FOREWORD

This manual (Volume 2) contains repair procedures for the following components of the model B13 and N14 series.

- | | |
|---|----------------------------------|
| 1. Chassis | 2. Body |
| • Clutch | 3. Heater & air conditioner unit |
| • Transaxle unit | 4. Electrical system |
| • Axle & suspension unit | |
| • Transfer unit | |
| • Propeller shaft &
Differential carrier | |
| • Brake system | |
| • Steering system | |

For maintenance and repair procedures for the engine, refer to Volume 1 (Pub. No. SM1E-1N4BG0).

In order to assure your safety and the efficient functioning of the vehicle, this manual should be read thoroughly. It is especially important that the PRECAUTIONS in the GI section be completely understood before starting any repair task.

All information in this manual is based on the latest product information at the time of publication. The right is reserved to make changes in specifications and methods at any time without notice.

IMPORTANT SAFETY NOTICE

The proper performance of service is essential for both the safety of the technician and the efficient functioning of the vehicle.

The service methods in this Service Manual are described in such a manner that the service may be performed safely and accurately.

Service varies with the procedures used, the skills of the technician and the tools and parts available. Accordingly, anyone using service procedures, tools or parts which are not specifically recommended by NISSAN must first completely satisfy himself that neither his safety nor the vehicle's safety will be jeopardized by the service method selected.

Observe the following precautions to ensure safe and proper servicing. These precautions are not described in each individual section.

1. Do not operate the engine for an extended period of time without proper exhaust ventilation. Keep the work area well ventilated and free of any inflammable materials. Special care should be taken when handling any inflammable or poisonous materials, such as gasoline, refrigerant gas, etc. When working in a pit or other enclosed area, be sure to properly ventilate the area before working with hazardous materials. Do not smoke while working on the vehicle.

2. Before jacking up the vehicle, apply wheel chocks or other tire blocks to the wheels to prevent the vehicle from moving. After jacking up the vehicle, support the vehicle weight with safety stands at the points designated for proper lifting and towing before working on the vehicle. These operations should be done on a level surface.
3. When removing a heavy component such as the engine or transaxle/transmission, be careful not to lose your balance and drop them. Also, do not allow them to strike adjacent parts, especially the brake tubes and master cylinder.

4. Before starting repairs which do not require battery power, always turn off the ignition switch, then disconnect the ground cable from the battery to prevent accidental short circuit.

5. To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe and muffler. Do not remove the radiator cap when the engine is hot.

PRECAUTIONS

6. Before servicing the vehicle, protect fenders, upholstery and carpeting with appropriate covers. Take caution that keys, buckles or buttons on your person do not scratch the paint.

7. Clean all disassembled parts in the designated liquid or solvent prior to inspection or assembly.
8. Replace oil seals, gaskets, packings, O-rings, locking washers, cotter pins, self-locking nuts, etc. with new ones.
9. Replace inner and outer races of tapered roller bearings and needle bearings as a set.
10. Arrange the disassembled parts in accordance with their assembled locations and sequence.
11. Do not touch the terminals of electrical components which use microcomputers (such as electronic control units). Static electricity may damage internal electronic components.
12. After disconnecting vacuum or air hoses, attach a tag to indicate the proper connection.
13. Use only the lubricants specified in MA section.
14. Use approved bonding agent, sealants or their equivalents when required.
15. Use tools and recommended special tools where specified for safe and efficient service repairs.
16. When repairing the fuel, oil, water, vacuum or exhaust systems, check all affected lines for leaks.
17. Dispose of drained oil or the solvent used for cleaning parts in an appropriate manner.

Precautions for E.F.I. or E.C.C.S. Engine

1. Before connecting or disconnecting E.F.I. or E.C.C.S. harness connector to or from any E.F.I. or E.C.C.S. control unit, be sure to turn the ignition switch to the "OFF" position and disconnect the negative battery terminal. Otherwise, there may be damage to control unit.
2. Before disconnecting pressurized fuel line from fuel pump to injectors, be sure to release fuel pressure to eliminate danger.
3. Be careful not to jar components such as control unit and air flow meter.

Precautions for Catalyst

If a large amount of unburned fuel flows into the converter, the converter temperature will be excessively high. To prevent this, follow the procedure below:

1. Use unleaded gasoline only. Leaded gasoline will seriously damage the catalytic converter.
2. When checking for ignition spark or measuring engine compression, make tests quickly and only when necessary.
3. Do not run engine when the fuel tank level is low, otherwise the engine may misfire causing damage to the converter.
4. Do not place the vehicle on inflammable material. Keep inflammable material off the exhaust pipe.

Precautions for Turbocharger

The turbocharger turbine revolves at extremely high speeds and becomes very hot. Therefore, it is essential to maintain a clean supply of oil flowing through the turbocharger and to follow all required maintenance instructions and operating procedures.

For proper operation of the system, follow the procedure below.

1. Always use the recommended oil. Follow the instructions for proper time to change the oil and proper oil level.
2. Avoid accelerating engine to a high rpm immediately after starting.
3. If engine had been operating at high rpm for an extended period of time, let it idle for a few minutes prior to shutting it off.

Asbestos Safety Instructions (Based on United Kingdom and Republic of Ireland regulations)

This vehicle uses parts containing asbestos. Most are not hazardous but Brake and Clutch linings can be. Consult the manufacturer or his agent for further details. When working with these please observe the "Garage Workers' Asbestos Code" available through your Nissan Dealer, Local Authority or Health and Safety Executive. In particular, work in a well-ventilated place using, where possible, appropriate dust extraction equipment, and avoid creating dust. Dampen all asbestos/dust where possible prior to machining, cutting, cleaning, etc. Use only hand or low speed tools.

Dispose of all asbestos waste, wet rags, etc., in a closed container as directed by your local waste disposal authority.

PRECAUTIONS

Engine Oils

Prolonged and repeated contact with mineral oil will result in the removal of natural fats from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

HEALTH PROTECTION PRECAUTIONS

1. Avoid prolonged and repeated contact with oils, particularly used engine oils.
2. Wear protective clothing, including impervious gloves where practicable.
3. Do not put oily rags in pockets.
4. Avoid contaminating clothes, particularly underpants, with oil.
5. Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly.
6. First Aid treatment should be obtained immediately for open cuts and wounds.
7. Use barrier creams, applying them before each work period, to help the removal of oil from the skin.
8. Wash with soap and water to ensure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanolin replace the natural skin oils which have been removed.
9. Do not use petrol, kerosine, diesel fuel, gas oil, thinners or solvents for cleaning skin.
10. If skin disorders develop, obtain medical advice without delay.
11. Where practicable, degrease components prior to handling.
12. Where there is a risk of eye contact, eye protection should be worn, for example, chemical goggles or face shields; in addition an eye wash facility should be provided.

(For the United Kingdom, see also HSE Cautionary Notice SHW 397 "Effects of Mineral Oil on the Skin".)

ENVIRONMENTAL PROTECTION PRECAUTIONS

Burning used engine oil in small space heaters or boilers can be recommended only for units of approved design. The heating system must meet the requirements of HM Inspectorate of Pollution for small burners of less than 0.4 MW. If in doubt check with the appropriate local authority and/or manufacturer of the approved appliance.

Dispose of used oil and used oil filters through authorized waste disposal contractors to licensed waste disposal sites, or to the waste oil reclamation trade. If in doubt, contact the local authority for advice on disposal facilities.

It is illegal to pour used oil on to the ground, down sewers or drains, or into water courses.

The regulations concerning the pollution of the environment will vary from country to country.

Precautions for Fuel

GASOLINE ENGINE:

For Europe

Catalytic converter equipped engines:

- GA14DS engine models except for Switzerland ...
Unleaded gasoline of at least 91 octane (RON)
- GA14DS engine models for Switzerland ...
Unleaded gasoline of at least 95 octane (RON)
- Except GA14DS engine models ...
Unleaded gasoline of at least 95 octane (RON)

CAUTION:

Do not use leaded gasoline. Using leaded gasoline will damage the catalytic converter.

Except catalytic converter equipped engines:

For the United Kingdom and France only

- GA14DS engine models ...
Unleaded gasoline of at least 91 octane (RON)
- Except GA14DS engine models ...
Unleaded gasoline of at least 95 octane (RON)

Except the United Kingdom and France

- GA14DS engine models ...
Unleaded or leaded gasoline of at least 91 octane (RON)
- Except GA14DS engine models ...
Unleaded or leaded gasoline of at least 95 octane (RON)

Except Europe

- Leaded gasoline of at least 88 octane (RON)
- GA16DS engine models for Middle East ...
Leaded gasoline of at least 95 octane (RON)

DIESEL ENGINE*:

CD17 engine models ... Diesel fuel of at least 45 cetane

CD20 engine models ... Diesel fuel of at least 50 cetane

* If two types of diesel fuel are available, use summer or winter fuel properly according to the following temperature conditions.

- Above -7°C (20°F) ... Summer type diesel fuel.
- Below -7°C (20°F) ... Winter type diesel fuel.

CAUTION:

- Do not use home heating oil, gasoline, or other alternate fuels in your diesel engine. The use of those can cause engine damage.
- Do not use summer fuel at temperature below -7°C (20°F). The cold temperatures will cause wax to form in the fuel. As a result, it may prevent the engine from running smoothly.
- Do not add gasoline or other alternate fuels to diesel fuel. Only under the following conditions may you use diesel fuel by mixing kerosene or regular gasoline (not premium gasoline) to prevent the fuel from thickening due to wax separation:

If the summer type diesel fuel is used at an ambient temperature below 0°C (32°F), add kerosene or regular gasoline but not more than 30% by volume. However, keep in mind that there may be less engine output performance due to the proportion of added fuel. The use of kerosene for motor vehicles is not permitted in some countries, e.g. U.K.

PRECAUTIONS

Precautions for Fuel (Cont'd)

Therefore, consult the relevant authorities before such mixtures are used.

1. **A QUICK REFERENCE INDEX**, a black tab (e.g. **BR**) is provided on the first page. You can quickly find the first page of each section by mating it to the section's black tab.
2. **THE CONTENTS** are listed on the first page of each section.
3. **THE TITLE** is indicated on the upper portion of each page and shows the part or system.
4. **THE PAGE NUMBER** of each section consists of two letters which designate the particular section and a number (e.g. "BR-5").
5. **THE LARGE ILLUSTRATIONS** are exploded views (See below) and contain tightening torques, lubrication points and other information necessary to perform repairs.
The illustrations should be used in reference to service matters only. When ordering parts, refer to the appropriate **PARTS CATALOG**.

6. **THE SMALL ILLUSTRATIONS** show the important steps such as inspection, use of special tools, knacks of work and hidden or tricky steps which are not shown in the previous large illustrations. Assembly, inspection and adjustment procedures for the complicated units such as the automatic transaxle or transmission, etc. are presented in a step-by-step format where necessary.
7. The following **SYMBOLS AND ABBREVIATIONS** are used:

	: Tightening torque	2WD	: 2-Wheel Drive
	: Should be lubricated with grease. Unless otherwise indicated, use recommended multi-purpose grease.	4WD	: 4-Wheel Drive
	: Should be lubricated with oil.	M/T	: Manual Transaxle/Transmission
	: Sealing point	A/T	: Automatic Transaxle/Transmission
	: Checking point	A/C	: Air Conditioner
	: Always replace after every disassembly.	P/S	: Power Steering
L.H., R.H.	: Left-Hand, Right-Hand	S.S.T.	: Special Service Tools
FR, RR	: Front, Rear	S.D.S.	: Service Data and Specifications

HOW TO USE THIS MANUAL

8. The **UNITS** given in this manual are primarily expressed as the SI UNIT (International System of Unit), and alternatively expressed in the metric system and in the yard/pound system.

"Example"

Tightening torque:

59 - 78 N·m (6.0 - 8.0 kg-m, 43 - 58 ft-lb)

9. **TROUBLE DIAGNOSES** are included in sections dealing with complicated components.
10. **SERVICE DATA AND SPECIFICATIONS** are contained at the end of each section for quick reference of data.
11. The captions **WARNING** and **CAUTION** warn you of steps that must be followed to prevent personal injury and/or damage to some part of the vehicle.
- **WARNING** indicates the possibility of personal injury if instructions are not followed.
 - **CAUTION** indicates the possibility of component damage if instructions are not followed.
 - **BOLD TYPED STATEMENTS** except **WARNING** and **CAUTION** give you helpful information.

WIRING DIAGRAM

Symbols used in WIRING DIAGRAM are shown below:

SWITCH POSITIONS

Wiring diagram switches are shown with the vehicle in the following condition.

- Ignition switch "OFF".
- Doors, hood and trunk lid/back door closed.
- Pedals are not depressed and parking brake is released.

Example

CONNECTOR SYMBOLS

- All connector symbols in wiring diagrams are shown from the terminal side.

Example

- Male and female terminals
Connector guides for male terminals are shown in black and female terminals in white in wiring diagrams.

MULTIPLE SWITCH

The continuity of the multiple switch is identified in the switch chart in wiring diagrams.

Example

SGI365

SUPER MULTIPLE JUNCTION (S.M.J.)

- The "S.M.J." indicated in wiring diagrams is shown in a simplified form. The terminal arrangement should therefore be referred to in the foldout at the end of the Service Manual.
- The foldout should be spread to read the entire wiring diagram.

Example

Super Multiple Junction (S.M.J.)

SEL653F

NOTICE

The flow chart indicates work procedures required to diagnose problems effectively. Observe the following instructions before diagnosing.

- 1) Use the flow chart after locating probable causes of a problem following the "Preliminary Check" or the "Symptom Chart".
- 2) After repairs, recheck that the problem has been completely eliminated.
- 3) Refer to Component Parts Location and Harness Layout for the Systems described in each section for identification/location of components and harness connectors.
- 4) Refer to the Circuit Diagram for Quick Pinpoint Check.
 If you must perform circuit continuity between harness connectors more detail, such as in case of sub-harness is used, refer to Wiring Diagram and Harness Layout in EL section for identification of harness connectors.
- 5) When checking circuit continuity, ignition switch should be "OFF".
- 6) Before checking voltage at connectors, check battery voltage.
- 7) After accomplishing the Diagnostic Procedures and Electrical Components Inspection, make sure that all harness connectors are reconnected as they were.

HOW TO FOLLOW THIS FLOW CHART

1 Work and diagnostic procedure

Start to diagnose a problem using procedures indicated in enclosed blocks, as shown in the following example.

2 Measurement results

Required results are indicated in bold type in the corresponding block, as shown below:

These have the following meanings:

Battery voltage → 11 - 14V or approximately 12V

Voltage: Approximately 0V → Less than 1V

3 Cross reference of work symbols in the text and illustrations

Illustrations are provided as visual aids for work procedures. For example, symbol **A** indicated in the left upper portion of each illustration corresponds with the symbol in the flowchart for easy identification. More precisely, the procedure under the "CHECK POWER SUPPLY." outlined previously is indicated by an illustration **A**.

4 Symbols used in illustrations

Symbols included in illustrations refer to measurements or procedures. Before diagnosing a problem, familiarize yourself with each symbol.

Direction mark

A direction mark is shown to clarify the side of connector (terminal side or harness side).

Direction marks are mainly used in the illustrations indicating terminal inspection.

: View from terminal side ... T.S.

- All connector symbols shown from the terminal side are enclosed by a single line.

: View from harness side ... H.S.

- All connector symbols shown from the harness side are enclosed by a double line.

	Turn ignition switch from "OFF" to "ON" position.		Fan switch is "OFF".
	Turn ignition switch from "ON" to "OFF" position.		Apply battery voltage directly to components.
	Do not start engine, or check with engine stopped.		Drive vehicle.
	Start engine, or check with engine running		Disconnect battery negative cable.
	Apply parking brake.		Depress brake pedal.
	Release parking brake.		Depress accelerator pedal.
	Check after engine is warmed up sufficiently.		Release accelerator pedal.
	Voltage should be measured with a voltmeter.	Pin terminal check for S.M.J. type E.C.U. and A/T control unit connectors. For details regarding the terminal arrangement, refer to the foldout page.	
	Circuit resistance should be measured with an ohmmeter.		
	Current should be measured with an ammeter.

SPECIAL SERVICE TOOLS

Tool number Tool name	Description
LM4086-0200 Board-on lift attachment	
LM4519-0000 Safety stand attachment	

Board-on Lift

CAUTION:

Make sure vehicle is empty when lifting.

- The board-on lift attachment (LM4086-0200) set at front end of vehicle should be set on the front of the sill under the front door opening.
- Position attachments at front and rear ends of board-on lift.

Models with sill spoiler

Fix board-on lift attachments to inner side of sill when the side sill flange is covered by sill spoiler.

Garage Jack and Safety Stand

WARNING:

- Never get under the vehicle while it is supported only by the jack. Always use safety stands when you have to get under the vehicle.
- Place wheel chocks at the front wheels when the rear wheels are raised and place wheel chocks at the rear wheels when the front wheels are raised.

2-wheel drive models

Garage Jack and Safety Stand (Cont'd)

4-wheel drive models

2-pole Lift

WARNING:

When lifting the vehicle, open the lift arms as wide as possible and ensure that the front and rear of the vehicle are well balanced.

When setting the lift arm, do not allow the arm to contact the brake tubes and fuel lines.

Tow Truck Towing

CAUTION:

- All applicable local laws regarding the towing operation must be obeyed.
- It is necessary to use proper towing equipment to avoid possible damage to the vehicle during a towing operation.
- When towing with the rear wheels on the ground, release the parking brake and move the gearshift lever to neutral ("N" position).

2-WHEEL DRIVE MODELS

NISSAN recommends that vehicle be towed with the driving (front) wheels off the ground as illustrated.

LIFTING POINTS AND TOW TRUCK TOWING

Tow Truck Towing (Cont'd)

Towing an automatic transaxle model with four wheels on ground

Observe the following restricted towing speeds and distances.

Speed: Below 50 km/h (30 MPH)

Distance: Less than 65 km (40 miles)

CAUTION:

Never tow an automatic transaxle model from the rear (i.e., backward) with four wheels on the ground as this may cause serious and expensive damage to the transaxle.

Towing an automatic transaxle model with rear wheels raised (With front wheels on ground)

Never tow an automatic transaxle model with rear wheels raised (with front wheels on ground) as this may cause serious and expensive damage to the transaxle. If it is necessary to tow it with rear wheels raised, always use a towing dolly under the front wheels.

4-WHEEL DRIVE MODELS

NISSAN recommends that the 4-wheel drive vehicle be towed with all wheels off the ground as follows:

1. Using a flat-bed truck.
2. Using a combination of a tow truck and a dolly as illustrated.

Towing with four wheels on ground

Observe the following restricted towing speeds and distances.

Speed: Below 50 km/h (30 MPH)

Distance: Less than 65 km (40 miles)

Towing a 4-wheel drive model with front or rear wheels raised (With rear or front wheels on the ground)

Never tow a 4-wheel drive model with front or rear wheels raised and rear or front wheels on the ground as this may cause serious and expensive damage to the transaxle. If it is necessary to tow the vehicle with the front or rear wheels raised, always use a towing dolly under the rear or front wheels.

Tow Truck Towing (Cont'd)

Model B13 series

Model N14 series

TOWING POINTS

Always pull the cable straight out from the vehicle. Never pull on the hook at a sideways angle.

CAUTION:

- a. When doing on-the-car wheel balancing with a full-time 4WD vehicle, to prevent the wheels from rotating at different speeds or in different directions from each other (which could lead to damage to transaxle gear), always be sure to observe the following precautions:
 - 1) All four wheels should be jacked up, clearing the ground completely.
 - 2) The wheels should be rotated with both the engine and the wheel balancer engaged.
 - 3) The parking brake lever should be fully released.
 - 4) None of the brakes should be allowed to drag.
- b. Avoid sudden acceleration, deceleration and braking.

1. Jack up vehicle so that all four wheels can rotate.
Make sure the vehicle is firmly supported on stands.

2. Release parking brake fully.

3. Make sure that brakes are not dragging on any of four wheels.

ON-THE-CAR WHEEL BALANCING

4. Place wheel to be balanced on wheel balancer.
Follow the procedure specified by the wheel balancer manufacturer.

5. Start engine

6.

— **M/T MODEL** —

Put shift lever in 3rd or 4th gear and engage clutch slowly, then gradually increase speed to test speed.

— **A/T MODEL** —

Put shift lever into "D" position, then gradually increase speed to test speed.

7. Rotate wheels using both engine's driving force and wheel balancer driving force and check wheel balance.

Assure that the other wheels will rotate at the same time.

Precautions

- Recommended fluid is brake fluid "DOT 3".
- Do not reuse drained brake fluid.
- Be careful not to splash brake fluid on painted areas.
- When removing and installing clutch piping, use Tool.
- Use new brake fluid to clean or wash all parts of master cylinder, operating cylinder and clutch damper.
- Never use mineral oils such as gasoline or kerosene. It will ruin the rubber parts of the hydraulic system.

WARNING:

After cleaning clutch disc, wipe it with a dust collector. Do not use compressed air.

Adjusting Clutch Pedal

1. Adjust pedal height with pedal stopper or clutch switch.
Pedal height "H":
Refer to S.D.S.

— For hydraulic type —

2. Adjust pedal free play with master cylinder push rod. Then tighten lock nut.

Pedal free play "A₁":

1.0 - 3.0 mm (0.039 - 0.118 in)

Pedal free play means the following total, measured at position of pedal pad:

- Play due to clevis pin and clevis pin hole in clutch pedal.

— For mechanical type —

2. Adjust withdrawal lever play "B" according to the following procedure.
 - (1) Push withdrawal lever by hand until resistance is felt, and then tighten adjusting nut.
 - (2) Turn back adjusting nut 2.5 to 3.5 turns, and then tighten lock nut.

Withdrawal lever play "B":

2.5 - 3.5 mm (0.098 - 0.138 in)

Lock nut:

☐: 3 - 4 N·m (0.3 - 0.4 kg-m, 2.2 - 2.9 ft-lb)

Adjusting Clutch Pedal (Cont'd)

- (3) As a final check, measure pedal free travel "A₂" at center of pedal pad.

Pedal free travel "A₂":

10.8 - 15.1 mm (0.425 - 0.594 in)

Bleeding Procedure — Hydraulic type

Bleed air according to the following procedure.

- **Carefully monitor fluid level at master cylinder during bleeding operation.**
1. Top up reservoir with recommended brake fluid.
 2. Connect a transparent vinyl tube to air bleeder valve.
 3. Fully depress clutch pedal several times.
 4. With clutch pedal depressed, open bleeder valve to release air.
 5. Close bleeder valve.
 6. Repeat steps 3 through 5 above until clear brake fluid comes out of air bleeder valve.

DISASSEMBLY AND ASSEMBLY

- Push piston into cylinder body with screwdriver when removing and installing valve stopper.

- Align groove of piston assembly and valve stopper when installing valve stopper.
- Check direction of piston cups.

Clutch Master Cylinder (Cont'd)

INSPECTION

Check the following items, and replace if necessary.

- Rubbing surface of cylinder and piston, for uneven wear, rust or damage
- Piston with piston cup, for wear or damage
- Return spring, for wear or damage
- Dust cover, for cracks, deformation or damage
- Reservoir, for deformation or damage

Operating Cylinder

INSPECTION

Check the following items, and replace if necessary.

- Rubbing surface of cylinder and piston, for uneven wear, rust or damage
- Piston with piston cup, for wear or damage
- Piston spring, for wear or damage
- Dust cover, for cracks, deformation or damage

HYDRAULIC TYPE

MECHANICAL TYPE

REMOVAL AND INSTALLATION

- Remove release bearing by pulling bearing retainers outward.
- Align retaining pin with cavity of clutch housing and tap out retaining pin.

INSPECTION

Check the following items, and replace if necessary.

- Release bearing, to see that it rolls freely and is free from noise, cracks, pitting or wear
- Release sleeve and withdrawal lever rubbing surface, for wear, rust or damage

LUBRICATION

- Apply recommended grease to contact surface and rubbing surface.
- Too much lubricant might damage clutch disc facing.

CLUTCH DISC AND CLUTCH COVER

Clutch Disc

INSPECTION

Check clutch disc for wear of facing.

Wear limit of facing surface to rivet head:
0.3 mm (0.012 in)

- Check clutch disc for backlash of spline and runout of facing.

Maximum backlash of spline (at outer edge of disc):

180CBL	0.7 mm (0.028 in)
190TBL, 200TBL	0.8 mm (0.031 in)
215TBL	0.9 mm (0.035 in)
240LTD	1.0 mm (0.039 in)

Runout limit:

1.0 mm (0.039 in)

Distance of runout check point (from hub center):

180CBL	85 mm (3.35 in)
190TBL	90 mm (3.54 in)
200TBL	95 mm (3.74 in)
215TBL	102.5 mm (4.04 in)
240LTD	115 mm (4.53 in)

- Check clutch disc for burns, discoloration or oil or grease leakage. Replace if necessary.

Clutch Cover and Flywheel

INSPECTION AND ADJUSTMENT

- Set Tools and check height and unevenness of diaphragm spring.

Set specified feeler gauges on distance pieces (ST20050100) to obtain the same thickness as clutch disc.

Thickness of feeler gauges:

C180S, C190S and C200S (CD20 engine models)

0.4 mm (0.016 in)

C200S (4WD models with GA16DS engine)

0.1 mm (0.004 in)

C215S Not required

C240S 0.3 mm (0.012 in)

Diaphragm spring height "A":

C180S 29 - 31 mm (1.14 - 1.22 in)

C190S

Except for models with CD17 engine

29 - 31 mm (1.14 - 1.22 in)

For models with CD17 engine

C240S 37.5 - 39.5 mm (1.476 - 1.555 in)

- Check thrust rings for wear or damage by shaking cover assembly and listening for chattering noise, or lightly hammering on rivets for a slightly cracked noise. Replace clutch cover assembly if necessary.
- Check pressure plate and clutch disc contact surface for slight burns or discoloration. Repair pressure plate with emery paper.
- Check pressure plate and clutch disc contact surface for deformation or damage. Replace if necessary.

- Adjust unevenness of diaphragm spring with Tool.

Uneven limit:

C180S 1.0 mm (0.039 in)

C190S, C200S and C215S 0.7 mm (0.028 in)

C240S 0.5 mm (0.020 in)

FLYWHEEL INSPECTION

- Check contact surface of flywheel for slight burns or discoloration. Repair flywheel with emery paper.
- Check flywheel runout.

Runout (Total indicator reading):

Flywheel

Less than 0.15 mm (0.0059 in)

CLUTCH DISC AND CLUTCH COVER

Clutch Cover and Flywheel (Cont'd)

INSTALLATION

- Insert Tool into clutch disc hub when installing clutch cover and disc.
- Tighten bolts in numerical order.
- **Be careful not to allow grease to contaminate clutch facing.**

Replacing Oil Seal

DIFFERENTIAL OIL SEAL

1. Drain gear oil from transaxle.
2. Remove drive shafts — Refer to section FA.
3. Remove differential oil seal.

4. Install differential oil seal.
- **Apply multi-purpose grease to seal lip of oil seal before installing.**
5. Install drive shafts — Refer to section FA.

Removal

1. Remove battery negative terminal.
2. Remove air duct.

3. Disconnect clutch control cable. (Except for SR20DET engine models)
Remove clutch operating cylinder from transaxle. (SR20DET engine models)
4. Disconnect speedometer cable from transaxle.
5. Disconnect back-up lamp switch, neutral switch and ground harness connectors.
6. Remove starter motor from transaxle.

7. Remove shift control rod and support rod from transaxle.
8. Drain gear oil from transaxle and transfer.
9. Draw out drive shafts — Refer to section FA.
10. Support engine with hoist. (SR20DET engine models)
11. Remove transfer — Refer to section TF. (4WD models)

12. Jack up transaxle together with engine slightly and insert wooden block between center member and engine oil pan. (2WD models)

CAUTION:

Do not place jack under oil pan drain plug.

13. Remove rear and L.H. mounts supporting transaxle with jack.
14. Remove bolts securing transaxle.
15. Lower transaxle.

Installation

Tighten bolts securing transaxle and install any part removed.

1. Remove transmission case while slightly tilting it to prevent 5th shift fork from interfering with case.

2. Draw out reverse idler spacer and fork shaft, then remove 5th and 3rd & 4th shift forks.

Be careful not to lose shifter cap.

3. Remove control bracket with 1st & 2nd shift fork.

Be careful not to lose shifter cap.

4. Remove gear components from clutch housing.

— RN4F30A and RS5F30A —

- a. Remove three screws and detach bearing retainer.

One of these three screws is torx type and should be removed with a suitable tool, as shown.

- b. Remove input shaft together with mainshaft by tapping lightly.

Always withdraw mainshaft straight out. Failure to do so can damage resin oil channel on clutch housing side.

Do not draw out reverse idler shaft from clutch housing because these fittings will be loose.

When removing input shaft, be careful not to scratch oil seal lip with shaft spline.

- c. Remove reverse idler gear and final drive assembly.

— RS5F31A —

- a. Remove mainshaft and final drive assembly.

Always withdraw mainshaft straight out. Failure to do so can damage resin oil channel on clutch housing side.

- b. Remove bearing retainer securing bolts.

- c. Remove input shaft together with bearing retainer and reverse idler gear by tapping lightly.

Do not draw out reverse idler shaft from clutch housing because these fittings will be loose.

When removing input shaft, be careful not to scratch oil seal lip with shaft spline.

5. Remove oil pocket, shift check ball, check spring and check ball plug.

6. Drive retaining pin out of striking lever, then remove striking rod, striking lever and striking interlock.

- Select a position where retaining pin does not interfere with clutch housing when removing retaining pin.

- Be careful not to damage oil seal lip, when removing striking rod. If necessary, tape edges of striking rod.

7. Remove reverse check plug, then detach reverse check spring and check balls.

8. Remove check sleeve assembly.

- If not within specification, disassemble and check contact surface of gear, shaft and hub. Then check clearance of snap ring groove -- Refer to "Assembly".

2. Remove snap ring and 5th stopper.
3. Remove 5th synchronizer, 5th input gear and 5th gear needle bearing.

4. Remove snap ring of input shaft front bearing and input gear spacer.

Input Shaft and Gears (Cont'd)

5. Pull out input shaft front bearing.
6. Remove bearing retainer.

INSPECTION

Gear and shaft

- Check shaft for cracks, wear or bending.
- Check gears for excessive wear, chips or cracks.

Synchronizer

- Check spline portion of coupling sleeves, hubs and gears for wear or cracks.
- Check baulk rings for cracks or deformation.
- Check shifting inserts for wear or deformation.

- Measure clearance between baulk ring and gear.

Clearance between baulk ring and gear:

Standard

1.0 - 1.35 mm (0.0394 - 0.0531 in)

Wear limit

0.7 mm (0.028 in)

Bearing

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.

Input Shaft and Gears (Cont'd)

ASSEMBLY

1. Assemble 5th synchronizer.

- Be careful not to hook front and rear ends of spread spring to the same insert.

2. Install bearing retainer.
3. Press on input shaft front bearing.
4. Install input gear spacer.

5. Select proper snap ring of input shaft front bearing to minimize clearance of groove in input shaft and then install it.

Allowable clearance of groove:

0 - 0.1 mm (0 - 0.004 in)

Snap ring of input shaft front bearing:

Refer to S.D.S.

6. Install 5th gear needle bearing, 5th input gear, 5th synchronizer and 5th stopper.
7. Measure gear end play as the final check — Refer to "Disassembly."

Input Shaft and Gears (Cont'd)

8. Select proper snap ring of 5th synchronizer hub to minimize clearance of groove in input shaft and install it.

Allowable clearance of groove:

0 - 0.1 mm (0 - 0.004 in)

Snap ring of 5th synchronizer:

Refer to S.D.S.

Mainshaft and Gears

DISASSEMBLY

1. Before disassembly, check 1st, 2nd, 3rd and 4th main gear end plays.

Gear end play

Refer to S.D.S.

- If not within specification, disassemble and check contact surface of gear, shaft and hub. Then check clearance of C-ring groove — Refer to "Assembly".

2. Press out mainshaft front bearing.

3. Press out mainshaft rear bearing.

4. Remove C-rings, C-ring holder and thrust washer.

Mainshaft and Gears (Cont'd)

5. Press out 5th main gear.

6. Remove 4th main gear, 4th bushing and steel ball.
- Be careful not to lose steel ball.

7. Remove 3rd & 4th synchronizer, 3rd main gear, 2nd & 3rd bushing, steel ball and 2nd main gear.
- Be careful not to lose steel ball.

Mainshaft and Gears (Cont'd)

8. Remove 1st & 2nd synchronizer and 1st main gear, then remove 1st gear needle bearing.

INSPECTION

Gear and shaft

- Check shaft for cracks, wear or bending.
- Check gears for excessive wear, chips or cracks.

Synchronizer

- Check spline portion of coupling sleeves, hubs and gears for wear or cracks.
- Check baulk rings for cracks or deformation.
- Check shifting inserts for wear or deformation.

- Measure clearance between baulk ring and gear.
Clearance between baulk rings and 1st-4th main gears:
Standard
1.0 - 1.35 mm (0.0394 - 0.0531 in)
Wear limit
0.7 mm (0.028 in)

Bearing

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.
- **When replacing tapered roller bearing, replace outer and inner race as a set.**

Mainshaft and Gears (Cont'd)

ASSEMBLY

1. Assemble 1st & 2nd and 3rd & 4th synchronizers.

- Be careful not to hook front and rear ends of spread spring to the same insert.

2. Install 1st gear needle bearing and 1st main gear.
3. Press on 1st & 2nd synchronizer.

4. Install steel ball, 2nd main gear, 2nd & 3rd bushing, 3rd main gear and 3rd & 4th synchronizer.
- Apply multi-purpose grease to steel ball before installing it.
 - 2nd & 3rd bushing has a groove in which steel ball fits.

Mainshaft and Gears (Cont'd)

5. Install steel ball, 4th bushing and 4th main gear.

- Apply multi-purpose grease to steel ball before installing it.
- 4th bushing has a groove in which steel ball fits.

6. Press on 5th main gear.

7. Install thrust washer.

8. Select proper C-ring to minimize clearance of groove in mainshaft and install it.

Allowable clearance of groove:
0 - 0.1 mm (0 - 0.004 in)

Mainshaft C-ring:
Refer to S.D.S.

9. Install C-ring holder.

10. Press on mainshaft rear bearing.

Mainshaft and Gears (Cont'd)

11. Press on mainshaft front bearing.

12. Measure gear end play as the final check — Refer to "Disassembly".

**Final Drive****DISASSEMBLY**

1. Remove final gear.
2. Remove speedometer drive gear by cutting it.
3. Press out differential side bearings.
- **Be careful not to mix up the right and left bearings.**

4. Drive out retaining pin and draw out pinion mate shaft.
5. Remove pinion mate gears and side gears.

**INSPECTION****Gear, washer, shaft and case**

- Check mating surfaces of differential case, side gears and pinion mate gears.
- Check washers for wear.

**Bearing**

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.
- **When replacing tapered roller bearing, replace outer and inner race as a set.**

Final Drive (Cont'd)

ASSEMBLY

1. Attach side gear thrust washers to side gears, then install pinion mate washers and pinion mate gears in place.

2. Insert pinion mate shaft.
 - When inserting, be careful not to damage pinion mate thrust washers.

3. Measure clearance between side gear and differential case with washers following the procedure below:
 - a. Set Tool and dial indicator on side gear.

- b. Move side gear up and down to measure dial indicator deflection. Always measure indicator deflection on both side gears.

Clearance between side gear and differential case with washers:

0.1 - 0.2 mm (0.004 - 0.008 in)

- c. If not within specification, adjust clearance by changing thickness of side gear thrust washers.

Side gear thrust washer:

Refer to S.D.S.

4. Install retaining pin.
 - Make sure that retaining pin is flush with case.

Final Drive (Cont'd)

5. Install final gear.

- Apply locking sealant to final gear fixing bolts before installing them.

6. Install speedometer drive gear and stopper.

7. Press on differential side bearings.

Shift Control Components**INSPECTION**

- Check contact surface and sliding surface for wear, scratches, projections or other damage.

**Case Components****Input shaft oil seal**

1. Drive out input shaft oil seal.

Case Components (Cont'd)

2. Install input shaft oil seal.

- **Apply multi-purpose grease to seal lip of oil seal before installing.**

Input shaft rear bearing

1. Remove welch plug from transmission case.

2. Remove input shaft rear bearing by tapping it from welch plug hole.

3. Install welch plug.

- **Apply recommended sealant to mating surface of transmission case.**

4. Install input shaft rear bearing.

Case Components (Cont'd)**Mainshaft front bearing outer race and oil channel**

1. Remove mainshaft front bearing outer race.
2. Remove oil channel.

3. Install oil channel.

- Ensure that oil groove in oil channel always faces toward oil pocket when installing it on clutch housing.

4. Install mainshaft front bearing outer race.

Mainshaft rear bearing outer race

- Refer to "ADJUSTMENT".

Differential side bearing outer race

- Refer to "ADJUSTMENT".

Differential Side Bearing Preload

If any of the following parts are replaced, adjust differential side bearing preload.

- Differential case
- Differential side bearing
- Clutch housing
- Transmission case

1. Remove differential side bearing outer race (transmission case side) and shim.

2. Reinstall differential side bearing outer race without shim.
3. Install final drive assembly on clutch housing.
4. Install transmission case on clutch housing.
- Tighten transmission case fixing bolts to the specified torque.

5. Set dial indicator on front end of differential case.
6. Insert Tool all the way into differential side gear.
7. Move Tool up and down and measure dial indicator deflection.
8. Select shim considering bearing preload.

Suitable shim thickness =
Dial indicator deflection
+ specified bearing preload

Differential side bearing adjusting shims and preload:
Refer to S.D.S.
9. Install selected shim and differential side bearing outer race.
10. Check differential side bearing turning torque.
 - a. Install final drive assembly on clutch housing.
 - b. Install transmission case on clutch housing.
 - Tighten transmission case fixing bolts to the specified torque.

Differential Side Bearing Preload (Cont'd)

- c. Measure turning torque of final drive assembly.

**Turning torque of final drive assembly
(New bearing):**

Refer to S.D.S.

- When old bearing is used again, turning torque will be slightly less than the above.
- Make sure torque is close to the specified range.
- Changes in turning torque of final drive assembly per revolution should be within 1.0 N·m (10 kg-cm, 8.7 in-lb) without binding.

Mainshaft Bearing Preload

If any of the following parts are replaced, adjust mainshaft bearing preload.

- Mainshaft
- Mainshaft bearings
- Clutch housing
- Transmission case

1. Remove case cover, O-ring, spacer, mainshaft bearing adjusting shim and mainshaft rear bearing outer race from transmission case.

2. Install mainshaft assembly on clutch housing.

3. Install transmission case on clutch housing.

- **Tighten transmission case fixing bolts to the specified torque.**

4. Reinstall mainshaft rear bearing outer race on inner race.

5. Measure distance from transmission case to bearing outer race.

- **Make sure that bearing is properly seated.**

6. Select shim with S.D.S. table as a guide.

7. Check total turning torque after assembling — Refer to "ASSEMBLY".

1. Install striking rod, lever and interlock.
 - **When inserting striking rod into clutch housing, tape edges of striking rod to avoid damaging oil seal lip.**

2. Install reverse check sleeve assembly.
3. Install check balls, reverse check spring and check plug.

4. Check reverse check force.

Reverse check force:

Refer to S.D.S.

- If not within specification, select another check plug having a different length and reinstall it.

Reverse check plug:

Refer to S.D.S.

5. Install selected reverse check plug.

Apply locking sealant to thread of plug before installing it.

6. Install check ball plug, shift check ball and check spring.
7. Install oil pocket.

8. Install gear components onto clutch housing.

— RN4F30A and RS5F30A —

- a. Install final drive assembly and reverse idler gear.

b. Install mainshaft and input gear as a set.

- Take care not to damage oil seal lip with splines of input shaft while shaft is being inserted into clutch housing.
- Take care not to damage oil channel when inserting mainshaft into clutch housing.

c. Install bearing retainer.

One of these three screws is torx type and should be installed with suitable tool, as shown.

d. After installing torx screw, stake it at two points.

— RS5F31A —

a. Install input shaft assembly and reverse idler gear.

- Take care not to damage oil seal lip with splines of input shaft while shaft is being inserted into clutch housing.

b. Install final drive assembly.

Mainshaft assembly

c. Install mainshaft assembly.

- Take care not to damage oil channel when inserting mainshaft into clutch housing.

9. Apply grease to shifter caps, then install it to control bracket. Install control bracket with 1st & 2nd shift fork.

10. Install 3rd & 4th and 5th shift forks.

11. Insert fork shaft.

- Apply multi-purpose grease to support spring before installing.

12. Install reverse idler spacer.

13. Apply recommended sealant to mating surface of clutch housing.

14. Install transmission case on clutch housing.

15. Measure total turning torque.

Total turning torque (New bearing):

Refer to S.D.S.

- When old bearing is used again, turning torque will be slightly less than the above.
- Make sure torque is close to the specified range.

MT-40

1. Remove case cover.

2. Remove mainshaft bearing snap ring.

3. Remove transmission case while slightly tilting it to prevent 5th shift fork from interfering with case.

4. Draw out reverse idler spacer and fork shaft.

5. Remove 5th and 3rd & 4th shift forks.

● Be careful not to lose shifter cap.

6. Remove control bracket with 1st & 2nd shift fork.

7. Remove gear components from clutch housing.

a. Remove input shaft front bearing retainer securing bolts.

b. Remove input shaft with bearing retainer, mainshaft assembly and reverse idler gear.

- **Always withdraw mainshaft straight out. Failure to do so can damage resin oil channel on clutch housing side.**

- **Do not draw out reverse idler shaft from clutch housing because these fittings will be loose.**

When removing input shaft, be careful not to scratch oil seal lip with shaft spline.

c. Remove final drive assembly.

8. Remove oil pocket, shift check ball, check spring and check ball plug.

9. Drive retaining pin out of striking lever, then remove striking rod, striking lever and striking interlock.
- Select a position where retaining pin does not interfere with clutch housing when removing retaining pin.

- Be careful not to damage oil seal lip, when removing striking rod. If necessary, tape edges of striking rod.

10. Remove reverse check plug, then detach reverse check spring and check balls.
- If the smaller ball does not come out, remove it together with check sleeve assembly.

11. Remove check sleeve assembly.

Input Shaft and Gears

DISASSEMBLY

1. Before disassembly, check 5th input gear end play.

Gears	End play mm (in)
5th input gear	0.18 - 0.31 (0.0071 - 0.0122)

- If not within specification, disassemble and check contact surface of gear, shaft and hub. Then check clearance of snap ring groove -- Refer to "Assembly — Input Shaft and Gears".

2. Remove snap ring and 5th stopper.

3. Remove 5th synchronizer, 5th input gear and 5th gear needle bearing.

Input Shaft and Gears (Cont'd)

4. Remove snap ring of input shaft front bearing and input gear spacer.

5. Pull out input shaft front bearing.
6. Remove bearing retainer.

INSPECTION

Gear and shaft

- Check shaft for cracks, wear or bending.
- Check gears for excessive wear, chips or cracks.

Synchronizer

- Check spline portion of coupling sleeves, hubs and gears for wear or cracks.
- Check baulk rings for cracks or deformation.
- Check insert springs for wear or deformation.

- Measure clearance between baulk ring and gear.
Clearance between baulk ring and gear:
Standard
1.0 - 1.35 mm (0.0394 - 0.0531 in)
Wear limit
0.7 mm (0.028 in)

Input Shaft and Gears (Cont'd)

Bearing

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.

ASSEMBLY

1. Assemble 5th synchronizer.

- Be careful not to hook front and rear ends of spread spring to the same insert.

2. Install bearing retainer.
3. Press on input shaft front bearing.
4. Install input gear spacer.

Input Shaft and Gears (Cont'd)

5. Select proper snap ring of input shaft front bearing to minimize clearance of groove in input shaft and then install it.

Allowable clearance of groove:

0 - 0.1 mm (0 - 0.004 in)

Snap rings of input shaft front bearing:

Thickness mm (in)	Part number
1.27 (0.0500)	32204-M8004
1.33 (0.0524)	32204-M8005
1.39 (0.0547)	32204-M8006
1.45 (0.0571)	32204-M8007

- **Be sure to replace 5th gear synchronizer hub with new one when it is removed.**
6. Install 5th gear needle bearing, 5th input gear, 5th synchronizer and 5th stopper.
- **Be sure to press input shaft in position vertically in relation to synchronizer hub.**
7. Measure gear end play as a final check — Refer to "Disassembly — Input Shaft and Gears".

8. Select proper snap ring of 5th synchronizer hub to minimize clearance of groove in input shaft and install it.

Allowable clearance of groove:

0 - 0.1 mm (0 - 0.004 in)

Snap ring of 5th synchronizer:

Thickness mm (in)	Part number
2.00 (0.0787)	32311-M8812

Mainshaft and Gears

DISASSEMBLY

1. Before disassembly, measure gear end play.

Gear end play:

Gears	End play mm (in)
1st main gear	0.18 - 0.31 (0.0071 - 0.0122)
2nd-4th main gear	0.20 - 0.30 (0.0079 - 0.0118)

- If end play is not within the specified limit, disassemble and check the parts.

2. Remove mainshaft rear bearing snap ring, C-ring holder and C-rings.

3. Remove mainshaft bearing and spacer.

Mainshaft and Gears (Cont'd)

4. Remove 5th main gear.

5. Remove 4th main gear, 4th gear bushing and steel ball.

- Take care not to lose steel ball.

6. Remove 3rd & 4th synchronizer and 3rd main gear.

Mainshaft and Gears (Cont'd)

7. Remove 2nd & 3rd gear bushing and 2nd main gear.

- Take care not to lose the steel ball.

8. Remove 1st & 2nd synchronizer hub and 1st main gear.

**INSPECTION****Gear and shaft**

- Check shaft for cracks, wear or bending.
- Check gears for excessive wear, chips or cracks.

Mainshaft and Gears (Cont'd)

Synchronizer

- Check spline portion of coupling sleeves, hubs and gears for wear or cracks.
- Check baulk rings for cracks or deformation.
- Check insert springs for deformation.

- Measure clearance between baulk ring and gear.

Clearance between baulk rings and gears, for 1st and 4th gear only:

Standard

1.0 - 1.35 mm (0.0394 - 0.0531 in)

Wear limit

0.7 mm (0.028 in)

- 2nd and 3rd gears have inner and outer baulk rings and so have different measurements.

- Measure wear of 2nd and 3rd baulk ring.
 - a. Place baulk rings in position on synchronizer cone.
 - b. While holding baulk ring against synchronizer cone as far as it will go, measure dimensions "A" and "B".

Standard:

A 0.7 - 0.9 mm (0.028 - 0.035 in)

B 0.6 - 1.1 mm (0.024 - 0.043 in)

Wear limit:

0.2 mm (0.008 in)

- c. If dimension "A" or "B" is smaller than the wear limit, replace baulk ring.

Mainshaft and Gears (Cont'd)

Bearing

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.
- **The mainshaft front bearing cannot be re-used. It must be replaced once removed.**

ASSEMBLY

1. Install 1st gear needle bearing, 1st main gear and baulk ring.
2. Press on 1st & 2nd synchronizer hub.

Mainshaft and Gears (Cont'd)

- Ensure correct fitting of 1st & 2nd synchronizer hub.

3. Install 2nd synchronizer cone, outer & inner baulk ring and 1st & 2nd coupling sleeve.

4. Install steel ball, 2nd main gear, 2nd & 3rd bushing.
 - Apply gear oil to 2nd & 3rd bushing before installing it.
 - Apply multi-purpose grease to steel ball before installing it.
 - 2nd & 3rd bushing has a groove in which steel ball fits.

Mainshaft and Gears (Cont'd)

5. Install 3rd main gear, synchronizer cone, outer & inner baulk ring.
6. Press on 3rd & 4th synchronizer hub.

- Ensure correct fitting of 3rd & 4th synchronizer hub.
7. Install 3rd & 4th coupling sleeve and 4th baulk ring.

8. Install steel ball, 4th bushing and 4th main gear.
- Apply multi-purpose grease to steel ball before installing it.
 - 4th bushing has a groove in which steel ball fits.

Mainshaft and Gears (Cont'd)

9. Press on 5th main gear.

10. Select proper mainshaft bearing spacer to give correct bearing distance.

Bearing distance "C":

230.15 - 230.25 mm (9.0610 - 9.0649 in)

Spacers available:

DISASSEMBLY

1. Remove final gear.
2. Remove speedometer drive gear by cutting it.
3. Press out differential side bearings.
- **Be careful not to mix up the right and left bearings.**

4. Drive out retaining pin and draw out pinion mate shaft.
5. Remove pinion mate gears and side gears.

INSPECTION

Gear, washer, shaft and case

- Check mating surfaces of differential case, side gears and pinion mate gears.
- Check washers for wear.

Bearing

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.
- **When replacing tapered roller bearing, replace outer and inner race as a set.**

ASSEMBLY

1. Attach side gear thrust washers to side gears, then install pinion mate washers and pinion mate gears in place.

Final Drive (Cont'd)

2. Insert pinion mate shaft.
 - **When inserting, be careful not to damage pinion mate thrust washers.**

3. Measure clearance between side gear and differential case with washers following the procedure below:
 - a. Set Tool and dial indicator on side gear.

- b. Move side gear up and down to measure dial indicator deflection. Always measure indicator deflection on both side gears.

1. Install striking lever & rod, striking interlock assembly and control bracket on clutch housing exactly.

- When installing control bracket on clutch housing, assure protrusion beneath bracket is correctly seated.

2. Measure maximum height "H" while shifting from neutral to reverse position.

Maximum height "H":

67.38 - 67.86 mm (2.6528 - 2.6716 in)

Height gauge

1st & 2nd shifter

1st & 2nd shifter

Striking lever

Control bracket fitting surface

Reverse brake cam

SMT728B

Shift Control Components (Cont'd)

3. Measure clearance "C" between reverse brake cam and striking lever while shifting to reverse position.

Clearance "C":

0.05 - 0.20 mm (0.0020 - 0.0079 in)

If "H" or "C" is not within specification, replace the following parts as a set.

- Striking lever assembly
- Striking interlock assembly (This includes reverse brake cam.)
- Control bracket assembly

Case Components**Input shaft oil seal**

1. Drive out input shaft oil seal.

2. Install input shaft oil seal.

- Apply multi-purpose grease to seal lip of oil seal before installing.

**Input shaft rear bearing**

1. Remove weld plug from transmission case.

Case Components (Cont'd)

2. Remove input shaft rear bearing by tapping it from wench plug hole.

3. Install wench plug.
 - Apply recommended sealant to mating surface of transmission case.

4. Install input shaft rear bearing.

Mainshaft front bearing and oil channel

1. Remove mainshaft front bearing retainer.

2. Remove mainshaft front bearing.
3. Remove oil channel.

Case Components (Cont'd)

4. Install oil channel.

- Ensure that oil groove in oil channel always faces toward oil pocket when installing it on clutch housing.

5. Install mainshaft front bearing.

6. Install mainshaft front bearing retainer.

Apply locking sealant to thread of screw before installation.

Differential Side Bearing Preload

If any of the following parts are replaced, adjust differential side bearing preload.

- Differential case
- Differential side bearing
- Clutch housing
- Transmission case

1. Remove differential side bearing outer race (transmission case side) and shim.

2. Reinstall differential side bearing outer race without shim.
 3. Install final drive assembly on clutch housing.
 4. Install transmission case on clutch housing.
- Tighten transmission case fixing bolts to the specified torque.

5. Set dial indicator on front end of differential case.
6. Insert Tool all the way into differential side gear.
7. Move Tool up and down and measure dial indicator deflection.
8. Select shim considering bearing preload.

Suitable shim thickness = Dial indicator deflection + Specified bearing preload

Differential side bearing adjusting shims and preload:

Refer to S.D.S.

Bearing preload:

0.25 - 0.30 mm (0.0098 - 0.0118 in)

9. Install selected shim and differential side bearing outer race.
 10. Check differential side bearing turning torque.
 - a. Install final drive assembly on clutch housing.
 - b. Install transmission case on clutch housing.
- Tighten transmission case fixing bolts to the specified torque.

Differential Side Bearing Preload (Cont'd)

c. Measure turning torque of final drive assembly.

Turning torque of final drive assembly

(New bearing):

2.9 - 6.9 N·m (30 - 70 kg-cm, 26 - 61 in-lb)

- When old bearing is used again, turning torque will be slightly less than the above.
- Make sure torque is close to the specified range.
- Changes in turning torque of final drive assembly per revolution should be within 1.0 N·m (10 kg-cm, 8.7 in-lb) without binding.

1. Install striking rod, lever and interlock.
- **When inserting striking rod into clutch housing, tape edges of striking rod to avoid damaging oil seal lip.**

2. Install reverse check sleeve assembly.
3. Install check balls, reverse check spring and check plug.

4. Check reverse check force.

Reverse check force:

4.9 - 7.4 N·m (50 - 75 kg-cm, 43 - 65 in-lb)

- If not within specification, select another check plug having a different length and reinstall it.

Available reverse check plugs:

Thickness mm (in)	Part number
7.1 (0.280)	32188-M8002
7.7 (0.303)	32188-M8003
8.3 (0.327)	32188-M8001*
8.9 (0.350)	32188-M8004

*Standard size check plug.

5. Install selected reverse check plug.
- Apply locking sealant to thread of plug before installing it.**

6. Install check ball plug, shift check ball and check spring.
7. Install oil pocket.

8. Install gear components onto clutch housing.
- a. Install final drive assembly.

- b. Install input shaft assembly with bearing retainer, mainshaft assembly and reverse idler gear.
- Be careful not to damage oil seal lip with splines of input shaft while shaft is being inserted into clutch housing.
- Be careful not to damage oil channel when inserting mainshaft into clutch housing.

- c. Install input shaft front bearing retainer.

9. Apply grease to shifter caps, then install it to control bracket. Install control bracket with 1st & 2nd shift fork.

- When installing control bracket on clutch housing, ensure protrusion beneath bracket is correctly seated.
10. Install 3rd & 4th and 5th shift forks.

11. Insert fork shaft.

- **Apply multi-purpose grease to support spring before installing.**

12. Install reverse idler spacer.

13. Apply recommended sealant to mating surface of clutch housing.

14. Install transmission case on clutch housing.

15. Install mainshaft front bearing snap ring.

16. Check mainshaft bearing end play.

Mainshaft bearing end play:

0 - 0.1 mm (0 - 0.004 in)

- Make sure that bearing is properly seated. If not, tap main shaft end with a rubber hammer.
- If not within specification, select another case cover having a different thickness.

Available case covers:

Refer to S.D.S.

17. Install O-ring and case cover on transmission case.

Apply recommended sealant to mating surface of transmission case.

• Apply recommended sealant (Nissan genuine part: KP610-00250) or equivalent.

1. Before removing transmission case, remove bolts and plugs as shown left.
2. Remove transmission case.

3. Remove position switch.

4. Mesh 4th gear, and then remove reverse idler shaft and reverse idler gear.

5. Pull out retaining pin from clutch housing.

6. Remove reverse lever spring and reverse lock spring from reverse lever assembly.

7. Remove reverse arm shaft while rotating it.

8. Remove reverse lever assembly.

9. Remove 5th & reverse check plug, spring and ball.

10. Remove stopper rings and retaining pins from 5th & reverse and 3rd & 4th fork rods.

11. Remove 5th & reverse and 3rd & 4th fork rods. Then remove forks and brackets.

12. Remove both input and mainshafts with 1st & 2nd fork and fork rod as a set.

13. Remove final drive assembly.

14. Remove reverse check assembly.

15. Remove retaining pin and detach the selector.

16. Remove plug for convenience in removing retaining pin which holds striking lever to striking rod.

17. Remove retaining pin and then withdraw striking lever and striking rod.

Input Shaft and Gears

DISASSEMBLY

1. Before disassembly, check 3rd, 4th and 5th input gear end plays.

Gear end play

Gears	End play mm (in)
3rd input gear	0.23 - 0.43 (0.0091 - 0.0169)
4th input gear	0.25 - 0.55 (0.0098 - 0.0217)
5th input gear	0.23 - 0.48 (0.0091 - 0.0189)

- If not within specification, disassemble and check contact surface of gear, shaft and hub. Then check clearance of snap ring and thrust washer — Refer to "ASSEMBLY".

2. Remove input shaft rear bearing.

3. Remove 5th & reverse synchronizer and 5th input gear.

4. Remove thrust washer ring, thrust washers and 4th input gear.

Input Shaft and Gears (Cont'd)

5. Remove snap ring.

6. Remove 3rd & 4th synchronizer and 3rd input gear.

7. Remove input shaft front bearing.

INSPECTION

Gear and shaft

- Check shaft for cracks, wear or bending.
- Check gears for excessive wear, chips or cracks.

Synchronizer

- Check spline portion of coupling sleeves, hubs and gears for wear or cracks.
- Check baulk rings for cracks or deformation.
- Check insert springs for wear or deformation.

Input Shaft and Gears (Cont'd)

- Measure clearance between baulk ring and gear. (4th and 5th)

Clearance between baulk ring and gear:

Standard

1.0 - 1.35 mm (0.0394 - 0.0531 in)

Wear limit

0.7 mm (0.028 in)

- Measure wear of reverse baulk ring.
- a. Place reverse baulk ring on Tool and then place reverse synchronizer cone on reverse baulk ring.

Make sure projection of synchronizer cone is positioned over the recess on suitable bearing puller.

- b. While holding reverse synchronizer cone against reverse baulk ring as firmly as possible, measure dimension "A" with dial indicator.

Wear limit: 1.2 mm (0.047 in)

- c. If dimension "A" is smaller than the wear limit, replace baulk ring.

Bearing

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.

ASSEMBLY

Input Shaft and Gears (Cont'd)

1. Place inserts in three grooves on coupling sleeve (3rd & 4th synchronizer).

2. Install 3rd input gear and 3rd baulk ring.
3. Press on 3rd & 4th synchronizer hub.
4. Select proper snap ring of 3rd & 4th synchronizer hub to minimize clearance of groove, and then install it.

Allowable clearance of groove:

0 - 0.1 mm (0 - 0.004 in)

Snap ring of 3rd & 4th synchronizer hub:

Refer to S.D.S.

5. Install 4th input gear.
6. Select proper thrust washers to minimize clearance of groove.

Then install them and thrust washer ring.

Allowable clearance of groove:

0 - 0.06 mm (0 - 0.0024 in)

Input shaft thrust washer:

Refer to S.D.S.

7. Install 5th & reverse synchronizer assembly.
 - a. Hook insert springs on reverse baulk ring.

Input Shaft and Gears (Cont'd)

- b. Install insert springs with reverse baulk ring onto coupling sleeve.
- **Pay attention to position of insert springs.**
- c. Place 5th baulk ring on 5th input gear.
- d. Install reverse synchronizer cone on reverse baulk ring.

- e. Place reverse synchronizer assembly on 5th input gear.
- **Mesh recesses of 5th input gear with projections of reverse synchronizer cone.**
- **Put insert spring mounts on reverse baulk ring upon those on 5th baulk ring.**

- f. Press on 5th & reverse synchronizer assembly with 5th input gear.

- 8. Install input shaft front and rear bearings.
- 9. Measure gear end play as the final check — Refer to "DISASSEMBLY".

Mainshaft and Gears

DISASSEMBLY

1. Before disassembly, check 1st and 2nd main gear end plays.

Gear end play

Gears	End play mm (in)
1st main gear	0.23 - 0.43 (0.0091 - 0.0169)
2nd main gear	0.23 - 0.58 (0.0091 - 0.0228)

If not within specification, disassemble and check contact surface of gear, shaft and hub. Then check clearance of snap ring — Refer to "ASSEMBLY".

2. Press out mainshaft rear bearing.

3. Remove thrust washer and snap ring.

4. Press out 5th main gear and 4th main gear.

5. Press out 3rd main gear and 2nd main gear.

Mainshaft and Gears (Cont'd)

6. Remove snap ring.

7. Remove 1st & 2nd synchronizer hub and 1st main gear.

8. Remove mainshaft front bearing.

INSPECTION

Gear and shaft

- Check shaft for cracks, wear or bending.
- Check gears for excessive wear, chips or cracks.

Synchronizer

- Check spline portion of coupling sleeves, hubs and gears for wear or cracks.
- Check baulk rings for cracks or deformation.
- Check insert springs for deformation.

Mainshaft and Gears (Cont'd)

- Measure clearance between baulk ring and gear (1st).

Clearance between baulk ring and gear:

Standard

1.0 - 1.35 mm (0.0394 - 0.0531 in)

Wear limit

0.7 mm (0.028 in)

- Measure wear of 2nd baulk rings.
 - a. Place baulk rings in position on synchronizer cone.
 - b. While holding baulk ring against synchronizer cone as far as it will go, measure dimensions "A" and "B".

Standard:

A 0.6 - 0.8 mm (0.024 - 0.031 in)

B 0.6 - 1.1 mm (0.024 - 0.043 in)

Wear limit:

0.2 mm (0.008 in)

- c. If dimension "A" or "B" is smaller than the wear limit, replace baulk ring.

Mainshaft and Gears (Cont'd)

Bearing

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.
- When replacing tapered roller bearing, replace outer and inner race as a set.

ASSEMBLY

1. Press on 1st main gear, 1st baulk ring and 1st & 2nd synchronizer hub.

- Pay attention to direction of 1st & 2nd synchronizer hub.

2. Select proper snap ring of 1st & 2nd synchronizer hub to minimize clearance of groove and then install it.

Allowable clearance of groove:

0 - 0.1 mm (0 - 0.004 in)

Snap ring of 1st & 2nd synchronizer hub:

Refer to S.D.S.

3. Install 2nd synchronizer cone, inner & outer baulk rings, insert springs and 1st & 2nd coupling sleeve.

4. Install 2nd main gear.

- Ensure four protrusions of 2nd synchronizer cone are set in holes of 2nd main gear.

Mainshaft and Gears (Cont'd)

5. Press on 3rd main gear.

6. Press on 4th main gear.

7. Press on 5th main gear.

8. Select proper snap ring of 5th main gear to minimize clearance of groove and then install it.

Allowable clearance of groove:

0 - 0.15 mm (0 - 0.0059 in)

Snap ring of 5th main gear:

Refer to S.D.S.

9. Press on thrust washer and press on mainshaft rear bearing.

10. Press on mainshaft front bearing.

11. Measure gear end play as the final check — Refer to "Disassembly".

**Final Drive (Center differential)****DISASSEMBLY**

1. Remove final gear.

2. Press out differential side bearing.

3. Remove viscous coupling.

4. Disassemble differential case.

Final Drive (Center differential) (Cont'd)

INSPECTION

Viscous coupling

- Check case for cracks.
- Check silicone oil for leakage.

Gear, washer, shaft and case

- Check mating surfaces of differential case, viscous coupling, side gear and pinion mate gear.
- Check washers for wear.

Bearing

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.

When replacing tapered roller bearing, replace outer and inner race as a set.

ASSEMBLY

1. Install side gear without thrust washers, pinion mate shaft and pinion mate gear.
2. Install differential case L.H. and R.H.

Final Drive (Center differential) (Cont'd)**— L.H. side gear —**

3. Measure clearance between side gear and viscous coupling following the procedure.
 - a. Measure dimension A between side gear and differential case.

- b. Measure dimension B and C of viscous coupling
Clearance between side gear and viscous coupling with washer (A - B + C):
0.03 - 0.14 mm (0.0012 - 0.0055 in)
- c. Select side gear thrust washer so clearance between side gear and viscous coupling is within specifications.
Side gear thrust washer: Refer to S.D.S.

**— R.H. side gear —**

3. Measure clearance between side gear and differential case following the procedure.
 - a. Install L.H. side gear thrust washer as priority selected and install differential case assembly.
 - b. Set dial indicator on side gear.
 - c. Move R.H. side gear up and down to measure dial indicator deflection.

Clearance between side gear and differential case with washer:

0.03 - 0.14 mm (0.0012 - 0.0055 in)

- d. Select side gear thrust washer so clearance between side gear and differential case is within specifications.

Side gear thrust washer: Refer to S.D.S.

4. Install viscous coupling and final gear.

Final Drive (Center differential) (Cont'd)

5. Press on differential side bearings.

Shift Control Components

INSPECTION

- Check contact surface and sliding surface for wear, scratches, projections or other damage.

Case Components

REMOVAL AND INSTALLATION

Input shaft oil seal

- Apply multi-purpose grease to seal lip of oil seal before installing.

Case Components (Cont'd)

Mainshaft front bearing outer race

Mainshaft rear bearing outer race — Refer to "ADJUSTMENT".

Differential side bearing outer race — Refer to "ADJUSTMENT".

Input Shaft End Play and Differential Side Bearing Preload

If any of the following parts are replaced, adjust input shaft end play.

- Input shaft
- Input shaft bearing
- Clutch housing
- Transmission case

If any of the following parts are replaced, adjust differential side bearing preload.

- Differential case
- Differential side bearing
- Clutch housing
- Transmission case

1. Remove differential side bearing outer race (transmission case side) and shim(s).
2. Reinstall differential side bearing outer race without shim(s).
3. Install input shaft and final drive assembly on clutch housing.
4. Install transmission case without input shaft bearing shim(s).
Then tighten it to the specified torque.
5. Using the following procedures, measure clearance between bearings and transmission case.
 - **Differential side**
 - a. Attach dial indicator. If clamp diameter of dial indicator is too small or too large, attach dial indicator using a magnetic stand.

Input Shaft End Play and Differential Side Bearing Preload (Cont'd)

- b. Insert Tool all the way into differential side gear. Move Tool up and down and measure dial indicator deflection.

- **Input shaft side**
 - a. Set dial indicator on end of input shaft.
 - b. Move input shaft up and down and measure dial indicator deflection.
- 6. Select shims with proper thickness with S.D.S. table as a guide.
- 7. Install selected differential side bearing adjusting shim and differential side bearing outer race.

8. Check differential side bearing turning torque.
 - a. Install final drive assembly on clutch housing.
 - b. Install transmission case on clutch housing.
- **Tighten transmission case fixing bolts to the specified torque.**

- c. Measure turning torque of final drive assembly.

**Turning torque of final drive assembly
(New bearing):**

4.9 - 7.8 N·m (50 - 80 kg·cm, 43 - 69 in·lb)

- **When old bearing is used again, turning torque will be slightly less than the above.**
- **Make sure torque is close to the specified range.**

Mainshaft Bearing Preload

If any of the following parts are replaced, adjust mainshaft bearing preload.

- **Mainshaft**
- **Mainshaft bearings**
- **Clutch housing**
- **Transmission case**

Mainshaft Bearing Preload (Cont'd)

1. Remove mainshaft rear bearing outer race and shim(s).

2. Reinstall mainshaft rear bearing outer race without shims.
3. Clean mating surfaces of clutch housing and transmission case with solvent.
4. Install mainshaft and mainshaft front bearing outer race into transmission case. Turn mainshaft while holding bearing outer race so that bearings are properly seated.

5. Put straightedge [width must be more than 50 mm (1.97 in)] on transmission case, and measure the distance from upper surface of straightedge to surface of the bearing outer race using a depth micrometer.

- **Measure at three places on bearing outer race, and take the average.**

6. Determine dimension A to be used by the following equation.

$$\text{Dimension A} = \text{Width of straightedge} - \text{measured distance}$$

7. Measure the distance from mating surface of clutch housing to portion with which mainshaft front bearing outer race is to be mated.

- **Measure at three places on the portion, and take the average.**

$$\text{Dimension B} = \text{Measured distance}$$

8. Determine dimension C to be used by the following equation.

$$C = B - A$$

9. Determine total thickness of shims with S.D.S. table as a guide.
10. Install selected mainshaft bearing adjusting shim and mainshaft bearing outer race.
11. Check total turning torque after assembly — Refer to "ASSEMBLY".

1. Install striking lever and striking rod.

2. Install selector and retaining pin.

3. Install reverse gate assembly.

4. Install final drive assembly.

5. Install input shaft and mainshaft with 1st & 2nd shift fork assembly.

- Be careful not to damage input shaft oil seal.

6. Install interlock balls and plunger.

7. Install 3rd & 4th shift fork and bracket, then install 3rd & 4th shift rod, stopper ring and retaining pin.

8. Install interlock balls.

9. Install 5th shift fork and bracket, then install shift rod, stopper ring and retaining pin.

10. Install 5th & reverse check plug, spring and ball.

11. Reverse lever assembly

a. Install reverse lock spring on 5th & reverse bracket.

- Pay attention to its direction.

b. Install check ball and reverse lever spring on reverse lever assembly.

- Apply multi-purpose grease to check ball.
- Pay attention to direction of reverse lever spring.

c. Install reverse lever assembly on clutch housing.

d. Install reverse arm shaft and retaining pin.

- e. Hook reverse lock spring and reverse lever spring on reverse lever assembly.

- f. Mesh 4th gear, then install reverse idler gear and shaft.
 ● Pay attention to direction of tapped hole.

12. Place magnet on clutch housing.

13. If bearing preload was adjusted, install selected shim(s) into transmission case.

- To aid in installation of transmission case, place shift selector in the 1st and 2nd shift bracket or between 1st and 2nd bracket and 3rd and 4th bracket.

14. Apply sealant to mating surface of transmission case and install it.

15. Install position switch.

16. Apply sealant to threads of check plugs. Install balls, springs and plugs.

17. After assembly, check that you can shift into each gear smoothly.

18. Measure total turning torque.

Total turning torque (New bearing):

8.8 - 21.6 N·m (90 - 220 kg-cm, 78 - 191 in-lb)

- When old bearing is used again, preload will be slightly less than the above. Make sure torque is close to the specified range.

Service Notice

- Before proceeding with disassembly, thoroughly clean the outside of the transaxle. It is important to prevent the internal parts from becoming contaminated by dirt or other foreign matter.
- Disassembly should be done in a clean work area.
- Use lint-free cloth or towels for wiping parts clean. Common shop rags can leave fibers that could interfere with the operation of the transaxle.
- When disassembling parts, place them in order in a parts rack so that they can be put back into the unit in their proper positions.
- All parts should be carefully cleaned with a general purpose, non-flammable solvent before inspection or reassembly.
- Gaskets, seals and O-rings should be replaced any time the transaxle is disassembled.
- It is very important to perform functional tests whenever they are indicated.
- The valve body contains precision parts and requires extreme care when parts are removed and serviced. Place removed parts in order on a parts rack so they can be put back in the valve body in the same positions and sequences. Care will also prevent springs and small parts from becoming scattered or lost.
- Properly installed valves, sleeves, plugs, etc. will slide along their bores in the valve body under their own weight.
- Before assembly, apply a coat of recommended A.T.F. to all parts. Petroleum jelly may be applied to O-rings and seals and used to hold small bearings and washers in place during reassembly. Do not use grease.
- Extreme care should be taken to avoid damage to O-rings, seals and gaskets when assembling.
- After overhaul, refill the transaxle with new A.T.F.

Control Valve Assembly and Accumulator

REMOVAL

1. Drain A.T.F. from transaxle.

2. Remove oil pan and gasket.

3. Disconnect A/T solenoid harness connector.

4. Remove stopper ring from A/T solenoid harness terminal body.

5. Pull out A/T solenoid harness from transmission case by pushing terminal body.

ON-VEHICLE SERVICE

Control Valve Assembly and Accumulator (Cont'd)

6. Remove control valve assembly by removing fixing bolts.

Bolt length, number and location:

Bolt symbol	A	B	C	D
Bolt length "ℓ"	25.0	33.0	40.0	43.5
 mm (in)	(0.984)	(1.299)	(1.575)	(1.713)
Number of bolts	2	6	5	2
Tightening torque N m (kg-m, ft-lb)	7 - 9 (0.7 - 0.9, 5.1 - 6.5)			

- Be careful not to drop manual valve, tube connector, tubes and 3-R accumulator return spring.

7. Disassemble and inspect control valve assembly if necessary — Refer to "REPAIR FOR COMPONENT PARTS".

8. Remove 3-R and N-D accumulators by applying compressed air if necessary.

- Hold each piston with a rag.

INSTALLATION

- Set manual shaft in Neutral, then align manual plate with groove in manual valve.
- After installing control valve assembly to transmission case, make sure that selector lever can be moved to all positions.

Throttle Wire Adjustment

GA14DS and GA16DS engine models

16 - 21 (1.6 - 2.1, 12 - 15)

GA16DE engine models

3.7 - 5.0 (0.38 - 0.51, 2.7 - 3.7)

1. Turn ignition switch to OFF.
2. While pressing lock plate, move adjusting tube in direction "T" (Transaxle side).
3. Return lock plate.
(Adjusting tube is locked at this time.)
4. Move throttle drum from "P₂" to "P₁" quickly [Adjusting tube moves in direction "U" (Engine side) while depressing the lock plate.] Ensure that throttle wire stroke "L" is within the specified range, between full throttle and idle.

Throttle wire stroke "L":

40 - 42 mm (1.57 - 1.65 in)

- Adjust throttle wire stroke when throttle wire/accelerator wire is installed and adjusted.
 - Put mark on throttle wire to facilitate measuring wire stroke.
5. Clamp throttle wire at proper positions shown in the illustration after adjusting throttle wire.
 6. After properly adjusting and clamping throttle wire, ensure the parting line is as straight as possible.

Throttle Wire Adjustment (Cont'd)

If throttle wire stroke is improperly adjusted the following problems may arise.

- When the throttle drum fully-open position "P₁" is too far in direction "T", the shift schedule will be as shown by ② in the figure, and the kickdown range will greatly increase.
- When the throttle drum fully-open position "P₁" is too far in direction "U", the shift schedule will be as shown by ① in the figure, and kickdown will not occur.

Control Cable Installation and Adjustment

- Move selector lever from the "P" range to the "1" range. You should be able to feel the detents in each range. If the detents cannot be felt or the pointer indicating the range is improperly aligned, the control cable needs adjustment.
- Always adjust control cable when it is removed from selector lever or manual shaft.

INSTALLATION

1. Place selector lever and manual shaft at "P" position.
2. Connect control cable to selector lever and tighten control cable lock nut. Clamp control cable to selector lever bracket.

Control Cable Installation and Adjustment (Cont'd)

3. Connect control cable to manual shaft and clamp control cable to bracket at transaxle.
4. Pull control cable in the direction of the arrow shown in the illustration by specified force.
Specified force: 6.9 N (0.7 kg, 1.5 lb)
5. Return control cable in the opposite direction of the arrow for 1.0 mm (0.039 in).
6. Tighten control cable lock nut.
7. Move selector lever from "P" range to "1" range and make sure that selector lever can be moved smoothly and without any sliding noise.
8. Apply grease to contacting areas of selector lever and control cable. Install any part removed.

SAT231E

ADJUSTMENT

1. Loosen control cable lock nut at transaxle side.
2. Place selector lever and manual shaft at "P" position.
3. Pull control cable in the direction of the arrow shown in the illustration by specified force.
Specified force: 6.9 N (0.7 kg, 1.5 lb)
4. Return control cable in the opposite direction of the arrow for 1.0 mm (0.039 in).
5. Tighten control cable lock nut.
6. Move selector lever from "P" range to "1" range and make sure that selector lever can be moved smoothly and without any sliding noise.
7. Apply grease to contacting areas of selector lever and control cable.

SAT232E

Governor Valve

1. Remove air duct.
2. Remove governor cap snap ring and spacer.
3. Remove governor cap.

SAT559D

Governor Valve (Cont'd)

4. Remove governor valve assembly from transaxle.
5. Check governor valve assembly if necessary — Refer to "DISASSEMBLY".

**Inhibitor Switch Adjustment**

1. Remove control cable end from manual shaft.
2. Set manual shaft in "N" range.
3. Loosen inhibitor switch fixing bolts.

4. Insert 4.0 mm (0.157 in) dia. pin into adjustment hole in both inhibitor switch and manual shaft as near vertically as possible.
5. Tighten inhibitor switch fixing bolts.
6. Remove pin from adjustment hole after adjusting inhibitor switch.
7. Reinstall any part removed.
8. Adjust control cable — Refer to "Control Cable Installation and Adjustment".
9. Check continuity of inhibitor switch — Refer to "ELECTRICAL SYSTEM".

**Differential Side Oil Seal Replacement**

1. Remove drive shaft assemblies. — Refer to section FA.
2. Remove oil seals.

Differential Side Oil Seal Replacement (Cont'd)

3. Install oil seals.

- Apply A.T.F. to oil seal surface before installing.

- Install oil seals so that dimensions "A" and "B" are within specifications.

Unit: mm (in)

A	B

4. Reinstall any part removed.

Preliminary Check (Prior to Road Testing)

A/T FLUID CHECK

Fluid leakage check

1. Clean area suspected of leaking, — for example, mating surface of converter housing and transmission case.
2. Start engine, apply foot brake, place selector lever in "D" range and wait a few minutes.
3. Stop engine.
4. Check for fresh leakage.

Fluid condition check

Fluid color	Suspected problem
Dark or black with burned odor	Wear of frictional material
Milky pink	Water contamination — Road water entering through filler tube or breather
Varnished fluid, light to dark brown and tacky	Oxidation — Over or under filling — Overheating

Fluid level check — Refer to section MA.

Road Testing

Perform road tests using "Symptom" chart. Refer to page AT-18.

"P" RANGE

1. Place selector lever in "P" range and start engine. Stop engine and repeat the procedure in all ranges, including neutral.
2. Stop vehicle on a slight upgrade and place selector lever in "P" range. Release parking brake to make sure vehicle remains locked.

"R" RANGE

1. Manually move selector lever from "P" to "R", and note shift quality.
2. Drive vehicle in reverse long enough to detect slippage or other abnormalities.

"N" RANGE

1. Manually move selector lever from "R" and "D" to "N" and note shift quality.
2. Release parking brake with selector lever in "N" range. Lightly depress accelerator pedal to make sure vehicle does not move. (When vehicle is new or soon after clutches have been replaced, vehicle may move slightly. This is not a problem.)

"D" RANGE

1. Manually shift selector lever from "N" to "D" range, and note shift quality.
2. Using the shift schedule as a reference, drive vehicle in "D" range. Record, on symptom chart, respective vehicle speeds at which up-shifting and down-shifting occur. These speeds are to be read at three different throttle positions (light, half and full), respectively. Also determine the timing at which shocks are encountered during shifting and which clutches are engaged.
3. Determine whether lock-up properly occurs while driving vehicle in proper gear position and at proper vehicle speed.

TROUBLE DIAGNOSES

Road Testing (Cont'd)

4. Check to determine if shifting to overdrive gear cannot be made while O.D. control switch is "OFF".
5. While driving vehicle in the 60 to 70 km/h (37 to 43 MPH) range in "D₃" range at half to light throttle position, fully depress accelerator pedal to make sure transaxle downshifts from 3rd to 2nd gear.
6. While driving vehicle in the 25 to 35 km/h (16 to 22 MPH) ("D₂" range) at half to light throttle position, fully depress accelerator pedal to make sure transaxle downshifts from 2nd to 1st gear.

"2" RANGE

1. Shift to "2" range and make sure vehicle starts in 1st gear.
2. Increase vehicle speed to make sure transaxle upshifts from 1st to 2nd gear.
3. Further increase vehicle speed. Make sure transaxle does not upshift to 3rd gear.
4. While driving vehicle at the 25 to 35 km/h (16 to 22 MPH) with throttle at half to light position ("2₂" range), fully depress accelerator pedal to make sure transaxle downshifts from 2nd to 1st gear.
5. Allow vehicle to run idle while in "2" range to make sure that transaxle downshifts to 1st gear.
6. Move selector lever to "D" range and allow vehicle to operate at 30 to 40 km/h (19 to 25 MPH). Then, shift to "2" range to make sure transaxle downshifts to 2nd gear.

"1" RANGE

1. Place selector lever in "1" range and accelerate vehicle. Make sure transaxle does not shift from 1st to 2nd gear although vehicle speed increases.
2. While driving vehicle in "1" range, release accelerator pedal to make sure that engine compression acts as a brake.
3. Place selector lever in "D" or "2" range and allow vehicle to run at 15 to 25 km/h (9 to 16 MPH). Then move selector lever to "1" range to make sure transaxle downshifts to 1st gear.

Road Testing (Cont'd)

VEHICLE SPEED WITH SHIFTING GEARS

This check should be carried out when oil temperature is between 50 and 80°C (122 and 176°F) after the vehicle has been driven approx. 10 minutes.

Stall Tasting

STALL TEST PROCEDURE

1. Check A/T and engine fluid levels. If necessary, add fluid.
2. Warm up engine until engine oil and A.T.F. reach operating temperature after vehicle has been driven approx. 10 minutes.

A.T.F. operating temperature:
50 - 80°C (122 - 176°F)

3. Set parking brake and block wheels.
4. Install a tachometer where it can be seen by driver during test.

5. Start engine, apply foot brake, and place selector lever in "D" range.

6. Accelerate to wide-open throttle gradually while applying foot brake.
 7. Quickly note the engine stall revolution and immediately release throttle.
- **During test, never hold throttle wide-open for more than 5 seconds.**

Stall revolution standard:

GA14DS engine:

For Europe 2,150 - 2,450 rpm

Except Europe 2,200 - 2,500 rpm

GA16DS engine:

For Europe and Middle East 2,450 - 2,750 rpm

Except Europe and Middle East 2,400 - 2,700 rpm

GA16DE engine 2,450 - 2,750 rpm

Pressure Testing

- Location of pressure test port.
- Always replace pressure plugs as they are self-sealing bolts.

LINE PRESSURE TEST PROCEDURE

1. Check A/T and engine fluid levels. If necessary, add fluid.
2. Warm up engine until engine oil and A.T.F. reach operating temperature; after vehicle has been driven approx. 10 minutes.

A.T.F. operating temperature:
50 - 80°C (122 - 176°F)

3. Install pressure gauge to line pressure port.

4. Set parking brake and block wheels.

Continue to depress brake pedal fully while performing line pressure test at stall speed.

Pressure Testing (Cont'd)

5. Start engine and measure line pressure at idle and stall speed.

Line pressure:

Engine speed rpm	Line pressure kPa (bar, kg/cm ² , psi)			
	R range	D range	2 range	1 range
Idle	883 (8.83, 9.0, 128)	539 (5.39, 5.5, 78)	588 (5.88, 6.0, 85)	883 (8.83, 9.0, 128)
Stall	1,765 (17.65, 18.0, 256)	1,079 (10.79, 11.0, 156)	883 (8.83, 9.0, 128)	1,079 (10.79, 11.0, 156)

JUDGMENT OF LINE PRESSURE TEST

- If line pressure does not rise, first check to make sure that throttle wire is connected properly.
- 1) When line pressure while idling is low at all positions ("D", "2", "1", "R" and "P"), the problem may be due to:
 - Wear on interior of oil pump
 - Oil leakage at or around oil pump, control valve body, transmission case or governor
 - Sticking pressure regulator valve
 - Sticking pressure modifier valve
 - 2) When line pressure while idling is low at a particular position, the problem may be due to the following:
 - If oil leaks at or around low & reverse brake circuit, line pressure becomes low in "R" range but is normal in "P", "D", "2" or "1" range.
 - 3) When line pressure is high while idling, pressure regulator valve may have stuck.

GOVERNOR PRESSURE TESTING

1. Check A/T and engine fluid levels. If necessary, add fluid.
2. Warm up engine until engine oil and A.T.F. reach operating temperature; after vehicle has been driven approx. 10 minutes.

A.T.F. operating temperature:

50 - 80°C (122 - 176°F)

TROUBLE DIAGNOSES

Pressure Testing (Cont'd)

3. Remove L.H. side drive shaft.
4. Install pressure gauge to governor pressure port.
5. Reinstall drive shaft.

Make sure that pressure gauge adapter does not touch drive shaft.

6. Set parking brake and block rear wheels.
7. Jack up front wheels.
8. Set selector lever in D range and drive vehicle.

Be careful of rotating wheels.

Governor pressure:

- Governor pressure is not generated when vehicle is stopped. (front wheels are not rotating.)
- Governor pressure rises gradually in response to vehicle speed. (front wheel rotating speed.)

If not, check governor valve assembly.

OVERDRIVE CONTROL SWITCH

- Check continuity between two terminals.

O.D. switch position	Continuity
ON	No
OFF	Yes

INHIBITOR SWITCH

- Check continuity in "N", "P" and "R" ranges.
- With control lever held in "N" range, turn manual lever an equal amount in both directions to see if current flow ranges are nearly the same. (When manual lever is in each position, continuity normally exists within 1.5° in either direction.) If current flows outside normal range, or if normal flow range is out of specifications, properly adjust inhibitor switch.

REMOVAL AND INSTALLATION

Removal

- Remove battery and bracket.
- Remove air duct. (GA16DE)
- Disconnect A/T solenoid harness connector and inhibitor switch harness connector.
- Disconnect throttle wire at engine side.

- Drain A.T.F.

- Disconnect control cable from transaxle.
- Disconnect oil cooler hoses.

- Remove drive shafts — Refer to "Section FA".
- Remove exhaust front tube.
- Remove starter motor from transaxle.

Removal (Cont'd)

- Remove front and rear gussets and engine rear plate.
- Remove bolts securing torque converter to drive plate.

Rotate crankshaft for access to securing bolts.

- Support engine by placing a jack under oil pan.

Do not place jack under oil pan drain plug.

- Support transaxle with a jack.
- Remove mountings from transaxle.
- Remove bolts fixing A/T to engine.
- Lower transaxle while supporting it with a jack.

Installation

- Drive plate runout

Maximum allowable runout:

0.5 mm (0.020 in)

If this runout is out of specification, replace drive plate with ring gear.

- When connecting torque converter to transaxle, measure distance "A" to be certain that they are correctly assembled.

Distance "A":

21.1 mm (0.831 in) or more

- Install converter to drive plate.
- **After converter is installed to drive plate, rotate crankshaft several turns and check to be sure that transaxle rotates freely without binding.**

REMOVAL AND INSTALLATION

Rear gusset to engine	16 - 21 (1.6 - 2.1, 12 - 15)	16 (0.63)

- Reinstall any part removed.
- Adjust control cable and throttle wire. Refer to "ON-VEHICLE SERVICE".
- Check inhibitor switch. Refer to "ELECTRICAL SYSTEM".
- Refill transaxle with A.T.F. and check fluid level.
- Move selector lever through all positions to be sure that transaxle operates correctly. With parking brake applied, idle engine. Move selector lever through "N" to "D", to "2", to "1" and "R". A slight shock should be felt through the hand gripping the selector each time the transaxle is shifted.
- Perform road test — Refer to "ROAD TESTING".

1. Drain A.T.F. through drain plug.

2. Remove torque converter.

3. Check torque converter one-way clutch using check tool as shown at left.

- Insert check tool into the groove of bearing support built into one-way clutch outer race.
- While fixing bearing support with check tool, rotate one-way clutch spline using flat-bladed screwdriver.
- Check inner race rotates clockwise only. If not, replace torque converter assembly.

4. Remove oil charging pipe and oil cooler tube.

DISASSEMBLY

5. Set manual lever to "P" position.
6. Remove inhibitor switch.

7. Remove oil pan and oil pan gasket.
 - Do not reuse oil pan bolts.

8. Check foreign materials in oil pan to help determine cause of malfunction. If the fluid is very dark, smells burned, or contains foreign particles, the frictional material (clutches, band) may need replacement. A tacky film that will not wipe clean indicates varnish build up which can cause valves, servo, and clutches to stick and may inhibit pump pressure.

9. Remove control valve assembly according to the following procedures.
 - a. Remove control valve assembly mounting bolts (A), (B), (C) and (D).

DISASSEMBLY

b. Remove stopper ring from terminal body.

c. Push terminal body into transmission case and draw out solenoid harness.

26. Remove differential side bearing adjusting shim from transmission case.

27. Remove oil seal from converter housing using a screwdriver.

- Be careful not to damage housing.

28. Remove oil tube from converter housing.

29. Remove oil pump according to the following procedures.
- a. Remove O-ring from input shaft.

- b. Remove oil pump assembly from transmission case.

- c. Remove thrust washer and bearing race from oil pump assembly.

30. Remove brake band according to the following procedures.
- a. Loosen lock nut, then back off band servo anchor end pin.

- b. Remove brake band from transmission case.

- To prevent brake linings from cracking or peeling, do not stretch the flexible band unnecessarily. When removing the brake band, always secure it with a clip as shown in the figure at left. Leave the clip in position after removing the brake band.

DISASSEMBLY

- c. Check brake band facing for damage, cracks, wear or burns.

31. Remove input shaft assembly (high clutch) and reverse clutch according to the following procedures.

- a. Remove input shaft assembly (high clutch) with reverse clutch.

- b. Remove input shaft assembly (high clutch) from reverse clutch.

- c. Remove needle bearing from high clutch drum.

- d. Check input shaft assembly and needle bearing for damage or wear.

32. Remove high clutch hub and needle bearing from transmission case.

33. Check high clutch hub and needle bearing for damage or wear.

DISASSEMBLY

34. Remove front sun gear and needle bearings from transmission case.
35. Check front sun gear and needle bearings for damage or wear.

36. Remove front planetary carrier assembly and low one-way clutch according to the following procedures.
- a. Remove snap ring using a screwdriver.

- b. Remove front planetary carrier with low one-way clutch.

- c. Check that low one-way clutch rotates in the direction of the arrow and locks in the opposite direction.
- d. Remove low one-way clutch from front planetary carrier by rotating it in the direction of unlock.

- e. Remove needle bearing from front planetary carrier.

DISASSEMBLY

- f. Check front planetary carrier, low one-way clutch and needle bearing for damage or wear.
- g. Check clearance between pinion washer and planetary carrier using feeler gauge.

Standard clearance:

0.15 - 0.70 mm (0.0059 - 0.0276 in)

Replace if the clearance exceeds 0.80 mm (0.0315 in).

- 37. Remove rear planetary carrier assembly and rear sun gear according to the following procedures.

- a. Remove rear planetary carrier assembly from transmission case.

- b. Remove rear sun gear from rear planetary carrier.

- c. Remove needle bearings from rear planetary carrier assembly.

- d. Check rear planetary carrier, rear sun gear and needle bearings for damage or wear.
- e. Check clearance between pinion washer and rear planetary carrier using feeler gauge.

Standard clearance:

0.15 - 0.70 mm (0.0059 - 0.0276 in)

Replace if the clearance exceeds 0.80 mm (0.0315 in).

38. Remove rear internal gear from transmission case.

39. Remove needle bearing from rear internal gear.

40. Check needle bearing for damage or wear.

41. Remove forward clutch assembly from transmission case.

42. Remove thrust washer and bearing race from transmission case.

43. Remove output shaft, output gear and reduction gear according to the following procedures.

a. Remove side cover.

● **Do not reuse side cover bolts.**

DISASSEMBLY

- b. Set manual lever to "P" position to fix idler gear and output gear.
- c. Unlock both idler gear and output gear lock nuts using a pin punch.

- d. Remove idler gear and output gear lock nuts.
- **Do not reuse idler gear and output gear lock nuts.**

- e. Remove idler gear and output gear using a puller.

- f. Remove reduction gear and output shaft from transmission case.
- g. Remove adjusting shim from reduction gear.
- h. Remove adjusting spacer from output shaft.

- 44. Remove return spring from parking shaft using a screwdriver.

45. Draw out parking shaft and remove parking pole from transmission case.
46. Check parking pole and shaft for damage or wear.

47. Remove parking actuator support from transmission case.
48. Check parking actuator support for damage or wear.

49. Remove governor valve assembly according to the following procedures.
 - a. Remove snap ring using a screwdriver.

- b. Remove spacer from governor cap.

- c. Remove governor cap using water pump pliers.
 - d. Remove O-ring from governor cap.

DISASSEMBLY

e. Remove governor valve assembly.

- f. With low primary weight closed, place top of governor valve assembly down to make sure governor valve properly lowers under its own weight.
- g. Place top of governor assembly down. Operate both low and high secondary weights to make sure governor valve functions properly.

50. Remove side oil seal from transmission case using a screwdriver.

- Be careful not to damage case.

Manual Shaft and Throttle Lever

REMOVAL

1. Remove detent spring from transmission case.
2. Pull out throttle shaft retaining pin, then draw out throttle shaft from transmission case.
3. Drive out manual plate retaining pin.

Manual Shaft and Throttle Lever (Cont'd)

4. Drive and then pull out parking rod plate retaining pin.

5. Remove parking rod plate from manual shaft.

6. Draw out parking rod from transmission case.

7. Pull out manual shaft retaining pin.

8. Remove manual shaft and manual plate from transmission case.

9. Remove manual shaft oil seal.

INSPECTION

- Check component parts for wear or damage. Replace if necessary.

Manual Shaft and Throttle Lever (Cont'd)

INSTALLATION

1. Install manual shaft oil seal.
 - Apply A.T.F. to outer surface of oil seal.

2. Install throttle lever and return spring on throttle shaft.
3. Install throttle lever assembly on transmission case.

4. Align groove of throttle shaft and hole of transmission case.
5. Install throttle shaft retaining pin.

6. Move throttle lever in the direction of the arrow.
7. Install manual shaft and manual plate.

8. Align groove of manual shaft and hole of transmission case.
9. Install manual shaft retaining pin.

REPAIR FOR COMPONENT PARTS

Manual Shaft and Throttle Lever (Cont'd)

10. Install parking rod to parking rod plate.
11. Install parking rod assembly to manual shaft.

12. Install manual plate retaining pin and parking rod plate retaining pin.

13. Install detent spring.

Oil Pump

DISASSEMBLY

1. Remove seal rings by undoing hooks.

2. Loosen bolts in numerical order and remove oil pump cover.

3. Remove inner and outer gear from oil pump housing.

REPAIR FOR COMPONENT PARTS

Oil Pump (Cont'd)

4. Remove O-ring from oil pump housing.

5. Remove oil pump housing oil seal.

INSPECTION

Oil pump housing, oil pump cover, inner gear and outer gear

- Check for wear or damage.

Side clearance

- Measure side clearance between end of oil pump housing and inner and outer gears in at least four places along their circumferences. Maximum measured values should be within specified ranges.

Standard clearance:

0.02 - 0.04 mm (0.0008 - 0.0016 in)

- If clearance is less than standard, select inner and outer gear as a set so that clearance is within specifications.

Inner and outer gear:

Refer to S.D.S.

- If clearance is more than standard, replace whole oil pump assembly except oil pump cover.

Oil Pump (Cont'd)

- Measure clearance between outer gear and oil pump housing.

Standard clearance:

0.08 - 0.15 mm (0.0031 - 0.0059 in)

- If not within standard clearance, replace whole oil pump assembly except oil pump cover.

Seal ring clearance

- Install new seal rings onto oil pump cover.
- Measure clearance between seal ring and ring groove.

Standard clearance:

0.07 - 0.19 mm (0.0028 - 0.0075 in)

Allowable limit:

0.19 mm (0.0075 in)

- If not within wear limit, replace oil pump cover assembly.

ASSEMBLY

1. Install oil seal on oil pump housing.

2. Install O-ring on oil pump housing.
 - Apply A.T.F. to O-ring.

3. Install inner and outer gears on oil pump housing.
 - Take care with the direction of the inner gear.

Oil Pump (Cont'd)

4. Install oil pump cover on oil pump housing.
 - a. Wrap masking tape around splines of oil pump cover assembly to protect seal. Position oil pump cover assembly on oil pump housing assembly, then remove masking tape.
 - b. Tighten bolts in numerical order.

5. Install new seal rings carefully after packing ring groove with petroleum jelly and connect hooks.
 - **Do not spread gap of seal ring excessively while installing. It may deform the ring.**

Control Valve Assembly

DISASSEMBLY

1. Remove tube connector and tube from control valve lower body.

REPAIR FOR COMPONENT PARTS

Control Valve Assembly (Cont'd)

2. Disassemble upper, inter and lower bodies using the following procedures.

Bolt length, number and location:

Bolt symbol	A	B	C	D	E	F
Bolt length "ℓ"	13.5	58.0	40.0	66.0	33.0	78.0

Number of bolts	4	3	6	11	2	2

- Remove bolts **A**, **D** and **F** shown in the illustration.
- Remove oil strainer from control valve assembly.

REPAIR FOR COMPONENT PARTS

Control Valve Assembly (Cont'd)

- c. Remove O.D. cancel solenoid from control valve assembly.

- d. Remove O-rings from O.D. cancel solenoid, and harness terminal body.

- e. Place upper body facedown, and remove bolts.

- f. Remove lower body from inter body and upper body.

Control Valve Assembly (Cont'd)

- g. Turn over lower body, and remove accumulator support plate.

- h. Remove separating plate and separating gaskets from lower body.
i. Remove steel balls and relief valve springs from lower body.
● **Be careful not to lose steel balls and relief valve springs.**

- j. Remove inter body from upper body.

- k. Check to see that steel balls are properly positioned in inter body and then remove them from inter body.
● **Be careful not to lose steel balls.**

Control Valve Assembly (Cont'd)

- l. Remove separating plate and separating gaskets from upper body.
 - m. Check to see that steel balls are properly positioned in upper body and then remove them from upper body.
- **Be careful not to lose steel balls.**

INSPECTION

Lower and upper bodies

- Check to see that retainer plates are in proper position in lower body.

SAT113D

- Check to see that retainer plates are in proper position in upper body.
- **Be careful not to lose these parts.**

SAT114D

Oil strainer

- Check wire netting of oil strainer for damage.

SAT115D

REPAIR FOR COMPONENT PARTS

Control Valve Assembly (Cont'd)

O.D. cancel solenoid

- Measure resistance — Refer to "ELECTRICAL SYSTEM".

Oil cooler relief valve spring

- Check for damage or deformation.
- Measure free length and outer diameter of valve spring.

ASSEMBLY

1. Install upper, inter and lower body.
- a. Place oil circuit of upper body face up. Install steel balls in their proper positions.

- b. Install new upper separating gasket, new upper inter separating gasket and upper separating plate in order shown in illustration.

Control Valve Assembly (Cont'd)

- c. Install reamer bolts ① from bottom of upper body and install separating gaskets and separating plate as a set on upper body using reamer bolts as guides.

- d. Place lower body side of inter body face up. Install steel balls in their proper positions.

- e. Install inter body on upper body using reamer bolts ① as guides.

● **Be careful not to dislocate or drop steel balls.**

- f. Install steel balls and relief valve springs in their proper positions in lower body.

- g. Install new lower separating gasket, new lower inter separating gasket and lower separating plate in order shown in illustration.

Control Valve Assembly (Cont'd)

- h. Install support plate fixing bolts ⑤ from bottom of lower body and install separating gaskets and separating plate as a set on lower body using bolts ⑤ as guides.

- i. Temporarily install support plates on lower body.

- j. Install lower body on inter body using reamer bolts ① as guides and tighten reamer bolts ① slightly.

2. Install O-rings to O.D. cancel solenoid and terminal body.
● Apply A.T.F. to O-rings.

Control Valve Assembly (Cont'd)

3. Install and tighten bolts.

Bolt length, number and location:

Bolt symbol	A	B	C	D	E	F
Bolt length "ℓ"  ℓ mm (in)	13.5 (0.531)	58.0 (2.283)	40.0 (1.575)	66.0 (2.598)	33.0 (1.299)	78.0 (3.071)

a. Install and tighten bolts ⑧ slightly.

Control Valve Assembly (Cont'd)

- b. Install O.D. cancel solenoid to lower body.
- c. Install and tighten bolts **(A)** and **(C)** slightly.
- d. Remove both reamer bolts **(F)** previously installed as guides. Install one reamer bolt **(F)** (marked in illustration) from lower body side.
- e. Tighten bolts **(A)**, **(B)**, **(C)** and **(F)** to specified torque.

- f. Install oil strainer and the other bolt **(F)** (marked in illustration), then tighten bolts **(A)**, **(D)** and **(F)** to specified torque.

Control Valve Assembly (Cont'd)

- g. Install support plates and tighten bolts ⑤ to specified torque.

- h. Install tube connector and tubes to lower body.
- Install oil circuit side of tube connector face up.

Control Valve Upper Body

Numbers preceding valve springs correspond with those shown in Spring Chart on page AT-79.

Apply A.T.F. to all components before their installation.

Control Valve Upper Body (Cont'd)

DISASSEMBLY

1. Remove valves at retainer plates.
 - Do not use a magnetic "hand".

- a. Use a screwdriver to pry out retainer plates.

- b. Remove retainer plates while holding spring, plugs and sleeves.
 - Remove plug slowly to prevent internal parts from jumping out.

- c. Place mating surface of valve face down, and remove internal parts.
 - If a valve is hard to remove, place valve body face down and lightly tap it with a soft hammer.
 - Be careful not to drop or damage valves and sleeves.

INSPECTION

Valve spring

- Measure free length and outer diameter of each valve spring. Also check for damage or deformation.
- Numbers of each valve spring listed in table below are the same as those in the figure on page AT-77.

- Replace valve springs if deformed or fatigued.

Control valves

- Check sliding surfaces of valves, sleeves and plugs.

ASSEMBLY

- Lay the control valve body down when installing valves.
- Do not stand the control valve body on edge.

1. Lubricate the control valve body and all valves with A.T.F. Install control valves by sliding them carefully into their bores.
- Be careful not to scratch or damage valve body.

REPAIR FOR COMPONENT PARTS

Control Valve Upper Body (Cont'd)

- Wrap a small screwdriver with vinyl tape and use it to insert the valves into their proper positions.

1-2 accumulator valve

- Install 1-2 accumulator valve and then align 1-2 accumulator retainer plate with 1-2 accumulator valve from opposite side of control valve body.
- Install return spring and 1-2 accumulator piston.

2. Install retainer plates

- While pushing plug or return spring, install retainer plate.

Apply A.T.F. to all components before their installation.

REPAIR FOR COMPONENT PARTS

Control Valve Lower Body (Cont'd)

DISASSEMBLY

1. Remove valves at retainer plate.
For removal procedures, refer to "DISASSEMBLY" in "Control Valve Upper Body".

Throttle valve

- Remove throttle valve at E-ring.

INSPECTION

Valve springs

- Check each valve spring for damage or deformation. Also measure free length and outer diameter.
- Numbers for each valve spring listed in the table below are the same as those in the figure on page AT-81.

Inspection standard:

- Replace valve springs if deformed or fatigued.

Control valves

- Check sliding surfaces of control valves, sleeves and plugs for damage.

REPAIR FOR COMPONENT PARTS

Control Valve Lower Body (Cont'd)

ASSEMBLY

Throttle valve

- Insert throttle valve to control valve body and then install E-ring to throttle valve.

Pressure regulator valve

- Install pressure regulator valve after assembling sleeve plug, plug A and plug B.

3-4 shift valve and 2-3 shift valve

- Install 3-4 shift valve and 2-3 shift valve after fixing plugs to retainer plates on the opposite side.

- Install control valves.
For installation procedures, refer to "ASSEMBLY in "Control Valve Upper Body."

- Install proper retainer plates

Reverse Clutch (Cont'd)

- Do not remove return springs from spring retainer.

6. Remove piston from reverse clutch drum by turning it.

7. Remove D-ring and oil seal from piston.

INSPECTION

Reverse clutch snap ring, spring retainer and return springs

- Check for deformation, fatigue or damage.
- Replace if necessary.
- When replacing spring retainer and return springs, replace them as a set.

Reverse clutch drive plates

- Check facing for burns, cracks or damage.
- Measure thickness of facing.
Thickness of drive plate:
Standard value: 2.0 mm (0.079 in)
Wear limit: 1.8 mm (0.071 in)
- If not within wear limit, replace.

REPAIR FOR COMPONENT PARTS

Reverse Clutch (Cont'd)

Reverse clutch dished plates

- Check for deformation or damage.
- Measure thickness of dished plate.

Thickness of dished plate:

2.89 - 3.19 mm (0.1138 - 0.1256 in)

- If deformed or fatigued, replace.

Reverse clutch piston

- Make sure check balls are not fixed.
- Apply compressed air to check ball oil hole opposite the return spring to make sure that there is no air leakage.
- Apply compressed air to oil hole on return spring side to make sure air leaks past ball.

ASSEMBLY

1. Install D-ring and oil seal on piston.

- Take care with the direction of the oil seal.
- Apply A.T.F. to both parts.

2. Install piston assembly by turning it slowly.

- Apply A.T.F. to inner surface of drum.

3. Install return springs and spring retainer on piston.

Reverse Clutch (Cont'd)

4. Set Tool on spring retainer and install snap ring while compressing return springs.

- Set Tool directly above return springs.

5. Install drive plates, driven plates, retaining plate and dished plates.

- Do not align the projections of any two dished plates.

6. Install snap ring.

7. Measure clearance between retaining plate and snap ring. If not within allowable limit, select proper retaining plate.

Specified clearance:

Standard: 0.5 - 0.8 mm (0.020 - 0.031 in)

Allowable limit: 1.2 mm (0.047 in)

Retaining plate: Refer to S.D.S.

Reverse Clutch (Cont'd)

8. Check operation of reverse clutch.
Refer to "DISASSEMBLY" in "Reverse Clutch."

High Clutch

For the number of clutch sheets (drive plates and driven plates), refer to the below cross-section.

Model 31X74, 31X75, 31X76, 31X79

1. Check operation of high clutch.
 - a. Apply compressed air to oil hole of input shaft.
 - **Stop up a hole on opposite side of input shaft.**
 - b. Check to see that retaining plate moves to snap ring.
 - c. If retaining plate does not move to snap ring, D-ring or oil seal may be damaged or fluid may be leaking at piston check ball.

SAT177D

2. Remove seal rings from input shaft.

High Clutch (Cont'd)

3. Remove snap ring.
4. Remove drive plates, driven plates, retaining plate and dished plate.

5. Set Tool on spring retainer and remove snap ring from high clutch drum while compressing return springs.
 - Set Tool directly above springs.
 - Do not expand snap ring excessively.
6. Remove spring retainer and return springs.

- Do not remove return springs from spring retainer.

7. Remove piston from high clutch drum by turning it.

8. Remove D-ring and oil seal from piston.

High Clutch (Cont'd)

INSPECTION

Reverse clutch snap ring, spring retainer and return springs

- Check for deformation, fatigue or damage.
- Replace if necessary.
- **When replacing spring retainer and return springs, replace them as a set.**

High clutch drive plates

- Check facing for burns, cracks or damage.
- Measure thickness of facing.

Thickness of drive plate:

Standard value: 2.0 mm (0.079 in)

Wear limit: 1.8 mm (0.071 in)

- If not within wear limit, replace.

High clutch dished plate

- Check for deformation or damage.
- Measure thickness of dished plate.

Thickness of dished plate:

2.55 - 2.85 mm (0.1004 - 0.1122 in)

- If deformed or fatigued, replace.

High clutch piston

- Make sure check balls are not fixed.
- Apply compressed air to check ball oil hole opposite the return spring to make sure that there is no air leakage.
- Apply compressed air to oil hole on return spring side to make sure air leaks past ball.

Seal ring clearance

- Install new seal rings onto input shaft.
- Measure clearance between seal ring and ring groove.

Standard clearance:

0.08 - 0.23 mm (0.0031 - 0.0091 in)

Allowable limit:

0.23 mm (0.0091 in)

- If not within wear limit, replace input shaft assembly.

REPAIR FOR COMPONENT PARTS

High Clutch (Cont'd)

ASSEMBLY

1. Install D-ring and oil seal on piston.
 - Take care with the direction of the oil seal.
 - Apply A.T.F. to both parts.

2. Install piston assembly by turning it slowly.
 - Apply A.T.F. to inner surface of drum.

3. Install return springs and spring retainer on piston.

4. Set Tool on spring retainer and install snap ring while compressing return springs.
 - Set Tool directly above return springs.

- Do not align snap ring gap with spring retainer stopper.

9. Install seal rings to input shaft.

- Apply petroleum jelly to seal rings.

- Roll paper around seal rings to prevent seal rings from spreading.

Forward Clutch and Overrun Clutch

DISASSEMBLY

1. Check operation of forward clutch and overrun clutch.
 - a. Install bearing retainer on forward clutch drum.
 - b. Apply compressed air to oil hole of forward clutch drum.
 - c. Check to see that retaining plate moves to snap ring.

- d. If retaining plate does not move to snap ring, D-ring or oil seal may be damaged or fluid may be leaking at piston check ball.

REPAIR FOR COMPONENT PARTS

Forward Clutch and Overrun Clutch (Cont'd)

2. Remove snap ring for forward clutch.
3. Remove drive plates, driven plates, retaining plate and dished plate for forward clutch.

4. Remove snap ring for overrun clutch.
5. Remove drive plates, driven plates, retaining plate and dished plate for overrun clutch.

6. Set Tool on spring retainer and remove snap ring from forward clutch drum while compressing return springs.

- **Set Tool directly above return springs.**
- **Do not expand snap ring excessively.**

7. Remove spring retainer and return springs.

8. Remove forward clutch piston with overrun clutch piston from forward clutch drum by turning it.

9. Remove overrun clutch piston from forward clutch piston by turning it.

Forward Clutch and Overrun Clutch (Cont'd)

10. Remove D-rings and oil seals from forward clutch piston and overrun clutch piston.

INSPECTION

Snap rings and spring retainer

- Check for deformation, fatigue or damage.

Forward clutch and overrun clutch return springs

- Check for deformation or damage.
- Measure free length and outer diameter.

Inspection standard:

Unit: mm (in)				
Parts		Part No.	l	D
Return spring	Inner	31505-31X03	26.3 (1.035)	7.7 (0.303)
	Outer	31505-31X02	26.6 (1.047)	10.6 (0.417)

- Replace if deformed or fatigued.

Forward clutch and overrun clutch drive plates

- Check facing for burns, cracks or damage.
- Measure thickness of facing.

Thickness of drive plate:

Forward clutch

Standard value: 1.8 mm (0.071 in)

Wear limit: 1.6 mm (0.063 in)

Overrun clutch

Standard value: 1.6 mm (0.063 in)

Wear limit: 1.4 mm (0.055 in)

- If not within wear limit, replace.

REPAIR FOR COMPONENT PARTS

Forward Clutch and Overrun Clutch (Cont'd)

Forward clutch and overrun clutch dished plates

- Check for deformation or damage.
- Measure thickness of dished plate.

Thickness of dished plate:

Forward clutch: 2.35 - 2.65 mm (0.0925 - 0.1043 in)

Overrun clutch: 2.00 - 2.30 mm (0.0787 - 0.0906 in)

- If deformed or fatigued, replace.

SAT163D

SAT213D

Forward clutch drum

- Make sure check balls are not fixed.
- Apply compressed air to check ball oil hole from outside of forward clutch drum to make sure air leaks past ball.
- Apply compressed air to oil hole from inside of forward clutch drum to make sure there is no air leakage.

SAT212D

Overrun clutch piston

- Make sure check balls are not fixed.
- Apply compressed air to check ball oil hole opposite the return spring to make sure there is no air leakage.
- Apply compressed air to oil hole on return spring side to make sure air leaks past ball.

ASSEMBLY

1. Install D-rings and oil seals on forward clutch piston and overrun clutch piston.

- Take care with direction of oil seal.
- Apply A.T.F. to both parts.

SAT140E

2. Install overrun clutch piston assembly on forward clutch piston while turning it slowly.

- Apply A.T.F. to inner surface of forward clutch piston.

SAT215D

REPAIR FOR COMPONENT PARTS

Forward Clutch and Overrun Clutch (Cont'd)

3. Install forward clutch piston assembly on forward clutch drum while turning it slowly.
- Apply A.T.F. to inner surface of drum.

4. Align notch in forward clutch piston with groove in forward clutch drum.

5. Install return springs on piston.
6. Install spring retainer on return springs.

7. Set Tool on spring retainer and install snap ring while compressing return springs.
- Set Tool directly above return springs.

- Do not align snap ring gap with spring retainer stopper.

REPAIR FOR COMPONENT PARTS

Forward Clutch and Overrun Clutch (Cont'd)

8. Install drive plates, driven plates, retaining plate and dished plate for overrun clutch.

9. Install snap ring for overrun clutch.

10. Measure clearance between overrun clutch retaining plate and snap ring.

If not within allowable limit, select proper retaining plate.

Specified clearance:

Standard: 1.0 - 1.4 mm (0.039 - 0.055 in)

Allowable limit: 2.0 mm (0.079 in)

Overrun clutch retaining plate: Refer to S.D.S.

11. Install drive plates, driven plates, retaining plate and dished plate for forward clutch.

12. Install snap ring for forward clutch.

Forward Clutch and Overrun Clutch (Cont'd)

13. Measure clearance between forward clutch retaining plate and snap ring.

If not within allowable limit, select proper retaining plate.

Specified clearance:

Standard: 0.45 - 0.85 mm (0.0177 - 0.0335 in)

Allowable limit: 1.85 mm (0.0728 in)

Forward clutch retaining plate: Refer to S.D.S.

14. Check operation of forward clutch.

Refer to "DISASSEMBLY" in "Forward Clutch and Overrun Clutch."

15. Check operation of overrun clutch.

Refer to "DISASSEMBLY" in "Forward Clutch and Overrun Clutch."

Low & Reverse Brake

For the number of clutch sheets (drive plates and driven plates), refer to the below cross-section.

SAT252E

DISASSEMBLY

1. Check operation of low & reverse brake.
 - a. Apply compressed air to oil hole of transmission case.
 - b. Check to see that retaining plate moves to snap ring.
 - c. If retaining plate does not move to snap ring, D-ring or oil seal may be damaged or fluid may be leaking at piston check ball.
2. Stand transmission case.
3. Remove snap ring.
4. Remove drive plates, driven plates, retaining plates and dished plates from transmission case.

Low & Reverse Brake (Cont'd)

5. Set Tool on spring retainer and remove snap ring while compressing return springs.
- Set Tool directly above return springs.
- Do not expand snap ring excessively.
6. Remove spring retainer and return springs.

- Do not remove return springs from spring retainer.

7. Apply compressed air to oil hole of transmission case while holding piston.
8. Remove piston from transmission case by turning it.

9. Remove D-ring and oil seal from piston.

REPAIR FOR COMPONENT PARTS

Low & Reverse Brake (Cont'd)

INSPECTION

Low & reverse clutch snap ring, spring retainer and return springs

- Check for deformation, fatigue or damage.
- Replace if necessary.
- When replacing spring retainer and return springs, replace them as a set.

Low & reverse brake drive plate

- Check facing for burns, cracks or damage.
- Measure thickness of facing.

Thickness of drive plate:

Standard value: 2.0 mm (0.079 in)

Wear limit: 1.8 mm (0.071 in)

- If not within wear limit, replace.

Low & reverse brake dished plates

- Check for deformation or damage.
- Measure thickness of dished plate.

Thickness of dished plate:

3.00 - 3.30 mm (0.1181 - 0.1299 in)

- If deformed or fatigued, replace.

ASSEMBLY

1. Install D-ring and oil seal on piston.
 - Take care with the direction of the oil seal.
 - Apply A.T.F. to both parts.
2. Stand transmission case.
3. Install piston assembly on transmission case while turning it slowly.
 - Apply A.T.F. to inner surface of transmission case.

Low & Reverse Brake (Cont'd)

4. Install return springs and spring retainer on piston.

5. Install snap ring while compressing return springs.

- Set Tool directly above return springs.

6. Install drive plates, driven plates, retaining plates and dished plates.

- Do not align the projections on the two dished plates.

Model 31X74, 31X79

Model 31X75, 31X76, 31X77

REPAIR FOR COMPONENT PARTS

Low & Reverse Brake (Cont'd)

7. Install snap ring.

8. Measure clearance between retaining plate and snap ring. If not within allowable limit, select proper retaining plate (front side).

Specified clearance:

Standard: 1.4 - 1.8 mm (0.055 - 0.071 in)

Allowable limit:

31X74, 31X79: 2.6 mm (0.102 in)

31X75, 31X76, 31X77: 2.8 mm (0.110 in)

Retaining plate: Refer to S.D.S.

9. Check operation of low & reverse brake.
Refer to "DISASSEMBLY" in "Low & Reverse Brake."

Rear Internal Gear, Forward Clutch Hub and Overrun Clutch Hub

DISASSEMBLY

1. Remove snap ring from overrun clutch hub.

2. Remove overrun clutch hub from forward clutch hub.

REPAIR FOR COMPONENT PARTS

Rear Internal Gear, Forward Clutch Hub and Overrun Clutch Hub (Cont'd)

3. Remove thrust washer from forward clutch hub.

4. Remove forward clutch hub from rear internal gear.

5. Remove end bearing from rear internal gear.

6. Remove thrust washer from rear internal gear.

7. Remove end bearing from forward one-way clutch.

Rear Internal Gear, Forward Clutch Hub and Overrun Clutch Hub (Cont'd)

8. Remove one-way clutch from forward clutch hub.

INSPECTION

Rear internal gear, forward clutch hub and overrun clutch hub

- Check rubbing surface for wear or damage.

Snap ring, end bearings and forward one-way clutch

- Check snap ring and end bearings for deformation and damage.
- Check forward one-way clutch for wear and damage.

ASSEMBLY

1. Install forward one-way clutch on forward clutch.
- Take care with the direction of the forward one-way clutch.

2. Install end bearing on forward one-way clutch.
- Apply petroleum jelly to end bearing.

REPAIR FOR COMPONENT PARTS

Rear Internal Gear, Forward Clutch Hub and Overrun Clutch Hub (Cont'd)

3. Install thrust washer on rear internal gear.
 - Apply petroleum jelly to thrust washer.
 - Align pawls of thrust washer with holes of rear internal gear.

4. Install end bearing on rear internal gear.
 - Apply petroleum jelly to end bearing.

5. Install forward clutch hub on rear internal gear.
 - Check operation of forward one-way clutch.

6. Install thrust washer on overrun clutch hub.
 - Apply petroleum jelly to thrust washer.
 - Align pawls of thrust washer with holes of overrun clutch hub.

7. Install overrun clutch hub on rear internal gear.
 - Align projections of rear internal gear with holes of overrun clutch hub.

Rear Internal Gear, Forward Clutch Hub and Overrun Clutch Hub (Cont'd)

8. Install snap ring to groove of rear internal gear.

Output Shaft, Output Gear, Idler Gear, Reduction Gear and Bearing Retainer

DISASSEMBLY

1. Remove seal rings from output shaft and bearing retainer.

2. Press out output shaft bearing inner race.

Output Shaft, Output Gear, Idler Gear, Reduction Gear and Bearing Retainer (Cont'd)

3. Remove output shaft bearing outer race from bearing retainer.

4. Remove output gear bearing inner race.

5. Remove output gear bearing outer race from bearing retainer.

6. Remove idler gear bearing inner race.

7. Remove idler gear bearing outer race from transmission case.

REPAIR FOR COMPONENT PARTS

Output Shaft, Output Gear, Idler Gear, Reduction Gear and Bearing Retainer (Cont'd)

8. Press out reduction gear inner race from reduction gear.

9. Remove reduction gear bearing outer race from transmission case.

INSPECTION

Output shaft, output gear, idler gear and reduction gear

- Check shafts for cracks, wear or bending.
- Check gears for wear, chips and cracks.

Bearings

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.
- **When replacing taper roller bearing, replace inner and outer races as a set.**

Seal ring clearance

- Install new seal rings to output shaft.
- Measure clearance between seal ring and ring groove of output shaft.

Standard clearance:

0.10 - 0.25 mm (0.0039 - 0.0098 in)

Wear limit:

0.25 mm (0.0098 in)

- If not within wear limit, replace output shaft.

REPAIR FOR COMPONENT PARTS

Output Shaft, Output Gear, Idler Gear, Reduction Gear and Bearing Retainer (Cont'd)

- Install new seal rings to bearing retainer.
- Measure clearance between seal ring and ring groove of bearing retainer.
Standard clearance:
0.10 - 0.25 mm (0.0039 - 0.0098 in)
Wear limit:
0.25 mm (0.0098 in)
- If not within wear limit, replace bearing retainer.

ASSEMBLY

1. Press reduction gear bearing inner race on reduction gear.

2. Install reduction gear bearing outer race on transmission case.

3. Press idler gear bearing inner race on idler gear.

4. Install idler gear bearing outer race on transmission case.

REPAIR FOR COMPONENT PARTS

Output Shaft, Output Gear, Idler Gear, Reduction Gear and Bearing Retainer (Cont'd)

5. Press output gear bearing inner race on output gear.

6. Install output gear bearing outer race on bearing retainer.

7. Press output shaft bearing inner race on output shaft.

8. Install output shaft bearing outer race on bearing retainer.

9. Install new seal rings onto output shaft and bearing retainer.

- Apply petroleum jelly to seal rings.

Output Shaft, Output Gear, Idler Gear, Reduction Gear and Bearing Retainer (Cont'd)

10. Roll paper around seal rings to prevent seal rings from spreading.

Band Servo Piston Assembly

DISASSEMBLY

1. Remove band servo piston snap ring.

2. Apply compressed air to oil hole in transmission case to remove O.D. servo piston retainer and band servo piston assembly.

- Hold band servo piston assembly with a rag.

3. Apply compressed air to oil hole in O.D. servo piston retainer to remove O.D. band servo piston from retainer.

- Hold O.D. band servo piston while applying compressed air.

REPAIR FOR COMPONENT PARTS

Band Servo Piston Assembly (Cont'd)

4. Remove D-ring from O.D. band servo piston.

5. Remove O-rings from O.D. servo piston retainer.

6. Remove band servo piston assembly from servo piston retainer by pushing it forward.

7. Place piston stem end on a wooden block. While pushing servo piston spring retainer down, remove E-ring.

8. Remove O.D. servo return spring, band servo thrust washer and band servo piston stem from band servo piston.

Band Servo Piston Assembly (Cont'd)

9. Remove O-rings from servo piston retainer.

10. Remove D-rings from band servo piston.

INSPECTION

Pistons, retainers and piston stem

- Check frictional surfaces for abnormal wear or damage.

Return springs

- Check for deformation or damage.
- Measure free length and outer diameter.

Inspection standard

Unit: mm (in)		
Parts	Free length	Outer diameter
2nd servo return spring	32.5 (1.280)	25.9 (1.020)
O.D. servo return spring	31.0 (1.220)	21.7 (0.854)

Band Servo Piston Assembly (Cont'd)

ASSEMBLY

1. Install D-rings to band servo piston.

- Apply A.T.F. to D-rings.
- Pay attention to the position of each D-ring.

D-rings:

Unit: mm (in)

D-ring	Inner diameter	
	Model 31X74, 31X79	Model 31X75, 31X76, 31X77
①	51.9 (2.043)	53.8 (2.118)
②	29.8 (1.173)	31.7 (1.248)

2. Install band servo piston stem, band servo thrust washer, O.D. servo return spring and spring retainer to band servo piston.

3. Place piston stem end on a wooden block. While pushing servo piston spring retainer down, install E-ring.

4. Install O-rings to servo piston retainer.

- Apply A.T.F. to O-rings.
- Pay attention to the position of each O-ring.

O-rings:

Unit: mm (in)

O-ring	Inner diameter
①	65.4 (2.575)
②	67.3 (2.650)

Band Servo Piston Assembly (Cont'd)

5. Install band servo piston assembly to servo piston retainer by pushing it inward.

6. Install D-ring to O.D. band servo piston.
 - Apply A.T.F. to D-ring.

7. Install O-rings to O.D. servo piston retainer.
 - Apply A.T.F. to O-rings.
 - Pay attention to the position of each O-ring.

O-rings:

Unit: mm (in)

O-ring	Inner diameter
①	69.2 (2.724)
②	71.2 (2.803)
③	73.1 (2.878)

8. Install O.D. band servo piston to O.D. servo piston retainer.

9. Install band servo piston assembly and 2nd servo return spring to transmission case.
 - Apply A.T.F. to O-ring of band servo piston and transmission case.

Band Servo Piston Assembly (Cont'd)

10. Install O.D. band servo piston assembly to transmission case.

- Apply A.T.F. to O-ring of band servo piston and transmission case.

11. Install band servo piston snap ring to transmission case.

Final Drive

DISASSEMBLY

1. Remove final gear.

2. Press out differential side bearings.

3. Remove speedometer drive gear.

Final Drive (Cont'd)

4. Drive out pinion mate shaft retaining pin.

5. Draw out pinion mate shaft from differential case.

6. Remove pinion mate gears and side gears.

INSPECTION

Gear, washer, shaft and case

- Check mating surfaces of differential case, side gears and pinion mate gears.
- Check washers for wear.

Bearings

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.

ASSEMBLY

1. Install side gears and thrust washers in differential case.
 2. Install pinion mate gears and thrust washers in the differential case while rotating them.
- Apply A.T.F. to all parts.

REPAIR FOR COMPONENT PARTS

Final Drive (Cont'd)

3. Measure clearance between side gear and differential case with washers.

Clearance between side gear and differential case with washers:

0.1 - 0.2 mm (0.004 - 0.008 in)

- If not within specification, adjust clearance by changing thickness of side gear thrust washers.

Side gear thrust washer: Refer to S.D.S.

4. Install retaining pin.

- **Make sure that retaining pin is flush with case.**

5. Install speedometer drive gear on differential case.

- **Align projection of speedometer drive gear with groove of differential case.**

6. Press differential side bearings on differential case.

Final Drive (Cont'd)

7. Install final gear and tighten fixing bolts in numerical order.

Assembly

1. Install differential side oil seals on transmission case and converter housing, so that "A" and "B" are within specifications.

Unit: mm (in)

A	B
5.5 - 6.5 (0.217 - 0.256)	0.5 (0.020) or less

2. Install parking actuator support to transmission case.
 - Pay attention to direction of parking actuator support.

3. Install parking pawl on transmission case and fix it with parking shaft.

Assembly (Cont'd)

4. Install return spring.

Adjustment

REDUCTION GEAR BEARING PRELOAD

1. Select proper thickness of reduction gear bearing adjusting shim using the following procedures.
 - a. Place reduction gear on transmission case as shown.

- b. Place idler gear bearing on transmission case.
- c. Measure dimensions "B", "C" and "D" and calculate dimension "A".

$$A = D - (B + C)$$

"A": Distance between surface of idler gear bearing inner race and adjusting shim mating surface of reduction gear.

- Measure dimension "B" between end of reduction gear and surface of transmission case.
- Measure in at least two places.

- Measure dimension "C" between surface of idler gear bearing inner race and converter housing fitting surface of transmission case.
- Measure in at least two places.

ASSEMBLY

Adjustment (Cont'd)

- Measure dimension "D" between end of reduction gear and adjusting shim mating surface of reduction gear.
- **Measure in at least two places.**
- Calculate dimension "A"

$$A = D - (B + C)$$

- d. Measure dimension "E" between end of idler gear and idler gear bearing of idler gear inner race mating surface.
- **Measure in at least two places.**

- e. Calculate "T" and select proper thickness of reduction gear bearing adjusting shim using S.D.S. table as a guide.

$$T = A - E$$

Reduction gear bearing adjusting shim:

Refer to S.D.S.

2. Install reduction gear and reduction gear bearing adjusting shim selected in step 2-e on transmission case.
 3. Press idler gear bearing inner race on idler gear.
 4. Press idler gear on reduction gear.
- **Press idler gear so that idler gear can be locked with parking pawl.**

5. Tighten idler gear lock nut to specified torque.
- **Lock idler gear with parking pawl when tightening lock nut.**

ASSEMBLY

Adjustment (Cont'd)

6. Measure reduction gear bearing preload.

- When measuring bearing preload, turn reduction gear in both directions several times to seat bearing rollers correctly.

Reduction gear bearing preload:

0.11 - 0.69 N·m (1.1 - 7.0 kg-cm, 0.95 - 6.08 in-lb)

- If not within specified range, readjust bearing preload.

OUTPUT SHAFT BEARING PRELOAD

1. Select proper thickness of output shaft bearing adjusting spacer using the following procedures.
 - a. Remove paper rolled around output shaft.
 - b. Place bearing retainer on output shaft.

- c. Place output gear bearing inner race on bearing retainer.
- d. Measure dimensions "G" and "H" and calculate dimension "F".

"F": Distance between the surface of output gear bearing inner race and adjusting shim mating surface of output shaft.

$$F = H - G$$

- Measure dimension "G" between end of output shaft and surface of output gear bearing inner race.
- Measure in at least two places.

- Measure dimension "H" between end of output shaft and adjusting spacer mating surface of output shaft.
- Measure in at least two places.
- Calculate dimension "F".

$$F = H - G$$

ASSEMBLY

Adjustment (Cont'd)

- e. Measure distance "I" between end of output gear (adjusting spacer mating surface) and bearing inner race fitting surface.
- Measure in at least two places.

- f. Calculate dimension " T_2 ".

" T_2 ": Distance between adjusting spacer mating surface of output gear and output shaft

$$T_2 = F - I$$

- g. Select proper thickness of output shaft bearing adjusting spacer using S.D.S. table as a guide.

**Output shaft bearing adjusting spacer:
Refer to S.D.S.**

2. Install bearing retainer on transmission case.

3. Place output shaft on bearing retainer.
4. Place output shaft bearing adjusting spacer selected in step 1-g on output shaft.
5. Press output gear bearing inner race on output gear.
6. Press output gear on output shaft.

7. Tighten output gear lock nut to specified torque.

Adjustment (Cont'd)

8. Remove idler gear to measure output shaft bearing preload.

9. Measure output shaft bearing preload.

- When measuring bearing preload, turn output shaft in both directions several times to seat bearing rollers correctly.

Output shaft bearing preload:

0.25 - 0.88 N·m

(2.5 - 9.0 kg-cm, 2.2 - 7.8 in-lb)

10. Install idler gear and tighten lock nut to specified torque.
11. After properly adjusting "turning" torque, clinch idler gear and output gear lock nuts as shown.

Assembly

1. Install new gasket and side cover on transmission case.

- Always replace side cover bolts.

2. Remove paper rolled around bearing retainer.
 3. Install thrust washer on bearing retainer.
- Apply petroleum jelly to thrust washer.

ASSEMBLY

Assembly (Cont'd)

4. Install forward clutch assembly.
 - Align teeth of low & reverse brake drive plates before installing.
 - Make sure that bearing retainer seal rings are not spread.

5. Install bearing race on bearing retainer.
 - Apply petroleum jelly to bearing race.
 - Pay attention to direction of bearing race.

6. Install needle bearings on rear internal gear.
 - Apply petroleum jelly to needle bearings.
 - Pay attention to direction of needle bearing.

7. Hold forward clutch hub and turn overrun clutch hub. Check overrun clutch hub for directions of lock and unlock.
 - If not as shown in illustration, check installed direction of forward one-way clutch.

8. Install rear internal gear assembly.
 - Align teeth of forward clutch and overrun clutch drive plate.

Assembly (Cont'd)

9. Install needle bearing on rear planetary carrier.

- Apply petroleum jelly to needle bearing.
- Pay attention to direction of needle bearing.

10. Install rear sun gear on rear planetary carrier.

- Pay attention to direction of rear sun gear.

11. Install rear planetary carrier on transmission case.

12. Install thrust needle bearing on front planetary carrier.

- Apply petroleum jelly to thrust needle bearing.
- Pay attention to direction of thrust needle bearing.

13. Install low one-way clutch to front planetary carrier by turning it in the direction of the arrow as shown.

14. While holding front planetary carrier, turn low one-way clutch.

Check low one-way clutch for correct directions of lock and unlock.

Assembly (Cont'd)

15. Install front planetary carrier assembly on transmission case.

16. Install snap ring with screwdriver.
- If forward clutch and bearings are not installed correctly snap ring will not fit groove of transmission case.

17. Install needle bearing on front sun gear.
- Apply petroleum jelly to needle bearing.
 - Pay attention to direction of needle bearing.

18. Install front sun gear on front planetary carrier.

19. Install needle bearing on front sun gear.
- Apply petroleum jelly to needle bearing.
 - Pay attention to direction of needle bearing.

Assembly (Cont'd)

20. Install high clutch hub on front sun gear.

21. Install needle bearing on high clutch hub.

- Apply petroleum jelly to needle bearing.
- Pay attention to direction of needle bearing.

22. Remove paper rolled around input shaft.

23. Install input shaft assembly.

- Align teeth of high clutch drive plates before installing.

24. Install reverse clutch assembly.

- Align teeth of reverse clutch drive plates before installing.

Adjustment

When any parts listed in the following table are replaced, total end play or reverse clutch end play must be adjusted.

Part name \ Item	Total end play	Reverse clutch end play
Transmission case	•	•
Overrun clutch hub	•	•
Rear internal gear	•	•
Rear planetary carrier	•	•
Rear sun gear	•	•
Front planetary carrier	•	•
Front sun gear	•	•
High clutch hub	•	•
High clutch drum	•	•
Oil pump cover	•	•
Reverse clutch drum	•	•

TOTAL END PLAY

- Measure clearance between reverse clutch drum and needle bearing for oil pump cover.
- Select proper thickness of bearing race so that end play is within specifications.

1. Measure dimensions "K" and "L" and then calculate dimension "J".

- a. Measure dimension "K".

Adjustment (Cont'd)

- b. Measure dimension "L".
- c. Calculate dimension "J".

"J": Distance between oil pump fitting surface of transmission case and needle bearing mating surface of high clutch drum.

$$J = K - L$$

2. Measure dimension "M".

- a. Place bearing race and needle bearing on oil pump assembly.

- b. Measure dimension "M".

"M": Distance between transmission case fitting surface and needle bearing on oil pump cover.

M₁: Indication of gauge.

- c. Measure thickness of straightedge "t".

$$M = M_1 - t$$

3. Adjust total end play "T₃".

$$T_3 = J - M$$

Total end play "T₃":

0.25 - 0.55 mm (0.0098 - 0.0217 in)

- Select proper thickness of bearing race so that total end play is within specifications.

Bearing races: Refer to S.D.S.

ASSEMBLY

Adjustment (Cont'd)

REVERSE CLUTCH END PLAY

- Measure clearance between oil pump cover and thrust washer for reverse clutch drum.
- Select proper thickness of thrust washer so that end play is within specifications.

1. Measure dimensions "O" and "P" and then calculate dimension "N".

- a. Place thrust washer on reverse clutch drum.
- b. Measure dimension "O".

- c. Measure dimension "P".
- d. Calculate dimension "N".

"N": Distance between oil pump fitting surface of transmission case and thrust washer on reverse clutch drum.

$$N = O - P$$

2. Measure dimensions "R" and "S" and then calculate dimension "Q".

Adjustment (Cont'd)

a. Measure dimension "R".

b. Measure dimension "S".

c. Calculate dimension "Q".

"Q": Distance between transmission case fitting surface and thrust washer mating surface.

$$Q = R - S$$

3. Adjust reverse clutch end play " T_4 ".

$$T_4 = N - Q$$

Reverse clutch end play:

0.65 - 1.00 mm (0.0256 - 0.0394 in)

- Select proper thickness of thrust washer so that reverse clutch end play is within specifications.

Thrust washer: Refer to S.D.S.

Assembly

1. Remove reverse clutch assembly and install needle bearing on high clutch assembly.
- **Pay attention to direction of needle bearing.**
2. Install reverse clutch assembly.

3. Install anchor end pin, washer and lock nut on transmission case.
4. Place brake band on periphery of reverse clutch drum. Then, tighten anchor end pin just enough so that brake band is fitted on periphery of reverse clutch drum uniformly.

ASSEMBLY

Assembly (Cont'd)

5. Place bearing race selected in total end play adjustment step on oil pump cover.

- Apply petroleum jelly to bearing race.

6. Place thrust washer selected in reverse clutch end play step on reverse clutch drum.

- Apply petroleum jelly to thrust washer.

7. Install oil pump assembly on transmission case.

8. Tighten oil pump fixing bolts to specified torque.

9. Install O-ring to input shaft.

- Apply A.T.F. to O-ring.

Assembly (Cont'd)

10. Adjust brake band.
 - a. Tighten anchor end pin to specified torque.
Anchor end pin:
 4 - 6 N·m (0.4 - 0.6 kg-m, 2.9 - 4.3 ft-lb)

- b. Back off anchor end pin two and a half turns.

- c. While holding anchor end pin, tighten lock nut.

11. Apply compressed air to oil holes of transmission case and check operation of brake band.

Adjustment

FINAL DRIVE END PLAY

- Measure clearance between differential side bearing and transmission case.
- Select proper thickness of adjusting shim so that end play is within specifications.

ASSEMBLY

Adjustment (Cont'd)

1. Measure dimension "T" between side bearing fitting surface of transmission case and converter housing fitting surface of transmission case.
"T₁": Indication of gauge

2. Measure thickness of straightedge "t".
 $T = T_1 - t$

3. Place final drive assembly on converter housing.
4. Measure dimension "U" between end of differential case and transmission case fitting surface of converter housing.

5. Measure dimension "V" between end of differential case and adjusting shim mating surface of differential side bearing.
6. Calculate final drive end play.
Final drive end play:
 $T - U + V$
7. Select proper thickness of differential side bearing adjusting shim so that final drive end play is within specifications.
Final drive end play:
0 - 0.15 mm (0 - 0.0059 in)
Differential side bearing adjusting shim:
Refer to S.D.S.

Assembly

1. Install differential side bearing adjusting shim selected in final drive end play adjustment step on transmission case.
 2. Install final drive assembly on transmission case.
 3. Install oil tube on converter housing.
 4. Install O-ring on differential oil port of transmission case.
 5. Install converter housing on transmission case.
- Apply locking sealant to mating surface of converter housing.

Bolt	Length mm (in)
Ⓐ	30 (1.18)
Ⓑ	40 (1.57)

ASSEMBLY

Assembly (Cont'd)

6. Install accumulator piston.

a. Check contact surface of accumulator piston for damage.

b. Install O-rings on accumulator piston.

• Apply A.T.F. to O-rings.

Accumulator piston O-rings:

Unit: mm (in)

Accumulator	Inner diameter (Small)	Inner diameter (Large)
3-R accumulator	26.9 (1.059)	44.2 (1.740)
N-D accumulator	34.6 (1.362)	39.4 (1.551)

c. Install accumulator pistons and return springs on transmission case.

• Apply A.T.F. to inner surface of transmission case.

Return springs:

Unit: mm (in)

Spring	Free length	Outer diameter
3-R accumulator spring	56.4 (2.220)	21.0 (0.827)
N-D accumulator spring	43.5 (1.713)	28.0 (1.102)

7. Install lip seals for band servo oil holes on transmission case.

• Apply petroleum jelly to lip seals.

8. Install oil filter for governor valve.

• Take care with its direction.

ASSEMBLY

Assembly (Cont'd)

9. Install throttle wire to transmission case.

10. Install throttle wire to throttle lever.

11. Install control valve assembly.
a. Insert manual valve into control valve assembly.
● **Apply A.T.F. to manual valve.**

- b. Set manual shaft in Neutral position.
c. Install control valve assembly on transmission case while aligning manual valve with manual plate and detent valve with throttle lever.

- d. Pass solenoid harness through transmission case and install terminal body on transmission case by pushing it.

ASSEMBLY

Assembly (Cont'd)

- e. Install clip to terminal body.

- f. Tighten bolts A, B, C and D.

Bolt length, number and location:

Bolt	A	B	C	D
Bolt length "ℓ" mm (in)	33.0 (1.299)	40.0 (1.575)	43.5 (1.713)	25.0 (0.984)
Number of bolts	6	5	2	2
Tightening torque N·m (kg-m, ft-lb)	7 - 9 (0.7 - 0.9, 5.1 - 6.5)			

12. Install oil pan.

- a. Attach magnet to oil pan.

- b. Install new oil pan gasket on transmission case.

- c. Install oil pan on transmission case.

- **Always replace oil pan bolts.**
- **Tighten the four bolts in a criss-cross pattern to prevent dislocation of gasket.**

- d. Tighten drain plug to specified torque.

Assembly (Cont'd)

13. Install governor valve.
 - a. Install governor valve assembly into transmission case.

- b. Install O-ring to governor cap.
 - Apply A.T.F. to O-ring.

- c. Install governor cap onto transmission case.

- d. Place spacer on governor cap.

- e. Install snap ring onto transmission case with a screwdriver.
 - Align snap ring gap with the notch of transmission case.

ASSEMBLY

Assembly (Cont'd)

14. Install inhibitor switch.
 - a. Set manual lever in "P" position.
 - b. Temporarily install inhibitor switch on manual shaft.
 - c. Move selector lever to "N" position.

- d. Insert 4.0 mm (0.157 in) dia. pin into adjustment hole in both inhibitor switch and manual shaft as near vertically as possible.
 - e. Tighten inhibitor switch fixing bolts.
 - f. Remove pin from adjustment hole after adjusting inhibitor switch.

15. Install oil charging pipe and oil cooler tube to transmission case.

16. Install torque converter.
 - a. Pour A.T.F. into torque converter.
 - Approximately 1 liter (7/8 Imp qt) of fluid is required for a new torque converter.
 - When reusing old torque converter, add the same amount of fluid as was drained.

- b. Install torque converter while aligning notches of torque converter with notches of oil pump.

Assembly (Cont'd)

- c. Measure distance "A" to check that torque converter is in proper position.

Distance "A":

21.1 mm (0.831 in) or more

A/T SHIFT LOCK SYSTEM

Shift Lock System Part Locations

Shift lock release knob:
When selector lever cannot be removed from "P" range even if ignition switch is in "ON" position and brake pedal is depressed, move selector lever from "P" range while pushing shift lock release button.

Wiring Diagram

Diagnostic Procedure 1

SYMPTOM:

Selector lever cannot be moved from "P" range when ignition switch is set in "ON" position and brake pedal is applied, or can be moved when brake pedal is released.

Selector lever can be moved from "P" range when key is removed from key cylinder.

Diagnostic Procedure 1 (Cont'd)

Check key switch.
(Refer to "COMPONENT CHECK".)

Check the following items:

1. Harness continuity between control unit harness terminal ⑪ and key switch harness terminal ⑪.
2. Harness continuity between key switch harness terminal ④ and fuse
3. Key switch (Refer to "COMPONENT CHECK".)

Check detention switch—shift
(Refer to "COMPONENT CHECK".)

CHECK INPUT SIGNAL (DETENTION SWITCH—SHIFT).

8 2. Check voltage between control unit harness terminal ⑤ and ground with brake pedal depressed and selector lever button pushed. **Battery voltage should exist.**

9 3. Check voltage between control unit harness terminal ⑤ and ground with selector lever set in any position except "P". **When selector lever cannot be moved from "P" position with brake pedal depressed, push shift lock release knob. Battery voltage should exist.**

N.G.

- Check the following items:
1. Harness continuity between control unit harness terminal ⑤ and detention switch harness terminal ⑤
 2. Harness continuity between detention switch harness terminal ⑪ and key switch harness terminal ⑪
 3. Detention switch—shift (Refer to "COMPONENT CHECK".)

Component Check

SHIFT LOCK SOLENOID

- Check operation by applying battery voltage to shift lock harness connector.

DETENTION SWITCH

Shift detention switch

- Check continuity between terminals ⑤ and ⑪ of shift lock harness connector.

Condition	Continuity
When selector lever is set in "P" position with selector lever button pushed or selector lever is set in any position except "P".	Yes
Except the above	No

Key detention switch

- Check continuity between terminals ⑪ and ⑫ of shift lock harness connector.

Condition	Continuity
When selector lever is set in "P" position with selector lever button pushed or selector lever is set in any position except "P".	Yes
Except the above	No

KEY LOCK SOLENOID

Operation of locking mechanism

- Check operation by applying battery voltage to key lock solenoid harness connector.

Operating sound must be emitted.

Component Check (Cont'd)

Operation of unlocking mechanism

- Check operation by applying battery voltage to key lock solenoid harness connector.
- Operating sound must be emitted.

KEY SWITCH

- Check continuity between terminals ④ and ⑪ of key switch harness connector.

Condition	Continuity
When key is inserted into key cylinder	Yes
When key is removed from key cylinder	No

STOP LAMP SWITCH

- Check continuity between terminals ② and ③ of stop lamp switch harness connector.

Condition	Continuity
When brake pedal is depressed	Yes
When brake pedal is released	No

Check stop lamp switch after adjusting brake pedal — refer to section BR.

Checking Transfer Oil

- Check transfer for leakage.

- Check oil level.

Replacing Oil Seal

ADAPTER OIL SEAL

DRIVE SHAFT OIL SEAL

- Lubricate seal lips of drive shaft oil seal and adapter oil seal of transfer with multi-purpose grease before installing drive shaft.
- Be careful not to damage drive shaft oil seal and adapter oil seal of transfer when installing drive shaft.

Replacing Viscous Coupling

REMOVAL

- Drain transfer oil.
- Remove front stabilizer bar.
- Remove transaxle control rod and support rod from trans-axle.
- Remove propeller shaft from transfer.
- Separate center exhaust tube from front tube.
- Support transaxle and transfer by a jack.
- Remove rear mount.
- Remove pinion sleeve assembly using a sliding hammer.

Install 2 nuts to prevent the pinion sleeve assembly from dropping. Do not tighten nuts.

- Replacing viscous coupling
Refer to "REPAIR FOR COMPONENT PARTS".

Replacing Viscous Coupling (Cont'd)**INSTALLATION**

- Install O-ring on pinion sleeve and then install pinion sleeve shim and pinion sleeve.

Removal

- Drain gear oil from transfer and transaxle.
- Remove exhaust front tube.
- Put matchmarks on flanges and then separate propeller shaft from transfer.
- Remove transaxle support rod from transfer.

- Remove R.H. drive shaft and oil filter.

- Remove parts shown in above illustration.
 - Rear mount bracket
 - Speedometer pinion
 - Stays and gusset
 - Starter motor

- Remove transfer fixing bolts, then lower transfer.

WARNING:

- Support transaxle by a jack.
- Support transfer by a jack while removing it.

Installation

- Lubricate seal lips of transfer side oil seal in transaxle and drive shaft oil seal and adapter oil seal of transfer, with multi-purpose grease before installing transfer and drive shaft.

- Apply recommended sealant on transfer case as shown at left.

Recommended sealant:

Nissan genuine part (KP510-00150) or equivalent

- **Be careful not to damage transaxle oil seal when inserting spline portion of transfer ring gear into transaxle.**

- Tighten bolts securing transfer.

Bolt No.	Tightening torque N·m (kg-m, ft-lb)	ℓ mm (in)
1	30 - 40 (3.1 - 4.1, 22 - 30)	65 (2.56)
2	30 - 40 (3.1 - 4.1, 22 - 30)	65 (2.56)

- **Be careful not to damage drive shaft oil seal and transfer front cover oil seal when installing drive shaft.**
- Refill with recommended gear oil.
- **Gear oil for transfer is different from that for transaxle.**

Case Components

SMT851B

Gear Components

: N·m (kg-m, ft-lb)
★ : Select proper thickness.

Viscous Coupling

- Check case for cracks.
- Check silicone oil for leakage.

Oil Seal

RING GEAR OIL SEAL

- Check ring gear oil seal for oil leakage.

Be careful not to damage ring gear when removing ring gear oil seal.

Apply multi-purpose grease to seal lip of oil seal before installing.

Gear Components

1. Check hypoid gear-to-pinion backlash.
 - a. Install a bolt in viscous coupling.
 - b. Measure hypoid gear-to-pinion backlash.

Hypoid gear-to-pinion backlash
(at bolt hole of companion flange):
0.08 - 0.12 mm (0.0031 - 0.0047 in)
 - c. If not within specification, adjust hypoid pinion height — Refer to "ADJUSTMENT".

2. Remove pinion sleeve assembly using a sliding hammer. **Install 2 nuts to prevent the pinion sleeve assembly from dropping. Do not tighten nuts.**

Gear Components (Cont'd)

3. Check ring gear-to-counter gear backlash.

Ring gear-to-counter gear backlash**(at ring gear spline):****0.02 - 0.04 mm (0.0008 - 0.0016 in)**

If not within specification, disassemble and check transfer case, case adapter, ring gear and countershaft components. Replace if necessary.

4. Check pinion bearing preload.

- Turn hypoid pinion several times in both directions to seat bearings correctly.
- Measure preload with Tool.

Pinion bearing preload:**1.1 - 1.6 N·m (11 - 16 kg-cm, 9.5 - 13.9 in-lb)**

If not within specification, disassemble and adjust it — Refer to "REPAIR FOR COMPONENT PARTS".

5. Check countershaft bearing preload.

- Wind a strong line on to ring gear spline.
- Turn ring gear several times in both directions to seat bearing correctly.
- Measure countershaft bearing preload.

Countershaft bearing preload**(at outer diameter of ring gear spline):****88 - 235 N (9 - 24 kg, 20 - 53 lb)**

If not within specification, disassemble and adjust countershaft bearing preload — Refer to "ADJUSTMENT" and check countershaft, hypoid gear and ring gear bearings.

Gear Components (Cont'd)

6. Check tooth contact — Refer to "TOOTH CONTACT".

Check the gear tooth contact pattern to verify correct contact of the hypoid gear and pinion.

A hypoid gear set not positioned properly may be noisy, have short life or both.

1. Remove pinion sleeve using a sliding hammer.
Install 2 nuts to prevent the pinion sleeve from dropping. Do not tighten nuts.
2. Thoroughly clean hypoid gear and pinion teeth.

3. Sparingly apply a mixture of powdered ferric oxide and oil or equivalent to 3 or 4 teeth of hypoid gear.

4. Install pinion sleeve shim and sleeve assembly.
 - **After installing pinion sleeve, tighten nuts to the specified torque.**

5. Hold ring gear spline steady by hand and rotate companion flange back and forth.
6. Remove pinion sleeve assembly.
7. Compare contact marks left on hypoid gear to those in the following illustration.

Tooth Pattern Interpretation

1. Remove pinion sleeve using a sliding hammer.
Install 2 nuts to prevent the pinion sleeve from dropping. Do not tighten nuts.

2. Remove all case adapter bolts and then remove case adapter by lightly tapping.

3. Remove ring gear and countershaft assembly as a set.

Removal

SMT246A

Transfer Case and Case Adapter**REMOVAL AND INSTALLATION**

- Hypoid gear bearing outer race (Transfer case side)
- Adapter oil seal — Refer to "ON-VEHICLE SERVICE".

Install adapter oil seal after assembly.

- Shift shaft oil seal — Refer to "PRE-DISASSEMBLY INSPECTION".
- Ring gear oil seal — Refer to "PRE-DISASSEMBLY INSPECTION".

Installation

SMT247A

Ring Gear**DISASSEMBLY**

1. Pull out ring gear bearings.
2. Remove speedometer drive gear.
3. Remove drive shaft oil seal — Refer to "ON-VEHICLE SERVICE".

INSPECTION**Gear and shaft**

- Check gears for excessive wear, chips or cracks.
- Check shaft for cracks or wear.

Ring Gear (Cont'd)

Bearings

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.

ASSEMBLY

1. Install speedometer drive gear.
2. Press on ring gear bearings.
3. Install drive shaft oil seal — Refer to "ON-VEHICLE SERVICE".

Countershaft

DISASSEMBLY

1. Remove countershaft nuts.
2. Press out hypoid gear together with hypoid gear bearing. **Only use press — do not use puller. Puller could damage plug of countershaft.**

Countershaft (Cont'd)

3. Press out hypoid gear bearing.

4. Press out countershaft bearing.

INSPECTION

Gears and shaft

- Check gears for excessive wear, chips or cracks.

When replacing hypoid gear, replace hypoid gear and hypoid pinion as a set.

- Check shaft for cracks or wear.

Bearings

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.

When replacing tapered roller bearing, replace outer and inner race as a set.

ASSEMBLY

1. Press on hypoid gear bearing.

Countershaft (Cont'd)

2. Press on hypoid gear together with hypoid gear bear

3. Press on countershaft bearing.

4. Install new countershaft nuts and tighten them.
 ⚙️: 373 - 441 N·m (38 - 45 kg-m, 275 - 325 ft-lb)

Pinion Sleeve

DISASSEMBLY

1. Before disassembly, check pinion bearing preload — F to "PRE-DISASSEMBLY INSPECTION".
2. Remove pinion nut.
 - a. Hold torx wrenches (T30L type) in vise.
 - b. Put assembly on the vise aligning two holes with two wrenches.
 - c. Loosen pinion nut.

Pinion Sleeve (Cont'd)

3. Remove viscous coupling with suitable puller and drift. **Insert aluminum or copper plates between puller and viscous coupling.**

4. Press out hypoid pinion together with front bearing inner race, collapsible spacer and spacer.

5. Pull out pinion oil seal and remove pinion rear bearing inner race.

6. Remove bearing outer races with brass drift.

7. Remove pinion front bearing inner race. **Always replace after removing.**

INSPECTION

Gear and shaft

- Check gears for excessive wear, chips or cracks.
When replacing hypoid pinion, replace hypoid gear and hyp pinion as a set.
- Check shaft for cracks or wear.

Bearing

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.
When replacing tapered roller bearing, replace outer and inner race as a set.

ASSEMBLY

1. Press on pinion front bearing inner race.

2. Press-fit front and rear bearing outer races.

Pinion Sleeve (Cont'd)

3. Place pinion rear bearing inner race in pinion sleeve.

Before installing, lubricate pinion rear bearing with recommended gear oil.

4. Install pinion oil seal.

Before installing, apply multi-purpose grease to seal lip of oil seal.

5. Place spacer and new collapsible spacer on hypoid pinion and lubricate pinion front bearing with gear oil, and insert them in pinion sleeve.

6. Press viscous coupling so pinion nut can be tightened.

7. Tighten pinion nut slowly to the specified preload. Check bearing preload often to prevent over torque.

Pinion Sleeve (Cont'd)**Tightening torque of pinion nut:****127 - 294 N·m (13 - 30 kg-m, 94 - 217 ft-lb)****When checking preload, turn drive pinion in both direction several times to seat bearings correctly.****Pinion bearing preload:****1.1 - 1.6 N·m (11 - 16 kg-cm, 9.5 - 13.9 in-lb)**

Adjustment Procedure

① SELECTION OF HYPOID GEAR SHIM

1. To simplify the adjustment, make a chart like the one below and write measurements on the chart.

FACTOR	HUNDREDTHS OF A MILLIMETER
A. Transfer case	
B. Hypoid gear	
C. Hypoid gear bearing	

2. Measure hypoid gear bearing thickness.

- a. Prepare required tools for measurement.

- ① Master gauge (KV38101900)
- ② Base plate
- ③ Dial indicator

- b. Place dial indicator and master gauge on base plate.
- c. Place dial indicator on top of master gauge and then adjust dial indicator scale to zero.
- d. Carefully slide master gauge out from under dial indicator.

- e. Place hypoid gear bearing inner race on base plate and then place hypoid gear bearing outer race on inner race.
- f. Place dial indicator on top of outer race.
- g. Read dial indicator.
- If the needle fluctuates erratically then bearing is either dirty or defective and should be cleaned or replaced.
- h. Determine factor "C" to be used by the following equation.

$$C = \text{"Dial gauge deflection"} \times 100$$

(Bearing height = 20 mm (0.79 in) + Dial gauge deflection)

- i. Write "C" on chart.

Adjustment Procedure (Cont'd)

3. Write figure marked on transfer case as factor "A" on chart.

4. Write figure marked on hypoid gear as factor "B" on chart.

5. Determine dimension "D" to be used by the following equation.

$$D = 100 + A - B - C$$

FOR EXAMPLE

FACTOR	HUNDREDTHS OF A MILLIMETER
A. Transfer case	3
B. Hypoid gear	2
C. Hypoid gear bearing	9 (0.09 x 100)

$$D = 100 + 3 - 2 - 9 = 92$$

6. Select proper shims using S.D.S. table as a guide.

7. Install selected shims and hypoid gear bearing outer race (Transfer case side) in transfer case.

**② REMOVAL OF RING GEAR SNAP RING**

1. Remove adapter oil seal.
2. Remove ring gear snap ring.

Adjustment Procedure (Cont'd)**③ INSTALLATION OF RING GEAR, COUNTERSHAFT AND CASE ADAPTER**

1. Install ring gear and countershaft.
2. Install case adapter.

Tighten bolts to the specified torque.

**④ SELECTION OF RING GEAR SNAP RING**

1. Install the thinnest snap ring [Part No. 33138-10R00, Thickness: 3.00 mm (0.1181 in)] in ring gear snap ring groove.

2. Tap ring gear snap ring lightly to seat it into groove.

3. Measure clearance of groove.
4. Select proper snap ring using S.D.S. table as a guide.
5. Remove snap ring (Part No. 33138-10R00).
6. Install selected snap ring in ring gear snap ring groove.
7. Measure clearance of groove (ring gear end play) as a final check.

**Allowable clearance of groove
(Ring gear end play):**
0 - 0.06 mm (0 - 0.0024 in)

**⑤ SELECTION OF COUNTERSHAFT SHIM**

1. Remove end cover and countershaft shim.
- Be careful not to lose O-ring.

Adjustment Procedure (Cont'd)

2. Tap countershaft bearing outer race lightly to seat bearings properly.

3. Measure factor "E".

4. Measure factor "F".
5. Determine dimension "G" to be used by the following equation.

$$G = F - E$$

6. Select proper shims using S.D.S. table as a guide.
7. Install selected shims and end cover without O-ring in case adapter.

Tighten bolts to the specified torque.

8. Check countershaft preload as final check — Refer to "PRE-DISASSEMBLY INSPECTION".
If not within specification, select countershaft shim again.

Adjustment Procedure (Cont'd)

⑥ SELECTION OF PINION SLEEVE SHIM

1. Install pinion sleeve assembly without O-ring and shim.

2. While pushing pinion sleeve assembly, measure clearance "H" between transfer case and pinion sleeve, (at least 4 points) with feeler gauge.
3. Select proper shims using S.D.S. table as a guide.
4. Remove pinion sleeve assembly.

⑦ HYPOID GEAR-TO-PINION BACKLASH INSPECTION

1. Install pinion sleeve assembly with pinion sleeve shim.
2. Check hypoid gear-to-pinion backlash.

Hypoid gear-to-pinion backlash:

0.08 - 0.12 mm (0.0031 - 0.0047 in)

- If backlash is too small, decrease thickness of hypoid gear shim and increase thickness of countershaft shim by the same amount.
- If backlash is too great, reverse the above procedure.

Never change the total amount of shims as it will change the bearing preload.

3. Remove pinion sleeve assembly.

Adjustment Procedure (Cont'd)

⑧ CHECK OF TOOTH CONTACT — Refer to "TOOTH CONTACT".

Usually tooth contact pattern will be correct if you have selected the shims accurately.

However, in extremely rare cases you will have to use trial-and-error processes until the tooth contact pattern is right.

The tooth pattern is the best indication of how well a hypoid gear and pinion have been set up.

⑨ REMOVAL OF END COVER

⑩ REMOVAL OF CASE ADAPTER, RING GEAR AND COUNTERSHAFT

1. Install countershaft.
2. Install ring gear. Tilt countershaft a little to install ring gear more easily.
3. Clean mating surface of case adapter and transfer case.
4. Apply recommended sealant to mating surface of transfer case and case adapter.

Recommended sealant:

Nissan genuine part (KP610-00250) or equivalent

5. Install case adapter.

6. Install O-rings on case adapter and end cover.
Before installing, apply multi-purpose grease to O-rings.

7. Install countershaft bearing outer race, countershaft shim and end cover.

8. Install O-ring on pinion sleeve and then install pinion sleeve shim and pinion sleeve assembly on transfer case.
● **Before installing O-ring, apply multi-purpose grease to O-ring.**
9. Install adapter oil seal. Refer to "ON-VEHICLE SERVICE".

Checking Transfer Oil

- Check transfer oil for leakage.

- Check oil level.

Replacing Oil Seal

FRONT COVER OIL SEAL

- Lubricate transfer front cover oil seal lips with multi purpose grease before installing drive shaft.

Be careful not to damage transfer front cover oil seal when installing drive shaft.

Removal

- Drain gear oil from transfer and transaxle.
- Remove exhaust front tube.
- Put matchmarks on flanges and then separate propeller shaft from transfer.
- Remove shift control rod and support rod from transaxle and transfer.
- Draw out drive shafts from transaxle — Refer to section FA.
- Remove clutch operating cylinder and hose from transaxle.
- **Support engine with hoist.**
- Remove engine mounting bracket LH and insulator located at left front corner of engine compartment.
- Remove parts shown in below illustration.

- Separate transaxle from engine and transfer and slide transaxle to left side about 50 mm (1.97 in).
- Remove transfer fixing bolts, then lower transfer.

WARNING

- **Support transaxle by a jack.**
- **Support transfer by a jack while removing it.**
- **Be careful not to damage transaxle oil seal when removing transfer.**

Installation

- Lubricate transfer side oil seal lip in transaxle and transfer front cover oil seal with multi-purpose grease before installing transfer and drive shaft.
- Apply recommended sealant on transfer case as shown at left.

Recommended sealant:

Nissan genuine part (KP510-00150) or equivalent

- Be careful not to damage transaxle oil seal when inserting spline portion of transfer ring gear and connect shaft into transaxle.
- Tighten bolts securing transfer.

Bolt No.	Tightening torque N m (kg-m, ft-lb)	ℓ mm (in)
1	30 - 40 (3.1 - 4.1, 22 - 30)	65 (2.56)
2	30 - 40 (3.1 - 4.1, 22 - 30)	85 (3.35)
3	30 - 40 (3.1 - 4.1, 22 - 30)	65 (2.56)

- Be careful not to damage drive shaft oil seal and transfer front cover oil seal when installing drive shaft.
- Refill with recommended gear oil.

Gear oil for transfer is different from that for transaxle.

Oil seal

RING GEAR OIL SEAL

- Check ring gear oil seal for oil leakage.

Be careful not to damage ring gear when removing ring gear oil seal.

Installation

Apply multi-purpose grease to seal lip of oil seal before installing.

Gear Components

1. Check hypoid gear-to-pinion backlash.
 - a. Install a bolt and nut in one bolt hole of companion flange.
 - b. Measure hypoid gear-to-pinion backlash.

**Hypoid gear-to-pinion backlash
(at bolt hole of companion flange):**
0.10 - 0.15 mm (0.0039 - 0.0059 in)

- c. If not within specification, adjust hypoid pinion height.

2. Remove pinion sleeve assembly by tapping.

Install 2 bolts through pinion sleeve and onto transfer case to prevent the pinion sleeve assembly from dropping. Do not tighten bolts.

Gear Components (Cont'd)

3. Check ring gear-to-counter gear backlash.

Ring gear-to-counter gear backlash:

0.02 - 0.04 mm (0.0008 - 0.0016 in)

If not within specification, disassemble and check transfer case, adapter plate, ring gear and countershaft components. Replace if necessary.

4. Check pinion bearing preload.
 - a. Turn hypoid pinion several times in both directions to seat bearings correctly.
 - b. Measure preload with Tool.

Pinion bearing preload:

1.1 - 1.6 N·m

(11 - 16 kg-cm, 9.5 - 13.9 in-lb)

If not within specification, disassemble and adjust it — Refer to "REPAIR FOR COMPONENT PARTS".

Gear Components (Cont'd)

5. Check countershaft bearing preload.
 - a. Wind a strong line onto ring gear shaft.
 - b. Turn ring gear several times in both directions to seat bearing correctly.
- c. Measure countershaft bearing preload.

Countershaft bearing preload

(at outer diameter of ring gear spline):

88 - 235 N (9 - 24 kg, 20 - 53 lb)

If not within specification, disassemble and adjust countershaft bearing preload — Refer to "ADJUSTMENT" and check countershaft, hypoid gear and ring gear bearings.

6. Check tooth contact — Refer to "TOOTH CONTACT".

Check the gear tooth contact pattern to verify correct contact of the hypoid gear and pinion.

A hypoid gear set not positioned properly may be noisy, have short life or both.

1. Remove pinion sleeve by lightly tapping.

Install 2 bolts through pinion sleeve and onto transfer case to prevent the pinion sleeve from dropping. Do not tighten bolts.

2. Thoroughly clean hypoid gear and pinion teeth.

3. Sparingly apply a mixture of powdered ferric oxide and oil or equivalent to 3 or 4 teeth of hypoid gear.

4. Install pinion sleeve shim and sleeve assembly.

- **Install 2 bolts through pinion sleeve and onto transfer case. Do not tighten bolts. These bolts will guide pinion sleeve into case.**
- **After installing pinion sleeve, tighten bolts to the specified torque.**

5. Hold ring gear spline steady by hand and rotate companion flange back and forth.
6. Remove pinion sleeve assembly.
7. Compare contact marks left on hypoid gear to those in the following illustration.

Ring Gear (Cont'd)

2. Remove speedometer drive gear.

3. Remove drive shaft oil seal.

INSPECTION

Gear and shaft

- Check gears for excessive wear, chips or cracks.
- Check shaft for cracks or wear.

Bearings

- Make sure bearings roll freely and are free from noise, crack, pitting or wear.

Ring Gear (Cont'd)

ASSEMBLY

1. Install speedometer drive gear.

2. Press on ring gear bearings.

3. Install drive shaft oil seal.

Countershaft

DISASSEMBLY

1. Remove countershaft nut.

2. Press out hypoid gear together with hypoid gear bearing.

Countershaft (Cont'd)

3. Press out hypoid gear bearing.

4. Press out countershaft bearing.

INSPECTION

Gears and shaft

- Check gears for excessive wear, chips or cracks.
- When replacing hypoid gear, replace hypoid gear and hypoid pinion as a set.**
- Check shaft for cracks or wear.

Bearings

- Make sure bearings roll freely and are free from noise, crack, pitting or wear.
- When replacing tapered roller bearing, replace outer and inner race as a set.**

ASSEMBLY

1. Press on hypoid gear bearing.

Countershaft (Cont'd)

2. Press on hypoid gear together with hypoid gear bearing.

3. Press on countershaft bearing.

4. Install new countershaft nut.

Pinion Sleeve

DISASSEMBLY

1. Before disassembly, check pinion bearing preload — Refer to "PRE-DISASSEMBLY INSPECTION".
2. Remove pinion nut.

3. Press out hypoid pinion together with front inner race, collapsible spacer and spacer.

Pinion Sleeve (Cont'd)

4. Pull out pinion oil seal and remove pinion rear bearing inner cone.

5. Remove bearing outer races with brass drift.

6. Remove pinion front bearing inner race.
Always replace after removing.

**INSPECTION****Gear and shaft**

- Check gears for excessive wear, chips or cracks.
- When replacing hypoid pinion, replace hypoid gear and hypoid pinion as a set.**
- Check shaft for cracks or wear.

**Bearing**

- Make sure bearings roll freely and are free from noise, crack, pitting or wear.
- When replacing tapered roller bearing, replace outer and inner race as a set.**

Pinion Sleeve (Cont'd)

ASSEMBLY

1. Press fit pinion front bearing.

2. Press fit front and rear bearing outer races.

3. Place pinion rear bearing inner race in pinion sleeve.
Before installing, lubricate pinion rear bearing with recommended gear oil.

4. Install pinion oil seal.
Before installing, apply multi-purpose grease to seal lip of oil seal.

Pinion Sleeve (Cont'd)

5. Place spacer and **new** collapsible spacer on hypoid pinion and lubricate pinion front bearing with gear oil, and insert them in pinion sleeve.

6. Press in companion flange until there is no axial end play.

7. Tighten pinion nut slowly to the specified preload. Check bearing preload often to prevent over torque.

When checking preload, turn drive pinion in both directions several times to seat bearing correctly.

Pinion bearing preload:

1.1 - 1.6 N·m (11 - 16 kg-cm, 9.5 - 13.9 in-lb)

**Front Differential****DISASSEMBLY**

1. Remove front differential side bearing.

Front Differential (Cont'd)

2. Drive out pinion mate shaft retaining pin.
3. Remove pinion mate shaft, pinion mate gear and side gear.

4. Remove connect shaft.

INSPECTION

Gear, washer, shaft and case

- Check mating surfaces of differential case, side gears and pinion mate gears.
- Check washers for wear.

Bearing

- Make sure bearings roll freely and are free from noise, cracks, pitting or wear.

ASSEMBLY

1. Fit side gear thrust washers and side gears, then install pinion mate washers and pinion mate gears in case.

Front Differential (Cont'd)

Take care to install left and right side gear correctly.

2. Insert pinion mate shaft.

When installing, be careful not to damage pinion mate thrust washers.

3. Measure clearance between side gear and differential case with washers.

Clearance between side gear and differential case with washers:

0.1 - 0.2 mm (0.004 - 0.008 in)

If not within specification, adjust clearance by changing thickness of side gear thrust washers.

Side gear thrust washer:

Refer to S.D.S.

4. Install retaining pin.

Make sure that retaining pin is flush with case.

5. Install connect shaft by lightly tapping.

Front Differential (Cont'd)

6. Press on differential side bearing.

It is necessary to adjust ring gear end play, countershaft bearing preload, hypoid gear and hypoid pinion height, front differential case end play when replacing any part in chart below.

Adjustment Procedure Chart

① SELECTION OF HYPOID GEAR SHIM

1. To simplify the adjustment, make a chart like the one below and write measurements on the chart.

FACTOR	HUNDREDTHS OF A MILLIMETER
A: Hypoid gear	
B Hypoid gear bearing	

2. Measure hypoid gear bearing thickness.
- Prepare required tools for measurement.
 - Master Gauge KV38101900
 - Base Plate
 - Dial Indicator
 - Place dial indicator and master gauge on base plate.
 - Place dial indicator on top of master gauge and then adjust dial indicator scale to zero.
 - Carefully slide master gauge out from under dial indicator.
 - Place hypoid gear bearing inner race on base plate and then place hypoid gear bearing outer race on inner race.
 - Place dial indicator on top of outer race.
 - Read dial indicator.
 - If the needle fluctuates erratically then bearing is either dirty or defective and should be cleaned or replaced.
 - Determine factor "B" to be used by the following equation.

$$B = \text{"Dial gauge deflection"} \times 100$$

[Bearing height = 20 mm (0.79 in) + Dial gauge deflection]
 - Write "B" on chart.

Adjustment Procedure Chart (Cont'd)

3. Write figure marked on hypoid gear as factor "A" on chart.
4. Determine dimension "C" to be used by the following equation.

$$C = 110 - A - B$$

FOR EXAMPLE

FACTOR	HUNDREDTHS OF A MILLIMETER
A: Hypoid gear	2
B: Hypoid gear bearing	9 (0.09 × 100)

$$C = 110 - 2 - 9$$

$$= 99$$

6. Select proper shims using S.D.S. table as a guide.
7. Install selected shims and hypoid gear bearing outer race (Transfer case side) in transfer case.

② REMOVAL OF RING GEAR SNAP RING

Removing ring gear snap ring.

③ INSTALLATION OF RING GEAR, COUNTERSHAFT AND ADAPTER PLATE

1. Install ring gear and countershaft.
2. Install adapter plate.

Temporarily install spacers and tighten bolts to the specified torque.

Spacer: 25 mm (0.98 in)

Adjustment Procedure Chart (Cont'd)

④ SELECTION OF RING GEAR SNAP RING

1. Install the thinnest snap ring [Part No. 33138-56E00, Thickness: 4.00 mm (0.1575 in)] in ring gear snap ring groove.

2. Tap ring gear snap ring lightly to seat it into groove.

3. Measure clearance of groove.
4. Select proper snap ring using S.D.S. table as a guide.
5. Remove snap ring (Part No. 33138-56E00).
6. Install selected snap ring in ring gear snap ring groove.
7. Measure clearance of groove (ring gear end play) as a final check.

Allowable clearance of groove

(Ring gear end play):

0 - 0.06 mm (0 - 0.0024 in)

⑤ SELECTION OF COUNTERSHAFT SHIM

1. Remove adapter cover and countershaft shim.

Adjustment Procedure Chart (Cont'd)

2. Tap countershaft bearing outer race lightly to seat bearings properly.

3. Measure factor "E".

4. Measure factor "F".
5. Determine dimension "G" to be used by the following equation.

$$G = F - E$$

6. Select proper shims using S.D.S. table as a guide.
7. Install selected shims and adapter cover in adapter plate.

Tighten bolts to the specified torque.

8. Check countershaft preload as final check — Refer to "PRE-DISASSEMBLY INSPECTION".
If not within specification, select countershaft shim again.

⑥ SELECTION OF PINION SLEEVE SHIM

1. Install pinion sleeve assembly without O-ring and shim.

Adjustment Procedure Chart (Cont'd)

2. While pushing pinion sleeve assembly, measure clearance "H" between transfer case and pinion sleeve at least 4 points with feeler gauge.
3. Select proper shims using S.D.S. table as a guide.
4. Remove pinion sleeve assembly.

**⑦ HYPOID GEAR-TO-PINION BACKLASH INSPECTION**

1. Install pinion sleeve assembly with pinion sleeve shim.
2. Check hypoid gear-to-pinion backlash.

Hypoid gear-to-pinion backlash:

0.10 - 0.15 mm (0.0039 - 0.0059 in)

- If backlash is too small, decrease thickness of hypoid gear shim and increase thickness of countershaft shim by the same amount.
- If backlash is too great, reverse the above procedure.

Never change the total amount of shims as it will change the bearing preload.

3. Remove pinion sleeve assembly.

**⑧ SELECTION OF FRONT DIFFERENTIAL SIDE BEARING SHIM**

1. Measure factor "I".

Adjustment Procedure Chart (Cont'd)

2. Install front differential assembly in adapter plate.

3. Measure factor "J".

4. Measure factor "K".

Front differential case end play (I - J + K):
0.05 - 0.20 mm (0.0020 - 0.0079 in)

Select proper shims using S.D.S. table as a guide.

5. Install front cover.

⑨ TOOTH CONTACT INSPECTION — Refer to "TOOTH CONTACT".

Usually tooth contact pattern will be correct if you have selected the shims accurately.

However, in extremely rare cases you will have to use trial-and-error processes until the tooth contact pattern is right.

The tooth pattern is the best indication of how well a hypoid gear and pinion have been set up.

⑩ REMOVAL OF ADAPTER COVER

⑪ REMOVAL OF FRONT COVER, FRONT DIFFERENTIAL, ADAPTER PLATE, RING GEAR AND COUNTER-SHAFT

1. Install countershaft and ring gear as a set.
2. Clean adapter plate and transfer case mating surface.
3. Apply recommended sealant to transfer case and adapter plate mating surface.

4. Install adapter plate.
5. Install countershaft bearing, countershaft shim and adapter cover.

6. Install front differential assembly and front cover.

7. Install O-ring on pinion sleeve and then install pinion sleeve shim and pinion sleeve.
8. Install front cover oil seal.

PROPELLER SHAFT

On-vehicle Service

PROPELLER SHAFT VIBRATION

If vibration is present at high speed, inspect propeller shaft runout first.

1. Raise rear wheels.
2. Measure propeller shaft runout at indicated points by rotating final drive companion flange with hands.

Runout limit: 0.6 mm (0.024 in)

Propeller shaft runout measuring points:

Distance "A"

GA16DS: 222.5 mm (8.76 in)

SR20DET: 234 mm (9.21 in)

Distance "B"

GA16DS: 317.5 mm (12.50 in)

SR20DET: 315 mm (12.40 in)

Distance "C"

GA16DS: 281 mm (11.06 in)

SR20DET: 272.5 mm (10.73 in)

PROPELLER SHAFT

On-vehicle Service (Cont'd)

3. If runout exceeds specifications, disconnect propeller shaft at final drive companion flange; then rotate companion flange 90, 180 and 270 degrees and reconnect propeller shaft.

Runout limit: 0.6 mm (0.024 in)

4. Check runout again. If runout still exceeds specifications replace propeller shaft assembly.
5. Perform road test.

APPEARANCE CHECK

- Inspect propeller shaft tube surface for dents or cracks. If damaged, replace propeller shaft assembly.
- If center bearing is noisy or damaged, replace center bearing.

Removal and Installation

- Put matchmarks on flanges and separate propeller shaft from final drive.

- Before removing/installing propeller shaft or moving it from one place to another, wrap boot located at constant-velocity joint with a cloth or rubber material to protect it against damage, as shown in figure at left.

Inspection

- Inspect propeller shaft runout. If runout exceeds specifications, replace propeller shaft assembly.

Runout limit: 0.6 mm (0.024 in)

Inspection (Cont'd)

- Inspect journal axial play. If the play exceeds specifications, replace propeller shaft assembly.

Journal axial play:
0 mm (0 in)

Front Oil Seal Replacement

1. Remove propeller shaft.
2. Loosen drive pinion nut with Tool.

3. Remove companion flange.

4. Remove front oil seal.

5. Apply multi-purpose grease to sealing lips of oil seal. Press front oil seal into carrier.
6. Install companion flange and drive pinion nut.
7. Install propeller shaft.

Side Oil Seal Replacement

1. Remove drive shafts.
Refer to RA section.
2. Remove oil seal.

Side Oil Seal Replacement (Cont'd)

3. Apply multi-purpose grease to sealing lips of oil seal. Press-fit oil seal into carrier with Tool.

Tool number: ST33400001

4. Install drive shafts.

REMOVAL AND INSTALLATION (Final drive)

Removal

- Remove propeller shaft.
- Remove drive shafts.
Refer to RA section.
- Disconnect breather hose from final drive side in advance.
- Support final drive with jack and disconnect differential mounting bracket from final drive.
- Disconnect final drive from mounting member.
- Remove final drive by moving it slightly forward and down.
- Remove final drive mounting member from body.

CAUTION:

Be careful not to damage spline, joint and front oil seal when removing propeller shaft.

R180V

Pre-inspection

Before disassembling final drive, perform the following inspection.

- Total preload
 - 1) Turn drive pinion in both directions several times to set bearing rollers.
 - 2) Check total preload with Tool.

Tool number: ST3127S000

Total preload:

1.0 - 1.6 N·m

(10 - 16 kg-cm, 8.7 - 13.9 in-lb)

- Ring gear backlash

Check ring gear backlash with a dial indicator at several points.

Ring gear backlash:

0.10 - 0.20 mm (0.0039 - 0.0079 in)

- Ring gear runout

Check runout of ring gear with a dial indicator.

Runout limit:

0.05 mm (0.0020 in)

- Tooth contact

Check tooth contact. (Refer to Adjustment.)

Differential Carrier

1. Using three 12 mm (0.5 in) spacers, mount final drive on Tool.

Tool number: KV38100800

2. Mark side retainers for identification. Remove side retainers.

Be careful not to confuse right and left side retainers and shims.

DISASSEMBLY

Differential Carrier (Cont'd)

3. Extract differential case from final drive housing.

4. Remove side outer races.

Tool number: ST33290001

Be careful to keep the side bearing outer races together with their respective inner cones — do not mix them up.

5. Remove side oil seal.

6. Loosen drive pinion nut.

7. Remove companion flange with puller.

8. Take out drive pinion together with pinion rear bearing inner cone, drive pinion bearing spacer and pinion bearing adjusting washer.

9. Remove front oil seal.

Differential Carrier (Cont'd)

10. Remove pinion front and rear bearing outer races with brass drift.

11. Remove pinion rear bearing inner cone and drive pinion adjusting washer.

Tool number: ST30031000

**Differential Case**

1. Remove side bearing inner cones.

To prevent damage to bearing, engage puller jaws in grooves.

Tool number:

(A) ST33051001

(B) ST33061000

Be careful not to confuse the right and left hand parts.

Differential Case (Cont'd)

2. Loosen ring gear bolts in a criss-cross fashion.
3. Tap ring gear off differential case with a soft hammer.
Tap evenly all around to keep ring gear from binding.

4. Drive out pinion mate shaft lock pin with Tool from ring gear side.
Lock pin is caulked at pin hole mouth on differential case.

Ring Gear and Drive Pinion

Check gear teeth for scoring, cracks or chipping.
If any damaged part is evident, replace ring gear and drive pinion as a set (hypoid gear set).

Differential Case Assembly

Check mating surfaces of differential case, side gears, pinion mate gears, pinion mate shaft, thrust block and thrust washers.

Bearing

1. Thoroughly clean bearing.
2. Check bearing for wear, scratches, pitting or flaking.
Check tapered roller bearing for smooth rotation. If damaged, replace outer race and inner cone as a set.

ADJUSTMENT

For quiet and reliable final drive operation, the following five adjustments must be made correctly:

1. Side bearing preload
2. Pinion gear height
3. Pinion bearing preload (Refer to ASSEMBLY.)
4. Ring gear-to-pinion backlash (Refer to ASSEMBLY.)
5. Ring and pinion gear tooth contact pattern

Drive Pinion Height

1. First prepare Tools for pinion height adjustment.

- ① Height gauge (ST31211000)
- ② Dummy shaft (ST31212000)
- ③ Collar (ST31214000)
- ④ Feeler gauge
- ⑤ Stopper (ST31213000)
- ⑥ Preload gauge (ST3127S000)

2. To simplify the job, make a chart, like the one below, to organize your calculations.

LETTERS	HUNDREDTHS OF A MILLIMETER
H: Head number	
D': Figure marked on dummy shaft	
S: Figure marked on height gauge	
N: Measuring clearance	
W: Thickness of washer used	

3. Write the following numbers down in the chart.

H: Head number

D': Figure marked on dummy shaft

ADJUSTMENT

Drive Pinion Height (Cont'd)

S: Figure marked on height gauge

W: Thickness of washer used

4. Set Tool (Dummy shaft) as shown at left.

Tool number:

- Ⓐ Dummy shaft (ST31212000)
- Ⓑ Collar (ST31214000)
- Ⓒ Dummy shaft spacer (ST31851000)
- Ⓓ Stopper (ST31213000)

5. Attach Tool (Height gauge) to gear carrier, and measure the clearance between the height gauge tip and the dummy shaft face.

Tool number:

- Ⓐ Height gauge (ST31211000)
- Ⓑ Dummy shaft (ST31212000)

ADJUSTMENT

Drive Pinion Height (Cont'd)

6. Substitute these values into the equation to calculate the thickness of the washer.

If values signifying H, D' and S are not given, regard them as zero and calculate.

T: Thickness of washer

$$T = W + N + [(D' - H - S) \times 0.01] - 0.20$$

Example:

$$W = 3.09$$

$$N = 0.33$$

$$H = +2$$

$$D' = +1$$

$$S = +1$$

$$T = W + N + [(D' - H - S) \times 0.01] - 0.20$$

(1)	D' (+1)	
	- H - (+2)	
		- 1

(2)	- S - (+1)	
		- 2

(3)		- 2
		× 0.01
		- 0.02

(4)	W 3.09	
	+ N + 0.33	
		3.42

(5)		+ [- 0.02]
		3.40

(6)		- 0.20
		3.20

7. Select the proper washer (Refer to S.D.S.).

If you cannot find the desired thickness of washer, use washer so that thickness is the closest to the calculated value.

Example:

Calculated value ... T = 3.20 mm

Used washer ... T = 3.21 mm

Side Bearing Preload

- To simplify the job, make a chart like the one below to organize your calculation.

LETTERS	HUNDREDTHS OF A MILLIMETER
A - Left housing	
B - Right housing	
C - Differential case	
D - Differential case	
E - Left side bearing	
F - Right side bearing	
G ₁ - Left side retainer	
G ₂ - Right side retainer	

- Write the following numbers down in the chart.
A & B: Figures marked on gear carrier

C & D: Figures marked on differential case

G₁ & G₂: Figures marked on side retainer

ADJUSTMENT

Side Bearing Preload (Cont'd)

3. Measure how far under standard thickness [20 mm (0.79 in) in the side bearings are.

It will require tools shown at left.

- ① Weight block (ST32501000)
- ② Master gauge (KV38101900)
- ③ Base plate
- ④ Dial indicator

4. Place the outer race of the opposite side bearing to be measured.
5. Place a weight block on the outer race, and a master gauge on that block.

Tool number:

① ST32501000

② KV38101900

6. Adjust dial indicator scale to zero.
7. Carefully slide master gauge and weight block out from under dial indicator.

8. Lubricate side bearing and place the bearing outer race and inner cone to be measured on the opposite side outer race.

If the bearing assembly is placed on the base plate, the bearing width cannot be accurately determined due to its cage being in contact with base plate.

9. Place weight block on side bearing.
10. Slide dial indicator on weight block.

11. Turn weight block a few times to ensure that bearing is properly seated.
12. Read dial indicator.

Normal indication:

0.10 - 0.30 mm (0.0039 - 0.0118 in)

If the needle fluctuates erratically then bearing is either dirty or damaged and should be cleaned or replaced.

Side Bearing Preload (Cont'd)

13. Measure both bearings in the same way and write the left side bearing measurement next to "E" and the right side bearing measurement next to "F".
14. Substitute these values into the equation to calculate the thickness of the shim.

If values signifying A, B, C, D, G₁ and G₂ are not given, regard them as zero and calculate.

Left side:

$$T_1 = (A + C + G_1 - D) \times 0.01 + 0.76 - E$$

Right side:

$$T_2 = (B + D + G_2) \times 0.01 + 0.76 - F$$

ADJUSTMENT

Side Bearing Preload (Cont'd)

Example:

$$\begin{array}{ll} A = 5 & E = 0.11 \\ B = 5 & F = 0.15 \\ C = 3 & G_1 = 4 \\ D = 3 & G_2 = 1 \end{array}$$

Left side:

$$\begin{aligned} T_1 &= (A + C + G_1 - D) \times 0.01 + 0.76 - E \\ &= (5 + 3 + 4 - 3) \times 0.01 + 0.76 - 0.11 \end{aligned}$$

(1)	A	5	
	+ C	+3	
		8	
	+ G ₁	+4	
		12	
	- D	-3	
		9	
(2)		9	
		× 0.01	
		0.09	
(3)		0.09	
		+ 0.76	
		0.85	
(4)		0.85	
	- E	- 0.11	
		0.74	

$$\therefore T_1 = 0.74 \text{ mm}$$

Right side:

$$\begin{aligned} T_2 &= (B + D + G_2) \times 0.01 + 0.76 - F \\ &= (5 + 3 + 1) \times 0.01 + 0.76 - 0.15 \end{aligned}$$

(1)	B	5	
	+ D	+3	
		8	
	+ G ₂	+1	
		9	
(2)		9	
		× 0.01	
		0.09	
(3)		0.09	
		+ 0.76	
		0.85	
(4)		0.85	
		- 0.15	
		0.70	

$$\therefore T_2 = 0.70 \text{ mm}$$

15. Select the proper shims (Refer to S.D.S.).

If you cannot find the desired thickness of shims, use shims so that the total thickness is the closest to the calculated value.

Tooth Contact

Checking of gear tooth contact pattern is necessary to verify correct relationship between ring gear and drive pinion. Hypoid gear sets which are not positioned properly in relation to one another may be noisy, or have short life, or both. With a pattern check, the most desirable contact for low noise level and long life can be assured.

1. Thoroughly clean ring gear and drive pinion teeth.
2. Sparingly apply a mixture of powdered ferric oxide and oil or equivalent to 3 or 4 teeth of ring gear drive side.
3. Hold companion flange steady by hand and rotate the ring gear in both directions.

Usually the pattern will be correct if you have calculated the shims correctly and the backlash is correct. However, in rare cases you may have to use trial-and-error processes until you get a good tooth contact pattern. The tooth pattern is the best indication of how well a differential has been set up.

Heel contact

Face contact

To correct, increase thickness of pinion height adjusting washer in order to bring drive pinion close to ring gear.

Toe contact

Flank contact

To correct, reduce thickness of pinion height adjusting washer in order to make drive pinion go away from ring gear.

Correct tooth contact

When adjustment is completed, be sure to wipe off completely the ferric oxide and oil or their equivalent.

SPD007

Differential Case

1. Install side gears, pinion mate gears and thrust washers into differential case.

2. Fit pinion mate shaft to differential case so that it meets lock pin holes.
3. Adjust backlash between side gear and pinion mate gear selecting side gear thrust washer. (Refer to S.D.S.)

**Backlash between side gear and pinion mate gear
(Clearance between side gear thrust washer and differential case):**

0.10 - 0.20 mm (0.0039 - 0.0079 in)

4. Install pinion mate shaft lock pin with a punch.

Make sure lock pin is flush with case.

5. Apply gear oil to gear tooth surfaces and thrust surfaces and check to see they turn properly.

6. Place differential case on ring gear.
7. Apply locking sealant to ring gear bolts, and install them. **Tighten bolts in a criss-cross fashion, lightly tapping bolt heads with a hammer.**

8. Select side bearing adjusting shims. Refer to ADJUSTMENT.
9. Install the shims behind each bearing and press on side bearing inner cones with Tool.

Tool number:

Ⓐ ST33230000

Ⓑ ST33061000

Differential Carrier

1. Press-fit front and rear bearing outer races with Tools.

Tool number:

- (A) ST30611000
- (B) ST30621000
- (C) ST30701000

2. Select pinion height adjusting washer, referring to ADJUSTMENT.
3. Install pinion height adjusting washer in drive pinion, and press-fit rear bearing inner cone in it with a press and Tool.

Tool number:

ST30901000

4. Set drive pinion assembly (as shown at left) in differential carrier and install drive pinion, using press and suitable tool.

Stop when drive pinion touches bearing.

Differential Carrier (Cont'd)

5. Apply multi-purpose grease to cavity at sealing lips of front oil seal.

Install front oil seal.

Tool number: ST30720000

6. Install companion flange, and tighten pinion nut to specified torque.

Ascertain that threaded portion of drive pinion and pinion nut are free from oil or grease.

7. Turn drive pinion in both directions several times, and measure pinion bearing preload.

Tool number: ST3127S000

Pinion bearing preload (With oil seal):

1.1 - 1.7 N·m (11 - 17 kg-cm, 9.5 - 14.8 in-lb)

When pinion bearing preload is outside the specification, replace pinion bearing adjusting washer and spacer with different thickness.

8. Select side retainer adjusting washer. Refer to Adjustment.

9. Press-fit side bearing outer race into side retainer.

Tool number:

(A) ST30611000

(B) ST30621000

Differential Carrier (Cont'd)

10. Install side oil seal.
11. Install differential case assembly.
12. Place side retainer adjusting shims and O-ring on side retainer, and install them in gear carrier.

Tool number: ST33720000

- Align mark on side retainer and gear carrier.

13. Measure ring gear-to-drive pinion backlash with a dial indicator.

Ring gear-to-drive pinion backlash:

0.10 - 0.20 mm (0.0039 - 0.0079 in)

- If backlash is too small, decrease thickness of right shim and increase thickness of left shim by the same amount.
- If backlash is too great, reverse the above procedure.

Never change the total amount of shims as it will change the bearing preload.

14. Check total preload with Tool.

When checking preload, turn drive pinion in both directions several times to set bearing rollers.

Tool number: ST3127S000

Total preload:

1.0 - 1.6 N·m (10 - 16 kg-cm, 8.7 - 13.9 in-lb)

- If preload is too great, add the same amount of shims from each side.
- If preload is too small, remove the same amount of shims to each side.

Never add or remove a different number of shims for each side as it will change ring gear-to-drive pinion backlash.

15. Recheck ring gear-to-drive pinion backlash because an increase or decrease in thickness of shims will cause change of ring gear-to-drive pinion backlash.

Differential Carrier (Cont'd)

16. Check ring gear runout with a dial indicator.

Runout limit: 0.05 mm (0.0020 in)

- If backlash varies excessively in different places, the variance may have resulted from foreign matter caught between the ring gear and the differential case.
- If the backlash varies greatly when the ring gear runout is within the specified range, the hypoid gear set or differential case should be replaced.

17. Check tooth contact.

Refer to ADJUSTMENT.

18. Install rear cover and gasket.

Disassembly and Assembly

1. Loosen screws on differential cases A and B.
2. Separate differential cases A and B.

CAUTION:

Assemble differential case firmly.

Inspection

CONTACT SURFACES

1. Clean the disassembled parts in suitable solvent and blow dry with compressed air.
2. If following surfaces are found to be burred or scratched, smooth with oil stone.
 - Differential case A
 - Differential case B
 - Side gear
 - Pinion mate gear
 - Pinion mate shaft
3. Check viscous coupling for oil leakage. If necessary, replace it with new one.

Adjustment

THRUST WASHER SELECTION

Whenever side gears or pinion mate gears are replaced, select suitable thrust washers as follows:

1. Clean side gears and pinion mate gears using white gasoline.
2. Before assembling gears, apply hypoid gear oil to frictional surfaces.
3. Install the previously removed thrust washer on right side gear. On left side gear, install a suitable thrust washer. Temporarily tighten differential cases using two screws.
4. Position differential assembly so that right side gear is on the upper side. Place a 0.03 mm (0.0012 in) feeler gauge (for example) between right side gear and thrust washer.

Do not place feeler gauge at groove side of differential case.

5. Also place a 0.03 mm (0.0012 in) additional feeler gauge between right side gear and thrust washer so that it is positioned diagonal to (180° apart from) the feeler gauge described previously.
6. Rotate right side gear with a suitable tool attached to splines.
If right side gear cannot be rotated, replace thrust washer used on left side gear with a thinner one.
7. Replace both 0.03 mm (0.0012 in) feeler gauges with 0.10 mm (0.0039 in) gauges. At this point, make sure right side gear does not rotate. If it does, replace thrust washer on left side gear with a thicker one so that right side gear does not rotate.
8. As explained in above example, select suitable thrust washers to ensure that:
 - a) Both side gears rotate. [0.03 mm (0.0012 in) feeler gauges are used in this case.]
 - b) Side gear is held stationary. [0.10 mm (0.0039 in) feeler gauges are used in this case.]
 (Refer to S.D.S.)

PRECAUTIONS AND PREPARATION

Precautions

- When installing each rubber part, final tightening must be carried out under unladen condition* with tires on ground.
*: Fuel, radiator coolant and engine oil full. Spare tire, jack, hand tools and mats in designated positions.
- When removing each suspension part, check wheel alignment and adjust if necessary.
- Use Tool when removing or installing brake tubes.

CHECK AND ADJUSTMENT

Front Axle and Front Suspension Parts

Check front axle and front suspension parts for looseness, cracks, wear or other damage.

- Shake each front wheel to check for excessive play.

- Make sure that cotter pin is inserted.
- Retighten all nuts and bolts to the specified torque.

Tightening torque:

Refer to FRONT SUSPENSION.

- Check strut (shock absorber) for oil leakage or other damage.

- Check suspension ball joint for grease leakage and ball joint dust cover for cracks or other damage.

CHECK AND ADJUSTMENT

Front Axle and Front Suspension Parts (Cont'd)

- Check suspension ball joint end play.
 - a. Jack up front of vehicle and set the stands.
 - b. Clamp dial indicator onto transverse link and place indicator tip on lower edge of brake caliper.
 - c. Make sure front wheels are straight and brake pedal is depressed.
 - d. Place a pry bar between transverse link and inner rim of road wheel.
 - e. While raising and releasing pry bar, observe maximum dial indicator value.

Vertical end play:

0 mm (0 in)

- f. If ball joint movement is beyond specifications, remove and recheck it.

Front Wheel Bearing

- Check that wheel bearings operate smoothly.
- Check axial end play.

Axial end play:

0.05 mm (0.0020 in) or less

- If axial end play is not within specification or wheel bearing does not turn smoothly, replace wheel bearing assembly. Refer to FRONT AXLE — Wheel Hub and Knuckle.

Front Wheel Alignment

Before checking front wheel alignment, be sure to make a preliminary inspection (Unladen*).

*: Fuel, radiator coolant and engine oil full. Spare tire, jack, hand tools and mats in designated positions.

PRELIMINARY INSPECTION

1. Check tires for wear and improper inflation.
2. Check wheel runout.

Wheel runout:

Refer to S.D.S.

3. Check front wheel bearings for looseness.
4. Check front suspension for looseness.
5. Check steering linkage for looseness.
6. Check that front shock absorbers work properly by using the standard bounce test.
7. Check vehicle posture (Unladen).

CHECK AND ADJUSTMENT

Front Wheel Alignment (Cont'd)

CAMBER, CASTER AND KINGPIN INCLINATION

Camber, caster and kingpin inclination are preset at factory and cannot be adjusted.

1. Measure camber, caster and kingpin inclination of both right and left wheels with a suitable alignment gauge.

Camber:

Refer to S.D.S.

Caster:

Refer to S.D.S.

Kingpin inclination:

Refer to S.D.S.

2. If camber, caster and kingpin inclination are not within specification, inspect and replace any damaged or worn front suspension parts.

TOE-IN

1. Draw a base line across the tread.
2. After lowering front of vehicle, move it up and down to eliminate friction, and set steering wheel in straight-ahead position.

3. Measure toe-in.

- Measure distance "A" and "B" at the same height as hub center.

Total toe-in (Unladen):

A - B	1 - 3 mm (0.04 - 0.12 in)
2θ	6' - 18'

4. Adjust toe-in by varying the length of steering tie-rods.
 - a. Loosen lock nuts.
 - b. Adjust toe-in by screwing tie-rods in and out.

CHECK AND ADJUSTMENT

Front Wheel Alignment (Cont'd)

Standard length "L":

Refer to ST section.

- c. Tighten lock nuts to specified torque.

Lock nut tightening torque:

Refer to ST section.

FRONT WHEEL TURNING ANGLE

1. Set wheels in straight-ahead position and then move vehicle forward until front wheels rest on turning radius gauge properly.

2. Rotate steering wheel all the way right and left with a force of 98 to 147 N (10 to 15 kg, 22 to 33 lb) while engine is running at idle and measure turning angle.

Do not hold the steering wheel on full lock for more than 15 seconds.

Wheel turning angle (Full turn):

Refer to S.D.S.

Drive Shaft

Check for grease leakage or other damage.

SFA949A

- ① Drive shaft
- ② Inner grease seal
- ③ Knuckle
- ④ Baffle plate
- ⑤ Wheel bearing assembly
- ⑥ Snap ring

FRONT AXLE — Wheel Hub and Knuckle

Removal

- Remove wheel bearing lock nut while depressing brake pedal.

- Remove brake caliper assembly.
Brake hose does not need to be disconnected from brake caliper. Be careful not to depress brake pedal, or piston will pop out.
Make sure brake hose is not twisted.

- Remove tie-rod ball joint.

- Separate drive shaft from knuckle by slightly tapping it.
Cover boots with waste cloth so as not to damage them when removing drive shaft.

- Remove strut lower mounting bolts.

FRONT AXLE — Wheel Hub and Knuckle

Removal (Cont'd)

- Loosen lower ball joint tightening nut.
- Separate knuckle from lower ball joint stud with Tool.
- Remove knuckle from transverse link.

Installation

- Install knuckle with wheel hub.
- Tighten wheel bearing lock nut.
 τ : 196 - 275 N·m
(20 - 28 kg-m, 145 - 203 ft-lb)
- Check that wheel bearings operate smoothly.

- Check wheel bearing axial end play.
Axial end play:
0.05 mm (0.0020 in) or less

Disassembly

CAUTION:

When removing wheel hub or wheel bearing from knuckle, replace wheel bearing assembly (outer race, inner races and grease seals) with a new one.

WHEEL HUB

Drive out hub with inner race (outside) from knuckle with a suitable tool.

WHEEL BEARING

When replacing wheel bearing, replace wheel bearing assembly (including inner and outer races).

- Remove bearing inner race (outside), then remove outer grease seal.

FRONT AXLE — Wheel Hub and Knuckle

Disassembly (Cont'd)

- Remove inner and outer grease seals from knuckle.

- Remove snap ring.

- Press out bearing outer race.

Inspection

WHEEL HUB AND KNUCKLE

Check wheel hub and knuckle for cracks by using a magnetic exploration or dyeing test.

SNAP RING

Check snap ring for wear or cracks. Replace if necessary.

Assembly

1. Press new wheel bearing assembly into knuckle.

Maximum load P:

29 kN (3 t, 3.3 US ton, 3.0 Imp ton)

CAUTION:

- Do not press inner race of wheel bearing assembly.
 - Do not apply oil or grease to mating surfaces of wheel bearing outer race and knuckle.
2. Install snap ring into groove of knuckle.

FRONT AXLE — Wheel Hub and Knuckle

Assembly (Cont'd)

3. Pack grease seal lip with multi-purpose grease.

4. Install outer grease seal.

5. Install inner grease seal.

6. Press wheel hub into knuckle.

Maximum load P:

29 kN (3 ton, 3.3 US ton, 3.0 Imp ton)

Be careful not to damage grease seal.

7. Check bearing operation.

- a. Add load P with press.

Load P:

34.3 - 49.0 kN

(3.5 - 5.0 ton, 3.9 - 5.5 US ton, 3.44 - 4.92 Imp ton)

FRONT AXLE — Wheel Hub and Knuckle

Assembly (Cont'd)

- b. Spin knuckle several turns in both directions.
- c. Make sure that wheel bearings operate smoothly.

FRONT AXLE — Drive Shaft

Removal

- Remove wheel bearing lock nut.
- Remove brake caliper assembly.

Brake hose need not be disconnected from brake caliper.
Be careful not to depress brake pedal, or piston will pop out.
Do not pull or twist brake hose.

- Remove tie-rod ball joint.
- Separate drive shaft from knuckle by lightly tapping it. If it is hard to remove, use a puller.

When removing drive shaft, cover boots with waste cloth to prevent damage to them.

Refer to FRONT AXLE — Wheel Hub and Knuckle.

1. Remove right drive shaft from transaxle.
— Models without support bearing —

— Models with support bearing —

2. Remove left drive shaft from transaxle.
— For M/T models —

FRONT AXLE — Drive Shaft

Removal (Cont'd)

— For A/T models —

- Remove left drive shaft with a suitable tool.

Be careful not to damage pinion mate shaft and side gear.

A/T models

SFA730

— For 4WD models (SR20DET: Left drive shaft, GA16DS: Right drive shaft) —

SFA150B

Installation

TRANSAXLE SIDE

1. Drive a new oil seal to transaxle. Refer to section MT or AT.
2. Set Tool along the inner circumference of oil seal.

R.H.

SFA482

L.H.

SFA483

3. Insert drive shaft into transaxle. Be sure to properly align the serrations and then withdraw Tool.
4. Push drive shaft, then press-fit circular clip on the drive shaft into circular clip groove of side gear.
5. After its insertion, try to pull the flange out of the slide joint by hand. If it pulls out, the circular clip is not properly meshed with the side gear.

FRONT AXLE — Drive Shaft

Installation (Cont'd)

WHEEL SIDE

- Install drive shaft into knuckle.
- Tighten wheel bearing lock nut. Refer to section Installation in FRONT AXLE — Wheel Hub and Knuckle.

FRONT AXLE — Drive Shaft for 2WD **Components (Cont'd)**

Circular clip:

Make sure circular clip is properly meshed with side gear (transaxle side) and joint assembly (wheel side), and will not come out

Be careful not to damage boots. Use suitable protector of cloth during removal and installation.

Disassembly

TRANSAXLE SIDE (TS70C, TS79C type)

1. Remove boot bands.
2. Put matchmarks on slide joint housing and drive shaft before separating joint assembly.
3. Put matchmarks on spider assembly and drive shaft.

4. Pry off snap ring, then remove spider assembly.

CAUTION:

Do not disassemble spider assembly.

5. Draw out boot.

Cover drive shaft serration with tape to prevent damage to the boot.

TRANSAXLE SIDE (DS86 type)

1. Remove boot bands.
2. Put matchmarks on slide joint housing and inner race, before separating joint assembly.
3. Pry off snap ring "A" with a screwdriver, and pull out slide joint housing.

4. Put matchmarks on inner race and drive shaft.
5. Pry off snap ring "C", then remove ball cage, inner race and balls as a unit.
6. Pry off snap ring "B".
7. Draw out boot.

Cover drive shaft serrations with tape so as not to damage the boot.

WHEEL SIDE (ZF80, ZF90, BF86 type)

CAUTION:

The joint on the wheel side cannot be disassembled.

- Before separating joint assembly, put matchmarks on drive shaft and joint assembly.
- Separate joint assembly with a suitable tool.

Be careful not to damage threads on drive shaft.

- Remove boot bands.

FRONT AXLE — Drive Shaft for 2WD

Disassembly (Cont'd)

SUPPORT BEARING

- Remove dust shield.

- Pry off snap ring.

- Press support bearing assembly out of drive shaft.

- Press support bearing out of retainer.

Inspection

Thoroughly clean all parts in cleaning solvent, and dry with compressed air. Check parts for evidence of deformation or other damage.

DRIVE SHAFT

Replace drive shaft if it is twisted or cracked.

BOOT

Check boot for fatigue, cracks, or wear. Replace boot with new boot bands.

JOINT ASSEMBLY (Transaxle side)

TS70C, TS79C type

- Check spider assembly for bearing, roller and washer damage. Replace spider assembly if necessary.
- Check housing for any damage. Replace housing set and spider assembly, if necessary.

- When replacing only spider assembly, select a new spider assembly from among those listed in table below. Ensure the number stamped on sliding joint is the same as that stamped on new part.

Housing alone cannot be replaced. It must be replaced together with spider assembly.

TS70C

06	39720-61E06

DS86 type

- Replace joint assembly if it is deformed or damaged.

JOINT ASSEMBLY (Wheel side)

Replace joint assembly if it is deformed or damaged.

Inspection (Cont'd)

SUPPORT BEARING

Make sure wheel bearing rolls freely and is free from noise, cracks, pitting or wear.

SUPPORT BEARING BRACKET

Check support bearing bracket for cracks with a magnetic exploration or dyeing test.

Assembly

- After drive shaft has been assembled, ensure that it moves smoothly over its entire range without binding.
- Use **NISSAN GENUINE GREASE** or equivalent after every overhaul.

WHEEL SIDE (ZF80, ZF90, BF86 type)

1. Install boot and new small boot band on drive shaft.

Cover drive shaft serration with tape so as not to damage boot during installation.

2. Set joint assembly onto drive shaft by lightly tapping it. Install joint assembly securely, ensuring marks which were made during disassembly are properly aligned.

3. Pack drive shaft with specified amount of grease.

Specified amount of grease:

ZF80	90 - 100 g (3.17 - 3.53 oz)
ZF90	155 - 175 g (5.47 - 6.17 oz)
BF86	105 - 125 g (3.70 - 4.41 oz)

FRONT AXLE — Drive Shaft for 2WD

Assembly (Cont'd)

4. Make sure that boot is properly installed on the drive shaft groove.
Set boot so that it does not swell and deform when its length is "L₁".

Length "L₁":

ZF80	90.5 - 92.5 mm (3.563 - 3.642 in)
ZF90	96 - 98 mm (3.78 - 3.86 in)
BF86	99.5 - 101.5 mm (3.917 - 3.996 in)

5. Lock new larger and smaller boot bands securely with a suitable tool.

TRANSAXLE SIDE

(TS70C, TS79C type)

1. Install boot and new small boot band on drive shaft.
Cover drive shaft serration with tape to prevent damage to boot during installation.

2. Install spider assembly securely, making sure marks are properly aligned.
 - Press-fit with spider assembly serration chamfer facing shaft.
3. Install new snap ring.

FRONT AXLE — Drive Shaft for 2WD

Assembly (Cont'd)

4. Pack drive shaft with specified amount of grease.

Specified amount of grease:

TS70C 185 - 195 g (6.52 - 6.88 oz)

TS79C 225 - 235 g (7.94 - 8.29 oz)

5. Install slide joint housing.
6. Set boot so that it does not swell and deform when its length is " L_2 ".

Length " L_2 ":

TS70C 95.5 - 97.5 mm (3.760 - 3.839 in)

TS79C 101.5 - 103.5 mm (4.00 - 4.07 in)

Make sure that boot is properly installed on the drive shaft groove.

7. Lock new larger and smaller boot bands securely with a suitable tool.

(DS86 type)

1. Install boot and new small boot band on drive shaft.

Cover drive shaft serration with tape to prevent damage boot during installation.

2. Install new snap ring "B", then securely install ball cage, inner race and balls as a unit, making sure the marks which were made during disassembly are properly aligned.
3. Install new snap ring "C".

FRONT AXLE — Drive Shaft for 2WD

Assembly (Cont'd)

4. Pack drive shaft with specified amount of grease.

Specified amount of grease:

140 - 160 g (4.94 - 5.64 oz)

5. Install slide joint housing, then install new snap ring "A".
6. Make sure that boot is properly installed on the drive shaft groove.

Set boot so that it does not swell and deform when its length is "L₂".

Length "L₂":

97 - 99 mm (3.82 - 3.90 in)

7. Lock new larger and smaller boot bands securely with a suitable tool.

Make sure that boot is properly installed on the drive shaft groove.

5. Lock new larger and smaller boot bands securely with a suitable tool.

Assembly (Cont'd)

TRANSAXLE SIDE (TS82F)

1. Install boot and new small boot band on drive shaft.

Cover drive shaft serration with tape so as not to damage boot during installation.

2. Install spider assembly securely, making sure marks are properly aligned.

- Press-fit with spider assembly serration chamfer facing shaft.

3. Install new snap ring.

4. Pack drive shaft with specified amount of grease.

Specified amount of grease:

185 - 195 g (6.52 - 6.88 oz)

5. Install slide joint housing.

6. Set boot so that it does not swell and deform when its length is "L₂".

Length "L₂": 95 - 97 mm (3.74 - 3.82 in)

Make sure that boot is properly installed on the drive shaft groove.

7. Lock new larger and smaller boot bands securely with a suitable tool.

TRANSAXLE SIDE (DS80, DS90)

1. Install boot and new small boot band on drive shaft.

Cover drive shaft serration with tape so as not to damage boot during installation.

FRONT AXLE — Drive Shaft for 4WD

Assembly (Cont'd)

2. Install new snap ring "B", then securely install ball cage, inner race and balls as a unit, making sure the marks which were made during disassembly are properly aligned.
3. Install new snap ring "C".

4. Pack drive shaft with specified amount of grease.
Specified amount of grease:
DS80 90 - 110 g (3.17 - 3.88 oz)
DS90 165 - 175 g (5.82 - 6.17 oz)
5. Install slide joint housing, then install new snap ring "A".
6. Set boot so that it does not swell and deform when its length is "L₃".
Length "L₃":
DS80 86 - 88 mm (3.39 - 3.46 in)
DS90 97 - 99 mm (3.82 - 3.90 in)

Make sure that boot is properly installed on the drive shaft groove.

7. Lock new larger and smaller boot bands securely with a suitable tool.

FRONT SUSPENSION — Coil Spring and Strut Assembly

Removal and Installation

- Remove strut assembly fixing bolts and nuts (to hoodledge).
Do not remove piston rod lock nut on vehicle.

Disassembly

1. Set strut assembly on vise with Tool, then loosen piston rod lock nut.

Do not remove piston rod lock nut.

2. Compress spring with Tool so that the strut mounting insulator can be turned by hand.

3. Remove piston rod lock nut.

FRONT SUSPENSION — Coil Spring and Strut Assembly

Assembly

- When installing coil spring on strut, it must be positioned as shown in the figure at left.

- When installing spring seat, make sure that it is positioned as shown.

FRONT SUSPENSION — Stabilizer Bar

Removal and Installation

- Remove stabilizer bar.
- When installing stabilizer, make sure that paint mark and clamp face in their correct directions.
- When removing and installing stabilizer bar, fix portion A.
- Install stabilizer bar with ball joint socket properly placed.

FRONT SUSPENSION — Transverse Link and Lower Ball Joint

Removal and Installation

1. Remove wheel bearing lock nut.
2. Remove tie-rod ball joint.
3. Remove strut lower bracket fixing bolts and nuts.
4. Separate drive shaft from knuckle by slightly tapping drive shaft end.

Cover boots with waste cloth so as not to damage them when removing drive shaft.

5. Separate lower ball joint stud from knuckle with Tool. Refer to FRONT AXLE — Wheel Hub and Knuckle.

6. Remove bolts and nuts as shown at left.

Inspection

- Check ball joint for play. If ball stud is worn, play in axial direction is excessive or joint is hard to swing, replace lower ball joint.

Before checking, turn ball joint at least 10 revolutions so that ball joint is properly broken in.

Swinging force "A":

(measuring point: cotter pin hole of ball stud)

7.8 - 57.9 N (0.8 - 5.9 kg, 1.8 - 13.0 lb)

Turning torque "B":

0.5 - 3.4 N·m (5 - 35 kg-cm, 4.3 - 30.4 in-lb)

Vertical end play "C":

0 mm (0 in)

- Check dust cover for damage. Replace it and cover clamp if necessary.

PRECAUTIONS AND PREPARATION

Precautions

- When installing each rubber part, final tightening must be carried out under unladen condition* with tires on ground.
- *: Fuel, radiator coolant and engine oil full. Spare tire, jack, hand tools and mats in designated positions.
- Use Tool when removing or installing brake tubes.
- When removing each suspension part, check wheel alignment and adjust if necessary.
- Do not jack up at the parallel links.

Preparation

SRA350A

Rear Axle and Rear Suspension Parts

Check axle and suspension parts for looseness, wear or damage.

- Shake each rear wheel to see excessive play.

- Retighten all nuts and bolts to the specified torque.
Tightening torque: Refer to **REAR SUSPENSION**.

- Check strut (shock absorber) for oil leakage or other damage.

Rear Wheel Bearing

- Check axial end play.

Axial end play:

0.05 mm (0.0020 in) or less

- Check that wheel bearings operate smoothly.
- Check tightening torque of wheel bearing lock nut.

Ⓜ: 186 - 255 N·m

(19 - 26 kg-m, 137 - 188 ft-lb)

- If there is any axial end play or wheel bearing does not turn smoothly, replace wheel bearing assembly. Refer to **REAR AXLE — Wheel Hub**.

Rear Wheel Alignment

PRELIMINARY INSPECTION

Make following checks. Adjust, repair or replace if necessary.

- Check tires for wear and for improper inflation.
- Check rear wheel bearings for looseness.
- Check wheel runout.

Wheel runout: Refer to S.D.S. in FA section.

- Check that rear strut (shock absorber) works properly.
- Check rear axle and rear suspension parts for looseness.
- Check vehicle posture (Unladen*).

*: Fuel, radiator and engine oil full. Spare tire, jack, hand tools and mats in designated positions.

CAMBER

Camber is preset at factory and cannot be adjusted.

Camber:

B13 models

$-1^{\circ}55'$ to $-0^{\circ}25'$

N14 models

$-1^{\circ}40'$ to $-0^{\circ}10'$

- If the camber is not within specification, inspect and replace any damaged or worn rear suspension parts.

TOE-IN

1. Draw a base line across the tread.

- After lowering rear of vehicle, move it up and down to eliminate friction.

2. Measure toe-in.

- Measure distance "A" and "B" at the same height as hub center.

Total toe-in:

$A - B$	-1 to 3 mm (-0.04 to 0.12 in)
2θ	$-6'$ to $18'$

Rear Wheel Alignment (Cont'd)

3. Loosen adjusting pin fixing nuts.
4. Adjust toe-in by turning adjusting pins.

Toe changes about 2.0 mm (0.079 in) [One side] with each graduation of the adjusting pin.

5. Tighten adjusting pin fixing nuts to the specified torque.

**⚙: 98 - 118 N·m
(10 - 12 kg-m, 72 - 87 ft-lb)**

Removal

CAUTION:

Wheel hub bearing usually does not require maintenance. If any of the following symptoms are noted, replace wheel hub bearing assembly.

- Growling noise is emitted from wheel hub bearing during operation.
- Wheel hub bearing drags or turns roughly when hub is turned with your hand after bearing lock nut is tightened to specified torque.
- If the wheel hub bearing assembly is removed, it must be renewed. The old assembly must not be re-used.

1. Remove brake caliper assembly and rotor.
2. Remove wheel bearing lock nut.

Brake hose does not need to be disconnected from brake caliper.

Be careful not to depress brake pedal, or piston will pop out. Make sure brake hose is not twisted.

Installation

- Install wheel hub bearing.
- Tighten wheel bearing lock nut.
 $\text{Torque: } 186 - 255 \text{ N}\cdot\text{m}$
 $(19 - 26 \text{ kg}\cdot\text{m}, 137 - 188 \text{ ft}\cdot\text{lb})$
- Check that wheel bearings operate smoothly.

- Check wheel bearing axial end play.
Axial end play:
 $0.05 \text{ mm } (0.0020 \text{ in}) \text{ or less}$

When installing each rubber part, final tightening must be carried out under unladen condition* with tires on ground.

Removal and Installation

CAUTION:

Do not jack up at the parallel links or radius rods.

- Remove suspension assembly.
- 1. Remove brake caliper assembly and rotor.
- 2. Remove parallel link fixing bolt, radius rod fixing bolt, stabilizer fixing bolt and stabilizer connecting rod.
- 3. Remove rear seat and finisher. Refer to section BF.
- 4. Remove strut securing nuts (Upper side). Then pull out strut assembly.

Disassembly

1. Set strut assembly in vise with attachment, then loosen piston rod lock nut.

Do not remove piston rod lock nut.

2. Compress spring with Tool so that the strut mounting insulator can be turned by hand.

3. Remove piston rod lock nut.
4. Remove spring, complete with Tool.

Inspection

STRUT ASSEMBLY

- Check for smooth operation through a full stroke, both compression and extension.
- Check for oil leakage occurring on welded or gland packing portions.
- Check piston rod for cracks, deformation or other damage. Replace if necessary.

SPRING RUBBER SEAT AND DUST COVER

Check rubber parts for deterioration or cracks. Replace if necessary.

STRUT MOUNTING INSULATOR

- Check cemented rubber-to-metal portion for melting or cracks.
- Check rubber parts for deterioration.

Inspection (Cont'd)

COIL SPRING

Check for cracks, deformation or other damage.
Replace if necessary.

Assembly

1. Locate upper spring seat as shown.

SPRA358A

SFA508

2. When installing coil spring on strut, there must be 2 identification color marks on the lower side.
3. After placing coil spring in position on lower spring seat tighten lock nut, and release spring compressor gradually.

Removal and Installation

- Remove stabilizer bar.

- When installing stabilizer, it must be positioned as shown.

- Install stabilizer bar with ball joint socket properly placed.

When installing each rubber part, final tightening must be carried out under unladen condition* with tires on ground.

* Fuel, radiator coolant and engine oil full. Spare tire, jack, hand tools and mats in designated positions.

Rear Wheel Alignment

PRELIMINARY INSPECTION

Make following checks. Adjust, repair or replace if necessary.

- Check tires for wear and for improper inflation.
- Check rear wheel bearings for looseness.
- Check wheel runout.

Wheel runout: Refer to S.D.S. in FA section.

- Check that rear strut (shock absorber) works properly.
- Check rear axle and rear suspension parts for looseness.
- Check vehicle posture (Unladen*).

*: Fuel, radiator and engine oil full. Spare tire, jack, hand tools and mats in designated positions.

CAMBER

Camber is preset at factory and cannot be adjusted.

Camber:

–0°55' to 0°35'

- If the camber is not within specification, inspect and replace any damaged or worn rear suspension parts.

TOE-IN

1. Draw a base line across the tread.
- After lowering rear of vehicle, move it up and down to eliminate friction.

2. Measure toe-in.

Rear Axle and Rear Suspension Parts

Check axle and suspension parts for looseness, wear or damage.

- Shake each rear wheel to see excessive play.

SMA525A

SRA351A

- Retighten all nuts and bolts to the specified torque.
Tightening torque: Refer to REAR SUSPENSION.

SRA404A

SMA113

- Check strut (shock absorber) for oil leakage or other damage.

Rear Wheel Bearing

- Check axial end play.
Axial end play:
0.05 mm (0.0020 in) or less
- Check that wheel bearings operate smoothly.
- Check tightening torque of wheel bearing lock nut.
🔧: 196 - 275 N·m
(20 - 28 kg-m, 145 - 203 ft-lb)
- If there is any axial end play or wheel bearing does not turn smoothly, replace wheel bearing assembly. Refer to REAR AXLE — Wheel Hub.

Removal

For drum brake models

- Remove wheel bearing lock nut.
- Disconnect brake hydraulic line and parking brake cable.

CAUTION:

Use Tool when removing or installing brake tubes.

For disc brake models

- Remove wheel bearing lock nut.
- Remove brake caliper assembly and rotor.
- Remove parking brake cable.
- Remove A.B.S. sensor. (Models with A.B.S. only)

Brake hose need not be disconnected from brake caliper. Be careful not to depress brake pedal, or piston will pop out. Make sure brake hose is not twisted.

- Separate drive shaft from knuckle by slightly tapping it. Cover boots with waste cloth so as not to damage them when removing drive shaft.

- Remove nuts and bolts.

Installation

- Install axle housing with wheel hub.
- Tighten wheel bearing lock nut.
 [T]: 196 - 275 N·m (20 - 28 kg-m, 145 - 203 ft-lb)

Installation (Cont'd)

- Check wheel bearing axial end play.
Axial end play: 0.05 mm (0.0020 in) or less

Disassembly

CAUTION:

When removing wheel hub or wheel bearing from knuckle, replace wheel bearing assembly (outer race, inner races and grease seal) with a new one.

WHEEL HUB

- Drive out hub with inner race (Outside) from knuckle with Tool.

WHEEL BEARING

- Drive out bearing inner race (Outside), then remove outer grease seal.

- Drive out bearing inner race (Inside), inner and outer grease seals.

- Remove snap rings.

Disassembly (Cont'd)

- Drive out bearing outer race.

Inspection

WHEEL HUB AND KNUCKLE

- Check wheel hub for cracks by using a magnetic exploration or dyeing test.
- Check rubber bushings for wear or other damage.

If necessary, replace radius rod bushing with a suitable tool.

SNAP RING

Check snap rings for wear or cracks.

Replace if necessary.

Assembly

1. Press new wheel bearing assembly into knuckle.

Maximum load P:

29 kN (3 t, 3.3 US ton, 3.0 Imp ton)

CAUTION:

- Do not press inner race of wheel bearing assembly.
 - Do not apply oil or grease to mating surfaces of wheel bearing outer race and knuckle.
2. Install snap ring into groove of knuckle.

3. Pack grease seal lip with multi-purpose grease.

4. Install outer grease seal.

Assembly (Cont'd)

5. Install inner grease seal.

6. Press wheel hub into knuckle.

Maximum load P:

29 kN (3 ton, 3.3 US ton, 3.0 Imp ton)

Be careful not to damage grease seal.

7. Check bearing operation.

a. Add load P with press.

Load P:

34.3 - 49.0 kN

(3.5 - 5.0 ton, 3.9 - 5.5 US ton, 3.44 - 4.92 Imp ton)

b. Spin knuckle several turns in both directions.

c. Make sure that wheel bearings operate smoothly.

Removal and Installation

- Remove wheel bearing lock nut.
 - Separate drive shaft from knuckle by slightly tapping it.
- Cover boots with cloth so as not to damage them when removing drive shaft.

- Remove parallel link and radius rod fixing bolts.

- Extract drive shaft from final drive gear by prying it with a suitable tool.

CAUTION:

Be careful not to damage oil seal of final drive gear. Make sure that circular clip is properly meshed with side gear and will not come out.

Components

Circular clip:

Make sure circular clip is properly installed with side gear (final drive side) and joint assembly (wheel side), and will not come out.

Drive shaft joint grease:

Use Nissan Genuine Grease or equivalent after every overhaul.

Wheel side (ZF80, ZF90)

Final drive side (TS70C, TS79C)

Be careful not to damage boots. Use suitable protector or cloth during removal and installation.

Disassembly

FINAL DRIVE SIDE (TS70C, TS79C)

1. Remove boot bands.
2. Put matchmarks on slide joint housing and drive shaft before separating joint assembly.
3. Put matchmarks on spider assembly and drive shaft.

Disassembly (Cont'd)

4. Pry off snap ring, then remove spider assembly.

CAUTION:

Do not disassemble spider assembly.

5. Draw out boot.

Cover drive shaft serration with tape so as not to damage the boot.

WHEEL SIDE (ZF80, ZF90)

CAUTION:

The joint on the wheel side cannot be disassembled.

- Before separating joint assembly, put matchmarks on drive shaft and joint assembly.
- Separate joint assembly with a suitable tool.

Be careful not to damage threads on drive shaft.

- Remove boot bands.

Inspection

Thoroughly clean all parts in cleaning solvent, and dry with compressed air. Check parts for evidence of deformation or other damage.

DRIVE SHAFT

Replace drive shaft if it is twisted or cracked.

BOOT

Check boot for fatigue, cracks, or wear. Replace boot with new boot bands.

JOINT ASSEMBLY (Final drive side)

- Check spider assembly for bearing, roller and washer damage. Replace spider assembly if necessary.
- Check housing for any damage. Replace housing set and spider assembly, if necessary.

Inspection (Cont'd)

- When replacing only spider assembly, select a new spider assembly from among those listed in table below. Ensure the number stamped on sliding joint is the same as that stamped on new part.

Housing alone cannot be replaced. It must be replaced together with spider assembly.

JOINT ASSEMBLY (Wheel side)

Replace joint assembly if it is deformed or damaged.

Assembly

- After drive shaft has been assembled, ensure that it moves smoothly over its entire range without binding.
- Use Nissan Genuine Grease or equivalent after every overhaul.

Assembly (Cont'd)

WHEEL SIDE (ZF80, ZF90)

1. Install boot and new small boot band on drive shaft.
Cover drive shaft serration with tape so as not to damage boot during installation.

2. Set joint assembly onto drive shaft by lightly tapping it. Install joint assembly securely, ensuring marks which were made during disassembly are properly aligned.

3. Pack drive shaft with specified amount of grease.

Specified amount of grease:

ZF80: 90 - 100 g (3.17 - 3.53 oz)

ZF90: 160 - 170 g (5.64 - 6.00 oz)

4. Set boot so that it does not swell and deform when its length is "L₁".

Length "L₁":

ZF80: 90.5 - 92.5 mm (3.563 - 3.642 in)

ZF90: 96 - 98 mm (3.78 - 3.86 in)

Make sure that boot is properly installed on the drive shaft groove.

Assembly (Cont'd)

- Lock new larger and smaller boot bands securely with a suitable tool.

SFA472

FINAL DRIVE SIDE (TS70C, TS79C)

- Install boot and new small boot band on drive shaft.

Cover drive shaft serration with tape so as not to damage boot during installation.

SFA800

- Install spider assembly securely, making sure marks are properly aligned.
- Press-fit with spider assembly serration chamfer facing shaft.
- Install new snap ring.

SFA397

- Pack drive shaft with specified amount of grease.

Specified amount of grease:

TS70C: 185 - 195 g (6.52 - 6.88 oz)

TS79C: 225 - 235 g (7.94 - 8.29 oz)

- Install slide joint housing.
- Set boot so that it does not swell and deform when its length is " L_2 ".

Length " L_2 ":

TS70C: 95.5 - 97.5 mm (3.760 - 3.839 in)

TS79C: 101.5 - 103.5 mm (4.00 - 4.07 in)

PRECAUTIONS AND PREPARATION

Precautions

- Use brake fluid "DOT 3".
- Never reuse drained brake fluid.
- Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.
- To clean or wash all parts of master cylinder, disc brake caliper and wheel cylinder, use clean brake fluid.
- Never use mineral oils such as gasoline or kerosene. They will ruin rubber parts of hydraulic system.

- Use Tool when removing and installing brake tube.

WARNING:

- Clean brake pads and shoes with a vacuum dust collector to minimize the hazard of airborne asbestos or other materials.

Preparation

SPECIAL SERVICE TOOLS

Tool number Tool name	Description
GG94310000 Flare nut torque wrench	 Removing and installing each brake piping
KV991V0010 Brake fluid pressure gauge	 Measuring brake fluid pressure

CHECK AND ADJUSTMENT

Checking Brake Fluid Level

- Check fluid level in reservoir tank. It should be between Max. and Min. lines on reservoir tank.
- If fluid level is extremely low, check brake system for leaks.
- When brake warning lamp comes on even when parking brake lever is released, check brake system for leaks.

Checking Brake Line

CAUTION:

If leakage occurs around joints, retighten or, if necessary, replace damaged parts.

1. Check brake lines (tubes and hoses) for cracks, deterioration or other damage. Replace any damaged parts.
2. Check for oil leakage by fully depressing brake pedal while engine is running.

Changing Brake Fluid

CAUTION:

- Refill with new brake fluid "DOT 3".
- Never reuse drained brake fluid.
- Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.

1. Connect a vinyl tube to each air bleeder valve.
2. Drain brake fluid from each air bleeder valve by depressing brake pedal.
3. Refill until new brake fluid comes out of each air bleeder valve.

Use same procedure as in bleeding hydraulic system to refill brake fluid.

Refer to "Bleeding Procedure" in "AIR BLEEDING".

AIR BLEEDING

Bleeding Procedure

CAUTION:

- Carefully monitor brake fluid level at master cylinder during bleeding operation.
- Fill reservoir with new brake fluid "DOT 3". Make sure it is full at all times while bleeding air out of system.
- Place a container under master cylinder to avoid spillage of brake fluid.

1. Connect a transparent vinyl tube to air bleeder valve.
2. Fully depress brake pedal several times.
3. With brake pedal depressed, open air bleeder valve to release air.
4. Close air bleeder valve.
5. Release brake pedal slowly.
6. Repeat steps 2. through 5. until clear brake fluid comes out of air bleeder valve.

- Bleed air in the following order.

Removal

CAUTION:

- Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.
 - All hoses must be free from excessive bending, twisting and pulling.
1. Connect a vinyl tube to air bleeder valve.
 2. Drain brake fluid from each air bleeder valve by depressing brake pedal.
 3. Remove flare nut securing brake tube to hose, then withdraw lock spring.
 4. Cover openings to prevent entrance of dirt whenever disconnecting hydraulic line.

Inspection

Check brake lines (tubes and hoses) for cracks, deterioration or other damage. Replace any damaged parts.

Installation

CAUTION:

- Refill with new brake fluid "DOT 3".
 - Never reuse drained brake fluid.
1. Tighten all flare nuts and connecting bolts.

Specification:

Flare nut

15 - 18 N·m

(1.5 - 1.8 kg-m, 11 - 13 ft-lb)

Connecting bolt

17 - 20 N·m

(1.7 - 2.0 kg-m, 12 - 14 ft-lb)

2. Refill until new brake fluid comes out of each air bleeder valve.
3. Bleed air. Refer to "Bleeding Procedure" in "AIR BLEEDING".

CONTROL VALVE

Proportioning Valve

INSPECTION

CAUTION:

- Carefully monitor brake fluid level at master cylinder.
 - Use new brake fluid "DOT 3".
 - Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on paint areas, wash it away with water immediately.
 - Depress pedal slowly when raising front brake pressure.
 - Check rear brake pressure 2 seconds after front brake pressure reaches specified value.
 - For models with A.B.S. disconnect harness connectors from A.B.S. actuator relay before checking.
1. Connect Tool to air bleeders of front and rear brakes on either L.H. and R.H. side.
 2. Bleed air from the Tool.
 3. Check fluid pressure by depressing brake pedal.

4. Bleed air after disconnecting the Tool. Refer to "Bleeding Procedure" in "AIR BLEEDING".

CONTROL VALVE

Proportioning Valve (Cont'd)

REMOVAL (Separated type)

CAUTION:

- Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.

1. Connect a vinyl tube to air bleeder valve.
2. Drain brake fluid from each air bleeder valve by depressing brake pedal.

3. Loosen flare nut with wooden block placed between proportioning valve and dash panel.
4. Remove proportioning valve mounting bolt, then remove flare nut.

INSTALLATION (Separated type)

CAUTION:

- Refill with new brake fluid "DOT 3".
- Never reuse drained brake fluid.

1. Temporarily fit flare nut to proportioning valve.
2. Tighten proportioning valve mounting bolt, then tighten flare nut with wooden block placed between proportioning valve and dash panel.

Specification:

Flare nut

15 - 18 N·m

(1.5 - 1.8 kg-m, 11 - 13 ft-lb)

3. Refill until new brake fluid comes out of each air bleeder valve.
4. Bleed air. Refer to "Bleeding Procedure" in "AIR BLEEDING".

REMOVAL AND INSTALLATION (Built-in type)

Always replace together with master cylinder as an assembly.

- Refer to "MASTER CYLINDER".

CONTROL VALVE

Twin Load Sensing Valve

SBR803B

When replacing load sensing valve, it should be replaced with rod as an assembly.

CONTROL VALVE

Twin Load Sensing Valve (Cont'd)

INSPECTION

CAUTION:

- Carefully monitor brake fluid level at master cylinder.
- Use new brake fluid "DOT 3".
- Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on paint areas, wash it away with water immediately.
- Depress pedal slowly when raising front brake pressure.
- Check rear brake pressure 2 seconds after front brake pressure reaches specified value.
- For models with A.B.S. disconnect harness connectors from A.B.S. actuator relay before checking.

1. Check length "H" in unladen condition.
"Unladen"

Fuel, radiator coolant and engine oil full. Spare tire, jack, hand tools and mats in designated positions.

Length "H":

SR20DE 38.2 mm (1.504 in) or more

GA16DS 39.0 mm (1.535 in) or more

2. Connect tool to air bleeders of front and rear brakes on either L.H. and R.H. side.
3. Bleed air from Tool.

4. With one person aboard depress brake pedal until master cylinder oil pressure reaches 4,904 kPa (49.0 bar, 50 kg/cm², 711 psi). Hold brake pedal in that position and read rear brake oil pressure on pressure gauge indicator.

Rear brake pressure:

SR20DE

1,667 - 3,138 kPa

(16.7 - 31.4 bar, 17 - 32 kg/cm², 242 - 455 psi)

GA16DS

981 - 1,863 kPa

(9.8 - 18.6 bar, 10 - 19 kg/cm², 142 - 270 psi)

5. Depress brake pedal until master cylinder oil pressure reaches 9,807 kPa (98.1 bar, 100 kg/cm², 1,422 psi). With brake pedal held in that position, read rear brake oil pressure on pressure gauge indicator.

Rear brake pressure:

SR20DE

2,648 - 4,119 kPa

(26.5 - 41.2 bar, 27 - 42 kg/cm², 384 - 597 psi)

GA16DS

1,471 - 2,354 kPa

(14.7 - 23.5 bar, 15 - 24 kg/cm², 213 - 341 psi)

CONTROL VALVE

Twin Load Sensing Valve (Cont'd)

6. If rear brake pressure is out of specifications, adjust rod mounting so that rear brake pressure is within specifications.

Adjusting direction:

- Ⓐ: If rear brake pressure is lower than specifications
- Ⓑ: If rear brake pressure is higher than specifications.

If it is impossible to adjust load sensing valve correctly, it is out of order. Replace load sensing valve assembly.

7. Check length "H" again. For details, refer to step 1. If length "H" is out of specifications, adjust rod mounting again (step 6).

BRAKE PEDAL AND BRACKET

Removal and Installation

Inspection

Check brake pedal for following items.

- Brake pedal bend
- Clevis pin deformation
- Crack of any welded portion
- Crack or deformation of clevis pin stopper

Adjustment

Check brake pedal free height from dash reinforcement panel. Adjust if necessary.

- H: Free height
Refer to S.D.S.
- D: Depressed height
Refer to S.D.S.
Under force of 490 N (50 kg, 110 lb)
with engine running
- A: Pedal free play
Refer to S.D.S.

BRAKE PEDAL AND BRACKET

Adjustment (Cont'd)

1. Loosen lock nut and adjust pedal free height by turning brake booster input rod. Then tighten lock nut.
2. Check pedal free play.

Make sure that stop lamps go off when pedal is released.

3. Check brake pedal's depressed height while engine is running.

If depressed height is below specified value, check brake system for leaks, accumulation of air or any damage to components (master cylinder, wheel cylinder, etc.); then make necessary repairs.

MASTER CYLINDER

Removal

CAUTION:

Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.

1. Connect a vinyl tube to air bleeder valve.
2. Drain brake fluid from each air bleeder valve, depressing brake pedal to empty fluid from master cylinder.
3. Remove brake pipe flare nuts.
4. Remove master cylinder mounting nuts.

Disassembly

1. Bend claws of stopper cap outward.

MASTER CYLINDER

Disassembly (Cont'd)

2. Remove valve stopper while piston is pushed into cylinder. (Models with A.B.S. only)

3. Remove piston assemblies.

If it is difficult to remove secondary piston assembly, gradually apply compressed air through fluid outlet.

4. Draw out reservoir tank.

Inspection

Check for the following items.

Replace any part if damaged.

Master cylinder:

- Pin holes or scratches on inner wall.

Piston:

- Deformation of or scratches on piston cups.

Stopper cap:

- Damage or excessive deformation of claws.

Assembly

1. Insert secondary piston assembly. Then insert primary piston assembly.

- Pay attention to direction of piston cups in figure at left. Also, insert pistons squarely to avoid scratches on cylinder bore.

- Pay attention to alignment of secondary piston slit with valve stopper mounting hole of cylinder body (For models with A.B.S. only).

MASTER CYLINDER

Assembly (Cont'd)

2. Install stopper cap.

Before installing stopper cap, ensure that claws are bent inward.

3. Push reservoir tank seals.

4. Push reservoir tank into master cylinder.

5. Install valve stopper while piston is pushed into cylinder.
(Models with A.B.S. only)

Installation

CAUTION:

- Refill with new brake fluid "DOT 3".
- Never reuse drained brake fluid.

1. Place master cylinder onto brake booster and secure mounting nuts lightly.
2. Fit flare nuts to master cylinder.
3. Tighten mounting nuts.

Specification:

8 - 11 N·m

(0.8 - 1.1 kg-m, 5.8 - 8.0 ft-lb)

4. Tighten flare nuts.

Specification:

15 - 18 N·m

(1.5 - 1.8 kg-m, 11 - 13 ft-lb)

5. Bleed air. Refer to "Bleeding Procedure" in "AIR BLEEDING".

BRAKE BOOSTER

On-vehicle Service

OPERATING CHECK

- Depress brake pedal several times with engine off, and check that there is no change in pedal stroke.
- Depress brake pedal, then start engine. If pedal goes down slightly, operation is normal.

AIRTIGHT CHECK

- Start engine, and stop it after one or two minutes. Depress brake pedal several times slowly. If pedal goes further down the first time and gradually rises after second or third time, booster is airtight.
- Depress brake pedal while engine is running, and stop engine with pedal depressed. If there is no change in pedal stroke after holding pedal down **30 seconds**, brake booster is airtight.

Removal

BRAKE BOOSTER

Removal (Cont'd)

CAUTION:

- Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.
- Be careful not to deform or bend brake pipes, during removal of booster.
- Take care not to damage brake booster mounting bolt thread when installing. Due to the acute angle of installation, the threads can be damaged on the metal surrounding the bulkhead holes.

(For GA16DE engine models)

- It is necessary to remove intake manifold first because space around booster is limited.

Inspection

OUTPUT ROD LENGTH CHECK

1. Supply brake booster with vacuum of -66.7 kPa (-667 mbar , -500 mmHg , -19.69 inHg) using a handy vacuum pump.
2. Check output rod length.

Specified length:

S180 or C180

4.875 - 5.125 mm (0.1919 - 0.2018 in)

M165T, M195T, S205 or C205

10.275 - 10.525 mm (0.4045 - 0.4144 in)

Installation

CAUTION:

- Be careful not to deform or bend brake pipes, during installation of booster.
- Replace clevis pin if damaged.
- Refill with new brake fluid "DOT 3".
- Never reuse drained brake fluid.

1. Before fitting booster, temporarily adjust clevis to dimension shown. (Does not apply to vehicles fitted with A.B.S.)
2. Fit booster, then secure mounting nuts (brake pedal bracket to master cylinder) lightly.
3. Connect brake pedal and booster input rod with clevis pin.
4. Secure mounting nuts.

Specification:

13 - 16 N·m

(1.3 - 1.6 kg-m, 9 - 12 ft-lb)

5. Install master cylinder. Refer to "Installation" in "MASTER CYLINDER".
6. Bleed air. Refer to "Bleeding Procedure" in "AIR BLEEDING".

VACUUM HOSE

Removal and Installation

CAUTION:

When installing vacuum hoses, pay attention to the following points.

- Do not apply any oil or lubricants to vacuum hose and check valve.
- Insert vacuum tube into vacuum hose as shown.

- Install check valve, paying attention to its direction.
TYPE 1

TYPE 2

Inspection

HOSES AND CONNECTORS

Check vacuum lines, connections and check valve for airtightness, improper attachment chafing and deterioration.

VACUUM HOSE

Inspection (Cont'd)

CHECK VALVE

Check vacuum with a vacuum pump.

Connect to booster side	Vacuum should exist.
Connect to engine side	Vacuum should not exist.

FRONT DISC BRAKE

Pad Replacement

WARNING:

Clean brake pads with a vacuum dust collector to minimize the hazard of airborne asbestos or other materials.

CAUTION:

- When cylinder body is open, do not depress brake pedal because piston will pop out.
- Be careful not to damage piston boot or get oil on rotor. Always replace shims when replacing pads.
- If shims are rusted or show peeling of the rubber coat, replace them with new shims.
- It is not necessary to remove connecting bolt except for disassembly or replacement of caliper assembly. In this case, suspend cylinder body with wire so as not to stretch brake hose.

1. Remove master cylinder reservoir cap.
2. Remove pin bolt.

3. Open cylinder body upward. Then remove pad retainers, and inner and outer shims.

Standard pad thickness:

10 mm (0.39 in)

Pad wear limit:

2.0 mm (0.079 in)

Carefully monitor brake fluid level because brake fluid will return to reservoir when pushing back piston.

WARNING:

Clean brake pads with a vacuum dust collector to minimize the hazard of airborne asbestos or other materials.

CAUTION:

Suspend caliper assembly with wire so as not to stretch brake hose.

Remove torque member fixing bolts and connecting bolt.

It is not necessary to remove connecting bolt except for disassembly or replacement of caliper assembly.

Disassembly

1. Remove piston boot retainer with a screwdriver.

WARNING:

Do not place your fingers in front of piston.

CAUTION:

Do not scratch or score cylinder wall.

2. Push out piston with dust seal with compressed air.
3. Remove piston seal with a suitable tool.

FRONT DISC BRAKE

Inspection — Caliper

CYLINDER BODY

- Check inside surface of cylinder for score, rust, wear, damage or presence of foreign materials. If any of the above conditions are observed, replace cylinder body.
- Minor damage from rust or foreign materials may be eliminated by polishing surface with a fine emery paper. Replace cylinder body if necessary.

CAUTION:

Use brake fluid to clean. Never use mineral oil.

PISTON

Check piston for score, rust, wear, damage or presence of foreign materials. Replace if any of the above conditions are observed.

CAUTION:

Piston sliding surface is plated. Do not polish with emery paper even if rust or foreign materials are stuck to sliding surface.

SLIDE PIN, PIN BOLT AND PIN COVER

Check for wear, cracks or other damage. Replace if any of the above conditions are observed.

Inspection — Rotor

RUBBING SURFACE

Check rotor for roughness, cracks or chips.

RUNOUT

1. Secure rotor to wheel hub with two nuts (M12 x 1.25).
2. Check runout using a dial indicator.

Make sure that axial end play is within the specifications before measuring. Refer to section FA.

3. Change relative positions of rotor and wheel hub so that runout is minimized.

Installation

CAUTION:

- Refill with new brake fluid "DOT 3".
 - Never reuse drained brake fluid.
1. Install brake hose to caliper securely.
 2. Install all parts and secure all bolts.
 3. Bleed air. Refer to "Bleeding Procedure" in "AIR BLEEDING".

REAR DRUM BRAKE

Removal

WARNING:

Clean brake lining with a vacuum dust collector to minimize the hazard of airborne asbestos or other materials.

CAUTION:

Make sure parking brake lever is released completely.

REAR DRUM BRAKE

Removal (Cont'd)

1. Release parking brake lever fully, then remove drum.
If drum is hard to remove, the following procedures should be carried out.
 - a. Remove plug. Then shorten adjuster to make clearance between brake shoe and drum as shown.

- b. Tighten the two bolts gradually.

2. After removing retainer, remove spring by rotating shoes.
Be careful not to damage parking brake cable when separating it.
3. Remove adjuster.
4. Disconnect parking brake cable from toggle lever.

REAR DRUM BRAKE

Removal (Cont'd)

5. Remove retainer ring with a suitable tool. Then separate toggle lever and brake shoe.

Inspection — Wheel Cylinder

- Check wheel cylinder for leakage.
- Check for wear, damage and loose conditions. Replace if any such condition exists.

Wheel Cylinder Overhaul

Pay attention so as not to scratch cylinder when installing pistons.

Inspection — Drum

7. Install brake drum.
8. When installing new wheel cylinder or overhauling wheel cylinder, bleed air. Refer to "Bleeding procedure" in "AIR BLEEDING".

REAR DRUM BRAKE

Installation (Cont'd)

— LT23B —

- Install return spring so that paint mark faces downward (adjuster side).

3. Shorten adjuster by rotating it.

CAUTION:

Pay attention to adjuster assembly direction since stamped mark and wheel locations differ for left-hand and right-hand brakes.

Wheel	Screw	Indication mark
Left	Left-hand thread	"R"
Right	Right-hand thread	"L"

4. Connect parking brake cable to toggle lever.
5. Install all parts.

6. Check all parts are installed properly.

Pay attention to direction of adjuster assembly.

7. Install brake drum.
8. When installing new wheel cylinder, bleed air. Refer to "Bleeding procedure" in "AIR BLEEDING".

Pad Replacement

WARNING:

Clean brake pads with a vacuum dust collector to minimize the hazard of airborne asbestos or other materials.

CAUTION:

- When cylinder body is open, do not depress brake pedal because piston will pop out.
- Be careful not to damage piston boot or get oil on rotor. Always replace shims in replacing pads.
- If shims are rusted or show peeling of rubber coat, replace them with new shims.
- It is not necessary to remove connecting bolt except for disassembly or replacement of caliper assembly. In this case, suspend cylinder body with wire so as not to stretch brake hose.

1. Remove master cylinder reservoir cap.
2. Remove brake cable lock spring.
3. Disconnect cable.
4. Remove pin bolt.

Adjustment

Before or after adjustment, pay attention to the following points.

- a. For rear disc brake be sure that toggle lever returns to stopper when parking brake lever is released.
- b. There is no drag when parking brake lever is released.

1. Adjust clearance between shoe and drum/pad and rotor as follows:

— LT23B —

- a. Pull parking brake lever several times until clicking sound does not occur from rear brake.

— OTHERS —

- a. Release parking brake lever and loosen adjusting nut.
 - b. Depress brake pedal fully at least 10 times.
2. Pull control lever 4 - 5 notches. Then adjust control lever by turning adjusting nut.

Number of "A" notches : 1 or less

ANTI-LOCK BRAKING SYSTEM

Purpose

- Excessive braking in any condition (Dry or wet) will adversely affect the normal turning of the vehicle's wheels and they may lock up.
- When the front wheels are locked, a vehicle cannot be controlled by the steering system.
- When the rear wheels are locked, the vehicle will enter a flat spin.

The A.B.S., by the use of electronic and hydraulic components, allows for control of braking force so that locking of the wheels can be avoided in the circumstances described above.

The A.B.S.:

- 1) Ensures proper tracking performance through steering wheel operation.
- 2) Enables obstacles to be avoided through steering wheel operation.
- 3) Ensures vehicle stability by preventing flat spins.

Operation

The A.B.S. is controlled by an electronic control unit (E.C.U.), which receives signals from various sensors relating to vehicle condition, speed, etc.

The hydraulic circuit is controlled by an actuator containing an electric motor, pump and 2 solenoids. The E.C.U. directs the actuator to increase, hold or decrease hydraulic pressure to all or individual wheels. The E.C.U. receives information regarding wheel speed from sensors, mounted one per wheel.

When excessive braking force causes a wheel to lock, the E.C.U. sends a 5 amp current to the actuator to release the locked wheel.

As the wheel unlocks, it can be steered. The E.C.U. senses wheel speed is increasing and re-applies hydraulic pressure. The wheel locks again, is released, steered, braked, and so on. This continuous locking and unlocking of the wheels allows for rapid speed reduction and the vehicle to be steered in the correct manner.

The hydraulic pressure can also be "held" constant by a 2 amp current sent from the E.C.U. to the actuator.

The rear wheels utilize a load-sensing valve to further prevent wheel locking, especially under minimum vehicle load conditions.

However, when the vehicle speed is less than 10 km/h (6MPH), this system does not work.

ANTI-LOCK BRAKING SYSTEM

Operation (Cont'd)

$$\text{SLIP RATIO} = \frac{\text{VEHICLE SPEED} - \text{WHEEL SPEED}}{\text{VEHICLE SPEED}}$$

- The applied brake condition is expressed by a slip ratio, as shown above. If the slip ratio is in the range from 0.15 to 0.3, the wheel has adequate cornering performance, and also minimum stopping distance can be achieved.
- The slip ratio formula indicates the control of wheel speed by the brakes.
The Anti-lock Braking System (A.B.S.) controls brake fluid pressure using the slip ratios and locking condition calculation contained in the A.B.S. control unit.
- To adjust wheel speed so that the optimum slip ratio can be obtained, the A.B.S. must sense wheel speed and vehicle speed through a wheel speed sensor.
If the brake is applied, especially in the locked wheel condition, the vehicle speed differs from the wheel speed.
- After the wheel speed changes from the vehicle speed due to excessive brake force, the A.B.S. calculates vehicle speed when the reduced wheel speed reaches the minimum.

ANTI-LOCK BRAKING SYSTEM

System Components

System Description

SENSOR

The sensor unit consists of a gear-shaped rotor and a sensor element which contains a bar magnet around which a coil is wound. The sensor is installed on the back side of the brake rotor. Sine-wave current is generated by the sensor as the wheel rotates. The frequency and voltage increase(s) as the rotating speed increases.

CONTROL UNIT

The control unit computes the rotating speed of the wheel by the signal current sent from the sensor, and supplies a DC current of about 5 amperes, about 2 amperes, or 0 amperes to the actuator solenoid valve provided for each wheel by changing its internal resistance. It also controls ON-OFF operation of the valve relay and pump relay. If any electrically detectable malfunction should occur in the system, the control unit causes the warning light to light up, and the L.E.D. indicator to flash the number of times which corresponds to the malfunction location. In this condition, the A.B.S. will be deactivated by the control unit, and the vehicle's braking system reverts to normal operation.

ANTI-LOCK BRAKING SYSTEM

System Description (Cont'd)

CONTROL UNIT CONTROL CHART

ANTI-LOCK BRAKING SYSTEM

System Description (Cont'd)

G SENSOR (4WD models only)

Since engine power can be delivered simultaneously to all four wheels, the 4WD model has the following characteristics:

- (A) Ease of synchronous wheel rotation
- (B) High rotational inertia of wheels

The above two characteristics (A) and (B) have a tendency to increase while vehicle is being driven on road surfaces with low frictional coefficients. These characteristics also have a tendency to increase due to the limited slip differential that utilizes viscous coupling, etc.

The following figure shows the effect of characteristics (A) and (B) on the ABS.

In general, 4WD and ABS are made compatible with each other by utilizing the following techniques:

- The ABS does not operate with the center differential locked.
- 4WD is set in the 2WD mode during braking.
- Torque distribution to the front and rear wheels is controlled in response to ABS action.

The G sensor indirectly senses the frictional coefficient of different road surfaces during braking to control the ABS accordingly. In other words, control of the center differential, etc. are not required anymore.

ANTI-LOCK BRAKING SYSTEM

System Description (Cont'd)

ACTUATOR

The actuator consists of solenoid valves, a pump, reservoir (for pressure decreasing). The solenoid valve changes its spool position corresponding to the control unit output amperage: it forms a pressure decreasing circuit at about 5 amperes, a pressure holding circuit at about 2 amperes, and a pressure increasing circuit at 0 amperes. When the pressure decreasing circuit is formed, the brake fluid in the caliper flows into the reservoir and the pressure drops. The pump delivers the fluid to the master cylinder. When the pressure holding circuit is formed, the caliper line is cut off, and the fluid pressure in the caliper is held constant.

ANTI-LOCK BRAKING SYSTEM

Operation of Actuator Hydraulic Circuit

SBR285B

COMPONENT PARTS AND THEIR FUNCTIONS

Solenoid valve

Current flowing through the solenoid controls the anchor position. Thus, the required ports open or close so that brake pressure to the caliper is adjusted properly.

Pump

The pump delivers **brake fluid to the master cylinder to decrease fluid pressure in the caliper**. When the pump shaft's eccentric cam pushes the plunger to the left (as shown in the figure), oil from the reservoir is delivered to the master cylinder via the inlet and outlet ports and the inlet and outlet valves. At this point, the plunger on the right side of the pump is held stationary so that both the inlet and outlet ports as well as the inlet and outlet valves are closed. In this manner, the valve controls suction and discharge.

ANTI-LOCK BRAKING SYSTEM

Operation of Actuator Hydraulic Circuit (Cont'd)

Reservoir

The reservoir temporarily stores brake fluid returning from the calipers as required in order to provide a smooth pressure decrease in the calipers.

Bypass check valve

During brake release, brake fluid returns from the caliper to the master cylinder through this valve without entering the solenoid valve.

ANTI-LOCK BRAKING SYSTEM

Operation of Actuator Hydraulic Circuit (Cont'd)

NORMAL BRAKE OPERATION (A.B.S. is not operating)

Description

Electric current to the solenoid ... 0 [A]

1. Magnetic force is not produced at the solenoid valve so that the anchor is not attracted toward the solenoid.
2. The inlet port is opened and the outlet port is closed.
3. Master cylinder brake fluid pressure is directly transmitted to the caliper (= disc brake) via the inlet port of the solenoid valve.
 - ➡ Since the outlet port of the solenoid valve is closed, brake fluid pressure is not delivered to the reservoir.

ANTI-LOCK BRAKING SYSTEM

Operation of Actuator Hydraulic Circuit (Cont'd)

ANTI-LOCK OPERATION

The following operations are repeated in a very short period of time (during pressure "Hold" and "Decrease"). As a result, each wheel is prevented from locking up.

Operation during pressure "Hold" (Wheels begin to slip)

Description

Electric current to the solenoid ... 2 [A]

1. Magnetic force produced by current "2[A]" attracts the anchor to a position where the anchor and return spring are balanced. (Travel distance is small.)
2. Both inlet and outlet ports are closed.
3. Master cylinder fluid pressure is not delivered to the solenoid valve so that caliper pressure is held.
 - ➡ Caliper fluid pressure is not delivered to the reservoir since the outlet port of the solenoid valve is closed. The bypass check valve is closed due to high master cylinder fluid pressure.

ANTI-LOCK BRAKING SYSTEM

Operation of Actuator Hydraulic Circuit (Cont'd)

Operation during pressure "Decrease" (Wheels slip excessively)

SBR288B

Description

Electric current to the solenoid ... 5 [A]

1. Magnetic force of the solenoid increases to attract the anchor further.
2. The inlet port remains closed and the outlet port opens.
3. Master cylinder fluid pressure does not act on the caliper since the inlet port of the solenoid valve is closed.
4. Caliper pressure is delivered to the reservoir via the outlet port of the solenoid valve so that it decreases.
5. Current "5[A]" to the solenoid is controlled and the pump motor activates at the same time. This has brake fluid (which returns to the reservoir) return to the master cylinder.
6. The damping unit which is built into the master cylinder activates to reduce the high pressure of the brake fluid from being applied to the master cylinder. Therefore, brake pedal "kickback" is prevented.

ANTI-LOCK BRAKING SYSTEM

Operation of Actuator Hydraulic Circuit (Cont'd)

OPERATION DURING BRAKE RELEASE

Description

Electric current to the solenoid ... 0 [A]

Master cylinder fluid pressure decreases so that the bypass valve opens. This allows caliper fluid pressure to return to the master cylinder.

ANTI-LOCK BRAKING SYSTEM

Operation of Damping Unit Hydraulic Circuit

CONSTRUCTION OF DAMPING UNIT (Built into master cylinder)

INCREASE OPERATION

Description

1. When the brake pedal is depressed, the master cylinder produces pressure on the brake fluid.
2. This pressure is applied to the piston and the poppet of the damping unit so that the passage between the poppet and the piston is opened.
3. The brake fluid pressure is applied to the actuator.

ANTI-LOCK BRAKING SYSTEM

Operation of Damping Unit Hydraulic Circuit (Cont'd)

DAMPING OPERATION (During decreasing operation of actuator)

Description

1. While the brake pedal is being depressed, the master cylinder and actuator produce fluid pressure. Because of the application of these pressures to the poppet and the piston respectively, they are positioned as shown.
2. The passage between the poppet and the piston is very small so that it works as an orifice. Therefore, brake pedal "kickback" is prevented.

RELEASING OPERATION (Brake pedal release)

Description

1. The fluid pressure of the actuator side is much higher than the pressure of the master cylinder side. Therefore, the piston moves to the body end as shown.
2. The brake fluid is returned through the passage between the piston and the poppet.

Always replace G sensor if bumped or dropped. Otherwise, performance characteristics of G sensor will be changed, which in turn changes ABS control performance characteristics.

Removal

ACTUATOR (L.H.D. models)

1. Disconnect battery cable.
2. Drain brake fluid. Refer to "Changing Brake Fluid" in "CHECK AND ADJUSTMENT".
3. Drain power steering fluid. Refer to section ST.
4. Discharge air conditioner refrigerant. Refer to section HA.

5. Disconnect power steering fluid pipe and hose.
6. Disconnect all connectors from actuator relay bracket.

7. Remove mounting nut for relay bracket.
8. Remove mounting bolt for relay bracket. (This bolt is located just under the relay.)
9. Remove actuator relay box with bracket.
10. Remove air conditioner tubes.

ANTI-LOCK BRAKING SYSTEM

Removal (Cont'd)

11. Disconnect top two brake pipes from actuator. (Pipes from master cylinder to actuator)

It is not necessary to remove these pipes.

12. Remove the other two brake pipes. (Pipes from actuator to DP valve)

13. Remove/loosen mounting nuts between actuator and bracket.

14. Remove actuator grounding bolt.

15. Draw out actuator as shown.

ACTUATOR (R.H.D.)

1. Disconnect battery cable.
2. Drain brake fluid. Refer to "Changing Brake Fluid" in "CHECK AND ADJUSTMENT".
3. Discharge air conditioner refrigerant. Refer to section HA. Then, remove air conditioner tubes.
4. Disconnect connector from actuator relay.
5. Remove grounding cable from actuator.
6. Remove/loosen actuator mounting nuts and draw out actuator.

Installation

CAUTION:

After installation, pay attention to the following points.

- Refill brake fluid and bleed air. Refer to "CHECK AND ADJUSTMENT" and "AIR BLEEDING" respectively.
- Charge air conditioner refrigerant. Refer to section HA.
- For L.H.D. models, refill power steering fluid. Refer to section ST.

- Installation procedure is basically the reverse order of removal.
- For L.H.D. models, it is recommended to install relay bracket first. Then install actuator relay box.

- For R.H.D. models, tighten ground cable nut to specified torque to prevent poor grounding or damage to bolt.

How to Perform Trouble Diagnoses for Quick and Accurate Repair

INTRODUCTION

The A.B.S. system has an electronic control unit to control major functions. The control unit accepts input signals from sensors and instantly drives actuators. It is essential that both kinds of signals are proper and stable. At the same time, it is important that there are no conventional problems such as air leaks in the booster or lines, lack of brake fluid, or other problems with brake system.

It is much more difficult to diagnose a problem that occurs intermittently rather than continuously. Most intermittent problems are caused by poor electric connections or faulty wiring. In this case, careful checking of suspicious circuits may help prevent the replacement of good parts.

A visual check only may not find the cause of the problems, so a road test should be carried out.

Before undertaking actual checks, take just a few minutes to talk with a customer who approaches with a A.B.S. complaint. The customer is a very good source of information on such problems; especially intermittent ones. Through the talks with the customer, find out what symptoms are present and under what conditions they occur.

Start your diagnosis by looking for "conventional" problems first. This is one of the best ways to troubleshoot brake problems on an A.B.S. controlled vehicle.

DIAGNOSTIC WORKSHEET

There are many kinds of operating conditions that lead to customer complaints, even if the system is normal.

A good grasp of such conditions can make trouble-shooting faster and more accurate.

In general, feelings for a problem depend on each customer's information. It is therefore important to fully understand the symptoms or under what conditions a customer complains.

Make good use of a diagnostic worksheet such as the one shown below in order to utilize all the complaints for trouble-shooting.

Worksheet sample

Customer name MR/MS		Model & Year			VIN		
Engine #		Trans			Mileage		
Incident Date		Manuf. Date			In Service Date		
Symptoms	☐ Pedal vibration and noise	☐ Warning activates	☐ Long stop-ping distance	☐ Unexpected pedal action	☐ A.B.S. doesn't work	☐ A B S works but warning ac-tivates	☐ A B S works fre-quently
Engine conditions		☐ When starting ☐ After starting ☐ Engine speed: 5,000 rpm or more					
Road conditions		☐ Low friction road (☐ Snow ☐ Gravel ☐ Other) ☐ Protrusion					
Driving conditions		☐ High speed cornering ☐ Vehicle speed: Greater than 10 km/h (6 MPH) ☐ Vehicle speed: 10 km/h (6 MPH) or less ☐ Vehicle is stopped					
Applying brake conditions		☐ Suddenly ☐ Gradually					
Other conditions		☐ Operation of electrical equipment ☐ Large pedal stroke ☐ Operation of clutch

TROUBLE DIAGNOSES

Preliminary Check

Check brake fluid level in reservoir tank.

N.G. → Fill up brake fluid.

O.K. →

Check brake system.
Refer to CHECK AND ADJUSTMENT.

O.K. →

Check brake booster operation and airtightness.
Refer to "Inspection" of BRAKE BOOSTER.

Repair or replace booster system. ← N.G.

O.K. →

Check brake pads and rotor.
Refer to "Inspection" of FRONT and REAR DISC BRAKE.

N.G. → Replace malfunctioning parts.

TROUBLE DIAGNOSES

Self-diagnosis

CHECKING THE NUMBER OF L.E.D. FLASHES

When a problem occurs in the A.B.S., the warning light on the instrument panel comes on. As shown in the Table, the control unit performs self-diagnosis.

To obtain satisfactory self-diagnosing results, the vehicle must be driven above 30 km/h (19 MPH) for at least one minute before the self-diagnosis is performed. After the vehicle is stopped, the number of L.E.D. flashes is counted while the engine is running.

The L.E.D. is located on the control unit, identifying a malfunctioning part or unit by the number of flashes. Both the warning light and the L.E.D. persistently activate, even after a malfunctioning part or unit has been repaired, unless the ignition switch is turned "OFF". After repairs, turn the ignition switch "OFF". Then start the engine and drive the vehicle over 30 km/h (19 MPH) for at least one minute to ensure that the malfunctioning part or unit has been repaired properly.

If more than two circuits malfunction at the same time, the L.E.D. will flash to indicate one of the malfunctioning circuits. After the circuit has been repaired, the L.E.D. will then flash to indicate that the other circuit is malfunctioning.

No. of L.E.D. flashes	Malfunctioning parts or circuit	Diagnostic Procedure
1	Left front actuator solenoid circuit	8
2	Right front actuator solenoid circuit	8
3	Both actuator solenoid circuits	8
5	Left front wheel sensor circuit	9
6	Right front wheel sensor circuit	9
7	Right rear wheel sensor circuit	9
8	Left rear wheel sensor circuit	9
9	Motor and motor relay	10
10	Solenoid valve relay	11
11	G sensor circuit	12
15	Sensor rotor	13
*16	Control unit	14

Example

Improper operation of left front wheel sensor circuit

SBR745B

* Turn off the engine, and start it again by slowly turning the ignition key (quickly doing so may cause the ABS warning light to stay on when there is nothing wrong). If the light stays on, carry out the diagnostic procedure.

TROUBLE DIAGNOSES

Diagnostic Procedure 1

SYMPTOM: Pedal vibration and noise

Refer to worksheet result.

Check whether the symptom appears only when brake is applied suddenly.

Yes

When brake is suddenly applied, A.B.S. works and produces pedal vibration or noise.

No

Check whether the symptom appears only when engine is started.

Yes

Carry out self-diagnosis (See page BR-79.)

No

Check whether the symptom appears only when the vehicle speed is within 10 km/h (6 MPH) after starting engine.

Yes

Check whether the symptom disappears within 5 seconds.

No

Yes

A

A.B.S. may sometimes operate when load is high and voltage is low due to insufficient alternator output.

No

Check whether the symptom appears while the vehicle is being driven.

No

A

Yes

Check whether the symptom appears when brake is applied gradually.

No

(Appears when brake is not applied.)

Check if there are any conditions, among those listed below, when symptom appears.

- Shifting
- Operating clutch
- Passing over bumps/potholes

No

Yes

A

Under these conditions individual wheel speed can change suddenly. This may sometimes cause the A.B.S. to operate.

Diagnostic Procedure 9

WHEEL SPEED SENSOR (LED flashing number 5 - 8)

INSPECTION START
Remove battery negative terminal connector.

A

CHECK SPEED SENSOR RESISTANCE. Check resistance between control unit connector (vehicle side) terminals as shown.

Flashing number 5 (Fr. LH): 2WD
④ and ⑤
4WD
④ and ②②

Flashing number 6 (Fr. RH): ①① and ②①

Flashing number 7 (Rr. RH): ②④ and ②⑥

Flashing number 8 (Rr. LH): ⑧ and ⑨

Resistance: 0.8 - 1.3 kΩ

B

Check resistance for sensor.
Resistance: 0.8 - 1.3 kΩ

Repair harness between sensor connector and control unit connector.

Note

WHEEL SENSOR MECHANICAL CHECK

Check for inflation pressure, wear and size of each tire.

Note

Adjust tire pressure or replace tire(s).

Note

Check wheel bearing axial end play. Refer to FA or RA section ("Front/Rear Wheel Bearing", "ON-VEHICLE SERVICE").

Note

Follow the direction in FA or RA section ("Front/Rear Wheel Bearing", "ON-VEHICLE SERVICE").

C

Note

Check clearance between sensor and rotor.
Clearance: 0.1 - 1.1 mm (0.004 - 0.043 in)

Note

Clean sensor fixing portion, or replace sensor.

Note

Check sensor rotor for teeth damage.

Note

Replace sensor rotor (with drive shaft, wheel hub).

Replace control module.

Note: Wheel position should be distinguished by code No.

Check G sensor. Refer to "G SENSOR" in "Electrical Components Inspection".
(See page BR-99.)

N.G. → Replace G sensor.

A

Check voltage between G sensor connector terminal ① and ground.
Battery voltage should exist.

N.G. → Repair harness between G sensor connector terminal ① and battery. For details, refer to "Power Supply Routing" in section EL.

B

- Disconnect harness connector from control unit.
- Check continuity between control unit connector terminal ⑩ and G sensor connector terminal ②.
Continuity should exist.

PRECAUTIONS

- The power steering gear and oil pump should be disassembled only when repairing an "oil leak". they should not be disassembled to repair any other steering defect, steering noise, etc.
- Before disassembly, thoroughly clean the outside of the unit.
- Disassembly should be done in a clean work area. It is important to prevent the internal parts from becoming contaminated by dirt or other foreign matter.
- When disassembling parts, be sure to place them in order in a parts rack so they can be put back in the unit in their proper positions.
- Use a nylon cloth or paper towel for wiping parts clean. Common shop rags can leave lint that might interfere with the operation.
- All parts should be carefully cleaned with a general purpose, non-flammable solvent before inspection or reassembly.
- Before assembly, apply a coat of recommended A.T.F.* to hydraulic parts. Vaseline may be applied to O-rings and seals. Do not use any grease.
- Gaskets, seals and O-rings should be replaced. Care should be taken to avoid damaging O-rings, seals and gaskets when assembling. It is also very important to perform functional tests whenever it is designated.

ON-VEHICLE INSPECTION

Checking Steering Wheel Play

1. With wheels in a straight-ahead position, check steering wheel play.
Steering wheel play:
35 mm (1.38 in) or less
2. If it is not within specification, check steering gear assembly when front suspension and axle, steering gear assembly and steering column are mounted correctly.

Checking Neutral Position on Steering Wheel

Pre-checking

- Make sure that wheel alignment is correct.
Wheel alignment:
Refer to section FA for S.D.S.
- Verify that the steering gear is centered before removing the steering wheel.

Checking

1. Check that the steering wheel is in the neutral position when driving straight ahead.
2. If it is not in the neutral position, remove the steering wheel and reinstall it correctly.
3. If the neutral position is between two serrated teeth, loosen tie-rod lock nut and move tie-rod in the opposite direction by the same amount on both left and right sides to compensate for error in the neutral position.

Front Wheel Turning Angle

1. Rotate steering wheel all the way right and left; measure turning angle.
Turning angle of full turns:
Refer to section FA for S.D.S.
2. If it is not within specification, check rack stroke.
Rack stroke "L":
Refer to S.D.S.

Checking Gear Housing Movement

1. Check the movement of steering gear housing during stationary steering on a dry paved surface.
 - Apply a force of 49 N (5 kg, 11 lb) to steering wheel to check the gear housing movement.
Turn off ignition key while checking.
Movement of gear housing:
 ± 2 mm (± 0.08 in) or less
2. If movement exceeds the limit, replace mount insulator after confirming proper installation of gear housing clamps.

ON-VEHICLE INSPECTION

Checking and Adjusting Drive Belts

Refer to section MA for Drive Belt Inspection.

Checking Fluid Level

Check fluid level.

Fluid level should be checked using "HOT" range on dipstick at fluid temperatures of 50 to 80°C (122 to 176°F) or using "COLD" range on dipstick at fluid temperatures of 0 to 30°C (32 to 86°F).

CAUTION:

- Do not overfill.
- Recommended fluid is Automatic Transmission Fluid "DEXRON™" type.

Checking Fluid Leakage

Check the lines for improper attachment and for leaks, cracks, damage, loose connections, chafing or deterioration.

1. Run engine between idle speed and 1,000 rpm.

Make sure temperature of fluid in oil tank rises to 60 to 80°C (140 to 176°F).

2. Turn steering wheel right-to-left several times.
3. Hold steering wheel at each "lock" position for five seconds and carefully check for fluid leakage.

CAUTION:

Do not hold the steering wheel in a locked position for more than 15 seconds.

4. If fluid leakage at connectors is noticed, loosen flare nut and then retighten.

Do not overtighten connector as this can damage O-ring, washer and connector.

Bleeding Hydraulic System

1. Raise front end of vehicle until wheels are clear of the ground.
2. Add fluid into oil tank to specified level. Meanwhile quickly turn steering wheel fully to right and left and lightly touch steering stoppers.
Repeat steering wheel operation until fluid level no longer decreases.
3. Start engine.
Repeat step 2 above.

ON-VEHICLE INSPECTION

Bleeding Hydraulic System (Cont'd)

- Incomplete air bleeding will cause the following to occur.
When this happens, bleed air again.
 - a. Generation of air bubbles in reservoir tank
 - b. Generation of clicking noise in oil pump
 - c. Excessive buzzing in oil pump

While the vehicle is stationary or while moving the steering wheel slowly, fluid noise may occur in the valve or oil pump. This noise is inherent in this steering system, and it will not affect performance or durability of the system.

Checking Steering Wheel Turning Force

1. Park vehicle on a level, dry surface and set parking brake.
2. Start engine.
3. Bring power steering fluid up to adequate operating temperature. [Make sure temperature of fluid is approximately 60 to 80°C (140 to 176°F).]

Tires need to be inflated to normal pressure.

4. Check steering wheel turning force when steering wheel has been turned 360° from the neutral position.

Steering wheel turning force:

39 N (4 kg, 9 lb) or less

5. If steering wheel turning force is out of specifications, check rack sliding force to detect condition of steering gear assembly.
 - a. Disconnect steering column lower joint and knuckle arms from the gear.
 - b. Start and run engine at idle to make sure steering fluid has reached normal operating temperature.
 - c. While pulling tie-rod slowly in the ± 11.5 mm (± 0.453 in) range from the neutral position, make sure rack sliding force is within specification.

Average rack sliding force:

Less than 226 N (23 kg, 51 lb)

- d. Check sliding force outside above range.

Maximum rack sliding force:

Not more than 39 N (4 kg, 9 lb) beyond above value

6. If rack sliding force is not within specification, overhaul steering gear assembly.

Checking Hydraulic System

Before starting, check belt tension, driving pulley and tire pressure.

1. Set Tool. Open shut-off valve. Then bleed air. (See "Bleeding Hydraulic System".)
2. Run engine.

Make sure temperature of fluid in tank rises to 60 to 80°C (140 to 176°F).

WARNING:

Warm up engine with shut-off valve fully opened. If engine is started with shut-off valve closed, oil pressure in oil pump will increase to relief pressure, resulting in an abnormal rise in oil temperature.

3. Check pressure with steering wheel fully turned to left and right positions with engine idling at 1,000 rpm.

CAUTION:

Do not hold the steering wheel in a locked position for more than 15 seconds.

Oil pump maximum standard pressure:

Except CD17 engine

7,649 - 8,238 kPa

(76.5 - 82.4 bar, 78 - 84 kg/cm², 1,109 - 1,194 psi)

CD17 engine

6,669 - 7,257 kPa

(66.7 - 72.6 bar, 68 - 74 kg/cm², 967 - 1,052 psi)

4. If oil pressure is below the standard pressure, slowly close shut-off valve and check pressure.
 - When pressure reaches standard pressure, gear is damaged.
 - ⊗ When pressure remains below standard pressure, pump is damaged.

CAUTION:

Do not close shut-off valve for more than 15 seconds.

5. If oil pressure is higher than standard pressure, check oil pump flow control valve.
6. After checking hydraulic system, remove Tool and add fluid as necessary, then completely bleed air out of system.

STEERING WHEEL AND STEERING COLUMN

- ① Column cover
- ② Steering column assembly
- ③ Combination switch
- ④ Steering wheel
- ⑤ Horn pad

Removal

STEERING WHEEL

1. Remove horn pad.

— Two spoke type —

- Horn pad is installed using pawls (plastic) and clamps. To remove horn pad, pry pawls by hand and push clamps with a standard screwdriver inserted between pad and steering wheel.

STEERING WHEEL AND STEERING COLUMN

Removal (Cont'd)

— Three spoke type —

- Horn pad is installed using three clamps. To remove horn pad, insert a standard screwdriver into hole on back of lower spoke and pry clamps up.

— Four spoke type —

- Insert a crosshead screwdriver into hole on lower side of spoke and remove clamps. Lift horn pad off by hand.

2. Remove steering wheel with Tool.

Installation

STEERING WHEEL

When installing steering wheel, apply multi-purpose grease to entire surface of turn signal cancel pin (both portions) and also to horn contact slip ring.

STEERING WHEEL AND STEERING COLUMN

Installation (Cont'd)

STEERING COLUMN

- When installing steering column, fingertighten all lower bracket and clamp retaining bolts; then tighten them securely. Do not apply undue stress to steering column.
- When attaching coupling joint, be sure tightening bolt faces cutout portion.

CAUTION:

After installing steering column, turn steering wheel to make sure it moves smoothly and that the number of turns from the straight forward position to left and right locks are equal. Be sure that the steering wheel is in a neutral position when driving straight ahead.

STEERING WHEEL AND STEERING COLUMN

Disassembly and Assembly (Cont'd)

- Remove combination switch.

- Ensure that rounded surface of snap ring faces toward bearing when snap ring is installed.
- Install snap ring on upper shaft with a suitable tool.

- Steering lock
- a. Break self-shear type screws with a drill or other appropriate tool.

- b. Install self-shear type screws and then cut off self-shear type screw heads.

Tilt mechanism

- After installing steering column, check tilt mechanism operation.

STEERING WHEEL AND STEERING COLUMN

Inspection

- When steering wheel can not be rotated smoothly, check the steering column for the following matters and replace damaged parts.
 - a. Check column bearings for damage or unevenness. Lubricate with recommended multi-purpose grease or replace steering column as an assembly, if necessary.
 - b. Check jacket tube for deformation or breakage. Replace if necessary.
- When the vehicle is involved in a light collision, check column length "L". If it is not within specifications, replace steering column as an assembly.

Column length "L":

536.2 - 537.8 mm (21.11 - 21.17 in)

- ① Hole cover
- ② Lower joint
- ③ Manual steering gear assembly
- ④ Steering gear mounting clamp
- ⑤ Rack mounting insulator
- ⑥ Cotter pin

- Detach tie-rod ball studs from knuckle arms with Tool.

MANUAL STEERING GEAR AND LINKAGE (Model R24S and R24N)

Removal and Installation (Cont'd)

- Initially, tighten nut on tie-rod outer socket and knuckle arm to 29 to 39 N·m (3 to 4 kg-m, 22 to 29 ft-lb).
- Tighten nut further to align nut groove with the first pin hole so cotter pin can be installed.

CAUTION:

Tightening torque must not exceed 49 N·m (5 kg-m, 36 ft-lb).

Inspection

BOOT

Check condition of boot. If it is cracked excessively, replace it.

RACK

Thoroughly examine rack gear. If rack gear is damaged, cracked or worn, replace.

PINION ASSEMBLY

- Thoroughly examine pinion gear. If pinion gear is damaged, cracked or worn, replace.
- Inspect bearings to see that they roll freely and are free from cracked, pitted, or worn balls, rollers and races. Replace if necessary.

TIE-ROD OUTER AND INNER SOCKET

- Check ball joint for swinging force.
Tie-rod outer ball joint:
At cotter pin hole
6.9 - 64.7 N (0.7 - 6.6 kg, 1.5 - 14.6 lb)
Tie-rod inner ball joint:
14.7 - 21.6 N (1.5 - 2.2 kg, 3.3 - 4.9 lb)

- Check ball joint for rotating torque.
Tie-rod outer ball joint:
0.3 - 2.9 N·m
(3 - 30 kg-cm, 2.6 - 26.0 in-lb)

- Check ball joint for axial end play.
Tie-rod outer ball joint:
Less than 0.5 mm (0.020 in)
Tie-rod inner ball joint:
0 mm (0 in)

MANUAL STEERING GEAR AND LINKAGE (Model R24S and R24N)

Inspection (Cont'd)

- Check condition of dust cover. If it is cracked excessively, replace it.

Assembly and Adjustment

STEERING GEAR

1. Insert rack gear from gear housing side.
2. Set rack gear in neutral position.

3. Insert pinion assembly, then set guide chip at neutral position as shown in figure. Pinion rack gear should be held in place.

4. Install rear cover with Tool and secure with lock nut.

Tool number: KV48102000

- Before installing rear cover, apply locking sealant to threaded areas. Do not allow sealant to get into pinion bearing.
- Apply a coat of multi-purpose grease to sealing lips of dust seal.

CAUTION:

Wrap cellophane tape around pinion gear end when installing dust seal.

5. Insert retainer, spring, plain washer and wave washer. Then, install adjusting screw.
- Apply a coat of locking sealant to threaded areas of retainer cover.

MANUAL STEERING GEAR AND LINKAGE (Model R24S and R24N)

Assembly and Adjustment (Cont'd)

6. Adjust pinion rotating torque as follows:
 - a. Set gears to Neutral position.
 - b. Loosen lock nut.
 - c. Tighten adjusting screw two times to a torque of 2.9 N·m (30 kg-cm, 26 in-lb).
 - d. Loosen adjusting screw and retighten it to a torque of 0.2 N·m (2 kg-cm, 1.7 in-lb).
 - e. Rotate pinion to move rack back and forth two times, and return it to Neutral position.

- f. Slowly rotate the pinion and measure rotating torque in the $\pm 180^\circ$ range from Neutral position. Find the position where the rotating torque is at its maximum.

- g. Loosen adjusting screw at the position where the rotating torque is at its maximum.
- h. Tighten adjusting screw to a torque of 2.9 N·m (30 kg-cm, 26 in-lb). Then back it off by 50° to 70° .
- i. Prevent adjusting nut from rotating and tighten lock nut to specified torque 39 to 59 N·m (4 to 6 kg-m, 29 to 43 ft-lb) holding adjusting screw in place.

- j. While slowly rotating pinion in the $\pm 100^\circ$ range from Neutral position, make sure its rotating torque is within the specifications.

Average value in the $\pm 100^\circ$ range from neutral position:

**0.7 - 1.2 N·m
(7 - 12 kg-cm, 6.1 - 10.4 in-lb)**

Max. allowable fluctuation within $\pm 100^\circ$ range from neutral position:

Below 0.3 N·m (3 kg-cm, 2.6 in-lb)

Max. allowable fluctuation within $\pm 500^\circ$ range from neutral position:

Below 0.5 N·m (5 kg-cm, 4.3 in-lb)

- k. If pinion rotating torque is not within the specifications, readjust.

If pinion rotating torque is outside the specifications after adjustment has been made, replace retaining spring.

MANUAL STEERING GEAR AND LINKAGE (Model R24S and R24N)

Assembly and Adjustment (Cont'd)

7. Install new lock plate.
 - Attach lock plate ② to side rod inner socket ①.
 - Apply locking sealant to inner socket threads ③.
 - Screw inner socket into rack ④ and tighten to specified torque.
 - Clinch two places of lock plate at rack's groove.

CAUTION:

To prevent scratching the boot, remove burrs from lock plate.

TIE-ROD AND BOOT

1. Install boot on tie-rod inner socket.
2. Apply locking sealant to threaded portion of inner socket and install tie-rod inner socket to rack end together with new lock plate.
3. Install lock nut and outer socket to inner socket. Adjust tie-rod length "L" and tighten lock nut.

Tie-rod length "L": Refer to S.D.S.

Screwed length "l": 32 mm (1.26 in) or more

4. Measure rack stroke.
Measure length "l":
Refer to S.D.S.

5. Install boot to gear housing.
Apply sealant between boot and gear housing.

6. Install boot clamps.
 - To install, wrap boot clamp around boot groove twice. Tighten clamp by twisting rings at both ends four or four and one-half turns with screwdriver while pulling with a force of approx. 98 N (10 kg, 22 lb).

MANUAL STEERING GEAR AND LINKAGE (Model R24S and R24N)

Assembly and Adjustment (Cont'd)

- Install boot clamp so that it is to the rear of the vehicle when gear housing is attached to the body. (This will avoid interference with other parts.)

- After twisting boot clamp four or four and one-half turns, bend twisted end diagonally so it does not contact boot.

POWER STEERING GEAR AND LINKAGE (Model PR24SC)

Removal and Installation

① Hole cover

② Gear and linkage assembly

③ Cotter pin

④ Rack mounting insulator

⑤ Gear housing mounting bracket

- On N14 GTI-R left-hand drive models; engine must be removed (in advance.)

- Detach tie-rod outer sockets from knuckle arms with Tool.

POWER STEERING GEAR AND LINKAGE (Model PR24SC)

Removal and Installation (Cont'd)

- Install pipe connector.
- Observe specified tightening torque when tightening high-pressure and low-pressure pipe connectors. Excessive tightening will damage threads of connector or O-ring.
- The O-ring in low-pressure pipe connector is larger than that in high-pressure connector. Take care to install the proper O-ring.

Connector tightening torque:

Low-pressure side "1"

27 - 39 N·m (2.8 - 4.0 kg-m, 20 - 29 ft-lb)

High-pressure side "2"

15 - 25 N·m (1.5 - 2.5 kg-m, 11 - 18 ft-lb)

- Initially, tighten nut on tie-rod outer socket and knuckle arm to 29 to 39 N·m (3 to 4 kg-m, 22 to 29 ft-lb). Then tighten further to align nut groove with first pin hole so that cotter pin can be installed.

CAUTION:

Tightening torque must not exceed 49 N·m (5 kg-m, 36 ft-lb).

- Before removing lower joint from gear, set gear in neutral (wheels in straight-ahead position). After removing lower joint, put matching mark on pinion shaft and pinion housing to record neutral position of gear.
- To install, set left and right dust boots to equal deflection, and attach lower joint by aligning matching marks of pinion shaft and pinion housing.

- Tighten gear housing mounting bracket bolts in the order shown.

POWER STEERING GEAR AND LINKAGE (Model PR24SC)

Disassembly

1. Prior to disassembling, measure pinion rotating torque. Record the pinion rotating torque as a reference.
 - Before measuring, disconnect gear housing tube and drain fluid.
 - Use soft jaws when holding steering gear housing. Handle gear housing carefully, as it is made of aluminum. Do not grip cylinder in a vise.
2. Remove pinion gear.

Be careful not to damage pinion gear when removing pinion seal ring.

3. Remove tie-rod outer sockets and boots.
4. Loosen tie-rod inner socket by prying up staked portion, and remove socket.
5. Remove retainer.
6. Remove pinion assembly.

7. Drill staked portion of gear housing end with drill of 2 to 2.5 mm (0.079 to 0.098 in) diameter, until the staking is eliminated.

8. Remove end cover assembly with a suitable tool.
9. Draw out rack assembly.

POWER STEERING GEAR AND LINKAGE (Model PR24SC)

Disassembly (Cont'd)

10. Remove rack seal ring.

- Using a heat gun, heat rack seal to approximately 40°C (104°F).

- Remove rack seal ring.

Be careful not to damage rack.

11. Remove center bushing and rack oil seal using tape wrapped socket and extension bar.

Do not scratch inner surfaces of pinion housing.

Inspection

Thoroughly clean all parts in cleaning solvent or automatic transmission fluid "DEXRONTM" type, and blow dry with compressed air, if available.

BOOT

Check condition of boot. If cracked excessively, replace it.

RACK

Thoroughly examine rack gear. If damaged, cracked or worn, replace it.

PINION ASSEMBLY

- Thoroughly examine pinion gear. If pinion gear is damaged, cracked or worn, replace it.
- Inspect bearings to see that they roll freely and are free from cracked, pitted, or worn balls, rollers and races. Replace if necessary.

GEAR HOUSING CYLINDER

Check gear housing cylinder bore for scratches or other damage. Replace if necessary.

POWER STEERING GEAR AND LINKAGE (Model PR24SC)

Inspection (Cont'd)

TIE-ROD OUTER AND INNER SOCKET

- Check ball joint for swinging force.

Tie-rod outer ball joint:

At cotter pin hole

6.9 - 64.7 N

(0.7 - 6.6 kg, 1.5 - 14.6 lb)

Tie-rod inner ball joint:

14.7 - 21.6 N

(1.5 - 2.2 kg, 3.3 - 4.9 lb)

- Check ball joint for rotating torque.

Tie-rod outer ball joint:

0.3 - 2.9 N·m

(3 - 30 kg·cm, 2.6 - 26.0 in-lb)

- Check ball joint for axial end play.

Tie-rod outer ball joint:

Less than 0.5 mm (0.020 in)

Tie-rod inner ball joint:

0 mm (0 in)

- Check condition of dust cover. If cracked excessively, replace it.

Assembly

1. Using a heat gun, heat new rack seal ring (made of Teflon) to approximately 40°C (104°F) and install it onto rack with your hand.

2. Using Tool, compress periphery of rack seal ring to position and secure it on rack.

Always insert Tool from the rack gear side.

POWER STEERING GEAR AND LINKAGE (Model PR24SC)

Assembly (Cont'd)

3. Insert new rack oil seal.

- Place plastic film into rack oil seal to prevent damage by rack teeth.
- Do not forget to remove plastic film after rack oil seal is positioned properly.
- Make sure lips of rack oil seal face each other.

4. Install center bushing and rack oil seal with rack assembly.

5. Tighten end cover assembly with a suitable tool.

6. Fasten end cover assembly to gear housing by staking.

7. Set rack gear in neutral position.

Rack stroke "L":

Refer to S.D.S.

POWER STEERING GEAR AND LINKAGE (Model PR24SC)

Assembly (Cont'd)

8. Coat seal lip of new pinion oil seal with multi-purpose grease and install it to pinion housing of gear housing with a suitable tool.

Make sure lip of oil seal faces up when installed.

9. Install pinion bearing adjusting shim(s).
- Whenever pinion assembly, gear housing and rear housing are disassembled, replace shim(s) with new ones. Always use the same number of shim(s) when replacing.

10. Install new pinion seal ring (made of Teflon) on pinion gear assembly.
- Using a heat gun, heat pinion seal ring to approximately 40°C (104°F) before installing it onto pinion gear assembly.
 - Make sure pinion seal ring is properly settled in valve groove.

11. Apply a coat of multi-purpose grease to needle bearing roller and oil seal lip before installing pinion assembly in gear housing.

12. Install pinion assembly to pinion housing.
- Be careful not to damage pinion oil seal.**

POWER STEERING GEAR AND LINKAGE (Model PR24SC)

Assembly (Cont'd)

13. Apply a coat of multi-purpose grease to new rear oil seal lip before installing rear housing.

14. Install rear cover cap so that protrusion of rear housing cover is positioned as shown in figure at left when rack is centralized.

Be careful not to damage worm ring and oil seal.

15. Install diaphragm spring into gear housing.
- Always install retainer, spring washer and diaphragm spring in that order.
 - Make sure convex end (painted white) of diaphragm spring faces outward when installing.
16. Install retainer and adjusting screw temporarily.

17. Install new lock plate.
- Attach lock plate ② to side rod inner socket ①.
 - Apply locking sealant to inner socket threads ③.
 - Screw inner socket into rack ④ and tighten to specified torque.
 - Clinch two places of lock plate at rack's groove.

CAUTION:

To prevent scratching the boot, remove burrs from lock plate.

18. Tighten outer socket lock nut.

Tie-rod length "L":

Refer to S.D.S.

POWER STEERING GEAR AND LINKAGE (Model PR24SC)

Assembly (Cont'd)

19. Measure rack stroke.
Rack stroke "L":
Refer to S.D.S.

20. Before installing boot, coat the contact surfaces between boot and tie-rod with grease.

21. Install boot clamps.
- To install, wrap boot clamp around boot groove twice. Tighten clamp by twisting rings at both ends 4 to 4-1/2 turns with screwdriver while pulling with a force of approx. 98 N (10 kg, 22 lb).

- Install boot clamps so they are behind the gear housing when it is attached to the vehicle. (This will prevent interference with other parts.)

- Twist boot clamp in the direction shown in figure at left.

POWER STEERING GEAR AND LINKAGE (Model PR24SC)

Assembly (Cont'd)

- After twisting boot clamp, bend twisted and diagonally so it does not contact boot.

Adjustment

Adjust pinion rotating torque as follows:

1. Set rack to the neutral position without fluid in the gear.
2. Coat the adjusting screw with locking sealant and screw it in.
3. Lightly tighten lock nut.
4. Tighten adjusting screw to a torque of 4.9 to 5.9 N·m (50 to 60 kg-cm, 43 to 52 in-lb).
5. Loosen adjusting screw, then retighten it to 0.2 N·m (2 kg-cm, 1.7 in-lb).
6. Move rack over its entire stroke several times.
7. Measure pinion rotating torque within the range of 180° from neutral position.
Stop the gear at the point of maximum torque.
8. Loosen adjusting screw, then retighten it to 4.9 N·m (50 kg-cm, 43 in-lb).
9. Loosen adjusting screw by 40° to 60°.
10. Prevent adjusting screw from turning, and tighten lock nut to specified torque.

POWER STEERING GEAR AND LINKAGE (Model PR24SC)

Adjustment (Cont'd)

11. Measure pinion rotating torque.

Within $\pm 100^\circ$ from the neutral position:

Average rotating torque

0.8 - 1.3 N·m (8 - 13 kg-cm, 6.9 - 11.3 in-lb)

Maximum torque deviation

0.4 N·m (4 kg-cm, 3.5 in-lb)

Except for above measuring range:

Maximum rotating torque

1.9 N·m (19 kg-cm, 16 in-lb)

Maximum force deviation

0.6 N·m (6 kg-cm, 5.2 in-lb)

- If pinion rotating torque is not within specifications, readjust it starting from procedure 4. If pinion rotating torque is still out of specifications after readjustment, replace steering gear assembly.

12. Check rack sliding force on vehicle as follows:

- Install steering gear onto vehicle, but do not connect tie-rod to knuckle arm.
- Connect all piping and fill with steering fluid.
- Start engine and bleed air completely.
- Disconnect steering column lower joint from the gear.
- Keep engine at idle and make sure steering fluid has reached normal operating temperature.
- While pulling tie-rod slowly in the ± 11.5 mm (± 0.453 in) range from the neutral position, make sure rack sliding force is within specification.

Average rack sliding force:

Less than 226 N (23 kg, 51 lb)

- Check sliding force outside above range.

Maximum rack sliding force:

Not more than 39 N (4 kg, 9 lb) beyond above value

- If rack sliding force is not within specification, readjust by repeating adjustment procedure from the beginning.
- If rack sliding force is still out of specification after readjustment, gear assembly needs to be replaced.

Pre-disassembly Inspection

Disassemble the power steering oil pump only if the following items are found.

- Oil leak from any point shown in the figure.
- Deformed or damaged pulley.

POWER STEERING OIL PUMP

Disassembly

CAUTION:

- Parts which can be disassembled are strictly limited. Never disassemble parts other than those specified.
- Disassemble in as clean a place as possible.
- Clean your hands before disassembly.
- Do not use rags; use nylon cloths or paper towels.
- Follow the procedures and cautions in the Service Manual.
- When disassembling and reassembling, do not let foreign matter enter or contact the parts.

- Remove snap ring, then draw drive shaft out.
Be careful not to drop drive shaft.

- Remove oil seal.
Be careful not to damage front housing.

- Remove connector.
Be careful not to drop control valve.

Inspection

Inspect each component part for wear, deformation, scratches, and cracks. If damage is found, replace the part.

Assembly

Assemble oil pump, noting the following instructions.

- Make sure O-rings and oil seal are properly installed.
- Always install new O-rings and oil seal.
- Be careful of oil seal direction.
- Cam ring, rotor and vanes must be replaced as a set if necessary.
- Coat each part with A.T.F. when assembling.

- Pay attention to the direction of rotor.

- When assembling vanes to rotor, rounded surfaces of vanes must face cam ring side.

- Insert pin ② into pin groove ① of front housing and front side plate. Then install cam ring ③ as shown at left.

Precautions

- When removing or installing various parts, place a cloth or padding onto the vehicle body to prevent scratches.
- Handle trim, molding, instruments, grille, etc. carefully during removing or installation. Be careful not to soil or damage them.
- Apply sealing compound where necessary when installing parts.
- When applying sealing compound, be careful that the sealing compound does not protrude from parts.
- When replacing any metal parts (for example body outer panel, members, etc.), be sure to take rust prevention measures.

Circuit Breaker Inspection

For example, when current is 30A, the circuit is broken within 8 to 20 seconds.

Circuit breakers are used in the following systems.

- Power window & power door lock
- Power sun roof

- When removing or installing hood, trunk lid or back door, place a cloth or other padding on hood, trunk lid or back door corners to avoid scratching vehicle body.
- Bumper fascia: It is made of plastic, so do not use excessive force and take care to keep oil away from it.
- Hood adjustment: Adjust at hinge portion.
- Hood lock adjustment: After adjusting, check hood lock control operation. Apply a coat of grease to hood locks engaging mechanism.
- Hood opener: Do not attempt to bend cable forcibly. Doing so increases effort required to unlock hood.

Front Door (Cont'd)

- When removing and installing the door glass, remove the door outside molding. (For the removal and installation procedure, refer to "Exterior".)
- When adjusting the door glass, it is not necessary to remove the door outside molding.
- The outer stabilizer is an integral part of the door outside molding. It can neither be removed nor adjusted.

DOOR GLASS ADJUSTMENT

1. Inner stabilizer adjustment

- a. Set door glass in fully raised (closed) position.
- b. Lightly press door glass upper end outward so that glass outer surface contacts outer stabilizer. With glass held in that position, press inner stabilizer to glass inner surface and tighten adjusting bolt **A**.

CAUTION:

Make sure nap portions of stabilizers are clean and free from oil, grease, etc.

2. Door glass sub-channel adjustment

Adjust door glass sub-channel until clearances A and B match body side weatherstrip retainer.

CAUTION:

- Make sure door glass sub-channel is horizontal.
- Adjust clearances A and B simultaneously when adjusting guide rail (described under "5. Guide Rail Adjustment").

DOOR

Front Door (Cont'd)

3. Guide rail adjustment

- Adjust rear adjusting bolt until door glass lightly contacts body side weatherstrip retainer at "A". From that position, turn adjusting bolt approximately two rotations counter-clockwise.

CAUTION:

- Turn adjusting bolt clockwise to move door glass upper end outward.
 - Turn adjusting bolt counterclockwise to move door glass upper end inward.
- After adjusting guide rail, turn front adjusting bolt until its flange lightly contacts inner panel and tighten lock nut.

CAUTION:

Make sure both adjusting bolts protrude equally ($A = B$).

4. Glass upper end adjustment

- Adjust inner stabilizer stopper height until door glass upper end clearance is as shown in figure at left, and tighten lock nut.
- Make sure door glass stopper is in contact with door panel stopper during adjustment.

CAUTION:

Make sure front and rear stoppers are in contact with their mating stoppers when body side weatherstrip is parallel to door glass upper end. If not, adjust door glass sub-channel. (Refer to "2. Door glass sub-channel adjustment".)

DOOR

Front Door (Cont'd)

5. Guide rail adjustment ②

- Adjust the guide rail so that the clearance between the upper end of the glass and weatherstrip retainer is 0.5 to 2.0 mm (0.020 to 0.079 in), 20 mm (0.79 in) from the end of the weatherstrip in the door corner.
- After adjustment, open and close the door several times to confirm that the outer periphery of the glass will not contact the weatherstrip retainer. If any contact occurs, perform the adjustment as mentioned in "2. Door glass sub-channel adjustment" again.

CAUTION:

Do not allow the adjusting bolt to rotate when loosening the guide rail lock nut.

- Lower the glass slightly until the glass side stopper comes off the panel side stopper.

CAUTION:

Do not lower the glass excessively.

- After completing door glass adjustment, retighten all lock nuts.

CAUTION:

While tightening lock nuts, hold adjusting bolts using a standard screwdriver to prevent them from turning.

Since left and right component parts are basically the same, harness layout and methods for electrical components inspection are shown for one side only.

Although methods for checking component parts on both sides are described in the flow chart, making it easier to troubleshoot, apply checking procedures to either side that have malfunction during trouble diagnoses.

DOOR — Trouble Diagnoses for Power Window and Power Door Lock

Diagnostic Procedure 1 (Except Coupe)

SYMPTOM:

Power door locks cannot be operated by either the main or door lock knob switches but power windows can be operated.

CHECK DOOR LOCK OPERATION CIRCUIT.
Check voltage for main switch 6-pin connector.

Terminals	Main switch operation	Voltage
1 - Ground	Unlock	0V → 12V → 0V
4 - Ground	Lock	0V → 12V → 0V

N.G. → Replace main switch.

O.K.

Go to Diagnostic Procedure 4.
(See page BF-49.)

DOOR — Trouble Diagnoses for Power Window and Power Door Lock

Diagnostic Procedure 2 (Coupe)

SYMPTOM:

Power door locks cannot be operated.

A CHECK DOOR LOCK OPERATION CIRCUIT.

O.K. → (Go to **A** on next page.)

- 1) Disconnect 12-pin connector from main switch.
- 2) Check door lock actuators by grounding terminal ①7.

Terminals	Result
①7 - Ground	Should be locked

B Check battery voltage existence.

O.K. → (Go to **B** on next page.)

Terminals	Battery voltage exists
①7 - Ground	Yes

C 1) Disconnect connector from passenger switch.

N.G. → Repair harness.

Terminals	Continuity
①7 - ③2	Yes

O.K. → Replace passenger switch.

DOOR — Trouble Diagnoses for Power Window and Power Door Lock

Diagnostic Procedure 2 (Coupe) (Cont'd)

DOOR — Trouble Diagnoses for Power Window and Power Door Lock

Diagnostic Procedure 3 (Cont'd)

DOOR — Trouble Diagnoses for Power Window and Power Door Lock

Diagnostic Procedure 4 (Except Coupe)

SYMPTOM:

One or two door locks cannot be operated.

A

CHECK DOOR LOCK ACTUATOR CIRCUIT.

- 1) Disconnect 6-pin connector from main switch.
- 2) Disconnect connector from inoperative door lock actuator(s).
- 3) Check continuity.

Terminals	Continuity
④ - ⑤①	Yes
① - ⑤②	Yes

N.G.

Repair harness

B

O.K.

Does continuity exist?

Terminals
④ - Ground
① - Ground

Yes

Repair harness.
There will be incorrect grounding between terminals ④ and ⑤①, ① and ⑤②.

No

Go to DOOR LOCK ACTUATOR in Electrical Components Inspection. (See page BF-58.)

O.K.

Check system again.

N.G.

Replace door lock actuator.

DOOR — Trouble Diagnoses for Power Window and Power Door Lock

SYMPTOM:

Driver's side power window cannot be operated but other power windows can be operated.

DOOR — Trouble Diagnoses for Power Window and Power Door Lock

Diagnostic Procedure 6

SYMPTOM:

Passenger power windows cannot be operated but door locks can be operated.

DOOR — Trouble Diagnoses for Power Window and Power Door Lock

Diagnostic Procedure 7

SYMPTOM:

Passenger power windows cannot be operated by either the passenger's switches or main switch.

DOOR — Trouble Diagnoses for Power Window and Power Door Lock

Diagnostic Procedure 8

SYMPTOM:

Passenger power windows cannot be operated by main switch but can be operated by passenger's switches.

CHECK DATA LINE SIGNAL CIRCUIT.

- 1) Disconnect connectors from all switches except main switch.
- 2) Check voltage while power window lock switch is "OFF".

Terminals	Main switch operation	Voltage
28 - Ground	Up	Above 12V
	Down	Approx. 4V
	No operation	Approx. 0V

O.K. → Replace Main switch.

N.G.

- 1) Disconnect 12-pin connector from main switch.
- 2) Check continuity.

	Terminals
Passenger	16 - 28
Rear left	18 - 28
Rear right	14 - 28

Continuity should exist.

N.G. → Repair harness.

O.K.

Does continuity exist?

	Terminals
Passenger	16 - Ground
Rear left	18 - Ground
Rear right	14 - Ground

Yes → Repair harness. There will be incorrect grounding.

No

Replace main switch.

Diagnostic Procedure 9

SYMPTOM:

Power door locks cannot be operated by vehicle speed sensor system.

A

CHECK DETECTING SWITCH CIRCUIT.

- 1) Disconnect 12-pin connector from main switch.
- 2) Check continuity between terminal 12 and body ground.

Condition	Continuity
All doors except driver's are locked	No
One of passenger doors is unlocked	Yes

O.K.

→ (Go to **A** on next page.)

N.G.

Disconnect door lock actuator connector.

B

Check continuity between terminals 12 and 53, 54 and body ground.

N.G.

Repair harness.

O.K.

C

Does continuity exist?

Terminals
12 - Ground

Yes

Repair harness.
There will be incorrect grounding.

No

Replace detecting switch.

SUNROOF

ADJUSTMENT

When motor & limit SW assembly and sunroof rail assembly are being installed, perform operations in the following sequence:

1. Make sure that link and wire assemblies are arranged in lateral symmetry.
2. Connect sunroof connector to sunroof switch and positive (+) power supply.
3. Set lid assembly to fully closed position **A** by operating CLOSE switch and TILT switch.
4. Fit outer side of lid assembly to the surface of roof on body outer panel.
5. Remove motor, and keep CLOSE switch pressed until motor pinion gear reaches the end of its rotating range.
6. Install motor.
7. Check that motor drive gear fits snugly in wires.
8. Press TILT-UP switch to check lid assembly for normal tilting.
9. Check sunroof lid assembly for normal operations (tilt-up, tilt-down, open, and close).

T-BAR ROOF

- Handle T-bar roof glass with care so not to damage it.
- Apply sealant to portions susceptible to water leakage if necessary.
- Side molding, sash, lock basement and glass of T-bar roof constitute one unit and cannot be disassembled.

REMOVAL

After removing moldings, remove glass.

CAUTION:

Be careful not to scratch glass when removing.

INSTALLATION

- Use genuine Nissan Sealant kit or equivalent. Follow instructions furnished with it.
- After installation, the vehicle should remain stationary for about 24 hours.
- Do not use sealant which is more than 12 months past its production date.
- Do not leave cartridge unattended with its cap open.
- Keep primers and sealant in a cool, dry place. Ideally, they should be stored in a refrigerator.

WARNING:

Keep heat or open flames away as primers are flammable.

CAUTION:

Allow primers to dry for 10 to 15 minutes before proceeding to the next step.

CAUTION:
Allow primers to dry for 10 to 15 minutes before proceeding to the next step.

Set glass in position and press glass lightly and evenly.

CAUTION:
Windshield glass should be installed within 15 minutes of applying sealant: sealant starts to harden 15 minutes after it is applied.

Check for water leakage.

Install moldings.

CAUTION:
Molding must be installed securely so that it is in position and leaves no gap.

Advise the user of the fact that vehicle should not be driven on rough roads or surfaces until sealant has properly vulcanized.

Repairing Water Leaks for Windshield and Rear Window

Leaks can be repaired without removing and reinstalling glass.

If water is leaking between caulking material and body or between glass and caulking material, determine the extent of the leak by applying water while pushing glass outward.

To stop the leak, apply primer and then sealant to the leak point.

Afterwards, install molding securely.

DESCRIPTION — Overall System

Introduction

Besides a lever control system, a push control system is newly applied to B13/N14 models.

Features

The push control system operates the intake and mode door motors to activate the doors corresponding to each button. When the MODE switch is pushed at "DEF" or "F/D", the push control amplifier automatically sets the intake door to "FRE" to prevent windshield fogging.

Control Operation

FAN SWITCH OR FAN LEVER

This switch or lever turns the fan ON and OFF, and controls fan speed.

MODE SWITCHES OR AIR CONTROL LEVER

These switches or air control lever allow you to select the outlet air flow.

TEMPERATURE CONTROL LEVER

This lever allows you to adjust the temperature of the outlet air.

RECIRC SWITCH OR INTAKE LEVER

OFF position or slide to  :

Outside air is drawn into the passenger compartment when this switch is OFF.

ON position or slide to  :

Interior air is recirculated inside the vehicle.

AIR CONDITIONER SWITCH

Start the engine, move the fan control lever to the desired (1 to 4) position and push the air conditioner switch to turn ON the air conditioner. The indicator light will come on when the air conditioner is ON. To stop the air conditioner, push the switch again to return it to the original position.

The air conditioner cooling function operates only when the engine is running.

DESCRIPTION — Overall System

Fresh Vent Lever (Except Europe models)

In order to prevent unpleasant hot air in the heater mode, or especially in the FOOT, FOOT/DEF or DEF modes, this system can provide cold air flow to the ventilator ducts directly (bypassing the heater core) by means of a fresh vent lever beside the center vent duct.

OPERATIONAL CHECK

Operational Check

The purpose of the operational check is to confirm that the system operates as it should. The systems which are checked are the blower, mode (discharge air), intake air, temperature decrease, temperature increase.

CONDITIONS:

Engine running at normal operating temperature.

Fresh vent "OFF"

PROCEDURE:

1. Check blower

- 1) Turn or slide fan lever to 1-speed.
Blower should operate on 1-speed.
- 2) Then turn or slide fan lever to 2-speed.
- 3) Continue checking blower speed until all four speeds are checked.
- 4) Leave blower on 4-speed.

2. Check discharge air

- 1) Press the VENT button or slide air control lever to VENT.
VENT indicator should light. (Push control type only)
- 2) Confirm that all discharge air comes out of face vents.
- 3) Press the B/L button or slide air control lever to B/L.
B/L indicator should light. (Push control type only)
- 4) Confirm that discharge air comes out of face vents and foot vents.
- 5) Press the FOOT button or slide air control lever to FOOT.
FOOT indicator should light. (Push control system only)
- 6) Confirm that discharge air comes out of foot vents, with some air from defroster vents.
- 7) Press the F/D button or slide air control lever to F/D.
F/D indicator should light. (Push control type only)
- 8) Confirm that discharge air comes out of foot vents, with some air from defroster vents. Intake door position is at FRE. (L.H.D. models push control type only)
- 9) Press the DEF button or slide air control lever to DEF.
DEF indicator should light. (Push control type only)
- 10) The discharge air should be coming only from defroster vents. At the same time the intake door position should be at FRE. (L.H.D. models push control type only)

3. Check RECIRC

- 1) Press RECIRC button or slide intake lever to RECIRC.
RECIRC indicator should light. (Push control type only)
- 2) Listen for intake door position change (you should hear blower sound change slightly).

OPERATIONAL CHECK

Operational Check (Cont'd)

4. Check temperature decrease

- 1) Slide temperature control lever to full cold.
- 2) Check for cold air at discharge air outlets.

5. Check temperature increase

- 1) Slide temperature control lever to full hot.
- 2) Check for hot air at discharge air outlets.

6. Check air conditioner switch

Move the fan control lever to the desired (1 to 4-speed) position and push the air conditioner button to turn ON the air conditioner.

The indicator light should come on when air conditioner is ON.

DESCRIPTION — Refrigeration System

Refrigeration Cycle

REFRIGERANT FLOW

The refrigerant flows in the standard pattern, that is, through the compressor, the condenser, the receiver drier, through the evaporator, and back to the compressor.

The refrigerant evaporation through the evaporator coil is controlled by an externally equalized expansion valve, located inside the evaporator case.

FREEZE PROTECTION

The compressor cycles on and off to maintain the evaporator temperature within a specified range. When the evaporator coil temperature falls below a specified point, the thermo control amplifier interrupts the compressor operation. When the evaporator coil temperature rises above the specification, the thermo control amplifier allows compressor operation.

REFRIGERANT SYSTEM PROTECTION

Dual-pressure switch

The refrigerant system is protected against excessively high or low pressures by the dual-pressure switch, located on the receiver drier. If the system pressure rises above, or falls below the specifications, the dual-pressure switch opens to interrupt the compressor operation.

Fusible plug

Open at temperature above 105°C (221°F), thereby discharging refrigerant to the atmosphere. If this plug is melted and opened, check the refrigerant line and replace receiver drier.

PRECAUTIONS FOR THE HANDLING OF REFRIGERANT

- Always wear eye protection when working around the system.
- Always be careful that refrigerant does not come in contact with your skin.
- Keep refrigerant containers stored below 40°C (104°F) and never drop from high places.
- Work in well-ventilated area because refrigerant gas evaporates quickly and breathing may become difficult due to the lack of oxygen.
- Keep refrigerant away from open flames because poisonous gas will be produced if it burns.
- Do not increase can temperature beyond 40°C (104°F) in charging.
- Do not heat refrigerant container with an open flame. There is a danger that container will explode.

CAUTION:

- Do not use steam to clean surface of condenser or evaporator. Be sure to use cold water or compressed air.
- Compressed air must never be used to clean a dirty line.

- Do not release refrigerant into the atmosphere.

RHA676B

DIAGNOSES — Overall System

- Do not use manifold gauge whose press point shape is different from that shown. Otherwise, insufficient evacuating may occur.
- Do not over-tighten service valve cap.
- Do not allow refrigerant to rush out. Otherwise, compressor oil will be discharged along with refrigerant.

TEST CONDITION

Testing must be performed as follows:

Vehicle location: In doors or in the shade (in a well ventilated place)

Doors: Closed

Door window: Open

Hood: Open

TEMP. lever position: Max. COLD

Air control lever position or mode switch:  (Ventilation)

INTAKE lever position :  (Recirculation)

FAN lever position or recirc switch: Max. position

Engine speed: 1,500 rpm

Time required before starting testing after air conditioner starts operating: More than 10 minutes

DIAGNOSES — Overall System

Performance Test Diagnoses

Characteristics revealed by the manifold gauge readings for the air conditioning system are shown in the following.

For how to do the performance test, refer to the item "Performance Chart".

In the following table, the portion smeared with ink on each gauge scale indicates the range showing that the air conditioning system is in good order. This range is described in Performance Chart.

Condition	Probable cause	Corrective action
INSUFFICIENT REFRIGERANT CHARGE  AC352A	Insufficient cooling. Bubbles appear in sight glass. Refrigerant is low, or leaking slightly.	1. Leak test. 2. Repair leak. 3. Charge system. Evacuate, as necessary, and recharge system.
ALMOST NO REFRIGERANT  AC353A	No cooling action. A lot of bubbles or something like mist appears in sight glass.	Stop compressor immediately. 1. Leak test. 2. Discharge system. 3. Repair leak(s). 4. Replace receiver drier if necessary. 5. Check oil level. 6. Evacuate and recharge system.
MALFUNCTIONING EXPANSION VALVE  AC354A	Slight cooling. Sweat or frosting on expansion valve inlet. Expansion valve restricts refrigerant flow. • Expansion valve is clogged. • Expansion valve is inoperative. Valve stuck closed. Thermal bulb has lost charge.	If valve inlet reveals sweat or frost: 1. Discharge system. 2. Remove valve and clean it. Replace it if necessary. 3. Evacuate system. 4. Charge system. If valve does not operate: 1. Discharge system. 2. Replace valve. 3. Evacuate and charge system.

DIAGNOSES — Overall System

Performance Test Diagnoses (Cont'd)

Condition	Probable cause	Corrective action
 AC355A	Insufficient cooling. Sweat on suction line.	Expansion valve allows too much refrigerant through evaporator. Check valve for operation. If suction side does not show a pressure decrease, replace valve.
 AC356A	No cooling. Sweat or frosting on suction line.	Malfunctioning expansion valve. 1. Discharge system. 2. Replace valve. 3. Evacuate and charge system
AIR IN SYSTEM  AC359A	Insufficient cooling. Sight glass shows occasional bubbles.	Air mixed with refrigerant in system. 1. Discharge system. 2. Replace receiver drier. 3. Evacuate and charge system.
MOISTURE IN SYSTEM  AC360A	After short operation, suction side may show vacuum pressure reading. During this condition, discharge air will be warm. As a warning of this, reading vibrates around 39 kPa (0.39 bar, 0.4 kg/cm², 6 psi).	Drier is saturated with moisture. Moisture has frozen in expansion valve. Refrigerant flow is restricted. 1. Discharge system. 2. Replace receiver drier (twice if necessary). 3. Evacuate system completely. (Repeat 30-minutes evacuating three times.) 4. Recharge system.

DIAGNOSES — Overall System

Performance Test Diagnoses (Cont'd)

Condition	Probable cause	Corrective action
MALFUNCTIONING CONDENSER  AC361A	No cooling action: engine may overheat. Bubbles appear in sight glass of drier. Suction line is very hot. Usually a malfunctioning condenser.	• Check radiator fan motors. • Check condenser for dirt accumulation. • Check engine cooling system for overheating. • Check for refrigerant overcharging. If pressure remains high in spite of all above actions taken, remove and inspect the condenser for possible oil clogging.
HIGH PRESSURE LINE BLOCKED  AC362A	Insufficient cooling. Frosted high pressure liquid line. Drier clogged, or restriction in high pressure line.	1. Discharge system. 2. Remove receiver drier or strainer and replace it. 3. Evacuate and charge system.
MALFUNCTIONING COMPRESSOR  AC363A	Insufficient cooling. Internal problem in compressor, or damaged gasket and valve.	1. Discharge system. 2. Remove and check compressor. 3. Repair or replace compressor. 4. Check oil level. 5. Replace receiver drier. 6. Evacuate and charge system.

DIAGNOSES — Overall System

Condition	Probable cause	Corrective action
TOO MUCH OIL IN SYSTEM (Excessive)  AC354A	Insufficient cooling. Too much oil circulates with refrigerant, causing the cooling capacity of the system to be reduced.	Refer to COMPRESSOR OIL for correcting oil level.

PRECAUTIONS FOR REFRIGERANT CONNECTIONS

WARNING:

Gradually loosen discharge side hose fitting, and remove it after remaining pressure has been released.

CAUTION:

When replacing or cleaning refrigerant cycle components, observe the following.

- Do not leave compressor on its side or upside down for more than 10 minutes, as compressor oil will enter low pressure chamber.
- When connecting tubes, always use a torque wrench and a back-up wrench.
- After disconnecting tubes, plug all openings immediately to prevent entrance of dirt and moisture.

- Always replace used O-rings.
- When connecting tube, apply compressor oil to portions shown in illustration. Be careful not to apply oil to threaded portion.
- O-ring must be closely attached to inflated portion of tube.

- After inserting tube into union until O-ring is no longer visible, tighten nut to specified torque.
- After connecting line, conduct leak test and make sure that there is no leakage from connections. When the gas leaking point is found, disconnect that line and replace the O-ring. Then tighten connections of seal seat to the specified torque.

EVACUATING, CHARGING AND CHECKING

Refrigerant Charging Procedure (Cont'd)

SETTING OF SERVICE TOOLS

Make sure that the service tools are set as indicated below and that no refrigerant is leaking.

EVACUATING, CHARGING AND CHECKING

Evacuation

Why evacuation is needed

When installing a car air conditioner, it is essential to completely remove air and water from the inside of the refrigeration system beforehand. This process is called evacuation. If the air conditioner is operated without completely removing these substances, the following abnormalities may result.

- Poor cooling due to reduction in the thermal exchange rate in condenser
- Moisture recirculating together with the refrigerant through the refrigeration system freezes at the port of the cold expansion valve. This impedes the normal refrigerant flow, thus lowering the cooling efficiency.
- The refrigerant reacts with water chemically, generating corrosive hydrochloric acid thus causing corrosion to the refrigeration system components.

CAUTION:

- When installing an air conditioner in the vehicle, the pipes must be connected as the final stage of the operation. The seal caps of the pipes and other components must not be removed until their removal is required for connection.
- Before installing any air conditioner component that has been stored in a cool location to a vehicle that has been exposed to the hot sun, leave the component as it is for some time in a hot location with its seal cap unremoved. This step is necessary to prevent condensation of moisture inside the cold component.
- Thoroughly remove moisture from the refrigeration system before charging the refrigerant.

Relation between boiling point of water and atmospheric pressure

Water boils at 100°C (212°F) under normal atmospheric pressure. The boiling point lowers with the atmospheric pressure. This characteristic of water is utilized to purge it from the system. The pressure inside the refrigeration system is lowered by a vacuum pump so that water can evaporate at a normal temperature. The water vapor is then discharged to the outside together with the air.

EVACUATING, CHARGING AND CHECKING

Evacuation (Cont'd)

Vacuum pump

The degree of evacuation greatly affects the cooling capacity of the air conditioner and the service life of the refrigeration system components. However, use of a vacuum pump having insufficient capacity results in prolonged evacuation. It is necessary to use a vacuum pump with a sufficiently large capacity and also to maintain the pump to ensure its original pumping capacity.

EVACUATION PROCEDURE

1. Completely tighten the low pressure and high pressure adapter valves.

Tightening of the valves opens the service canister valve.

2. Open the high and low pressure valves and vacuum pump valve of the gauge manifold.
3. Run the vacuum pump.

4. Perform evacuation for more than five minutes to stabilize the vacuum inside the system. Check to ensure that the low pressure gauge indicates -98.6 to -101.3 kPa (-986 to -1,013 mbar, -740 to -760 mmHg, -29.13 to -29.92 inHg).
5. Shut off the high and low pressure valves and vacuum pump valve of the gauge manifold.

EVACUATING, CHARGING AND CHECKING

Evacuation (Cont'd)

CHECKING AIRTIGHTNESS

1. Shut off the high and low pressure valves and vacuum pump valve of the gauge manifold, and leave the system as it is for 5 to 10 minutes.
2. Make sure that the needle of the low pressure gauge will not move back toward the atmospheric pressure side (gauge pressure 0).

If any reverse movement is noted, it indicates poor system airtightness. Service the system until airtightness is complete. If pressure changes approx. 13.3 kPa (133 mbar, 100 mmHg, 3.94 inHg) in 10 minutes, the refrigerant in the system will be exhausted in about one month.

MAINTENANCE

If inadequate airtightness is detected, check and service the following portions:

Leak from pipe joints	Leak from gauge manifold
● Contaminated, damaged, or deformed O-ring ● No oil applied when connecting pipe ● Excessive or insufficient tightening of pipe joint	● Malfunctioning hose ● Improper installation of gauge ● Malfunctioning valve ● Malfunctioning packing

EVACUATION

If no abnormality is found during the airtightness check, perform evacuation again for more than 20 minutes.

1. Run the vacuum pump.
2. Open the high and low pressure valve and vacuum pump valve of the gauge manifold.
3. Evacuate for more than 20 minutes.
4. Close the high and low pressure valves and vacuum pump valve of the gauge manifold.

Charging Refrigerant WORK PROCEDURE

PRELIMINARY CHARGING PROCEDURE

This operation is performed to check the refrigerant leakage and to protect the compressor.

1. Turn the charge valve handle to open a hole in the service canister to allow the refrigerant to flow through the gauge manifold.
2. Open the low pressure valve of the gauge manifold, and charge the refrigerant into the system from the low pressure side.
3. After charging approx. 200 g (7.05 oz) of refrigerant, shut off the low pressure valve.

CAUTION:

- The refrigerant charging operation must be performed after shutting off the engine. If the compressor is operated with an insufficient amount of refrigerant, the compressor may seize up due to a lack of return of the compressor oil.
- Do not shake nor hold the refrigerant canister upside down.

EVACUATING, CHARGING AND CHECKING

Charging Refrigerant (Cont'd)

PRELIMINARY CHECK FOR REFRIGERANT LEAKS

1. Make sure that the gauge manifold valve is closed.
2. Check for refrigerant leak from each connector in the system using the leak detector.

At this point, the pressure in the system is not high. Only large amounts of refrigerant leak due to loose pipe joints, etc. can be detected.

CHARGING REFRIGERANT

1. Make sure that the valves of the gauge manifold are closed.
2. Start the engine, and run the compressor.
3. Slowly open the low pressure valve of the gauge manifold.
4. Charge the specified amount of refrigerant.

The charged amount of refrigerant can be determined by subtracting the weight of the canister measured after charging from its weight measured before charging.

WARNING:

Never attempt to open the high pressure valve while the engine is running. If opened, the pressure in the refrigerant canister will increase, thus causing an explosion.

CHARGING REFRIGERANT WITHOUT USING T-JOINT ADAPTER

If the service canister used for charging is empty, replace the canister with a new one, and proceed as follows:

1. Make sure by shaking the canister that no refrigerant is left inside.
2. Shut off all the valves of the gauge manifold.
3. Disconnect the charge valve from the emptied canister, and attach it to a new service canister.
4. Run the vacuum pump, and open the vacuum valve (center) of the gauge manifold to purge air from the inside of the hose.
5. Run the vacuum pump for approx. 30 seconds.
6. Shut off the vacuum valve (center) and stop the vacuum pump.
7. Unseal the new canister, and open the charge valve.
8. Open the low pressure valve to charge the refrigerant into the system.

EVACUATING, CHARGING AND CHECKING

Charging Refrigerant — Charging cylinder WORK PROCEDURE

Install the charging cylinder correctly to the vehicle. Refer to "SETTING OF SERVICE TOOLS" in "Refrigerant Charging Procedure".

PRELIMINARY CHARGING OF REFRIGERANT-1

1. Make sure that the inlet and outlet valves of the charging cylinder are closed.
2. Slowly open the outlet valve of a refrigerant container [13.6 kg (30 lb)].
3. Slowly open the inlet valve of the charging cylinder.

The refrigerant will flow into the sight glass of the charging cylinder as the valve is opened.

EVACUATING, CHARGING AND CHECKING

Charging Refrigerant — Charging cylinder (Cont'd)

4. Slowly open the upper vent valve to release pressure from the charging cylinder. While doing so, continue charging until the required amount of refrigerant is reached.

The refrigerant volume changes with the temperature and pressure. It is necessary to charge refrigerant with a little more than the required amount (indicated on the sight glass). Refer to the CAUTION label attached on the vehicle, or to the Service Manual.

5. Close the inlet valve and upper vent valve of the charging cylinder.

6. Turn on the heater switch (the charging cylinder is provided with a heater.)

The refrigerant charging time can be reduced by heating the refrigerant to increase its pressure. In this case, do not allow the pressure in the cylinder to rise higher than 1,030 kPa (10.30 bar, 10.5 kg/cm², 150 psi). (If pressure rises above this level, turn off the heater.)

The pressure in the charging cylinder can be measured by the upper pressure gauge.

EVACUATION AND AIRTIGHTNESS CHECK

Refer to "EVACUATION" and "CHECKING AIRTIGHTNESS" in "Evacuation".

SETTING OF FLOW METER

1. Rotate the charging cylinder main body until the scale for R12 is at the correct position on the sight glass.
2. Read the charging cylinder pressure gauge.
3. Rotate the charging cylinder so that the scale of the charging cylinder agrees with the pressure value indicated on the pressure gauge.
4. Open the outlet valve of the charging cylinder.

EVACUATING, CHARGING AND CHECKING

Charging Refrigerant — Charging cylinder (Cont'd)

CALCULATING CHARGING AMOUNT OF REFRIGERANT

1. Record the amount of refrigerant in the sight glass before charging.
2. Subtract the required amount of refrigerant (charge quantity specified for the vehicle) from the amount of refrigerant recorded in step 1. Charge refrigerant into the system until the remaining value equals to the value indicated on the sight glass.

Example:

Level in sight glass: 3 lb 8 oz

Charge specification (from S.D.S.) 2.0 - 2.4 lb.

Calculate charge quantity into lb and oz as follows: 1 lb = 16 oz, and 0.1 lb = 1.6 oz, so that 2.0 lb = 32 oz, 2.4 lb = 32 + (4 x 1.6) = 32 + 6.4 = 38.4, round off to 38. Therefore our charge quantity will be between 32 and 38 oz, or 2 lb 0 oz to 2 lb 6 oz. Subtract 2 lb 6 oz from the level in the sight glass (3 lb 8 oz) = 1 lb 2 oz.

This will be our ending point.

PRELIMINARY CHARGING OF REFRIGERANT-2

1. Slowly open the high pressure side valve of the manifold gauge to charge refrigerant from the high pressure side.
2. Close the high pressure valve after charging approx. 200 g (7.05 oz) refrigerant.

CAUTION:

The refrigerant in the charging cylinder is kept in the liquid state, so the refrigerant should be charged from high pressure side. Do not start the engine with the high pressure valve kept open.

PRELIMINARY CHECK FOR REFRIGERANT LEAKS

Refer to "PRELIMINARY CHECK FOR REFRIGERANT LEAKS" in "Charging Refrigerant".

CHARGING REFRIGERANT

1. Slowly open the high pressure valve of the manifold gauge, and charge the calculated amount of refrigerant in "CALCULATING CHARGING AMOUNT OF REFRIGERANT".

CAUTION:

The refrigerant in the charging cylinder is kept in the liquid state, so the refrigerant should be charged from high pressure side. Do not start the engine with the high pressure valve kept open.

2. Close the high pressure valve of the manifold gauge.
3. Make sure that the calculated amount of refrigerant is in the sight glass.
4. Close the charging cylinder outlet valve.
5. Turn off the heater if it is on (when using heater equipped type).

EVACUATING, CHARGING AND CHECKING

Inspection for Refrigerant Leaks WORK PROCEDURE

To facilitate inspection for refrigerant leaks, establish the following conditions:

- Start the engine.
- Run the air conditioner.
- Set the blower fan control to MAX.
- Set the temperature control to FULL COLD.
- Run the refrigerant system for more than 5 minutes after setting the above-mentioned conditions (to circulate the refrigerant through the system).

Refrigerant leaks should be checked immediately after stopping the engine, beginning with the high pressure line, using a gas leak tester. This is because the pressure in the high pressure line drops gradually after the refrigerant circulation stops while the pressure in the low pressure line rises gradually as shown in the graph. Leaks can be detected easily when pressure is high.

EVACUATING, CHARGING AND CHECKING

Inspection for Refrigerant Leaks (Cont'd) INSPECTION PROCEDURE

To prevent detecting errors, make sure that there is no refrigerant vapor or tobacco smoke in the vicinity of the vehicle. It is also necessary to shield the vehicle from the wind so that the leaking refrigerant is not blown away.

INSPECTION POINTS

Check carefully each of the pipe joints. To check, wipe the portion to be checked with waste cloth, and move the tester probe all around the joint.

Compressor

Check the shaft seals and bolt holes, and also around the magnet clutch.

Receiver drier

Check the pressure valve, safety valve and the fusible plug mounts.

Service valves

Check all around the service valves.

Ensure that each valve core is not loose.

The service valve cap must be attached to the valve (to prevent leak).

Also check that there are no foreign objects inside the cap.

Inside of cooling unit

To check, insert the leak tester probe into the drain hose immediately after stopping the engine. (Keep the probe inserted for more than 10 seconds.)

EVACUATING, CHARGING AND CHECKING

Confirmation of Amount of Charged Refrigerant

The amount of refrigerant charged into the system can be observed through the sight glass by watching the flow of the refrigerant and by reading the high pressure and low pressure manifold gauges under the following conditions:

CONDITIONS

- Doors:
Close completely.
- Window glasses:
Close completely.
- Intake door position:
RECIRC
- Mode door position:
VENT
- Blower fan:
HI
- TEMP control:
Optional (Set so that intake air temperature is 30 to 35°C (86 to 95°F).
- AIR CON switch:
ON
- Engine speed:
Approx. 1,500 rpm

WORK PROCEDURE

EVACUATING, CHARGING AND CHECKING

Confirmation of Amount of Charged Refrigerant (Cont'd)

Check item	Amount of charge	Appropriate	Refrigerant is insufficient	Almost no refrigerant	Overcharged, or air in system
Temperature of high and low pressure pipes		High pressure side is hot while low pressure side is cold.	High pressure side is warm and low pressure side is somewhat cold.	No difference is felt between high and low pressure sides.	High pressure side is very hot.
Flow of refrigerant viewed through sight glass		Mostly transparent. Occasionally some bubbles are seen when engine rpm is increased or decreased. 	Bubbles are always flowing. Refrigerant is cloudy. 	Nothing is visible. 	If overcharged, no bubbles are seen. If there is air in the system, large bubbles are seen.
Pressure		Normal high pressure: 1.373 - 1.765 kPa (13.7 - 17.7 bar, 14 - 18 kg/cm², 199 - 256 psi) Normal low pressure: 147 - 294 kPa (1.47 - 2.94 bar, 1.5 - 3 kg/cm², 21 - 43 psi)	Both high and low pressure values are insufficient.	High pressure value is very small.	Both high and low pressure values are excessive.
Action to take		Bubbles may be generated when the receiver drier strainer is clogged, or when the expansion valve is opened excessively.	Add refrigerant after checking for leaks.	Check the refrigerant system.	Stop the compressor and extract excessive refrigerant. If air is found, perform evacuation, then charge the specified amount of refrigerant.

CAUTION:

The condition of bubbles seen through the sight glass as well as the intake and discharge pressures are influenced by the ambient temperature, wind velocity, weather, and by the air temperature in front of the condenser, etc.

EVACUATING, CHARGING AND CHECKING

Recovery Procedure

REMOVAL OF REFRIGERANT CHARGING DEVICE

1. Completely loosen the adapter valves of the low pressure and high pressure lines.

The inner valve of the adapter valve will prevent the refrigerant from leaking out.

2. Remove both the high-pressure and low-pressure side adapter valves from the on-vehicle service valve.

If adapter valve is not used for charging, proceed as follows to minimize the refrigerant discharge into the atmosphere.

3. Loosen the nut of the low pressure charging hose while pressing it against the service valve to prevent refrigerant leakage.
4. After loosening the nut, quickly remove the charge valve from the service valve.
5. Wait until the high pressure gauge indication drops to below 981 kPa (9.8 bar, 10 kg/cm², 142 psi), then similarly disconnect the high pressure charging hose.

DISPOSAL OF RESIDUAL REFRIGERANT

Securely shut off each of the charge valves, adapter valves and manifold gauge valves to prevent the residual refrigerant from leaking out. Keep these valves in a safe location for the next charging.

The amount of refrigerant remaining in a service canister can be estimated from the Table shown here. It is recommended that a label be attached indicating the remaining amount in the canister.

Maintenance of Oil Quantity in Compressor

The oil used to lubricate the compressor circulates through the system with the refrigerant. Whenever any component of the system is replaced or a large amount of gas leakage occurs, add oil to the compressor to maintain the specified amount. If oil quantity is not maintained properly, the following malfunctions may result:

- Lack of oil: May lead to a seized compressor
- Excessive oil: Inadequate cooling (thermal exchange impeded)

COMPRESSOR OIL — Checking and Adjusting

Maintenance of Oil Quantity in Compressor (Cont'd)

A new compressor is charged with the specified amount of oil (the overall amount needed in the system). So some oil needs to be drained from a new compressor to ensure that the amount of oil in the compressor is the same as was in the old compressor.

Amount of oil to be extracted from new compressor

Unit: ml (Imp fl oz)

Type	Pre-charged amount of oil in new compressor	Recovered amount of oil from old compressor	Amount of oil to be drained from new compressor
DKV14B DKV14C DKV14D	200 (7.0)	Less than 70 (2.5)	110 (3.9)
		Greater than 70 (2.5)	200 (7.0) - [Recovered amount + 20 (0.7)]

		Greater than 130 (4.6)	200 (7.0) - [Recovered amount + 20 (0.7, 0.7)]
MJS130 MJS170	150 (5.3)	—	80 (2.8)

Pre-charged amount of oil for some models differs from figures listed above. Refer to S.D.S. for each model when servicing compressor oil.

After replacing any of the following major components of the system, be sure to add the correct amount of oil to the system.

Amount of oil to be added

Part replaced	Oil to be added to system		Remarks
	Amount of oil ml (Imp fl oz)	Ratio (%)	
Evaporator	45 - 75 (1.6 - 2.6)	30	—
Condenser	30 - 50 (1.1 - 1.8)	20	—
Receiver drier	15 - 25 (0.5 - 0.9)	10	—
In case of refrigerant leak	30 - 50 (1.1 - 1.8)	—	Large leak
	—	—	Small leak*

*: If refrigerant leak is small, no addition of oil is needed.

"Ratio" in this table indicates the ratio of added oil to the overall amount of oil needed in the system.

Precautions

- Plug all openings to prevent moisture and foreign matter from entering.
- Do not leave compressor on its side or upside down for more than 10 minutes.
- When replacing or repairing compressor, check compressor oil level in system.
- When replacing with a new compressor, drain specified oil from new compressor. Refer to COMPRESSOR OIL.
- Be sure there is no oil or dirt on frictional surface of clutch disc and pulley.
- When replacing compressor clutch, be careful not to scratch shaft or bend pulley.
- When replacing compressor clutch assembly, do not forget BREAK-IN OPERATION.

Shaft Seal

REMOVAL

- Before disassembling, be sure to measure the amount of oil. After assembling, charge with the same amount of new oil.
- When removing seal, apply pressure with refrigerant.

CAUTION:

Do not use air to prevent entry of moisture, dust, etc.

- Using shaft seal remover and installer, depress carbon seal and hook the case of shaft seal.

INSPECTION

- Check the carbon seal surface of shaft seal for damage.

- Check O-ring and the carbon seal contact surface of shaft seal seat for damage. Make sure the O-ring contact surface at front cover is not damaged.

Shaft Seal (Cont'd)

INSTALLATION

- When installing shaft seal;
 - 1) Cap shaft seal pilot to the top end of compressor shaft.
 - 2) Using shaft seal remover and installer, insert shaft seal with shaft seal case and shaft cutout aligned.Apply force to turn the seal somewhat to the left and right. Insure that shaft seal seats properly in the shaft cutout.

Cylinder Head, Valve and Cylinder

REMOVAL (Rear)

- Using Allen socket, remove rear cover.

- Using cylinder head remover, remove rear cylinder head.

INSPECTION

- Check suction valve plate and cylinder head for signs of damage.

REMOVAL (Front)

- With the front facing downward, support compressor shell. Using a plastic mallet, tap at the rear end of the shell flange, driving shell straight downward.
- Detach front cover from cylinder assembly.

INSPECTION

- Check suction valve plate and cylinder head for signs of damage.
- Check to make sure contact surfaces of cylinders, compressor shaft and compressor shell are free from any sign of scratches.

Cylinder Head, Valve and Cylinder (Cont'd)

INSTALLATION

1. Front cover must be installed so that the cutout portions of front cover and shell are aligned.
For this purpose, install front cover on cylinder head so that angle between threaded hole in front cover and low-pressure side refrigerant passage in cylinder head is about 60°.

2. When installing shell on cylinder, adjust position of shell so that suction inlet of shell opens in the same direction as suction slit of cylinder visible in suction inlet by removing suction valve.

- When installing suction cover to rear cover, align knock pin.

Cylinder Head, Valve and Cylinder (Cont'd)

- Using Allen socket, install rear cover.

Leak Test

- Charge refrigerant from suction side and evacuate air from discharge side. Then conduct leak test.

Circuit Diagram for Quick Pinpoint Check (Cont'd)

Circuit Diagram for Quick Pinpoint Check (Cont'd)

The diagram illustrates the electrical system for a vehicle, featuring two ignition switches and a complex network of fuses, relays, and sensors.

Ignition Switches:

- Left Ignition Switch:** Labeled "IGNITION SWITCH ACC or ON". It controls the Blower Motor and Fan Resistor through a 15A fuse.
- Right Ignition Switch:** Labeled "IGNITION SWITCH ACC or ON". It controls the Thermo Control Amp and other components through a 10A fuse.

Blower Motor and Fan Resistor:

- The **Blower Motor** (M48) is connected to the left ignition switch via a 15A fuse.
- The **Fan Resistor** (M47) is connected to the left ignition switch via a 15A fuse.

Fan Switch:

- The **FAN SWITCH** is a 4-position switch (OFF, 1, 2, 3, 4) that controls the Blower Motor and Fan Resistor.

Illumination Lump:

- The **ILLUMINATION LUMP** is connected to the Fan Switch and provides power to the Blower Motor and Fan Resistor.

Thermo Control Amp and Thermistor:

- The **THERMO CONTROL AMP.** (M45) is connected to the right ignition switch via a 10A fuse.
- The **THERMISTOR** is connected to the Thermo Control Amp.

Other Components:

- A/C SWITCH:** (M40) is connected to the right ignition switch via a 10A fuse.
- DUAL-PRESSURE SWITCH:** (E29, E30) is connected to the right ignition switch via a 10A fuse.
- F.I.C.D. SOLENOID VALVE:** (M87) is connected to the right ignition switch via a 10A fuse.
- THERMAL PROTECTOR:** (A3) is connected to the right ignition switch via a 10A fuse.
- COMPRESSOR:** (E238) is connected to the right ignition switch via a 10A fuse.

Wiring Details:

- The diagram shows various fuses (15A, 10A) and relays (M48, M47, M45, M40, M87, A3, E238).
- Wiring paths are indicated by lines connecting components to their respective power sources.
- Grounding points are marked with "G" and "E".

TROUBLE DIAGNOSES

Main Power Supply and Ground Circuit Check

POWER SUPPLY CIRCUIT CHECK FOR A/C SYSTEM

Check power supply circuit for air conditioning system.

Refer to "POWER SUPPLY ROUTING" in EL section and A/C ELECTRICAL CIRCUIT.

THERMO CONTROL AMP. CHECK

Check power supply circuit for thermo control amp. with ignition switch ON.

1. Disconnect thermo control amp. harness connector.
2. Connect voltmeter from harness side.
3. Measure voltage across terminal No. ⑨ and body ground.

Voltmeter terminal		Voltage
+	-	
⑨	Body ground	Approx. 12V

Check body ground circuit for thermo control amp. with ignition switch OFF, A/C switch ON and fan switch ON.

1. Disconnect thermo control amp. harness connector.
2. Connect ohmmeter from harness side.
3. Check for continuity between terminal No. ⑩② and body ground.

Ohmmeter terminal		Continuity
+	-	
⑩②	Body ground	Yes

TROUBLE DIAGNOSES

Main Power Supply and Ground Circuit Check (Cont'd)

PUSH CONTROL UNIT CHECK

Check power supply circuit for push control unit with ignition switch at ACC.

1. Disconnect push control unit harness connector.
2. Connect voltmeter from harness side.
3. Measure voltage across terminal No. ⑤① and body ground.

Voltmeter terminal		Voltage
⊕	⊖	
⑤①	Body ground	Approx. 12V

Check body ground circuit for push control unit with ignition switch OFF.

1. Disconnect push control unit harness connector.
2. Connect ohmmeter from harness side.
3. Check for continuity between terminal No. ①①③ and body ground.

Ohmmeter terminal		Continuity
⊕	⊖	
①①③	Body ground	Yes

TROUBLE DIAGNOSES

3	Fan does not rotate at 2-speed.	③
4	Fan does not rotate at 3-speed.	④
5	Fan does not rotate at 4-speed.	⑤

Diagnostic Procedure 1

SYMPTOM: Blower motor does not rotate.

- Perform **PRELIMINARY CHECK 2** before referring to the following flow chart.

Check if blower motor rotates properly at each fan speed. Conduct check as per flow chart at left.

Note:
If the result is N.G. after checking circuit continuity, repair harness or connector.

TROUBLE DIAGNOSES

Diagnostic Procedure 1 (Cont'd)

Reconnect resistor harness connector.

G

Note

Check circuit continuity between fan switch and resistor.

CHECK FAN SWITCH AFTER DISCONNECTING IT.
(Refer to Electrical Components Inspection.)

N.G. → Replace fan switch.

O.K. →

F

Note

Check circuit continuity between fan switch harness terminal No. **101** and body ground.

O.K. → Replace blower motor.

TROUBLE DIAGNOSES

Diagnostic Procedure 3

SYMPTOM: Intake door does not change. — For push control type

- Perform **PRELIMINARY CHECK 1 (FOR L.H.D. MODEL ONLY)** and **Main Power Supply and Ground Circuit Check** before referring to the following flow chart.

A

CHECK POWER SUPPLY FOR INTAKE DOOR MOTOR.
Disconnect intake door motor harness connector.
Do approx. 12 volts exist between intake door motor harness terminal No. ④① and body ground?

N.G. Check 10A fuses at fuse block. (Refer to "POWER SUPPLY ROUTING" in EL section and A/C ELECTRICAL CIRCUIT.)

B

CHECK BODY GROUND CIRCUIT FOR INTAKE DOOR MOTOR.
Does continuity exist between intake door motor harness terminal No. ④② and body ground when REC switch is ON?
Does continuity exist between intake door motor harness terminal No. ④① and body ground when REC switch is OFF?

N.G. Disconnect push control unit harness connector.

C Note

Check circuit continuity between push control unit harness terminal No. ④② (④①) and intake door motor harness terminal No. ④② (④①)?

O.K. Replace control amp. built-in push control unit.

O.K. Replace intake door motor.

Note:

If the result is N.G. after checking circuit continuity, repair harness or connector.

Diagnostic Procedure 4

SYMPTOM: Magnet clutch does not operate when A/C switch and fan switch are ON. — GA16DE and SR20DE engine models

- Perform PRELIMINARY CHECK 2 before referring to the following flow chart.

Note:

If the result is N.G. after checking circuit continuity, repair harness or connector.

Diagnostic Procedure 6

SYMPTOM: Illumination or indicators of push control unit do not come on. — For push control type

- Perform Main Power Supply and Ground Circuit Check before referring to the following flow chart.

Turn ignition switch and lighting switch ON.

CHECK ILLUMINATION AND INDICATORS.

- Turn A/C, REC and fan switches ON.
- Push VENT, B/L, FOOT, F/D and DEF switches in order.
- Check for incidents and follow the repairing methods as shown:

INCIDENTS								"How to repair"
ILL.	VENT	B/L	FOOT	F/D	DEF	REC	A/C	
X	○	○	○	○	○	○	△	Go to DIAGNOSTIC PROCEDURE 6-1.

○ : Illumination or indicator comes on.

X : Illumination or indicator does not come on.

△ : Some indicators for VENT, B/L, FOOT, F/D, DEF or REC come on.

DIAGNOSTIC PROCEDURE 6-1

CHECK OTHER ILLUMINATION SYSTEMS EXCEPT FOR A/C SYSTEM.

Does other illumination come on with ignition switch and lighting switch ON?

N.G.

CHECK ILLUMINATION SYSTEM. Refer to illumination/Wiring Diagram in EL section.

O.K.

Turn ignition switch and lighting switch OFF.

A

CHECK ILLUMINATION BULB. Remove push control unit and disconnect harness connectors. Remove illumination bulb(s) and check them.

N.G.

Replace illumination bulb(s).

O.K.

(Go to next page.)

TROUBLE DIAGNOSES

Diagnostic Procedure 6 (Cont'd)

B

CHECK POWER SUPPLY FOR ILLUMINATION WITH LIGHTING SWITCH ON.
Do approx. 12 volts exist between push control unit harness terminal No. ⑤② and body ground?

N.G. → **CHECK POWER SUPPLY FOR A/C ILLUMINATION SYSTEM.**
Refer to Illumination/Wiring Diagram in EL section.

O.K.

C

CHECK BODY GROUND CIRCUIT FOR ILLUMINATION.
Does continuity exist between push control unit harness terminal No. ①①② and body ground?

Note

O.K.

Replace control amp. built-in push control unit.

Note:

If the result is N.G. after checking circuit continuity, repair harness or connector.

DIAGNOSTIC PROCEDURE 6-3

Turn ignition switch and lighting switch OFF.

Disconnect push control unit harness connector.

A

CHECK POWER SUPPLY FOR PUSH CONTROL UNIT.
Do approx. 12 volts exist between push control unit harness terminal No. ⑤1 and body ground?

N.G. → Check 10A fuse at fuse block. (Refer to "POWER SUPPLY ROUTING" in EL section and A/C ELECTRICAL CIRCUIT.)

O.K.

B

CHECK BODY GROUND CIRCUIT FOR PUSH CONTROL UNIT.
Does continuity exist between push control unit harness terminal No. ①13 and body ground?

Note

O.K.

Replace control amp. built-in push control unit.

Note:

If the result is N.G. after checking circuit continuity, repair harness or connector.

TROUBLE DIAGNOSES

Electrical Components Inspection (Cont'd)

FAN SWITCH

Check continuity between terminals as each switch position.

BLOWER MOTOR

Confirm smooth rotation of the blower motor.

- Ensure that there are no foreign particles inside the intake unit.

BLOWER RESISTOR

Check continuity between terminals.

DOOR CONTROL

Control Cable and Rod Adjustment — Lever control type

- When disconnecting the control cable, remove the E-ring and take off the cable while pushing the cable outer in the direction of the arrow.

AIR CONTROL CABLE

- Clamp the cable while pushing cable outer and side link in DEF mode.

After positioning control cable, check it operates properly.

- For R.H.D. models, set side link in VENT mode.

WATER COCK CONTROL ROD

- When adjusting water cock control rod, first disconnect temperature control cable from air mix door lever. Reconnect and readjust temperature control cable.

1. Push air mix door lever in direction of arrow.
2. Pull control rod of water cock in direction of arrow so as to make clearance of about 2 mm (0.08 in) between ends of rod and link lever and connect the rod to door lever.

After connecting control rod, check it operates properly.

TEMPERATURE CONTROL CABLE

- Clamp the cable while pushing cable outer and air mix door lever in full hot position.

After positioning control cable, check it operates properly.

- For R.H.D. models, set air mix door lever in full cold position.

DOOR CONTROL

Control Cable and Rod Adjustment — Lever control type (Cont'd)

INTAKE DOOR CONTROL CABLE

- Clamp the cable while pushing cable outer and intake door lever at FRE position.

After positioning control cable, check it operates properly.

- For R.H.D. models, set intake door lever at REC position.

FRESH VENT DOOR — For Europe models

1. Set air control cable at VENT.
2. Push fresh vent door link in direction of arrow.
3. Clamp fresh vent door control rod.

After connecting control rod, check fresh vent door is shut tightly in both VENT mode and DEF mode.

FRESH VENT DOOR — Except Europe models

1. Set fresh vent lever at  position.
2. Set fresh vent shaft in direction of arrow. Pull on outer cable and then clamp it.

After positioning control cable, check it operates properly.

Control Cable and Rod Adjustment — Push control type

MODE DOOR

1. Move side link with hand and hold mode door in VENT mode.
2. Install mode door motor on heater unit and connect it to body harness.
3. Turn ignition switch to ACC.
4. Turn VENT switch ON.
5. Attach mode door motor rod to side link rod holder.
6. Turn DEF switch ON. Check that side link operates at the fully-open position. Also turn VENT switch ON to check that side link operates at the fully-open position.

DOOR CONTROL

Control Cable and Rod Adjustment — Push control type (Cont'd)

TEMPERATURE CONTROL CABLE

Refer to "TEMPERATURE CONTROL CABLE" section in "Control Cable and Rod Adjustment — Lever control type" on page HA-121.

INTAKE DOOR

1. Connect the intake door motor harness connector before installing to the intake door motor.
2. Turn ignition switch to ACC.
3. Turn REC switch ON.
4. Install intake door motor on intake unit.
5. Install intake door lever.
6. Set intake door rod in REC position and fasten door rod to holder on intake door lever.
7. Check that intake door operates properly when REC switch is turned ON and OFF.

FRESH VENT DOOR

Refer to "FRESH VENT DOOR" section in "Control Cable and Rod Adjustment — Lever control type" on page HA-122.

Intake Door Motor

The intake door motor is installed on the front portion of the intake unit. Using a rod and link it opens and closes the intake door.

When the REC switch is ON (OFF), the ground line of the intake door motor is switched from terminal ⑪ to ⑨ (⑨ to ⑪). This causes the motor to start because the position switch contacts built into it are set to the current flow position. The contacts turn along with the motor. When they reach the non-current flow position, the motor will stop. The motor always turns in the same direction.

Removal and Installation

1. Remove cluster lid C.

2. Remove the 6 bracket screws.

3. Disconnect temperature control cable at heater unit side.

4. Remove cassette deck.

5. Disconnect push control unit harness connectors.

6. Remove lower instrument panel with push control unit.

7. Remove push control unit.

8. Installation is in the reverse order of removal.

Refer to "Control Cable and Rod Adjustment" for temperature control cable.

HANDLING METHOD AND STRUCTURE

Manifold gauge

The manifold gauge is used to measure the operating pressure accurately in the high pressure and low pressure lines of the refrigerating system.

The high pressure gauge measures from -101.3 kPa ($-1,013 \text{ mbar}$, -760 mmHg , -29.92 inHg) to $2,942 \text{ kPa}$ (29.4 bar , 30 kg/cm^2 , 427 psi), and the low pressure gauge measures generally from -101.3 kPa ($-1,013 \text{ mbar}$, -760 mmHg , -29.92 inHg) to $1,471 \text{ kPa}$ (14.7 bar , 15 kg/cm^2 , 213 psi).

CAUTION:

- When installing the gauge to the refrigerating system, use utmost care not to mistake high pressure and low pressure line connections. (Wrong connections will lead to a damaged gauge.)
- Before evacuating, confirm that the gauge has a negative pressure scale. (If not, the gauge will be damaged.)

Charging hose

1. Completely tighten the high pressure valve, low pressure valve and vacuum pump valve cocks of the gauge manifold.
2. Connect the charging hoses to the high and low pressure lines.
3. Connect the charging hose fitted with a valve core to the refrigerant canister.
4. Connect the charging hose to the vacuum pump.

The high and low pressure hoses are color coded to prevent wrong connection.

High pressure line hose	Red
Low pressure line hose	Yellow
Refrigerant canister hose	Blue or green (with valve core)
Vacuum pump hose	Blue or green

CAUTION:

- Check each hose for cracks. If found, discard the hose.
- Do not use any hose if bulges are found.
- Check the rubber packing. If any deterioration or cracks are found, replace it with a new one.

PREPARATION

Service Tools (Cont'd)

Charge valve

The charge valve is used to charge the refrigerant into the system from the service canister through the gauge manifold. Attach this valve to the head of a service canister by screwing it on. Then turn the handle clockwise to pierce the canister to allow the refrigerant to flow into the refrigerating system.

CAUTION:

Check the packing for any sign of deterioration or cracks. If any abnormalities are found, replace it with a new one.

1. Turn the charge valve handle counterclockwise to fully retract the needle, and then attach the charge valve to the service canister. Note that leakage will occur if the charge valve is attached to the canister without retracting the needle.
2. Securely fit the charge valve to the head of the service canister by turning it. Then turn the handle slowly clockwise to make a hole in the canister with the needle.
3. Turn the handle counterclockwise to retract the needle, and the refrigerant will flow into the gauge manifold through the hole. To stop the flow of the refrigerant, turn the handle clockwise to close the hole with the needle.

Connecting T-joint adapter

The T-joint adapter is used to connect two refrigerant canisters so that air purging and the accompanying discharge of refrigerant into the atmosphere can be eliminated when recharging the refrigerant. If only one service canister is sufficient to charge the refrigeration system, do not use this T-joint adapter.

1. Turn the handle of each charge valve fully counterclockwise, and attach the valve to a refrigerant canister.
2. Connect the T-joint adapter to both charge valves so that two refrigerant canisters are connected as shown.
3. Connect the charging hose with valve core to the T-joint adapter. Connect the valve core end of the charging hose to the manifold gauge.

If more than three service canisters are needed for charging, use a cross joint adapter to connect four service canisters.

PREPARATION

Service Tools (Cont'd)

Installing the adapter valve

Install the adapter valve to each of the high pressure and low pressure service valves so that air purging from the charging hose can be omitted. This also ensures that refrigerant leakage upon disconnection of the hose can be prevented.

1. Before connecting the adapter valve to the on-vehicle service valve, turn the adapter valve handle fully counterclockwise to retract the pin.

CAUTION:

Check the packing for any sign of deterioration or cracks. If any abnormality is found, replace it with a new one.

2. Connect the charging hose to the adapter valve.

Turning the handle clockwise will cause the on-vehicle service valve pin to be pushed open by the adapter valve pin, thus opening the refrigerant passage.

Turning the handle counterclockwise will close the passage. Before removing the adapter valve from the on-vehicle service valve, be sure to fully turn the handle counterclockwise to shut off the refrigerant passage.

Vacuum pump

The vacuum pump is used to purge air and moisture from the inside of the refrigeration system by evacuation, thereby ensuring proper functioning of the air conditioner system.

Check the vacuum pump to see that the vacuum pump capacity is greater than -100.0 kPa (-1,000 mbar, -750 mmHg, -29.53 inHg).

Vacuum pump performance check procedure

1. Connect the vacuum gauge to the system.
2. Run the vacuum pump, and check to see that the needle pointers of the gauge manifold and vacuum gauge move smoothly, indicating a similar value.
3. After running the vacuum pump for two or three minutes, read the vacuum gauge. The measured value indicates the capacity of the vacuum pump.

Gas leak detector

The gas leak detector is used to check whether the refrigeration system is leaking. The detector is available in two types; halide torch or electrical. The features of these gas leak detectors are listed on the next page.

PREPARATION

Service Tools (Cont'd)

Type		Detection ability	Features
Halide torch		200 g (7.05 oz)/year (thin green)	● Low price ● Low sensitivity ● Less safe because of the use of flame for detection
Electrical	Discharge type (Suction type)	3 - 50 g (0.11 - 1.76 oz)/year	● Easy handling ● Medium sensitivity ● Each point needs two or more seconds for detection.
	Positive ion emission type (Suction type)	2 g (0.07 oz)/year	● High sensitivity ● High price ● Warm-up time is needed because a heater is incorporated.
Other simple checking method: Change in vacuum when evacuating		1 kg (2 lb)/month; if 13.3 kPa (133 mbar, 100 mmHg, 3.94 inHg) change in vacuum is detected in 10 minutes.	● Can be used easily in refrigerant charging operation. ● Detection ability is very low with vacuum gauge in gauge manifold.

- Leakage inspection of a refrigeration system needs a sensitivity greater than 20 g (0.71 oz)/year.
- The actual amount of leak is estimated at 5 to 10 times the detected amount.
- Insufficient cooling may be felt if leakage exceeds 150 to 200 g (5.29 to 7.05 oz).

Temperature gauge

Use to check the air conditioner performance. An etched stem type thermometer may be used. A hygrometer must also be used because the air conditioner performance depends on the humidity.

Scale

Measure the weight of the refrigerant to determine how much the refrigerant is charged.

PREPARATION

Service Tools (Cont'd)

Charging cylinder

The charging cylinder is used to correctly measure the amount of refrigerant to be charged.

Features

- With the charging cylinder, the operator can measure correctly the amount of refrigerant to be charged into the system.
- Change in the refrigerant volume due to a change in temperature and pressure can be supplemented, and this ensures correct charging of refrigerant.

CAUTION:

- Never attempt to carry the charging cylinder containing refrigerant.
- Do not put the charging cylinder in a hot place. If the temperature and pressure of the refrigerant in the cylinder increase, the safety valve will be pushed open and the refrigerant will be released into the atmosphere.
- Do not expose the cylinder to the direct sunlight.
- Do not over-charge the refrigerant so that it exceeds the maximum limit of the cylinder.
- Do not charge the cylinder with more refrigerant than is needed.

How to Identify Type I and Type II Vehicles

The vehicles are classified into two types (Type I and Type II) according to the difference in the electrical system. Before starting any trouble diagnoses, be sure to identify whether a Type I or Type II wiring diagram matches the vehicle by comparing the vehicle's fuse block with the diagram below.

POWER SUPPLY ROUTING

POWER SUPPLY ROUTING

Fuse

- If fuse is blown, be sure to eliminate cause of problem before installing new fuse.
- Use fuse of specified rating. Never use fuse of more than specified rating.
- Do not install fuse in oblique direction; always insert it into fuse holder properly.
- Remove fuse for clock if vehicle is not used for a long period of time.

Fusible Link

A melted fusible link can be detected by visual inspection. If its condition is questionable, use circuit tester or test lamp.

CAUTION:

- If fusible link should melt, it is possible that critical circuit (power supply or large current carrying circuit) is shorted. In such a case, carefully check and eliminate cause of problem.
- Never wrap periphery of fusible link with vinyl tape. Extreme care should be taken with this link to ensure that it does not come into contact with any other wiring harness or vinyl or rubber parts.

BATTERY

CAUTION:

- If it becomes necessary to start the engine with a booster battery and jumper cables, use a 12-volt booster battery.
- After connecting battery cables, ensure that they are tightly clamped to battery terminals for good contact.
- Never add distilled water through the hole used to check specific gravity.

How to Handle Battery

METHODS OF PREVENTING OVER-DISCHARGE

The following precautions must be taken to prevent over-discharging a battery.

- The battery surface (particularly its top) should always be kept clean and dry.
If the top surface of a battery is wet with electrolyte or water, leakage current will cause the battery to discharge. Always keep the battery clean and dry.
- When the vehicle is not going to be used over a long period of time, disconnect the negative battery terminal. (If the vehicle has an extended storage switch, turn it off.)
- Check the charge condition of the battery.
Periodically check the specific gravity of the electrolyte. Keep a close check on charge condition to prevent over-discharge.

BATTERY

How to Handle Battery (Cont'd)

CHECKING ELECTROLYTE LEVEL

WARNING:

Do not allow battery fluid to come in contact with skin, eyes, fabrics, or painted surfaces. After touching a battery, do not touch or rub your eyes until you have thoroughly washed your hands. If the acid contacts the eyes, skin or clothing, immediately flush with water for 15 minutes and seek medical attention.

Normally the battery does not require additional water. However, when the battery is used under severe conditions, adding distilled water may be necessary during the battery life.

- Remove the cell plug using a suitable tool.
- Add distilled water up to the MAX level.

SULPHATION

When a battery has been left unattended for a long period of time and has a specific gravity of less than 1.100, it will be completely discharged, resulting in sulphation on the cell plates.

Compared with a battery discharged under normal conditions, the current flow in a "sulphated" battery is not as smooth although its voltage is high during the initial stage of charging, as shown in the figure at the left.

SPECIFIC GRAVITY CHECK

1. Read hydrometer and thermometer indications at eye level.

2. When electrolyte level is too low, tilt battery case to raise it for easy measurement.

BATTERY

How to Handle Battery (Cont'd)

2. Convert into specific gravity at 20°C (68°F).

Example:

- When electrolyte temperature is 35°C (95°F) and specific gravity of electrolyte is 1.230, converted specific gravity at 20°C (68°F) is 1.240.
- When electrolyte temperature is 0°C (32°F) and specific gravity of electrolyte is 1.210, converted specific gravity at 20°C (68°F) is 1.196.

- Keep battery away from open flame while it is being charged.
- When connecting charger, connect leads first, then turn on charger. Do not turn on charger first, as this may cause a spark.

- ▷ Check battery type and determine the specified current using the table shown above.
- ▷ After starting charging, adjustment of charging current is not necessary.

CAUTION:

- Do not use quick charge method on a battery whose specific gravity is less than 1.100.
- Set initial charging current to value specified in Fig. 6. If charger is not capable of producing specified current value, set its charging current as close to that value as possible.
- Keep battery away from open flame while it is being charged.
- When connecting charger, connect leads first, then turn on charger. Do not turn on charger first, as this may cause a spark.
- Be careful of a rise in battery temperature because a large current flow is required during quick-charge operation.
If battery temperature rises above 60°C (140°F), stop charging. Always charge battery when its temperature is below 60°C (140°F).
- Do not exceed the charging time specified in Fig. 6, because charging battery over the charging time can cause deterioration of the battery.

Removal and Installation

REMOVAL

2WD with GA (M/T) and E10S engines

- Remove starter from transaxle side (from engine compartment upper side.)

GA engine (A/T)

SEL479P

GA (A/T) and CD engines

- Remove starter from engine side (from engine compartment underside.)

CD engines

SEL480P

SEL206Q

4WD with GA engines

1. Remove battery, air cleaner, intake air duct, EFI harness, vacuum hoses and speedometer cable from transfer.
2. Remove rear buffer rod, buffer rod bracket and intake manifold supports.
3. Remove starter from transaxle side (from engine compartment upper side).

SEL207Q

4WD with SR20DET engine

1. Remove battery, air cleaner and intercooler.
2. Remove power steering hose mounting bracket from intake collector.
3. Remove vacuum hose from brake booster (R.H.D. only).
4. Remove front exhaust tube.
5. Remove intake manifold support mounting bolts.

Removal and Installation (Cont'd)

6. Remove vacuum hoses and EFI harness.
7. Remove rear buffer rod and bracket.

8. Remove intercooler support and rear intake manifold support.
9. Move intake manifold support to engine compartment rear side as much as possible, then remove starter from trans-axle side (from engine compartment upper side).

INSTALLATION

Installation procedure is the reverse order of removal.

Magnetic Switch Check

- Before starting to check, disconnect battery ground cable.
 - Disconnect "M" terminal of starter motor.
1. Continuity test (between "S" terminal and switch body).
- ⊗ No continuity ... Replace.

Pinion/Clutch Check

1. Inspect pinion teeth.
- Replace pinion if teeth are worn or damaged. (Also check condition of ring gear teeth.)
2. Check to see if pinion locks in one direction and rotates smoothly in the opposite direction.
- If it does not lock (or locks) in either direction or unusual resistance is evident. ... Replace.

 - Abnormal resistance ... Replace.

Brush Check

BRUSH

Check wear of brush.

Wear limit length:

Refer to S.D.S.

- Excessive wear ... Replace.

BRUSH SPRING PRESSURE

Check brush spring pressure with brush spring detached from brush.

Spring pressure (with new brush):

Refer to S.D.S.

- Not within the specified values ... Replace.

1. Continuity test (between field coil positive terminal and positive brushes).
 - No continuity ... Replace field coil.
2. Insulation test (between field coil positive terminal and yoke).
 - Continuity exists. ... Replace field coil.

Pole Piece Check [M1T72086A, M1T72087A, M1T72985, M1T60185]

Pole piece is secured to yoke by bonding agent. Check pole piece to see that it is secured to yoke and for any cracks. Replace malfunctioning parts as an assembly.

Holder may move slightly as it is only inserted and not bonded.

CAUTION:

Do not clamp yoke in a vice or strike it with a hammer.

Yoke Assembly Check [S114-530, -533, -535, -701A]

Check magnet for cracks. If there is any crack, replace malfunctioning parts as an assembly.

Armature Check

1. Continuity test (between two segments side by side).
 - No continuity ... Replace.

2. Insulation test (between each commutator bar and shaft).
 - Continuity exists. ... Replace.

3. Check commutator surface.
 - Rough ... Sand lightly with No. 500 - 600 sandpaper.

4. Check diameter of commutator.
Commutator minimum diameter:
Refer to S.D.S.
 - Less than specified value ... Replace.

Armature Check (Cont'd)

5. Check depth of insulating mold from commutator surface.
 - Less than 0.2 mm (0.008 in) ... Undercut to 0.5 to 0.8 mm (0.020 to 0.031 in)

Assembly

Apply high-temperature grease to lubricate the bearing, gears and frictional surface when assembling the starter. Carefully observe the following instructions.

Trouble-shooting

Before conducting an alternator test, make sure that the battery is fully charged. A 30-volt voltmeter and suitable test probes are necessary for the test. The alternator can be checked easily by referring to the Inspection Table.

Before starting trouble-shooting, inspect the fusible link.

WITH IC REGULATOR

Make sure connector (S, L) is connected correctly.

- 1) Use fully charged battery
- 2) Light : Charge warning light
A.C.G. : Alternator parts except IC regulator
IC-RG : IC regulator
O.K. : IC-alternator is in good condition
- 3) When reaching "Damaged A.C.G.", remove alternator from vehicle and disassemble, inspect and correct or replace faulty parts
- 4) *Method of grounding F terminal (HITACHI make only)

Gasoline engine model

Connect tip of wire to brush and attach wire to alternator body.

Diesel engine model

Remove vacuum pump and connect tip of wire to brush and attach wire to alternator body.

- 5) Terminals "S", "L", "B" and "E" are marked on rear cover of alternator.

Rotor Slip Ring Check

1. Continuity test
 - No continuity ... Replace rotor.
2. Insulator test
 - Continuity exists ... Replace rotor.
3. Check slip ring for wear.
 - Slip ring minimum outer diameter:**
Refer to S.D.S.

Brush Check

1. Check smooth movement of brush.
 - Not smooth ... Check brush holder and clean.
2. Check brush for wear.
 - Replace brush if it is worn down to the limit line.

Brush Check (Cont'd)

3. Check brush lead wire for damage.

- Damaged ... Replace.

4. Check brush spring pressure.

Measure brush spring pressure with brush projected approximately 2 mm (0.08 in) from brush holder.

Spring pressure:

Refer to S.D.S.

- Not within the specified values ... Replace.

Stator Check (Except LR165-708B, LR170-738B)

To test the stator or diode, separate them by unsoldering the connecting wires.

CAUTION:

Use only as much heat as required to melt solder. Otherwise, diodes will be damaged by excessive heat.

1. Continuity test

- No continuity ... Replace stator.

HEADLAMP — Daytime Light System —

Operation

After starting the engine with the lighting switch in the "OFF" position, the headlamp low beam and clearance, tail, license and instrument illumination lamps automatically turn on. Lighting switch operations other than the above are the same as conventional light systems.

Operation

When ignition switch is in the "ON" position with the lighting switch in the "1ST" position, the headlamp low beam comes on dimly to function as a clearance lamp. Lighting switch operations other than the above are the same as conventional light systems.

Description

- The vertical direction of the headlamp projection can be adjusted from inside the vehicle to prevent the headlight beam axis from facing upward due to a change in the number of occupants and load conditions in the vehicle.

HEADLAMP — Headlamp Aiming Control —

Description (Cont'd)

CIRCUIT OPERATION

[Example]

Aiming switch "0"

- When the aiming switch is set to "0", the motor will not start because the power terminals are positioned at the nonconductive section of the sensor's rotary unit.

Aiming switch "0" → "1"

- When the aiming switch is moved from "0" to "1", power is applied to the motor through the relay operated by the sensor's conductive section. The headlamps will then move in the "DOWN" direction.
- The motor continues to rotate while the rotary unit of the sensor moves from point A to point B.
- The power terminals will then be positioned at the nonconductive section, disconnecting the power to the motor. Then motor then stops.

Aiming switch "1" → "0"

- When the aiming switch is moved from "1" to "0", power is applied to the motor through the relay operated by the conductive section of the sensor. The motor will rotate to move the headlamps in the "UP" direction.
- When the rotary unit of the sensor moves from point B to point A, the motor will stop.

Trouble-diagnosis

SYMPTOM: Headlamp aiming does not operate.

N.G. → Check 10A fuse at fuse block.
(Refer to "POWER SUPPLY ROUTING".)

N.G. → Replace aiming switch.

N.G. → Repair harness between aiming motor and body ground.

N.G. → Check harness between aiming switch and aiming motor unit

O.K. → Replace aiming motor unit.

HEADLAMP

Bulb Replacement

The headlamp is a semi-sealed beam type which uses a replaceable halogen bulb. The bulb can be replaced from the engine compartment side without removing the headlamp body.

- **Grasp only the plastic base when handling the bulb. Never touch the glass envelope.**

1. Disconnect the battery cable.
2. Disconnect the harness connector from the back side of the bulb.
3. Turn the bulb retaining ring counterclockwise until it is free from the headlamp reflector, and then remove it.
4. Pull off the rubber cap.
5. Remove the headlamp bulb carefully. Do not shake or rotate the bulb when removing it.
6. Install in the reverse order of removal.

CAUTION:

- **Do not leave the bulb out of the headlamp reflector for a long period of time as dust, moisture, smoke, etc. may enter the headlamp body and affect the performance of the headlamp. Thus, the headlamp bulb should not be removed from the headlamp reflector until just before a replacement bulb is to be installed.**

Aiming Adjustment

When performing headlamp aiming adjustment, use an aiming machine, aiming wall screen or headlamp tester. For operating instructions of any aimer, it should be in good repair, calibrated and used according to respective operation manuals supplied with the unit.

If any aimer is not available, aiming adjustment can be done as follows:

For details, refer to the regulations in your own country.

CAUTION:

- a. **Keep all tires inflated to correct pressures.**
- b. **Place vehicle and tester on one and same flat surface.**
- c. **See that there is no-load in vehicle (coolant, engine oil filled up to correct level and full fuel tank) other than the driver (or equivalent weight placed in driver's position).**

CAUTION:

Be sure aiming switch is set to "0" when performing aiming adjustment on vehicles equipped with headlamp aiming control.

HEADLAMP

Aiming Adjustment (Cont'd)

LOW BEAM

1. Turn headlamp low beam on.
 2. Use adjusting screws to perform aiming adjustment.
- **First tighten the adjusting screw all the way and then make adjustment by loosening the screw.**

- a. Adjust headlamps so that main axis of light is parallel to center line of body and is aligned with point P shown in illustration.
 - b. Figure to the left shows headlamp aiming pattern for driving on right side of road; for driving on left side of road, aiming pattern is reversed.
 - c. Dotted lines in illustration show center of headlamp.

 "W": Distance between each headlamp center

 - Fuse Block:** Contains fuses for 15A and 10A.
 - Front Fog Lamp Switch:** Controls the front fog lamps.
 - Lighting Switch:** Controls the lighting system.
 - Front Fog Lamps:** R. H. and L. H. lamps are connected to the front fog lamp relay.
 - Front Fog Lamp Relay:** Controls the front fog lamps.
 - Engine Room Harness:** Connects the battery to the main harness.
 - Main Harness:** Distributes power to the front fog lamps and other components.
 - Sub-harness:** Connects the main harness to the front fog lamps.
 - Body Ground:** Provides a common ground for the system.

Turn Signal and Hazard Warning Lamps/Wiring Diagram

Wiring Diagram

This diagram illustrates the electrical system for the vehicle, showing the connections between various components and their respective fuses.

Legend:

- (C) : Coupe
- (S) : Sedan
- (DM) : Digital meter
- (NT) : Needle meter with tachometer
- (WT) : Needle meter without tachometer
- (ME) : For Middle East
- (EM) : Except ME

Components and Connections:

- IGNITION SWITCH ON OF START BATTERY:** Connected to the main power source.
- FUSE BLOCK (Refer to "POWER SUPPLY ROUTING"):** Contains fuses for various circuits.
- COMBINATION METER:** Includes gauges for fuel level, engine temperature, oil pressure, and battery charge.
- HAZARD SWITCH:** Controls the hazard warning lights.
- TURN SIGNAL LAMP R. H. / L. H.:** Right and Left Hand Turn Signal Lamps.
- FRONT COMBINATION LAMP R. H. / L. H.:** Front Right and Left Hand Combination Lamps.
- REAR COMBINATION LAMP R. H. / L. H.:** Rear Right and Left Hand Combination Lamps.
- SIDE TURN SIGNAL LAMP R. H. / L. H.:** Side Turn Signal Lamps.
- TAIL LIGHTS:** Located at the rear of the vehicle.
- BRAKE LIGHTS:** Controlled by the brake pedal.
- HORN:** Used for signaling.
- WIPER MOTOR:** Operates the windshield wipers.
- INTERIOR LIGHTS:** Provide illumination inside the cabin.
- EXTERIOR LIGHTS:** Provide illumination outside the vehicle.

The diagram shows the flow of electricity from the battery through various switches and fuses to the lamps and other electrical components. Wire colors are indicated throughout the diagram to identify specific circuits.

Combination Flasher Unit Check

- Before checking, ensure that bulbs meet specifications.
- Connect a battery and test lamp to the combination flasher unit, as shown. Combination flasher unit is properly functioning if it blinks when power is supplied to the circuit.

Inspection/Fuel Gauge and Water Temperature Gauge

Fuel Tank Gauge Unit Check (2WD)

- For removal, refer to FE section.
- Check the resistance between terminals (G) and (E).

Ohmmeter		Float position mm (in)				Resistance value (Ω)
(+)	(-)			Type-I	Type-II	
G	E	*3	Full	59 (2.32)	58 (2.28)	Approx. 4 - 6

		*1	Empty	166 (6.54)	161 (6.34)	78 - 85

*1 and *3: When float rod is in contact with stopper.

Fuel Tank Gauge Unit Check (4WD)

- For removal, refer to FE section.
- Check the resistance between terminals (G) and (E).

Main tank

Ohmmeter		Draft line mm (in)			Resistance value (Ω)
(+)	(-)				
G	E	*1	Full	13 (0.51)	Approx. 5 - 8

○: ON, —: OFF

Fuel Warning Lamp Sensor Check

- It will take a short time for the bulb to light.

Thermal Transmitter Check

Check the resistance between the terminals of thermal transmitter and body ground.

Water temperature	Resistance
60°C (140°F)	Approx. 70 - 90Ω
100°C (212°F)	Approx. 21 - 24Ω

Oil Pressure Switch Check

Check the continuity between the terminals of oil pressure switch and body ground.

	Oil pressure kPa (bar, kg/cm ² , psi)	Continuity
Engine start	More than 10 - 20 (0.10 - 0.20, 0.1 - 0.2, 1.4 - 2.8)	NO
Engine stop	Less than 10 - 20 (0.10 - 0.20, 0.1 - 0.2, 1.4 - 2.8)	YES

Oil Pressure Sending Unit Check

Check the resistance between the terminals of oil pressure sending unit and body ground.

Oil pressure kPa (bar, kg/cm ² , psi)	Resistance value
0 (0, 0, 0) (Engine is stopped)	∞
392 (3.9, 4, 57)	Approx. 27 - 37Ω
588 (5.9, 6, 85)	Approx. 17 - 27Ω

Oil Temperature Sensor Check

Check the resistance between the terminals of oil temperature sensor and body ground.

Water temperature	Resistance
70°C (158°F)	Approx. 87 - 97Ω
110°C (230°F)	Approx. 26 - 29Ω

Boost Pressure Sensor Check

1. Connect vacuum pump gauge to boost pressure sensor vacuum hose.
2. Disconnect harness connector from boost pressure sensor and connect battery and voltmeter as shown.
3. Apply vacuum pressure to boost pressure sensor by vacuum pump gauge and measure voltages.

Vacuum pressure kPa (mbar, mmHg, inHg)	Voltage (V)
0 (0, 0, 0)	Approx. 2.2
-53.3 (-533, -400, -5.75)	Approx. 1.3

Speedometer Cable Removal and Installation

After disconnecting speedometer cable end from transaxle, push speedometer cable so that combination meter is pushed into passenger compartment. Disconnect speedometer cable end from combination meter as shown in the figure at left.

Speed Sensor Signal Check (Non-turbo models)

- A speed sensor is built into the speedometer.
1. Turn speedometer slowly using a small screwdriver.
 2. Check continuity of speed sensor circuit.

Continuity exists two times for each turn ... O.K.

Speed Sensor Signal Check (Turbo models)

1. Remove speed sensor from transaxle.
2. Turn speedometer pinion quickly and measure voltage across **a** and **b**.

Trouble Diagnoses

SELF-CHECK (SEGMENT CHECK)

1. Turn light switch from "OFF" to "ON" more than 10 times, within 15 seconds after ignition switch is turned from "OFF" to "ON".
2. The display starts self-check automatically. This function operates on speedometer, tachometer, temperature gauge and fuel gauge at the same time.
To stop this function, run engine or turn ignition switch to "OFF".

MAIN POWER SUPPLY AND GROUND CIRCUIT CHECK

Main power supply

Terminal No.		Ignition switch		
(+)	(-)	OFF	ACC	ON
31	Ground	0V	0V	Battery voltage
36	Ground	Battery voltage	Battery voltage	Battery voltage
40	Ground	0V	Battery voltage	Battery voltage

Ground circuit

Terminal No.	Continuity
34	Yes

Trouble Diagnoses (Cont'd)

DIAGNOSTIC PROCEDURE ①

SYMPTOM: Speedometer always indicates zero ("0") when driving.

A

SPEED SENSOR INPUT SIGNAL CHECK

1. Apply wheel chocks and jack up front of vehicle.
2. Connect voltmeter between harness terminals No. 37 and No. 39.
3. Turn front wheel slowly.
4. Check deflection of voltmeter pointer.

O.K.

Replace digital meter.

N.G.

SPEED SENSOR CHECK

Refer to "Speed sensor signal check".

N.G.

Replace speed sensor.

O.K.

B

SPEED SENSOR CIRCUIT CHECK

Check continuity between digital meter harness terminals and speed sensor terminals.

Terminal No.		Continuity
Digital meter	Speed sensor	
37	a	Yes
39	b	

N.G.

Repair harness or connector.

Trouble Diagnoses (Cont'd)

DIAGNOSTIC PROCEDURE ②

SYMPTOM: Indicated value of speedometer changes irregularly or is incorrect.

SPEED SENSOR CHECK

Refer to "Speed sensor signal check".

O.K.

Replace speed sensor.

N.G.

A

SPEED SENSOR CIRCUIT CHECK

Check continuity between digital meter harness terminals and speed sensor terminals.

N.G.

Repair harness or connector.

Terminal No.		Continuity
Digital meter	Speed sensor	
37	a	Yes
39	b	

O.K.

Replace digital meter.

DIAGNOSTIC PROCEDURE ③

SYMPTOM: Indicated value of tachometer is incorrect.

A

TACHOMETER INPUT SIGNAL CHECK

Check voltage between digital meter harness terminal No. 41 and body ground.

O.K.

Replace digital meter.

Terminal No		Voltage (V)
(+)	(-)	
41	Ground	Approx. 1 - 5

N.G.

B

TACHOMETER CIRCUIT CHECK

Check continuity between digital meter terminal No. 41 and E.C.C.S. control unit harness terminal No. 2.

N.G.

Repair harness or connector.

O.K.

Check E.C.C.S. control unit. Refer to EF & EC section.

Trouble Diagnoses (Cont'd)

DIAGNOSTIC PROCEDURE ④

SYMPTOM: Indicated value of water temperature gauge is incorrect.

A

WATER TEMPERATURE SENSOR INPUT SIGNAL CHECK
Check resistance between digital meter harness terminal No. 32 and body ground.
Compare measured resistance with indication of gauge segment (before disconnecting connector).
Gauge indication is changed by the water temperature.

Segment	Resistance (Ω)
7	Approx. 14
}	}
4	Approx. 64
}	}
1	Approx. 203

O.K. → Replace digital meter.

N.G.

THERMAL TRANSMITTER CHECK
Refer to "Thermal Transmitter Check".

N.G. → Replace thermal transmitter.

O.K.

B

WATER TEMPERATURE SENSOR CIRCUIT CHECK.
Check continuity between digital meter harness terminal No. 32 and thermal transmitter harness terminal.

Repair harness or connector.

Trouble Diagnoses (Cont'd)

DIAGNOSTIC PROCEDURE ⑤

SYMPTOM: Indicated value of fuel gauge is incorrect.

FUEL GAUGE SENSOR INPUT SIGNAL CHECK

Check resistance between digital meter harness terminal No. 33 and body ground. Compare measured resistance with indication of gauge segment (before disconnecting connector). Gauge indication is changed by the amount of fuel.

Segment	Resistance (Ω)
14	Approx. 12
}	}
8	Approx. 33
}	}
1	Approx. 76

O.K. → Replace digital meter.

N.G.

FUEL GAUGE SENSOR CHECK
Refer to "Fuel Tank Gauge Unit Check".

N.G. → Replace fuel tank gauge unit.

O.K.

FUEL GAUGE SENSOR CIRCUIT CHECK
Check continuity between digital meter harness terminal No. 33 and fuel gauge sensor harness terminal ⑧.

N.G.

Repair harness or connector.

Fuel Tank Gauge Unit Check

- For removal, refer to FE section.
- Check the resistance between terminals (G) and (E).

Ohmmeter		Float position mm (in)				Resistance value (Ω)
(+)	(-)			Type-I	Type-II	
G	E	*3	Full	59 (2.32)	58 (2.28)	Approx. 4 - 6
		*2	1/2	110 (4.33)	108 (4.25)	27 - 35
		*1	Empty	166 (6.54)	161 (6.34)	78 - 85

Fuel Warning Lamp Sensor Check

- It will take a short time for the bulb to light.

Thermal Transmitter Check

- Check the resistance between the terminals of thermal transmitter and body ground.

Water temperature	Resistance
60°C (140°F)	Approx. 70 - 90Ω
100°C (212°F)	Approx. 21 - 24Ω

Oil Pressure Switch Check

	Oil pressure kPa (bar, kg/cm ² , psi)	Continuity
Engine start	More than 10 - 20 (0.10 - 0.20, 0.1 - 0.2, 1.4 - 2.8)	NO
Engine stop	Less than 10 - 20 (0.10 - 0.20, 0.1 - 0.2, 1.4 - 2.8)	YES

Check the continuity between the terminals of oil pressure switch and body ground.

Speed Sensor Signal Check

1. Remove speed sensor from transaxle.
2. Turn speedometer pinion quickly and measure voltage across **a** and **b**.

Wiring Components and Connections:

- COMBINATION METER:** Includes gauges for BELT, FILTER, GLOW, OIL, BRAKE, FUEL, DOOR, and CHARGE.
- SEAT BELT TIMER:** Connected to the main harness.
- DIODE:** Connected to the main harness.
- DOOR SWITCH:** Includes switches for Front driver's side, Front passenger side, Rear R.H., and Rear L.H.
- PARKING BRAKE SWITCH:** Connected to the main harness.
- FUEL TANK GAUGE UNIT:** Connected to the main harness.
- IGNITION SWITCH ON OF START:** Connected to the main harness.
- FUSE BLOCK:** Contains fuses for 10A, 15A, 20A, 25A, 30A, 35A, 40A, 45A, 50A, 55A, 60A, 65A, 70A, 75A, 80A, 85A, 90A, 95A, 100A.
- UP:** Upward arrow indicating power supply routing.
- Engine room harness:** Includes components like E104, E105, E106, E107, E108, E109, E110, E111, E112, E113, E114, E115, E116, E117, E118, E119, E120, E121, E122, E123, E124, E125, E126, E127, E128, E129, E130, E131, E132, E133, E134, E135, E136, E137, E138, E139, E140, E141, E142, E143, E144, E145, E146, E147, E148, E149, E150, E151, E152, E153, E154, E155, E156, E157, E158, E159, E160, E161, E162, E163, E164, E165, E166, E167, E168, E169, E170, E171, E172, E173, E174, E175, E176, E177, E178, E179, E180, E181, E182, E183, E184, E185, E186, E187, E188, E189, E190, E191, E192, E193, E194, E195, E196, E197, E198, E199, E200, E201, E202, E203, E204, E205, E206, E207, E208, E209, E210, E211, E212, E213, E214, E215, E216, E217, E218, E219, E220, E221, E222, E223, E224, E225, E226, E227, E228, E229, E230, E231, E232, E233, E234, E235, E236, E237, E238, E239, E240, E241, E242, E243, E244, E245, E246, E247, E248, E249, E250, E251, E252, E253, E254, E255, E256, E257, E258, E259, E260, E261, E262, E263, E264, E265, E266, E267, E268, E269, E270, E271, E272, E273, E274, E275, E276, E277, E278, E279, E280, E281, E282, E283, E284, E285, E286, E287, E288, E289, E290, E291, E292, E293, E294, E295, E296, E297, E298, E299, E300, E301, E302, E303, E304, E305, E306, E307, E308, E309, E310, E311, E312, E313, E314, E315, E316, E317, E318, E319, E320, E321, E322, E323, E324, E325, E326, E327, E328, E329, E330, E331, E332, E333, E334, E335, E336, E337, E338, E339, E340, E341, E342, E343, E344, E345, E346, E347, E348, E349, E350, E351, E352, E353, E354, E355, E356, E357, E358, E359, E360, E361, E362, E363, E364, E365, E366, E367, E368, E369, E370, E371, E372, E373, E374, E375, E376, E377, E378, E379, E380, E381, E382, E383, E384, E385, E386, E387, E388, E389, E390, E391, E392, E393, E394, E395, E396, E397, E398, E399, E400, E401, E402, E403, E404, E405, E406, E407, E408, E409, E410, E411, E412, E413, E414, E415, E416, E417, E418, E419, E420, E421, E422, E423, E424, E425, E426, E427, E428, E429, E430, E431, E432, E433, E434, E435, E436, E437, E438, E439, E440, E441, E442, E443, E444, E445, E446, E447, E448, E449, E450, E451, E452, E453, E454, E455, E456, E457, E458, E459, E460, E461, E462, E463, E464, E465, E466, E467, E468, E469, E470, E471, E472, E473, E474, E475, E476, E477, E478, E479, E480, E481, E482, E483, E484, E485, E486, E487, E488, E489, E490, E491, E492, E493, E494, E495, E496, E497, E498, E499, E500, E501, E502, E503, E504, E505, E506, E507, E508, E509, E510, E511, E512, E513, E514, E515, E516, E517, E518, E519, E520, E521, E522, E523, E524, E525, E526, E527, E528, E529, E530, E531, E532, E533, E534, E535, E536, E537, E538, E539, E540, E541, E542, E543, E544, E545, E546, E547, E548, E549, E550, E551, E552, E553, E554, E555, E556, E557, E558, E559, E560, E561, E562, E563, E564, E565, E566, E567, E568, E569, E570, E571, E572, E573, E574, E575, E576, E577, E578, E579, E580, E581, E582, E583, E584, E585, E586, E587, E588, E589, E590, E591, E592, E593, E594, E595, E596, E597, E598, E599, E600, E601, E602, E603, E604, E605, E606, E607, E608, E609, E610, E611, E612, E613, E614, E615, E616, E617, E618, E619, E620, E621, E622, E623, E624, E625, E626, E627, E628, E629, E630, E631, E632, E633, E634, E635, E636, E637, E638, E639, E640, E641, E642, E643, E644, E645, E646, E647, E648, E649, E650, E651, E652, E653, E654, E655, E656, E657, E658, E659, E660, E661, E662, E663, E664, E665, E666, E667, E668, E669, E670, E671, E672, E673, E674, E675, E676, E677, E678, E679, E680, E681, E682, E683, E684, E685, E686, E687, E688, E689, E690, E691, E692, E693, E694, E695, E696, E697, E698, E699, E700, E701, E702, E703, E704, E705, E706, E707, E708, E709, E710, E711, E712, E713, E714, E715, E716, E717, E718, E719, E720, E721, E722, E723, E724, E725, E726, E727, E728, E729, E730, E731, E732, E733, E734, E735, E736, E737, E738, E739, E740, E741, E742, E743, E744, E745, E746, E747, E748, E749, E750, E751, E752, E753, E754, E755, E756, E757, E758, E759, E760, E761, E762, E763, E764, E765, E766, E767, E768, E769, E770, E771, E772, E773, E774, E775, E776, E777, E778, E779, E780, E781, E782, E783, E784, E785, E786, E787, E788, E789, E790, E791, E792, E793, E794, E795, E796, E797, E798, E799, E800, E801, E802, E803, E804, E805, E806, E807, E808, E809, E810, E811, E812, E813, E814, E815, E816, E817, E818, E819, E820, E82

Installation

1. Prior to wiper arm installation, turn on wiper switch to operate wiper motor and then turn it "OFF" (Auto Stop).
2. Lift the blade up and then set it down onto glass surface to set the blade center to clearance "C", "D", "E", or "F" immediately before tightening nut.
3. Eject washer fluid. Turn on wiper switch to operate wiper motor and then turn it "OFF".
4. Ensure that wiper blades stop within clearance "C", "D", "E", or "F".

When wiper motor is locked, a protective circuit built into wiper motor activates to stop wiper motor. If wiper motor will not restart even after cause of problems has been eliminated, turn ignition switch OFF and leave it off for approx. 1 to 3 minutes.

1. Turn headlamp wiper switch OFF.
2. Connect ohmmeter and check continuity.

Filament Check

1. Attach probe circuit tester (in volt range) to middle portion of each filament.

2. If a filament is burned out, circuit tester registers 0 or 12 volts.

3. To locate burned out point, move probe to left and right along filament to determine point where tester needle swings abruptly.

REPAIR EQUIPMENT

1. Conductive silver composition (Dupont No. 4817 or equivalent)
2. Ruler 30 cm (11.8 in) long
3. Drawing pen
4. Heat gun
5. Alcohol
6. Cloth

REPAIRING PROCEDURE

1. Wipe broken heat wire and its surrounding area clean with a cloth dampened in alcohol.
2. Apply a small amount of conductive silver composition to tip of drawing pen.

Shake silver composition container before use.

3. Place ruler on glass along broken line. Deposit conductive silver composition on break with drawing pen. Slightly overlap existing heat wire on both sides [preferably 5 mm (0.20 in)] of the break.
4. After repair has been completed, check repaired wire for continuity. This check should be conducted 10 minutes after silver composition is deposited.

Do not touch repaired area while test is being conducted.

5. Apply a constant stream of hot air directly to the repaired area for approximately 20 minutes with a heat gun. A minimum distance of 3 cm (1.2 in) should be kept between repaired area and hot air outlet. If a heat gun is not available, let the repaired area dry for 24 hours.

ANTI-THEFT SYSTEM

By using a personal 4-digit code known only to the vehicle owner, the possibility of the audio unit being stolen is effectively reduced, because without the code the unit can not be activated. When in normal use, the unit is unlocked and accessible in the usual way.

If however, someone attempts to remove the unit or the ground cable is disconnected from the battery, the Anti-theft system activates and the unit "locks". The only way it can be unlocked is by entering a personal code number known only by the owner.

UNLOCKING THE UNIT (How to enter a personal code number)

Use the following procedures to enter a personal code number into the radio.

1. Turn ignition switch to "ACC" or "ON".
2. Turn SW. VOL knob to "ON" and "8888" will appear on the display.
3. Press any button (except "eject") and "0000" will appear on the display.
4. Enter a personal code number by pressing station select buttons 1, 2, 3, 4 the required number of times to display the code.
5. Press  to enter the code. Unit is unlocked and the radio/cassette will operate. If the wrong code number is entered, the display shows "----". Wait ten seconds then enter the correct code.

CAUTION:

There is a theft prevention mechanism restricting the number of times a wrong code number can be entered into the radio unit. If a wrong code number is entered 1 to 2 times, you will have to wait for 10 seconds before the radio will receive further input. If a wrong code number is entered 3 to 20 times, you will have to wait a duration of 15 minutes. The radio unit will lock permanently if any further attempts are made.

Radio Fuse Check

Antenna Trimmer Adjustment (Mechanical tuning type)

The antenna trimmer should be adjusted in the following cases.

- Fading and weak MW (AM) reception.
- After installation of new antenna, feeder cable or radio receiver.

Before adjusting, be sure to check harness and antenna feeder cable connectors for proper connection.

1. Extend antenna completely.
2. Turn radio on, and turn volume control to increase speaker volume.
3. Tune in the weakest station (barely audible) on dial at the range around 14 (1,400 kHz).
4. Turn antenna trimmer to left or right slowly, and set it in the position where reception is strongest.

CAUTION:

Do not turn antenna trimmer more than one-half turn.

Antenna Rod Replacement

REMOVAL

1. Remove antenna nut and antenna base.
2. Withdraw antenna rod while raising it by operating antenna motor. (Radio switch: OFF → ON)

INSTALLATION

1. Lower antenna rod by operating antenna motor. (Radio switch: OFF → ON)
2. Insert gear section of antenna rope into place with it facing toward antenna motor.
3. As soon as antenna rope is wound on antenna motor, stop antenna motor. Insert antenna rod lower end into antenna motor pipe.
4. Retract antenna rod completely by operating antenna motor.
5. Install antenna nut and base.

Window Antenna Repair

ELEMENT CHECK

1. Attach probe circuit tester (in ohm range) to antenna terminal on each side.

2. If an element is broken, no continuity will exist.

3. To locate broken point, move probe to left and right along element to determine point where tester needle swings abruptly.
