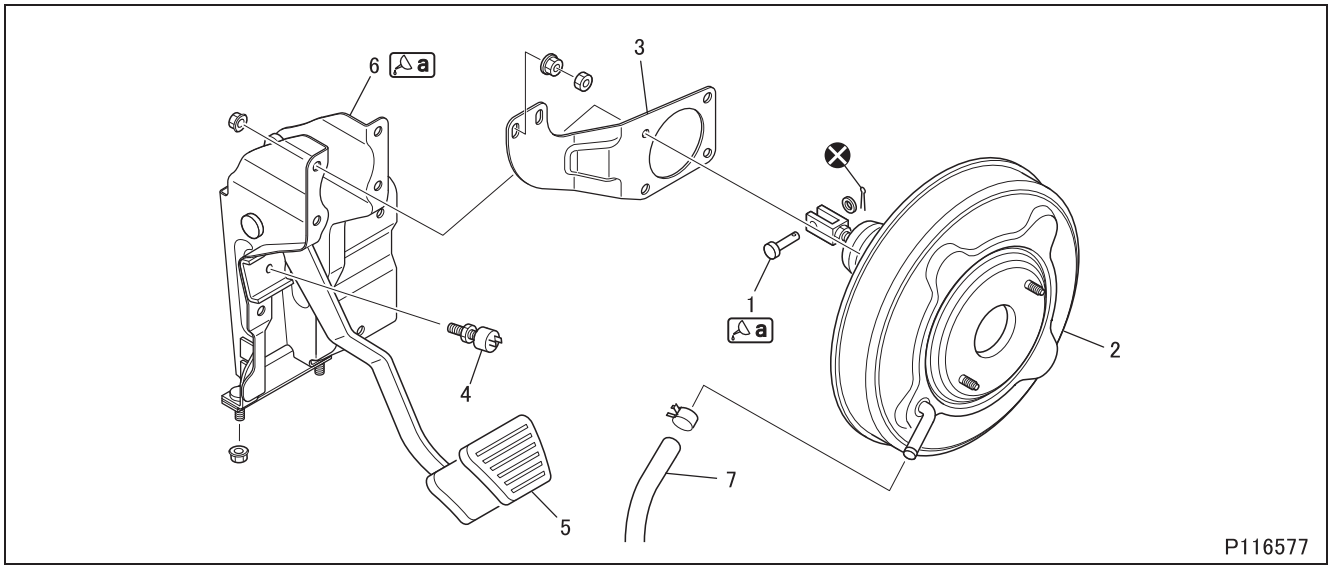
- **Be sure to use the grease included in the furnished spare parts kit for the brake master cylinder.**

- Install the brake master cylinder to the vacuum booster.

■Work after installation

- After the installation, inspect and adjust the brake pedal.

BRAKE PEDAL & VACUUM BOOSTER



● **Disassembly sequence**

1 Clevis pin
2 Vacuum booster
3 Bracket
4 Stop lamp switch
5 Pedal pad
6 Brake pedal & pedal support
7 Vacuum hose

⊗: Non-reusable parts

CAUTION ⚠

- **Do not attempt to disassemble the vacuum booster.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Clearance between threaded end of stop lamp switch and brake pedal	1.5 to 2.5 {0.059 to 0.098}	–	Adjust

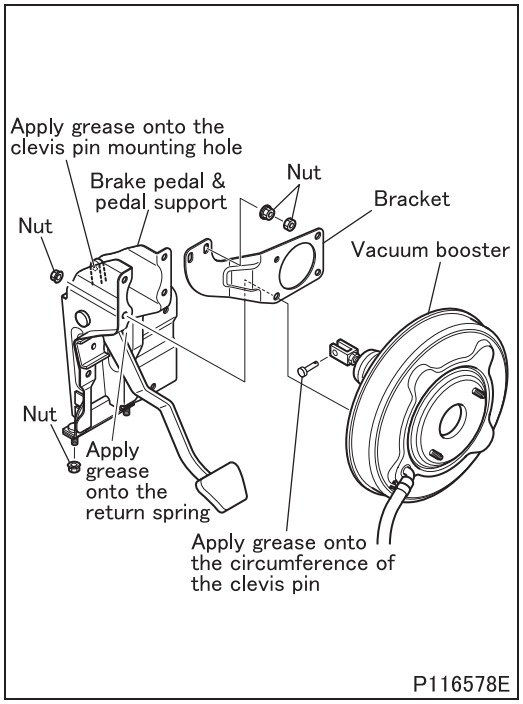
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut (stop lamp switch)	21.6 {16, 2.2}	–

Lubricant and/or sealant

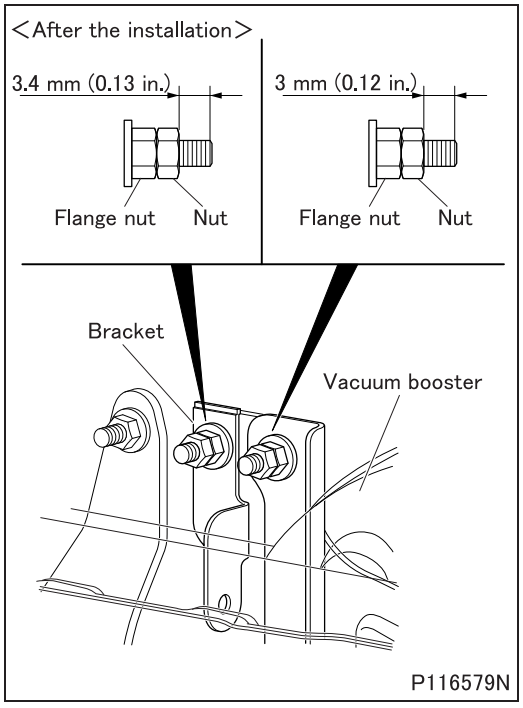
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Return spring of brake pedal & pedal support; Inner periphery of clevis pin hole	Chassis grease [NLGI No. 1 (Li soap)]	As required

◆Installation procedure◆

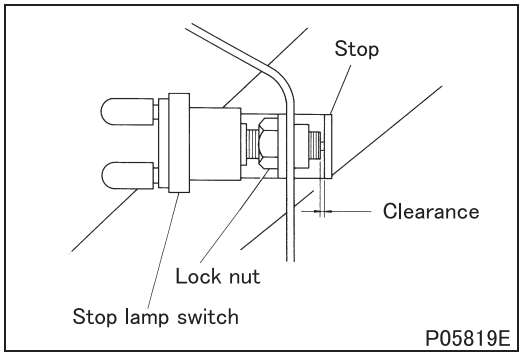


■**Installation: Brake pedal & pedal support, bracket, vacuum booster**

- Apply chassis grease onto the return spring and the inner surface of the clevis pin mounting hole of the brake pedal & pedal support. Also, apply the grease onto the circumference of the clevis pin.



- Tighten the bracket mounting double nut so that the amount of bolt protrusion from the nut is as shown in the illustration.



■ **Installation: Stop lamp switch**

- After the installation, measure the clearance between the threaded end of the stop lamp switch and the brake pedal stopper. If the measurement deviates from the standard value, loosen the lock nut and adjust by turning the operating rod for the specified clearance.
- After adjustment, secure the switch with the lock nut.

CAUTION ⚠

- **To prevent brake drag, ensure that the threaded end of the stop lamp switch does not interfere with the stop for the brake pedal.**

16 Outer shim B
17 Outer pad (with pad wear indicator)
18 Inner pad
19 Inner shim B
20 Inner shim A
21 Pin boots
22 Main slide pin

⊗: Non-reusable parts

NOTE

- **For removal and installation of the front disc brake and disc rotor, see Gr26A.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Repair kit: Pad kit, Seal kit

CAUTION ⚠

- **Rubber parts that are disassembled must be replaced as a seal kit.**
- **Items included in a seal kit must be lubricated with grease supplied with the kit before installation.**
- **Do not apply lubricant to the surface of the outer or inner pad and disc rotor. Otherwise, braking performance will be adversely affected.**
- **Do not use gasoline, engine oil, nitro phenycorol thinner, and other chlorine-based detergents for cleaning of parts, as a damaged rubber part could result.**
- **Measure disc brake drag torque after installing the disc brake. (See ON-VEHICLE INSPECTION AND ADJUSTMENT.)**
- **If the pads and outer shims are to be replaced, do not mix Type A and Type B on one axle.**

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
17, 18	Thickness of outer/inner pad		14 {0.55}	4 {0.16}	Replace
9	Disc rotor	Thickness	40 {1.57}	38 {1.50}	Replace
		Runout (measure, assembling it into knuckle)	0.07 {0.0028} or less	0.10 {0.0039}	Replace

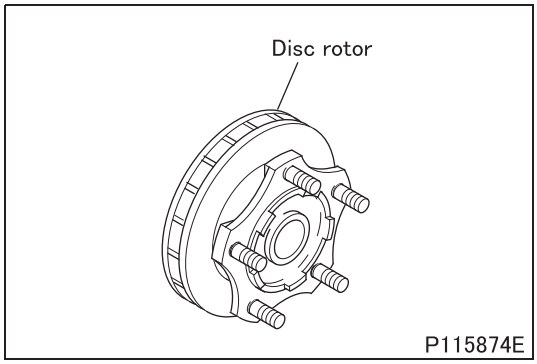
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Slide pin bolt	40 to 50 {30 to 37, 4.0 to 5.0}	–
Tb	Air bleeder	8.8 to 12.7 {6.5 to 9.4, 0.9 to 1.3}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Outer circumference of piston	Brake fluid (SAE J1703 or FMVSS No. 116 DOT3)	As required
b	Inner circumference of caliper cylinder lips	Rubber grease	As required
	Outer circumference of main and sub slide pins		
	Pin boots mating surfaces with slide pins		
	Torque member grooves and guide holes for pin boots		

◆Inspection procedure◆



■ Inspection: Disc rotor

(1) Visual check

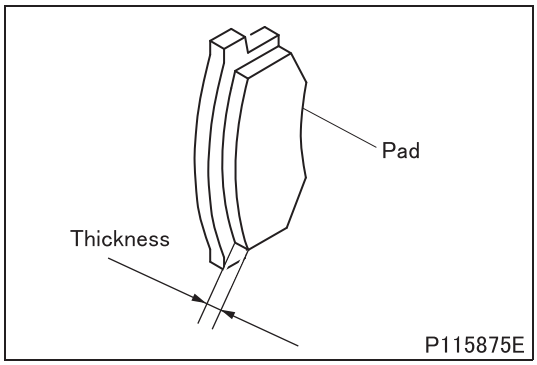
- If the disc rotor is abnormally worn or damaged, replace it.

(2) Thickness

- If the measurement exceeds the limit, replace the disc rotor.

(3) Runout

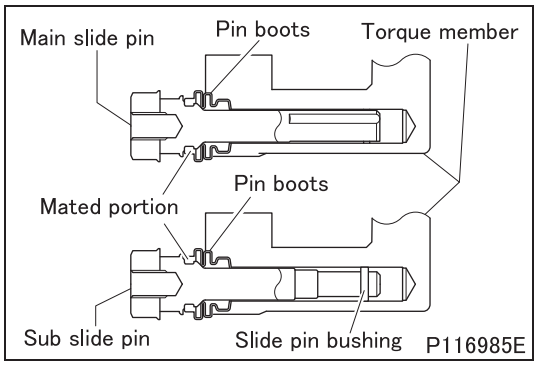
- Assemble the disc rotor onto the knuckle and measure the runout of the rotor.
- If the measurement exceeds the limit, replace the defective part with a new one.



■**Inspection: Outer pad and inner pad**

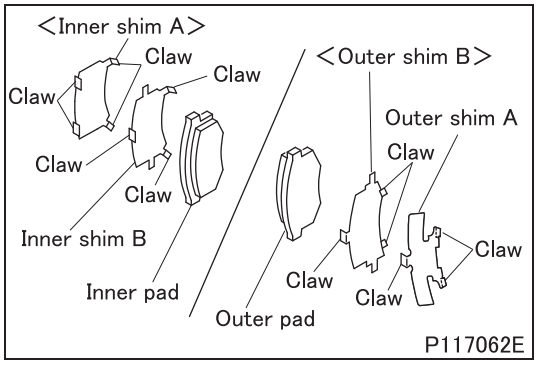
- Measure thicknesses of the outer and inner pads.
- If the measurement is less than the limit, replace the defective part with a new one.

◆**Installation procedure**◆



■ **Installation: Main slide pin, sub slide pin, pin boots, and slide pin bush**

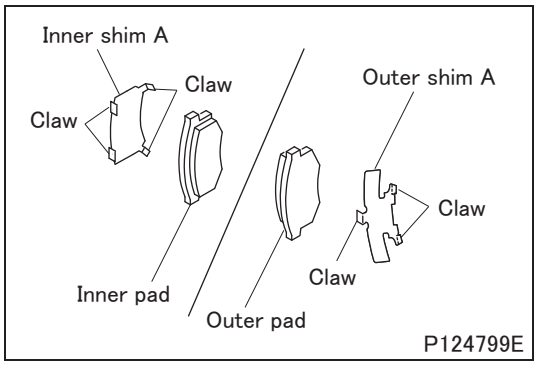
- Apply rubber grease onto the lips of the pin boots, pin boot fitting grooves on the torque member and the entire inner circumference of the slide pins. Then, install the pin boots into the fitting grooves on the torque member.
- Apply rubber grease onto the slide pin bushing and the bushing groove on the sub slide pin. Then, install the slide pin bushing to the sub slide pin.
- Apply rubber grease along the outer circumference of the main slide pin and sub slide pin and at the joints of the pin boots with the slide pins. Insert the slide pins in the mating holes in the torque member, then install the pin boots in place.
- Make sure that pin boot seals are fitted at the joints of the main slide pins and sub slide pins with the pin boots.



■ **Installation: Shims**

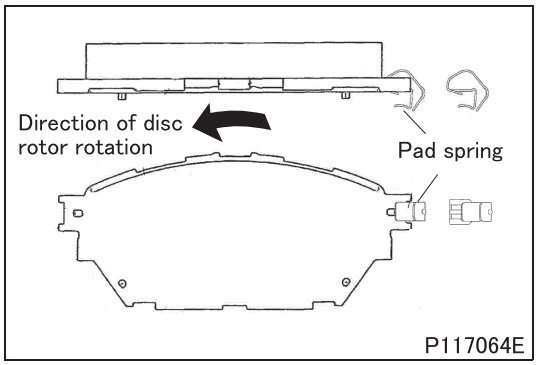
<Type A>

- Install the outer shims A and B and inner shims A and B to the pads in the directions shown in the drawing.



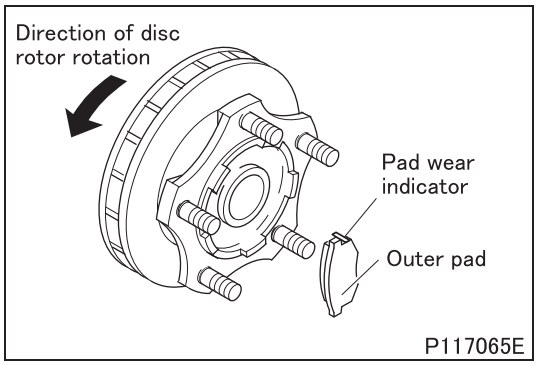
<Type B>

- Install the outer shim A and inner shim A to the pads in the directions shown in the drawing.



■ **Installation: Outer pad and inner pad**

- Install the outer and inner pads in such a way that the pad spring sits in the illustrated position relative to the rotational direction of the disc rotor in forward motion.

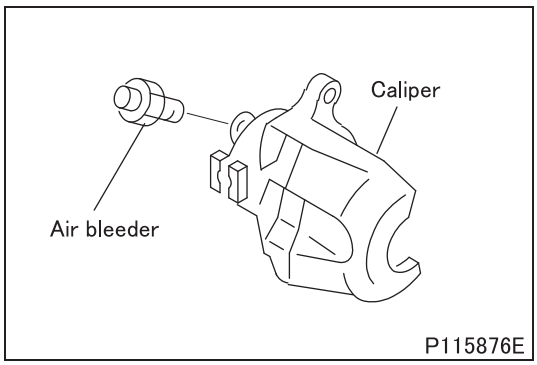


■ **Installation: Outer pad**

- Install the outer pad so that the pad wear indicator comes in the illustrated position relative to the rotating direction of the disc rotor during forward travel.

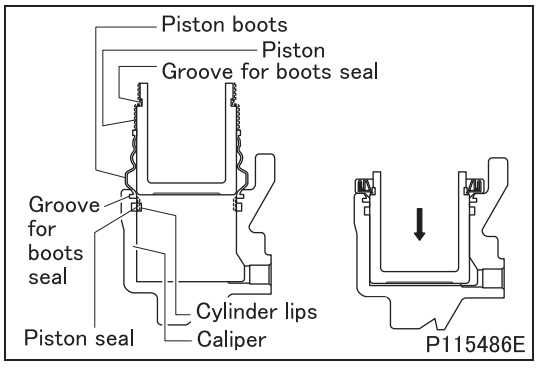
CAUTION ⚠

- **Install the outer pad so that the pad wear indicator always comes into the designated position. If not, the braking force will be decreased.**



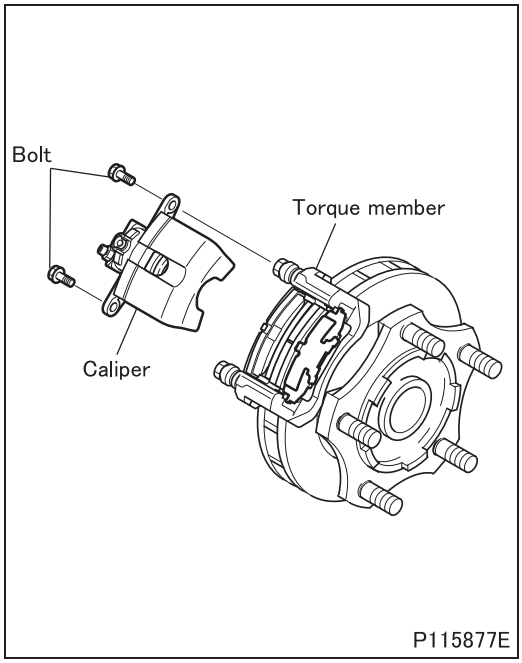
■ **Installation: Air bleeder**

- Install the air bleeder on the caliper.



■ **Installation: Piston boots, piston, and piston seal**

- Apply brake fluid onto the outer circumference of the piston. Then, insert the piston boots over the piston.
- On the piston seal, spread the grease, already applied on it, evenly over the seal. Then, install the seal into the groove on the caliper.
- Apply grease evenly along the inner circumference of the cylinder lips on the caliper.
- Install the caliper-end seal of the piston boots into the groove on the caliper.
- Press fit the piston further into the boots. Ensure that the piston-end seal of the piston boots is engaged in the groove on the piston.



■ **Installation: Caliper**

- Install the caliper to the torque member.

NOTE

- **For removal and installation procedures of the front drum brake and brake drum, see Gr26B.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Repair kit: Brake lining kit

CAUTION ⚠

- **Do not apply lubricant to the surface of the brake lining and disc rotor. Otherwise, braking performance will be adversely affected.**
- **When replacing the brake lining, clean the threaded portions of the wheel cylinder adjuster and adjust screw and coat them with rubber grease.**
- **Adjust clearance between brake drum and shoe after installing the drum brake. (See ON-VEHICLE INSPECTION AND ADJUSTMENT.)**

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
1	Return spring load (installed length 190 {7.48})		195 to 235 N {44 to 53 lbs, 19.8 to 24.2 kgf}	175 N {39 lbs, 18.0 kgf}	Replace
7	Brake lining thickness		8.8 {0.35}	4.0 {0.16} (side shoulder means wear limit)	Replace
*a	Brake drum	Inside diameter	320 {12.6}	322 {12.7} (※ 321 {12.6})	Repair or Replace
		Cylinder	0.05 {0.002}	0.2 {0.008}	

※ : Shows the correction limit value.

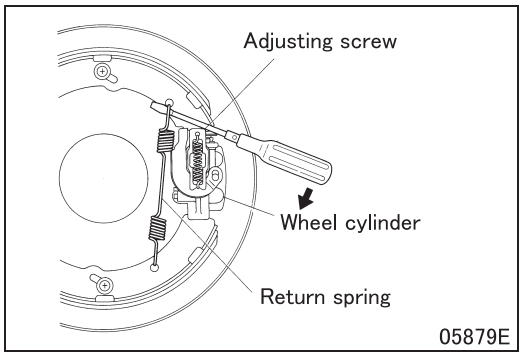
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Brake pipe	13 to 15 {9.6 to 11, 1.3 to 1.5}	–
	Extension		
Tb	Bolt (connector mounting)	7.8 to 12 {5.8 to 8.9, 0.8 to 1.2}	–
Tc	Bolt (wheel cylinder mounting)	37 to 49 {27 to 36, 3.8 to 5.0}	–

Lubricant and/or sealant

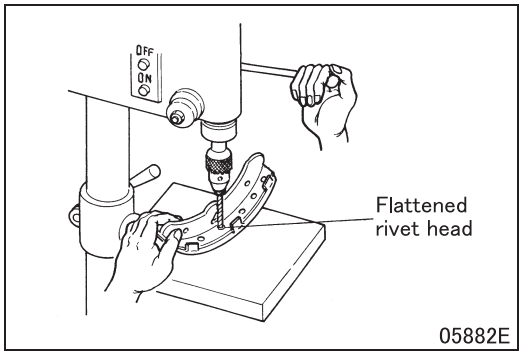
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Contact areas between brake shoe and wheel cylinder	Brake grease	As required
	Contact areas between backing plate and brake shoe		

◆Removal procedure◆



■ Removal: Return spring

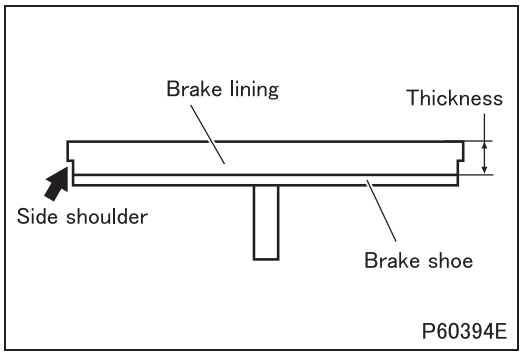
- Using a flat-head screwdriver, remove the return spring. To do this, rest the screwdriver on the wheel cylinder adjusting screw. Then, with the adjusting screw as a fulcrum, engage the screwdriver into the spring hook and pry away the spring.



■ **Removal: Brake lining**

- Using a drill, break the flattened rivet heads on the brake shoe side to release the brake lining.

◆**Inspection procedure**◆



■ **Inspection: Brake lining thickness**

- If any brake lining has worn to the side shoulder, replace the brake linings of both brakes on the same axle.

■ **Inspection: Brake drum**

(1) Visual inspection

- If an abnormal wear or damage is found on the inside circumference of the brake drum, resurface the brake drum inner surface with the wheel hub as a set within the correction limit or replace the drum.

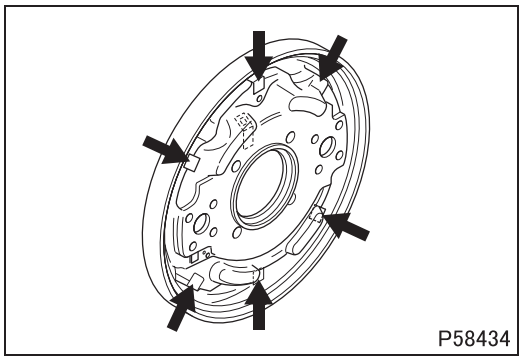
(2) Inner diameter

- If the measured value exceeds the limit, replace the brake drum.

(3) Cylindricity

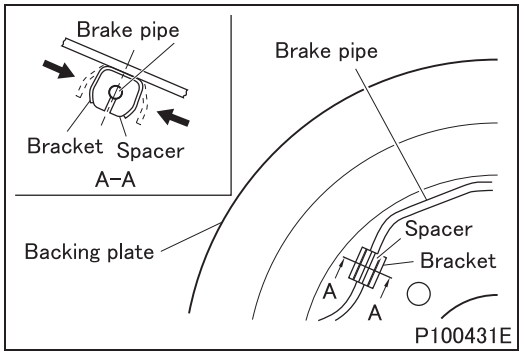
- If the measured value exceeds the limit, resurface the brake drum inner circumference within the correction limit or replace the drum.

◆**Installation procedure**◆



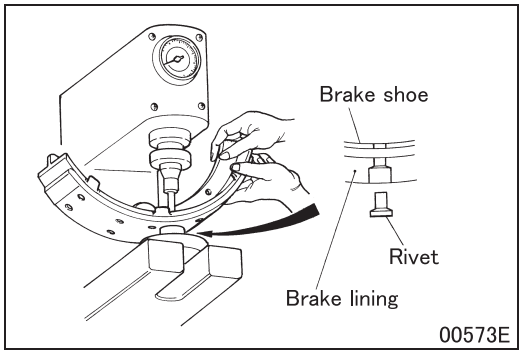
■ **Installation: Backing plate**

- Grease the backing plate at the illustrated locations.



■ **Installation: Brake pipe**

- Position the spacer correctly on the bracket so that the brake pipe and spacer assembly will not clear the backing plate surface.
- After making sure that the brake pipe and spacer assembly is centered on the bracket, close the bracket to secure the brake pipe in such a way that the brake pipe is retained evenly by the spacer.



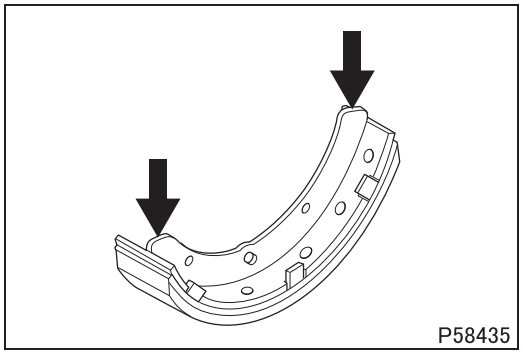
■ **Installation: Brake lining**

- Using cleaning fluid, clean the surface of the brake shoe to which the brake lining is to be mounted. Dry the brake shoe.
- Insert rivets from the lining to the shoe. Stake them, starting from the center of the shoe and moving towards the ends. Ensure that the shoe-to-lining clearances conform to the following specifications.
  - Around the rivets: 0.05 {0.0020 in.} mm or less
  - Along the shoe/lining:
    0.2 mm {0.0079 in.} or less
- Stake the rivets with a force of 17650 ± 980 N {3970 ± 220 lbs, 1800 ± 100 kgf}.

CAUTION ⚠

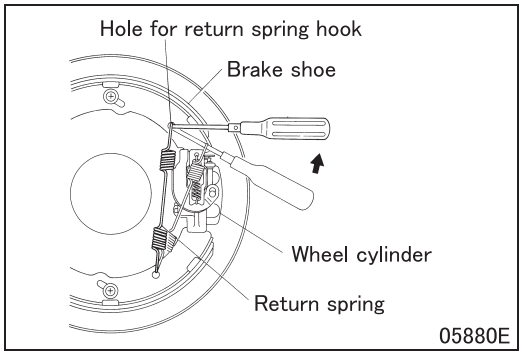
- **Replace all of the brake linings on the same axle and the brake linings should be in the same size and have the same identification mark. Otherwise, braking performance can be different from left to right.**

- After assembly, check the drum-to-lining contact. Correct as required.



■ **Installation: Brake shoe**

- Grease the brake shoe at the illustrated locations.



■ **Installation: Return spring**

- Hook the end of the return spring that has a smaller number of coils onto the brake shoe on the adjust screw side of the wheel cylinder.
- Engage a small Phillips screwdriver into the return spring hook. Then, using the screwdriver insert the spring hook into the hook hole in the brake shoe and attach the hook onto the shoe.

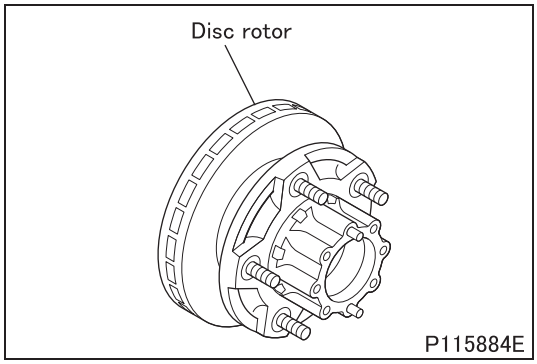
	Outer circumference of main and sub slide pins		
	Pin boots mating surfaces with slide pins		
	Torque member grooves and guide holes for pin boots		

◆Inspection procedure◆



■ Inspection: Disc rotor

(1) Visual check

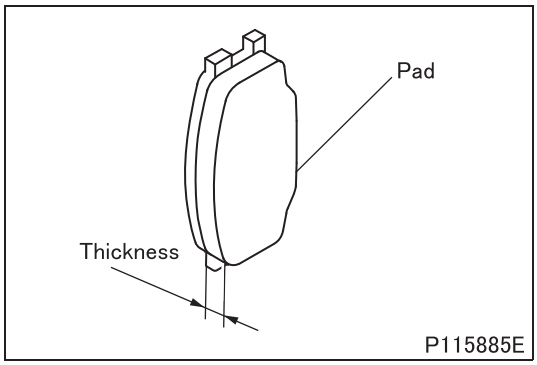
- If the disc rotor is abnormally worn or damaged, replace it.

(2) Thickness

- If the measurement exceeds the limit, replace the disc rotor.

(3) Runout

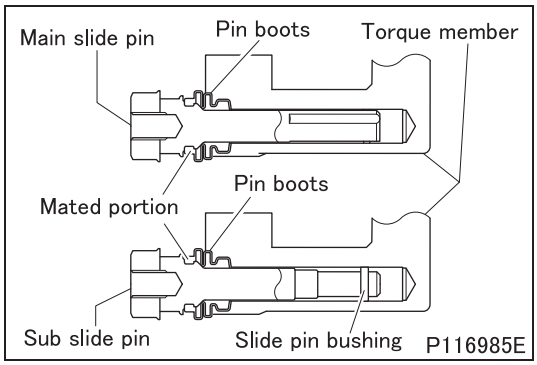
- Assemble the disc rotor onto the knuckle and measure the runout of the rotor.
- If the measurement exceeds the limit, replace the defective part with a new one.



■**Inspection: Outer pad and inner pad**

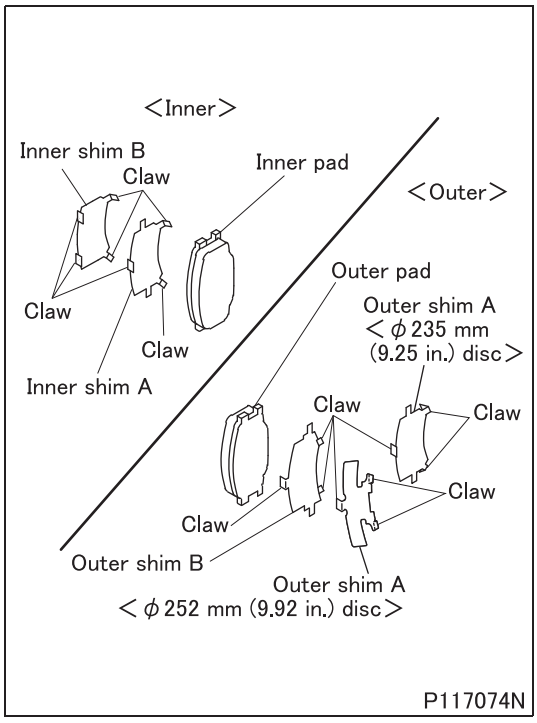
- Measure thicknesses of the outer and inner pads.
- If the measurement is less than the limit, replace the defective part with a new one.

◆Installation procedure◆



■**Installation: Main slide pin, sub slide pin, pin boots, and slide pin bush**

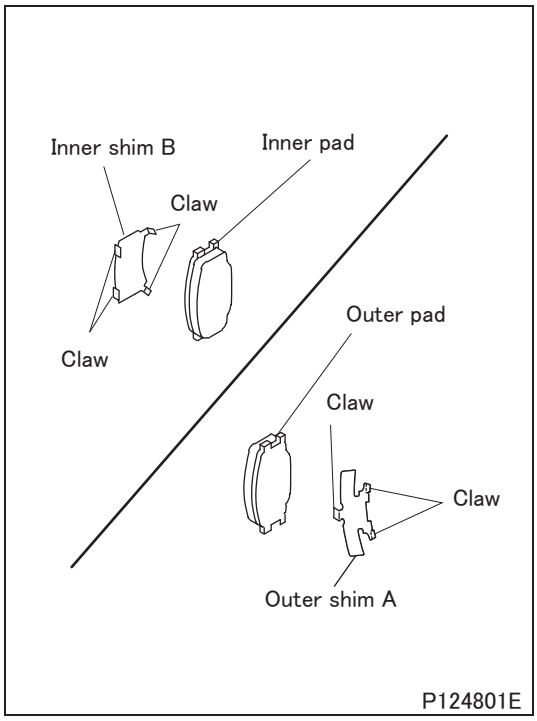
- Apply rubber grease onto the lips of the pin boots, pin boot fitting grooves on the torque member and the entire inner peripheries of the slide pins. Then, install the pin boots into the fitting grooves on the torque member.
- Apply rubber grease onto the slide pin bushing and the bushing groove on the sub slide pin. Then, install the slide pin bushing to the sub slide pin.
- Apply rubber grease along the outer peripheries of the main slide pin and sub slide pin and at the joints of the pin boots with the slide pins. Insert the slide pins in the mating holes in the torque member, then install the pin boots in place.
- Make sure that pin boot seals are fitted at the joints of the main slide pins and sub slide pins with the pin boots.



■**Installation: Shims**

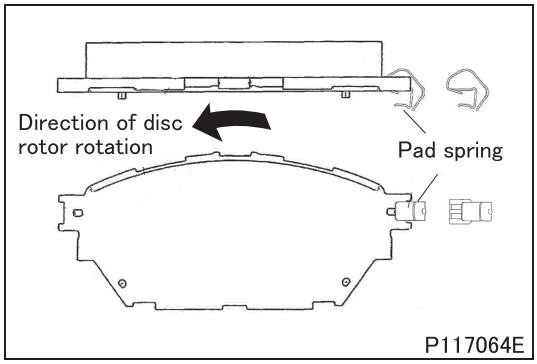
<Type A>

- Install the outer shims A and B and inner shims A and B to the pads in the directions shown in the drawing.



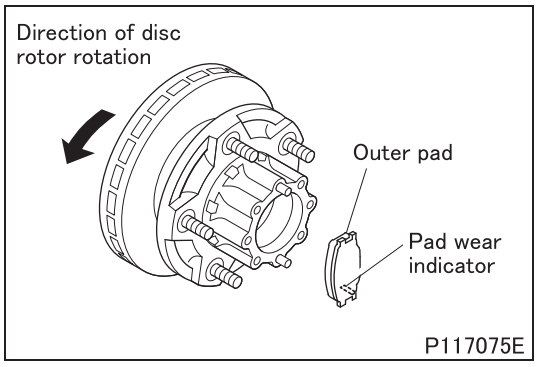
<Type B>

- Install the outer shim A and inner shim B to the pads in the directions shown in the drawing.



■ Installation: Outer pad and inner pad

- Install the outer and inner pads in such a way that the pad spring sits in the illustrated position relative to the rotational direction of the disc rotor in forward motion.

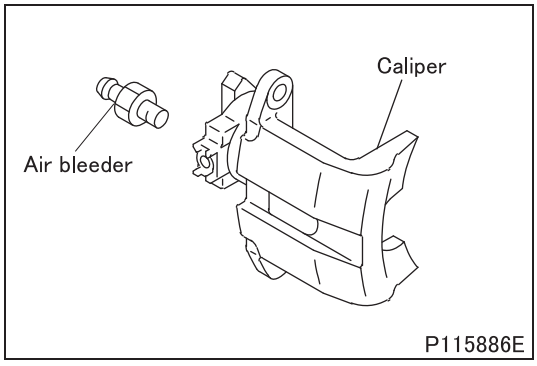


■ Installation: Outer pad

- Install the outer pad so that the pad wear indicator sits in the illustrated position relative to the rotating direction of the disc rotor during forward travel.

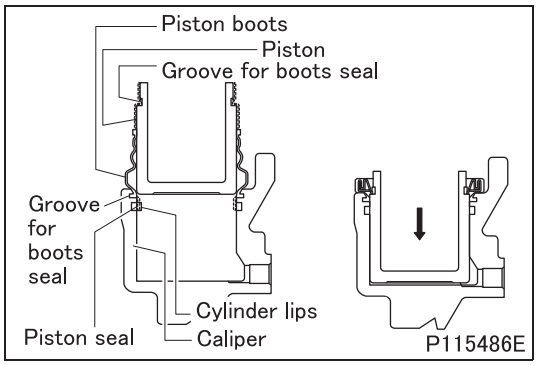
CAUTION ⚠

- **Install the outer pad so that the pad wear indicator always sits in the designated position. If not, the braking force will be decrease.**



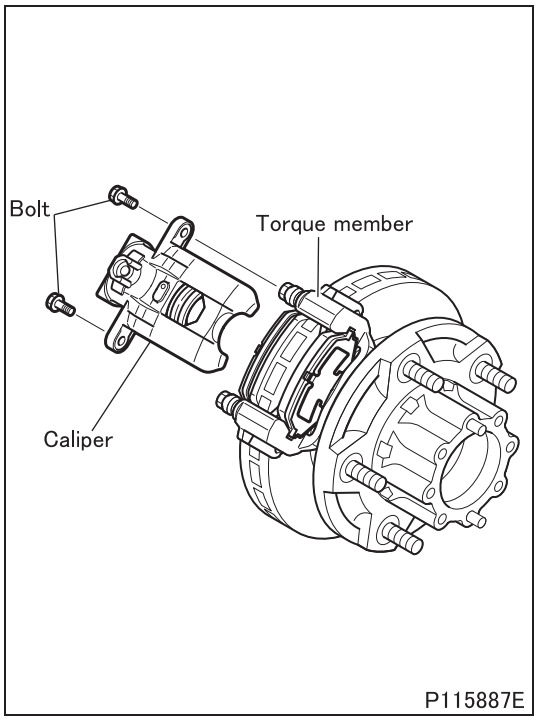
■ Installation: Air bleeder

- Install the air bleeder on the caliper.



■ **Installation: Piston boots, piston, and piston seal**

- Apply brake fluid onto the outer periphery of the piston. Then, insert the piston boots over the piston.
- On the piston seal, spread the grease, already applied on it, evenly over the seal. Then, install the seal into the groove on the caliper.
- Apply grease evenly along the inner circumference of the cylinder lips on the caliper.
- Install the caliper-end seal of the piston boots into the groove on the caliper.
- Press fit the piston further into the boots. Ensure that the piston-end seal of the piston boots is engaged in the groove on the piston.



■ **Installation: Caliper**

- Install the caliper to the torque member.

7 Brake lining
8 Brake shoe
9 Brake pipe
10 Spacer
11 Wheel cylinder (See later section.)
12 Cover
13 Cover
14 Cover
15 Backing plate

***a**: Brake drum (See Gr27.)
⊗: Non-reusable parts

CAUTION ⚠

- **For removal and installation of the rear drum brake and brake drum, see Gr27.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Do not apply lubricant to the surface of the brake lining. Otherwise, braking performance will be adversely affected.**
- **When replacing the brake lining, clean the threaded portions of the wheel cylinder adjuster and adjusting screw and coat them with rubber grease.**
- **Adjust clearance between brake drum and shoe after installing the drum brake. (See ON-VEHICLE INSPECTION AND ADJUSTMENT.)**

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
1	Return spring load (installed length 190 {7.48})		195 to 235 N {44 to 53 lbs, 19.8 to 24.2 kgf}	175 N {39 lbs, 18.0 kgf}	Replace
7	Brake lining thickness		10.4 {0.41}	4.0 {0.16} (side shoulder means wear limit)	Replace
***a**	Brake drum	Inside diameter	320 {12.6}	322 {12.7} (※ 321 {12.6})	Repair or Replace
		Cylinder	0.05 {0.002}	0.2 {0.008}	

※ : Shows the correction limit value.

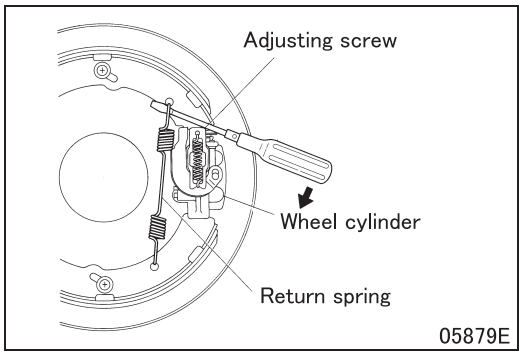
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Brake pipe	13 to 15 {9.6 to 11, 1.3 to 1.5}	–
Tb	Bolt (wheel cylinder mounting)	79 to 108 {58 to 80, 8.1 to 11.0}	–

Lubricant and/or sealant

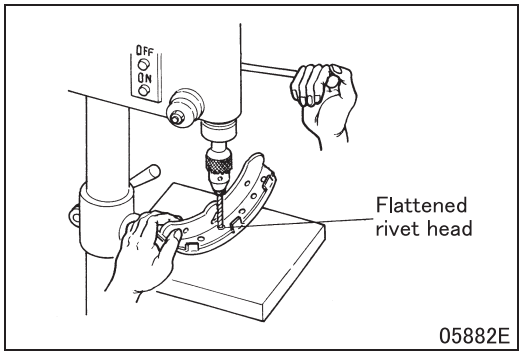
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Contact areas between brake shoe and wheel cylinder	Brake grease	As required
	Contact areas between backing plate and brake shoe		

◆Removal procedure◆



■ Removal: Return spring

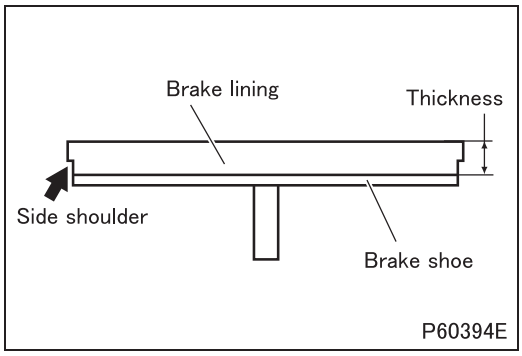
- Using a flat-head screwdriver, remove the return spring. To do this, rest the screwdriver on the wheel cylinder adjusting screw. Then, with the adjusting screw as a fulcrum, engage the screwdriver with the spring hook and pry away the spring.



■ **Removal: Brake lining**

- Using a drill, break the flattened rivet heads on the brake shoe side to release the brake lining.

◆**Inspection procedure**◆



■ **Inspection: Brake lining thickness**

- If any brake lining has worn to the side shoulder, replace the brake linings of both brakes on the same axle.

■ **Inspection: Brake drum**

(1) Visual inspection

- If abnormal wear or damage is found on the inside of the brake drum, resurface the brake drum inner circumference with the wheel hub as a set within the correction limit or replace the drum.

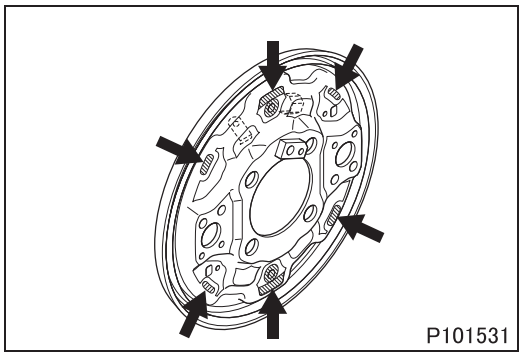
(2) Inner diameter

- If the measured value exceeds the limit, replace the brake drum.

(3) Cylindricity

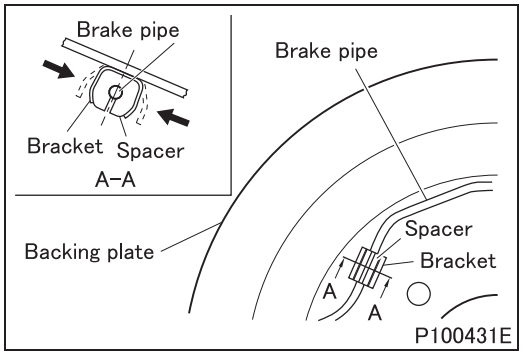
- If the measured value exceeds the limit, regrind the brake drum inner surface within the correction limit or replace the drum.

◆**Installation procedure**◆



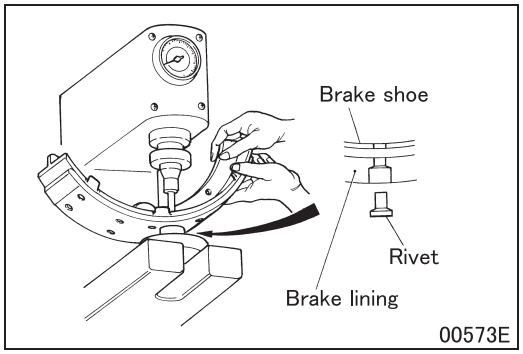
■ **Installation: Backing plate**

- Grease the backing plate at the illustrated locations.



■ **Installation: Brake pipe**

- Position the spacer correctly on the bracket so that the brake pipe and spacer assembly will not clear the backing plate surface.
- After making sure that the brake pipe and spacer assembly is centered on the bracket, close the bracket to secure the brake pipe in such a way that the brake pipe is retained evenly by the spacer.



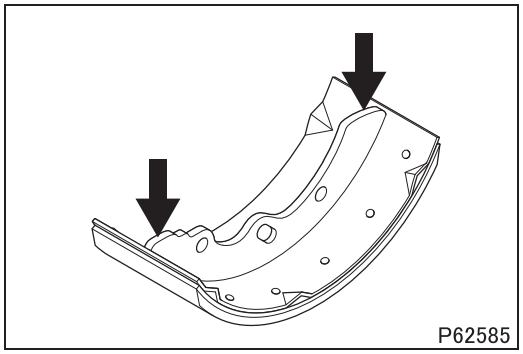
■ **Installation: Brake lining**

- Using cleaning fluid, clean the surface of the brake shoe to which the brake lining is to be mounted. Dry the brake shoe.
- Insert rivets from the lining to the shoe. Stake them, starting from the center of the shoe and moving towards the ends. Ensure that the shoe-to-lining clearances conform to the following specifications.
  - Around the rivets: 0.05 mm {0.0020 in.} or less
  - Along the shoe/lining:
    0.2 mm {0.0079 in.}
- Stake the rivets with a force of 17650 ± 980 N {3970 ± 220 lbs, 1800 ± 100 kgf}.

CAUTION ⚠

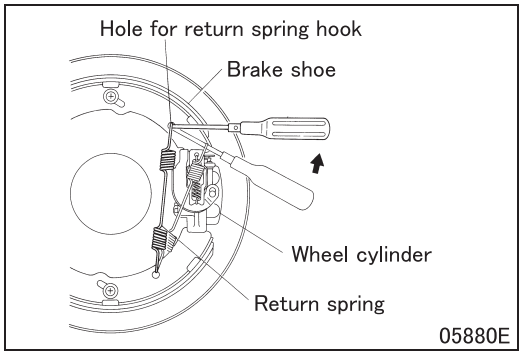
- **Replace all of the brake linings on the same axle and the brake linings should be in the same size and have the same identification mark. Otherwise, braking performance can be different from left to right.**

- After assembly, check the drum-to-lining contact. Correct as required.



■ **Installation: Brake shoe**

- Grease the brake shoe at the illustrated locations.



■ **Installation: Return spring**

- Engage a small Phillips screwdriver into the return spring hook. Then, using the screwdriver insert the spring hook into the hook hole in the brake shoe and attach the hook onto the shoe.

2. **Inspection of Vacuum Booster 35-4**

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection and Adjustment of Brake Pedal

CAUTION ⚠

- **Securely chock the wheels so that the vehicle does not move. Do not remove the chocks until the entire operation is completed.**

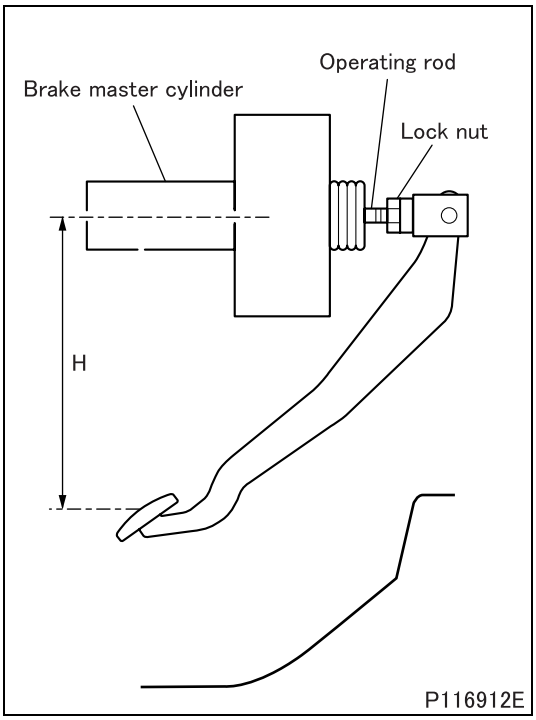
- Inspection and adjustment of the brake pedal must be carried out after those of the following are completed.
  - Bleeding of brake system
  - Measurement of drag torque of disc brake

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Installed height of brake pedal	FEC5, FEC7	243 ± 3 {9.6 ± 0.12}	–	Adjust
		FEC9, FECX, FGB7	214.2 ± 3 {8.4 ± 0.123}		
–	Clearance between floor and brake pedal (when depressed with a force of 490 N {110 lbs, 50 kgf})		10 {0.39} or more	–	Adjust
–	Brake pedal free play		0.1 to 3 {0.0034 to 0.12}	–	Adjust
–	Clearance between threaded end of stop lamp switch and brake pedal		1.5 to 2.5 {0.059 to 0.098}	–	Adjust

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut (operating rod securing)	20.4 to 30.6 {15 to 23, 2.1 to 3.1}	–



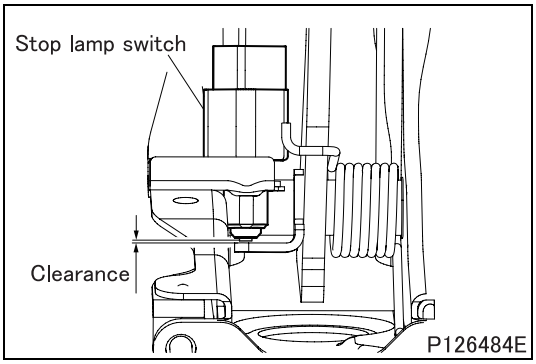
1.1 Brake pedal installed height

[Inspection]

- Remove the center lower cover of the instrument panel so that measurement can be performed.
- With the engine stopped and the brake pedal released, measure the height (H) from the center of the brake master cylinder to the center of the brake pedal.
- If the measurement deviates from the standard value, adjust the height by turning the operating rod of the vacuum booster.

[Adjustment]

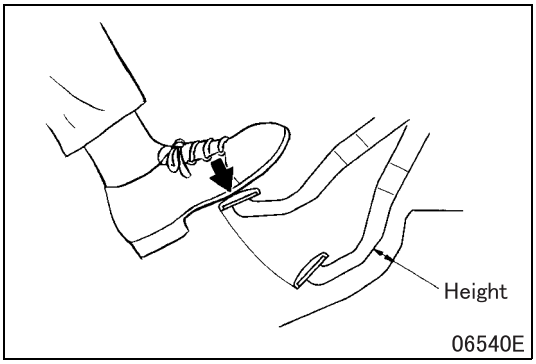
- Loosen the lock nut and turn the operating rod to bring the installed height of the brake pedal into the standard value range.
- Tighten the lock nut to the specified torque.
- After tightening the lock nut, depress the brake pedal and check the brake pedal play and clearance between the brake pedal and floor.



- After adjustment, check the clearance between the threaded end of the stop lamp switch and brake pedal.

CAUTION ⚠

- **When the pedal is fully depressed, the vacuum booster operating rod functions as a stopper for the brake pedal.**



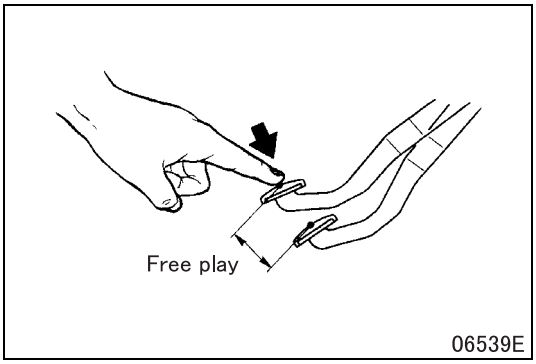
1.2 Clearance between depressed brake pedal and floor

[Inspection]

- Remove the floor mat to prepare for the measurement.
- With the engine idling, depress the brake pedal with a force of 490N {110 lbs, 50 kgf} and measure the clearance between the brake pedal and floor.
- If the measurement deviates from the standard value, adjust the brake pedal height by turning the operating rod of the vacuum booster.

[Adjustment]

- See “1.1 Brake pedal installed height”.



1.3 Brake pedal play

- Check the brake pedal play with the vehicle in the following state.
- Stop the engine and set the starter switch to ON.
- With the parking brake applied, depress the brake pedal several times until the pedal requires too much efforts.
- Depress the brake pedal several more times.

[Inspection]

- Depress the center of the brake pedal pad with a finger until you feel resistance to measure the brake pedal play.
- If the measurement deviates from the standard value, adjust the installed height of the brake pedal.

[Adjustment]

- See “1.1 Brake pedal installed height”.

2. Inspection of Vacuum Booster

- The vacuum booster can be inspected in 2 ways: one without using any tester and the other using a simplified tester. Either way, ensure that the brake piping and hosing and their connections are free of leakage, damage, or other faults.

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Fluid pressure at vacuum of 67 kPa {19.8 in.Hg, 500 mmHg}	FEC5 FEC7	5380 kPa {780 psi, 55 kgf/cm^2} (pedal depressed with a force of 98 N {22.0 lbs, 10 kgf})	–	Replace

			8790 kPa {1270 psi, 90 kgf/cm^2} (pedal depressed with a force of 295 N {66.3 lbs, 30 kgf})	–	
–	Fluid pressure at vacuum of 0 kPa {0 in.Hg, 0 mmHg}	FEC5 FEC7	90 Pa {13 psi, 0.0009 kgf/cm^2} (pedal depressed with a force of 98 N {22.0 lbs, 10 kgf})	–	Replace
			1330 kPa {190 psi, 14 kgf/cm^2} (pedal depressed with a force of 295 N {66.3 lbs, 30 kgf})	–	
		FECX	180 kPa {26 psi, 1.9 kgf/cm^2} (pedal depressed with a force of 98 N {22.0 lbs, 10 kgf})	–	
			1620 kPa {234 psi, 17 kgf/cm^2} (pedal depressed with a force of 295 N {66.3 lbs, 30 kgf})	–	
		FEC9 FG	160 kPa {23 psi, 1.6 kgf/cm^2} (pedal depressed with a force of 98 N {22.0 lbs, 10 kgf})	–	
			1560 kPa {225 psi, 16 kgf/cm^2} (pedal depressed with a force of 295 N {66.3 lbs, 30 kgf})	–	

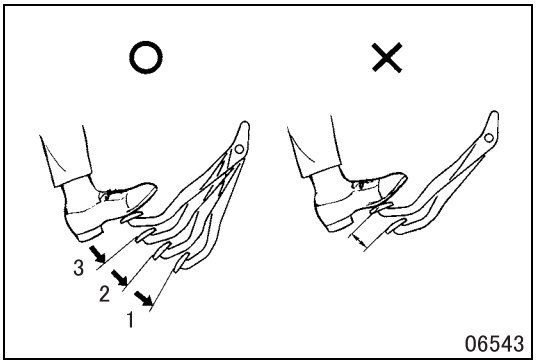
2.1 Operational check of vacuum booster

CAUTION ⚠

- **The vacuum booster operational checks described below are only of summary nature. If the vacuum booster continues to malfunction, perform a bench test specified by a service station of the manufacturer on the vacuum booster after removing it from the vehicle.**
- **If the vacuum booster is found to be faulty during the specified testing, ask the service station of the manufacturer for repair.**

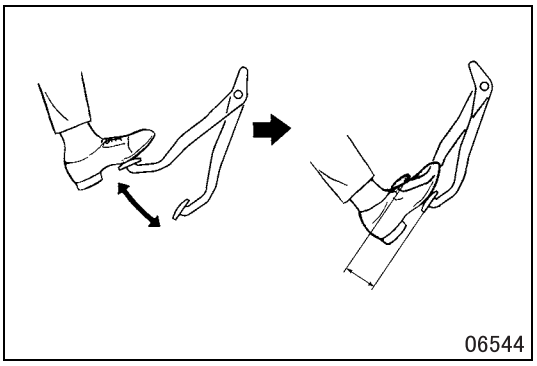
(1) Operational check without any tester

- Inspect the check valve in the vacuum hose for normal operation.
- Perform the checks described below. If any fault is found during these checks, inspect the following parts.
  - Vacuum booster
  - Vacuum pump



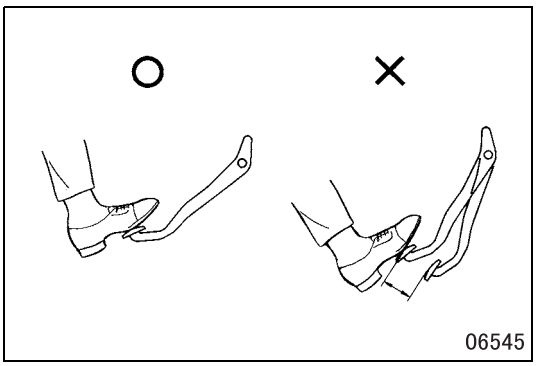
[Check 1]

- Start the engine and run it for 1 to 2 minutes. Stop the engine.
- Depress the brake pedal repetitively with the normal depressing force.
- The pedal stroke should become shorter each time the pedal is depressed.



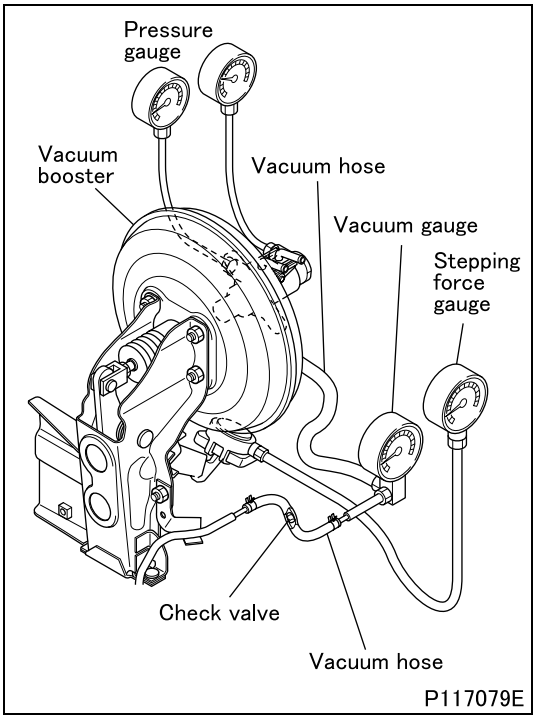
[Check 2]

- With the engine stationary, depress the brake pedal several times.
- With the brake pedal depressed, start the engine. The pedal should sink slightly.



[Check 3]

- With the engine running and the brake pedal depressed, stop the engine.
- The brake pedal should maintain the same height for approximately 30 seconds.



(2) Operational check with a simplified tester

(2.1) Airtightness check

- Inspect the check valve in the vacuum hose for normal operation.
- Remove the vacuum hose from the vacuum booster and connect it to the vacuum gauge.
- Connect another hose (not equipped with a check valve) onto the vacuum booster and the vacuum gauge.
- Install 2 pressure gauges and 1 stepping-force gauge as illustrated. Bleed the pressure gauges of air.
- Perform the following checks. If any fault is encountered during these checks, inspect the vacuum booster.

[Check 1]

- Start the engine. When the reading on the vacuum gauge has reached 67 kPa {19.8 in.Hg, 500 mmHg}, stop the engine.
- The vacuum lost in approximately 15 seconds of the engine stop should conform to the standard value.

[Check 2]

- Start the engine, and depress the brake pedal. When the reading on the vacuum gauge has reached 67 kPa {19.8 in.Hg, 500 mmHg}, stop the engine.
- The vacuum lost in approximately 15 seconds of the engine stop should conform to the standard value.

(2.2) System characteristics check

- Perform the following system characteristics checks after the airtightness check described above is completed.
- Perform the following checks. If any fault is encountered during these checks, inspect the vacuum booster.

[Check 1]

- Start the engine. When the reading on the vacuum gauge has reached 67 kPa {19.8 in.Hg, 500 mmHg}, depress the brake pedal with the specified depressing forces.
- The fluid pressures indicated on the pressure gauges should conform to the specified values.

[Check 2]

- Start the engine. When the reading on the vacuum gauge has reached 0 kPa {0 in.Hg, 0 mmHg}, depress the brake pedal with the specified stepping forces.
- The fluid pressures indicated on the pressure gauges should conform to the specified values.

STRUCTURE AND OPERATION

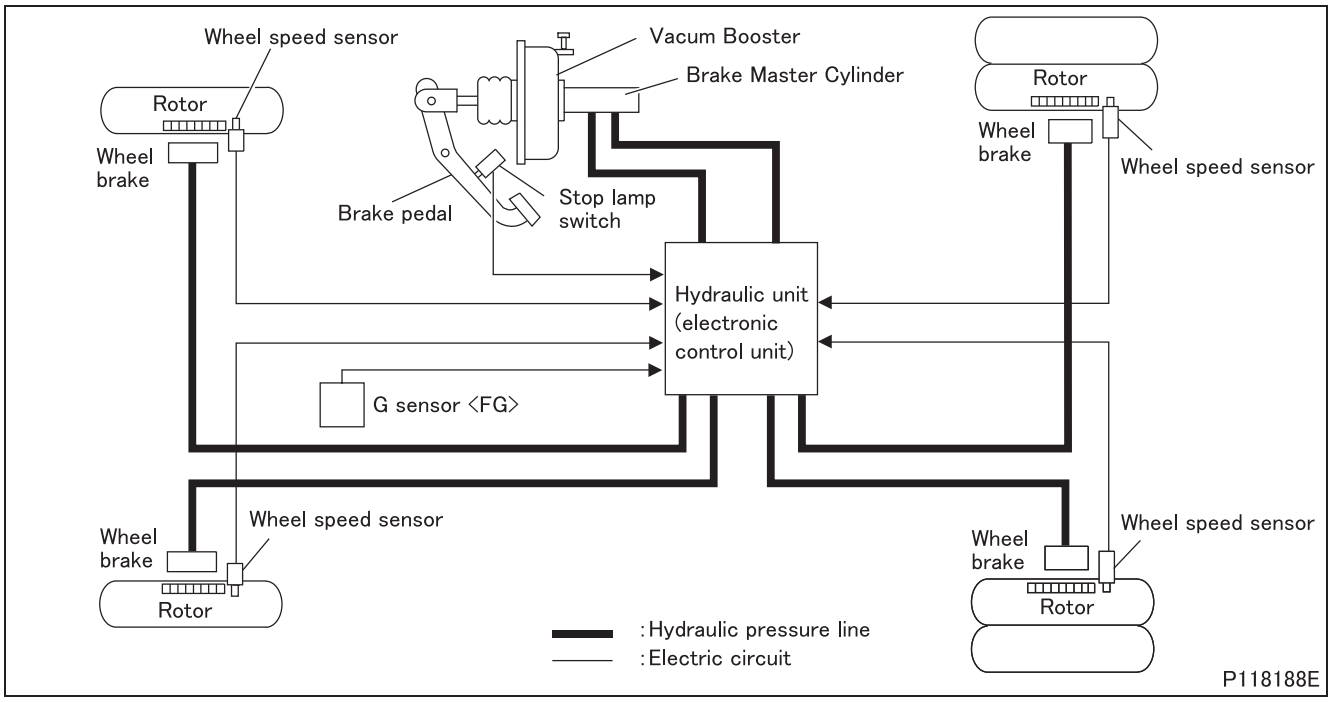
1. Overview

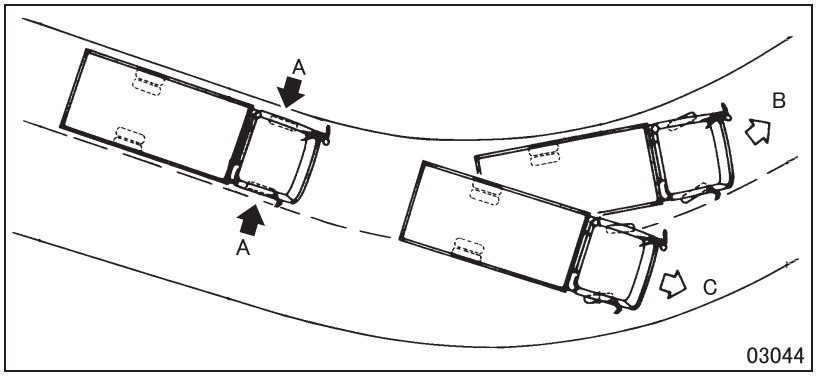


- The illustration shown above is intended to explain the structure and operation only and parts of it may differ from that of the actual piping diagram. For the details, see the piping diagram in Gr35.
- The anti-lock brake system (ABS) prevents wheel lock-up and resultant skid when braking hard or on slippery roads, thus maintain vehicle stability and steerability.

1.1 Outline of anti-lock brake system

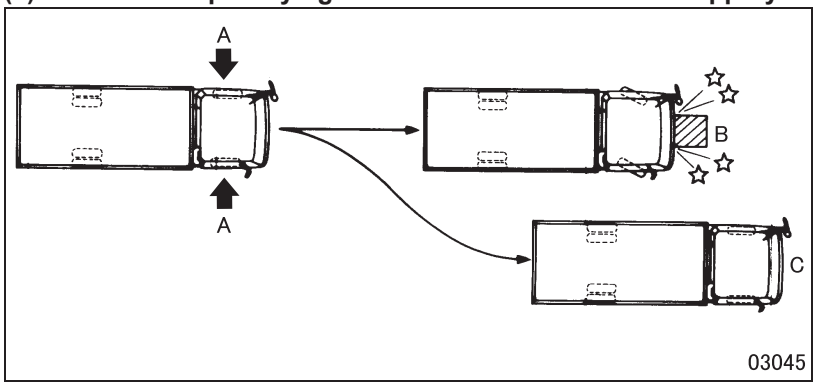
- Wheels will roll along on the road in the direction of their rotation. Therefore, the driver can steer the vehicle as he/she wishes by maneuvering the steering wheel.
  However, on vehicles not equipped with ABS, applying the brakes hard can cause wheel lock-up. Once tires are locked up, they are simply a piece of rubber in contact with the road surface and steering control will be lost. The vehicle will skid in the direction of inertia irrespective of the steering angle.
  In other words, vehicle stability and steerability are lost and the vehicle is out of the driver's control.
- On vehicles equipped with anti-lock brake system, the system prevents wheel lock-up by reducing the braking power to the wheel that is about to lock up and, thereby, maintain vehicle stability and steerability.

(1) Wheel lock-up when cornering on slippery road



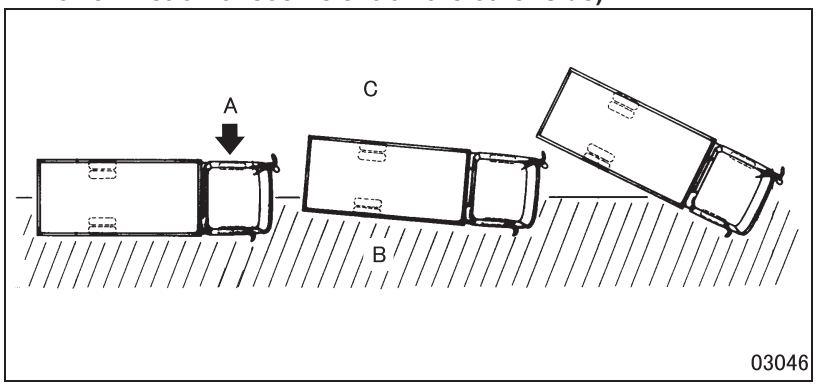
- If wheel lock-up occurs during braking on a slippery curve, steering control will be lost. If this happens, the vehicle may deviate, while skidding, from the intended course no matter how the driver maneuvers the steering wheel.
  A: Application of brakes (wheel lock-up)
  B: Intended course
  C: Actual course

(2) Wheel lock-up in trying to avoid obstacle ahead on slippery straight road



- If wheel lock-up occurs during hard braking on a slippery straight road in trying to avoid an obstacle ahead, steering control will be lost. If this happens, the vehicle will not be able to avoid the obstacle no matter how the driver maneuvers the steering wheel.
  A: Application of brakes (wheel lock-up)
  B: Obstacle
  C: Intended course

(3) Split μ (wheel lock-up on asymmetrical road surface, with higher friction of coefficient on one side and lower friction of coefficient on the other side)



- If the front and rear wheels on one side of the vehicle are on the side of the road that has a lower friction of coefficient and therefore is more slippery than the other side of the road, these wheels are more likely to lock up and slip than the wheels on the other side of the vehicle. When the brakes are applied under such conditions, the braking efficiency will be different between the right and left sides of the vehicle and the vehicle will lose stability. Braking hard under such conditions can even cause the vehicle to spin.
  A: Application of brakes (wheel lock-up)
  B: Less slippery road surface
  C: More slippery road surface

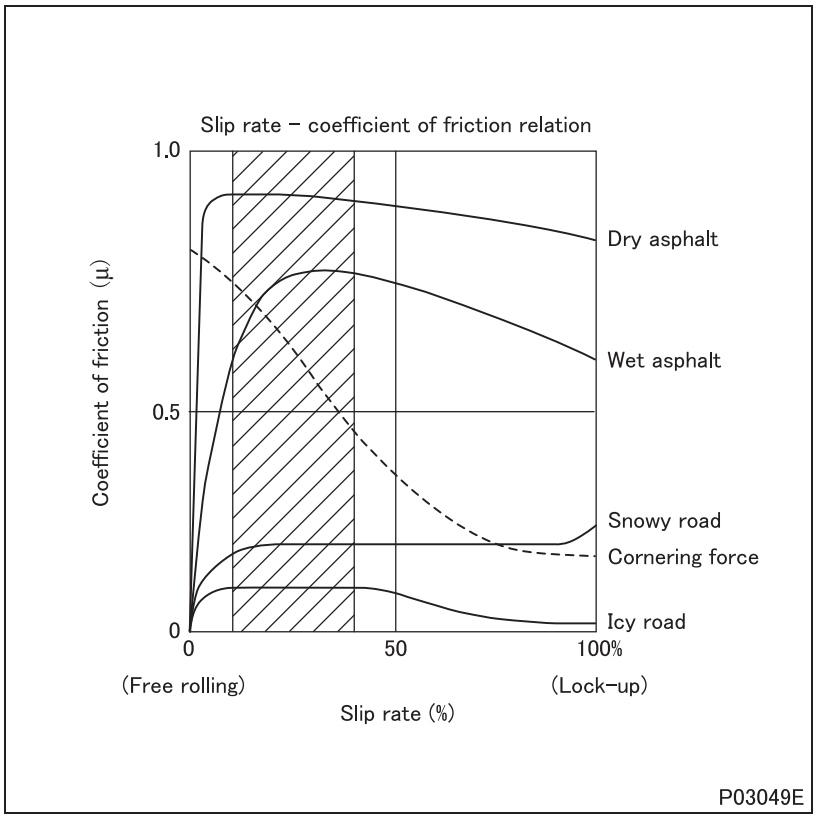
- As mentioned above, the system prevents wheel lock-up by providing controlled braking force to each wheel. This prevents wheel slip and skid and ensures steering control and vehicle stability even during hard braking.

1.2 Anti-lock brake system control process

- Anti-lock brake system ensures controlled yet optimum braking in a given road surface condition by placing the braking force within a certain range of slip rate determined by the wheel speed - vehicle speed relation.
- Stepping on the brake pedal causes the wheel speed to slow down and, as a result, the vehicle also slows down. However, the vehicle will still try to move on due to the inertia that has built up. This causes a difference between the wheel speed and the vehicle speed, or, in other words, slip. The amount of slip can be expressed as slip rate, as follows.

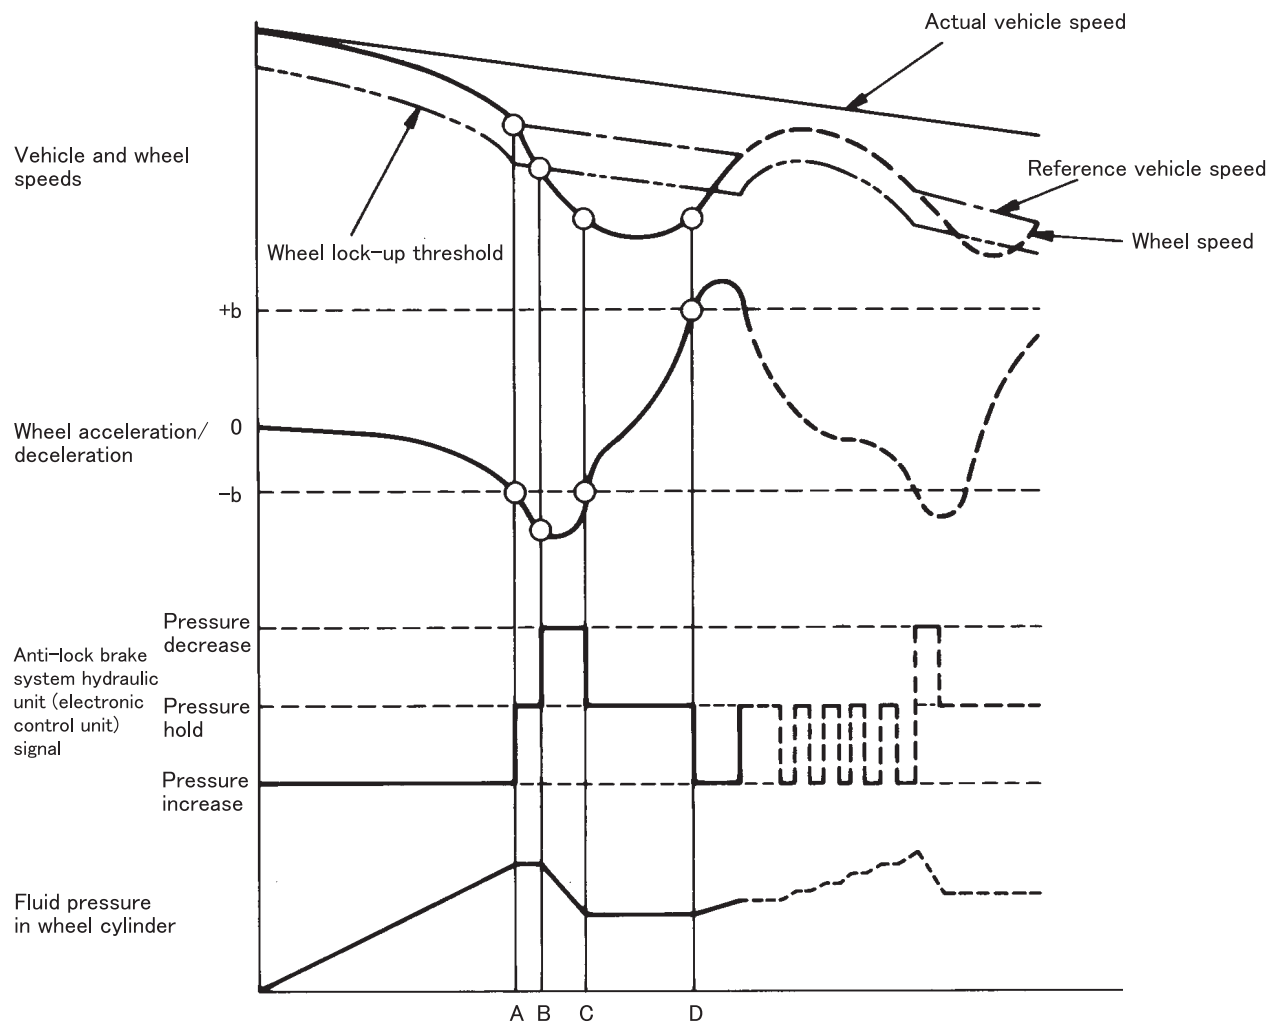
$$\text{Slip rate (\%)} = \frac{\text{Vehicle speed} - \text{Wheel speed}}{\text{Vehicle speed}} \times 100$$

- A slip ratio of 0% means that there is no slip between the wheel and the road surface. A slip rate of 100% means that the wheel is locked up.

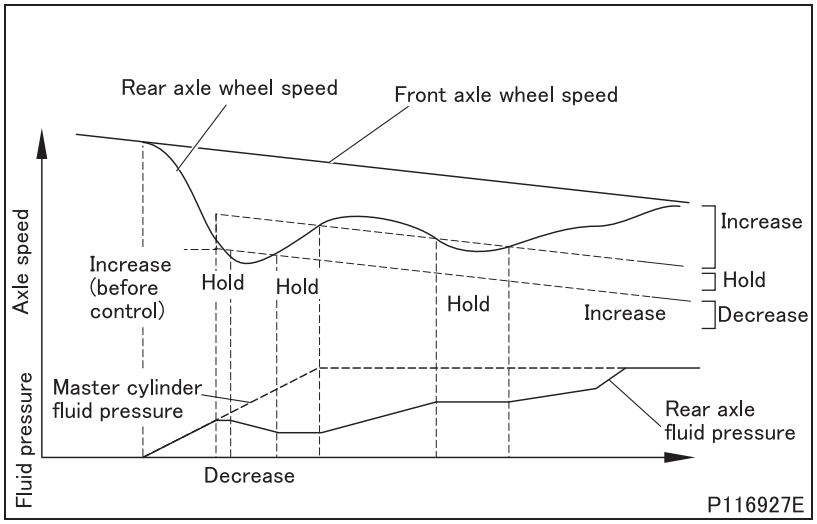


- The graph shows the variation in the tire's coefficient of friction from free rolling to lock-up. As the brake pedal is slowly pressed, the tires continue to rotate but start slipping.
- As the application force on the brake pedal increases, the tires will stop rotating and the vehicle will just skid. This is wheel lock-up.
- As the graph shows, the coefficient of friction peaks within the hatched area.
- In other words, the maximum coefficient of friction can be achieved, not by stepping on the brake pedal with full force, but by doing so moderately to try to place the slip rate within the hatched area.
- On vehicles equipped with anti-lock brake system, the hydraulic control unit (electronic control unit) controls the braking force so that it falls within the hatched area. This will ensure that the tires do not lock up but have the maximum coefficient of friction, thus achieving efficient braking performance.

(1) Anti-lock brake system control cycle



- The chart above shows the typical control cycle of anti-lock brake system following the application of brakes, detailing in time series the variation in wheel speed, wheel speed acceleration/deceleration and fluid pressure in the wheel cylinder.
- When the wheel speed acceleration/deceleration drops to the "–b" threshold at A, the hydraulic unit (electronic control unit) sends "pressure hold" signal to maintain the fluid pressure in the wheel cylinder.
  At the same time, the hydraulic unit (electronic control unit) calculates the reference vehicle speed.
- When the vehicle decelerates to the wheel lock-up threshold at B, the hydraulic unit (electronic control unit) interprets this as imminent wheel lock-up and sends "pressure decrease" signal to reduce the fluid pressure in the wheel cylinder.
- When the wheel speed picks up and exceeds the "–b" threshold at C, the hydraulic unit (electronic control unit) sends "pressure hold" signal to maintain the fluid pressure in the wheel cylinder at the current level.
- When the wheel speed exceeds the "+b" threshold at D, the hydraulic unit (electronic control unit) determines that the imminent wheel lock-up has gone and sends "pressure increase" signal to increase the fluid pressure in the wheel cylinder.
- The pressure hold-decrease-increase cycle is repeated to keep the slip rate at optimum levels to prevent wheel lock-up.



1.3 Electronic Brake force Distribution (EBD)

- The Electronic Brake force Distribution limits increase in brake fluid pressure to rear axle wheels with an increased skid/slip tendency so that braking forces appropriate for loads on the axles are distributed.
- Through this control, activation of the anti-lock brake system (ABS) is delayed near the critical limit.

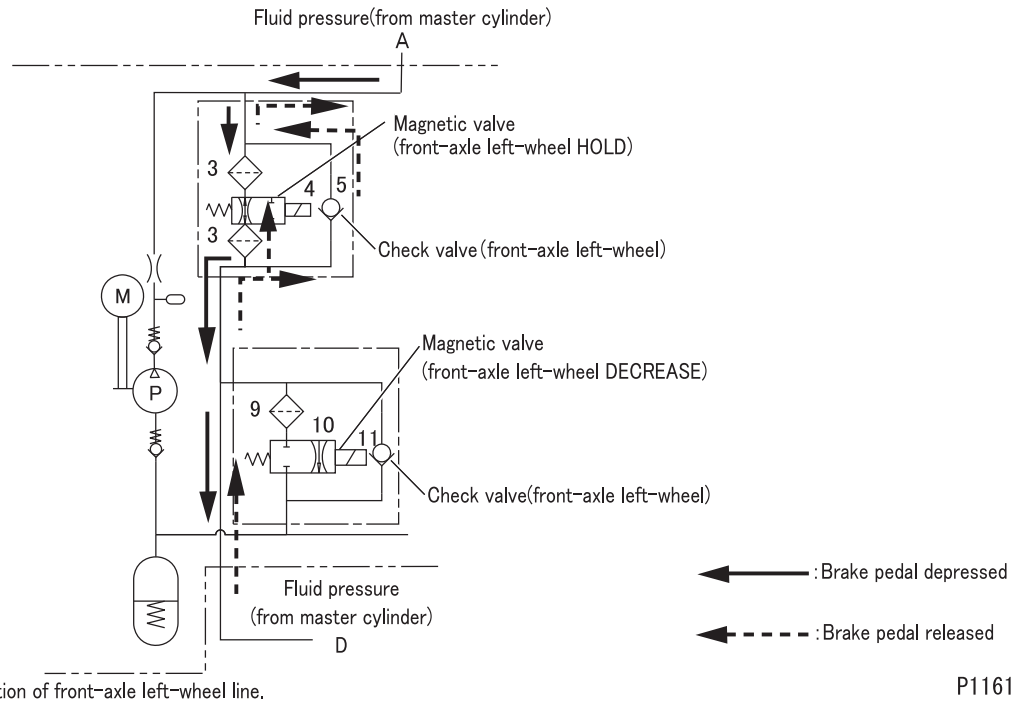
* : The motor will operate only when brake fluid accumulates in the secondary circuit during pressure reduction.

(2) Normal braking (anti-lock brake system not in operation)

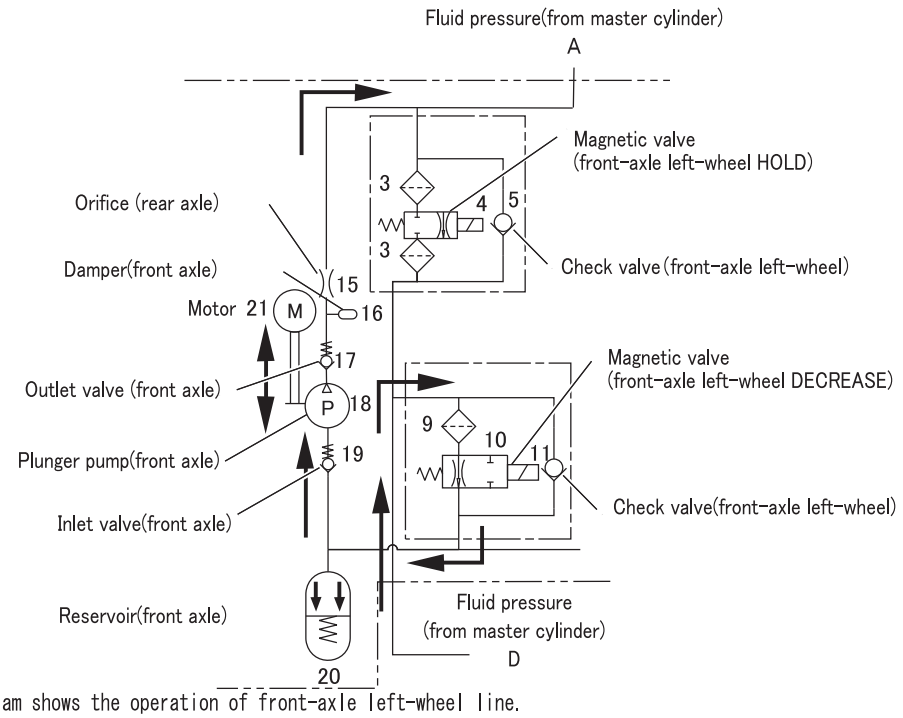


The diagram shows the operation of front-axle left-wheel line.

P116162E

- When the brake pedal is depressed and there is no imminent wheel lock-up, the hydraulic unit (electronic control unit) will not send any control signal to the magnetic valve (front-axle left-wheel DECREASE) or to the magnetic valve (front-axle left-wheel HOLD). The former valve remains closed while the latter valve stays open.
- Pressure fluid A from the brake master cylinder flows past the magnetic valve (front-axle left-wheel HOLD) and to the wheel brake D.
- When the brake pedal is released, pressure fluid A from the brake master cylinder drops. Pressure fluid from the wheel brake D now flows past the magnetic valve (front-axle left-wheel HOLD) and the check valve (front-axle left-wheel) and returns to the brake master cylinder.

(3) Anti-lock braking (pressure decrease)

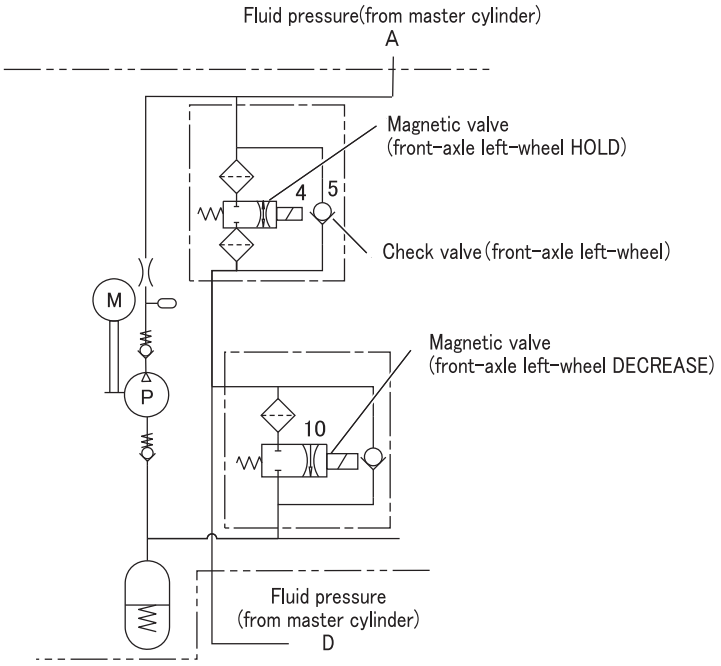


The diagram shows the operation of front-axle left-wheel line.

P116163E

- When the brake pedal is depressed and there is imminent wheel lock-up, the hydraulic unit (electronic control unit) sends control signal to the magnetic valve (front-axle left-wheel DECREASE) and the magnetic valve (front-axle left-wheel HOLD). The former valve will open while the latter valve will close.
- Pressure fluid form the wheel brake D now flows past the magnetic valve (front-axle left-wheel DECREASE) and to the reservoirs. The line pressure will drop.
- When the hydraulic unit (electronic control unit) sends control signal to the magnetic valve (front-axle left-wheel DECREASE) and the magnetic valve (front-axle left-wheel HOLD), it also sends control signal to the motor at the same time, causing the plunger pump (front axle) to start pumping. Pressure fluid in the reservoirs now flows past the inlet valve (front axle), the outlet valve (front axle), the damper (front axle) and the orifice (front axle) and returns to the master cylinder.
- During this process, the check valve (front-axle left-wheel) remains closed by the fluid pressure A from the brake master cylinder. As a result, no pressure fluid from the master cylinder flows to the wheel brake.

(4) Anti-lock braking (pressure hold)

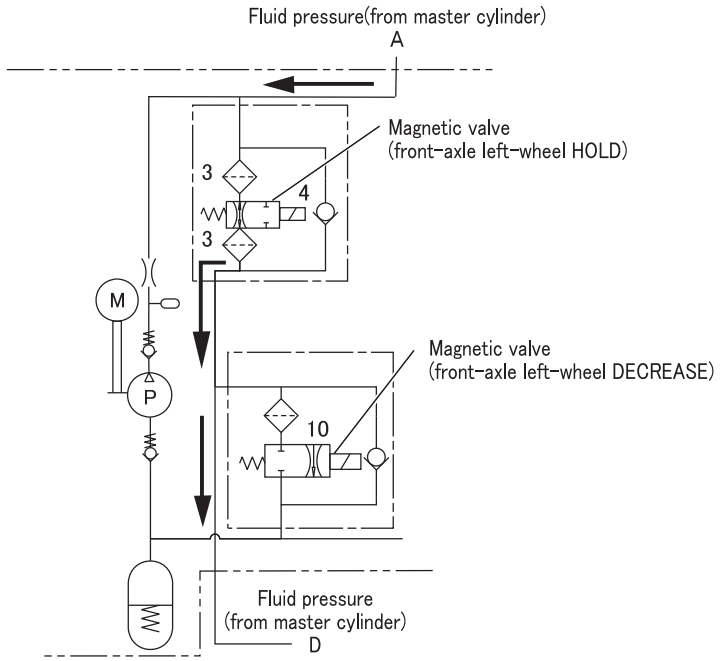


The diagram shows the operation of front-axle left-wheel line.

P116164E

- When it becomes necessary to hold the fluid pressure D in the wheel brake at the same level as part of anti-lock brake system control, the hydraulic unit (electronic control unit) sends a “HOLD” signal to the magnetic valve (front-axle left-wheel HOLD). As a result, both the magnetic valve (front-axle left-wheel HOLD) and the magnetic valve (front-axle left-wheel DECREASE) will be closed, which holds the fluid pressure in the wheel brake at the current level.
- The check valve (front-axle left-wheel) remains closed by the fluid pressure A from the brake master cylinder.

(5) Anti-lock braking (pressure increase)

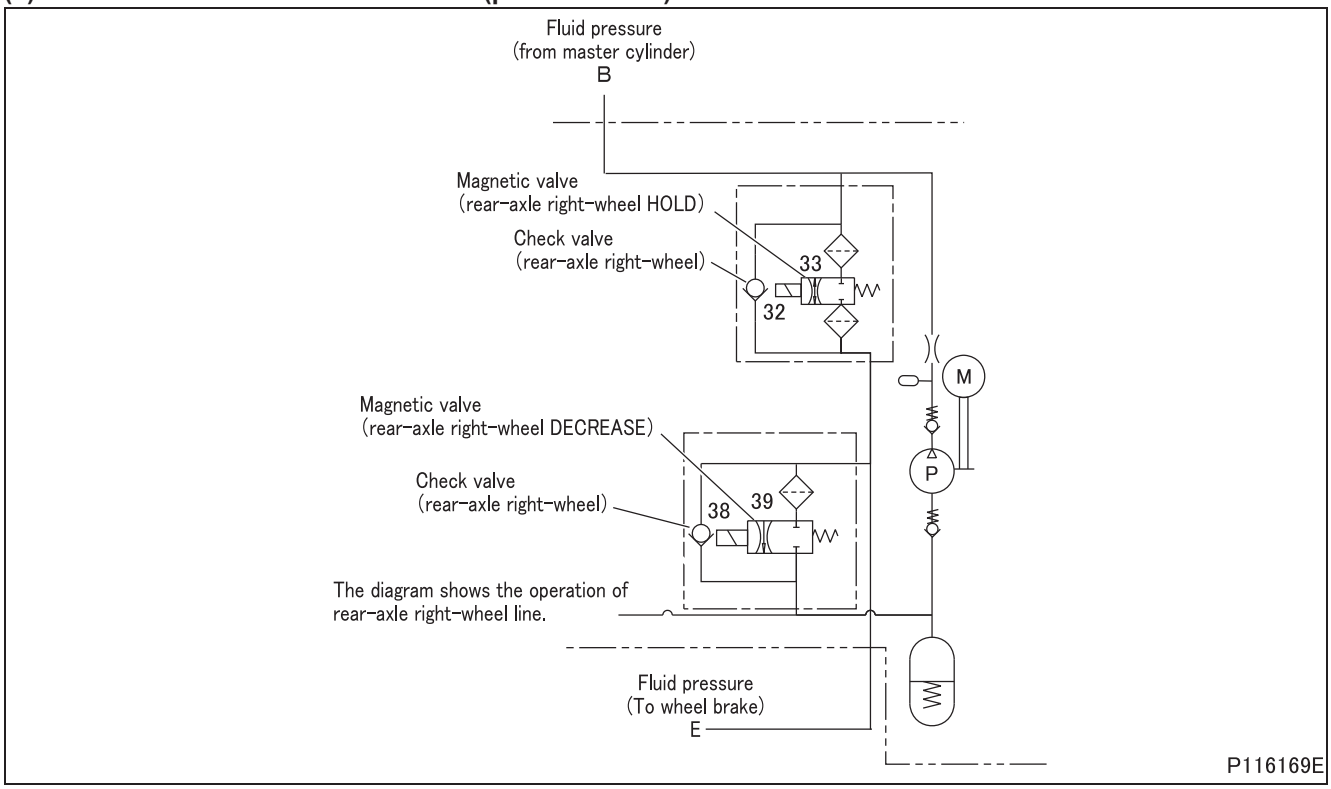


The diagram shows the operation of front-axle left-wheel line.

P116165E

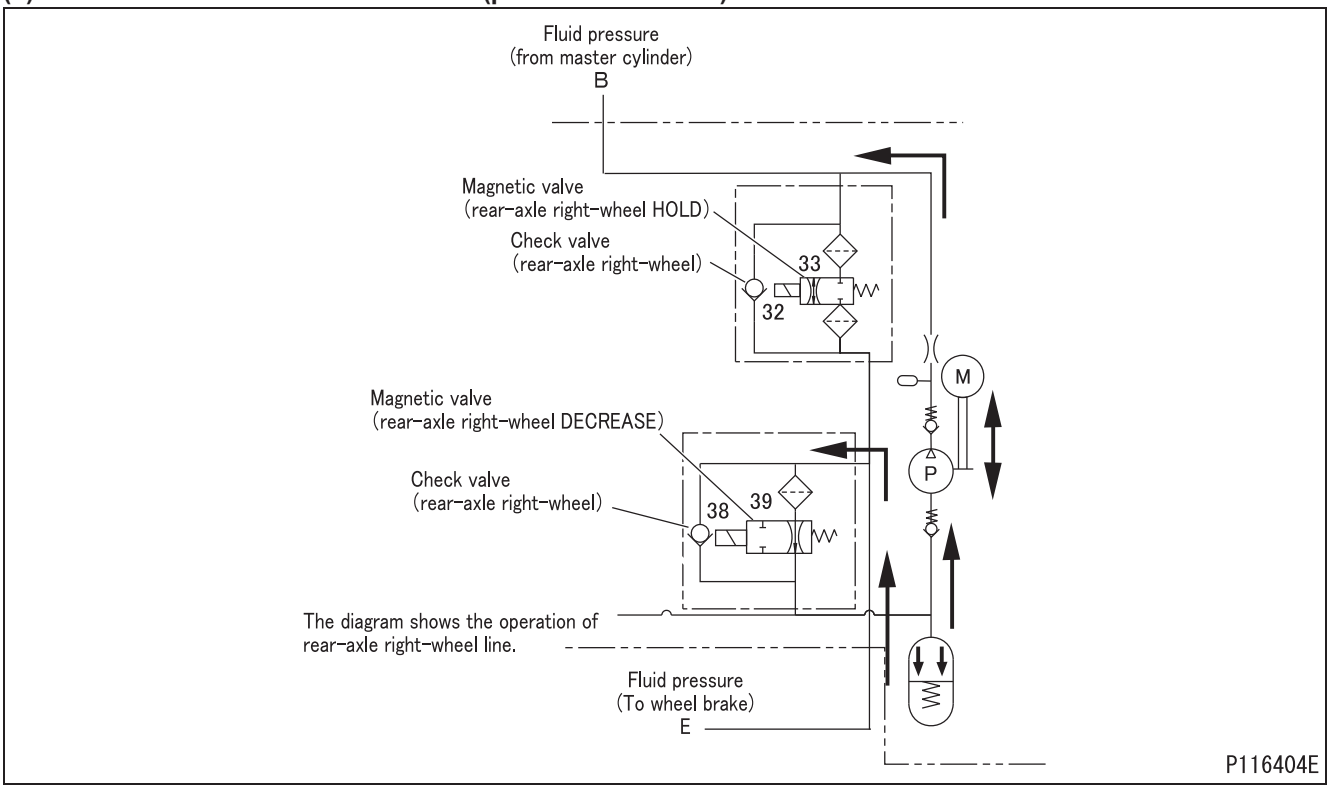
- When it becomes necessary to increase the fluid pressure D in the wheel brake, control signal from the hydraulic unit (electronic control unit) to the magnetic valve (front-axle left-wheel HOLD) and to the magnetic valve (front-axle left-wheel DECREASE) will be cut off.
- As a result, the magnetic valve (front-axle left-wheel HOLD) will open while the magnetic valve (front-axle left-wheel DECREASE) will close. Both valves are now in their normal-braking positions. Fluid pressure A being generated by the depression of the brake pedal is now applied to the wheel brake to increase the braking force.

(6) Electronic Brake force Distribution (pressure hold)



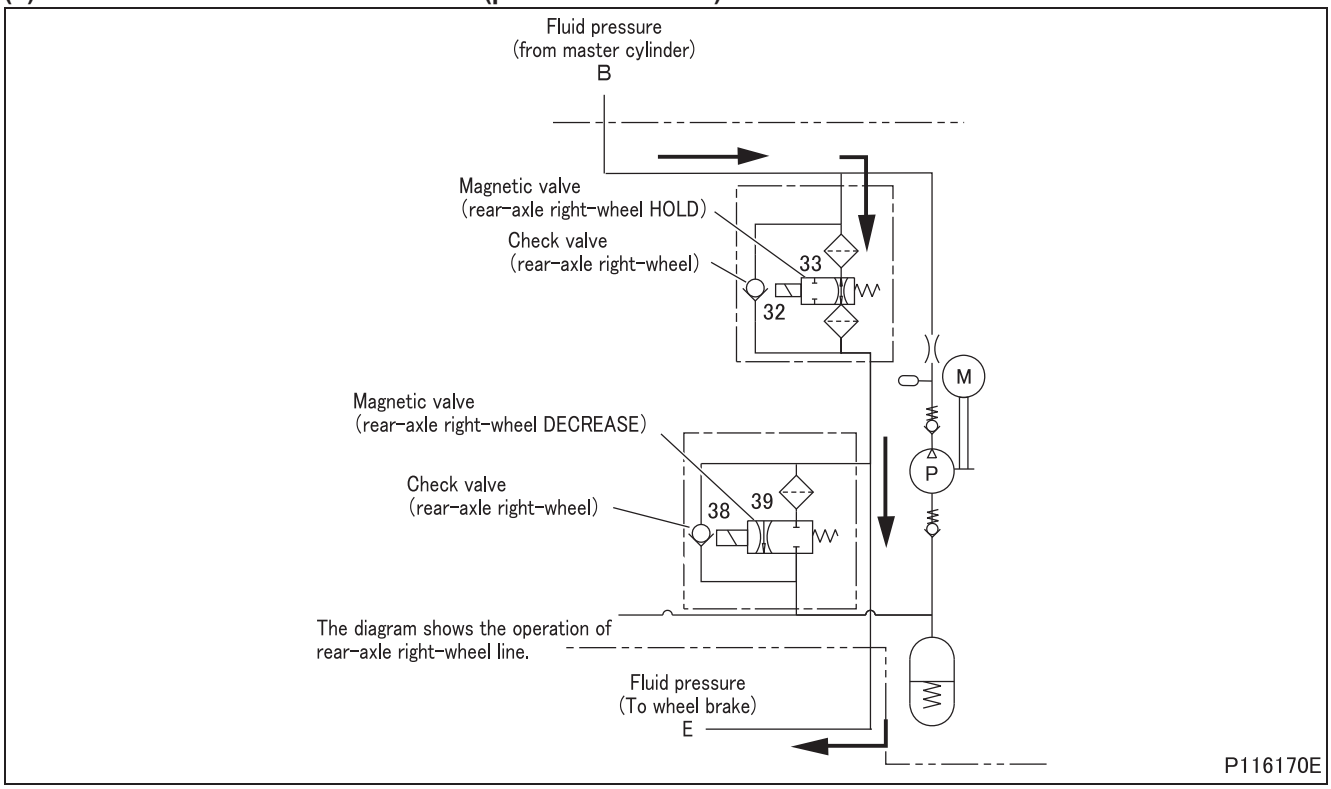
- When it becomes necessary for the electronic control of brake force distribution to hold wheel brake fluid pressure E, the electronic control unit sends a hold control signal to the magnetic valve (rear-axle right-wheel HOLD) of the hydraulic unit. As a result, the magnetic valves (rear-axle right-wheel HOLD and rear-axle right wheel DECREASE) are closed, so the fluid pressure is held.
- In this state, the magnetic valve (front-axle right-wheel HOLD) is kept closed by fluid pressure B from the master cylinder, so the fluid pressure from the brake master cylinder is not distributed to the wheel brakes.

(7) Electronic Brake force Distribution (pressure decrease)

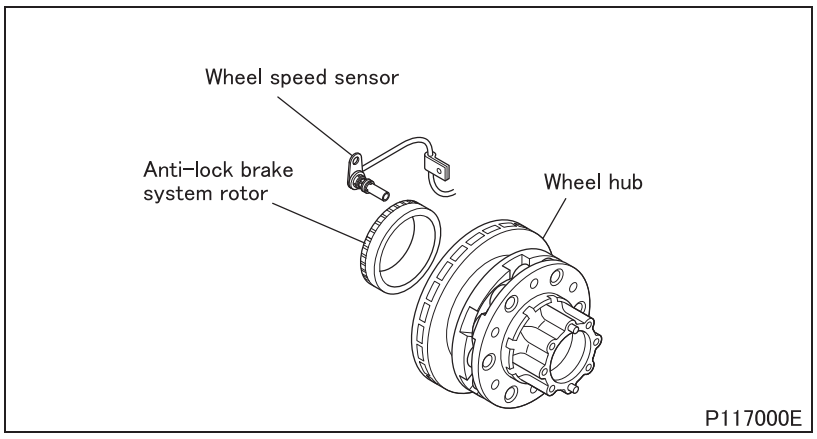


- If wheels are about to lock, the hydraulic unit (electronic control unit) sends a control signal to the relevant magnetic valves (rear-axle right-wheel DECREASE and rear-axle right-wheel HOLD). As a result, the magnetic valve (rear-axle right-wheel DECREASE) opens and the magnetic valve (rear-axle right-wheel HOLD) closes.
- Fluid pressure E from wheel brakes flows to the reservoir (rear axle) via the magnetic valve (rear-axle right-wheel DECREASE). The fluid pressure is thus decreased.
- In this state, the check valve (rear-axle right-wheel) is kept closed by fluid pressure B from the brake master cylinder, so the fluid pressure from the brake master cylinder is not distributed to the wheel brakes.

(8) Electronic Brake force Distribution (pressure increase)

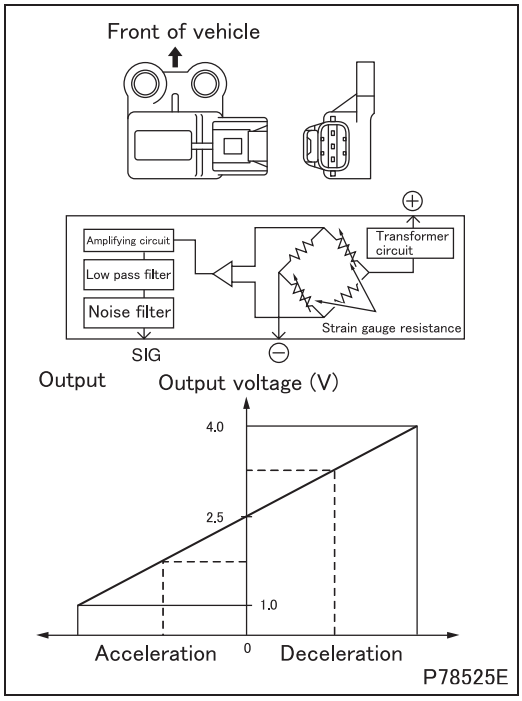


- When it becomes necessary to increase fluid pressure E to wheel brakes, electronic control unit stops sending the control signal to the magnetic valve (rear-axle right-wheel HOLD).
- As a result, the magnetic valve (rear-axle right-wheel HOLD) opens and the magnetic valve (rear-axle right-wheel DECREASE) closes. This creates the same condition as the one established when the Electronic Brake force Distribution is not working (normal brake condition), so brake pressure B produced by pressing the brake pedal works directly on wheel brakes (brake line pressure increases).



1.5 Wheel speed sensor

- Each wheel speed sensor detects wheel speed and sends this as a signal to the hydraulic unit (electronic control unit). The sensor is essentially a magnetic pickup unit, consisting of a permanent magnet core and a coil of wire wound around the core.
- A rotor is fitted onto the wheel hub. This rotor, like a ring gear, has a set of evenly-spaced teeth directly facing the sensor. As the wheel rotates, these teeth pass through the magnetic flux of the sensor, inducing potential difference in the coil which is then sent as a signal (alternating voltage proportional to the wheel speed) to the hydraulic unit (electronic control unit).

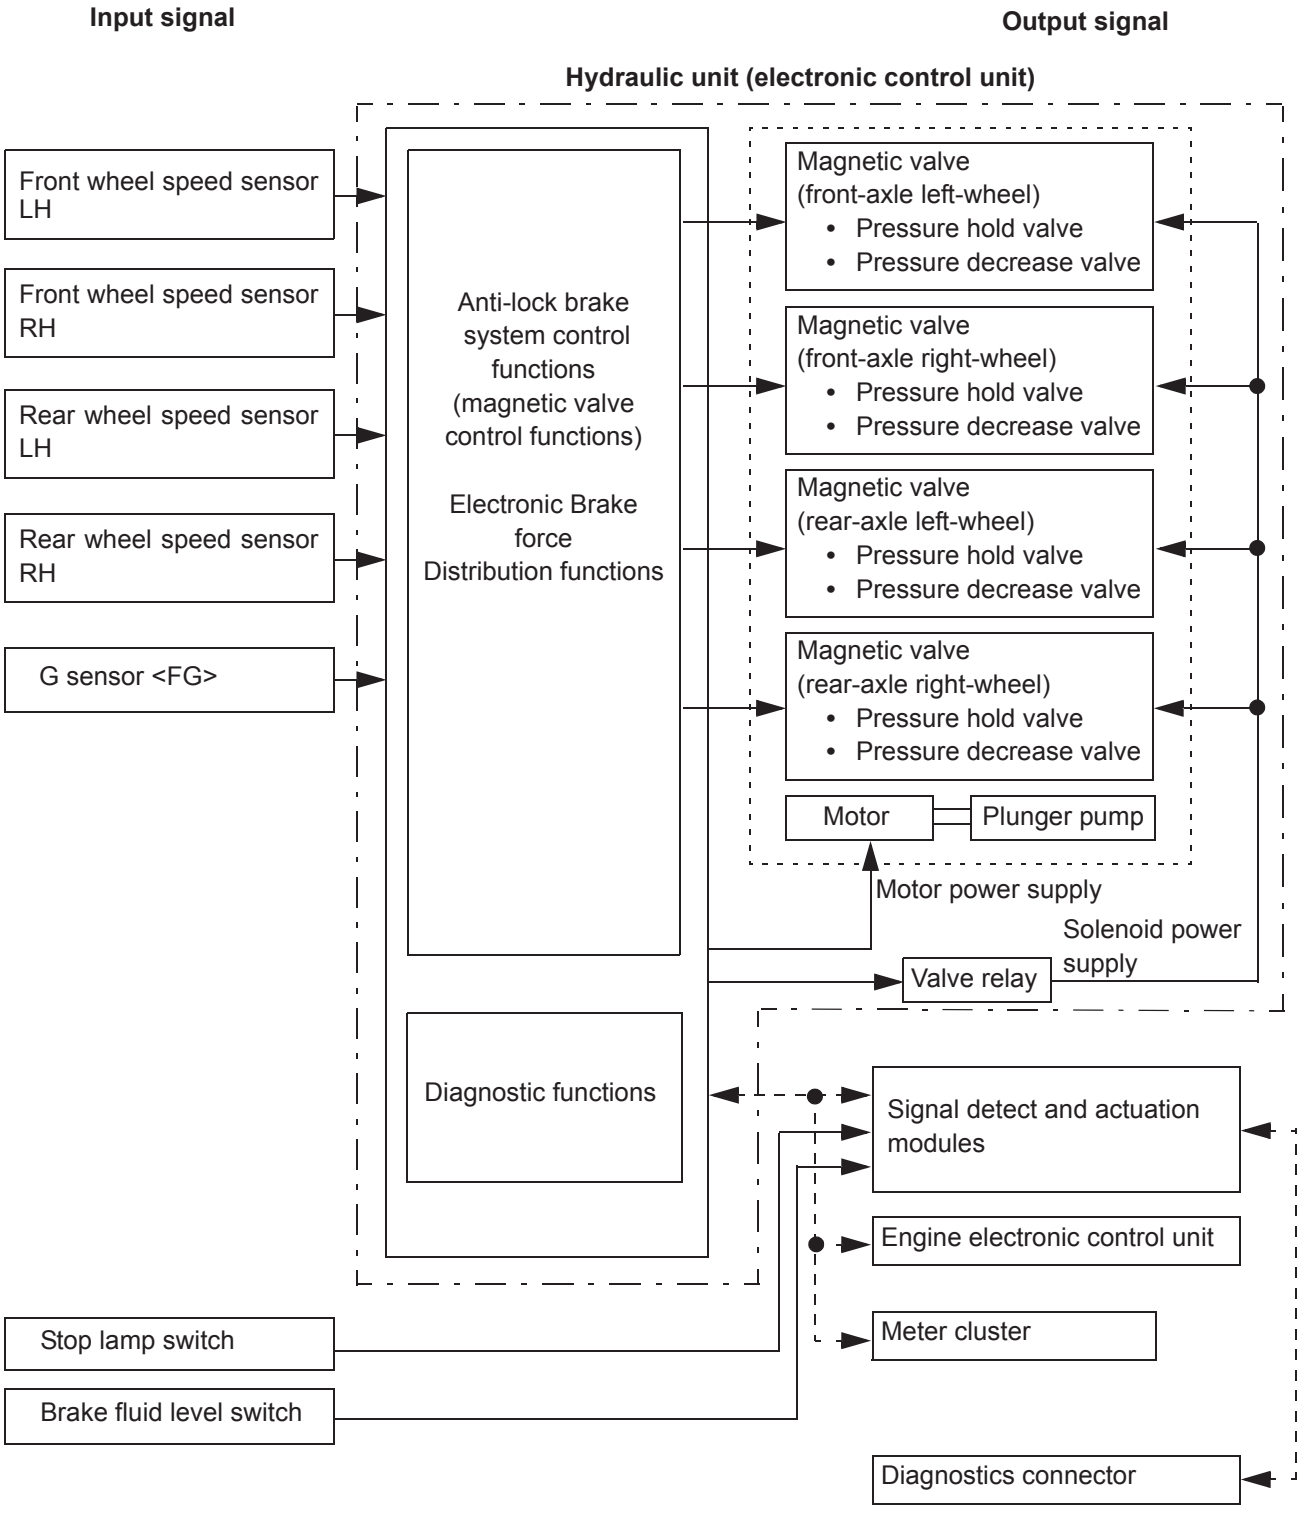


1.6 G sensor <FG>

- On slippery roads, trucks can experience wheel lock-up due to the inertia of the powertrain. This makes it difficult for the anti-lock brake system to perform controlled braking.
- To avoid this, in addition to the wheel speed sensors, a G sensor is also used to detect acceleration/deceleration and assist anti-lock brake system control.
- The G sensor is a semiconductor-type strain gauge. It detects acceleration or deceleration by converting acceleration/deceleration inertia into resistance and further converting this into voltage.

2. Electronic Control System

2.1 Block diagram

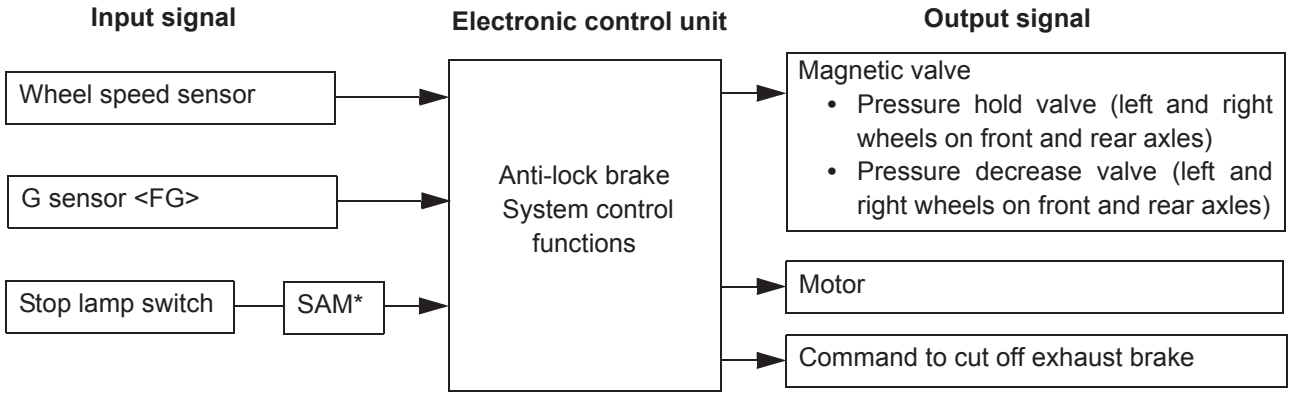


Part	Primary function or operation
Wheel speed sensor	Senses wheel speed
Engine electronic control unit	Cuts off exhaust brake in anti-lock braking mode
SAM*	Manages power supply to system components
	Inputs stop lamp signal (indicating that brake pedal is in pressed position)
	Inputs brake fluid level signal (from brake fluid level switch indicating that brake fluid level is too low)
Meter cluster	Displays anti-lock brake system faults
G sensor <FG>	Senses acceleration/deceleration
FUSO Diagnostics (diagnostics connector)	Provides communication between FUSO diagnostics and the hydraulic unit (electronic control unit)

*: SAM (Signal detect and actuation modules)

2.2 Anti-lock brake system control functions

- The hydraulic unit (electronic control unit) continuously monitors signals from the wheel speed sensors. The unit sends signals to magnetic valves.

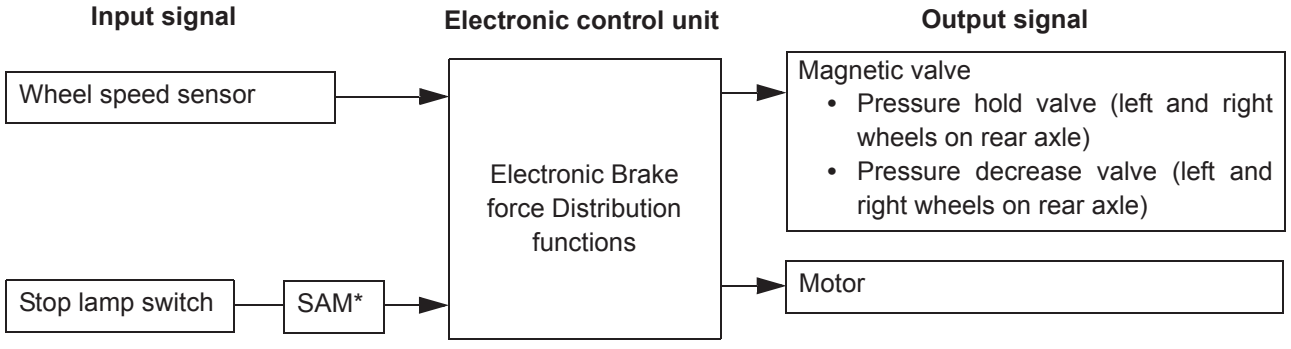


*: SAM (Signal detect and actuation modules)

(1) Anti-lock brake system fail-safe

- If any fault occurs in the anti-lock brake system, the warning lamp illuminates to warn the driver of the fault and normal braking will resume in place of the anti-lock braking which will be disabled.

(2) Electronic Brake force Distribution functions



*: SAM (Signal detect and actuation modules)

• When active, this function switches the control mode as follows to prevent further increase in slip factor of the rear wheel tires and appropriately distributes braking force to wheels according to the load on each axle.

Control mode	Description	State of actuator		
		HOLD valve	DECREASE valve	Motor
Mode 1 (HOLD)	When the slip factor of the rear wheel tires increases beyond the reference value, the system applies a control to hold the rear wheel brake pressure.	ON (closed)	OFF (closed)	OFF
Mode 2 (DECREASE)	When the slip factor of the rear wheel tires increases beyond the reference value, the system applies a control to decrease the rear wheel brake pressure.	ON (closed)	ON (closed)	OFF*
Mode 3 (INCREASE)	When the slip factor of the rear wheel tires decreases, the system applies a control to increase the rear wheel brake pressure.	OFF (open)	OFF (closed)	OFF

*: ON if brake fluid collects in the secondary circuit.

(3) Anti-lock brake system and exhaust brake

• On slippery roads, wheel lock-up can result even from application of the exhaust brake. In the anti-lock braking mode, activation of the exhaust brake makes it difficult for anti-lock brake system to perform controlled braking.
To avoid this, the exhaust brake will be disabled upon activation of anti-lock brake system even when the exhaust brake switch is in the “ON” position.
The exhaust brake will automatically be enabled upon deactivation of anti-lock brake system.

2.3 Diagnostic functions

• When the starter switch is in the ON position, the system continuously monitors the sensors and other system components. If any fault is detected, the system warns the driver of this by displaying the relevant fault information on the meter cluster. At the same time, the system also stores a relevant diagnosis code in the memory and starts operation in the fault mode.
• In the fault-mode operation, the system functions are limited to ensure safety for the driver and the vehicle. Stored diagnosis codes can be accessed using Scanning tool or can be read by observing the flashing of the warning lamp.

TROUBLESHOOTING

1. Inspections According to Diagnosis Codes

- Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.

1.1 List of diagnosis codes

Code	Message	Warning lamp indication ((ABS))	Remarks
96-7	The brake fluid level is too low.	O	
789-2	The signal from component 'B3 (Wheel speed sensor (Left front axle))' is faulty.	O	
789-3	Component 'B3 (Wheel speed sensor (Left front axle))' has a short circuit to positive.	O	
789-5	Component 'B3 (Wheel speed sensor (Left front axle))' has an open circuit.	O	
789-7	No feedback was received from component 'B3 (Wheel speed sensor (Left front axle))'	O	
789-9	An implausible left front wheel speed signal was received.	O	
789-10	No signal from component 'B3 (Wheel speed sensor (Left front axle))'	O	
790-2	The signal from component 'B4 (Wheel speed sensor (Right front axle))' is faulty.	O	
790-3	Component 'B4 (Wheel speed sensor (Right front axle))' has a short circuit to positive.	O	
790-5	Component 'B4 (Wheel speed sensor (Right front axle))' has an open circuit.	O	
790-7	No feedback was received from component 'B4 (Wheel speed sensor (Right front axle))'.	O	
790-9	An implausible right front wheel speed signal was received.	O	
790-10	No signal from component 'B4 (Wheel speed sensor (Right front axle))'	O	
791-2	The signal from component 'B5 (Wheel speed sensor (Left rear axle))' is faulty.	O	
791-3	Component 'B5 (Wheel speed sensor (Left rear axle))' has a short circuit to positive.	O	
791-5	Component 'B5 (Wheel speed sensor (Left rear axle))' has an open circuit.	O	
791-7	No feedback was received from component 'B5 (Wheel speed sensor (Left rear axle))'.	O	
791-9	An implausible left rear wheel speed signal was received.	O	
791-10	No signal from component 'B5 (Wheel speed sensor (Left rear axle))'	O	
792-2	The signal from component 'B6 (Wheel speed sensor (Right rear axle))' is faulty.	O	
792-3	Component 'B6 (Wheel speed sensor (Right rear axle))' has a short circuit to positive.	O	
792-5	Component 'B6 (Wheel speed sensor (Right rear axle))' has an open circuit.	O	
792-7	No feedback was received from component 'B6 (Wheel speed sensor (Right rear axle))'.	O	
792-9	An implausible right rear wheel speed signal was received.	O	
792-10	No signal from component 'B6 (Wheel speed sensor (Right rear axle))'	O	
932-3	Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.	O	
932-5	Component 'Solenoid (Antilock brake system Control unit)' has an open circuit.	O	
932-6	Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.	O	
932-12	Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.	O	
933-3	Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.	O	

Code	Message	Warning lamp indication ((ABS))	Remarks
933-5	Component 'Solenoid (Antilock brake system Control unit)' opens too early.	O	
933-6	Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.	O	
933-12	Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.	O	
934-3	Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.	O	
934-5	Component 'Solenoid (Antilock brake system Control unit)' opens too early.	O

521403-12	Faulty component ‘Antilock brake system Control unit’	O	
521404-2	Component ‘B62 (Acceleration sensor)’ has an electrical fault.	–	

1.2 Code generation criteria and inspection items

96-7: The brake fluid level is too low.

Generation condition	• Brake fluid low signal is received
Recoverability	• System recovers on recognition of normal status
Control effected by electronic control unit	• Half system-control of anti-lock brake system is effected.
Possible causes	• Brake fluid level is lower than specified.

789-2: The signal from component 'B3 (Wheel speed sensor (Left front axle))' is faulty.

Generation condition	• Abnormal Front wheel speed sensor LH lasts longer than specified time during running
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Anti-lock brake system rotor is dented or is missing a tooth. • Wheel speed sensor is not installed properly. • Radio interference

789-3: Component 'B3 (Wheel speed sensor (Left front axle))' has a short circuit to positive.

Generation condition	• Front wheel speed sensor LH circuit is shorted.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is short circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is short circuited. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

789-5: Component 'B3 (Wheel speed sensor (Left front axle))' has an open circuit.

Generation condition	• Electric continuity is lost in Front wheel speed sensor LH circuit.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is shorted to higher-potential point. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

789-7: No feedback was received from component 'B3 (Wheel speed sensor (Left front axle))'

Generation condition	• Wheel speed is lower than specified.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective anti-lock brake system rotor (Improper air gap.) • Anti-lock brake system rotor is not provided. • Wheel speed sensor not installed properly

789-9: An implausible left front wheel speed signal was received.

Generation condition	• Wheel acceleration becomes abnormal during operation.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor not installed properly • Anti-lock brake system rotor dented or is missing a tooth • Defective wheel speed sensor • Defective harness

789-10: No signal from component 'B3 (Wheel speed sensor (Left front axle))'

Generation condition	• Wheel speed (front-axle left-wheel) does not become higher than specified at initial start.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor not installed properly • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

790-2: The signal from component 'B4 (Wheel speed sensor (Right front axle))' is faulty.

Generation condition	• Abnormal Front wheel speed sensor RH lasts longer than specified time during running.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Anti-lock brake system rotor dented or lacks a tooth. • Wheel speed sensor not installed properly • Radio interference

790-3: Component 'B4 (Wheel speed sensor (Right front axle))' has a short circuit to positive.

Generation condition	• Wheel speed sensor circuit is shorted.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is short-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is short-circuited. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

790-5: Component 'B4 (Wheel speed sensor (Right front axle))' has an open circuit.

Generation condition	• Electric continuity is lost in wheel speed sensor circuit.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is shorted to higher potential point. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

790-7: No feedback was received from component 'B4 (Wheel speed sensor (Right front axle))'.

Generation condition	• Wheel speed does not become higher than specified.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective anti-lock brake system rotor (Improper gap.) • Anti-lock brake system rotor is missing. • Wheel speed sensor not installed properly

790-9: An implausible right front wheel speed signal was received.

Generation condition	• Abnormal wheel acceleration is detected during operation.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor not installed properly • Anti-lock brake system rotor dented or is missing a tooth • Defective wheel speed sensor • Defective harness

790-10: No signal from component 'B4 (Wheel speed sensor (Right front axle))'

Generation condition	• Wheel speed (front-axle left-wheel) does not become higher than specified at initial start.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor not installed properly • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

791-2: The signal from component 'B5 (Wheel speed sensor (Left rear axle))' is faulty.

Generation condition	• Abnormal Rear wheel speed sensor LH lasts longer than specified time during running.
Generation condition	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Anti-lock brake system rotor dented or is missing a tooth • Wheel speed sensor not installed properly • Radio interference

791-3: Component 'B5 (Wheel speed sensor (Left rear axle))' has a short circuit to positive.

Generation condition	• Wheel speed sensor circuit is shorted.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is short-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is short-circuited. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

791-5: Component 'B5 (Wheel speed sensor (Left rear axle))' has an open circuit.

Generation condition	• Electric continuity is lost in wheel speed sensor circuit.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is shorted to higher potential point. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

791-7: No feedback was received from component 'B5 (Wheel speed sensor (Left rear axle))'.

Generation condition	• Wheel speed does not become higher than specified.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective anti-lock brake system rotor (Improper air gap.) • Anti-lock brake system rotor is missing. • Wheel speed sensor not installed properly

791-9: An implausible left rear wheel speed signal was received.

Generation condition	• Abnormal wheel acceleration is detected during operation.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor not installed properly • Anti-lock brake system rotor dented or is missing a tooth • Defective wheel speed sensor • Defective harness

791-10: No signal from component 'B5 (Wheel speed sensor (Left rear axle))'

Generation condition	• Wheel speed (front-axle left-wheel) does not become higher than specified at initial start.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor not installed properly • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

792-2: The signal from component 'B6 (Wheel speed sensor (Right rear axle))' is faulty.

Generation condition	• Abnormal Rear wheel speed sensor RH lasts longer than specified length of time during running.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Anti-lock brake system rotor dented or is missing a tooth • Wheel speed sensor not installed properly • Radio interference

792-3: Component 'B6 (Wheel speed sensor (Right rear axle))' has a short circuit to positive.

Generation condition	• Wheel speed sensor circuit is shorted.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is short-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is short-circuited. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

792-5: Component 'B6 (Wheel speed sensor (Right rear axle))' has an open circuit.

Generation condition	• Electric continuity is lost in wheel speed sensor circuit.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is shorted to higher potential point. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

792-7: No feedback was received from component 'B6 (Wheel speed sensor (Right rear axle))'.

Generation condition	• Wheel speed does not become higher than specified.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective anti-lock brake system rotor (Improper air gap.) • Anti-lock brake system rotor is missing. • Wheel speed sensor not installed properly

792-9: An implausible right rear wheel speed signal was received.

Generation condition	• Abnormal wheel acceleration is detected during running.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor not installed properly • Anti-lock brake system rotor dented or is missing a tooth • Defective wheel speed sensor • Defective harness

792-10: No signal from component 'B6 (Wheel speed sensor (Right rear axle))'

Generation condition	• Wheel speed signal (front-axle right-wheel) does not become higher than specified at initial start.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor not installed properly • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

932-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Abnormal value of monitor voltage remains for specified time against activation command for magnetic valve (front-axle left-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

932-5: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit.

Generation condition	• Abnormal value of monitor voltage remains for specified time against activation commend for magnetic valve (front-axle left-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

932-6: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Magnetic valve (front-axle left-wheel) in hydraulic unit (electronic control unit) are both short- and open-circuited.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

932-12: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Abnormal value of monitor voltage remains for specified time against activation command for magnetic valve (front-axle left-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

933-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Abnormal value of monitor voltage remains for specified time against activation commend for magnetic valve (front-axle right-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

933-5: Component 'Solenoid (Antilock brake system Control unit)' opens too early.

Generation condition	• Abnormal value of monitor voltage remains for specified time against activation command for magnetic valve (front-axle right-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

933-6: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Magnetic valve (front-axle right-wheel) in hydraulic unit (electronic control unit) is both short- and open-circuited.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

933-12: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Abnormal value of monitor voltage remains for specified length of time against activation command for magnetic valve (front-axle right-wheel) in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

934-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Abnormal value of monitor voltage remains for specified time against activation command for magnetic valve (rear-axle left-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

934-5: Component 'Solenoid (Antilock brake system Control unit)' opens too early.

Generation condition	• Abnormal value of monitor voltage remains for specified time against activation command for magnetic valve (rear-axle left-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

934-6: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Magnetic valve (rear-axle right-wheel) in hydraulic unit (electronic control unit) are both short- and open-circuited.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

934-12: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Abnormal value of monitor voltage remains for specified time against activation command for magnetic valve (rear-axle left-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

935-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Abnormal value of monitor voltage remains for specified time against activation commend for magnetic valve (rear-axle right-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

935-5: Component 'Solenoid (Antilock brake system Control unit)' opens too early.

Generation condition	• Abnormal value of monitor voltage remains for specified time against activation command for magnetic valve (rear-axle right-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

935-6: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Magnetic valve (rear-axle right-wheel) in hydraulic unit (electronic control unit) are both short- and open-circuited.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

935-12: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Abnormal value of monitor voltage remains for specified time against activation command for magnetic valve (rear-axle right-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

938-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Abnormal value of monitor voltage remains for specific time against activation command for magnetic valve (front-axle left-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

938-5: Component 'Solenoid (Antilock brake system Control unit)' opens too early.

Generation condition	• Abnormal value of monitor voltage remains for specific time against activation command for magnetic valve (front-axle left-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution normally remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

938-6: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Magnetic valve (front-axle left-wheel) in hydraulic unit (electronic control unit) is both short- and open- circuited.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

938-12: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Abnormal value of monitor voltage remains for specific time against activation command for magnetic valve (front-axle left-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

939-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Abnormal value of monitor voltage remains for specific time against activation command for magnetic valve (front-axle right-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

939-5: Component 'Solenoid (Antilock brake system Control unit)' opens too early.

Generation condition	• Abnormal value of monitor voltage remains for specific time against activation command for magnetic valve (front-axle right-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

939-6: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Magnetic valve (front-axle right-wheel) in hydraulic unit (electronic control unit) is both short- and open- circuited.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

939-12: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Abnormal value of monitor voltage remains for specific time against activation command for magnetic valve (front-axle right-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

940-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Abnormal value of monitor voltage remains for specific time against activation command for magnetic valve (rear-axle left-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Limited control of Electronic Brake force Distribution effected.)
Possible causes	• Defective hydraulic unit (electronic control unit)

940-5: Component 'Solenoid (Antilock brake system Control unit)' opens too early.

Generation condition	• Abnormal value of monitor voltage remains for specific time against activation command for magnetic valve (rear-axle left-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

940-6: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Magnetic valve (rear-axle right-wheel) in hydraulic unit (electronic control unit) is both short- and open-circuited.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

940-12: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Abnormal value of monitor voltage remains for specific time against activation command for magnetic valve (rear-axle left-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

941-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Abnormal value of monitor voltage remains for specific time against activation command for magnetic valve (rear-axle right-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Limited control of Electronic Brake force Distribution effected.)
Possible causes	• Defective hydraulic unit (electronic control unit)

941-5: Component 'Solenoid (Antilock brake system Control unit)' opens too early.

Generation condition	• Abnormal value of monitor voltage remains for specific time against activation command for magnetic valve (rear-axle right-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

941-6: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Magnetic valve (rear-axle left-wheel) in hydraulic unit (electronic control unit) is both short- and open-circuited.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

941-12: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Abnormal value of monitor voltage remains for specific time against activation commend for magnetic valve (rear-axle right-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

1044-5: Component 'Drive of high pressure fuel pump' has an open circuit.

Generation condition	• Feedback voltage is higher than specified when motor in hydraulic unit (electronic control unit) is off.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective motor in hydraulic unit (electronic control unit) • Defective hydraulic unit (electronic control unit)

1044-6: Component 'Drive of high pressure fuel pump' is sluggish or blocked.

Generation condition	• Motor in hydraulic unit (electronic control unit) is inoperative.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective motor in hydraulic unit (electronic control unit) • Defective hydraulic unit (electronic control unit)

1044-12: The power supply of component 'Drive of high pressure fuel pump' has an open circuit.

Generation condition	• Terminal voltage of motor in hydraulic unit (electronic control unit) is lower than battery voltage.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution normally remains controllable.)
Possible causes	• Power harness between battery and hydraulic unit (electronic control unit) is open-circuited or shorted to ground. • Malfunction of battery • Defective alternator • Defective hydraulic unit (electronic control unit)

521216-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Minor error not affecting control, such as interruption of controller area network communication (CAN) signal not used for control, occurs.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Electronic control unit is internally faulty. • Controller area network communication (CAN) signal is abnormal.

521217-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521218-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521219-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521220-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521221-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521280-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521281-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521282-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521283-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521284-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521285-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521287-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521288-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521289-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521290-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521291-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521292-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521293-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521294-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521295-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521296-0: The battery voltage is too high.

Generation condition	• System voltage is higher than 19 V.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective alternator • Defective hydraulic unit (electronic control unit)

521296-1: The battery voltage is too low.

Generation condition	• System voltage is lower than 8 V.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• ON power line between starter switch and hydraulic unit (electronic control unit) is open-circuited or shorted to ground. • Malfunction of battery • Defective alternator • Defective relay of signal detect and actuation modules • Defective starter switch • Defective signal detect and actuation modules • Defective hydraulic unit (electronic control unit)

521296-3: The battery voltage is too high.

Generation condition	• System voltage is higher than 16 V.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective alternator • Defective hydraulic unit (electronic control unit)

521296-4: The battery voltage is too low.

Generation condition	• System voltage is lower than 9 V.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• ON power line between starter switch and hydraulic unit (electronic control unit) is open-circuited or shorted to ground. • Malfunction of battery • Defective alternator • Defective relay of signal detect and actuation modules • Defective starter switch • Defective signal detect and actuation modules • Defective hydraulic unit (electronic control unit)

521296-5: Faulty component 'Antilock brake system Control unit'

Generation condition	• Solenoid coil voltage lowers below 80% of battery voltage when power switch in hydraulic unit (electronic control unit) is ON.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521296-6: Faulty component 'Antilock brake system Control unit'

Generation condition	• Solenoid coil voltage lowers below 80% of battery voltage when power switch in hydraulic unit (electronic control unit) is ON.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521297-12: The internal voltage is outside the permissible range.

Generation condition	• Voltage in hydraulic unit (electronic control unit) is abnormal.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521314-2: One or more rpm sensors supply implausible values.

Generation condition	• Wheel speed error involving two or more wheels is detected.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Wheel speed sensor not installed properly • Defective wheel speed sensor

521315-7: Faulty wheel speed sensor detected on both sides of one axle

Generation condition	• Simultaneous failure of wheel speed sensors for left and right wheels on one axle is detected
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Wheel speed sensor not installed properly • Defective wheel speed sensor

521331-7: Component 'B62 (Acceleration sensor)' is mechanically damaged or it sticks.

Generation condition	• Signal does not change for the specified period of time, or signal that exceeds the specified upper limit is detected.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective G sensor • Defective harness • Defective hydraulic unit (electronic control unit)

521331-10: Component 'B62 (Acceleration sensor)' has an electrical fault.

Generation condition	• Variation that exceeds the specified value is detected in the next signal.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• G sensor underwent acceleration exceeding limit (no need for replacement of sensor as it is not faulty). • Defective G sensor • Defective harness • Defective hydraulic unit (electronic control unit)

521332-2: The offset value of component 'B62 (Acceleration sensor)' is faulty.

Generation condition	• Zero-point offset that exceeds the specified value is detected when the vehicle is stopped.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective G sensor • Defective harness • Defective hydraulic unit (electronic control unit)

521333-2: The offset value of component 'B62 (Acceleration sensor)' is faulty.

Generation condition	• Zero-point offset that exceeds the specified value is detected when the vehicle is running.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective G sensor • Defective harness • Defective hydraulic unit (electronic control unit)

521334-2: The signal voltage of component 'B62 (Acceleration sensor)' is too low.

Generation condition	• Variation that exceeds the specified value is detected through comparison with theoretical value.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Harness between hydraulic unit (electronic control unit) and battery open or shorted to ground • Signal harness between hydraulic unit (electronic control unit) and G sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and G sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and G sensor is shorted to higher-potential point. • Defective G sensor • Defective hydraulic unit (electronic control unit)

521349-7: Different types of tires are installed on the vehicle.

Generation condition	• Speed of one wheel differs from that of others by more than 25%.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Tire is not as specified in size. • Anti-lock brake system rotor is not as specified.

521354-12: A RAM fault was detected in the CAN controller.

Generation condition	• Specified controller area network communication (CAN) signal is not received.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Half-system control of anti-lock brake system is effected.
Possible causes	• Controller area network communication (CAN) line is open-circuited, shorted to higher potential point, shorted to ground or short circuited. • Defective hydraulic unit (electronic control unit)

521356-12: CAN communications is faulty or disrupted.

Generation condition	• Specified controller area network communication (CAN) signal is not received.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Half-system control of anti-lock brake system is effected.
Possible causes	• Controller area network communication (CAN) line is open-circuited, shorted to higher potential point, shorted to ground or short circuited. • Defective hydraulic unit (electronic control unit)

521367-12: Error in CAN reception from component “A20 (SAM)”

Generation condition	• Necessary controller area network communication (CAN) from signal detect and actuation module is lost.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Half-system control of anti-lock brake system is effected.
Possible causes	• Controller area network communication (CAN) line is open-circuited, shorted to higher potential point, shorted to ground or short circuited. • Defective signal detect and actuation modules. • Defective hydraulic unit (electronic control unit)

521395-13: Coding failed to be executed

Generation condition	• Conditioning has not been done.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Conditioning has not been done. • Conditioning is not sufficient.

521403-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521404-2: Component 'B62 (Acceleration sensor)' has an electrical fault.

Generation condition	• Intermittent open- or short-range output is detected.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Harness between hydraulic unit (electronic control unit) and battery open or shorted to ground • Signal harness between hydraulic unit (electronic control unit) and G sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and G sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and G sensor is shorted to higher-potential point. • G sensor underwent acceleration exceeding limit (no need for replacement of sensor as it is not faulty). • Defective G sensor • Defective hydraulic unit (electronic control unit)

2. FUSO Diagnostics Service Data (Measured Values)

- Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.

Current value group	Description	Value	Explanation
Voltages	Supply voltage: High pressure and return pump	9 to 18 V	Shows the motor supply voltage in the hydraulic unit (electronic control unit).
	Power supply of valves	9 to 18 V	Shows the magnetic valve supply voltage in the hydraulic unit (electronic control unit).
	Supply voltage: Relay 'Solenoid valve'	9 to 18 V	Shows the magnetic valve relay voltage in the hydraulic unit (electronic control unit).
	Uecu unfiltered	9 to 18 V	Indicates the supply voltage of hydraulic unit (electronic control unit) (unfiltered).
	Uecu filtered	9 to 18 V	Indicates the supply voltage of hydraulic unit (electronic control unit) (filtered).
Vehicle speed	Wheel speed at left rear axle	0 to 155.4 mph	Shows the wheel speed sensor (rear-axle left-wheel) value.
	Wheel speed at right rear axle	0 to 155.4 mph	Shows the wheel speed sensor (rear-axle right-wheel) value.
	Wheel speed at left front axle	0 to 155.4 mph	Shows the wheel speed sensor (front-axle left-wheel) value.
	Wheel speed at right front axle	0 to 155.4 mph	Shows the wheel speed sensor (front-axle right-wheel) value.
Switches	Exhaust Brake Switch Status	ON/OFF	Indicates state of exhaust brake switch.
	Exhaust brake cut status	ON/OFF	Shows the exhaust brake cutoff state.
	Intake valve ABS Rear axle RIGHT	ON/OFF	Shows the magnetic valve (rear-axle right-wheel) HOLD valve status.
	Intake valve ABS Rear axle LEFT	ON/OFF	Shows the magnetic valve (rear-axle left-wheel) HOLD valve status.
	Outlet valve ABS Rear axle RIGHT	ON/OFF	Shows the magnetic valve (rear-axle right-wheel) DECREASE valve status.
	Outlet valve ABS Rear axle LEFT	ON/OFF	Shows the magnetic valve (rear-axle left-wheel) DECREASE valve status.
	Intake valve ABS Front axle RIGHT	ON/OFF	Shows the magnetic valve (front-axle right-wheel) HOLD valve status.
	Intake valve ABS Front axle LEFT	ON/OFF	Shows the magnetic valve (front-axle left-wheel) HOLD valve status.
	Outlet valve ABS Front axle RIGHT	ON/OFF	Shows the magnetic valve (front-axle right-wheel) DECREASE valve status.
	Outlet valve ABS Front axle LEFT	ON/OFF	Shows the magnetic valve (front-axle left-wheel) DECREASE valve status.
	Switch 'Brake lights' Low	ON/OFF	Shows the brake switch 1 status.
	Switch 'Brake lights' High	ON/OFF	Shows the brake switch 2 status.
	Status of component 'Relay Solenoid valve'	OK/NOT OK	Shows the valve relay status.
	Switch 'Brake fluid level'	ON/OFF	Shows the brake fluid level switch status.
	High pressure and return pump	ON/OFF	Shows the motor status.
Control unit information	Total number of ignition sequences	0 to 65535	Shows the cumulative number of times the starter switch was turned ON.

Current value group	Description	Value	Explanation
On-board actual values	Indicator lamp 'ABS'	ON/OFF	Shows the anti-lock brake system indicator lamp state.
	ABS ACTIVE	ON/OFF	Shows the anti-lock brake system operation state.
	EBD ACTIVE	ON/OFF	Shows the Electronic Brake force Distribution operation state.
Other actual value	2WD_4WD info	0/1/2/3/4	Indicates vehicle specification information.

3. Actuator Test (Control) Using FUSO Diagnostics

- Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.
- The basic conditions for performing the actuator test: Vehicle stopped, engine stopped, starter switch ON, DUONIC™ system in P range, and accelerator pedal and brake pedal released.

Selection	Description
Solenoid valve Rear axle RIGHT Solenoid valve Front axle LEFT Solenoid valve Front axle RIGHT Solenoid valve Rear axle LEFT	Activate the magnetic valve (for the wheel being tested) and the motor. [Additional condition for performing actuator test] There is no error in the magnetic valve and motor when the starter switch is ON.  P116880E
Hydraulic pump	Activate the motor. [Additional condition for performing actuator test] There is no error in the motor when the starter switch is ON.  P118190E
Manual bleeding	Perform control of manual bleeding. [Additional condition for performing actuator test] Engine starting. [Test method] Press the brake pedal to perform air bleeding. (See Gr35.)

4. Electronic Control Unit Coding

- The anti-brake system electronic control unit has various kinds of information such as technical data of vehicle and equipment registered as coding data.
- Therefore, each time the anti-brake system electronic control unit is replaced or some specification changes are made, the coding data must surely be rewritten using FUSO diagnostics.

5. Rewriting of Coding Data

- If specification changes have been made, be sure to rewrite the relevant coding data. For details of the rewriting procedure, consult an authorized dealer or distributor.

Remedy \ Hydraulic unit (electronic control unit) data		Overall data (latest record data set for applicable vehicles)	Remarks
Coding	Replacement of electronic control unit	O	

6. Electronic Control Unit Input/Output Table

- See the Electronic Control Unit Schematic Diagram for the pin locations of each signal and ground.

Device to be connected	Terminal	Input/output	Voltage and wave form
High-current fuse box (VB1)	25-Ground	In	[Measurement condition] Disconnect the electronic control unit and harness, then inspect on the vehicle-side connector. [Judgment criteria] 10 to 16 V
High-current fuse box (VB2)	1-Ground	In	[Measurement condition] Disconnect the electronic control unit and harness, then perform inspection on the vehicle-side connector. [Judgment criteria] 10 to 16 V
Front wheel speed sensor RH	3-4	In	[Measurement condition] Disconnect the electronic control unit and harness, then perform inspection on the vehicle-side connector. For the method of connecting the oscilloscope, see #329 “Inspection of wheel speed sensor” in “INSPECTION OF ELECTRICAL PARTS”. [Judgment criteria]
Front wheel speed sensor LH	27-28	In	
Rear wheel speed sensor RH	11-10	In	
Rear wheel speed sensor LH	36-35	In	 P116993E • If the spacing between adjacent pulses is wider in part of the waveform, there may be a dent or missing tooth in the rotor. • Visually inspect the rotor for defects and replace if necessary. • (See Gr26A, 26B and 27.)

M E M O

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Functional Check

1.1 Inspection with vehicle stationary

- While depressing the brake pedal, check the hydraulic unit (electronic control unit) and the brake pipes and connections for fluid leakage.
- If fluid is leaking from the hydraulic unit (electronic control unit), replace the unit. If fluid is leaking from the brake pipes or connections, retighten the hardware.

1.2 Inspection using brake tester

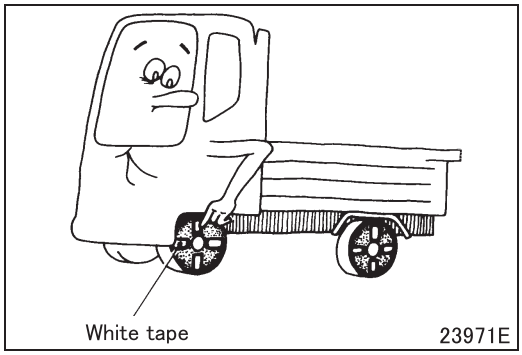
- Using the brake tester, check each wheel for braking force following the normal procedures.
- If faulty, check the wheel brake in question, the service brake system and the hydraulic unit (electronic control unit).

1.3 Inspection of anti-lock brake system operation while driving the vehicle

WARNING ⚠

- **During this inspection, do not allow any other vehicle or anyone into the test course.**

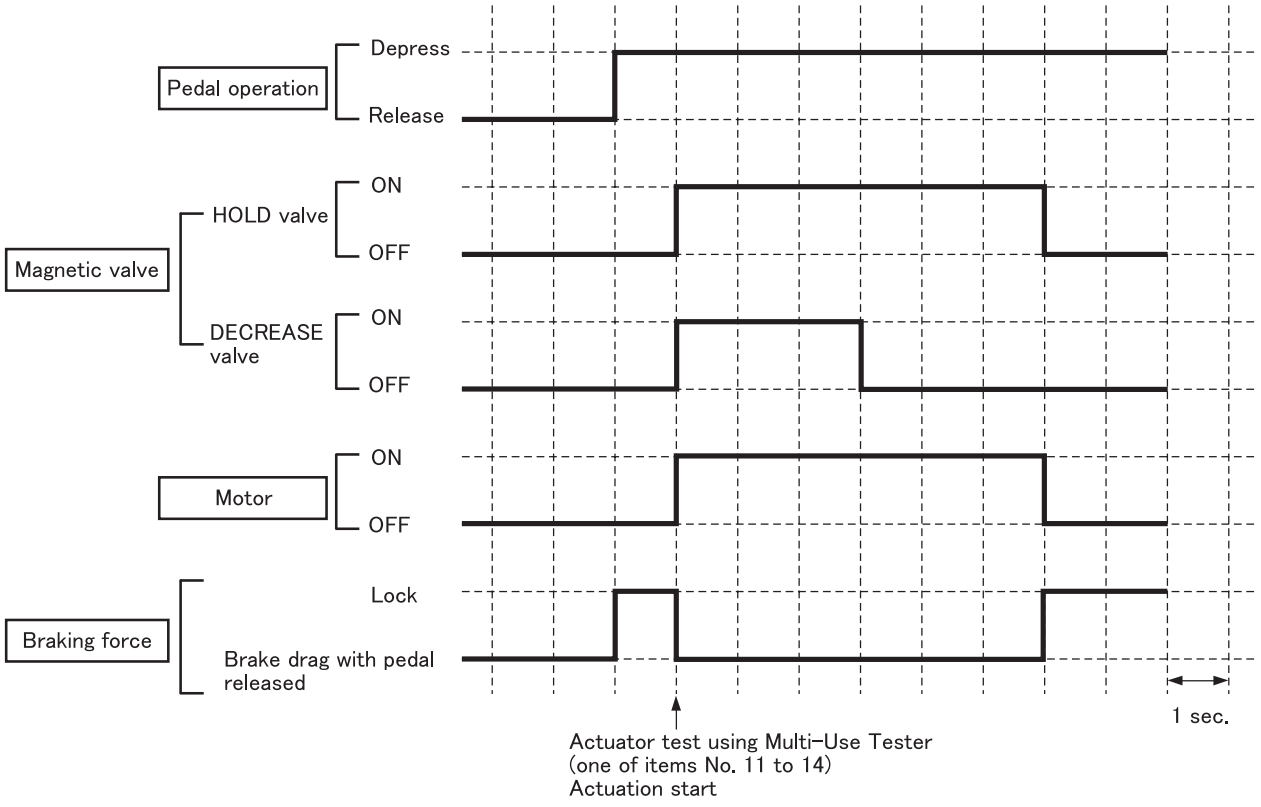
- The vehicle being tested should be unloaded.
- Apply white tape onto the walls of front and rear tires to aid the observation of wheel rotation.
- Turn the starter switch from LOCK to ON. The warning lamp should illuminate and, in several seconds, extinguish.
- Drive the vehicle at 20 to 30 km/h {12 to 19 mph} and apply the brakes hard. The wheels should not lock up.



2. Inspection of Hydraulic Unit (Electronic Control Unit) Operation

2.1 Inspection using Multi-Use Tester

- The hydraulic unit (electronic control unit) cannot be inspected for operation during control effected by the electronic control unit at the time of a fault which will cause a diagnosis code to occur. The inspection should be performed after system recovery from the control through troubleshooting.
- Jack up the vehicle and support it on jack stands, or place the vehicle on the rollers of a brake tester.
- Apply the parking brake when testing the front brake. Apply chocks to the front wheels when testing the rear brake.
- During inspection, keep the brake tester rollers and the tires dry.
- With the parking brake released, feel the brake drag of each wheel. When the brake tester is used, read the brake drag indicated in the tester.
- Connect the Multi-Use Tester. (See Gr00.)
- With the transmission in neutral, start the engine.



- When abnormality is found as a result of inspection, take a remedial action in accordance with the table below.

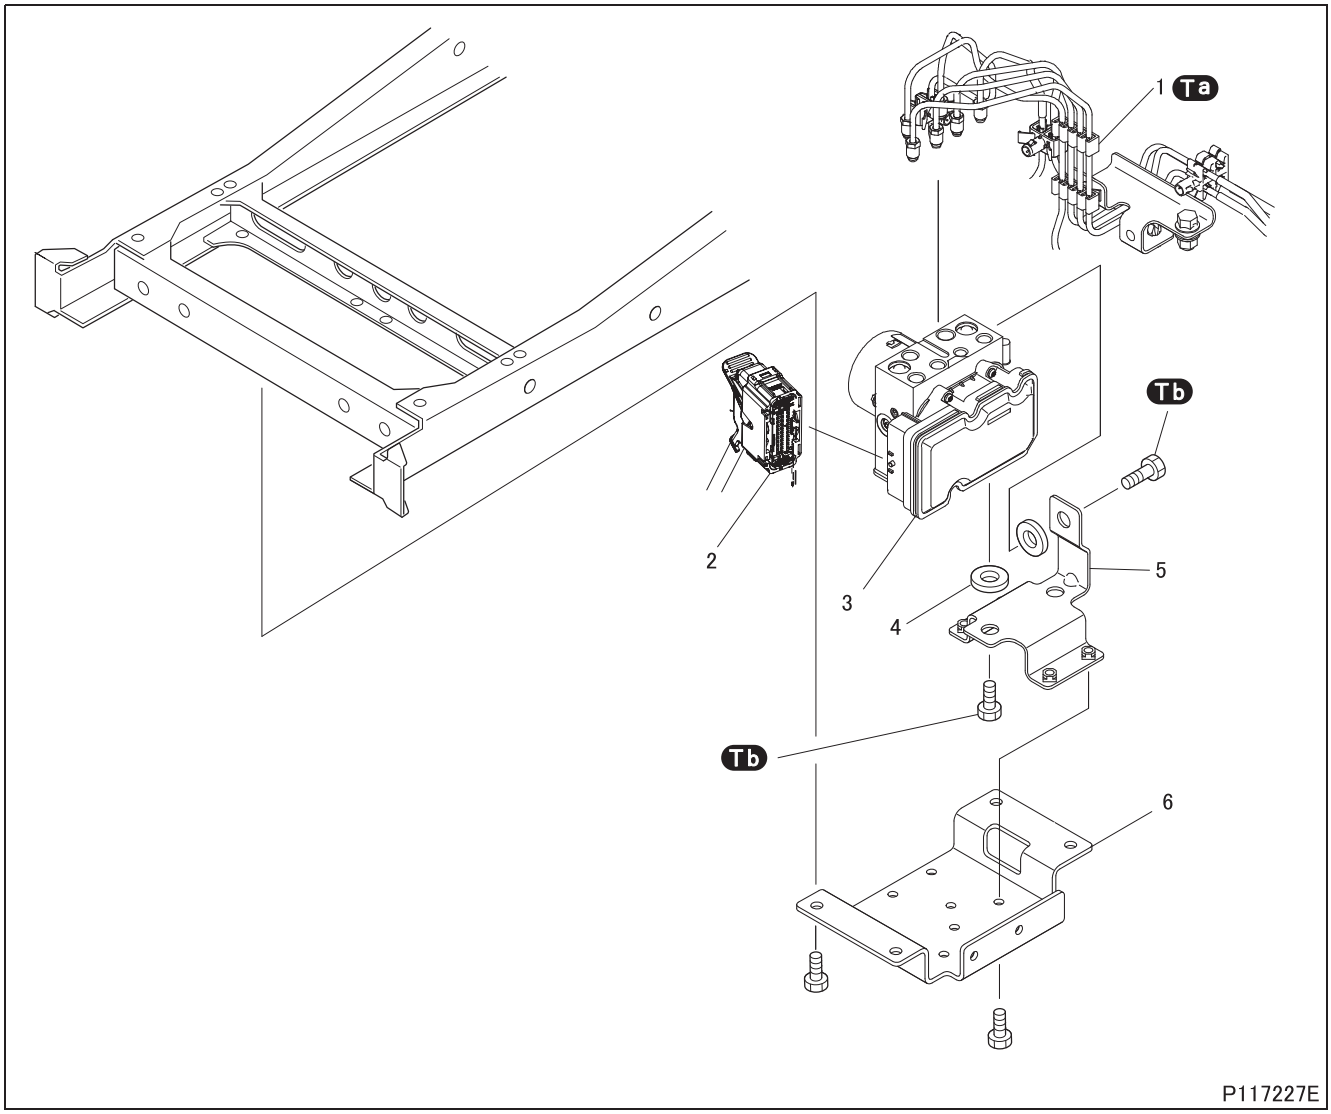
Symptom	Cause	Remedial action
Wheel will not lock up when brake pedal is pressed.	Clogged brake line outside hydraulic unit (electronic control unit)	Inspect and clean brake line
	Clogged line inside hydraulic unit (electronic control unit)	Replace hydraulic unit (electronic control unit)
Braking force will not drop.	Incorrectly connected hydraulic unit (electronic control unit) brake piping	Connect piping correctly
	Faulty hydraulic unit (electronic control unit) magnetic valve	Replace hydraulic unit (electronic control unit)

3. Inspection after Replacing or Removing/Installing Hydraulic Unit (Electronic Control Unit)

- Check the hydraulic unit (electronic control unit) for normal operation.
- After replacing or removing/installing the hydraulic unit (electronic control unit), always check the system for normal operation. Controlled braking will not be available if the piping is incorrect.
- After replacement or reinstallation of the hydraulic unit (electronic control unit), be sure to bleed the brake system. (See Gr35.)
- The vehicle harness connector is equipped with a locking device. For correct use of the device, see “HYDRAULIC UNIT CONNECTOR COUPLING AND UNCOUPLING” in this manual.

M E M O

HYDRAULIC UNIT (ELECTRONIC CONTROL UNIT)



● **Removal sequence**

1 Brake pipe
2 Harness connector
3 Hydraulic unit (electronic control unit)
4 Grommet
5 Hydraulic unit bracket A
6 Hydraulic unit bracket B

● **Installation sequence**

Follow the removal sequence in reverse.

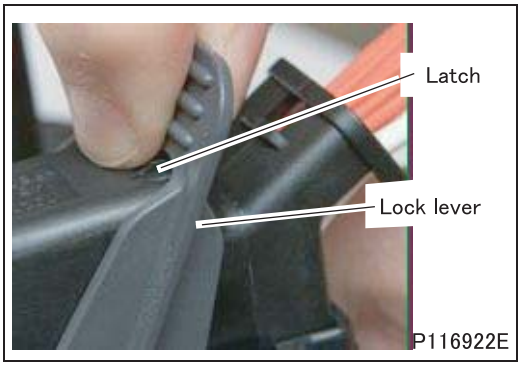
CAUTION ⚠

- **After the hydraulic unit (electronic control unit) is replaced with a new one, air bleeding should be performed for the secondary side circuit (anti-lock brake system circuit) in addition to the primary side circuit. (See Gr35.)**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

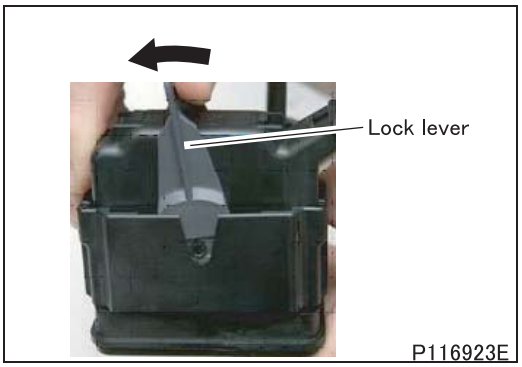
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Brake pipe mounting	17.5 ± 2.7 {13 ± 2.0, 1.8 ± 0.3}	–
Tb	Hydraulic unit (electronic control unit) mounting	14.7 to 15.8 {11 to 12, 1.5 to 1.6}	–

◆Removal procedure◆



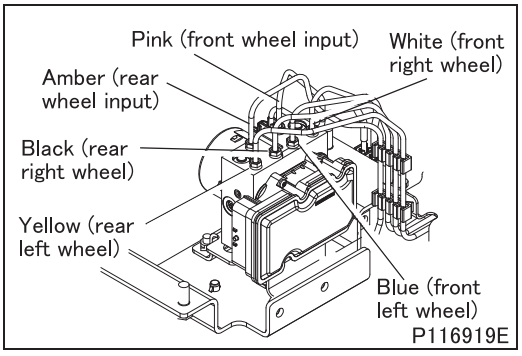
■ **Removal: Harness connector**

- Press the latch to unlock the lock lever.



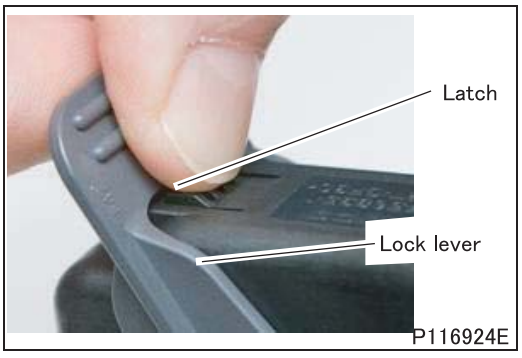
- Move the lock lever in the direction shown in the illustration to unlock the harness connector.
- Remove the harness connector by pulling it upwards.

◆Installation procedure◆



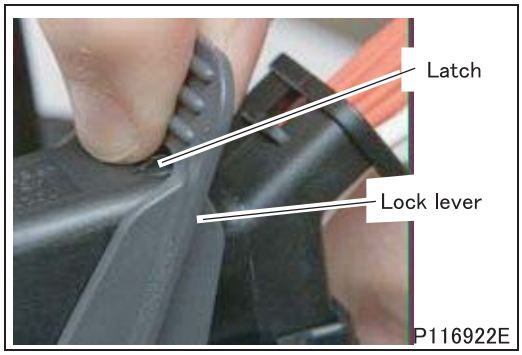
■ **Installation: Brake pipe**

- Confirm the location to be connected using marking colors on the brake pipes and connect the pipes to the correct connectors on the hydraulic unit (electronic control unit) as shown in the figure.



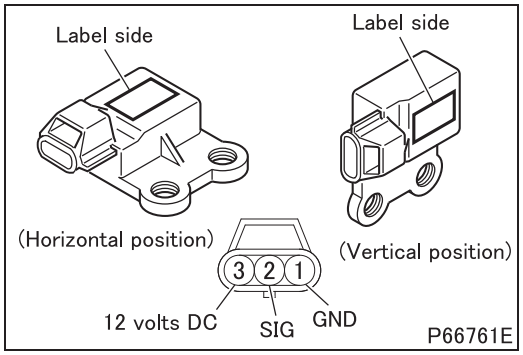
■ **Installation: Harness connector**

- Push the lock lever toward the left to latch it.
- Insert the harness connector straight into the hydraulic unit (electric control unit).
- Press the latch to unlock the lever.



- Move the lock lever in the direction opposite to the installation to lock the harness connector.
- Push the lock lever toward the right to latch it.
- Check that the harness connector is securely locked.

M E M O

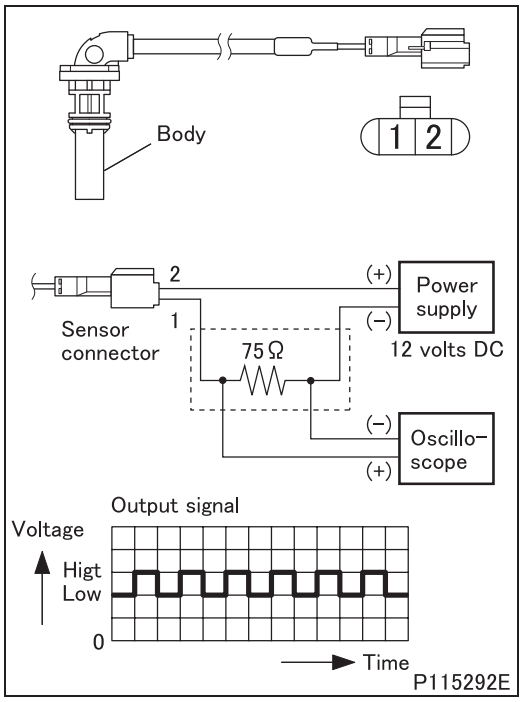


#327 Inspection of G sensor

- Apply a 12 volts DC across terminals 3 and 1 of the G sensor.
- Measure the G sensor output voltage between terminals 2 and 1 for both when the sensor is in a horizontal position and when it is in a vertical position.

Standard value	Horizontal position	2.3 to 2.7 V
	Vertical position	3.3 to 3.7 V

- If any of the measurements is not within the standard value range, replace the sensor.



#329 Inspection of wheel speed sensor
<FE>

- Perform the following check. Replace the wheel speed sensor if any fault is found.

CAUTION ⚠

- **The wheel speed sensor has a magnet in it. Be careful not to allow metal pieces to attach the sensor.**

(1) Output voltage

- Because output check using the anti-lock brake system rotor is required, follow the steps below to measure the output voltage with the sensor mounted on the vehicle.
- Jack up the wheel to be measured, then remove the connector of the wheel speed sensor.
- Connect the terminals of the removed connector to an oscilloscope as shown in the circuit diagram, then check the voltage on the oscilloscope while rotating the wheel by hand at a constant speed.

Standard value	High	$1.05^{+0.21}_{-0.16}$ V
	Low	$0.53^{+0.10}_{-0.09}$ V

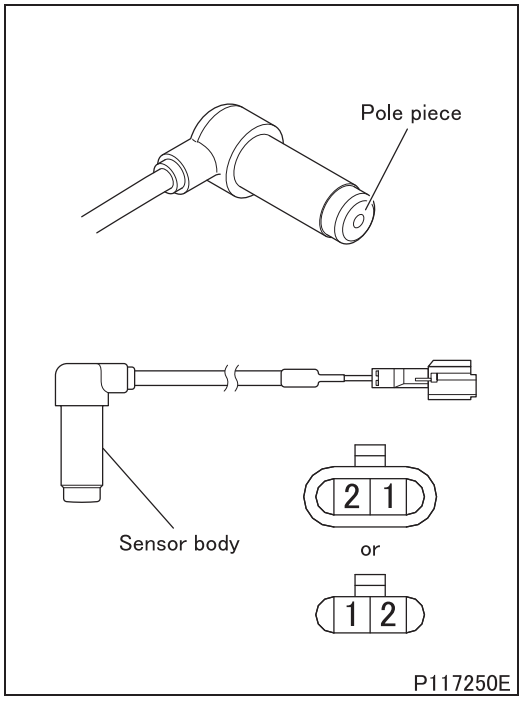
(2) Insulation resistance

- Measure the resistance between terminal 1 and body and between terminal 2 and body.

Standard value	5 MΩ or above

(3) Open circuit

- If there is an open circuit, remove the clamp on the harness from the vehicle, then check for transient open circuit while bending and stretching the harness at the clamp. Also, check the connection conditions of the connector terminals.



<FG>

- Carry out the following checks. If faulty, replace the wheel speed sensor.

CAUTION ⚠

- **The pole piece is magnetized by the magnet housed in the wheel speed sensor. Be careful not to allow metal parts to stick onto the pole piece.**

(1) Resistance between terminals

Standard value	1.4 ± 0.2 kΩ

(2) Insulation resistance (between the sensor body and each terminal)

Standard value	1 MΩ or above

(3) Open circuit

- If open circuit is suspected, remove the harness clamps and wiggle the harness to determine whether it is an intermittent fault or not. Check also the connector terminals for proper connection.

M E M O

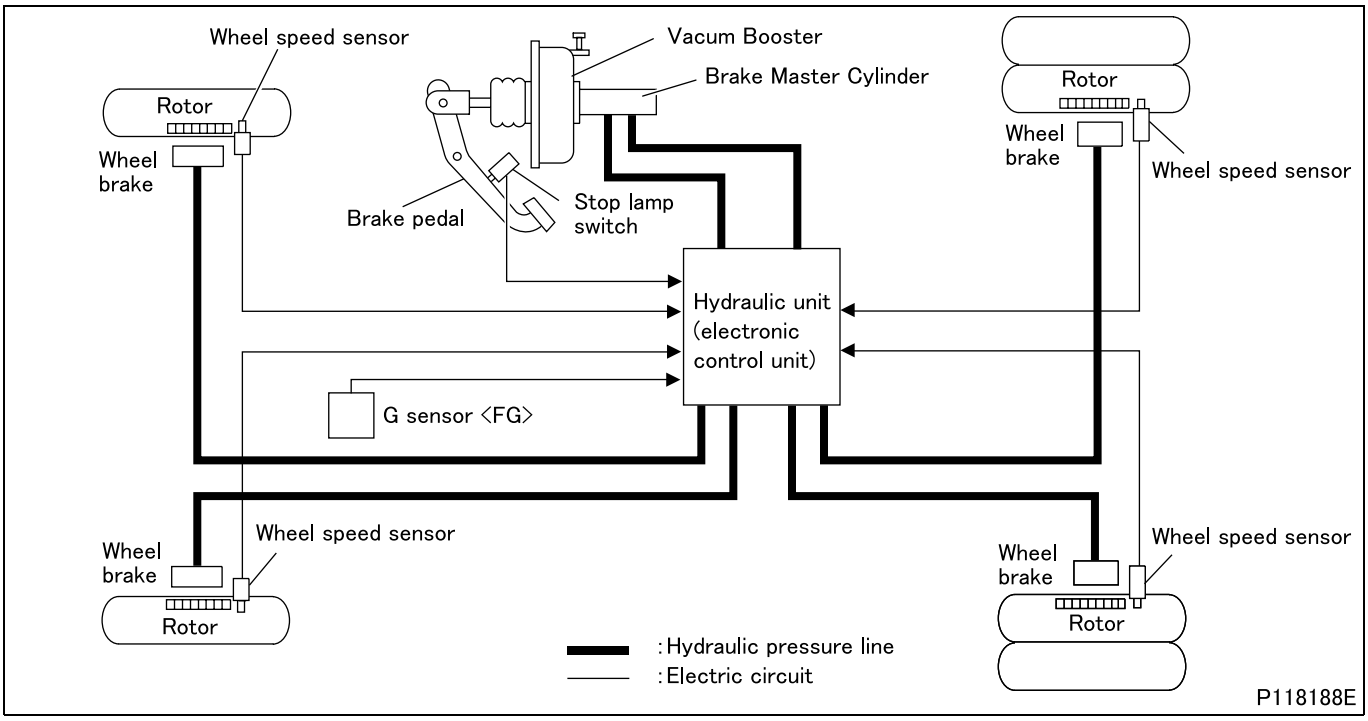
1. Overview

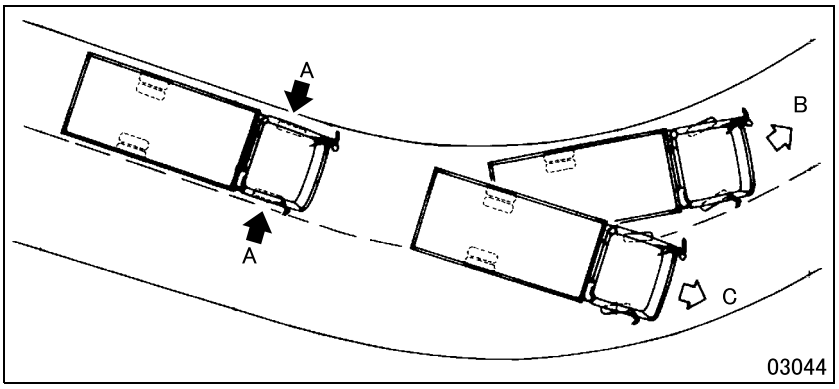


- The illustration shown above is intended to explain the structure and operation only and parts of it may differ from that of the actual piping diagram. For the details, see the piping diagram in Gr35.
- The anti-lock brake system (ABS) prevents wheel lock-up and resultant skid when braking hard or on slippery roads, thus maintain vehicle stability and steerability.

1.1 Outline of anti-lock brake system

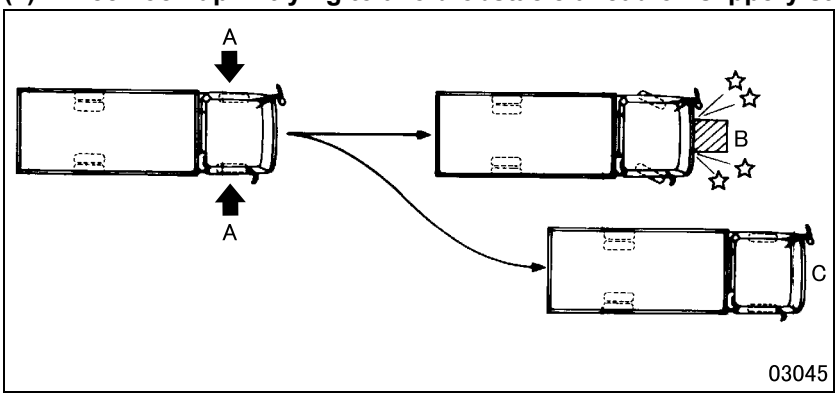
- Wheels will roll along on the road in the direction of their rotation. Therefore, the driver can steer the vehicle as he/she wishes by maneuvering the steering wheel.
  However, on vehicles not equipped with anti-lock brake system (ABS), applying the brakes hard can cause wheel lock-up. Once tires are locked up, they are simply a piece of rubber in contact with the road surface and steering control will be lost. The vehicle will skid in the direction of inertia irrespective of the steering angle.
  In other words, vehicle stability and steerability are lost and the vehicle is out of the driver's control.
- On vehicles equipped with anti-lock brake system, the system prevents wheel lock-up by reducing the braking power to the wheel that is about to lock up and, thereby, maintain vehicle stability and steerability.

(1) Wheel lock-up when cornering on slippery road



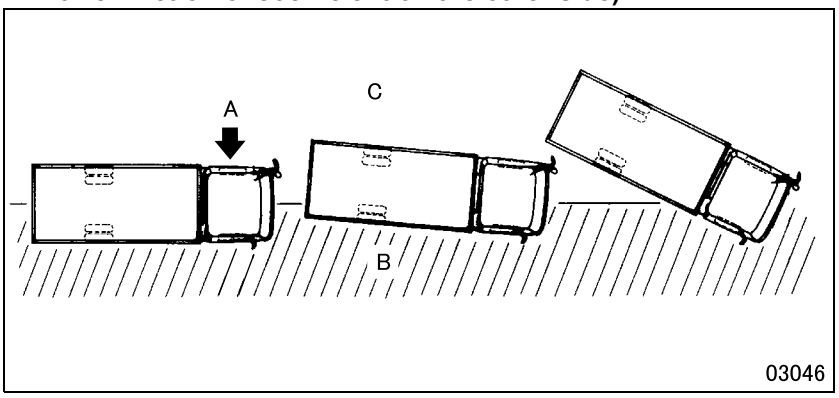
- If wheel lock-up occurs during braking on a slippery curve, steering control will be lost. If this happens, the vehicle may deviate, while skidding, from the intended course no matter how the driver maneuvers the steering wheel.
  A: Application of brakes (wheel lock-up)
  B: Intended course
  C: Actual course

(2) Wheel lock-up in trying to avoid obstacle ahead on slippery straight road



- If wheel lock-up occurs during hard braking on a slippery straight road in trying to avoid an obstacle ahead, steering control will be lost. If this happens, the vehicle will not be able to avoid the obstacle no matter how the driver maneuvers the steering wheel.
  A: Application of brakes (wheel lock-up)
  B: Obstacle
  C: Intended course

(3) Split μ (wheel lock-up on asymmetrical road surface, with higher friction of coefficient on one side and lower friction of coefficient on the other side)



- If the front and rear wheels on one side of the vehicle are on the side of the road that has a lower friction of coefficient and therefore is more slippery than the other side of the road, these wheels are more likely to lock up and slip than the wheels on the other side of the vehicle. When the brakes are applied under such conditions, the braking efficiency will be different between the right and left sides of the vehicle and the vehicle will lose stability. Braking hard under such conditions can even cause the vehicle to spin.
  A: Application of brakes (wheel lock-up)
  B: Less slippery road surface
  C: More slippery road surface

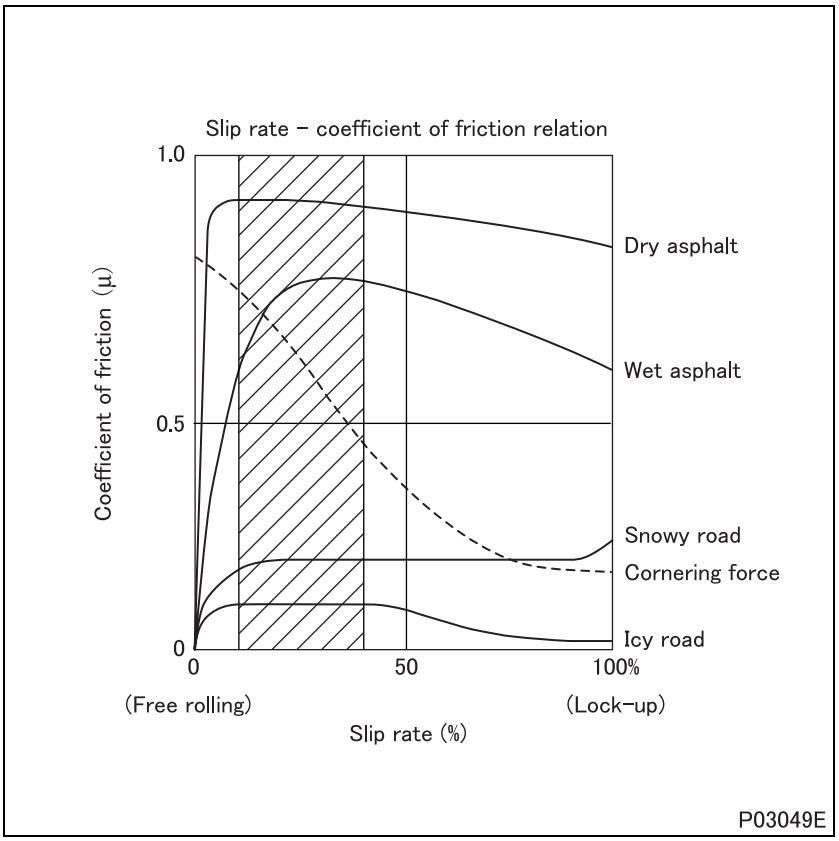
- As mentioned above, the system prevents wheel lock-up by providing controlled braking force to each wheel. This prevents wheel slip and skid and ensures steering control and vehicle stability even during hard braking.

1.2 Anti-lock brake system control process

- Anti-lock brake system ensures controlled yet optimum braking in a given road surface condition by placing the braking force within a certain range of slip rate determined by the wheel speed - vehicle speed relation.
- Stepping on the brake pedal causes the wheel speed to slow down and, as a result, the vehicle also slows down. However, the vehicle will still try to move on due to the inertia that has built up. This causes a difference between the wheel speed and the vehicle speed, or, in other words, slip. The amount of slip can be expressed as slip rate, as follows.

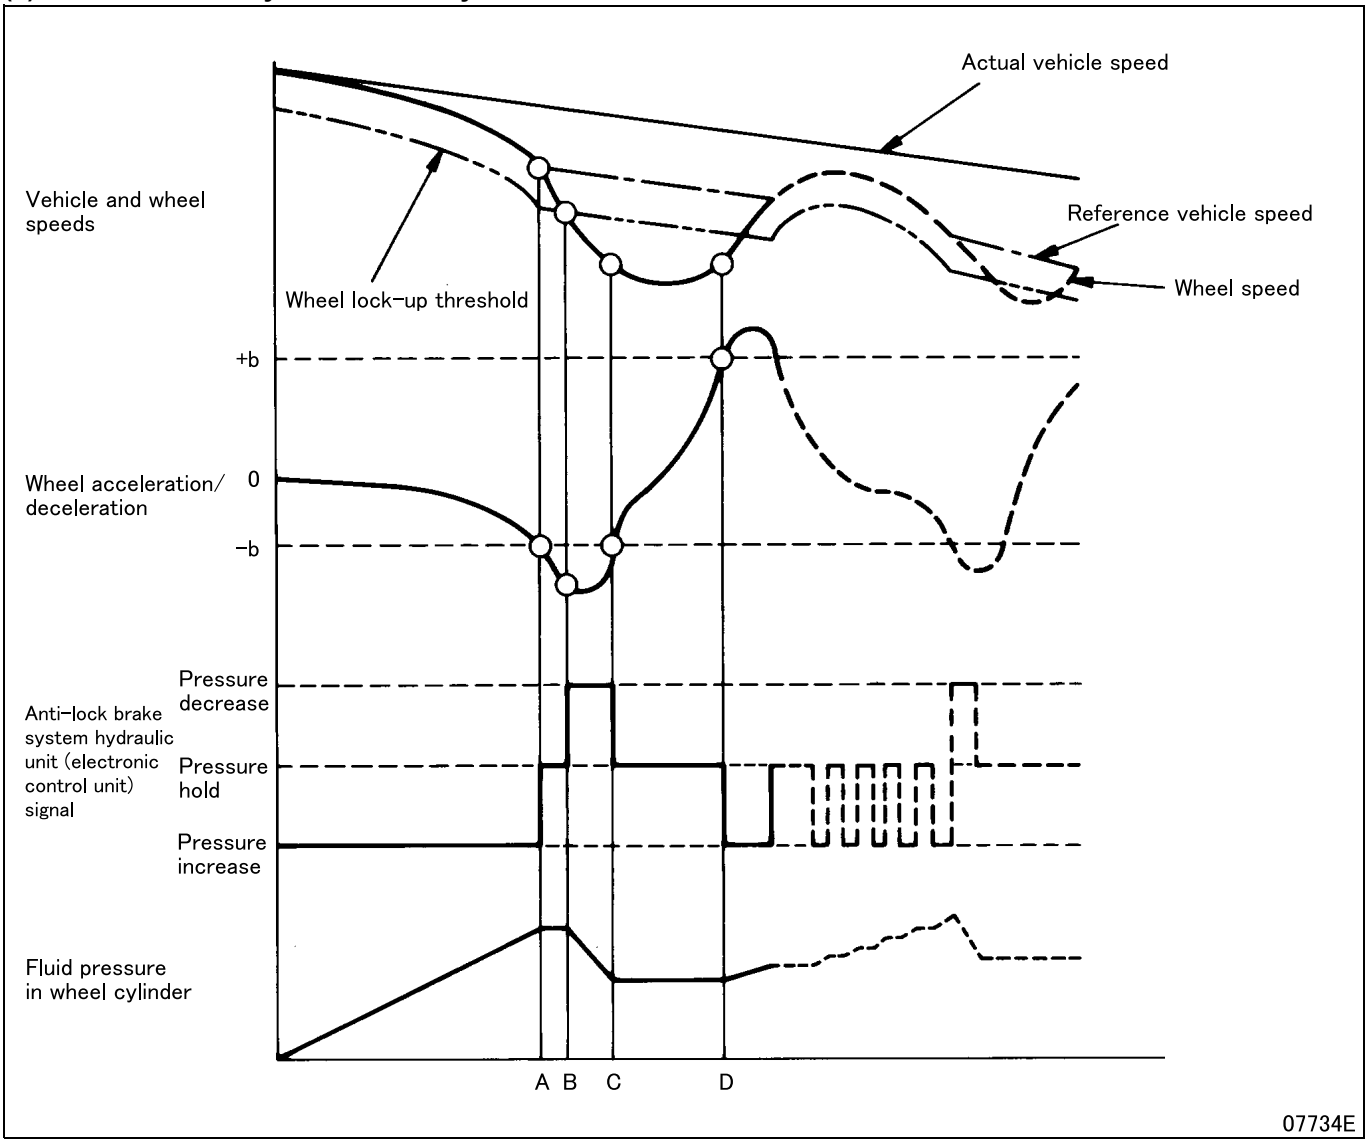
$$\text{Slip rate (\%)} = \frac{\text{Vehicle speed} - \text{Wheel speed}}{\text{Vehicle speed}} \times 100$$

- A slip ratio of 0% means that there is no slip between the wheel and the road surface. A slip rate of 100% means that the wheel is locked up.

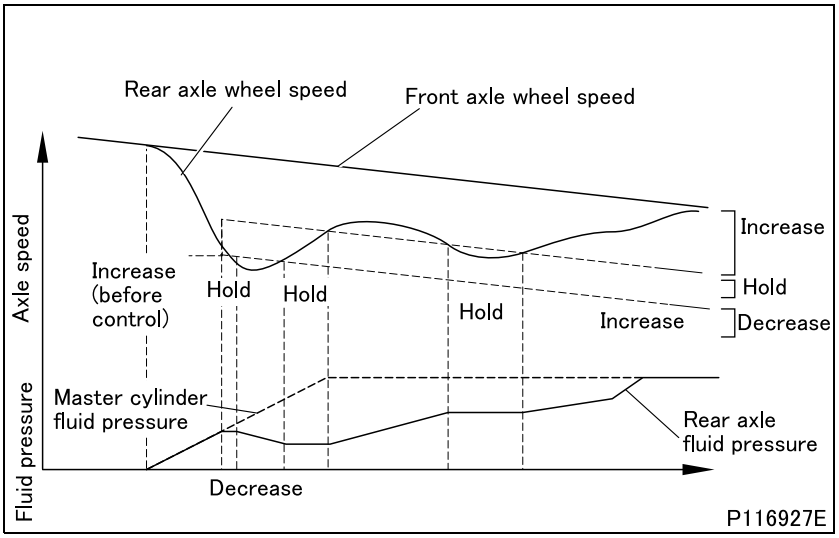


- The graph shows the variation in the tire's coefficient of friction from free rolling to lock-up. As the brake pedal is slowly pressed, the tires continue to rotate but start slipping.
- As the application force on the brake pedal increases, the tires will stop rotating and the vehicle will just skid. This is wheel lock-up.
- As the graph shows, the coefficient of friction peaks within the hatched area.
- In other words, the maximum coefficient of friction can be achieved, not by stepping on the brake pedal with full force, but by doing so moderately to try to place the slip rate within the hatched area.
- On vehicles equipped with anti-lock brake system, the hydraulic control unit (electronic control unit) controls the braking force so that it falls within the hatched area. This will ensure that the tires do not lock up but have the maximum coefficient of friction, thus achieving efficient braking performance.

(1) Anti-lock brake system control cycle



- The chart above shows the typical control cycle of anti-lock brake system following the application of brakes, detailing in time series the variation in wheel speed, wheel speed acceleration/deceleration and fluid pressure in the wheel cylinder.
- When the wheel speed acceleration/deceleration drops to the “–b” threshold at A, the hydraulic unit (electronic control unit) sends “pressure hold” signal to maintain the fluid pressure in the wheel cylinder.
  At the same time, the hydraulic unit (electronic control unit) calculates the reference vehicle speed.
- When the vehicle decelerates to the wheel lock-up threshold at B, the hydraulic unit (electronic control unit) interprets this as imminent wheel lock-up and sends “pressure decrease” signal to reduce the fluid pressure in the wheel cylinder.
- When the wheel speed picks up and exceeds the “–b” threshold at C, the hydraulic unit (electronic control unit) sends “pressure hold” signal to maintain the fluid pressure in the wheel cylinder at the current level.
- When the wheel speed exceeds the “+b” threshold at D, the hydraulic unit (electronic control unit) determines that the imminent wheel lock-up has gone and sends “pressure increase” signal to increase the fluid pressure in the wheel cylinder.
- The pressure hold-decrease-increase cycle is repeated to keep the slip rate at optimum levels to prevent wheel lock-up.



1.3 Electronic Brake force Distribution (EBD)

- The Electronic Brake force Distribution limits increase in brake fluid pressure to rear axle wheels with an increased skid/slip tendency so that braking forces appropriate for loads on the axles are distributed.
- Through this control, activation of the anti-lock brake system (ABS) is delayed near the critical limit.

36 Magnetic valve (rear-axle left-wheel DECREASE)
37 Filter (rear-axle right-wheel)
38 Check valve (rear-axle right-wheel)
39 Magnetic valve (rear-axle left-wheel DECREASE)

A: From master cylinder (front axle)
B: From master cylinder (rear axle)
C: To wheel brake (front-axle right-wheel)
D: To wheel brake (front-axle left-wheel)
E: To wheel brake (rear-axle right-wheel)
F: To wheel brake (rear-axle left-wheel)

- The hydraulic unit (electronic control unit) is the heart of anti-lock brake system and Electronic Brake force Distribution control, energizing/de-energizing the magnetic valves and turning ON/OFF the motor. The table below shows how each magnetic valve and the motor are controlled in each phase.

		Anti-lock brake system control											
		Front-axle right-wheel			Front-axle left-wheel			Rear-axle right-wheel			Rear-axle left-wheel		
		DECREASE	HOLD	INCREASE	DECREASE	HOLD	INCREASE	DECREASE	HOLD	INCREASE	DECREASE	HOLD	INCREASE
Magnetic valve	Front-axle right-wheel DECREASE	O	×	×	–	–	–	–	–	–	–	–	–
	Front-axle right-wheel HOLD	O	O	×	–	–	–	–	–	–	–	–	–
	Front-axle left-wheel DECREASE	–	–	–	O	×	×	–	–	–	–	–	–
	Front-axle left-wheel HOLD	–	–	–	O	O	×	–	–	–	–	–	–
	Rear-axle right-wheel DECREASE	–	–	–	–	–	–	O	×	×	–	–	–
	Rear-axle right-wheel HOLD	–	–	–	–	–	–	O	O	×	–	–	–

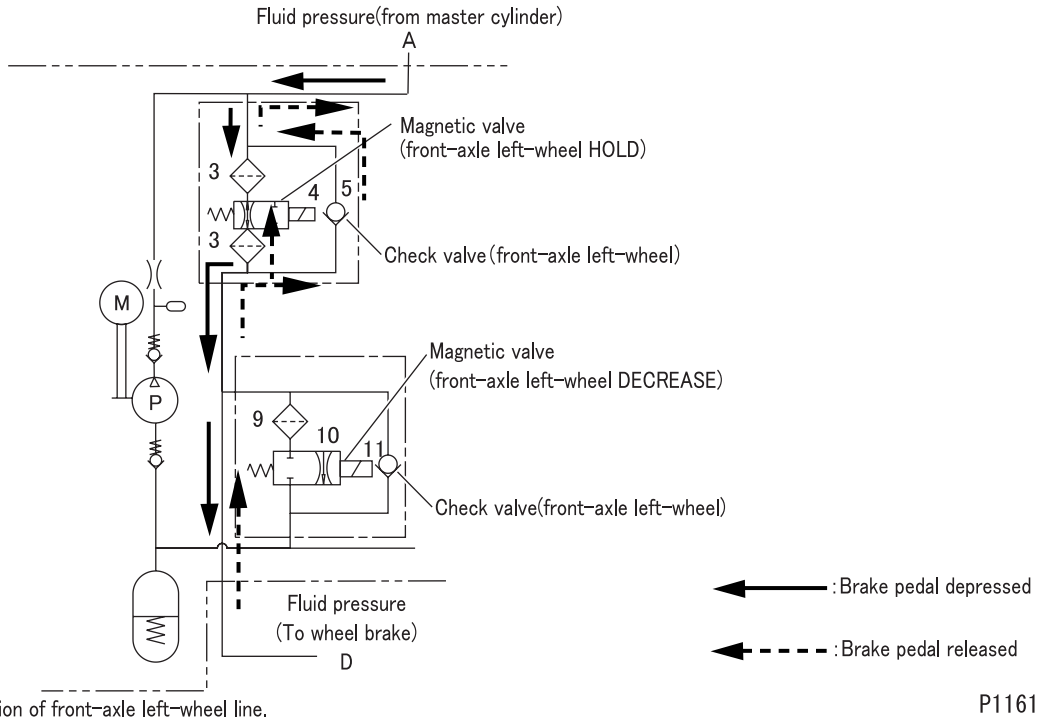
Motor		×*		

O: On

× : OFF

* : The motor will operate only when brake fluid accumulates in the secondary circuit during pressure reduction.

(2) Normal braking (anti-lock brake system not in operation)

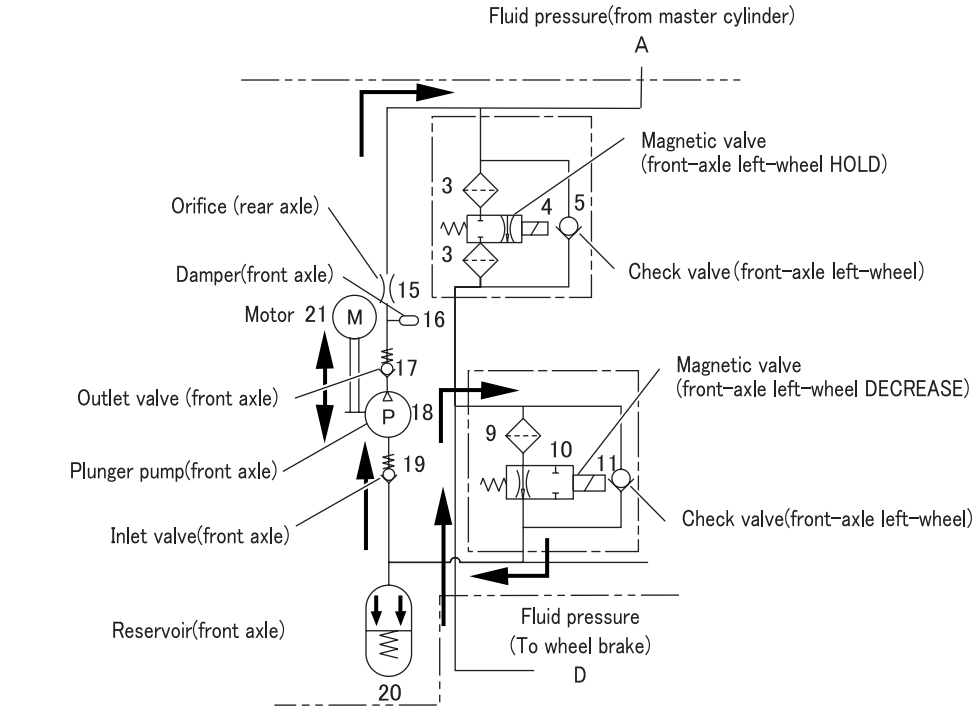


The diagram shows the operation of front-axle left-wheel line.

P116162E

- When the brake pedal is pressed and there is no imminent wheel lock-up, the hydraulic unit (electronic control unit) will not send any control signal to the magnetic valve (front-axle left-wheel DECREASE) or to the magnetic valve (front-axle left-wheel HOLD). The former valve remains closed while the latter valve stays open.
- Pressure fluid A from the brake master cylinder flows past the magnetic valve (front-axle left-wheel HOLD) and to the wheel brake D.
- When the brake pedal is released, pressure fluid A from the brake master cylinder drops. Pressure fluid from the wheel brake D now flows past the magnetic valve (front-axle left-wheel HOLD) and the check valve (front-axle left-wheel) and returns to the brake master cylinder.

(3) Anti-lock braking (pressure decrease)

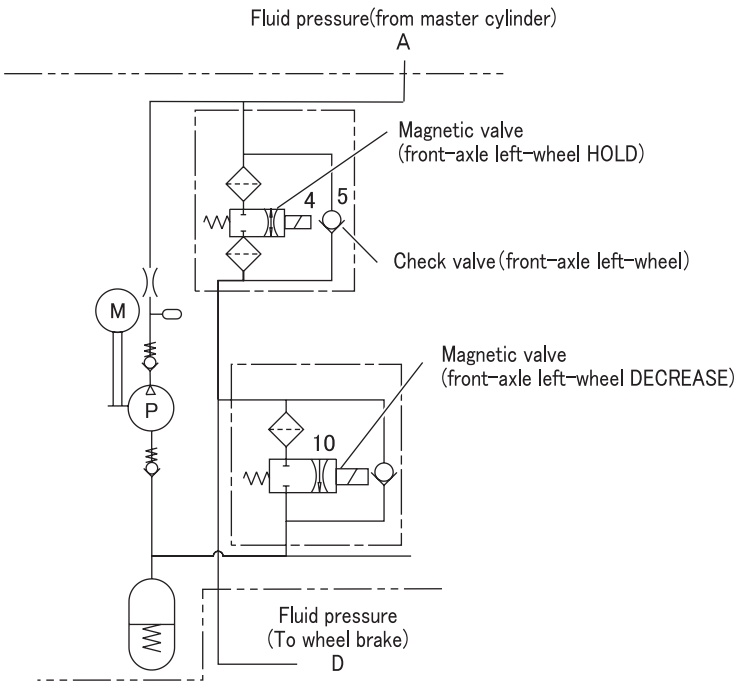


The diagram shows the operation of front-axle left-wheel line.

P116163E

- When the brake pedal is pressed and there is imminent wheel lock-up, the hydraulic unit (electronic control unit) sends control signal to the magnetic valve (front-axle left-wheel DECREASE) and the magnetic valve (front-axle left-wheel HOLD). The former valve will open while the latter valve will close.
- Pressure fluid form the wheel brake D now flows past the magnetic valve (front-axle left-wheel DECREASE) and to the reservoirs. The line pressure will drop.
- When the hydraulic unit (electronic control unit) sends control signal to the magnetic valve (front-axle left-wheel DECREASE) and the magnetic valve (front-axle left-wheel HOLD), it also sends control signal to the motor at the same time, causing the plunger pump (front axle) to start pumping. Pressure fluid in the reservoirs now flows past the inlet valve (front axle), the outlet valve (front axle), the damper (front axle) and the orifice (front axle) and returns to the master cylinder.
- During this process, the check valve (front-axle left-wheel) remains closed by the fluid pressure A from the brake master cylinder. As a result, no pressure fluid from the master cylinder flows to the wheel brake.

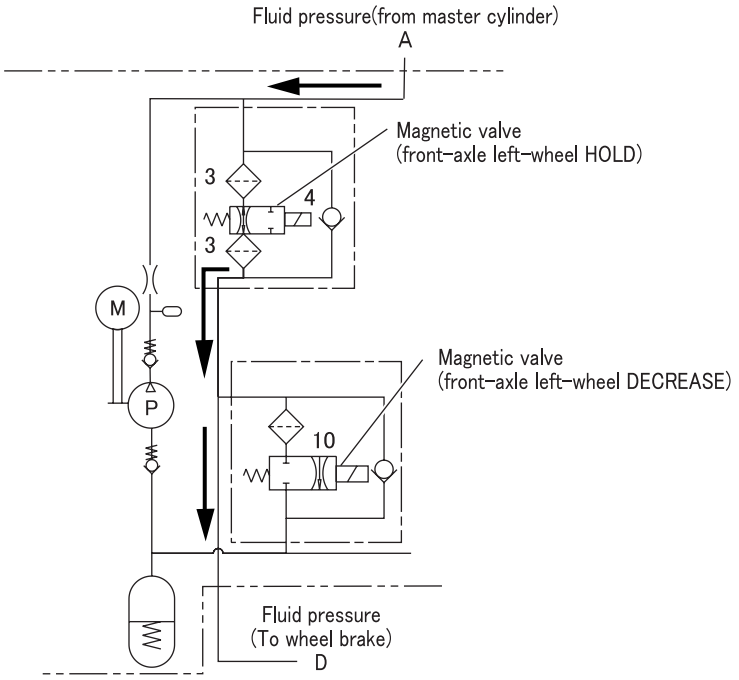
(4) Anti-lock braking (pressure hold)



The diagram shows the operation of front-axle left-wheel line. P116164E

- When it becomes necessary to hold the fluid pressure D in the wheel brake at the same level as part of anti-lock brake system control, the hydraulic unit (electronic control unit) sends a “HOLD” signal to the magnetic valve (front-axle left-wheel HOLD). As a result, both the magnetic valve (front-axle left-wheel HOLD) and the magnetic valve (front-axle left-wheel DECREASE) will be closed, which holds the fluid pressure in the wheel brake at the current level.
- The check valve (front-axle left-wheel) remains closed by the fluid pressure A from the brake master cylinder.

(5) Anti-lock braking (pressure increase)

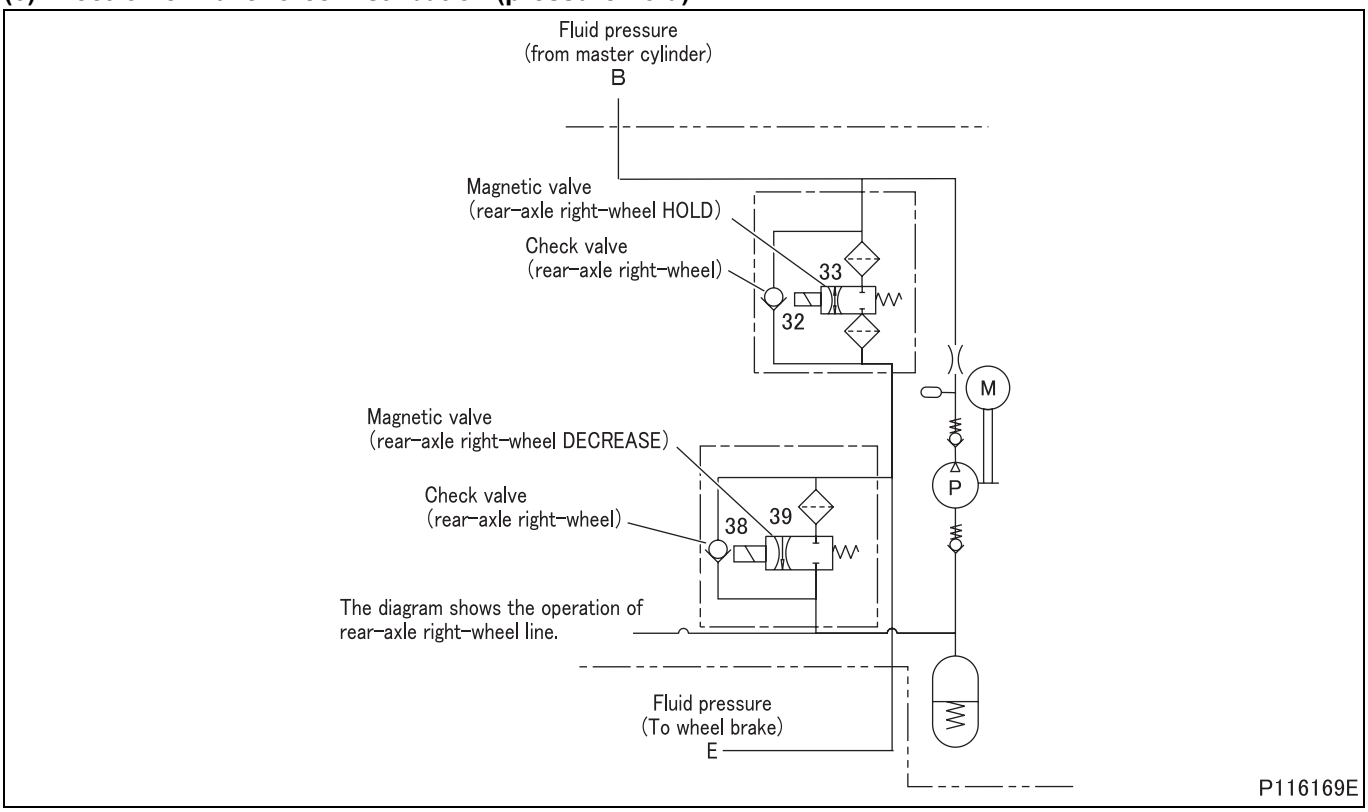


The diagram shows the operation of front-axle left-wheel line.

P116165E

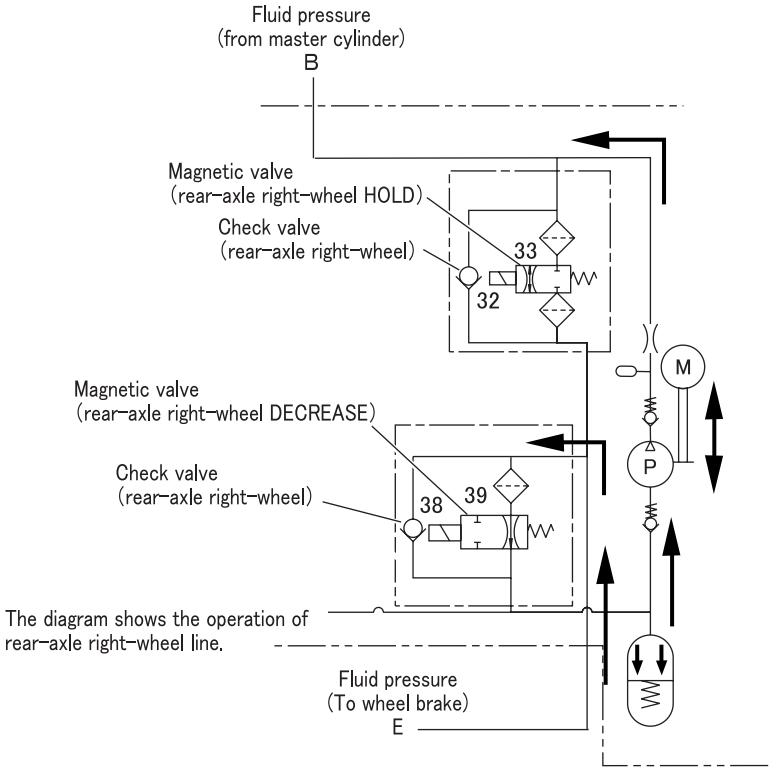
- When it becomes necessary to increase the fluid pressure D in the wheel brake, control signal from the hydraulic unit (electronic control unit) to the magnetic valve (front-axle left-wheel HOLD) and to the magnetic valve (front-axle left-wheel DECREASE) will be cut off.
- As a result, the magnetic valve (front-axle left-wheel HOLD) will open while the magnetic valve (front-axle left-wheel DECREASE) will close. Both valves are now in their normal-braking positions. Fluid pressure A being generated by the depression of the brake pedal is now applied to the wheel brake to increase the braking force.

(6) Electronic Brake force Distribution (pressure hold)



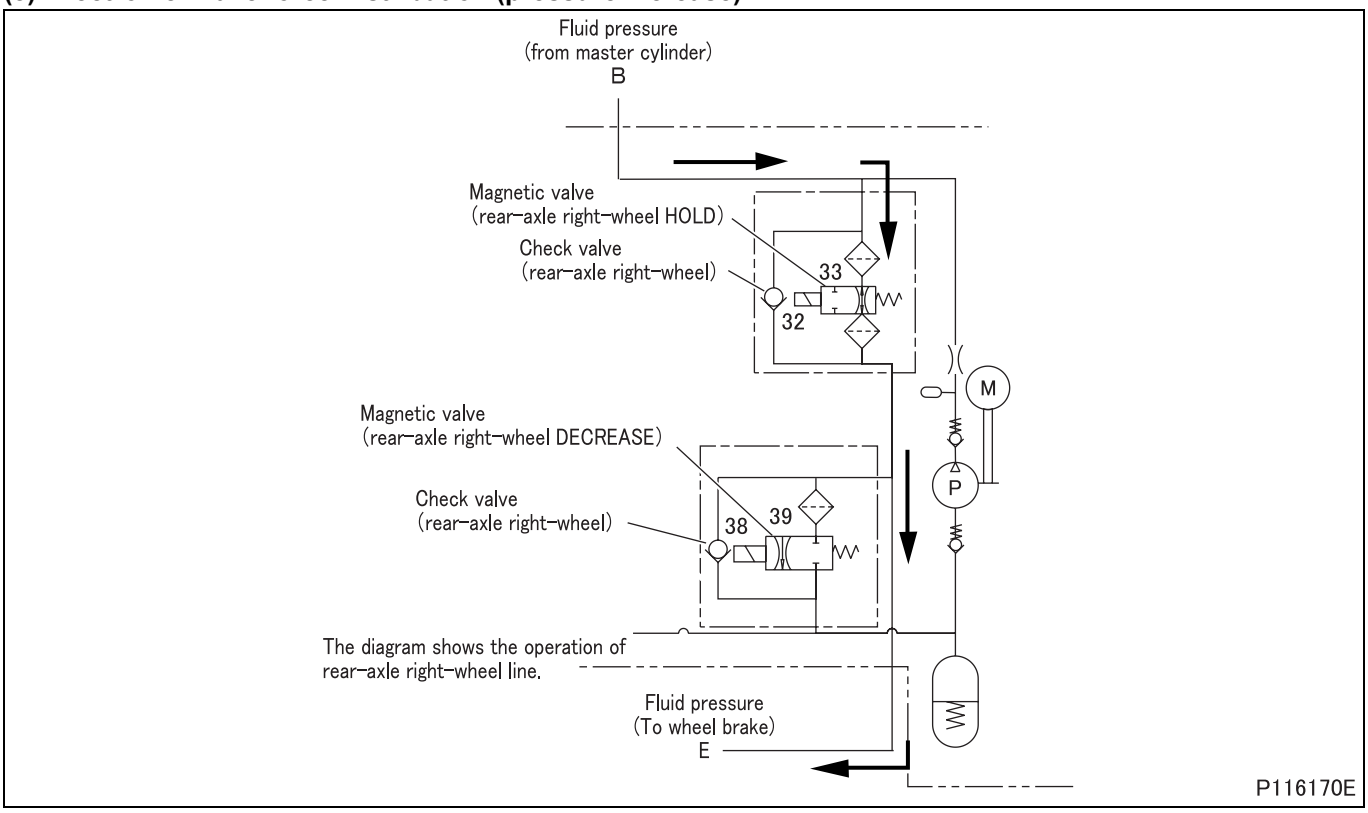
- When it becomes necessary for the electronic control of brake force distribution to hold wheel brake fluid pressure E, the electronic control unit sends a hold control signal to the magnetic valve (rear-axle right-wheel HOLD) of the hydraulic unit. As a result, the magnetic valves (rear-axle right-wheel HOLD and rear-axle right wheel DECREASE) are closed, so the fluid pressure is held.
- In this state, the magnetic valve (front-axle right-wheel HOLD) is kept closed by fluid pressure B from the master cylinder, so the fluid pressure from the brake master cylinder is not distributed to the wheel brakes.

(7) Electronic Brake force Distribution (pressure decrease)

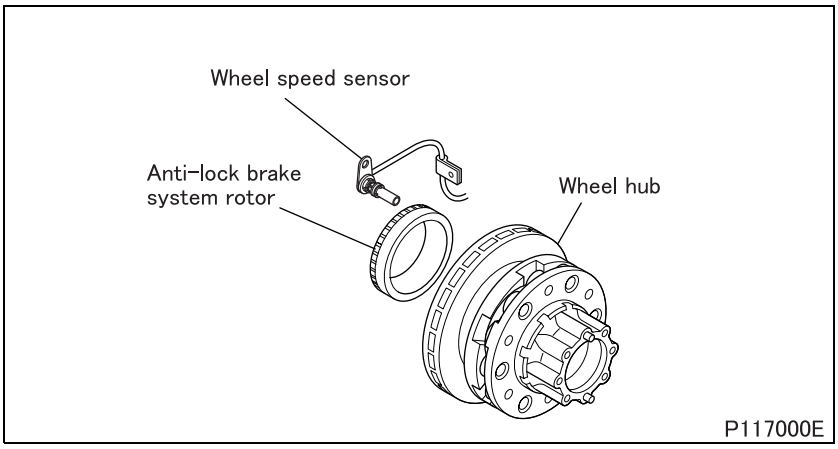


- If wheels are about to lock, the hydraulic unit (electronic control unit) sends a control signal to the relevant magnetic valves (rear-axle right-wheel DECREASE and rear-axle right-wheel HOLD). As a result, the magnetic valve (rear-axle right-wheel DECREASE) opens and the magnetic valve (rear-axle right-wheel HOLD) closes.
- Fluid pressure E from wheel brakes flows to the reservoir (rear axle) via the magnetic valve (rear-axle right-wheel DECREASE). The fluid pressure is thus decreased.
- In this state, the check valve (rear-axle right-wheel) is kept closed by fluid pressure B from the brake master cylinder, so the fluid pressure from the brake master cylinder is not distributed to the wheel brakes.

(8) Electronic Brake force Distribution (pressure increase)

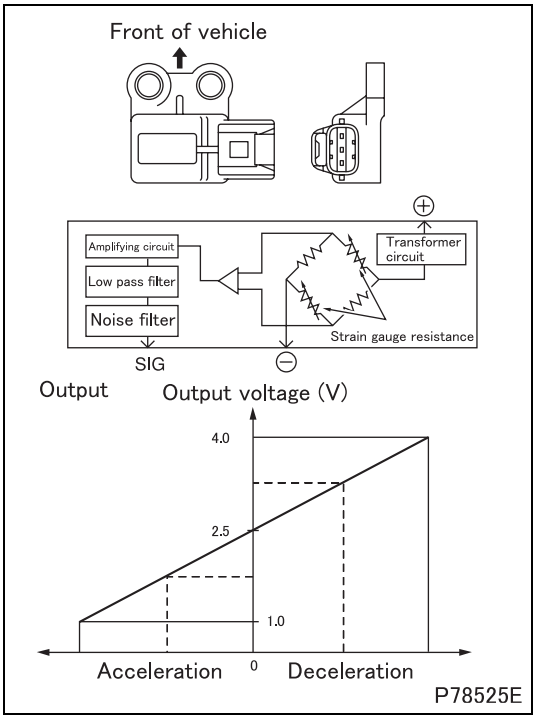


- When it becomes necessary to increase fluid pressure E to wheel brakes, electronic control unit stops sending the control signal to the magnetic valve (rear-axle right-wheel HOLD).
- As a result, the magnetic valve (rear-axle right-wheel HOLD) opens and the magnetic valve (rear-axle right-wheel DECREASE) closes. This creates the same condition as the one established when the Electronic Brake force Distribution is not working (normal brake condition), so brake pressure B produced by pressing the brake pedal works directly on wheel brakes (brake line pressure increases).



1.5 Wheel speed sensor

- Each wheel speed sensor detects wheel speed and sends this as a signal to the hydraulic unit (electronic control unit). The sensor is essentially a magnetic pickup unit, consisting of a permanent magnet core and a coil of wire wound around the core.
- An anti-lock brake system rotor is fitted onto the wheel hub. This rotor, like a ring gear, has a set of evenly-spaced teeth directly facing the sensor. As the wheel rotates, these teeth pass through the magnetic flux of the sensor, inducing potential difference in the coil which is then sent as a signal (alternating voltage proportional to the wheel speed) to the hydraulic unit (electronic control unit).

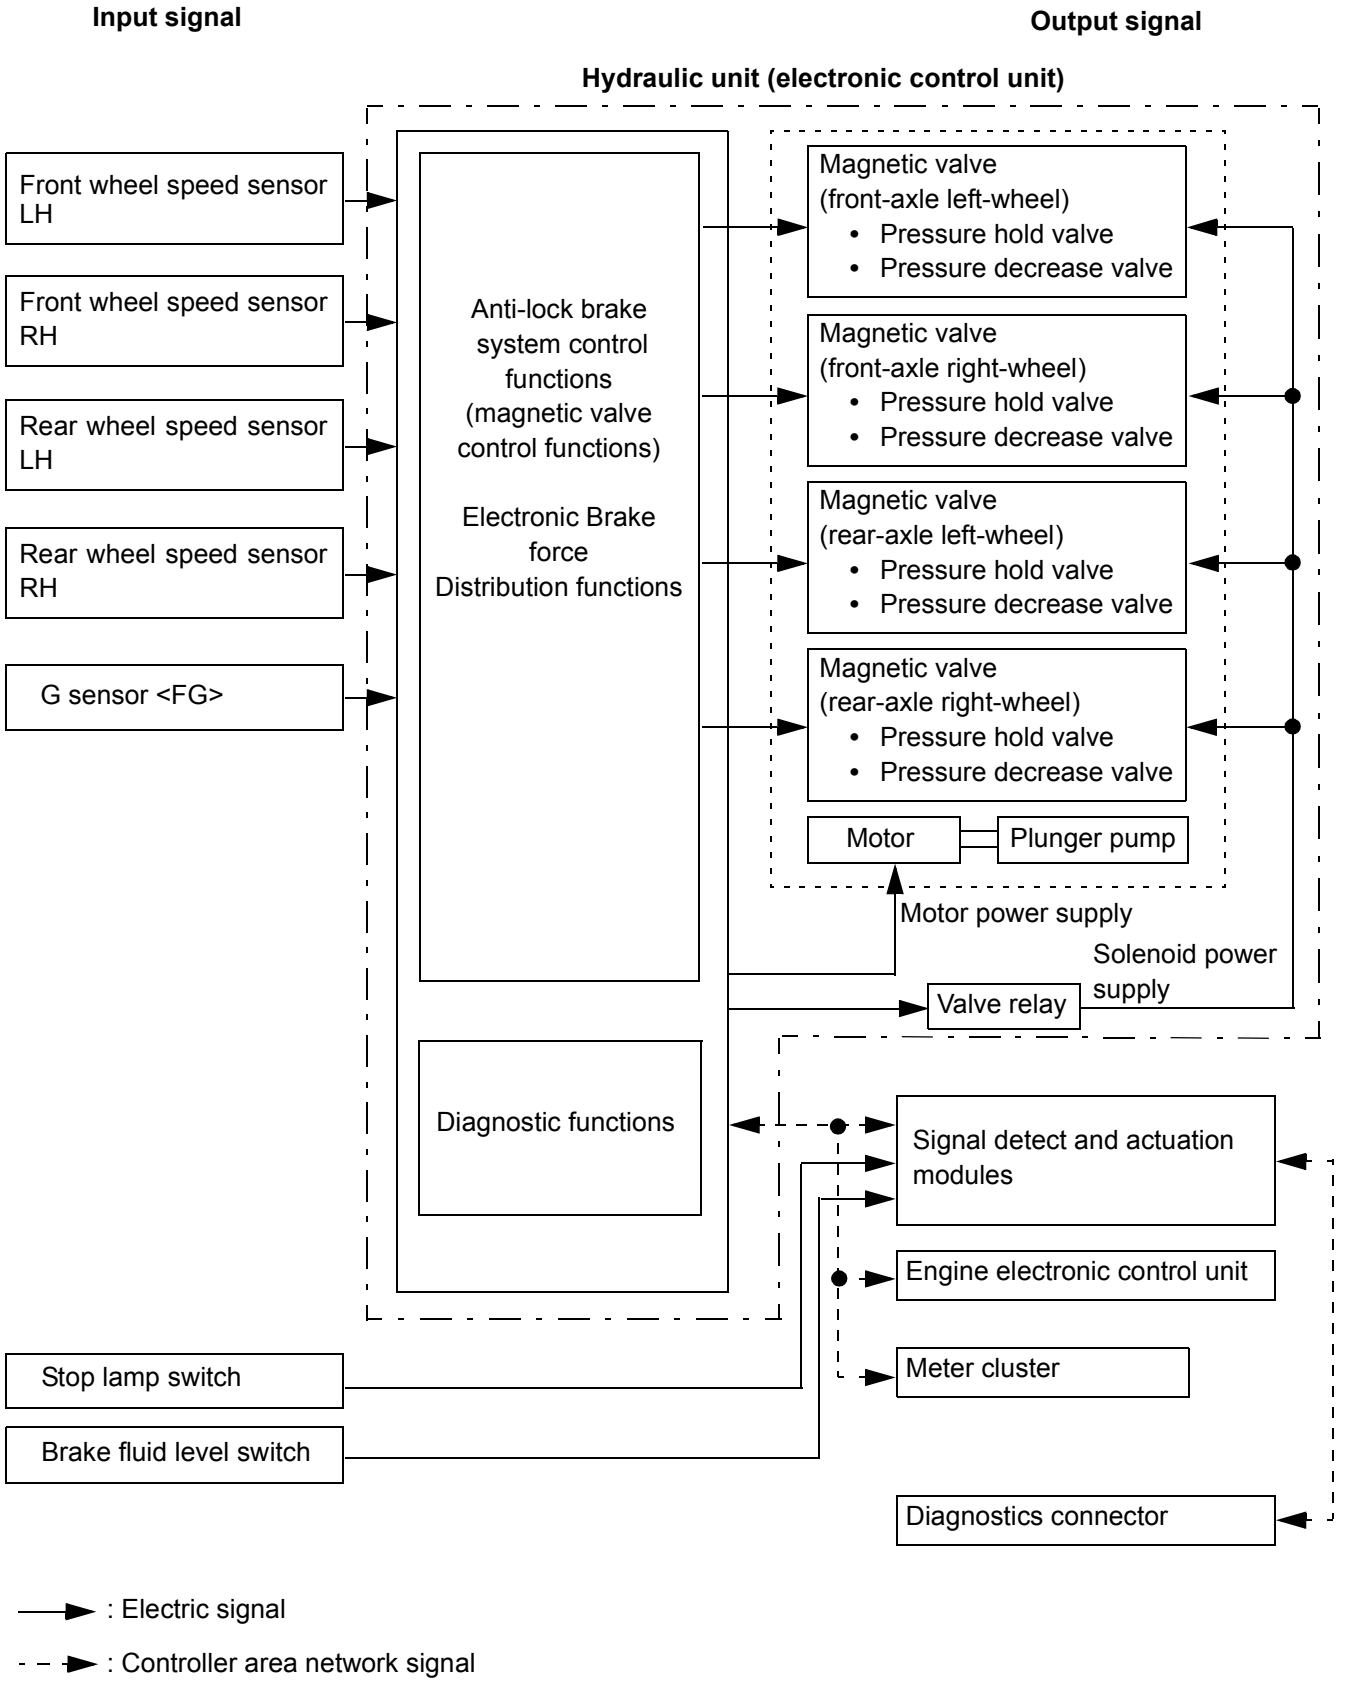


1.6 G sensor <FG>

- On slippery roads, trucks can experience wheel lock-up due to the inertia of the powertrain. This makes it difficult for the anti-lock brake system to perform controlled braking.
- To avoid this, in addition to the wheel speed sensors, a G sensor is also used to detect acceleration/deceleration and assist anti-lock brake system control.
- The G sensor is a semiconductor-type strain gauge. It detects acceleration or deceleration by converting acceleration/deceleration inertia into resistance and further converting this into voltage.

2. Electronic Control System

2.1 Block diagram

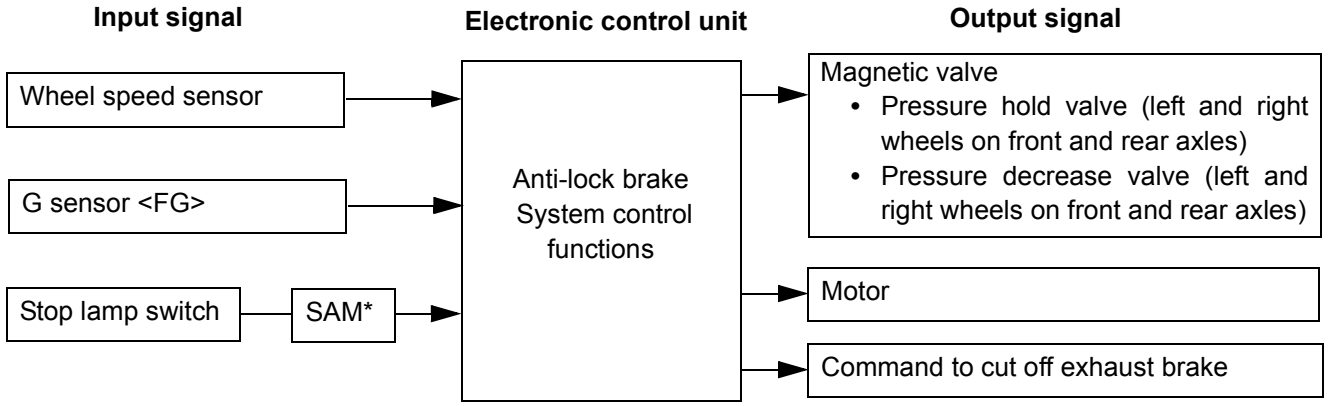


Part	Primary function or operation
Wheel speed sensor	Senses wheel speed
Engine electronic control unit	Cuts off exhaust brake in anti-lock braking mode
SAM*	Manages power supply to system components
	Inputs stop lamp signal (indicating that brake pedal is in pressed position)
	Inputs brake fluid level signal (from brake fluid level switch indicating that brake fluid level is too low)
Meter cluster	Displays anti-lock brake system faults
G sensor <FG>	Senses acceleration/deceleration
FUSO Diagnostics (diagnostics connector)	Provides communication between FUSO diagnostics and the hydraulic unit (electronic control unit)

*: SAM (Signal detect and actuation modules)

2.2 Anti-lock brake system control functions

- The hydraulic unit (electronic control unit) continuously monitors signals from the wheel speed sensors. The unit sends signals to magnetic valves.

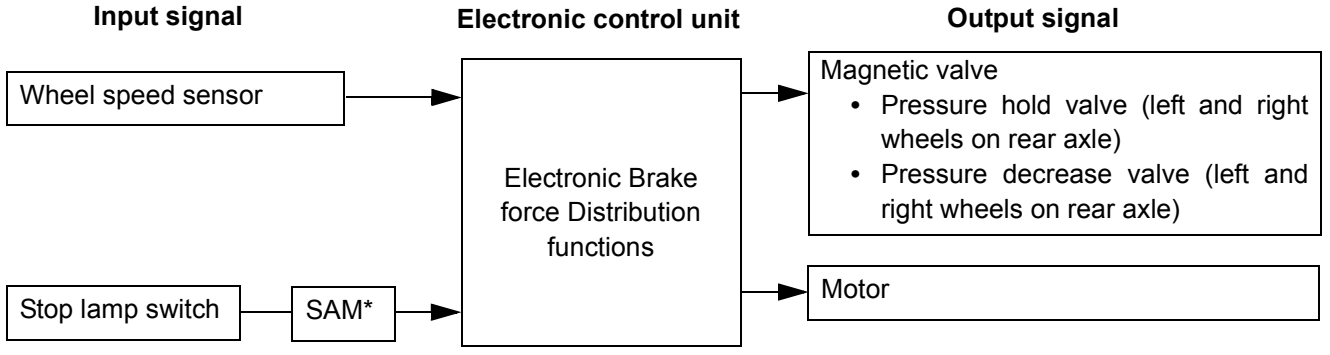


*: SAM (Signal detect and actuation modules)

(1) Anti-lock brake system fail-safe

- If any fault occurs in the anti-lock brake system, the warning lamp illuminates to warn the driver of the fault and normal braking will resume in place of the anti-lock braking which will be disabled.

(2) Electronic Brake force Distribution functions



*: SAM (Signal detect and actuation modules)

- When active, this function switches the control mode as follows to prevent further increase in slip factor of the rear wheel tires and appropriately distributes braking force to wheels according to the load on each axle.

Control mode	Description	State of actuator		
		HOLD valve	DECREASE valve	Motor
Mode 1 (HOLD)	When the slip factor of the rear wheel tires increases beyond the reference value, the system applies a control to hold the rear wheel brake pressure.	ON (closed)	OFF (closed)	OFF
Mode 2 (DECREASE)	When the slip factor of the rear wheel tires increases beyond the reference value, the system applies a control to decrease the rear wheel brake pressure.	ON (closed)	ON (closed)	OFF*
Mode 3 (INCREASE)	When the slip factor of the rear wheel tires decreases, the system applies a control to increase the rear wheel brake pressure.	OFF (open)	OFF (closed)	OFF

*: ON if brake fluid collects in the secondary circuit.

(3) Anti-lock brake system and exhaust brake

- On slippery roads, wheel lock-up can result even from application of the exhaust brake. In the anti-lock braking mode, activation of the exhaust brake makes it difficult for anti-lock brake system to perform controlled braking. To avoid this, the exhaust brake will be disabled upon activation of anti-lock brake system even when the exhaust brake switch is in the “ON” position.
  The exhaust brake will automatically be enabled upon deactivation of anti-lock brake system.

2.3 Diagnostic functions

- When the starter switch is in the ON position, the system continuously monitors the sensors and other system components. If any fault is detected, the system warns the driver of this by displaying the relevant fault information on the meter cluster. At the same time, the system also stores a relevant diagnosis code in the memory and starts operation in the fault mode.
- In the fault-mode operation, the system functions are limited to ensure safety for the driver and the vehicle. Stored diagnosis codes can be accessed using Scanning tool or can be read by observing the flashing of the warning lamp.

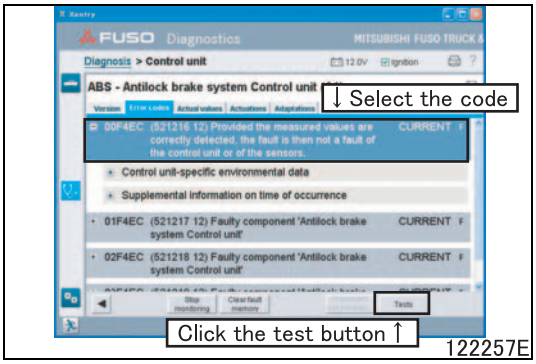
1. Inspections Based on Diagnosis Codes

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.



- When the FUSO Diagnostics is connected, perform the interactive troubleshooting with the following procedure.

  Select the code from the diagnostics code list
  ↓
  Click the test button
  ↓
  Start the interactive troubleshooting

1.1 List of diagnosis codes

Code	Message	Warning lamp indication (ABS)	Remarks
96-7	The brake fluid level is too low.	O	
789-2	The signal from component ‘B3 (Wheel speed sensor (Left front axle)’ is faulty.	O	
789-3	Component ‘B3 (Wheel speed sensor (Left front axle)’ has a short circuit.	O	
789-5	Component ‘B3 (Wheel speed sensor (Left front axle)’ has an open circuit.	O	
789-7	The signal from component ‘B3 (Wheel speed sensor (Left front axle)’ is faulty.	O	
789-9	The signal from component ‘B3 (Wheel speed sensor (Left front axle)’ is faulty.	O	
789-10	No signal from component ‘B3 (Wheel speed sensor (Left front axle)’	O	
790-2	The signal from component ‘B4 (Wheel speed sensor (Right front axle)’ is faulty.	O	
790-3	Component ‘B4 (Wheel speed sensor (Right front axle)’ has a short circuit.	O	
790-5	Component ‘B4 (Wheel speed sensor (Right front axle)’ has an open circuit.	O	
790-7	The signal from component ‘B4 (Wheel speed sensor (Right front axle)’ is faulty.	O	
790-9	The signal from component ‘B4 (Wheel speed sensor (Right front axle)’ is faulty.	O	
790-10	No signal from component ‘B4 (Wheel speed sensor (Right front axle)’	O	
791-2	The signal from component ‘B5 (Wheel speed sensor (Left rear axle)’ is faulty.	O	
791-3	Component ‘B5 (Wheel speed sensor (Left rear axle)’ has a short circuit.	O	
791-5	Component ‘B5 (Wheel speed sensor (Left rear axle)’ has an open circuit.	O	
791-7	The signal from component ‘B5 (Wheel speed sensor (Left rear axle)’ is faulty.	O	
791-9	The signal from component ‘B5 (Wheel speed sensor (Left rear axle)’ is faulty.	O

1.2 Code generation criteria and inspection items

96-7: The brake fluid level is too low.

Generation condition	• Brake fluid low signal is received
Recoverability	• System recovers on recognition of normal status
Control effected by electronic control unit	• Control by anti-lock brake system is inhibited. (Electronic Brake force Distribution is brought into half system control mode.)
Possible causes	• Brake fluid level is lower than specified.

789-2: The signal from component 'B3 (Wheel speed sensor (Left front axle)' is faulty.

Generation condition	• The system has judged broken rotor teeth from signals generated by the wheel speed sensor (on front-axle left-wheel) during running.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Anti-lock brake system rotor is dented or is missing a tooth. • Wheel speed sensor is not installed properly. • Defective hydraulic unit (electronic control unit)

789-3: Component 'B3 (Wheel speed sensor (Left front axle)' has a short circuit.

Generation condition	• No wheel speed signals are input from front-axle left-wheel even after the vehicle is started.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is short circuited. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

789-5: Component 'B3 (Wheel speed sensor (Left front axle)' has an open circuit.

Generation condition	• No wheel speed signals are input from front-axle left-wheel even after the vehicle is started.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is shorted to higher-potential point. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

789-7: The signal from component 'B3 (Wheel speed sensor (Left front axle)' is faulty.

Generation condition	• Wheel speed of at least 20% lower than the fastest wheel are detected for longer than the predetermined period of time during running.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective anti-lock brake system rotor (Improper air gap.) • Wheel speed sensor not installed properly • Defective hydraulic unit (electronic control unit)

789-9: The signal from component 'B3 (Wheel speed sensor (Left front axle)' is faulty.

Generation condition	• Wheel acceleration based on wheel speed signals (from front-axle left-wheel) is judged as more than 108 km/h {67.1 mph}.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor not installed properly • Anti-lock brake system rotor dented or is missing a tooth • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is shorted to higher potential point. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

789-10: No signal from component 'B3 (Wheel speed sensor (Left front axle)'

Generation condition	• Wheel speed signal from front-axle left-wheel deviates from those from other wheels by less than 1.2 kph during vehicle starting.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor not installed properly • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

790-2: The signal from component 'B4 (Wheel speed sensor (Right front axle)' is faulty.

Generation condition	• The system has judged broken rotor teeth from signals generated by the wheel speed sensor (on front-axle right-wheel) during running.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Anti-lock brake system rotor dented or missing a tooth. • Wheel speed sensor not installed properly • Defective hydraulic unit (electronic control unit)

790-3: Component 'B4 (Wheel speed sensor (Right front axle)' has a short circuit.

Generation condition	• No wheel speed signals are input from front-axle right-wheel even after the vehicle is started.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is short-circuited. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

790-5: Component 'B4 (Wheel speed sensor (Right front axle)' has an open circuit.

Generation condition	• No wheel speed signals are input from front-axle right-wheel even after the vehicle is started.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is shorted to higher potential point. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

790-7: The signal from component 'B4 (Wheel speed sensor (Right front axle)' is faulty.

Generation condition	• Wheel speed of at least 20% lower than the fastest wheel are detected for longer than the predetermined period of time during running.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective anti-lock brake system rotor (Improper gap.) • Wheel speed sensor not installed properly • Defective hydraulic unit (electronic control unit)

790-9: The signal from component 'B4 (Wheel speed sensor (Right front axle)' is faulty.

Generation condition	• Wheel acceleration based on wheel speed signals (from front-axle right-wheel) is judged as more than 108 km/h {67.1 mph}.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor is missing • Anti-lock brake system rotor dented or is missing a tooth • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is shorted to higher potential point. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

790-10: No signal from component 'B4 (Wheel speed sensor (Right front axle)'

Generation condition	• Wheel speed signal from front-axle right-wheel deviates from those from other wheels by less than 1.2 kph during vehicle starting.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor not installed properly • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

791-2: The signal from component 'B5 (Wheel speed sensor (Left rear axle)' is faulty.

Generation condition	• The system has judged broken rotor teeth from signals generated by the wheel speed sensor (on rear-axle left-wheel) during running.
Generation condition	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Anti-lock brake system rotor dented or is missing a tooth • Wheel speed sensor not installed properly • Defective hydraulic unit (electronic control unit)

791-3: Component 'B5 (Wheel speed sensor (Left rear axle)' has a short circuit.

Generation condition	• No wheel speed signals are input from rear-axle left-wheel even after the vehicle is started.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is short-circuited. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

791-5: Component 'B5 (Wheel speed sensor (Left rear axle)' has an open circuit.

Generation condition	• No wheel speed signals are input from rear-axle left-wheel even after the vehicle is started.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is shorted to higher potential point. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

791-7: The signal from component 'B5 (Wheel speed sensor (Left rear axle)' is faulty.

Generation condition	• Wheel speed of at least 20% lower than the fastest wheel are detected for longer than the predetermined period of time during running.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective anti-lock brake system rotor (Improper air gap.) • Wheel speed sensor not installed properly • Defective hydraulic unit (electronic control unit)

791-9: The signal from component 'B5 (Wheel speed sensor (Left rear axle)' is faulty.

Generation condition	• Wheel acceleration based on wheel speed signals (from rear-axle left-wheel) is judged as more than 108 km/h {67.1 mph}.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor is missing • Anti-lock brake system rotor dented or is missing a tooth • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is shorted to higher potential point. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

791-10: No signal from component 'B5 (Wheel speed sensor (Left rear axle)'

Generation condition	• Wheel speed signal from rear-axle left-wheel deviates from those from other wheels by less than 1.2 kph during vehicle starting.
Recoverability	• System recovers if signal becomes normal when running at 10 km /h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor not installed properly • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

792-2: The signal from component 'B6 (Wheel speed sensor (Right rear axle)' is faulty.

Generation condition	• The system has judged broken rotor teeth from signals generated by the wheel speed sensor (on rear-axle right-wheel) during running.
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Anti-lock brake system rotor dented or is missing a tooth • Wheel speed sensor not installed properly • Defective hydraulic unit (electronic control unit)

792-3: Component 'B6 (Wheel speed sensor (Right rear axle)' has a short circuit.

Generation condition	• No wheel speed signals are input from rear-axle right-wheel even after the vehicle is started.
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is short-circuited. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

792-5: Component 'B6 (Wheel speed sensor (Right rear axle)' has an open circuit.

Generation condition	• No wheel speed signals are input from rear-axle right-wheel even after the vehicle is started.
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is shorted to higher potential point. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

792-7: The signal from component 'B6 (Wheel speed sensor (Right rear axle)' is faulty.

Generation condition	• Wheel speed of at least 20% lower than the fastest wheel are detected for longer than the predetermined period of time during running.
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective anti-lock brake system rotor (Improper air gap.) • Wheel speed sensor not installed properly • Defective hydraulic unit (electronic control unit)

792-9: The signal from component 'B6 (Wheel speed sensor (Right rear axle)' is faulty.

Generation condition	• Wheel acceleration based on wheel speed signals (from rear-axle right-wheel) is judged as more than 108 km/h {67.1 mph}.
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor is missing • Anti-lock brake system rotor dented or is missing a tooth • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and wheel speed sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and wheel speed sensor is shorted to higher potential point. • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

792-10: No signal from component 'B6 (Wheel speed sensor (Right rear axle)'

Generation condition	• Wheel speed signal from rear-axle right-wheel deviates from those from other wheels by less than 1.2 kph during vehicle starting.
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Wheel speed sensor not installed properly • Defective wheel speed sensor • Defective hydraulic unit (electronic control unit)

932-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Monitored voltage status of more than 80% is detected for continuous 15 seconds after operation command is given to a magnetic valve (for front-axle left-wheel) in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

932-5: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit.

Generation condition	• Monitored voltage status of 30 to 80% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for front-axle left-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

932-6: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Magnetic valve (front-axle left-wheel) in hydraulic unit (electronic control unit) are both short- and open-circuited.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

932-12: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Monitored voltage status of less than 30% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for front-axle left-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

933-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Monitored voltage status of more than 80% is detected for continuous 15 seconds after operation command is given to a magnetic valve (for front-axle right-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

933-5: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit.

Generation condition	• Monitored voltage status of 30 to 80% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for front-axle right-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

933-6: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Magnetic valve (front-axle right-wheel) in hydraulic unit (electronic control unit) is both short- and open-circuited.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

933-12: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Monitored voltage status of less than 30% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for front-axle right-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

934-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Monitored voltage status of more than 80% is detected for continuous 15 seconds after operation command is given to a magnetic valve (for rear-axle left-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

934-5: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit.

Generation condition	• Monitored voltage status of 30 to 80% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for rear-axle left-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

934-6: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Magnetic valve (rear-axle right-wheel) in hydraulic unit (electronic control unit) are both short- and open-circuited.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

934-12: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Monitored voltage status of less than 30% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for rear-axle left-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

935-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Monitored voltage status of more than 80% is detected for continuous 15 seconds after operation command is given to a magnetic valve (for rear-axle right-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

935-5: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit.

Generation condition	• Monitored voltage status of 30 to 80% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for rear-axle right-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

935-6: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Magnetic valve (rear-axle right-wheel) in hydraulic unit (electronic control unit) are both short- and open-circuited.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

935-12: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Monitored voltage status of less than 30% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for rear-axle right-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

938-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Monitored voltage status of more than 80% is detected for continuous 15 seconds after operation command is given to a magnetic valve (for front-axle left-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

938-5: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit.

Generation condition	• Monitored voltage status of 30 to 80% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for front-axle left-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution normally remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

938-6: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Magnetic valve (front-axle left-wheel) in hydraulic unit (electronic control unit) is both short- and open- circuited.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

938-12: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Monitored voltage status of less than 30% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for front-axle left-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

939-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Monitored voltage status of more than 80% is detected for continuous 15 seconds after operation command is given to a magnetic valve (for front-axle right-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

939-5: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit.

Generation condition	• Monitored voltage status of 30 to 80% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for front-axle right-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

939-6: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Magnetic valve (front-axle right-wheel) in hydraulic unit (electronic control unit) is both short- and open- circuited.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

939-12: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Monitored voltage status of less than 30% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for front-axle right-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

940-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Monitored voltage status of more than 80% is detected for continuous 15 seconds after operation command is given to a magnetic valve (for rear-axle left-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Control by Electronic Brake force Distribution is inhibited.
Possible causes	• Defective hydraulic unit (electronic control unit)

940-5: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit.

Generation condition	• Monitored voltage status of 30 to 80% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for rear-axle left-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

940-6: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Magnetic valve (rear-axle right-wheel) in hydraulic unit (electronic control unit) is both short- and open-circuited.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

940-12: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Monitored voltage status of less than 30% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for rear-axle left-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

941-3: Component 'Solenoid (Antilock brake system Control unit)' has a short circuit to positive.

Generation condition	• Monitored voltage status of more than 80% is detected for continuous 15 seconds after operation command is given to a magnetic valve (for rear-axle right-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Control by Electronic Brake force Distribution is inhibited.
Possible causes	• Defective hydraulic unit (electronic control unit)

941-5: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit.

Generation condition	• Monitored voltage status of 30 to 80% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for rear-axle right-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

941-6: Component 'Solenoid (Antilock brake system Control unit)' has an open circuit or short circuit.

Generation condition	• Magnetic valve (rear-axle left-wheel) in hydraulic unit (electronic control unit) is both short- and open-circuited.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

941-12: Component 'Solenoid (Antilock brake system Control unit)' or the signal lines to the component are defective.

Generation condition	• Monitored voltage status of less than 30% is detected for continuous 30 seconds after operation command is given to a magnetic valve (for rear-axle right-wheel) in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

1044-5: Faulty component 'Electric motor (Antilock brake system Control unit)'

Generation condition	• A signal voltage of more than 0.75 V is detected across motor terminal in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective motor in hydraulic unit (electronic control unit) • Defective hydraulic unit (electronic control unit)

1044-6: Component 'Electric motor (Antilock brake system Control unit)' is mechanically damaged or it sticks.

Generation condition	• Motor in hydraulic unit (electronic control unit) is inoperative.
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective motor in hydraulic unit (electronic control unit) • Defective hydraulic unit (electronic control unit)

1044-12: The power supply of component 'Electric motor (Antilock brake system Control unit)' has an open circuit.

Generation condition	• Terminal voltage of motor in hydraulic unit (electronic control unit) is lower than battery voltage.
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution normally remains controllable.)
Possible causes	• Power harness between battery and hydraulic unit (electronic control unit) is open-circuited or shorted to ground. • Malfunction of battery • Defective alternator • Defective hydraulic unit (electronic control unit)

521216-12: Provided the measured values are correctly detected, the fault is then not a fault of the control unit or of the sensors.

Generation condition	• A minor error which may have no effect on control is found in electronic control unit or controller area network signals.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Controller area network communication (CAN) signal is abnormal. • Defective hydraulic unit (electronic control unit)

521217-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521218-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521219-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521220-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521221-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521280-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521281-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521282-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521283-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521284-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521285-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521288-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521289-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521290-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521291-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521292-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521293-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521294-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit)
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521295-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Total number of times of HET interrupt caused by solenoid during system self-testing does not agree with the specified number of times.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521296-0: The battery voltage is too high.

Generation condition	• System voltage is higher than 19.5 V.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective alternator • Defective hydraulic unit (electronic control unit)

521296-1: The battery voltage is too low.

Generation condition	• System voltage is lower than 7 V.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• ON power line between starter switch and hydraulic unit (electronic control unit) is open-circuited or shorted to ground. • Malfunction of battery • Defective alternator • Defective relay of signal detect and actuation modules • Defective starter switch • Defective signal detect and actuation modules • Defective hydraulic unit (electronic control unit)

521296-3: The battery voltage is too high.

Generation condition	• System voltage is higher than 16 V.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective alternator • Defective hydraulic unit (electronic control unit)

521296-4: The battery voltage is too low.

Generation condition	• System voltage is lower than 9 V.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• ON power line between starter switch and hydraulic unit (electronic control unit) is open-circuited or shorted to ground. • Malfunction of battery • Defective alternator • Defective relay of signal detect and actuation modules • Defective starter switch • Defective signal detect and actuation modules • Defective hydraulic unit (electronic control unit)

521296-5: Component 'Power supply of component 'Antilock brake system Control unit" has an open circuit.

Generation condition	• A voltage of less than 80% is detected for power supply voltage with starter switch in ON position.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521296-6: Component 'Power supply of component 'Antilock brake system Control unit" has a short circuit.

Generation condition	• A voltage of less than 80% is detected for power supply voltage with starter switch in ON position.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled. (Electronic Brake force Distribution remains controllable.)
Possible causes	• Defective hydraulic unit (electronic control unit)

521297-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• A voltage of less than 4.75 V or more than 5.25 V is detected in the hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521331-7: Component 'Acceleration sensor' has an electrical fault.

Generation condition	• Signal does not change for the specified period of time, or signal that exceeds the specified upper limit is detected.
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective G sensor • Defective harness • Defective hydraulic unit (electronic control unit)

521331-10: Component 'Acceleration sensor' has an electrical fault.

Generation condition	• Variation that exceeds the specified value is detected in the next signal.
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• G sensor underwent acceleration exceeding limit (no need for replacement of sensor as it is not faulty). • Defective harness • Defective hydraulic unit (electronic control unit)

521332-2: The offset value of component 'Acceleration sensor' is faulty.

Generation condition	• Zero-point offset that exceeds the specified value is detected when the vehicle is stopped.
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective G sensor • Defective harness • Defective hydraulic unit (electronic control unit)

521333-2: The offset value of component 'Acceleration sensor' is faulty.

Generation condition	• Zero-point offset that exceeds the specified value is detected when the vehicle is running.
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective G sensor • Defective harness • Defective hydraulic unit (electronic control unit)

521334-2: Component 'Acceleration sensor' has an electrical fault.

Generation condition	• Variation that exceeds the specified value is detected through comparison with theoretical value.
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Harness between hydraulic unit (electronic control unit) and battery open-circuited • Signal harness between hydraulic unit (electronic control unit) and G sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and G sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and G sensor is shorted to higher-potential point. • Defective G sensor • Defective hydraulic unit (electronic control unit)

521349-7: Different types of tires are installed on the vehicle.

Generation condition	• A wheel speed continuously deviates from other wheel speeds by 20% during running.
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Tire is not as specified in size. • Anti-lock brake system rotor is not as specified.

521354-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit).
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective hydraulic unit (electronic control unit)

521356-12: CAN communication is faulty or disrupted.

Generation condition	• It is detected that controller area network communication (CAN) is not established.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Controller area network communication (CAN) line is open-circuited, shorted to higher potential point, shorted to ground or short circuited. • Defective resistor in hydraulic unit (electronic control unit) • Defective hydraulic unit (electronic control unit)

521367-12: CAN communication with component 'A20 (SAM)' has a malfunction.

Generation condition	• Necessary controller area network communication (CAN) from signal detect and actuation module is lost.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Controller area network communication (CAN) line is open-circuited, shorted to higher potential point, shorted to ground or short circuited. • Defective resistor in hydraulic unit (electronic control unit) • Defective signal detect and actuation modules. • Defective hydraulic unit (electronic control unit)

521369-19: CAN fault

Generation condition	• No controller area network (CAN) signals are received
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Controller area network communication (CAN) line is open-circuited, shorted to higher potential point, shorted to ground or short circuited. • Defective resistor in hydraulic unit (electronic control unit) • Defective engine electronic control unit • Defective signal detect and actuation modules. • Defective hydraulic unit (electronic control unit)

521395-13: Faulty coding

Generation condition	• Coding has not been done.
Recoverability	• System recovers on recognition of normal status.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Coding has not been done. • Coding is not sufficient.

521403-12: Faulty component 'Antilock brake system Control unit'

Generation condition	• Internal abnormality occurs in hydraulic unit (electronic control unit).
Recoverability	• System recovers if signal becomes normal after the starter switch is turned OFF and then ON.
Control effected by electronic control unit	• Anti-lock brake system control is disabled.
Possible causes	• Defective hydraulic unit (electronic control unit)

521404-2: Component 'Acceleration sensor' has an electrical fault.

Generation condition	• Intermittent open- or short-range output is detected.
Recoverability	• System recovers if signal becomes normal when running at 10 km/h or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Harness between hydraulic unit (electronic control unit) and battery open-circuited • Signal harness between hydraulic unit (electronic control unit) and G sensor is open-circuited. • Ground harness between hydraulic unit (electronic control unit) and G sensor is open-circuited. • Signal harness between hydraulic unit (electronic control unit) and G sensor is shorted to higher-potential point. • G sensor has undergone too large accelerating force (no need for replacement of sensor as it is not faulty). • Defective G sensor • Defective hydraulic unit (electronic control unit)

2. FUSO Diagnostics Service Data (Actual Values)

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.

[Current value group: Voltages]

No.	Description	Value	Explanation
000	Supply voltage of component 'Electric motor'	■■■■ V	Supply voltage to electric motor in hydraulic unit (electronic control unit) is indicated. Normal voltage: 9 to 18 V [Related parts] • Battery • Hydraulic unit (electronic control unit)
001	Supply voltage of component 'solenoid valve'	■■■■ V	Supply voltage to magnetic valve in hydraulic unit (electronic control unit) is indicated. Normal voltage: 9 to 18 V [Related parts] • Battery • Hydraulic unit (electronic control unit)
002	Supply voltage of component 'Solenoid valve Relays'	■■■■ V	Supply voltage to magnetic valve relay in hydraulic unit (electronic control unit) is indicated. Normal voltage: 9 to 18 V [Related parts] Hydraulic unit (electronic control unit)
003	Stabilized supply voltage of control unit	■■■■ V	Stabilized voltage to hydraulic unit (electronic control unit) is indicated. Normal voltage: 9 to 18 V [Related parts] • Battery • Hydraulic unit (electronic control unit)
004	Present supply voltage of control unit	■■■■ V	Voltage applied to hydraulic unit (electronic control unit) is indicated. Normal voltage: 9 to 18 V [Related parts] • Battery • Hydraulic unit (electronic control unit)

[Current value group: Vehicle speed]

No.	Description	Value	Explanation
005	Wheel speed at left rear axle	■■■■ mph	Values from wheel speed sensor (on rear-axle left-wheel) are indicated. Normal value: 0 to 250 km/h {0 to 155.4 mph} [Related parts] Wheel speed sensor (on rear-axle left-wheel)
006	Wheel speed at right rear axle	■■■■ mph	Values from wheel speed sensor (on rear-axle right-wheel) are indicated. Normal value: 0 to 250 km/h {0 to 155.4 mph} [Related parts] Wheel speed sensor (on rear-axle right-wheel)
007	Wheel speed at left front axle	■■■■ mph	Values from wheel speed sensor (on front-axle left-wheel) are indicated. Normal value: 0 to 250 km/h {0 to 155.4 mph} [Related parts] Wheel speed sensor (on front-axle left-wheel)
008	Wheel speed at right front axle	■■■■ mph	Values from wheel speed sensor (on front-axle right-wheel) are indicated. Normal value: 0 to 250 km/h {0 to 155.4 mph} [Related parts] Wheel speed sensor (on front-axle right-wheel)
009	Longitudinal acceleration	■■■■ m/s^2	G longitudinally applied to the vehicle is indicated. Normal value: -15 to 15 m/s^2 [Related parts] Hydraulic unit (electronic control unit)

[Current value group: Switches]

No.	Description	Value	Explanation
013	Status of engine brake (Switching off)	ON/OFF	State of exhaust brake cut signal flowing from hydraulic unit (electronic control unit) to engine electronic control unit is indicated. • ON: Exhaust brake cut commanded • OFF: Exhaust brake cut not commanded [Related parts] Hydraulic unit (electronic control unit)
014	Outlet valve ABS Rear axle RIGHT	ON/OFF	Pressure reduction valve operating state of magnetic valve (for rear-axle right-wheel) in hydraulic unit (electronic control unit) is indicated. • ON: Magnetic valve is in operation. • OFF: Magnetic valve is not in operation. [Related parts] Hydraulic unit (electronic control unit)
015	Intake valve ABS Rear axle RIGHT	ON/OFF	Holding valve operating state of magnetic valve (for rear-axle right-wheel) in hydraulic unit (electronic control unit) is indicated. • ON: Magnetic valve is in operation. • OFF: Magnetic valve is not in operation. [Related parts] Hydraulic unit (electronic control unit)
016	Outlet valve ABS Rear axle LEFT	ON/OFF	Pressure reduction valve operating state of magnetic valve (for rear-axle left-wheel) in hydraulic unit (electronic control unit) is indicated. • ON: Magnetic valve is in operation. • OFF: Magnetic valve is not in operation. [Related parts] Hydraulic unit (electronic control unit)
017	Intake valve ABS Rear axle LEFT	ON/OFF	Holding valve operating state of magnetic valve (for rear-axle left-wheel) in hydraulic unit (electronic control unit) is indicated. • ON: Magnetic valve is in operation. • OFF: Magnetic valve is not in operation. [Related parts] Hydraulic unit (electronic control unit)
018	Outlet valve ABS Front axle RIGHT	ON/OFF	Pressure reduction valve operating state of magnetic valve (for front-axle right-wheel) in hydraulic unit (electronic control unit) is indicated. • ON: Magnetic valve is in operation. • OFF: Magnetic valve is not in operation. [Related parts] Hydraulic unit (electronic control unit)
019	Intake valve ABS Front axle RIGHT	ON/OFF	Holding valve operating state of magnetic valve (for front-axle right-wheel) in hydraulic unit (electronic control unit) is indicated. • ON: Magnetic valve is in operation. • OFF: Magnetic valve is not in operation. [Related parts] Hydraulic unit (electronic control unit)
020	Outlet valve ABS Front axle LEFT	ON/OFF	Pressure reduction valve operating state of magnetic valve (for front-axle left-wheel) in hydraulic unit (electronic control unit) is indicated. • ON: Magnetic valve is in operation. • OFF: Magnetic valve is not in operation. [Related parts] Hydraulic unit (electronic control unit)
021	Intake valve ABS Front axle LEFT	ON/OFF	Holding valve operating state of magnetic valve (for front-axle left-wheel) in hydraulic unit (electronic control unit) is indicated. • ON: Magnetic valve is in operation. • OFF: Magnetic valve is not in operation. [Related parts] Hydraulic unit (electronic control unit)

No.	Description	Value	Explanation
022	Status of component 'Relay Solenoid valve'	OK/NOT OK	Operating state of magnetic valve relay in hydraulic unit (electronic control unit) is indicated. • OK: Magnetic valve relay is in normal condition. • NOT OK: Magnetic valve relay is in abnormal condition. [Related parts] Hydraulic unit (electronic control unit)
023	Brake light Switches 1 (CAN)	ON/OFF	Whether brake pedal is depressed or released is indicated. • ON: Brake pedal depressed • OFF: Brake pedal released [Related parts] Stop lamp switch
024	Brake light Switches 2 (CAN)	ON/OFF	Whether brake pedal is depressed or released is indicated. • ON: Brake pedal released • OFF: Brake pedal depressed [Related parts] Stop lamp switch
025	Electric motor	ON/OFF	Operating state of pump motor in hydraulic unit (electronic control unit) is indicated. • ON: Pump motor is in operation. • OFF: Pump motor is not in operation. [Related parts] Hydraulic unit (electronic control unit)
026	Switch 'Brake fluid level'	ON/OFF	Operating state of brake fluid level switch is indicated. • ON: Brake fluid level is lowered below limit. • OFF: Brake fluid level is in normal range. [Related parts] Brake fluid level switch
027	Status of engine brake (Switches)	ON/OFF	Operating state of exhaust brake switch (combination switch) is indicated. • ON: Exhaust brake switch is actuated. • OFF: Exhaust brake switch is not actuated. [Related parts] • Combination switch • Signal detect and actuation modules

[Current value group: Control unit information]

No.	Description	Value	Explanation
033	Frequency counter Ignition cycle	■■■■	Cumulative number of times of starter switch turning ON is indicated. Normal number of times: 0 to 65535 [Related parts] • Starter switch • Signal detect and actuation modules
036	Status Longitudinal acceleration	INVALID/VALID	Operation condition of longitudinal G sensor is indicated. INVALID: G sensor is invalid. VALID: G sensor is valid. [Related parts] G sensor

[Current value group: On-board actual values]

No.	Description	Value	Explanation
048	ABS Warning lamp	ON/OFF	Operating state of anti-lock brake system warning lamp is indicated. • ON: Anti-lock brake system warning lamp is illuminated. • OFF: Anti-lock brake system warning lamp is not illuminated. [Related parts] • Meter cluster • Signal detect and actuation modules
055	ABS ACTIVE	ON/OFF	Operating state of anti-lock brake system is indicated. • ON: Anti-lock brake system is in operation. • OFF: Anti-lock brake system is not in operation. [Related parts] Hydraulic unit (electronic control unit)
056	EBD ACTIVE	ON/OFF	Operating state of electronic brake force distribution is indicated. • ON: Electronic brake force distribution is in operation. • OFF: Electronic brake force distribution is not in operation. [Related parts] Hydraulic unit (electronic control unit)

[Current value group: Vehicle configuration]

No.	Description	Value	Explanation
076	Type of drive	0/1/2/3/4	Vehicle specification information is indicated. • 0: not configured • 1: 2WD • 2: 2WD Passive • 3: 4WD Active • 4: 4WD Passive [Related parts] Hydraulic unit (electronic control unit)

3. FUSO Diagnostics Actuator Test (Actuations)

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.
- The basic conditions for performing the actuator test: Vehicle stopped, engine stopped, starter switch ON, and accelerator pedal and brake pedal released.

No.	Selection	Description
000	Solenoid valves • Solenoid valve Front axle LEFT • Solenoid valve Front axle RIGHT • Solenoid valve Rear axle LEFT • Solenoid valve Rear axle RIGHT • motor	Activate the magnetic valve (for the wheel being tested) and the motor. [Additional condition for performing actuator test] There is no error in the magnetic valve and motor when the starter switch is ON.  P116880E
001	Manual bleeding	Perform control of manual bleeding. [Additional condition for performing actuator test] Engine starting. [Test method] Press the brake pedal to perform air bleeding. (See Gr35.)

4. Coding Data in Electronic Control Unit

4.1 Overview

- The anti-brake system electronic control unit has various kinds of information such as technical data of vehicle and equipment registered as coding data.
- Therefore, each time the anti-brake system electronic control unit is replaced or some specification changes are made, the coding data must surely be rewritten using FUSO diagnostics.

4.2 Rewriting of Coding Data

- If specification changes have been made, be sure to rewrite the relevant coding data. For details of the rewriting procedure, consult an authorized dealer or distributor.

Remedy \ Hydraulic unit (electronic control unit) data		Overall data (latest record data set for applicable vehicles)	Remarks
Coding	Replacement of electronic control unit	O	

5. Electronic Control Unit Input/Output Table

- See the Electronic Control Unit Schematic Diagram for the pin locations of each signal and ground.

Device to be connected	Terminal	Input/output	Voltage and wave form
High-current fuse box (VB2)	25-Ground	In	[Measurement condition] Disconnect the electronic control unit and harness, then perform inspection on the vehicle-side connector. [Judgment criteria] 10 to 16 V
High-current fuse box (VB1)	1-Ground	In	[Measurement condition] Disconnect the electronic control unit and harness, then perform inspection on the vehicle-side connector. [Judgment criteria] 10 to 16 V
Front wheel speed sensor RH	3-4	In	[Measurement condition] Disconnect the electronic control unit and harness, then perform inspection on the vehicle-side connector. For the method of connecting the oscilloscope, see #329 “Inspection of wheel speed sensor” in “INSPECTION OF ELECTRICAL PARTS”. [Judgment criteria]
Front wheel speed sensor LH	27-28	In	
Rear wheel speed sensor RH	11-10	In	
Rear wheel speed sensor LH	36-35	In	 P116993E • If the spacing between adjacent pulses is wider in part of the waveform, there may be a dent or missing tooth in the rotor. • Visually inspect the rotor for defects and replace if necessary. • (See Gr26A, 26B and 27.)

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Functional Check

1.1 Inspection with vehicle stationary

- While pressing the brake pedal, check the hydraulic unit (electronic control unit) and the brake pipes and connections for fluid leakage.
- If fluid is leaking from the hydraulic unit (electronic control unit), replace the unit. If fluid is leaking from the brake pipes or connections, retighten the hardware.

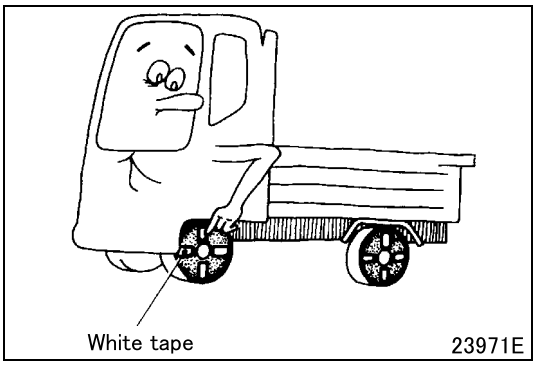
1.2 Inspection using brake tester

- Using the brake tester, check each wheel for braking force following the normal procedures.
- If faulty, check the wheel brake in question, the service brake system and the hydraulic unit (electronic control unit).

1.3 Inspection of anti-lock brake system operation while driving the vehicle

WARNING ⚠

- **During this inspection, do not allow any other vehicle or anyone into the test course.**

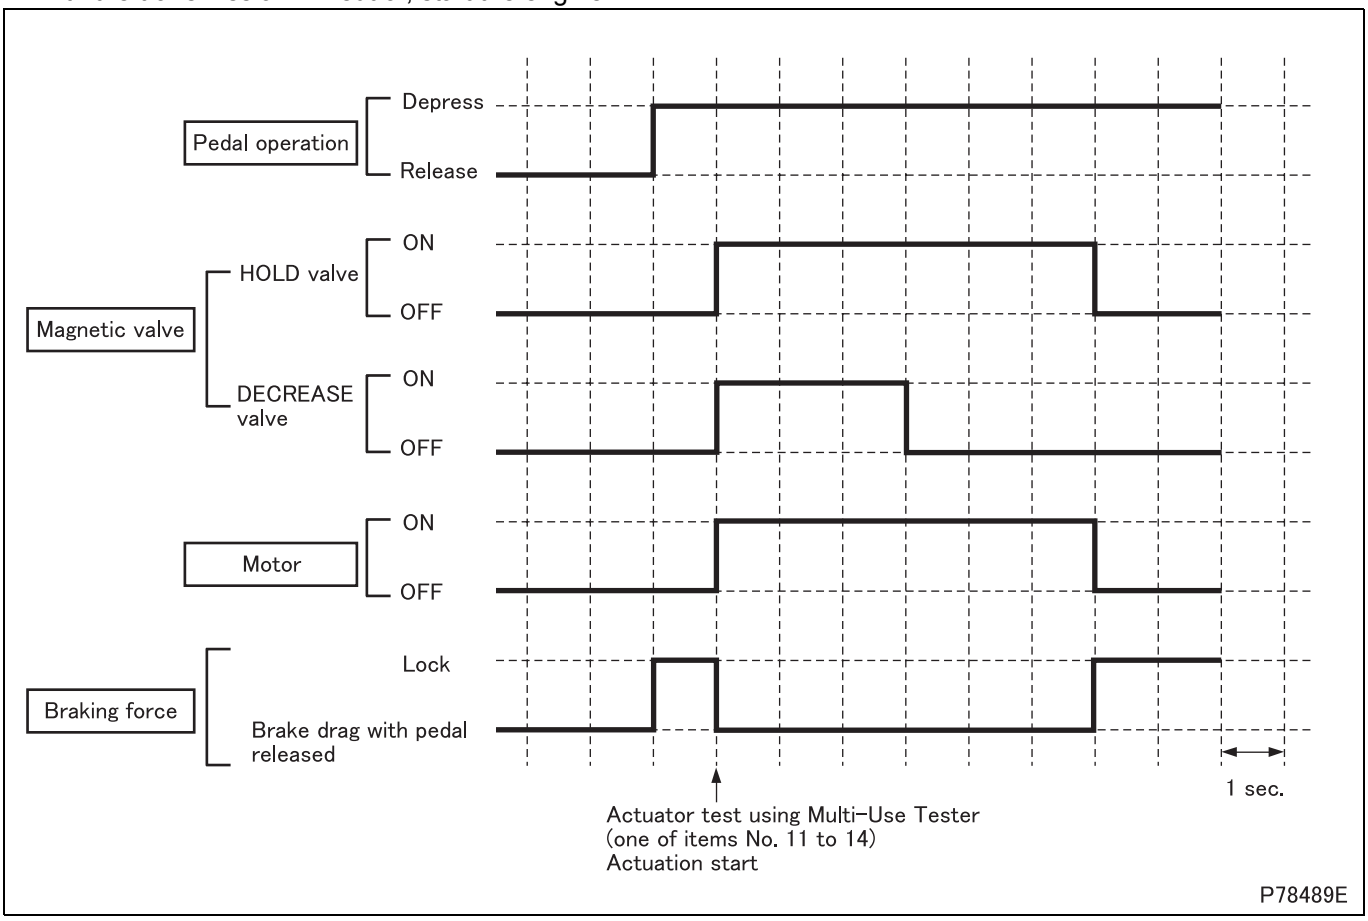


- The vehicle being tested should be unloaded.
- Apply white tape onto the walls of front and rear tires to aid the observation of wheel rotation.
- Turn the starter switch from LOCK to ON. The warning lamp should illuminate and, in several seconds, extinguish.
- Drive the vehicle at 20 to 30 km/h {12 to 19 mph} and apply the brakes hard. The wheels should not lock up.

2. Inspection of Hydraulic Unit (Electronic Control Unit) Operation

2.1 Inspection using Multi-Use Tester

- The hydraulic unit (electronic control unit) cannot be inspected for operation during control effected by the electronic control unit at the time of a fault which will cause a diagnosis code to occur. The inspection should be performed after system recovery from the control through troubleshooting.
- Jack up the vehicle and support it on jack stands, or place the vehicle on the rollers of a brake tester.
- Apply the parking brake when testing the front brake. Apply chocks to the front wheels when testing the rear brake.
- During inspection, keep the brake tester rollers and the tires dry.
- With the parking brake released, feel the brake drag of each wheel. When the brake tester is used, read the brake drag indicated in the tester.
- Connect the Multi-Use Tester. (See Gr00.)
- With the transmission in neutral, start the engine.



- When abnormality is found as a result of inspection, take a remedial action in accordance with the table below.

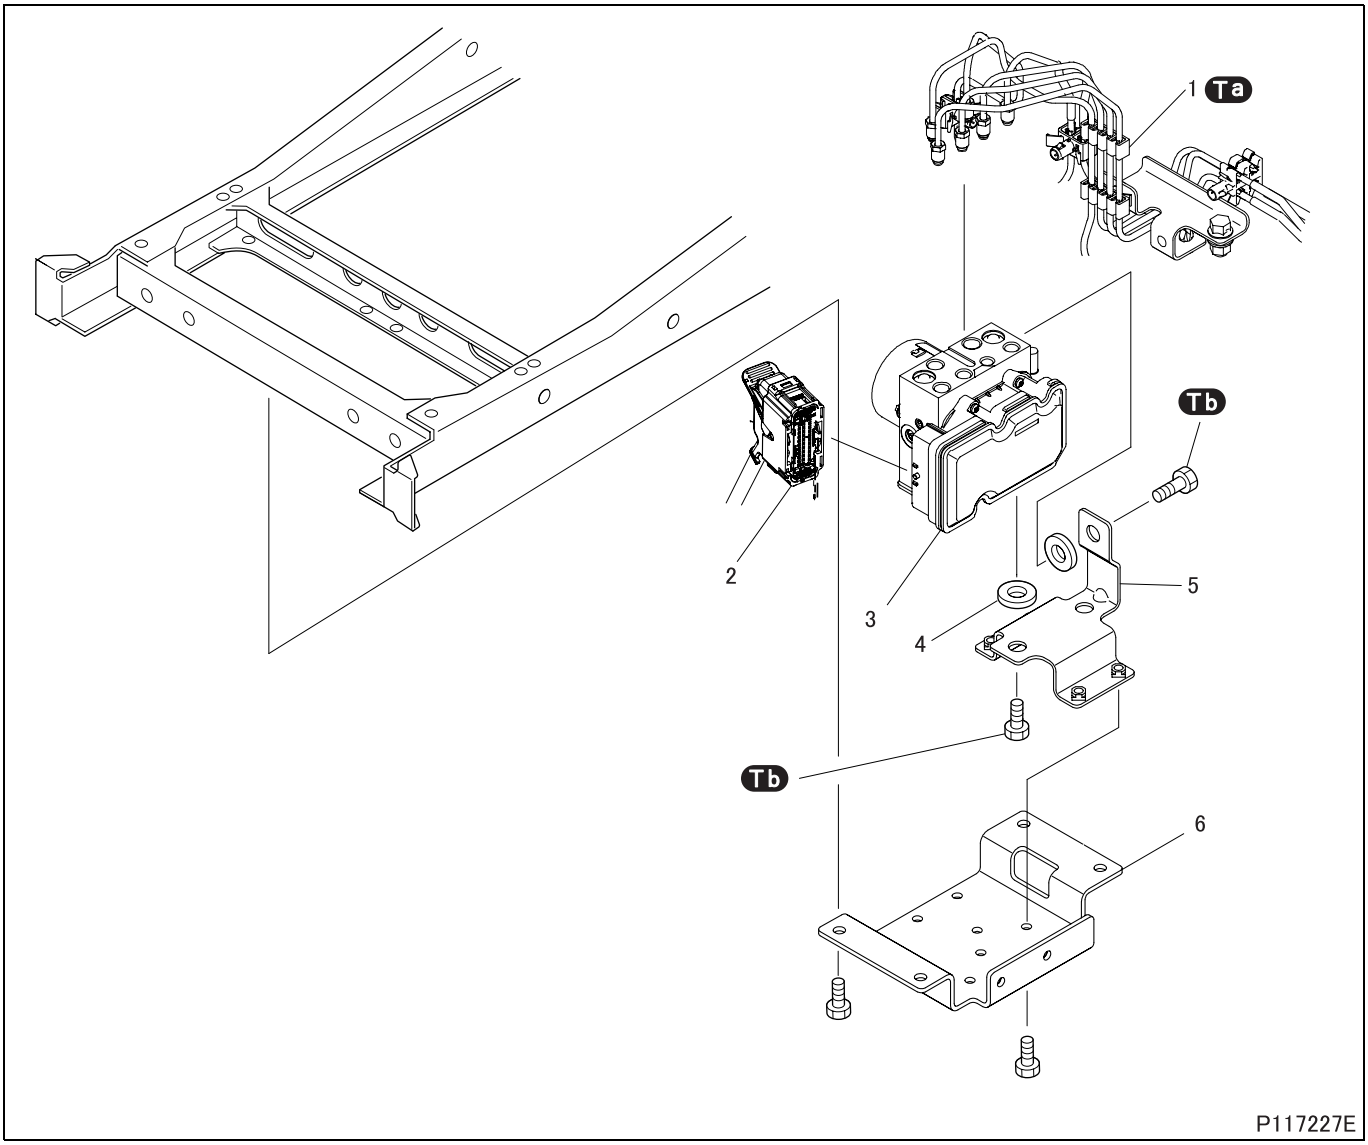
Symptom	Cause	Remedial action
Wheel will not lock up when brake pedal is pressed.	Clogged brake line outside hydraulic unit (electronic control unit)	Inspect and clean brake line
	Clogged line inside hydraulic unit (electronic control unit)	Replace hydraulic unit (electronic control unit)
Braking force will not drop.	Incorrectly connected hydraulic unit (electronic control unit) brake piping	Connect piping correctly
	Faulty hydraulic unit (electronic control unit) magnetic valve	Replace hydraulic unit (electronic control unit)

3. Inspection after Replacing or Removing/Installing Hydraulic Unit (Electronic Control Unit)

- Check the hydraulic unit (electronic control unit) for normal operation.
- After replacing or removing/installing the hydraulic unit (electronic control unit), always check the system for normal operation. Controlled braking will not be available if the piping is incorrect.
- After replacement or reinstallation of the hydraulic unit (electronic control unit), be sure to bleed the brake system. (See Gr35.)
- The vehicle harness connector is equipped with a locking device. For correct use of the device, see “HYDRAULIC UNIT CONNECTOR COUPLING AND UNCOUPLING” in this manual.

M E M O

HYDRAULIC UNIT (ELECTRONIC CONTROL UNIT)



● **Removal sequence**

1 Brake pipe
2 Harness connector
3 Hydraulic unit (electronic control unit)
4 Grommet
5 Hydraulic unit bracket A
6 Hydraulic unit bracket B

● **Installation sequence**

Follow the removal sequence in reverse.

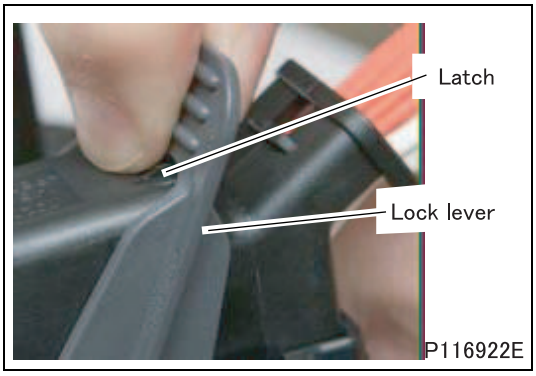
CAUTION ⚠

- **After the hydraulic unit (electronic control unit) is replaced with a new one, air bleeding should be performed for the secondary side circuit (anti-lock brake system circuit) in addition to the primary side circuit. (See Gr35.)**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

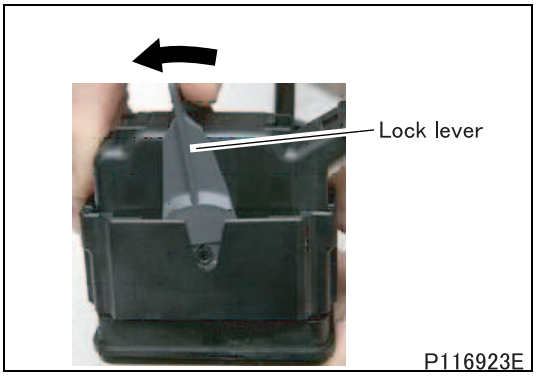
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Brake pipe mounting	17.5 ± 2.7 {13 ± 2.0, 1.8 ± 0.3}	–
Tb	Hydraulic unit (electronic control unit) mounting	14.7 to 15.8 {11 to 12, 1.5 to 1.6}	–

◆Removal procedure◆



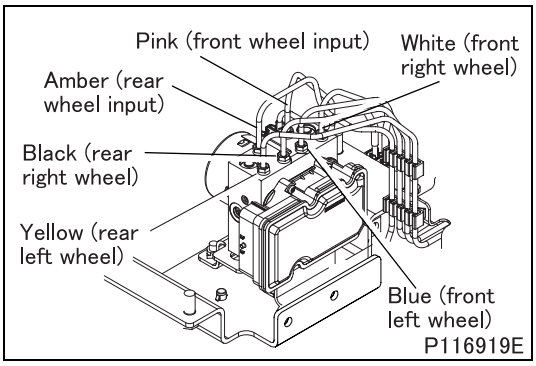
■ **Removal: Harness connector**

- Press the latch to unlock the lock lever.



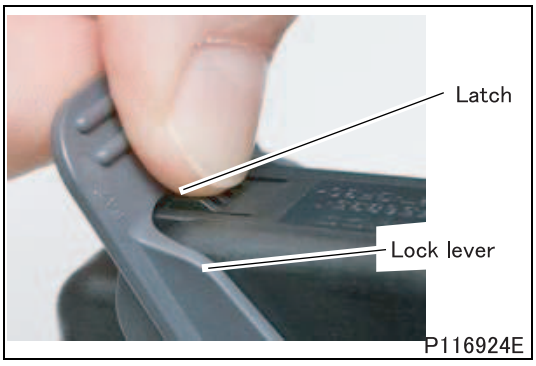
- Move the lock lever in the direction shown in the illustration to unlock the harness connector.
- Remove the harness connector by pulling it upwards.

◆Installation procedure◆



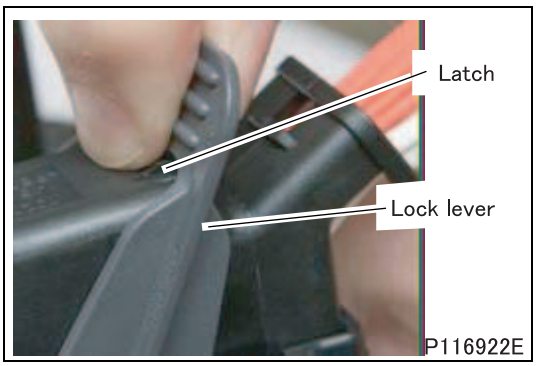
■ **Installation: Brake pipe**

- Confirm the location to be connected using marking colors on the brake pipes and connect the pipes to the correct connectors on the hydraulic unit (electronic control unit) as shown in the figure.



■ **Installation: Harness connector**

- Push the lock lever toward the left to latch it.
- Insert the harness connector straight into the hydraulic unit (electric control unit).
- Press the latch to unlock the lever.



- Move the lock lever in the direction opposite to the installation to lock the harness connector.
- Push the lock lever toward the right to latch it.
- Check that the harness connector is securely locked.

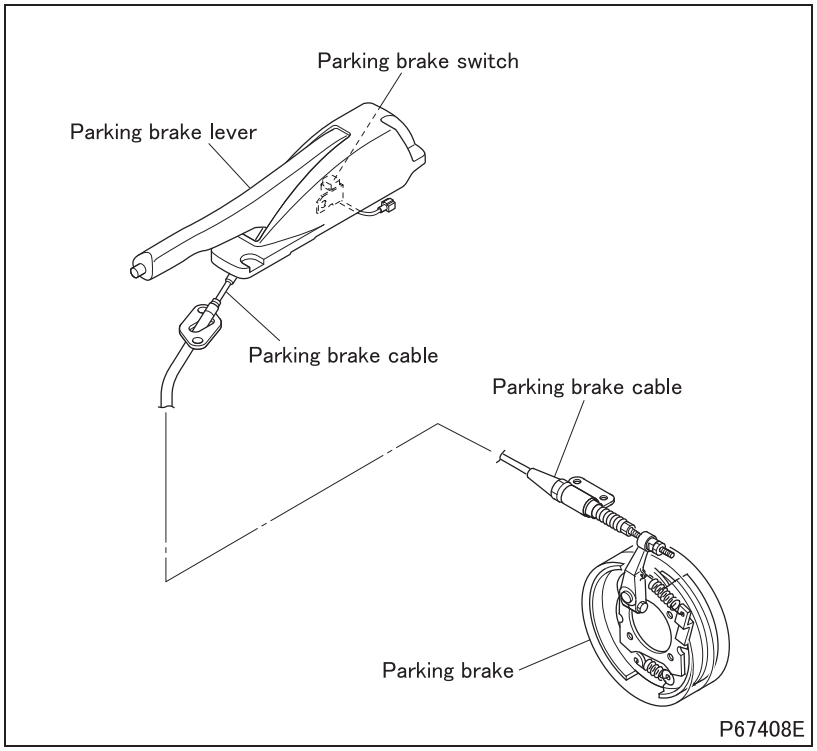
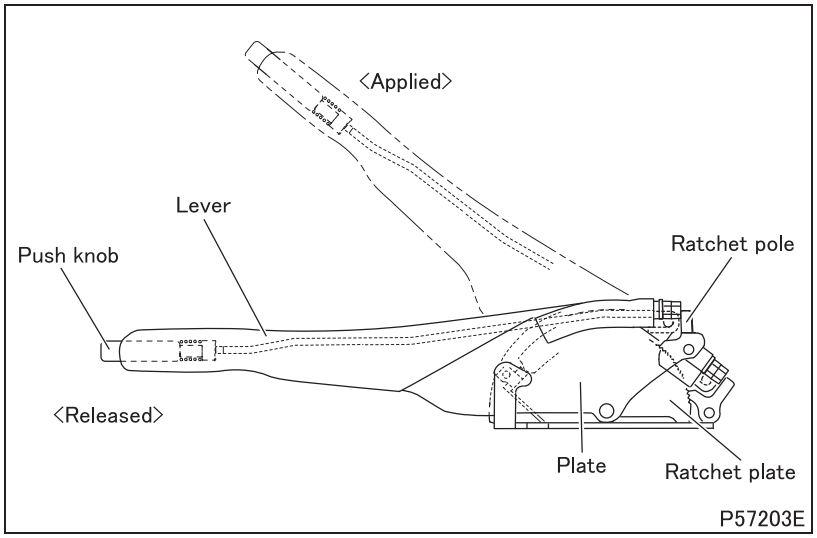
1. Components and Parts

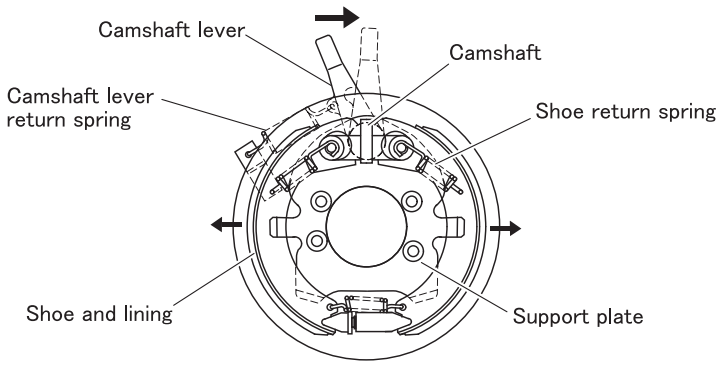


2. Parking Brake Lever



- Pulling the parking brake lever makes the parking brake work, at which point the ratchet pole engages with the ratchet plate and the lever is locked.
- To release the parking brake lever, slightly pull it up while pushing the release knob. This disengages the ratchet pole from the ratchet plate, allowing the parking brake lever to return to the released position.

3. Parking Brake



P56131E

- The camshaft lever, which is used to actuate the shoes/linings, is built into the parking brake unit. Pulling the parking brake lever actuates the camshaft lever via the parking brake cable.
- Actuation of the camshaft lever causes the camshaft to rotate, which expands both shoes/linings onto the brake drum. In this case, both shoes/drums function as a leading shoe.
- As the parking brake lever (camshaft lever) is released, the forces of the shoe and camshaft lever return springs restore the components to their home positions. This releases the parking brake.

Possible causes \ Symptoms		Parking brake does not work	Parking brake release not smooth (dragging)	Parking brake lever operating physical force insufficient	Parking brake lever operating physical force excessive	Reference Gr
Parking brake cable	Inner cable stretched or damaged	O	O	O	O	
	Inner cable improperly adjusted	O	O	O	O	
Parking brake lever	Ratchet pole and ratchet plate pawl engaged improperly	O

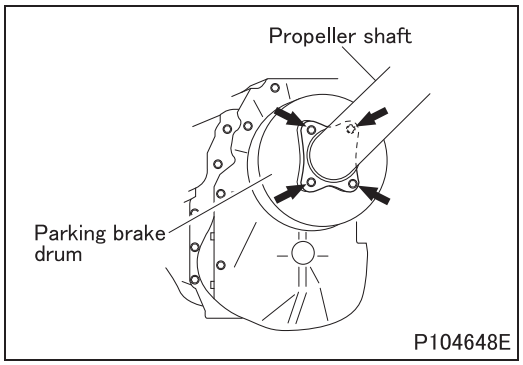
ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection of Parking Brake Drum Mounting for Looseness

Tightening torque (Unit: N·m {ft.lbs, kgf·m}

Mark	Parts to be tightened	Tightening torque	Remarks
–	Nut (parking brake drum mounting)	100 to 120 {74 to 89, 10 to 12}	–

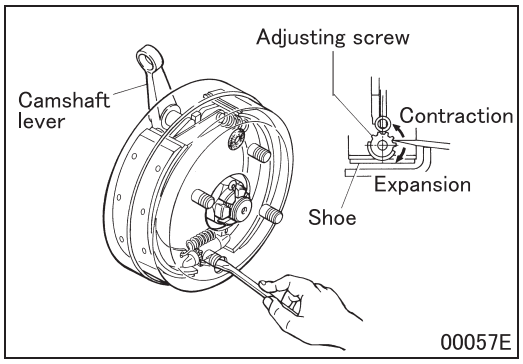


- Check the parking brake drum mounting nuts for looseness with a spanner or the similar tool.
- If looseness is found, tighten the nuts to the specified torque.

2. Adjustment of Parking Brake Shoe Clearance

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Brake shoe clearance	0.1 to 0.25 {0.0039 to 0.0098}	–	Adjust



- Apply chocks to the front wheels and raise the rear wheels with a jack.
- Operate the parking brake lever to release the parking brake.
- Using a screwdriver or similar tool inserted through the shoe adjusting hole in the parking brake drum, turn the adjusting screw in the shoe expanding direction until the shoes closely contact the brake drum.
- From the above point, turn the screw in the shoe contracting direction by 8 notches; the shoe-to-drum clearance is now adjusted to the standard value.

3. Inspection and Adjustment of Parking Brake Lever

Service standards

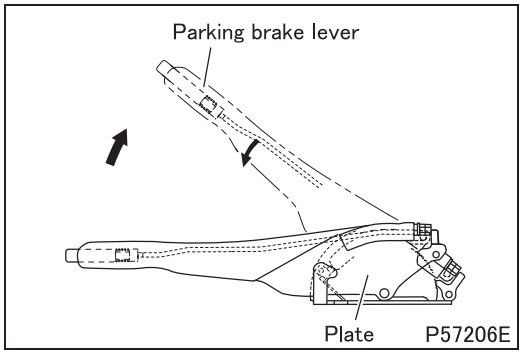
Location	Maintenance item	Standard value	Limit	Remedy
–	Parking brake lever pulling stroke (with an operating physical force of 294 N {66 lbs, 30 kgf})	7 to 9 notches	–	Adjust or inspect

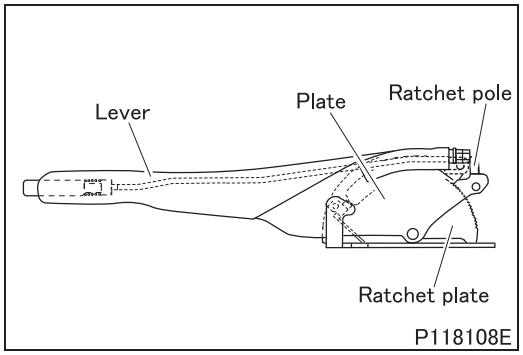
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

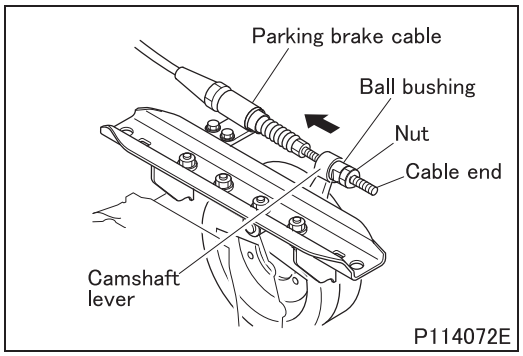
Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut	12.5 ± 2.5 {9.2 ± 1.8, 1.3 ± 0.3}	–

Lubricant and/or sealant

Mark	Point of application	Specified lubricant and/or sealant	Quantity
–	Camshaft lever (on sliding face with parking brake cable and on contact face with ball bushing)	Chassis grease [NLGI No. 1 (Li soap)]	As required







3.1 Inspection

(1) Parking brake lever pulling stroke

- Pull the parking brake lever from the released position with an operating physical force of 294 N {66 lbs, 30 kgf} and count the number of cleared notches.
- If the count of notches deviates from the specified range of standard values, adjust the length of the parking brake cable.
- If the count of notches (pulling stroke) is still out of the specified range after the cable length adjustment, check the parking brake shoe clearance.

(2) Condition of ratchet

- Operate the parking brake lever and check to see if the ratchet is properly engaged.
- Check the ratchet plate and ratchet pole for nicked or broken teeth.
- If these parts are defective, replace the parking brake lever.

3.2 Adjustment

- Pull on the parking brake cable end with a force of 100 N {22 lbs, 10 kgf} to remove any slack from the cable.
- Apply grease onto the camshaft lever, on the sliding face with the parking brake cable and on the contact face with the ball bushing.
- While pulling the cable end of the camshaft lever in the direction of the arrow with a force of 45 to 50 N {10 to 11 lbs, 4.6 to 5.1 kgf}, rotate the ball bushing until it contacts the cable end of the camshaft lever.

CAUTION ⚠

- **Do not rotate the ball bushing so much as to cause the camshaft lever to move.**

- Pull the parking brake lever 3 times with a force of 500 N {110 lbs, 51 kgf}.
- This operation causes the cable to extend. Rotate the ball bushing again until it contacts the camshaft lever. Then, pull the parking brake lever with a force of 45 to 50 N {10 to 11 lbs, 4.6 to 5.1 kgf}. The camshaft lever should not move more than 1 mm {0.039 in.}.
- Pull the parking brake lever from the released position with a force of 294 N {66 lbs, 30 kgf}. The lever should travel past the specified number of notches. Tighten the nut.

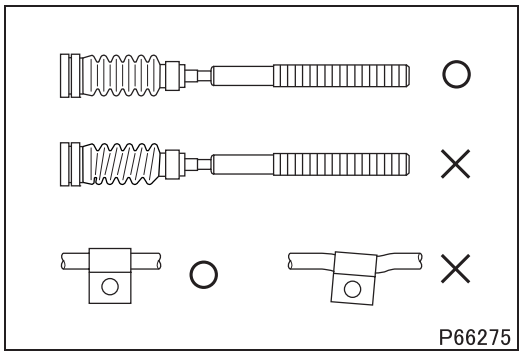
Tc	Nut (ball bushing mounting)	12.5 ± 2.5 {9.2 ± 1.8, 1.3 ± 0.3}	–
Td	Bolt (parking brake cable attaching)	23.5 ± 9.5 {17.0 ± 3.3, 2.4 ± 0.5}	–
Te	Bolt (parking brake cable bracket mounting)	75 ± 10 {55 ± 7.4, 7.6 ± 1.0}	–

Lubricant and/or sealant

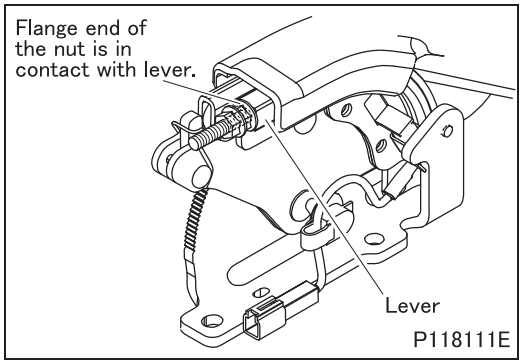
Mark	Point of application	Specified lubricant and/or sealant	Quantity
a	Contact surfaces of parking brake lever	Chassis grease [NLGI No. 1 (Li soap)]	As required
	Spherical face of ball bushing		

◆Installation procedure◆



■ Installation: Parking brake cable

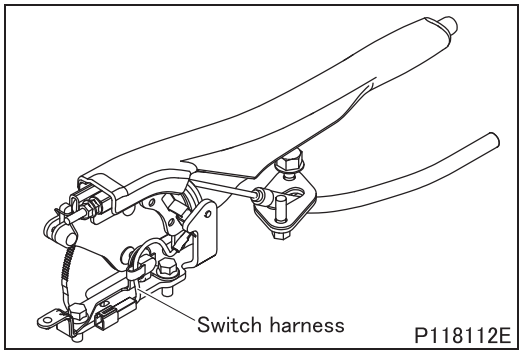
- Lay the parking brake cable along the frame while paying attention to the following:
- The cable must not be bent at the clamped portions.
- There must not be torsion in the boot.
- Avoid any interference with other components when routing the cable.



- Tighten the mounting nut of the parking brake cable fully until it reaches the thread end of the parking brake cable. Adjust the cable position as necessary to ensure that flanged end of the nut is in contact with the parking lever.

CAUTION ⚠

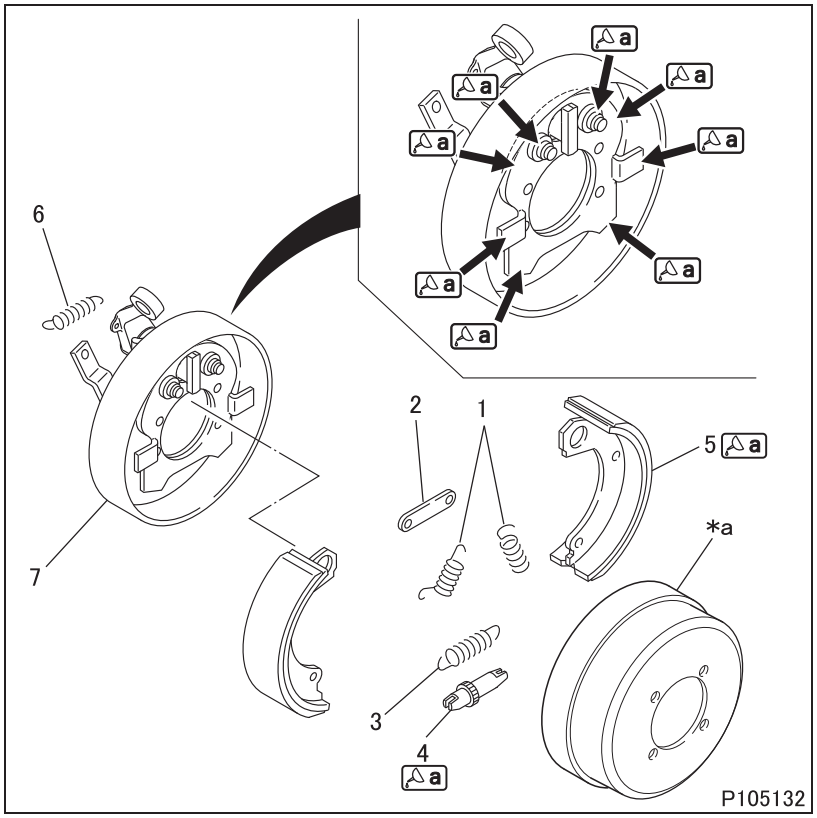
- **The nut should not be tightened too far beyond the thread end of the parking brake cable. Overtightening the nut can cause the cable to slip out of the nut or the cable end to be damaged.**



■ Installation: Parking brake lever

- Attach the cover bracket to the parking brake lever and install the assembly on the floor. Route the switch harness as illustrated. Operate the parking brake lever to verify that the harness can neither interfere with the lever nor be overtensioned.

PARKING BRAKE



● **Disassembly sequence**

1 Shoe return spring
2 Anchor pin brace
3 Adjuster wheel return spring
4 Adjuster screw
5 Shoe and lining
6 Camshaft lever return spring
7 Support plate and dust cover

***a:** Parking brake drum

- For removal and installation of the parking brake and parking brake drum, see Gr22, Gr24.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **To prevent poor working of the brake, do not smear the surface of shoe and lining with grease or oil.**

- After reassembly, perform an inspection and adjustment of the brake shoe clearance. (See “ON-VEHICLE INSPECTION AND ADJUSTMENT”.)

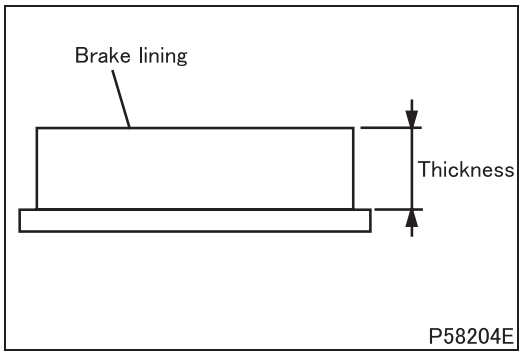
Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
1	Installed load of shoe return spring (installed length: 57.5 {2.26})		157 ± 15.7 N {135 ± 3.5 lbs, 16 ± 1.6 kgf}	126 N {28 lbs, 13 kgf}	Replace
3	Installed load of adjuster wheel return spring (installed length: 59 {2.32})		128 ± 12.8 N {29 ± 2.9 lbs, 13 ± 1.3 kgf}	62 N {14 lbs, 6.3 kgf}	Replace
5	Lining thickness of shoe and lining		3.75 {0.15}	1.4 {0.055}	Replace
6	Installed load of camshaft lever return spring (installed length: 85 {3.35})		49 ± 4.9 N {11 ± 1.1 lbs, 5.0 ± 0.5 kgf}	39 N {8.8 lbs, 4.0 kgf}	Replace
***a**	Parking brake drum	Inner diameter	$\phi 203.2\ ^{+0.3}_{0}$ {$\phi 8.00\ ^{+0.012}_{0}$}	ϕ205 {8.07}	Replace
		Squareness	0 to 0.05 {0 to 0.0020}	–	
		Concentricity	0 to 0.2 {0 to 0.0079}	–	
		Cylindricity	0 to 0.05 {0 to 0.0020}	–	
		Static rotation imbalance	0.0088 N·m {0.007 ft.lbs, 0.9 gf·m} or less	–	

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Shoe and lining contact points on both ends of adjuster screw	Brake grease AKB100	As required
	Shoe and lining contact surface of camshaft on support plate		
	Anchor pins and shoe and lining contact surface on support plate		

◆Inspection procedure◆



■ Inspection: Lining thickness of shoe and lining

- If the measured value is lower than the limit, replace the shoe and lining.

■ Inspection: Parking brake drum

(1) Visual inspection

- If abnormal wear or damage is found on the parking brake drum, replace the parking brake drum.

(2) Inner diameter, squareness, concentricity, cylindricity and static rotation imbalance

- If the measured value exceeds the limit or deviates from the standard value, replace the parking brake drum.

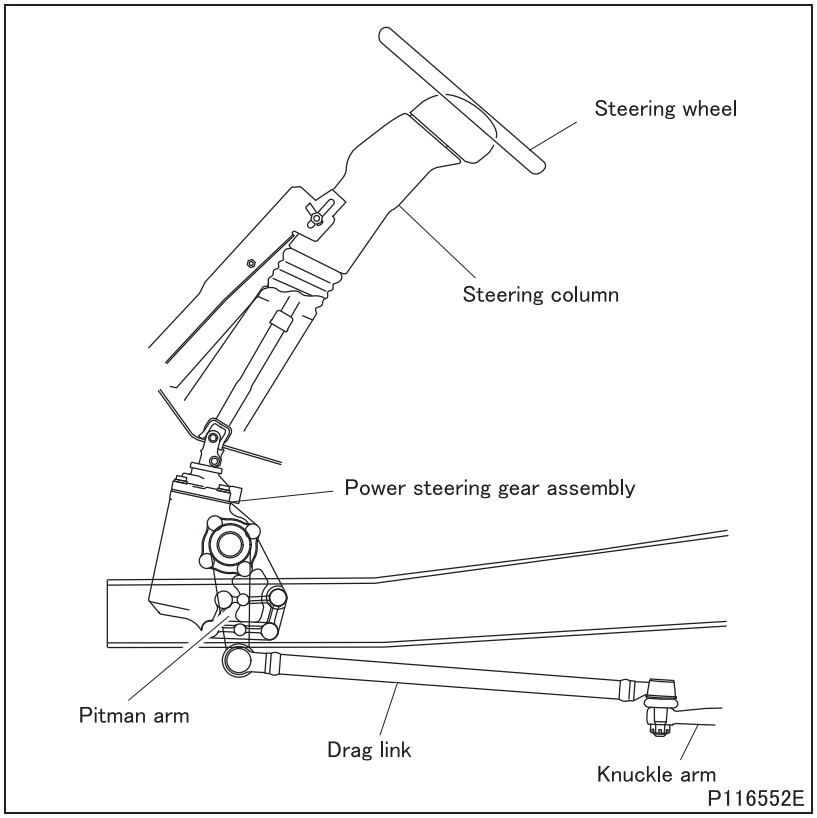
Permissible revolutions rpm	500 to 4900	

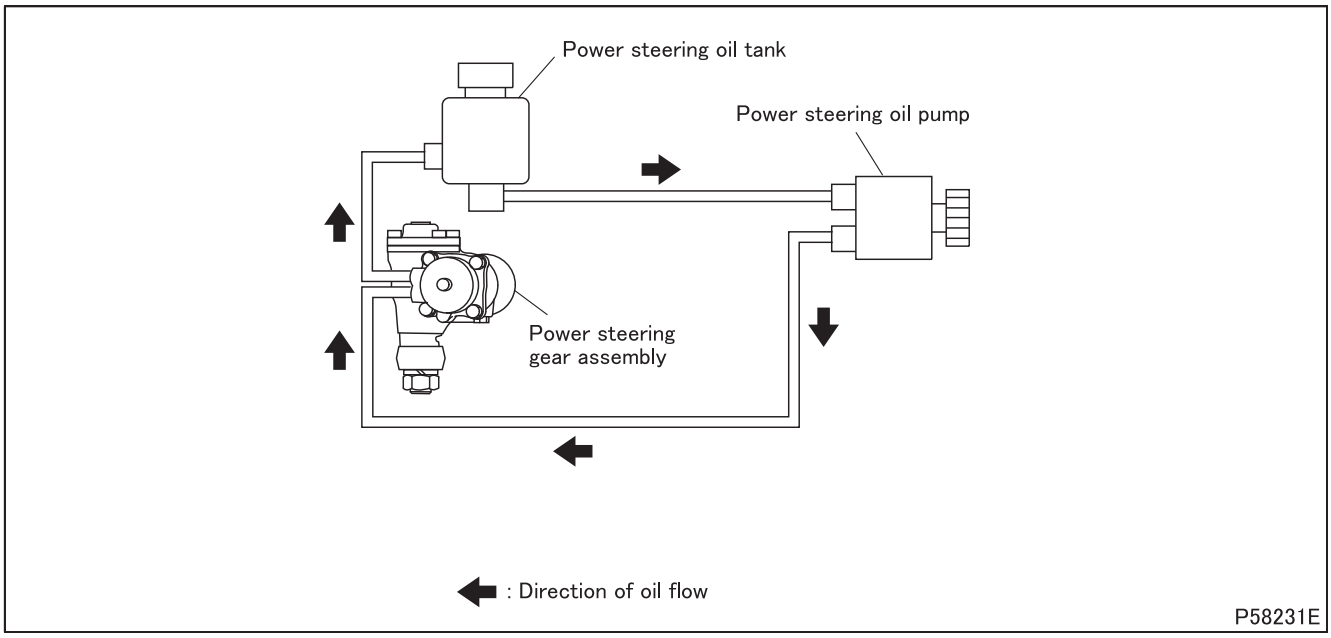
M E M O

STRUCTURE AND OPERATION

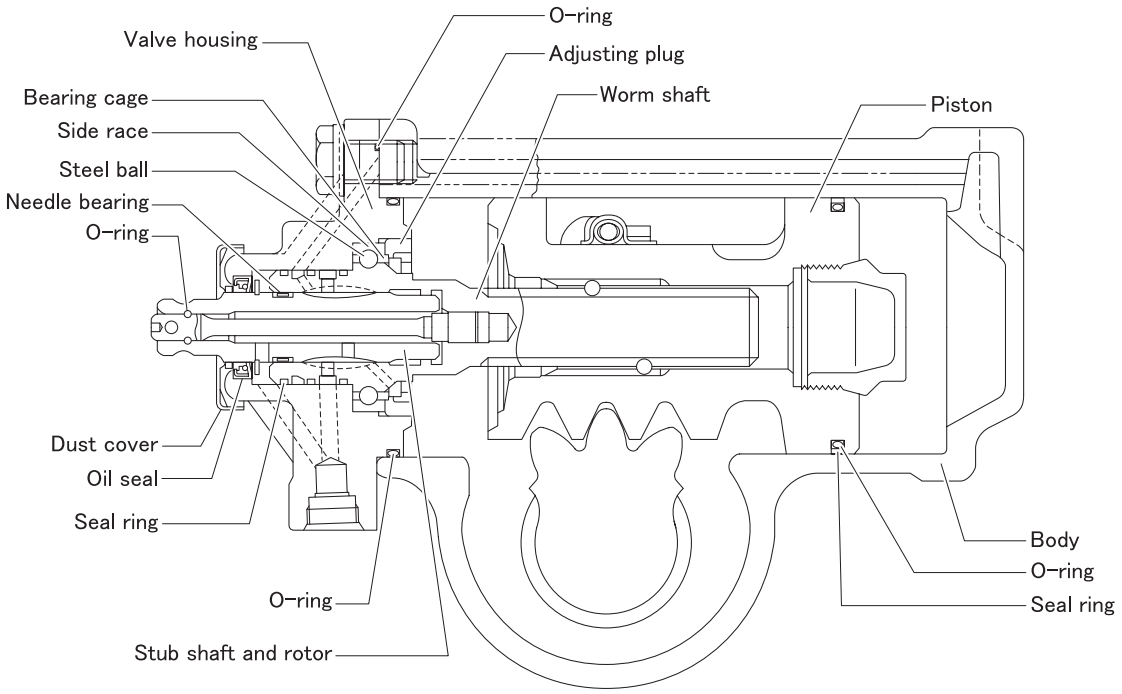
1. Steering System

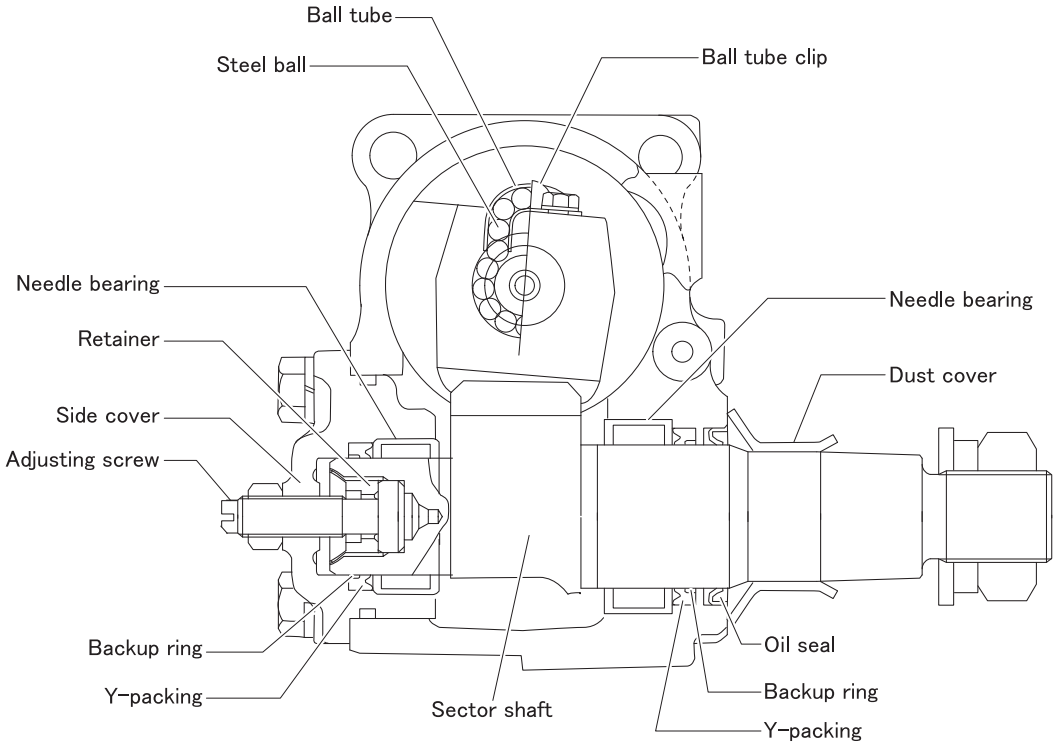


2. Oil Flow



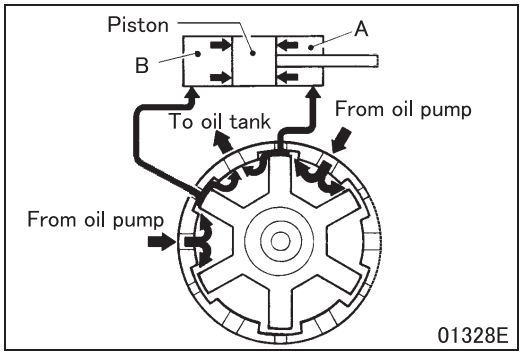
3. Power Steering Gear Assembly





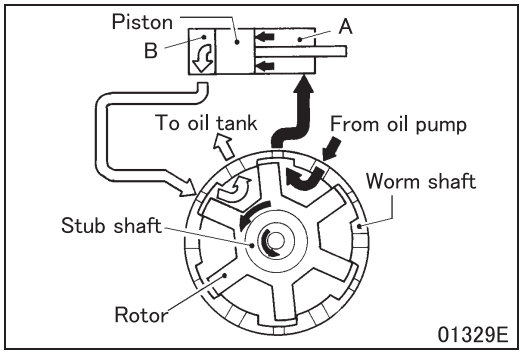
P118114E

- The power steering gear assembly utilizes a rotary valve and torsion bar to ensure light and smooth operation at low speeds and stable steering feel at high speeds.



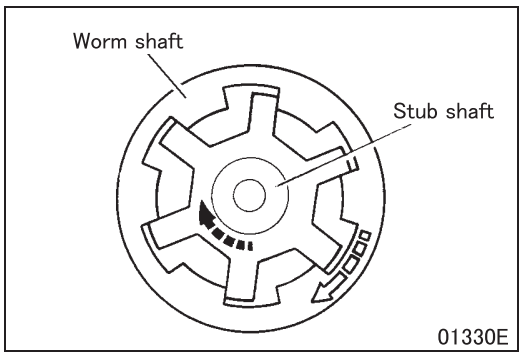
3.1 When moving straight forward

- As equal pressure is applied to cylinder chambers A and B on both sides of the piston, the piston rests in a neutral position.



3.2 When turning the steering wheel

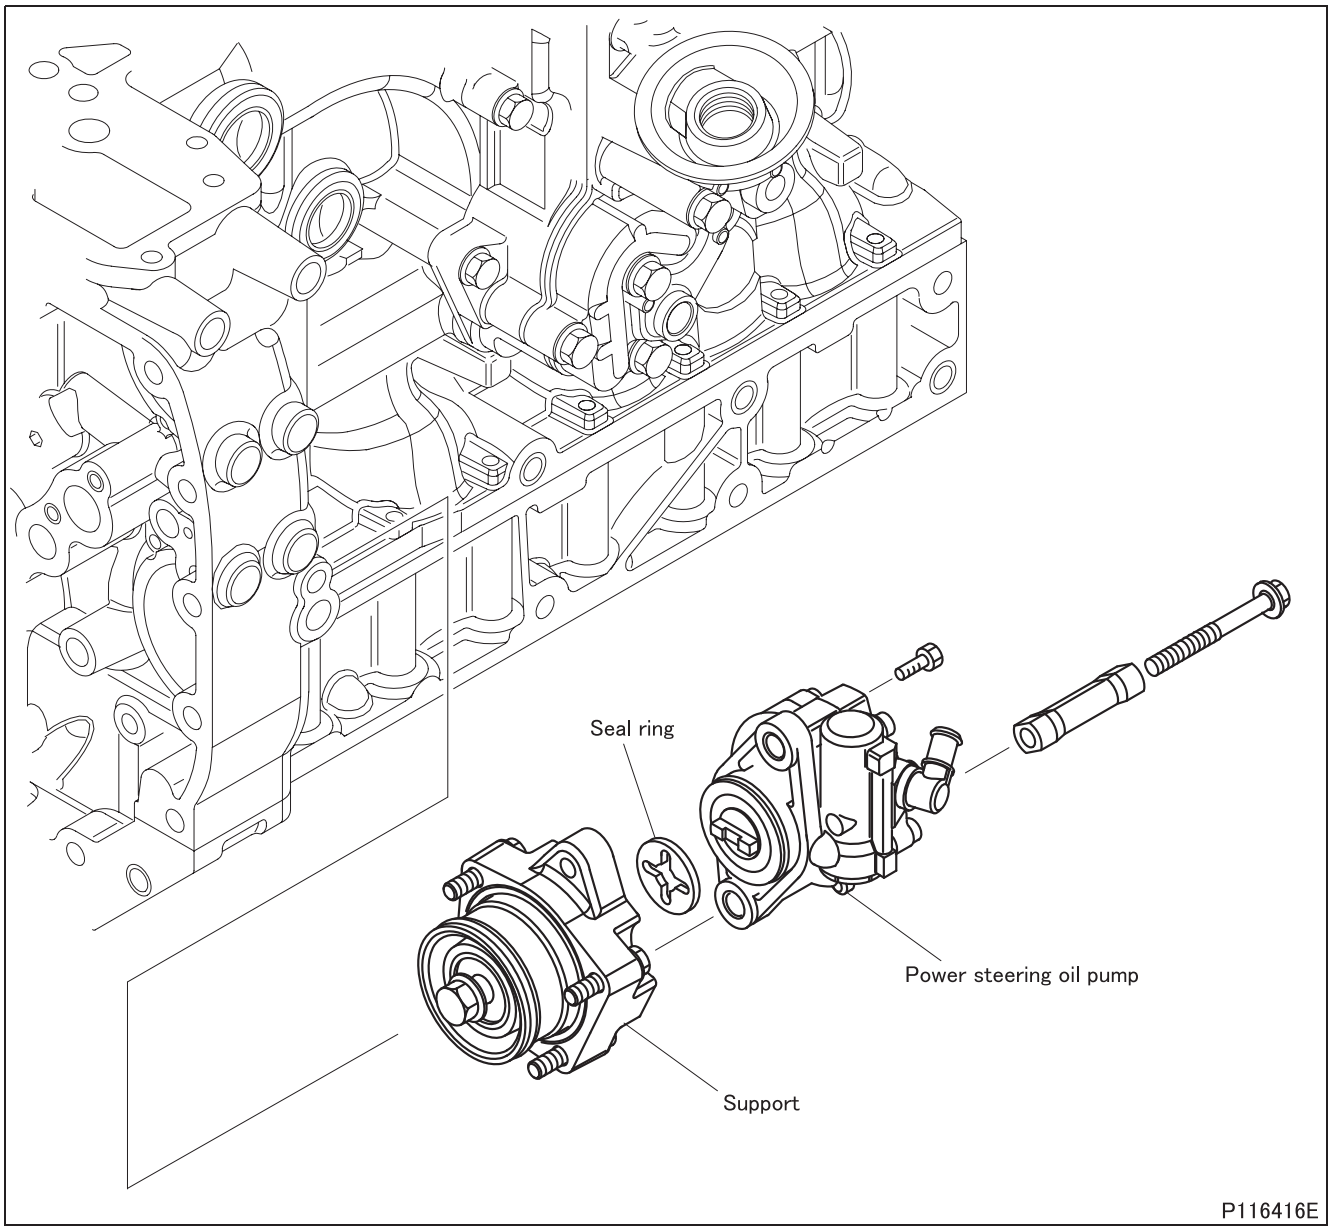
- When the steering wheel is turned, the stub shaft is twisted, which causes the rotor to shut off oil supply passages to cylinder chamber B. As a result, a pressure difference is created between cylinder chamber A and cylinder chamber B, and the piston moves, facilitating rotation of the worm shaft.
  The illustration shows a condition when the steering wheel is turned to the left.



3.3 When hydraulic circuit fails

- The turning force of the stub shaft alone turns the worm shaft.

4. Power Steering Oil Pump



- The power steering pump incorporated in the engine block generates hydraulic pressure for steering assistance. The pump is driven by the engine via the timing gear chain.
- The power steering pump cannot be disassembled. To remove and reinstall it, see Gr11.

TROUBLESHOOTING

Possible causes \ Symptoms		Steering wheel heavy to operate	Steering wheel play excessive and unstable	Steering wheel pulls to one side	Steering wheel vibration	Steering wheel return not smooth	Steering wheel does not turn	Steering angle insufficient or different between right and left	Oil leakage	Oil pump oil pressure abnormal	Noise from oil pump (grinding)	Noise from oil pump (squeaking)	Noise from oil pump (low whirring)	Reference Gr

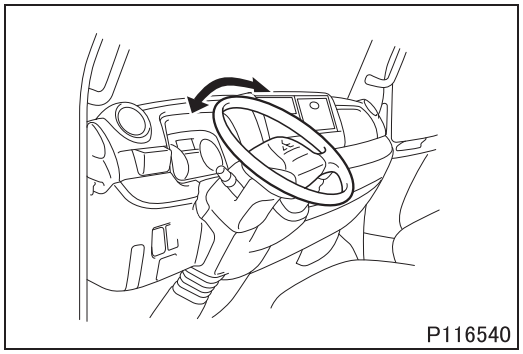
ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Steering Wheel Play

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Steering wheel play (measured at outer periphery of wheel)	At engine start	5 to 50 {0.2 to 2.0}	–	Replace
		Engine stopped	10 to 20 {0.39 to 0.79}	–	Adjust



- With the vehicle placed straight forward, perform the following checks.

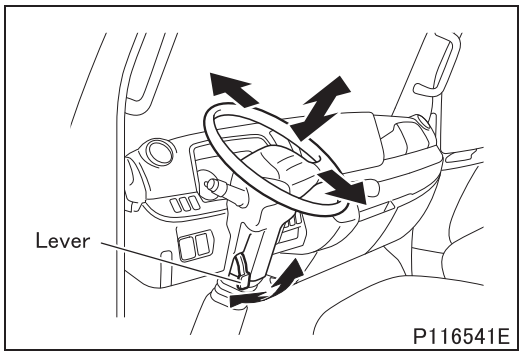
1.1 At engine start

- Start the engine and gently turn the steering wheel left and right to measure its peripheral play.
- If the play deviates from the standard value check tightening points of steering shaft and steering linkage parts as pitman arm to knuckle, and replace those parts if they have any looseness.

1.2 When engine is stopped

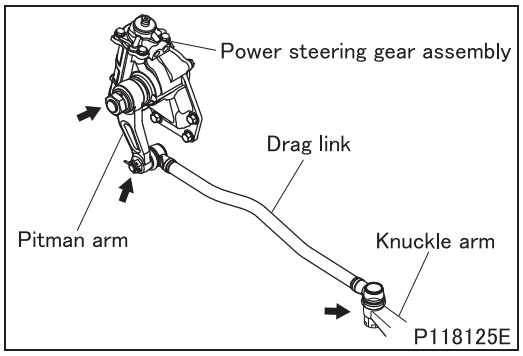
- Stop the engine and turn the steering wheel left and right within the range where the drag link does not move (tangential force on the periphery: 5 N {1.1 lbs, 0.5 kgf}) to measure its peripheral play.
- If the play deviates from the standard value, adjust the play with the adjusting screw of the power steering booster.

2. Steering Column Looseness



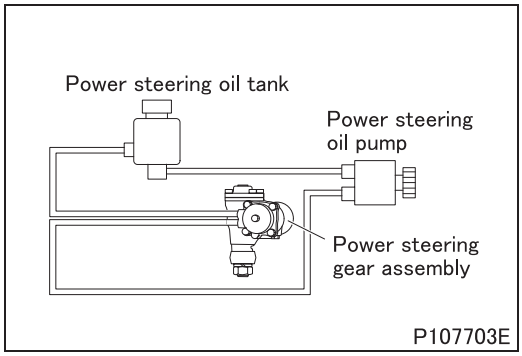
- Push and pull the steering wheel by hand to check the steering column for looseness.
- With the steering column tilted all the way forward, pull the steering wheel backward and check the steering column for looseness.
- If the steering column is loose, adjust the tilting and telescoping lever.

3. Inspection of Rods and Arms for Looseness



- Check the rods and arms of drag link, pitman arm for damage and looseness.
- If any abnormality is found, replace the faulty parts or tighten the parts to the specified torque.

4. Inspection of Power Steering System Mounts for Looseness



- Check the mounting sections of power steering oil tank, power steering oil pump and power steering gear assembly for looseness.
- Check the connections of hose and pipe for looseness.
- If any looseness is found, tighten the loose parts to the specified torque.

5. Inspection and Replacement of Power Steering Oil

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Feed pipe and return pipe	11.8 to 17.6 {8.7 to 13, 1.2 to 1.8}	–

Lubricant and/or sealant

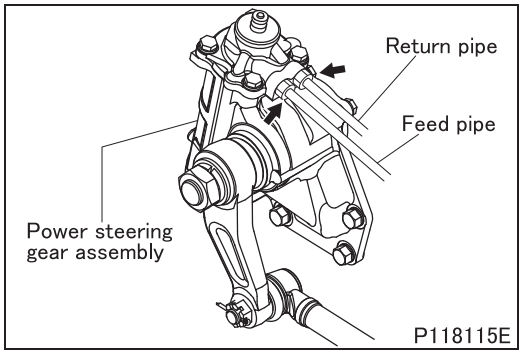
Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Power steering oil tank	Automatic transmission fluid (DEXRON II, DEXRON III type)	Between MIN and MAX of power steering oil tank

5.1 Oil leakage

- Check the power steering oil tank, power steering oil pump, power steering gear assembly and hose and pipe connections for oil leaks. Check also the hoses for blistering due to deterioration, damage and crack.
- If any oil leaks are found, tighten the connection or replace the faulty parts.

5.2 Oil level check

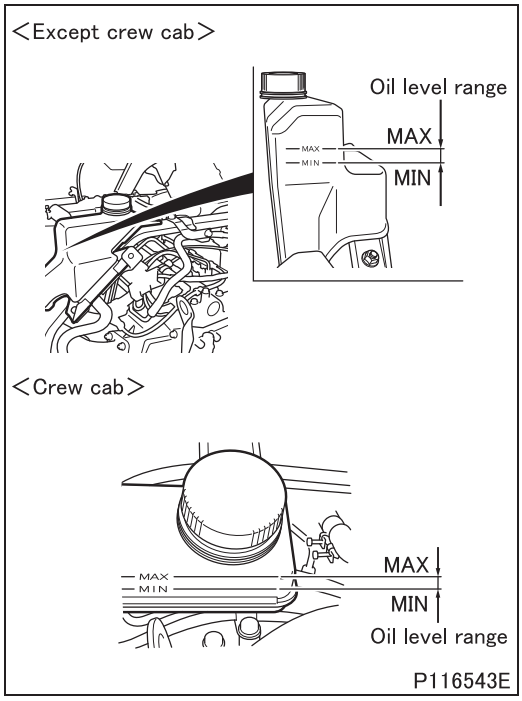
- Confirm that the hydraulic fluid is within the specified oil level range.
- Pour additional fluid if necessary.



5.3 Replacement

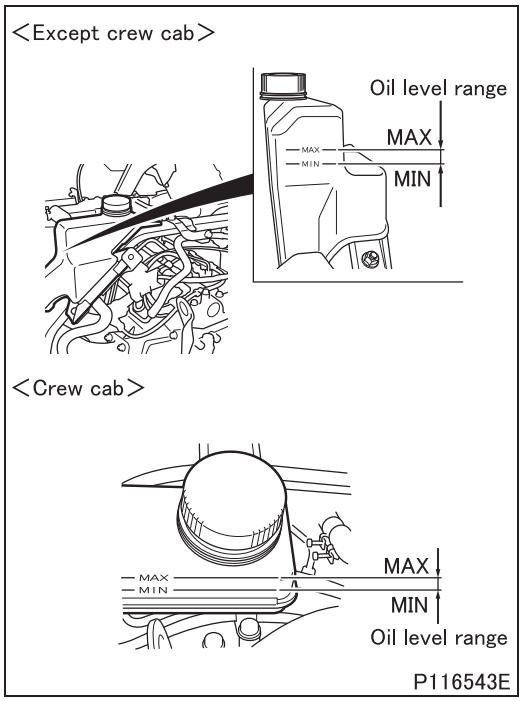
[Draining]

- Jack up the front wheels.
- Clean the port areas of feed and return pipes to prevent entry of dirt, dust, and other foreign material inside the power steering gear assembly.
- Loosen feed and return pipes connected to the power steering gear assembly.
- Repeatedly turn the steering wheel fully left and right to drain the fluid from the power steering gear assembly.
- After draining the fluid, tighten the feed and return pipes to specified torque.



[Filling]

- Pour fluid into the power steering oil tank up to the specified oil level range.
- Bleed the power steering system of air.



5.4 Air bleeding

- Pour fluid into the power steering oil tank up to the specified oil level range.
- With the engine stopped, jack up the front wheels.
- Repeatedly turn the steering wheel fully left and right. When the fluid level has dropped, add sufficient fluid to maintain the fluid level within the specified range.
- Start the engine to idle.
- When the fluid level has dropped, stop the engine and add sufficient fluid to maintain the fluid level within the specified range.
- Restart the engine. While checking for a drop in fluid level, turn the steering wheel fully left and right and add fluid as much as necessary. Repeat this practice until the fluid level is stabilized within the specified range.
- Turn the steering wheel fully left and right repeatedly.

CAUTION ⚠

- **To avoid seizure of the power steering oil pump, do not keep the steering wheel turned fully to left or right for more than 10 seconds when the engine is running.**
- **Do not rev the engine during air bleeding; otherwise, the power steering pipe may break. Run the engine at idle.**

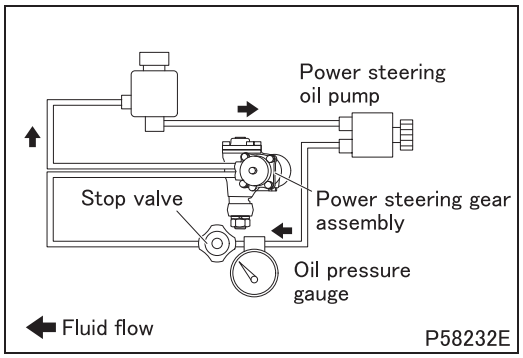
- If there is any abnormal noise or a fluid level fluctuation, there is likely still some air trapped in the power steering system. Turn the steering wheel several times to raise the fluid temperature to approximately 60 to 80°C {140 to 176°F}.
- Stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise or fluid level fluctuation, the bleeding of the power steering system is completed.
- Repeat starting and stopping the engine several times to remove small air bubbles left in the power steering oil tank.

- If air bubbles are not removed completely, drive the vehicle for a while, then check for abnormal noise and oil level fluctuation.
- When bleeding is finished, check that fluid in the power steering oil tank is within the specified level range. Also check pipe and hose connections for fluid leaks.

6. Performance Verification Test of Power Steering System

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Power steering system fluid pressure (with hands off steering wheel)		490 kPa {71 psi, 5 kgf/cm^2} or less	–	Repair or replace
–	Relief set pressure	FEC7 FEC9	12.5 $^{0}_{-0}$ {1810 $^{0}_{-140}$ psi, 127 $^{0}_{-10}$ kgf/cm^2}	–	Replace
		FEC5 FG	11.0 $^{0}_{-0}$ MPa {1590 $^{0}_{-140}$ psi, 112 $^{0}_{-10}$ kgf/cm^2}		



- Perform the inspection with the following measuring conditions to verify normal operation of the power steering gear assembly and power steering oil pump.
- Install oil pressure gauge capable of measuring upward of 13.5 MPa {1950 psi, 137 kgf/cm^2} and stop valve between power steering oil pump and power steering gear assembly, then bleed air.
- Start engine to idle with stop value fully opened.
- Turn steering wheel left and right several times to raise fluid temperature up to 50 to 60°C {122 to 140°F}.

CAUTION ⚠

- **To avoid seizure of the power steering oil pump, never close the stop valve for more than 10 seconds.**

6.1 Steering wheel operation check

- With the front wheels jacked up, turn the steering wheel all the way in both directions to check that it smoothly moves.
- If any abnormality is found, disassemble and repair defective parts.

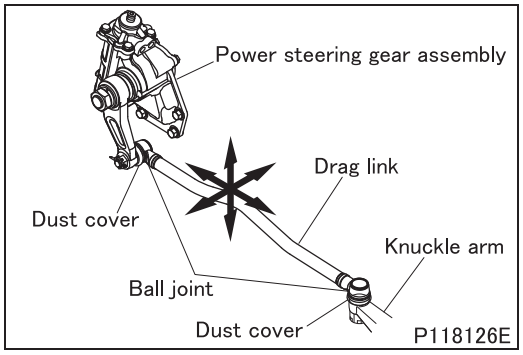
6.2 Power steering system fluid pressure check

- Measure the fluid pressure with hands off the steering wheel. If the measurement deviates from the standard value, check the power steering gear assembly and hydraulic circuit for clogging. If clogging is not found, check the power steering oil pump and replace defective parts.

6.3 Relief set pressure check

- With the engine speed gradually increased up to 1000 to 1500 rpm, close the stop valve and measure the maximum fluid pressure. Do not leave the stop valve closed for any longer than 10 seconds.
- If the measurement deviates from the standard value, replace the power steering oil pump.

7. Inspection of Drag Link Ball Joint



7.1 Backlash

- With the vehicle stationary, move the drag link by the rod in the forward, backward, vertical and lateral directions and check for play at the ball joints with power steering gear assembly and knuckle arm.
- If play is excessive, replace the drag link.

7.2 Dust cover

- Check the dust cover for excessive wear, cracks and other damage.
- Replace the drag link if it is defective.

8. Inspection of Steering Wheel Operation during Running

- Check to see if the steering wheel wobbles continuously while the vehicle is running (at a constant vehicle speed).
- The steering wheel should not pull to one side: Check to see if the steering wheel pulls to right or left while the vehicle is running straight on a flat road.
- Steering should not be excessively hard: Check that the steering effort is moderate with no excessive fluctuations throughout the entire operating range.
- Quick steering wheel return: Check to see if the steering wheel is hard to return or binds as it is returned from turned to center position.

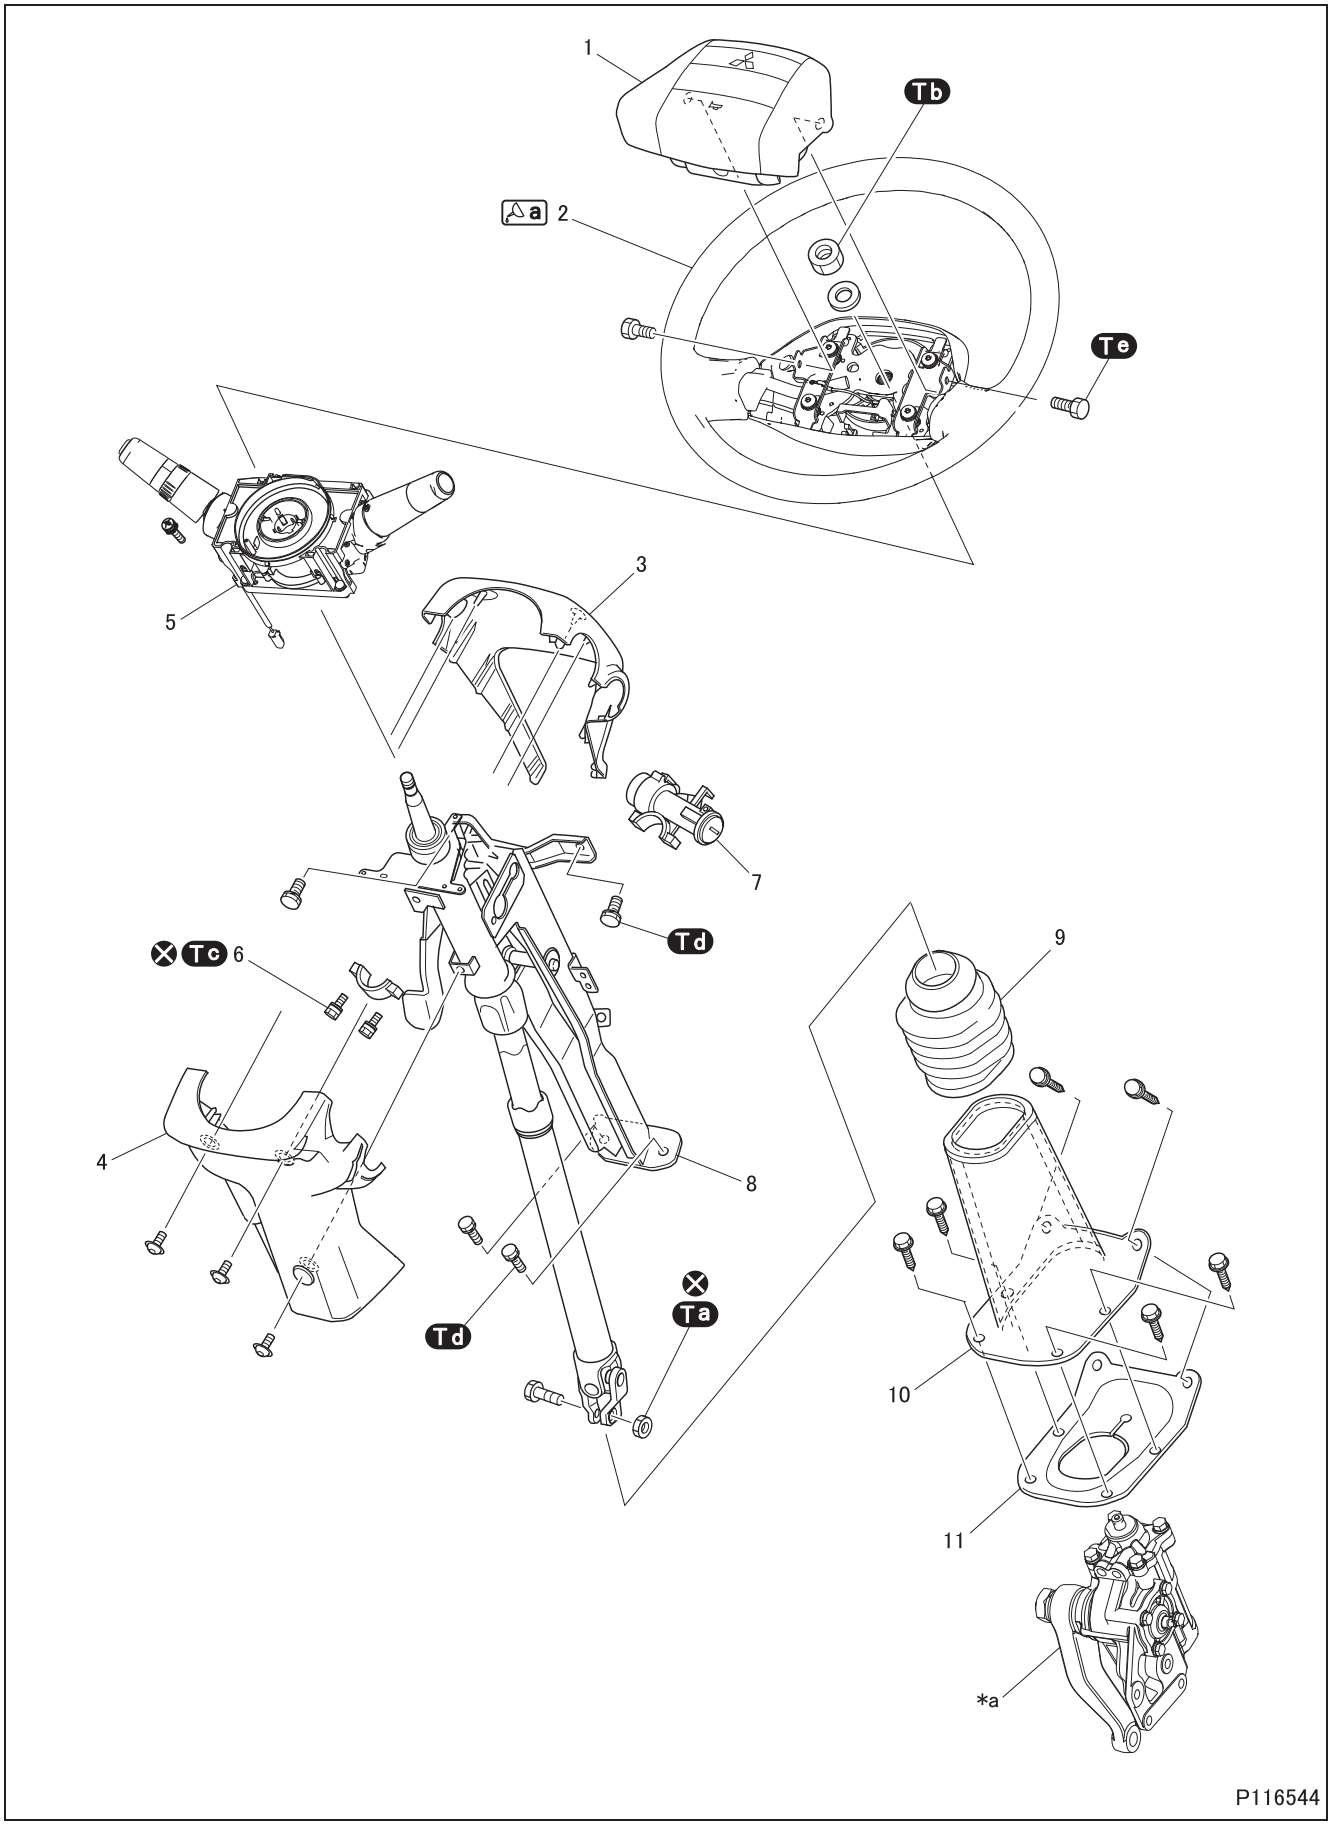
STEERING COLUMN



● **Removal sequence**

1 Horn pad
2 Steering wheel
3 Front column cover
4 Rear column cover
5 Combination switch
6 Twist-off bolt
7 Starter switch
8 Steering column
(For details, see later pages.)
9 Dust cover
10 Dust cover
11 Dust cover

***a**: Power steering gear assembly
⊗: Non-reusable parts

● **Installation sequence**

Follow the removal sequence in reverse.

- After installation, check the steering column for looseness. (See ON-VEHICLE INSPECTION AND ADJUSTMENT.)

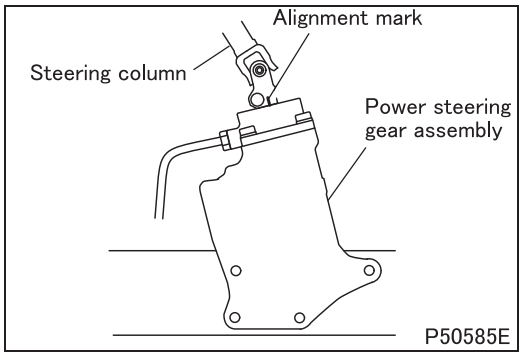
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (steering column and power steering gear mounting)	22 to 31 {16 to 23, 2.2 to 3.2}	–
Tb	Nut (steering wheel mounting)	39 to 49 {29 to 36, 4.0 to 5.0}	–
Tc	Twist-off bolt (starter switch mounting)	14.2 ± 1.5 {10 ± 1.1, 1.4 ± 0.2}	–
Td	Bolt (steering column assembly mounting)	17 to 25 {12 to 19, 1.7 to 2.6}	–
Te	Bolt (horn pad mounting)	7 to 11 {5.2 to 8.1, 0.7 to 1.1}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Horn contact ring under steering wheel	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

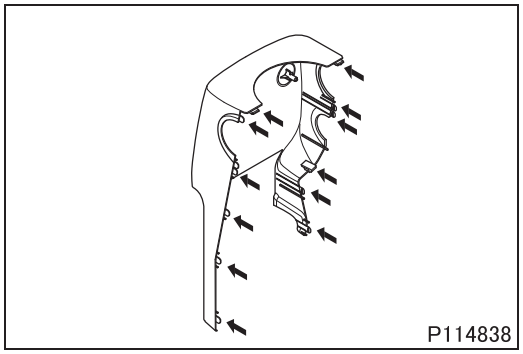
◆**Work before removal**◆



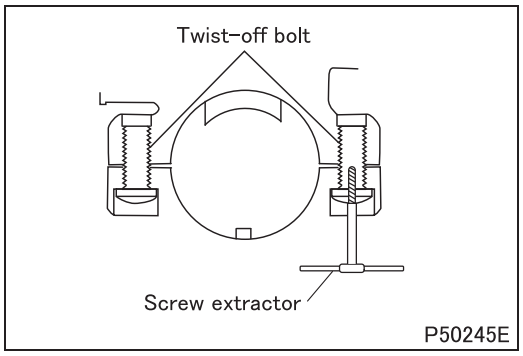
■ **Alignment mark: Steering column and power steering gear assembly**

- Provide alignment marks on the steering column and power steering gear assembly.

◆Removal procedure◆

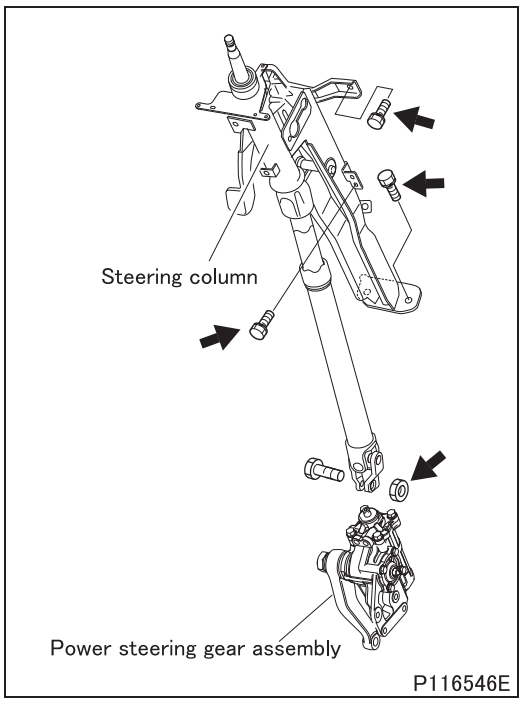


■ **Removal: Front column cover**



■ **Removal: Starter switch**

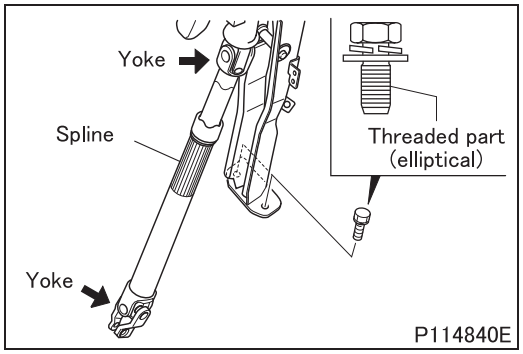
- Drill a hole of 5.5 to 6 mm {0.22 to 0.24 in.} in diameter to a depth of 10 to 15 mm {0.39 to 0.59 in.} in the twist-off bolt.
- Using the drilled hole, screw the screw extractor counterclockwise into the twist-off bolt and remove it.



■ **Removal: Steering column**

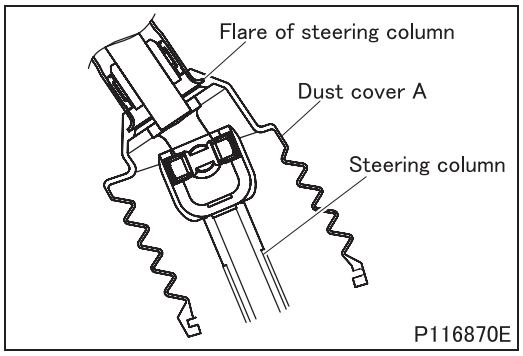
- To remove the steering column, remove the nut connecting it to the power steering gear, in addition to mounting bolts in the cab.

◆Installation procedure◆



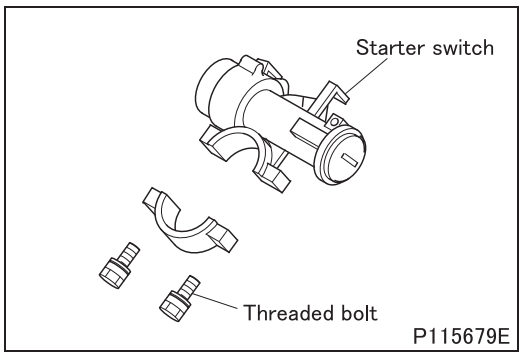
■ **Installation: Steering column**

- If the spline is off the steering column, assemble them with the yokes facing in the same direction.
- Install the steering column using the illustrated bolts. The threaded portion of these bolts is elliptical for grounding the horn circuit properly.



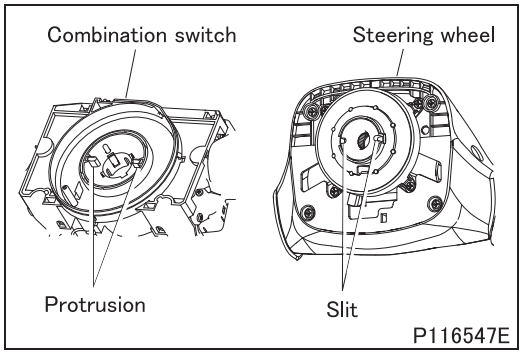
■ **Installation: Dust cover A**

- Install the dust cover A with the inside groove fit to the flare of the steering column.



■ **Installation: Starter switch**

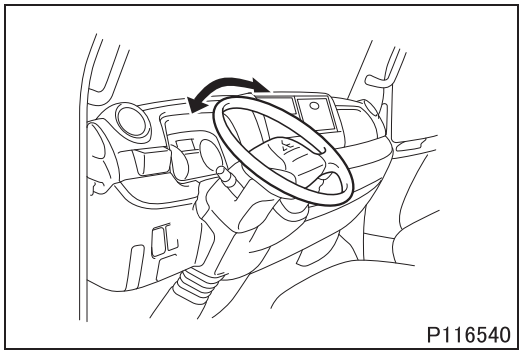
- Install the starter switch using new twist-off bolts. Tighten the bolts to specified torque to snap off their heads.



■ **Installation: Steering wheel**

- Align two slits of the steering wheel with two protrusions of the cancel cam on the combination switch to attach the steering wheel.

◆Inspection after installation◆

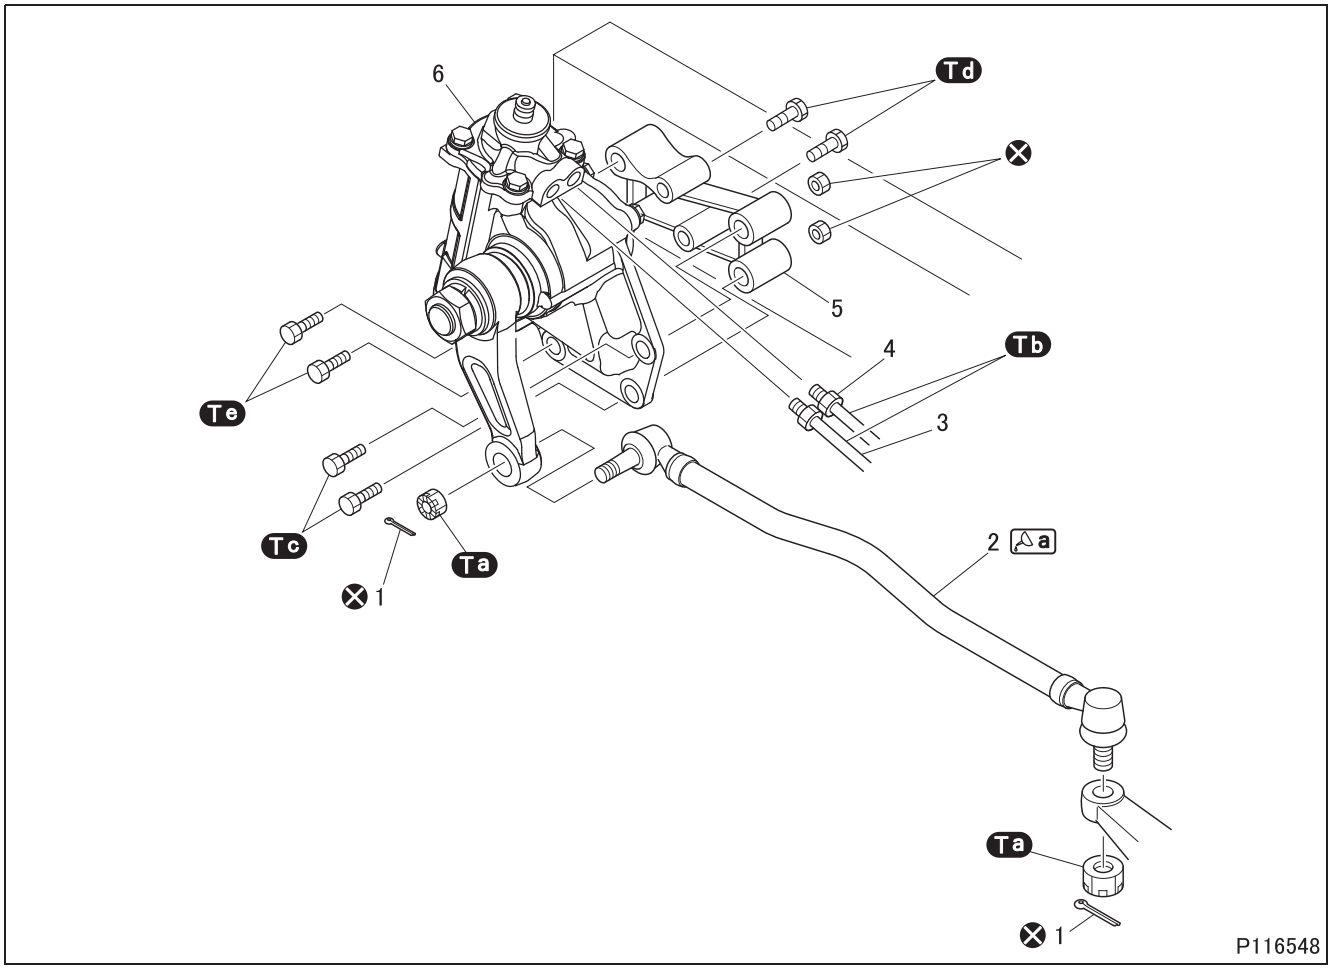


■ Inspection: Noise from steering wheel

- Lightly turn the steering wheel left and right and check for noise and other abnormalities.
- If any abnormality is found, disassemble the steering wheel, remove the cause and reinstall.

M E M O

POWER STEERING GEAR ASSEMBLY AND DRAG LINK



● **Removal sequence**

1 Split pin
2 Drag link
3 Feed pipe
4 Return pipe
5 Bracket
6 Power steering gear assembly

⊗: Non-reusable parts

CAUTION ⚠

- **When removing the drag link, take care not to deform or damage the dust cover.**

- Do not attempt to disassemble the drag link because it is of a unit construction.

● **Installation sequence**

Follow the removal sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
1	Ball joint of drag link	Play (± 980 N {± 220 lbs, ± 100 kgf} loaded)	0 to 0.15 {0 to 0.0059}	–	Replace
		Rotation torque	0.1 to 5.9 N·m {0.1 to 4.4 ft.lbs, 0.01 to 0.6 kgf·m}	–	

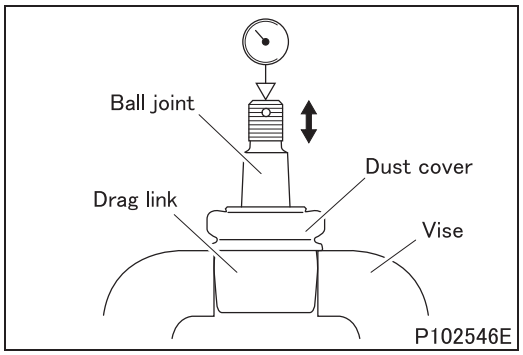
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (drag link mounting)	137 to 196 {100 to 145, 14 to 20}	–
Tb	Feed pipe and return pipe	11.8 to 17.6 {8.7 to 13, 1.2 to 1.8}	–
Tc	Nut (power steering gear mounting)	130 to 160 {96 to 120, 13 to 16}	–
Td	Bolt (bracket mounting)	45 to 55 [33 to 41, 4.6 to 5.6]	–
Te	Bolt (power steering gear mounting)	230 to 260 {170 to 190, 23 to 27}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Lip area of drag link ball joint dust cover	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

◆Inspection procedure◆



■ **Inspection: Drag link**

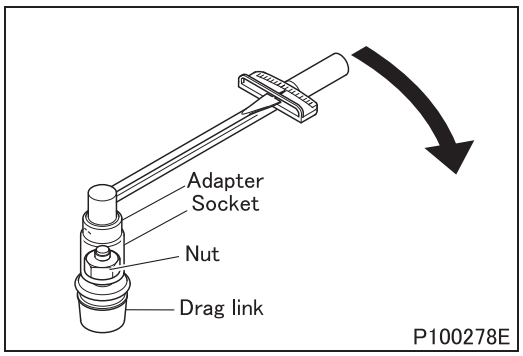
(1) Play

- Fix the tie drag link with a vise.

CAUTION ⚠

- **Take care not to deform or damage the dust cover when fixing it with a vise.**

- If measured value deviates from the standard value with applying the specified load (push and pull) to the ball joint, replace the drag link.



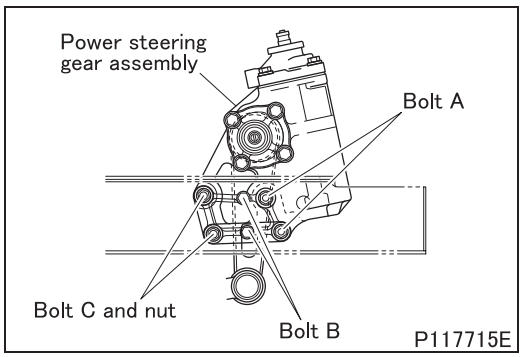
(2) Rotation torque

- Install the drag link mounting nut on the drag link.
- Install the socket, adapter and torque wrench to measure the rotation torque.
- If the measured value deviates from the standard value, replace the drag link.

(3) Dust cover

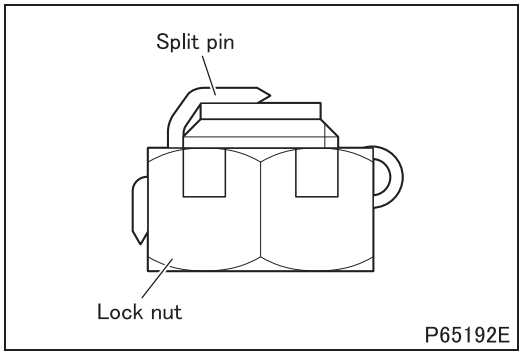
- Check the dust cover for wear, cracks and other damage. These abnormalities may cause water infiltration to the ball joint and wearing it out prematurely.
- If any abnormality is found in the dust cover, replace the drag link.

◆Installation procedure◆



■ **Installation: Power steering gear assembly**

- Attach the bracket on the frame with the bolts B.
- Install the power steering gear assembly with bolts A (width across flats: 22 mm {0.87 in.}) on the vehicle front side and bolts C and nuts (width across flats: 19 mm {0.75 in.}) on the vehicle rear side by securing it together with the frame.



■ **Installation: Drag link**

- Align the slot in the lock nut with the split pin hole in the ball joint by turning the lock nut in the tightening direction while checking the torque is within the specified range, then install the split pin as shown in the illustration.

POWER STEERING GEAR ASSEMBLY AND DRAG LINK

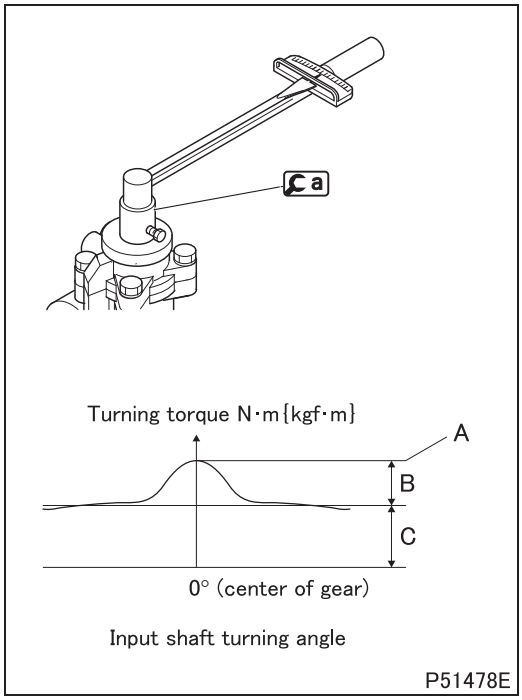
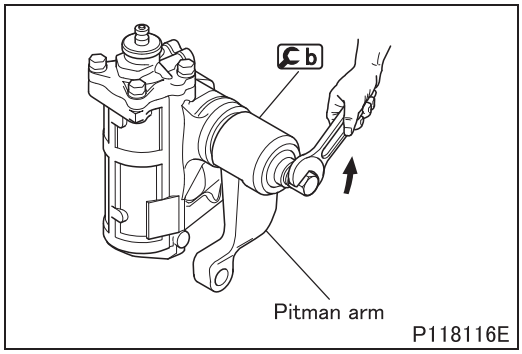
◆Inspection before removal◆



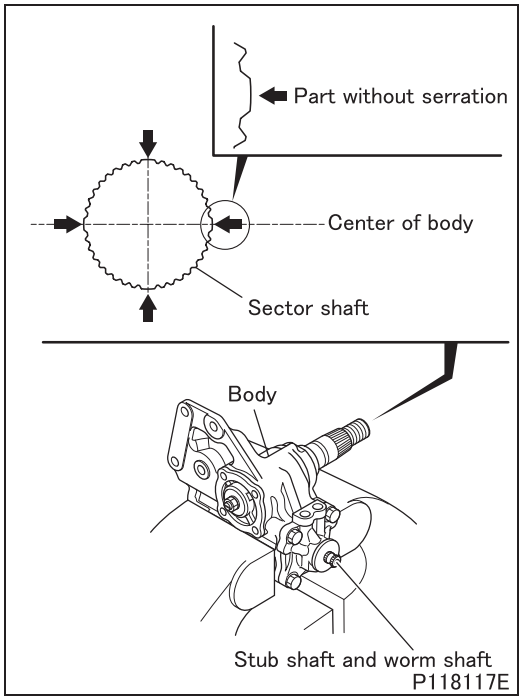
■ **Inspection: Starting torque**

- Using a, measure the starting torque of the power steering gear assembly for reference at the time of reassembly before removal.
  - A: Starting torque (= engagement torque + normal turning torque)
  - B: Engagement torque
  - C: Normal turning torque

◆Removal procedure◆

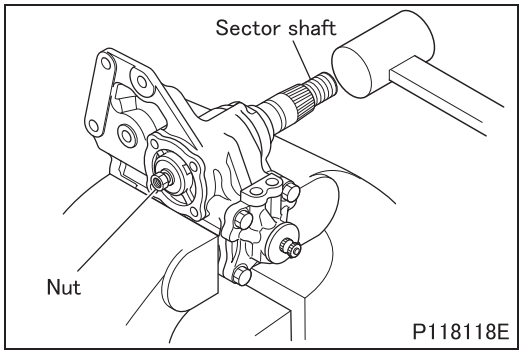


■ **Removal: Pitman arm**

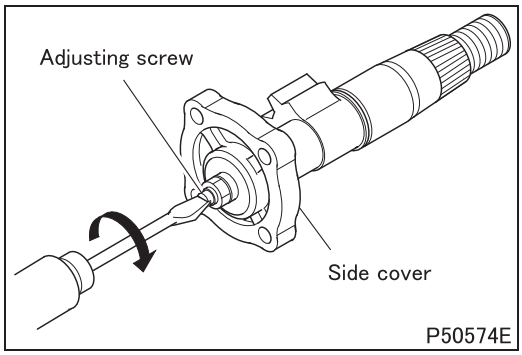


■ **Removal: Sector shaft**

- Before removing, set the sector shaft in neutral position as follows.
- Turn the stub shaft and worm shaft counterclockwise into the lock position, then back it up roughly 2.6 turns to bring the serration missing part of the serrated portion of the sector shaft into parallelism with the center of the body as shown.

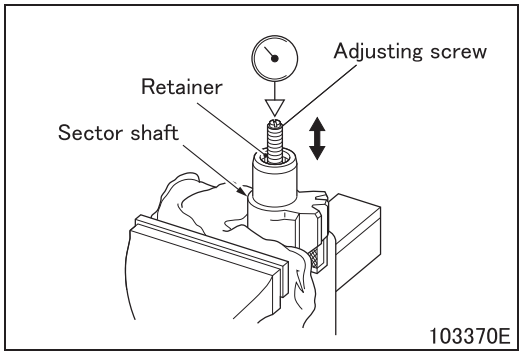


- Loosen nut, and remove the sector shaft by tapping the shaft end with a plastic hammer.
- If the sector shaft is stuck, it could be out of neutral position. In such a case, do not attempt to force it out by hammering but redo the neutral positioning procedure.



■ **Removal: Side cover**

- Remove the side cover by screwing in the adjusting screw.



■ **Inspection: Play between sector shaft and adjusting screw**

• Remove the side cover and measure the axial play between the sector shaft and adjusting screw.

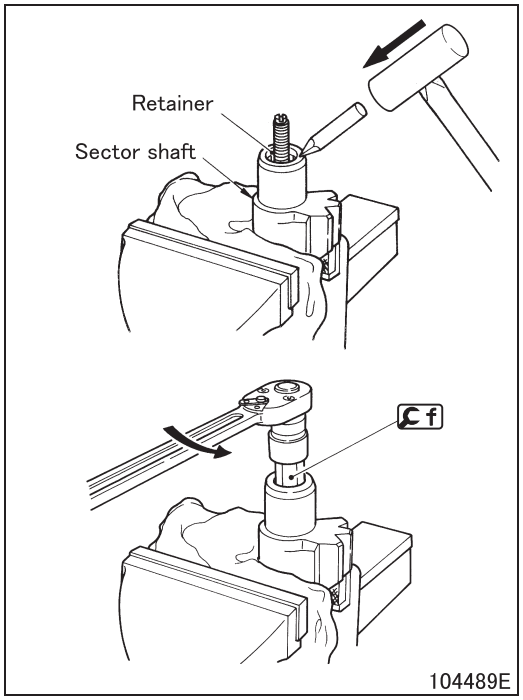
[Inspection]

• Hold the sector shaft with a vise.

CAUTION ⚠

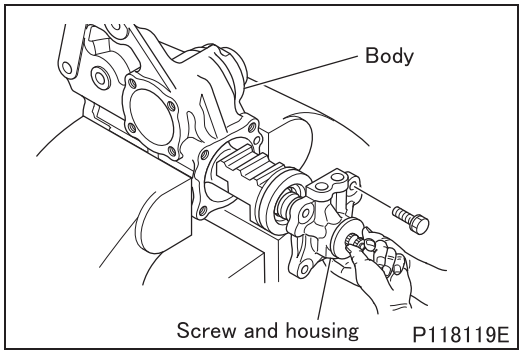
• When holding the sector shaft with a vice, be sure to cover it with a cloth or equivalent for protection.

• Measure the axial play between the sector shaft and adjusting screw.
• If the measurement deviates from the standard value, replace defective parts.



■ **Removal: Retainer**

• Undo the crimp of the retainer (at 2 points) using a chisel.
• Remove the retainer by Cf.

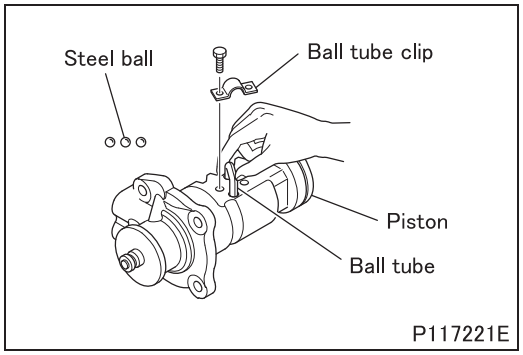


■ **Removal: Screw and housing**

• Remove the worm screw and housing from the body.

CAUTION ⚠

• Take care so that balls in the worm screw and housing do not pop out.
• Take care not to scratch or otherwise damage the inner surface of the body and piston.

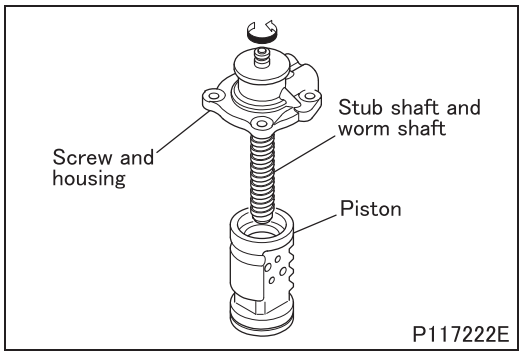


■ **Removal: Ball tube and steel ball**

- First remove steel balls from the piston, then remove ball tube clip. Hold the ball tube between fingers and remove it from the piston moving it lightly.

CAUTION ⚠

- **Be careful not to lose the steel balls (28 pieces in all).**



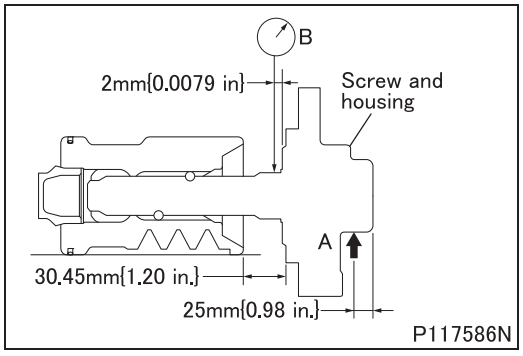
■ **Removal: Piston**

- Holding the screw and housing with the piston downward, turn the worm and stub shaft and remove the piston.

CAUTION ⚠

- **Be careful not to tilt the piston during removal. If it is tilted, steel balls will fall off the race of the piston and worm and stub shaft into the piston.**

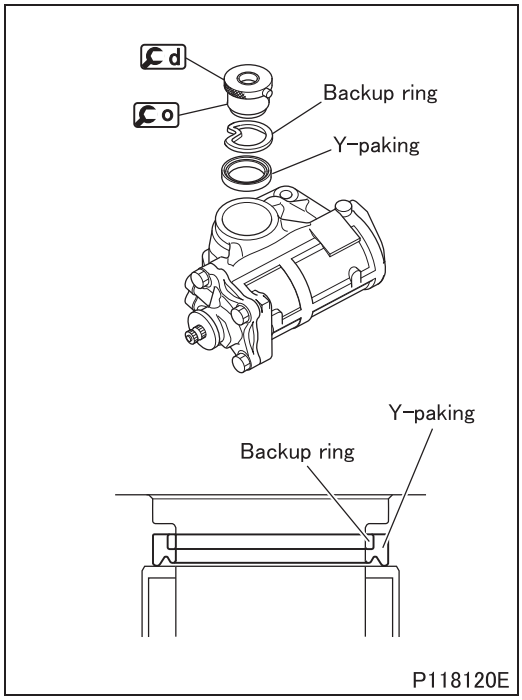
◆Inspection procedure◆



■ **Inspection: Side play of piston and worm and stub shaft**

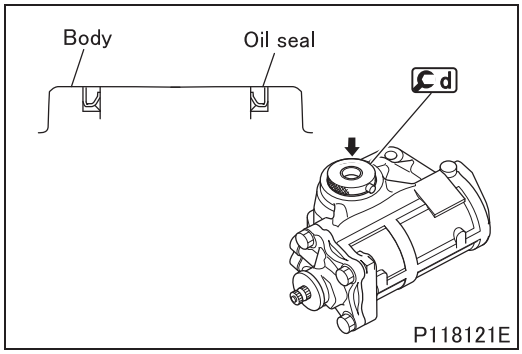
- Apply a force of 49 N {11 lbs, 5.0 kgf} to the illustrated point A and measure play B (play in the diametric direction) of the screw and housing.
- If the measurement exceeds the limit, replace the faulty parts.

◆Installation procedure◆



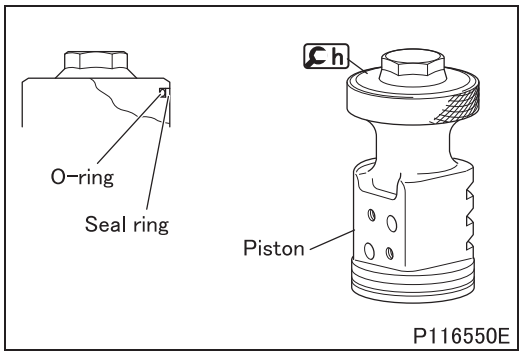
■ **Installation: Backup ring and Y-packing**

- Fill grease in the groove of Y-packing and install Y-packing in the illustrated direction.
- Install backup ring, formed as shown, using d and o.



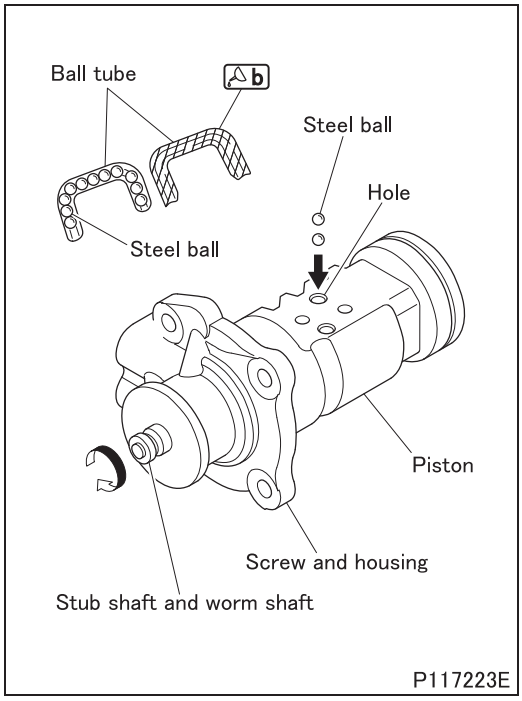
■ **Installation: Oil seal**

- Install the oil seal to the body in the illustrated direction.



■ **Installation: Seal ring and O-ring**

- Install seal ring and O-ring in the outer surface grooves of the piston, and form the seal ring to fit in place using h.

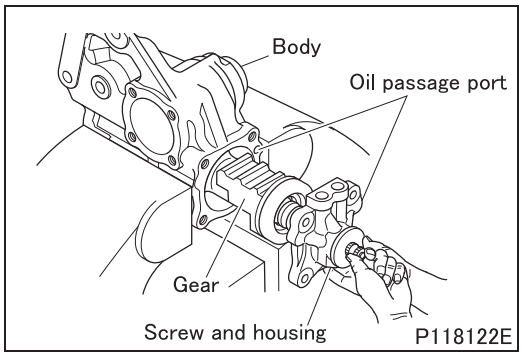


■ **Installation: Ball tube**

- Pack grease in one half of the ball tube, place 10 to 11 steel balls in it and put the other half ON it.
- Place the piston on a flat workbench, align the positions of the screw and housing and piston ball race, then while turning the worm and stub shaft, let steel balls fall from the ball tube hole.

CAUTION ⚠

- **Do not draw out the screw and housing until its end passes over the ball tube hole during installation. Otherwise the steel balls will come out of the ball race.**

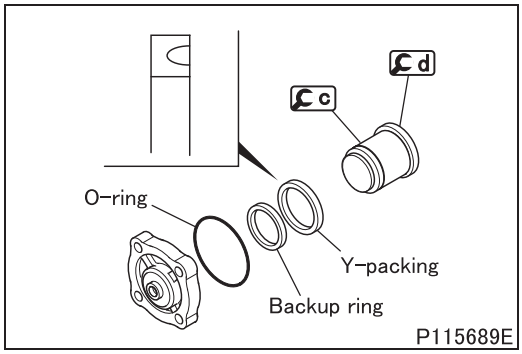


■ **Installation: Screw and housing**

- Position the gear toothed portion of the screw and housing in the illustrated direction so that it engages with the sector shaft.
- Install the screw and housing to the body, lightly holding it with hand so that its gear portion does not turn out of position. When installing, align the oil passage ports of the screw and housing and body.

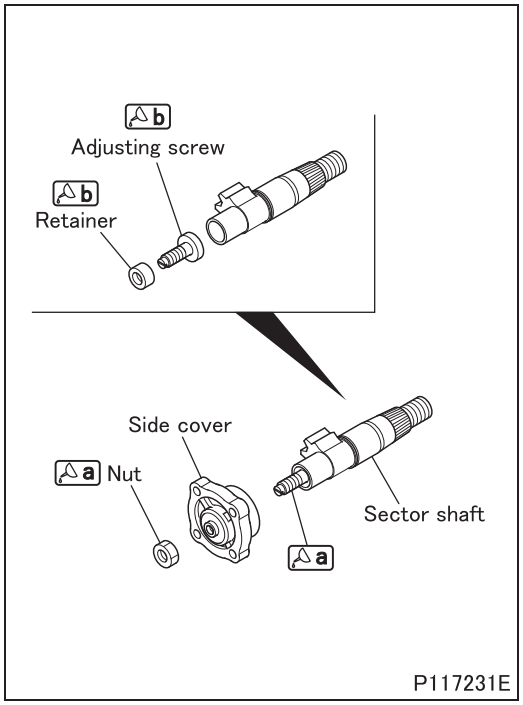
CAUTION ⚠

- **Be careful not to damage the seal ring on the piston and the inner surface of the body.**

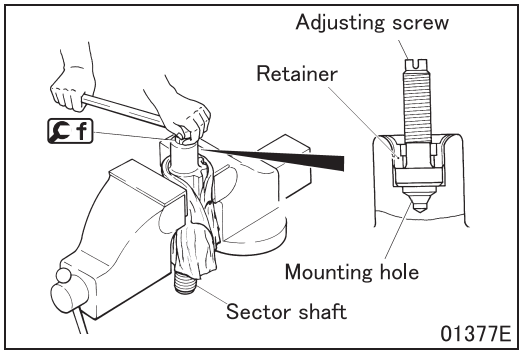


■ **Assembly: Side cover and center shaft**

- Install the O-ring on the side cover.
- Apply b to the inside circumference of the backup ring and fill b in the inside circumference of the Y-packing, then install them on the side cover in the direction shown. After installation, straighten them up using c and d.
- Install the needle bearing on the side cover.

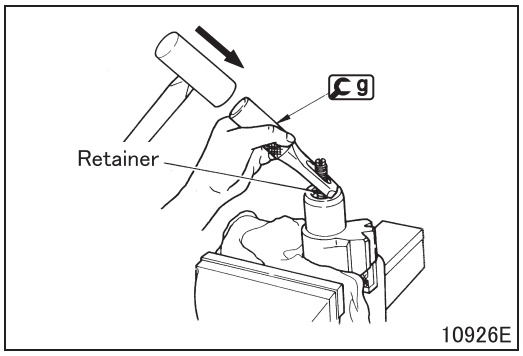


- Fill b in the inside circumference of the retainer and the mating surfaces of the adjusting screw and center shaft, then install each part of the center shaft.
- Apply b to the threads of the adjusting screw and the mating surfaces of the nut and side cover, then install the side cover on the center shaft.

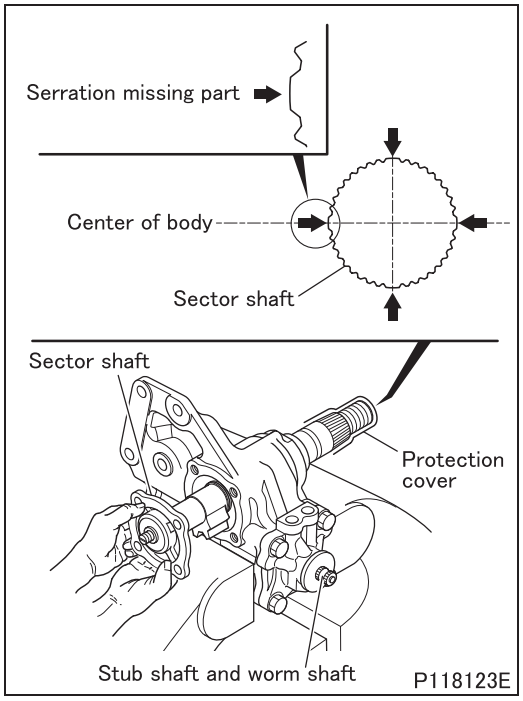


■ **Installation: Retainer**

- Pack grease in the adjusting screw mounting hole on the sector shaft.
- Install the adjusting screw into the sector shaft.
- Using f, tighten the retainer into place in the sector shaft.
- Back up the retainer by 180°, retighten it to a torque of 39 N·m {29 ft.lbs, 4 kgf·m}, then back it up again by 20°.
- Check that the adjusting screw turns smoothly.



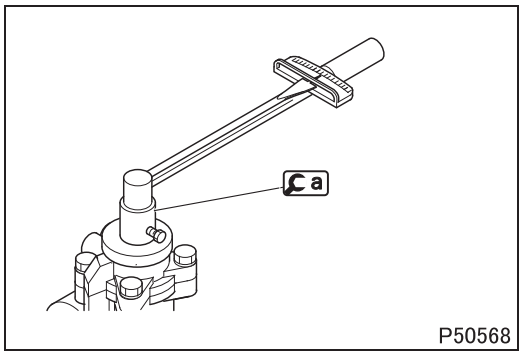
- Using g, crimp the retainer at two places.



■ **Installation: Sector shaft**

- Set the sector shaft in the neutral position and install it into the body.
- When installing the sector shaft, cover up its threaded end and serrated portions for protection.
- Turn the worm and stub shaft to check that it makes roughly five turns lock to lock.
- If the number of turns is lower, check engagement of the stub shaft and worm shaft with the sector shaft, and correct if necessary.

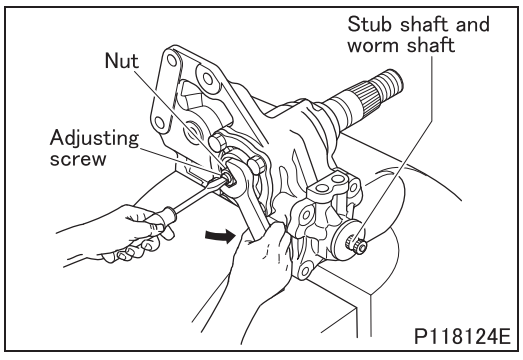
◆Adjustment after installation◆



■ **Inspection: Starting torque**

[Inspection]

- Using a, measure the starting torque of the power steering gear assembly in the same manner as the measurement before removal. If the measurement deviates from the standard value, adjust the power steering gear assembly for proper starting torque or replace.



[Adjustment]

- Loosen nut.
- While rotating the stub shaft and worm shaft approximately 1/4 turn left and right, adjust for proper starting torque with the adjusting screw.

Bumper and Frame

2012 to 2016 Model Years

MITSUBISHI FUSO TRUCK OF AMERICA, Inc.

Pub.No.00ELT0001-41

INDEX

SPECIFICATIONS 41-2

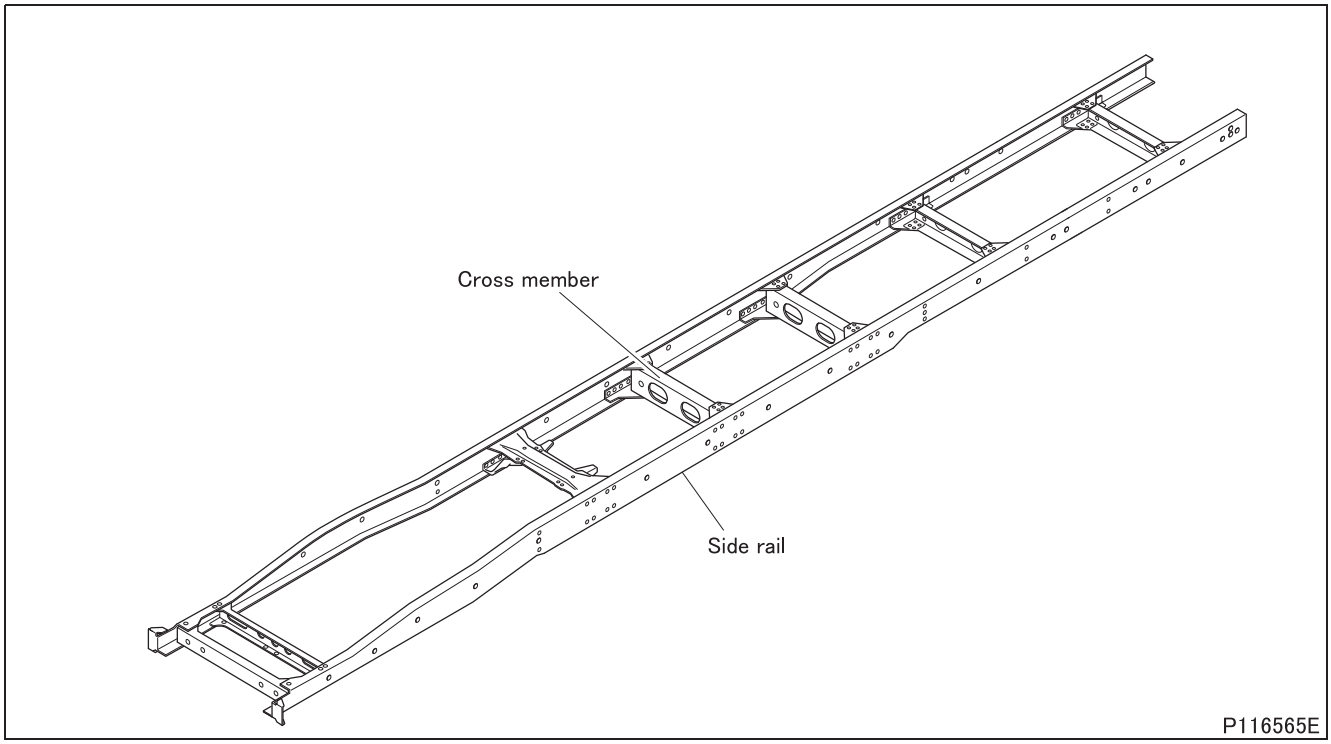
STRUCTURE AND OPERATION 41-3

FRONT BUMPER 41-4

FRAME 41-6

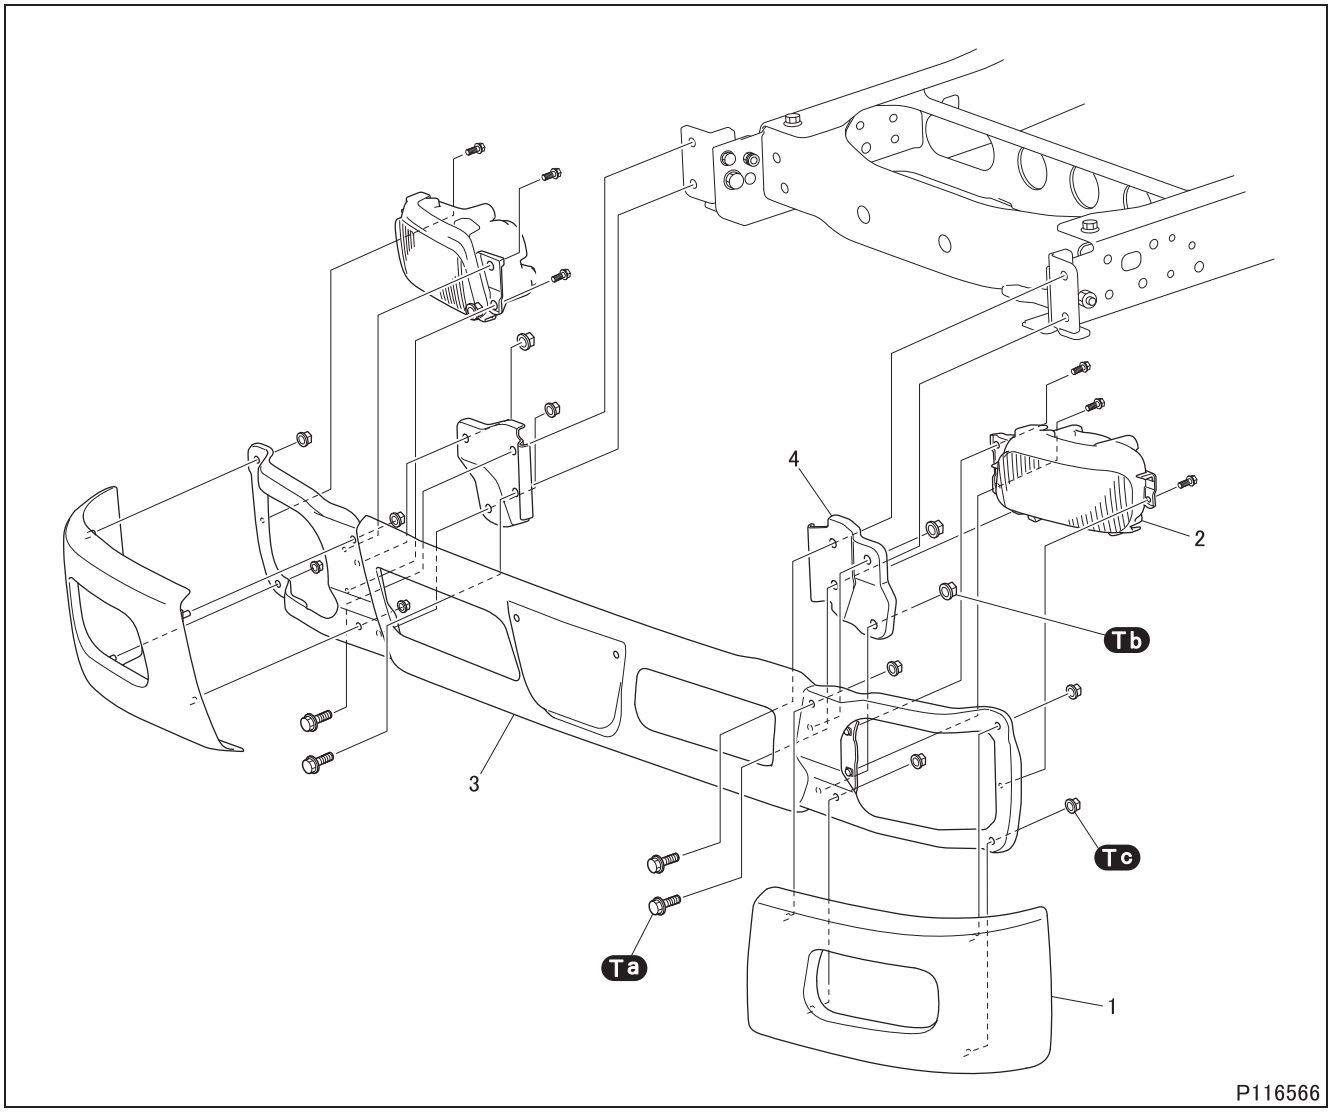
SPECIFICATIONS

Item	Specifications	
	Except 4WD	4WD
Frame type	Ladder type	
Cross section configuration of side rail	⊐ shaped (open) channel section	



- The frame has cross members fastened to the web of side rails (lateral linkage) so that stress on the joints is very small. This allows joint rivets to maintain tightness and ensures long-lasting high torsional stiffness.
- Unlike vertical linkage where cross members are fastened to the flange of side rails, no rivets appear on top of the frame, making the body mounting greatly easier.

FRONT BUMPER



● **Removal sequence**

1 Front bumper corner cover
2 Front bumper
3 Fog lamp
4 Bumper stay

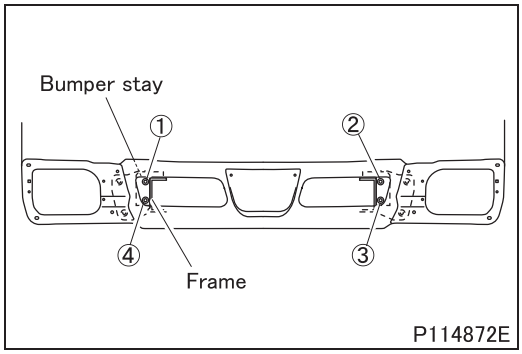
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (bumper stay mounting)	45 to 54 {33 to 40, 4.6 to 5.5}	–
Tb	Nut (front bumper mounting)	26 to 31 {19 to 23, 2.7 to 3.2}	–
Tc	Nut (front bumper corner cover mounting)	4 to 6 {3.0 to 4.4, 0.4 to 0.6}	–

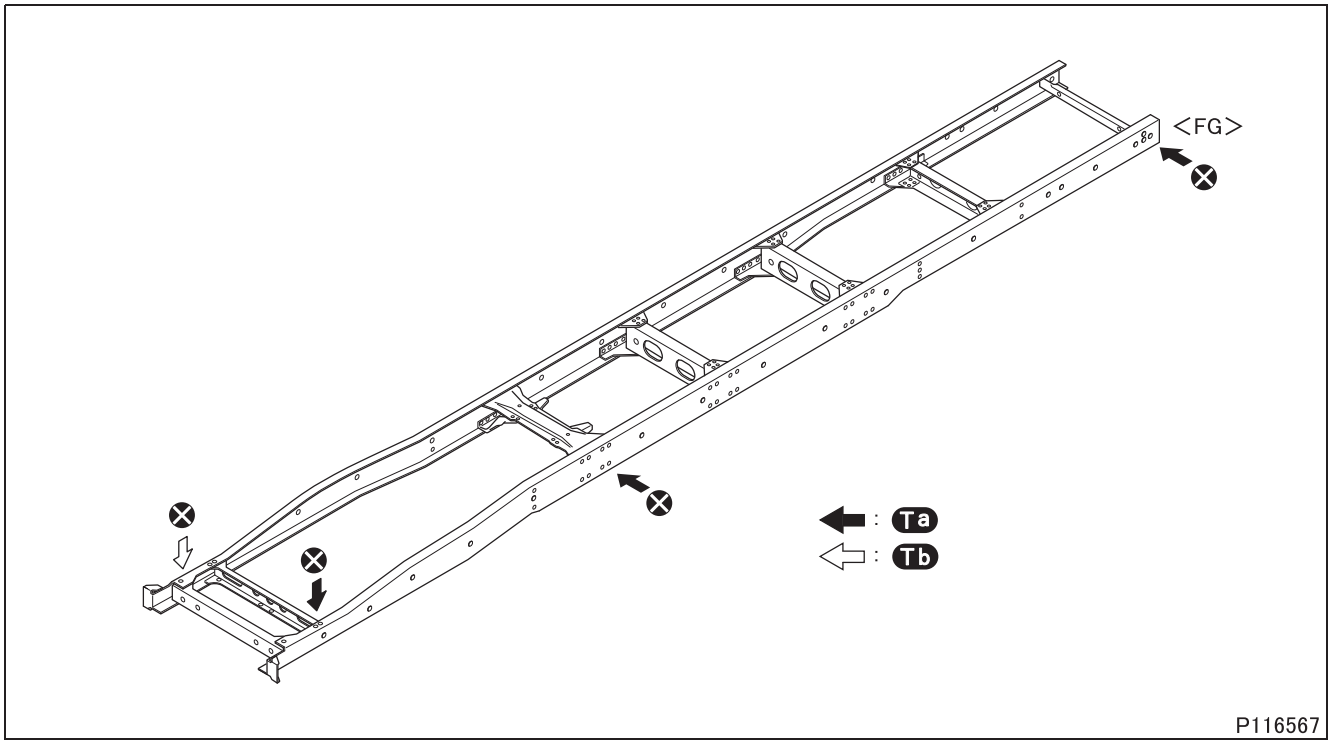
◆Installation procedure◆



■ **Installation: Bumper stay**

- Install the bumper stay on the frame by tightening the bolts (four places) to the specified torque in the order of the numbers (1 to 4) indicated in the illustration.

FRAME



⊗: Non-reusable parts

CAUTION ⚠

- **Since the mounting bolts and nuts are tightened by a torque-to-yield method, they must not be reused.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	M10 bolt or nut	60 to 80 {43 to 58, 6 to 8}	–
Tb	M12 bolt or nut	98 to 120 {72 to 87, 10 to 12}	–

◆Cleaning procedure◆

■ Cleaning: Frame

- Thoroughly remove mud, grease, rust etc. from the outer and inner surfaces of the frame.

◆Inspection procedure◆

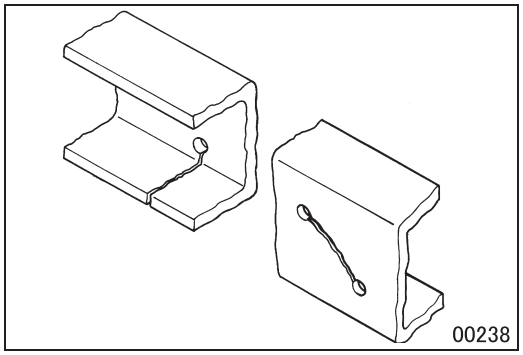
■ Inspection: Frame

(1) Inspection for deformation

- If deformation or any other defect is found, repair the frame.

(2) Inspection for cracks

- Remove paint from suspected areas and carefully inspect exposed surfaces for cracks.
- If visual inspection is difficult, perform dye check or any other suitable examination.
  If a crack is found, repair as follows.

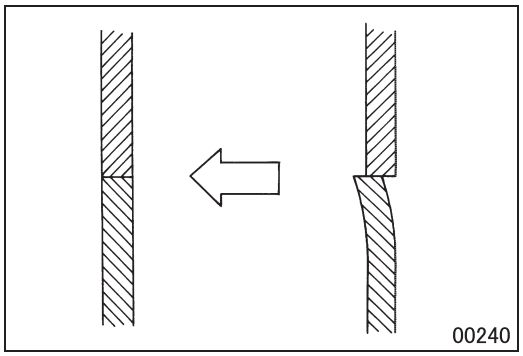


(3) Repair of crack in frame

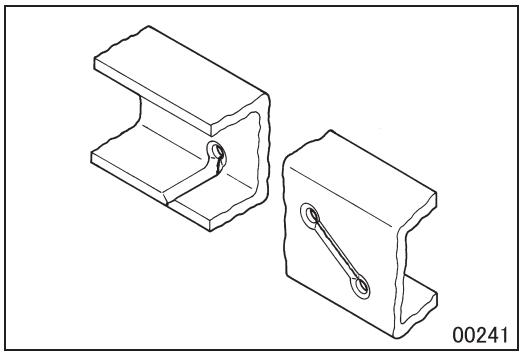
- With the vehicle unloaded, level the frame.
- Drill a hole, roughly twice the thickness of frame plate in diameter, 10 mm {0.39 in.} from the inside end of crack.

NOTE

- **If crack is within the frame plate, drill holes at both ends of the crack.**



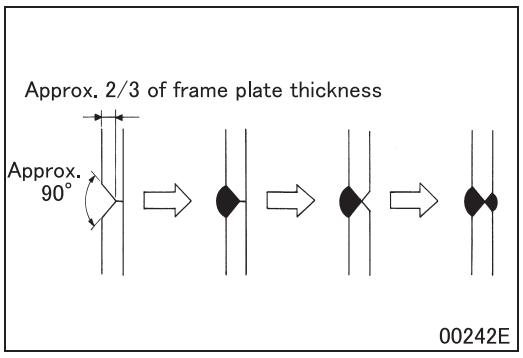
- If the edges of crack are uneven, make them even.



- Using a grinder, cut a 90° V-channel at the crack to a depth of approximately 2/3 of the frame plate thickness, then fill the channel with filler metal by welding.

CAUTION ⚠

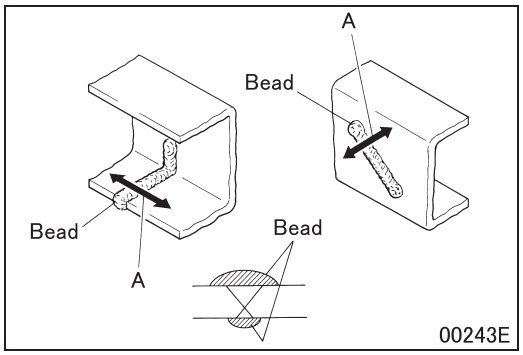
- **Avoid gas welding because heat embrittles the material of welded area. Be sure to use electric welding.**
- **Electric welding could allow the welding current to reverse through ground circuit and burn electrical components. To prevent this, be sure to disconnect negative cable from the battery and ground the welding machine at a point near the weld zone before work.**
- **For electric welding, follow other precautions given elsewhere.**
- **If there are any combustibles, such as pipeline, wiring harness, rubber part and fuel tank, near the weld zone, be sure to cover them for protection.**
- **Use low-hydrogen type coated CO_2 and arc welding electrodes for welding and check that there are not harmful defects such as undercut and blow hole after welding.**
- **Preheat the area around weld zone to approximately 50 to 350°C {120 to 660°F} before welding when the workshop temperature is below 0°C {32°F}.**
- **Be sure to protect mountings that may be affected by heat, such as main sills, using heat insulators or equivalent.**



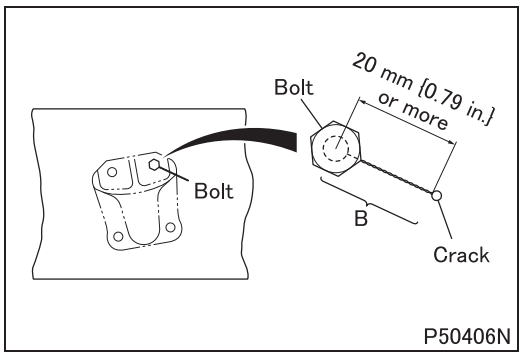
- Then, make a similar V-channel on the opposite side of the weld and fill it with filler metal by electric welding as well. At the same time, deposit metal to cover up the hole or holes at both ends of the crack by welding.

NOTE

- **In cold districts, heat the weld zone to approximately 200°C {390°F} after welding.**

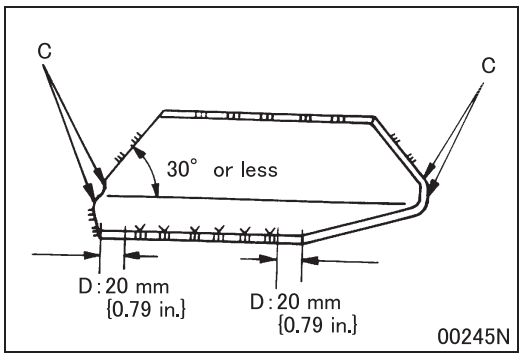


- After welding, run a grinder over the bead at right angles A to remove the hatched portion from the weld on each side of the plate.
- Finish the ground surfaces flat to a thickness equal to the original plate thickness.



[Repairing crack from rivet or bolt hole]

- To make the edges of cracked hole even, temporarily tighten bolt in the hole.
- First weld to close the crack at a point at least 20 mm {0.79 in.} apart from the center of the bolt.
  For this welding, refer to the aforementioned welding procedures for crack repair.
- Remove the temporary bolt. After making hole edges even, weld to close the rest B of the crack. Fill the hole with weld metal at the same time.
- Drill a hole at the location of original hole, and install a rivet or bolt in it.



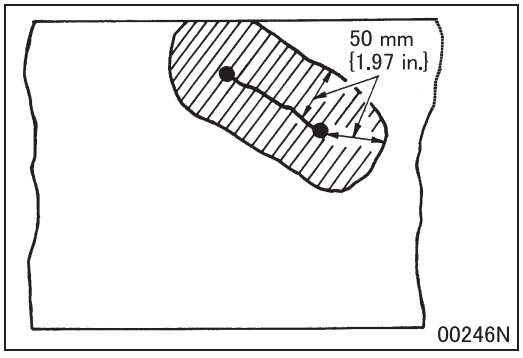
[Repairing using reinforcement plate]

- To prevent the concentration of welding stress at both ends C of the reinforcement plate, cut the ends at a bevel of 30° or less for welding. Do not weld at points D.
- The reinforcement plate must be large enough to cover the cracked area.

NOTE

- **Reinforcement plate thickness: Equal to frame plate thickness**
- **Reinforcement plate material: As specified below or equivalent**

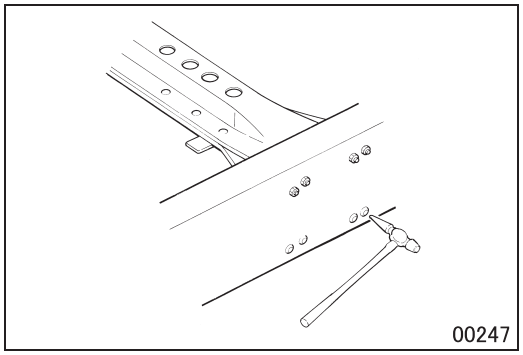
SAPH440 (hot rolled steel for automobiles), or SS400 (rolled steel for general structures)



- After welding, heat the hatched area to 600 to 700°C {1110 to 1292°F}.

CAUTION ⚠

- **Be sure to protect mountings that may be affected by heat, such as main sills, using heat insulators or equivalent.**

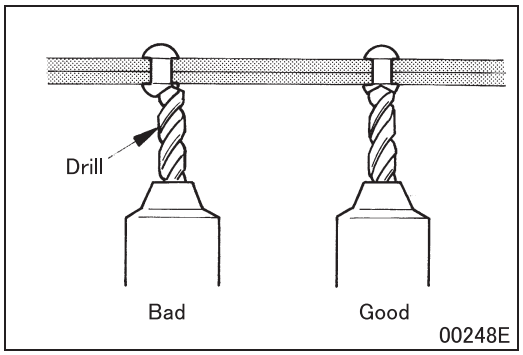


(4) Inspection of rivets for looseness

- Lightly tap the head of each rivet using an inspection hammer and feel or listen for the echo to determine if the rivet is loose.
- Rusting between rivet and frame plate is an indication of a loosened rivet.

CAUTION ⚠

- **Be sure to replace loose rivets. They could break off or allow cracks to develop from the rivet holes, leading to an accident.**

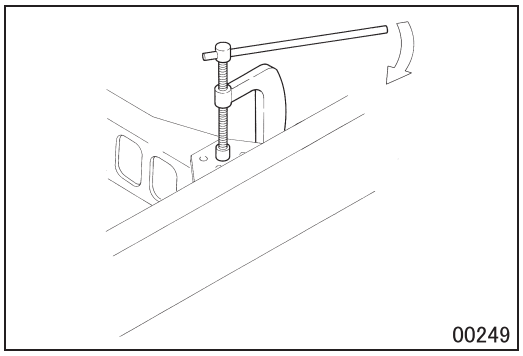


(5) Replacement of rivet

- To remove a loosened rivet, eliminate its head using a drill or grinder. When a drill is used, make a dent in the middle of the rivet's head and align the drill bit to the dent as shown.

NOTE

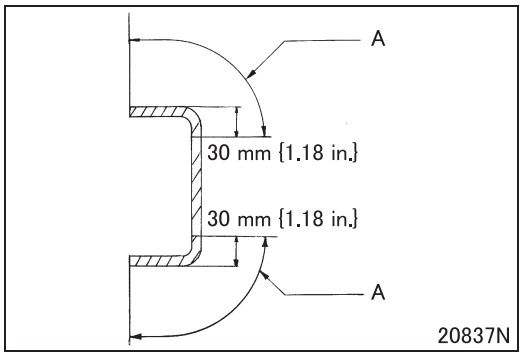
- **The rivet hole must be intact.**



- Before riveting, clamp the two plates closely together near the rivet hole using a C clamp.
- Using a riveting machine, drive the rivet (cold rivet) into the rivet hole.
- If riveting is impracticable, ream the rivet hole, drive a reamer bolt in the hole, fully tighten the nut, then weld it in place.
  As the reamer bolt and nut, use a flange bolt and a flange nut.

(6) Inspection of bolts and nuts for looseness

- Inspect the bolts attaching cross members to the side rails for looseness. If any loose bolt is found, retighten it to specified torque.



(7) Drilling hole in frame

- When drilling holes in the frame becomes necessary, perform it using care in the following respects.

CAUTION ⚠

- **When drilling holes in the side rail, avoid the illustrated ranges A to prevent cracking.**
- **Grind the edge of drilled hole smooth.**
- **Avoid drilling a hole in the vicinity of a point where the rigidity of the side rail change sharply, such as an area near the joint to the cross member or an end of the stiffener.**
- **The diameter of drilled holes must be 11 mm {0.43 in.} or smaller and the hole-to-hole distance must be 20 mm {0.79 in.} or larger.**

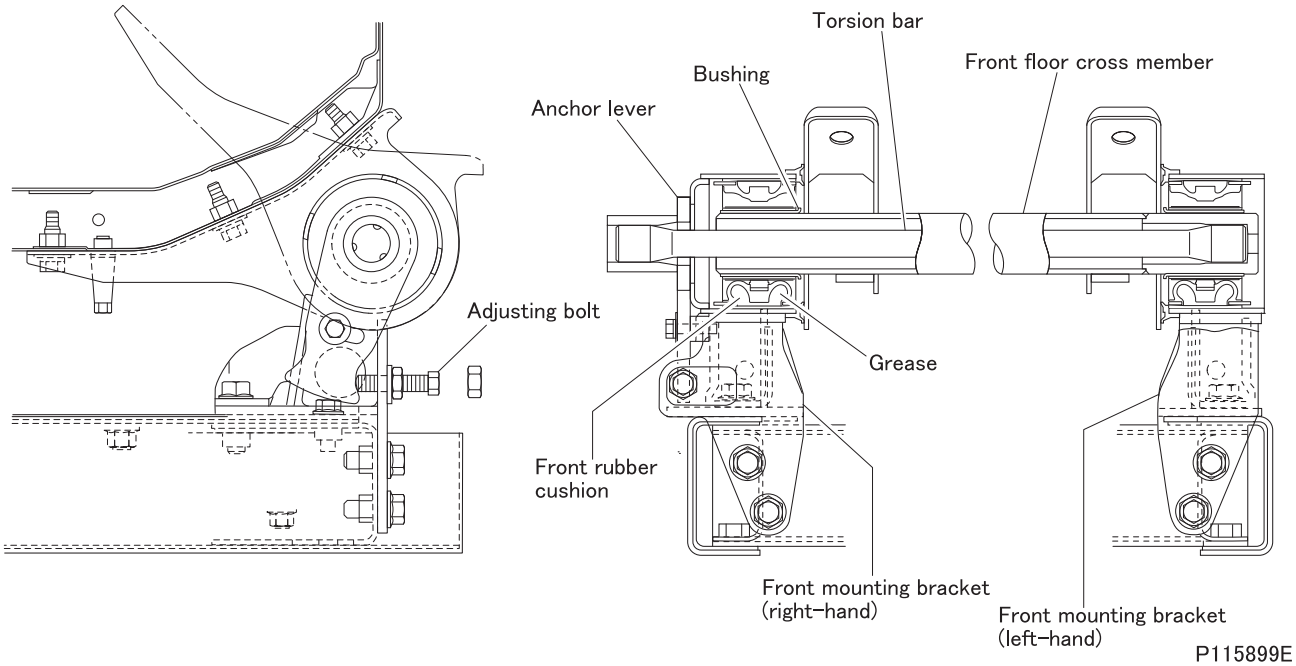
Cab Tilt System <Except Crew Cab>

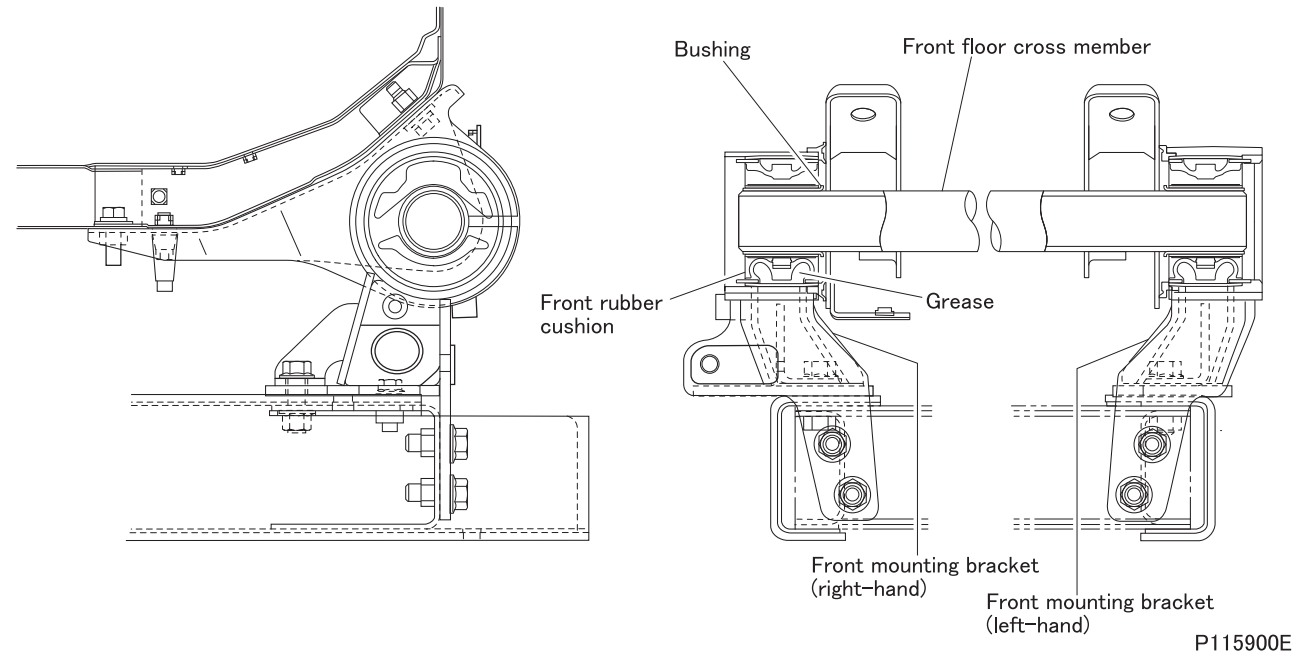
Item	Specifications
Type	Torsion bar type
Tilt angle	45°
Cab tilt lock	Manually operated hook type

1. Front Cab Mounting

<Except crew cab>

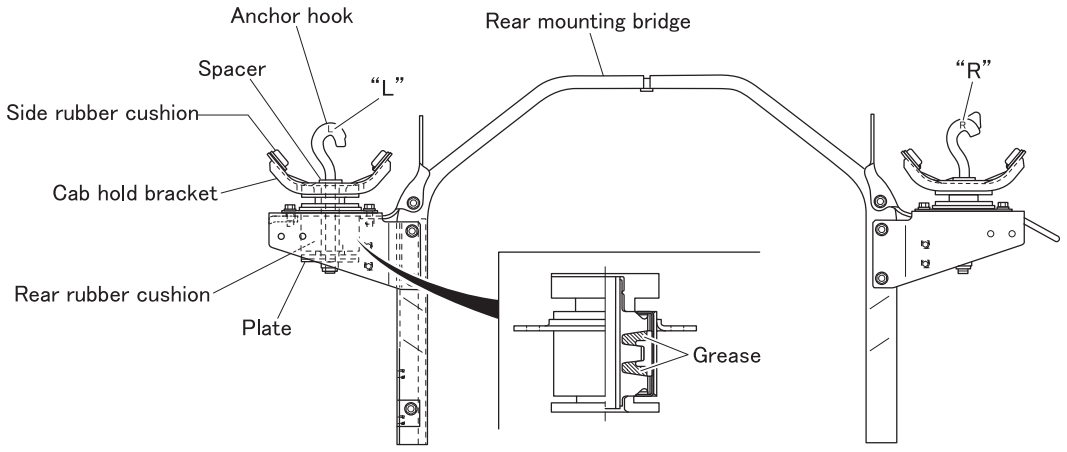


<Crew cab>



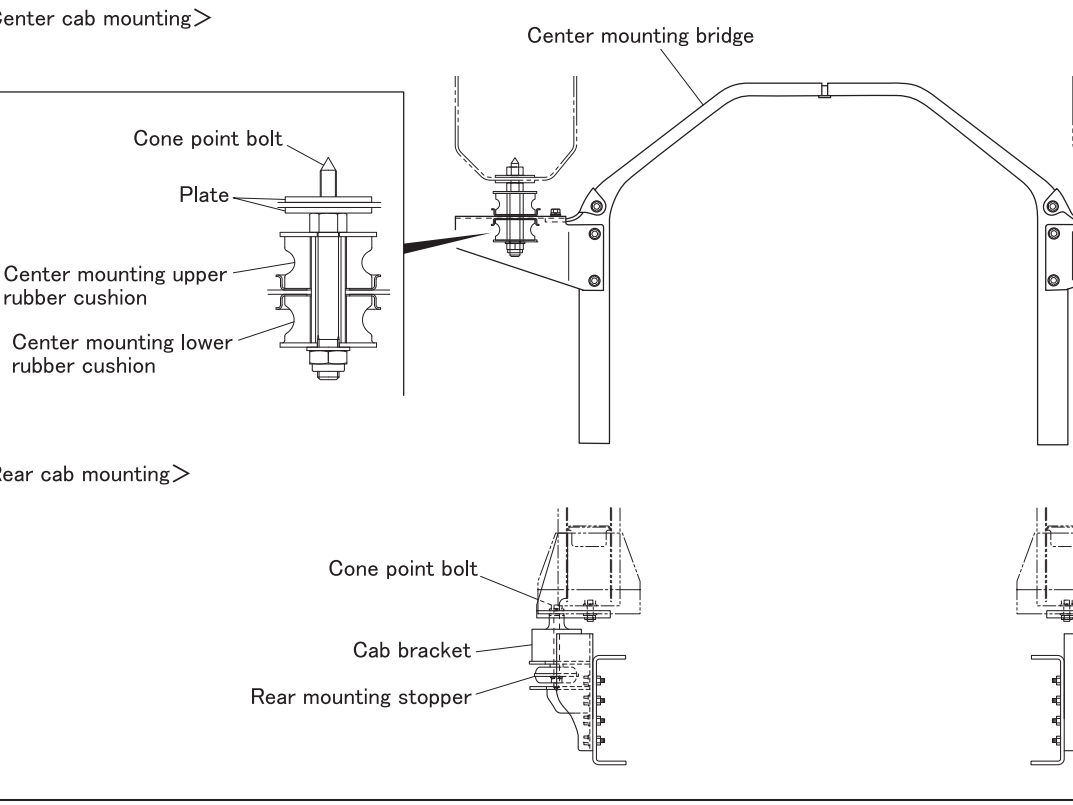
- The operating physical force for the cab tilt system can be adjusted using the adjusting bolt on the front mounting bracket. <Except crew cab>
- The front rubber cushion reduces the vibration and noise of the cab.

2. Rear Cab Mounting <Except Crew Cab>



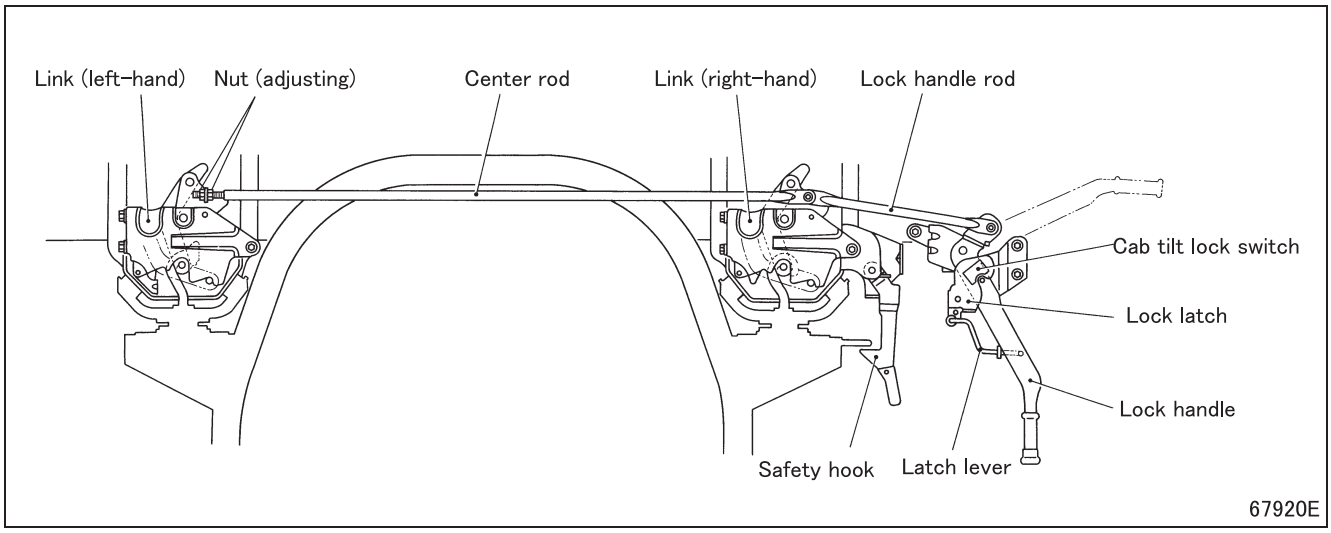
- The left and right anchor hooks are identified with marks "L" and "R", respectively.
- The operating physical force for the lock handle can be adjusted by increasing and decreasing the number of spacers provided between the anchor hook and cab hold bracket.
- Rear mounting upper and lower rubber cushions reduce the vibration and noise of the cab.

3. Center and Rear Cab Mountings <Crew Cab>



- Center mounting upper and lower rubber cushions reduce the vibration and noise of the cab.

4. Cab Tilt Link <Except Crew Cab>



- The length of center rod is adjustable with the adjusting nut.
- The cab tilt lock switch of the manual cab tilt system monitors the locking status of the lock handle.

TROUBLESHOOTING

Cabs in general

Possible causes \ Symptoms			Cab shimmy (vibration with pitching and rolling)	High-frequency vibration (above 20Hz) and noise in cab and steering wheel	Reference Gr
Cab-related problems	Front cab mounting	Front mounting bracket loose, play	O		
		Sagging of front rubber cushion		O	
	Center or rear cab mounting	Sagging of mounting rubber cushion		O	
	Cab improperly mounted			O	
Engine-related problems		Propeller shaft inclination angle excessive due to increased tilt angle caused by deteriorated engine mounting		O	Gr11
		Engine improperly mounted		O	
		Intake and exhaust system components improperly installed		O	Gr15
Transmission-related problem		Transmission improperly mounted		O	Gr22

ON-VEHICLE INSPECTION AND ADJUSTMENT

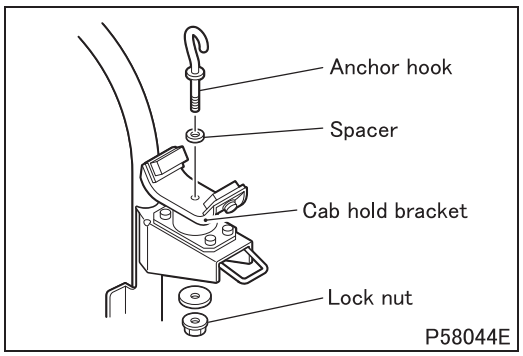
1. Adjustment of Cab Tilt System <Except Crew Cab>

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut (anchor hook fitting)	83 to 98 {61 to 72, 8.5 to 10}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Sliding contact surfaces of lock handle and link	Chassis grease [NLGI No. 1 (Li soap)]	As required



1.1 Inspection of lock handle operating physical force

[Inspection]

- If the lock handle is excessively light to operate, make adjustment as follows.
- If the lock handle is excessively heavy, apply grease to the sliding contact surfaces of handle and link, then operate the handle again for physical operating force. If the lock handle is still heavy, make adjustment as follows.

[Adjustment]

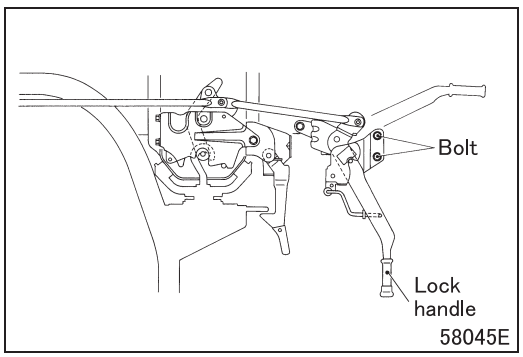
- Remove the lock nut, then remove the anchor hook.
- Adjust the operating physical force by increasing or decreasing the number of spacers between anchor hook and cab hold bracket as follows.

	Number of spacers
If lock handle feels too heavy	Increase
If lock handle feels too light	Decrease

- After adjustment, tighten the lock nut to the specified torque.

CAUTION ⚠

- **If the lock handle feels too light, it is an indication that the handle could be easily unlocked by the vibration of the running vehicle.**

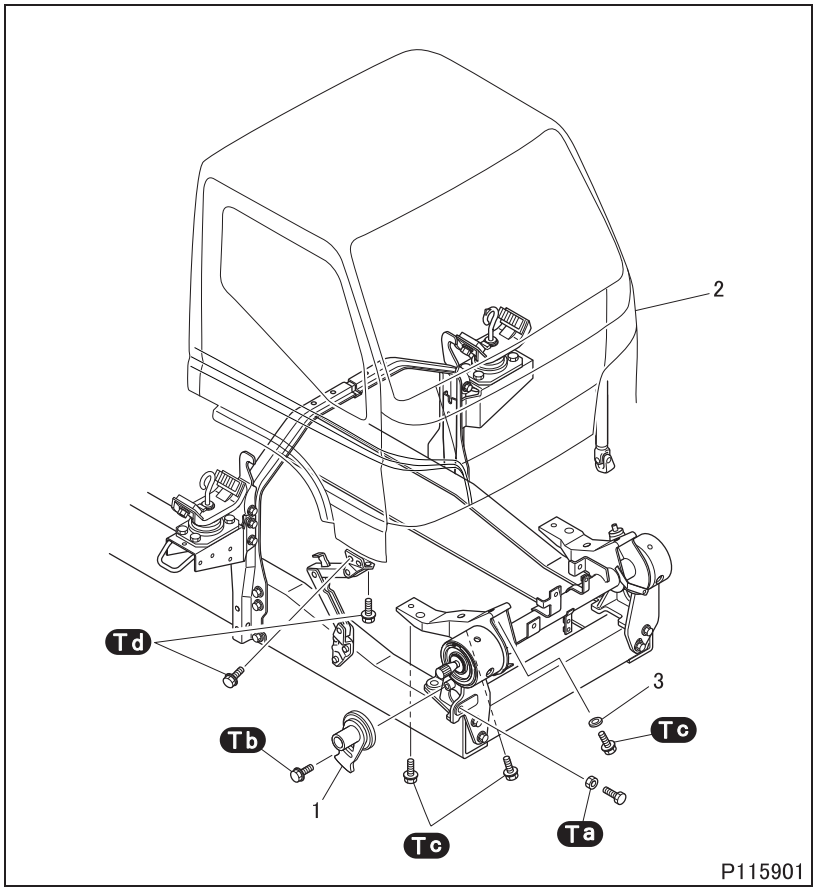


1.2 Adjustment of latch

- If the latch resists, loosen bolts and adjust the installed position of the lock handle using bolt slot.
- After adjustment, retighten the bolts.

M E M O

REMOVAL AND INSTALLATION OF CAB <EXCEPT CREW CAB>



● **Removal sequence**

1 Anchor lever
2 Cab
3 Spacer

WARNING ⚠

- **During removal and installation of the cab, the parking brake is not available for holding the vehicle at a standstill. Therefore, be sure to apply chocks to the tires to ensure that the vehicle does not move.**
- **Never remove the chocks until all the operations are completed.**

- Disconnect all cables, hoses and wires before removal and installation of the cab.

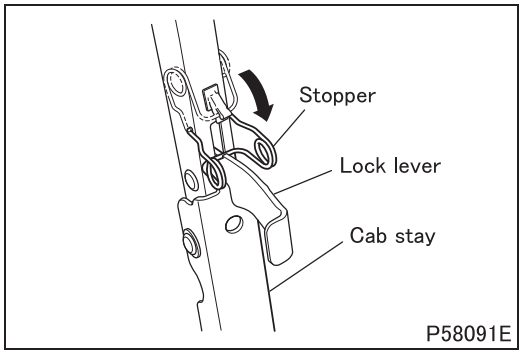
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Lock nut (anchor lever adjusting bolt locking)	59 to 83 {43 to 61, 6 to 8.5}	–
Tb	Bolt (anchor lever attaching)	34 to 54 {25 to 40, 3.5 to 5.5}	–
Tc	Bolt (cab mounting)	100 to 130 {74 to 96, 10 to 13}	–

◆**Removal procedure**◆

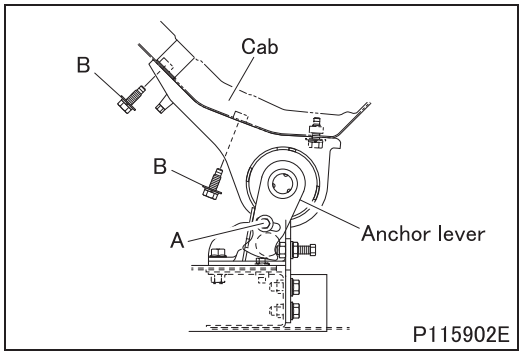


■ **Removal: Cab**

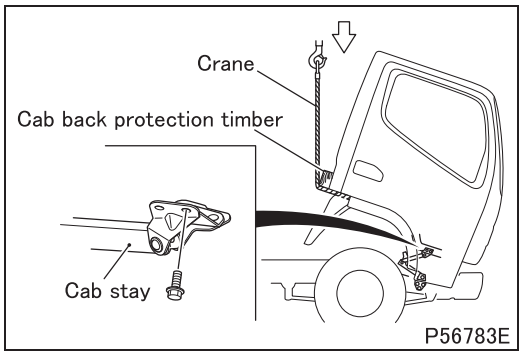
- Tilt the cab to securely lock the cab stay.

WARNING ⚠

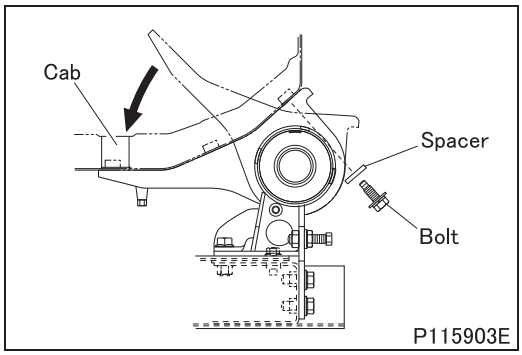
- **Be sure to fit the stopper onto the lock lever to lock the cab stay.**



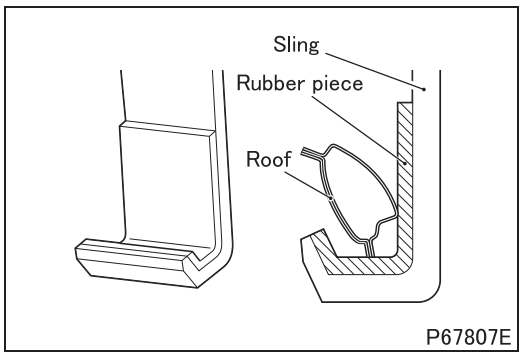
- Remove the bolt A, then detach the anchor lever.
- Remove the bolts B holding the cab in place.



- Support the tilted cab with the crane, then remove the cab stay.

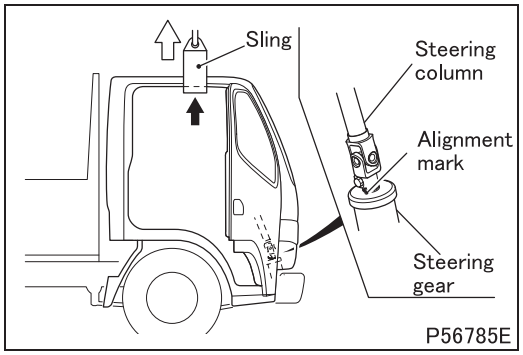


- Lower the cab all the way, then remove bolt.



- Make available slings rigid enough to carry the weight of the cab.
- The hook portion of the sling must be lined with a rubber piece as shown to prevent deformation of the roof of the cab.

REMOVAL AND INSTALLATION OF CAB <EXCEPT CREW CAB>

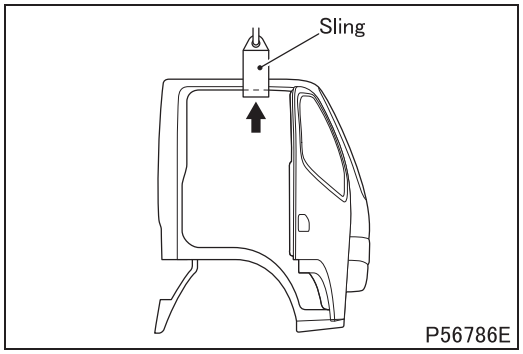


- Hook the slings on the cab roof as shown, then hoist the cab a little to see if it maintains level (balanced at the center of gravity).
- Provide alignment marks on the power steering gear and steering column, then separate the steering column.
- To prevent the steering column from falling off, tie it securely to the cab using a rigid cord.
- Slowly and slightly hoist the cab straight up to confirm that all cables, hoses and electric wiring have been disconnected before removing the cab.
- Lift off the cab straight.

WARNING ⚠

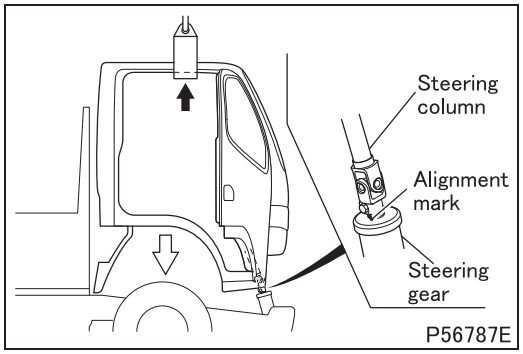
- **While the cab is up in the air, be sure to stay out from under it.**

◆Installation procedure◆

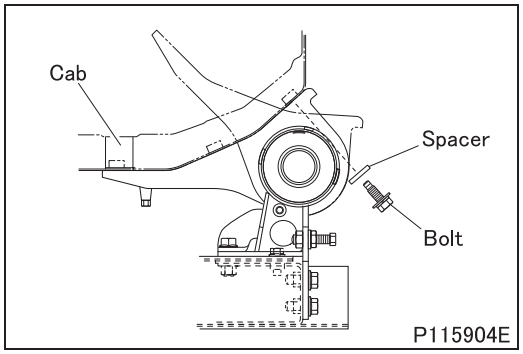


■ Installation: Cab

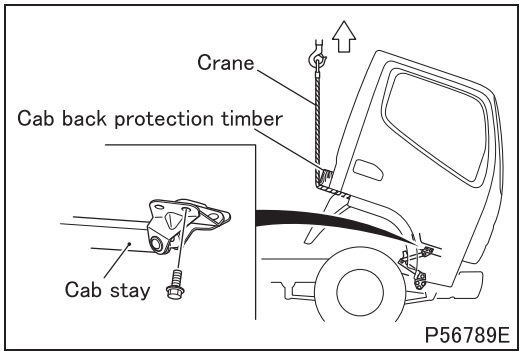
- Hook the slings at center-of-gravity points on both sides of the cab roof, and lift the cab.



- Slowly lower the cab halfway.
- Join the power steering gear and steering column together in accordance with the alignment marks.



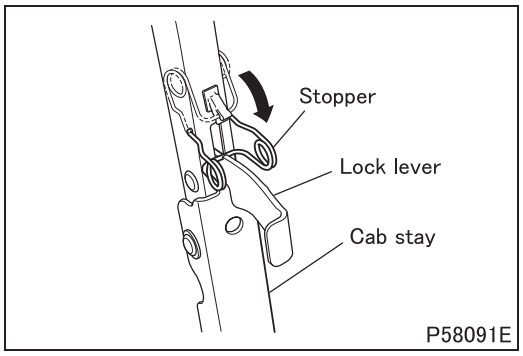
- Further lower the cab slowly to mount in position, then unhook the slings.
- Tighten mounting bolts to specified torque.



- Before tilting, support the cab using the crane.
- Tilt the cab with the crane, and install the cab stay.

WARNING ⚠

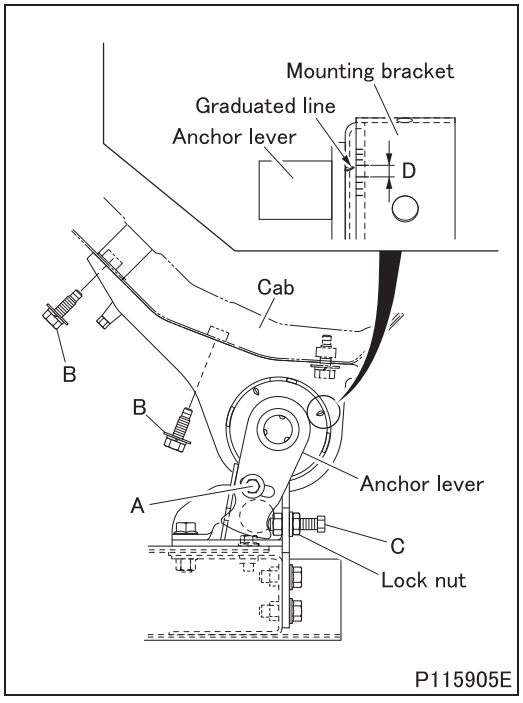
- **Be careful not to tilt the cab more than necessary. Doing so is extremely dangerous because it causes the cab to fall down forward.**



- After the cab stay is installed, tilt the cab to securely lock the cab stay. Then, remove the crane from the cab.

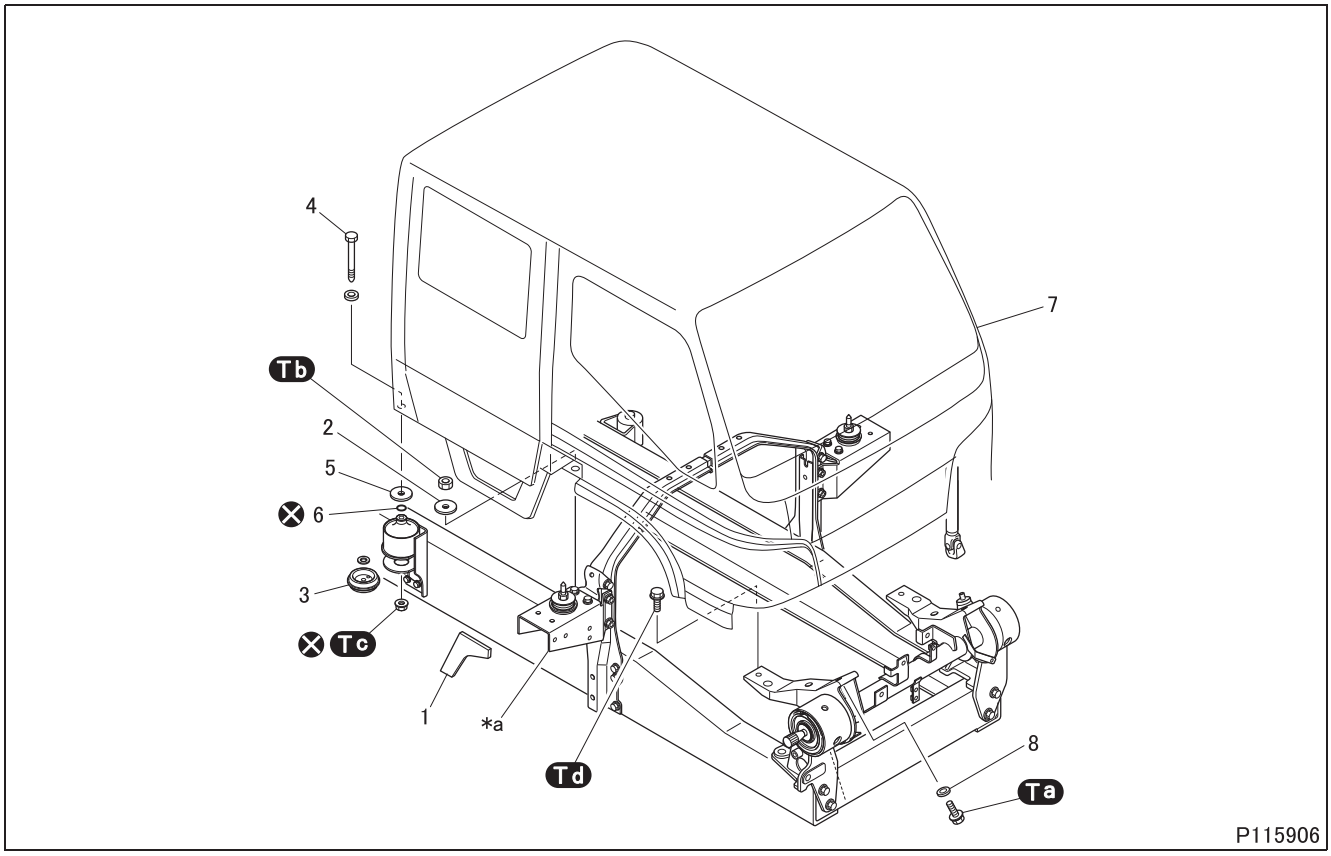
WARNING ⚠

- **Be sure to fit the stopper onto the lock lever to lock the cab stay.**



- Tighten the bolt B to specified torque.
- Align the graduated line of the anchor lever to the illustrated range of D (long division) of the scale graduated on the mounting bracket, then install the bolt A handtight.
- After contacting the bolt C with the anchor lever, tighten the bolt C to 10 mm {0.39 in.} (six and two third turns).
- Tighten the lock nut to specified torque.
- Tighten the handtight bolt A to specified torque.

REMOVAL AND INSTALLATION OF CAB <CREW CAB>



● **Removal sequence**

1 Garnish
2 Plate
3 Rear mounting stopper
4 Cone point bolt
5 Plate
6 O-ring
7 Cab
8 Spacer

⊗: Non-reusable parts

CAUTION ⚠

- **During removal and installation of the cab, the parking brake is not available for holding the vehicle at a standstill. Therefore, be sure to apply chocks to the tires to ensure that the vehicle does not move.**
- **Never remove the chocks until all the operations are completed.**

- Disconnect all cables, hoses and wires before removal and installation of the cab.

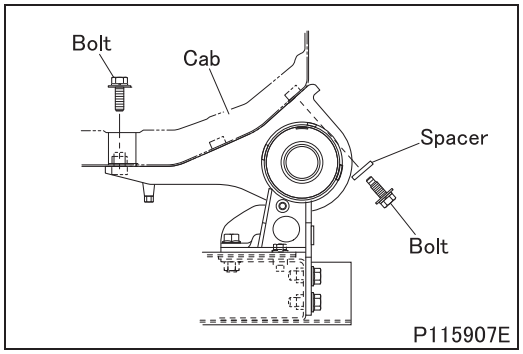
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

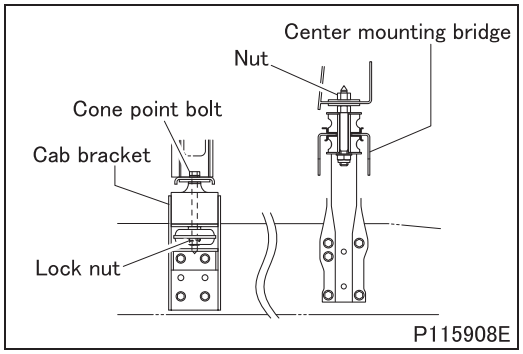
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (cab mounting)	70 to 95 {51 to 70, 7.1 to 9.7}	–
Tb	Nut (cab mounting)	39 to 59 {30 to 43, 4 to 6}	–
Tc	Lock nut (cab mounting)	59 to 69 {43 to 51, 6 to 7}	–
Td	Bolt (cab mounting)	100 to 130 {74 to 96, 10 to 13}	–

◆Removal procedure◆

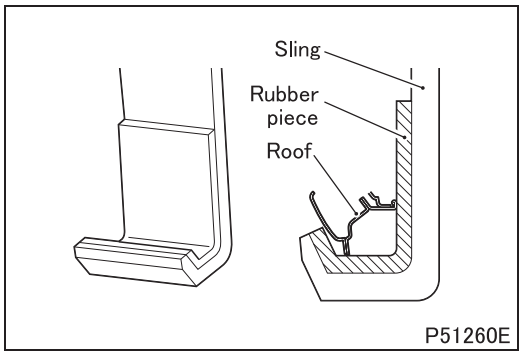


■ **Removal: Cab**

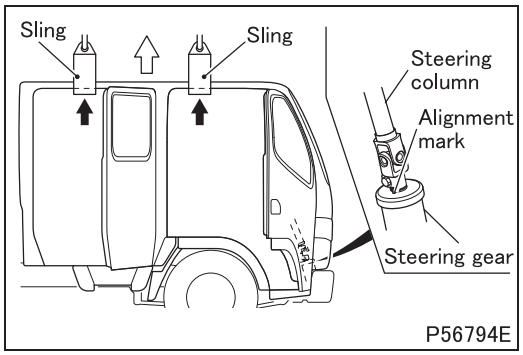
- Remove bolts from inside and outside the cab.



- Remove nuts from the center mounting post, then remove lock nut and cone point bolt from the cab bracket.



- Make available slings rigid enough to support the weight of the cab.
- Line the hook portion of each sling with a rubber piece to prevent deformation of the roof of the cab.



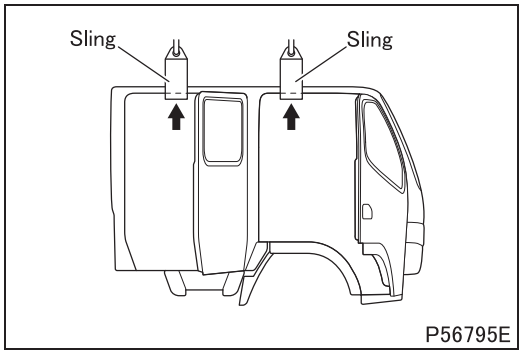
- Hook the slings at appropriate points on the roof of the cab, and lift the cab a little to see if it maintains level (balanced at the center of gravity).
- Provide alignment marks on the power steering gear, then separate the steering column.
- Tie the steering column securely to the cab with a rigid cord not to fall off.
- Slowly and slightly hoist the cab straight up to check that all cables, hoses and electric wiring have been disconnected before removing the cab.
- Slowly lift off the cab.

WARNING ⚠

- **When the cab is up in the air, be sure to stay out from under it.**

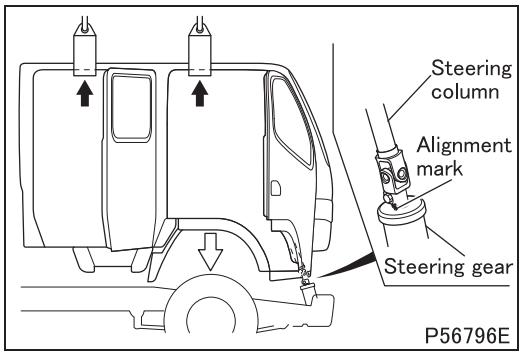
REMOVAL AND INSTALLATION OF CAB <CREW CAB>

◆Installation procedure◆

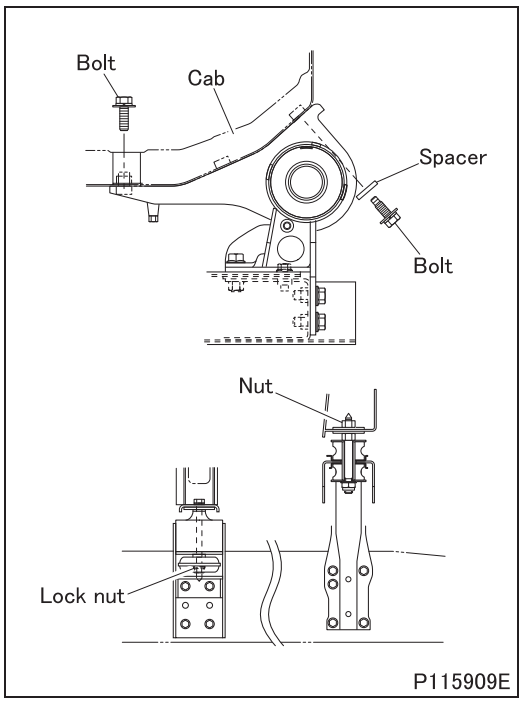


■ **Installation: Cab**

- Hook the slings at equilibrium center-of-gravity points on the roof of the cab.



- Slowly lower the cab.
- Join the power steering gear and steering column together in accordance with the alignment marks on them.



- Further lower the cab slowly into place. Then unhook the slings and tighten bolts, nuts and lock nuts to specified torques.

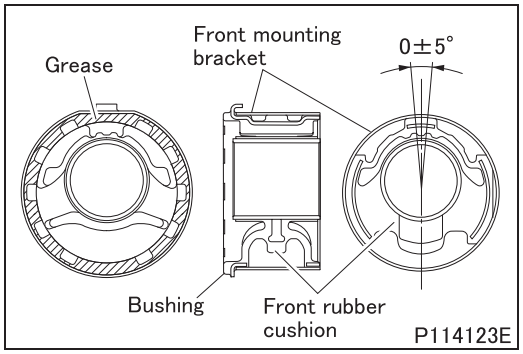
Ta	Bolt (front mounting bracket attaching)	200 to 270 {145 to 200, 20 to 28}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Bushing contact surface of front rubber cushion	Rubber Grease	As required

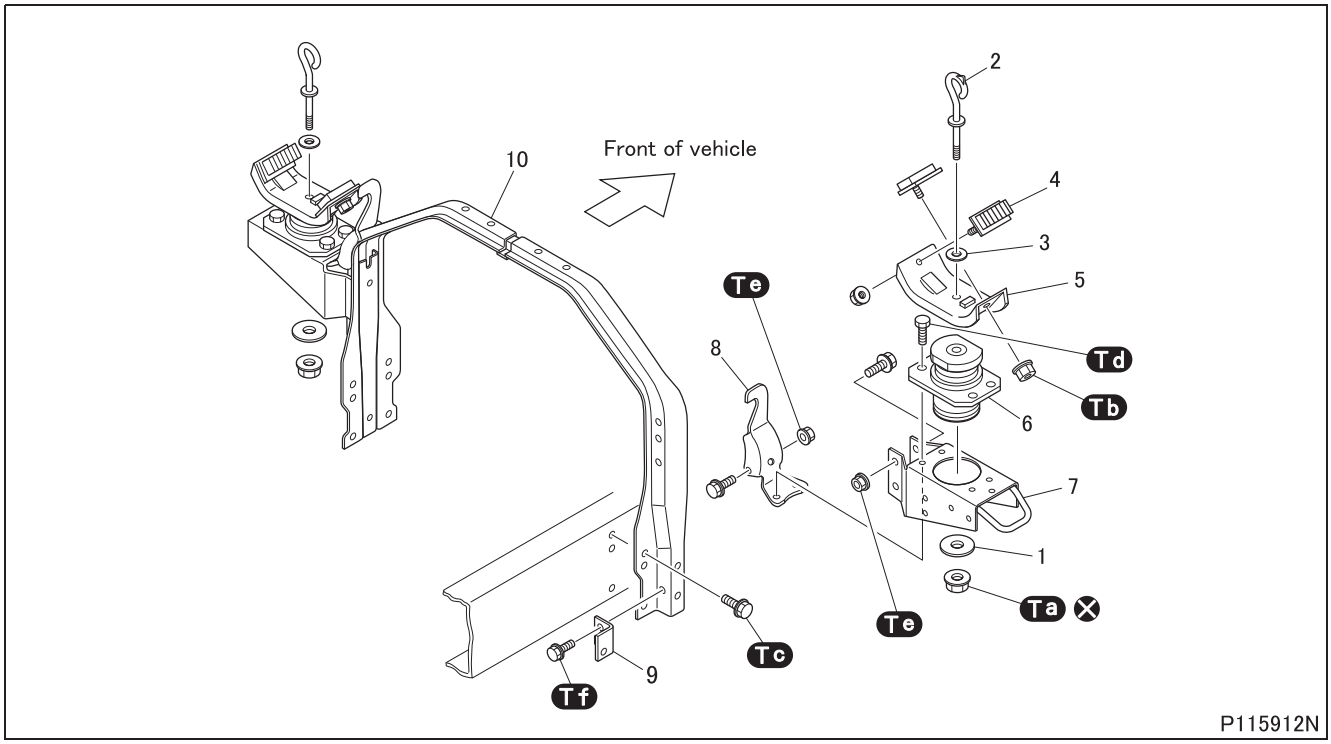
◆Installation procedure◆



■ **Installation: Bushing and front rubber cushion**

- Fit the front rubber cushion to the front mounting bracket at an angle within the illustrated range.
- After installing the front rubber cushion, fill grease in the bushing as shown and fit it onto the mounting bracket.

REAR CAB MOUNTING <EXCEPT CREW CAB>



● **Disassembly sequence**

1 Plate
2 Anchor hook
3 Spacer
4 Side rubber cushion
5 Cab hold bracket
6 Rear rubber cushion
7 Rear mounting bracket
8 Cab catch
9 Mounting bracket
10 Rear mounting bridge

⊗: Non-reusable parts

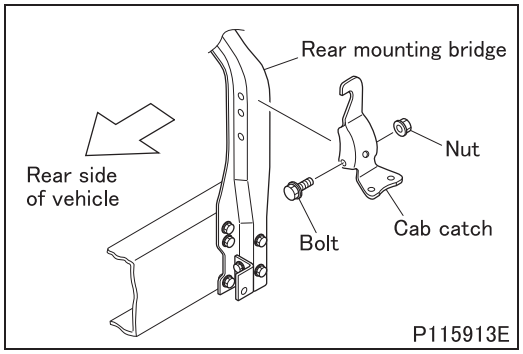
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

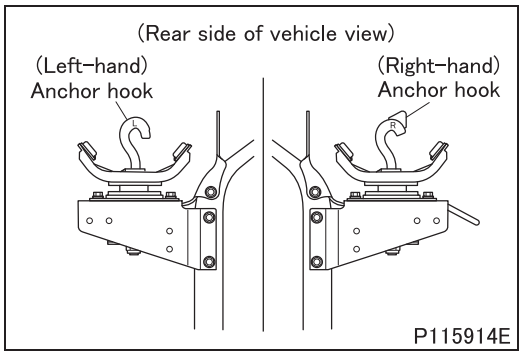
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Lock nut (anchor hook attaching)	83 to 98 {61 to 72, 8.5 to 10.0}	–
Tb	Nut (side rubber cushion attaching)	10 to 15 {7.4 to 11, 1.0 to 1.5}	–
Tc	Bolt (rear mounting bridge attaching)	75 to 90 {55 to 66, 7.6 to 9.2}	–
Td	Bolt (rear rubber cushion attaching)	20 to 30 {15 to 22, 2.1 to 3.1}	–
Te	Nut (rear mounting bracket attaching)	55 to 65 {41 to 48, 5.6 to 6.6}	–
	Nut (cab catch attaching)		
Tf	Bolt (mounting bracket attaching)	45 to 55 {33 to 41, 4.6 to 5.6}	–

◆Installation procedure◆



■ **Installation: Cab catch**

- When installing the cab catch, be sure to install the bolt from the rear side of the vehicle.



■ **Installation: Anchor hook**

- Fit the anchor hooks to the bracket as shown in the illustration.

CAUTION ⚠

- **When the cab is tilted down with the anchor hooks installed in wrong direction, the links installed in the cab can not hook to the anchor hooks and it may damage both of the anchor hooks and the links.**

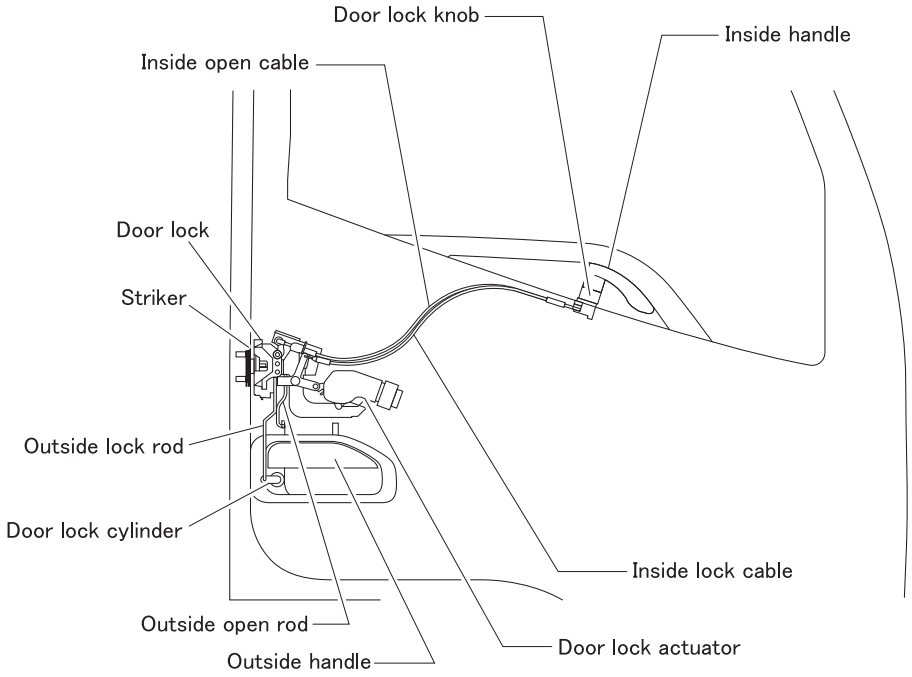
SPECIFICATIONS

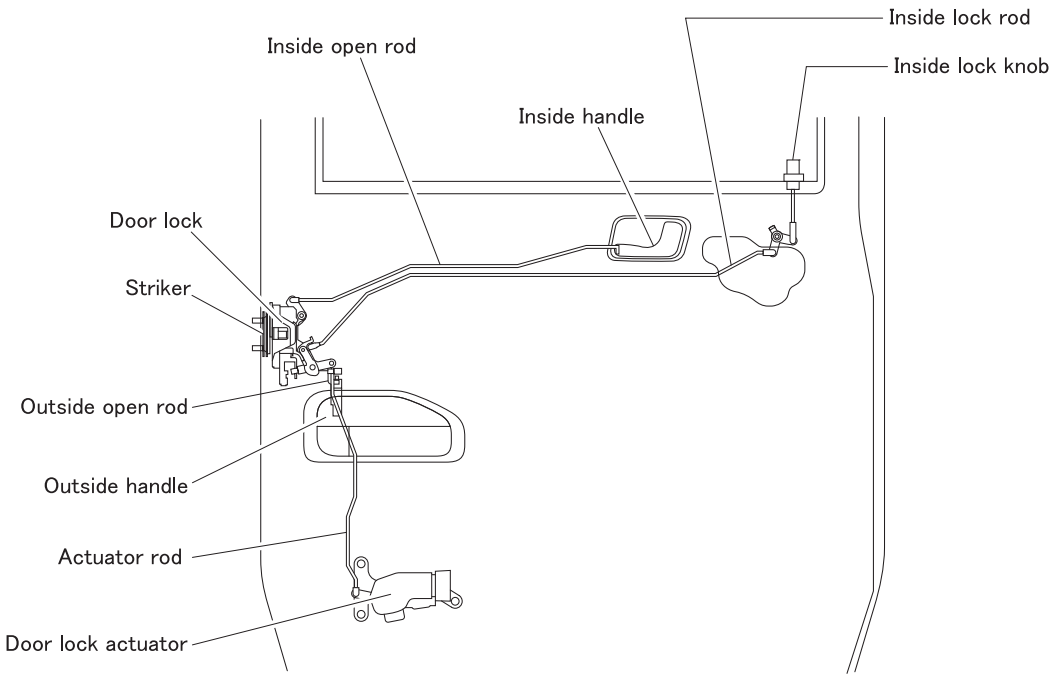
Item			Specifications
Front door		Door lock system	Automatic door lock system (central door lock)
		Door glass opening and closing mechanism	Electrical control type
Rear door <crew cab>		Door lock system	Automatic door lock system (central door lock)
		Door glass opening and closing mechanism	Manual control type
Keyless entry system	Transmitter	Type	Holder with separate key type (independent buttons for lock and unlock)
		Rated voltage V	3
		Consumption current mA	7.5 (during transmission)
		Transmitting frequency MHz	315
		Battery	Lithium battery
	Keyless entry electrical control unit	Rated voltage V	12
		Consumption current mA	13 or less
		Receiving frequency MHz	315

1. Front Door Lock System



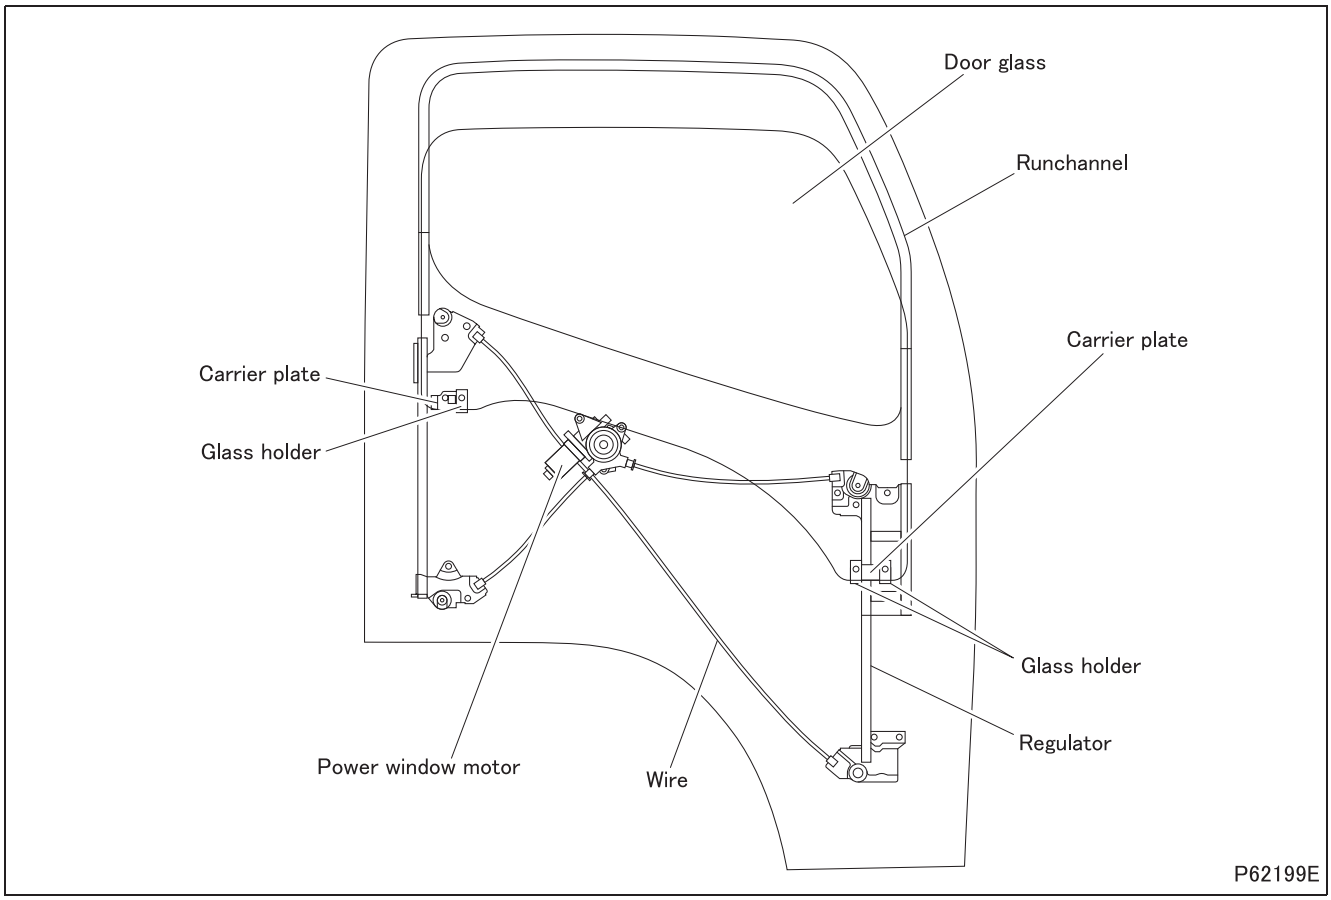
P115960E

2. Rear Door Lock System <Crew Cab>



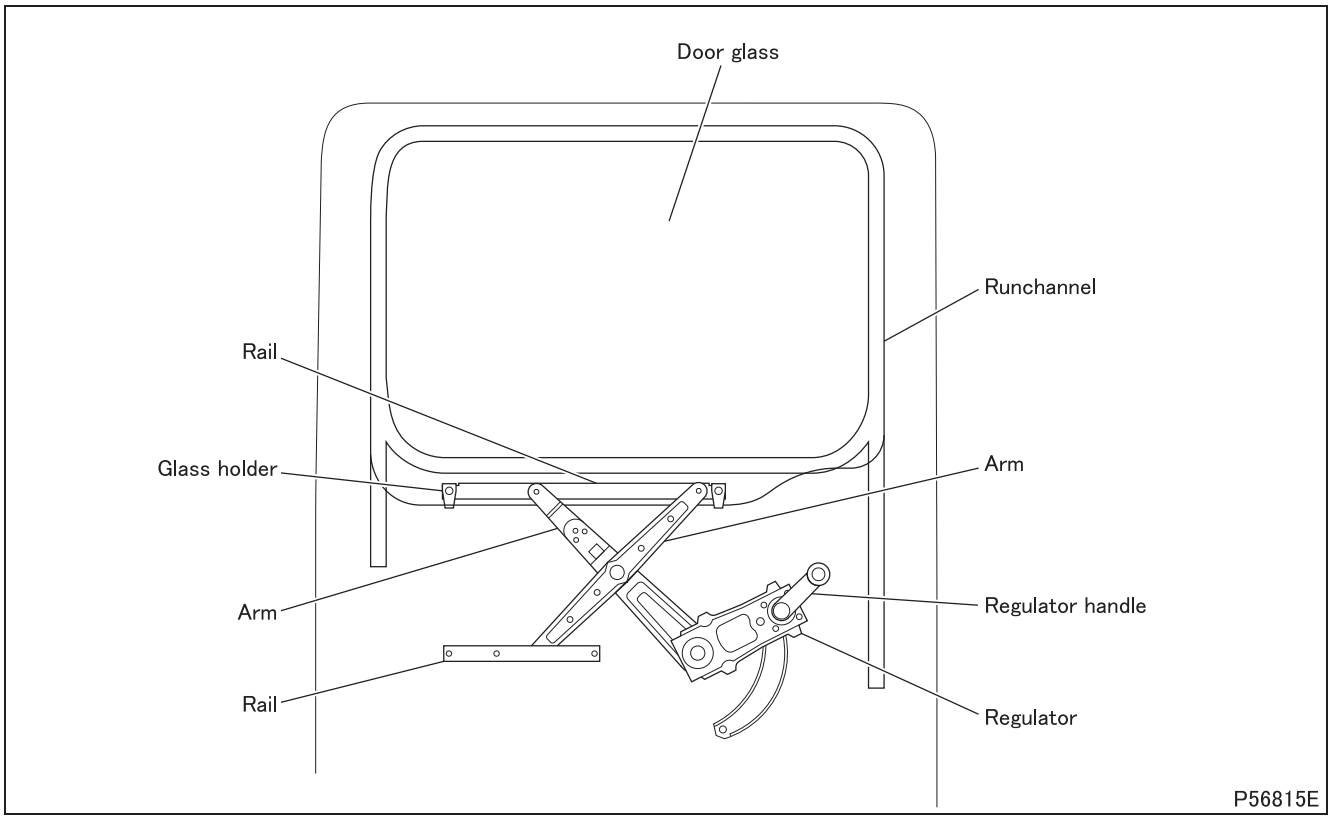
P115961E

3. Front Door Glass Opening and Closing Mechanism



- The door glass is secured to the carrier plate by the glass holder.
- With the rotation of the power window motor the carrier plate is moved up and down by means of the wire to open and close the door glass.

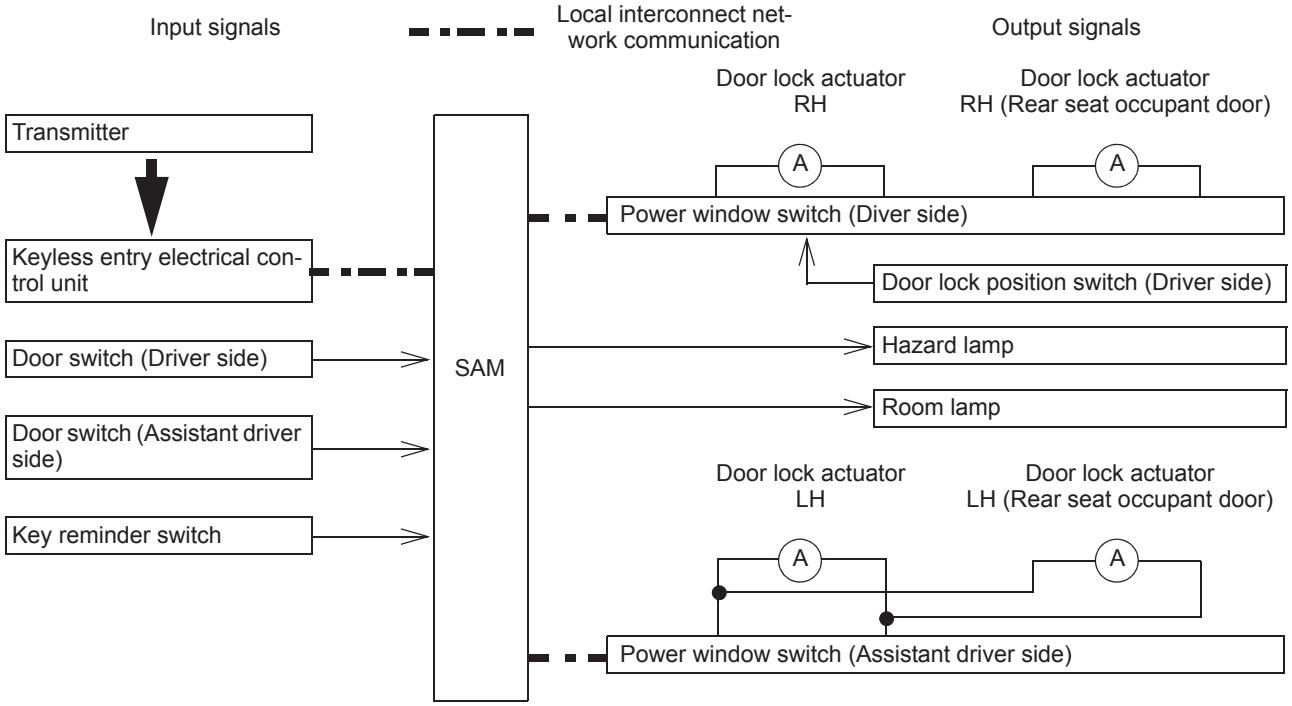
4. Rear Door Glass Opening and Closing Mechanism <Crew Cab>



- The door glass is secured to the rail by the glass holder.
- The rail is secured to the door panel, and the arms slide back and forth inside the rail.
- Turning the regulator handle moves the rail up and down by means of the regulator and arm to open and close the door glass.

5. Keyless Entry System

5.1 System block diagram

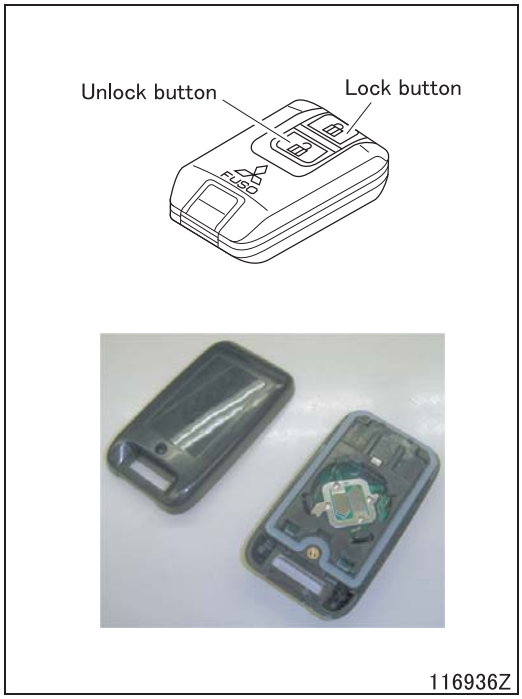


Name of components	Main functions and operations
Transmitter	Transmission of door lock and unlock signals
Keyless entry electrical control unit	Reception of radio signals from transmitter and control of keyless entry system
Door switch	Detection of door state (open/closed)
Door lock position switch	Detection of door lock state
Key reminder switch	Detection of starter key remaining in key cylinder
Central door locking switch	Central operation of door locks
Power window switch	Control of door lock functions
Hazard lamp	Answer-back function
Room lamp	
SAM	Control of local interconnect network communication, control of answer-back functions (hazard and room lamps)
Door lock actuator	Locking/unlocking of doors

- The key entry system operates the lock and unlock system of the right and left doors by remote control using radio signals.
- The system consists of the conventional auto door lock system and additional transmitter and keyless entry electrical control unit.
- Operational conditions of the system: The system operates only when both the right and left doors are completely closed (should not be open even slightly), and the starter key is pulled out from the starter switch.
- Starter switch and door switch are included in the system for detection of the above status.
- The system has an answer back function that turns on the room lamp and the hazard lamp when activated, thus confirming operation of the system when the user is away from the vehicle. The room lamp and the hazard lamp light up when they are functioning, as shown below.
  - The lamps blink twice when the doors are locked.

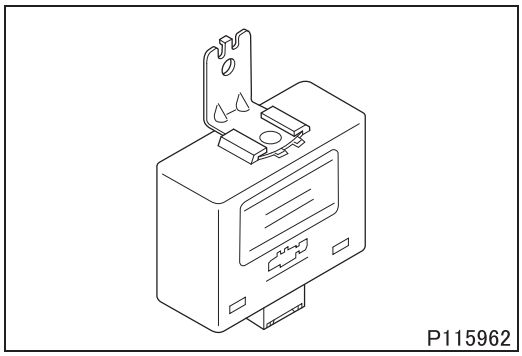
- When the door lock is cancelled, the room lamp lights up for a few seconds, gradually fading and eventually going out (fade out function).
- When the door lock is cancelled, the hazard lamp blinks once.

- Features of the system:
  - Failure in the transmitter or keyless entry electrical control unit does not affect the auto door lock system and does not hinder the locking or unlocking of doors.
  - The system operates at 95% within a 3 m diameter and 75% within a 5 m diameter from the center of the cabin.
  - A transmission code rewrite function is incorporated into the keyless entry electrical control unit. If a transmitter is lost or damaged, the function can be recovered by registering a new code, without having to replace the whole system.
  - Because the keyless entry electrical control unit can store three transmission codes, one vehicle can use three transmitters.
  - The system is equipped with an auto lock function. If the unlock button is pressed by mistake while the doors are locked and the operating conditions of the system are met, this will be considered an error, providing a door (right or left) is not opened within 30 seconds after pressing the button, and the doors will automatically lock again.



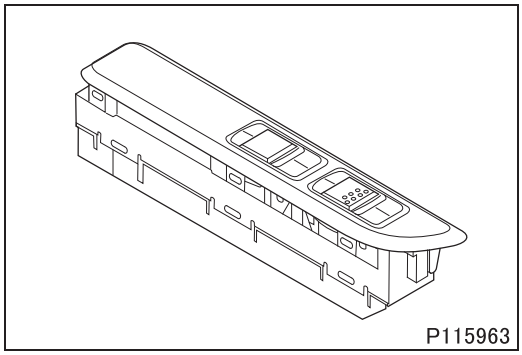
(1) Transmitter

- The transmitter has a lock button and an unlock button that operate independently.
- The transmitter has a unique transmitter code assigned to each vehicle, ensuring that each vehicle has an ordinary starter key with a different transmission key. There are more than one million transmission codes and one of them is assigned to each transmitter.
- If the lock button or unlock button is pressed, the transmission code will be transmitted as a radio signal.
- A lithium battery is used as power supply.



(2) Keyless entry electrical control unit

- The keyless entry electrical control unit receives radio signals sent from the transmitter and controls the keyless entry system to send locking or unlocking signals to the power window switch.



(3) Power window switch

- This switch outputs electric signals to the door lock actuator according to the commands from the keyless entry electrical control unit.

M E M O

Door Glass Opening and Closing Mechanism <Electrical control type>

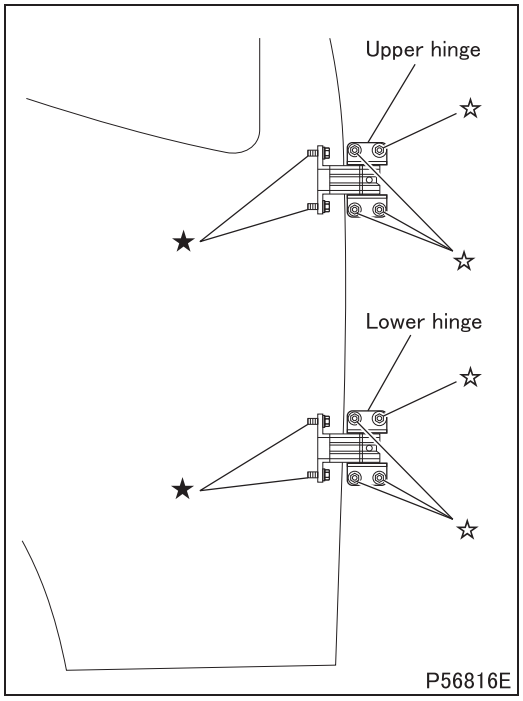
ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Adjustment of Front Door Alignment

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

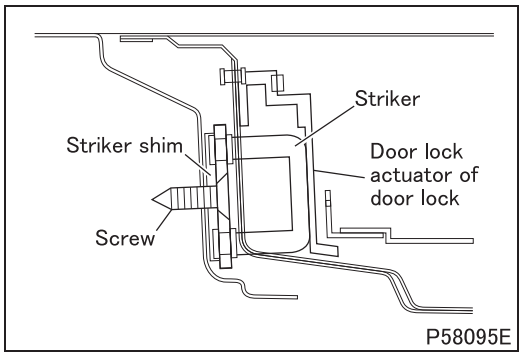
Mark	Parts to be tightened	Tightening torque	Remarks
–	Bolt (door mounting; ★ marked)	17 to 26 {12 to 19, 1.7 to 2.6}	–
	Bolt (upper and lower hinge mounting; ☆ marked)		
–	Screw (striker mounting)	9 to 14 {6.5 to 10, 0.9 to 1.4}	–

- Door alignment is adjusted by changing the positions of the upper and lower hinges and striker.
  Door alignment dimensions: See **1.3**.



1.1 Adjustment of hinge positions

- Use ★ marked bolts to adjust gap.
- Use ☆ marked bolts to adjust flushness.

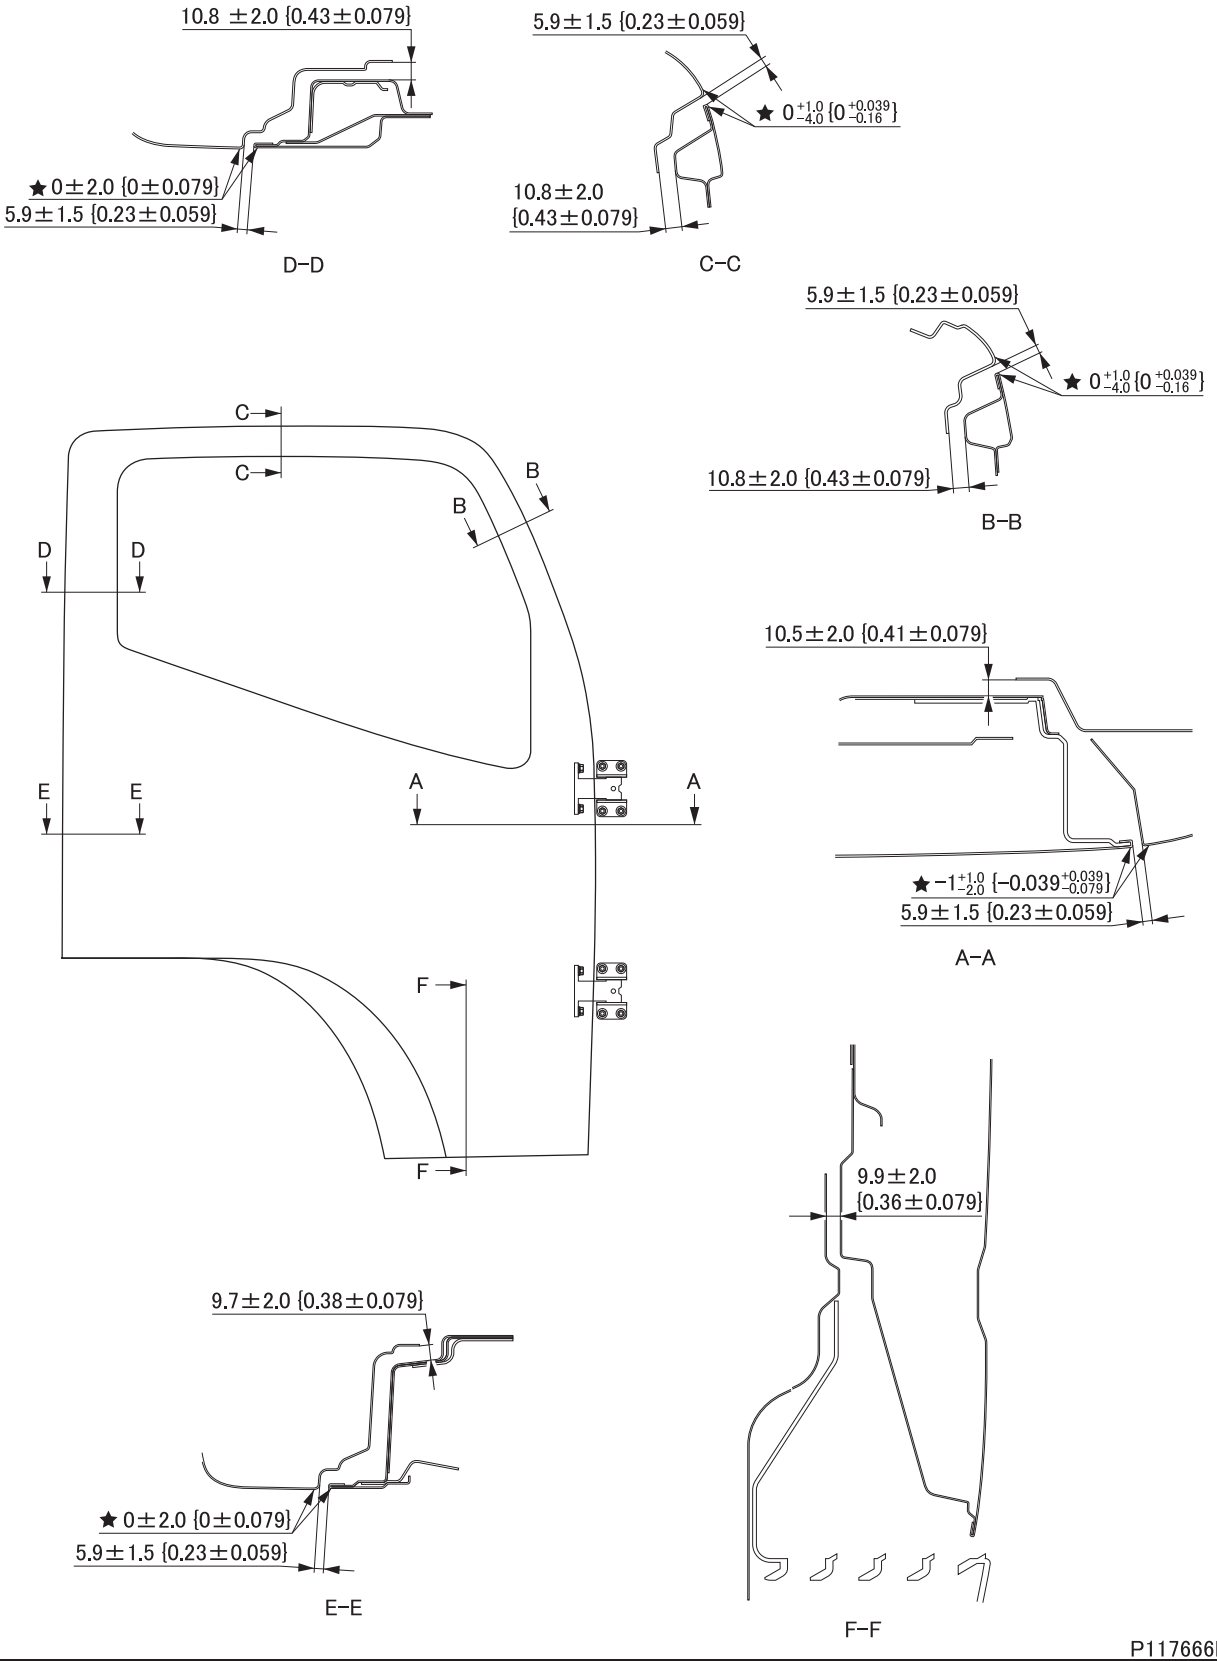


1.2 Adjustment of striker position

- Use mounting screw to make the adjustment.
- To adjust the engagement of the striker with the door lock actuator or door lock, change the number of striker shims as required.

1.3 Front door alignment dimensions

Unit : mm {in.}



P117666N

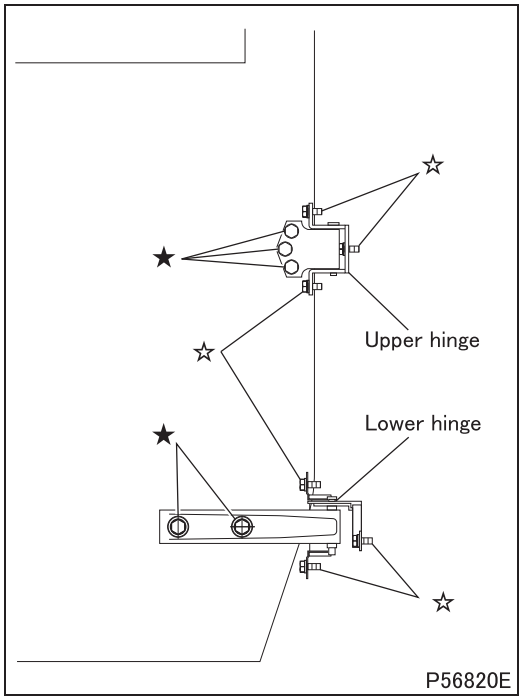
★: Flushness dimension (+ for outside of cab; – for inside of cab)

2. Adjustment of Rear Door Alignment <Crew Cab>

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

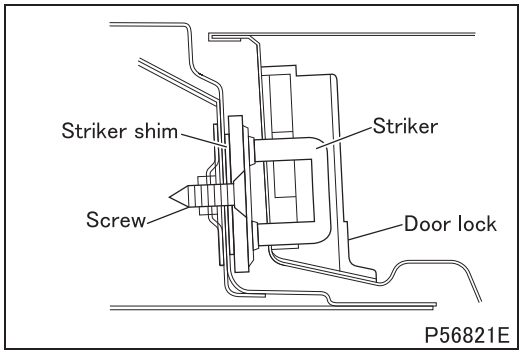
Mark	Parts to be tightened	Tightening torque	Remarks
–	Screw (striker mounting)	9 to 14 {6.5 to 10, 0.9 to 1.4}	–

- Door alignment is adjusted by changing the positions of the upper and lower hinges and striker.
  Rear door alignment dimensions: See **2.3**.



2.1 Adjustment of hinge positions

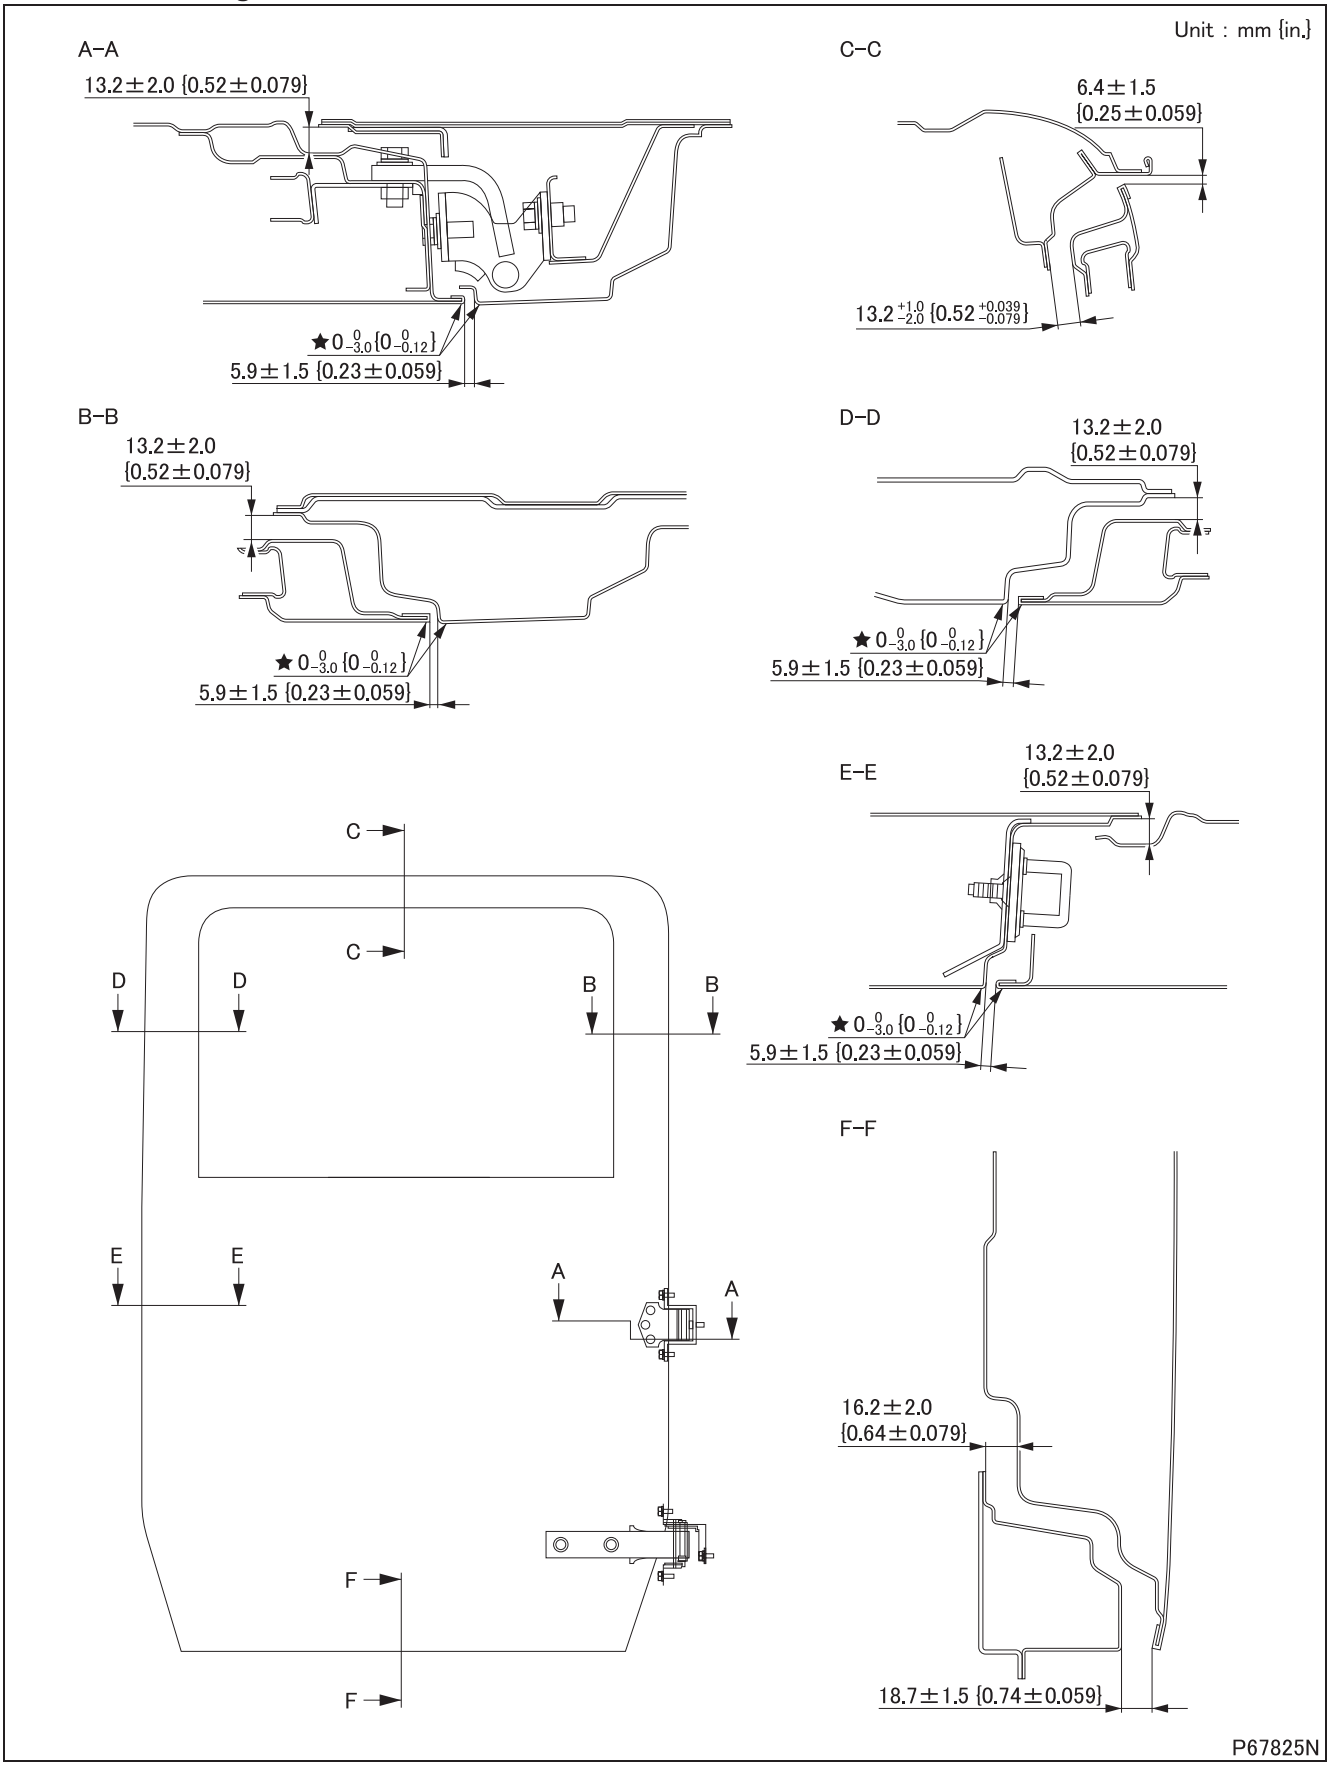
- Use ★ marked bolts to adjust gap.
- Use ☆ marked bolts to adjust flushness.



2.2 Adjustment of striker position

- Use mounting screw to make the adjustment.
- To adjust the engagement of the striker with the door lock, change the number of striker shims as required.

2.3 Rear door alignment dimensions



★: Flushness dimension (+ for outside of cab; – for inside of cab)

ON-VEHICLE INSPECTION AND ADJUSTMENT

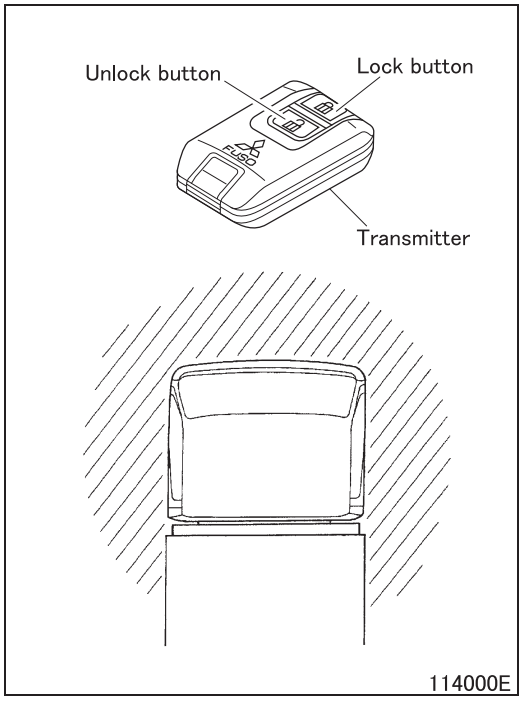
3. Inspection of Keyless Entry System

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Range of system operation	3 m {9.8 ft.} or less (operation at approx. 95%)	–	Replace
–	Time of automatic lock function	Approx. 30 sec.	–	Replace

CAUTION ⚠

- **Keep the transmitter dry, and do not disassemble or drop it; otherwise, it may become broken.**
- **Do not leave the transmitter in any place, including the inside of the vehicle, where it would be exposed to direct sunlight or high temperature (above 60°C {140°F}). The battery life will be shortened and the transmitter may become broken.**
- **Do not remove the cover except when changing the battery. It can cause malfunction of the transmitter.**



3.1 Inspection of system operation range

- Confirm before inspection that the doors are completely closed and the starter key is pulled out from the starter switch.
- Check if lock and unlock can be made without failure by pressing LOCK and UNLOCK buttons of transmitter from the range of distance (hatched section) from the cabin.

CAUTION ⚠

- **The range of operation may be smaller than the standard value because of electromagnetic hindrance if there is a TV tower, a power plant, a broadcasting tower, etc. in the vicinity.**
- **The standard values are those obtained when the system is operating at approx. 95%. The system operates at approx. 75% when the distance is 5 m {16 ft}.**

- If the system is not operating within the standard values, the following are possible causes:
  - Transmitter battery run out or transmitter unit faulty
  - Starter key switch (part of key reminder switch) faulty
  - Electrical circuit of the system faulty
  - Keyless entry electrical control unit or power window switch faulty
  - Door switch faulty
  - Door lock actuator faulty
  - Door lock position switch faulty

3.2 Inspection of automatic lock function

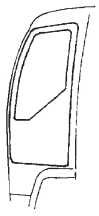
- Unlock the locked doors by pressing the unlock button of transmitter.
- Keep both right and left doors closed without opening after unlocking, and measure the time until the doors are automatically locked again.
- If the measured time is greatly different from the standard values or if the doors are not locked, replace the keyless entry electrical control unit.

4. Method of Transmitting Code to Keyless Entry Electrical Control Unit

- When a transmitter is replaced or additionally installed, it is necessary to register the transmission code on the transmitter side in the keyless entry electrical control unit.
- When registering a transmission code in the keyless entry electrical control unit, there is a specified time limit for each process of work and if the work is not completed within these time limits, the transmission code will not be registered.
- Three (3) transmission codes can be registered in each keyless entry electrical control unit. If the fourth or subsequent transmission code is registered, the oldest transmission codes will be erased.
- If a new transmitter is registered to replace a lost transmitter, the registration process must be repeated three times to complete registration.

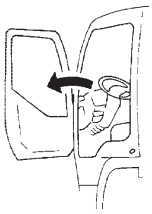
Time limit of process

Close the doors on both the driver and passenger sides with the starter key pulled out from the starter switch.



62200

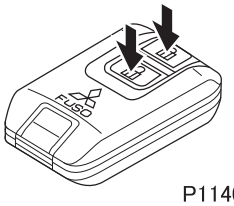
Open the door on the driver's side.



62201

Within 10 sec.

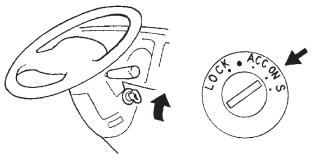
Press the lock or unlock button of transmitter after the door on the driver's side has been opened.



P114007

Within 10 sec.

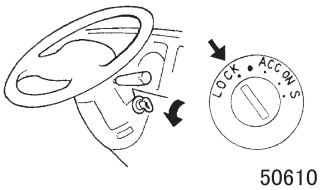
Turn the starter switch to ON position.



50609

Within 10 sec.

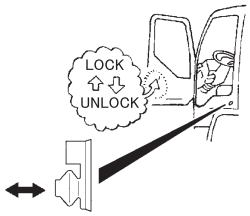
Pull out the starter key from the starter switch.



50610

Within 30 sec.

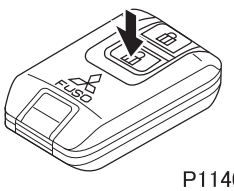
Repeat turning ON and OFF of the door switch on the driver's side (6 times or more) until the door lock actuator operates from LOCK to UNLOCK twice.



62202

Within 10 sec.

After the door lock actuator is operated, keep the unlock button on the transmitter pressed (for more than 5 seconds) until an operating noise of the door lock actuator is heard.



P114008

Completion of registration

- If the registration of transmission code did not complete normally, restart the procedure of registration from the beginning.
- After normal completion of transmission code registration, confirm that the transmitter operates normally by pressing the buttons of transmitter a few times.

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
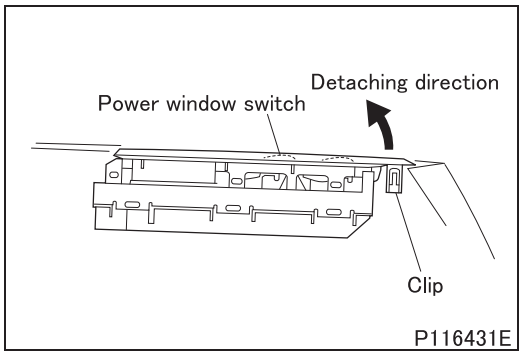
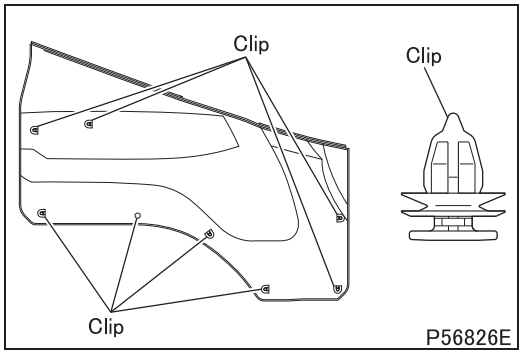
a	Waterproof cover fitting surface of door Panel	Butyl tape	As required

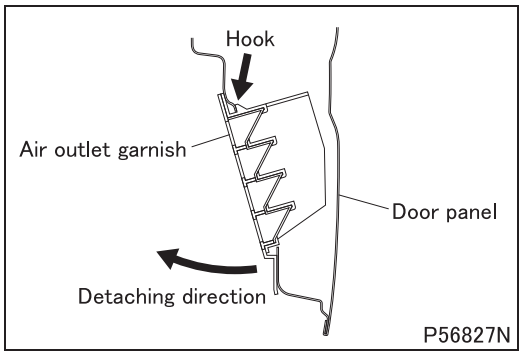
◆Removal procedure◆



■Removal: Power window switch

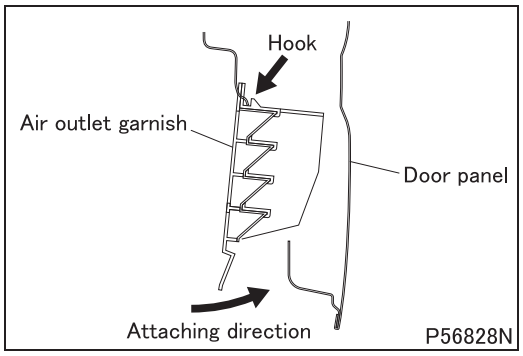


■Removal: Lower door trim



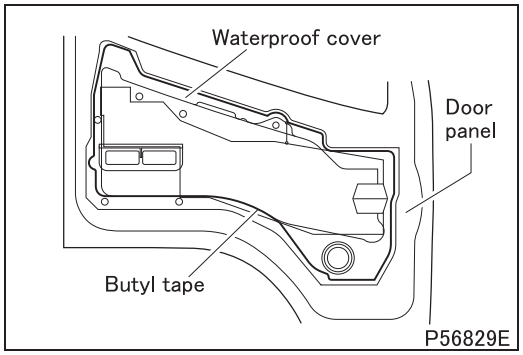
■Removal: Air outlet garnish

◆Installation procedure◆



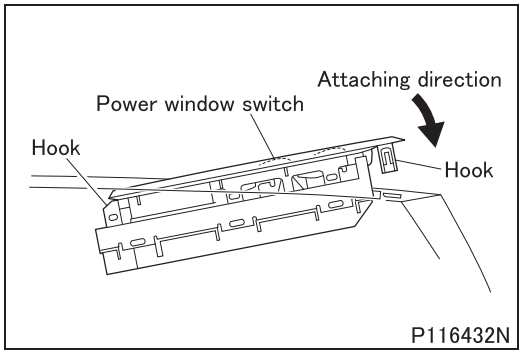
■Installation: Air outlet garnish

- Attach the air outlet garnish to the door panel in the illustrated direction, with its hook fitted in the door panel.



■**Installation: Waterproof cover**

- Apply butyl tape to the door panel as shown, then attach the waterproof cover to the door panel.



■**Installation: Power window switch**

- To install the power window switch in position, fit hook first, then tab, in the lower door trim.

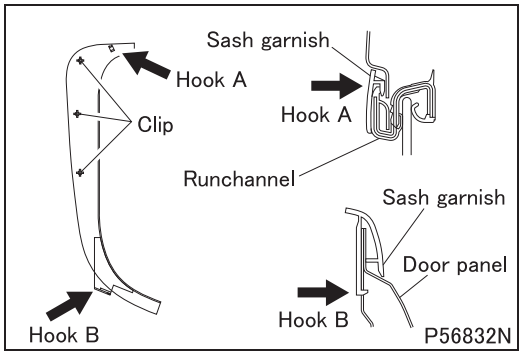
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (upper door trim attaching)	10 to 15 {7.2 to 11, 1.0 to 1.5}	–
Tb	Bolt (door glass attaching)	4 to 6 {2.9 to 4.3, 0.4 to 0.6}	Sealant
	Nut (regulator and motor or manual regulator attaching)		–
	Bolt (regulator and motor or manual regulator attaching)		
	Bolt (outside handle attaching)		
	Nut (door check attaching)		
Tc	Screw (door lock attaching)	4.9 to 8.2 {3.7 to 6.1, 0.51 to 0.84}	–

Lubricant and/or sealant

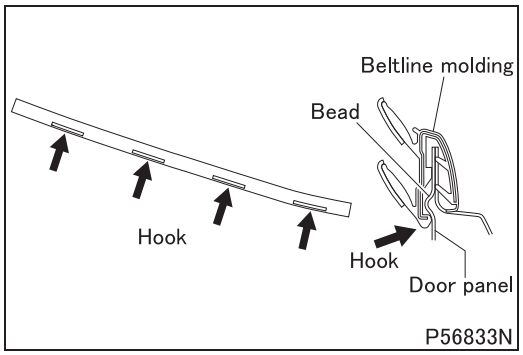
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Bolt threads	Loctite Dri-Loc 202	As required
b	Sliding contact surface of regulator and motor	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
	Sliding contact surface of door lock		As required
	Rotating contact surface of outside handle		As required
	Rotating contact surface of inside handle		
c	Sliding contact surface of door check	Chassis grease [NLGI No. 2 (urea)]	1 g {0.035 oz}

◆ Removal sequence ◆



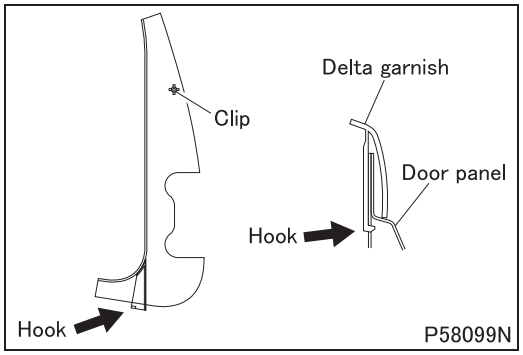
■Removal: Sash garnish

- Disengage hook A on upper part of the sash garnish from the runchannel, then remove clips (3 places).
- Disengage hook B on the lower part of the sash garnish from the door panel.



■Removal: Beltline molding

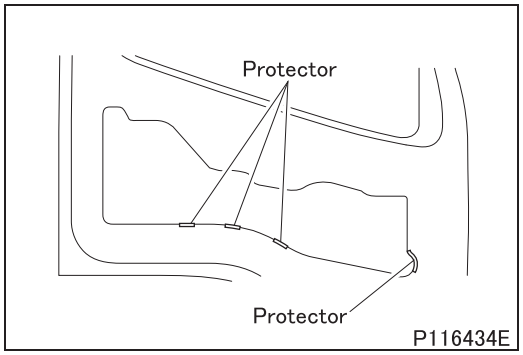
- Disengage hooks (4 places) and remove the beltline molding from the door panel bead.



■Removal: Delta garnish

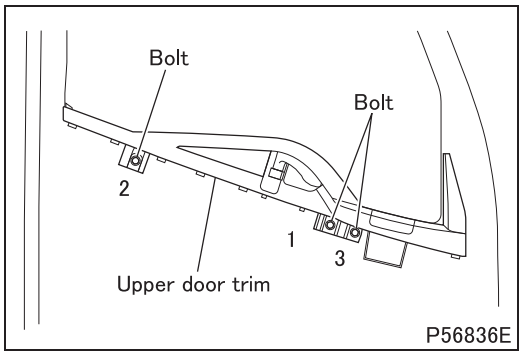
- Disengage clip (1 place) first and then hook to remove the delta garnish from the door panel.

◆Installation procedure◆



■Installation: Protector

- Fit the protectors (4 places) to the door panel in the illustrated positions.

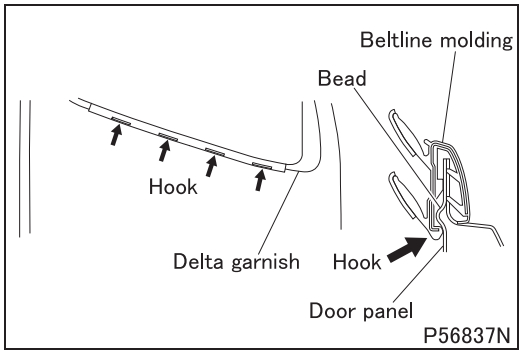


■Installation: Upper door trim

- Tighten bolts to specified torque in numerical order (1 to 3) as shown to secure the upper door trim.

■Installation: Delta garnish

- To install the delta garnish, follow the removal procedure in reverse.
  (See **"■Removal: Delta garnish"**.)

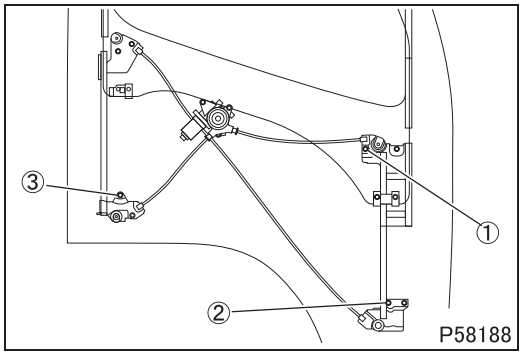


■Installation: Beltline molding

- Position the beltline molding with its front side applied to the delta garnish, then engage hooks (4 places) with the door panel bead to secure the beltline molding in place.

■Installation: Sash garnish

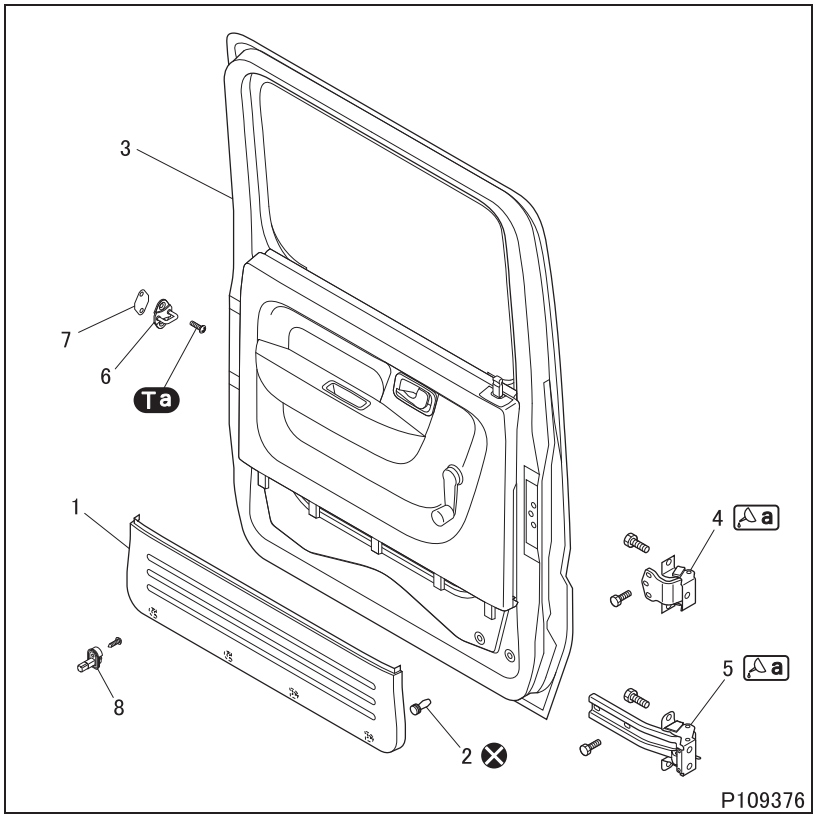
- To install the sash garnish, follow the removal procedure in reverse.
  (See **"■Removal: Sash garnish"**.)



■**Installation: Regulator and motor or manual regulator**

- Tighten bolts (3 places) to specified torque in numerical order (1 to 3) as shown, then tighten the remaining bolts and nuts to specified torque.

REAR DOOR <CREW CAB>



●Removal sequence

1 Lower door trim
2 Clip
3 Door (See later section.)
4 Upper hinge
5 Lower hinge
6 Striker
7 Strike shim
8 Door switch

⊗: Non-reusable parts

●Installation sequence

Follow the removal sequence in reverse.

- Adjust rear door alignment after installation. (See ON-VEHICLE INSPECTION AND ADJUSTMENT.)

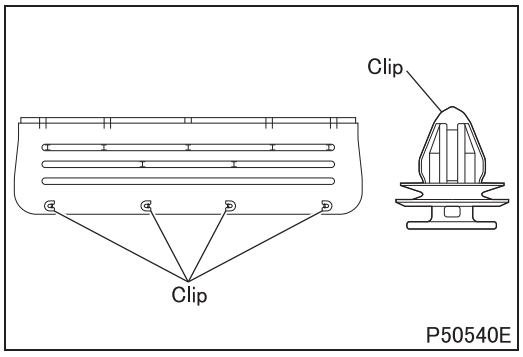
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Screw (striker attaching)	9 to 14 {6.5 to 10, 0.9 to 1.4}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Rotating contact surfaces of upper and lower hinges	Chassis grease [NLGI No. 1 (Li soap)]	As required

◆Removal procedure◆



■Removal: Lower door trim

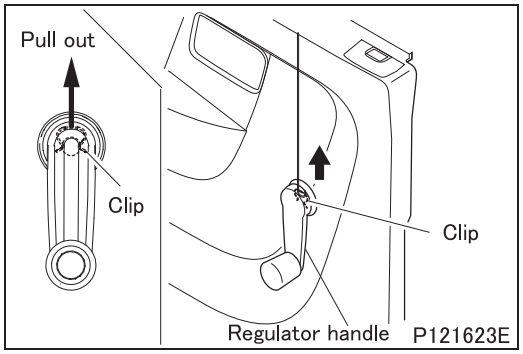
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

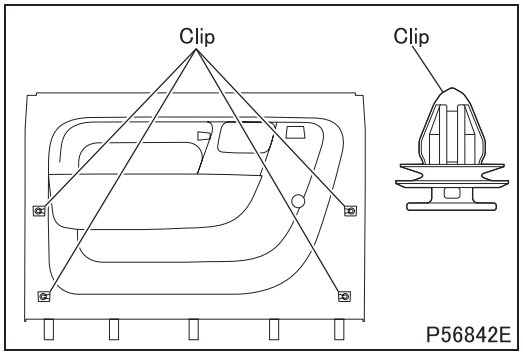
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Screw (pull handle cover attaching)	2 to 3 {1.4 to 2.1, 0.2 to 0.3}	–

◆Removal procedure◆

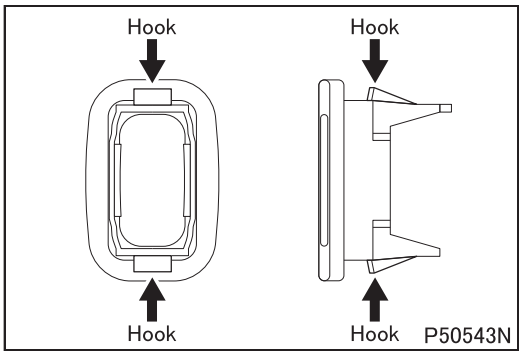


■Removal: Regulator handle

- Place the knob of the regulator handle in the lower position.
- Check the position of a clip through a gap between the regulator handle and the upper door trim.
- Remove the clip from the handle by pulling it upwards with a tool fabricated from a piece of wire or the like.

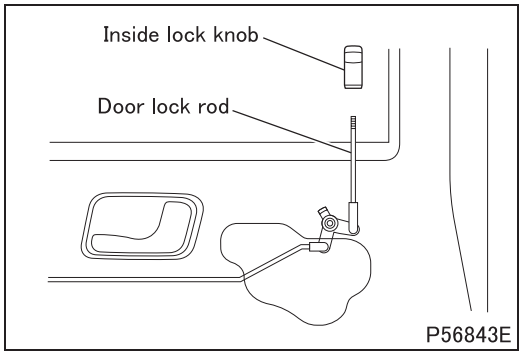


■Removal: Upper door trim



■Removal: Bushing

◆Installation procedure◆



■Installation: Inside lock knob

- Screw the inside lock knob all the way onto the door lock rod, then back it up 1 or 2 turns.

REAR DOOR <CREW CAB>

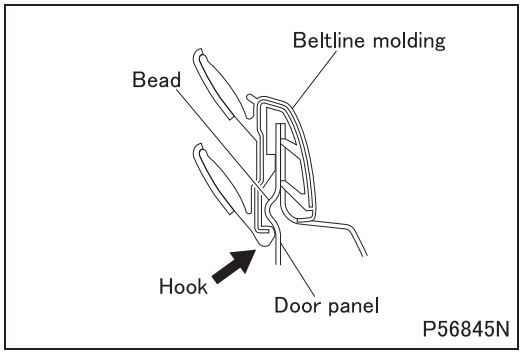
	Rotating contact surface of inside handle		
	Rotating contact surface of outside handle		
	Rotating and sliding contact surfaces of door lock		
b	Waterproof cover attaching surface of door panel	Butyl tape	As required

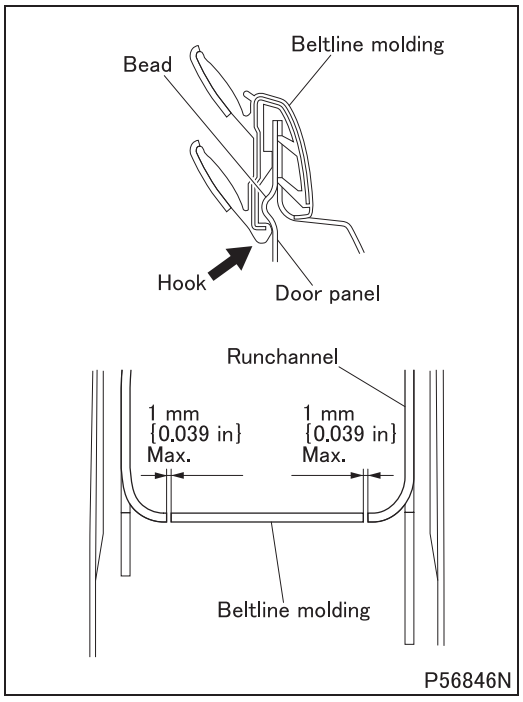
◆Removal procedure◆



■Removal: Beltline molding

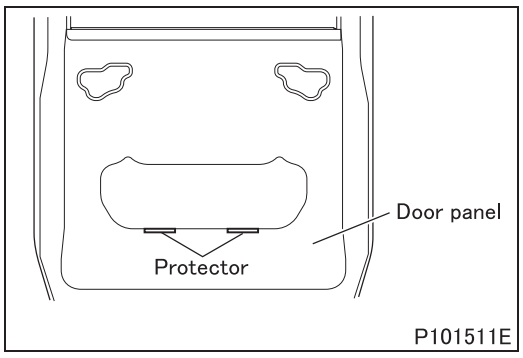
- Disengage hooks (4 places) from the door panel bead to remove the beltline molding from the door panel.

◆Installation procedure◆



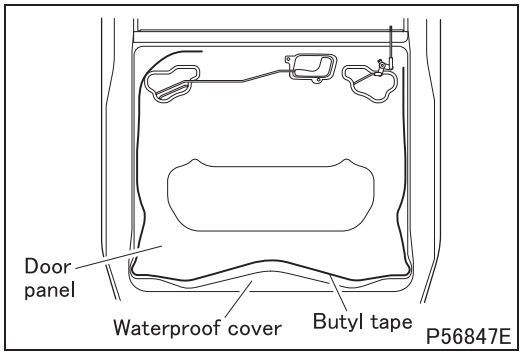
■Installation: Beltline molding

- Engage hooks (4 places) with the door panel bead to install the beltline molding to the door panel. Gaps between beltline molding and runchannel should be as shown.
- Make sure that the cover is tight at both ends of the belt line molding.



■Installation: Protector

- Fit the protectors to the door panel in the illustrated positions.



■**Installation: Waterproof cover**

- Apply butyl tape to the door panel as shown, and attach the waterproof cover to the door panel.

●Disassembly sequence

1 Clamp
2 Mirror
3 Cover
4 Mirror stay

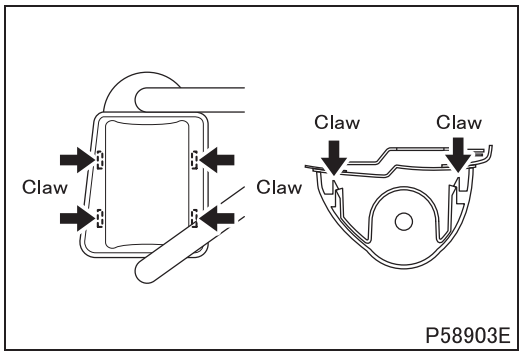
●Assembly sequence

Follow the disassembly sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

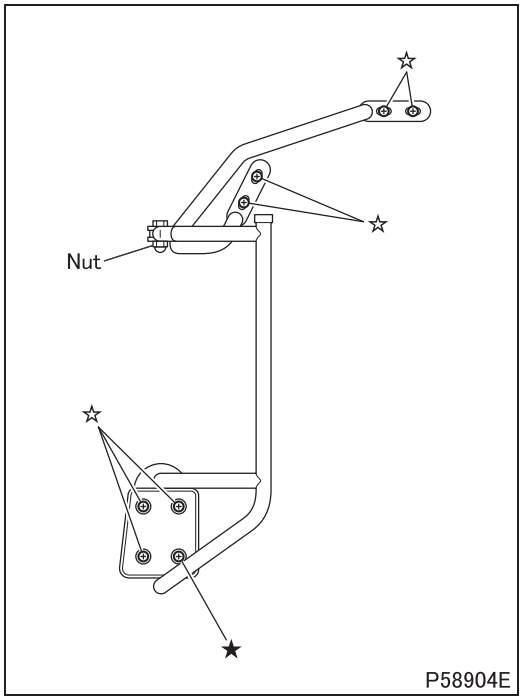
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (mirror mounting)	6.5 to 7.2 {4.8 to 5.3, 0.66 to 0.73}	–
Tb	Screw (mirror stay mounting)	9 to 14 {6.6 to 10, 0.9 to 14}	–
Tc	Nut (mirror stay fastening)	19 to 28 {14 to 21, 1.9 to 2.9}	–

◆Removal procedure◆



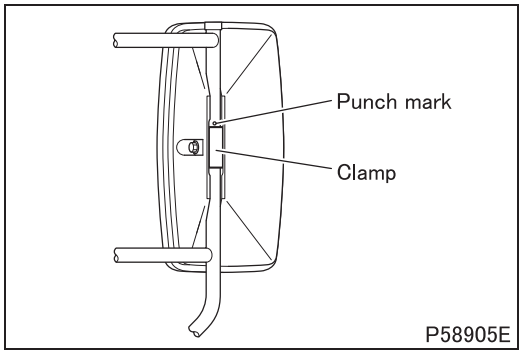
■Removal: Cover

◆Installation procedure◆



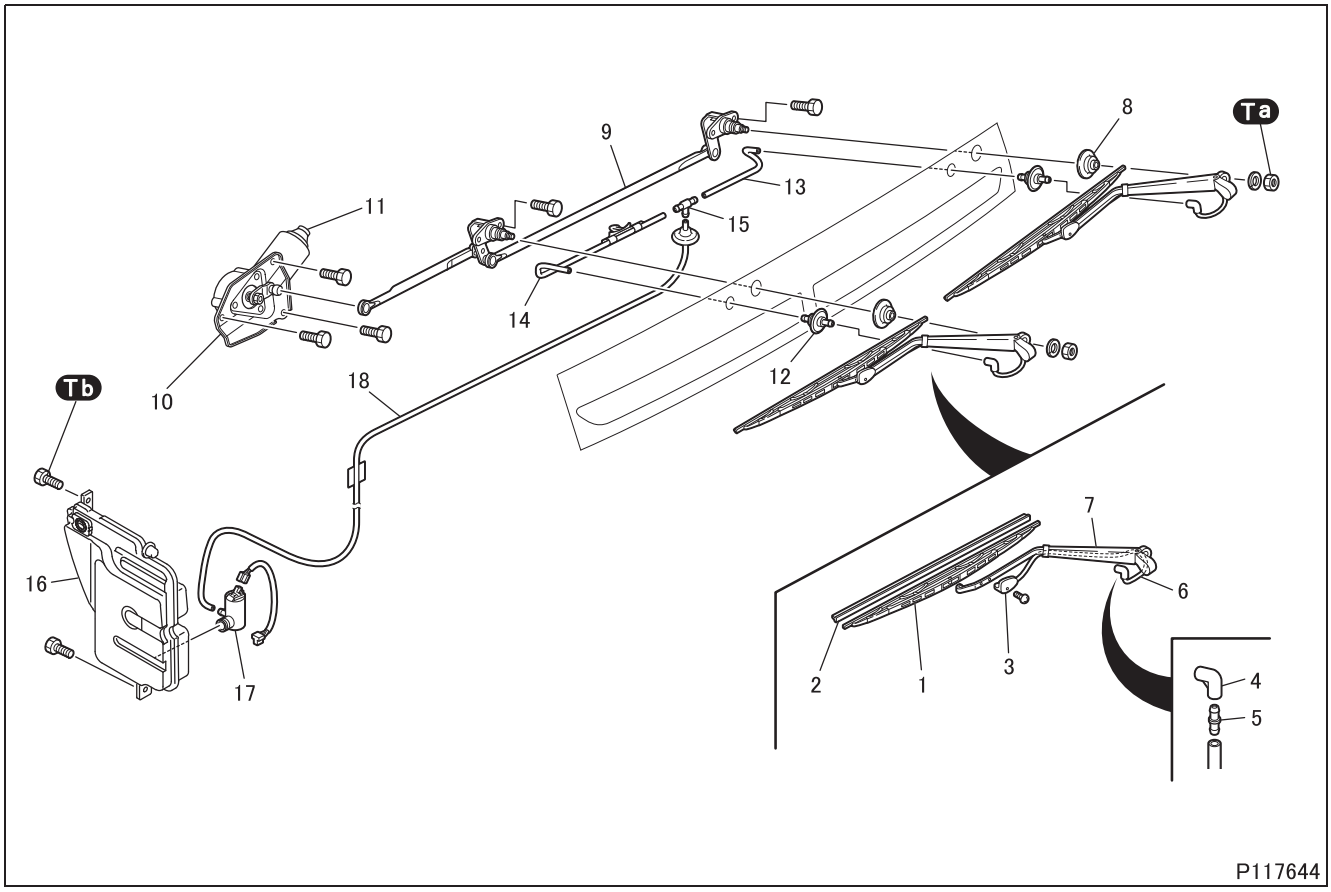
■Installation: Mirror stay

- Install the one screw marked ★ and adjust the position of the mirror stay.
- Install all the remaining seven screws marked ☆ to secure the mirror stay.
- Fasten the mirror stay nut to the specified torque.



■Installation: Mirror

- Adjust the height of the mirror by aligning the punch mark on the mirror stay with the clamp edge as shown in the illustration.



●Disassembly sequence

1 Wiper blade
2 Blade rubber
3 Washer nozzle
4 Elbow joint
5 Joint
6 Hose
7 Wiper arm
8 Pivot cap
9 Wiper link
10 Wiper motor bracket
11 Wiper motor
12 Joint
13 Washer hose
14 Washer hose
15 Joint
16 Washer tank
17 Washer motor
18 Washer hose

NOTE

- **Before disconnecting the connector to remove the wiper motor, pull out cab side harness sufficiently, otherwise it will fall into the cab and cannot be taken out without removing the instrument panel.**

●Assembly sequence

Follow the disassembly sequence in reverse.

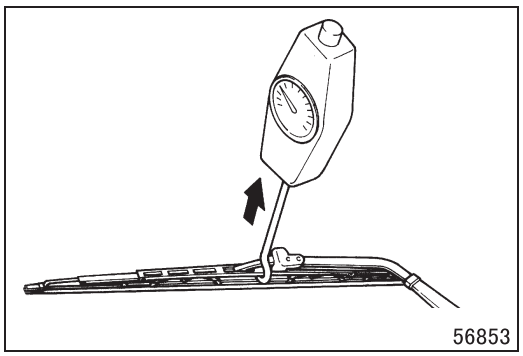
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
7	Wiper arm force to press blade against windshield	5.9 ± 0.5 N {1.4 ± 0.11 lbs, 0.60 ± 0.05 kgf}	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (wiper arm and blade attaching)	10.8 to 15.7 {8.0 to 12, 1.1 to 1.6}	–
Tb	Bolt (washer tank attaching)	7.8 to 11.8 {5.8 to 8.7, 0.8 to 1.2}	–

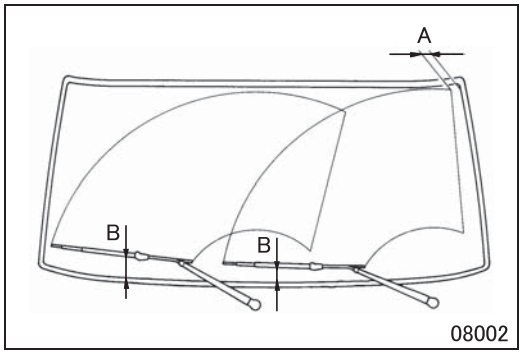
◆Inspection procedure◆



■Inspection: Wiper arm

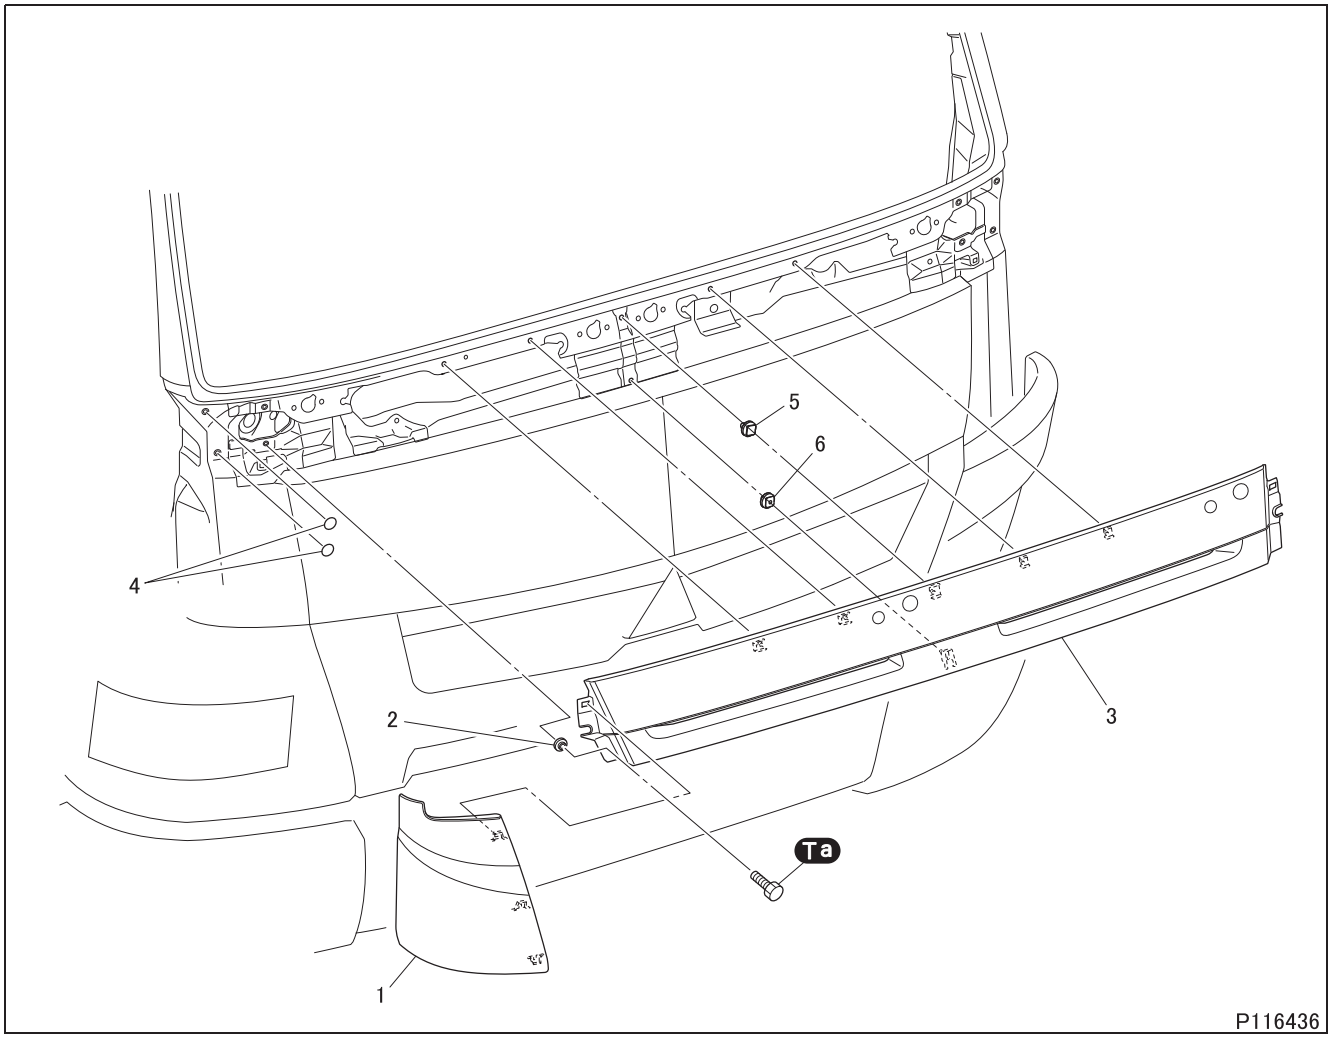
- Measure the wiper arm force to press the blade against the windshield.
- If the measurement deviates from the standard value, replace the wiper arm.

◆Installation procedure◆



■Installation: Wiper arm and blade

- Install the wiper arm and blade so that the blades travel no closer than points A and B from the edge of the weatherstrip.
  A: 50 mm {1.97 in.}
  B: 59 ± 5 mm {2.3 ± 0.20 in.}



●Disassembly sequence

1 Front corner panel (See later section.)
2 Collar
3 Front cover
4 Plug
5 Clip A
6 Clip B

●Assembly sequence

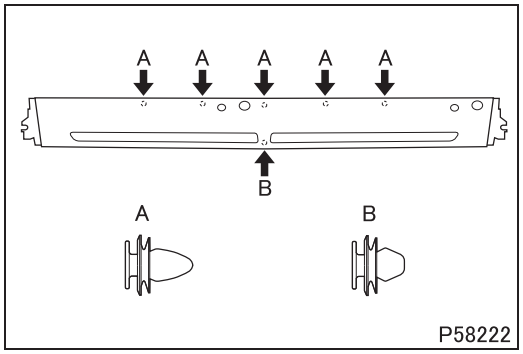
Follow the disassembly sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (front cover attaching)	9 to 14 {6.6 to 10, 0.9 to 1.4}	–

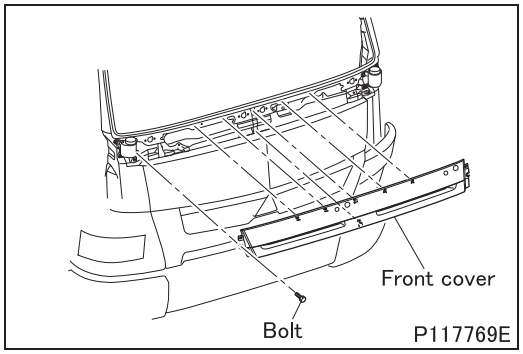
FRONT COVER

◆Removal procedure◆



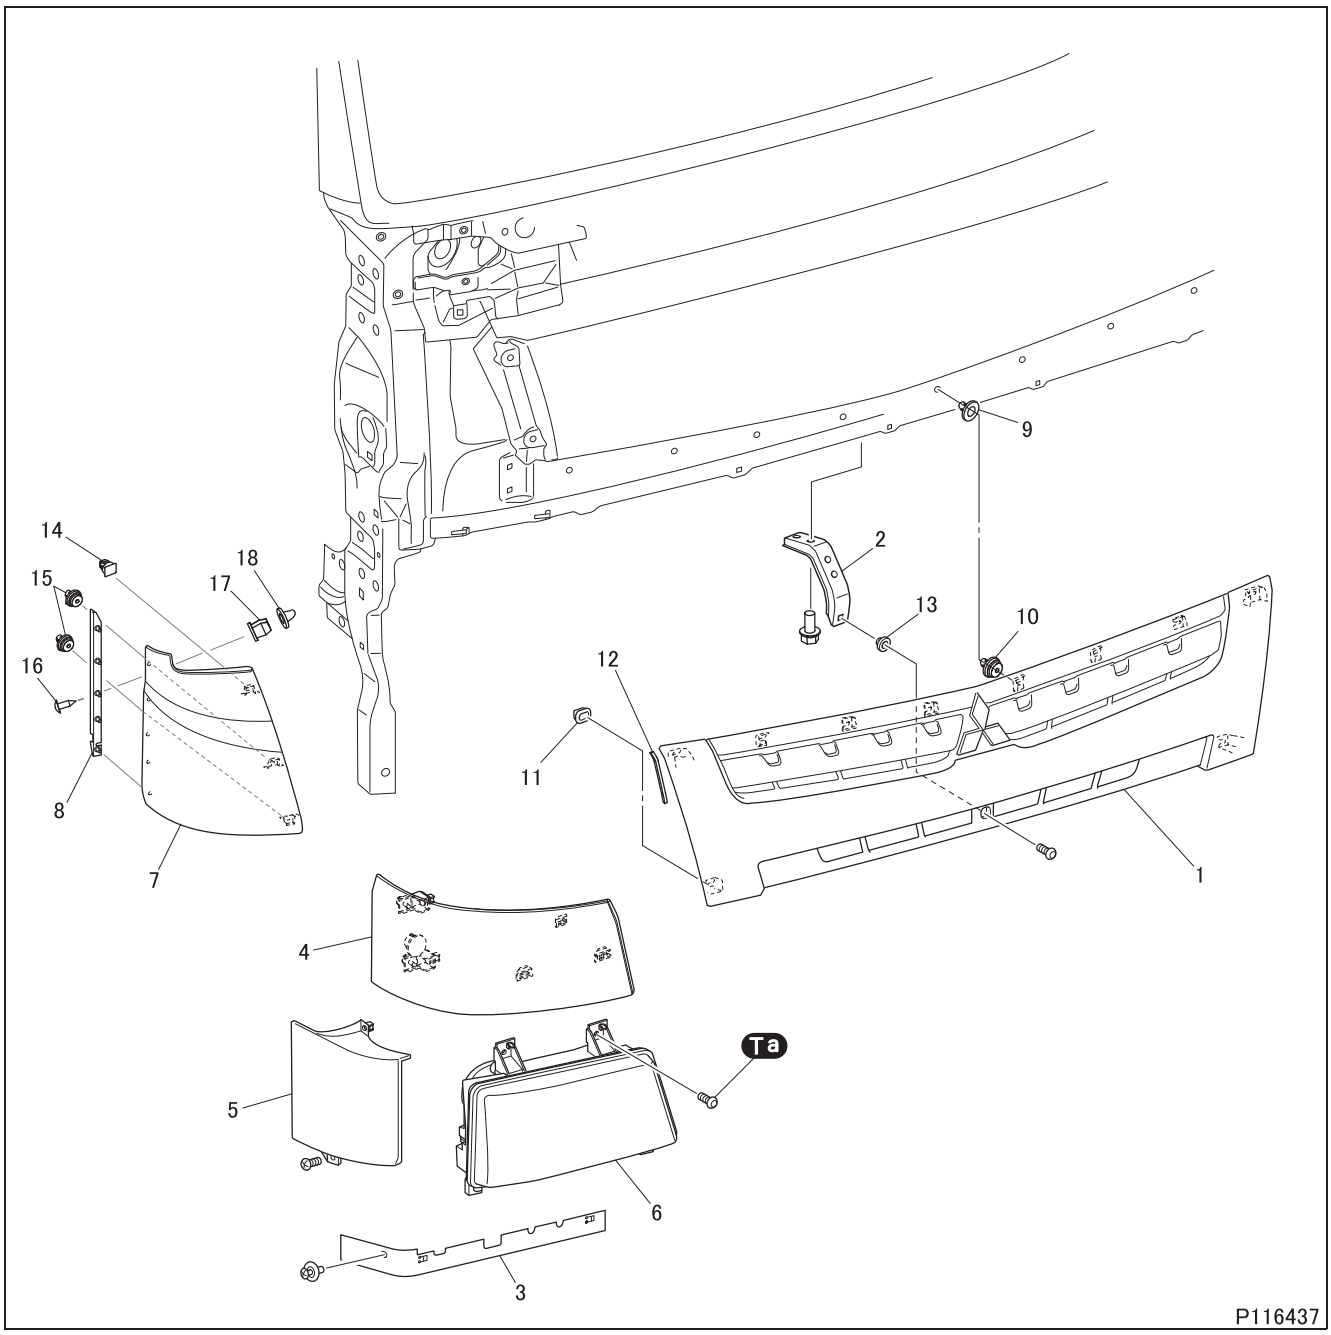
■Removal: Front cover

◆Installation procedure◆



■Installation: Front cover

- Push the front cover until a click is heard of the clip and then install the bolt.



● **Disassembly sequence**

1	Front grille	**7**	Front corner panel	**13**	Grommet
2	Bracket	**8**	Door opening seal	**14**	Clip C
3	Lamp rubber	**9**	Clip A	**15**	Clip D
4	Turn signal lamp	**10**	Front grill clip	**16**	Screw
5	Headlamp garnish	**11**	Clip B	**17**	Grommet
6	Headlamp	**12**	Packing	**18**	Clip E

CAUTION ⚠

- **Do not attempt to forcedly remove lamp rubber, turn signal lamp, headlamp garnish and headlamp. Their mounting claws could be damaged.**
- **Do not remove door opening seal unless absolutely necessary.**

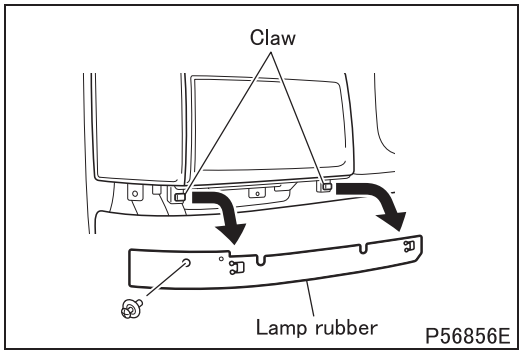
FRONT GRILLE, FRONT CORNER PANEL AND HEADLAMP

●Assembly sequence
Follow the disassembly sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (front cover attaching)	4 to 6 {3.0 to 4.4, 0.4 to 0.6}	–

◆Removal procedure◆

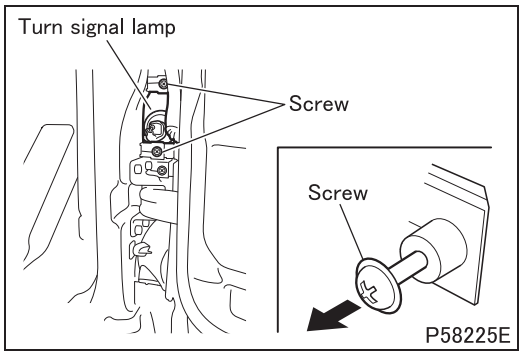


■Removal: Lamp rubber

- Slide the lamp rubber sideways to disengage from the claws of the headlamp.

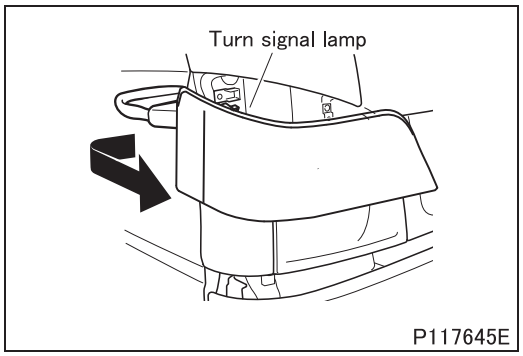
CAUTION ⚠

- **Do not pull the lamp rubber to forcedly remove. It could be damaged.**

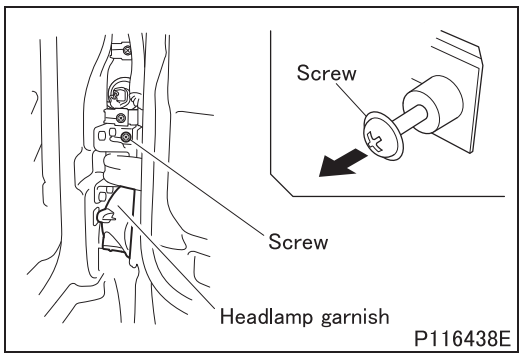


■Removal: Turn signal lamp

- Open the door. Loosen screws securing the turn signal lamp from behind until they turn freely.
- Pull out the loosened screws.

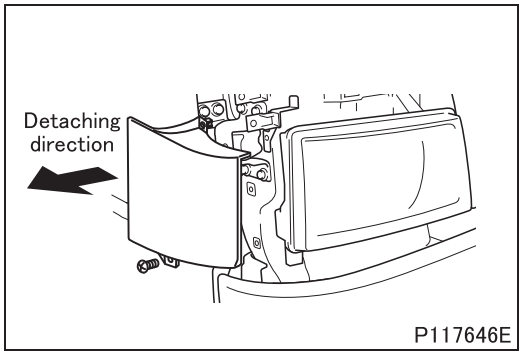


- Close the door. Move the turn signal lamp sideways to disengage its claws.
- Confirm the disengagement of the claws, then pull out the turn signal lamp.

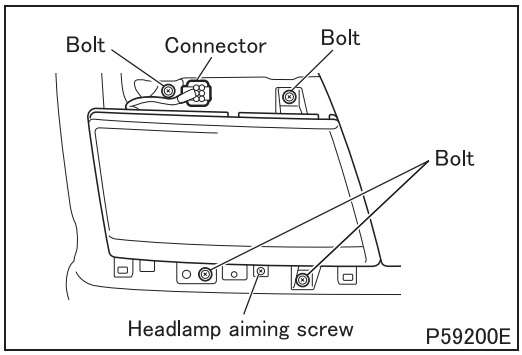


■Removal: Headlamp garnish

- Open the door. Loosen the screw securing the headlamp garnish from behind until it turn freely.
- Pull out the loosened screw.



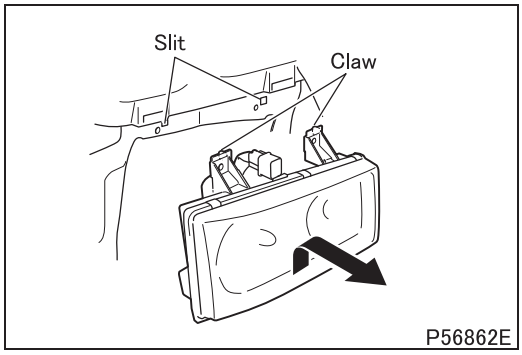
- Close the door, and remove the headlamp garnish.



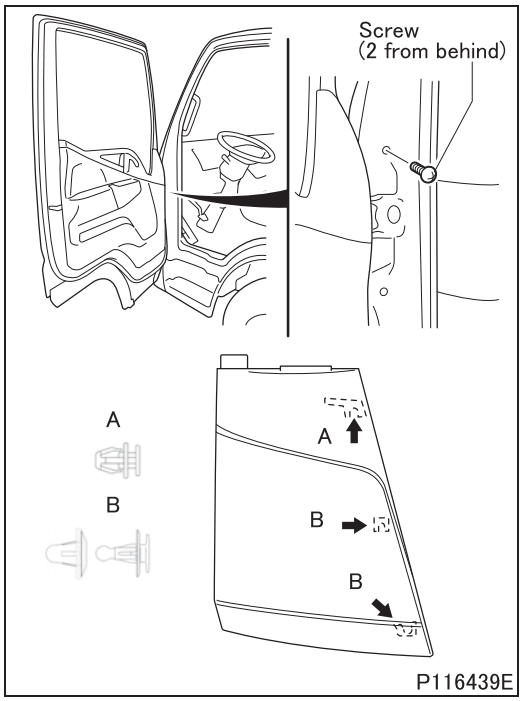
■Removal: Headlamp

CAUTION ⚠

- **The headlamp has aiming screws at the illustrated positions. Do not mistake them for mounting bolts.**



- Lift the headlamp a little to disengage its claws from the slits, then pull it out.



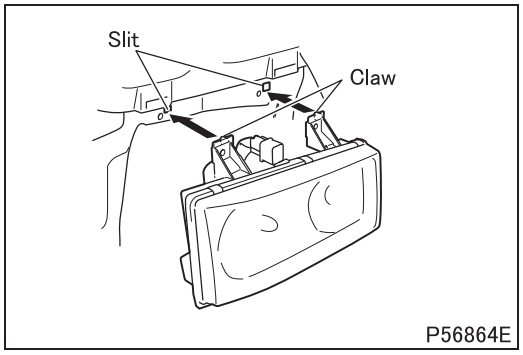
■Removal: Front corner panel

- Open the door. Remove two screws securing the front corner panel from behind.
- Close the door. Remove three clips securing the front corner panel from front.
- Remove the front corner panel.

◆Installation procedure◆

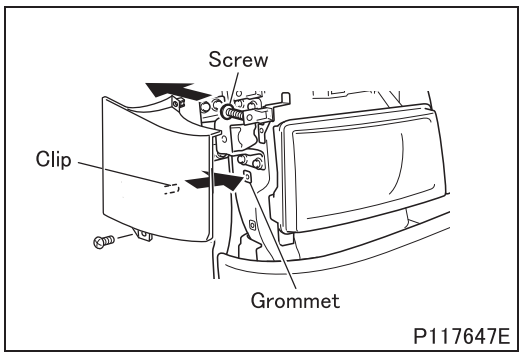
■Installation: Front corner panel

- To install the front corner panel, follow the removal sequence in reverse.
- To install the front corner panel, push it until a click is heard of the clips (at three places).
  (See **"■Removal: Front corner panel"**.)



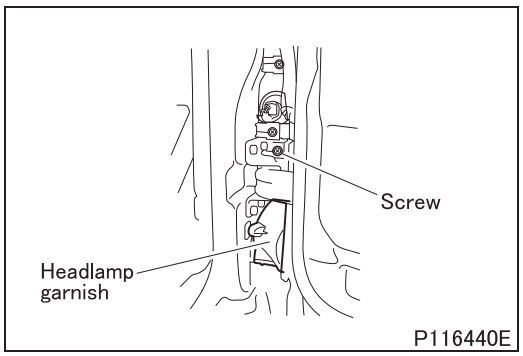
■Installation: Headlamp

- Install the headlamp with its claws inserted in the slits.



■Installation: Headlamp garnish

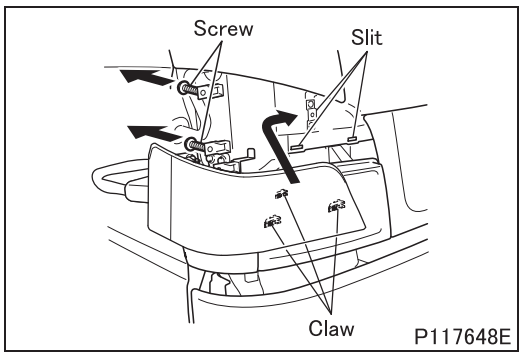
- Check to see if the threaded portion of cab-side screw protrudes. If it does, move it out of the way in the illustrated direction.
- Check to see that the end rubber is installed in the headlamp garnish.
- Insert the clip of the headlamp garnish into the grommet.



- Open the door. Tighten the screw securing the headlamp garnish from behind.

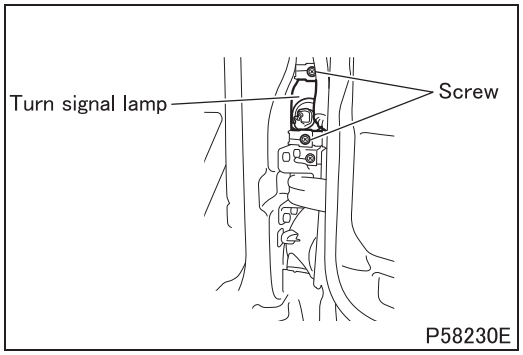
CAUTION ⚠

- **Do not overtighten the screw. Doing so may damage the headlamp garnish.**



■Installation: Turn signal lamp

- Check to see if the threaded portions of screws protrude. If they protrude, move them out of the way in the illustrated direction.
- Put the claws of the turn signal lamp in the cab-side slits, then press-fit the lamp sideways into place.



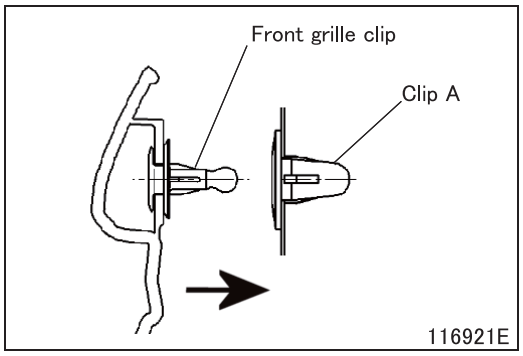
• Open the door, and secure the turn signal lamp by tightening screws from behind.

CAUTION ⚠

- **Do not open the door when the turn signal lamp is not seated completely. Doing so may damage the turn signal lamp.**
- **Do not overtighten the screws. Doing so may damage the turn signal lamp.**

■Installation: Lamp rubber

• Perform the removal procedure in reverse.
(See **"■Removal: Lamp rubber"**.)



■Installation: Front grille

• Install the front grille by pushing the areas where a clip is fitted. If clip engaging sound is not heard, replace both the front grille clip and clip A.

CAUTION ⚠

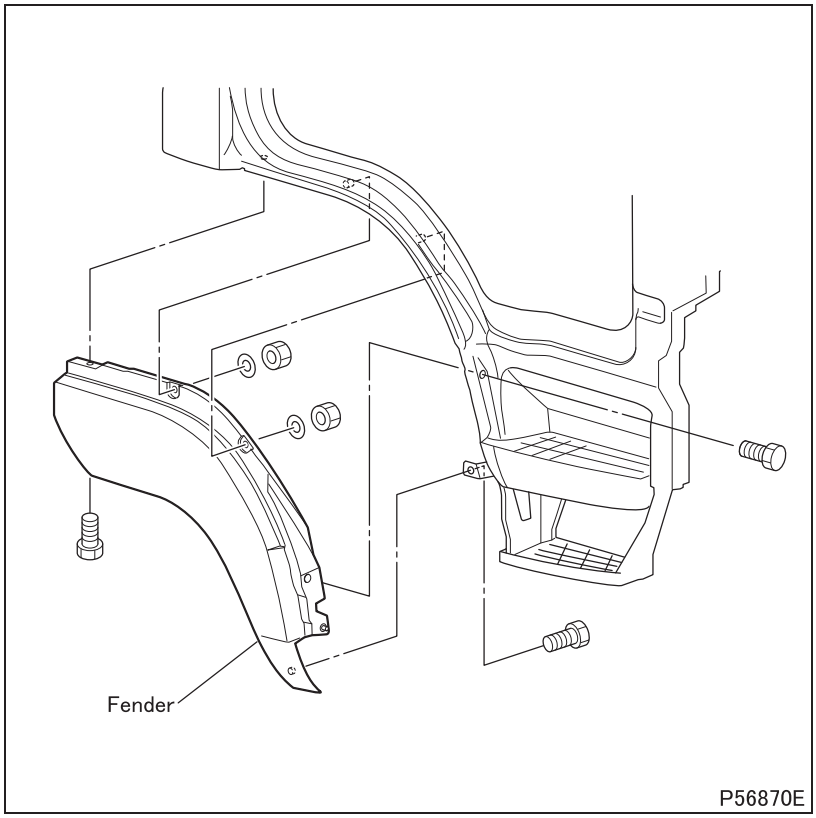
- **Do not hit on the areas where a clip is fitted. Doing so could damage the front grille.**

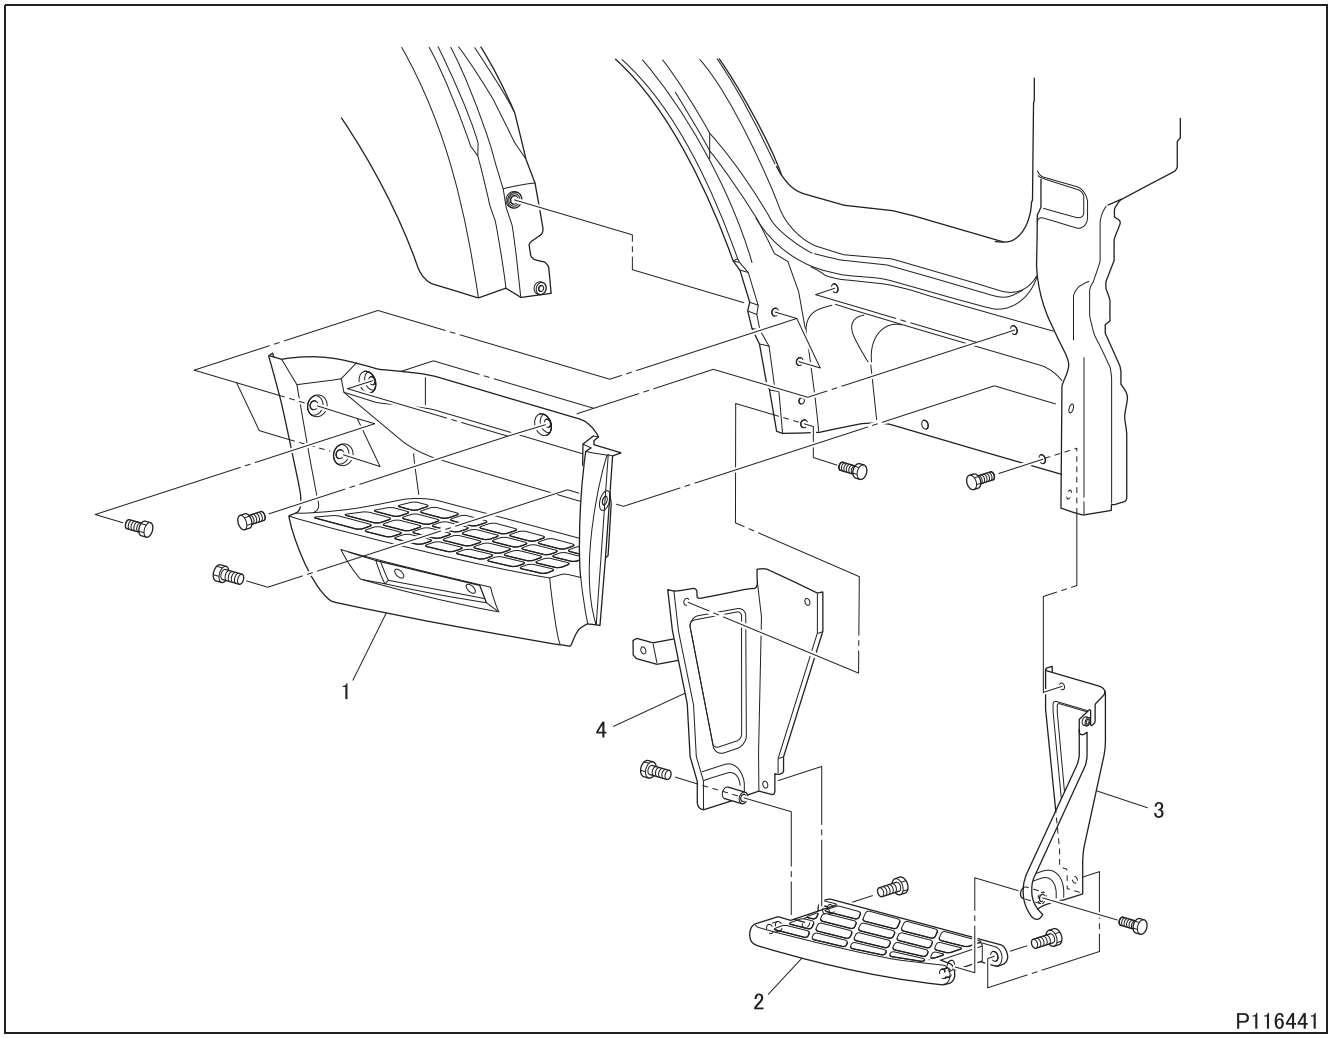
• After installing the front grille, check that the packings at both ends of the front grille are not extruded from the gaps between the front grille and headlamps. If the packings are extruded, fit them into the gaps.

CAUTION ⚠

- **Be careful not to damage the front grille and headlamps.**

FENDER <FG>





●Removal sequence

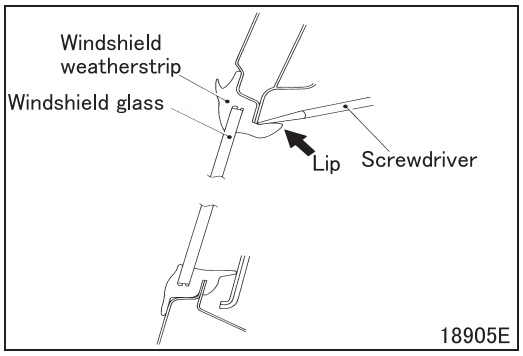
1 Windshield weatherstrip
2 Windshield glass
3 Rear window weatherstrip
4 Rear window glass

⊗: Non-reusable parts

●Installation sequence

Follow the removal sequence in reverse.

◆Removal procedure◆



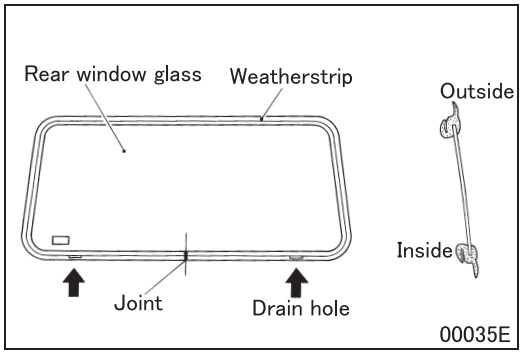
■Removal: Windshield weatherstrip and windshield glass

- While prying up the lip of the weatherstrip with the tip of a screwdriver, push the windshield glass out from inside the cab.

CAUTION ⚠

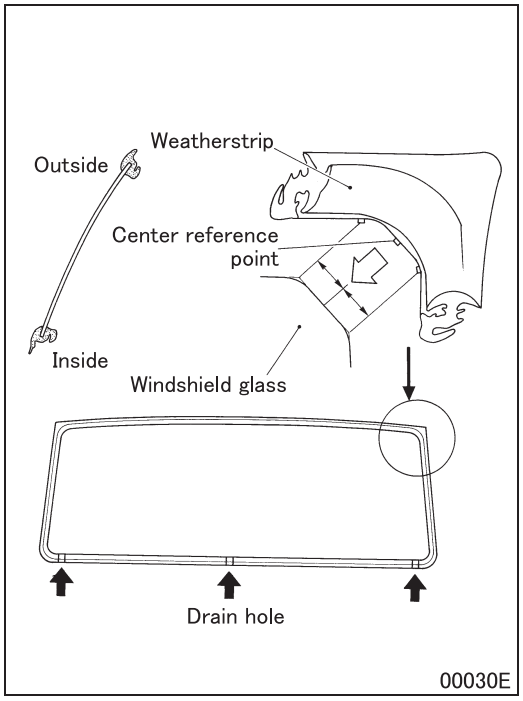
- **Be careful not to damage the painted surface of the cab. Damaged surface may form rust.**

◆Installation procedure◆



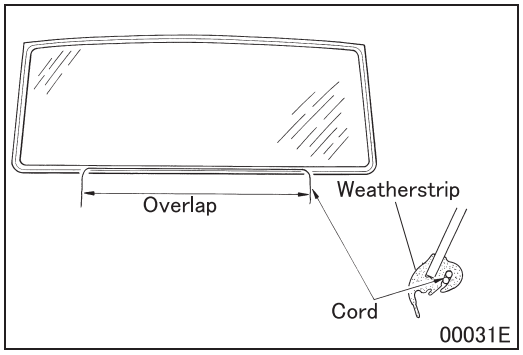
■Installation: Rear window weatherstrip and rear window glass

- Fit the rear window weatherstrip round the rear window glass so that the joint of weatherstrip comes at the bottom center of the glass.
- Except for the point mentioned above, install the rear window glass in the same manner as the windshield glass.

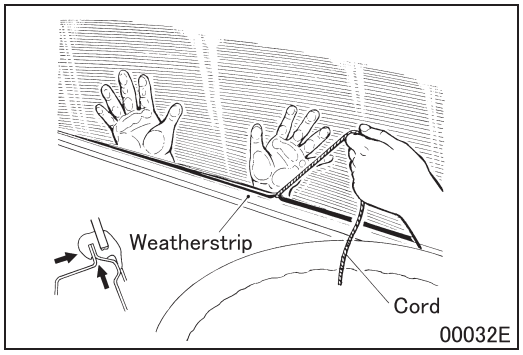


■Installation: Windshield weatherstrip and windshield glass

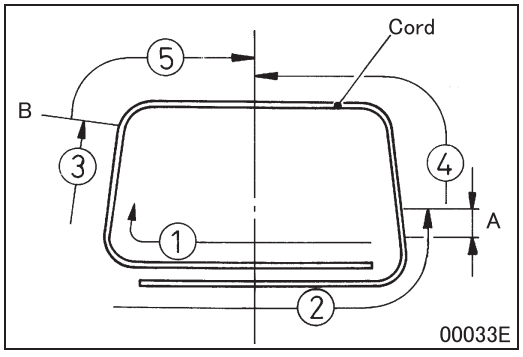
- Install the weatherstrip with its center reference point aligned with the center of the cut at each corner of the glass.



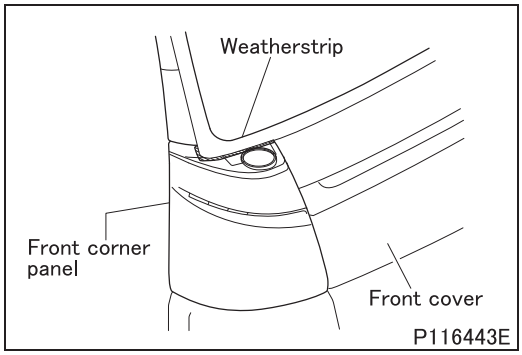
- Put a piece of strong cord in the cab flange fitting groove in the weatherstrip with its end portions overlapped.



- With the glass strongly pushed from outside, pull out the cord by its ends from inside the cab to gradually fit the flange of the cab in the inner groove of the weatherstrip.



- Pull the cord in the numerical order of steps as shown. At the same time, while tapping with a rubber-headed mallet from outside the cab, settle the windshield glass in place in the weatherstrip.
  - A: Approx. 100 mm {3.9 in.} from the beginning of straight portion
  - B: Up to the end of straight portion



- To ensure watertightness, put the hatched part of the weatherstrip inside between the cab and the front cover and front corner panel.

● **Installation sequence**

Follow the removal sequence in reverse.

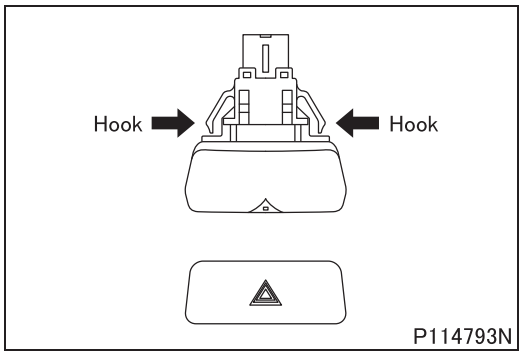
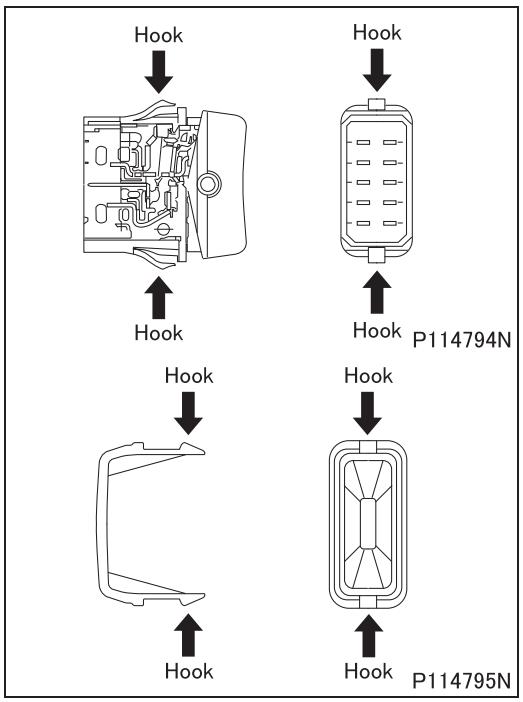
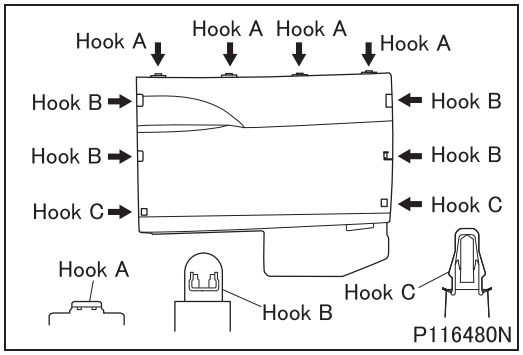
◆**Removal procedure**◆



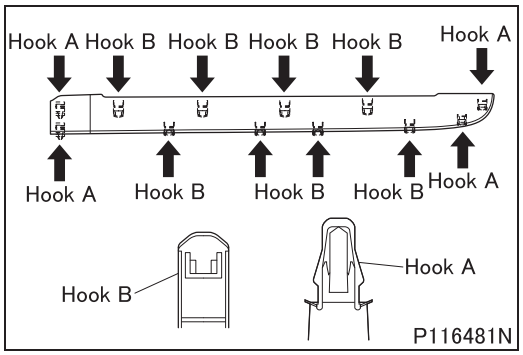
■ **Removal: Hazard switch**



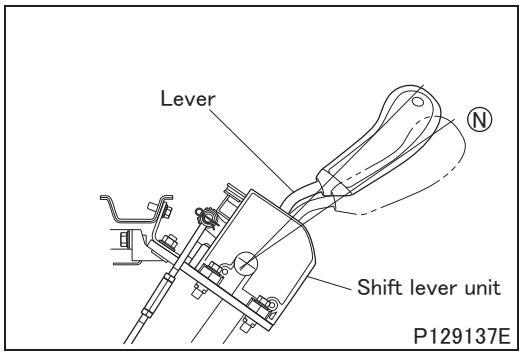
■ **Removal: Switch or plug**



■ **Removal: Passenger panel**

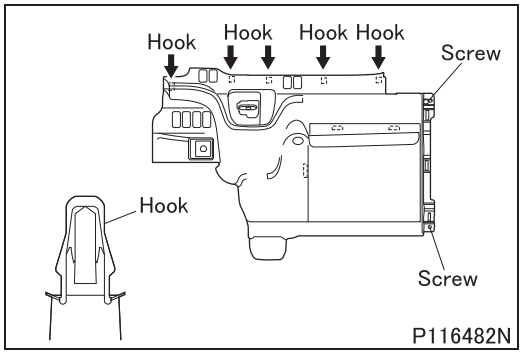


■ **Removal: Passenger garnish**

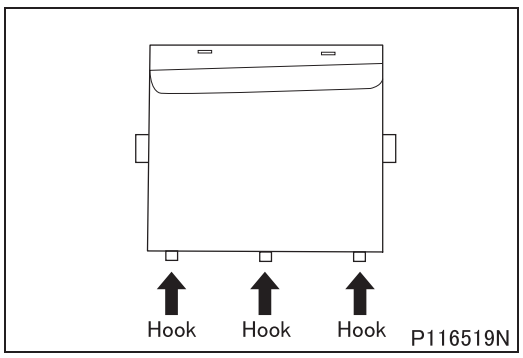


■ **Removal: Lower center panel**

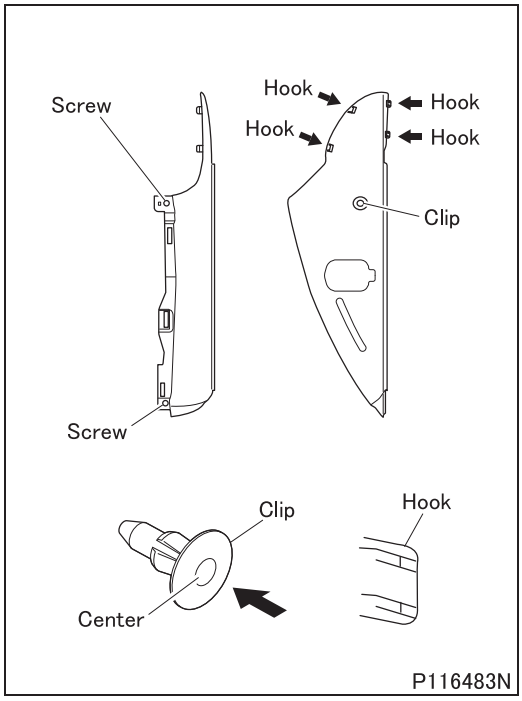
- Set the shift lever in N range.



- Remove the screws (× 2) from the lower center panel.

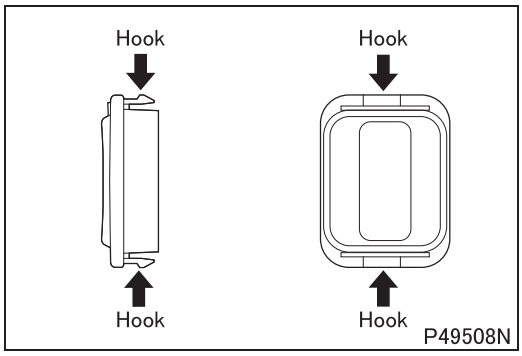


■ **Removal: Pocket panel**

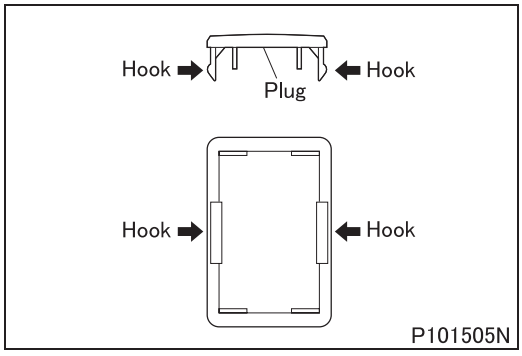


■ **Removal: Side panel**

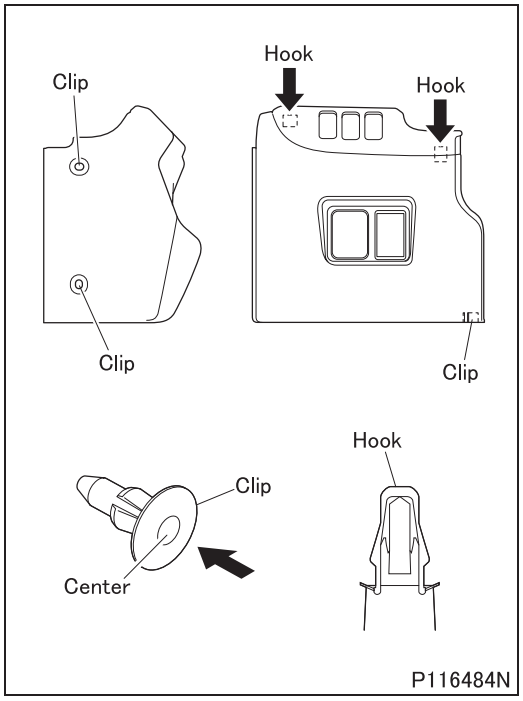
- Remove the screws (× 2) from the side panel.
- Push the clip (× 1) in the center to disengage them from the side panel.



■ **Removal: Plug**



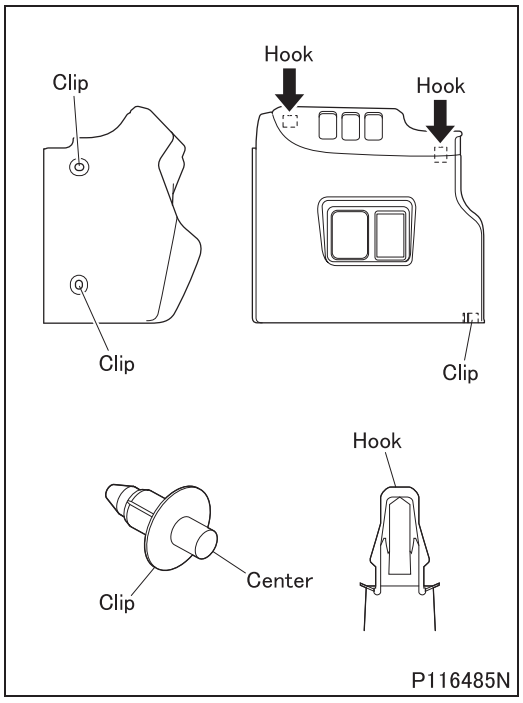
■ **Removal: Plug**



■ **Removal: Driver panel**

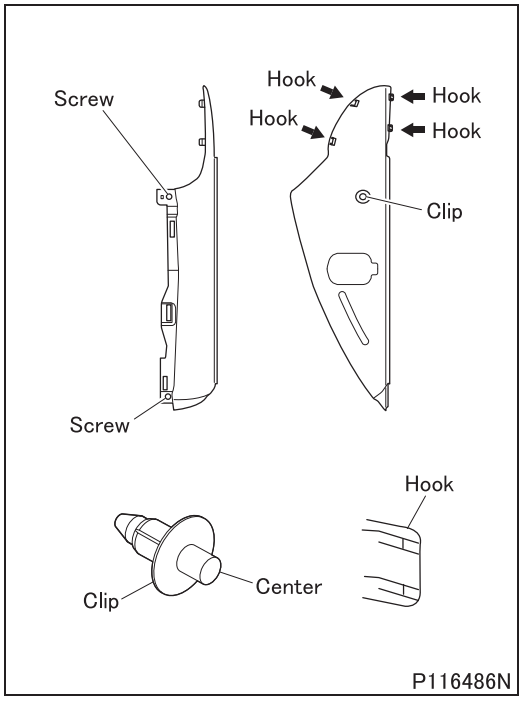
- Push the clips in the center to disengage them from the driver panel.

◆**Installation procedure**◆



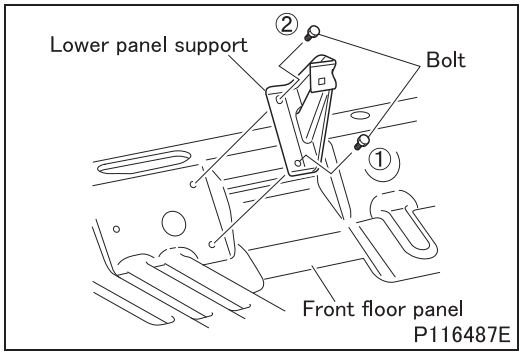
■ **Installation: Driver panel**

- Insert the clips at the illustrated locations and push them in the center to engage into the driver panel.



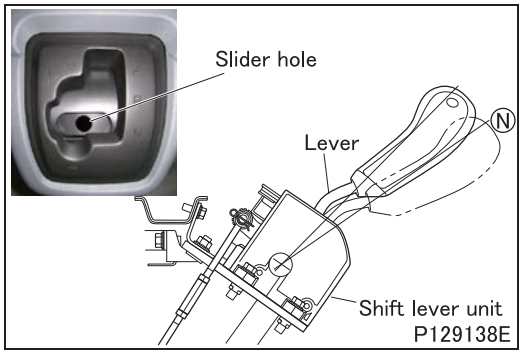
■ **Installation: Side panel**

- Insert the clip (× 1) at the illustrated location and push it in the center to engage into the side panel.
- Install the screws (× 2) to the passenger panel.



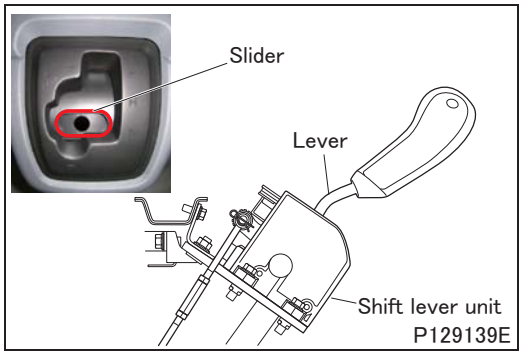
■ **Installation: Lower panel support**

- Insert the clips (× 3) at the illustrated locations and push them in the center to engage into the gear shift lever cover.



■ **Installation: Lower center panel**

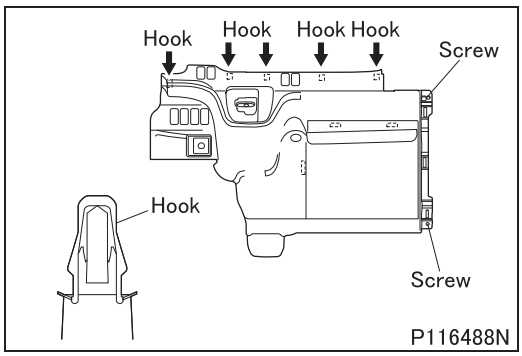
- Set the shift lever and the hole in the slider of the lower center panel in N range position.



- When installing the lower center panel, check if the shift lever interferes with the slider (part which moves laterally, marked with a circle) and pushes it upward. If so, correct the installation condition.

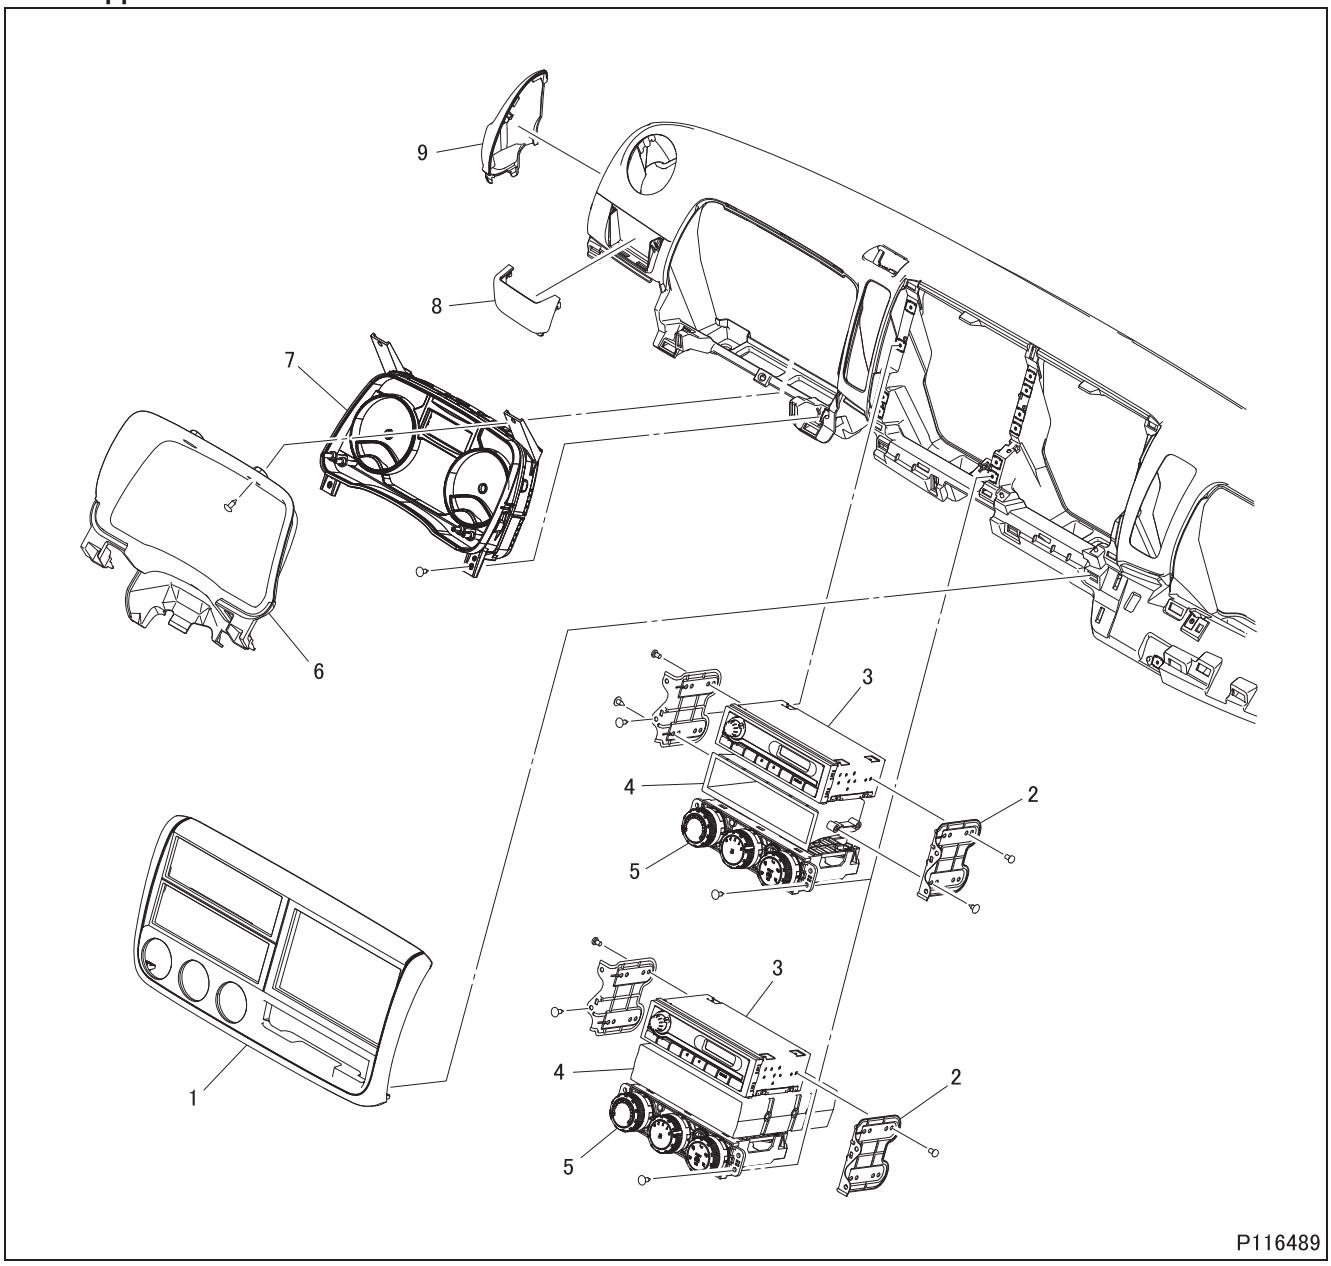
CAUTION ⚠

- **When passing the shift lever through the hole in the slider to install the lower center panel, the slider is pushed upward if the lever interferes with the slider. If the shift lever is operated in this condition, the slider will deform and disturb the smooth operation of the shift lever. When passing the shift lever through the hole in the slider, be careful not to interfere the lever with the slider.**



- Install the screws (× 2) to the lower center panel.

Driver Upper Panel



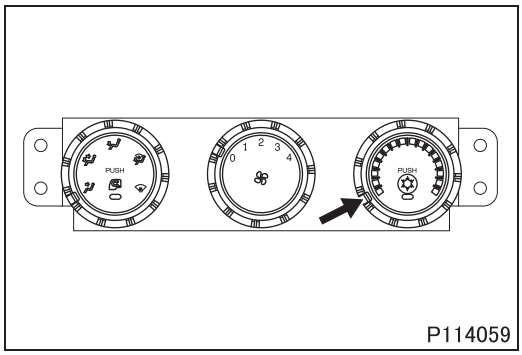
● Removal sequence

1 Upper center panel
2 Radio bracket
3 Box or radio or tachograph
4 Box or tachograph
5 Heater control (See later section.)
6 Meter bezel
7 Meter cluster
8 Pocket panel
9 Lid (brake fluid tank)

● Installation sequence

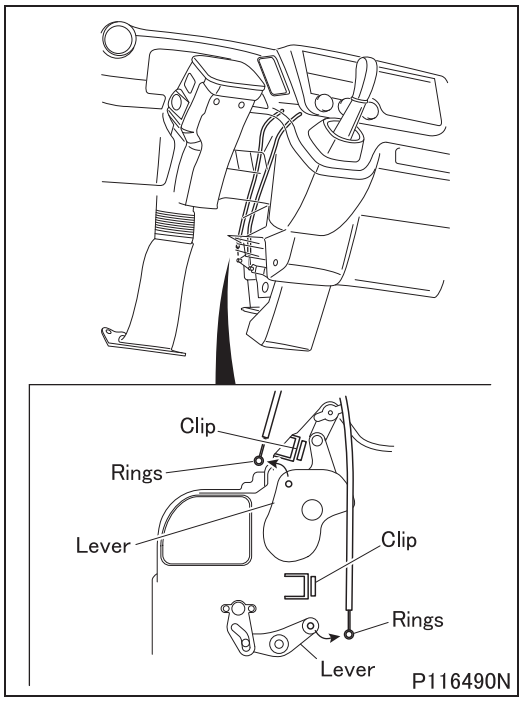
Follow the removal sequence in reverse.

◆Work before removal◆

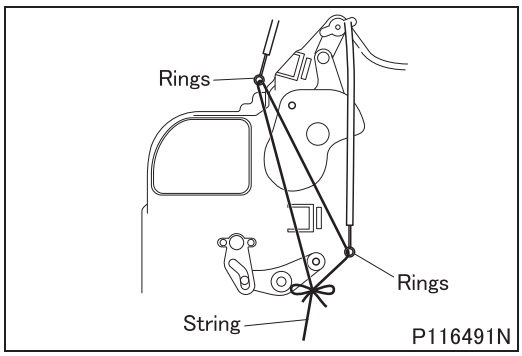


■ **Removal: Control cables**

- Turn the temperature control knob of the heater controls to the MAX-COOL position.

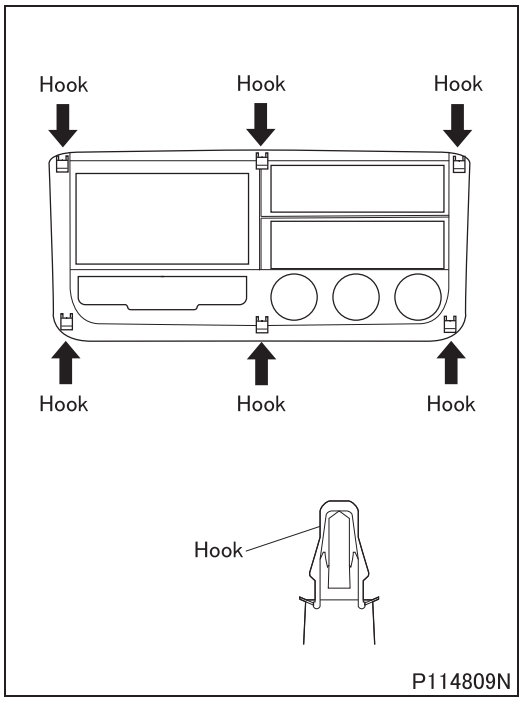


- Before disconnecting the cables from the levers, put pairing marks on each cable and its lever.
- Disconnect the control cables from the heater unit.

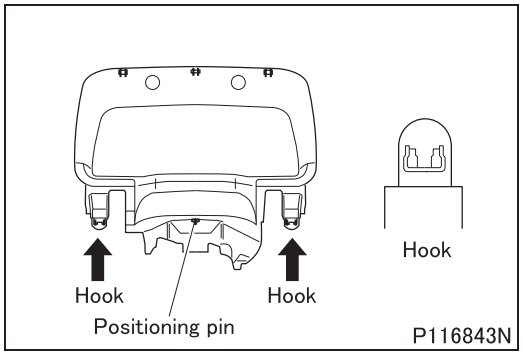


- In order that the control cables can be pulled back during installation, attach a string to the rings on the cables as shown in the illustration.

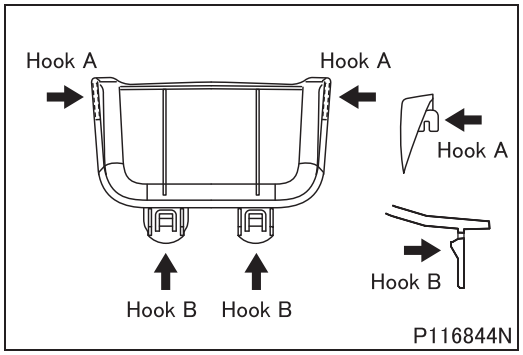
◆Removal procedure◆



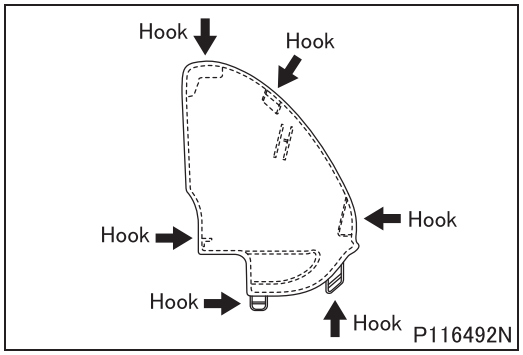
■ **Removal: Upper center panel**



■ **Removal: Meter cluster**

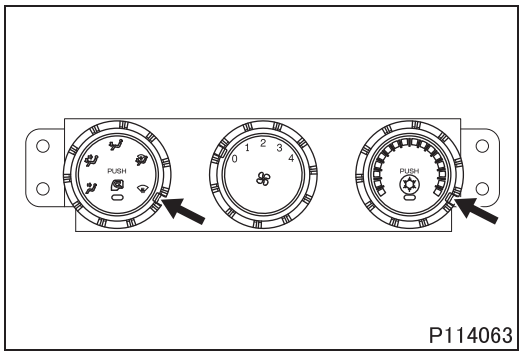


■ **Removal: Pocket panel**



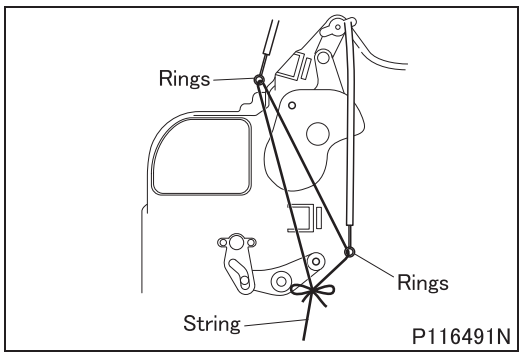
■ **Removal: Lid (brake fluid tank)**

◆**Work after installation**◆



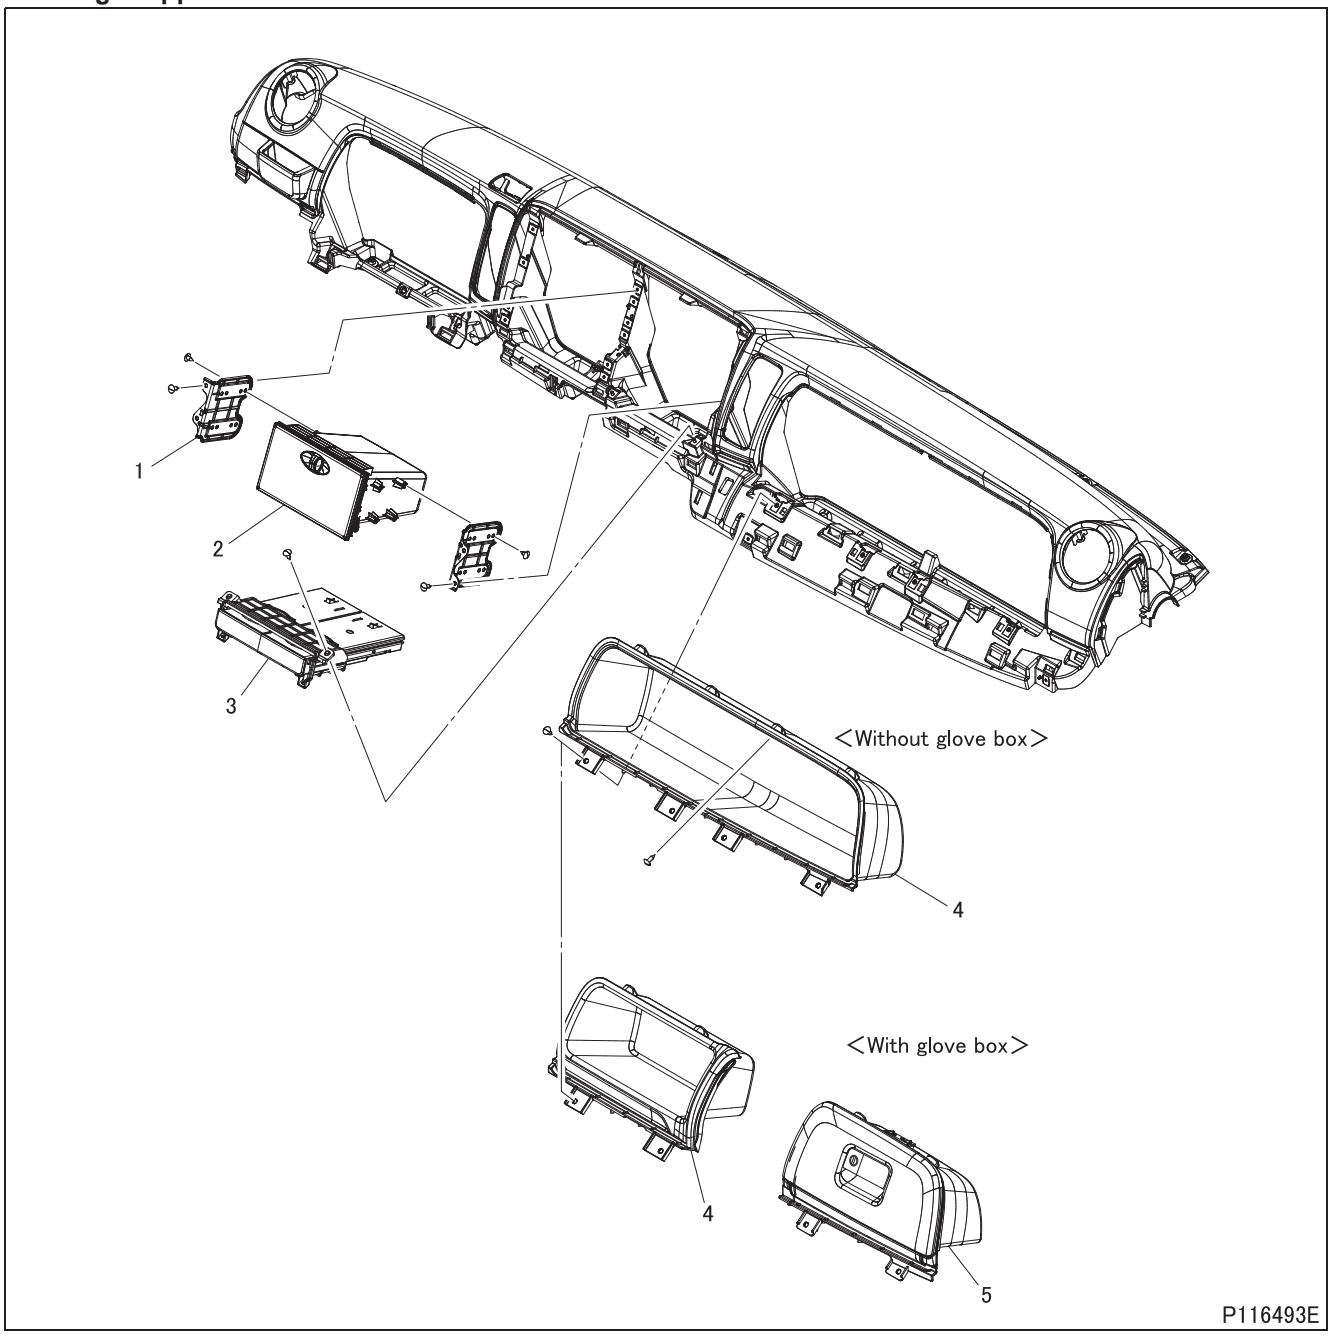
■**Installation: Control cables**

- Of the heater controls, turn the temperature control knob to the MAX-HOT position and also turn the mode selector knob to the DEF position.



- Pull out the control cables using the string that was attached to them at the time of removal.
- According to the pairing marks, reconnect the cables to the heater unit levers correctly. (See Gr55.)

Passenger Upper Panel



●Removal sequence

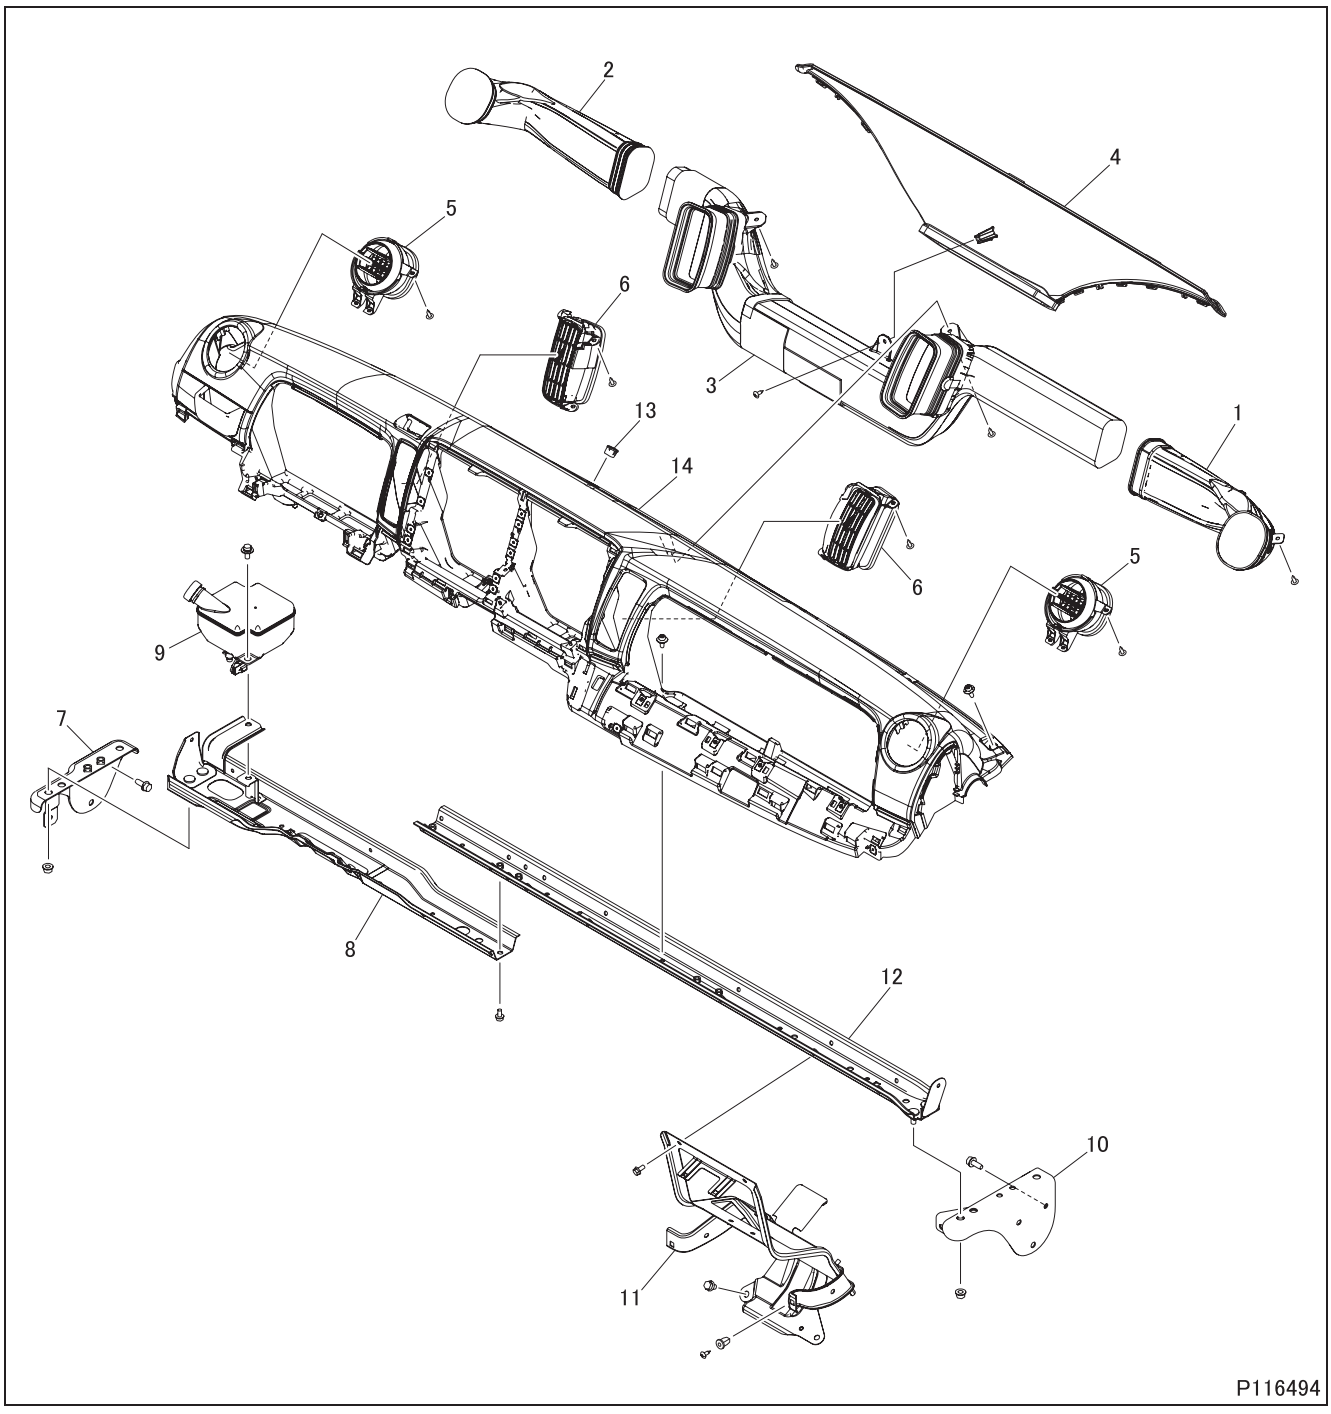
1 Radio bracket
2 Box
3 Cap holder
4 Parcel tray
5 Glove box <With glove box>

● Installation sequence

Follow the removal sequence in reverse.

INSTRUMENT PANEL

Instrument Panel



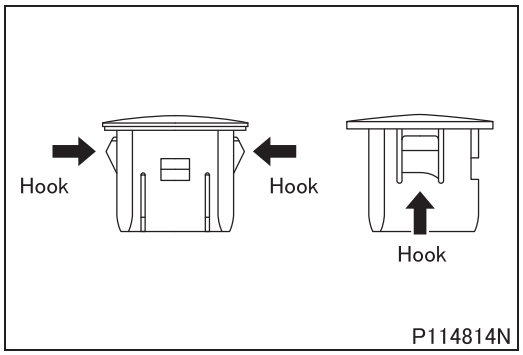
● **Removal sequence**

1 Passenger face duct
2 Driver face duct
3 Center face duct
4 Defroster duct
5 Air outlet side grille
6 Air outlet center grille
7 Instrument panel bracket (left-hand)
8 Driver instrument panel frame
9 Brake fluid tank
10 Instrument panel bracket (right-hand)
11 Sam support
12 Passenger instrument panel frame
13 Plug or photo sensor
14 Instrument panel

● Installation sequence

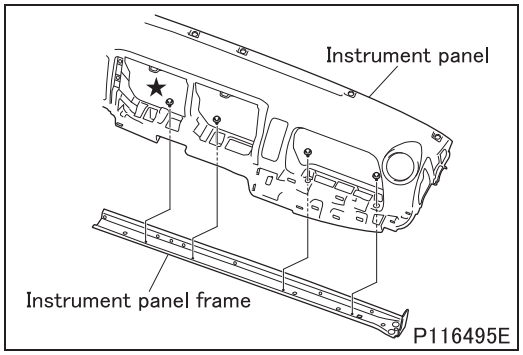
Follow the removal sequence in reverse.

◆Removal procedure◆



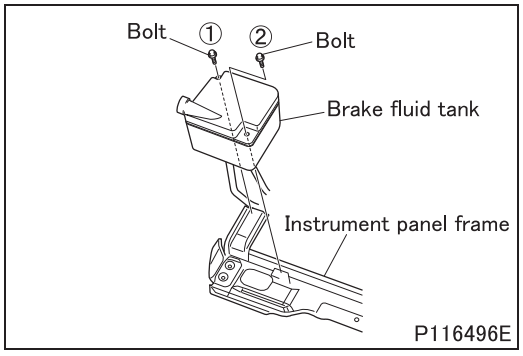
■ **Removal: Plug or photo sensor**

◆Installation procedure◆



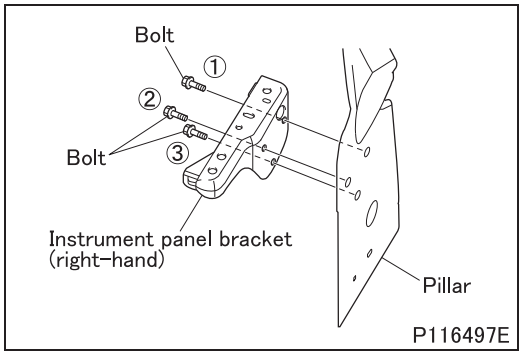
■**Installation: Passenger-side instrument panel frame**

- Install the passenger-side instrument panel frame to the instrument panel by tightening the positioning bolt (marked with ★ in the illustration) first.



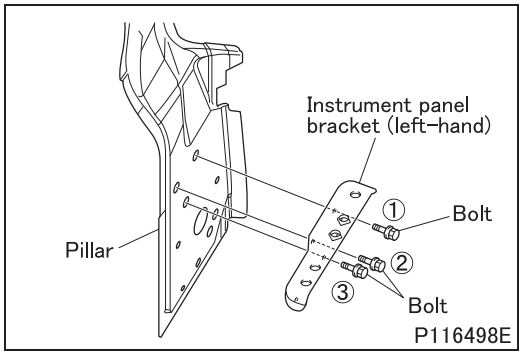
■**Installation: Brake fluid tank**

- Install the brake fluid tank to the driver-side instrument panel frame by tightening the bolts in the order shown in the illustration.



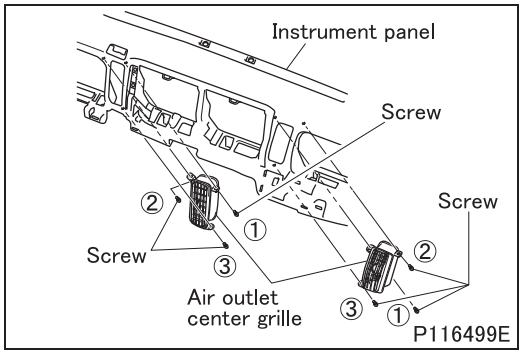
■**Installation: Instrument panel bracket (right-hand)**

- Install the instrument panel bracket (right-hand) to the pillar by tightening the bolts in the order shown in the illustration.



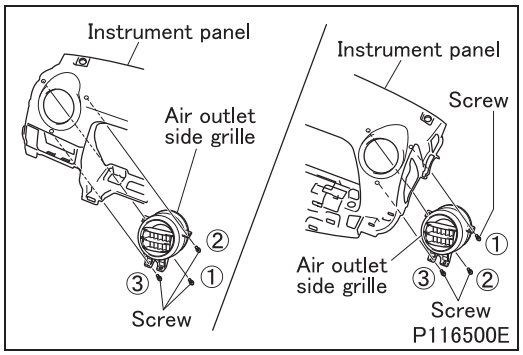
■**Installation: Instrument panel bracket (left-hand)**

- Install the instrument panel bracket (left-hand) to the pillar by tightening the bolts in the order shown in the illustration.



■**Installation: Air outlet center grille**

- Install the air outlet center grille to the instrument panel by tightening the screws in the order shown in the illustration.

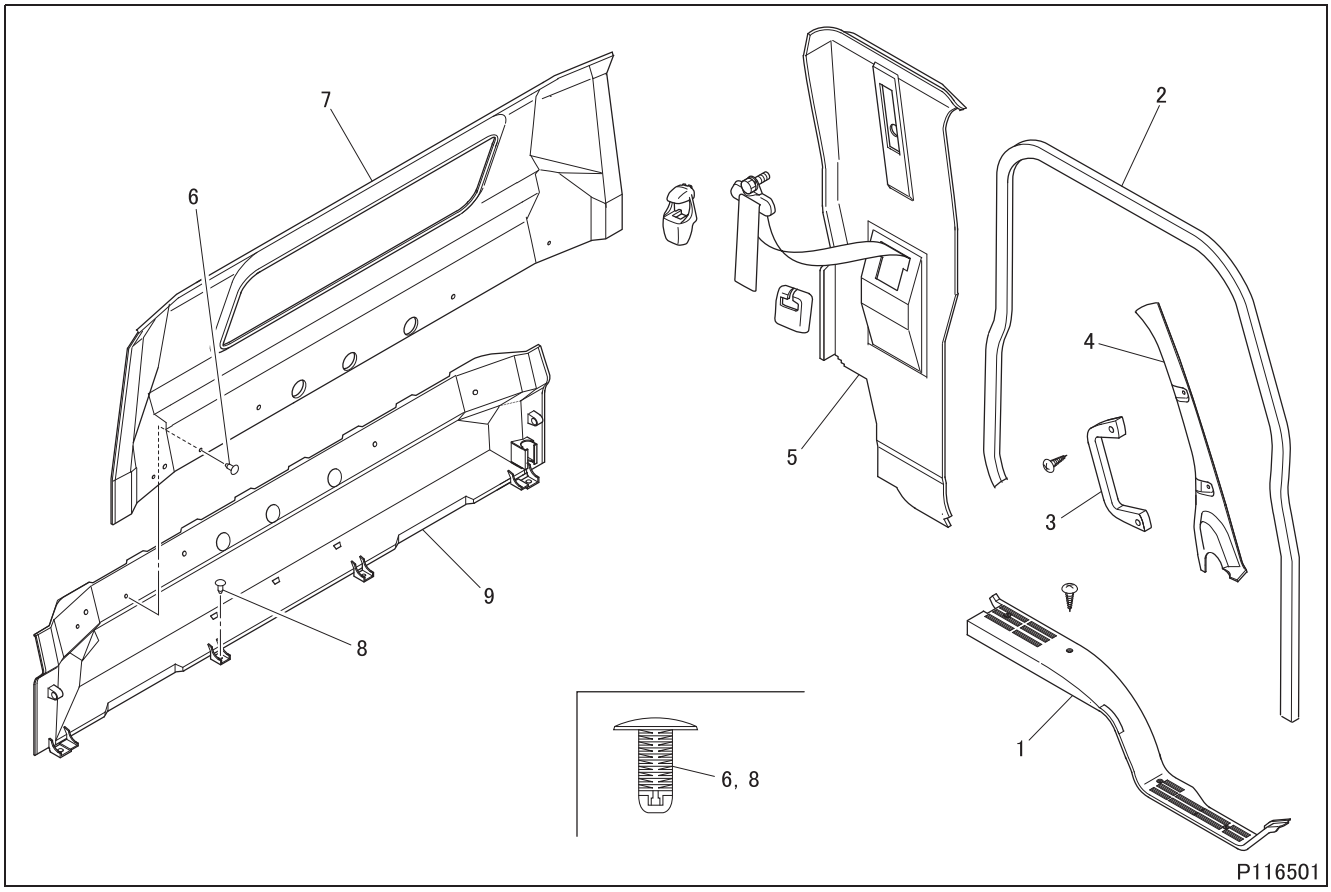


■**Installation: Air outlet side grille**

- Install the air outlet side grille to the instrument panel by tightening the screws in the order shown in the illustration.

M E M O

TRIM AND SCUFF PLATE <EXCEPT CREW CAB>



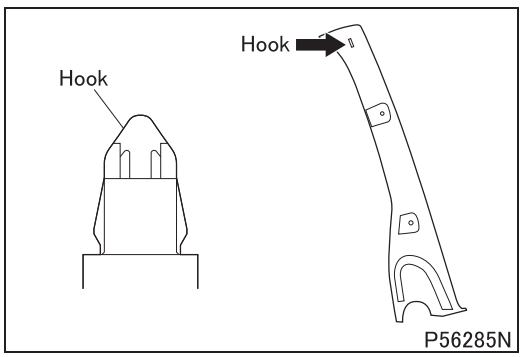
● **Removal sequence**

1 Scuff plate
2 Weatherstrip
3 Grip
4 Front pillar trim
5 Rear pillar trim
6 Clip
7 Upper rear trim
8 Clip
9 Lower rear trim

● **Installation sequence**

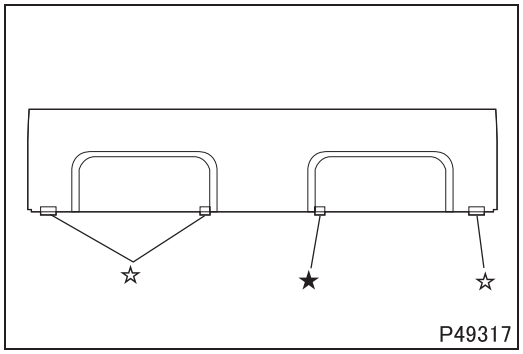
Follow the removal sequence in reverse.

◆**Removal procedure**◆



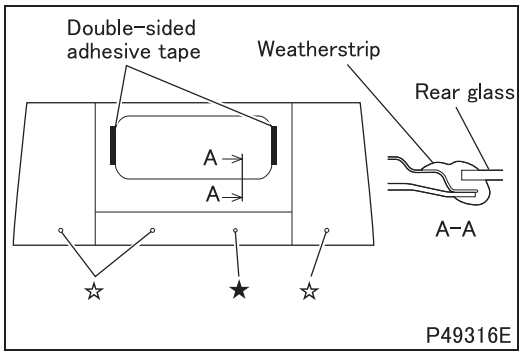
■ **Removal: Front pillar trim**

◆Installation procedure◆



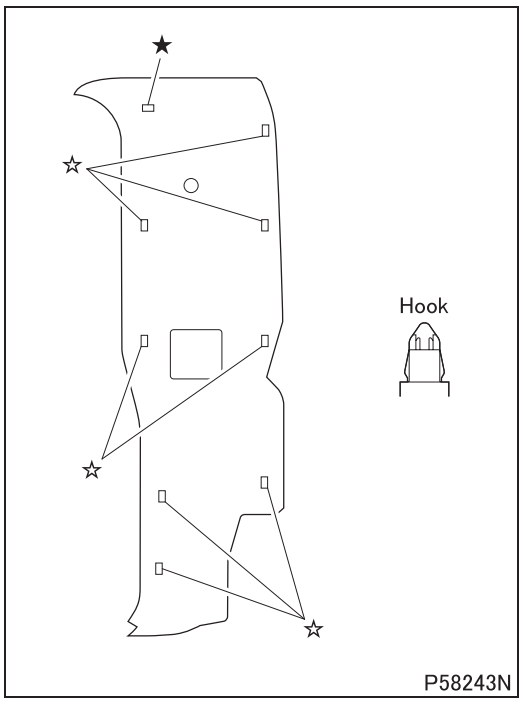
■ Installation: Lower rear trim

- Align the lower rear trim correctly in position by installing a clip into the hole ★.
- Install 3 clips into the holes ☆ to completely fix the lower rear trim in position.



■ Installation: Upper rear trim

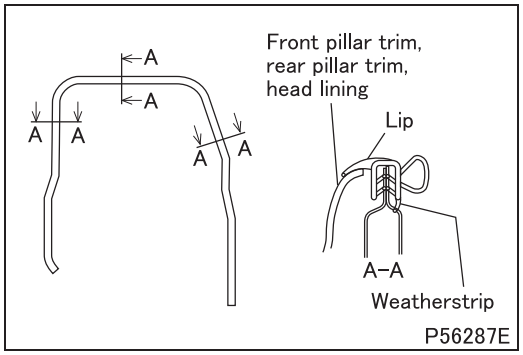
- Stick double-sided adhesive tape onto the upper rear trim along the strips referenced in the illustration.
- Align the upper rear trim correctly in position by installing a clip into the hole ★.
- Remove the backing strips from the double-sided adhesive tapes. Press the trim firmly on where the adhesive tape is applied on the back. Then, install 3 clips at the places ☆.
- Install the rear glass by inserting the rear glass weatherstrip over the upper rear trim.



■ Installation: Rear pillar trim

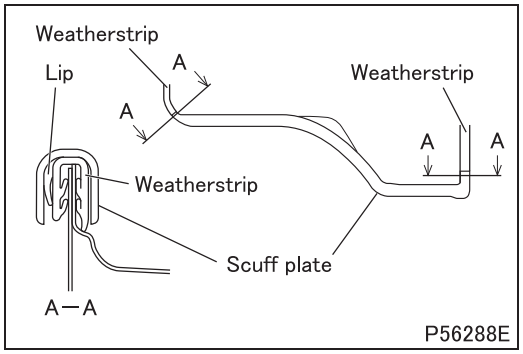
- Align the rear pillar trim correctly onto the cab by engaging the hook ★.
- Engage the hooks ☆ (× 8) onto the cab, from the front to the rear.

TRIM AND SCUFF PLATE <EXCEPT CREW CAB>



■ **Installation: Weatherstrip**

- Install the weatherstrip so that the lip of the strip holds down the front pillar trim, rear pillar trim, and head lining.

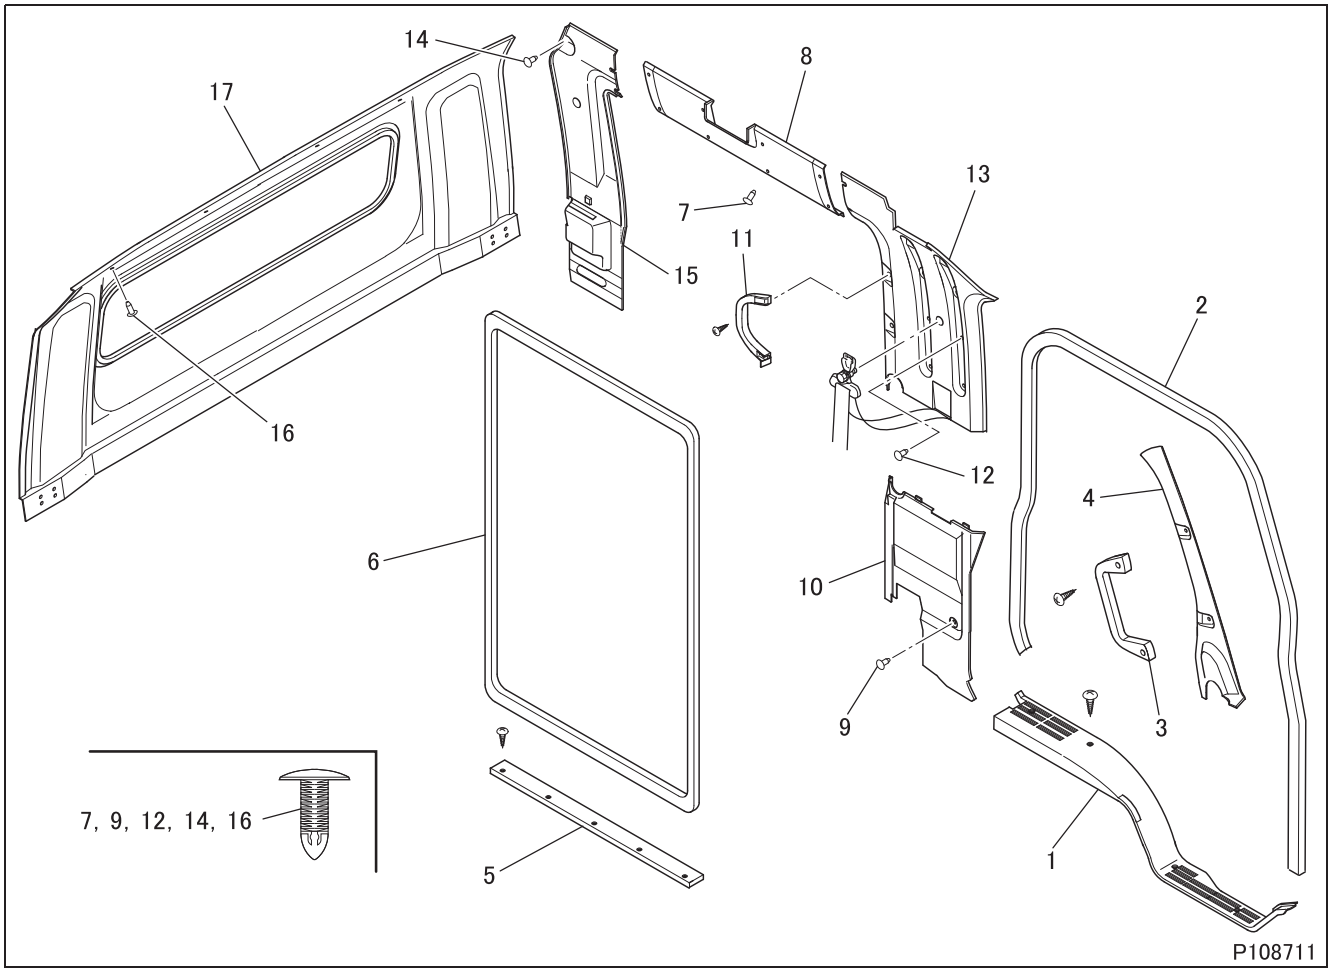


■ **Installation: Scuff plate**

- Install the scuff plate so that it holds down the lip of the weatherstrip.

M E M O

TRIM AND SCUFF PLATE <CREW CAB>



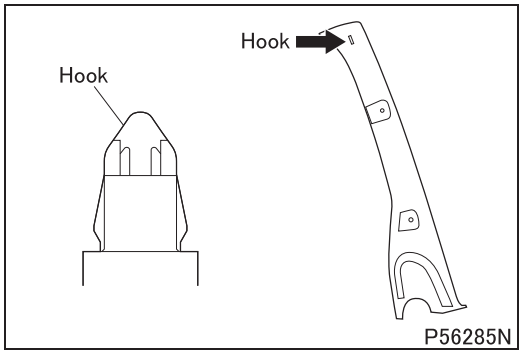
● **Removal sequence**

1 Front scuff plate
2 Weatherstrip
3 Front grip
4 Front pillar trim
5 Rear scuff plate
6 Weatherstrip
7 Clip
8 Roof rail trim
9 Clip
10 Center pillar lower trim
11 Rear grip
12 Clip
13 Center pillar upper trim
14 Clip
15 Rear pillar trim
16 Clip
17 Rear trim

● **Installation sequence**

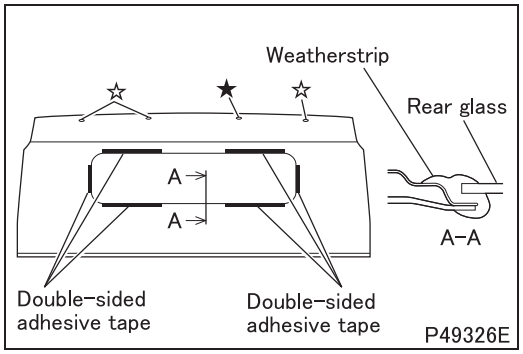
Follow the removal sequence in reverse.

◆Removal procedure◆



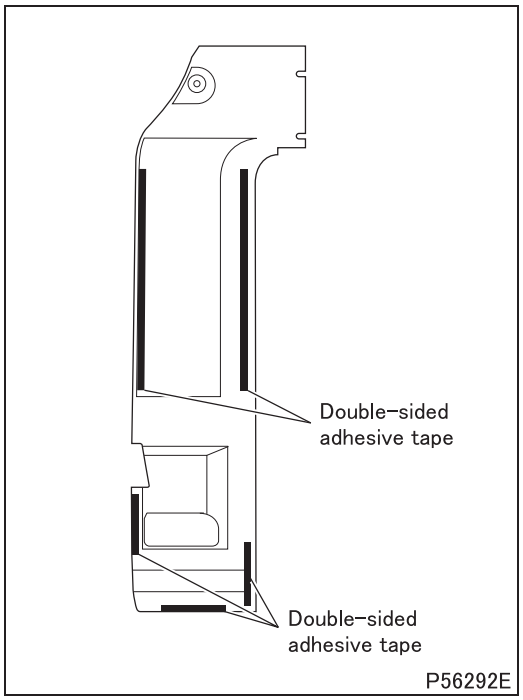
■ **Removal: Front pillar trim**

◆Installation procedure◆



■ **Installation: Rear trim**

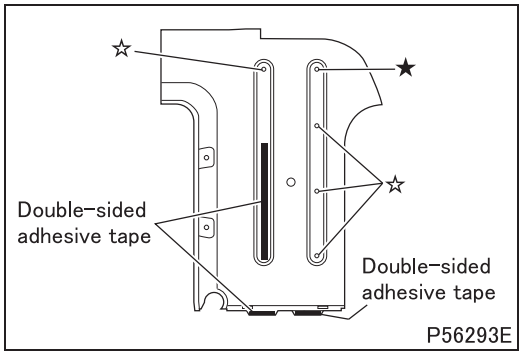
- Stick double-sided adhesive tape onto the rear trims as illustrated.
- Align the rear trim on the cab correctly by installing a clip (marked ★).
- Attach the rear trim onto the cab with adhesive tape.
- Install three clips (marked ☆).
- Place the rear window weatherstrip over the rear trim.



■ **Installation: Rear pillar trim**

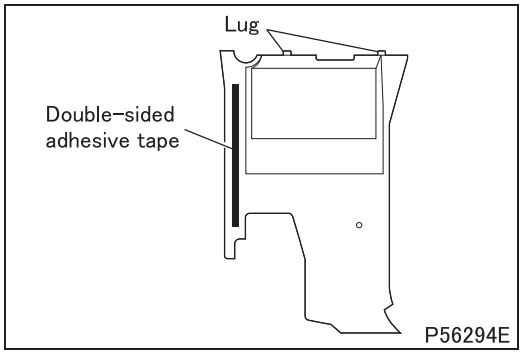
- Stick double-sided adhesive tape onto the rear pillar trims as illustrated.
- Locate the rear pillar trim correctly in position by installing a clip.
- Attach the rear pillar trim onto the cab with adhesive tape.

TRIM AND SCUFF PLATE <CREW CAB>



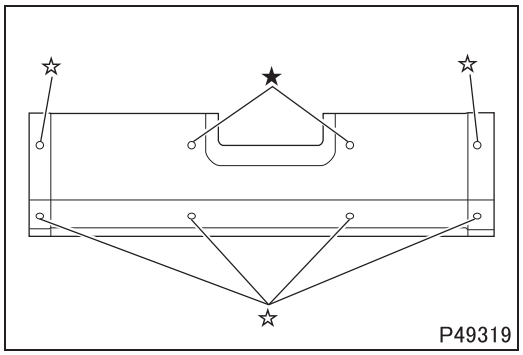
■ **Installation: Center pillar upper trim**

- Stick double-sided adhesive tape onto the center pillar upper trim as illustrated.
- Align the center pillar upper trim on the cab correctly by installing a clip (marked ★).
- Install clips at the locations ☆ (× 4). Remove the backing strip from the double-sided adhesive tape. Press the trim firmly on where the adhesive tape is applied on the back.



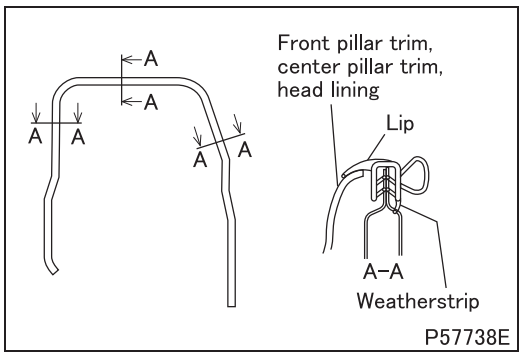
■ **Installation: Center pillar lower trim**

- Stick double-sided adhesive tape onto the center pillar lower trim as illustrated.
- Insert the center pillar lower trim lug(s) (× 2) into the center pillar upper trim hole(s).
- Align the center pillar lower trim correctly in position by installing a clip.
- Attach the center pillar lower trim onto the cab with adhesive tape.



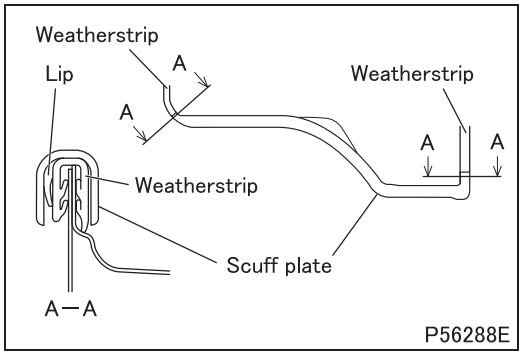
■ **Installation: Roof rail trim**

- Align the center pillar upper trim on the cab correctly by installing two clips (marked ★).
- Install clips at the locations ☆ (× 6).



■ **Installation: Weatherstrip**

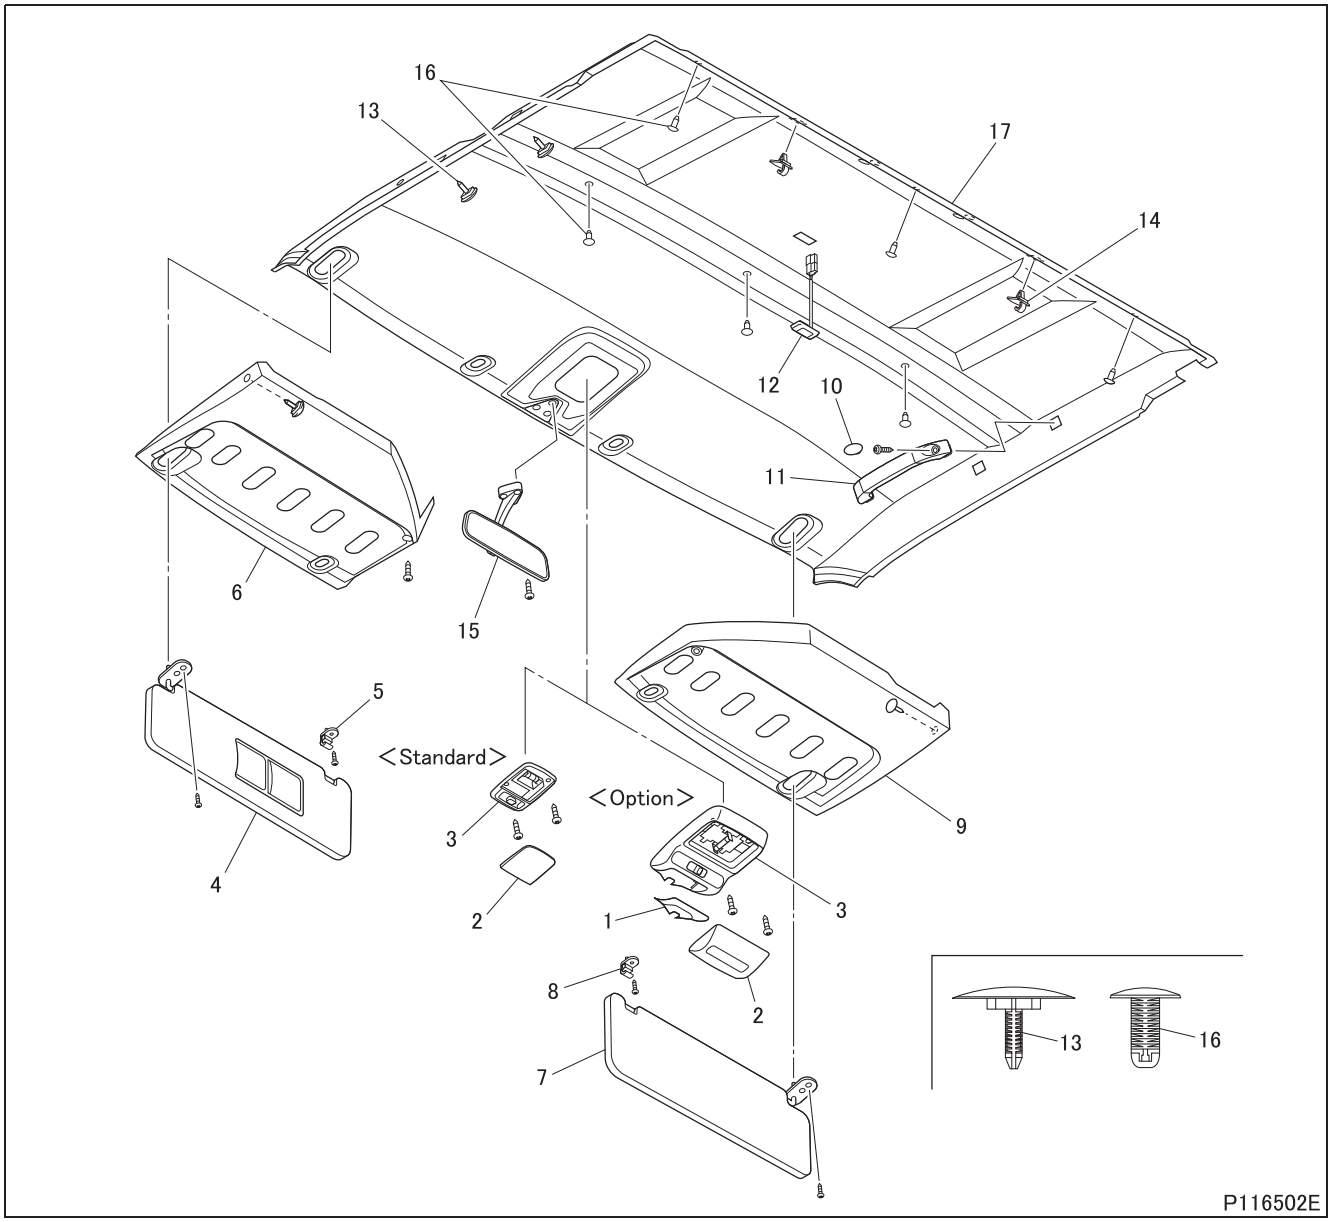
- Install the weatherstrip in such a manner that the lip of the strip holds down the front pillar trim, center pillar trim, and head lining.



■ **Installation: Scuff plate**

- Install the scuff plate so that it holds down the lip of the weatherstrip.

HEAD LINING <EXCEPT CREW CAB>



● **Removal sequence**

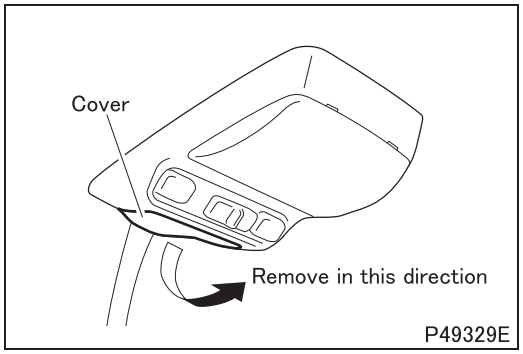
1 Cover <Option>
2 Lens
3 Room lamp
4 Sun visor (left-hand)
5 Sun visor hook
6 Overhead shelf (left-hand)
7 Sun visor (right-hand)
8 Sun visor hook
9 Overhead shelf (right-hand)
10 Cap
11 Grip
12 In car sensor <F-A/C>
13 Plug
14 Coat hanger
15 Inside mirror
16 Clip (× 8)
17 Head lining

F-A/C: Fully automatic air conditioner

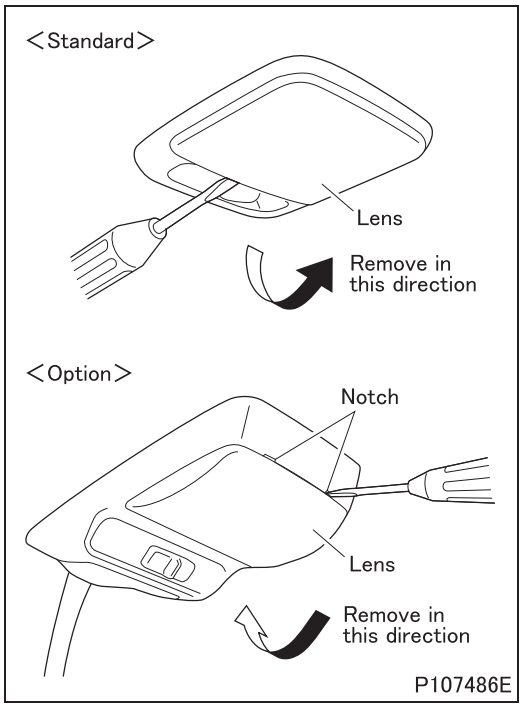
● **Installation sequence**

Follow the removal sequence in reverse.

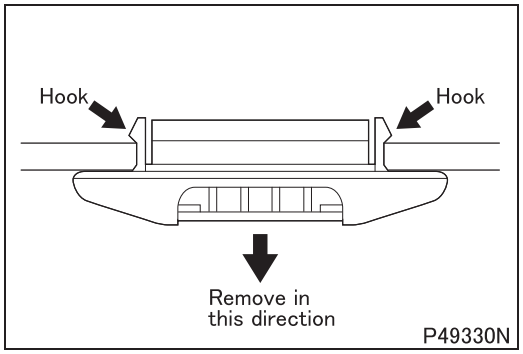
◆Removal procedure◆



■ **Removal: Cover**

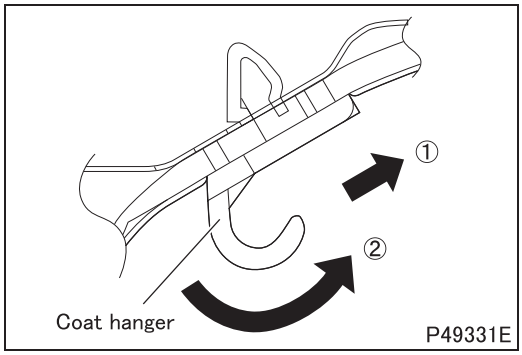


■ **Removal: Lens**



■ **Removal: In car sensor**

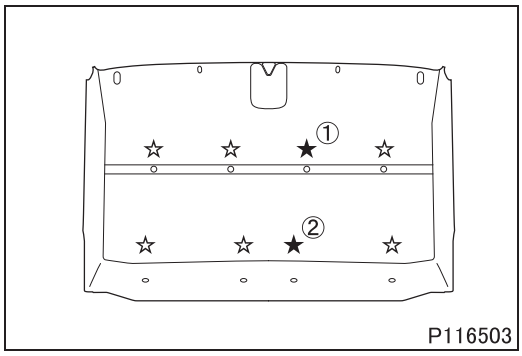
HEAD LINING <EXCEPT CREW CAB>



■ **Removal: Coat hanger**

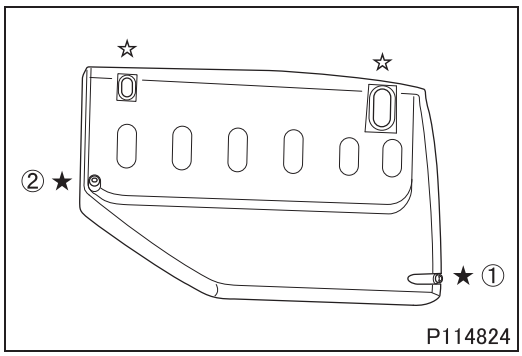
- Remove the coat hanger from the head lining by pulling it in the direction of “2” while pressing it in the direction of “1”.

◆**Installation procedure**◆



■ **Installation: Head lining**

- Install the head lining to the cab by first fastening the clips marked ★ (2 places) in the order shown in the illustration and then fastening the clips marked ☆ (6 places).

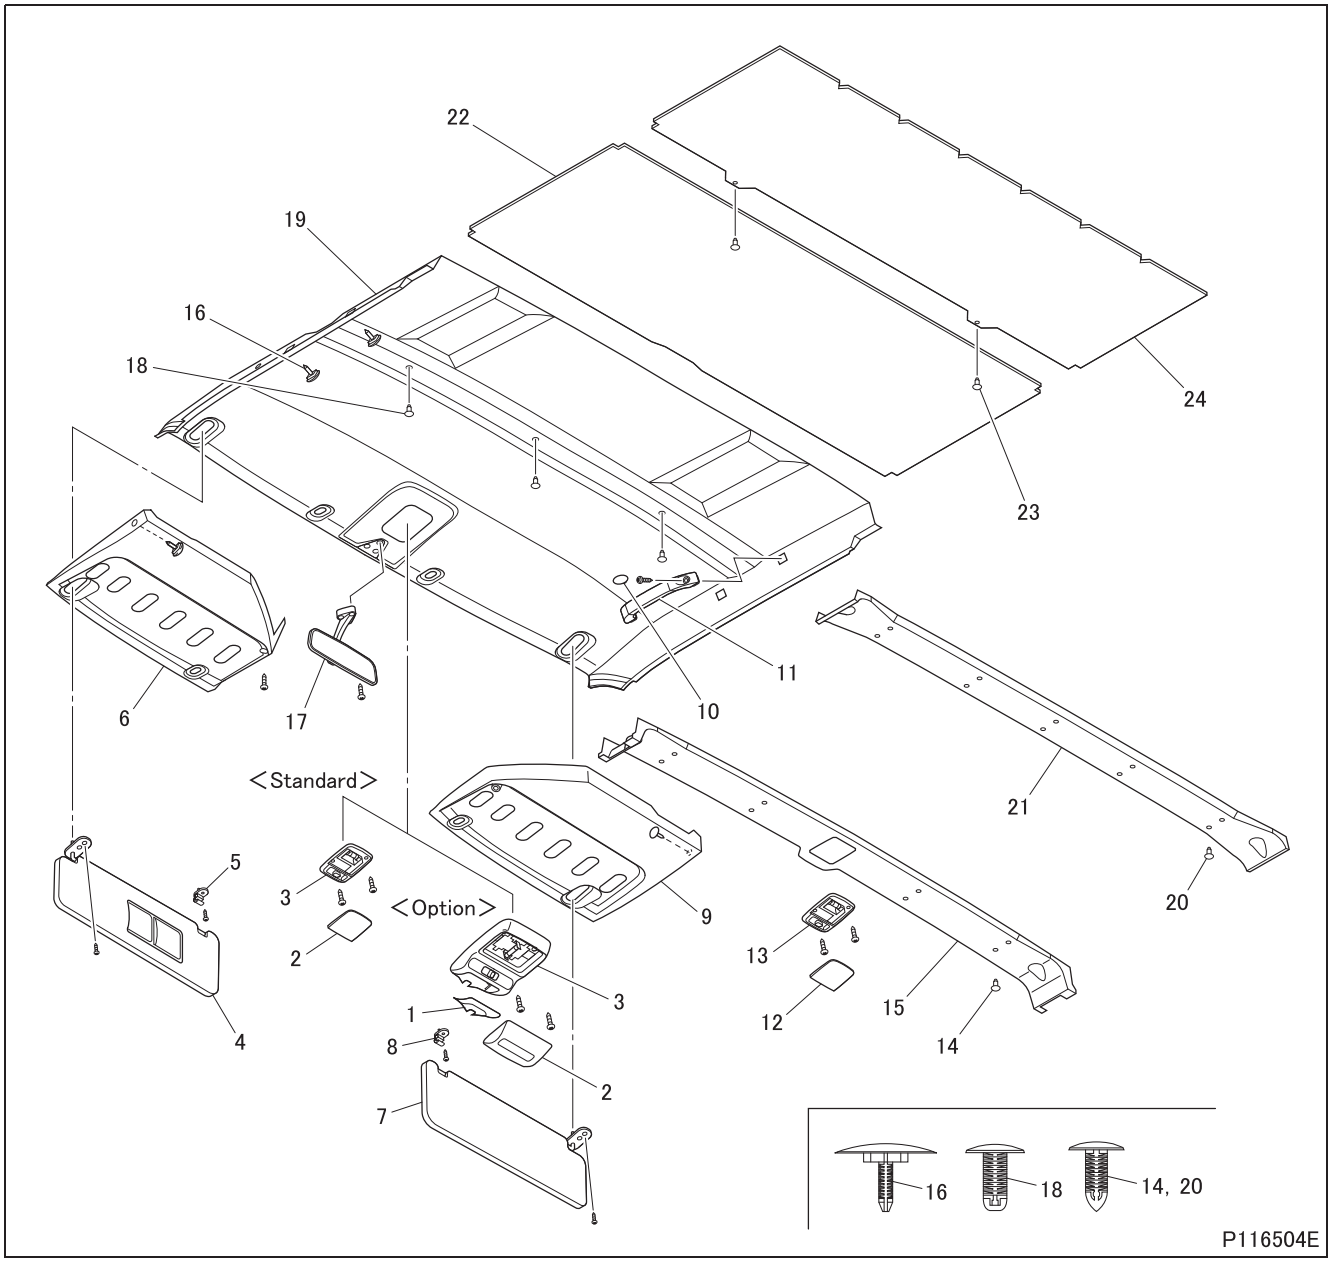


■ **Installation: Overhead shelf**

- Install the overhead shelf with the screws marked ★ (2 places) by tightening them in the order shown in the illustration and then with the screws marked ☆ (2 places) that are also used for fastening the sun visor hook and sun visor.

M E M O

HEAD LINING <CREW CAB>



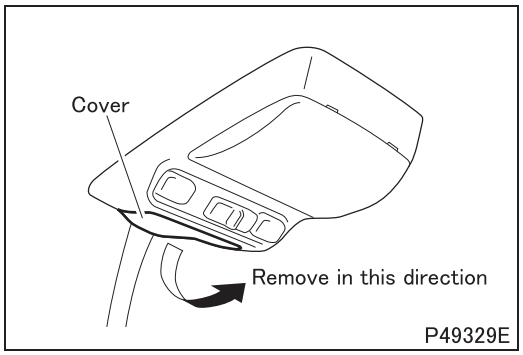
● **Removal sequence**

1 Cover <Option>
2 Lens
3 Room lamp
4 Sun visor (left-hand)
5 Sun visor hook
6 Overhead shelf (left-hand)
7 Sun visor (right-hand)
8 Sun visor hook
9 Overhead shelf (right-hand)
10 Cap
11 Grip
12 Lens
13 Rear room lamp
14 Clip (× 14)
15 Center roof garnish
16 Plug
17 Inside mirror
18 Clip (× 4)
19 Front head lining
20 Clip (× 14)
21 Rear roof garnish
22 Center head lining
23 Clip
24 Rear head lining

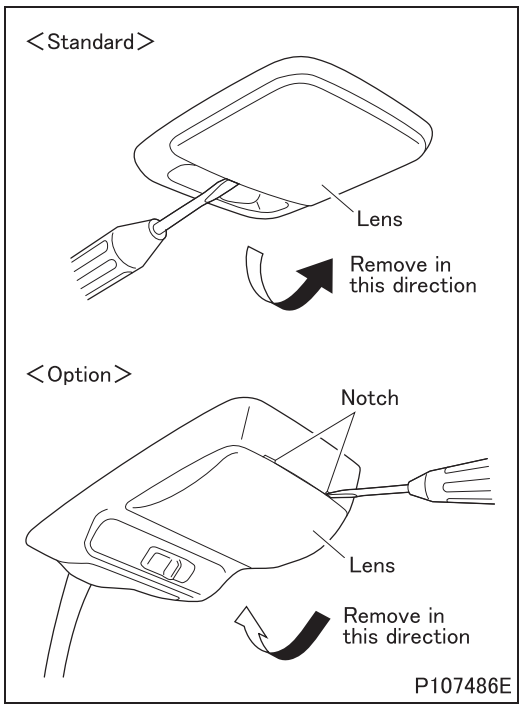
● Installation sequence

Follow the removal sequence in reverse.

◆Removal procedure◆

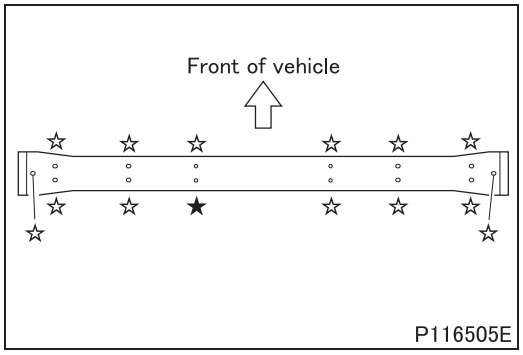


■ **Removal: Cover**



■ **Removal: Lens**

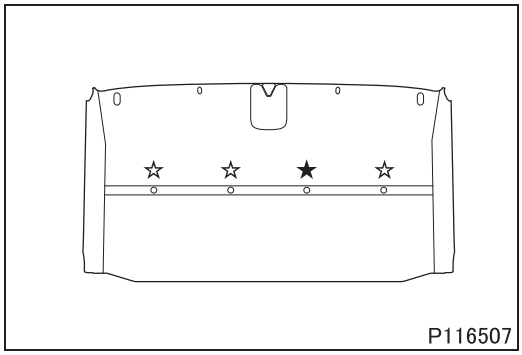
◆Installation procedure◆



■ **Installation: Rear roof garnish**

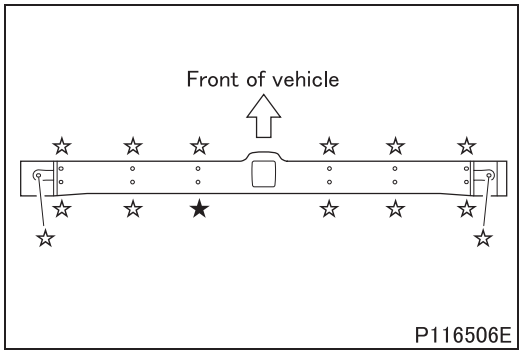
- Locate the rear roof garnish correctly onto the cab by installing clips at the locations ★ (× 3). Install clips at the locations ☆ (× 11).

HEAD LINING <CREW CAB>



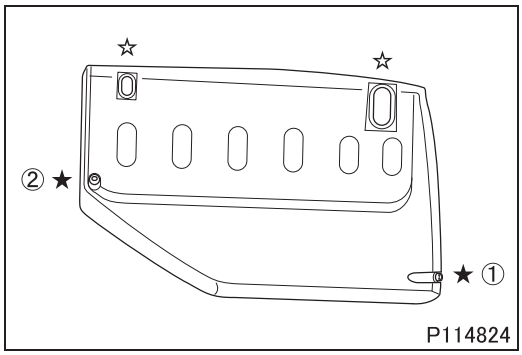
■ **Installation: Front head lining**

- Locate the front head lining correctly onto the cab by installing clips at the locations ★ (× 1). Install clips at the locations ☆ (× 3).



■ **Installation: Center roof garnish**

- Locate the center roof garnish correctly onto the cab by installing clips at the locations ★ (× 3). Install clips at the locations ☆ (× 11).



■ **Installation: Overhead shelf**

- Install the overhead shelf with the screws marked ★ (2 places) by tightening them in the order shown in the illustration and then with the screws marked ☆ (2 places) that are also used for fastening the sun visor hook and sun visor.

54-00C STRUCTURE AND OPERATION

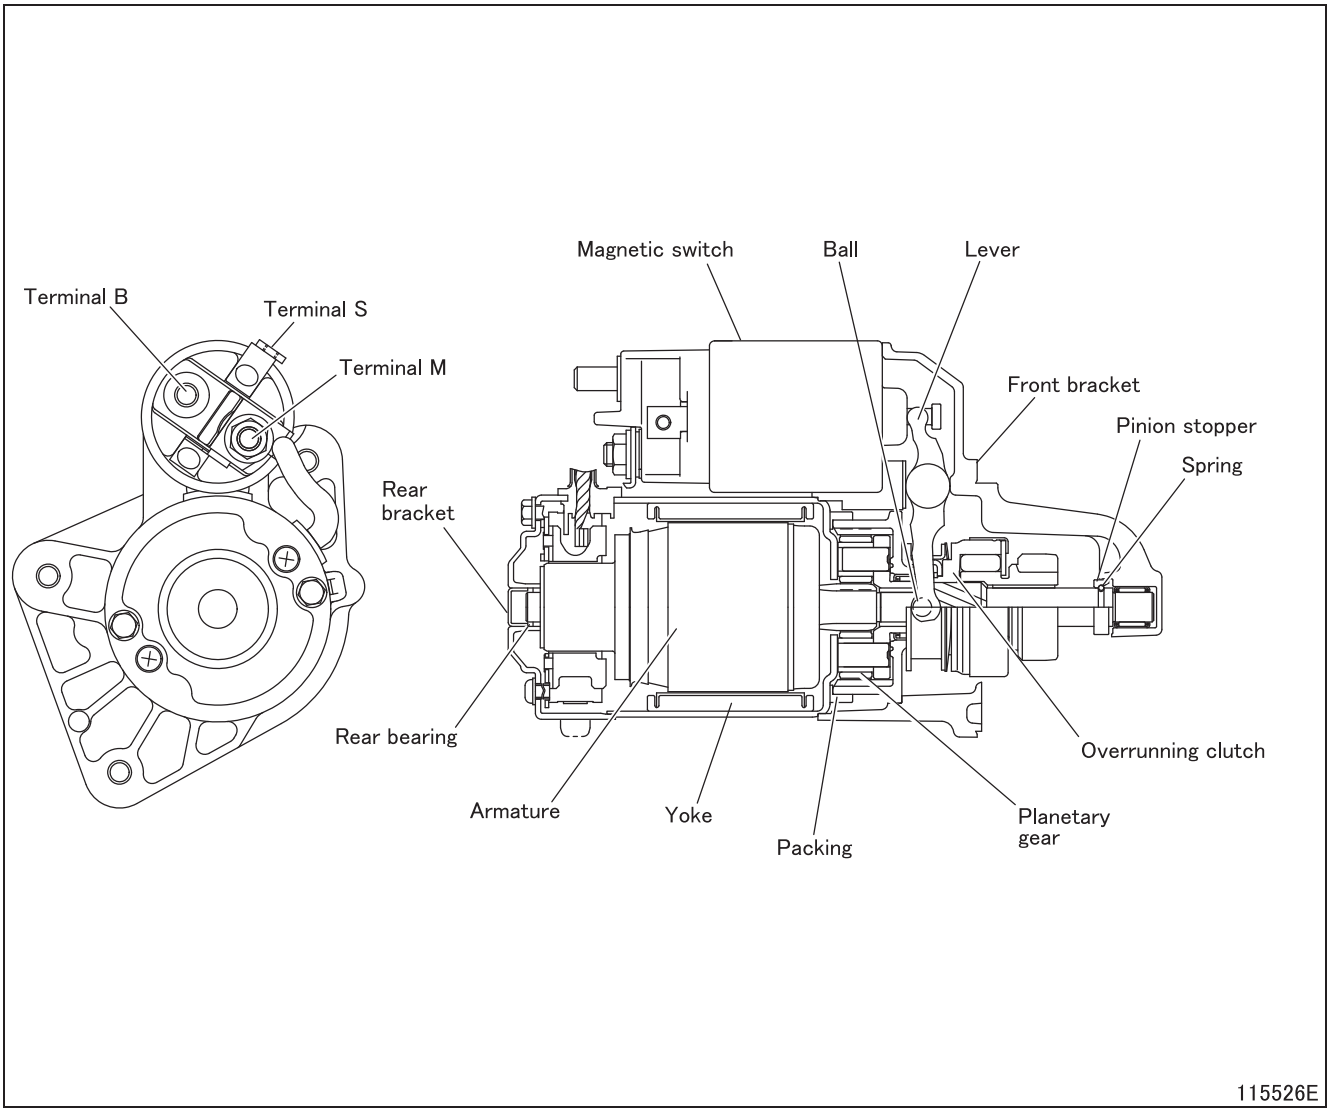
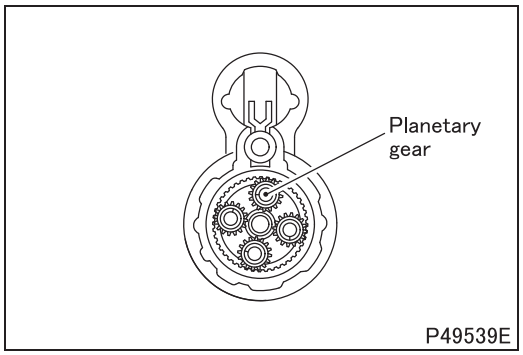
STRUCTURE AND OPERATION

1. Starter

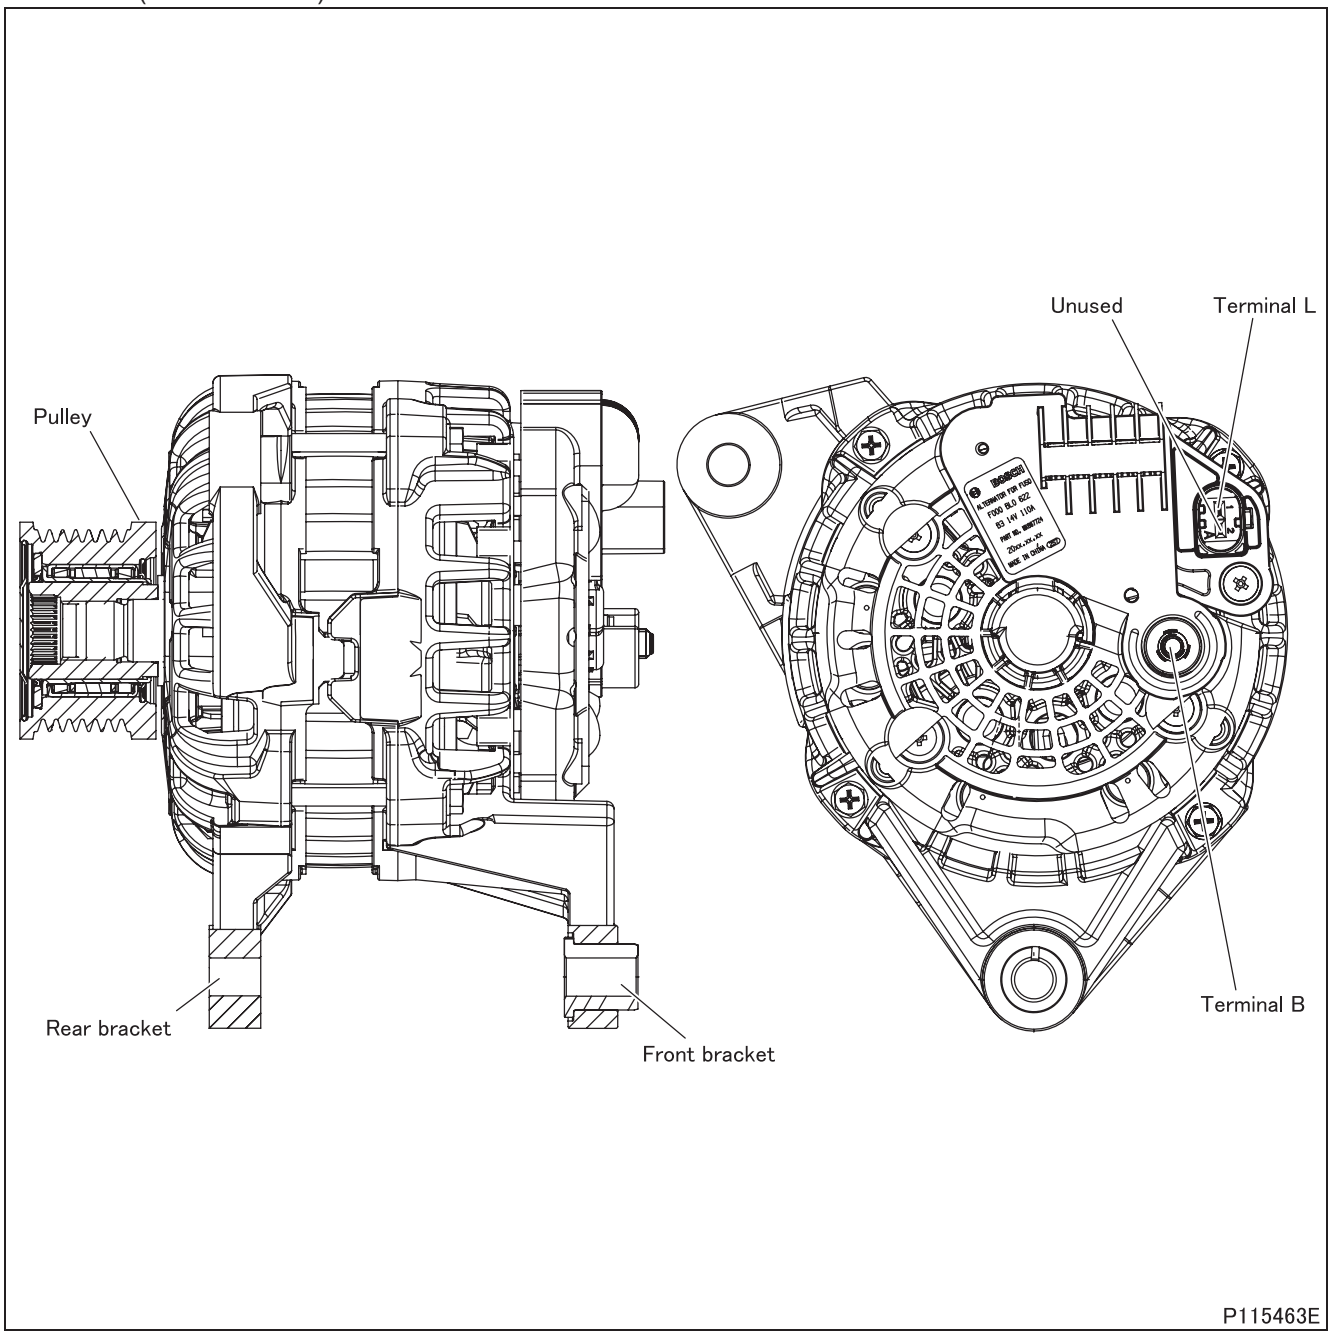




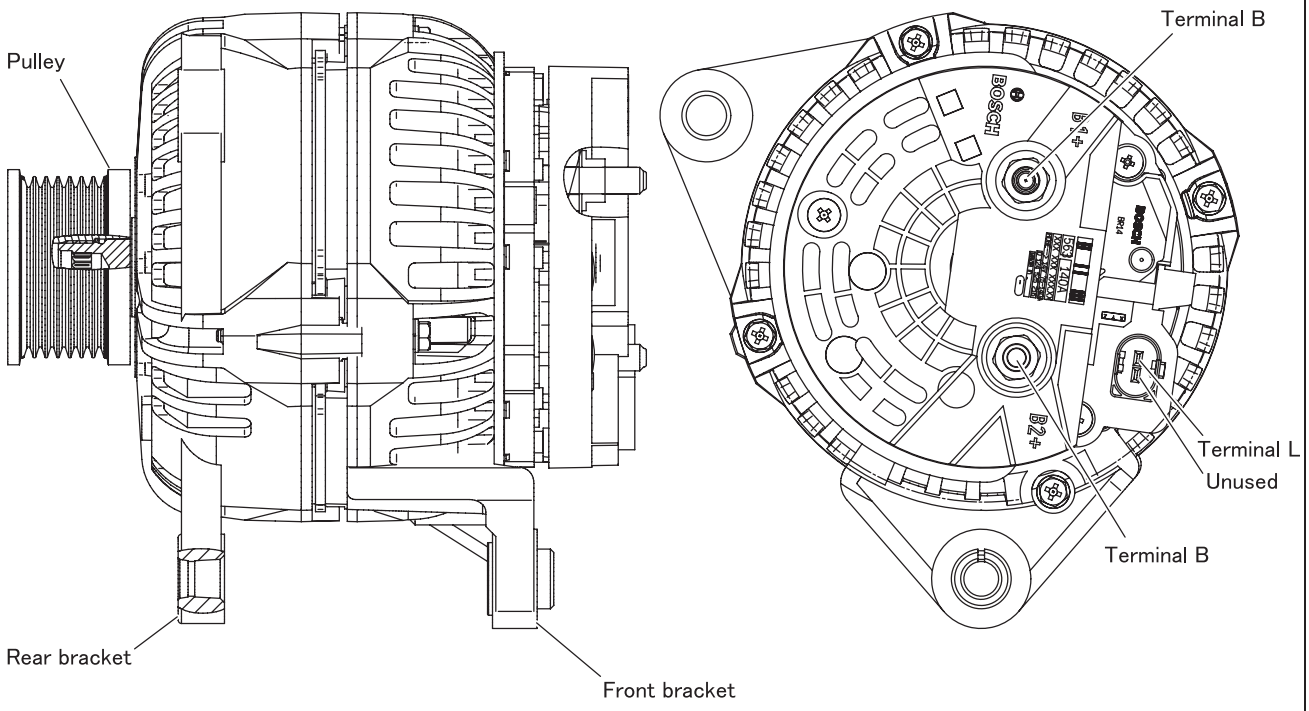
- This starter uses planetary gears as its reduction gearing mechanism.

2. Alternator

<12V-110A (F 000 BL0 622)>

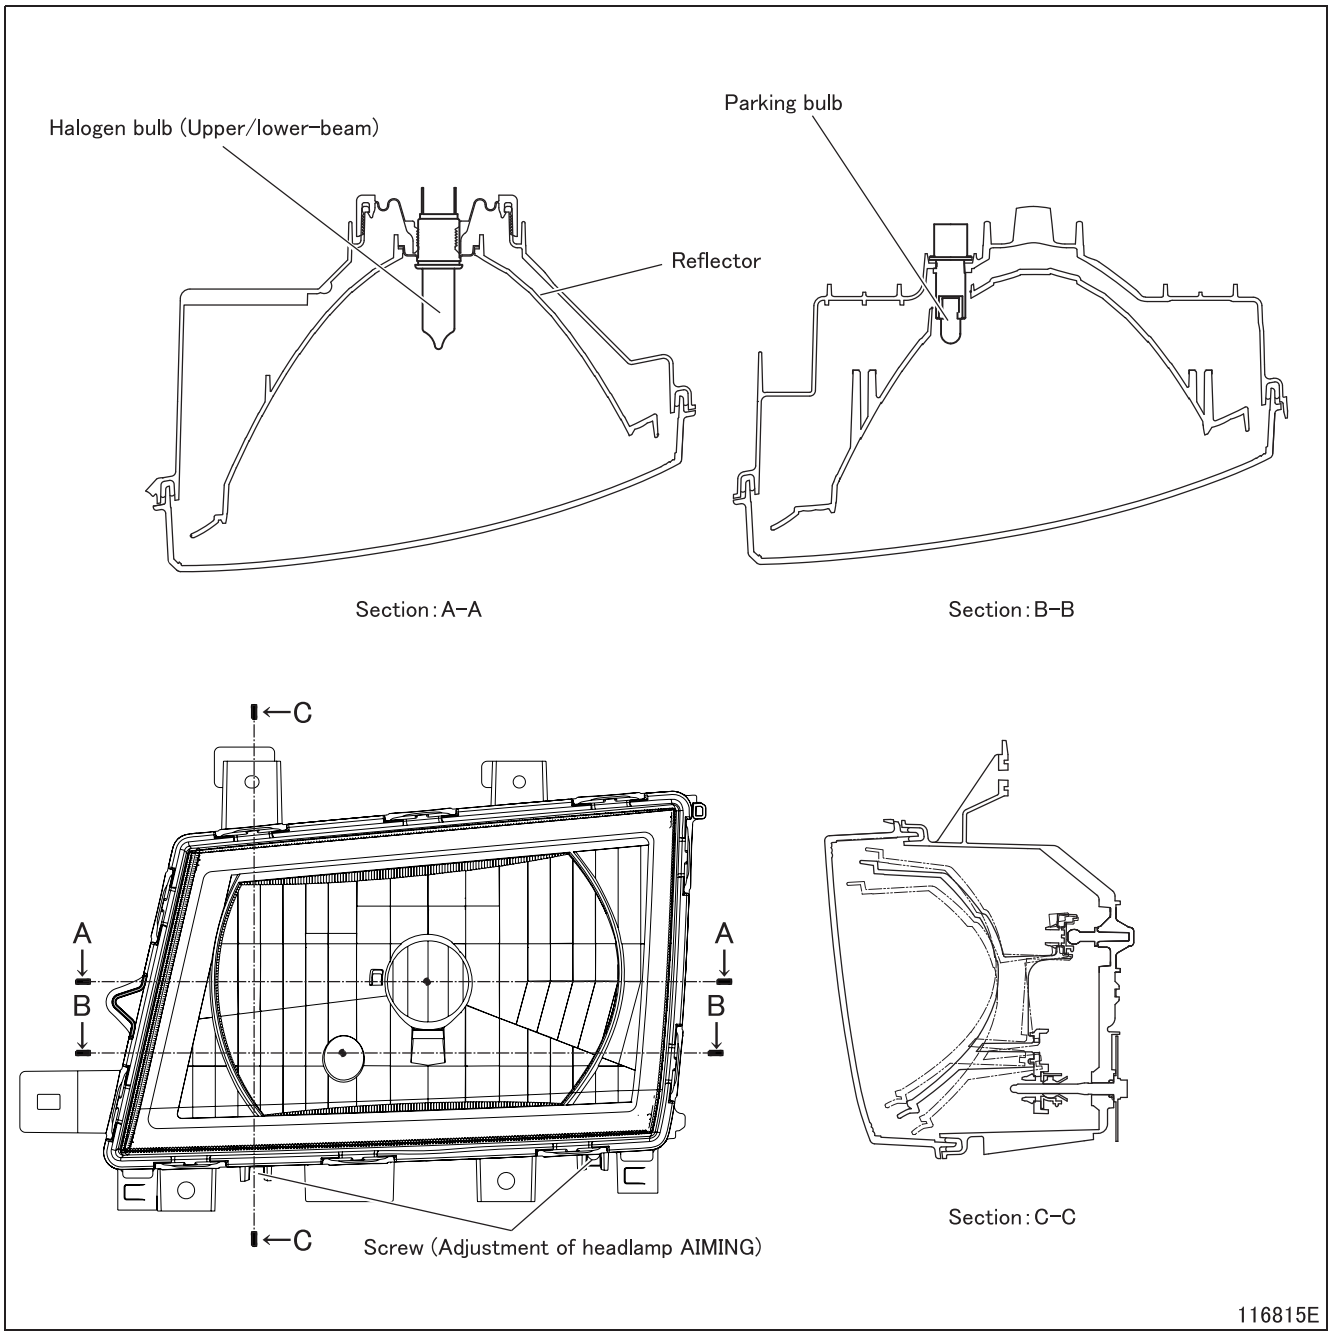


<12V-140A (0 124 525 216)>



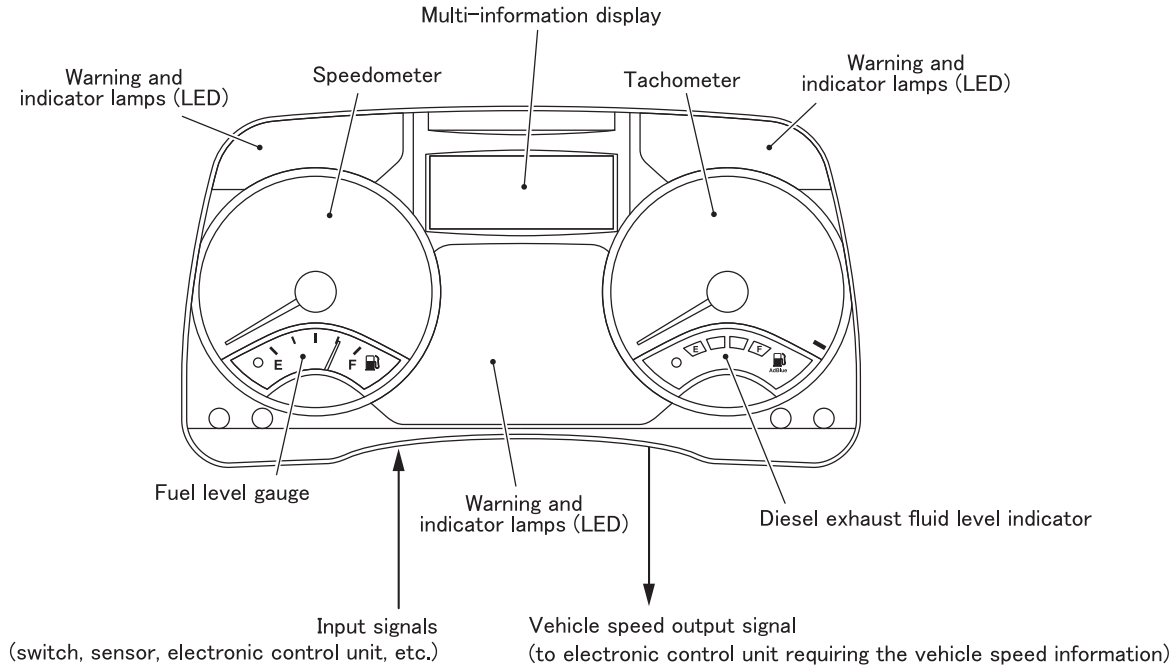
P115464E

3. Headlamps



(Left headlamps are shown in this illustration.)

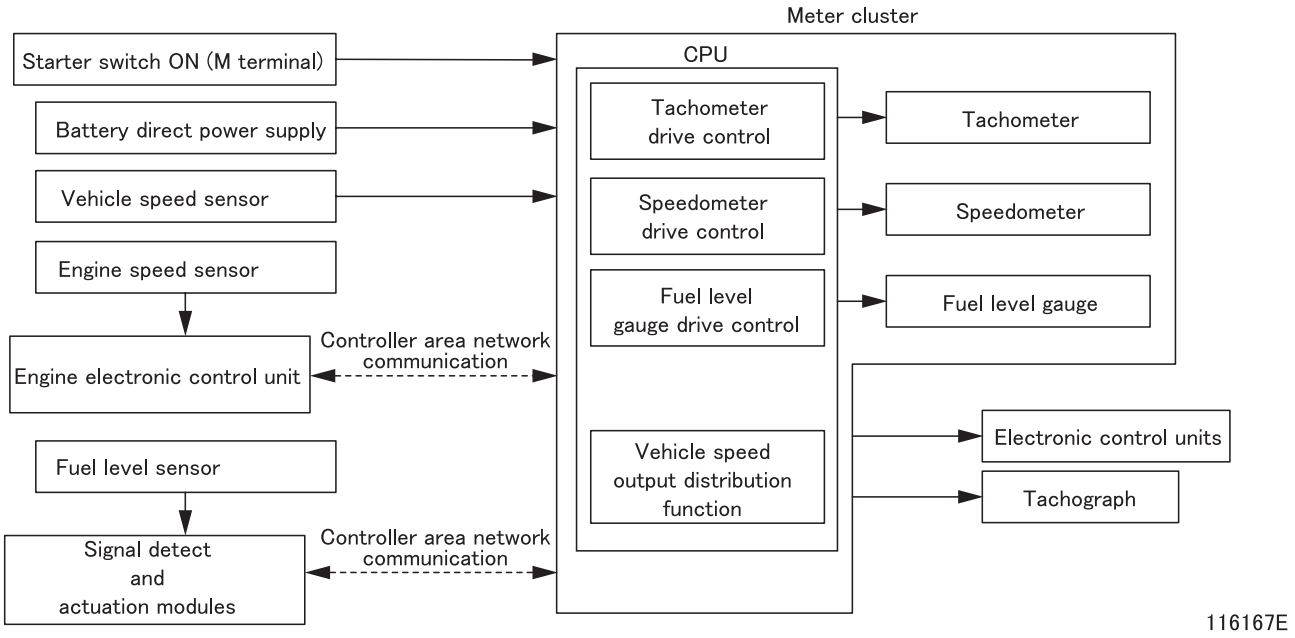
4. Meter Cluster



- This meter cluster contains a central processing unit with the following functions.
  - Instrument drive function (speedometer, tachometer, fuel level gauge)
  - Vehicle speed output distribution function
  - Indicator and warning lamps indication function
  - Multi-information display indication function
  - Diesel exhaust fluid level indicator operation function
  - Buzzer sound function
  - Fault diagnosis function

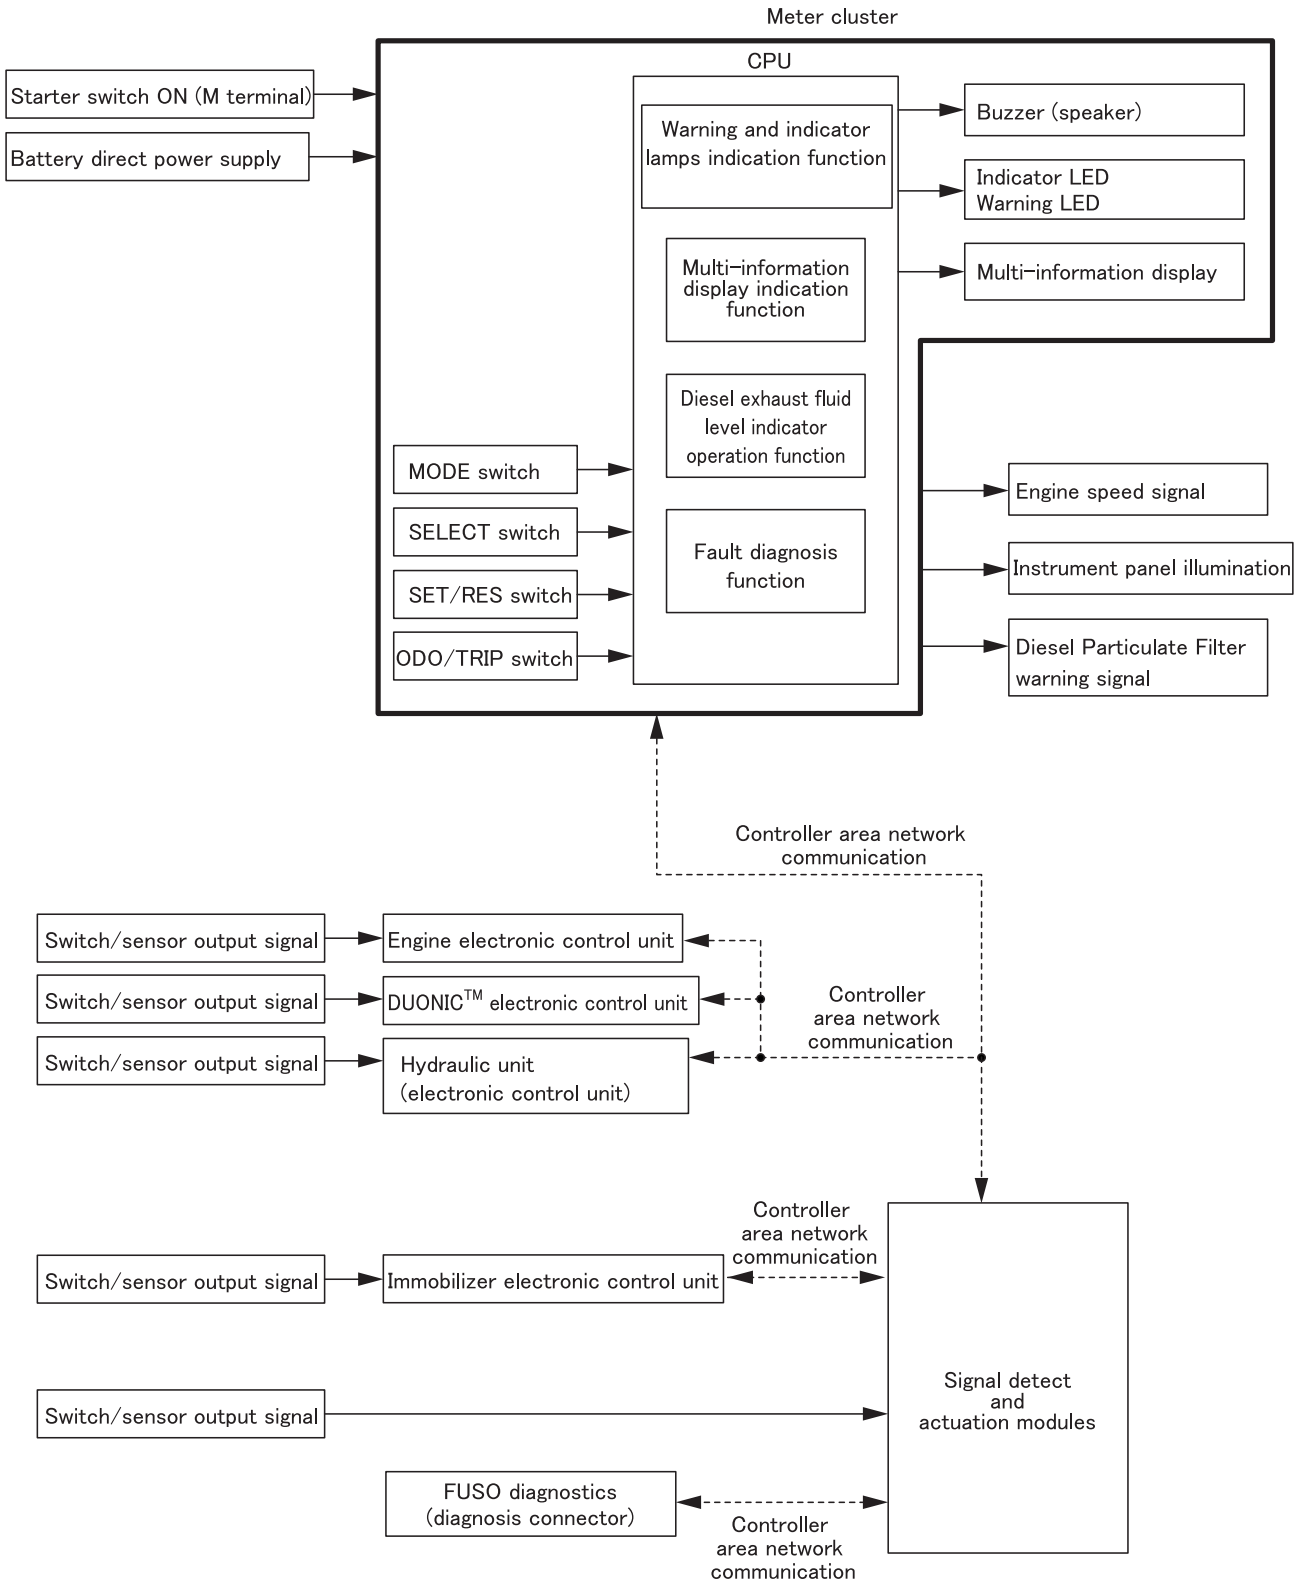
4.1 Instrument drive function and vehicle speed output distribution function

(1) System block diagram



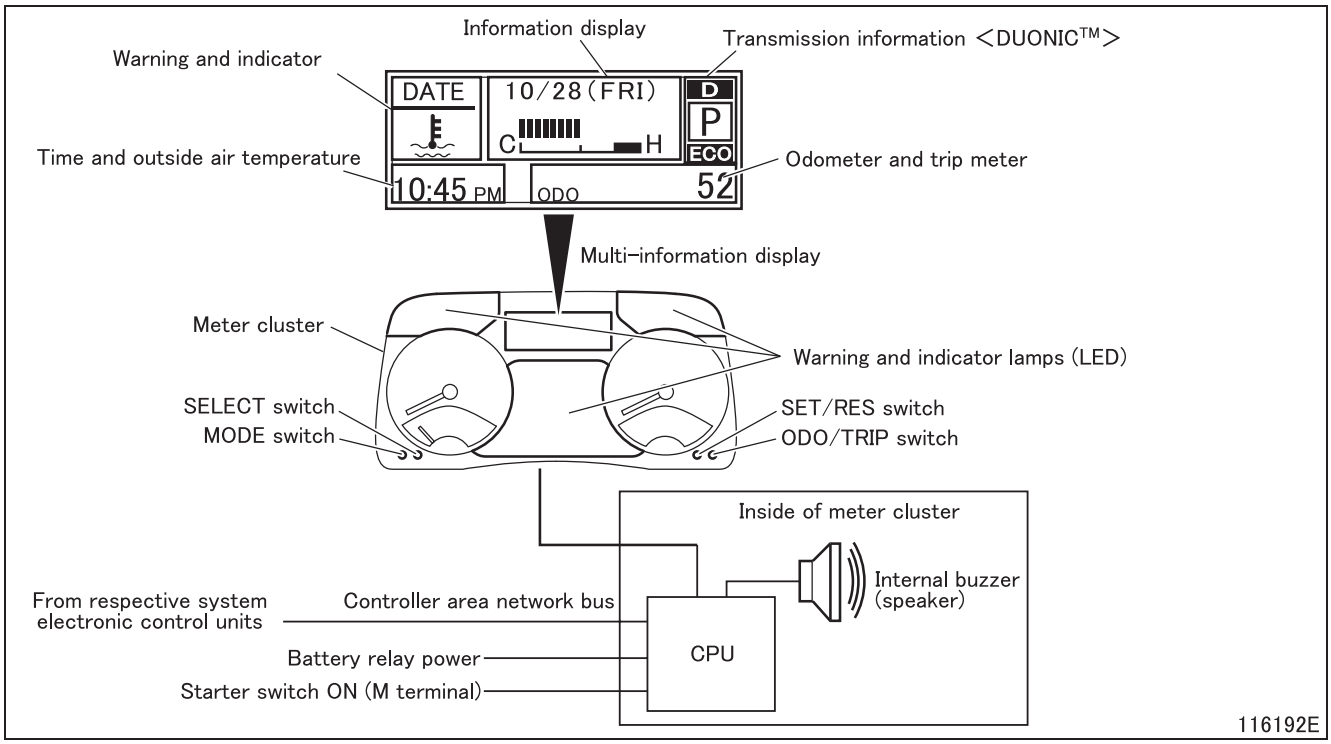
4.2 Warning and indicator lamps indication function, multi-information display function, urea level indicator operation function and fault diagnosis function

(1) System block diagram



117205E

4.3 General description



- The warning and indicator lamps indication function indicates warning characters or graphical marks (LED), thereby adequately alerting the driver to abnormalities.
- Output data signals from respective systems are gathered in the central processing unit in the meter cluster and indicated through appropriate LED or the multi-information display. Alarm is sounded by the buzzer (speaker) in the meter cluster.
- The system features are as shown below.
  - The multi-information display distinctly shows necessary information by changing display colors according to the degree of significance of the information.
  - MODE switch, SELECT switch, SET/RES switch and ODO/TRIP switch are used to have option vehicle information (such as trip meter, clock, check and service data) and diagnosis codes for respective electronic control systems indicated by the multi-information display according to information gathered in the meter cluster.
  - When there are two or more warning items, the display is switched to show them in every three seconds.

Lamp	Illuminating/ flashing	Internal buzzer sounding	Condition for illuminating/flashing	Remarks
•	Illuminates	–	Fuel level is low	See (420).
BRAKE or (!)	Illuminates	O	Parking brake is engaged (Buzzer sounds when vehicle speed exceeds 12 km/h with parking brake engaged.)	See (510).
		–	Brake fluid level is low	See (515).
LOW VACUUM	Illuminates	–	Vacuum in vacuum tank is low <Vacuum booster-equipped vehicle>	See (515).
	Illuminates	O	Engine is overheated	See (537).
	Illuminates	–	Charging system is defective	See (125).
	Illuminates	–	Engine hydraulic pressure is low	See (536).
	Illuminates	–	Engine is being preheated	See Gr13E.
	Illuminates	–	• Engine control system is defective • Exhaust gas aftertreatment is defective	See Gr13E.
(orange)	Flashes	–	• Soot is accumulated in Diesel Particulate Filter (flashes at 0.5 second interval)	See Gr13E.
	Flashes	–	• Diesel Particulate Filter requires cleaning (flashes at 0.25 second interval)	
	Illuminates	–	• Manual regeneration is in progress in the Diesel Particulate Filter	
(green)	Illuminates	–	Automatic regeneration is in progress in the Diesel Particulate Filter	See Gr13E.
	Illuminates	O	• Abnormality is detected by NOx sensor • BlueTec® exhaust gas aftertreatment system is defective • Diesel exhaust fluid level decreases (5% or lower) • Quality of diesel exhaust fluid refilled decreases	See Gr17E.
	Flashes	O	• Abnormality is detected by NOx sensor • Quality of diesel exhaust fluid refilled decreases	
DEF GAUGE •	Illuminates	O	Diesel exhaust fluid level decreases (10% or lower)	See Gr17E.
	Flashes	O	• Diesel exhaust fluid level decreases (5% or lower) • Diesel exhaust fluid tank is empty • Abnormality is detected by NOx sensor • Quality of diesel exhaust fluid refilled decreases	
	Illuminates	–	Headlamp high beam is on	See (310).
	Illuminates	–	Fog lamp is on	See (315).
	Flashes	O (turn signal sound)	• Turn signal lamp is on • Hazard lamp is on	See (330).
	Illuminates	–	• Exhaust brake is on • Warm-up system is on	See Gr13E.

Mark	Illuminating/ flashing	Internal buzzer sounding	Condition for illuminating/flashing	Remarks
ABS or	Illuminates	–	Anti-lock brake system is abnormal	See Gr35E.
	Illuminates	–	• Engine immobilizer starter key communication is defective • Engine immobilizer system is defective	See (210).
	Illuminates	–	Vehicle is running in four-wheel drive mode	See (810).
	Illuminates	–	Headlamp comes on by daytime running light system	See (313).
	Illuminates	–	Vehicle is running in cruise control mode	See Gr13E.

(3) Multi-information display indications

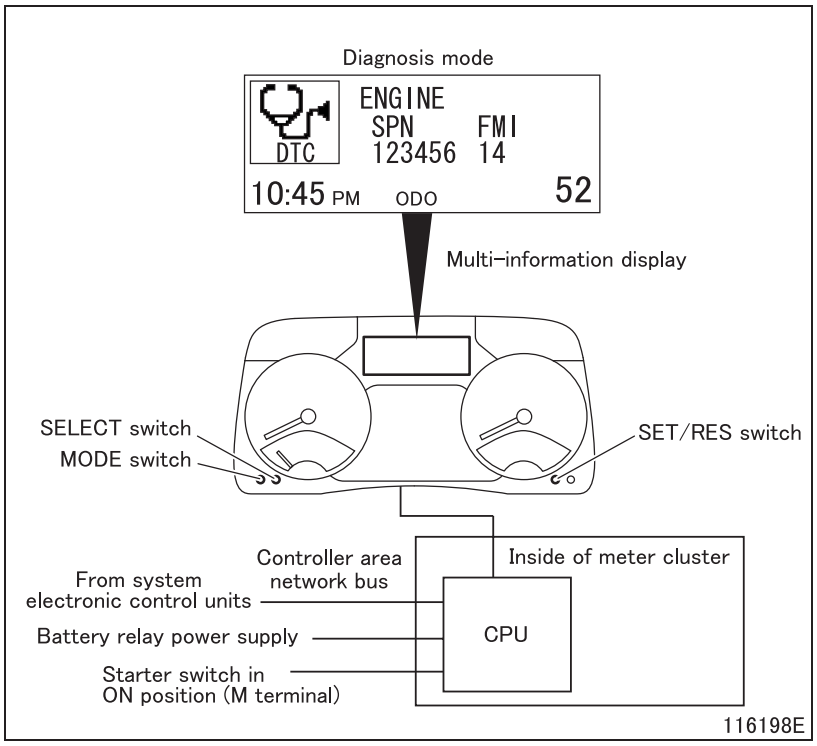
Mark	Illuminating/ flashing	Internal buzzer sounding	Condition for illuminating/flashing	Remarks
ENG SYS (red)	Illuminates	–	Engine output is limited	See Gr13E.
ENG SYS (orange)	Illuminates	–	• Engine check is required • Engine oil change is required (when the mark appears alternately with ENG OIL) • System is reset after engine oil change (indicated for 10 seconds)	See Gr13E.
T/M OIL	Illuminates	–	Transmission fluid is too hot	See Gr22E.
T/M SYS (red)	Illuminates	O	DUONIC^{TM} system is faulty or abnormal in electric control system (The system malfunction causes gears to remain in the present shift position; lamp comes on and buzzer sounds.)	See Gr22E.
T/M SYS (orange)	Illuminates	–	DUONIC^{TM} system is faulty or abnormal in electric control system (Automatic or manual gear shifting is enabled.)	See Gr22E.
CAB TILT	Illuminates	O	Cab tilt lock is incomplete (Buzzer sounds at vehicle speed beyond 5 km/h.)	See **550**.
SAM (red)	Illuminates	–	Signal detect and actuation modules are faulty in electric control system	See **105**.
SAM (orange)	Illuminates	–	Signal detect and actuation modules are abnormal in electric control system (when outside light check is needed)	See **105**.
METER	Illuminates	–	Meter cluster electric circuit is defective	See **401**.
ENG OIL (orange)	Illuminates	–	Engine oil change is required (when quantity of fuel mixed in engine oil exceeds upper limit)	See Gr13E.
ENG OIL (green)	Illuminates	–	PCV (positive crankcase ventilation) filter regeneration must be performed or PCV (positive crankcase ventilation) filter must be replaced.	See Gr13E.
DPF FULL	Illuminates	–	Soot accumulation in Diesel Particulate Filter is excessive	See Gr13E.
WATER SEPR	Illuminates	–	Moisture in fuel filter becomes excessive	See **566**.

Mark	Illuminating/ flashing	Internal buzzer sounding	Condition for illuminating/flashing	Remarks
PTO	Illuminates	–	Transmission power take-off is connected <Vehicles with transmission power take-off>	See (850).
PTO READY	Illuminates	–	Transmission power take-off is ready for connection <Vehicles with DUONIC™ transmission power take-off>	See (850).
ENG OIL	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled engine oil change interval	–
OIL FILTER	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled engine oil filter replacement interval	–
FUEL FILTER	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled fuel filter replacement interval	–
BRAKE FLUID	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled brake fluid change interval	–
AIR FILTER	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled air cleaner replacement interval	–
T/M OIL	Illuminates	–	• Less than 1,000 km (600 miles) or one month remains before the next scheduled clutch fluid and transmission fluid change interval • Less than 1,000 km (600 miles) or one month remains before the next scheduled transmission fluid change interval (manual transmission)	–
HUB GREASE	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled wheel hub bearing grease change interval	–
DIFF OIL	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled differential gear oil change interval	–
P/S OIL	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled power steering fluid change interval	–
ENG WATER	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled engine coolant change interval	–

(4) Alarm with buzzer only (without warning lamp on)

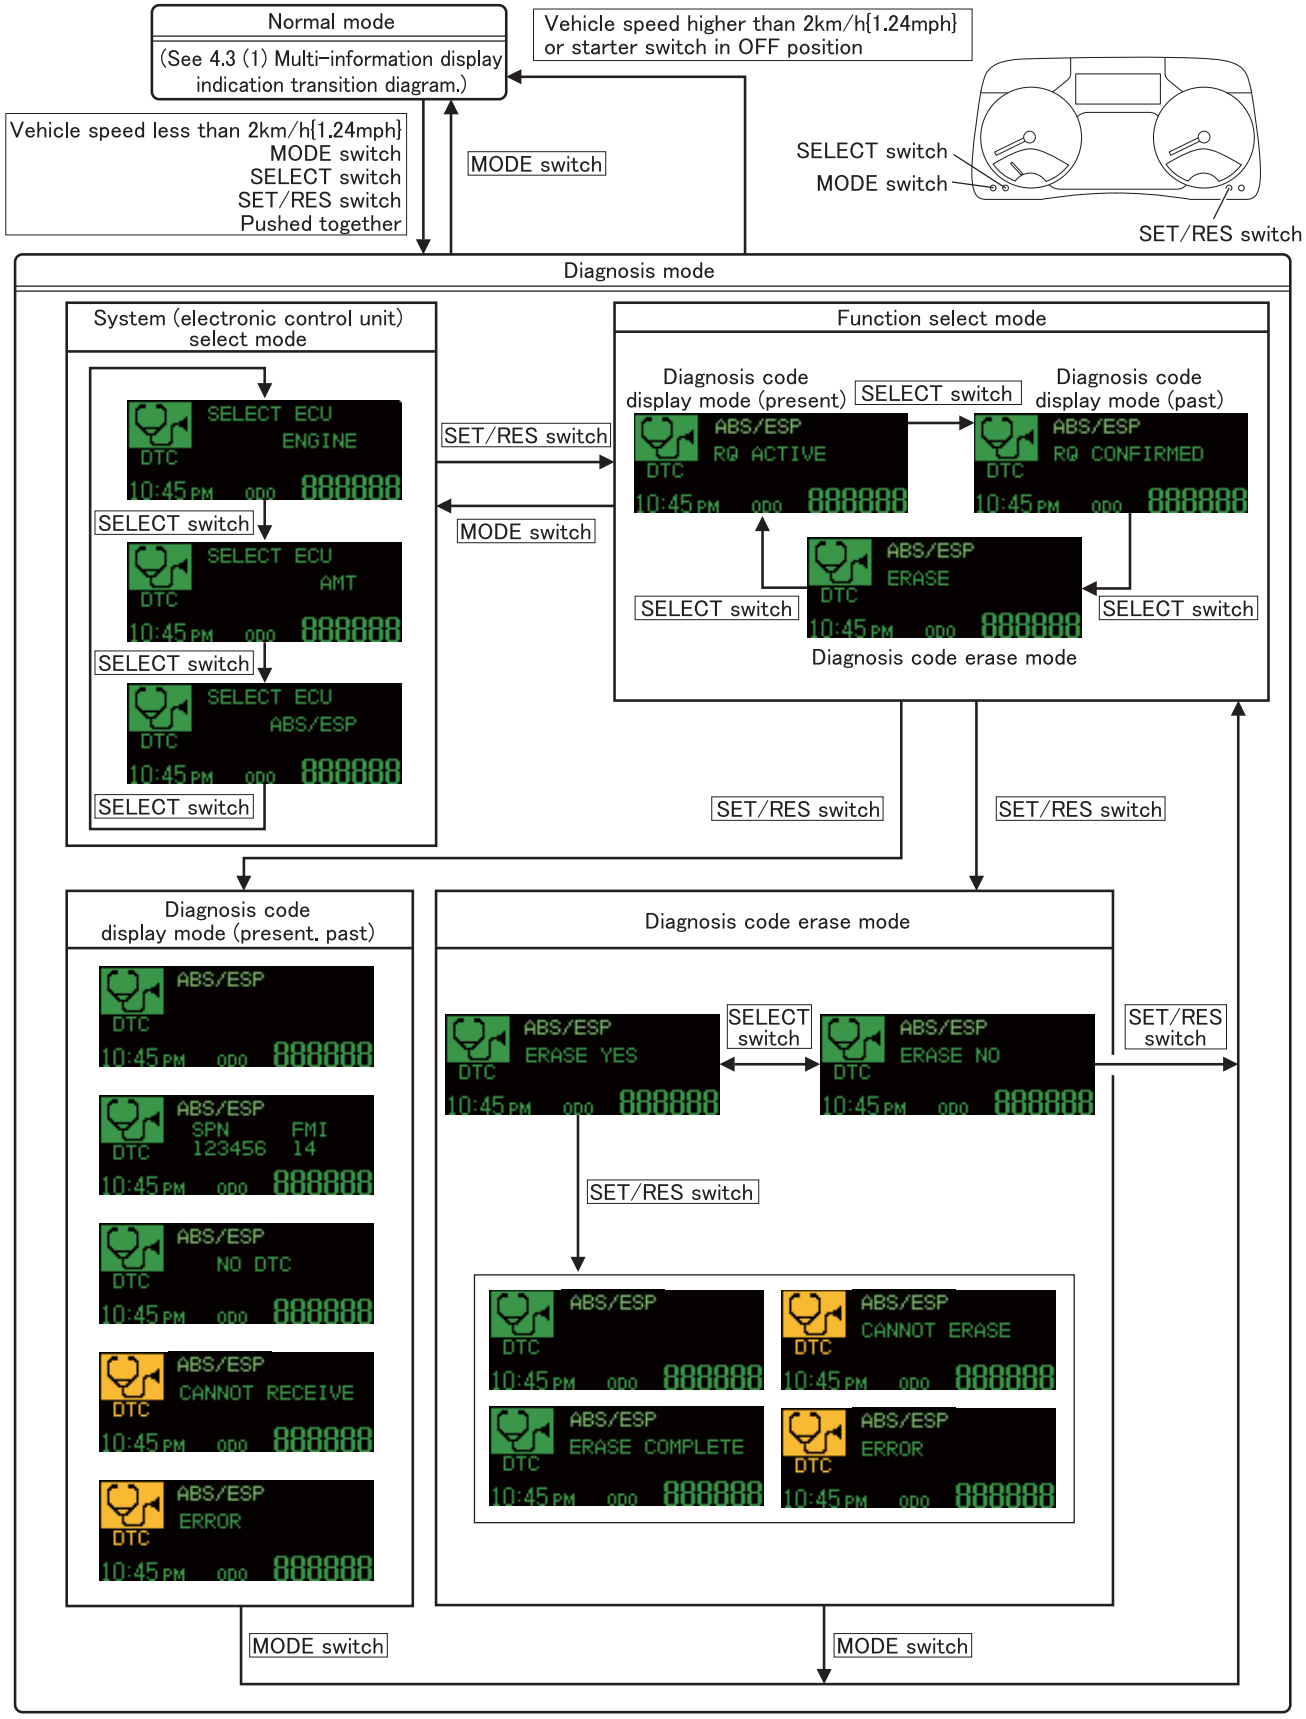
Buzzer	Internal buzzer sounding	Condition for buzzing	Remarks
Back buzzer	O	Shifter lever is put in the “R” position	–
Key reminder buzzer	O	When all conditions below are established • Starter key is left inserted • Starter switch in the OFF position • Driver’s side door switch is in “OPEN” position	–

4.4 Fault diagnosis function



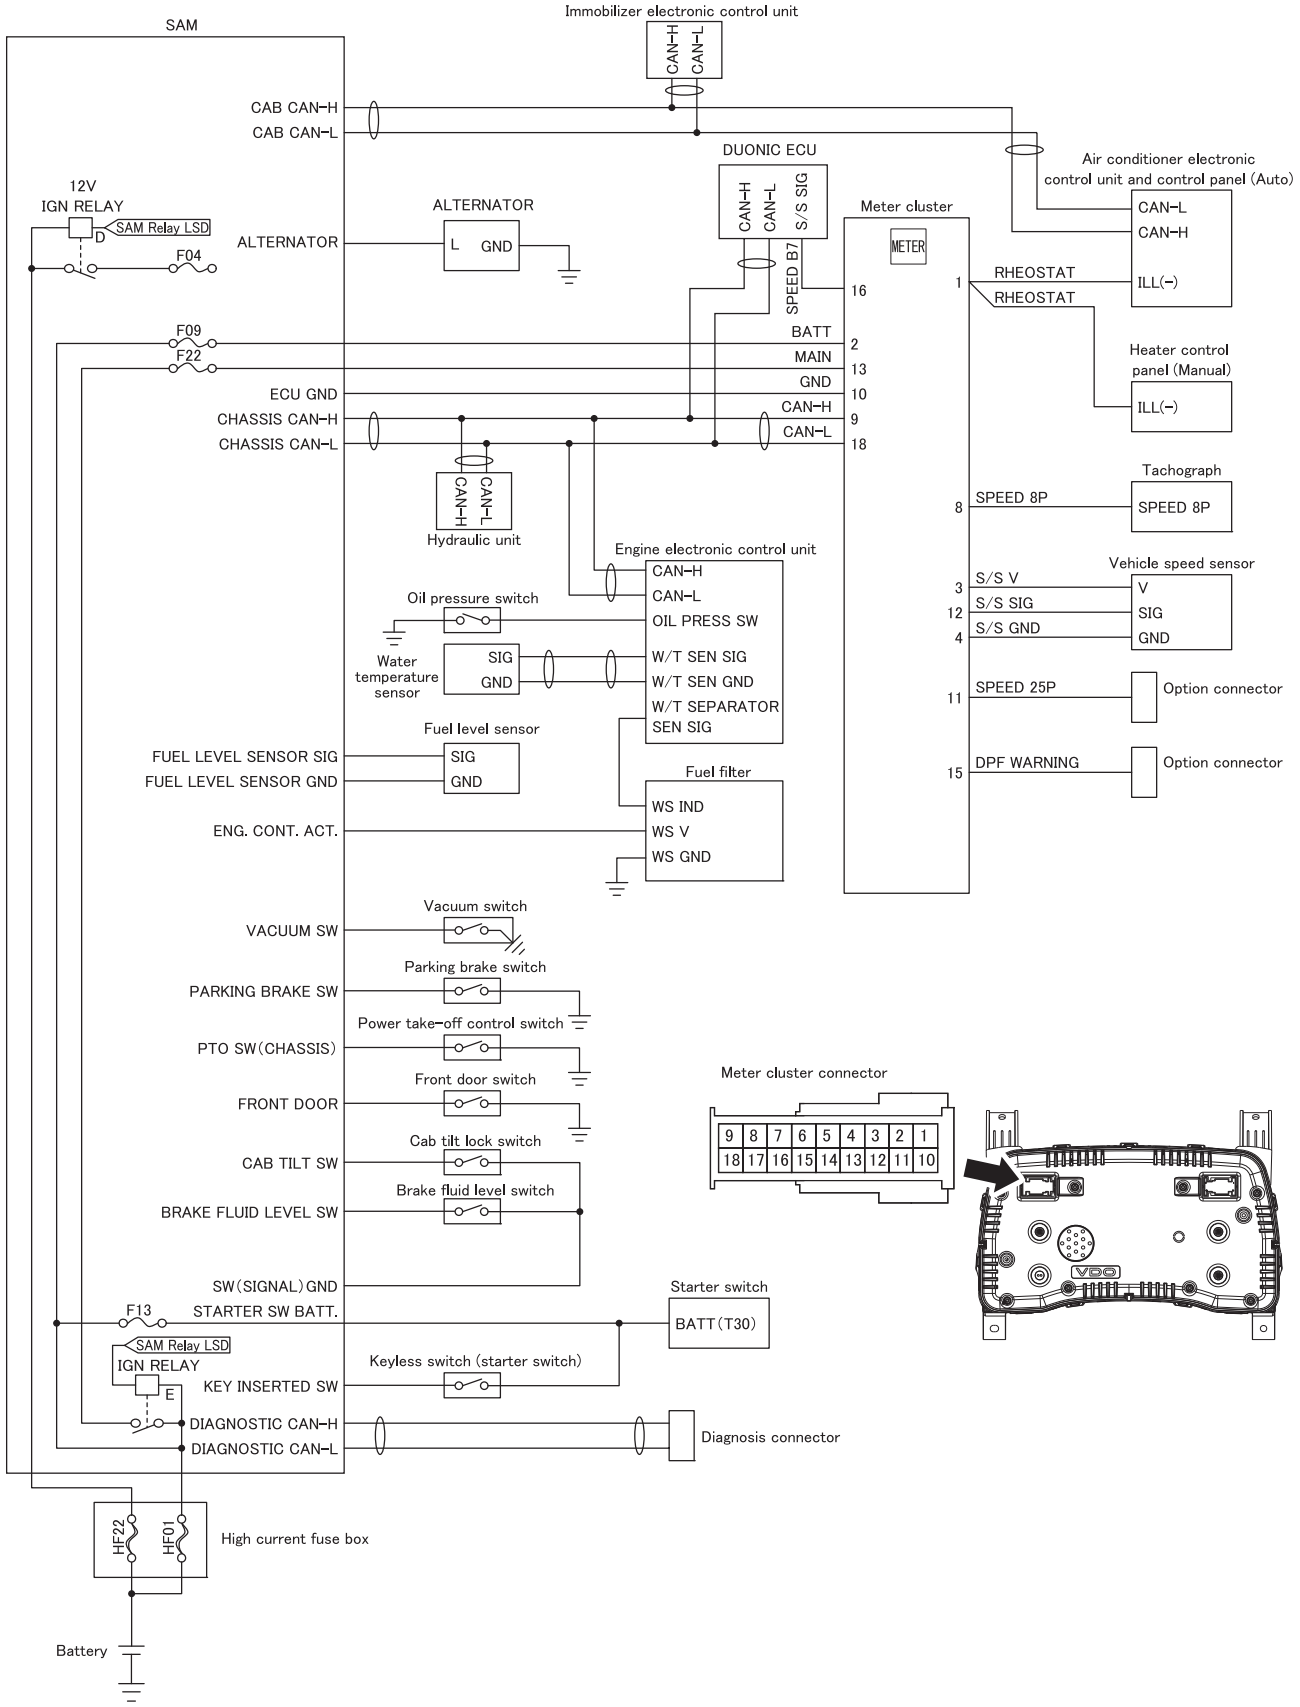
- The fault diagnosis function establishes the diagnosis mode through simultaneous push of the MODE, SELECT and SET/RES switches with the vehicle at a stop to perform the fault diagnosis of respective systems.

(1) Fault diagnosis function (diagnosis mode) display transition diagram (anti-lock brake system electronic control unit (hydraulic unit))



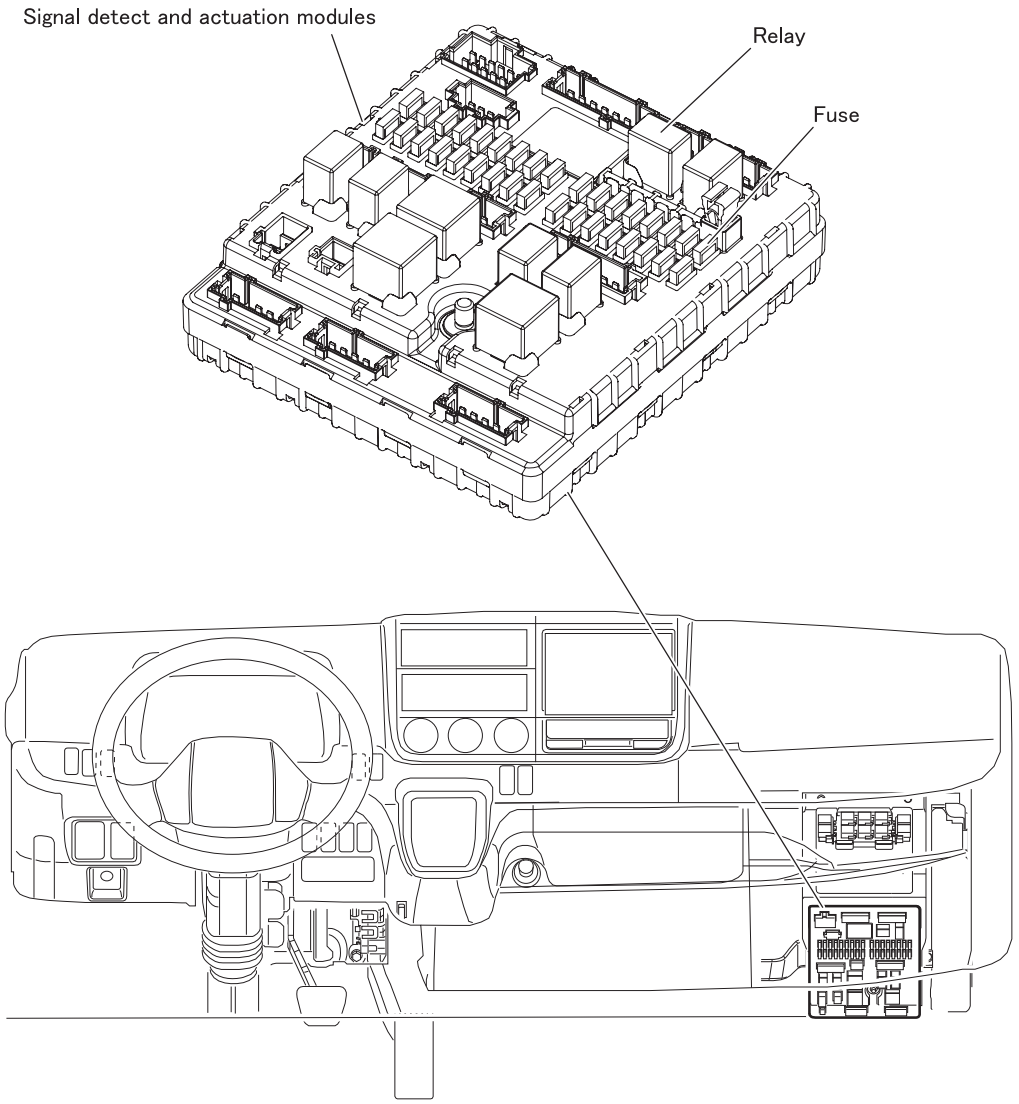
116199N

4.5 Electronic control unit circuit diagram



C07345-ECU-MTR E

5. Signal Detect and Actuation Modules

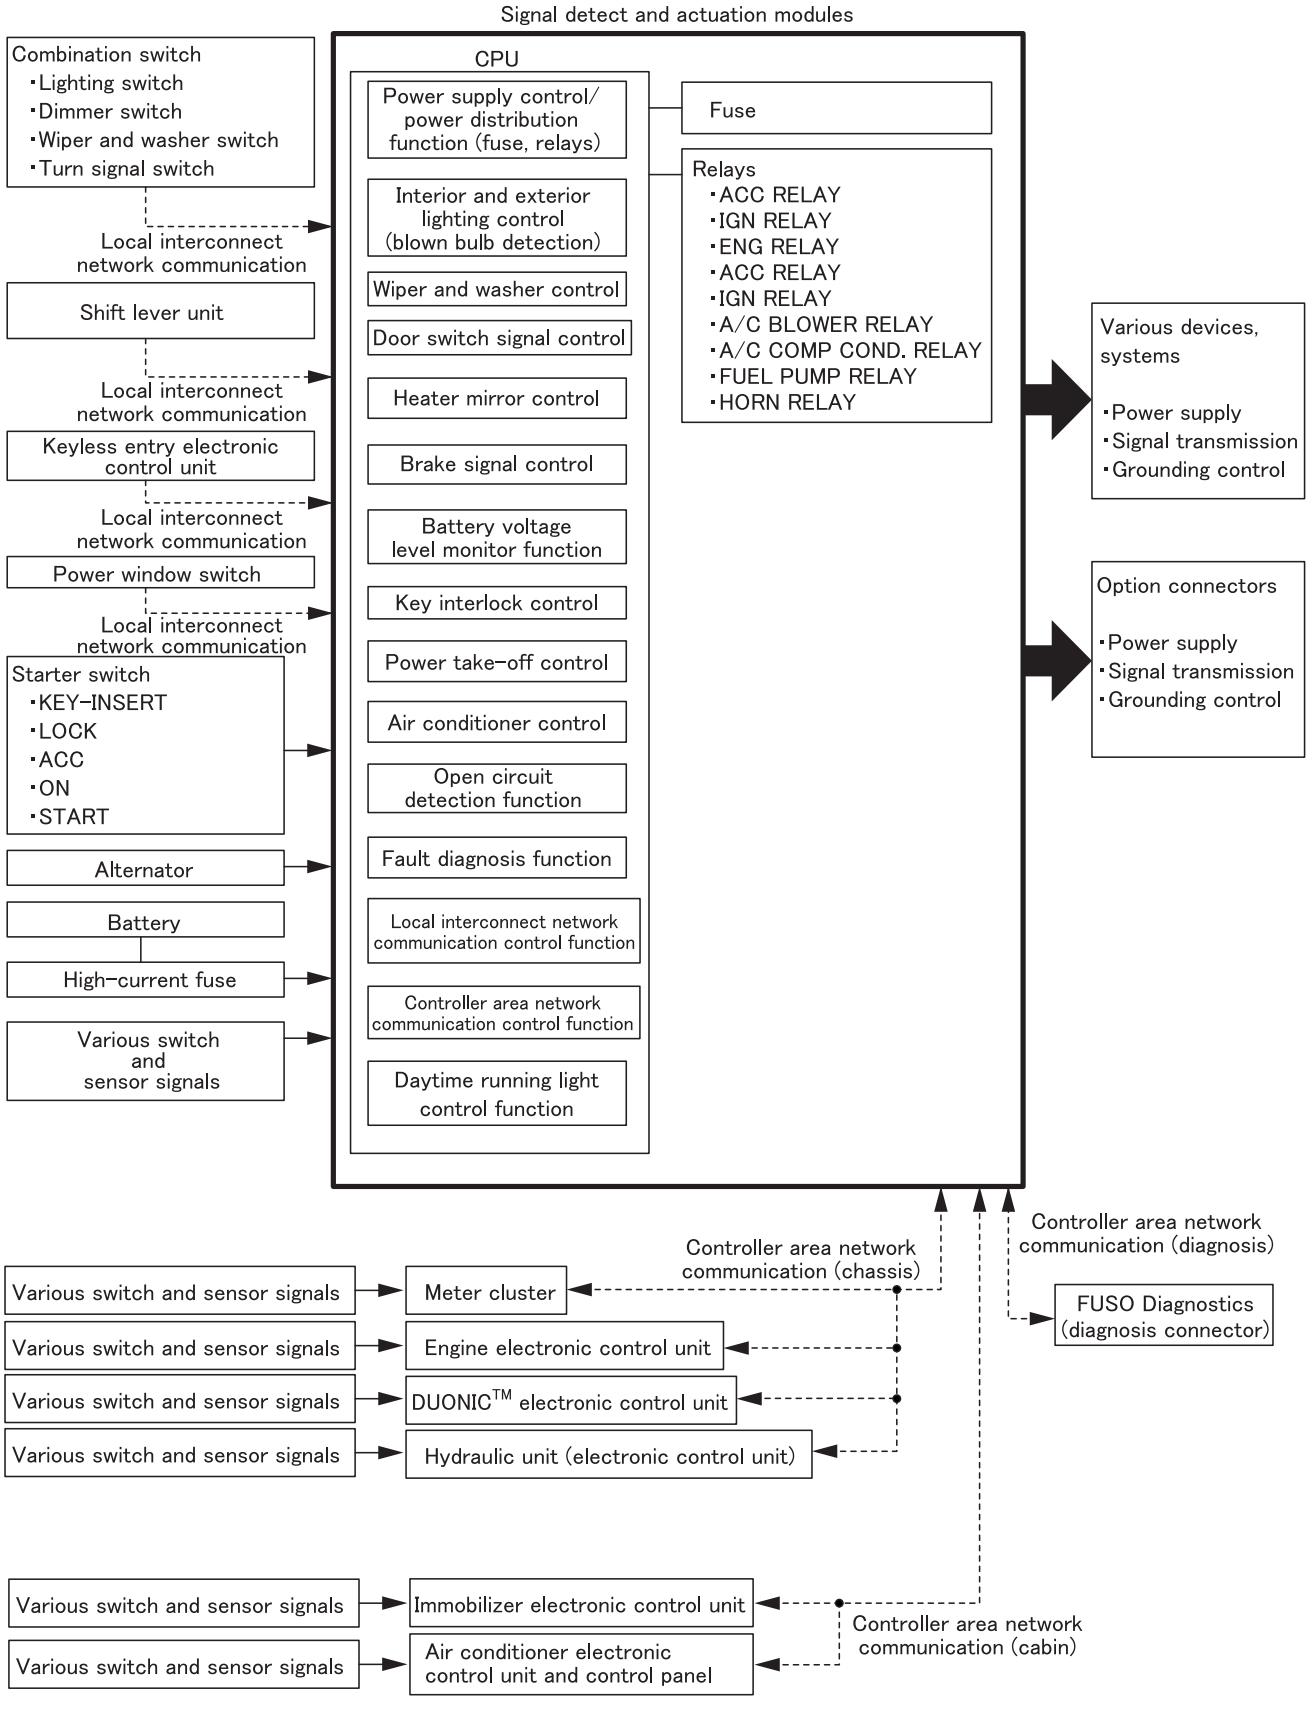


- Signal detect and actuation modules contains conventional relays and fuses in the central processing unit and effects integrated control of electric parts and power distribution. Basically, it has the following functions.
  - Power supply and power distribution functions
  - Detection of various control switch output signals (starter switch, combination switch, etc.)
  - Detection of various detection switch output signals (stop lamp switch, clutch switch, etc.)
  - Detection of various sensor output signals (fuel level sensor, etc.)
  - Junction for controller area network communication between electronic control units
  - Fault diagnosis function
  - Open circuit detection function
  - Various lighting control functions (blown bulb detection)
  - Wiper & washer control
  - Mirror (mirror heater) control

CAUTION ⚠

- **Before replacing the signal detect and actuation modules, associated fuses and relays, be sure to disconnect (–) battery cable and protect the (–) battery terminal and (–) battery cable with insulating tape or the like.**
- **When a fuse is blown, identify the cause and repair to remove it completely. Then, install a new fuse. Be sure to use the fuse of designated ampere.**
- **To remove a spare fuse, insert a fuse puller from outside the wall holding the spare fuse. Inserting the fuse puller from inside the wall may damage the signal detect and actuation modules, resulting in system malfunction or a fire.**
- **Connect the (+) and (–) cables to the battery at right terminals. Wrong connection causes an excessive current to the signal detect and actuation modules, damaging internal elements and circuits.**

5.1 System block diagram



117206E

5.2 Input and output signals list by signal detect and actuation modules functions

Function	Input	Output	Remarks
Back buzzer	• Starter switch • Back light switch	• Back buzzer • Buzzer in meter cluster • Electronic control units	See (340).
Power take-off subsystem	• Starter switch • Transmission power take-off switch (cab) • Power take-off control switch (chassis)	• Option connector: Power take-off • Electronic control units	See (850).
Backup switch signal output	• Starter switch • Backup lamp switch	Option connector: Backup light switch	See (115).
Parking brake switch output	• Starter switch • Parking brake switch	Option connector: Parking brake switch cut-off	See (115).
Service brake switch	• Stop lamp switch N.O. (service brake switch 1) • Stop lamp switch N.C. (service brake switch 2)	Electronic control units	See (325), Gr13E, Gr22E, Gr35E.
Parking brake switch	Parking brake switch	Electronic control units	See (510).
Brake fluid level switch	Brake fluid level switch	Electronic control units	See (515).
Vacuum flow switch	Vacuum switch	Electronic control units	See (515).
Air conditioner compressor clutch & condenser fan motor	• Starter switch • Air conditioner cut-off signal (controller area network signal) • Air conditioner main switch	• Air conditioner condenser fan motor • Dual pressure switch (air conditioner compressor clutch)	See (620), Gr55E.
Air conditioner blower motor control	• Starter switch • Air conditioner cut-off signal (controller area network signal)	• Air conditioner blower motor • Air conditioner blower motor grounding point	See (620), Gr55E.
Door switch status	• Driver's seat side door switch • Assistant driver's seat side door switch • Rear door switch (left-hand, right-hand) • Starter switch	Electronic control units	See (345).
Keyless entry	• Answer back signal (local interconnect network communication) • Driver's seat side door switch • Assistant driver's seat side door switch • Rear door switch (left-hand, right-hand) • Starter key insert	• Rear turn signal lamp (left-hand) • Rear turn signal lamp (right-hand) • Front turn signal lamp (left-hand) • Front turn signal lamp (right-hand) • Option connector: Side turn signal lamp (left-hand) • Option connector: Side turn signal lamp (right-hand) • Interior lamp	See (115), (654).
Diesel Particulate Filter	Diesel Particulate Filter cleaning switch	Engine electronic control unit	See Gr13E.
Fuel level sensor	Fuel level sensor	Meter cluster	See (420).

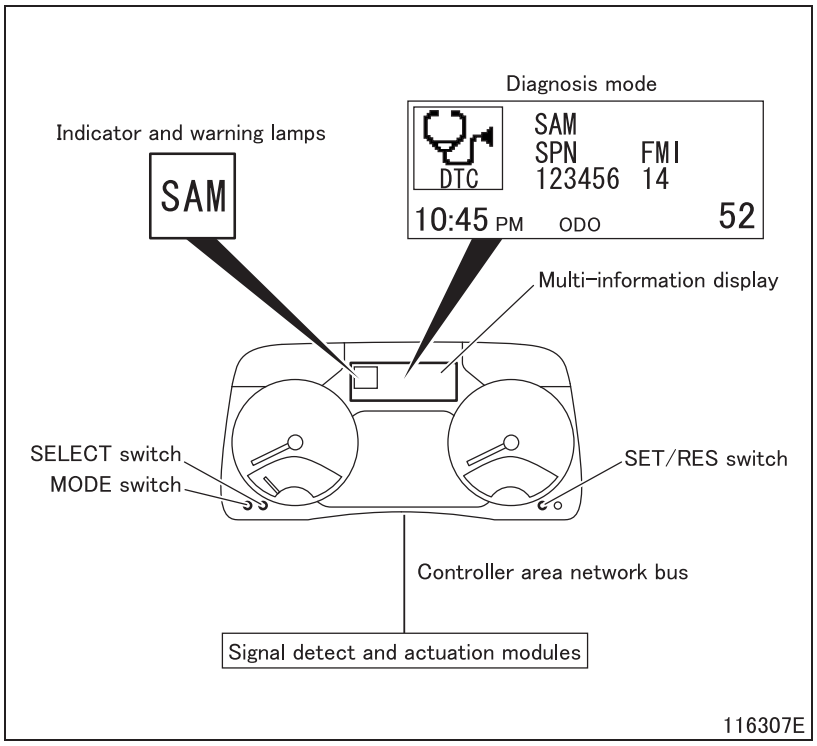
Function	Input	Output	Remarks
Starter switch & relay control	• Starter switch ACC • Starter switch ON • Starter switch CRANK • Starter switch inserted	• Electronic control units [In signal detect and actuation modules] • IGN RELAY • ACC RELAY • IGN RELAY (OPTION) • ACC RELAY (OPTION)	See (105), (110).
Backup lamp	Backup lamp switch	Backup lamp (left-hand, right-hand)	See (340).
Headlamp	• Starter switch • Combination switch	• Low beam (left-hand) • Low beam (right-hand)	See (310).
	• Starter switch • Combination switch	• High beam (left-hand) • High beam (right-hand) • Meter cluster	
Stop lamp	Stop lamp switch N.O. (service brake switch 1)	• Stop lamp (left-hand) • Stop lamp (right-hand)	See (325).
Position lamp, license plate lamp, tail lamp	• Starter switch • Combination switch	• Position lamp (left-hand) • Position lamp (right-hand) • License plate lamp (left-hand) • License plate lamp (right-hand) • Tail lamp (left-hand) • Tail lamp (right-hand)	See (320).
		• Identification lamp relay • Clearance and side marker lamp (right-hand) • Clearance and side marker lamp (left-hand) • Identification lamp (right-hand) • Identification lamp (left-hand) • Identification lamp (center)	See (349).
Turn signal lamp, hazard lamp	• Hazard lamp switch • Combination switch	• Rear turn signal lamp (left-hand) • Rear turn signal lamp (right-hand) • Front turn signal lamp (left-hand) • Front turn signal lamp (right-hand) • Option connector: Side turn signal lamp (left-hand) • Option connector: Side turn signal lamp (right-hand) • Meter cluster	See (115), (330).
Fog lamp	• Combination switch • Fog lamp switch	• Fog lamp (left-hand) • Fog lamp (right-hand) • Meter cluster	See (315).
Cab lamp	• Driver's seat side door switch • Assistant driver's seat side door switch • Rear door switch (left-hand, right-hand) • Starter switch	• Cab lamp (battery) • Cab lamp (control)	See (345).
Step lamp	• Driver's seat side door switch • Assistant driver's seat side door switch	• Step lamp (driver's seat side) • Step lamp (assistant driver's seat side)	See (345).
Illumination lamp	Combination switch	• Air conditioner control panel illumination • Audio illumination • Various control switches illumination • Option connector: Illumination chassis • Option connector: Illumination body	See (115), (348).

Function	Input	Output	Remarks
Cab tilt signal switch	Cab tilt lock switch	Meter cluster	See (550).
Alternator (L terminal)	Alternator (L terminal)	Meter cluster	See (125).
Clutch switch (upper)	Clutch switch	Electronic control units	See Gr13E.
Key interlock	• Gear shift signal (controller area network line) • Starter switch	Key interlock solenoid: control	See (873).
Wiper & washer	• Starter switch • Combination switch	• Wiper motor (LOW) • Wiper motor (HIGH) • Washer motor (CONTROL)	See (514).
Battery monitor	Battery	Limitation of various functions at low voltage and overvoltage	–
Horn	Horn switch	• Horn battery [In signal detect and actuation modules] • Horn relay	See (616).
Mirror heater	Mirror heater switch	• Mirror heater switch illumination • Mirror heater on driver's seat side • Mirror heater on assistant driver's seat side	See (629).
Central door locking switch control	Door lock switch	• Power window switch (right-hand) • Power window switch (left-hand) • Door lock actuator (right-hand) • Door lock actuator (left-hand) • Rear door lock actuator (right-hand) • Rear door lock actuator (left-hand)	See (622).
Daytime running light	• Combination switch • Parking brake switch • Alternator (terminal L) • Engine electronic control unit	• Headlamp (right-hand) • Headlamp (left-hand) • Meter cluster	See (313).
Transfer four-wheel drive switch status	Transfer four-wheel drive switch	• Meter cluster • Anti-lock brake electronic control unit	See (810).

Function		Input	Output	Remarks
Power distribution module: J: accessory relay output	Fuse F15	–	• DUONIC™ electronic control unit accessory • Audio accessory • ETC accessory • CLU accessory relay drive	See (105), (115), (110).
	Fuse F16	–	• Cigarette lighter accessory • Motor-driven retractable mirror	
Power distribution module: E: IGN relay output	Fuse F22	–	• Meter cluster IGN • Tachograph IGN • Air conditioner IGN • Rear air conditioner IGN	See (105), (115), (110).
	Fuse F18	–	• Hydraulic unit (electronic control unit) IGN1	
	Fuse F19	–	• Engine electronic control unit IGN	
	Fuse F3	–	–	
	Fuse F24	–	• DUONIC™ electronic control unit IGN1 • DUONIC™ electronic control unit IGN2 • Shift lever 1 IGN1 • Shift lever 2 IGN2	
	Fuse F20	–	• Front drive switch • Van body dome light switch	
	Fuse F1	–	• Starter relay	
Power distribution module: H: Engine relay output	Fuse F31	–	• Engine battery control 1 • Engine battery control 2 • Engine battery control 3	See (105), (110).
	Fuse F28	–	• Engine actuator battery control • Fuel heater relay drive • Fuel pump relay drive	
	Fuse F29/F30	–	• Selective catalytic reduction battery control 1 • Selective catalytic reduction battery control 2	
Power distribution module: C: ACC relay (OPTION) output	Fuse F25	–	• Option connector: ACC chassis • Option connector: ACC body	See (105), (115), (110).
Power distribution module: D: IGN relay (OPTION) output	Fuse F04	–	• Option connector: Main chassis • Option connector: Main body	See (105), (115), (110).
Power distribution module: battery output	Fuse F26	–	• Option connector: Battery body • Option connector: Battery chassis	

Function		Input	Output	Remarks
Power distribution module: BAT output	Fuse F9	–	• Meter cluster BAT • Diagnosis connector BAT • Combination switch BAT	See (105), (115), (110).
	Fuse F12	–	• Audio BAT • Interior lamp BAT • Tachograph BAT	
	Fuse F13	–	• Immobilizer electronic control unit BAT 2 • Immobilizer electronic control unit BAT 1 • Starter switch BAT	
	Fuse F6	–	–	
	Fuse F17	–	• Fuel heater BAT	
	Fuse F10	–	–	
Power distribution module: A: A/C BLOWER RELAY output	Fuse F11	–	• Air conditioner blower motor	See (105), (110).
Power distribution module: G: A/C COMP COND. RELAY output	Fuse F32	–	• Air conditioner condenser fan motor relay drive • Air conditioner condenser fan clutch	See (105), (110).
Power distribution module: F: FUEL PUMP RELAY output	Fuse F28	–	• Fuel pump control • Fuel pump BAT control	See (105), (110).
	Fuse F34	–	• Fuel heater control	
Power distribution module: Power window supply	Fuse F5	–	• Power window BAT driver's seat side	See (105), (110).
	Fuse F7	–	• Power window BAT assistant driver's seat side	
Communication		• Controller area network - Cabin • Controller area network - Chassis • Controller area network - Diagnosis • Various local interconnect network lines	• Controller area network - Cabin • Controller area network - Chassis • Controller area network - Diagnosis • Various local interconnect network lines	–
Signal detect and actuation modules supply		• Signal detect and actuation modules BAT • Signal detect and actuation modules BAT • Signal detect and actuation modules ENG BAT	–	See (105), (110), (130).
Grounding		• Signal detect and actuation modules ground • Ground, body harness, POWER • Ground, body harness, SIGNAL • Ground, central harness • Ground, various electronic control units		

5.3 Fault diagnosis function



- The driver is informed of faults in the signal detect and actuation modules through the multi-information display in the meter cluster.
- Details of diagnosis codes can be called out through the multi-information display in the meter cluster and the FUSO Diagnostics (diagnosis connector). (See Gr00.)

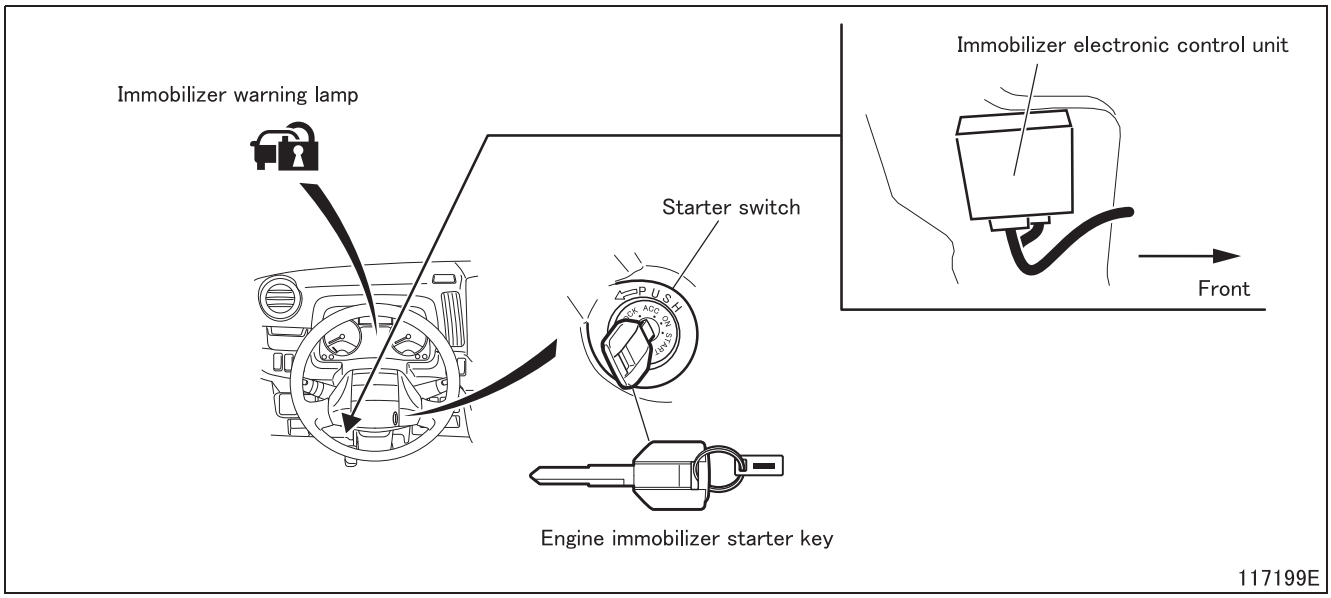
Terminal positions (See section 5.4.)

*1: Enabled when the option is mounted or parameters are set using coding
*2: Specify the limit at a battery voltage of 13 V.
*3: Specify the limit at a battery voltage of 13 V and to a short-circuit to 10-mΩ ground.

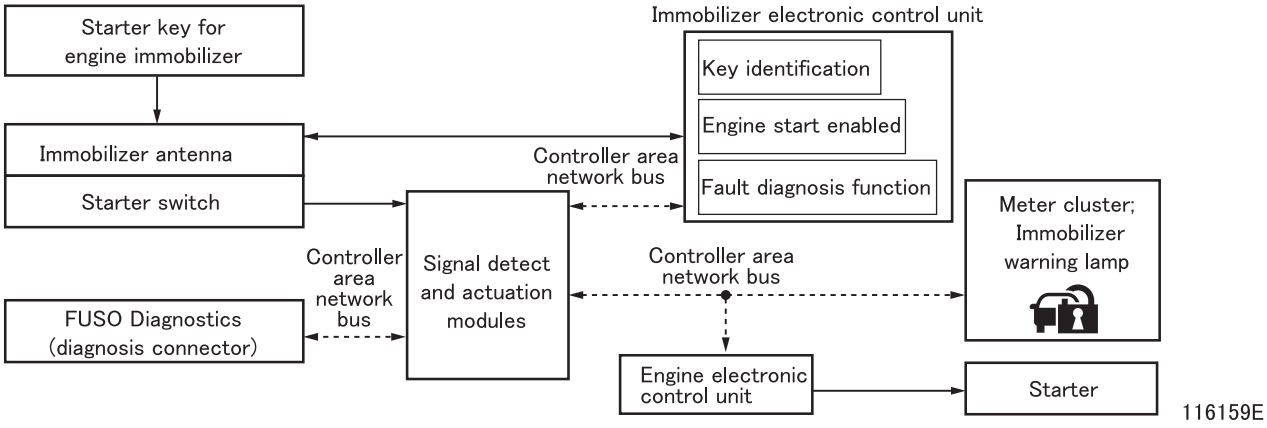
6. Immobilizer

- The immobilizer stops the supply of power to the starter and supply of fuel to the engine thereby to prevent improper vehicle control when any other key than the engine immobilizer starter key registered in the immobilizer electronic control unit is used in an attempt to start the engine.



- The immobilizer electronic control unit has the capacity enough to accept the registration of up to six starter keys for engine immobilizer. In case the registered starter key is lost, its registration is erased, then an available starter key is additionally registered.
- If all the registered starter keys are lost or damaged, the erasing of such keys and additional registration of new starter keys are impossible. In such case, the immobilizer electronic control unit is replaced in combination with the new starter keys.
- The immobilizer electronic control unit performs self-diagnosis of the system, and if there is any abnormality in the system, the immobilizer warning lamp is lit to inform the driver of the abnormality.

6.1 System block diagram



Part name	Function or use
Starter key for immobilizer	Sending and receiving of ID No. signal
Immobilizer antenna	Sending and receiving of ID No. signal
Starter switch	Check of starter switch ON/OFF
Immobilizer electronic control unit	Identification of ID No. and enabling signal for engine start
Starter	Start of engine
Immobilizer warning lamp (meter cluster)	Lit for approx. 3 seconds after starter switch ON (with immobilizer system in “set” status)
	Lit when immobilizer system becomes abnormal.
FUSO Diagnostics (diagnosis connector)	Communication between FUSO Diagnostics and immobilizer electronic control unit (controller area network communication via signal detect and actuation modules)
Signal detect and actuation modules	Junction for sent and received signals between immobilizer electronic control unit, engine electronic control unit, meter cluster and FUSO Diagnostics
	Sending of starter ON/OFF signal

6.2 Fault diagnosis function

- The status of the system is constantly monitored when the starter switch is put in the ON position, and if a fault is detected in the system, the driver is informed of the fault through warning lamp in the meter cluster. At the same time, the location of the fault is stored in the memory in the form of diagnosis code and appropriate fault-response control is effected.
- The diagnosis code stored in the memory can be called out on the multi-information display in the meter cluster and through the FUSO Diagnostics. (See Gr00.)

6.3 Electronic control circuit diagram

54-00D TROUBLESHOOTING

TROUBLESHOOTING

1. Power and Charging

Symptoms / Possible causes		Battery fluid (electrolyte) decreases too fast.	Battery temperature is too high.	Battery is normal but excessively discharged.	Charge warning lamp is not illuminated when starter switch is in ON position with engine not running.	Alternator is normal but battery is excessively discharged.	Alternator does not generate electricity.	Reference Gr
Connector connection faulty, harness broken, grounding faulty				O		O		
Fuse blown				O	O	O		
High-current fuse blown				O	O	O		
Belt tension insufficient				O		O		Gr14
Belt cut off				O		O		Gr14
Defective battery		O				O		
Communication failure of controller area network (Controller area network communication)					O			
Alternator	Open-circuited stator coil			O				
	Short circuit between stator coil and core			O				
	Open-circuited field coil			O				
	Defective rectifier			O				
	Defective regulator		O	O	O			
	Brush worn			O				
	Permanent set of brush spring in fatigue			O				
	Improper wiring			O				
Power is not supplied to alternator R terminal	Relay "Optional power supply (IGN)" inoperative			O		O	O	Gr54-13 (Performing inspections based on diagnosis codes; check of FUSO Diagnostics service data; inspection and disconnection/connection of relay (D))
	Fuse blown			O		O	O	Gr54-01 (Inspection and removal/installation of fuse (F04))
Defective meter cluster					O			

2. Engine Starting, Stopping and Preheating

Symptoms / Possible causes		Starter is not activated.	Starter is activated but engine does not start			Engine does not stop.	Engine cannot be warmed up.	Engine is slow to start.	Exhaust brake is nonfunctional.	Reference Gr
			Pinion does not mesh with ring gear.	Pinion meshes with ring gear but does not rotate.	Flywheel rotates but engine does not start.					
Connector connection faulty, harness broken, grounding faulty		O			O	O	O	O	O	
High current fuse blown		O					O		O	
Fuse blown		O					O		O	
Signal detect and actuation modules malfunctioning		O					O		O

5. Cigarette Lighter and Audio

Symptoms / Possible causes	Cigarette lighter			Audio										Reference Gr
	Will not turn red-hot.	Will not return.	Night illumination lamp is not illuminated.	Radio will not turned on.	Radio has poor reception.	Radio is not responsive to specific frequency band.	Noise occurs.	Quality of sound is poor.	Sound comes out from one side only.	Sound volume is different between left and right.	Will not accept a CD.	Sound skips at the same place.	CD is accepted but no sound comes out.	
Connector connection faulty, harness broken, grounding faulty	O		O	O			O		O				O	
Fuse blown	O			O									O	
Signal detect and actuation modules malfunctioning	O		O	O									O	
Defective cigarette lighter	O	O												
Antenna and antenna feeder poorly connected				O	O		O							
Defective radio amplifier				O			O	O	O	O				
Defective radio tuner				O	O	O		O						
Defective speaker				O	O	O	O	O	O	O			O	
Left and right speakers are different in impedance										O				
CD is already in											O			
CD scratched or soiled												O		
CD scratched and/or soiled and CD-ROM incapable of reading data is inserted													O	
Starter switch signal is not received.	O													Gr54-13 (Inspection and disconnection/connection of signal detect and actuation module connectors (15B/18B); performing inspections based on diagnosis codes; check of FUSO Diagnostics service data
				O									O	Gr54-13 (Inspection and disconnection/connection of signal detect and actuation module connectors (15B/18B); check of FUSO Diagnostics service data

Symptoms / Possible causes		Cigarette lighter			Audio										Reference Gr
		Will not turn red-hot.	Will not return.	Night illumination lamp is not illuminated.	Radio will not turned on.	Radio has poor reception.	Radio is not responsive to specific frequency band.	Noise occurs.	Quality of sound is poor.	Sound comes out from one side only.	Sound volume is different between left and right.	Will not accept a CD.	Sound skips at the same place.	CD is accepted but no sound comes out.	
Power is not supplied.	Blown fuse	O													Gr54-01 (Inspection and removal/ installation of fuse (F16))
					O									O	Gr54-01 (Inspection and removal/ installation of fuses (F12/F15))
	ACC relay inoperative	O			O									O	Gr54-13 (Performing inspections based on diagnosis codes; check of FUSO Diagnostics service data; inspection and removal/installation of relay (J))
Output conditions are not satisfied	Power is not supplied to the combination switch.			O											Gr54-01 (Inspection and removal/ installation of fuse (F09)); Gr54-13 (Inspection and disconnection/connection of signal detect and actuation module connector (2B))
	combination switch signal is not received.			O											Gr54-13 (Inspection and disconnection/connection of signal detect and actuation module connector (18B); performing inspections based on diagnosis codes)
	Key switch position			O											Gr54-13 (Inspection of disconnection/connection of signal detect and actuation module connectors (15B/ 18B); performing inspections based on diagnosis codes; check of FUSO Diagnostics service data

Symptoms / Possible causes		Cigarette lighter			Audio										Reference Gr
		Will not turn red-hot.	Will not return.	Night illumination lamp is not illuminated.	Radio will not turned on.	Radio has poor reception.	Radio is not responsive to specific frequency band.	Noise occurs.	Quality of sound is poor.	Sound comes out from one side only.	Sound volume is different between left and right.	Will not accept a CD.	Sound skips at the same place.	CD is accepted but no sound comes out.	
Output is halted.	External factor			O											Gr54-13 (Inspection of signal detect and actuation module connector (14B); check of FUSO Diagnostics service data
	Over current			O											Gr54-01 (Check of installed aftermarket parts; inspection of illumination condition of other night illuminations)
	Internal factor of signal detect and output module			O											Inspection by replacing with a known-good signal detect and actuation module

Source of accessory noise

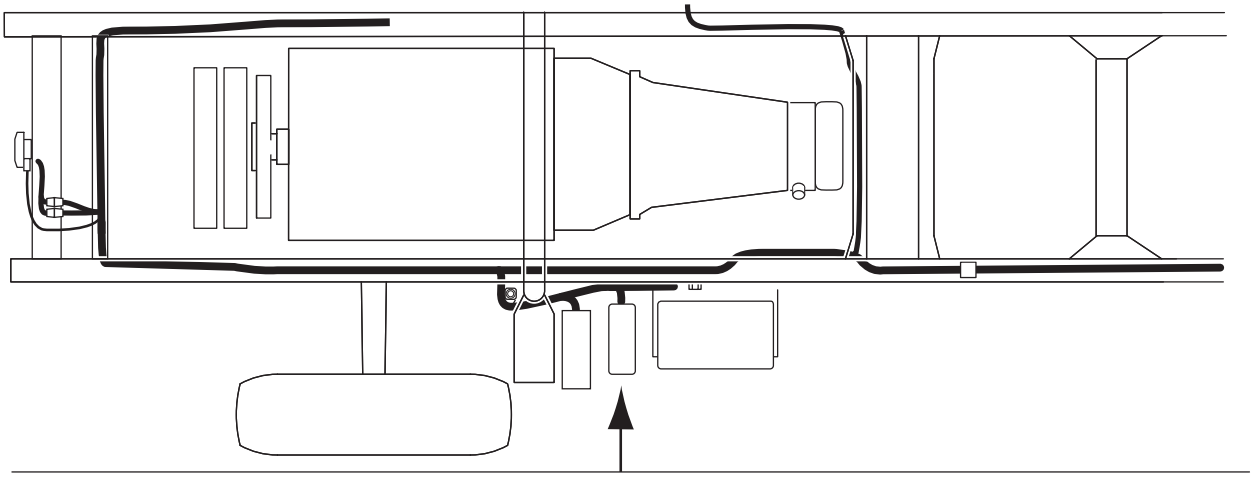
Accessory	Noise	Status
Alternator	Beep-beep	High-pitched sound that occurs when accelerator pedal is quickly depressed. (Sound stops as soon as engine is stopped.)
Fuel level sensor	Scratchy sound	Heard when engine is suddenly revved up, vehicle is running on rough road or starter switch is turned ON
Horn	Hushing sound	Heard when horn button is pressed or released
Wiper motor	Whizzing sound	Heard depending on windshield wiper speed
Washer motor	Whizzing sound	Heard when washer is operating on front windshield

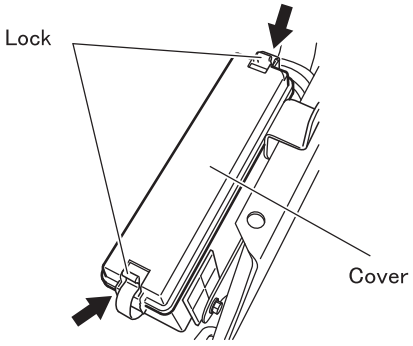
6. Horn

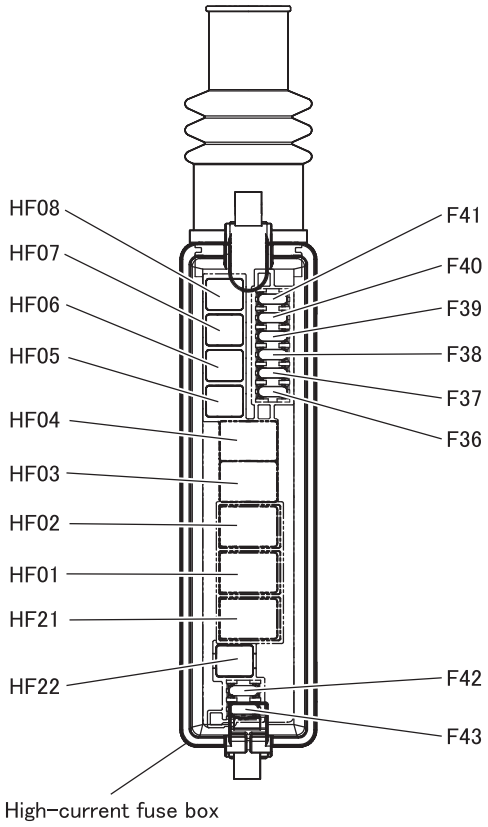
Symptoms / Possible causes		Horn				Reference Gr
		Horn does not sound.	Horn does not stop sounding.	Horn sound volume is insufficient.	Horn sound quality is poor.	
Connector connection faulty, harness broken, grounding faulty		O				
Fuse blown		O				
Defective horn switch		O	O			
Defective horn relay		O	O			
Signal detect and actuation modules malfunctioning		O	O			
Defective horn		O		O	O	
Horn stay bent				O	O	
Battery insufficient in capacity		O		O		
Horn switch signal is not received.		O				Gr54-13 (Inspection and disconnection/connection of signal detect and actuation module connector (15B))
Horn switch signal is received.			O			
Power is not supplied.	Blown fuse	O				Gr54-01 (Inspection and removal/installation of fuse (F14))
	Horn relay inoperative	O				Gr54-13 (Inspection and removal/installation of relay (B))
Power is supplied continuously.	Fused horn relay		O			

54-01 POWER, CHARGE AND GROUND CIRCUIT

HIGH-CURRENT FUSE BOX







WARNING ⚠

- **To prevent possible injury, be sure to disconnect the negative (-) cable of the battery and insulate it with tape before removing high-current fuses. (See Gr00.)**

CAUTION ⚠

- **With the negative (-) cable of the battery connected, some high-current fuses are always under battery voltage. An arc will be generated when any of these high-current fuses is replaced without disconnecting the battery negative cable, and this could cause the related electric devices to be damaged.**
- **If replace the fuse, remove the high-current fuse box from the vehicle.**
- **If a fuse blows out, identify and remedy the cause, then replace the fuse.**
- **Be sure to use the fuse with the specified ampere.**

54−L05232HF−1

SAM : Signal detect and actuation modules

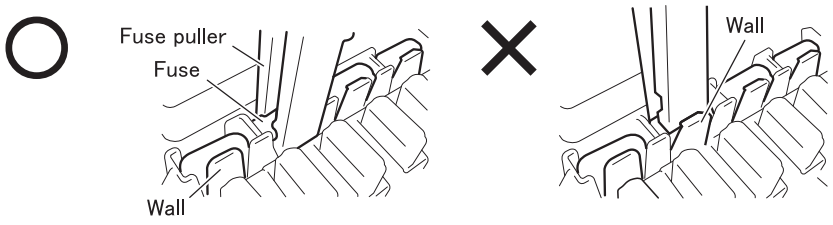
Removal of spare fuse



WARNING ⚠

- **To prevent possible injury, be sure to disconnect the negative (-) cable of the battery and insulate it with tape before removing fuses. (See Gr00.)**

CAUTION ⚠

- **If a fuse blows out, identify and remedy the cause, then replace the fuse.**
- **Be sure to use the fuse with the specified ampere.**
- **Insert the fuse puller into the gap on the outer side of the fuse holder wall to remove the spare fuse. Do not force the puller into the gap on the inner side of the fuse holder wall. Doing so will break the SAM and cause malfunctions or a fire.**

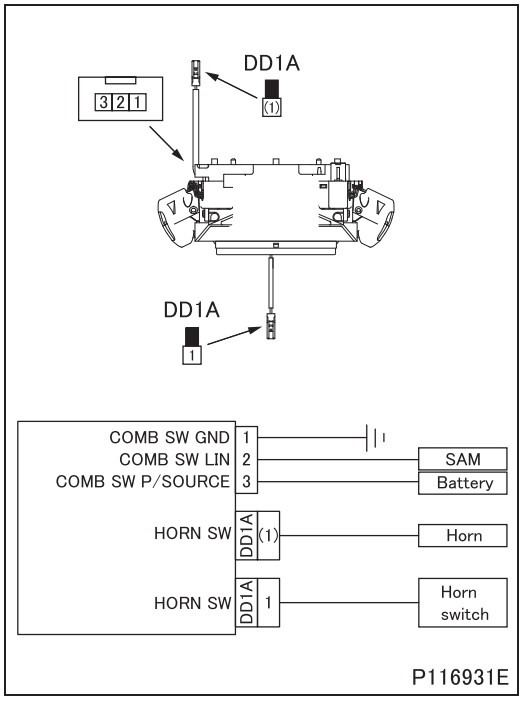
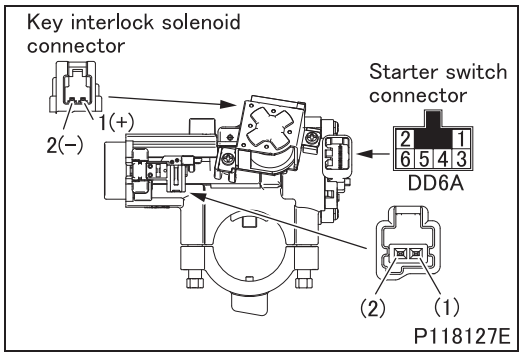
54-11 INSPECTION OF ELECTRICAL EQUIPMENT

#001 to #179 SWITCH



#001 Inspection of combination switch

- Because it is not easy to independently check the switch for the function, determine the quality of the switch indirectly by checking the related parts, such as the harness, horn switch, etc. in the system.
- If there is nothing abnormal in the related parts, but the problem remains in the system, then replace the switch. (See Gr37.)



#002 Inspection of starter switch

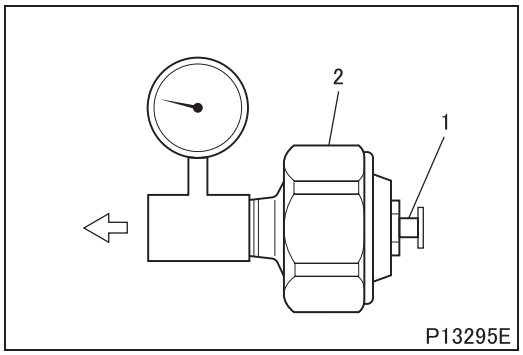
- Perform the following checks, and if any fault is found, replace the switch. (See Gr37.)

(1) Starter switch

Switch position		Continuity terminal
LOCK	without key	–
	with key	(1)–(2)
ACC		(1)–(2), 4–5
ON		(1)–(2), 4–5–6
START		(1)–(2), 3–4–5–6

(2) Key interlock solenoid

- Confirm that applying battery voltage between the terminals 1 and 2 prevents the key from turning toward the LOCK position.



#023 Inspection of vacuum switch

- Perform the following checks, and if any fault is found, replace the switch. (See Gr35.)

(1) Inspection without applying negative pressure

- Make sure that there is no continuity between terminals 1 and 2 (body).

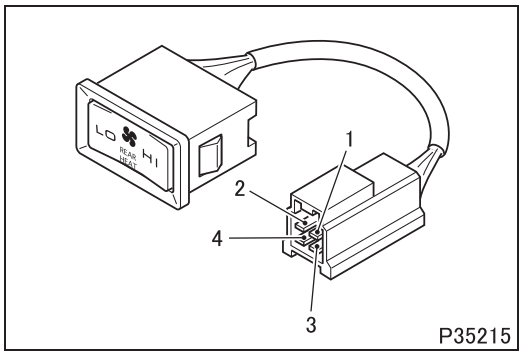
(2) Inspection by applying negative pressure

- Gradually apply negative pressure to the switch starting from 0 kPa {0 psi, 0 kgf/cm^2}.
- Measure the degree of air pressure at the moment when continuity is detected between terminals 1 and 2 (body), and make sure to confirm if the value meets the standard.

Standard value	$-(47\ ^{+3.3}_{-4.0})$ kPa {$-(13.8\ ^{+0.98}_{-1.18})$ in.Hg, $-(350\ ^{+25}_{-30})$ mmHg}

#027 Inspection of power window switch

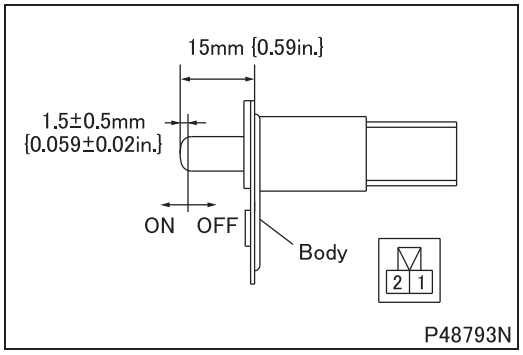
- Because it is not easy to check these switches individually, determine the quality of the switches indirectly by checking related parts, such as harnesses, power window motor, etc. in the system.
- If there is nothing abnormal in related parts, but there is still something wrong with the system, then replace the switches. (See Gr43.)



#034 Inspection of rear heater switch

Switch position	Continuity terminal
HI	2–4
OFF	–
LO	1–2

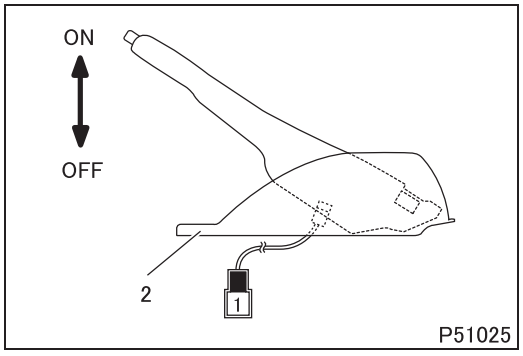
- If any fault is found, replace the switch.



#035 Inspection of door switch

Switch position	Continuity terminal
OFF	–
ON	1-body, 2-body

- If any fault is found, replace the switch. (See Gr43.)

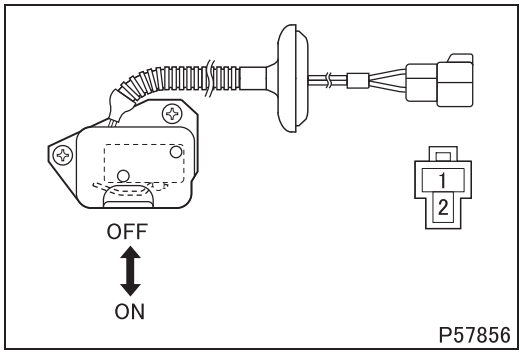


#038 Inspection of parking brake switch

- Measure continuity between terminals 1 and 2 (body) ground.

Pull the parking brake lever	Continuity exists
Release the parking brake lever	Continuity does not exist

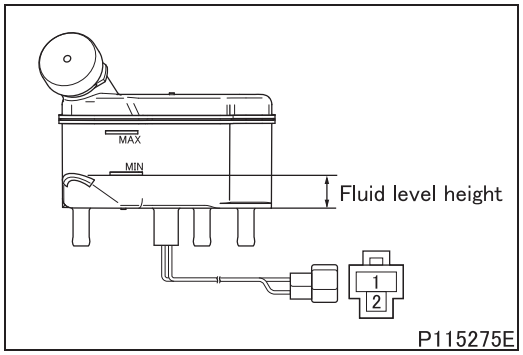
- If any fault is found, replace the switch. (See Gr36.)



#039 Inspection of cab tilt lock switch

Switch position	Continuity terminal
OFF	–
ON	1–2

- If any fault is found, replace the switch. (See Gr42.)



#041 Inspection of brake fluid level switch

- Gradually drain brake fluid from the brake fluid reservoir.

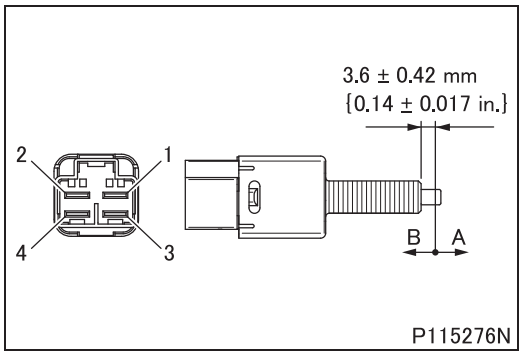
CAUTION ⚠

- **Brake fluid contains ingredients that dissolve the vehicle's paint. Quickly wipe off brake fluid when it is spilled.**

- Measure height of the switch when continuity is detected between terminals 1 and 2.

Standard value	18 to 20 mm {0.71 to 0.79 in.}

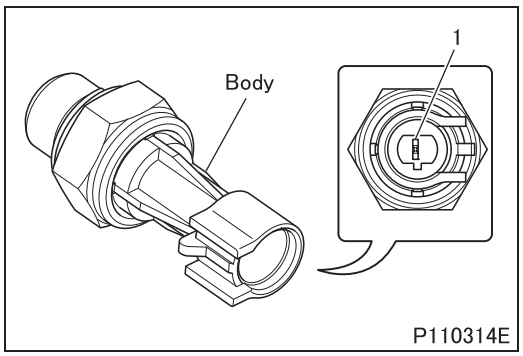
- If the measured value deviates from the standard value, replace the brake fluid reservoir. (See Gr52.)



#042 Inspection of stop lamp switch

Switch position	Continuity terminal
A	1–2
B	3–4

- If any fault is found, replace the switch. (See Gr35.)



#044 Inspection of oil pressure switch

- Perform the following checks, and if any fault is found, replace the switch. (See Gr12.)

(1) Inspection without applying air pressure

- Make sure that there is continuity between terminals 1 and the body.

(2) Inspection by applying air pressure

- Gradually apply air pressure to the switch starting from 0 kPa {0 psi, 0 kgf/cm^2}.

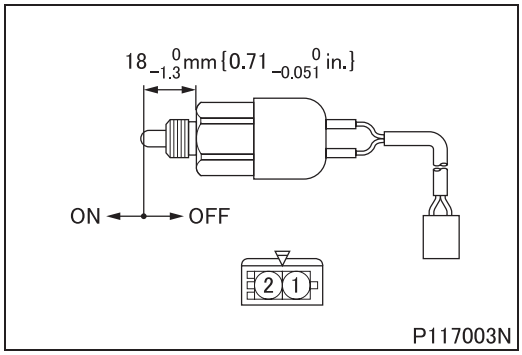
- Measure the degree of air pressure at the moment when continuity is not detected between terminals 1 and body, and make sure to confirm if the value meets the standard.

Standard value (operating pressure)	50 ± 10 kPa {7.1 ± 1.4 psi, 0.5 ± 0.1 kgf/cm^2}

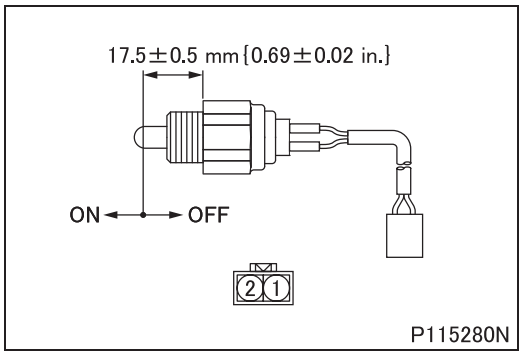
#054 Inspection of switch

- Perform the following checks, and if any fault is found, replace the switch.

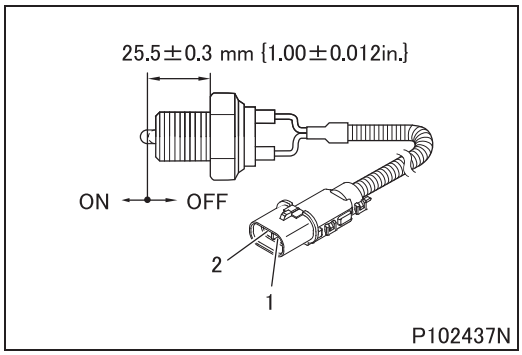
Switch position	Continuity terminal
OFF	–
ON	1–2



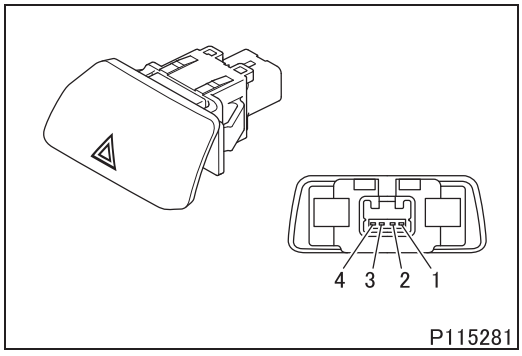
- Transfer four-wheel drive switch. <FG>



- Parking gear switch. (See Gr22.)



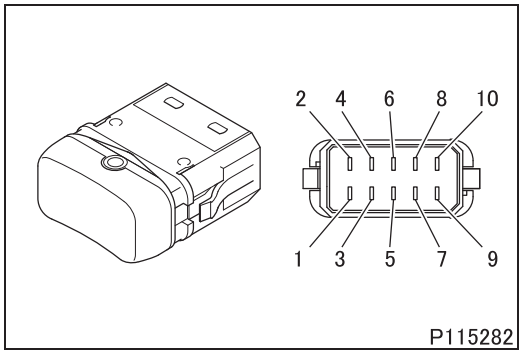
- Power take-off control switch. (See Gr22.)



#081 Inspection of hazard switch

Switch position	Continuity terminal	Night illumination
OFF	–	(+) 4-1 (–)
ON	2–3	

- If any fault is found, replace the switch. (See Gr52.)



#089 Inspection of switch

- Perform the following checks, and if any fault is found, replace the switch.
  - Fog lamp switch
  - DPF cleaning switch
  - Transmission power take-off switch

Switch position	Continuity terminal	Night illumination
OFF	–	(+) 1–10 (–)
ON	3–7	

  - Font drive switch

• ECO mode switch

Switch position	Continuity terminal	Night illumination
OFF	5–7	(+) 1–10 (–)
ON	3–7	

• Van body dome light switch

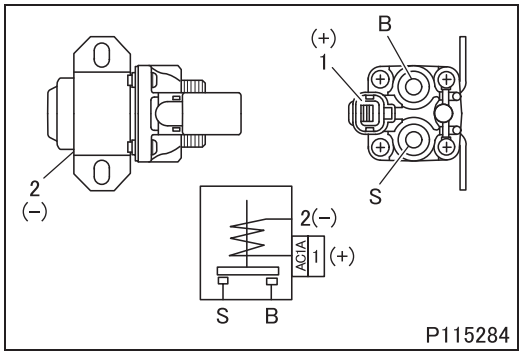
Switch position	Continuity terminal	Operation illumination	Night illumination
OFF	–	–	(+) 1–10 (–)
ON	3–7	(+) 9–10 (–)	

• Door lock switch

Switch position	Continuity terminal	Night illumination
LOCK	3–7, 4–6	(+) 1–10 (–)
Neutral	4–6, 5–7	
UNLOCK	4–8, 5–7	

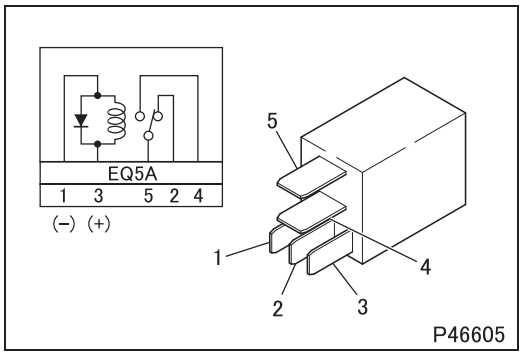
• Cruise control main switch

Switch position	Continuity terminal	Operation illumination	Night illumination
OFF	4–8, 5–7	–	(+) 1–10 (–)
Neutral	4–6, 5–7	–	
ON	3–7, 4–6	(+) 9–10 (–)	



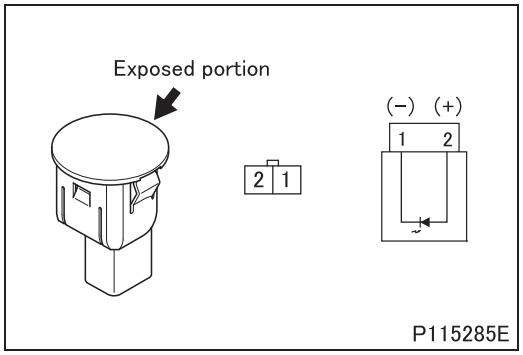
#187 Inspection of starter relay

- Perform continuity and operation checks, and if any fault is found, replace the relay.



#201 Inspection of relay (normally open type 5 pin)

- Perform continuity and operation checks, and if any fault is found, replace the relay.



#251 Inspection of photo sensor

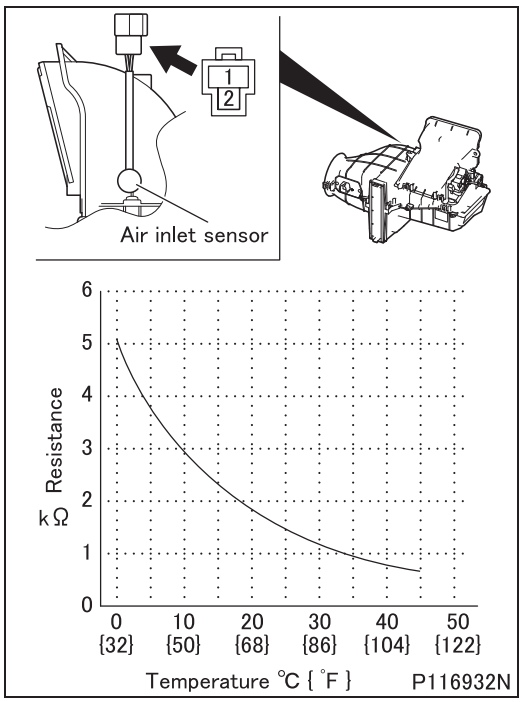
- With the photo sensor connected to the control panel at the sensor connector, turn the starter switch ON.
- With the exposed portion of the sensor exposed to light, measure the output voltage between terminal 2 and body ground.

Standard value	Inspection condition: Move a lit bulb of about 60 watts toward and away from right above the photo sensor (approx. 150 mm {5.91 in.} from sensor at closest point).	1 to 5 V (voltage lowers as light nears sensor)

- If the measured value deviates from the standard value, replace the sensor. (See Gr52.)

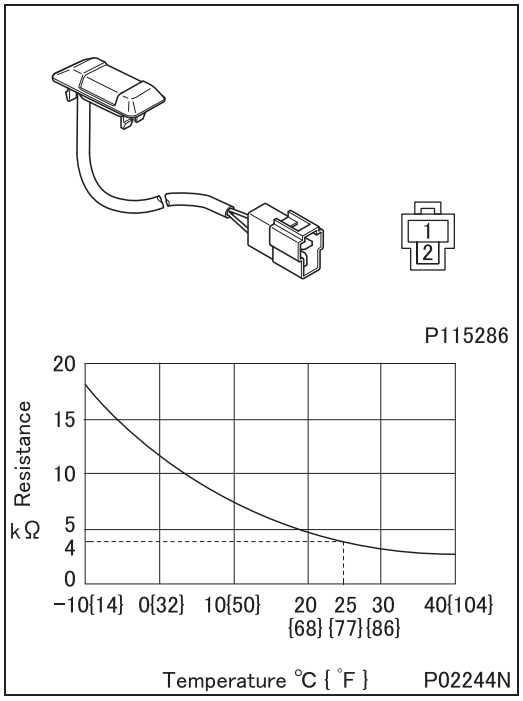
#252 Inspection of pressure sensor

- Because it is not easy to check these switches individually, determine the quality of the sensors indirectly by checking related parts, such as harnesses, etc. in the system.
- If there is nothing abnormal in the related parts, but there is still something wrong with the system, then replace the sensors.



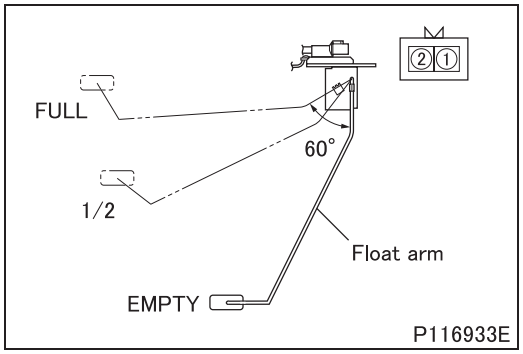
#253 Inspection of air inlet sensor

- Change the ambient temperature of the sensor and measure the resistance between terminals 1 and 2.
- If the measured value deviates from the characteristic shown in the table at left, replace the sensor. (See Gr55.)



#256 Inspection of in car sensor

- Change the ambient temperature of the sensor and measure the resistance between terminals 1 and 2.
- If the measured value deviates from the characteristics shown in the table at left, replace the sensor. (See Gr52.)

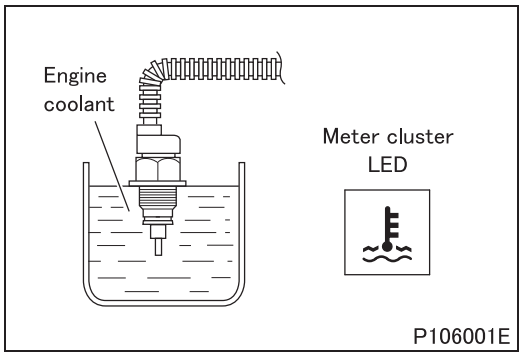


#258 Inspection of fuel level sensor

- Measure resistance values between terminals 1 and 2 when bringing the float arm into contact with stoppers (at EMPTY and FULL positions) and placing it at the midpoint position.

Standard value	at FULL position	0^{+2}_{0} Ω
	at 1/2 position	50 ± 3 Ω
	at EMPTY position	150 ± 10 Ω

- If the measured value deviates from the standard value, replace the sensor. (See Gr13.)



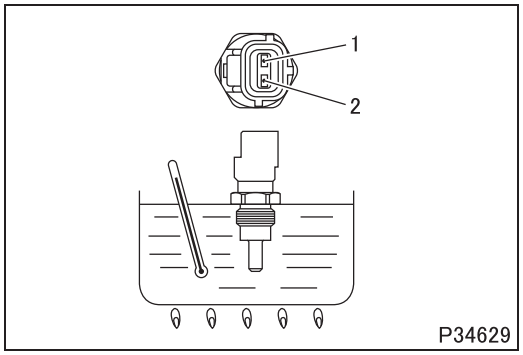
#259 Inspection of water level sensor

- Remove the water level sensor from the radiator.
- Turn the starter switch ON.
- Dip the water level sensor in a container filled with engine coolant, and check that the meter cluster LED illuminates and extinguishes under the following conditions.

Condition	Meter cluster LED
When water level sensor is out of the water	Illuminates
When water level sensor is in the water	Extinguishes

- If any fault is found, replace the sensor. (See Gr14.)

#250 to #349 SENSOR

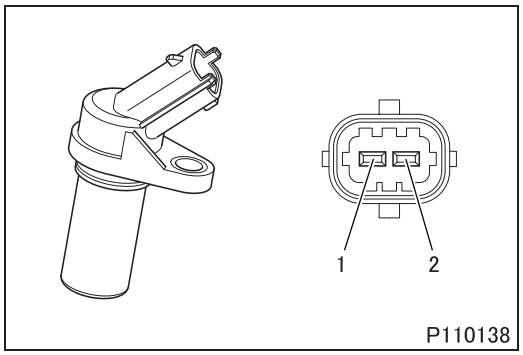


#262 Inspection of water temperature sensor

- Dip the sensor in a container filled with engine oil.
- Raise the oil temperature to each specification below while stirring the oil.
- Measure resistance values between terminals 1 and 2.

Standard value	–30°C {–22°F}	22.307 to 310.194 kΩ
	20°C {68°F}	2.262 to 2.760 kΩ
	80°C {176°F}	0.304 to 0.342 kΩ
	120°C {248°F}	0.106 to 0.119 kΩ

- If the measured value deviates from the standard value, replace the sensor. (See Gr14.)

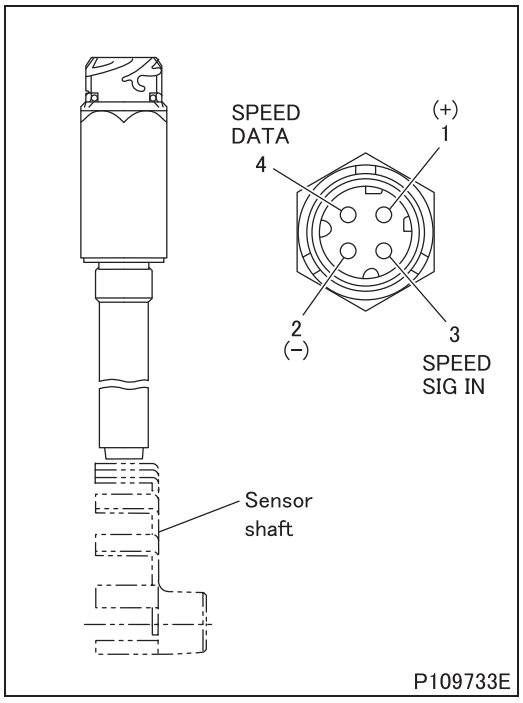


#263 Inspection of engine speed sensor

- Measure the resistance value between terminals 1 and 2.

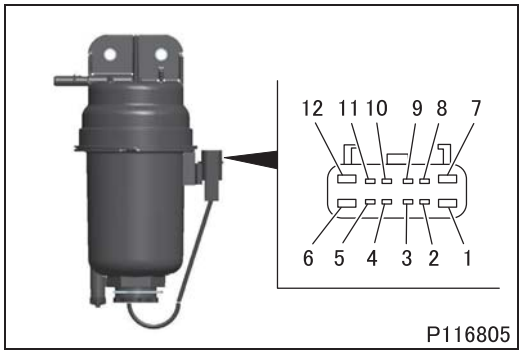
Standard value (at 20°C {68°F})	860 ± 86 Ω

- If the measured value deviates from the standard value, replace the sensor. (See Gr11.)



#265 Inspection of vehicle speed sensor

- While applying a voltage of 6.5 to 9 V between terminals 1 and 2, rotate the sensor shaft.
- Check the signals of terminal 3 (SPEED SIG IN) and terminal 4 (SPEED DATA). If no signals are found, replace the sensor. (See Gr22.)



#323 Inspection of fuel filter (fuel temperature sensor)

- Measure the resistance between terminals 8 and 9.

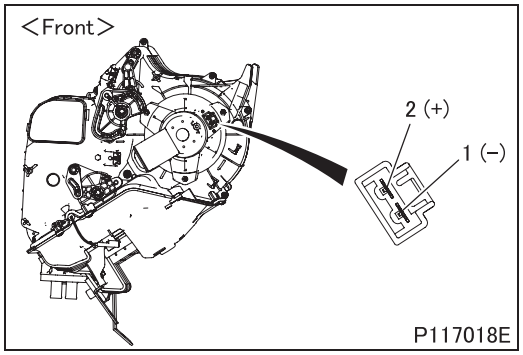
Standard value	–30°C {–22°F}	26.114 ± 2.533 Ω
	0°C {32°F}	5.896 ± 0.430 Ω
	25°C {77°F}	2.057 ± 0.115 Ω
	60°C {140°F}	596 ± 23 Ω
	100°C {212°F}	186 ± 4 Ω
	110°C {230°F}	144 ± 3.456 Ω

- If the measurement is out of specification, replace the fuel filter. (See Gr13.)

#350 Inspection of control unit and other units

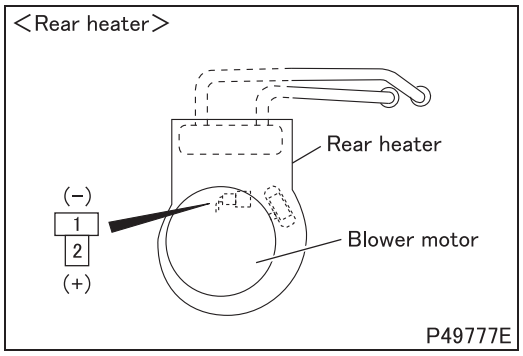
- Since the units alone cannot be readily checked off the vehicle, check the harness, switch and other related parts in each system.
- If faults are not found in the related parts, and the problem still remains in the system, replace the control units or other units.

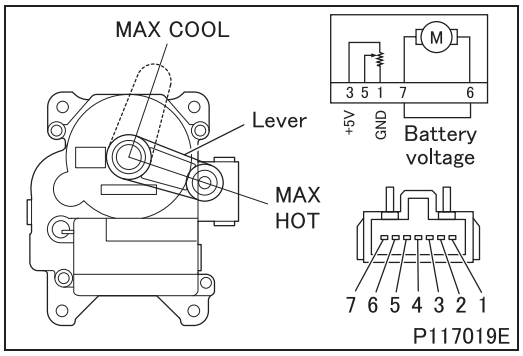
#410 to #509 MOTOR



#411 Inspection of blower motor

- Make sure that the motor operates when 12 volts DC is applied between each terminal.
- If any fault is found, replace the motor. (See Gr55.)





#413 Inspection of air mixing motor

- Perform the following checks, and if any fault is found, replace the motor. (See Gr55.)

(1) Inspection of motor

- Make sure that the motor operates when 12 volts DC is applied between each terminal.

Lever position	Continuity terminal
MAX HOT	(+) 6–7 (–)
MAX COOL	(+) 7–6 (–)

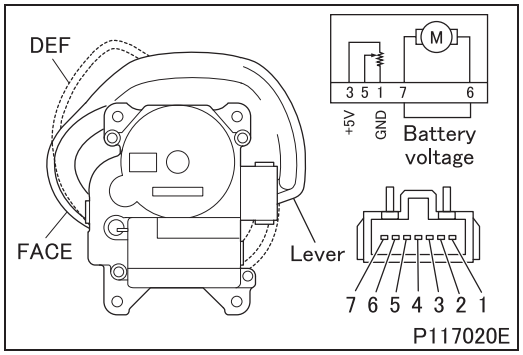
CAUTION ⚠

- **Stop voltage application when the lever stops.**
- **After inspection of the motor, return the lever to a position within the range of MAX HOT to MAX COOL.**

(2) Inspection of potentiometer

- Apply 5 volts DC between the terminals 1 and 3 and measure the voltage between the terminals 1 and 5.

Lever position	Standard value
MAX HOT	4 ± 0.03
MAX COOL	1 ± 0.03



#414 Inspection of mode motor

- Perform the following checks, and if any fault is found, replace the motor. (See Gr55.)

<Fully automatic air-conditioner>

(1) Inspection of motor

- Make sure that the motor operates when 12 volts DC is applied between each terminal.

Lever position	Continuity terminal
FACE	(+) 6–7 (–)
DEF	(+) 7–6 (–)

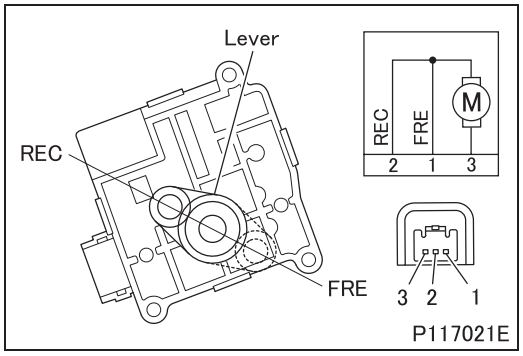
CAUTION ⚠

- **Stop voltage application when the lever stops.**
- **After inspection of the motor, return the lever to a position within the range of FACE to DEF.**

(2) Inspection of potentiometer

- Apply 5 volts DC between the terminals 1 and 3 and measure the voltage between the terminals 1 and 5.

Lever position	Standard value
FACE	4.5 ± 0.03
DEF	0.5 ± 0.03



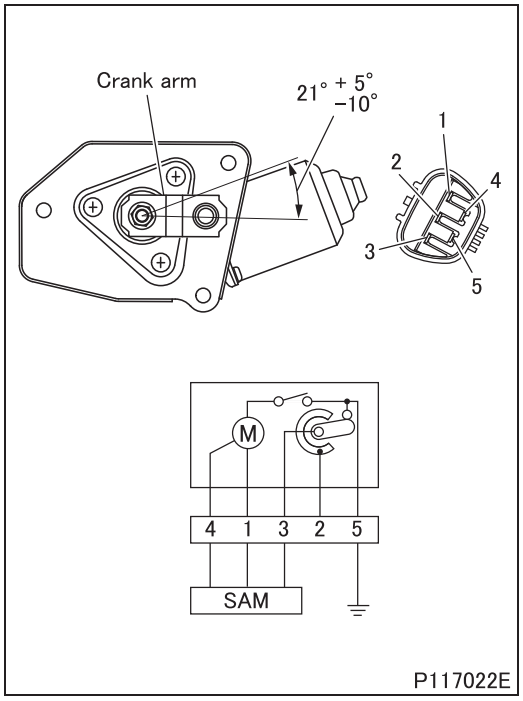
#415 Inspection of fresh/recirculation changeover motor

- Perform the following checks, and if any fault is found, replace the motor. (See Gr55.)
- Make sure that the motor operates when 12 volts DC is applied between each terminal.

Lever position	Continuity terminal
REC (inside air)	(+) 3–2 (–)
FRE (outside air)	(+) 3–1 (–)

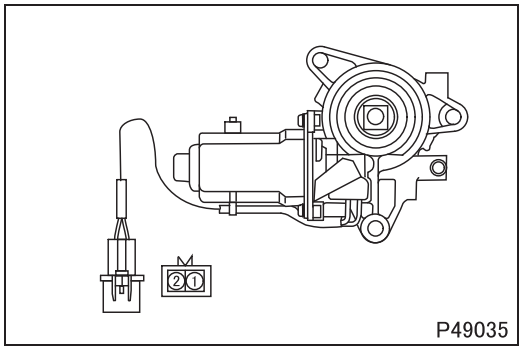
CAUTION ⚠

- **Stop applying 12 volts DC if the lever stops spontaneously at the REC or FRE position.**



#422 Inspection of wiper motor

- Because it is not easy to check these switches individually, determine the quality of the motor indirectly by checking related parts, such as harnesses, power window motor, etc. in the system.
- If there is nothing abnormal in related parts, but there is still something wrong with the system, then replace the motor. (See Gr51.)

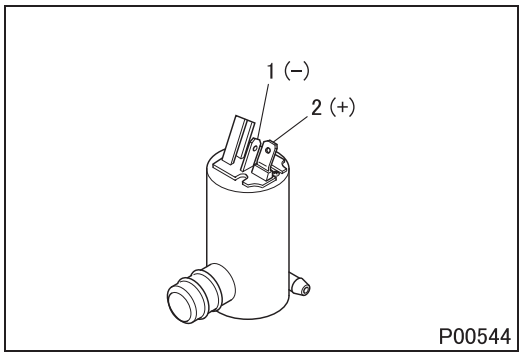


#423 Inspection of power window motor

- Make sure that the motor operates when 12 volts DC is applied between each terminal.

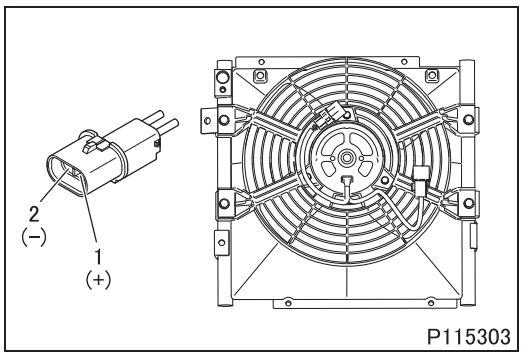
Rotation direction	Continuity terminal
Left	(+) 2–1 (–)
Right	(+) 1–2 (–)

- If any fault is found, replace the motor and the regulator as a set. (See Gr43.)



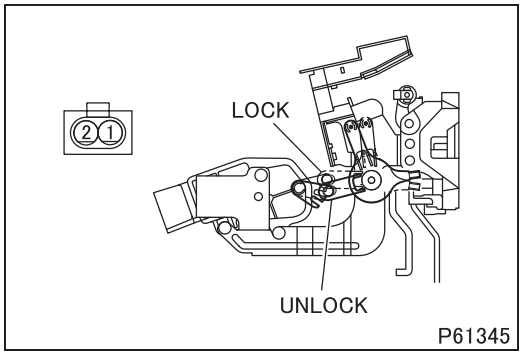
#428 Inspection of windshield washer motor

- Make sure that the motor operates when 12 volts DC is applied between each terminal.
- If any fault is found, replace the motor. (See Gr51.)



#431 Inspection of condenser fan motor

- Make sure that the motor operates when 12 volts DC is applied between each terminal.
- If any fault is found, replace the condenser. (See Gr55.)

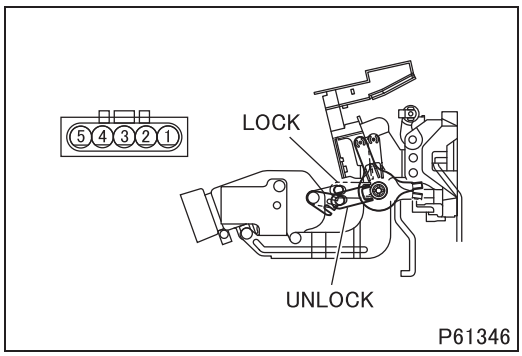


#510 Inspection of door lock actuator (passenger's seat side)

- Make sure that the actuator operates when 12 volts DC is applied between each terminal.

Switch position	Terminal
LOCK	(+) 1–2 (–)
UNLOCK	(+) 2–1 (–)

- If any fault is found, replace the actuator. (See Gr43.)

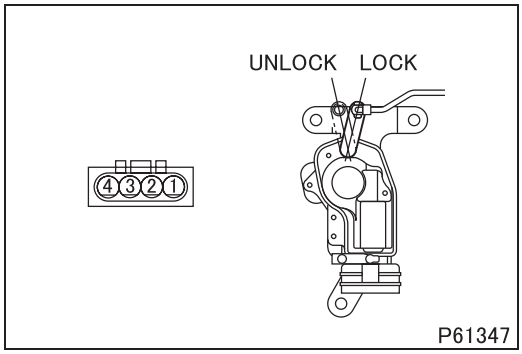


#511 Inspection of door lock actuator (driver's seat side)

- Make sure that the actuator operates when 12 volts DC is applied between each terminal.

Switch position	Continuity terminal	Terminal
LOCK	1–2	(+) 3–4 (–)
UNLOCK	1–5	(+) 4–3 (–)

- If any fault is found, replace the actuator. (See Gr43.)



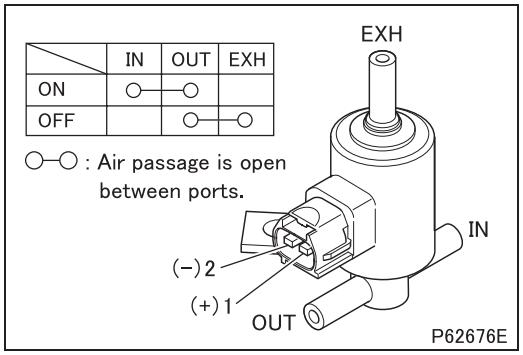
#512 Inspection of rear door lock actuator

- Make sure that the actuator operates when 12 volts DC is applied between each terminal.

Switch position	Terminal
LOCK	(+) 2–3 (–)
UNLOCK	(+) 3–2 (–)

- If any fault is found, replace the actuator. (See Gr43.)

#560 to #609 MAGNETIC VALVE



#565 Inspection of 3-way magnetic valve

<Type-1>

- Perform the following checks, and if any fault is found, replace the 3-way magnetic valve.

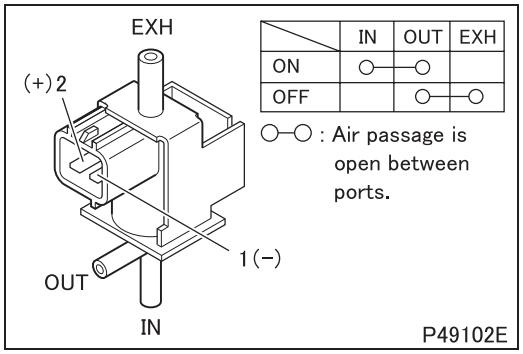
(1) Operation check

- Gradually apply DC current between each terminal starting from 0 V.
- Measure the voltage when the 3-way magnetic valve operates. (Determine ON/OFF of the magnetic valve by operating noises.)

Standard value (minimum operating voltage)	11 V or less

(2) Inspection of continuity and air tightness

- Negative pressure when inspected: –99.99 kPa {–29.5 in.Hg, –750 mmHg}



<Type-2>

- Perform the following checks, and if any fault is found, replace the 3-way magnetic valve.

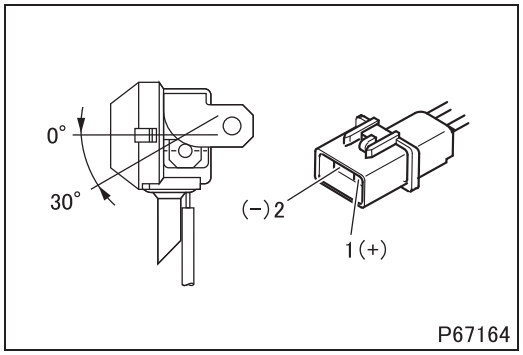
(1) Operation check

- Gradually apply DC current between each terminal starting from 0 V.
- Measure the voltage at which the 3-way magnetic valve operates. (Determine ON/OFF of the magnetic valve by operating noises.)

Standard value (minimum operating voltage)	8 V or less

(2) Inspection of continuity and air tightness

- Negative pressure when inspected: –60 kPa {–17.7 in.Hg, –450 mmHg}



#614 Inspection of backup buzzer

[Inspection]

- Make sure to confirm if the buzzer intermittently sounds by applying the 12 volts DC between each terminal.
- If any fault is found, replace the buzzer.

[Installation]

- Install the backup buzzer to the frame in the range of angles as illustrated.

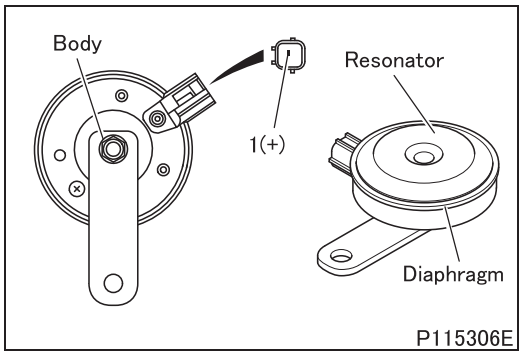
CAUTION ⚠

- **Be aware that if the installed angle of the buzzer is out of the range as illustrated, water in the buzzer will not drain normally.**

#615 Inspection of electric horn

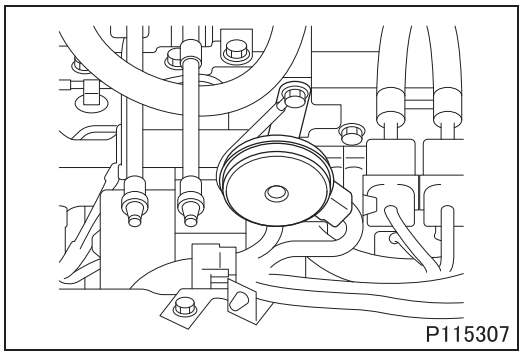
CAUTION ⚠

- **Bending the stay changes the sound quality of the horn, degrading the horn performance.**
- **Never bend or damage the stay.**



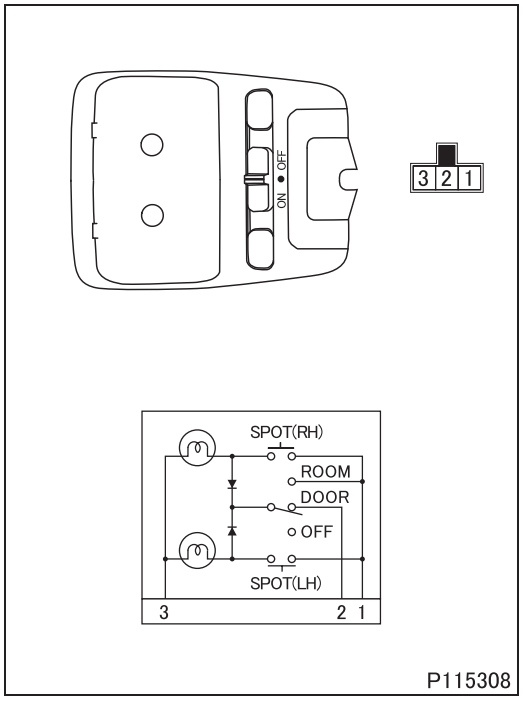
[Inspection]

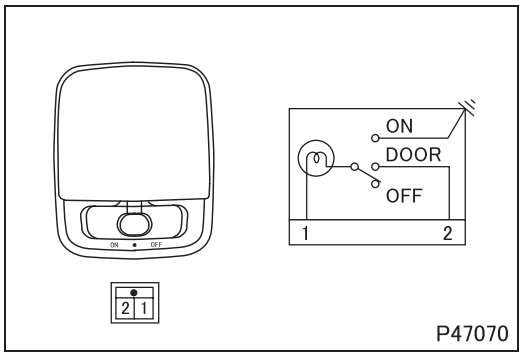
- Make sure to confirm whether the horn sounds by applying the 12 volts DC between terminals 1 and body.
- Remove foreign substances adhered to the resonator and diaphragm.
- If any fault is found, replace the horn.



[Installation]

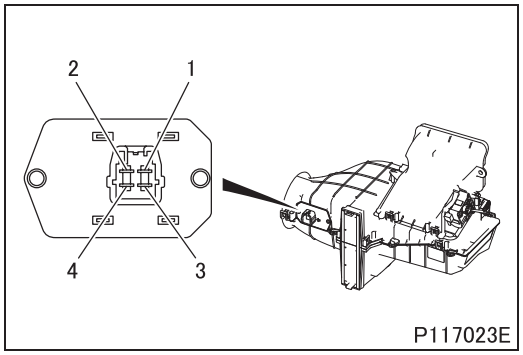
- Install in the direction as illustrated.





#656 Inspection of cab and spot lamp

- If any fault is found, replace the lamp.

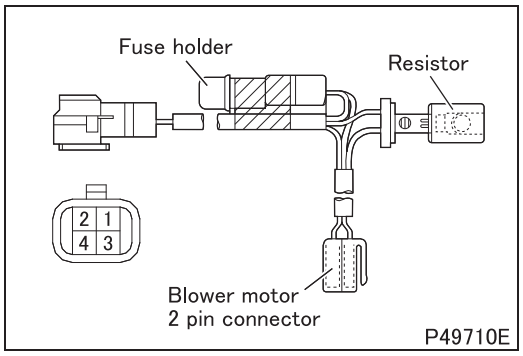


#750 Inspection of blower resistor
<Front air-conditioner (manual)>

- Measure resistance values between each terminals.

Fan speed	Terminal	Standard value
MEDIUM HIGH	2–4	0.56 ± 0.0392 Ω
MEDIUM LOW	3–4	1.56 ± 0.109 Ω
LOW	1–4	3.36 ± 0.235 Ω

- If the measured value deviates from the standard value, replace the blower resistor. (See Gr55.)

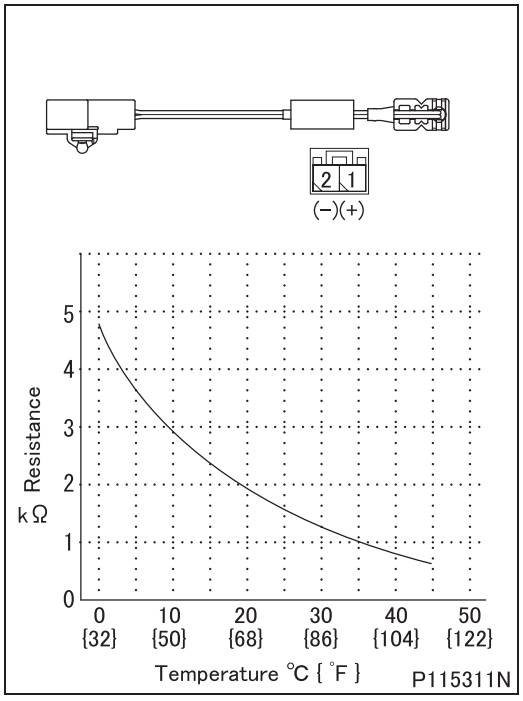


<With rear heater>

- Measure resistance value between terminals 1 and 4.

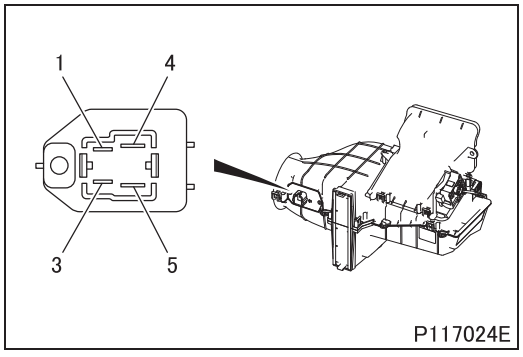
Fan speed	Terminal	Standard value
LOW	1–4	3 Ω

- If the measured value deviates from the standard value, replace the blower resistor. (See Gr55.)



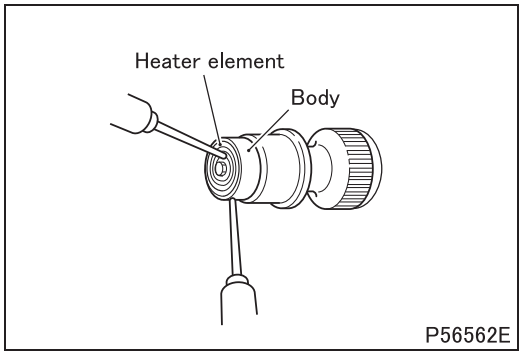
#751 Inspection of thermostat

- Measure the output voltage between terminals 1 and 2 at the specified temperatures.
- If the measured value deviates from the characteristic shown in the table at left, replace the sensor. (See Gr55.)



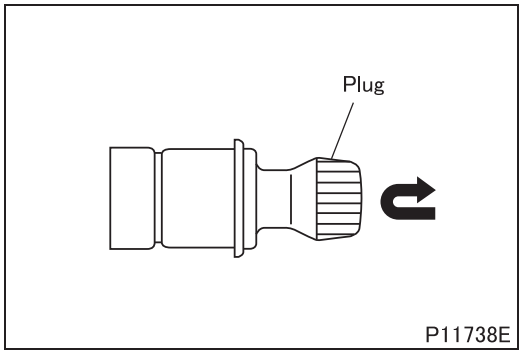
#752 Inspection of power MOS-FET (transistor)

- Perform the following checks, and if any fault is found, replace the power transistor. (See Gr55.)
  - Start the engine and operate the blower in the HI mode. Check that a high blower output equivalent to HI is obtained.
  - Operate the control to step down the flow of air. Check that the blower output equally decreases gradually.
  - Check that nothing is abnormal with the blower motor, wiring, air conditioner electronic control unit, control panel and related parts. If the blower motor is inoperative in that state, the power MOS-FET (transistor) should be faulty.



#754 Inspection of cigarette lighter

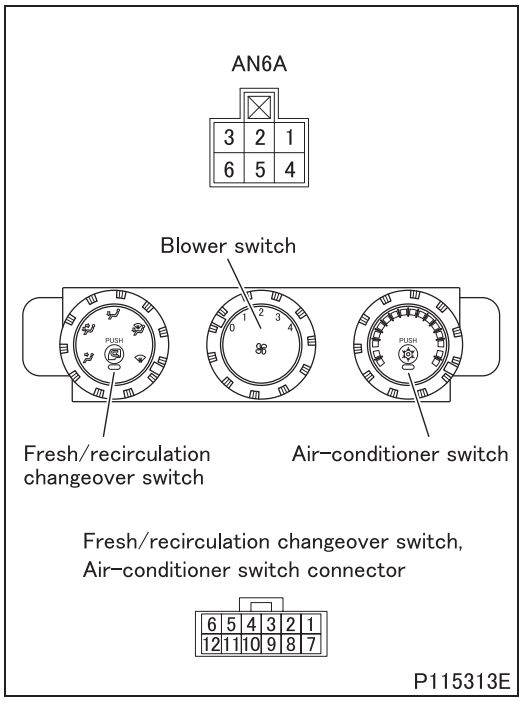
- Perform the following checks, and if any fault is found, replace the cigarette lighter. (See Gr52.)
- Make sure that there is continuity between heater element and body.



- Make sure that when plug is pushed in by hand, it immediately returns to its original position.
- Place the starter switch at ACC or ON position.
- Push plug into the socket in the cab.
- Measure the time required for plug to automatically return.

Standard value	15 ± 5 seconds

- Check to see that heater element is red-hot.



#763 Inspection of heater control panel

- Perform the following checks, and if any fault is found, replace the heater control panel. (See Gr52.)

(1) Blower switch <AN6A connector>

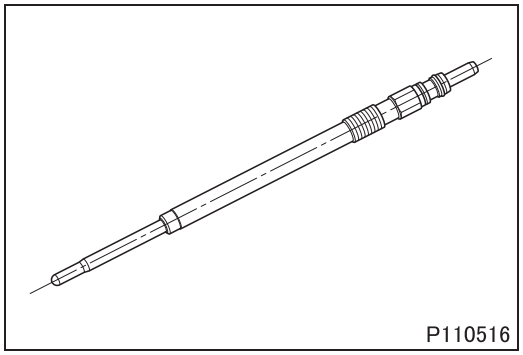
Switch position	Continuity terminal
0: OFF	–
1: LO (LOW)	1–2–4
2: ML (MEDIUM LOW)	1–3–4
3: MH (MEDIUM HIGH)	1–4–6
4: HI (HIGH)	1–4–5

(2) Fresh/recirculation changeover switch

Switch position	Continuity terminal	Operation illumination	Night illumination
OFF: Fresh air	6–12	–	(+) 9–10 (–)
ON: Recirculation air	5–12	(+) 1–12 (–)	

(3) Air-conditioner switch

Switch position	Continuity terminal	Operation illumination	Night illumination
OFF	–	–	(+) 9–10 (–)
ON	3–7	(+) 1–7 (–)	



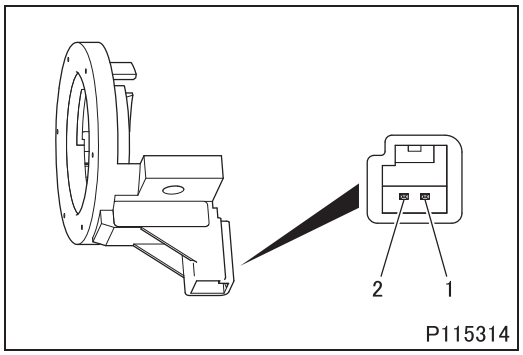
P110516

#764 Inspection of glow plug

- Measure the resistance between the housing and the connection pin using a multimeter.

Standard value (at 20°C {68°F})	0.6 to 1.0 Ω

- If the measured value deviates from the standard value, replace the glow plug. (See Gr11.)



P115314

#771 Inspection of immobilizer antenna

- Measure the resistance between terminals 1 and 2.

Standard value (at 25°C {77°F})	20 ± 2 Ω

- If the measured value deviates from the standard value, replace the immobilizer antenna.

#860 BATTERY

DANGER ⚠

- **Since flammable hydrogen gas is generated by the battery be sure to obey the following warnings:**
  - **Do not short-circuit the (+) and (–) terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over battery.**
- **Because the battery electrolyte is made of diluted sulfuric acid and is corrosive, when handling battery wear safety glasses and rubber gloves to protect the eyes and hands.**

WARNING ⚠

- **Make sure that you disconnect battery cable (–) first when you disconnect battery cables.**

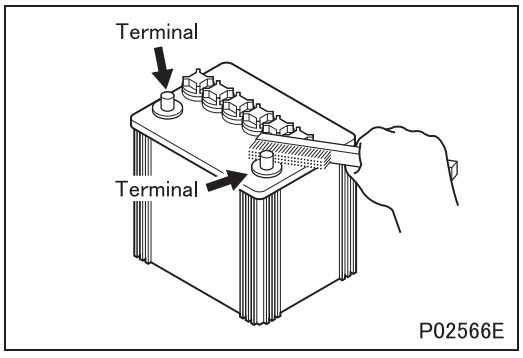
CAUTION ⚠

- **Make sure that all electrical switches of the vehicle are OFF before connecting battery cables.**
- **Make sure that you connect battery cable (+) before you connect battery cable (–).**
- **To prevent a short-circuit be sure that disconnected battery cables do not accidentally touch the battery terminals.**

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Specific gravity of battery electrolyte (20°C {68°F})	1.280	1.220	Charge or replace

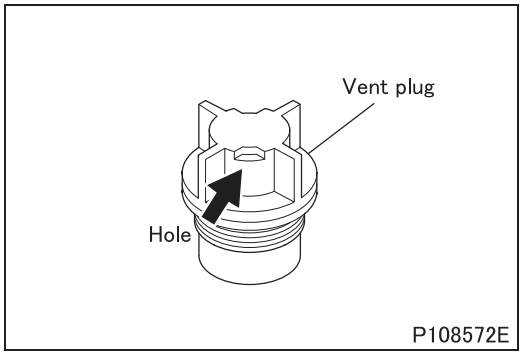
◆Service procedure◆



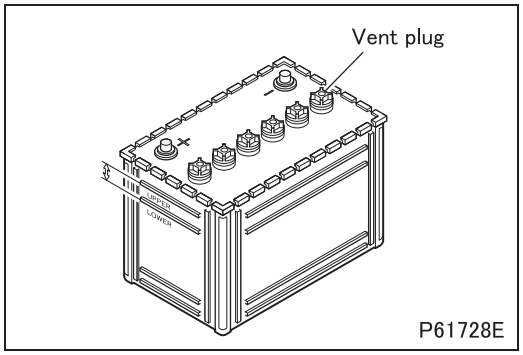
Inspection of battery

(1) Visual inspection

- If a terminal is corroded, remove the corrosion from it using a wire brush.
- If cracks or defects are found on battery, replace it since the cracks or defects can cause liquid spills.

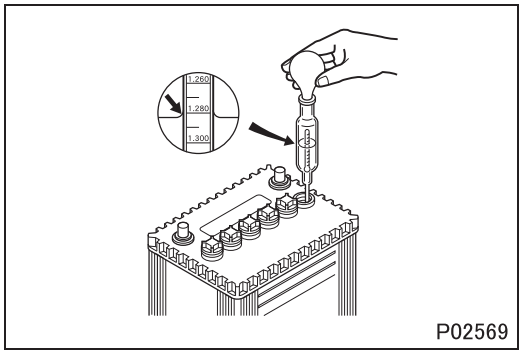


- If vent plug bleed hole is clogged, clean the hole.



(2) Inspection of fluid level

- Make sure that the battery electrolyte level is between UPPER and LOWER.
- If the level is below LOWER, remove the vent plug and fill the battery with distilled water or battery replenisher to UPPER.



(3) Measurement of specific gravity

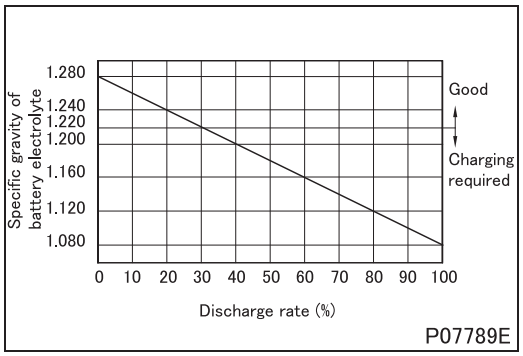
Measure the specific gravity of the battery electrolyte. If the measured value is lower than the limit, charge the battery.

NOTE

- **The specific gravity of the battery electrolyte depends on the liquid temperature. Use the following formula to convert the actual value to the value for a temperature of 20°C {68°F}.**

$S^{20} = S^t + 0.0007\ (t–20)$

S^{20} : Specific gravity at a temperature of 20°C {68°F}
S^t : Specific gravity actually measured with the temperature at t°C
t : Temperature of battery electrolyte



(4) Charging

- Although, as a rule, battery charging should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect battery cable (–).
- Remove vent plugs before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity / 10	*Amount of discharge (Ah) / Charge current (A) ×1.2 (to 1.5)	45 {113}
Quick charge	Value of 5-hour rating capacity / 1.5	0.5	55 {131}

* Amount of discharge (Ah) =

$$\text{5-hour rating capacity (Ah)} \times \frac{\text{Amount of discharge (\%)}}{100}$$

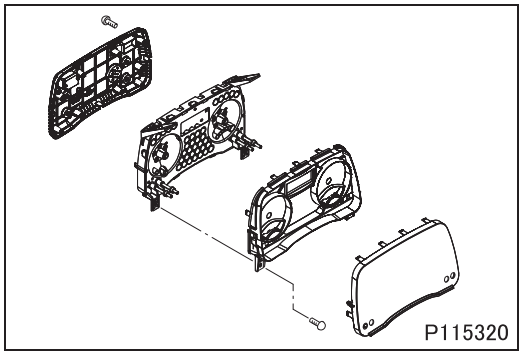
- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.

DANGER ⚠

- **Keep naked light away from the battery while charging to prevent explosion.**
- **It is dangerous to generate sparks while charging the battery.**
- **Do not charge battery if the electrolyte level is below LOWER LEVEL, since it can cause early deterioration, heating, or explosion. Make sure to add the fluid to the specified level before charging.**

WARNING ⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **After charging the battery, tighten vent plug, wash away sulfuric acid from the battery using water, and dry the surface.**



#890 Meter cluster

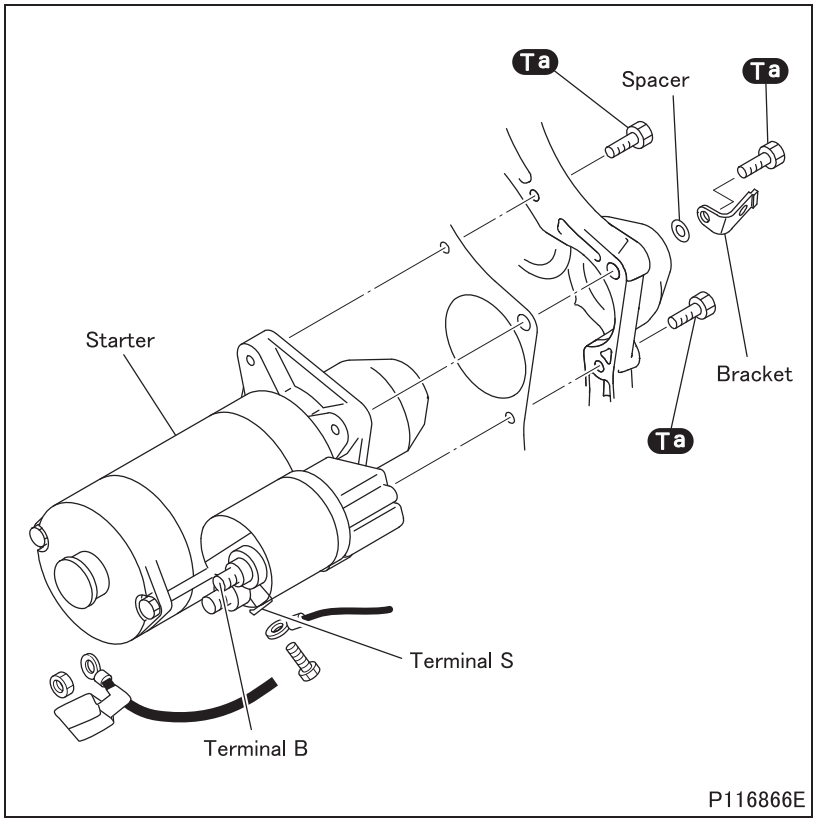
- Check the meter cluster by the actuator test of FUSO Diagnostics. (See #986.)
- Check for meter cluster faults with diagnosis codes. (See #986.)
- When the meter cluster is replaced, be sure to rewrite data in the electronic control unit using FUSO Diagnostics.

CAUTION ⚠

- **The replacement of the meter cluster should be performed only when the meter cluster is judged as faulty after performing the following inspections.**
  - **Check the connectors, harnesses and fuses.**
  - **Perform the actuator test.**
  - **Temporarily install the said meter cluster to other vehicle and check if the same problem occurs.**

54-12 STARTER AND ALTERNATOR

#930 STARTER



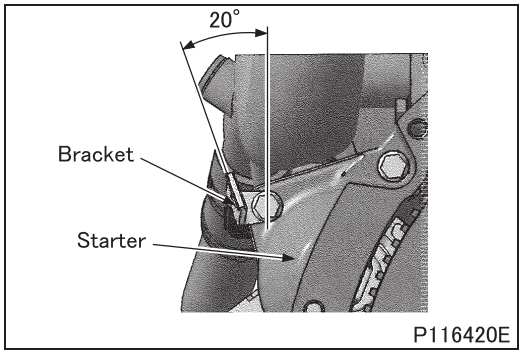
WARNING ⚠

- **Before removing the starter, disconnect the (–) battery cable and insulate the cable and the (–) battery terminal with tape.**
- **It is dangerous to leave the (–) battery cable connected since the battery cable voltage is always present at terminal B.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (starter mounting)	22 to 30 {16 to 22, 2.2 to 3.1}	–

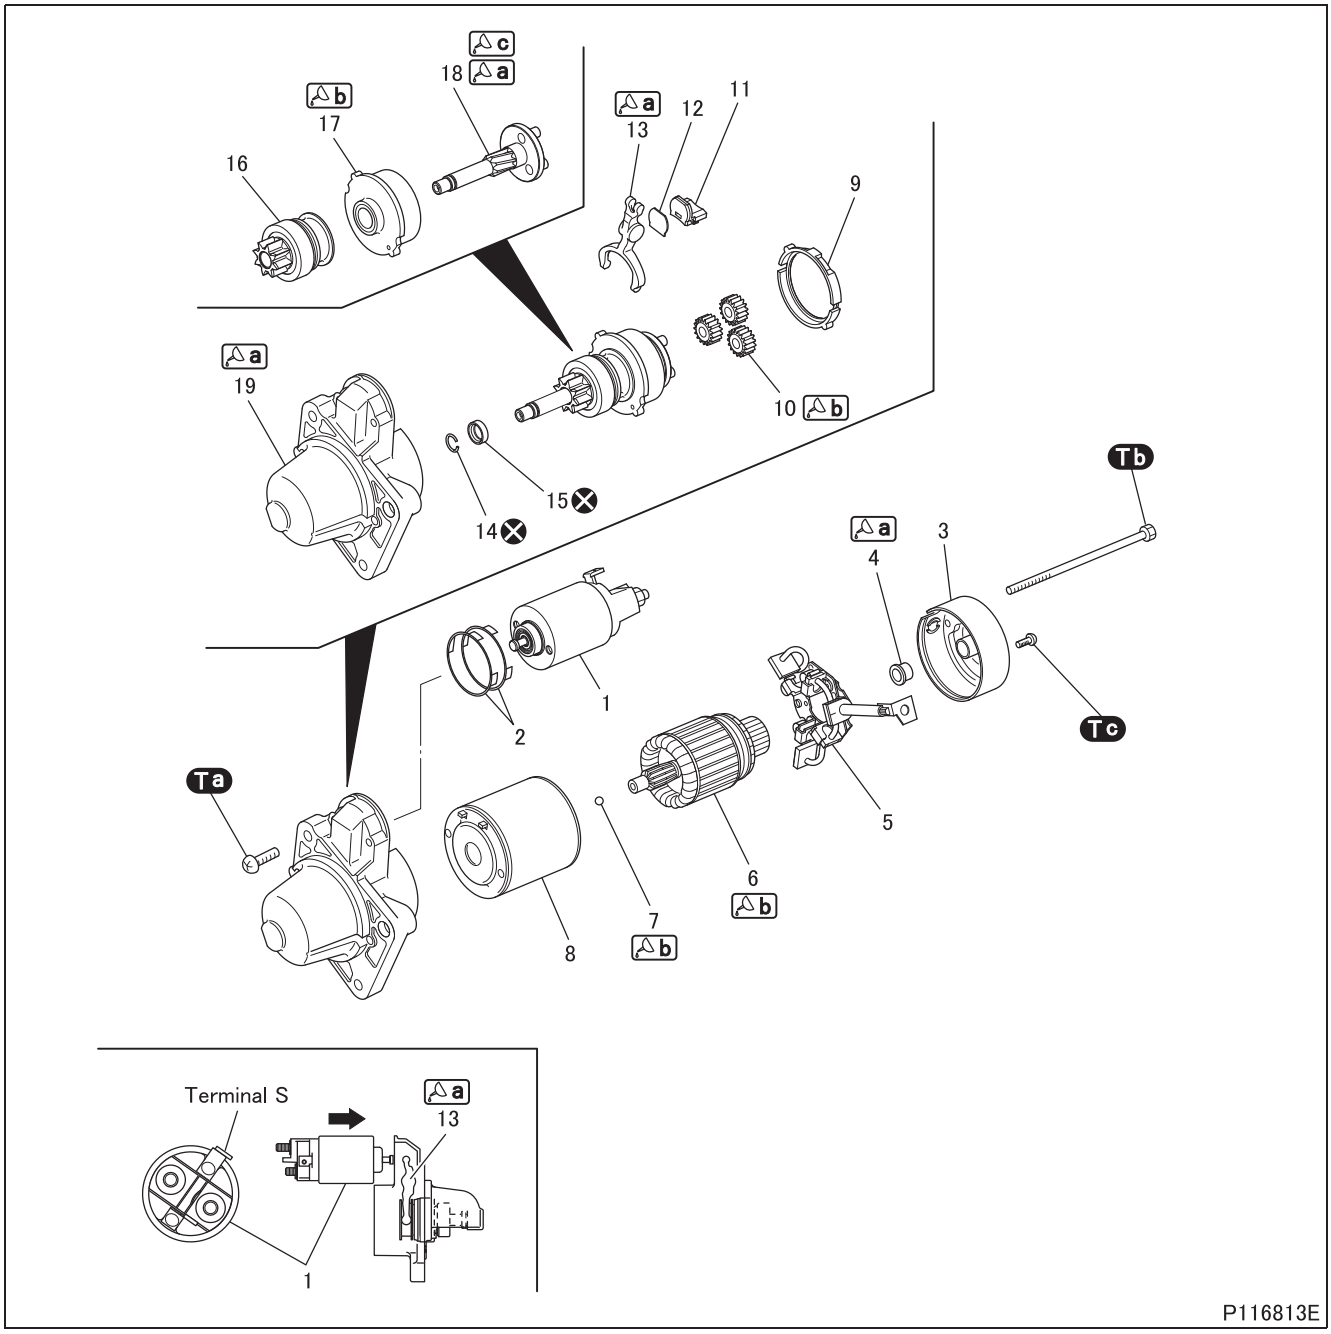
◆Assembly procedure◆



■ Assembly: Bracket

- Install the bracket at the angle shown in the illustration.

M E M O



● **Disassembly sequence**

1	Magnetic switch	**8**	Yoke	**15**	Stop ring
2	Shim	**9**	Packing A	**16**	Overrunning clutch
3	Rear bracket	**10**	Planetary gear	**17**	Internal gear
4	Rear bearing	**11**	Packing B	**18**	Planetary gear holder
5	Brush holder	**12**	Plate	**19**	Front bracket
6	Armature	**13**	Lever		
7	Ball	**14**	Snap ring	⊗:	Non-reusable parts

CAUTION ⚠

- **When the armature is removed, the ball may come out with it. Take care not to lose the ball.**

- Do not remove the rear bearing unless defects are evident.

● Assembly sequence

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Do not immerse parts in any kind of solvent for cleaning.**
- **Immersing the armature in a solvent will damage the insulation. Wipe parts clean with a cloth.**
- **Immersion cleaning of the drive unit is prohibited.**
- **The overrunning clutch is filled with grease at the factory. Immersion cleaning will wash away the grease from the clutch. To clean the drive unit, use a cleaning solvent-moistened brush and then wipe it dry with a cloth.**

- Whenever the magnetic switch is replaced, the pinion gap must be adjusted.
- The packing A is serviceable if any defect is not found.

Service standards (Unit: mm {in.})

Location	Maintenance item			Standard value	Limit	Remedy
–	Pinion gap			0.5 to 2.0 {0.02 to 0.079}	–	Adjust
–	No-load characteristics	With 11 V applied	Current	120 A or less	–	Correct or replace
			Rotation speed	2870 rpm or higher	–	
4,6	Difference between inside diameter of rear bearing and outside diameter of armature shaft			0.1 {0.0039} or less	–	Replace
5	Brush spring pressure			23.4 to 31.6 N {5.3 to 7.1 lbs, 2.4 to 3.2 kgf}	10 N {2.2 lbs, 1.0 kgf}	Replace
	Brush length			17.6 {0.69}	12.1 {0.48}	Replace
6	Commutator outside diameter			29.4 {1.16}	28.8 {1.13}	Replace
	Runout of commutator periphery			–	0.1 {0.0039} or higher	
	Mold depth between segments			0.5 {0.02}	0.2 {0.0079} or less	Correct or replace
13	Overrunning clutch contact surface of lever			8 {0.31} or higher	–	Replace

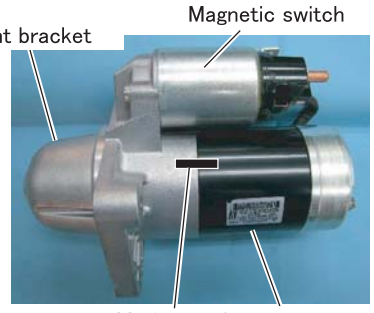
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Screw (magnetic switch mounting)	4.1 to 7.6 {3.0 to 5.6, 0.4 to 0.8}	–
Tb	Through bolt (rear bracket mounting)	5.0 to 7.1 {3.7 to 5.2, 0.5 to 0.7}	–
Tc	Screw (rear bracket mounting)	2.4 to 4.4 {1.8 to 3.2, 0.2 to 0.4}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Armature contact surface of rear bearing	Multipurpose grease [NLGI No. 2 (Li soap)]	As required
	Sliding surfaces of lever and overrunning clutch and lever supporting point		
	Internal gear contact surface and spline of planetary gear holder		
	Gear shaft contact surface of front bracket		
b	Sliding surfaces of armature and gear shaft	Molykote AG650	As required
	Ball		
	Teeth of planetary gear		
	Internal gear and gear shaft contact surfaces		
c	Splines of planetary gear holder	Multemp OA-171 (Kyodo Yushi Co., Ltd.)	As required

◆Work before disassembly◆



■ **Mating mark: Front bracket and yoke**

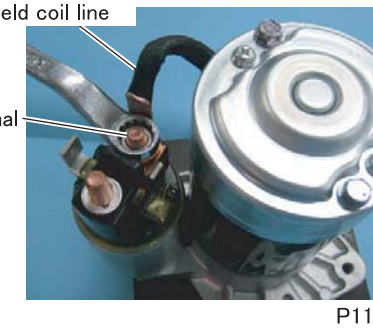
CAUTION ⚠

- **Make sure that the motor body is free of damage and that the magnet switch terminals S, B and M are normal.**

CAUTION ⚠

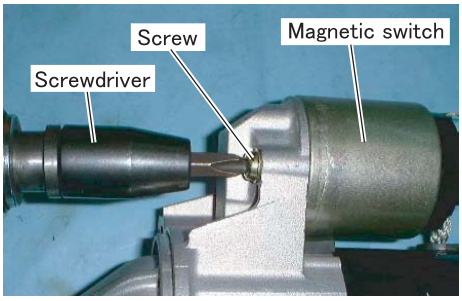
- **A permanent magnet is used in the field section. Do not strike at the yoke hard with a hammer or equivalent, drop it nor squeeze it with a vise.**

◆Disassembly procedure◆



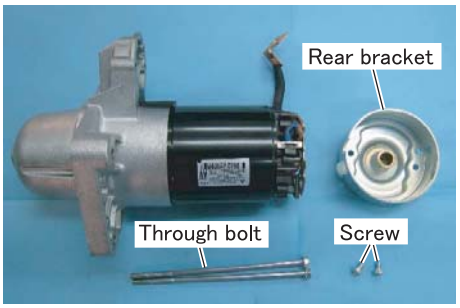
■ **Disassembly: Magnet switch**

- Remove the terminal M nut from the magnet switch and disconnect the field coil line.



P116361E

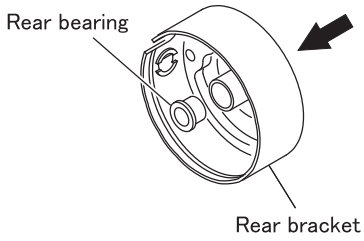
- Remove screws and remove the magnet switch.



P116362E

■ Disassembly: Rear bracket

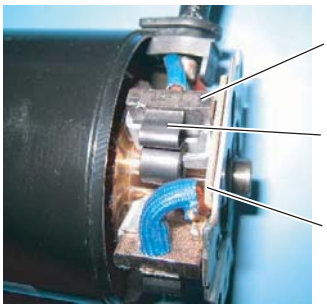
- Remove through bolts and screws, and then remove the rear bracket.



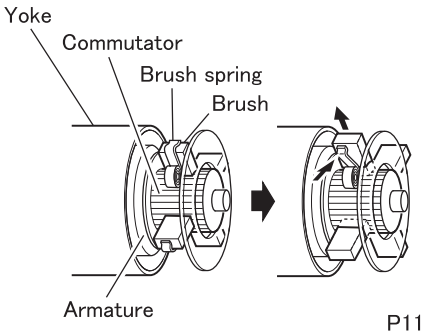
P116428E

■ Disassembly: Rear bearing

- To remove the rear bearing, press it out of the rear bracket using a round bar slightly thinner than the bearing and a hand press to apply force from outside of the rear bracket.



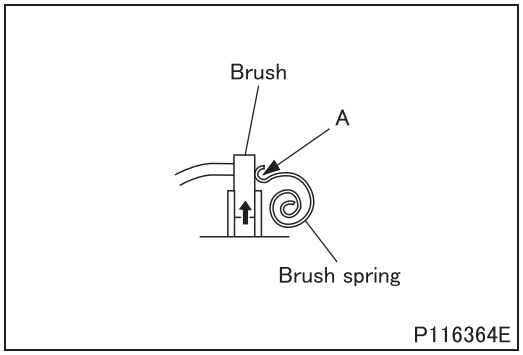
P116363E



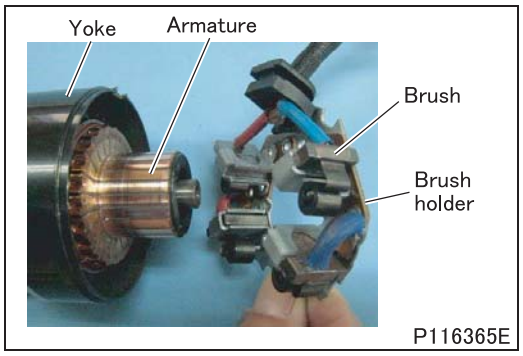
P116417E

■ Disassembly: Brush holder, armature and yoke

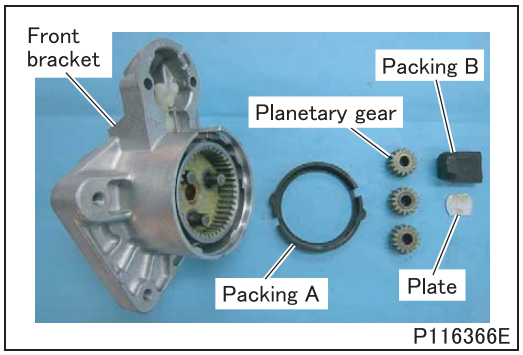
- Separate the brushes from the commutator. Then, hold each brush with the brush spring applied against the flank of brush.



- Pull the brush spring at A to draw up the brush.
- Hold the drawn-up brush with the brush spring as shown.

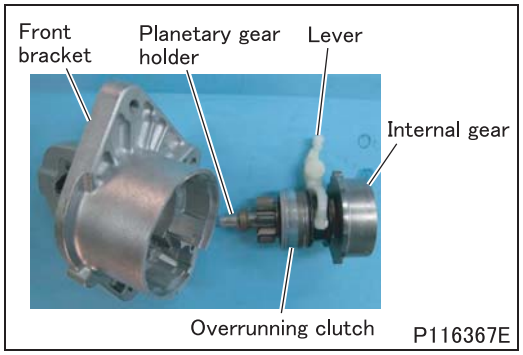


- With the brushes held, remove in this order: the brush holder, armature and yoke.



■ **Disassembly: Packing A, B, plate and planetary gear**

- Remove packing A, three planetary gears, packing B and plate from the front bracket.

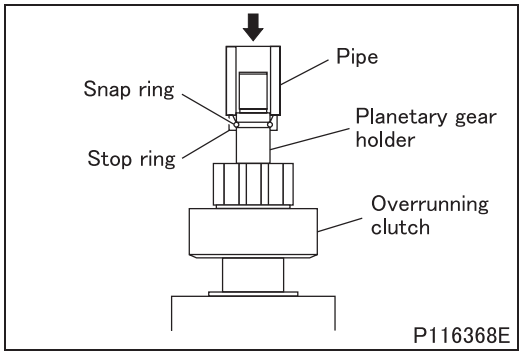


■ **Disassembly: Planetary gear holder, internal gear, overrunning clutch and lever**

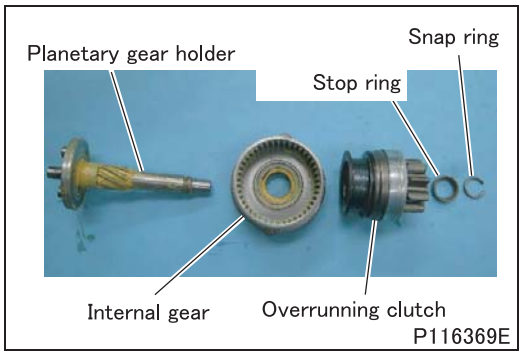
- Remove the planetary gear holder, internal gear, overrunning clutch and lever from the front bracket.

CAUTION ⚠

- **Confirm the lever direction before removal.**

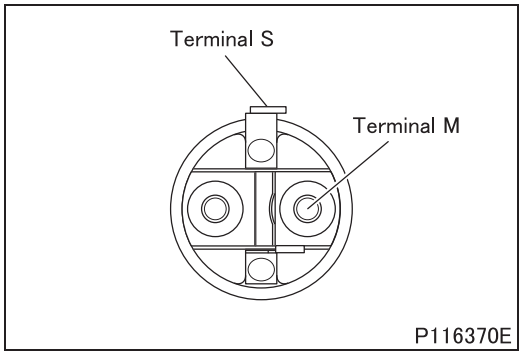


- Apply a pipe of the same size to the stop ring, and then hammer the pipe moderately to release the stop ring from the snap ring.



- Remove the snap ring, stop ring, overrunning clutch and internal gear from the planetary gear holder.

◆Inspection procedure◆

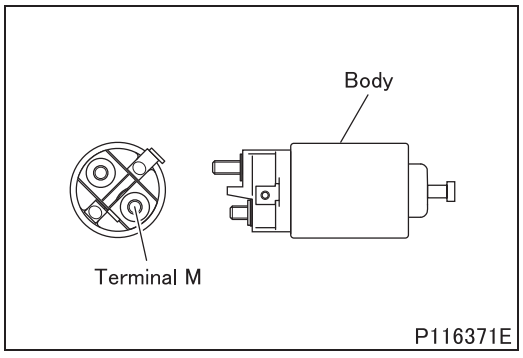


■Inspection: Magnetic switch

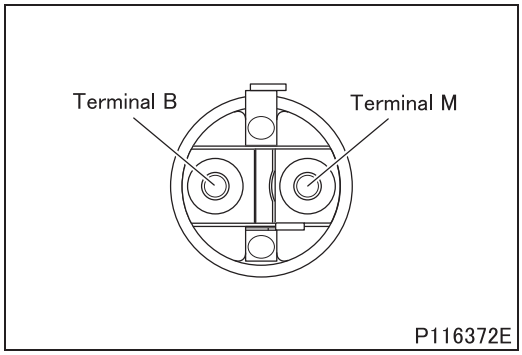
- Perform the following checks, and if any fault is found, replace the switch.

(1) Test for coil open circuit

- Confirm that continuity exists between terminals S and M.

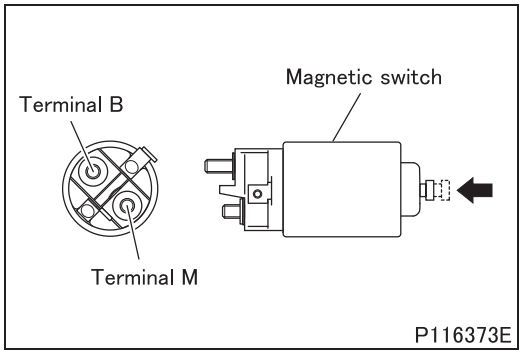


- Confirm that continuity exists between terminal M and the body.



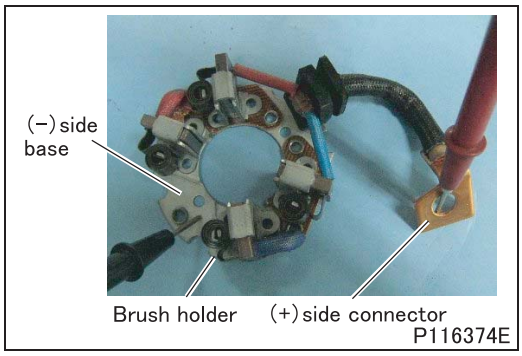
(2) Test for fused-together contacts

- Confirm that continuity does not exist between terminals B and M.



(3) Test for contact-to-contact continuity

- Push in the end of the magnetic switch to close the internal contacts. Then, confirm that continuity exists between terminals B and M.



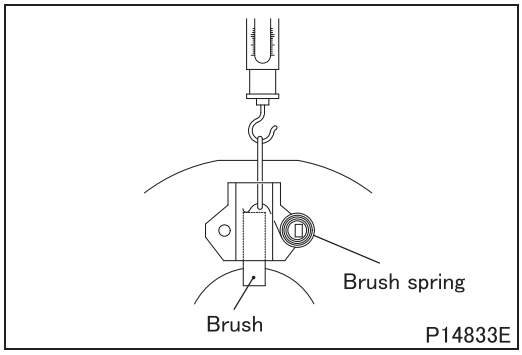
■Inspection: Brush holder

(1) Test for insulation

- Thoroughly clean the (+) side connector and (–) side base and check for continuity between them.
- If continuity exists, there is a short circuit and the brush holder must be replaced.

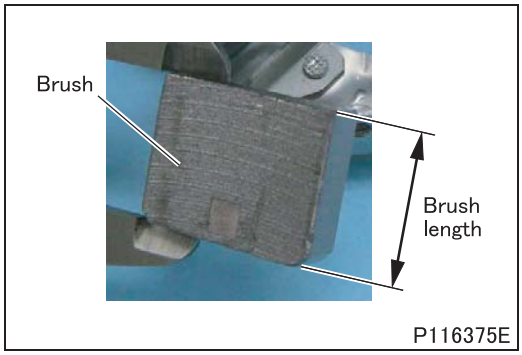
(2) Manual and visual inspections

- Perform the following inspections. If any fault is found, replace the brush holder.
  - The brush holder should be free of deformation, cracks, loosening of swaged joints and rusted base.
  - The brushes should be able to move smoothly in the brush holder.
  - The brush springs should be free of rust.



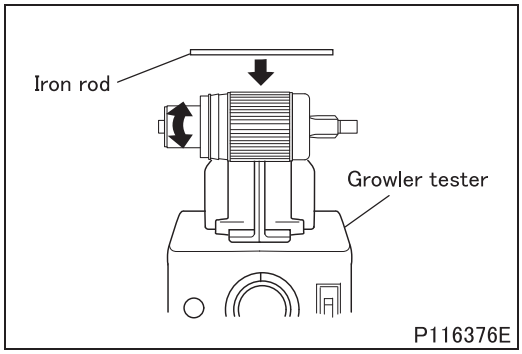
■ Inspection: Brush spring

- Using new brushes, measure the load required to separate each brush spring from its brush.
- If either measurement is lower than the specified limit, replace the brush springs.



■ **Inspection: Brush (+) (–)**

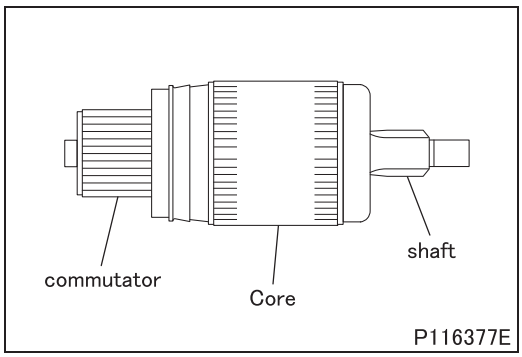
- If either brush is shorter than the limit, it must be replaced.



■ **Inspection: Armature**

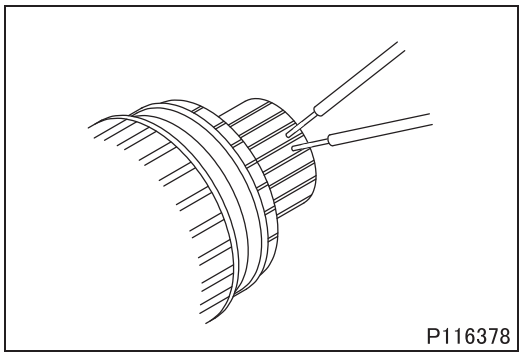
(1) Test for coil short circuit

- Hold an iron rod parallel with the armature.
- Slowly rotate the armature by hand.
- If the iron rod vibrates or is pulled toward the armature, the coil is short-circuited and the armature must be replaced.



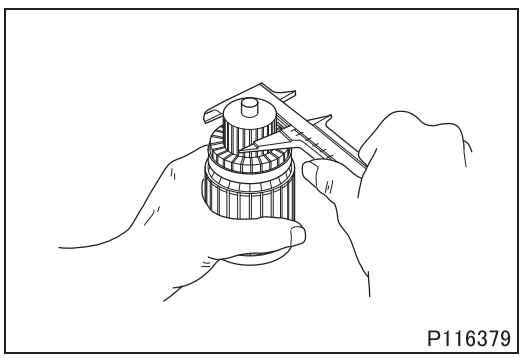
(2) Test for coil grounding

- Confirm that continuity does not exist between the commutator and the core (or shaft).
- If continuity exists, the coil is grounded and the armature must be replaced.



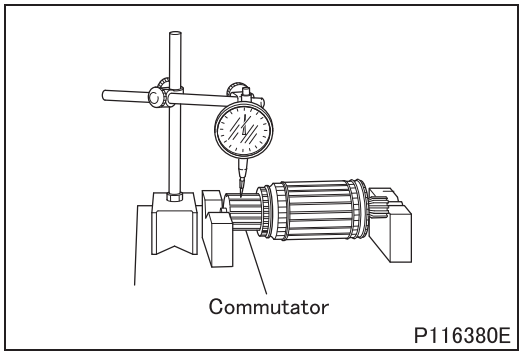
(3) Test for coil open circuit

- Check for continuity between commutator segments.
- If continuity does not exist, replace the armature.



(4) Commutator outside diameter

- If the measurement is out of specification, replace the armature.

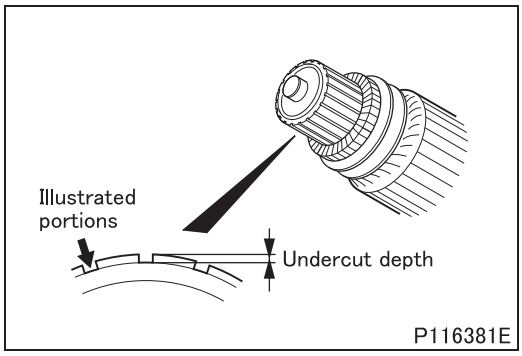


(5) Runout of commutator periphery

- If the reading exceeds the specified limit, rectify the commutator of the armature, making sure the outside diameter stays within specification.

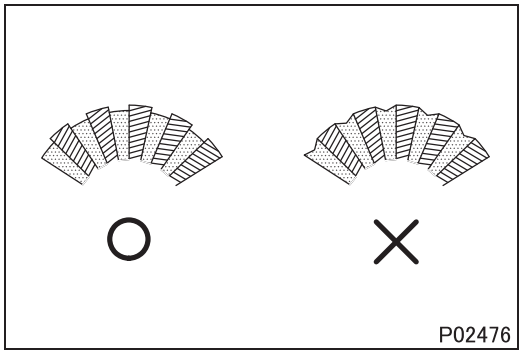
(6) Condition of commutator surface

- If the surface is rough or has stepped wear, rectify it with emery paper (#300 to 500).
- After rectifying the surface, check the extent of commutator runout.



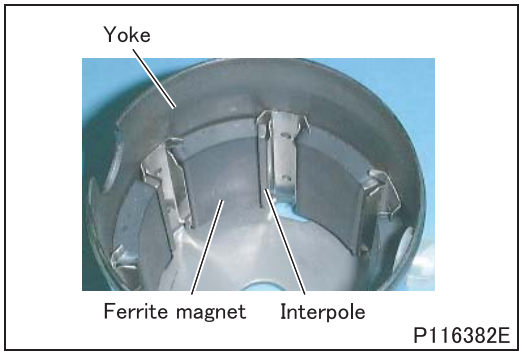
(7) Undercut depth between segments

- If the measurement is lower than the specified limit, rectify or replace the armature.
- To rectify the armature, grind the illustrated portions.



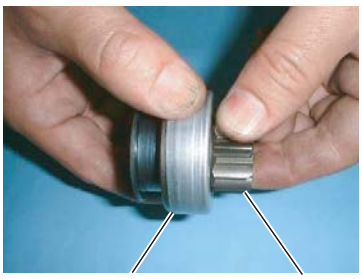
- If the undercut is worn as illustrated, rectify or replace the armature.

○: Acceptable
×: Unacceptable



■ Inspection: Yoke

- Inspect the ferrite magnet in the yoke for damages and cracks. If any fault is found, replace the yoke.



P116383E

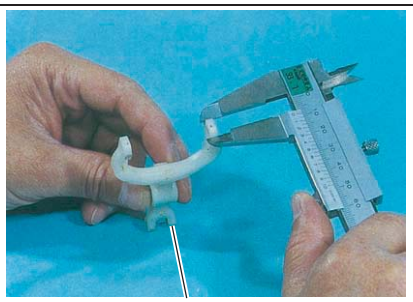
■ **Inspection: Overrunning clutch**

If the following inspections reveal any abnormality, replace the overrunning clutch.

- While holding the housing, give a turn to the pinion. The pinion should not turn at all in one direction but should turn smoothly in the other direction with some resistance felt.
- Confirm that the pinion teeth are free of chips and not abnormally worn.
- Confirm that the pinion metal is not abnormally worn.

CAUTION ⚠

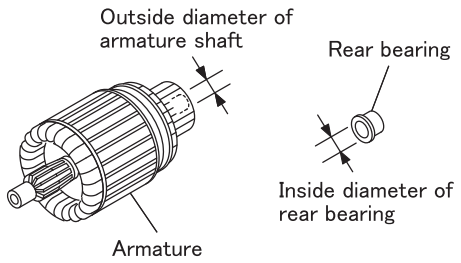
- **The overrunning clutch is filled with grease inside. Do not use immersion cleaning.**



P116384E

■ **Inspection: Lever**

- Measure the overrunning clutch contact surface of the lever to see if it meets the standard value.
- If the measurement is out of the standard value, replace the lever.

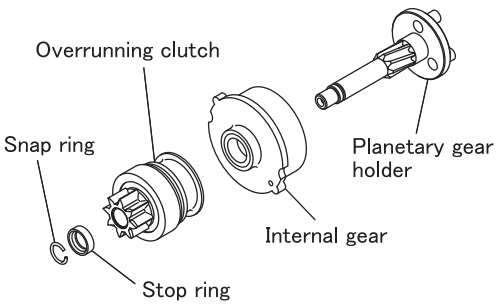


P116385E

■ **Inspection: Rear bearing**

- Confirm that the difference between the inside diameter of the rear bearing and outside diameter of the armature shaft meets the standard value.
- If the measurement is out of the standard value, replace the rear bearing.

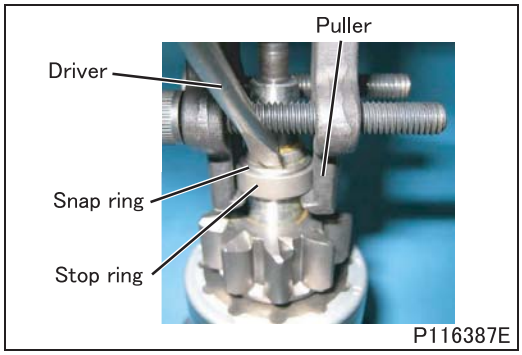
◆Assembly procedure◆



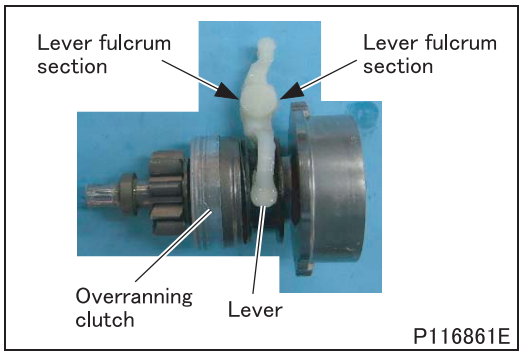
P116860E

■ **Assembly: Planetary gear holder, internal gear and overrunning clutch**

- Install the internal gear, overrunning clutch and stop ring onto the planetary gear holder.

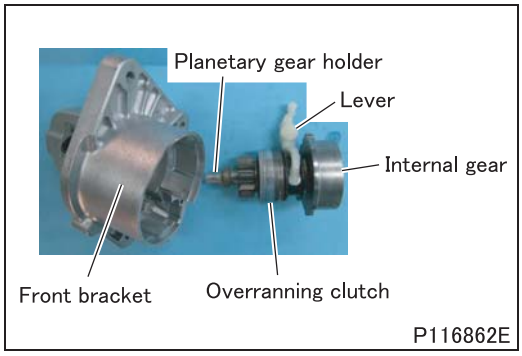


- Set a new snap ring in the groove of the planetary gear holder.
- Using a puller, draw the stop ring toward the snap ring and then fit the snap ring into the stop ring by pressing with a screwdriver.



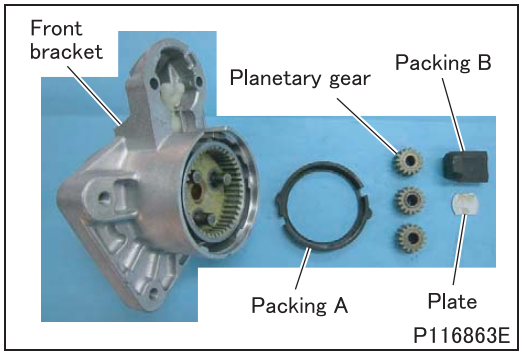
■ Assembly: Lever

- Paying attention to its direction, install the lever onto the over-running clutch.



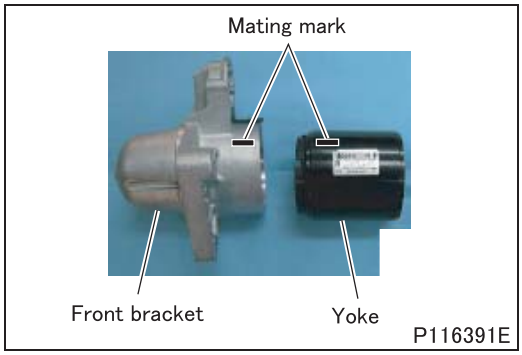
■ Assembly: Front bracket

- Install the planetary gear holder, internal gear, overrunning clutch and lever on the front bracket.



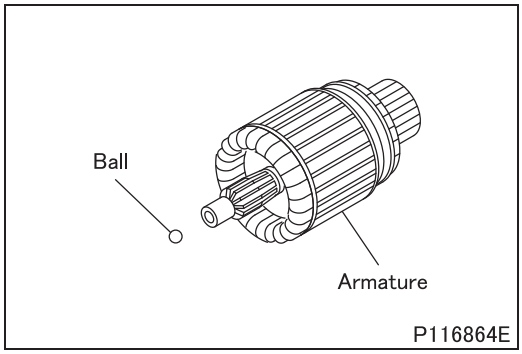
■ Assembly: Packing A, B, plate and planetary gear

- Install in this order: plate, packing B, three planetary gears and packing A.



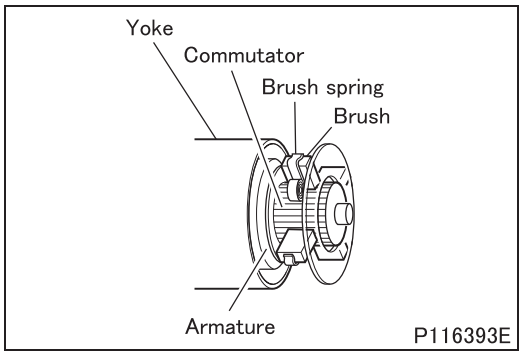
■ **Assembly: Front bracket and yoke**

- Using the mating marks provided before disassembly for alignment, install the yoke to the front bracket.



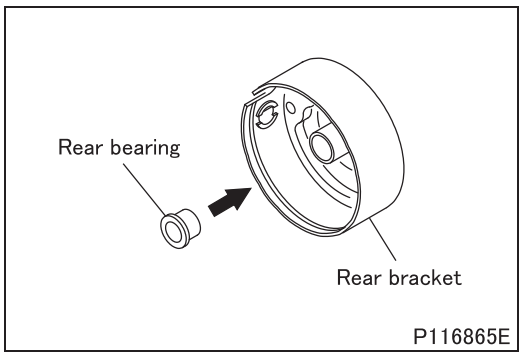
■ **Assembly: Ball and armature**

- Insert the ball, and then install the armature on the planetary gear holder side.



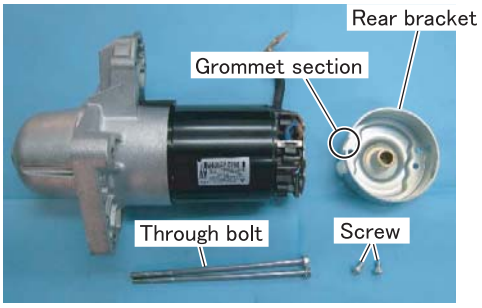
■ **Assembly: Brush holder**

- Install the brush holder on the armature.
- Set the brush springs in the regular state.



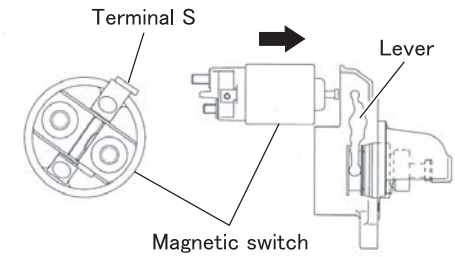
■ **Assembly: Rear bearing and rear bracket**

- Install the rear bearing to the rear bracket.



P116395E

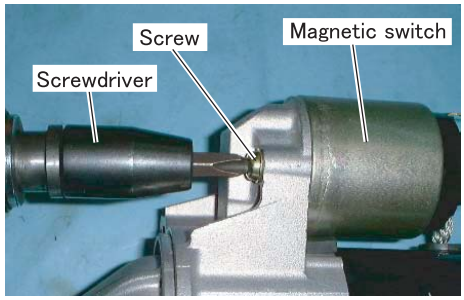
- Install the rear bracket on the yoke. Make sure that the parts are fitted at the grommet section of the rear bracket.
- Tighten the through bolts and screws.



P116396E

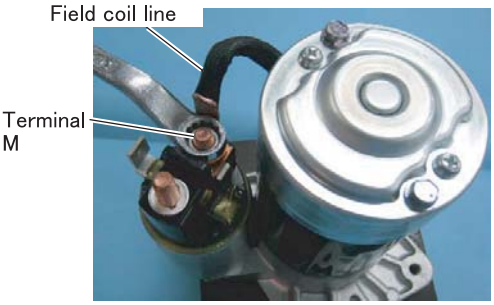
■ **Assembly: Magnetic switch**

- Install the magnet switch onto the lever with its terminal S in the illustrated direction.



P116361E

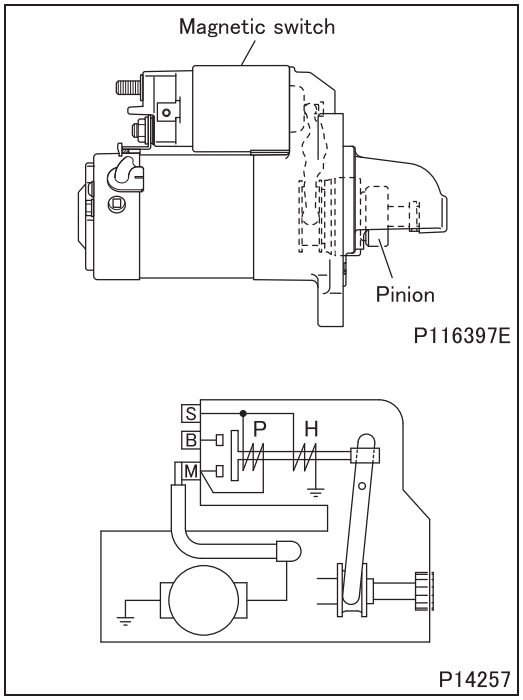
- Tighten the screws.

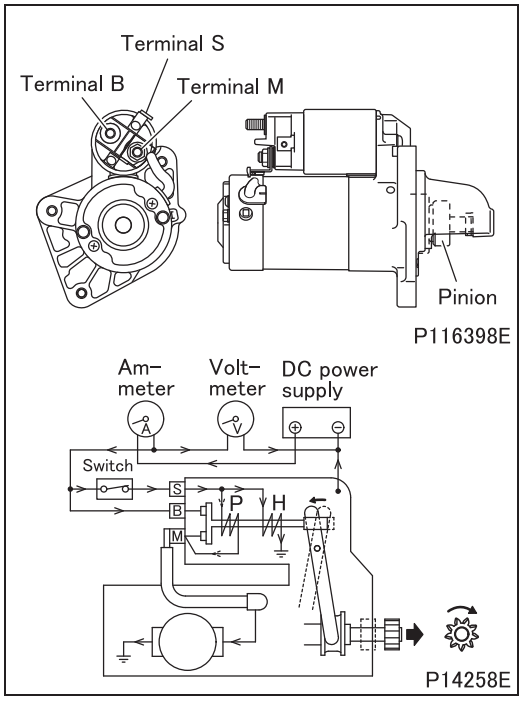


P116360E

- Connect the field coil line to terminal M of the magnet switch, and then tighten the nut.

◆Inspection after assembly◆





■ Inspection: Performance and pinion gap

- After assembling the starter, perform inspections with current supplied to it.

WARNING ⚠

- **When the starter is energized, the pinion will spring out and rotate. Be careful not to touch it with your hands.**
- **The magnetic switch may become very hot during inspections. Be careful when touching it.**

CAUTION ⚠

- **Do not energize the pull-in coil P for longer than 10 seconds, and do not energize the holding coil H for longer than 30 seconds. If these periods are exceeded, the coils may overheat and burn out.**
- **When current is supplied to the starter, a large current (100 A or higher) will flow. For inspection purposes, booster cables or similarly thick cables must therefore be used. It is also important to ensure that all connections are secure.**

(1) Performance test

- Connect the starter as illustrated.
- Set the voltage to 11 volts DC.

CAUTION ⚠

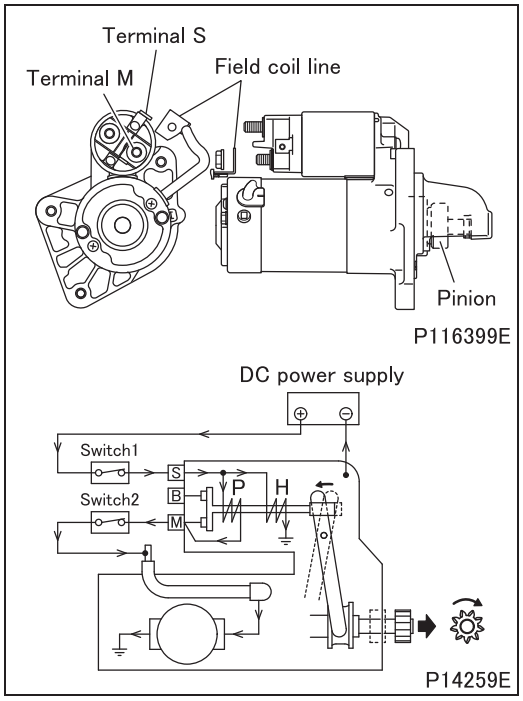
- **The voltage applied must not exceed 12 V.**

- The following operations are performed with current supplied to the starter. Thus, the entire test (consisting of measurement of the current flowing through the starter and measurement of the starter's rotational speed) must be completed within 30 seconds.
  - Turn ON the switch to supply current to the starter. The pinion will spring out and rotate.

CAUTION ⚠

- **When the switch is turned ON, the pull-in coil P and holding coil H are both energized. When the large current from the DC power supply flows from terminal B to terminal M, the supply of current to the pull-in coil P is cut; only the holding coil H remains energized. To prevent the holding coil from burning out, it is essential to complete all operations within 30 seconds.**

  - Measure the current, then measure the starter's rotational speed with a digital tachometer.
  - Turn OFF the switch to de-energize the starter.
- If either measurement is out of specification, disassemble and inspect the starter again.



(2) Pinion gap

- Connect the starter as illustrated.
- The following operations are performed with current supplied to the starter. Thus, the entire procedure for measurement of the pinion gap must be completed within 30 seconds.
  - Turn ON switches 1 and 2 to supply current to the starter. The pinion will spring out and rotate.

  - After the pinion starts to rotate, quickly (within five seconds) turn OFF switch 2 to stop the pinion's rotation.

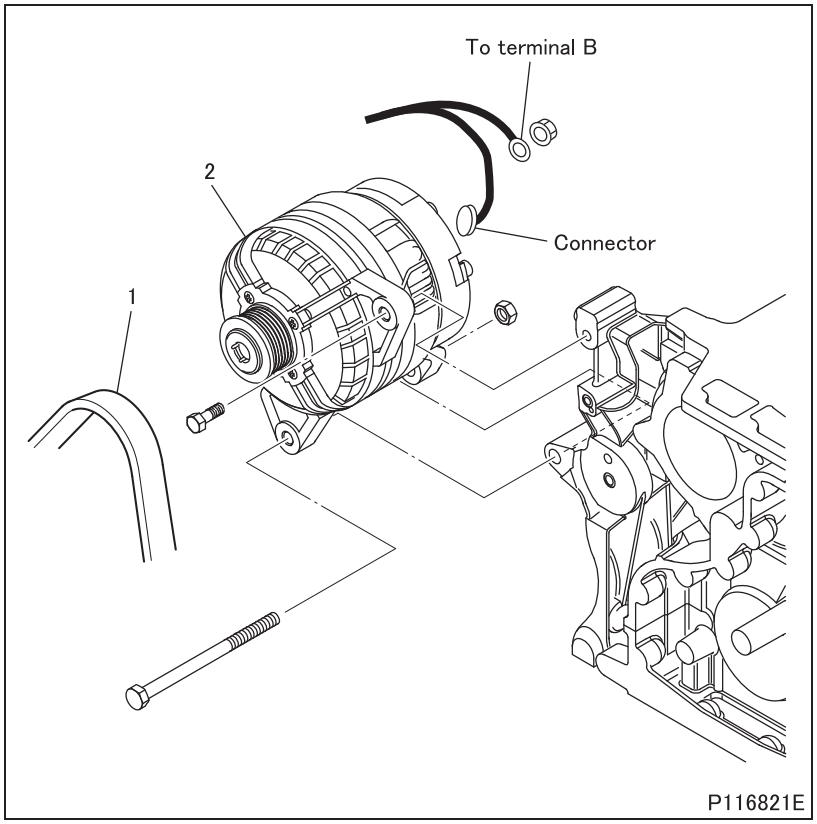
CAUTION ⚠

- **When switches 1 and 2 are turned ON, the pull-in coil P and holding coil H are both energized. The circuit is connected such that no voltage is applied to starter terminal B, so current flows to the pull-in coil while the pinion rotates. To prevent the pull-in coil from burning out, it is essential to turn OFF switch 2 quickly (within five seconds) after the pinion starts to rotate.**

  - Pull out the end of the pinion by hand, and then lightly push it back by hand. Measure the amount of axial movement (pinion gap).
  - Turn OFF switch 1 to de-energize the starter.
- If the measurement is out of specification, replace the lever.

M E M O

#940 ALTERNATOR



● **Removal sequence**

1 Belt
2 Alternator

WARNING ⚠

- **Before removing the alternator, disconnect the (–) battery cable and insulate the cable and the (–) battery terminal with tape.**
- **It is dangerous to leave the (–) battery cable connected since the battery cable voltage is always present at terminal B.**

● **Installation sequence**

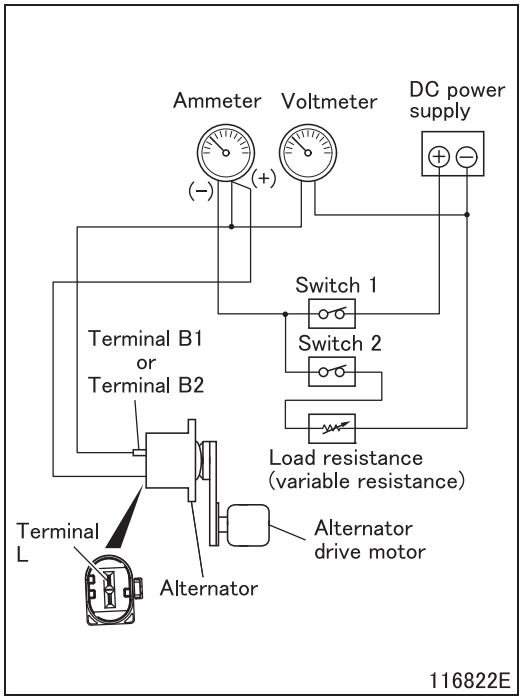
Follow the removal sequence in reverse.

Service standards

Location	Maintenance item			Standard value	Limit	Remedy
2	Alternator output current (*when alternator is hot and producing 13.5 V)	110A	At 1800 rpm	55 A or more	–	Correct or replace
			At 6000 rpm	110 A or more	–	
		140A	At 1800 rpm	75 A or more	–	
			At 6000 rpm	140 A or more	–	
	Adjustment voltage of regulator (at 6000 rpm, 5 A is loaded)			14.5 ± 0.25 V	–	Replace

* The hot condition occurs after the alternator has been running at normal ambient temperature at 6000 rpm and maximum output for 30 minutes.

◆Inspection procedure◆



■ Inspection: Alternator

(1) Alternator output current (bench test)

- Connect the alternator as illustrated.

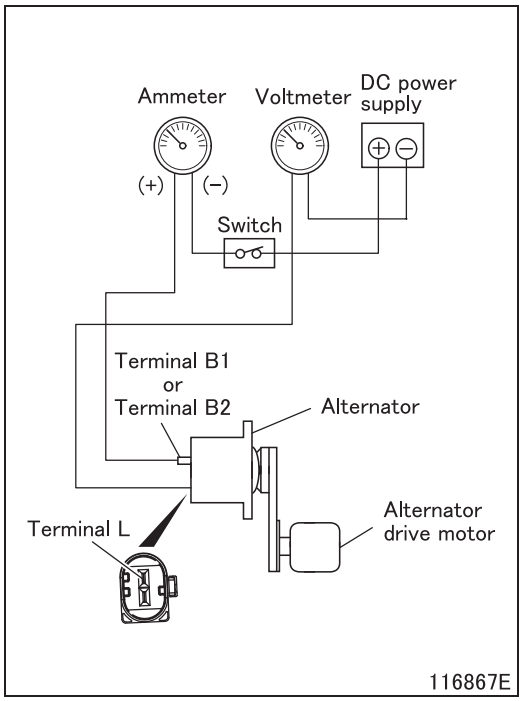
CAUTION ⚠

- **Wires with sufficient thickness should be used for wiring and each connection should be securely fastened.**

- Increase load resistance to the maximum (condition under which the load current hardly flows).
- Turn switch 1 and 2 ON.
- Run alternator at 6000 rpm for 30 minutes by adjusting load resistance so that electric current can conform to the following standard.
  Alternator nominal current

Alternator	Current
110A	Approx. 110A
140A	Approx. 140A

- Measure the current at each specified revolution of alternator.
- If the measured value is lower than the standard value, disassemble and check alternator.

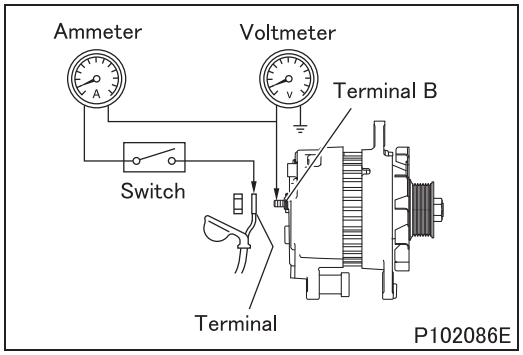


(2) Adjustment voltage of regulator (bench test)

- Connect the alternator as illustrated.
- Turn switch ON.
- Run alternator at low speeds.
- Increase the speed of alternator to 6000 rpm and measure the voltage (adjustment voltage) at this speed. At the same time, make sure that the current is 5 amperes or less at 6000 rpm.
- If the measured value deviates from the standard value, do as follows:
  - If higher than the standard value: Replace the regulator.
  - If lower than the standard value: Inspect the alternator related parts before replacing the regulator.

54-13 ON-VEHICLE INSPECTION AND ADJUSTMENT

#950 INSPECTION OF ALTERNATOR



Performance test

- The on-vehicle inspection is only a simplified check. Use a test bench for accurate checking.
- Connect the meters to the alternator as shown.

WARNING ⚠

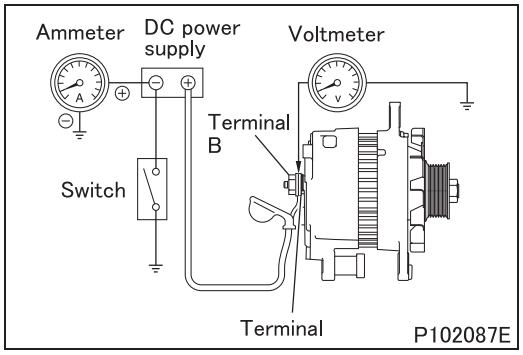
- **To prevent possible injury, be sure to disconnect the negative battery cable and insulate the cable and the negative battery terminal with tape before working on the wiring. With the negative (–) battery cable connected, battery voltage is always applied to terminal B.**
- **To connect to switch, use a lead wire with the same or larger diameter than that of the chassis harness connected to terminal B.**

- Turn on switch and make sure that voltmeter indicates battery voltage.
- Start the engine.
- Immediately turn on the switches for all lamps on the vehicle.
- Immediately accelerate the engine to the speed indicated below and measure the alternator's output current.
  Approx. 2200 rpm
- The alternator is considered to be good if the measured value is 70% or more of the nominal output current.
  Alternator nominal output

Voltage	Output current
12 V	110 A
12 V	140 A

Service standards

Location	Maintenance item	Standard value		Limit	Remedy
–	Adjusting voltage	12V-110A	14.5 ± 0.2 V	–	Replace
		12V-140A	14.5 ± 0.25 V		



- Connect the meters to the alternator as shown.

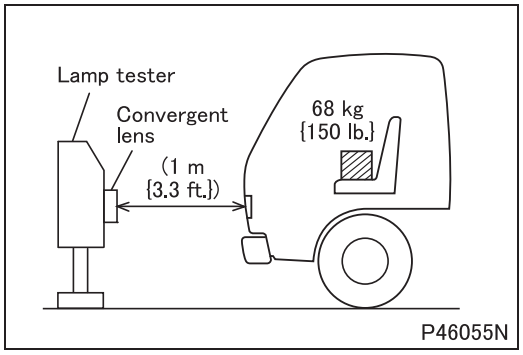
WARNING ⚠

- **To prevent possible injury, be sure to disconnect the negative battery cable and insulate the cable and the negative battery terminal with tape before working on the wiring. With the negative (–) battery cable connected, battery voltage is always applied to terminal B.**
- **To connect to switch, use a lead wire with the same or larger diameter than that of the chassis harness connected to terminal B.**

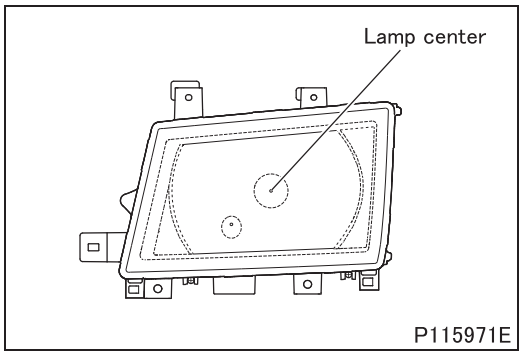
- Turn off the switches for lamps, heater, etc. so that electric loads may not be applied during the inspection.
- Turn on switch and then start the engine.
- If the output current is 5 amperes or less when the engine speed is raised to the appropriate speed indicated below, then measure the voltage at terminal B.
  Approx. 2200 rpm
- If the output current is not less than 5 amperes, the measured value (regulated voltage) will be slightly lower.
- If the output current is 5 amperes or more, do one of the following:
  - Run the engine for a while to charge the battery.
  - Replace the battery with a fully-charged one.
- If the measured value deviates from the standard value, conduct checking again on the test bench.

#960 HEADLAMP AIMING

1. Preparation before Adjustment



- Park the vehicle on a level flat place and apply chocks to the wheels.
- Empty the vehicle.
- Adjust the tire inflation pressure to the specified value.
- Place a mass of 68 kg {150 lb} (corresponding to a mean weight of one man) on the driver's seat.
- On vehicles with headlamp leveling device, set the headlamp leveling switch to 0.
- Start the engine to charge the battery.
- Locate a lamp tester at a place opposite to the vehicle front end face as illustrated.

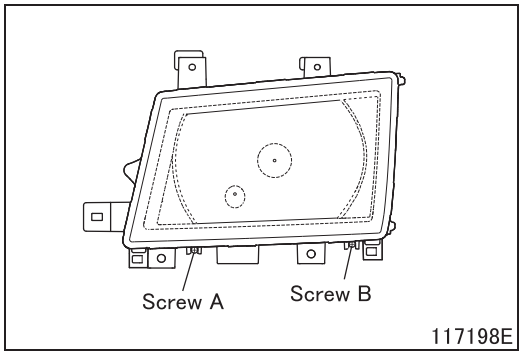


- Turn on the headlamps and aim the headlamps such that the passing beam lamp center is aligned with the beam convergent lens center of the lamp tester. (Shown here is the left-hand headlamp.)
- Mask other lamps than that next subjected to adjustment in such a way that no light may leak.

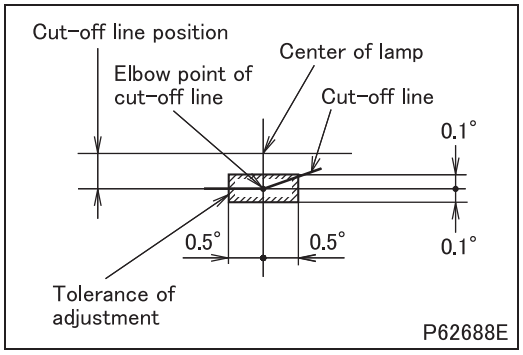
CAUTION ⚠

- **Headlamp lenses are made of plastic. Do not keep the masked headlamps illuminated for longer than 2 minutes. Sustained illumination of these lamps can cause heat generation, possibly resulting in deformed headlamp lens.**

2. Adjustment



- Turn on the passing beam.
- Perform the following procedure to adjust the passing beam such that the elbow point of the cut-off line between the lighted and shaded areas is positioned as shown in the figure:
- Adjustment in vertical direction: Turn screws A and B the same amount in this order.
- Adjustment in horizontal direction: Turn screw B.



- The position of the cut-off line between the lighted and shaded areas must correspond to the adjustment value.

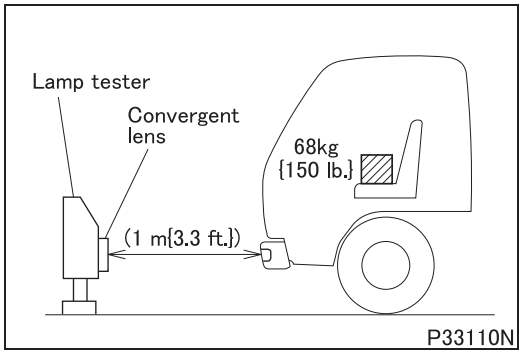
	Adjustment value
Cut-off line position	0.57° <FE>
	0.86° <FG>

	Beam adjustment direction							
	Right-hand headlamp				Left-hand headlamp			
	Up	Down	Left	Right	Up	Down	Left	Right
Screw A	CCW	CW	–	–	CCW	CW	–	–
Screw B	CCW	CW	CCW	CW	CCW	CW	CW	CCW

CW: Clockwise
CCW: Counter-clockwise

#961 FOG LAMP AIMING

1. Preparation before Adjustment

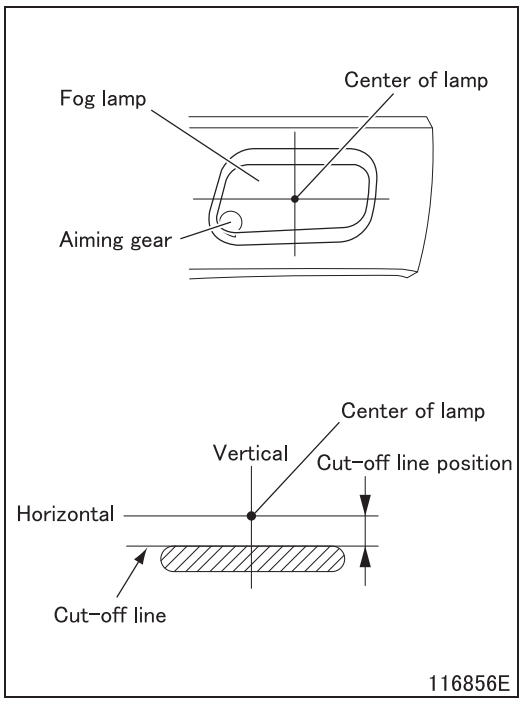


- Park the vehicle on a level flat place and apply chocks to the wheels.
- Empty the vehicle.
- Adjust the tire inflation pressure to the specified value.
- Place a mass of 68 kg {150 lb} (corresponding to a mean weight of one man) on the driver's seat.
- Start the engine to charge the battery.
- Locate a lamp tester at a place opposite to the vehicle front end face as illustrated.
- With the fog lamp turned on, align the center of fog lamp bulb and the center of convergent lens of convergent lamp tester. (Shown here is the left-hand fog lamp.)
- Mask other lamps than that next subjected to adjustment in such a way that no light may leak.

CAUTION ⚠

- **Fog lamp lenses are made of plastic. Do not keep the masked fog lamp illuminated for longer than 2 minutes. Sustained illumination of these lamps can cause heat generation, possibly resulting in deformed fog lamp lens.**

2. Adjustment



- Turn on fog lamp.
- Make adjustment with the aiming gear to bring for lamp cut-off line into the illustrated position.

Cut-off line position	Standard value
	1.5% or less

	Adjusting direction for optical axis	
	Upward	Downward
Screwdriver rotation direction	Clockwise	Counter-clockwise

M E M O

#984 INSPECTION OF IMMOBILIZER

- Since the FUSO diagnostics data are updated from time to time, descriptions or wording may not agree with the workshop manual. The FUSO diagnostics will have the latest data.

1. List of Diagnosis Codes

Code	Message	Warning lamp indication	Remarks
521742-12	Immobilizer fault	O	
521742-31	Watchdog reset	O	
521743-2	Missing transponder modulation	O	
521744-2	Invalid secret key	O	
521745-2	Bad ECM authentication	O	
521746-2	No ECM challenge/acknowledge	O	
521747-2	Transponder authentication failed	O	
521748-2	Transponder ID table empty	O	
521749-2	Transponder data format error	O	
521750-19	CAN bus performance	O	
521750-31	Lost communication with SAM	O	

2. Details of Diagnosis Codes

521742-12: Immobilizer fault

Generation condition	• Some abnormality has occurred in immobilizer electronic control unit.
Recoverability	• System recovers when relevant diagnosis code is erased.
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Defective immobilizer electronic control unit

521742-31: Watchdog reset

Generation condition	• CPU has been reset.
Recoverability	• System recovers if no abnormal conditions are present when starter switch is placed in ON again.
Control effected by electronic control unit	• None
Possible causes	• Defective immobilizer electronic control unit

521743-2: Missing transponder modulation

Generation condition	• No communication takes place between transponder key (starter key) and immobilizer electronic control unit.
Recoverability	• System recovers if no abnormal conditions are present when starter switch is placed in ON again.
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Defective transponder key (starter key) • Defective harness between immobilizer antenna and immobilizer electronic control unit • Defective immobilizer antenna • Defective immobilizer electronic control unit

521744-2: Invalid secret key

Generation condition	• Secret key is not registered in immobilizer electronic control unit.
Recoverability	• None
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Defective immobilizer electronic control unit

521745-2: Bad ECM authentication

Generation condition	• Collation between engine electronic control unit and immobilizer electronic control unit is not successfully made.
Recoverability	• System recovers if collation is made successfully when starter switch is placed in ON again.
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Defective engine electronic control unit • Incorrect engine electronic control unit in use • Engine electronic control unit transferred from another vehicle

521746-2: No ECM challenge/acknowledge

Generation condition	• No communication is possible between engine electronic control unit and immobilizer electronic control unit.
Recoverability	• System recovers if normal communication is established when starter switch is placed in ON again.
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Defective engine electronic control unit • Controller area network communication line is open or short-circuited to power, ground or another circuit. • Incorrect engine electronic control unit in use

521747-2: Transponder authentication failed

Generation condition	• Collation between transponder key (starter key) and immobilizer electronic control unit is made unsuccessfully.
Recoverability	• System recovers if collation is made successfully when starter switch is placed in ON again.
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Unauthorized transponder key (starter key) is used. • Transponder key (starter key) not registered yet is used.

521748-2: Transponder ID table empty

Generation condition	• Transponder key (starter key) ID is not stored in immobilizer electronic control unit.
Recoverability	• System recovers when initial key registration is executed.
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Transponder key (starter key) used is not a one registered in immobilizer electronic control unit.

521749-2: Transponder data format error

Generation condition	• Immobilizer electronic control unit has received an implausible data from transponder key (starter key) through communication line.
Recoverability	• System recovers if a plausible data is obtained when starter switch is placed in ON again.
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Faulty transponder key (starter key) • Faulty immobilizer antenna • Faulty immobilizer electronic control unit

521750-19: CAN bus performance

Generation condition	• Controller area network error message is received.
Recoverability	• System recovers if any normal signal is received when starter switch is placed in ON position.
Control effected by electronic control unit	• None
Possible causes	• Controller area network communication line is open or shorted to power, ground or another circuit. • Faulty controller area network resistor • Faulty signal detect and actuation module • Faulty immobilizer electronic control unit

521750-31: Lost communication with SAM

Generation condition	• No controller area network message is receivable.
Recoverability	• System recovers if any normal signal is received when starter switch is placed in ON position.
Control effected by electronic control unit	• None
Possible causes	• Controller area network communication line is open or shorted to power, ground or another circuit. • Faulty controller area network resistor • Faulty signal detect and actuation module • Faulty immobilizer electronic control unit

3. FUSO Diagnostics Service Data (Measured Values)

• Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.

Current Value Group	Description	Value	Explanation
Vehicle key	Number of registered key	0 to 6	Shows the number of registered starter keys (transponder keys) for the engine immobilizer.
	Transponder key type	Registered/Unregistered	Shows the type of the starter key (transponder key) for the engine immobilizer that is currently inserted in the starter switch.
	Ignition status	ON/OFF	Shows the ignition status.
Immobilizer status	Immobilizer mode	Normal mode/ Transponder key ID initial registration mode/ Transponder key ID additional registration mode/ Transponder key deletion mode/ Secret key registration mode	Shows the current state of the immobilizer ECU.
	Immobilizer indicator	ON/OFF	Shows the immobilizer indicator lamp state.
	Immobilizer status	ACTIVE/NOT ACTIVE	Shows the immobilizer system state.

4. Initial Settings of Immobilizer

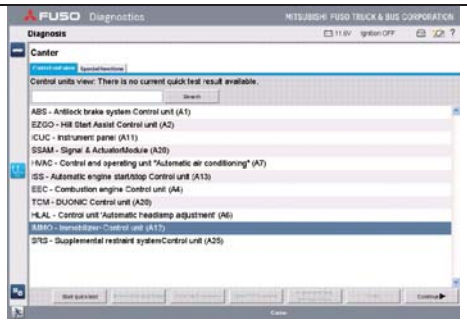
4.1 Connecting the FUSO Diagnostics

CAUTION ⚠

- **The immobilizer can be set with FUSO Diagnostics Ver. FDS-R10-1 or higher.**
- **Display images will be applied to FUSO Diagnostics Ver. FDS-R12-1 or higher. Display images might look different according to the version of FUSO Diagnostics.**

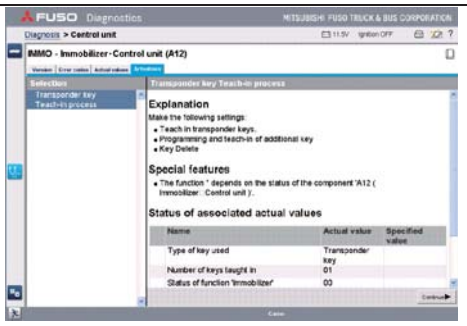
- Connect FUSO Diagnostics. (See Gr54-00A.)

4.2 Selection of the setting of immobilizer



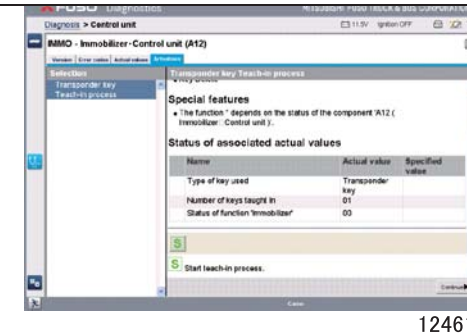
124615E

- From the control unit list screen, select [IMMO - Immobilizer Control Unit (A12)].



124616E

- Select “Actuations” tab.
- Select [Transponder key Teach-in process].



124617

- Press the “S” button of “Start teach-in process”.

#984 INSPECTION OF IMMOBILIZER

4.3 Various operations (initial key registration, additional key registration, secret key registration, key information deletion)

- Details of each function are as follows.

Function	FUSO Diagnostics display	Outline
Initial key registration	Button “R”: Register Initial Key	Used to allow the immobilizer electronic control unit to identify starter key data or to load new data to the memory after replacement of the electronic control unit. (See “(1) Initial key registration”.)
Additional key registration	Button “R”: Register Additional Key	Used to allow the immobilizer electronic control unit to identify starter key data or to load new data to the memory at re-registration of starter key or addition of a new key. (See “(2) Additional key registration”.)
Secret key registration	Button “R”: Perform teach-in process “security code”.	Used to allow the system to collate immobilizer electronic control unit ID with engine electronic control unit ID. (See “(3) Secret key registration”.)
Key information deletion	Button “N”: Delete key.	Used to delete starter key data registered in the immobilizer electronic control unit memory. (See “(4) Key information deletion”.)

CAUTION ⚠

- **The secret key data can be registered in the memory only after the initial key has been previously registered.**

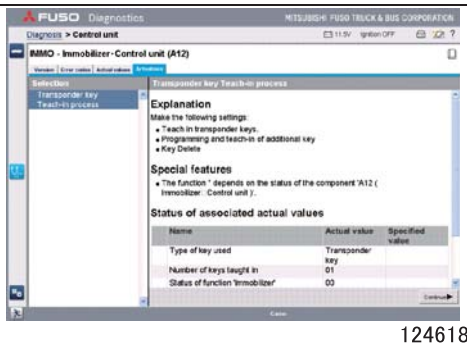
(1) Initial key registration

- After replacement of the immobilizer electronic control unit, this function should be executed to allow the electronic control unit to identify the starter key data in the memory or load new data to the memory.
  (The procedure of initial key registration is identical with the procedure of additional key registration after pressing the button “R” for “Register Initial Key” See “(2) Additional key registration”.)

(2) Additional key registration

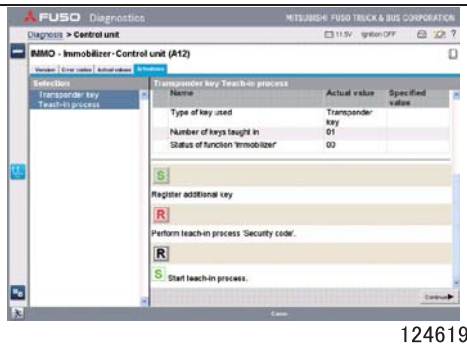
- At re-registration of starter key or addition of a new key, additional key registration function should be executed to allow the electronic control unit to identify the starter key data in the memory or load new data to the memory.
- Up to 6 sets of the key data can be registered in the immobilizer electronic control unit memory.

(2.1) Registration procedure



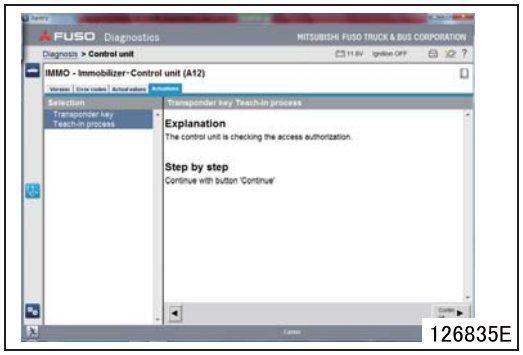
124618E

- Insert the starter key registered in the immobilizer electronic control unit memory.
- Check the actual value of “Type of key used” is “Transponder key”.

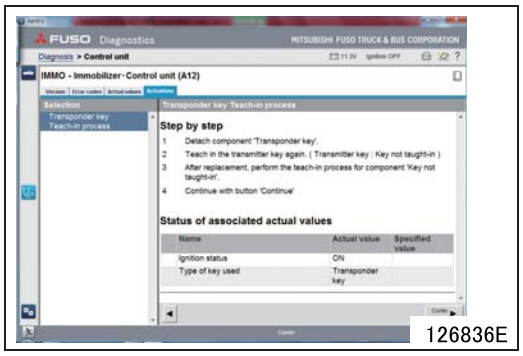


124619E

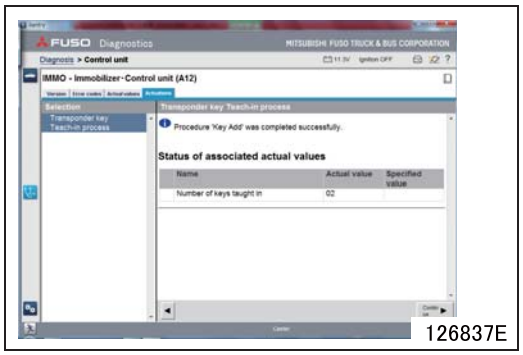
- Press the “R” (red) button of “Register additional key”.



- Press the “Continue” button.
  If an error occurs, or when work was interrupted in the middle, and then press the "Continue" button after the ON again to OFF once the starter switch.



- Insert a new starter key to be registered in the immobilizer electronic control unit memory into the starter key switch.
- Press the “Continue” button.



- A message appears to show registration of additional starter key data in the immobilizer electronic control unit has been successfully completed.
- Make sure that the number of the value of “Numbers of keys taught in” is increased.

(3) Secret key registration

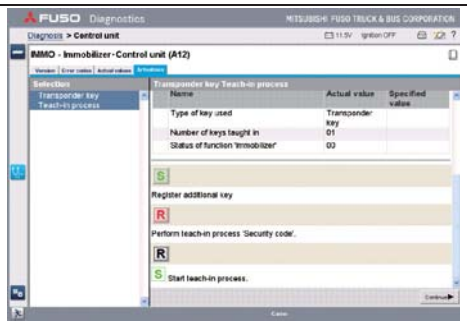
- Secret key registration function should be executed whenever the following operations have been done. Without secret key registration, the engine cannot be started because engine cannot find the same key ID in the memory.
  - The immobilizer electronic control unit is replaced with new one.
  - The engine electronic control unit is replaced with new one.
  - The engine electronic control unit is replaced with one derived from other vehicles.

CAUTION ⚠

- **The immobilizer electronic control unit should never be replaced with one derived from other vehicles.**
- **The secret key registration function need not be executed after the starter key data is once deleted and registered again.**

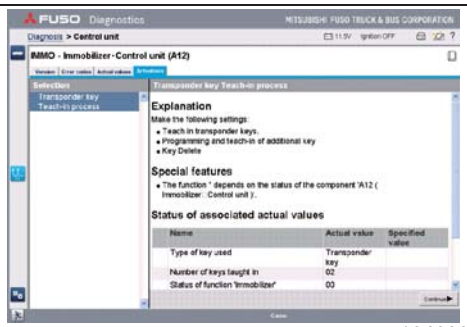
#984 INSPECTION OF IMMOBILIZER

(3.1) Registration procedure



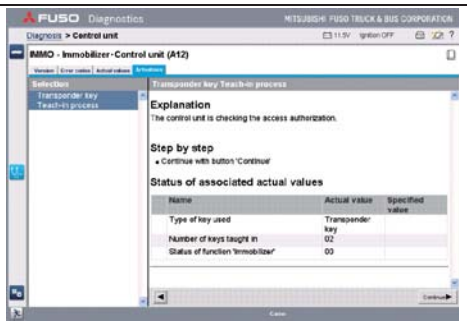
124619E

- Press the “R” (black) button of “Perform teach-in process ‘Security code’”.



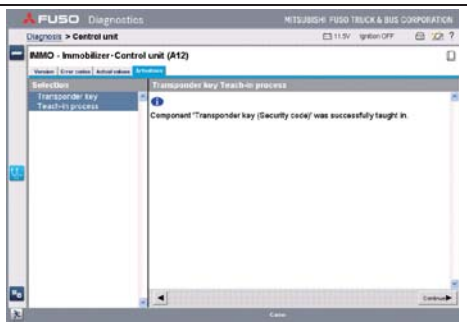
124623E

- Press the “Continue” button.



124624E

- Press the “Continue” button.



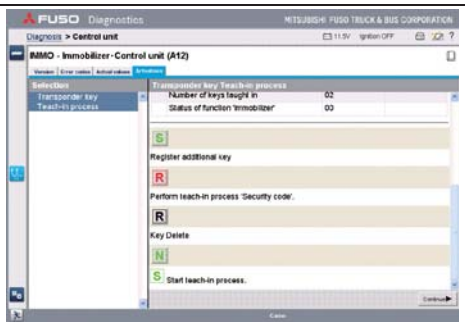
124625E

- A message appears to show that registration of the secret key in the engine electronic control unit memory has been successfully completed.

(4) Key information deletion

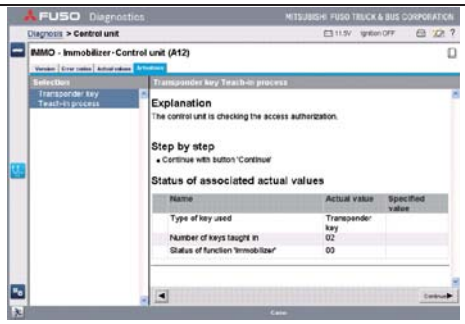
- Key information deletion function should be executed to delete the starter key data registered in the immobilizer electronic control unit memory.

(4.1) Deletion procedure



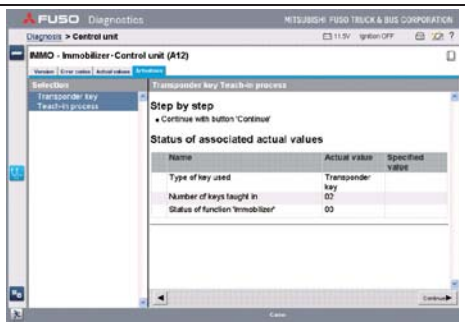
124626E

- Press the “N” button of “Key Delete”.



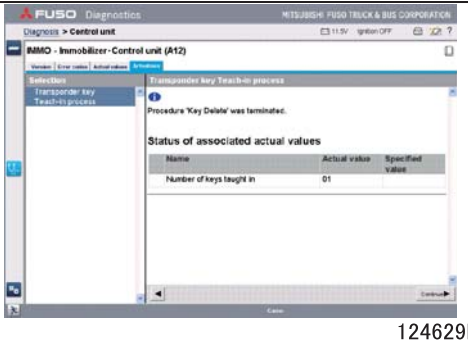
124627E

- Press the “Continue” button.



124628E

- Press the button “Continue” again.

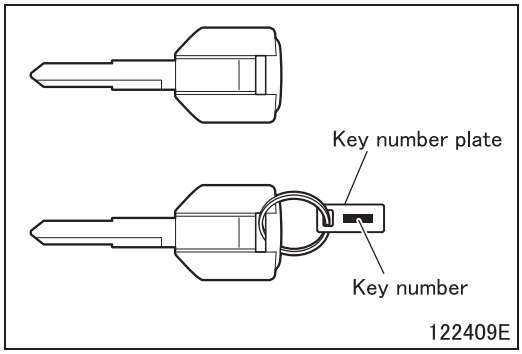


124629E

- A message appears to show deletion of the starter key data registered in the immobilizer electronic control unit memory has been successfully completed.
- Make sure that the value of “Number of keys taught in” is “01”. (Only the starter key inserted in the starter key switch has been taught in.)

4.4 Additional starter key registration (up to 6 keys can be registered)

- Follow the procedure below to register the additional starter key after checking its key number. When the key number is unavailable, the key cutouts must be cut as this starter key has no cutout on it.



- Key number is shown on the key number plate attached to one of two starter keys initially provided.

Prepare the additional starter key to be registered with the key number confirmed.
(If the key number is unavailable, the key cutouts must be cut as this starter key has no cutout on it.)

↓

Prepare the existing starter key and the new and additional starter key to be registered.

↓

Insert the existing starter key (other than the new and additional starter key to be registered) into the starter key switch.

↓

Delete the starter key data with FUSO Diagnostics. (See “4.3 (4) Key information deletion”.)
After deletion of the starter key registration has been completed, all of the starter key data except the starter key inserted into the starter key switch is deleted.

↓

Register the additional starter key with FUSO Diagnostics. (See “4.3 (2) Additional key registration”.)
Any starter keys except the starter key inserted into the starter key switch at deletion of key registration can be registered.

↓

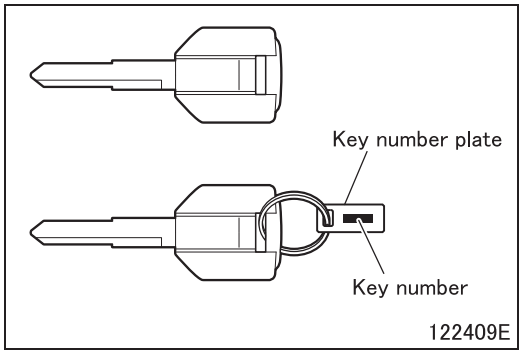
Register the secret key with FUSO Diagnostics. (See “4.3 (3) Secret key registration”.)

↓

End

4.5 New starter key registration after all of starter keys have been lost

- When the new starter key has to be registered after all of starter keys have been lost, firstly check the key number because the key parts to be prepared will differ according to availability of key number.



- Key number is shown on the key number plate attached to one of two starter keys initially provided.

- Follow the procedure below after checking if the key number is available or not.

When the key number is unavailable

Replace all the parts below with new ones.
- Starter key
- Starter key switch
- Key cylinder
- Immobilizer electronic control unit
- Fuel cap
- Glove box with key
  <Glove box with key type>

When the key number is available

Replace all the parts below with new ones.
(Provide the key number.)
- Starter key
- Immobilizer electronic control unit

Insert the starter key into the starter switch.

Register the initial starter key with FUSO Diagnostics. (See “4.3 (1) Initial key registration”.)

Register the secret key with FUSO Diagnostics. (See “4.3 (3) Secret key registration”.)

Register the additional starter key. (See “4.4 Additional starter key registration”.)

End

#985 INSPECTION OF SIGNAL DETECT AND ACTUATION MODULES

- Since the FUSO diagnostics data are updated from time to time, descriptions or wording may not agree with the workshop manual. The FUSO diagnostics will have the latest data.

1. List of Diagnosis Codes

Code	Message	Warning lamp indication		Remarks
		SAM (red)	SAM (orange)	
2372-4	Left rear brake light - Insufficient voltage or short circuit to ground	-	O	
2372-5	Left rear brake light - The current strength is too low or there is an open circuit.	-	O	
2374-4	Right rear brake light - Insufficient voltage or short circuit to ground	-	O	
2374-5	Right rear brake light - The current strength is too low or there is an open circuit.	-	O	
521985-4	BBC Side turn lamp LH - Insufficient voltage or short circuit to ground	-	-	
521985-5	BBC Side turn lamp LH - The current strength is too low or there is an open circuit.	-	-	
521986-4	BBC Side turn lamp RH - Insufficient voltage or short circuit to ground	-	-	
521986-5	BBC Side turn lamp RH - The current strength is too low or there is an open circuit.	-	-	
521987-4	BBC Body illumination - Insufficient voltage or short circuit to ground	-	-	
521988-4	BBC Chassis illumination - Insufficient voltage or short circuit to ground	-	-	
521989-4	BBC Backup Alarm - Insufficient voltage or short circuit to ground	-	-	
521990-4	Transmission power take-off 3-way magnetic valve - Insufficient voltage or short circuit to ground	-	-	
521990-5	Transmission power take-off 3-way magnetic valve - The current strength is too low or there is an open circuit.	-	-	
521992-4	Driver mirror heater - Insufficient voltage or short circuit to ground	-	-	
521994-4	Backup lamp - Insufficient voltage or short circuit to ground	-	-	
521994-5	Backup lamp - The current strength is too low or there is an open circuit.	-	-	
521995-4	Left high beam - Insufficient voltage or short circuit to ground	-	-	
521995-5	Left high beam - The current strength is too low or there is an open circuit.	-	-	
521996-4	Right high beam - Insufficient voltage or short circuit to ground	-	-	
521996-5	Right high beam - The current strength is too low or there is an open circuit.	-	-	
521997-4	Left low beam - Insufficient voltage or short circuit to ground	-	-	
521997-5	Left low beam - The current strength is too low or there is an open circuit.	-	-	
521998-4	Right low beam - Insufficient voltage or short circuit to ground	-	-	
521998-5	Right low beam - The current strength is too low or there is an open circuit.	-	-	
522003-4	Left standing light - Insufficient voltage or short circuit to ground	-	O	
522003-5	Left standing light - The current strength is too low or there is an open circuit.	-	O	

Code	Message	Warning lamp indication		Remarks
		SAM (red)	SAM (orange)	
522004-4	Right standing light - Insufficient voltage or short circuit to ground	-	O	
522004-5	Right standing light - The current strength is too low or there is an open circuit.	-	O	
522005-4	Left tail lamp - Insufficient voltage or short circuit to ground	-	O	
522005-5	Left tail lamp - The current strength is too low or there is an open circuit.	-	O	
522006-4	Right tail lamp - Insufficient voltage or short circuit to ground	-	O	
522006-5	Right tail lamp - The current strength is too low or there is an open circuit.	-	O	
522007-4	Left rear turn signal lamp - Insufficient voltage or short circuit to ground	-	-	
522007-5	Left rear turn signal lamp - The current strength is too low or there is an open circuit.	-	-	
522008-4	Right rear turn signal lamp - Insufficient voltage or short circuit to ground	-	-	
522008-5	Right rear turn signal lamp - The current strength is too low or there is an open circuit.	-	-	
522009-4	Left turn signal lamp (front) - Insufficient voltage or short circuit to ground	-	-	
522009-5	Left turn signal lamp (front) - The current strength is too low or there is an open circuit.	-	-	
522010-4	Right turn signal lamp (front) - Insufficient voltage or short circuit to ground	-	-	
522010-5	Right turn signal lamp (front) - The current strength is too low or there is an open circuit.	-	-	
522011-4	Right front fog lamp - Insufficient voltage or short circuit to ground	-	-	
522011-5	Right front fog lamp - The current strength is too low or there is an open circuit.	-	-	
522014-4	Passenger exit lamp - Insufficient voltage or short circuit to ground	-	-	
522014-5	Passenger exit lamp - The current strength is too low or there is an open circuit.	-	-	
522015-4	Driver exit lamp - Insufficient voltage or short circuit to ground	-	-	
522015-5	Driver exit lamp - The current strength is too low or there is an open circuit.	-	-	
522016-4	Cabin button illumination - Insufficient voltage or short circuit to ground	-	-	
522017-4	Washer motor - Insufficient voltage or short circuit to ground	-	-	
522017-5	Washer motor - The current strength is too low or there is an open circuit.	-	-	
522020-4	Left license plate lamp - Insufficient voltage or short circuit to ground	-	O	
522020-5	Left license plate lamp - The current strength is too low or there is an open circuit.	-	O	
522022-4	Left front fog lamp - Insufficient voltage or short circuit to ground	-	-	
522022-5	Left front fog lamp - The current strength is too low or there is an open circuit.	-	-	
522026-4	Passenger mirror heater - Insufficient voltage or short circuit to ground	-	-

522150-17	Faulty component “SAM” - Occurring	O	-	

2. Details of Diagnosis Codes

2372-4: Left rear brake light - Insufficient voltage or short circuit to ground

Generation condition	• Output current to stop lamp (left-hand) rises to range of 2.3 to 3.7 A or higher.
Recoverability	• System recovers when output current to stop lamp (left-hand) falls within range of 2.3 to 3.7 A or lower.
Control effected by electronic control unit	• Output to stop lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between stop lamp (left-hand) and signal detect and actuation module • Faulty stop lamp (left-hand) • Defective signal detect and actuation module

2372-5: Left rear brake light - The current strength is too low or there is an open circuit.

Generation condition	• Output current to stop lamp (left-hand) falls to range of 0.5 to 1.1 A or lower.
Recoverability	• System recovers when output current to stop lamp (left-hand) rises to range of 0.5 to 1.1 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between stop lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between stop lamp (left-hand) and signal detect and actuation module • Faulty stop lamp (left-hand) • Defective signal detect and actuation module

2374-4: Right rear brake light - Insufficient voltage or short circuit to ground

Generation condition	• Output current to stop lamp (right-hand) rises to range of 2.3 to 3.7 A or higher.
Recoverability	• System recovers when output current to stop lamp (right-hand) falls within range of 2.3 to 3.7 A or lower.
Control effected by electronic control unit	• Output to stop lamp (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between stop lamp (right-hand) and signal detect and actuation module • Faulty stop lamp (right-hand) • Defective signal detect and actuation module

2374-5: Right rear brake light - The current strength is too low or there is an open circuit.

Generation condition	• Output current to stop lamp (right-hand) falls to range of 0.5 to 1.1 A or lower.
Recoverability	• System recovers when output current to stop lamp (right-hand) rises to range of 0.5 to 1.1 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between stop lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between stop lamp (right-hand) and signal detect and actuation module • Faulty stop lamp (right-hand) • Defective signal detect and actuation module

521985-4: BBC Side turn lamp LH - Insufficient voltage or short circuit to ground

Generation condition	• Output current to side turn signal lamp (left-hand) rises to range of 2.3 to 3.7 A or higher.
Recoverability	• System recovers when output current to side turn signal lamp (left-hand) falls within range of 2.3 to 3.7 A or lower.
Control effected by electronic control unit	• Output to side turn signal lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between side turn signal lamp (left-hand) and signal detect and actuation module • Faulty side turn signal lamp (left-hand) • Defective signal detect and actuation module

521985-5: BBC Side turn lamp LH - The current strength is too low or there is an open circuit.

Generation condition	• Output current to side turn signal lamp (left-hand) falls to range of 0.5 to 1.1 A or lower.
Recoverability	• System recovers when output current to side turn signal lamp (left-hand) rises to range of 0.5 to 1.1 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between side turn signal lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between side turn signal lamp (left-hand) and signal detect and actuation module • Faulty side turn signal lamp (left-hand) • Defective signal detect and actuation module

521986-4: BBC Side turn lamp RH - Insufficient voltage or short circuit to ground

Generation condition	• Output current to side turn signal lamp (right-hand) rises to range of 2.3 to 3.7 A or higher.
Recoverability	• System recovers when output current to side turn signal lamp (right-hand) falls within range of 2.3 to 3.7 A or lower.
Control effected by electronic control unit	• Output to side turn signal lamp (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between side turn signal lamp (right-hand) and signal detect and actuation module • Faulty side turn signal lamp (right-hand) • Defective signal detect and actuation module

521986-5: BBC Side turn lamp RH - The current strength is too low or there is an open circuit.

Generation condition	• Output current to side turn signal lamp (right-hand) falls to range of 0.5 to 1.1 A or lower.
Recoverability	• System recovers when output current to side turn signal lamp (right-hand) rises to range of 0.5 to 1.1 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between side turn signal lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between side turn signal lamp (right-hand) and signal detect and actuation module • Faulty side turn signal lamp (right-hand) • Defective signal detect and actuation module

521987-4: Body illumination - Insufficient voltage or short circuit to ground

Generation condition	• Output current to body illumination lamp rises to range of 3.8 to 7.3 A or higher.
Recoverability	• System recovers when output current to body illumination lamp falls within range of 3.8 to 7.3 A or lower.
Control effected by electronic control unit	• Output to body illumination lamp is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between body illumination lamp (12 V) and signal detect and actuation module • Faulty body illumination lamp (12 V) • Defective signal detect and actuation module

521988-4: Chassis illumination - Insufficient voltage or short circuit to ground

Generation condition	• Output current to chassis illumination lamp rises to range of 3.8 to 7.3 A or higher.
Recoverability	• System recovers when output current to chassis illumination lamp falls within range of 3.8 to 7.3 A or lower.
Control effected by electronic control unit	• Output to chassis illumination lamp is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between chassis illumination lamp (12 V) and signal detect and actuation module • Faulty chassis illumination lamp (12 V) • Defective signal detect and actuation module

#985 INSPECTION OF SIGNAL DETECT AND ACTUATION MODULES

521989-4: BBC Backup Alarm - Insufficient voltage or short circuit to ground

Generation condition	• Output current to backup lamp rises to range of 0.4 to 0.7 A or higher.
Recoverability	• System recovers when output current to backup lamp falls within range of 0.4 to 0.7 A or lower.
Control effected by electronic control unit	• Output to backup lamp is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between backup lamp and signal detect and actuation module • Faulty backup lamp • Defective signal detect and actuation module

521990-4: Transmission power take-off 3-way magnetic valve - Insufficient voltage or short circuit to ground

Generation condition	• Output current to transmission power take-off 3-way magnetic valve rises to range of 1.0 to 1.7 A or higher.
Recoverability	• System recovers when output current to transmission power take-off 3-way magnetic valve falls within range of 1.0 to 1.7 A or lower.
Control effected by electronic control unit	• Output to transmission power take-off 3-way magnetic valve is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between transmission power take-off 3-way magnetic valve and signal detect and actuation module • Faulty transmission power take-off 3-way magnetic valve • Defective signal detect and actuation module

521990-5: Transmission power take-off 3-way magnetic valve - The current strength is too low or there is an open circuit.

Generation condition	• Output current to transmission power take-off 3-way magnetic valve falls to range of 0.2 to 0.4 A or lower.
Recoverability	• System recovers when output current to transmission power take-off 3-way magnetic valve rises to range of 0.2 to 0.4 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between transmission power take-off 3-way magnetic valve and signal detect and actuation module • Open-circuit in Plus harness between transmission power take-off 3-way magnetic valve and signal detect and actuation module • Faulty transmission power take-off 3-way magnetic valve • Defective signal detect and actuation module

521992-4: Right mirror heater - Insufficient voltage or short circuit to ground

Generation condition	• Output current to mirror heater (driver side) rises to range of 7.7 to 13.5 A or higher.
Recoverability	• System recovers when output current to mirror heater (right-hand) falls within range of 7.7 to 13.5 A or lower.
Control effected by electronic control unit	• Output to mirror heater (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between mirror heater (right-hand) and signal detect and actuation module • Faulty mirror heater (right-hand) • Defective signal detect and actuation module

521994-4: Backup lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to backup lamp rises to range of 4.7 to 8.2 A or higher.
Recoverability	• System recovers when output current to backup lamp falls within range of 4.7 to 8.2 A or lower.
Control effected by electronic control unit	• Output to backup lamp is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between backup lamp and signal detect and actuation module • Faulty backup lamp • Defective signal detect and actuation module

521994-5: Backup lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to backup lamp falls to range of 1.1 to 2.2 A or lower.
Recoverability	• System recovers when output current to backup lamp rises to range of 1.1 to 2.2 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between backup lamp and signal detect and actuation module • Open-circuit in Plus harness between backup lamp and signal detect and actuation module • Faulty backup lamp • Defective signal detect and actuation module

521995-4: Left high beam - Insufficient voltage or short circuit to ground

Generation condition	• Output current to headlamp Hi (left-hand) rises to range of 6.5 to 11.7 A or higher.
Recoverability	• System recovers when output current to headlamp Hi (left-hand) falls within range of 6.5 to 11.7 A or lower.
Control effected by electronic control unit	• Output to headlamp Hi (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between headlamp Hi (left-hand) and signal detect and actuation module • Faulty headlamp Hi (left-hand) • Defective signal detect and actuation module

521995-5: Left high beam - The current strength is too low or there is an open circuit.

Generation condition	• Output current to headlamp Hi (left-hand) falls to range of 0.8 to 2.9 A or lower.
Recoverability	• System recovers when output current to headlamp Hi (left-hand) rises to range of 0.8 to 2.9 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between headlamp Hi (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between headlamp Hi (left-hand) and signal detect and actuation module • Faulty headlamp Hi (left-hand) • Defective signal detect and actuation module

521996-4: Right high beam - Insufficient voltage or short circuit to ground

Generation condition	• Output current to headlamp Hi (right-hand) rises to range of 6.5 to 11.7 A or higher.
Recoverability	• System recovers when output current to headlamp Hi (right-hand) falls within range of 6.5 to 11.7 A or lower.
Control effected by electronic control unit	• Output to headlamp Hi (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between headlamp Hi (right-hand) and signal detect and actuation module • Faulty headlamp Hi (right-hand) • Defective signal detect and actuation module

#985 INSPECTION OF SIGNAL DETECT AND ACTUATION MODULES

521996-5: Right high beam - The current strength is too low or there is an open circuit.

Generation condition	• Output current to headlamp Hi (right-hand) falls to range of 0.8 to 2.9 A or lower.
Recoverability	• System recovers when output current to headlamp Hi (right-hand) rises to range of 0.8 to 2.9 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between headlamp Hi (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between headlamp Hi (right-hand) and signal detect and actuation module • Faulty headlamp Hi (right-hand) • Defective signal detect and actuation module

521997-4: Left low beam - Insufficient voltage or short circuit to ground

Generation condition	• Output current to headlamp Lo (left-hand) rises to range of 6.0 to 10.9 A or higher.
Recoverability	• System recovers when output current to headlamp Lo (left-hand) falls within range of 6.0 to 10.9 A or lower.
Control effected by electronic control unit	• Output to headlamp Lo (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between headlamp Lo (left-hand) and signal detect and actuation module • Faulty headlamp Lo (left-hand) • Defective signal detect and actuation module

521997-5: Left low beam - The current strength is too low or there is an open circuit.

Generation condition	• Output current to headlamp Lo (left-hand) falls to range of 0.8 to 2.9 A or lower.
Recoverability	• System recovers when output current to headlamp Lo (left-hand) rises to range of 0.8 to 2.9 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between headlamp Lo (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between headlamp Lo (left-hand) and signal detect and actuation module • Faulty headlamp Lo (left-hand) • Defective signal detect and actuation module

521998-4: Right low beam - Insufficient voltage or short circuit to ground

Generation condition	• Output current to headlamp Lo (right-hand) rises to range of 6.0 to 10.9 A or higher.
Recoverability	• System recovers when output current to headlamp Lo (right-hand) falls within range of 6.0 to 10.9 A or lower.
Control effected by electronic control unit	• Output to headlamp Lo (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between headlamp Lo (right-hand) and signal detect and actuation module • Faulty headlamp Lo (right-hand) • Defective signal detect and actuation module

521998-5: Right low beam - The current strength is too low or there is an open circuit.

Generation condition	• Output current to headlamp Lo (right-hand) falls to range of 0.8 to 2.9 A or lower.
Recoverability	• System recovers when output current to headlamp Lo (right-hand) rises to range of 0.8 to 2.9 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between headlamp Lo (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between headlamp Lo (right-hand) and signal detect and actuation module • Faulty headlamp Lo (right-hand) • Defective signal detect and actuation module

522003-4: Left standing light - Insufficient voltage or short circuit to ground

Generation condition	• Output current to parking lamp (left-hand) rises to range of 0.5 to 1.0 A or higher.
Recoverability	• System recovers when output current to parking lamp (left-hand) falls within range of 0.5 to 1.0 A or lower.
Control effected by electronic control unit	• Output to parking lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between parking lamp (left-hand) and signal detect and actuation module • Faulty parking lamp (left-hand) • Defective signal detect and actuation module

522003-5: Left standing light - The current strength is too low or there is an open circuit.

Generation condition	• Output current to parking lamp (left-hand) falls to range of 0.1 to 0.3 A or lower.
Recoverability	• System recovers when output current to parking lamp (left-hand) rises to range of 0.1 to 0.3 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between parking lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between parking lamp (left-hand) and signal detect and actuation module • Faulty parking lamp (left-hand) • Defective signal detect and actuation module

522004-4: Right standing light - Insufficient voltage or short circuit to ground

Generation condition	• Output current to parking lamp (right-hand) rises to range of 0.5 to 1.0 A or higher.
Recoverability	• System recovers when output current to parking lamp (right-hand) falls within range of 0.5 to 1.0 A or lower.
Control effected by electronic control unit	• Output to parking lamp (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between parking lamp (right-hand) and signal detect and actuation module • Faulty parking lamp (right-hand) • Defective signal detect and actuation module

#985 INSPECTION OF SIGNAL DETECT AND ACTUATION MODULES

522004-5: Right standing light - The current strength is too low or there is an open circuit.

Generation condition	• Output current to parking lamp (right-hand) falls to range of 0.1 to 0.3 A or lower.
Recoverability	• System recovers when output current to parking lamp (right-hand) rises to range of 0.1 to 0.3 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between parking lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between parking lamp (right-hand) and signal detect and actuation module • Faulty parking lamp (right-hand) • Defective signal detect and actuation module

522005-4: Left tail lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to tail lamp (left-hand) rises to range of 1.3 to 2.4 A or higher.
Recoverability	• System recovers when output current to tail lamp (left-hand) falls within range of 1.3 to 2.4 A or lower.
Control effected by electronic control unit	• Output to tail lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between tail lamp (left-hand) and signal detect and actuation module • Faulty tail lamp (left-hand) • Defective signal detect and actuation module

522005-5: Left tail lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to tail lamp (left-hand) falls to range of 0.1 to 0.3 A or lower.
Recoverability	• System recovers when output current to tail lamp (left-hand) rises to range of 0.1 to 0.3 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between tail lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between tail lamp (left-hand) and signal detect and actuation module • Faulty tail lamp (left-hand) • Defective signal detect and actuation module

522006-4: Right tail lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to tail lamp (right-hand) rises to range of 1.3 to 2.2 A or higher.
Recoverability	• System recovers when output current to tail lamp (right-hand) falls within range of 1.3 to 2.2 A or lower.
Control effected by electronic control unit	• Output to tail lamp (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between tail lamp (right-hand) and signal detect and actuation module • Faulty tail lamp (right-hand) • Defective signal detect and actuation module

522006-5: Right tail lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to tail lamp (right-hand) falls to range of 0.0 to 0.3 A or lower.
Recoverability	• System recovers when output current to tail lamp (right-hand) rises to range of 0.0 to 0.3 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between tail lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between tail lamp (right-hand) and signal detect and actuation module • Faulty tail lamp (right-hand) • Defective signal detect and actuation module

522007-4: Left rear turn signal lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to rear turn signal lamp (left-hand) rises to range of 2.3 to 3.7 A or higher.
Recoverability	• System recovers when output current to rear turn signal lamp (left-hand) falls within range of 2.3 to 3.7 A or lower.
Control effected by electronic control unit	• Output to rear turn signal lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between rear turn signal lamp (left-hand) and signal detect and actuation module • Faulty rear turn signal lamp (left-hand) • Defective signal detect and actuation module

522007-5: Left rear turn signal lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to rear turn signal lamp (left-hand) falls to range of 0.5 to 1.1 A or lower. <In case of LED> • Output current to rear turn signal lamp (left/right-hand) falls to range of 0.007 to 0.03 A or lower.
Recoverability	• System recovers when output current to rear turn signal lamp (left-hand) rises to range of 0.5 to 1.1 A or higher. <In case of LED> • System recovers when output current to rear turn signal lamp (left/right-hand) rises to range of 0.007 to 0.03 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between rear turn signal lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between rear turn signal lamp (left-hand) and signal detect and actuation module • Faulty rear turn signal lamp (left-hand) • Defective signal detect and actuation module

522008-4: Right rear turn signal lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to rear turn signal lamp (right-hand) rises to range of 2.3 to 3.7 A or higher.
Recoverability	• System recovers when output current to rear turn signal lamp (right-hand) falls within range of 2.3 to 3.7 A or lower.
Control effected by electronic control unit	• Output to rear turn signal lamp (right-hand) is stopped
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between rear turn signal lamp (right-hand) and signal detect and actuation module • Faulty rear turn signal lamp (right-hand) • Defective signal detect and actuation module

522008-5: Right rear turn signal lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to rear turn signal lamp (right-hand) falls to range of 0.5 to 1.1 A or lower. <In case of LED> • Output current to rear turn signal lamp (left/right-hand) falls to range of 0.007 to 0.03 A or lower.
Recoverability	• System recovers when output current to rear turn signal lamp (right-hand) rises to range of 0.5 to 1.1 A or higher. <In case of LED> • System recovers when output current to rear turn signal lamp (left/right-hand) rises to range of 0.007 to 0.03 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between rear turn signal lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between rear turn signal lamp (right-hand) and signal detect and actuation module • Faulty rear turn signal lamp (right-hand) • Defective signal detect and actuation module

#985 INSPECTION OF SIGNAL DETECT AND ACTUATION MODULES

522009-4: Left turn signal lamp (front and side) - Insufficient voltage or short circuit to ground

Generation condition	• Output current to front side turn signal lamp (left-hand) rises to range of 2.3 to 3.7 A or higher.
Recoverability	• System recovers when output current to front side turn signal lamp (left-hand) falls within range of 2.3 to 3.7 A or lower.
Control effected by electronic control unit	• Output to front side turn signal lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between front side turn signal lamp (left-hand) and signal detect and actuation module • Faulty front side turn signal lamp (left-hand) • Defective signal detect and actuation module

522009-5: Left turn signal lamp (front and side) - The current strength is too low or there is an open circuit.

Generation condition	• Output current to front side turn signal lamp (left-hand) falls to range of 0.5 to 1.1 A or lower.
Recoverability	• System recovers when output current to front side turn signal lamp (left-hand) rises to range of 0.5 to 1.1 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between front side turn signal lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between front side turn signal lamp (left-hand) and signal detect and actuation module • Faulty front side turn signal lamp (left-hand) • Defective signal detect and actuation module

522010-4: Right turn signal lamp (front and side) - Insufficient voltage or short circuit to ground

Generation condition	• Output current to front side turn signal lamp (right-hand) rises to range of 2.3 to 3.9 A or higher.
Recoverability	• System recovers when output current to front side turn signal lamp (right-hand) falls within range of 2.3 to 3.9 A or lower.
Control effected by electronic control unit	• Output to front side turn signal lamp (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between front side turn signal lamp (right-hand) and signal detect and actuation module • Faulty front side turn signal lamp (right-hand) • Defective signal detect and actuation module

522010-5: Right turn signal lamp (front and side) - The current strength is too low or there is an open circuit.

Generation condition	• Output current to front side turn signal lamp (right-hand) falls to range of 0.5 to 1.1 A or lower.
Recoverability	• System recovers when output current to front side turn signal lamp (right-hand) rises to range of 0.5 to 1.1 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between front side turn signal lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between front side turn signal lamp (right-hand) and signal detect and actuation module • Faulty front side turn signal lamp (right-hand) • Defective signal detect and actuation module

522011-4: Right front fog lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to fog lamp (right-hand) rises to range of 6.0 to 10.9 A or higher.
Recoverability	• System recovers when output current to fog lamp (right-hand) falls within range of 6.0 to 10.9 A or lower.
Control effected by electronic control unit	• Output to fog lamp (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between fog lamp (right-hand) and signal detect and actuation module • Faulty fog lamp (right-hand) • Defective signal detect and actuation module

522011-5: Right front fog lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to fog lamp (right-hand) falls to range of 0.8 to 2.9 A or lower.
Recoverability	• System recovers when output current to fog lamp (right-hand) rises to range of 0.8 to 2.9 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between fog lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between fog lamp (right-hand) and signal detect and actuation module • Faulty fog lamp (right-hand) • Defective signal detect and actuation module

522014-4: Left exit lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to step lamp (left-hand) rises to range of 0.5 to 0.9 A or higher.
Recoverability	• System recovers when output current to step lamp (left-hand) falls within range of 0.5 to 0.9 A or lower.
Control effected by electronic control unit	• Output to step lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between step lamp (left-hand) and signal detect and actuation module • Faulty step lamp (left-hand) • Defective signal detect and actuation module

522014-5: Left exit lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to step lamp (left-hand) falls to range of 0.1 to 0.3 A or lower.
Recoverability	• System recovers when output current to step lamp (left-hand) rises to range of 0.1 to 0.3 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between step lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between step lamp (left-hand) and signal detect and actuation module • Faulty step lamp (left-hand) • Defective signal detect and actuation module

522015-4: Right exit lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to step lamp (right-hand) rises to range of 0.5 to 0.9 A or higher.
Recoverability	• System recovers when output current to step lamp (right-hand) falls within range of 0.5 to 0.9 A or lower.
Control effected by electronic control unit	• Output to step lamp (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between step lamp (right-hand) and signal detect and actuation module • Faulty step lamp (right-hand) • Defective signal detect and actuation module

522015-5: Right exit lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to step lamp (right-hand) falls to range of 0.1 to 0.3 A or lower.
Recoverability	• System recovers when output current to step lamp (right-hand) rises to range of 0.1 to 0.3 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between step lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between step lamp (right-hand) and signal detect and actuation module • Faulty step lamp (right-hand) • Defective signal detect and actuation module

#985 INSPECTION OF SIGNAL DETECT AND ACTUATION MODULES

522016-4: Cabin button illumination - Insufficient voltage or short circuit to ground

Generation condition	• Output current to illumination lamp rises to range of 3.9 to 6.7 A or higher.
Recoverability	• System recovers when output current to illumination lamp falls within range of 3.9 to 6.7 A or lower.
Control effected by electronic control unit	• Output to illumination lamp is stopped.
Possible causes	• Short-circuit to ground in harness between battery and signal detect and actuation module • Malfunction of battery • Faulty alternator • Defective signal detect and actuation module

522017-4: Washer motor - Insufficient voltage or short circuit to ground

Generation condition	• Output current to washer motor rises to range of 4.9 to 8.9 A or higher.
Recoverability	• System recovers when output current to washer motor falls within range of 4.9 to 8.9 A or lower.
Control effected by electronic control unit	• Output to washer motor is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between washer motor and signal detect and actuation module • Faulty washer motor • Defective signal detect and actuation module

522017-5: Washer motor - The current strength is too low or there is an open circuit.

Generation condition	• Output current to washer motor falls to range of 0.4 to 1.7 A or lower.
Recoverability	• System recovers when output current to washer motor rises to range of 0.4 to 1.7 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between washer motor and signal detect and actuation module • Open-circuit in Plus harness between washer motor and signal detect and actuation module • Faulty washer motor • Defective signal detect and actuation module

522020-4: Left license plate lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to license plate lamp (left-hand) rises to range of 1.1 to 1.8 A or higher.
Recoverability	• System recovers when output current to license plate lamp (left-hand) falls within range of 1.1 to 1.8 A or lower.
Control effected by electronic control unit	• Output to license plate lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between license plate lamp (left-hand) and signal detect and actuation module • Faulty license plate lamp (left-hand) • Defective signal detect and actuation module

522020-5: Left license plate lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to license plate lamp (left-hand) falls to range of 0.1 to 0.3 A or lower.
Recoverability	• System recovers when output current to license plate lamp (left-hand) rises to range of 0.1 to 0.3 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between license plate lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between license plate lamp (left-hand) and signal detect and actuation module • Faulty license plate lamp (left-hand) • Defective signal detect and actuation module

522022-4: Left front fog lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to fog lamp (left-hand) rises to range of 6.0 to 10.9 A or higher.
Recoverability	• System recovers when output current to fog lamp (left-hand) falls within range of 6.0 to 10.9 A or lower.
Control effected by electronic control unit	• Output to fog lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between fog lamp (left-hand) and signal detect and actuation module • Faulty fog lamp (left-hand) • Defective signal detect and actuation module

522022-5: Left front fog lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to fog lamp (left-hand) falls to range of 0.8 to 2.9 A or lower.
Recoverability	• System recovers when output current to fog lamp (left-hand) rises to range of 0.8 to 2.9 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between fog lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between fog lamp (left-hand) and signal detect and actuation module • Faulty fog lamp (left-hand) • Defective signal detect and actuation module

522026-4: Left mirror heater - Insufficient voltage or short circuit to ground

Generation condition	• Output current to mirror heater (passenger side) rises to range of 7.7 to 13.5 A or higher.
Recoverability	• System recovers when output current to mirror heater (left-hand) falls within range of 7.7 to 13.5 A or lower.
Control effected by electronic control unit	• Output to mirror heater (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between mirror heater (left-hand) and signal detect and actuation module • Faulty mirror heater (left-hand) • Defective signal detect and actuation module

522027-3: Interior lamp - Excessive voltage or short circuit to positive

Generation condition	• Output current to room lamp rises to range of 6.0 to 12.0 A or higher.
Recoverability	• System recovers when output current to room lamp falls within range of 6.0 to 12.0 A or lower.
Control effected by electronic control unit	• Output to room lamp is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between room lamp and signal detect and actuation module • Faulty room lamp • Defective signal detect and actuation module

522028-4: Mirror heater Switches - Insufficient voltage or short circuit to ground

Generation condition	• Output current to mirror heater switch (illuminated) rises to range of 0.4 to 0.9 A or higher.
Recoverability	• System recovers when output current to mirror heater switch (illuminated) falls within range of 0.4 to 0.9 A or lower.
Control effected by electronic control unit	• Output to mirror heater switch (illuminated) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between mirror heater switch (illuminated) and signal detect and actuation module • Faulty mirror heater switch (illuminated) • Defective signal detect and actuation module

#985 INSPECTION OF SIGNAL DETECT AND ACTUATION MODULES

522030-4: Backup buzzer - Insufficient voltage or short circuit to ground

Generation condition	• Chip internal temperature rises abnormally high due to overcurrent generated by full or partial short-circuit to ground.
Recoverability	• System recovers when normal current flow is detected.
Control effected by electronic control unit	• Output to back buzzer is stopped.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between back buzzer and signal detect and actuation module • Open-circuit in Plus harness between back buzzer and signal detect and actuation module • Faulty back buzzer • Defective signal detect and actuation module

522032-4: Connected electrical equipment - Insufficient voltage or short circuit to ground

Generation condition	• Output current to option connector (transmission power take-off output) rises to range of 0.4 to 0.9 A or higher.
Recoverability	• System recovers when output current to option connector (transmission power take-off output) falls within range of 0.4 to 0.9 A or lower.
Control effected by electronic control unit	• Output to option connector (transmission power take-off output) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between option connector (transmission power take-off output) and signal detect and actuation module • Faulty option connector (transmission power take-off output) • Defective signal detect and actuation module

522033-4: Connected electrical equipment - Insufficient voltage or short circuit to ground

Generation condition	• Output current to option connector (transmission neutral switch signal) rises to range of 0.4 to 0.9 A or higher.
Recoverability	• System recovers when output current to option connector (transmission neutral switch signal) falls within range of 0.4 to 0.9 A or lower.
Control effected by electronic control unit	• Output to option connector (transmission neutral switch signal) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between option connector (transmission neutral switch signal) and signal detect and actuation module • Faulty option connector (transmission neutral switch signal) • Defective signal detect and actuation module

522034-4: Connected electrical equipment - Insufficient voltage or short circuit to ground

Generation condition	• Output current to option connector (parking brake switch signal) rises to range of 0.4 to 0.9 A or higher.
Recoverability	• System recovers when output current to option connector (parking brake switch signal) falls within range of 0.4 to 0.9 A or lower.
Control effected by electronic control unit	• Output to option connector (parking brake switch signal) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between option connector (parking brake switch signal) and signal detect and actuation module • Faulty option connector (parking brake switch signal) • Defective signal detect and actuation module

522038-5: Air conditioner blower - The current strength is too low or there is an open circuit.

Generation condition	• A/C blower relay in signal detect and actuation module is malfunctioning.
Recoverability	• System recovers when A/C blower relay in signal detect and actuation module resumes normal control.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective signal detect and actuation module (faulty A/C blower relay)

522039-5: Accessory 12V/24V relay - The current strength is too low or there is an open circuit.

Generation condition	• A/C relay in signal detect and actuation module is malfunctioning.
Recoverability	• System recovers when A/C relay in signal detect and actuation module resumes normal control.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective signal detect and actuation module (faulty A/C relay)

522040-5: Ignition relay - The current strength is too low or there is an open circuit.

Generation condition	• IGN relay in signal detect and actuation module is malfunctioning.
Recoverability	• System recovers when IGN relay in signal detect and actuation module resumes normal control.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective signal detect and actuation module (faulty IGN relay)

522041-5: Accessory relay - The current strength is too low or there is an open circuit.

Generation condition	• ACC relay in signal detect and actuation module is malfunctioning.
Recoverability	• System recovers when ACC relay in signal detect and actuation module resumes normal control.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective signal detect and actuation module (faulty ACC relay)

522042-5: Ignition 12V/24V relay - The current strength is too low or there is an open circuit.

Generation condition	• IGN relay (option) in signal detect and actuation module is malfunctioning.
Recoverability	• System recovers when IGN relay (option) in signal detect and actuation module resumes normal control.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective signal detect and actuation module (faulty IGN relay)

522043-5: Air conditioner compressor relay - The current strength is too low or there is an open circuit.

Generation condition	• A/C compressor/condenser relay in signal detect and actuation module is malfunctioning.
Recoverability	• System recovers when A/C compressor/condenser relay in signal detect and actuation module resumes normal control.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective signal detect and actuation module (faulty A/C compressor/condenser relay)

522064-25: Transmission current gear signal - Received network data is in error.

Generation condition	• Controller area network communication data (gear information) from DUONIC™ electronic control unit are abnormal.
Recoverability	• System recovers when normal controller area network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Controller area network line is open or shorted to power, ground or another circuit. • Faulty DUONIC™ electronic control unit • Defective signal detect and actuation module

522067-25: Main light switch request signal - Received network data is in error.

Generation condition	• Local interconnect network communication data (headlight and markers information) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522069-25: High beam switch request signal - Received network data is in error.

Generation condition	• Local interconnect network communication data (high beam switch information) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522070-25: High beam flash switch request signal - Received network data is in error.

Generation condition	• Local interconnect network communication data (high beam flash switch information) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522071-25: Transmission current gear signal - Received network data is in error.

Generation condition	• Controller area network communication data from DUONIC™ electronic control unit are abnormal.
Recoverability	• System recovers when normal controller area network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Controller area network line is open or shorted to power, ground or another circuit. • Faulty DUONIC™ electronic control unit • Defective signal detect and actuation module

522074-25: Combustion engine Control unit - Received network data is in error.

Generation condition	• Controller area network communication data from engine electronic control unit are abnormal.
Recoverability	• System recovers when normal controller area network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Controller area network line is open or shorted to power, ground or another circuit. • Defective engine electronic control unit • Defective signal detect and actuation module

522075-25: Combustion engine Control unit - Received network data is in error.

Generation condition	• Controller area network communication data from engine electronic control unit are abnormal.
Recoverability	• System recovers when normal controller area network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Controller area network line is open or shorted to power, ground or another circuit. • Defective engine electronic control unit • Defective signal detect and actuation module

522076-25: Combustion engine Control unit - Received network data is in error.

Generation condition	• Controller area network communication data from engine electronic control unit are abnormal.
Recoverability	• System recovers when normal controller area network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Controller area network line is open or shorted to power, ground or another circuit. • Defective engine electronic control unit • Defective signal detect and actuation module

522077-25: Combination switch - Received network data is in error.

Generation condition	• Local interconnect network communication data (lighting information) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Headlamps and Marker Lights automatically turns on when IGN=ON.
Possible causes	• Local interconnect network line is open or shorted to power, ground or another circuit. • Defective combination switch • Defective signal detect and actuation module

522078-25: Combination switch - Received network data is in error.

Generation condition	• Local interconnect network communication data (wiper information) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Wiper slow mode automatically turns on when IGN=ON.
Possible causes	• Local interconnect network line is open or shorted to power, ground or another circuit. • Defective combination switch • Defective signal detect and actuation module

522079-25: Selector lever - Received network data is in error.

Generation condition	• Local interconnect network communication data from gear shift lever unit are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Local interconnect network line is open or shorted to power, ground or another circuit. • Faulty gear shift lever unit • Defective signal detect and actuation module

#985 INSPECTION OF SIGNAL DETECT AND ACTUATION MODULES

522080-25: Keyless entry unit - Received network data is in error.

Generation condition	• Local interconnect network communication data from keyless entry electronic control unit are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Local interconnect network line is open or shorted to power, ground or another circuit. • Faulty keyless entry electronic control unit • Defective signal detect and actuation module

522081-25: Right power window Switches - Received network data is in error.

Generation condition	• Local interconnect network communication data from power window switch driver side are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Local interconnect network line is open or shorted to power, ground or another circuit. • Faulty power window switch right-hand • Defective signal detect and actuation module

522082-25: Left power window Switches - Received network data is in error.

Generation condition	• Local interconnect network communication data from power window switch passenger side are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Local interconnect network line is open or shorted to power, ground or another circuit. • Faulty power window switch left-hand • Defective signal detect and actuation module

522097-2: Starter Switches - Data erratic, intermittent or incorrect

Generation condition	• Starter key position disagrees with starter switch signal (the key is OFF but the signal is ACC); there is a trouble in starter switch internal circuit. • Starter key position corresponds with starter switch signal (both are ACC); there is a trouble in key reminder switch (stuck at OFF position).
Recoverability	• System recovers when normal signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Faulty key reminder switch (sticking in OFF position or open-circuit) • Open-circuit in harness between key reminder switch and signal detect and actuation module • Short-circuit in harness between signal detect and actuation module and starter switch • Faulty starter switch • Defective signal detect and actuation module

522098-2: Starter Switches - Data erratic, intermittent or incorrect

Generation condition	• Starter key position disagrees with starter switch signal (the key is OFF or ACC but the signal is ON); there is a trouble in starter switch internal circuit. • Starter key position corresponds with starter switch signal (both are ON); there is a trouble in key reminder switch (stuck at OFF position).
Recoverability	• System recovers when normal signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Faulty key reminder switch (sticking in OFF position or open-circuit) • Open-circuit in harness between key reminder switch and signal detect and actuation module • Short-circuit in harness between signal detect and actuation module and starter switch • Faulty starter switch • Defective signal detect and actuation module

522099-2: Starter Switches - Data erratic, intermittent or incorrect

Generation condition	• Starter key position disagrees with starter switch signal (the key is OFF, ACC or ON but the signal is ON); there is a trouble in starter switch internal circuit. • Starter key position corresponds with starter switch signal (both are ON); there is a trouble in key reminder switch (stuck at OFF position).
Recoverability	• System recovers when normal signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Faulty key reminder switch (sticking in OFF position or open-circuit) • Open-circuit in harness between key reminder switch and signal detect and actuation module • Short-circuit in harness between signal detect and actuation module and starter switch • Faulty starter switch • Defective signal detect and actuation module

522112-3: The battery voltage is too high. - Excessive voltage or short circuit to positive

Generation condition	• Battery voltage (12 V) is too high.
Recoverability	• System recovers when normal voltage is applied.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Faulty alternator • Defective signal detect and actuation module

522112-4: The battery voltage is too low. - Insufficient voltage or short circuit to ground

Generation condition	• Battery voltage (12 V) is too low.
Recoverability	• System recovers when normal voltage is applied.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to ground in harness between battery and signal detect and actuation module • Faulty alternator • Defective signal detect and actuation module

522113-25: Combination switch - Received network data is in error.

Generation condition	• Local interconnect network communication data (lighting information) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Headlamps and Marker Lights automatically turns on when IGN=ON.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

#985 INSPECTION OF SIGNAL DETECT AND ACTUATION MODULES

522114-25: Combination switch - Received network data is in error.

Generation condition	• Local interconnect network communication data from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522115-25: Right power window Switches - Received network data is in error.

Generation condition	• Local interconnect network communication data from power window switch driver side are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty power window switch right-hand • Defective signal detect and actuation module

522116-25: Left power window Switches - Received network data is in error.

Generation condition	• Local interconnect network communication data from power window switch passenger side are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty power window switch left-hand • Defective signal detect and actuation module

522117-25: Keyless entry unit - Received network data is in error.

Generation condition	• Local interconnect network communication data from keyless entry unit are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty keyless entry unit • Defective signal detect and actuation module

522118-25: Selector lever - Received network data is in error.

Generation condition	• Local interconnect network communication data from gear shift lever unit are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty gear shift lever unit • Defective signal detect and actuation module

522133-17: Power take-off is not connected when the Power take-off Switches are turned ON. - Occurring

Generation condition	• Power take-off control switch does not turn ON even in 5 seconds after transmission power take-off switch is turned ON.
Recoverability	• System recovers when normal signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit in SIG harness between transmission power take-off 3-way magnetic valve and signal detect and actuation module • Open-circuit in Plus harness between transmission power take-off 3-way magnetic valve and signal detect and actuation module • Faulty transmission power take-off 3-way magnetic valve • Defective signal detect and actuation module

522134-17: Power take-off is not disconnected when the Power take-off Switches are turned OFF. - Occurring

Generation condition	• Transmission power take-off switch (cabin switch) does not turn OFF even in 5 seconds after power take-off control switch (chassis switch) is turned OFF.
Recoverability	• System recovers when normal signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Short-circuit to power or ground in SIG harness between transmission power take-off 3-way magnetic valve and signal detect and actuation module • Faulty transmission power take-off 3-way magnetic valve • Defective signal detect and actuation module

522135-17: Power take-off was disconnected when the Transmission power take-off 3-way magnetic valve was ON. - Occurring

Generation condition	• Power take-off control switch turns OFF before transmission power take-off switch is turned OFF with transmission power take-off 3-way magnetic valve ON.
Recoverability	• System recovers when normal signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit in SIG harness between power take-off control switch and signal detect and actuation module • Open-circuit in Plus harness between power take-off control switch and signal detect and actuation module • Faulty power take-off control switch • Defective signal detect and actuation module

522136-17: Power take-off was connected when Transmission power take-off 3-way magnetic valve was OFF. - Occurring

Generation condition	• Power take-off control switch turns ON before transmission power take-off switch is turned ON with transmission power take-off 3-way magnetic valve OFF.
Recoverability	• System recovers when normal signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between power take-off control switch and signal detect and actuation module • Faulty power take-off control switch • Defective signal detect and actuation module

522138-25: Combination switch - Received network data is in error.

Generation condition	• Local interconnect network communication data (turn signal left-hand) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522139-25: Combination switch - Received network data is in error.

Generation condition	• Local interconnect network communication data (turn signal right-hand) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522140-25: Combination switch - Received network data is in error.

Generation condition	• Local interconnect network communication data (wiper signal) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Wiper slow mode automatically turns on when IGN=ON.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522141-25: Combination switch - Received network data is in error.

Generation condition	• Local interconnect network communication data (interval wiper signal) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522142-4: Wiper motor - Insufficient voltage or short circuit to ground

Generation condition	• Voltage output to wiper motor is abnormal.
Recoverability	• System recovers when normal voltage is applied.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Short-circuit to ground in SIG harness between wiper motor and signal detect and actuation module • Faulty wiper motor • Defective signal detect and actuation module

522143-5: Wiper motor - The current strength is too low or there is an open circuit.

Generation condition	• Current output to wiper motor is abnormal.
Recoverability	• System recovers when normal current is applied.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit in SIG harness between wiper motor and signal detect and actuation module • Open-circuit in Plus harness between wiper motor and signal detect and actuation module • Faulty wiper motor • Defective signal detect and actuation module

522144-3: Wiper motor - Excessive voltage or short circuit to positive

Generation condition	• Voltage input from wiper motor is abnormal.
Recoverability	• System recovers when normal voltage is applied.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Short-circuit to power in SIG harness between wiper motor and signal detect and actuation module • Faulty wiper motor • Defective signal detect and actuation module

522147-4: Key interlock solenoid - Insufficient voltage or short circuit to ground

Generation condition	• Output current to key interlock solenoid rises to range of 4.2 to 7.4 A or higher.
Recoverability	• System recovers when output current to key interlock solenoid falls within range of 4.2 to 7.4 A or lower.
Control effected by electronic control unit	• Output to key interlock solenoid is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between key interlock solenoid and signal detect and actuation module • Faulty key interlock solenoid • Defective signal detect and actuation module

522148-17: Faulty part CPU inside component "SAM" - Occurring

Generation condition	• Watch dog of signal detect and actuation module generation condition is detected and resetting takes place.
Recoverability	• Watch dog of signal detect and actuation module generation condition is cleared after resetting.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective CPU of signal detect and actuation module • Defective software of signal detect and actuation module

522149-17: Faulty part Memory inside component "SAM" - Occurring

Generation condition	• Checksum of signal detect and actuation module calculated at data rewriting is not correct.
Recoverability	• Checksum of signal detect and actuation module calculated at data rewriting becomes correct.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Abnormality of signal detect and actuation module

522150-17: Faulty component "SAM" - Occurring

Generation condition	• Memory unit is in an abnormal condition.
Recoverability	• Normal operations of memory unit are resumed after restarting.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective software of signal detect and actuation module

3. FUSO Diagnostics Service Data (Measured Values)

• Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.

Current Value Group	Description	Value	Explanation
Lighting: Outputs	Left license plate lamp	ON/OFF	Shows the state of voltage supply to the license plate lamp. ON: 12 V OFF: 0 V
	Right daytime running light	ON/OFF	Shows the state of voltage supply to the daytime running light (RH). ON: 12 V OFF: 0 V
	Left daytime running light	ON/OFF	Shows the state of voltage supply to the daytime running light (LH). ON: 12 V OFF: 0 V
	Clearance lamp RIGHT	ON/OFF	Shows the state of voltage supply to the parking lamp (RH). ON: 12 V OFF: 0 V
	Clearance lamp LEFT	ON/OFF	Shows the state of voltage supply to the parking lamp (LH). ON: 12 V OFF: 0 V
	Right high beam	ON/OFF	Shows the state of voltage supply to the headlamp high beam (RH). ON: 12 V OFF: 0 V

Current Value Group	Description	Value	Explanation
Lighting: Outputs	Left high beam	ON/OFF	Shows the state of voltage supply to the headlamp high beam (LH). ON: 12 V OFF: 0 V
	Right turn signal on trailer	ON/OFF	Shows the state of voltage supply to the option connector (right turn signal on trailer). ON: 12 V OFF: 0 V
	Left turn signal on trailer	ON/OFF	Shows the state of voltage supply to the option connector (left turn signal on trailer). ON: 12 V OFF: 0 V
	Right turn signal REAR	ON/OFF	Shows the state of voltage supply to the rear turn signal lamp (RH). ON: 12 V OFF: 0 V
	Left turn signal REAR	ON/OFF	Shows the state of voltage supply to the rear turn signal lamp (LH). ON: 12 V OFF: 0 V
	Right turn signal	ON/OFF	Shows the state of voltage supply to the front turn signal lamp (RH). ON: 12 V OFF: 0 V
	Left turn signal	ON/OFF	Shows the state of voltage supply to the front turn signal lamp (LH). ON: 12 V OFF: 0 V
	Right front fog lamp	ON/OFF	Shows the state of voltage supply to front fog lamp (RH). ON: 12 V OFF: 0 V
	Left front fog lamp	ON/OFF	Shows the state of voltage supply to front fog lamp (LH). ON: 12 V OFF: 0 V
	Right rear brake light	ON/OFF	Shows the state of voltage supply to the stop lamp (LH). ON: 12 V OFF: 0 V
	Left rear brake light	ON/OFF	Shows the state of voltage supply to the stop lamp (RH). ON: 12 V OFF: 0 V
	Right tail lamp	ON/OFF	Shows the state of voltage supply to the tail lamp (RH). ON: 12 V OFF: 0 V
	Left tail lamp	ON/OFF	Shows the state of voltage supply to the tail lamp (LH). ON: 12 V OFF: 0 V
	Left exit lamp	ON/OFF	Shows the state of voltage supply to the step lamp (LH). ON: 12 V OFF: 0 V
	Right exit lamp	ON/OFF	Shows the state of voltage supply to the step lamp (RH). ON: 12 V OFF: 0 V
	Switch and controls illumination	ON/OFF	Shows the state of voltage supply to the illumination lamp. ON: 12 V OFF: 0 V

#985 INSPECTION OF SIGNAL DETECT AND ACTUATION MODULES

Current Value Group	Description	Value	Explanation
Lighting: Outputs	Body illumination	ON/OFF	Shows the state of voltage supply to the option connector (body illumination). ON: 12 V OFF: 0 V
	Chassis illumination	ON/OFF	Shows the state of voltage supply to the option connector (chassis illumination). ON: 12 V OFF: 0 V
Wipe and wash: Outputs	Windshield wiper Stage ON	ON/OFF	Shows the state of voltage supply to the wiper motor (Lo). ON: 12 V OFF: 0 V
	Windshield wiper Stage HIGH	ON/OFF	Shows the state of voltage supply to the wiper motor (Hi). ON: 12 V OFF: 0 V
Output 'Pump of windshield washer system'	Windshield washer system	ON/OFF	Shows the state of voltage supply to the wiper washer motor. ON: 12 V OFF: 0 V
Door module: Outputs	Mirror heater Switches	ON/OFF	Shows the state of voltage supply to the mirror heater switch illumination. ON: 12 V OFF: 0 V
	Right mirror heater	ON/OFF	Shows the state of voltage supply to the mirror heater (LH). ON: 12 V OFF: 0 V
	Left mirror heater	ON/OFF	Shows the state of voltage supply to the mirror heater (RH). ON: 12 V OFF: 0 V
Ignition: Outputs	Starter signal Relays (ACC)	ON/OFF	Shows the state of voltage supply to the accessory relay connected equipment. • Gearshift lever unit relay • ETC accessory • Audio accessory • DUONIC™ accessory • Cigarette lighter accessory • Power mirror accessory ON: 12 V OFF: 0 V
	Option relay (ACC)	ON/OFF	Shows the state of voltage supply to the accessory relay (option) connected equipment. • Option connector (accessory body) • Option connector (accessory chassis) ON: 12 V OFF: 0 V
	Starter signal Relays (IGN)	ON/OFF	Shows the state of voltage supply to the ignition relay connected equipment. • Meter cluster (M power supply) • Anti-skid brake system electronic control unit (M power supply) • Engine electronic control unit (M power supply) • DUONIC™ electronic control unit (M power supply 1) • DUONIC™ electronic control unit (M power supply 2) • Gearshift lever unit (M power supply 1) • Gearshift lever unit (M power supply 2) • Starter relay ON: 12 V OFF: 0 V

Current Value Group	Description	Value	Explanation
Ignition: Outputs	Option relay (IGN)	ON/OFF	Shows the state of voltage supply to the ignition relay (option) connected equipment. • Option connector (M power supply, body) • Option connector (M power supply, chassis) • Alternator (R terminal) ON: 12 V OFF: 0 V
Air conditioning: Outputs	Refrigerant compressor Relays	ON/OFF	Shows the state of voltage supply to the air conditioner compressor condenser relay connected equipment. • Dual pressure switch • Condenser fan relay ON: 12 V OFF: 0 V
	Blower motor Relays	ON/OFF	Shows the state of voltage supply to the air conditioner blower relay connected equipment. • Blower fan relay ON: 12 V OFF: 0 V
Brake system: Outputs	Parking brake Switches Release	ON/OFF	Shows the state of voltage supply to the option connector (parking brake cut). ON: 12 V OFF: 0 V
Transmission: Outputs	Transmission neutral position switch	ON/OFF	Shows the state of voltage supply to the neutral position switch. ON: 12 V OFF: 0 V
	Transmission backup light Switches	ON/OFF	Shows the state of voltage supply to the backup lamp switch. ON: 12 V OFF: 0 V
	Backup buzzer	ON/OFF	Shows the state of voltage supply to the backup buzzer. ON: 12 V OFF: 0 V
Status of power take-off: Outputs	Transmission power take-off 3-way magnetic valve	ON/OFF	Shows the state of voltage supply to the power-take off magnetic valve. ON: 12 V OFF: 0 V
	Power take-off outputs	ON/OFF	Shows the state of voltage supply to the option connector (power-take off magnetic valve). ON: 12 V OFF: 0 V
PWM	Interior lamp Door OPEN	0 to 100%	Shows the state of supply voltage to the cab lamp. Driving duty cycle: 0 to 100%
	Left low beam	0 to 100%	Shows the state of supply voltage to the headlamp low beam (LH). Driving duty cycle: 0 to 100%
	Right low beam	0 to 100%	Shows the state of supply voltage to the headlamp low beam (RH). Driving duty cycle: 0 to 100%
	Key interlock solenoid	0 to 100%	Shows the state of supply voltage to the key interlock solenoid. Driving duty cycle: 0 to 100%
Lighting: Inputs	Front fog lamp Switches	ON/OFF	Shows the ON/OFF state of the front fog lamp switch. OFF: 12 V ON: 0 V (unlatched)
	Hazard warning flasher Switches	ON/OFF	Shows the ON/OFF state of the hazard switch. OFF: 12 V ON: 0 V (unlatched)

#985 INSPECTION OF SIGNAL DETECT AND ACTUATION MODULES

Current Value Group	Description	Value	Explanation
Wipe and wash: Inputs	Windshield wiper Switch 'Rest position'	ON/OFF	Shows the ON/OFF state of the automatic stop position of the wiper motor. OFF: 12 V ON: 0 V
Door module: Inputs	Mirror heater	ON/OFF	Shows the ON/OFF state of the mirror heater. OFF: 12 V ON: 0 V (unlatched)
	Right rear door / Left rear door	OPEN/ CLOSED	Shows the open/closed state of the rear door.
	Passenger door	OPEN/ CLOSED	Shows the open/closed state of the passenger door.
	Driver door	OPEN/ CLOSED	Shows the open/closed state of the driver door.
	Door Lock Switch OFF	ON/OFF	Shows the ON/OFF state of the door lock switch.
	Door Lock Switch ON	ON/OFF	Shows the ON/OFF state of the door lock switch.
Ignition: Inputs	Starter Switches (START)	ON/OFF	Shows the ON/OFF state of the starter switch (START position). OFF: 0 V ON: 12 V
	Starter Switches (LOCK)	ON/OFF	Shows the ON/OFF state of the starter insert switch. OFF: 0 V ON: 12 V
	Starter Switches (ACC)	ON/OFF	Shows the ON/OFF state of the starter switch (ACC position). OFF: 0 V ON: 12 V
	Starter Switches (ON)	ON/OFF	Shows the ON/OFF state of the starter switch (M position). OFF: 0 V ON: 12 V
	Alternator	ON/OFF	Shows the state of supply voltage from the alternator (L terminal). ON: 12 V OFF: 0 V
	Starter signal Relays (ACC)	ON/OFF	Shows the operating state of the accessory relay output. ON: 12 V OFF: 0 V
	Option relay (ACC)	ON/OFF	Shows the operating state of the accessory relay (option) output. ON: 12 V OFF: 0 V
	Starter signal Relays (IGN)	ON/OFF	Shows the operating state of the ignition relay output. ON: 12 V OFF: 0 V
	Option relay (IGN)	ON/OFF	Shows the operating state of the ignition relay (option) output. ON: 12 V OFF: 0 V
Air conditioning: Inputs	Air conditioning switch	ON/OFF	Shows the ON/OFF state of the air conditioning switch. OFF: 12 V ON: 0 V
	Refrigerant compressor Relays	ON/OFF	Shows the ON/OFF state of the blower fan. OFF: 0 V ON: 12 V

Current Value Group	Description	Value	Explanation
Air conditioning: Inputs	Blower fan output	ON/OFF	Shows the ON/OFF state of the refrigerant compressor relays. OFF: 0 V ON: 12 V
Brake system: Inputs	Vacuum Switches	ON/OFF	Shows the ON/OFF state of the vacuum switch. OFF: 12 V ON: 0 V
	Brake fluid level Switches	ON/OFF	Shows the ON/OFF state of the brake fluid level switch. OFF: 12 V ON: 0 V
	Parking brake Switches	ON/OFF	Shows the ON/OFF state of the parking brake switch. OFF: 12 V ON: 0 V
	Brake light Switches 2	ON/OFF	Shows the ON/OFF state of the brake switch (normal close). OFF: 12 V ON: 0 V
	Brake light Switches 1	ON/OFF	Shows the ON/OFF state of the brake switch (normal open). OFF: 12 V ON: 0 V
Transmission: Inputs	Backup light Switches	ON/OFF	Shows the ON/OFF state of the backup lamp switch. OFF: 12 V ON: 0 V
	Transmission neutral position switch	ON/OFF	Shows the ON/OFF state of the neutral switch. OFF: 0 V ON: 12 V
	Clutch Switches	ON/OFF	Shows the ON/OFF state of the clutch switch. OFF: 12 V ON: 0 V
Status of power take-off: Inputs	Power take-off Inputs	ON/OFF	Shows the ON/OFF state of the option connector (power take-off control switch). OFF: 0 V ON: 12 V
	Switch for power take-off on body	ON/OFF	Shows the ON/OFF state of the power take-off control switch. OFF: 12 V ON: 0 V
	Switch for power take-off in cab	ON/OFF	Shows the ON/OFF state of the transmission power take-off switch. OFF: 12 V ON: 0 V
Fill level of fuel tank	Fuel level	0	Shows the fuel level in the fuel tank. Fuel tank empty: Approx. 0 Fuel tank full: Approx. 242
Battery voltage	Battery voltage	0	Shows the input voltage from the battery (high-current fuse box) to the SAM (signal detect and actuation modules).

4. Actuator Test (Control) Using FUSO Diagnostics

- Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.
- The basic conditions for performing the actuator test: Vehicle stopped, engine stopped and starter switch ON.

Selection	Explanation
Exterior illumination	Illuminates the stop lamp (LH).
	Illuminates the headlamp high beam (LH).
	Illuminates the parking lamp (LH).
	Illuminates the turn signal lamp (LH).
	Illuminates the stop lamp (RH).
	Illuminates the headlamp high beam (RH).
	Illuminates the parking lamp (RH).
	Illuminates the turn signal lamp (RH).
M7 (Washer motor)	Activates the windshield washer system.
K22 (Starter relay)	Activates the ignition relay. [Additional condition for performing actuator test] Starter switch position: ACC
	Activates the ignition relay (option) [Additional condition for performing actuator test] Starter switch position: ACC
	Activates the accessory relay.
	Activates the accessory relay (option).
Door module	–
Air conditioning	Activates the air conditioner compressor condenser relay.
	Activates the air blower relay.

5. Electronic Control Unit Coding

- The signal detect and actuation module has various kinds of information such as technical data of vehicle and equipment registered as coding data.
- Therefore, each time the signal detect and actuation module is replaced or some setting changes are made, the coding data must surely be rewritten using FUSO Diagnostics. Otherwise, the data stored in the signal detect and actuation module could deviate from the actual conditions of the vehicles, resulting in occurrence of diagnosis codes.

5.1 Rewriting of coding data

- If one of the following changes has been made, be sure to rewrite the relevant coding data. For details of the rewriting procedure, consult an authorized dealer or distributor.
- Depending on the specifications of the rear body to be mounted, coding data other than those listed below may have to be rewritten. For further information, consult an authorized dealer or distributor.

Rewriting coding data required	Standards for rewriting signal detect and actuation module internal data
When signal detect and actuation module is replaced	–
When additional turn signal lamps are installed	–
When rear body is mounted	If an optional connector for rear body mounting is used, the following diagnosis/actuator functions must be set valid: • Illumination • Backup buzzer • Power take-off • Neutral switch • Parking brake switch
When additional LED rear lamps are installed	–
When additional mirror with heater is installed	–

6. Electronic Control Unit Input/Output Table

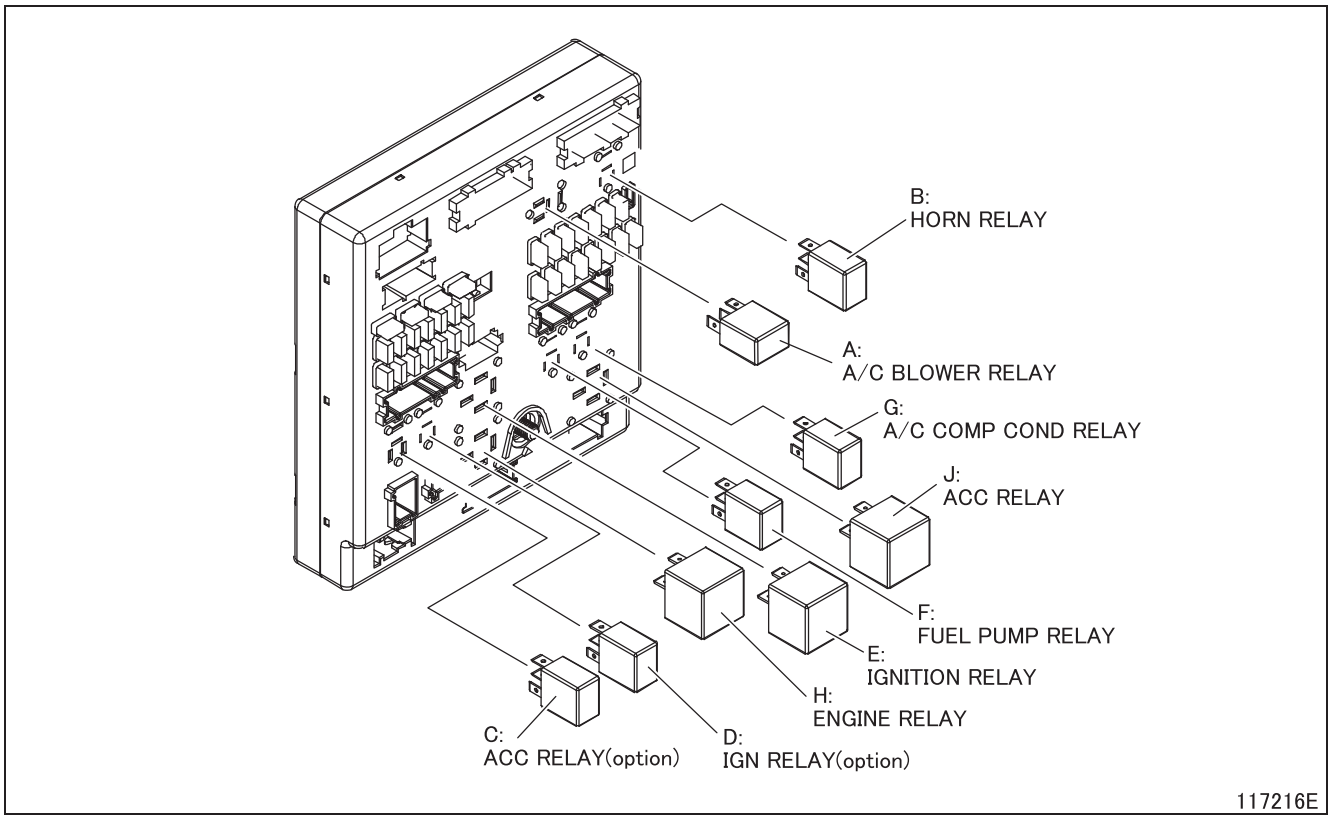
- See the Electronic Control Unit Schematic Diagram for the pin locations of each signal and ground. (See Gr54-00C)

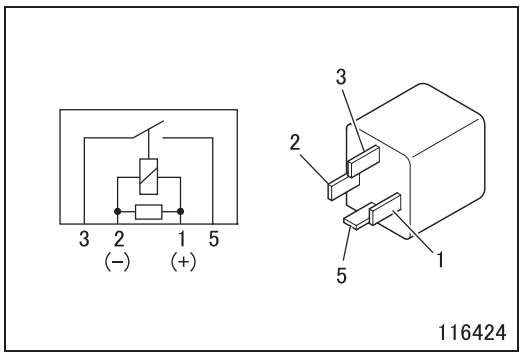
Devices to be connected	Terminal	Input/ output	Voltage and wave form
License plate lamp	13C-9-Ground	Output	ON: 12 V/OFF: 0 V
Parking lamp (RH)	15B-11-Ground	Output	ON: 12 V/OFF: 0 V
Parking lamp (LH)	15B-10-Ground	Output	ON: 12 V/OFF: 0 V
Head lamp high beam (RH)	14B-7-Ground	Output	ON: 12 V/OFF: 0 V
Head lamp high beam (LH)	16B-2-Ground	Output	ON: 12 V/OFF: 0 V
Option connector (side turn lamp (RH))	13C-4-Ground	Output	ON: 12 V/OFF: 0 V
Option connector (side turn lamp (LH))	12C-7-Ground	Output	ON: 12 V/OFF: 0 V
Rear turn lamp (RH)	13C-5-Ground	Output	ON: 12 V/OFF: 0 V
Rear turn lamp (LH)	12C-4-Ground	Output	ON: 12 V/OFF: 0 V
Front turn lamp (RH)	14B-4-Ground	Output	ON: 12 V/OFF: 0 V
Front turn lamp (LH)	16B-4-Ground	Output	ON: 12 V/OFF: 0 V
Front fog lamp (RH)	12C-6-Ground	Output	ON: 12 V/OFF: 0 V
Front fog lamp (LH)	13C-2-Ground	Output	ON: 12 V/OFF: 0 V
Stop lamp (RH)	13C-7-Ground	Output	ON: 12 V/OFF: 0 V
Stop lamp (LH)	12C-1-Ground	Output	ON: 12 V/OFF: 0 V
Tail lamp (RH)	12C-3-Ground	Output	ON: 12 V/OFF: 0 V
Tail lamp (LH)	13C-8-Ground	Output	ON: 12 V/OFF: 0 V
Step lamp (RH)	15B-12-Ground	Output	ON: 12 V/OFF: 0 V
Step lamp (LH)	15B-14-Ground	Output	ON: 12 V/OFF: 0 V
Illumination lamp	14B-8-Ground	Output	ON: 12 V/OFF: 0 V
Wiper motor (Hi)	16B-5-Ground	Output	ON: 12 V/OFF: 0 V
Wiper motor (Lo)	16B-1-Ground	Output	ON: 12 V/OFF: 0 V
Wiper washer motor	17B-5-Ground	Output	ON: 12 V/OFF: 0 V
Mirror heater switch illumination	15B-27-Ground	Output	ON: 12 V/OFF: 0 V
Mirror heater (LH)	14B-5-Ground	Output	ON: 12 V/OFF: 0 V
Mirror heater (RH)	14B-1-Ground	Output	ON: 12 V/OFF: 0 V
Backup lamp	13C-6-Ground	Output	ON: 12 V/OFF: 0 V
Backup buzzer	11C-6-Ground	Output	ON: 12 V/OFF: 0 V
Cab lamp	17B-15-Ground	Output	PWM
Key interlock solenoid	17B-17-Ground	Output	PWM
Front fog lamp switch	15B-16-Ground	Input	OFF: 12 V/ON: 0 V (Unlatched type)
Hazard switch	15B-4-Ground	Input	OFF: 12 V/ON: 0 V (Unlatched type)
Wiper motor stop position switch	17B-16-Ground	Input	OFF: 12 V/ON: 0 V
Heater mirror switch	18B-11-Ground	Input	OFF: 12 V/ON: 0 V (Unlatched type)
Rear door switch	15B-2-Ground	Input	OFF: 12 V/ON: 0 V
Front door switch (assistant driver's seat side)	15B-3-Ground	Input	OFF: 12 V/ON: 0 V
Front door switch (driver's seat side)	15B-18-Ground	Input	OFF: 12 V/ON: 0 V
Starter switch (START position)	15B-15-Ground	Input	OFF: 0 V/ON: 12 V
Starter switch (key insert switch)	18B-18-Ground	Input	OFF: 0 V/ON: 12 V
Starter switch (ACC position)	18B-17-Ground	Input	OFF: 0 V/ON: 12 V
Starter switch (M position)	18B-3-Ground	Input	OFF: 0 V/ON: 12 V

#985 INSPECTION OF SIGNAL DETECT AND ACTUATION MODULES

Devices to be connected	Terminal	Input/ output	Voltage and wave form
Alternator (L terminal)	11C-8-Ground	Input	Engine running: 12 V Engine stopped: 0 V
Accessory relay	3B-8, 7C-8, 3B-10, 3B-13-Ground	Output	Activated: 12 V Not activated: 0 V
Accessory relay (option)	6X-1-Ground	Output	Activated: 12 V Not activated: 0 V
Ignition relay	1B-11, 5C-2, 5C-4, 5C-11, 5C-9, 1B-1, 1B-4, 1B-5, 1B-13, 1B-14-Ground	Output	Activated: 12 V/24 V Not activated: 0 V
Ignition relay (option)	6X-5-Ground	Output	Activated: 12 V Not activated: 0 V
Air conditioner switch	15B-17-Ground	Input	OFF: 12 V/ON: 0 V
Air conditioner compressor condenser relay	7C-11, 7C-12-Ground	Output	Activated: 12 V Not activated: 0 V
Air conditioner blower relay	2B-14-Ground	Output	Active (with air conditioner compressor operating): 12 V Not activated: 0 V
Vacuum switch	15B-1-Ground	Input	OFF: 12 V/ON: 0 V
Brake fluid level switch	18B-7-Ground	Input	OFF: 12 V/ON: 0 V
Parking brake switch	18B-6-Ground	Input	OFF: 12 V/ON: 0 V
Stop lamp switch (normal close)	15B-19-Ground	Input	OFF: 12 V/ON: 0 V
Stop lamp switch (normal open)	18B-4-Ground	Input	OFF: 12 V/ON: 0 V
Power-take off control switch	11C-9-Ground	Input	OFF: 12 V/ON: 0 V
Cab tilt lock switch	18B-10-Ground	Input	OFF: 12 V/ON: 0 V
Diesel particulate filter cleaning switch	15B-20-Ground	Input	OFF: 12 V/ON: 0 V (Unlatched type)
Fuel level sensor	11C-1-Ground	Input	Fuel tank empty: 150 ± 3.5Ω or more Full: 5 ± 2Ω
Battery voltage	10C-1-Ground	Input	Shows the battery voltage (12 V).

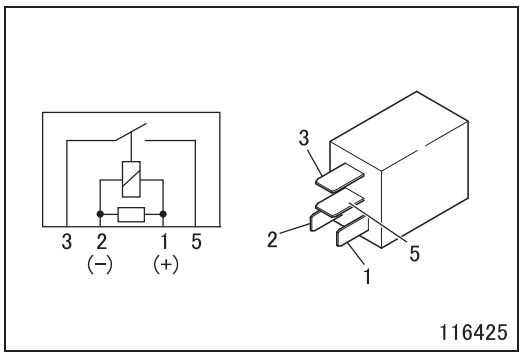
7. Inspection of Relays in Signal Detect and Actuation Module





E: Ignition relay
H: Engine relay
J: ACC relay (normally open 4-pin)

- Replace the relay if any abnormal conditions are found during checking for conductivity or operation.



A: A/C blower relay
B: Horn relay
C: ACC relay (option)
D: IGN relay (option)
F: Fuel pump relay
G: A/C compressor (normally open 4-pin)

- Replace the relay if any abnormal conditions are found during checking for conductivity or operation.

#985 INSPECTION OF SIGNAL DETECT AND ACTUATION MODULES

8. Confirmation items before replacing the signal detect and actuation module

8.1 Diagnosis codes for signal detect and actuation module

- The diagnosis code for the signal detect and actuation module is generated when the signal detect and actuation module has normally performed self-diagnosis and has detected an abnormal load of the unit connected to the module.
- If a diagnosis code of the signal detect and actuation module is generated, first check the unit connected to the module before judging it as faulty signal detect and actuation module.

8.2 Troubleshooting before replacing the signal detect and actuation module

- Check the unit, harnesses and connectors related to the generated diagnosis code.
- Check if the system returns normal by disconnecting and connecting of the battery cable.
- Check the coding data in the signal detect and actuation module matches with the vehicle to which it is mounted.
- Temporarily replace the signal detect and actuation module with a known-good one and check if the same failure is detected.

8.3 Major symptoms and troubleshooting

- If the symptom is not observed currently, also check the past diagnosis codes.

(1) Engine would not start

Diagnosis code	Cause	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
522074-25 (522074-19)	Faulty communication to engine electronic control unit	Check the engine electronic control unit.
522075-25 (522075-19)		
522076-25 (522076-19)		
522074-25 (522074-19)	Faulty controller area network communication	• Check the controller area network-related connectors (17B/18B) and harnesses of the signal detect and actuation module, including disconnection and connection of the connectors. • Check the controller area network-related harnesses and connectors of the electronic control unit indicated by the diagnosis code, including disconnection and connection of the connectors. • If the problem reappears after the above check (and repair, if necessary), the cause of the problem may be an internal failure of the signal detect and actuation module. Replace the signal detect and actuation module.
522075-25 (522075-19)		
522076-25 (522076-19)		
522064-25 (522064-19)		
522071-25 (522071-19)		
522073-25 (522073-19)		
522040-5	Relay in signal detect and actuation module inoperative	• Disconnect and reconnect the relay - IGNITION RELAY for diagnosis code 522040-5 or ACC RELAY for 522041-5. • If the problem reappears after the above operation, the cause of the problem may be an internal failure of the signal detect and actuation module. Replace the signal detect and actuation module.
522041-5		
522097-2	Faulty starter switch signal	• Check the starter switch-related connectors (18B/15B) of the signal detect and actuation module, including disconnection and connection of the connectors. • Check the starter switch.
522098-2		
522099-2		

(2) Headlamps, turn-signal lights or wipers would not operate

Diagnosis code	Cause	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
None	None	• Check the connector (18B) and harness of the signal detect and actuation module, including disconnection and connection of the connectors. • Check the combination switch and connectors, including disconnection and connection of the connectors. In the same way as that for signal detect and actuation module, temporarily replace the combination switch with a known-good one and check if the same failure is detected.
521995-4	Headlamp, LH (high)	Check the lamps, related harnesses and connectors.
521995-5		
521996-4	Headlamp, RH (high)	
521996-5		
521997-4	Headlamp, LH (low)	
521997-5		
521998-4	Headlamp, RH (low)	
521998-5		
522142-4	Wipers	Check the wipers and related harnesses and connectors.
522143-5		
522144-3		
522007-4	Rear combination lamp, LH (turn)	Check the lamps and related harnesses and connectors.
522007-5		
522008-4	Rear combination lamp, RH (turn)	
522008-5		
522009-4	Front & side turn signal, lamps LH	
522009-5		
522010-4	Front & side turn signal, lamps RH	
522010-5		

(3) Headlamps cannot be turned off, turn-signal lamps would not operate, and wipers operate spontaneously

Diagnosis code	Cause	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
522077-25 (522077-19)	Faulty communication to combination switch	• Check the combination switch and connectors, including disconnection and connection of the connectors. In the same way as that for signal detect and actuation module, temporarily replace the combination switch with a known-good one and check if the same failure is detected. • Check the connector (18B) and harness of the signal detect and actuation module, including disconnection and connection of the connectors.
522078-25 (522078-19)		
522077-25 (522077-19)	Faulty local interconnect network communication	• Check the harness connection and operation of the unit indicated by the diagnosis code. • Check the connector (18B) and harness of the signal detect and actuation module, including disconnection and connection of the connectors.
522078-25 (522078-19)		
522079-25 (522079-19)		
522080-25 (522080-19)		
522081-25 (522081-19)		

#985 INSPECTION OF SIGNAL DETECT AND ACTUATION MODULES

(4) Headlamps cannot be turned off and wipers would not operate

Diagnosis code	Cause	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
None	None (Internal failure of the signal detect and actuation module is suspected.)	• Check the connector (10C) and harness of the signal detect and actuation module, including disconnection and connection of the connectors. • Check the battery, including disconnection and connection of the terminals.
522077-25 (522077-19)	Faulty communication to combination switch	• If both diagnosis codes 522078-25 (522078-19) and 522114-25 (522114-19) are not generated concurrently, check the combination switch, including disconnection and connection of the connectors. • Temporarily replace the combination switch with a known-good one and check if the same failure is detected.
522113-25 (522113-19)		

(5) Headlamps cannot be turned on and wipers operate spontaneously

Diagnosis code	Cause	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
None	None	Check the connector (18B) of the signal detect and actuation module, related harnesses and combination switch, including disconnection and connection of the connectors.
522078-25 (522078-19)	Faulty communication to combination switch	• If both diagnosis codes 522077-25 (522077-19) and 522113-25 (522113-19) are not generated concurrently, check the combination switch, including disconnection and connection of the connectors. • Temporarily replace the combination switch with a known-good one and check if the same failure is detected.
522114-25 (522114-19)		

9. Symptoms and inspection procedures when warning lamp (red or amber) illuminates

(1) When signal detect and actuation module warning lamp (red) illuminates

Diagnosis code	Symptom	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
522040-5	Engine unable to start	• Check the IGNITION RELAY, including disconnection and connection of the relay. (See Inspection of relays in signal detect and actuation module.) • Check service data No. 038 “Starter signal Relays (IGN)”. (See FUSO Diagnostics service data (measured values).)
522041-5	Engine unable to start	• Check the ACC RELAY, including disconnection and connection of the relay. (See Inspection of relays in signal detect and actuation module.) • Check service data No. 036 “Starter signal relays (ACC)”. (See FUSO Diagnostics service data (measured values).)
522097-2	Engine unable to start	• Check the fuse (F13), including disconnection and connection of the fuse. • Check the starter switch. • Check the starter switch connector, including disconnection and connection of the connectors. • Check the harness between the starter switch and the signal detect and actuation module. • Check the connector (18B) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 064 “Starter Switches (ACC)”. (See FUSO Diagnostics service data (measured values).)
522098-2	Engine unable to start	• Check the fuse (F13), including disconnection and connection of the fuse. • Check the starter switch. • Check the starter switch connector, including disconnection and connection of the connectors. • Check the harness between the starter switch and the signal detect and actuation module. • Check the connector (18B) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 065 “Starter Switches (ON)”. (See FUSO Diagnostics service data (measured values).)
522099-2	Engine unable to start	• Check the fuse (F13), including disconnection and connection of the fuse. • Check the starter switch. • Check the starter switch connector, including disconnection and connection of the connectors. • Check the harness between the starter switch and the signal detect and actuation module. • Check the connector (15B) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 066 “Starter Switches (Start)”. (See FUSO Diagnostics service data (measured values).)
522112-3	Engine unable to start, or signal detect and actuation module output function halted	• Check the battery. • Check the alternator. • Check the service data No. 087 “Battery Voltage”. (See FUSO Diagnostics service data (measured values).)
522112-4	Engine unable to start, or signal detect and actuation module output function halted	• Check the battery. • Check the battery cable, including disconnection and connection of the cables. • Check the alternator. • Check the harness between the battery and alternator. • Check the high-current fuse, including disconnection and connection of the fuse. • Check the harness between the high-current fuse and the signal detect and actuation module. • Check the service data No. 087 “Battery Voltage”. (See FUSO Diagnostics service data (measured values).)
522149-17 (522149-31)	Engine unable to start	• Replace the signal detect and actuation module.
522150-17 (522150-31)	Engine unable to start	• Replace the signal detect and actuation module.

(2) When signal detect and actuation module warning lamp (amber) illuminates

Diagnosis code	Symptom	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
2372-4	Left stop lamp does not illuminate	• Check the stop lamp bulb. • Check the harness between the stop lamp and the signal detect and actuation module. • Check the connector (12C) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 007 “Left rear brake light”. (See FUSO Diagnostics service data (measured values).)
2372-5	Left stop lamp does not illuminate	
2374-4	Right stop lamp does not illuminate	• Check the stop lamp bulb. • Check the harness between the stop lamp and the signal detect and actuation module. • Check the connector (13C) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 006 “Right rear brake light”. (See FUSO Diagnostics service data (measured values).)
2374-5	Right stop lamp does not illuminate	
522003-4	Left parking lamp does not illuminate	• Check the parking lamp bulb. • Check the harness between the parking lamp and the signal detect and actuation module. • Check the connector (15B) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 011 “Left clearance lamps/Left side marker lamps”. (See FUSO Diagnostics service data (measured values).)
522003-5	Left parking lamp does not illuminate	
522004-4	Right parking lamp does not illuminate	• Check the parking lamp bulb. • Check the harness between the parking lamp and the signal detect and actuation module. • Check the connector (15B) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 010 “Right clearance lamps/Right side marker lamps”. (See FUSO Diagnostics service data (measured values).)
522004-5	Right parking lamp does not illuminate	
522005-4	Left tail lamp does not illuminate	• Check the tail lamp bulb. • Check the harness between the tail lamp and the signal detect and actuation module. • Check the connector (13C) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 009 “Left taillamp”. (See FUSO Diagnostics service data (measured values).)
522005-5	Left tail lamp does not illuminate	
522006-4	Right tail lamp does not illuminate	• Check the tail lamp bulb. • Check the harness between the tail lamp and the signal detect and actuation module. • Check the connector (12C) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 008 “Right taillamp”. (See FUSO Diagnostics service data (measured values).)
522006-5	Right tail lamp does not illuminate	
522020-4	License plate lamp does not illuminate	• Check the license plate lamp bulb. • Check the harness between the license plate lamp and the signal detect and actuation module. • Check the connector (13C) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 013 “Left license plate lamp”. (See FUSO Diagnostics service data (measured values).)
522020-5	License plate lamp does not illuminate	
522038-5	Blower does not operate	• Check the A/C BLOWER RELAY, including disconnection and connection of the relay. (See Inspection of relays in signal detect and actuation module.) • Check the service data No. 041 “Blower motor relays”. (See FUSO Diagnostics service data (measured values).)
522039-5	Option ACC power unable to use	• Check the ACC RELAY, including disconnection and connection of the relay. (See Inspection of relays in signal detect and actuation module.) • Check the service data No. 037 “Relay 'Power supply for optional bodies' (ACC)”. (See FUSO Diagnostics service data (measured values).)

Diagnosis code	Symptom	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
522042-5	Option IGN power unable to use Alternator does not operate (24 V models)	• Check the IGN RELAY, including disconnection and connection of the relay. (See Inspection of relays in signal detect and actuation module.) • Check the service data No. 039 “Relay 'Power supply for optional bodies' (IGN)”. (See FUSO Diagnostics service data (measured values).)
522043-5	Air conditioner does not operate	• Check the A/C COMP COND RELAY, including disconnection and connection of the relay. (See Inspection of relays in signal detect and actuation module.) • Check the service data No. 040 “Refrigerant compressor Relays”. (See FUSO Diagnostics service data (measured values).)
522067-25 (522067-19)	Headlamps illuminate spontaneously	• Check the fuse (F09), including disconnection and connection of the fuse. • Check the combination switch. • Check the combination switch connector, including disconnection and connection of the connectors. • Check the harness between the combination switch and the signal detect and actuation module. • Check the connector (18B) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 002 “Right turn signal”. (See FUSO Diagnostics service data (measured values).)
522077-25 8522077-19)	Headlamps illuminate spontaneously	

#986 INSPECTION OF METER CLUSTER

- Since the FUSO diagnostics data are updated from time to time, descriptions or wording may not agree with the workshop manual. The FUSO diagnostics will have the latest data.

1. List of Diagnosis Codes

Code	Message	Warning lamp indication METER	Remarks
158-3	The battery voltage is too high. - Voltage above normal or shorted to high source	O	
158-4	The battery voltage is too low. - Voltage below normal or shorted to low source	O	
629-31	Watchdog reset condition exists	O	
639-4	CAN bus OFF fault - Voltage below normal or shorted to low source	O	
1213-14	MIL lamp internal LED circuit failure	O	
521751-7	Stopper motor internal circuit failure	O	
521768-19	EEPROM internal access failure	O	

2. Details of Diagnosis Codes

158-3: The battery voltage is too high. - Voltage above normal or shorted to high source

Generation condition	• In meter cluster is indicated a battery voltage higher than 16 V for 10 seconds.
Recoverability	• System recovers if normal reading is obtained when starter switch is turned to OFF and then to ON.
Control effected by electronic control unit	• None
Possible causes	• Faulty alternator • Faulty signal detect and actuation module • Defective meter cluster

158-4: The battery voltage is too low. - Voltage below normal or shorted to low source

Generation condition	• In meter cluster is indicated a battery voltage lower than 10 V for 10 seconds
Recoverability	• System recovers if normal reading is obtained when starter switch is turned to OFF and then to ON.
Control effected by electronic control unit	• None
Possible causes	• Open-circuit or short-circuit to ground in harness between battery and meter cluster • Malfunction of battery • Faulty alternator • Faulty signal detect and actuation module • Defective meter cluster

629-31: Watchdog reset condition exists

Generation condition	• CPU in meter cluster is reset.
Recoverability	• System recovers if any normal signal is received when starter switch is turned to OFF and then to ON.
Control effected by electronic control unit	• None
Possible causes	• Defective meter cluster • Faulty alternator • Faulty signal detect and actuation module

639-4: CAN bus OFF fault - Voltage below normal or shorted to low source

Generation condition	• Controller area network communication bus off condition is detected.
Recoverability	• System recovers if any normal signal is received when starter switch is turned to OFF and then to ON.
Control effected by electronic control unit	• None
Possible causes	• Controller area network communication bus is open or shorted to power, ground or another circuit. • Faulty resistor in meter cluster • Defective meter cluster

1213-14: MIL lamp internal LED circuit failure

Generation condition	• Internal circuit is malfunctioning.
Recoverability	• System recovers if any normal signal is received when starter switch is turned to OFF and then to ON.
Control effected by electronic control unit	• Error message is sent through controller area network.
Possible causes	• Defective meter cluster

521751-7: Stopper motor internal circuit failure

Generation condition	• Internal circuit is malfunctioning.
Recoverability	• System recovers if any normal signal is received when starter switch is turned to OFF and then to ON.
Control effected by electronic control unit	• None
Possible causes	• Defective meter cluster

521768-19: EEPROM internal access failure

Generation condition	• Access to EEPROM is impossible.
Recoverability	• System recovers if any normal signal is received when starter switch is turned to OFF and then to ON.
Control effected by electronic control unit	• None
Possible causes	• Defective meter cluster

3. FUSO Diagnostics Service Data (Measured Values)

• Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.

Current Value Group	Description	Value	Explanation
–	Vehicle speed Tachograph	0.000 to 255.000 km/h {0.000 to 158.4 mph}	Shows the vehicle speed as determined by the tachograph.
–	Vehicle speed ECU	0.000 to 255.000 km/h {0.000 to 158.4 mph}	Shows the vehicle speed as determined by the ECU.

#986 INSPECTION OF METER CLUSTER

4. Actuator Test (Control) Using FUSO Diagnostics

- Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.
- The basic conditions for performing the actuator test: Vehicle stopped, engine stopped and starter switch ON.

Selection	Explanation
Instrument cluster	[Test method] Operate each indication in the meter cluster. [Checking method] • The speedometer operates from 0 to maximum. It stops on the way for about 5 seconds at the 40 km/h {40 mph} point. • The tachometer operates from 0 to maximum. It stops on the way for about 5 seconds at the 2000 rpm point. • The fuel level gauge operates from 0 to full. It stops on the way for about 5 seconds at the one half point. • The indicator lamp, illumination, multi-information display and buzzer cycle ON/OFF every 1 second. [Note] The test stops automatically when three rounds of inspection are completed. (Or, terminated using the stop button.)

5. Electronic Control Unit Coding

- The meter cluster has various kinds of information such as technical data of vehicle and equipment registered as coding data.
- Therefore, each time the meter cluster is replaced or some specification changes are made, the coding data must surely be rewritten using FUSO Diagnostics. Otherwise, the data stored in the meter cluster could deviate from the actual conditions of the vehicles, resulting in incorrect alarms.

6. Rewriting of Coding Data

- If specification changes have been made, be sure to rewrite the relevant coding data. For details of the rewriting procedure, consult an authorized dealer or distributor.

Rewriting coding data required	Standards for rewriting meter cluster internal data
Final gear	When the final gear is changed, the meter cluster internal data must be updated.
Rear tire	When the tire size is changed, the meter cluster internal data must be updated.
Anti-lock brake system	When specifications of this system are changed, the meter cluster internal data must be updated.

SPECIFICATIONS

Battery

Item		Specifications
Model		115D31L
Voltage × Quantity	V	12 × 1
Capacity (5-hour rating)	Ah	70

Alternator

Item		Specifications	
Manufacturer		Bosch	
Type		Alternator with built-in regulator	
Model		F000 BLO 622	0 124 525 216
Output	V-A	12-110	12-140

Starter and Preheat System

Item			Specifications
Starter	Manufacturer		MITSUBISHI ELECTRIC
	Model		M001T31072
	Output	V-kW	12-2.0
	Reduction gear mechanism		Planetary gears
	Magnetic switch operating voltage	V	8 or less
Starter relay	Model		U001T13974
	Excitation current	V-A	12-4
	Closing voltage	V	8 or less
	Opening voltage	V	3.5 or less
	Allowable cutoff current	A	200
Glow electronic control unit	Manufacturer		Bosch
Glow plug	Model		Sheathed type
	Excitation current	V-A	11-18 (reference value)

Lighting

Item			Specifications
Headlamp	Model		Unconventional, 2-lamp-system
	Type		Reflector type
	Upper beam (HIGH)	W	60/55 (HB2)* (HIGH/LOW)
	Lower beam (LOW)	W	
	Parking lamp	W	5 (W5W)*
Fog lamp		W	55 (H3)*
Front and side turn signal lamp (serving also as hazard warning lamp)		W	21 (W21W)*
Clearance and side marker lamp		W	7.5
Rear combination lamp	Stop and tail lamp (stop/tail)	W	21/5 (P21/5W)*
	Rear turn signal lamp (serving also as hazard warning lamp)	W	21 (P21W)*
	Backup lamp	W	21 (P21W)*
Step lamp		W	5 (W5W)*
License plate lamp		W	10 (R10W)*
Identification lamp		W	7.5
Cab lamp		W	10
Cab and spot lamp		W	8

All bulbs in the lamps shown above have voltage rating of 12 volts.

*: The types of bulbs are shown in parentheses.

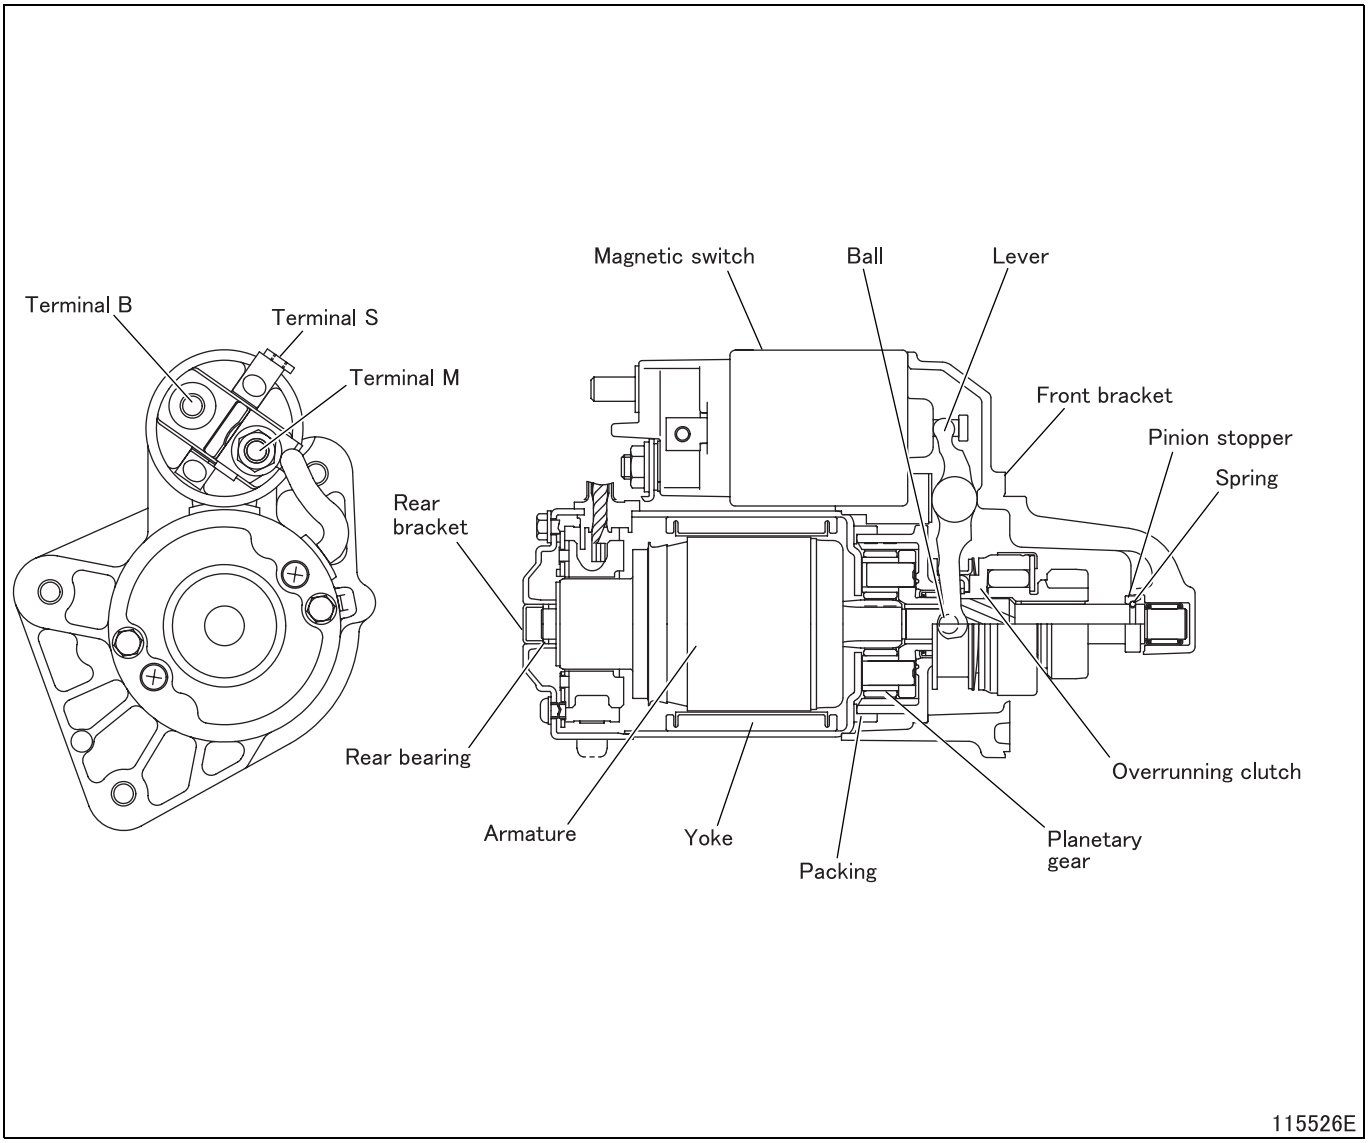
SPECIFICATIONS

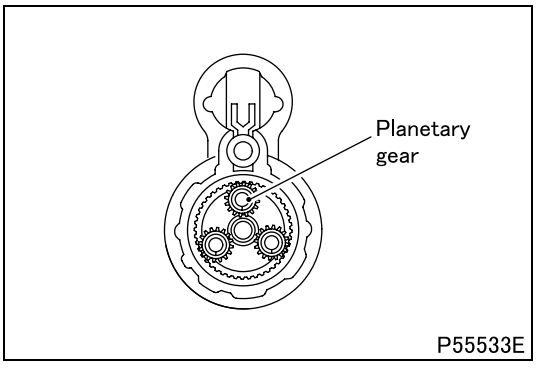
Relay, Radio, Motor, Horn, Buzzer

Item			Specifications
Minimum operating voltage of relay		V	8 or less
Relay in SAM	Minimum operating voltage	V	7.2 or less
	Rated voltage	V	12
AM/FM radio <Option>	Manufacturer		Clarion
	Type		RM9296RA
AM/FM radio (with CD) <Option>	Manufacturer		DAEWOO
	Type		AGC-0010AF
Loudspeaker	Rated input	W	15
	Maximum input	W	25
	Impedance	Ω	4 ± 0.6
Wiper motor	Rated voltage	V	12
	No-load current	A	4 or less
	Bound current	A	30 or less
Washer motor	Rated voltage	V	12
	Rated current	A	3.8 or less
Power window motor	Rated voltage	V	12
	Rated current	A	5 or less
Electric horn	Rated voltage	V	12
	Current consumption	A	3.5
	Sound pressure	dB	110 ± 5 (at 2 m {6.6 ft.})
Back buzzer	Rated voltage	V	12
	Rated current	mA	50 or less
	Sound pressure	dB	85 ± 10 (at 1 m {3.3 ft.})

54-00C STRUCTURE AND OPERATION

1. Starter

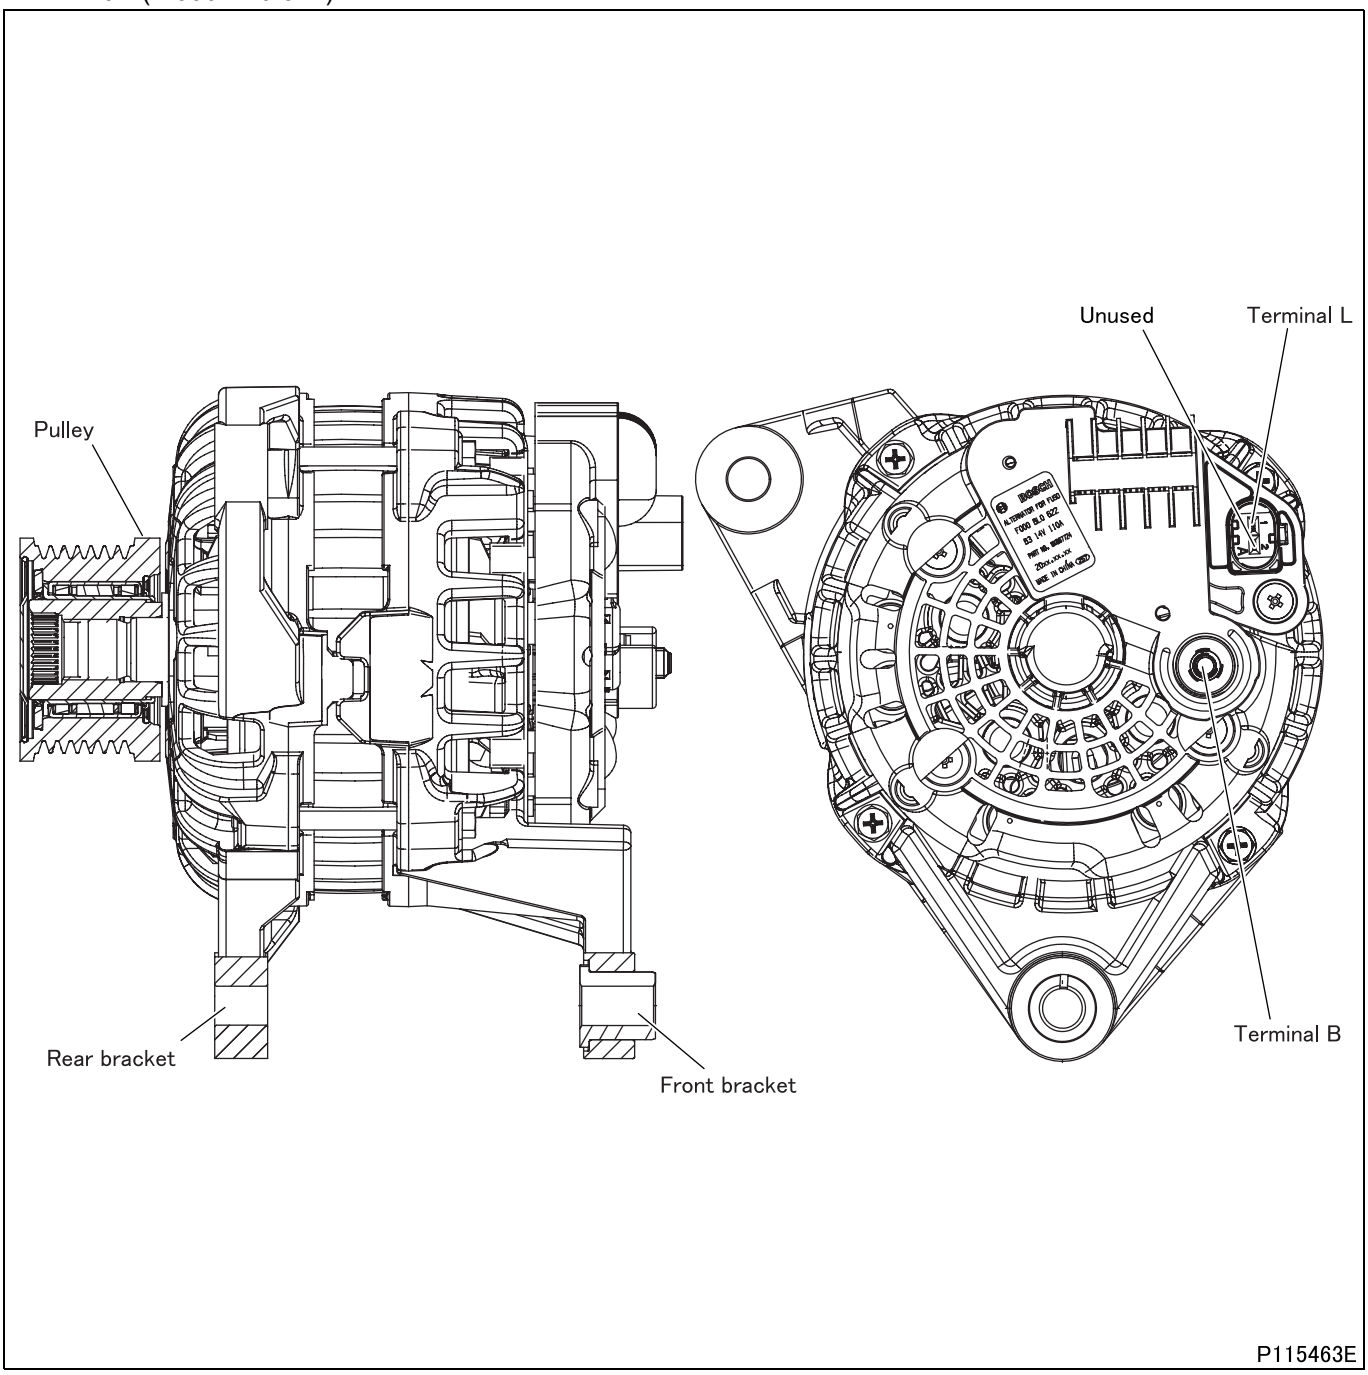




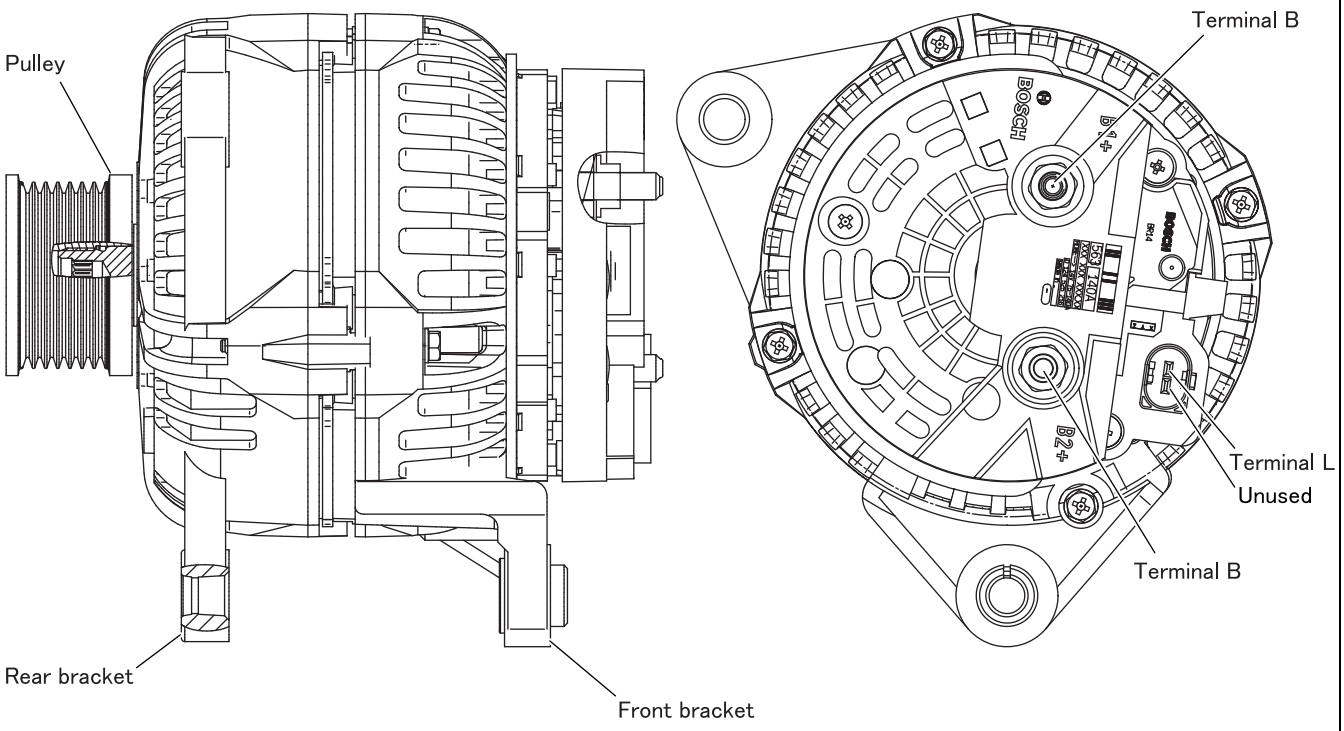
- This starter uses planetary gears as its reduction gearing mechanism.

2. Alternator

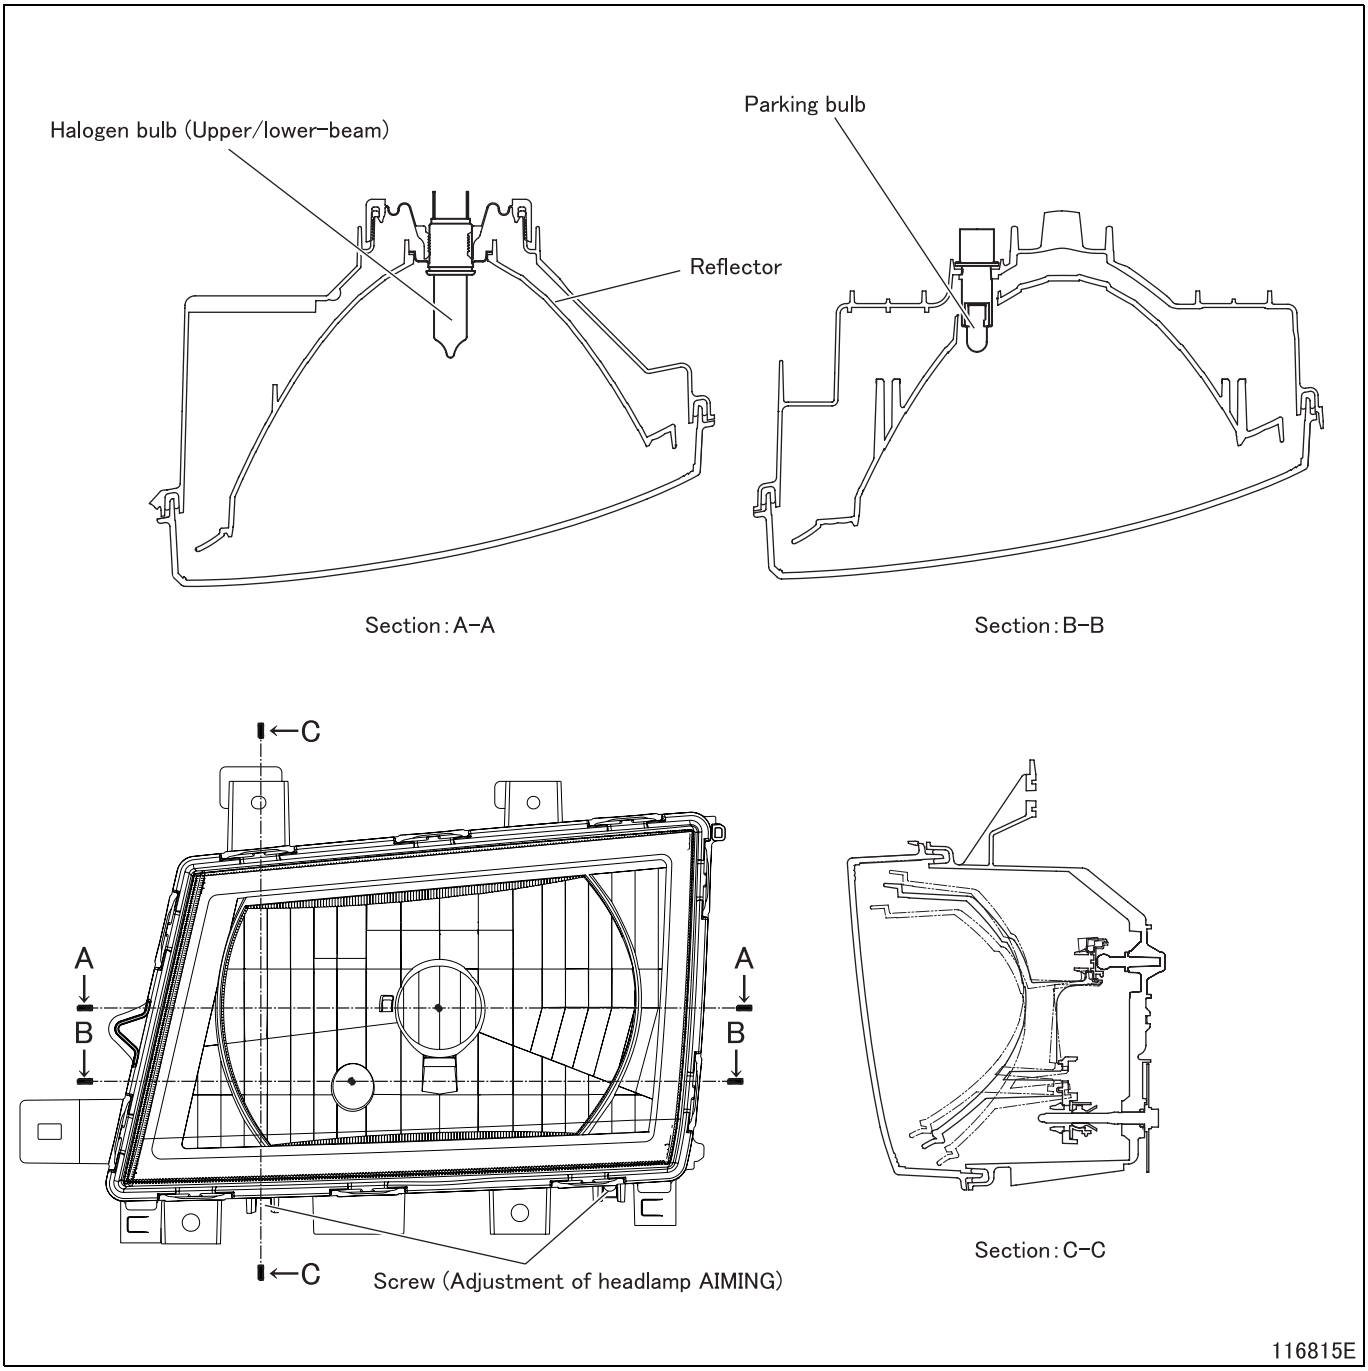
<12V-110A (F 000 BL0 622)>



<12V-140A (0 124 525 216)>



3. Headlamps



(Left headlamps are shown in this illustration.)

54-00D TROUBLESHOOTING

1. Power and Charging

Symptoms / Possible causes		Battery fluid (electrolyte) decreases too fast.	Battery temperature is too high.	Battery is normal but excessively discharged.	Charge warning lamp is not illuminated when starter switch is in ON position with engine not running.	Alternator is normal but battery is excessively discharged.	Alternator does not generate electricity.	Reference Gr
Connector connection faulty, harness broken, grounding faulty				O		O		
Fuse blown				O	O	O		
High-current fuse blown				O	O	O		
Belt tension insufficient				O		O		Gr14
Belt cut off				O		O		Gr14
Defective battery		O				O		
Communication failure of controller area network (Controller area network communication)					O			
Alternator	Open-circuited stator coil			O				
	Short circuit between stator coil and core			O				
	Open-circuited field coil			O				
	Defective rectifier			O				
	Defective regulator		O	O	O			
	Brush worn			O				
	Permanent set of brush spring in fatigue			O				
	Improper wiring			O				
Power is not supplied to alternator R terminal	Relay "Optional power supply (IGN)" inoperative			O		O	O	Gr54ES (Performing inspections based on diagnosis codes; check of FUSO Diagnostics service data (actual values) (039/067/071); inspection and disconnection/ connection of relay (D))
	Fuse blown			O		O	O	Gr54-01 (Inspection and removal/installation of fuse (F04))
Defective meter cluster					O			

2. Engine Starting, Stopping and Preheating

Symptoms / Possible causes		Starter is not activated.	Starter is activated but engine does not start			Engine does not stop.	Engine cannot be warmed up.	Engine is slow to start.	Exhaust brake is nonfunctional.	Reference Gr
			Pinion does not mesh with ring gear.	Pinion meshes with ring gear but does not rotate.	Flywheel rotates but engine does not start.					
Connector connection faulty, harness broken, grounding faulty		O			O	O	O	O	O	
High current fuse blown		O					O		O	
Fuse blown		O					O		O	
Signal detect and actuation modules malfunctioning		O					O		O	
Battery capacity insufficient		O		O						
Starter	Magnet switch contact stuck, fused	O								
	Magnet switch coil open circuited	O								
	Overrunning clutch malfunctioning		O							
	Pinion worn, damaged		O							
Defective starter relay		O								
Defective starter switch		O				O				
Flywheel ring gear worn, damaged			O							Gr11
Common rail system malfunctioning		O			O	O	O	O	O	Gr13E
Faulty starter relay (for drive)		O								
Faulty shift lever unit relay		O								
DUONIC^{TM} system malfunctioning		O								Gr22E
Gear shift lever in other position than P or N		O								Gr22E
Defective glow plug							O	O	O	Gr11
Glow electronic control unit malfunctioning							O	O	O	Gr13E
Connecting plate poorly fitted							O	O	O	Gr11
Defective water temperature sensor							O	O		
Exhaust brake system malfunctioning									O	Gr35E
Combination switch	Defective exhaust brake switch								O	
	Defective warming-up switch						O			
Immobilizer system malfunctioning		O								
Engine immobilizer starter key not registered in immobilizer electronic control unit is in use		O								
Warning lamp (red) for signal detect and actuation module is illuminating.		O								Gr54ES
Communication failure (Controller area network / Local interconnect network)		O								Gr54ES

Symptoms / Possible causes	Starter is not activated.	Starter is activated but engine does not start			Engine does not stop.	Engine cannot be warmed up.	Engine is slow to start.	Exhaust brake is nonfunctional.	Reference Gr
		Pinion does not mesh with ring gear.	Pinion meshes with ring gear but does not rotate.	Flywheel rotates but engine does not start.					
Power is not supplied to starter switch.	O								Gr54-01 (Inspection and removal/installation of fuse (F13)); Gr54ES (Inspection and disconnection/connection of signal detect and actuation module connector (3B))
Starter switch signal is not received.	O								Gr54ES (Inspection and disconnection/connection of signal detect and actuation module connectors (15B/18B); perform inspections based on diagnosis codes; check of FUSO Diagnostics service data (actual values) (063 - 066); performing FUSO Diagnostics actuator test (actuations) (002))
Output conditions are not satisfied <DUONIC^{TM} models>	O								Gr13E, Gr22E, Gr54EI (Check of each inhibit condition for electronic control module);Gr22E (Check of FUSO Diagnostics service data (actual values) (021));Gr54-01 (Inspection and removal/installation of fuses (F15/F24));Gr54ES (Inspection and disconnection/connection of signal detect and actuation module connector (18B);Check of coding data for signal detect and actuation module)

Symptoms / Possible causes		Starter is not activated.	Starter is activated but engine does not start			Engine does not stop.	Engine cannot be warmed up.	Engine is slow to start.	Exhaust brake is nonfunctional.	Reference Gr
			Pinion does not mesh with ring gear.	Pinion meshes with ring gear but does not rotate.	Flywheel rotates but engine does not start.					
Power is not supplied to related electronic control units/components	Blown fuse	O								Gr54-01 (Inspection and removal/installation of fuses (F01/F04/F09/F13/F15/F19/F24/F28 - F31/F34))
	Starter signal relay (ACC) inoperative	O								Gr54ES (Performing inspections based on diagnosis codes; check of FUSO Diagnostics service data (actual values) (036/068))
	Starter signal relay (IGN) inoperative	O								Gr54ES (Performing inspections based on diagnosis codes; check of FUSO Diagnostics service data (actual values) (038/070/071); inspection and removal/installation of relay (E))
	Fuel pump relay inoperative	O								Gr54ES (Inspection and removal/installation of relay (F))

Symptoms / Possible causes		Starter is not activated.	Starter is activated but engine does not start			Engine does not stop.	Engine cannot be warmed up.	Engine is slow to start.	Exhaust brake is nonfunctional.	Reference Gr
			Pinion does not mesh with ring gear.	Pinion meshes with ring gear but does not rotate.	Flywheel rotates but engine does not start.					
Output conditions are satisfied but S signal is not outputted	Faulty communication of controller area network	O								Gr54ES (Inspection and disconnection/connection of signal detect and actuation module connector (17B); performing inspections based on diagnosis codes)
	Low input voltage	O								Gr54ES (Check of input terminals (8C/9C/10C) of signal detect and actuation module; performing inspections based on diagnosis codes; check of FUSO Diagnostics service data (actual values) (087))
	Low output voltage	O								Inspect by replacing with a known-good signal detect and actuation module.
Communication failure (Controller area network / Local interconnect network)							O		O	Gr54ES
Power is not supplied to Combination switch.							O		O	Gr54-01 (Inspection and removal/installation of fuse (F09)); Gr54ES (Inspection and disconnection/connection of signal detect and actuation module connector (2B))

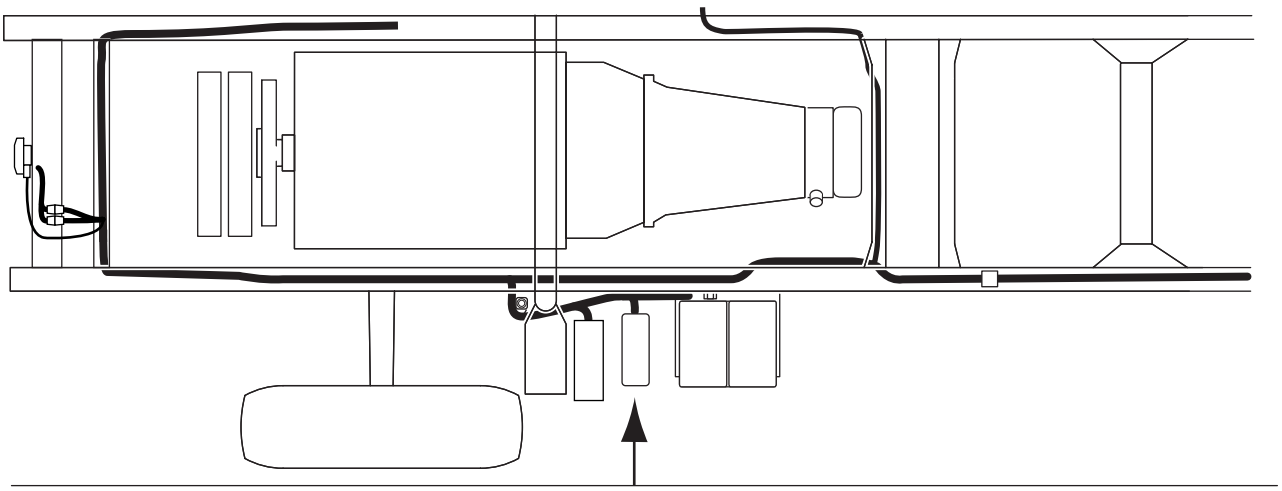
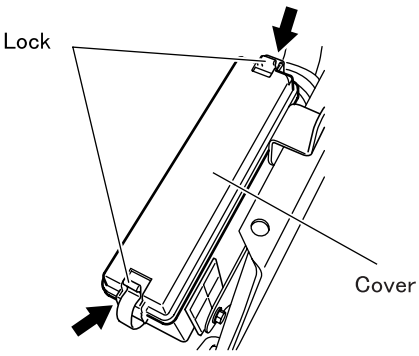
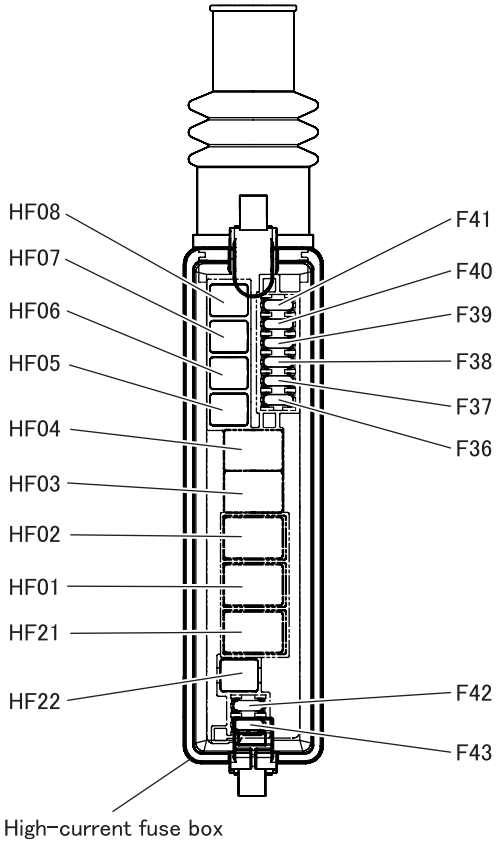
Battery insufficient in capacity		O		O		
Horn switch signal is not received.		O				Gr54ES (Inspection and disconnection/connection of signal detect and actuation module connector (15B))
Horn switch signal is received.			O			
Power is not supplied.	Blown fuse	O				Gr54-01 (Inspection and removal/installation of fuse (F14))
	Horn relay inoperative	O				Gr54ES (Inspection and removal/installation of relay (B))
Power is supplied continuously.	Fused horn relay		O			

54-01 POWER, CHARGE AND GROUND CIRCUIT

HIGH-CURRENT FUSE BOX







WARNING ⚠

- **To prevent possible injury, be sure to disconnect the negative (-) cable of the battery and insulate it with tape before removing high-current fuses. (See Gr00.)**

CAUTION ⚠

- **With the negative (-) cable of the battery connected, some high-current fuses are always under battery voltage. An arc will be generated when any of these high-current fuses is replaced without disconnecting the battery negative cable, and this could cause the related electric devices to be damaged.**
- **If replace the fuse, remove the high-current fuse box from the vehicle.**
- **If a fuse blows out, identify and remedy the cause, then replace the fuse.**
- **Be sure to use the fuse with the specified ampere.**

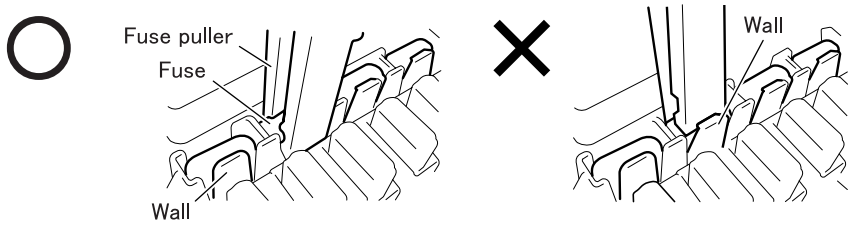
Removal of spare fuse



WARNING ⚠

- **To prevent possible injury, be sure to disconnect the negative (-) cable of the battery and insulate it with tape before removing fuses. (See Gr00.)**

CAUTION ⚠

- **If a fuse blows out, identify and remedy the cause, then replace the fuse.**
- **Be sure to use the fuse with the specified ampere.**
- **Insert the fuse puller into the gap on the outer side of the fuse holder wall to remove the spare fuse. Do not force the puller into the gap on the inner side of the fuse holder wall. Doing so will break the SAM and cause malfunctions or a fire.**

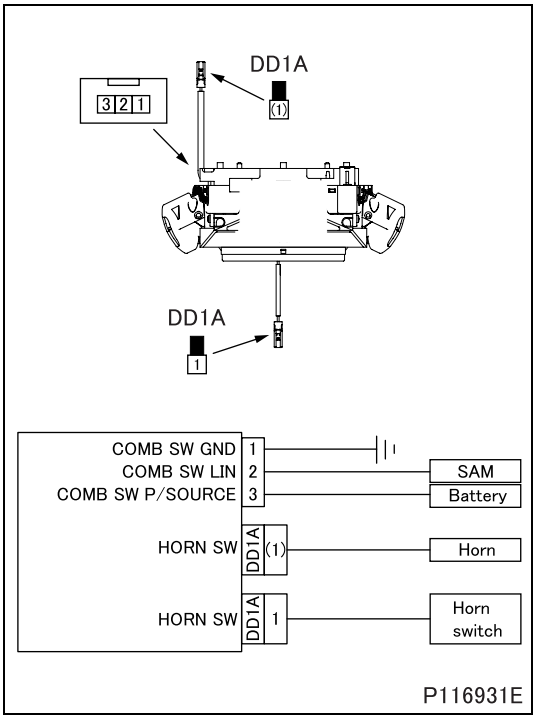
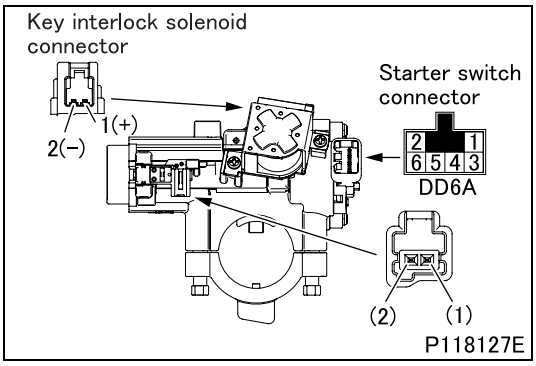
54-11 INSPECTION OF ELECTRICAL EQUIPMENT



#001 Inspection of combination switch

- Because it is not easy to independently check the switch for the function, determine the quality of the switch indirectly by checking the related parts, such as the harness, horn switch, etc. in the system.
- If there is nothing abnormal in the related parts, but the problem remains in the system, then replace the switch. (See Gr37.)



#002 Inspection of starter switch

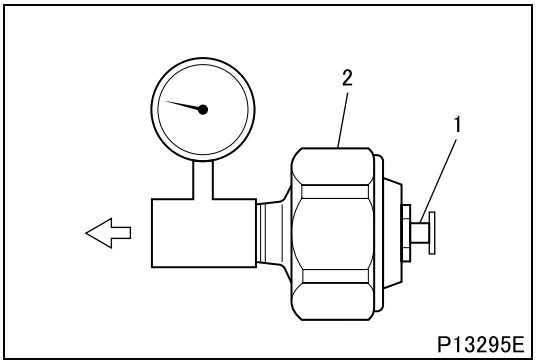
- Perform the following checks, and if any fault is found, replace the switch. (See Gr37.)

(1) Starter switch

Switch position		Continuity terminal
LOCK	without key	–
	with key	(1)–(2)
ACC		(1)–(2), 4–5
ON		(1)–(2), 4–5–6
START		(1)–(2), 3–4–5–6

(2) Key interlock solenoid

- Confirm that applying battery voltage between the terminals 1 and 2 prevents the key from turning toward the LOCK position.



#023 Inspection of vacuum switch

- Perform the following checks, and if any fault is found, replace the switch. (See Gr35.)

(1) Inspection without applying negative pressure

- Make sure that there is continuity between terminals 1 and 2 (body).

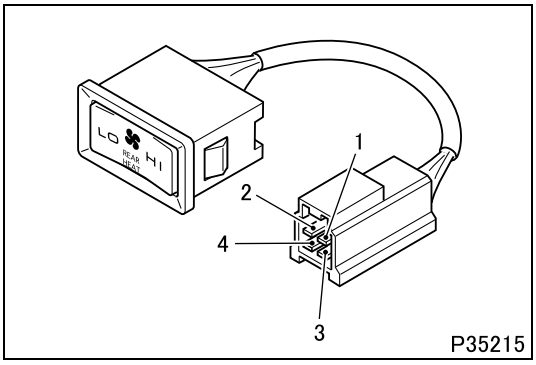
(2) Inspection by applying negative pressure

- Gradually apply negative pressure to the switch starting from 0 kPa {0 psi, 0 kgf/cm^2}.
- Measure the degree of air pressure at the moment when continuity is not detected between terminals 1 and 2 (body), and make sure to confirm if the value meets the standard.

Standard value	$-(47\ ^{+3.3}_{-4.0})$ kPa {$-(13.8\ ^{+0.98}_{-1.18})$ in.Hg, $-(350\ ^{+25}_{-30})$ mmHg}

#027 Inspection of power window switch

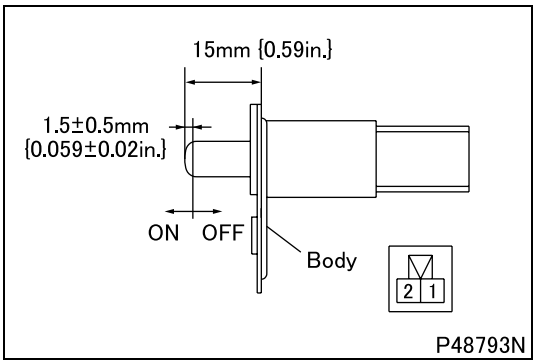
- Because it is not easy to check these switches individually, determine the quality of the switches indirectly by checking related parts, such as harnesses, power window motor, etc. in the system.
- If there is nothing abnormal in related parts, but there is still something wrong with the system, then replace the switches. (See Gr43.)



#034 Inspection of rear heater switch

Switch position	Continuity terminal
HI	2–4
OFF	–
LO	1–2

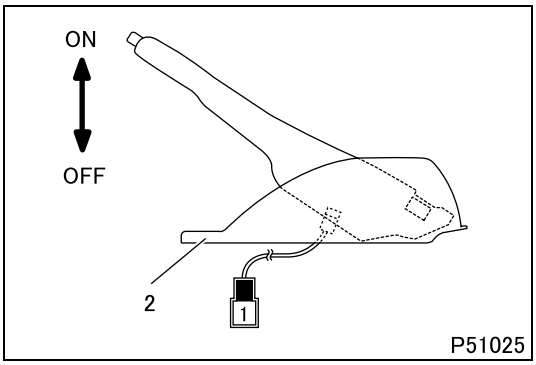
- If any fault is found, replace the switch.



#035 Inspection of door switch

Switch position	Continuity terminal
OFF	–
ON	1-body, 2-body

- If any fault is found, replace the switch. (See Gr43.)

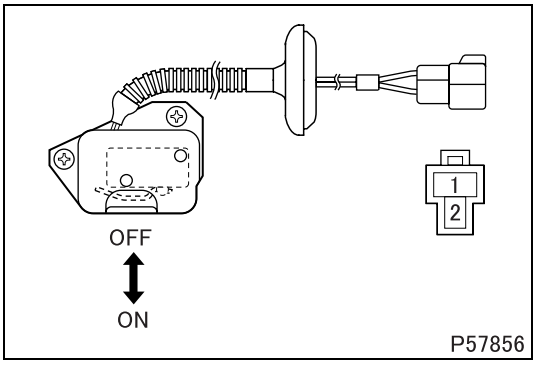


#038 Inspection of parking brake switch

- Measure continuity between terminals 1 and 2 (body) ground.

Pull the parking brake lever	Continuity exists
Release the parking brake lever	Continuity does not exist

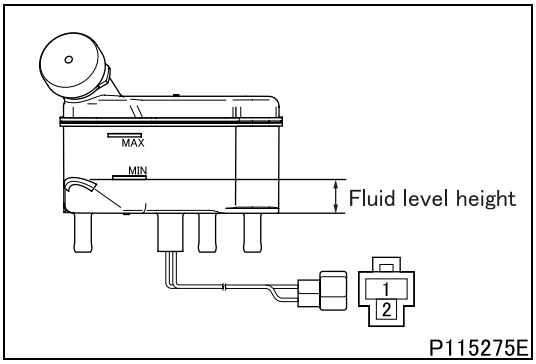
- If any fault is found, replace the switch. (See Gr36.)



#039 Inspection of cab tilt lock switch

Switch position	Continuity terminal
OFF	–
ON	1–2

- If any fault is found, replace the switch. (See Gr42.)



#041 Inspection of brake fluid level switch

- Gradually drain brake fluid from the brake fluid reservoir.

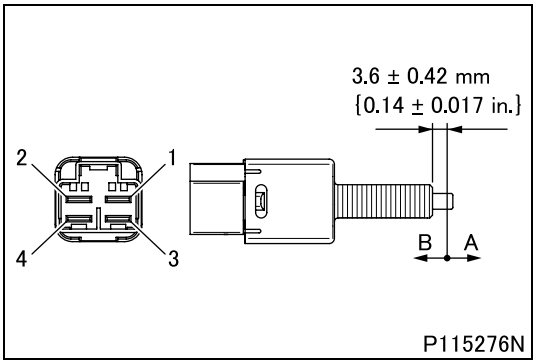
CAUTION ⚠

- **Brake fluid contains ingredients that dissolve the vehicle's paint. Quickly wipe off brake fluid when it is spilled.**

- Measure height of the switch when continuity is detected between terminals 1 and 2.

Standard value	18 to 20 mm {0.71 to 0.79 in.}

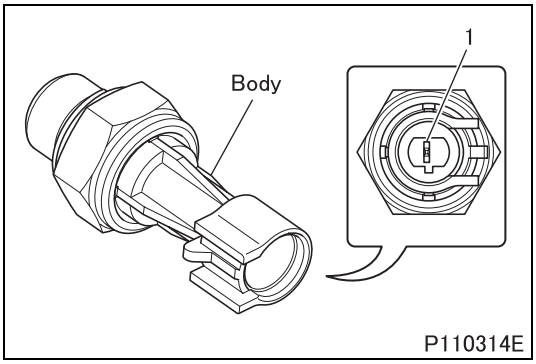
- If the measured value deviates from the standard value, replace the brake fluid reservoir. (See Gr52.)



#042 Inspection of stop lamp switch

Switch position	Continuity terminal
A	1–2
B	3–4

- If any fault is found, replace the switch. (See Gr35.)



#044 Inspection of oil pressure switch

- Perform the following checks, and if any fault is found, replace the switch. (See Gr12.)

(1) Inspection without applying air pressure

- Make sure that there is continuity between terminals 1 and the body.

(2) Inspection by applying air pressure

- Gradually apply air pressure to the switch starting from 0 kPa {0 psi, 0 kgf/cm^2}.

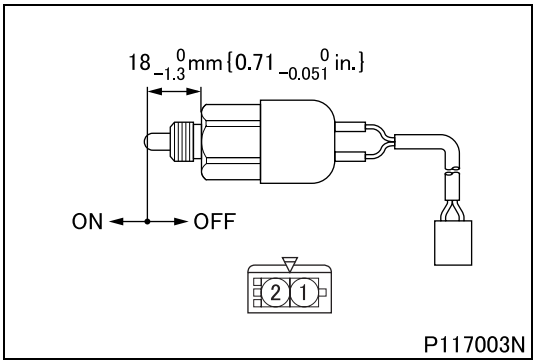
- Measure the degree of air pressure at the moment when continuity is not detected between terminals 1 and body, and make sure to confirm if the value meets the standard.

Standard value (operating pressure)	50 ± 10 kPa {7.1 ± 1.4 psi, 0.5 ± 0.1 kgf/cm^2}

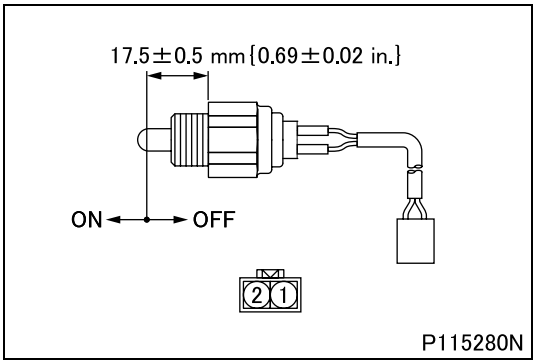
#054 Inspection of switch

- Perform the following checks, and if any fault is found, replace the switch.

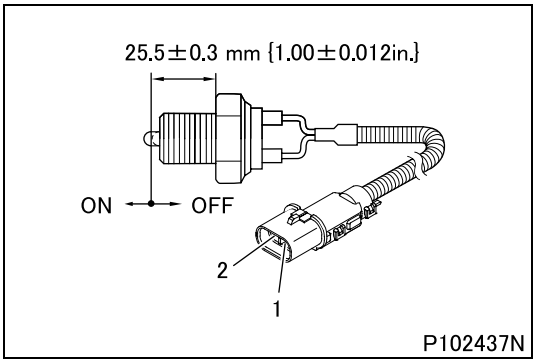
Switch position	Continuity terminal
OFF	–
ON	1–2



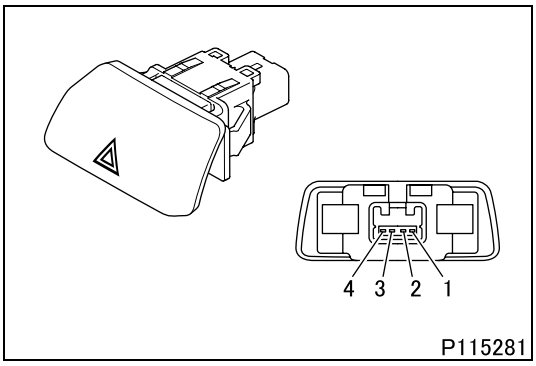
- Transfer four-wheel drive switch. <FG>



- Parking gear switch. (See Gr22.)



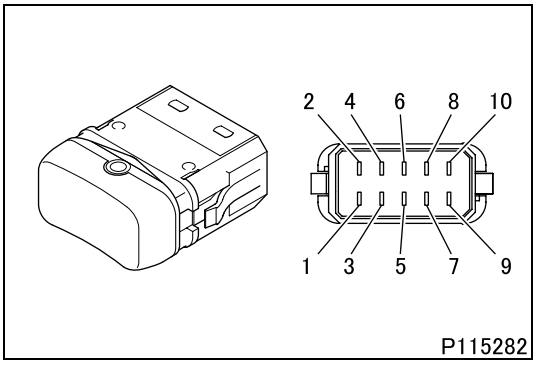
- Power take-off control switch. (See Gr22.)



#081 Inspection of hazard switch

Switch position	Continuity terminal	Night illumination
OFF	–	(+) 4-1 (–)
ON	2–3	

- If any fault is found, replace the switch. (See Gr52.)



#089 Inspection of switch

- Perform the following checks, and if any fault is found, replace the switch.
  - Fog lamp switch
  - DPF cleaning switch
  - Transmission power take-off switch

Switch position	Continuity terminal	Night illumination
OFF	–	(+) 1–10 (–)
ON	3–7	

- Front drive switch
- ECO mode switch

Switch position	Continuity terminal	Night illumination
OFF	5–7	(+) 1–10 (–)
ON	3–7	

- Van body dome light switch

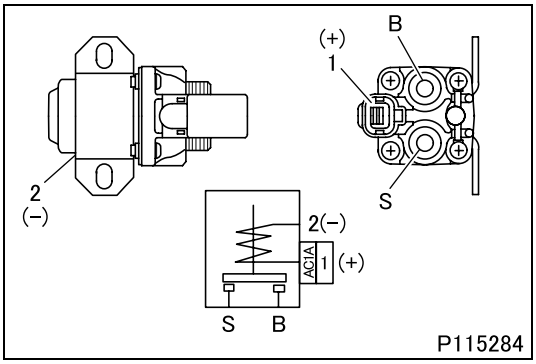
Switch position	Continuity terminal	Operation illumination	Night illumination
OFF	–	–	(+) 1–10 (–)
ON	3–7	(+) 9–10 (–)	

- Door lock switch

Switch position	Continuity terminal	Night illumination
LOCK	3–7, 4–6	(+) 1–10 (–)
Neutral	4–6, 5–7	
UNLOCK	4–8, 5–7	

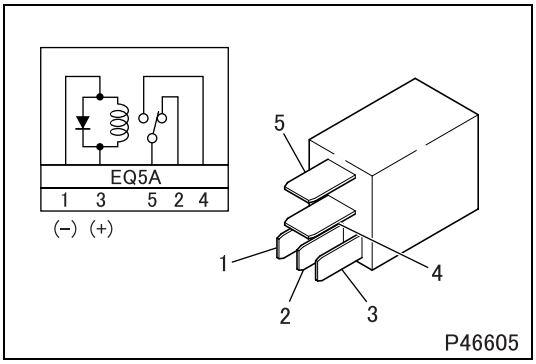
- Cruise control main switch

Switch position	Continuity terminal	Operation illumination	Night illumination
OFF	4–8, 5–7	–	(+) 1–10 (–)
Neutral	4–6, 5–7	–	
ON	3–7, 4–6	(+) 9–10 (–)	



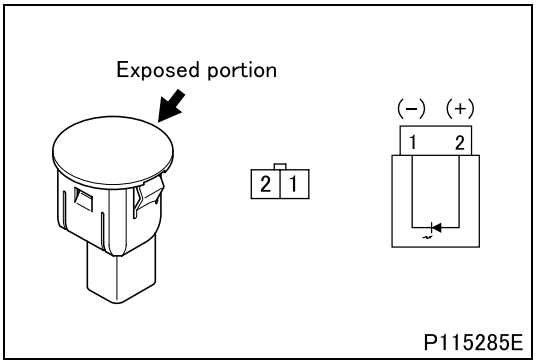
#187 Inspection of starter relay

- Perform continuity and operation checks, and if any fault is found, replace the relay.



#201 Inspection of relay (normally open type 5 pin)

- Perform continuity and operation checks, and if any fault is found, replace the relay.



#251 Inspection of photo sensor

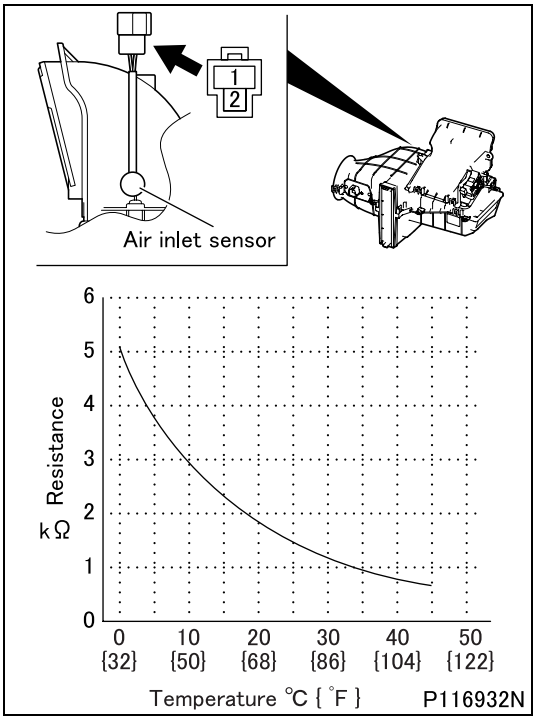
- With the photo sensor connected to the control panel at the sensor connector, turn the starter switch ON.
- With the exposed portion of the sensor exposed to light, measure the output voltage between terminal 2 and body ground.

Standard value	Inspection condition: Move a lit bulb of about 60 watts toward and away from right above the photo sensor (approx. 150 mm {5.91 in.} from sensor at closest point).	1 to 5 V (voltage lowers as light nears sensor)

- If the measured value deviates from the standard value, replace the sensor. (See Gr52.)

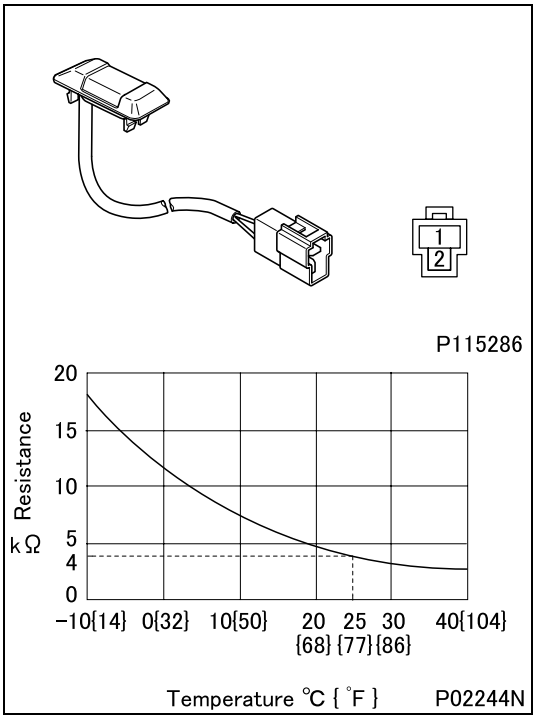
#252 Inspection of sensor

- Because it is not easy to check these switches individually, determine the quality of the sensors indirectly by checking related parts, such as harnesses, etc. in the system.
- If there is nothing abnormal in the related parts, but there is still something wrong with the system, then replace the sensors.



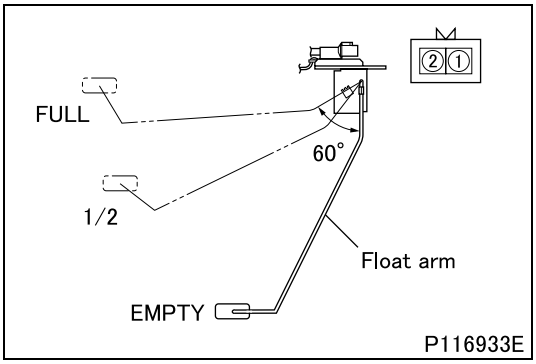
#253 Inspection of air inlet sensor

- Change the ambient temperature of the sensor and measure the resistance between terminals 1 and 2.
- If the measured value deviates from the characteristic shown in the table at left, replace the sensor. (See Gr55.)



#256 Inspection of in car sensor

- Change the ambient temperature of the sensor and measure the resistance between terminals 1 and 2.
- If the measured value deviates from the characteristics shown in the table at left, replace the sensor. (See Gr52.)

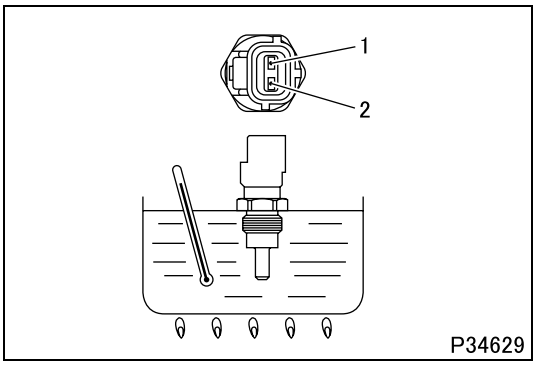


#258 Inspection of fuel level sensor

- Measure resistance values between terminals 1 and 2 when bringing the float arm into contact with stoppers (at EMPTY and FULL positions) and placing it at the midpoint position.

Standard value	at FULL position	0^{+2}_{0} Ω
	at 1/2 position	50 ± 3 Ω
	at EMPTY position	150 ± 10 Ω

- If the measured value deviates from the standard value, replace the sensor. (See Gr13.)

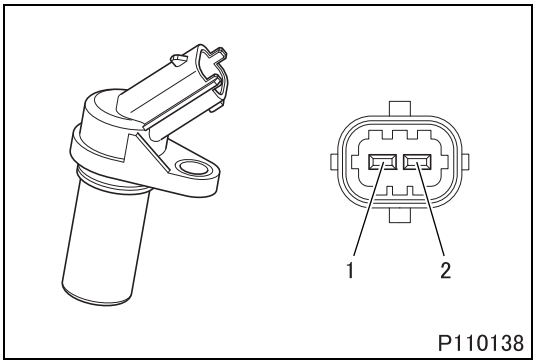


#262 Inspection of water temperature sensor

- Dip the sensor in a container filled with engine oil.
- Raise the oil temperature to each specification below while stirring the oil.
- Measure resistance values between terminals 1 and 2.

Standard value	–30°C {–22°F}	22.307 to 310.194 kΩ
	20°C {68°F}	2.262 to 2.760 kΩ
	80°C {176°F}	0.304 to 0.342 kΩ
	120°C {248°F}	0.106 to 0.119 kΩ

- If the measured value deviates from the standard value, replace the sensor. (See Gr14.)

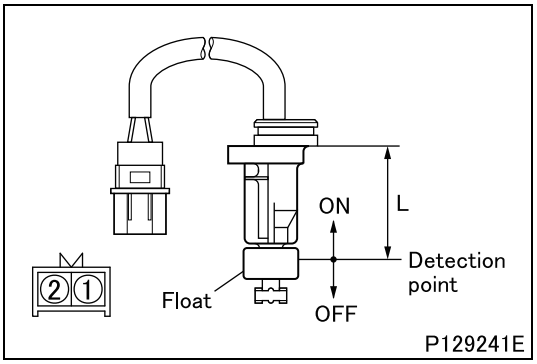


#263 Inspection of engine speed sensor

- Measure the resistance value between terminals 1 and 2.

Standard value (at 20°C {68°F})	860 ± 86 Ω

- If the measured value deviates from the standard value, replace the sensor. (See Gr11.)

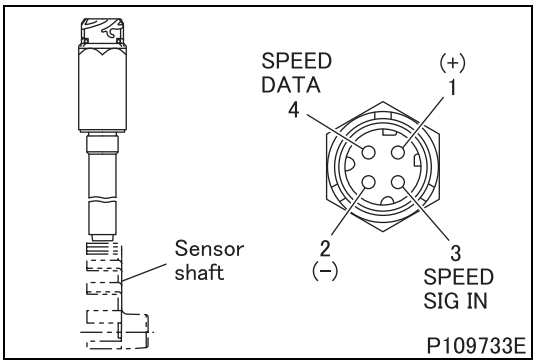


#264 Inspection of engine oil level sensor

Switch position	Continuity terminal
OFF	-
ON	1-2

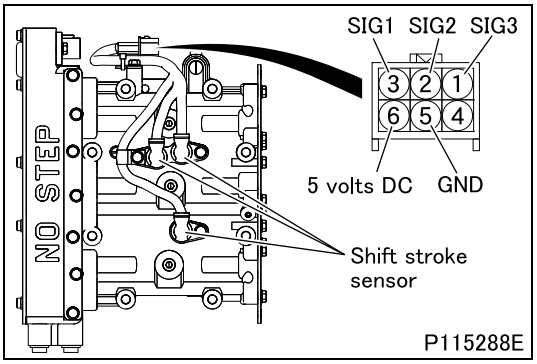
L: 45.6 ± 2 mm <FG>
50.6 ± 2 mm <FE>

- If any fault is found, replace the sensor. (See Gr12.)



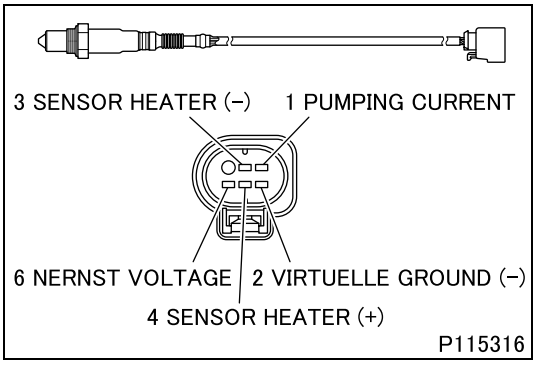
#265 Inspection of vehicle speed sensor

- While applying a voltage of 6.5 to 9 V between terminals 1 and 2, rotate the sensor shaft.
- Check the signals of terminal 3 (SPEED SIG IN) and terminal 4 (SPEED DATA). If no signals are found, replace the sensor. (See Gr22.)



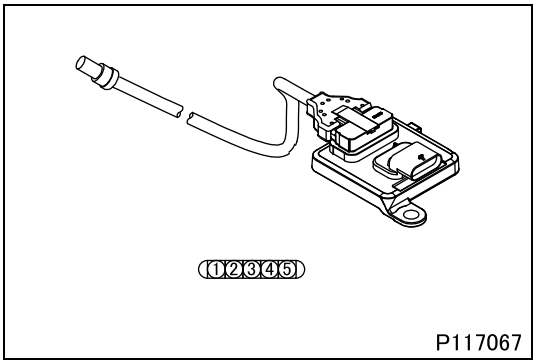
#296 Inspection of shift stroke sensor (connector)

- Because it is not easy to independently check the sensor for the functions, check the FUSO Diagnostics service data using the FUSO Diagnostics.
- Replace the gear shift unit if there is any fault in the sensor.



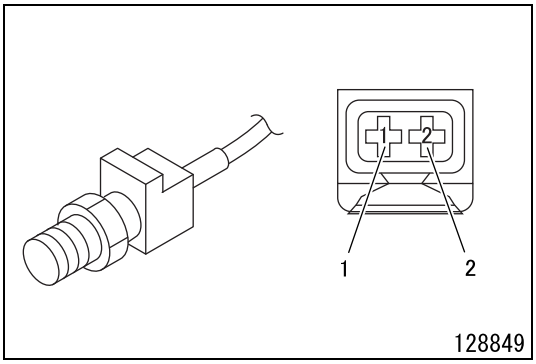
#297 Inspection of lambda sensor

- Because it is not easy to check these sensor individually, determine quality of the sensor indirectly by checking related parts, such as harnesses, etc. in the system.
- If any fault is not found in the related parts, and the problem still remains in the system, replace the sensor. (See Gr15.)



#298 Inspection of NOx sensor

- Because it is not easy to check these sensor individually, determine quality of the sensor indirectly by checking related parts, such as harnesses, etc. in the system.
- If any fault is not found in the related parts, and the problem still remains in the system, replace the sensor. (See Gr17.)
  - NOx sensor 1
  - NOx sensor 2

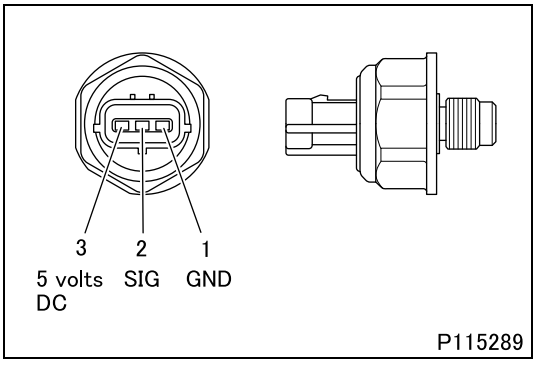


#299 Inspection of intercooler outlet temperature sensor

- Measure the resistance between terminals 1 and 2.
- See the chart below for normal resistance versus temperature.

Standard value	-40°C {-40°F}	45313Ω
	-30°C {-22°F}	26114Ω
	-20°C {-4°F}	15462Ω
	-10°C {14°F}	9397Ω
	0°C {32°F}	5896Ω
	10°C {50°F}	3792Ω
	20°C {68°F}	2500Ω
	30°C {86°F}	1707Ω
	40°C {104°F}	1175Ω
	50°C {122°F}	834Ω
	60°C {140°F}	595.5Ω
	70°C {158°F}	435.7Ω
	80°C {176°F}	322.5Ω
	90°C {194°F}	243.2Ω
	100°C {212°F}	186.6Ω
	110°C {230°F}	144.2Ω
	120°C {248°F}	112.7Ω
	130°C {266°F}	89.3Ω

- Check if the measured value is within the standard value by comparing the measured value with the value according to the chart and outside temperature.
- Measure resistance between each pin to sensor body. Resistance should be greater than 1 MΩ (open circuit).
- If the measurement is out of standard value, replace the sensor. (See Gr15.)

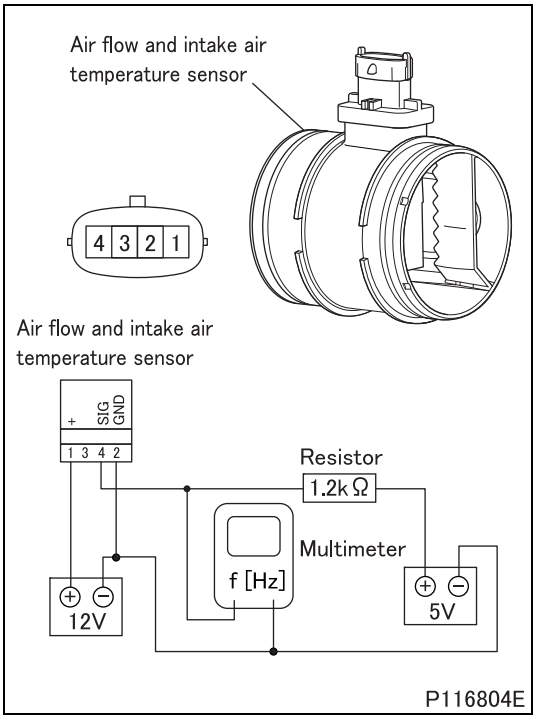


#302 Inspection of brake fluid pressure sensor

- Apply 5 volts DC to terminals 1 and 3.
- Measure the output voltage occurring at terminals 2 and 3.

Standard value	0.5 V

- If the measured value deviates from the standard value, replace the sensor.



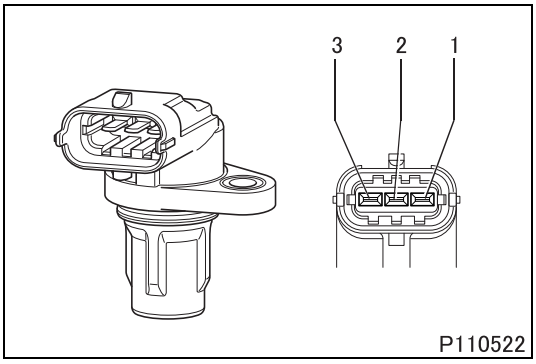
#306 Inspection of air flow and intake air temperature sensor

<Inspection of on-vehicle condition>

- Using the FUSO Diagnostics, check if its service data changes in accordance with changes in the engine speed.
- Replace the sensor if the service data is not changed. (See Gr15.)

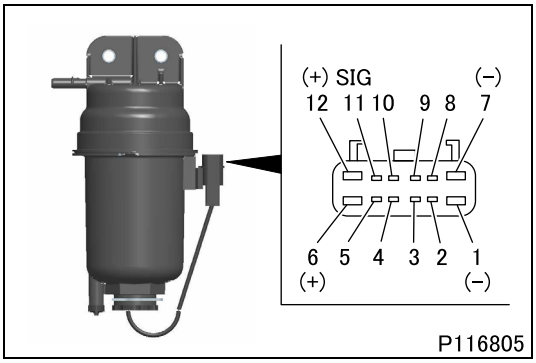
<Inspection of standalone condition>

- Connect the air flow and intake air temperature sensor, multimeter capable of measuring frequency output, resistor and batteries as shown in the illustration.
- Blow air against the sensor and check if the frequency is changed.
- Replace the sensor if the frequencies not changed. (See Gr15.)



#320 Inspection of camshaft timing sensor

- Apply 5 volts DC to terminals 3 and 1 and measure, using a multimeter the output from terminal 2 and 1.
- With no metallic part close to sensor tip the output should be 5 V.
- Approach the sensor tip to a metallic part. The output should become 0 V when it comes to approx. 1mm {0.039in.} to the part.
- If the measurement is out of specification, replace the sensor. (See Gr11.)
- This kind of test is made in static condition, and it isn't able to detect all sensor failure mode on the engine during normal functioning.

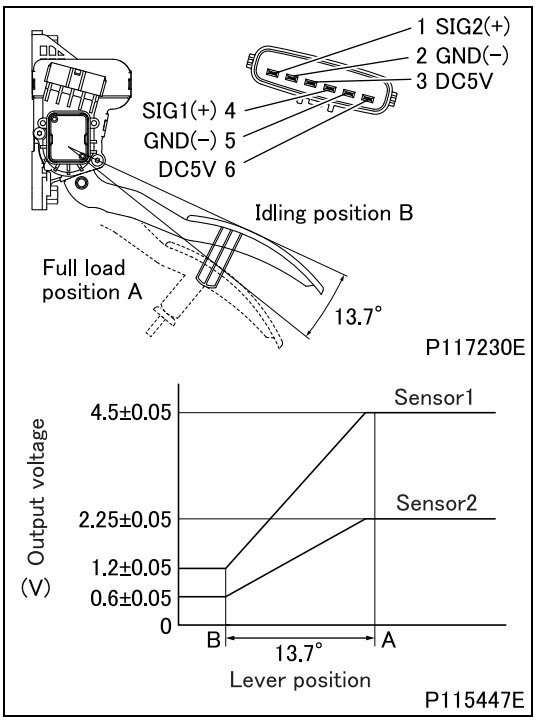


#323 Inspection of fuel filter (fuel temperature sensor)

- Measure the resistance between terminals 8 and 9.

Standard value	–30°C {–22°F}	26.114 ± 2.533 Ω
	0°C {32°F}	5.896 ± 0.430 Ω
	25°C {77°F}	2.057 ± 0.115 Ω
	60°C {140°F}	596 ± 23 Ω
	100°C {212°F}	186 ± 4 Ω
	110°C {230°F}	144 ± 3.456 Ω

- If the measurement is out of specification, replace the fuel filter. (See Gr13.)

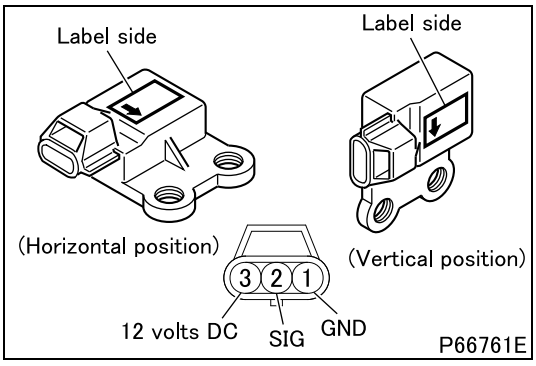


#324 Inspection of accelerator pedal position sensor

- Apply 5 volts DC to terminals 6 and 5 (sensor 1) and terminals 3 and 2 (sensor 2) of the accelerator pedal position sensor.
- Measure the output voltage at terminals 4 and 5 (sensor 1) and the output voltage at terminals 1 and 2 (sensor 2) with the accelerator lever in each specified position.

	Lever position	Output voltage	
Standard value	Full load position A	Sensor 1	4.5 ± 0.05 V
		Sensor 2	2.25 ± 0.05 V
	Idling position B	Sensor 1	1.2 ± 0.05 V
		Sensor 2	0.6 ± 0.05 V

- If the measurement is out of specification, replace the sensor.

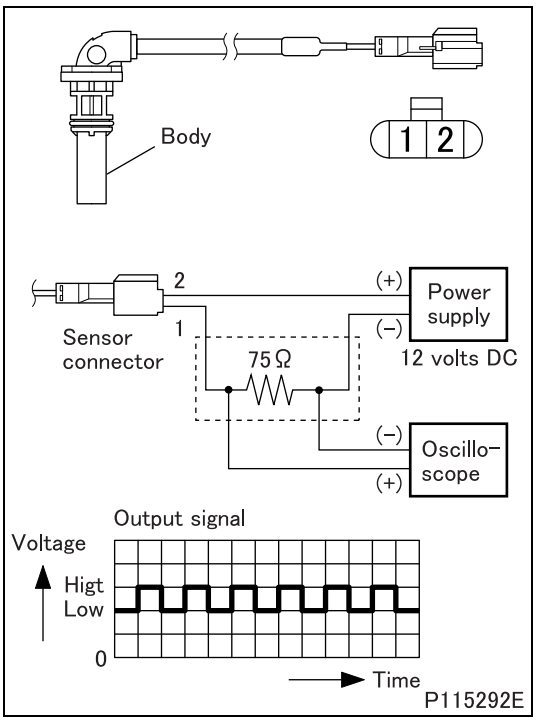


#327 Inspection of G sensor

- Apply a 12 volts DC across terminals 3 and 1 of the G sensor.
- Measure the G sensor output voltage between terminals 2 and 1 for both when the sensor is in a horizontal position and when it is in a vertical position.

Standard value	Horizontal position	2.3 to 2.7 V
	Vertical position	3.3 to 3.7 V

- If any of the measurements is not within the standard value range, replace the sensor.



#329 Inspection of wheel speed sensor

<FE>

- Perform the following check. Replace the wheel speed sensor if any fault is found.

CAUTION ⚠

- **The wheel speed sensor has a magnet in it. Be careful not to allow metal pieces to attach the sensor.**

(1) Output voltage

- Because output check using the anti-lock brake system rotor is required, follow the steps below to measure the output voltage with the sensor mounted on the vehicle.
- Jack up the wheel to be measured, then remove the connector of the wheel speed sensor.
- Connect the terminals of the removed connector to an oscilloscope as shown in the circuit diagram, then check the voltage on the oscilloscope while rotating the wheel by hand at a constant speed.

Standard value	High	$1.05^{+0.21}_{-0.16}$ V
	Low	$0.53^{+0.10}_{-0.09}$ V

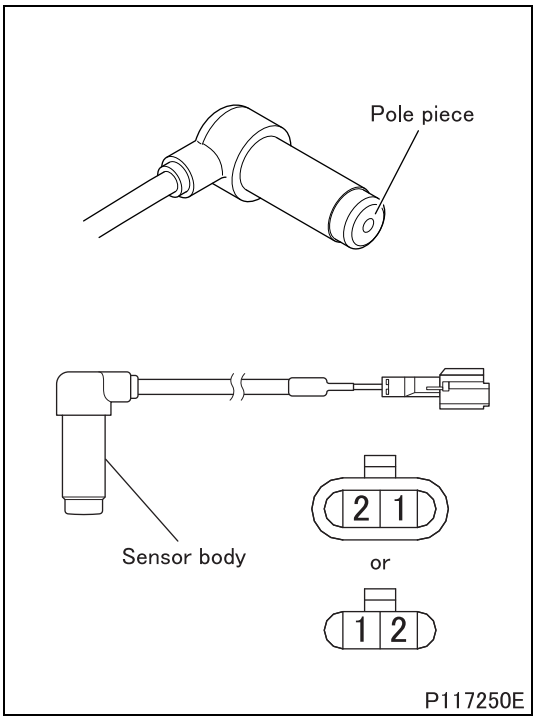
(2) Insulation resistance

- Measure the resistance between terminal 1 and body and between terminal 2 and body.

Standard value	5 MΩ or above

(3) Open circuit

- If there is an open circuit, remove the clamp on the harness from the vehicle, then check for transient open circuit while bending and stretching the harness at the clamp. Also, check the connection conditions of the connector terminals.



<FG>

- Carry out the following checks. If faulty, replace the wheel speed sensor.

CAUTION ⚠

- **The pole piece is magnetized by the magnet housed in the wheel speed sensor. Be careful not to allow metal parts to stick onto the pole piece.**

(1) Resistance between terminals

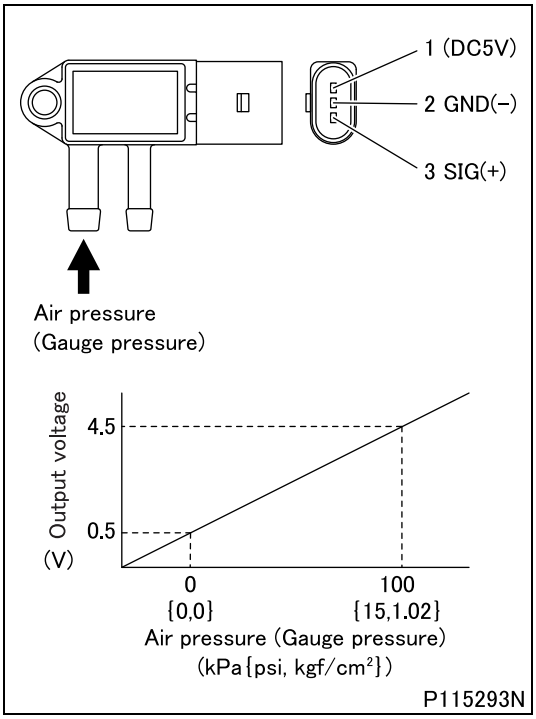
Standard value	1.4 ± 0.2 kΩ

(2) Insulation resistance (between the sensor body and each terminal)

Standard value	1 MΩ or above

(3) Open circuit

- If open circuit is suspected, remove the harness clamps and wiggle the harness to determine whether it is an intermittent fault or not. Check also the connector terminals for proper connection.

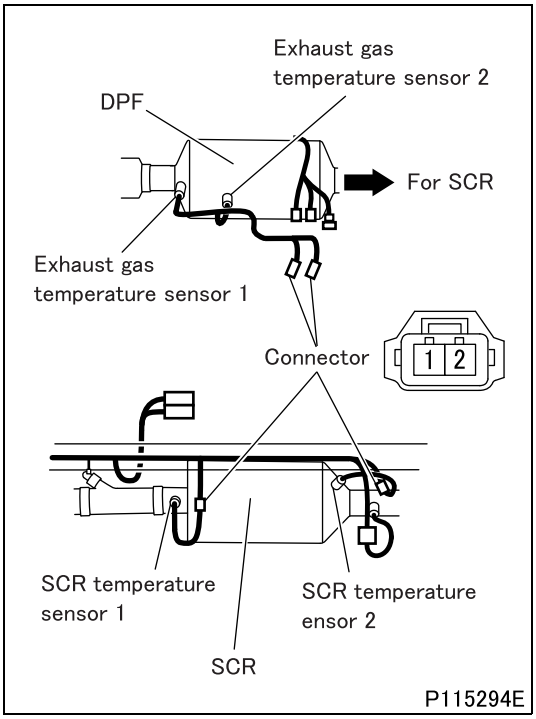


#334 Inspection of DPF differential pressure sensor

- Apply 5 volts DC to terminals 1 and 2.
- Apply air pressure (gauge pressure) and measure the output voltage occurring at terminals 2 and 3 (left figure).

Standard value	0 kPa {0 psi, 0 kgf/cm^2}	0.5 V
	100 kPa {15 psi, 1.02 kgf/cm^2}	4.5 V

- If the measurement is out of specification, replace the sensor. (See Gr17.)

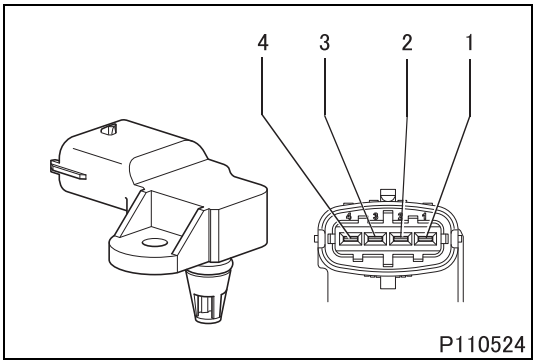


#336 Exhaust gas temperature sensor 1, 2, SCR temperature sensor 1, 2

- Measurement must be carried out with DPF (diesel particulate filter) cooled enough.
- Unplug electrical connector, but do not remove sensor from DPF and SCR (selective catalytic reduction).
- Measure the resistance between terminals 1 and 2.
- See the chart below for normal resistance versus temperature.

Standard value	–18°C {0°F}	187 Ω
	–12°C {10°F}	191 Ω
	–7°C {19°F}	195 Ω
	–1°C {30°F}	200 Ω
	0°C {32°F}	201 Ω
	4°C {39°F}	204 Ω
	10°C {50°F}	208 Ω
	16°C {61°F}	212 Ω
	21°C {70°F}	217 Ω
	27°C {81°F}	221 Ω
	32°C {90°F}	225 Ω
	38°C {100°F}	229 Ω

- Check if the measured value is within the standard value by comparing the measured value with the value according to the chart and outside temperature.
- Measure resistance between each pin to sensor body. Resistance should be greater than 1 MΩ (open circuit).
- If the measurement is out of standard value, replace the sensor. (See Gr17.)



#346 Inspection of boost pressure and temperature sensor

(1) Boost pressure sensor inspection

- Apply 5 volts DC to terminals 3 and 1.
- Apply air pressure and gradually increase it, measuring the output voltage occurring at terminals 2 and 1.

	Air pressure (gauge)	Voltage
Standard value	100 kPa {15 psi, 1 kgf/cm^2}	3 V
	250 kPa {36 psi, 2.5 kgf/cm^2}	4.35 V

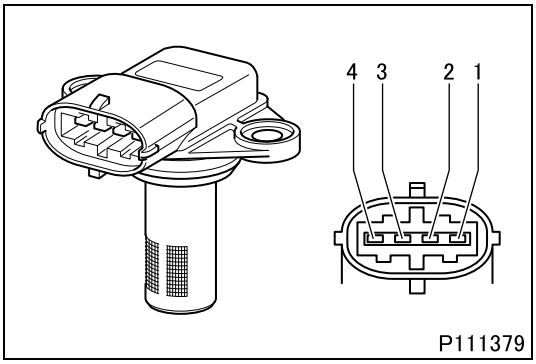
- If the measured value deviates from the standard value, replace the sensor. (See Gr15.)

(2) Boost temperature sensor inspection

- Place the sensor in ambient with temperature controlled to 20°C {68°F} for 15 min.
- Measure the resistance between terminals 2 and 1.

Standard value	0°C {32°F}	5895 ± 250 Ω
	20°C {68°F}	2499 ± 80 Ω
	40°C {104°F}	1174 ± 30 Ω

- If the measured value deviates from the standard value, replace the sensor. (See Gr15.)



#347 Inspection of humidity and intake air temperature sensor

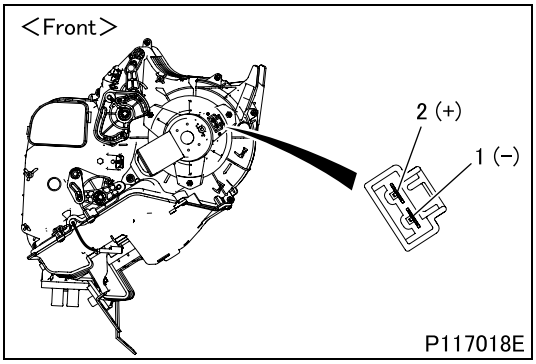
- Measure the resistance value between terminals 4 and 3.

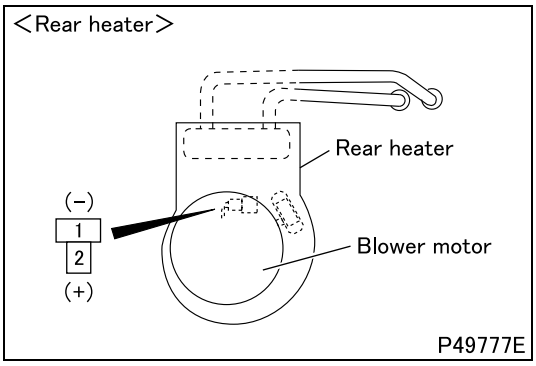
Standard value	0°C {32°F}	5750 to 6230 Ω
	30°C {86°F}	1759 to 1875 Ω
	60°C {140°F}	634 to 690 Ω
	90°C {194°F}	265 to 293 Ω

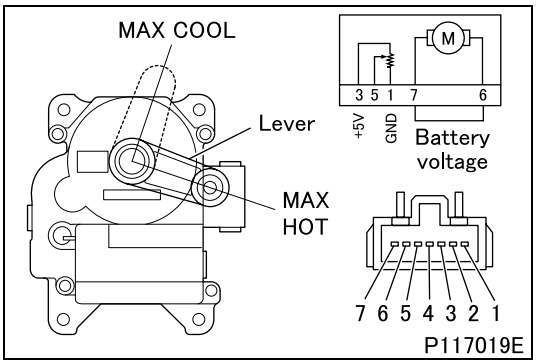
- If the measurement is out of standard value, replace the sensor. (See Gr15.)

#350 Inspection of control unit and other units

- Since the units alone cannot be readily checked off the vehicle, check the harness, switch and other related parts in each system.
- If any unit is found giving out diagnosis output, check the issued diagnosis code to identify the cause of existing faults, and replace such unit or electronic control unit, if its malfunction is determined.
- If faults are not found in the related parts, and the problem still remains in the system, replace the control units or other units.







#411 Inspection of blower motor

- Make sure that the motor operates when 12 volts DC is applied between each terminal.
- If any fault is found, replace the motor. (See Gr55.)

#413 Inspection of air mixing motor

- Perform the following checks, and if any fault is found, replace the motor. (See Gr55.)

(1) Inspection of motor

- Make sure that the motor operates when 12 volts DC is applied between each terminal.

Lever position	Continuity terminal
MAX HOT	(+) 6–7 (–)
MAX COOL	(+) 7–6 (–)

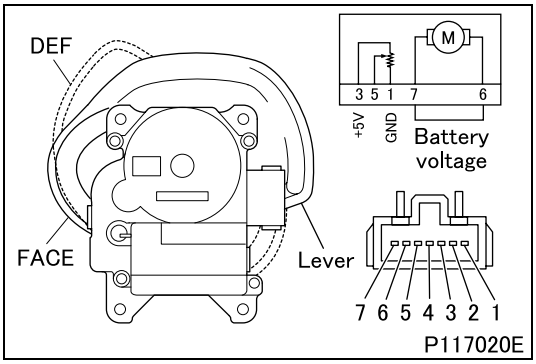
CAUTION ⚠

- **Stop voltage application when the lever stops.**
- **After inspection of the motor, return the lever to a position within the range of MAX HOT to MAX COOL.**

(2) Inspection of potentiometer

- Apply 5 volts DC between the terminals 1 and 3 and measure the voltage between the terminals 1 and 5.

Lever position	Standard value
MAX HOT	4 ± 0.03
MAX COOL	1 ± 0.03



#414 Inspection of mode motor

- Perform the following checks, and if any fault is found, replace the motor. (See Gr55.)

<Fully automatic air-conditioner>

(1) Inspection of motor

- Make sure that the motor operates when 12 volts DC is applied between each terminal.

Lever position	Continuity terminal
FACE	(+) 6–7 (–)
DEF	(+) 7–6 (–)

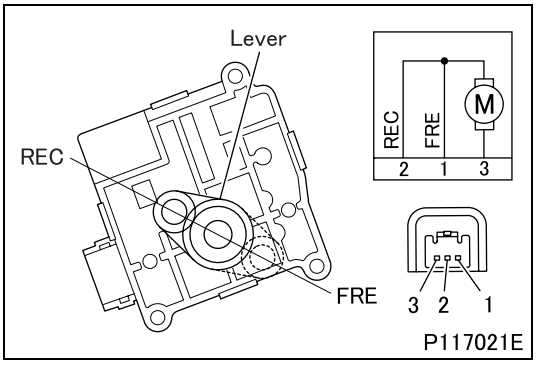
CAUTION ⚠

- **Stop voltage application when the lever stops.**
- **After inspection of the motor, return the lever to a position within the range of FACE to DEF.**

(2) Inspection of potentiometer

- Apply 5 volts DC between the terminals 1 and 3 and measure the voltage between the terminals 1 and 5.

Lever position	Standard value
FACE	4.5 ± 0.03
DEF	0.5 ± 0.03



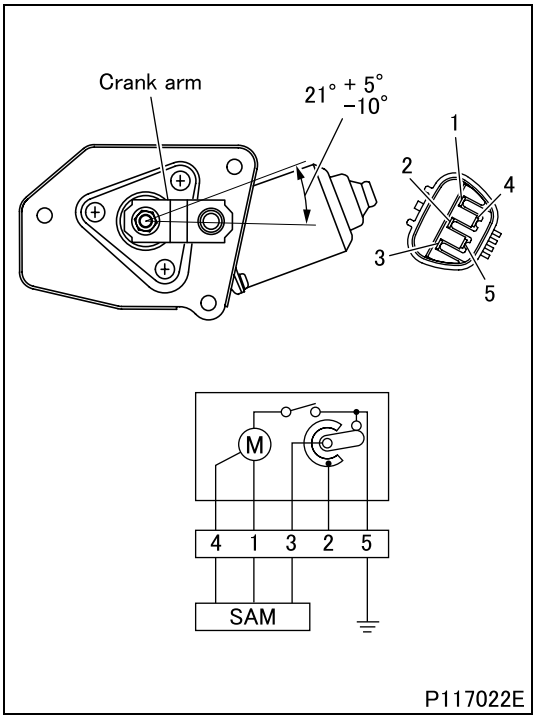
#415 Inspection of fresh/recirculation changeover motor

- Perform the following checks, and if any fault is found, replace the motor. (See Gr55.)
- Make sure that the motor operates when 12 volts DC is applied between each terminal.

Lever position	Continuity terminal
REC (inside air)	(+) 3–2 (–)
FRE (outside air)	(+) 3–1 (–)

CAUTION ⚠

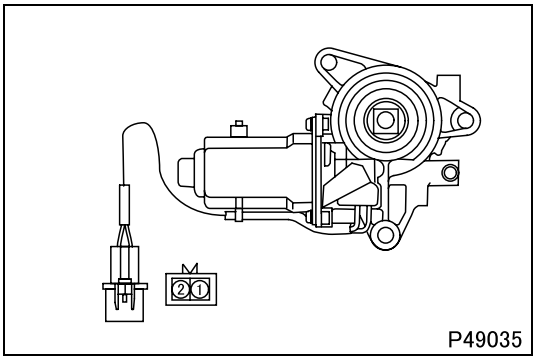
- **Stop applying 12 volts DC if the lever stops spontaneously at the REC or FRE position.**



P117022E

#422 Inspection of wiper motor

- Because it is not easy to check these switches individually, determine the quality of the motor indirectly by checking related parts, such as harnesses, power window motor, etc. in the system.
- If there is nothing abnormal in related parts, but there is still something wrong with the system, then replace the motor. (See Gr51.)



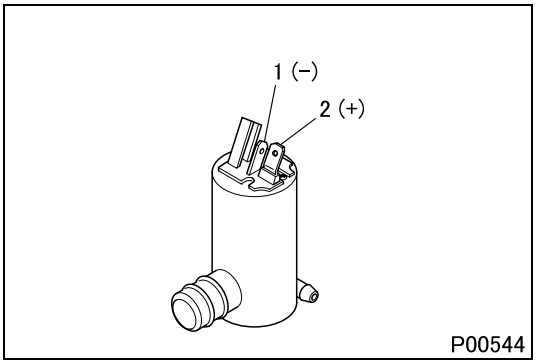
P49035

#423 Inspection of power window motor

- Make sure that the motor operates when 12 volts DC is applied between each terminal.

Rotation direction	Continuity terminal
Left	(+) 2–1 (–)
Right	(+) 1–2 (–)

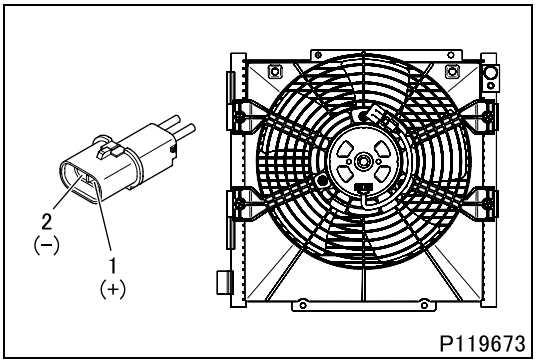
- If any fault is found, replace the motor and the regulator as a set. (See Gr43.)



P00544

#428 Inspection of windshield washer motor

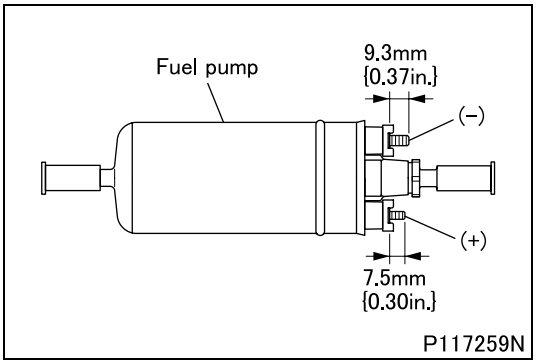
- Make sure that the motor operates when 12 volts DC is applied between each terminal.
- If any fault is found, replace the motor. (See Gr51.)



P119673

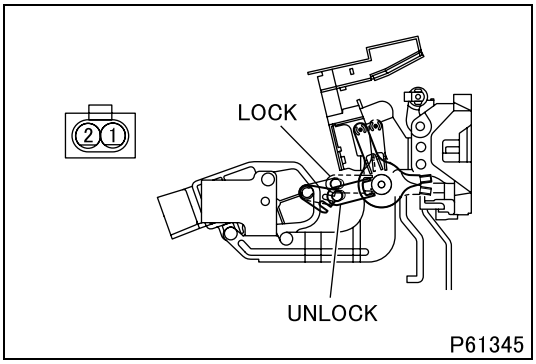
#431 Inspection of condenser fan motor

- Make sure that the motor operates when 12 volts DC is applied between each terminal.
- If any fault is found, replace the condenser. (See Gr55.)



#497 Inspection of fuel pump

- Make sure that the motor operates when battery voltage is applied between each terminal.
- If any fault is found, replace the fuel pump. (See Gr13.)

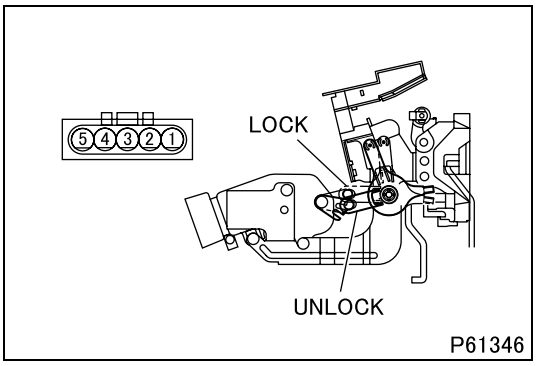


#510 Inspection of door lock actuator (passenger's seat side)

- Make sure that the actuator operates when 12 volts DC is applied between each terminal.

Switch position	Terminal
LOCK	(+) 1–2 (–)
UNLOCK	(+) 2–1 (–)

- If any fault is found, replace the actuator. (See Gr43.)

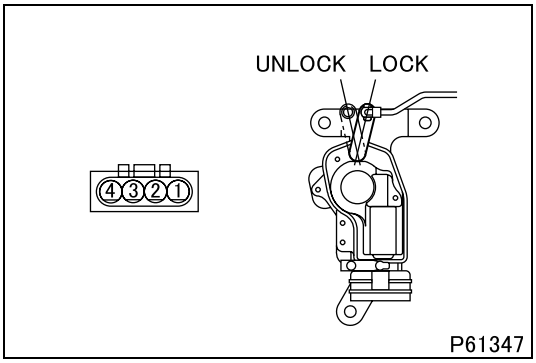


#511 Inspection of door lock actuator (driver's seat side)

- Make sure that the actuator operates when 12 volts DC is applied between each terminal.

Switch position	Continuity terminal	Terminal
LOCK	1–2	(+) 3–4 (–)
UNLOCK	1–5	(+) 4–3 (–)

- If any fault is found, replace the actuator. (See Gr43.)



#512 Inspection of rear door lock actuator

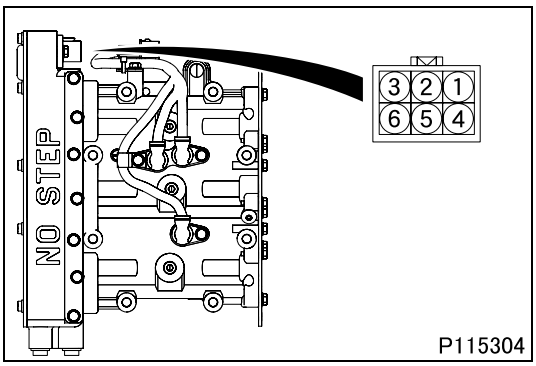
- Make sure that the actuator operates when 12 volts DC is applied between each terminal.

Switch position	Terminal
LOCK	(+) 2–3 (–)
UNLOCK	(+) 3–2 (–)

- If any fault is found, replace the actuator. (See Gr43.)

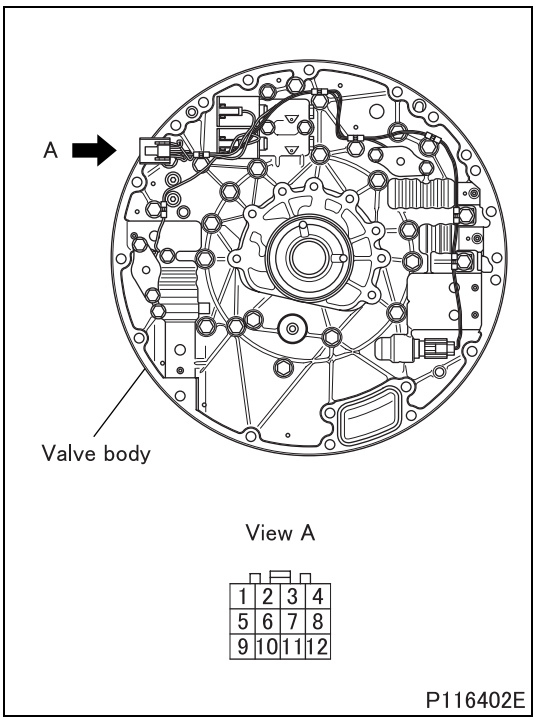
#530 Inspection of EGR actuator

- Because it is not easy to check these actuator individually, determine quality of the actuator indirectly by checking related parts, such as harnesses, power window motor, etc. in the system.
- If any fault is not found in the related parts, and the problem still remains in the system, replace the EGR actuator. (See Gr17.)



#534 Inspection of gear shift unit

- Because it is not easy to independently check the sensor for the functions, check the FUSO Diagnostics service data using the FUSO Diagnostics. (See Gr22.)
- Replace the gear shift unit if there is any fault in the sensor. (See Gr22.)



#535 Inspection of valve body (connector)

(1) Inspection of solenoid valve 1, 2

- Measure the resistance between terminals 3 and 7, and terminals 4 and 8.

Standard value (at 20°C {68°F})	5.3 ± 0.5 Ω

- If the measured value deviates from the standard value, replace the valve body. (See Gr22.)

(2) Inspection of solenoid valve (cooling) and solenoid valve (relief)

- Gradually apply DC current between each terminals starting from 0 V.
- Measure the voltage at which the cooling valve and relief valve operates.

Standard value (minimum operating voltage)	Solenoid valve (relief)	1-body	8 V or less
	Solenoid valve (cooling)	2-body	

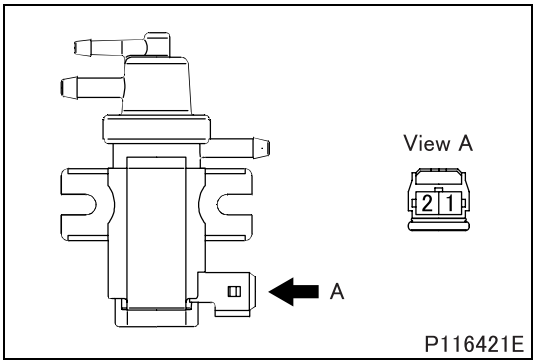
- If the measured value deviates from the standard value, replace the valve body.

(3) Inspection of oil temperature sensor

- Measure the resistance between terminals 5 and 6.

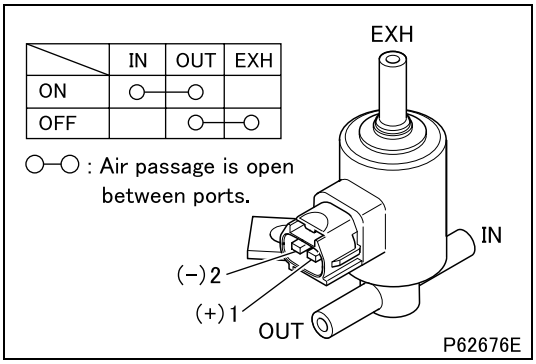
Standard value (at 20°C {68°F})	2.31 to 2.59 kΩ

- If the measured value deviates from the standard value, replace the valve body. (See Gr22.)



#536 Inspection of vacuum modulator

- Apply battery voltage between each terminals confirm that the vacuum modulator operates.
- If any fault is found, replace the vacuum modulator. (See Gr15.)



#565 Inspection of 3-way magnetic valve

<Type-1>

- Perform the following checks, and if any fault is found, replace the 3-way magnetic valve.

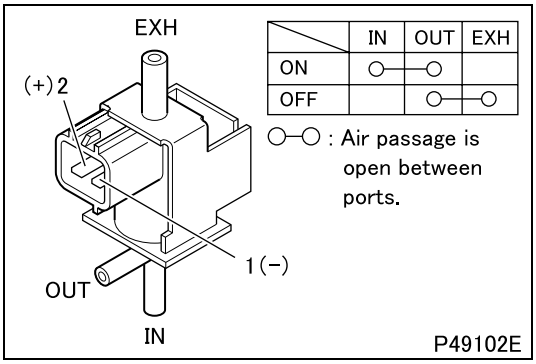
(1) Operation check

- Gradually apply DC current between each terminal starting from 0 V.
- Measure the voltage when the 3-way magnetic valve operates. (Determine ON/OFF of the magnetic valve by operating noises.)

Standard value (minimum operating voltage)	11 V or less

(2) Inspection of continuity and air tightness

- Negative pressure when inspected: –99.99 kPa {–29.5 in.Hg, –750 mmHg}



<Type-2>

- Perform the following checks, and if any fault is found, replace the 3-way magnetic valve.

(1) Operation check

- Gradually apply DC current between each terminal starting from 0 V.
- Measure the voltage at which the 3-way magnetic valve operates. (Determine ON/OFF of the magnetic valve by operating noises.)

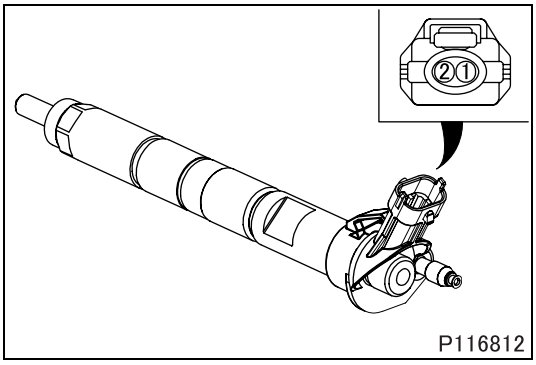
Standard value (minimum operating voltage)	8 V or less

(2) Inspection of continuity and air tightness

- Negative pressure when inspected: –60 kPa {–17.7 in.Hg, –450 mmHg}

#572 Inspection of FMU (fuel metering unit)

- Because it is not easy to check these FMU (fuel metering unit) individually, determine quality of the FMU (fuel metering unit) indirectly by checking related parts, such as harnesses, etc. in the system.
- If any fault is not found in the related parts, and the problem still remains in the system, replace the FMU (fuel metering unit).

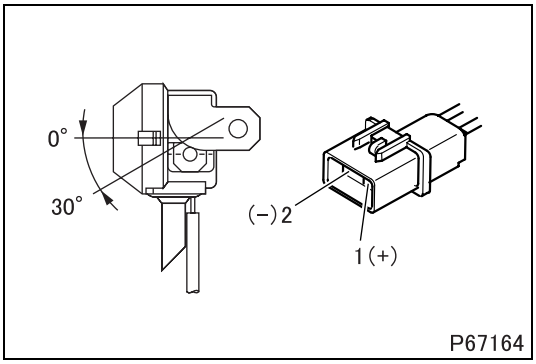


#582 Inspection of injector

- Measure the resistance between terminals 1 and 2.

Standard value (at 20°C {68°F})	180 ± 30 kΩ

- If the measurement is out of specification, replace the injector. (See Gr13.)
- If an injector was replaced with a new one, the data must be written and reset in the engine electronic control unit.
- For the data writing and resetting work, consult your nearest authorized dealer or distributor.



#614 Inspection of back buzzer

[Inspection]

- Make sure to confirm if the buzzer intermittently sounds by applying the 12 volts DC between each terminal.
- If any fault is found, replace the buzzer.

[Installation]

- Install the backup buzzer to the frame in the range of angles as illustrated.

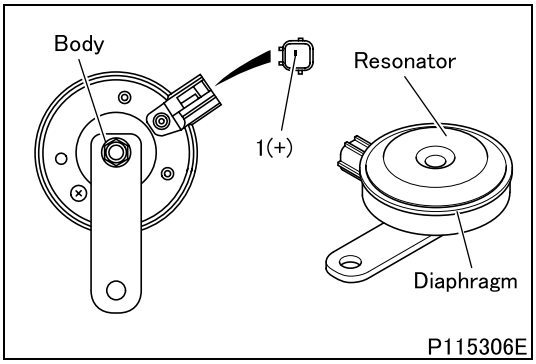
CAUTION ⚠

- **Be aware that if the installed angle of the buzzer is out of the range as illustrated, water in the buzzer will not drain normally.**

#615 Inspection of electric horn

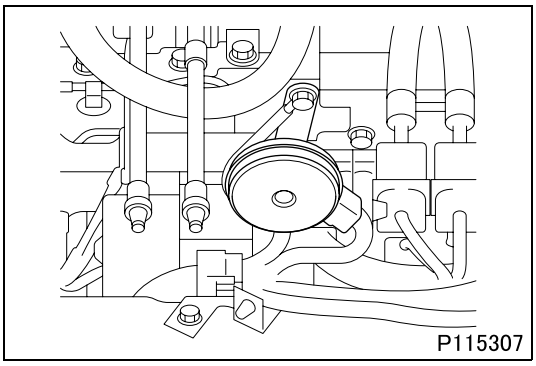
CAUTION ⚠

- **Bending the stay changes the sound quality of the horn, degrading the horn performance.**
- **Never bend or damage the stay.**



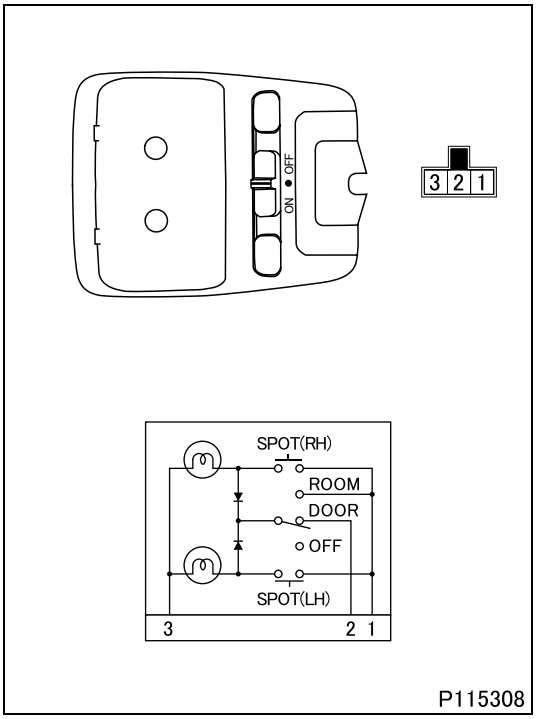
[Inspection]

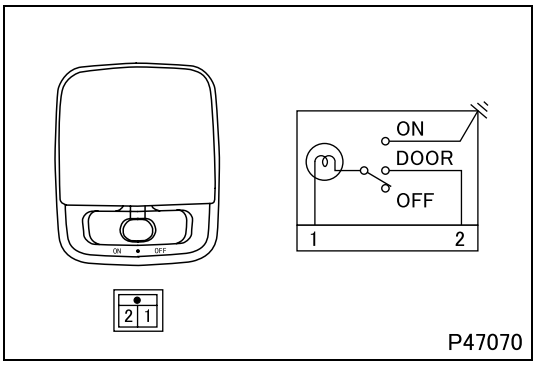
- Make sure to confirm whether the horn sounds by applying the 12 volts DC between terminals 1 and body.
- Remove foreign substances adhered to the resonator and diaphragm.
- If any fault is found, replace the horn.



[Installation]

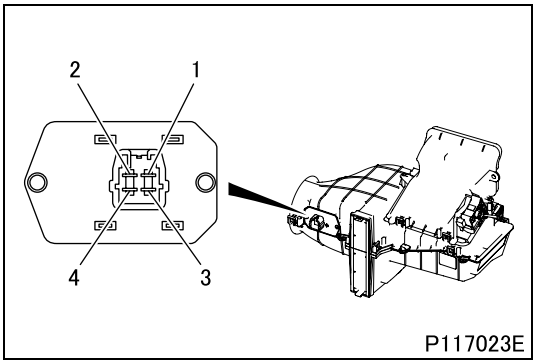
- Install in the direction as illustrated.





#656 Inspection of cab and spot lamp

- If any fault is found, replace the lamp.



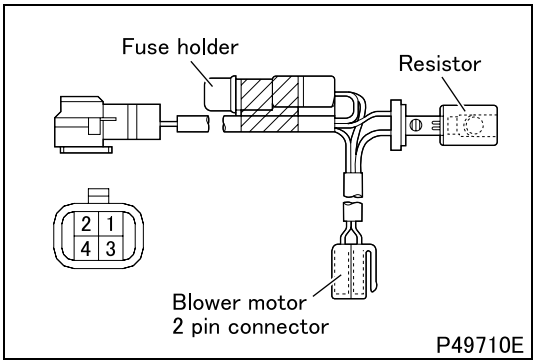
#750 Inspection of blower resistor

<Front air-conditioner (manual)>

- Measure resistance values between each terminals.

Fan speed	Terminal	Standard value
MEDIUM HIGH	2–4	0.56 ± 0.0392 Ω
MEDIUM LOW	3–4	1.56 ± 0.109 Ω
LOW	1–4	3.36 ± 0.235 Ω

- If the measured value deviates from the standard value, replace the blower resistor. (See Gr55.)

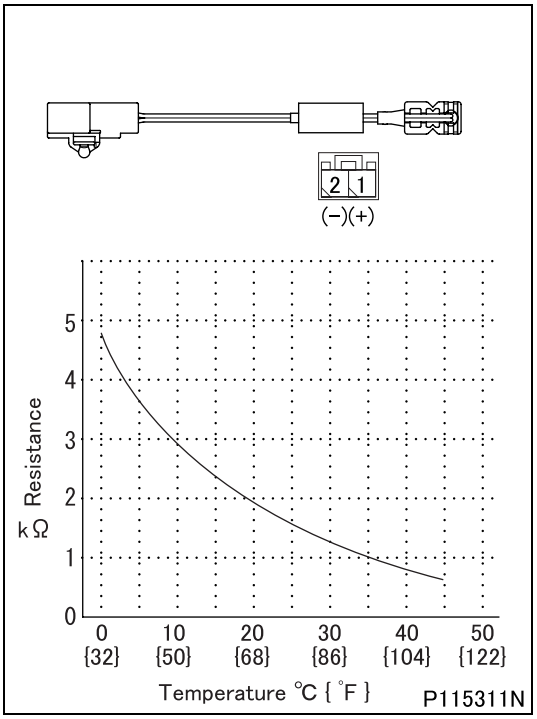


<With rear heater>

- Measure resistance value between terminals 1 and 4.

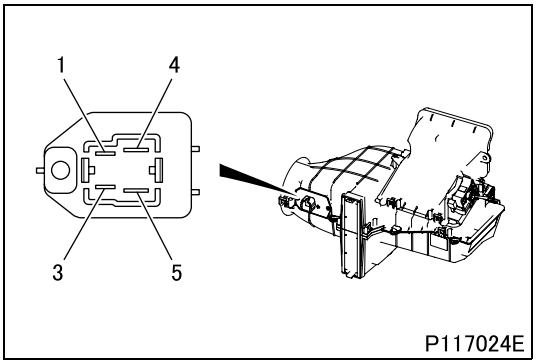
Fan speed	Terminal	Standard value
LOW	1–4	3 Ω

- If the measured value deviates from the standard value, replace the blower resistor. (See Gr55.)



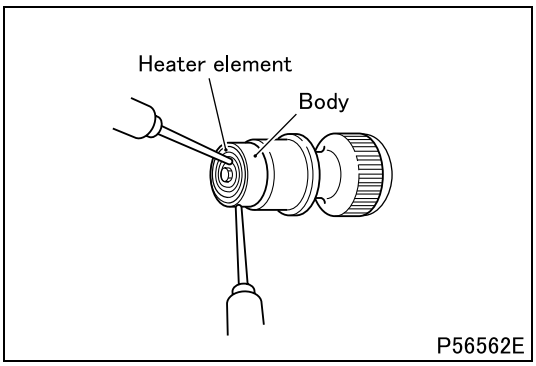
#751 Inspection of thermostat

- Measure the output voltage between terminals 1 and 2 at the specified temperatures.
- If the measured value deviates from the characteristic shown in the table at left, replace the sensor. (See Gr55.)



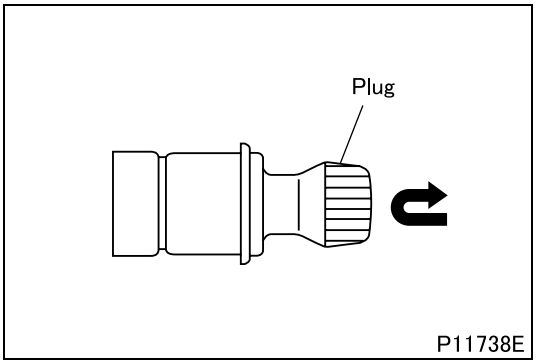
#752 Inspection of power MOS-FET (transistor)

- Perform the following checks, and if any fault is found, replace the power transistor. (See Gr55.)
  - Start the engine and operate the blower in the HI mode. Check that a high blower output equivalent to HI is obtained.
  - Operate the control to step down the flow of air. Check that the blower output equally decreases gradually.
  - Check that nothing is abnormal with the blower motor, wiring, air conditioner electronic control unit, control panel and related parts. If the blower motor is inoperative in that state, the power MOS-FET (transistor) should be faulty.



#754 Inspection of cigarette lighter

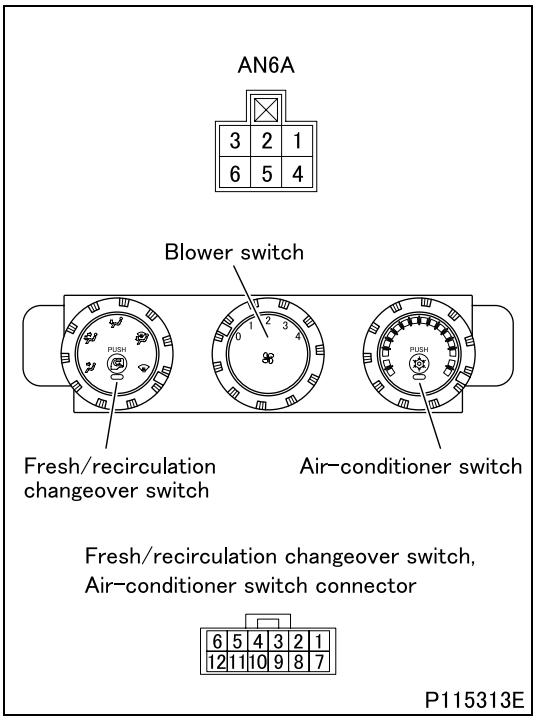
- Perform the following checks, and if any fault is found, replace the cigarette lighter. (See Gr52.)
- Make sure that there is continuity between heater element and body.



- Make sure that when plug is pushed in by hand, it immediately returns to its original position.
- Place the starter switch at ACC or ON position.
- Push plug into the socket in the cab.
- Measure the time required for plug to automatically return.

Standard value	15 ± 5 seconds

- Check to see that heater element is red-hot.



#763 Inspection of heater control panel

- Perform the following checks, and if any fault is found, replace the heater control panel. (See Gr52.)

(1) Blower switch <AN6A connector>

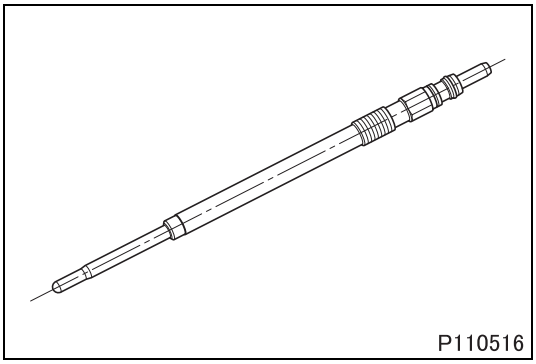
Switch position	Continuity terminal
0: OFF	–
1: LO (LOW)	1–2–4
2: ML (MEDIUM LOW)	1–3–4
3: MH (MEDIUM HIGH)	1–4–6
4: HI (HIGH)	1–4–5

(2) Fresh/recirculation changeover switch

Switch position	Continuity terminal	Operation illumination	Night illumination
OFF: Fresh air	6–12	–	(+) 9–10 (–)
ON: Recirculation air	5–12	(+) 1–12 (–)	

(3) Air-conditioner switch

Switch position	Continuity terminal	Operation illumination	Night illumination
OFF	–	–	(+) 9–10 (–)
ON	3–7	(+) 1–7 (–)	

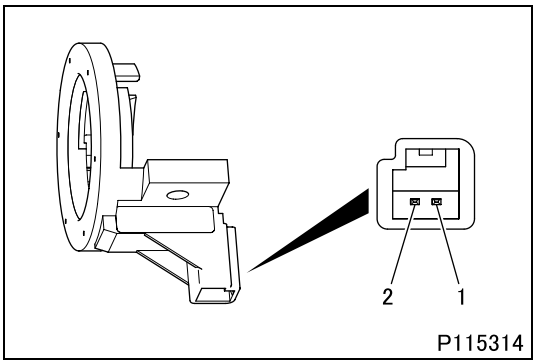


#764 Inspection of glow plug

- Measure the resistance between the housing and the connection pin using a multimeter.

Standard value (at 20°C {68°F})	0.6 to 1.0 Ω

- If the measured value deviates from the standard value, replace the glow plug. (See Gr11.)

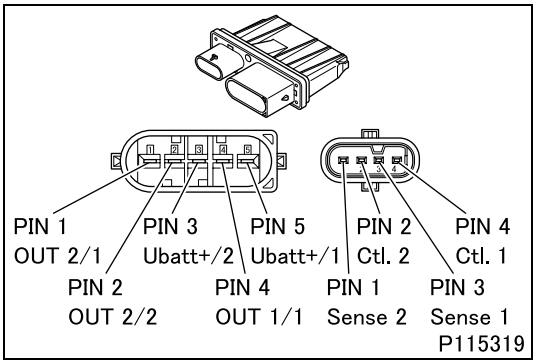


#771 Inspection of immobilizer antenna

- Measure the resistance between terminals 1 and 2.

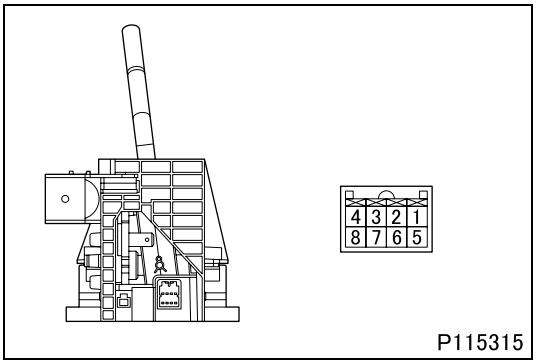
Standard value (at 25°C {77°F})	20 ± 2 Ω

- If the measured value deviates from the standard value, replace the immobilizer antenna.



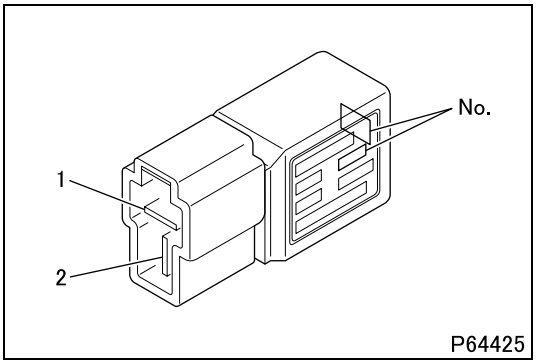
#773 Inspection of DEF heater power unit

- Because it is not easy to check these DEF heater power unit individually, determine quality of the DEF heater power unit indirectly by checking related parts, such as harnesses, etc. in the system.
- If any fault is not found in the related parts, and the problem still remains in the system, replace the DEF heater power unit. (See Gr17.)



#825 Inspection of shift lever unit

- Because it is not easy to check these shift lever unit individually, determine quality of shift lever unit indirectly by checking related parts, such as harnesses, etc. in the system.
- If any fault is not found in the related parts, and the problem still remains in the system, replace the shift lever unit. (See Gr22.)



#828 Inspection of controller area network resistor

- Measure the resistance of the resistor number marked on the controller area network resistor.

Standard value (at 20°C {68°F})	Resistor No.	1	270 ± 13.5 Ω
		2	510 ± 25.5 Ω
		3	820 ± 41 Ω
		4	1300 ± 65 Ω
		5	2000 ± 100 Ω
		6	3300 ± 165 Ω
		7	5600 ± 280 Ω
		8	15000 ± 750 Ω
		9	390 ± 19.5 Ω
		10	4300 ± 215 Ω
		11	9100 ± 455 Ω
		12	120 ± 6 Ω

- If the measurement is out of specification, replace the controller area network resistor with one that has the same resistor number and same specified resistance.

CAUTION ⚠

The controller area network resistor are matched to the engine. If you replace any of them, be sure to replace it with one that has the same resistor number.

DANGER ⚠

- **Since flammable hydrogen gas is generated by the battery be sure to obey the following warnings:**
  - **Do not short-circuit the (+) and (–) terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over battery.**
- **Because the battery electrolyte is made of diluted sulfuric acid and is corrosive, when handling battery wear safety glasses and rubber gloves to protect the eyes and hands.**

WARNING ⚠

- **Make sure that you disconnect battery cable (–) first when you disconnect battery cables.**

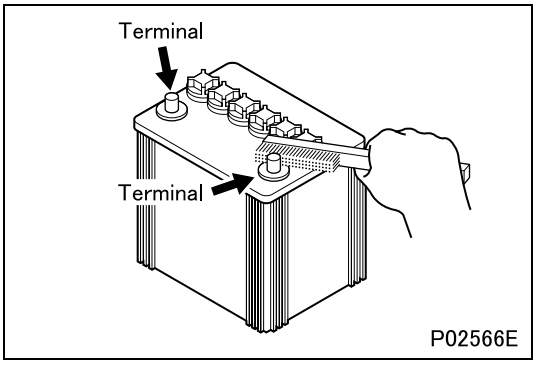
CAUTION ⚠

- **Make sure that all electrical switches of the vehicle are OFF before connecting battery cables.**
- **Make sure that you connect battery cable (+) before you connect battery cable (–).**
- **To prevent a short-circuit be sure that disconnected battery cables do not accidentally touch the battery terminals.**

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Specific gravity of battery electrolyte (20°C {68°F})	1.280	1.220	Charge or replace

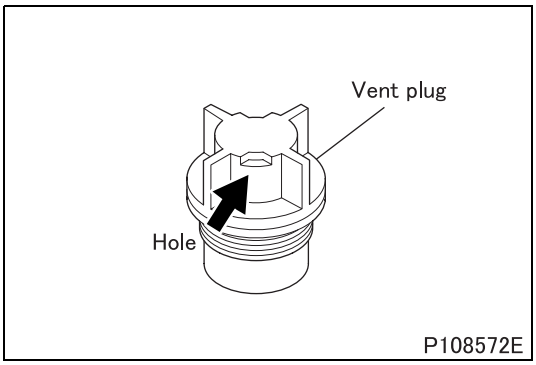
◆Service procedure◆



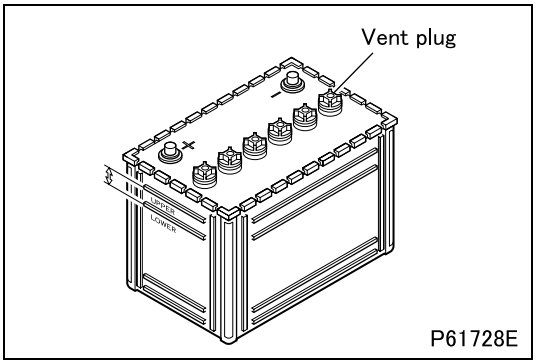
Inspection of battery

(1) Visual inspection

- If a terminal is corroded, remove the corrosion from it using a wire brush.
- If cracks or defects are found on battery, replace it since the cracks or defects can cause liquid spills.

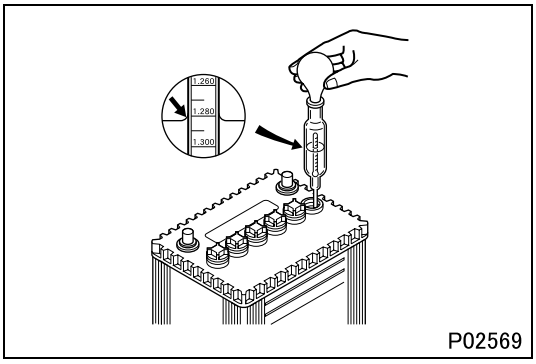


- If vent plug bleed hole is clogged, clean the hole.



(2) Inspection of fluid level

- Make sure that the battery electrolyte level is between UPPER and LOWER.
- If the level is below LOWER, remove the vent plug and fill the battery with distilled water or battery replenisher to UPPER.



(3) Measurement of specific gravity

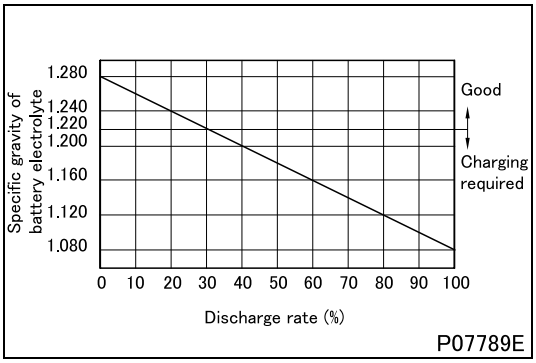
Measure the specific gravity of the battery electrolyte. If the measured value is lower than the limit, charge the battery.

NOTE

- **The specific gravity of the battery electrolyte depends on the liquid temperature. Use the following formula to convert the actual value to the value for a temperature of 20°C {68°F}.**

$S^{20} = S^t + 0.0007\ (t–20)$

S^{20} : Specific gravity at a temperature of 20°C {68°F}
S^t : Specific gravity actually measured with the temperature at t°C
t : Temperature of battery electrolyte



(4) Charging

- Although, as a rule, battery charging should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect battery cable (–).
- Remove vent plugs before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity / 10	*Amount of discharge (Ah) / Charge current (A) ×1.2 (to 1.5)	45 {113}
Quick charge	Value of 5-hour rating capacity / 1.5	0.5	55 {131}

* Amount of discharge (Ah) =

$$\text{5-hour rating capacity (Ah)} \times \frac{\text{Amount of discharge (\%)}}{100}$$

- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.

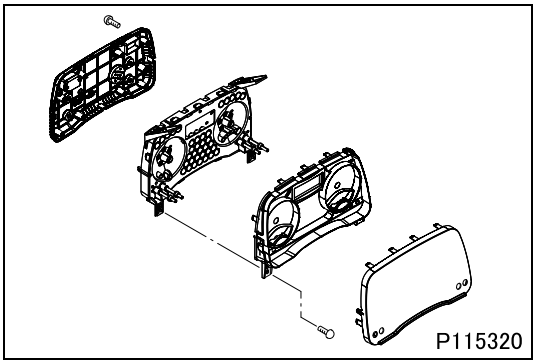
DANGER ⚠

- **Keep naked light away from the battery while charging to prevent explosion.**
- **It is dangerous to generate sparks while charging the battery.**
- **Do not charge battery if the electrolyte level is below LOWER LEVEL, since it can cause early deterioration, heating, or explosion. Make sure to add the fluid to the specified level before charging.**

WARNING ⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **After charging the battery, tighten vent plug, wash away sulfuric acid from the battery using water, and dry the surface.**

#890 METER



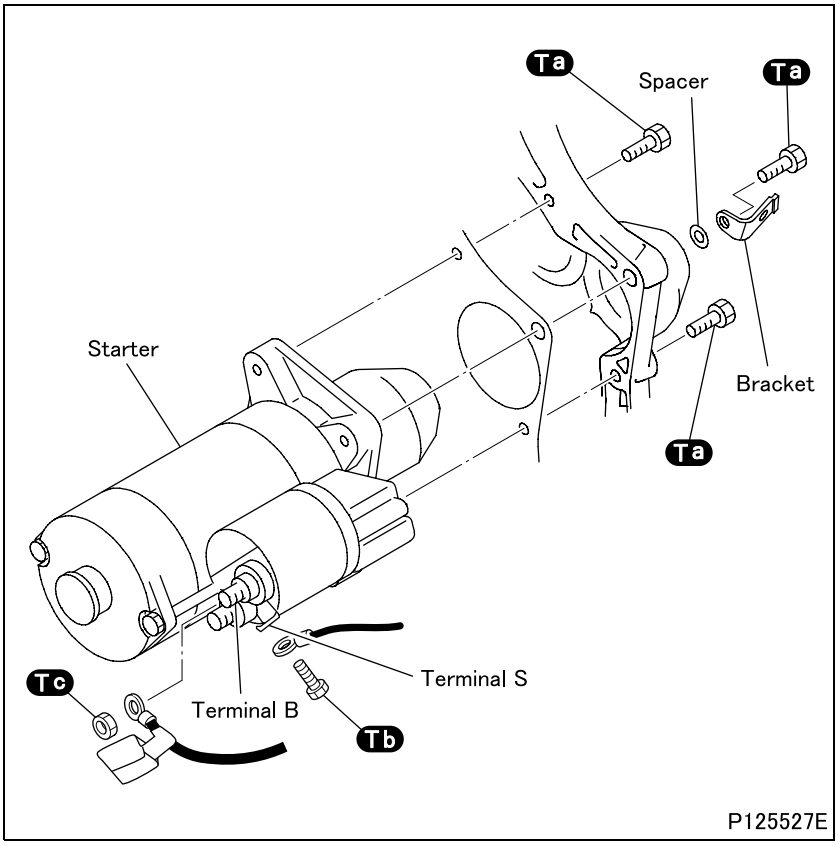
#890 Meter cluster

- Check the meter cluster by the actuator test of FUSO Diagnostics. (See Gr54EM.)
- Check for meter cluster faults with diagnosis codes. (See Gr54EM.)
- When the meter cluster is replaced, be sure to rewrite data in the electronic control unit using FUSO Diagnostics.

CAUTION ⚠

- **The replacement of the meter cluster should be performed only when the meter cluster is judged as faulty after performing the following inspections.**
  - **Check the connectors, harnesses and fuses.**
  - **Perform the actuator test.**
  - **Temporarily install the said meter cluster to other vehicle and check if the same problem occurs.**

54-12 STARTER AND ALTERNATOR



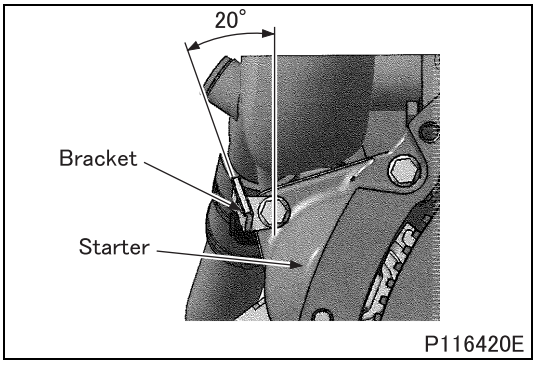
WARNING ⚠

- **Before removing the starter, disconnect the (–) battery cable and insulate the cable and the (–) battery terminal with tape.**
- **It is dangerous to leave the (–) battery cable connected since the battery cable voltage is always present at terminal B.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (starter mounting)	22 to 30 {16 to 22, 2.2 to 3.1}	–
Tb	Bolt (cable mounting)	2.25 to 4.08 {1.7 to 3.0, 0.2 to 0.4}	–
Tc	Nut (Battery cable mounting)	9.8 to 11.8 {7.2 to 8.7, 1.0 to 1.2}	–

◆Assembly procedure◆

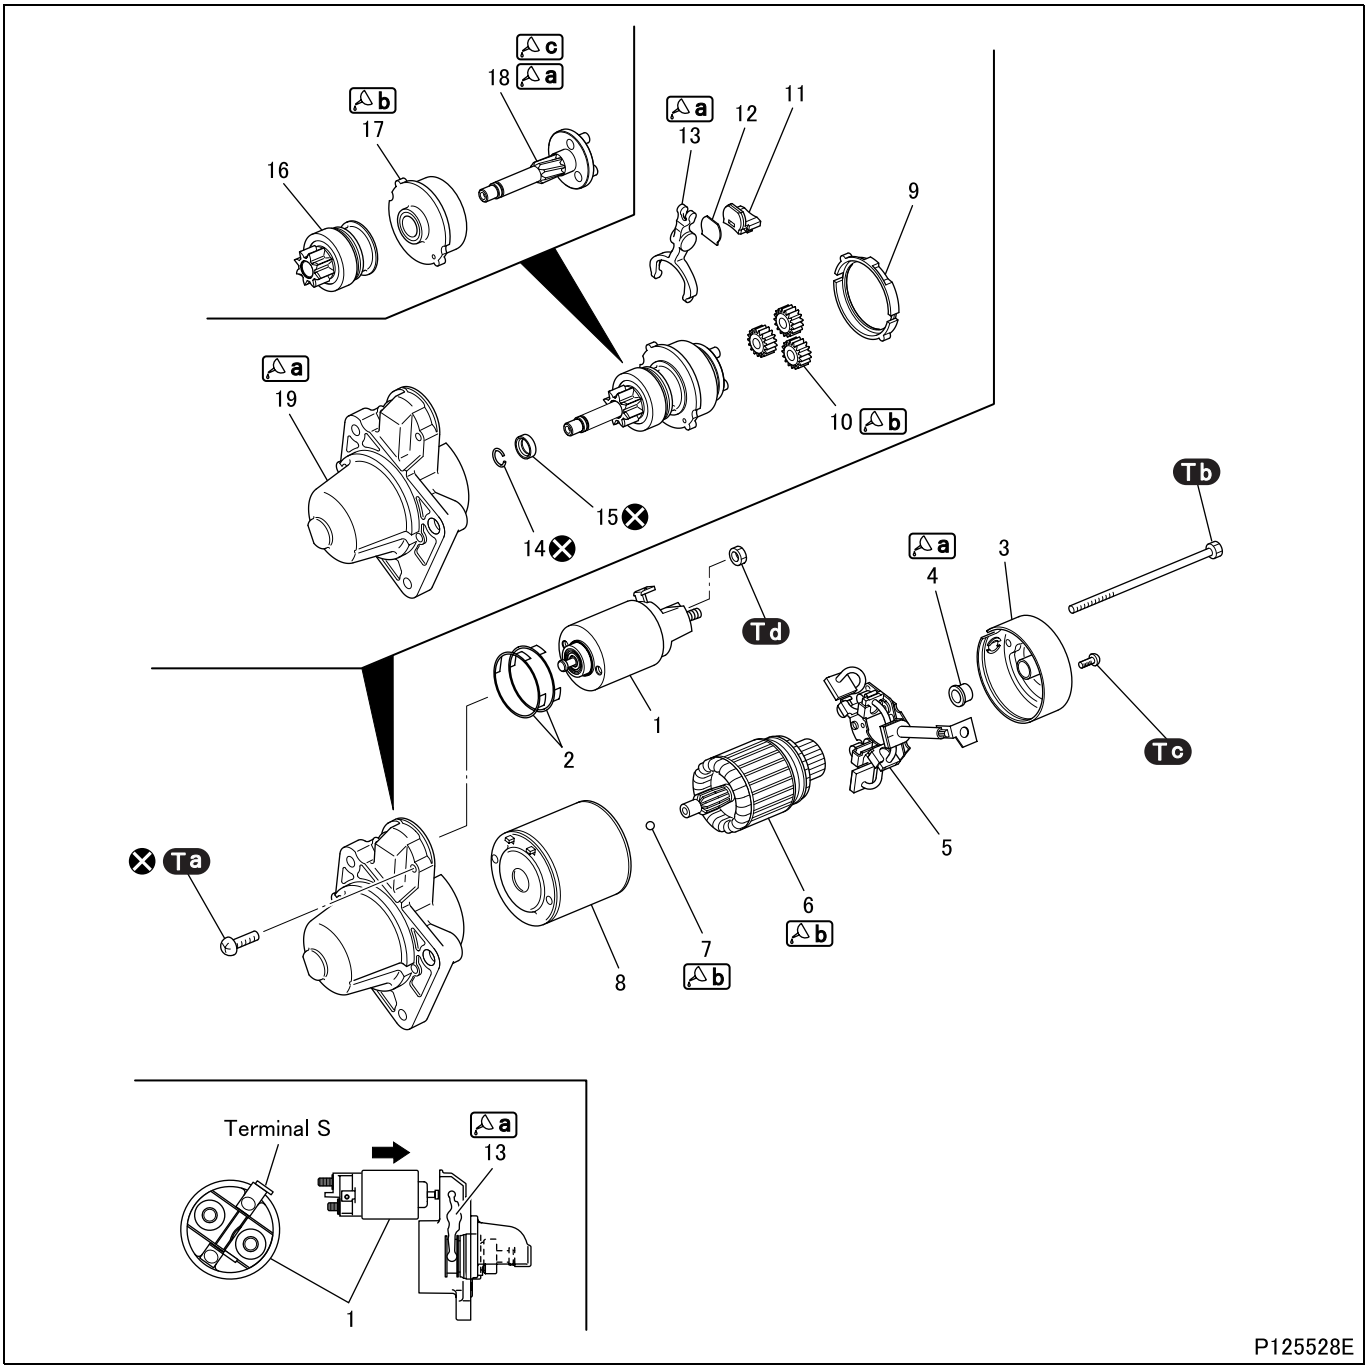


■ Assembly: Bracket

- Install the bracket at the angle shown in the illustration.

M E M O

#930 STARTER



● **Disassembly sequence**

1 Magnetic switch
2 Shim
3 Rear bracket
4 Rear bearing
5 Brush holder
6 Armature
7 Ball
8 Yoke
9 Packing A
10 Planetary gear
11 Packing B
12 Plate
13 Lever
14 Snap ring
15 Stop ring
16 Overrunning clutch
17 Internal gear
18 Planetary gear holder
19 Front bracket

⊗: Non-reusable parts

CAUTION ⚠

- **When the armature is removed, the ball may come out with it. Take care not to lose the ball.**

- Do not remove the rear bearing unless defects are evident.

● Assembly sequence

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Do not immerse parts in any kind of solvent for cleaning.**
- **Immersing the armature in a solvent will damage the insulation. Wipe parts clean with a cloth.**
- **Immersion cleaning of the drive unit is prohibited.**
- **The overrunning clutch is filled with grease at the factory. Immersion cleaning will wash away the grease from the clutch. To clean the drive unit, use a cleaning solvent-moistened brush and then wipe it dry with a cloth.**

- Whenever the magnetic switch is replaced, the pinion gap must be adjusted.
- The packing A is serviceable if any defect is not found.

Service standards (Unit: mm {in.})

Location	Maintenance item			Standard value	Limit	Remedy
–	Pinion gap			0.5 to 2.0 {0.02 to 0.079}	–	Adjust
–	No-load characteristics	With 11 V applied	Current	120 A or less	–	Correct or replace
			Rotation speed	2870 rpm or higher	–	
4,6	Difference between inside diameter of rear bearing and outside diameter of armature shaft			0.1 {0.0039} or less	–	Replace
5	Brush spring pressure			23.4 to 31.6 N {5.3 to 7.1 lbs, 2.4 to 3.2 kgf}	10 N {2.2 lbs, 1.0 kgf}	Replace
	Brush length			17.6 {0.69}	12.1 {0.48}	Replace
6	Commutator outside diameter			29.4 {1.16}	28.8 {1.13}	Replace
	Runout of commutator periphery			–	0.1 {0.0039} or higher	
	Mold depth between segments			0.5 {0.02}	0.2 {0.0079} or less	Correct or replace
13	Overrunning clutch contact surface of lever			8 {0.31} or higher	–	Replace

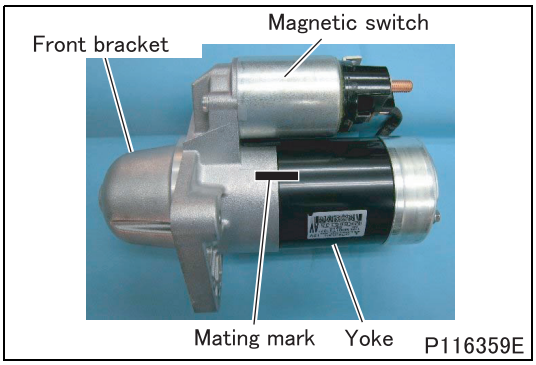
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Screw (magnetic switch mounting)	4.1 to 7.6 {3.0 to 5.6, 0.4 to 0.8}	–
Tb	Through bolt (rear bracket mounting)	5.0 to 7.1 {3.7 to 5.2, 0.5 to 0.7}	–
Tc	Screw (rear bracket mounting)	2.4 to 4.4 {1.8 to 3.2, 0.2 to 0.4}	–
Td	Nut (tightening cable to terminal M)	9.8 to 11.8 {7.2 to 8.7, 1.0 to 1.2}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Armature contact surface of rear bearing	Multipurpose grease [NLGI No. 2 (Li soap)]	As required
	Sliding surfaces of lever and overrunning clutch and lever supporting point		
	Internal gear contact surface and spline of planetary gear holder		
	Gear shaft contact surface of front bracket		
b	Sliding surfaces of armature and gear shaft	Molykote AG650	As required
	Ball		
	Teeth of planetary gear		
	Internal gear and gear shaft contact surfaces		
c	Splines of planetary gear holder	Multemp OA-171 (Kyodo Yushi Co., Ltd.)	As required

◆Work before disassembly◆



■ Mating mark: Front bracket and yoke

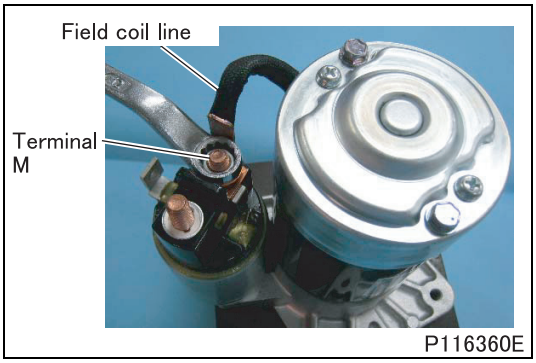
CAUTION ⚠

- **Make sure that the motor body is free of damage and that the magnet switch terminals S, B and M are normal.**

CAUTION ⚠

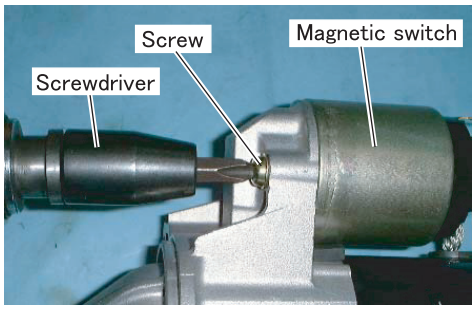
- **A permanent magnet is used in the field section. Do not strike at the yoke hard with a hammer or equivalent, drop it nor squeeze it with a vise.**

◆Disassembly procedure◆



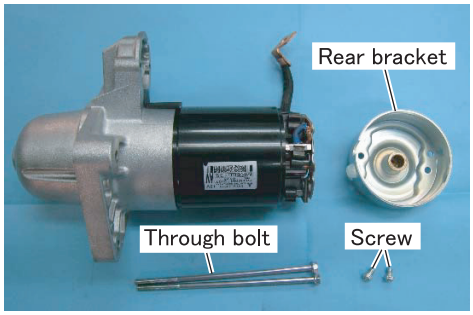
■ Disassembly: Magnet switch

- Remove the terminal M nut from the magnet switch and disconnect the field coil line.



P116361E

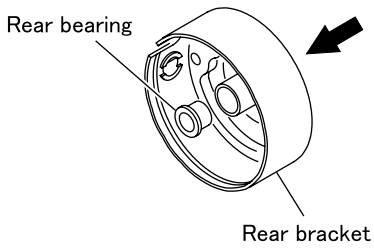
- Remove screws and remove the magnet switch.



P116362E

■ **Disassembly: Rear bracket**

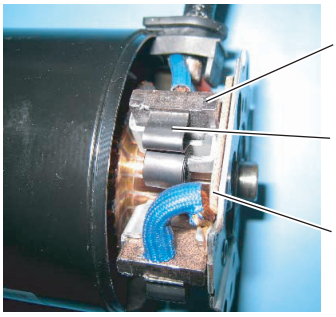
- Remove through bolts and screws, and then remove the rear bracket.



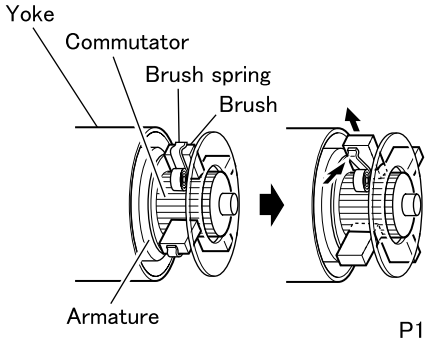
P116428E

■ **Disassembly: Rear bearing**

- To remove the rear bearing, press it out of the rear bracket using a round bar slightly thinner than the bearing and a hand press to apply force from outside of the rear bracket.



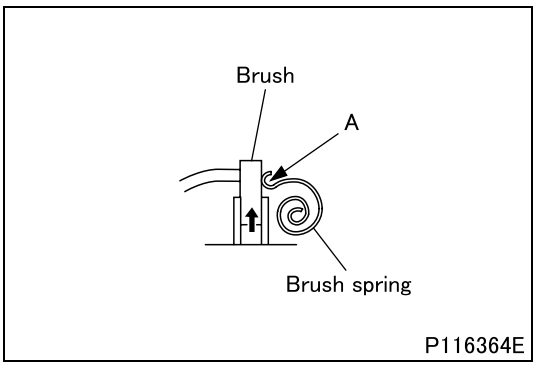
P116363E



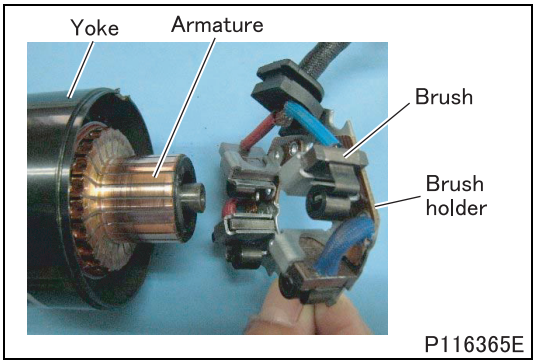
P116417E

■ **Disassembly: Brush holder, armature and yoke**

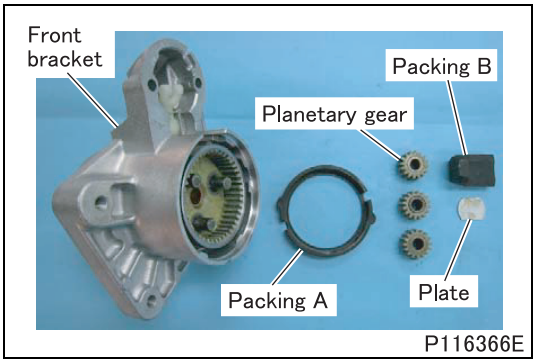
- Separate the brushes from the commutator. Then, hold each brush with the brush spring applied against the flank of brush.



- Pull the brush spring at A to draw up the brush.
- Hold the drawn-up brush with the brush spring as shown.

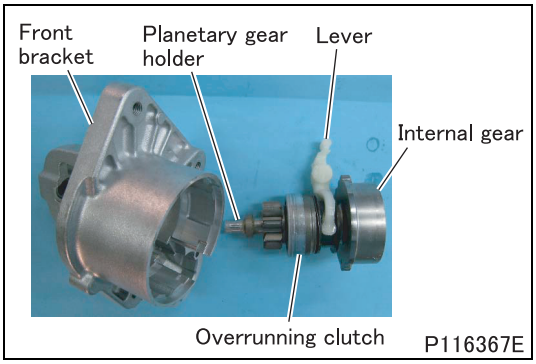


- With the brushes held, remove in this order: the brush holder, armature and yoke.



■ Disassembly: Packing A, B, plate and planetary gear

- Remove packing A, three planetary gears, packing B and plate from the front bracket.

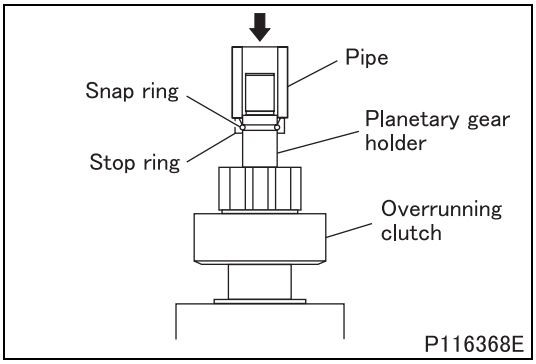


■ Disassembly: Planetary gear holder, internal gear, overrunning clutch and lever

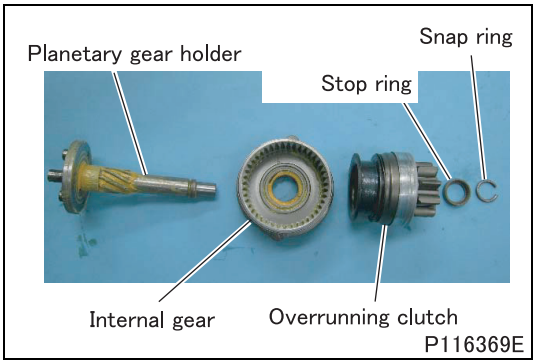
- Remove the planetary gear holder, internal gear, overrunning clutch and lever from the front bracket.

CAUTION ⚠

- **Confirm the lever direction before removal.**

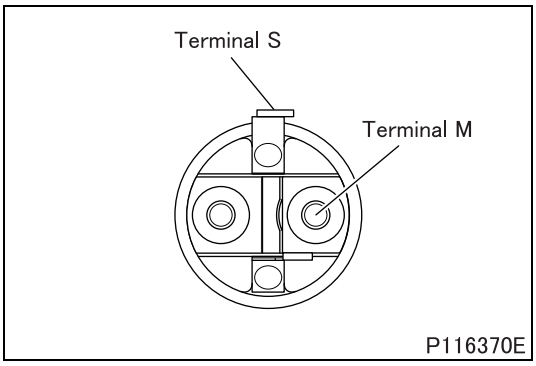


- Apply a pipe of the same size to the stop ring, and then hammer the pipe moderately to release the stop ring from the snap ring.



- Remove the snap ring, stop ring, overrunning clutch and internal gear from the planetary gear holder.

◆Inspection procedure◆

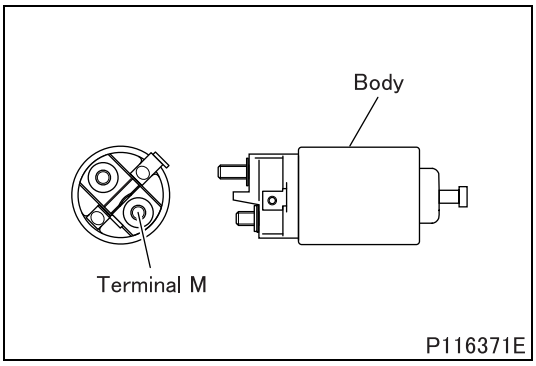


■Inspection: Magnetic switch

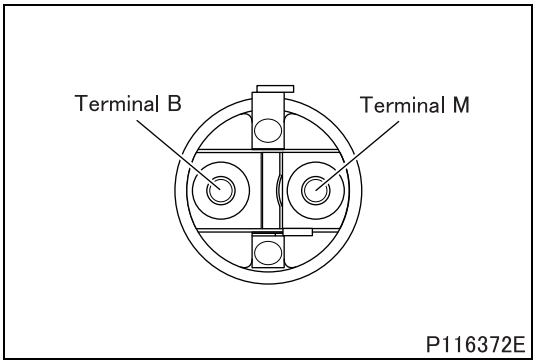
- Perform the following checks, and if any fault is found, replace the switch.

(1) Test for coil open circuit

- Confirm that continuity exists between terminals S and M.

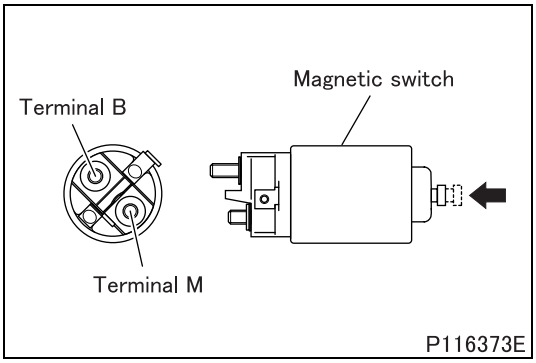


- Confirm that continuity exists between terminal M and the body.



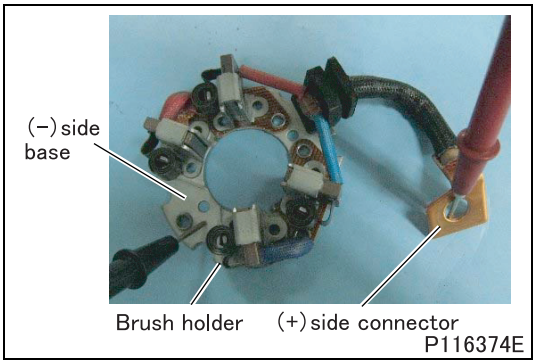
(2) Test for fused-together contacts

- Confirm that continuity does not exist between terminals B and M.



(3) Test for contact-to-contact continuity

- Push in the end of the magnetic switch to close the internal contacts. Then, confirm that continuity exists between terminals B and M.



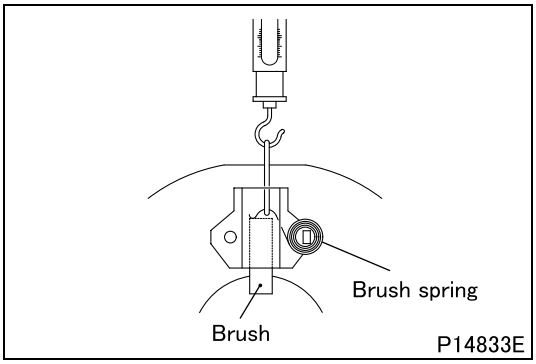
■Inspection: Brush holder

(1) Test for insulation

- Thoroughly clean the (+) side connector and (–) side base and check for continuity between them.
- If continuity exists, there is a short circuit and the brush holder must be replaced.

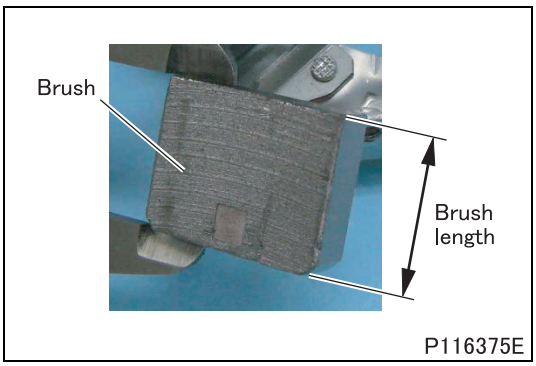
(2) Manual and visual inspections

- Perform the following inspections. If any fault is found, replace the brush holder.
  - The brush holder should be free of deformation, cracks, loosening of swaged joints and rusted base.
  - The brushes should be able to move smoothly in the brush holder.
  - The brush springs should be free of rust.



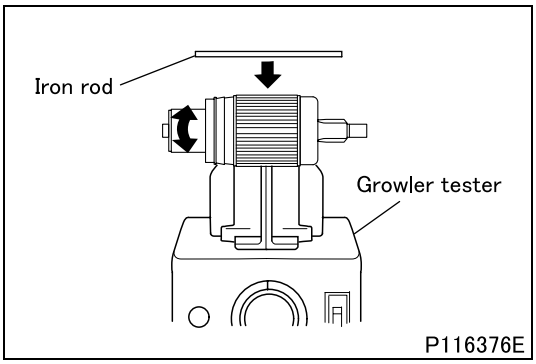
■ Inspection: Brush spring

- Using new brushes, measure the load required to separate each brush spring from its brush.
- If either measurement is lower than the specified limit, replace the brush springs.



■ **Inspection: Brush (+) (–)**

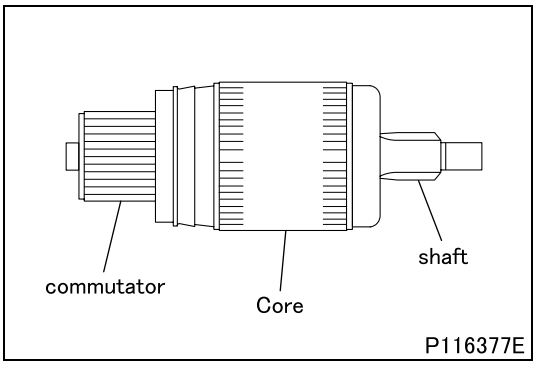
- If either brush is shorter than the limit, it must be replaced.



■ **Inspection: Armature**

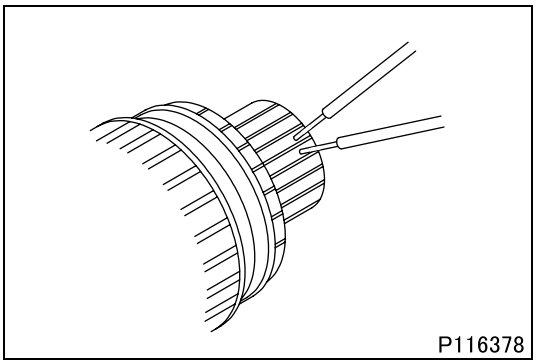
(1) Test for coil short circuit

- Hold an iron rod parallel with the armature.
- Slowly rotate the armature by hand.
- If the iron rod vibrates or is pulled toward the armature, the coil is short-circuited and the armature must be replaced.



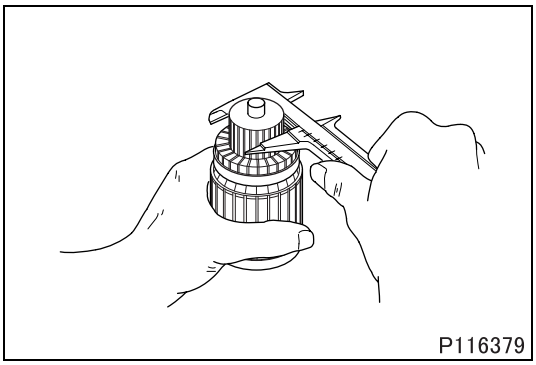
(2) Test for coil grounding

- Confirm that continuity does not exist between the commutator and the core (or shaft).
- If continuity exists, the coil is grounded and the armature must be replaced.



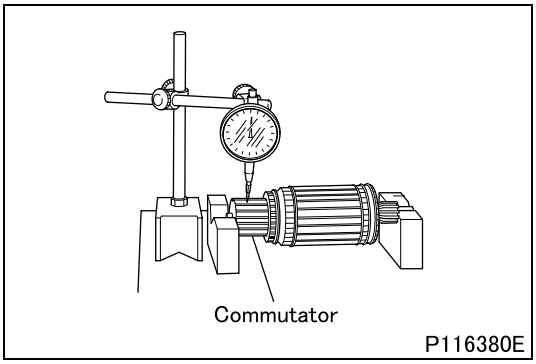
(3) Test for coil open circuit

- Check for continuity between commutator segments.
- If continuity does not exist, replace the armature.



(4) Commutator outside diameter

- If the measurement is out of specification, replace the armature.

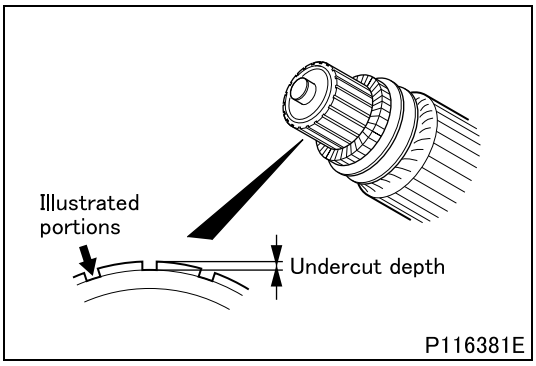


(5) Runout of commutator periphery

- If the reading exceeds the specified limit, replace the armature.

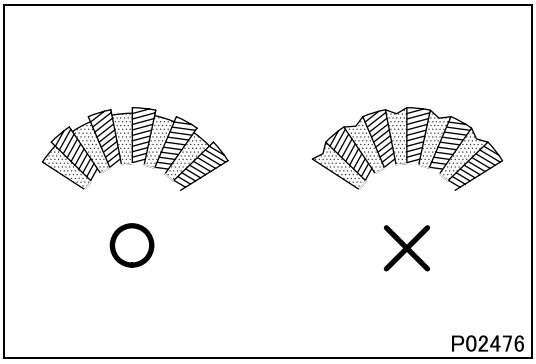
(6) Condition of commutator surface

- If the surface is rough or has stepped wear, rectify it with emery paper (#300 to 500).
- After rectifying the surface, check the extent of commutator runout.



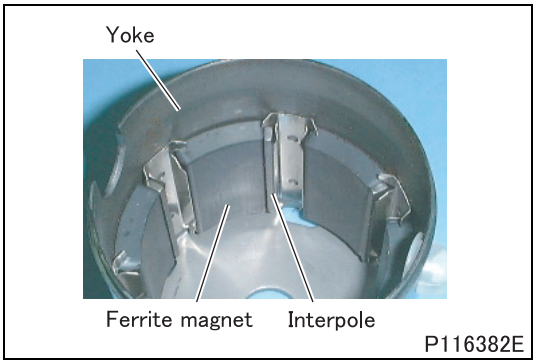
(7) Undercut depth between segments

- If the measurement is lower than the specified limit, rectify or replace the armature.
- To rectify the armature, grind the illustrated portions.



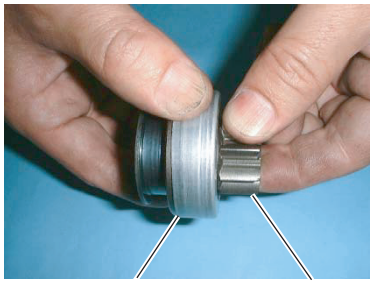
- If the undercut is worn as illustrated, rectify or replace the armature.

○: Acceptable
×: Unacceptable



■ Inspection: Yoke

- Inspect the ferrite magnet in the yoke for damages and cracks. If any fault is found, replace the yoke.



P116383E

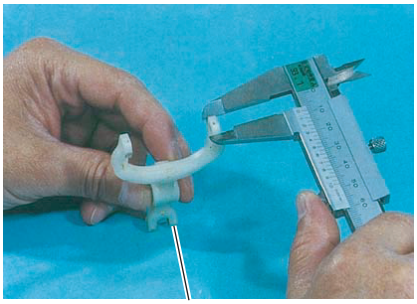
■ **Inspection: Overrunning clutch**

If the following inspections reveal any abnormality, replace the overrunning clutch.

- While holding the housing, give a turn to the pinion. The pinion should not turn at all in one direction but should turn smoothly in the other direction with some resistance felt.
- Confirm that the pinion teeth are free of chips and not abnormally worn.
- Confirm that the pinion metal is not abnormally worn.

CAUTION ⚠

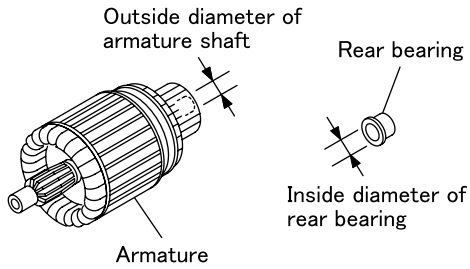
- **The overrunning clutch is filled with grease inside. Do not use immersion cleaning.**



P116384E

■ **Inspection: Lever**

- Measure the overrunning clutch contact surface of the lever to see if it meets the standard value.
- If the measurement is out of the standard value, replace the lever.

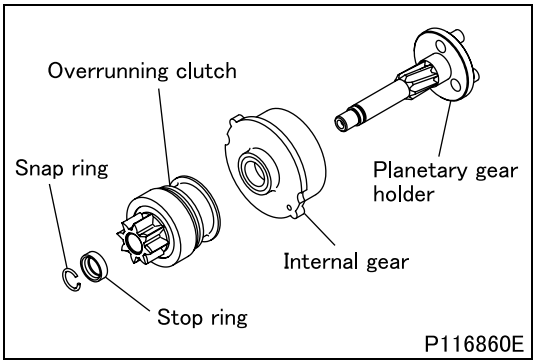


P116385E

■ **Inspection: Rear bearing**

- Confirm that the difference between the inside diameter of the rear bearing and outside diameter of the armature shaft meets the standard value.
- If the measurement is out of the standard value, replace the rear bearing.

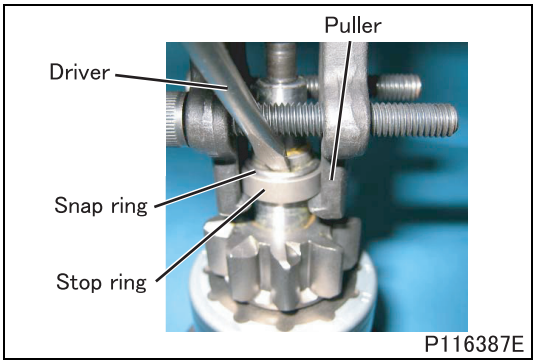
◆Assembly procedure◆



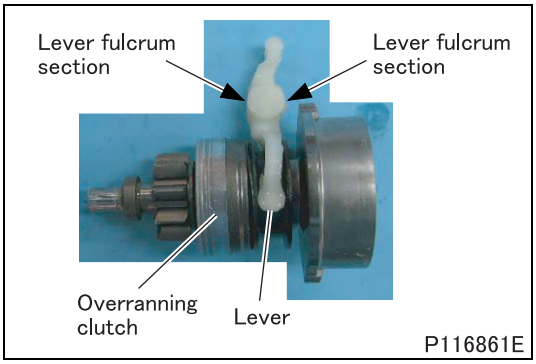
P116860E

■ **Assembly: Planetary gear holder, internal gear and overrunning clutch**

- Install the internal gear, overrunning clutch and stop ring onto the planetary gear holder.

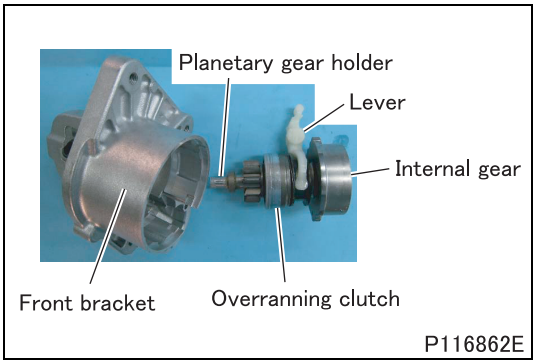


- Set a new snap ring in the groove of the planetary gear holder.
- Using a puller, draw the stop ring toward the snap ring and then fit the snap ring into the stop ring by pressing with a screwdriver.



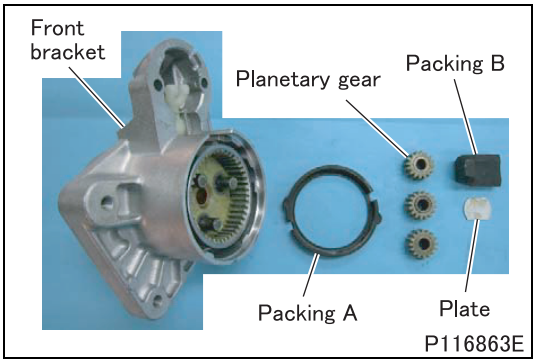
■ Assembly: Lever

- Paying attention to its direction, install the lever onto the overrunning clutch.



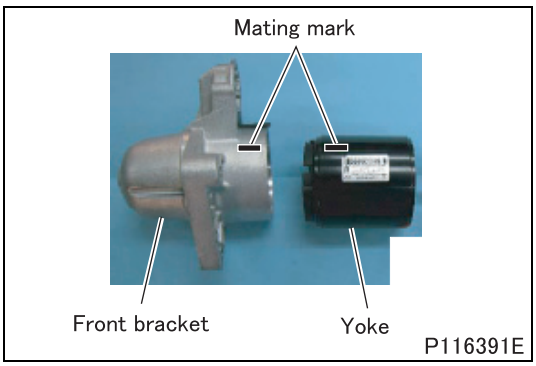
■ Assembly: Front bracket

- Install the planetary gear holder, internal gear, overrunning clutch and lever on the front bracket.



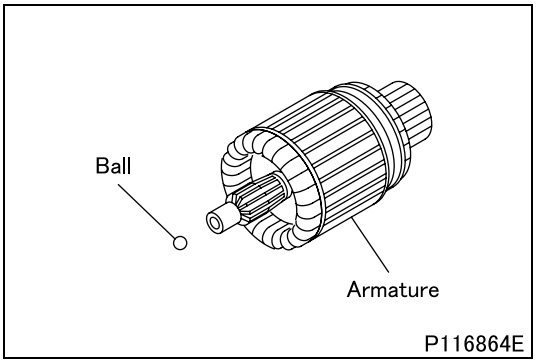
■ Assembly: Packing A, B, plate and planetary gear

- Install in this order: plate, packing B, three planetary gears and packing A.



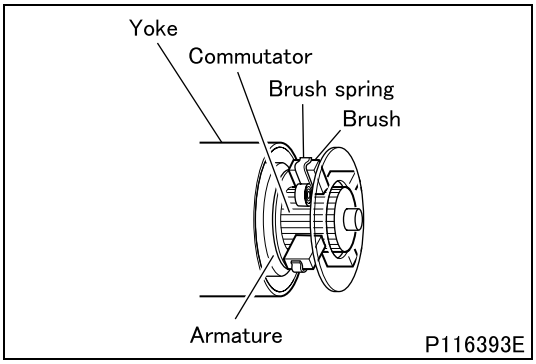
■ **Assembly: Front bracket and yoke**

- Using the mating marks provided before disassembly for alignment, install the yoke to the front bracket.



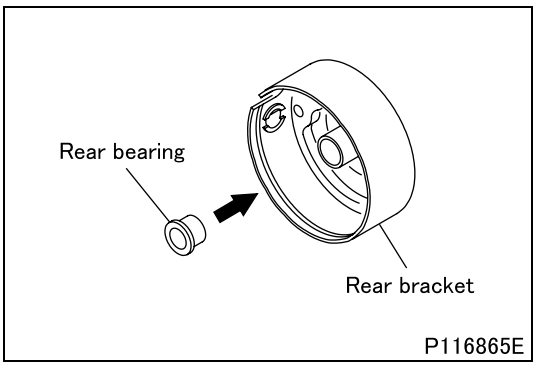
■ **Assembly: Ball and armature**

- Insert the ball, and then install the armature on the planetary gear holder side.



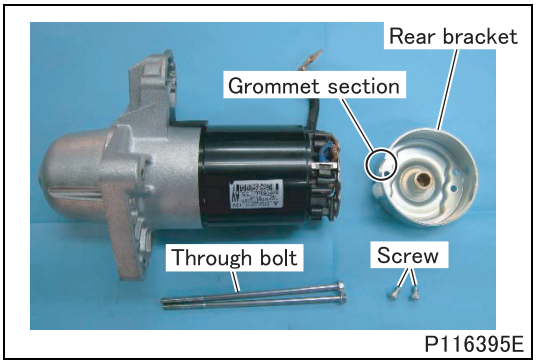
■ **Assembly: Brush holder**

- Install the brush holder on the armature.
- Set the brush springs in the regular state.



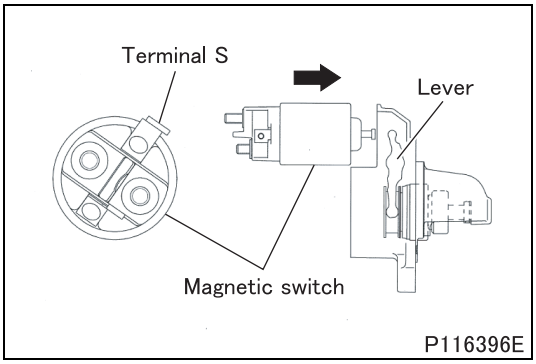
■ **Assembly: Rear bearing and rear bracket**

- Install the rear bearing to the rear bracket.



P116395E

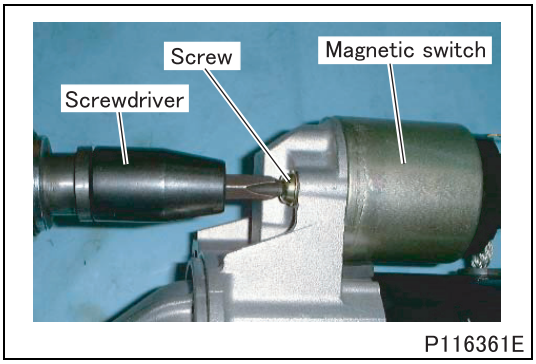
- Install the rear bracket on the yoke. Make sure that the parts are fitted at the grommet section of the rear bracket.
- Tighten the through bolts and screws.



P116396E

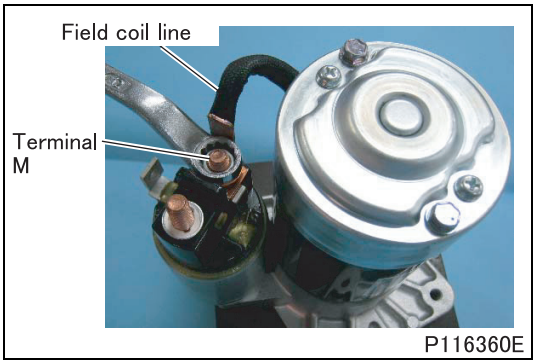
■ **Assembly: Magnetic switch**

- Install the magnet switch onto the lever with its terminal S in the illustrated direction.



P116361E

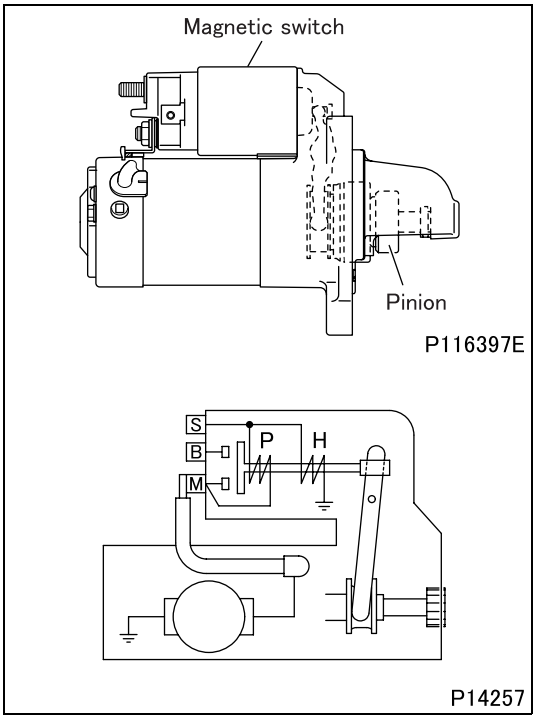
- Tighten the screws.

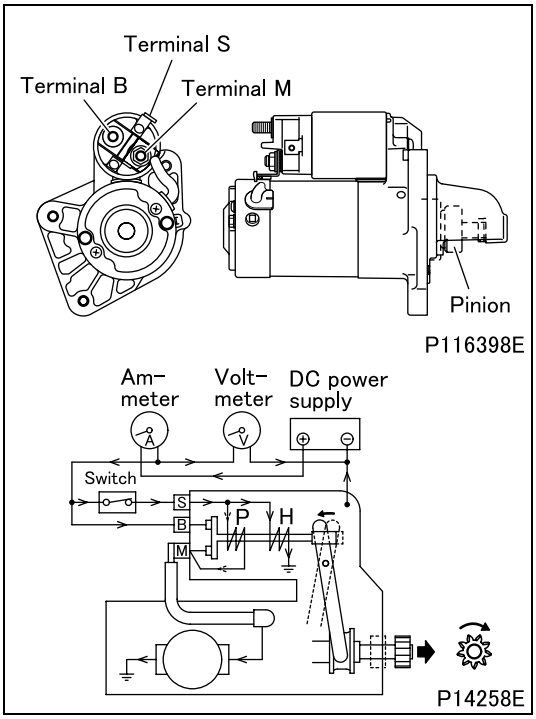


P116360E

- Connect the field coil line to terminal M of the magnet switch, and then tighten the nut.

◆Inspection after assembly◆





■ Inspection: Performance and pinion gap

- After assembling the starter, perform inspections with current supplied to it.

WARNING ⚠

- **When the starter is energized, the pinion will spring out and rotate. Be careful not to touch it with your hands.**
- **The magnetic switch may become very hot during inspections. Be careful when touching it.**

CAUTION ⚠

- **Do not energize the pull-in coil P for longer than 10 seconds, and do not energize the holding coil H for longer than 30 seconds. If these periods are exceeded, the coils may overheat and burn out.**
- **When current is supplied to the starter, a large current (100 A or higher) will flow. For inspection purposes, booster cables or similarly thick cables must therefore be used. It is also important to ensure that all connections are secure.**

(1) Performance test

- Connect the starter as illustrated.
- Set the voltage to 11 volts DC.

CAUTION ⚠

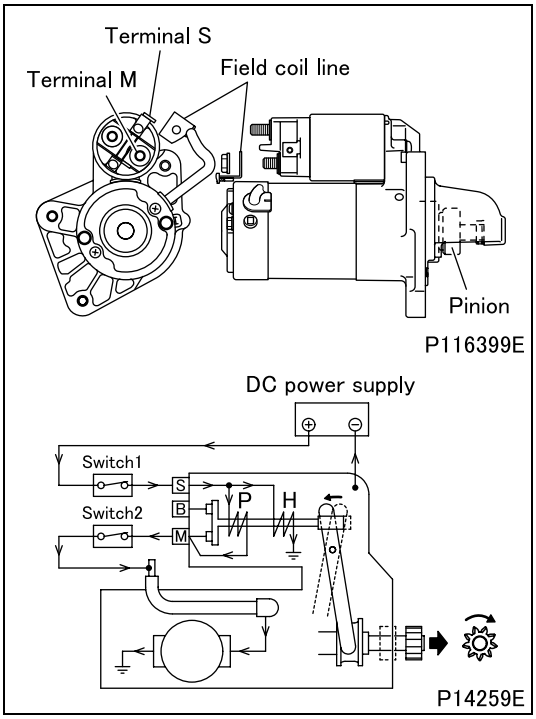
- **The voltage applied must not exceed 12 V.**

- The following operations are performed with current supplied to the starter. Thus, the entire test (consisting of measurement of the current flowing through the starter and measurement of the starter's rotational speed) must be completed within 30 seconds.
  - Turn ON the switch to supply current to the starter. The pinion will spring out and rotate.

CAUTION ⚠

- **When the switch is turned ON, the pull-in coil P and holding coil H are both energized. When the large current from the DC power supply flows from terminal B to terminal M, the supply of current to the pull-in coil P is cut; only the holding coil H remains energized. To prevent the holding coil from burning out, it is essential to complete all operations within 30 seconds.**

  - Measure the current, then measure the starter's rotational speed with a digital tachometer.
  - Turn OFF the switch to de-energize the starter.
- If either measurement is out of specification, disassemble and inspect the starter again.



(2) Pinion gap

- Connect the starter as illustrated.
- The following operations are performed with current supplied to the starter. Thus, the entire procedure for measurement of the pinion gap must be completed within 30 seconds.
  - Turn ON switches 1 and 2 to supply current to the starter. The pinion will spring out and rotate.

  - After the pinion starts to rotate, quickly (within five seconds) turn OFF switch 2 to stop the pinion's rotation.

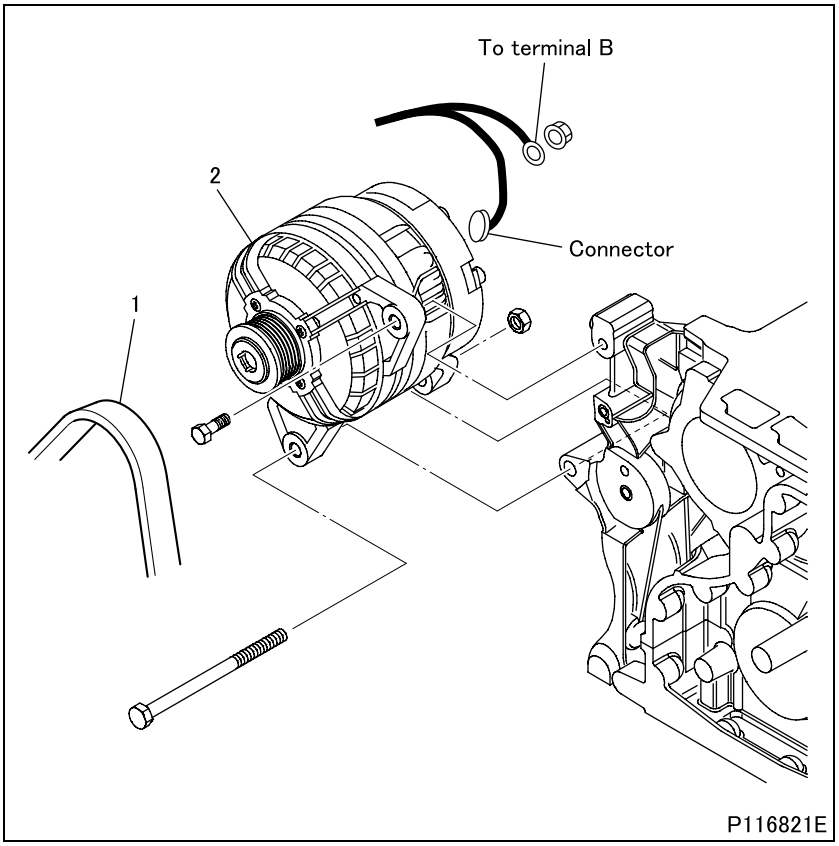
CAUTION ⚠

- **When switches 1 and 2 are turned ON, the pull-in coil P and holding coil H are both energized. The circuit is connected such that no voltage is applied to starter terminal B, so current flows to the pull-in coil while the pinion rotates. To prevent the pull-in coil from burning out, it is essential to turn OFF switch 2 quickly (within five seconds) after the pinion starts to rotate.**

  - Pull out the end of the pinion by hand, and then lightly push it back by hand. Measure the amount of axial movement (pinion gap).
  - Turn OFF switch 1 to de-energize the starter.
- If the measurement is out of specification, replace the lever.

M E M O

#940 ALTERNATOR



● **Removal sequence**

1 Belt
2 Alternator

WARNING ⚠

- **Before removing the alternator, disconnect the (–) battery cable and insulate the cable and the (–) battery terminal with tape.**
- **It is dangerous to leave the (–) battery cable connected since the battery cable voltage is always present at terminal B.**

● **Installation sequence**

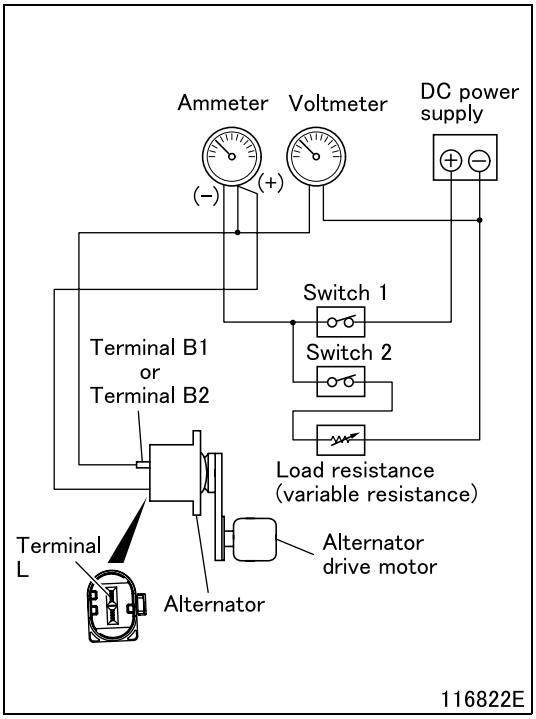
Follow the removal sequence in reverse.

Service standards

Location	Maintenance item			Standard value	Limit	Remedy
2	Alternator output current (*when alternator is hot and producing 13.5 V)	110A	At 1800 rpm	55 A or more	–	Correct or replace
			At 6000 rpm	110 A or more	–	
		140A	At 1800 rpm	75 A or more	–	
			At 6000 rpm	140 A or more	–	
	Adjustment voltage of regulator (at 6000 rpm, 5 A is loaded)			14.5 ± 0.25 V	–	Replace

* The hot condition occurs after the alternator has been running at normal ambient temperature at 6000 rpm and maximum output for 30 minutes.

◆Inspection procedure◆



■ **Inspection: Alternator**

(1) Alternator output current (bench test)

- Connect the alternator as illustrated.

CAUTION ⚠

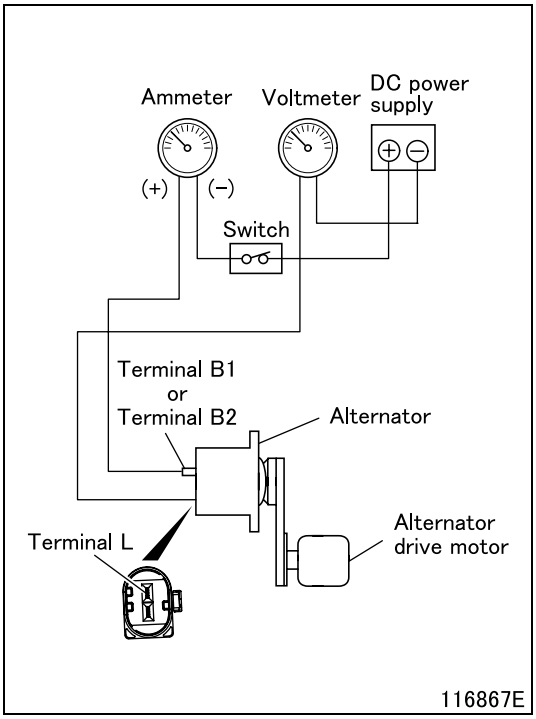
- **Wires with sufficient thickness should be used for wiring and each connection should be securely fastened.**

- Increase load resistance to the maximum (condition under which the load current hardly flows).
- Turn switch 1 and 2 ON.
- Run alternator at 6000 rpm for 30 minutes by adjusting load resistance so that electric current can conform to the following standard.

  Alternator nominal current

Alternator	Current
110A	Approx. 110A
140A	Approx. 140A

- Measure the current at each specified revolution of alternator.
- If the measured value is lower than the standard value, disassemble and check alternator.

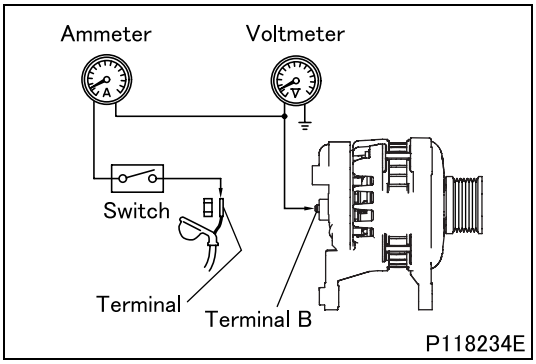


(2) Adjustment voltage of regulator (bench test)

- Connect the alternator as illustrated.
- Turn switch ON.
- Run alternator at low speeds.
- Increase the speed of alternator to 6000 rpm and measure the voltage (adjustment voltage) at this speed. At the same time, make sure that the current is 5 amperes or less at 6000 rpm.
- If the measured value deviates from the standard value, do as follows:
  - If higher than the standard value: Replace the regulator.
  - If lower than the standard value: Inspect the alternator related parts before replacing the regulator.

54-13 ON-VEHICLE INSPECTION AND ADJUSTMENT

#950 INSPECTION OF ALTERNATOR



Performance test

- The on-vehicle inspection is only a simplified check. Use a test bench for accurate checking.
- Connect the meters to the alternator as shown.

WARNING ⚠

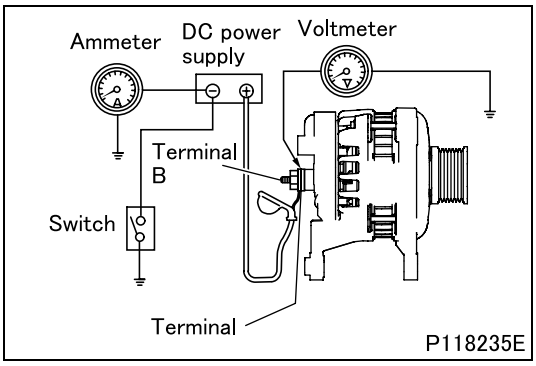
- **To prevent possible injury, be sure to disconnect the negative battery cable and insulate the cable and the negative battery terminal with tape before working on the wiring. With the negative (–) battery cable connected, battery voltage is always applied to terminal B.**
- **To connect to switch, use a lead wire with the same or larger diameter than that of the chassis harness connected to terminal B.**

- Turn on switch and make sure that voltmeter indicates battery voltage.
- Start the engine.
- Immediately turn on the switches for all lamps on the vehicle.
- Immediately accelerate the engine to the speed indicated below and measure the alternator's output current.
  Approx. 2200 rpm
- The alternator is considered to be good if the measured value is 70% or more of the nominal output current.
  Alternator nominal output

Voltage	Output current
12 V	110 A
12 V	140 A

Service standards

Location	Maintenance item	Standard value		Limit	Remedy
–	Adjusting voltage	12V-110A	14.5 ± 0.2 V	–	Replace
		12V-140A	14.5 ± 0.25 V		



- Connect the meters to the alternator as shown.

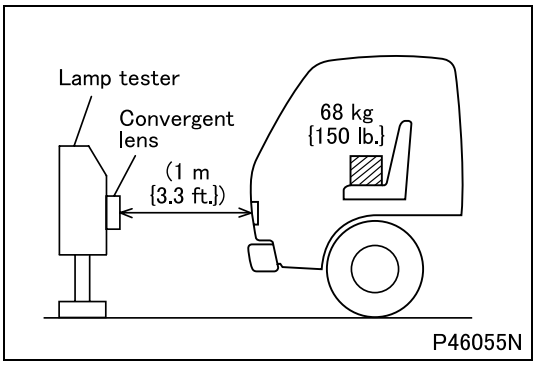
WARNING ⚠

- **To prevent possible injury, be sure to disconnect the negative battery cable and insulate the cable and the negative battery terminal with tape before working on the wiring. With the negative (–) battery cable connected, battery voltage is always applied to terminal B.**
- **To connect to switch, use a lead wire with the same or larger diameter than that of the chassis harness connected to terminal B.**

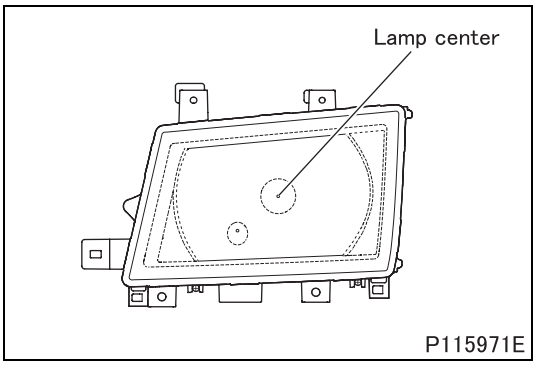
- Turn off the switches for lamps, heater, etc. so that electric loads may not be applied during the inspection.
- Turn on switch and then start the engine.
- If the output current is 5 amperes or less when the engine speed is raised to the appropriate speed indicated below, then measure the voltage at terminal B.
  Approx. 2200 rpm
- If the output current is not less than 5 amperes, the measured value (regulated voltage) will be slightly lower.
- If the output current is 5 amperes or more, do one of the following:
  - Run the engine for a while to charge the battery.
  - Replace the battery with a fully-charged one.
- If the measured value deviates from the standard value, conduct checking again on the test bench.

#960 HEADLAMP AIMING

1. Preparation before Adjustment



- Park the vehicle on a level flat place and apply chocks to the wheels.
- Empty the vehicle.
- Adjust the tire inflation pressure to the specified value.
- Place a mass of 68 kg {150 lb} (corresponding to a mean weight of one man) on the driver's seat.
- On vehicles with headlamp leveling device, set the headlamp leveling switch to 0.
- Start the engine to charge the battery.
- Locate a lamp tester at a place opposite to the vehicle front end face as illustrated.

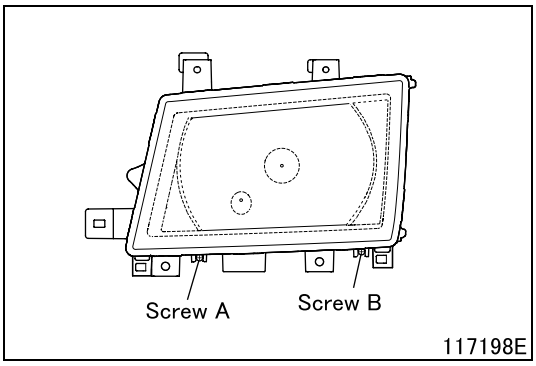


- Turn on the headlamps and aim the headlamps such that the passing beam lamp center is aligned with the beam convergent lens center of the lamp tester. (Shown here is the left-hand headlamp.)
- Mask other lamps than that next subjected to adjustment in such a way that no light may leak.

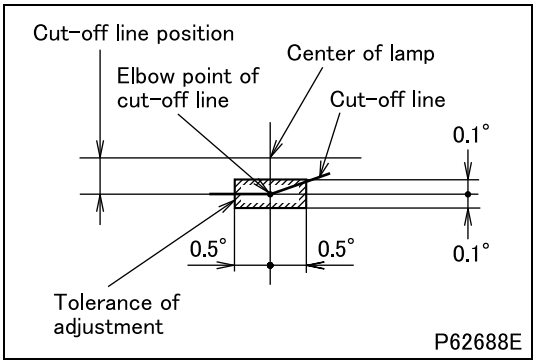
CAUTION ⚠

- **Headlamp lenses are made of plastic. Do not keep the masked headlamps illuminated for longer than 2 minutes. Sustained illumination of these lamps can cause heat generation, possibly resulting in deformed headlamp lens.**

2. Adjustment



- Turn on the passing beam.
- Perform the following procedure to adjust the passing beam such that the elbow point of the cut-off line between the lighted and shaded areas is positioned as shown in the figure:
- Adjustment in vertical direction: Turn screws A and B the same amount in this order.
- Adjustment in horizontal direction: Turn screw B.



- The position of the cut-off line between the lighted and shaded areas must correspond to the adjustment value.

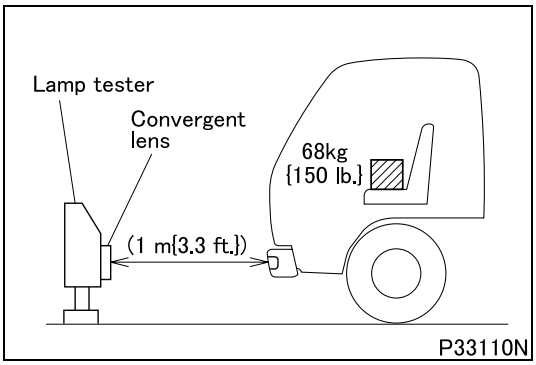
	Adjustment value
Cut-off line position	0.57° <FE>
	0.86° <FG>

	Beam adjustment direction							
	Right-hand headlamp				Left-hand headlamp			
	Up	Down	Left	Right	Up	Down	Left	Right
Screw A	CCW	CW	–	–	CCW	CW	–	–
Screw B	CCW	CW	CCW	CW	CCW	CW	CW	CCW

CW: Clockwise
CCW: Counter-clockwise

#961 FOG LAMP AIMING

1. Preparation before Adjustment

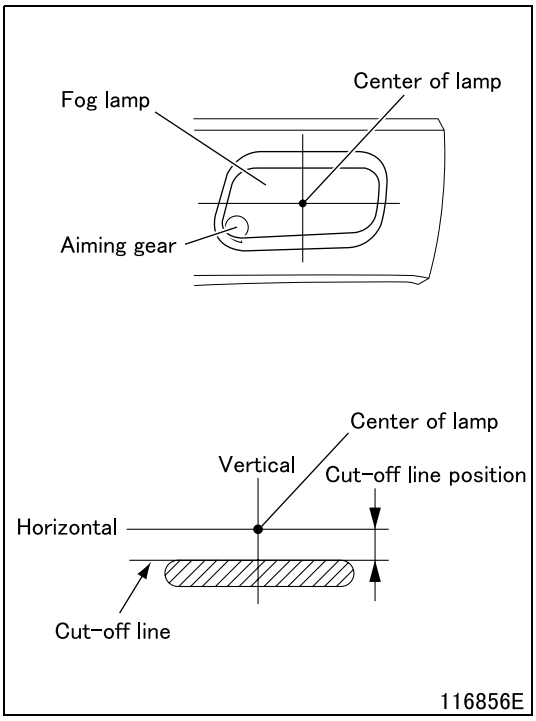


- Park the vehicle on a level flat place and apply chocks to the wheels.
- Empty the vehicle.
- Adjust the tire inflation pressure to the specified value.
- Place a mass of 68 kg {150 lb} (corresponding to a mean weight of one man) on the driver's seat.
- Start the engine to charge the battery.
- Locate a lamp tester at a place opposite to the vehicle front end face as illustrated.
- With the fog lamp turned on, align the center of fog lamp bulb and the center of convergent lens of convergent lamp tester. (Shown here is the left-hand fog lamp.)
- Mask other lamps than that next subjected to adjustment in such a way that no light may leak.

CAUTION ⚠

- **Fog lamp lenses are made of plastic. Do not keep the masked fog lamp illuminated for longer than 2 minutes. Sustained illumination of these lamps can cause heat generation, possibly resulting in deformed fog lamp lens.**

2. Adjustment



- Turn on fog lamp.
- Make adjustment with the aiming gear to bring for lamp cut-off line into the illustrated position.

Cut-off line position	Standard value
	1.5% or less

	Adjusting direction for optical axis	
	Upward	Downward
Screwdriver rotation direction	Clockwise	Counter-clockwise

Group 54EI

Immobilizer

2014½ to 2016 Model Years

MITSUBISHI FUSO TRUCK OF AMERICA, Inc.

Pub.No.00ELT0032-54EI

INDEX

STRUCTURE AND OPERATION

1. Overview 54EI-2
2. Electronic Control System 54EI-3
3. Electronic Control Circuit Diagram 54EI-4

TROUBLESHOOTING

1. Inspection Based on Diagnosis Codes 54EI-6
2. FUSO Diagnostics Service Data (Measured Values) 54EI-9

INITIAL SETTINGS OF IMMOBILIZER

1. Connecting the FUSO Diagnostics 54EI-10
2. Selection of the Setting of Immobilizer 54EI-10
3. Various Operations (Initial Key Registration, Additional Key Registration, Secret Key Registration, Key Information Deletion) 54EI-11
4. Additional Starter Key Registration (Up to 6 Keys Can be Registered) 54EI-15
5. New Starter Key Registration after All of Starter Keys Have Been Lost 54EI-16

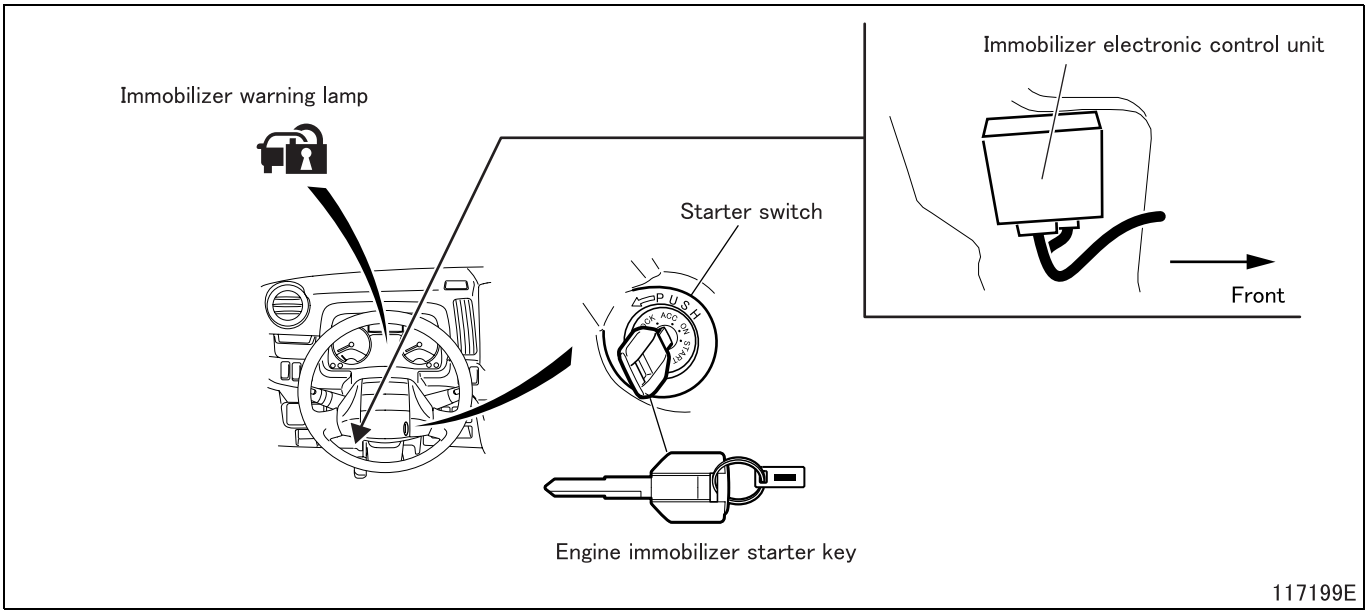
INSPECTION OF ELECTRICAL PARTS ..... (See Gr54.)

INSTALLED LOCATIONS OF PARTS ..... (See Gr54.)

ELECTRIC CIRCUIT DIAGRAM ..... (See Gr54.)

1. Overview

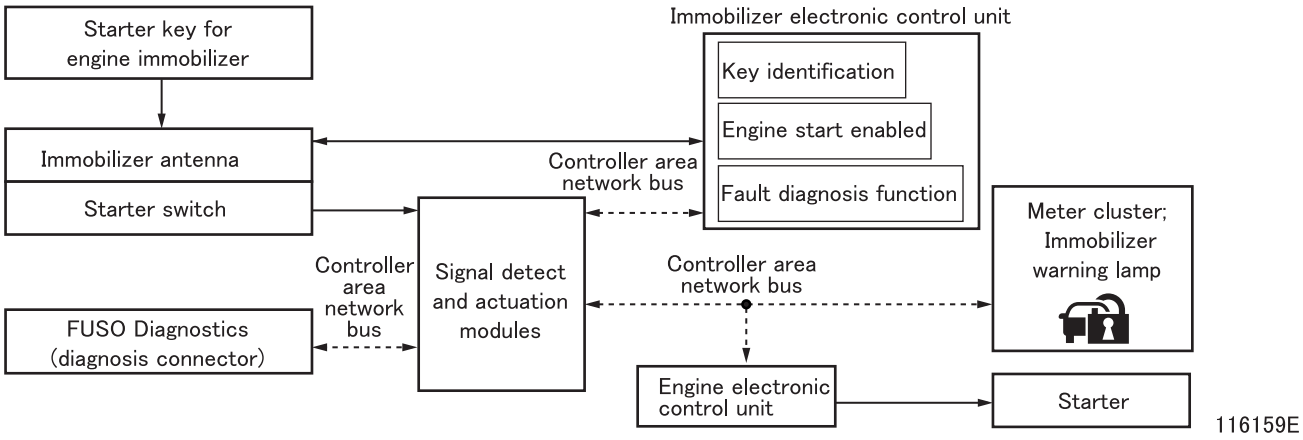
- The immobilizer stops the supply of power to the starter and supply of fuel to the engine thereby to prevent improper vehicle control when any other key than the engine immobilizer starter key registered in the immobilizer electronic control unit is used in an attempt to start the engine.



- The immobilizer electronic control unit has the capacity enough to accept the registration of up to six starter keys for engine immobilizer. In case the registered starter key is lost, its registration is erased, then an available starter key is additionally registered.
- If all the registered starter keys are lost or damaged, the erasing of such keys and additional registration of new starter keys are impossible. In such case, the immobilizer electronic control unit is replaced in combination with the new starter keys.
- The immobilizer electronic control unit performs self-diagnosis of the system, and if there is any abnormality in the system, the immobilizer warning lamp is lit to inform the driver of the abnormality.

2. Electronic Control System

2.1 System block diagram

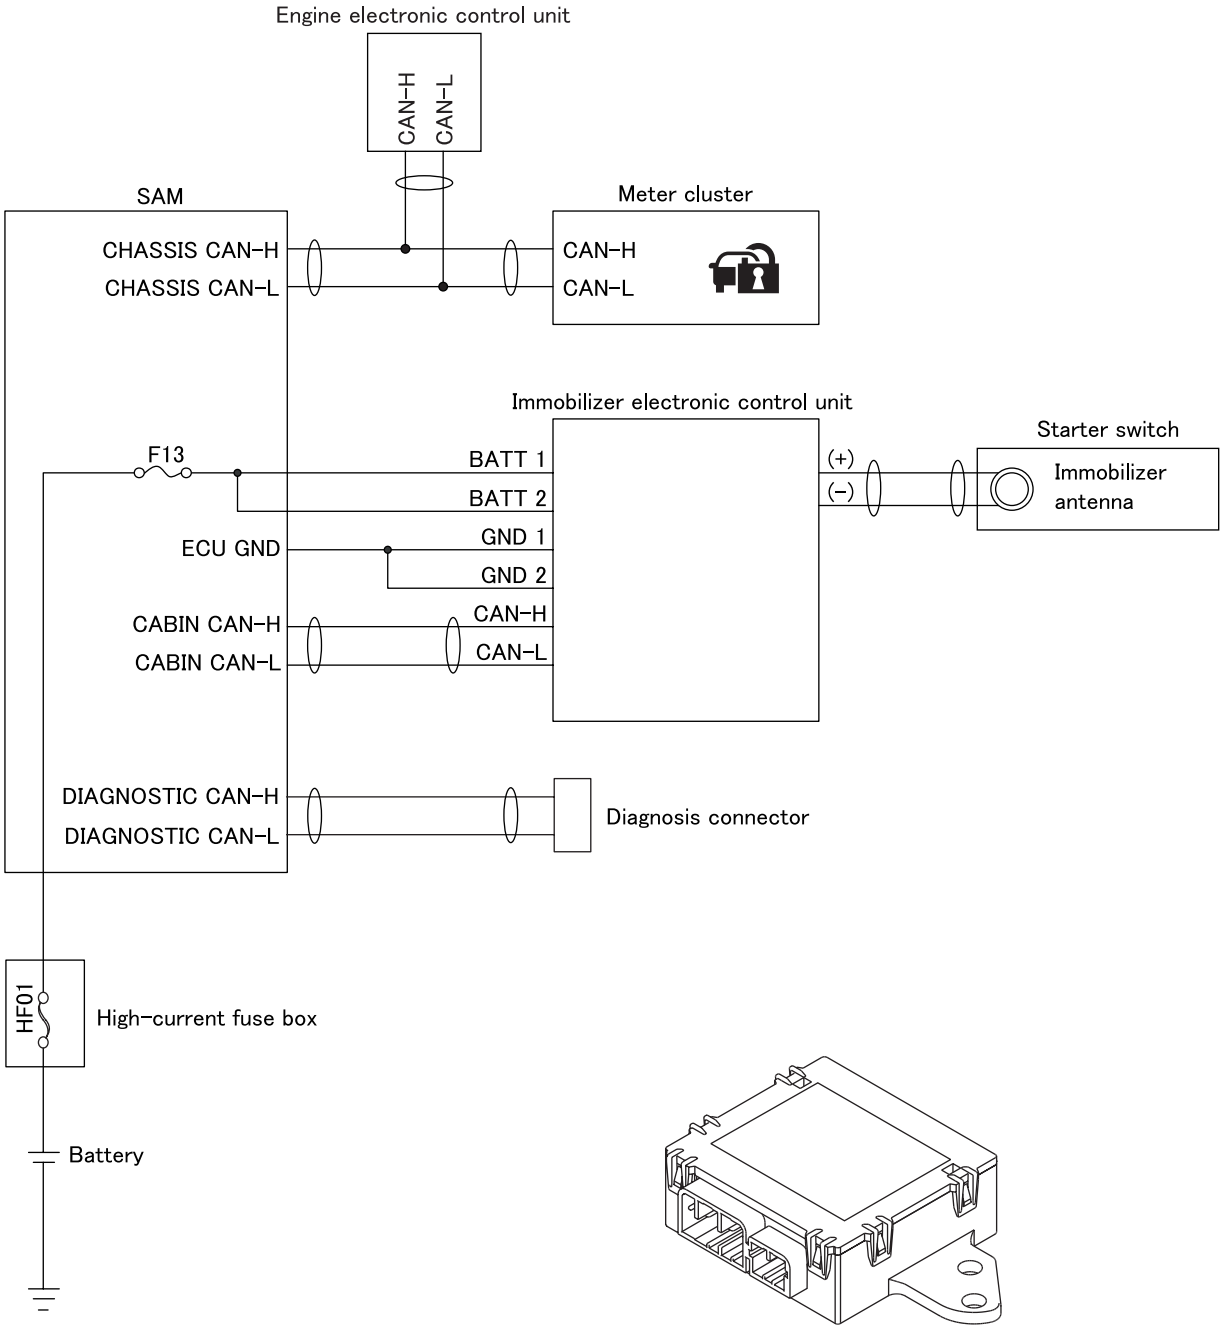


Part name	Function or use
Starter key for immobilizer	Sending and receiving of ID No. signal
Immobilizer antenna	Sending and receiving of ID No. signal
Starter switch	Check of starter switch ON/OFF
Immobilizer electronic control unit	Identification of ID No. and enabling signal for engine start
Starter	Start of engine
Immobilizer warning lamp (meter cluster)	Lit for approx. 3 seconds after starter switch ON (with immobilizer system in “set” status)
	Lit when immobilizer system becomes abnormal.
FUSO Diagnostics (diagnosis connector)	Communication between FUSO Diagnostics and immobilizer electronic control unit (controller area network communication via signal detect and actuation modules)
Signal detect and actuation modules	Junction for sent and received signals between immobilizer electronic control unit, engine electronic control unit, meter cluster and FUSO Diagnostics
	Sending of starter ON/OFF signal

2.2 Fault diagnosis function

- The status of the system is constantly monitored when the starter switch is put in the ON position, and if a fault is detected in the system, the driver is informed of the fault through warning lamp in the meter cluster. At the same time, the location of the fault is stored in the memory in the form of diagnosis code and appropriate fault-response control is effected.
- The diagnosis code stored in the memory can be called out on the multi-information display in the meter cluster and through the FUSO Diagnostics. (See Gr00.)

3. Electronic Control Circuit Diagram

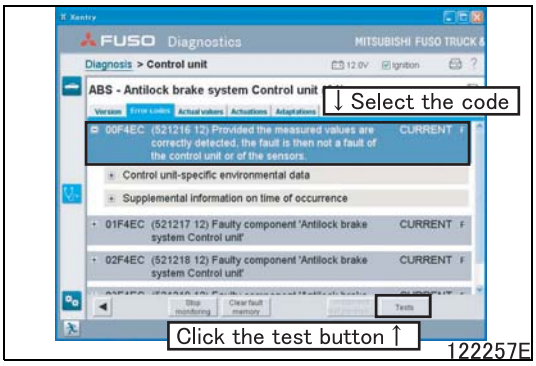


C07391-ECU-IMM E

M E M O

1. Inspection Based on Diagnosis Codes

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.



- When the FUSO Diagnostics is connected, perform the interactive troubleshooting with the following procedure.

  Select the code from the diagnostics code list
  ↓
  Click the test button
  ↓
  Start the interactive troubleshooting

1.1 List of Diagnosis Codes

Code	Message	Warning lamp indication	Remarks
521742-12	Faulty component 'Immobilizer Control unit'	O	
521742-31	Faulty component 'Immobilizer Control unit'	O	
521743-2	Faulty component 'Transponder key, W1 (Receiving antenna of immobilizer)'	O	
521744-2	A transponder key which has not been taught in was detected	O	
521745-2	Faulty component 'Combustion engine Control unit'	O	
521746-2	Faulty component 'Immobilizer control unit, Combustion engine control unit Authentication'	O	
521747-2	Faulty component 'Immobilizer control unit, Transponder key Authentication'	O	
521748-2	The default settings have not yet been applied of Immobilizer Control unit	O	
521749-2	Faulty component 'Transponder key Data'	O	
521750-19	CAN fault	O	
521750-31	No CAN message received from component 'Signal & ActuatorModule'.	O	

1.2 Details of Diagnosis Codes

521742-12: Faulty component 'Immobilizer Control unit'

Generation condition	• Some abnormality has occurred in immobilizer electronic control unit.
Recoverability	• System recovers when relevant diagnosis code is erased.
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Defective immobilizer electronic control unit

521742-31: Faulty component 'Immobilizer Control unit't

Generation condition	• CPU has been reset.
Recoverability	• System recovers if no abnormal conditions are present when starter switch is placed in ON again.
Control effected by electronic control unit	• None
Possible causes	• Defective immobilizer electronic control unit

521743-2: Faulty component 'Transponder key, W1 (Receiving antenna of immobilizer)'

Generation condition	• No communication takes place between transponder key (starter key) and immobilizer electronic control unit.
Recoverability	• System recovers if no abnormal conditions are present when starter switch is placed in ON again.
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Defective transponder key (starter key) • Defective harness between immobilizer antenna and immobilizer electronic control unit • Defective immobilizer antenna • Defective immobilizer electronic control unit

521744-2: A transponder key which has not been taught in was detected

Generation condition	• Secret key is not registered in immobilizer electronic control unit.
Recoverability	• None
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Defective immobilizer electronic control unit

521745-2: Faulty component 'Combustion engine Control unit'

Generation condition	• Collation between engine electronic control unit and immobilizer electronic control unit is not successfully made.
Recoverability	• System recovers if collation is made successfully when starter switch is placed in ON again.
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Defective engine electronic control unit • Incorrect engine electronic control unit in use • Engine electronic control unit transferred from another vehicle

521746-2: Faulty component 'Immobilizer control unit, Combustion engine control unit Authentication'

Generation condition	• No communication is possible between engine electronic control unit and immobilizer electronic control unit.
Recoverability	• System recovers if normal communication is established when starter switch is placed in ON again.
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Defective engine electronic control unit • Controller area network communication line is open or short-circuited to power, ground or another circuit. • Incorrect engine electronic control unit in use

521747-2: Faulty component 'Immobilizer control unit, Transponder key Authentication'

Generation condition	• Collation between transponder key (starter key) and immobilizer electronic control unit is made unsuccessfully.
Recoverability	• System recovers if collation is made successfully when starter switch is placed in ON again.
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Unauthorized transponder key (starter key) is used. • Transponder key (starter key) not registered yet is used.

521748-2: The default settings have not yet been applied of Immobilizer Control unit

Generation condition	• Transponder key (starter key) ID is not stored in immobilizer electronic control unit.
Recoverability	• System recovers when initial key registration is executed.
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Transponder key (starter key) used is not a one registered in immobilizer electronic control unit.

521749-2: Faulty component 'Transponder key Data'

Generation condition	• Immobilizer electronic control unit has received an implausible data from transponder key (starter key) through communication line.
Recoverability	• System recovers if a plausible data is obtained when starter switch is placed in ON again.
Control effected by electronic control unit	• Engine is disabled from starting.
Possible causes	• Faulty transponder key (starter key) • Faulty immobilizer antenna • Faulty immobilizer electronic control unit

521750-19: CAN fault

Generation condition	• Controller area network error message is received.
Recoverability	• System recovers if any normal signal is received when starter switch is placed in ON position.
Control effected by electronic control unit	• None
Possible causes	• Controller area network communication line is open or shorted to power, ground or another circuit. • Faulty controller area network resistor • Faulty signal detect and actuation module • Faulty immobilizer electronic control unit

521750-31: No CAN message received from component 'Signal & ActuatorModule'.

Generation condition	• No controller area network message is receivable.
Recoverability	• System recovers if any normal signal is received when starter switch is placed in ON position.
Control effected by electronic control unit	• None
Possible causes	• Controller area network communication line is open or shorted to power, ground or another circuit. • Faulty controller area network resistor • Faulty signal detect and actuation module • Faulty immobilizer electronic control unit

2. FUSO Diagnostics Service Data (Measured Values)

- Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.

[Current Value Group: Transponder key]

No.	Description	Value	Explanation
000	Ignition status	ON/OFF	Indicates the ignition status • ON: Starter switch is in ACC, ON or START position • OFF: Starter switch is in LOCK position
001	Type of key used	Transponder key/ Key not taught-in/ Vehicle key NOT INSERTED	Indicates the type of the starter key (transponder key for engine immobilizer) currently inserted in the starter switch. • Transponder key: Starter key registered in the immobilizer electronic control unit • Key not taught-in: Starter key not registered in the immobilizer electronic control unit • Vehicle key NOT INSERTED: No key in the starter switch.
002	Number of keys taught in	■■■■	Indicates the number of registered starter keys • 00 to 06

[Current Value Group: Status of function “Immobilizer”]

No.	Description	Value	Explanation
003	Status of function 'Immobilizer'	■■■■	Indicates the current status of the immobilizer electronic control unit • 00: Initial key registration completed • 01: Initial key registration not completed • 02: Additional key registration in progress • 03: Deletion of registered key in progress • 04: Secret key registration in progress • 05: Standby
004	Immobilizer Warning lamp	ON/OFF	Indicates the status of the immobilizer indicator lamp • ON: Indicator lamp is illuminating • OFF: Indicator lamp is off
005	Immobilizer Operating condition	ACTIVE/NOT ACTIVE	Indicates the status of the immobilizer system • ACTIVE: Immobilizer system is active • NOT ACTIVE: Immobilizer system is inactive

INITIAL SETTINGS OF IMMOBILIZER

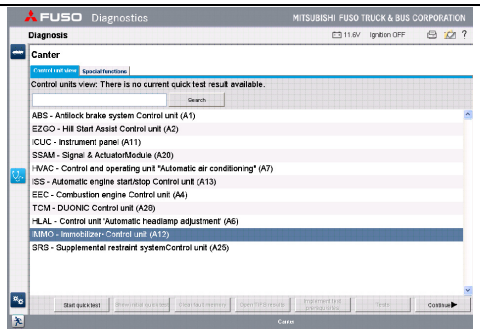
1. Connecting the FUSO Diagnostics

CAUTION ⚠

- **The immobilizer can be set with FUSO Diagnostics Ver. FDS-R10-1 or higher.**
- **Display images will be applied to FUSO Diagnostics Ver. FDS-R12-1 or higher. Display images might look different according to the version of FUSO Diagnostics.**

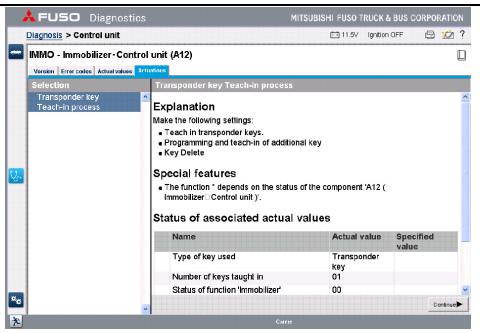
- Connect FUSO Diagnostics. (See Gr54-00A.)

2. Selection of the Setting of Immobilizer



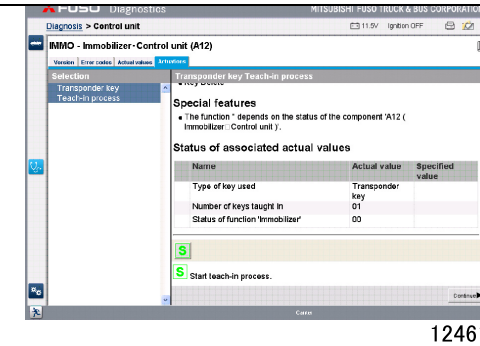
124615E

- From the control unit list screen, select [IMMO - Immobilizer Control Unit (A12)].



124616E

- Select “Actuations” tab.
- Select [Transponder key Teach-in process].



124617

- Press the “S” button of “Start teach-in process”.

3. Various Operations (Initial Key Registration, Additional Key Registration, Secret Key Registration, Key Information Deletion)

- Details of each function are as follows.

Function	FUSO Diagnostics display	Outline
Initial key registration	Button “R”: Register Initial Key	Used to allow the immobilizer electronic control unit to identify starter key data or to load new data to the memory after replacement of the electronic control unit. (See “(1) Initial key registration”.)
Additional key registration	Button “R”: Register Additional Key	Used to allow the immobilizer electronic control unit to identify starter key data or to load new data to the memory at re-registration of starter key or addition of a new key. (See “(2) Additional key registration”.)
Secret key registration	Button “R”: Perform teach-in process “security code”.	Used to allow the system to collate immobilizer electronic control unit ID with engine electronic control unit ID. (See “(3) Secret key registration”.)
Key information deletion	Button “N”: Delete key.	Used to delete starter key data registered in the immobilizer electronic control unit memory. (See “(4) Key information deletion”.)

CAUTION ⚠

- **The secret key data can be registered in the memory only after the initial key has been previously registered.**

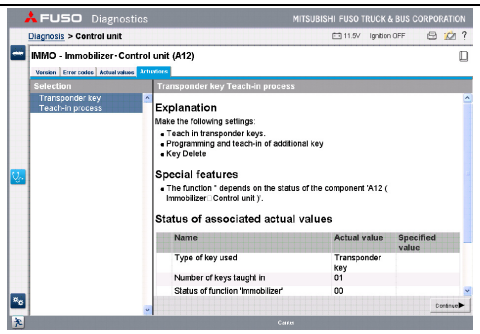
(1) Initial key registration

- After replacement of the immobilizer electronic control unit, this function should be executed to allow the electronic control unit to identify the starter key data in the memory or load new data to the memory.
  (The procedure of initial key registration is identical with the procedure of additional key registration after pressing the button “R” for “Register Initial Key”. See “(2) Additional key registration”.)

(2) Additional key registration

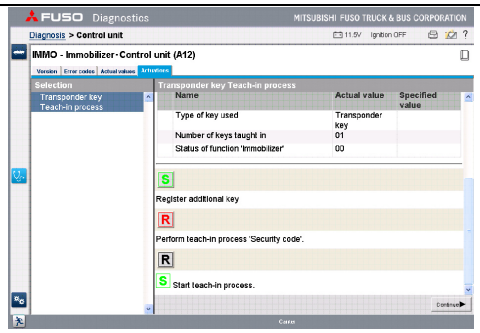
- At re-registration of starter key or addition of a new key, additional key registration function should be executed to allow the electronic control unit to identify the starter key data in the memory or load new data to the memory.
- Up to 6 sets of the key data can be registered in the immobilizer electronic control unit memory.

(2.1) Registration procedure



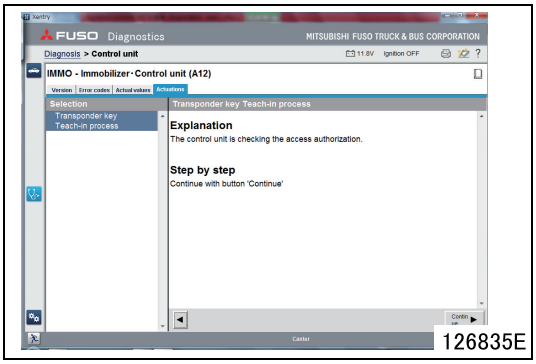
124618E

- Insert the starter key registered in the immobilizer electronic control unit memory.
- Check that the actual value of “Type of key used” is “Transponder key”.

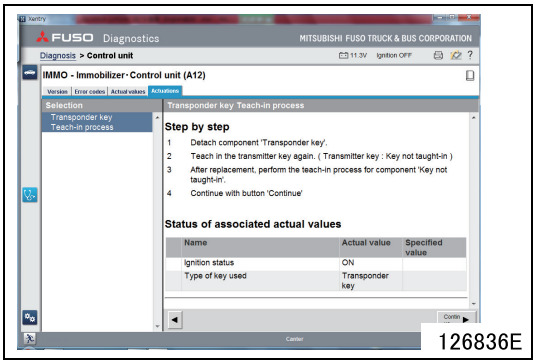


124619E

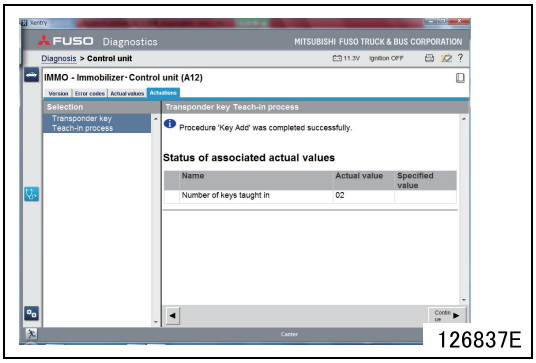
- Press the “R” (red) button of “Register additional key”.



- Press the “Continue” button.
  If an error occurs, or when work was interrupted in the middle, and then press the "Continue" button after the ON again to OFF once the starter switch



- Insert a new starter key to be registered in the immobilizer electronic control unit memory into the starter key switch.
- Press the “Continue” button.



- A message appears to show registration of additional starter key data in the immobilizer electronic control unit has been successfully completed.
- Make sure that the number of the value of “Numbers of keys taught in” is increased.

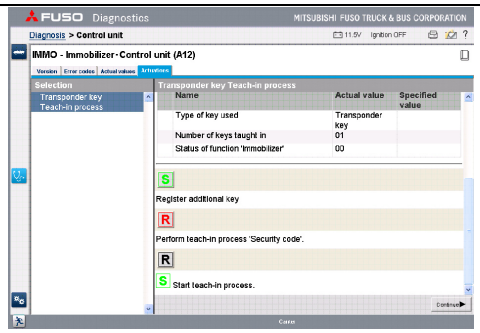
(3) Secret key registration

- Secret key registration function should be executed whenever the following operations have been done. Without secret key registration, the engine cannot be started because engine cannot find the same key ID in the memory.
  - The immobilizer electronic control unit is replaced with new one.
  - The engine electronic control unit is replaced with new one.
  - The engine electronic control unit is replaced with one derived from other vehicles.

CAUTION ⚠

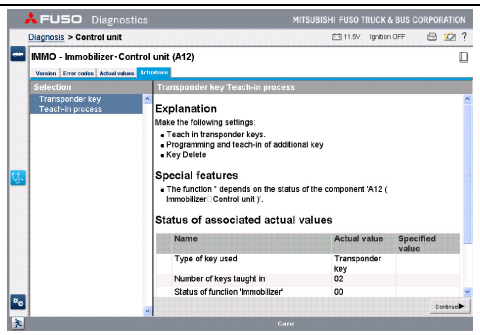
- **The immobilizer electronic control unit should never be replaced with one derived from other vehicles.**
- **The secret key registration function need not be executed after the starter key data is once deleted and registered again.**

(3.1) Registration procedure



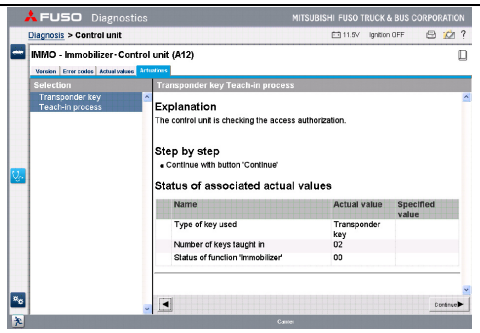
124619E

- Press the “R” (black) button of “Perform teach-in process ‘Security code’”.



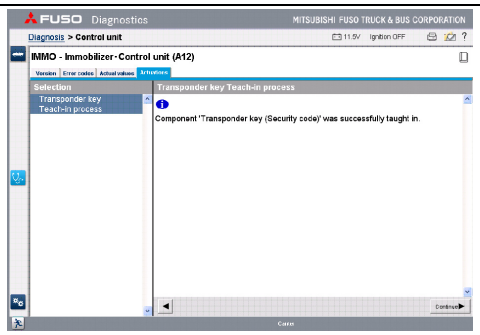
124623E

- Press the “Continue” button.



124624E

- Press the “Continue” button.



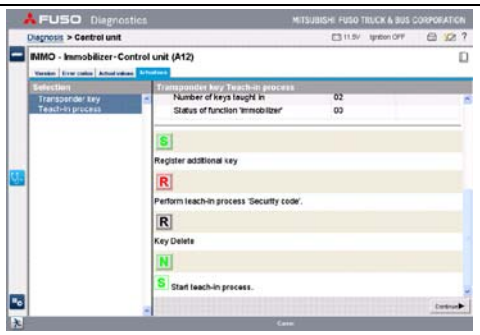
124625E

- A message appears to show that registration of the secret key in the engine electronic control unit memory has been successfully completed.

(4) Key information deletion

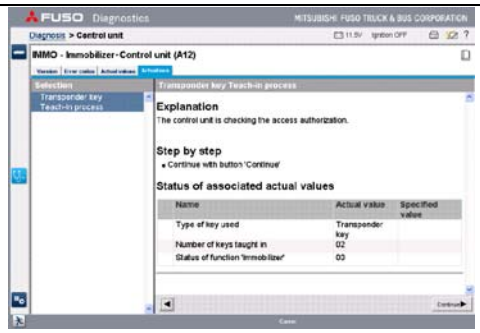
- Key information deletion function should be executed to delete the starter key data registered in the immobilizer electronic control unit memory.

(4.1) Deletion procedure



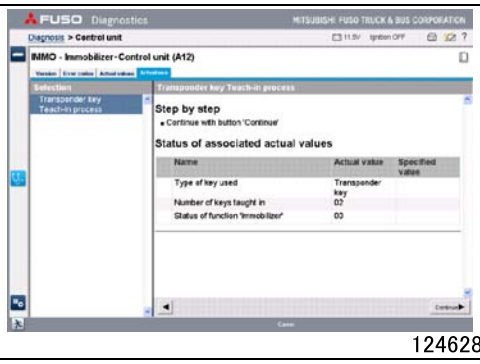
124626E

- Press the “N” button of “Key Delete”.



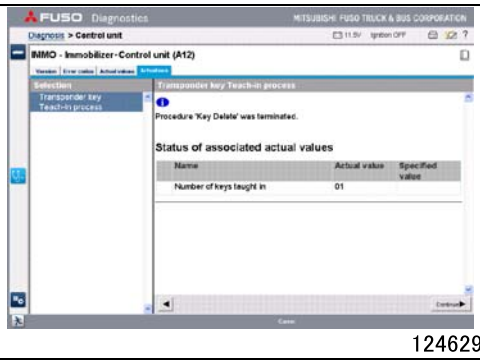
124627E

- Press the “Continue” button.



124628E

- Press the button “Continue” again.

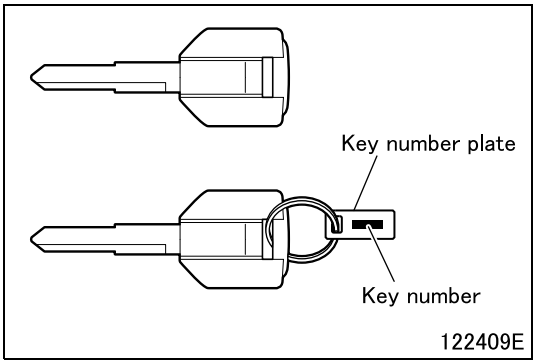


124629E

- A message appears to show deletion of the starter key data registered in the immobilizer electronic control unit memory has been successfully completed.
- Make sure that the value of “Number of keys taught in” is “01”. (Only the starter key inserted in the starter key switch has been taught in.)

4. Additional Starter Key Registration (Up to 6 Keys Can be Registered)

- Follow the procedure below to register the additional starter key after checking its key number. When the key number is unavailable, the key cutouts must be cut as this starter key has no cutout on it.



- Key number is shown on the key number plate attached to one of two starter keys initially provided.

Prepare the additional starter key to be registered with the key number confirmed.
(If the key number is unavailable, the key cutouts must be cut as this starter key has no cutout on it.)

↓

Prepare the existing starter key and the new and additional starter key to be registered.

↓

Insert the existing starter key (other than the new and additional starter key to be registered) into the starter key switch.

↓

Delete the starter key data with FUSO Diagnostics. (See “3. (4) Key information deletion”.)
After deletion of the starter key registration has been completed, all of the starter key data except the starter key inserted into the starter key switch is deleted.

↓

Register the additional starter key with FUSO Diagnostics. (See “3. (2) Additional key registration”.)
Any starter keys except the starter key inserted into the starter key switch at deletion of key registration can be registered.

↓

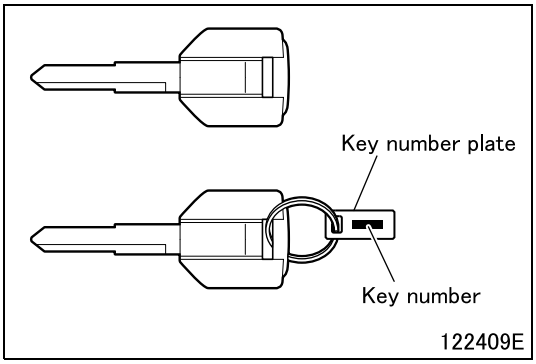
Register the secret key with FUSO Diagnostics. (See “3. (3) Secret key registration”.)

↓

End

5. New Starter Key Registration after All of Starter Keys Have Been Lost

- When the new starter key has to be registered after all of starter keys have been lost, firstly check the key number because the key parts to be prepared will differ according to availability of key number.



- Key number is shown on the key number plate attached to one of two starter keys initially provided.

- Follow the procedure below after checking if the key number is available or not.

When the key number is unavailable

Replace all the parts below with new ones.
- Starter key
- Starter key switch
- Key cylinder
- Immobilizer electronic control unit
- Fuel cap
- Glove box with key
  <Glove box with key type>

When the key number is available

Replace all the parts below with new ones.
(Provide the key number.)
- Starter key
- Immobilizer electronic control unit

Insert the starter key into the starter switch.

Register the initial starter key with FUSO Diagnostics. (See “3. (1) Initial key registration”.)

Register the secret key with FUSO Diagnostics. (See “3. (3) Secret key registration”.)

Register the additional starter key. (See “4. Additional Starter Key Registration”.)

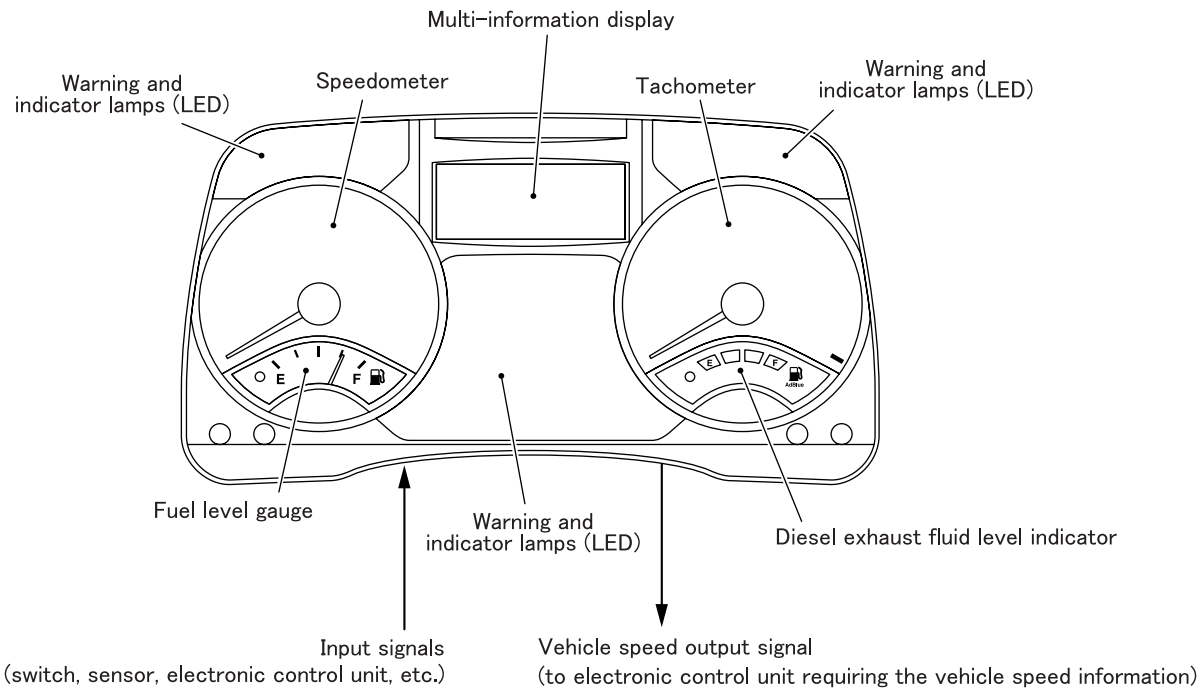
Meter

Item			Specifications
Meter cluster	Manufacturer		Continental
	Voltage V		12
	Speedometer indicating range km/h {MPH}		0 to 160 ($^{+3}_{0}$ at 60 km/h) {0 to 100 ($^{+2}_{0}$ at 40 MPH)}
	Tachometer indicating range rpm		0 to 5000 (±50 at 3000 rpm)
	Water temperature gauge indicating range		 P118175N
	Meter warning buzzer	Sound pressure dB	55 ± 3 (at 1 m {3.3 ft.})
	Low vacuum pressure buzzer	Sound pressure dB	75 ± 3 (at 1 m {3.3 ft.})

M E M O

1. Overview

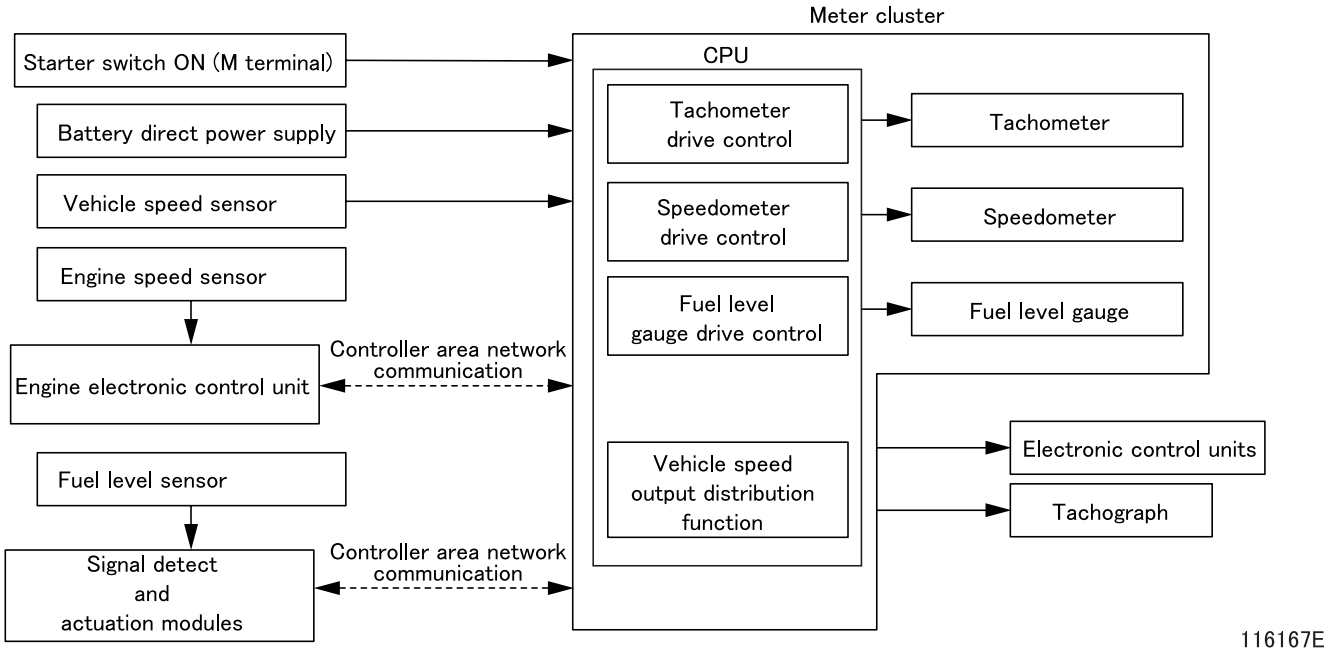


- This meter cluster contains a central processing unit with the following functions.
  - Instrument drive function (speedometer, tachometer, fuel level gauge)
  - Vehicle speed output distribution function
  - Indicator and warning lamps indication function
  - Multi-information display indication function
  - Diesel exhaust fluid level indicator operation function
  - Buzzer sound function
  - Fault diagnosis function

2. Electronic Control System

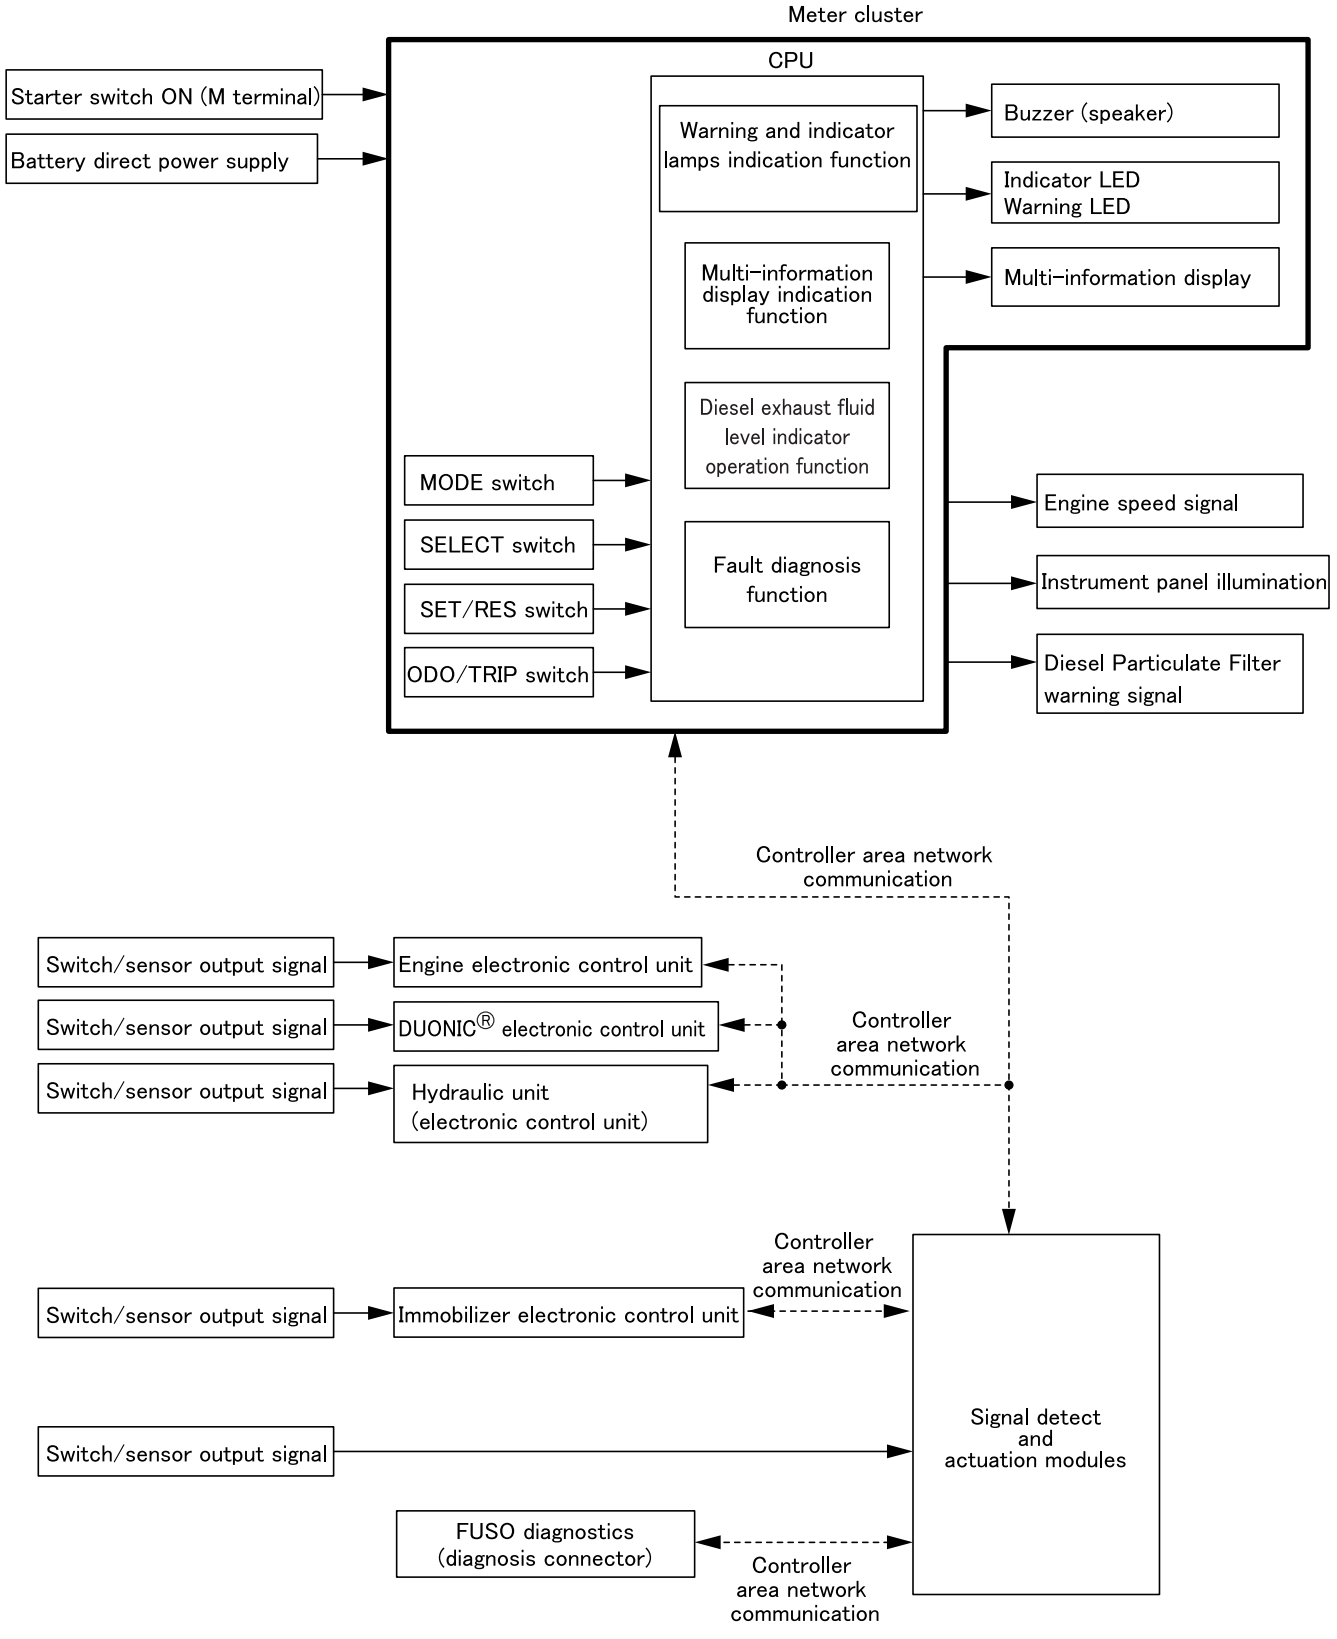
2.1 Instrument drive function and vehicle speed output distribution function

(1) System block diagram



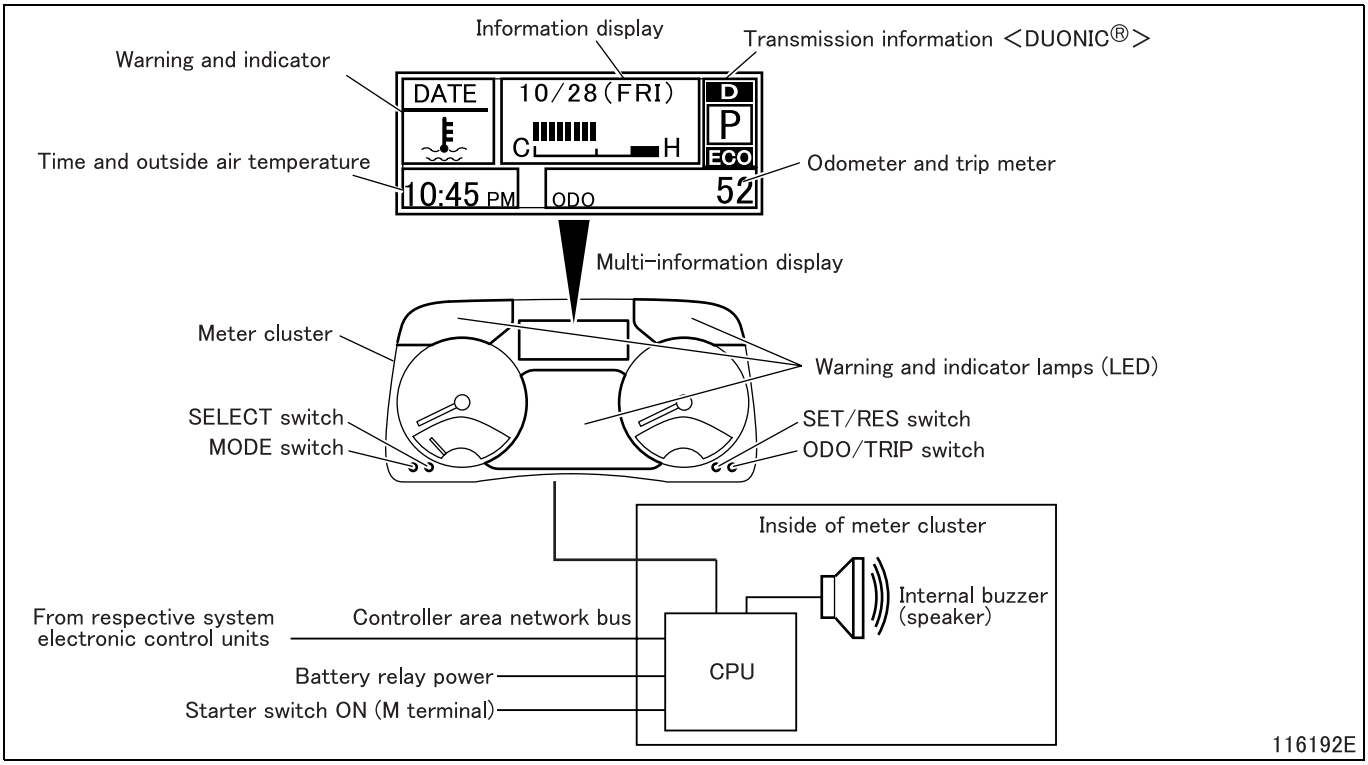
2.2 Warning and indicator lamps indication function, multi-information display function, urea level indicator operation function and fault diagnosis function

(1) System block diagram



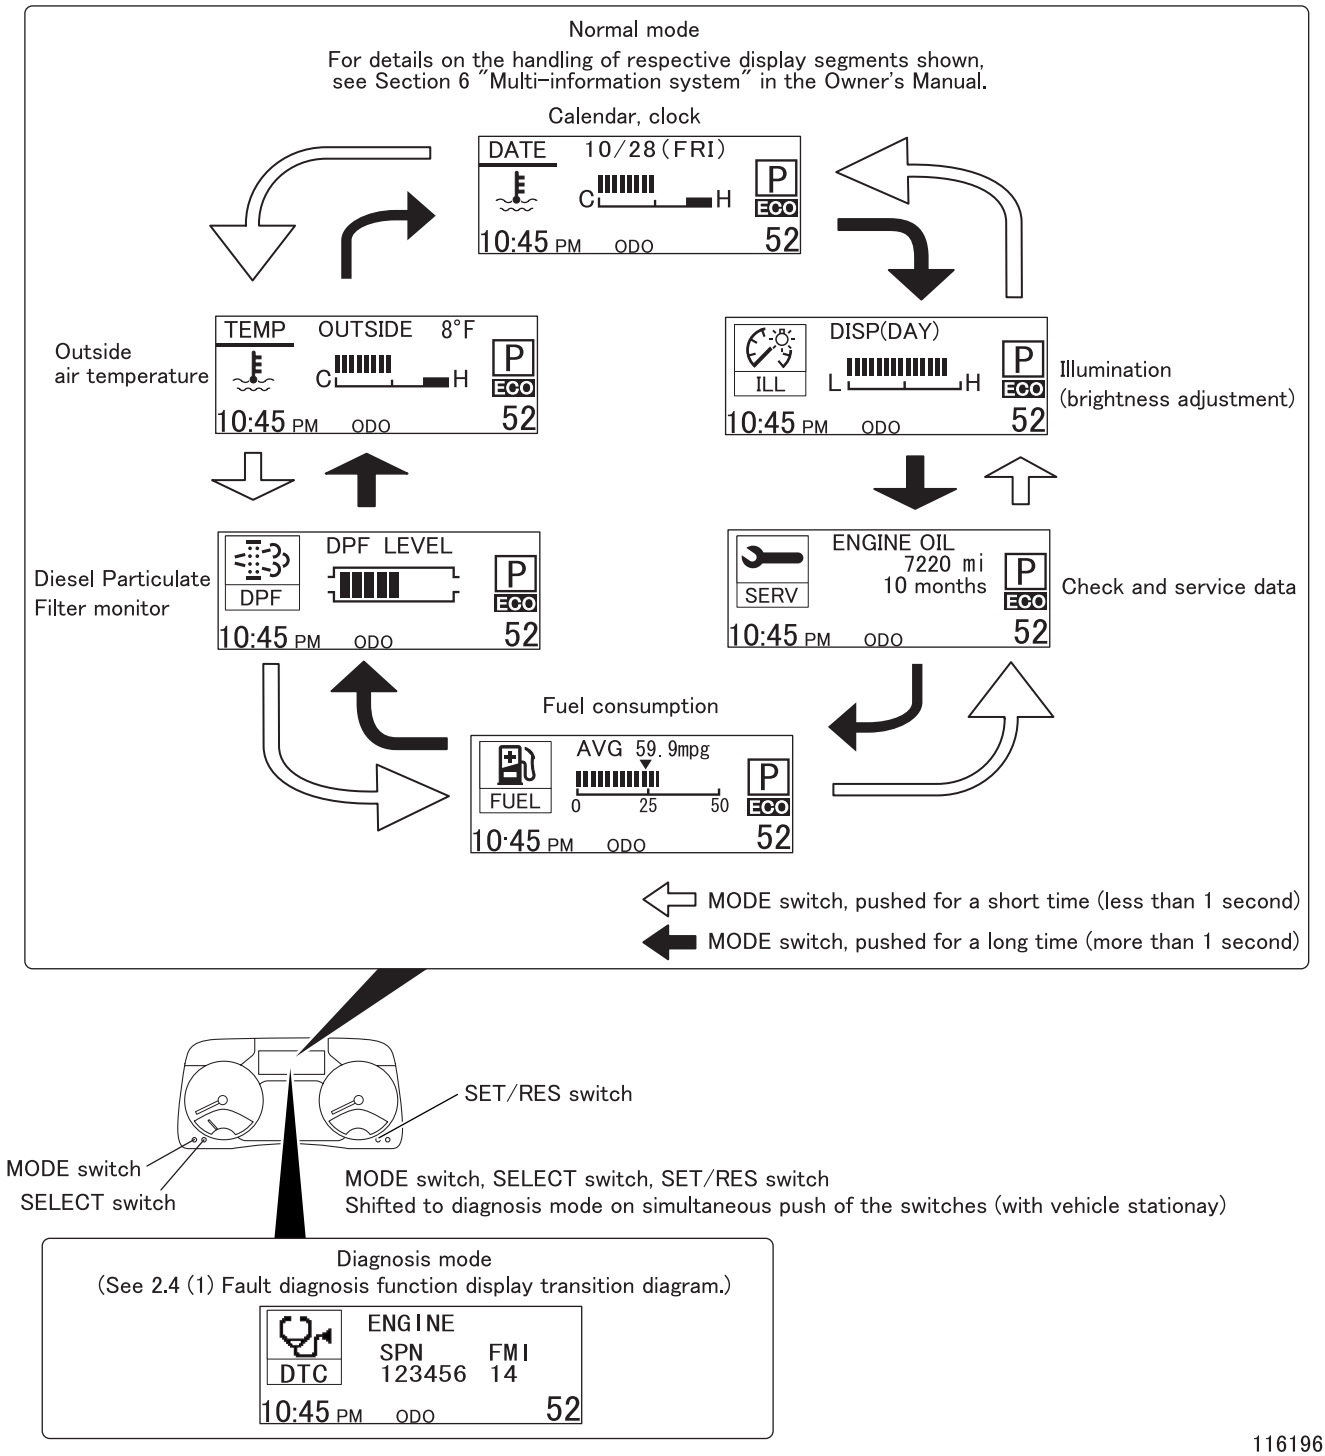
117205E

2.3 General description



- The warning and indicator lamps indication function indicates warning characters or graphical marks (LED), thereby adequately alerting the driver to abnormalities.
- Output data signals from respective systems are gathered in the central processing unit in the meter cluster and indicated through appropriate LED or the multi-information display. Alarm is sounded by the buzzer (speaker) in the meter cluster.
- The system features are as shown below.
  - The multi-information display distinctly shows necessary information by changing display colors according to the degree of significance of the information.
  - MODE switch, SELECT switch, SET/RES switch and ODO/TRIP switch are used to have option vehicle information (such as trip meter, clock, check and service data) and diagnosis codes for respective electronic control systems indicated by the multi-information display according to information gathered in the meter cluster.
  - When there are two or more warning items, the display is switched to show them in every three seconds.

(1) Multi-information display indication transition diagram



(2) Indicator lamps (LED)

Lamp	Illuminating/ flashing	Internal buzzer sounding	Condition for illuminating/flashing	Remarks
●	Illuminates	–	Fuel level is low	See (420).
BRAKE or (!)	Illuminates	O	Parking brake is engaged (Buzzer sounds when vehicle speed exceeds 12 km/h {7.46 mph} with parking brake engaged.)	See (510).
		–	Brake fluid level is low	See (515).
LOW VACUUM	Illuminates	–	Vacuum in vacuum tank is low <Vacuum booster-equipped vehicle>	See (515).
	Illuminates	O	Engine is overheated	See (537).
	Illuminates	–	Charging system is defective	See (125).
	Illuminates	–	Engine oil pressure is low	See (536).
	Illuminates	–	Engine is being preheated	See Gr13E.
	Illuminates	–	• Engine control system is defective • Exhaust gas aftertreatment is defective	See Gr13E.
(amber)	Flashes	–	• Soot is accumulated in Diesel Particulate Filter (flashes at 0.5 second interval)	See Gr13E.
	Flashes	–	• Diesel Particulate Filter requires cleaning (flashes at 0.25 second interval)	
	Illuminates	–	• Parked regeneration is in progress in the Diesel Particulate Filter	
(green)	Illuminates	–	Automatic regeneration is in progress in the Diesel Particulate Filter	See Gr13E.
	Illuminates	O	• Abnormality is detected by NOx sensor • BlueTec® exhaust gas aftertreatment system is defective • Diesel exhaust fluid level decreases (5% or lower) • Quality of diesel exhaust fluid refilled decreases	See Gr17E.
	Flashes	O	• Abnormality is detected by NOx sensor • Quality of diesel exhaust fluid refilled decreases	
DEF level indicator ●	Illuminates	O	Diesel exhaust fluid level decreases (10% or lower)	See Gr17E.
	Flashes	O	• Diesel exhaust fluid level decreases (5% or lower) • Diesel exhaust fluid tank is empty • Abnormality is detected by NOx sensor • Quality of diesel exhaust fluid refilled decreases	
	Illuminates	–	Headlamp high beam is on	See (310).
	Illuminates	–	Fog lamp is on	See (315).
	Flashes	O (turn signal sound)	• Turn signal lamp is on • Hazard lamp is on	See (330).
	Illuminates	–	• Exhaust brake is on • Warm-up system is on	See Gr13E.

Mark	Illuminating/ flashing	Internal buzzer sounding	Condition for illuminating/flashing	Remarks
ABS or	Illuminates	–	Anti-lock brake system is abnormal	See Gr35E.
	Illuminates	–	• Engine immobilizer starter key communication is defective • Engine immobilizer system is defective	See Gr54EI.
	Illuminates	–	Vehicle is running in four-wheel drive mode	See (810).
	Illuminates	–	Headlamp comes on by daytime running light system	See (313).
	Illuminates	–	Vehicle is running in cruise control mode	See Gr13E.

(3) Multi-information display indications

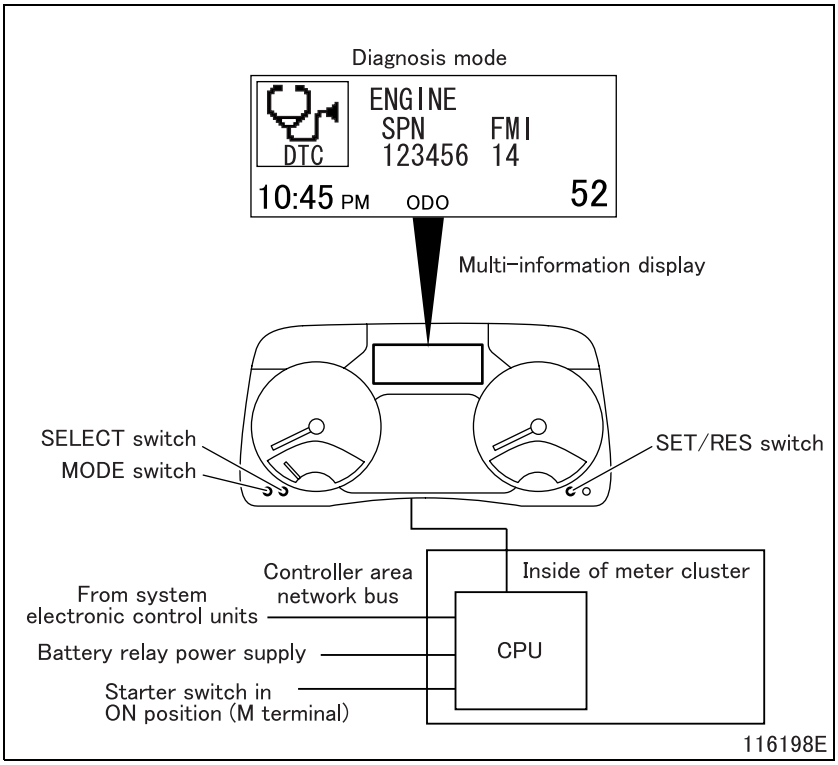
Mark	Illuminating/ flashing	Internal buzzer sounding	Condition for illuminating/flashing	Remarks
ENG SYS (red)	Illuminates	–	Engine output is limited	See Gr13E.
ENG SYS (amber)	Illuminates	–	• Engine check is required • Engine oil change is required (when the mark appears alternately with ENG OIL) • System is reset after engine oil change (indicated for 10 seconds)	See Gr13E.
T/M OIL	Illuminates	–	Transmission fluid is too hot	See Gr22E.
T/M SYS (red)	Illuminates	O	DUONIC® system is faulty or abnormal in electric control system (The system malfunction causes gears to remain in the present shift position; lamp comes on and buzzer sounds.)	See Gr22E.
T/M SYS (amber)	Illuminates	–	DUONIC® system is faulty or abnormal in electric control system (Automatic or manual gear shifting is enabled.)	See Gr22E.
CAB TILT	Illuminates	O	Cab tilt lock is incomplete (Buzzer sounds at vehicle speed beyond 5 km/h.)	See (**550**).
SAM (red)	Illuminates	–	Signal detect and actuation modules are faulty in electric control system	See Gr54ES.
SAM (amber)	Illuminates	–	Signal detect and actuation modules are abnormal in electric control system (when outside light check is needed)	See Gr54ES.
METER	Illuminates	–	Meter cluster electric circuit is defective	See Gr54EM.
ENG OIL (amber)	Illuminates	–	Engine oil change is required (when quantity of fuel mixed in engine oil exceeds upper limit)	See Gr13E.
ENG OIL (green)	Illuminates	–	PCV (positive crankcase ventilation) filter regeneration must be performed or PCV (positive crankcase ventilation) filter must be replaced.	See Gr13E.
DPF FULL	Illuminates	–	Soot accumulation in Diesel Particulate Filter is excessive	See Gr13E.
WATER SEPR	Illuminates	–	Moisture in fuel filter becomes excessive	See (**566**).

Mark	Illuminating/ flashing	Internal buzzer sounding	Condition for illuminating/flashing	Remarks
PTO	Illuminates	–	Transmission power take-off is connected <Vehicles with transmission power take-off>	See (850).
PTO READY	Illuminates	–	Transmission power take-off is ready for connection <Vehicles with DUONIC® transmission power take-off>	See (850).
ENG OIL	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled engine oil change interval	–
OIL FILTER	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled engine oil filter replacement interval	–
FUEL FILTER	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled fuel filter replacement interval	–
BRAKE FLUID	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled brake fluid change interval	–
AIR FILTER	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled air cleaner replacement interval	–
T/M OIL	Illuminates	–	• Less than 1,000 km (600 miles) or one month remains before the next scheduled clutch fluid and transmission fluid change interval • Less than 1,000 km (600 miles) or one month remains before the next scheduled transmission fluid change interval (manual transmission)	–
HUB GREASE	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled wheel hub bearing grease change interval	–
DIFF OIL	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled differential gear oil change interval	–
P/S OIL	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled power steering fluid change interval	–
ENG WATER	Illuminates	–	Less than 1,000 km (600 miles) or one month remains before the next scheduled engine coolant change interval	–

(4) Alarm with buzzer only (without warning lamp on)

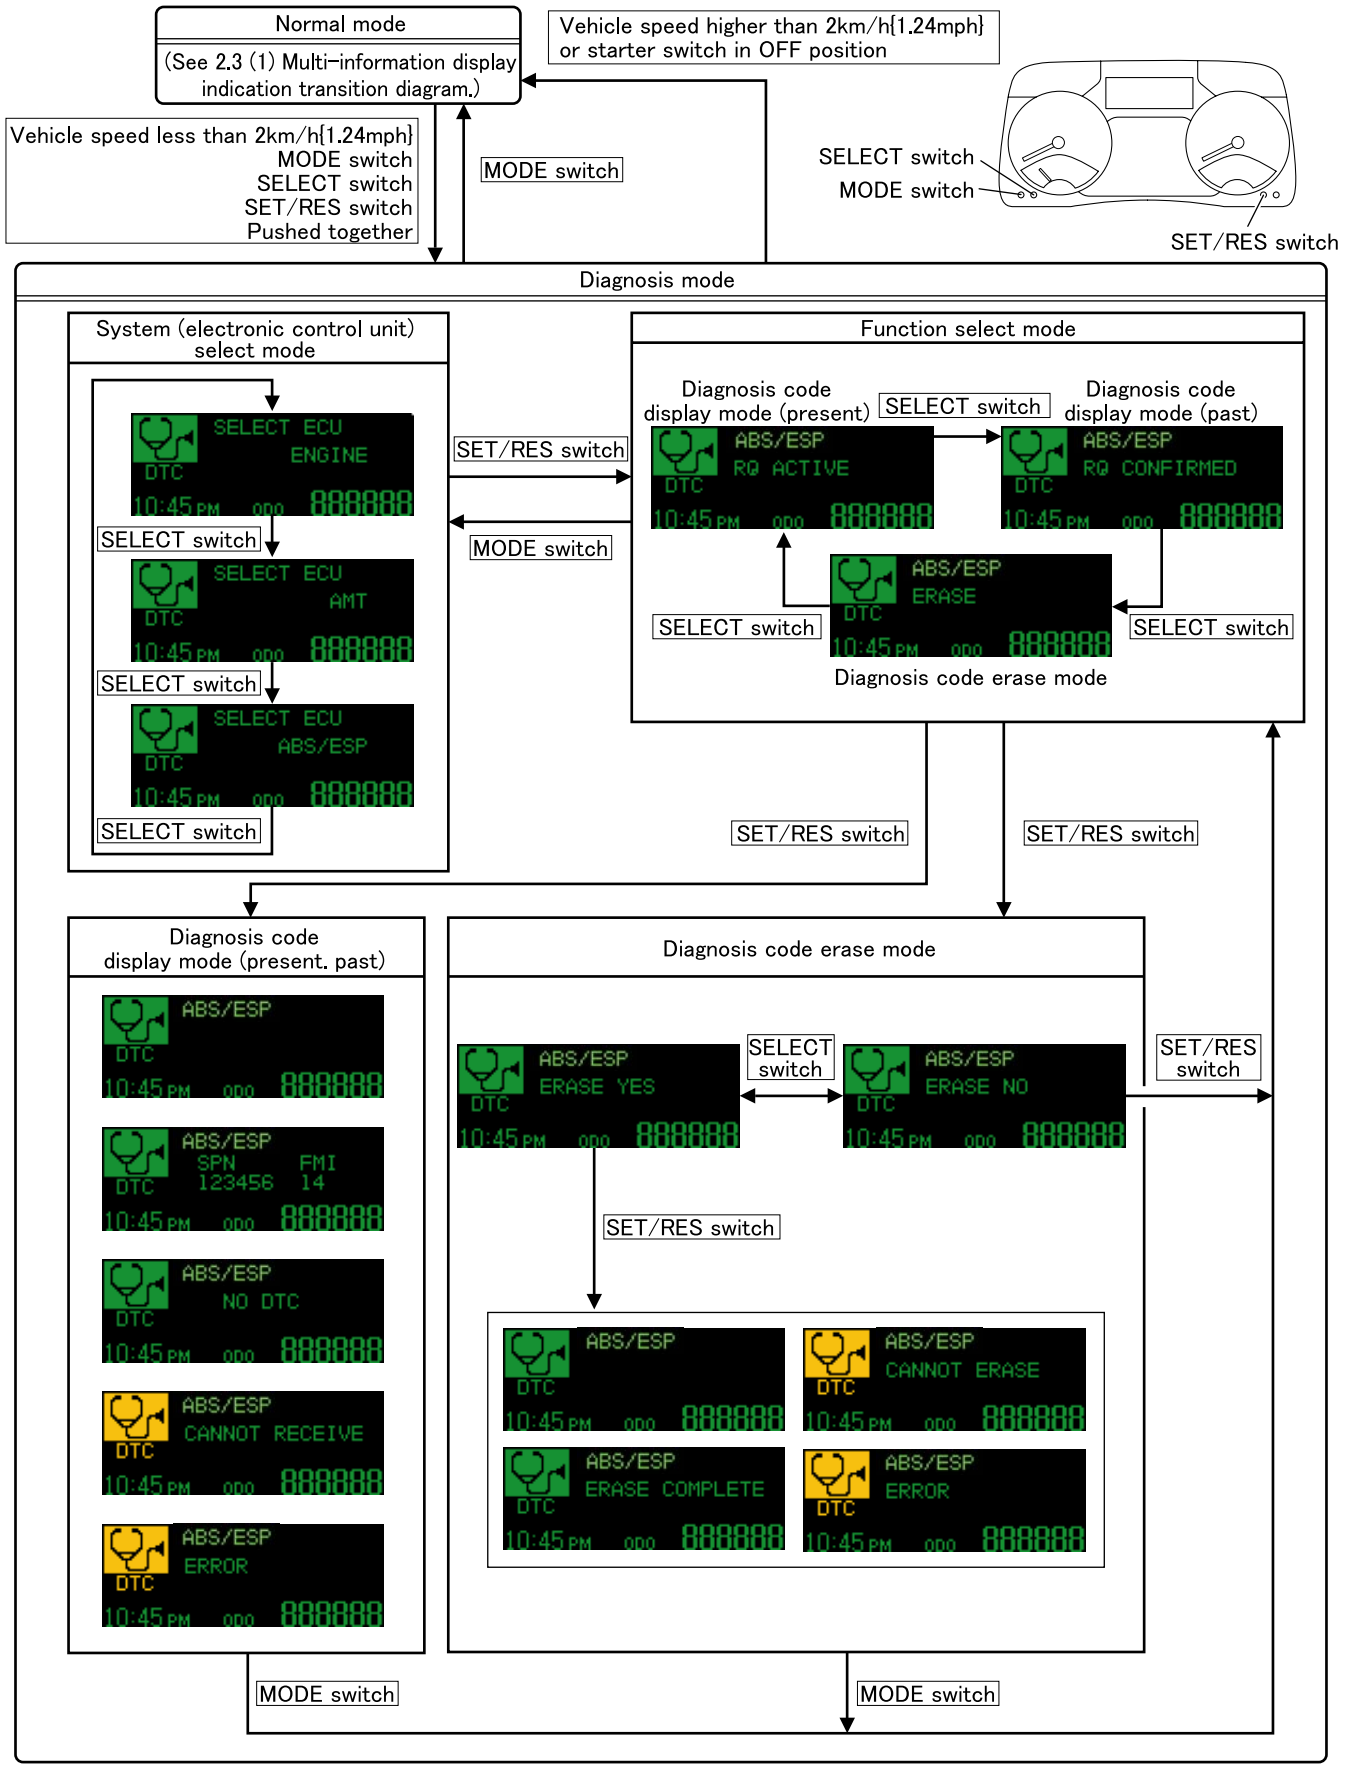
Buzzer	Internal buzzer sounding	Condition for buzzing	Remarks
Back buzzer	O	Shifter lever is put in the “R” position	–
Key reminder buzzer	O	When all conditions below are established • Starter key is left inserted • Starter switch in the OFF position • Driver’s side door switch is in “OPEN” position	–

2.4 Fault diagnosis function

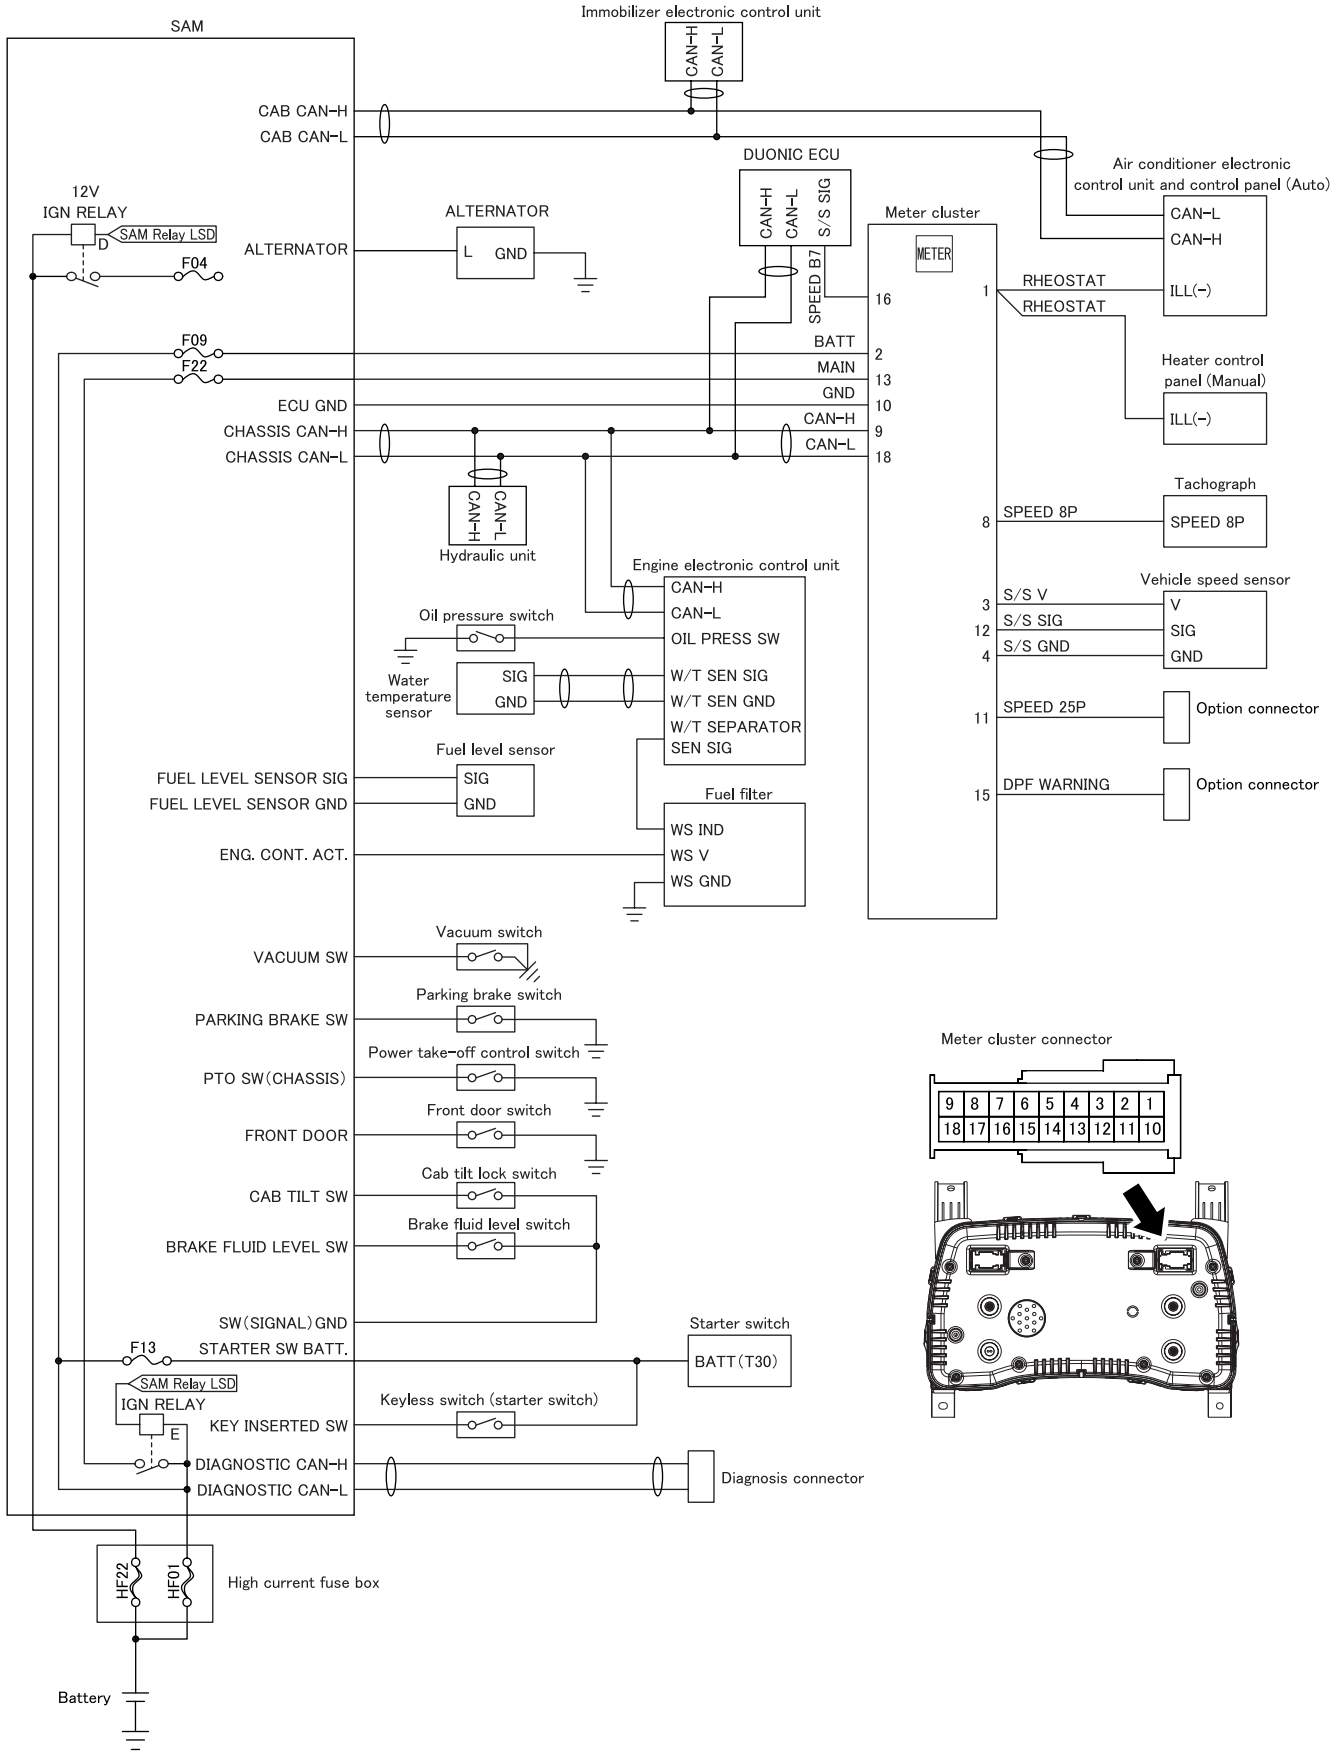


- The fault diagnosis function establishes the diagnosis mode through simultaneous push of the MODE, SELECT and SET/RES switches with the vehicle at a stop to perform the fault diagnosis of respective systems.

(1) Fault diagnosis function (diagnosis mode) display transition diagram (anti-lock brake system electronic control unit (hydraulic unit))

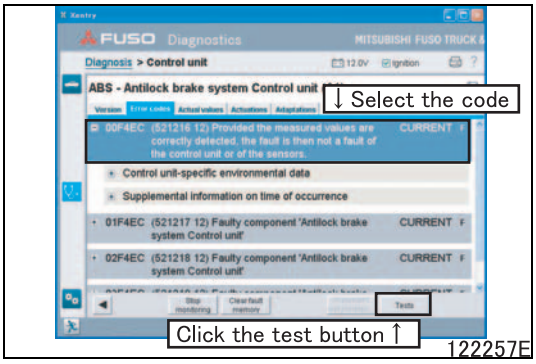


3. Electronic Control Unit Circuit Diagram



1. Inspection Based on Diagnosis Codes

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.



- When the FUSO Diagnostics is connected, perform the interactive troubleshooting with the following procedure.

Select the code from the diagnostics code list
↓
Click the test button
↓
Start the interactive troubleshooting

1.1 List of Diagnosis codes

Code	Message	Warning indication METER	Remarks
158-3	The battery voltage is too high.	O	
158-4	The battery voltage is too low.	O	
629-31	Faulty part CPU inside component “Instrument panel“	O	
639-4	CAN bus OFF fault	O	
1213-14	There is an internal fault in component ‘instrument panel’.	O	
521751-7	There is an internal fault in component ‘instrument panel’.	O	
521768-19	Faulty part CPU inside component “Instrument panel“	O	

1.2 Details of Diagnosis codes

158-3: The battery voltage is too high.

Generation condition	• In meter cluster is indicated a battery voltage higher than 16 V for 10 seconds.
Recoverability	• System recovers if normal reading is obtained when starter switch is turned to OFF and then to ON.
Control effected by electronic control unit	• None
Possible causes	• Faulty alternator • Faulty signal detect and actuation module • Defective meter cluster

158-4: The battery voltage is too low.

Generation condition	• In meter cluster is indicated a battery voltage lower than 10 V for 10 seconds
Recoverability	• System recovers if normal reading is obtained when starter switch is turned to OFF and then to ON.
Control effected by electronic control unit	• None
Possible causes	• Open-circuit or short-circuit to ground in harness between battery and meter cluster • Malfunction of battery • Faulty alternator • Faulty signal detect and actuation module • Defective meter cluster

629-31: Faulty part CPU inside component "Instrument panel"

Generation condition	• CPU in meter cluster is reset.
Recoverability	• System recovers if any normal signal is received when starter switch is turned to OFF and then to ON.
Control effected by electronic control unit	• None
Possible causes	• Defective meter cluster

639-4: CAN bus OFF fault

Generation condition	• Controller area network communication bus off condition is detected.
Recoverability	• System recovers if any normal signal is received when starter switch is turned to OFF and then to ON.
Control effected by electronic control unit	• None
Possible causes	• Controller area network communication bus is open or shorted to power, ground or another circuit. • Faulty resistor in meter cluster • Defective meter cluster

1213-14: There is an internal fault in component "instrument panel".

Generation condition	• Internal circuit is malfunctioning.
Recoverability	• System recovers if any normal signal is received when starter switch is turned to OFF and then to ON.
Control effected by electronic control unit	• Error message is sent through controller area network.
Possible causes	• Defective meter cluster

521751-7: There is an internal fault in component "instrument panel".

Generation condition	• Internal circuit is malfunctioning.
Recoverability	• System recovers if any normal signal is received when starter switch is turned to OFF and then to ON.
Control effected by electronic control unit	• None
Possible causes	• Defective meter cluster

521768-19: Faulty part CPU inside component "Instrument panel"

Generation condition	• Access to EEPROM is impossible.
Recoverability	• System recovers if any normal signal is received when starter switch is turned to OFF and then to ON.
Control effected by electronic control unit	• None
Possible causes	• Defective meter cluster

2. FUSO Diagnostics Service Data (Actual values)

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.

No.	Current Value Group	Description	Value	Explanation
000	–	Vehicle speed Tachograph	■■■■ mph	Shows the vehicle speed as determined by the tachograph. • Synchronous with the speedometer • 0.000 to 255.000 km/h {0.000 to 158.4 mph} [Associated parts] • vehicle speed sensor
001	–	Vehicle speed ECU	■■■■ mph	Shows the vehicle speed as determined by the option connector • Synchronous with the speedometer • 0.000 to 255.000 km/h {0.000 to 158.4 mph} [Associated parts] • vehicle speed sensor

3. FUSO Diagnostics Actuator Test (Actuations)

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.
- The basic conditions for performing the actuator test: Vehicle stopped, engine stopped and starter switch ON.

No.	Selection	Explanation
000	Instrument cluster	[Test method] Operate each indication in the meter cluster. [Checking method] • The speedometer operates from 0 to maximum. It stops on the way for about 5 seconds at the 40 km/h {24.9 mph} point. • The tachometer operates from 0 to maximum. It stops on the way for about 5 seconds at the 2000 rpm point. • The fuel level gauge operates from 0 to full. It stops on the way for about 5 seconds at the one half point. • The indicator lamp, illumination, multi-information display and buzzer cycle ON/OFF every 1 second. [Note] The test stops automatically when three rounds of inspection are completed. (Or, terminated using the stop button.)

4. Coding Data in Electronic Control Unit

4.1 Overview

- The meter cluster has various kinds of information such as technical data of vehicle and equipment registered as coding data.
- Therefore, each time the meter cluster is replaced or some specification changes are made, the coding data must surely be rewritten using FUSO Diagnostics. Otherwise, the data stored in the meter cluster could deviate from the actual conditions of the vehicles, resulting in incorrect alarms.

4.2 Rewriting of Coding Data

- If specification changes have been made, be sure to rewrite the relevant coding data. For details of the rewriting procedure, consult an authorized dealer or distributor.

Rewriting coding data required	Standards for rewriting meter cluster internal data
Final gear	When the final gear is changed, the meter cluster internal data must be updated.
Rear tire	When the tire size is changed, the meter cluster internal data must be updated.
Anti-lock brake system	When specifications of this system are changed, the meter cluster internal data must be updated.
Meter cluster replacement	All data (entire set of the latest history data for the vehicle)

5. Electronic Control Unit Input/Output Table

- For the signal and ground terminal positions, see the circuit diagram for the electronic control unit.

Connected unit	Terminal	I/O	Voltage or waveform
SAM (Starter switch (M terminal voltage))	13 - Ground	Input	[Judgment criteria] • Starter switch ON: Approx. 12 V (battery voltage) • Starter switch OFF: 0 V
SAM (Battery direct (B terminal voltage))	2 - Ground	Input	[Judgment criteria] • Constant: Approx. 12 V (battery voltage)
Vehicle speed sensor	12 - 4	Input	 [Judgment criteria] • Lo: 0.8 V max. • Hi: Approx. 6.0 V
Tachograph (vehicle speed signal)	8 - Ground	Output	 [Judgment criteria] • Lo: 1.5 V max. • Hi: (Input voltage from vehicle speed sensor) - 0.5 V
Option connector (vehicle speed signal)	11 - Ground	Output	 [Judgment criteria] • Lo: Approx. 0.5 V • Hi: Approx. 7.0 to 9.0 V

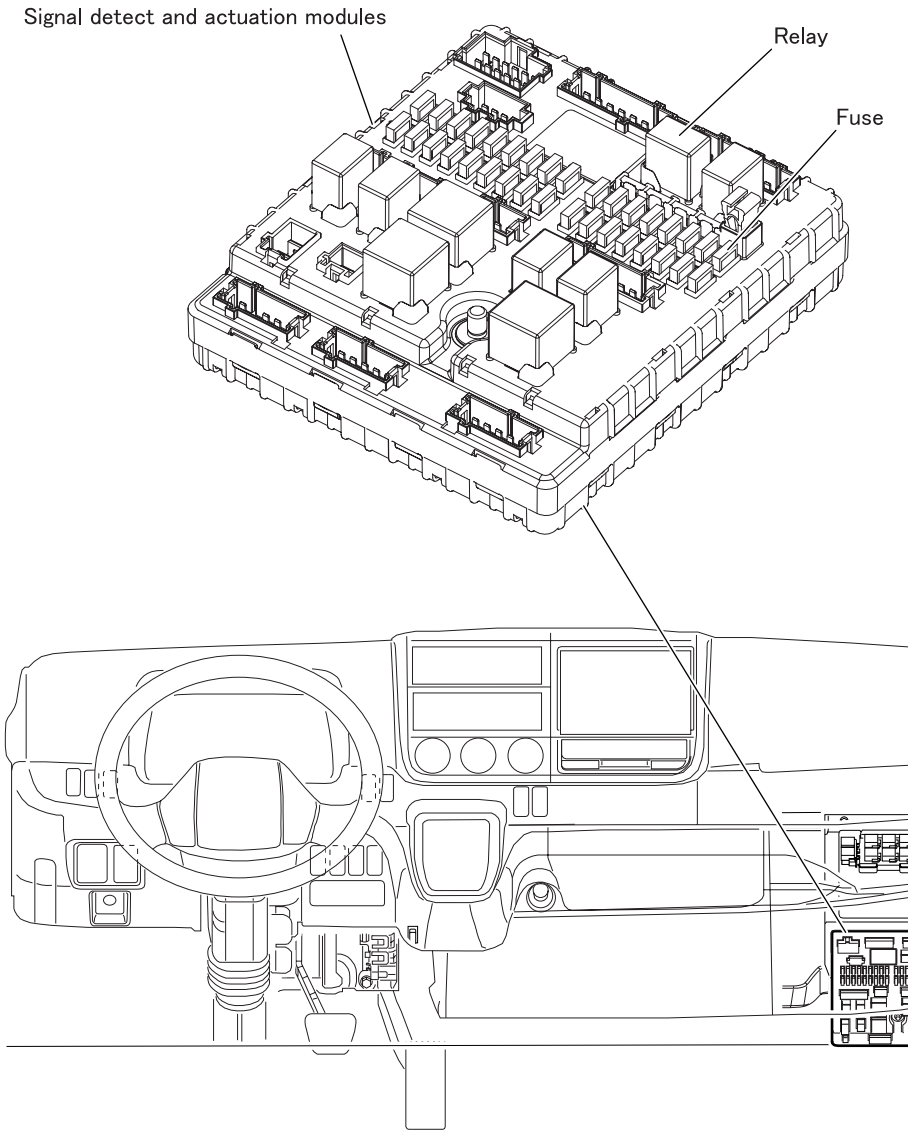
INSPECTION OF RELAYS IN SIGNAL DETECT AND ACTUATION MODULE 54ES-70

INSPECTION OF ELECTRICAL PARTS ..... (See Gr54.)

INSTALLED LOCATIONS OF PARTS ..... (See Gr54.)

ELECTRIC CIRCUIT DIAGRAM ..... (See Gr54.)

1. Overview



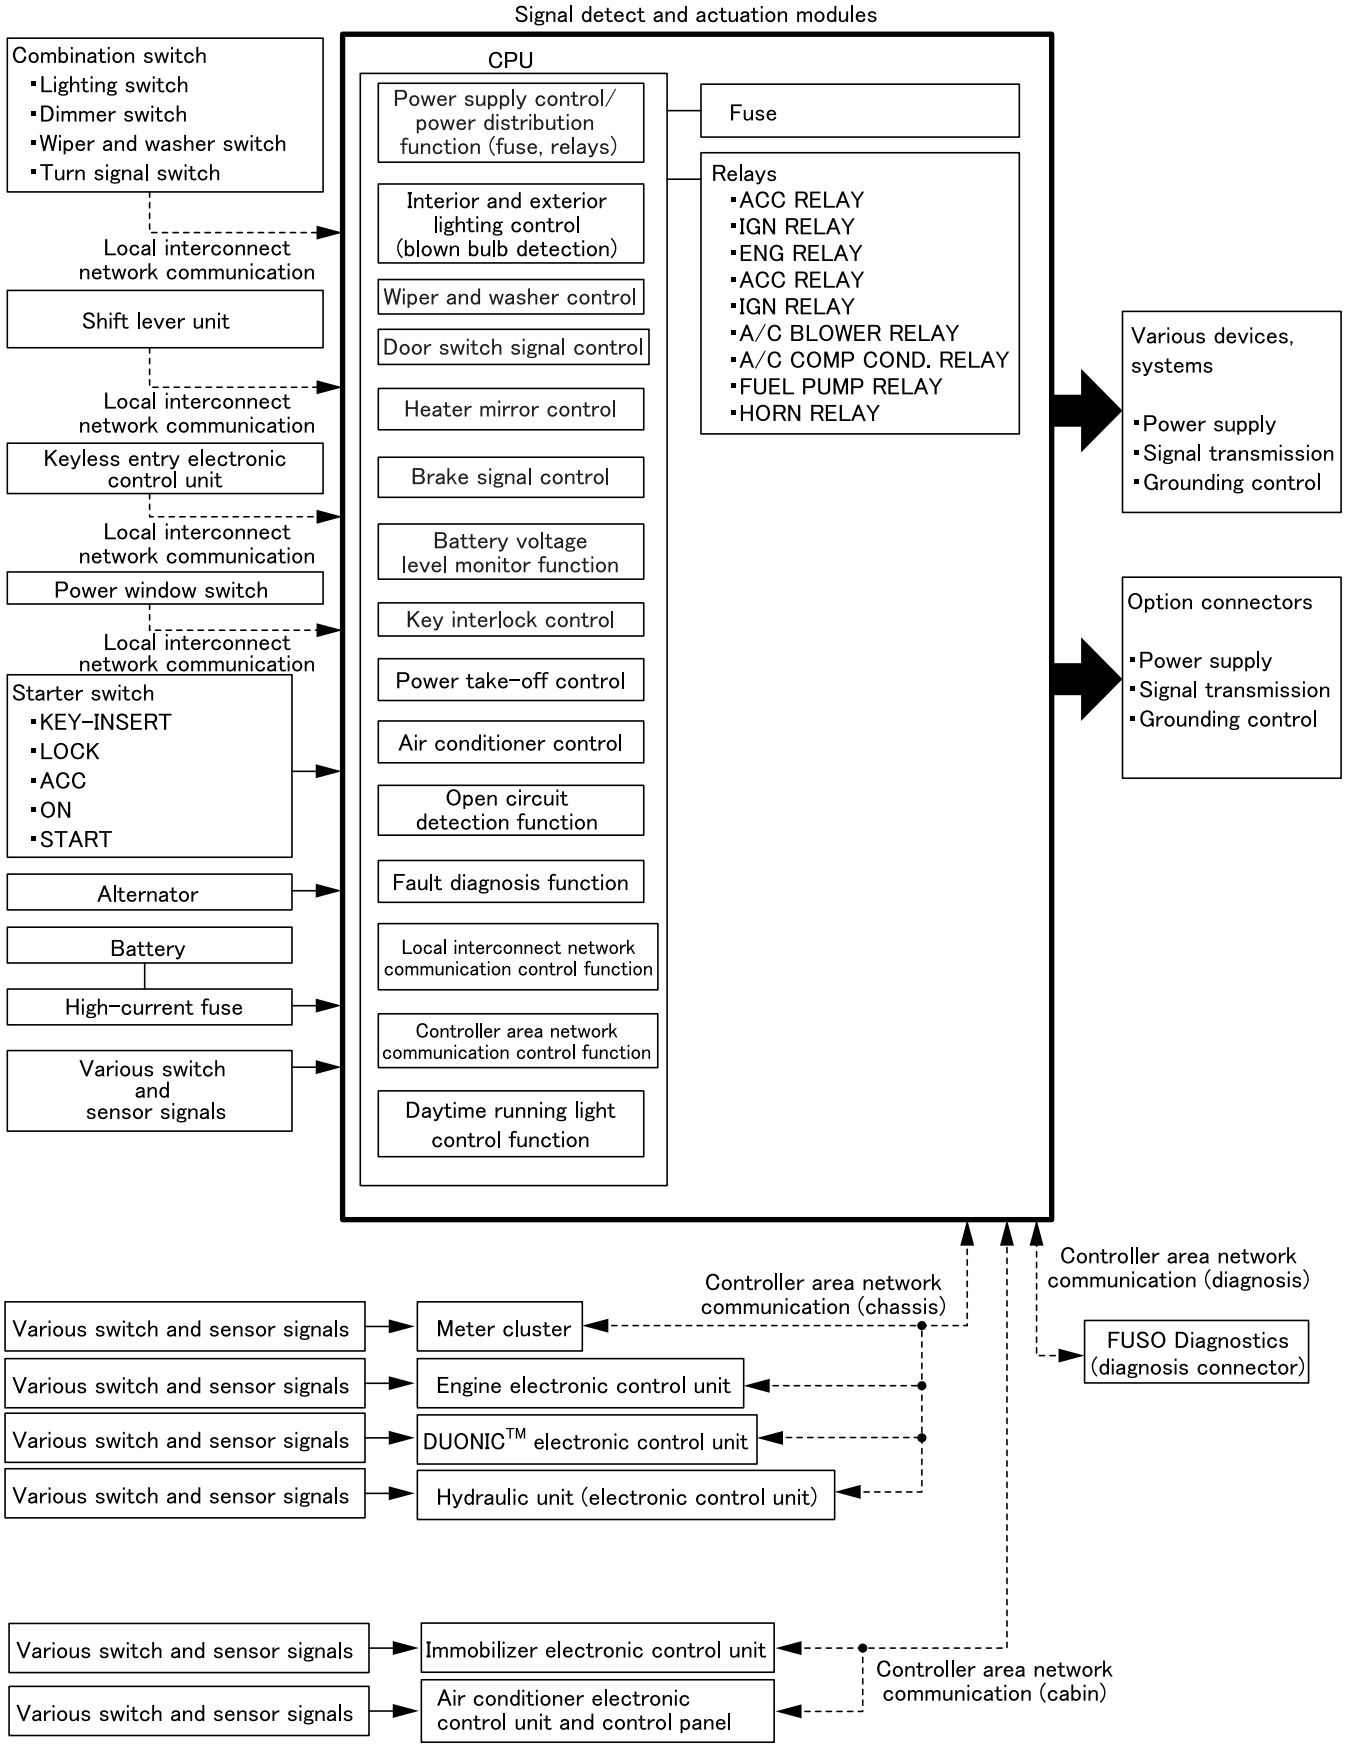
- Signal detect and actuation modules contains conventional relays and fuses in the central processing unit and effects integrated control of electric parts and power distribution. Basically, it has the following functions.
  - Power supply and power distribution functions
  - Detection of various control switch output signals (starter switch, combination switch, etc.)
  - Detection of various detection switch output signals (stop lamp switch, clutch switch, etc.)
  - Detection of various sensor output signals (fuel level sensor, etc.)
  - Junction for controller area network communication between electronic control units
  - Fault diagnosis function
  - Open circuit detection function
  - Various lighting control functions (blown bulb detection)
  - Wiper & washer control
  - Mirror (mirror heater) control

CAUTION ⚠

- **Before replacing the signal detect and actuation modules, associated fuses and relays, be sure to disconnect (–) battery cable and protect the (–) battery terminal and (–) battery cable with insulating tape or the like.**
- **When a fuse is blown, identify the cause and repair to remove it completely. Then, install a new fuse. Be sure to use the fuse of designated ampere.**
- **To remove a spare fuse, insert a fuse puller from outside the wall holding the spare fuse. Inserting the fuse puller from inside the wall may damage the signal detect and actuation modules, resulting in system malfunction or a fire.**
- **Connect the (+) and (–) cables to the battery at right terminals. Wrong connection causes an excessive current to the signal detect and actuation modules, damaging internal elements and circuits.**

2. Electronic Control System

2.1 System block diagram



117206E

2.2 Input and output signals list by signal detect and actuation modules functions

Function	Input	Output	Remarks
Back buzzer	• Starter switch • Back light switch	• Back buzzer • Buzzer in meter cluster • Electronic control units	See Gr54 (340).
Power take-off subsystem	• Starter switch • Transmission power take-off switch (cab) • Power take-off control switch (chassis)	• Option connector: Power take-off • Electronic control units	See Gr54 (850).
Backup switch signal output	• Starter switch • Backup lamp switch	Option connector: Backup light switch	See Gr54 (115).
Parking brake switch output	• Starter switch • Parking brake switch	Option connector: Parking brake switch cut-off	See Gr54 (115).
Service brake switch	• Stop lamp switch N.O. (service brake switch 1) • Stop lamp switch N.C. (service brake switch 2)	Electronic control units	See Gr54 (325), (880), (873), (790),
Parking brake switch	Parking brake switch	Electronic control units	See Gr54 (510).
Brake fluid level switch	Brake fluid level switch	Electronic control units	See Gr54 (515).
Vacuum flow switch	Vacuum switch	Electronic control units	See Gr54 (515).
Air conditioner compressor clutch & condenser fan motor	• Starter switch • Air conditioner cut-off signal (controller area network signal) • Air conditioner main switch	• Air conditioner condenser fan motor • Dual pressure switch (air conditioner compressor clutch)	See Gr54 (620).
Air conditioner blower motor control	• Starter switch • Air conditioner cut-off signal (controller area network signal)	• Air conditioner blower motor • Air conditioner blower motor grounding point	See Gr54 (620).
Door switch status	• Driver's seat side door switch • Assistant driver's seat side door switch • Rear door switch (left-hand, right-hand) • Starter switch	Electronic control units	See Gr54 (345).
Keyless entry	• Answer back signal (local interconnect network communication) • Driver's seat side door switch • Assistant driver's seat side door switch • Rear door switch (left-hand, right-hand) • Starter key insert	• Rear turn signal lamp (left-hand) • Rear turn signal lamp (right-hand) • Front turn signal lamp (left-hand) • Front turn signal lamp (right-hand) • Option connector: Side turn signal lamp (left-hand) • Option connector: Side turn signal lamp (right-hand) • Interior lamp	See Gr54 (115), (654).
Diesel Particulate Filter	Diesel Particulate Filter cleaning switch	Engine electronic control unit	See Gr54 (880).
Fuel level sensor	Fuel level sensor	Meter cluster	See Gr54 (420).

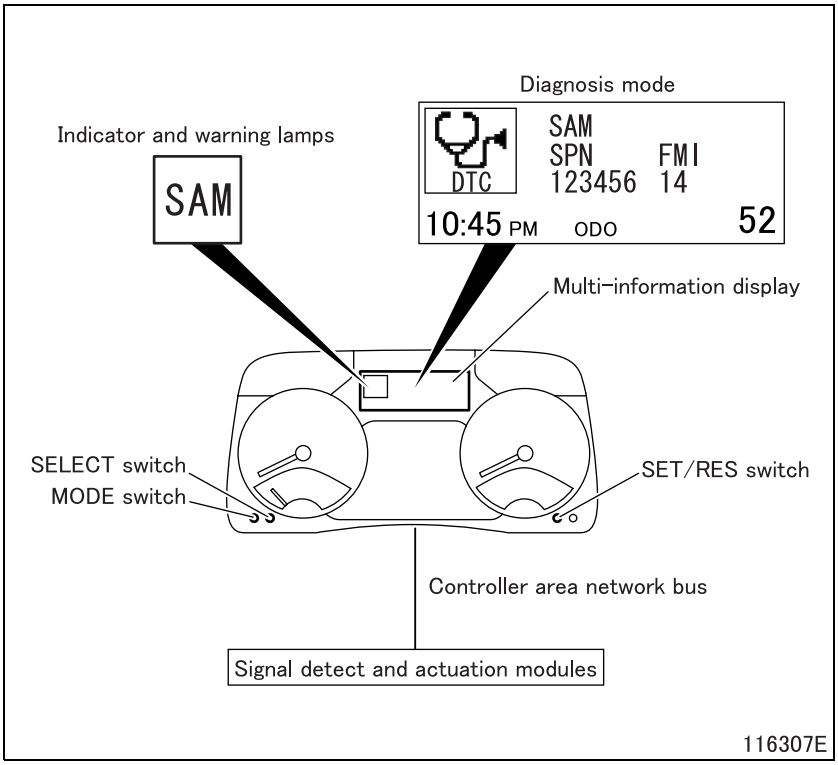
Function	Input	Output	Remarks
Starter switch & relay control	• Starter switch ACC • Starter switch ON • Starter switch CRANK • Starter switch inserted	• Electronic control units [In signal detect and actuation modules] • IGN RELAY • ACC RELAY • IGN RELAY (OPTION) • ACC RELAY (OPTION)	See Gr54 (105), (110).
Backup lamp	Backup lamp switch	Backup lamp (left-hand, right-hand)	See Gr54 (340).
Headlamp	• Starter switch • Combination switch	• Low beam (left-hand) • Low beam (right-hand)	See Gr54 (310).
	• Starter switch • Combination switch	• High beam (left-hand) • High beam (right-hand) • Meter cluster	
Stop lamp	Stop lamp switch N.O. (service brake switch 1)	• Stop lamp (left-hand) • Stop lamp (right-hand)	See Gr54 (325).
Position lamp, license plate lamp, tail lamp	• Starter switch • Combination switch	• Position lamp (left-hand) • Position lamp (right-hand) • License plate lamp (left-hand) • License plate lamp (right-hand) • Tail lamp (left-hand) • Tail lamp (right-hand)	See Gr54 (320).
		• Identification lamp relay • Clearance and side marker lamp (right-hand) • Clearance and side marker lamp (left-hand) • Identification lamp (right-hand) • Identification lamp (left-hand) • Identification lamp (center)	See Gr54 (349).
Turn signal lamp, hazard lamp	• Hazard lamp switch • Combination switch	• Rear turn signal lamp (left-hand) • Rear turn signal lamp (right-hand) • Front turn signal lamp (left-hand) • Front turn signal lamp (right-hand) • Option connector: Side turn signal lamp (left-hand) • Option connector: Side turn signal lamp (right-hand) • Meter cluster	See Gr54 (115), (330).
Fog lamp	• Combination switch • Fog lamp switch	• Fog lamp (left-hand) • Fog lamp (right-hand) • Meter cluster	See Gr54 (315).
Cab lamp	• Driver's seat side door switch • Assistant driver's seat side door switch • Rear door switch (left-hand, right-hand) • Starter switch	• Cab lamp (battery) • Cab lamp (control)	See Gr54 (345).
Step lamp	• Driver's seat side door switch • Assistant driver's seat side door switch	• Step lamp (driver's seat side) • Step lamp (assistant driver's seat side)	See Gr54 (345).
Illumination lamp	Combination switch	• Air conditioner control panel illumination • Audio illumination • Various control switches illumination • Option connector: Illumination chassis • Option connector: Illumination body	See Gr54 (115), (348).

Function	Input	Output	Remarks
Cab tilt signal switch	Cab tilt lock switch	Meter cluster	See Gr54 (550).
Alternator (L terminal)	Alternator (L terminal)	Meter cluster	See Gr54 (125).
Clutch switch (upper)	Clutch switch	Electronic control units	See Gr54 (880).
Key interlock	• Gear shift signal (controller area network line) • Starter switch	Key interlock solenoid: control	See Gr54 (873).
Wiper & washer	• Starter switch • Combination switch	• Wiper motor (LOW) • Wiper motor (HIGH) • Washer motor (CONTROL)	See Gr54 (514).
Battery monitor	Battery	Limitation of various functions at low voltage and overvoltage	–
Horn	Horn switch	• Horn battery [In signal detect and actuation modules] • Horn relay	See Gr54 (616).
Mirror heater	Mirror heater switch	• Mirror heater switch illumination • Mirror heater on driver's seat side • Mirror heater on assistant driver's seat side	See Gr54 (629).
Central door locking switch control	Door lock switch	• Power window switch (right-hand) • Power window switch (left-hand) • Door lock actuator (right-hand) • Door lock actuator (left-hand) • Rear door lock actuator (right-hand) • Rear door lock actuator (left-hand)	See Gr54 (622).
Daytime running light	• Combination switch • Parking brake switch • Alternator (terminal L) • Engine electronic control unit	• Headlamp (right-hand) • Headlamp (left-hand) • Meter cluster	See Gr54 (313).
Transfer four-wheel drive switch status	Transfer four-wheel drive switch	• Meter cluster • Anti-lock brake electronic control unit	See Gr54 (810).

Function		Input	Output	Remarks
Power distribution module: J: accessory relay output	Fuse F15	–	• DUONIC® electronic control unit accessory • Audio accessory • ETC accessory • CLU accessory relay drive	See Gr54 (105), (115), (110).
	Fuse F16	–	• Cigarette lighter accessory • Motor-driven retractable mirror	
Power distribution module: E: IGN relay output	Fuse F22	–	• Meter cluster IGN • Tachograph IGN • Air conditioner IGN • Rear air conditioner IGN	See Gr54 (105), (115), (110).
	Fuse F18	–	• Hydraulic unit (electronic control unit) IGN1	
	Fuse F19	–	• Engine electronic control unit IGN	
	Fuse F3	–	–	
	Fuse F24	–	• DUONIC® electronic control unit IGN1 • DUONIC® electronic control unit IGN2 • Shift lever 1 IGN1 • Shift lever 2 IGN2	
	Fuse F20	–	• Front drive switch • Van body dome light switch	
	Fuse F1	–	• Starter relay	
Power distribution module: H: Engine relay output	Fuse F31	–	• Engine battery control 1 • Engine battery control 2 • Engine battery control 3	See Gr54 (105), (110).
	Fuse F28	–	• Engine actuator battery control • Fuel heater relay drive • Fuel pump relay drive	
	Fuse F29/F30	–	• Selective catalytic reduction battery control 1 • Selective catalytic reduction battery control 2	
Power distribution module: C: ACC relay (OPTION) output	Fuse F25	–	• Option connector: ACC chassis • Option connector: ACC body	See Gr54 (105), (115), (110).
Power distribution module: D: IGN relay (OPTION) output	Fuse F04	–	• Option connector: Main chassis • Option connector: Main body	See Gr54 (105), (115), (110).
Power distribution module: battery output	Fuse F26	–	• Option connector: Battery body • Option connector: Battery chassis	

Function		Input	Output	Remarks
Power distribution module: BAT output	Fuse F9	–	• Meter cluster BAT • Diagnosis connector BAT • Combination switch BAT	See Gr54 (105), (115), (110).
	Fuse F12	–	• Audio BAT • Interior lamp BAT • Tachograph BAT	
	Fuse F13	–	• Immobilizer electronic control unit BAT 2 • Immobilizer electronic control unit BAT 1 • Starter switch BAT	
	Fuse F6	–	–	
	Fuse F17	–	• Fuel heater BAT	
	Fuse F10	–	–	
Power distribution module: A: A/C BLOWER RELAY output	Fuse F11	–	• Air conditioner blower motor	See Gr54 (105), (110).
Power distribution module: G: A/C COMP COND. RELAY output	Fuse F32	–	• Air conditioner condenser fan motor relay drive • Air conditioner condenser fan clutch	See Gr54 (105), (110).
Power distribution module: F: FUEL PUMP RELAY output	Fuse F28	–	• Fuel pump control • Fuel pump BAT control	See Gr54 (105), (110).
	Fuse F34	–	• Fuel heater control	
Power distribution module: Power window supply	Fuse F5	–	• Power window BAT driver's seat side	See Gr54 (105), (110).
	Fuse F7	–	• Power window BAT assistant driver's seat side	
Communication		• Controller area network - Cabin • Controller area network - Chassis • Controller area network - Diagnosis • Various local interconnect network lines	• Controller area network - Cabin • Controller area network - Chassis • Controller area network - Diagnosis • Various local interconnect network lines	–
Signal detect and actuation modules supply		• Signal detect and actuation modules BAT • Signal detect and actuation modules BAT • Signal detect and actuation modules ENG BAT	–	See Gr54 (105), (110), (130).
Grounding		• Signal detect and actuation modules ground • Ground, body harness, POWER • Ground, body harness, SIGNAL • Ground, central harness • Ground, various electronic control units		

2.3 Fault diagnosis function



- The driver is informed of faults in the signal detect and actuation modules through the multi-information display in the meter cluster.
- Details of diagnosis codes can be called out through the multi-information display in the meter cluster and the FUSO Diagnostics (diagnosis connector). (See Gr00.)

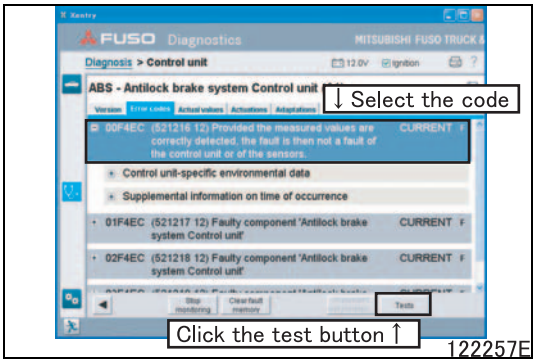
1. Inspection Based on Diagnosis Codes

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.



- When the FUSO Diagnostics is connected, perform the interactive troubleshooting with the following procedure.

Select the code from the diagnostics code list
↓
Click the test button
↓
Start the interactive troubleshooting

1.1 List of diagnosis codes

Code	Message	Warning lamp indication		Remarks
		SAM (red)	SAM (orange)	
2372-4	Left rear brake light - Insufficient voltage or short circuit to ground	-	O	
2372-5	Left rear brake light - The current strength is too low or there is an open circuit.	-	O	
2374-4	Right rear brake light - Insufficient voltage or short circuit to ground	-	O	
2374-5	Right rear brake light - The current strength is too low or there is an open circuit.	-	O	
521985-4	BBC Left turn signal lamp Short circuit to ground - Insufficient voltage or short circuit to ground	-	-	
521985-5	BBC Left turn signal lamp Open circuit - The current strength is too low or there is an open circuit.	-	-	
521986-4	BBC Right turn signal lamp Short circuit to ground - Insufficient voltage or short circuit to ground	-	-	
521986-5	BBC Right turn signal lamp Open circuit - The current strength is too low or there is an open circuit.	-	-	
521987-4	Interior illumination - Insufficient voltage or short circuit to ground	-	-	
521988-4	Exterior illumination - Insufficient voltage or short circuit to ground	-	-	
521989-4	Switches BBC Backup warning system Short circuit to ground - Insufficient voltage or short circuit to ground	-	-	
521990-4	3/2-way valve 'Power take-off' - Insufficient voltage or short circuit to ground	-	-	
521990-5	3/2-way valve 'Power take-off' - The current strength is too low or there is an open circuit.	-	-	
521992-4	Mirror heater Driver side - Insufficient voltage or short circuit to ground	-	-	
521994-4	Backup lamp - Insufficient voltage or short circuit to ground	-	-	
521994-5	Backup lamp - The current strength is too low or there is an open circuit.	-	-	
521995-4	Left high beam - Insufficient voltage or short circuit to ground	-	-	
521995-5	Left high beam - The current strength is too low or there is an open circuit.	-	-	

Code	Message	Warning lamp indication		Remarks
		SAM (red)	SAM (orange)	
521996-4	Right high beam - Insufficient voltage or short circuit to ground	-	-	
521996-5	Right high beam - The current strength is too low or there is an open circuit.	-	-	
521997-4	Left low beam - Insufficient voltage or short circuit to ground	-	-	
521997-5	Left low beam - The current strength is too low or there is an open circuit.	-	-	
521998-4	Right low beam - Insufficient voltage or short circuit to ground	-	-	
521998-5	Right low beam - The current strength is too low or there is an open circuit.	-	-	
522003-4	Left standing light - Insufficient voltage or short circuit to ground	-	O	
522003-5	Left standing light - The current strength is too low or there is an open circuit.	-	O	
522004-4	Right standing light - Insufficient voltage or short circuit to ground	-	O	
522004-5	Right standing light - The current strength is too low or there is an open circuit.	-	O	
522005-4	Left tail lamp - Insufficient voltage or short circuit to ground	-	O	
522005-5	Left tail lamp - The current strength is too low or there is an open circuit.	-	O	
522006-4	Right tail lamp - Insufficient voltage or short circuit to ground	-	O	
522006-5	Right tail lamp - The current strength is too low or there is an open circuit.	-	O	
522007-4	Left rear turn signal lamp - Insufficient voltage or short circuit to ground	-	-	
522007-5	Left rear turn signal lamp - The current strength is too low or there is an open circuit.	-	-	
522008-4	Right rear turn signal lamp - Insufficient voltage or short circuit to ground	-	-	
522008-5	Right rear turn signal lamp - The current strength is too low or there is an open circuit.	-	-	
522009-4	Left turn signal lamp (front and side) - Insufficient voltage or short circuit to ground	-	-	
522009-5	Left turn signal lamp (front and side) - The current strength is too low or there is an open circuit.	-	-	
522010-4	Right turn signal lamp (front and side) - Insufficient voltage or short circuit to ground	-	-	
522010-5	Right turn signal lamp (front and side) - The current strength is too low or there is an open circuit.	-	-	
522011-4	Right front fog lamp - Insufficient voltage or short circuit to ground	-	-	
522011-5	Right front fog lamp - The current strength is too low or there is an open circuit.	-	-	
522014-4	Passenger side Step illumination - Insufficient voltage or short circuit to ground	-	-	
522014-5	Passenger side Step illumination - The current strength is too low or there is an open circuit.	-	-	
522015-4	Driver side Step illumination - Insufficient voltage or short circuit to ground	-	-	

Code	Message	Warning lamp indication		Remarks
		SAM (red)	SAM (orange)	
522015-5	Driver side Step illumination - The current strength is too low or there is an open circuit.	-	-	
522016-4	Cabin button illumination - Insufficient voltage or short circuit to ground	-	-	
522017-4	Washer motor - Insufficient voltage or short circuit to ground	-	-	
522017-5	Washer motor - The current strength is too low or there is an open circuit.	-	-	
522020-4	Left license plate lamp - Insufficient voltage or short circuit to ground	-	O	
522020-5	Left license plate lamp - The current strength is too low or there is an open circuit.	-	O	
522022-4	Left front fog lamp - Insufficient voltage or short circuit to ground	-	-	
522022-5	Left front fog lamp - The current strength is too low or there is an open circuit.	-	-	
522026-4	Mirror heater Passenger side - Insufficient voltage or short circuit to ground	-	-	
522027-3	Interior lamp - Excessive voltage or short circuit to positive	-	-	
522028-4	Mirror heater Switches - Insufficient voltage or short circuit to ground	-	-	
522030-4	Warning buzzer (Backup warning system) - Insufficient voltage or short circuit to ground	-	-	
522032-4	BBC Power take-off Short circuit to ground - Insufficient voltage or short circuit to ground	-	-	
522033-4	BBC Switch 'TCM Neutral position' Short circuit to ground - Insufficient voltage or short circuit to ground	-	-	
522034-4	BBC Switch 'Parking brake' Short circuit to ground - Insufficient voltage or short circuit to ground	-	-	
522038-5	Blower motor Relays - The current strength is too low or there is an open circuit.	-	O	
522039-5	Relay 'Power supply for optional bodies' (ACC) - The current strength is too low or there is an open circuit.	-	O	
522040-5	Starter signal Relays (IGN) - The current strength is too low or there is an open circuit.	O	-	
522041-5	Starter signal Relays (ACC) - The current strength is too low or there is an open circuit.	O	-	
522042-5	Relay 'Power supply for optional bodies' (IGN) - The current strength is too low or there is an open circuit.	-	O	
522043-5	Refrigerant compressor Relays - The current strength is too low or there is an open circuit.	-	O	
522064-25	DUONIC Control unit - The received data are implausible.	-	-	
522067-25	Combination switch - The received data are implausible.	-	O	
522069-25	Combination switch - The received data are implausible.	-	-	
522070-25	Combination switch - The received data are implausible.	-	-	
522071-25	DUONIC Control unit - The received data are implausible.	-	-	
522074-25	Combustion engine Control unit - The received data are implausible.	-	-	
522075-25	Combustion engine Control unit - The received data are implausible.	-	-	

Code	Message	Warning lamp indication		Remarks

1.2 Details of diagnosis codes

2372-4: Left rear brake light - Insufficient voltage or short circuit to ground

Generation condition	• Output current to stop lamp (left-hand) rises to range of 2.3 to 3.7 A or higher.
Recoverability	• System recovers when output current to stop lamp (left-hand) falls within range of 2.3 to 3.7 A or lower.
Control effected by electronic control unit	• Output to stop lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between stop lamp (left-hand) and signal detect and actuation module • Faulty stop lamp (left-hand) • Defective signal detect and actuation module

2372-5: Left rear brake light - The current strength is too low or there is an open circuit.

Generation condition	• Output current to stop lamp (left-hand) falls to range of 0.5 to 1.1 A or lower.
Recoverability	• System recovers when output current to stop lamp (left-hand) rises to range of 0.5 to 1.1 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between stop lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between stop lamp (left-hand) and signal detect and actuation module • Faulty stop lamp (left-hand) • Defective signal detect and actuation module

2374-4: Right rear brake light - Insufficient voltage or short circuit to ground

Generation condition	• Output current to stop lamp (right-hand) rises to range of 2.3 to 3.7 A or higher.
Recoverability	• System recovers when output current to stop lamp (right-hand) falls within range of 2.3 to 3.7 A or lower.
Control effected by electronic control unit	• Output to stop lamp (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between stop lamp (right-hand) and signal detect and actuation module • Faulty stop lamp (right-hand) • Defective signal detect and actuation module

2374-5: Right rear brake light - The current strength is too low or there is an open circuit.

Generation condition	• Output current to stop lamp (right-hand) falls to range of 0.5 to 1.1 A or lower.
Recoverability	• System recovers when output current to stop lamp (right-hand) rises to range of 0.5 to 1.1 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between stop lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between stop lamp (right-hand) and signal detect and actuation module • Faulty stop lamp (right-hand) • Defective signal detect and actuation module

521985-4: BBC Left turn signal lamp Short circuit to ground - Insufficient voltage or short circuit to ground

Generation condition	• Output current to side turn signal lamp (left-hand) rises to range of 2.3 to 3.7 A or higher.
Recoverability	• System recovers when output current to side turn signal lamp (left-hand) falls within range of 2.3 to 3.7 A or lower.
Control effected by electronic control unit	• Output to side turn signal lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between side turn signal lamp (left-hand) and signal detect and actuation module • Faulty side turn signal lamp (left-hand) • Defective signal detect and actuation module

521985-5: BBC Left turn signal lamp Open circuit - The current strength is too low or there is an open circuit.

Generation condition	• Output current to side turn signal lamp (left-hand) falls to range of 0.5 to 1.1 A or lower.
Recoverability	• System recovers when output current to side turn signal lamp (left-hand) rises to range of 0.5 to 1.1 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between side turn signal lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between side turn signal lamp (left-hand) and signal detect and actuation module • Faulty side turn signal lamp (left-hand) • Defective signal detect and actuation module

521986-4: BBC Right turn signal lamp Short circuit to ground - Insufficient voltage or short circuit to ground

Generation condition	• Output current to side turn signal lamp (right-hand) rises to range of 2.3 to 3.7 A or higher.
Recoverability	• System recovers when output current to side turn signal lamp (right-hand) falls within range of 2.3 to 3.7 A or lower.
Control effected by electronic control unit	• Output to side turn signal lamp (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between side turn signal lamp (right-hand) and signal detect and actuation module • Faulty side turn signal lamp (right-hand) • Defective signal detect and actuation module

521986-5: BBC Right turn signal lamp Open circuit - The current strength is too low or there is an open circuit.

Generation condition	• Output current to side turn signal lamp (right-hand) falls to range of 0.5 to 1.1 A or lower.
Recoverability	• System recovers when output current to side turn signal lamp (right-hand) rises to range of 0.5 to 1.1 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between side turn signal lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between side turn signal lamp (right-hand) and signal detect and actuation module • Faulty side turn signal lamp (right-hand) • Defective signal detect and actuation module

521987-4: Interior illumination - Insufficient voltage or short circuit to ground

Generation condition	• Output current to body illumination lamp rises to range of 3.8 to 7.3 A or higher.
Recoverability	• System recovers when output current to body illumination lamp falls within range of 3.8 to 7.3 A or lower.
Control effected by electronic control unit	• Output to body illumination lamp is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between body illumination lamp (12 V) and signal detect and actuation module • Faulty body illumination lamp (12 V) • Defective signal detect and actuation module

521988-4: Exterior illumination - Insufficient voltage or short circuit to ground

Generation condition	• Output current to chassis illumination lamp rises to range of 3.8 to 7.3 A or higher.
Recoverability	• System recovers when output current to chassis illumination lamp falls within range of 3.8 to 7.3 A or lower.
Control effected by electronic control unit	• Output to chassis illumination lamp is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between chassis illumination lamp (12 V) and signal detect and actuation module • Faulty chassis illumination lamp (12 V) • Defective signal detect and actuation module

521989-4: Switches BBC Backup warning system Short circuit to ground - Insufficient voltage or short circuit to ground

Generation condition	• Output current to backup lamp rises to range of 0.4 to 0.7 A or higher.
Recoverability	• System recovers when output current to backup lamp falls within range of 0.4 to 0.7 A or lower.
Control effected by electronic control unit	• Output to backup lamp is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between backup lamp and signal detect and actuation module • Faulty backup lamp • Defective signal detect and actuation module

521990-4: 3/2-way valve 'Power take-off' - Insufficient voltage or short circuit to ground

Generation condition	• Output current to transmission power take-off 3-way magnetic valve rises to range of 1.0 to 1.7 A or higher.
Recoverability	• System recovers when output current to transmission power take-off 3-way magnetic valve falls within range of 1.0 to 1.7 A or lower.
Control effected by electronic control unit	• Output to transmission power take-off 3-way magnetic valve is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between transmission power take-off 3-way magnetic valve and signal detect and actuation module • Faulty transmission power take-off 3-way magnetic valve • Defective signal detect and actuation module

521990-5: 3/2-way valve 'Power take-off' - The current strength is too low or there is an open circuit.

Generation condition	• Output current to transmission power take-off 3-way magnetic valve falls to range of 0.2 to 0.4 A or lower.
Recoverability	• System recovers when output current to transmission power take-off 3-way magnetic valve rises to range of 0.2 to 0.4 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between transmission power take-off 3-way magnetic valve and signal detect and actuation module • Open-circuit in Plus harness between transmission power take-off 3-way magnetic valve and signal detect and actuation module • Faulty transmission power take-off 3-way magnetic valve • Defective signal detect and actuation module

521992-4: Mirror heater Driver side - Insufficient voltage or short circuit to ground

Generation condition	• Output current to mirror heater (driver side) rises to range of 7.7 to 13.5 A or higher.
Recoverability	• System recovers when output current to mirror heater (right-hand) falls within range of 7.7 to 13.5 A or lower.
Control effected by electronic control unit	• Output to mirror heater (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between mirror heater (right-hand) and signal detect and actuation module • Faulty mirror heater (right-hand) • Defective signal detect and actuation module

521994-4: Backup lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to backup lamp rises to range of 4.7 to 8.2 A or higher.
Recoverability	• System recovers when output current to backup lamp falls within range of 4.7 to 8.2 A or lower.
Control effected by electronic control unit	• Output to backup lamp is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between backup lamp and signal detect and actuation module • Faulty backup lamp • Defective signal detect and actuation module

521994-5: Backup lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to backup lamp falls to range of 1.1 to 2.2 A or lower.
Recoverability	• System recovers when output current to backup lamp rises to range of 1.1 to 2.2 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between backup lamp and signal detect and actuation module • Open-circuit in Plus harness between backup lamp and signal detect and actuation module • Faulty backup lamp • Defective signal detect and actuation module

521995-4: Left high beam - Insufficient voltage or short circuit to ground

Generation condition	• Output current to headlamp Hi (left-hand) rises to range of 6.5 to 11.7 A or higher.
Recoverability	• System recovers when output current to headlamp Hi (left-hand) falls within range of 6.5 to 11.7 A or lower.
Control effected by electronic control unit	• Output to headlamp Hi (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between headlamp Hi (left-hand) and signal detect and actuation module • Faulty headlamp Hi (left-hand) • Defective signal detect and actuation module

521995-5: Left high beam - The current strength is too low or there is an open circuit.

Generation condition	• Output current to headlamp Hi (left-hand) falls to range of 0.8 to 2.9 A or lower.
Recoverability	• System recovers when output current to headlamp Hi (left-hand) rises to range of 0.8 to 2.9 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between headlamp Hi (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between headlamp Hi (left-hand) and signal detect and actuation module • Faulty headlamp Hi (left-hand) • Defective signal detect and actuation module

521996-4: Right high beam - Insufficient voltage or short circuit to ground

Generation condition	• Output current to headlamp Hi (right-hand) rises to range of 6.5 to 11.7 A or higher.
Recoverability	• System recovers when output current to headlamp Hi (right-hand) falls within range of 6.5 to 11.7 A or lower.
Control effected by electronic control unit	• Output to headlamp Hi (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between headlamp Hi (right-hand) and signal detect and actuation module • Faulty headlamp Hi (right-hand) • Defective signal detect and actuation module

521996-5: Right high beam - The current strength is too low or there is an open circuit.

Generation condition	• Output current to headlamp Hi (right-hand) falls to range of 0.8 to 2.9 A or lower.
Recoverability	• System recovers when output current to headlamp Hi (right-hand) rises to range of 0.8 to 2.9 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between headlamp Hi (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between headlamp Hi (right-hand) and signal detect and actuation module • Faulty headlamp Hi (right-hand) • Defective signal detect and actuation module

521997-4: Left low beam - Insufficient voltage or short circuit to ground

Generation condition	• Output current to headlamp Lo (left-hand) rises to range of 6.0 to 10.9 A or higher.
Recoverability	• System recovers when output current to headlamp Lo (left-hand) falls within range of 6.0 to 10.9 A or lower.
Control effected by electronic control unit	• Output to headlamp Lo (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between headlamp Lo (left-hand) and signal detect and actuation module • Faulty headlamp Lo (left-hand) • Defective signal detect and actuation module

521997-5: Left low beam - The current strength is too low or there is an open circuit.

Generation condition	• Output current to headlamp Lo (left-hand) falls to range of 0.8 to 2.9 A or lower.
Recoverability	• System recovers when output current to headlamp Lo (left-hand) rises to range of 0.8 to 2.9 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between headlamp Lo (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between headlamp Lo (left-hand) and signal detect and actuation module • Faulty headlamp Lo (left-hand) • Defective signal detect and actuation module

521998-4: Right low beam - Insufficient voltage or short circuit to ground

Generation condition	• Output current to headlamp Lo (right-hand) rises to range of 6.0 to 10.9 A or higher.
Recoverability	• System recovers when output current to headlamp Lo (right-hand) falls within range of 6.0 to 10.9 A or lower.
Control effected by electronic control unit	• Output to headlamp Lo (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between headlamp Lo (right-hand) and signal detect and actuation module • Faulty headlamp Lo (right-hand) • Defective signal detect and actuation module

521998-5: Right low beam - The current strength is too low or there is an open circuit.

Generation condition	• Output current to headlamp Lo (right-hand) falls to range of 0.8 to 2.9 A or lower.
Recoverability	• System recovers when output current to headlamp Lo (right-hand) rises to range of 0.8 to 2.9 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between headlamp Lo (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between headlamp Lo (right-hand) and signal detect and actuation module • Faulty headlamp Lo (right-hand) • Defective signal detect and actuation module

522003-4: Left standing light - Insufficient voltage or short circuit to ground

Generation condition	• Output current to parking lamp (left-hand) rises to range of 0.5 to 1.0 A or higher.
Recoverability	• System recovers when output current to parking lamp (left-hand) falls within range of 0.5 to 1.0 A or lower.
Control effected by electronic control unit	• Output to parking lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between parking lamp (left-hand) and signal detect and actuation module • Faulty parking lamp (left-hand) • Defective signal detect and actuation module

522003-5: Left standing light - The current strength is too low or there is an open circuit.

Generation condition	• Output current to parking lamp (left-hand) falls to range of 0.1 to 0.3 A or lower.
Recoverability	• System recovers when output current to parking lamp (left-hand) rises to range of 0.1 to 0.3 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between parking lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between parking lamp (left-hand) and signal detect and actuation module • Faulty parking lamp (left-hand) • Defective signal detect and actuation module

522004-4: Right standing light - Insufficient voltage or short circuit to ground

Generation condition	• Output current to parking lamp (right-hand) rises to range of 0.5 to 1.0 A or higher.
Recoverability	• System recovers when output current to parking lamp (right-hand) falls within range of 0.5 to 1.0 A or lower.
Control effected by electronic control unit	• Output to parking lamp (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between parking lamp (right-hand) and signal detect and actuation module • Faulty parking lamp (right-hand) • Defective signal detect and actuation module

522004-5: Right standing light - The current strength is too low or there is an open circuit.

Generation condition	• Output current to parking lamp (right-hand) falls to range of 0.1 to 0.3 A or lower.
Recoverability	• System recovers when output current to parking lamp (right-hand) rises to range of 0.1 to 0.3 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between parking lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between parking lamp (right-hand) and signal detect and actuation module • Faulty parking lamp (right-hand) • Defective signal detect and actuation module

522005-4: Left tail lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to tail lamp (left-hand) rises to range of 1.3 to 2.4 A or higher.
Recoverability	• System recovers when output current to tail lamp (left-hand) falls within range of 1.3 to 2.4 A or lower.
Control effected by electronic control unit	• Output to tail lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between tail lamp (left-hand) and signal detect and actuation module • Faulty tail lamp (left-hand) • Defective signal detect and actuation module

522005-5: Left tail lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to tail lamp (left-hand) falls to range of 0.1 to 0.3 A or lower.
Recoverability	• System recovers when output current to tail lamp (left-hand) rises to range of 0.1 to 0.3 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between tail lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between tail lamp (left-hand) and signal detect and actuation module • Faulty tail lamp (left-hand) • Defective signal detect and actuation module

522006-4: Right tail lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to tail lamp (right-hand) rises to range of 1.3 to 2.2 A or higher.
Recoverability	• System recovers when output current to tail lamp (right-hand) falls within range of 1.3 to 2.2 A or lower.
Control effected by electronic control unit	• Output to tail lamp (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between tail lamp (right-hand) and signal detect and actuation module • Faulty tail lamp (right-hand) • Defective signal detect and actuation module

522006-5: Right tail lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to tail lamp (right-hand) falls to range of 0.0 to 0.3 A or lower.
Recoverability	• System recovers when output current to tail lamp (right-hand) rises to range of 0.0 to 0.3 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between tail lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between tail lamp (right-hand) and signal detect and actuation module • Faulty tail lamp (right-hand) • Defective signal detect and actuation module

522007-4: Left rear turn signal lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to rear turn signal lamp (left-hand) rises to range of 2.3 to 3.7 A or higher.
Recoverability	• System recovers when output current to rear turn signal lamp (left-hand) falls within range of 2.3 to 3.7 A or lower.
Control effected by electronic control unit	• Output to rear turn signal lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between rear turn signal lamp (left-hand) and signal detect and actuation module • Faulty rear turn signal lamp (left-hand) • Defective signal detect and actuation module

522007-5: Left rear turn signal lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to rear turn signal lamp (left-hand) falls to range of 0.5 to 1.1 A or lower. <In case of LED> • Output current to rear turn signal lamp (left/right-hand) falls to range of 0.007 to 0.03 A or lower.
Recoverability	• System recovers when output current to rear turn signal lamp (left-hand) rises to range of 0.5 to 1.1 A or higher. <In case of LED> • System recovers when output current to rear turn signal lamp (left/right-hand) rises to range of 0.007 to 0.03 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between rear turn signal lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between rear turn signal lamp (left-hand) and signal detect and actuation module • Faulty rear turn signal lamp (left-hand) • Defective signal detect and actuation module

522008-4: Right rear turn signal lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to rear turn signal lamp (right-hand) rises to range of 2.3 to 3.7 A or higher.
Recoverability	• System recovers when output current to rear turn signal lamp (right-hand) falls within range of 2.3 to 3.7 A or lower.
Control effected by electronic control unit	• Output to rear turn signal lamp (right-hand) is stopped
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between rear turn signal lamp (right-hand) and signal detect and actuation module • Faulty rear turn signal lamp (right-hand) • Defective signal detect and actuation module

522008-5: Right rear turn signal lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to rear turn signal lamp (right-hand) falls to range of 0.5 to 1.1 A or lower. <In case of LED> • Output current to rear turn signal lamp (left/right-hand) falls to range of 0.007 to 0.03 A or lower.
Recoverability	• System recovers when output current to rear turn signal lamp (right-hand) rises to range of 0.5 to 1.1 A or higher. <In case of LED> • System recovers when output current to rear turn signal lamp (left/right-hand) rises to range of 0.007 to 0.03 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between rear turn signal lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between rear turn signal lamp (right-hand) and signal detect and actuation module • Faulty rear turn signal lamp (right-hand) • Defective signal detect and actuation module

522009-4: Left turn signal lamp (front and side) - Insufficient voltage or short circuit to ground

Generation condition	• Output current to front side turn signal lamp (left-hand) rises to range of 2.3 to 3.7 A or higher.
Recoverability	• System recovers when output current to front side turn signal lamp (left-hand) falls within range of 2.3 to 3.7 A or lower.
Control effected by electronic control unit	• Output to front side turn signal lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between front side turn signal lamp (left-hand) and signal detect and actuation module • Faulty front side turn signal lamp (left-hand) • Defective signal detect and actuation module

522009-5: Left turn signal lamp (front and side) - The current strength is too low or there is an open circuit.

Generation condition	• Output current to front side turn signal lamp (left-hand) falls to range of 0.5 to 1.1 A or lower.
Recoverability	• System recovers when output current to front side turn signal lamp (left-hand) rises to range of 0.5 to 1.1 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between front side turn signal lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between front side turn signal lamp (left-hand) and signal detect and actuation module • Faulty front side turn signal lamp (left-hand) • Defective signal detect and actuation module

522010-4: Right turn signal lamp (front and side) - Insufficient voltage or short circuit to ground

Generation condition	• Output current to front side turn signal lamp (right-hand) rises to range of 2.3 to 3.9 A or higher.
Recoverability	• System recovers when output current to front side turn signal lamp (right-hand) falls within range of 2.3 to 3.9 A or lower.
Control effected by electronic control unit	• Output to front side turn signal lamp (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between front side turn signal lamp (right-hand) and signal detect and actuation module • Faulty front side turn signal lamp (right-hand) • Defective signal detect and actuation module

522010-5: Right turn signal lamp (front and side) - The current strength is too low or there is an open circuit.

Generation condition	• Output current to front side turn signal lamp (right-hand) falls to range of 0.5 to 1.1 A or lower.
Recoverability	• System recovers when output current to front side turn signal lamp (right-hand) rises to range of 0.5 to 1.1 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between front side turn signal lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between front side turn signal lamp (right-hand) and signal detect and actuation module • Faulty front side turn signal lamp (right-hand) • Defective signal detect and actuation module

522011-4: Right front fog lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to fog lamp (right-hand) rises to range of 6.0 to 10.9 A or higher.
Recoverability	• System recovers when output current to fog lamp (right-hand) falls within range of 6.0 to 10.9 A or lower.
Control effected by electronic control unit	• Output to fog lamp (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between fog lamp (right-hand) and signal detect and actuation module • Faulty fog lamp (right-hand) • Defective signal detect and actuation module

522011-5: Right front fog lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to fog lamp (right-hand) falls to range of 0.8 to 2.9 A or lower.
Recoverability	• System recovers when output current to fog lamp (right-hand) rises to range of 0.8 to 2.9 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between fog lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between fog lamp (right-hand) and signal detect and actuation module • Faulty fog lamp (right-hand) • Defective signal detect and actuation module

522014-4: Passenger side Step illumination - Insufficient voltage or short circuit to ground

Generation condition	• Output current to step lamp (left-hand) rises to range of 0.5 to 0.9 A or higher.
Recoverability	• System recovers when output current to step lamp (left-hand) falls within range of 0.5 to 0.9 A or lower.
Control effected by electronic control unit	• Output to step lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between step lamp (left-hand) and signal detect and actuation module • Faulty step lamp (left-hand) • Defective signal detect and actuation module

522014-5: Passenger side Step illumination - The current strength is too low or there is an open circuit.

Generation condition	• Output current to step lamp (left-hand) falls to range of 0.1 to 0.3 A or lower.
Recoverability	• System recovers when output current to step lamp (left-hand) rises to range of 0.1 to 0.3 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between step lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between step lamp (left-hand) and signal detect and actuation module • Faulty step lamp (left-hand) • Defective signal detect and actuation module

522015-4: Driver side Step illumination - Insufficient voltage or short circuit to ground

Generation condition	• Output current to step lamp (right-hand) rises to range of 0.5 to 0.9 A or higher.
Recoverability	• System recovers when output current to step lamp (right-hand) falls within range of 0.5 to 0.9 A or lower.
Control effected by electronic control unit	• Output to step lamp (right-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between step lamp (right-hand) and signal detect and actuation module • Faulty step lamp (right-hand) • Defective signal detect and actuation module

522015-5: Driver side Step illumination - The current strength is too low or there is an open circuit.

Generation condition	• Output current to step lamp (right-hand) falls to range of 0.1 to 0.3 A or lower.
Recoverability	• System recovers when output current to step lamp (right-hand) rises to range of 0.1 to 0.3 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between step lamp (right-hand) and signal detect and actuation module • Open-circuit in Plus harness between step lamp (right-hand) and signal detect and actuation module • Faulty step lamp (right-hand) • Defective signal detect and actuation module

522016-4: Cabin button illumination - Insufficient voltage or short circuit to ground

Generation condition	• Output current to illumination lamp rises to range of 3.9 to 6.7 A or higher.
Recoverability	• System recovers when output current to illumination lamp falls within range of 3.9 to 6.7 A or lower.
Control effected by electronic control unit	• Output to illumination lamp is stopped.
Possible causes	• Short-circuit to ground in harness between battery and signal detect and actuation module • Malfunction of battery • Faulty alternator • Defective signal detect and actuation module

522017-4: Washer motor - Insufficient voltage or short circuit to ground

Generation condition	• Output current to washer motor rises to range of 4.9 to 8.9 A or higher.
Recoverability	• System recovers when output current to washer motor falls within range of 4.9 to 8.9 A or lower.
Control effected by electronic control unit	• Output to washer motor is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between washer motor and signal detect and actuation module • Faulty washer motor • Defective signal detect and actuation module

522017-5: Washer motor - The current strength is too low or there is an open circuit.

Generation condition	• Output current to washer motor falls to range of 0.4 to 1.7 A or lower.
Recoverability	• System recovers when output current to washer motor rises to range of 0.4 to 1.7 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between washer motor and signal detect and actuation module • Open-circuit in Plus harness between washer motor and signal detect and actuation module • Faulty washer motor • Defective signal detect and actuation module

522020-4: Left license plate lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to license plate lamp (left-hand) rises to range of 1.1 to 1.8 A or higher.
Recoverability	• System recovers when output current to license plate lamp (left-hand) falls within range of 1.1 to 1.8 A or lower.
Control effected by electronic control unit	• Output to license plate lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between license plate lamp (left-hand) and signal detect and actuation module • Faulty license plate lamp (left-hand) • Defective signal detect and actuation module

522020-5: Left license plate lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to license plate lamp (left-hand) falls to range of 0.1 to 0.3 A or lower.
Recoverability	• System recovers when output current to license plate lamp (left-hand) rises to range of 0.1 to 0.3 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between license plate lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between license plate lamp (left-hand) and signal detect and actuation module • Faulty license plate lamp (left-hand) • Defective signal detect and actuation module

522022-4: Left front fog lamp - Insufficient voltage or short circuit to ground

Generation condition	• Output current to fog lamp (left-hand) rises to range of 6.0 to 10.9 A or higher.
Recoverability	• System recovers when output current to fog lamp (left-hand) falls within range of 6.0 to 10.9 A or lower.
Control effected by electronic control unit	• Output to fog lamp (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between fog lamp (left-hand) and signal detect and actuation module • Faulty fog lamp (left-hand) • Defective signal detect and actuation module

522022-5: Left front fog lamp - The current strength is too low or there is an open circuit.

Generation condition	• Output current to fog lamp (left-hand) falls to range of 0.8 to 2.9 A or lower.
Recoverability	• System recovers when output current to fog lamp (left-hand) rises to range of 0.8 to 2.9 A or higher.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between fog lamp (left-hand) and signal detect and actuation module • Open-circuit in Plus harness between fog lamp (left-hand) and signal detect and actuation module • Faulty fog lamp (left-hand) • Defective signal detect and actuation module

522026-4: Mirror heater Passenger side - Insufficient voltage or short circuit to ground

Generation condition	• Output current to mirror heater (passenger side) rises to range of 7.7 to 13.5 A or higher.
Recoverability	• System recovers when output current to mirror heater (left-hand) falls within range of 7.7 to 13.5 A or lower.
Control effected by electronic control unit	• Output to mirror heater (left-hand) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between mirror heater (left-hand) and signal detect and actuation module • Faulty mirror heater (left-hand) • Defective signal detect and actuation module

522027-3: Interior lamp - Excessive voltage or short circuit to positive

Generation condition	• Output current to room lamp rises to range of 6.0 to 12.0 A or higher.
Recoverability	• System recovers when output current to room lamp falls within range of 6.0 to 12.0 A or lower.
Control effected by electronic control unit	• Output to room lamp is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between room lamp and signal detect and actuation module • Faulty room lamp • Defective signal detect and actuation module

522028-4: Mirror heater Switches - Insufficient voltage or short circuit to ground

Generation condition	• Output current to mirror heater switch (illuminated) rises to range of 0.4 to 0.9 A or higher.
Recoverability	• System recovers when output current to mirror heater switch (illuminated) falls within range of 0.4 to 0.9 A or lower.
Control effected by electronic control unit	• Output to mirror heater switch (illuminated) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between mirror heater switch (illuminated) and signal detect and actuation module • Faulty mirror heater switch (illuminated) • Defective signal detect and actuation module

522030-4: Warning buzzer (Backup warning system) - Insufficient voltage or short circuit to ground

Generation condition	• Chip internal temperature rises abnormally high due to overcurrent generated by full or partial short-circuit to ground.
Recoverability	• System recovers when normal current flow is detected.
Control effected by electronic control unit	• Output to back buzzer is stopped.
Possible causes	• Open-circuit or short-circuit to power or ground in SIG harness between back buzzer and signal detect and actuation module • Open-circuit in Plus harness between back buzzer and signal detect and actuation module • Faulty back buzzer • Defective signal detect and actuation module

522032-4: BBC Power take-off Short circuit to ground - Insufficient voltage or short circuit to ground

Generation condition	• Output current to option connector (transmission power take-off output) rises to range of 0.4 to 0.9 A or higher.
Recoverability	• System recovers when output current to option connector (transmission power take-off output) falls within range of 0.4 to 0.9 A or lower.
Control effected by electronic control unit	• Output to option connector (transmission power take-off output) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between option connector (transmission power take-off output) and signal detect and actuation module • Faulty option connector (transmission power take-off output) • Defective signal detect and actuation module

522033-4: BBC Switch 'TCM Neutral position' Short circuit to ground - Insufficient voltage or short circuit to ground

Generation condition	• Output current to option connector (transmission neutral switch signal) rises to range of 0.4 to 0.9 A or higher.
Recoverability	• System recovers when output current to option connector (transmission neutral switch signal) falls within range of 0.4 to 0.9 A or lower.
Control effected by electronic control unit	• Output to option connector (transmission neutral switch signal) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between option connector (transmission neutral switch signal) and signal detect and actuation module • Faulty option connector (transmission neutral switch signal) • Defective signal detect and actuation module

522034-4: BBC Switch 'Parking brake' Short circuit to ground - Insufficient voltage or short circuit to ground

Generation condition	• Output current to option connector (parking brake switch signal) rises to range of 0.4 to 0.9 A or higher.
Recoverability	• System recovers when output current to option connector (parking brake switch signal) falls within range of 0.4 to 0.9 A or lower.
Control effected by electronic control unit	• Output to option connector (parking brake switch signal) is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between option connector (parking brake switch signal) and signal detect and actuation module • Faulty option connector (parking brake switch signal) • Defective signal detect and actuation module

522038-5: Blower motor Relays - The current strength is too low or there is an open circuit.

Generation condition	• A/C blower relay in signal detect and actuation module is malfunctioning.
Recoverability	• System recovers when A/C blower relay in signal detect and actuation module resumes normal control.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective signal detect and actuation module (faulty A/C blower relay)

522039-5: Relay 'Power supply for optional bodies' (ACC) - The current strength is too low or there is an open circuit.

Generation condition	• A/C relay in signal detect and actuation module is malfunctioning.
Recoverability	• System recovers when A/C relay in signal detect and actuation module resumes normal control.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective signal detect and actuation module (faulty A/C relay)

522040-5: Starter signal Relays (IGN) - The current strength is too low or there is an open circuit.

Generation condition	• IGN relay in signal detect and actuation module is malfunctioning.
Recoverability	• System recovers when IGN relay in signal detect and actuation module resumes normal control.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective signal detect and actuation module (faulty IGN relay)

522041-5: Starter signal Relays (ACC) - The current strength is too low or there is an open circuit.

Generation condition	• ACC relay in signal detect and actuation module is malfunctioning.
Recoverability	• System recovers when ACC relay in signal detect and actuation module resumes normal control.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective signal detect and actuation module (faulty ACC relay)

522042-5: Relay 'Power supply for optional bodies' (IGN) - The current strength is too low or there is an open circuit.

Generation condition	• IGN relay (option) in signal detect and actuation module is malfunctioning.
Recoverability	• System recovers when IGN relay (option) in signal detect and actuation module resumes normal control.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective signal detect and actuation module (faulty IGN relay)

522043-5: Refrigerant compressor Relays - The current strength is too low or there is an open circuit.

Generation condition	• A/C compressor/condenser relay in signal detect and actuation module is malfunctioning.
Recoverability	• System recovers when A/C compressor/condenser relay in signal detect and actuation module resumes normal control.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective signal detect and actuation module (faulty A/C compressor/condenser relay)

522064-25: DUONIC Control unit - The received data are implausible.

Generation condition	• Controller area network communication data (gear information) from DUONIC electronic control unit are abnormal.
Recoverability	• System recovers when normal controller area network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Controller area network line is open or shorted to power, ground or another circuit. • Faulty DUONIC electronic control unit • Defective signal detect and actuation module

522067-25: Combination switch - The received data are implausible.

Generation condition	• Local interconnect network communication data (headlight and markers information) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522069-25: Combination switch - The received data are implausible.

Generation condition	• Local interconnect network communication data (high beam switch information) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522070-25: Combination switch - The received data are implausible.

Generation condition	• Local interconnect network communication data (high beam flash switch information) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522071-25: DUONIC Control unit - The received data are implausible.

Generation condition	• Controller area network communication data from DUONIC electronic control unit are abnormal.
Recoverability	• System recovers when normal controller area network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Controller area network line is open or shorted to power, ground or another circuit. • Faulty DUONIC electronic control unit • Defective signal detect and actuation module

522074-25: Combustion engine Control unit - The received data are implausible.

Generation condition	• Controller area network communication data from engine electronic control unit are abnormal.
Recoverability	• System recovers when normal controller area network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Controller area network line is open or shorted to power, ground or another circuit. • Defective engine electronic control unit • Defective signal detect and actuation module

522075-25: Combustion engine Control unit - The received data are implausible.

Generation condition	• Controller area network communication data from engine electronic control unit are abnormal.
Recoverability	• System recovers when normal controller area network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Controller area network line is open or shorted to power, ground or another circuit. • Defective engine electronic control unit • Defective signal detect and actuation module

522076-25: Combustion engine Control unit - The received data are implausible.

Generation condition	• Controller area network communication data from engine electronic control unit are abnormal.
Recoverability	• System recovers when normal controller area network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Controller area network line is open or shorted to power, ground or another circuit. • Defective engine electronic control unit • Defective signal detect and actuation module

522077-25: Combination switch - The received data are implausible.

Generation condition	• Local interconnect network communication data (lighting information) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Headlamps and Marker Lights automatically turns on when IGN=ON.
Possible causes	• Local interconnect network line is open or shorted to power, ground or another circuit. • Defective combination switch • Defective signal detect and actuation module

522078-25: Combination switch - The received data are implausible.

Generation condition	• Local interconnect network communication data (wiper information) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Wiper slow mode automatically turns on when IGN=ON.
Possible causes	• Local interconnect network line is open or shorted to power, ground or another circuit. • Defective combination switch • Defective signal detect and actuation module

522079-25: Selector lever - The received data are implausible.

Generation condition	• Local interconnect network communication data from gear shift lever unit are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Local interconnect network line is open or shorted to power, ground or another circuit. • Faulty gear shift lever unit • Defective signal detect and actuation module

522080-25: Key less entry unit - The received data are implausible.

Generation condition	• Local interconnect network communication data from keyless entry electronic control unit are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Local interconnect network line is open or shorted to power, ground or another circuit. • Faulty keyless entry electronic control unit • Defective signal detect and actuation module

522081-25: Power window 'Driver door' Switches - The received data are implausible.

Generation condition	• Local interconnect network communication data from power window switch driver side are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Local interconnect network line is open or shorted to power, ground or another circuit. • Faulty power window switch right-hand • Defective signal detect and actuation module

522082-25: Power window 'Front passenger door' Switches - The received data are implausible.

Generation condition	• Local interconnect network communication data from power window switch passenger side are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Local interconnect network line is open or shorted to power, ground or another circuit. • Faulty power window switch left-hand • Defective signal detect and actuation module

522097-2: Starter Switches (ACC) - Implausible data

Generation condition	• Starter key position disagrees with starter switch signal (the key is OFF but the signal is ACC); there is a trouble in starter switch internal circuit. • Starter key position corresponds with starter switch signal (both are ACC); there is a trouble in key reminder switch (stuck at OFF position).
Recoverability	• System recovers when normal signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Faulty key reminder switch (sticking in OFF position or open-circuit) • Open-circuit in harness between key reminder switch and signal detect and actuation module • Short-circuit in harness between signal detect and actuation module and starter switch • Faulty starter switch • Defective signal detect and actuation module

522098-2: Starter Switches (ON) - Implausible data

Generation condition	• Starter key position disagrees with starter switch signal (the key is OFF or ACC but the signal is ON); there is a trouble in starter switch internal circuit. • Starter key position corresponds with starter switch signal (both are ON); there is a trouble in key reminder switch (stuck at OFF position).
Recoverability	• System recovers when normal signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Faulty key reminder switch (sticking in OFF position or open-circuit) • Open-circuit in harness between key reminder switch and signal detect and actuation module • Short-circuit in harness between signal detect and actuation module and starter switch • Faulty starter switch • Defective signal detect and actuation module

522099-2: Starter Switches (START) - Implausible data

Generation condition	• Starter key position disagrees with starter switch signal (the key is OFF, ACC or ON but the signal is ON); there is a trouble in starter switch internal circuit. • Starter key position corresponds with starter switch signal (both are ON); there is a trouble in key reminder switch (stuck at OFF position).
Recoverability	• System recovers when normal signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Faulty key reminder switch (sticking in OFF position or open-circuit) • Open-circuit in harness between key reminder switch and signal detect and actuation module • Short-circuit in harness between signal detect and actuation module and starter switch • Faulty starter switch • Defective signal detect and actuation module

522112-3: The battery voltage is too high. - Excessive voltage or short circuit to positive

Generation condition	• Battery voltage (12 V) is too high.
Recoverability	• System recovers when normal voltage is applied.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Faulty alternator • Defective signal detect and actuation module

522112-4: The battery voltage is too low. - Insufficient voltage or short circuit to ground

Generation condition	• Battery voltage (12 V) is too low.
Recoverability	• System recovers when normal voltage is applied.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to ground in harness between battery and signal detect and actuation module • Faulty alternator • Defective signal detect and actuation module

522113-25: Combination switch - The received data are implausible.

Generation condition	• Local interconnect network communication data (lighting information) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Headlamps and Marker Lights automatically turns on when IGN=ON.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522114-25: Combination switch - The received data are implausible.

Generation condition	• Local interconnect network communication data from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522115-25: Power window 'Driver door' Switches - The received data are implausible.

Generation condition	• Local interconnect network communication data from power window switch driver side are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty power window switch right-hand • Defective signal detect and actuation module

522116-25: Power window 'Front passenger door' Switches - The received data are implausible.

Generation condition	• Local interconnect network communication data from power window switch passenger side are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty power window switch left-hand • Defective signal detect and actuation module

522117-25: Key less entry unit - The received data are implausible.

Generation condition	• Local interconnect network communication data from keyless entry unit are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty keyless entry unit • Defective signal detect and actuation module

522118-25: Selector lever - The received data are implausible.

Generation condition	• Local interconnect network communication data from gear shift lever unit are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty gear shift lever unit • Defective signal detect and actuation module

522133-17: Vacuum system Power take-off M/T - Activation Timeout error

Generation condition	• Power take-off control switch does not turn ON even in 5 seconds after transmission power take-off switch is turned ON.
Recoverability	• System recovers when normal signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit in SIG harness between transmission power take-off 3-way magnetic valve and signal detect and actuation module • Open-circuit in Plus harness between transmission power take-off 3-way magnetic valve and signal detect and actuation module • Faulty transmission power take-off 3-way magnetic valve • Defective signal detect and actuation module

522134-17: Vacuum system Power take-off M/T - Deactivation Timeout error

Generation condition	• Transmission power take-off switch (cabin switch) does not turn OFF even in 5 seconds after power take-off control switch (chassis switch) is turned OFF.
Recoverability	• System recovers when normal signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Short-circuit to power or ground in SIG harness between transmission power take-off 3-way magnetic valve and signal detect and actuation module • Faulty transmission power take-off 3-way magnetic valve • Defective signal detect and actuation module

522135-17: Vacuum system Power take-off M/T - Deactivation No request

Generation condition	• Power take-off control switch turns OFF before transmission power take-off switch is turned OFF with transmission power take-off 3-way magnetic valve ON.
Recoverability	• System recovers when normal signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit in SIG harness between power take-off control switch and signal detect and actuation module • Open-circuit in Plus harness between power take-off control switch and signal detect and actuation module • Faulty power take-off control switch • Defective signal detect and actuation module

522136-17: Vacuum system Power take-off M/T - Activation No request

Generation condition	• Power take-off control switch turns ON before transmission power take-off switch is turned ON with transmission power take-off 3-way magnetic valve OFF.
Recoverability	• System recovers when normal signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between power take-off control switch and signal detect and actuation module • Faulty power take-off control switch • Defective signal detect and actuation module

522138-25: Combination switch - The received data are implausible.

Generation condition	• Local interconnect network communication data (turn signal left-hand) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522139-25: Combination switch - The received data are implausible.

Generation condition	• Local interconnect network communication data (turn signal right-hand) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522140-25: Combination switch - The received data are implausible.

Generation condition	• Local interconnect network communication data (wiper signal) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Wiper slow mode automatically turns on when IGN=ON.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522141-25: Combination switch - The received data are implausible.

Generation condition	• Local interconnect network communication data (interval wiper signal) from combination switch are abnormal.
Recoverability	• System recovers when normal local interconnect network signals are received.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit or short-circuit to power, ground or another circuit in local interconnect network line between combination switch and signal detect and actuation module • Faulty combination switch • Defective signal detect and actuation module

522142-4: Wiper motor - Insufficient voltage or short circuit to ground

Generation condition	• Voltage output to wiper motor is abnormal.
Recoverability	• System recovers when normal voltage is applied.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Short-circuit to ground in SIG harness between wiper motor and signal detect and actuation module • Faulty wiper motor • Defective signal detect and actuation module

522143-5: Wiper motor - The current strength is too low or there is an open circuit.

Generation condition	• Current output to wiper motor is abnormal.
Recoverability	• System recovers when normal current is applied.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Open-circuit in SIG harness between wiper motor and signal detect and actuation module • Open-circuit in Plus harness between wiper motor and signal detect and actuation module • Faulty wiper motor • Defective signal detect and actuation module

522144-3: Wiper motor - Excessive voltage or short circuit to positive

Generation condition	• Voltage input from wiper motor is abnormal.
Recoverability	• System recovers when normal voltage is applied.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Short-circuit to power in SIG harness between wiper motor and signal detect and actuation module • Faulty wiper motor • Defective signal detect and actuation module

522147-4: Ignition key Locking solenoid - Insufficient voltage or short circuit to ground

Generation condition	• Output current to key interlock solenoid rises to range of 4.2 to 7.4 A or higher.
Recoverability	• System recovers when output current to key interlock solenoid falls within range of 4.2 to 7.4 A or lower.
Control effected by electronic control unit	• Output to key interlock solenoid is stopped.
Possible causes	• Short-circuit to power, ground or another circuit in SIG harness between key interlock solenoid and signal detect and actuation module • Faulty key interlock solenoid • Defective signal detect and actuation module

522148-17: Faulty part CPU inside component "Signal & ActuatorModule"

Generation condition	• Watch dog of signal detect and actuation module generation condition is detected and resetting takes place.
Recoverability	• Watch dog of signal detect and actuation module generation condition is cleared after resetting.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective CPU of signal detect and actuation module • Defective software of signal detect and actuation module

522149-17: Faulty part Memory inside component "Signal & ActuatorModule"

Generation condition	• Checksum of signal detect and actuation module calculated at data rewriting is not correct.
Recoverability	• Checksum of signal detect and actuation module calculated at data rewriting becomes correct.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Abnormality of signal detect and actuation module

522150-17: Faulty component 'Signal & ActuatorModule'

Generation condition	• Memory unit is in an abnormal condition.
Recoverability	• Normal operations of memory unit are resumed after restarting.
Control effected by electronic control unit	• Normal control is effected.
Possible causes	• Defective software of signal detect and actuation module

2. FUSO Diagnostics Service Data (Actual Values)

• Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.

[Current Value Group: Lighting Outputs]

No.	Description	Value	Explanation
000	Right high beam	ON/OFF	Shows the ON/OFF state of the headlamp RH (high beam). • ON: Illumination • OFF: Extinction [Related parts] • Headlamp RH (high beam)
001	Left high beam	ON/OFF	Shows the ON/OFF state of the headlamp LH (high beam). • ON: Illumination • OFF: Extinction [Related parts] • Headlamp LH (high beam)
002	Right turn signal	ON/OFF	Shows the ON/OFF state of the front and side turn signal lamp RH. • ON: Illumination • OFF: Extinction [Related parts] • Front and side turn signal lamp RH
003	Left turn signal	ON/OFF	Shows the ON/OFF state of the front and side turn signal lamp LH. • ON: Illumination • OFF: Extinction [Related parts] • Front and side turn signal lamp LH
004	Right turn signal REAR	ON/OFF	Shows the ON/OFF state of the rear turn lamp RH. • ON: Illumination • OFF: Extinction [Related parts] • Rear turn lamp RH

No.	Description	Value	Explanation
005	Left turn signal REAR	ON/OFF	Shows the ON/OFF state of the rear turn lamp LH. • ON: Illumination • OFF: Extinction [Related parts] • Rear turn lamp LH
006	Right rear brake light	ON/OFF	Shows the ON/OFF state of the stop lamp RH. • ON: Illumination • OFF: Extinction [Related parts] • Stop lamp RH
007	Left rear brake light	ON/OFF	Shows the ON/OFF state of the stop lamp LH. • ON: Illumination • OFF: Extinction [Related parts] • Stop lamp LH
008	Right taillamp	ON/OFF	Shows the ON/OFF state of the tail lamp RH. • ON: Illumination • OFF: Extinction [Related parts] • Tail lamp RH
009	Left taillamp	ON/OFF	Shows the ON/OFF state of the tail lamp LH. • ON: Illumination • OFF: Extinction [Related parts] • Tail lamp LH
010	Right clearance lamps/Right side marker lamps	ON/OFF	Shows the ON/OFF state of the clearance lamp RH. • ON: Illumination • OFF: Extinction [Related parts] • Clearance lamp RH
011	Left clearance lamps/Left side marker lamps	ON/OFF	Shows the ON/OFF state of the clearance lamp LH. • ON: Illumination • OFF: Extinction [Related parts] • Clearance lamp LH
012	Right license plate lamp	ON/OFF	Unused
013	Left license plate lamp	ON/OFF	Shows the ON/OFF state of the license plate lamp. • ON: Illumination • OFF: Extinction [Related parts] • License plate lamp
014	Driver side Step illumination	ON/OFF	Shows the ON/OFF state of the step lamp, driver side. • ON: Illumination • OFF: Extinction [Related parts] • Step lamp (driver side)
015	Passenger side Step illumination	ON/OFF	Shows the ON/OFF state of the step lamp, passenger side. • ON: Illumination • OFF: Extinction [Related parts] • Step lamp (passenger side)
016	Switch and controls illumination	ON/OFF	Shows the ON/OFF state of the Illumination lamp. • ON: Illumination • OFF: Extinction [Related parts] • Illumination lamp
017	Electric motor 'Automatic headlamp adjustment'	ON/OFF	Unused

No.	Description	Value	Explanation
018	Right front fog lamp	ON/OFF	Shows the ON/OFF state of the fog lamp RH. • ON: Illumination • OFF: Extinction [Related parts] • Fog lamp RH
019	Left front fog lamp	ON/OFF	Shows the ON/OFF state of the fog lamp LH. • ON: Illumination • OFF: Extinction [Related parts] • Fog lamp LH
020	Rear fog lamp	ON/OFF	Unused
021	Right daytime running light	ON/OFF	Unused
022	Left daytime running light	ON/OFF	Unused
023	Right turn signal on trailer	ON/OFF	Unused
024	Left turn signal on trailer	ON/OFF	Unused
025	Backup light of trailer	ON/OFF	Unused
028	Interior illumination	ON/OFF	Shows the ON/OFF state of the optional connecotor (body illumination lamp). • ON: Illumination • OFF: Extinction [Related parts] • Optional connector (body illumination lamp)
029	Exterior illumination	ON/OFF	Shows the ON/OFF state of the optional connecotor (chassis illumination lamp). • ON: Illumination • OFF: Extinction [Related parts] • Optional connector (chassis illumination lamp)

[Current Value Group: Washer Wiper Outputs]

No.	Description	Value	Explanation
030	Windshield wiper Stage ON	ON/OFF	Shows the ON/OFF state of the wiper motor LO. • ON: Operation • OFF: Stopped [Related parts] • Wiper motor
031	Windshield wiper Stage HIGH	ON/OFF	Shows the ON/OFF state of the wiper motor HI. • ON: Operation • OFF: Stopped [Related parts] • Wiper motor

[Current Value Group: Washer Pump Control Output]

No.	Description	Value	Explanation
032	Windshield washer system	ON/OFF	Shows the ON/OFF state of the windshield washer motor. • ON: Operation • OFF: Stopped [Related parts] • Windshield washer motor

[Current Value Group: Door Outputs]

No.	Description	Value	Explanation
033	Mirror heater Swithches	ON/OFF	Shows the ON/OFF state of the mirror heater switch illumination. • ON: Mirror heater switch ON • OFF: Mirror heater switch OFF [Related parts] • Mirror heater switch
034	Driver side Mirror heater	ON/OFF	Shows the ON/OFF state of the mirror heater (driver side). • ON: Operation • OFF: Stopped [Related parts] • Mirror heater (driver side)
035	Passenger side Mirror heater	ON/OFF	Shows the ON/OFF state of the mirror heater (passenger side). • ON: Operation • OFF: Stopped [Related parts] • Mirror heater (passenger side)

[Current Value Group: Ignition Relay Outputs]

No.	Description	Value	Explanation
036	Starter signal Relays (ACC)	ON/OFF	Shows the ON/OFF state of the ACC relay. • ON: ACC RELAY ON • OFF: ACC RELAY OFF [Related parts] • Shift lever unit relay • ETC ACC • Audio ACC • DUONIC ACC • Cigarette lighter ACC • Electric-powered mirror ACC
037	Relay 'Power supply for optional bodies' (ACC)	ON/OFF	Shows the ON/OFF state of the 12V/24V ACC relay. • ON: 12V/24V ACC RELAY ON • OFF: 12V/24V ACC RELAY OFF [Related parts] • Optional connector (ACC body) • Optional connector (ACC chassis)
038	Starter signal Relays (IGN)	ON/OFF	Shows the ON/OFF state of the ignition relay. • ON: IGN RELAY ON • OFF: IGN RELAY OFF [Related parts] • Meter cluster (M power supply) • Battery equalizer (M power supply) • Anti-lock brake system electronic control unit (M power supply) • Engine electronic control unit (M power supply) • Airbag system electronic control unit (M power supply) • DUONIC electronic control unit (M power supply 1) • DUONIC electronic control unit (M power supply 2) • Shift lever unit (M power supply 1) • Shift lever unit (M power supply 2) • Lock brake electronic control unit (M power supply) • Headlamp auto leveling system electronic control unit (M power supply) • Idling stop and start system electronic control unit (M power supply) • Starter relay
039	Relay 'Power supply for optional bodies' (IGN)	ON/OFF	Shows the ON/OFF state of the 12V/24V ignition relay. • ON: 12V/24V IGN RELAY ON • OFF: 12V/24V IGN RELAY OFF [Related parts] • Optional connector (M power supply body) • Optional connector (power supply chassis) • Alternator (R terminal)

[Current Value Group: Air Conditioning Outputs]

No.	Description	Value	Explanation
040	Refrigerant compressor Relays	ON/OFF	Shows the ON/OFF state of the air conditioner compressor-condender relay. • ON: A/C COMP COND.RELAY ON • OFF: A/C COMP COND.RELAY OFF [Related parts] • Dual pressure switch • Condenser fan relay
041	Blower motor Relays	ON/OFF	Shows the ON/OFF state of the air conditioner blower relay. • ON: A/C BLOWER RELAY ON • OFF: A/C BLOWER RELAY OFF [Related parts] • Blower motor relay

[Current Value Group: Brake Output]

No.	Description	Value	Explanation
042	Parking brake Switches	ON/OFF	Shows the ON/OFF state of the optional connecotor (parking brake cut). • ON: Optional connector (parking brake cut) ON • OFF: Optional connector (parking brake cut) OFF [Related parts] • Optional connector (parking brake cut)

[Current Value Group: Transmission Outputs]

No.	Description	Value	Explanation
043	Transmission Neutral position Switches	ON/OFF	Shows the ON/OFF state of the optional connecotor (neutral signal). • ON: Optional connector (neutral signal) ON • OFF: Optional connector (neutral signal) OFF [Related parts] • Optional connector (neutral signal)
044	Backup light Switches	ON/OFF	Unused
045	Warning buzzer (Backup warning system)	ON/OFF	Shows the ON/OFF state of the backup buzzer. • ON: Backup buzzer ON • OFF: Backup buzzer OFF [Related parts] • Backup buzzer

[Current Value Group: PTO Outputs]

No.	Description	Value	Explanation
046	3/2-way valve Power take-off	ON/OFF	Shows the ON/OFF state of the transmission power take-off 3-way magnetic valve <Vacuum>. • ON: Transmission power take-off 3-way magnetic valve ON (12V) • OFF: Transmission power take-off 3-way magnetic valve OFF (0V) [Related parts] • Transmission power take-off 3-way magnetic valve <Vacuum>
047	Power take-off Outputs	ON/OFF	Shows the ON/OFF state of the optional connector (power take-off magnetic valve). • ON: Optional connector (power take-off magnetic valve) ON • OFF: Optional connector (power take-off magnetic valve) OFF [Related parts] • Optional connector

[Current Value Group: PWM Actuation]

No.	Description	Value	Explanation
048	Interior lamp	■■■■%	Shows the output state of cab lamp PWM (pulse width modulation) control • 0 - 100% [Related parts] • Cab lamp
049	Left low beam	■■■■%	Shows the output state of headlamp LH (lower) PWM (pulse width modulation) control • 0 - 100% [Related parts] • Headlamp
050	Right low beam	■■■■%	Shows the output state of headlamp RH (lower) PWM (pulse width modulation) control • 0 - 100% [Related parts] • Headlamp
051	Ignition key Locking solenoid	■■■■%	Shows the output state of interlock solenoid PWM (pulse width modulation) control • 0 - 100% [Related parts] • Key interlock solenoid

[Current Value Group: Lighting Inputs]

No.	Description	Value	Explanation
052	Rear fog lamp switches	ON/OFF	Unused
053	Front fog lamp Switches	ON/OFF	Shows the ON/OFF state of the fog lamp switch. • ON: Fog lamp switch ON • OFF: Fog lamp switch OFF [Related parts] • Fog lamp switch
054	Hazard warning flasher Switches	ON/OFF	Shows the ON/OFF state of the hazard warning switch. • ON: Hazard warning switch ON • OFF: Hazard warning switch OFF [Related parts] • Hazard warning switch
055	Blackout switch	ON/OFF	Unused

[Current Value Group: Washer Wiper Inputs]

No.	Description	Value	Explanation
056	Windshield wiper Switch 'Rest position'	ON/OFF	Shows the ON/OFF state of the wiper switch. • ON: Wiper switch ON • OFF: Wiper switch OFF [Related parts] • Wiper switch

[Current Value Group: Door Inputs]

No.	Description	Value	Explanation
057	Mirror heater	ON/OFF	Shows the ON/OFF state of the mirror heater switch. • ON: Mirror heater switch ON • OFF: Mirror heater switch OFF [Related parts] • Mirror heater switch
058	Driver door	OPEN/CLOSE	Shows the OPEN/CLOSE state of the door switch LH. • OPEN: Door switch RH ON • CLOSE: Door switch RH OFF [Related parts] • Front door switch RH
059	Passenger door	OPEN/CLOSE	Shows the OPEN/CLOSE state of the door switch LH. • OPEN: Door switch RH ON • CLOSE: Door switch RH OFF [Related parts] • Front door switch RH
060	Right rear door / Left rear door	OPEN/CLOSE	Shows the OPEN/CLOSE state of the rear door switch RH and LH. • OPEN: Rear door switch RH and LH ON • CLOSE: Rear door switch RH and LH OFF [Related parts] • Rear door switch RH and LH
061	Driver door Lock Switches OFF	ON/OFF	Shows the ON/OFF state of the door lock switch OFF. • ON: Driver door lock switches OFF • OFF: Driver door lock switches ON [Related parts] • Rear door switch RH and LH
062	Driver door Lock Switches ON	ON/OFF	Shows the ON/OFF state of the door lock switch ON. • ON: Driver door lock switches ON • OFF: Driver door lock switches OFF [Related parts] • Rear door switch RH and LH

[Current Value Group: Ignition Switch Inputs]

No.	Description	Value	Explanation
063	Starter Switches (LOCK)	ON/OFF	Shows the ON/OFF state of the starter switch (LOCK position). • ON: Starter switch (LOCK position) • OFF: Starter switch (any position except LOCK) [Related parts] • Starter switch
064	Starter Switches (ACC)	ON/OFF	Shows the ON/OFF state of the starter switch (ACC position). • ON: Starter switch (ACC position) • OFF: Starter switch (any position except LOCK) [Related parts] • Starter switch
065	Starter Switches (ON)	ON/OFF	Shows the ON/OFF state of the starter switch (ON position). • ON: Starter switch (ON position) • OFF: Starter switch (any position except ON) [Related parts] • Starter switch
066	Starter Switches (Start)	ON/OFF	Shows the ON/OFF state of the starter switch (START position). • ON: Starter switch (START position) • OFF: Starter switch (any position except START) [Related parts] • Starter switch
067	Alternator	ON/OFF	Shows the ON/OFF state of the alternator operation. • ON: Alternator in operation • OFF: Alternator stopped [Related parts] • Alternator
068	Starter signal Relays (ACC)	ON/OFF	Shows the ON/OFF state of the ACC relay. • ON: ACC relay ON • OFF: ACC relay OFF [Related parts] • ACC relay (a relay within the signal detection and actuation module)
069	Relay 'Power supply for optional bodies' (ACC)	ON/OFF	Shows the ON/OFF state of the 12V/24V ACC relay. • ON: 12V/24V ACC relay ON • OFF: 12V/24V ACC relay OFF [Related parts] • 12V/24V ACC relay (a relay within the signal detection and actuation module)
070	Starter signal Relays (IGN)	ON/OFF	Shows the ON/OFF state of the ignition relay. • ON: Ignition relay ON • OFF: Ignition relay OFF [Related parts] • Ignition relay (a relay within the signal detection and actuation module)
071	Relay 'Power supply for optional bodies' (IGN)	ON/OFF	Shows the ON/OFF state of the 12V/24V ignition relay. • ON: 12V/24V Ignition relay ON • OFF: 12V/24V Ignition relay OFF [Related parts] • 12V/24V ignition relay (a relay within the signal detection and actuation module)

[Current Value Group: Air Conditioning Inputs]

No.	Description	Value	Explanation
072	Air conditioning Switches	ON/OFF	Shows the ON/OFF state of the air conditioner switch. • ON: Air conditioner switch ON • OFF: Air conditioner switch OFF [Related parts] • Air conditioner switch (Air conditioner control unit and control panel) <Full automatic air conditioner> • Air conditioner switch (heater control panel) <Manual air conditioner>
073	Refrigerant compressor Relays	ON/OFF	Shows the ON/OFF state of the compressor. • ON: Compressor in operation • OFF: Compressor stopped [Related parts] • Magnetic clutch • Dual pressure switch
074	Output of component 'Blower motor'	ON/OFF	Shows the ON/OFF state of the blower motor. • ON: Blower motor in operation • OFF: Blower motor stopped [Related parts] • Blower motor • Blower resistor <Manual air conditioner> • Power MOS-FET <Full automatic air conditioner>

[Current Value Group: Brake Inputs]

No.	Description	Value	Explanation
075	Vacuum Switches	ON/OFF	Shows the ON/OFF state of the vacuum switch. • ON: Vacuum switch ON • OFF: Vacuum switch OFF [Related parts] • Vacuum switch
076	Bake fluid level Switches	ON/OFF	Shows the ON/OFF state of the brake fluid switch. • ON: Brake fluid switch ON • OFF: Brake fluid switch OFF [Related parts] • Brake fluid switch
077	Parking brake Switches	ON/OFF	Shows the ON/OFF state of the parking brake switch. • ON: Parking brake switch ON • OFF: Parking brake switch OFF [Related parts] • Parking brake switch
078	Brake light Switches 2	ON/OFF	Shows the ON/OFF state of the stop lamp switch (N.C.). • ON: Stop lamp switch (N.C.) ON • OFF: Stop lamp switch (N.C.) OFF [Related parts] • Stop lamp switch
079	Brake light Switches 1	ON/OFF	Shows the ON/OFF state of the stop lamp switch (N.O.). • ON: Stop lamp switch (N.O.) ON • OFF: Stop lamp switch (N.O.) OFF [Related parts] • Stop lamp switch

[Current Value Group: Transmission Inputs]

No.	Description	Value	Explanation
080	Backup light Switches	ON/OFF	Unused
081	Transmission Neutral position Switches	ON/OFF	Shows the ON/OFF state of the optional connector (neutral signal). • ON: Optional connector (neutral signal) ON • OFF: Optional connector (neutral signal) OFF [Related parts] • Optional connector (neutral signal)
082	Clutch Switches	ON/OFF	Unused

[Current Value Group: PTO Inputs]

No.	Description	Value	Explanation
083	Power take-off Inputs	ON/OFF	Shows the ON/OFF state of the optional connector (power-take off signal). • ON: Optional connector (power-take off signal) available • OFF: Optional connector (power-take off signal) unavailable [Related parts] • Optional connector (power-take off signal)
084	Actuation of power take-off Switches	ON/OFF	Shows the ON/OFF state of the power take-off control switch. • ON: Power take-off control switch ON • OFF: Power take-off control switch OFF [Related parts] • Power take-off control switch
085	Power take-off Switches	ON/OFF	Shows the ON/OFF state of the transmission power take-off switch and damp lever switch. • ON: Transmission power take-off switch and damp lever switch ON • OFF: Transmission power take-off switch and damp lever switch OFF [Related parts] • Transmission power take-off switch <Vacuum (M/T)> • Damp lever switch <Damp>

[Current Value Group: Fill Level of Fuel Tank]

No.	Description	Value	Explanation
086	Fuel level	■■■■%	Shows fill level of the fuel tank. • Approx. 0% (0): Fuel tank empty • Approx. 100% (250): Fuel tank full [Related parts] • Fuel level sensor

[Current Value Group: Battery Voltage]

No.	Description	Value	Explanation
087	Battery Voltage	■■■■V	Shows input voltage from the battery (high-current fuse box) to signal detection and actuation module. • 0 - 25.4V (0 - 254) [Related parts] • Battery • High-current fuse box

3. FUSO Diagnostics Actuator Test (Actuations)

- Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.
- The basic conditions for performing the actuator test: Vehicle stopped, engine stopped and starter switch ON.

No.	Selection	Explanation
000	Exterior illumination	Illuminates the stop lamp (LH).
		Illuminates the headlamp high beam (LH).
		Illuminates the parking lamp (LH).
		Illuminates the turn signal lamp (LH).
		Illuminates the stop lamp (RH).
		Illuminates the headlamp high beam (RH).
		Illuminates the parking lamp (RH).
		Illuminates the turn signal lamp (RH).
001	Actuation of pump for windshield washer system “Windshield“	Activates the windshield washer system.
002	Status of integrated ignition module	Activates the ignition relay. [Additional condition for performing actuator test] Starter switch position: ACC
		Activates the ignition relay (option) [Additional condition for performing actuator test] Starter switch position: ACC
		Activates the accessory relay.
		Activates the accessory relay (option).
003	Air conditioning	Activates the air conditioner compressor condenser relay.
		Activates the air blower relay.

4. Coding Data in Electronic Control Unit

4.1 Overview

- The signal detect and actuation module has various kinds of information such as technical data of vehicle and equipment registered as coding data.
- Therefore, each time the signal detect and actuation module is replaced or some setting changes are made, the coding data must surely be rewritten using FUSO Diagnostics. Otherwise, the data stored in the signal detect and actuation module could deviate from the actual conditions of the vehicles, resulting in occurrence of diagnosis codes.

4.2 Rewriting of coding data

- If one of the following changes has been made, be sure to rewrite the relevant coding data. For details of the rewriting procedure, consult an authorized dealer or distributor.
- Depending on the specifications of the rear body to be mounted, coding data other than those listed below may have to be rewritten. For further information, consult an authorized dealer or distributor.

Rewriting coding data required	Standards for rewriting signal detect and actuation module internal data
When signal detect and actuation module is replaced	–
When additional turn signal lamps are installed	–
When rear body is mounted	If an optional connector for rear body mounting is used, the following diagnosis/actuator functions must be set valid: • Illumination • Backup buzzer • Power take-off • Neutral switch • Parking brake switch
When additional LED rear lamps are installed	–
When additional mirror with heater is installed	–

5. Electronic Control Unit Input/Output Table

- See the Electronic Control Unit Schematic Diagram for the pin locations of each signal and ground. (See Electronic Control Unit Circuit Diagram)

Devices to be connected	Terminal	Input/ output	Voltage and wave form
License plate lamp	13C-9-Ground	Output	ON: 12 V/OFF: 0 V
Parking lamp (RH)	15B-11-Ground	Output	ON: 12 V/OFF: 0 V
Parking lamp (LH)	15B-10-Ground	Output	ON: 12 V/OFF: 0 V
Head lamp high beam (RH)	14B-7-Ground	Output	ON: 12 V/OFF: 0 V
Head lamp high beam (LH)	16B-2-Ground	Output	ON: 12 V/OFF: 0 V
Option connector (side turn lamp (RH))	13C-4-Ground	Output	ON: 12 V/OFF: 0 V
Option connector (side turn lamp (LH))	12C-7-Ground	Output	ON: 12 V/OFF: 0 V
Rear turn lamp (RH)	13C-5-Ground	Output	ON: 12 V/OFF: 0 V
Rear turn lamp (LH)	12C-4-Ground	Output	ON: 12 V/OFF: 0 V
Front turn lamp (RH)	14B-4-Ground	Output	ON: 12 V/OFF: 0 V
Front turn lamp (LH)	16B-4-Ground	Output	ON: 12 V/OFF: 0 V
Front fog lamp (RH)	12C-6-Ground	Output	ON: 12 V/OFF: 0 V
Front fog lamp (LH)	13C-2-Ground	Output	ON: 12 V/OFF: 0 V
Stop lamp (RH)	13C-7-Ground	Output	ON: 12 V/OFF: 0 V
Stop lamp (LH)	12C-1-Ground	Output	ON: 12 V/OFF: 0 V
Tail lamp (RH)	12C-3-Ground	Output	ON: 12 V/OFF: 0 V
Tail lamp (LH)	13C-8-Ground	Output	ON: 12 V/OFF: 0 V
Step lamp (RH)	15B-12-Ground	Output	ON: 12 V/OFF: 0 V
Step lamp (LH)	15B-14-Ground	Output	ON: 12 V/OFF: 0 V
Illumination lamp	14B-8-Ground	Output	ON: 12 V/OFF: 0 V
Wiper motor (Hi)	16B-5-Ground	Output	ON: 12 V/OFF: 0 V
Wiper motor (Lo)	16B-1-Ground	Output	ON: 12 V/OFF: 0 V
Wiper washer motor	17B-5-Ground	Output	ON: 12 V/OFF: 0 V
Mirror heater switch illumination	15B-27-Ground	Output	ON: 12 V/OFF: 0 V
Mirror heater (LH)	14B-5-Ground	Output	ON: 12 V/OFF: 0 V
Mirror heater (RH)	14B-1-Ground	Output	ON: 12 V/OFF: 0 V

Devices to be connected	Terminal	Input/ output	Voltage and wave form
Backup lamp	13C-6-Ground	Output	ON: 12 V/OFF: 0 V
Backup buzzer	11C-6-Ground	Output	ON: 12 V/OFF: 0 V
Cab lamp	17B-15-Ground	Output	PWM
Key interlock solenoid	17B-17-Ground	Output	PWM
Front fog lamp switch	15B-16-Ground	Input	OFF: 12 V/ON: 0 V (Unlatched type)
Hazard switch	15B-4-Ground	Input	OFF: 12 V/ON: 0 V (Unlatched type)
Wiper motor stop position switch	17B-16-Ground	Input	OFF: 12 V/ON: 0 V
Heater mirror switch	18B-11-Ground	Input	OFF: 12 V/ON: 0 V (Unlatched type)
Rear door switch	15B-2-Ground	Input	OFF: 12 V/ON: 0 V
Front door switch (assistant driver's seat side)	15B-3-Ground	Input	OFF: 12 V/ON: 0 V
Front door switch (driver's seat side)	15B-18-Ground	Input	OFF: 12 V/ON: 0 V
Starter switch (START position)	15B-15-Ground	Input	OFF: 0 V/ON: 12 V
Starter switch (key insert switch)	18B-18-Ground	Input	OFF: 0 V/ON: 12 V
Starter switch (ACC position)	18B-17-Ground	Input	OFF: 0 V/ON: 12 V
Starter switch (M position)	18B-3-Ground	Input	OFF: 0 V/ON: 12 V
Alternator (L terminal)	11C-8-Ground	Input	Engine running: 12 V Engine stopped: 0 V
Accessory relay	3B-8, 7C-8, 3B-10, 3B-13-Ground	Output	Activated: 12 V Not activated: 0 V
Accessory relay (option)	6X-1-Ground	Output	Activated: 12 V Not activated: 0 V
Ignition relay	1B-11, 5C-2, 5C-4, 5C-11, 5C-9, 1B-1, 1B-4, 1B-5, 1B-13, 1B-14-Ground	Output	Activated: 12 V/24 V Not activated: 0 V
Ignition relay (option)	6X-5-Ground	Output	Activated: 12 V Not activated: 0 V
Air conditioner switch	15B-17-Ground	Input	OFF: 12 V/ON: 0 V
Air conditioner compressor condenser relay	7C-11, 7C-12-Ground	Output	Activated: 12 V Not activated: 0 V
Air conditioner blower relay	2B-14-Ground	Output	Active (with air conditioner compressor operating): 12 V Not activated: 0 V
Vacuum switch	15B-1-Ground	Input	OFF: 12 V/ON: 0 V
Brake fluid level switch	18B-7-Ground	Input	OFF: 12 V/ON: 0 V
Parking brake switch	18B-6-Ground	Input	OFF: 12 V/ON: 0 V
Stop lamp switch (normal close)	15B-19-Ground	Input	OFF: 12 V/ON: 0 V
Stop lamp switch (normal open)	18B-4-Ground	Input	OFF: 12 V/ON: 0 V
Power-take off control switch	11C-9-Ground	Input	OFF: 12 V/ON: 0 V
Cab tilt lock switch	18B-10-Ground	Input	OFF: 12 V/ON: 0 V
Diesel particulate filter cleaning switch	15B-20-Ground	Input	OFF: 12 V/ON: 0 V (Unlatched type)
Fuel level sensor	11C-1-Ground	Input	Fuel tank empty: 150 ± 3.5 Ω or more Full: 5 ± 2 Ω
Battery voltage	10C-1-Ground	Input	Shows the battery voltage (12 V).

6. Confirmation items before replacing the signal detect and actuation module

6.1 Diagnosis codes for signal detect and actuation module

- The diagnosis code for the signal detect and actuation module is generated when the signal detect and actuation module has normally performed self-diagnosis and has detected an abnormal load of the unit connected to the module.
- If a diagnosis code of the signal detect and actuation module is generated, first check the unit connected to the module before judging it as faulty signal detect and actuation module.

6.2 Troubleshooting before replacing the signal detect and actuation module

- Check the unit, harnesses and connectors related to the generated diagnosis code.
- Check if the system returns normal by disconnecting and connecting of the battery cable.
- Check the coding data in the signal detect and actuation module matches with the vehicle to which it is mounted.
- Temporarily replace the signal detect and actuation module with a known-good one and check if the same failure is detected.

6.3 Major symptoms and troubleshooting

- If the symptom is not observed currently, also check the past diagnosis codes.

(1) Engine would not start

Diagnosis code	Cause	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
522074-25 (522074-19)	Faulty communication to engine electronic control unit	Check the engine electronic control unit.
522075-25 (522075-19)		
522076-25 (522076-19)		
522074-25 (522074-19)	Faulty controller area network communication	• Check the controller area network-related connectors (17B/18B) and harnesses of the signal detect and actuation module, including disconnection and connection of the connectors. • Check the controller area network-related harnesses and connectors of the electronic control unit indicated by the diagnosis code, including disconnection and connection of the connectors. • If the problem reappears after the above check (and repair, if necessary), the cause of the problem may be an internal failure of the signal detect and actuation module. Replace the signal detect and actuation module.
522075-25 (522075-19)		
522076-25 (522076-19)		
522064-25 (522064-19)		
522071-25 (522071-19)		
522073-25 (522073-19)		
522040-5	Relay in signal detect and actuation module inoperative	• Disconnect and reconnect the relay - IGNITION RELAY for diagnosis code 522040-5 or ACC RELAY for 522041-5. • If the problem reappears after the above operation, the cause of the problem may be an internal failure of the signal detect and actuation module. Replace the signal detect and actuation module.
522041-5		
522097-2	Faulty starter switch signal	• Check the starter switch-related connectors (18B/15B) of the signal detect and actuation module, including disconnection and connection of the connectors. • Check the starter switch.
522098-2		
522099-2		

(2) Headlamps, turn-signal lights or wipers would not operate

Diagnosis code	Cause	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
None	None	• Check the connector (18B) and harness of the signal detect and actuation module, including disconnection and connection of the connectors. • Check the combination switch and connectors, including disconnection and connection of the connectors. In the same way as that for signal detect and actuation module, temporarily replace the combination switch with a known-good one and check if the same failure is detected.
521995-4	Headlamp, LH (high)	Check the lamps, related harnesses and connectors.
521995-5		
521996-4	Headlamp, RH (high)	
521996-5		
521997-4	Headlamp, LH (low)	
521997-5		
521998-4	Headlamp, RH (low)	
521998-5		
522142-4	Wipers	Check the wipers and related harnesses and connectors.
522143-5		
522144-3		
522007-4	Rear combination lamp, LH (turn)	Check the lamps and related harnesses and connectors.
522007-5		
522008-4	Rear combination lamp, RH (turn)	
522008-5		
522009-4	Front & side turn signal, lamps LH	
522009-5		
522010-4	Front & side turn signal, lamps RH	
522010-5		

(3) Headlamps cannot be turned off, turn-signal lamps would not operate, and wipers operate spontaneously

Diagnosis code	Cause	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
522077-25 (522077-19)	Faulty communication to combination switch	• Check the combination switch and connectors, including disconnection and connection of the connectors. In the same way as that for signal detect and actuation module, temporarily replace the combination switch with a known-good one and check if the same failure is detected. • Check the connector (18B) and harness of the signal detect and actuation module, including disconnection and connection of the connectors.
522078-25 (522078-19)		
522077-25 (522077-19)	Faulty local interconnect network communication	• Check the harness connection and operation of the unit indicated by the diagnosis code. • Check the connector (18B) and harness of the signal detect and actuation module, including disconnection and connection of the connectors.
522078-25 (522078-19)		
522079-25 (522079-19)		
522080-25 (522080-19)		
522081-25 (522081-19)		

(4) Headlamps cannot be turned off and wipers would not operate

Diagnosis code	Cause	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
None	None (Internal failure of the signal detect and actuation module is suspected.)	• Check the connector (10C) and harness of the signal detect and actuation module, including disconnection and connection of the connectors. • Check the battery, including disconnection and connection of the terminals.
522077-25 (522077-19)	Faulty communication to combination switch	• If both diagnosis codes 522078-25 (522078-19) and 522114-25 (522114-19) are not generated concurrently, check the combination switch, including disconnection and connection of the connectors. • Temporarily replace the combination switch with a known-good one and check if the same failure is detected.
522113-25 (522113-19)		

(5) Headlamps cannot be turned on and wipers operate spontaneously

Diagnosis code	Cause	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
None	None	Check the connector (18B) of the signal detect and actuation module, related harnesses and combination switch, including disconnection and connection of the connectors.
522078-25 (522078-19)	Faulty communication to combination switch	• If both diagnosis codes 522077-25 (522077-19) and 522113-25 (522113-19) are not generated concurrently, check the combination switch, including disconnection and connection of the connectors. • Temporarily replace the combination switch with a known-good one and check if the same failure is detected.
522114-25 (522114-19)		

7. Symptoms and inspection procedures when warning lamp (red or amber) illuminates

(1) When signal detect and actuation module warning lamp (red) illuminates

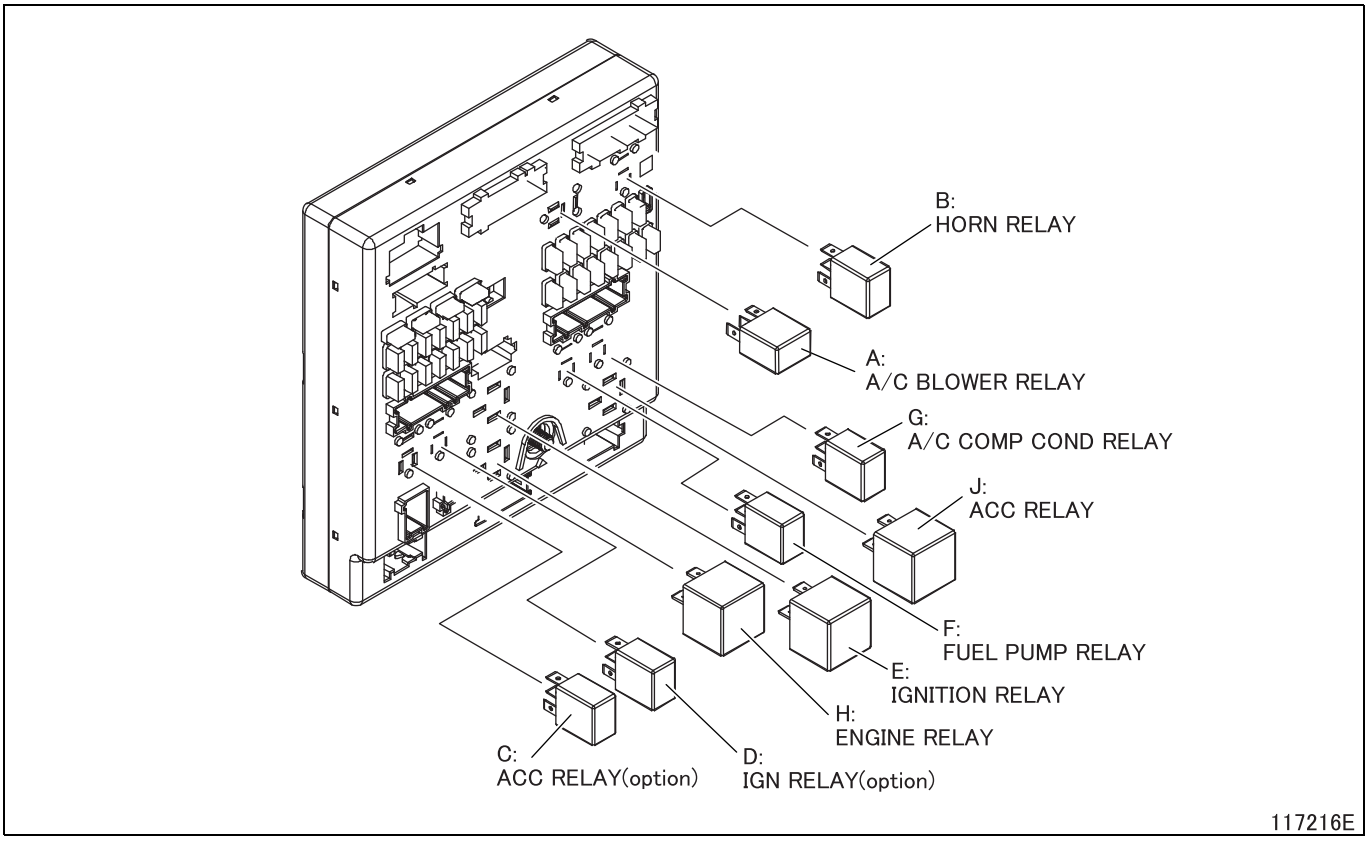
Diagnosis code	Symptom	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
522040-5	Engine unable to start	• Check the IGNITION RELAY, including disconnection and connection of the relay. (See Inspection of relays in signal detect and actuation module.) • Check service data No. 038 “Starter signal Relays (IGN)”. (See FUSO Diagnostics service data (measured values).)
522041-5	Engine unable to start	• Check the ACC RELAY, including disconnection and connection of the relay. (See Inspection of relays in signal detect and actuation module.) • Check service data No. 036 “Starter signal Relays (ACC)”. (See FUSO Diagnostics service data (measured values).)
522097-2	Engine unable to start	• Check the fuse (F13), including disconnection and connection of the fuse. • Check the starter switch. • Check the starter switch connector, including disconnection and connection of the connectors. • Check the harness between the starter switch and the signal detect and actuation module. • Check the connector (18B) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 064 “Starter Switches (ACC)”. (See FUSO Diagnostics service data (measured values).)
522098-2	Engine unable to start	• Check the fuse (F13), including disconnection and connection of the fuse. • Check the starter switch. • Check the starter switch connector, including disconnection and connection of the connectors. • Check the harness between the starter switch and the signal detect and actuation module. • Check the connector (18B) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 065 “Starter Switches (ON)”. (See FUSO Diagnostics service data (measured values).)
522099-2	Engine unable to start	• Check the fuse (F13), including disconnection and connection of the fuse. • Check the starter switch. • Check the starter switch connector, including disconnection and connection of the connectors. • Check the harness between the starter switch and the signal detect and actuation module. • Check the connector (15B) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 066 “Starter Switches (Start)”. (See FUSO Diagnostics service data (measured values).)
522112-3	Engine unable to start, or signal detect and actuation module output function halted	• Check the battery. • Check the alternator. • Check the service data No. 087 “Battery Voltage”. (See FUSO Diagnostics service data (measured values).)
522112-4	Engine unable to start, or signal detect and actuation module output function halted	• Check the battery. • Check the battery cable, including disconnection and connection of the cables. • Check the alternator. • Check the harness between the battery and alternator. • Check the high-current fuse, including disconnection and connection of the fuse. • Check the harness between the high-current fuse and the signal detect and actuation module. • Check the service data No. 087 “Battery Voltage”. (See FUSO Diagnostics service data (measured values).)
522149-17 (522149-31)	Engine unable to start	• Replace the signal detect and actuation module.
522150-17 (522150-31)	Engine unable to start	• Replace the signal detect and actuation module.

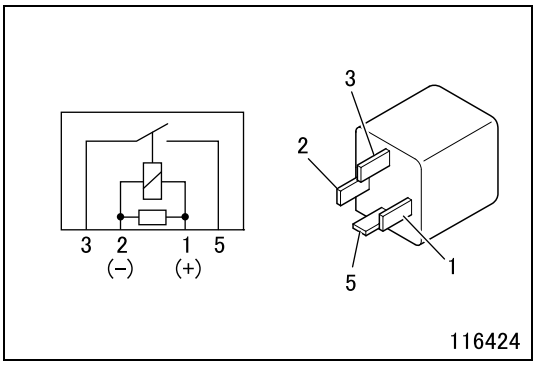
(2) When signal detect and actuation module warning lamp (amber) illuminates

Diagnosis code	Symptom	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
2372-4	Left stop lamp does not illuminate	• Check the stop lamp bulb. • Check the harness between the stop lamp and the signal detect and actuation module. • Check the connector (12C) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 007 “Left rear brake light”. (See FUSO Diagnostics service data (measured values).)
2372-5	Left stop lamp does not illuminate	
2374-4	Right stop lamp does not illuminate	• Check the stop lamp bulb. • Check the harness between the stop lamp and the signal detect and actuation module. • Check the connector (13C) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 006 “Right rear brake light”. (See FUSO Diagnostics service data (measured values).)
2374-5	Right stop lamp does not illuminate	
522003-4	Left parking lamp does not illuminate	• Check the parking lamp bulb. • Check the harness between the parking lamp and the signal detect and actuation module. • Check the connector (15B) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 011 “Left clearance lamps/Left side marker lamps”. (See FUSO Diagnostics service data (measured values).)
522003-5	Left parking lamp does not illuminate	
522004-4	Right parking lamp does not illuminate	• Check the parking lamp bulb. • Check the harness between the parking lamp and the signal detect and actuation module. • Check the connector (15B) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 010 “Right clearance lamps/Right side marker lamps”. (See FUSO Diagnostics service data (measured values).)
522004-5	Right parking lamp does not illuminate	
522005-4	Left tail lamp does not illuminate	• Check the tail lamp bulb. • Check the harness between the tail lamp and the signal detect and actuation module. • Check the connector (13C) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 009 “Left taillamp”. (See FUSO Diagnostics service data (measured values).)
522005-5	Left tail lamp does not illuminate	
522006-4	Right tail lamp does not illuminate	• Check the tail lamp bulb. • Check the harness between the tail lamp and the signal detect and actuation module. • Check the connector (12C) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 008 “Right taillamp”. (See FUSO Diagnostics service data (measured values).)
522006-5	Right tail lamp does not illuminate	
522020-4	License plate lamp does not illuminate	• Check the license plate lamp bulb. • Check the harness between the license plate lamp and the signal detect and actuation module. • Check the connector (13C) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 013 “Left license plate lamp”. (See FUSO Diagnostics service data (measured values).)
522020-5	License plate lamp does not illuminate	
522038-5	Blower does not operate	• Check the A/C BLOWER RELAY, including disconnection and connection of the relay. (See Inspection of relays in signal detect and actuation module.) • Check the service data No. 041 “Blower motor Relays”. (See FUSO Diagnostics service data (measured values).)
522039-5	Option ACC power unable to use	• Check the ACC RELAY, including disconnection and connection of the relay. (See Inspection of relays in signal detect and actuation module.) • Check the service data No. 037 “Relay 'Power supply for optional bodies' (ACC)”. (See FUSO Diagnostics service data (measured values).)

Diagnosis code	Symptom	Items to be inspected (See the “Electronic control unit circuit diagram” for the location of the signal detect and actuation module connector.)
522042-5	Option IGN power unable to use Alternator does not operate (24 V models)	• Check the IGN RELAY, including disconnection and connection of the relay. (See Inspection of relays in signal detect and actuation module.) • Check the service data No. 039 “Relay 'Power supply for optional bodies' (IGN)”. (See FUSO Diagnostics service data (measured values).)
522043-5	Air conditioner does not operate	• Check the A/C COMP COND RELAY, including disconnection and connection of the relay. (See Inspection of relays in signal detect and actuation module.) • Check the service data No. 040 “Refrigerant compressor Relays”. (See FUSO Diagnostics service data (measured values).)
522067-25 (522067-19)	Headlamps illuminate spontaneously	• Check the fuse (F09), including disconnection and connection of the fuse. • Check the combination switch. • Check the combination switch connector, including disconnection and connection of the connectors. • Check the harness between the combination switch and the signal detect and actuation module. • Check the connector (18B) of the signal detect and actuation module, including disconnection and connection of the connector. • Check the service data No. 002 “Right turn signal”. (See FUSO Diagnostics service data (measured values).)
522077-25 8522077-19)	Headlamps illuminate spontaneously	

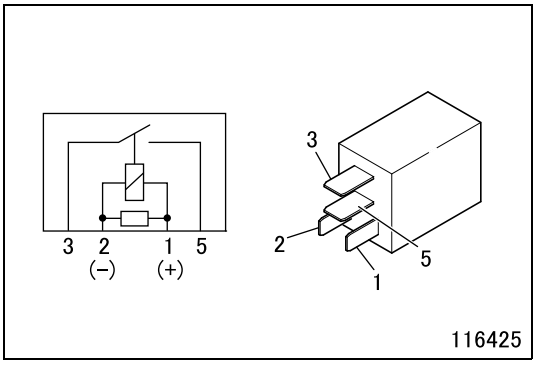
INSPECTION OF RELAYS IN SIGNAL DETECT AND ACTUATION MODULE





E: Ignition relay
H: Engine relay
J: ACC relay (normally open 4-pin)

- Replace the relay if any abnormal conditions are found during checking for conductivity or operation.



A: A/C blower relay
B: Horn relay
C: ACC relay (option)
D: IGN relay (option)
F: Fuel pump relay
G: A/C compressor (normally open 4-pin)

- Replace the relay if any abnormal conditions are found during checking for conductivity or operation.

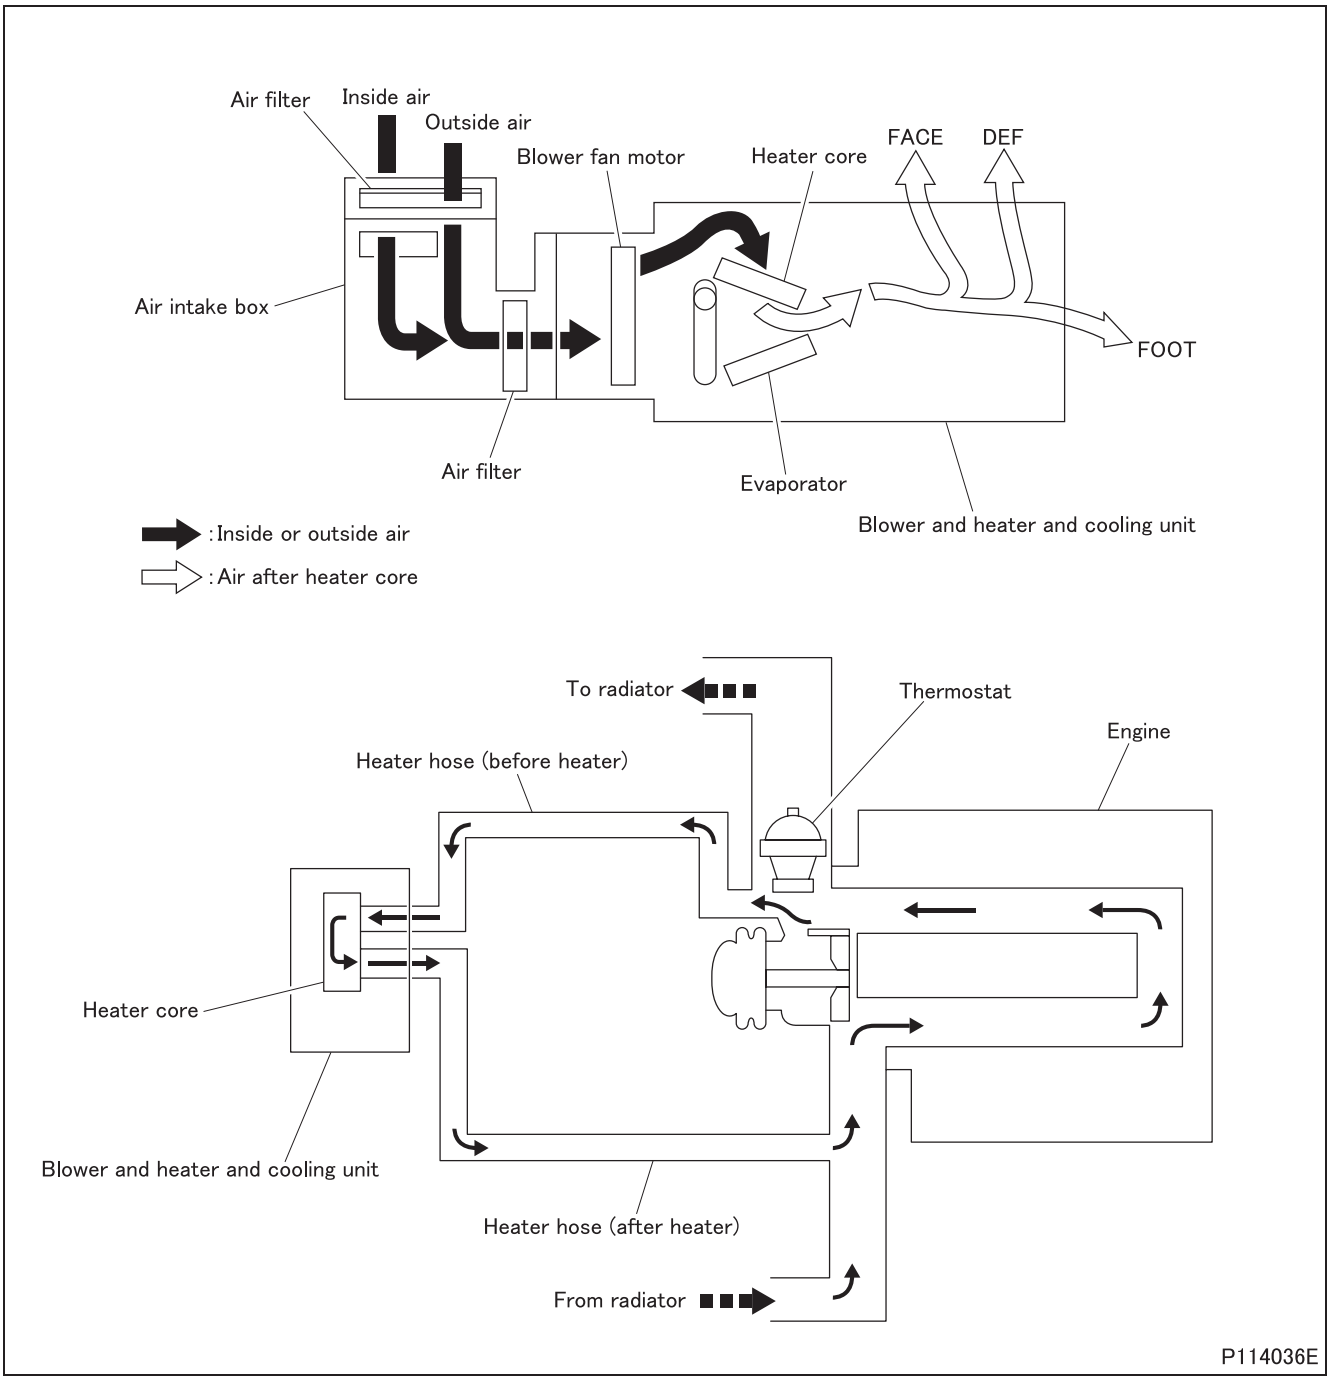
SPECIFICATIONS

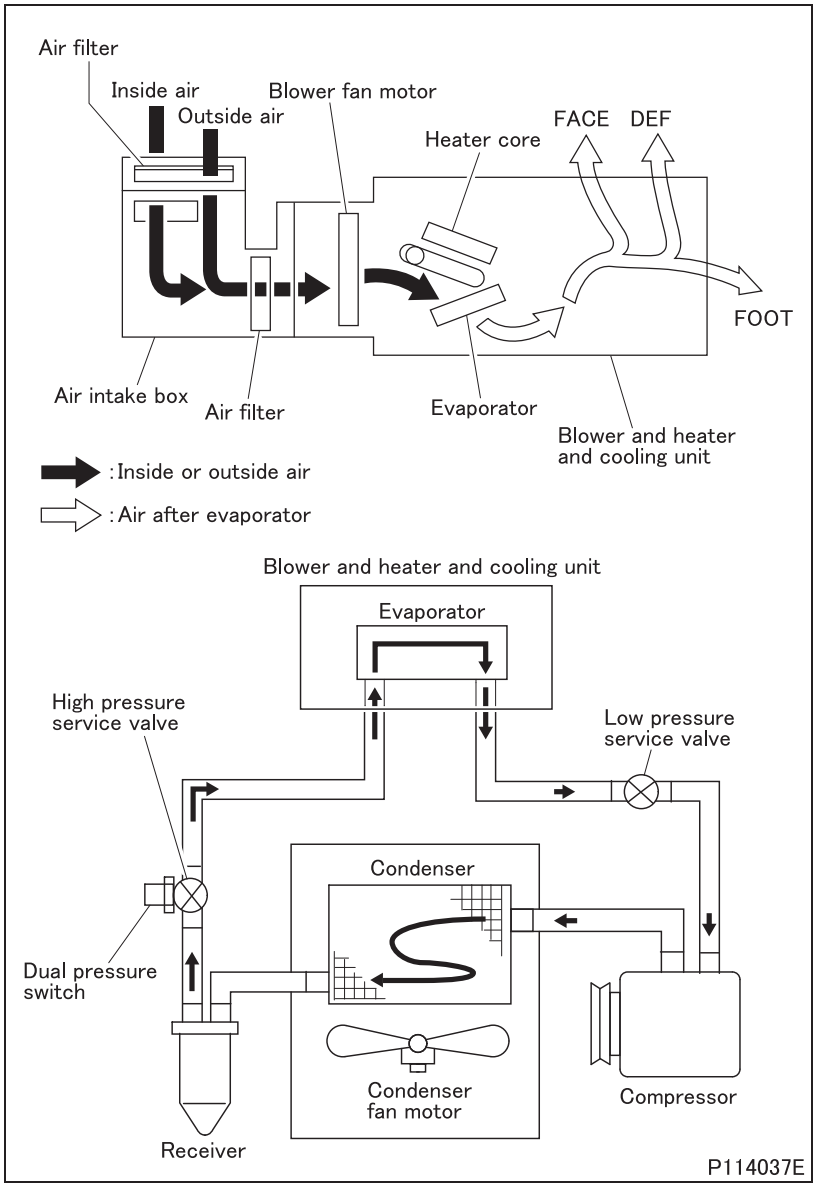
Item				Specifications	
				Manual air conditioner	Fully automatic air conditioner <Option>
Refrigerant	Type			HFC134a	
	Charged quantity g {oz}			500 {17.6}	
Damper change-over system	Mode selection			Manual cable type	Servomotor
	Air mixing				
	Fresh/recirculation changeover			Servomotor	
Servomotor rated voltage V				12	
Blower and Heater and cooling unit	Manufacturer			DENSO	
	Heating capacity W {kcal/h}			4600 ± 460 {3956 ± 396}	
	Cooling capacity W {kcal/h}			3650 ± 365 {3139 ± 314}	
	Temperature control system			Air mixing type	
	Rated voltage V			12	
Compressor	Manufacturer			DENSO	
	Model			10S15C	
	Discharge cm^3 {cu.in.}/1 rotation			167.3 {10.2}	
	Lubricant	Type		ND-OIL8	
		Quantity cm^3 {cu.in.}	without rear air conditioner	120 $^{+15}_{0}$ {7.32 $^{+0.92}_{0}$}	
			with rear air conditioner	200 $^{+15}_{0}$ {12.2 $^{+0.92}_{0}$}	
Condenser	Manufacturer			Valeo Thermal Systems Japan Corporation	
	Rated voltage V			12	
	Rated current A			9.0 ± 0.5	
Receiver	Manufacturer			Valeo Thermal Systems Japan Corporation	
	Capacity cm^3 {cu.in.}			300 {18.3}	
Rear heater unit <crew cab>	Manufacturer			DENSO	
	Heating capacity W {kcal/h}			1760 ± 180 {1514 ± 151}	

1. Heater



- The air intake box sends air to the blower and heater and cooling unit, where the air is heated by the heater core (heat exchanger). The warmed-up air is then sent through the ducts into the cab.
- Water (engine coolant) warmed up by the heat from the engine circulates permanently through the heater core, irrespective of whether the thermostat is open or closed.

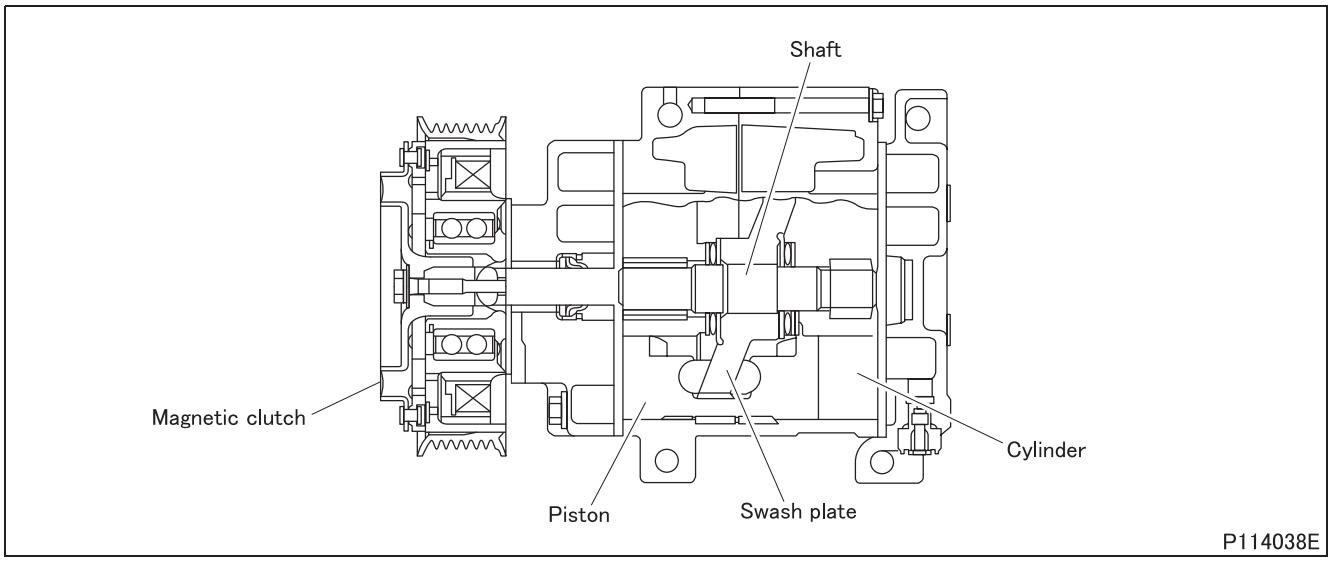
2. Air Conditioner



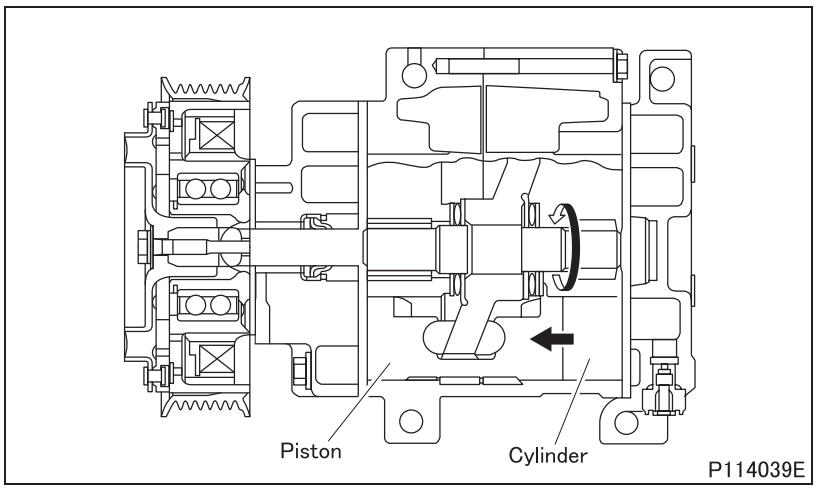
- The air intake box sends air to the blower and heater and cooling unit, where the air is cooled by the evaporator. The cooled air is then sent through the ducts into the cab.
- Refrigerant in gas form is compressed by the compressor. The compressed gas is then sent to the side condenser, where it is cooled by outside air and condenses into liquid form.
- The liquid refrigerant is sprayed into the evaporator, where it quickly evaporates into gas form while at the same time absorbing heat from the surrounding air.
- The refrigerant in gas form is again sent to the compressor and is compressed there.
- When the refrigerant pressure in the high pressure line reaches the specified limit, the dual pressure switch senses this and turns itself OFF. At the same time, the magnet clutch is turned OFF.

3. Compressor

- The compressor draws low-temperature, low-pressure refrigerant gas from the evaporator, compresses it, and discharges a high-temperature, high-pressure refrigerant gas into the condenser.
- The compressor is driven by the engine via a belt and magnetic clutch.

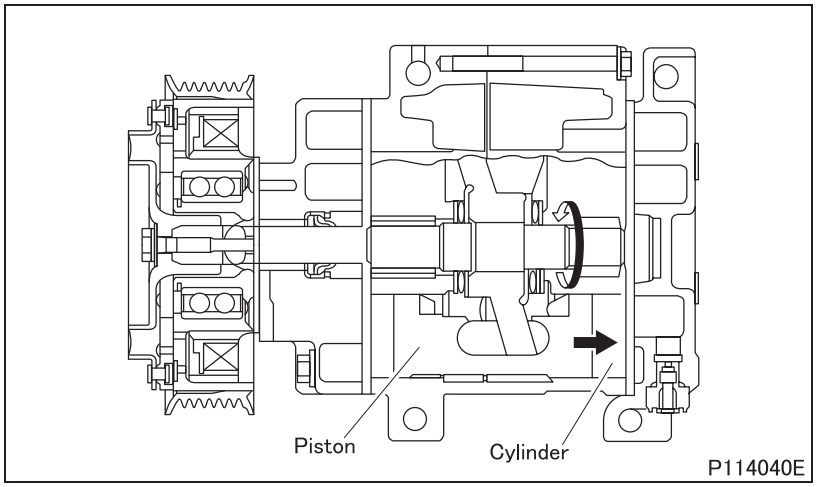


- The swash plate compressor is equipped with a piston and a swash plate that is secured at an angle to the shaft.
- Rotation of the swash plate integrated with the shaft converts the rotary motion of the shaft into the reciprocating motion of the piston, thereby drawing, compressing and discharging the gas refrigerant.



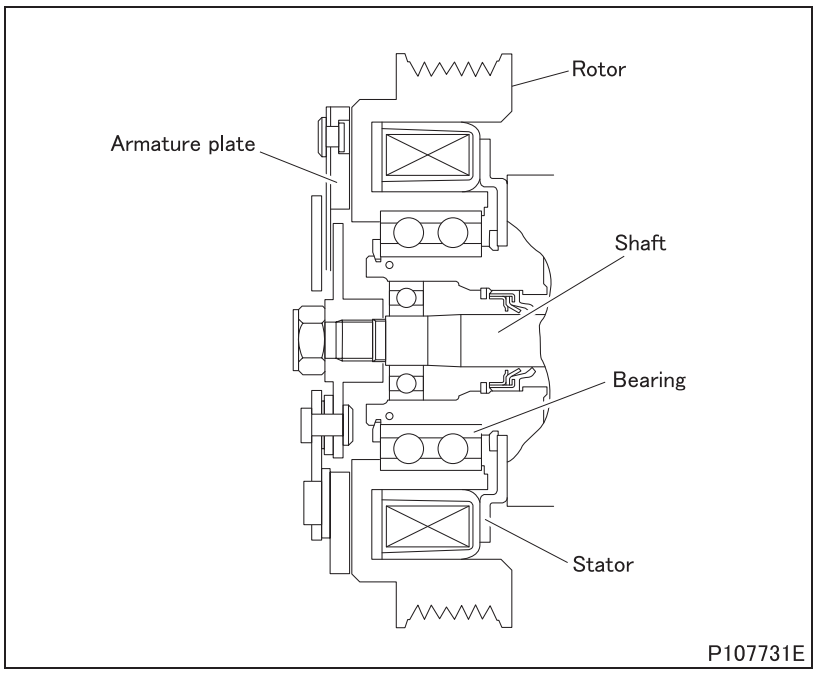
(1) Operation

- When the piston moves to the left, the difference in pressure between the refrigerant that has been sent into the compressor and the space inside the cylinder opens the suction valve in the compressor, feeding the refrigerant into the cylinder.

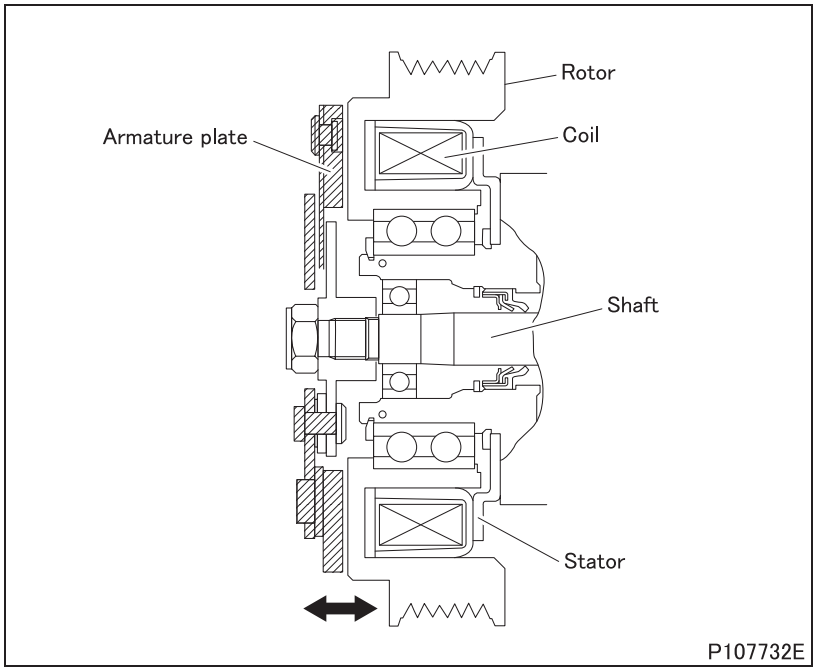


- When the piston moves to the right, the suction valve closes and the refrigerant is compressed.
- When the pressure of the refrigerant reaches a certain level as the compression progresses, the discharge valve in the compressor opens the discharge valve to discharge the compressed refrigerant.
- The suction and discharge valves prevent the refrigerant from flowing backward.

3.1 Magnetic clutch



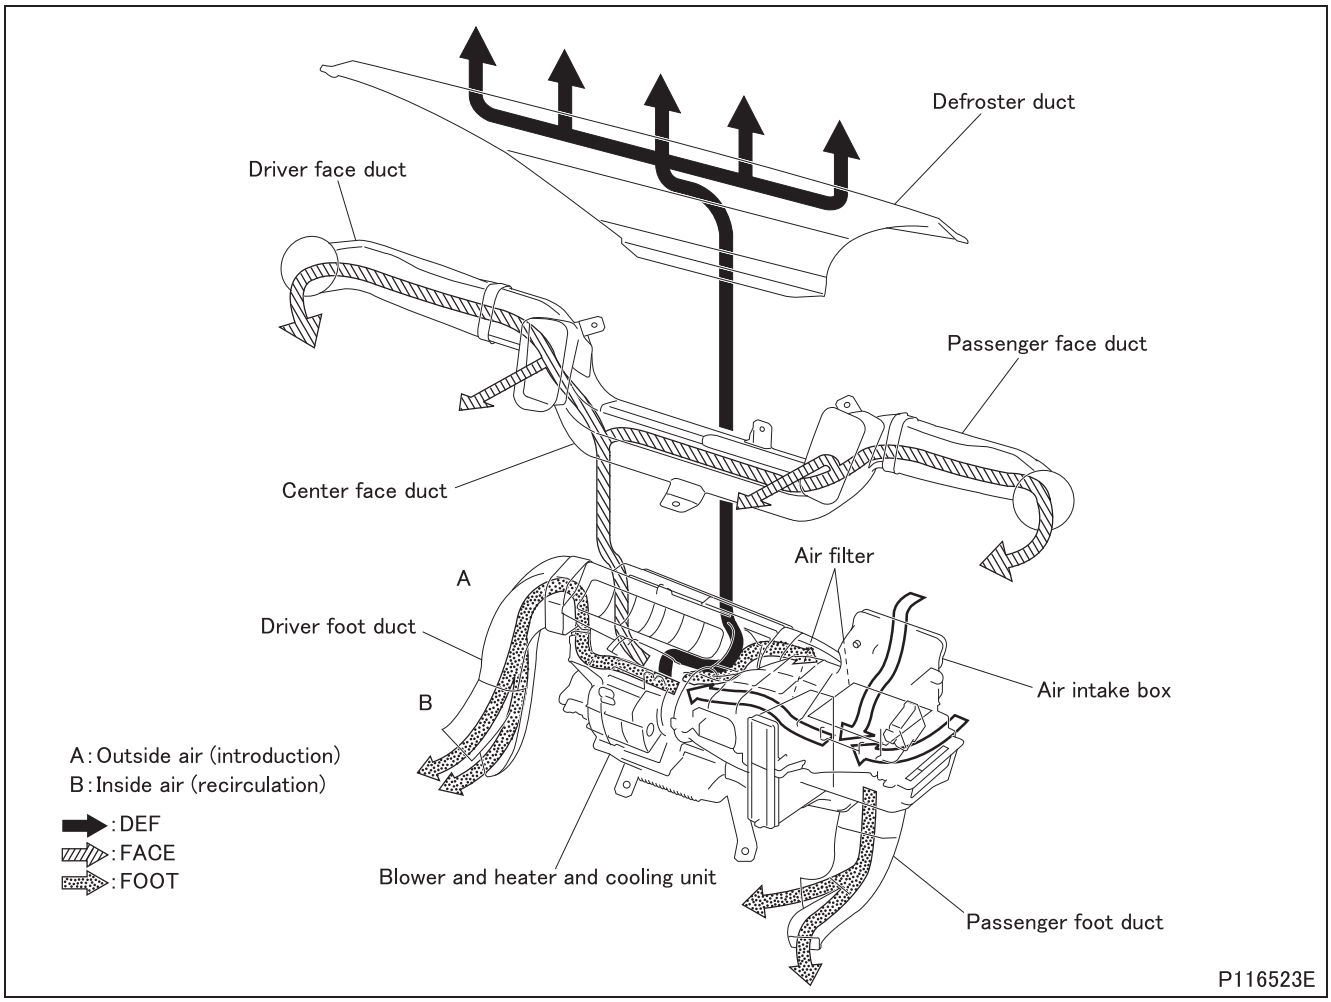
- The magnetic clutch is installed in the shaft of the air compressor to operate and stop the compressor.



(1) Operation

- When the stator coil in the stator is energized, the generated electromagnetic force strongly attracts the armature plate until it comes in contact with the rotor to rotate the compressor.
- De-energizing the coil releases the armature plate from the rotor to stop the rotation of the compressor.

4. Air Duct

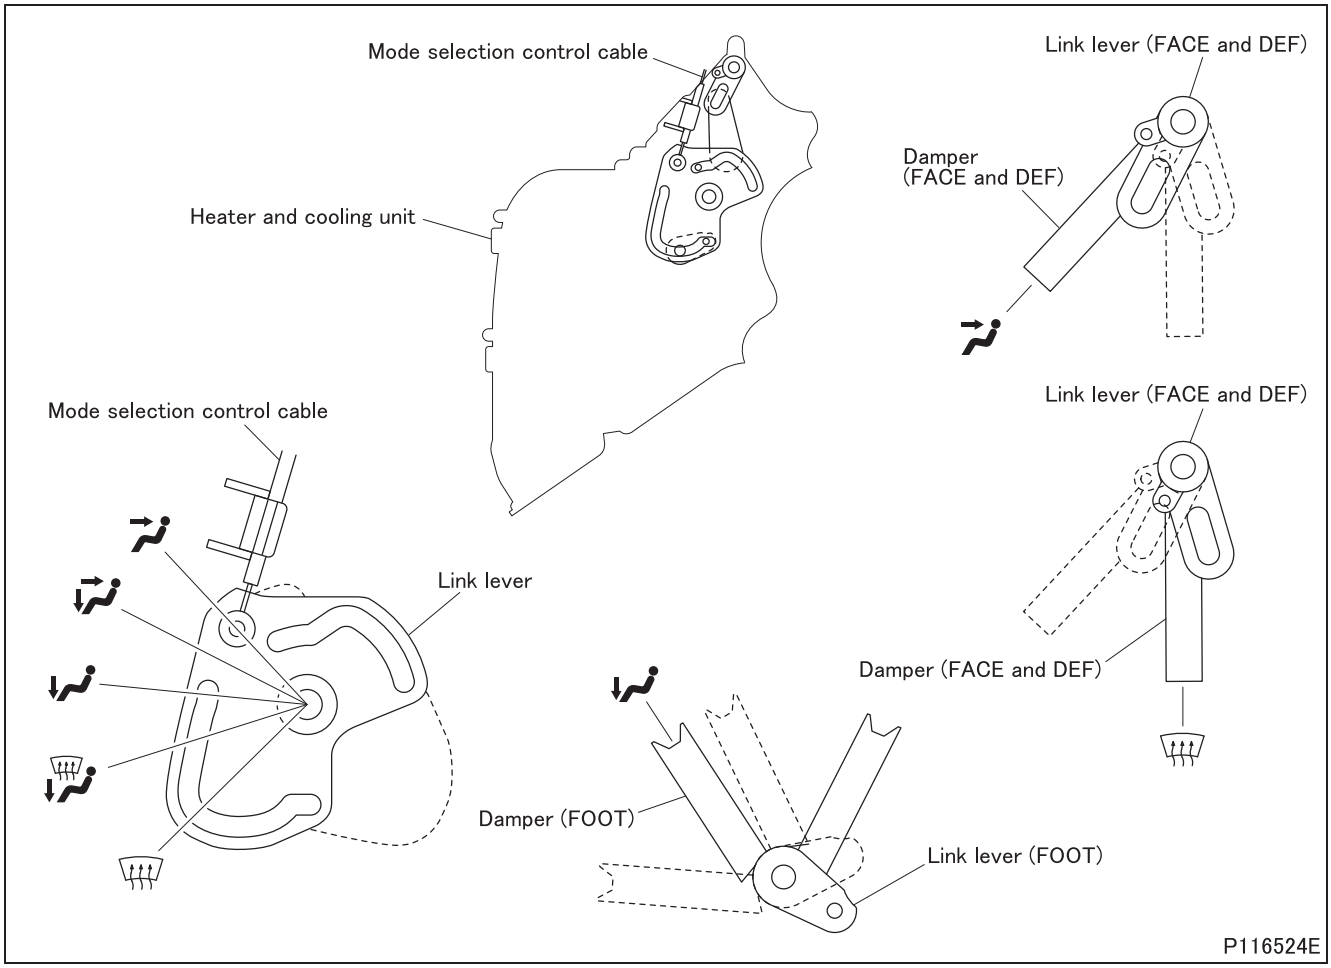


- The air intake box sends outside air A or inside air B through the blower and heater and cooling unit to the ducts. The flow of air is dependent on the open/closed positions of the various dampers.

5. Heater Control

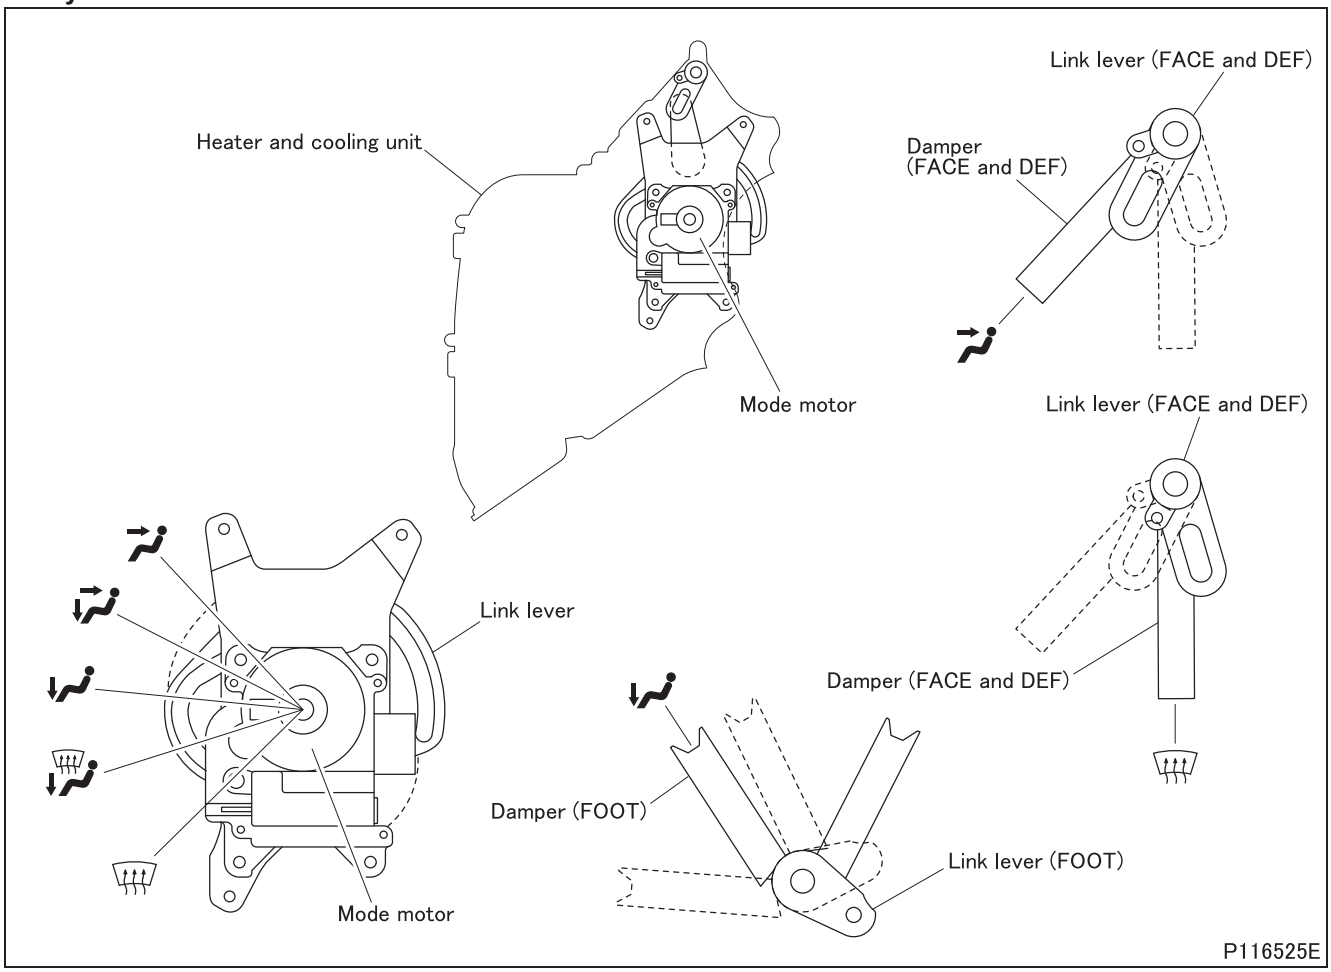
5.1 Mode selection

<Manual air conditioner>



- Mode selection (opening/closing the dampers) is achieved by the operation of the mode selection control cables and the resultant movement of the related parts linked to the cables.

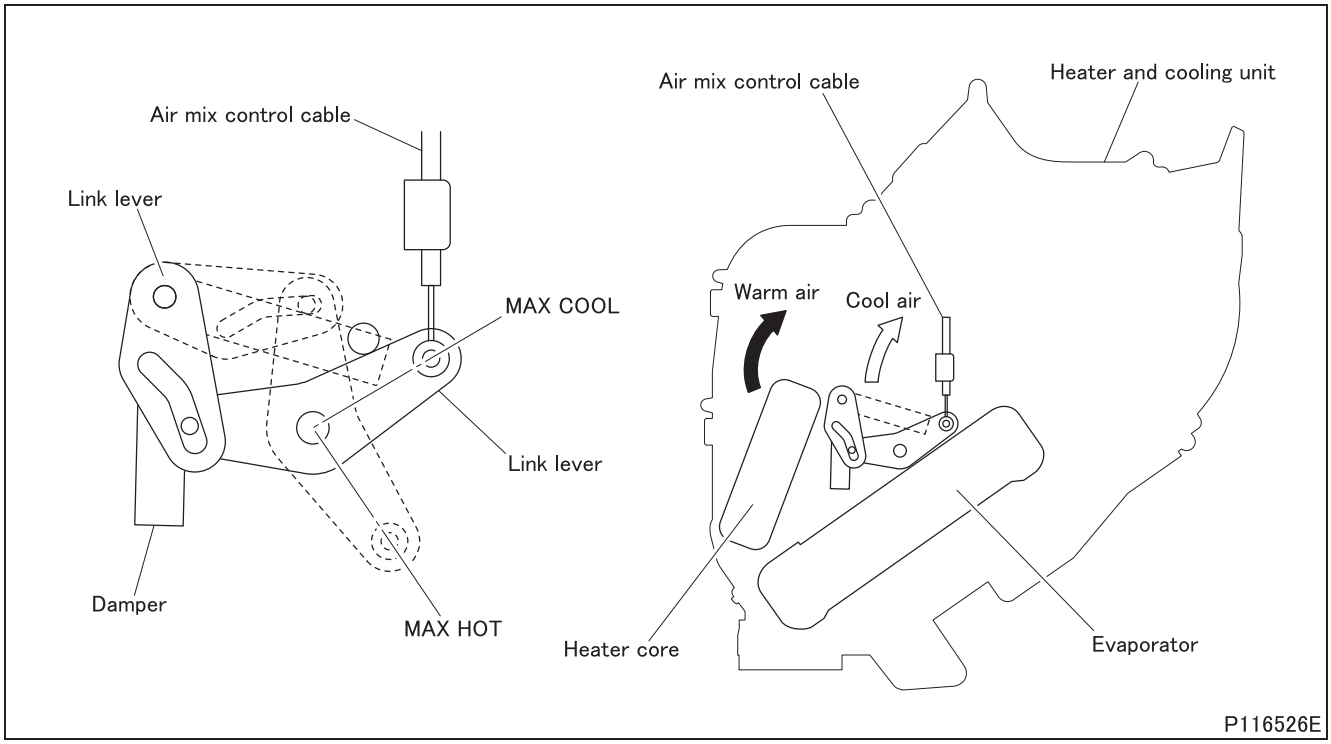
<Fully automatic air conditioner>



- Mode selection (opening/closing the dampers) is achieved by the operation of the mode motor and the resultant movement of the related parts linked to the motor.

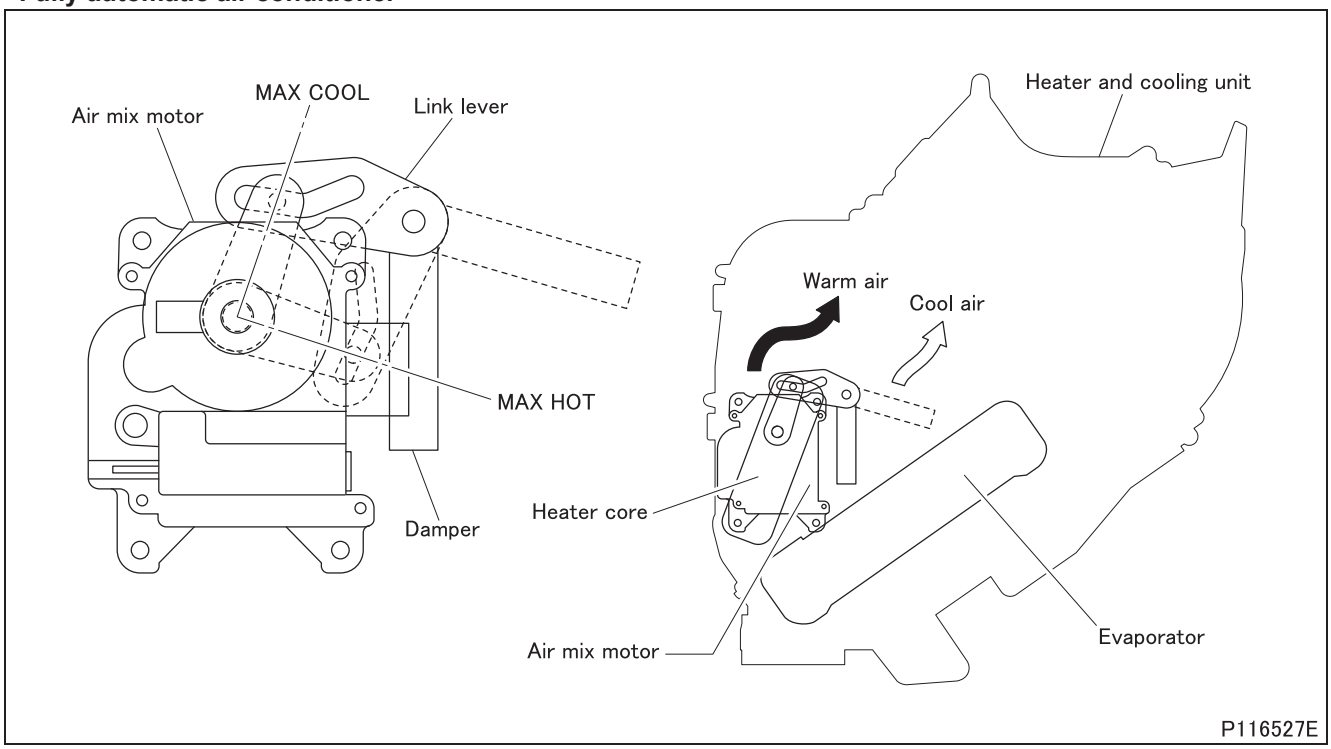
5.2 Air mix selection

<Manual air conditioner>



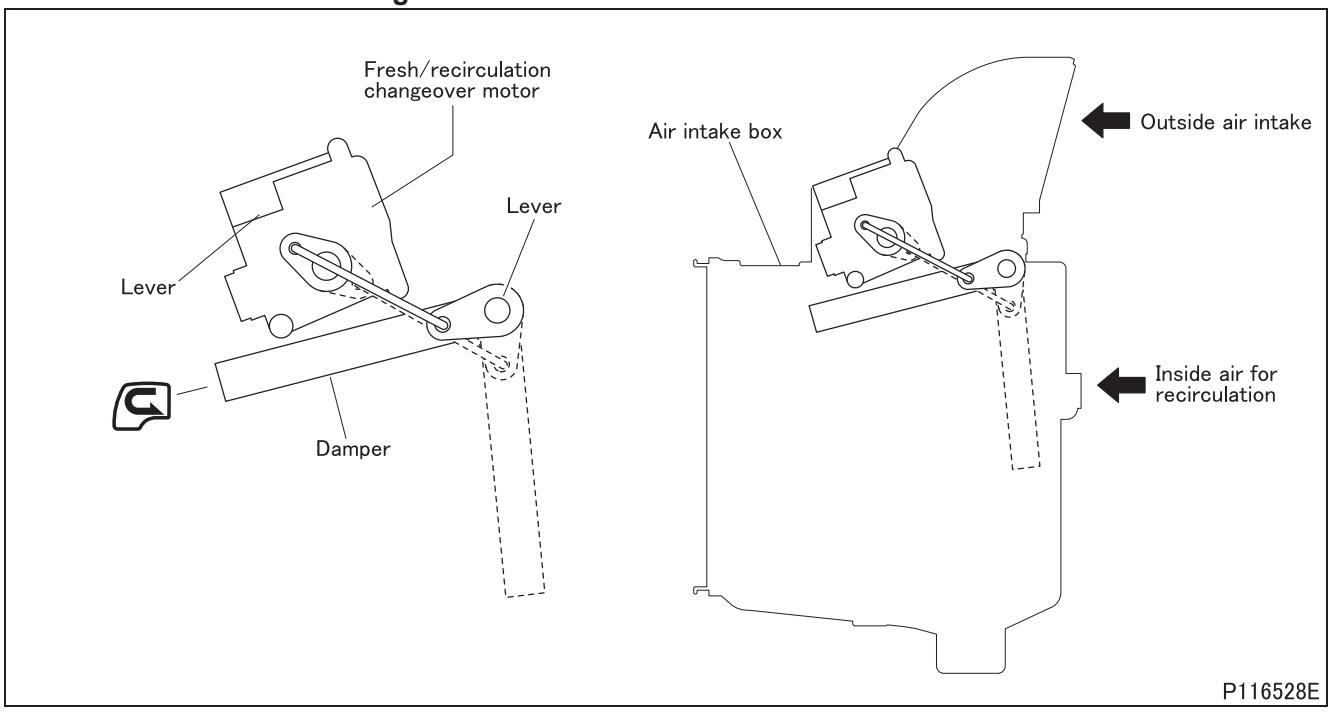
- Air mix selection is achieved by controlling the positions of the dampers, thereby proportioning the volumes of warm and cool air that is and is not sent through the heater core.

<Fully automatic air conditioner>



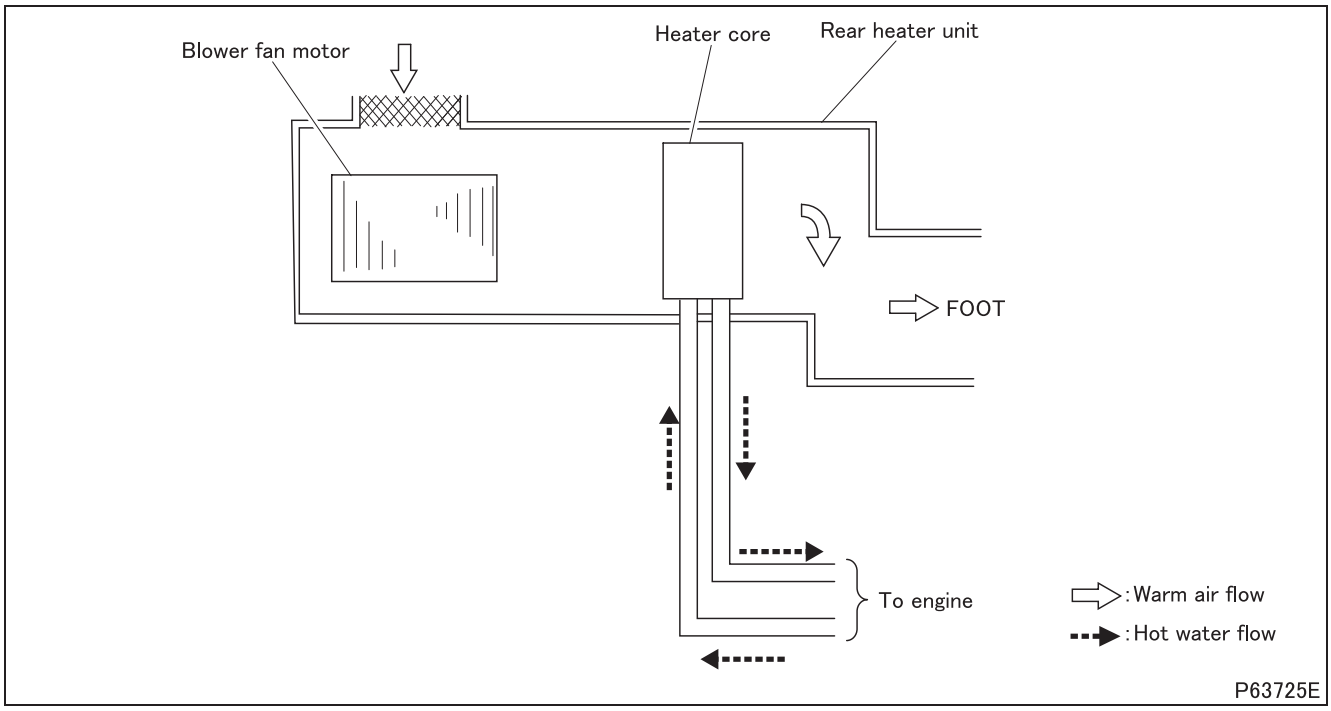
- Air mix selection is achieved by controlling the positions of the dampers, thereby proportioning the volumes of warm and cool air that is and is not sent through the heater core.

5.3 Fresh/recirculation changeover



- The fresh/recirculation changeover damper is operated by a motor.

6. Rear Heater <Crew Cab>



Front Heater, Front Air Conditioner

Symptoms / Possible causes	No air from vents	Poor cooling	Poor heating	No mode selection	Draft from vents	No temperature setting	No fresh/recirculation selection	Air volume from vents unstable	Controls require too much effort	Reference Gr

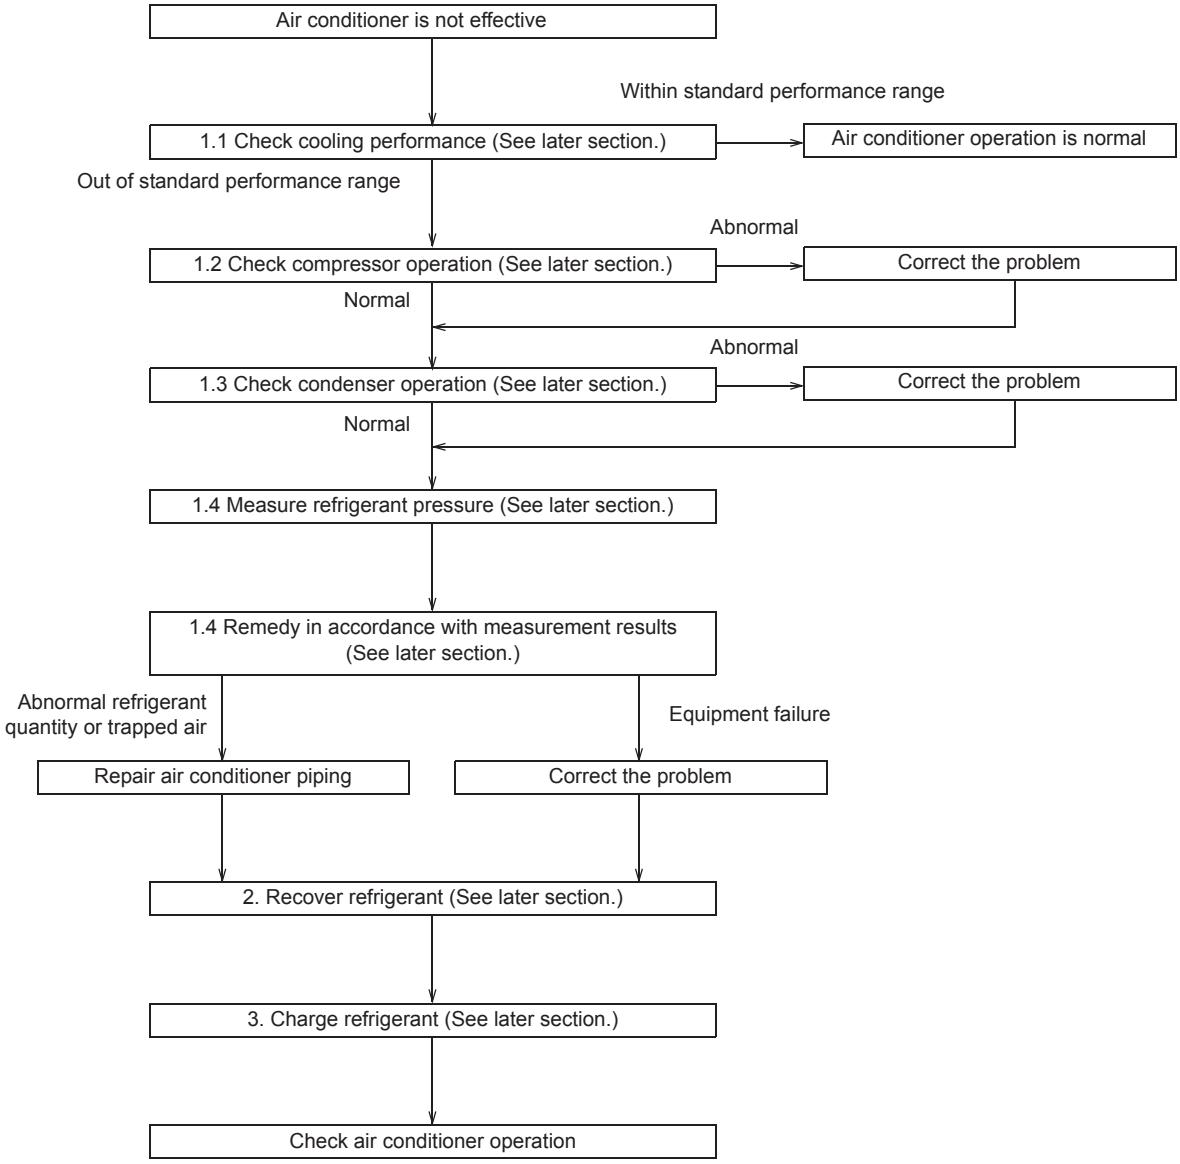
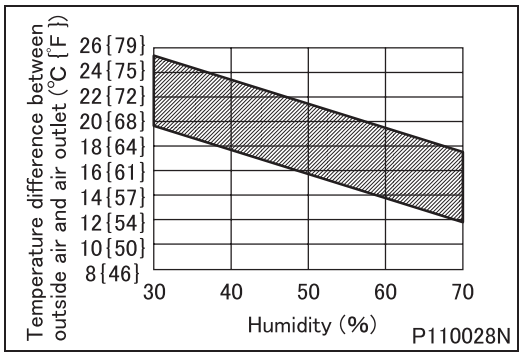
ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Operation Check of Air Conditioner

- Check the operation using the following flow chart.

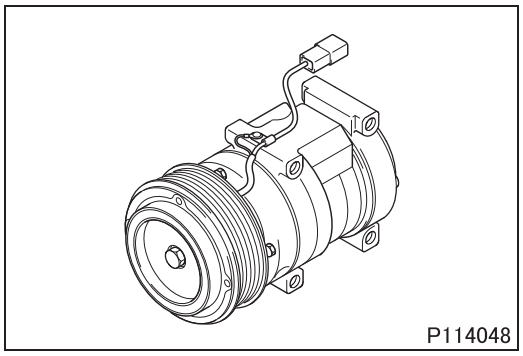


1.1 Checking the cooling performance



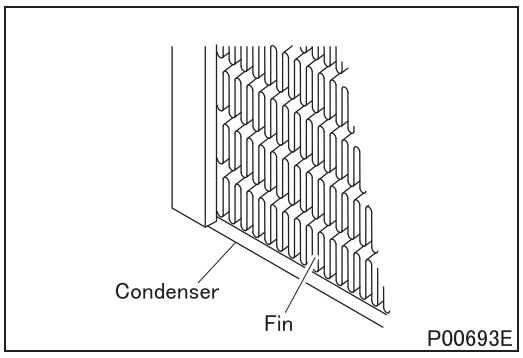
- In the cooling performance check, measure the temperature difference between the outside air and air outlet, and the ambient humidity, and check if the measurement is within the normal range (shaded area in the graph).
- This check should be done under the following conditions:
  - Engine speed: 1400 rpm
  - Air conditioner switch: ON
  - Fan switch: MAX
  - Temperature control: MAX COOL
  - Fresh/recirculation selection: Recirculation
  - Doors: Fully opened
  - Environment: No wind, in the shade

1.2 Checking compressor operation



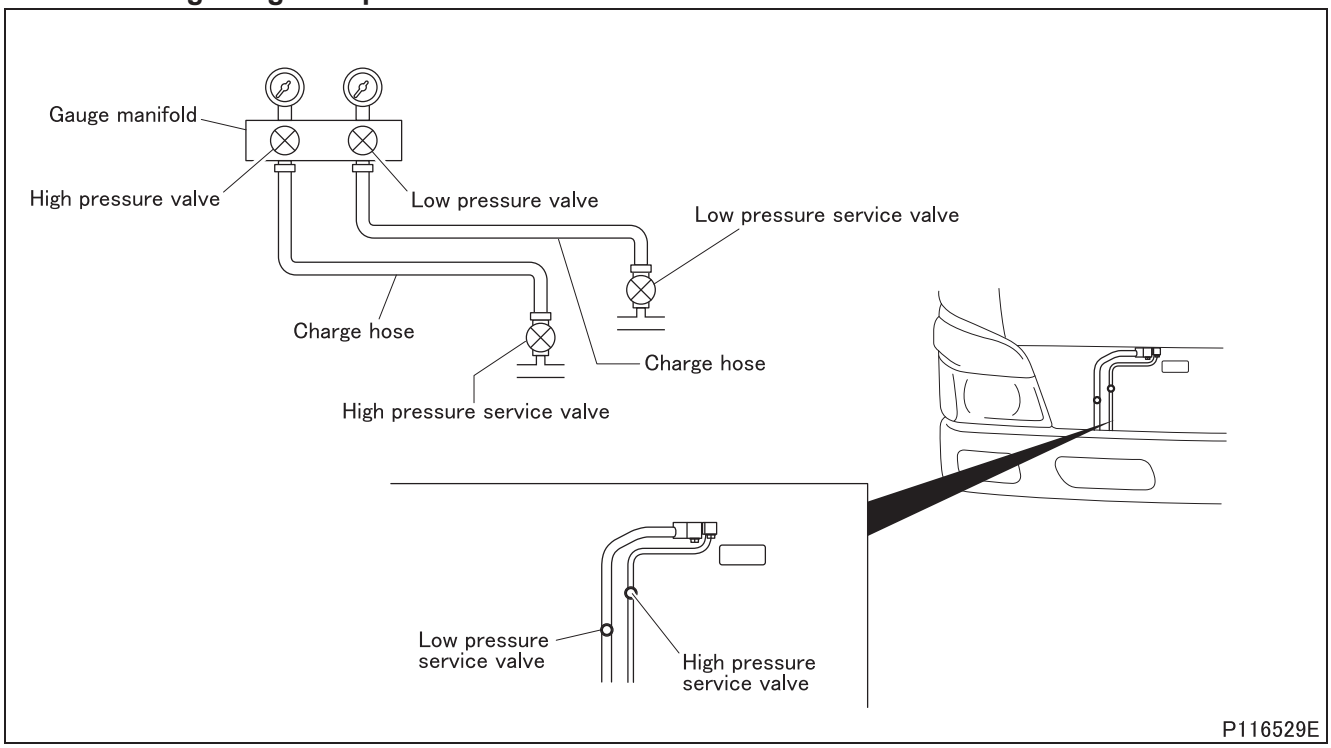
- Check the following:
  - Seizure or failure of compressor (See COMPRESSOR.)
  - Magnet clutch failure (See COMPRESSOR.)
  - Fusing of air conditioner relay contacts, open or short circuit in relay coil (See Gr54.)
  - Open or short circuit in dual pressure switch coil (See Gr54.)
  - Heater control failure (See AIR CONDITIONING CONTROL, FULLY AUTOMATIC AIR CONDITIONER SYSTEM.)

1.3 Checking condenser operation

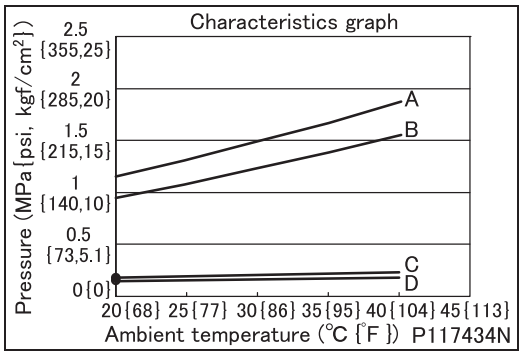


- Check the following:
  - Open or short circuit in condenser fan motor (See Gr54.)
  - Fusing of condenser relay contacts, open or short circuit in relay coil (See Gr54.)
  - Clogging, crushed fins or contamination of condenser (See CONDENSER, RECEIVER.)

1.4 Measuring refrigerant pressure



- The measurement should be performed under the following conditions:
  - Engine speed: 825 rpm
  - Air conditioner switch: ON
  - Fan switch: MAX
  - Temperature control: MAX COOL
  - Fresh/recirculation selection: Recirculation
  - Doors: Fully closed
  - Environment: No wind, in the shade, humidity 50%

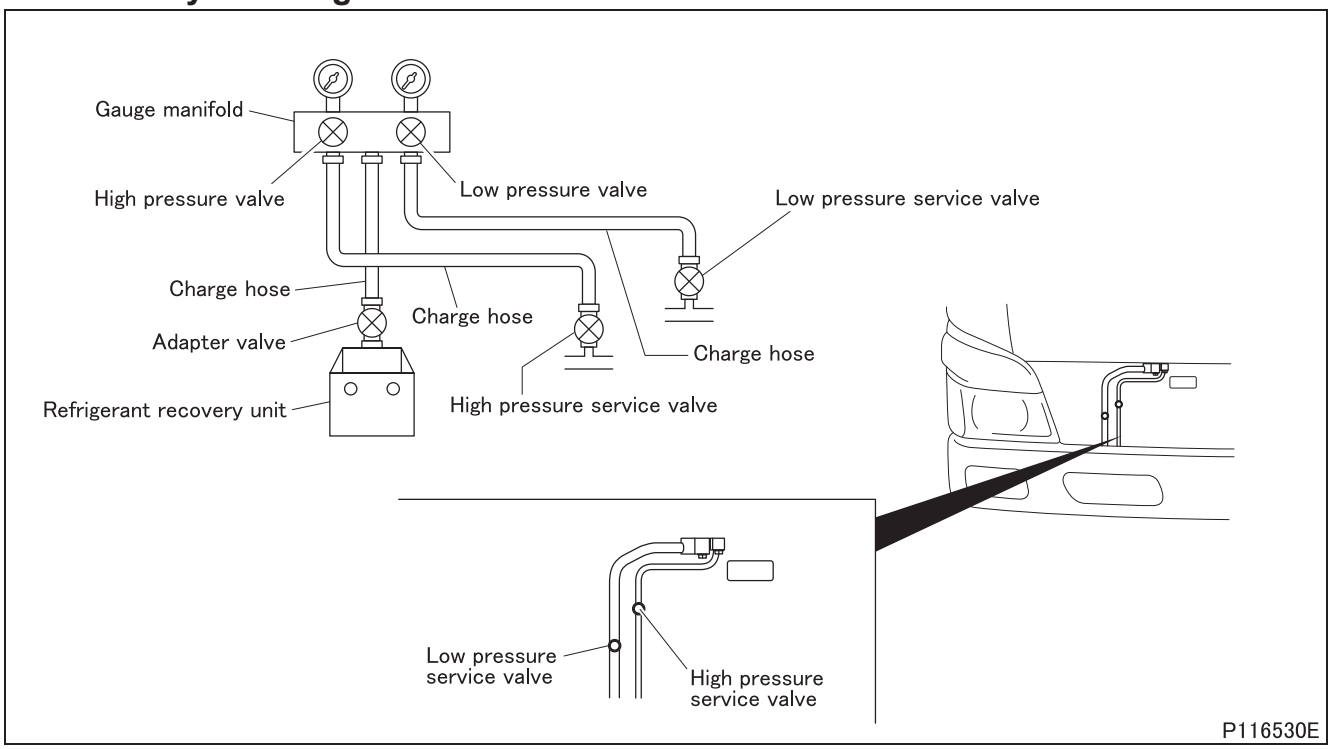


- Check if the measured pressure is within the limit range shown in the characteristics graph. The pressure values in the graph should be regarded as a reference since pressure values vary depending on the measurement environment and vehicle conditions.
  A: Upper limit on the high pressure side
  B: Lower limit on the high pressure side
  C: Upper limit on the low pressure side
  D: Lower limit on the low pressure side
- If the measurement is out of the standard value, take the necessary measures by referring to the following table.

Measurement results	Possible cause	Remedy
Pressure is too low on both the low and high pressure sides	Refrigerant leakage	Check for refrigerant leaks from piping connections, and repair as required. (See CONNECTING AIR CONDITIONER PIPING.)
Negative pressure on the low pressure side	• Clogged expansion valve • Clogged condenser	• Check the heater and cooling unit, and repair as required. (See HEATER AND COOLING UNIT, BLOWER.) • Check the condenser, and repair or replace as required. (See CONDENSER, RECEIVER.)
Pressure is too high on both the low and high pressure sides	• Too much refrigerant • Poor cooling performance of condenser • Air trapped in refrigerant line • Contamination or abnormal quantity of compressor lubricant	• Check the condenser, and repair or replace as required. (See CONDENSER, RECEIVER.) • Check the compressor, and repair or replace as required. (See COMPRESSOR.)
Almost no difference in pressure between the low and high pressure sides	Compressor failure	Check the compressor, and repair or replace as required. (See COMPRESSOR.)

• After correcting the problem, recover all refrigerant and charge the specified quantity of refrigerant.

2. Recovery of Refrigerant



- Recover refrigerant from the air conditioning system in accordance with the following flow chart.
  - Installation of the refrigerant recovery unit

Close both the low pressure and high pressure valves.

↓

Connect the charge hose to the low pressure service valve.

↓

Connect the charge hose to the high pressure service valve.

↓

Connect the charge hose to the adapter valve.

↓

Open both the low pressure and high pressure valves.

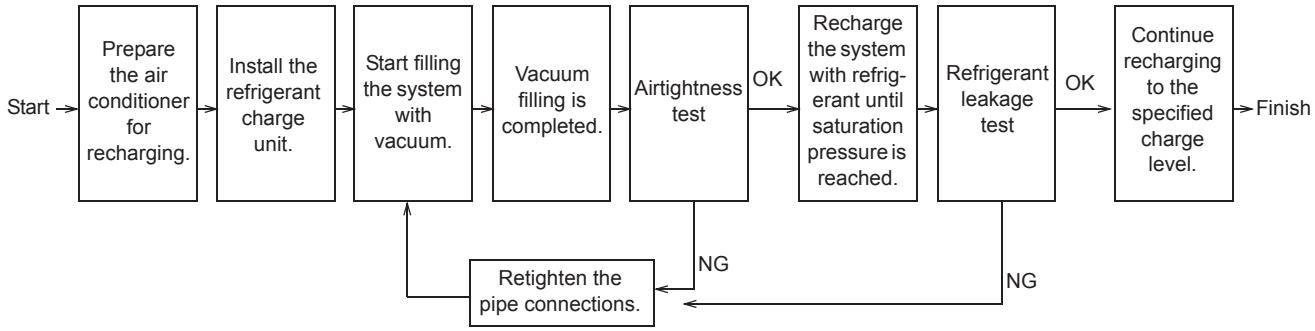
↓

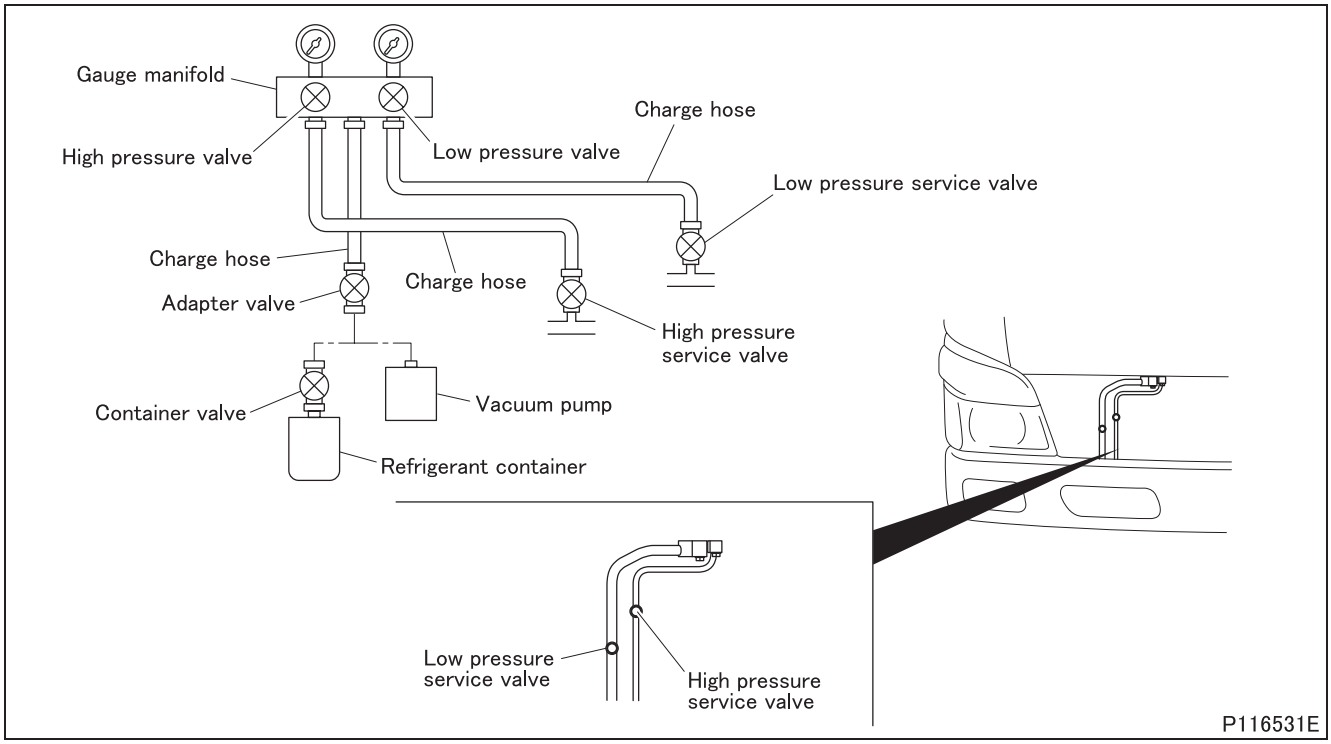
Open the adapter valve.

↓

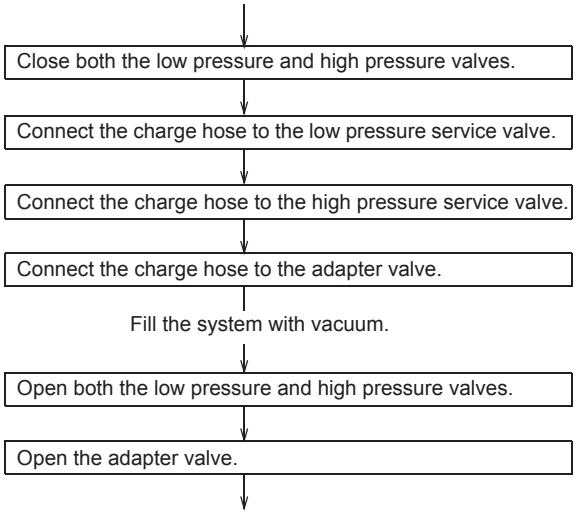
Run the recovery unit to collect the refrigerant.

3. Recharging the System with Refrigerant





- Recharge the system with refrigerant in accordance with the following flow chart.
  - Installation of the refrigerant charge unit



Run the vacuum pump.

Continue to run the pump for a minimum of 10 to 15 minutes. Close the adapter valve.

Stop the vacuum pump.

CAUTION ⚠

- **Make sure that the adapter valve is closed before stopping the vacuum pump.**

Close both the low pressure and high pressure valves.

Wait for 5 minutes. During this interval, the readings on the gauges installed on the gauge manifold should stay where they are and should not move towards zero.

Vacuum filling is now completed.

Recharging the system with refrigerant

With the adapter valve still closed, remove it from the vacuum pump. Connect the valve to the refrigerant container via the container valve.

Open the container valve and then the adapter valve.

Open the low pressure valve to fill refrigerant in gas form.

CAUTION ⚠

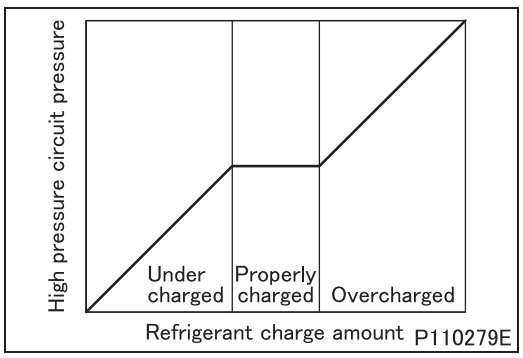
- **Filling refrigerant into the system in liquid form may damage the compressor. To prevent this, keep the refrigerant container in the upright position so that refrigerant is filled in gas form.**

When the refrigerant container is empty, close the adapter valve and install a new container. Continue filling the system.

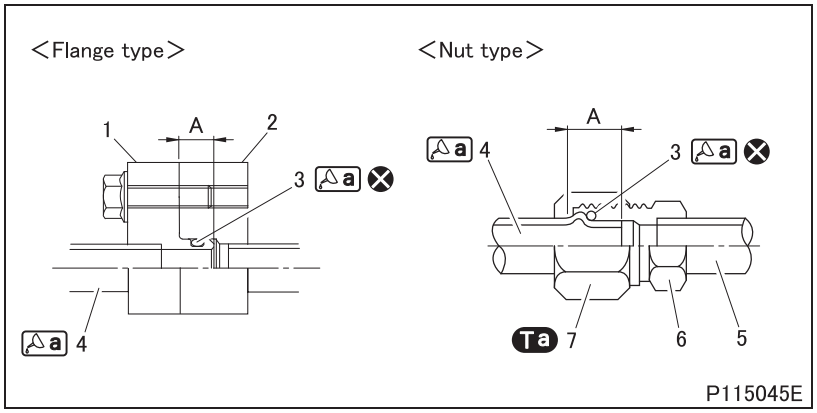
When the air conditioning system is saturated, start the engine. Turn on the air conditioner to run the compressor, and continue recharging until the specified charge level is reached.

CAUTION ⚠

- **Remove the refrigerant completely and charge the system with refrigerant of the specified quantity.**



- Charge the system with small amounts of refrigerant (approximately 25g) at a time while checking the air outlet temperature and the change in pressure relative to the amount of charge of refrigerant. Consider the system to be properly charged when the pressure stops changing as shown in the graph.
- After the refrigerant charging has completed, perform cooling performance check and refrigerant pressure measurement. (See “1. Checking Air Conditioner Operation”.)



1 Flange (pipe end) <Flange type>
2 Flange (mating end) <Flange type>
3 O-ring
4 Pipe
5 Pipe <Nut type>
6 Union <Nut type>
7 Nut <Nut type>

A: Refrigerant oil application area
⊗: Non-reusable parts

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Nut	Fluid pipes	11.8 to 14.7 {8.7 to 11.0, 1.2 to 1.5}	–
		High-pressure pipes	19.6 to 24.5 {14 to 18, 2.0 to 2.5}	–
		Low-pressure pipes	29.4 to 34.2 {22 to 25, 3.0 to 3.5}	–

Lubricant and/or sealant

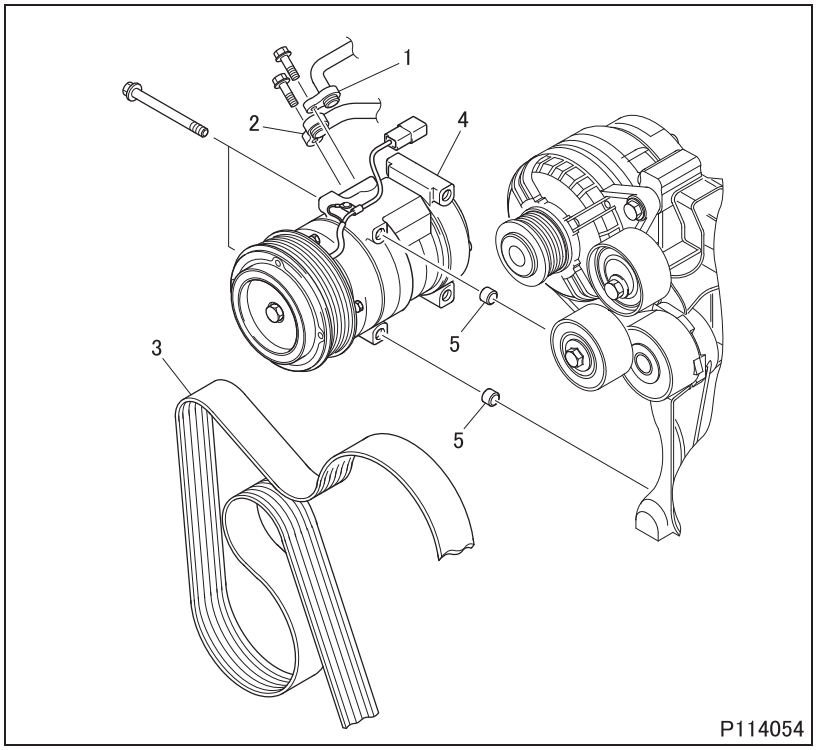
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	O-ring	Refrigerant machine oil ND-OIL8	As required
	Outer periphery of pipe end (area A)		

- There are 2 types of air conditioner pipe/hose connections: flange type and nut type. When connecting/tightening the connections, observe the following precautions.

CAUTION ⚠

- **The connected parts are sealed by the O-ring. Be careful not to damage the O-ring, such as by twisting.**
- **The O-rings are exclusively designed for HFC-134a refrigerant and are not reusable.**
- **Never tighten the nut-type connection by rotating the union. This will deform the piping, allowing refrigerant to leak out. Tighten by rotating the nut while holding the union in position.**

COMPRESSOR



● Removal sequence

1 Discharge hose (high pressure side)
2 Suction hose (low pressure side)
3 Belt (See Gr14.)
4 Compressor
5 Knock bushing

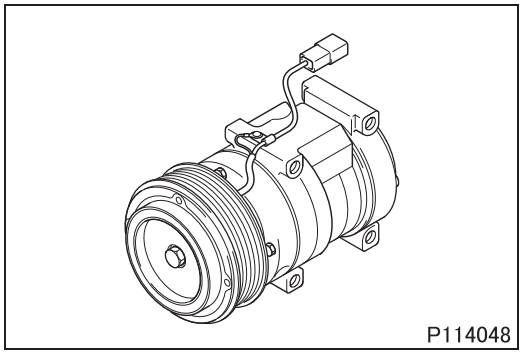
- Recover the refrigerant before disconnecting the hose. (See “On-Vehicle Inspection and Adjustment”.)

● Installation sequence

Follow the removal sequence in reverse.

- See the CONNECTING AIR CONDITIONER PIPING section for the installation of hose and pipe.
- After installation, tension the belt to specification. (See Gr14.)

◆Inspection procedure◆

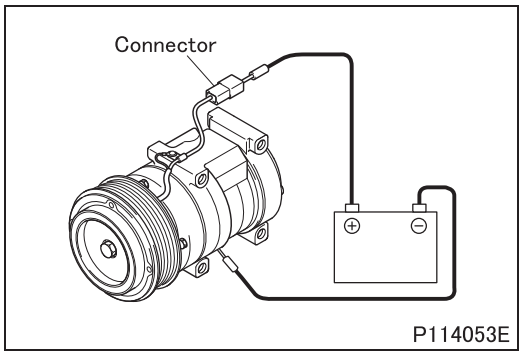


■ Inspection: Compressor

- Perform the following inspections. If any abnormality is found, replace the compressor.

(1) Operation and oil leakage

- Check the compressor proper for malfunction and oil leakage.

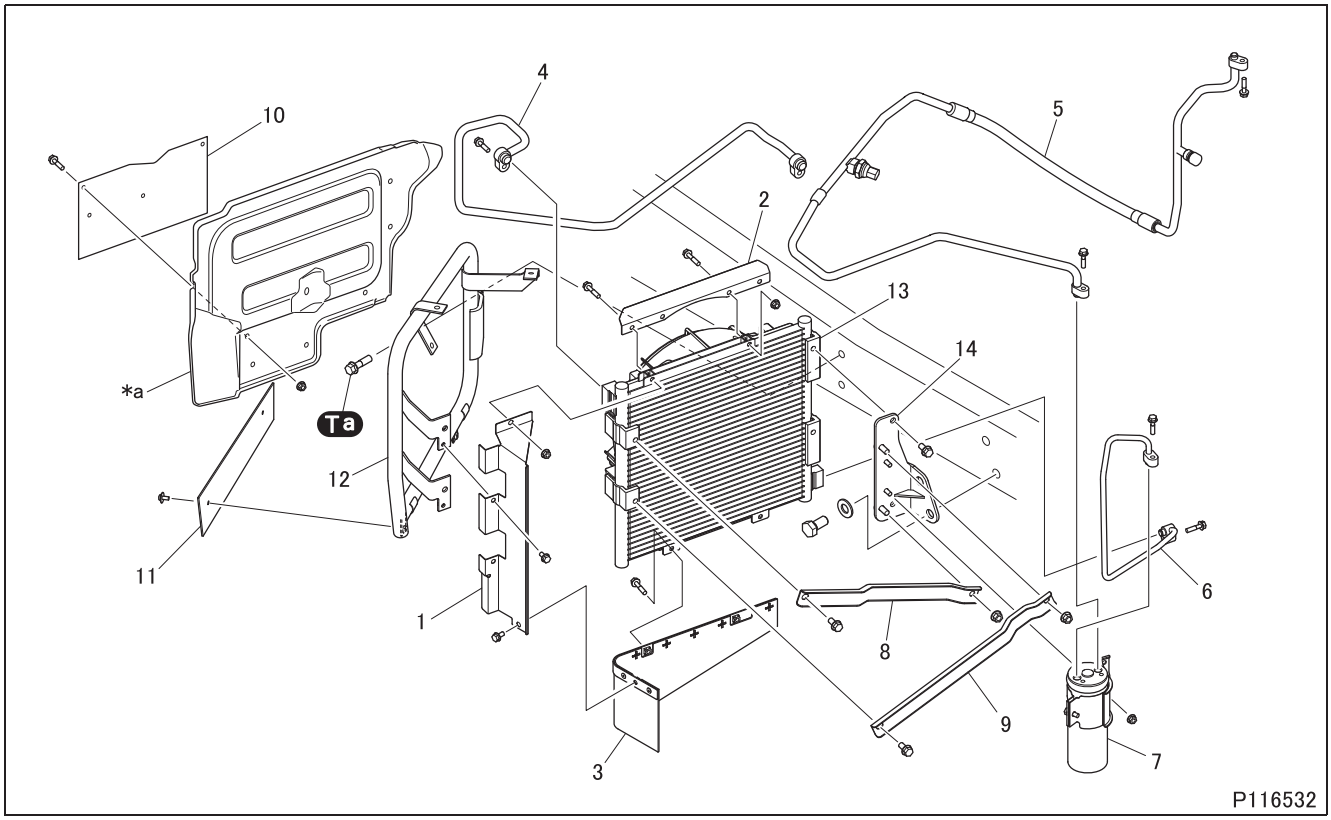


(2) Magnetic clutch

- Disconnect the magnetic clutch harness connector and supply power from the positive terminal of the battery to check if the magnetic clutch operates normally.

CAUTION ⚠

- **Do not allow the lead wire connected to the positive terminal of the battery to touch any other component around the connector. Otherwise, a short circuit will occur and the component may fail.**



● **Removal sequence**

1 Side baffle plate
2 Upper baffle plate
3 Lower baffle plate
4 Discharge hose (compressor end)
5 Liquid hose (heater and cooling unit end)
6 Liquid pipe (condenser end)
7 Receiver
8 Condenser bracket
9 Condenser bracket
10 Rubber plate
11 Rubber plate
12 Condenser rear bracket
13 Condenser
14 Condenser front bracket

***a**: Front shield panel

- Recover the refrigerant before disconnecting the hose and the pipe. (See “On-Vehicle Inspection and Adjustment”.)

● **Installation sequence**

Follow the removal sequence in reverse.

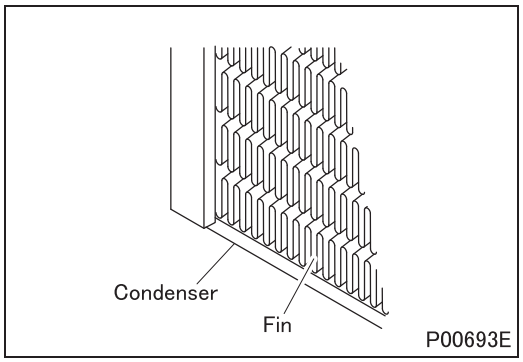
- See the CONNECTING AIR CONDITIONER PIPING section for the installation of hose and pipe.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (condenser rear bracket mounting)	50 to 65 {37 to 48, 5.1 to 6.6}	–

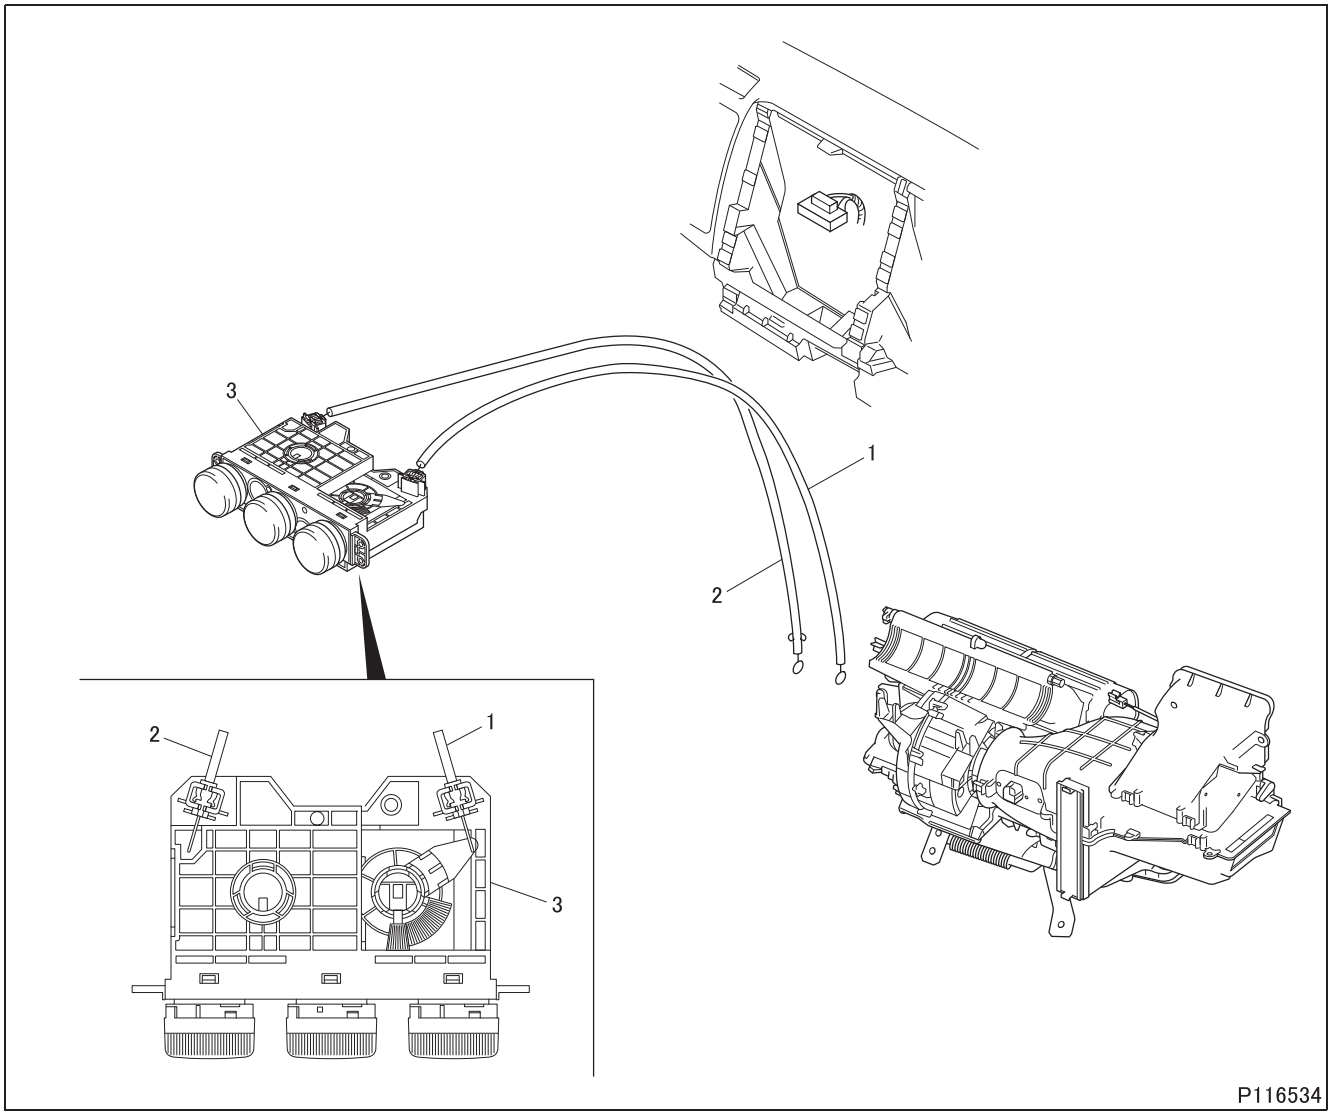
CONDENSER, RECEIVER

◆Inspection procedure◆



■Inspection: Condenser

- If the condenser fins are clogged with dirt, dust or other foreign material wash it out. Any deformed fins should be straightened using a spatula or the like.



● **Removal sequence**

1 Air mix control cable (NATURAL)
2 Mode selection control cable (LIGHT BLUE)
3 Heater controls

CAUTION ⚠

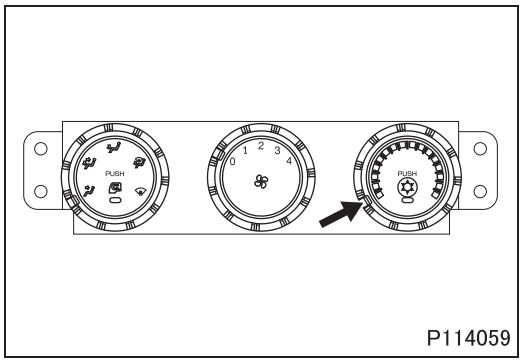
- **Never remove the cable(s) from the heater controls except when the control cable(s) needs to be replaced. Failure to observe this may damage the hooks on the cable clip.**

● **Installation sequence**

Follow the removal sequence in reverse.

HEATER CONTROL <MANUAL AIR CONDITIONER>

◆Work before removal◆

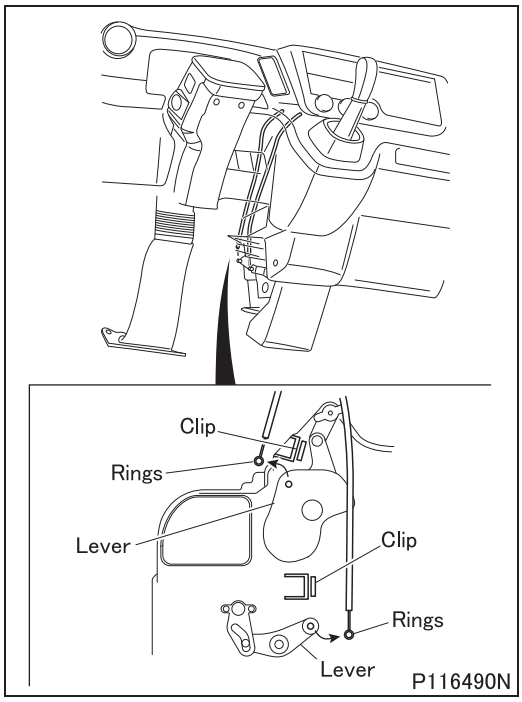


P114059

■ **Adjustment: Temperature control knob**

- Before disconnecting the control cables, turn the temperature control knob of the heater controls to the MAX-COOL position.

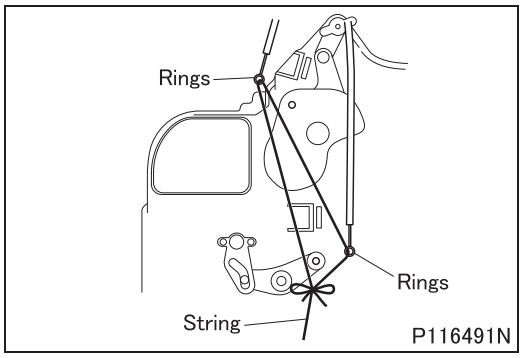
◆Removal procedure◆



P116490N

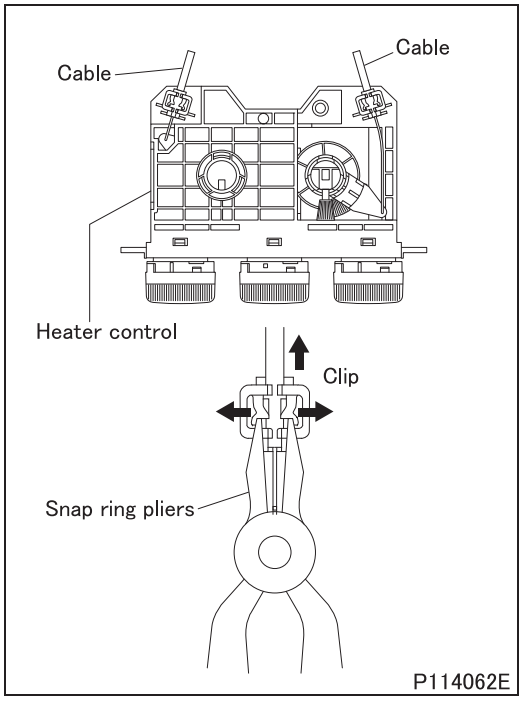
■ **Removal: Control cables**

- Before disconnecting the cables from the levers, put pairing marks on each cable and its lever.
- Disconnect the control cables from the heater and cooling unit.



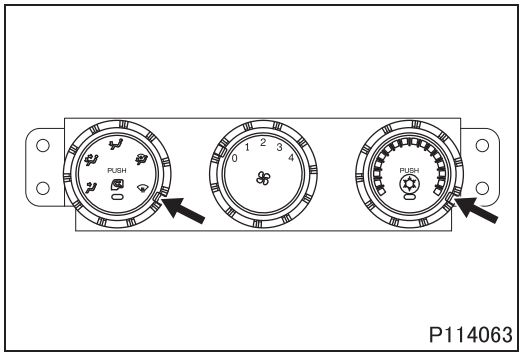
P116491N

- In order that the control cables can be pulled back during installation, attach a string to the rings on the cables as shown in the illustration.



- Remove the heater controls from the instrument panel.
- Use snap ring pliers to disconnect the cable(s) from the heater controls.

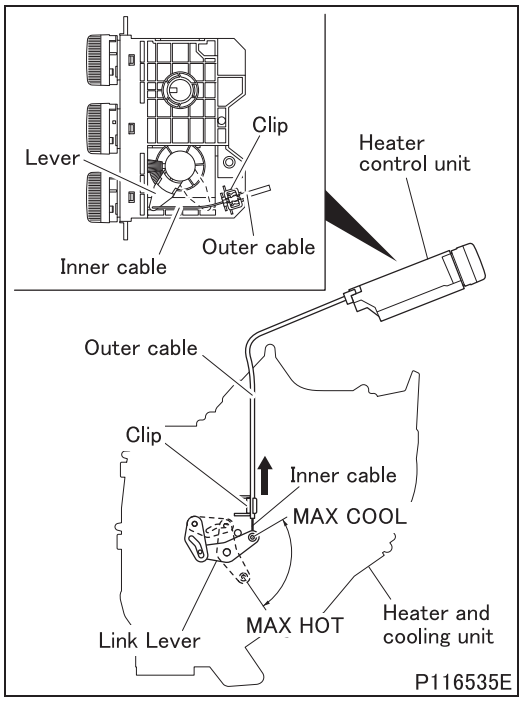
◆Work before installation◆



■Adjustment: Heater controls knobs

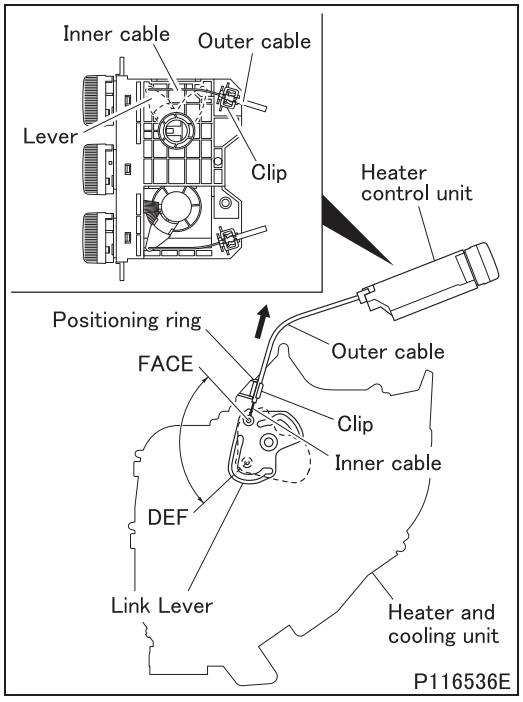
- At the heater controls, turn the temperature control knob to the MAX-HOT position and turn the mode selector knob to the DEF position before reconnecting the control cables.

◆Installation procedure◆



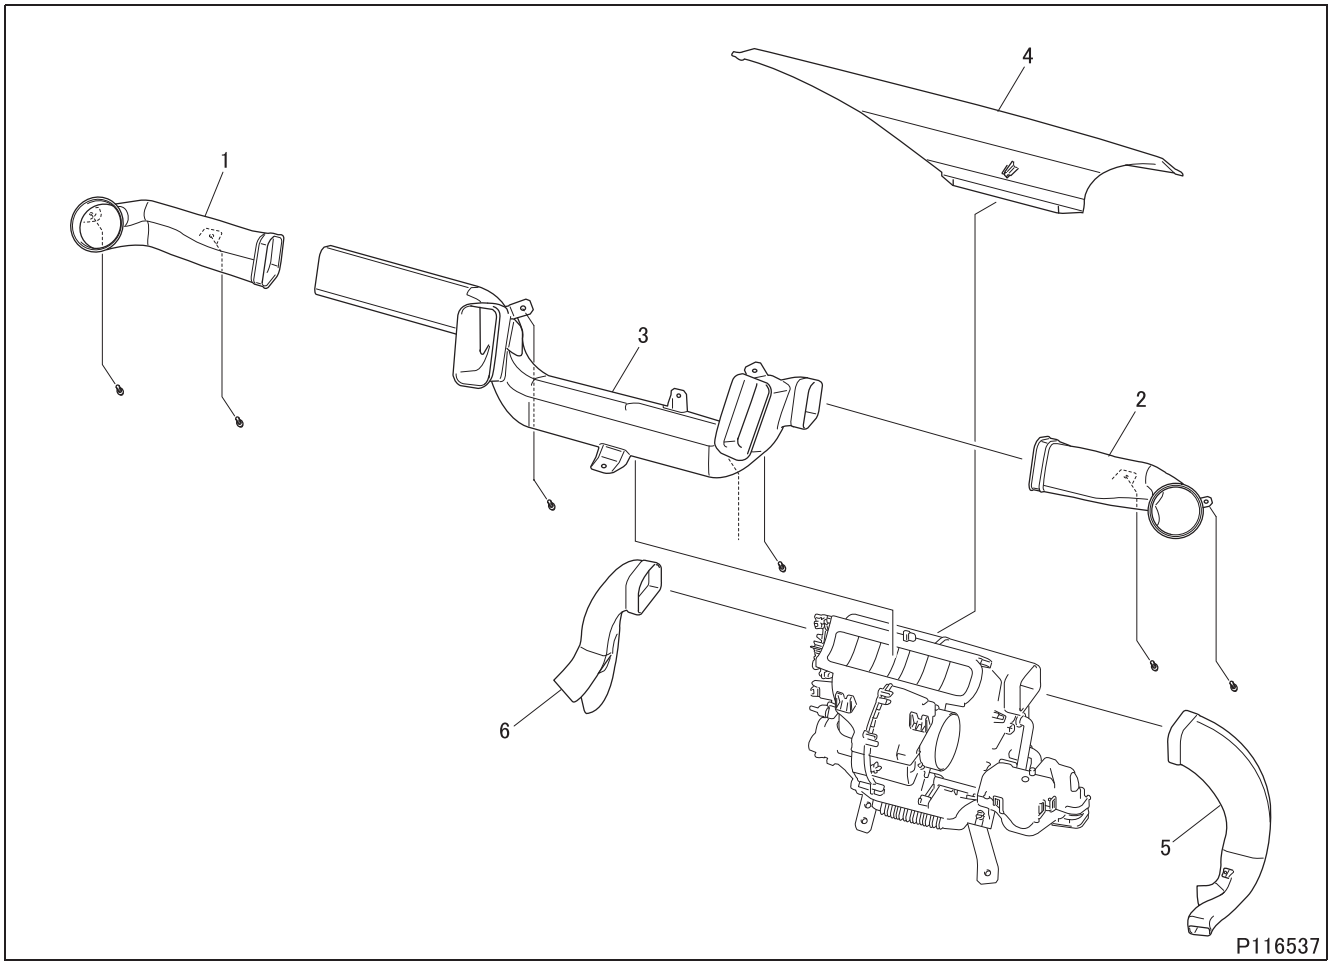
■Installation: Air mix control cable

- Connect the air mix control inner cable to the lever in the heater control unit.
- Insert the air mix control outer cable into the clip on the heater control while lightly pulling on the cable, and securely fasten the cable with the clip.
- Turn the heater control unit's temperature control knob to the MAX-COOL position. Hold the knob at that position.
- Using the string attached to the control cable during the removal procedure, pull the cable back.
- Connect the air mix control inner cable to the pin on the link lever in the heater and cooling unit.
- Insert the air mix control outer cable into the clip on the heater and cooling unit while lightly pulling on the cable, and securely fasten the cable with the clip.
- Set the heater control unit's temperature control knob to the MAX-COOL and MAX-HOT positions to check that the link lever properly moves to the corresponding positions. If the lever fails to move correctly, repeat the cable installation steps from the beginning.



■Installation: Mode selection control cable

- Connect the end of the mode selection control inner cable to the lever in the heater control unit.
- Insert the mode selection control outer cable into the clip on the heater control unit while lightly pulling on the cable, and securely fasten the cable with the clip.
- Move the control unit's mode control knob to the DEF position. Hold the knob in that position.
- Pull the control cable back using the string attached to the cable during the removal procedure.
- Connect the other end of the mode selection control inner cable to the pin on the link lever of the heater and cooling unit.
- Put the mode selection control outer cable positioning ring to the side of the clip on the heater and cooling unit, and securely fasten the cable with the clip.
- Set the heater control unit's mode control knob to the FACE and DEF positions to check that the lever properly moves to the corresponding positions. If the lever fails to move correctly, repeat the cable installation steps from the beginning.



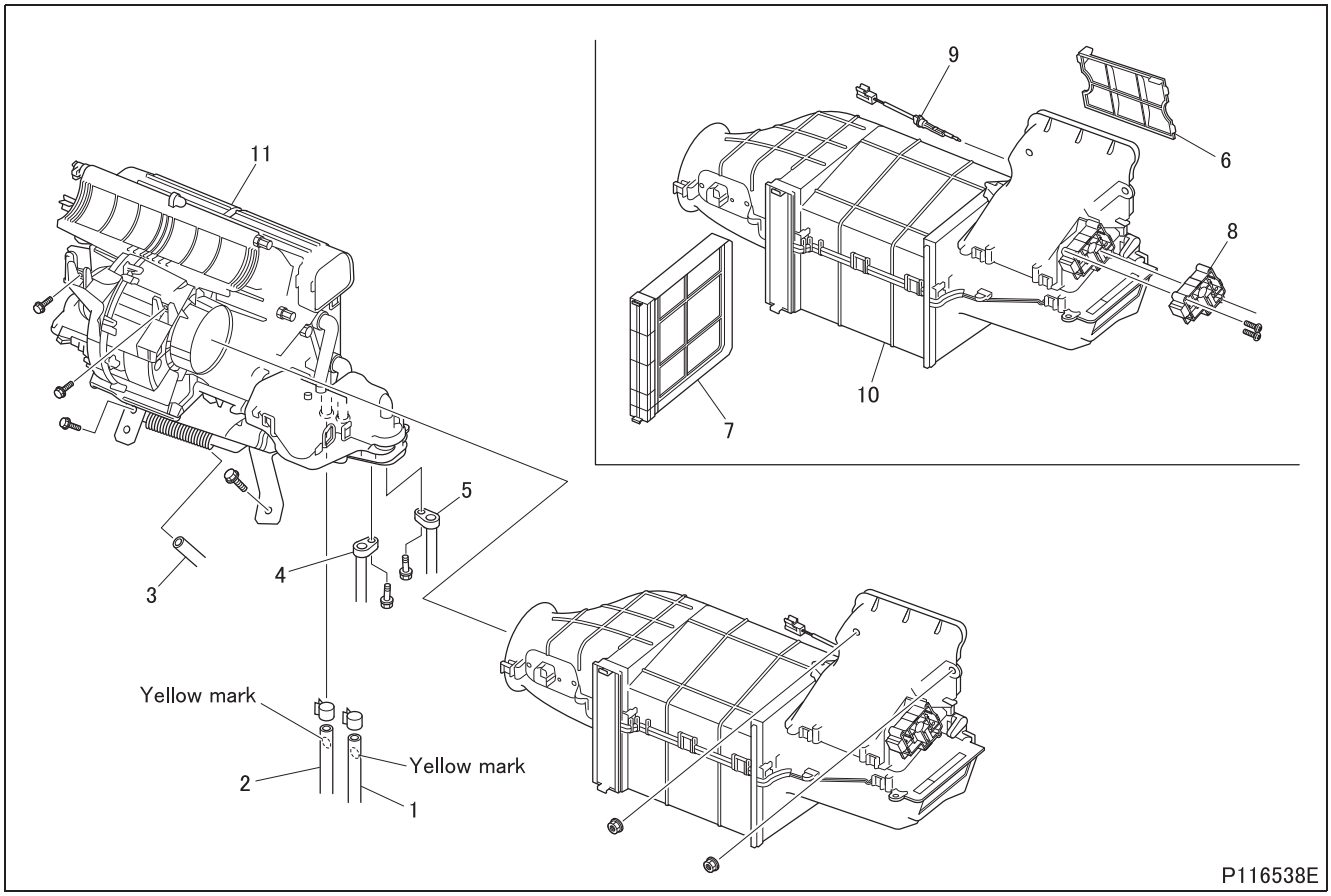
● **Removal sequence**

1 Driver face duct
2 Passenger face duct
3 Center face duct
4 Defroster duct
5 Passenger foot duct
6 Driver foot duct

● **Installation sequence**

Follow the removal sequence in reverse.

HEATER AND COOLING UNIT, BLOWER



● Removal sequence

1 Heater hose (outlet)
2 Heater hose (return)
3 Drain hose
4 Liquid hose (high pressure)
5 Suction hose (low pressure)
6 Air filter
7 Air filter
8 Fresh/recirculation changeover motor
9 Air inlet sensor <F-A/C>
10 Air intake box
11 Blower and heater and cooling unit

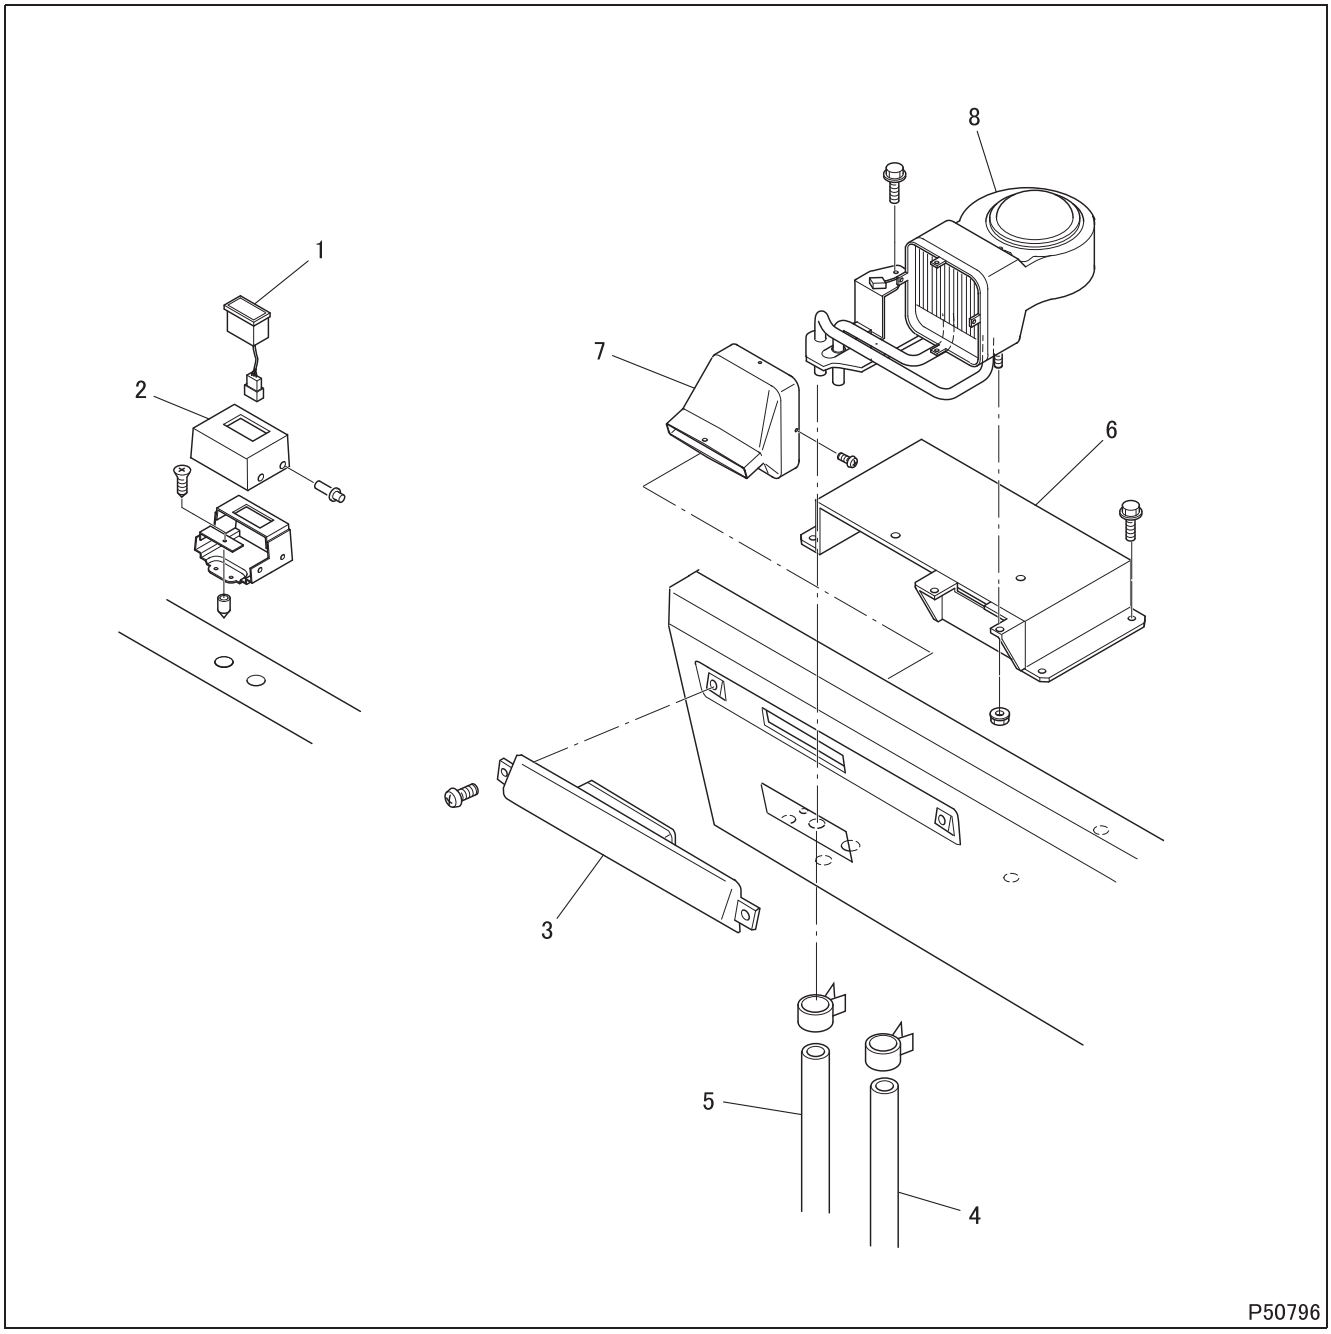
F-A/C: Fully automatic air conditioner

- Recover the refrigerant before disconnecting the hose. (See “On-Vehicle Inspection and Adjustment”.)

● Installation sequence

Follow the removal sequence in reverse.

- See the CONNECTING AIR CONDITIONER PIPING section for the installation of hose and pipe.



● **Removal sequence**

1 Rear heater switch
2 Switch box
3 Foot duct
4 Heater hose (return)
5 Heater hose (outlet)
6 Plate
7 Joint duct
8 Rear heater unit

● **Installation sequence**

Follow the removal sequence in reverse.

Receiver	Manufacturer			Valeo Thermal Systems Japan Corporation
	Capacity cm^3 {cu.in.}			300 {18.3}

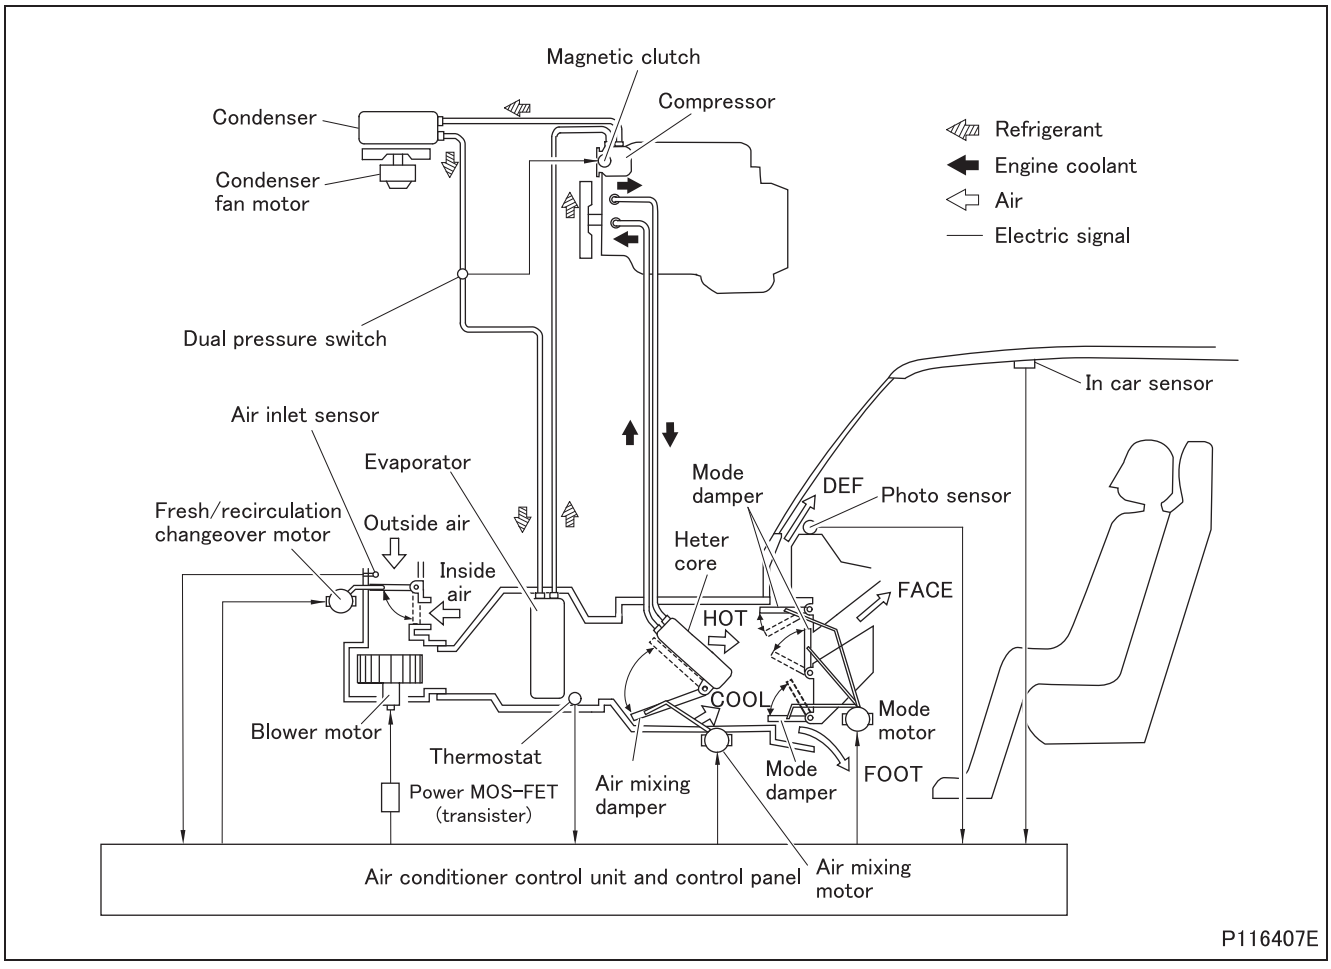
M E M O

STRUCTURE AND OPERATION

1. Overview

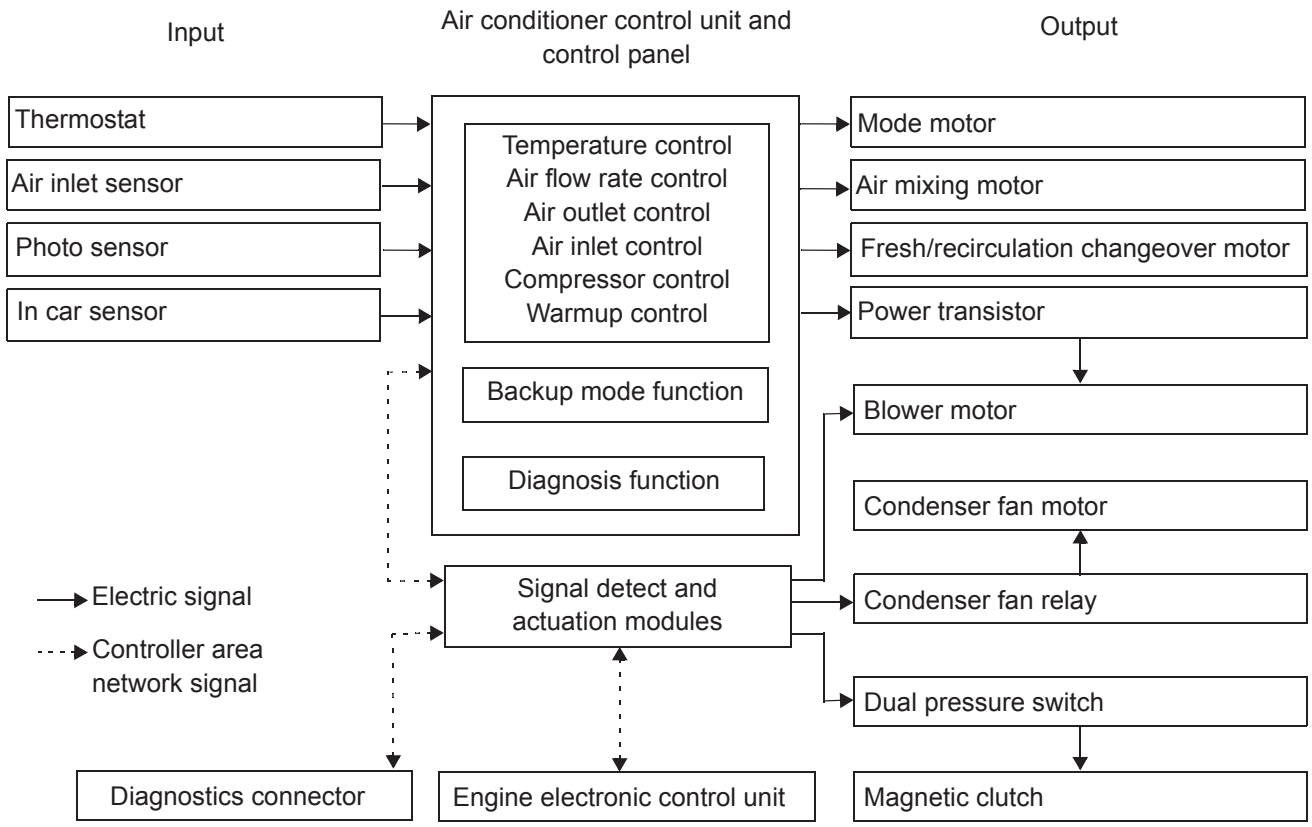
- The fully automatic air conditioner system automatically determines the following parameters to always maintain the optimum condition for a selected temperature.
  - Blow-off air temperature
  - Air outlets
  - Air flow rate
  - Air intake port (inside and outside air changeover)
  - Compressor ON/OFF
- These controls are achieved by the control unit built in air conditioner control unit and control panel; it calculates the temperature control command value using the information from the various sensors provided indoors and outdoors and the temperature control map to determine the operating amount of each actuator.

1.1 System composition



2. Electronic Control System

2.1 System block diagram



Part name	Major function or operation
Thermostat	Detection of temperature of air passed through evaporator
Air inlet sensor	Detection of outside air temperature
Photo sensor	Detection of sunlight intensity
In car sensor	Detection of inside air temperature
Mode motor	Changeover of mode damper
Air mixing motor	Changeover of air mixing damper
Fresh/recirculation changeover motor	Changeover of inside and outside air damper
Power transistor	Regulator of blower motor operating voltage
Blower motor	Operation of blower fan
Condenser fan motor	Refrigerant cooling
Condenser fan relay	Operation of blower fan motor
Dual pressure switch	Detection of refrigerant pressure
Magnetic clutch	Operation of compressor
Engine electronic control unit	Detection of engine coolant temperature
SAM *	Control of power supply to relevant devices
	Repeating of signals transmitted via controller area network from airbag electronic control unit to send them to relevant devices
FUSO Diagnostics (diagnostics connector)	Communication with air conditioner electronic control unit and control panel

* : SAM (Signal detect and actuation modules)

2.2 Fully automatic air conditioner control functions

(1) Temperature control

- The air conditioner control unit & control panel operates air mixing motor to adjust the opening of the air mixing damper.

(2) Air flow rate control

- In the auto fan mode, the air conditioner control unit & control panel changes the base voltage of power transistor, thereby changing the drive voltage of blower motor to control the air delivery rate.
- In the warmup control mode, it controls the blower motor depending on the signals from water temperature sensor.

(3) Air outlet control

- In the auto air outlet control mode, the air conditioner control unit & control panel operates mode motor to adjust the openings of the individual dampers (DEF, FACE, FOOT).
- There are 5 selectable positions: FACE, FACE/FOOT, FOOT, FOOT/DEF, and DEF. They are numbered as -1, -2, -3, -4, and -5 in this order.

(4) Air inlet control

- The air selector motor switches the air mode between inside air recirculation and outside air introduction according to the conditions established as a result of manual selections.

	Condition	Damper position
Inside air recirculation	MAX COOL is selected when both the mode and fan speed controls are in AUTO.	Inside air position
Outside air introduction	• MAX HOT is selected when both the mode and fan speed controls are in AUTO. • DEF position is selected.	Outside air position

- If the above conditions are not met when both the mode and fan speed controls are in AUTO, the damper position is automatically adjusted between the inside air and outside air positions according to the temperature.

(5) Compressor control

- In the auto mode, the air conditioner control unit & control panel operates compressor in economy mode (ON/OFF).

(6) Warmup control

- When the following conditions are satisfied, the air conditioner control unit & control panel interrupts air outlet and air flow rate controls, initiating warmup control.
  <Automatic mode control>
  - Mode: AUTO
  - Engine coolant temperature: ≤60°C {140°F}

  <Automatic fan speed control>
  - Fan speed: AUTO
  - Mode: Other position than FACE and DEF
  - Engine coolant temperature: ≥50°C {122°F}

  After warmup control, the air conditioner control unit & control panel enters the auto mode.

(7) Backup function

- The air conditioner control unit & control panel in air conditioner control unit and control panel keeps the set temperature and the setting conditions of all the switches in the memory unless the battery terminals are disconnected.

2.3 Diagnosis function

- Each time the starter switch is set to ON, the air conditioner control unit & control panel performs a self-diagnostic to ensure that all the sensors, etc. are in order. If any of them is found to be defective, the air conditioner control unit & control panel stores the defective element in memory, and enters the backup mode.
- The air conditioner control unit limits the function of the system to keep the vehicle safety when the system is failing. The defective element stored in memory can be called out in terms of a diagnosis code by an Multi-Use Tester or the diagnosis switch. (See Gr00.)

TROUBLESHOOTING

1. Inspection According to Diagnosis Code (Trouble Codes)

- Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.

1.1 List of diagnosis code

Code	Message	warning lamp indication	Remarks
170-3	Interior temperature sensor open circuit - Voltage above normal or shorted to high source	-	
170-4	Interior temperature sensor short circuit - Voltage below normal or shorted to low source	-	
171-3	Ambient temperature sensor open circuit - Voltage above normal or shorted to high source	-	
171-4	Ambient temperature sensor short circuit - Voltage below normal or shorted to low source	-	
639-19	Communication with the CAN-bus has a malfunction. - Received network data is in error	-	
1547-3	Evaporator temperature sensor open circuit - Voltage above normal or shorted to high source	-	
1547-4	Evaporator temperature sensor short circuit - Voltage below normal or shorted to low source	-	
2610-4	Solar radiation sensor short circuit - Voltage below normal or shorted to low source	-	
3981-3	Mode door feedback potentiometer open circuit - Voltage above normal or shorted to high source	-	
3981-4	Mode door feedback potentiometer short circuit - Voltage below normal or shorted to low source	-	
3981-7	Mode door actuator stuck - Mechanical system not responding or out of adjustment	-	
3985-12	The control unit has an internal fault. - Bad intelligent device or component	-	
3986-3	Air mix door feedback potentiometer open circuit - Voltage above normal or shorted to high source	-	
3986-4	Air mix door feedback potentiometer short circuit - Voltage below normal or shorted to low source	-	
3986-7	Air mix door actuator stuck - Mechanical system not responding or out of adjustment	-	

CAN: Controller Area Network communication

1.2 Code generation criteria and inspection item

170-3: Interior temperature sensor open circuit - Voltage above normal or shorted to high source

Generation condition	• Output voltage of inside air temperature sensor is 4.9 V or higher.
Recoverability	• System recovers normal state when sensor voltage becomes normal.
Control effected by electronic control unit	• If starter switch is turned to ON when faulty condition exists: Default values are invariably assumed. • If faulty condition occurs while starter switch is in ON position: Values just before occurrence of fault are invariably assumed.
Possible causes	• Open signal harness between air conditioner electronic control unit & control panel and inside air temperature sensor • Open ground harness between air conditioner electronic control unit & control panel and inside air temperature sensor • Short circuit to power supply of signal harness between air conditioner electronic control unit & control panel and inside air temperature sensor • Faulty inside air temperature sensor • Faulty air conditioner electronic control unit & control panel

170-4: Interior temperature sensor short circuit - Voltage below normal or shorted to low source

Generation condition	• Output voltage of inside air temperature sensor is 0.1 V or lower.
Recoverability	• System recovers normal state when sensor output voltage becomes normal.
Control effected by electronic control unit	• If starter switch is turned to ON when faulty condition exists: Default values are invariably assumed. • If faulty condition occurs while starter switch is in ON position: Values just before occurrence of fault are invariably assumed.
Possible causes	• Shorted signal harness between air conditioner electronic control unit & control panel and inside air temperature sensor • Faulty inside air temperature sensor • Faulty air conditioner electronic control unit & control panel

171-3: Ambient temperature sensor open circuit - Voltage above normal or shorted to high source

Generation condition	• Output voltage of outside air temperature sensor is 4.9 V or higher.
Recoverability	• System recovers normal state when sensor output voltage becomes normal.
Control effected by electronic control unit	• If starter switch is turned to ON when faulty condition exists: Default values are invariably assumed. • If faulty condition occurs while starter switch is in ON position: Values just before occurrence of fault are invariably assumed.
Possible causes	• Open signal harness between air conditioner electronic control unit & control panel and outside air temperature sensor • Open ground harness between air conditioner electronic control unit & control panel and outside air temperature sensor • Short circuit to power supply of signal harness between air conditioner electronic control unit & control panel and outside air temperature sensor • Faulty outside air temperature sensor • Faulty air conditioner electronic control unit & control panel

171-4: Ambient temperature sensor short circuit - Voltage below normal or shorted to low source

Generation condition	• Output voltage of outside air temperature sensor is 0.1 V or lower.
Recoverability	• System recovers normal state when sensor output voltage becomes normal.
Control effected by electronic control unit	• If starter switch is turned to ON when faulty condition exists: Default values are invariably assumed. • If faulty condition occurs while starter switch is in ON position: Values just before occurrence of fault are invariably assumed.
Possible causes	• Shorted signal harness between air conditioner electronic control unit & control panel and outside air temperature sensor • Faulty outside air temperature sensor • Faulty air conditioner electronic control unit & control panel

639-19: Communication with the CAN-bus has a malfunction. - Received network data is in error

Generation condition	• There is some controller area network communications problem.
Recoverability	• System recovers normal state when all of the following conditions are met. • Communication bus is not in off state. • Message indicating normal speed range is being received. • Message indicating normal coolant temperature range is being received.
Control effected by electronic control unit	• Default value is invariably assumed for non-received controller area network message.
Possible causes	• Controller area network communications bus is open, shorted to power supply, shorted to ground, or otherwise shorted. • Faulty malfunction signal detect and actuation modules for resistors in air conditioner electronic control unit & control panel. • Faulty air conditioner electronic control unit & control panel.

1547-3: Evaporator temperature sensor open circuit - Voltage above normal or shorted to high source

Generation condition	• Output voltage of thermostat is 4.9 V or higher.
Recoverability	• System recovers normal state when thermostat output voltage becomes normal.
Control effected by electronic control unit	• If starter switch is turned to ON when faulty condition exists: Default values are invariably assumed. • If faulty condition occurs while starter switch is in ON position: Values just before occurrence of fault are invariably assumed.
Possible causes	• Open signal harness between air conditioner electronic control unit & control panel and thermostat • Open ground harness between air conditioner electronic control unit & control panel and thermostat • Short circuit to power supply of signal harness between air conditioner electronic control unit & control panel and thermostat • Faulty thermostat • Faulty air conditioner electronic control unit & control panel

1547-4: Evaporator temperature sensor short circuit - Voltage below normal or shorted to low source

Generation condition	• Output voltage of thermostat is 0.1 V or lower.
Recoverability	• System recovers normal state when thermostat output voltage becomes normal.
Control effected by electronic control unit	• If starter switch is turned to ON when faulty condition exists: Default values are invariably assumed. • If faulty condition occurs while starter switch is in ON position: Values just before occurrence of fault are invariably assumed.
Possible causes	• Shorted signal harness between air conditioner electronic control unit & control panel and thermostat • Faulty thermostat • Faulty air conditioner electronic control unit & control panel

2610-4: Solar radiation sensor short circuit - Voltage below normal or shorted to low source

Generation condition	• Output voltage of photo sensor is 0.1 V or lower.
Recoverability	• System recovers normal state when photo sensor output voltage becomes normal.
Control effected by electronic control unit	• Photo sensor output voltage is invariably assumed to be 0 W.
Possible causes	• Shorted signal harness between air conditioner electronic control unit & control panel and photo sensor • Faulty photo sensor • Faulty air conditioner electronic control unit & control panel

CAN: Controller Area Network communication

3981-3: Mode door feedback potentiometer open circuit - Voltage above normal or shorted to high source

Generation condition	• Output voltage of potentiometer inside the mode motor is 4.9 V or higher.
Recoverability	• System recovers normal state when potentiometer output voltage becomes normal.
Control effected by electronic control unit	• Air mixing actuator is not driven any further.
Possible causes	• Short circuit to power supply (5 V and/or 24 V) of signal harness between air conditioner electronic control unit & control panel and mode motor • Open ground harness between air conditioner electronic control unit & control panel and mode motor • Faulty potentiometer inside the mode motor • Faulty air conditioner electronic control unit & control panel

3981-4: Mode door feedback potentiometer short circuit - Voltage below normal or shorted to low source

Generation condition	• Output voltage of potentiometer inside the mode motor is 0.1 V or lower.
Recoverability	• System recovers normal state when potentiometer output voltage becomes normal.
Control effected by electronic control unit	• Mode actuator is not driven any further.
Possible causes	• Short circuit to ground of signal harness between air conditioner electronic control unit & control panel and mode motor • Open power harness between air conditioner electronic control unit & control panel and mode motor • Faulty potentiometer inside the mode motor • Faulty air conditioner electronic control unit & control panel

3981-7: Mode door actuator stuck - Mechanical system not responding or out of adjustment

Generation condition	• Mode motor is stopped from being driven if potentiometer output does not vary 12 bits or more. This code is set after consecutive 5 stop-and-restart cycles of mode motor after it is first stopped.
Recoverability	• System recovers normal state when potentiometer varies more than 12 bits when air mixing motor is driven.
Control effected by electronic control unit	• Repeats stop-and-restart cycles as many time as required to reach the target.
Possible causes	• Foreign material caught in mode dampers (DEF, FACE, and FOOT) and links.

3985-12: The control unit has an internal fault. - Bad intelligent device or component

Generation condition	• There is some problem inside electronic control unit.
Recoverability	• System recovers normal state when all of the following conditions are met. • Both writing and reading into EEPROM complete successfully. • Resetting completes successfully.
Control effected by electronic control unit	• When EEPROM is faulty: Battery backup data is used as substitute. • When reset circuit is faulty: Normal resetting is impossible.
Possible causes	• Faulty air conditioner electronic control unit & control panel.

3986-3: Air mix door feedback potentiometer open circuit - Voltage above normal or shorted to high source

Generation condition	• Output voltage of air mixing motor is 4.9 V or higher.
Recoverability	• System recovers normal state when output voltage of air mixing motor becomes normal.
Control effected by electronic control unit	• Electronic control unit causes air mixing motor to stop.
Possible causes	• Short circuit to power supply (5 V and/or 24 V) of signal harness between air conditioner electronic control unit & control panel and air mixing motor • Open ground harness between air conditioner electronic control unit & control panel and air mixing motor • Faulty potentiometer inside the air mixing motor • Faulty air conditioner electronic control unit & control panel

3986-4: Air mix door feedback potentiometer short circuit - Voltage below normal or shorted to low source

Generation condition	• Output voltage of air mixing motor is 0.1 V or lower.
Recoverability	• System recovers normal state when air mixing motor output voltage becomes normal.
Control effected by electronic control unit	• Air mixing actuator is not driven any further.
Possible causes	• Short circuit to ground of signal harness between air conditioner electronic control unit & control panel and air mixing motor • Open power harness between air conditioner electronic control unit & control panel and air mixing motor • Faulty potentiometer inside the air mixing motor • Faulty air conditioner electronic control unit & control panel

3986-7: Air mix door actuator stuck - Mechanical system not responding or out of adjustment

Generation condition	• Air mixing motor is stopped from being driven if potentiometer output does not vary 12 bits or more. This code is set after consecutive 5 stop-and-restart cycles of mode motor after it is first stopped.
Recoverability	• System recovers normal state when potentiometer output varies more than 12 bits.
Control effected by electronic control unit	• Repeats stop-and-restart cycles of air mixing motor as many time as required to reach the target.
Possible causes	• Foreign material caught in air mixing damper and links.

2. FUSO Diagnostics Service Data (Measured Values)

- Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.

Current value group	Description	Value	Explanation
Temperature values	Ambient temperature	-20.20 to 117.5°F	Detected by the in-car sensor. 0.12 to 4.86 V
	Vehicle interior temperature	-20.20 to 117.5°F	Detected by the air inlet sensor. 0.12 to 4.86 V
	Evaporator temperature	-20.20 to 117.5°F	Detected by the thermostat. 0.12 to 4.86 V
	Solar value	0 to 1559W	Detected by the photo sensor. 0.12 to 5 V Measured values are changed by direct sunlight only.
Status of electric motor	Temperature motor output Feedback	0 to 100%	Shows the value of the photometer in the air mixing motor. 0.12 to 4.86 V
	Mode motor output Feedback	Mode B/L1 Mode B/L2 Mode B/L3 Mode Def/Foot1 Mode Def/Foot2 Mode Def/Foot3 Mode Foot Mode Def Mode Face	Shows the damper value of the photometer in the mode motor. 0.12 to 4.86 V
	Compressor output	ON/OFF	Shows the output value of the air conditioner. ON: Approx. 0 V OFF: Supply voltage from SAM (Signal detect and actuation modules)
	Fresh/Recirculate motor output	Fresh/Recirculate	Shows the output value of the fresh/recirculation changeover motor. Fresh mode Pin 23: Approx. 0 V Recirc. mode Pin 24: Approx. 0 V
	Temperature motor output	0 to 100%	Shows the output value of the air mixing motor. When the air mixing motor is running: Voltage between pins 1 and 2: Approx. -11 to 11 V
	Blower fan output	Fan OFF/ Fan speed 1/ Fan speed 2/ Fan speed 3/ Fan speed 4/ Fan speed 5/ Fan speed 6/ Fan speed 7/ Fan speed 8	Shows the output value of the blower motor. Voltage between pins 14 and 31: Approx. 0 to 12 V
	Mode motor output	Mode B/L1 Mode B/L2 Mode B/L3 Mode Def/Foot1 Mode Def/Foot2 Mode Def/Foot3 Mode Foot Mode Def Mode Face	Shows the output value of the mode motor. When the mode motor is running: Voltage between pins 21 and 22: Approx. -11 to 11 V

Current value group	Description	Value	Explanation
Switch status	Fresh/Recirculate switch	Auto/ Fresh/ Recirculate	Shows the state of the fresh/recirculate switch.
	Air conditioning switch	Auto/OFF/ON	Shows the state of the air conditioning switch.
	Mode dial position	Mode B/L1 Mode B/L2 Mode B/L3 Mode Def/Foot1 Mode Def/Foot2 Mode Def/Foot3 Mode Auto Mode Foot Mode Def Mode Face	Shows the mode dial position.
	Fan dial position	Fan speed Auto/ Fan OFF/ Fan speed 1 Fan speed 2 Fan speed 3 Fan speed 4 Fan speed 5 Fan speed 6 Fan speed 7 Fan speed 8	Shows the fan dial position.
	Temperature dial position	19 to 31°F	Shows the temperature dial position. 19 (max. cool) to 31 (max. hot)
Other actual values	Coolant temperature	-40.00 to 210.0°F	Shows the coolant temperature data.
	Switch illumination	Reserved/ OFF/ ON	Shows the switch illumination state. Voltage between pins 27 and 28: Approx. 12 V when ON, Approx. 0 V when OFF

3. Actuator Test (Control) Using FUSO Diagnostics

- Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.

Selection	Description
Compressor outlet	Drives the compressor output (pin 26). The actuator test cannot be performed when the blower motor is OFF. [Additional condition for performing actuator test] +12V (M): ON Blower fan: ON [Checking method] Confirm that cold air comes out after the activation sound of the magnetic clutch is heard.
Fresh/recirculation changeover motor output	Drives the fresh/recirculation changeover motor output (pins 23 and 24). Wait for 1.5 seconds before switching the motor. [Additional condition for performing actuator test] +12V (M): ON Turn off the blower fan and drive the vehicle. Switch the motor between the fresh air and recirculation modes. [Checking method] Confirm that air comes out from the outlet in the fresh air mode. Confirm that air does not come out from the outlet in the recirculation mode.
Temperature motor output	Drives the air mixing motor output (pins 1 and 2). [Additional condition for performing actuator test] +12V (M): ON Temperature motor output: Low (2 to 18%) Temperature motor output: Center (42 to 58%) Temperature motor output: High (82 to 98%) [Checking method] Confirm that the motor output feedback follows the motor output.
Blower fan outlet	Drives the condenser fan motor output (pin 13). [Additional condition for performing actuator test] +12V (M): ON Blower motor: OFF Blower motor speed setting: 1 to 8 [Checking method] When the blower motor is OFF, confirm that air does not come out from the outlet. When a blower motor speed is selected, confirm that air comes out from the outlet and that the airflow rate corresponds to the selected speed.
Mode motor outlet	Drives the mode motor output (pins 21 and 22). [Additional condition for performing actuator test] +12V (M): ON 1=Face 2=BL1 3=BL2 4=BL3 5=Foot 6=DF1 7=DF2 8=DF3 9=Front windshield [Checking method] Confirm that air comes out from the same outlet as the selected mode.

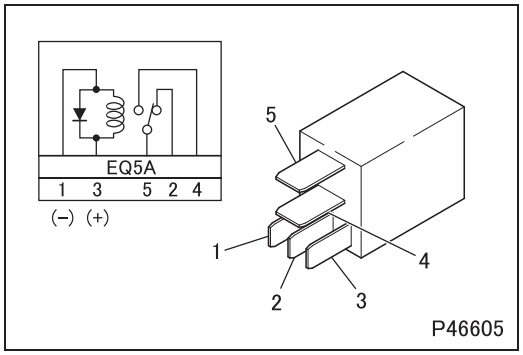
4. Electronic Control Unit Input/Output Table

- See the Electronic Control Unit Schematic Diagram for the pin locations of each signal and ground.

Devices to be connected	Terminal	Input/output	Voltage and wave form
In car sensor	37-9	In	[Measurement condition] Disconnect the electronic control unit and harness, then inspect on the vehicle-side connector. [Judgment criteria] See 54-#256.
Air inlet sensor	35-9	In	[Measurement condition] Disconnect the electronic control unit and harness, then inspect on the vehicle-side connector. [Judgment criteria] See 54-#253.
Thermostat	36-9	In	[Measurement condition] Disconnect the electronic control unit and harness, then inspect on the vehicle-side connector. [Judgment criteria] See 54-#751.
Potentiometer of air mixing motor	34-9	Out	[Judgment criteria] • Lever position Max. hot: 4.0 ± 0.03 V • Lever position Max. cool: 1.0 ± 0.03 V
Potentiometer of mode motor	33-9	Out	[Judgment criteria] • Lever position Face: 4.5 ± 0.03 V • Lever position Def.: 0.5 ± 0.03 V

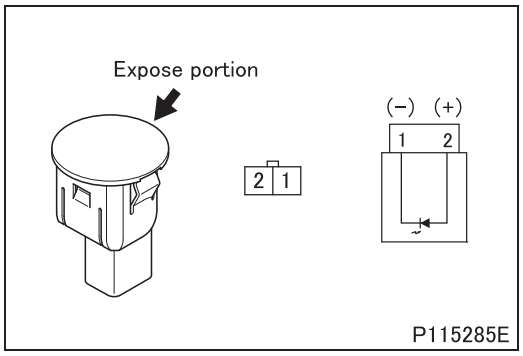
M E M O

INSPECTION OF ELECTRICAL PARTS



#201 Inspection of relay (normally open type 5 pin)

- Perform continuity check and operation check, and if any fault is found, replace the relay.

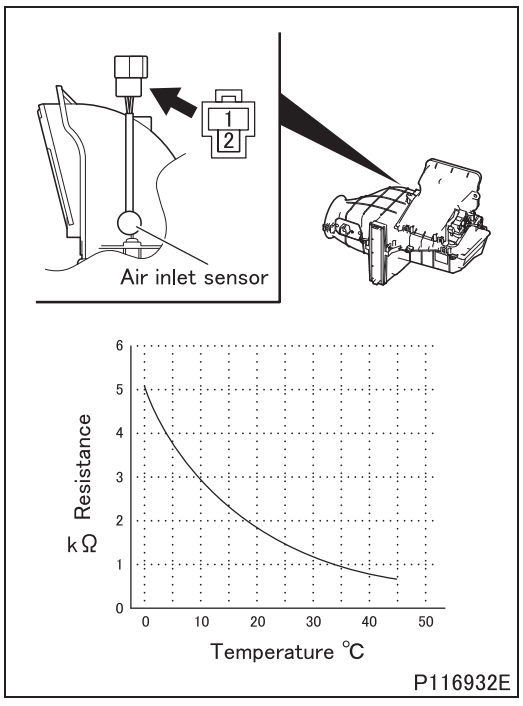


#251 Inspection of photo sensor

- Turn the starter switch to the ON position with the photo sensor connected to the control panel connector.
- Measure the voltage output from between terminal 2 and body ground while shining light on the light receiving part of the sensor.

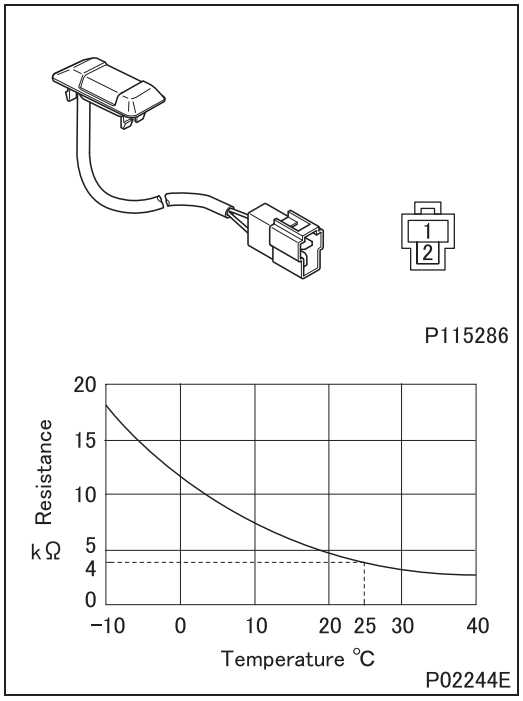
Standard value	Inspection condition: Move an electric lamp of approx. 60 watts up and down right above the photo sensor (150 mm {5.91 in.} at closest point).	1 to 5V (Voltage decreases when the lamp is closer.)

- If the measured value deviates from the standard value, replace the sensor. (See Gr52.)



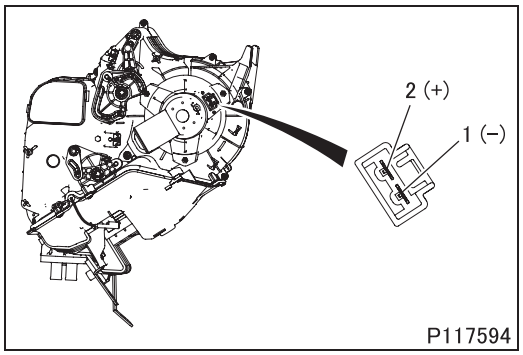
#253 Inspection of air inlet sensor

- Change the ambient temperature of the sensor and measure the resistance between terminals 1 and 2.
- If the measured value deviates from the characteristic shown in the table at left, replace the sensor. (See Gr55.)



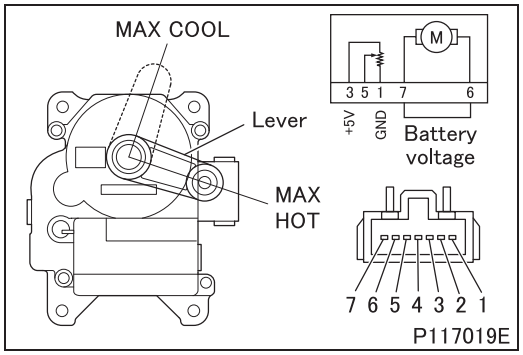
#256 Inspection of in car sensor

- Change the ambient temperature of the sensor and measure the resistance between terminals 1 and 2.
- If the measured value deviates from the characteristic shown in the table at left, replace the sensor. (See Gr52.)



#411 Inspection of blower motor

- Make sure that the motor operates when 12 volts DC is applied between each terminal.
- If any fault is found, replace the motor. (See Gr55.)



#413 Inspection of air mixing motor

- Perform the following checks, and if any fault is found, replace the motor. (See Gr55.)

(1) Inspection of motor

- Make sure that the motor operates when 12 volts DC is applied between each terminal.

Lever position	Continuity terminal
MAX HOT	(+) 6–7 (–)
MAX COOL	(+) 7–6 (–)

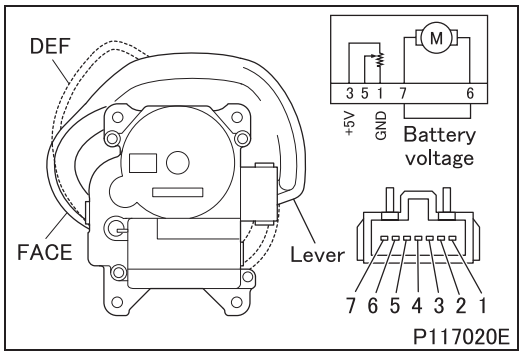
CAUTION ⚠

- **Stop applying voltage when the lever has stopped.**
- **After inspecting the motor, return the lever to a position between MAX HOT and MAX COOL.**

(2) Inspection of potentiometer

• Apply 5 volts DC between the terminals 1 and 3 and measure the voltage between the terminals 1 and 5.

Lever position	Standard value
MAX HOT	4 ± 0.03
MAX COOL	1 ± 0.03



#414 Inspection of mode motor

• Perform the following checks, and if any fault is found, replace the motor. (See Gr55.)

(1) Inspection of motor

• Make sure that the motor operates when 12 volts DC is applied between each terminal.

Lever position	Continuity terminal
FACE	(+) 6–7 (–)
DEF	(+) 7–6 (–)

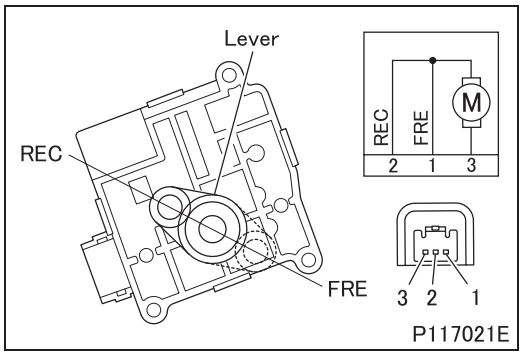
CAUTION ⚠

- **Stop applying voltage when the lever has stopped.**
- **After inspecting the motor, return the lever to a position between FACE and DEF.**

(2) Inspection of potentiometer

• Apply 5 volts DC between the terminals 1 and 3 and measure the voltage between the terminals 1 and 5.

Lever position	Standard value
FACE	4.5 ± 0.03
DEF	0.5 ± 0.03



#415 Inspection of fresh/recirculation changeover motor

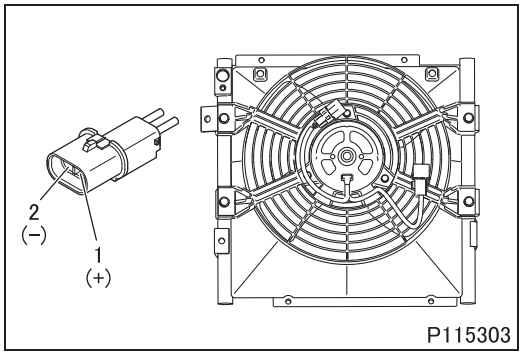
• Perform the following checks, and if any fault is found, replace the motor. (See Gr55.)

• Make sure that the motor operates when 12 volts DC is applied between each terminal.

Lever position	Continuity terminal
REC (inside air)	(+) 3–2 (–)
FRE (outside air)	(+) 3–1 (–)

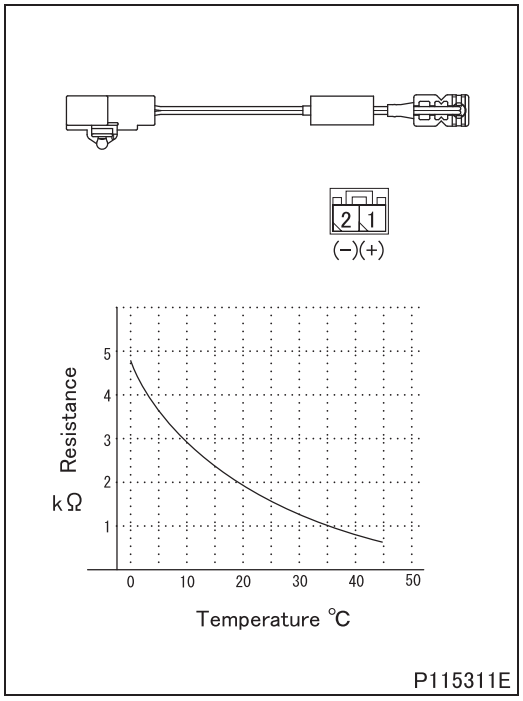
CAUTION ⚠

- **Stop applying 12 volts DC if the lever stops spontaneously at the REC or FRE position.**



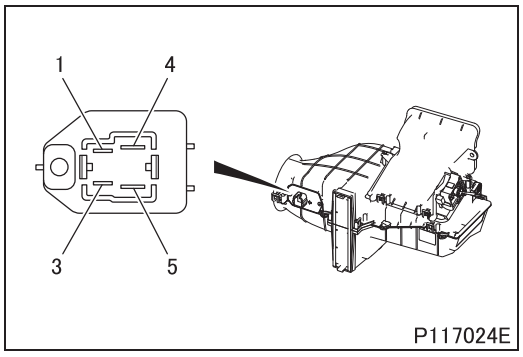
#431 Inspection of condenser fan motor

- Make sure that the motor operates when 12 volts DC is applied between each terminal.
- If any fault is found, replace condenser. (See Gr55.)



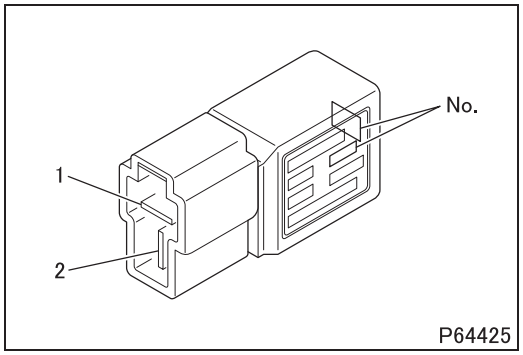
#751 Inspection of thermostat

- Measure the output voltage between terminals 1 and 2 at the specified temperatures.
- If the measured value deviates from the characteristic shown in the table at left, replace the sensor.



#752 Inspection of power MOS-FET (transistor)

- Perform the following checks, and if any fault is found, replace the power transistor. (See Gr55.)
  - Start the engine and operate the blower with the HI setting. Confirm that the rate of air flow from the blower corresponds to the HI level.
  - Next, gradually decrease the air flow rate by operating the control panel and confirm that the rate of air flow from the blower gradually decreases.
  - Confirm that there is no problem in the blower motor, wiring, air conditioner electronic control unit and control panel. If the blower motor does not rotate in this condition, the power MOS-FET (transistor) is faulty.



#828 Inspection of controller area network resistor

- Measure the resistance of the resistor number marked on the controller area network resistor.

Standard value (at 20°C {68°F})	Resistor No.	1	270 ± 13.5 Ω
		2	510 ± 25.5 Ω
		3	820 ± 41 Ω
		4	1300 ± 65 Ω
		5	2000 ± 100 Ω
		6	3300 ± 165 Ω
		7	5600 ± 280 Ω
		8	15000 ± 750 Ω
		9	390 ± 19.5 Ω
		10	4300 ± 215 Ω
		11	9100 ± 455 Ω
		12	120 ± 6 Ω (for controller area network resistor)

- If the measurement is out of specification, replace the controller area network resistor with one that has the same resistor number and same specified resistance.

CAUTION ⚠

The controller area network resistor are matched to the engine. If you replace any of them, be sure to replace it with one that has the same resistor number.

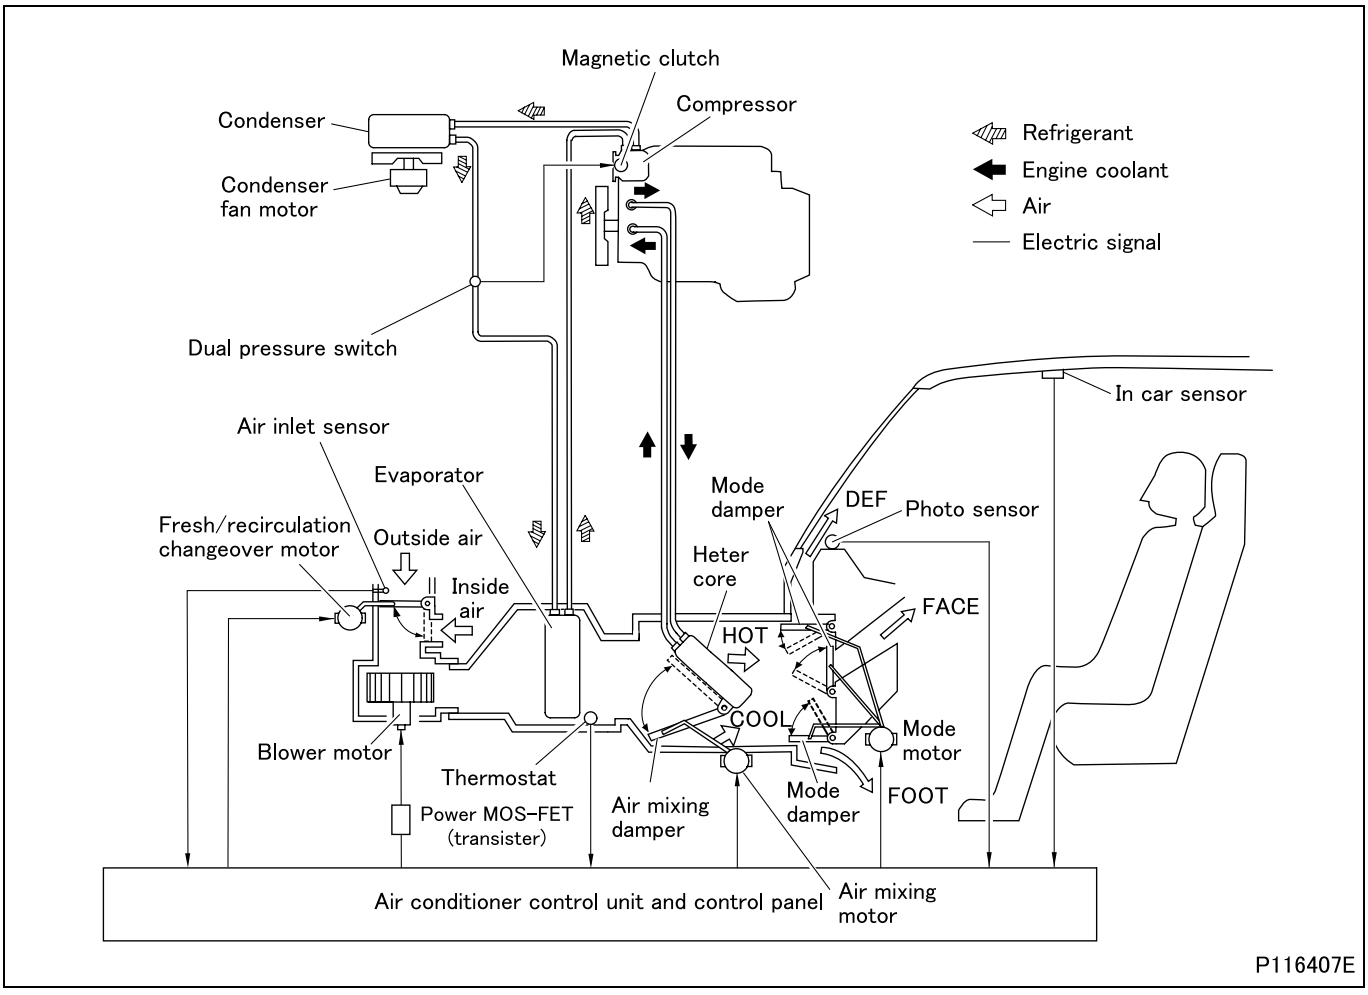
ELECTRICAL CIRCUIT DIAGRAM ..... (See Gr54.)

1. Overview

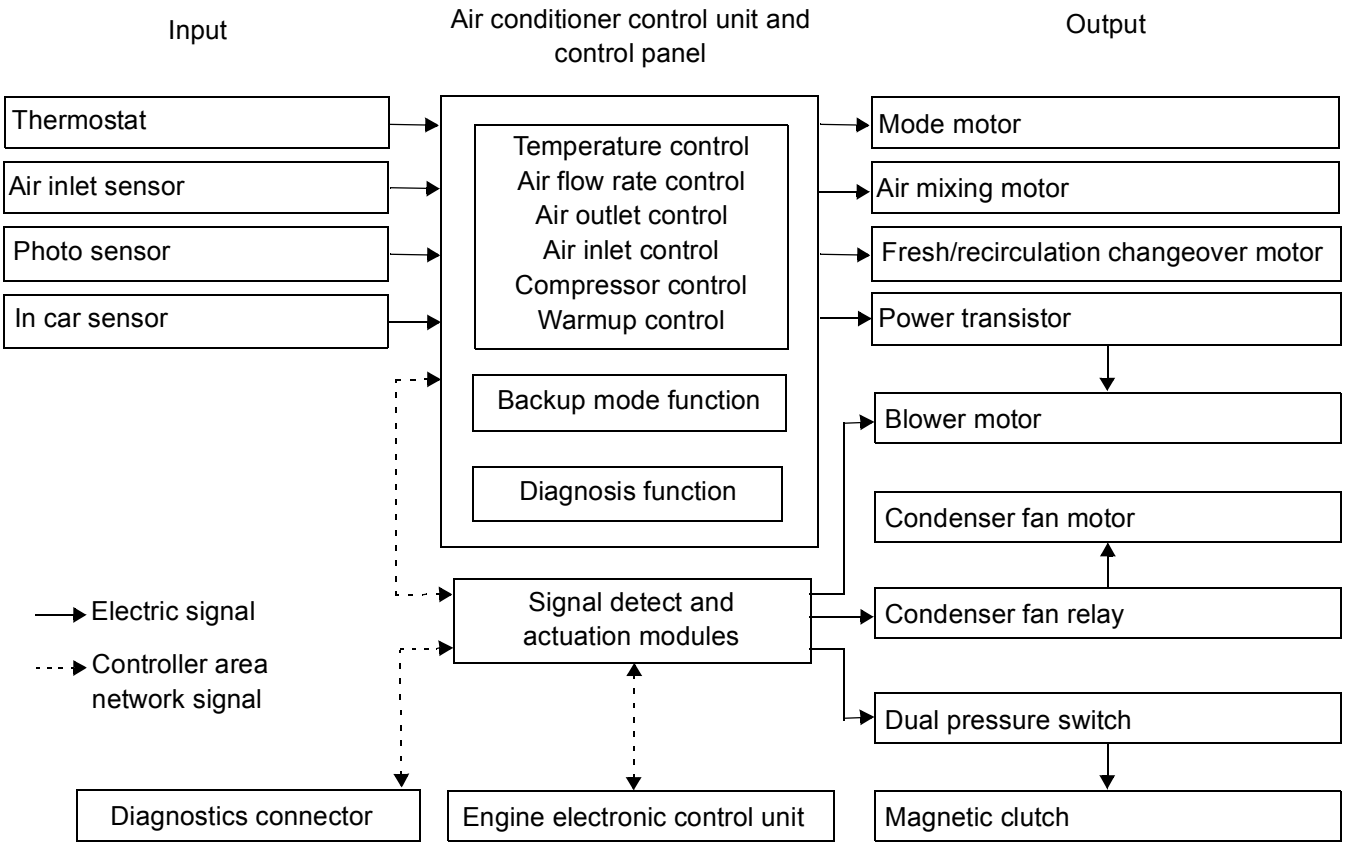
- The fully automatic air conditioner system automatically determines the following parameters to always maintain the optimum condition for a selected temperature.
  - Blow-off air temperature
  - Air outlets
  - Air flow rate
  - Air intake port (inside and outside air changeover)
  - Compressor ON/OFF
- These controls are achieved by the control unit built in air conditioner control unit and control panel; it calculates the temperature control command value using the information from the various sensors provided indoors and outdoors and the temperature control map to determine the operating amount of each actuator.

1.1 System composition



2. Electronic Control System

2.1 System block diagram



Part name	Major function or operation
Thermostat	Detection of temperature of air passed through evaporator
Air inlet sensor	Detection of outside air temperature
Photo sensor	Detection of sunlight intensity
In car sensor	Detection of inside air temperature
Mode motor	Changeover of mode damper
Air mixing motor	Changeover of air mixing damper
Fresh/recirculation changeover motor	Changeover of inside and outside air damper
Power transistor	Regulator of blower motor operating voltage
Blower motor	Operation of blower fan
Condenser fan motor	Refrigerant cooling
Condenser fan relay	Operation of blower fan motor
Dual pressure switch	Detection of refrigerant pressure
Magnetic clutch	Operation of compressor
Engine electronic control unit	Detection of engine coolant temperature
SAM *	Control of power supply to relevant devices
	Repeating of signals transmitted via controller area network from airbag electronic control unit to send them to relevant devices
FUSO Diagnostics (diagnostics connector)	Communication with air conditioner electronic control unit and control panel

* : SAM (Signal detect and actuation modules)

2.2 Fully automatic air conditioner control functions

(1) Temperature control

- The air conditioner control unit & control panel operates air mixing motor to adjust the opening of the air mixing damper.

(2) Air flow rate control

- In the auto fan mode, the air conditioner control unit & control panel changes the base voltage of power transistor, thereby changing the drive voltage of blower motor to control the air delivery rate.
- In the warmup control mode, it controls the blower motor depending on the signals from water temperature sensor.

(3) Air outlet control

- In the auto air outlet control mode, the air conditioner control unit & control panel operates mode motor to adjust the openings of the individual dampers (DEF, FACE, FOOT).
- There are 5 selectable positions: FACE, FACE/FOOT, FOOT, FOOT/DEF, and DEF. They are numbered as -1, -2, -3, -4, and -5 in this order.

(4) Air inlet control

- The air selector motor switches the air mode between inside air recirculation and outside air introduction according to the conditions established as a result of manual selections.

	Condition	Damper position
Inside air recirculation	MAX COOL is selected when both the mode and fan speed controls are in AUTO.	Inside air position
Outside air introduction	• MAX HOT is selected when both the mode and fan speed controls are in AUTO. • DEF position is selected.	Outside air position

- If the above conditions are not met when both the mode and fan speed controls are in AUTO, the damper position is automatically adjusted between the inside air and outside air positions according to the temperature.

(5) Compressor control

- In the auto mode, the air conditioner control unit & control panel operates compressor in economy mode (ON/OFF).

(6) Warmup control

- When the following conditions are satisfied, the air conditioner control unit & control panel interrupts air outlet and air flow rate controls, initiating warmup control.
  <Automatic mode control>
  - Mode: AUTO
  - Engine coolant temperature: ≤60°C {140°F}

  <Automatic fan speed control>
  - Fan speed: AUTO
  - Mode: Other position than FACE and DEF
  - Engine coolant temperature: ≥50°C {122°F}

  After warmup control, the air conditioner control unit & control panel enters the auto mode.

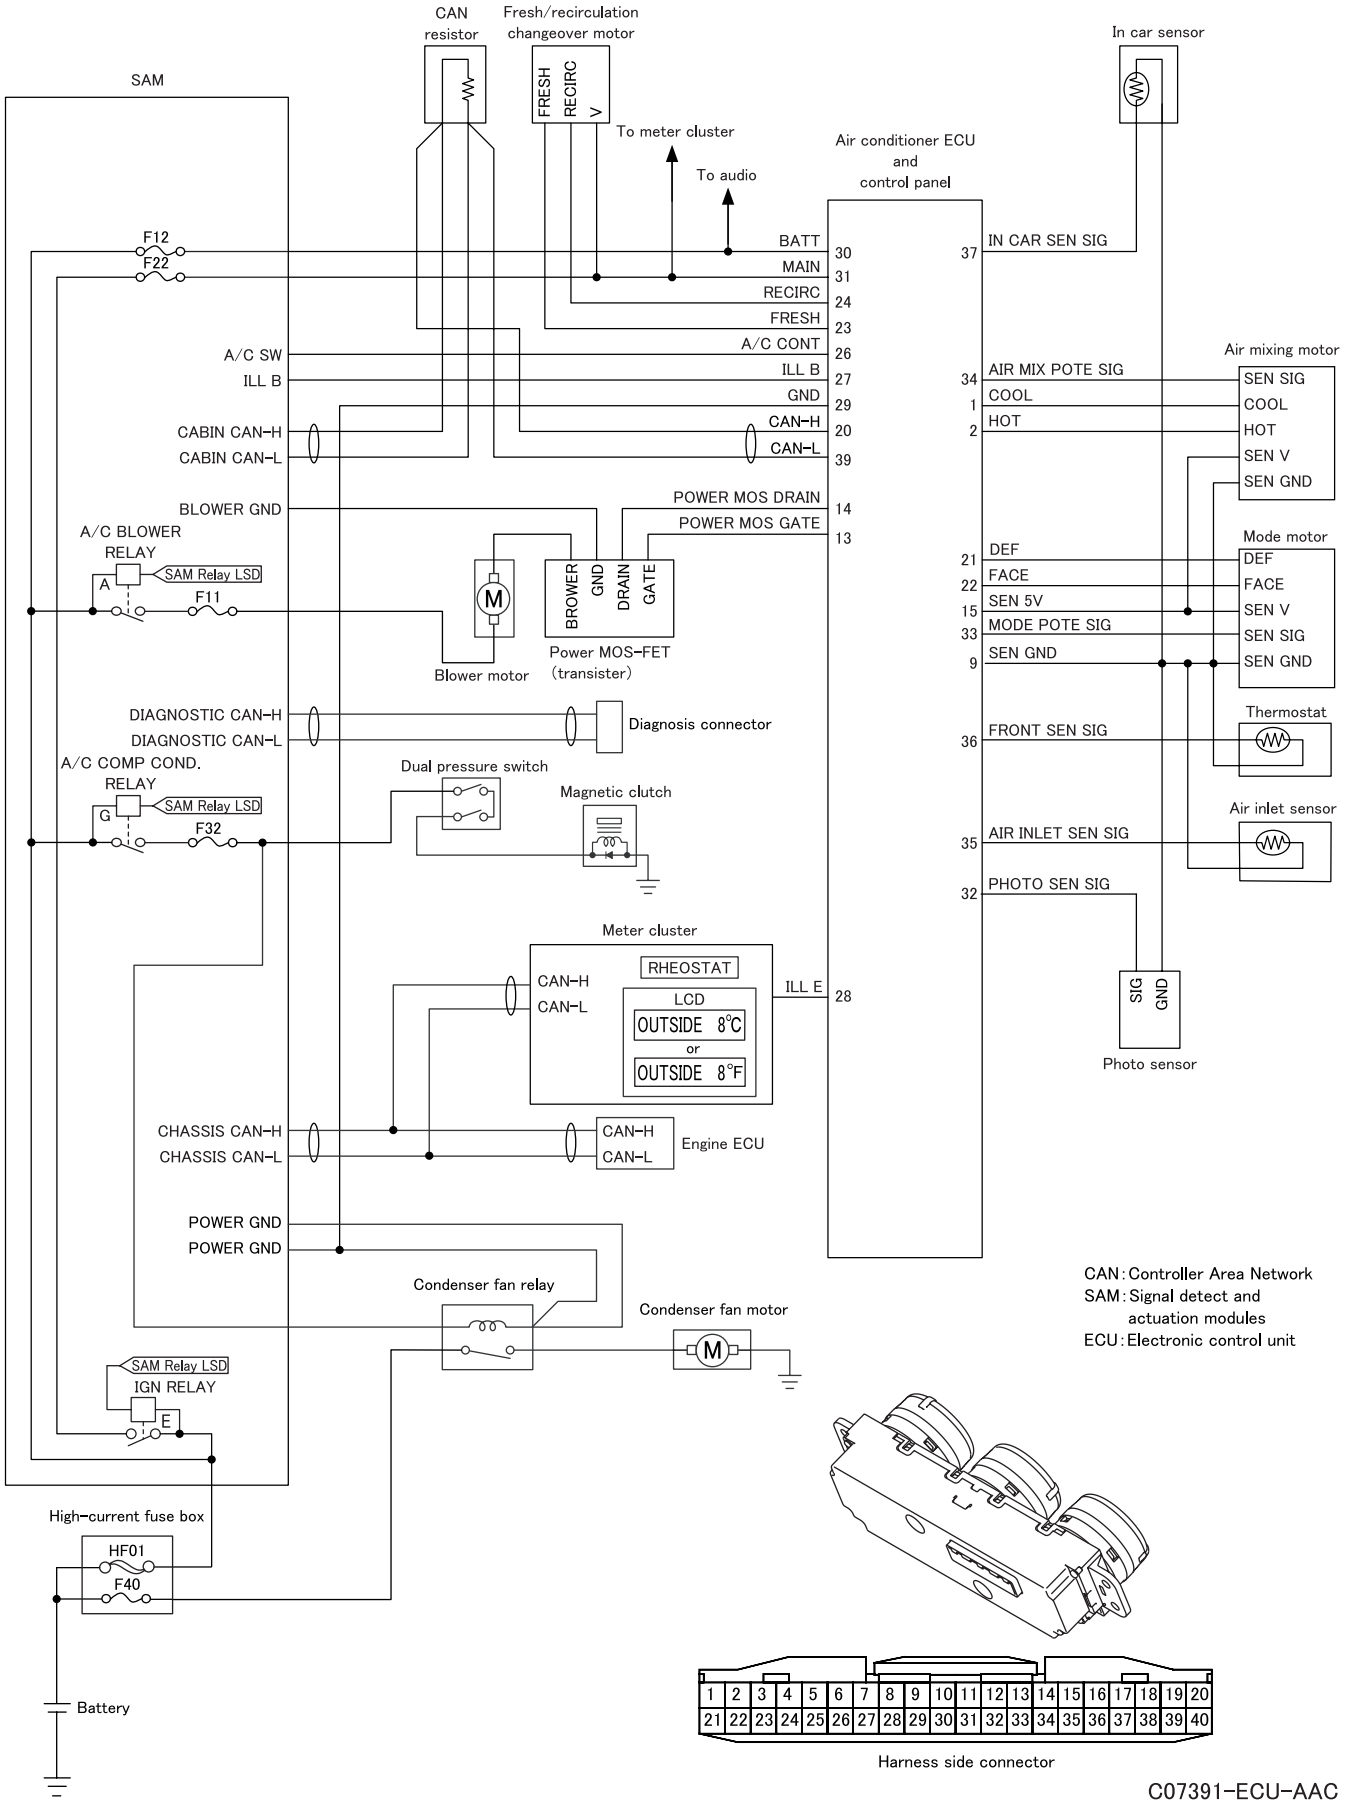
(7) Backup function

- The air conditioner control unit & control panel in air conditioner control unit and control panel keeps the set temperature and the setting conditions of all the switches in the memory unless the battery terminals are disconnected.

2.3 Diagnosis function

- Each time the starter switch is set to ON, the air conditioner control unit & control panel performs a self-diagnostic to ensure that all the sensors, etc. are in order. If any of them is found to be defective, the air conditioner control unit & control panel stores the defective element in memory, and enters the backup mode.
- The air conditioner control unit limits the function of the system to keep the vehicle safety when the system is failing. The defective element stored in memory can be called out in terms of a diagnosis code by an Multi-Use Tester or the diagnosis switch. (See Gr00.)

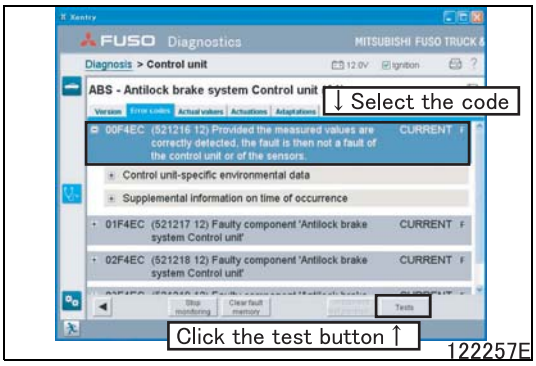
3. Electronic Control Unit Schematic Diagram



C07391-ECU-AAC

1. Inspection Based on Diagnosis Codes

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.



- When the FUSO Diagnostics is connected, perform the interactive troubleshooting with the following procedure.

  Select the code from the diagnostics code list
  ↓
  Click the test button
  ↓
  Start the interactive troubleshooting

1.1 List of diagnosis code

Code	Message	warning lamp indication	Remarks
170-3	The signal voltage of component ‘Interior temperature sensor’ is too high.	-	
170-4	The signal voltage of component ‘Interior temperature sensor’ is too low.	-	
171-3	The signal voltage of component ‘Outside temperature sensor’ is too high.	-	
171-4	The signal voltage of component ‘Outside temperature sensor’ is too low.	-	
639-19	CAN fault	-	
1547-3	The signal voltage of component ‘Thermostat’ is too high.	-	
1547-4	The signal voltage of component ‘Thermostat’ is too low.	-	
2610-4	The signal voltage of component ‘Light sensor’ is too low.	-	
3981-3	The signal voltage of component ‘Potentiometer (Mode setting Electric motor)’ is too high.	-	
3981-4	The signal voltage of component ‘Potentiometer (Mode setting Electric motor)’ is too low.	-	
3981-7	Component ‘Potentiometer (Mode setting Electric motor)’ is stuck.	-	
3985-12	The control unit has an internal fault.	-	
3986-3	The signal voltage of component ‘Potentiometer (Actuator motor for blend air flap)’ is too high.	-	
3986-4	The signal voltage of component ‘Potentiometer (Actuator motor for blend air flap)’ is too low.	-	
3986-7	Component ‘Actuator motor for blend air flap’ is stuck.	-	

CAN: Controller Area Network communication

1.2 Code generation criteria and inspection item

170-3: The signal voltage of component 'Interior temperature sensor' is too high.

Generation condition	• Output voltage of inside air temperature sensor is 4.9 V or higher.
Recoverability	• System recovers normal state when sensor voltage becomes normal.
Control effected by electronic control unit	• If starter switch is turned to ON when faulty condition exists: Default values are invariably assumed. • If faulty condition occurs while starter switch is in ON position: Values just before occurrence of fault are invariably assumed.
Possible causes	• Open signal harness between air conditioner electronic control unit & control panel and inside air temperature sensor • Open ground harness between air conditioner electronic control unit & control panel and inside air temperature sensor • Short circuit to power supply of signal harness between air conditioner electronic control unit & control panel and inside air temperature sensor • Faulty inside air temperature sensor • Faulty air conditioner electronic control unit & control panel

170-4: The signal voltage of component 'Interior temperature sensor' is too low.

Generation condition	• Output voltage of inside air temperature sensor is 0.1 V or lower.
Recoverability	• System recovers normal state when sensor output voltage becomes normal.
Control effected by electronic control unit	• If starter switch is turned to ON when faulty condition exists: Default values are invariably assumed. • If faulty condition occurs while starter switch is in ON position: Values just before occurrence of fault are invariably assumed.
Possible causes	• Shorted signal harness between air conditioner electronic control unit & control panel and inside air temperature sensor • Faulty inside air temperature sensor • Faulty air conditioner electronic control unit & control panel

171-3: The signal voltage of component 'Outside temperature sensor' is too high.

Generation condition	• Output voltage of outside air temperature sensor is 4.9 V or higher.
Recoverability	• System recovers normal state when sensor output voltage becomes normal.
Control effected by electronic control unit	• If starter switch is turned to ON when faulty condition exists: Default values are invariably assumed. • If faulty condition occurs while starter switch is in ON position: Values just before occurrence of fault are invariably assumed.
Possible causes	• Open signal harness between air conditioner electronic control unit & control panel and outside air temperature sensor • Open ground harness between air conditioner electronic control unit & control panel and outside air temperature sensor • Short circuit to power supply of signal harness between air conditioner electronic control unit & control panel and outside air temperature sensor • Faulty outside air temperature sensor • Faulty air conditioner electronic control unit & control panel

171-4: The signal voltage of component 'Outside temperature sensor' is too low.

Generation condition	• Output voltage of outside air temperature sensor is 0.1 V or lower.
Recoverability	• System recovers normal state when sensor output voltage becomes normal.
Control effected by electronic control unit	• If starter switch is turned to ON when faulty condition exists: Default values are invariably assumed. • If faulty condition occurs while starter switch is in ON position: Values just before occurrence of fault are invariably assumed.
Possible causes	• Shorted signal harness between air conditioner electronic control unit & control panel and outside air temperature sensor • Faulty outside air temperature sensor • Faulty air conditioner electronic control unit & control panel

639-19: CAN fault

Generation condition	• There is some controller area network communications problem.
Recoverability	• System recovers normal state when all of the following conditions are met. • Communication bus is not in off state. • Message indicating normal speed range is being received. • Message indicating normal coolant temperature range is being received.
Control effected by electronic control unit	• Default value is invariably assumed for non-received controller area network message.
Possible causes	• Controller area network communications bus is open, shorted to power supply, shorted to ground, or otherwise shorted. • Faulty malfunction signal detect and actuation modules for resistors in air conditioner electronic control unit & control panel. • Faulty air conditioner electronic control unit & control panel.

1547-3: The signal voltage of component 'Thermostat' is too high.

Generation condition	• Output voltage of thermostat is 4.9 V or higher.
Recoverability	• System recovers normal state when thermostat output voltage becomes normal.
Control effected by electronic control unit	• If starter switch is turned to ON when faulty condition exists: Default values are invariably assumed. • If faulty condition occurs while starter switch is in ON position: Values just before occurrence of fault are invariably assumed.
Possible causes	• Open signal harness between air conditioner electronic control unit & control panel and thermostat • Open ground harness between air conditioner electronic control unit & control panel and thermostat • Short circuit to power supply of signal harness between air conditioner electronic control unit & control panel and thermostat • Faulty thermostat • Faulty air conditioner electronic control unit & control panel

1547-4: The signal voltage of component 'Thermostat' is too low.

Generation condition	• Output voltage of thermostat is 0.1 V or lower.
Recoverability	• System recovers normal state when thermostat output voltage becomes normal.
Control effected by electronic control unit	• If starter switch is turned to ON when faulty condition exists: Default values are invariably assumed. • If faulty condition occurs while starter switch is in ON position: Values just before occurrence of fault are invariably assumed.
Possible causes	• Shorted signal harness between air conditioner electronic control unit & control panel and thermostat • Faulty thermostat • Faulty air conditioner electronic control unit & control panel

2610-4: The signal voltage of component 'Light sensor' is too low.

Generation condition	• Output voltage of photo sensor is 0.1 V or lower.
Recoverability	• System recovers normal state when photo sensor output voltage becomes normal.
Control effected by electronic control unit	• Photo sensor output voltage is invariably assumed to be 0 W/m^2.
Possible causes	• Shorted signal harness between air conditioner electronic control unit & control panel and photo sensor • Faulty photo sensor • Faulty air conditioner electronic control unit & control panel

CAN: Controller Area Network communication

3981-3: The signal voltage of component 'Potentiometer (Mode setting Electric motor)' is too high.

Generation condition	• Output voltage of potentiometer inside the mode motor is 4.9 V or higher.
Recoverability	• System recovers normal state when potentiometer output voltage becomes normal.
Control effected by electronic control unit	• Air mixing actuator is not driven any further.
Possible causes	• Short circuit to power supply (5 V and/or 24 V) of signal harness between air conditioner electronic control unit & control panel and mode motor • Open ground harness between air conditioner electronic control unit & control panel and mode motor • Faulty potentiometer inside the mode motor • Faulty air conditioner electronic control unit & control panel

3981-4: The signal voltage of component 'Potentiometer (Mode setting Electric motor)' is too low.

Generation condition	• Output voltage of potentiometer inside the mode motor is 0.1 V or lower.
Recoverability	• System recovers normal state when potentiometer output voltage becomes normal.
Control effected by electronic control unit	• Mode actuator is not driven any further.
Possible causes	• Short circuit to ground of signal harness between air conditioner electronic control unit & control panel and mode motor • Open power harness between air conditioner electronic control unit & control panel and mode motor • Faulty potentiometer inside the mode motor • Faulty air conditioner electronic control unit & control panel

3981-7: Component 'Potentiometer (Mode setting Electric motor)' is stuck.

Generation condition	• Mode motor is stopped from being driven if potentiometer output does not vary 12 bits or more. This code is set after consecutive 5 stop-and-restart cycles of mode motor after it is first stopped.
Recoverability	• System recovers normal state when potentiometer varies more than 12 bits when air mixing motor is driven.
Control effected by electronic control unit	• Repeats stop-and-restart cycles as many time as required to reach the target.
Possible causes	• Foreign material caught in mode dampers (DEF, FACE, and FOOT) and links.

3985-12: The control unit has an internal fault.

Generation condition	• There is some problem inside electronic control unit.
Recoverability	• System recovers normal state when all of the following conditions are met. • Both writing and reading into EEPROM complete successfully. • Resetting completes successfully.
Control effected by electronic control unit	• When EEPROM is faulty: Battery backup data is used as substitute. • When reset circuit is faulty: Normal resetting is impossible.
Possible causes	• Faulty air conditioner electronic control unit & control panel.

3986-3: The signal voltage of component 'Potentiometer (Actuator motor for blend air flap)' is too high.

Generation condition	• Output voltage of air mixing motor is 4.9 V or higher.
Recoverability	• System recovers normal state when output voltage of air mixing motor becomes normal.
Control effected by electronic control unit	• Electronic control unit causes air mixing motor to stop.
Possible causes	• Short circuit to power supply (5 V and/or 24 V) of signal harness between air conditioner electronic control unit & control panel and air mixing motor • Open ground harness between air conditioner electronic control unit & control panel and air mixing motor • Faulty potentiometer inside the air mixing motor • Faulty air conditioner electronic control unit & control panel

3986-4: The signal voltage of component 'Potentiometer (Actuator motor for blend air flap)' is too low.

Generation condition	• Output voltage of air mixing motor is 0.1 V or lower.
Recoverability	• System recovers normal state when air mixing motor output voltage becomes normal.
Control effected by electronic control unit	• Air mixing actuator is not driven any further.
Possible causes	• Short circuit to ground of signal harness between air conditioner electronic control unit & control panel and air mixing motor • Open power harness between air conditioner electronic control unit & control panel and air mixing motor • Faulty potentiometer inside the air mixing motor • Faulty air conditioner electronic control unit & control panel

3986-7: Component 'Actuator motor for blend air flap' is stuck.

Generation condition	• Air mixing motor is stopped from being driven if potentiometer output does not vary 12 bits or more. This code is set after consecutive 5 stop-and-restart cycles of mode motor after it is first stopped.
Recoverability	• System recovers normal state when potentiometer output varies more than 12 bits.
Control effected by electronic control unit	• Repeats stop-and-restart cycles of air mixing motor as many time as required to reach the target.
Possible causes	• Foreign material caught in air mixing damper and links.

2. FUSO Diagnostics Service Data (Actual Values)

- Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.

[Current value group: Temperature values]

No.	Description	Value	Explanation
000	Ambient temperature	■■■■ °F	Indicates the ambient temperature detected by the ambient temperature sensor Normal temperature: -29 to 47.5°C {-20 to 117°F} [Related part] Ambient temperature sensor
001	Vehicle interior temperature	■■■■ °F	Indicates the vehicle interior temperature detected by the vehicle interior temperature sensor Normal temperature: -29 to 47.5°C {-20 to 117°F} [Related part] Vehicle interior temperature sensor
002	Evaporator temperature	■■■■ °F	Indicates the temperature around evaporator detected by the thermostat Normal temperature: -29 to 47.5°C {-20 to 117°F} [Related part] Thermostat
003	Light intensity of sun sensor	■■■■ W	Indicates the amount of solar radiation detected by the sun sensor Normal amount of solar radiation: 0 to 1559 W/m^2 Measurement varies depending on the amount of direct sunlight [Related part] Sun sensor

[Current value group: Status of electric motor]

No.	Description	Value	Explanation
004	Output of component 'Actuator motor for blend air flap'	■■■■ %	Indicates the damper opening detected by the potentiometer in the air mix motor 0 (MAX COOL) to 100% (MAX HOT) [Related part] Air mix motor
005	Output of component 'Potentiometer'	2/3/4/5/6/7/8/9/10	Indicates the damper opening detected by the potentiometer in the mode motor 2: Mode FACE 3: Mode B/L1 4: Mode B/L2 5: Mode B/L3 6: Mode FOOT 7: Mode D/F1 8: Mode D/F2 9: Mode D/F3 10: Mode DEF [Related part] Mode motor
006	Output of component 'Air conditioning'	ON/OFF	Indicates the output condition of air conditioner 0: OFF Others: ON [Related part] Air conditioner electronic control unit and control panel
007	Output of component 'Actuator motor for fresh air/recirculated air flap'	Introducing outside air/Recirculated air	Indicates the output value of fresh air/recirculated air changeover motor [Related part] Air mix motor
008	Mode setting Electric motor (Damper position)	■■■■ %	Indicates the output value of air mix motor 0 to 100% [Related part] Air mix motor

No.	Description	Value	Explanation
009	Output of component 'Blower motor'	2/3/4/5/6/7/8/9/10	Indicates the output value of the blower motor 2: Fan "OFF" 3: Fan speed 1 4: Fan speed 2 5: Fan speed 3 6: Fan speed 4 7: Fan speed 5 8: Fan speed 6 9: Fan speed 7 10: Fan speed 8 [Related part] Fan motor
010	Output of component 'Mode setting Electric motor'	2/3/4/5/6/7/8/9/10	Indicates the output value of the mode motor 2: Mode FACE 3: Mode B/L1 4: Mode B/L2 5: Mode B/L3 6: Mode FOOT 7: Mode D/F1 8: Mode D/F2 9: Mode D/F3 10: Mode DEF [Related part] Mode motor

[Current value group: Switch status]

No.	Description	Value	Explanation
011	Manual switchover to air recirculation mode Switches	Introducing air/Recirculated air/AUTOMATIC	Indicates the status of fresh air/recirculation air mode [Related part] Air conditioner electronic control unit and control panel
012	Air conditioning Switches	OFF/ON/AUTO	Indicates the status of air conditioner switch [Related part] Air conditioner electronic control unit and control panel
013	Position of diffuser flap	1/2/3/4/5/6/7/8/9/10	Indicates the status of air conditioner switch (mode position) 1: Mode AUTO 2: Mode FACE 3: Mode B/L1 4: Mode B/L2 5: Mode B/L3 6: Mode FOOT 7: Mode D/F1 8: Mode D/F2 9: Mode D/F3 10: Mode DEF [Related part] Air conditioner electronic control unit and control panel
014	Blower stage	1/2/3/4/5/6/7/8/9/10	Indicates the status of air conditioner switch (air volume) 1: Fan AUTO 2: Fan OFF 3: Fan speed 1 4: Fan speed 2 5: Fan speed 3 6: Fan speed 4 7: Fan speed 5 8: Fan speed 6 9: Fan speed 7 10: Fan speed 8 [Related part] Air conditioner electronic control unit and control panel
015	Temperature setting	■■■■ °C	Indicates status of air conditioner switch (temperature) Normal temperature: 19°C (MAX COOL) to 31°C (MAX HOT) [Related part] Air conditioner electronic control unit and control panel

[Current value group: Other actual values]

No.	Description	Value	Explanation
016	Coolant temperature	■■■■ °F	Indicates the engine coolant temperature detected by the coolant temperature sensor Normal temperature: -40 to 210°C {-20 to 117°F} [Related part] Engine electronic control unit
017	Switch illumination	ON/Spare input/ OFF	Indicates the status of illumination lamp [Related part] Air conditioner electronic control unit and control panel

3. FUSO Diagnostics Actuator Test (Actuations)

- Since the contents of the FUSO Diagnostics are regularly updated, the descriptions and expressions may differ from those given in the service manuals. Check the latest information with the FUSO Diagnostics.

No.	Selection	Description
000	Compressor	Drives the compressor output (pin 26). The actuator test cannot be performed when the blower motor is OFF. [Additional condition for performing actuator test] +12V (M): ON Blower fan: ON No diagnosis code [Checking method] Confirm that cold air comes out after the activation sound of the magnetic clutch is heard.
001	Actuator motor for fresh air/recirculated air flap	Drives the fresh/recirculation changeover motor output (pins 23 and 24). Wait for 1.5 seconds before switching the motor. [Additional condition for performing actuator test] +12V (M): ON Turn off the blower fan and drive the vehicle. Switch the motor between the fresh air and recirculation modes. No diagnosis code [Checking method] Confirm that air comes out from the outlet in the fresh air mode. Confirm that air does not come out from the outlet in the recirculation mode.
002	Actuator motor for blend air flap	Drives the air mixing motor output (pins 1 and 2). [Additional condition for performing actuator test] +12V (M): ON Temperature motor output: Low (2 to 18%) Temperature motor output: Center (42 to 58%) Temperature motor output: High (82 to 98%) No diagnosis code [Checking method] Confirm that the motor output feedback follows the motor output.
003	Blower motor	Drives the condenser fan motor output (pin 13). [Additional condition for performing actuator test] +12V (M): ON Blower motor: OFF Blower motor speed setting: 1 to 8 No diagnosis code [Checking method] When the blower motor is OFF, confirm that air does not come out from the outlet. When a blower motor speed is selected, confirm that air comes out from the outlet and that the airflow rate corresponds to the selected speed.

No.	Selection	Description
004	Mode setting Electric motor	Drives the mode motor output (pins 21 and 22). [Additional condition for performing actuator test] +12V (M): ON 2=FACE 3=BL1 4=BL2 5=BL3 6=Foot 7=DF1 8=DF2 9=DF3 10=Front windshield No diagnosis code [Checking method] Confirm that air comes out from the same outlet as the selected mode.

4. Electronic Control Unit Input/Output Table

- See the Electronic Control Unit Schematic Diagram for the pin locations of each signal and ground.

Devices to be connected	Terminal	Input/output	Voltage and wave form
In car sensor	37-9	In	[Measurement condition] Disconnect the electronic control unit and harness, then inspect on the vehicle-side connector. [Judgment criteria] See 54-11, #256.
Air inlet sensor	35-9	In	[Measurement condition] Disconnect the electronic control unit and harness, then inspect on the vehicle-side connector. [Judgment criteria] See 54-11, #253.
Thermostat	36-9	In	[Measurement condition] Disconnect the electronic control unit and harness, then inspect on the vehicle-side connector. [Judgment criteria] See 54-11, #751.
Potentiometer of air mixing motor	34-9	Out	[Judgment criteria] • Lever position Max. hot: 4.0 ± 0.03 V • Lever position Max. cool: 1.0 ± 0.03 V
Potentiometer of mode motor	33-9	Out	[Judgment criteria] • Lever position FACE: 4.5 ± 0.03 V • Lever position DEF: 0.5 ± 0.03 V
