015	Ambient temperature	■■■■°F	Intake air temperature (equivalent to ambient temperature) from humidity and intake air temperature sensor is indicated. • Ignition ON (in cold engine): At ambient temperature [Related parts] • Humidity and intake air temperature sensor
016	Coolant temperature	■■■■°F	Engine coolant temperatures detected by water temperature sensor will be indicated. • Standard: 95°C or less <Except cold regions> [Related parts] • Water temperature sensor

[Current value group: Pressure values]

No.	Description	Value	Explanation
017	Boost pressure	■■■■kPa	Signal voltage detected by boost pressure sensor section of boost pressure and temperature sensor will be indicated. • During idling: At atmospheric pressure [Related parts] • Boost pressure and temperature sensor
018	Pressure of component 'Crankcase pressure sensor 1'	■■■■kPa	Crankcase internal pressure from blow-by pressure sensor 1 is indicated. • During idling: -0.5kPa or less [Related parts] • Blow-by pressure sensor 1

No.	Description	Value	Explanation
019	Pressure of component 'Crankcase pressure sensor 2'	■■■■kPa	Blow-by gas pressure from blow-by pressure sensor 2 is indicated. • During idling: -0.5kPa or less [Related parts] • Blow-by pressure sensor 2
020	Pressure differential in diesel particulate filter (Correction values)	■■■■kPa	Differential pressure of diesel particulate filter calculated by engine electronic control unit will be indicated. [Related parts] • Diesel particulate filter differential pressure sensor • Engine electronic control unit
021	Pressure differential in diesel particulate filter	■■■■kPa	Differential pressure across diesel particulate filter detected by diesel particulate filter differential pressure sensor will be indicated. [Related parts] • Diesel particulate filter differential pressure sensor
022	Pressure differential of component 'DPF'	■■■■kPa	Pressure difference between upstream side of oxidation catalyst before diesel particulate filter and downstream side of diesel particulate filter detected by diesel particulate filter differential sensor will be indicated. [Related parts] • Diesel particulate filter differential pressure sensor
023	Engine oil pressure	■■■■kPa	Engine oil pressure detected by engine oil pressure switch will be indicated. • Ignition ON: 0kPa • Engine running: 1000kPa [Related parts] • Oil pressure switch
024	Boost pressure (Specified value)	■■■■kPa	Target value of turbocharger boost pressure calculated by engine electronic control unit will be indicated. • During idling: At atmospheric pressure [Related parts] • Engine electronic control unit
025	Rail pressure	■■■■kPa	Actual measurements of common rail pressure taken by common rail pressure sensor will be indicated. [Related parts] • Pressure sensor
026	Pressure of component ‘DEF delivery pump’	■■■■kPa	Diesel exhaust fluid pressure in DEF pump unit from DEF pressure sensor is indicated. To make the pressure to the specified value of 500 kPa, set the exhaust temperature to 110°C {230°F}or higher. [Related parts] DEF pressure sensor
027	Ambient pressure	■■■■kPa	Atmospheric pressure will be indicated. [Related parts] • Atmospheric pressure sensor (built in engine electronic control unit)
028	Boost pressure (Differential pressure)	■■■■kPa	Deviation of actual value from target value for turbocharger boost pressure will be indicated. [Related parts] • Boost pressure and temperature sensor
029	Rail pressure (Differential pressure)	■■■■kPa	Deviation of actual value from target value for common rail pressure will be indicated. [Related parts] • Pressure sensor
030	Rail pressure (specified value)	■■■■kPa	Pressure demanded by pressure regulation valve will be indicated. [Related parts] • Pressure sensor

[Current value group: Voltage values]

No.	Description	Value	Explanation
031	Battery voltage	■■■■V	Battery voltage will be indicated. • Standard value: 8 to 15V [Related parts] • Battery • Signal detect and actuation modules
032	Operating state of component 'Lambda control tester' (Heater ON)	■■■■%	Signals (duty values) used to operate heater of O_2 sensor (lambda sensor) will be indicated. • Heater warms up the value of the lambda sensor is increased. If there is no variation in the value of the defect or sensor heater is not warmed might have occurred. [Related parts] • Lambda sensor
033	Signal voltage from pressure sensor of component 'Boost pressure / Temperature sensor'	■■■■V	Signal voltage detected by boost pressure sensing section of boost pressure and temperature sensor will be indicated. [Related parts] • Boost pressure and temperature sensor
034	Signal voltage of component 'Air mass flow rate / Intake air temperature sensor' (Temperature sensors)	■■■■V	Signal voltage detected by intake air temperature sensing section of airflow and intake air temperature sensor will be indicated. [Related parts] • Air flow and intake air temperature sensor
035	Signal voltage of component 'Temperature sensor (Charge air temperature downstream of charge air cooler)'	■■■■V	Signal voltage from intercooler outlet temperature sensor is indicated. [Related parts] • Intercooler outlet temperature sensor
036	Signal voltage of component 'Boost pressure / Temperature sensor' (Temperature sensors)	■■■■V	Signal voltage (estimation) detected by boost pressure sensing section of boost pressure and temperature sensor will be indicated. [Related parts] • Boost pressure and temperature sensor
037	Signal voltage of component ‘Position sensor ‘Accelerator pedal’1’	■■■■V	Signal voltage output by accelerator pedal position sensor 1 will be indicated. • Standard value: 1.1 to 4.6 V [Related parts] • Accelerator pedal position sensor 1
038	Signal voltage of component ‘Position sensor ‘Accelerator pedal’2’	■■■■V	Signal voltage output by accelerator pedal position sensor 2 will be indicated. (Output characteristic of accelerator pedal position sensor 2 is different from that of sensor 1.) • Standard value:0.5 to 2.35 V [Related parts] • Accelerator pedal position sensor 2
039	Signal voltage of component ‘Atmospheric pressure sensor’	■■■■V	Signal voltage from atmospheric pressure sensor (built in engine electronic control unit) will be indicated. [Related parts] • Atmospheric pressure sensor (built in engine electronic control unit)
040	Signal voltage of component 'Intake air temperature / Air humidity sensor' (Temperature sensors)	■■■■V	Signal voltage from intake air temperature (equivalent to ambient temperature) sensing section of humidity and intake air temperature sensor is indicated. [Related parts] • Humidity and intake air temperature sensor
041	Sensor voltage (Pressure differential in diesel particulate filter) (raw value)	■■■■V	Signal voltage (estimation) from diesel particulate filter differential pressure sensor will be indicated. [Related parts] • Diesel particulate filter differential pressure sensor

No.	Description	Value	Explanation
043	Signal voltage of component ‘Temperature sensor Exhaust system1’	■■■■V	Signal voltage (estimation) from exhaust gas temperature sensor 1 will be indicated. [Related parts] • Exhaust gas temperature sensor 1
044	Signal voltage of component 'Intake air temperature / Air humidity sensor' (Air humidity sensor)	■■■■V	Signal voltage from intake air humidity (estimation) sensing section of humidity and intake air temperature sensor is indicated. [Related parts] • Humidity and intake air temperature sensor

[Current value group: Rpm, Vehicle speed]

No.	Description	Value	Explanation
047	Engine speed	■■■■1/min	Engine speed will be indicated. • Idling speed (no load minimum speed): 650 1/min. • Idle-up: 825 to 850 1/min. • Diesel particulate filter automatic regeneration: 800 1/min. • Diesel particulate filter parked regeneration: 1500 1/min. • Actuator test “011 Regeneration of diesel particulate filter” when used: 1500 1/min. [Related parts] • Engine speed sensor
051	Transmission ratio	■■■■-	Transmission reduction ratio will be indicated. [Related parts] • DUONIC electronic control unit
052	Vehicle speed	■■■■mph	Current vehicle speed will be indicated. [Related parts] • Vehicle speed sensor

[Current value group: Air mass]

No.	Description	Value	Explanation
053	Air mass flow rate (Actual value)	■■■■mg	Total flow rate (m^3/s) of intake air detected by airflow sensor will be indicated. [Related parts] • Air flow and intake air temperature sensor
054	Air mass flow rate (Specified value)	■■■■mg	Target value of intake air volume for each cylinder will be indicated (for use in exhaust gas recirculation control). [Related parts] • Air flow and intake air temperature sensor
055	Air mass flow rate (Cylinder)	■■■■mg	Amount of air (m^3/s) taken in each cylinder during one cycle engine operation (detected by airflow sensor) will be indicated. [Related parts] • Air flow and intake air temperature sensor
056	Humidity of intake air	■■■■%	Humidity of intake air from humidity and intake air temperature sensor is indicated. • Normal: And values when the ignition key ON, the value after the engine warm-up is the same. [Related parts] • Humidity and intake air temperature sensor
057	Lambda value	■■■■-	Lambda value detected by lambda sensor will be indicated. (When confirm the service data, it is confirmed that the lambda sensor is functioning at "010 Temperature at component 'Lambda control tester'" in advance.) [Related parts] • Lambda sensor

[Current value group: Injection quantity]

No.	Description	Value	Explanation
063	Required fuel quantity for post injection	■■■■mg/hub	Demanded post-injection amount ([mg/hub] = [mg/cycle]) will be indicated. [Related parts] • Injector • Engine electronic control unit
064	Injection quantity (Adjustment value)	■■■■mg/hub	Fuel injection amount calculated based on electric current value will be indicated. • Fuel injection amount: 3.0000 to 10.0000 mg/hub [Related parts] • Injector • Engine electronic control unit
065	Injection quantity (Raw values)	■■■■mg/hub	Fuel injection amount calculated based on injector operation time will be indicated. • Fuel injection amount: 3.0000 to 10.0000 mg/hub [Related parts] • Injector • Engine electronic control unit
066	Current injection quantity	■■■■mg/hub	Current fuel injection amount will be indicated. (Checking of actual fuel injection amount is performed using this value as the fuel injection quantity (control value) and fuel injection quantity (pre-process value) are both the values calculated by engine electronic control unit.) ([mg/hub] = [mg/cycle]) • Fuel injection amount: 3.0000 to 10.0000 mg/hub [Related parts] • Injector • Engine electronic control unit
067	Fuel in engine oil	■■■■lb	Amount of fuel merged into engine oil which has been calculated by engine electronic control unit will be indicated. • Normal value: 400000mg {0.8818lb} or less [Related parts] • Engine electronic control unit
070	Correction value of fuel quantity (Cylinder 1)	■■■■mg/hub	Correction value of injection quantity of injector 1 will be indicated. • Normal: if all of actual measurements No. 70 to 73 are nearly in accordance with the standard. • Abnormal: if any one of actual measurements No. 70 to 73 deviates extremely from the standard. [Related parts] • Injector 1
071	Correction value of fuel quantity (Cylinder 3)	■■■■mg/hub	Correction value of injection quantity of injector 2 will be indicated. • Normal: if all of actual measurements No. 70 to 73 are nearly in accordance with the standard. • Abnormal: if any one of actual measurements No. 70 to 73 deviates extremely from the standard. [Related parts] • Injector 2
072	Correction value of fuel quantity (Cylinder 4)	■■■■mg/hub	Correction value of injection quantity of injector 3 will be indicated. • Normal: if all of actual measurements No. 70 to 73 are nearly in accordance with the standard. • Abnormal: if any one of actual measurements No. 70 to 73 deviates extremely from the standard. [Related parts] • Injector 3

No.	Description	Value	Explanation
073	Correction value of fuel quantity (Cylinder 2)	■■■■mg/hub	Correction value of injection quantity of injector 4 will be indicated. • Normal: if all of actual measurements No. 70 to 73 are nearly in accordance with the standard. • Abnormal: if any one of actual measurements No. 70 to 73 deviates extremely from the standard. [Related parts] • Injector 4
074	Soot content (Engine oil)	■■■■lb	Amount of soot merged into engine oil which has been calculated by engine electronic control unit will be indicated. [Related parts] • Engine electronic control unit
075	Status of component 'Relay 'Fuel pump''	ON/OFF	Whether or not electromagnetic high pressure pump is actuated by engine electronic control unit will be indicated. • ON: High pressure pump is in operation • OFF: High pressure pump is not in operation [Related parts] • High pressure pump • Engine electronic control unit
076	Specified value of component ‘Pressure regulating valve in rail’	■■■■A	Electric current value demanded by pressure regulation valve will be indicated. [Related parts] • Pressure regulation valve
077	Specified value of component 'FMU (Fuel Metering device)'	■■■■A	Electric current value demanded by pressure regulation valve will be indicated. [Related parts] • Pressure regulation valve
078	PWM signal of component 'FMU (Fuel Metering device)'	■■■■%	PWM outputs to common rail pressure control valve will be indicated. [Related parts] • Pressure regulation valve

[Current value group: Travel distance]

No.	Description	Value	Explanation
089	Main odometer reading on deactivation 1	■■■■mi	Vehicle travel distance when the vehicle was recovered from shortage of diesel exhaust fluid (SCR system-related error) is indicated. [Related parts] • Engine electronic control unit
090	Main odometer reading on deactivation 2	■■■■mi	Vehicle travel distance when the vehicle was recovered from abnormal NOx (SCR system-related error) is indicated. [Related parts] • Engine electronic control unit

[Current value group: Hours]

No.	Description	Value	Explanation
099	Time since engine start	■■■■h	Engine operating time will be indicated. [Related parts] • Engine electronic control unit
100	Measurement value of oil dilution during regeneration of diesel particulate filter	■■■■h	Oil dilution measurement time during diesel particulate filter regeneration will be indicated. • With older than 136800sec Engine electronic control unit to generate is determined that a fault diagnosis code. [Related parts] • Engine electronic control unit

[Current value group: Diesel particulate filter]

No.	Description	Value	Explanation
101	Efficiency of SCR catalytic converter (Raw values)	■■■■-	Purification efficiency (estimation) of SCR catalytic converter is indicated. [Related parts] • Engine electronic control unit
104	Ash content of diesel particulate filter	■■■■lb	Amount of ash accumulated on diesel particulate filter will be indicated. • Normal value:200g {0.4409lb} or less [Related parts] • Engine electronic control unit
105	Soot content of diesel particulate filter	■■■■lb	Amount (calculated value) of soot accumulated on inner side of diesel particulate filter will be indicated. • 15g or less: Diesel particulate filter regeneration is stopped. • More than 42g: Diesel particulate filter automatic regeneration is started. • More than 52g: Diesel particulate filter parked regeneration is possible. • More than 65g: Particulate matter (PM) is over-deposited and diagnosis code is generated. [Related parts] • Engine electronic control unit
106	Status of regeneration	Normal mode/ Automatic regeneration 1/ Automatic regeneration 2/ Automatic regeneration 3/ Emergency operation mode/ Parked regeneration 1/ Parked regeneration 2	Regeneration control condition of diesel particulate filter will be indicated. • Normal mode: Normal mode • Automatic regeneration 1: Diesel particulate filter automatic regeneration without post-injection • Automatic regeneration 2: Diesel particulate filter automatic regeneration with post-injection (automatically controlled) • Automatic regeneration 3: Diesel particulate filter automatic regeneration with post-injection (controlled by governor) • (Emergency mode): Emergent operation mode with diesel particulate filter loaded with excessive amount of accumulation (without exhaust gas recirculation) • Parked regeneration: Parked regeneration 1: Parked diesel particulate filter regeneration (not accompanied by post-injection) • Parked regeneration: Parked regeneration 2: Parked diesel particulate filter regeneration (followed by post-injection and controlled by governor) [Related parts] • Engine electronic control unit

[Current value group: EGR]

No.	Description	Value	Explanation
107	Position of exhaust gas recirculation controller (raw value)	■■■■%	Exhaust gas recirculate actuator opening (target value) of the engine electronic control unit has requested will be indicated. [Related parts] • Exhaust gas recirculation actuator
108	NOx values (Raw values)	■■■■ppm	NOx density (non-processed value) is indicated. [Related parts] • Nox sensor
111	Position of component 'Engine brake Solenoid valve'	■■■■%	Exhaust brake valve position will be indicated. (A value exceeding 90% will be indicated because of operation of engine brake.) [Related parts] • Exhaust brake valve

No.	Description	Value	Explanation
112	Smoke limit	■■■■ mg/hub	Fuel injection limitation amount for smoke reduction will be indicated. [Related parts] • Engine electronic control unit
113	Exhaust gas volume flow rate	■■■■ m^3/s	Calculated exhaust volume flow rate (m^3/s) inside particulate filter will be indicated. [Related parts] • Engine electronic control unit
114	Position of exhaust gas recirculation positioner (actual value)	■■■■ %	Exhaust gas recirculate actuator opening (actual value) will be indicated. Actuator opening: 5.000 to 95.00% [Related parts] • Exhaust gas recirculate actuator
115	NOx values	■■■■ ppm	NOx density from NOx sensor is indicated. • Immediately after the start of the engine and sensor heated before : 5000ppm (A numerical value indicating the behavior of the sensor, is not a standard value of the NOx concentration) [Related parts] • Nox sensor
116	Fill level of NOx storage catalytic converter (NH3)	■■■■ lb	Estimated amount of ammonia (NH_3) inside catalytic converter will be indicated. [Related parts] • Engine electronic control unit
118	Status of component 'Lambda control tester'	Activation/ NOT ACTIVATED	Operation status of O_2 sensor (lambda sensor) will be indicated. • Activation: Sensor unit activation. • NOT ACTIVATED: Sensor unit not activated. [Related parts] • Lambda sensor

[Current value group: Turbocharger]

No.	Description	Value	Explanation
121	PWM signal of component ‘Actuator in turbocharger’	■■■■ %	Driving opening of turbocharger vacuum modulator will be indicated. • Driving opening: 5.000 to 95.00% [Related parts] • Vacuum modulator

[Current value group: Urea values]

No.	Description	Value	Explanation
122	Current DEF metering quantity	■■■■ g/s	Measured value of diesel exhaust fluid dosing rate is indicated. [Related parts] • DEF pump unit • DEF dosing module • Engine electronic control unit
123	Requested DEF metering amount	■■■■ g/s	Target value of diesel exhaust fluid dosing rate is indicated. [Related parts] • Engine electronic control unit
124	Total DEF consumption	■■■■ lb	Amount of DEF (diesel exhaust fluid) is indicated. [Related parts] • Engine electronic control unit
125	Fill level of DEF tank	■■■■ %	Fluid level in DEF tank is indicated. • 100%: Fill-up • 0%: Empty [Related parts] • DEF level sensor

No.	Description	Value	Explanation
126	Status of DEF fill level	OK/NG	Whether DEF (diesel exhaust fluid) in DEF tank has been replaced or not is indicated. • NG: DEF (diesel exhaust fluid) is not fill-up. • OK: DEF (diesel exhaust fluid) is fill-up. [Related parts] • DEF level sensor • Engine electronic control unit
128	Status of component 'DEF heating element'	ON/OFF	Operating status of DEF line heater system will be indicated. • ON: Actuation • OFF: Non-actuation [Related parts] • DEF line heater
129	Status of component 'Heating element of DEF tank'	ON/OFF	Operating status of DEF pump unit heater is indicated. • ON: DEF pump heater is in operation. • OFF: DEF pump heater is not in operation. [Related parts] • DEF pump unit
130	DEF Delivery pump Electric motor (Specified value)	■■■■%	Target value of DEF pump unit motor is indicated. [Related parts] • DEF pump unit • Engine electronic control unit
131	DEF Delivery pump Electric motor (Measured value)	■■■■%	Measured value of DEF pump unit motor is indicated. [Related parts] • DEF pump unit
132	Status of component 'DEF Reverting valve' (Input signal)	ON/OFF	Operation status of inlet side of DEF reverting valve is indicated. • Inlet side of DEF reverting valve is in operation. • Inlet side of DEF reverting valve is not in operation. [Related parts] • DEF reverting valve
133	Status of component 'DEF Reverting valve' (Output signal)	ON/OFF	Operation status of outlet side of DEF reverting valve is indicated. • Outlet side of DEF reverting valve is in operation. • Outlet side of DEF reverting valve is not in operation. [Related parts] • DEF reverting valve
134	Status of component 'DEF level sensor'	■■■■%	DEF (diesel exhaust fluid) level in DEF tank is indicated. • Sensor failure: less than 45% [Related parts] • DEF level sensor
135	Status of oxygen sensor heater	ON/OFF	Operation status of lambda sensor heater will be indicated. • ON: Lambda sensor heater is in operation • OFF: Lambda sensor heater is not in operation [Related parts] • Lambda sensor

No.	Description	Value	Explanation
136	Status of DEF metering	■■■■	Operation status of SCR control is indicated. • 00 00: Water temperature before correction detected • 01 A8: SCR catalyst temperature too low / NOx sensor faulty / Addition of DEF (diesel exhaust fluid) not allowed (preparatory works not completed) • 21 8A: Water temperature too low / SCR catalyst temperature too low (at downstream side) / NOx sensor faulty / Addition of DEF (diesel exhaust fluid) not allowed (preparatory works not completed) / BlueTec® system monitoring stopped • 42 00: Diesel particulate filter regeneration requested • 62 00: Diesel particulate filter regeneration requested / BlueTec® system monitoring stopped • 01 AA: Water temperature too low / SCR catalyst temperature too low (at downstream side) / NOx sensor faulty / Addition of DEF (diesel exhaust fluid) not allowed (preparatory works not completed) • 21 AA: Water temperature too low / SCR catalyst temperature too low (at downstream side) / NOx sensor faulty / Addition of DEF (diesel exhaust fluid) not allowed (preparatory works not completed) / BlueTec® system monitoring stopped • 20 A8: SCR catalyst temperature too low (at downstream side) / SCR catalyst function deteriorated / NOx sensor faulty / BlueTec® system monitoring stopped • 20 00: BlueTec® system monitoring stopped • [Related parts] • Engine electronic control unit

[Current value group: Engine brake]

No.	Description	Value	Explanation
137	Engine brake Switches	ON/OFF	Status of exhaust brake switch will be indicated. • OFF: Exhaust brake deactivated • ON: Exhaust brake activated [Related parts] • Combination switch (exhaust brake switch) • Signal detect and actuation modules
138	Engine Brake	ON/OFF	Current status of engine brake will be indicated. • OFF: Engine brake deactivated • ON: Engine brake activated [Related parts] • Combination switch (exhaust brake switch) • Exhaust brake valve • Signal detect and actuation modules
139	Parking brake	ON/OFF	Status of parking brake will be indicated. • Parking brake applied: ON • Parking brake not applied: OFF [Related parts] • Parking brake switch • Signal detect and actuation modules
140	Position of brake pedal	ON/OFF	Status of brake switch will be indicated. • ON: Brake pedal is operated. • OFF: Brake pedal is not operated. [Related parts] • Stop lamp switch • Signal detect and actuation modules

No.	Description	Value	Explanation
141	Status of engine brake (Switching off)	ON/OFF	Input signal of exhaust brake cut request will be indicated. • Exhaust brake cutoff requested from anti-skid brake system electronic control unit: ON • No exhaust brake cutoff request from anti-skid brake system electronic control unit: OFF [Related parts] • Hydraulic unit (electronic control unit)
142	Measurement value of component 'Status of engine brake (Switching off)'	ON/OFF	Detected value of exhaust brake cut switch will be indicated. • Exhaust brake cutoff requested from anti-skid brake system electronic control unit: ON • No exhaust brake cutoff request from anti-skid brake system electronic control unit: OFF [Related parts] • Hydraulic unit (electronic control unit)
143	Measurement value of component 'Signal of switch 'Engine brake''	ON/OFF	Status of exhaust brake switch will be indicated. • ON: Exhaust brake switch is ON. • OFF: Exhaust brake switch is OFF. [Related parts] • Combination switch (exhaust brake switch) • Signal detect and actuation modules

[Current value group: Preheating]

No.	Description	Value	Explanation
144	System status (Preglow system)	ON/OFF	Operation status of glow electronic control unit (glow plug) will be indicated. • ON: Glow plug control is valid. • OFF: Glow plug control is invalid. [Related parts] • Glow electronic control unit • Glow plug
145	Status of component 'Glow plug'	ACTIVE/ NOT ACTIVE	Status of glow plug is indicated. • ACTIVE: Glow plug power stage mode is valid. • NOT ACTIVE: Glow plug power stage mode is invalid. [Related parts] • Glow electronic control unit • Glow plug
146	Signal of component 'Glow plug' (Feedback)	ACTIVE/ NOT ACTIVE	Status of the glow plug drive feedback will be indicated. • NOT ACTIVE: No feedback received from the glow plug. • ACTIVE: Feedback received from the glow plug.

[Current value group: Status]

No.	Description	Value	Explanation
147	Oil pressure switch	ON/OFF	Status of engine oil pressure switch will be indicated. • ON: No oil pressure is applied. • OFF: Some oil pressure is applied. [Related parts] • Oil pressure switch
148	Measurement value of component 'Fill level sensor at water separator'	Water NOT PRESENT/ Water PRESENT	Value detected by water separator sensor will be indicated. [Related parts] • Fuel filter (water separator sensor)
149	Fuel filter heater	ON/OFF	Operating state of the fuel heater will be indicated. • Fuel heater is in operation: ON • Fuel heater is not in operation: OFF [Related parts] • Fuel filter (fuel heater)

No.	Description	Value	Explanation
150	Status of combustion engine	---/ OPERATIONAL/ Engine running/ Ignition ON/ ENGINE START/ ENGINE STOP/	Engine operation status will be indicated. • ---: - • OPERATIONAL: Standby state • Engine running: Engine running • Ignition ON: Starter switch ON • ENGINE START: Engine started • ENGINE STOP: Engine stopped [Related parts] • Engine electronic control unit
151	Status of function "Regeneration of diesel particulate filter"	Normal mode/ ---/	Operation mode of diesel particulate filter regeneration will be indicated. • Normal mode: Normal [Related parts] • Engine electronic control unit
152	Engine speed request	No request/ Cut-in request 1/ Cut-in request 2/ Cut-in request 3	• No request: For Idle up • Cut-in request 1: Idle up request received from hardware. • Cut-in request 2: Idle up request received from another electronic control unit via controller area network. • Cut-in request 3: Idle up request received via hardware and controller area network.
153	Accelerator pedal sensor 1 (raw value)	■■■■%	Signal value (non-corrected) from accelerator pedal position sensor 1 will be indicated. [Related parts] • Accelerator pedal position sensor 1
154	Accelerator pedal sensor 1	■■■■%	Accelerator opening signal from accelerator pedal position sensor 1 will be indicated. Related parts] • Accelerator pedal position sensor 1
155	Neutral position	ON/OFF	Whether neutral position is selected or not will be indicated. • ON: The transmission is in neutral. • OFF: The transmission is not in neutral. [Related parts] • DUONIC electronic control unit <DUONIC®>
156	Actual gear	■■■■-	Selected gear will be indicated. • 0-: P or N • 1-: 1st • 2-: 2nd • -1-: R [Related parts] • DUONIC electronic control unit <DUONIC®>
157	Status of component ‘Refrigerant compressor’	ON/OFF	Operation status of air conditioner compressor will be indicated. • ON: Air conditioner compressor activated • OFF: Air conditioner compressor deactivated [Related parts] • Air conditioner electronic control unit and control panel <Full automatic air conditioner> • Heater control panel <Manual air conditioner> • Signal detect and actuation modules
158	Status of component "MIL"	DOES NOT LIGHT UP/ LIGHTS UP/ FLASHING	ON/OFF condition of engine control lamp (amber) and other conditions such as background of lamp illumination will be indicated. [Related parts] • Engine electronic control unit
159	Status of component "Indicator lamp "ENGINE STOP""	DOES NOT LIGHT UP/ LIGHTS UP/ FLASHING	ON/OFF condition of engine control lamp (red) and other conditions such as background of lamp illumination will be indicated. [Related parts] • Engine electronic control unit

No.	Description	Value	Explanation
160	Air mass flow rate Learned value 1	■■■■%	Learnings of air flow sensor (idle point) will be indicated. • 0%: Learning from sensor not executed yet [Related parts] • Air flow and intake air temperature sensor
161	Air mass flow rate Learned value 2	■■■■%	Learnings of air flow sensor (loaded point) will be indicated. • 0%: Learning from sensor not executed yet [Related parts] • Air flow and intake air temperature sensor
162	Status of air conditioning	ON/OFF	Operating status of air conditioner will be indicated. • Air conditioner is in operation: ON • Air conditioner is not in operation: OFF [Related parts] • Air conditioner electronic control unit and control panel <Full automatic air conditioner> • Heater control panel <Manual air conditioner> • Signal detect and actuation modules
164	Position of accelerator pedal (Kickdown recognition)	ON/OFF	Kickdown position of accelerator pedal (accelerator opening: 90% or more) will be indicated. [Related parts] • Accelerator pedal position sensor
165	Status of power take-off	ON/OFF	Operation status of PTO is indicated. ON: Power take-off is in operation OFF: Power take-off is not in operation [Related parts] • Power take-off control switch • Signal detect and actuation modules
167	Status of button ‘CRUISE CONTROL’	ON/OFF	Status of cruise control main switch is indicated. [Related parts] • Cruise control main switch • Engine electronic control unit
169	Status of component ‘Relay ‘Supply voltage of control module’’	ON/OFF	Whether main relay activation request from engine electronic control unit is received or not will be indicated. • ON: Main relay is in operation • OFF: Main relay is not in operation [Related parts] • Signal detect and actuation modules • Engine electronic control unit
171	Status of component 'ECU Main circuit Voltage source'	DEENERGIZED/ NORMAL	Detected status of main power supply for electronic control unit will be indicated. • DEENERGIZED: No power supplied to electronic control unit • NORMAL: Power supplied to electronic control unit [Related parts] • Engine electronic control unit
172	Status of component 'Ignition Main circuit'	Miscellaneous/Start	Detected status of power supply for ignition ON will be indicated. • Miscellaneous: Starter switch (in position except START) • Start: Starter switch (in START position) [Related parts] • Starter switch • Signal detect and actuation modules
173	Starter relay	Miscellaneous/Start	Operation status of starter relay will be indicated. • Miscellaneous: Starter switch (in position except START) • Start: Starter switch (in START position) [Related parts] • Starter relay • Engine electronic control unit • Signal detect and actuation modules

No.	Description	Value	Explanation
174	Starter relay (Control unit: Pin 91)	Miscellaneous/Start	Starter relay energization status at terminal (K91) for engine electronic control unit will be indicated. • Miscellaneous: Starter switch (in position except START) • Start: Starter switch (in START position) [Related parts] • Starter relay (for drive) • Engine electronic control unit
175	Starter relay (Control unit: Pin 69)	Miscellaneous/Start	Starter relay energization status at terminal (K69) for engine electronic control unit will be indicated. • Miscellaneous: Starter switch (in position except START) • Start: Starter switch (in START position) [Related parts] • Starter relay (for drive) • Engine electronic control unit
176	Number of engine starts	■■■■	Number of times of starter operation learned by engine electronic control unit will be indicated. [Related parts] • Engine electronic control unit • Signal detect and actuation modules

3. FUSO Diagnostics Actuator Test (Actuations)

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.

No.	Section	Explanation
000	Cold start	• Allows to actuate the “cold start” function forcibly. [Test condition] • Engine stopped • Set the starter switch to “ON” position. [Test procedure] • Start the “control” sequence. • Battery voltage will lower to the lower limit. • Finish the “control” sequence. • Battery voltage will rise to the upper limit.
001	FMU (Fuel Metering device)	• Allows to actuate the fuel metering unit forcibly. [Cautions] • Adjust the engine speed to 650 rpm (idling). • Start the “control” sequence. • The engine will stop after running for a while. • Check to confirm that no fuel leaks through the fuel metering unit. • Turn off the ignition and then turn it on again.
002	Pressure regulating valve in rail	• Allows to actuate the common rail pressure control valve forcibly. [Cautions] • Adjust the engine speed to 650 rpm (idling). • Start the “control” sequence. • The engine will stop after running for a while. • Check to confirm that no fuel leaks through the common rail pressure control valve. • Turn off the ignition and then turn it on again.
003	Injection valve	• Allows to actuate the injectors forcibly. [Test condition] • Start the engine with the vehicle stationary. • Adjust the engine speed to no-load minimum rpm (idling). • Cut off the fuel supply on each cylinder one by one. [Cautions] • Take actual measurements. • The actual measurement will fluctuate. • There will occur rough engine operations during the control process.
004	Boost pressure control 1	• Allows to activate the “boost pressure control” function forcibly while the engine is running at idle. [Test condition] • Start the engine. • Run the engine at around 650 rpm.
005	Boost pressure control 2	• Allows to activate the “boost pressure control” function forcibly while the engine is running at 2000 rpm. [Test condition] • Start the engine. • Run the engine at around 650 rpm.
006	Exhaust gas recirculation actuator	• Allows to actuate the exhaust gas recirculation control forcibly. [Test condition] • Start the engine. • Adjust the engine speed to no-load minimum rpm (idling).
007	Engine brake solenoid valve	• Allows to actuate the exhaust brake forcibly. [Test condition] • Start the engine. • Adjust the engine speed to no-load minimum rpm (idling).

No.	Section	Explanation
008	Test of DEF metering amount	• Allows to activate the diesel exhaust fluid dosing function forcibly and add 20 ± 3 g of diesel exhaust fluid at each specified period of time. • Allows to make the following tests at each specified period of time for verifying that all requirements are met. [Test condition] • Ignition ON • Engine OFF • Remove the dosing module with the DEF tube and harness connector connected. • Prepare DEF (diesel exhaust fluid) measuring instrument (beaker, etc.), and set the removed dosing module on the instrument (beaker, etc.). [Status of applicable actual measurements] Dose 20 ± 3 g of diesel exhaust fluid at the following specified periods of time with the ambient temperature kept at 20 ± 10°C {68 ± 18°F} and the DEF (diesel exhaust fluid) temperature at 20 ± 10°C {68 ± 18°F}: • Distribution test: 267 s • Distribution test: 57 s • Distribution test: 28.6 s
009	DEF Leak tester	• Allows to check for DEF (diesel exhaust fluid) leakage [Test conditions] • Ignition ON • Engine OFF [Cautions] • Start the test sequence. - DEF (diesel exhaust fluid) will be pressurized. • If any DEF (diesel exhaust fluid) leakage through BlueTec® exhaust aftertreatment device is found, perform necessary corrections and replacements. • Finish the test sequence. - DEF (diesel exhaust fluid) pressure will be reduced.
010	Emptying DEF lines	• Allows to check for diesel exhaust fluid line backflow function [Test condition] • Adjust the engine speed between 650 and 1500 rpm. • Reference value of temperature must be lower than 200°C {392°F}.
011	Regeneration of diesel particulate filter	• Allows to activate the diesel particulate filter regeneration function forcibly. [Test condition] • Start the engine. • Engine speed: Approx. 650 rpm • Following conditions should also be observed. • Coolant temperature: 60°C {140°F} or higher • Fuel temperature: Lower than 70°C {158°F} • Battery voltage: 5 V or higher • Accelerator pedal status: 90% or lower • Exhaust gas temperature (upstream of diesel particulate filter): Lower than 600°C {1112°F} • Soot accumulation in diesel particulate filter: Less than 330 g • Exhaust gas temperature (upstream of diesel particulate filter): Lower than 700°C {1292°F} • Oxidation catalyst temperature: Lower than 600°C {1112°F} • Clutch pedal: Released • Transmission: Neutral • Brake pedal: Released • Vehicle is stopped. • Engine operating condition: Normal • No diesel particulator filter-related diagnostic trouble code

4. Alteration and Reset of Coding Data in Electronic Control Unit

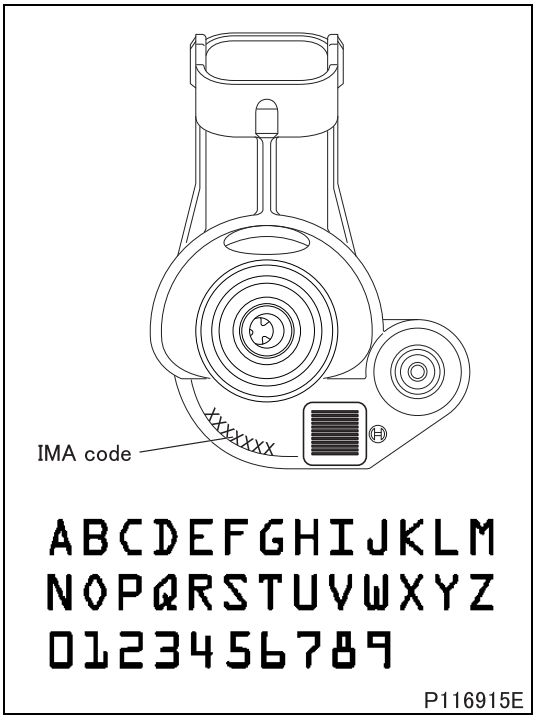
4.1 General

- In the engine electronic control unit, information such as vehicle information and equipment specifications are registered as the coding data.
- When a specified equipment is replaced, alteration of the coding data or resetting of information using the FUSO Diagnostics must be performed. Otherwise, the discrepancies between the vehicle information in the engine electronic control unit and the actual conditions may generate the engine-control-related diagnosis code(s).
- For the details of coding data rewriting and data resetting, contact the nearest Mitsubishi FUSO dealer or distributor.

(1) Replacing Engine Oil

- During vehicle life time, the engine electronic control unit counts up the quantity of post-injected fuel in order to activate and maintain regeneration.
- A least fraction of this fuel, comes into contact with lubrication oil and dissolves into it.
- The engine electronic control unit is capable to calculate the limit quantity of fuel dissolved into oil and, consequently, to suggest oil refilling.
- It is obvious that, if after engine oil refilling the function is not reset, the engine electronic control unit will keep on counting the increase of oil fraction in engine oil even with new oil and, sooner or later, groundlessly request to replace engine oil by flashing warning lamp (red).
- See Gr12, “Engine Oil Replacement in ON-VEHICLE INSPECTION AND ADJUSTMENT” for the procedure of resetting the engine oil parameter.

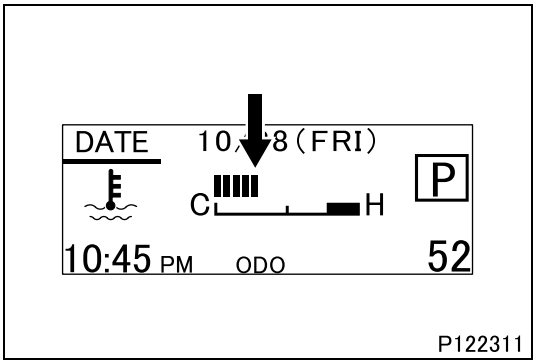
(2) Replacing Injector



- When electrical injectors mounted on the vehicle must be replaced, meet following warnings:
  - Where electrical injectors are dismounted and do not need to be replaced, their mounting position has to be noted down in order to remount them later in the same position; this is done to avoid to reprogram the engine electronic control unit;
  - After replacing one or more injectors, the engine electronic control unit has to be reprogrammed;
- Where the engine electronic control unit is replaced, reprogram the new engine electronic control unit with the IMA codes of the electrical injectors mounted on the engine and copy down the rectification coefficients of replaced engine electronic control unit;

(3) Replacing airflow and intake air temperature sensor (Re-learning procedure)

- New values should be re-learned for the air flow and intake air temperature sensor after it is replaced with a new one. Observe the following precautions when the re-learning is performed.
- Re-learning for airflow sensor shall be performed with vehicle parked. Follow the procedure shown below in the re-learning.
- Using FUSO Diagnostics, reset the learning values.
- Please note that before performing the AFS learning, be sure to take AFS reset and turn off the engine once and wait at least for 60 seconds to have the after-run finished completely before proceeding to the verification check.
- Turn off the air conditioning switch.
- Using FUSO Diagnostics, check to ensure that the learning value of the airflow sensor is “0”. (Service data No.160 [Air mass flow rate Learned value 1] and No.161 [Air mass flow rate Learned value 2])
- Run the engine until the engine cooling water temperature rises above 60°C (on meter cluster: Over 5 points).
- Wait for about 2 minutes with the engine idling.
- Keep the engine revolution to high-idling for about 15 seconds until the buzzer beeped.
- If the learning value is to be verified using FUSO Diagnostics, turn off the engine once and wait at least for 60 seconds to have the after-run finished completely before proceeding to the verification check.



4.2 Coding Data Rewriting and Initialization

- The engine electronic control unit stores various kinds of information (e.g., vehicle information, equipment specifications) as coding data.
- Always rewrite or reset the coding data of the engine electronic control unit once some change has been made in the vehicle specifications or some kind of electrical equipment has been replaced with a new one. Otherwise, it may happen that the vehicle information registered in the engine electronic control unit does not agree with that from the actual vehicle and thereby some diagnosis codes are generated.

(1) Coding Data Rewriting / Data Resetting

- For the details of coding data rewriting and data resetting, contact the nearest Mitsubishi FUSO dealer.
- The following are the items requiring the coding data rewriting or data resetting:
  - Replacement of engine electronic control unit
  - Replacement of injectors
  - Specification change of air conditioner
  - Specification change of fuel filter (fuel heater)
  - Specification change of exhaust brake
  - Specification change of power take-off
  - Replacement of boost pressure and temperature sensor
  - Replacement of airflow & intake air temperature sensor
  - Replacement of pressure regulation valve
  - Replacement of pressure sensor
  - Replacement of turbocharger
  - Replacement of vacuum modulator
  - Replacement of EGR valve
  - Replacement of lambda sensor

- Replacement of DPF differential pressure sensor
- Replacement of diesel particulate filter
- Replacement of SCR muffler
- Replacement of DEF tank
- Replacement of DEF dosing module (dosing valve)
- Replacement of engine oil
- Replacement of engine

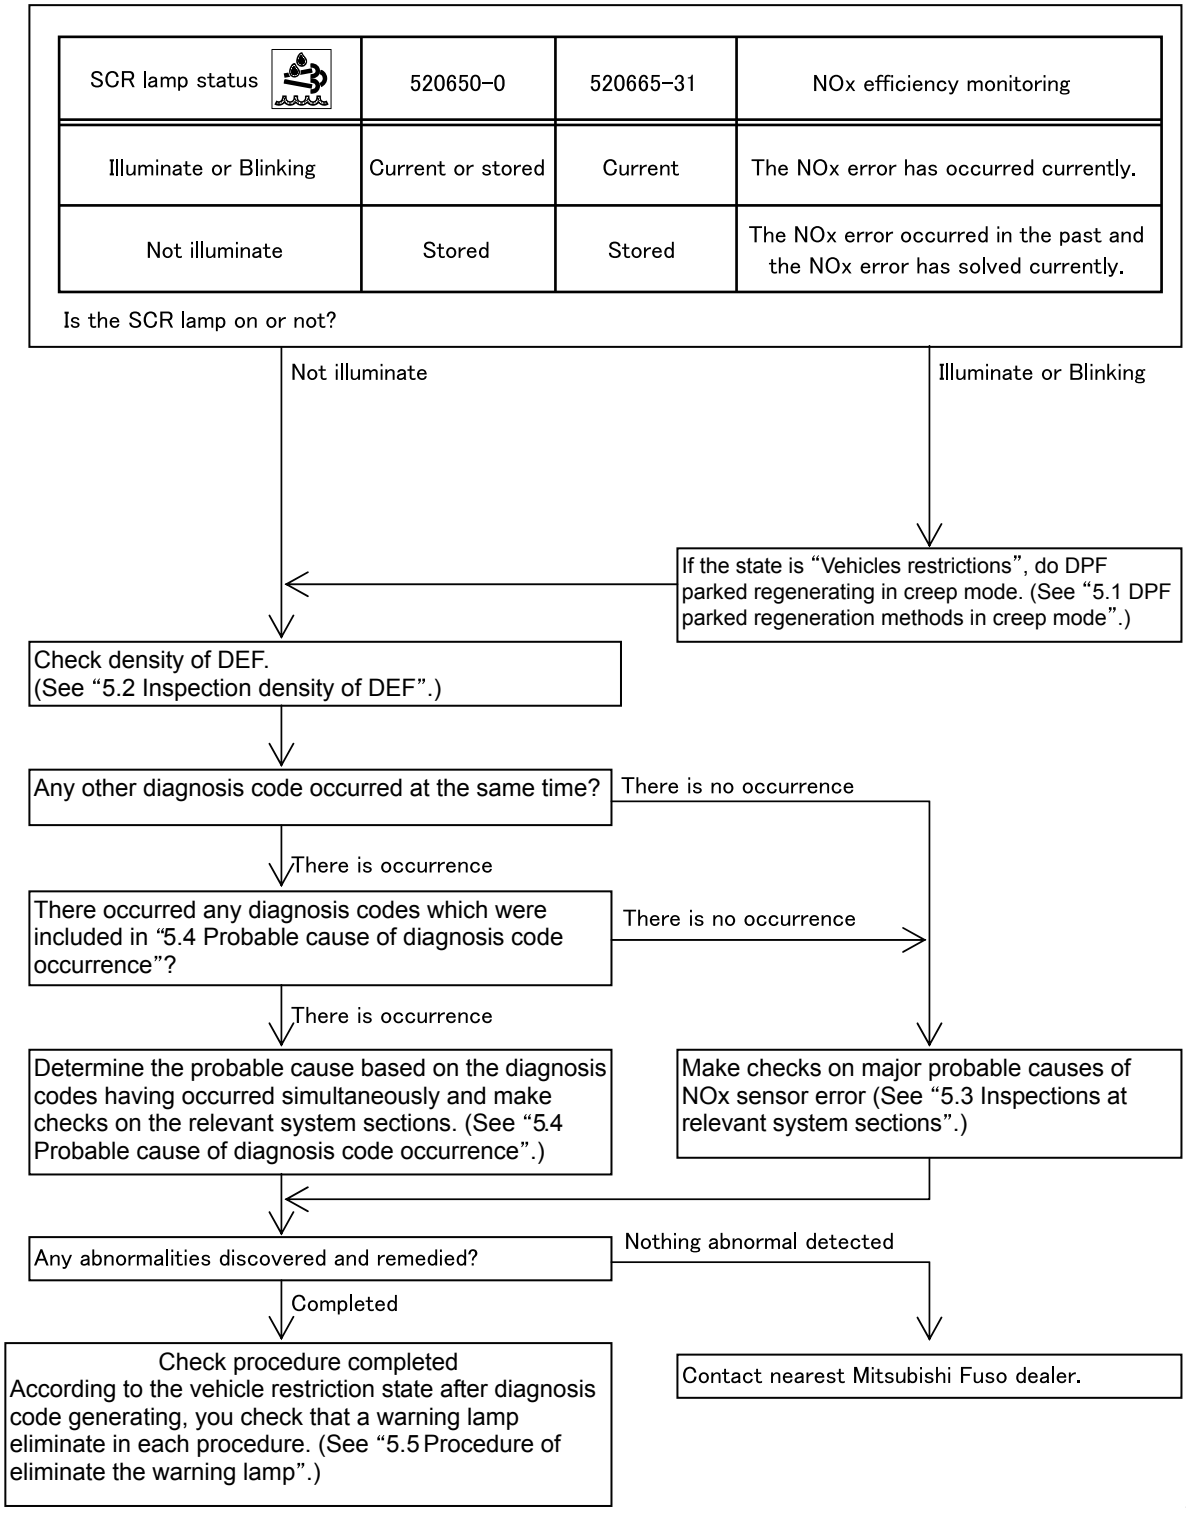
5. Inspections to be Made at NOx Error Occurrence

- When the following diagnosis code occurs, and performs troubleshooting with reference to this section.
  - (520650-0) The emission value of the NOx sensor (raw value) is too high.
  - (520665-31) Fault group: SCR 3 (Crawler mode) Function 'SCR' is faulty.

CAUTION ⚠

- **Recommended FUSO Diagnostics version: FDS-R13-1 or newer.**

SCR lamp status	520650-0	520665-31	NOx efficiency monitoring
Illuminate or Blinking	Current or stored	Current	The NOx error has occurred currently.
Not illuminate	Stored	Stored	The NOx error occurred in the past and the NOx error has solved currently.



127384E

5.1 DPF parked regeneration methods in creep mode

- If the vehicle is the state of torque and power limitation, run the engine at idle a few hours until creep mode is reached. In creep mode a parked regeneration can be started.
- Turn the starter switch to the OFF position, wait at least 60 seconds and complete the after-run.
- Turn the starter switch to the ON position and after a lapse of 10 seconds or longer, start the engine.
- Warm up the engine until the engine coolant temperature exceeds 60°C {140°F}.
- Press the Diesel Particulate Filter cleaning switch to perform the parked regeneration of Diesel Particulate Filter. In the parked regeneration, the engine speed increases to 1500 - 2500 rpm and it takes approximately 20 minutes to complete the parked regeneration.
- After that, engine revolution goes to idling and DPF manual regenerating is end.

5.2 Inspection density of DEF

- Check the DEF density in the DEF tank.

Standard value	32.5 ± 0.8%

- If the measured value exceeds a standard value, exchange the DEF to new one.

5.3 Inspections at relevant system sections

- Perform the following inspections in this order.

(1) Inspection of NOx sensor 1 and NOx sensor 2

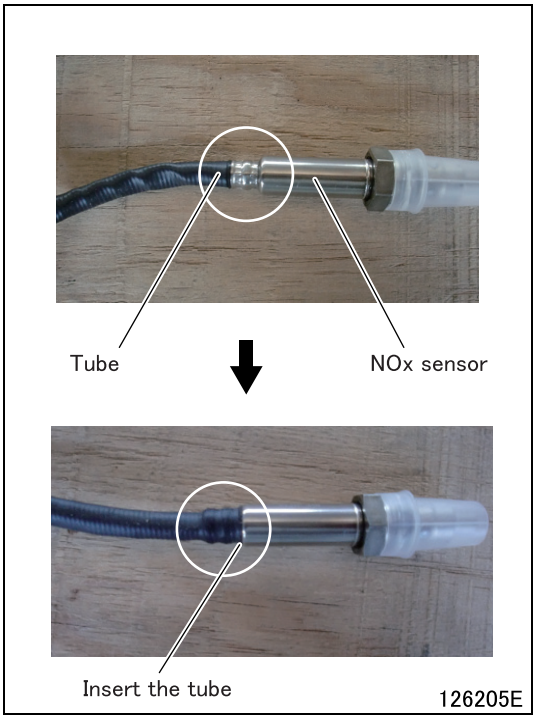
(1.1) Inspection of NOx sensor 1 and NOx sensor 2

- In case of diagnosis codes related to NOx sensor 1, replace NOx sensor 1 and delete diagnosis codes.
- In case of diagnosis codes related to NOx sensor 2, replace go through the following procedure.
- Turn on DPF parked regeneration.
- Then DPF parked regeneration check the service data (actual measurements) using FUSO Diagnostics.
- Check to confirm that the NOx sensors are active. (Service data No.115 [NOx value] of other than “-1-” are indicated.)
- Within 10 minutes, run the engine at idle to check the service data No.115 [NOx value] of FUSO diagnostics.
- If the measured value deviates from the standard value, replace the NOx sensor 2.

Service data	Standard value	Replace
No.115 [NOx value] (Downstream sensor)	Less than 200 ppm is indicated continuously	NOx sensor 2 (Downstream sensor)

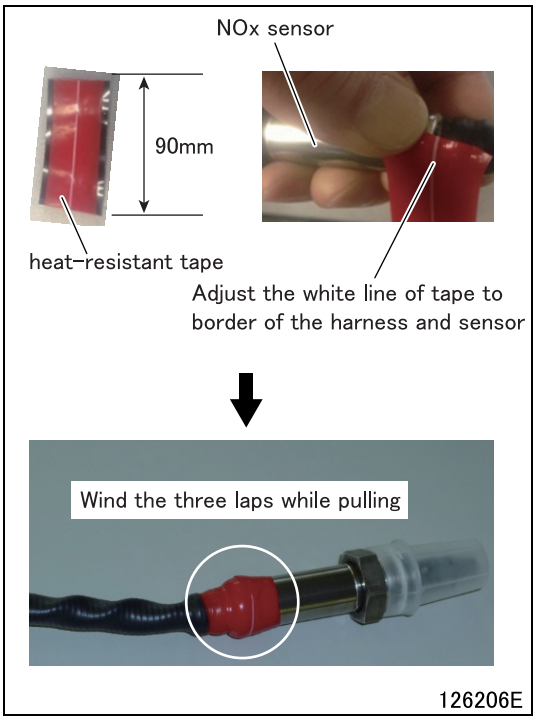
(1.2) Replacement of the NOx sensor

- Insert the tube as shown.



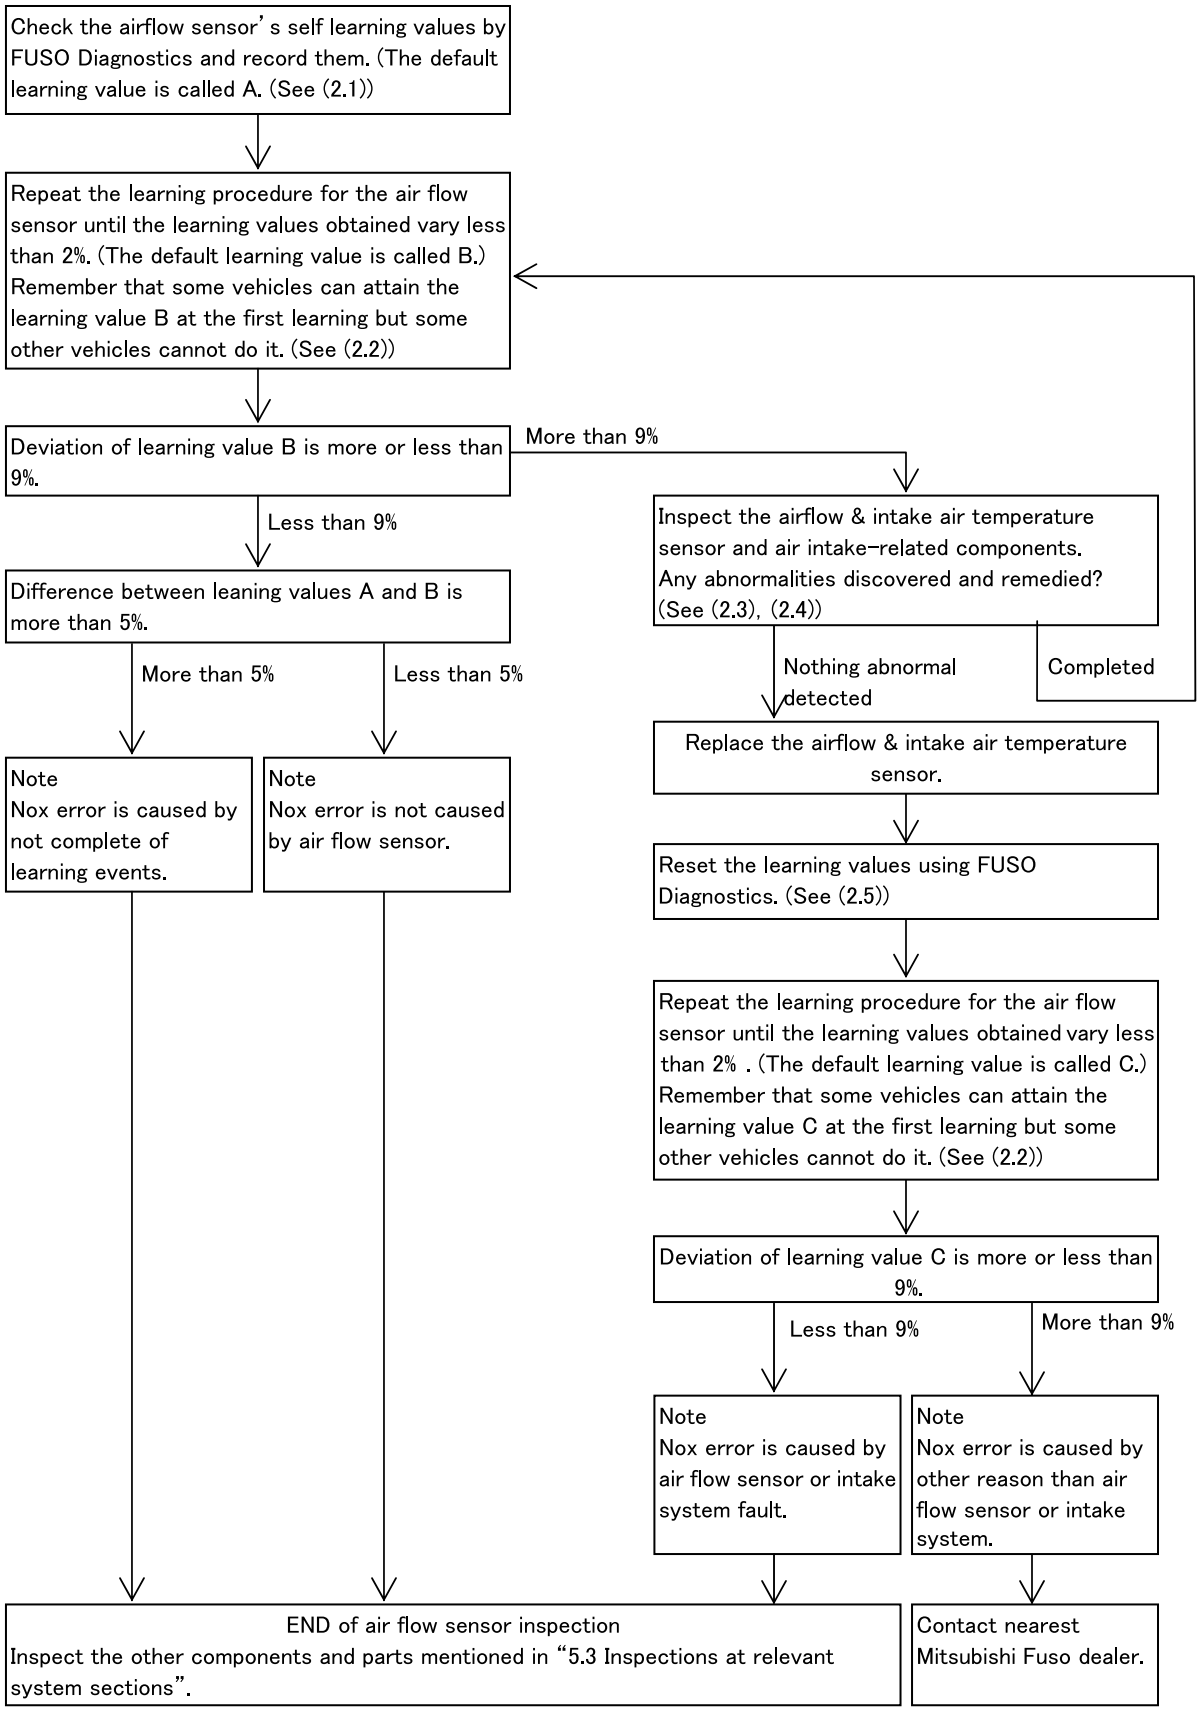
- Cut to a length of about 90 mm heat-resistant tape.
- Adjust the white line of tape to border of the harness and sensor.
- Wind the three laps while pulling.

  Heat-resistant tape: LLFA tape



(2) Inspection of air flow & intake air temperature sensor (air flow sensing section)

- Inspect the air flow & intake air temperature sensor according to the following flowchart:



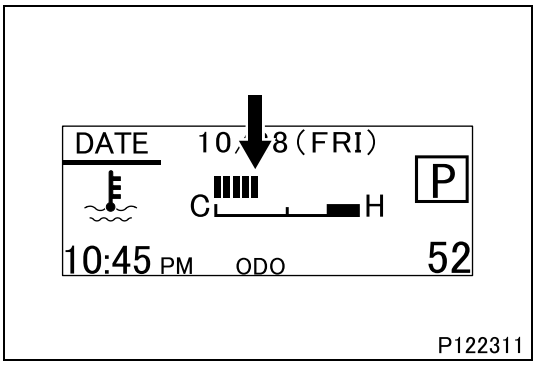
129346E

(2.1) Verification of learning value of airflow sensor

- Using FUSO Diagnostics, Check the airflow sensor self learning values and record them. (Service data No.161 [Air mass flow rate Learned value 2])

(2.2) Start re-learning to allow airflow sensor to learn new values.

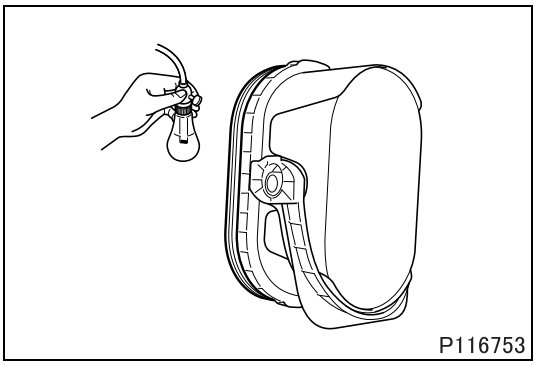
- Re-learning for airflow sensor shall be performed with vehicle parked. Follow the procedure shown below in the re-learning.
- Using FUSO Diagnostics, reset the learning values.
- Please note that before performing the AFS learning, be sure to take AFS reset and turn off the engine once and wait at least for 60 seconds to have the after-run finished completely before proceeding to the verification check.
- Turn off the air conditioning switch.
- Using FUSO Diagnostics, check to ensure that the learning value of the airflow sensor is “0”. (Service data No.160 [Air mass flow rate Learned value 1] and No.161 [Air mass flow rate Learned value 2])
- Run the engine until the engine cooling water temperature rises above 60°C {140°F} (on meter cluster: Over 5 points).
- Wait for about 2 minutes with the engine idling.
- Keep the engine revolution to high-idling for about 15 seconds until the buzzer beeped.
- If the learning value is to be verified using FUSO Diagnostics, turn off the engine once and wait at least for 60 seconds to have the after-run finished completely before proceeding to the verification check.



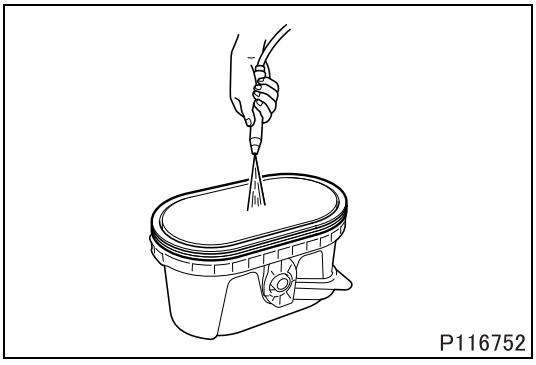
P122311

(2.3) Inspection of intake air-related components

- Check that there is no clogging or smearing in the air cleaner element by following procedure.
- Shine light inside the element.
- Replace the element if thin spots or broken parts are evident in the filter paper, or if the packing at the top of the element is damaged.
  Also replace the element if the dust on the element is damp with oily soot.

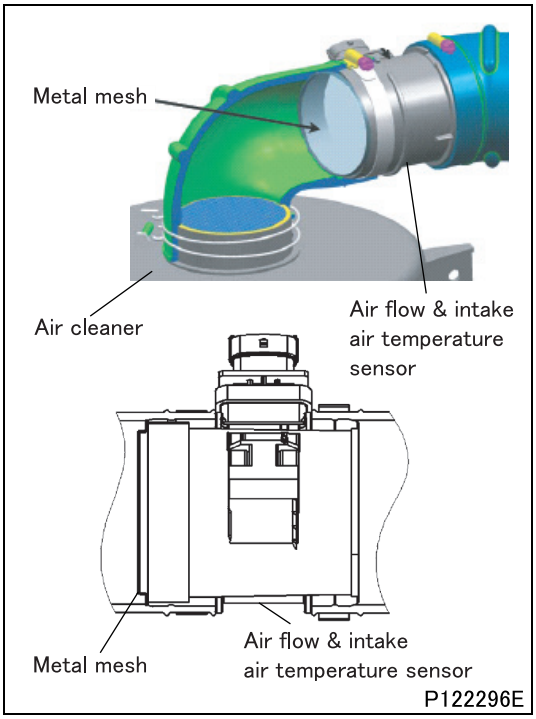


P116753

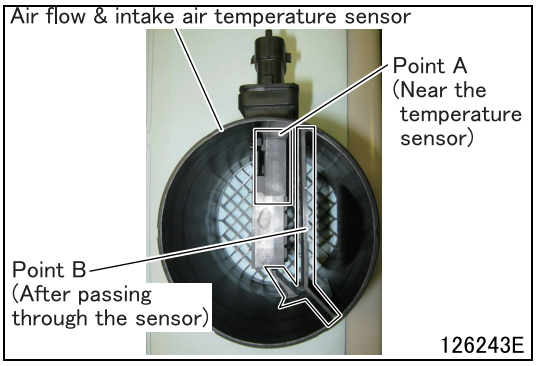


P116752

- Blow a jet of compressed air at a pressure not higher than 685 kPa {100 psi, 7 kgf/cm^2} against the inside surfaces of the element.
- Move the compressed air jet up and down along all pleats of the filter paper element.
- Oily air flow & intake air temperature sensor can be evidence that there is another faulty part in the system. In such a case, check other air intake-related parts for contamination and clean them if contaminated.

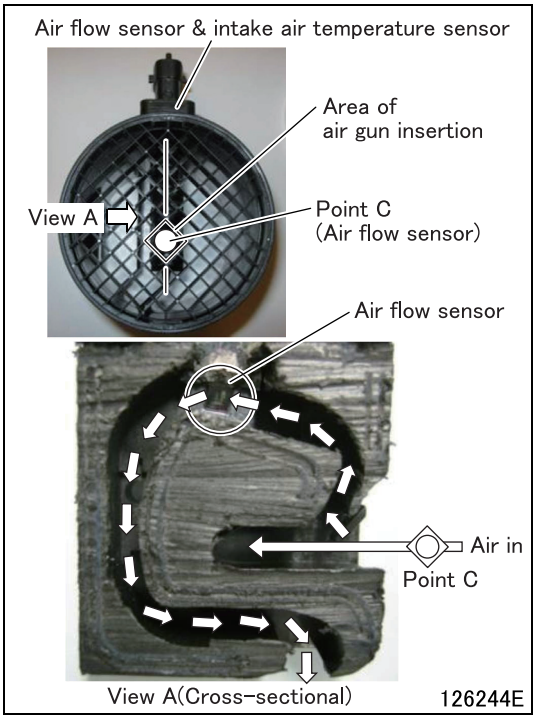


- Check that there is no smear or deformation in the metal mesh.
- Attach the metal mesh to the air hose by direction of illustration.



(2.4) Inspection of airflow sensor & intake air temperature sensor

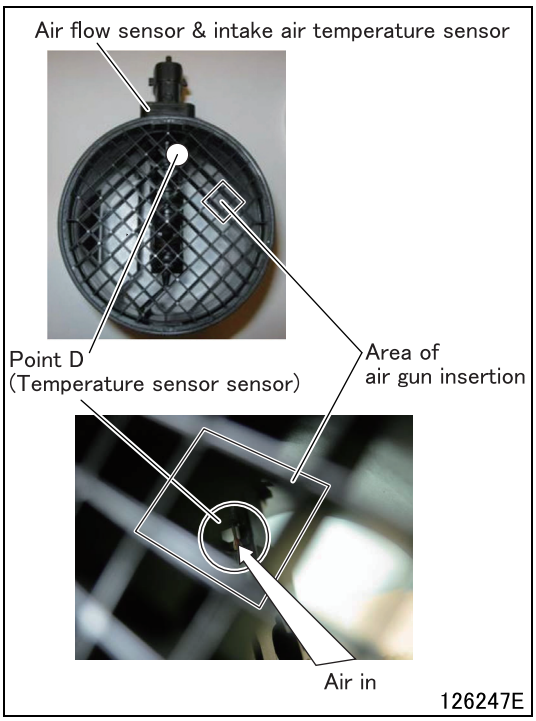
- Inspect oil or moisture and dust on surface of point A and B.
- If it is dirty, do the cleaning air blow by the following procedure.



- Blow clean air from the point C as shown below.
- Use air with pressure level of 600 kPa {87 psi, 6 kgf/cm^2} (15 shots) and air with pressure level of 300 kPa {43.5 psi, 3 kgf/cm^2} (10 sec. × 6 shots).

CAUTION ⚠

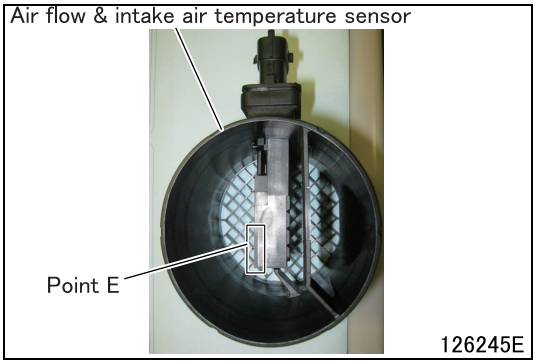
- **Using high pressure air equipped with water separator.**
- **Check the no moisture in the high pressure air before performing this air blow procedure by air blow trial.**



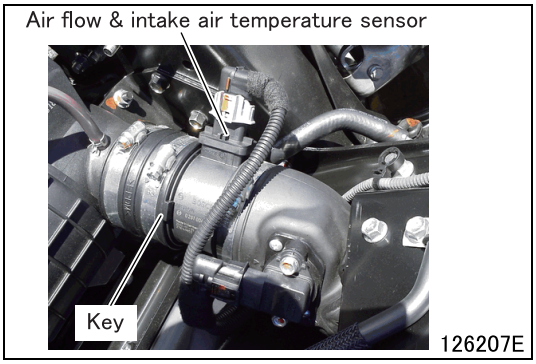
- Blow clean air through area of air gun insertion toward the point D as shown below.
- Use air with pressure level of 300 kPa {43.5 psi, 3 kgf/cm^2} (5 sec. × 1 shot).

CAUTION ⚠

- **Using high pressure air equipped with water separator.**
- **Check the no moisture in the high pressure air before performing this air blow procedure by air blow trial.**



- After air blow, check oil or any moisture and dust or out of the partition line of point E.



- Check the engagement and attachment state of airflow & intake air temperature sensor's align slit and air hose's key.
- Inspect the lines connecting the airflow & intake air temperature sensor with the air cleaner and the turbocharger for installed conditions of clamps and air leakage through the sealing sections.
- Check that the clips are correctly closed and the sealing is correct without gaps.
- Inspect the gap between airflow & intake air temperature sensor and turbocharger.

(2.5) Resetting method of learning values using FUSO Diagnostics

- Using FUSO Diagnostics to reset the learning value of the airflow sensor. (Adaptations·Teach-in processes No.005 [Air mass flow rate / Intake air temperature sensor])

(3) Inspection of SCR temperature sensor 1 and 2

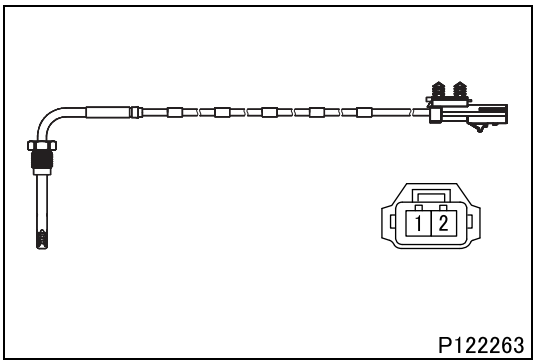
(3.1) Inspection of hot range

- Run the engine at idle for 1 hour.
- Using FUSO Diagnostics, check the SCR temperature sensors 1 and 2 values (service data No.011 [Temperature at component 'SCR catalytic converter (BACK)'], No.012 [Temperature at component 'SCR catalytic converter (FORWARD)']).
- Check that both SCR temperature sensors 1 and 2 give the same measurements (tolerance within 15°C {27°F} at a temperature between 50 and 150°C {122 and 302°F}).
- Perform the parked regeneration.
- After DPF parked regeneration is completed, using FUSO Diagnostics, check the SCR temperature sensors 1 and 2 values (service data No.011 [Temperature at component 'SCR catalytic converter (BACK)'], No.012 [Temperature at component 'SCR catalytic converter (FORWARD)']).
- SCR temperature sensors 1 and 2 give the same measurements (tolerance within 40°C {72°F} at a temperature between 480 and 600°C {896 and 1112°F}).

(3.2) Inspection of cold range

- When the engine is cold.
- Using FUSO Diagnostics, check the SCR temperature sensors 1 and 2 values (service data No.011 [Temperature at component 'SCR catalytic converter (BACK)'], No.012 [Temperature at component 'SCR catalytic converter (FORWARD)']).
- Check that both SCR temperature sensors give the same measurements as other temperature sensors (tolerance within 15°C {27°F}).

(3.3) Inspection by removal



- Removal the SCR temperature sensor 1 and 2 and do visual check and if it is dirty then you should clean it.
- Using a known temperature reference source, measure the resistance between terminals 1 and 2.

Standard value	–18°C {–0.4°F}	187 Ω
	–12°C {10°F}	191 Ω
	–7°C {19°F}	195 Ω
	–1°C {30°F}	200 Ω
	0°C {32°F}	201 Ω
	4°C {39°F}	204 Ω
	10°C {50°F}	208 Ω
	16°C {61°F}	212 Ω
	21°C {70°F}	217 Ω
	27°C {81°F}	221 Ω
	32°C {90°F}	225 Ω
	38°C {100°F}	229 Ω
	50°C {122°F}	239 Ω
	100°C {212°F}	276 Ω
	150°C {302°F}	313 Ω

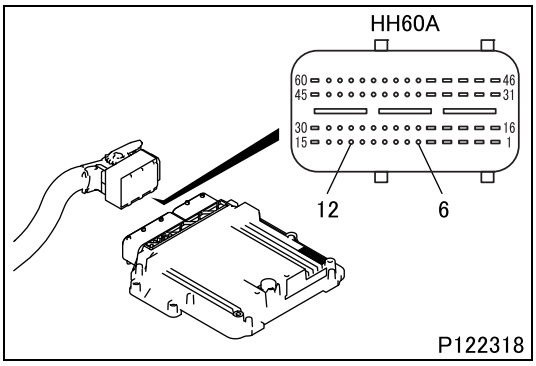
- If the measurement is out of reference value, replace the sensor.
- Measure resistance between each pin to sensor body. Resistance should be greater than 1 MΩ (open circuit).

(4) Inspection of boost pressure & boost temperature sensor (temperature sensing section)

(4.1) On-vehicle inspection

- When the engine is cold.
- Using FUSO Diagnostics, check the boost pressure & boost temperature sensor values (service data No.002 [Temperature at component 'Boost pressure / Temperature sensor']).
- Check that this sensor gives the same measurement as other temperature sensors (tolerance within 15°C {27°F}).
- Visually check the sensor and clean it if contaminated.

(4.2) Inspection by removal

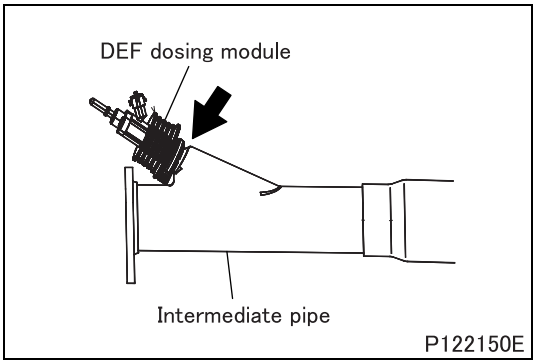


- Remove boost pressure & temperature sensor with wiring.
- Do visual check and if there is smear you should clean it.
- Remove engine electronic control unit connector.
- Using a known temperature reference source, measure the resistance between terminals 6 and 12 at the electronic control unit connector side.

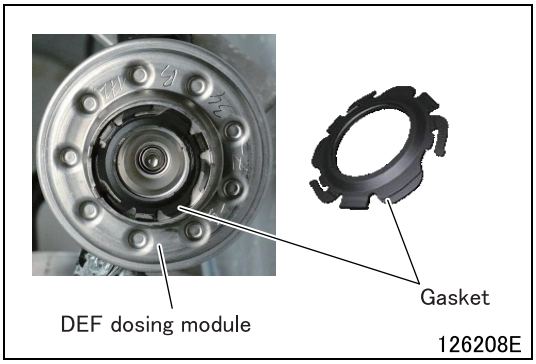
Standard value	–40°C {–40°F}	48153 Ω
	–30°C {–22°F}	26855 Ω
	–20°C {–4°F}	15614 Ω
	–10°C {–14°F}	9426 Ω
	0°C {32°F}	5886.7 Ω
	10°C {50°F}	3791.1 Ω
	20°C {68°F}	2510.6 Ω
	30°C {86°F}	1715.4 Ω
	40°C {104°F}	1199.6 Ω
	50°C {122°F}	851.1 Ω
	60°C {140°F}	612.27 Ω
	70°C {158°F}	446.33 Ω
	80°C {176°F}	329.48 Ω
	90°C {194°F}	246.15 Ω
	100°C {212°F}	186 Ω
	110°C {230°F}	142.08 Ω
	120°C {248°F}	109.65 Ω
	130°C {266°F}	85.45 Ω

- If the measurement is out of standard value, replace the sensor.

(5) Inspection of DEF dosing module, DEF supply module (motor and heater)



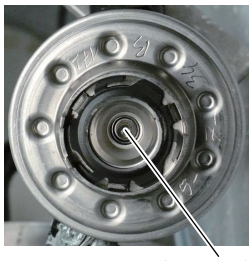
- Check that there are no gas leaks and adhesion of deposits on the attachment part of the DEF dosing module. If there is some abnormality, then it is possibility that the attachment failure of the DEF dosing module is the cause of NOx errors.
- Remove the DEF dosing module. Check the DEF dosing module and its mount are in a proper condition.



- Replace gasket, if dosing module is removed.

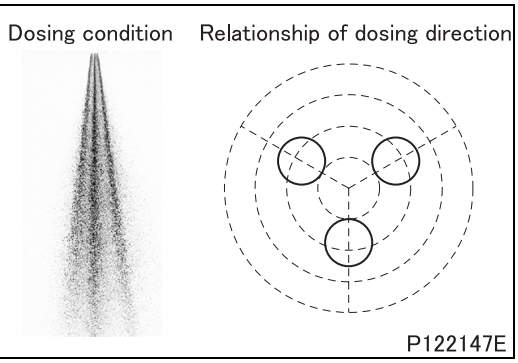
- Verify that the injection hole in the DEF dosing module is free from any deposits. Replace the DEF dosing module if the injection hole is blocked.
- Clean the DEF dosing module if other places than the injection hole are deposited, please use distillated water.
- When at the actuator test of FUSO Diagnostics there is no abnormality, there is no problem even with when there is a deposit.

- If any deposits are found on the mounting section of the DEF dosing module, remove them completely before the module is re-installed. After the module is installed, be sure to perform forced DPF regeneration using FUSO Diagnostics.

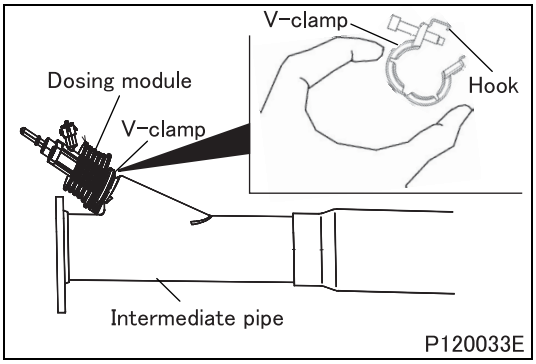


- Using FUSO Diagnostics, run of the actuator test (actuator test No.009 [DEF Leak tester]).
- Perform the test with a DEF dosing module removed from intermediate pipe.
- Verify that there is no leakage of DEF at the time of test execution.
- Replace the DEF dosing module if leakage is found at dosing module tip.
- Replace the DEF tube if leakage is found on DEF tube itself.
- Re-check the DEF tube install condition if the leakage is found from DEF tube junction part.
- After the additional test is finished, make the starter switch OFF and wait 60 seconds and finish the after run.

- Using FUSO Diagnostics, run of the actuator test (actuator test No.008 [Test of DEF metering amount]).
- Verify that the specified amount of solution is dosed. Replace the DEF dosing module if the amount is abnormal, and then perform the actuator test again. If the amount is still abnormal, replace the DEF supply module (motor and heater).
- After addition test is finished, switch OFF and wait 60 seconds to finish the after run.



- Retest the using FUSO Diagnostics, run of the actuator test (actuator test No.008 [Test of DEF metering amount]).
- Check for dosing condition.
- Verify that DEF is sprayed evenly in three directions as shown in the illustration.
- Replace the DEF dosing module if the spray pattern is abnormal.
- After addition test is finished, switch OFF and wait 60 seconds to finish the after run.



- Attach a new gasket to the DEF dosing module.
- Stick and install the DEF dosing module to intermediate pipe.
- Push the clamp central part until it applies the hook of a new clamp and stick and install the clamp to dosing module. In this regard, do not adhere oil or grease to clamp and screw.

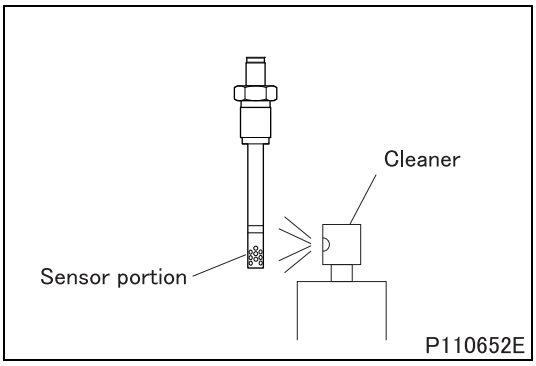
Tightening torque	5 $^{0}_{-0.5}$ N·m {3.7 $^{0}_{-0.37}$ lbs.ft, 0.5 $^{0}_{-0.05}$ kgf·m

- When attaching the DEF tube to the DEF dosing module. If it needs the lubrication, please use distillated water.
- Check the gas leakage after attaching the DEF dosing module.
- Using FUSO Diagnostics, run of the actuator test (actuator test No.011 [Regeneration of diesel particulate filter]).

(6) Inspection of exhaust gas temperature sensor 1 and 2 (DPF exhaust gas temperature sensor 1 and 2)

(6.1) Inspection of cold range

- When the engine is cold (10 hours after the engine off)
- Using FUSO Diagnostics, check the exhaust gas temperature sensors 1 and 2 values (service data No.007 [Exhaust temperature upstream of diesel oxidation catalytic converter], No.008 [Exhaust temperature upstream of diesel particulate filter]).
- Check that both exhaust gas temperature sensors give the same measurements as other temperature sensors (tolerance within 15°C {27°F}).

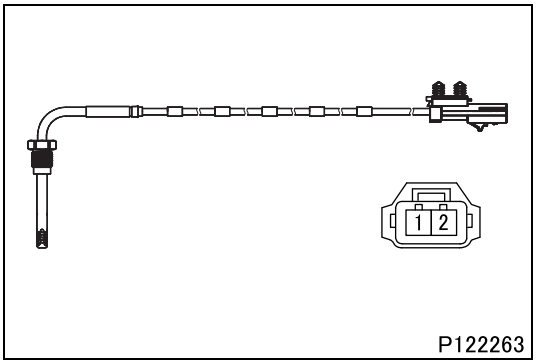


(6.2) Cleaning

- Check that the sensor portion is free of soot, oily substance, etc.
- If not, clean the sensor portion as follows.
- Spray a cleaner on the sensor portion from 2 or 3 cm {0.79 or 1.18 in.} away.
  Recommended cleaners: Non chlorinated solvent
- In 20 to 30 seconds after spraying, wipe the sensor portion clear of the sprayed cleaner using a soft waste cloth the like.

CAUTION ⚠

- **Be sure to wait for 20 to 30 seconds before wiping. It takes the cleaner that long to dissolve foreign matter.**



(6.3) Inspection by removal

- Removal the exhaust gas temperature sensor 1 and 2 and do visual check and if it is dirty then you should clean it.
- Using a known temperature reference source, measure the resistance between terminals 1 and 2.

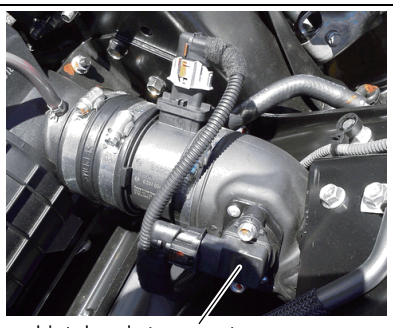
Standard value	–18°C {–0.4°F}	187 Ω
	–12°C {10°F}	191 Ω
	–7°C {19°F}	195 Ω
	–1°C {30°F}	200 Ω
	0°C {32°F}	201 Ω
	4°C {39°F}	204 Ω
	10°C {50°F}	208 Ω
	16°C {61°F}	212 Ω
	21°C {70°F}	217 Ω
	27°C {81°F}	221 Ω
	32°C {90°F}	225 Ω
	38°C {100°F}	229 Ω
	50°C {122°F}	239 Ω
	100°C {212°F}	276 Ω
	150°C {302°F}	313 Ω

- If the measurement is out of reference value, replace the sensor.
- Measure resistance between each pin to sensor body. Resistance should be greater than 1 MΩ (open circuit).

CAUTION ⚠

- **When mounting the sensor, please check that are not mistaken the mounting position of the exhaust gas temperature sensor 1 and 2.**

(7) Inspection of humidity and intake air temperature sensor



(7.1) Inspection of sensor output signal

- Write down the humidity value on at key-on and engine off state.
- Using FUSO Diagnostics, check the humidity and intake air temperature sensor values (service data No.056 [Humidity of in take air]). (Value A)
- Key off at once and wait for around 60 second to complete engine after run. Write down again the humidity value at key-on and engine off state. (Value B: second time)
- Do once again. (Value C: third time)
- Compare these three values.
- Replace the sensor, if the values out of more than ±10%.
  - ex: Nok (replace): A:10%, B:25%, C:5%, → 25–5=20%
  - ex: Ok: A:7%, B:5%, C:14%, →14–5=9%

(7.2) Check diagnosis failure code in the past

- When the following diagnosis code occurs, replace the sensor.
  - (354 17) Component ‘Humidity and temperature sensor “Intake air”’ or its electrical line is defective.
  - (354 18) The signal voltage of component ‘Humidity and temperature sensor “Intake air”’ is too low.

5.4 Probable cause of diagnosis code occurrence

- Check the diagnosis code which occurs simultaneously with diagnosis code 520650-0. And if there is the code in bellow chart, check the part which caused the diagnosis code ◎ or ○ for each codes. (See13E-100.)
  For inspection procedures for parts marked with ★, see “5.3 Inspections at relevant system sections” as well.

Parts to be inspected \ Diagnosis codes that occurred		27-15	27-17	102-15	102-17	110-12	110-31	132-20	132-21	171-7	172-2	1172-2	1174-2	3058-0	3058-1	3058-16	3058-18	Remarks

EGR: Exhaust gas recirculation

5.5 Procedure of eliminate the warning lamp

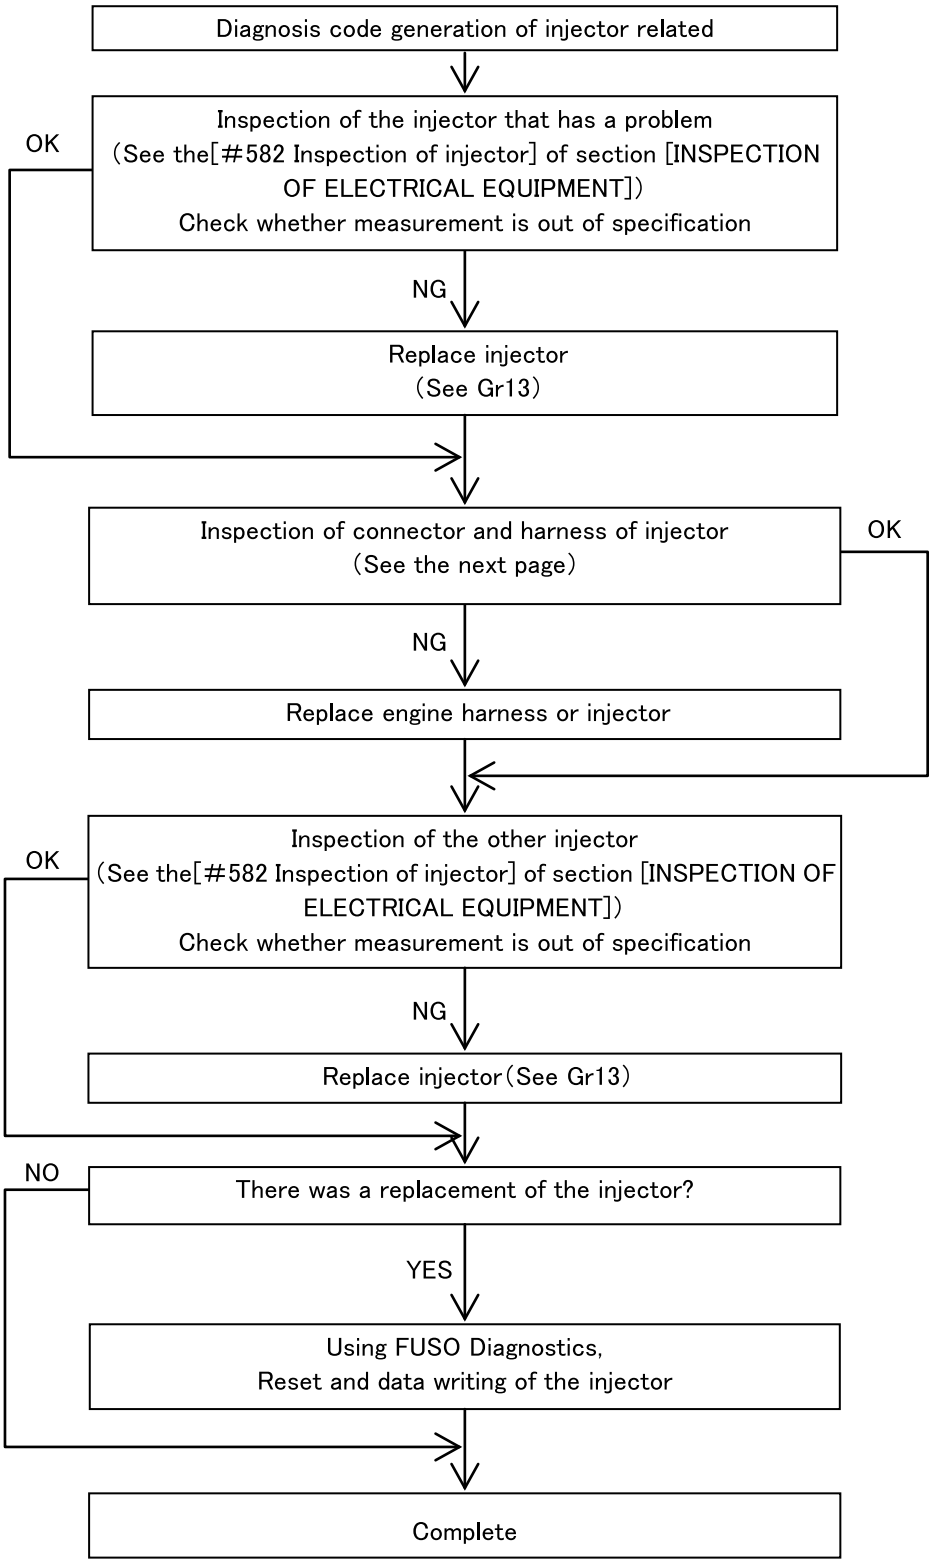
(1) The case of the mileage or running time of after diagnosis code was occurred are less than 320 km [200 miles] or 4 hours. (Torque and power is restricted)

- Turn the starter switch to the OFF position, wait at least 60 seconds and complete the after-run.
- Turn the starter switch to the ON position and after a lapse of 10 seconds or longer, start the engine.
- Drive the vehicle at 80 km/h about for 30 minutes to collect the service data (actual measurements) using FUSO Diagnostics.
- Then check to confirm that the NOx sensor 2 is active (service data No.115 [NOx value] of other than “-1-” is indicated and service data No.011 [Temperature at component ‘SCR catalytic converter (BACK)’] is more than 250°C {482°F}).
- After running of above procedure, check the warning lamp is eliminated.

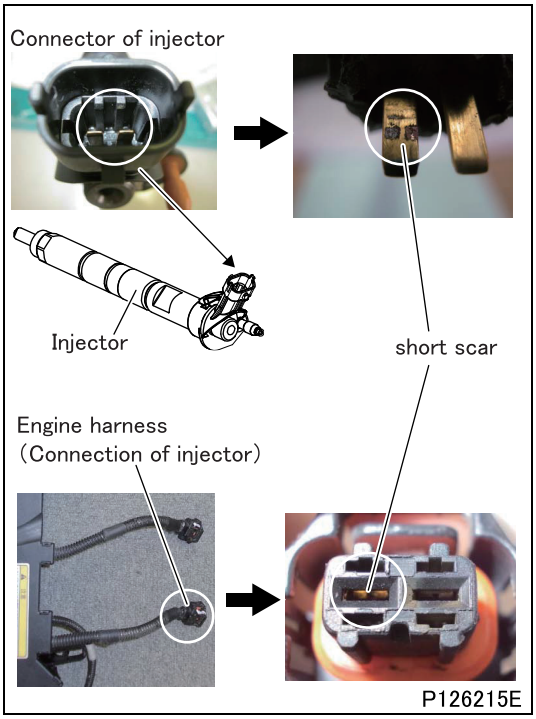
(2) The case of the mileage or running time of after diagnosis code was occurred are more than 320 km [200 miles] or 4 hours. (Creep mode)

- Turn the starter switch to the OFF position, wait at least 60 seconds and complete the after-run.
- Turn the starter switch to the ON position and after a lapse of 10 seconds or longer, start the engine.
- Warm up the engine until the engine coolant temperature exceeds 60°C {140°F}.
- Press the Diesel Particulate Filter cleaning switch to perform the parked regeneration of Diesel Particulate Filter. In the parked regeneration, the engine speed increases to 1500 - 2500 rpm and it takes approximately 20 minutes to complete the parked regeneration.
- After that, the engine speed drops to idle and warning goes out. It may not go out immediately and it can take 10 minutes for the lamp to go out.

6. Inspections to be Made at Injector Error Occurrence



126312E



(1) Inspection of connector and harness of injector

- Check the short scar to the terminals of the connector section.

7. Inspection when an error in the exhaust gas recirculation and exhaust break valve system Error Occurrence

- The exhaust gas recirculation system recirculates the exhaust gas recirculation gas by closing the exhaust break valve.
- Perform troubleshooting by referring to this section when the following diagnosis codes are generated, because there are cases where errors in the exhaust gas recirculation system occur due to an exhaust brake valve malfunction, and the problem persists even after inspecting and repairing the exhaust gas recirculation system.

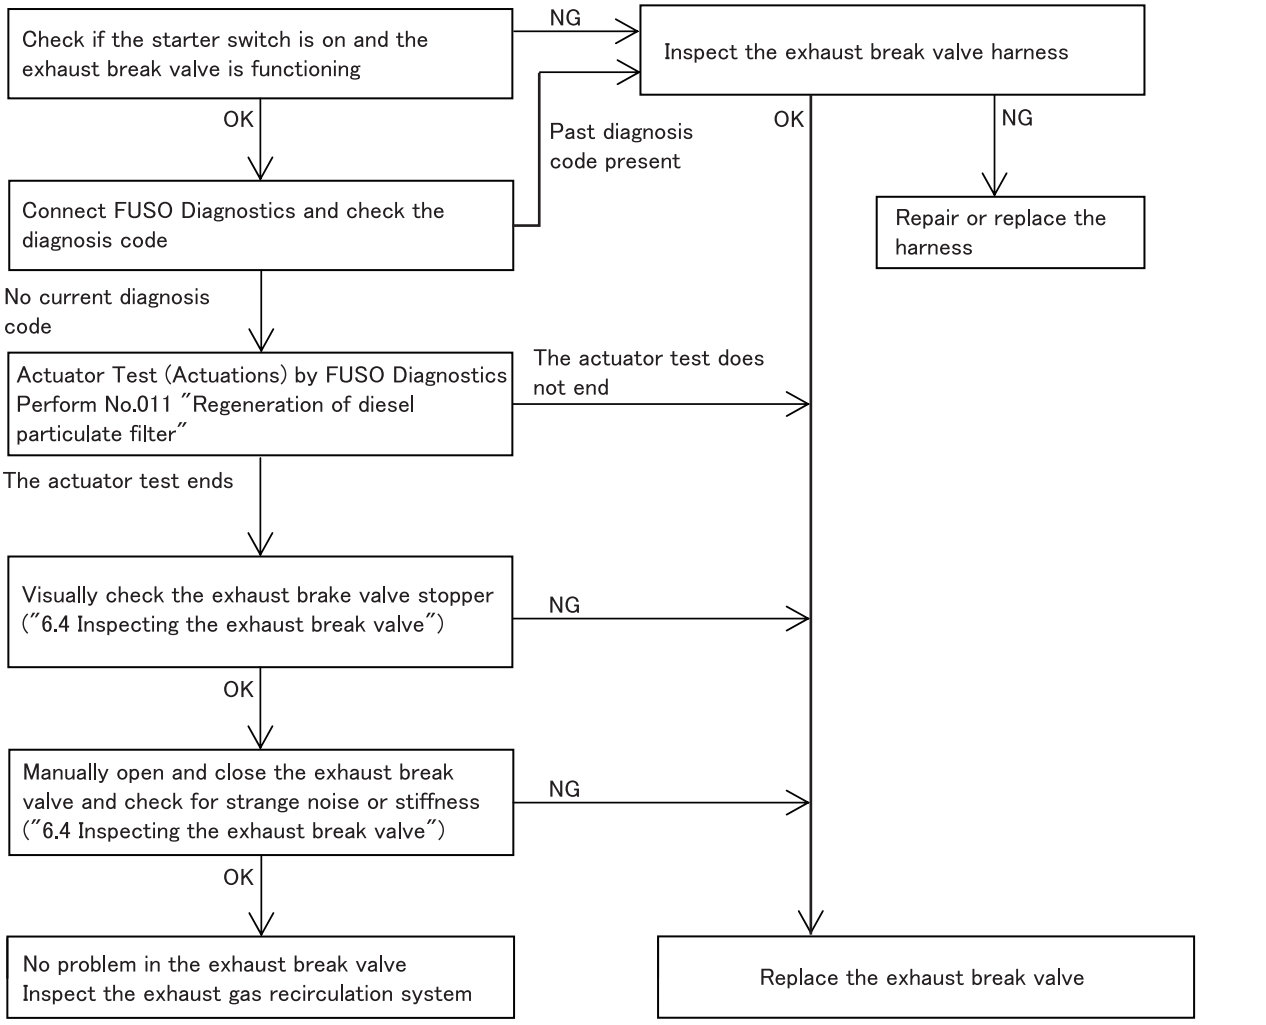
7.1 Exhaust gas recirculation system error

- When the following diagnosis codes are generated, perform troubleshooting of the exhaust break valve first by referring to this section.
  - (27-15) The position of component ‘Exhaust gas recirculation valve’ is implausible.
  - (27-17) The position of component ‘Exhaust gas recirculation valve’ is implausible.
  - (2791-0) The signal voltage of component ‘Position sensor ‘Exhaust gas recirculation controller’’ is too high.
  - (2791-1) The signal voltage of component ‘Position sensor ‘Exhaust gas recirculation controller’’ is too low.
  - (2791-3) Component ‘Exhaust gas recirculation valve’ has a short circuit to positive.
  - (2791-4) Component ‘Exhaust gas recirculation valve’ has a short circuit to ground.
  - (2791-5) Component ‘Exhaust gas recirculation valve’ has an open circuit.
  - (2791-7) Component ‘Exhaust gas recirculation valve’ has a mechanical fault.
  - (2791-12) Component ‘Exhaust gas recirculation valve’ has overtemperature.
  - (2791-16) The signal voltage of component ‘Position sensor ‘Exhaust gas recirculation controller’’ is too high.
  - (2791-18) The signal voltage of component ‘Position sensor ‘Exhaust gas recirculation controller’’ is too low.
  - (2791-31) The power consumption of component ‘Exhaust gas recirculation valve’ is too high.
  - (3058-0) The signal of component ‘Exhaust gas recirculation actuator’ is implausible compared with the signal of component ‘Air mass flow rate / Intake air temperature sensor’.
  - (3058-1) The signal of component ‘Exhaust gas recirculation actuator’ is implausible compared with the signal of component ‘Air mass flow rate / Intake air temperature sensor’.
  - (3058-16) The signal of component ‘Exhaust gas recirculation actuator’ is implausible compared with the signal of component ‘Air mass flow rate / Intake air temperature sensor’.
  - (3058-18) The signal of component ‘Exhaust gas recirculation actuator’ is implausible compared with the signal of component ‘Air mass flow rate / Intake air temperature sensor’.
  - (3058-31) The signal from component ‘Exhaust gas recirculation valve’ is faulty.
  - (520344-3) Component ‘Exhaust gas recirculation valve’ has a short circuit to positive.
  - (520344-4) Component ‘Exhaust gas recirculation valve’ has a short circuit to ground.
  - (520344-6) Component ‘Exhaust gas recirculation valve’ has an electrical fault.
  - (520344-7) The function of component ‘Exhaust gas recirculation valve’ is not OK.

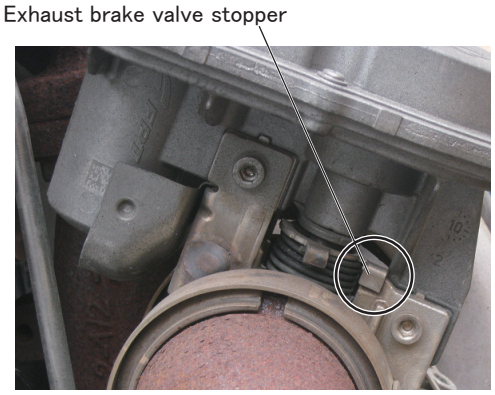
7.2 Exhaust break valve system error

- When the following diagnosis codes are generated, perform troubleshooting of the exhaust break valve by referring to this section.
  - (1074-3) Component ‘Engine brake Solenoid valve’ has a short circuit to positive.
  - (1074-4) The exhaust flap has a short circuit to ground. / Component ‘Engine brake Solenoid valve’ has a mechanical defect.
  - (1074-5) Component ‘Engine brake Solenoid valve’ has an open circuit.
  - (1074-12) The function of component ‘Engine brake Solenoid valve’ is not OK.
  - (520358-2) Component ‘Engine brake Solenoid valve’ is mechanically damaged or it sticks.
  - (520359-2) Component ‘Engine brake Solenoid valve’ or its electrical line is defective.
  - (520360-2) Component ‘Engine brake Solenoid valve’ or its electrical line is defective.
  - (520361-2) Component ‘Engine brake Solenoid valve’ or its electrical line is defective.
  - (520362-2) Component ‘Engine brake Solenoid valve’ or its electrical line is defective.

7.3 Inspection work flow

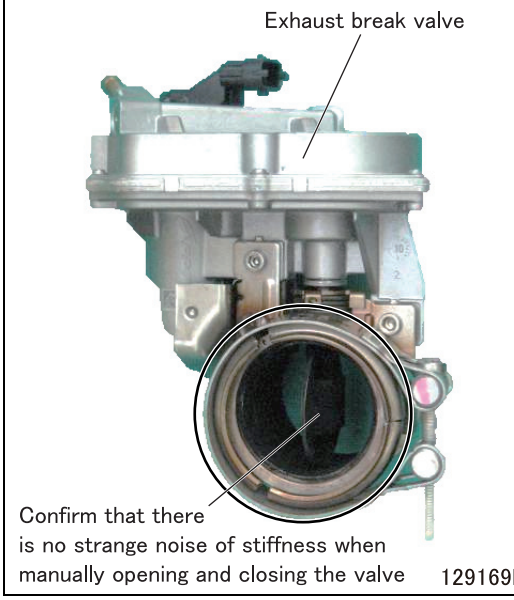


7.4 Inspecting the exhaust break valve



(1) Visual inspection of the exhaust brake valve stopper

- Replace the exhaust brake valve main unit when there is breakage, damage, etc.



(2) Operational (manual) inspection of the exhaust break valve

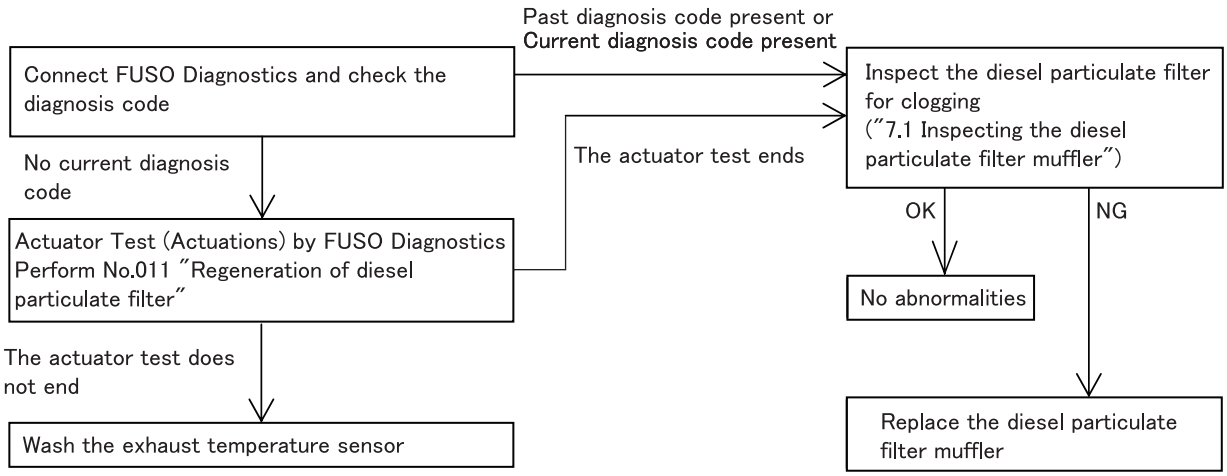
CAUTION ⚠

- **The valve gets very hot after engine operation. Proceed with work after letting it cool down completely to prevent burns.**

- Remove the exhaust pipe. (See Gr15.)
- Manually open and close the exhaust break valve and check for strange noise or stiffness.
- When there is a strange noise of stiffness when opening or closing the valve, replace the exhaust brake valve main unit.

8. Inspection when a diesel particulate filter-related sensor system Error Occurrence

- There are cases when a diagnosis code is generated for a diesel particulate filter-related sensor due to a malfunction in the diesel particulate filter.
- When a diesel particulate filter-related sensor diagnosis code is generated, the following diagnosis codes are generated again even after processing the sensor and harness malfunction or even when there is no problem with the sensor. In this case, perform diesel particulate filter troubleshooting by referring to this section.
  - (3244-2) The signal value of component 'Temperature sensor 'Exhaust system' 2' is implausible.
  - (3253-18) Check hose between diesel particulate filter and component 'Differential pressure sensor of diesel particular filter' for correct connection.
  - (3285-17) Check hose between diesel particulate filter and component 'Differential pressure sensor of diesel particular filter' for correct connection.
  - (3701-2) The value measured by component 'Differential pressure sensor of diesel particular filter' is too high.
  - (3726-16) The soot content of the diesel particulate filter is not OK.
  - (520429-18) The signal from component 'Lambda control tester' is faulty.



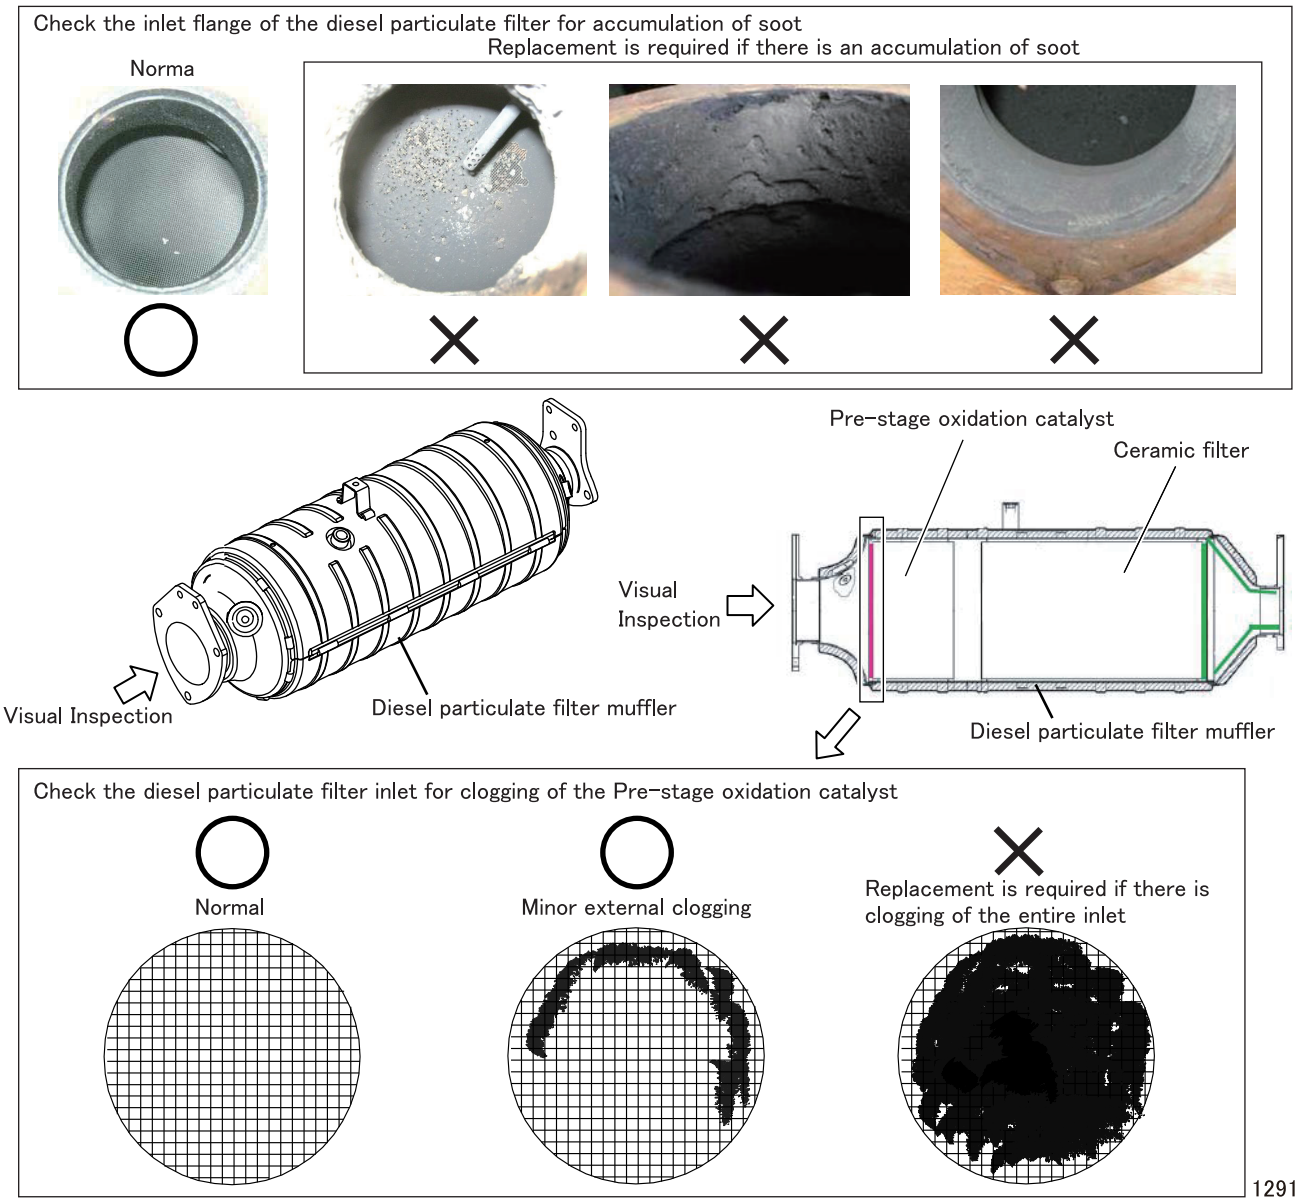
129345E

8.1 Inspecting the diesel particulate filter muffler

CAUTION ⚠

- **The diesel particulate filter muffler gets very hot after engine operation. Proceed with work after letting it cool down completely to prevent burns.**

- Visually inspect the diesel particulate filter for any clogging or accumulation of soot.
- Replace the diesel particulate filter when there is clogging or heavy accumulation of soot. (See Gr17.)

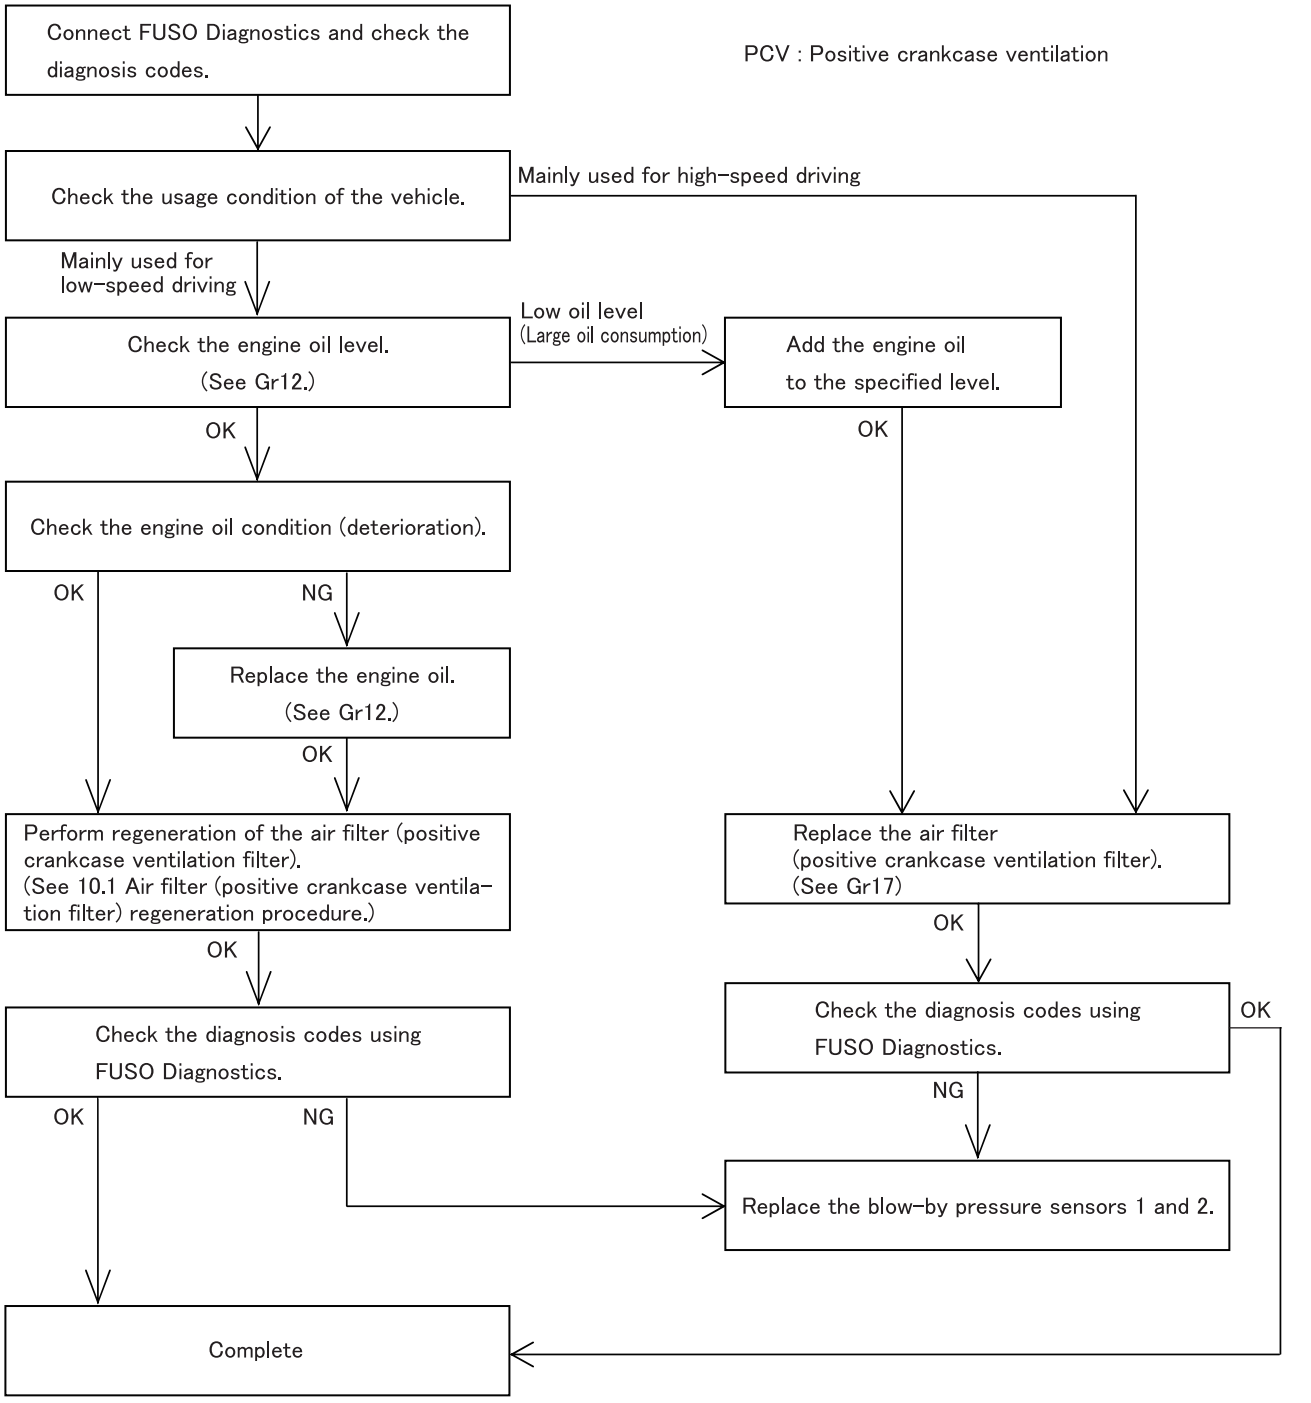


9. Inspection when a DEF dosing module system Error Occurrence

- If the injection port of the DEF dosing module is clogged by crystallized DEF, the following diagnosis code may be stored.
- If the following diagnosis code is stored, troubleshoot by referring to (5) Inspection of DEF dosing module, DEF supply module (motor and heater) in 5.3 Inspections at relevant system sections of 5. Inspections to be Made at NOx Error Occurrence.
- (3361-5) Component 'DEF metering device' has an open circuit.

10. Inspections to be Made at Blow-by pressure sensor Error Occurrence

- The blow-by pressure sensor-related diagnosis codes may occur due to faulty oil (quantity or quality) or faulty air filter (positive crankcase ventilation filter).
- If any of the following diagnosis codes is stored, perform troubleshooting with reference to this section before replacing the blow-by pressure sensor.
  - (22-0) The signal voltage of component 'Crankcase pressure sensor2' is too high.
  - (22-1) The signal voltage of component 'Crankcase pressure sensor2' is too low.
  - (22-16) The signal value of component 'Crankcase pressure sensor2' is too high.
  - (22-18) The signal value of component 'Pressure sensor in crankcase' is too low.
  - (30-0) Component 'Pressure sensor in hose line of crankcase ventilation system' has a short circuit or is defective.
  - (30-1) Component 'Pressure sensor in hose line of crankcase ventilation system' has a short circuit or is defective.
  - (30-15) The differential pressure between sensor in crankcase and sensor in hose line of crankcase ventilation system is above upper limit.
  - (30-16) The signal value of component 'Pressure sensor in hose line of crankcase ventilation system' is too high.
  - (30-17) The differential pressure between sensor in crankcase and sensor in hose line of crankcase ventilation system is above upper limit.: TOO HIGH



129285E

10.1 Air filter (PCV (positive crankcase ventilation filter)) regeneration procedure

NOTE

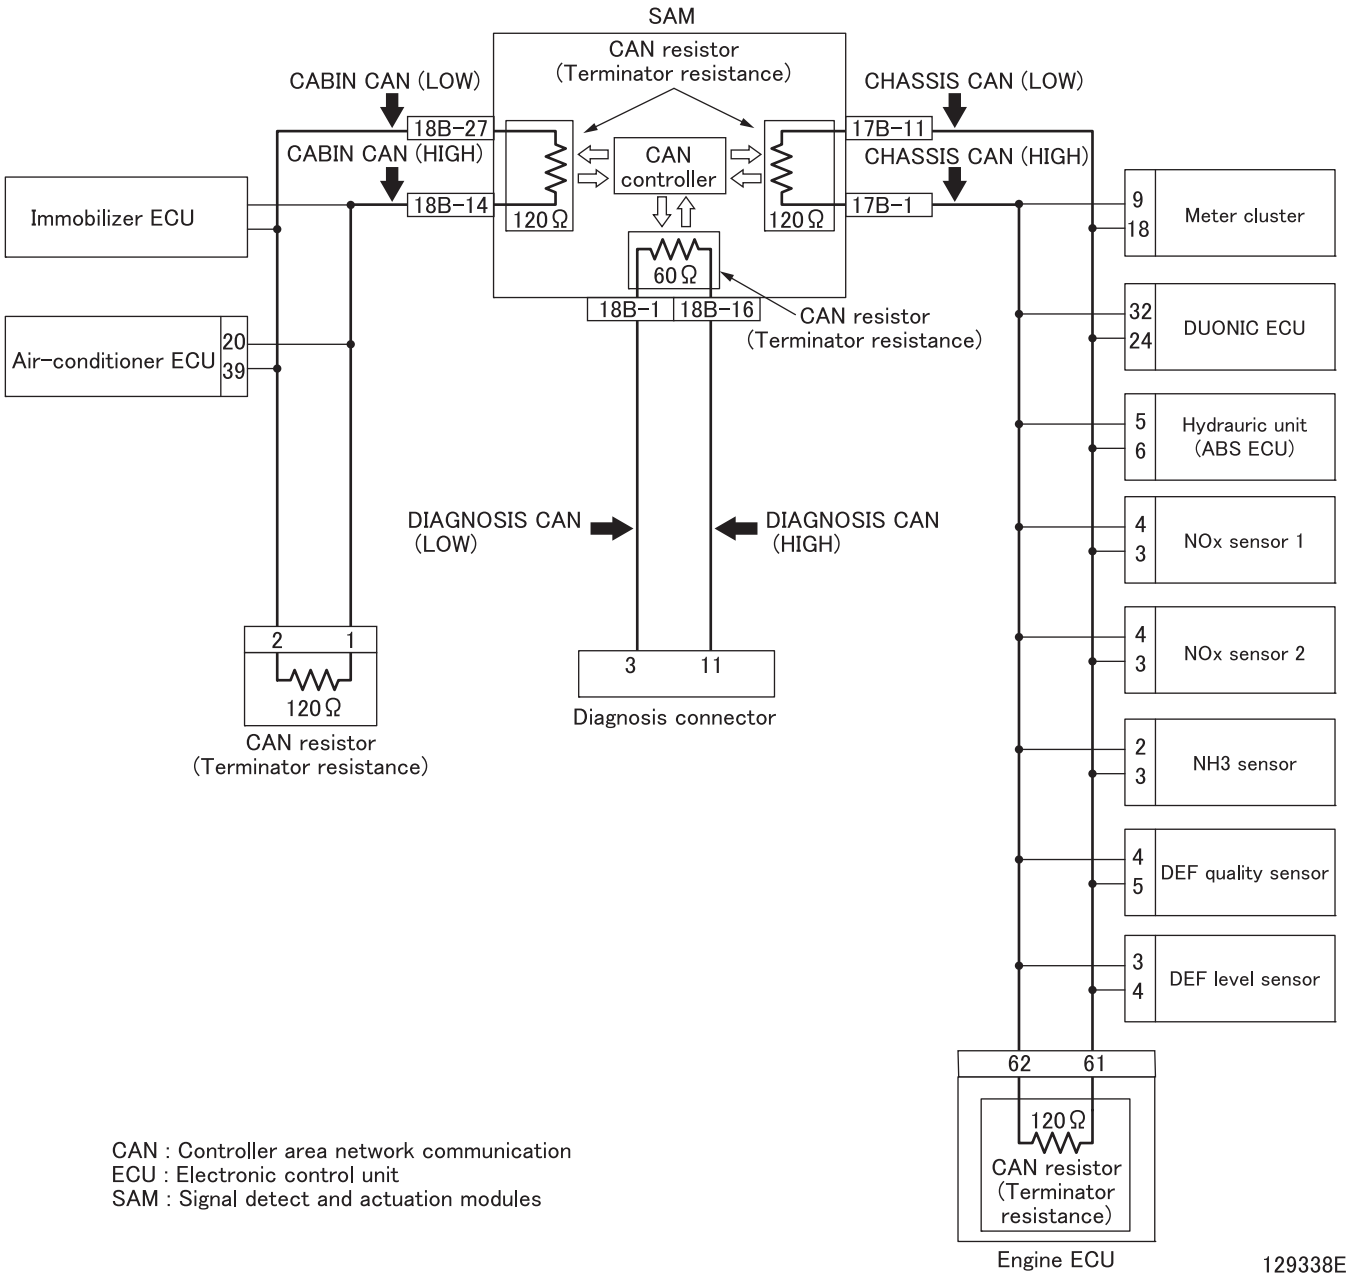
- **Using the this procedure extends the air filter (PCV (positive crankcase ventilation) filter) replacement interval by approximately 50 hours.**
- **Air filter (PCV (positive crankcase ventilation) filter) regeneration can be repeated.**

- Stop the vehicle in a safe place, firmly apply the parking brake and move the gearshift lever to “P”.
- Press the accelerator pedal fully so that the engine speed is 4,000 rpm, and wait for 2 minutes.
- Release the accelerator pedal after 2 minutes.

11. Inspections to be Made at CAN error Occurrence

- If any of the CAN error is stored, perform troubleshooting with reference to this section.

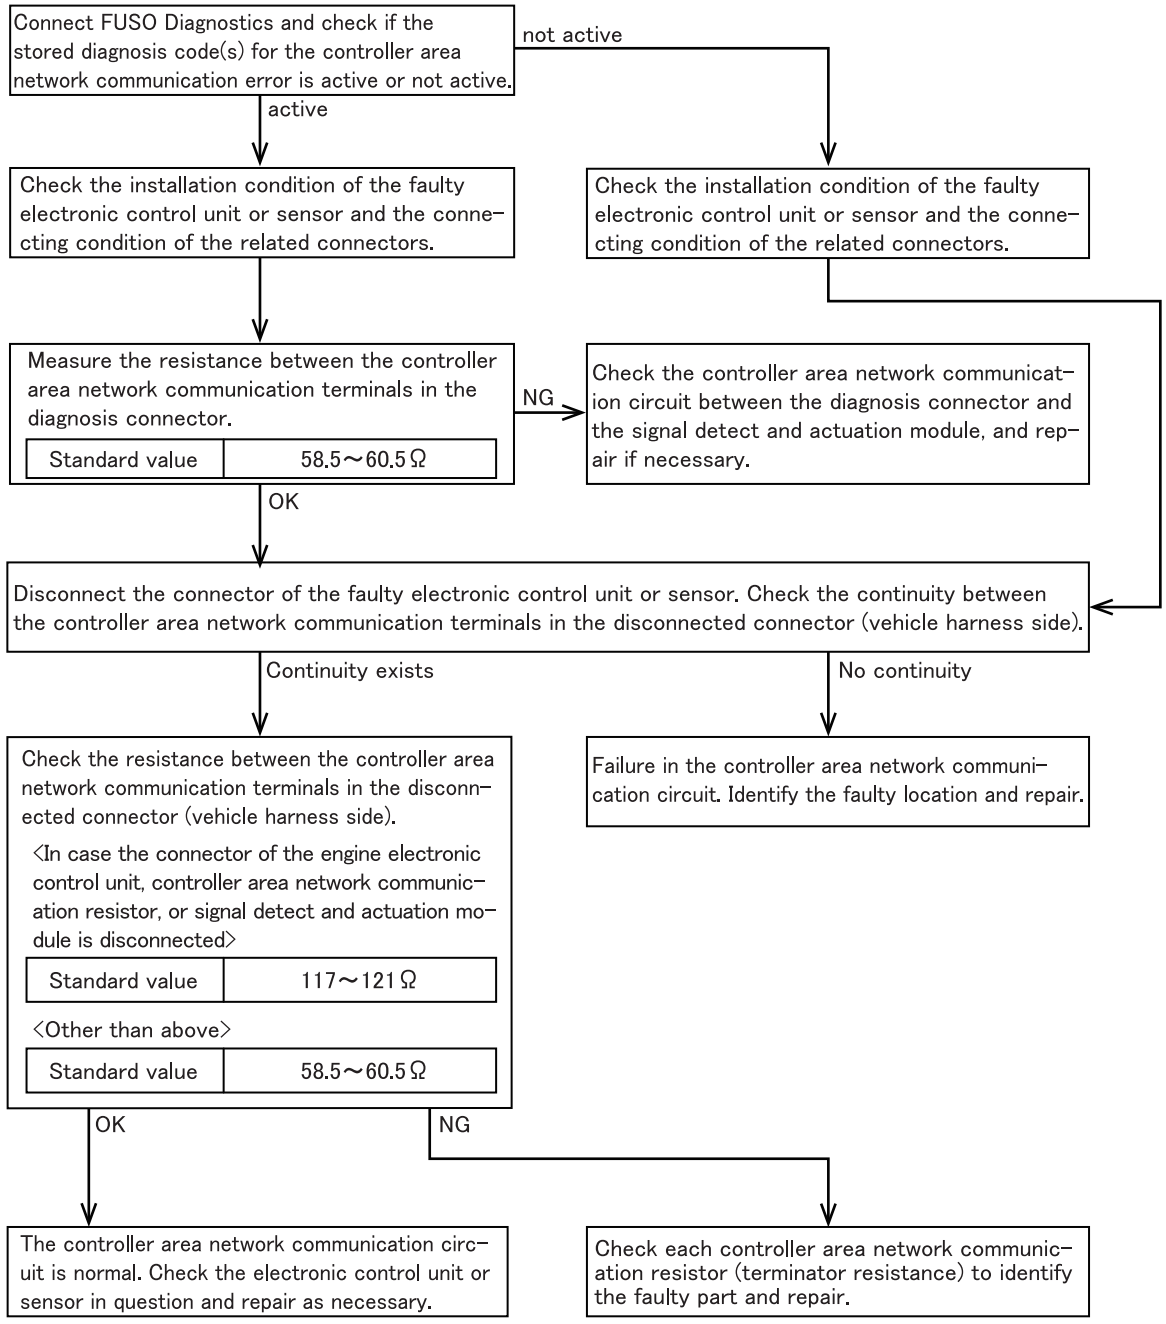
11.1 Schematic diagram of the CAN circuit



CAN : Controller area network communication
ECU : Electronic control unit
SAM : Signal detect and actuation modules

11.2 Inspection work flow

- Perform inspection in accordance with the following flowchart while referring to the schematic diagram of the controller area network communication circuit.



CAN : Controller area network communication
ECU : Electronic control unit
SAM : Signal detect and actuation modules

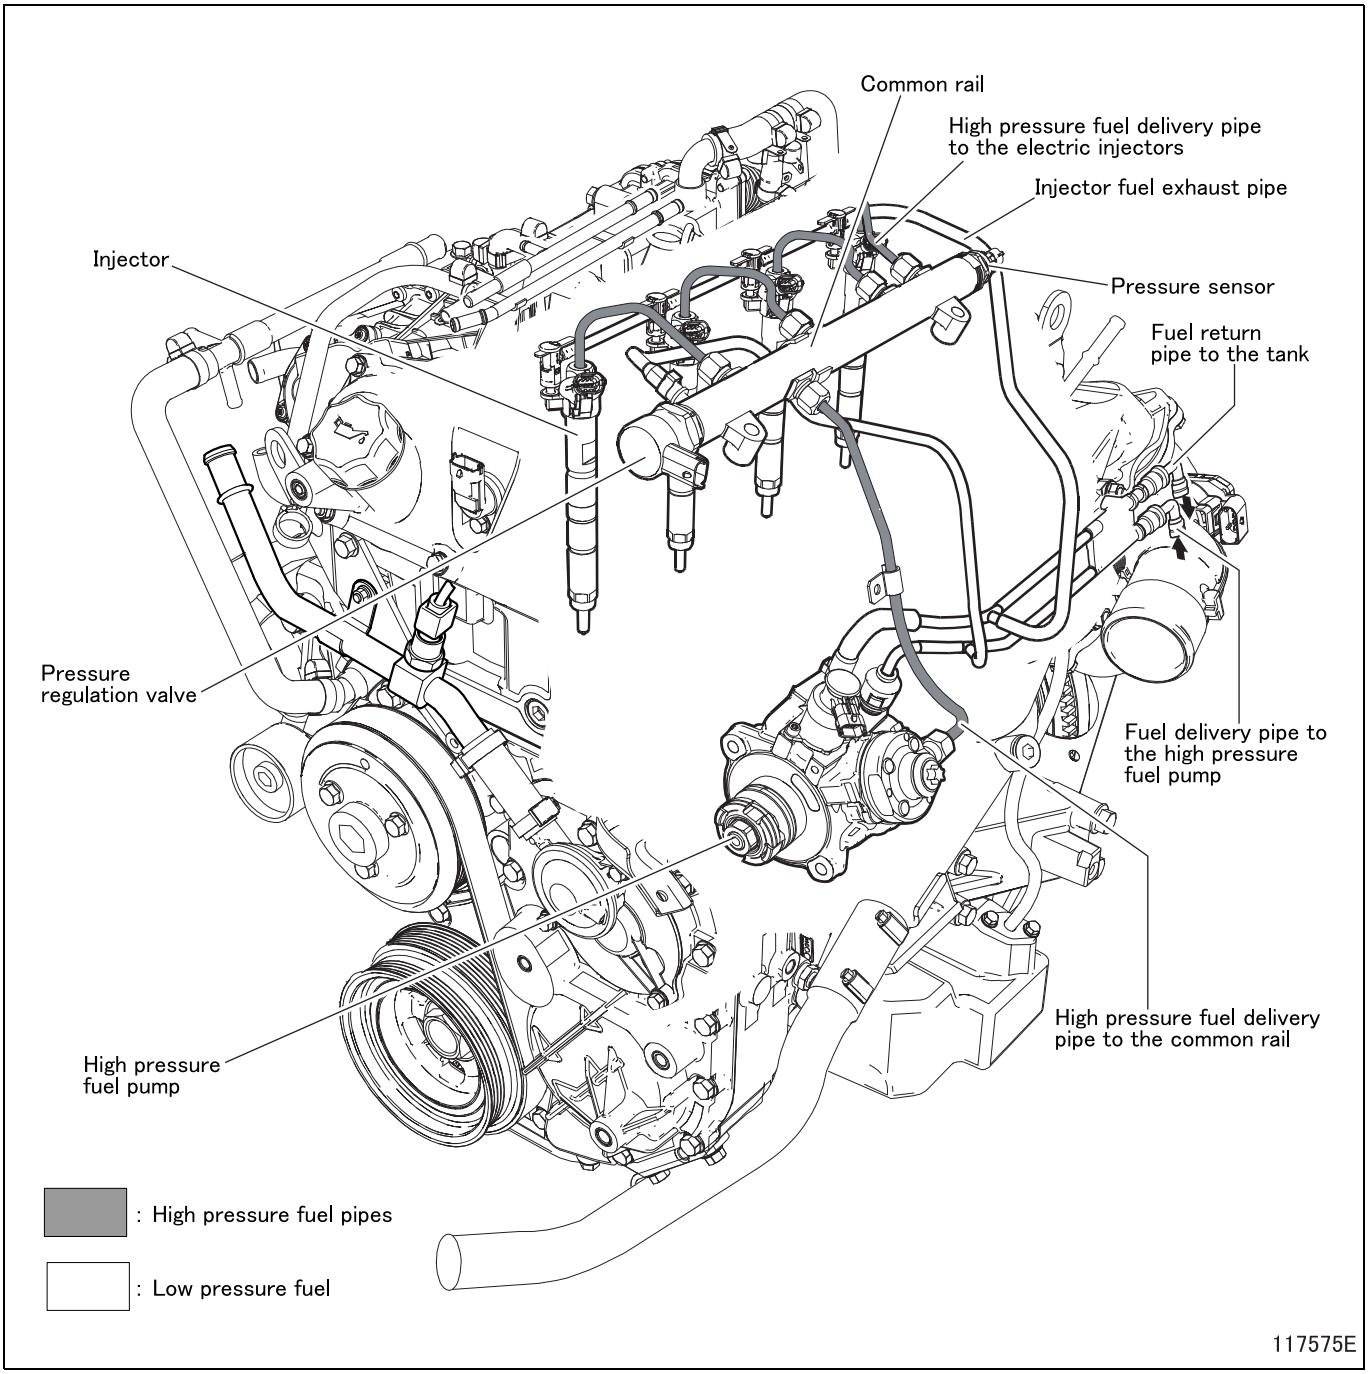
INSTALLED LOCATIONS OF PARTS ..... (See Gr54.)

ELECTRIC CIRCUIT DIAGRAM ..... (See Gr54.)

1. High Pressure Electronic Injection System

1.1 Overview

- The main characteristics of high pressure electronic injection system are.
  - High injection pressures available.
  - Pressures can be modulated irrespective of the speed of rotation and engine load.
  - Capacity to operate at very high speeds.
  - Injection control precision (injection duration and advance).
  - Lower consumption.
  - Lower emissions.

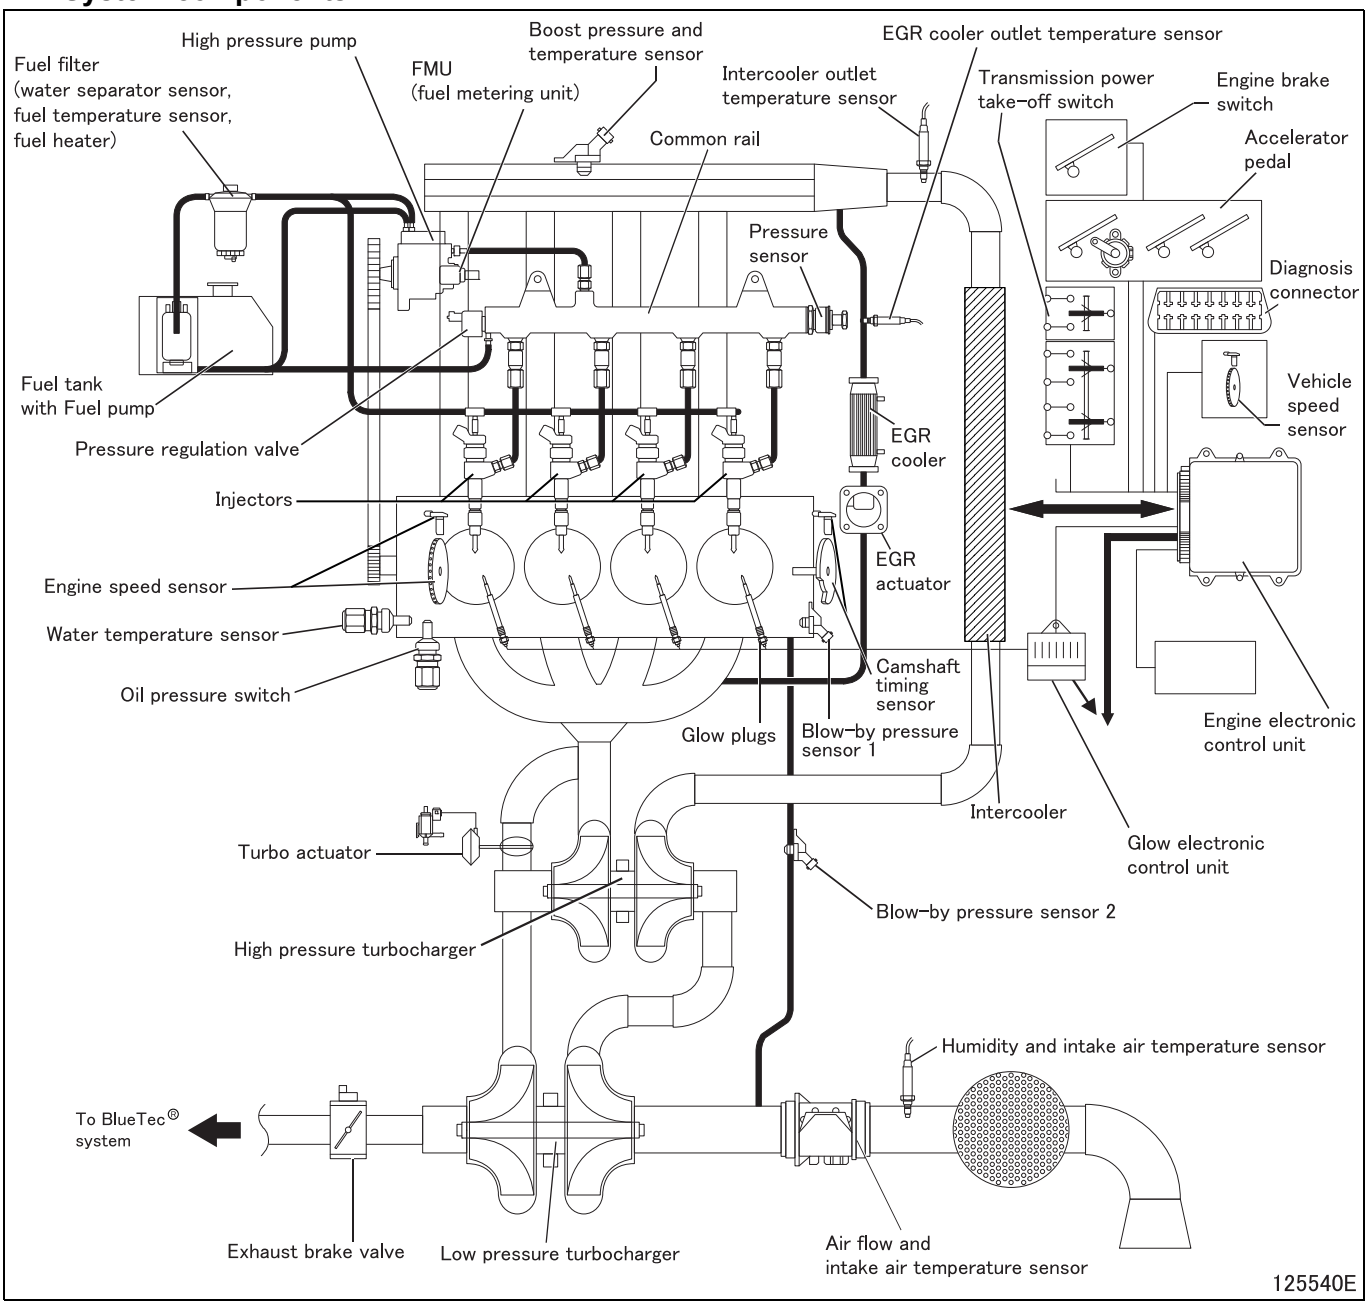


- The main functions of the system are basically as follows.
  - Checking fuel temperature.
  - Checking engine coolant temperature.
  - Checking amount of fuel injected.
  - Checking idling speed.
  - Fuel cut-off when the accelerator pedal is released.
  - Checking cylinder balancing when idling.
  - Checking smokiness at exhaust on acceleration.
  - Checking exhaust gas recirculation (E.G.R.).
  - Checking top speed limit.
  - Checking glow plugs.
  - Checking activation of air-conditioning system (if any).
  - Checking auxiliary fuel pump.
  - Checking position of cylinders.
  - Checking main and pilot injection advance.
  - Checking closed cycle of injection pressure.
  - Checking turbocharging pressure.
  - Self-diagnosis.
  - Immobilizer electronic control unit.
  - Maximum torque limitation.

- The information the engine electronic control unit processes to regulate the amount of fuel to be injected comprises.
  - Engine speed.
  - Coolant temperature.
  - Turbocharging pressure.
  - Air temperature.
  - Intake air quantity.
  - Battery voltage.
  - Fuel pressure.
  - Position of throttle pedal.

2. Engine Electronic Control System

2.1 System components



2.2 Electronic injection system particular features of engines EPA 13

- To observe emission limits EPA 13, engines EPA 13 have following features.
  - E.G.R. system present.
  - DPF (diesel particulate filter) present.
  - New digital flow meter (positioned after the air filter).
  - Air pressure sensor present (on the intake manifold after the intercooler).
  - Fuel electrical pump suitable to pressurize the circuit according to specifications Euro V.
  - Vehicle wiring harness for central unit electrical control unit new electrical scheme.
  - Exhaust brake valve present driven by electrical control unit (positioned on exhaust line).
- Constant regeneration particulate trap is mounted on engine exhaust. Through data processing (engine rpm's, H_2O temperature, oil temperature, lambda probe signal, etc.), the central unit calculates the quantity of particulate accumulated in filter and chooses to increase exhaust gas temperature (through post-injection) in order to burn particulate accumulated inside filter.
- Further, vehicles (for compliance with regulations EPA 13) differ from the ones of present production mainly in following components.
  - Fitting with catalytic converter DPF (diesel particulate filter) provided with exhaust gas temperature sensors,
  - Differential pressure (Delta-p) sensor for detecting DPF (diesel particulate filter) catalyst particulate filter clogging,
  - Fuel electric pump with different characteristics for boosting fuel system pressurization,
  - Electrical wiring harness.
  - Selective catalytic reduction.

2.3 Fuel injection control

- The system calculates injection on the basis of the processing of the following parameters.
  - Engine rpm.
  - Engine coolant fluid temperature.
  - Intake air capacity.
  - Battery voltage.
  - Fuel pressure.
  - Accelerator pedal position.

- The fuel pressure in the common rail varies according to engine rpm and load operating conditions.
- The pre-injection is carried out to reduce the noise level.
- Pre-injection advance angles, the distance between pre-injection and main injection and advance angles of main injection vary according to the instantaneous engine operating conditions.

(1) Immobilizer recognition

- When the control unit receives the signal of the key "ON" it communicates with the immobilizer control unit to enable starting.

(2) Checking engine coolant temperature

- The engine electronic control unit, depending on the temperature.
  - Of the engine coolant, turbocharging air and fuel, operates the viscous fan and switches on the coolant temperature warning light.

(3) Checking quantity of fuel injected

- According to the signals from the sensors and the mapped values, the engine electronic control unit.
  - Operates the pressure regulation valve.
  - Varies the “pilot” injection time.
  - Varies the “main” injection time.
  - Checking idling adjustment.

- The engine electronic control unit processes the signals from the various sensors and regulates the amount of fuel injected.
  - It operates the pressure regulator.
  - It varies the injection times of the injectors.

(4) Checking smokiness at exhaust on acceleration

- With heavy acceleration, on the basis of the signals received from the air introduction meter and engine speed sensor, the engine electronic control unit determines the optimum amount of fuel to inject.
  - It operates the pressure regulator.
  - It varies the injector injection time.

(5) Checking exhaust gas recirculation

- Depending on the engine load and the signal from the accelerator pedal sensor, the engine electronic control control unit limits the amount of air taken in, actuating partial suction of the exhaust gases.

(6) Checking engine rotation balance during acceleration

- Regular progression is assured in all conditions by the control of the pressure regulator and the injector opening time.

(7) Glow plug control

- During.
  - Preglow.
  - Afterglow.
  - The injection centre times the heater starter (or glow plugs for the 4P10 Engine) according to engine temperature.

(8) Checking fuel pump

- Irrespective of the speed, the engine electronic control unit.
  - Supplies the auxiliary fuel pump with the key “ON”.
  - Cuts off auxiliary pump supply if the engine is not started up within a few seconds.

(9) Checking fuel heater

- It times operation of fuel heater in relation to ambient temperature.

(10) Checking cylinder position

- During each turn of the engine, the engine electronic control unit recognizes which cylinder is in the power stroke and operates the injection sequence for the appropriate cylinder.

(11) Checking pilot and main injection timing

- According to the signals from the various sensors, including the absolute pressure sensor built into the engine electronic control unit, the engine electronic control unit determines the optimum point of injection according to internal mapping.

(12) Checking injection pressure closed cycle

- Depending on the engine load, determined by processing the signals from the various sensors, the engine electronic control unit operates the regulator to obtain optimum line pressure.

(13) Fuel supply

- The fuel supply is calculated in relation to.
  - Accelerator pedal position.
  - Engine speed.
  - Quantity of air introduced.
- The outcome may be corrected in relation to.
  - The water temperature.
- Or to avoid.
  - Noise.
  - Smoke.
  - Overloading.
  - Overheating.
  - Turbine over-revving.
- The delivery can be modified in the case of.
  - Action of external devices (anti-lock brake system).
  - Serious trouble decreasing the load or stopping the engine.

- After determining the mass of air introduced by measuring its volume and temperature, the engine electronic control unit calculates the corresponding mass of fuel to inject into the relevant cylinder (mg per delivery) also taking into account the temperature of the diesel.
- The mass of fuel calculated in this way is first converted into volume (mm^3 per delivery) and then into degrees of throw, or duration of injection.

(14) Correcting flow rate according to water temperature

- A cold engine meets with greater resistance during operation: friction is high, the oil is still very viscous, and the various clearances are not yet optimized.
- In addition, the injected fuel tends to condense on the metal surfaces that are still cold.
  The fuel supply for a cold engine is therefore greater than for a warm one.

(15) De-rating

- In the event of the engine overheating, injection is modified, decreasing the delivery to a varying degree, in proportion to the temperature reached by the coolant.

(16) Turbine rpm setting

- Based on signals from the accelerator pedal position and intake manifold air temperature/pressure engine rpm sensors, the electronic centre processes the field-back signal to turbo actuator pilot electro valve opening.

(17) Injection timing electronic test

- The advance (start of delivery, expressed in degrees) may be different from one injection to the next, also differentiated from one cylinder to another. It is calculated, similarly to the delivery, in relation to the engine load (accelerator position, engine speed and air introduced).
- The advance is appropriately corrected.
  - In phases of acceleration.
  - According to the water temperature.
- And also to obtain.
  - Lower emissions, noise and overloading.
  - Better vehicle acceleration.
- An extremely high advance is set on starting, depending on the water temperature.
- Feedback from the start of delivery is supplied by the change in impedance of the injector solenoid valve.

(18) Speed governor

- The electronic speed governor has both features of governors.
  - Idling and top speed.
  - All speeds.
- It is stable in ranges where conventional, mechanical governors are imprecise.
- Within certain thresholds the speed takes account of the battery voltage.

(19) Engine starting

- During the first few turns of the engine, the timing and cylinder no. 1 recognition signals (engine speed sensor and camshaft timing sensor) are synchronized.
- The accelerator pedal signal is ignored on starting. Starting delivery is set only according to water temperature, by a special map.

(20) Cold starting

- If even just one of the three temperature sensors (water, air or diesel) records a temperature lower than 10°C {50 °F}, the glow plugs are activated.
- On inserting the key contact, the glow plug indicator goes on and remains on for a period varying depending on temperature (air is heated by the pre-heating glow plugs that are located on cylinder head).
- Thereafter, the engine can be started up.
- When the motor is running this indicator light goes out, while the glow plugs continue to be powered for a certain length of time (variable) for post-heating.
- The pre-heating curve is also variable in relation to the battery voltage.

(21) Run up

- When the key makes contact, the engine electronic control unit transfers the information stored in memory when the engine was last stopped into the main memory (see After Run) and makes a diagnosis of the system.

(22) After run

- Whenever the engine is switched off with the key, the engine electronic control unit stays powered for about 30 seconds by the main relay.
- This makes it possible for the microprocessor to transfer some data from the main memory (volatile) to a non-volatile memory, which can be erased and written over (EEPROM), so as to make it available at the next start up (see Run Up).
- These data basically consist of.
  - Various settings (engine idling adjustment, etc.).
  - Settings of some components.
  - Fault memory.
- The process lasts a few seconds, typically from about 30 (depending on the amount of data to save), after which the engine electronic control unit sends a command to the main relay and makes it disconnect from the battery.

NOTE

- **It is extremely important for this procedure not to be broken off, for example by switching off the engine with the battery cut-out, or by disconnecting the battery cut-out before 20 seconds have passed since switching off the engine. If this happens, the functioning of the system is ensured, but repeated interruptions may damage the engine electronic control unit.**

(23) Cut-off

- This function cuts off fuel delivery when the vehicle is decelerating (accelerator pedal released).

(24) Cylinder balancing

- Individual cylinder balancing contributes to increasing comfort and handling.
- This function permits individual, customized control over the delivery of fuel and the start of delivery for each cylinder, even differently from one cylinder to another, to compensate for the hydraulic tolerances of the injector.

- The differences in flow (delivery specifications) between the various injectors cannot be evaluated directly by the engine electronic control unit. Therefore, it is necessary to input particular data of each injector into the engine electronic control unit using FUSO diagnostics each time after injector replacement.

(25) Synchronisation search

- If there is no signal from the camshaft timing sensor, the engine electronic control unit is able to recognize the cylinders into which the fuel is to be injected.
- If this occurs when the engine is already running, the combustion sequence has already been acquired, so the engine electronic control unit continues with the sequence on which it has already been synchronized.
- If this occurs when the engine is at a standstill, the engine electronic control unit energizes a single solenoid valve. Within 2 turns of the crankshaft, injection will take place in that cylinder, so the engine electronic control unit just needs to get synchronized on the firing sequence and to start up the engine.

(26) Brake override system (control with priority given to braking)

- The brake override system (control with priority given to braking) reduces the engine speed when the brake pedal is depressed with the accelerator pedal held depressed so that the brake may be operated preferentially.

(27) Engine protection system

- The engine protection system prevents overheating of the engine.
- If a vehicle continues to run with the engine oil pressure warning lamp illuminated, the engine system warning lamp (red) will illuminate, the alarm will sound, and the engine speed will be limited. If the vehicle still continues to run, the engine will stop automatically.

(28) Idle limiting system

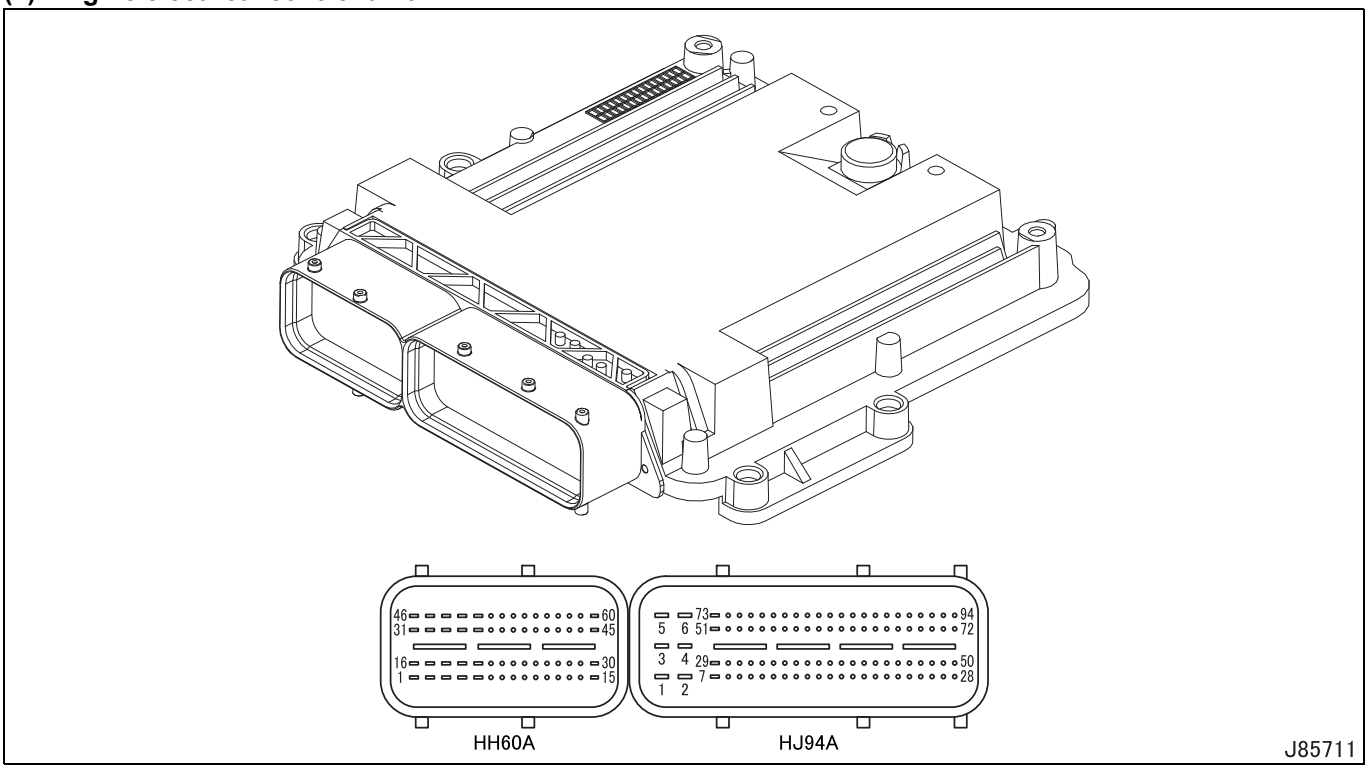
- The idle limiting system automatically stops the engine when the vehicle is stopped for a predetermined period of time.
- When a vehicle is stopped with the engine idling for a certain period of time, the engine system warning lamp (red) will illuminate and the alarm will sound. If further certain period of time has passed, the engine will stop automatically.
- The time to trigger the idle limiting system can be changed by the FUSO Diagnostics.
- The idle limiting system will not operate under any of the following conditions.
  - Gearshift lever is other than “P” or “N” position.
  - Accelerator pedal or brake pedal is depressed.
  - During automatic DPF regeneration or parked DPF regeneration
  - Coolant temperature indicator is under 8 segments
  - Power take-off engaged (in operation)

2.4 Actuators

- The injection system comprises three classes of actuators interlocked with the engine electronic control unit.
  - Injectors (see relevant heading).
  - Regulators (see relevant headings) requiring PWM control (Pulse Width Modulation).
    - For pressure.
    - EGR (Exhaust Gas Recirculation).
  - Actuators with continuous ON/OFF signal to.
    - Turn on/off air-conditioner compressor.
    - Electric supply pump.
    - Cruise control.

2.5 Electric/electronic components

(1) Engine electrical control unit

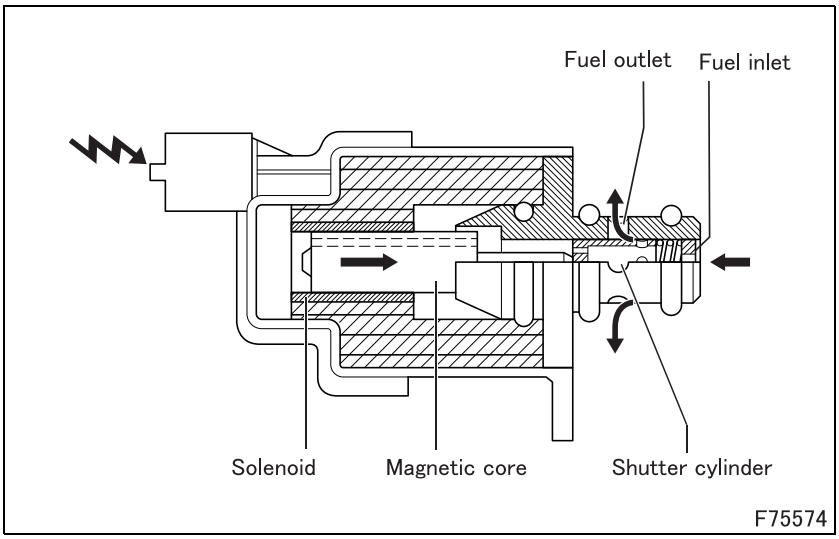


- The engine electronic control unit is of the “flash EPROM” type, i.e. it can be reprogrammed from the outside without acting on its hardware.
- The engine electronic control unit processes the signals from the sensors by applying software algorithms, and also controls the actuators (in particular, the electric injectors and the pressure regulator).
- The engine electronic control unit records, in the memory non-labile area, the information on the engine parameters originally set or acquired during engine operation.
- The injection control unit incorporates the atmospheric sensor, in order to further improve the injection system control.
- The engine electronic control unit is fitted to the left side of the engine compartment and is connected to the vehicle wiring by means of two connectors:
  - 60-pole connector “Engine side injection cable connector” for the components available on the engine;
  - 94-pole connector “Bonnet/cab cable connector” for the components on the vehicle.
- In addition to controlling the system functions described in the respective charter, the engine electronic control unit is interfaced with the other electronic systems found on the vehicle, such as ABS (Anti-lock Brake System), speed limiter, EGR (Exhaust Gas Recirculation), preheating plugs.
- On the vehicles equipped with DPF (Diesel Particulate Filter), the engine electronic control unit also controls the DPF regeneration system. In this case, after any of the operations below is carried out:
  - Replacing one or several injectors,
  - Replacing all the injectors,

  The engine electronic control unit shall be programmed again by means of the FUSO Diagnostics, and the replacement procedure for the concerned component shall be performed, in accordance with the indications of the diagnosis instruments.

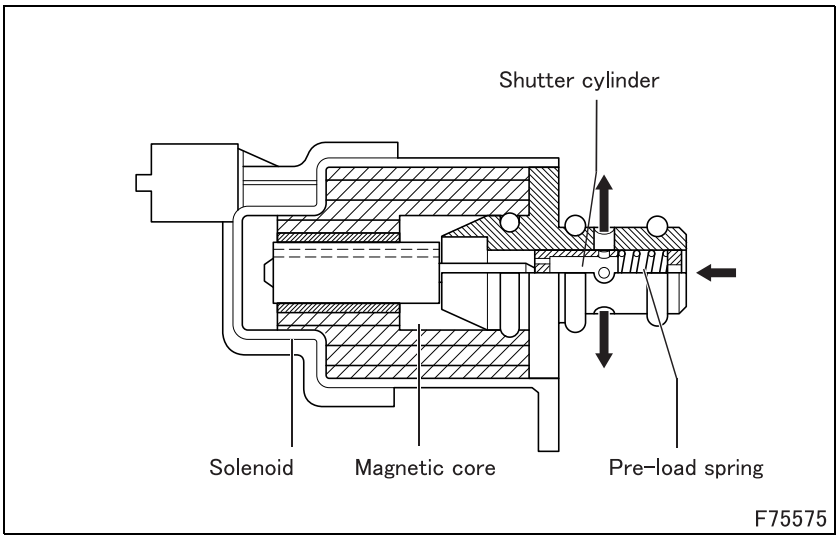
(2) FMU (fuel metering unit)

- The FMU (fuel metering unit) is mounted on the low-pressure circuit of the high pressure pump. The pressure regulator modulates the amount of fuel sent to the high-pressure circuit according to the commands received directly from the engine electronic control unit. The pressure regulator is mainly composed of the following components.
  - Connector.
  - Casing.
  - Solenoid.
  - Pre-load spring.
  - Hutter cylinder.
- When there is no signal, the pressure regulator is normally open, therefore with the pump providing maximum delivery.
- The engine electronic control unit, via the PWM (Pulse Width Modulation) signal, modulates the change in fuel flow rate in the high-pressure circuit by partially closing or opening the sections of passage of the fuel in the low-pressure circuit.

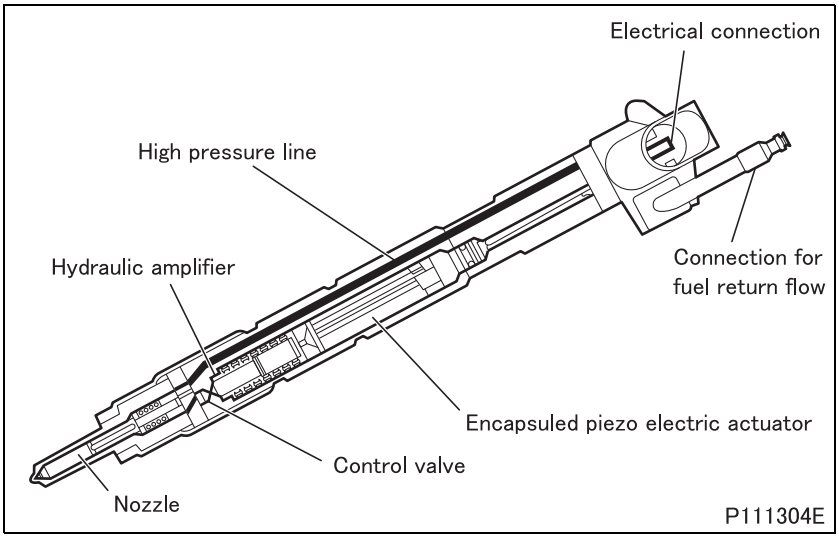


(2.1) Operation

- When the engine electronic control unit governs the FMU (fuel metering unit) (via PWM signal), the solenoid is energized that, in its turn, generates the movement of the magnetic core. The shift of the core causes the shutter cylinder to move axially, reducing the flow of fuel.

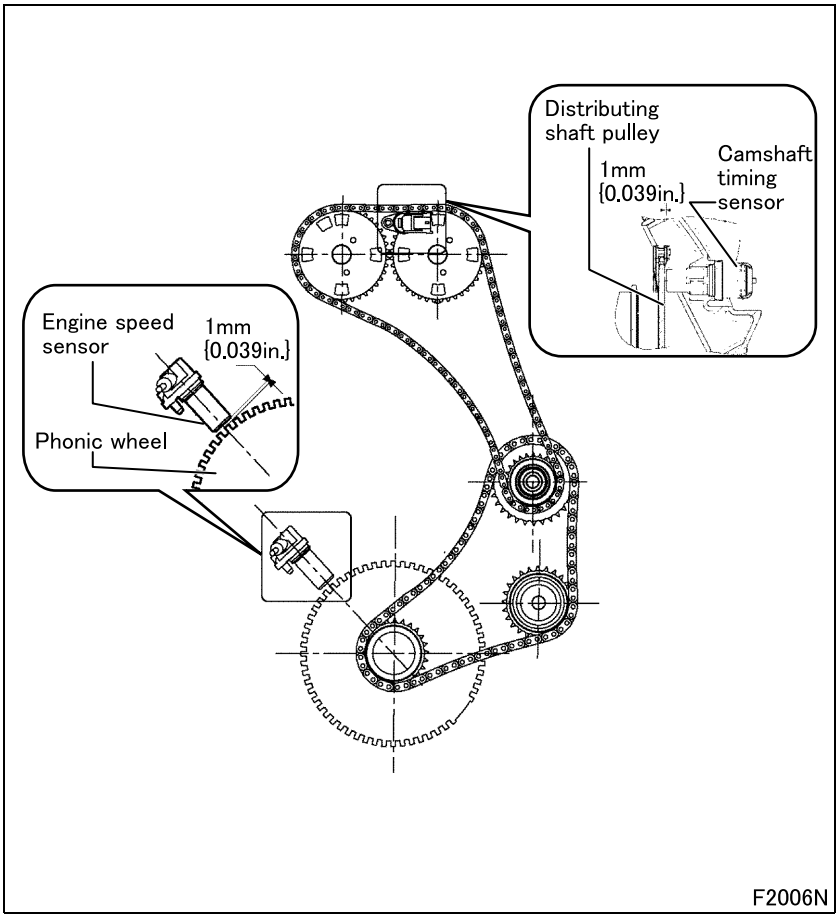


- When the solenoid is not energized, the magnetic core is pushed into the rest position by the pre-load spring. In this condition, the shutter cylinder is in such a position as to offer the fuel the maximum flow and pressure.



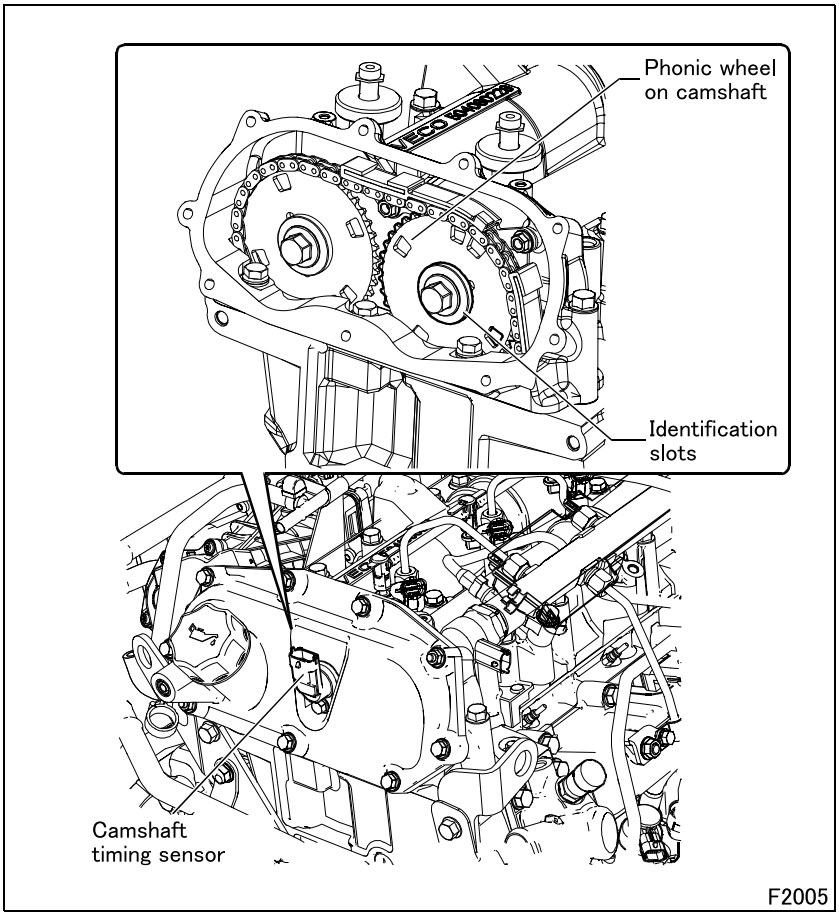
(3) Injector

- When the piezoelectric actuator is reached by an electrical load, commanded by the engine electronic control unit, it increases its length. The movement, amplified by the hydraulic amplifier, act mechanically on the control valve and it allows therefore the injection of the fuel present in the high pressure line. While stopping the electrical load, the actuator reacts elastically and again assumes its initial length.The springs add their contribution, winning the pressures that act in balancing on the whole surface of the components. The fuel in excess is than recirculated in the fuel circuit through the connection for fuel return flow.



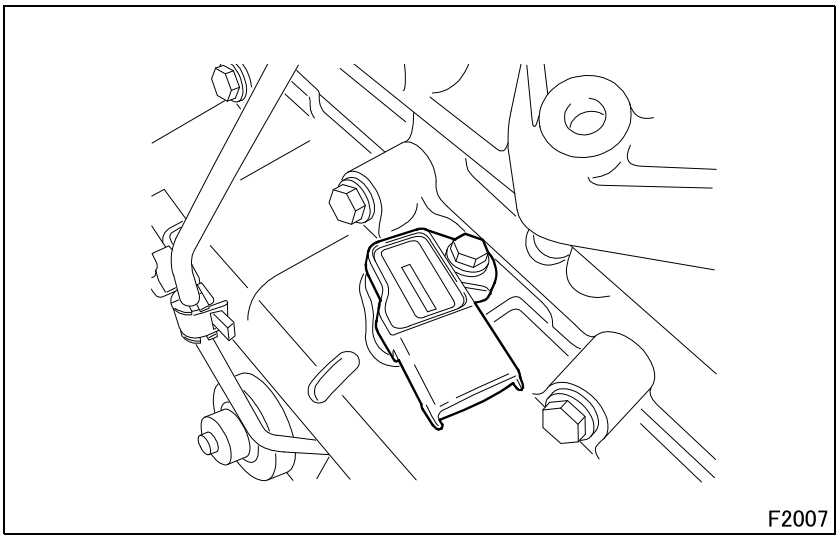
(4) Engine speed sensor

- It is an inductive sensor and is positioned on the phonic wheel fitted on the front end of the drive shaft.
- It generates the signals resulting from the magnetic flow lines which close through the teeth of the phonic wheel.
- The engine electronic control unit uses this signal to measure the speed of rotation of the engine, its angular position and to operate the electronic RPM counter.
- If this signal fails the RPM counter will not work.
- The sensor gap shall be as follows:
  - 1 ± 0.5 mm {0.039 ± 0.020 in.}, between distributing shaft pulley and phase sensor,
  - 1 mm {0.039 in.}, between phonic wheel and engine speed sensor.



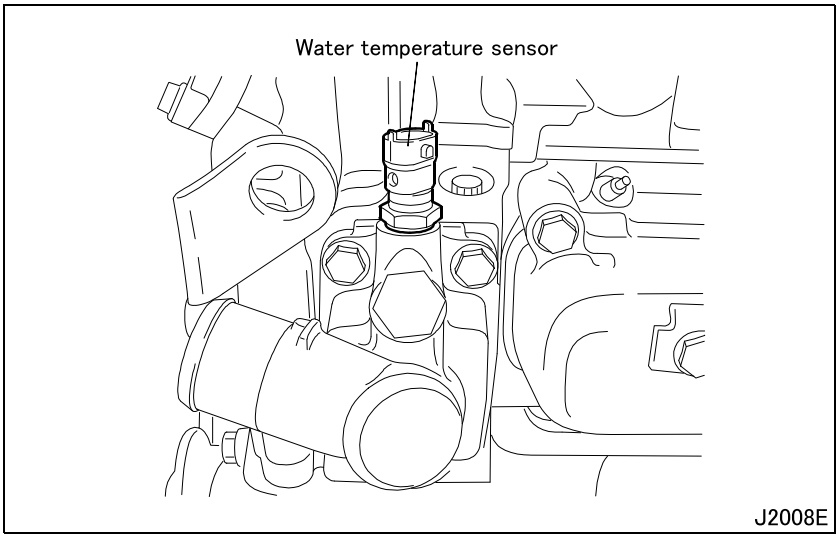
(5) Camshaft timing sensor

- It is an inductive sensor and is positioned on the camshaft gear of the suction valves.
- It generates the signals resulting from the magnetic flow lines which close through a slot on the gear itself.
- The signal generated by this sensor is used by the engine electronic control unit as a redundant signal to measure the different engine speeds.



(6) Boost pressure and temperature sensor

- Positioned on the intake manifold, it measures the pressure of the turbocharging air introduced into the intake manifold.
- This value, together with that of the boost pressure and temperature sensor, makes it possible for the engine electronic control unit to calculate the exact quantity of air introduced into the cylinders so as to operate the injectors adjusting the fuel delivery, limiting harmful emissions, improving consumption and performance.
- The sensor contains an electronic temperature correction circuit to optimize the pressure measurement in relation to the temperature of the intake air.



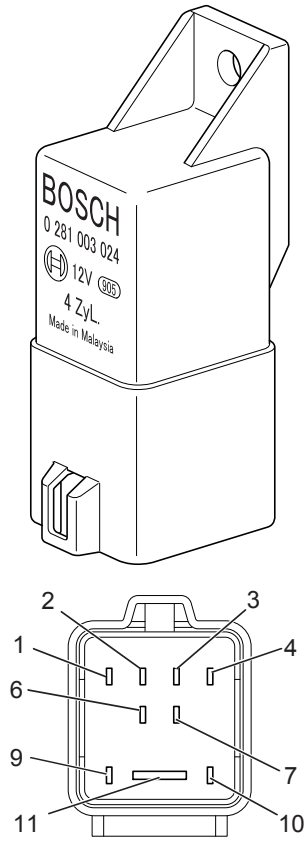
(7) Water temperature sensor

- When temperature sensor for engine control provides the engine electronic control unit with an index of the thermal status of the engine in order to determine corrections for the fuel delivery, injection pressure, exhaust gas recirculation injection advance when starting cold (if mounted) and warm-up.

(8) Atmospheric pressure sensor

- This is integrated in the engine electronic control unit. It provides a criterion of correction for the measurement of the air flow rate and to calculate the reference air flow rate to check the EGR.

(9) Glow plug electronic control unit

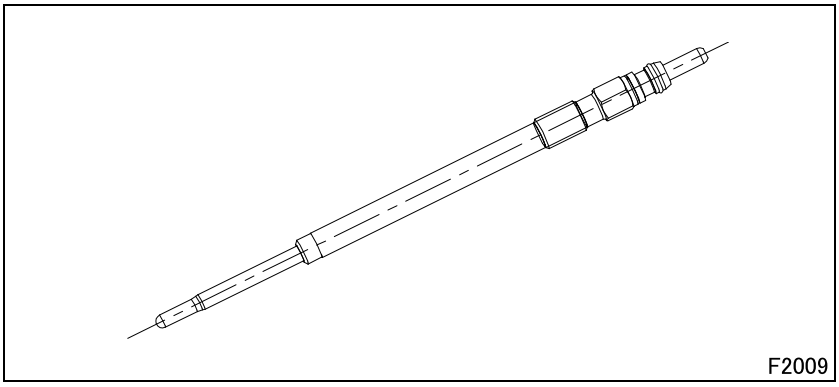


1 Connections glow plugs
2 Connections glow plugs
3 Connections glow plugs
4 Connections glow plugs
6 Start switch
7 Ground
9 Output: defect diagnosis signal to engine electronic control unit
10 Input: control signal from engine electronic control unit
11 Battery voltage

123072E

- The glow electronic control unit is controlled by engine electronic control unit and has following functions:
  - Switch of 4 glow plugs, control signal from engine electronic control unit;
  - Reversible overcurrent cut-off (electronic safety fuse);
  - Recognition of one or several damaged glow plugs and overall defect diagnosis;
  - High voltage switch - off by engine electronic control unit;

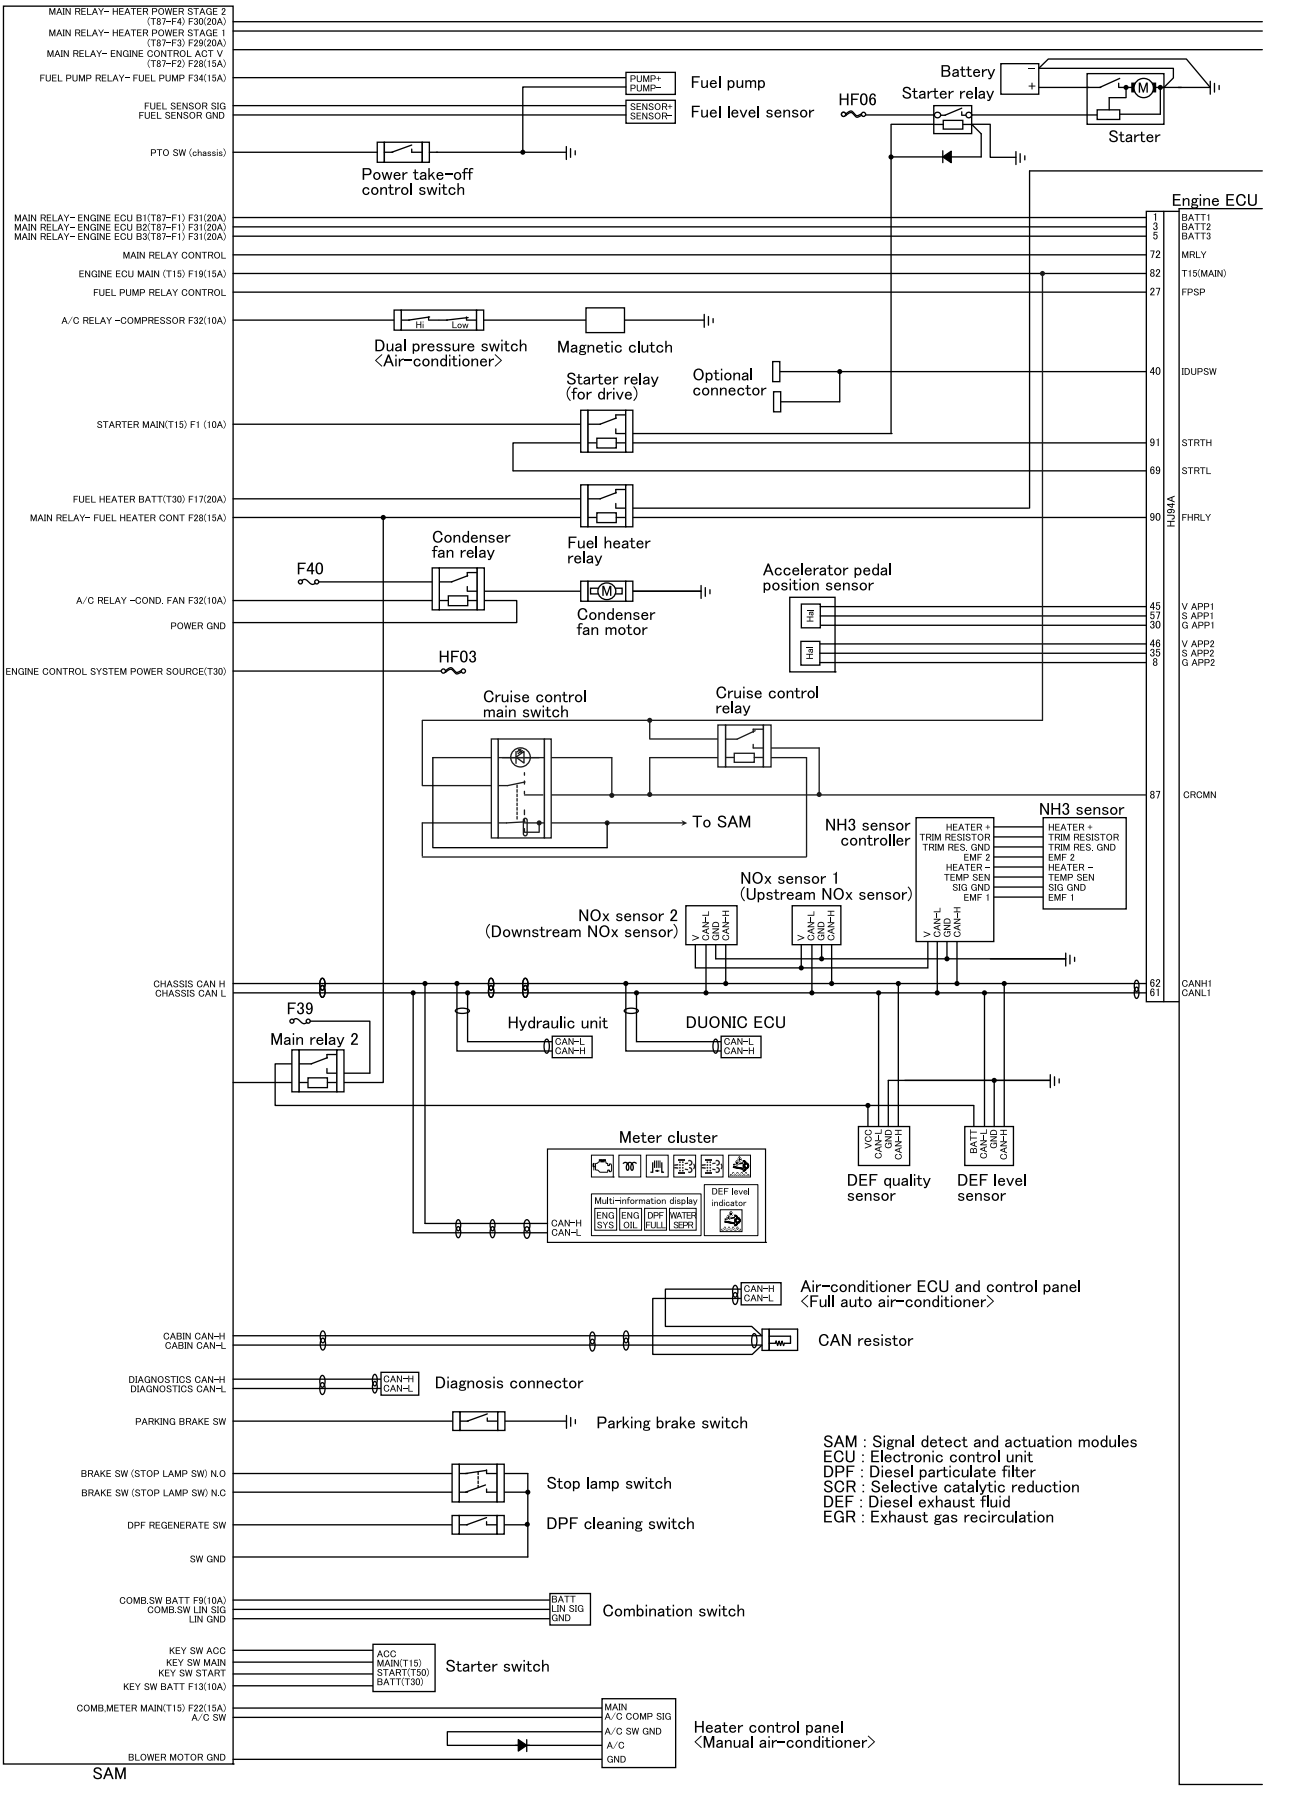
(10) Glow plug

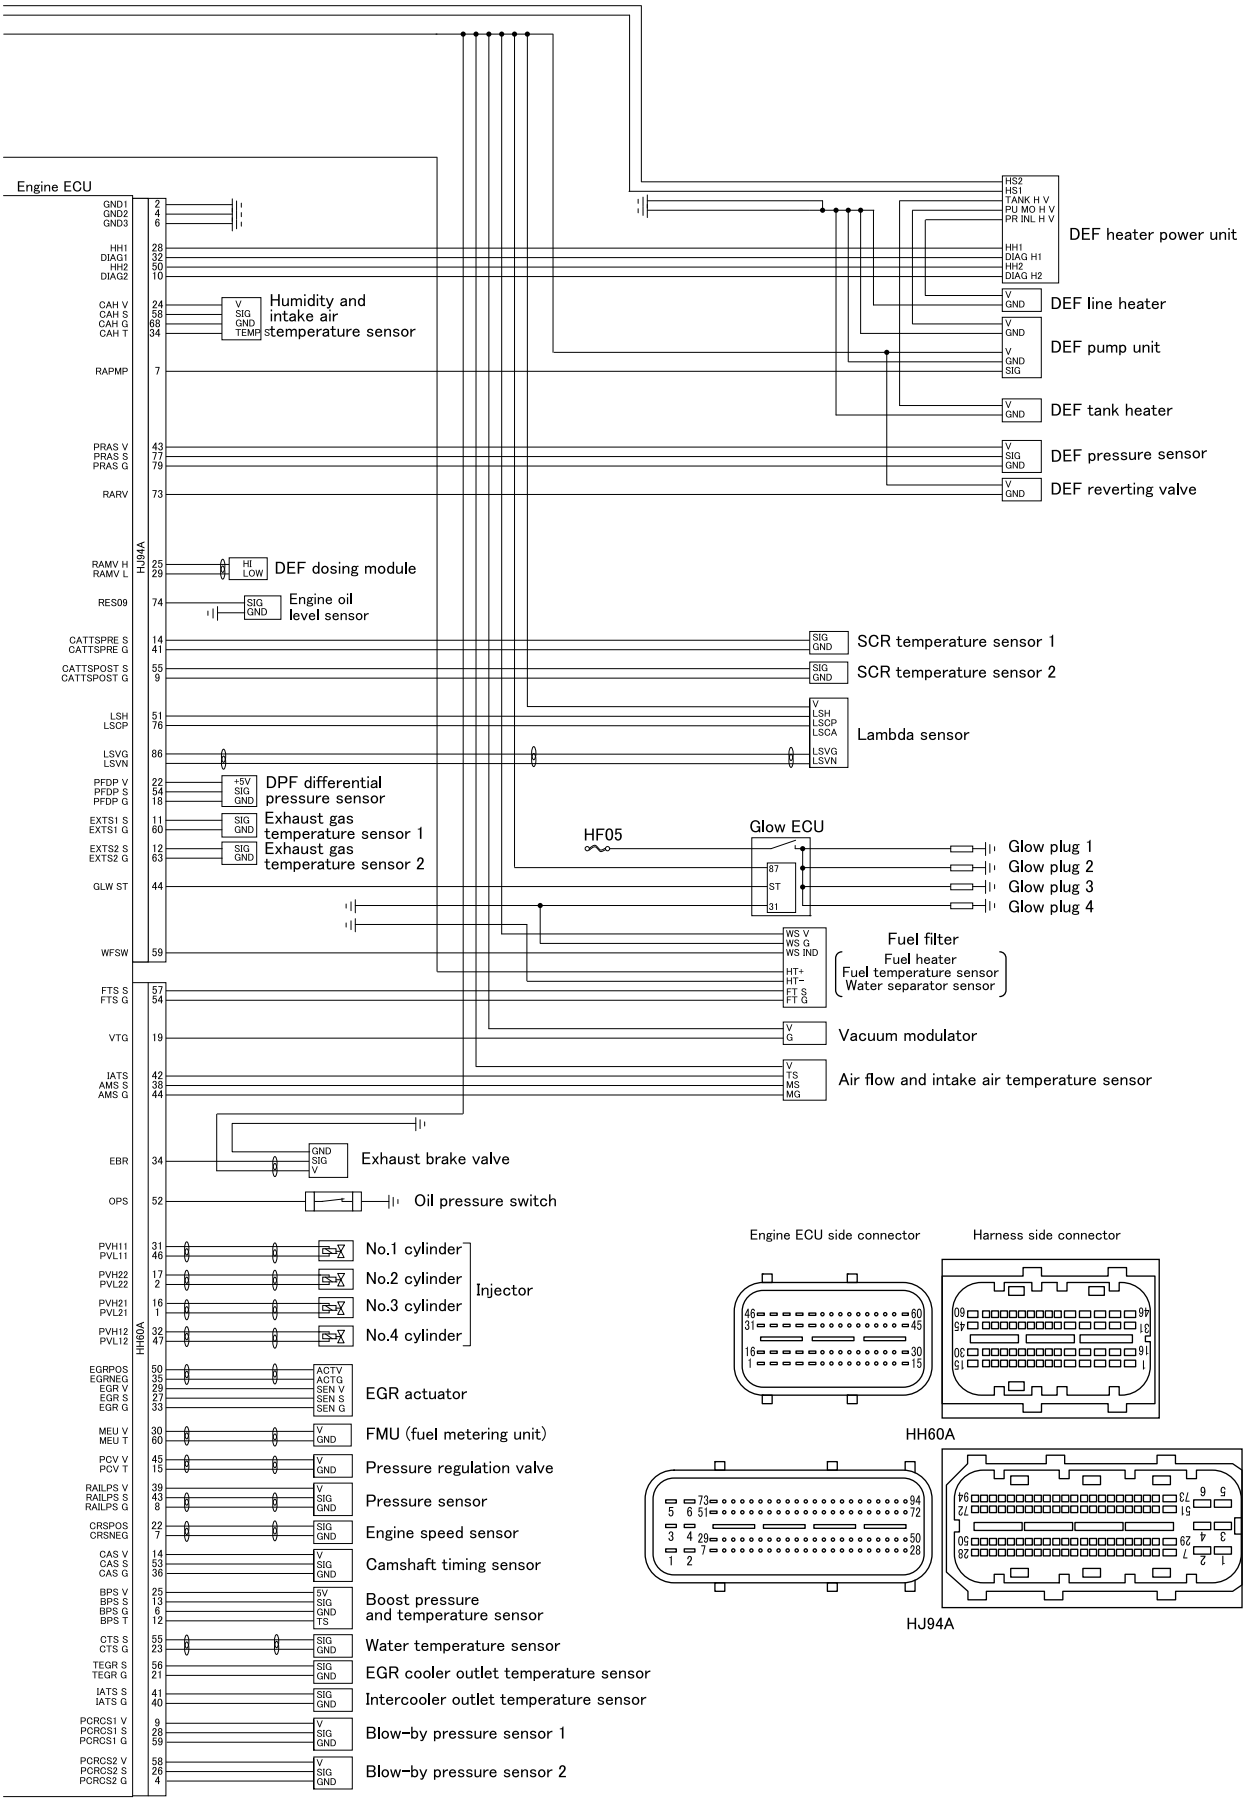


F2009

[CONTROL VALUES]
- With a constant supply voltage of 11 V:
  - Max. current drawn: 18 A.
  - In 5 sec: 11 ± 1.5 A.
  - In 30 sec: 6 ± 0.9 A.
  - Temperature after 7 sec.: 850°C. {1562°F}

2.6 Electronic control unit connection diagram

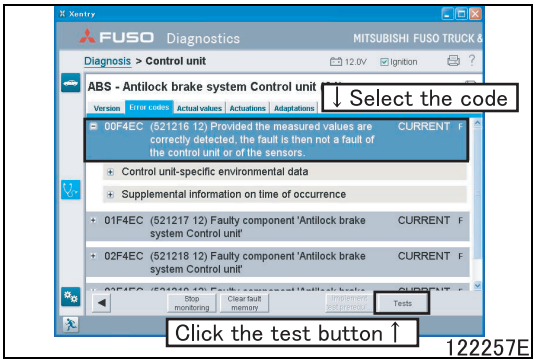




C07391-ECU-ENG-2a

1. Inspections Based on Diagnosis Codes

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.



- When the FUSO Diagnostics is connected, perform the interactive troubleshooting with the following procedure.

Select the code from the diagnostics code list
↓
Click the test button
↓
Start the interactive troubleshooting

1.1 List of diagnosis code. (List the diagnosis code that is added and changed by the software update of the engine electronic control unit)

- The meaning of the major acronyms listed in the table is as follows.
  IMD: Immediate
  DC [Drive cycle]: “Start switch ON to start engine till starter switch OFF” constitutes 1 DC.

Code	Message	Warning lamp indication			Fault diagnosis period
		ENG SYS (red)	ENG SYS (amber)		Validation (ON)
98-17	The oil level is low.	–	–	–	–
520438-0	Soot in Lube Oil has exceeded the Maximum limit.	–	–	–	–
520716-31	The component 'Crankcase ventilation system Gas Heating Relays' is not operating.	–	O	–	–
520717-31	There is an internal fault in control unit 'Crankcase ventilation system Gas Heating Relays'.	–	O	–	–
520718-5	Component 'Crankcase ventilation system Gas Heating Relays' has an open circuit.	–	O	–	–
520719-12	The temperature deviation is too high. (Crankcase ventilation system Gas Heating)	–	O	–	–
520720-3	Component 'Crankcase ventilation system Gas Heating Relays' has a short circuit to positive.	–	O	–	–
520721-4	Component 'Crankcase ventilation system Gas Heating Relays' has a short circuit to ground.	–	O	–	–

1.2 Details of Diagnosis code. (List the details of diagnosis code that is added and changed by the software update of the engine electronic control unit)

- Some vehicle specification do not control the system reaction.
- The meaning of the major acronyms listed in the table is as follows.

ADC: Analog to digital converter
AFS: Air flow sensor
AMT: Automatic manual transmission
ATS: After treatment system
CAC: Charge air cooler
CAN: Controller area network
DEF: Diesel exhaust fluid
DPF: Diesel particulate filter
ECM: Electronic control module (Engine ECU)

EDC: Electronic control module (Engine ECU)
ECU: Electronic control unit
EGR: Exhaust gas recirculation
ETC: Gearbox control unit
FBC: Fuel balancing correction
GCU: Glow control unit
HFM: Hot film air mass meter (Air flow sensor)
ITC: Injector temperature compensation
LSU: Lambda sensor unit
M/T: Manual transmission
MeUn: Metering Unit
OBD: On board diagnosis
Oxicat: Oxidation catalyst
PCV: Pressure control valve or positive crankcase ventilation
PTO: Power take off
PWM: Pulse wide modulation
SAM: Signal detect and actuation modules
SCR: Selective catalytic reduction
VGT: Variable geometry turbocharger

98-17: The oil level is low.

Generation condition		[Test Condition] • Monitoring is active if the ECU is not in afterrun. • Valid level signal could be measured, meaning. • Engine speed =0 rpm. • Last ECU afterrun was completed (no interrupted afterrun was detected). • Valid level signal is received within 4s. • Level sensor reports no error. • Engine stop time exceeded a time threshold, coolant temperature dependen. (normal condition: 30min at 99.96°C, cold ambient conditions: 60min at -50.04°C). • Oil level not already measured (level check is carried out only once per cycle). • Engine running time in the last driving cycle > 120s.
		[Fault Detection] • Low oil level is reported by digital oil level sensor.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000ms. • Failure is detected if active for 25% of the time.
Fault healing		• Low oil level not reported by digital oil level sensor.
System reaction		• Turn on the oil level lamp.
Failure cause		• Oil level below minimum.
Failure repair		• Check oil level. • Oil level low: Refill oil. • Oil level ok: Check wiring and oil level sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 193: Oil level
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None.
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #264 Inspection of engine oil level sensor
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520438-0: Soot in Lube Oil has exceeded the Maximum limit.

Generation condition		[Test Condition] • Engine running.
		[Fault Detection] • When oil time usage exceeds applied limit of time: due to different usage of unit, threshold time is calculated as follows. • Threshold = 1.25kg. • Time = threshold in kg*1000 = time in hours (example 1.25 kg = 1250 hours).
		[Defect Debouncing] • Defect condition fulfilled continuously >100 ms.
Fault healing		• When oil time of usage below threshold.
System reaction		• Turn on the oil level lamp.
Failure cause		• Engine oil reached end of life.
Failure repair		• Replace lubrication oil and reset the soot-in-oil calculation via tester, using FUSO Diagnostics. • Replace air filter (PCV (positive crankcase ventilation) filter) filter or run 2 minutes of high idle in order to clean air filter (PCV (positive crankcase ventilation) filter).
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 074: Soot content (Engine oil)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None.
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None.
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520716-31: The component 'Crankcase ventilation system Gas Heating Relays' is not operating.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun. • Continuously if heater is enabled.
		[Fault Detection] • If heating is demanded, but the feedback for the digital input signals an opened relay.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500ms. • Failure is detected if active for 25% of the time.
Fault healing		• If fault condition is not fulfilled.
System reaction		• None.
Failure cause		• Short circuit to battery or relay blocked open.
Failure repair		• Check relay, check heater.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None.
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None.
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None.
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520717-31: There is an internal fault in control unit 'Crankcase ventilation system Gas Heating Relays'.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun. • Continuously if heater is enabled.
		[Fault Detection] • If feedback for the digital input signals a closed relay although heater off state is demanded.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500ms. • Failure is detected if active for 25% of the time.
Fault healing		• If fault condition is not fulfilled.
System reaction		• None.
Failure cause		• Short circuit to ground or relay blocked closed.
Failure repair		• Check relay, check heater.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None.
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None.
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None.
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520718-5: Component 'Crankcase ventilation system Gas Heating Relays' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun. • Monitoring only if heater is NOT actuated.
		[Fault Detection] • The power stage hardware reports a “open load” (OL) error.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500ms. • Failure is detected if active for 25% of the time.
Fault healing		• The power stage does not report an “open load” (OL) error.
System reaction		• The power stage is shut-off. • Blow by heater is not actuated.
Failure cause		• Broken or disconnected wiring or defective relay (missing relay).
Failure repair		• Check of wiring or replacement of relay.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None.
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None.
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None.
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520719-12: The temperature deviation is too high. (Crankcase ventilation system Gas Heating)

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun. • Monitoring only when the power stage is active.
		[Fault Detection] • Hardware reports an excess temperature error on the power stage for the Blow by Heater.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500ms. • Failure is detected if active for 25% of the time.
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 0.25s 25 times in actual driving cycle. • Failure healed, if the power stage does not report an excess temperature error. • Else no healing possible at this driving cycle.
System reaction		• Power stage shut off.
Failure cause		• High battery voltage, high ECU temperature and high load or defective wiring, power stage or relay defective.
Failure repair		• Check battery voltage, wiring, power stage and relay.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None.
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None.
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None.
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520720-3: Component 'Crankcase ventilation system Gas Heating Relays' has a short circuit to positive.

Generation condition	[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun. • Monitoring only when the power stage is active.
	[Fault Detection] • Hardware reports a short circuit to battery (SCB) error on the power stage for the Blow by Heater.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500ms. • Failure is detected if active for 25% of the time.
Fault healing	• To give the possibility for healing, an electric impulse is sent to power stage each 250ms 25times in actual driving cycle. • Failure healed, if the power stage does not report an short circuit to battery error. • Else no healing possible at this driving cycle.
System reaction	• Power stage is shut-off.
Failure cause	• Short circuit of wiring to external source or inside relay.
Failure repair	• Check of wiring or replace relay.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None.
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None.

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None.
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520721-4: Component 'Crankcase ventilation system Gas Heating Relays' has a short circult to ground.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun. • Monitoring only when the power stage is NOT active.
		[Fault Detection] • Hardware reports a short circuit to ground error on the power stage for the Blow by Heater.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500ms. • Failure is detected if active for 25% of the time.
Fault healing		• Hardware does not report a short circuit to ground error on the power stage for the Blow by Heater.
System reaction		• Power stage is shut-off.
Failure cause		• Short circuit of wiring to ground or inside relay.
Failure repair		• Check of wiring or replace relay.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None.
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None.
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None.
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

1.3 List of diagnosis code

- The meaning of the major acronyms listed in the table is as follows.
  IMD: Immediate
  DC [Drive cycle]: “Start switch ON to start engine till starter switch OFF” constitutes 1 DC.

Code	Message	Warning lamp indication			Fault diagnosis period
		ENG SYS (red)	ENG SYS (amber)		Validation (ON)
520584-3	Component 'DEF Concentration sensor' has a short circuit to positive.	–	–	O	2DC
520586-4	Component 'DEF Concentration sensor' has a short circuit to ground.	–	–	O	2DC
520663-31	Internal control unit fault (Environmental data : Injection valve)	O	–	–	–
520665-31	Fault group: SCR 3 (Crawler mode) Function 'SCR' is faulty.	–	–	–	–
520666-31	Fault group: SCR 3 (Trigger level : Warning message) Function 'SCR' is faulty.	–	O	–	–
520705-3	Component 'DEF Concentration sensor' has a short circuit to positive.	–	–	O	2DC
520706-4	Component 'DEF Concentration sensor' has a short circuit to ground.	–	–	O	2DC

1.4 Details of Diagnosis code. (List the details of diagnosis code that is added by the software update of the engine electronic control unit)

- Some vehicle specification do not control the system reaction.
- The meaning of the major acronyms listed in the table is as follows.

ADC: Analog to digital converter
AFS: Air flow sensor
AMT: Automatic manual transmission
ATS: After treatment system
CAC: Charge air cooler
CAN: Controller area network
DEF: Diesel exhaust fluid
DPF: Diesel particulate filter
ECM: Electronic control module (Engine ECU)
EDC: Electronic control module (Engine ECU)
ECU: Electronic control unit
EGR: Exhaust gas recirculation
ETC: Gearbox control unit
FBC: Fuel balancing correction
GCU: Glow control unit
HFM: Hot film air mass meter (Air flow sensor)
ITC: Injector temperature compensation
LSU: Lambda sensor unit
M/T: Manual transmission
MeUn: Metering Unit
OBD: On board diagnosis
Oxicat: Oxidation catalyst
PCV: Pressure control valve or positive crankcase ventilation
PTO: Power take off
PWM: Pulse wide modulation
SAM: Signal detect and actuation modules
SCR: Selective catalytic reduction
VGT: Variable geometry turbocharger

520584-3: Component 'DEF Concentration sensor' has a short circuit to positive.

Generation condition	[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun.
	[Fault Detection] • The sensor connected via CAN sends an invalid Failure Mode Identifier.
	[Defect Debouncing] • Defect condition fulfilled continuously >2s.
Fault healing	• If the CAN signal returns to normal when the starter switch is in ON position.
System reaction	• None
Failure cause	• Sensor defect
Failure repair	• Check Sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF Quality sensor
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520586-4: Component 'DEF Concentration sensor' has a short circuit to ground.

Generation condition	[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun.
	[Fault Detection] • The sensor connected via CAN sends an invalid Failure Mode Identifier.
	[Defect Debouncing] • Defect condition fulfilled continuously >2s.
Fault healing	• If the CAN signal returns to normal when the starter switch is in ON position.
System reaction	• None
Failure cause	• Sensor defect
Failure repair	• Check Sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #252 Inspection of DEF Quality sensor
Inspection procedure (Step1)	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520663-31: Internal control unit fault (Environmental data : Injection valve)

Generation condition	[Test Condition] • Ambient pressure > 0hPa. • Ambient temperature between -50.04°C and 149.96°C. • Engine coolant temperature > -50.04°C.
	[Fault Detection] • If at least one error belonging to "Customer Inducement moderate" group is set, the timer for inducement level 1 (torque reduction) is incremented. • When timer exceeds 182.04h and at least one error belonging to the triggered group is active, level 1 for "Customer Inducement moderate" group is set.
	[Defect Debouncing] • Immediate
Fault healing	• When "Customer Inducement moderate" group fault no more active.
System reaction	• None
Failure cause	• INFO: Inducement Level1 due to "Customer Inducement moderate" group activated.
Failure repair	• No intervention necessary on this fault. • Root cause for inducement should be repaired.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Continue test with another fault code.

520665-31: Fault group: SCR 3 (Crawler mode) Function 'SCR' is faulty.

Generation condition		[Test Condition] • Ambient pressure > 0hPa. • Ambient temperature between -50.04°C and 149.96°C. • Engine coolant temperature > -50.04°C.
		[Fault Detection] • If at least one error belonging to "Customer inducement moderate" group is set, the timer for inducement level 3 (creep mode) is incremented. • When timer exceeds 3.5d and at least one error belonging to the triggered group is active, level 3 for "Customer Inducement moderate" group is set.
		[Defect Debouncing] • Immediate
Fault healing		• When "Customer Inducement moderate" group fault no more active.
System reaction		• None
Failure cause		• INFO: Inducement Level 3 due to "Customer Inducement moderate" group activated.
Failure repair		• No intervention necessary on this fault. • Root cause for inducement should be repaired.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Continue test with another fault code.

520666-31: Fault group: SCR 3 (Trigger level : Warning message) Function 'SCR' is faulty.

Generation condition		[Test Condition] • Ambient pressure > 0hPa. • Ambient temperature between -50.04°C and 149.96°C. • Engine coolant temperature > -50.04°C.
		[Fault Detection] • If at least one error belonging to "Customer Inducement moderate" group is set, inducement driver warning is activated.
		[Defect Debouncing] • Immediate
Fault healing		• When "Customer Inducement moderate" group fault no more active.
System reaction		• None
Failure cause		• INFO: Driver warning due to "Customer Inducement moderate" group activated.
Failure repair		• No intervention necessary on this fault. • Root cause for inducement should be repaired.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Continue test with another fault code.

520705-3: Component 'DEF Concentration sensor' has a short circuit to positive.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun.
		[Fault Detection] • The sensor connected via CAN sends an invalid Failure Mode Identifier.
		[Defect Debouncing] • Defect condition fulfilled continuously > 2s.
Fault healing		• If the CAN signal returns to normal when the starter switch is in ON position.
System reaction		• None
Failure cause		• Sensor defective
Failure repair		• Check sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF Quality sensor
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520706-4: Component 'DEF Concentration sensor' has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun.
		[Fault Detection] • The sensor connected via CAN sends an invalid Failure Mode Identifier.
		[Defect Debouncing] • Defect condition fulfilled continuously > 2s.
Fault healing		• If the CAN signal returns to normal when the starter switch is in ON position.
System reaction		• None
Failure cause		• Short cut to ground
Failure repair		• Check sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF Quality sensor
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

1.5 List of diagnosis code

- The meaning of the major acronyms listed in the table is as follows.
  IMD: Immediate
  DC [Drive cycle]: “Start switch ON to start engine till starter switch OFF” constitutes 1 DC.

Code	Message	Warning lamp indication			Fault diagnosis period
		ENG SYS (red)	ENG SYS (amber)		Validation (ON)
22-0	The signal voltage of component 'Crankcase pressure sensor2' is too high.	–	–	O	2DC
22-1	The signal voltage of component 'Crankcase pressure sensor2' is too low.	–	–	O	2DC
22-16	The signal value of component 'Crankcase pressure sensor2' is too high.	–	–	O	2DC
22-18	The signal value of component 'Pressure sensor in crankcase' is too low.	–	–	O	2DC
27-15	The position of component 'Exhaust gas recirculation valve' is implausible.	–	O	O	2DC
27-17	The position of component 'Exhaust gas recirculation valve' is implausible.	–	O	O	2DC
30-0	Component 'Pressure sensor in hose line of crankcase ventilation system' has a short circuit or is defective.	–	–	O	2DC
30-1	Component 'Pressure sensor in hose line of crankcase ventilation system' has a short circuit or is defective.	–	–	O	2DC
30-2	The value of component 'Differential pressure sensor of diesel particular filter' is implausible.	–	–	O	2DC
30-15	The differential pressure between sensor in crankcase and sensor in hose line of crankcase ventilation system is above upper limit.	–	–	O	2DC
30-16	The signal value of component 'Pressure sensor in hose line of crankcase ventilation system' is too high.	–	–	O	2DC
30-17	The differential pressure between sensor in crankcase and sensor in hose line of crankcase ventilation system is above upper limit.: TOO HIGH	–	–	O	2DC
84-12	The value of component 'Vehicle speed Sensors' is implausible.	O	–	O	2DC
84-15	The value measured by component 'Vehicle speed Sensors' is too high.	O	–	O	2DC
91-2	Signal 'Value of accelerator pedal sensor' is implausible.	O	–	O	2DC
91-3	The signal voltage of component 'Position sensor 'Accelerator pedal'' is too high.	O	–	O	2DC
91-4	The signal voltage of component 'Position sensor 'Accelerator pedal'' is too low.	O	–	O	2DC
100-2	Component 'Oil pressure switch' has a mechanical defect.	–	–	–	–
100-31	The oil pressure is too low.	–	–	–	–
101-2	The value of component 'Crankcase pressure sensor2' is implausible. (POWER-DOWN)	–	–	O	2DC

Code	Message	Warning lamp indication			Fault diagnosis period
		ENG SYS (red)	ENG SYS (amber)		Validation (ON)
102-0	The value measured by component 'Boost pressure sensor' is too high.	O	–	O	2DC
102-1	The value measured by component 'Boost pressure sensor' is too low.	O	–	O	2DC
102-15	Signal 'Boost pressure' is implausible.	O	–	O	2DC
102-16	The value measured by component 'Boost pressure sensor' is too high.	O	–	O	2DC
102-17	Signal 'Boost pressure' is implausible.	O	–	O	2DC
102-18	The value measured by component 'Boost pressure sensor' is too low.	O	–	O	2DC
105-0	The value measured by component 'temperature sensor (Exhaust temperature downstream of exhaust gas recirculation cooler)" is too high.	–	–	O	2DC
105-1	The value measured by component 'temperature sensor (Exhaust temperature downstream of exhaust gas recirculation cooler)"is too low.	–	–	O	2DC
108-0	The signal voltage of component 'Atmospheric pressure sensor' is too high. There is an internal fault in control unit 'Combustion engine Control unit'.	–	–	O	2DC
108-1	The value measured by component 'Atmospheric pressure sensor' is too low. There is an internal fault in control unit 'Combustion engine Control unit'.	–	–	O	2DC
108-16	There is an internal fault in control unit 'Combustion engine Control unit'.	–	–	O	2DC
108-18	There is an internal fault in control unit 'Combustion engine Control unit'.	–	–	O	2DC
110-0	The signal voltage of component 'Coolant temperature sensor' is too high.	–	O	O	2DC
110-1	The signal voltage of component 'Coolant temperature sensor' is too low.	–	O	O	2DC
110-12	The value of component 'Coolant temperature sensor' is implausible.	–	O	O	2DC
110-31	The value of component 'Coolant temperature sensor' is implausible.	–	O	O	2DC
111-1	The coolant level is too low.	–	–	–	–
129-16	The rail pressure is implausible.	–	O	O	2DC
129-18	The rail pressure is implausible.	–	O	O	2DC
132-0	Measurement value (Raw values) of the component 'Air mass flow rate' is above the specified value.	O	–	O	2DC
132-1	Measurement value (Raw values) of the component 'Air mass flow rate' is above the specified value.	O	–	O	2DC
132-2	Component 'Air mass flow rate / Intake air temperature sensor' has an electrical fault.	O	–	O	2DC
132-15	Measurement value (Correction value) of the component 'Air mass flow rate' is above the specified value.	O	–	O	2DC
132-17	Component 'Air mass flow rate / Intake air temperature sensor' or its electrical line is defective.	O	–	O	2DC
132-18	Component 'Air mass flow rate / Intake air temperature sensor' or its electrical line is defective.	O	–	O	2DC
132-20	Component 'Air mass flow rate / Intake air temperature sensor' or its electrical line is defective.	O	–	O	2DC

Code	Message	Warning lamp indication			Fault diagnosis period
		ENG SYS (red)	ENG SYS (amber)		Validation (ON)
132-21	Component 'Air mass flow rate / Intake air temperature sensor' or its electrical line is defective.	O	–	O	2DC
156-0	The signal voltage of component 'Rail pressure sensor' is too high.	O	–	O	2DC
156-1	The signal voltage of component 'Rail pressure sensor' is too low.	O	–	O	2DC
156-16	Component 'Rail pressure sensor' is faulty.	O	–	O	2DC
156-18	Component 'Rail pressure sensor' is faulty.	O	–	O	2DC
158-0	The battery voltage is too high.	–	–	O	2DC
158-1	The battery voltage is too low.	–	–	O	2DC
158-16	The battery voltage is too high.	–	–	O	2DC
158-18	The battery voltage is too low.	–	–	O	2DC

1.6 Details of Diagnosis code

- Some vehicle specification do not control the system reaction.
- The meaning of the major acronyms listed in the table is as follows.
  ADC: Analog to digital converter
  AFS: Air flow sensor
  AMT: Automatic manual transmission
  ATS: After treatment system
  CAC: Charge air cooler
  CAN: Controller area network
  DEF: Diesel exhaust fluid
  DPF: Diesel particulate filter
  ECM: Electronic control module (Engine ECU)
  EDC: Electronic control module (Engine ECU)
  ECU: Electronic control unit
  EGR: Exhaust gas recirculation
  ETC: Gearbox control unit
  FBC: Fuel balancing correction
  GCU: Glow control unit
  HFM: Hot film air mass meter (Air flow sensor)
  ITC: Injector temperature compensation
  LSU: Lambda sensor unit
  M/T: Manual transmission
  MeUn: Metering Unit
  OBD: On board diagnosis
  Oxicat: Oxidation catalyst
  PCV: Pressure control valve or positive crankcase ventilation
  PTO: Power take off
  PWM: Pulse wide modulation
  SAM: Signal detect and actuation modules
  SCR: Selective catalytic reduction
  VGT: Variable geometry turbocharger

22-0: The signal voltage of component 'Crankcase pressure sensor2' is too high.

Generation condition		[Test Condition] • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
		[Fault Detection] • The acquired voltage is above 3.17 V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00 ms • Failure is detected if active for 50% of the time
Fault healing		• The acquired voltage is below or equal to 3.17 V.
System reaction		• Healing condition fulfilled cumulatively > 10.00 min • Failure healed if not active for 50% of the time
		• None
Failure cause		• Short circuit of sensor to external source or defective sensor
Failure repair		• Check wiring and sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 018: Pressure of component 'Crankcase pressure sensor 1'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Blow-by pressure sensor 1. Check the circuit across Blow-by pressure sensor 1 and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Blow-by pressure sensor 1”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

22-1: The signal voltage of component 'Crankcase pressure sensor2' is too low.

Generation condition		[Test Condition] • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
		[Fault Detection] • The acquired voltage is below 640 mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00 ms • Failure is detected if active for 50% of the time
Fault healing		• The acquired voltage is above or equal to 640 mV
System reaction		• Healing condition fulfilled cumulatively > 10.00 min • Failure healed if not active for 50% of the time
		• None
Failure cause		• Short circuit of sensor to ground or defective sensor
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 018: Pressure of component 'Crankcase pressure sensor 1'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Blow-by pressure sensor 1. Check the circuit across Blow-by pressure sensor 1 and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Blow-by pressure sensor 1”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

22-16: The signal value of component 'Crankcase pressure sensor2' is too high.

Generation condition		[Test Condition] • If physical range check not inhibited by another failure
		[Fault Detection] • The filtered pressure is above 10 kPa {1.5 psi, 0.1 kgf/cm^2}.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 s • Failure is detected if active for 50% of the time
Fault healing		• The filtered pressure is below 10 kPa {1.5 psi, 0.1 kgf/cm^2}.
System reaction		• Healing condition fulfilled cumulatively > 10.00 s • Failure healed if not active for 50% of the time
		• None
Failure cause		• Inaccurate or defective crankcase differential pressure sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the crankcase differential pressure sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 018: Pressure of component 'Crankcase pressure sensor 1'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Blow-by pressure sensor 1. Check the circuit across Blow-by pressure sensor 1 and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Blow-by pressure sensor 1”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

22-18: The signal value of component 'Pressure sensor in crankcase' is too low.

Generation condition		[Test Condition] • If physical range check not inhibited by another failure.
		[Fault Detection] • The filtered pressure is below -2.1 kPa {-0.3 psi, -0.02 kgf/cm^2}
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 s • Failure is detected if active for 50% of the time
Fault healing		• The filtered pressure is above -2.1 kPa {-0.3 psi, -0.02 kgf/cm^2}
System reaction		• Healing condition fulfilled cumulatively > 10.00 s • Failure healed if not active for 50% of the time
		• None
Failure cause		• Inaccurate or defective crankcase differential pressure sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the crankcase differential pressure sensor and replace it if necessary. • Check also vacuum pump (vacuum breaker).
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 018: Pressure of component 'Crankcase pressure sensor 1'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Run the engine at idle speed to allow it to warm up. Turn off the engine and wait for 2 minutes to complete afterrun.
	Step2	Turn the starter switch to the “ON” position and check the service data shown blow. No.019 “Blow-by pressure sensor 2” Make sure that the pressure value is within the standard range (atmospheric pressure ±0.5 kPa {0.1 psi, 0.005 kgf/cm^2}).
	Step3	If the pressure value is out of the standard range, open or close the oil filter cap as required. Check the service data value again.
	Step4	If the value in the step 3 reduces, check the crankcase ventilation system for any faults. After that, follow the steps shown below for the continued check.
	Step5	If the value in the step 3 is out of the standard range (atmospheric pressure ±0.5 kPa {0.1 psi, 0.005 kgf/cm^2}), follow the step 6 to perform relearning for blow-by pressure sensor 2. Check the value in the step 2 again.
	Step6	Blow-by pressure sensor 2 relearning procedure. Start the engine and run it at idle for 1 minutes. Stop the engine and wait for 2 minutes to complete afterrun.
	Step7	Check the value in step 2. If it is out of the standard range, replace the blow-by pressure sensor 2 with a new one.

27-15: The position of component 'Exhaust gas recirculation valve' is implausible.

Generation condition	[Test Condition] • Continuously if monitoring is not disabled by another failure (valve control in closed loop).
	[Fault Detection] • The actual EGR valve position deviates by more than 10% from the target valve position in positive direction.
	[Defect Debouncing] • Immediate
Fault healing	• Deviation is 10% or less while the starter switch is ON.

System reaction		• Unblocking the EGR actuator is attempted by opening the actuator at a high speed. • None
Failure cause		• Desired EGR valve position can not be reached • EGR valve sticks • EGR valve position sensor mismatched
Failure repair		• No action needed, as long as failure “jammed valve is not detected”
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

27-17: The position of component 'Exhaust gas recirculation valve' is implausible.

Generation condition		[Test Condition] • Continuously if monitoring is not disabled by another failure (valve control in closed loop).
		[Fault Detection] • The actual EGR valve position deviates by more than 10% from the target valve position in negative direction.
		[Defect Debouncing] • Immediate
Fault healing		• Deviation is 10% or less while the starter switch is ON.
System reaction		• Unblocking the EGR actuator is attempted by opening the actuator at a high speed.
		• None
Failure cause		• Desired EGR valve position can not be reached • EGR valve sticks • EGR valve position sensor mismatched
Failure repair		• No action needed, as long as failure “jammed valve is not detected”
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6

Inspection procedure	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

30-0: Component 'Pressure sensor in hose line of crankcase ventilation system' has a short circuit or is defective.

Generation condition		[Test Condition] • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
		[Fault Detection] • The acquired voltage is above 4.75 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00 ms • Failure is detected if active for 50% of the time
Fault healing		• The acquired voltage is below 4.75 V.
System reaction		• Healing condition fulfilled cumulatively > 10.00 min • Failure healed if not active for 50% of the time
		• None
Failure cause		• Short circuit of sensor to external source or defective sensor
Failure repair		• Check wiring and sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 019: Pressure of component 'Crankcase pressure sensor 2'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Blow-by pressure sensor 2. Check the circuit across Blow-by pressure sensor 2 and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Blow-by pressure sensor 2”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6

Inspection procedure	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

30-1: Component 'Pressure sensor in hose line of crankcase ventilation system' has a short circuit or is defective.

Generation condition		[Test Condition] • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
		[Fault Detection] • The acquired voltage is below 250 mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00 ms • Failure is detected if active for 50% of the time
Fault healing		• The acquired voltage is above 250 mV.
System reaction		• Healing condition fulfilled cumulatively > 10.00 min • Failure healed if not active for 50% of the time
		• None
Failure cause		• Short circuit of sensor to ground or defective sensor
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 019: Pressure of component 'Crankcase pressure sensor 2'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Blow-by pressure sensor 2. Check the circuit across Blow-by pressure sensor 2 and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Blow-by pressure sensor 2”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6

Inspection procedure	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

30-2: The value of component 'Differential pressure sensor of diesel particular filter' is implausible.

Generation condition		[Test Condition] • During ECM after-run when engine is stopped
		[Fault Detection] • The absolute value of crankcase pressure is above 1.9 kPa {0.3psi, 0.02kgf/cm^2}
		[Defect Debouncing] • Immediate
Fault healing		• The absolute value of crankcase pressure is below 1.9 kPa {0.3psi, 0.02kgf/cm^2}.
System reaction		• None
		• None
Failure cause		• Inaccurate or defective crankcase differential pressure sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the crankcase differential pressure sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 018: Pressure of component 'Crankcase pressure sensor 1'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Run the engine at idle speed to allow it to warm up. Turn off the engine and wait for 2 minutes to complete afterrun.
	Step2	Turn the starter switch to the “ON” position and check the service data shown blow. No.019 “Blow-by pressure sensor 2” Make sure that the pressure value is within the standard range (atmospheric pressure ±0.5 kPa {0.1 psi, 0.005 kgf/cm^2}).
	Step3	If the pressure value is out of the standard range, open or close the oil filter cap as required. Check the service data value again.
	Step4	If the value in the step 3 reduces, check the crankcase ventilation system for any faults. After that, follow the steps shown below for the continued check.
	Step5	If the value in the step 3 is out of the standard range (atmospheric pressure ±0.5 kPa {0.1 psi, 0.005 kgf/cm^2}), follow the step 6 to perform relearning for blow-by pressure sensor 2. Check the value in the step 2 again.
	Step6	Blow-by pressure sensor 2 relearning procedure. Start the engine and run it at idle for 1 minutes. Stop the engine and wait for 2 minutes to complete afterrun.
	Step7	Check the value in step 2. If it is out of the standard range, replace the blow-by pressure sensor 2 with a new one.

30-15: The differential pressure between sensor in crankcase and sensor in hose line of crankcase ventilation system is above upper limit.

Generation condition		[Test Condition] • If monitor not inhibited by another failure • Engine speed between 2000 rpm and 3400 rpm • Air mass between 300 Kg/h and 600 Kg/h • atmospheric pressure > 75kPa {11psi, 0.8kgf/cm^2}, low altitude • environmental temperature > -40.04°C {-40.07°F} • coolant temperature between 59.96°C {139.93°F} and 119.96°C {247.93°F}
		[Fault Detection] • The crankcase differential pressure exceeds the limit (which varies depending on the engine running parameters and defined in the map) for longer than 10 s.
		[Defect Debouncing] • Defect condition fulfilled continuously >5000.0 ms
Fault healing		• The crankcase differential pressure is below the limit for longer than 500 ms.
System reaction		• None
		• None
Failure cause		• Disconnection in hose line between the crankcase and intake manifold
Failure repair		• Check blow-by duct
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 018: Pressure of component 'Crankcase pressure sensor 1' • 019: Pressure of component 'Crankcase pressure sensor 2'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

30-16: The signal value of component 'Pressure sensor in hose line of crankcase ventilation system' is too high.

Generation condition	[Test Condition] • If physical range check not inhibited by another failure
	[Fault Detection] • The filtered pressure is above 1.9 kPa {0.3 psi, 0.02 kgf/cm^2}.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 s • Failure is detected if active for 50% of the time
Fault healing	• The filtered pressure is below 1.9 kPa {0.3 psi, 0.02 kgf/cm^2}.
System reaction	• Healing condition fulfilled cumulatively > 10.00 s • Failure healed if not active for 50% of the time
	• None
Failure cause	• Inaccurate or defective crankcase differential pressure sensor, defect in the wiring
Failure repair	• Check wiring and the accuracy of the crankcase differential pressure sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 019: Pressure of component 'Crankcase pressure sensor 2'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Blow-by pressure sensor 2. Check the circuit across Blow-by pressure sensor 2 and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Blow-by pressure sensor 2”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

30-17: The differential pressure between sensor in crankcase and sensor in hose line of crankcase ventilation system is above upper limit.: TOO HIGH

Generation condition	[Test Condition] • If monitor not inhibited by another failure • engine speed is between 2000 rpm and 3400 rpm • atmospheric pressure > 75 kPa {11 psi, 0.8 kgf/cm^2}, low altitude • environmental temperature > -40.04°C {-40.07°F} • engine coolant temperature is between 59.96°C {139.93°F} and 119.96°C {247.93°F} • The current actual torque is between 100 N·m {74 lbs.ft, 10 kgf·m} and 450 N·m {330 lbs.ft, 46 kgf·m}
	[Fault Detection] • Crankcase differential pressure is above reference value for at least 10 s.
	[Defect Debouncing] • Defect condition fulfilled continuously >5000.0 ms
Fault healing	• Differential crankcase pressure is within specified range.
System reaction	• None
	• None
Failure cause	• Blocked blow-by valve or blocked blow-by oil filter
Failure repair	• Check Blow-by valve and oil filter
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 018: Pressure of component 'Crankcase pressure sensor 1' • 019: Pressure of component 'Crankcase pressure sensor 2'

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

84-12: The value of component 'Vehicle speed Sensors' is implausible.

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun • Not inhibited by due to another failure. • Engine speed > 1750 rpm and engine load > (Inner modelled torque) > 150 N·m {110 lbs.ft, 15 kgf·m} longer than 5 s
	[Fault Detection] • All conditions below fulfilled for at least 5 s. (Debouncing starts only after this delay time): • engine speed > 1750 rpm • engine torque > 150 N·m {110 lbs.ft, 15 kgf·m} • vehicle speed < 6 km/h {3.73 mph}
	[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00ms • Failure is detected if active for 50% of the time
Fault healing	• Vehicle speed > 6 km/h {3.73 mph} while the starter switch is ON.
System reaction	• The last valid values are used to control the vehicle speed and acceleration for a fraction of second after detection of this error; thereafter value zero (0) is used for the vehicle speed and acceleration control.
	• Engine speed limited to about 2000 rpm • Engine speed limited to 2060 rpm • PTO not available • Cruise control not available
Failure cause	• Defective vehicle speed sensor. • Engine driven under load without PTO (i.e. external PTO) • In very cold situation possible due to “engine warming up at higher speed” and vehicle stand still (high torque request in case of “non liquid oil”)
Failure repair	• Check vehicle speed sensor • Check if “external PTO” used • Check if failure occurred at very low engine temperature < -10°C {14°F})
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 052: Vehicle speed
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #265 Inspection of vehicle speed sensor
Inspection procedure — Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

84-15: The value measured by component 'Vehicle speed Sensors' is too high.

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun • Continuously if not inhibited by another failure.
	[Fault Detection] • The measured vehicle speed > 180 km/h {111.85 mph}.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time

Fault healing		• The measured vehicle speed < 180 km/h {111.85 mph}.
System reaction		• The last valid values are used to control the vehicle speed and acceleration for a fraction of second after detection of this error; thereafter value zero (0) is used for the vehicle speed and acceleration control.
		• Engine speed limited to about 2000 rpm • Engine speed limited to 2060 rpm • PTO not available • Cruise control not available
Failure cause		• Real overspeed, i.e. by engine tuning • Incorrect speed evaluation (depending on signal source by Wheel Speed Information, Tachograph Output, disturbed CAN)
Failure repair		• Check measuring device and replace it if necessary. • No action in case of real vehicle overspeed or engine tuning
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 052: Vehicle speed
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #265 Inspection of vehicle speed sensor
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

91-2: Signal 'Value of accelerator pedal sensor' is implausible.

Generation condition		[Test Condition] • Continuously. • If input signals > 650 mV. • Error is entered only if the signal path is not classified as defective.
		[Fault Detection] • Difference between input signals from the accelerator pedal position sensors 1 and 2 is higher than the specified value.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 250.00ms • Failure is detected if active for 25% of the time
Fault healing		• Error is no more detected.
System reaction		• None
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• Wiring problem, aged or defective accelerator pedal
Failure repair		• Check wiring and accelerator pedal
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 037: Signal voltage of component 'Position sensor 'Accelerator pedal'1' • 038: Signal voltage of component 'Position sensor 'Accelerator pedal'2' • 154: Accelerator pedal sensor 1 • 164: Position of accelerator pedal (Kickdown recognition)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #324 Inspection of accelerator pedal position sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Accelerator pedal position sensor. Check the circuit across Engine electronic control unit and Accelerator pedal position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “Accelerator pedal position sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across Accelerator pedal position sensor and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

91-3: The signal voltage of component 'Position sensor 'Accelerator pedal'' is too high.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Continuously.
	[Fault Detection] • The accelerator pedal position sensor (sensor 1) signal is higher than 4.8 V.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 50% of the time

Fault healing		• The signal is below 4.8 V.
System reaction		• Normal control is continued.
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• Short circuit of wiring to external source or inside accelerator pedal
Failure repair		• Check wiring or replace accelerator pedal
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 037: Signal voltage of component 'Position sensor 'Accelerator pedal'1' • 038: Signal voltage of component 'Position sensor 'Accelerator pedal'2' • 154: Accelerator pedal sensor 1 • 164: Position of accelerator pedal (Kickdown recognition)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #324 Inspection of accelerator pedal position sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Accelerator pedal position sensor. Check the circuit across Engine electronic control unit and Accelerator pedal position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “Accelerator pedal position sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10

Inspection procedure	Step9	Repair or replace the harness across Accelerator pedal position sensor and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

91-4: The signal voltage of component 'Position sensor 'Accelerator pedal'' is too low.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Continuously.
		[Fault Detection] • The accelerator pedal position sensor (sensor 1) signal is lower than 550 mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 50% of the time
Fault healing		• The signal is above 550 mV.
System reaction		• Normal control is continued.
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• Short circuit to ground in wiring or in accelerator pedal
Failure repair		• Check wiring or replace accelerator pedal
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 037: Signal voltage of component 'Position sensor 'Accelerator pedal'1' • 038: Signal voltage of component 'Position sensor 'Accelerator pedal'2' • 154: Accelerator pedal sensor 1 • 164: Position of accelerator pedal (Kickdown recognition)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #324 Inspection of accelerator pedal position sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Accelerator pedal position sensor. Check the circuit across Engine electronic control unit and Accelerator pedal position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “Accelerator pedal position sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across Accelerator pedal position sensor and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

100-2: Component 'Oil pressure switch' has a mechanical defect.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V and as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded • When engine is switched off.
	[Fault Detection] • Oil pressure is detected when the engine is not running.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 15.00s • Failure is detected if active for 25% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position

System reaction		• None
		• None
Failure cause		• Oil pressure digital switch defective
Failure repair		• Check oil pressure digital switch
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 023: Engine oil pressure • 147: Oil pressure switch
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #044 Inspection of oil pressure switch
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

100-31: The oil pressure is too low.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V and as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded • When engine is running (engine speed > 500 rpm).
		[Fault Detection] • Oil pressure does not reach to the specified value while the engine is running.
		[Defect Debouncing] • Debounce time is oil temperature dependent, indicated value is valid if temperature > 60°C {140°F} (debounce longer at lower temperatures) Debouncing time is depend on coolant temperature and between 25.00s at -30.04°C {-22.07°F} and 4.00s at 79.96°C {176°F}.
Fault healing		• Oil pressure increases when engine is running (> 500 rpm).
System reaction		• None
		• None
Failure cause		• Low oil pressure or digital oil pressure switch blocked
Failure repair		• Check oil level and pressure, check oil pressure switch
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 023: Engine oil pressure • 147: Oil pressure switch
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #044 Inspection of oil pressure switch
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

101-2: The value of component 'Crankcase pressure sensor2' is implausible. (POWER-DOWN)

Generation condition	[Test Condition] • During after-run
	[Fault Detection] • Absolute value > 2.5 kPa {0.4 psi, 0.025 kgf/cm^2} for at least 5 s
	[Defect Debouncing] • Defect condition fulfilled continuously > 500 ms
Fault healing	• Only possible at next afterrun if absolute value < 2.5 kPa {0.4 psi, 0.025 kgf/cm^2} for at least 3 s

System reaction		• Healing condition fulfilled continuously > 500 ms
		• None
Failure cause		• Inaccurate or defective crankcase differential pressure sensor
Failure repair		• Check sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 018: Pressure of component 'Crankcase pressure sensor 1'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Blow-by pressure sensor 1. Check the circuit across Blow-by pressure sensor 1 and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Blow-by pressure sensor 1”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

102-0: The value measured by component 'Boost pressure sensor' is too high.

Generation condition	[Test Condition] • The signal range checks are carried out if there is no ADC module and sensor supply error. Continuously.
	[Fault Detection] • Voltage from boost pressure & boost temperature sensor (boost pressure sensor section) is above 4.9 V.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• Voltage from boost pressure & boost temperature sensor is below 4.9 V.

System reaction		• The last valid boost pressure value is used for a fraction of second after detection of this error and the value is replaced by 1.06 bar thereafter.
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm • Slightly different drivability / noise
Failure cause		• Short circuit of sensor to external source or defective sensor
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 002: Temperature at component 'Boost pressure / Temperature sensor' • 017: Boost pressure • 028: Boost pressure (Differential pressure) • 033: Signal voltage from pressure sensor of component 'Boost pressure / Temperature sensor' • 036: Signal voltage of component 'Boost pressure / Temperature sensor' (Temperature sensors)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 004: Boost pressure control 1 • 005: Boost pressure control 2
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #346 Inspection of boost pressure and temperature sensor
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Boost pressure and temperature sensor. Check the circuit across Boost pressure and temperature sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Boost pressure and temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Boost pressure and temperature sensor which Engine electronic control unit learns. Perform learning of Boost pressure and temperature sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

102-1: The value measured by component 'Boost pressure sensor' is too low.

Generation condition		[Test Condition] • The signal range checks are carried out if there is no ADC module and sensor supply error. Continuously.
		[Fault Detection] • Voltage from boost pressure & boost temperature sensor (boost pressure sensor section) is below 178.4 mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• Voltage from boost pressure & boost temperature sensor is above 178.4 mV.
System reaction		• The last valid boost pressure value is used for a fraction of second after detection of this error and the value is replaced by 1.06 bar thereafter.
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm • Slightly different drivability / noise
Failure cause		• Short circuit at wiring harness or inside the boost pressure sensor to ground or open circuit
Failure repair		• Check of wiring or replace boost pressure sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 002: Temperature at component 'Boost pressure / Temperature sensor' • 017: Boost pressure • 028: Boost pressure (Differential pressure) • 033: Signal voltage from pressure sensor of component 'Boost pressure / Temperature sensor' • 036: Signal voltage of component 'Boost pressure / Temperature sensor' (Temperature sensors)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 004: Boost pressure control 1 • 005: Boost pressure control 2
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #346 Inspection of boost pressure and temperature sensor
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Boost pressure and temperature sensor. Check the circuit across Boost pressure and temperature sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Boost pressure and temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Boost pressure and temperature sensor which Engine electronic control unit learns. Perform learning of Boost pressure and temperature sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6

Inspection procedure	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

102-15: Signal 'Boost pressure' is implausible.

Generation condition		[Test Condition] • Boost pressure sensor is reliable • Engine speed <660 rpm • Throttle valve set point > 90% with no regeneration request • Fuel quantity < 7 mg/hub
		[Fault Detection] • Difference between the boost pressure and the environmental pressure is above 7 kPa {1 psi, 0.07 kgf/cm^2}
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 50% of the time
Fault healing		• Difference between the boost pressure and the environmental pressure is below 7 kPa {1 psi, 0.07 kgf/cm^2}
System reaction		• None
		• Slightly different drivability / noise • Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Inaccurate or defective boost pressure sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the boost pressure sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 002: Temperature at component 'Boost pressure / Temperature sensor' • 017: Boost pressure • 028: Boost pressure (Differential pressure) • 033: Signal voltage from pressure sensor of component 'Boost pressure / Temperature sensor' • 036: Signal voltage of component 'Boost pressure / Temperature sensor' (Temperature sensors)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 004: Boost pressure control 1 • 005: Boost pressure control 2
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #346 Inspection of boost pressure and temperature sensor
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Boost pressure and temperature sensor. Check the circuit across Boost pressure and temperature sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

Inspection procedure	Step3	Turn the starter switch in OFF. Replace component “Boost pressure and temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Boost pressure and temperature sensor which Engine electronic control unit learns. Perform learning of Boost pressure and temperature sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Setp6	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

102-16: The value measured by component 'Boost pressure sensor' is too high.

Generation condition	[Test Condition] • The signal range checks are carried out if there is no ADC module and sensor supply error. Continuously.
	[Fault Detection] • The sensor signal is above 340 kPa {49 psi, 3.5 kgf/cm^2}
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing	• The sensor signal is below 340 kPa {49 psi, 3.5 kgf/cm^2}
System reaction	• The last valid boost pressure value is used for a fraction of second after detection of this error and the value is replaced by 1.06 bar thereafter.
	• Slightly different drivability / noise • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause	• Inaccurate or defective boost pressure sensor, defect in the wiring
Failure repair	• Check wiring and the accuracy of the boost pressure sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 002: Temperature at component 'Boost pressure / Temperature sensor' • 017: Boost pressure • 028: Boost pressure (Differential pressure) • 033: Signal voltage from pressure sensor of component 'Boost pressure / Temperature sensor' • 036: Signal voltage of component 'Boost pressure / Temperature sensor' (Temperature sensors)

Perform the learned value resetting procedure of Boost pressure and temperature sensor which Engine electronic control unit learns. Perform learning of Boost pressure and temperature sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed

Inspection procedure	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

105-1: The value measured by component 'temperature sensor (Exhaust temperature downstream of exhaust gas recirculation cooler)"is too low.

Generation condition		[Test Condition] • ADC has not reported a module error (no failure “ADC...” active). • Continuous Monitoring
		[Fault Detection] • The sensor signal is below 130.4 mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• The sensor signal is above 130.4 mV.
System reaction		• If there is no error in environment air temperature sensor module, then the substitute value in case of error in Boost temperature is the sum of environmental air temperature and an offset -0.04°C {32°F}. • If there is an error in Environment Temperature sensor module, then the Boost temperature reaches the default value 29.96°C {86°F} via a ramp with the slopes 10.00K/s (ramping down) or 10.00K/s (ramping up).
		• None
Failure cause		• Sensor defective or short circuit to ground • Note: This failure can also be detected, if a very high boost temperature occured (> 350°C {662°F}) e.g. due to full flow of non cooled EGR or fire....
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 002: Temperature at component 'Boost pressure / Temperature sensor' • 017: Boost pressure • 028: Boost pressure (Differential pressure) • 033: Signal voltage from pressure sensor of component 'Boost pressure / Temperature sensor' • 036: Signal voltage of component 'Boost pressure / Temperature sensor' (Temperature sensors)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 004: Boost pressure control 1 • 005: Boost pressure control 2
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #346 Inspection of boost pressure and temperature sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check to see if EGR cooler is fully operational. For procedures, refer to the Shop Manual. Go to Step2
	Step2	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Boost pressure and temperature sensor. Check the circuit across Boost pressure and temperature sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “Boost pressure and temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Boost pressure and temperature sensor which Engine electronic control unit learns. Perform learning of Boost pressure and temperature sensor which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

108-0: The signal voltage of component 'Atmospheric pressure sensor' is too high. There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously.
	[Fault Detection] • Faulty signal of atmospheric pressure sensor in ECU. (Signal voltage is above 4.68 V.)
	[Defect Debouncing] • Defect condition exceeded cumulatively > 800.00ms • Failure is detected if active for 50% of the time
Fault healing	• Signal voltage is below 4.68 V.
System reaction	• The last valid atmospheric pressure value is used for a fraction of second after detection of this error and the value is replaced by 95 kPa {14 psi, 1.0 kgf/cm^2} thereafter.
	• AC off
Failure cause	• Ambient pressure sensor inside ECU is defect
Failure repair	• Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 039: Signal voltage of component ‘Atmospheric pressure sensor’

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

108-1: The value measured by component 'Atmospheric pressure sensor' is too low. There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10.00V and as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded • Continuously.
		[Fault Detection] • Faulty signal of atmospheric pressure sensor in ECU. (Signal voltage is below 369 mV.)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 800.00ms • Failure is detected if active for 50% of the time
Fault healing		• Signal voltage is above 369 mV.
System reaction		• The last valid atmospheric pressure value is used for a fraction of second after detection of this error and the value is replaced by 95 kPa {14 psi, 1.0 kgf/cm^2} thereafter.
		• AC off
Failure cause		• Ambient pressure sensor inside ECU is defect
Failure repair		• Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 039: Signal voltage of component ‘Atmospheric pressure sensor’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

108-16: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • Faulty signal of atmospheric pressure sensor in ECU. (Sensor signal is above 1.10 bar.)
	[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00ms • Failure is detected if active for 25% of the time
Fault healing	• Sensor signal is below 1.10 bar.

System reaction		• The last valid atmospheric pressure value is used for a fraction of second after detection of this error and the value is replaced by 95 kPa {14 psi, 1.0 kgf/cm^2} thereafter.
		• None
Failure cause		• Ambient pressure sensor inside ECU is defect
Failure repair		• Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

108-18: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Faulty signal of atmospheric pressure sensor in ECU. (Sensor signal is below 50 kPa {7.3 psi, 0.5 kgf/cm^2}.)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00ms • Failure is detected if active for 25% of the time
Fault healing		• Sensor signal is above 50 kPa {7.3 psi, 0.5 kgf/cm^2}.
System reaction		• The last valid atmospheric pressure value is used for a fraction of second after detection of this error and the value is replaced by 95 kPa {14 psi, 1.0 kgf/cm^2} thereafter.
		• None
Failure cause		• Ambient pressure sensor inside ECU is defect
Failure repair		• Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

110-0: The signal voltage of component 'Coolant temperature sensor' is too high.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously
		[Fault Detection] • Coolant temperature sensor signal is above 4.94 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• Coolant temperature sensor signal is below 4.94 V.
System reaction		• 79.96°C {176°F} is used as a substitute for the engine coolant sensor value.
		• More FAN activity • Manual DPF regeneration not available
Failure cause		• Sensor defective or short circuit to external source
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 016: Coolant temperature
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #262 Inspection of water temperature sensor
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Check the circuit across Engine electronic control unit and Water temperature sensor for open or short circuit. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Water temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step1

110-1: The signal voltage of component 'Coolant temperature sensor' is too low.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously
		[Fault Detection] • Coolant temperature sensor signal is below 232.2 mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• Coolant temperature sensor signal is above 232.2 mV.
System reaction		• 79.96°C {176°F} is used as a substitute for the engine coolant sensor value.
		• More FAN activity • Manual DPF regeneration not available
Failure cause		• Sensor defective or short circuit to ground
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 016: Coolant temperature
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #262 Inspection of water temperature sensor
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Check the circuit across Engine electronic control unit and Water temperature sensor for open or short circuit. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Water temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step1

110-12: The value of component 'Coolant temperature sensor' is implausible.

Generation condition		[Test Condition] • Coolant temperature sensor working correctly. • Monitoring not disabled by another failure • Injection quantity > speed dependent curve • The monitoring is executed once per driving cycle.
		[Fault Detection] • Coolant temperature does not reach the specified temperature within a specified duration after starting the engine.
		[Defect Debouncing] • Immediate
Fault healing		• If the coolant temperature returns to normal when the starter switch is set from OFF to ON position
System reaction		• None
		• None
Failure cause		• Very cold ambient conditions and cabin heater(s) on full power (specially if additional heaters using coolant temperature installed in the vehicle) • Additional electrical resistance in the wiring (corroded connector) • Inaccurate sensor (although sensor does not exceed its signal range) • Engine thermostat blogged in open position
Failure repair		• Ensure that engine was not running in extreme ambient conditions. • Check wiring and connectors (corrosion) • Check accuracy of sensor, replacement of sensor • Check Thermostat functionality
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 016: Coolant temperature
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #262 Inspection of water temperature sensor
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Check the circuit across Engine electronic control unit and Water temperature sensor for open or short circuit. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Water temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7

Inspection procedure	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step1

110-31: The value of component 'Coolant temperature sensor' is implausible.

Generation condition		[Test Condition] • Coolant temperature sensor working correctly. • Monitoring not disabled by another failure • Engine start temperature < 39.96°C {104°F} • Injection quantity > speed dependent curve • The monitoring is executed once per driving cycle.
		[Fault Detection] • Coolant temperature does not reach the specified temperature within a specified duration after starting the engine.
		[Defect Debouncing] • Immediate
Fault healing		• If the coolant temperature returns to normal when the starter switch is set from OFF to ON position
System reaction		• None
		• None
Failure cause		• Very cold ambient conditions and cabin heater(s) on full power (specially if additional heaters using coolant temperature installed in the vehicle) • Additional electrical resistance in the wiring (corroded connector) • Inaccurate sensor (although sensor does not exceed its signal range) • Engine thermostat blogged in open position
Failure repair		• Ensure that engine was not running in extreme ambient conditions. • Check wiring and connectors (corrosion) • Check accuracy of sensor, replacement of sensor • Check Thermostat functionality

	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step1

111-1: The coolant level is too low.

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Coolant level is below the specified value.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 25% of the time
Fault healing		• Coolant level is above the specified value.
System reaction		• None
		• None
Failure cause		• Check coolant level • If OK, check coolant switch.
Failure repair		[Test Condition] • Monitoring is active 2.00s after ECU initialization while engine isn’t running yet, while the engine isn’t cranking, 2.00s after engine startup, while the battery voltage is over 10.00V, as long as the battery voltage is over 10.00V and 2.00s after this threshold has been exceeded, if none of the CAN controllers is in bus-off state, 2.00s after last CAN controller is no more in bus-off state and if the ECU is not in afterrun • Continuously
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 016: Coolant temperature
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #262 Inspection of water temperature sensor
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

129-16: The rail pressure is implausible.

Generation condition		[Test Condition] • Engine normal running • Fuel pressure control in mode “both devices” switching to “only PCV” or “only Metering Unit”
		[Fault Detection] • The commonrail pressure is above 215 MPa {31180 psi, 2190 kgf/cm^2}.
		[Defect Debouncing] • Defect condition fulfilled continuously >240.0 ms
Fault healing		• None
System reaction		• None
		• None
Failure cause		• Pressure control valve (PCV) stuck in closed position • Too high current to PCV (due to partial short circuit) • Metering Unit (MeUn) stuck if “full feeding position” • Metering Unit (MeUn) without current • Zero delivery throttle clogged or pressure after Zero delivery valve to high (due to clogged return tubes) • Pressure before gear pump too high due to clogged pressure control valve in low pressure cycle (if present)
Failure repair		• Check Pressure control valve (PCV), if opening (PWM = 0%) • Check metering Unit (MeUn), if closing (PWM = 100%) • Check electric wiring to PCV and MeUn • Check low pressure fuel tubes (return from CP to tank free?) • Check zero delivery valve for correct working
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 076: Specified value of component 'Pressure regulating valve in rail' • 077: Specified value of component 'FMU (Fuel Metering device)' • 078: PWM signal of component 'FMU (Fuel Metering device)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #572 Inspection of FMU (fuel metering unit)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘Pressure regulation valve’ is faulty. Faulty Pressure regulation valve harness Component ‘Fuel metering unit’ is faulty. Faulty Fuel metering unit harness Plugged Fuel pump Plugged Fuel return line For procedures, refer to the Shop Manual. Go to Step2
	Step2	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Pressure regulation valve. Check the circuit across Pressure regulation valve and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step9

Inspection procedure	Step4	Turn the starter switch in OFF. Replace component “Pressure regulation valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Pressure regulation valve which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step6
	Step6	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘Pressure regulation valve’ is faulty. Faulty Pressure regulation valve harness Component ‘Fuel metering unit’ is faulty. Faulty Fuel metering unit harness Plugged Fuel pump Plugged Fuel return line For procedures, refer to the Shop Manual Go to Step7
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step8
	Step8	Inspection completed
	Step9	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step4

129-18: The rail pressure is implausible.

Generation condition	[Test Condition] • Engine normal running • Fuel pressure control in mode “both devices” switching to “only PCV” or “only Metering Unit”
	[Fault Detection] • The commonrail pressure is below the threshold value (fuel consumption is too much or supplied fuel is too low).
	[Defect Debouncing] • Defect condition fulfilled continuously >300.0 ms
Fault healing	• None
System reaction	• None
	• None
Failure cause	• Possible faults in high pressure part. • injection nozzle stuck in open position, low efficiency of high pressure pump, internal leakage of injector, leaking pressure control valve, leaking high pressure part itself (tubing) • Too low pressure at High pressure pump inlet due clogged filter, leaking low pressure tubes, electric pre supply pump defective or gear pump defective
Failure repair	• Check low pressure system for clogging (specially fuel filter). • Check tubing between pre-supply pump and gear pump. • Check that the relay of the pre-supply pump is actuating. • Check feeding of pre-supply pump (possibly low due to clogged tubes at tank outlet). • Check high pressure part for leakages (internal / external). • Check PCV for tightness. • Check injectors for tightness.

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 025: Rail pressure • 029: Rail pressure (Differential pressure) • 030: Rail pressure (specified value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #572 Inspection of FMU (fuel metering unit)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. • Low pressure system for clogging (specially fuel filter). • Tubing between pre-supply pump and gear pump. • The relay of the pre-supply pump is actuating. Go to Step2
	Step2	Check feeding of pre-supply pump (possibly low due to clogged tubes at tank outlet) following below procedure. • Ensure that engine is not running. • Remove fuel line after pre-supply pump and feed to a measuring jar. • Turn on ignition for 30 seconds and collect supplied fuel in measuring jar. • Turn off ignition. • Indication for good performance of pre-supply pump: ~ 2 liters / minute with +-10% tolerance. • Check tubing of pre-supply pump for clogged tubes (dismount and use compressed air). • If tubing is ok, replace pre-supply pump and repeat this step2. • Remount fuel line. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. • High pressure part for leakages (internal / external). • PCV for tightness. • Injectors for tightness. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? Yes: Go to Step4 No: Go to Step5
	Step4	Turn the starter switch in OFF. Replace component “PCV”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of PCV which Engine electronic control unit learns. Go to Step5
	Step5	Inspection completed

132-0: Measurement value (Raw values) of the component 'Air mass flow rate' is above the specified value.

Generation condition	[Test Condition] • Monitoring is active while the engine isn’t cranking, 2 s after engine startup and if the ECU is not in afterrun • The SRC High check of the raw air mass is released at the start of the driving cycle if: • engine speed between 0 rpm and 5000 rpm • Continuously.
	[Fault Detection] • When starting the engine, the pre-corrected air flow sensor signal is above the specified value.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• The pre-corrected air flow sensor signal is below the specified value.

System reaction		• The last valid air flow sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by a substitute value which depends on the engine speed and intake air pressure. • Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• Defect in wiring, defective air mass sensor
Failure repair		• Check wiring of the air mass sensor, replace air mass sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 003: Temperature at component 'Air mass flow rate / Intake air temperature sensor' • 034: Signal voltage of component 'Air mass flow rate / Intake air temperature sensor' (Temperature sensors) • 053: Air mass flow rate (Actual value) • 054: Air mass flow rate (Specified value) • 055: Air mass flow rate (Cylinder) • 160: Air mass flow rate Learned value 1 • 161: Air mass flow rate Learned value 2
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #306 Inspection of air flow and intake air temperature sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Airflow and intake air temperature sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Airflow and intake air temperature sensor for open or short circuit. Check the circuit across Signal detect and actuation module and Airflow and intake air temperature sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Airflow and intake air temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Airflow and intake air temperature sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed

Inspection procedure	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Airflow and intake air temperature sensor and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

132-1: Measurement value (Raw values) of the component 'Air mass flow rate' is above the specified value.

Generation condition	[Test Condition] • Monitoring is active while the engine isn't cranking, 2 s after engine startup and if the ECU is not in afterrun • The SRC Low check of the raw air mass is released at the start of the driving cycle if • injected fuel is below an engine speed dependent fuel quantity (from 205 mg/hub at 0 rpm over 170 mg/hub at 1000 rpm and 135 mg/hub at 2000 rpm and 100 mg/hub at 3000 rpm and 65 mg/hub at 4000 rpm to 37 mg/hub at 4800 rpm) longer than 2 s • After then continuously.
	[Fault Detection] • When starting the engine, the pre-corrected air flow sensor signal is below the specified value.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 600.00ms • Failure is detected if active for 50% of the time
Fault healing	• The pre-corrected air flow sensor signal is above the specified value.
System reaction	• The last valid air flow sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by a substitute value which depends on the engine speed and intake air pressure.
	• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause	• Defect in wiring, defective air mass sensor
Failure repair	• Check wiring of the air mass sensor, replace air mass sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 003: Temperature at component 'Air mass flow rate / Intake air temperature sensor' • 034: Signal voltage of component 'Air mass flow rate / Intake air temperature sensor' (Temperature sensors) • 053: Air mass flow rate (Actual value) • 054: Air mass flow rate (Specified value) • 055: Air mass flow rate (Cylinder) • 160: Air mass flow rate Learned value 1 • 161: Air mass flow rate Learned value 2

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #306 Inspection of air flow and intake air temperature sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Airflow and intake air temperature sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Airflow and intake air temperature sensor for open or short circuit. Check the circuit across Signal detect and actuation module and Airflow and intake air temperature sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Airflow and intake air temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Airflow and intake air temperature sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Airflow and intake air temperature sensor and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

Inspection procedure	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

132-2: Component 'Air mass flow rate / Intake air temperature sensor' has an electrical fault.

Generation condition		[Test Condition] • Monitoring is active while the engine isn't cranking, 2 s after engine startup and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Faulty air flow and intake air temperature sensor is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 580.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is set from OFF to ON position
System reaction		• The last valid air flow sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by a substitute value which depends on the engine speed and intake air pressure.
		• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• Defect in wiring or defective air mass sensor
Failure repair		• Check wiring of the intake air mass sensor, replace air mass sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 003: Temperature at component 'Air mass flow rate / Intake air temperature sensor' • 034: Signal voltage of component 'Air mass flow rate / Intake air temperature sensor' (Temperature sensors) • 053: Air mass flow rate (Actual value) • 054: Air mass flow rate (Specified value) • 055: Air mass flow rate (Cylinder) • 160: Air mass flow rate Learned value 1 • 161: Air mass flow rate Learned value 2
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #306 Inspection of air flow and intake air temperature sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Airflow and intake air temperature sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Airflow and intake air temperature sensor for open or short circuit. Check the circuit across Signal detect and actuation module and Airflow and intake air temperature sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

Inspection procedure	Step3	Turn the starter switch in OFF. Replace component “Airflow and intake air temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Airflow and intake air temperature sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Airflow and intake air temperature sensor and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

132-15: Measurement value (Correction value) of the component 'Air mass flow rate' is above the specified value.

Generation condition	[Test Condition] • Monitoring is active while the engine isn’t cranking, 2 s after engine startup and if the ECU is not in afterrun • Continuously.
	[Fault Detection] • When starting the engine, the corrected air flow sensor signal is above the specified value.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 650.00ms • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position

System reaction		• The last valid air flow sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by a substitute value which depends on the engine speed and intake air pressure. • Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• Defect in wiring, defective air mass sensor and/or the temperature sensor unit
Failure repair		• Check wiring of the air mass sensor, replace air mass sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 003: Temperature at component 'Air mass flow rate / Intake air temperature sensor' • 034: Signal voltage of component 'Air mass flow rate / Intake air temperature sensor' (Temperature sensors) • 053: Air mass flow rate (Actual value) • 054: Air mass flow rate (Specified value) • 055: Air mass flow rate (Cylinder) • 160: Air mass flow rate Learned value 1 • 161: Air mass flow rate Learned value 2

	Step8	Repair or replace the harness across Airflow and intake air temperature sensor and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

156-0: The signal voltage of component 'Rail pressure sensor' is too high.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Monitoring not inhibited by another failure
		[Fault Detection] • Commonrail pressure sensor voltage is above 4.9 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 140.00ms • Failure is detected if active for 50% of the time
Fault healing		• Commonrail pressure sensor voltage is below 4.9 V when the starter switch is in ON position.
System reaction		• None
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• Short circuit of wiring to external source or defective pressure sensor
Failure repair		• Check wiring and proper functioning of rail pressure sensor • Replace sensor if necessary and reset learning values in EEPROM / start New learning
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 025: Rail pressure • 029: Rail pressure (Differential pressure) • 030: Rail pressure (Specified value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of pressure sensor
Inspection procedure	Step1	Perform the followng actuator test to check it for normal operation. No.002 “Pressure regulating valve in rail”
	Step2	If not OK, replace common rail pressure sensor.

156-1: The signal voltage of component 'Rail pressure sensor' is too low.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Monitoring not inhibited by another failure
	[Fault Detection] • Commonrail pressure sensor voltage is below 342 mV.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 140.00ms • Failure is detected if active for 50% of the time
Fault healing	• Commonrail pressure sensor voltage is above 342 mV.
System reaction	• None
	• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause	• Short circuit of wiring to ground or defective pressure sensor
Failure repair	• Check wiring and proper functioning of rail pressure sensor • Replace sensor if necessary and reset learning values in EEPROM / start New learning
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 025: Rail pressure • 029: Rail pressure (Differential pressure) • 030: Rail pressure (Specified value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #252 Inspection of pressure sensor

Inspection procedure	Step1	Perform the followng actuator test to check it for normal operation. No.002 “Pressure regulating valve in rail”
	Step2	If not OK, replace common rail pressure sensor.

156-16: Component 'Rail pressure sensor' is faulty.

Generation condition		[Test Condition] • No electrical failure of sensor nor power stage active Monitoring carried out once a driving cycle during the after-run, if: • fuel temperature > 4.96°C {40.93°F} • waiting time depending on actual fuel Pressure at “Key 15 off” elapsed, to guarantee, that he fuel pressure is dropped to ambient pressure
		[Fault Detection] • Commonrail pressure sensor voltage is above 609 mV during afterrun.
		[Defect Debouncing] • immediately Defect condition fulfilled for at least at Afterrun: 3.00- times
Fault healing		• Healing is only possible at afterrun of next driving cycle, if no failure detected.
System reaction		• None
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• Rail pressure sensor inaccurate
Failure repair		• Ensure correct wiring and proper functioning of rail pressure sensor, • Replace sensor if necessary and reset learning values in EEPROM / start New learning
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 025: Rail pressure • 029: Rail pressure (Differential pressure) • 030: Rail pressure (Specified value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of pressure sensor
Inspection procedure	Step1	Perform the followng actuator test to check it for normal operation. No.002 “Pressure regulating valve in rail”
	Step2	If not OK, replace common rail pressure sensor.

156-18: Component 'Rail pressure sensor' is faulty.

Generation condition		[Test Condition] • No electrical failure of sensor nor power stage active Monitoring carried out once a driving cycle during the after-run, if: • fuel temperature > 4.96°C {40.93°F} • waiting time depending on actual fuel pressure at “Key 15 off” elapsed, to guarantee, that he fuel pressure is dropped to ambient pressure
		[Fault Detection] • Commonrail pressure sensor voltage is below 424 mV during afterrun.
		[Defect Debouncing] • immediately Defect condition fulfilled continuously at Afterrun: 3.00-
Fault healing		• Healing is only possible at afterrun of next driving cycle, if no failure detected.
System reaction		• None
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• Rail pressure sensor inaccurate
Failure repair		• Ensure correct wiring and proper functioning of rail pressure sensor, replace sensor • Replace sensor if necessary and reset learning values in EEPROM / start New learning

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 025: Rail pressure • 029: Rail pressure (Differential pressure) • 030: Rail pressure (Specified value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of pressure sensor
Inspection procedure	Step1	Perform the followng actuator test to check it for normal operation. No.002 “Pressure regulating valve in rail”
	Step2	If not OK, replace common rail pressure sensor.

158-0: The battery voltage is too high.

Generation condition		[Test Condition] • Continuously excepted when ECM is in pre drive mode (test phase immediately after ECM ignition) or monitoring is inhibited by another failure.
		[Fault Detection] • Battery voltage is above 2.31 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing		• Battery voltage is equal to or below 2.31 V.
System reaction		• The sensed battery voltage value is used.
		• Manual DPF regeneration not available
Failure cause		• Alternator voltage governor defect
Failure repair		• Replace alternator governor device or alternator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 031: Battery voltage
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #860 Battery
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Signal detect and actuation module. Check the circuit across Signal detect and actuation module and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Perform the operation start and replace Signal detect and actuation module. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Signal detect and actuation module which Engine electronic control unit learns. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

158-1: The battery voltage is too low.

Generation condition		[Test Condition] • Continuously excepted when ECM is in pre drive mode (test phase immediately after ECM ignition) or monitoring is inhibited by another failure.
		[Fault Detection] • Battery voltage is below 768 mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing		• Battery voltage is equal to or above 768 mV.
System reaction		• The sensed battery voltage value is used.
		• Manual DPF regeneration not available
Failure cause		• Battery defect, alternator defect, wiring problems (too high resistance) or ECU defect. Occurrence possible during cold start.
Failure repair		• Replace battery or alternator. Check ECU and wiring.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 031: Battery voltage
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #860 Battery
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Signal detect and actuation module. Check the circuit across Signal detect and actuation module and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Perform the operation start and replace Signal detect and actuation module. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Signal detect and actuation module which Engine electronic control unit learns. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

158-16: The battery voltage is too high.

Generation condition		[Test Condition] • Monitoring is active 2 s after ECU initialization while engine isn't running yet, while the engine isn't cranking and 2 s after engine startup • Continuously.
		[Fault Detection] • If battery voltage > 16.50V, there is a high battery voltage and power stage monitoring is disabled for all failure where this test condition is enabled.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• Battery voltage < 16.00V, the battery voltage is not exceeding high limit.
System reaction		• The sensed battery voltage value is used.
		• None
Failure cause		• Power supply is to high --> possibly external power supply connected (battery charger) or internal failure of ECU (wrong measurement of supply voltage)
Failure repair		• Check battery status and voltage level, Disconnect external device if connected or replace ECU if no supply problem is found.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 031: Battery voltage
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #860 Battery
Inspection procedure	Step1	Check the following components, repair or replace if necessary. Check battery voltage. Test battery and replace if necessary. Go to Step2
	Step2	If other fault codes relating to component 'SAM ECU' are present, process these first. Go to Step3

Inspection procedure	Step3	Switch off ignition. Disconnect plug from component 'Engine electronic control unit'. Disconnect plug from component 'Signal detect and actuation module'. Check the circuit across Signal detect and actuation module and Engine electronic control unit for open or short circuit. Perform visual inspection for each electrical connector. Was a fault discovered? No: Go to Step4 Yes: Go to Step7
	Step4	Switch off ignition. Replace component 'Signal detect and actuation module' by performing initial startup. Reconnect all separated electrical connectors. Switch on ignition. After performing function 'Resetting of learned values of component 'Signal detect and actuation module'', the learned values of component 'Engine electronic control unit' must be reset. Go to Step5
	Step5	Switch off ignition. Reconnect all separated electrical connectors. Erase fault memory and perform a city run for 30 minutes. Check whether this fault code has occurred. Are current fault codes present? NO: Go to Step6 Yes: Go to Step8
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reconnect all separated electrical connectors. Erase fault memory and perform a city run for 30 minutes. Check whether this fault code has occurred. Are current fault codes present? NO: Go to Step6 Yes: Go to Step4
	Step8	Replace component 'Engine electronic control unit' by performing initial startup. Go to Step6

158-18: The battery voltage is too low.

Generation condition	[Test Condition] • Monitoring is active 2 s after ECU initialization while engine isn't running yet, while the engine isn't cranking and 2.00s after engine startup • Continuously.
	[Fault Detection] • If battery voltage is < 9.00V, there is a low battery voltage and power stage monitoring is disabled for all failure where this test condition is enabled.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• If battery voltage > 9.50V, the battery voltage is not low.
System reaction	• The sensed battery voltage value is used.
	• None
Failure cause	• Too low battery voltage, possible also during engine cranking (possibly in cold conditrion), too low measurement of battery voltage possibly due to corroded contacts or wiring harness
Failure repair	• Chech battery state (charge state). Check connectors and wiring harness to corrosion and/or too high electrical resistance
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 031: Battery voltage
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #860 Battery
Inspection procedure	Step1	Check the following components, repair or replace if necessary. Check battery voltage. Test battery and replace if necessary. Go to Step2
	Step2	Switch off ignition. Disconnect plug from component 'Engine electronic control unit'. Disconnect plug from component 'Signal detect and actuation module'. Check the circuit across Signal detect and actuation module and Engine electronic control unit for open or short circuit. Perform visual inspection for each electrical connector. Was a fault discovered? No: Go to Step3 Yes: Go to Step6
	Step3	Switch off ignition. Replace component 'Signal detect and actuation module' by performing initial startup. Reconnect all separated electrical connectors. Switch on ignition. After performing function 'Resetting of learned values of component 'Signal detect and actuation module'', the learned values of component 'Engine electronic control unit' must be reset. Go to Step4
	Step4	Switch off ignition. Reconnect all separated electrical connectors. Erase fault memory and perform a city run for 30 minutes. Check whether this fault code has occurred. Are current fault codes present? No:Go to Step5 Yes:Go to Step7
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reconnect all separated electrical connectors. Erase fault memory and perform a city run for 30 minutes. Check whether this fault code has occurred. Are current fault codes present? No:Go to Step5 Yes:Go to Step3
	Step7	Replace component 'Engine electronic control unit' by performing initial startup. Go to Step5

171-0: Component 'Intake air temperature / Air humidity sensor' or its electrical line is defective.

Generation condition	[Test Condition] • Continuously.
	[Fault Detection] • Voltage from the humidity and intake air temperature sensor (temperature sensor section) is above 4.93 V.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• Voltage from the humidity and intake air temperature sensor (temperature sensor section) is below 4.93 V.
System reaction	• The last valid intake air temperature sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by 19.96°C {68°F}.
	• None
Failure cause	• Sensor defective or short circuit in wiring to external source
Failure repair	• Check wiring or replace sensor

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 015: Ambient temperature • 040: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Temperature sensors) • 044: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Air humidity sensor) • 056: Humidity of intake air
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #347 Inspection of Humidity and intake air temperature sensor
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Humidity and intake air temperature sensor. Check the circuit across Humidity and intake air temperature sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Humidity and intake air temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

171-1: Component 'Intake air temperature / Air humidity sensor' or its electrical line is defective.

Generation condition	[Test Condition] • Continuously.
	[Fault Detection] • Voltage from the humidity and intake air temperature sensor (temperature sensor section) is below 322.6 mV.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• Voltage from the humidity and intake air temperature sensor (temperature sensor section) is above 322.6 mV.
System reaction	• The last valid intake air temperature sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by 19.96°C {68°F}.
	• None

Failure cause		• Sensor defective or short circuit wiring to ground
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 015: Ambient temperature • 040: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Temperature sensors) • 044: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Air humidity sensor) • 056: Humidity of intake air

	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

171-7: Component 'Intake air temperature / Air humidity sensor' is faulty. / Component 'Air mass flow rate / Intake air temperature sensor' is faulty.

Generation condition		[Test Condition] • Monitoring is active 2 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2 s after engine startup and if the ECU is not in afterrun • The function is not inhibited by another failure • The vehicle speed exceeds the threshold 40 km/h {24.86 mph} • The air mass flow exceeds the threshold 100 Kg/h • The air temperature in HFM is <49.96°C {122°F} and > -3549.94°C {-6357.89°F} OR the current selected air temperature < 49.96°C {122°F} and > -3549.94°C {-6357.89°F}
		[Fault Detection] • Difference between the values from the ambient temperature sensor in ECU and from the air flow and intake air temperature sensor is above the specified value for 30 seconds.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 30.00s • Failure is detected if active for 50% of the time
Fault healing		• If the temperature difference returns within the normal range when the starter switch is in ON position.
System reaction		• None
		• None
Failure cause		• Environment Temperature sensor or Air Mass Flow Temperature deviating
Failure repair		• Check both sensors
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 015: Ambient temperature • 040: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Temperature sensors) • 044: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Air humidity sensor) • 056: Humidity of intake air
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #347 Inspection of Humidity and intake air temperature sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any diagnosis code is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Humidity and intake air temperature sensor. Check the circuit across Humidity and intake air temperature sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component "Humidity and intake air temperature sensor". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5

Inspection procedure	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

171-16: The current value for the 'Ambient temperature' component is too low.

Generation condition		[Test Condition] • Continuously if ADC module does not report an error for the sensor.
		[Fault Detection] • The sensor signal for environmental temperature is above 99.96°C {212°F}.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing		• The sensor signal for environmental temperature is below 99.96°C {212°F}.
System reaction		• A specific value is used as a substitute for the humidity/intake air temperature sensor value.
		• None
Failure cause		• Environment temperature sensor defective
Failure repair		• Check or replace temperature sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 015: Ambient temperature • 040: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Temperature sensors) • 044: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Air humidity sensor) • 056: Humidity of intake air
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #347 Inspection of Humidity and intake air temperature sensor
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Humidity and intake air temperature sensor. Check the circuit across Humidity and intake air temperature sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

Inspection procedure	Step3	Turn the starter switch in OFF. Replace component “Humidity and intake air temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform learning of Humidity and intake air temperature sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

172-0: Component 'Boost pressure / Temperature sensor 'Turbocharger'' has a short circuit or is defective.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
	[Fault Detection] • Voltage from boost pressure and boost temperature sensor (boost temperature section) is above 4.94 V.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 25% of the time
Fault healing	• Voltage from boost pressure and boost temperature sensor (boost temperature section) is below 4.94 V.
System reaction	• 29.96°C {86°F} is used as a substitute for the boost temperature sensor value.
	• None
Failure cause	• Short circuit of sensor to external source or defective sensor
Failure repair	• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 002: Temperature at component 'Boost pressure / Temperature sensor' • 017: Boost pressure • 028: Boost pressure (Differential pressure) • 033: Signal voltage from pressure sensor of component 'Boost pressure / Temperature sensor' • 036: Signal voltage of component 'Boost pressure / Temperature sensor' (Temperature sensors)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 004: Boost pressure control 1 • 005: Boost pressure control 2
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #346 Inspection of boost pressure and temperature sensor

Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Boost pressure and temperature sensor. Check the circuit across Boost pressure and temperature sensor Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Boost pressure and temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Boost pressure and temperature sensor which Engine electronic control unit learns. Perform learning of Boost pressure and temperature sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

172-1: Component 'Boost pressure / Temperature sensor 'Turbocharger'' has a short circuit to ground. / Component 'Boost pressure / Temperature sensor 'Turbocharger'' is defective.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
	[Fault Detection] • Voltage from boost pressure and boost temperature sensor (boost temperature section) is below 295.6 mV.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 25% of the time
Fault healing	• Voltage from boost pressure and boost temperature sensor (boost temperature section) is above 295.6 mV.
System reaction	• 29.96°C {86°F} is used as a substitute for the boost temperature sensor value.
	• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause	• Short circuit of sensor to ground or defective sensor
Failure repair	• Check wiring or replace sensor

Perform the learned value resetting procedure of Boost pressure and temperature sensor which Engine electronic control unit learns. Perform learning of Boost pressure and temperature sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

172-2: More than one intake air temperature sensors have plausibility error.

Generation condition		[Test Condition] • Once in a driving cycle at ECM start if an engine cold start has been detected: • monitoring not inhibited by another failure • engine speed = 0 • Engine OFF time > 5 h
		[Fault Detection] • If more than one sensor is deviating and it cannot be clearly identified which one is deviating.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the temperature returns to normal when the starter switch is set from OFF to ON position
System reaction		• None
		• None
Failure cause		• More than one temperature sensor considered for enhanced plausibility check is drifted
Failure repair		• Check all involved temperature sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

174-0: The signal voltage of component 'Fuel temperature sensor' is too high.

Generation condition	[Test Condition] • Monitoring is active as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously
	[Fault Detection] • Voltage from the fuel temperature sensor is above 4.94 V.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• Voltage from the fuel temperature sensor is below 4.94 V.
System reaction	• The engine coolant temperature value is used if the actual fuel temperature measurement is not available; 64.96°C {149°F} is used as a substitute value if the engine coolant temperature measurement is also unavailable.
	• None
Failure cause	• Sensor defective or short circuit to external source
Failure repair	• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 009: Fuel temperature
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #323 Inspection of fuel filter (fuel temperature sensor)

Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Fuel temperature sensor. Make a visual check on each connector. Measure the resistance between Fuel temperature sensor terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Turn the starter switch in OFF. Replace component “Fuel temperature sensor”. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step3	Turn the starter switch in OFF. Remove the connector of Engine ECU. Check the circuit across Engine electronic control unit and Connection of chassis harness and fuel harness for open or short circuit. Is any abnormality recognized? Yes: Go to Step5
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step5	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

174-1: The signal voltage of component 'Fuel temperature sensor' is too low.

Generation condition	[Test Condition] • Monitoring is active as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously
	[Fault Detection] • Voltage from the fuel temperature sensor is below 298 mV.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• Voltage from the fuel temperature sensor is above 298 mV.
System reaction	• The engine coolant temperature value is used if the actual fuel temperature measurement is not available; 64.96°C {149°F} is used as a substitute value if the engine coolant temperature measurement is also unavailable.
	• None
Failure cause	• Sensor defective or short circuit to ground
Failure repair	• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 009: Fuel temperature
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #323 Inspection of fuel filter (fuel temperature sensor)
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Fuel temperature sensor. Make a visual check on each connector. Measure the resistance between Fuel temperature sensor and ground or each terminal to check for short-circuit and electrical leakage. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Turn the starter switch in OFF. Replace component “Fuel temperature sensor”. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step3	Turn the starter switch in OFF. Remove the connector of Engine ECU. Check harness between Engine electronic control unit and Fuel temperature sensor for short-circuit to another line. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step5	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

174-2: Component 'Fuel temperature sensor' has a plausibility error.

Generation condition	[Test Condition] • Initial measured temperatures are frozen and evaluated if: • Engine off time > 5 h.
	[Fault Detection] • Temperature difference > 150 K at 100 s OR Temperature difference > 150 K at 100 s and < 150 K at 100 s but no heater is active failure is detected
	[Defect Debouncing] • Immediate
Fault healing	• If the temperature difference returns within the normal range when the starter switch is in ON position.
System reaction	• None
	• None
Failure cause	• Fuel temperature sensor defective
Failure repair	• Check sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 009: Fuel temperature
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #323 Inspection of fuel filter (fuel temperature sensor)
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

174-16: The fuel temperature is too high.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • The sensor signal is above 99.96°C {212°F}.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing		• The sensor signal is below 99.96°C {212°F}.
System reaction		• The engine coolant temperature value is used if the actual fuel temperature measurement is not available; 64.96°C {149°F} is used as a substitute value if the engine coolant temperature measurement is also unavailable.
		• None
Failure cause		• Fuel temperature sensor defective
Failure repair		• Check or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 009: Fuel temperature
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #323 Inspection of fuel filter (fuel temperature sensor)
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

188-0: The engine speed is too high. General fault at fuel injector

Generation condition		[Test Condition] • Following test conditions should be fulfilled: Error path not inhibited, Engine in normal mode, Engine Temperature between 59.96°C {140°F} and 111.96°C {202°F}, HLS is currently active, Vehicle speed < 1 km/h {0.62 mph}, Torque demand from speed governor, Drive train is open grip < 0.01- and Engine speed > 50.00 rpm • Monitoring is released
		[Fault Detection] • The maximum permitted limit for the engine speed is exceeded.
		[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing		• Engine speed is below the maximum permitted limit.
System reaction		• None
		• None
Failure cause		• Injection system problem, injectors deviation. (See "6. Inspections to be Made at Injector Error Occurrence")
Failure repair		• Replace Injectors
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1) • 071: Correction value of fuel quantity (Cylinder 3) • 072: Correction value of fuel quantity (Cylinder 4) • 073: Correction value of fuel quantity (Cylinder 2)

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. Remove the connector of Injector No.2 cylinder. Remove the connector of Injector No.3 cylinder. Remove the connector of Injector No.4 cylinder. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.2 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.3 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.4 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

188-1: Engine speed falls below the lower limit while HLSDem is active.

Generation condition	[Test Condition] • Following test conditions should be fulfilled: Error path not inhibited, Engine in normal mode, Engine Temperature between 59.96°C {140°F} and 111.96°C {202°F}, HLS is currently active, Vehicle speed < 1 km/h {0.62 mph}, Torque demand from speed governor, Drive train is open grip < 0.01- and Engine speed > 50.00 rpm • Monitoring is released
	[Fault Detection] • The engine speed is below the minimum permitted limit.
	[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms

Fault healing		• The engine speed is above the minimum permitted limit.
System reaction		• None
		• None
Failure cause		• Injection system problem, injectors deviation. (See "6. Inspections to be Made at Injector Error Occurrence")
Failure repair		• Replace Injectors
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1) • 071: Correction value of fuel quantity (Cylinder 3) • 072: Correction value of fuel quantity (Cylinder 4) • 073: Correction value of fuel quantity (Cylinder 2)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. Remove the connector of Injector No.2 cylinder. Remove the connector of Injector No.3 cylinder. Remove the connector of Injector No.4 cylinder. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.2 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.3 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.4 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

190-3: Component 'Rpm sensor 'Combustion engine'' has a short circuit to positive.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is active.
		[Fault Detection] • Short-circuit to battery of the engine speed sensor harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 1000 ms. Failure healed, if the power stage does not report an Short Circuit to Battery error.
System reaction		• The power stage is shut off.
		• None
Failure cause		• Short circuit of wiring to external source or defective engine speed limiter
Failure repair		• Check of wiring or replace tachometer
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 047: Engine speed
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #263 Inspection of engine speed sensor
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine speed sensor. Make a visual check on each connector. Measure the resistance between Engine speed sensor terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Turn the starter switch in OFF. Replace component “Engine speed sensor”. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step3	Turn the starter switch in OFF. Remove the connector of Engine ECU. Check the circuit across Engine electronic control unit and Engine speed sensor for open or short circuit. Is any abnormality recognized? Yes: Go to Step5
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step5	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

190-4: Component 'Rpm sensor 'Combustion engine'' has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is NOT active.
		[Fault Detection] • Short-circuit to ground of the engine speed sensor harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• Hardware does not report a short circuit to ground error on the PWM output power stage for the engine speed signal.
System reaction		• The power stage is shut-off.
		• None
Failure cause		• Short circuit of wiring to ground or defective tachometer
Failure repair		• Check of wiring or replace tachometer
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 047: Engine speed
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #263 Inspection of engine speed sensor
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine speed sensor. Make a visual check on each connector. Measure the resistance between Engine speed sensor and ground or each terminal to check for short-circuit and electrical leakage. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Turn the starter switch in OFF. Replace component “Engine speed sensor”. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step3	Turn the starter switch in OFF. Remove the connector of Engine ECU. Check harness between Engine electronic control unit and Engine speed sensor for short-circuit to another line. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step5	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

190-5: Component 'Rpm sensor 'Combustion engine'' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is NOT active.
		[Fault Detection] • Open-circuit of the engine speed sensor harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• Hardware does not report a “open load” (OL) error on the PWM output power stage for the Engine Speed.
System reaction		• The power stage is shut off.
		• None
Failure cause		• Broken or disconnected wiring or defective tachometer
Failure repair		• Check of wiring or replace tachometer
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 047: Engine speed
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #263 Inspection of engine speed sensor
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine speed sensor. Make a visual check on each connector. Measure the resistance between Engine speed sensor terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Turn the starter switch in OFF. Replace component “Engine speed sensor”. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step3	Turn the starter switch in OFF. Remove the connector of Engine ECU. Check the circuit across Engine electronic control unit and Engine speed sensor for open or short circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step5	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

190-12: Component 'Rpm sensor 'Combustion engine'' has overtemperature.

Generation condition		[Test Condition] • Monitoring only when the power stage is active.
		[Fault Detection] • Overcurrent is detected by the engine speed sensor.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 550.00ms • Failure is detected if active for 25% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage each 3 s. Failure healed, if the power stage does not report an over temperature error.
System reaction		• The power stage is shut off.
		• None
Failure cause		• High battery voltage, high load and high ECU temperature, defective wiring, Tachometer or ECU
Failure repair		• Check load and output, check wiring, replace Tachometer or ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 047: Engine speed
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #263 Inspection of engine speed sensor
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine speed sensor. Make a visual check on each connector. Measure the resistance between Engine speed sensor terminals to check for open-circuit. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Turn the starter switch in OFF. Replace component “Engine speed sensor”. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step3	Turn the starter switch in OFF. Remove the connector of Engine ECU. Check the circuit across Engine electronic control unit and Engine speed sensor for open or short circuit. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step5	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

251-2: Check for correct time (Daylight savings/standard time)

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Once at ECU start
		[Fault Detection] • The time received via CAN differs from the internal time of engine ECU for 10 seconds or longer.
		[Defect Debouncing] • Defect condition fulfilled continuously >1000.0 ms
Fault healing		• The time received via CAN matches with the internal time of engine ECU.
System reaction		• None
		• None
Failure cause		• Summer/winter time change or another time zone was entered
Failure repair		• No intervention necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

251-12: Component 'Tachograph' is defective.

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Once per cycle at ECM on
	[Fault Detection] • Difference between the internal time of ECU and the external time via CAN is out of specified range for 5 times or more when measured at every 100 s.
	[Defect Debouncing] • Immediate
Fault healing	• Difference between the absolute ECU internal time and the external CAN time is inside of applicable range for at least 5 times (tested every 100 s). • Healing not possible in same cycle, only at next ECU ON.
System reaction	• None
	• None
Failure cause	• Defective external clock (Tachhograf)
Failure repair	• Check and replace tachograf
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with Meter cluster is generated, make a system diagnosis according to the diagnosis code. Go to step2

Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of Meter cluster. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Meter cluster. Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed

Inspection procedure	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

354-0: Component 'Intake air temperature / Air humidity sensor' is faulty.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V and as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded • Monitoring not inhibited by another failure. • Engine running since start > 8.00 min • Engine temperature > 39.96°C {104°F} • SCR Dosing System ready for UREA Injection (including SCR temp > 129.96°C {266°F})
		[Fault Detection] • Sensor signal from the humidity and intake air temperature sensor (humidity sensor section) is above 3.8 V.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• Sensor signal from the humidity and intake air temperature sensor (humidity sensor section) is below 3.8 V.
System reaction		• Humidity/intake air temperature sensor value (humidity sensor section value) is frozen at the last valid value before detection of this error.
		• None
Failure cause		• Sensor full with water droplets • Sensor defective or short circuit to external source
Failure repair		• Clean Sensor (dry it) • Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 015: Ambient temperature • 040: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Temperature sensors) • 044: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Air humidity sensor) • 056: Humidity of intake air
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #347 Inspection of Humidity and intake air temperature sensor
Inspection procedure	Step1	Inspection of air flow & intake air temperature sensor (air flow sensing section) See the “(7) Inspection of humidity and intake air temperature sensor” of section 5.

354-16: Component 'Intake air temperature / Air humidity sensor' is faulty.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously, if no sensor supply error is detected.
		[Fault Detection] • Voltage from the humidity and intake air temperature sensor (humidity sensor section) is above 3.8 V.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• Voltage from the humidity and intake air temperature sensor (humidity sensor section) is below 3.8 V.
System reaction		• The last valid humidity sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by 50% as a substitute humidity value.
		• None
Failure cause		• Sensor full with water droplets or • Sensor defective or short circuit to external source
Failure repair		• NO action needed as long as the failure is not active. • If failure is not active, check duration of failure active: If a single duration lasts longer than ~10 min --> there is probably an electrical failure. --> Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 015: Ambient temperature • 040: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Temperature sensors) • 044: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Air humidity sensor) • 056: Humidity of intake air
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #347 Inspection of Humidity and intake air temperature sensor
Inspection procedure	Step1	Inspection of air flow & intake air temperature sensor (air flow sensing section) See the “(7) Inspection of humidity and intake air temperature sensor” of section 5.

354-17: Component 'Intake air temperature / Air humidity sensor' or its electrical line is defective.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously if no ADC failure is detected
	[Fault Detection] • The sensor signal is less than -3.00%
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• The last valid humidity sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by 50% as a substitute humidity value.
	• None
Failure cause	• Inaccurate or defective Induction Air Humidity sensor, or defect in its wiring
Failure repair	• Check wiring and the accuracy of Induction Air Humidity sensor and replace it if necessary

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 015: Ambient temperature • 040: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Temperature sensors) • 044: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Air humidity sensor) • 056: Humidity of intake air
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #347 Inspection of Humidity and intake air temperature sensor
Inspection procedure	Step1	Inspection of air flow & intake air temperature sensor (air flow sensing section) See the “(7) Inspection of humidity and intake air temperature sensor” of section 5.

354-18: The signal voltage of component 'Intake air temperature / Air humidity sensor' is too low.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously, if no sensor supply error is detected.
		[Fault Detection] • Voltage from the humidity and intake air temperature sensor (humidity sensor section) is below 600 mV.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• Voltage from the humidity and intake air temperature sensor (humidity sensor section) is above 600 mV.
System reaction		• The last valid humidity sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by 50% as a substitute humidity value.
		• None
Failure cause		• Short circuit of wiring to ground or defective sensor
Failure repair		• Check wiring and sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 015: Ambient temperature • 040: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Temperature sensors) • 044: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Air humidity sensor) • 056: Humidity of intake air
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #347 Inspection of Humidity and intake air temperature sensor
Inspection procedure	Step1	Inspection of air flow & intake air temperature sensor (air flow sensing section) See the “(7) Inspection of humidity and intake air temperature sensor” of section 5.

354-31: Component 'Air humidity sensor' has a plausibility error.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Plausibility check not inhibited by another failure • vehicle speed > 1 km/h {0.62 mph} • change in temperature between 0.04°C {32.07°F}/s and 0.04°C {32.07°F}/s
		[Fault Detection] • If the change in relative humidity is below 0.01%/s
		[Defect Debouncing] • Defect condition fulfilled continuously >10.0 ms
Fault healing		• If the change in relative humidity is above 0.01%/s
System reaction		• None
		• None
Failure cause		• Humidity sensor dynamic compromised, value sticking
Failure repair		• Check and replace humidity sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 015: Ambient temperature • 040: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Temperature sensors) • 044: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Air humidity sensor) • 056: Humidity of intake air
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #347 Inspection of Humidity and intake air temperature sensor
Inspection procedure	Step1	Inspection of air flow & intake air temperature sensor (air flow sensing section) See the “(7) Inspection of humidity and intake air temperature sensor” of section 5.

355-31: Measurement value (Operating hours counter) of the component 'Engine oil' is above the specified value.

Generation condition	[Test Condition] • Continuously.
	[Fault Detection] • Service life of the engine oil has expired.
	[Defect Debouncing] • None
Fault healing	• After replacing the oil, reset using Fuso Diagnostics.
System reaction	• Limited DPF regeneration control is applied.
	• Automatic regeneration no available -> risk for DPF overload
Failure cause	• Excessive engine running time under oil dilution conditions, due to retarded post injection for filter regeneration.
Failure repair	• Replace engine oil and reset timer for oil dilution with tester using the dedicated FUSO Diagnostics
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	Turn the starter switch in OFF. Replace component “Engine oil”. Perform the learned value resetting procedure of Engine oil which Engine electronic control unit learns. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

412-0: The exhaust gas temperature is too high. (Exhaust temperature downstream of exhaust gas recirculation cooler)

Generation condition		[Test Condition] • The signal range checks are carried out if there is no ADC module and sensor supply error. Continuously.
		[Fault Detection] • The voltage is above 1.48 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• The voltage is below 1.48 V.
System reaction		• EGR cooler downstream temperature is frozen at the last valid value on preliminary failure and ramps, using slope 3300.00K/s or 3300.00K/s depending whether the measured value is above or below replacement value, to a default value of 40.96°C {105.73°F} if failure is validated.
		• None
Failure cause		• Short circuit of sensor to external source or defective sensor
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 000: Temperature at component 'EGR cooler outlet temperature sensor'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Check the circuit across Engine electronic control unit and EGR cooler outlet temperature sensor for open or short circuit. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “EGR cooler outlet temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4

Inspection procedure	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

412-1: The exhaust gas temperature is too low. (Exhaust temperature downstream of exhaust gas recirculation cooler)

Generation condition		[Test Condition] • The signal range checks are carried out if there is no ADC module and sensor supply error. Continuously.
		[Fault Detection] • The voltage is below 470.4 mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• The voltage is above 470.4 mV.
System reaction		• EGR cooler downstream temperature is frozen at the last valid value on preliminary failure and ramps, using slope 3300.00K/s or 3300.00K/s depending whether the measured value is above or below replacement value, to a default value of 40.96°C {105.73°F} if failure is validated.
		• None
Failure cause		• Short circuit of sensor to ground or defective sensor
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 000: Temperature at component 'EGR cooler outlet temperature sensor'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Check the circuit across Engine electronic control unit and EGR cooler outlet temperature sensor for open or short circuit. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “EGR cooler outlet temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed

Inspection procedure	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

412-2: Component 'Exhaust temperature downstream of exhaust gas recirculation cooler' has a plausibility error.

Generation condition		[Test Condition] • Initial measured temperatures are frozen and evaluated if: • Engine off time > 5 h. • Plausibility test not inhibited
		[Fault Detection] • Temperature sensor 'Exhaust gas recirculation' is thermally overloaded.
		[Defect Debouncing] • Immediate
Fault healing		• Temperature difference is within specified range.
System reaction		• None
		• None
Failure cause		• EGR cooler downstream temperature sensor defective
Failure repair		• Check sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 000: Temperature at component 'EGR cooler outlet temperature sensor' • 005: Temperature in component 'Diesel oxidation catalytic converter' • 007: Exhaust temperature upstream of diesel oxidation catalytic converter • 043: Signal voltage of component 'Temperature sensor Exhaust system1'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of exhaust gas temperature sensor 1
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Check the circuit across Engine electronic control unit and EGR cooler outlet temperature sensor for open or short circuit. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Exhaust gas temperature sensor 1”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Turn the starter switch in OFF. Replace component “EGR cooler outlet temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed

Inspection procedure	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

412-16: Component 'Temperature sensor 'Exhaust gas recirculation'' is thermally overloaded.

Generation condition		[Test Condition] • The signal range checks are carried out if there is no ADC module and sensor supply error. Continuously.
		[Fault Detection] • The sensor signal is above 749.96°C {1381.93°F}.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing		• The sensor signal is below 749.96°C {1381.93°F}.
System reaction		• EGR cooler downstream temperature is frozen at the last valid value on preliminary failure and ramps, using slope 3300.00K/s or 3300.00K/s depending whether the measured value is above or below replacement value, to a default value of 40.96°C {105.73°F} if failure is validated.
		• None
Failure cause		• Inaccurate or defective EGR cooler downstream temperature sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the EGR cooler downstream temperature sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 000: Temperature at component 'EGR cooler outlet temperature sensor'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Check the circuit across Engine electronic control unit and EGR cooler outlet temperature sensor for open or short circuit. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “EGR cooler outlet temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5

Inspection procedure	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

521-12: The signal value of component 'Brake' is implausible.

Generation condition		[Test Condition] • Continuously, if the redundant brake contact is used and terminal 15 is on.
		[Fault Detection] • Input signals from the two stop lamp switch lines do not match for 30 seconds continuously.
		[Defect Debouncing] • Defect condition fulfilled continuously > 30000.0 ms
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Brake status message to CAN: Brakes defective
		• Manual DPF regeneration not available • Cruise control not available
Failure cause		• The adjustment of the brake switches is not good enough. • One of the brake switches has a short circuit. • The circuit has an open lead.
Failure repair		• Check the adjustment of the brake switches • Check the brake switches for short circuit • Check the wiring and the brake switches for open lead
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 140: Position of brake pedal
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #042 Inspection of stop lamp switch
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check to see if Stop lamp switch is fully operational. Check the circuit across Stop lamp switch and Signal detect and actuation module for open or short circuit. For procedures, refer to the Shop Manual. Go to step2

Inspection procedure	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step5
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step6	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

595-2: Component 'CRUISE CONTROL Switches' is faulty.

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
		[Fault Detection] • 2 Buttons pressed together (possible combinations): Resume + Down, Resume + Up and Up and Down
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 25% of the time
Fault healing		• No Healing possible (irreversible failure)
System reaction		• Cruise control goes into mode “off”
		• None
Failure cause		• Failure in Cruise control module (switches) • Failure in wiring harness
Failure repair		• Check Cruise control unit • Check wiring harness
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 167: Status of button ‘CRUISE CONTROL’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #089 Inspection of switch
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. For procedures, refer to the Shop Manual. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step6
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step5

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step6	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

595-31: Component 'CRUISE CONTROL Switches' is faulty.

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
		[Fault Detection] • One or more switches (Down, Up and Resume) are active for longer than 60 s.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 25% of the time
Fault healing		• If the cruise control switch signal returns to normal when the starter switch is in ON position
System reaction		• Cruise control goes into mode “off”
		• None
Failure cause		• Failure in Cruise control module (switches) • Failure in wiring harness
Failure repair		• Check Cruise control unit • Check wiring harness
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 167: Status of button ‘CRUISE CONTROL’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #089 Inspection of switch
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. For procedures, refer to the Shop Manual. Go to step2

Inspection procedure	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step6
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step5
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step6	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

598-2: The position of component 'Clutch pedal' is implausible.

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
		[Fault Detection] • Faulty clutch signal via CAN is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• If the clutch signal received by CAN does not report a clutch defect.
System reaction		• Zero (0) is output as the default value for clutch control unit.
		• Cruise control not available • Manual DPF regeneration not available
Failure cause		• Clutch switch defective or problem on CAN communication with cutch switch
Failure repair		• Check clutch switch. Check CAN connection
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

604-2: The signal value of component 'Gear NEUTRAL POSITION' is implausible.

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Test is executed during after-run (Key 15 off)
	[Fault Detection] • No input of transmission neutral switch signal at vehicle speed 80 km/h {49.7 mph} or higher.
	[Defect Debouncing] • Immediate.
Fault healing	• If the signal returns to normal when the starter switch is set from OFF to ON position
System reaction	• None
	• None
Failure cause	• If the driver drive off, the vehicle speed get upper than 80km/h {49.71mph}, and he had not change the gear for more than 1.00- times (e.g. starting in 3rd gear downhilll). • The gearbox neutral position switch is defective.
Failure repair	• Driver mistake (no action required) (probability high if duration of failed driving cycle short) • Check the gearbox neutral position switch.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

606-0: The engine speed is too high.

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • Engine speed exceeds 4375 rpm due to shifting error or faulty sensor. (Check the diagnosis code(s) generated simultaneously and perform troubleshooting according to that code(s).)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 3.00s • Failure is detected if active for 50% of the time
Fault healing		• Engine speed falls below threshold of 4250 rpm.
System reaction		• None
		• None
Failure cause		• Engine overspeed has occurred
Failure repair		• No reactions necessary only if this fault/information status reoccurs frequently. In this case check driving conditions of vehicle, engine speed acquisition and injection system for quantity set point and actual value during fault recognition, check also for ECM errors.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

636-2: The signal value of component 'Rpm sensor 'Combustion engine" is implausible.

Generation condition		[Test Condition] • Continuously if engine is running and speed > 650 rpm and diagnostic is not inhibited by another failure.
		[Fault Detection] • Error signal from the engine speed sensor is above the specified value.
		[Defect Debouncing] • Immediate
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Engine speed is calculated based on the camshaft speed signal.
		• Surging vehicle behavior • Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• High vibration of crank shaft signal sensor • Intermittent open circuit of sensor • Electrical disturbances due to damaged isolation of wiring harness • Electrical disturbances due external electromagnetic disturbances
Failure repair		• Check if sensor fixed correctly (should not be moveable) • Check wiring harness and contacts • Check if electrical lines with high electric performance are additionally installed (components not validated by the vehicle manufacturer)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

636-9: Crankshaft signal loss from engine speed sensor. Abnormal update rate

Generation condition		[Test Condition] • Continuously if engine is running and speed > 650 rpm and diagnostic is not inhibited by another failure.
		[Fault Detection] • Engine speed sensor signal error is detected while the camshaft rotates 2 turns.
		[Defect Debouncing] • Immediate
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Engine speed is calculated based on the camshaft speed signal.
		• Surging vehicle behavior • Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• Crank shaft speed sensor defect • Crank shaft speed sensor not mounted correctly • Crank shaft speed sensor not connected electrically, open circuit or short circuit.
Failure repair		• Check if crank shaft speed sensor mounted correctly • Check wiring harness to open/short circuit • Check crank shaft speed sensor for correct function and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 047: Engine speed
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #263 Inspection of engine speed sensor
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine speed sensor. Make a visual check on each connector. Measure the resistance between Engine speed sensor and ground or each terminal to check for short-circuit and electrical leakage. Special features If any visible damage is found, repair or replace the affected part and interrupt the inspection process. No abnormalities? No: Go to Step2 Yes: Go to Step3
	Step2	Turn the starter switch in OFF. Replace component “Engine speed sensor”. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step3	Turn the starter switch in OFF. Remove the connector of Engine ECU. Check harness between Engine electronic control unit and Engine speed sensor for short-circuit to another line. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step5
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

Inspection procedure	Step5	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

651-3: The fuel injector of cylinder 1 has a short circuit.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Short-circuit of the No. 1 injector harness is detected 4 times or more.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• None
		• Reduced power available due injector shut off • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Short circuit in wiring or injector (See "6. Inspections to be Made at Injector Error Occurrence")
Failure repair		• Check wiring, replace fuel injector of cylinder 1.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6
	Step2	Turn the starter switch in OFF. Replace component “Injector No.1 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.1 cylinder which Engine electronic control unit learns. Perform coding of Injector No.1 cylinder which Engine electronic control unit learns. Go to step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed

Inspection procedure	Step5	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

651-5: The fuel injector (cylinder 1) has an electrical fault or an open circuit.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Open-circuit of the No. 1 injector harness is detected 4 times or more.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• None
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Open load for injector of cylinder 1 is detected. (See "6. Inspections to be Made at Injector Error Occurrence")
Failure repair		• Check wiring, replace fuel injector of cylinder 1.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6
	Step2	Turn the starter switch in OFF. Replace component “Injector No.1 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.1 cylinder which Engine electronic control unit learns. Perform coding of Injector No.1 cylinder which Engine electronic control unit learns. Go to step3

Inspection procedure	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

651-6: The fuel injector of cylinder 1 has a short circuit between positive and ground.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Short-circuit of the No. 1 injector harness is detected 4 times or more.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• None
		• Reduced power available due injector shut off
Failure cause		• Short circuit in wiring or injector (See "6. Inspections to be Made at Injector Error Occurrence")
Failure repair		• Check wiring, replace fuel injector of cylinder 1.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6

Inspection procedure	Step2	Turn the starter switch in OFF. Replace component “Injector No.1 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.1 cylinder which Engine electronic control unit learns. Perform coding of Injector No.1 cylinder which Engine electronic control unit learns. Go to step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

652-3: The fuel injector of cylinder 3 has a short circuit.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • Short-circuit of the No. 3 injector harness is detected 4 times or more.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• None
	• Reduced power available due injector shut off • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• Short circuit in wiring or injector (See "6. Inspections to be Made at Injector Error Occurrence")
Failure repair	• Check wiring, replace fuel injector of cylinder 3.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 071: Correction value of fuel quantity (Cylinder 3)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #582 Inspection of injector

Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.3 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.3 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6
Inspection procedure	Step2	Turn the starter switch in OFF. Replace component “Injector No.3 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.3 cylinder which Engine electronic control unit learns. Perform coding of Injector No.3 cylinder which Engine electronic control unit learns. Go to step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

652-5: The fuel injector (cylinder 3) has an electrical fault or an open circuit.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • Open-circuit of the No. 3 injector harness is detected 4 times or more.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• None
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• Open load for injector of cylinder 3 is detected. (See "6. Inspections to be Made at Injector Error Occurrence")
Failure repair	• Check wiring, replace fuel injector of cylinder 3.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 071: Correction value of fuel quantity (Cylinder 3)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 003: Injection valve

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.3 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.3 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6
	Step2	Turn the starter switch in OFF. Replace component “Injector No.3 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.3 cylinder which Engine electronic control unit learns. Perform coding of Injector No.3 cylinder which Engine electronic control unit learns. Go to step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

652-6: The fuel injector of cylinder 3 has a short circuit between positive and ground.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • Short-circuit of the No. 3 injector harness is detected 4 times or more.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.2 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.2 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step

Inspection procedure	Step2	Turn the starter switch in OFF. Replace component “Injector No.2 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.2 cylinder which Engine electronic control unit learns. Perform coding of Injector No.2 cylinder which Engine electronic control unit learns. Go to step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

654-6: The fuel injector of cylinder 2 has a short circuit between positive and ground.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • Short-circuit of the No. 2 injector harness is detected 4 times or more.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• None
	• Reduced power available due injector shut off
Failure cause	• Short circuit in wiring or injector (See "6. Inspections to be Made at Injector Error Occurrence")
Failure repair	• Check wiring, replace fuel injector of cylinder 2.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 073: Correction value of fuel quantity (Cylinder 2)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #582 Inspection of injector

Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.2 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.2 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6
	Step2	Turn the starter switch in OFF. Replace component “Injector No.2 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.2 cylinder which Engine electronic control unit learns. Perform coding of Injector No.2 cylinder which Engine electronic control unit learns. Go to step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

677-3: The starter relay has a short circuit to positive.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Monitoring only when the power stage is inactive. • ECU not in after-run, Battery voltage > 9.50 V (switch off < 9.00 V) and Test of redundant shut-off paths not active)
	[Fault Detection] • Short-circuit to positive of the starter relay (drive) harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 25% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• Power stage is deactivated.
	• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause	• Short circuit of wiring to external source or defective starter relay
Failure repair	• Check of wiring or replacement of relay
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 173: Starter relay • 174: Starter relay (Control unit: Pin 91) • 175: Starter relay (Control unit: Pin 69)

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #187 Inspection of starter relay
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Starter relay (for drive). Check the circuit across Engine electronic control unit and Starter relay (for drive) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Starter relay (for drive)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Starter relay (for drive) and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

677-4: The starter relay has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Monitoring continuously in ON and OFF state. • ECU not in after-run, Battery voltage > 9.50 V (switch off < 9.00 V) and Test of redundant shut-off paths not active)
		[Fault Detection] • Short-circuit to ground of the starter relay (drive) harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• None
Failure cause		• Short circuit of wiring to ground or defective starter relay
Failure repair		• Check of wiring or replacement of starter relay
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 173: Starter relay • 174: Starter relay (Control unit: Pin 91) • 175: Starter relay (Control unit: Pin 69)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #187 Inspection of starter relay
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Starter relay (for drive). Check the circuit across Engine electronic control unit and Starter relay (for drive) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Starter relay (for drive)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed

Inspection procedure	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Starter relay (for drive) and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

677-5: The starter relay has an open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Monitoring only when the power stage is inactive. • ECU not in after-run, Battery voltage > 9.50 V (switch off < 9.00 V) and Test of redundant shut-off paths not active)
		[Fault Detection] • Open-circuit of the starter relay (drive) harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 90.00ms • Failure is detected if active for 25% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• None
Failure cause		• Broken or disconnected wiring or defective starter relay
Failure repair		• Check of wiring or replacement of starter relay
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 173: Starter relay • 174: Starter relay (Control unit: Pin 91) • 175: Starter relay (Control unit: Pin 69)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #187 Inspection of starter relay
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2

Inspection procedure	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Starter relay (for drive). Check the circuit across Engine electronic control unit and Starter relay (for drive) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Starter relay (for drive)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Starter relay (for drive) and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

723-2: Signal 'Engine speed' from component 'Position sensor 'Cylinder" is faulty.

Generation condition		[Test Condition] • Diagnostics is active if engine is running and no error in the crankshaft speed sensor is present
		[Fault Detection] • Number and position of the camshaft edges detected by the cylinder identification sensor is out of specification.
		[Defect Debouncing] • Immediate
Fault healing		• If correct pattern is recognised.
System reaction		• Engine phase is determined through test injections which are performed using the camshaft increment signal alone.
		• None
Failure cause		• Cam Shaft speed signal not stable: • electrical intermittent open circuit • sensor not fixed correctly • electrical disturbances due to damaged isolation of wiring harness • electrical disturbances due to special electrical features
Failure repair		• Check wiring, sensor installation and proper functioning of camshaft phase sensor (evaluate raw signals) • Check if sensor fixed correctly (should not be moveable), check wiring harness and contacts, check if electrical lines with high electric performance are additionally installed (components not validated by the vehicle manufacturer).
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #320 Inspection of camshaft timing sensor
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

723-9: No signal from component 'Position sensor 'Cylinder''

Generation condition		[Test Condition] • Diagnostics is active if engine is running and no error in the crankshaft speed sensor is present
		[Fault Detection] • Short-circuit of the cylinder identification sensor harness is detected.
		[Defect Debouncing] • Immediate
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Engine phase is determined through test injections which are performed using the camshaft increment signal alone.
		• None
Failure cause		• Camshaft speed sensor defective • Wiring harness “open circuit” • Camshaft sensor not mounted
Failure repair		• Check if sensor mounted correctly • Check wiring harness • Check sensor functionality and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #320 Inspection of camshaft timing sensor
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Camshaft timing sensor. Check the circuit across Camshaft timing sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Camshaft timing sensor”. Reinstall all the removed connectors. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

723-31: The signal value of component 'Position sensor 'Cylinder'' is implausible.

Generation condition		[Test Condition] • Continuously when engine speed is detectable and no camshaft failures already detected
		[Fault Detection] • Input signals from the cylinder identification sensor and the engine speed sensor do not match.
		[Defect Debouncing] • Immediate
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Engine phase is determined through test injections which are performed using the camshaft increment signal alone.
		• Engine speed limited to 1400 rpm • Engine speed limited to 1590 rpm
Failure cause		• Camshaft sensor position deviates form crankshaft position: • camshaft mal positioned (e.g. tooth belt: 1 tooth skipped) • camshaft position wheel mal positioned (if adjustable) • camshaft sensor position mal positioned (if adjustable) • crankshaft signal mal positioned (same as camshaft)
Failure repair		• Check correct positions of camshaft signal wheel and crankshaft signal wheel to piston position
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #320 Inspection of camshaft timing sensor
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

917-9: CAN timeout fault

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Timeout of High Resolution Vehicle Distance message
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• The default value for vehicle distance is used.
	• None
Failure cause	• Defective CAN controller of Body Computer, under voltage of BC missing BC, CAN cable connecting the Body Computer is disconnected or broken. Short circuit in wiring.
Failure repair	• Check presence and correct connection of the Body Computer to the network, Check correct functioning of the BC CAN controller and its voltage supply. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

931-3: Component 'Electric fuel pump' has a short circuit to positive.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only active pressure supply pump activated.
		[Fault Detection] • Short-circuit to positive of the fuel pump harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 290.00ms • Failure is detected if active for 25% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• Short circuit of wiring to external source or inside presupply pump
Failure repair		• Check of wiring or replace pre supply pump
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 075: Status of component 'Relay 'Fuel pump''
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #497 Inspection of fuel pump
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Signal detect and actuation module. Remove the connector of Fuel pump. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Fuel pump and Signal detect and actuation module for open or short circuit. Check the circuit across Fuel pump and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step9
	Step3	Turn the starter switch in OFF. Replace component “Fuel pump”. Reinstall all the removed connectors. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Perform the operation start and replace Signal detect and actuation module. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step8
	Step8	Inspection completed
	Step9	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Signal detect and actuation module. Remove the connector of Connection of chassis harness and fuel harness. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Connection of chassis harness and fuel harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and fuel harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Repair or replace the harness across Fuel pump and Connection of chassis harness and fuel harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3
	Step11	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and fuel harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3

931-4: Component 'Electric fuel pump' has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only active pressure supply pump NOT activated, i.e. 30 s after Key 15 “on” at engine stand still or after engine speed < 50 rpm (i.e. after Key 15 off or engine stall)
		[Fault Detection] • Short-circuit to ground of the fuel pump harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 270.00ms • Failure is detected if active for 25% of the time
Fault healing		• The power stage does not report an “short to ground” error.
System reaction		• Power stage is deactivated.
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• Short circuit of wiring to ground or inside presupply pump
Failure repair		• Check of wiring or replace pre supply pump
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 075: Status of component 'Relay 'Fuel pump''
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #497 Inspection of fuel pump
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Signal detect and actuation module. Remove the connector of Fuel pump. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Fuel pump and Signal detect and actuation module for open or short circuit. Check the circuit across Fuel pump and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step9
	Step3	Turn the starter switch in OFF. Replace component “Fuel pump”. Reinstall all the removed connectors. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Perform the operation start and replace Signal detect and actuation module. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step6

Inspection procedure	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step8
	Step8	Inspection completed
	Step9	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Signal detect and actuation module. Remove the connector of Connection of chassis harness and fuel harness. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Connection of chassis harness and fuel harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and fuel harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Repair or replace the harness across Fuel pump and Connection of chassis harness and fuel harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3
	Step11	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and fuel harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3

931-5: Component 'Electric fuel pump' has an open circuit.

Generation condition	[Test Condition] • Monitoring only active pressure supply pump NOT activated, i.e. 30 s after Key 15 “on” at engine stand still or after engine speed < 50 rpm (i.e. after Key 15 off or engine stall)
	[Fault Detection] • Open-circuit of the fuel pump harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 290.00ms • Failure is detected if active for 25% of the time
Fault healing	• The power stage does not report an “open load” error.
System reaction	• Power stage is deactivated.
	• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause	• Broken or disconnected wiring or defective presupply pump
Failure repair	• Check of wiring or replace pre supply pump
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 075: Status of component 'Relay 'Fuel pump''

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #497 Inspection of fuel pump
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Signal detect and actuation module. Remove the connector of Fuel pump. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Fuel pump and Signal detect and actuation module for open or short circuit. Check the circuit across Fuel pump and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step9
	Step3	Turn the starter switch in OFF. Replace component “Fuel pump”. Reinstall all the removed connectors. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Perform the operation start and replace Signal detect and actuation module. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step8
	Step8	Inspection completed

Inspection procedure	Step9	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Signal detect and actuation module. Remove the connector of Connection of chassis harness and fuel harness. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Connection of chassis harness and fuel harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and fuel harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11
	Step10	Repair or replace the harness across Fuel pump and Connection of chassis harness and fuel harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3
	Step11	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and fuel harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3

931-12: The function of component 'Electric fuel pump' is not OK.

Generation condition	[Test Condition] • Monitoring only active pressure supply pump activated.
	[Fault Detection] • Overcurrent in the fuel pump is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 270.00ms • Failure is detected if active for 25% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• Power stage is deactivated.
	• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause	• High battery voltage, high temperature inside ECU, high load or wiring problem
Failure repair	• No reaction needed if failure isn't present after short time, check load and output, check wiring, replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 075: Status of component 'Relay 'Fuel pump''
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #497 Inspection of fuel pump

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Signal detect and actuation module. Remove the connector of Fuel pump. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Fuel pump and Signal detect and actuation module for open or short circuit. Check the circuit across Fuel pump and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step9
	Step3	Turn the starter switch in OFF. Replace component “Fuel pump”. Reinstall all the removed connectors. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Perform the operation start and replace Signal detect and actuation module. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step8
	Step8	Inspection completed
	Step9	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Signal detect and actuation module. Remove the connector of Connection of chassis harness and fuel harness. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Connection of chassis harness and fuel harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and fuel harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step10 Yes: Go to Step11

Inspection procedure	Step10	Repair or replace the harness across Fuel pump and Connection of chassis harness and fuel harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3
	Step11	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and fuel harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step3

959-9: CAN timeout fault. Error on transmission of CAN message

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuous
	[Fault Detection] • CAN communication from the meter cluster (meter time information) is faulty (timeout).
	[Defect Debouncing] • Defect condition fulfilled continuously >1000.0 ms
Fault healing	• If the normal signal is received when the starter switch is in ON position
System reaction	• Day/time is frozen at the following: Year = 2010 Month = Jan Day = 1 Hour = 0 Minutes = 00 Seconds = 00
	• None
Failure cause	• Defective CAN controller of Tachograph or Instrument Cluster, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair	• Check presence and correct connection of the Tachograph or of the Instrument Cluster to the network, Check correct functioning of the CAN controller. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with Meter cluster is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of Meter cluster. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Meter cluster. Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed

Inspection procedure	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

980-9: CAN timeout fault. Error on transmission of CAN message

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
		[Fault Detection] • CAN communication from SAM (PTO control switch information) is faulty (timeout).
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• If the normal signal is received when the starter switch is in ON position
System reaction		• PTO switch signal is set to default value zero (0).
		• None
Failure cause		• Defective CAN controller of SAM Interface or PTO, CAN cable connecting the interface is disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the SAM and PTO Interface to the network. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5

Inspection procedure	Step2	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

1074-3: Component 'Engine brake Solenoid valve' has a short circuit to positive.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is active.
	[Fault Detection] • Short-circuit of the exhaust brake valve harness is detected for 10 seconds continuously.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• Power stage is deactivated.
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• Short circuit of wiring to external source or defective exhaust flap actuator
Failure repair	• Check of wiring or replace exhaust flap actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 111: Position of component 'Engine brake Solenoid valve' • 138: Engine Brake
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 007: Exhaust brake solenoid valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Exhaust brake valve. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Exhaust brake valve for open or short circuit. Check the circuit across Signal detect and actuation module and Exhaust brake valve for open or short circuit. Check the circuit across Ground and Exhaust brake valve for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Exhaust brake valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Ground and Connection of chassis harness and engine harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9

Inspection procedure	Step8	Repair or replace the harness across Exhaust brake valve and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and engine harness. Repair or replace the harness across Ground and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1074-4: The exhaust flap has a short circuit to ground. / Component 'Engine brake Solenoid valve' has a mechanical defect.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is NOT active.
		[Fault Detection] • Short-circuit to ground of the exhaust brake valve harness is detected.
		[Defect Debouncing] • Defect condition fulfilled continuously >40000.0 ms
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Short circuit of wiring to ground or defective Exhaust Flap Actuator
Failure repair		• First Check wiring, if no short circuit found replace Exhaust Flap Actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 111: Position of component 'Engine brake Solenoid valve' • 138: Engine Brake
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 007: Exhaust brake solenoid valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

Inspection procedure	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Exhaust brake valve. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Exhaust brake valve for open or short circuit. Check the circuit across Signal detect and actuation module and Exhaust brake valve for open or short circuit. Check the circuit across Ground and Exhaust brake valve for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Exhaust brake valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Ground and Connection of chassis harness and engine harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Exhaust brake valve and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3
	Step9	Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and engine harness. Repair or replace the harness across Ground and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

1074-5: Component 'Engine brake Solenoid valve' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is NOT active.
		[Fault Detection] • Open-circuit of the exhaust brake valve harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Broken or disconnected wiring or defective Exhaust Flap Actuator
Failure repair		• Check of wiring, replace Exhaust Flap Actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 111: Position of component 'Engine brake Solenoid valve' • 138: Engine Brake
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 007: Exhaust brake solenoid valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Exhaust brake valve. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Exhaust brake valve for open or short circuit. Check the circuit across Signal detect and actuation module and Exhaust brake valve for open or short circuit. Check the circuit across Ground and Exhaust brake valve for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Exhaust brake valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed

Inspection procedure	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Ground and Connection of chassis harness and engine harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Exhaust brake valve and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and engine harness. Repair or replace the harness across Ground and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1074-12: The function of component 'Engine brake Solenoid valve' is not OK.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is active.
	[Fault Detection] • Overcurrent in the exhaust brake valve is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 25% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• Power stage is deactivated.
	• None
Failure cause	• High battery voltage, high temperature inside ECU, high load or wiring problem
Failure repair	• Check load and output, check wiring, replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 111: Position of component 'Engine brake Solenoid valve' • 138: Engine Brake
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 007: Exhaust brake solenoid valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Exhaust brake valve. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Exhaust brake valve for open or short circuit. Check the circuit across Signal detect and actuation module and Exhaust brake valve for open or short circuit. Check the circuit across Ground and Exhaust brake valve for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Exhaust brake valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Ground and Connection of chassis harness and engine harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Exhaust brake valve and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

Inspection procedure	Step9	Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and engine harness. Repair or replace the harness across Ground and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1076-3: Component 'Pressure limiting valve in rail' has a short circuit to positive./Internal fault

Generation condition		[Test Condition] • Monitoring only when the power stage is active • Battery voltage > 9.5 V (switch off < 9 V)
		[Fault Detection] • Short-circuit to positive of the commonrail pressure control valve harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 280.00ms • Failure is detected if active for 25% of the time
Fault healing		• No healing possible (disabled by Data set)
System reaction		• Power stage is deactivated.
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP}
Failure cause		• Short circuit of wiring to battery or inside Pressure Control Valve at Low Side
Failure repair		• Check of wiring, replace Pressure Control Valve
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 076: Specified value of component 'Pressure regulating valve in rail' • 077: Specified value of component 'FMU (Fuel Metering device)' • 078: PWM signal of component 'FMU (Fuel Metering device)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Pressure regulation valve. Check the circuit across Pressure regulation valve and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Pressure regulation valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Pressure regulation valve which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed

Inspection procedure	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

1076-4: Component 'Pressure limiting valve in rail' has a short circuit to ground./Internal fault

Generation condition		[Test Condition] • Battery voltage > 9.5 V (switch off < 9 V)
		[Fault Detection] • Short-circuit to ground of the commonrail pressure control valve harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 220.00ms • Failure is detected if active for 25% of the time
Fault healing		• No healing possible (disabled by Data set)
System reaction		• Power stage is deactivated.
		• Engine stop
Failure cause		• Short circuit of wiring to ground or inside Pressure Control Valve at Low Side
Failure repair		• Check of wiring, replace Pressure Control Valve
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 076: Specified value of component 'Pressure regulating valve in rail' • 077: Specified value of component 'FMU (Fuel Metering device)' • 078: PWM signal of component 'FMU (Fuel Metering device)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Pressure regulation valve. Check the circuit across Pressure regulation valve and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Pressure regulation valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Pressure regulation valve which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed

Inspection procedure	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

1076-5: Component 'Pressure limiting valve in rail' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Monitoring only when the power stage is NOT active. • Battery voltage > 9.5 V (switch off < 9 V)
		[Fault Detection] • Open-circuit of the commonrail pressure control valve harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 280.00ms • Failure is detected if active for 50% of the time
Fault healing		• No healing possible (disabled by Data set)
System reaction		• Power stage is deactivated.
		• Engine stop
Failure cause		• Broken or disconnected wiring or defective pressure control valve
Failure repair		• Check of wiring or replace relay or pressure control valve
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 076: Specified value of component 'Pressure regulating valve in rail' • 077: Specified value of component 'FMU (Fuel Metering device)' • 078: PWM signal of component 'FMU (Fuel Metering device)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Pressure regulation valve. Check the circuit across Pressure regulation valve and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Pressure regulation valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Pressure regulation valve which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed

Inspection procedure	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

1076-12: Component 'Pressure limiting valve in rail' has overtemperature.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Monitoring only when the power stage is active. • Battery voltage > 9.5 V (switch off < 9 V)
		[Fault Detection] • Overcurrent in the commonrail pressure control valve is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 280.00ms • Failure is detected if active for 50% of the time
Fault healing		• No healing possible (disabled by Data set)
System reaction		• Power stage is deactivated.
		• Engine stop
Failure cause		• Short circuit of wiring or internal failure of pressure control valve
Failure repair		• Check of wiring and pressure control valve.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 076: Specified value of component 'Pressure regulating valve in rail' • 077: Specified value of component 'FMU (Fuel Metering device)' • 078: PWM signal of component 'FMU (Fuel Metering device)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Pressure regulation valve. Check the circuit across Pressure regulation valve and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Pressure regulation valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Pressure regulation valve which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed

Inspection procedure	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1076-16: Measurement value (Correction values) of the component 'Pressure limiting valve in rail' is above the specified value.

Generation condition		[Test Condition] • Adaptation was active, i.e.: • engine running • Fuel temperature between 4.96°C {40.93°F} and 69.96°C {158°F}. • Fuel pressure between 50MPa {7250psi, 510kgf/cm^2} and 150MPa {21750psi, 1530kgf/cm^2} • The ratio desired / measured fuel pressure < 0.02- • The ratio desired / measured current to pressure control valve < 0.02- • all the above conditions must be fulfilled for 5.00- “tasks” to guarantee stable situation. • if all conditions fulfilled the desired and measured fuel pressures are averaged over 5.00- “tasks” • the adaptation factor is calculated comparing the averaged desired and measured pressure, which is stored in the EEPROM and used for the current calculation for pressure control valve.
		[Fault Detection] • Corrected value of the fuel pressure is above 1.3.
		[Defect Debouncing] • Immediate
Fault healing		• Corrected value of the fuel pressure is below 1.3.
System reaction		• None
		• None
Failure cause		• The actual pressure is higher for a certain current than according specification. This can be caused by an additional current through the pressure control valve (partial short circuit in wiring) which is not measured in ECU. • Fuel pressure control valve not OK.
Failure repair		• Check wiring and pressure control valve. • Replace pressure control valve and reset EEPROM learning datas resp. execute first learning with tester.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 076: Specified value of component 'Pressure regulating valve in rail' • 077: Specified value of component 'FMU (Fuel Metering device)' • 078: PWM signal of component 'FMU (Fuel Metering device)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Pressure regulation valve. Check the circuit across Pressure regulation valve and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

Inspection procedure	Step3	Turn the starter switch in OFF. Replace component “Pressure regulation valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Pressure regulation valve which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1076-18: Measurement value (Correction values) of the component 'Pressure limiting valve in rail' is below the specified value.

Generation condition	[Test Condition] • Adaptation was active, i.e.: • engine running • Fuel temperature between 4.96°C {40.93°F} and 69.96°C {158°F}. • Fuel pressure between 50MPa {7250psi, 510kgf/cm^2} and 150MPa {21750psi, 1530kgf/cm^2} • The ratio desired / measured fuel pressure < 0.02- • The ratio desired / measured current to pressure control valve < 0.02- • all the above conditions must be fulfilled for 5.00- “tasks” to guarantee stable situation. • if all conditions fulfilled the desired and measured fuel pressures are averaged over 5.00- “tasks” • the adaptation factor is calculated comparing the averaged desired and measured pressure, which is stored in the EEPROM and used for the current calculation for pressure control valve.
	[Fault Detection] • Corrected value of the fuel pressure is below 0.7.
	[Defect Debouncing] • Immediate
Fault healing	• Corrected value of the fuel pressure is above 0.7.
System reaction	• None
	• None
Failure cause	• The actual pressure is lower for a certain current than according specification. This can be caused by a “current loss” by the wiring (partial short circuit in wiring) which does not go through the pressure control valve. • Fuel pressure control valve not OK.
Failure repair	• Check wiring and pressure control valve. • Replace pressure control valve and reset EEPROM learning datas resp. execute first learning with tester.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 076: Specified value of component 'Pressure regulating valve in rail' • 077: Specified value of component 'FMU (Fuel Metering device)' • 078: PWM signal of component 'FMU (Fuel Metering device)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Pressure regulation valve. Check the circuit across Pressure regulation valve and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Pressure regulation valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Pressure regulation valve which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1127-15: The boost pressure is too low.

Generation condition	[Test Condition] • Continuous monitoring if each of following conditions are fulfilled: • The engine is in the working range 3 or 4 of the closed-loop boost-pressure control, i.e. engine speed > 1250 rpm and engine load > 26 mg/hub • The system is not in cold start condition, i.e. the engine is running longer than starting temperature dependant time if engine speed is between 0 rpm and 800 rpm (no cold start condition recognised at engine speed > 800 rpm) • The Clutch is not activated longer than 3 s at engine load > 6 mg/hub • The engine brake is not activated • The closed loop control is not switched off due to detected permanent control deviation, limited VGT actuator functionality or turbocharger hysteresis • The closed loop control is not switched off by another failure
	[Fault Detection] • Measured boost pressure is lower than the target pressure, and the difference between them exceeds the allowable limit which is obtained from the engine speed and engine load.
	[Defect Debouncing] • Defect condition fulfilled continuously >5000.0 ms
Fault healing	• No healing possible (disabled by Data set)

		• Engine power is limited depending on the engine speed and load.
System reaction		• Slightly different drivability / noise • Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Mechanically blocked boost pressure actuator • Electrical defect in actuator • In case of VTG control by pressure or vacuum: No sub pressure at VTG actuator • Foreign matter in the intake duct (deposits etc.). • Leakage in air system (e.g. tube compressor - Intercooler or intercooler - manifold) • Boost pressure sensor measures wrong values • EGR tube or EGR cooler clogged partially (reason: exhaust flap closes to reach desired air flow) • EGR valve does not open fully (reason: exhaust flap closes to reach desired air flow)
Failure repair		• Check mechanical and electrical functionality of the actuator for VTG • If present: Check system of sub pressure • Ensure that the EGR actuators are functioning correctly • Check intake duct to deposits and/or leakages • Check Boost pressure sensor • Check EGR system (tube clogged, correct EGr valve function)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 002: Temperature at component 'Boost pressure / Temperature sensor' • 017: Boost pressure • 028: Boost pressure (Differential pressure) • 033: Signal voltage from pressure sensor of component 'Boost pressure / Temperature sensor' • 036: Signal voltage of component 'Boost pressure / Temperature sensor' (Temperature sensors) • 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value) • 121: PWM signal of component 'Actuator in turbocharger'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 004: Boost pressure control 1 • 005: Boost pressure control 2 • 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #346 Inspection of boost pressure and temperature sensor • #530 Inspection of EGR actuator
Inspection procedure	Step1	If the diagnosis codes for injector, exhaust gas recirculation actuator, or exhaust brake valve occur, inspect a fault for the code first.
	Step2	When 1127-15 is still indicated after the inspection of step 1, make the following checks.
	Step3	Check any leakage in the intake system. Check any leakage in the exhaust gas recirculation actuator. Remove exhaust gas recirculation actuator and visually inspect it. • Visually inspect the relevant harnesses and connectors for damage, bent or dislocated pins, corroded terminals, or broken wires. • Verify that the connectors are fully installed. Perform the following actuator test to check it for normal operation. No.006 “Control of exhaust gas recirculation”
	Step4	When any fault is not found in the step 3, check the turbocharger for any fault. • Mechanically blocked VTG actuator. • Check mechanical functionality of the VTG actuator. Visually inspect the relevant harnesses and connectors for damage, bent or dislocated pins, corroded terminals, or broken wires. Verify that the connectors are fully installed. • VGT actuator sticks.
	Step5	When any fault is not found in the step 4, check injectors. Replace faulty injectors as required. (See “6. Inspections to be Made at Injector Error Occurrence)

1127-17: Measurement value (Deviation from measurement value) of the component 'Boost pressure' is above the specified value.

Generation condition		[Test Condition] • Continuous monitoring if each of following conditions are fulfilled: • The engine is in the working range 3 or 4 of the closed-loop boost-pressure control, i.e. engine speed > 1250 rpm and engine load > 26 mg/hub • The system is not in cold start condition, i.e. the engine is running longer than starting temperature dependant time if engine speed is between 0 rpm and 800 rpm (no cold start condition recognized at engine speed > 800 rpm) • The Clutch is not activated longer than 3 s at engine load > 6 mg/hub • The engine brake is not activated • The closed loop control is not switched off due to detected permanent control deviation, limited VGT actuator functionality or turbocharger hysteresis • The closed loop control is not switched off by another failure
		[Fault Detection] • Measured boost pressure is higher than the target pressure, and the difference between them exceeds the allowable limit which is obtained from the engine speed and engine load.
		[Defect Debouncing] • Defect condition fulfilled continuously >5000.0 ms
Fault healing		• No healing possible (disabled by Data set)
System reaction		• Engine power is limited depending on the engine speed and load.
		• Slightly different drivability / noise • Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Mechanically blocked boost pressure actuator • Electrical defect in actuator • Boost pressure sensor measures too high values
Failure repair		• Check mechanical and electrical functionality of the actuator • If there is not failure detected in VGT, check Boost pressure sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 002: Temperature at component 'Boost pressure / Temperature sensor' • 017: Boost pressure • 028: Boost pressure (Differential pressure) • 033: Signal voltage from pressure sensor of component 'Boost pressure / Temperature sensor' • 036: Signal voltage of component 'Boost pressure / Temperature sensor' (Temperature sensors) • 121: PWM signal of component 'Actuator in turbocharger'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 004: Boost pressure control 1 • 005: Boost pressure control 2
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #346 Inspection of boost pressure and temperature sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component 'VGT vacuum modulator' is faulty. Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Boost pressure and temperature sensor. Check the circuit across Boost pressure and temperature sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step9
	Step5	Turn the starter switch in OFF. Replace component “Boost pressure and temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Boost pressure and temperature sensor which Engine electronic control unit learns. Perform learning of Boost pressure and temperature sensor which Engine electronic control unit learns. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step8
	Step8	Inspection completed
	Step9	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step5

1127-31: The boost pressure is implausible. (Low rpm range)

Generation condition	[Test Condition] • Monitor is started if: • Desired boost pressure gradient > 30 kPa {4.4 psi, 0.3 kgf/cm^2}/s and stable. (Turn on Delay with delay time 0.1s) • Engine speed > altitude dependent minimal engine speed • Filtered injection quantity > 15mg/hub • No PCR fault already detected • Monitor not inhibited by another fault • Monitor is reset if during evaluation window: • PCR error is detected • Engine speed change > 500rpm • Desired boost pressure change > 80 kPa {12 psi, 0.8 kgf/cm^2} • Slow response error is detected
	[Fault Detection] • Once the monitor is released (timer starts) the values of Engine speed and Desired boost pressure are frozen. • The absolute difference between actual Engine speed and frozen value of Engine speed and the absolute difference between desired boost pressure and frozen value of desired boost pressure are given as inputs to a map. • If the elapsed time of monitor timer > threshold fault is detected.
	[Defect Debouncing] • Defect condition fulfilled continuously >1 events
Fault healing	• No healing possible
System reaction	• None
	• Slightly different drivability / noise
Failure cause	• Leakage at air intake side, turbo charger wear (low efficiency).

Failure repair		• Check intake system for leakage Check turbo charger for correct working.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 017: Boost pressure • 028: Boost pressure (Differential pressure)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 004: Boost pressure control 1 • 005: Boost pressure control 2
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #346 Inspection of boost pressure and temperature sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

1136-2: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Faulty ECU internal temperature sensor. (Error message sent from the sensor is detected.)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 50.00 events • Failure is detected if active for 50% of events
Fault healing		• When correct message sent from sensor is detected.
System reaction		• The last valid ECU internal temperature sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by 40.96°C {106°F}.
		• None
Failure cause		• Temperature sensor defective (inside ECM)
Failure repair		• Replace ECM
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

1136-16: The internal temperature sensor of the control unit has a malfunction.

Generation condition		[Test Condition] • Range check is not inhibited by another failure.
		[Fault Detection] • Faulty ECU internal temperature sensor. (Sensor signal above 129.96°C {266°F} is detected.)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 25% of the time
Fault healing		• Sensor signal is below 129.96°C {266°F}.
System reaction		• The last valid ECU internal temperature sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by 40.96°C {106°F}.
		• None

Failure cause		• Inaccurate or defective temperature sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the temperature sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

1136-18: The internal temperature sensor of the control unit has an electrical fault.

Generation condition		[Test Condition] • Range check is not inhibited by another failure.
		[Fault Detection] • Faulty ECU internal temperature sensor. (Sensor signal below -40.04°C {-40°F} is detected.)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 25% of the time
Fault healing		• Sensor signal is above -40.04°C {-40°F}.
System reaction		• The last valid ECU internal temperature sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by 40.96°C {106°F}.
		• None
Failure cause		• Inaccurate or defective temperature sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the temperature sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

1172-2: Component 'Air mass flow rate / Intake air temperature sensor 1' has a plausibility error.

Generation condition		[Test Condition] • Once in a driving cycle at ECM start if an engine cold start has been detected: • monitoring not inhibited by another failure • engine speed = 0 • Engine OFF time > 5 h
		[Fault Detection] • Difference between the temperature from the sensor and that calculated by the engine ECU based on the signal from other temperature sensor is out of the specified value.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the normal temperature is detected when the starter switch is set from OFF to ON position.
System reaction		• None
		• None
Failure cause		• The temperature sensor is drifted
Failure repair		• Check temperature sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 003: Temperature at component ‘Air mass flow rate / Intake air temperature sensor’ • 034: Signal voltage of component ‘Air mass flow rate / Intake air temperature sensor’ (Temperature sensors) • 053: Air mass flow rate (Actual value) • 054: Air mass flow rate (Specified value) • 055: Air mass flow rate (Cylinder) • 160: Air mass flow rate Learned value 1 • 161: Air mass flow rate Learned value 2

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #306 Inspection of air flow and intake air temperature sensor
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

1175-2: Component 'Charge air temperature downstream of charge air cooler' is faulty.

Generation condition		[Test Condition] • Once in a driving cycle at ECM start if an engine cold start has been detected: • monitoring not inhibited by another failure • engine speed = 0 • Engine OFF time > 5 h
		[Fault Detection] • Difference between the temperature from the sensor and that calculated by the engine ECU based on the signal from other temperature sensor is out of the specified value.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the normal temperature is detected when the starter switch is set from OFF to ON position.
System reaction		• None
		• None
Failure cause		• The temperature sensor is drifted
Failure repair		• Check temperature sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 001: Temperature at component ’Charge air outlet temperature sensor’ • 035: Signal voltage of component ‘Air humidity sensor (Charge air temperature downstream of charge air cooler)’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #299 Inspection of intercooler outlet temperature sensor
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

1213-2: Component 'Instrument cluster' is defective.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
	[Fault Detection] • MIL lamp error due to faulty meter cluster is detected.
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• Substitute value zero (0) is applied to the MIL lamp.
	• None
Failure cause	• Defective Instrument Cluster
Failure repair	• Check Instrument Cluster
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with Meter cluster is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of Meter cluster. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Meter cluster. Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed

Inspection procedure	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

1254-31: Information: Torque limitation (The NOx concentration downstream of the SCR catalytic converter is too high.)

Generation condition		[Test Condition] • Monitoring is active if the ECU is not in afterrun • Continuous monitoring
		[Fault Detection] • The OBD performance limitation is activated, if there is a failure active, which causes high NOx emissions for a certain time. The performance limiter is activated immediately within 5.00 min or 5.00 min (depending on limitation).
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the failure which caused the high NOx disappears, the performance limiter is released within 5 s or 5 s (depending on limitation).
System reaction		• Reduced power due OBD performance limiter 1 or 2 active
		• None
Failure cause		• Active power reduction due to the OBD performance limiter because of too high NOx emissions
Failure repair		• Check which failure activated the performance limitation and perform troubleshooting on the basis of this defect. • Note: The OBD performance limiter can be disabled with service tester at maximum 3.00- times for 60.00min each time, to give the possibility to drive also a fully loaded vehicle to the next repair station.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

1321-3: The starter relay has a short circuit to positive.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Monitoring only when the power stage is active. • ECU not in after-run, Battery voltage > 9.50 V (switch off < 9.00 V) and Test of redundant shut-off paths not active)
		[Fault Detection] • Short-circuit to positive of the starter relay (drive) harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 25% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• None
Failure cause		• Short circuit of wiring to external source or defective starter relay
Failure repair		• Check of wiring or replacement of starter relay
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 173: Starter relay • 174: Starter relay (Control unit: Pin 91) • 175: Starter relay (Control unit: Pin 69)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #187 Inspection of starter relay
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Starter relay (for drive). Check the circuit across Engine electronic control unit and Starter relay (for drive) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Starter relay (for drive)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed

Inspection procedure	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Starter relay (for drive) and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1321-4: The starter relay has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Monitoring only when the power stage is inactive. • ECU not in after-run, Battery voltage > 9.50 V (switch off < 9.00 V) and Test of redundant shut-off paths not active)
		[Fault Detection] • Short-circuit to ground of the starter relay (drive) harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 90.00ms • Failure is detected if active for 25% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• Short circuit of wiring to ground or defective starter relay
Failure repair		• Check of wiring or replacement of starter relay
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 173: Starter relay • 174: Starter relay (Control unit: Pin 91) • 175: Starter relay (Control unit: Pin 69)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #187 Inspection of starter relay
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2

Inspection procedure	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Starter relay (for drive). Check the circuit across Engine electronic control unit and Starter relay (for drive) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Starter relay (for drive)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Starter relay (for drive) and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1321-12: Component 'Starter relay' signals overtemperature.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Monitoring only when the power stage is active. • ECU not in after-run, Battery voltage > 9.50 V (switch off < 9.00 V) and Test of redundant shut-off paths not active)
	[Fault Detection] • Overheat of starter relay is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 25% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position

System reaction		• Power stage is deactivated.
		• None
Failure cause		• High battery voltage, high temperature inside ECU, high load or wiring problem
Failure repair		• Check battery voltage, wiring, power stage and starter relay
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 173: Starter relay • 174: Starter relay (Control unit: Pin 91) • 175: Starter relay (Control unit: Pin 69)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #187 Inspection of starter relay
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Starter relay (for drive). Check the circuit across Engine electronic control unit and Starter relay (for drive) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Starter relay (for drive)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Starter relay (for drive) and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

Inspection procedure	Step9	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1322-12: Combustion misfiring has been detected.

Generation condition		[Test Condition] • Monitoring not inhibited by another failure, Engine speed between 500 rpm and 1100 rpm, Fuel Quantity between 2 mg/hub and 40 mg/hub, Engine temperature > 19.96°C {68°F}, vehicle speed < 3 km/h {1.9 mph}, Engine running, Engine in running since start > 5 s, Wheel slip < 1.00-, Wheel slip constant since 1000 ms and Failure memory erased by Scan tool
		[Fault Detection] • Number of misfiring of a cylinder is above the value specified by the engine ECU.
		[Defect Debouncing] • > 120.00- misfires
Fault healing		• No defect detection
System reaction		• Irregular engine running • If less than 1 cylinder shows misfiring: Failure paths of the defective cylinders also stored.
		• None
Failure cause		• Severe loss of compression or fuel injection failure (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• If Failure Path for Misfiring of single cylinders are also stored: check the dedicated cylinders. • If no Failure path of Misfiring of single cylidner is stored (this means more than 1.00- show misfiring): check all cylinders for correct injection and or compression.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1) • 071: Correction value of fuel quantity (Cylinder 3) • 072: Correction value of fuel quantity (Cylinder 4) • 073: Correction value of fuel quantity (Cylinder 2)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. Remove the connector of Injector No.2 cylinder. Remove the connector of Injector No.3 cylinder. Remove the connector of Injector No.4 cylinder. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.2 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.3 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.4 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

1323-12: Combustion misfiring of cylinder 1 has been detected.

Generation condition	[Test Condition] • Monitoring not inhibited by another failure, Engine speed between 500 rpm and 1100 rpm, Fuel Quantity between 2 mg/hub and 40 mg/hub, Engine temperature > 19.96°C {68°F}, vehicle speed < 3 km/h {1.9 mph}, Engine running, Engine in running since start > 5 s, Wheel slip < 1.00-, Wheel slip constant since 1000 ms and Failure memory erased by Scan tool
	[Fault Detection] • Number of misfiring of No. 1 cylinder is above the value specified by the engine ECU.
	[Defect Debouncing] • 120.00- misfires
Fault healing	• A test frame with no defect detection for cylinder 1 is completed.
System reaction	• Irregular engine running or idle
	• None
Failure cause	• Severe loss of compression or fuel injection failure (See “6. Inspections to be Made at Injector Error Occurrence)

Failure repair		• Check the sealing of the combustion chamber (piston ring, cylinder head.), look for injection failures of cylinder 1
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Turn the starter switch in OFF. Replace component “Injector No.1 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.1 cylinder which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step7
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step5

1324-12: Combustion misfiring of cylinder 3 has been detected.

Generation condition	[Test Condition] • Monitoring not inhibited by another failure, Engine speed between 500 rpm and 1100 rpm, Fuel Quantity between 2 mg/hub and 40 mg/hub, Engine temperature > 19.96°C {68°F}, vehicle speed < 3 km/h {1.9 mph}, Engine running, Engine in running since start > 5 s, Wheel slip < 1.00-, Wheel slip constant since 1000 ms and Failure memory erased by Scan tool
	[Fault Detection] • Number of misfiring of No. 3 cylinder is above the value specified by the engine ECU.
	[Defect Debouncing] • 120.00- misfires
Fault healing	• A test frame with no defect detection for cylinder 3 is completed.

System reaction		• Irregular engine running or idle
		• None
Failure cause		• Severe loss of compression or fuel injection failure (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• Check the sealing of the combustion chamber (piston ring, cylinder head.), look for injection failures of cylinder 3
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Turn the starter switch in OFF. Replace component “Injector No.3 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.3 cylinder which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step7
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step5

1325-12: Combustion misfiring of cylinder 4 has been detected.

Generation condition		[Test Condition] • Monitoring not inhibited by another failure, Engine speed between 500 rpm and 1100 rpm, Fuel Quantity between 2 mg/hub and 40 mg/hub, Engine temperature > 19.96°C {68°F}, vehicle speed < 3 km/h {1.9 mph}, Engine running, Engine in running since start > 5 s, Wheel slip < 1.00-, Wheel slip constant since 1000 ms and Failure memory erased by Scan tool
		[Fault Detection] • Number of misfiring of No. 4 cylinder is above the value specified by the engine ECU.
		[Defect Debouncing] • 120.00- misfires
Fault healing		• A test frame with no defect detection for cylinder 4 is completed.
System reaction		• Irregular engine running or idle
		• None
Failure cause		• Severe loss of compression or fuel injection failure (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• Check the sealing of the combustion chamber (piston ring, cylinder head.), look for injection failures of cylinder 4
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Turn the starter switch in OFF. Replace component “Injector No.4 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.4 cylinder which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed

Inspection procedure	Step6	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step7
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step5

1326-12: Combustion misfiring of cylinder 2 has been detected.

Generation condition		[Test Condition] • Monitoring not inhibited by another failure, Engine speed between 500 rpm and 1100 rpm, Fuel Quantity between 2 mg/hub and 40 mg/hub, Engine temperature > 19.96°C {68°F}, vehicle speed < 3 km/h {1.9 mph}, Engine running, Engine in running since start > 5 s, Wheel slip < 1.00-, Wheel slip constant since 1000 ms and Failure memory erased by Scan tool
		[Fault Detection] • Number of misfiring of No. 2 cylinder is above the value specified by the engine ECU.
		[Defect Debouncing] • 120.00- misfires
Fault healing		• A test frame with no defect detection for cylinder 2 is completed.
System reaction		• Irregular engine running or idle
		• None
Failure cause		• Severe loss of compression or fuel injection failure (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• Check the sealing of the combustion chamber (piston ring, cylinder head.), look for injection failures of cylinder 2
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Turn the starter switch in OFF. Replace component “Injector No.2 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.2 cylinder which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual. Go to Step7
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step5

1442-3: Component 'Pressure regulating valve in rail' has a short circuit to positive.

Generation condition		[Test Condition] • Monitoring is active 2 s after ECU initialization while engine isn't running yet and while the engine isn't cranking • Monitoring only when the power stage is active • Battery voltage > 9.5 V (switch off < 9 V)
		[Fault Detection] • Short-circuit to positive of the commonrail pressure control valve harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 220.00ms • Failure is detected if active for 25% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• None
Failure cause		• Short circuit of wiring to battery or inside Metering Unit at Low Side
Failure repair		• Check of wiring, replace Metering Unit
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #572 Inspection of FMU (fuel metering unit)
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Fuel metering unit. Check the circuit across Fuel metering unit and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component "Fuel metering unit". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

1442-4: Component 'Pressure regulating valve in rail' has a short circuit to ground.

Generation condition		[Test Condition] • Battery voltage > 9.5 V (switch off < 9 V)
		[Fault Detection] • Short-circuit to ground of the commonrail pressure control valve harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 280.00ms • Failure is detected if active for 25% of the time
Fault healing		• No healing possible (disabled by Data set)
System reaction		• None
		• None
Failure cause		• Short circuit of wiring to ground or inside Metering Unit at Low Side
Failure repair		• Check of wiring, replace Metering Unit
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #572 Inspection of FMU (fuel metering unit)
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Fuel metering unit. Check the circuit across Fuel metering unit and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Fuel metering unit”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

1442-5: Component 'Pressure regulating valve in rail' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Monitoring only when the power stage is NOT active. • Battery voltage > 9.5 V (switch off < 9 V)
		[Fault Detection] • Open-circuit of the commonrail pressure control valve harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 220.00ms • Failure is detected if active for 25% of the time
Fault healing		• Failure is healed if the power stage does not report an OL error.
System reaction		• Power stage is deactivated (which may result in a fuel pressure exceeding the limit due to supply of fuel into the common rail at the maximum rate).
		• None
Failure cause		• Broken or disconnected wiring, defective metering unit
Failure repair		• Check of wiring or metering unit
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #572 Inspection of FMU (fuel metering unit)
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Fuel metering unit. Check the circuit across Fuel metering unit and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Fuel metering unit”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

1442-12: The function of component 'Pressure regulating valve in rail' is not OK.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Monitoring only when the power stage is active. • Battery voltage > 9.5 V (switch off < 9 V)
		[Fault Detection] • Overcurrent in the commonrail pressure control valve is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 220.00ms • Failure is detected if active for 25% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated (which may result in a fuel pressure exceeding the limit due to supply of fuel into the common rail at the maximum rate).
		• None
Failure cause		• High battery voltage, high temperature inside ECU, high load or wiring problem
Failure repair		• Check of wiring or metering unit
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #572 Inspection of FMU (fuel metering unit)
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Fuel metering unit. Check the circuit across Fuel metering unit and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Fuel metering unit”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1485-7: The function of component 'Relay 'Supply voltage of control module'' is not OK.

Generation condition		[Test Condition] • Once per driving cycle after the After-run.
		[Fault Detection] • Main relay is not turned off even ECU commands to turn it off.
		[Defect Debouncing] • Immediate
Fault healing		• Proper opening of main relay in the coming driving cycles (without any abnormal delay after the request from System Control module).
System reaction		• None
		• None
Failure cause		• Main relay has a short circuit or is mechanically stuck in closed position
Failure repair		• Check wiring or replace main relay
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 169: Status of component 'Relay 'Supply voltage of control module''
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Perform the operation start and replace Signal detect and actuation module. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1485-31: The function of component 'Relay 'Supply voltage of control module" is not OK.

Generation condition	[Test Condition] • Once at ECU initialisation.
	[Fault Detection] • Main relay turns off before ECU commands to turn it off.
	[Defect Debouncing] • After 3.0 consecutive starts
Fault healing	• If the signal returns to normal when the starter switch is set from OFF to ON position
System reaction	• Internal memory does not store any new fault. FUSO Diagnostic tester does not show any new fault as well.
	• None
Failure cause	• The Main Relay is switched off directly by Key 15 instead of the request of ECU: • in case vehicle equipped with “main electrical switch”: engine stopped by “main switch” instead of Key 15 OR Main switch disconnected before after-run finished. • due to wrong wiring to the Main Relay (direct contact to the battery missing or wiring ECU to Main relay) • due to internal defect of ECU
Failure repair	• In case of vehicle equipped with “main electrical switch”: inform driver of correct engine shut off by Key 15. • In case of vehicle equipped with electronic “main electrical switch”: check electronic of main switch for correct working (if opens after afterrun finished) • Check wiring harness between main Relay and battery • Check wiring harness between ECU and Main Relay • Check ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 169: Status of component 'Relay 'Supply voltage of control module"
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Perform the operation start and replace Signal detect and actuation module. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1623-19: The CAN message from component 'Instrument panel' is faulty.

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
	[Fault Detection] • CAN communication (vehicle speed information) from DUONIC ECU is faulty.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• No validity check of the accelerator and brake pedals is executed due to an error in vehicle speed evaluation.
	• Engine speed limited to about 2000 rpm • Engine speed limited to 2060 rpm • Cruise control not available
Failure cause	• Sensor connected via CAN announces not valid signal
Failure repair	• Check sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Perform a diagnosis on the DUONIC electronic control unit side system.

1624-19: The CAN message from component 'Vehicle speed Sensors' is faulty.

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
		[Fault Detection] • CAN communication (vehicle speed information) from DUONIC ECU is faulty.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Zero (0) is used as a substitute value for the vehicle speed.
		• Engine speed limited to about 2000 rpm • Engine speed limited to 2060 rpm • PTO not available • Cruise control not available
Failure cause		• Defective or incorrect functioning of vehicle speed measuring device
Failure repair		• Check speed measuring device for proper functioning
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Perform a diagnosis on the DUONIC electronic control unit side system.

1624-31: The CAN message from component 'Vehicle speed Sensors' is faulty.

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Signal source is CAN
		[Fault Detection] • CAN communication (wheel speed sensor information) from the hydraulic unit (ECU) is faulty.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• Valid wheel speed signal received

System reaction		• No validity check of the accelerator and brake pedals is executed due to an error in vehicle speed evaluation.
		• Engine speed limited to about 2000 rpm • Engine speed limited to 2060 rpm • PTO not available • Cruise control not available
Failure cause		• Wheel speed sensor defective
Failure repair		• Check wheel speed sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Perform a diagnosis on the Hydraulic unit (electronic control unit) side system.

1633-9: CAN timeout fault. Error on transmission of CAN message

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Timeout of CCVSTM message is detected.
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• If the CCVSTM message is received correct, after the debouncing time the DFC is healed.
System reaction	• Cruise control is inhibited.
	• None
Failure cause	• Defective CAN controller of AMT, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair	• Check presence and correct connection of the AMT to the network, Check correct functioning of the CAN controller. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 167: Status of button 'CRUISE CONTROL'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #089 Inspection of switch

Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with DUONIC electronic control unit is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of DUONIC electronic control unit. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the DUONIC electronic control unit. Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed

Inspection procedure	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

1636-0: The signal voltage of component 'Air mass flow rate / Intake air temperature sensor' is too high.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
		[Fault Detection] • Voltage from the air flow and intake air temperature sensor (intake air temperature sensor section) is above 4.93 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• The sensor signal is equal to or below 4.93 V.
System reaction		• 29.96°C {86°F} is used as a substitute value for the intake air temperature.
		• None
Failure cause		• Short circuit of sensor to external source or defective sensor
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 034: Signal voltage of component 'Air mass flow rate / Intake air temperature sensor' (Temperature sensors)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #306 Inspection of air flow and intake air temperature sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Airflow and intake air temperature sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Airflow and intake air temperature sensor for open or short circuit. Check the circuit across Signal detect and actuation module and Airflow and intake air temperature sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

Inspection procedure	Step3	Turn the starter switch in OFF. Replace component “Airflow and intake air temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Airflow and intake air temperature sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Airflow and intake air temperature sensor and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1636-1: The signal voltage of component 'Air mass flow rate / Intake air temperature sensor' is too low.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
	[Fault Detection] • Voltage from the air flow and intake air temperature sensor (intake air temperature sensor section) is below 295.4 mV.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• The sensor signal is equal to or above 295.4 mV.
System reaction	• 29.96°C {86°F} is used as a substitute value for the intake air temperature.
	• None
Failure cause	• Short circuit of sensor to ground or defective sensor
Failure repair	• Check wiring or replace sensor

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 034: Signal voltage of component 'Air mass flow rate / Intake air temperature sensor' (Temperature sensors)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #306 Inspection of air flow and intake air temperature sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Airflow and intake air temperature sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Airflow and intake air temperature sensor for open or short circuit. Check the circuit across Signal detect and actuation module and Airflow and intake air temperature sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Airflow and intake air temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Airflow and intake air temperature sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Airflow and intake air temperature sensor and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

Inspection procedure	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

1636-16: Component 'Charge air temperature sensor' is thermally overloaded.

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • The sensed sensor signal is above 99.96°C {212°F}
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing		• The sensor signal is below 99.96°C {212°F}.
System reaction		• 29.96°C {86°F} is used as a substitute value for the intake air temperature.
		• None
Failure cause		• Inaccurate or defective air temperature sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the air temperature sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 001: Temperature at component 'Charge air outlet temperature sensor' • 035: Signal voltage of component 'Air humidity sensor (Charge air temperature downstream of charge air cooler)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Airflow and intake air temperature sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Airflow and intake air temperature sensor for open or short circuit. Check the circuit across Signal detect and actuation module and Airflow and intake air temperature sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “Airflow and intake air temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Airflow and intake air temperature sensor which Engine electronic control unit learns. Go to Step5

Inspection procedure	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across Airflow and intake air temperature sensor and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

1675-2: The electrical line to component 'Battery voltage (Ignition lock ON Voltages)' or component 'Battery voltage (Ignition lock ON Voltages)' is defective.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • Input of starter drive signal continues for 30 seconds.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 30.00s • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• None
	• None
Failure cause	• Too long cranking request, short circuit in ignition key module or in wiring
Failure repair	• Check ignition key module and wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 172: Status of component 'Ignition Main circuit' • 173: Starter relay • 174: Starter relay (Control unit: Pin 91) • 175: Starter relay (Control unit: Pin 69)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #187 Inspection of starter relay

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Starter relay (for drive). Check the circuit across Engine electronic control unit and Starter relay (for drive) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Starter relay (for drive)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Starter relay (for drive) and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

2623-3: The signal voltage of component 'Position sensor 'Accelerator pedal'' is too high.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Continuously.
	[Fault Detection] • Signal from the accelerator pedal position sensor (sensor 2) is above 3.7 V.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 50% of the time

Fault healing		• Signal from the accelerator pedal position sensor (sensor 2) is below 3.7 V.
System reaction		• Normal control is continued.
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• Short circuit of wiring to external source or inside accelerator pedal
Failure repair		• Check wiring and accelerator pedal
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 037: Signal voltage of component 'Position sensor 'Accelerator pedal'1' • 038: Signal voltage of component 'Position sensor 'Accelerator pedal'2' • 153: Accelerator pedal sensor 1 (raw value) • 154: Accelerator pedal sensor 1 • 164: Position of accelerator pedal (Kickdown recognition)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #324 Inspection of accelerator pedal position sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Accelerator pedal position sensor. Check the circuit across Engine electronic control unit and Accelerator pedal position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “Accelerator pedal position sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10

Inspection procedure	Step9	Repair or replace the harness across Accelerator pedal position sensor and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2623-4: The signal voltage of component 'Position sensor 'Accelerator pedal'' is too low.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Continuously.
		[Fault Detection] • Signal from the accelerator pedal position sensor (sensor 2) is below 270 mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 50% of the time
Fault healing		• Signal from the accelerator pedal position sensor (sensor 2) is above 270 mV.
System reaction		• Normal control is continued.
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• Short circuit to ground in wiring or in accelerator pedal
Failure repair		• Check wiring or replace accelerator pedal
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 037: Signal voltage of component 'Position sensor 'Accelerator pedal'1' • 038: Signal voltage of component 'Position sensor 'Accelerator pedal'2' • 153: Accelerator pedal sensor 1 (raw value) • 154: Accelerator pedal sensor 1 • 164: Position of accelerator pedal (Kickdown recognition)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #324 Inspection of accelerator pedal position sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Accelerator pedal position sensor. Check the circuit across Engine electronic control unit and Accelerator pedal position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “Accelerator pedal position sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across Accelerator pedal position sensor and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2630-2: The efficiency of the charge air cooler is not sufficient.

Generation condition	[Test Condition] • Monitoring of the charge-air cooler is only carried out if; vehicle speed > 40 km/h {24.86 mph}; air mass flow is within the thresholds and 75 Kg/h; engine temperature > 47.96°C {118.33°F}; pressure ratio at the compressor > 1.25-; Exhaust flap is within the thresholds 110% and 90%; control value of the cooler bypass valve is within the thresholds 399.99% and 0%; release time of monitoring < 3.67 min)
	[Fault Detection] • The calculated cooler efficiency is below the threshold value based on fix value 0.50- plus a temperature dependent correction from curve 0.00- at 18.96°C {66.13°F}
	[Defect Debouncing] • Monitoring release time > 3.67min

Fault healing		• Cooler efficiency calculated by the engine ECU is above the specified value.
System reaction		• None
		• None
Failure cause		• Charge air-cooler defective
Failure repair		• Check charge-air cooler
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 001: Temperature at component 'Charge air outlet temperature sensor' • 035: Signal voltage of component ‘Air humidity sensor (Charge air temperature downstream of charge air cooler)’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #299 Inspection of intercooler outlet temperature sensor
Inspection procedure	Step1	Inspection Intercooler outlet temperature sensor See the “#299 Inspection Intercooler outlet temperature sensor” of section “INSPECTION OF ELECTRICAL EQUIPMENT”.

2791-0: The signal voltage of component 'Position sensor 'Exhaust gas recirculation controller'' is too high.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring not inhibited by another failure. • Continuously.
		[Fault Detection] • Voltage from the EGR position sensor (built in EGR actuator) is above 4.8 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• Voltage from the EGR position sensor is equal to or below 4.8 V.
System reaction		• The last valid EGR position sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by a default value.
		• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• Short circuit of wiring to external source or defective EGR valve position sensor
Failure repair		• Check of wiring or replace EGR valve position sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2

Inspection procedure	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2791-1: The signal voltage of component 'Position sensor 'Exhaust gas recirculation controller'' is too low.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring not inhibited by another failure. • Continuously.
	• Voltage from the EGR position sensor (built in EGR actuator) is below 200 mV.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• Voltage from the EGR position sensor is equal to or above 200 mV.
System reaction	• The last valid EGR position sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by a default value.
	• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm

Failure cause		• Short circuit of wiring to ground or defective EGR valve position sensor
Failure repair		• Check of wiring or replace EGR valve position sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2791-3: Component 'Exhaust gas recirculation valve' has a short circuit to positive.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Open Load diagnosis not active
		[Fault Detection] • Short-circuit to positive of the EGR actuator harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 300.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• Short circuit of wiring to external source
Failure repair		• Check of wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5

Inspection procedure	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present No: Go to Step7 Yes: Go to Step4

2791-4: Component 'Exhaust gas recirculation valve' has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Open Load diagnosis not active
		[Fault Detection] • Short-circuit to ground of the EGR actuator harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 300.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• Short circuit of wiring to ground
Failure repair		• Check of wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2791-5: Component 'Exhaust gas recirculation valve' has an open circuit.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring is carried out only once a driving cycle, in following conditions: • During After-run • During normal operation: only if Jammed valve error active. • Testing is carried out for 610 ms (system start or during engine running) or 1000 ms (in after-run). During Testing the power stage is switched off
	[Fault Detection] • Open-circuit of the EGR actuator harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• Power stage is deactivated.
	• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause	• Electrical problem of the EGR valve actuator: broken wiring harness, no contact of connector, internal broken line in actuator
Failure repair	• Check wiring harness on open circuit • Check EGR valve actuator on open circuit

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2791-7: Component 'Exhaust gas recirculation valve' has a mechanical fault.

Generation condition	[Test Condition] • After a governor deviation is detected
	[Fault Detection] • EGR actuator seized in closed state.
	[Defect Debouncing] • 300.00ms after last release trial

Fault healing		• None
System reaction		• EGR actuator is deactivated.
		• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• EGR valve can not be opened as desired within expected time • EGR valve blocked mechanically • EGR valve sticks • EGR valve position sensor mismatched
Failure repair		• Check Functionality of EGR valve and the corresponding position
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator

Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed

Inspection procedure	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2791-12: Component 'Exhaust gas recirculation valve' has overtemperature.

Generation condition		[Test Condition] • Monitoring only when the power stage is active. • If open load monitoring not active. • If the plausible test for short circuit overload not active.
		[Fault Detection] • Overcurrent in the EGR actuator is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• High battery voltage, high temperature inside ECU, high load or wiring problem
Failure repair		• No reaction needed if failure isn't present again after short time, check load and output, check wiring, replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control "Control of exhaust gas recirculation". Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8

Inspection procedure	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2791-16: The signal voltage of component 'Position sensor 'Exhaust gas recirculation controller" is too high.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Every time the actuator is at fully open or fully closed position.
	[Fault Detection] • Output voltage of the EGR position sensor (built in EGR actuator) is above the specified value.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• Position is in the specified range
System reaction	• None
	• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause	• EGR valve position sensor gives higher values than maximum due to electrical problems (“short circuit”) or position sensor mismatch
Failure repair	• Check wiring harness • Check EGR valve position sensor electrically • Check correct position in closed (0%) and fully opened (100%) position
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 107: Position of exhaust gas recirculation controller (raw value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #530 Inspection of EGR actuator

Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2791-18: The signal voltage of component 'Position sensor 'Exhaust gas recirculation controller'' is too low.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Every time the actuator is at fully open or fully closed position.
	[Fault Detection] • Output voltage of the EGR position sensor (built in EGR actuator) is below the specified value.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• Position is in the specified range

System reaction		• None
		• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• EGR valve position sensor gives lower values than minimum due to electrical problems (“short circuit”) or position sensor mismatch
Failure repair		• Check wiring harness • Check EGR valve position sensor electrically • Check correct position in closed (0%) and fully opened (100%) position
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed

Inspection procedure	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2791-31: The power consumption of component 'Exhaust gas recirculation valve' is too high.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Operating current of EGR actuator is above 1.76 A for 20 seconds continuously.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00s • Failure is detected if active for 50% of the time
Fault healing		• If actuator current is below its limit value of 1.76 A for longer than debounce time.
System reaction		• None
		• Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• EGR Valve actuation current is higher than allowed to reach the desired position: possibly electrical problem inside EGR Valve actuator or wiring harness (“short” circuit) or mechanical sticking of valve
Failure repair		• Check EGR valve electric circuit • Check mechanical EGR valve functionality
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8

Inspection procedure	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

2797-2: The control unit 'DC/DC converter' has a malfunction. (Injector bank 1)

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • Engine ECU power supply for injector system is faulty.
		[Defect Debouncing] • Immediate
Fault healing		• None
System reaction		• Nos.1 and 4 cylinders are deactivated.
		• Reduced power available due injector shut off
Failure cause		• Buffer capacitor cannot be charged, problem can be located in the capacitor or the power stage itself.
Failure repair		• Check presence of other failures connected to injector supply (short circuit), check capacitor, replace ECM if power stage is responsible.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

2797-3: The injector bank 1 has a short circuit.

Generation condition		[Test Condition] • When system is switched on, after the buffer capacitor is loaded.
		[Fault Detection] • Short-circuit of the power supply harness for No. 1 and 4 cylinders is detected 4 times or more.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 50% of events
Fault healing		• None
System reaction		• None
		• Engine stop
Failure cause		• Short circuit in wiring or injector connected to No. 1 and 4 cylinders. (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• Check the wiring and injectors connected to No. 1 and 4 cylinders.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. Remove the connector of Injector No.4 cylinder. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.4 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. (FUSO Diagnostics actuation test 003 Injector) Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed

Inspection procedure	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

2797-6: The injector bank 1 has a short circuit.

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • Short-circuit of the power supply harness for No. 1 and 4 cylinders is detected 4 times or more.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing		• None
System reaction		• None
		• Reduced power available due injector shut off
Failure cause		• Short circuit in wiring or injector connected to No. 1 and 4 cylinders. (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• Check the wiring and injectors connected to No. 1 and 4 cylinders.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. Remove the connector of Injector No.4 cylinder. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.4 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6
	Step2	Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. (FUSO Diagnostics actuation test 003 Injector) Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5

Inspection procedure	Step4	Inspection completed
	Step5	Replace Engine electronic control unit. Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

2797-12: The control unit 'DC/DC converter' has a malfunction. (Injector bank 1)

Generation condition		[Test Condition] • Each time that an attempt is made to switch off a DC/DC converter.
		[Fault Detection] • Engine ECU power supply for injector system is faulty.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 25% of events
Fault healing		• None
System reaction		• None
		• Reduced power available due injector shut off
Failure cause		• DC/DC converter cannot be shut off
Failure repair		• Check presence of other failures connected to injector supply (short circuit), check capacitor, replace ECM if power stage is responsible.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

2797-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition	[Test Condition] • Continuously.
	[Fault Detection] • Internal failure of the engine ECU (injector power supply system).
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 50% of events
Fault healing	• As soon as the error is detected.
System reaction	• None
	• None
Failure cause	• Defective ECM

Failure repair		• Replace ECM
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

2798-2: The control unit 'DC/DC converter' has a malfunction. (Injector bank 2)

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Engine ECU power supply for injector system is faulty.
		[Defect Debouncing] • Immediate
Fault healing		• None
System reaction		• Nos.2 and 3 cylinders are deactivated.
		• Reduced power available due injector shut off
Failure cause		• Buffer capacitor cannot be charged, problem can be located in the capacitor or the power stage itself.
Failure repair		• Check presence of other failures connected to injector supply (short circuit), check capacitor, replace ECM if power stage is responsible.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. Go to Step2
Inspection procedure	Step2	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

2798-3: The injector bank 2 has a short circuit.

Generation condition	[Test Condition] • When system is switched on, after the buffer capacitor is loaded.
	[Fault Detection] • Short-circuit of the power supply harness for No. 2 and 3 cylinders is detected 5 times or more.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 50% of events

Fault healing		• None
System reaction		• None
		• Engine stop
Failure cause		• Short circuit in wiring or injector connected to No. 2 and 3 cylinders. (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• Check the wiring and injectors connected to No. 2 and 3 cylinders.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.2 cylinder. Remove the connector of Injector No.3 cylinder. Check the circuit across Injector No.2 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.3 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. (FUSO Diagnostics actuation test 003 Injector) Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

2798-6: The injector bank 2 has a short circuit.

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • Short-circuit of the power supply harness for No. 2 and 3 cylinders is detected 5 times or more.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing		• None
System reaction		• None
		• Reduced power available due injector shut off
Failure cause		• Short circuit in wiring or injector connected to No. 2 and 3 cylinders. (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• Check the wiring and injectors.

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.2 cylinder. Remove the connector of Injector No.3 cylinder. Check the circuit across Injector No.2 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.3 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. (FUSO Diagnostics actuation test 003 Injector) Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed

Inspection procedure	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

2798-12: The control unit 'DC/DC converter' has a malfunction. (Injector bank 2)

Generation condition		[Test Condition] • Each time that an attempt is made to switch off a DC/DC converter.
		[Fault Detection] • Engine ECU power supply for injector system is faulty.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 25% of events
Fault healing		• None
System reaction		• None
		• Reduced power available due injector shut off
Failure cause		• DC/DC converter cannot be shut off
Failure repair		• Check presence of other failures connected to injector supply (short circuit), check capacitor, replace ECM if power stage is responsible.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

2900-9: CAN timeout fault. Error on transmission of CAN message

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
	[Fault Detection] • CAN communication from DUONIC ECU is faulty (timeout).
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• When the frame is received, the time out error is cleared.
System reaction	• DUONIC ECU data is used as a default value.
	• None

Failure cause		• Defective CAN controller of Gearbox Control Unit, under voltage of Gearbox Control Unit, missing Gearbox Control Unit, CAN cable connecting the Gearbox Control Unit is disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the Gearbox Control Unit to the network, check correct functioning of the Gearbox Control Unit CAN controller and its voltage supply. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with DUONIC electronic control unit is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of DUONIC electronic control unit. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

Inspection procedure	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the DUONIC electronic control unit. Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

3050-10: Signal 'Pressure in DEF supply circuit' is faulty.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Timer is started at every system start. If the duration between the system start and the pressure oscillation detection is below 3 hours, an error will be set.
		[Defect Debouncing] • Defect condition fulfilled continuously >10.0 ms
Fault healing		• This error will be healed if duration between system start and pressure oscillation detection is above 3 hours.
System reaction		• None
		• Manual DPF regeneration not available
Failure cause		• Open item, should be checked with Bosch, probably too rigid pipes or excessive system vibrations
Failure repair		• See fault cause (probable cause non conformity of pipes)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 026: Pressure of component ‘DEF Delivery pump’ • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 130: DEF Delivery pump Electric motor (Specified Value) • 131: DEF Delivery pump Electric motor (Measured Value) • 132: Status of component 'DEF Reverting valve' (Input signal) • 133: Status of component 'DEF Reverting valve' (Output signal)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Replace DEF pressure lines from tank to dosing module.

3050-16: The fill level of the DEF tank is too low.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • DEF pressure is above 7.50 bar.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing		• None
System reaction		• DEF injecting action is deactivated. (System start is attempted after recovery from the error.)
		• Manual DPF regeneration not available
Failure cause		• DEF level too low (suction of air) • Back flow into tank clogged • Pump control not OK (e.g. pump is running on max due to electric failure). • DEF pressure sensor shows too high values.
Failure repair		• Check if DEF level was OK when failure occurred (see ambient conditions). • Check if back flow line into tank is open (with test: adjust system to normal pressure (500kPa {73psi, 5.1kgf/cm^2}) and check, if pressure is constant, if not, stop pump --> pressure must drop down (=system emptying through back flow line)).
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 026: Pressure of component 'DEF Delivery pump' • 125: Fill level of DEF tank
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 009: DEF Leak tester
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Check if enough DEF is in tank.
	Step2	Make sure that the DEF is not frozen.
	Step3	Perform the following actuator test to check it for normal operation. No.008 "Test of DEF metering amount" If not OK, check pipes & wiring.
	Step4	If pipes and wiring OK, replace DEF tank.

3050-18: The pressure in the DEF system is released too slowly.

Generation condition	[Test Condition] • System in the PRESSURE REDUCTION state (after a failure of DEF pressure during system start up or normal operation OR at system stop by Key 15) • Pressure reduction not inhibited by another failure.
	[Fault Detection] • DEF pressure has not dropped to 50 kPa {7.3 psi, 0.5 kgf/cm^2} within 5.5 seconds.
	[Defect Debouncing] • Immediate
Fault healing	• No healing in this driving cycle.
System reaction	• None
	• Manual DPF regeneration not available
Failure cause	• Reverse valve does not work (blocked closed). • Back flow tube into tank clogged. • DEF pressure sensor stuck.

Failure repair		• Check if Back flow tube free. • Check if Reverse valve works with tester: set DEF pressure to 500kPa {73psi, 5.1kgf/cm^2} (dosing valve closed) - wait until pressure stable - actuate reverse valve --> if pressure does not drop down --> reverse valve does not work.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 026: Pressure of component 'DEF Delivery pump' • 125: Fill level of DEF tank
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Check if enough DEF is in tank.
	Step2	Make sure that the DEF is not frozen.
	Step3	Perform the following actuator test to check it for normal operation. No.008 "Test of DEF metering amount" If not OK, check pipes & wiring.
	Step4	If pipes and wiring OK, replace DEF tank.

3051-0: The fill level of the DEF tank is too low.

Generation condition	[Test Condition] • Dosing system in normal operation ("metering control") and DEF pressure > 200 kPa {29 psi, 2.0 kgf/cm^2} since 7 s. • Monitoring not inhibited by another failure.
	[Fault Detection] • DEF pressure dropped below 4 bar (but not below 2 bar), and did not returned to 4.2 bar within 10 seconds.
	[Defect Debouncing] • Immediate
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• System goes into the "depressurized" state and then starts being "pressurized" again (with no DEF injection).
	• Manual DPF regeneration not available
Failure cause	• DEF level too low (suction of air) • Leakage in the DEF system outside or internal (i.e. back flow into tank, leakage into pump housing, external leakage). • Pump not delivering enough. • Reverting valve blocked "open" (occurrence during normal operation - low probability) • DEF pressure sensor shows too low values.
Failure repair	• Check, if enough DEF was in tank when failure occurred (ambient conditions) • Check if pump can reach enough pressure with tester: set system under normal pressure (500kPa {73psi, 5.1kgf/cm^2}): • check if there is an external leakage (visible check) • if 500kPa {73psi, 5.1kgf/cm^2} reachable: open dosing valve fully for ~3 sec, if pressure drops < 420kPa {61psi, 4.3kgf/cm^2} --> pump not delivering enough or internal leakage --> replace pump module. If pressure remains stable --> system seems to be OK • if 500kPa {73psi, 5.1kgf/cm^2} not reachable: pump not delivering enough or internal leakage or reverting valve blocked open--> replace pump module
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 026: Pressure of component 'DEF Delivery pump' • 125: Fill level of DEF tank
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 009: DEF Leak tester

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Check if enough DEF is in tank.
	Step2	Make sure that the DEF is not frozen.
	Step3	Perform the following actuator test to check it for normal operation. No.008 “Test of DEF metering amount” If not OK, check pipes & wiring.
	Step4	If pipes and wiring OK, replace DEF tank.

3051-16: The fill level of the DEF tank is too low.

Generation condition		[Test Condition] • Dosing system in normal operation (“metering control”) and monitoring not inhibited by another failure.
		[Fault Detection] • DEF pressure exceeded 6.5 bar, and did not return to 6 bar or lower within 60 seconds.
		[Defect Debouncing] • Immediate
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• System goes into the “depressurized” state and then starts being “pressurized” again (with no DEF injection).
		• Manual DPF regeneration not available
Failure cause		• DEF level too low (suction of air) • Back flow into tank clogged • Pump control not OK (e.g. pump is running on max due to electric failure). • DEF pressure sensor shows too high values.
Failure repair		• Check if DEF level was OK when failure occurred (see ambient conditions). • Check if back flow line into tank is open (with test: adjust system to normal pressure (500kPa {73psi, 5.1kgf/cm^2}) and check, if pressure is constant, if not, stop pump --> pressure must drop down (=system emptying through back flow line)).
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 026: Pressure of component ‘DEF Delivery pump’ • 125: Fill level of DEF tank
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 009: DEF Leak tester
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Check if enough DEF is in tank.
	Step2	Make sure that the DEF is not frozen.
	Step3	Perform the following actuator test to check it for normal operation. No.008 “Test of DEF metering amount” If not OK, check pipes & wiring.
	Step4	If pipes and wiring OK, replace DEF tank.

3058-0: The signal of component 'Exhaust gas recirculation actuator' is implausible compared with the signal of component 'Air mass flow rate / Intake air temperature sensor'.

Generation condition		[Test Condition] • Monitoring is active if the ECU is not in afterrun • The check is carried out every 20ms if the EGR closed control loop is switched on and no other system error is present. • No DPF regeneration is active.
		[Fault Detection] • During driving, the air flow value becomes out of the specified value for 8 seconds continuously.
		[Defect Debouncing] • Defect condition fulfilled continuously > 20000 ms
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• EGR system is deactivated and a default value is used.
		• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm • Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP}
Failure cause		• Defective air mass flow sensor, leakage in the air duct, electrical or mechanical defect in EGR actuators or defect in wiring of EGR actuators
Failure repair		• Check air mass flow sensor, air duct, EGR actuators and their wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 000: Temperature at component 'EGR cooler outlet temperature sensor' • 003: Temperature at component ‘Air mass flow rate / Intake air temperature sensor’ • 034: Signal voltage of component ‘Air mass flow rate / Intake air temperature sensor’ (Temperature sensors) • 053: Air mass flow rate (Actual value) • 055: Air mass flow rate (Cylinder) • 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value) • 160: Air mass flow rate Learned value 1 • 161: Air mass flow rate Learned value 2
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #306 Inspection of air flow and intake air temperature sensor • #530 Inspection of EGR actuator
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘EGR actuator’ is faulty. Component ‘EGR actuator’ is faulty. Damage of Intake system For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with EGR actuator is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with EGR actuator is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Airflow and intake air temperature sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Airflow and intake air temperature sensor for open or short circuit. Check the circuit across Signal detect and actuation module and Airflow and intake air temperature sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10
	Step5	Turn the starter switch in OFF. Replace component “Airflow and intake air temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Airflow and intake air temperature sensor which Engine electronic control unit learns. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘EGR actuator’ is faulty. Component ‘EGR actuator’ is faulty. Damage of Intake system For procedures, refer to the Shop Manual. Go to Step8
	Step8	Perform the operation start and replace Engine electronic control unit. Go to Step9
	Step9	Inspection completed
	Step10	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Repair or replace the harness across Airflow and intake air temperature sensor and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5
	Step12	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

3058-1: The signal of component 'Exhaust gas recirculation actuator' is implausible compared with the signal of component 'Air mass flow rate / Intake air temperature sensor'.

Generation condition		[Test Condition] • Monitoring is active if the ECU is not in afterrun - EGR is in closed control loop and no other system error is present. - EGR quantity > 5.00% - No DPF regeneration is active.
		[Fault Detection] • During driving, the air flow value becomes out of the specified value for 8 seconds continuously.
		[Defect Debouncing] • Defect condition fulfilled continuously >6000.0 ms
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• EGR system is deactivated and a default value is used.
		• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• Defective air mass flow sensor, obstruction or leackage in air duct, electrical or mechanical defect in EGR actuators or defect in wiring of EGR actuators
Failure repair		• Check air mass flow sensor, air duct, EGR actuators and their wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 000: Temperature at component 'EGR cooler outlet temperature sensor' • 003: Temperature at component ‘Air mass flow rate / Intake air temperature sensor’ • 034: Signal voltage of component ‘Air mass flow rate / Intake air temperature sensor’ (Temperature sensors) • 053: Air mass flow rate (Actual value) • 055: Air mass flow rate (Cylinder) • 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value) • 160: Air mass flow rate Learned value 1 • 161: Air mass flow rate Learned value 2

	Step8	Perform the operation start and replace Engine electronic control unit. Go to Step9
	Step9	Inspection completed
	Step10	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Repair or replace the harness across Airflow and intake air temperature sensor and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5
	Step12	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

3058-31: The signal from component 'Exhaust gas recirculation valve' is faulty.

Generation condition		[Test Condition] • Monitoring is active if the ECU is not in afterrun • During transition from regeneration too normal mode.
		[Fault Detection] • Output signal of the EGR actuator is faulty.
		[Defect Debouncing] • Immediate
Fault healing		• None
System reaction		• None
		• None
Failure cause		• Defect in the EGR actuators (EGR- and throttle valve) • Calibration error (wrong layout of the open loop EGR control during transition from Regeneration to normal mode)
Failure repair		• Check for errors of the EGR actuators (correct installation, wiring, electrical connectors, jammed actuator) • Replace Engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6

Inspection procedure	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

3087-31: The value of component 'DEF fill level sensor' is implausible.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • If the tank level sensor sends out an error message.
		[Defect Debouncing] • Immediate
Fault healing		• If the tank level sensor does not send out an error message
System reaction		• Tank level will be set to default value 20mm
		• None
Failure cause		• Tank level sensor defective
Failure repair		• Replace DEF tank.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 125: Fill level of DEF tank • 126: Status of DEF fill level • 134: Status of component "DEF Level sensor"
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF level sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

3217-0: The electrical line to component 'Lambda control tester' or component 'Lambda control tester' is defective.

Generation condition	[Test Condition] • Continuously when following conditions fulfilled: • The calibration is active. • No Error of LSU
	[Fault Detection] • O2 signal from the lambda sensor above 200 mV has detected for 10 times.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 50% of events
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• Healing condition fulfilled cumulatively > 10.00 events • Failure healed if not active for 50% of events
	• None
Failure cause	• Defect in wiring of lambda sensor, inaccurate or defective lambda sensor, problems with EGR actuators or injection system

Failure repair		• Check wiring and accuracy of lambda sensor, check functioning of injection system and EGR actuators, if necessary replace lambda sensor (and reset all learning values in EEPROM with tester)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 010: Temperature at component 'Lambda control tester' • 032: Operating state of component 'Lambda control tester' (Heater ON) • 057: Lambda value • 118: Status of component "Lambda control tester" • 135: Status of oxygen sensor heater
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with EGR actuator is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component "Lambda sensor". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

3217-1: The electrical line to component 'Lambda control tester' or component 'Lambda control tester' is defective.

Generation condition		[Test Condition] • Continuously when following conditions fulfilled: • The calibration is active. • No Error of LSU
		[Fault Detection] • O2 signal from the lambda sensor below -200 mV has detected for 10 times.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 50% of events
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Healing condition fulfilled cumulatively > 10.00 events • Failure healed if not active for 50% of events
		• None
Failure cause		• Defect in wiring of lambda sensor, inaccurate or defective lambda sensor, problems with EGR actuators or injection system
Failure repair		• Check wiring and accuracy of lambda sensor, check functioning of injection system and EGR actuators, if necessary replace lambda sensor (and reset all learning values in EEPROM with tester)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 010: Temperature at component 'Lambda control tester' • 032: Operating state of component 'Lambda control tester' (Heater ON) • 057: Lambda value • 118: Status of component "Lambda control tester" • 135: Status of oxygen sensor heater
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with EGR actuator is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component "Lambda sensor". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step5

Inspection procedure	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

3217-16: The signal voltage of component 'Lambda control tester' is too high.

Generation condition		[Test Condition] • Continuously if all following conditions fulfilled: • LSU not in calibration mode • LSU not in a failure mode • Exhaust gas pressure < 160kPa {23psi, 1.6kgf/cm^2} • Monitoring not inhibit by another failure
		[Fault Detection] • O2 signal from the lambda sensor is equal to or above 3.2 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• O2 signal from the lambda sensor is below 3.2 V.
System reaction		• Healing condition fulfilled cumulatively > 2.00 s • Failure healed if not active for 50% of the time
		• None
Failure cause		• Defect in wiring, Excessive drifting in O2 concentration during overrun, Defective lambda sensor. • Short circuit to external source
Failure repair		• Reset the Calibration factor and measure the O2 signal in overrun phase. Let the system learn and read the voltage at motoring (O2 content = 20.95%). If the signal still > 3.20V --> replace sensor (and reset all learning values in EEPROM with tester) • Check entire wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 010: Temperature at component ‘Lambda control tester’ • 032: Operating state of component ‘Lambda control tester’ (Heater ON) • 057: Lambda value • 118: Status of component “Lambda control tester” • 135: Status of oxygen sensor heater
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step4
	Step4	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step9
	Step5	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step7
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step8
	Step8	Inspection completed
	Step9	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. No occurrence? No: Go to Step8 Yes: Go to Step5

3221-0: Signal 'Oxygen concentration' of component 'Lambda control tester' is implausible.

Generation condition	[Test Condition] • Lambda sensor working in normal condition (no learning or calibration mode active) and O2 signal valid • Monitoring not inhibited by another failure • Fuel level > 0.00l • Battery Voltage > 10.7 V • Engine in normal operation • Engine in steady state, i.e. the variation of calculated O2 concentration (by air flow and fuel injection) < 0.01- during 1.5 s • Engine in overrun condition (engine speed between 1000 rpm and 4000 rpm and engine load between -10 mg/hub and 0.2 mg/hub and Air flow between 50 mg/Hub and 1500 mg/Hub) • Air mass passed through engine while all conditions above are fulfilled >= 150 g
	[Fault Detection] • The condition that O2 concentration measured and corrected by temperature and pressure is higher than the specified value is detected for 100 times.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00 events • Failure is detected if active for 50% of events

Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Healing condition fulfilled cumulatively > 100 events • Failure healed if not active for 50% of events
		• None
Failure cause		• Leakage or blockage in exhaust gas system, defect in wiring of lambda sensor, inaccurate lambda or air flow sensor, problems in injection system (e.g. blockage in injectors)
Failure repair		• Check exhaust gas system, check wiring of lambda sensor, check accuracy of lambda and air flow sensor, reset all learning factors of LSU in EEPROM and recheck the accuracy of LSU, check injection system, if necessary replace lambda sensor (and reset all learning values in EEPROM with tester)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 003: Temperature at component 'Air mass flow rate / Intake air temperature sensor' • 010: Temperature at component 'Lambda control tester' • 032: Operating state of component 'Lambda control tester' (Heater ON) • 034: Signal voltage of component 'Air mass flow rate / Intake air temperature sensor' (Temperature sensors) • 053: Air mass flow rate (Actual value) • 054: Air mass flow rate (Specified value) • 055: Air mass flow rate (Cylinder) • 057: Lambda value • 063: Required fuel quantity for post injection • 064: Injection quantity (Adjustment value) • 065: Injection quantity (Raw values) • 066: Current injection quantity • 070: Correction value of fuel quantity (Cylinder 1) • 071: Correction value of fuel quantity (Cylinder 3) • 072: Correction value of fuel quantity (Cylinder 4) • 073: Correction value of fuel quantity (Cylinder 2) • 118: Status of component "Lambda control tester" • 135: Status of oxygen sensor heater • 160: Air mass flow rate Learned value 1 • 161: Air mass flow rate Learned value 2
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #263 Inspection of engine speed sensor • #306 Air flow and intake air temperature sensor • #582 Inspection of injector
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If Exhaust system fault has occurred, check the system in question. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Airflow and intake air temperature sensor is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step5

Inspection procedure	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step6
	Step6	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step11
	Step7	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. No occurrence? No: Go to Step10 Yes: Go to Step7

3221-1: Signal 'Oxygen concentration' of component 'Lambda control tester' is implausible.

Generation condition	[Test Condition] • Lambda sensor working in normal condition (no learning or calibration mode active) and O2 signal valid • Monitoring not inhibited by another failure • Fuel level > 0.00l • Battery Voltage > 10.7 V • Engine in normal operation • Engine in steady state, i.e. the variation of calculated O2 concentration (by air flow and fuel injection) < 0.01- during 1.5 s • Engine in overrun condition (engine speed between 1000 rpm and 4000 rpm and engine load between -10 mg/hub and 0.2 mg/hub and Air flow between 50 mg/Hub and 1500 mg/Hub) • Air mass passed through engine while all conditions above are fulfilled >= 150 g
	[Fault Detection] • The condition that O2 concentration measured and corrected by temperature and pressure is lower than the specified value is detected for 100 times.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00 events • Failure is detected if active for 50% of events

Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Healing condition fulfilled cumulatively > 100 events • Failure healed if not active for 50% of events
		• None
Failure cause		• Leakage or blockage in exhaust gas system, defect in wiring of lambda sensor, inaccurate lambda or air flow sensor, problems in injection system (e.g. leaky injectors)
Failure repair		• Check exhaust gas system, check wiring of lambda sensor, check accuracy of lambda and air flow sensor, reset all learning factors of LSU in EEPROM and recheck the accuracy of LSU, check injection system, if necessary replace lambda sensor (and reset all learning values in EEPROM with tester)

3222-5: Component 'NOx sensor1' has an open circuit. (CAN messages)

Generation condition	[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously if NOx sensor is OK
	[Fault Detection] • CAN message reports open circuit faults
	[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing	• CAN message does not report open circuit faults
System reaction	• The NOx sensor upstream does not get ready for measurement • SCR Dosing can not work in closed loop control and no NOx monitoring possible
	• None
Failure cause	• Wiring defect • NOx Sensor upstream defect

Failure repair		• Internal NOx Upstream Sensor wiring defect, replace sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

3222-6: Component 'NOx sensor1' has a short circuit. (CAN messages)

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously if NOx sensor is OK
		[Fault Detection] • If the Sensor sends the message "short circuit" detected
		[Defect Debouncing] • Defect condition fulfilled continuously > 0.2s
Fault healing		• If the Sensor does not send the message "short circuit"
System reaction		• The NOx sensor upstream does not get ready for measurement • SCR Dosing can not work in closed loop control and no NOx monitoring possible
		• None
Failure cause		• Wiring defect • NOx Sensor upstream defect
Failure repair		• Internal NOx Upstream Sensor wiring defect, replace sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

3222-31: The operating temperature of component 'NOx sensor1 (Heating)' was not reached.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Only at cold start detection if not inhibited
		[Fault Detection] • Starting from the dew point detection during a cold start, the heater has not reached the working temperature • after 120.00s
		[Defect Debouncing] • Defect condition fulfilled continuously > 1 events
Fault healing		• Only at next cold start possible if heater performance is in range

System reaction		• None
		• None
Failure cause		• NOx upstream sensor heater efficiency decreased
Failure repair		• Check wiring/supply, replace NOx upstream sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

3224-0: Component 'NOx sensor1' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • If NOx upstream sensor has detected open wire fault
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• Failure not detected
System reaction		• NOx upstream value not available.
		• None
Failure cause		• Wiring defect • NOx Upstream Sensor defect
Failure repair		• Internal NOx Upstream Sensor wiring defect, replace sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None

		[Fault Detection] • If NOx sensor has detected short circuit fault
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• Failure not detected

System reaction		• NOx upstream value not available.
		• None
Failure cause		• Wiring defect • NOx Upstream Sensor defect
Failure repair		• Internal NOx Upstream Sensor wiring defect, replace sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

3224-2: Signal 'Lambda value or NOx values' from component 'NOx sensor 1' is faulty.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • The NOx Sensor upstream sends the message "Lambda signal not plausible" or "NOx signal not plausible"
		[Defect Debouncing] • Defect condition fulfilled continuously >120 s
Fault healing		• The NOx Sensor upstream sends the message "Lambda signal plausible" and "NOx signal plausible"
System reaction		• None
		• None
Failure cause		• Short Circuit or Open wire in Sensor internal wiring harness. • Defective NOx Upstream Sensor.
Failure repair		• Replace NOx Upstream Sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

3224-9: CAN timeout fault (NOx sensor1)

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Timeout of NOx Sensor message.
		[Defect Debouncing] • Defect condition fulfilled continuously >0.5s
Fault healing		• If the NOx sensor message is received correct after the debouncing time .
System reaction		• NOX value set to default value 5000ppm • Lambda value set to default value 1.2
		• None
Failure cause		• Defective CAN controller of NOx Sensor Upstream , undervoltage of NOx Sensor, missing NOx Sensor Upstream, CAN cable connecting the NOx Sensor Upstream is disconnected or broken. • Short circuit in wiring.
Failure repair		• Check presence and correct connection of the NOx Sensor Upstream to the network, Check correct functioning of the NOx Sensor Upstream CAN controller and its voltage supply. • Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

3232-5: Component 'NOx sensor' has an open circuit.

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously if NOx sensor is OK
	[Fault Detection] • Open-circuit of NOx sensor harness (heater line) is detected.
	[Defect Debouncing] • Defect condition fulfilled continuously > 2000.0 ms
Fault healing	• If NOx sensor does not send the Message “Open wire”.
System reaction	• No SCR monitoring or DEF releasing is possible.
	• None
Failure cause	• Wiring defect • NOx Sensor defect
Failure repair	• Check wiring (specially heating wires) • Check NOx Sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 108: NOx values (Raw values) • 115: NOx values • 116: Fill level of NOx storage catalytic converter (NH3)

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and NOx sensor for open or short circuit. Check the circuit across Signal detect and actuation module and NOx sensor for open or short circuit. Check the circuit across NOx sensor and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and ATS harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and ATS harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness and ATS harness for open or short circuit. Check the circuit across Connection of chassis harness and ATS harness and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Lambda sensor and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

Inspection procedure	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3232-6: Component 'NOx sensor' has a short circuit.

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously if NOx sensor is OK
		[Fault Detection] • Short-circuit of NOx sensor harness (heater line) is detected.
		[Defect Debouncing] • Defect condition fulfilled continuously > 2000.0 ms
Fault healing		• If the sensor does not send the message “short circuit detected”.
System reaction		• No SCR monitoring or DEF releasing is possible.
		• None
Failure cause		• Wiring harness has short circuit • NOx Sensor defect
Failure repair		• Check wiring harness • Check Sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values • 116: Fill level of NOx storage catalytic converter (NH3)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and NOx sensor for open or short circuit. Check the circuit across Signal detect and actuation module and NOx sensor for open or short circuit. Check the circuit across NOx sensor and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and ATS harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and ATS harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness and ATS harness for open or short circuit. Check the circuit across Connection of chassis harness and ATS harness and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Lambda sensor and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3232-31: The function 'Heating element' of component 'NOx sensor' has an internal fault.

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Only at cold start detection if monitor not inhibited
	[Fault Detection] • Starting from the dew point detection during a cold start, the heater has not reached the working temperature in 120 s
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• None
	• None
Failure cause	• NOx sensor heater efficiency decreased
Failure repair	• Check wiring/supply, replace NOx sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 108: NOx values (Raw values) • 115: NOx values

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Check the following components, repair or replace if necessary. • If other fault codes relating to component 'Signal detect and actuation module' are present, process these first. Go to Step2
	Step2	Switch off ignition. Disconnect plug from component 'Engine electronic control unit'. Disconnect plug from component 'NOx sensor'. Disconnect plug from component 'Signal detect and actuation module'. Check the circuit across Engine electronic control unit and NOx sensor for open or short circuit. Check the circuit across Signal detect and actuation module and NOx sensor for open or short circuit. Check the circuit across NOx sensor and Ground for open or short circuit. Perform visual inspection for each electrical connector. Was a fault discovered? No: Go to Step3 Yes: Go to Step6
	Step3	Switch off ignition. Replace component "NOx sensor". Reconnect all separated electrical connectors. Switch on ignition. Go to Step4
	Step4	Switch off ignition. Reconnect all separated electrical connectors. Erase fault memory and perform a city run for 30 minutes. Check whether this fault code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step9
	Step5	End of test
	Step6	Switch off ignition. Disconnect plug from component 'Engine electronic control unit'. Disconnect plug from component 'Connection of chassis harness and ATS harness'. Disconnect plug from component 'Signal detect and actuation module'. Check the circuit across Engine electronic control unit and Connection of chassis harness and ATS harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness and ATS harness for open or short circuit. Check the circuit across Connection of chassis harness and ATS harness and Ground for open or short circuit. Perform visual inspection for each electrical connector. Was a fault discovered? No: Go to Step7 Yes: Go to Step8
	Step7	Repair or replace defective electrical lines between components 'Lambda sensor' and 'Connection of chassis harness and ATS harness'. Reconnect all separated electrical connectors. Erase fault memory and perform a city run for 30 minutes. Check whether this fault code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

Inspection procedure	Step8	Repair or replace defective electrical lines between components 'Engine electronic control unit' and 'Connection of chassis harness and ATS harness'. Reconnect all separated electrical connectors. Erase fault memory and perform a city run for 30 minutes. Check whether this fault code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3
	Step9	Replace component 'Engine electronic control unit' by performing initial startup. Go to Step5

3234-2: Component 'NOx sensor' has an open circuit or short circuit.

Generation condition		[Test Condition] • The NOx Sensor itself checks if the Signals are plausible or not and sends the state to the ECM by CAN message: Bits 0-1: temperature: 00 = not OK / 01=OK Bits 2-3: Lambda Signal: 00= not OK / 01=OK Bits 4-5: NOx Signal: 00=not OK / 01=OK Bits 6-7: Supply Voltage: 00=not OK / 01=OK • continuously
		[Fault Detection] • Error signal from the NOx sensor is received.
		[Defect Debouncing] • Defect condition fulfilled continuously > 240000.0 ms
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Normally, NOx signal value is set by NOx sensor itself, which causes the NOx concentration to be frozen at a substitute value. (After regeneration by FUSO Diagnostics, the proper range is from 0 ppm up to 200 ppm)
		• None
Failure cause		• Short Circuit or Open wire in wiring harness • Defective NOx Sensor
Failure repair		• Check wiring harness • Check NOx Sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values • 116: Fill level of NOx storage catalytic converter (NH3)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor (See “5.3 Inspections at relevant system sections”)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Check for an open circuit between SAM and Nox sensor. Check for a short circuit between SAM and Nox sensor. Check the Nox sensor supply voltage. Check the Nox Sensor, Check the integrity of the component. Check the integrity of the sensor. Visually inspect the relevant harnesses and connectors for damage, bent or dislocated pins, corroded terminals, or broken wires. Verify that the connectors are fully installed. Flex the harnesses involved to reveal intermittent breaks or shorts in the wiring concerned. Check if current diagnosis codes present or not. No: Go to Step3 Yes: Go to Step7

Inspection procedure	Step3	Turn the starter switch in OFF. Replace component “Nox sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4 Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and ATS harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and ATS harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness and ATS harness for open or short circuit. Check the circuit across Connection of chassis harness and ATS harness and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Lambda sensor and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

3241-0: Component 'Temperature sensor Exhaust system' has a short circuit or is defective.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
	[Fault Detection] • Voltage from the exhaust temperature sensor 1 is above 4 V.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing	• Voltage from the exhaust temperature sensor 1 is below 4 V.
System reaction	• The last valid value before detection of this error is first used as the value of exhaust temperature sensor 1 and then the value is replaced by 79.96°C {176°F}.
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available

Failure cause		• Short circuit of sensor to external source or defective sensor
Failure repair		• Check wiring and sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 005: Temperature in component 'Diesel oxidation catalytic converter' • 007: Exhaust temperature upstream of diesel oxidation catalytic converter
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of exhaust gas temperature sensor 1
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Check the circuit across Engine electronic control unit and Exhaust gas temperature sensor 1 for open or short circuit. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component "Exhaust gas temperature sensor 1". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step1

3241-1: Component 'Temperature sensor Exhaust system' has a short circuit to ground. / Component 'Temperature sensor Exhaust system' is defective.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
	[Fault Detection] • Voltage from the exhaust temperature sensor 1 is below 500 mV.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing	• Voltage from the exhaust temperature sensor 1 is above 500 mV.

System reaction		• The last valid value before detection of this error is first used as the value of exhaust temperature sensor 1 and then the value is replaced by 79.96°C {176°F}.
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Short circuit of sensor to ground or defective sensor
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 005: Temperature in component 'Diesel oxidation catalytic converter' • 007: Exhaust temperature upstream of diesel oxidation catalytic converter
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None

Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Check the circuit across Engine electronic control unit and Exhaust gas temperature sensor 1 for open or short circuit. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component "Exhaust gas temperature sensor 1". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step1

3241-18: The exhaust gas temperature is too low. (Exhaust temperature downstream of oxidation catalytic converter)

Generation condition	[Test Condition] • Continuously if ADC is not reporting an electrical problem on the sensor
	[Fault Detection] • The sensor signal is below -45.04°C {-49.07°F}.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing	• The sensor signal is above -45.04°C {-49.07°F}.

System reaction		• The last valid value before detection of this error is first used as the value of exhaust temperature sensor 1 and then the value is replaced by 79.96°C {176°F}.
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Inaccurate or defective temperature sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the temperature sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 005: Temperature in component 'Diesel oxidation catalytic converter' • 007: Exhaust temperature upstream of diesel oxidation catalytic converter
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of exhaust gas temperature sensor 1
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Check the circuit across Engine electronic control unit and Exhaust gas temperature sensor 1 for open or short circuit. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component "Exhaust gas temperature sensor 1". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3241-31: Plausibility check of component 'Exhaust temperature upstream of diesel oxidation catalytic converter 1' The received data are implausible.

Generation condition		[Test Condition] • once in a driving cycle if following conditions are true: • monitoring not disabled by another failure. • Not in high altitude (ambient pressure > 50 kPa {7.3 psi, 0.5 kgf/cm^2} • The time since last engine stop > 5 h (time usually taken via CAN from tachograph). • In case the timer or the CAN transmission is defective, the monitoring is inhibited
		[Fault Detection] • Detected temperature does not match with the temperatures from other temperature sensors.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• None
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Exhaust Temperature Sensor before Oxicat measures wrong values
Failure repair		• Note: Too fast ambient temperature change, e.g. vehicle (and dedicated temperature sensor) exposed to sun shine after very cold night, or if the sensor is in a “warm air stream” (e.g. by additional engines like a cooling compressor for a cold compartment which runs also during vehicle stand still, or an external source like a “exhaust stream” of a building climatisation) can cause this failure, if the ambient of this sensor is not equal to the “normal” ambient! --> in this case no action needed! • Check wiring and connectors for correct contact (corrosion). • Check sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 005: Temperature in component ‘Diesel oxidation catalytic converter’ • 007: Exhaust temperature upstream of diesel oxidation catalytic converter
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of exhaust gas temperature sensor 1
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If this diagnosis code has occurred during operation in an environment which was often exposed to sudden temperature change, investigate the driving conditions at that time because it may have been temporary. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Check the circuit across Engine electronic control unit and Exhaust gas temperature sensor 1 for open or short circuit. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Exhaust gas temperature sensor 1”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

3242-2: Plausibility check of component 'Exhaust temperature upstream of diesel oxidation catalytic converter 1' The received data are implausible.

Generation condition	[Test Condition] • once in a driving cycle if following conditions are true: • monitoring not disabled by another failure. • Not in high altitude (ambient pressure > 50 kPa {7.3 psi, 0.5 kgf/cm^2} • The time since last engine stop > 5 h (time usually taken via CAN from tachograph). • In case the timer or the CAN transmission is defective, the monitoring is inhibited

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 006: Temperature in component ‘DPF’ • 008: Exhaust temperature upstream of diesel particulate filter
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #336 Inspection of exhaust gas temperature sensor 2

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If this diagnosis code has occurred during operation in an environment which was often exposed to sudden temperature change, investigate the driving conditions at that time because it may have been temporary. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Check the circuit across Engine electronic control unit and Exhaust gas temperature sensor 2 for open or short circuit. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Exhaust gas temperature sensor 2”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

3244-0: Component 'Temperature sensor 'Exhaust system'' has a short circuit or is defective.

Generation condition	[Test Condition] • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
	[Fault Detection] • Voltage from the exhaust temperature sensor 2 is above 4 V.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing	• Voltage from the exhaust temperature sensor 2 is below 4 V.
System reaction	• The value of exhaust temperature sensor 2 is frozen at the last valid value before detection of this error.
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• Short circuit of sensor to external source or defective sensor
Failure repair	• Check wiring and sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 006: Temperature in component ‘DPF’ • 008: Exhaust temperature upstream of diesel particulate filter

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of exhaust gas temperature sensor 2
Inspection procedure	Step1	If the diagnosis codes for injector occur, inspect a fault for the code first.
	Step2	Inspection of air flow & intake air temperature sensor (air flow sensing section) See the “(6) Inspection of exhaust gas temperature sensor 1 and 2 (DPF exhaust gas temperature sensor 1 and 2)” of section 5.

3244-1: Component 'Temperature sensor 'Exhaust system'' has a short circuit to ground. / Component 'Temperature sensor 'Exhaust system'' is defective.

Generation condition		[Test Condition] • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
		[Fault Detection] • Voltage from the exhaust temperature sensor 2 is below 500 mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing		• Voltage from the exhaust temperature sensor 2 is above 500 mV.
System reaction		• The value of exhaust temperature sensor 2 is frozen at the last valid value before detection of this error.
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Short circuit of sensor to ground or defective sensor
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 006: Temperature in component ‘DPF’ • 008: Exhaust temperature upstream of diesel particulate filter
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of exhaust gas temperature sensor 2
Inspection procedure	Step1	If the diagnosis codes for injector occur, inspect a fault for the code first.
	Step2	Inspection of air flow & intake air temperature sensor (air flow sensing section) See the “(6) Inspection of exhaust gas temperature sensor 1 and 2 (DPF exhaust gas temperature sensor 1 and 2)” of section 5.

3244-16: The exhaust gas temperature is too high. (Exhaust gas temperature upstream of diesel particulate filter (raw value))

Generation condition	[Test Condition] • Continuously if ADC is not reporting an electrical problem on the sensor
	[Fault Detection] • The sensor signal is above 999.96°C {1831.93°F}.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing	• The sensor signal is below 999.96°C {1831.93°F}
System reaction	• Validity checking of the DPF upstream exhaust temperature is suspended.
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• Inaccurate or defective temperature sensor, defect in the wiring

Failure repair		• Check wiring and the accuracy of the temperature sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 006: Temperature in component 'DPF' • 008: Exhaust temperature upstream of diesel particulate filter
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of exhaust gas temperature sensor 2
Inspection procedure	Step1	If the diagnosis codes for injector occur, inspect a fault for the code first.
	Step2	Inspection of air flow & intake air temperature sensor (air flow sensing section) See the "(6) Inspection of exhaust gas temperature sensor 1 and 2 (DPF exhaust gas temperature sensor 1 and 2)" of section 5.

3244-18: The exhaust gas temperature is too low. (Exhaust gas temperature upstream of diesel particulate filter (raw value))

Generation condition		[Test Condition] • Continuously if ADC is not reporting an electrical problem on the sensor
		[Fault Detection] • The sensor signal is below -45.04°C {-49.07°F}.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing		• The sensor signal is above -45.04°C {-49.07°F}
System reaction		• Validity checking of the DPF upstream exhaust temperature is suspended.
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Inaccurate or defective temperature sensor, defect in the wiring
Failure repair		• Check wiring and the accuracy of the air temperature sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 006: Temperature in component 'DPF' • 008: Exhaust temperature upstream of diesel particulate filter
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of exhaust gas temperature sensor 2
Inspection procedure	Step1	If the diagnosis codes for injector occur, inspect a fault for the code first.
	Step2	Inspection of air flow & intake air temperature sensor (air flow sensing section) See the "(6) Inspection of exhaust gas temperature sensor 1 and 2 (DPF exhaust gas temperature sensor 1 and 2)" of section 5.

3245-31: Plausibility check of component 'Exhaust temperature downstream of diesel particular filter' The received data are implausible.

Generation condition		[Test Condition] • once in a driving cycle if following conditions are true: • monitoring not disabled by another failure. • Not in high altitude (ambient pressure > 50 kPa {7.3 psi, 0.5 kgf/cm^2} • The time since last engine stop > 5 h (time usually taken via CAN from tachograph). • In case the timer or the CAN transmission is defective, the monitoring is inhibited
		[Fault Detection] • Temperature from SCR temperature sensor 2 does not match with the detected temperatures from other sensors when the engine is cold.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• None
		• Manual DPF regeneration not available
Failure cause		• Exhaust Temperature Sensor after DPF measures wrong values
Failure repair		• Note: Too fast ambient temperature change, e.g. vehicle (and dedicated temperature sensor) exposed to sun shine after very cold night, or if the sensor is in a “warm air stream” (e.g. by additional engines like a cooling compressor for a cold compartment which runs also during vehicle stand still, or an external source like a “exhaust stream” of a building climatisation) can cause this failure, if the ambient of this sensor is not equal to the “normal” ambient! --> in this case no action needed! • Check wiring and connectors for correct contact (corrosion). • Check sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 006: Temperature in component ‘DPF’ • 008: Exhaust temperature upstream of diesel particulate filter
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of SCR temperature sensor 2
Inspection procedure	Step1	Inspection of SCR temperature sensor 1 and 2. See the “(3) Inspection of SCR temperature sensor 1 and 2” of section 5.

3246-2: Plausibility check of component 'Exhaust temperature upstream of diesel particulate filter' The received data are implausible.

Generation condition	[Test Condition] • once in a driving cycle if following conditions are true: • monitoring not disabled by another failure. • Not in high altitude (ambient pressure > 50 kPa {7.3 psi, 0.5 kgf/cm^2} • The time since last engine stop > 5 h (time usually taken via CAN from tachograph). • In case the timer or the CAN transmission is defective, the monitoring is inhibited
	[Fault Detection] • Temperature from exhaust temperature sensor 2 does not match with the detected temperatures from other sensors when the engine is cold.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• None
	• Manual DPF regeneration not available

Failure cause		• Exhaust Temperature Sensor before DPF measures wrong values
Failure repair		• Note: Too fast ambient temperature change, e.g. vehicle (and dedicated temperature sensor) exposed to sun shine after very cold night, or if the sensor is in a “warm air stream” (e.g. by additional engines like a cooling compressor for a cold compartment which runs also during vehicle stand still, or an external source like a “exhaust stream” of a building climatisation) can cause this failure, if the ambient of this sensor is not equal to the “normal” ambient! --> in this case no action needed! • Check wiring and connectors for correct contact (corrosion). • Check sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 006: Temperature in component ‘DPF’ • 008: Exhaust temperature upstream of diesel particulate filter
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of exhaust gas temperature sensor 2
Inspection procedure	Step1	If the diagnosis codes for injector occur, inspect a fault for the code first.
	Step2	Inspection of air flow & intake air temperature sensor (air flow sensing section) See the “(6) Inspection of exhaust gas temperature sensor 1 and 2 (DPF exhaust gas temperature sensor 1 and 2)” of section 5.

3248-0: Component 'Temperature sensor "SCR catalytic converter" 2' has a short circuit or is defective.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously if the ADC module does not report any error.
		[Fault Detection] • Voltage from the SCR temperature sensor 2 is above 4 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 700.00ms • Failure is detected if active for 50% of the time
Fault healing		• Voltage from the SCR temperature sensor 2 is below 4 V.
System reaction		• The last valid value of the SCR temperature sensor 2 is used for a fraction of second after detection of this error and thereafter the value is replaced by 19.96°C {68°F}.
		• Manual DPF regeneration not available
Failure cause		• Sensor defective or short circuit in wiring to external source
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 011: Temperature at component ‘SCR catalytic converter (BACK)’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of SCR temperature sensor 2
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of SCR temperature sensor 2. Check the circuit across Engine electronic control unit and SCR temperature sensor 2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “SCR temperature sensor 2”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and ATS harness. Check the circuit across Engine electronic control unit and Connection of chassis harness and ATS harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across SCR temperature sensor 2 and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

3248-1: Component 'Temperature sensor "SCR catalytic converter" 2' has a short circuit to ground. / Component 'Temperature sensor "SCR catalytic converter" 2' is defective.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously if the ADC module does not report any error.
	[Fault Detection] • Voltage from the SCR temperature sensor 2 is below 500 mV.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 700.00ms • Failure is detected if active for 50% of the time
Fault healing	• Voltage from the SCR temperature sensor 2 is above 500 mV.

System reaction		• The last valid value of the SCR temperature sensor 2 is used for a fraction of second after detection of this error and thereafter the value is replaced by 19.96°C {68°F}.
		• Manual DPF regeneration not available
Failure cause		• Sensor defective or short circuit in wiring to ground
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 011: Temperature at component 'SCR catalytic converter (BACK)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of SCR temperature sensor 2
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and ATS harness. Check the circuit across Engine electronic control unit and Connection of chassis harness and ATS harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10

Inspection procedure	Step9	Repair or replace the harness across SCR temperature sensor 2 and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

3248-16: Signal 'Exhaust temperature downstream of SCR catalytic converter' is faulty.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • continuously if analogic Digital Converter module doesn't report any error and the Signal Range Check error for the catalyst downstream temperature sensor is not set
		[Fault Detection] • The sensor signal is above 999.96°C {1831.93°F}
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing		• The sensor signal is below 999.96°C {1831.93°F}
System reaction		• The last valid value of the SCR temperature sensor 2 is used for a fraction of second after detection of this error and thereafter the value is replaced by 19.96°C {68°F}.
		• Manual DPF regeneration not available
Failure cause		• DEF Catalyst temperature downstream sensor drifted or not correctly mounted • Partial short circuit on wiring harness or sensor
Failure repair		• Check sensor • Check wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 011: Temperature at component 'SCR catalytic converter (BACK)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of SCR temperature sensor 2
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of SCR temperature sensor 2. Check the circuit across Engine electronic control unit and SCR temperature sensor 2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step

Inspection procedure	Step3	Turn the starter switch in OFF. Replace component “SCR temperature sensor 2”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and ATS harness. Check the circuit across Engine electronic control unit and Connection of chassis harness and ATS harness for open or short circuit. Make a visual check on each connector. 3248-18: Signal 'Exhaust temperature downstream of SCR catalytic converter' is faulty.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • continuously if analogic Digital Converter module doesn’t report any error and the Signal Range Check error for the DEF tank temperature sensor is not set
	[Fault Detection] • The sensor signal is below -45.04°C {-49.07°F}.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing	• The sensor signal is above -45.04°C {-49.07°F}.
System reaction	• The last valid value of the SCR temperature sensor 2 is used for a fraction of second after detection of this error and thereafter the value is replaced by 19.96°C {68°F}.
	• Manual DPF regeneration not available
Failure cause	• DEF Catalyst temperature downstream sensor drifted or not correctly mounted • Partial short circuit on wiring harness or sensor

Failure repair		• Check sensor • Check wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 011: Temperature at component ‘SCR catalytic converter (BACK)’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of SCR temperature sensor 2
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of SCR temperature sensor 2. Check the circuit across Engine electronic control unit and SCR temperature sensor 2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step
	Step3	Turn the starter switch in OFF. Replace component “SCR temperature sensor 2”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and ATS harness. Check the circuit across Engine electronic control unit and Connection of chassis harness and ATS harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across SCR temperature sensor 2 and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

Inspection procedure	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

3251-18: The value of component 'B37 (DPF differential pressure sensor)' is implausible. The minimum pressure was not reached.

Generation condition		[Test Condition] • Monitoring is active if the ECU is not in afterrun • The check is carried out continuously in the 100 ms interval if not inhibited by another failure. • There is no pending regeneration • The volume flow lies above the threshold 500.00 m^3/h
		[Fault Detection] • A failure is detected if the particulate filter differential pressure is below the monitoring threshold stored in the map depending on the simulated soot mass and the exhaust volume flow.
		[Defect Debouncing] • Defect condition fulfilled continuously >5000.0 ms
Fault healing		• No healing possible (disabled by Data set)
System reaction		• None
		• None
Failure cause		• Filter is not installed or has an internal breakthrough
Failure repair		• Check filter for proper installation and function (no black smoke at exhaust pipe)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 021: Pressure differential in diesel particulate filter • 022: Pressure differential of component ‘DPF’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #334 Inspection of DPF differential pressure sensor
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3253-16: The signal value of component 'Differential pressure sensor of diesel particular filter' is implausible.

Generation condition	[Test Condition] • Condition is tested during ECM after-run 2 s, after turning key off.
	[Fault Detection] • Differential pressure signal is above the allowable limit of 2.5 kPa {0.4 psi, 0.0 kgf/cm^2}.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00ms • Failure is detected if active for 50% of the time
Fault healing	• Adapted differential pressure signal is below 2.5 kPa {0.4 psi, 0.0 kgf/cm^2}.
System reaction	• None
	• None
Failure cause	• Differential pressure sensor is inaccurate.
Failure repair	• Check accuracy of differential pressure sensor.

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 021: Pressure differential in diesel particulate filter • 022: Pressure differential of component 'DPF'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #334 Inspection of DPF differential pressure sensor
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DPF differential pressure sensor. Check the circuit across DPF differential pressure sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component "DPF differential pressure sensor". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DPF differential pressure sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3285-2: The pressure differential in the diesel particulate filter is too high.

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun • Dynamic check not inhibited by another failure
	[Fault Detection] • Changes of the flow rate signal and the differential pressure signal are abnormal.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 900.00ms • Failure is detected if active for 50% of the time
Fault healing	• When the change of differential pressure is greater than or equal to the positive minimum value or smaller than or equal to the negative minimum value, healing takes place.
System reaction	• Signal range check for the flow rate signal and differential pressure signal.
	• None

Failure cause		• Dynamic plausibility check of the DPF differential pressure sensor. Possibly Pressure sensor failure, connection tubes or filter substrate.
Failure repair		• Please check differential pressure sensor as well as connection tubes. If failure remains, check particulate filter substrate if missing.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 021: Pressure differential in diesel particulate filter • 022: Pressure differential of component 'DPF'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #334 Inspection of DPF differential pressure sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Pressure hose of DPF differential pressure sensor Ceramic filter of Diesel particulate filter muffler Check DPF differential pressure hose; repair or replace it if there is a problem.Check DPF; repair or replace it if there is a problem.If DPF differential pressure hose has been corrected or replaced, perform the learned value resetting procedure of DPF differential pressure sensor learned by Engine electronic control unit.For procedures, refer to the Shop Manual. Go to Step2
	Step2	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DPF differential pressure sensor. Check the circuit across DPF differential pressure sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component "DPF differential pressure sensor". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DPF differential pressure sensor which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

3285-17: Check hose between diesel particulate filter and component 'Differential pressure sensor of diesel particular filter' for correct connection.

Generation condition		[Test Condition] • Monitoring is active if the ECU is not in afterrun • If monitoring not inhibited by another failure
		[Fault Detection] • Filtered differential pressure signal is below the minimum value of 2.5 kPa {0.4 psi, 0.0 kgf/cm^2}.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing		• None
System reaction		• None
		• None
Failure cause		• Hose connection upstream from the particle filter detached or completely blocked. • Atmospheric pressure is constantly present at the pressure connection upstream from the particle filter.
Failure repair		• Check mounting, check hose line
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 021: Pressure differential in diesel particulate filter • 022: Pressure differential of component ‘DPF’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #334 Inspection of DPF differential pressure sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Pressure hose of DPF differential pressure sensor Check DPF differential pressure hose; repair or replace it if there is a problem. If DPF differential pressure hose has been corrected or replaced, perform the learned value resetting procedure of DPF differential pressure sensor learned by Engine electronic control unit. For procedures, refer to the Shop Manual. Go to Step2
	Step2	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DPF differential pressure sensor. Check the circuit across DPF differential pressure sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “DPF differential pressure sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DPF differential pressure sensor which Engine electronic control unit learns. Go to Step5

Inspection procedure	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

3287-0: The signal voltage of component 'Differential pressure sensor of diesel particular filter' is too high.

Generation condition		[Test Condition] • ADC has not reported a module error (no failure “ADC...” active). Continuous Monitoring
		[Fault Detection] • Voltage from the DPF differential pressure sensor is above 4.9 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.80s • Failure is detected if active for 50% of the time
Fault healing		• Voltage from the DPF differential pressure sensor is below 4.9 V.
System reaction		• The last valid value of the DPF differential pressure sensor is used for a fraction of second after detection of this error and thereafter the value is replaced by 0.1 kPa {0.0 psi, 0.0 kgf/cm^2}.
		• None
Failure cause		• Short circuit of sensor to external source or defective sensor
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 021: Pressure differential in diesel particulate filter • 022: Pressure differential of component ‘DPF’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #334 Inspection of DPF differential pressure sensor
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DPF differential pressure sensor. Check the circuit across DPF differential pressure sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

Inspection procedure	Step3	Turn the starter switch in OFF. Replace component “DPF differential pressure sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DPF differential pressure sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3287-1: The signal voltage of component 'Differential pressure sensor of diesel particular filter' is too low.

Generation condition		[Test Condition] • ADC has not reported a module error (no failure “ADC...” active). Continuous Monitoring
		[Fault Detection] • Voltage from the DPF differential pressure sensor is below 200.4 mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.80s • Failure is detected if active for 50% of the time
Fault healing		• Voltage from the DPF differential pressure sensor is above 200.4 mV.
System reaction		• The last valid value of the DPF differential pressure sensor is used for a fraction of second after detection of this error and thereafter the value is replaced by 0.1 kPa {0.0 psi, 0.0 kgf/cm^2}.
		• None
Failure cause		• Short circuit of wiring to ground or defective sensor
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 021: Pressure differential in diesel particulate filter • 022: Pressure differential of component ‘DPF’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #334 Inspection of DPF differential pressure sensor
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2

Inspection procedure	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DPF differential pressure sensor. Check the circuit across DPF differential pressure sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “DPF differential pressure sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DPF differential pressure sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3360-31: Cavity detected around SCR tank heater A cavity was detected in the heating element of the DEF tank.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • tank heater was activated longer than an applicable time threshold 20 s • Cavity check not inhibited by another failure • Tank temperature < 1.96°C {35.53°F}
	[Fault Detection] • Heater current when unfreezing DEF is below the specified value.
	[Defect Debouncing] • Defect condition fulfilled continuously >50.0 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• DEF injecting action is deactivated.
	• None
Failure cause	• During tank defrosting, DEF consumption is higher than DEF quantity that can be defrosted by tank heater.
Failure repair	• No repair intervention necessary.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 128: Status of component ‘DEF heating element’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #773 Inspection of DEF heater power unit

Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3361-2: The measurement value of component 'NOx sensor' is outside the measuring range.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup and if the ECU is not in afterrun. • Monitor not inhibited by another failure • Monitor execution is requested, this monitor is normally executed only if an efficiency problem on the catalyst was detected. • Urea dosing released. • SCR protection not active. • Engine speed - 3500rpm. • Engine speed gradient< 180rpm/s. • Engine load within 0mg/cyc and 80mg/cyc. • Engine load gradient < 8mg/cyc. • Catalyst temperature within 479.96°C {864°F}.
		[Fault Detection] • Ratio between NOx downstream measured value divided by NOx upstream measured value outside the range 0.75 to 1.25.
		[Defect Debouncing] • Totally 0.00- failed tests.
Fault healing		• NOx ratio WITHIN the range 0.75 to 1.25.
System reaction		• None
		• None
Failure cause		• NOx downstream Sensor does not measure correctly.
Failure repair		• Replace NOx sensor downstream.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

3361-3: Component 'DEF metering device' has a short circuit to positive.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is active. • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-)
	[Fault Detection] • Short-circuit to positive of DEF dosing module (dosing valve) harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1.80s • Failure is detected if active for 50% of the time
Fault healing	• To give the possibility for healing, an electric impulse is sent to power stage at every 1000 ms for 5 times in actual driving cycle. Failure is healed if the power stage does not report a SCB error. No other healing is possible at this driving cycle.
System reaction	• Power stage is deactivated.
	• Manual DPF regeneration not available

Failure cause		• Short circuit of wiring (Ground wire) to external source or inside DEF Dosing Valve Actuator
Failure repair		• Check of wiring or replace DEF Dosing Valve Actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF dosing module. Check the circuit across DEF dosing module and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “DEF dosing module”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF dosing module which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

3361-4: Component 'DEF metering device' has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is NOT active. • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-)
		[Fault Detection] • Short-circuit to ground of DEF dosing module (dosing valve) harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• Manual DPF regeneration not available
Failure cause		• Short circuit of wiring (Ground Wire) to ground or inside DEF Dosing Valve Actuator
Failure repair		• Check of wiring or replace DEF Dosing Valve Actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF dosing module. Check the circuit across DEF dosing module and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “DEF dosing module”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF dosing module which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed

Inspection procedure	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

3361-5: Component 'DEF metering device' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is not active. • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-)
		[Fault Detection] • Open-circuit of DEF dosing module (dosing valve) harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.80s • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• Manual DPF regeneration not available
Failure cause		• Broken or disconnected wiring or defective DEF Dosing Valve Actuator
Failure repair		• Check of wiring, replace DEF Dosing Valve Actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF dosing module. Check the circuit across DEF dosing module and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “DEF dosing module”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF dosing module which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed

Inspection procedure	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

3361-7: Component 'DEF metering device' is faulty.

Generation condition		[Test Condition] • Monitoring not inhibited by another failure. • The System must be ready for DEF injection (State “Pressure Control” / Sub state “Metering control”) • Ambient pressure between 74 kPa {11 psi, 0.8 kgf/cm^2} and 130 kPa {19 psi, 1.3 kgf/cm^2}. • Battery Voltage between 10 V and 16 V. • DEF pressure between 0 kPa {0 psi, 0 kgf/cm^2} and 1 MPa {145 psi, 10 kgf/cm^2}. • Coil temperature of DEF injection valve between -0.04°C {32°F} and 119.96°C {247.93°F}.
		[Fault Detection] • “Not opening” condition of the DEF dosing module (dosing valve) is detected for 150 times or more.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 150.00 events • Failure is detected if active for 50% of events
Fault healing		• None
System reaction		• DEF injecting action is deactivated (engine output limitation is likely to prevent the DEF dosing module (dosing valve) from overheating).
		• Manual DPF regeneration not available
Failure cause		• Dosing valve blocked mechanically (or frozen)
Failure repair		• Check if dosing valve opens. • Check if tube between pump and dosing valve is free.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3361-12: Component 'DEF metering device' has overtemperature.

Generation condition	[Test Condition] • Monitoring only when the power stage is active. • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-)
	[Fault Detection] • Overcurrent is detected in the DEF dosing module (dosing valve).
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• To give the possibility for healing, an electric impulse is sent to power stage at every 5 s for 5 times in actual driving cycle. Failure is healed if the power stage does not report an OT error. No other healing is possible at this driving cycle.

System reaction		• Power stage is deactivated.
		• Manual DPF regeneration not available
Failure cause		• High battery voltage, high ECU temperature and high load or defective wiring, power stage or DEF Dosing Valve Actuator defective
Failure repair		• Check battery voltage, wiring, power stage and DEF Dosing Valve Actuator.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF dosing module. Check the circuit across DEF dosing module and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “DEF dosing module”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF dosing module which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3362-0: The electrical line from control unit 'Combustion engine Control unit' to component 'DEF pressure sensor' has a short circuit. / Component 'DEF pressure sensor' is defective.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • ECU Hardware does not report an ADC failure.
		[Fault Detection] • Voltage from the DEF pressure sensor is above 2.82 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 300.00ms • Failure is detected if active for 50% of the time
Fault healing		• None
System reaction		• The last valid value of the DEF pressure sensor is used for a fraction of second after detection of this error and thereafter the value is replaced by 0.2 kPa {0.0 psi, 0.0 kgf/cm^2}.
		• Manual DPF regeneration not available
Failure cause		• Short circuit of sensor to external source or defective sensor
Failure repair		• Check wiring and sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 026: Pressure of component ‘DEF Delivery pump’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF pressure sensor. Check the circuit across Engine electronic control unit and DEF pressure sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed

Inspection procedure	Step6	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step8
	Step7	Repair or replace the harness across DEF pressure sensor and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2
	Step8	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

3362-1: Component 'DEF pressure sensor' has a short circuit to ground.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • ECU Hardware does not report an ADC failure.
	[Fault Detection] • Voltage from the DEF pressure sensor is below 230 mV.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 300.00ms • Failure is detected if active for 50% of the time
Fault healing	• None
System reaction	• The last valid value of the DEF pressure sensor is used for a fraction of second after detection of this error and thereafter the value is replaced by 0.2 kPa {0.0 psi, 0.0 kgf/cm^2}.
	• Manual DPF regeneration not available
Failure cause	• Short circuit of sensor to ground or defective sensor
Failure repair	• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 026: Pressure of component ‘DEF Delivery pump’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF pressure sensor. Check the circuit across Engine electronic control unit and DEF pressure sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step8
	Step7	Repair or replace the harness across DEF pressure sensor and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2
	Step8	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

3362-7: Component 'DEF switchover valve' is faulty.

Generation condition		[Test Condition] • Monitoring not inhibited by another failure. • System entered into PRESSURE REDUCTION state (reverting valve actuated, pump set to 15% and dosing valve fully closed) with DEF pressure > 400 kPa {58 psi, 4.1 kgf/cm^2}.
		[Fault Detection] • During pressure reduction state using DEF reverting valve, the pressure reduction ratio is below the specified value (pressure does not drop).
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing		• None
System reaction		• The DEF supply module (motor and heater) is deactivated and the DEF reduction valve is made temporarily open during after-running of the engine.
		• None
Failure cause		• Reverse valve does not work (blocked closed). • Back flow tube into tank clogged. • DEF pressure sensor stuck.
Failure repair		• Check if Back flow tube free. • Check if Reverse valve works with tester: set DEF pressure to 500kPa {73psi, 5.1kgf/cm^2} (dosing valve closed) - wait until pressure stable - actuate reverse valve --> if pressure does not drop down --> reverse valve does not work.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 132: Status of component 'DEF Reverting valve' (Input signal) • 133: Status of component 'DEF Reverting valve' (Output signal)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘DEF reverting valve’ is stuck. Plugged DEF tank Component ‘DEF pressure sensor’ is faulty. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF reverting valve. Remove the connector of Signal detect and actuation module. Check the circuit across Signal detect and actuation module and DEF reverting valve for open or short circuit. Check the circuit across Engine electronic control unit and DEF reverting valve for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10

Inspection procedure	Step5	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘DEF reverting valve’ is stuck. Plugged DEF tank Component ‘DEF pressure sensor’ is faulty. For procedures, refer to the Shop Manual. Go to Step8
	Step8	Perform the operation start and replace Engine electronic control unit. Go to Step9
	Step9	Inspection completed
	Step10	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness and DEF tank harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Repair or replace the harness across DEF reverting valve and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5
	Step12	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

3363-0: The signal voltage of component 'Heating element of DEF tank' is too high.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously, if ADC module does not report any error.
	[Fault Detection] • Voltage from the DEF heater power unit is above 3.2 V.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 50.00ms • Failure is detected if active for 50% of the time

Fault healing		• None
System reaction		• The last valid value of the DEF heater power unit is used for a fraction of second after detection of this error and thereafter the value is replaced by 41 µA.
		• None
Failure cause		• Wiring harness (short circuit) • Relay defect • DEF Tank heater element defect
Failure repair		• Check Wiring harness (short circuit) • Check Relay • Check DEF Tank heater element
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 128: Status of component 'DEF heating element'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF tank heater. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF temperature sensor and DEF tank heater for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF temperature sensor and DEF tank heater and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step11
	Step3	Turn the starter switch in OFF. Replace component "DEF tank heater". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component "DEF heater power unit". Reinstall all the removed connectors. Go to Step6

Inspection procedure	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF tank heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

3363-2: Component 'Heating element of DEF tank' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is NOT active. • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-) • Power stage not switched off, i.e. ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V) and Battery voltage < 16 V (switch off > 16.5 V)
		[Fault Detection] • Open-circuit of the DEF heater power unit harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• None
Failure cause		• Broken or disconnected wiring or defective DEF Tank Heater
Failure repair		• Check of wiring, replace DEF Tank Heater
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 128: Status of component ‘DEF heating element’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF tank heater. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF temperature sensor and DEF tank heater for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF temperature sensor and DEF tank heater and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step11
	Step3	Turn the starter switch in OFF. Replace component “DEF tank heater”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component “DEF heater power unit”. Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF tank heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

Inspection procedure	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

3363-3: Component 'Heating element of DEF tank' has a short circuit to positive.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is active. • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-) • Power stage not switched off, i.e. ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V) and Battery voltage < 16 V (switch off > 16.5 V)
		[Fault Detection] • Short-circuit to positive of the DEF heater power unit harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• None
Failure cause		• Short circuit of wiring to external source or inside DEF Tank Heater
Failure repair		• Check of wiring, replace DEF Tank Heater
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 128: Status of component ‘DEF heating element’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2

Inspection procedure	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF tank heater. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF temperature sensor and DEF tank heater for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF temperature sensor and DEF tank heater and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step11
	Step3	Turn the starter switch in OFF. Replace component “DEF tank heater”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component “DEF heater power unit”. Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed

Inspection procedure	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF tank heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

3363-4: Component 'Heating element of DEF tank' has a short circuit to ground.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is NOT active. • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-) • Power stage not switched off, i.e. ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V) and Battery voltage < 16 V (switch off > 16.5 V)
	[Fault Detection] • Short-circuit to ground of the DEF heater power unit harness is detected.
	[Defect Debouncing] • Defect condition exceeded immediately
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• Power stage is deactivated.
	• None
Failure cause	• Short circuit of wiring to ground or inside DEF Tank Heater
Failure repair	• Check of wiring, replace DEF Tank Heater

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 128: Status of component 'DEF heating element'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF tank heater. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF temperature sensor and DEF tank heater for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF temperature sensor and DEF tank heater and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step11
	Step3	Turn the starter switch in OFF. Replace component "DEF tank heater". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component "DEF heater power unit". Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component "DEF tank". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8

Inspection procedure	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF tank heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

3363-12: Component 'Heating element of DEF tank' is faulty.

Generation condition		[Test Condition] • Monitoring not inhibited by another failure. • Tank heater active • Vehicle speed > 10 km/h {6.2 mph} • Remaining DEF tank content > 31.99% • Internal release delay 60 s has expired • DEF tank temperature is outside of range -17.04°C {1.33°F} and -8.04°C {18°F}
		[Fault Detection] • DEF temperature does not rise when the DEF tank heater is operating.
		[Defect Debouncing] • Immediate
Fault healing		• If the signal returns to normal when the starter switch is set from OFF to ON position
System reaction		• None
		• None
Failure cause		• Heater in “air bubble” with frozen DEF --> check ambient conditions, if failure happened at temp < -10°{14°F} --> possible reason. • Tank heater defect • Wiring harness defect
Failure repair		• Check tank heater • Check wiring harness
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 130: DEF Delivery pump Electric motor (Specified Value) • 131: DEF Delivery pump Electric motor (Measured Value) • 132: Status of component 'DEF Reverting valve' (Input signal) • 133: Status of component 'DEF Reverting valve' (Output signal)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. If this fault code occurs under conditions of -10°C {14°F} or less, the fault may be transient; check the environment where the fault code occurs. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF line heater. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF line heater for open or short circuit. Check the circuit across DEF heater power unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF line heater and Ground for open or short circuit. Check the circuit across DEF supply module (motor and heater) and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized?

Inspection procedure	Step3	Turn the starter switch in OFF. Replace component “DEF line heater”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component “DEF heater power unit”. Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13

Inspection procedure	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF supply module (motor and heater). Repair or replace the harness across DEF heater power unit and DEF line heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

3470-3: Component 'Actuator in turbocharger' has a short circuit to positive.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is active.
	[Fault Detection] • Short-circuit to positive of the VGT vacuum modulator harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 480.00ms • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• Power stage is deactivated.
	• Slightly different drivability / noise • Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• Short circuit of wiring to external source or inside PWM actuator
Failure repair	• Check of wiring, replace PWM actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 121: PWM signal of component ‘Actuator in turbocharger’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of VGT vacuum modulator. Remove the connector of Signal detect and actuation module. Check the circuit across VGT vacuum modulator and Signal detect and actuation module for open or short circuit. Check the circuit across VGT vacuum modulator and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “VGT vacuum modulator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Turbocharger which Engine ECU learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3470-4: Component 'Actuator in turbocharger' has a short circuit to ground.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is NOT active.
	[Fault Detection] • Short-circuit to ground of the VGT vacuum modulator harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 480.00ms • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• Power stage is deactivated.
	• Slightly different drivability / noise • Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• Short circuit of wiring to ground or inside PWM
Failure repair	• Check of wiring, replace PWM actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 121: PWM signal of component ‘Actuator in turbocharger’

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of VGT vacuum modulator. Remove the connector of Signal detect and actuation module. Check the circuit across VGT vacuum modulator and Signal detect and actuation module for open or short circuit. Check the circuit across VGT vacuum modulator and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “VGT vacuum modulator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Turbocharger which Engine ECU learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3470-5: Component 'Actuator in turbocharger' has an open circuit.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is NOT active. • Open load diagnosis can be asked by another failure.
	[Fault Detection] • Open-circuit of the VGT vacuum modulator harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 480.00ms • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position

System reaction		• Power stage is deactivated.
		• Slightly different drivability / noise • Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Broken or disconnected wiring, defective PWM actuator
Failure repair		• Check of wiring, replace PWM actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 121: PWM signal of component 'Actuator in turbocharger'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of VGT vacuum modulator. Remove the connector of Signal detect and actuation module. Check the circuit across VGT vacuum modulator and Signal detect and actuation module for open or short circuit. Check the circuit across VGT vacuum modulator and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component "VGT vacuum modulator". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Turbocharger which Engine ECU learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3470-12: Component 'Actuator in turbocharger' has an internal fault.

Generation condition		[Test Condition] • Monitoring only when the power stage is active.
		[Fault Detection] • Overcurrent is detected in the VGT vacuum modulator.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• Slightly different drivability / noise • Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• High battery voltage, high ECU temperature and high load or defective wiring, power stage or VGT actuator
Failure repair		• Check wiring, power stage and VGT actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 121: PWM signal of component ‘Actuator in turbocharger’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of VGT vacuum modulator. Remove the connector of Signal detect and actuation module. Check the circuit across VGT vacuum modulator and Signal detect and actuation module for open or short circuit. Check the circuit across VGT vacuum modulator and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “VGT vacuum modulator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Turbocharger which Engine ECU learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6

Inspection procedure	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of VGT vacuum modulator. Remove the connector of Signal detect and actuation module. Check the circuit across VGT vacuum modulator and Signal detect and actuation module for open or short circuit. Check the circuit across VGT vacuum modulator and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step4

3517-1: The DEF tank is empty.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • DEF tank is empty.
		[Defect Debouncing] • Defect condition fulfilled continuously > 500.0 ms
Fault healing		• Calculated Tank level > 0
System reaction		• None
		• None
Failure cause		• Tank is empty
Failure repair		• Refill DEF tank
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 125: Fill level of DEF tank • 126: Status of DEF fill level
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3597-0: Measurement value (Supply voltages) of the component 'Combustion engine Control unit' is above the specified value.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • Power supply voltage of the engine ECU is above the specified limit.
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• Power supply voltage of the engine ECU is below the specified limit.
System reaction	• None
	• None
Failure cause	• Excessive voltage supply of a Low side power drivers component: High battery voltage, defective wiring, internal defect of the ECM
Failure repair	• Check the battery for correct voltage supply, check wiring. If defect remains replace ECM (internal defect)

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 031: Battery voltage
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #860 Battery
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Signal detect and actuation module. Check the circuit across Signal detect and actuation module and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Perform the operation start and replace Signal detect and actuation module. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Signal detect and actuation module which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3597-1: Measurement value (Supply voltages) of the component 'Combustion engine Control unit' is below the specified value.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • Power supply voltage of the engine ECU is below the specified limit.
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• Power supply voltage of the engine ECU is above the specified limit.
System reaction	• None
	• None
Failure cause	• Insufficient voltage supply of a Low side power drivers component: Low battery voltage, defective wiring, internal defect of the ECM

Failure repair		• Check the battery for sufficient voltage supply, check wiring. If defect remains replace ECM (internal defect)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 031: Battery voltage
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #860 Battery
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Signal detect and actuation module. Check the circuit across Signal detect and actuation module and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Perform the operation start and replace Signal detect and actuation module. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Signal detect and actuation module which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

3597-12: The power supply is faulty./Component 'A4 (Engine electronic control unit)' has an internal fault.

Generation condition	[Test Condition] • Continuously.
	[Fault Detection] • Voltage of the sensor power supply system 1 is out of specification.
	[Defect Debouncing] • Defect condition fulfilled continuously >100.0 ms
Fault healing	• The supply voltage must lie within the thresholds.
System reaction	• None
	• Limit engine speed to max 1500 rpm • Accelerator pedal disabled • Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm

Failure cause		• Excessive battery voltage, defect in wiring harness, electrical failure in connected sensors or in the ECM
Failure repair		• Check battery voltage, check wiring for correct voltage supply of the connected sensor and the ECM. • Replace ECM
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 026: Pressure of component 'DEF Delivery pump' • 037: Signal voltage of component 'Position sensor 'Accelerator pedal'1' • 121: PWM signal of component 'Actuator in turbocharger' • 153: Accelerator pedal sensor 1 (raw value) • 154: Accelerator pedal sensor 1
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #324 Inspection of accelerator pedal position sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Position sensor is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Camshaft timing sensor is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with DEF pressure sensor is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Accelerator pedal position sensor is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Blow-by pressure sensor 1 is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Perform the operation start and replace Engine electronic control unit. Inspection completed

3598-12: The power supply is faulty./Component 'A4 (Engine electronic control unit)' has an internal fault.

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • Voltage of the sensor power supply system 2 is out of specification.
		[Defect Debouncing] • Defect condition fulfilled continuously >100.0 ms
Fault healing		• The supply voltage lies within the thresholds.
System reaction		• None
		• Limit engine speed to max 1500 rpm • AC off • Slightly different drivability / noise • Accelerator pedal disabled • Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Low idle speed adjustment disabled • Low idle speed adjustment disabled
Failure cause		• Excessive battery voltage, defect in wiring harness, electrical failure in connected sensors or in the ECM
Failure repair		• Check battery voltage, check wiring for correct voltage supply of the connected sensor and the ECM. • Replace ECM
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 002: Temperature at component ‘Boost pressure / Temperature sensor’ • 017: Boost pressure • 025: Rail pressure • 038: Signal voltage of component ‘Position sensor ‘Accelerator pedal’2’ • 045: Sensor voltage (Signal voltage of component ‘Torque sensor ‘Power take-off”) (raw value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rai • 004: Boost pressure control 1 • 005: Boost pressure control 2
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of pressure sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Boost pressure and temperature sensor is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Pressure sensor is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Accelerator pedal position sensor is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with PTO load sensor (for cab back) is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Perform the operation start and replace Engine electronic control unit. Inspection completed

3599-12: Component 'A4 (Engine electronic control unit)' has an internal fault./General calibration fault

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • Voltage of the sensor power supply system 3 is out of specification.
		[Defect Debouncing] • Defect condition fulfilled continuously >100.0 ms
Fault healing		• The supply voltage lies within the thresholds.
System reaction		• None
		• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• Excessive battery voltage, defect in wiring harness, electrical failure in connected sensors or in the ECM
Failure repair		• Check battery voltage, check wiring for correct voltage supply of the connected sensor and the ECM. • Replace ECM
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 015: Ambient temperature • 021: Pressure differential in diesel particulate filter • 022: Pressure differential of component ‘DPF’ • 023: Engine oil pressure • 056: Humidity of intake air • 105: Soot content of diesel particulate filter • 113: Exhaust gas volume flow rate
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #044 Inspection of oil pressure switch • #334 Inspection of DPF differential pressure sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with EGR actuator is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Humidity and intake air temperature sensor is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with DPF differential pressure sensor is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Oil pressure switch is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Blow-by pressure sensor 2 is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Perform the operation start and replace Engine electronic control unit. Inspection completed

3659-0: Corrected value of voltage for opening the injector 1 is out of valid range.

Generation condition		[Test Condition] • Continuous
		[Fault Detection] • Opening voltage corrected by learned factor and temperature compensation is out of fuel pressure dependant range.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5000.00 events • Failure is detected if active for 50% of events
Fault healing		• Opening voltage corrected by learned factor and temperature compensation is within fuel pressure dependant range.
System reaction		• Possibly irregular engine running due to non-equilibrated injection quantity. • Possibly too high emissions (possibly failure recognition if applied)
		• None
Failure cause		• Additional resistances in the wiring of injectors (connectors) • Electric part of injectors (See “6. Inspections to be Made at Injector Error Occurrence) • ECU internal defect (Injector power stage / Booster)
Failure repair		• Check wiring • Check injectors, replace them if necessary • Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Injector No.1 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.1 cylinder which Engine electronic control unit learns. Perform coding of Injector No.1 cylinder which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4

Inspection procedure	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3659-6: The fuel injector (cylinder 1) has a short circuit to ground.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Short-circuit of No. 1 injector harness is detected for 4 times or more.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing		• None
System reaction		• None
		• Reduced power available due injector shut off • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Short circuit in wiring or injector (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• Check wiring, replace fuel injector of cylinder 1.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6
	Step2	Turn the starter switch in OFF. Replace component “Injector No.1 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.1 cylinder which Engine electronic control unit learns. Perform coding of Injector No.1 cylinder which Engine electronic control unit learns. Go to step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5

Inspection procedure	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

3659-15: Discharge time of injector 1 is out of valid range.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Discharge time difference to the nominal value >= 60 µs
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5000.00 events • Failure is detected if active for 50% of events
Fault healing		• Discharge time difference to the nominal value < 60 µs
System reaction		• Possibly irregular engine running due to non-equilibrated injection quantity. • Possibly too high emissions (possibly failure recognition if applied)
		• None
Failure cause		• Additional resistances in the wiring of injectors (connectors) • Electric part of injectors (See “6. Inspections to be Made at Injector Error Occurrence) • ECU internal defect (Injector power stage / Booster)
Failure repair		• Check wiring • Check injectors, replace them if necessary • Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Injector No.1 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.1 cylinder which Engine electronic control unit learns. Perform coding of Injector No.1 cylinder which Engine electronic control unit learns. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3659-16: The voltage for opening the injector 1 is out of valid range.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Difference of the actual voltage from the required one >= 20 V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5000.00 events • Failure is detected if active for 50% of events
Fault healing		• Difference of the actual voltage from the required one < 20 V
System reaction		• Possibly irregular engine running due to non-equilibrated injection quantity. • Possibly too high emissions (possibly failure recognition if applied)
		• None
Failure cause		• Additional resistances in the wiring of injectors (connectors) • Electric part of injectors (See “6. Inspections to be Made at Injector Error Occurrence) • ECU internal defect (Injector power stage / Booster)
Failure repair		• Check wiring • Check injectors, replace them if necessary • Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6

Inspection procedure	Step2	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? Go to Step3
	Step3	Turn the starter switch in OFF. Replace component “Injector No.1 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.1 cylinder which Engine electronic control unit learns. Perform coding of Injector No.1 cylinder which Engine electronic control unit learns. No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3660-0: Corrected value of voltage for opening the injector 3 is out of valid range.

Generation condition	[Test Condition] • Continuous
	[Fault Detection] • Opening voltage corrected by learned factor and temperature compensation is out of fuel pressure dependant range.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 5000.00 events • Failure is detected if active for 50% of events
Fault healing	• Opening voltage corrected by learned factor and temperature compensation is within fuel pressure dependant range.
System reaction	• Possibly irregular engine running due to non-equilibrated injection quantity. • Possibly too high emissions (possibly failure recognition if applied)
	• None
Failure cause	• Additional resistances in the wiring of injectors (connectors) • Electric part of injectors (See “6. Inspections to be Made at Injector Error Occurrence) • ECU internal defect (Injector power stage / Booster)
Failure repair	• Check wiring • Check injectors, replace them if necessary • Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 071: Correction value of fuel quantity (Cylinder 3)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #582 Inspection of injector

Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.3 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.3 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Injector No.3 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.3 cylinder which Engine electronic control unit learns. Perform coding of Injector No.3 cylinder which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3660-6: The fuel injector (cylinder 3) has a short circuit to ground.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Short-circuit of No. 3 injector harness is detected for 4 times or more.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing		• None
System reaction		• None
		• Reduced power available due injector shut off • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Short circuit in wiring or injector (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• Check wiring, replace fuel injector of cylinder 3.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 071: Correction value of fuel quantity (Cylinder 3)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.3 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.3 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step2 Yes: Go to step6
	Step2	Turn the starter switch in OFF. Replace component “Injector No.3 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.3 cylinder which Engine electronic control unit learns. Perform coding of Injector No.3 cylinder which Engine electronic control unit learns. Go to step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Inspection completed

Inspection procedure	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step4 Yes: Go to step2

3660-15: Discharge time of injector 3 is out of valid range.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Discharge time difference to the nominal value >= 60 µs
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5000.00 events • Failure is detected if active for 50% of events
Fault healing		• Discharge time difference to the nominal value < 60 µs
System reaction		• Possibly irregular engine running due to non-equilibrated injection quantity. • Possibly too high emissions (possibly failure recognition if applied)
		• None
Failure cause		• Additional resistances in the wiring of injectors (connectors) • Electric part of injectors (See “6. Inspections to be Made at Injector Error Occurrence) • ECU internal defect (Injector power stage / Booster)
Failure repair		• Check wiring • Check injectors, replace them if necessary • Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 071: Correction value of fuel quantity (Cylinder 3)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.3 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.3 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Injector No.3 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.3 cylinder which Engine electronic control unit learns. Perform coding of Injector No.3 cylinder which Engine electronic control unit learns. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3660-16: The voltage for opening the injector 3 is out of valid range.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Difference of the actual voltage from the required one >= 20 V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5000.00 events • Failure is detected if active for 50% of events
Fault healing		• Difference of the actual voltage from the required one < 20 V

Check the circuit across Injector No.3 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6

Inspection procedure	Step2	Turn the starter switch in OFF. Replace component “Injector No.3 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.3 cylinder which Engine electronic control unit learns. Perform coding of Injector No.3 cylinder which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3661-0: Corrected value of voltage for opening the injector 4 is out of valid range.

Generation condition	[Test Condition] • Continuous
	[Fault Detection] • Opening voltage corrected by learned factor and temperature compensation is out of fuel pressure dependant range.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 5000.00 events • Failure is detected if active for 50% of events
Fault healing	• Opening voltage corrected by learned factor and temperature compensation is within fuel pressure dependant range.
System reaction	• Possibly irregular engine running due to non-equilibrated injection quantity. • Possibly too high emissions (possibly failure recognition if applied)
	• None
Failure cause	• Additional resistances in the wiring of injectors (connectors) • Electric part of injectors (See “6. Inspections to be Made at Injector Error Occurrence) • ECU internal defect (Injector power stage / Booster)
Failure repair	• Check wiring • Check injectors, replace them if necessary • Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 072: Correction value of fuel quantity (Cylinder 4)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #582 Inspection of injector

Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.4 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.4 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Injector No.4 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.4 cylinder which Engine electronic control unit learns. Perform coding of Injector No.4 cylinder which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3661-6: The fuel injector (cylinder 4) has a short circuit to ground.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • Short-circuit of No. 4 injector harness is detected for 4 times or more.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 4.00 events • Failure is detected if active for 20% of events
Fault healing	• None
System reaction	• None
	• Reduced power available due injector shut off • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available

No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Injector No.2 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.2 cylinder which Engine electronic control unit learns. Perform coding of Injector No.2 cylinder which Engine electronic control unit learns. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3662-16: The voltage for opening the injector 2 is out of valid range.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Difference of the actual voltage from the required one >= 20 V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5000.00 events • Failure is detected if active for 50% of events
Fault healing		• Difference of the actual voltage from the required one < 20 V
System reaction		• Possibly irregular engine running due to non-equilibrated injection quantity. • Possibly too high emissions (possibly failure recognition if applied)
		• None
Failure cause		• Additional resistances in the wiring of injectors (connectors) • Electric part of injectors (See “6. Inspections to be Made at Injector Error Occurrence) • ECU internal defect (Injector power stage / Booster)
Failure repair		• Check wiring • Check injectors, replace them if necessary • Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 073: Correction value of fuel quantity (Cylinder 2)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.2 cylinder. If corresponding fault codes are also present on other components, check the common power supply and common ground point ‘‘ for open circuit and short circuit. Check the circuit across Injector No.2 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6

Inspection procedure	Step2	Turn the starter switch in OFF. Replace component “Injector No.2 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.2 cylinder which Engine electronic control unit learns. Perform coding of Injector No.2 cylinder which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

3696-2: The signal value of component 'Regeneration of diesel particulate filter Switches' is implausible.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • DPF cleaning switch is depressed for 60 seconds continuously while the vehicle is running.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 60.00s • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• None
	• None
Failure cause	• Emergency regeneration switch pressed at high vehicle speed or switch defective
Failure repair	• Check emergency regeneration switch
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #089 Inspection of switch

Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

3701-2: The value measured by component 'Differential pressure sensor of diesel particular filter' is too high.

Generation condition		[Test Condition] • The check is carried out continuously.
		[Fault Detection] • Pressure drop at DPF is above the specified value.
		[Defect Debouncing] • Defect condition fulfilled continuously >15000.0 ms
Fault healing		• None
System reaction		• None
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm • Automatic regeneration no available -> risk for DPF overload
Failure cause		• DPF is clogged. • Filter regeneration was not successful or not possible.
Failure repair		• Launch service regeneration via tester and check filter and exhaust system.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

3702-2: Regeneration of the diesel particulate filter was aborted.

Generation condition	[Test Condition] • The exhaust-gas volume flow > 300 m^3/h. • The temperature of DPF < 399.96°C {752°F}. • For DPF load detection, the calculation from the differential pressure is active, and not the simulation. • Successful regeneration has been completed, driving distance since regeneration < 15 km
	[Fault Detection] • Calculated soot mass is out of the specified value.
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• None
	• None
Failure cause	• Real ash load too high or some restriction upstream OxiCat or differential pressure measuring wrong (rear hose clogged)
Failure repair	• Check exhaust for restrictions, check differential pressure sensor for gain failure, perform manual regeneration,
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 020: Pressure differential in diesel particulate filter (Correction values) • 021: Pressure differential in diesel particulate filter • 022: Pressure differential of component 'DPF' • 041: Sensor voltage (Pressure differential in diesel particulate filter) (raw value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #334 Inspection of DPF differential pressure sensor

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any abnormalities are found on DPF differential pressure hose, recheck it closely and replace as necessary. Check DPF differential pressure hose for clogging, and remedy it if any restriction is found. Check for the correct connection of DPF differential pressure hose; if not correct, rectify the connection. If DPF differential pressure hose has been corrected or replaced, perform the learned value resetting procedure of DPF differential pressure sensor learned by Engine electronic control unit. Check Exhaust system for clogging, and remedy it if any restriction is found. If this diagnosis code has occurred again even after conducting DPF regeneration, clean or replace DPF. If DPF has been corrected or replaced, perform the learned value resetting procedure of DPF learned by Engine electronic control unit. For procedures, refer to the Shop Manual. Go to Step2
	Step2	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DPF differential pressure sensor. Check the circuit across DPF differential pressure sensor and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “DPF differential pressure sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DPF differential pressure sensor which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

3719-31: Uncontrolled regeneration has taken place.

Generation condition		[Test Condition] • Monitor not inhibited by another failure • If the frequent regeneration monitoring without second regeneration is not tested since last • successful regeneration • If regeneration is active and none of the worst case release conditions are fulfilled • If at least one of the worst case release conditions is fulfilled
		[Fault Detection] • Regeneration is started and since last regeneration no "worst case" condition is fulfilled: • Accumulated driven distance since last regeneration < 150km and accumulated engine running time since last regeneration < 3h and accumulated soot since last regeneration < 52g
		[Defect Debouncing] • Defect condition fulfilled continuously >1 events
Fault healing		• At least one "worst case" condition elapsed before new regeneration is triggered
System reaction		• None
		• None
Failure cause		• Leakage of injectors or any engine problem causing unexpected high soot emissions. • Too low air flow (leakage in intake air system), differential pressure not measure correctly (rear hose line clogged) or DOC front face blocked.
Failure repair		• Check leakage in intake system, check injectors. • Clean DOC front face mechanically and perform service regeneration if needed.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1) • 071: Correction value of fuel quantity (Cylinder 3) • 072: Correction value of fuel quantity (Cylinder 4) • 073: Correction value of fuel quantity (Cylinder 2)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

3726-16: The soot content of the diesel particulate filter is not OK.

Generation condition	[Test Condition] • The check is carried out continuously.
	[Fault Detection] • Actual soot accumulation volume at DPF is larger than that of the measured value, so that the regeneration of DPF cannot be performed.
	[Defect Debouncing] • Defect condition fulfilled continuously >100.0 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position.
System reaction	• None
	• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm • Automatic regeneration no available -> risk for DPF overload

Failure cause		• Special ambient conditions and vehicle use which does not allow correct DPF regeneration due to too low exhaust temperatures • Temperature sensor before Oxicat and/or before DPF shows too low temperature • Oxicat does not work correctly (bad HC burning) - in this case also a further dedicated failure should be stored and the vehicle shows blue smoke and strong odour.
Failure repair		• Service regeneration should be performed to reduce soot mass in the filter • If Service regeneration fails: see troubleshooting there.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 005: Temperature in component 'Diesel oxidation catalytic converter' • 006: Temperature in component 'DPF' • 007: Exhaust temperature upstream of diesel oxidation catalytic converter • 008: Exhaust temperature upstream of diesel particulate filter
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of exhaust gas temperature sensor 1 • #336 Inspection of exhaust gas temperature sensor 2
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

4009-3: Component 'Fuel filter heater' has a short circuit to positive.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V and as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded • Monitoring only active if power stage actuated, i.e. filter heating active , i.e. Fuel temp < -3.04°C {-5°F} (switch off at > 4.96°C {9°F}) AND engine NOT cranking AND engine speed > 5.00 rpm • Battery voltage > 9.50 V (switch off < 9.00 V) and test of redundant shut-off paths not active)
	[Fault Detection] • Short-circuit to positive of the fuel heater relay harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing	• To give the possibility for healing, an electric impulse is sent to power stage at every 1000 ms for 5 times in actual driving cycle. Failure is healed if the power stage does not report a "short to battery" (SCB) error. No other healing is possible at this driving cycle.
System reaction	• Power stage is deactivated.
	• None
Failure cause	• Short circuit of wiring to external source or inside fuel filter heater
Failure repair	• Check of wiring, replace fuel filter heater
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 149: Fuel filter heater
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #201 Inspection of relay (normally open type 5 pin)

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Fuel heater relay. Remove the connector of Signal detect and actuation module. Check the circuit across Signal detect and actuation module and Fuel heater relay for open or short circuit. Check the circuit across Engine electronic control unit and Fuel heater relay for open or short circuit. Check the circuit across Fuel heater relay and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step8
	Step3	Turn the starter switch in OFF. Replace component “Fuel heater relay”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspect or verify the following items. Repair or replace faulty items as necessary. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across Fuel heater relay and Connection of cab harness and chassis harness. Repair or replace the harness across Fuel heater relay and Signal detect and actuation module. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3

4009-4: Component 'Fuel filter heater' has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V and as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded • Monitoring only active if power stage NOT actuated, i.e. filter heating NOT active , i.e. Fuel temp > 4.96°C or engine cranking or engine speed < 5.00 rpm • Battery voltage > 9.50 V (switch off < 9.00 V) and test of redundant shut-off paths not active)
		[Fault Detection] • Short-circuit to ground of the fuel heater relay harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage at every 1000 ms for 5 times in actual driving cycle. Failure is healed if the power stage does not report an “short to ground” (SCG) error. No other healing is possible at this driving cycle.
System reaction		• Power stage is deactivated.
		• None
Failure cause		• Short circuit of wiring to ground or inside fuel filter heater
Failure repair		• Check of wiring, replace fuel filter heater
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 149: Fuel filter heater
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #201 Inspection of relay (normally open type 5 pin)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Fuel heater relay. Remove the connector of Signal detect and actuation module. Check the circuit across Signal detect and actuation module and Fuel heater relay for open or short circuit. Check the circuit across Engine electronic control unit and Fuel heater relay for open or short circuit. Check the circuit across Fuel heater relay and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step8
	Step3	Turn the starter switch in OFF. Replace component “Fuel heater relay”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspect or verify the following items. Repair or replace faulty items as necessary. Go to Step5

Inspection procedure	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across Fuel heater relay and Connection of cab harness and chassis harness. Repair or replace the harness across Fuel heater relay and Signal detect and actuation module. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3

4009-5: Component 'Fuel preheating system' has an open circuit.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V and as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded • Monitoring only active if power stage NOT actuated, i.e. filter heating NOT active , i.e. Fuel temp > 4.96°C or engine cranking or engine speed < 5.00 rpm • Battery voltage > 9.50 V (switch off < 9.00 V) and test of redundant shut-off paths not active)
	[Fault Detection] • Open-circuit of the fuel heater relay harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing	• To give the possibility for healing, an electric impulse is sent to power stage at every 1000 ms for 5 times in actual driving cycle. Failure is healed if the power stage does not report an “open load” (OL) error. No other healing is possible at this driving cycle.
System reaction	• Power stage is deactivated.
	• None
Failure cause	• Broken or disconnected wiring or defective fuel filter heater.
Failure repair	• Check of wiring or replace fuel filter heater

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 149: Fuel filter heater
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #201 Inspection of relay (normally open type 5 pin)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Fuel heater relay. Remove the connector of Signal detect and actuation module. Check the circuit across Signal detect and actuation module and Fuel heater relay for open or short circuit. Check the circuit across Engine electronic control unit and Fuel heater relay for open or short circuit. Check the circuit across Fuel heater relay and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step8
	Step3	Turn the starter switch in OFF. Replace component “Fuel heater relay”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspect or verify the following items. Repair or replace faulty items as necessary. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10

Inspection procedure	Step9	Repair or replace the harness across Fuel heater relay and Connection of cab harness and chassis harness. Repair or replace the harness across Fuel heater relay and Signal detect and actuation module. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3

4009-12: Component 'Fuel filter heater' signals overtemperature.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V and as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded • Monitoring only active if power stage actuated, i.e. filter heating active , i.e. Fuel temp < -3.04°C {9°F} (switch off at > 4.96°C {5°F}) AND engine NOT cranking AND engine speed > 5.00 rpm • Battery voltage > 9.50 V (switch off < 9.00 V) and test of redundant shut-off paths not active)
		[Fault Detection] • Overcurrent in the fuel heater relay is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 510.00ms • Failure is detected if active for 25% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage at every 1 s for 5 times in actual driving cycle. Failure is healed if the power stage does not report an “short to ground” (SCG) error. No other healing is possible at this driving cycle.
System reaction		• Power stage is deactivated.
		• None
Failure cause		• High battery voltage, high temperature inside ECU, high load or wiring problem
Failure repair		• Check load and output, check wiring, replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 149: Fuel filter heater
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #201 Inspection of relay (normally open type 5 pin)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2

Inspection procedure	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Fuel heater relay. Remove the connector of Signal detect and actuation module. Check the circuit across Signal detect and actuation module and Fuel heater relay for open or short circuit. Check the circuit across Engine electronic control unit and Fuel heater relay for open or short circuit. Check the circuit across Fuel heater relay and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step8
	Step3	Turn the starter switch in OFF. Replace component “Fuel heater relay”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Inspect or verify the following items. Repair or replace faulty items as necessary. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across Fuel heater relay and Connection of cab harness and chassis harness. Repair or replace the harness across Fuel heater relay and Signal detect and actuation module. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step3

4358-2: The pressure drop in the system is too high.

Generation condition		[Test Condition] • Function not inhibited by another failure and System is currently dosing. • Test strategy is released, number of performed tests < 3, dosing quantity between 4g and 6.55kg, pressure amplitude between 5 kPa {0.7 psi, 0.1 kgf/cm^2} and 20 kPa {2.9 psi, 0.2 kgf/cm^2} and Dosing valve component protection is not active.
		[Fault Detection] • Pressure drop during test injection: > 29.6 kPa {4.3 psi, 0.3 kgf/cm^2} * 327.67 OR < 29.6 kPa {4.3 psi, 0.3 kgf/cm^2} * 0.47.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 3 events • Failure is detected if active for 50% of events
Fault healing		• No Healing possible (disabled by Data set).
System reaction		• None
		• None
Failure cause		• DEF dosing injection deviating from expected quantity: • Blockage between DEF Pump and Dosing valve, caused by a blocked Pressure line (Line is kniked or blocked by dirt) or DEF Dosing valve (nozzle holes blocked) (dosing valve clogged or pressure line blocked).
Failure repair		• Check the DEF Pressure lines for blockages --> If DEF line is blocked remove the blockage or replace the line. • Check the DEF Pump outlet connector for blockages --> If outlet connector is blocked remove the blockage. • Check if the DEF Dosing valve is properly working --> Dismount the Dosing valve from the Exhaust pipe and perform UDS Dosing quantity test --> If test fail, replace DEF Dosing module.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

4385-31: Pressure buildup is not possible in the system.

Generation condition		[Test Condition] • During system start up (refilling - pressure build up) • Refilling not inhibited by another failure. • Pressure build up not inhibited by another failure. • System Ventilation not inhibited by another failure. • After one pressure build up attempt is completed.
		[Fault Detection] • If the DEF pressure does not reach 3.50 bar within 10 s after one “pressure build up” cycle.
		[Defect Debouncing] • Immediate
Fault healing		• If pressure buildup was successful by one attempt.
System reaction		• DEF injection control is suspended. DPF regeneration control is suspended.
		• Manual DPF regeneration not available
Failure cause		• DEF level too low (suction of air) • Suction tube leaky • Leakage in the DEF system outside or internal (i.e. back flow into tank, leakage into pump housing, external leakage). • Dosing valve blocked open. • Pump not delivering enough. • Reverting valve blocked open. • DEF pressure sensor shows too low values.
Failure repair		• Check, if enough DEF was in tank when failure occurred (ambient conditions) • Check if pump can reach enough pressure with tester: set system under normal pressure (5 bar) : - check if there is an external leakage (visible check) - if 5bar reachable: open dosing valve fully for ~3 sec, if pressure drops < 4.20bar --> pump not delivering enough or internal leakage --> check tubing for correct connection (suction tube!), replace pump module. If pressure remains stable --> system seems to be OK - if 5 bar not reachable: pump not delivering enough or internal leakage or dosing valve blocked open or reverting valve blocked open --> check tubing for correct connection (suction tube!), check dosing valve, replace pump module • Check dosing valve and reverting valve: Set pump speed to ~20% and actuate reverse valve --> pressure must drop down (< 0.8 bar absolute) - if OK: open dosing valve --> pressure must rise to ~1 bar absolute (=ambient) • If no depressurisation detected: reverting valve blocked closed or dosing valve open. • If there was a depressurisation before actuating the reverting valve --> reverting valve blocked closed.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 026: Pressure of component ‘DEF Delivery pump’ • 122: Current DEF metering quantity • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Check if enough DEF is in tank.
	Step2	Make sure that the DEF is not frozen.
	Step3	Perform the following actuator test to check it for normal operation. No.008 “Test of DEF metering amount” If not OK, check pipes & wiring.
	Step4	If pipes and wiring OK, replace DEF tank.

520192-20: Component 'Air mass flow rate / Intake air temperature sensor' is faulty.

Generation condition		[Test Condition] • Monitoring is active if the ECU is not in afterrun • Continuously
		[Fault Detection] • The learned correction value of the air flow & intake air temperature sensor (air flow sensor section) exceeds the specified value.
		[Defect Debouncing] • None
Fault healing		• None
System reaction		• None
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Fouling or blockage of the air mass sensor, inaccurate sensor due to ageing, leakage or obstruction in the intake duct, jammed EGR actuator, defective VTG/WG
Failure repair		• Clean sensor and check intake system, replace air mass sensor if necessary, check EGR actuators and boost pressure actuator. • Reinitialize drift compensation values using FUSO Diagnostics

Inspection procedure	Step1	Inspection of air flow & intake air temperature sensor (air flow sensing section) See the “(2) Inspection of air flow & intake air temperature sensor (air flow sensing section)” of section 5.

520195-20: The value of component 'Air mass flow rate / Intake air temperature sensor' is implausible.

Generation condition	[Test Condition] • Monitoring is active while the engine isn't cranking, 2 s after engine startup and if the ECU is not in afterrun • Drift test not inhibited by tester intervention or by another failure. • Operation not in high altitude, i.e ambient pressure > 80 kPa {12 psi, 0.8 kgf/cm^2}. • Engine in normal operation since at least 6 s. • Engine temperature between 68.46°C {155.23°F} and 111.96°C {233.53°F} • Engine in steady state, i.e. the Boost air temperature variation between -1000°C {-1768°F}/s and 1000°C {1832°F}/s • Fuel injection quantity < 100 mg/hub and engine speed between 620 rpm and 840 rpm. • Boost pressure < 104 kPa {15 psi, 1.1 kgf/cm^2} • If available EGR throttle valve open, i.e. between -10% and 105% resp. the exhaust break flap position between 98% and 105% longer than 2 s. • If available, throttle for variable swirl control between -10% and 110%. • EGR valve closed, i.e. between 105% and 98% since at least 2 s: this is normally only the case during drift compensation learning at idle or at high engine speed, each once per driving cycle! Drift compensation is released and EGR valve closed for 13 s (idle) resp. for 1.7 s (high load), if all following conditions are met in addition to the above mentioned conditions for at least 1000 ms: • Boost air temperature between -3549.94°C {-6357.89°F} and 3003.56°C {5438.41°F}. • Ambient temperature between -0.04°C {32°F} and 39.96°C {104°F}. • The engine is running in normal state since at least 14 min. • Drift compensation not inhibited by another failure • ambient pressure > 81 kPa {12 psi, 0.8 kgf/cm^2} • And for correction at idle: • Difference between boost pressure and ambient pressure < 3277 kPa {475 psi, 33 kgf/cm^2} (i.e no boost pressure) • Injection quantity between 2.5 mg/hub and 25 mg/hub. • Engine speed between 600 rpm and 850 rpm. • no drift correction at idle executed this driving cycle. And for correction at High Load: • Vehicle speed between 1 km/h {0.62 mph} and 150 km/h {93.2 mph} • Boost pressure between 100 kPa {15 psi, 1.0 kgf/cm^2} and 3277 kPa {475 psi, 33 kgf/cm^2}. • Fuel injection quantity between engine speed dependant limits: • between 100 mg/hub at 2250 rpm and 100 mg/hub at 2250 rpm • between 55 mg/hub at 2900 rpm and 100 mg/hub at 2750 rpm • between 47.07 mg/hub at 3500 rpm and 72 mg/hub at 3500 rpm • between 0 mg/hub at 4000 rpm and 0 mg/hub at 4000 rpm • Engine steady state, i.e. variation of boost pressure (filtered by 500 ms)< 49.997 kPa {7.2 psi, 0.5 kgf/cm^2}/s, of fuel injection (filtered by 2 s) < 4 (mg/stroke)/s and engine speed (filtered by 999.99 ms) < 180 rpm/s • No drift compensation under load executed this driving cycle.
	[Fault Detection] • There is a large deviation between the measured and corrected air flow value and the calculated air flow value (air flow is too low).
	[Defect Debouncing] • Debounce time engine temperature dependent
Fault healing	• If the signal returns to normal when the starter switch is in ON position.
System reaction	• The last valid air flow sensor value is used for a fraction of second after detection of this error and thereafter the value is replaced by a substitute value which depends on the engine speed and intake air pressure.
	• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause	• Defect in wiring, inaccurate or defective air mass sensor, leakage or obstruction in the intake duct, defective VTG/WG

Failure repair		• Check wiring of the intake air mass sensor and its accuracy and replace it if necessary, check intake duct and boost pressure actuator. • Reset HFM learning drift correction factors using FUSO Diagnostics
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 002: Temperature at component 'Boost pressure / Temperature sensor' • 003: Temperature at component 'Air mass flow rate / Intake air temperature sensor' • 017: Boost pressure • 028: Boost pressure (Differential pressure) • 033: Signal voltage from pressure sensor of component 'Boost pressure / Temperature sensor' • 034: Signal voltage of component 'Air mass flow rate / Intake air temperature sensor' (Temperature sensors) • 036: Signal voltage of component 'Boost pressure / Temperature sensor' (Temperature sensors) • 053: Air mass flow rate (Actual value) • 054: Air mass flow rate (Specified value) • 055: Air mass flow rate (Cylinder) • 160: Air mass flow rate Learned value 1 • 161: Air mass flow rate Learned value 2

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If Intake system fault has occurred, check the system in question. If Turbocharger system fault has occurred, check the system in question. For procedures, refer to the Shop Manual.
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Airflow and intake air temperature sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Airflow and intake air temperature sensor for open or short circuit. Check the circuit across Signal detect and actuation module and Airflow and intake air temperature sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10
	Step5	Turn the starter switch in OFF. Replace component “Airflow and intake air temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Airflow and intake air temperature sensor which Engine electronic control unit learns. Go to Step6

Inspection procedure	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. If Intake system fault has occurred, check the system in question. If Turbocharger system fault has occurred, check the system in question. For procedures, refer to the Shop Manual. Go to Step8
	Step8	Perform the operation start and replace Engine electronic control unit. Go to Step9
	Step9	Inspection completed
	Step10	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Repair or replace the harness across Airflow and intake air temperature sensor and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5
	Step12	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

520195-21: Measurement value (Deviation from measurement value) of the component 'Air mass flow rate' is below the specified value.

Generation condition	[Test Condition] • Monitoring is active while the engine isn't cranking, 2 s after engine startup and if the ECU is not in afterrun • Drift test not inhibited by tester intervention or by another failure. • Operation not in high altitude, i.e ambient pressure > 80 kPa {12 psi, 0.8 kgf/cm^2}. • Engine in normal operation since at least 6 s. • Engine temperature between 68.46°C {155.23°F} and 111.96°C {233.53°F} • Engine in steady state, i.e. the Boost air temperature variation between -1000°C {-1768°F}/s and 1000°C {1832°F}/s • Fuel injection quantity < 100 mg/hub and engine speed between 620 rpm and 840 rpm. • Boost pressure > 80 kPa {12 psi, 0.8 kgf/cm^2} • If available EGR throttle valve open, i.e. between -10% and 105% resp. the exhaust break flap position between 98% and 105% longer than 2 s. • If available, throttle for variable swirl control between -10% and 110%. • EGR valve closed, i.e. between 98% and 105% since at least 2 s: this is normally only the case during drift compensation learning at idle or at high engine speed, each once per driving cycle! Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If Intake system fault has occurred, check the system in question. If Turbocharger system fault has occurred, check the system in question. For procedures, refer to the Shop Manual.
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Airflow and intake air temperature sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Airflow and intake air temperature sensor for open or short circuit. Check the circuit across Signal detect and actuation module and Airflow and intake air temperature sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10
	Step5	Turn the starter switch in OFF. Replace component “Airflow and intake air temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Airflow and intake air temperature sensor which Engine electronic control unit learns. Go to Step6

Inspection procedure	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. If Intake system fault has occurred, check the system in question. If Turbocharger system fault has occurred, check the system in question. For procedures, refer to the Shop Manual. Go to Step8
	Step8	Perform the operation start and replace Engine electronic control unit. Go to Step9
	Step9	Inspection completed
	Step10	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Repair or replace the harness across Airflow and intake air temperature sensor and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5
	Step12	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

520200-2: Component 'Air conditioning' is defective. / The power supply is faulty.

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
	[Fault Detection] • No CAN signal from the air conditioner ECU and control panel.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing	• CAN signal from the air conditioner ECU and control panel is received.
System reaction	• Air conditioning is switched off.
	• AC off
Failure cause	• A/C defective, A/C supply defective
Failure repair	• Check A/C supply, check A/C module

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 162: Status of air conditioning
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• Heater control panel <Manual air conditioner>
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520200-12: The CAN message from component 'Air conditioning' is faulty.

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously.
		[Fault Detection] • A/C signal (A/C switch information) received via CAN is faulty.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing		• If A/C signal received via CAN is plausible.
System reaction		• Air conditioning is switched off.
		• AC off
Failure cause		• CAN Timeout in message Com_stAC, A/C supply defective, CAN connection problem
Failure repair		• Check presence and correct connection of the A/C, • check A/C voltage supply, check wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Air Conditioning electronic control unit & control panel is generated, make a system diagnosis according to the diagnosis code. For procedures, refer to the Shop Manual. Go to step2

Inspection procedure	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step6
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step5
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step6	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520203-2: CAN fault:The configuration is faulty.

Generation condition		[Test Condition] • Monitoring is active 2 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2 s after engine startup, while the battery voltage is over 10 V, as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • No CAN communication (communication error).
		[Defect Debouncing] • Defect condition fulfilled continuously > 40.0 ms
Fault healing		• To give the possibility for healing, controller is reinitialized every 50 ms
System reaction		• None
		• None
Failure cause		• Wrong configuration of CAN timing (Prescaler, synchronization jump width, sampling, propagation and phase segments), bad termination resistors, defective network connection and contacts or defective CAN controller with erroneous messages.
Failure repair		• Check timing configuration with hardware compatibility, check termination resistors and network connection and contacts. Short circuits to external source, ground or CAN High to Low.Monitor CAN communication for erroneous behaviour of a participant.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520203-31: CAN fault:The configuration is faulty./The CAN controller is defective./The control unit has an internal hardware fault.

Generation condition	[Test Condition] • Monitoring is active 2 s after ECU initialization while engine isn't running yet, while t he engine isn't cranking, 2 s after engine startup, while the battery voltage is over 10 V, as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously.
	[Fault Detection] • No CAN communication (communication error).
	[Defect Debouncing] • Defect condition fulfilled continuously > 40.0 ms
Fault healing	• To give the possibility for healing, controller is reinitialized every 50 ms
System reaction	• None
	• None
Failure cause	• Wrong configuration of CAN timing (Prescaler, synchronization jump width, sampling, propagation and phase segments), bad termination resistors, defective network connection and contacts or defective CAN controller with erroneous messages.
Failure repair	• Check timing configuration with hardware compatibility, check termination resistors and network connection and contacts. Short circuits to external source, ground or CAN High to Low.Monitor CAN communication for erroneous behaviour of a participant.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step
	Step2	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520207-2: Plausibility check of component 'Coolant temperature' The received data are implausible.

Generation condition		[Test Condition] • Initial measured temperatures are frozen and evaluated if: • Engine off time > 5 h.
		[Fault Detection] • Faulty engine coolant temperature is detected. • Temperature difference limits are applied in curves depending on engine OFF time.
		[Defect Debouncing] • Immediate
Fault healing		• Temperature difference is in range
System reaction		• None
		• None
Failure cause		• Coolant temperature sensor drifted
Failure repair		• Check sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 016: Coolant temperature
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #262 Inspection of water temperature sensor
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Check the circuit across Engine electronic control unit and Water temperature sensor for open or short circuit. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “Water temperature sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step5
	Step4	Inspection completed
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step4
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step7
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step4 Yes: Go to Step2

520208-12: Component 'A4 (Engine electronic control unit)' has an internal fault.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Internal error of the 5 V power supply system in the engine ECU is detected.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• None
		• None
Failure cause		• Electric disturbances, internal defect of the ECU leading to a SPI bus communication error
Failure repair		• Replace ECU if failure remains present
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520210-2: General fault at fuel injector

Generation condition	[Test Condition] • Monitoring not inhibited by another failure • Fuel balancing not inhibited by another failure • Engine in normal running state since > 30 s • Engine temperature > 49.96°C {122°F} • Fuel balancing active i.e.: • engine speed between -100 rpm and 2500 rpm and fuel quantity between • 2 mg/hub and an engine speed dependant upper limit (50 mg/hub at 800 rpm)
	[Fault Detection] • Imbalance of combustion in cylinders is detected.
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing	• If the signal returns to normal when the starter switch is in ON position.
System reaction	• None
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• non balanced cylinders possibly due to problem of one or more injectors. (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair	• try to identify the irregular cylinders by the deviations at failure recognition (snap shot): the 2 extreme cylinders have probably a problem. • check regularity of combustion (idle test or run up test)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 070: Correction value of fuel quantity (Cylinder 1) • 071: Correction value of fuel quantity (Cylinder 3) • 072: Correction value of fuel quantity (Cylinder 4) • 073: Correction value of fuel quantity (Cylinder 2)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 003: Injection valve

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. Remove the connector of Injector No.2 cylinder. Remove the connector of Injector No.3 cylinder. Remove the connector of Injector No.4 cylinder. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.2 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.3 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.4 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

520211-0: Quantity correction for cylinder 1 has reached the lower limit value.

Generation condition	[Test Condition] • Monitoring not inhibited by another failure • Fuel balancing not inhibited by another failure • Engine in normal running state since > 30 s • Engine temperature > 49.96°C {122°F} • Fuel balancing active i.e.: • engine speed between -100 rpm and 2500 rpm and fuel quantity between • 2 mg/hub and an engine speed dependant upper limit (50 mg/hub at 800 rpm)
	[Fault Detection] • Fuel balance correction for No. 1 cylinders is faulty.
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing	• If the signal returns to normal when the starter switch is in ON position.

System reaction		• None
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• injector of cylinder 1 has too low fuel quantity or the cylinder itself is defect (no compression/misfiring) (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• check regularity of combustion (idle test or run up test) and replace injector if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual.
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Turn the starter switch in OFF. Replace component “Injector No.1 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.1 cylinder which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step5
	Step5	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual.
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed

520211-1: Quantity correction for cylinder 1 has reached the upper limit value.

Generation condition		[Test Condition] • Monitoring not inhibited by another failure • Fuel balancing not inhibited by another failure • Engine in normal running state since > 30 s • Engine temperature > 49.96°C {122°F} • Fuel balancing active i.e.: • engine speed between -100 rpm and 2500 rpm and fuel quantity between • 2 mg/hub and an engine speed dependant upper limit (50 mg/hub at 800 rpm)
		[Fault Detection] • Fuel balance correction for No. 1 cylinders is faulty.
		[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing		• If the signal returns to normal when the starter switch is in ON position.
System reaction		• None
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• injector of cylinder 1 has too high fuel quantity (open locked injector) (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• check regularity of combustion (idle test or run up test) and replace injector if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for run-up engine speed. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Turn the starter switch in OFF. Replace component “Injector No.1 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.1 cylinder which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step5
	Step5	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for run-up engine speed. For procedures, refer to the Shop Manual. Go to Step6

Inspection procedure	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed

520212-0: Quantity correction for cylinder 3 has reached the lower limit value.

Generation condition		[Test Condition] • Monitoring not inhibited by another failure • Fuel balancing not inhibited by another failure • Engine in normal running state since > 30 s • Engine temperature > 49.96°C {122°F} • Fuel balancing active i.e.: • engine speed between -100 rpm and 2500 rpm and fuel quantity between • 2 mg/hub and an engine speed dependant upper limit (50 mg/hub at 800 rpm)
		[Fault Detection] • Fuel balance correction for No. 3 cylinders is faulty.
		[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• None
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• injector of cylinder 3 has too low fuel quantity or the cylinder itself is defect (no compression/misfiring) (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• check regularity of combustion (idle test or run up test) and replace injector if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 071: Correction value of fuel quantity (Cylinder 3)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual.
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Turn the starter switch in OFF. Replace component “Injector No.3 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.3 cylinder which EGR actuator learns. Perform coding of Fuel injector which EGR actuator learns. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step5
	Step5	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual.
	Step6	Perform the operation start and replace EGR actuator. Go to Step7
	Step7	Inspection completed

520212-1: Quantity correction for cylinder 3 has reached the upper limit value.

Generation condition		[Test Condition] • Monitoring not inhibited by another failure • Fuel balancing not inhibited by another failure • Engine in normal running state since > 30 s • Engine temperature > 49.96°C {122°F} • Fuel balancing active i.e.: • engine speed between -100 rpm and 2500 rpm and fuel quantity between • 2 mg/hub and an engine speed dependant upper limit (50 mg/hub at 800 rpm)
		[Fault Detection] • Fuel balance correction for No. 3 cylinders is faulty.
		[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing		• If the signal returns to normal when the starter switch is in ON position.
System reaction		• None
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• injector of cylinder 3 has too high fuel quantity (open locked injector) (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• check regularity of combustion (idle test or run up test) and replace injector if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 071: Correction value of fuel quantity (Cylinder 3)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for run-up engine speed. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Replace component “Injector No.3 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.3 cylinder which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step5
	Step5	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for run-up engine speed. For procedures, refer to the Shop Manual. Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed

520213-0: Quantity correction for cylinder 4 has reached the lower limit value.

Generation condition	[Test Condition] • Monitoring not inhibited by another failure • Fuel balancing not inhibited by another failure • Engine in normal running state since > 30 s • Engine temperature > 49.96°C {122°F} • Fuel balancing active i.e.: • engine speed between -100 rpm and 2500 rpm and fuel quantity between • 2 mg/hub and an engine speed dependant upper limit (50 mg/hub at 800 rpm)
	[Fault Detection] • Fuel balance correction for No. 4 cylinders is faulty.
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing	• If the signal returns to normal when the starter switch is in ON position.
System reaction	• None
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• injector of cylinder 4 has too low fuel quantity or the cylinder itself is defect (no compression/misfiring) (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair	• check regularity of combustion (idle test or run up test) and replace injector if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 072: Correction value of fuel quantity (Cylinder 4)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #582 Inspection of injector

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual.
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Turn the starter switch in OFF. Replace component “Injector No.4 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.4 cylinder which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step5
	Step5	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual.
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed

520213-1: Quantity correction for cylinder 4 has reached the upper limit value.

Generation condition	[Test Condition] • Monitoring not inhibited by another failure • Fuel balancing not inhibited by another failure • Engine in normal running state since > 30 s • Engine temperature > 49.96°C {122°F} • Fuel balancing active i.e.: • engine speed between -100 rpm and 2500 rpm and fuel quantity between • 2 mg/hub and an engine speed dependant upper limit (50 mg/hub at 800 rpm)
	[Fault Detection] • Fuel balance correction for No. 4 cylinders is faulty.
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• None
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• injector of cylinder 4 has too high fuel quantity (open locked injector) (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair	• check regularity of combustion (idle test or run up test) and replace injector if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 072: Correction value of fuel quantity (Cylinder 4)

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for run-up engine speed. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Turn the starter switch in OFF. Replace component “Injector No.4 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.4 cylinder which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step5
	Step5	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for run-up engine speed. For procedures, refer to the Shop Manual. Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed

520214-0: Quantity correction for cylinder 2 has reached the lower limit value.

Generation condition	[Test Condition] • Monitoring not inhibited by another failure • Fuel balancing not inhibited by another failure • Engine in normal running state since > 30 s • Engine temperature > 49.96°C {122°F} • Fuel balancing active i.e.: • engine speed between -100 rpm and 2500 rpm and fuel quantity between • 2 mg/hub and an engine speed dependant upper limit (50 mg/hub at 800 rpm)
	[Fault Detection] • Fuel balance correction for No. 2 cylinders is faulty.
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• None
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• injector of cylinder 2 has too low fuel quantity or the cylinder itself is defect (no compression/misfiring) (See “6. Inspections to be Made at Injector Error Occurrence)

Failure repair		• check regularity of combustion (idle test or run up test) and replace injector if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 073: Correction value of fuel quantity (Cylinder 2)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual.
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Turn the starter switch in OFF. Replace component “Injector No.2 cylinder”. Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Perform the learned value resetting procedure of Injector No.2 cylinder which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step5
	Step5	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for possible misfire when the engine is in idle state. Check for damaged cylinder. For procedures, refer to the Shop Manual.
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed

520214-1: Quantity correction for cylinder 2 has reached the upper limit value.

Generation condition	[Test Condition] • Monitoring not inhibited by another failure • Fuel balancing not inhibited by another failure • Engine in normal running state since > 30 s • Engine temperature > 49.96°C {122°F} • Fuel balancing active i.e.: • engine speed between -100 rpm and 2500 rpm and fuel quantity between • 2 mg/hub and an engine speed dependant upper limit (50 mg/hub at 800 rpm)
	[Fault Detection] • Fuel balance correction for No. 2 cylinders is faulty.
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 events
Fault healing	• If the signal returns to normal when the starter switch is in ON position.

System reaction		• None
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• injector of cylinder 2 has too high fuel quantity (open locked injector) (See “6. Inspections to be Made at Injector Error Occurrence)
Failure repair		• check regularity of combustion (idle test or run up test) and replace injector if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 073: Correction value of fuel quantity (Cylinder 2)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Check for run-up engine speed. For procedures, refer to the Shop Manual. Go to Step2

	Step7	Inspection completed

520215-31: System information : Limiting of engine power by engine protection function (Protection of turbocharger)

Generation condition		[Test Condition] • Monitoring is active 2 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2 s after engine startup and if the ECU is not in afterrun • Engine speed > 750 rpm
		[Fault Detection] • Generated under engine output limiting condition to protect the turbocharger. (Check the diagnosis code(s) generated simultaneously and perform troubleshooting according to that code(s).)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• Performance/engine speed limitation no more active • OR • engine speed < 750 rpm
System reaction		• None
		• None
Failure cause		• Active power reduction > 2.00s due to turbo charger protection
Failure repair		• No actions necessary due to this failure alone. If power reduction occurred due to actual defect, the failure triggering the torque limitation should also be in the failure memory. Follow troubleshooting of this root error.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520217-31: System information : Limiting of engine power by engine protection function (Protection of fuel injection system)

Generation condition	[Test Condition] • Monitoring is active 2 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2 s after engine startup and if the ECU is not in afterrun • Engine speed > 750 rpm
	[Fault Detection] • Output limitation is activated to protect the high-pressure fuel pump from too high fuel temperature. (Check the diagnosis code(s) generated simultaneously and perform troubleshooting according to that code(s).)
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• Performance/engine speed limitation no more active • OR • engine speed < 750 rpm
System reaction	• None
	• None
Failure cause	• Active power reduction > 2.00s due to high pressure fuel pump protection
Failure repair	• No actions necessary due to this failure alone. If power reduction occurred due to actual defect, the failure triggering the torque limitation should also be in the failure memory. Follow troubleshooting of this root error.

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520218-31: System information : Limiting of engine power by engine protection function (Engine brake)

Generation condition		[Test Condition] • Monitoring is active 2 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2 s after engine startup and if the ECU is not in afterrun • Engine speed > 750 rpm
		[Fault Detection] • Output limitation is activated after releasing the engine braking system. (Check the diagnosis code(s) generated simultaneously and perform troubleshooting according to that code(s).)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• Performance/engine speed limitation no more active • OR • engine speed < 750 rpm
System reaction		• None
		• None
Failure cause		• Active power reduction > 2.00s due to torque rise limitation after engine brake release.
Failure repair		• No actions necessary due to this failure alone. If power reduction occurred due to actual defect, the failure triggering the torque limitation should also be in the failure memory. Follow troubleshooting of this root error.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520219-31: System information : Limiting of engine power by engine protection function (Protection of fuel injection system)

Generation condition		[Test Condition] • Monitoring is active 2 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2 s after engine startup and if the ECU is not in afterrun • Engine speed > 750 rpm
		[Fault Detection] • Output limitation is activated to protect DPF. (Check the diagnosis code(s) generated simultaneously and perform troubleshooting according to that code(s).)
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 50% of the time
Fault healing		• Performance/engine speed limitation no more active • OR • engine speed < 750 rpm
System reaction		• None
		• None
Failure cause		• Active power reduction > 5.00s due to torque limitation for pressure drop limitation over particulate filter.
Failure repair		• No actions necessary due to this failure alone. If power reduction occurred due to actual defect, the failure triggering the torque limitation should also be in the failure memory. Follow troubleshooting of this root error.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520221-31: System information : Limiting of engine power by engine protection function (Protection of SCR catalytic converter)

Generation condition	[Test Condition] • Monitoring is active 2 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2 s after engine startup and if the ECU is not in afterrun • Engine speed > 750 rpm
	[Fault Detection] • The torque limiting function is activated when too high SCR temperature has been continued. (Check the diagnosis code(s) generated simultaneously and perform troubleshooting according to that code(s).)
	[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 50% of the time
Fault healing	• Performance/engine speed limitation no more active • OR • engine speed < 750 rpm
System reaction	• None
	• None
Failure cause	• Active power reduction due to excessive temperatures in the SCR catalyst
Failure repair	• No actions necessary due to this failure alone. If power reduction occurred due to actual defect, the failure triggering the torque limitation should also be in the failure memory. Follow troubleshooting of this root error.

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520222-31: System information : Limiting of engine power by engine protection function (Torque limitation by smoke limit)

Generation condition	[Test Condition] • Monitoring is active 2 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2 s after engine startup and if the ECU is not in afterrun • Engine speed > 750 rpm
	[Fault Detection] • Torque is limited during acceleration to suppress smoke emission due to lean air-fuel mixture. • Failure related to EGR or boost pressure control. (Check the diagnosis code(s) generated simultaneously and perform troubleshooting according to that code(s).)
	[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 50% of the time
Fault healing	• Performance/engine speed limitation no more active • OR • engine speed < 750 rpm
System reaction	• None
	• None
Failure cause	• Active power reduction due to smoke limitation with unexpected long duration > 5.00s • If no other failure stored concerning EGR or Boost pressure control: • operation in extreme high altitude (>1800 m, i.e ambient pressure < 78kPa {11psi, 0.8kgf/cm^2}) • sticking of VGT or EGR actuator or engine brake flap (if available) • turbocharger with slow response (bad efficiency) • wrong signal of HFM (or boost pressure sensor if HFM not available)
Failure repair	• No actions necessary due to this failure alone. If power reduction occurred due to actual defect, the failure triggering the torque limitation should also be in the failure memory. Follow troubleshooting of this root error. • If no failure stored in memory concerning EGR or Boost pressure control: if failure occurred at high altitude > 1800m (ambient pressure < 78kPa {11psi, 0.8kgf/cm^2}): no action needed. • Check actuators of EGR, Boost pressure and exhaust flap control for sticking. • Check turbocharger for correct efficiency • Check HFM and Boost pressure sensor for correct measuring values
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520223-2: The installation position of component 'NH3 Sensor' is incorrect.

Generation condition		[Test Condition] • Monitor not inhibited by another failure • NH3 Sensor is ready • DEF mass flow between 0mg/s and 2000mg/s • SCR downstream temperature between 199.96°C {392°F} and 649.96°C {1202°F} • Modeled NH3 > 0.10 for 10s • NH3 capacity of SCR catalyst > Threshold temperature dependent • Correction factor of def governor < 0
		[Fault Detection] • No signal can be received from the NH3 sensor.
		[Defect Debouncing] • Immediate
Fault healing		• When a signal is received from the NH3 sensor with the starter switch in the ON position.
System reaction		• None
		• None
Failure cause		• NH3 Sensor has been possibly dismounted from its correct position and it is not measuring exhaust values
Failure repair		• Check sensor mounting
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of NH3 Sensor • #350 Inspection of NH3 Sensor ECU
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520227-9: Error on transmission of CAN message (CAN message 'VIN' from control unit 'SAM')

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuous
		[Fault Detection] • CAN communication from SAM (chassis number information) is faulty (time-out).
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• As soon as the frame is received, the time out error is cleared.
System reaction		• None
		• None
Failure cause		• CAN bus overload or disturbed, frame could not be received.
Failure repair		• Check the installation and the proper connection of the SAM Module (Central Gateway or Body Computer) to the CAN vehicle network. • Check correct operating conditions of the CAN controller. • Check the vehicle wirings.

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step5
	Step2	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step5	Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520228-9: CAN timeout fault. Error on transmission of CAN message

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
	[Fault Detection] • CAN communication from SAM is faulty (timeout).
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• When the frame is received, the time out error will be cleared.
System reaction	• Default value for self-recovery cycle data is used.
	• None
Failure cause	• CAN bus overload or disturbed, frame could not be received.
Failure repair	• Check CAN bus wiring. A defect could cause error frames which lead to high bus load or send the CAN controller to “bus off” state. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520231-9: CAN timeout fault (Exhaust aftertreatment system)

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Time out for the CAN frame is detected.
		[Defect Debouncing] • Defect condition fulfilled continuously >0.5s
Fault healing		• When the frame is received, the Timeout error is cleared.
System reaction		• In case of an error will the following values be replaced with applicable values: • Temperature of the catalyst reagent at the device measuring reagent quality is set to -0.04°C {32°F} • Concentration of urea in water is set to 0.00% • Parameter indicates what reagent is in the tank is set to 0.00- .
		• None
Failure cause		• CAN bus overload or disturbed, frame could not be received.
Failure repair		• Check CAN bus wiring. A defect could cause error frames which lead to high bus load or send the CAN controller to "bus off" state. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” If communication between the connected control units is not possible, check the common CAN line for short circuit. Go to Step2
	Step2	Continue troubleshooting in control unit Signal detect and actuation module. Go to Step3
	Step3	Turn the starter switch in OFF. Unplug connector from control unit connected to CAN line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. If damage is visible, rectify it appropriately or replace the component and abort the test. Was a fault discovered? No: Go to step6 Yes: Go to step4
	Step4	Repair or replace electrical lines. Reconnect all separated electrical connectors. Turn the starter switch in ON. Go to Step5
	Step5	Inspection completed
	Step6	Measure resistance between pins 17B1 and 17B11 on connector Signal detect and actuation module. Specified value: 120Ω To avoid erroneous measurements, disconnect the plug from component Engine electronic control unit before starting the test. Was a fault discovered? No: Go to step8 Yes: Go to step7

Inspection procedure	Step7	Turn the starter switch in OFF. Reconnect all separated electrical connectors. Erase fault memory and perform a city run for 30 minutes. If the fault code still has status 'CURRENT' after the test drive, then replace component Signal detect and actuation module by performing initial startup. Go to Step5
	Step8	Determine faulty components with the following tests and repair or replace if necessary. Perform a quick test to determine whether CAN faults are present. Disconnect the electrical connections at all relevant control units one after the other and perform a quick test to determine whether CAN faults are present. Restore all disconnected electrical connections at the relevant control units one after the other and check the wiring harness. Go to Step5

520237-9: CAN timeout fault. Error on transmission of CAN message

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • continuously
		[Fault Detection] • CAN communication from the hydraulic unit (ECU) is faulty (timeout).
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Deactivation of ABS is used as a substitution.
		• None
Failure cause		• Defective CAN controller of ABS / ASR / ESP, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the ABS / ASR / ESP to the network, Check correct functioning of the CAN controller. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 141: Status of engine brake (Switching off) • 142: Measurement value of component ’Status of engine brake (Switching off)’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• Hydraulic unit
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with Hydraulic unit (electronic control unit) is generated, make a system diagnosis according to the diagnosis code. Go to step2

Inspection procedure	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of Hydraulic unit (electronic control unit). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Hydraulic unit (electronic control unit). Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520239-9: Timeout error of component 'NH3 Sensor'

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Fault is detected if a Timeout of NH3 sensor message occurs.
		[Defect Debouncing] • Defect condition fulfilled continuously >0.5s
Fault healing		• If the NH3 sensor message is received correct after the debouncing time
System reaction		• Default values are used: • for NH3 raw signal: 1V • for NO2 raw signal: 1V
		• None
Failure cause		• Defective CAN controller of NH3 sensor, cable disconnected or broken. • Short circuit in wiring.
Failure repair		• Check presence and correct connection of the NH3 sensor to the network, Check correct functioning of the CAN controller. • Check wiring.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of NH3 Sensor • #350 Inspection of NH3 Sensor ECU
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520243-9: CAN timeout fault. Error on transmission of CAN message

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
	[Fault Detection] • CAN communication from the engine ECU is faulty (timeout). • CAN communication from SAM is faulty (timeout).
	[Defect Debouncing] • Defect condition fulfilled continuously > 500.0 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• None
	• None
Failure cause	• Defective CAN controller, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair	• Check the presence and correct connection of the EDC to the network, Check correct functioning of the CAN controller. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520244-31: Component 'NH3 Sensor' is faulty. (Heat output FALLING)

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Dew point detection reached • Monitor not inhibited by another sensor
		[Fault Detection] • Time since dew point reached > 100s and sensor heat up not completed
		[Defect Debouncing] • Defect condition fulfilled continuously >1 events
Fault healing		• Sensor heat up completed before time since dew point reached > 100s
System reaction		• None
		• None
Failure cause		• Sensor heating defective or insufficient
Failure repair		• Check NH3 sensor wiring between Sensor controller and Sensor for defects. • If visual inspection is OK, replace NH3 sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of NH3 Sensor • #350 Inspection of NH3 Sensor ECU
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520258-9: CAN timeout fault. Error on transmission of CAN message

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
	[Fault Detection] • CAN communication from DUONIC ECU is faulty (timeout).
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• When the frame is received, the time out error is cleared.
System reaction	• Default value is used for DUONIC data.
	• None
Failure cause	• Defective CAN controller of Gearbox Control Unit, under voltage of ETC, missing ETC, CAN cable connecting the ETC is disconnected or broken. Short circuit in wiring.
Failure repair	• Check presence and correct connection of the ETC to the network, check correct functioning of the ETC CAN controller and its voltage supply. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 155: Neutral position • 156: Actual gear
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• DUONIC electronic control unit
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with DUONIC electronic control unit is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of DUONIC electronic control unit. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the DUONIC electronic control unit. Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed

Inspection procedure	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520259-9: CAN timeout fault. Error on transmission of CAN message

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
		[Fault Detection] • CAN communication from DUONIC ECU is faulty (timeout).
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• When the frame is received, the time out error is cleared.
System reaction		• Default value is used for DUONIC data.
		• None
Failure cause		• Defective CAN controller of Gearbox Control Unit, under voltage of ETC, missing ETC, CAN cable connecting the ETC is disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the ETC to the network, check correct functioning of the ETC CAN controller and its voltage supply. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 155: Neutral position • 156: Actual gear
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• DUONIC electronic control unit
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with DUONIC electronic control unit is generated, make a system diagnosis according to the diagnosis code. Go to step2

Inspection procedure	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of DUONIC electronic control unit. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the DUONIC electronic control unit. Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520260-2: Sensor drift of component 'NH3 Sensor'

Generation condition		[Test Condition] • Monitor not inhibited by another failure • NH3 Sensor is ready • Modeled NH3 < 0.5 • NH3 capacity of SCR catalyst < Threshold temperature dependent • DEF mass flow between 0mg/s and 2000mg/s • Detected NH3 < 0ppm • Correction factor of def governor > -0.1 • SCR catalyst upstream temperature is within 199.96°C {392°F} and 349.96°C {662°F} • Gradient of engine speed, injection quantity and SCR catalyst upstream temperature are below a threshold for a given time
		[Fault Detection] • Failure is detected in the signal received from the NH3 sensor.
		[Defect Debouncing] • Defect condition fulfilled continuously >20s
Fault healing		• Difference between EMF2 and EMF1 > 0.5V or < -40mV • The system recovers when a normal signal is detected with the starter switch in the ON position.
System reaction		• None
		• None
Failure cause		• NH3 sensor shows negative drift.
Failure repair		• Replace NH3 sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of NH3 Sensor • #350 Inspection of NH3 Sensor ECU
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520264-9: CAN timeout fault. Error on transmission of CAN message

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
	[Fault Detection] • CAN communication from DUONIC ECU (cancelling idle-up) is faulty (time-out).
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position.
System reaction	• Substitute value zero (0) is used for fast idle cancellation (permission for fast idle).
	• None
Failure cause	• Defective CAN controller of gearbox, CAN cable connecting the gearbox is disconnected or broken. Short circuit in wiring.
Failure repair	• Check correct connection of the gearbox to the network, check correct functioning of the gearbox CAN controller and its voltage supply. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 155: Neutral position • 156: Actual gear
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• DUONIC ECU
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with DUONIC electronic control unit is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of DUONIC electronic control unit. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the DUONIC electronic control unit. Inspection completed

Inspection procedure	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520265-9: Faulty component 'Automatic engine start/stop' / CAN fault

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • CAN communication from ISS ECU is faulty (timeout).
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• As soon as the message is again received, the time out error is cleared.
System reaction		• None
		• None
Failure cause		• CAN bus failure or idle start stop controller failure.
Failure repair		• Check CAN Bus and idle start stop controller.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Perform a diagnosis on the Idling stop & start system electronic control unit side system.

520273-0: Component 'NOx sensor' has an open circuit.

Generation condition		[Test Condition] • The smart NOx sensor deliver information about its error status, error byte is configured as follows: Bit 0: Open wire heater Bit 1: Open wire NOx Bit 2: Open wire linear lambda Bit 3: Open wire binary lambda Bit 4: Short heater Bit 5: Short NOx Bit 6: Short linear lambda Bit 7: Short binary lambda If failure is detected corresponding bit is set. • Continuously
		[Fault Detection] • Open-circuit of NOx sensor harness is detected.
		[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing		• Failure not detected (bit are not set).
System reaction		• None
		• None
Failure cause		• Wiring defect • NOx Sensor defect
Failure repair		• Check wiring • Check NOx Sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of NOx sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and NOx sensor for open or short circuit. Check the circuit across Signal detect and actuation module and NOx sensor for open or short circuit. Check the circuit across NOx sensor and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “NOx sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness for open or short circuit. Check the circuit across Connection of chassis harness and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520273-1: Component 'NOx sensor' has a short circuit.

Generation condition	[Test Condition] • The smart NOx sensor deliver information about its error status, error byte is configured as follows: Bit 0: Open wire heater Bit 1: Open wire NOx Bit 2: Open wire linear lambda Bit 3: Open wire binary lambda Bit 4: Short heater Bit 5: Short NOx Bit 6: Short linear lambda Bit 7: Short binary lambda If failure is detected corresponding bit is set. • Continuously
	[Fault Detection] • Short-circuit of NOx sensor harness is detected.
	[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing	• Failure not detected (bit are not set)
System reaction	• FUSO Diagnostics Service Data (Actual values) 108 displays no value.
	• None
Failure cause	• None
Failure repair	• Check wiring • Check NOx Sensor

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of NOx sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and NOx sensor for open or short circuit. Check the circuit across Signal detect and actuation module and NOx sensor for open or short circuit. Check the circuit across NOx sensor and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “NOx sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Are current diagnosis codes present? No, go to step 7 Yes, inspection completed.
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness for open or short circuit. Check the circuit across Connection of chassis harness and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9

Inspection procedure	Step8	Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520276-9: CAN timeout fault. Error on transmission of CAN message

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
	[Fault Detection] • CAN communication from SAM (parking brake information) is faulty (time-out).
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position.
System reaction	• Default value is used for SAM data.
	• None
Failure cause	• Defective CAN controller, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair	• Check the installation and the proper connection of the SAM ECU to the CAN vehicle network. Check correct functioning of the CAN controller. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520278-9: CAN timeout fault. Error on transmission of CAN message

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuous
	[Fault Detection] • CAN communication from SAM (DPF cleaning switch and air conditioner information) is faulty (timeout).
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• Timeout no more detected.

System reaction		• Default value is used for SAM data. • None
Failure cause		• Defective CAN controller, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair		• Check the installation and the proper connection of the SAM ECU to the CAN vehicle network. Check correct functioning of the CAN controller. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5
	Step2	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed

Inspection procedure	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520279-9: CAN timeout fault. Error on transmission of CAN message

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuous
		[Fault Detection] • CAN communication from SAM (ignition information) is faulty (timeout).
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• Timeout no more detected
System reaction		• Default value is used for SAM data.
		• None
Failure cause		• Defective CAN controller, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair		• Check the installation and the proper connection of the SAM ECU to the CAN vehicle network. Check correct functioning of the CAN controller. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step2 Yes: Go to step5

Inspection procedure	Step2	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step4
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step5	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520281-9: CAN timeout fault. Error on transmission of CAN message

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
	[Fault Detection] • CAN communication from the meter cluster (meter speed display information) is faulty (timeout).
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• When the frame is received, the time out error is cleared.
System reaction	• Substitute value zero (0) is used for the transmission output shaft speed.
	• Engine speed limited to about 2000 rpm • Engine speed limited to 2060 rpm • PTO not available
Failure cause	• Defective CAN controller of Tachograph or Instrument Cluster, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair	• Check presence and correct connection of the Tachograph or of the Instrument Cluster to the network, Check correct functioning of the CAN controller. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with Meter cluster is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of Meter cluster. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Meter cluster. Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed

Inspection procedure	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520288-9: CAN timeout fault. Error on transmission of CAN message

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
		[Fault Detection] • CAN communication from the NOx sensor is faulty (timeout).
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Default value is used for NOx sensor signal.
		• None
Failure cause		• Defective CAN controller of NOx Sensor, undervoltage of NOx Sensor, missing NOx Sensor, CAN cable connecting the NOx Sensor is disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the NOx Sensor to the network, Check correct functioning of the NOx Sensor CAN controller and its voltage supply. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with NOx sensor is generated, make a system diagnosis according to the diagnosis code. Go to step2

Inspection procedure	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of NOx sensor. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, replace the NOx sensor. Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520297-9: CAN timeout fault

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuous
		[Fault Detection] • CAN communication from the hydraulic unit (ECU) is faulty (timeout).
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• If the signal returns to normal when the starter switch is in ON position.
System reaction		• ABS is deactivated (set to default value).
		• None
Failure cause		• Defective CAN controller of ABS / ASR / ESP, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the ABS / ASR / ESP to the network, Check correct functioning of the CAN controller. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with Hydraulic unit (electronic control unit) is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8

Inspection procedure	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of Hydraulic unit (electronic control unit). Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Hydraulic unit (electronic control unit). Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520298-9: CAN timeout fault

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously

Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with DUONIC electronic control unit is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8

Inspection procedure	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of DUONIC electronic control unit. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the DUONIC electronic control unit. Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520310-9: CAN timeout fault

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
	[Fault Detection] • CAN communication from DUONIC ECU is faulty (timeout).
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• Default value is used for DUONIC data.
	• None
Failure cause	• Defective CAN controller of Transmission Controller, CAN cable disconnected or broken. Short circuit in wiring.

Failure repair		• Check presence and correct connection of the Transmission Controller to the network, Check correct functioning of the CAN controller. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with DUONIC electronic control unit is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of DUONIC electronic control unit. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

Inspection procedure	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the DUONIC electronic control unit. Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520311-9: CAN timeout fault

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
	[Fault Detection] • CAN communication from DUONIC ECU is faulty (timeout).
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• Default value is used for DUONIC data.
	• None
Failure cause	• Defective CAN controller of Transmission Controller, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair	• Check presence and correct connection of the Transmission Controller to the network, Check correct functioning of the CAN controller. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with DUONIC electronic control unit is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of DUONIC electronic control unit. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the DUONIC electronic control unit. Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed

Inspection procedure	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520312-9: CAN bus OFF fault

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • Continuously
		[Fault Detection] • CAN communication from DUONIC ECU is faulty (timeout).
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Default value is used for DUONIC data.
		• None
Failure cause		• Defective CAN controller of Transmission Controller, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the Transmission Controller to the network, Check correct functioning of the CAN controller. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with DUONIC electronic control unit is generated, make a system diagnosis according to the diagnosis code. Go to step2

Inspection procedure	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of DUONIC electronic control unit. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the DUONIC electronic control unit. Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520324-9: CAN timeout fault (DEF Level sensor)

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Timeout of DEF level message.
		[Defect Debouncing] • Defect condition fulfilled continuously >500 ms
Fault healing		• If the DEF level message is received correct after the debouncing time.
System reaction		• The default value is used: 0%
		• None
Failure cause		• Defective CAN controller of DEF tank level sensor, CAN cable connecting the sensor is disconnected or broken. • Short circuit in wiring.
Failure repair		• Check presence and correct connection of the DEF tank level sensor to the network, Check correct functioning of the sensor CAN controller and its voltage supply. • Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 125: Fill level of DEF tank • 126: Status of DEF fill level • 134: Status of component "DEF Level sensor"
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF level sensor
Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520325-9: Component 'Vehicle dynamics CAN bus' is faulty.

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Fault is detected if a time out of the message occurs.
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position.
System reaction	• Substitute data from Hydraulic unit are used.
	• None
Failure cause	• Defective CAN controller of Hydraulic unit, under voltage of Hydraulic unit, missing Hydraulic unit, CAN cable connecting the Hydraulic unit is disconnected or broken. Short circuit in wiring.
Failure repair	• Check presence and correct connection of the Hydraulic unit to the network, check correct functioning of the Hydraulic unit CAN controller and its voltage supply. Check wiring.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520327-12: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • Internal error of the power supply system in the engine ECU is detected.
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• Communication correctly restored.
System reaction	• None
	• None
Failure cause	• ECM internal failure
Failure repair	• Replace ECM
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None
Inspection procedure / Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520336-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition	[Test Condition] • Whenever an erase operation is started.
	[Fault Detection] • Erasure of the registration information in the engine ECU has failed.
	[Defect Debouncing] • Immediate
Fault healing	• None
System reaction	• None
	• None
Failure cause	• Wrong programming/flashing of the ECM, internal defect of the ECM.
Failure repair	• Try to flash the ECM correctly with a proper dataset, if defect persists: replace ECM.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520337-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • At every read access to memory media.
		[Fault Detection] • Reading of the registration information in the engine ECU has failed.
		[Defect Debouncing] • Immediate
Fault healing		• None
System reaction		• Relevant substitute values are used for error points.
		• None
Failure cause		• Wrong programming/flashing of the ECM, internal defect of the ECM.
Failure repair		• Try to flash the ECM correctly with a proper dataset, if defect persists: replace ECM.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520340-0: The efficiency of the exhaust gas recirculation cooler is not sufficient.

Generation condition	[Test Condition] • Following release conditions are considered: stationary engine operating mode is detected, EGR mass flow lies within the thresholds 200 Kg/h and 30 Kg/h and A switch-off case not be pending for closed-loop EGR control lies within the thresholds 111.96°C {233.53°F} and 47.96°C {118.33°F}; average engine speed lies within the thresholds 3500 rpm and 2500 rpm; injection quantity lies within the thresholds 100 mg/hub and 35 mg/hub; engine operating in normal mode (no regeneration))
	[Fault Detection] • If the measured value is greater than the calculated value, then the EGR cooler is defective.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• None
	• None
Failure cause	• EGR cooler efficiency low
Failure repair	• Check EGR cooler
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 001: Temperature at component 'Charge air outlet temperature sensor'

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #299 Inspection of intercooler outlet temperature sensor
Inspection procedure	Step1	Removal the EGR cooler outlet temperature sensor and do visual check and if it is dirty then you should clean it. Remount the EGR cooler outlet temperature sensor.
	Step2	Turn the starter switch to the "ON" position and check the service data shown below. No.000 “Temperature at component 'Temperature sensor (Exhaust temperature downstream of exhaust gas recirculation cooler)'”, No.015 “Ambient temperature'” Check the value in No.000 is within the standard range (Value of No.015 ± 10 °C {18°F}).
	Step3	Check the value in step2. If it is out of standard range, replace the exhaust gas recirculation cooler outlet temperature sensor with a new one.

520344-1: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Open Load diagnosis not active • Plausibility Check for Short Circuit Overload not active
		[Fault Detection] • Open-circuit of the EGR actuator harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• None
		• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• Too high Voltage fluctuations in system • internal failure of ECU
Failure repair		• Check electrical system of vehicle • Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520344-3: Component 'Exhaust gas recirculation valve' has a short circuit to positive.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Open Load diagnosis not active
	[Fault Detection] • Short-circuit to positive of the EGR actuator harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 300.00ms • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• Power stage is deactivated.
	• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause	• Short circuit of wiring to external source
Failure repair	• Check of wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 006: Exhaust gas recirculation actuator

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520344-4: Component 'Exhaust gas recirculation valve' has a short circuit to ground.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Open Load diagnosis not active
	[Fault Detection] • Short-circuit to ground of the EGR actuator harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 300.00ms • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position

System reaction		• Power stage is deactivated.
		• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• Short circuit of wiring to ground
Failure repair		• Check of wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520344-6: Component 'Exhaust gas recirculation valve' has an electrical fault.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Open Load diagnosis not active • Failure “Short Circuit to Battery” (SCB) or “short circuit to Ground” (SCG) detected.
		[Fault Detection] • Overcurrent is detected in the EGR actuator.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 300.00ms • Failure is detected if active for 50% of the time
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Power stage is deactivated.
		• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• Short circuit of wiring
Failure repair		• Check of wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5

Inspection procedure	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520344-7: The function of component 'Exhaust gas recirculation valve' is not OK.

Generation condition		[Test Condition] • After a governor deviation is detected
		[Fault Detection] • EGR actuator seized in open state.
		[Defect Debouncing] • 300.00ms after last release trial
Fault healing		• None
System reaction		• EGR actuator is deactivated.
		• Slightly different drivability / noise • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Limitation to 75% torque / 50% power • Engine speed limited to 3570 rpm
Failure cause		• EGR valve can not be closed as desired within expected time • EGR valve blocked mechanically • EGR valve sticks • EGR valve position sensor mismatched
Failure repair		• Check Functionality of EGR valve and the corresponding position
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in ON. Execute the control “Control of exhaust gas recirculation”. Turn the starter switch in OFF. Check the Mechanical fault at EGR actuator. Can occurrence of a mechanical fault be confirmed? No: Go to Step3 Yes: Go to Step4

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of EGR actuator. Check the circuit across Engine electronic control unit and EGR actuator for open or short circuit. Check the circuit across Engine electronic control unit and EGR position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “EGR actuator”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of EGR actuator which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520347-31: System information : Limiting of engine power by engine protection function (Protection of fuel injection system)

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • Generated when the injection cutoff occurred (engine speed was above 1600 rpm) under engine output limiting condition. (Check the diagnosis code(s) generated simultaneously and perform troubleshooting according to that code(s).)
		[Defect Debouncing] • Immediate.
Fault healing		• If engine speed < 1600 rpm.
System reaction		• Fuel injection rate is reduced if engine speed has reached 1500 rpm; fuel injection is suspended if it has exceeded 1600 rpm.
		• Engine stop
Failure cause		• Another failure requested engine speed limitation. • This failure path should always appear in failure memory with another lead failure from ECM monitoring level (level 2)
Failure repair		• Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520348-0: Signal 'Exhaust temperature upstream of oxidation catalytic converter' is implausible.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Monitoring not inhibited by another failure
	[Fault Detection] • Exhaust gas temperature of the SCR temperature sensor 2 exceeds 649.96°C {1202°F} for 5 seconds continuously.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 50% of the time
Fault healing	• Measured temperature < 649.96°C {1202°F}
System reaction	• DPF monitoring which compares the calculated flow resistance with pressure drop measurements is disabled.
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• Exhaust Temperature Sensor before Oxicat measures wrong values or interchanged with Temperature before Oxicat
Failure repair	• Check wiring and connectors for correct contact (corrosion). • Check sensor and replace it if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 011: Temperature at component 'SCR catalytic converter (BACK)' • 012: Temperature at component 'SCR catalytic converter (FORWARD)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of SCR temperature sensor 1 • #336 Inspection of SCR temperature sensor 2
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Incorrect assembly of SCR temperature sensor 1, SCR temperature sensor 2 For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step4
	Step4	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of SCR temperature sensor 2. Check the circuit across Engine electronic control unit and SCR temperature sensor 2 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step10
	Step5	Turn the starter switch in OFF. Replace component “SCR temperature sensor 2”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step7
	Step7	Inspect or verify the following items. Repair or replace faulty items as necessary. Incorrect assembly of SCR temperature sensor 1, SCR temperature sensor 2 For procedures, refer to the Shop Manual. Go to Step8
	Step8	Perform the operation start and replace Engine electronic control unit. Go to Step9
	Step9	Inspection completed
	Step10	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and ATS harness. Check the circuit across Engine electronic control unit and Connection of chassis harness and ATS harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step11 Yes: Go to Step12
	Step11	Repair or replace the harness across SCR temperature sensor 2 and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

Inspection procedure	Step12	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step9 Yes: Go to Step5

520352-0: Measurement value (Duration of actuation) of the component 'Fuel injector 1' is above the specified value.

Generation condition	[Test Condition] • Zero fuel calibration not inhibited due to other failures • Intake air temperature > -7.14°C {19°F} • Fuel temperature between -0.04°C {32°F} and 79.96°C {176°F}. • Engine temperature > 62.96°C {145°F} • System Voltage > 10.00 V • The combustion chamber has not cooled off and the conditions for combustion are met • The limitation of the learning frequency is greater than 0 • Air conditioner pressure < 20.00 bar • The boost pressure > 80 kPa {12 psi, 0.8 kgf/cm^2} and boost pressure sensing is OK • Accelerator Pedal Position < 0.01% • System in overrun, but not longer than a time, which is dependent on intake air temperature (from 0.00ms at -8.04°C {18°F} over 10000.00 ms at 9.96°C {50°F} and 25000.00 ms at 39.96°C {104°F} to 25000.00 ms at 106.86°C {224°F}), but longer than 0.00 ms. • Engine speed is in a defined gear dependent window • Clutch not pressed • Vehicle speed > threshold depending on fuel pressure set point: • At set point 0 350.00 bar > 0 km/h {0 mph} • At set point 0 600.00 bar > 0 km/h {0 mph} • At set point 0 800.00 bar > 0 km/h {0 mph} • At set point 0 1000.00 bar > 0 km/h {0 mph} • At set point 0 1300.00 bar > 0 km/h {0 mph} • At set point 0 1600.00 bar > 0 km/h {0 mph} • Rail pressure must be reached since 300.00 ms • If 5 learning cycles were executed successfully, a minimal distance > 1000.00 km has to be driven, before next learning cycles starts (this time only for 5 learning cycles). • The rail pressure deviation of the desired rail pressure calibration point is in defined range and time 300.00 ms for rail pressure stabilization has expired • No gear change occurring • The sensor wheel adaptation must be executed correctly • The environmental pressure > 76 kPa {11 psi, 0.8 kgf/cm^2}
	[Fault Detection] • Energization time for No. 1 cylinder is above the specified maximum energization time.
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position.
System reaction	• None
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• Clogged nozzles in the injector of cylinder 1, mechanical defect partially jamming the valve lift, implausible lambda signal (See “6. Inspections to be Made at Injector Error Occurrence) • Lambda sensor failure • Air flow and intake air temperature sensor failure
Failure repair	• Check injector of cylinder 1 for blocked nozzles and jammed valve needle, check lambda sensor for plausible signals, replace injector if necessary

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 057: Lambda value • 070: Correction value of fuel quantity (Cylinder 1)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspection of Lambda sensor See the “#297 Inspection of Lambda sensor” of section “INSPECTION OF ELECTRICAL EQUIPMENT”.
	Step2	Inspection of air flow & intake air temperature sensor (air flow sensing section) See the “(2) Inspection of air flow & intake air temperature sensor (air flow sensing section)” of section 5.
	Step3	The reset of the injector learning value.
Inspection procedure	Step4	If the failure is not deleted in step 1 to 3, replace the injectors.

520352-1: Measurement value (Duration of actuation) of the component 'Fuel injector 1' is below the specified value.

Generation condition	[Test Condition] • Zero fuel calibration not inhibited due to other failures • Intake air temperature > -7.14°C {19°F} • Fuel temperature between -0.04°C {32°F} and 79.96°C {176°F}. • Engine temperature > 62.96°C {145°F} • System Voltage > 10.00 V • The combustion chamber has not cooled off and the conditions for combustion are met • The limitation of the learning frequency is greater than 0 • Air conditioner pressure < 20.00 bar • The boost pressure > 80 kPa {12 psi, 0.8 kgf/cm^2} and boost pressure sensing is OK • Accelerator Pedal Position < 0.01% • System in overrun, but not longer than a time, which is dependent on intake air temperature (from 0.00 ms at -8.04°C {18°F} over 10000.00 ms at 9.96°C {50°F} and 25000.00 ms at 39.96°C {104°F} to 25000.00 ms at 106.86°C {224°F}), but longer than 0.00 ms. • Engine speed is in a defined gear dependent window • Clutch not pressed • Vehicle speed > threshold depending on fuel pressure set point: • At set point 0 350.00 bar > 0 km/h {0 mph} • At set point 0 600.00 bar > 0 km/h {0 mph} • At set point 0 800.00 bar > 0 km/h {0 mph} • At set point 0 1000.00 bar > 0 km/h {0 mph} • At set point 0 1300.00 bar > 0 km/h {0 mph} • At set point 0 1600.00 bar > 0 km/h {0 mph} • Rail pressure must be reached since 300.00 ms • If 5 learning cycles were executed successfully, a minimal distance > 1000.00 km has to be driven, before next learning cycles starts (this time only for 5 learning cycles). • The rail pressure deviation of the desired rail pressure calibration point is in defined range and time 300.00 ms for rail pressure stabilisation has expired • No gear change occurring • The sensor wheel adaptation must be executed correctly • The environmental pressure > 76 kPa {11 psi, 0.8 kgf/cm^2}
	[Fault Detection] • Energization time for No. 1 cylinder is below the specified minimum energization time.
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position

System reaction		• None
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Defective injector of cylinder 1, the injector could be jammed and cannot close entirely, implausible lambda signal (See “6. Inspections to be Made at Injector Error Occurrence) • Lambda sensor failure • Air flow and intake air temperature sensor failure
Failure repair		• Check injector of cylinder 1 for proper functioning, check lambda sensor for plausible signals, replace injector if necessary

Inspection procedure	Step1	Inspection of Lambda sensor See the “#297 Inspection of Lambda sensor” of section “INSPECTION OF ELECTRICAL EQUIPMENT”.
	Step2	Inspection of air flow & intake air temperature sensor (air flow sensing section) See the “(2) Inspection of air flow & intake air temperature sensor (air flow sensing section)” of section 5.
	Step3	The reset of the injector learning value.
	Step4	If the failure is not deleted in step 1 to 3, replace the injectors.

520354-1: Measurement value (Duration of actuation) of the component 'Fuel injector 4' is below the specified value.

Generation condition	[Test Condition] • Zero fuel calibration not inhibited due to other failures • Intake air temperature > -7.14°C {19°F} • Fuel temperature between -0.04°C {32°F} and 79.96°C {176°F}. • Engine temperature > 62.96°C {145°F} • System Voltage > 10.00 V • The combustion chamber has not cooled off and the conditions for combustion are met • The limitation of the learning frequency is greater than 0 • Air conditioner pressure < 20.00 bar • The boost pressure > 80 kPa {12 psi, 0.8 kgf/cm^2} and boost pressure sensing is OK • Accelerator Pedal Position < 0.01% • System in overrun, but not longer than a time, which is dependent on intake air temperature (from 0.00ms at -8.04°C {18°F} over 10000.00 ms at 9.96°C {50°F} and 25000.00 ms at 39.96°C {104°F} to 25000.00 ms at 106.86°C {224°F}), but longer than 0.00 ms. • Engine speed is in a defined gear dependent window • Clutch not pressed • Vehicle speed > threshold depending on fuel pressure set point: • At set point 0 350.00 bar > 0 km/h {0 mph} • At set point 0 600.00 bar > 0 km/h {0 mph} • At set point 0 800.00 bar > 0 km/h {0 mph} • At set point 0 1000.00 bar > 0 km/h {0 mph} • At set point 0 1300.00 bar > 0 km/h {0 mph} • At set point 0 1600.00 bar > 0 km/h {0 mph} • Rail pressure must be reached since 300.00 ms • If 5 learning cycles were executed successfully, a minimal distance > 1000.00 km has to be driven, before next learning cycles starts (this time only for 5 learning cycles). • The rail pressure deviation of the desired rail pressure calibration point is in defined range and time 300.00 ms for rail pressure stabilisation has expired • No gear change occurring • The sensor wheel adaptation must be executed correctly • The environmental pressure > 76 kPa {11 psi, 0.8 kgf/cm^2}
	[Fault Detection] • Energization time for No. 4 cylinder is below the specified minimum energization time.
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• None
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• Defective injector of cylinder 4, the injector could be jammed and cannot close entirely, implausible lambda signal (See “6. Inspections to be Made at Injector Error Occurrence) • Lambda sensor failure • Air flow and intake air temperature sensor failure
Failure repair	• Check injector of cylinder 4 for proper functioning, check lambda sensor for plausible signals, replace injector if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 057: Lambda value • 072: Correction value of fuel quantity (Cylinder 4)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #582 Inspection of injector

Inspection procedure	Step1	Inspection of Lambda sensor See the “#297 Inspection of Lambda sensor” of section “INSPECTION OF ELECTRICAL EQUIPMENT”.
	Step2	Inspection of air flow & intake air temperature sensor (air flow sensing section) See the “(2) Inspection of air flow & intake air temperature sensor (air flow sensing section)” of section 5.
	Step3	The reset of the injector learning value.
	Step4	If the failure is not deleted in step 1 to 3, replace the injectors.

520355-0: Measurement value (Duration of actuation) of the component 'Fuel injector 2' is above the specified value.

Generation condition	[Test Condition] • Zero fuel calibration not inhibited due to other failures • Intake air temperature > -7.14°C {19°F} • Fuel temperature between -0.04°C {32°F} and 79.96°C {176°F}. • Engine temperature > 62.96°C {145°F} • System Voltage > 10.00 V • The combustion chamber has not cooled off and the conditions for combustion are met • The limitation of the learning frequency is greater than 0 • Air conditioner pressure < 20.00 bar • The boost pressure > 80 kPa {12 psi, 0.8 kgf/cm^2} and boost pressure sensing is OK • Accelerator Pedal Position < 0.01% • System in overrun, but not longer than a time, which is dependent on intake air temperature (from 0.00 ms at -8.04°C {18°F} over 10000.00 ms at 9.96°C {50°F} and 25000.00 ms at 39.96°C {104°F} to 25000.00 ms at 106.86°C {224°F}), but longer than 0.00 ms. • Engine speed is in a defined gear dependent window • Clutch not pressed • Vehicle speed > threshold depending on fuel pressure set point: • At set point 0 350.00 bar > 0 km/h {0 mph} • At set point 0 600.00 bar > 0 km/h {0 mph} • At set point 0 800.00 bar > 0 km/h {0 mph} • At set point 0 1000.00 bar > 0 km/h {0 mph} • At set point 0 1300.00 bar > 0 km/h {0 mph} • At set point 0 1600.00 bar > 0 km/h {0 mph} • Rail pressure must be reached since 300.00 ms • If 5 learning cycles were executed successfully, a minimal distance > 1000.00 km has to be driven, before next learning cycles starts (this time only for 5 learning cycles). • The rail pressure deviation of the desired rail pressure calibration point is in defined range and time 300.00 ms for rail pressure stabilisation has expired • No gear change occurring • The sensor wheel adaptation must be executed correctly • The environmental pressure > 76 kPa {11 psi, 0.8 kgf/cm^2}
	[Fault Detection] • Energization time for No. 2 cylinder is above the specified maximum energization time.
	[Defect Debouncing] • Defect condition fulfilled continuously >1.00 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• None
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• Clogged nozzles in the injector of cylinder 2, mechanical defect partially jamming the valve lift, implausible lambda signal (See “6. Inspections to be Made at Injector Error Occurrence) • Lambda sensor failure • Air flow and intake air temperature sensor failure
Failure repair	• Check injector of cylinder 2 for blocked nozzles and jammed valve needle, check lambda sensor for plausible signals, replace injector if necessary

Inspection procedure	Step4	If the failure is not deleted in step 1 to 3, replace the injectors.

520357-0: A fault was detected during regeneration of the diesel particulate filter.The current value for the 'Exhaust temperature upstream of diesel particulate filter' component is too low.

Generation condition	[Test Condition] • Engine speed and load within a specified range (by calibration) for more than 0.00 s. • Engine in "steady state condition", i.e. the variation of the exhaust temperature < 3276.70 K since 0.00 s. • Regeneration and outer control loop active , i.e. the Adapted DPF upstream temperature in interval between 549.96°C {1022°F} and 799.96°C {1472°F} but at least 149.96°C {270°F} (to guarantee burning of fuel) for at least 0.00 s resp. not longer than 0.00 s outside this range.
	[Fault Detection] • On DPF regeneration, temperature after Oxicat does not reach to the target value (too low).
	[Defect Debouncing] • Defect condition fulfilled continuously > 100000 ms
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• None
	• None
Failure cause	• Difficult ambient conditions resp vehicle use (demanded temperature can not reached due to ambient conditions) • Problems with temperature measurement after Oxicat (sensor defect or sensors before/after Oxicat interchanged) • Oxicat defective (does not burn fuel) • Problems with injection system (too low post injection quantity)
Failure repair	• Check Temperature sensors • Check Oxicat (execute service regeneration --> does tempa fter Oxicat increase with activated Post injection?) • Check injection system

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 005: Temperature in component 'Diesel oxidation catalytic converter' • 006: Temperature in component 'DPF' • 007: Exhaust temperature upstream of diesel oxidation catalytic converter • 008: Exhaust temperature upstream of diesel particulate filter • 043: Signal voltage of component 'Temperature sensor Exhaust system1'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of exhaust gas temperature sensor 1 • #336 Inspection of exhaust gas temperature sensor 2
Inspection procedure	Step1	Inspection of exhaust gas temperature sensor 1 and 2 (DPF exhaust gas temperature sensor 1 and 2) See the “(6) Inspection of exhaust gas temperature sensor 1 and 2 (DPF exhaust gas temperature sensor 1 and 2)” of section 5.

520357-1: A fault was detected during regeneration of the diesel particulate filter.The current value of component 'Exhaust temperature upstream of diesel particulate filter' is too high.

Generation condition		[Test Condition] • Engine speed and load within a specified range (by calibration) for more than 0.00 s. • Engine in "steady state condition", i.e. the variation of the exhaust temperature < 3276.70 K since 0.00 s. • Regeneration and outer control loop active , i.e. the Adapted DPF upstream temperature in interval between 549.96°C {1022°F} and 799.96°C {1472°F} but at least 149.96°C {270°F} (to guarantee burning of fuel) for at least 0.00 s resp. not longer than 0.00 s outside this range.
		[Fault Detection] • On DPF regeneration, temperature after Oxicat exceeds the target value (too high).
		[Defect Debouncing] • Defect condition fulfilled continuously > 100000 ms
Fault healing		• No Healing possible (disabled by Data set)
System reaction		• None
		• None
Failure cause		• Problems with temperature measurement after Oxicat (sensor measures much too high temp) • Problems with injection system (too high post injection quantity)
Failure repair		• Check Temperature sensors • Check Oxicat (execute service regeneration --> does tempa fter Oxicat increase with activated Post injection?) • Check injection system
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 005: Temperature in component 'Diesel oxidation catalytic converter' • 006: Temperature in component 'DPF' • 007: Exhaust temperature upstream of diesel oxidation catalytic converter • 008: Exhaust temperature upstream of diesel particulate filter • 043: Signal voltage of component 'Temperature sensor Exhaust system1'

520358-2: Component 'Engine brake Solenoid valve' is mechanically damaged or it sticks.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously
	[Fault Detection] • Seizure of the exhaust brake valve is detected for 5 times.
	[Defect Debouncing] • Immediate
Fault healing	• Exhaust flap not sticking for at least 800 ms
System reaction	• None
	• None
Failure cause	• Electrical problem in exhaust flap (loose connection) or sticking flap
Failure repair	• Check exhaust flap, check electrical connection
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 111: Position of component 'Engine brake Solenoid valve' • 138: Engine Brake
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 007: Exhaust brake solenoid valve

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code.
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Exhaust brake valve. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Exhaust brake valve for open or short circuit. Check the circuit across Signal detect and actuation module and Exhaust brake valve for open or short circuit. Check the circuit across Ground and Exhaust brake valve for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step
	Step3	Turn the starter switch in OFF. Replace component “Exhaust brake valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Ground and Connection of chassis harness and engine harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Exhaust brake valve and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

Inspection procedure	Step9	Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and engine harness. Repair or replace the harness across Ground and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520359-2: Component 'Engine brake Solenoid valve' or its electrical line is defective.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously
		[Fault Detection] • Failure of temperature or power supply for exhaust brake valve is detected for 2 times or more.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00 events • Failure is detected if active for 25% of events
Fault healing		• None
System reaction		• Exhaust brake is deactivated.
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Exhaust flap too hot (due to bad cooling or too high current due to electrical problem) • Supply wiring defect / or ECM Supply to Exhaust flap actuator defect • PWM wiring defect (sporadic interruptions lead to “wrong PWM” detection)
Failure repair		• Check exhaust flap actuator and wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 111: Position of component 'Engine brake Solenoid valve' • 138: Engine Brake
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 007: Exhaust brake solenoid valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Exhaust brake valve. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Exhaust brake valve for open or short circuit. Check the circuit across Signal detect and actuation module and Exhaust brake valve for open or short circuit. Check the circuit across Ground and Exhaust brake valve for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

Inspection procedure	Step3	Turn the starter switch in OFF. Replace component “Exhaust brake valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Ground and Connection of chassis harness and engine harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Exhaust brake valve and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and engine harness. Repair or replace the harness across Ground and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520360-2: Component 'Engine brake Solenoid valve' or its electrical line is defective.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously
	[Fault Detection] • Seizure of the exhaust brake valve in closed state is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00 events • Failure is detected if active for 25% of events
Fault healing	• None

System reaction		• Exhaust brake is deactivated.
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm • Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available • Slightly different drivability / noise
Failure cause		• Exhaust flap mechanically blocked in closed position • Internal failure in Exhaust flap actuator.
Failure repair		• Check exhaust flap actuator and wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 111: Position of component 'Engine brake Solenoid valve' • 138: Engine Brake
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 007: Exhaust brake solenoid valve

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

Inspection procedure	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Exhaust brake valve. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Exhaust brake valve for open or short circuit. Check the circuit across Signal detect and actuation module and Exhaust brake valve for open or short circuit. Check the circuit across Ground and Exhaust brake valve for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Exhaust brake valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and engine harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Ground and Connection of chassis harness and engine harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Exhaust brake valve and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and engine harness. Repair or replace the harness across Ground and Connection of chassis harness and engine harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520362-2: Component 'Engine brake Solenoid valve' or its electrical line is defective.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously
		[Fault Detection] • Seizure of exhaust brake valve in mid or open state is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 25% of events
Fault healing		• None
System reaction		• Exhaust brake is deactivated.
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Exhaust flap mechanically blocked or high movement resistance • Internal failure in Exhaust flap actuator.
Failure repair		• Check exhaust flap actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 111: Position of component 'Engine brake Solenoid valve' • 138: Engine Brake
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 007: Exhaust brake solenoid valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code.
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Exhaust brake valve. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Exhaust brake valve for open or short circuit. Check the circuit across Signal detect and actuation module and Exhaust brake valve for open or short circuit. Check the circuit across Ground and Exhaust brake valve for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step
	Step3	Turn the starter switch in OFF. Replace component “Exhaust brake valve”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed

Inspection procedure	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Ground and Connection of chassis harness and engine harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness and engine harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Exhaust brake valve and chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Signal detect and actuation module and chassis harness and DEF tank harness. Repair or replace the harness across Ground and chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520364-2: Components 'Temperature sensor 'Exhaust system'' and 'Temperature sensor "SCR catalytic converter"' are faulty.

Generation condition	[Test Condition] • once in a driving cycle if following conditions are true: • monitoring not disabled by another failure. • Not in high altitude (ambient pressure > 50 kPa {7.3 psi, 0.5 kgf/cm^2} • The time since last engine stop > 5 h (time usually taken via CAN from tachograph). • In case the timer or the CAN transmission is defective, the monitoring is inhibited.
	[Fault Detection] • Detected temperatures from temperature sensors do not match when the engine is cold.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1000.00ms • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• DPF regeneration is suspended.
	• None
Failure cause	• Several sensors have wrong measurement values. • Too fast change of ambient temperature (e.g. due to sun shining in the morning after cold night.) --> see ambient conditions

Failure repair		• Check with ambient conditions, which sensors show highest deviation form intake air temperature in AFS, Boost temperature and Coolant temperature. If Boost temperature and coolant temperature are similar but higher than the exhaust temperatures --> failure caused probably by “fast ambient temperature change” --> no action needed. • Else identify sensors which deviate most from the intake air temperature. • Note: Too fast ambient temperature change, e.g. vehicle (and dedicated temperature sensor) exposed to sun shine after very cold night, or if the sensor is in a “warm air stream” (e.g. by additional engines like a cooling compressor for a cold compartment which runs also during vehicle stand still, or an external source like a “exhaust stream” of a building climatisation) can cause this failure, if the ambient of this sensor is not equal to the “normal” ambient! --> in this case no action needed!
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 007: Exhaust temperature upstream of diesel oxidation catalytic converter • 008: Exhaust temperature upstream of diesel particulate filter • 011: Temperature at component 'SCR catalytic converter (BACK)' • 012: Temperature at component 'SCR catalytic converter (FORWARD)' • 015: Ambient temperature
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of SCR temperature sensor 1 • #336 Inspection of SCR temperature sensor 2 • #336 Inspection of exhaust gas temperature sensor 1 • #336 Inspection of exhaust gas temperature sensor 2 • #347 Inspection of Humidity and intake air temperature sensor
Inspection procedure	Step1	Inspection of exhaust gas temperature sensor 1 and 2 (DPF exhaust gas temperature sensor 1 and 2) See the “(6) Inspection of exhaust gas temperature sensor 1 and 2 (DPF exhaust gas temperature sensor 1 and 2)” of section 5.

520365-2: The temperature measured at component 'Temperature sensor Exhaust system 1' is implausible.

Generation condition	[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • By Data Set Mask Monitoring not inhibited by due to another failure, Monitoring not inhibited by running mode and Engine running > 5.45min since start
	[Fault Detection] • Invalid value is detected in the exhaust temperature before Oxicat.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 20s • Failure is detected if active for 50% of the time
Fault healing	• No Healing possible
System reaction	• None
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• Bad electrical wiring (e.g. corroded connector or damaged isolation of wire), incorrect mounting (measuring fresh air) or gain offset of sensor for Exhaust Temperature before Oxicat.

Failure repair		• Note: failure can also be caused, if the real exhaust temperature differs from the calculated one due to a failure in the engine like: wrong injection pressure, wrong injection begin, wrong EGR rate • Therefore check also the engine system, if the failure can not be repaired easily. • Check wiring and connectors for correct isolation / contact. • Check if sensor is mounted correctly. • Check plausibility of Temperature sensor OxiCat upstream by comparing to known temperature -> if not ok replace. • Dismount temperature sensor and check for pollution -> if polluted clean sensor. • If no issue found so far, -> replace sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 005: Temperature in component 'Diesel oxidation catalytic converter' • 007: Exhaust temperature upstream of diesel oxidation catalytic converter • 043: Signal voltage of component 'Temperature sensor Exhaust system1'

Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520379-0: Measurement value (Correction value) of the component 'Injection quantity' is above the specified value.

Generation condition	[Test Condition] • Continuously monitoring
	[Fault Detection] • Calculated fuel injection amount (obtained from the measured values of lambda (air-fuel ratio) and air flow (air volume)) is above the specified value for 30 seconds.
	[Defect Debouncing] • Defect condition fulfilled continuously > 30000.0 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• Healing condition fulfilled continuously > 300000 ms
	• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause	• Calculated lambda may be wrong: air mass meter defect or injectors defect. (See “6. Inspections to be Made at Injector Error Occurrence) Measured lambda-value wrong, check lambda sensor.
Failure repair	• Check air mass meter, injectors and lambda sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 003: Temperature at component 'Air mass flow rate / Intake air temperature sensor' • 010: Temperature at component 'Lambda control tester' • 032: Operating state of component 'Lambda control tester' (Heater ON) • 034: Signal voltage of component 'Air mass flow rate / Intake air temperature sensor' (Temperature sensors) • 053: Air mass flow rate (Actual value) • 054: Air mass flow rate (Specified value) • 055: Air mass flow rate (Cylinder) • 057: Lambda value • 118: Status of component 'Lambda control tester' • 135: Status of oxygen sensor heater • 160: Air mass flow rate Learned value 1 • 161: Air mass flow rate Learned value 2
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #297 Inspection of lambda sensor • #306 Inspection of air flow and intake air temperature sensor

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with Airflow and intake air temperature sensor is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with pressure regulation valve is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520379-1: Measurement value (Correction value) of the component 'Injection quantity' is below the specified value.

Generation condition	[Test Condition] • Continuously monitoring
	[Fault Detection] • Calculated fuel injection amount (obtained from the measured values of lambda (air-fuel ratio) and air flow (air volume)) is below the specified value for 30 seconds.
	[Defect Debouncing] • Defect condition fulfilled continuously > 30000.0 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position

System reaction		• Healing condition fulfilled continuously > 300000 ms
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Calculated lambda may be wrong: air mass meter defect or injectors defect. (See “6. Inspections to be Made at Injector Error Occurrence) Measured lambda-value wrong, check lambda sensor.
Failure repair		• Check air mass meter, injectors and lambda sensor.

	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step5

Inspection procedure	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520380-31: NOx sensor : The power supply is faulty.

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • continuously
		[Fault Detection] • Self-diagnosis of NOx sensor detects an error (power supply error).
		[Defect Debouncing] • Defect condition fulfilled continuously >20000.0 ms
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• Normally, NOx signal value is set by NOx sensor itself, which causes the NOx concentration to be frozen at a substitute value.
		• None
Failure cause		• Defective NOx sensor supply
Failure repair		• Check wiring harness • Check NOx Sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2

Inspection procedure	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and NOx sensor for open or short circuit. Check the circuit across Signal detect and actuation module and NOx sensor for open or short circuit. Check the circuit across NOx sensor and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component "Lambda sensor". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step6
	Step5	Inspection completed
	Step6	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and ATS harness. Remove the connector of Signal detect and actuation module. Check the circuit across Engine electronic control unit and Connection of chassis harness and ATS harness for open or short circuit. Check the circuit across Signal detect and actuation module and Connection of chassis harness and ATS harness for open or short circuit. Check the circuit across Connection of chassis harness and ATS harness and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across Lambda sensor and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step3

520381-31: The power supply of component 'NOx sensor 1' is faulty.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • The NOx Sensor upstream sends the message "Sensor supply not OK"
		[Defect Debouncing] • Defect condition fulfilled continuously >20 s
Fault healing		• The NOx Sensor upstream sends the message "Sensor supply OK"
System reaction		• None
		• None
Failure cause		• Defective NOx sensor upstream sensor supply.
Failure repair		• Check wiring harness, vehicle supply voltage. • If failure is still present replace the sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520382-31: Signal 'Y11 (Glow plug 1)' is faulty.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Only if glow plug are actuated and no other glow plug failure already detected.
	[Fault Detection] • Glow plug resistance is not between thresholds determined by the map. The input values of the map are the derivation of the glow plug current and the effective glow plug voltage.
	[Defect Debouncing] • Defect condition fulfilled continuously >3000.0 ms
Fault healing	• Glow plug resistance is in range
System reaction	• None
	• None
Failure cause	• Glow Plug resistance not matching specification: wiring problem, defective glow plug or glow plug installed not matching dataset application
Failure repair	• Check wiring, check glow plug
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #764 Inspection of glow plug

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9

Inspection procedure	Step9	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520383-31: Signal 'Y12 (Glow plug 2)' is faulty.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Only if glow plug are actuated and no other glow plug failure already detected.
		[Fault Detection] • Glow plug resistance is not between thresholds determined by the map. The input values of the map are the derivation of the glow plug current and the effective glow plug voltage.
		[Defect Debouncing] • Defect condition fulfilled continuously >3000.0 ms
Fault healing		• Glow plug resistance is in range
System reaction		• None
		• None
Failure cause		• Glow Plug resistance not matching specification: wiring problem, defective glow plug or glow plug installed not matching dataset application
Failure repair		• Check wiring, check glow plug
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520384-31: Signal 'Y13 (Glow plug 3)' is faulty.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Only if glow plug are actuated and no other glow plug failure already detected.
		[Fault Detection] • Glow plug resistance is not between thresholds determined by the map. The input values of the map are the derivation of the glow plug current and the effective glow plug voltage.
		[Defect Debouncing] • Defect condition fulfilled continuously >3000.0 ms
Fault healing		• Glow plug resistance is in range
System reaction		• None
		• None
Failure cause		• Glow Plug resistance not matching specification: wiring problem, defective glow plug or glow plug installed not matching dataset application
Failure repair		• Check wiring, check glow plug
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)

	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520386-9: Control unit GCU4 has LIN timeout error while receiving glow plug current information.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Continuously if not inhibited by LIN BUS Off failure
		[Fault Detection] • TimeOut of Receive Frame is determined (receive frame glow plug current)
		[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing		• Time out no more detected
System reaction		• None
		• None
Failure cause		• LIN Disturbance, glowplug connection interruption, defective glow plug
Failure repair		• Check LIN connection, check glow plugs
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10

Inspection procedure	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520387-9: Control unit GCU4 has LIN timeout error while receiving glow plug status information.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Continuously if not inhibited by LIN BUS Off failure
	[Fault Detection] • Timeout of Receive Frame is detected (glow plug diagnostic information)
	[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing	• Time out no more detected
System reaction	• None
	• None
Failure cause	• LIN Disturbance, glowplug connection interruption, defective glow plug
Failure repair	• Check LIN connection, check glow plugs
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #764 Inspection of glow plug

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9

Inspection procedure	Step9	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520388-9: Control unit GCU4 has LIN timeout error while receiving glow plug current information and status information.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Continuously if not inhibited by LIN BUS Off failure
		[Fault Detection] • Communication error to glow ECU
		[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing		• At least one receive frame received
System reaction		• None
		• None
Failure cause		• LIN Disturbance, glowplug connection interruption, defective glow plug
Failure repair		• Check LIN connection, check glow plugs
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520391-0: Component 'Glow plug' has detected an overvoltage.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • If overvoltage error is reported by LIN.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• If overvoltage error is not reported.
System reaction		• None
		• None
Failure cause		• Overvoltage at main power supply / GCU4
Failure repair		• Check GCU4 voltage at connector term.11 with running engine, if overvoltage is not present, failure can be deleted. Failure was probably caused by jump start (24V). • If voltage is abnormal, problem at alternator control. • Check alternator.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520391-9: Engine control unit has LIN timeout error while receiving informations from control unit GCU4.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • Glow plug overcurrent error signal from the glow ECU is received.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• None
		• None
Failure cause		• LIN communication problem or glow plug failure
Failure repair		• Check LIN, check glow plugs
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520391-12: Component 'Glow plug' is thermally overloaded.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • When overtemperature is reported by LIN.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• When overtemperature is not reported by LIN.
System reaction		• Glow plugs are switched off.
		• None
Failure cause		• High battery voltage, high temperature inside Glow Plug Control, high load or wiring problem
Failure repair		• Check battery load and output, check wiring, replace Glow Plug Control
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520391-31: The Glow Plugs Control Unit could not be reset.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • When GCU4 not responding for request to reset. • OR when GCU4 not responding for request to set the GE flag.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Command from ECU to GCU and status replied by GCU are compatible
System reaction		• None
		• None
Failure cause		• GCU not responding to set/reset command from ECU
Failure repair		• Internal GCU4 SW failure code, no direct check possible • Replace GCU4.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520392-1: Component 'Fuel pump' has detected an undervoltage.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
	[Fault Detection] • When there is charge pump under voltage reported by LIN.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing	• Undervoltage no more detected.
System reaction	• Glow plugs are switched off.
	• None
Failure cause	• Glow plug failure
Failure repair	• Replace glow plug
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #764 Inspection of glow plug

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9

Inspection procedure	Step9	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520393-5: The current value of component 'Y11 (Glow plug 1)' is too high.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • If the plug current on cylinder 1 < 0.23V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Plug current on cylinder 1 > 0.23V
System reaction		• None
		• None
Failure cause		• Open load error in the glow plug of cylinder 1
Failure repair		• Check glow plug and wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520393-6: The electric circuit of component 'Y11 (Glow plug 1)' is overloaded.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • If the plug current > 2.2 V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Plug current < 2.2 V
System reaction		• Glow plugs are switched off.
		• None
Failure cause		• Current overload for Glow Plug of cylinder 1
Failure repair		• Check glow plug cylinder 1 • Check wiring between glow plug cylinder 1 and GCU4 • After repair, system can be checked using actuator test: • Activate Glow plugs by sending duty cycle > 8% for at least 5 seconds at PWM Outputs: Glow Plug Actuator (Id: $D90C). • After that verify Failure memory to check if failure was detected again. • If not, problem is solved.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520393-31: Glow Plug control unit 4 has a Transistor failure for glow plug in cylinder 1.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • Glow plug of cylinder 1 reports over LIN a MOSFET error (Transistor failure).
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Glow plug of cylinder 1 does not report a MOSFET error (Transistor failure).
System reaction		• Glow plug for cylinder 1 is deactivated.
		• None
Failure cause		• Glow plug failure of cylinder 1
Failure repair		• Replace glow plug for cylinder 1
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520394-5: The current value of component 'Y12 (Glow plug 2)' is too high.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • If the plug current on cylinder 2 < 0.23V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Plug current on cylinder 2 > 0.23V
System reaction		• None
		• None
Failure cause		• Open load error in the glow plug of cylinder 2
Failure repair		• Check glow plug and wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step6

Inspection procedure	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520395-6: The electric circuit of component 'Y13 (Glow plug 3)' is overloaded.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • If the plug current > 2.2 V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Plug current < 2.2 V
System reaction		• Glow plug for cylinder 3 is deactivated.
		• None
Failure cause		• Current overload for Glow Plug of cylinder 3
Failure repair		• Check glow plug cylinder 3 • Check wiring between glow plug cylinder 3 and GCU4 • After repair, system can be checked using actuator test: • Activate Glow plugs by sending duty cycle > 8% for at least 5 seconds at PWM Outputs: Glow Plug Actuator (Id: $D90C). • After that verify Failure memory to check if failure was detected again. • If not, problem is solved.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520395-31: Glow Plug control unit 4 has a Transistor failure for glow plug in cylinder 3.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • Glow plug of cylinder 3 reports over LIN a MOSFET error (Transistor failure).
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Glow plug of cylinder 3 does not report a MOSFET error (Transistor failure).
System reaction		• Glow plug for cylinder 3 is deactivated.
		• None
Failure cause		• Glow plug failure of cylinder 3
Failure repair		• Replace glow plug for cylinder 3
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520396-5: The current value of component 'Y14 (Glow plug 4)' is too high.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • If the plug current on cylinder 4 < 0.23V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Plug current on cylinder 4 > 0.23V
System reaction		• None
		• None
Failure cause		• Open load error in the glow plug of cylinder 4
Failure repair		• Check glow plug and wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step6

Inspection procedure	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520396-6: The electric circuit of component 'Y14 (Glow plug 4)' is overloaded.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • If the plug current > 2.2 V
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Plug current < 2.2 V
System reaction		• Glow plug for cylinder 4 is deactivated.
		• None
Failure cause		• Current overload for Glow Plug of cylinder 4
Failure repair		• Check glow plug cylinder 4 • Check wiring between glow plug cylinder 4 and GCU4 • After repair, system can be checked using actuator test: • Activate Glow plugs by sending duty cycle > 8% for at least 5 seconds at PWM Outputs: Glow Plug Actuator (Id: $D90C). • After that verify Failure memory to check if failure was detected again. • If not, problem is solved.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520396-31: Glow Plug control unit 4 has a Transistor failure for glow plug in cylinder 4.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • Glow plug of cylinder 4 reports over LIN a MOSFET error (Transistor failure).
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Glow plug of cylinder 4 does not report a MOSFET error (Transistor failure).
System reaction		• Glow plug for cylinder 4 is deactivated.
		• None
Failure cause		• Glow plug failure of cylinder 4
Failure repair		• Replace glow plug for cylinder 4
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520397-31: Component 'Y11 (Glow plug 1)' has a short circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active)
		[Fault Detection] • If a Short circuit error is reported for a glow plug over LIN.
		[Defect Debouncing] • Immediate
Fault healing		• No short circuit reported.
System reaction		• Glow plug for cylinder 1 is deactivated.
		• None
Failure cause		• Short circuit in glow plug of cylinder 1 or in its wiring
Failure repair		• Check wiring, check and replace glow plug
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step6

Inspection procedure	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520398-31: Component 'Y12 (Glow plug 2)' has a short circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active)
		[Fault Detection] • If a Short circuit error is reported for a glow plug over LIN.
		[Defect Debouncing] • Immediate
Fault healing		• No short circuit reported.
System reaction		• Glow plug for cylinder 2 is deactivated.
		• None
Failure cause		• Short circuit in glow plug of cylinder 2 or in its wiring
Failure repair		• Check wiring, check and replace glow plug
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520399-31: Component 'Y13 (Glow plug 3)' has a short circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active)
		[Fault Detection] • If a Short circuit error is reported for a glow plug over LIN.
		[Defect Debouncing] • Immediate
Fault healing		• No short circuit reported.
System reaction		• Glow plug for cylinder 3 is deactivated.
		• None
Failure cause		• Short circuit in glow plug of cylinder 3 or in its wiring
Failure repair		• Check wiring, check and replace glow plug
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)

520400-31: Component 'Y14 (Glow plug 4)' has a short circuit.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active)
	[Fault Detection] • If a Short circuit error is reported for a glow plug over LIN.
	[Defect Debouncing] • Immediate
Fault healing	• No short circuit reported.
System reaction	• Glow plug for cylinder 4 is deactivated.
	• None
Failure cause	• Short circuit in glow plug of cylinder 4 or in its wiring
Failure repair	• Check wiring, check and replace glow plug
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #764 Inspection of glow plug

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9

Inspection procedure	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520401-31: The power supply of circuit 30 is not OK.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • If glow plugs are activated (LIN communication active only when glow plugs are active)
		[Fault Detection] • Faulty glow plug power supply signal from the glow ECU is received.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 20.00 events • Failure is detected if active for 25% of events
Fault healing		• Missing voltage not reported.
System reaction		• Glow plugs are switched off.
		• None
Failure cause		• No supply on terminal 11, GCU4 detects no terminal 11 voltage
Failure repair		• Measure GCU4 voltage at connector term.11 • If voltage is not present or very low failure can be result of disconnected terminal 11 supply wire. Check wire and connection (check battery terminals)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520418-0: The signal voltage of component 'Fuel injector' is too high.

Generation condition		[Test Condition] • Continuously speed synchronously with each measurement of a main injection.
		[Fault Detection] • Injector actuator voltage is above 3.3 V for 10 times or more.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 50% of events
Fault healing		• If the injector actuator voltage is below 3.3 V.
System reaction		• None
		• None
Failure cause		• Failure in wiring harness between ECU and injectors • Failure in injector (actuator) (See “6. Inspections to be Made at Injector Error Occurrence) • Failure in ECU (power stage)
Failure repair		• Check wiring harness between ECU and injectors • Check injectors • Check/Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1) • 071: Correction value of fuel quantity (Cylinder 3) • 072: Correction value of fuel quantity (Cylinder 4) • 073: Correction value of fuel quantity (Cylinder 2)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. Remove the connector of Injector No.2 cylinder. Remove the connector of Injector No.3 cylinder. Remove the connector of Injector No.4 cylinder. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.2 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.3 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.4 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

520418-1: The signal voltage of component 'Fuel injector' is too low.

Generation condition	[Test Condition] • Continuously speed synchronously with each measurement of a main injection.
	[Fault Detection] • Injector actuator voltage is below 0 mV for 10 times or more.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00 events • Failure is detected if active for 50% of events
Fault healing	• If the injector actuator voltage is above 0 mV.
System reaction	• None
	• None
Failure cause	• Failure in wiring harness between ECU and injectors • Failure in injector (actuator) (See “6. Inspections to be Made at Injector Error Occurrence) • Failure in ECU (power stage)
Failure repair	• Check wiring harness between ECU and injectors • Check injectors • Check/Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 070: Correction value of fuel quantity (Cylinder 1) • 071: Correction value of fuel quantity (Cylinder 3) • 072: Correction value of fuel quantity (Cylinder 4) • 073: Correction value of fuel quantity (Cylinder 2)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #582 Inspection of injector

Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Injector No.1 cylinder. Remove the connector of Injector No.2 cylinder. Remove the connector of Injector No.3 cylinder. Remove the connector of Injector No.4 cylinder. Check the circuit across Injector No.1 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.2 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.3 cylinder and Engine electronic control unit for open or short circuit. Check the circuit across Injector No.4 cylinder and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Reinstall all the removed connectors. Turn the starter switch in ON. Erase the fault code. Execute the control “Fuel injector”. Turn the starter switch in OFF. Replace the damaged Fuel injector. Perform the learned value resetting procedure of Fuel injector which Engine electronic control unit learns. Perform coding of Fuel injector which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

520419-2: The values for injector injection quantity adjustment (cylinder 1) are faulty.

Generation condition	[Test Condition] • After each switch on of the ECU (Key 15 “on”)
	[Fault Detection] • Faulty coding
	[Defect Debouncing] • immediate
Fault healing	• No healing at actual driving cycle. • Healing possible if all values correct at next system start or after a reprogramming of the injector correction.
System reaction	• No correction is made for the injector in question, which may result in deviation from the normal range of the injector's fuel injection rate (disordered engine idling is possible).
	• None
Failure cause	• Invalid IMA/ISA code has been programmed • wrong programming/flashing of the EDC (initialization of EEPROM) • internal defect of the ECU

Failure repair		• Reprogram IMA/ISA code • Reflash the ECU (including EEPROM initialisation) • if defect persists: replace EDC
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 064: Injection quantity (Adjustment value) • 065: Injection quantity (Raw values)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520419-31: The values for injector injection quantity adjustment (cylinder 1) are faulty.

Generation condition		[Test Condition] • After each switch on of the ECU (Key 15 “on”) • After each programming with tester.
		[Fault Detection] • Faulty coding
		[Defect Debouncing] • immediate
Fault healing		• No healing at actual driving cycle. • Healing possible if all values correct at next system start or after a reprogramming of the injector correction.
System reaction		• No correction is made for the injector in question, which may result in deviation from the normal range of the injector's fuel injection rate (disordered engine idling is possible).
		• None
Failure cause		• Invalid IMA code has been programmed • wrong programming/flashing of the EDC (initialization of EEPROM) • internal defect of the ECU
Failure repair		• Reprogram IMA code • Reflash the ECU (including EEPROM initialisation) • if defect persists: replace EDC
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 064: Injection quantity (Adjustment value) • 065: Injection quantity (Raw values)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520420-2: The values for injector injection quantity adjustment (cylinder 3) are faulty.

Generation condition		[Test Condition] • After each switch on of the ECU (Key 15 “on”)
		[Fault Detection] • Faulty coding
		[Defect Debouncing] • immediate
Fault healing		• No healing at actual driving cycle. • Healing possible if all values correct at next system start or after a reprogramming of the injector correction.

System reaction		• No correction is made for the injector in question, which may result in deviation from the normal range of the injector's fuel injection rate (disordered engine idling is possible).
		• None
Failure cause		• Invalid IMA/ISA code has been programmed • wrong programming/flashing of the EDC (initialization of EEPROM) • internal defect of the ECU
Failure repair		• Reprogram IMA/ISA code • Reflash the ECU (including EEPROM initialisation) • if defect persists: replace EDC
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 064: Injection quantity (Adjustment value) • 065: Injection quantity (Raw values)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520420-31: The values for injector injection quantity adjustment (cylinder 3) are faulty.

Generation condition		[Test Condition] • After each switch on of the ECU (Key 15 “on”) • After each programming with tester.
		[Fault Detection] • Faulty coding
		[Defect Debouncing] • immediate
Fault healing		• No healing at actual driving cycle. • Healing possible if all values correct at next system start or after a reprogramming of the injector correction.

Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520423-16: The signal voltage of component 'Position sensor 'Accelerator pedal'' is too high.

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
		[Fault Detection] • Voltage of accelerator pedal position sensor is above 4.5 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing		• Voltage of accelerator pedal position sensor is below 4.5 V.
System reaction		• Substitute value zero (0) is used for the accelerator position sensor.
		• PTO volume disabled • PTO volume disabled • PTO not available
Failure cause		• Short circuit to external source or defective sensor
Failure repair		• Check wiring and sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 037: Signal voltage of component 'Position sensor 'Accelerator pedal'1' • 038: Signal voltage of component 'Position sensor 'Accelerator pedal'2'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #324 Inspection of accelerator pedal position sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Accelerator pedal position sensor. Check the circuit across Engine electronic control unit and Accelerator pedal position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “Accelerator pedal position sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across Accelerator pedal position sensor and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520423-18: The signal voltage of component 'Position sensor 'Accelerator pedal'' is too low.

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • The signal range checks are only carried out if ADC has not reported a module error. Continuously.
	[Fault Detection] • Voltage of accelerator pedal position sensor is below 500 mV.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time

Fault healing		• Voltage of accelerator pedal position sensor is above 500 mV.
System reaction		• Substitute value zero (0) is used for the accelerator position sensor. • PTO volume disabled • PTO volume disabled • PTO not available
Failure cause		• Short circuit of sensor to ground or defective sensor
Failure repair		• Check wiring and sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 037: Signal voltage of component 'Position sensor 'Accelerator pedal'1' • 038: Signal voltage of component 'Position sensor 'Accelerator pedal'2'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #324 Inspection of accelerator pedal position sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Accelerator pedal position sensor. Check the circuit across Engine electronic control unit and Accelerator pedal position sensor for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “Accelerator pedal position sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of cab harness and chassis harness. Check the circuit across Engine electronic control unit and Connection of cab harness and chassis harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10

Inspection procedure	Step9	Repair or replace the harness across Accelerator pedal position sensor and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520424-0: The signal voltage of component 'Position sensor 'Accelerator pedal'' is too high.

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • The signal range checks are only carried out if ADC has not reported a module error. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across Accelerator pedal position sensor and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of cab harness and chassis harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520425-19: Communication malfunction with LIN bus (Default)

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V • Continuously
		[Fault Detection] • Short circuit of the LIN-Bus to Ubatt or Ground, or all LIN-Frames of all LIN-Nodes timed out.
		[Defect Debouncing] • Defect condition fulfilled continuously >2000.0 ms
Fault healing		• LIN Bus working correctly
System reaction		• No LIN communication is possible. Glow plug activation is not possible.
		• Bad startability in cold environment
Failure cause		• LIN-Bus disturbance
Failure repair		• Check LIN-Bus
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 146: Signal of component 'Glow plug' (Feedback)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 000: Cold start
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #764 Inspection of glow plug
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to step2

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Glow electronic control unit. Remove the connector of Glow plug 1. Remove the connector of Glow plug 2. Remove the connector of Glow plug 3. Remove the connector of Glow plug 4. Remove the connector of High-current fuse HF5. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Glow electronic control unit for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 1 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 2 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 3 for open or short circuit. Check the circuit across Glow electronic control unit and Glow plug 4 for open or short circuit. Check the circuit across Glow electronic control unit and High-current fuse HF5 for open or short circuit. Check the circuit across Glow electronic control unit and Signal detect and actuation module for open or short circuit. Check the circuit across Glow electronic control unit and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to step4 Yes: Go to step10
	Step4	Reinstall all the removed connectors. Erase the fault code. Turn the starter switch in ON. Execute the control “Cold start”. Turn the starter switch in OFF. Replaced the damaged electrical parts Go to step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step7
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Replace component “Glow electronic control unit”. Reinstall all the removed connectors. Go to step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step9
	Step9	Perform the operation start and replace Engine electronic control unit. Inspection completed

Inspection procedure	Step10	Repair or replace electrical lines. Reinstall all the removed connectors. Erase the fault code. Execute the control “Cold start”. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to step6 Yes: Go to step4

520426-5: Component 'Lambda control tester' has an open circuit.

Generation condition		[Test Condition] • Following condition must be fulfilled: • The LSU Temperature is in operating range (> 804.96°C {1480.93°F}) for at least 10 s • The Vehicle is not in Overrun (engine not motored) since 0 ms or in Overrun not longer than 100 ms • Battery Voltage > 10.7 V for at least 2 s or < 10.7 V not longer than 0 ms • LSU in normal operation (no error) • Monitoring not inhibited by another failure
		[Fault Detection] • Lambda sensor signal is out of the specified value for 2 seconds continuously.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• None
System reaction		• None
		• None
Failure cause		• Defect in wiring (open load in Nernst Cell (UN) line, Nernst cell; Due to SW bug: open load in heater line, K51) of the lambda sensor, defective lambda sensor
Failure repair		• Check entire wiring of lambda sensor, check lambda sensor itself, if necessary replace lambda sensor (and reset all learning values in EEPROM with tester)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 010: Temperature at component 'Lambda control tester' • 032: Operating state of component 'Lambda control tester' (Heater ON) • 057: Lambda value • 118: Status of component 'Lambda control tester' • 135: Status of oxygen sensor heater
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7

Inspection procedure	Step3	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520427-5: Component 'Lambda control tester' has an open circuit.

Generation condition	[Test Condition] • The O2 signal is valid and Lambda sensor in normal mode • The Open load test not inhibited by another failure • The calculated O2 content >0.07- longer than 2 s • Engine not in Overrun condition since 100 ms or not longer in overrun than 0 ms • Battery voltage >= 10.7 V since 2 s or < 10.7 V not longer than 0 ms • By Data Set: Engine in normal operation
	[Fault Detection] • O_2 value after temperature compensation is above the specified value for 2 seconds continuously.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• None
System reaction	• None
	• None
Failure cause	• Defect in wiring (open load in IP line, pump current; of the lambda sensor, defective lambda sensor
Failure repair	• Check entire wiring of lambda sensor, check lambda sensor itself, if necessary replace lambda sensor (and reset all learning values in EEPROM with tester)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 010: Temperature at component 'Lambda control tester' • 032: Operating state of component 'Lambda control tester' (Heater ON) • 057: Lambda value • 118: Status of component 'Lambda control tester' • 135: Status of oxygen sensor heater
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #297 Inspection of lambda sensor

Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520428-5: Component 'Lambda control tester' has an open circuit.

Generation condition	[Test Condition] • Following condition must be fulfilled: • The LSU Temperature is in operating range (> 804.96°C {1480.93°F}) for at least 10 s • The Vehicle is not in Overrun (engine not motored) since 0 ms or in Overrun not longer than 100 ms • Battery Voltage > 10.7 V for at least 2 s or < 10.7 V not longer than 0 ms • LSU in normal operation (no error) • Monitoring not inhibited by another failure
	[Fault Detection] • Lambda sensor signal is out of the specified value for 2 seconds continuously.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• None
System reaction	• None
	• None
Failure cause	• Defect in wiring (open load in Virtual Ground (VG) line, virtual ground; Due to SW bug: open load in heater line, K51) of the lambda sensor, defective lambda sensor

Failure repair		• Check entire wiring of lambda sensor, check lambda sensor itself, if necessary replace lambda sensor (and reset all learning values in EEPROM with tester)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 010: Temperature at component 'Lambda control tester' • 032: Operating state of component 'Lambda control tester' (Heater ON) • 057: Lambda value • 118: Status of component 'Lambda control tester'' • 135: Status of oxygen sensor heater
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520429-18: The signal from component 'Lambda control tester' is faulty.

Generation condition		[Test Condition] • Sensor is working in normal operation and O2 signal is valid • Monitoring not disabled by another failure • Engine in normal operation • Battery Voltage > 10.70 V • Engine speed > 1350.00 rpm and engine load > 15.00 mg/hub • Steady state condition, i.e. the engine load variation < 2.50 mg/hub during 0.90 s • Dynamic check is started if all conditions above are fulfilled and the engine load drops down from 15.00 mg/hub (or higher) by more than 2.50 mg/hub to < 0.50 mg/hub within 0.60 s and must remain < 0.50 mg/hub until OK or defect recognition happens. Otherwise test is aborted and restarted if the conditions are fulfilled again.
		[Fault Detection] • The measured and pressure compensated O2-concentration - needs longer than 1.50 s to rise from 30% to 60% of the expected step between actual O2 concentration to 20.95% OR - 60% of expected step are not reached within 3.00 s.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 3.00 events • Failure is detected if active for 50% of events
Fault healing		• The measured and pressure compensated O2-concentration - needs less than 1.50 s to rise from 30% to 60% of the expected step between actual O2 concentration to 20.95% AND - 60% of expected step are reached within 3.00 s.
System reaction		• Healing condition fulfilled cumulatively > 2.00 events • Failure healed if not active for 50% of events
		• None
Failure cause		• Defect in wiring of lambda sensor, defective lambda sensor, problems in injection system (e.g. leaky injectors) or EGR valve does not close in overrun condition
Failure repair		• Check wiring, check injection system, replace lambda sensor (and reset all learning values in EEPROM with tester)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 010: Temperature at component 'Lambda control tester' • 032: Operating state of component 'Lambda control tester' (Heater ON) • 057: Lambda value • 118: Status of component 'Lambda control tester' • 135: Status of oxygen sensor heater
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Fuel injector is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with EGR actuator is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520431-2: Component 'Lambda control tester' or its electrical line is defective.

Generation condition	[Test Condition] • Continuously if all following conditions are fulfilled: • LSU Heater Power stage active: ECU not in After-run state and Battery Voltage > 9.5 V (with switch off Hysteresis at 9 V) • By Data Set: ECU not in After-run state • Battery voltage > 10.7 V longer than 2 s or Battery Voltage < 10.7 V less than 0 ms Integrated Circuit Lambda sensor control not defective
	[Fault Detection] • Open-circuit of the lambda sensor harness is detected for 5 seconds continuously.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 50% of the time
Fault healing	• None
System reaction	• Lambda sensor is deactivated.
	• None
Failure cause	• Broken or disconnected wiring or defective lambda sensor
Failure repair	• Check wiring and lambda sensor, if necessary replace lambda sensor (and reset all learning values in EEPROM with tester)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 010: Temperature at component 'Lambda control tester' • 032: Operating state of component 'Lambda control tester' (Heater ON) • 057: Lambda value • 118: Status of component 'Lambda control tester'' • 135: Status of oxygen sensor heater

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520431-3: Component 'Lambda control tester' has a short circuit or is defective.

Generation condition	[Test Condition] • Continuously if all following conditions are fulfilled: • LSU Heater Power stage active: ECU not in After-run state and Battery Voltage > 9.5 V (with switch off Hysteresis at 9 V) • By Data Set: ECU not in After-run state • Battery voltage > 10.7 V longer than 2 s or Battery Voltage < 10.7 V less than 0 ms Integrated Circuit Lambda sensor control not defective
	[Fault Detection] • Short-circuit to positive of the lambda sensor harness is detected for 5 seconds continuously.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 50% of the time
Fault healing	• If the signal returns to normal when the starter switch is set from OFF to ON position

System reaction		• Lambda sensor is deactivated.
		• None
Failure cause		• Short circuit of wiring to external source, defective lambda sensor or power stage
Failure repair		• Check wiring and lambda sensor, if necessary replace lambda sensor (and reset all learning values in EEPROM with tester) or ECU.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 032: Operating state of component 'Lambda control tester' (Heater ON)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520431-4: Component 'Lambda control tester' has a short circuit or is defective.

Generation condition		[Test Condition] • Continuously if all following conditions are fulfilled: • LSU Heater Power stage active: ECU not in After-run state and Battery Voltage > 9.5 V (with switch off Hysteresis at 9 V) • By Data Set: ECU not in After-run state • Battery voltage > 10.7 V longer than 2 s or Battery Voltage < 10.7 V less than 0 ms
		[Fault Detection] • Short-circuit to positive of the lambda sensor harness is detected for 5 seconds continuously.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 5.00s • Failure is detected if active for 50% of the time
Fault healing		• The SPI chip Lambda sensor control reports no “short circuit to ground” failure.
System reaction		• Lambda sensor is deactivated.
		• None
Failure cause		• Short circuit of wiring to external ground, defective lambda sensor or power stage
Failure repair		• Check wiring and lambda sensor, if necessary replace lambda sensor (and reset all learning values in EEPROM with tester) or ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 032: Operating state of component 'Lambda control tester' (Heater ON)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6

Inspection procedure	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520434-2: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • Detection is done continuously
		[Fault Detection] • Faulty SPI chip in ECU.
		[Defect Debouncing] • Immediate
Fault healing		• If the initialisation register value of the SPI chip read by HWE and the value written into the chip in the previous cycle by HWE function are identical.
System reaction		• None
		• None
Failure cause		• SPI chip in ECU defective
Failure repair		• Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 010: Temperature at component 'Lambda control tester' • 032: Operating state of component 'Lambda control tester' (Heater ON) • 057: Lambda value
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520434-31: The supply voltage of component 'Lambda control tester' is too low (undervoltage).

Generation condition		[Test Condition] • Battery voltage > 10.7 V at least for 2 s or < 10.7 V not longer than 0 ms. • Engine running in normal state • No temporary communication error to the SPI • The monitoring not inhibited by another failure
		[Fault Detection] • Low battery voltage for lambda sensor is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing		• The SPI chip Lambda sensor control reports no “very low battery voltage” failure (i.e. Voltage at the ASIC > 9V)
System reaction		• Healing condition fulfilled cumulatively > 2.00 s • Failure healed if not active for 50% of the time
		• None
Failure cause		• wiring defect, defective lambda sensor or SPI chip in ECU
Failure repair		• Check Wiring of lambda sensor, if necessary replace lambda sensor (and reset the learning factors in EEPROM with tester) or ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 010: Temperature at component ‘Lambda control tester’ • 032: Operating state of component ‘Lambda control tester’ (Heater ON) • 057: Lambda value

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520435-0: The temperature of component 'Lambda control tester' is outside the permissible range.

Generation condition	[Test Condition] • The test frequency is continuous as long as following conditions are met: • The battery voltage > 10.7 V for at least 2 s and not longer than 0 ms below 10.7 V • Engine not in Overrun (motoring) for at least 0 ms and not longer in Overrrun than 100 ms • LSU Heater in control mode
	[Fault Detection] • Calculated lambda sensor temperature is above 823.96 °C {1515 °F} for 30 seconds continuously.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 30.00s • Failure is detected if active for 50% of the time
Fault healing	• Calculated lambda sensor temperature is below 823.96 °C {1515 °F}.

System reaction		• Healing condition fulfilled cumulatively > 30.00 s • Failure healed if not active for 50% of the time
		• None
Failure cause		• Defect in wiring of sensor. • Disconnected lambda sensor. • Short circuit to ground in UN line. • Defective lambda sensor.
Failure repair		• Check entire wiring of the sensor and the sensor itself, • check connection of lambda sensor, • if necessary replace lambda sensor (and reset the learning factors in EEPROM with tester)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 010: Temperature at component 'Lambda control tester' • 032: Operating state of component 'Lambda control tester' (Heater ON) • 057: Lambda value
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component "Lambda sensor". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520435-1: The temperature of component 'Lambda control tester' is outside the permissible range.

Generation condition		[Test Condition] • The test frequency is continuous as long as following conditions are met: • The battery voltage > 10.7 V for at least 2 s and not longer than 0 ms below 10.7 V • Engine not in Overrun (motoring) for at least 0 ms and not longer in Overrrun than 100 ms • LSU Heater in control mode
		[Fault Detection] • Calculated lambda sensor temperature is equal to or below 805.96 °C {1483 °F} for 60 seconds continuously.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 60.00s • Failure is detected if active for 50% of the time
Fault healing		• Calculated lambda sensor temperature is above 805.96 °C {1483 °F}.
System reaction		• Healing condition fulfilled cumulatively > 60.00 s • Failure healed if not active for 50% of the time
		• None
Failure cause		• Disconnected lambda sensor. • Open load in VM or UN sensor line • Defect in wiring of sensor • Defective lambda sensor
Failure repair		• Check connection of lambda sensor, • check entire wiring of the sensor and the sensor itself, • if necessary replace lambda sensor (and reset the learning factors in EEPROM with tester)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 010: Temperature at component ‘Lambda control tester’ • 032: Operating state of component ‘Lambda control tester’ (Heater ON) • 057: Lambda value
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520436-3: Component 'Lambda control tester' has a short circuit to positive.

Generation condition	[Test Condition] • Continuously when all following conditions fulfilled: • No open load failure Pump Cell (IA,IP), Nernst Cell (UN) or Virtual Ground (VG) • Open load test for Nernst Cell (UN) and Virtual Ground (VG) not active • Monitoring not inhibited by another failure • The Nernst Cell is monitored only if Lambda Sensor temperature measurement is valid (no Ri failure) • The Pump Cell is monitored additionally at cold condition: During EDC initialisation the Short to Batt test is executed for 3 s
	[Fault Detection] • Short-circuit to positive of the lambda sensor harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• None
System reaction	• Checking for short circuit to battery/ground of the lambda sensor harness is deactivated.
	• None
Failure cause	• Short circuit to external source in one of the wiring lines of the lambda sensor, open load in virtual ground VG, defective LSU
Failure repair	• Check entire wiring of lambda sensor, check lambda sensor itself, if necessary replace lambda sensor (and reset the learning factors in EEPROM with tester)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 010: Temperature at component ‘Lambda control tester’ • 032: Operating state of component ‘Lambda control tester’ (Heater ON) • 057: Lambda value
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #297 Inspection of lambda sensor

Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “Lambda sensor”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520436-4: Component 'Lambda control tester' has a short circuit to ground.

Generation condition	[Test Condition] • Continuously when all following conditions fulfilled: • No open load failure Pump Cell (IA,IP), Nernst Cell (UN) or Virtual Ground (VG) • Open load test for Nernst Cell (UN) and Virtual Ground (VG) not active • Monitoring not inhibited by another failure • The Nernst Cell is monitored only if Lambda Sensor temperature measurement is valid (no Ri failure)
	[Fault Detection] • Short-circuit to ground of the lambda sensor harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• None
System reaction	• Lambda sensor is deactivated as soon as its temperature reaches 804.96°C {1481°F}.
	• None
Failure cause	• Short circuit to ground in one of the wiring lines of the lambda sensor, defective LSU

Failure repair		• Check entire wiring of lambda sensor, check lambda sensor itself, if necessary replace lambda sensor (and reset the learning factors in EEPROM with tester)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 010: Temperature at component 'Lambda control tester' • 032: Operating state of component 'Lambda control tester' (Heater ON) • 057: Lambda value
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor
Inspection procedure	Step1	If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Lambda sensor. Remove the connector of Signal detect and actuation module. Check the circuit across Lambda sensor and Engine electronic control unit for open or short circuit. Check the circuit across Lambda sensor and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component "Lambda sensor". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Lambda sensor which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520437-0: The oil level of the combustion engine is implausible. (Fuel in engine oil)

Generation condition	[Test Condition] • Engine running
	[Fault Detection] • Fuel volume in the engine oil is above the maximum allowable limit.
	[Defect Debouncing] • Defect condition fulfilled continuously >100.0 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position

System reaction		• None
		• Automatic regeneration no available -> risk for DPF overload • Manual DPF regeneration not available
Failure cause		• Excessive oil dilution by fuel due to post injections during particulate filter regeneration
Failure repair		• Change lubrication oil and reset the fuel-in-oil calculation via tester, using FUSO Diagnostics
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 100: Measurement value of oil dilution during regeneration of diesel particulate filter
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Replace component “Engine oil”. Perform the learned value resetting procedure of Engine oil which Engine electronic control unit learns. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520437-16: The oil level of the combustion engine is implausible. (Fuel in engine oil)

Generation condition		[Test Condition] • Engine running
		[Fault Detection] • Fuel volume in the engine oil exceeds the specified volume.
		[Defect Debouncing] • Defect condition fulfilled continuously >100.0 ms
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• None
		• None
Failure cause		• Excessive oil dilution by fuel due to post injections during particulate filter regenerations
Failure repair		• Change lubrication oil and reset the fuel-in-oil calculation via tester, using FUSO Diagnostics
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 100: Measurement value of oil dilution during regeneration of diesel particulate filter
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Replace component “Engine oil”. Perform the learned value resetting procedure of Engine oil which Engine electronic control unit learns. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520438-0: Soot in Lube Oil has exceeded the Maximum limit.

Generation condition		[Test Condition] • Engine running
		[Fault Detection] • Soot in engine oil is above the maximum allowable limit.
		[Defect Debouncing] • Defect condition fulfilled continuously >100.0 ms
Fault healing		• None
System reaction		• None
		• None
Failure cause		• Soot accumulation in the lubrication oil too high
Failure repair		• Change lubrication oil and reset the soot-in-oil calculation via tester, using FUSO Diagnostics
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 074: Soot content (Engine oil)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Replace component “Engine oil”. Perform the learned value resetting procedure of Engine oil which Engine electronic control unit learns. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520439-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • When accelerator pedal input is stationary
		[Fault Detection] • Internal failure of ECU (failure of analog - digital converter (ADC))
		[Defect Debouncing] • Defect condition fulfilled continuously >12.0 times
Fault healing		• None
System reaction		• None
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace ECM
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520440-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Internal failure of ECU (failure of analog - digital converter (ADC))
		[Defect Debouncing] • Defect condition fulfilled continuously >15.0 times
Fault healing		• None
System reaction		• None
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace ECM
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520441-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • Internal failure of ECU (failure of analog - digital converter (ADC))
		[Defect Debouncing] • Immediate Defect condition fulfilled continuously >15.0 times
Fault healing		• None
System reaction		• None
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace ECM
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520442-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • If there is no active shut-off path test, the error counters are tested during every call of the process MoCCom (80ms task).
		[Fault Detection] • Temporal failure • Internal failure of ECU (communication failure)
		[Defect Debouncing] • Immediate
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• ECU is reset 7 times at maximum; the engine is shut down if the error persists.
		• None
Failure cause		• Defective monitoring module or CPU (e.g. impaired functioning of the CPU clock) of the EDC. Disturbed SPI-Bus.
Failure repair		• If error exists only temporary (i.e. injection reoccurs) error can be ignored and error deleted in the fault memory. In case of a permanent error the injection remains blocked and the ECU has to be replaced
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520443-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • If there is no active shut-off path test, the error counter is tested during every call of the process MoCCOM (80ms task).
		[Fault Detection] • Temporal failure • Internal failure of ECU (communication failure)
		[Defect Debouncing] • Immediate
Fault healing		• In case of error counter = 0, the error path is reset.
System reaction		• ECU is reset 7 times at maximum; the engine is shut down if the error persists.
		• None
Failure cause		• Disturbed SPI-Bus
Failure repair		• If ECM functions correctly after recovery only temporary SPI error occurred and fault memory can be deleted and error ignored. If permanent SPI error is present and the ECM does not leave boot block --> Replace ECM
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520444-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • During after-run.
		[Fault Detection] • Internal failure of ECU (faulty ECU or damaged data)
		[Defect Debouncing] • Immediate
Fault healing		• None.
System reaction		• Power stage is deactivated.
		• None
Failure cause		• Corrupted datas in the ECM,ECM internal failure
Failure repair		• Reprogram ECM, replace ECM
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520445-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • During ECM start up
		[Fault Detection] • Internal failure of ECU is detected 10 times or more.
		[Defect Debouncing] • Defect condition fulfilled > 10 times (software constant MOCSOP_MM_RESPBYTE_ • RESET_ERROR)
Fault healing		• None
System reaction		• Software resetting is performed.
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520446-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • Internal failure of ECU and injector system failure are detected.
		[Defect Debouncing] • Immediate
Fault healing		• None
System reaction		• Software resetting is performed.
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• ECM internal failure or injector problem
Failure repair		• Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520447-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • During ECM start up
		[Fault Detection] • Internal failure of ECU (timeout error of monitoring module) is detected for 2 times or more.
		[Defect Debouncing] • Defect condition fulfilled > 2 times (software constant MOCSOP_MM_RESPTIME_ • RESET_ERRORS)
Fault healing		• None
System reaction		• Software resetting is performed.
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520448-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • During ECM start up
		[Fault Detection] • Internal failure of ECU (SPI-related communication error during shut-off path test) is detected for 16 times or more.
		[Defect Debouncing] • Defect condition fulfilled > 16 times (software constant MOCSOP_SPI_RESET_ERRORS)
Fault healing		• None
System reaction		• Software resetting is performed.
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520449-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • During ECM start up
		[Fault Detection] • Internal failure of ECU (insufficient voltage during shut-off path test) is detected for 209 times or more.
		[Defect Debouncing] • Defect condition fulfilled > 209.00 times
Fault healing		• None
System reaction		• None
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520450-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • During ECM start up
		[Fault Detection] • Internal failure of ECU (improper response in the power stage feedback during shut-off path test).
		[Defect Debouncing] • Immediate
Fault healing		• None
System reaction		• None
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520451-31: Faulty component 'Combustion engine Control unit'

Generation condition		[Test Condition] • During ECM start up
		[Fault Detection] • Internal failure of ECU (setting or resetting of alarm task impossible after detecting a timeout problem during shut-off path test) is detected for 2 times or more.
		[Defect Debouncing] • Defect condition fulfilled > 2 times
Fault healing		• None
System reaction		• Software resetting is performed.
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520452-31: Faulty component 'Combustion engine Control unit'

Generation condition		[Test Condition] • During ECM start up
		[Fault Detection] • Internal failure of ECU (irreparable error occurred)
		[Defect Debouncing] • Immediate
Fault healing		• None
System reaction		• Software resetting is performed.
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520453-31: Faulty component 'Combustion engine Control unit'

Generation condition		[Test Condition] • During ECM start up
		[Fault Detection] • Internal failure of ECU (timeout of power stage feedback during shut-off path test) is detected for 209 times or more.
		[Defect Debouncing] • Defect condition fulfilled > 209.00 times
Fault healing		• None
System reaction		• Software resetting is performed.
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520454-31: Faulty component 'Combustion engine Control unit'

Generation condition		[Test Condition] • During ECM start up
		[Fault Detection] • Internal failure of ECU (overvoltage during shut-off path test) is detected for 309 times or more.
		[Defect Debouncing] • Defect condition fulfilled > 209.00 times
Fault healing		• None
System reaction		• Software resetting is performed.
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520455-31: Faulty component 'Combustion engine Control unit'

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Internal failure of ECU (voltages detected by the two accelerator pedal sensors are out of the specified value).
		[Defect Debouncing] • Debouncing of the error and setting of the test bit with 330.00ms.
Fault healing		• None
System reaction		• ECU is reset once (no fuel injection then takes place in the engine).
		• None
Failure cause		• ECM internal failure or calibration error.
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520456-31: CAN message 'Engine speed' is faulty.: Component 'A4 (Engine electronic control unit)' has an internal fault./General calibration fault

Generation condition		[Test Condition] • If the engine speed, calculated in level 2 >= 1200 rpm.
		[Fault Detection] • Internal failure of ECU (difference between level 2 engine speed and level 1 engine speed is above 400 rpm) is detected for 8 times or more.
		[Defect Debouncing] • Defect condition fulfilled continuously > 8.0 times
Fault healing		• None
System reaction		• ECU is reset once (no fuel injection then takes place in the engine).
		• None
Failure cause		• ECM internal failure or calibration error.
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520457-31: Faulty component 'Combustion engine Control unit'

Generation condition		[Test Condition] • Continuously if engine speed > 1200 rpm AND rail pressure > 20 MPa {2900 psi, 205 kgf/cm^2}
		[Fault Detection] • Internal failure of ECU (difference between the measured value and programmed value of the injection duration is above the specified value) is detected for 10 times or more.
		[Defect Debouncing] • Defect condition fulfilled continuously >10.0 times
Fault healing		• None
System reaction		• ECU is reset once (no fuel injection then takes place in the engine).
		• None
Failure cause		• ECM internal failure or calibration error.
Failure repair		• Replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520458-31: Faulty component 'Combustion engine Control unit'

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Internal failure of ECU (failure of start of energization for main, pilot or post injection) is detected for 10 times or more.
		[Defect Debouncing] • Defect condition fulfilled continuously >10.0 times
Fault healing		• None
System reaction		• ECU is reset once (no fuel injection then takes place in the engine).
		• None
Failure cause		• ECM internal failure or calibration error.
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520459-31: Faulty component 'Combustion engine Control unit'

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Internal failure of ECU (energization duration for zero fuel flow calibration (ZFC) is out of tolerance) is detected for 5 times or more.
		[Defect Debouncing] • Defect condition fulfilled continuously > 5.0 times
Fault healing		• None
System reaction		• ECU is reset once (no fuel injection then takes place in the engine).
		• None
Failure cause		• ECM internal failure or calibration error.
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520461-31: Faulty component 'Combustion engine Control unit'

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Internal failure of ECU (amount of post-injection 2 is above the limit of 5 mg in normal mode) is detected for 10 times or more.
		[Defect Debouncing] • Defect condition fulfilled continuously > 10.0 times
Fault healing		• None
System reaction		• ECU is reset once (no fuel injection then takes place in the engine).
		• None
Failure cause		• ECM internal failure or calibration error.
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520462-31: Component 'A4 (Engine electronic control unit)' has an internal fault./General calibration fault

Generation condition		[Test Condition] • Continuously.
		[Fault Detection] • Internal failure of ECU (post-injection efficiency is out of the specified value) is detected for 20 times or more.
		[Defect Debouncing] • Defect condition fulfilled continuously > 20.0 times
Fault healing		• None
System reaction		• ECU is reset once (no fuel injection then takes place in the engine).
		• None
Failure cause		• ECM internal failure or calibration error.
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520463-31: Component 'A4 (Engine electronic control unit)' has an internal fault.

Generation condition	[Test Condition] • “Overrun” (= no requested fuel injection) is active since > 226.00- 20ms-Tasks (surge dampener could be active - gear ratio dependant - for 400 ms at 1.00- to 400 ms at 6.00- --> assurance, that surge dampener is no more active). • “Overrun” is active if all following conditions fulfilled: • Driver Demand = 0 (Accelerator Pedal request = 0). • Idle speed governor not active, i.e. engine speed > 2000 rpm. AND Engine start system not active, i.e. engine speed > 80 rpm (which is higher). • No Cruise control request OR Vehicle Brake actuated > 80 ms. • No torque request of the vehicle dynamics control. • No torque request of the gear box. • No torque request by an auxiliary (e.g. A/C).
	[Fault Detection] • Internal failure of ECU (current injector energizing duration is above the engine-speed-dependent limit) is detected for 20 times or more.
	[Defect Debouncing] • Continuously 20.00- Events
Fault healing	• None
System reaction	• ECU is reset once (no fuel injection then takes place in the engine).
	• None
Failure cause	• Electronic disturbances, requested torque increase via tester, wrong application of injection relevant parameters, defective ECU
Failure repair	• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520464-31: Component 'A4 (Engine electronic control unit)' has an internal fault./General calibration fault

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • Internal failure of ECU (correction value for main-, post- and pilot-injection is out of the specified value) is detected for 11 times or more.
		[Defect Debouncing] • Continuously 11.00- Events
Fault healing		• None
System reaction		• ECU is reset once (no fuel injection then takes place in the engine).
		• None
Failure cause		• ECU internal failure or calibration error.
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520465-31: Actual value 'Rail pressure' is implausible.

Generation condition		[Test Condition] • Continuously as long as the failures are not set.
		[Fault Detection] • Commonrail internal pressure is out of the specified value.
		[Defect Debouncing] • Case 1 (Rail pressure > 204MPa {29580psi, 2080kgf/cm^2} or < 20MPa {2900psi, 205kgf/cm^2}): Continuously 510.00ms • infinite for Case 2 (Pressure Gradient))
Fault healing		• None
System reaction		• Engine ECU is reset once.
		• None
Failure cause		• ECU internal failure or calibration error.
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520466-31: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • Engine running with load (i.e. fuel quantity >0) • No engine test active
		[Fault Detection] • Internal failure of ECU (requested engine torque is above the maximum allowable torque) is detected for 13 times or more.
		[Defect Debouncing] • Continuously 13.00- events
Fault healing		• None
System reaction		• Engine speed is limited to 1500 rpm; fuel injection is suspended if 1600 rpm is exceeded and the engine is shut down if its speed exceeds 1720 rpm twice.
		• None
Failure cause		• ECU internal failure or calibration error.
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520469-31: Component 'A4 (Engine electronic control unit)' has an internal fault./An incorrect control unit is installed.

Generation condition		[Test Condition] • Engine speed > 1200 rpm
		[Fault Detection] • Internal failure of ECU (calculated engine torque is above the maximum allowable torque) is detected for 100 times or more.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00 events • Failure is detected if active for 50% of events
Fault healing		• The calculated (inner) engine torque < max acceptable (inner) engine torque
System reaction		• Engine torque is limited to the maximum permissible torque.
		• None
Failure cause		• ECU internal failure or failure in the data set calibration of ECU or another vehicle control unit
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520486-12: Component 'Combustion engine Control unit' has an internal fault.

Generation condition		[Test Condition] • Continuously if shut off path test not active
		[Fault Detection] • Internal failure of ECU.
		[Defect Debouncing] • Immediate
Fault healing		• No fault detected.
System reaction		• None
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520487-12: Component 'Combustion engine Control unit' has an internal fault.

Generation condition		[Test Condition] • Continuously if battery voltage > 8 V and shut off path test not active
		[Fault Detection] • Internal failure of ECU.
		[Defect Debouncing] • Immediate
Fault healing		• No undervoltage detection
System reaction		• None
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520488-12: Component 'Combustion engine Control unit' has an internal fault.

Generation condition		[Test Condition] • Continuously if shut off path test not active
		[Fault Detection] • Internal failure of ECU is detected for 1 time or more.
		[Defect Debouncing] • Defect condition fulfilled continuously >1.00 times
Fault healing		• No overvoltage detection
System reaction		• None
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520489-12: Component 'Combustion engine Control unit' has an internal fault.

Generation condition		[Test Condition] • Continuously if shut off path test not active and battery voltage > 8 V
		[Fault Detection] • Internal failure of ECU.
		[Defect Debouncing] • Immediate
Fault healing		• No undervoltage detection
System reaction		• None
		• None
Failure cause		• ECM internal failure
Failure repair		• Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None

Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the ECU. Inspection completed

520491-2: The function of component 'Oxidation catalytic converter' is not OK.

Generation condition		[Test Condition] • The monitoring is STARTED if following conditions are all fulfilled: • By Data set: DPF Regeneration 1 active • The time since last post injection sequence > 0 s (to be sure that Oxicat is “cold” enough, i.e. no more hot due to last thermic reaction) • The measured Temperature before Oxicat > 219.96°C {427.93°F} (light off of Oxicat guaranteed) • HC mass (post injection) flow > 0 Kg/h (for enough exothermic energy) • The Difference between measured and calculated temperature after Oxicat is between -200 K and 200 K for at least 1 s (i.e. calculation and measurement congruent) • The monitoring is ABORTED (and no evaluation made!) if one of the following conditions is fulfilled: • Monitoring inhibited by another failure. • By Data set: engine in normal operation and DPF Regeneration 1 active • During ACTIVE monitoring the converted HC mass by the Oxicat is integrated as: • MEASURED HC conversion by comparing the MEASURED temperature after catalyst and CALCULATED Temperature after catalyst WITHOUT HC Conversion energy • CALCULATED (=expected) HC conversion by comparing the CALCULATED Temperatures after Catalyst WITH and WITHOUT HC Conversion energy. • The Duration of integration lasts until the DPF regeneration has finished OR the injected HC mass has reached 50 g, which is enough for a validation of the exothermic. • Evaluation of the results takes place if: • The average HC flow during integration > 0 g/s • The Total converted HC > 25 g
		[Fault Detection] • Difference between temperatures measured by SCR temperature sensor 1 and SCR temperature sensor 2 is out of the specified value.
		[Defect Debouncing] • Defect condition fulfilled continuously > 1.00 events • Note: As Monitoring is made only each regeneration, debouncing can last several 100km’s
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• DPF regeneration does not work probably. --> risk of DPF clogging respective detection of corresponding failure
		• Automatic regeneration no available -> risk for DPF overload
Failure cause		• Temperature sensors before and after Oxicat interchanged • Oxicat thermal aged (too low efficiency) • Post injection not working
Failure repair		• Check correct connection of Temperature sensors at Oxicat • Check / Replace Oxicat • Check Injectors
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of exhaust gas temperature sensor 1 • #336 Inspection of exhaust gas temperature sensor 2
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520495-12: Component 'Combustion engine Control unit' has an internal fault.

Generation condition		[Test Condition] • At ECU initialisation
		[Fault Detection] • Internal failure of ECU
		[Defect Debouncing] • Immediate
Fault healing		• Healing takes place if the condition for detecting the error is no longer met.
System reaction		• None
		• None
Failure cause		• Wrong application of the basic map for conversion of injection quantity to inner torque and vice versa (FMTC_trq2qBas_MAP).
Failure repair		• Replace ECU.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520496-2: SCR Reagent pump has not defrosted within time.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • System start and “DEF heating” active OR remaining defrosting time of DEF tank < 120 s. • Pump Actuation between 87 and 91% (Dataset = 88%)
		[Fault Detection] • DEF has not been thawed within the specified duration.
		[Defect Debouncing] • Native (ECU internal, not calibrated)
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• None
		• None
Failure cause		• Pump blocked • heating system not OK
Failure repair		• Check if Pump runs in warm condition: • If OK: problem of heating system • If not OK: replace Pump module
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 013: Temperature at component ‘DEF tank’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #339 Inspection of DEF temperature sensor and DEF tank heater
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520497-0: The signal voltage of component 'Torque sensor 'Power take-off'' is too high.

Generation condition		[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • The error monitoring is carried out if the PTO state of the accelerator position sensor checked a value out of the range. Or if the PTO accelerator pedal is enabled during the PTO operation.
		[Fault Detection] • Signal from the work load sensor is above 4.7 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing		• Signal from the work load sensor is below 4.7 V.
System reaction		• Substitute value zero (0) is used for the PTO load sensor.
		• Low idle speed adjustment disabled • Low idle speed adjustment disabled • PTO not available
Failure cause		• Short circuit of sensor to battery plus or defective sensor.
Failure repair		• Check wiring and sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of PTO load sensor (for cab back). Check the circuit across Engine electronic control unit and PTO load sensor (for cab back) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “PTO load sensor (for cab back)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6

Inspection procedure	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and cab back harness. Check the circuit across Engine electronic control unit and Connection of chassis harness and cab back harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across PTO load sensor (for cab back) and Connection of chassis harness and cab back harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and cab back harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520497-1: The signal voltage of component 'Torque sensor 'Power take-off'' is too low.

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in after-run • The error monitoring is carried out if the PTO state of the accelerator position sensor checked a value out of the range. Or if the PTO accelerator pedal is enabled during the PTO operation.
	[Fault Detection] • Signal from the work load sensor is below 300 mV.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing	• Signal from the work load sensor is above 300 mV.
System reaction	• Substitute value zero (0) is used for the PTO load sensor.
	• Low idle speed adjustment disabled • Low idle speed adjustment disabled • PTO not available
Failure cause	• Short circuit of sensor to ground or defective sensor.
Failure repair	• Check wiring and sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of PTO load sensor (for cab back). Check the circuit across Engine electronic control unit and PTO load sensor (for cab back) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “PTO load sensor (for cab back)”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and cab back harness. Check the circuit across Engine electronic control unit and Connection of chassis harness and cab back harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across PTO load sensor (for cab back) and Connection of chassis harness and cab back harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and cab back harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520499-20: The fuel pressure in the metering device is too low.

Generation condition		[Test Condition] • Monitoring not inhibited by another failure • Fuel Tank not Empty • Pressure control by metering unit • The high pressure pump delivery quantity > than max engine speed dependant quantity (from 8200 mm3/s at 800 rpm to 34830 mm3/s at 3900 rpm) for MeUn Control
		[Fault Detection] • Actual rail pressure is below the targeted value.
		[Defect Debouncing] • Defect condition fulfilled continuously >1000.0 ms
Fault healing		• None
System reaction		• None
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• Leakage in the high pressure system: • injection nozzle stuck in open position, low efficiency of high pressure pump, internal leakage of injector, leaking pressure control valve • Too low pressure at High pressure pump inlet due clogged filter, leaking low pressure tubes, electric pre supply pump defective or gear pump defective
Failure repair		• Check low pressure system for clogging (specially fuel filter). • Check tubing between pre-supply pump and gear pump. • Check that the relay of the pre-supply pump is actuating. • Check feeding of pre-supply pump (possibly low due to clogged tubes at tank outlet). • Check high pressure part for leakages (internal / external). • Check PCV for tightness. • Check injectors for tightness.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 025: Rail pressure • 029: Rail pressure (Differential pressure) • 030: Rail pressure (specified value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #572 Inspection of FMU (fuel metering unit)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. • Low pressure system for clogging (specially fuel filter). • Tubing between pre-supply pump and gear pump. • The relay of the pre-supply pump is actuating. Go to Step2
	Step2	Check feeding of pre-supply pump (possibly low due to clogged tubes at tank outlet) following below procedure. • Ensure that engine is not running. • Remove fuel line after pre-supply pump and feed to a measuring jar. • Turn on ignition for 30 seconds and collect supplied fuel in measuring jar. • Turn off ignition. • Indication for good performance of pre-supply pump: ~ 2 liters / minute with +-10% tolerance. • Check tubing of pre-supply pump for clogged tubes (dismount and use compressed air). • If tubing is ok, replace pre-supply pump and repeat this step2. • Remount fuel line. Go to Step3

Inspection procedure	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. • High pressure part for leakages (internal / external). • PCV for tightness. • Injectors for tightness. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? Yes: Go to Step4 No: Go to Step5
	Step4	Turn the starter switch in OFF. Replace component “PCV”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of PCV which Engine electronic control unit learns. Go to Step5
	Step5	Inspection completed

520500-0: The rail pressure is too low. / Check fuel high pressure circuit for leaktightness.

Generation condition	[Test Condition] • Monitoring is active 2 s after ECU initialization while engine isn’t running yet, while the engine isn’t cranking and 2 s after engine startup • Monitoring not inhibited by another failure • Fuel Tank not Empty • Pressure control by metering unit • The high pressure pump delivery quantity > engine speed dependant quantity (from 9200 mm3/s at 1000 rpm to 34330 mm3/s at 4800 rpm)
	[Fault Detection] • Actual rail pressure is below the targeted value.
	[Defect Debouncing] • Defect condition fulfilled continuously >300.0 ms
Fault healing	• None
System reaction	• None
	• Engine stop
Failure cause	• Leakage in the high pressure system: • injection nozzle stuck in open position, low efficiency of high pressure pump, internal leakage of injector, leaking pressure control valve • Too low pressure at High pressure pump inlet due clogged filter, leaking low pressure tubes, electric pre supply pump defective or gear pump defective
Failure repair	• Check low pressure system for clogging (specially fuel filter). • Check tubing between pre-supply pump and gear pump. • Check that the relay of the pre-supply pump is actuating. • Check feeding of pre-supply pump (possibly low due to clogged tubes at tank outlet). • Check high pressure part for leakages (internal / external). • Check PCV for tightness. • Check injectors for tightness.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 025: Rail pressure • 029: Rail pressure (Differential pressure) • 030: Rail pressure (specified value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #572 Inspection of FMU (fuel metering unit)

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. • Low pressure system for clogging (specially fuel filter). • Tubing between pre-supply pump and gear pump. • The relay of the pre-supply pump is actuating. Go to Step2
	Step2	Check feeding of pre-supply pump (possibly low due to clogged tubes at tank outlet) following below procedure. • Ensure that engine is not running. • Remove fuel line after pre-supply pump and feed to a measuring jar. • Turn on ignition for 30 seconds and collect supplied fuel in measuring jar. • Turn off ignition. • Indication for good performance of pre-supply pump: ~ 2 liters / minute with +-10% tolerance. • Check tubing of pre-supply pump for clogged tubes (dismount and use compressed air). • If tubing is ok, replace pre-supply pump and repeat this step2. • Remount fuel line. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. • High pressure part for leakages (internal / external). • PCV for tightness. • Injectors for tightness. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? Yes: Go to Step4 No: Go to Step5
	Step4	Turn the starter switch in OFF. Replace component “PCV”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of PCV which Engine electronic control unit learns. Go to Step5
	Step5	Inspection completed

520500-16: The fuel pressure in the system is too high.

Generation condition	[Test Condition] • Monitoring not inhibited by another failure • Fuel Tank not Empty • Pressure control by metering unit • Fuel injection quantity > 2.5 mg/hub and Desired fuel flow of MeUn <= -2100 mm3/s and fuel temperature > 9.96°C {50°F}
	[Fault Detection] • Actual rail pressure is above the targeted value.
	[Defect Debouncing] • Defect condition fulfilled continuously >3000.0 ms
Fault healing	• None
System reaction	• None
	• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause	• Metering unit stuck in open position, zero-delivery throttle clogged, metering unit without power due to electrical error. • Low pressure side: Pressure before gear pump too high (e.g. by pressure relieve valve), pressure after zero-delivery throttle too high
Failure repair	• Check metering Unit (MeUn), if closing (PWM = 100%) • Check electric wiring to PCV and MeUn • Check low pressure fuel tubes (return from CP to tank free?) • Check zero delivery valve for correct working

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 025: Rail pressure • 029: Rail pressure (Differential pressure) • 030: Rail pressure (specified value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #572 Inspection of FMU (fuel metering unit)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component 'Fuel metering unit' is stuck. The electrical line between pins Engine electronic control unit and Pressure regulation valve has an open circuit. Component 'Fuel pump (Electric pump)' is faulty. For procedures, refer to the Shop Manual. Go to Step2
	Step2	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Fuel metering unit. Check the circuit across Fuel metering unit and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step9
	Step4	Turn the starter switch in OFF. Replace component "Fuel metering unit". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of Fuel metering unit which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step6
	Step6	Inspect or verify the following items. Repair or replace faulty items as necessary. Component 'Fuel metering unit' is stuck. The electrical line between pins Engine electronic control unit and Pressure regulation valve has an open circuit. Component 'Fuel pump (Electric pump)' is faulty. For procedures, refer to the Shop Manual Go to Step7
	Step7	Perform the operation start and replace Engine electronic control unit. Go to Step8
	Step8	Inspection completed
	Step9	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step8 Yes: Go to Step4

520500-20: The fuel pressure in the system is too low.

Generation condition		[Test Condition] • Monitoring not inhibited by another failure • Fuel Tank not Empty • Pressure control by metering unit • Monitoring only active if requested by another failure • Desired fuel quantity for MeUn Control > engine speed dependant maximal Set point (i.e. required quantity rises due to too low measured fuel pressure)
		[Fault Detection] • Actual rail pressure is below the targeted value.
		[Defect Debouncing] • Defect condition fulfilled continuously >750.0 ms
Fault healing		• None
System reaction		• None
		• None
Failure cause		• Leakage in the high pressure system: • injection nozzle stuck in open position, low efficiency of high pressure pump, internal leakage of injector, leaking pressure control valve • Too low pressure at High pressure pump inlet due clogged filter, leaking low pressure tubes, electric pre supply pump defective or gear pump defective
Failure repair		• Check low pressure system for clogging (specially fuel filter). • Check tubing between pre-supply pump and gear pump. • Check that the relay of the pre-supply pump is actuating. • Check feeding of pre-supply pump (possibly low due to clogged tubes at tank outlet). • Check high pressure part for leakages (internal / external). • Check PCV for tightness. • Check injectors for tightness.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 025: Rail pressure • 029: Rail pressure (Differential pressure) • 030: Rail pressure (specified value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #572 Inspection of FMU (fuel metering unit)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. • Low pressure system for clogging (specially fuel filter). • Tubing between pre-supply pump and gear pump. • The relay of the pre-supply pump is actuating. Go to Step2
	Step2	Check feeding of pre-supply pump (possibly low due to clogged tubes at tank outlet) following below procedure. • Ensure that engine is not running. • Remove fuel line after pre-supply pump and feed to a measuring jar. • Turn on ignition for 30 seconds and collect supplied fuel in measuring jar. • Turn off ignition. • Indication for good performance of pre-supply pump: ~ 2 liters / minute with +-10% tolerance. • Check tubing of pre-supply pump for clogged tubes (dismount and use compressed air). • If tubing is ok, replace pre-supply pump and repeat this step2. • Remount fuel line. Go to Step3

Inspection procedure	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. • High pressure part for leakages (internal / external). • PCV for tightness. • Injectors for tightness. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? Yes: Go to Step4 No: Go to Step5
	Step4	Turn the starter switch in OFF. Replace component “PCV”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of PCV which Engine electronic control unit learns. Go to Step5
	Step5	Inspection completed

520502-0: The rail pressure is too low. / Component 'Pressure regulating valve in rail' is faulty.

Generation condition		[Test Condition] • Monitoring not inhibited by another failure • Fuel Tank not Empty • Pressure control by metering unit
		[Fault Detection] • Actual rail pressure is above the threshold.
		[Defect Debouncing] • Defect condition fulfilled continuously >300.0 ms
Fault healing		• None
System reaction		• None
		• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause		• Metering unit stuck in open position, zero-delivery throttle clogged, metering unit without power due to electrical error. • Low pressure side: Pressure before gear pump too high (e.g. by pressure relieve valve), pressure after zero-delivery throttle too high
Failure repair		• Check metering Unit (MeUn), if closing (PWM = 100%) • Check electric wiring to PCV and MeUn • Check low pressure fuel tubes (return from CP to tank free?) • Check zero delivery valve for correct working

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #572 Inspection of FMU (fuel metering unit)
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. • Low pressure system for clogging (specially fuel filter). • Tubing between pre-supply pump and gear pump. • The relay of the pre-supply pump is actuating. Go to Step2

Inspection procedure	Step2	Check feeding of pre-supply pump (possibly low due to clogged tubes at tank outlet) following below procedure. • Ensure that engine is not running. • Remove fuel line after pre-supply pump and feed to a measuring jar. • Turn on ignition for 30 seconds and collect supplied fuel in measuring jar. • Turn off ignition. • Indication for good performance of pre-supply pump: ~ 2 liters / minute with +-10% tolerance. • Check tubing of pre-supply pump for clogged tubes (dismount and use compressed air). • If tubing is ok, replace pre-supply pump and repeat this step2. • Remount fuel line. Go to Step3
	Step3	Inspect or verify the following items. Repair or replace faulty items as necessary. • High pressure part for leakages (internal / external). • PCV for tightness. • Injectors for tightness. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? Yes: Go to Step4 No: Go to Step5
	Step4	Turn the starter switch in OFF. Replace component “PCV”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of PCV which Engine electronic control unit learns. Go to Step5
	Step5	Inspection completed

520503-21: The rail pressure is too high. / Component 'Pressure limiting valve in rail' is faulty.

Generation condition	[Test Condition] • Monitoring not inhibited by another failure • Fuel Tank not empty • Pressure control by metering unit or in CPC (“both devices”) mode • PCV governor output in open position
	[Fault Detection] • Actual rail pressure is above the targeted value.
	[Defect Debouncing] • Defect condition fulfilled continuously >1000.0 ms
Fault healing	• None
System reaction	• None
	• Limitation to 180 N·m {130 lbs.ft, 18 kgf·m} 43 kW {58.5 HP} • Engine speed limited to 3570 rpm
Failure cause	• Pressure Control Valve (PCV) stuck in close position, additional current though PCV due to electric problem in wiring, return flow tube from PCV clogged
Failure repair	• Check PCV for opening (PWM=0% --> no pressure) • Check wiring harness for “external” electric power (short circuit) • Check return tube from PCV to tank for clogging
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 076: Specified value of component ‘Pressure regulating valve in rail’ • 077: Specified value of component 'FMU (Fuel Metering device)' • 078: PWM signal of component 'FMU (Fuel Metering device)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 001: FMU (Fuel Metering device) • 002: Pressure regulating valve in rail
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	Check wiring harness.
	Step2	Perform the following actuator test to check it for normal operation. No.002 “Pressure regulating valve in rail” If not OK, replace common rail pressure control valve.
	Step3	Check return tube from common rail pressure control valve to tank for clogging. If not OK, replace common rail pressure control valve.

520505-31: The fill level of the DEF tank is too low. (The DEF fill level has reached warning stage 1.)

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • DEF quantity in DEF tank is too small.
		[Defect Debouncing] • Defect condition fulfilled continuously > 500.0 ms
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• None
		• None
Failure cause		• Reducing agent tank level below first warning level
Failure repair		• Refill reducing agent tank
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520506-31: The fill level of the DEF tank is too low.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • DEF tank level is below the calibratable limit of 5%.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• DEF tank level is above the calibratable limit of 5%.
System reaction		• None
		• None
Failure cause		• Reducing agent tank level below low second warning level
Failure repair		• Refill reducing agent tank
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 125: Fill level of DEF tank • 126: Status of DEF fill level
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520509-2: The EEPROM data in component 'Combustion engine Control unit' are faulty.

Generation condition		[Test Condition] • During ECM start up.
		[Fault Detection] • Internal failure of ECU (invalid variant identifier)
		[Defect Debouncing] • Immediate
Fault healing		• None
System reaction		• Master dataset is used.
		• None
Failure cause		• Dataset not correct
Failure repair		• Check programmed dataset, Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520510-2: The EEPROM data in component 'Combustion engine Control unit' are faulty.

Generation condition		[Test Condition] • During ECM start up.
		[Fault Detection] • Error when writing the correct data during coding
		[Defect Debouncing] • Immediate.
Fault healing		• None
System reaction		• Master dataset is used.
		• None
Failure cause		• Dataset incorrect, possibly not compatible with End of Line application
Failure repair		• Check dataset, Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Perform the appropriate coding. Coding items All Set items All Go to step2

Inspection procedure	Step2	Perform the appropriate settings. Set items Default settings of sensors For procedures, refer to the Shop Manual. All Inspection completed

520511-2: The EEPROM data in component 'Combustion engine Control unit' are faulty.

Generation condition		[Test Condition] • During ECM start up.
		[Fault Detection] • Coding data cannot be read correctly from EEPROM.
		[Defect Debouncing] • Immediate
Fault healing		• If the signal returns to normal when the starter switch is set from OFF to ON position
System reaction		• Master dataset is used.
		• None
Failure cause		• ECM End of line programming not correctly completed
Failure repair		• Check ECM programming, Replace engine ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Perform the appropriate coding. Coding items All Set items All Go to step2
	Step2	Perform the appropriate settings. Set items Default settings of sensors For procedures, refer to the Shop Manual. All Inspection completed

520512-12: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition	[Test Condition] • None
	[Fault Detection] • Internal failure of ECU
	[Defect Debouncing] • None
Fault healing	• If the signal returns to normal when the starter switch is in ON position
System reaction	• ECU is reset (which may be accompanied by transient flashing of instrument panel lights and disappearance of meter cluster displays).
	• None
Failure cause	• Electronic disturbances, various hardware defects (ECU internal) or configuration problems
Failure repair	• Analyze what error triggered the recovery (Read out label Recovery and compare the value with the according table). If error occurs repeatedly, reprogram EDC. If error remains, replace EDC.

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520513-12: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • None
		[Fault Detection] • Internal failure of ECU
		[Defect Debouncing] • None
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• ECU is reset (which may be accompanied by transient flashing of instrument panel lights and disappearance of meter cluster displays).
		• None
Failure cause		• Electronic disturbances, various hardware defects (ECU internal) or configuration problems
Failure repair		• Analyze what error triggered the recovery (Read out label Recovery and compare the value with the according table). If error occurs repeatedly, reprogram EDC. If error remains, replace EDC.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520514-12: There is an internal fault in control unit 'Combustion engine Control unit'.

Generation condition		[Test Condition] • None
		[Fault Detection] • Internal failure of ECU
		[Defect Debouncing] • None
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• ECU is reset (which may be accompanied by transient flashing of instrument panel lights and disappearance of meter cluster displays).
		• None
Failure cause		• Electronic disturbances, various hardware defects (ECU internal) or configuration problems

Failure repair		• Analyze what error triggered the recovery (Read out label Recovery and compare the value with the according table). If error occurs repeatedly, re-program EDC. If error remains, replace EDC.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

520530-0: The signal value of component 'Temperature sensor "SCR catalytic converter"' is implausible.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously if the ADC module does not report any error.
		[Fault Detection] • Voltage from the SCR temperature sensor 1 is above 4 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 700.00ms • Failure is detected if active for 50% of the time
Fault healing		• Voltage from the SCR temperature sensor 1 is below 4 V.
System reaction		• The last valid value of the SCR temperature sensor 1 is used for a fraction of second after detection of this error and thereafter the value is replaced by 19.96°C {68°F}.
		• Manual DPF regeneration not available
Failure cause		• Sensor defective or short circuit in wiring to external source
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 012: Temperature at component ‘SCR catalytic converter (FORWARD)’
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of SCR temperature sensor 1
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3

Inspection procedure	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of SCR temperature sensor 1. Check the circuit across Engine electronic control unit and SCR temperature sensor 1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component "SCR temperature sensor 1". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and ATS harness. Check the circuit across Engine electronic control unit and Connection of chassis harness and ATS harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across SCR temperature sensor 1 and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520530-1: The signal value of component 'Temperature sensor "SCR catalytic converter"' is implausible.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously if the ADC module does not report any error.
		[Fault Detection] • Voltage from the SCR temperature sensor 1 is below 500 mV.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 700.00ms • Failure is detected if active for 50% of the time
Fault healing		• Voltage from the SCR temperature sensor 1 is above 500 mV.
System reaction		• The last valid value of the SCR temperature sensor 1 is used for a fraction of second after detection of this error and thereafter the value is replaced by 19.96°C {68°F}.
		• Manual DPF regeneration not available
Failure cause		• Sensor defective or short circuit in wiring to ground
Failure repair		• Check wiring or replace sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 012: Temperature at component 'SCR catalytic converter (FORWARD)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of SCR temperature sensor 1
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of SCR temperature sensor 1. Check the circuit across Engine electronic control unit and SCR temperature sensor 1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component "SCR temperature sensor 1". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Perform the operation start and replace Engine electronic control unit. Inspection completed

Inspection procedure	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and ATS harness. Check the circuit across Engine electronic control unit and Connection of chassis harness and ATS harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across SCR temperature sensor 1 and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520530-16: Signal 'Exhaust temperature upstream of SCR catalytic converter' is faulty.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • continuously if analogic Digital Converter module doesn't report any error and the Signal Range Check error for the catalyst upstream temperature sensor is not set
	[Fault Detection] • The sensor signal is above 999.96°C {1831.93°F}.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing	• The sensor signal is below 999.96°C {1831.93°F}.
System reaction	• The last valid value of the SCR temperature sensor 1 is used for a fraction of second after detection of this error and thereafter the value is replaced by 19.96°C {68°F}.
	• None
Failure cause	• DEF Catalyst temperature upstream sensor drifted or not correctly mounted • Partial short circuit on wiring harness or sensor
Failure repair	• Check sensor • Check wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 012: Temperature at component 'SCR catalytic converter (FORWARD)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #336 Inspection of SCR temperature sensor 1

Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of SCR temperature sensor 1. Check the circuit across Engine electronic control unit and SCR temperature sensor 1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component "SCR temperature sensor 1". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No:Go to Step6 Yes: Go to Step7
	Step6	Inspection completed
	Step7	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and ATS harness. Check the circuit across Engine electronic control unit and Connection of chassis harness and ATS harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across SCR temperature sensor 1 and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520530-18: Signal 'Exhaust temperature upstream of SCR catalytic converter' is faulty.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • continuously if analogic Digital Converter module doesn't report any error and the Signal Range Check error for the catalyst upstream temperature sensor is not set
		[Fault Detection] • The sensor signal is below -45.04°C {-49.07°F}.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 10.00s • Failure is detected if active for 50% of the time
Fault healing		• The sensor signal is above -45.04°C {-49.07°F}.
System reaction		• The last valid value of the SCR temperature sensor 1 is used for a fraction of second after detection of this error and thereafter the value is replaced by 19.96°C {68°F}.
		• None
Failure cause		• DEF Catalyst temperature upstream sensor drifted or not correctly mounted • Partial short circuit on wiring harness or sensor
Failure repair		• Check sensor • Check wiring
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 012: Temperature at component 'SCR catalytic converter (FORWARD)'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #336 Inspection of SCR temperature sensor 1
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of SCR temperature sensor 1. Check the circuit across Engine electronic control unit and SCR temperature sensor 1 for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component "SCR temperature sensor 1". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step7

Inspection procedure	Step6	Inspection completed
	Step7	Perform the operation start and replace Engine electronic control unit. Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and ATS harness. Check the circuit across Engine electronic control unit and Connection of chassis harness and ATS harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across SCR temperature sensor 1 and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and ATS harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step4

520531-3: Component 'DEF metering device' has a short circuit to positive.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-)
	[Fault Detection] • Short-circuit to ground is detected in the DEF dosing module (DEF valve) harness.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 25% of the time
Fault healing	• The measured current < 200 mA AND Low side switch does NOT report an Open Load error.
System reaction	• None
	• Manual DPF regeneration not available
Failure cause	• Short circuit in the wiring (+ wire) to U-Batt • Short circuit inside dosing valve actuator.
Failure repair	• Check wiring harness • Check Dosing valve actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 122: Current DEF metering quantity
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF dosing module. Check the circuit across DEF dosing module and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “DEF dosing module”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF dosing module which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

520531-4: Component 'DEF metering device' has a short circuit to ground.

Generation condition	[Test Condition] • Monitoring is active 2 s after ECU initialization while engine isn’t running yet, while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-)
	[Fault Detection] • Overcurrent in the DEF dosing module (DEF valve) is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• To give the possibility for healing, an electric impulse is sent to power stage at every 1000 ms for 5 times in actual driving cycle. Failure is healed if the power stage does not report an error AND the measured current < 1.6 A. No other healing is possible at this driving cycle.
System reaction	• Power stage is deactivated.
	• Manual DPF regeneration not available
Failure cause	• Short circuit in the wiring (+ wire) to Ground • Short circuit inside dosing valve actuator.
Failure repair	• Check wiring harness • Check Dosing valve actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 122: Current DEF metering quantity

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF dosing module. Check the circuit across DEF dosing module and Engine electronic control unit for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step2 Yes: Go to Step6
	Step2	Turn the starter switch in OFF. Replace component “DEF dosing module”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF dosing module which Engine electronic control unit learns. Go to Step3
	Step3	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step4
	Step4	Perform the operation start and replace Engine electronic control unit. Go to Step5
	Step5	Inspection completed
	Step6	Repair or replace electrical lines. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step5 Yes: Go to Step2

520532-4: Component 'DEF heating element' has a short circuit to ground.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Once per heating cycle if a jump is detected or if 0.2 s has expired.
	[Fault Detection] • Short-circuit of the DEF heater power unit harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing	• No more fault is detected.
System reaction	• None
	• None
Failure cause	• Short circuit error in the heater element of DEF Pressure Line or in wiring
Failure repair	• Check and replace wiring and DEF Pressure Line Heater
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 122: Current DEF metering quantity • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF line heater. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF line heater for open or short circuit. Check the circuit across DEF heater power unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF line heater and Ground for open or short circuit. Check the circuit across DEF supply module (motor and heater) and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized?
	Step3	Turn the starter switch in OFF. Replace component “DEF line heater”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component “DEF heater power unit”. Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8

Inspection procedure	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF supply module (motor and heater). Repair or replace the harness across DEF heater power unit and DEF line heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

520532-5: Component 'DEF heating element' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Once per heating cycle if a jump is detected or if 0.2 s has expired.
		[Fault Detection] • Open-circuit of the DEF heater power unit harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing		• No more fault is detected.
System reaction		• None
		• None
Failure cause		• Open circuit error in the heater element of DEF Pressure Line or in the wiring
Failure repair		• Check and replace wiring and DEF Pressure Line Heater
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 128: Status of component 'DEF heating element' • 129: Status of component 'Heating element of DEF tank' • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF line heater. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF line heater for open or short circuit. Check the circuit across DEF heater power unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF line heater and Ground for open or short circuit. Check the circuit across DEF supply module (motor and heater) and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized?
	Step3	Turn the starter switch in OFF. Replace component "DEF line heater". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5

Inspection procedure	Step5	Turn the starter switch in OFF. Replace component “DEF heater power unit”. Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF supply module (motor and heater). Repair or replace the harness across DEF heater power unit and DEF line heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

Inspection procedure	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

520533-4: Component 'Heating element (DEF delivery pump)' has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Once per heating cycle if a jump is detected or if 2 s has expired.
		[Fault Detection] • Short-circuit of the DEF heater power unit harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing		• No more fault is detected.
System reaction		• None
		• None
Failure cause		• Short circuit error in the heater element of DEF Supply Module or in wiring
Failure repair		• Check and replace wiring and DEF Supply Module Heater
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF line heater. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF line heater for open or short circuit. Check the circuit across DEF heater power unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF line heater and Ground for open or short circuit. Check the circuit across DEF supply module (motor and heater) and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized?

Inspection procedure	Step3	Turn the starter switch in OFF. Replace component “DEF line heater”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component “DEF heater power unit”. Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13

Inspection procedure	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF supply module (motor and heater). Repair or replace the harness across DEF heater power unit and DEF line heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

520533-5: Component 'Heating element (DEF delivery pump)' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Once per heating cycle if a jump is detected or if 2 s has expired.
		[Fault Detection] • Open-circuit of the DEF heater power unit harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing		• No more fault is detected.
System reaction		• None
		• None
Failure repair		• Check and replace wiring and Supply Module Heater
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2

Inspection procedure	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF line heater. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF line heater for open or short circuit. Check the circuit across DEF heater power unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF line heater and Ground for open or short circuit. Check the circuit across DEF supply module (motor and heater) and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized?
	Step3	Turn the starter switch in OFF. Replace component “DEF line heater”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component “DEF heater power unit”. Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed

Inspection procedure	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF supply module (motor and heater). Repair or replace the harness across DEF heater power unit and DEF line heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

520534-6: The value of component 'DEF heating element' is implausible.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously if DEF Pressure Line heater is OFF
	[Fault Detection] • Short-circuit of the DEF heater power unit harness is detected.
	[Defect Debouncing] • Defect condition fulfilled continuously > 1000.0 ms
Fault healing	• If the conductance < 0.101/Ohm when heater is OFF.
System reaction	• None
	• None
Failure cause	• Short circuit error in the wiring or the DEF Pressure Line Heater or DEF Module Supply Heater
Failure repair	• Check wiring or replace defective heater

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 128: Status of component 'DEF heating element' • 129: Status of component 'Heating element of DEF tank' • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)

Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF line heater. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF line heater for open or short circuit. Check the circuit across DEF heater power unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF line heater and Ground for open or short circuit. Check the circuit across DEF supply module (motor and heater) and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized?
	Step3	Turn the starter switch in OFF. Replace component "DEF line heater". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component "DEF heater power unit". Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component "DEF tank". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8

Inspection procedure	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF supply module (motor and heater). Repair or replace the harness across DEF heater power unit and DEF line heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

520536-5: Component 'Heating element of DEF tank' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously if heater is ON
		[Fault Detection] • No current flow is detected when the DEF heater power unit is turned on.
		[Defect Debouncing] • Defect condition fulfilled continuously >2200.0 ms
Fault healing		• None
System reaction		• None
		• None
Failure cause		• Open circuit error in the wiring or the Tank Heater
Failure repair		• Check wiring or replace tank heater
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 013: Temperature at component 'DEF tank' • 128: Status of component 'DEF heating element' • 129: Status of component 'Heating element of DEF tank' • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #339 Inspection of DEF temperature sensor and DEF tank heater • #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF tank heater. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF temperature sensor and DEF tank heater for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF temperature sensor and DEF tank heater and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step11
	Step3	Turn the starter switch in OFF. Replace component "DEF tank heater". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component "DEF heater power unit". Reinstall all the removed connectors. Go to Step6

Inspection procedure	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF tank heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

520536-6: Component 'Heating element of DEF tank' has a short circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously if the heater is not activated.
		[Fault Detection] • Current flow is detected when the DEF heater power unit is turned off.
		[Defect Debouncing] • Defect condition fulfilled continuously > 1000.0 ms
Fault healing		• Current measured in an OFF state < 200 µA
System reaction		• None
		• None
Failure cause		• Possible short circuit in the wiring or the Tank Heater
Failure repair		• Check wiring and replace tank heater
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 013: Temperature at component 'DEF tank' • 128: Status of component 'DEF heating element' • 129: Status of component 'Heating element of DEF tank' • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)

Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF tank heater. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF temperature sensor and DEF tank heater for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF temperature sensor and DEF tank heater and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step11
	Step3	Turn the starter switch in OFF. Replace component "DEF tank heater". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component "DEF heater power unit". Reinstall all the removed connectors. Go to Step6

Inspection procedure	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF tank heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

520537-5: Component 'Heating element of DEF tank' has a short circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously if heater activated
		[Fault Detection] • Maximum conductance is above the specified value. • Heater operating time is longer than 70 seconds.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing		• No more fault is detected.
System reaction		• None
		• None
Failure cause		• Short circuit in the heating element of Tank Heater
Failure repair		• Check and replace tank heater
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 013: Temperature at component 'DEF tank' • 128: Status of component 'DEF heating element' • 129: Status of component 'Heating element of DEF tank' • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #339 Inspection of DEF temperature sensor and DEF tank heater • #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF tank heater. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF temperature sensor and DEF tank heater for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF temperature sensor and DEF tank heater and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step11
	Step3	Turn the starter switch in OFF. Replace component "DEF tank heater". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5

Inspection procedure	Step5	Turn the starter switch in OFF. Replace component “DEF heater power unit”. Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF tank heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

Inspection procedure	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

520537-6: Component 'Heating element of DEF tank' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously if heater activated
		[Fault Detection] • Maximum conductance is below the specified value. • Heater operating time is longer than 70 seconds.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing		• No more fault is detected.
System reaction		• None
		• None
Failure cause		• Open circuit error in the heating element of Tank Heater
Failure repair		• Check and replace tank heater
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 013: Temperature at component ‘DEF tank’ • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #339 Inspection of DEF temperature sensor and DEF tank heater • #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF tank heater. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF temperature sensor and DEF tank heater for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF temperature sensor and DEF tank heater and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step11

Inspection procedure	Step3	Turn the starter switch in OFF. Replace component “DEF tank heater”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component “DEF heater power unit”. Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13

Inspection procedure	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF tank heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

520538-0: The signal voltage of component 'DEF heating element' is too high.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously, if ADC module does not report any error.
		[Fault Detection] • Voltage from the DEF heater power unit is above 3.2 V.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 50.00ms • Failure is detected if active for 50% of the time
Fault healing		• None
System reaction		• The last valid value of the DEF solution heater power unit is used for a fraction of second after detection of this error and thereafter the value is replaced by 41 µA.
		• None
Failure cause		• Wiring Harness defect (short circuit) • Relay defect. • Heating element in pressure line defect
Failure repair		• Check Wiring Harness • Check Relay • Check Heating element in pressure line
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2

Inspection procedure	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF line heater. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF line heater for open or short circuit. Check the circuit across DEF heater power unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF line heater and Ground for open or short circuit. Check the circuit across DEF supply module (motor and heater) and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized?
	Step3	Turn the starter switch in OFF. Replace component “DEF line heater”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component “DEF heater power unit”. Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed

Inspection procedure	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF supply module (motor and heater). Repair or replace the harness across DEF heater power unit and DEF line heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

520538-1: The signal voltage of component 'DEF heating element' is too low.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Continuously, if ADC module does not report any error.
	[Fault Detection] • Voltage from the DEF heater power unit is below 0 mV.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing	• The voltage > 0 mV
System reaction	• The last valid value of the DEF solution heater power unit is used for a fraction of second after detection of this error and thereafter the value is replaced by 41 µA.
	• None
Failure cause	• Wiring Harness defect (short circuit or Open load) • Relay defect. • Heating element in pressure line defect

Failure repair		• Check Wiring Harness • Check Relay • Check Heating element in pressure line
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 128: Status of component 'DEF heating element' • 129: Status of component 'Heating element of DEF tank' • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)

Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF line heater. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF line heater for open or short circuit. Check the circuit across DEF heater power unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF line heater and Ground for open or short circuit. Check the circuit across DEF supply module (motor and heater) and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized?
	Step3	Turn the starter switch in OFF. Replace component "DEF line heater". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component "DEF heater power unit". Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7

Inspection procedure	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF supply module (motor and heater). Repair or replace the harness across DEF heater power unit and DEF line heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

520538-3: Component 'DEF heating element' has a short circuit to positive.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is active. • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-) • Power stage not switched off, i.e. ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V) and Battery voltage < 16 V (switch off > 16.5 V)
		[Fault Detection] • Short-circuit to positive of the DEF heater power unit harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 450.00ms • Failure is detected if active for 50% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage at every 1000 ms for 5 times in actual driving cycle. Failure is healed if the power stage does not report an SCB error. No other healing is possible at this driving cycle.
System reaction		• Power stage is deactivated.
		• None
Failure cause		• Short circuit of wiring to external source or inside SCR Reagent Heating
Failure repair		• Check of wiring, replace SCR Reagent Heating
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF line heater. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF line heater for open or short circuit. Check the circuit across DEF heater power unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF line heater and Ground for open or short circuit. Check the circuit across DEF supply module (motor and heater) and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized?
	Step3	Turn the starter switch in OFF. Replace component “DEF line heater”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component “DEF heater power unit”. Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13

Inspection procedure	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF supply module (motor and heater). Repair or replace the harness across DEF heater power unit and DEF line heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

520538-4: Component 'DEF heating element' has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is NOT active. • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-) • Power stage not switched off, i.e. ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V) and Battery voltage < 16 V (switch off > 16.5 V)
		[Fault Detection] • Short-circuit to ground of the DEF heater power unit harness is detected.
		[Defect Debouncing] • Defect condition exceeded immediately
Fault healing		• SCG fault not detected.
System reaction		• Power stage is deactivated.
		• None
Failure cause		• Short circuit of wiring to ground or inside SCR Reagent Heating
Failure repair		• Check of wiring, replace SCR Reagent Heating
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2

Inspection procedure	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF line heater. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF line heater for open or short circuit. Check the circuit across DEF heater power unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF line heater and Ground for open or short circuit. Check the circuit across DEF supply module (motor and heater) and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized?
	Step3	Turn the starter switch in OFF. Replace component “DEF line heater”. Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component “DEF heater power unit”. Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7
	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed

Inspection procedure	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF supply module (motor and heater). Repair or replace the harness across DEF heater power unit and DEF line heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

520538-5: Component 'DEF heating element' has an open circuit.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is NOT active. • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80 - (switch off < 0.78-) and 1.56- (switch off > 1.65-) • Power stage not switched off, i.e. ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V) and Battery voltage < 16 V (switch off > 16.5 V)
	[Fault Detection] • Open-circuit of the DEF heater power unit harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 2.00s • Failure is detected if active for 50% of the time
Fault healing	• Hardware does not report an Open Load (OL) error on the power stage for the power stage of DEF Pressure Line heater.
System reaction	• Power stage is deactivated.
	• None

Failure cause		• Broken or disconnected wiring or defective relay
Failure repair		• Check of wiring, replace DEF Pressure Line heater actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 128: Status of component 'DEF heating element' • 129: Status of component 'Heating element of DEF tank' • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	If one of diagnosis codes associated with SAM ECU is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF heater power unit. Remove the connector of DEF line heater. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF heater power unit for open or short circuit. Check the circuit across DEF heater power unit and DEF line heater for open or short circuit. Check the circuit across DEF heater power unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across DEF heater power unit and Signal detect and actuation module for open or short circuit. Check the circuit across DEF line heater and Ground for open or short circuit. Check the circuit across DEF supply module (motor and heater) and Ground for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step5 Yes: Go to Step3
	Step3	Turn the starter switch in OFF. Replace component "DEF line heater". Reinstall all the removed connectors. Turn the starter switch in ON. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step5
	Step5	Turn the starter switch in OFF. Replace component "DEF heater power unit". Reinstall all the removed connectors. Go to Step6
	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step7

Inspection procedure	Step7	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step8
	Step8	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step9
	Step9	Perform the operation start and replace Engine electronic control unit. Go to Step10
	Step10	Inspection completed
	Step11	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Ground for open or short circuit. Check the circuit across Connection of chassis harness and DEF tank harness and Signal detect and actuation module for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step12 Yes: Go to Step13
	Step12	Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF heater power unit and DEF supply module (motor and heater). Repair or replace the harness across DEF heater power unit and DEF line heater. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3
	Step13	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step10 Yes: Go to Step3

520539-0: Component 'DEF pressure sensor' is defective.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Plausibility Monitoring not inhibited by another failure. • Dosing system not yet pressurised after start or depressurised at system stop (after-run) (“No pressure control”). • System not in “defreezing mode”, i.e. reagent not frozen.
		[Fault Detection] • Relative pressure measured and corrected according to the ambient temperature is above 50 kPa {7.3 psi, 0.5 kgf/cm^2}.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 600.00ms • Failure is detected if active for 50% of the time
Fault healing		• None
System reaction		• None
		• Manual DPF regeneration not available
Failure cause		• Sensor in Pump module defective • Possibly emptying not executed correctly (clogged tubes, reverting valve not opening etc)
Failure repair		• Check sensor signal: Set Pump speed to 0, wait 1 minute (to give to the system for pressure release), open dosing valve to 100%, wait again some seconds and measure the DEF pressure: the value must be near 0 (between -50kPa {-7.3psi, -0.5kgf/cm^2} and 50kPa {7.3psi, 0.5kgf/cm^2}) • If OK --> failure occurred under “strange circumstances” and system seems OK. • If not OK: Check if system clogged: • Backflow test: Set pressure to ~500kPa {73psi, 5.1kgf/cm^2}, switch off pump (set to 0) --> pressure must decrease slowly --> if OK tube OK • Dosing test: Set pressure to ^500kPa {73psi, 5.1kgf/cm^2}, switch off pump, open dosing valve 100% --> pressure must decrease fast. --> if OK --> sensor does not measure correctly --> replace sensor (or whole pump module) • If pressure does not decrease: dismount dosing valve and repeat “dosing test”. If DEF exits form dosing valve --> pressure sensor defect, if no flow --> dosing valve or DEF tubes possibly clogged.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 026: Pressure of component ‘DEF Delivery pump’ • 122: Current DEF metering quantity • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value) • 132: Status of component 'DEF Reverting valve' (Input signal) • 133: Status of component 'DEF Reverting valve' (Output signal)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with DEF supply module (motor and heater) is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with DEF dosing module is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with DEF pressure sensor is generated, make a system diagnosis according to the diagnosis code. If one of diagnosis codes associated with DEF reverting valve is generated, make a system diagnosis according to the diagnosis code. Go to Step2

Inspection procedure	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step3
	Step3	Remove DEF dosing module from Exhaust pipe. Turn the starter switch in ON. Perform control and make sure that appropriate DEF can be added. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8
	Step4	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove DEF tube from DEF supply module (motor and heater). Remove DEF dosing module from DEF tube. Check the Clogging or Breaks at DEF tube. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Turn the starter switch in OFF. Replace component “DEF dosing module”. Mount DEF tube on DEF supply module (motor and heater). Mount DEF tube on DEF dosing module. Mount DEF dosing module on Exhaust pipe. Reinstall all the removed connectors. Turn the starter switch in ON. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step4
	Step10	Turn the starter switch in OFF. Replace component “DEF tube”. Mount DEF tube on DEF supply module (motor and heater). Mount DEF tube on DEF dosing module. Mount DEF dosing module on Exhaust pipe. Reinstall all the removed connectors. Turn the starter switch in ON. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Is any abnormality recognized? No: Go to Step7 Yes: Go to Step4

520539-2: Component 'DEF pressure sensor' is defective.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded
		[Fault Detection] • Open- or short-circuit of the DEF supply module (motor and heater) harness is detected for 4 to 6 seconds continuously.
		[Defect Debouncing] • Defect condition fulfilled continuously > 1.00 events
Fault healing		• If the signal returns to normal when the starter switch is set from OFF to ON position
System reaction		• None
		• None
Failure cause		• Pump motor defective (blocked, possibly due to crystallisation (after long stand still period) or frozen DEF in case of cold ambient condition)
Failure repair		• Check if Pump is delivering: • If OK: failure is only sporadic (possibly long still stand period or by frozen Re-agent - check ambient conditions) --> probably no action needed. If failure appears several times --> replace pump module. • If Not OK: Replace Pump module
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. Component ‘Due to Crystallization of DEF DEF supply module (motor and heater)’ is stuck. Component ‘Due to Freeze of DEF DEF supply module (motor and heater)’ is stuck. For procedures, refer to the Shop Manual. Go to Step2
	Step2	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step3
	Step3	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across Signal detect and actuation module and DEF supply module (motor and heater) for open or short circuit. Check the circuit across Ground and DEF supply module (motor and heater) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step4 Yes: Go to Step8

Inspection procedure	Step4	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step5
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step6
	Step6	Perform the operation start and replace Engine electronic control unit. Go to Step7
	Step7	Inspection completed
	Step8	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across Signal detect and actuation module and DEF supply module (motor and heater) for open or short circuit. Check the circuit across Ground and DEF supply module (motor and heater) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step9 Yes: Go to Step10
	Step9	Repair or replace the harness across DEF supply module (motor and heater) and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF supply module (motor and heater) and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4
	Step10	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step7 Yes: Go to Step4

520539-3: Component 'DEF delivery pump' has a short circuit to positive.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • DEF Pump is actuated • DEF Pump Motor Power stage not disabled, i.e. Battery voltage > 9.5 V (switch off < 9 V) and Battery voltage < 16 V (switch off > 16.5 V) • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-)
		[Fault Detection] • Short-circuit to positive of the DEF supply module (motor and heater) harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 50% of the time
Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage at every 1000 ms for 5 times in actual driving cycle. Failure is healed if the power stage does not report an SCB error. No other healing is possible at this driving cycle.
System reaction		• Power stage for DEF supply module (motor and heater) is deactivated.
		• Manual DPF regeneration not available
Failure cause		• Short circuit of wiring to external source or inside DEF pump motor
Failure repair		• Check of wiring, replace DEF pump motor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across Signal detect and actuation module and DEF supply module (motor and heater) for open or short circuit. Check the circuit across Ground and DEF supply module (motor and heater) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Check the circuit across Signal detect and actuation module and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Ground and Connection of chassis harness and DEF tank harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across DEF supply module (motor and heater) and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF supply module (motor and heater) and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520539-4: Component 'DEF delivery pump' has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • DEF Pump not actuated • DEF Pump Motor Power stage not disabled, i.e. Battery voltage > 9.5 V (switch off < 9 V) and Battery voltage < 16 V (switch off > 16.5 V) • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-)
		[Fault Detection] • Short-circuit to ground of the DEF supply module (motor and heater) harness is detected for 8 seconds continuously.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 8.00s • Failure is detected if active for 50% of the time
Fault healing		• The power stage hardware does not report a “short circuit to ground” (SCG) error.
System reaction		• Power stage for DEF supply module (motor and heater) is deactivated.
		• Manual DPF regeneration not available
Failure cause		• Short circuit of wiring to ground or inside DEF pump motor
Failure repair		• Check of wiring, replace DEF pump motor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across Signal detect and actuation module and DEF supply module (motor and heater) for open or short circuit. Check the circuit across Ground and DEF supply module (motor and heater) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Check the circuit across Signal detect and actuation module and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Ground and Connection of chassis harness and DEF tank harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across DEF supply module (motor and heater) and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF supply module (motor and heater) and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520539-5: Component 'DEF delivery pump' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • DEF Pump not actuated • DEF Pump Motor Power stage not disabled, i.e. Battery voltage > 9.5 V (switch off < 9 V) and Battery voltage < 16 V (switch off > 16.5 V) • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-)
		[Fault Detection] • Open-circuit of the DEF supply module (motor and heater) harness is detected for 8 seconds continuously.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 8.00s • Failure is detected if active for 50% of the time
Fault healing		• The power stage does not report an “open load” (OL) error.
System reaction		• Power stage for DEF supply module (motor and heater) is deactivated.
		• Manual DPF regeneration not available
Failure cause		• Broken or disconnected wiring or defective relay
Failure repair		• Check of wiring, replace DEF pump motor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across Signal detect and actuation module and DEF supply module (motor and heater) for open or short circuit. Check the circuit across Ground and DEF supply module (motor and heater) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Check the circuit across Signal detect and actuation module and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Ground and Connection of chassis harness and DEF tank harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across DEF supply module (motor and heater) and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF supply module (motor and heater) and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520539-12: The function of component 'DEF delivery pump' is not OK.

Generation condition	[Test Condition] • DEF Pump is actuated • DEF Pump Motor Power stage not disabled, i.e. Battery voltage > 9.5 V (switch off < 9 V) and Battery voltage < 16 V (switch off > 16.5 V) • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-)
	[Fault Detection] • Overcurrent is detected in the DEF supply module (motor and heater).
	[Defect Debouncing] • Defect condition exceeded cumulatively > 250.00ms • Failure is detected if active for 50% of the time

Fault healing		• To give the possibility for healing, an electric impulse is sent to power stage at every 5 s for 5 times in actual driving cycle. Failure is healed if the power stage does not report an SCB error. No other healing is possible at this driving cycle.
System reaction		• Power stage for DEF supply module (motor and heater) is deactivated.
		• Manual DPF regeneration not available
Failure cause		• High battery voltage, high temperature inside ECU, high load or wiring problem
Failure repair		• No reaction needed if failure isn't present after short time, check load and output, check wiring, replace ECU
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If any other fault code has occurred, perform the diagnostics procedure for the fault code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF supply module (motor and heater). Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Check the circuit across Engine electronic control unit and DEF supply module (motor and heater) for open or short circuit. Check the circuit across Signal detect and actuation module and DEF supply module (motor and heater) for open or short circuit. Check the circuit across Ground and DEF supply module (motor and heater) for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component "DEF tank". Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed

Inspection procedure	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Remove the connector of Ground. Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Check the circuit across Signal detect and actuation module and Connection of chassis harness and DEF tank harness for open or short circuit. Check the circuit across Ground and Connection of chassis harness and DEF tank harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across DEF supply module (motor and heater) and Connection of chassis harness and DEF tank harness. Repair or replace the harness across DEF supply module (motor and heater) and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Signal detect and actuation module and Connection of chassis harness and DEF tank harness. Repair or replace the harness across Ground and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520540-3: Component 'DEF switchover valve' has a short circuit to positive.

Generation condition	[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is active. • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-) • Power state not switched off, i.e. Battery voltage > 9.5 V (switch off < 9 V) and Battery voltage < 16 V (switch off > 16.5 V)
	[Fault Detection] • Short-circuit to positive of the DEF reverting valve harness is detected.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 100.00ms • Failure is detected if active for 50% of the time
Fault healing	• To give the possibility for healing, an electric impulse is sent to power stage at every 1000 ms for 5 times in actual driving cycle. Failure is healed if the power stage does not report an SCB error. No other healing is possible at this driving cycle.
System reaction	• Power stage is deactivated.
	• Manual DPF regeneration not available
Failure cause	• Short circuit of wiring to external source or inside DEF Reverting Valve Actuator

Failure repair		• Check of wiring, replace DEF Reverting Valve Actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 132: Status of component 'DEF Reverting valve' (Input signal) • 133: Status of component 'DEF Reverting valve' (Output signal)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF reverting valve. Remove the connector of Signal detect and actuation module. Check the circuit across Signal detect and actuation module and DEF reverting valve for open or short circuit. Check the circuit across Engine electronic control unit and DEF reverting valve for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Check the circuit across Signal detect and actuation module and Connection of chassis harness and DEF tank harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9

Inspection procedure	Step8	Repair or replace the harness across DEF reverting valve and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520540-4: Component 'DEF switchover valve' has a short circuit to ground.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is NOT active. • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-) • Power state not switched off, i.e. Battery voltage > 9.5 V (switch off < 9 V) and Battery voltage < 16 V (switch off > 16.5 V)
		[Fault Detection] • Short-circuit to ground of the DEF reverting valve harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 50% of the time
Fault healing		• None
System reaction		• Power stage is deactivated.
		• Manual DPF regeneration not available
Failure cause		• Short circuit of wiring to ground or inside DEF Reverting Valve Actuator
Failure repair		• Check of wiring, replace DEF Reverting Valve Actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value) • 132: Status of component 'DEF Reverting valve' (Input signal) • 133: Status of component 'DEF Reverting valve' (Output signal)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2

Inspection procedure	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF reverting valve. Remove the connector of Signal detect and actuation module. Check the circuit across Signal detect and actuation module and DEF reverting valve for open or short circuit. Check the circuit across Engine electronic control unit and DEF reverting valve for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step4
	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Check the circuit across Signal detect and actuation module and Connection of chassis harness and DEF tank harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across DEF reverting valve and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520540-5: Component 'DEF switchover valve' has an open circuit.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 10 V and as long as the battery voltage is over 10 V and 2 s after this threshold has been exceeded • Monitoring only when the power stage is NOT active. • ECU not in pre drive condition, Battery voltage > 9.5 V (switch off < 9 V), Battery voltage < 16 V (switch off > 16.5 V) and Battery voltage correction factor between 0.80- (switch off < 0.78-) and 1.56- (switch off > 1.65-) • Power state not switched off, i.e. Battery voltage > 9.5 V (switch off < 9 V) and Battery voltage < 16 V (switch off > 16.5 V)
		[Fault Detection] • Open-circuit of the DEF reverting valve harness is detected.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 700.00ms • Failure is detected if active for 50% of the time
Fault healing		• Hardware does not report an open load (OL) error on the power stage for the DEF Reverting Valve Actuator.
System reaction		• Power stage is deactivated.
		• Manual DPF regeneration not available
Failure cause		• Broken or disconnected wiring or defective DEF Reverting Valve Actuator
Failure repair		• Check of wiring, replace DEF Reverting Valve Actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 122: Current DEF metering quantity • 128: Status of component ‘DEF heating element’ • 129: Status of component ‘Heating element of DEF tank’ • 130: DEF Delivery pump Electric motor (Specified value) • 131: DEF Delivery pump Electric motor (Measured value) • 132: Status of component 'DEF Reverting valve' (Input signal) • 133: Status of component 'DEF Reverting valve' (Output signal)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect or verify the following items. Repair or replace faulty items as necessary. If one of diagnosis codes associated with Signal detect and actuation module is generated, make a system diagnosis according to the diagnosis code. Go to Step2
	Step2	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of DEF reverting valve. Remove the connector of Signal detect and actuation module. Check the circuit across Signal detect and actuation module and DEF reverting valve for open or short circuit. Check the circuit across Engine electronic control unit and DEF reverting valve for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step3 Yes: Go to Step7
	Step3	Turn the starter switch in OFF. Replace component “DEF tank”. Reinstall all the removed connectors. Turn the starter switch in ON. Perform the learned value resetting procedure of DEF tank which Engine electronic control unit learns. Go to Step4

Inspection procedure	Step4	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step5
	Step5	Perform the operation start and replace Engine electronic control unit. Go to Step6
	Step6	Inspection completed
	Step7	Turn the starter switch in OFF. Remove the connector of Engine electronic control unit. Remove the connector of Connection of chassis harness and DEF tank harness. Remove the connector of Signal detect and actuation module. Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Check the circuit across Signal detect and actuation module and Connection of chassis harness and DEF tank harness for open or short circuit. Make a visual check on each connector. Is any abnormality recognized? No: Go to Step8 Yes: Go to Step9
	Step8	Repair or replace the harness across DEF reverting valve and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3
	Step9	Repair or replace the harness across Engine electronic control unit and Connection of chassis harness and DEF tank harness. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. Check if this diagnosis code has occurred. Are current fault codes present? No: Go to Step6 Yes: Go to Step3

520550-2: The learned value of component 'NOx sensor 1' is too high. (NOx values)

Generation condition	[Test Condition] • Upstream catalyst temperature intact, Catalyst installed, NH3 sensor signal reliable, NOx estimation reliable, Dosing system Ready for Reagent injection, No DPF Regeneration active, Engine Break not active and Intake air temperature > -10.04°C {14°F}
	[Fault Detection] • Sensed NH3 value > 200ppm
	[Defect Debouncing] • Defect condition fulfilled continuously >600 s
Fault healing	• None
System reaction	• None
	• None
Failure cause	• Reagent with too high DEF concentration (>>32%) • Too high Reagent injection
Failure repair	• Check Reagent, if correct concentration. • Check Dosing quantity of SCR system. • If also Efficiency monitor is detected, replace SCR catalyst.

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 008: Test of DEF metering amount • 009: DEF Leak tester • 010: Emptying DEF lines
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520561-0: Engine start: The maximum number of operating cycles has been exceeded.

Generation condition		[Test Condition] • Monitoring is active while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Number of engine starting is above the specified value (350,000 times).
		[Defect Debouncing] • Defect condition exceeded cumulatively > 500.00ms • Failure is detected if active for 25% of the time
Fault healing		• None
System reaction		• Normal control is continued.
		• None
Failure cause		• Number of engine starts exceeded, starter and possibly other component relevant for engine start reached end of life.
Failure repair		• Replace starter (and other specified components defined as relevant for engine start) and reset weighted number of starts (Routine control $0274: Reset of engine start counter value)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520569-31: Component 'DUONIC Control unit' reports an implausible gear.

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
	[Fault Detection] • CAN communication from DUONIC ECU is faulty (timeout). • Error signal (improper gear position) is received.
	[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing	• If the signal returns to normal when the starter switch is in ON position

System reaction		• Default values are used for DUONIC data.
		• None
Failure cause		• ETC2 message from AMT transmission is disabled or AMT problem with gear recognition
Failure repair		• Check if dataset in ECU is compatible to AMT transmission, check AMT for gear recognition problem
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 155: Neutral position • 156: Actual gear
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling If one of diagnosis codes associated with DUONIC electronic control unit is generated, make a system diagnosis according to the diagnosis code. Go to step2
	Step2	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Turn the starter switch in OFF. Remove all ECU connectors from the CAN communication line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step3 Yes: Go to step8
	Step3	Attach the connector of Signal detect and actuation module. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step4 Yes: Go to step7
	Step4	Attach the connector of DUONIC electronic control unit. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Is any abnormality recognized? No: Go to step5 Yes: Go to step6
	Step5	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Engine electronic control unit. Inspection completed

Inspection procedure	Step6	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the DUONIC electronic control unit. Inspection completed
	Step7	Turn the starter switch in OFF. Reinstall all the removed connectors. Erase fault memory and perform a city run for 30 minutes. If the diagnosis code has occurred even during the test drive, start the operation and then replace the Signal detect and actuation module. Inspection completed
	Step8	Refer to the help menu for Nos. other than above. *1: M/T *2: DUONIC *3: ISS (With Lock brake) *4: ISS (Without Lock brake) *5: Lock brake (Without ISS) *6: Other than *3,*4,*5 *7: Full-automatic air conditioner *8: Auto leveling *9: Manual leveling Repair or replace electrical lines. Reinstall all the removed connectors. Turn the starter switch in ON. Inspection completed

520578-31: Information: Torque limitation active The current value for the 'Urea content' component is too low.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • The creep mode request is activated.
		[Defect Debouncing] • Defect condition fulfilled continuously >500.0 ms
Fault healing		• No creep mode request present.
System reaction		• None
		• None
Failure cause		• A failure related to the SCR system should be present ot DEF tank is empty
Failure repair		• Refill DEF tank if empty, check and repair SCR failures
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520588-12: The electrical fuse of component 'Instrument cluster' is defective.

Generation condition	[Test Condition] • Monitoring is active if the ECU is not in afterrun
	[Fault Detection] • Acceleration is slower than the specified value.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 200.00ms • Failure is detected if active for 50% of the time

Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• None
		• Engine speed limited to about 2000 rpm • Engine speed limited to 2060 rpm • PTO not available • Cruise control not available
Failure cause		• Instrument Cluster fuse burned or removed.
Failure repair		• Check Instrument Cluster fuse, check IC is running correctly.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Inspect the suspected factors mentioned above sequentially to locate faulty parts. Repair or replace the faulty part as necessary.

520598-31: The accelerator pedal and brake pedal were operated by the driver simultaneously. (History)

Generation condition		[Test Condition] • Engine speed > 600 rpm • Vehicle speed > 2 km/h {1.24 mph} • Vehicle speed acquisition intact
		[Fault Detection] • If the implausibility of APP with brake is detected, then the error path will be set.
		[Defect Debouncing] • Immediate
Fault healing		• Implausibility no more detected
System reaction		• None
		• None
Failure cause		• Pedal state recognition defective or driver is pressing brake and accelerator at the same time
Failure repair		• Check brake pedal switch
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 140: Position of brake pedal
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #042 Inspection of stop lamp switch
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520607-31: Component "Exhaust gas recirculation actuator" reacts too slowly.

Generation condition		[Test Condition] • Monitor not inhibited by another failure • Monitor is released if following conditions are fulfilled: engine speed within 1500.00 rpm and 3500.00 rpm, fuel quantity is within the limits -5.00 mg/hub and 100.00 mg/hub, engine temperature > 19.96°C {68°F}, air system control is active for at least 1.00 s, no regeneration is active, engine is running for at least 10.00 s and grip value > 0.00 • The negative setpoint value gradient must lie between -30.00 mg/Hub/s and -1000.00 mg/Hub/s • To avoid consideration of overshoot/undershoot situations after entering test condition window, a time delay of 0.00 s is applied
		[Fault Detection] • The cumulated release time duration for negative gradient deviation exceeds 60.00 s • and the cumulated negative deviation due to slow response exceeds the threshold value 85.00 mg/Hub
		[Defect Debouncing] • Immediate
Fault healing		• The cumulated release time duration for negative gradient deviation exceeds 60.00 s • and the cumulated negative deviation due to slow response is below the threshold value 85.00 mg/Hub
System reaction		• None
		• None
Failure cause		• EGR actuator response is too slow, sticking actuator or increased friction.
Failure repair		• Check and replace EGR actuator
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 107: Position of exhaust gas recirculation controller (raw value) • 114: Position of exhaust gas recirculation positioner (actual value)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 006: Exhaust gas recirculation actuator
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #530 Inspection of EGR actuator
Inspection procedure	Step1	Check component 'Exhaust gas recirculation actuator' for dirt. Check component 'Exhaust gas recirculation actuator' for fouling and replace if necessary. Replace faulty components. Go to Step2
	Step2	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520612-9: Timeout error of component 'DEF exhaust aftertreatment unit'

Generation condition	[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
	[Fault Detection] • When any message is not received from the DEF exhaust aftertreatment unit within the given period of time
	[Defect Debouncing] • Defect condition fulfilled continuously >0.5s
Fault healing	• When any message is received from the DEF exhaust aftertreatment unit within the given period of time

System reaction		• Tank level will be set to default value 20mm. • Tank temperature will be set to default value 19.96°C {68°F}
		• None
Failure cause		• Defective CAN controller of Reagent Tank level/temperature sensor, CAN cable disconnected or broken. Short circuit in wiring.
Failure repair		• Check presence and correct connection of the Reagent Tank level/temperature sensor to the network, Check correct functioning of the CAN controller. • Check wiring.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 125: Fill level of DEF tank • 126: Status of DEF fill level • 128: Status of component 'DEF heating element' • 134: Status of component ''DEF Level sensor''
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF level sensor • #773 Inspection of DEF heater power unit
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520614-9: CAN bus OFF fault

Generation condition	[Test Condition] • Monitoring is active 2.00 s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00 s after engine startup, while the battery voltage is over 9.00 V, as long as the battery voltage is over 9.00 V and 2.00 s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Time out for the DD CAN frame is detected.
	[Defect Debouncing] • Defect condition fulfilled continuously > 500.0 ms
Fault healing	• No timeout for DD message detected
System reaction	• Default value for fuel tank level (0) is used.
	• None
Failure cause	• Defective CAN controller of Dash Display, CAN cable is disconnected or broken. • Short circuit in wiring.
Failure repair	• Check presence and correct connection of the Dash Display to the network, check correct functioning of the CAN controller. Check wiring. (See “11. Inspections to be Made at CAN error Occurrence”)
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• None

Inspection procedure	Step1	See “11. Inspections to be Made at CAN error Occurrence” If other fault codes relating to component ’Meter cluster’ are present, process these first. Go to Step2
	Step2	Switch off ignition. Unplug connector from control unit connected to CAN line. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Was a fault discovered? No: Go to Step3 Yes: Go to Step7
	Step3	Connect plug connection to component ’Signal detect and actuation module’. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Was a fault discovered? No: Go to Step4 Yes: Go to Step8
	Step4	Connect plug connection to component ’Meter cluster’. Check CAN line for open circuit, short circuit to positive, short circuit to ground or short circuit to another electrical line. Was a fault discovered? No: Go to Step5 Yes: Go to Step9
	Step5	Switch off ignition. Reconnect all separated electrical connectors. Erase fault memory and perform a city run for 30 minutes. If the fault code still has status ’CURRENT’ after the test drive, then replace component ’Engine electronic control unit’ by performing initial startup. Go to Step6
	Step6	Inspection completed
	Step7	Repair or replace electrical lines. Reconnect all separated electrical connectors. Switch on ignition. Go to Step6
	Step8	Switch off ignition. Reconnect all separated electrical connectors. Erase fault memory and perform a city run for 30 minutes. If the fault code still has status ’CURRENT’ after the test drive, then replace component ’Signal detect and actuation module’ by performing initial startup. Go to Step6
	Step9	Switch off ignition. Reconnect all separated electrical connectors. Erase fault memory and perform a city run for 30 minutes. If the fault code still has status ’CURRENT’ after the test drive, then replace component ’Meter cluster’ by performing initial startup. Go to Step6

520618-31: Component 'NH3 Sensor' has an open circuit or is defective.

Generation condition	[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Failure is detected in case of an open load or a short circuit on one of the measuring cell lines of the sensor
	[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing	• Electrical failure on the sensor no more detected
System reaction	• None
	• None

Failure cause		• Defective NH3 Sensor.
Failure repair		• Replace NH3 Sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of NH3 Sensor • #350 Inspection of NH3 Sensor ECU
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520619-31: Component 'NH3 Sensor' has an open circuit or is defective. (Ground cable)

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2.00s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Failure is detected in case of an open load or a short circuit on the signal ground line of the sensor
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• Electrical failure on the sensor no more detected
System reaction		• None
		• None
Failure cause		• Defective NH3 Sensor.
Failure repair		• Replace NH3 Sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of NH3 Sensor • #350 Inspection of NH3 Sensor ECU
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520620-5: Component 'NH3 Sensor' has overtemperature.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Failure is detected in case of electrical (line) error which causes overheating of the sensor (heater line).
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• Electrical failure on the sensor no more detected

System reaction		• None
		• None
Failure cause		• Defective NH3 Sensor.
Failure repair		• Replace NH3 Sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of NH3 Sensor • #350 Inspection of NH3 Sensor ECU
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520621-6: Timeout error of component 'NH3 Sensor'

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Failure is detected in case the sensor is reporting an electrical (line) error which causes underheating of the sensor (heater line).
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• Electrical failure on the sensor no more detected
System reaction		• None
		• None
Failure cause		• Defective NH3 Sensor.
Failure repair		• Replace NH3 Sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of NH3 Sensor • #350 Inspection of NH3 Sensor ECU
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520622-31: Component 'NH3 Sensor' has an open circuit or is defective.

Generation condition	[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Failure is detected in case the sensor is reporting an open load or a short circuit on the temperature cell input line
	[Defect Debouncing] • Defect condition fulfilled continuously >0.2s

Fault healing		• Electrical failure on the sensor no more detected
System reaction		• None
		• None
Failure cause		• Defective NH3 Sensor.
Failure repair		• Replace NH3 Sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of NH3 Sensor • #350 Inspection of NH3 Sensor ECU
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520623-31: Component 'NH3 Sensor' has an open circuit or is defective.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Failure is detected in case the sensor is reporting an open load or a short circuit on the trim resistor line input
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• Electrical failure on the sensor no more detected
System reaction		• None
		• None
Failure cause		• Defective NH3 Sensor.
Failure repair		• Replace NH3 Sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of NH3 Sensor • #350 Inspection of NH3 Sensor ECU
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520624-31: Component 'NH3 Sensor' is faulty. (Heat output FALLING)

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Failure is detected in case the sensor is reporting a heater control fault
		[Defect Debouncing] • Defect condition fulfilled continuously >10000 ms

Fault healing		• Electrical failure on the sensor no more detected
System reaction		• None
		• None
Failure cause		• Defective NH3 Sensor.
Failure repair		• Replace NH3 Sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of NH3 Sensor • #350 Inspection of NH3 Sensor ECU
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520626-0: The component 'DEF Concentration sensor' has received the CAN message 'The DEF quality is insufficient.'.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun. • Continuous, if not inhibited by another failure.
		[Fault Detection] • DEF quality sensor reports a Signal Range Check High error status.
		[Defect Debouncing] • Defect condition fulfilled continuously > 0.2s
Fault healing		• No Healing possible (disabled by Data set).
System reaction		• None
		• None
Failure cause		• DEF quality sensor defective.
Failure repair		• Replace DEF tank.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF Quality sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520627-1: The component 'DEF Concentration sensor' has received the CAN message 'The DEF quality is insufficient.'.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun. • Continuous, if not inhibited by another failure.
		[Fault Detection] • DEF quality sensor reports a Signal Range Check Low error status.
		[Defect Debouncing] • Defect condition fulfilled continuously > 0.2s
Fault healing		• No Healing possible (disabled by Data set).
System reaction		• None
		• None
Failure cause		• DEF quality sensor defective.
Failure repair		• Replace DEF tank.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF Quality sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520628-31: Component 'NH3 Sensor' is faulty.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Failure is detected in case the sensor is reporting an error related to power supply of heater or sensor
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• Electrical failure on the sensor no more detected
System reaction		• None
		• None
Failure cause		• Defective NH3 Sensor.
Failure repair		• Replace NH3 Sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of NH3 Sensor • #350 Inspection of NH3 Sensor ECU
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520629-31: The EEPROM data in component 'NH3 Sensor' are faulty.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
		[Fault Detection] • Failure is detected in case the sensor is reporting an error related to ASIC, NVM or flash memory.
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• Electrical failure on the sensor no more detected
System reaction		• None
		• None
Failure cause		• Defective NH3 Sensor.
Failure repair		• Replace NH3 Sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of NH3 Sensor • #350 Inspection of NH3 Sensor ECU
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520630-9: Timeout error of component 'NH3 Sensor'

Generation condition	[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun • Continuously
	[Fault Detection] • Timeout of NH3Sens message.
	[Defect Debouncing] • Defect condition fulfilled continuously >0.5s
Fault healing	• NH3Sensor message received
System reaction	• None
	• None
Failure cause	• Defective CAN controller of NH3 Sensor , undervoltage of Sensor, missing Sensor, CAN cable connecting the Sensor is disconnected or broken. • Short circuit in wiring.
Failure repair	• Check presence and correct connection of the NH3 Sensor to the network, Check correct functioning of the Sensor CAN controller and its voltage supply. • Check wiring.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of NH3 Sensor • #350 Inspection of NH3 Sensor ECU
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520642-20: Sensor drift of component "NOx sensor"

Generation condition		[Test Condition] • The detection needs following stages: • Set up stage: • Engine speed > 1000.00 rpm • Injection quantity > 20.00 mg/cyc • Catalyst efficiency > 0.80 • Catalist temperature within 229.96°C {446°F} and 399.96°C {752°F} • Change to release state if: • Setup state maintained for 10.00 s then injection quantity < -1.00 mg/cyc • Monitor is released if • Engine speed within 400.00 rpm and 1000.00 rpm • NOx level < 20.00 ppm • Catalyst efficiency > 0.95 • For at least > 12.00 s
		[Fault Detection] • NOx concentration during idling is lower than the specified value.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1.00 events • Failure is detected if active for 50% of events
Fault healing		• If the signal returns to normal when the starter switch is in ON position
System reaction		• DEF injection control is suspended.
		• None
Failure cause		• NOx sensor is drifted
Failure repair		• Check and replace NOx sensor
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Replace sensor. Go to Step2
	Step2	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520643-31: The measurement value of component 'NOx sensor' is outside the measuring range.

Generation condition		[Test Condition] • Following conditions fulfilled: Engine Temperature evaluation not inhibited by due to another failure, Engine temperature > 39.96°C {104°F}, Upstream catalyst temperature intact, Catalyst installed, Dosing system Ready for Reagent injection and Engine Break not active • Delay time of 25s reached • Monitor sample time reached 15s
		[Fault Detection] • Difference between maximal and minimal measured NOx signal over defined sample period is below 25ppm
		[Defect Debouncing] • Defect condition exceeded cumulatively > 23 events • Failure is detected if active for 50% of events
Fault healing		• NOx signal variation sufficient (> 25ppm)
System reaction		• None
		• None
Failure cause		• NOx sensor defective or incorrectly mounted.
Failure repair		• Check sensor mounting. • Replace NOx sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 108: NOx values (Raw values) • 115: NOx values
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520644-31: The coolant temperature is implausible.

Generation condition	[Test Condition] • Engine is running • Monitor not inhibited by another failure • The calculated modelled temperature is between 74.96°C {167°F} and 83.96°C {183°F}
	[Fault Detection] • The modeled coolant temperature is calculated starting from temperature measured at engine start and integrating heat summed by load and subtracted by heat exchangers. • The modeled temperature is compared to measured temperature, if deviation between the two values exceeds a coolant temperature dependant threshold, failure is detected.
	[Defect Debouncing] • Defect condition fulfilled continuously >100s
Fault healing	• Deviation between measured and modeled temperature is in range
System reaction	• None
	• None
Failure cause	• Thermostat is blocked open or closed or coolant flow restricted or coolant temperature sensor negative offset.
Failure repair	• Check thermostat check cooling system. • Check coolant temperature sensor plausibility by comparing to known temperature at 20°C {68°F} and 80°C {176°F}.

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 016: Coolant temperature
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #262 Inspection of water temperature sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520650-0: The emission value of the NOx sensor (raw value) is too high.

Generation condition	[Test Condition] • SCR catalyst temperature within range 199.96°C {392°F} and 599.96°C {1112°F}, Ambient pressure > 60 kPa {8.7 psi, 0.6 kgf/cm^2}, Environment temperature between -100.04°C {-148°F} and 99.96°C {212°F}, Fuel injection quantity within 0.10mg/cyc and 85.00mg/cyc, Coolant temperature within 69.96°C {158°F} and 104.96°C {221°F}, monitoring not inhibited by another failure and DEF mass flow > 90.00g/h • Upstream catalyst temperature intact, Catalyst installed, NH3 sensor signal reliable, NOx estimation reliable, Dosing system Ready for Reagent injection, No DPF Regeneration active, Engine Break not active and Intake air temperature > -10.04°C {14°F}
	[Fault Detection] • NOx mass upstream/downstream of catalyst is integrated during a catalyst temperature dependent time or until integrated NOx mass upstream exceeds a defined temperature dependent quantity, then integrated calculated catalyst efficiency (NOX downstream/ NOX upstream of catalyst) is compared to the integrated expected reference efficiency, if measured efficiency does not match expected efficiency failure is set.
	[Defect Debouncing] • Defect condition exceeded cumulatively > 25.00 events • Failure is detected if active for 50% of events
Fault healing	• SCR efficiency is in range
System reaction	• None
	• None
Failure cause	• Too low Reagent injection. • Wrong NOx measurement (NOx Sensor measures too high values) Engine NOx raw emissions higher than expected (humidity sensor measures too wet air, injection timing anticipated, fuel pressure sensor measures too low fuel pressure...). • Bad catalyst efficiency.
Failure repair	• Check Reagent, if correct concentration. • Check Dosing quantity of SCR system. • Check if engine raw emissions are OK (e.g. drive vehicle at constant speed without Reagent injection and compare measured with estimated NOx with tester), if not check: NOx Sensor, Humidity Sensor, Fuel pressure sensor, Injection timing. • Replace catalyst.

Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 015: Ambient temperature • 025: Rail pressure • 029: Rail pressure (Differential pressure) • 030: Rail pressure (specified value) • 040: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Temperature sensors) • 044: Signal voltage of component 'Intake air temperature / Air humidity sensor' (Air humidity sensor) • 056: Humidity of intake air • 108: NOx values (Raw values) • 115: NOx values
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of pressure sensor • #298 Inspection of NOx sensor • #347 Inspection of Humidity and intake air temperature sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520651-0: The learned values for component 'NOx sensor 2' are outside the permissible range. (Lambda value)

Generation condition		[Test Condition] • NOx sensor is working correctly (no fault detected) • Sensor is activated (dew point reached, FId_DStgyMonLambda is intact) • No regeneration is active • Fuel quantity > 5mg/cyc at least for 10s
		[Fault Detection] • Lambda difference between value measured by NOx sensor downstream and calculated lambda value is outside window defined by maximum/minimum curves, dependent on lambda value itself
		[Defect Debouncing] • Defect condition fulfilled continuously >130 s
Fault healing		• Lambda difference between downstream NOx sensor and calculated Lambda is in range
System reaction		• None
		• None
Failure cause		• NOx sensors downstream is measuring lambda value different from LSU sensor.
Failure repair		• Check correct mounting of NOx sensor and LSU. • If also this failure is active then replace LSU sensor, otherwise replace Nox sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 010: Temperature at component 'Lambda control tester' • 032: Operating state of component 'Lambda control tester' (Heater ON) • 057: Lambda value • 108: NOx values (Raw values) • 115: NOx values • 118: Status of component 'Lambda control tester' • 135: Status of oxygen sensor heater
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor • #297 Inspection of lambda sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520652-0: The learned values for component 'NOx sensor 1' are outside the permissible range. (Lambda value)

Generation condition		[Test Condition] • NOx sensor is working correctly (no fault detected) • Sensor is activated (dew point reached) • No regeneration is active • Fuel quantity > 5mg/cyc at least for 10s
		[Fault Detection] • Lambda difference between value measured by NOx sensor upstream and calculated lambda value is outside window defined by maximum/minimum curves, dependent on lambda value itself
		[Defect Debouncing] • Defect condition fulfilled continuously >130 s
Fault healing		• Lambda difference between upstream NOx sensor and calculated Lambda is in range
System reaction		• None
		• None
Failure cause		• NOx sensors upstream is measuring lambda value different from LSU sensor.
Failure repair		• Check correct mounting of NOx upstream sensor and LSU, if also this failure is active then replace LSU sensor, otherwise replace Nox upstream sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 010: Temperature at component 'Lambda control tester' • 032: Operating state of component 'Lambda control tester' (Heater ON) • 057: Lambda value • 108: NOx values (Raw values) • 115: NOx values • 118: Status of component 'Lambda control tester' • 135: Status of oxygen sensor heater
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #297 Inspection of lambda sensor • #298 Inspection of NOx sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520654-2: The learned values for component 'NOx sensor' are outside the permissible range.

Generation condition	[Test Condition] • NOx sensor upstream is intact • Engine speed between 600rpm and 900rpm • Fuel quantity between 1mg/cyc and 20mg/cyc • Engine coolant temperature > 69.96°C {158°F}
	[Fault Detection] • The difference between the NOx estimation and the corrected NOx sensor signal is above the threshold
	[Defect Debouncing] • Defect condition fulfilled continuously >25s
Fault healing	• No Healing possible (disabled by Data set)
System reaction	• None
	• None
Failure cause	• NOx sensors upstream is not measuring correct values, engine is emitting unexpected quantity of NOx or NOx estimation model is incorrect.
Failure repair	• Check presence of other failures which could influence NOx emission or NOx estimation, if no other failure identified, replace NOx sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 108: NOx values (Raw values) • 115: NOx values

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #298 Inspection of NOx sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520657-0: The learned values for component 'Injection valve (Injection quantity)' are outside the permissible range. (At idle)

Generation condition		[Test Condition] • Monitor not inhibited by another failure. • Engine is running, accelerator pedal is not pressed, brake is actuated if gear is engaged (not N or P), gear is in parking or neutral, no gear shift is detected, vehicle speed <= 2 km/h {1.24 mph}, clutch not pressed, • Engine speed between 620rpm and 850rpm, ambient pressure > 75 kPa {11 psi , 0.8 kgf/cm^2}, engine temperature > 29.96°C {86°F} and engine speed governor in HLS mode.
		[Fault Detection] • The injection quantity at idle is above the tolerance corrected, calculated injection quantity limit.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1 events • Failure is detected if active for 50% of events
Fault healing		• Fuel quantity at low idle in range.
System reaction		• Possibly irregular idling or engine running
		• None
Failure cause		• PTO with high torque request activated. • Injector defective, stuck open.
Failure repair		• Check for PTO and adapt PTO. • Run engine in standard low idle (no AC, lamps off, no PTO) in warm condition and check injection quantity. • If injection quantity is above 9mg/cyc replace injectors. • Otherwise ignore failure.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1) • 071: Correction value of fuel quantity (Cylinder 3) • 072: Correction value of fuel quantity (Cylinder 4) • 073: Correction value of fuel quantity (Cylinder 2)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520658-1: The learned values for component 'Injection valve (Injection quantity)' are outside the permissible range. (At idle)

Generation condition		[Test Condition] • Monitor not inhibited by another failure. • Engine is running, accelerator pedal is not pressed, brake is actuated if gear is engaged (not N or P), gear is in parking or neutral, no gear shift is detected, vehicle speed <= 2 km/h {1.24 mph}, clutch not pressed, engine speed between 620rpm and 850rpm, ambient pressure > 75 kPa {11 psi , 0.8 kgf/cm^2}, engine temperature > 29.96°C {86°F} and engine speed governor in HLS mode.
		[Fault Detection] • The Injection quantity at idle is below the tolerance corrected calculated injection quantity limit.
		[Defect Debouncing] • Defect condition exceeded cumulatively > 1events • Failure is detected if active for 50% of events
Fault healing		• None
System reaction		• Possibly irregular idling or engine running
		• None
Failure cause		• Injector defective, stuck open
Failure repair		• Run engine in standard low idle (no AC, lamps off, no PTO) in warm condition and check injection quantity. • If injection quantity is below 4.5mg/cyc replace injectors. • Otherwise ignore failure.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 070: Correction value of fuel quantity (Cylinder 1) • 071: Correction value of fuel quantity (Cylinder 3) • 072: Correction value of fuel quantity (Cylinder 4) • 073: Correction value of fuel quantity (Cylinder 2)
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• 003: Injection valve
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #582 Inspection of injector
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520663-31: Internal control unit fault (Environmental data : Injection valve)

Generation condition	[Test Condition] • Inducement logic is active if: • Ambient pressure between 0 kPa {0.0 psi, 0.0 kgf/cm^2} and 0 kPa {0.0 psi, 0.0 kgf/cm^2} • Ambient temperature between -50.04°C {-58°F} and 149.96°C {270°F} • Engine coolant temperature > -50.04°C {-58°F}
	[Fault Detection] • If at least one error belonging to "Customer Inducement moderate" group is set, the timer for inducement level 1 (torque reduction) is incremented. • When timer exceeds 182.04h and at least one error belonging to the triggered group is active, level 1 for "Customer Inducement moderate" group is set.
	[Defect Debouncing] • Immediate
Fault healing	• When "Customer Inducement moderate" group fault. no more active
System reaction	• None
	• Buzzer low continuously • Only 75% of max torque / 50% of power available
Failure cause	• INFO: Inducement Level1 due to "Customer Inducement moderate" group activated

Failure repair		• No intervention necessary on this fault. • Root cause for inducement should be repaired.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Continue test with another fault code.

520670-31: System information (Fault group: SCR 1)

Generation condition		[Test Condition] • Inducement logic is active if: • Ambient pressure between 0 kPa {0.0 psi, 0.0 kgf/cm^2} and 0 kPa {0.0 psi, 0.0 kgf/cm^2} • Ambient temperature between -50.04°C {-58°F} and 149.96°C {270°F} • Engine coolant temperature > -50.04°C {-58°F}
		[Fault Detection] • If at least one error belonging to "Reagent dosing interruption" group is set, the timer for inducement level 1 (torque reduction) is incremented. • When timer exceeds 60h and at least one error belonging to the triggered group is active, level 1 for "Reagent dosing interruption" group is set.
		[Defect Debouncing] • Immediate
Fault healing		• When Reagent dosing interruption group fault. no more active
System reaction		• None
		• Buzzer low continuously • Only 75% of max torque / 50% of power available
Failure cause		• INFO: Inducement Level1 due to Reagent dosing interruption activated
Failure repair		• No intervention necessary on this fault. • Reagent dosing interruption fault which is root cause for inducement should be repaired.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Continue test with another fault code.

520672-31: System information (Fault group: SCR Warning)

Generation condition		[Test Condition] • Inducement logic is active if: • Ambient pressure between 0 kPa {0.0 psi, 0.0 kgf/cm^2} and 0 kPa {0.0 psi, 0.0 kgf/cm^2} • Ambient temperature between -50.04°C {-58°F} and 149.96°C {270°F} • Engine coolant temperature > -50.04°C {-58°F}
		[Fault Detection] • If at least one error belonging to "Reagent dosing interruption" group is set, inducement driver warning is activated
		[Defect Debouncing] • Immediate
Fault healing		• No error belonging to "Reagent dosing interrupted" group is set.

System reaction		• None
		• Only 75% of max torque available • DPF lamp on
Failure cause		• INFO: Driver warning due to reagent dosing interrupting fault activated
Failure repair		• No intervention necessary on this fault. • Reagent dosing interrupting fault, which is root cause for inducement should be repaired.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Continue test with another fault code.

520677-31: System information (Fault group: SCR 1)

Generation condition		[Test Condition] • Inducement logic is active if: • Ambient pressure between 0 kPa {0.0 psi, 0.0 kgf/cm^2} and 0 kPa {0.0 psi, 0.0 kgf/cm^2} • Ambient temperature between -50.04°C {-58°F} and 149.96°C {270°F} • Engine coolant temperature > -50.04°C {-58°F}
		[Fault Detection] • If at least one error belonging to "Reagent quality" group is set, the timer for inducement level 1 (torque reduction) is incremented. • When timer exceeds 60h and at least one error belonging to the triggered group is active, level 1 for "Reagent quality" group is set.
		[Defect Debouncing] • Immediate
Fault healing		• When Reagent quality group fault. no more active
System reaction		• None
		• Only 75% of max torque / 50% of power available • Buzzer low continuously
Failure cause		• INFO: Inducement Level1 due to "Reagent quality" fault activated
Failure repair		• No intervention necessary on this fault. • "Reagent quality" fault which is root cause for inducement should be repaired.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Continue test with another fault code.

520679-31: System information (Fault group: SCR Warning)

Generation condition		[Test Condition] • Inducement logic is active if: • Ambient pressure between 0 kPa {0.0 psi, 0.0 kgf/cm^2} and 0 kPa {0.0 psi, 0.0 kgf/cm^2} • Ambient temperature between -50.04°C {-58°F} and 149.96°C {270°F} • Engine coolant temperature > -50.04°C {-58°F}
		[Fault Detection] • If at least one error belonging to "Reagent Quality" group is set, inducement driver warning is activated
		[Defect Debouncing] • Immediate
Fault healing		• No error belonging to "Reagent quality" group is set.
System reaction		• None
		• Only 75% of max torque available • DPF lamp on • Urea warning lamp blinking
Failure cause		• INFO: Driver warning due to "Reagent Quality" fault activated
Failure repair		• No intervention necessary on this fault. • "Reagent Quality" fault, which is root cause for inducement should be re-paired.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Continue test with another fault code.

520680-31: System information (Fault group: SCR 1)

Generation condition	[Test Condition] • Inducement logic is active if: • Ambient pressure between 0 kPa {0.0 psi, 0.0 kgf/cm^2} and 0 kPa {0.0 psi, 0.0 kgf/cm^2} • Ambient temperature between -50.04°C {-58°F} and 149.96°C {270°F} • Engine coolant temperature > -50.04°C {-58°F}
	[Fault Detection] • If at least one error belonging to "Tampering" group is set, the timer for inducement level 1 (torque reduction) is incremented. • When timer exceeds 60.00h and at least one error belonging to the triggered group is active, level 1 for "Tampering" group is set.
	[Defect Debouncing] • Immediate
Fault healing	• When Tampering group fault.no more active
System reaction	• None
	• Only 75% of max torque / 50% of power available • Buzzer low continuously
Failure cause	• INFO: Inducement Level1 due to "Tampering" fault activated
Failure repair	• No intervention necessary on this fault. • "Tampering" fault which is root cause for inducement should be repaired.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• None

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Continue test with another fault code.

520682-31: System information (Fault group: SCR Warning)

Generation condition		[Test Condition] • Inducement logic is active if: • Ambient pressure between 0 kPa {0.0 psi, 0.0 kgf/cm^2} and 0 kPa {0.0 psi, 0.0 kgf/cm^2} • Ambient temperature between -50.04°C {-58°F} and 149.96°C {270°F} • Engine coolant temperature > -50.04°C {-58°F}
		[Fault Detection] • If at least one error belonging to "Tampering" group is set, inducement driver warning is activated
		[Defect Debouncing] • Immediate
Fault healing		• No error belonging to "Tampering" group is set.
System reaction		• None
		• Only 75% of max torque available • DPF lamp on
Failure cause		• INFO: Driver warning due to "Tampering" fault activated
Failure repair		• No intervention necessary on this fault. • "Tampering" fault, which is root cause for inducement should be repaired.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	Continue test with another fault code.

520686-31: The value of component 'DEF fill level sensor' is implausible.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • The sensor connected via CAN sends a Failure Mode Identifier
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• The system recovers when a normal signal is detected with the starter switch in the ON position.
System reaction		• None
		• None
Failure cause		• Sensor signal is affected, sensor defective or wiring problem.
Failure repair		• Replace DEF tank.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 125: Fill level of DEF tank • 126: Status of DEF fill level • 134: Status of component "DEF Level sensor"
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF level sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520689-31: The value of component 'DEF fill level sensor' is implausible.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • The sensor connected via CAN sends an invalid Failure Mode Identifier
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• The system recovers when a normal signal is detected with the starter switch in the ON position.
System reaction		• None
		• None
Failure cause		• The sensor is sending a Failure Mode Identifier not forseen by the specification. • This monitor is particularly relevant during development phase when different sensor types are checked.
Failure repair		• DEF tank should be replaced with another of correct type conform to ECU software specification.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 125: Fill level of DEF tank • 126: Status of DEF fill level • 134: Status of component "DEF Level sensor"
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF level sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520693-31: Component 'DEF Temperature sensor' has a plausibility error.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • The sensor connected via CAN sends a Failure Mode Identifier
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• The system recovers when a normal signal is detected with the starter switch in the ON position.
System reaction		• None
		• None
Failure cause		• Sensor signal is affected, sensor defective or wiring problem.
Failure repair		• Replace DEF tank.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 128: Status of component 'DEF heating element'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520694-0: The signal from component 'DEF Temperature sensor' is faulty.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • The sensor connected via CAN sends a Failure Mode Identifier
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• The system recovers when a normal signal is detected with the starter switch in the ON position.
System reaction		• None
		• None
Failure cause		• Sensor defective or short circuit to external source.
Failure repair		• Replace DEF tank.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 128: Status of component 'DEF heating element'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520695-1: Component 'DEF Temperature sensor' has a plausibility error.

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • The sensor connected via CAN sends a Failure Mode Identifier
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• The system recovers when a normal signal is detected with the starter switch in the ON position.
System reaction		• None
		• None
Failure cause		• Sensor defective or short circuit to ground.
Failure repair		• Replace DEF tank.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 128: Status of component 'DEF heating element'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520698-0: Component 'DEF Concentration sensor' has a plausibility error. (EXCESS TEMPERATURE)

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • The difference of Environmental temperature - tank temperature exceeds 49.96°C {122°F}.
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• The difference of Environmental temperature - tank temperature is below 49.96°C {122°F}.
System reaction		• None
		• None
Failure cause		• Inaccurate or defective tank temperature sensor (drifted high).
Failure repair		• Check if sensor is mounted correctly. • Check plausibility of DEF Tank temperature by comparing to known temperature (e.g after long stand still temperature must be similar to ambient temperature). • If not ok replace DEF tank.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 128: Status of component 'DEF heating element'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520699-1: Component 'DEF Concentration sensor' has a plausibility error. (Undertemperature)

Generation condition		[Test Condition] • Continuously
		[Fault Detection] • The difference of Environmental temperature - tank temperature is below -30.04°C {86°F}.
		[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing		• The difference of Environmental temperature - tank temperature exceeds -30.04°C {86°F}.
System reaction		• None
		• None
Failure cause		• Inaccurate or defective tank temperature sensor (drifted low).
Failure repair		• Check if sensor is mounted correctly. • Check plausibility of DEF Tank temperature by comparing to known temperature (e.g after long stand still temperature must be similar to ambient temperature). • If not ok replace DEF tank.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 128: Status of component 'DEF heating element'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #773 Inspection of DEF heater power unit
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520700-31: The signal of component 'DEF Temperature sensor' is invalid.

Generation condition	[Test Condition] • Continuously
	[Fault Detection] • The sensor connected via CAN sends an invalid Failure Mode Identifier
	[Defect Debouncing] • Defect condition fulfilled continuously >0.2s
Fault healing	• The system recovers when a normal signal is detected with the starter switch in the ON position.
System reaction	• None
	• None
Failure cause	• The sensor is sending a Failure Mode Identifier not forseen by the specification. • Sensor type not matching ECU software configuration. • This monitor is particularly relevant during development phase when different sensor types are checked.
Failure repair	• DEF tank should be replaced with another of correct type conform to ECU software specification.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)	• 128: Status of component 'DEF heating element'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)	• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)	• #773 Inspection of DEF heater power unit

Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520703-31: Component 'DEF Concentration sensor' has a plausibility error.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun. • Continuous if not inhibited by another failure.
		[Fault Detection] • DEF quality sensor reports a system error.
		[Defect Debouncing] • Defect condition fulfilled continuously > 0.2s
Fault healing		• No Healing possible (disabled by Data set).
System reaction		• None
		• None
Failure cause		• DEF quality sensor defective.
Failure repair		• Replace DEF tank.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF Quality sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520707-0: The component 'DEF Concentration sensor' has received the CAN message 'EXCESS TEMPERATURE'.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun. • Continuous, if not inhibited by another failure.
		[Fault Detection] • DEF quality sensor reports a Signal Range Check High error status for its temperature sensor.
		[Defect Debouncing] • Defect condition fulfilled continuously
Fault healing		• No Healing possible (disabled by Data set).
System reaction		• None
		• None
Failure cause		• Temperature sensor inside DEF quality sensor defective.
Failure repair		• Replace DEF tank.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 013: Temperature at component 'DEF tank'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF Quality sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520708-1: The component 'DEF Concentration sensor' has received the CAN message 'Undertemperature'.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun. • Continuous, if not inhibited by another failure.
		[Fault Detection] • DEF quality sensor reports a Signal Range Check Low error status for its temperature sensor.
		[Defect Debouncing] • Defect condition fulfilled continuously > 0.2s
Fault healing		• No Healing possible (disabled by Data set).
System reaction		• None
		• None
Failure cause		• Temperature sensor inside DEF quality sensor defective.
Failure repair		• Replace DEF tank.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 013: Temperature at component 'DEF tank'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF Quality sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520709-31: Component 'DEF Concentration sensor' has a plausibility error.

Generation condition		[Test Condition] • Monitoring is active 2s after ECU initialization while engine isn't running yet, while the engine isn't cranking, 2s after engine startup, while the battery voltage is over 9V, as long as the battery voltage is over 9V and 2s after this threshold has been exceeded and if the ECU is not in afterrun. • Continuous, if not inhibited by another failure.
		[Fault Detection] • DEF quality sensor reports a system error status for its temperature sensor.
		[Defect Debouncing] • Defect condition fulfilled continuously > 0.2s
Fault healing		• No Healing possible (disabled by Data set).
System reaction		• None
		• None
Failure cause		• Temperature sensor inside DEF quality sensor defective.
Failure repair		• Replace DEF tank.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None

Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF Quality sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

520711-31: The DEF concentration is not OK.

Generation condition		[Test Condition] • Following conditions must be fulfilled: Monitor not inhibited by another failure, Battery voltage within 9V and 16V, DEF tank level > 1%, DEF tank temperature within -5.04°C {23°F} and 54.96°C {131°F} and Defrost state reached
		[Fault Detection] • Reducing agent concentration is outside the limits of 28.75% and 36.25%
		[Defect Debouncing] • Defect condition fulfilled continuously >600 s
Fault healing		• No Healing possible
System reaction		• None
		• None
Failure cause		• Reducing agent concentration outside accepted range
Failure repair		• Check DEF tank content • Replace fluid if necessary
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If the DEF quality is inadequate, replace DEF.

520712-31: The DEF concentration is not OK.

Generation condition		[Test Condition] • Only if a concentration or a conductivity out of range has been detected. • Following conditions must be fulfilled: Monitor not inhibited by another failure, Battery voltage within 9V and 16V, DEF tank level > 1%, DEF tank temperature within -5.04°C {23°F} and 54.96°C {131°F} and Defrost state reached
		[Fault Detection] • A concentration or conductivity out of range has been detected and the liquid was classified as Diesel or reductant type
		[Defect Debouncing] • Defect condition fulfilled continuously >600s
Fault healing		• No Healing possible
System reaction		• None
		• None
Failure cause		• Critical substance instead of reagent was detected (diesel or other fluid potentially destructive).
Failure repair		• Replace reagent.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• None

Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• None
Inspection procedure	Step1	If the DEF quality is inadequate, replace DEF.

520714-31: Faulty component 'DEF Concentration sensor' (The temperature deviation is too high.)

Generation condition		[Test Condition] • Engine off time is above a threshold of 5h • The engine off time data is valid is set • CAN delay time is over is set • Monitor not inhibited by another failure
		[Fault Detection] • The difference between DEF tank temperature and sensor temperature > 20°C {68°F}
		[Defect Debouncing] • Immediate
Fault healing		• At next start if temperature is in range
System reaction		• None
		• None
Failure cause		• Quality Sensor not mounted in the DEV circuit, possible tampering.
Failure repair		• Check sensor mounting, check temperature measured value both on tank and sensor.
Reference service data (See later section 2. FUSO Diagnostics Service Data (Actual values).)		• 013: Temperature at component 'DEF tank'
Reference actuator test (See later section 3. FUSO Diagnostics Actuator Test (Actuations).)		• None
Reference inspection of electrical equipment (See Gr54-11 INSPECTION OF ELECTRICAL EQUIPMENT.)		• #252 Inspection of DEF Quality sensor
Inspection procedure	Step1	Check sequence of fault causes listed above, determine faulty components and repair or replace if necessary.

2. FUSO Diagnostics Service Data (Actual values)

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.

2.1 Diagnostics service data (List the service data that is added by the software update of the engine electronic control unit)

[Current value group: Air mass]

No.	Description	Value	Explanation
180	Status 'Sensor drift of component 'Air mass flow rate / Intake air temperature sensor''	■■■■	Analytical data for MFTBC. [Related parts] • Air flow and intake air temperature sensor

[Current value group: EGR]

No.	Description	Value	Explanation
184	Dew point of component 'NH3 Sensor'	Preparation for test/ READY	The actual value is determined from NH3 Sensor. • Preparation for test: Sensor not active (before dew point completion). • READY: Sensor active (dew point ready). [Related parts] • NH3 Sensor
185	Dew point of component 'NOx sensor 2'	Preparation for test/ READY	The actual value is determined from NOx sensor 2. • Preparation for test: Sensor not active (before dew point completion). • READY: Sensor active (dew point ready). [Related parts] • NOx sensor 2
186	Dew point of component 'NOx sensor 1'	Preparation for test/ READY	The actual value is determined from NOx sensor 1. • Preparation for test: Sensor not active (before dew point completion). • READY: Sensor active (dew point ready). [Related parts] • NOx sensor 1
189	Crankcase ventilation system Pressure line Learned value	■■■■kPa	Learnings of crankcase ventilation system pressure line will be indicated. [Related parts] • Blow-by pressure sensor 2
190	Pressure in crankcase Learned value	■■■■kPa	Learnings of crankcase pressure line will be indicated. [Related parts] • Blow-by pressure sensor 1
191	NH3 concentration value	■■■■ppm	NH3 density is indicated. [Related parts] • NH3 Sensor

[Current value group: Engine oil]

No.	Description	Value	Explanation
192	Status "Engine oil"	CHECKED/ NOT CHECKED	The actual value is registered by component. CHECKED: Oil level is evaluated. NOT CHECKED: Oil level is not evaluated (Due to short engine stand still time etc). [Related parts] • Engine electronic control unit • Engine oil level sensor
193	Oil level	LOW/ VERY HIGH	Oil level is indicated. • LOW: Engine oil level is low. • VELY HIGH: Engine oil level is high. [Related parts] • Engine oil level sensor

[Current value group: BlueTec®]

No.	Description	Value	Explanation
194	DEF Concentration	■■■■%	DEF (diesel exhaust fluid) concentration will be indicated. • Standard value: 27.5 to 37.5%. [Related parts] • DEF quality sensor • DEF tank

2.2 Diagnostics service data

[Current value group: Temperature values]

No.	Description	Value	Explanation
000	Temperature at component 'EGR cooler outlet temperature sensor'	■■■■°F	EGR (exhaust gas recirculation) gas temperature (downstream of EGR cooler) from EGR cooler outlet temperature sensor is indicated. • Ignition ON (in cold engine): At ambient temperature [Related parts] • EGR cooler outlet temperature sensor
001	Temperature at component 'Charge air outlet temperature sensor'	■■■■°F	Intake air temperature (downstream of intercooler) from Intercooler outlet temperature sensor is indicated. • Ignition ON (in cold engine): At ambient temperature [Related parts] • Intercooler outlet temperature sensor
002	Temperature at component 'Boost pressure / Temperature sensor'	■■■■°F	Intake air temperatures detected by boost pressure and boost temperature sensor will be indicated. • Ignition ON (in cold engine): At ambient temperature [Related parts] • Boost pressure and and temperature sensor
003	Temperature at component 'Air mass flow rate / Intake air temperature sensor'	■■■■°F	Intake air temperatures detected by air flow and intake air temperature sensor will be indicated. • Ignition ON (in cold engine): At ambient temperature [Related parts] • Air flow and intake air temperature sensor
005	Temperature in component ‘Diesel oxidation catalytic converter’	■■■■°F	Internal temperature of oxidation catalyst before diesel particulate filter calculated by engine electronic control unit will be indicated. • During parked diesel particulate filter regeneration : About 600°C [Related parts] • Exhaust gas temperature sensor 1 • Engine electronic control unit
006	Temperature in component ‘DPF’	■■■■°F	Internal temperature of diesel particulate filter calculated by engine electronic control unit will be indicated. • During parked diesel particulate filter regeneration : About 600°C [Related parts] • Exhaust gas temperature sensor 2 • Engine electronic control unit
007	Exhaust temperature upstream of diesel oxidation catalytic converter	■■■■°F	Exhaust gas temperature upstream of pre-diesel particulate filter oxidation catalyst from exhaust gas temperature sensor 1 is indicated. • Ignition ON (in cold engine): At ambient temperature [Related parts] • Exhaust gas temperature sensor 1
008	Exhaust temperature upstream of diesel particulate filter	■■■■°F	Exhaust gas temperatures measured on up-stream side of diesel particulate filter by exhaust temperature sensor 2 will be indicated. • Ignition ON (in cold engine): At ambient temperature [Related parts] • Exhaust gas temperature sensor 2

No.	Description	Value	Explanation
009	Fuel temperature	■■■■°F	Fuel temperatures detected by fuel temperature sensor will be indicated. • Ignition ON (in cold engine): At ambient temperature [Related parts] • Fuel temperature sensor
010	Temperature at component 'Lambda control tester'	■■■■°F	Exhaust gas temperatures detected by O_2 sensor (lambda sensor) will be indicated. • Before heating: 604°C {1119°F} • In operation: 815°C {1499°F} [Related parts] • Lambda sensor
011	Temperature at component ‘SCR catalytic converter (BACK)’	■■■■°F	Exhaust gas temperatures downstream of SCR oxidation catalyst from SCR temperature sensor 2 is indicated. • Ignition ON (in cold engine): At ambient temperature [Related parts] • SCR temperature sensor 2
012	Temperature at component ‘SCR catalytic converter (FORWARD)’	■■■■°F	Exhaust gas temperatures upstream of SCR oxidation catalyst from SCR temperature sensor 1 is indicated. • Ignition ON (in cold engine): At ambient temperature [Related parts] • SCR temperature sensor 1
013	Temperature at component ‘DEF tank’	■■■■°F	Temperature of diesel exhaust fluid in DEF tank from DEF quality sensor and DEF level sensor is indicated. • Ignition ON (in cold engine): At ambient temperature [Related parts] • DEF quality sensor • DEF level sensor
014	Temperature at component ‘Combustion engine Control unit’	■■■■°F	Internal temperatures of engine electronic control unit will be indicated. • Ignition ON (in cold engine): At ambient temperature [Related parts] • Engine electronic control unit
015	Ambient temperature	■■■■°F	Intake air temperature (equivalent to ambient temperature) from humidity and intake air temperature sensor is indicated. • Ignition ON (in cold engine): At ambient temperature [Related parts] • Humidity and intake air temperature sensor
016	Coolant temperature	■■■■°F	Engine coolant temperatures detected by water temperature sensor will be indicated. • Standard: 95°C or less <Except cold regions> [Related parts] • Water temperature sensor

[Current value group: Pressure values]

No.	Description	Value	Explanation
017	Boost pressure	■■■■kPa	Signal voltage detected by boost pressure sensor section of boost pressure and temperature sensor will be indicated. • During idling: At atmospheric pressure [Related parts] • Boost pressure and temperature sensor
018	Pressure of component 'Crankcase pressure sensor 1'	■■■■kPa	Crankcase internal pressure from blow-by pressure sensor 1 is indicated. • During idling: -0.5kPa or less [Related parts] • Blow-by pressure sensor 1

No.	Description	Value	Explanation
019	Pressure of component 'Crankcase pressure sensor 2'	■■■■kPa	Blow-by gas pressure from blow-by pressure sensor 2 is indicated. • During idling: -0.5kPa or less [Related parts] • Blow-by pressure sensor 2
020	Pressure differential in diesel particulate filter (Correction values)	■■■■kPa	Differential pressure of diesel particulate filter calculated by engine electronic control unit will be indicated. [Related parts] • Diesel particulate filter differential pressure sensor • Engine electronic control unit
021	Pressure differential in diesel particulate filter	■■■■kPa	Differential pressure across diesel particulate filter detected by diesel particulate filter differential pressure sensor will be indicated. [Related parts] • Diesel particulate filter differential pressure sensor
022	Pressure differential of component 'DPF'	■■■■kPa	Pressure difference between upstream side of oxidation catalyst before diesel particulate filter and downstream side of diesel particulate filter detected by diesel particulate filter differential sensor will be indicated. [Related parts] • Diesel particulate filter differential pressure sensor
023	Engine oil pressure	■■■■kPa	Engine oil pressure detected by engine oil pressure switch will be indicated. • Ignition ON: 0kPa • Engine running: 1000kPa [Related parts] • Oil pressure switch
024	Boost pressure (Specified value)	■■■■kPa	Target value of turbocharger boost pressure calculated by engine electronic control unit will be indicated. • During idling: At atmospheric pressure [Related parts] • Engine electronic control unit
025	Rail pressure	■■■■kPa	Actual measurements of common rail pressure taken by common rail pressure sensor will be indicated. [Related parts] • Pressure sensor
026	Pressure of component ‘DEF delivery pump’	■■■■kPa	Diesel exhaust fluid pressure in DEF pump unit from DEF pressure sensor is indicated. To make the pressure to the specified value of 500 kPa, set the exhaust temperature to 110°C {230°F}or higher. [Related parts] DEF pressure sensor
027	Ambient pressure	■■■■kPa	Atmospheric pressure will be indicated. [Related parts] • Atmospheric pressure sensor (built in engine electronic control unit)
028	Boost pressure (Differential pressure)	■■■■kPa	Deviation of actual value from target value for turbocharger boost pressure will be indicated. [Related parts] • Boost pressure and temperature sensor
029	Rail pressure (Differential pressure)	■■■■kPa	Deviation of actual value from target value for common rail pressure will be indicated. [Related parts] • Pressure sensor
030	Rail pressure (specified value)	■■■■kPa	Pressure demanded by pressure regulation valve will be indicated. [Related parts] • Pressure sensor

[Current value group: Voltage values]

No.	Description	Value	Explanation
031	Battery voltage	■■■■V	Battery voltage will be indicated. • Standard value: 8 to 15V [Related parts] • Battery • Signal detect and actuation modules
032	Operating state of component 'Lambda control tester' (Heater ON)	■■■■%	Signals (duty values) used to operate heater of O_2 sensor (lambda sensor) will be indicated. • Heater warms up the value of the lambda sensor is increased. If there is no variation in the value of the defect or sensor heater is not warmed might have occurred. [Related parts] • Lambda sensor
033	Signal voltage from pressure sensor of component 'Boost pressure / Temperature sensor'	■■■■V	Signal voltage detected by boost pressure sensing section of boost pressure and temperature sensor will be indicated. [Related parts] • Boost pressure and temperature sensor
034	Signal voltage of component 'Air mass flow rate / Intake air temperature sensor' (Temperature sensors)	■■■■V	Signal voltage detected by intake air temperature sensing section of airflow and intake air temperature sensor will be indicated. [Related parts] • Air flow and intake air temperature sensor
035	Signal voltage of component 'Temperature sensor (Charge air temperature downstream of charge air cooler)'	■■■■V	Signal voltage from intercooler outlet temperature sensor is indicated. [Related parts] • Intercooler outlet temperature sensor
036	Signal voltage of component 'Boost pressure / Temperature sensor' (Temperature sensors)	■■■■V	Signal voltage (estimation) detected by boost pressure sensing section of boost pressure and temperature sensor will be indicated. [Related parts] • Boost pressure and temperature sensor
037	Signal voltage of component ‘Position sensor ‘Accelerator pedal’1’	■■■■V	Signal voltage output by accelerator pedal position sensor 1 will be indicated. • Standard value: 1.1 to 4.6 V [Related parts] • Accelerator pedal position sensor 1
038	Signal voltage of component ‘Position sensor ‘Accelerator pedal’2’	■■■■V	Signal voltage output by accelerator pedal position sensor 2 will be indicated. (Output characteristic of accelerator pedal position sensor 2 is different from that of sensor 1.) • Standard value:0.5 to 2.35 V [Related parts] • Accelerator pedal position sensor 2
039	Signal voltage of component ‘Atmospheric pressure sensor’	■■■■V	Signal voltage from atmospheric pressure sensor (built in engine electronic control unit) will be indicated. [Related parts] • Atmospheric pressure sensor (built in engine electronic control unit)
040	Signal voltage of component 'Intake air temperature / Air humidity sensor' (Temperature sensors)	■■■■V	Signal voltage from intake air temperature (equivalent to ambient temperature) sensing section of humidity and intake air temperature sensor is indicated. [Related parts] • Humidity and intake air temperature sensor
041	Sensor voltage (Pressure differential in diesel particulate filter) (raw value)	■■■■V	Signal voltage (estimation) from diesel particulate filter differential pressure sensor will be indicated. [Related parts] • Diesel particulate filter differential pressure sensor

No.	Description	Value	Explanation
043	Signal voltage of component ‘Temperature sensor Exhaust system1’	■■■■V	Signal voltage (estimation) from exhaust gas temperature sensor 1 will be indicated. [Related parts] • Exhaust gas temperature sensor 1
044	Signal voltage of component 'Intake air temperature / Air humidity sensor' (Air humidity sensor)	■■■■V	Signal voltage from intake air humidity (estimation) sensing section of humidity and intake air temperature sensor is indicated. [Related parts] • Humidity and intake air temperature sensor

[Current value group: Rpm, Vehicle speed]

No.	Description	Value	Explanation
047	Engine speed	■■■■1/min	Engine speed will be indicated. • Idling speed (no load minimum speed): 650 1/min. • Idle-up: 825 to 850 1/min. • Diesel particulate filter automatic regeneration: 800 1/min. • Diesel particulate filter parked regeneration: 1500 1/min. • Actuator test “011 Regeneration of diesel particulate filter” when used: 1500 1/min. [Related parts] • Engine speed sensor
051	Transmission ratio	■■■■-	Transmission reduction ratio will be indicated. [Related parts] • DUONIC electronic control unit
052	Vehicle speed	■■■■mph	Current vehicle speed will be indicated. [Related parts] • Vehicle speed sensor

[Current value group: Air mass]

No.	Description	Value	Explanation
053	Air mass flow rate (Actual value)	■■■■mg	Total flow rate (m^3/s) of intake air detected by airflow sensor will be indicated. [Related parts] • Air flow and intake air temperature sensor
054	Air mass flow rate (Specified value)	■■■■mg	Target value of intake air volume for each cylinder will be indicated (for use in exhaust gas recirculation control). [Related parts] • Air flow and intake air temperature sensor
055	Air mass flow rate (Cylinder)	■■■■mg	Amount of air (m^3/s) taken in each cylinder during one cycle engine operation (detected by airflow sensor) will be indicated. [Related parts] • Air flow and intake air temperature sensor
056	Humidity of intake air	■■■■%	Humidity of intake air from humidity and intake air temperature sensor is indicated. • Normal: And values when the ignition key ON, the value after the engine warm-up is the same. [Related parts] • Humidity and intake air temperature sensor
057	Lambda value	■■■■-	Lambda value detected by lambda sensor will be indicated. (When confirm the service data, it is confirmed that the lambda sensor is functioning at "010 Temperature at component 'Lambda control tester'" in advance.) [Related parts] • Lambda sensor

[Current value group: Injection quantity]

No.	Description	Value	Explanation
063	Required fuel quantity for post injection	■■■■mg/hub	Demanded post-injection amount ([mg/hub] = [mg/cycle]) will be indicated. [Related parts] • Injector • Engine electronic control unit
064	Injection quantity (Adjustment value)	■■■■mg/hub	Fuel injection amount calculated based on electric current value will be indicated. • Fuel injection amount: 3.0000 to 10.0000 mg/hub [Related parts] • Injector • Engine electronic control unit
065	Injection quantity (Raw values)	■■■■mg/hub	Fuel injection amount calculated based on injector operation time will be indicated. • Fuel injection amount: 3.0000 to 10.0000 mg/hub [Related parts] • Injector • Engine electronic control unit
066	Current injection quantity	■■■■mg/hub	Current fuel injection amount will be indicated. (Checking of actual fuel injection amount is performed using this value as the fuel injection quantity (control value) and fuel injection quantity (pre-process value) are both the values calculated by engine electronic control unit.) ([mg/hub] = [mg/cycle]) • Fuel injection amount: 3.0000 to 10.0000 mg/hub [Related parts] • Injector • Engine electronic control unit
067	Fuel in engine oil	■■■■lb	Amount of fuel merged into engine oil which has been calculated by engine electronic control unit will be indicated. • Normal value: 400000mg {0.8818lb} or less [Related parts] • Engine electronic control unit
070	Correction value of fuel quantity (Cylinder 1)	■■■■mg/hub	Correction value of injection quantity of injector 1 will be indicated. • Normal: if all of actual measurements No. 70 to 73 are nearly in accordance with the standard. • Abnormal: if any one of actual measurements No. 70 to 73 deviates extremely from the standard. [Related parts] • Injector 1
071	Correction value of fuel quantity (Cylinder 3)	■■■■mg/hub	Correction value of injection quantity of injector 2 will be indicated. • Normal: if all of actual measurements No. 70 to 73 are nearly in accordance with the standard. • Abnormal: if any one of actual measurements No. 70 to 73 deviates extremely from the standard. [Related parts] • Injector 2
072	Correction value of fuel quantity (Cylinder 4)	■■■■mg/hub	Correction value of injection quantity of injector 3 will be indicated. • Normal: if all of actual measurements No. 70 to 73 are nearly in accordance with the standard. • Abnormal: if any one of actual measurements No. 70 to 73 deviates extremely from the standard. [Related parts] • Injector 3

No.	Description	Value	Explanation
073	Correction value of fuel quantity (Cylinder 2)	■■■■mg/hub	Correction value of injection quantity of injector 4 will be indicated. • Normal: if all of actual measurements No. 70 to 73 are nearly in accordance with the standard. • Abnormal: if any one of actual measurements No. 70 to 73 deviates extremely from the standard. [Related parts] • Injector 4
074	Soot content (Engine oil)	■■■■lb	Amount of soot merged into engine oil which has been calculated by engine electronic control unit will be indicated. [Related parts] • Engine electronic control unit
075	Status of component 'Relay 'Fuel pump''	ON/OFF	Whether or not electromagnetic high pressure pump is actuated by engine electronic control unit will be indicated. • ON: High pressure pump is in operation • OFF: High pressure pump is not in operation [Related parts] • High pressure pump • Engine electronic control unit
076	Specified value of component ‘Pressure regulating valve in rail’	■■■■A	Electric current value demanded by pressure regulation valve will be indicated. [Related parts] • Pressure regulation valve
077	Specified value of component 'FMU (Fuel Metering device)'	■■■■A	Electric current value demanded by pressure regulation valve will be indicated. [Related parts] • Pressure regulation valve
078	PWM signal of component 'FMU (Fuel Metering device)'	■■■■%	PWM outputs to common rail pressure control valve will be indicated. [Related parts] • Pressure regulation valve

[Current value group: Travel distance]

No.	Description	Value	Explanation
089	Main odometer reading on deactivation 1	■■■■mi	Vehicle travel distance when the vehicle was recovered from shortage of diesel exhaust fluid (SCR system-related error) is indicated. [Related parts] • Engine electronic control unit
090	Main odometer reading on deactivation 2	■■■■mi	Vehicle travel distance when the vehicle was recovered from abnormal NOx (SCR system-related error) is indicated. [Related parts] • Engine electronic control unit

[Current value group: Hours]

No.	Description	Value	Explanation
099	Time since engine start	■■■■h	Engine operating time will be indicated. [Related parts] • Engine electronic control unit
100	Measurement value of oil dilution during regeneration of diesel particulate filter	■■■■h	Oil dilution measurement time during diesel particulate filter regeneration will be indicated. • With older than 136800sec Engine electronic control unit to generate is determined that a fault diagnosis code. [Related parts] • Engine electronic control unit

[Current value group: Diesel particulate filter]

No.	Description	Value	Explanation
101	Efficiency of SCR catalytic converter (Raw values)	■■■■-	Purification efficiency (estimation) of SCR catalytic converter is indicated. [Related parts] • Engine electronic control unit
104	Ash content of diesel particulate filter	■■■■lb	Amount of ash accumulated on diesel particulate filter will be indicated. • Normal value:200g {0.4409lb} or less [Related parts] • Engine electronic control unit
105	Soot content of diesel particulate filter	■■■■lb	Amount (calculated value) of soot accumulated on inner side of diesel particulate filter will be indicated. • 15g or less: Diesel particulate filter regeneration is stopped. • More than 42g: Diesel particulate filter automatic regeneration is started. • More than 52g: Diesel particulate filter parked regeneration is possible. • More than 65g: Particulate matter (PM) is over-deposited and diagnosis code is generated. [Related parts] • Engine electronic control unit
106	Status of regeneration	Normal mode/ Automatic regeneration 1/ Automatic regeneration 2/ Automatic regeneration 3/ Emergency operation mode/ Parked regeneration 1/ Parked regeneration 2	Regeneration control condition of diesel particulate filter will be indicated. • Normal mode: Normal mode • Automatic regeneration 1: Diesel particulate filter automatic regeneration without post-injection • Automatic regeneration 2: Diesel particulate filter automatic regeneration with post-injection (automatically controlled) • Automatic regeneration 3: Diesel particulate filter automatic regeneration with post-injection (controlled by governor) • (Emergency mode): Emergent operation mode with diesel particulate filter loaded with excessive amount of accumulation (without exhaust gas recirculation) • Parked regeneration: Parked regeneration 1: Parked diesel particulate filter regeneration (not accompanied by post-injection) • Parked regeneration: Parked regeneration 2: Parked diesel particulate filter regeneration (followed by post-injection and controlled by governor) [Related parts] • Engine electronic control unit

[Current value group: EGR]

No.	Description	Value	Explanation
107	Position of exhaust gas recirculation controller (raw value)	■■■■%	Exhaust gas recirculate actuator opening (target value) of the engine electronic control unit has requested will be indicated. [Related parts] • Exhaust gas recirculation actuator
108	NOx values (Raw values)	■■■■ppm	NOx density (non-processed value) is indicated. [Related parts] • Nox sensor
111	Position of component 'Engine brake Solenoid valve'	■■■■%	Exhaust brake valve position will be indicated. (A value exceeding 90% will be indicated because of operation of engine brake.) [Related parts] • Exhaust brake valve

No.	Description	Value	Explanation
112	Smoke limit	■■■■ mg/hub	Fuel injection limitation amount for smoke reduction will be indicated. [Related parts] • Engine electronic control unit
113	Exhaust gas volume flow rate	■■■■ m^3/s	Calculated exhaust volume flow rate (m^3/s) inside particulate filter will be indicated. [Related parts] • Engine electronic control unit
114	Position of exhaust gas recirculation positioner (actual value)	■■■■ %	Exhaust gas recirculate actuator opening (actual value) will be indicated. Actuator opening: 5.000 to 95.00% [Related parts] • Exhaust gas recirculate actuator
115	NOx values	■■■■ ppm	NOx density from NOx sensor is indicated. • Immediately after the start of the engine and sensor heated before : 5000ppm (A numerical value indicating the behavior of the sensor, is not a standard value of the NOx concentration) [Related parts] • Nox sensor
116	Fill level of NOx storage catalytic converter (NH3)	■■■■ lb	Estimated amount of ammonia (NH_3) inside catalytic converter will be indicated. [Related parts] • Engine electronic control unit
118	Status of component 'Lambda control tester'	Activation/ NOT ACTIVATED	Operation status of O_2 sensor (lambda sensor) will be indicated. • Activation: Sensor unit activation. • NOT ACTIVATED: Sensor unit not activated. [Related parts] • Lambda sensor

[Current value group: Turbocharger]

No.	Description	Value	Explanation
121	PWM signal of component ‘Actuator in turbocharger’	■■■■ %	Driving opening of turbocharger vacuum modulator will be indicated. • Driving opening: 5.000 to 95.00% [Related parts] • Vacuum modulator

[Current value group: Urea values]

No.	Description	Value	Explanation
122	Current DEF metering quantity	■■■■ g/s	Measured value of diesel exhaust fluid dosing rate is indicated. [Related parts] • DEF pump unit • DEF dosing module • Engine electronic control unit
123	Requested DEF metering amount	■■■■ g/s	Target value of diesel exhaust fluid dosing rate is indicated. [Related parts] • Engine electronic control unit
124	Total DEF consumption	■■■■ lb	Amount of DEF (diesel exhaust fluid) is indicated. [Related parts] • Engine electronic control unit
125	Fill level of DEF tank	■■■■ %	Fluid level in DEF tank is indicated. • 100%: Fill-up • 0%: Empty [Related parts] • DEF level sensor

No.	Description	Value	Explanation
126	Status of DEF fill level	OK/NG	Whether DEF (diesel exhaust fluid) in DEF tank has been replaced or not is indicated. • NG: DEF (diesel exhaust fluid) is not fill-up. • OK: DEF (diesel exhaust fluid) is fill-up. [Related parts] • DEF level sensor • Engine electronic control unit
128	Status of component 'DEF heating element'	ON/OFF	Operating status of DEF line heater system will be indicated. • ON: Actuation • OFF: Non-actuation [Related parts] • DEF line heater
129	Status of component 'Heating element of DEF tank'	ON/OFF	Operating status of DEF pump unit heater is indicated. • ON: DEF pump heater is in operation. • OFF: DEF pump heater is not in operation. [Related parts] • DEF pump unit
130	DEF Delivery pump Electric motor (Specified value)	■■■■%	Target value of DEF pump unit motor is indicated. [Related parts] • DEF pump unit • Engine electronic control unit
131	DEF Delivery pump Electric motor (Measured value)	■■■■%	Measured value of DEF pump unit motor is indicated. [Related parts] • DEF pump unit
132	Status of component 'DEF Reverting valve' (Input signal)	ON/OFF	Operation status of inlet side of DEF reverting valve is indicated. • Inlet side of DEF reverting valve is in operation. • Inlet side of DEF reverting valve is not in operation. [Related parts] • DEF reverting valve
133	Status of component 'DEF Reverting valve' (Output signal)	ON/OFF	Operation status of outlet side of DEF reverting valve is indicated. • Outlet side of DEF reverting valve is in operation. • Outlet side of DEF reverting valve is not in operation. [Related parts] • DEF reverting valve
134	Status of component 'DEF level sensor'	■■■■%	DEF (diesel exhaust fluid) level in DEF tank is indicated. • Sensor failure: less than 45% [Related parts] • DEF level sensor
135	Status of oxygen sensor heater	ON/OFF	Operation status of lambda sensor heater will be indicated. • ON: Lambda sensor heater is in operation • OFF: Lambda sensor heater is not in operation [Related parts] • Lambda sensor

No.	Description	Value	Explanation
136	Status of DEF metering	■■■■	Operation status of SCR control is indicated. • 00 00: Water temperature before correction detected • 01 A8: SCR catalyst temperature too low / NOx sensor faulty / Addition of DEF (diesel exhaust fluid) not allowed (preparatory works not completed) • 21 8A: Water temperature too low / SCR catalyst temperature too low (at downstream side) / NOx sensor faulty / Addition of DEF (diesel exhaust fluid) not allowed (preparatory works not completed) / BlueTec® system monitoring stopped • 42 00: Diesel particulate filter regeneration requested • 62 00: Diesel particulate filter regeneration requested / BlueTec® system monitoring stopped • 01 AA: Water temperature too low / SCR catalyst temperature too low (at downstream side) / NOx sensor faulty / Addition of DEF (diesel exhaust fluid) not allowed (preparatory works not completed) • 21 AA: Water temperature too low / SCR catalyst temperature too low (at downstream side) / NOx sensor faulty / Addition of DEF (diesel exhaust fluid) not allowed (preparatory works not completed) / BlueTec® system monitoring stopped • 20 A8: SCR catalyst temperature too low (at downstream side) / SCR catalyst function deteriorated / NOx sensor faulty / BlueTec® system monitoring stopped • 20 00: BlueTec® system monitoring stopped • [Related parts] • Engine electronic control unit

[Current value group: Engine brake]

No.	Description	Value	Explanation
137	Engine brake Switches	ON/OFF	Status of exhaust brake switch will be indicated. • OFF: Exhaust brake deactivated • ON: Exhaust brake activated [Related parts] • Combination switch (exhaust brake switch) • Signal detect and actuation modules
138	Engine Brake	ON/OFF	Current status of engine brake will be indicated. • OFF: Engine brake deactivated • ON: Engine brake activated [Related parts] • Combination switch (exhaust brake switch) • Exhaust brake valve • Signal detect and actuation modules
139	Parking brake	ON/OFF	Status of parking brake will be indicated. • Parking brake applied: ON • Parking brake not applied: OFF [Related parts] • Parking brake switch • Signal detect and actuation modules
140	Position of brake pedal	ON/OFF	Status of brake switch will be indicated. • ON: Brake pedal is operated. • OFF: Brake pedal is not operated. [Related parts] • Stop lamp switch • Signal detect and actuation modules

No.	Description	Value	Explanation
141	Status of engine brake (Switching off)	ON/OFF	Input signal of exhaust brake cut request will be indicated. • Exhaust brake cutoff requested from anti-skid brake system electronic control unit: ON • No exhaust brake cutoff request from anti-skid brake system electronic control unit: OFF [Related parts] • Hydraulic unit (electronic control unit)
142	Measurement value of component 'Status of engine brake (Switching off)'	ON/OFF	Detected value of exhaust brake cut switch will be indicated. • Exhaust brake cutoff requested from anti-skid brake system electronic control unit: ON • No exhaust brake cutoff request from anti-skid brake system electronic control unit: OFF [Related parts] • Hydraulic unit (electronic control unit)
143	Measurement value of component 'Signal of switch 'Engine brake''	ON/OFF	Status of exhaust brake switch will be indicated. • ON: Exhaust brake switch is ON. • OFF: Exhaust brake switch is OFF. [Related parts] • Combination switch (exhaust brake switch) • Signal detect and actuation modules

[Current value group: Preheating]

No.	Description	Value	Explanation
144	System status (Preglow system)	ON/OFF	Operation status of glow electronic control unit (glow plug) will be indicated. • ON: Glow plug control is valid. • OFF: Glow plug control is invalid. [Related parts] • Glow electronic control unit • Glow plug
145	Status of component 'Glow plug'	ACTIVE/ NOT ACTIVE	Status of glow plug is indicated. • ACTIVE: Glow plug power stage mode is valid. • NOT ACTIVE: Glow plug power stage mode is invalid. [Related parts] • Glow electronic control unit • Glow plug
146	Signal of component 'Glow plug' (Feedback)	ACTIVE/ NOT ACTIVE	Status of the glow plug drive feedback will be indicated. • NOT ACTIVE: No feedback received from the glow plug. • ACTIVE: Feedback received from the glow plug.

[Current value group: Status]

No.	Description	Value	Explanation
147	Oil pressure switch	ON/OFF	Status of engine oil pressure switch will be indicated. • ON: No oil pressure is applied. • OFF: Some oil pressure is applied. [Related parts] • Oil pressure switch
148	Measurement value of component 'Fill level sensor at water separator'	Water NOT PRESENT/ Water PRESENT	Value detected by water separator sensor will be indicated. [Related parts] • Fuel filter (water separator sensor)
149	Fuel filter heater	ON/OFF	Operating state of the fuel heater will be indicated. • Fuel heater is in operation: ON • Fuel heater is not in operation: OFF [Related parts] • Fuel filter (fuel heater)

No.	Description	Value	Explanation
150	Status of combustion engine	---/ OPERATIONAL/ Engine running/ Ignition ON/ ENGINE START/ ENGINE STOP/	Engine operation status will be indicated. • ---: - • OPERATIONAL: Standby state • Engine running: Engine running • Ignition ON: Starter switch ON • ENGINE START: Engine started • ENGINE STOP: Engine stopped [Related parts] • Engine electronic control unit
151	Status of function "Regeneration of diesel particulate filter"	Normal mode/ ---/	Operation mode of diesel particulate filter regeneration will be indicated. • Normal mode: Normal [Related parts] • Engine electronic control unit
152	Engine speed request	No request/ Cut-in request 1/ Cut-in request 2/ Cut-in request 3	• No request: For Idle up • Cut-in request 1: Idle up request received from hardware. • Cut-in request 2: Idle up request received from another electronic control unit via controller area network. • Cut-in request 3: Idle up request received via hardware and controller area network.
153	Accelerator pedal sensor 1 (raw value)	■■■■%	Signal value (non-corrected) from accelerator pedal position sensor 1 will be indicated. [Related parts] • Accelerator pedal position sensor 1
154	Accelerator pedal sensor 1	■■■■%	Accelerator opening signal from accelerator pedal position sensor 1 will be indicated. Related parts] • Accelerator pedal position sensor 1
155	Neutral position	ON/OFF	Whether neutral position is selected or not will be indicated. • ON: The transmission is in neutral. • OFF: The transmission is not in neutral. [Related parts] • DUONIC electronic control unit <DUONIC®>
156	Actual gear	■■■■-	Selected gear will be indicated. • 0-: P or N • 1-: 1st • 2-: 2nd • -1-: R [Related parts] • DUONIC electronic control unit <DUONIC®>
157	Status of component ‘Refrigerant compressor’	ON/OFF	Operation status of air conditioner compressor will be indicated. • ON: Air conditioner compressor activated • OFF: Air conditioner compressor deactivated [Related parts] • Air conditioner electronic control unit and control panel <Full automatic air conditioner> • Heater control panel <Manual air conditioner> • Signal detect and actuation modules
158	Status of component "MIL"	DOES NOT LIGHT UP/ LIGHTS UP/ FLASHING	ON/OFF condition of engine control lamp (amber) and other conditions such as background of lamp illumination will be indicated. [Related parts] • Engine electronic control unit
159	Status of component "Indicator lamp "ENGINE STOP""	DOES NOT LIGHT UP/ LIGHTS UP/ FLASHING	ON/OFF condition of engine control lamp (red) and other conditions such as background of lamp illumination will be indicated. [Related parts] • Engine electronic control unit

No.	Description	Value	Explanation
160	Air mass flow rate Learned value 1	■■■■%	Learnings of air flow sensor (idle point) will be indicated. • 0%: Learning from sensor not executed yet [Related parts] • Air flow and intake air temperature sensor
161	Air mass flow rate Learned value 2	■■■■%	Learnings of air flow sensor (loaded point) will be indicated. • 0%: Learning from sensor not executed yet [Related parts] • Air flow and intake air temperature sensor
162	Status of air conditioning	ON/OFF	Operating status of air conditioner will be indicated. • Air conditioner is in operation: ON • Air conditioner is not in operation: OFF [Related parts] • Air conditioner electronic control unit and control panel <Full automatic air conditioner> • Heater control panel <Manual air conditioner> • Signal detect and actuation modules
164	Position of accelerator pedal (Kickdown recognition)	ON/OFF	Kickdown position of accelerator pedal (accelerator opening: 90% or more) will be indicated. [Related parts] • Accelerator pedal position sensor
165	Status of power take-off	ON/OFF	Operation status of PTO is indicated. ON: Power take-off is in operation OFF: Power take-off is not in operation [Related parts] • Power take-off control switch • Signal detect and actuation modules
167	Status of button ‘CRUISE CONTROL’	ON/OFF	Status of cruise control main switch is indicated. [Related parts] • Cruise control main switch • Engine electronic control unit
169	Status of component ‘Relay ‘Supply voltage of control module’’	ON/OFF	Whether main relay activation request from engine electronic control unit is received or not will be indicated. • ON: Main relay is in operation • OFF: Main relay is not in operation [Related parts] • Signal detect and actuation modules • Engine electronic control unit
171	Status of component 'ECU Main circuit Voltage source'	DEENERGIZED/ NORMAL	Detected status of main power supply for electronic control unit will be indicated. • DEENERGIZED: No power supplied to electronic control unit • NORMAL: Power supplied to electronic control unit [Related parts] • Engine electronic control unit
172	Status of component 'Ignition Main circuit'	Miscellaneous/Start	Detected status of power supply for ignition ON will be indicated. • Miscellaneous: Starter switch (in position except START) • Start: Starter switch (in START position) [Related parts] • Starter switch • Signal detect and actuation modules
173	Starter relay	Miscellaneous/Start	Operation status of starter relay will be indicated. • Miscellaneous: Starter switch (in position except START) • Start: Starter switch (in START position) [Related parts] • Starter relay • Engine electronic control unit • Signal detect and actuation modules

No.	Description	Value	Explanation
174	Starter relay (Control unit: Pin 91)	Miscellaneous/Start	Starter relay energization status at terminal (K91) for engine electronic control unit will be indicated. • Miscellaneous: Starter switch (in position except START) • Start: Starter switch (in START position) [Related parts] • Starter relay (for drive) • Engine electronic control unit
175	Starter relay (Control unit: Pin 69)	Miscellaneous/Start	Starter relay energization status at terminal (K69) for engine electronic control unit will be indicated. • Miscellaneous: Starter switch (in position except START) • Start: Starter switch (in START position) [Related parts] • Starter relay (for drive) • Engine electronic control unit
176	Number of engine starts	■■■■	Number of times of starter operation learned by engine electronic control unit will be indicated. [Related parts] • Engine electronic control unit • Signal detect and actuation modules

3. FUSO Diagnostics Actuator Test (Actuations)

- The contents of FUSO Diagnostics are updated to improve without any notice. When there is any difference between the FUSO Diagnostics and the workshop manual, check the latest information with the FUSO Diagnostics.

No.	Section	Explanation
000	Cold start	• Allows to actuate the “cold start” function forcibly. [Test condition] • Engine stopped • Set the starter switch to “ON” position. [Test procedure] • Start the “control” sequence. • Battery voltage will lower to the lower limit. • Finish the “control” sequence. • Battery voltage will rise to the upper limit.
001	FMU (Fuel Metering device)	• Allows to actuate the fuel metering unit forcibly. [Cautions] • Adjust the engine speed to 650 rpm (idling). • Start the “control” sequence. • The engine will stop after running for a while. • Check to confirm that no fuel leaks through the fuel metering unit. • Turn off the ignition and then turn it on again.
002	Pressure regulating valve in rail	• Allows to actuate the common rail pressure control valve forcibly. [Cautions] • Adjust the engine speed to 650 rpm (idling). • Start the “control” sequence. • The engine will stop after running for a while. • Check to confirm that no fuel leaks through the common rail pressure control valve. • Turn off the ignition and then turn it on again.
003	Injection valve	• Allows to actuate the injectors forcibly. [Test condition] • Start the engine with the vehicle stationary. • Adjust the engine speed to no-load minimum rpm (idling). • Cut off the fuel supply on each cylinder one by one. [Cautions] • Take actual measurements. • The actual measurement will fluctuate. • There will occur rough engine operations during the control process.
004	Boost pressure control 1	• Allows to activate the “boost pressure control” function forcibly while the engine is running at idle. [Test condition] • Start the engine. • Run the engine at around 650 rpm.
005	Boost pressure control 2	• Allows to activate the “boost pressure control” function forcibly while the engine is running at 2000 rpm. [Test condition] • Start the engine. • Run the engine at around 650 rpm.
006	Exhaust gas recirculation actuator	• Allows to actuate the exhaust gas recirculation control forcibly. [Test condition] • Start the engine. • Adjust the engine speed to no-load minimum rpm (idling).
007	Engine brake solenoid valve	• Allows to actuate the exhaust brake forcibly. [Test condition] • Start the engine. • Adjust the engine speed to no-load minimum rpm (idling).

No.	Section	Explanation
008	Test of DEF metering amount	• Allows to activate the diesel exhaust fluid dosing function forcibly and add 20 ± 3 g of diesel exhaust fluid at each specified period of time. • Allows to make the following tests at each specified period of time for verifying that all requirements are met. [Test condition] • Ignition ON • Engine OFF • Remove the dosing module with the DEF tube and harness connector connected. • Prepare DEF (diesel exhaust fluid) measuring instrument (beaker, etc.), and set the removed dosing module on the instrument (beaker, etc.). [Status of applicable actual measurements] Dose 20 ± 3 g of diesel exhaust fluid at the following specified periods of time with the ambient temperature kept at 20 ± 10°C {68 ± 18°F} and the DEF (diesel exhaust fluid) temperature at 20 ± 10°C {68 ± 18°F}: • Distribution test: 267 s • Distribution test: 57 s • Distribution test: 28.6 s
009	DEF Leak tester	• Allows to check for DEF (diesel exhaust fluid) leakage [Test conditions] • Ignition ON • Engine OFF [Cautions] • Start the test sequence. - DEF (diesel exhaust fluid) will be pressurized. • If any DEF (diesel exhaust fluid) leakage through BlueTec® exhaust aftertreatment device is found, perform necessary corrections and replacements. • Finish the test sequence. - DEF (diesel exhaust fluid) pressure will be reduced.
010	Emptying DEF lines	• Allows to check for diesel exhaust fluid line backflow function [Test condition] • Adjust the engine speed between 650 and 1500 rpm. • Reference value of temperature must be lower than 200°C {392°F}.
011	Regeneration of diesel particulate filter	• Allows to activate the diesel particulate filter regeneration function forcibly. [Test condition] • Start the engine. • Engine speed: Approx. 650 rpm • Following conditions should also be observed. • Coolant temperature: 60°C {140°F} or higher • Fuel temperature: Lower than 70°C {158°F} • Battery voltage: 5 V or higher • Accelerator pedal status: 90% or lower • Exhaust gas temperature (upstream of diesel particulate filter): Lower than 600°C {1112°F} • Soot accumulation in diesel particulate filter: Less than 330 g • Exhaust gas temperature (upstream of diesel particulate filter): Lower than 700°C {1292°F} • Oxidation catalyst temperature: Lower than 600°C {1112°F} • Clutch pedal: Released • Transmission: Neutral • Brake pedal: Released • Vehicle is stopped. • Engine operating condition: Normal • No diesel particulator filter-related diagnostic trouble code

4. Alteration and Reset of Coding Data in Electronic Control Unit

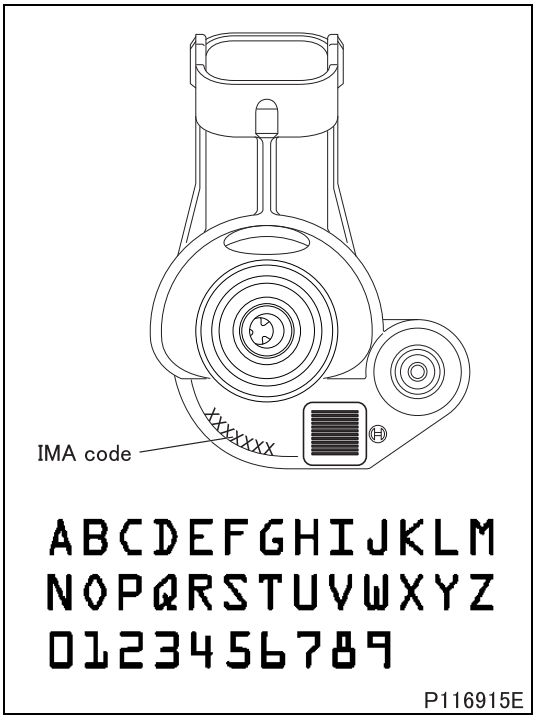
4.1 General

- In the engine electronic control unit, information such as vehicle information and equipment specifications are registered as the coding data.
- When a specified equipment is replaced, alteration of the coding data or resetting of information using the FUSO Diagnostics must be performed. Otherwise, the discrepancies between the vehicle information in the engine electronic control unit and the actual conditions may generate the engine-control-related diagnosis code(s).
- For the details of coding data rewriting and data resetting, contact the nearest Mitsubishi FUSO dealer or distributor.

(1) Replacing Engine Oil

- During vehicle life time, the engine electronic control unit counts up the quantity of post-injected fuel in order to activate and maintain regeneration.
- A least fraction of this fuel, comes into contact with lubrication oil and dissolves into it.
- The engine electronic control unit is capable to calculate the limit quantity of fuel dissolved into oil and, consequently, to suggest oil refilling.
- It is obvious that, if after engine oil refilling the function is not reset, the engine electronic control unit will keep on counting the increase of oil fraction in engine oil even with new oil and, sooner or later, groundlessly request to replace engine oil by flashing warning lamp (red).
- See Gr12, “Engine Oil Replacement in ON-VEHICLE INSPECTION AND ADJUSTMENT” for the procedure of resetting the engine oil parameter.

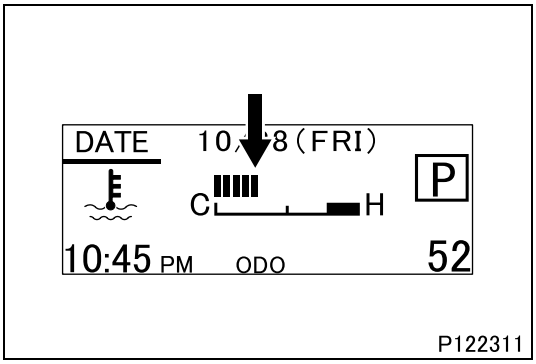
(2) Replacing Injector



- When electrical injectors mounted on the vehicle must be replaced, meet following warnings:
  - Where electrical injectors are dismounted and do not need to be replaced, their mounting position has to be noted down in order to remount them later in the same position; this is done to avoid to reprogram the engine electronic control unit;
  - After replacing one or more injectors, the engine electronic control unit has to be reprogrammed;
- Where the engine electronic control unit is replaced, reprogram the new engine electronic control unit with the IMA codes of the electrical injectors mounted on the engine and copy down the rectification coefficients of replaced engine electronic control unit;

(3) Replacing airflow and intake air temperature sensor (Re-learning procedure)

- New values should be re-learned for the air flow and intake air temperature sensor after it is replaced with a new one. Observe the following precautions when the re-learning is performed.
- Re-learning for airflow sensor shall be performed with vehicle parked. Follow the procedure shown below in the re-learning.
- Using FUSO Diagnostics, reset the learning values.
- Please note that before performing the AFS learning, be sure to take AFS reset and turn off the engine once and wait at least for 60 seconds to have the after-run finished completely before proceeding to the verification check.
- Turn off the air conditioning switch.
- Using FUSO Diagnostics, check to ensure that the learning value of the airflow sensor is “0”. (Service data No.160 [Air mass flow rate Learned value 1] and No.161 [Air mass flow rate Learned value 2])
- Run the engine until the engine cooling water temperature rises above 60°C (on meter cluster: Over 5 points).
- Wait for about 2 minutes with the engine idling.
- Keep the engine revolution to high-idling for about 15 seconds until the buzzer beeped.
- If the learning value is to be verified using FUSO Diagnostics, turn off the engine once and wait at least for 60 seconds to have the after-run finished completely before proceeding to the verification check.



4.2 Coding Data Rewriting and Initialization

- The engine electronic control unit stores various kinds of information (e.g., vehicle information, equipment specifications) as coding data.
- Always rewrite or reset the coding data of the engine electronic control unit once some change has been made in the vehicle specifications or some kind of electrical equipment has been replaced with a new one. Otherwise, it may happen that the vehicle information registered in the engine electronic control unit does not agree with that from the actual vehicle and thereby some diagnosis codes are generated.

(1) Coding Data Rewriting / Data Resetting

- For the details of coding data rewriting and data resetting, contact the nearest Mitsubishi FUSO dealer.
- The following are the items requiring the coding data rewriting or data resetting:
  - Replacement of engine electronic control unit
  - Replacement of injectors
  - Specification change of air conditioner
  - Specification change of fuel filter (fuel heater)
  - Specification change of exhaust brake
  - Specification change of power take-off
  - Replacement of boost pressure and temperature sensor
  - Replacement of airflow & intake air temperature sensor
  - Replacement of pressure regulation valve
  - Replacement of pressure sensor
  - Replacement of turbocharger
  - Replacement of vacuum modulator
  - Replacement of EGR valve
  - Replacement of lambda sensor

- Replacement of DPF differential pressure sensor
- Replacement of diesel particulate filter
- Replacement of SCR muffler
- Replacement of DEF tank
- Replacement of DEF dosing module (dosing valve)
- Replacement of engine oil
- Replacement of engine

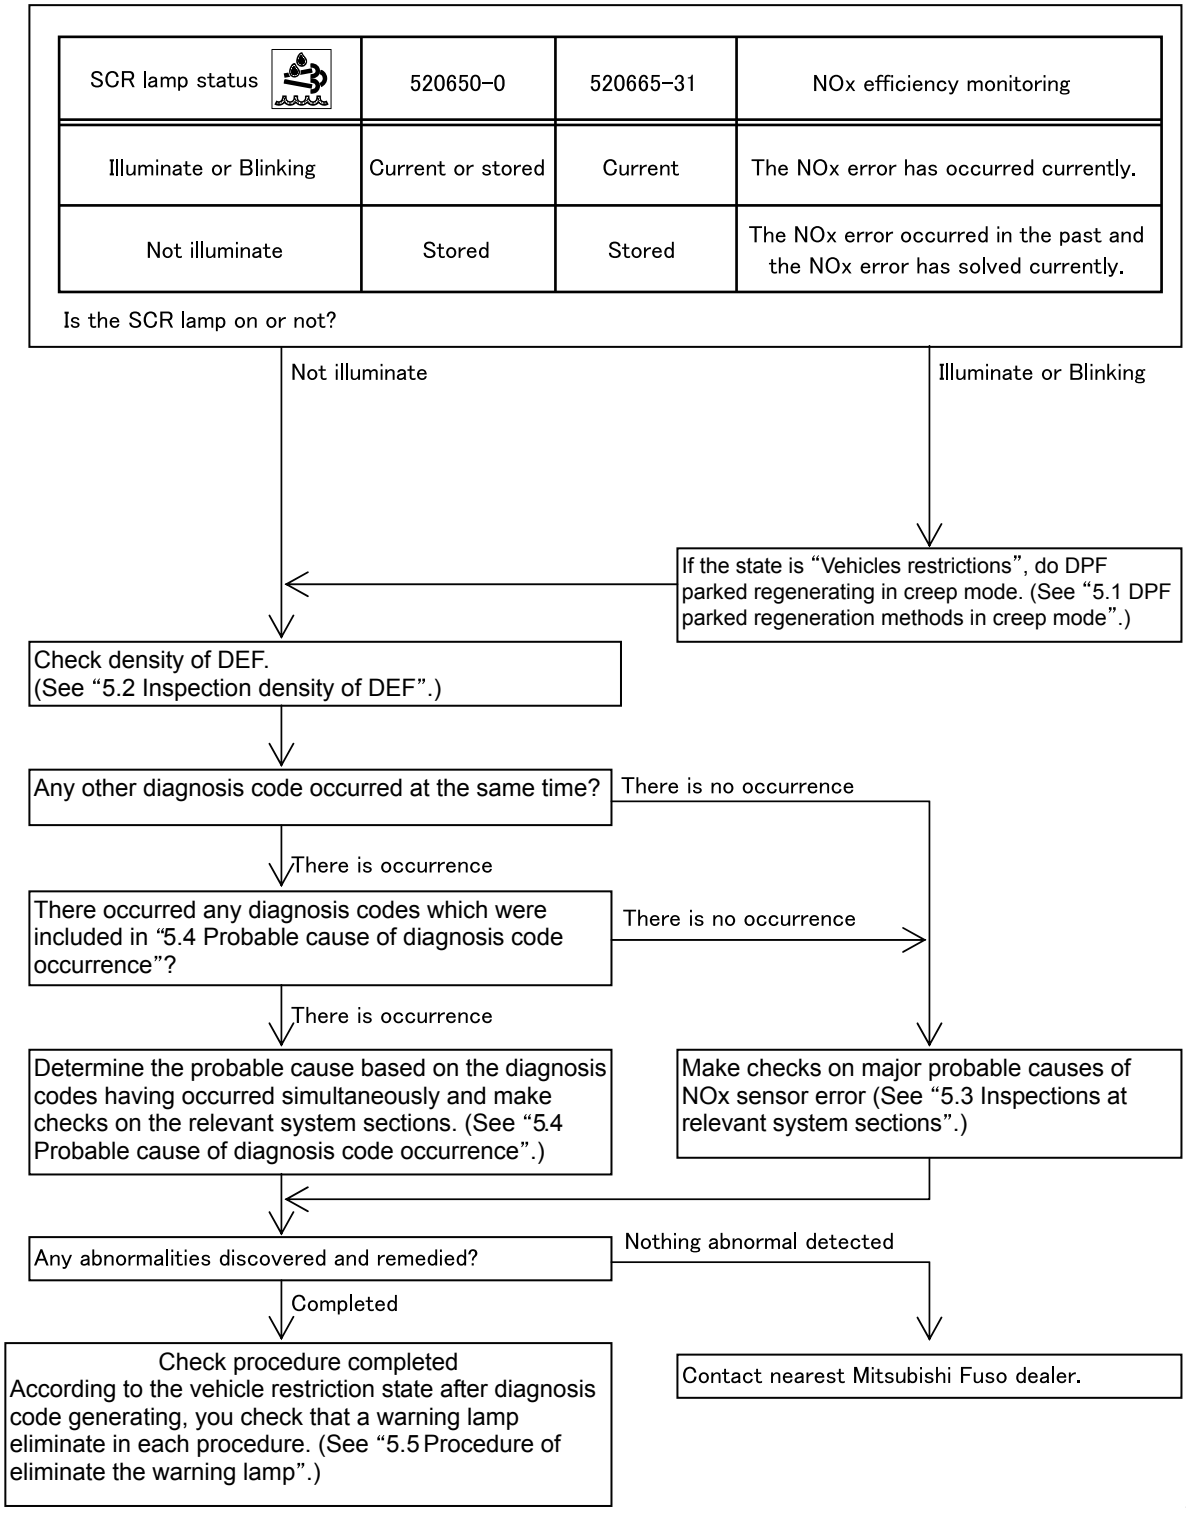
5. Inspections to be Made at NOx Error Occurrence

- When the following diagnosis code occurs, and performs troubleshooting with reference to this section.
  - (520650-0) The emission value of the NOx sensor (raw value) is too high.
  - (520665-31) Fault group: SCR 3 (Crawler mode) Function 'SCR' is faulty.

CAUTION ⚠

- **Recommended FUSO Diagnostics version: FDS-R13-1 or newer.**

SCR lamp status	520650-0	520665-31	NOx efficiency monitoring
Illuminate or Blinking	Current or stored	Current	The NOx error has occurred currently.
Not illuminate	Stored	Stored	The NOx error occurred in the past and the NOx error has solved currently.



127384E

5.1 DPF parked regeneration methods in creep mode

- If the vehicle is the state of torque and power limitation, run the engine at idle a few hours until creep mode is reached. In creep mode a parked regeneration can be started.
- Turn the starter switch to the OFF position, wait at least 60 seconds and complete the after-run.
- Turn the starter switch to the ON position and after a lapse of 10 seconds or longer, start the engine.
- Warm up the engine until the engine coolant temperature exceeds 60°C {140°F}.
- Press the Diesel Particulate Filter cleaning switch to perform the parked regeneration of Diesel Particulate Filter. In the parked regeneration, the engine speed increases to 1500 - 2500 rpm and it takes approximately 20 minutes to complete the parked regeneration.
- After that, engine revolution goes to idling and DPF manual regenerating is end.

5.2 Inspection density of DEF

- Check the DEF density in the DEF tank.

Standard value	32.5 ± 0.8%

- If the measured value exceeds a standard value, exchange the DEF to new one.

5.3 Inspections at relevant system sections

- Perform the following inspections in this order.

(1) Inspection of NOx sensor 1 and NOx sensor 2

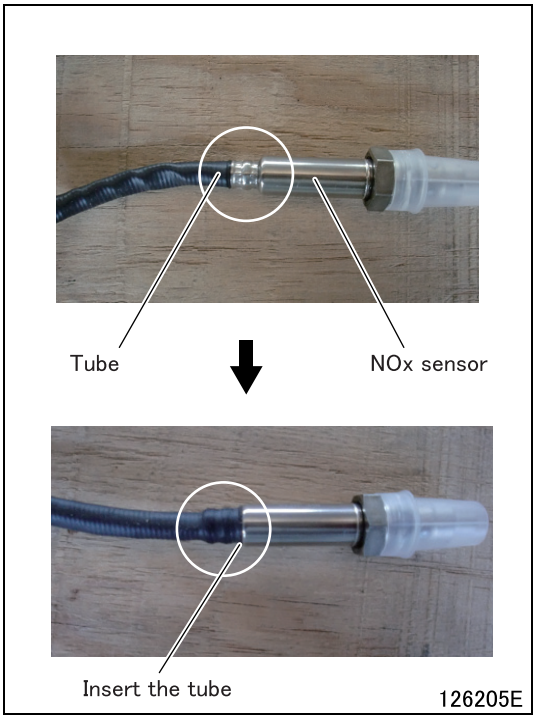
(1.1) Inspection of NOx sensor 1 and NOx sensor 2

- In case of diagnosis codes related to NOx sensor 1, replace NOx sensor 1 and delete diagnosis codes.
- In case of diagnosis codes related to NOx sensor 2, replace go through the following procedure.
- Turn on DPF parked regeneration.
- Then DPF parked regeneration check the service data (actual measurements) using FUSO Diagnostics.
- Check to confirm that the NOx sensors are active. (Service data No.115 [NOx value] of other than “-1-” are indicated.)
- Within 10 minutes, run the engine at idle to check the service data No.115 [NOx value] of FUSO diagnostics.
- If the measured value deviates from the standard value, replace the NOx sensor 2.

Service data	Standard value	Replace
No.115 [NOx value] (Downstream sensor)	Less than 200 ppm is indicated continuously	NOx sensor 2 (Downstream sensor)

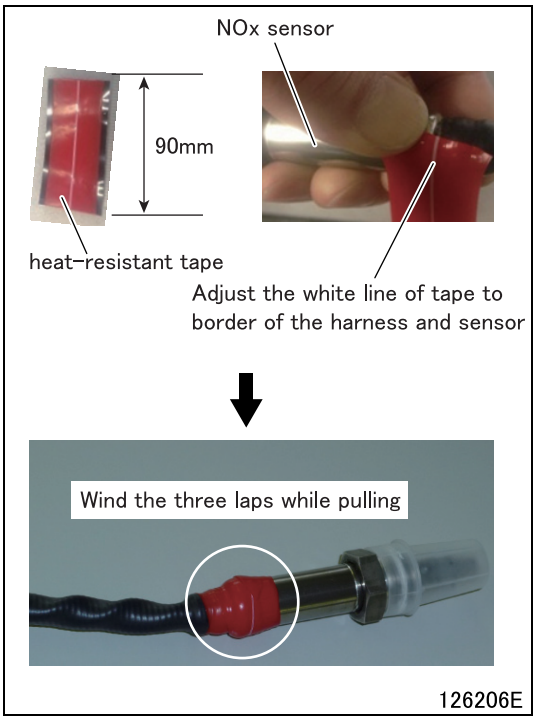
(1.2) Replacement of the NOx sensor

- Insert the tube as shown.



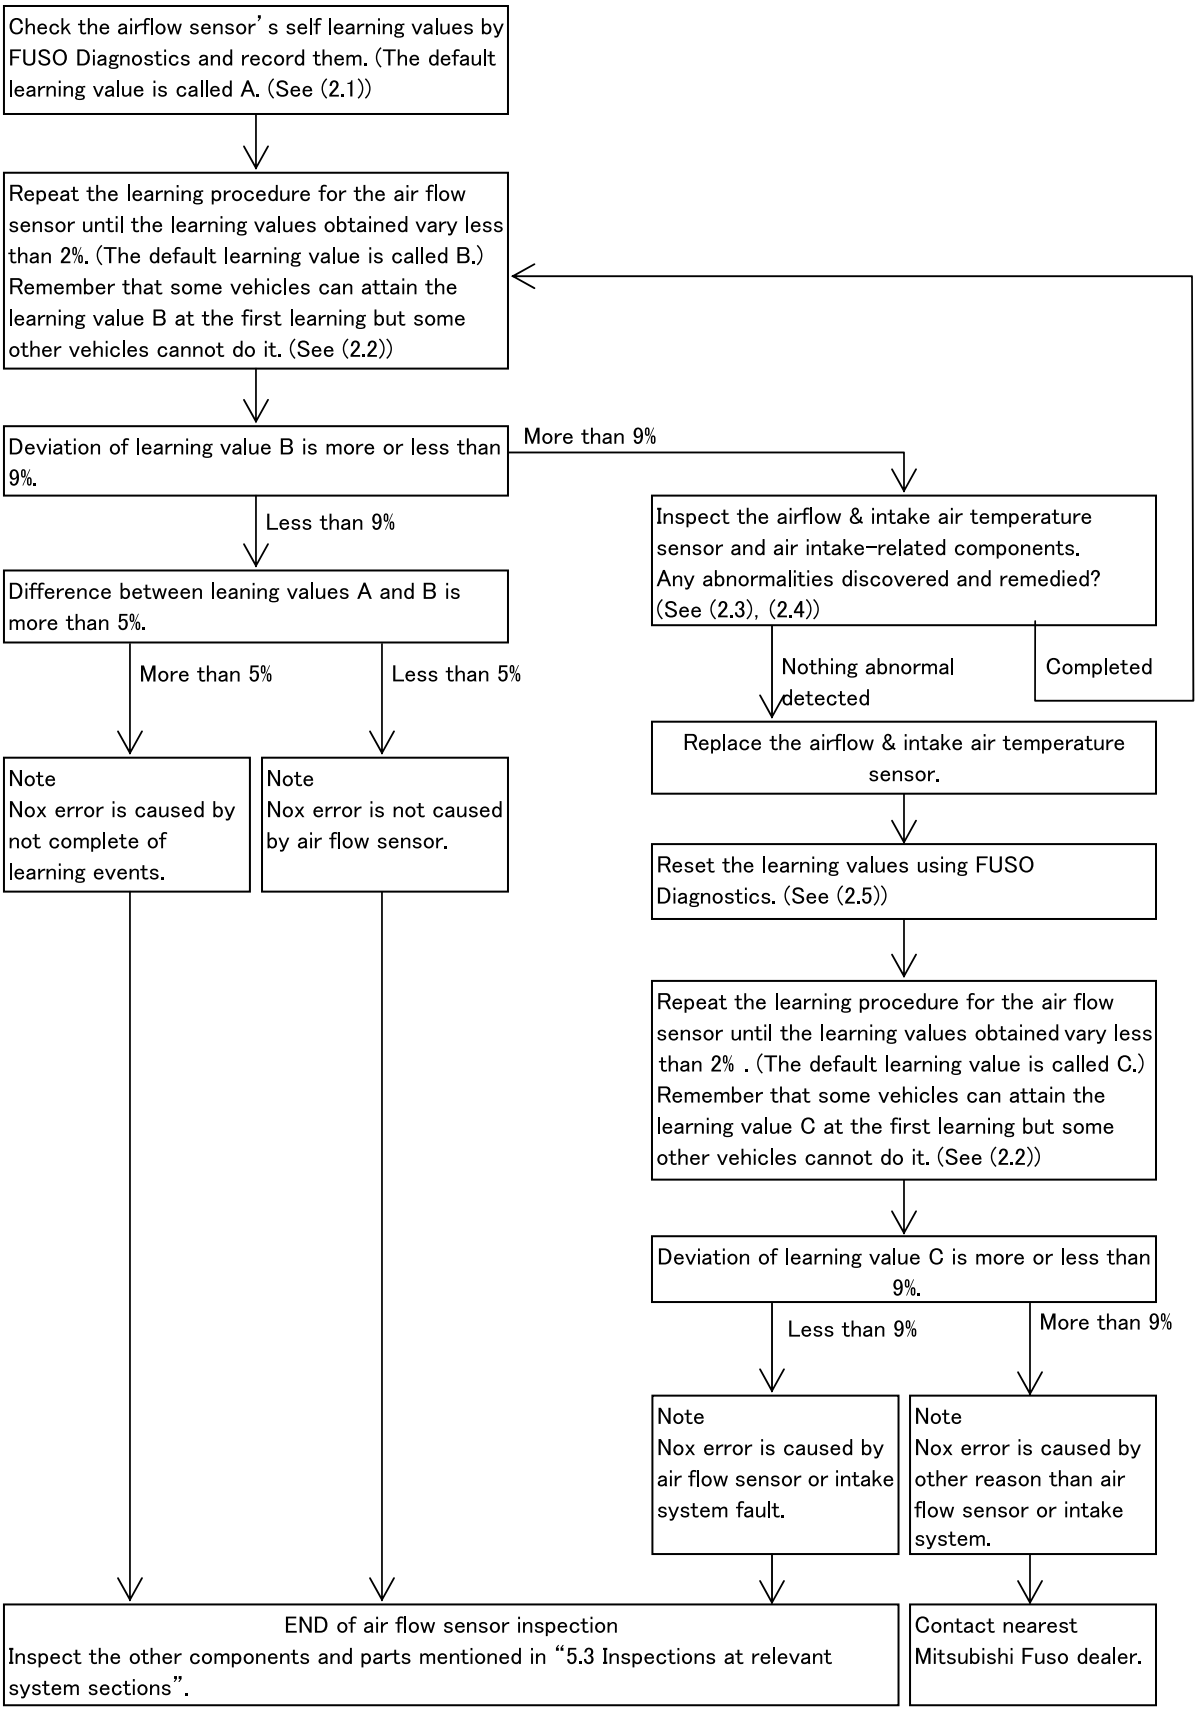
- Cut to a length of about 90 mm heat-resistant tape.
- Adjust the white line of tape to border of the harness and sensor.
- Wind the three laps while pulling.

  Heat-resistant tape: LLFA tape



(2) Inspection of air flow & intake air temperature sensor (air flow sensing section)

- Inspect the air flow & intake air temperature sensor according to the following flowchart:



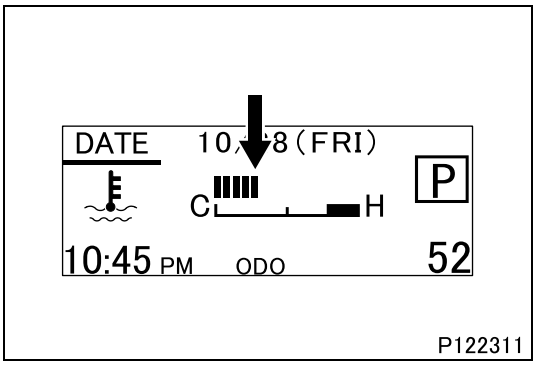
129346E

(2.1) Verification of learning value of airflow sensor

- Using FUSO Diagnostics, Check the airflow sensor self learning values and record them. (Service data No.161 [Air mass flow rate Learned value 2])

(2.2) Start re-learning to allow airflow sensor to learn new values.

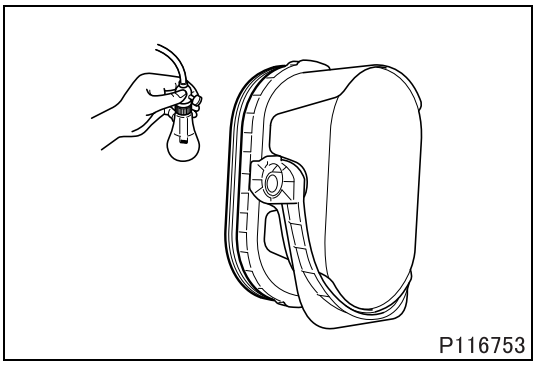
- Re-learning for airflow sensor shall be performed with vehicle parked. Follow the procedure shown below in the re-learning.
- Using FUSO Diagnostics, reset the learning values.
- Please note that before performing the AFS learning, be sure to take AFS reset and turn off the engine once and wait at least for 60 seconds to have the after-run finished completely before proceeding to the verification check.
- Turn off the air conditioning switch.
- Using FUSO Diagnostics, check to ensure that the learning value of the airflow sensor is “0”. (Service data No.160 [Air mass flow rate Learned value 1] and No.161 [Air mass flow rate Learned value 2])
- Run the engine until the engine cooling water temperature rises above 60°C {140°F} (on meter cluster: Over 5 points).
- Wait for about 2 minutes with the engine idling.
- Keep the engine revolution to high-idling for about 15 seconds until the buzzer beeped.
- If the learning value is to be verified using FUSO Diagnostics, turn off the engine once and wait at least for 60 seconds to have the after-run finished completely before proceeding to the verification check.



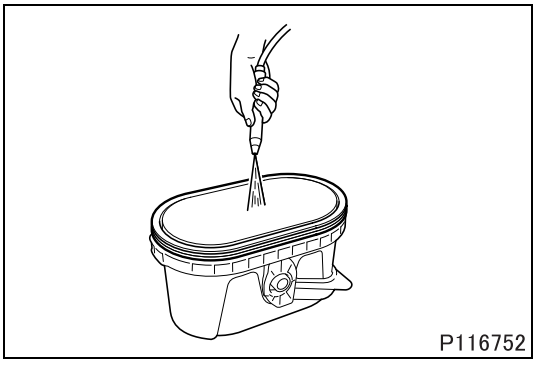
P122311

(2.3) Inspection of intake air-related components

- Check that there is no clogging or smearing in the air cleaner element by following procedure.
- Shine light inside the element.
- Replace the element if thin spots or broken parts are evident in the filter paper, or if the packing at the top of the element is damaged.
  Also replace the element if the dust on the element is damp with oily soot.

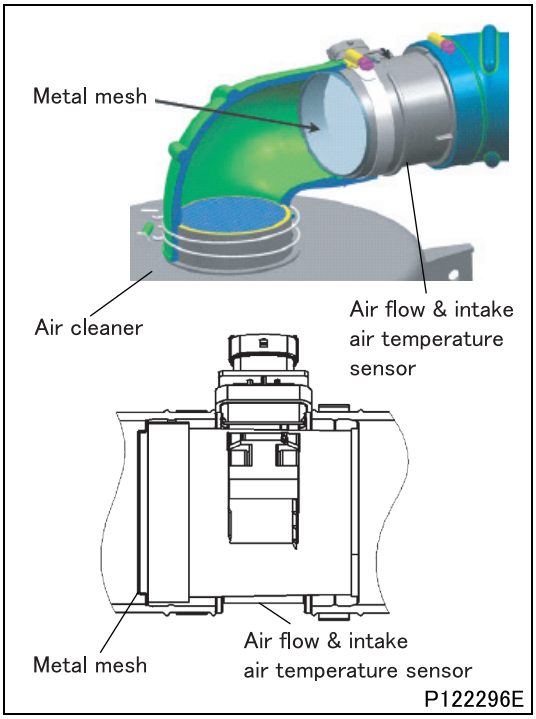


P116753

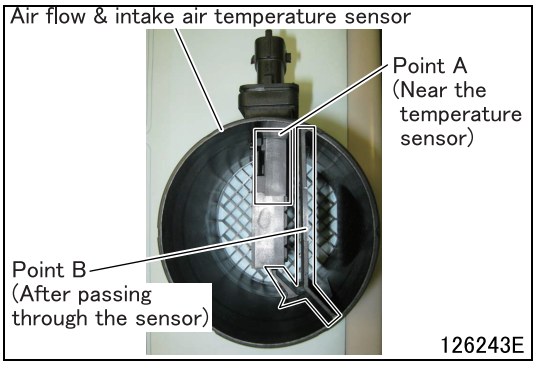


P116752

- Blow a jet of compressed air at a pressure not higher than 685 kPa {100 psi, 7 kgf/cm^2} against the inside surfaces of the element.
- Move the compressed air jet up and down along all pleats of the filter paper element.
- Oily air flow & intake air temperature sensor can be evidence that there is another faulty part in the system. In such a case, check other air intake-related parts for contamination and clean them if contaminated.

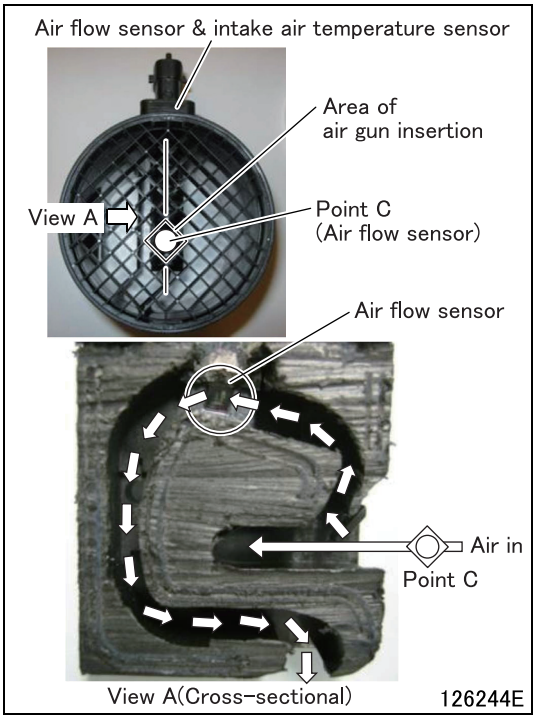


- Check that there is no smear or deformation in the metal mesh.
- Attach the metal mesh to the air hose by direction of illustration.



(2.4) Inspection of airflow sensor & intake air temperature sensor

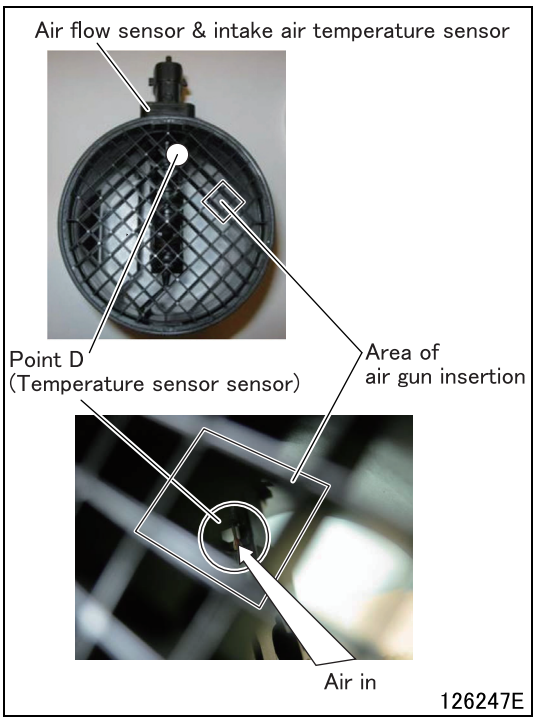
- Inspect oil or moisture and dust on surface of point A and B.
- If it is dirty, do the cleaning air blow by the following procedure.



- Blow clean air from the point C as shown below.
- Use air with pressure level of 600 kPa {87 psi, 6 kgf/cm^2} (15 shots) and air with pressure level of 300 kPa {43.5 psi, 3 kgf/cm^2} (10 sec. × 6 shots).

CAUTION ⚠

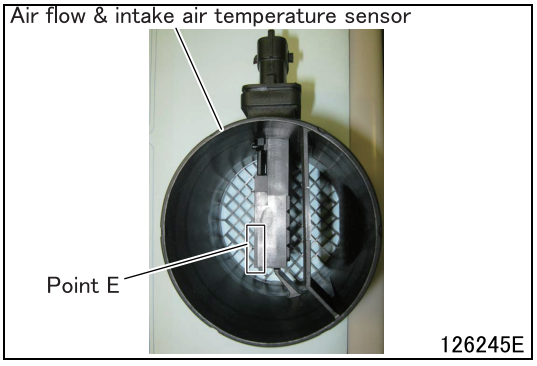
- **Using high pressure air equipped with water separator.**
- **Check the no moisture in the high pressure air before performing this air blow procedure by air blow trial.**



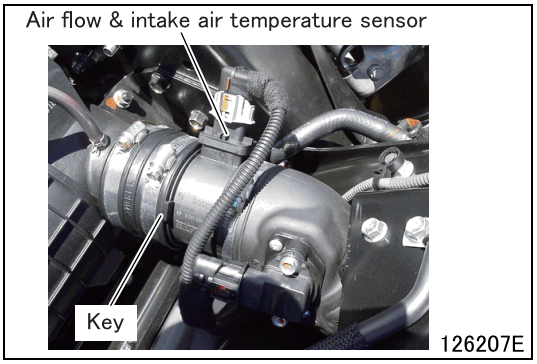
- Blow clean air through area of air gun insertion toward the point D as shown below.
- Use air with pressure level of 300 kPa {43.5 psi, 3 kgf/cm^2} (5 sec. × 1 shot).

CAUTION ⚠

- **Using high pressure air equipped with water separator.**
- **Check the no moisture in the high pressure air before performing this air blow procedure by air blow trial.**



- After air blow, check oil or any moisture and dust or out of the partition line of point E.



- Check the engagement and attachment state of airflow & intake air temperature sensor's align slit and air hose's key.
- Inspect the lines connecting the airflow & intake air temperature sensor with the air cleaner and the turbocharger for installed conditions of clamps and air leakage through the sealing sections.
- Check that the clips are correctly closed and the sealing is correct without gaps.
- Inspect the gap between airflow & intake air temperature sensor and turbocharger.

(2.5) Resetting method of learning values using FUSO Diagnostics

- Using FUSO Diagnostics to reset the learning value of the airflow sensor. (Adaptations·Teach-in processes No.005 [Air mass flow rate / Intake air temperature sensor])

(3) Inspection of SCR temperature sensor 1 and 2

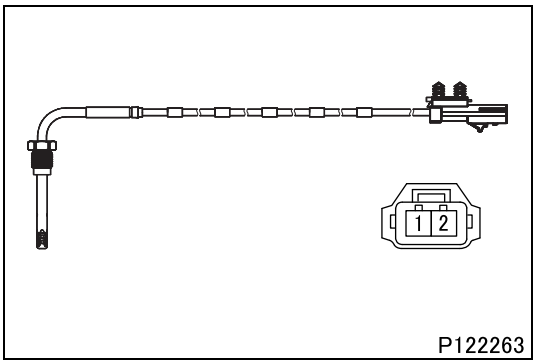
(3.1) Inspection of hot range

- Run the engine at idle for 1 hour.
- Using FUSO Diagnostics, check the SCR temperature sensors 1 and 2 values (service data No.011 [Temperature at component 'SCR catalytic converter (BACK)'], No.012 [Temperature at component 'SCR catalytic converter (FORWARD)']).
- Check that both SCR temperature sensors 1 and 2 give the same measurements (tolerance within 15°C {27°F} at a temperature between 50 and 150°C {122 and 302°F}).
- Perform the parked regeneration.
- After DPF parked regeneration is completed, using FUSO Diagnostics, check the SCR temperature sensors 1 and 2 values (service data No.011 [Temperature at component 'SCR catalytic converter (BACK)'], No.012 [Temperature at component 'SCR catalytic converter (FORWARD)']).
- SCR temperature sensors 1 and 2 give the same measurements (tolerance within 40°C {72°F} at a temperature between 480 and 600°C {896 and 1112°F}).

(3.2) Inspection of cold range

- When the engine is cold.
- Using FUSO Diagnostics, check the SCR temperature sensors 1 and 2 values (service data No.011 [Temperature at component 'SCR catalytic converter (BACK)'], No.012 [Temperature at component 'SCR catalytic converter (FORWARD)']).
- Check that both SCR temperature sensors give the same measurements as other temperature sensors (tolerance within 15°C {27°F}).

(3.3) Inspection by removal



- Removal the SCR temperature sensor 1 and 2 and do visual check and if it is dirty then you should clean it.
- Using a known temperature reference source, measure the resistance between terminals 1 and 2.

Standard value	–18°C {–0.4°F}	187 Ω
	–12°C {10°F}	191 Ω
	–7°C {19°F}	195 Ω
	–1°C {30°F}	200 Ω
	0°C {32°F}	201 Ω
	4°C {39°F}	204 Ω
	10°C {50°F}	208 Ω
	16°C {61°F}	212 Ω
	21°C {70°F}	217 Ω
	27°C {81°F}	221 Ω
	32°C {90°F}	225 Ω
	38°C {100°F}	229 Ω
	50°C {122°F}	239 Ω
	100°C {212°F}	276 Ω
	150°C {302°F}	313 Ω

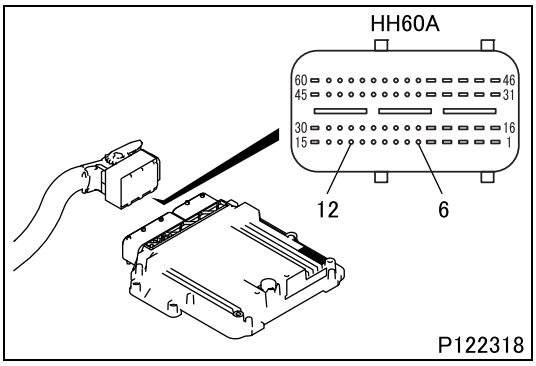
- If the measurement is out of reference value, replace the sensor.
- Measure resistance between each pin to sensor body. Resistance should be greater than 1 MΩ (open circuit).

(4) Inspection of boost pressure & boost temperature sensor (temperature sensing section)

(4.1) On-vehicle inspection

- When the engine is cold.
- Using FUSO Diagnostics, check the boost pressure & boost temperature sensor values (service data No.002 [Temperature at component 'Boost pressure / Temperature sensor']).
- Check that this sensor gives the same measurement as other temperature sensors (tolerance within 15°C {27°F}).
- Visually check the sensor and clean it if contaminated.

(4.2) Inspection by removal

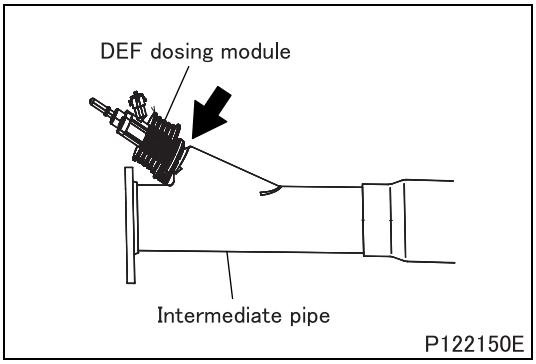


- Remove boost pressure & temperature sensor with wiring.
- Do visual check and if there is smear you should clean it.
- Remove engine electronic control unit connector.
- Using a known temperature reference source, measure the resistance between terminals 6 and 12 at the electronic control unit connector side.

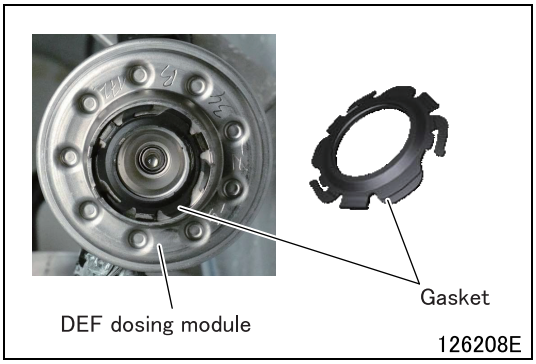
Standard value	–40°C {–40°F}	48153 Ω
	–30°C {–22°F}	26855 Ω
	–20°C {–4°F}	15614 Ω
	–10°C {–14°F}	9426 Ω
	0°C {32°F}	5886.7 Ω
	10°C {50°F}	3791.1 Ω
	20°C {68°F}	2510.6 Ω
	30°C {86°F}	1715.4 Ω
	40°C {104°F}	1199.6 Ω
	50°C {122°F}	851.1 Ω
	60°C {140°F}	612.27 Ω
	70°C {158°F}	446.33 Ω
	80°C {176°F}	329.48 Ω
	90°C {194°F}	246.15 Ω
	100°C {212°F}	186 Ω
	110°C {230°F}	142.08 Ω
	120°C {248°F}	109.65 Ω
	130°C {266°F}	85.45 Ω

- If the measurement is out of standard value, replace the sensor.

(5) Inspection of DEF dosing module, DEF supply module (motor and heater)



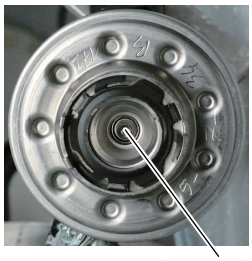
- Check that there are no gas leaks and adhesion of deposits on the attachment part of the DEF dosing module. If there is some abnormality, then it is possibility that the attachment failure of the DEF dosing module is the cause of NOx errors.
- Remove the DEF dosing module. Check the DEF dosing module and its mount are in a proper condition.



- Replace gasket, if dosing module is removed.

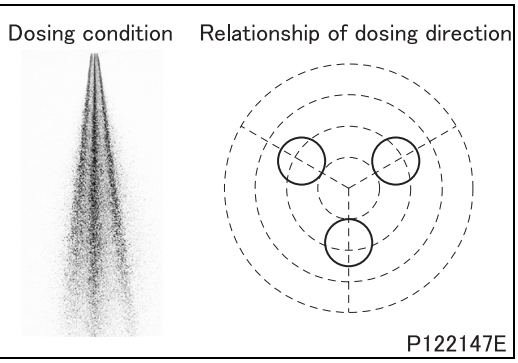
- Verify that the injection hole in the DEF dosing module is free from any deposits. Replace the DEF dosing module if the injection hole is blocked.
- Clean the DEF dosing module if other places than the injection hole are deposited, please use distillated water.
- When at the actuator test of FUSO Diagnostics there is no abnormality, there is no problem even with when there is a deposit.

- If any deposits are found on the mounting section of the DEF dosing module, remove them completely before the module is re-installed. After the module is installed, be sure to perform forced DPF regeneration using FUSO Diagnostics.

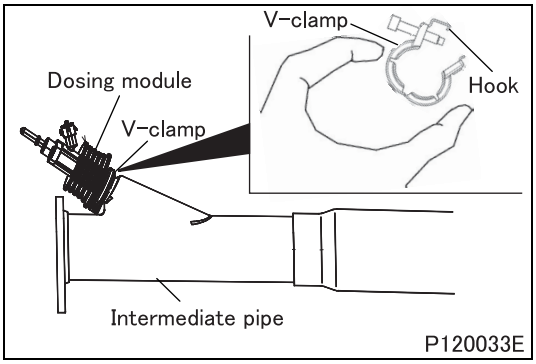


- Using FUSO Diagnostics, run of the actuator test (actuator test No.009 [DEF Leak tester]).
- Perform the test with a DEF dosing module removed from intermediate pipe.
- Verify that there is no leakage of DEF at the time of test execution.
- Replace the DEF dosing module if leakage is found at dosing module tip.
- Replace the DEF tube if leakage is found on DEF tube itself.
- Re-check the DEF tube install condition if the leakage is found from DEF tube junction part.
- After the additional test is finished, make the starter switch OFF and wait 60 seconds and finish the after run.

- Using FUSO Diagnostics, run of the actuator test (actuator test No.008 [Test of DEF metering amount]).
- Verify that the specified amount of solution is dosed. Replace the DEF dosing module if the amount is abnormal, and then perform the actuator test again. If the amount is still abnormal, replace the DEF supply module (motor and heater).
- After addition test is finished, switch OFF and wait 60 seconds to finish the after run.



- Retest the using FUSO Diagnostics, run of the actuator test (actuator test No.008 [Test of DEF metering amount]).
- Check for dosing condition.
- Verify that DEF is sprayed evenly in three directions as shown in the illustration.
- Replace the DEF dosing module if the spray pattern is abnormal.
- After addition test is finished, switch OFF and wait 60 seconds to finish the after run.



- Attach a new gasket to the DEF dosing module.
- Stick and install the DEF dosing module to intermediate pipe.
- Push the clamp central part until it applies the hook of a new clamp and stick and install the clamp to dosing module. In this regard, do not adhere oil or grease to clamp and screw.

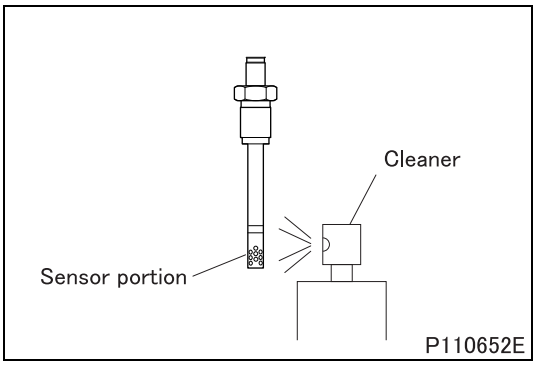
Tightening torque	5 $^{0}_{-0.5}$ N·m {3.7 $^{0}_{-0.37}$ lbs.ft, 0.5 $^{0}_{-0.05}$ kgf·m

- When attaching the DEF tube to the DEF dosing module. If it needs the lubrication, please use distillated water.
- Check the gas leakage after attaching the DEF dosing module.
- Using FUSO Diagnostics, run of the actuator test (actuator test No.011 [Regeneration of diesel particulate filter]).

(6) Inspection of exhaust gas temperature sensor 1 and 2 (DPF exhaust gas temperature sensor 1 and 2)

(6.1) Inspection of cold range

- When the engine is cold (10 hours after the engine off)
- Using FUSO Diagnostics, check the exhaust gas temperature sensors 1 and 2 values (service data No.007 [Exhaust temperature upstream of diesel oxidation catalytic converter], No.008 [Exhaust temperature upstream of diesel particulate filter]).
- Check that both exhaust gas temperature sensors give the same measurements as other temperature sensors (tolerance within 15°C {27°F}).

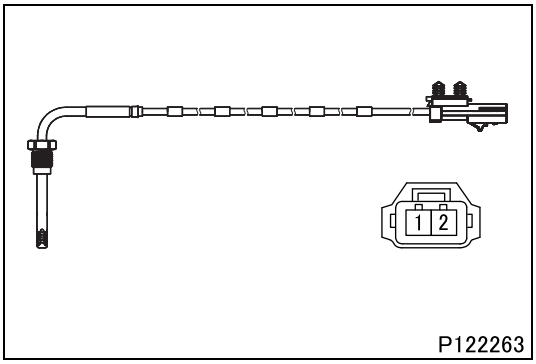


(6.2) Cleaning

- Check that the sensor portion is free of soot, oily substance, etc.
- If not, clean the sensor portion as follows.
- Spray a cleaner on the sensor portion from 2 or 3 cm {0.79 or 1.18 in.} away.
  Recommended cleaners: Non chlorinated solvent
- In 20 to 30 seconds after spraying, wipe the sensor portion clear of the sprayed cleaner using a soft waste cloth the like.

CAUTION ⚠

- **Be sure to wait for 20 to 30 seconds before wiping. It takes the cleaner that long to dissolve foreign matter.**



(6.3) Inspection by removal

- Removal the exhaust gas temperature sensor 1 and 2 and do visual check and if it is dirty then you should clean it.
- Using a known temperature reference source, measure the resistance between terminals 1 and 2.

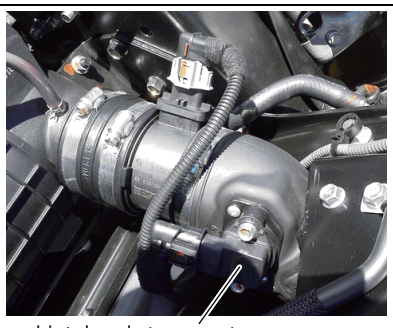
Standard value	–18°C {–0.4°F}	187 Ω
	–12°C {10°F}	191 Ω
	–7°C {19°F}	195 Ω
	–1°C {30°F}	200 Ω
	0°C {32°F}	201 Ω
	4°C {39°F}	204 Ω
	10°C {50°F}	208 Ω
	16°C {61°F}	212 Ω
	21°C {70°F}	217 Ω
	27°C {81°F}	221 Ω
	32°C {90°F}	225 Ω
	38°C {100°F}	229 Ω
	50°C {122°F}	239 Ω
	100°C {212°F}	276 Ω
	150°C {302°F}	313 Ω

- If the measurement is out of reference value, replace the sensor.
- Measure resistance between each pin to sensor body. Resistance should be greater than 1 MΩ (open circuit).

CAUTION ⚠

- **When mounting the sensor, please check that are not mistaken the mounting position of the exhaust gas temperature sensor 1 and 2.**

(7) Inspection of humidity and intake air temperature sensor



(7.1) Inspection of sensor output signal

- Write down the humidity value on at key-on and engine off state.
- Using FUSO Diagnostics, check the humidity and intake air temperature sensor values (service data No.056 [Humidity of in take air]). (Value A)
- Key off at once and wait for around 60 second to complete engine after run. Write down again the humidity value at key-on and engine off state. (Value B: second time)
- Do once again. (Value C: third time)
- Compare these three values.
- Replace the sensor, if the values out of more than ±10%.
  - ex: Nok (replace): A:10%, B:25%, C:5%, → 25–5=20%
  - ex: Ok: A:7%, B:5%, C:14%, →14–5=9%

(7.2) Check diagnosis failure code in the past

- When the following diagnosis code occurs, replace the sensor.
  - (354 17) Component ‘Humidity and temperature sensor “Intake air”’ or its electrical line is defective.
  - (354 18) The signal voltage of component ‘Humidity and temperature sensor “Intake air”’ is too low.

5.4 Probable cause of diagnosis code occurrence

- Check the diagnosis code which occurs simultaneously with diagnosis code 520650-0. And if there is the code in bellow chart, check the part which caused the diagnosis code ◎ or ○ for each codes. (See13E-100.)
  For inspection procedures for parts marked with ★, see “5.3 Inspections at relevant system sections” as well.

EGR: Exhaust gas recirculation

5.5 Procedure of eliminate the warning lamp

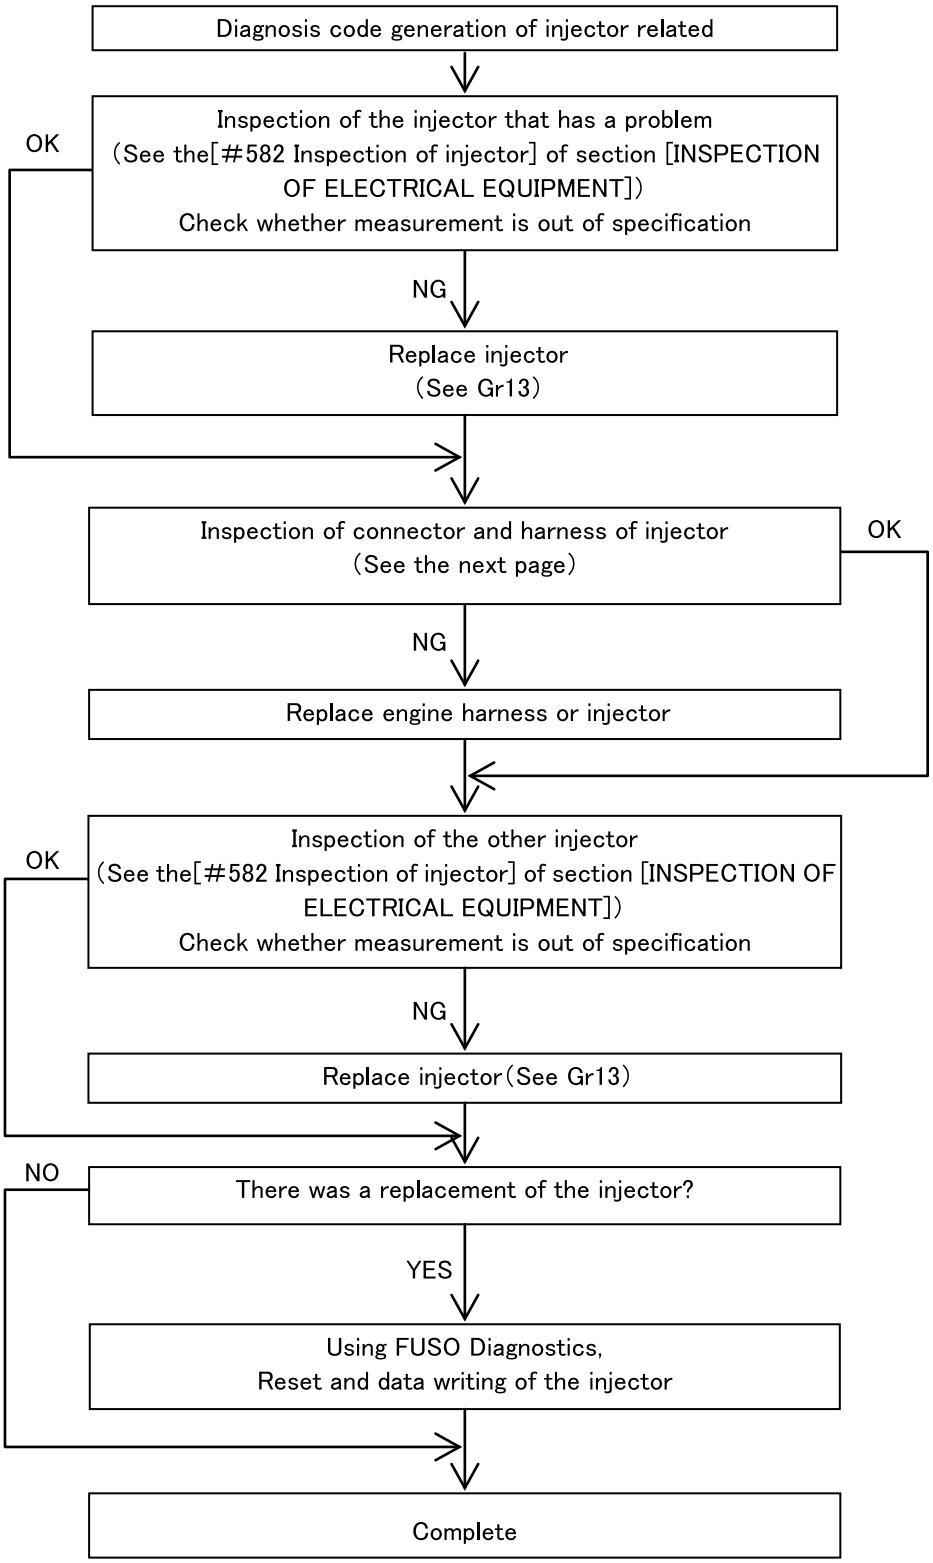
(1) The case of the mileage or running time of after diagnosis code was occurred are less than 320 km [200 miles] or 4 hours. (Torque and power is restricted)

- Turn the starter switch to the OFF position, wait at least 60 seconds and complete the after-run.
- Turn the starter switch to the ON position and after a lapse of 10 seconds or longer, start the engine.
- Drive the vehicle at 80 km/h about for 30 minutes to collect the service data (actual measurements) using FUSO Diagnostics.
- Then check to confirm that the NOx sensor 2 is active (service data No.115 [NOx value] of other than “-1-” is indicated and service data No.011 [Temperature at component ‘SCR catalytic converter (BACK)’] is more than 250°C {482°F}).
- After running of above procedure, check the warning lamp is eliminated.

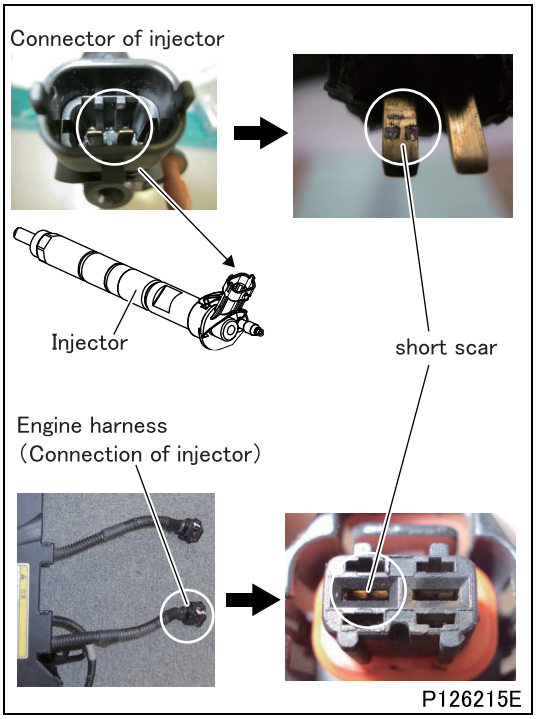
(2) The case of the mileage or running time of after diagnosis code was occurred are more than 320 km [200 miles] or 4 hours. (Creep mode)

- Turn the starter switch to the OFF position, wait at least 60 seconds and complete the after-run.
- Turn the starter switch to the ON position and after a lapse of 10 seconds or longer, start the engine.
- Warm up the engine until the engine coolant temperature exceeds 60°C {140°F}.
- Press the Diesel Particulate Filter cleaning switch to perform the parked regeneration of Diesel Particulate Filter. In the parked regeneration, the engine speed increases to 1500 - 2500 rpm and it takes approximately 20 minutes to complete the parked regeneration.
- After that, the engine speed drops to idle and warning goes out. It may not go out immediately and it can take 10 minutes for the lamp to go out.

6. Inspections to be Made at Injector Error Occurrence



126312E



(1) Inspection of connector and harness of injector

- Check the short scar to the terminals of the connector section.

7. Inspection when an error in the exhaust gas recirculation and exhaust break valve system Error Occurrence

- The exhaust gas recirculation system recirculates the exhaust gas recirculation gas by closing the exhaust break valve.
- Perform troubleshooting by referring to this section when the following diagnosis codes are generated, because there are cases where errors in the exhaust gas recirculation system occur due to an exhaust brake valve malfunction, and the problem persists even after inspecting and repairing the exhaust gas recirculation system.

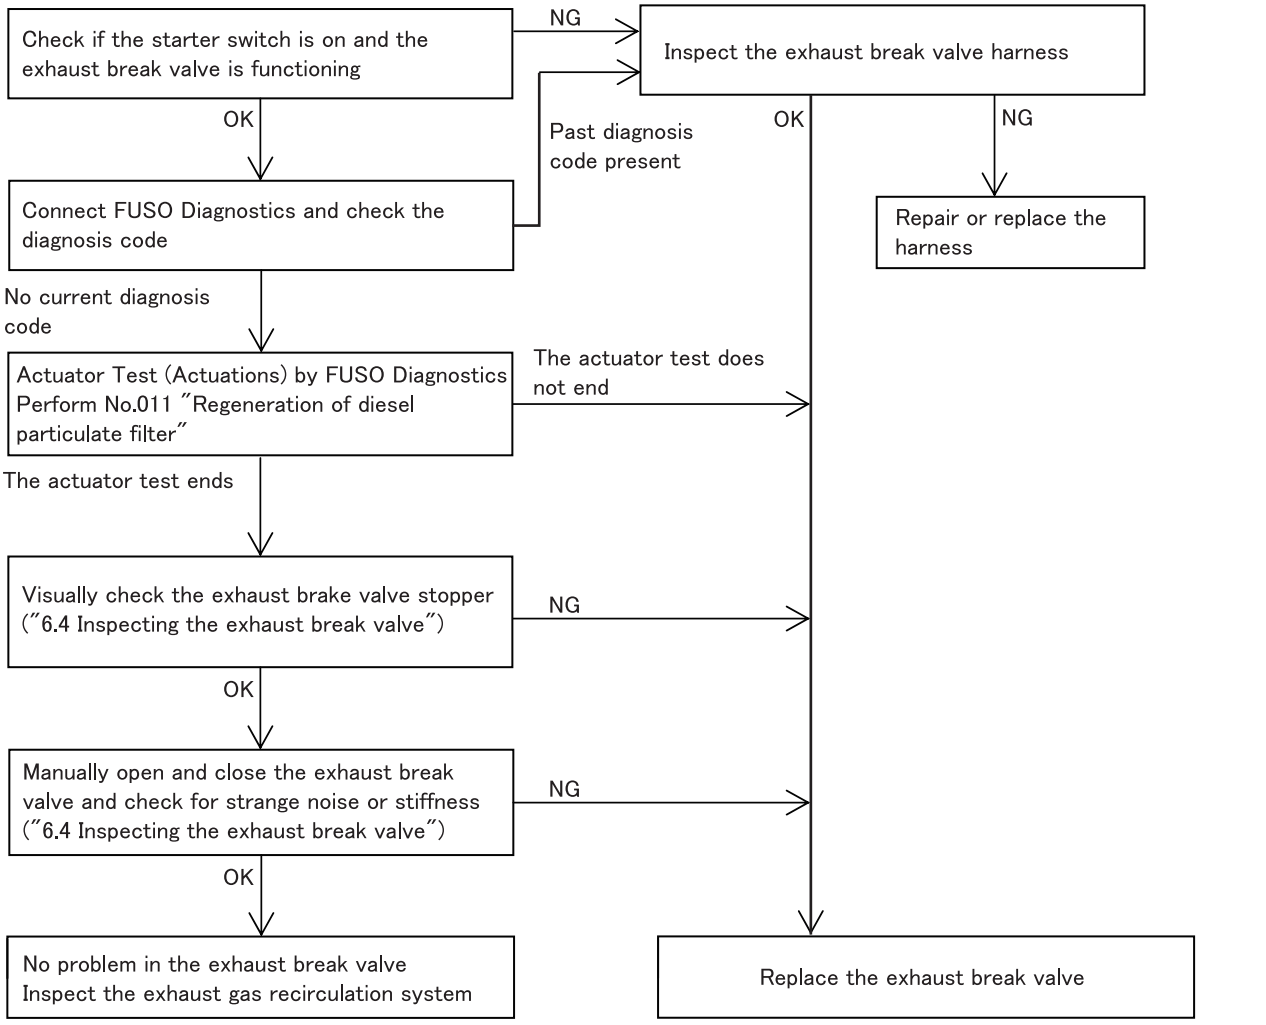
7.1 Exhaust gas recirculation system error

- When the following diagnosis codes are generated, perform troubleshooting of the exhaust break valve first by referring to this section.
  - (27-15) The position of component ‘Exhaust gas recirculation valve’ is implausible.
  - (27-17) The position of component ‘Exhaust gas recirculation valve’ is implausible.
  - (2791-0) The signal voltage of component ‘Position sensor ‘Exhaust gas recirculation controller’’ is too high.
  - (2791-1) The signal voltage of component ‘Position sensor ‘Exhaust gas recirculation controller’’ is too low.
  - (2791-3) Component ‘Exhaust gas recirculation valve’ has a short circuit to positive.
  - (2791-4) Component ‘Exhaust gas recirculation valve’ has a short circuit to ground.
  - (2791-5) Component ‘Exhaust gas recirculation valve’ has an open circuit.
  - (2791-7) Component ‘Exhaust gas recirculation valve’ has a mechanical fault.
  - (2791-12) Component ‘Exhaust gas recirculation valve’ has overtemperature.
  - (2791-16) The signal voltage of component ‘Position sensor ‘Exhaust gas recirculation controller’’ is too high.
  - (2791-18) The signal voltage of component ‘Position sensor ‘Exhaust gas recirculation controller’’ is too low.
  - (2791-31) The power consumption of component ‘Exhaust gas recirculation valve’ is too high.
  - (3058-0) The signal of component ‘Exhaust gas recirculation actuator’ is implausible compared with the signal of component ‘Air mass flow rate / Intake air temperature sensor’.
  - (3058-1) The signal of component ‘Exhaust gas recirculation actuator’ is implausible compared with the signal of component ‘Air mass flow rate / Intake air temperature sensor’.
  - (3058-16) The signal of component ‘Exhaust gas recirculation actuator’ is implausible compared with the signal of component ‘Air mass flow rate / Intake air temperature sensor’.
  - (3058-18) The signal of component ‘Exhaust gas recirculation actuator’ is implausible compared with the signal of component ‘Air mass flow rate / Intake air temperature sensor’.
  - (3058-31) The signal from component ‘Exhaust gas recirculation valve’ is faulty.
  - (520344-3) Component ‘Exhaust gas recirculation valve’ has a short circuit to positive.
  - (520344-4) Component ‘Exhaust gas recirculation valve’ has a short circuit to ground.
  - (520344-6) Component ‘Exhaust gas recirculation valve’ has an electrical fault.
  - (520344-7) The function of component ‘Exhaust gas recirculation valve’ is not OK.

7.2 Exhaust break valve system error

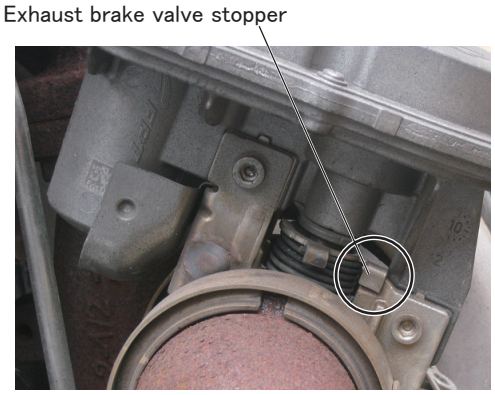
- When the following diagnosis codes are generated, perform troubleshooting of the exhaust break valve by referring to this section.
  - (1074-3) Component ‘Engine brake Solenoid valve’ has a short circuit to positive.
  - (1074-4) The exhaust flap has a short circuit to ground. / Component ‘Engine brake Solenoid valve’ has a mechanical defect.
  - (1074-5) Component ‘Engine brake Solenoid valve’ has an open circuit.
  - (1074-12) The function of component ‘Engine brake Solenoid valve’ is not OK.
  - (520358-2) Component ‘Engine brake Solenoid valve’ is mechanically damaged or it sticks.
  - (520359-2) Component ‘Engine brake Solenoid valve’ or its electrical line is defective.
  - (520360-2) Component ‘Engine brake Solenoid valve’ or its electrical line is defective.
  - (520361-2) Component ‘Engine brake Solenoid valve’ or its electrical line is defective.
  - (520362-2) Component ‘Engine brake Solenoid valve’ or its electrical line is defective.

7.3 Inspection work flow



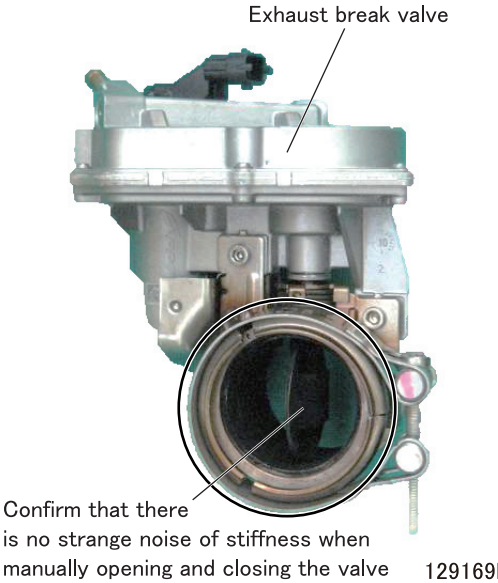
129201E

7.4 Inspecting the exhaust break valve



(1) Visual inspection of the exhaust brake valve stopper

- Replace the exhaust brake valve main unit when there is breakage, damage, etc.



(2) Operational (manual) inspection of the exhaust break valve

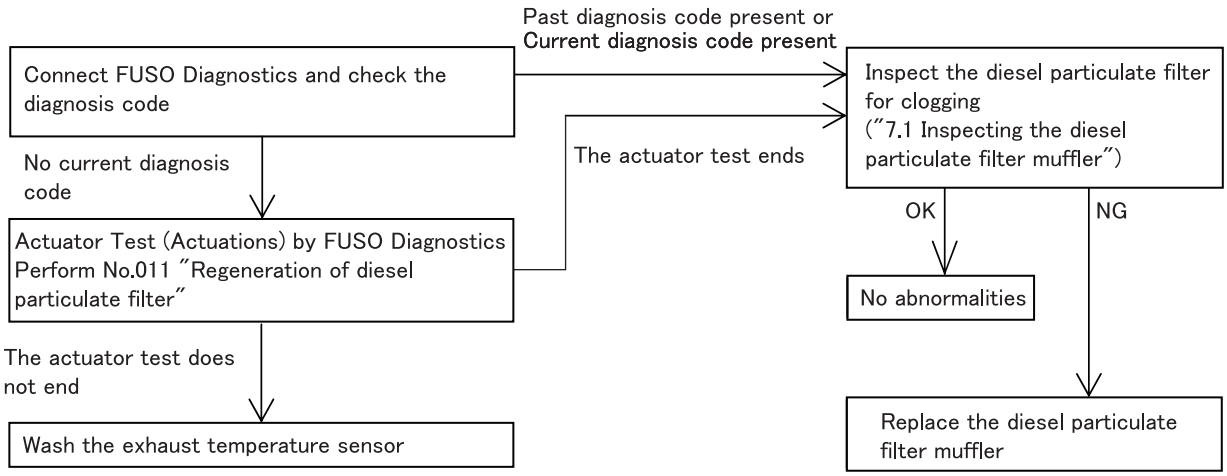
CAUTION ⚠

- **The valve gets very hot after engine operation. Proceed with work after letting it cool down completely to prevent burns.**

- Remove the exhaust pipe. (See Gr15.)
- Manually open and close the exhaust break valve and check for strange noise or stiffness.
- When there is a strange noise of stiffness when opening or closing the valve, replace the exhaust brake valve main unit.

8. Inspection when a diesel particulate filter-related sensor system Error Occurrence

- There are cases when a diagnosis code is generated for a diesel particulate filter-related sensor due to a malfunction in the diesel particulate filter.
- When a diesel particulate filter-related sensor diagnosis code is generated, the following diagnosis codes are generated again even after processing the sensor and harness malfunction or even when there is no problem with the sensor. In this case, perform diesel particulate filter troubleshooting by referring to this section.
  - (3244-2) The signal value of component 'Temperature sensor 'Exhaust system' 2' is implausible.
  - (3253-18) Check hose between diesel particulate filter and component 'Differential pressure sensor of diesel particular filter' for correct connection.
  - (3285-17) Check hose between diesel particulate filter and component 'Differential pressure sensor of diesel particular filter' for correct connection.
  - (3701-2) The value measured by component 'Differential pressure sensor of diesel particular filter' is too high.
  - (3726-16) The soot content of the diesel particulate filter is not OK.
  - (520429-18) The signal from component 'Lambda control tester' is faulty.



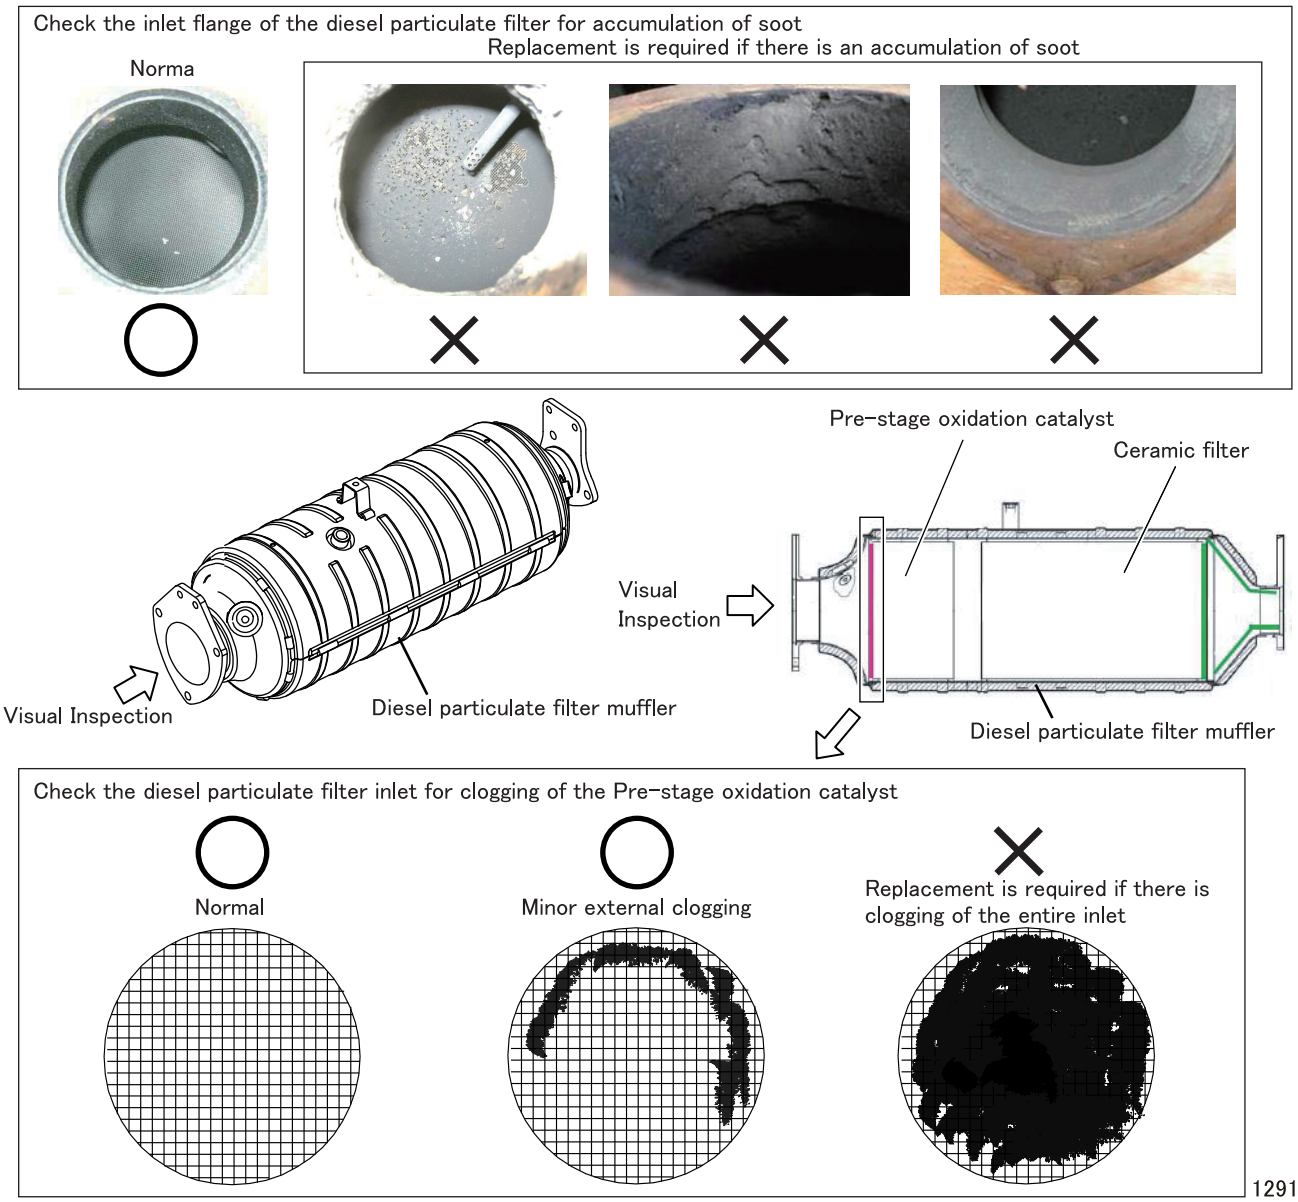
129345E

8.1 Inspecting the diesel particulate filter muffler

CAUTION ⚠

- **The diesel particulate filter muffler gets very hot after engine operation. Proceed with work after letting it cool down completely to prevent burns.**

- Visually inspect the diesel particulate filter for any clogging or accumulation of soot.
- Replace the diesel particulate filter when there is clogging or heavy accumulation of soot. (See Gr17.)

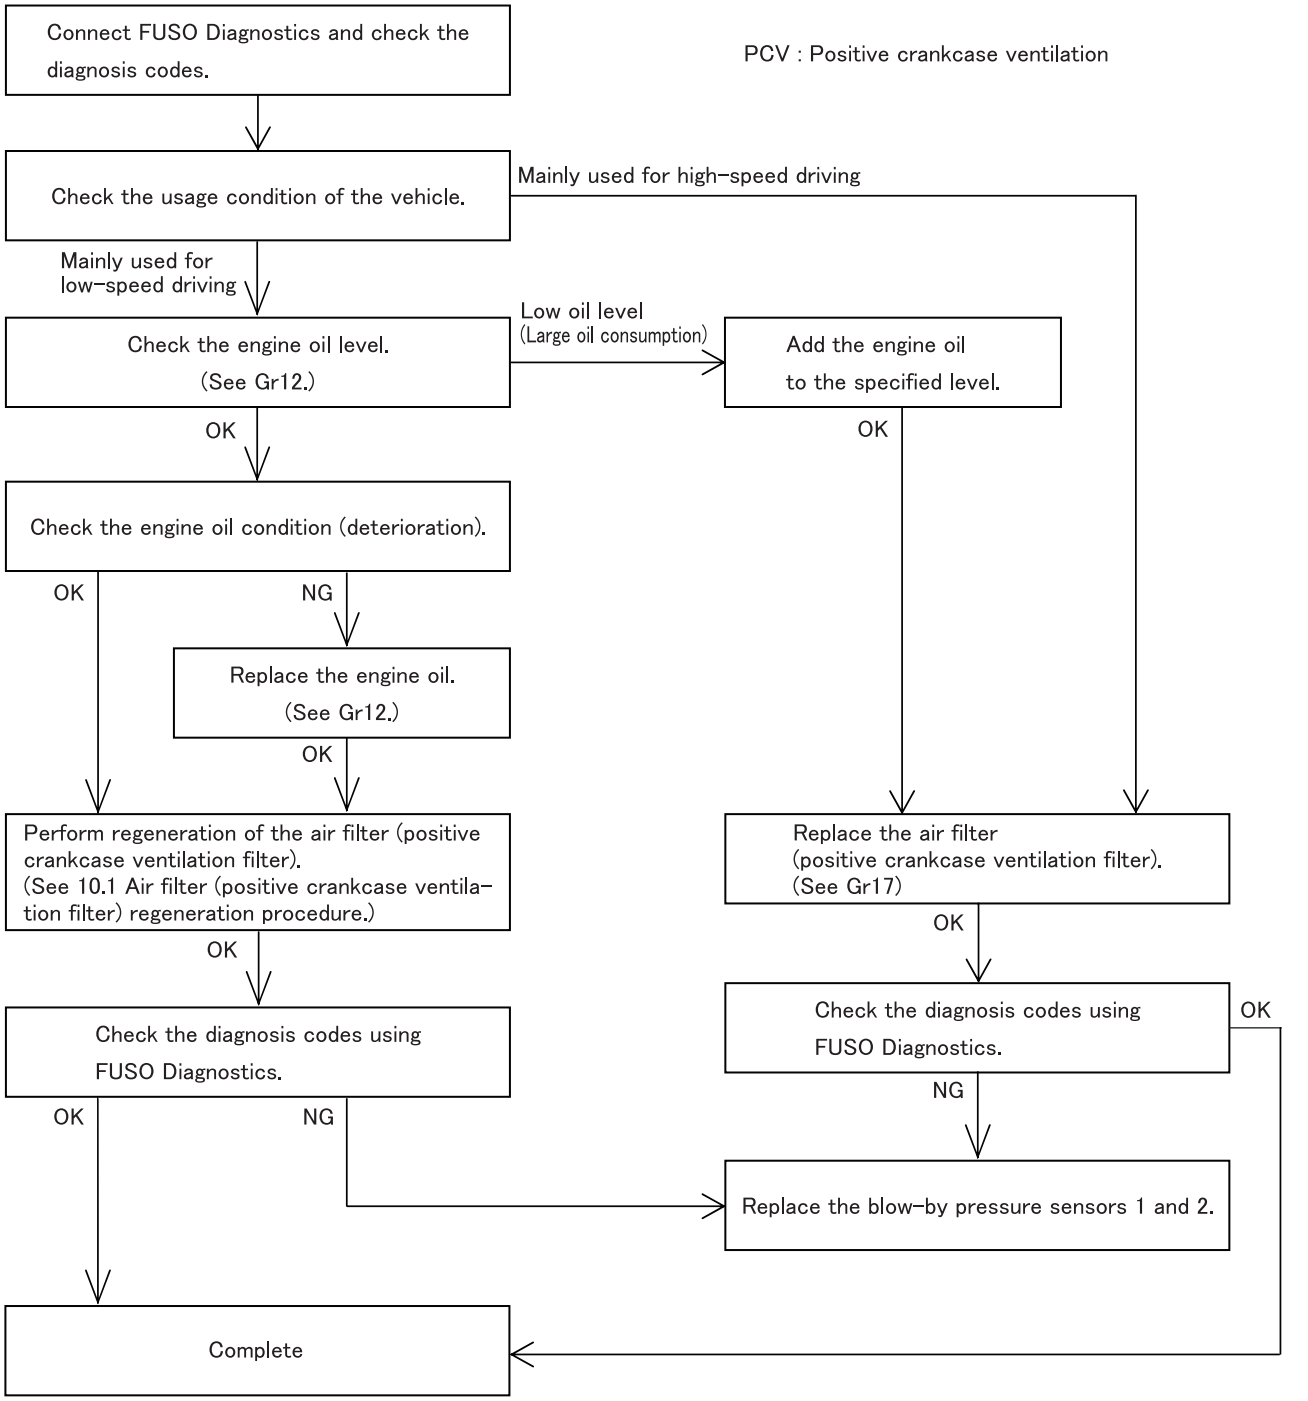


9. Inspection when a DEF dosing module system Error Occurrence

- If the injection port of the DEF dosing module is clogged by crystallized DEF, the following diagnosis code may be stored.
- If the following diagnosis code is stored, troubleshoot by referring to (5) Inspection of DEF dosing module, DEF supply module (motor and heater) in 5.3 Inspections at relevant system sections of 5. Inspections to be Made at NOx Error Occurrence.
- (3361-5) Component 'DEF metering device' has an open circuit.

10. Inspections to be Made at Blow-by pressure sensor Error Occurrence

- The blow-by pressure sensor-related diagnosis codes may occur due to faulty oil (quantity or quality) or faulty air filter (positive crankcase ventilation filter).
- If any of the following diagnosis codes is stored, perform troubleshooting with reference to this section before replacing the blow-by pressure sensor.
  - (22-0) The signal voltage of component 'Crankcase pressure sensor2' is too high.
  - (22-1) The signal voltage of component 'Crankcase pressure sensor2' is too low.
  - (22-16) The signal value of component 'Crankcase pressure sensor2' is too high.
  - (22-18) The signal value of component 'Pressure sensor in crankcase' is too low.
  - (30-0) Component 'Pressure sensor in hose line of crankcase ventilation system' has a short circuit or is defective.
  - (30-1) Component 'Pressure sensor in hose line of crankcase ventilation system' has a short circuit or is defective.
  - (30-15) The differential pressure between sensor in crankcase and sensor in hose line of crankcase ventilation system is above upper limit.
  - (30-16) The signal value of component 'Pressure sensor in hose line of crankcase ventilation system' is too high.
  - (30-17) The differential pressure between sensor in crankcase and sensor in hose line of crankcase ventilation system is above upper limit.: TOO HIGH



129285E

10.1 Air filter (PCV (positive crankcase ventilation filter)) regeneration procedure

NOTE

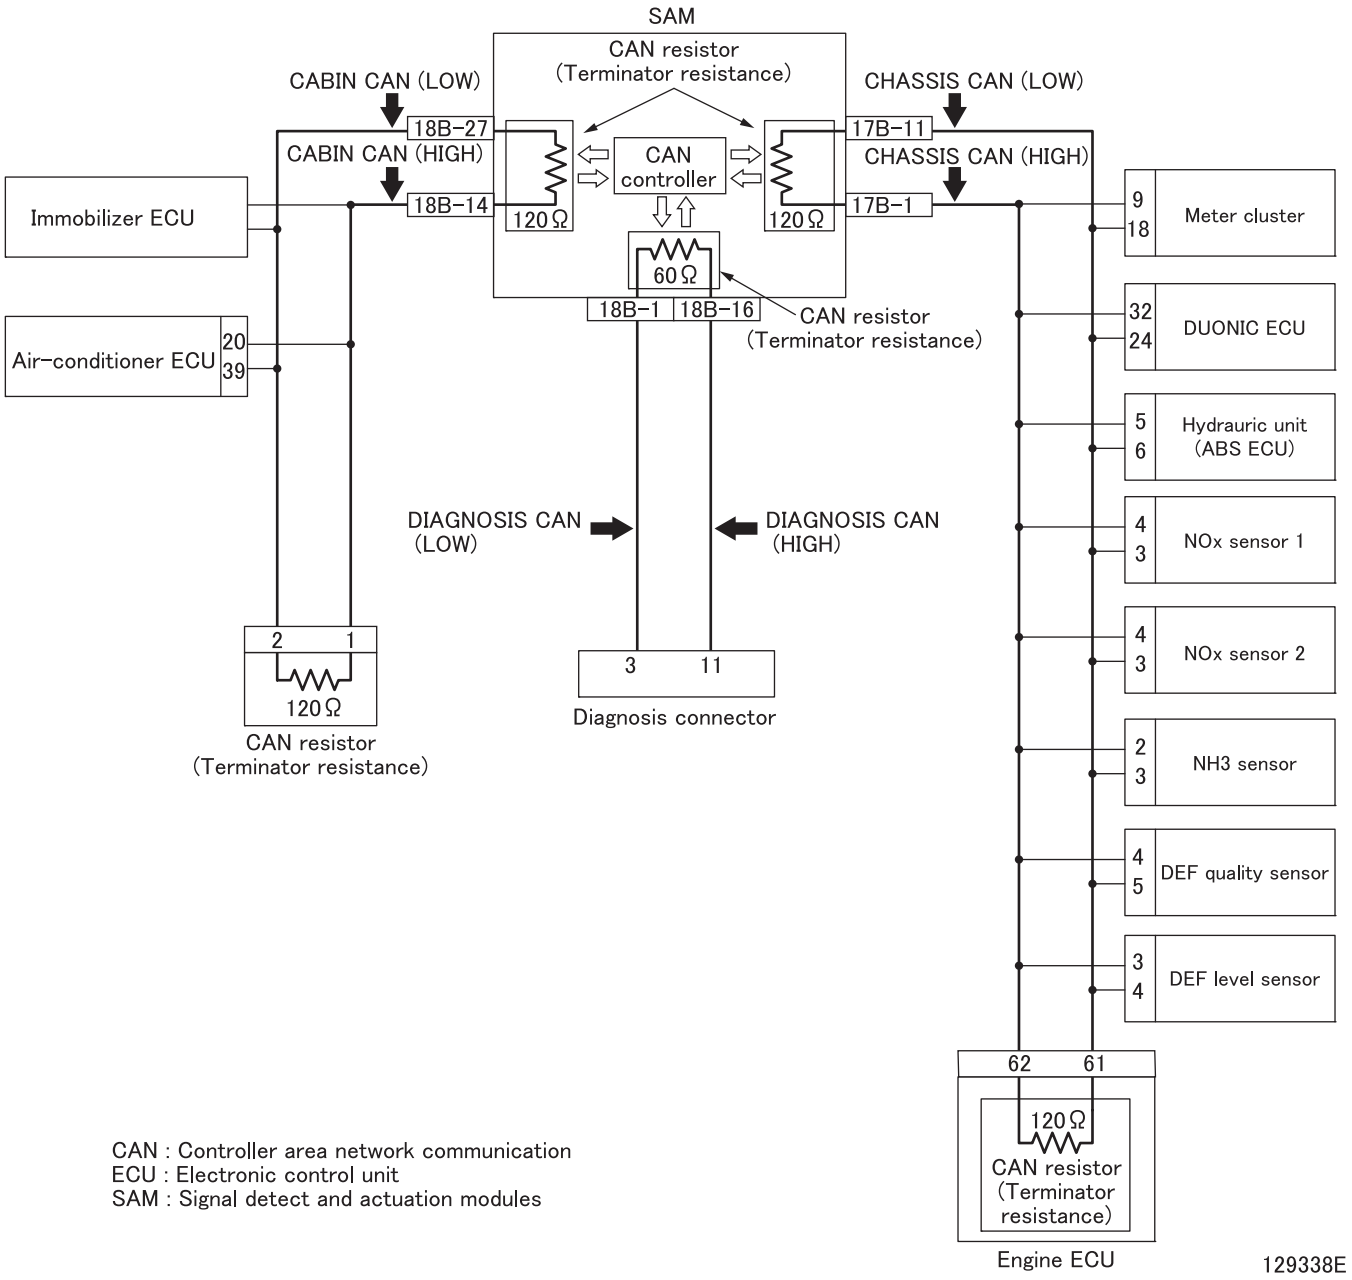
- **Using the this procedure extends the air filter (PCV (positive crankcase ventilation) filter) replacement interval by approximately 50 hours.**
- **Air filter (PCV (positive crankcase ventilation) filter) regeneration can be repeated.**

- Stop the vehicle in a safe place, firmly apply the parking brake and move the gearshift lever to “P”.
- Press the accelerator pedal fully so that the engine speed is 4,000 rpm, and wait for 2 minutes.
- Release the accelerator pedal after 2 minutes.

11. Inspections to be Made at CAN error Occurrence

- If any of the CAN error is stored, perform troubleshooting with reference to this section.

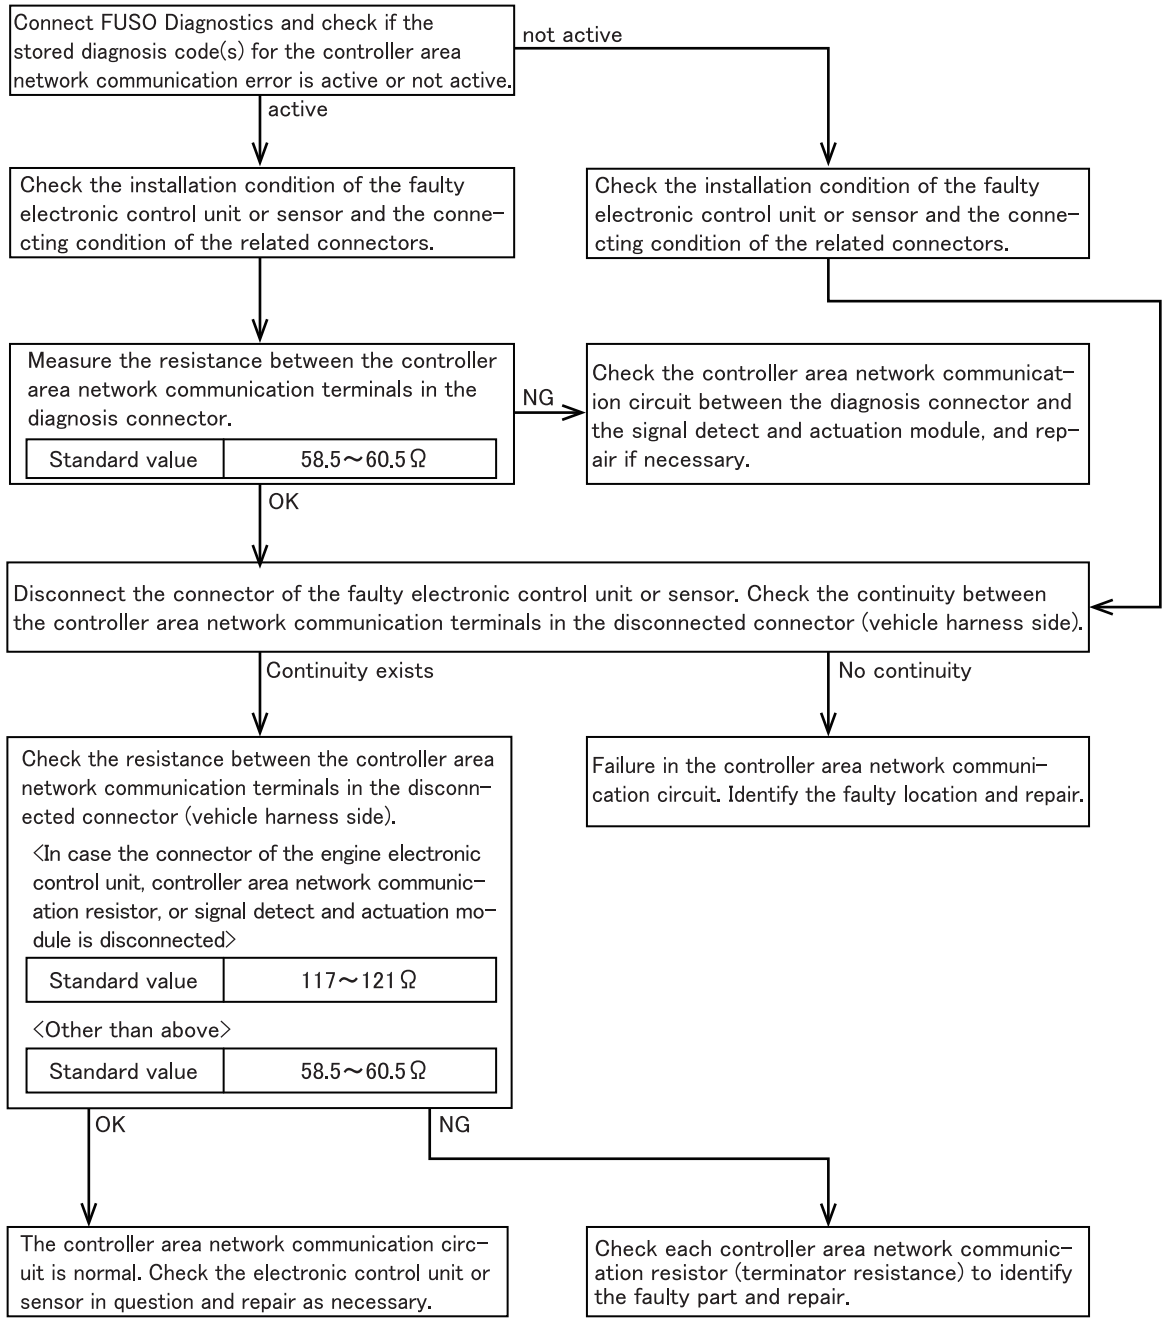
11.1 Schematic diagram of the CAN circuit



CAN : Controller area network communication
ECU : Electronic control unit
SAM : Signal detect and actuation modules

11.2 Inspection work flow

- Perform inspection in accordance with the following flowchart while referring to the schematic diagram of the controller area network communication circuit.



CAN : Controller area network communication
ECU : Electronic control unit
SAM : Signal detect and actuation modules

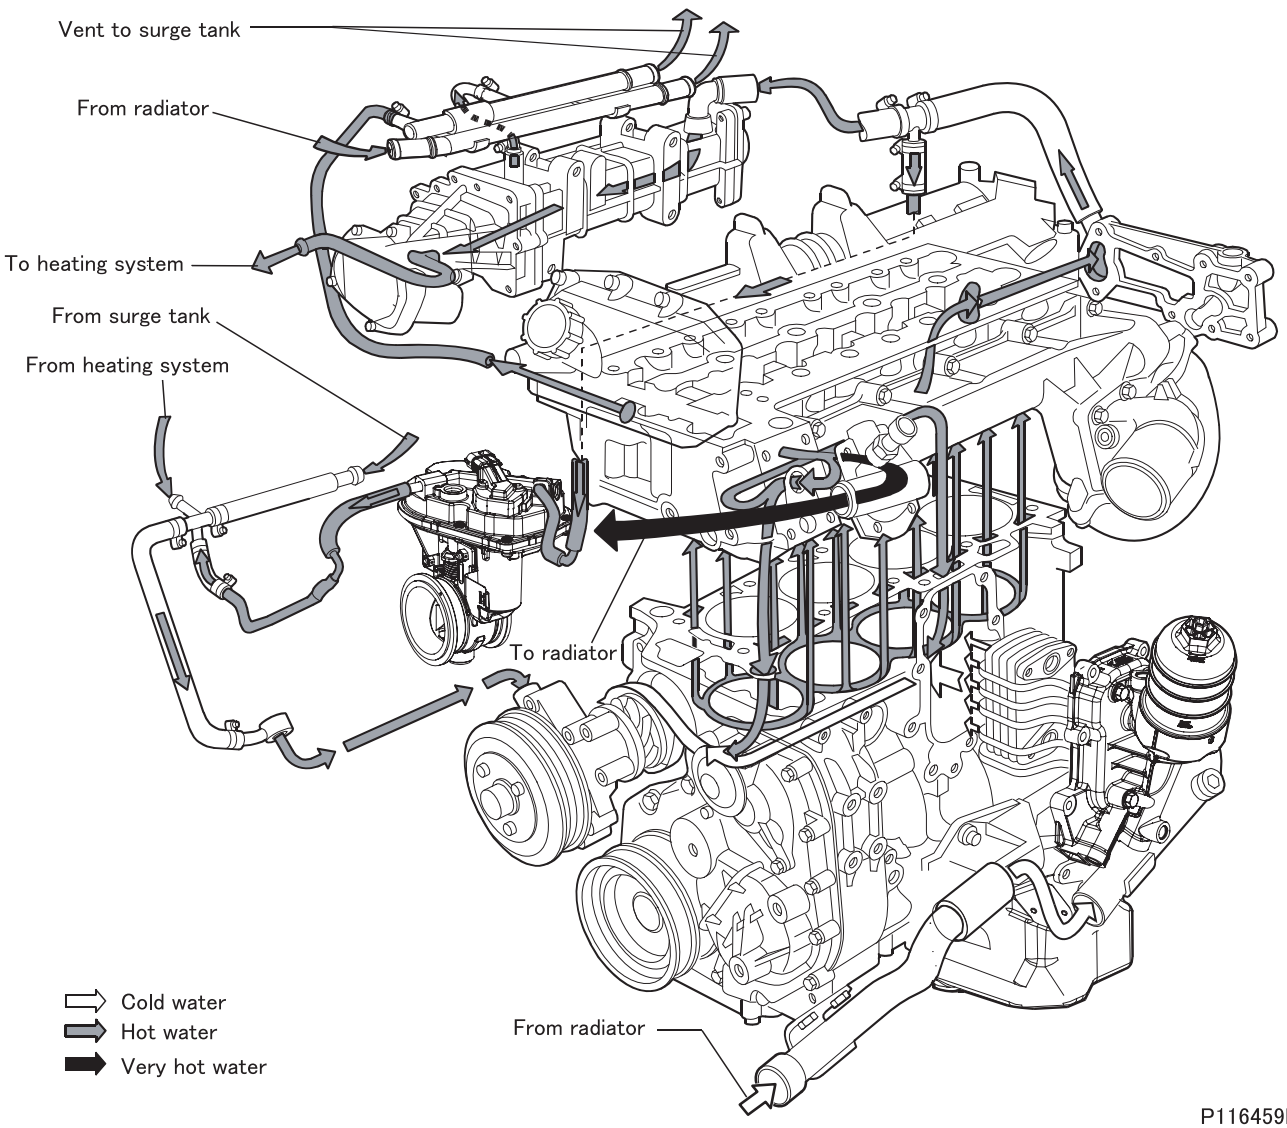
SPECIFICATIONS

Item			Specifications
Cooling system			Forced water circulation system
Water pump			Belt-driven involute type
Thermostat	Type		N.I.
	Start of opening °C {°F}		79 ± 2 {174 ± 3.6}
	Max opening °C {°F}		92 ± 2 {198 ± 3.6}
Automatic cooling fan coupling			Continuous control type (viscous coupling)
Radiator			Tube and corrugated fin type
Coolant capacity L {qts}	Except crew cab		Approx. 14 {15}
	Crew cab	With rear air conditioner	Approx. 15.1 {16}
		With rear heater	Approx. 15.2 {16}

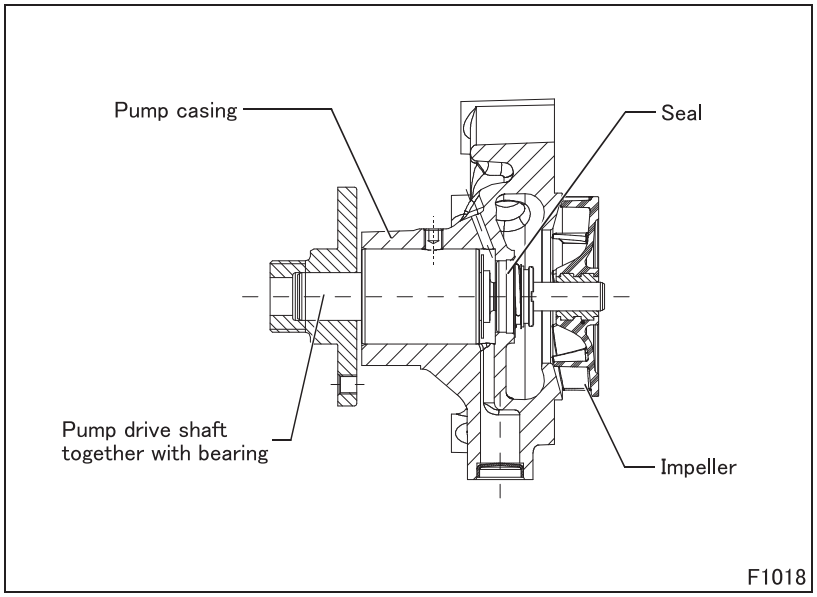
1. Cooling System



- The engine cooling system is the type with forced circulation in a closed circuit. It comprises the following parts.
  - A surge tank.
  - An engine cooling module to dissipate the heat taken from the engine by the coolant with a radiator.
  - An oil cooler to cool the lubricating oil.
  - A water pump incorporated in the crankcase.
  - A cooling fan activated by a viscous coupling.
  - A thermostat governing the circulation of the coolant.
- The water pump driven by a V belt by the crankshaft sends coolant into the crankcase and into the cylinder head.
- When the coolant temperature reaches and exceeds the working temperature, it causes the thermostat to open and the fluid is channelled from there to the radiator and is cooled by the fan.
- The pressure in the system due to the change in temperature is governed by the outlet and inlet valves incorporated in the surge tank pressure cap.
- The outlet valve has the following twofold function.
  - To keep the system slightly pressurized so as to raise the boiling point of the coolant.
  - To discharge into the atmosphere the excess pressure produced in case of high coolant temperatures.

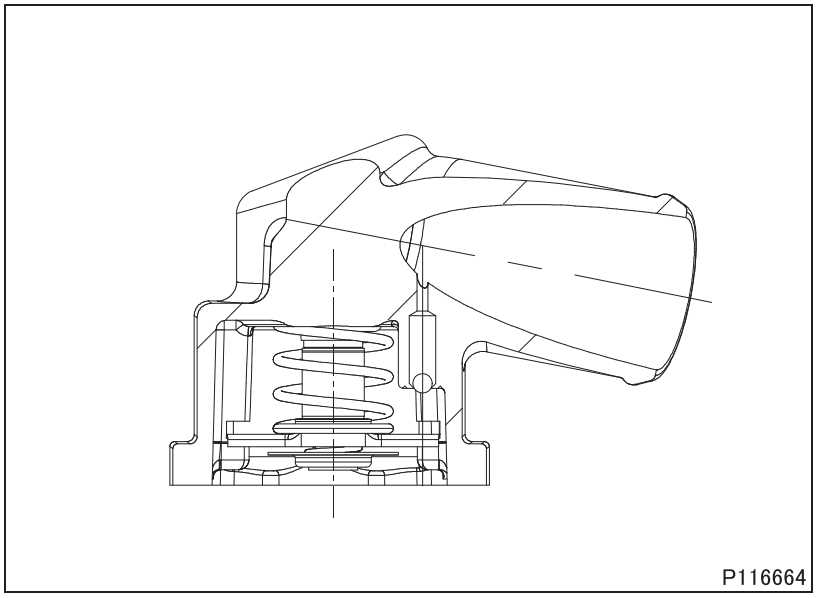
- The function of the inlet valve is to permit transferring the coolant from the surge tank to the radiator when a lower pressure is created in the system due to the reduction in volume of the coolant as a result of its temperature lowering.

2. Water Pump



- The water pump is the belt-driven involute type.

3. Thermostat



- The thermostat casing is fitted with the thermometric switch/transmitter and water temperature sensor.
  Valve travel at 79 ± 2°C {174 ± 3.6°F} = 0.3 mm {0.012 in.}
  Valve travel at 92 ± 2°C {198 ± 3.6°F}, min. 7.5 mm {0.30 in.}

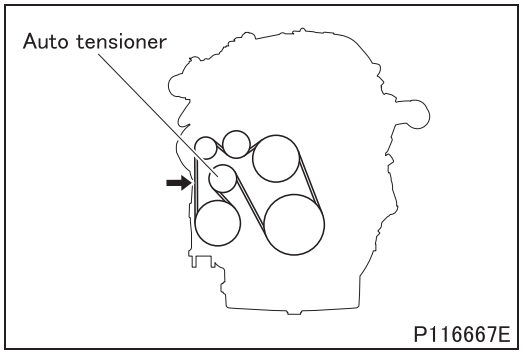
Possible causes \ Symptoms		Overheating (poor cooling)	Overcooling	Abnormal noise	Excessive coolant loss	Electronic control unit diagnosis lamp	Reference Gr
V-belt	Damaged	O				O	
	Oil on belt	O					
Water pump	Incorrectly mounted water pump	O		O	O	O	
	Defective gasket	O			O	O	
	Defective water pump	O		O	O	O	
Thermostat	Incorrectly mounted thermostat	O			O	O	
	Defective gasket	O			O	O	
	Valve opening temperature too high (valve remains closed)	O				O	
	Valve opening temperature too low (valve remains open)		O				
	Leakage from coolant temperature sensor	O			O		
Radiator	Clogged core	O				O	
	Cracked core and/or separation in welds	O			O	O	
	Cracks in upper tank and/or lower tank	O			O	O	
Automatic cooling fan coupling	Defective bearing	O		O		O	
	Damaged bimetal	O				O	
	Contaminated bimetal	O	O			O	
	Silicone oil leakage	O		O		O	
Cylinder head	Incorrectly mounted cylinder head	O			O	O	Gr11
	Defective gasket	O			O	O	
Oil cooler	Incorrectly mounted oil cooler	O			O	O	Gr12
	Defective gasket	O			O	O	
Exhaust gas recirculation-related items	Incorrectly mounted exhaust gas recirculation gas pipes			O		O	Gr17
	Incorrectly mounted exhaust gas recirculation coolant pipes	O			O		
	Exhaust gas recirculation cooler clogged (coolant side)	O					
	Damaged O-ring (exhaust gas recirculation-coolant sealing)	O			O		
Poorly airtight pressure cap		O			O	O	
Insufficient coolant amount, contaminated coolant		O				O	
Clogged or scaled coolant passage		O				O	
Incorrectly connected hoses		O			O	O	
Incorrectly connected pipes		O			O	O	
Excessively low exterior temperature			O				

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection of Auto Tensioner

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
ⓒa	Sonic belt tension gauge  92054	ME357715	Measurement of tension of belt



- The fan belt is automatically adjusted for proper tension by the auto tensioner. So, check the auto tensioner for correct operation.
- Confirm that the tension pulley moves smoothly when each of the midpoints between pulleys of the fan belt indicated by the arrows is pushed with your palm or pull on it.

1.1 Looseness of belt

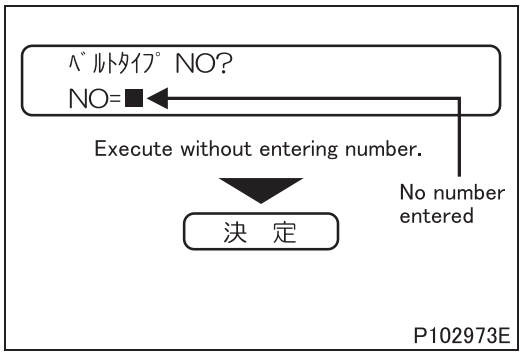
- Use a sonic belt tension gauge to check to see that the belt tension is within the standard.

[Inspection of tension]

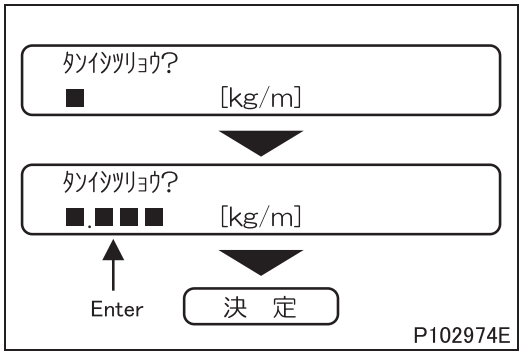
- Measurement using sonic belt tension gauge
- Direct the sensor microphone of ⓒa to the position shown in the illustration and measure the belt tension. For the operation of the sonic belt tension gauge, see the instruction manual of the tension gauge.
  ⓒa: Sonic belt tension gauge ME357715

CAUTION ⚠

- **When checking or adjusting the belt tension, measure the belt tension with the belt surface temperature being similar to the room temperature. Higher temperature will increase the belt tension, leading to incorrect tension measurements.**

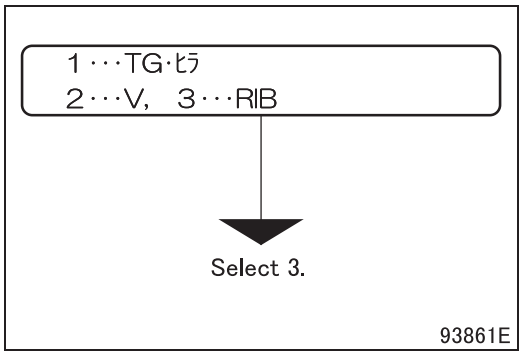


- Turn on ⓒa.
- Press “決定 (means “execute”)” key with no belt type number entered.
- Set the sensitivity of its sensor microphone when measuring the belt tension.
  ON (低 : means “low”): Measuring in noisy environment, or outdoors in heavy wind
  ON (高 : means “high”):Measuring in silent environment, or measuring a hard-to-vibrate belt

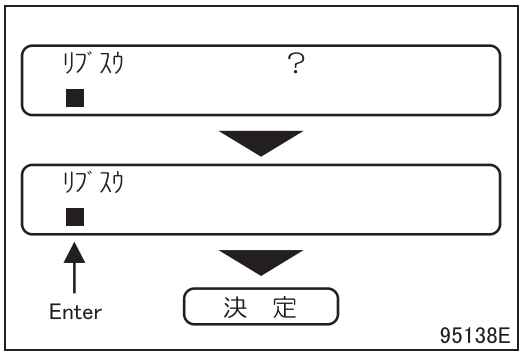


- Enter the unit mass of the belt and push “決定 (means “execute”)”.

Measuring point on the belt	Unit mass of the belt
Fan belt	0.016 kg/m

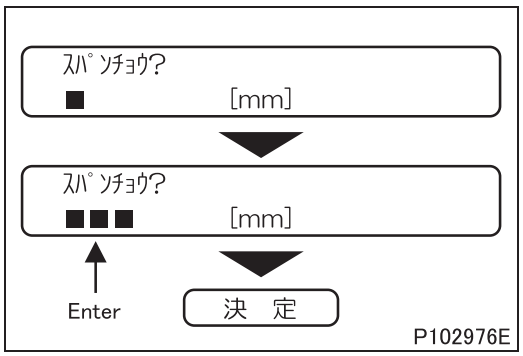


- Select the type of the belt. (Select “3” for ribbed belt.)



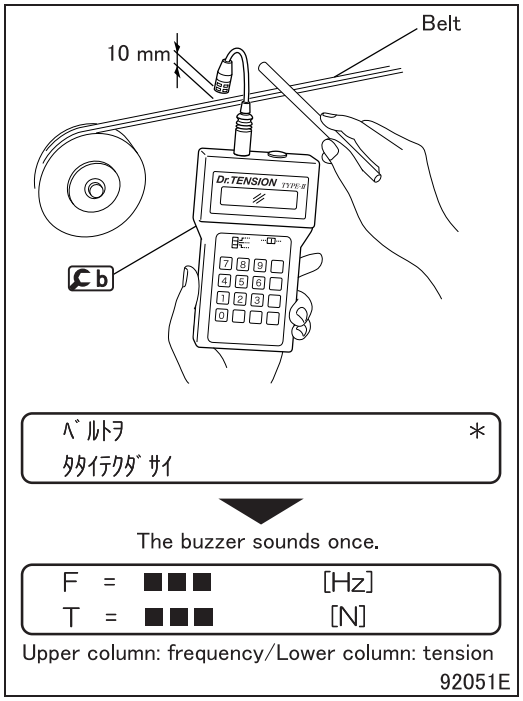
- Enter the number of ribs and push “決定 (means “execute”)”.

Measuring point on the belt	Number of ribs
Fan belt	7



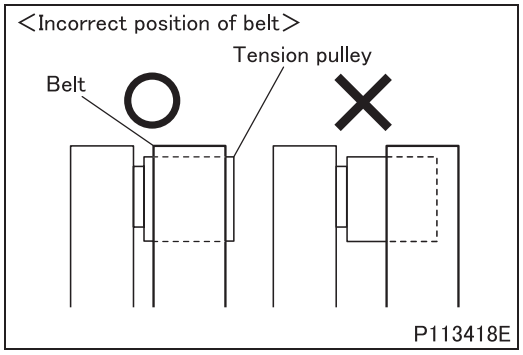
- Enter the length of span and push “決定 (means “execute”)”.

Measuring point on the belt	Length of span
Fan belt	202 mm



- Set the sensor microphone of approx. 10 mm {0.39 in.} above the belt, at the middle position between pulleys.
- Tap the belt lightly with a grip of a screwdriver to vibrate the belt.
- Measure the tension a few times and calculate the average value.

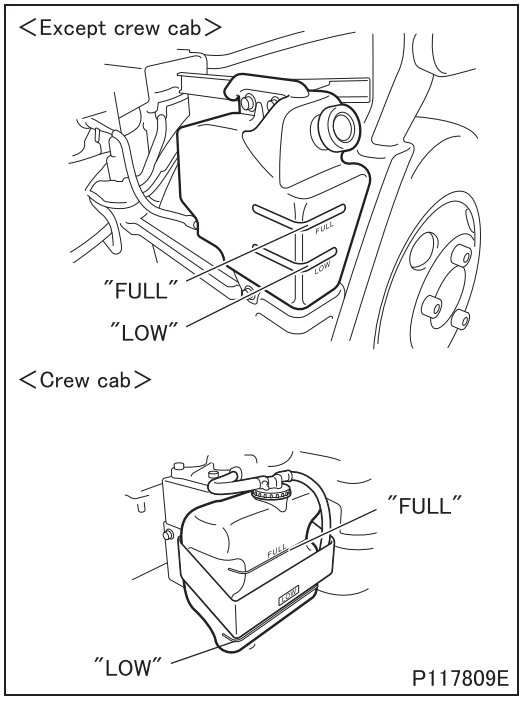
Standard value	300 to 700 N



- Confirm that the belt is in correct alignment with the tension pulley.

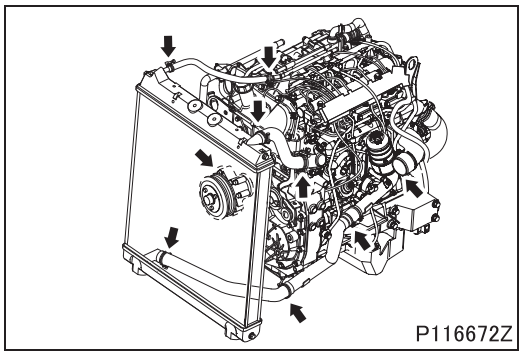
- If the belt is not in correct alignment with tension pulley, check the auto tensioner or replace the belt with a new one.

2. Inspection of Coolant Level



- Perform the coolant level inspection when the coolant is cold before the engine is started.
- Confirm that the coolant level is between the “FULL” and “LOW” lines of the reservoir tank.
- If the coolant level is lower than the “LOW” line, check that the cooling system for leaks. If no leaks are found, then add coolant up to the “FULL” line. Use coolant containing the predetermined amount of coolant to protect the cooling system from freezing and corrosion. (See the Owner’s Manual for how to prepare the coolant.)
- If the coolant level is abnormally low or lowers in an abnormally short period of time, the cooling system may be leaking. Inspect the system for leaks. (See “3. Inspection for coolant leaks” in ON-VEHICLE INSPECTION AND ADJUSTMENT.)

3. Inspection for Coolant Leaks



- Sufficiently warm up the engine. With the engine still running at idle, check that no coolant leaks from the radiator, reservoir tank, water pump, radiator hose, heater hose, or other associated components.
- If there is a coolant leak, check connections of the corresponding components. Tighten any loose connections to the specified torques. Replace any cracked or otherwise damaged part with a new one. (See later section.)

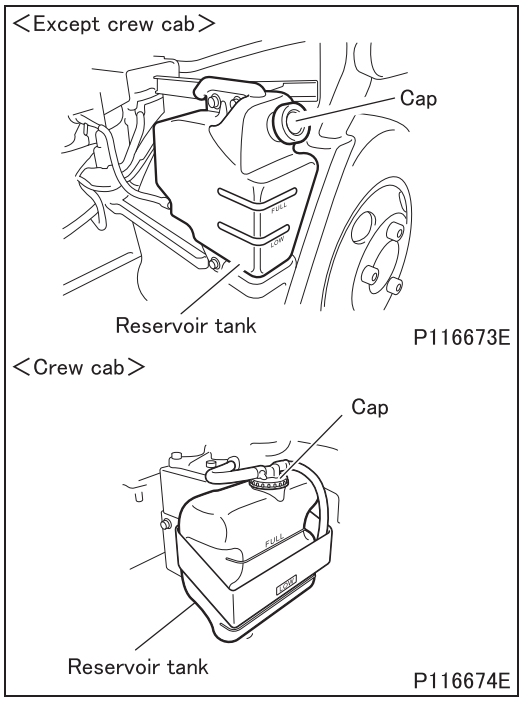
4. Coolant Replacement and Cleaning of Cooling System

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

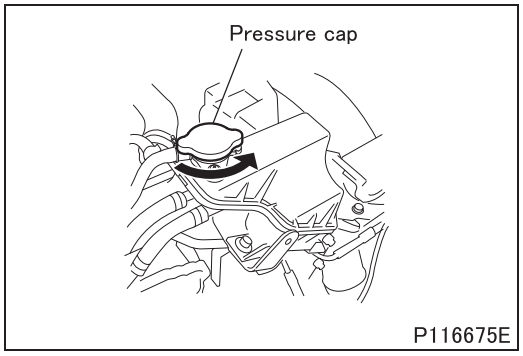
Mark	Parts to be tightened	Tightening torque	Remarks
–	Radiator drain cock	2.5 ± 0.5 {1.8 ± 0.4, 0.3 ± 0.1}	–

- Using the radiator for extended periods of time without cleaning can increase chance of rust and scale formation, which may cause engine overheating. The cooling system must be cleaned periodically.

4.1 Draining of coolant



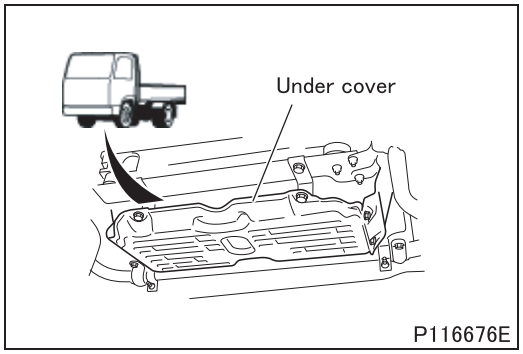
- Place a container to catch coolant under the radiator drain cock.
- Remove the cap from the reservoir tank.



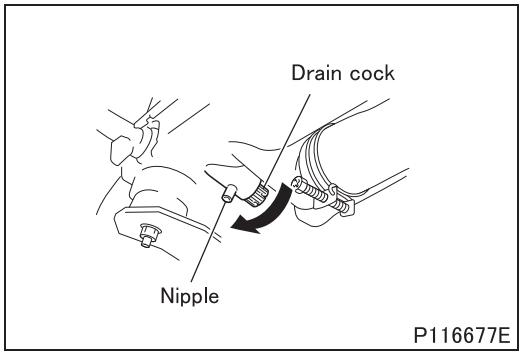
- Before draining the coolant, loosen the pressure cap to reduce the pressure in the cooling system. Remember to drain the coolant out of the reservoir tank as well.

WARNING ⚠

- **Drain the coolant only after it has cooled sufficiently to avoid getting scalded.**
- **Opening the pressure cap while the coolant temperature is still high can cause hot coolant to spray out. Cover the pressure cap with a cloth, and loosen it slowly to let the pressure out before opening it fully.**



- Remove the under cover below the radiator, if the vehicle is so equipped.



- Loosen the radiator drain cock to let the coolant run through the nipple.

4.2 Cleaning procedure

- Using coolant additive
  To prevent the cooling system freezing up and minimize corrosion, use coolant or an equivalent. Coolant is an ethylene-glycol-based antifreeze (SAE J814-C) with both anti-freeze and anti-corrosion properties. Dilute it with soft water to the specified concentration.
- Keep the coolant temperature at approximately 90°C {194°F} so that the thermostat valve remains open and the coolant continues to circulate in the radiator.
- For the sake of convenience you can raise the coolant temperature quickly by covering the front of the radiator with corrugated cardboard or something similar.
- In cases where a large amount of rust has accumulated it is common for the radiator to leak as a result of cleaning. Conduct a thorough check for leakage after cleaning.
- After completing the cleaning, check the reservoir tank coolant level. Add coolant if necessary.
- If the coolant has been completely replaced, reset the service and maintenance memory of the multi-information system. (See Chapter 6 “Multi-information system” of Owner’s Manual.)

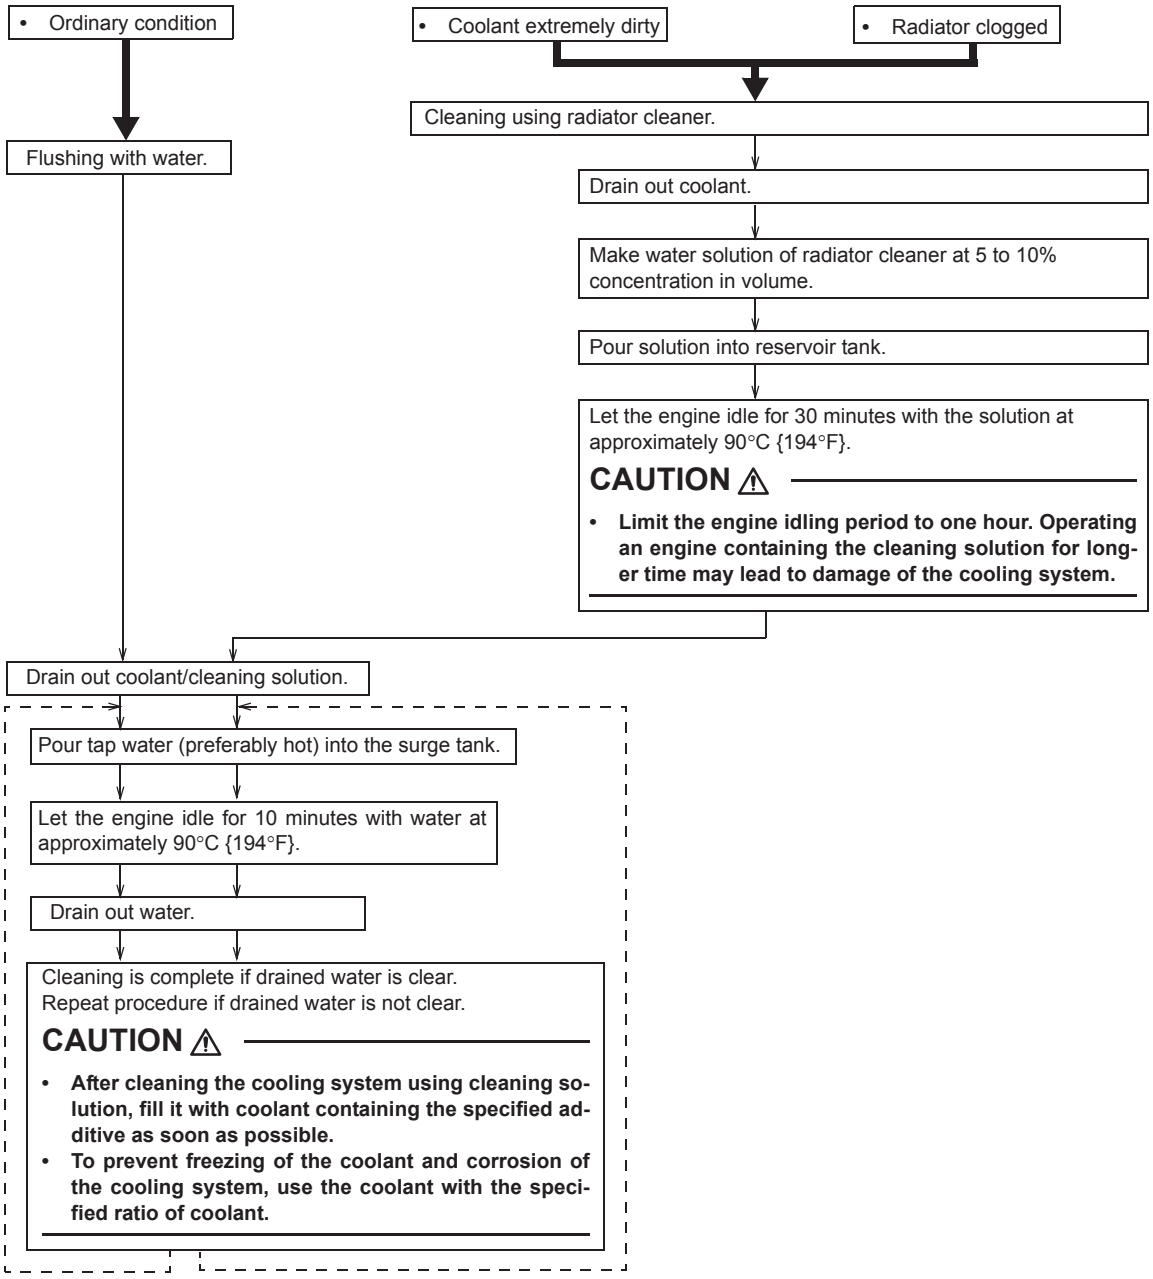
WARNING ⚠

- **If you splash coolant in your eye, immediately rinse the eye with water and then seek medical attention.**

CAUTION ⚠

- **Coolant is flammable. Never bring an open flame close to it.**

- Select an appropriate cleaning method according to the condition of the cooling system as shown below.



5. Air Bleeding of Cooling System

- With the pressure cap removed and the coolant temperature at 90°C {194°F}, let the engine idle in order to bleed air completely out of the cooling system.
- After air bleeding is completed, refill the surge tank with coolant as needed.

6. Air/Gas Leakage Test

- Presence of air or exhaust gas in coolant accelerates corrosion of the cooling system components. To prevent this, carry out air/gas leakage tests in accordance with the following procedure.
- Remove the pressure cap.

WARNING ⚠

- **If the engine is hot, boiling coolant may spurt out from the filler port when the pressure cap is loosened. To avoid burning yourself, make sure to remove the pressure cap only when the coolant is cold.**

- Run the engine until the coolant temperature rises to approximately 90°C {194°F}.
- If air bubbles appear continuously through the filler port, there is air or exhaust gas penetrating into the cooling system.
- Presence of air in coolant can be an indication of loose cylinder head bolts, loose water pump mounting bolts, loose hose connections, and/or a damaged hose.
- Presence of exhaust gas in coolant can be an indication of a damaged cylinder head gasket and/or cracks in the cylinder head.

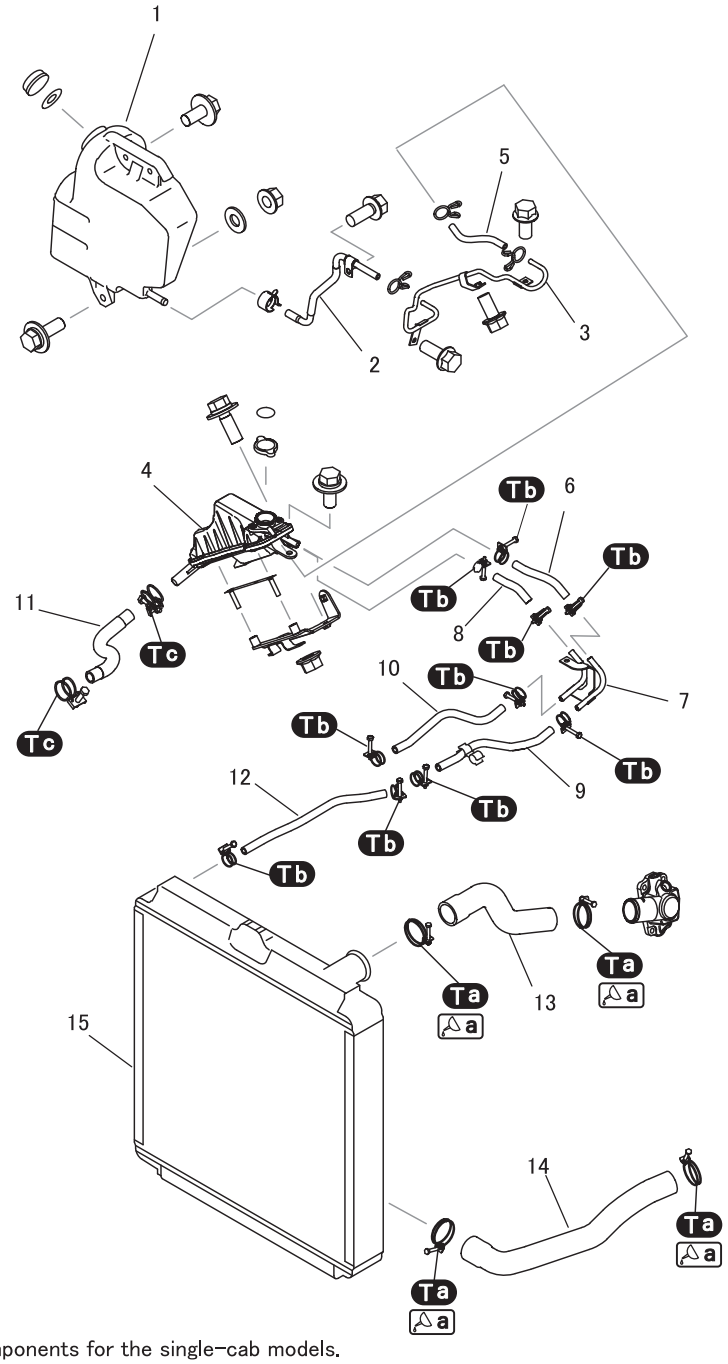
7. Inspection of Cracks or Damage of the Belt

- If a belt is cracked or otherwise damaged, have it replaced it as soon as possible. Belt replacement requires component disassembly.

Belt condition	Remaining service life (reference)
 Piece(s) missing from rib(s) P110542E	• The belt has reached the end of its service life and must be replaced.

DISCONNECTION AND CONNECTION OF HOSES AND PIPES

Radiator Hose and Pipe



This drawing shows the components for the single-cab models.

P116679E-1

● Removal sequence

1 Reservoir tank (See later section.)
2 Water hose A
3 Water pipe A
4 Surge tank (See later section.)
5 Water hose B
6 Water hose C
7 Water pipe B
8 Water hose D
9 Water hose E
10 Water hose F
11 Supply hose
12 Water hose G
13 Upper radiator hose
14 Lower radiator hose
15 Radiator (See later section.)

● Installation sequence

Follow the removal sequence in reverse.

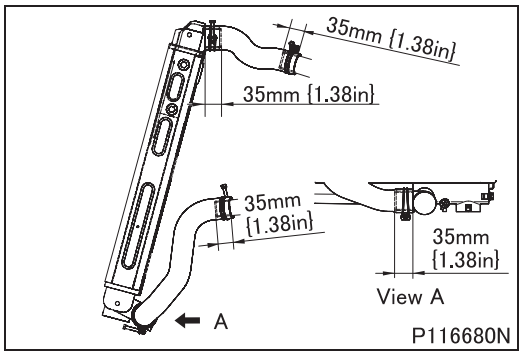
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Clamp	4.0 ± 0.1 {3.0 ± 0.1, 0.4 ± 0.01}	Wet
Tb	Clamp	1 ± 0.5 {0.7 ± 0.4, 0.1 ± 0.05}	–
Tc	Clamp	2.25 ± 0.25 {1.71 ± 0.2, 0.2 ± 0.03}	–

Lubricant and/or sealant

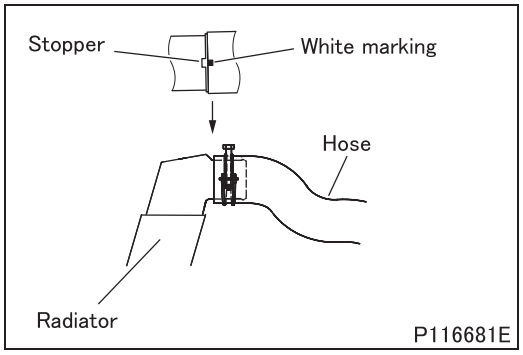
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Clamp	Engine oil	As required

◆Installation procedure◆

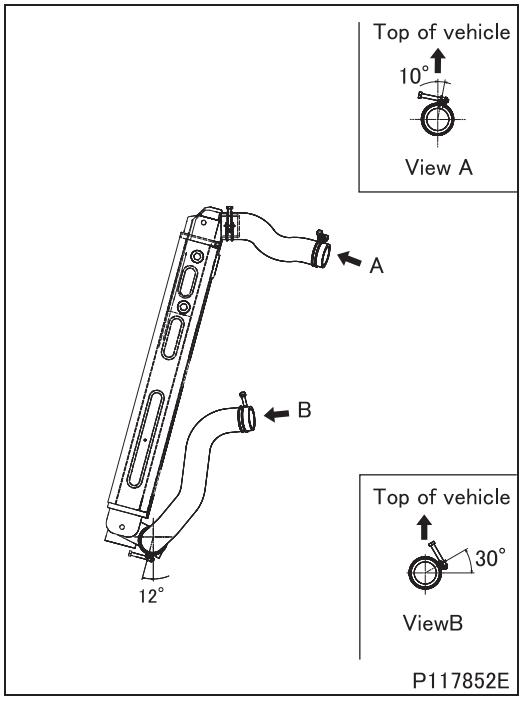


■ **Installation: Upper radiator hose, lower radiator hose**

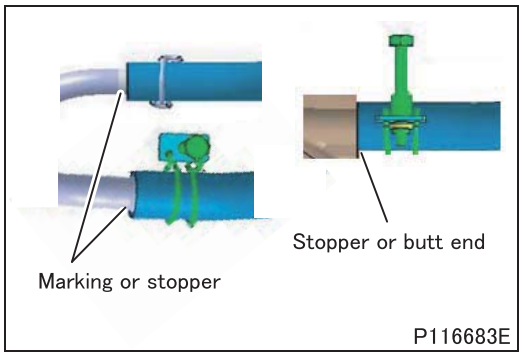
- Each hose end should overlap with the fitting to the dimension shown in the illustration.



- Install the radiator end of the radiator hose with its white marking aligned with the stopper on the hose fitting of the radiator.

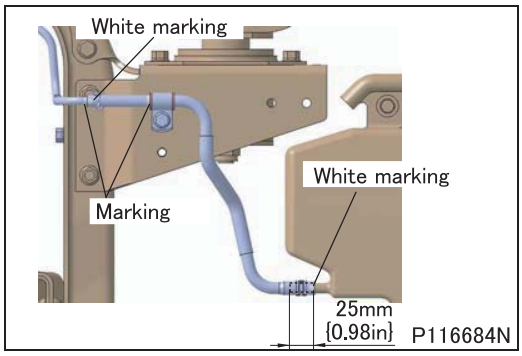


- Install the clamps at the angles shown.



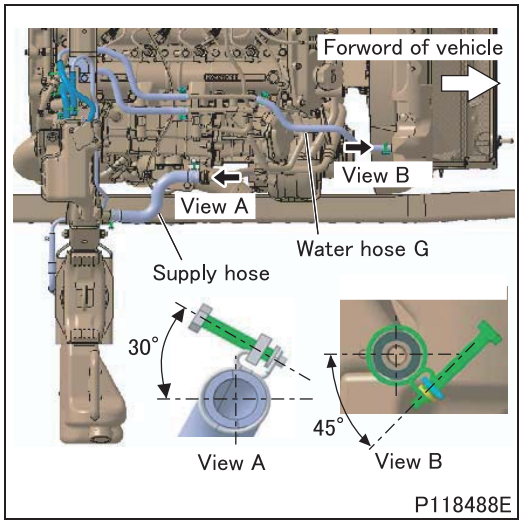
■ Installation: Water hose, water pipe

- Insert the water hose all the way up to the stopper or marking on the water pipe.
- Insert the reservoir tank end of the water hose all the way until it stops against the stopper or butt end.
- The white or yellow marking on the water hose, if provided, should face upward of the vehicle when the water hose is installed.



- The reservoir tank end of the water hose should overlap with the filling by 25 mm {0.98 in.} and the white marking should face the rear of the vehicle. Affix the hose on the cab bridge while making the edges of the clips align with the markings on the hose as shown in the illustration.
- Be careful to direction of clamp, and check interference of the other parts on periphery.

- Fasten the clamps firmly.

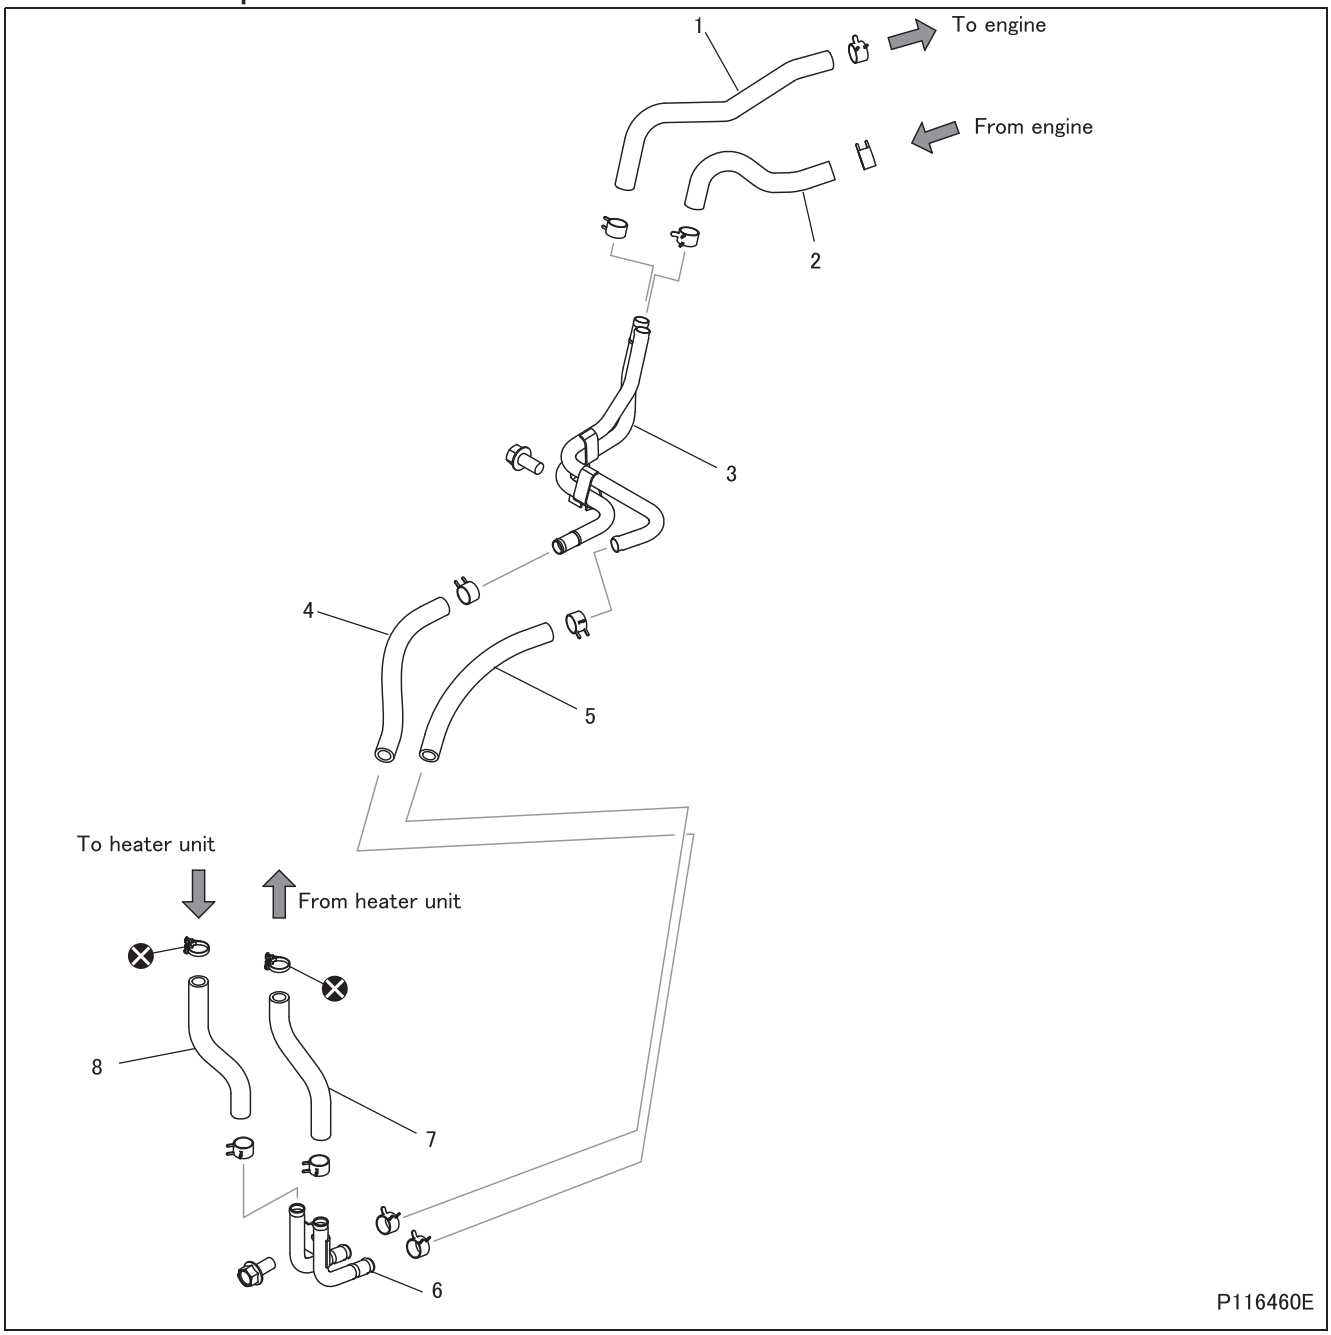


■ **Installation: Supply hose, water hose G**

- Install the supply hose clamp at the angle shown.
- Install clamp of the water hose G at the angle shown.
- Be careful to direction of clamp, and check interference of the other parts on periphery.

DISCONNECTION AND CONNECTION OF HOSES AND PIPES

Heater Hose and Pipe <Front Heater>



● **Removal sequence**

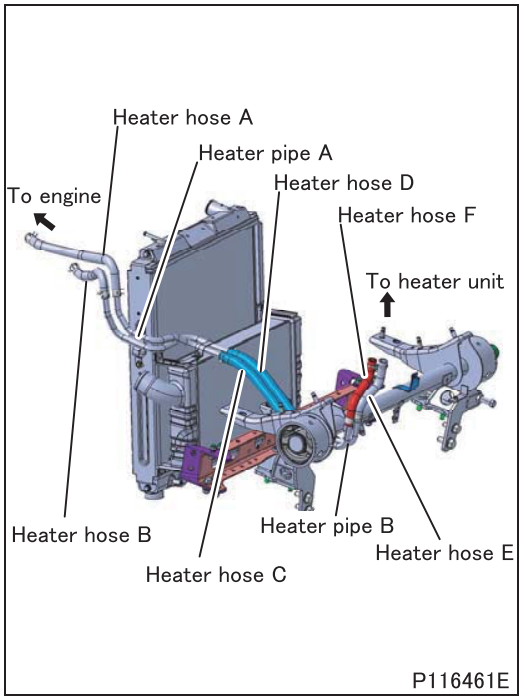
1 Heater hose A
2 Heater hose B
3 Heater pipe A
4 Heater hose C
5 Heater hose D
6 Heater pipe C
7 Heater hose E
8 Heater hose F

⊗: Non-reusable parts

● **Installation sequence**

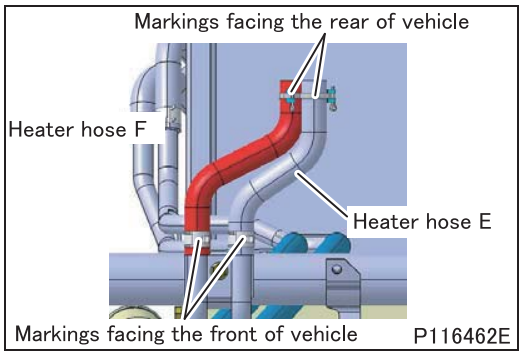
Follow the removal sequence in reverse.

◆Installation procedure◆



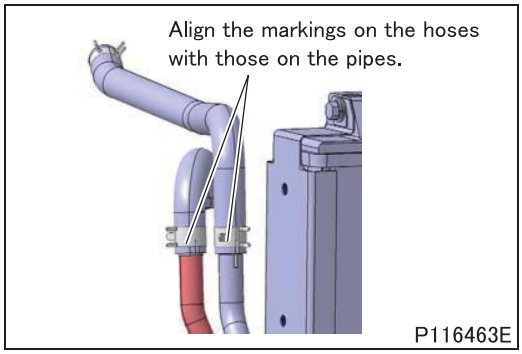
■ Installation: Heater hoses, heater pipes

- Install the heater hoses to the pipes as shown in the illustration.



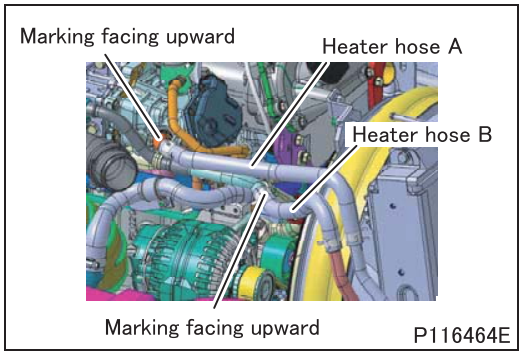
■ Installation: Heater hose E, heater hose F

- Connect the heater hoses E and F to the heater unit with the markings facing the rear of the vehicle and to the heater pipes C with the markings facing the front of the vehicle.



■ Installation: Heater hose A, heater hose B

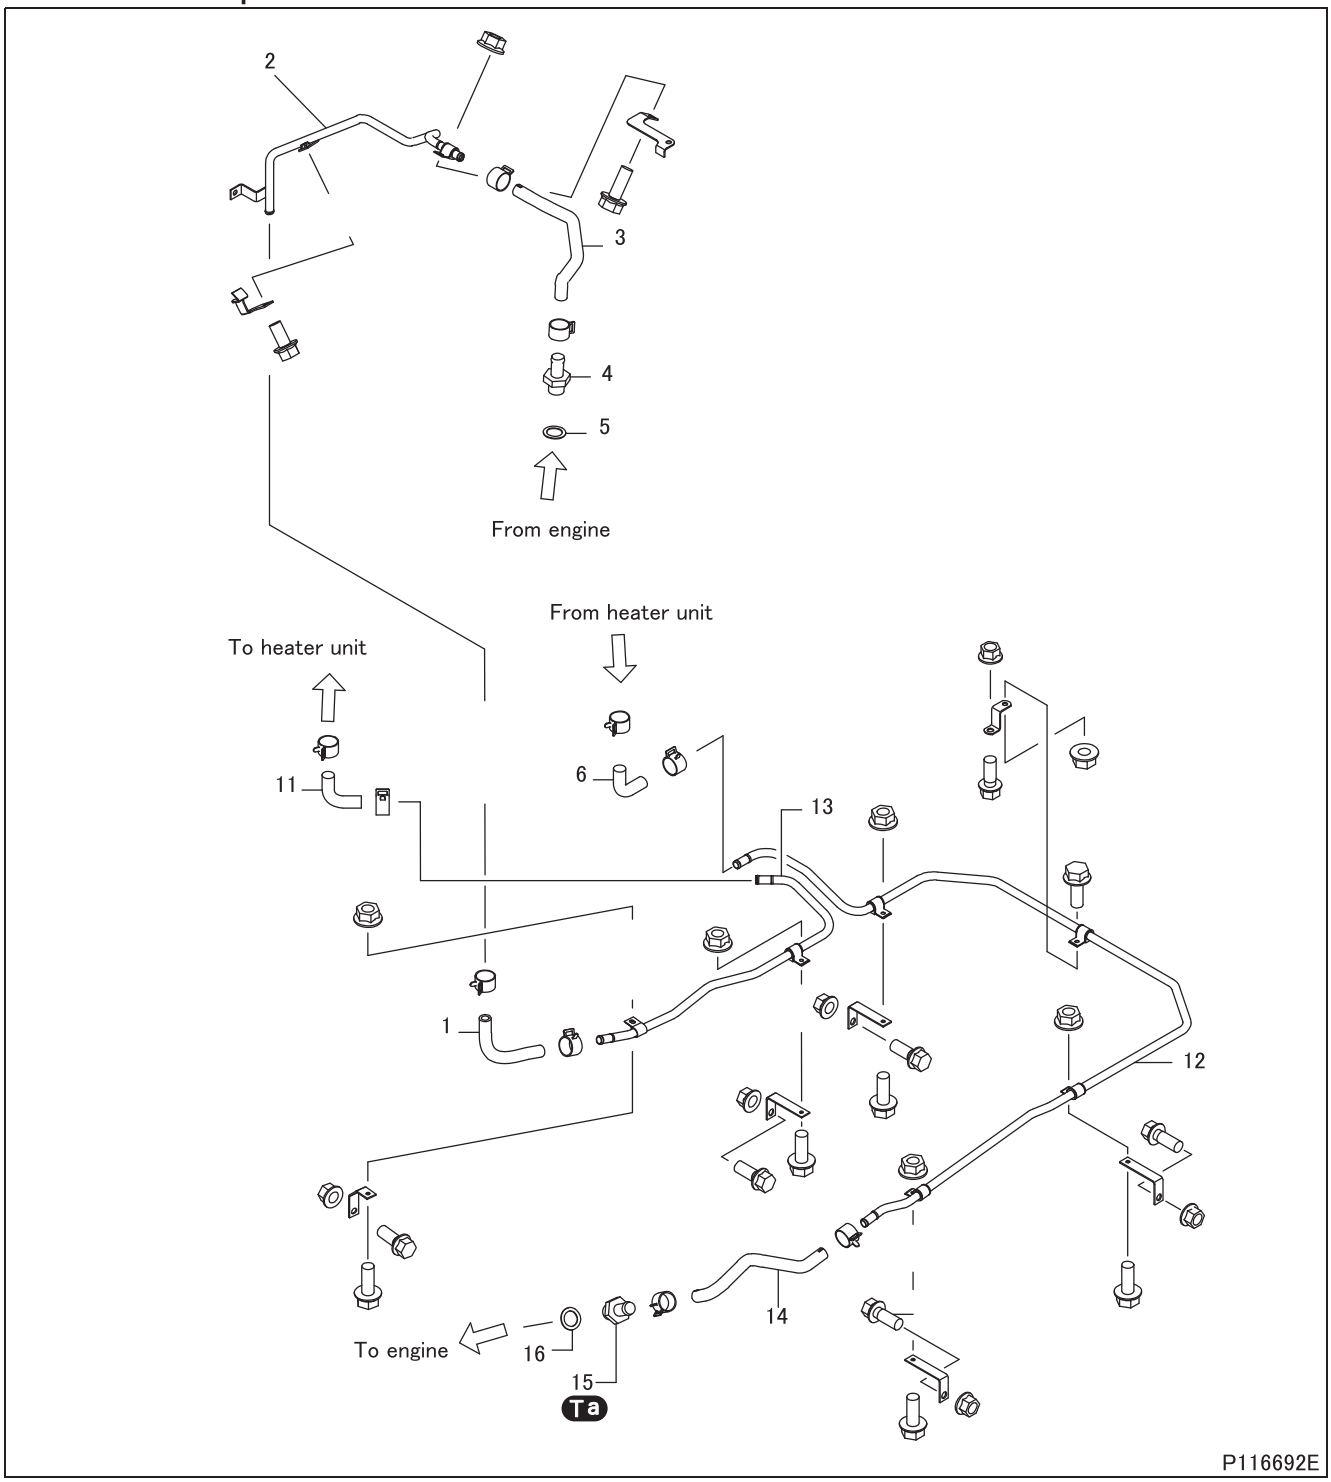
- Connect the hoses aligning the shown markings with each other.



■ **Installation: Heater hose A, heater hose B**

- Install the engine ends of the hoses with the markings facing upward.

Heater Hose and Pipe <Rear Heater>



● **Removal sequence**

1 Heater hose A

15 Connector
16 Gasket

DISCONNECTION AND CONNECTION OF HOSES AND PIPES

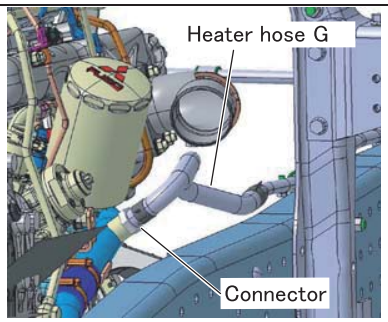
● Installation sequence

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Connector	50 to 60 {37 to 44, 5.1 to 6.1}	–

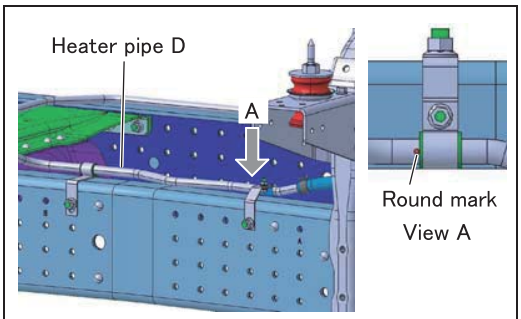
◆Installation procedure◆



P116693E

■ Installation: Connector, heater hose G

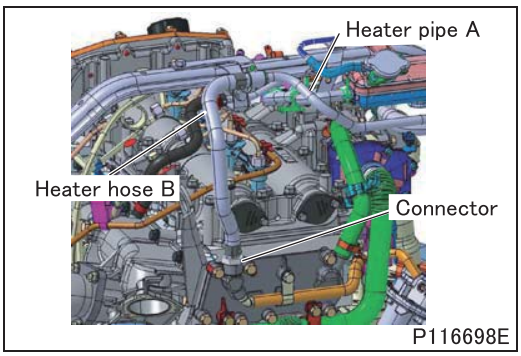
- Install the gasket and connector on the connection fitting on the engine side.
- Connect the heater hose G to the connector with its marking facing upward. Connect the heater hose G to the heater pipe D with the markings on them aligned with each other.



P116697E

■ Installation: Heater pipe D

- Install heater pipe D with its round mark facing upward and aligned with the edge of the clip.



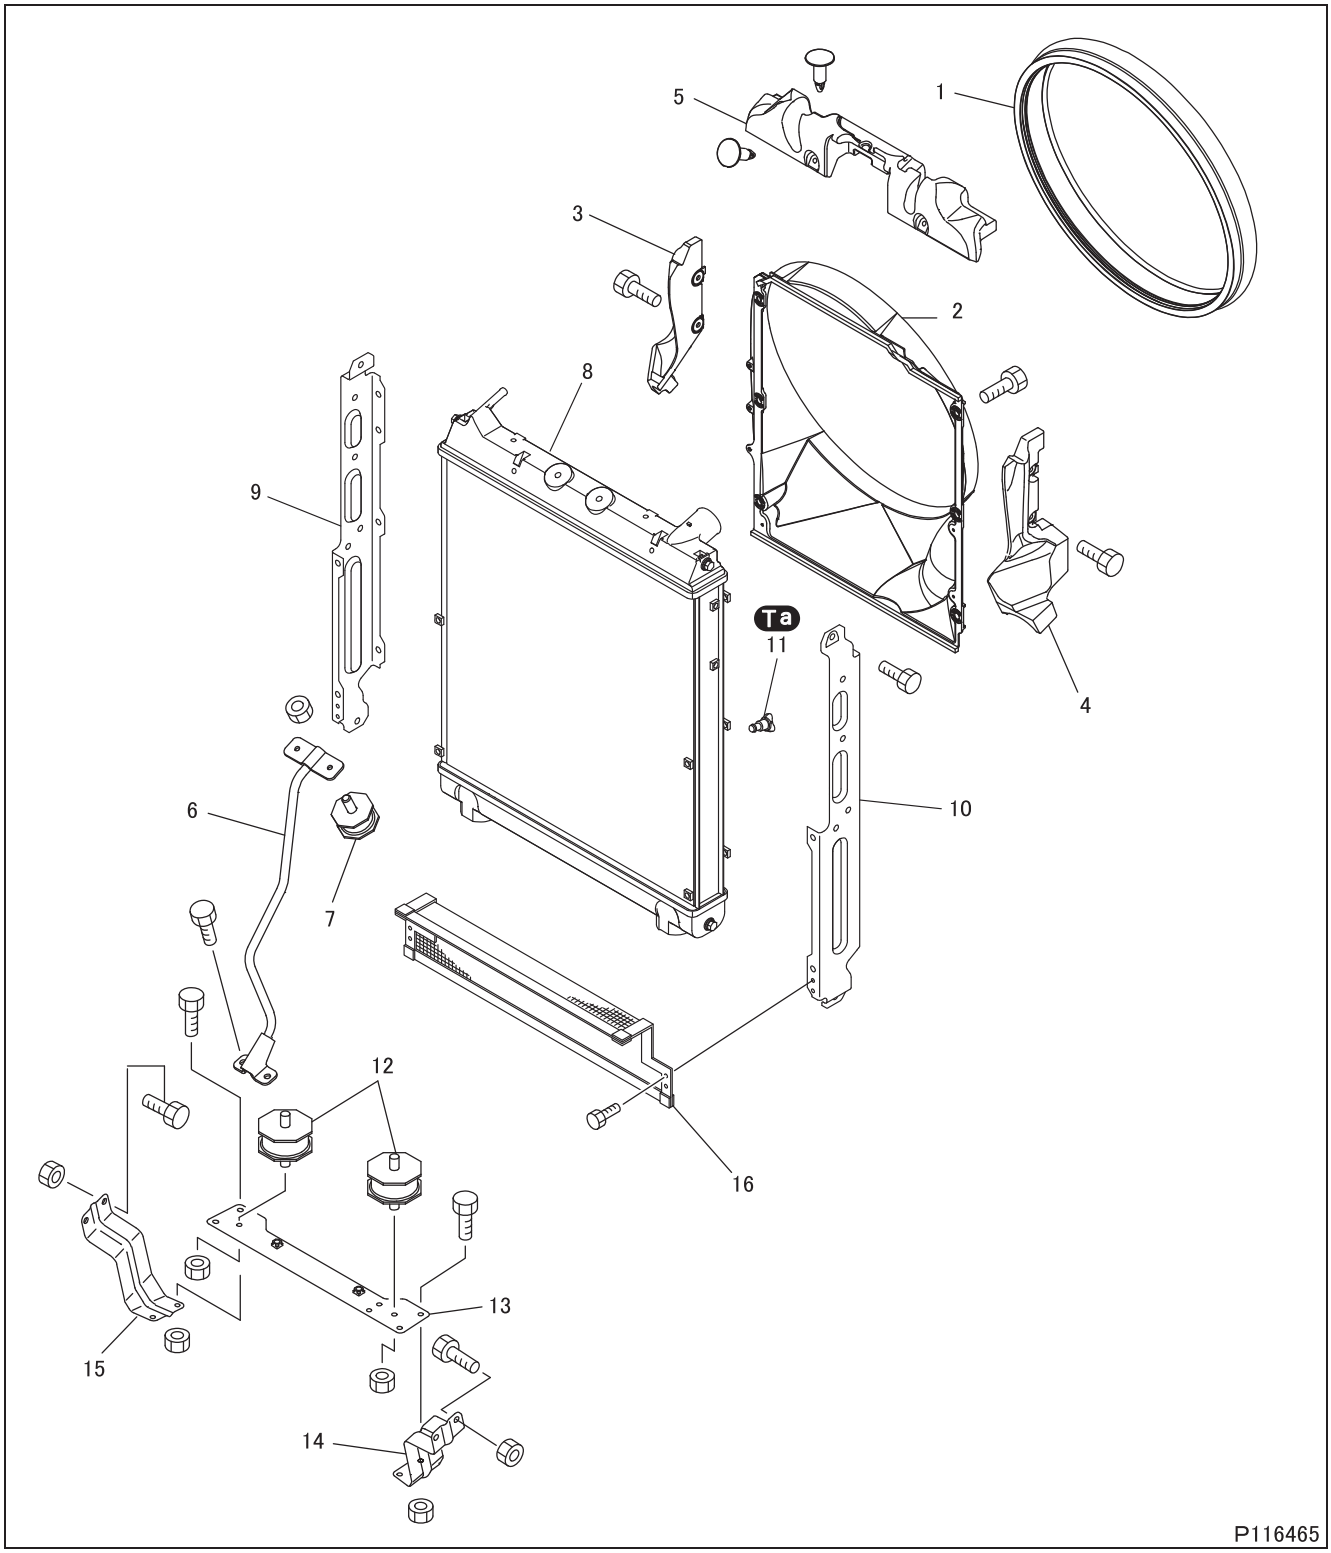
P116698E

■ Installation: Connector, heater hose B

- Install the gasket and connector on the connection fitting on the engine side.
- Connect the heater hose B to the connector with its marking facing the rear of the vehicle. Connect the heater hose B to the heater pipe A with its marking facing upward.

M E M O

RADIATOR



● **Removal sequence**

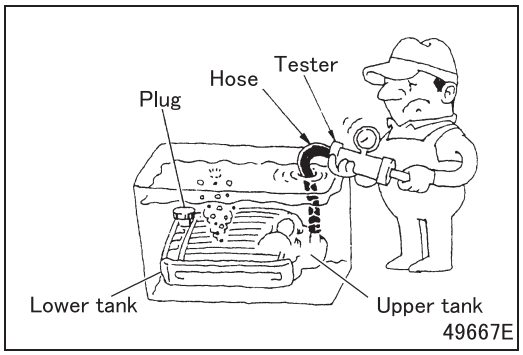
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
8	Air leakage from radiator (air pressure 147 kPa {21 psi, 1.47 kgf/cm^2})	0 cm^3 {0 mL}	–	Repair or replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Radiator drain cock	2.5 ± 0.5 {1.8 ± 0.4, 0.3 ± 0.1}	–

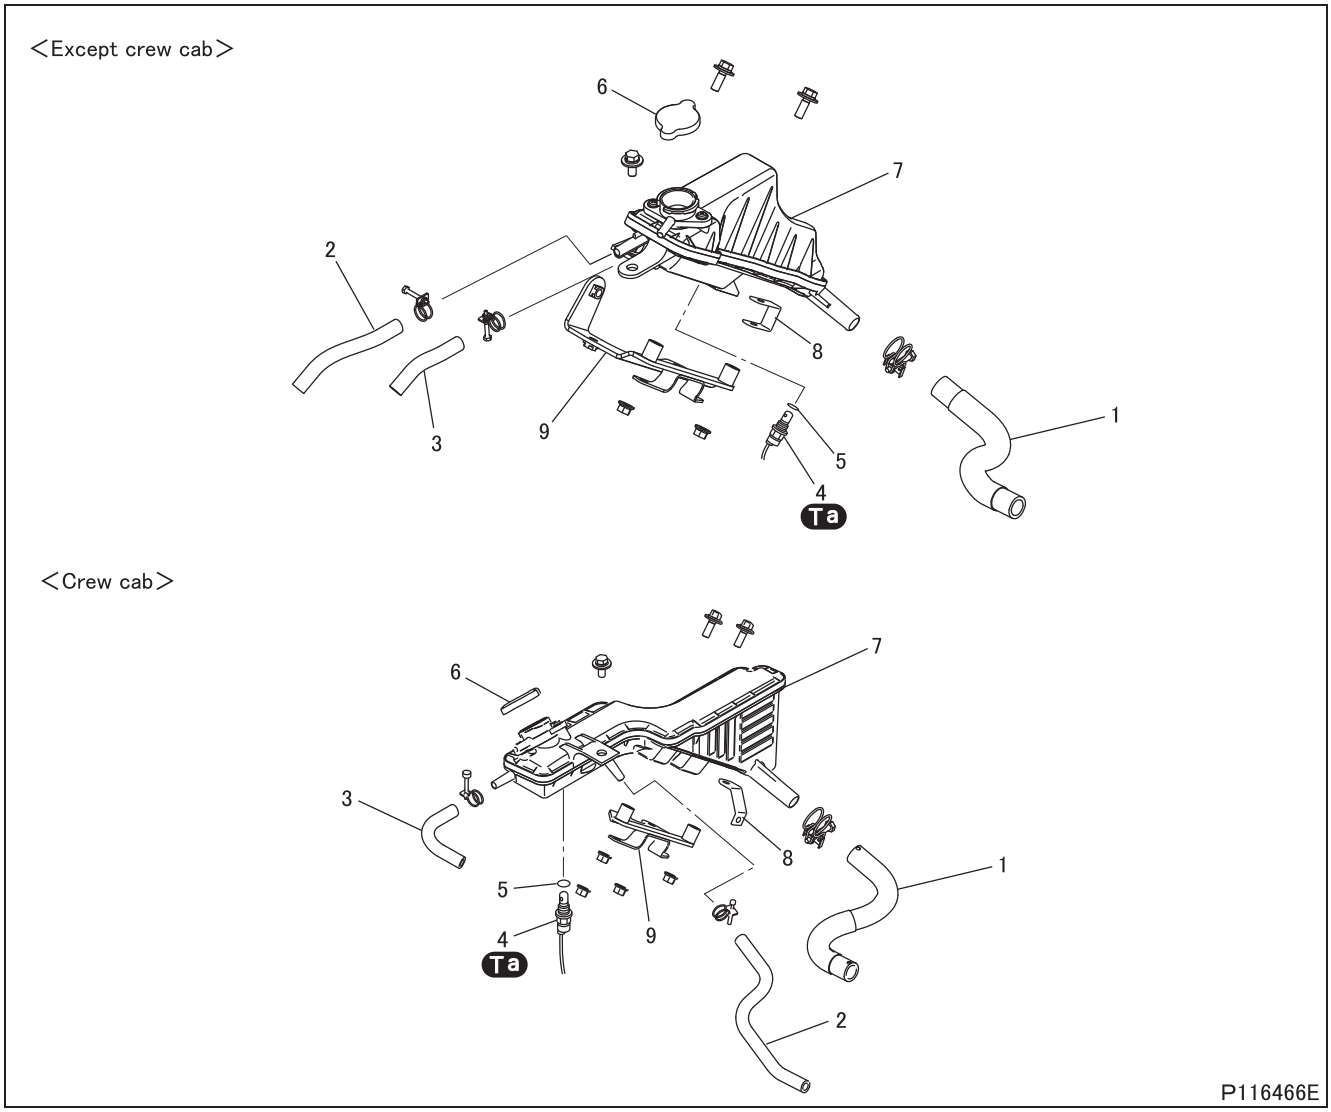
◆Inspection procedure◆



■ Inspection: Radiator air leakage

- Connect a hose and radiator cap tester to the upper tank.
- Plug the lower tank and put the entire radiator into a tank filled with water.
- Use the radiator cap tester to apply an air pressure of 147 kPa {21 psi, 1.47 kgf/cm^2} and check for air leakage.
- If air leakage is found, replace the radiator.

PRESSURE CAP, SURGE TANK



● **Removal sequence**

1 Water hose A
2 Water hose B

Follow the removal sequence in reverse.

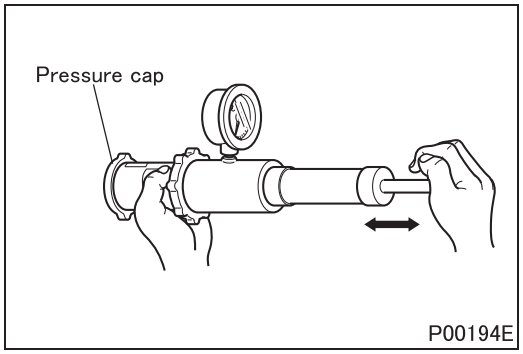
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
1	Pressure cap valve opening pressure	110 ± 15 kPa {16 ± 2.2 psi, 1.1 ± 0.15 kgf/cm^2}	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Water level sensor	$3\ ^{+1}_{0}$ {$2.2\ ^{+0.7}_{0}$, $0.3\ ^{+0.1}_{0}$}	–

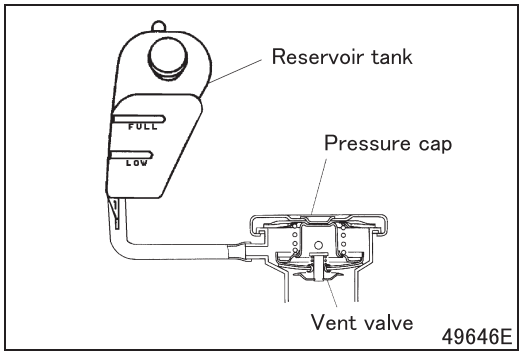
◆Inspection procedure◆



■ **Inspection: Pressure cap**

(1) Pressure valve opening pressure

- Measure the pressure valve opening pressure using a pressure cap tester.
- Replace the pressure cap if the measured value deviates from the standard value range.



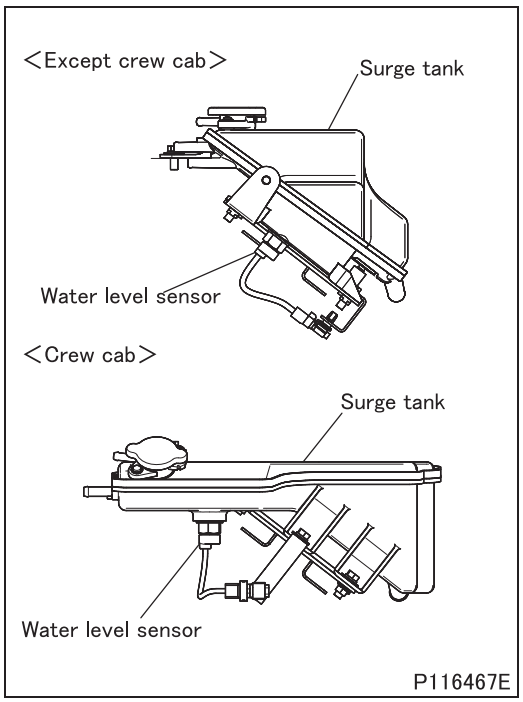
(2) Inspection: Vent valve

- Check the reservoir tank for water level in advance.
- Let the engine run at high speeds and, when a certain amount of coolant overflows to the reservoir tank, stop the engine.
- Leave the unit to stand for some time. When the coolant temperature becomes the atmospheric temperature, check that the water level of the reservoir tank is the same as that before the engine was started.
- If the water level does not lower, the vent valve is faulty. So, replace the pressure cap with a new one.

CAUTION ⚠

- **If the pressure cap is removed before the coolant temperature lowers to the atmospheric level, a vacuum develops inside the radiator, so that the coolant cannot return to the reservoir tank.**

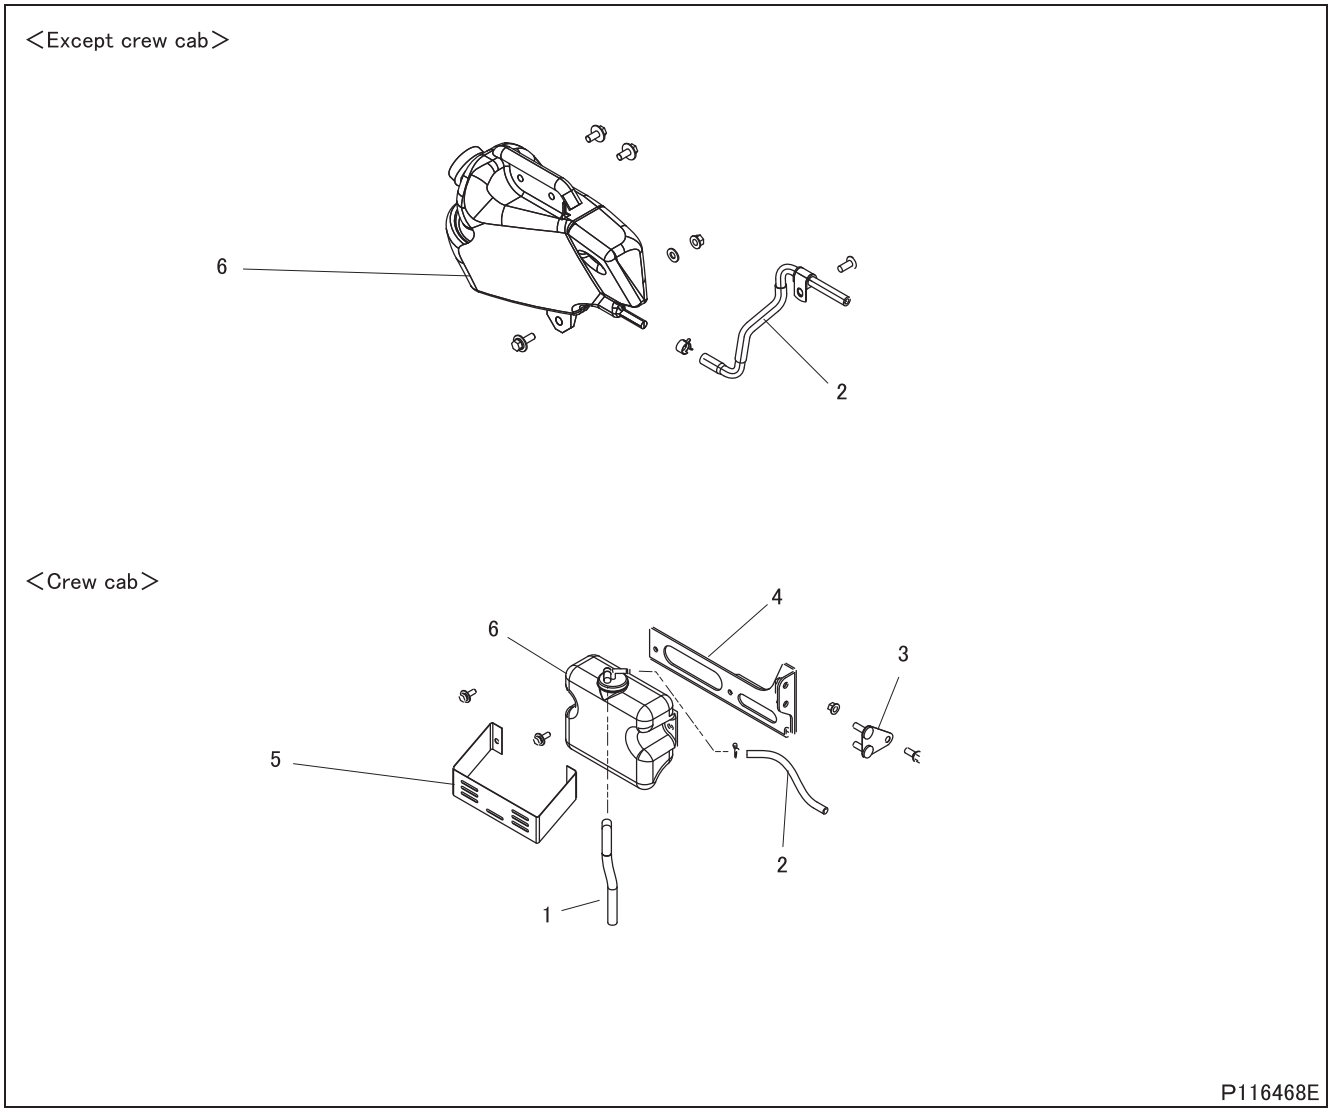
◆Installation procedure◆



■ **Installation: Water level sensor**

- The water level sensor is installed on the surge tank.

RESERVOIR TANK



● **Removal sequence**

1 Water hose A
2 Water hose B

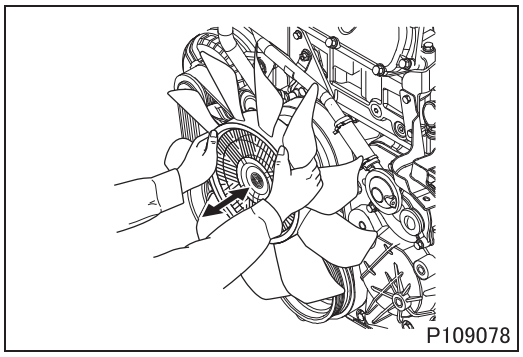
Tc	Bolt	19 to 28 {14 to 21, 1.9 to 2.8}	–
Td	Bolt	45 to 55 {33 to 41, 4.5 to 5.6}	–
Te	Bolt	32 to 48 {24 to 35, 3.3 to 4.9}	–

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
Ca	Coupling fan attachment tool A: 101 {3.98}, B: 12.7 {0.50}, C: 230 {9.06}  P116718	MH064219	Holding of fan pulley

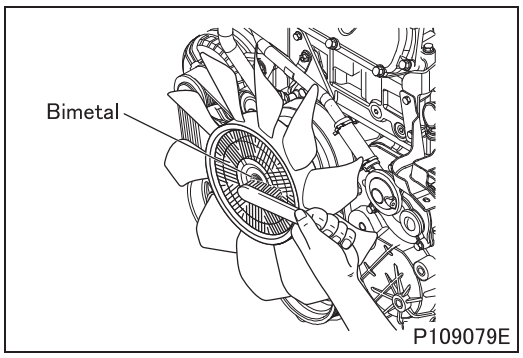
◆Inspection and cleaning procedure◆



P109078

■ **Inspection: Automatic cooling fan coupling**

- Make an inspection of the following points. Replace the automatic cooling fan coupling if defective.
  Check the followings.
  - The hydraulic oil sealed inside the coupling is not leaking.
  - The coupling does not make any abnormal noise or rotate unevenly due to defects in the inside bearing when rotated manually.
  - The automatic cooling fan coupling does not move too much when pushed and pulled in the axial directions when the engine is cold.

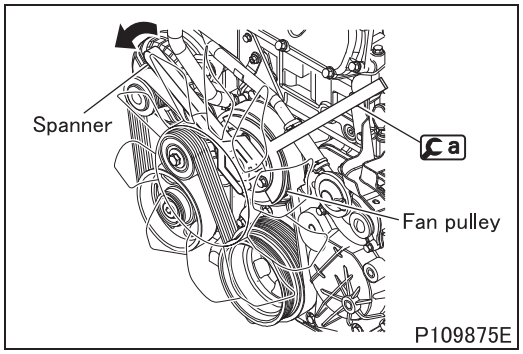


P109079E

■ **Cleaning: Automatic cooling fan coupling**

- When removing foreign matter from the bimetal, be careful not to press too hard against the bimetal.

◆Removal procedure◆



P109875E

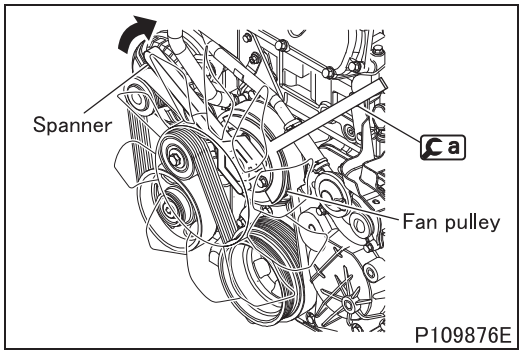
■ **Removal: Automatic cooling fan coupling**

- Fit Ca to the fan pulley.
- While holding Ca, remove the automatic cooling fan coupling.

CAUTION ⚠

- **The automatic cooling fan coupling has left hand thread.**

◆Installation procedure◆

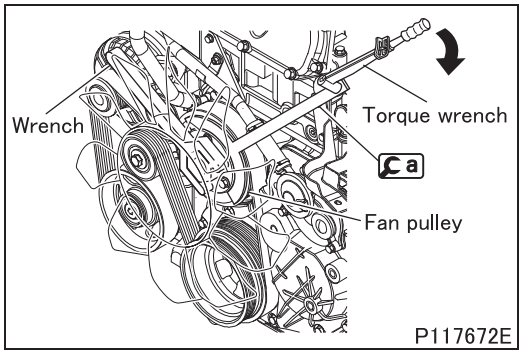


■ Installation: Automatic cooling fan coupling

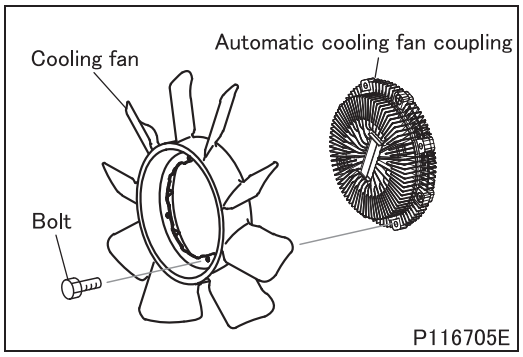
- Fit a to the fan pulley.
- While holding a, tighten the automatic cooling fan coupling to the specified torque.

CAUTION ⚠

- **The automatic cooling fan coupling has left hand thread.**

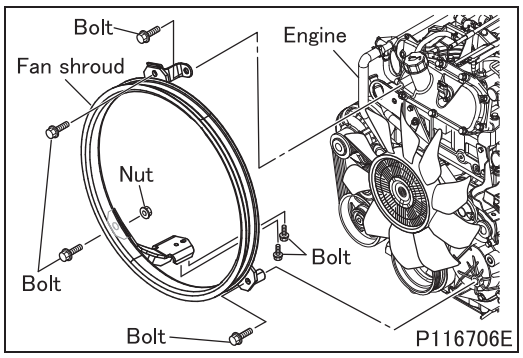


- If it is difficult to check the tightening torque during tightening the automatic cooling fan coupling, perform the following steps: set a torque wrench on a while holding down the automatic cooling fan coupling with a wrench and tighten the automatic cooling fan coupling by turning the fan pulley, to thereby check the tightening torque.
- In this case, the length 230 mm {9.06 in.} of a should be taken into consideration when setting the tightening torque.



■ Installation: Cooling fan

- Mount the cooling fan on the automatic cooling fan coupling.



■ Installation: Fan shroud

- Install the fan shroud on the engine main body.
- Make sure that, when assembled, there is the specified clearance between the fan shroud and cooling fan throughout the entire periphery.

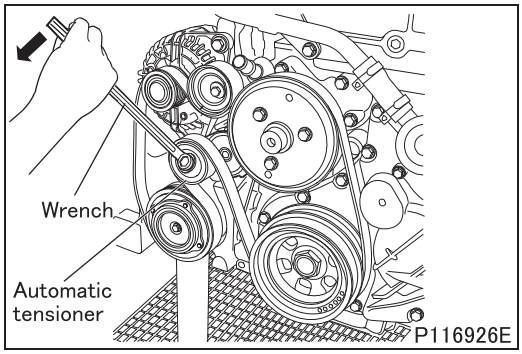
a	Wrench, alternator pulley  P116715	MH063986	Wrench for alternator pulley (free wheel) removal/refitting
b	Tool to retain engine flywheel  P116334	MH064205	Stop the rotation of the engine flywheel
c	Coupling fan attachment tool A: 101 {3.98}, B: 12.7 {0.50}, C: 230 {9.06}  P116718	MH064219	Holding of fan pulley

◆Removal procedure◆



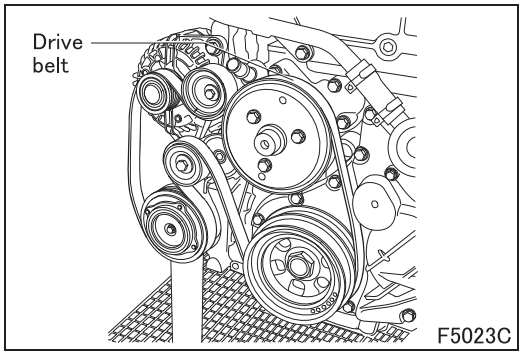
P116926E

■ Removal: Belt

- Using a wrench of an adequate type, operate automatic belt tensioner in the direction of the arrow to loosen the belt.

CAUTION ⚠

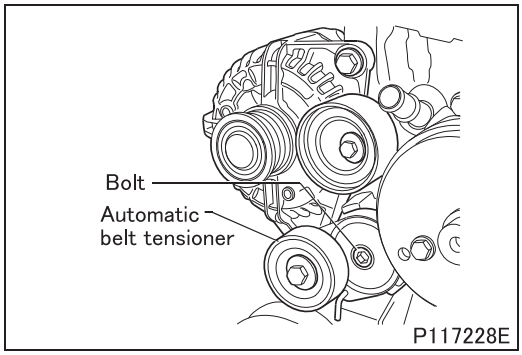
- **Use care not to allow your finger to be caught between the belt and pulley.**



F5023C

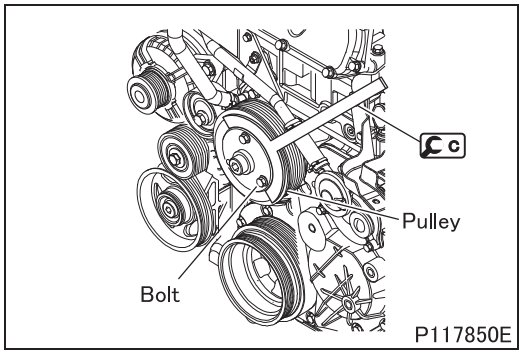
- Remove the auxiliary mechanism drive belt.

BELT, WATER PUMP, DAMPER PULLEY



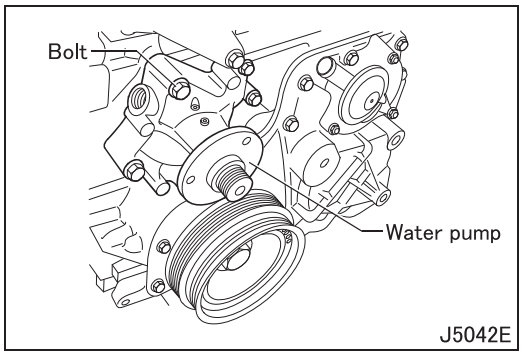
■ **Removal: Automatic belt tensioner**

- Loosen the bolt and remove the automatic belt tensioner.



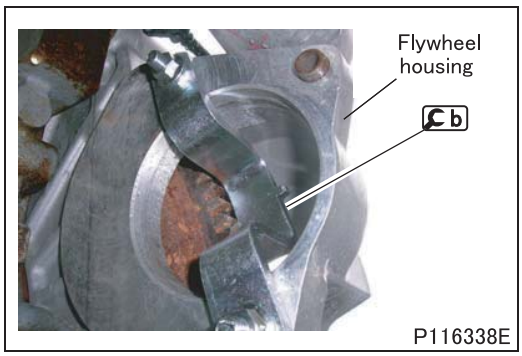
■ **Removal: Pulley**

- Fit c to the fan pulley.
- While holding c, remove the automatic cooling fan coupling.



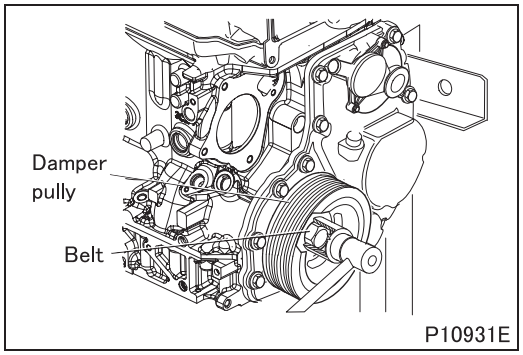
■ **Removal: Water pump**

- Unscrew and remove the attaching bolts; remove the water pump taking care to remove the gasket.

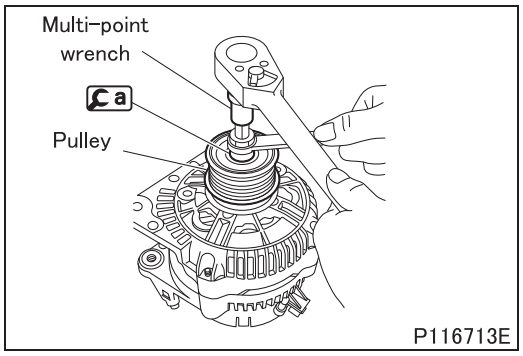


■ **Removal: Damper pulley**

- Using b, block rotation of the engine flywheel.



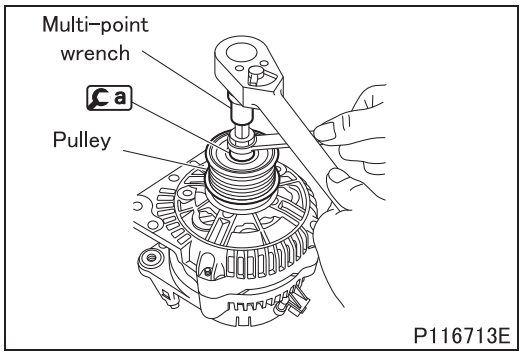
- Take out the bolt and remove the damper pulley.



■ Removal: Alternator pulley

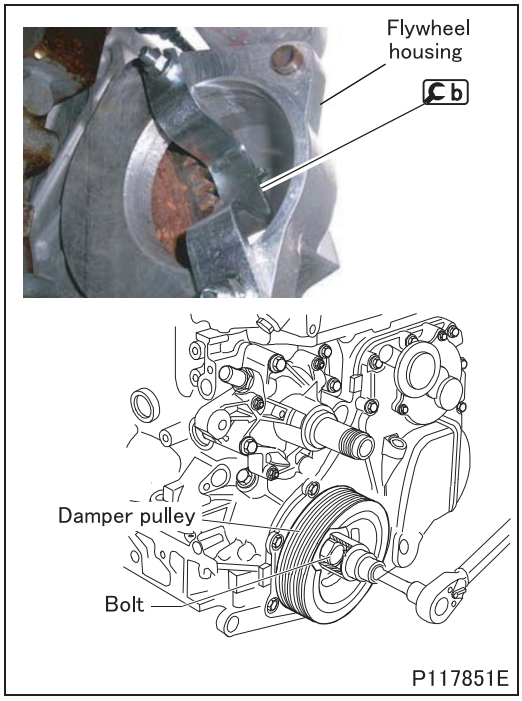
- Insert a, into the inner gear of the pulley.
- While holding the rotor shaft of the alternator with a multi-point wrench, remove the pulley using a and ϕ17 {0.67 in.} box wrench.

◆Installation procedure◆



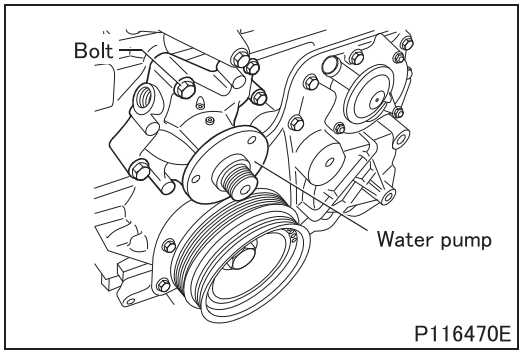
■ Installation: Alternator pulley

- Insert a, into the inner gear of the free wheel pulley.
- While holding the rotor shaft of the alternator with a multi-point wrench, tighten the pulley to the specified torque using a and ϕ17 {0.67 in.} wrench.



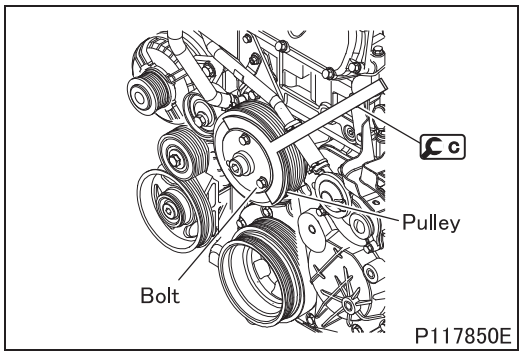
■ **Installation: Damper pulley**

- Stop the rotation of the engine flywheel by means of b.
- Fit the damper pulley. Drive in the screw and tighten it to the prescribed torque.



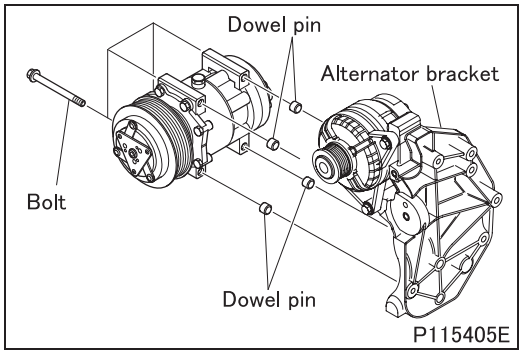
■ **Installation: Water pump**

- Install the water pump with a new gasket.
- Drive in the bolts and tighten them to the prescribed torque.



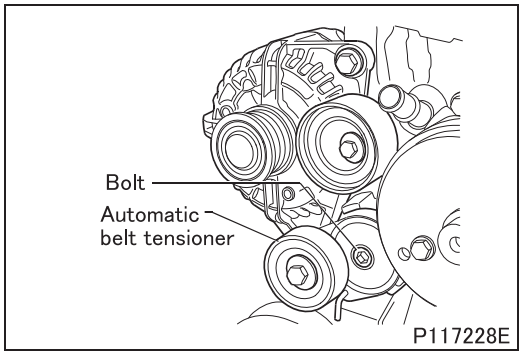
■ **Installation: Pulley**

- Attach c to the fan pulley.
- While holding c, tighten the automatic cooling fan coupling to a torque of 25 N·m {18 ft.lbs, 2.5 kgf·m}.



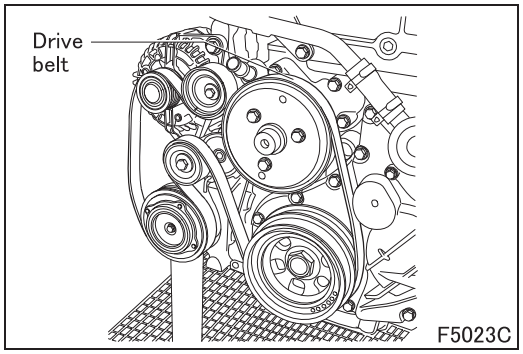
■ **Installation: Air compressor**

- Install the air compressor on the alternator bracket.



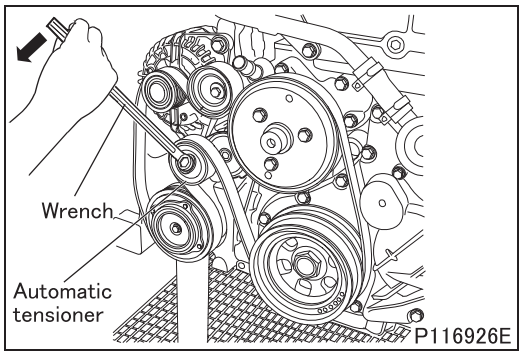
■ **Installation: Automatic belt tensioner**

- Install the automatic belt tensioner and tighten the bolt.



■ **Installation: Belt**

- Position the auxiliary mechanism drive belt.



- Using a wrench of an adequate type, operate the automatic belt tensioner in the direction of the arrow to tighten the accessory drive belt.

CAUTION ⚠

- **Use care not to allow your finger to be caught between the belt and pulley.**

Follow the removal sequence in reverse.

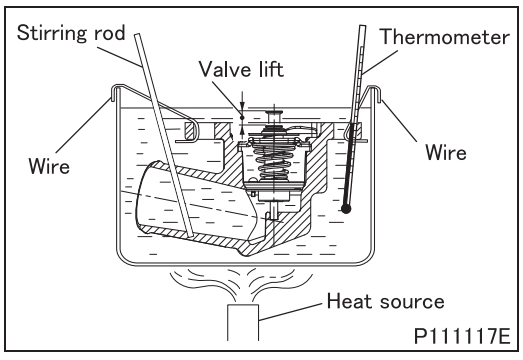
Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
1	Thermostat	Valve opening temperature	79 ± 2°C {174 ± 3.6°F}	–	Replace
		Valve lift / temperature	7.5 or more / 92°C {0.30 or more / 198°F}		

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (thermostat mounting)	25 {18, 2.5}	–
Tb	Water temperature sensor	40 {30, 4.1}	–

◆Inspection procedure◆



■ Inspection: Thermostat

- Stir the water using a stirring rod to maintain an even water temperature in the container, then conduct the tests indicated below.
- If the measured values deviate from the standard value ranges, replace the thermostat.

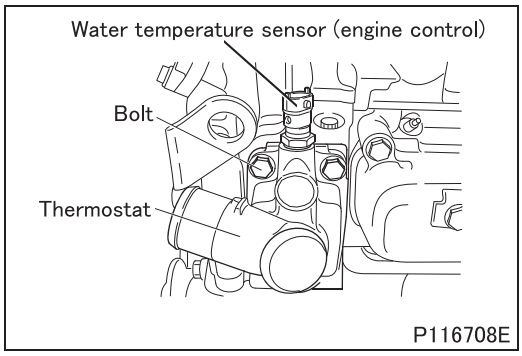
(1) Valve opening temperature

- Hold the thermostat with wire to keep it away from the heat source.
- Heat the water gradually to the valve opening temperature.
- Maintain this temperature for five minutes and make sure that the valve is completely open.
- Make sure that the valve closes completely when the water temperature drops below 77°C {171°F}.

(2) Valve lift

- Heat the water to 94°C {201°F} and keep the temperature for five minutes with the valve opened completely. Measure the amount of the valve lift.

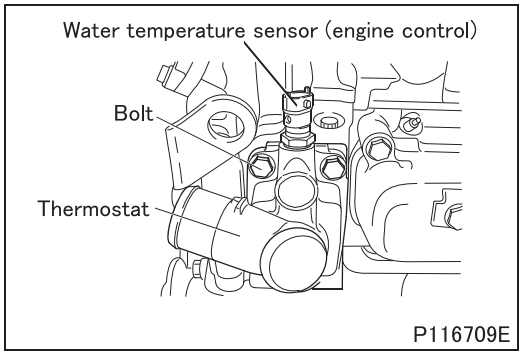
◆Removal procedure◆



■ **Removal: Thermostat, water temperature sensor**

- Remove four bolts and remove the thermostat together with the water temperature sensor.

◆Installation procedure◆



■ **Installation: Thermostat, water temperature sensor**

- Install the thermostat together with the water temperature sensor. Mount a new gasket between the thermostat and cylinder head.

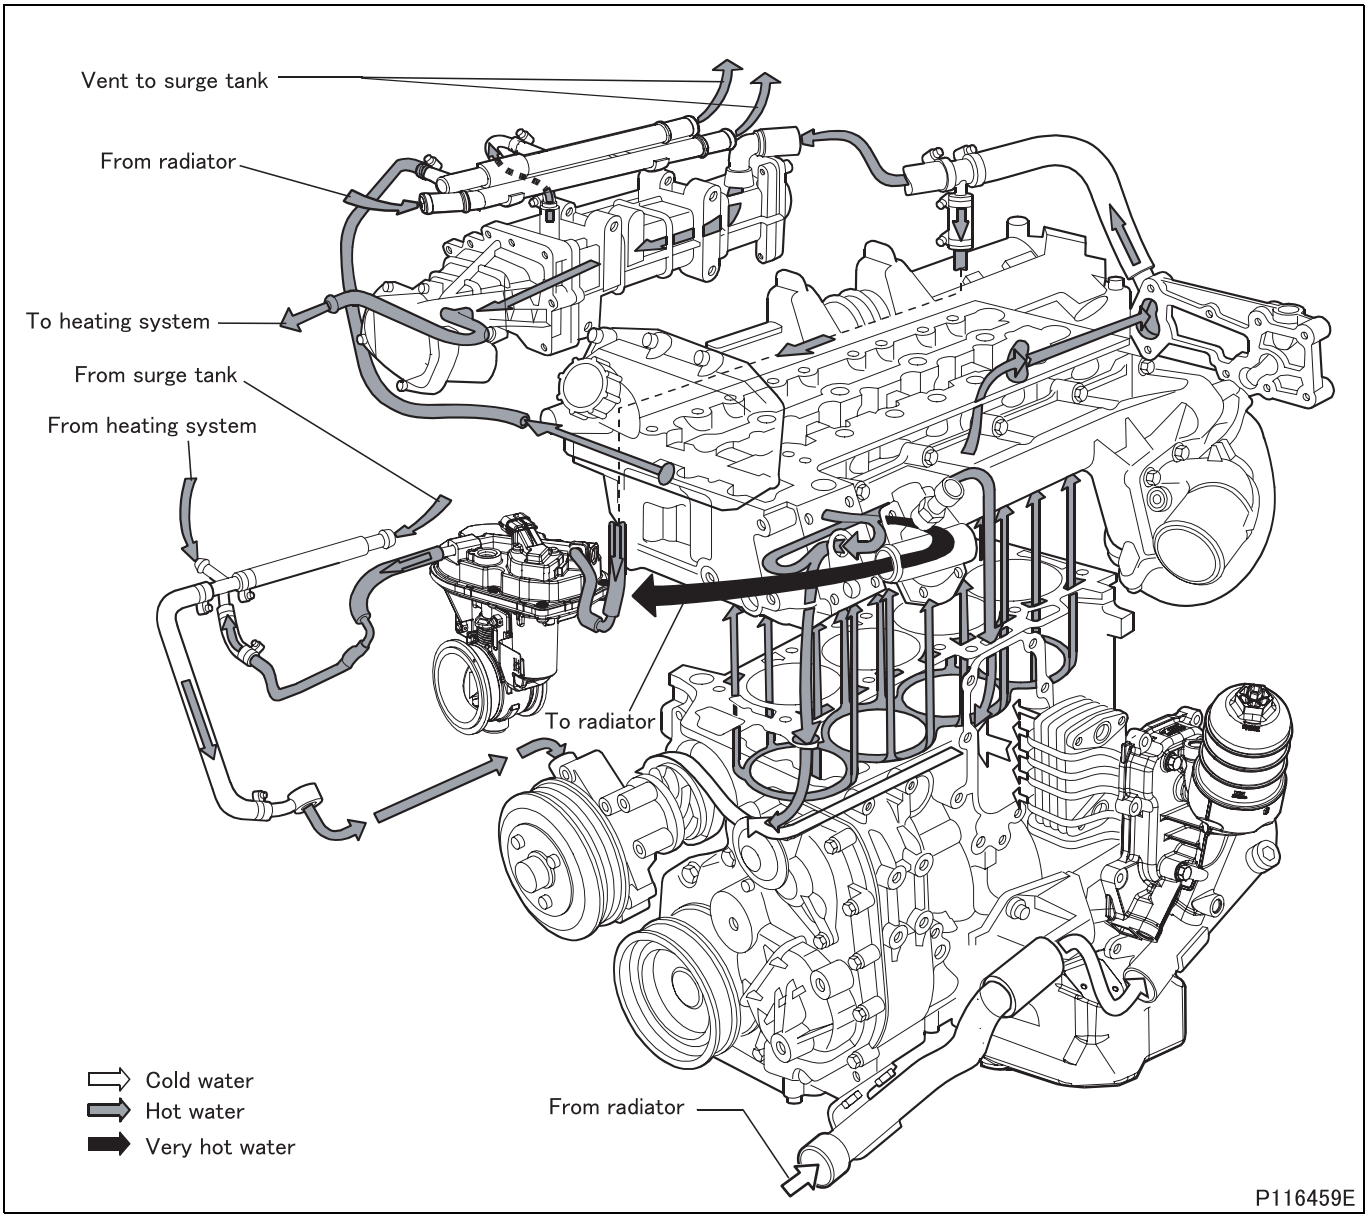
SPECIFICATIONS

Item			Specifications
Cooling system			Forced water circulation system
Water pump			Belt-driven involute type
Thermostat	Type		N.I.
	Start of opening °C {°F}		79 ± 2 {174 ± 3.6}
	Max opening °C {°F}		92 ± 2 {198 ± 3.6}
Automatic cooling fan coupling			Continuous control type (viscous coupling)
Radiator			Tube and corrugated fin type
Coolant capacity L {qts}	Except crew cab		Approx. 14 {15}
	Crew cab	With rear air conditioner	Approx. 15.1 {16}
		With rear heater	Approx. 15.2 {16}

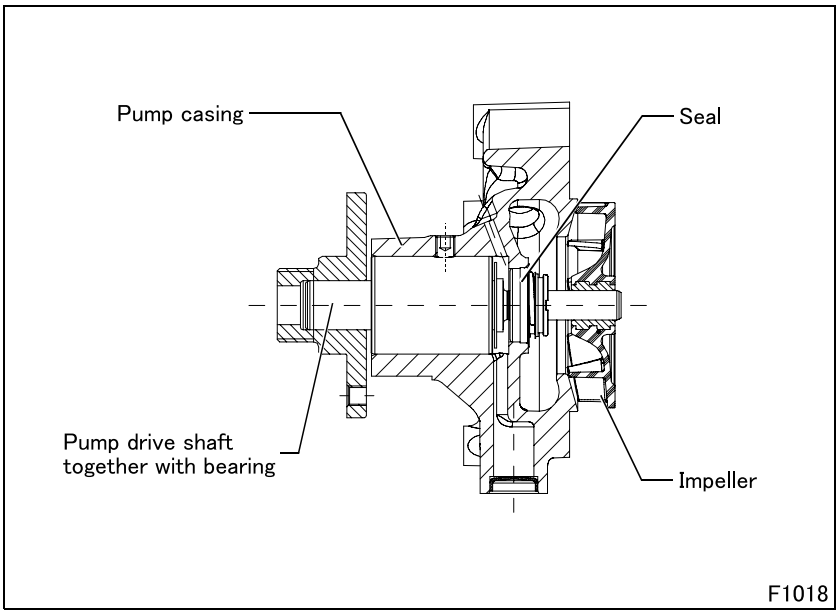
1. Cooling System



- The engine cooling system is the type with forced circulation in a closed circuit. It comprises the following parts.
  - A surge tank.
  - An engine cooling module to dissipate the heat taken from the engine by the coolant with a radiator.
  - An oil cooler to cool the lubricating oil.
  - A water pump incorporated in the crankcase.
  - A cooling fan activated by a viscous coupling.
  - A thermostat governing the circulation of the coolant.
- The water pump driven by a V belt by the crankshaft sends coolant into the crankcase and into the cylinder head.
- When the coolant temperature reaches and exceeds the working temperature, it causes the thermostat to open and the fluid is channelled from there to the radiator and is cooled by the fan.
- The pressure in the system due to the change in temperature is governed by the outlet and inlet valves incorporated in the surge tank pressure cap.
- The outlet valve has the following twofold function.
  - To keep the system slightly pressurized so as to raise the boiling point of the coolant.
  - To discharge into the atmosphere the excess pressure produced in case of high coolant temperatures.

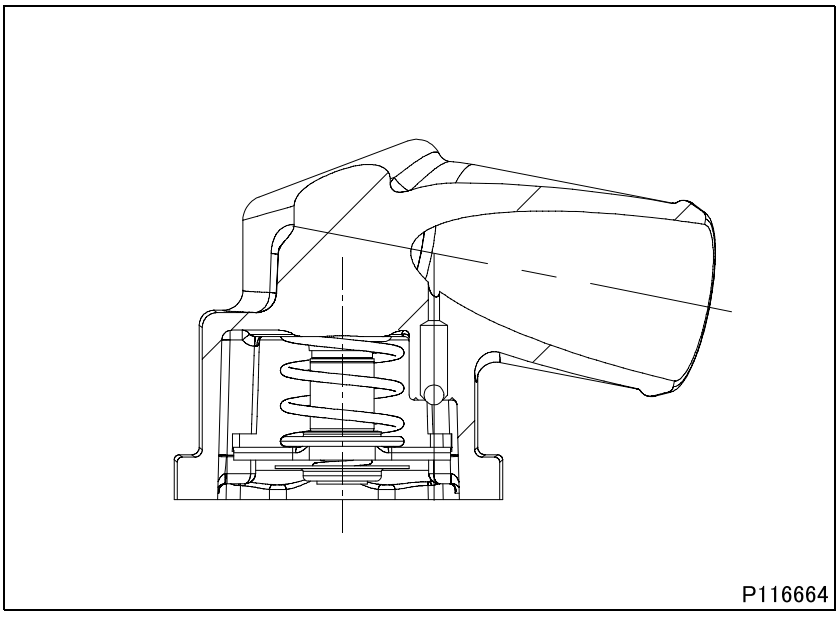
- The function of the inlet valve is to permit transferring the coolant from the surge tank to the radiator when a lower pressure is created in the system due to the reduction in volume of the coolant as a result of its temperature lowering.

2. Water Pump



- The water pump is the belt-driven involute type.

3. Thermostat



- The thermostat casing is fitted with the thermometric switch/transmitter and water temperature sensor.
  Valve travel at 79 ± 2°C {174 ± 3.6°F} = 0.3 mm {0.012 in.}
  Valve travel at 92 ± 2°C {198 ± 3.6°F}, min. 7.5 mm {0.30 in.}

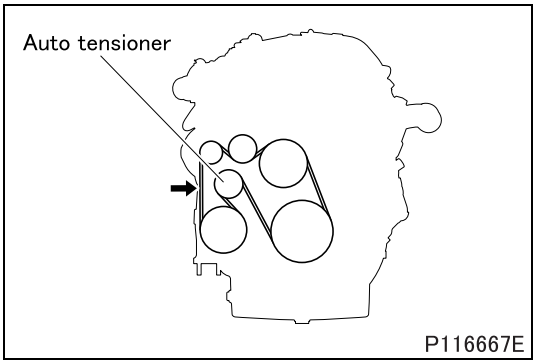
Possible causes \ Symptoms		Overheating (poor cooling)	Overcooling	Abnormal noise	Excessive coolant loss	Electronic control unit diagnosis lamp	Reference Gr
V-belt	Damaged	O				O	
	Oil on belt	O					
Water pump	Incorrectly mounted water pump	O		O	O	O	
	Defective gasket	O			O	O	
	Defective water pump	O		O	O	O	
Thermostat	Incorrectly mounted thermostat	O			O	O	
	Defective gasket	O			O	O	
	Valve opening temperature too high (valve remains closed)	O				O	
	Valve opening temperature too low (valve remains open)		O				
	Leakage from coolant temperature sensor	O			O		
Radiator	Clogged core	O				O	
	Cracked core and/or separation in welds	O			O	O	
	Cracks in upper tank and/or lower tank	O			O	O	
Automatic cooling fan coupling	Defective bearing	O		O		O	
	Damaged bimetal	O				O	
	Contaminated bimetal	O	O			O	
	Silicone oil leakage	O		O		O	
Cylinder head	Incorrectly mounted cylinder head	O			O	O	Gr11
	Defective gasket	O			O	O	
Oil cooler	Incorrectly mounted oil cooler	O			O	O	Gr12
	Defective gasket	O			O	O	
Exhaust gas recirculation-related items	Incorrectly mounted exhaust gas recirculation gas pipes			O		O	Gr17
	Incorrectly mounted exhaust gas recirculation coolant pipes	O			O		
	Exhaust gas recirculation cooler clogged (coolant side)	O					
	Damaged O-ring (exhaust gas recirculation-coolant sealing)	O			O		
Poorly airtight pressure cap		O			O	O	
Insufficient coolant amount, contaminated coolant		O				O	
Clogged or scaled coolant passage		O				O	
Incorrectly connected hoses		O			O	O	
Incorrectly connected pipes		O			O	O	
Excessively low exterior temperature			O				

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection of Auto Tensioner

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Sonic belt tension gauge  92054	ME357715	Measurement of tension of belt



- The fan belt is automatically adjusted for proper tension by the auto tensioner. So, check the auto tensioner for correct operation.
- Confirm that the tension pulley moves smoothly when each of the midpoints between pulleys of the fan belt indicated by the arrows is pushed with your palm or pull on it.

1.1 Looseness of belt

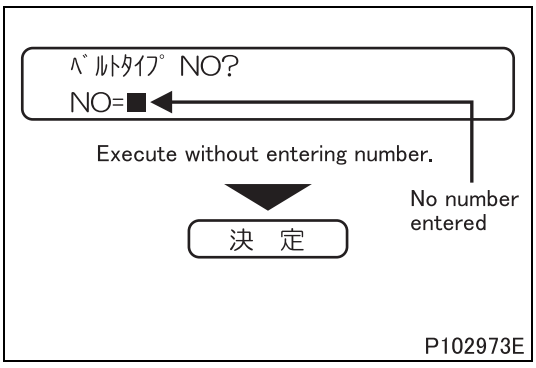
- Use a sonic belt tension gauge to check to see that the belt tension is within the standard.

[Inspection of tension]

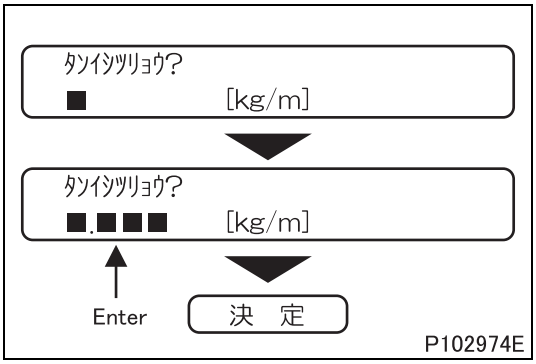
- Measurement using sonic belt tension gauge
- Direct the sensor microphone of a to the position shown in the illustration and measure the belt tension. For the operation of the sonic belt tension gauge, see the instruction manual of the tension gauge.
  a: Sonic belt tension gauge ME357715

CAUTION ⚠

- **When checking or adjusting the belt tension, measure the belt tension with the belt surface temperature being similar to the room temperature. Higher temperature will increase the belt tension, leading to incorrect tension measurements.**

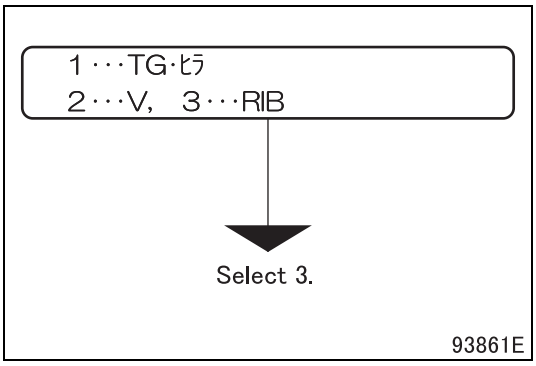


- Turn on a.
- Press “決定 (means “execute”)” key with no belt type number entered.
- Set the sensitivity of its sensor microphone when measuring the belt tension.
  ON (低 : means “low”): Measuring in noisy environment, or outdoors in heavy wind
  ON (高 : means “high”): Measuring in silent environment, or measuring a hard-to-vibrate belt

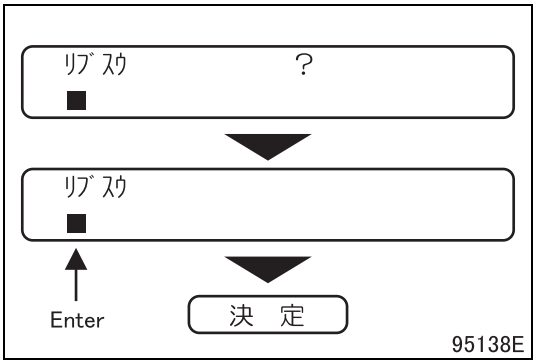


- Enter the unit mass of the belt and push “決定 (means “execute”)”.

Measuring point on the belt	Unit mass of the belt
Fan belt	0.016 kg/m

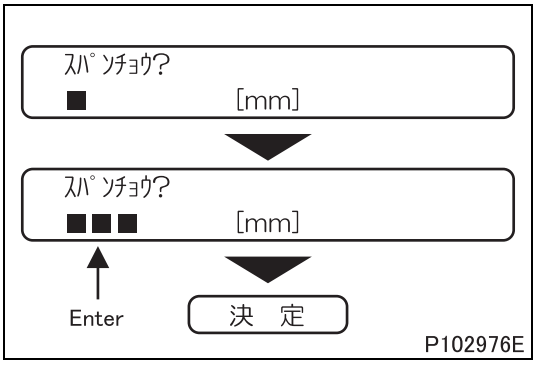


- Select the type of the belt. (Select “3” for ribbed belt.)



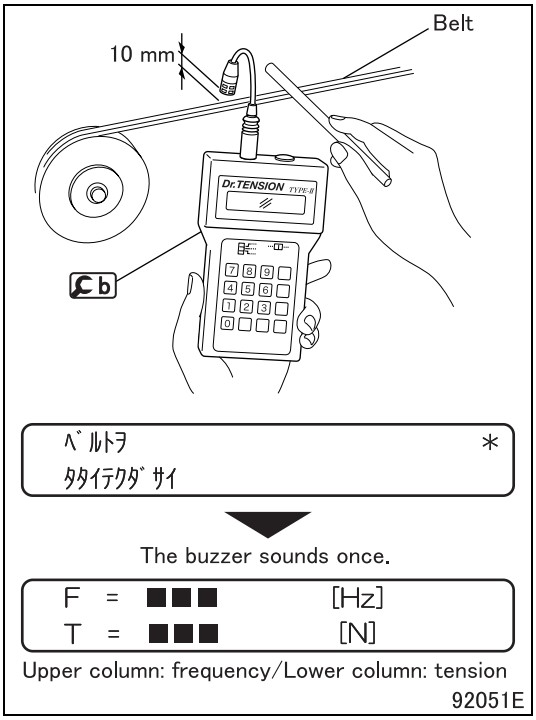
- Enter the number of ribs and push “決定 (means “execute”)”.

Measuring point on the belt	Number of ribs
Fan belt	7



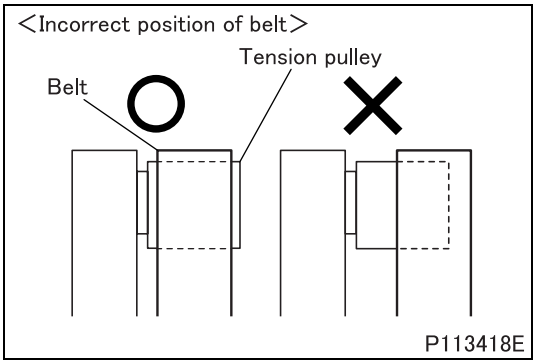
- Enter the length of span and push “決定 (means “execute”)”.

Measuring point on the belt	Length of span
Fan belt	202 mm



- Set the sensor microphone of approx. 10 mm {0.39 in.} above the belt, at the middle position between pulleys.
- Tap the belt lightly with a grip of a screwdriver to vibrate the belt.
- Measure the tension a few times and calculate the average value.

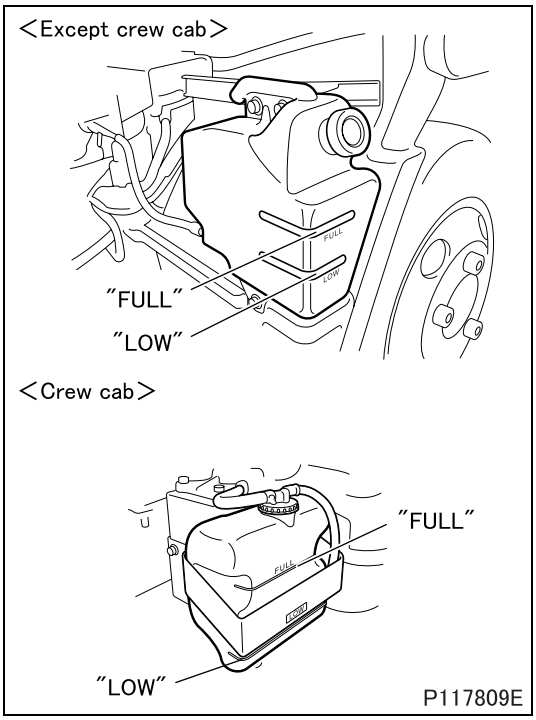
Standard value	300 to 700 N



- Confirm that the belt is in correct alignment with the tension pulley.

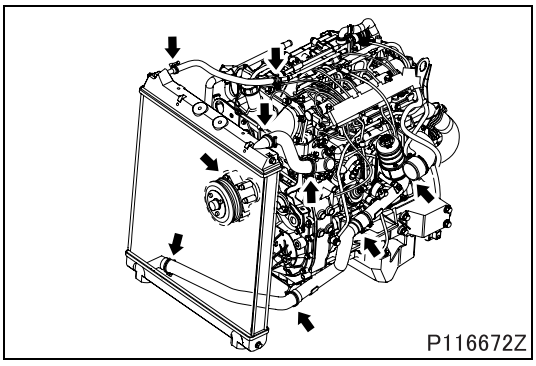
- If the belt is not in correct alignment with tension pulley, check the auto tensioner or replace the belt with a new one.

2. Inspection of Coolant Level



- Perform the coolant level inspection when the coolant is cold before the engine is started.
- Confirm that the coolant level is between the “FULL” and “LOW” lines of the reservoir tank.
- If the coolant level is lower than the “LOW” line, check that the cooling system for leaks. If no leaks are found, then add coolant up to the “FULL” line. Use coolant containing the predetermined amount of coolant to protect the cooling system from freezing and corrosion. (See the Owner’s Manual for how to prepare the coolant.)
- If the coolant level is abnormally low or lowers in an abnormally short period of time, the cooling system may be leaking. Inspect the system for leaks. (See “3. Inspection for coolant leaks” in ON-VEHICLE INSPECTION AND ADJUSTMENT.)

3. Inspection for Coolant Leaks



- Sufficiently warm up the engine. With the engine still running at idle, check that no coolant leaks from the radiator, reservoir tank, water pump, radiator hose, heater hose, or other associated components.
- If there is a coolant leak, check connections of the corresponding components. Tighten any loose connections to the specified torques. Replace any cracked or otherwise damaged part with a new one. (See later section.)

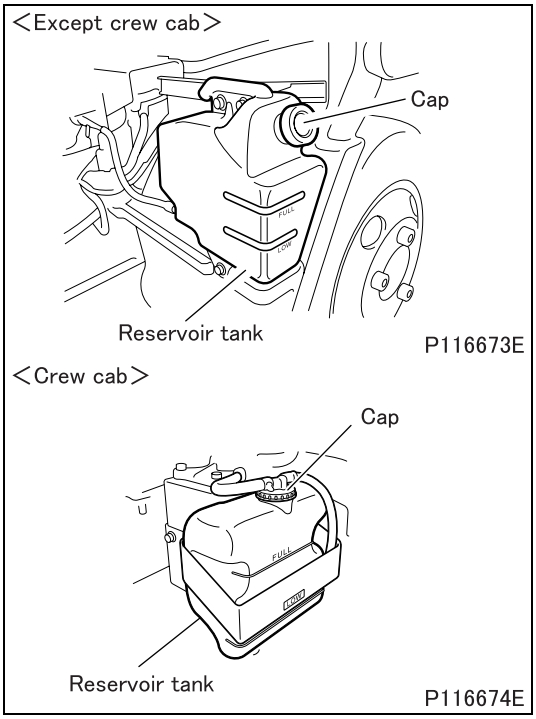
4. Coolant Replacement and Cleaning of Cooling System

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

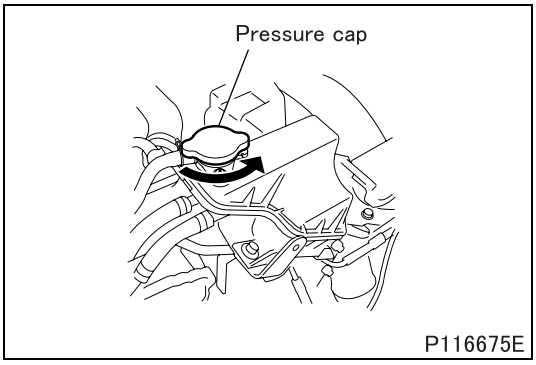
Mark	Parts to be tightened	Tightening torque	Remarks
–	Radiator drain cock	2.5 ± 0.5 {1.8 ± 0.4, 0.3 ± 0.1}	–

- Using the radiator for extended periods of time without cleaning can increase chance of rust and scale formation, which may cause engine overheating. The cooling system must be cleaned periodically.

4.1 Draining of coolant



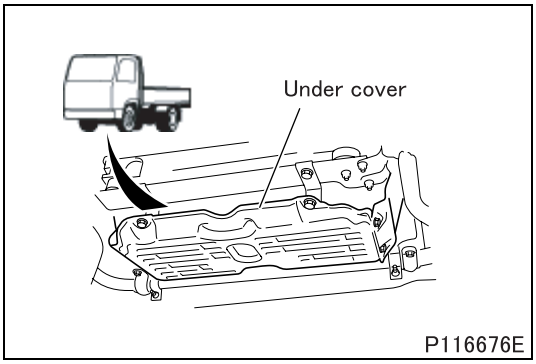
- Place a container to catch coolant under the radiator drain cock.
- Remove the cap from the reservoir tank.



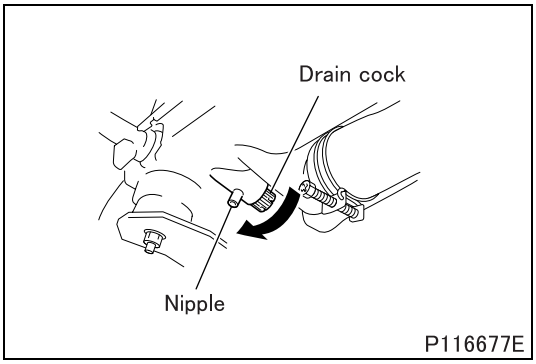
- Before draining the coolant, loosen the pressure cap to reduce the pressure in the cooling system. Remember to drain the coolant out of the reservoir tank as well.

WARNING ⚠

- **Drain the coolant only after it has cooled sufficiently to avoid getting scalded.**
- **Opening the pressure cap while the coolant temperature is still high can cause hot coolant to spray out. Cover the pressure cap with a cloth, and loosen it slowly to let the pressure out before opening it fully.**



- Remove the under cover below the radiator, if the vehicle is so equipped.



- Loosen the radiator drain cock to let the coolant run through the nipple.

4.2 Cleaning procedure

- Using coolant additive
  To prevent the cooling system freezing up and minimize corrosion, use coolant or an equivalent. Coolant is an ethylene-glycol-based antifreeze (SAE J814-C) with both anti-freeze and anti-corrosion properties. Dilute it with soft water to the specified concentration.
- Keep the coolant temperature at approximately 90°C {194°F} so that the thermostat valve remains open and the coolant continues to circulate in the radiator.
- For the sake of convenience you can raise the coolant temperature quickly by covering the front of the radiator with corrugated cardboard or something similar.
- In cases where a large amount of rust has accumulated it is common for the radiator to leak as a result of cleaning. Conduct a thorough check for leakage after cleaning.
- After completing the cleaning, check the reservoir tank coolant level. Add coolant if necessary.
- If the coolant has been completely replaced, reset the service and maintenance memory of the multi-information system. (See Chapter 6 “Multi-information system” of Owner’s Manual.)

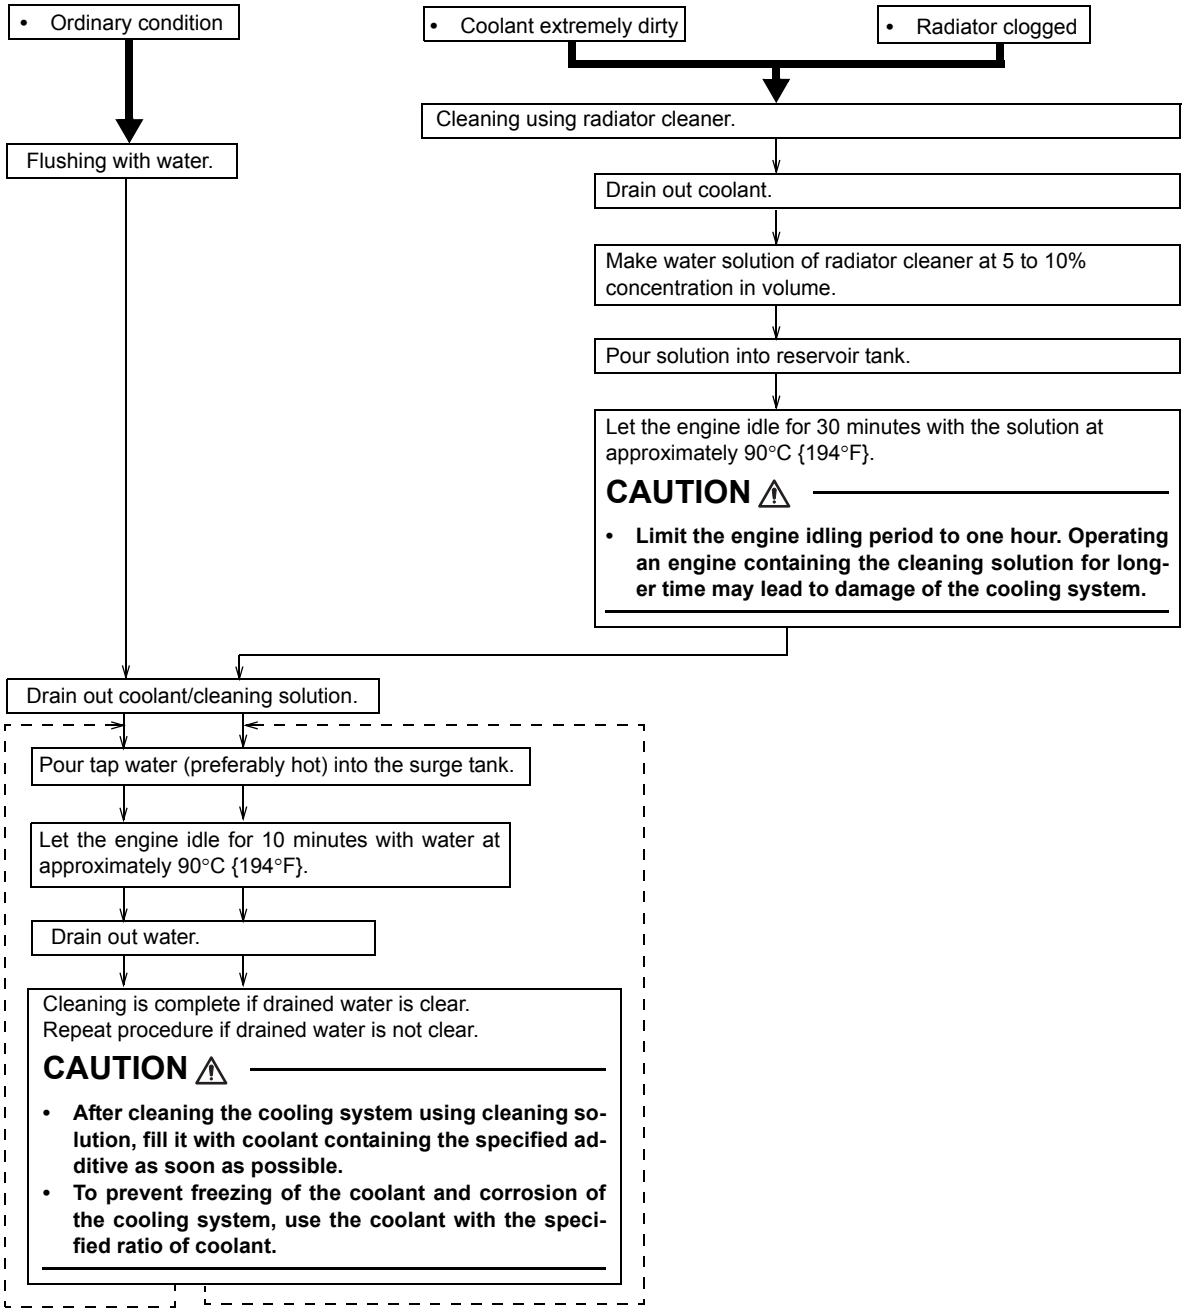
WARNING ⚠

- **If you splash coolant in your eye, immediately rinse the eye with water and then seek medical attention.**

CAUTION ⚠

- **Coolant is flammable. Never bring an open flame close to it.**

- Select an appropriate cleaning method according to the condition of the cooling system as shown below.



5. Air Bleeding of Cooling System

- With the pressure cap removed and the coolant temperature at 90°C {194°F}, let the engine idle in order to bleed air completely out of the cooling system.
- After air bleeding is completed, refill the surge tank with coolant as needed.

6. Air/Gas Leakage Test

- Presence of air or exhaust gas in coolant accelerates corrosion of the cooling system components. To prevent this, carry out air/gas leakage tests in accordance with the following procedure.
- Remove the pressure cap.

WARNING ⚠

- **If the engine is hot, boiling coolant may spurt out from the filler port when the pressure cap is loosened. To avoid burning yourself, make sure to remove the pressure cap only when the coolant is cold.**

- Run the engine until the coolant temperature rises to approximately 90°C {194°F}.
- If air bubbles appear continuously through the filler port, there is air or exhaust gas penetrating into the cooling system.
- Presence of air in coolant can be an indication of loose cylinder head bolts, loose water pump mounting bolts, loose hose connections, and/or a damaged hose.
- Presence of exhaust gas in coolant can be an indication of a damaged cylinder head gasket and/or cracks in the cylinder head.

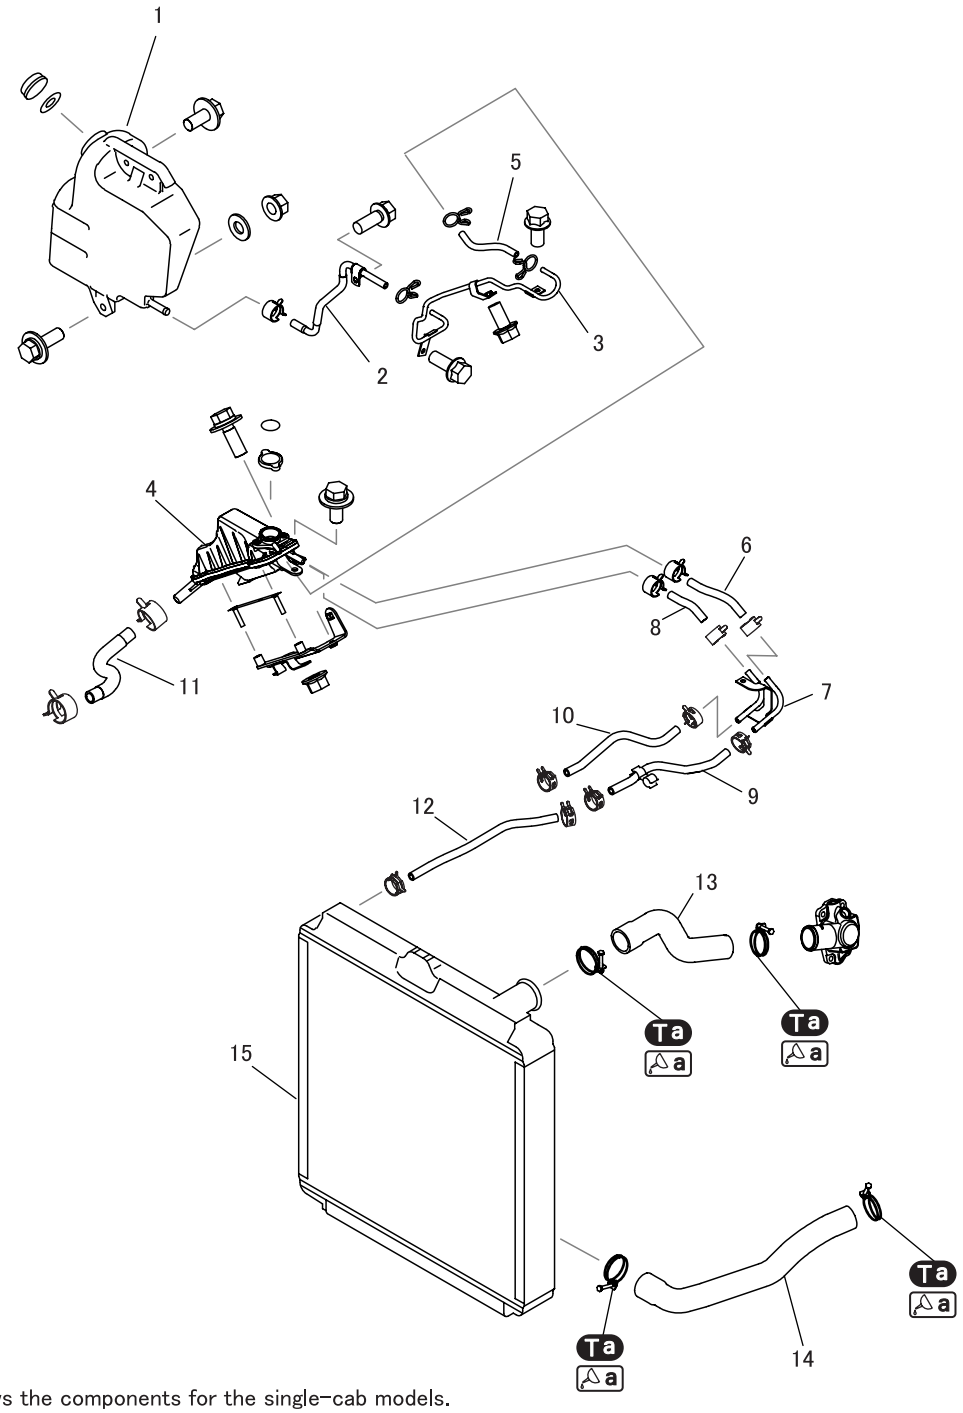
7. Inspection of Cracks or Damage of the Belt

- If a belt is cracked or otherwise damaged, have it replaced it as soon as possible. Belt replacement requires component disassembly.

Belt condition	Remaining service life (reference)
 Piece(s) missing from rib(s) P110542E	• The belt has reached the end of its service life and must be replaced.

DISCONNECTION AND CONNECTION OF HOSES AND PIPES

Radiator Hose and Pipe



● **Removal sequence**

1. Reservoir tank (See later section.)
2. Water hose A
3. Water pipe A
4. Surge tank (See later section.)
5. Water hose B
6. Water hose C
7. Water pipe B
8. Water hose D
9. Water hose E
10. Water hose F
11. Supply hose
12. Water hose G
13. Upper radiator hose
14. Lower radiator hose
15. Radiator (See later section.)

● Installation sequence

Follow the removal sequence in reverse.

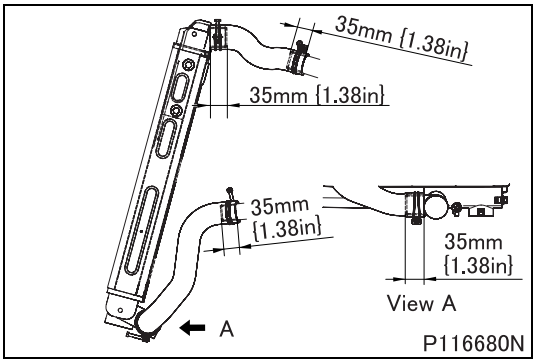
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Clamp	4.0 ± 0.1 {3.0 ± 0.1, 0.4 ± 0.01}	Wet

Lubricant and/or sealant

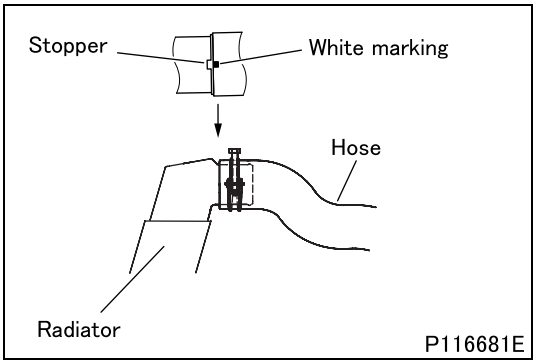
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Clamp	Engine oil	As required

◆Installation procedure◆

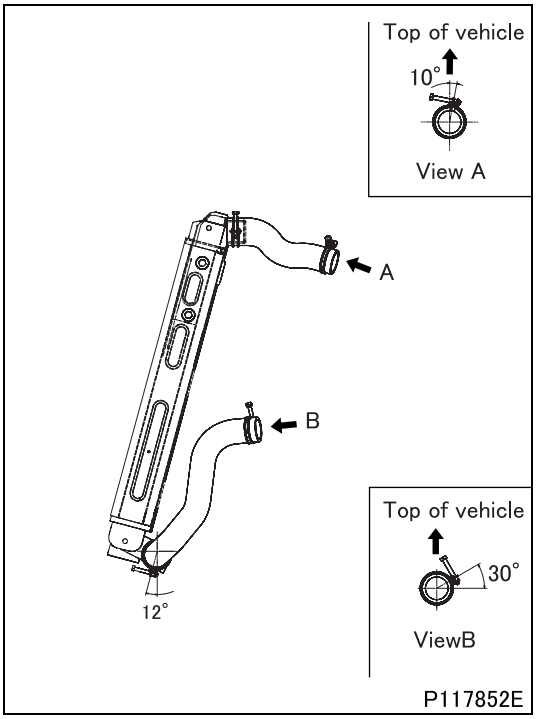


■ **Installation: Upper radiator hose, lower radiator hose**

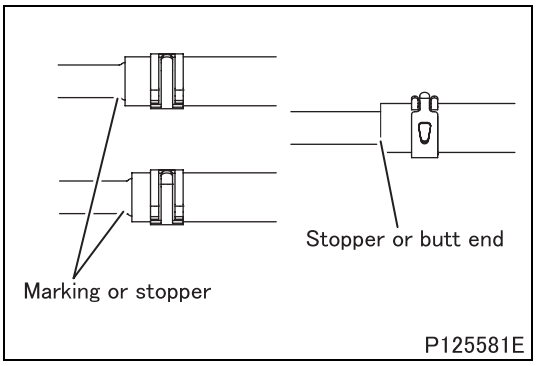
- Each hose end should overlap with the fitting to the dimension shown in the illustration.



- Install the radiator end of the radiator hose with its white marking aligned with the stopper on the hose fitting of the radiator.

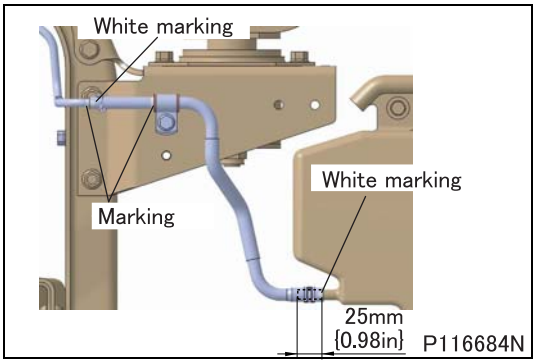


- Install the clamps at the angles shown.



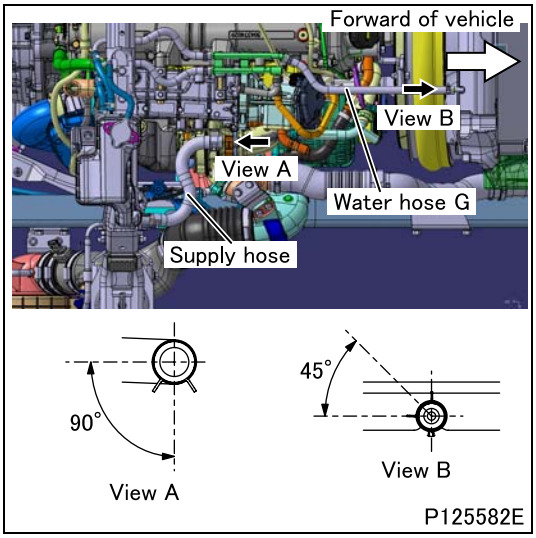
■ Installation: Water hose, water pipe

- Insert the water hose all the way up to the stopper or marking on the water pipe.
- Insert the reservoir tank end of the water hose all the way until it stops against the stopper or butt end.
- The white or yellow marking on the water hose, if provided, should face upward of the vehicle when the water hose is installed.



- The reservoir tank end of the water hose should overlap with the filling by 25 mm {0.98 in.} and the white marking should face the rear of the vehicle. Affix the hose on the cab bridge while making the edges of the clips align with the markings on the hose as shown in the illustration.
- Be careful to direction of clamp, and check interference of the other parts on periphery.

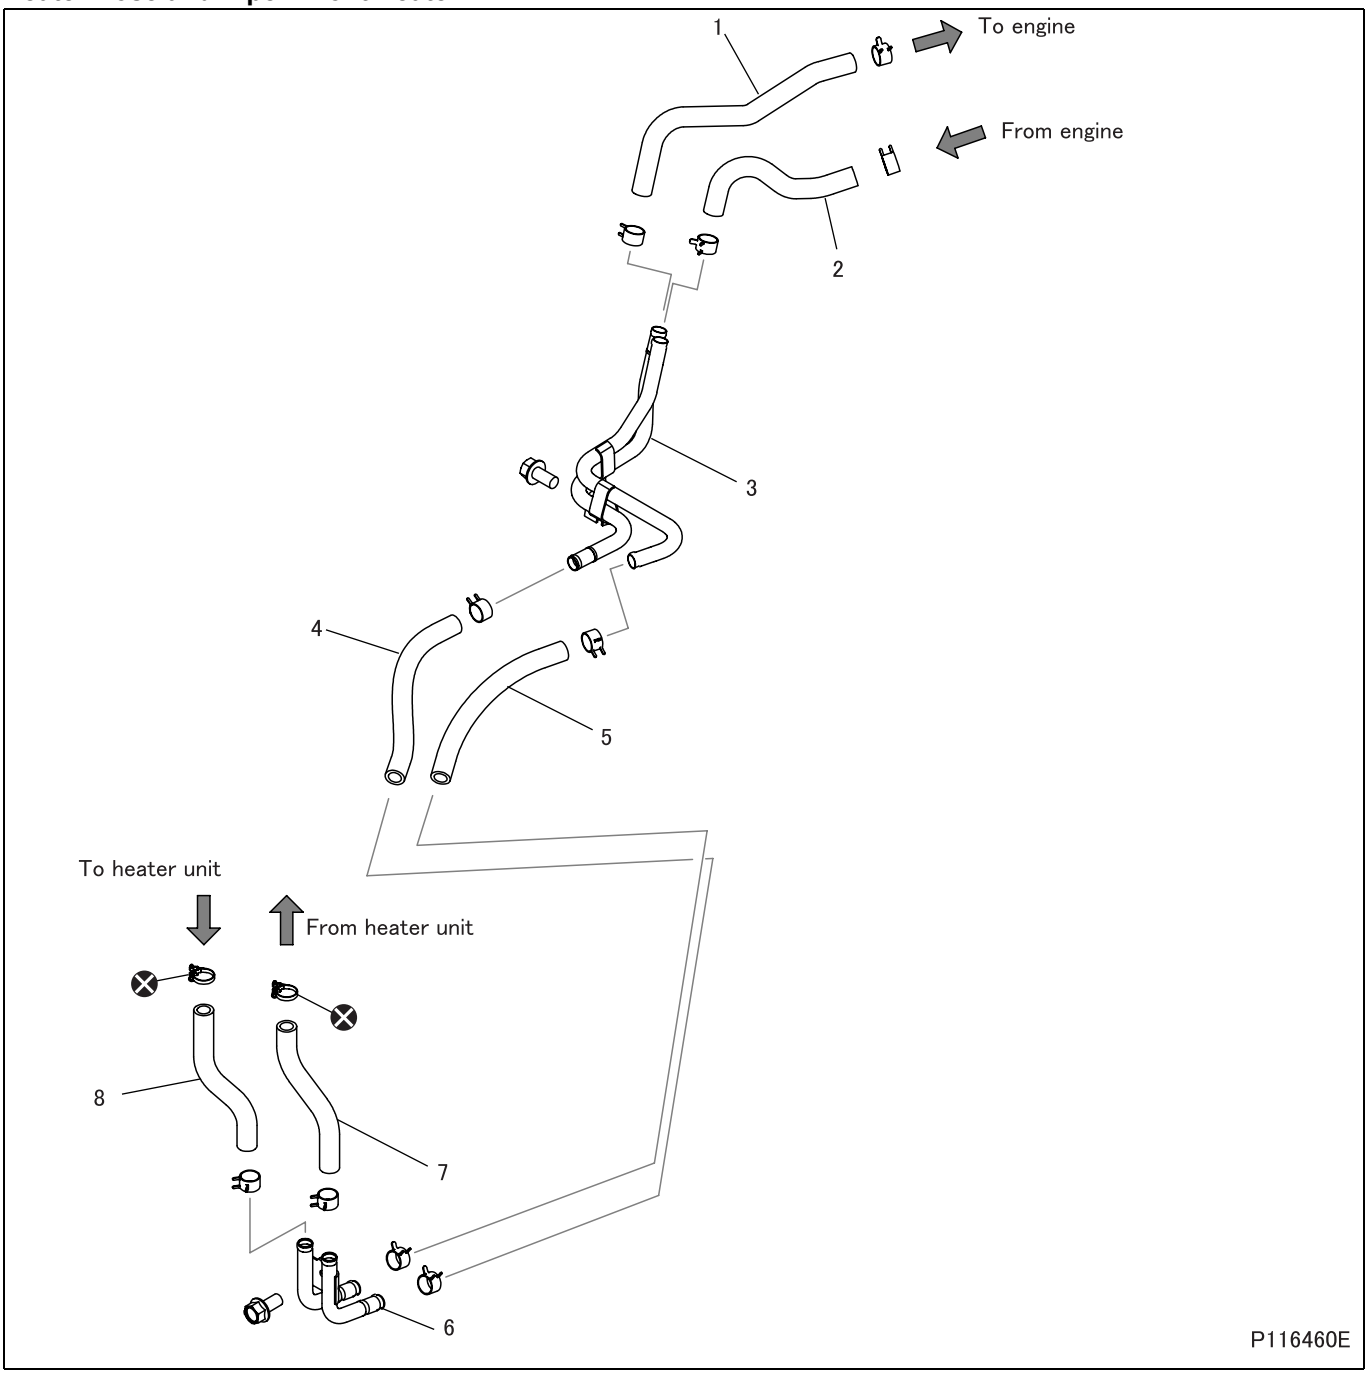
- Fasten the clamps firmly.



■ **Installation: Supply hose, water hose G**

- Install the supply hose clamp at the angle shown.
- Install clamp of the water hose G at the angle shown.
- Be careful to direction of clamp, and check interference of the other parts on periphery.

Heater Hose and Pipe <Front Heater>



● **Removal sequence**

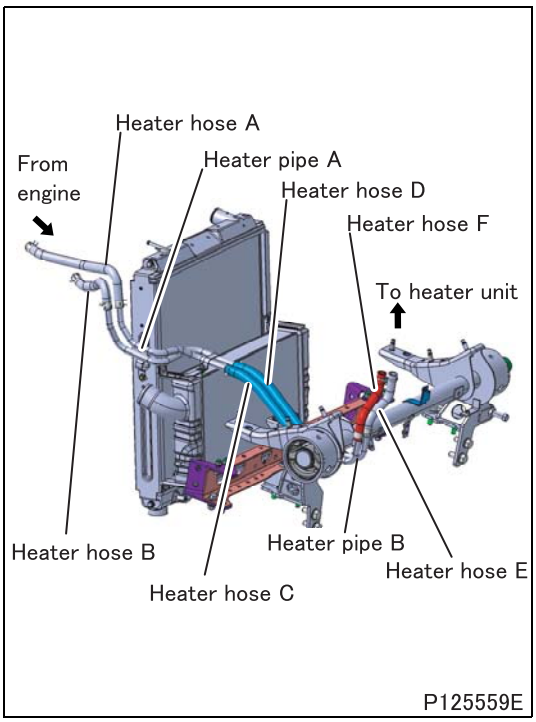
1 Heater hose A
2 Heater hose B
3 Heater pipe A
4 Heater hose C
5 Heater hose D
6 Heater pipe C
7 Heater hose E
8 Heater hose F

⊗: Non-reusable parts

● **Installation sequence**

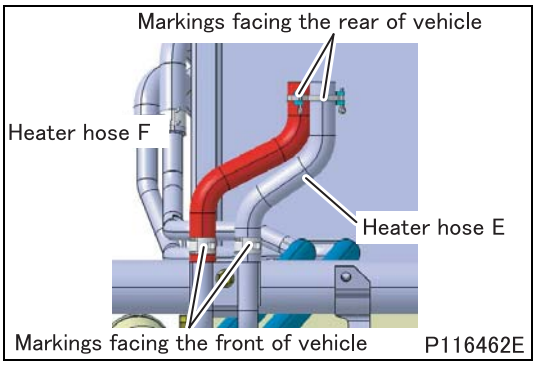
Follow the removal sequence in reverse.

◆Installation procedure◆



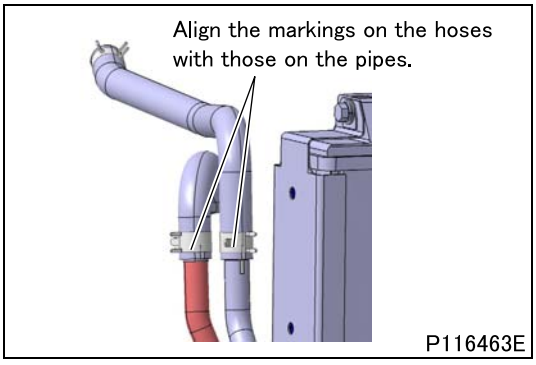
■ Installation: Heater hoses, heater pipes

- Install the heater hoses to the pipes as shown in the illustration.



■ Installation: Heater hose E, heater hose F

- Connect the heater hoses E and F to the heater unit with the markings facing the rear of the vehicle and to the heater pipes C with the markings facing the front of the vehicle.



■ Installation: Heater hose A, heater hose B

- Connect the hoses aligning the shown markings with each other.
