AIR CONDITIONER(DIAGNOSTICS) > General Description

CAUTION

- 1.** Never connect the battery in reverse polarity.
 - Doing so may immediately damage the A/C control panel.
- 2.** Do not disconnect the battery terminals while the engine is running.
 - A large counter electromotive force will be generated in the generator, and this voltage may damage electronic parts such as A/C control panel etc.
- 3.** Before disconnecting the connectors of sensors and the A/C control panel, be sure to turn off the ignition switch.
 - A/C control panel may be damaged.
- 4.** Every A/C-related part is a precision part. Do not drop them.
- 5.** Airbag system harness is routed near the A/C control panel and junction box.

Caution:

- **Do not use electrical test equipment on the airbag system harness and connector.**
- **Be careful not to damage the airbag system harness when servicing the A/C control panel and junction box.**

Blind Spot Detection/Rear Cross Traffic Alert (DIAGNOSTICS) > Control Module I/O Signal

SYSTEM BLOCK DIAGRAM

- BSD/RCTA system is configured by the following components.
- There is a control ECM in the radar sensor main body, which performs the vehicle identification and the alert judgment control.
- The LH/RH radar sensors are identified as Master/Slave for control purposes. They are connected by the private CAN to execute the controls through mutual communication. The radar on the Master side receives the input from the vehicle CAN and the SRVD OFF switch, and information necessary for control can be obtained from other modules via the vehicle CAN.
- The outer mirror LED is directly driven by the signal from the radar sensor.

CAUTION

1. BSD/RCTA

1. In some cases, BSD/RCTA may not work correctly under the following conditions.
 - In bad weather such as heavy rain, fog, snow, sand storm, etc.
 - When ice, snow, dirt, etc. cover the rear bumper.
 - When the rear bumper has scratches or deformation in the area of the radar sensor.
 - When a difference of vehicle speeds between your own vehicle and another vehicle within the detection range is too large.
 - When there is another vehicle remaining within the detection range while your own vehicle starts from stationary state.
 - While driving on a steep slope with a series of uphill and downhill.
 - While driving on a wet road with such as puddles.
 - When more than one vehicle is approaching one after another with a short distance.
 - When vehicle speed of your own vehicle is almost the same as that of the vehicle within the detection range.
 - When a difference of the vehicle heights between your own vehicle and another vehicle in the next lane is too large.
 - Immediately after operating the BSD/RCTA OFF switch.
 - On wide lanes, when another vehicle of the next lane drives along the opposite edge so the distance is too large for the detection.
2. BSD/RCTA does not detect the following type of vehicles as well as objects other than vehicles.
 - Oncoming vehicle.
 - Small motorcycle, bike, pedestrian, etc.*
 - Vehicle following behind on the same lane.*
 - Stationary objects such as guardrail, wall, sign and parked vehicle.*
 - Another vehicle driving on two lanes away.*

Note:

***: Detection may be successful depending on circumstances.**

3. BSD/RCTA may perform unnecessary detection in the following conditions.
 - When guardrails or walls are close enough to be within the detection range.
 - When distance from the vehicle behind is short.
 - On narrow lanes, when another vehicle driving on two lanes away enters the detection range.
4. Radar sensors of BSD/RCTA are each located on LH and RH sides. Always observe the followings for proper operation of the system.
 - Always clean the vicinity of radar sensors.
 - Do not give a strong impact to the radar sensor areas. Displacement of the radar sensors may result in improper operation of the system such that it may not detect the vehicle entering the detection range.
 - Do not disassemble the radar sensors.
 - Do not scratch or deform the bumper areas with the radar sensors.

Note:

Replace the rear bumper in the following cases.

- **When there is any collision trace or dent inside the radar projection area.**
- **When there is any scuffed (chipped off) section inside the radar projection area on the resin bumper.**
- **When there is any crack inside the radar projection area.**

Note:

Radar projection area

(a) Radar projection area

(b) 50 mm (2.0 in)

(c) Extended line

(d) Vertical line

(e) Horizontal line

For other flaws, perform the sensor readjustment. If no problem is found, replacement is unnecessary.

- Do not put a sticker, etc. on/around the radar sensors.
- Do not retrofit the radar sensors or the bumper close to the radar sensors.
- Do not repaint the radar sensors or the bumper close to the radar sensors.

Note:

If there is any painting defect inside the radar projection area, replace the rear bumper without trying to repair it.

- Do not give a strong impact, force or drop-off to the radar sensors because they are precision devices.
- Do not reuse the radar sensors that were affected by strong impact, force, or fell off.

Blind Spot Detection/Rear Cross Traffic Alert (DIAGNOSTICS) > Subaru Select Monitor

INSPECTION

When communication with the radar sensor is impossible

Detecting condition:

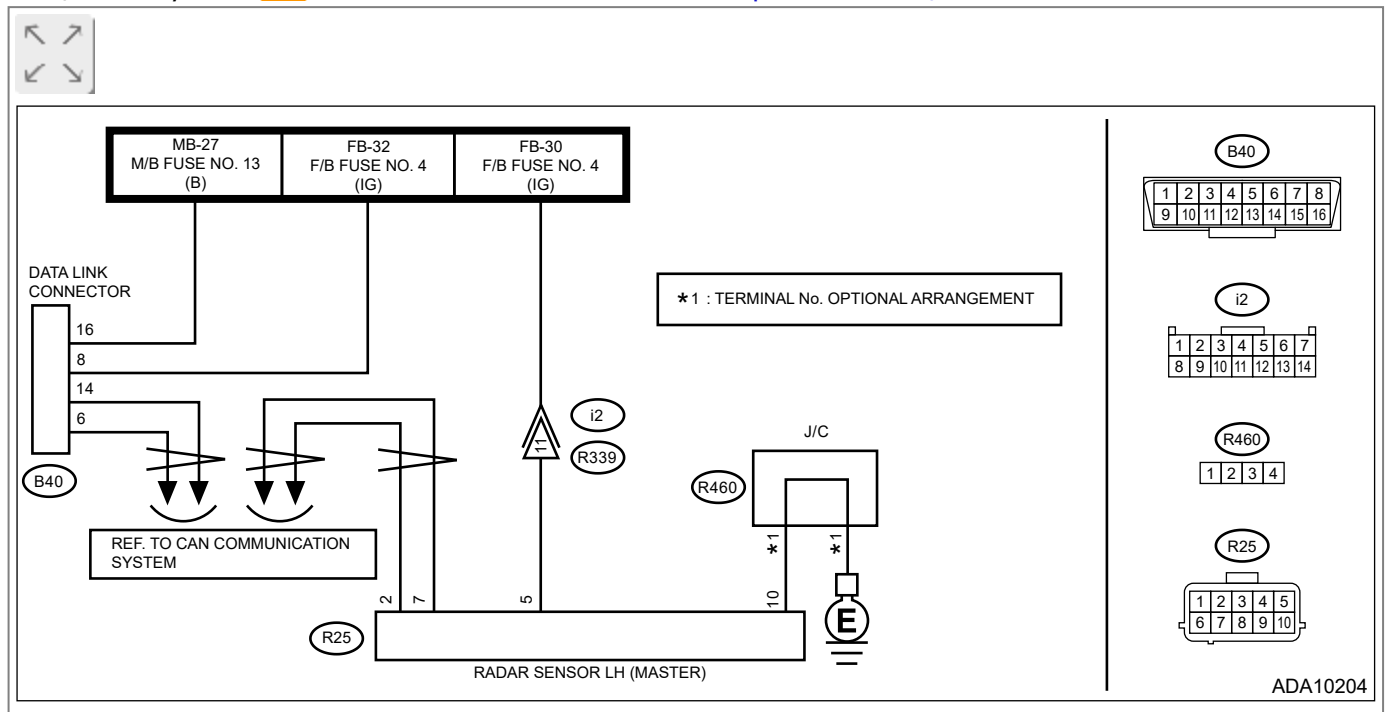

- Defective harness connector
- Power supply circuit malfunction
- Defective radar sensor
- Defective CAN communication circuit
- Defective Subaru Select Monitor

Trouble symptom:

Communication is impossible between radar sensor and Subaru Select Monitor.

Wiring diagram:

BSD/RCTA system  [Ref. to WIRING SYSTEM>Blind Spot Detection/Rear Cross Traffic Alert.](#)

1. CHECK FUSE.

1. Turn the ignition switch to OFF.
2. Check the fuse for radar sensor LH.  [Ref. to Blind Spot Detection/Rear Cross Traffic Alert>Relay and Fuse.](#)

Is the check result OK?

Yes

 [Go to 2.](#)

No

Replace the fuse. If the replaced fuse has blown out immediately, repair the short circuit to ground in harness between fuse — radar sensor LH.

2. CHECK HARNESS (OPEN CIRCUIT).

1. Disconnect the radar sensor LH connector.
2. Turn the ignition switch to ON.
3. Using a tester, measure the voltage between radar sensor LH connector (harness side) and chassis ground.

Connector & terminal

(R25) No. 5 (+) — Chassis ground (-):

Is the voltage 10 V or more?

Yes

 [Go to 3.](#)

No

Repair the open circuit of harness between fuse — radar sensor LH connector. For models with Auto Start Stop, also check the Auto Start Stop system.

3. CHECK HARNESS (OPEN CIRCUIT).

1. Turn the ignition switch to OFF.
2. Using a tester, measure the resistance between radar sensor LH connector (harness side) and chassis ground.

Connector & terminal

(R25) No. 10 — Chassis ground:

Is the resistance less than 1 Ω ?

Yes

 [Go to 4.](#)

No

Repair the open circuit in harness between radar sensor and chassis ground.

4. CHECK LAN SYSTEM.

1. Connect the radar sensor LH connector.
2. Inspect LAN system.  [Ref. to Blind Spot Detection/Rear Cross Traffic Alert \(DIAGNOSTICS\)>Basic Diagnostic Procedure.](#)

Is the check result OK?

Yes

 [Go to 5.](#)

No

Perform the inspection according to the diagnosis for LAN system.

5. CHECK RADAR SENSOR.

Communicate with the radar sensor.

Is communication possible?

Yes

The circuit has returned to a normal condition at this time. Reproduce the failure, and then perform the diagnosis again.

Note:

In this case, temporary poor contact of connector, temporary open or short circuit of harness may be the cause.

No

Replace the radar sensor LH.  [Ref. to Blind Spot Detection/Rear Cross Traffic Alert>Radar Sensor.](#)

INSPECTION

1. HIGH BEAM ASSIST INDICATOR DOES NOT ILLUMINATE

Trouble symptom:

High beam assist indicator light does not illuminate though the operating conditions for the high beam assist are met.

Note:

When there is faulty in the combination switch, combination meter, illumination sensor for the auto lighting or the operation of auto lighting, perform the diagnosis for each system in advance.

1. CHECK BODY INTEGRATED UNIT SETTING.

Using the Subaru Select Monitor, check the data monitor [High Beam Assist Function Setting (EyeSight System)] and [High Beam Assist Current Setting] of the body control.

Is [High Beam Assist Function Setting (EyeSight System)] set to [ON], and [High Beam Assist Current Setting] set to [ON]?

Yes

 [Go to 2.](#)

No

Set [High Beam Assist Function Setting (EyeSight System)] to [ON], and set [High Beam Assist Current Setting] to [ON].

2. CHECK DTC.

Using the Subaru Select Monitor, read all DTCs.

Are any DTCs displayed? (Current malfunction)

Yes

Perform the diagnosis for the displayed DTCs.

No

 [Go to 3.](#)

3. CHECK "EyeSight TEMPORARY STOP INDICATOR".

- 1.** Turn the ignition switch to OFF.
- 2.** Turn the ignition switch to ON.
- 3.** Check "EyeSight temporary stop indicator".

Is "EyeSight temporary stop indicator" displayed?

Yes

Perform inspection according to "Check EyeSight temporary stop code" in "EyeSight (DIAGNOSTICS)".

No

 [Go to 4.](#)

4. CHECK HIGH BEAM ASSIST INDICATOR.

1. Turn the ignition switch to ON.
2. Set the light SW position to Auto.
3. Set the dimmer Hi SW to ON.
4. Shade the illumination sensor for the auto lighting.

Does the high beam assist indicator illuminate?

Yes

The circuit has returned to a normal condition at this time. Reproduce the failure, and then perform the diagnosis again.

Note:

In this case, temporary poor contact of connector, temporary open or short circuit of harness may be the cause.

No

 [Go to 5.](#)

5. CHECK HIGH BEAM ASSIST INDICATOR.

Connect the Subaru Select Monitor, and, perform the active test [HBA indicator] for the combination meter.  [Ref. to COMBINATION METER \(DIAGNOSTICS\)>Active Test.](#)

No

Replace the body integrated unit.  [Ref. to SECURITY AND LOCKS>Body Integrated Unit.](#)

2. THE LIGHTING DOES NOT SWITCH FROM LOW BEAM TO HIGH BEAM AUTOMATICALLY

Trouble symptom:

The lighting does not switch to the high beam while the high beam assist indicator is illuminating, even when there is no object in front of the vehicle.

1. CHECK HIGH BEAM ACTIVATION (CHECK BY MANUAL OPERATION).

Check for the activation of the high beam.

1. Light SW position: Second notch
2. Dimmer Hi SW: ON

Does the high beam light come on?

Is "EyeSight temporary stop indicator" displayed?

Yes

Perform inspection according to "Check EyeSight temporary stop code" in "EyeSight (DIAGNOSTICS)".

No

 [Go to 4.](#)

4. PERFORM RECOGNIZATION TEST (JUDGMENT OF NIGHT STATUS).

1. Set the light SW position to Auto.
2. Set the dimmer Hi SW to ON.
3. With the vehicle stopped, turn the ignition switch to OFF.
4. Shade the front of the stereo camera.

Note:

It is recommended to perform the test under complete dark environment where all illumination is turned off and there is no windows in the room. If it is not possible to perform the test in complete dark environment, perform the test in a room where the direct sunlight is shielded and illumination is turned off, while the windshield, driver's seat, and passenger's seat are covered from outside of the vehicle with cloth etc. having high light-blocking effect.

Caution:

In order to avoid touching the lens of the stereo camera, do not apply light-blocking measures directly at the lens portion.

5. Turn the ignition switch to ON.
6. Using the Subaru Select Monitor, check the data monitor [Judgment Night] of the EyeSight.  [Ref. to EyeSight \(DIAGNOSTICS\)>Data Monitor.](#)

Is [Judgment Night] set to [Night]?

Yes

System is normal. It is considered that the conditions for the high beam activation are not satisfied enough for an environmental reason.

No

Replace the stereo camera.  [Ref. to EyeSight>Stereo Camera.](#)

3. THE LIGHTING DOES NOT SWITCH FROM HIGH BEAM TO LOW BEAM AUTOMATICALLY

Trouble symptom:

The lighting does not switch to the low beam, even when the high beam assist indicator is illuminating.

1. CHECK HIGH BEAM ACTIVATION (CHECK BY MANUAL OPERATION).

Check for the activation of the high beam.

1. Light SW position: Second notch
2. Dimmer Hi SW: ON

Caution:

For the body integrated unit, function selection is available to control the entire vehicle systems. It is possible to control the original functions of vehicle when registrations of body integrated unit and function setting are corresponded to vehicle equipment. If registrations and function setting are different from vehicle equipment, vehicle system does not operate normally and diagnosis cannot be performed correctly. Pay attention to following item.

- **Be sure to correspond registrations, or User Customizing settings to vehicle equipment.**
- **Do not change the settings of vehicle improperly.**
- **Make sure that the key illumination does not blink with ignition switch ON, or that the body integrated unit registration item Factory initial setting is set to Market. If [Factory initial setting] is set to Factory, the key illumination blinks when the ignition switch is turned ON, to notify that the settings are not confirmed. (For models with keyless access with push button start system, the room light blinks.)**
- **Key illumination does not blink with ignition switch turned to ON and go off with door closed. (Except for model with the keyless access with push button start system)**
- **Be sure to register immobilizer if body integrated unit is replaced with a new part. (Models without the keyless access with push button start system)**
- **Make a registration of immobilizer when the parts related to immobilizer have been replaced. Refer to the "REGISTRATION MANUAL FOR IMMOBILIZER" provided as a**

6. Change the setting to the contents saved at confirmation of current setting.

Caution:

- **To perform normal operation of vehicle and diagnosis, the above settings must match the actual vehicle equipment.**
- **When the body integrated unit is new or in Factory mode, the key illumination blinks, and user customizing is incomplete. Check the user customizing settings. (For models with keyless access with push button start system, the room light blinks.)**
- **Be sure not to change Factory initial setting except when installing a new body integrated unit.**

Note:

“Factory” mode:

- **Body integrated unit has not been set yet. It can be recognized by key illumination blinking with ignition switch turned to ON. (Except for model with keyless access)**
- **All replacement body integrated units are set to “Factory” mode. When replacing a body integrated unit, be sure to perform the registration operation.**

DTC detecting condition:

Abnormal clutch signal

Trouble symptom:

Hill start assist does not operate.

Note:

Depending on the user clutch operation patterns, the hill start assist warning light may illuminate for a while, and then go off.

Illumination condition:

While the vehicle speed is 10 km/h (6 MPH) or above, and the clutch switch signal ON (depressed) condition continues five minutes or more, if the vehicle speed lowers to 10 km/h (6 MPH) or below, the module judges as abnormal (clutch switch stuck ON), and then turns on the warning light.

Turning off condition:

If the clutch switch signal OFF (foot released) condition continues for 2 seconds, the module turns off the warning light.

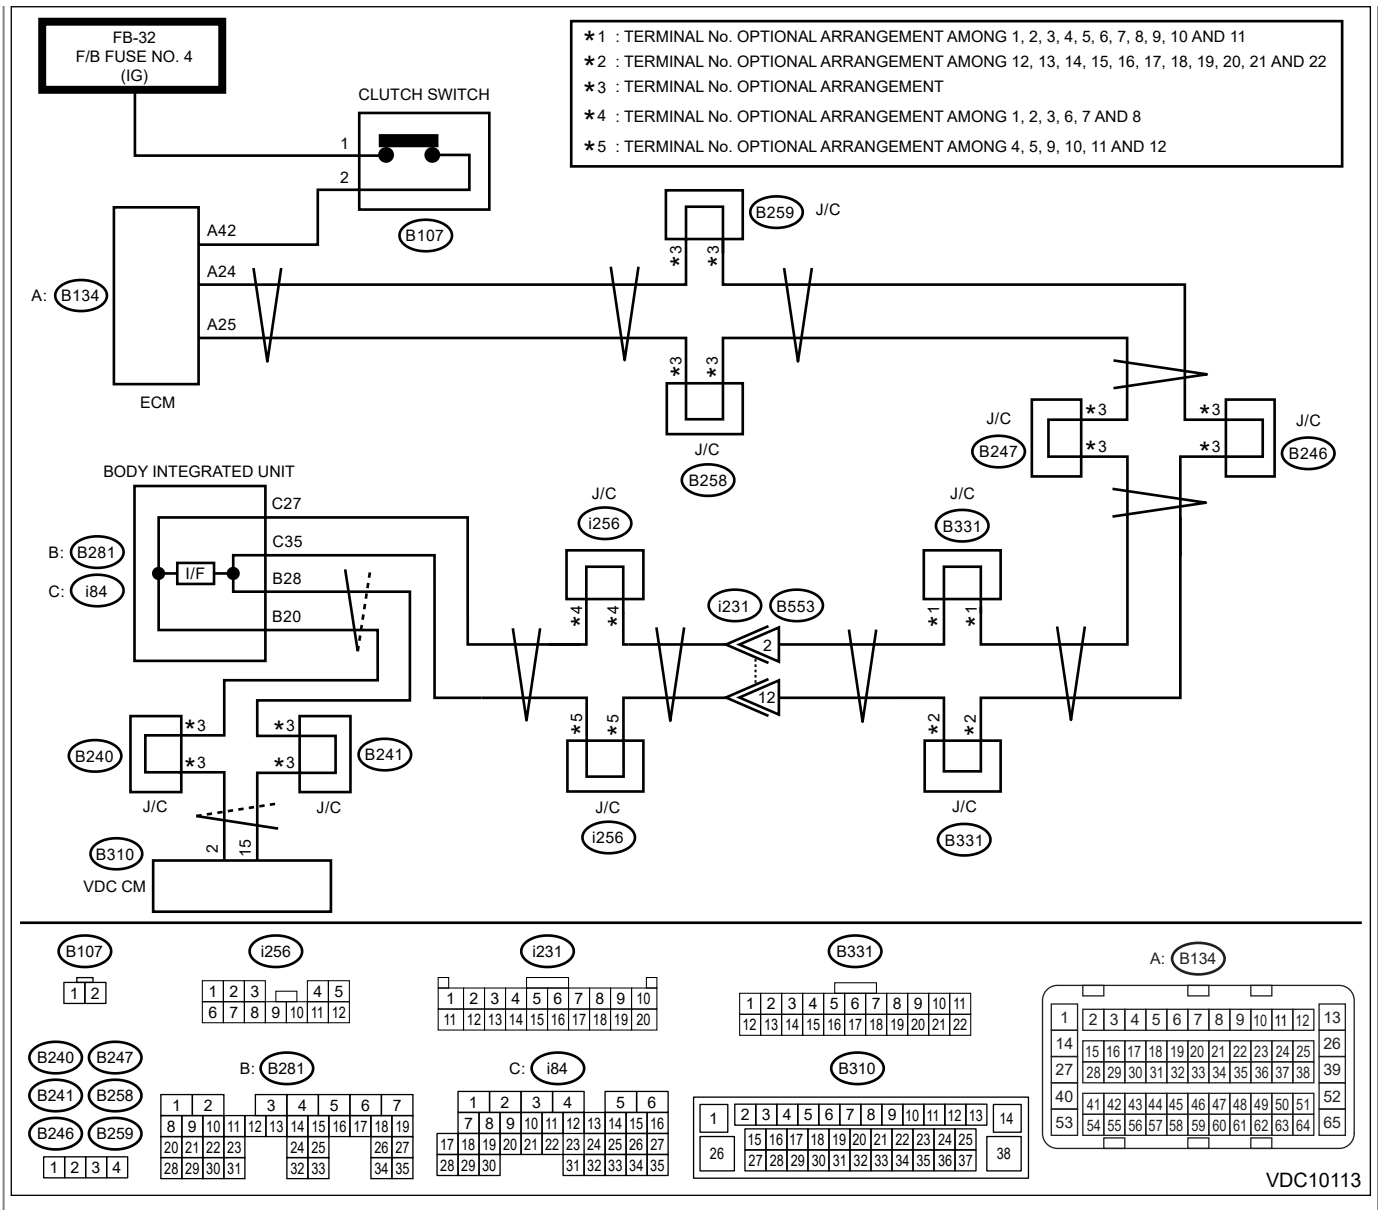

The hill start assist function does not operate, while the warning light illuminates.

Note:

Hill start assist warning light always illuminates when the hill start assist is in the OFF mode.

- When warning lights or indicator lights do not illuminate in accordance with this illumination pattern, there must be an electrical malfunction.
- When the warning lights or indicator lights remain constantly OFF, check the combination meter circuit. Note:

- **Even though the ABS warning light, and the VDC warning light & VDC indicator light do not go off in 2 seconds after illuminating, the ABS and VDC functions are normal if the warning lights go off while the vehicle is driven at approximately 38 km/h (23 MPH). However, while these lights are on, the functions with their warning lights illuminated do not operate.**
- **It may take several minutes before the VDC warning light & VDC indicator light goes off, if the vehicle is parked under low temperature for a specified time. This is not defective because it is resulted from low engine coolant temperature. Clear the memory because DTC may be recorded at this time.**  [Ref. to BRAKE CONTROL \(DIAGNOSTICS\)>Clear memory.](#)
- **With the vehicle jack-up/lift-up or set on free rollers, when the wheels lock or spin after starting the engine, ABS warning light, and VDC warning light & VDC indicator light may illuminate because VDCCM&H/U detects the abnormal conditions from ABS wheel speed sensor or longitudinal G sensor. In this case, this is not a malfunction. Clear the memory.**  [Ref. to BRAKE CONTROL \(DIAGNOSTICS\)>Clear memory.](#)

CRUISE CONTROL (DIAGNOSTICS) > List of Cancel Code

LIST

Note:

- The cancel code is registered even when cancel is performed intentionally by the driver.
- Cancel codes are cleared if the ignition switch is turned to OFF.
- If a different cancel code is input after a cancel code (latest code) has been input, the latest code is overwritten.
- If the cruise indicator light is flashing, a malfunction is occurring in the system or cruise control related switch. The cancel code at this time is saved even after ignition switch is OFF as a memory code of a past malfunction.
- To display a cancel code, use the Subaru Select Monitor to read the code after the cruise control is deactivated during a driving test.

CRUISE CONTROL (DIAGNOSTICS) > Subaru Select Monitor

OPERATION

1. GENERAL DESCRIPTION

The on-board diagnosis function of the cruise control system uses Subaru Select Monitor. The on-board diagnosis function operates in two categories, which are used depending on the type of problems.

1. Cruise Control Cancel Conditions Diagnosis:

- (1) This category of diagnosis requires actual vehicle driving in order to determine the cause, as when cruise speed is cancelled during driving although cruise cancel condition is not entered.
- (2) Cruise control memory in ECM stores the cancel code which occurred during driving. When there are multiple cancel code, they are shown on the Subaru Select Monitor.

Caution:

- **In the cruise control memory, not only the cruise control "cancel" occurred (although the "cancel" operation is not entered by the driver), but also the "cancel" condition input by the driver is stored.**
- **The latest memory content (latest code) is cleared when ignition switch is turned to OFF. However, memory contents set by the diagnosis of faulty switches related to the system and cruise control will remain as trouble history (memory code) after the ignition switch is turned to OFF.**

2. Real-time Diagnosis:

Real-time diagnosis function is used to determine whether or not the input signal system is in good order, according to signal emitted from switches, sensors, etc.

- (1) Vehicle cannot be driven at cruise speed when the problem occurs in the cruise control system or relevant circuits.
- (2) Monitor the signal conditions from switches and sensors.

2. BASIC OPERATION

For detailed operation procedures, refer to "Application help".

45 – 74

Yes

ECM is good; finish the diagnosis.

No

Replace the ECM and perform drive cycle N. When DTC is not displayed, end the diagnosis. [Ref. to FUEL INJECTION \(FUEL SYSTEMS\)\(H4DO\)>Engine Control Module \(ECM\).](#)

1. OUTLINE OF DIAGNOSIS

Detect the AVCS system malfunction.

Judge as NG when standard timing advance amount is far from learning angle.

2. EXECUTION CONDITION

Secondary Parameters	Execution condition
Battery voltage	≥ 10.9 V
Elapsed time after external load (power steering, neutral position switch) change	≥ 3000ms
AVCS learning	In operation
Actual timing advance change amount (for 8 ms)	< 3.7°CA

3. GENERAL DRIVING CYCLE

Perform the diagnosis continuously at idling after warming up engine.

4. DIAGNOSTIC METHOD

Judge as NG when the absolute value of the difference between cam signal input position and learning value is out of specification.

Diagnosis 1

If the duration of time while the following conditions are met is longer than the time indicated, judge as NG.

Judgment value

--	--

Malfunction Criteria	Threshold Value
Crankshaft position when camshaft position sensor signal is input – Learning value	> 10°CA

Time needed for diagnosis:5000ms

Diagnosis 2

Judgment value

Malfunction Criteria	Threshold Value
Camshaft position sensor signal input position (bank 1)	< 0.24°CA or > 58.73°CA
Camshaft position sensor signal input position (bank 2)	< 0.24°CA or > 57.26°CA

Time needed for diagnosis:5000ms

Malfunction indicator light illumination: Illuminates as soon as a malfunction occurs.

Note:

Initial standard learning value is the value of crank angle initially input at the production plant. And then it will be updated every time normal judgment has been completed. Learning value will not be updated if NG judgment occurs because timing belt or chain derails suddenly in process or because wrong assembly occurs during servicing.

For the diagnostic procedure, refer to DTC P0304.  Ref. to [ENGINE \(DIAGNOSTICS\) \(H4DO\)>Diagnostic Procedure with Diagnostic Trouble Code \(DTC\)>DTC P0304 CYLINDER 4 MISFIRE DETECTED.](#)

1. OUTLINE OF DIAGNOSIS

Detect the presence of misfire occurrence. (Revolution fluctuation method)

Monitoring misfire which influences exhaust deterioration (1.5 times of FTP) and catalyst damage is made obligatory by the law. Misfire affecting these two has two patterns below:

- Intermittent misfire (the same cylinder misfires in random, or different cylinders misfire in random): FTP 1.5 times misfire
- Every time misfire (the same cylinder misfires every time): FTP 1.5 times misfire, catalyst damage misfire

The following detecting methods are adopted for these detection.

1. Intermittent misfire: FTP 1.5 times misfire
 - 180° Interval Difference Method (MT: 1800 rpm or less; CVT: None)
 - 360° Interval Difference Method (whole range)
 - 720° Interval Difference Method (3000 rpm or more)
2. Misfire every time: FTP 1.5 times misfire, catalyst damage misfire
 - 360° Interval Difference Method

2. EXECUTION CONDITION

3. GENERAL DRIVING CYCLE

- If conditions are met, it is possible to detect the misfires from idling to high engine speed. However, in case any engine load or breakage occurs, perform with the engine at idle.
- Perform the diagnosis continuously.

4. DIAGNOSTIC METHOD

When a misfire occurs, the engine speed will decrease and the crankshaft position speed will change. Calculate the interval difference value (diagnostic value) from crankshaft position speed by the following formula, and judge whether a misfire is occurring or not comparing the calculated result with judgment value. Count the number of misfires, if the misfire ratio is higher during 1000 revs. or 200 revs., judge corresponding cylinders as NG.

Diagnostic value calculation (Calculate from angle speed) →	Misfire detection every single ignition (Compare diagnostic value with judgment value) →	NG judgment (Misfire occurrence judgment required by the law) (Compare number of misfire with judgment value)

180° INTERVAL DIFFERENCE METHOD

Diagnostic c value	180 degree interval difference = $(B - A) - (F - B)/4$

360° INTERVAL DIFFERENCE METHOD

Diagnostic value	360 degree interval difference = $(B - A) - (D - C)$
Misfire	360 degree interval difference >

judgment	Judgment value → Judged as misfire
----------	------------------------------------

720° INTERVAL DIFFERENCE METHOD

Diagnostic value	720 degree interval difference = (B - A) - (E - F)
Misfire judgment	720 degree interval difference > Judgment value: → Judged as misfire

1. OUTLINE OF DIAGNOSIS

This diagnosis judges whether the Evaporative Leak Check Module operation is normal or not, and whether the evaporative emission system has leak and clogging or not.

To purge the canister, after driving, perform the five hours soaking after ignition switch OFF in order to stabilize the evaporative gas status. * After 5 or 7 or 9.5 hours passed, ECM is activated by soaking timer, and the leak check is started.

Judges whether the Evaporative Leak Check Module operation is normal or not, by measuring the reference pressure status via reference orifice (0.02 inch orifice). Judge as malfunction if the reference pressure is out of specified range. Then, judge whether there is a leak or not, by comparing the pressure (leak pressure) when the reference pressure and the evaporative emission system are in negative pressure condition. Judge as system leak in the evaporative emission system if the leak pressure is higher than reference pressure. Judge as clogging of pipe if the leak pressure becomes lower than the reference pressure within the specified amount of time.

0.02 inch leak and 0.04 inch leak can be distinguished by measuring the leak pressure.

The diagnosis results are stored inside ECM until the engine is started again.

*: When the test conditions are not met in 5 hours, perform diagnosis at elapsed time of 7 hours.

When the test conditions are not met in 7 hours, perform diagnosis at elapsed time of 9.5 hours.

In this case, temporary open or short circuit of harness or temporary poor contact of connector may be the cause.

1. OUTLINE OF DIAGNOSIS

To detect malfunctions, the diagnostic uses a predictive model, individual cylinder fuel control, and the primary oxygen sensor measurement. The diagnostic does not directly attempt to separate the primary oxygen sensor measurement into individual cylinder contributions, but uses a predictive model to do so. Individual cylinders STFT are independently adjusted to obtain the moving 720 degree average lambda of all four cylinders using feedback from primary oxygen sensor. If any individual cylinder's STFT is different than the average of the other cylinder's STFT by a calibratable amount, that cylinder will be identified as failing.

Monitor Method

This diagnostic monitor performs a functional check of the fuel system to determine an air-fuel ratio cylinder imbalance, as required by the regulations in Section (e)(6.2.1)(c). This method uses a parameter called "imbalance value" which is calculated for each cylinder. The "imbalance value" is the difference between the individual STFT of the specific cylinder and the average value of the individual STFT of the other three cylinders. These imbalance values are compared to each other in order to determine the "imbalanced cylinder", which is the cylinder with the maximum "imbalance value". A diagnostic value is calculated for the "imbalanced cylinder". When this diagnostic value is more than the predetermined threshold (lean malfunction) or less than the predetermined threshold (rich malfunction), a DTC for the most imbalanced cylinder is determined.

DTC for "Imbalanced cylinder" is following.

P219C: Cylinder 1 Air-Fuel Ratio Imbalance

P219D: Cylinder 2 Air-Fuel Ratio Imbalance

P219E: Cylinder 3 Air-Fuel Ratio Imbalance

P219F: Cylinder 4 Air-Fuel Ratio Imbalance

Malfunction Criteria.

Rich malfunction (negative) Diagnostic value < Threshold

or

Lean malfunction (positive) Diagnostic value > Threshold

Diagnostic value = "Imbalance value n" of the "Imbalanced cylinder"

(n: Cylinder number (#1 or #2 or #3 or #4))

•Imbalance value n = iSTFTn - Average (other 3 iSTFTs)

For example: Imbalance value #1 = iSTFT # 1 - (iSTFT # 2 + iSTFT # 3 + iSTFT # 4) / 3.

•Imbalanced cylinder: The cylinder with maximum (ABS (Imbalance value #1, #2, #3, #4)) is selected

•iSTFT: Individual cylinder STFT (Refer to the following about the detail)

Individual Cylinder STFT (iSTFT n (k))

Individual cylinder STFT (= iSTFT n (k)) are calculated by integral control and individual cylinder λ deviation $u(k)$ converges to target (no deviation).

$iSTFT\ n\ (k) = iSTFT\ n\ (k-1) + C(tgt - u(k))$

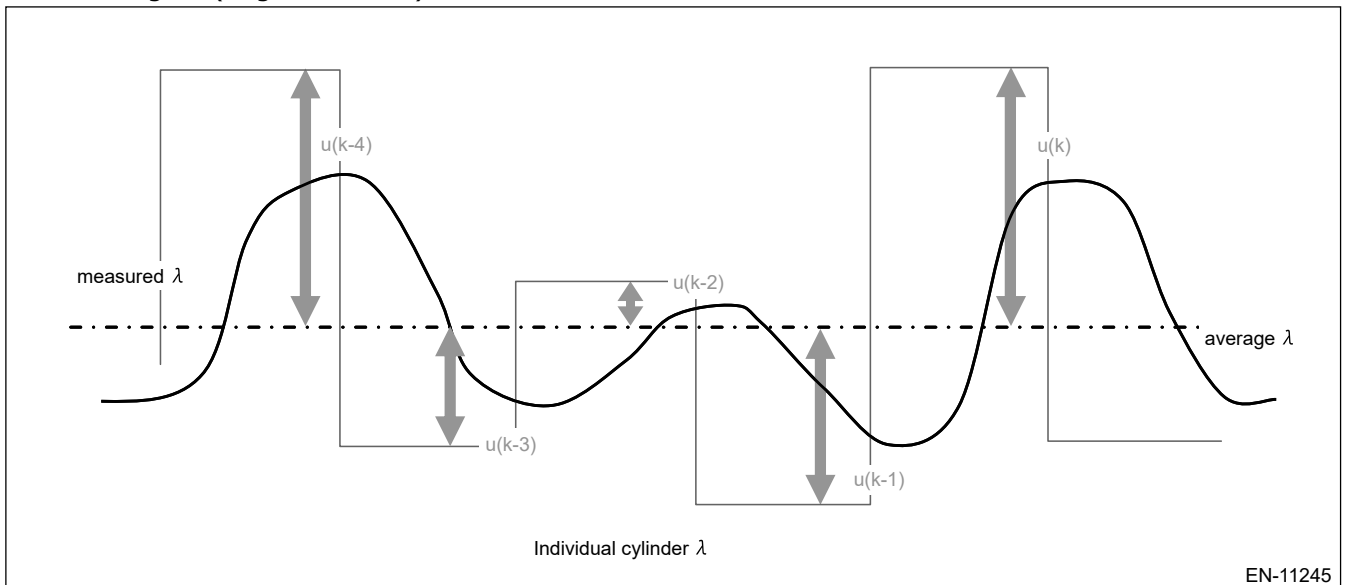

iSTFT n (k) = Individual cylinder STFT

$u(k)$: Estimated individual cylinder λ deviation*

tgt: Target (No deviation = zero)

C: Control gain (negative value)

C: Control gain (negative value)

*individual cylinder λ deviation: $u(k)$

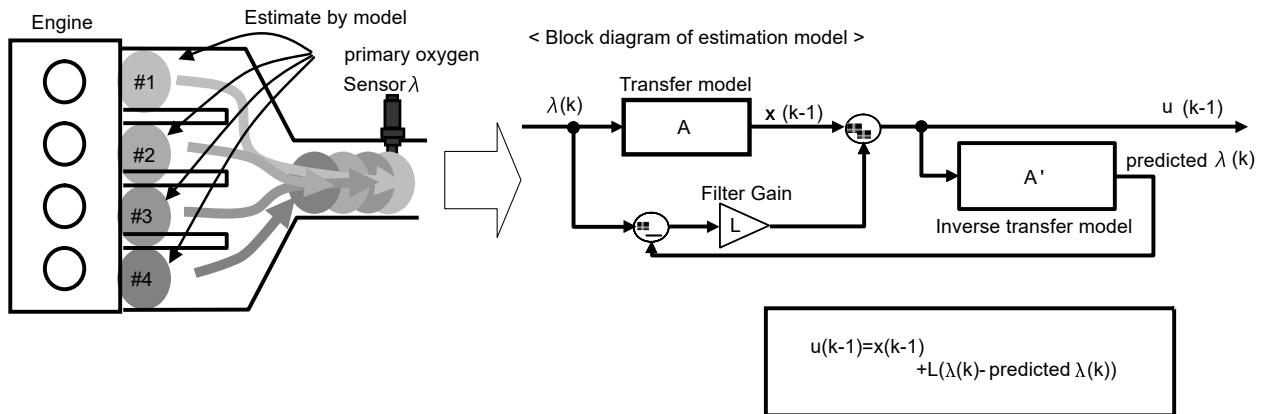

= Individual cylinder λ - average λ during 720°CA

Estimated individual cylinder λ deviation "u(k)" is calculated by model (as described below).

Estimation Model for individual cylinder λ deviation (u(k))

Subaru developed a model for estimating individual cylinder λ deviation* by the output signal of the primary oxygen sensor (mounted on the collector section of the exhaust manifold). This estimation model makes it possible to control cylinder A/F individually. The estimation model is designed as follows.

$\lambda(k)$: Measured λ

$u(k-1)$: Estimated individual cylinder λ deviation (after filter)

$x(k-1)$: Estimated individual cylinder λ deviation (before filter)

predicted $\lambda(k)$: Estimated λ

Model equations for individual cylinder λ deviation ($u(k)$)

" $u(k-1)$ ": Estimated individual cylinder λ deviation is calculated by the following model.

< Model equations >

Transfer model "A" Measured λ (A/F sensor) \rightarrow Individual cylinder λ

$$x(k-1) = \frac{(\lambda(k) - a_1 \lambda(k-1) - a_2 \lambda(k-2) - a_3 \lambda(k-3) - a_4 \lambda(k-4))}{b_1} - \frac{(b_2 x(k-2) + b_3 x(k-3) + b_4 x(k-4))}{b_1}$$

Inverse transfer model "A'" Individual cylinder $\lambda \rightarrow$ Measured λ (A/F sensor)

$$\text{predicted } \lambda(k) = -a_1 \text{predicted } \lambda(k-1) + a_2 \text{predicted } \lambda(k-2) + a_3 \text{predicted } \lambda(k-3) + a_4 \text{predicted } \lambda(k-4) + (b_1 u(k-1) + b_2 u(k-2) + b_3 u(k-3) + b_4 u(k-4))$$

CHECK BRAKE OVERRIDE SYSTEM

Caution:

Perform this test in a location where the driving can be checked safely, while paying sufficient attention to the vicinity. While driving, the traffic laws and regulations such as speed limit must always be observed.

Note:

- The value of [Accel. Opening Angle] on the data monitor normally changes according to the value of accelerator sensor No. 1 voltage ratio. (The values do not become the same. Refer to ES-41 for the values)
- Even if the voltage difference between [Accel. Opening Angle] and the accelerator sensor No. 1 is large and the value of [Accelerator Pedal Angle] is not consistent, the corresponding control can be considered to be activated if the value of the accelerator sensor No. 1 voltage ratio is consistent. (Use of the data storage function of Subaru Select Monitor 4 allows the data during driving to be stored. The stored data can be checked after the driving.)
- When the customer complains of deceleration feeling when he/she intentionally depresses both the accelerator pedal and the brake pedal, advise them not to depress both pedals. (Example: operating the brake pedal with the left foot while operating the accelerator pedal)

Diagnostic procedure:

1. Drive according to the drive pattern described below.

(A) Shift the select lever to "P" range or the shift lever to the neutral position, and cool down the engine by idling it for 10 seconds or more.

(D) Decelerate with fully closed throttle to 64 km/h (40 MPH) or less.

(G) Stop vehicle with the throttle fully closed.

- (B) Accelerate to 97 km/h (60 MPH) or more within 20 seconds. (E) Drive for 20 seconds or more at 64 km/h (40 MPH) or less. (H) Vehicle speed km/h (MPH)
- (C) Drive for 20 seconds or more at 97 km/h (60 MPH) or more. (F) Accelerate to 97 km/h (60 MPH) or more within 10 seconds. (I) Sec.

Note:

- Perform the following only for catalyst system bank 1.
- Check that Catalyst monitoring completed is "YES", and read the temporary code.
- If Catalyst monitoring completed indicates "NO", the diagnosis has not been completed. In this case, repeat driving until the reading changes to "YES".
- Read the temporary "data monitor" using the Subaru Select Monitor or general scan tool.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DO\)>Subaru Select Monitor>OPERATION > DATA MONITOR.](#)

Diagnostic procedure:

1. With the ignition switch ON (engine stopped), read the values in [Coolant Temp.] and [Intake Air Temp.].  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DO\)>Subaru Select Monitor>OPERATION > DATA MONITOR.](#)
2. If the values from step 1) satisfy the following conditions, idle the engine for two minutes or more.

Condition:

|Engine coolant temperature – Intake air temperature| ≤ 5°C (9°F)

Note:

- If the conditions are not satisfied, turn the ignition switch to OFF and wait until the parameters are satisfied.
- Hold the select lever in "P" range or "N" range at idling.

3. Drive according to the drive pattern described below.

- (A) Vehicle speed (B) Elapsed time
- (1) Idle the engine for 2 minutes or more. (4) Drive for 30 seconds or more at a constant speed of 80 km/h (50 MPH) or more. (6) Drive for 30 seconds or more at a constant speed of 80 km/h (50 MPH) or more.
- (2) Drive for a total period of 15 minutes or more at a speed of 80 km/h (50 MPH) or more. (5) Stop the vehicle and idle for 30 seconds or more. (7) Stop the vehicle and idle for 30 seconds.
- (3) Stop the vehicle and idle for 30 seconds or more.

Note:

- In pattern (2), it is acceptable to decelerate to less than 80 km/h (50 MPH) or to stop the vehicle depending on the traffic conditions. Drive the vehicle at 80 km/h (50 MPH) or more until the total driving time reaches or exceeds 15 minutes.
- There is no given transition time between idling and cruising.
- Driving at constant speed only on a downhill causes smaller engine load and may result in failure to obtain a right diagnostic result.
- If the ignition switch is turned to OFF during driving cycle F, perform this driving cycle again after satisfying the conditions listed in the table.

P2404	EVAP SYSTEM LEAK DETECTION PUMP SENSE CIRCUIT RANGE/PERFORMANCE	
P2420	EVAP SYSTEM SWITCHING VALVE CONTROL CIRCUIT HIGH	

Caution:

Be careful of the state of the battery when performing the drive cycle I consecutively. Performing the drive cycle I consecutively without the engine running may cause a low battery voltage and battery discharge.

Note:

- If it is necessary to perform drive cycle I consecutively, drive the vehicle under the following conditions to release accumulated evaporating gas. Performing the drive cycle I consecutively without starting the engine causes a large amount of evaporating gas to accumulate in the canister, which hinders an accurate diagnosis.
 - After engine is warmed up.
 - Drive for 10 minutes or more at a speed of 48 km/h (30 MPH) or more (duration of drive can be an accumulation)
- To obtain an accurate diagnostic result, perform the procedures according to the following points.
 - Do not refuel gas immediately before performing drive cycle I. There will be a large amount of evaporating gas immediately after refuel, which may cause a less accurate diagnostic performance.
 - Do not shake the vehicle while performing drive cycle I. Shaking the vehicle causes evaporating gas to increase inside the fuel tank, which may cause a less accurate diagnostic performance.
 - Do not perform any service operation including installation or removal of parts or connectors while performing drive cycle I. Performing service operation could affect on the functions of related parts, which may cause a less accurate diagnostic performance.
- Perform **MODE \$08** when using a general scan tool.

Diagnostic procedure:

1. Prepare the Subaru Select Monitor.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DO\)>General Description>PREPARATION TOOL.](#)
2. Prepare PC with Subaru Select Monitor installed.
3. Connect the USB cable to the DST-i and the USB port on the personal computer (dedicated port for the Subaru Select Monitor).

Note:

The dedicated port for the Subaru Select Monitor means the USB port which was used to install the Subaru Select Monitor.

4. Connect the diagnosis cable to DST-i.
5. Connect the DST-i to the data link connector located in the lower portion of the instrument panel (on the driver's side).

Caution:

Do not connect the scan tools except for Subaru Select Monitor and general scan tool.

6. Start the PC.
7. Turn the ignition switch to ON (engine OFF) and run the "PC application for Subaru Select Monitor".
8. On [Main Menu] display, select [Each System].

10. Click the [OK] button after the information of engine type has been displayed.
11. On the engine diagnosis display, select [Generic OBDII].
12. On the OBD menu display, select [Evaporative System Leak Test].
13. On [Evaporative System Leak Test] display, select [Evaporative System Leak Test].
14. On [Evaporative System Leak Test is running. Press Cancel to exit this function.] display, click [OK] button to perform evaporative system leak test.
15. When [Conditions have been enabled to control this function. Turn the ignition switch off to terminate the test.] display appears, wait for 30 minutes without clicking the [OK] button.

Caution:

Do not leave the vehicle for an extended period of time after the test is complete. This may cause early deterioration of the battery or discharged battery.

Note:

- Clicking the [OK] button brings [Evaporative System Leak Test] display back, although the test is continuing.
- The Subaru Select Monitor screen does not change after the evaporative system leak test is complete or when the test is aborted by turning off the ignition switch.
- If "Test conditions are not correct" display appears, use Subaru Select Monitor to check that the values in [Coolant Temp.] and [Intake Air Temp.] satisfy the conditions. If the conditions are satisfied, make the necessary preparation for the drive cycle again. Ref. to Target Not Found

16. After 30 minutes passed from the start of step 14), click the [OK] button to return to the [Evaporative System Leak Test] display.
17. Return to the OBD menu display, and select [On-board monitor test result].
18. Check TID \$C1 —\$CA of MID \$3C in [On-board monitor test result].

Note:

Perform MODE \$06 and check when using a general scan tool.

P0018	CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION BANK 2 SENSOR A	

Warning:

When performing drive cycle N on a public road, pay sufficient attention to the traffic condition and give the highest priority to safe driving.

1. Check the data in condition column of table by using the Subaru Select Monitor or general scan tool.

Note:

- **Subaru Select Monitor**

 - **General scan tool**
For detailed operation procedures, refer to the general scan tool operation manual.
2. While the conditions in the list are satisfied, race the engine at the speed of approx. 2500 rpm for 40 seconds or more.
 3. Start to move the vehicle, then accelerate the vehicle to 50 km/h (31.1 MPH) or more.
 4. When the speed reaches 50 km/h (31.1 MPH) or more, release the accelerator pedal, the brake pedal and the clutch pedal (MT model) to decelerate the vehicle without shifting the gear. At this time, select an appropriate gear beforehand so that the engine speed falls within the range from 2500 rpm to 1900 rpm for 5 seconds or more.

Note:

- The vehicle speed does not matter so long as the engine speed can maintain from 2500 rpm to 1900 rpm for 5 seconds or more.
Example: On a downhill grade, it can be performed with a low speed gear and at a low vehicle speed.
- When it is performed with the electrical load such as the air conditioner, etc. turned OFF or the vehicle driven on a downhill grade, the engine speed decreases slowly. Therefore, the continuous time can be maintained easily.

5. Bring the vehicle to a stop in a safe place, and idle it for 5 minutes or more.

Note:

Driving method while vehicle is driven to a stop at safe place is not restricted.

6. With the vehicle idling, read the temporary diagnostic code of DTC using Subaru Select Monitor or general scan tool.

Note:

- Refer to "Read Diagnostic Trouble Code (DTC)" for detailed operation procedure. 
- Ref. to ENGINE (DIAGNOSTICS)(H4DO)>Read Diagnostic Trouble Code (DTC).
- In the step 6), if the DTC is not displayed on the Subaru Select Monitor or general scan tool display screen, the trouble is resolved.

Note:

- After engine is warmed up, attach the check board for measurement.
- Set the select lever in "P" range or "N" range, or the shift lever in neutral.
- Turn the A/C to OFF.
- Turn all the accessory switches to OFF.
- Waveforms vary depending on a measurement environment and vehicle condition.

Note:

- For measurement of the waveform of the crankshaft position sensor, we recommend using the DST-i oscilloscope function or a general oscilloscope.
- The waveform of the crankshaft position sensor may be shown as in diagram (A) using the oscilloscope function of the Subaru Select Monitor.

This is because the output unit of the crankshaft position sensor is smaller than the minimal measurement unit of the Subaru Select Monitor, and therefore this phenomenon is not a malfunction of either the Subaru Select monitor or the crankshaft position sensor.

ENGINE (DIAGNOSTICS)(H4DO) > General Description

CAUTION

1. Airbag system wiring harness is routed near the ECM, main relay and fuel pump relay.

Caution:

- **Do not use electrical test equipment on the airbag system circuits.**
 - **Be careful not to damage the airbag system wiring harness when servicing the ECM, TCM, main relay and fuel pump relay.**
2. Never connect the battery in reverse polarity. Doing so will damage the ECM instantly, and other parts will also be damaged.
 3. Do not disconnect the battery cables while the engine is running. A large counter electromotive force will be generated in the generator, and this voltage may damage electronic parts such as ECM etc.
 4. When disconnecting the connectors of the electrical components, always be sure to turn the ignition switch to OFF. Perform the Clear Memory after connecting the connectors.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DO\)>Clear Memory Mode.](#)
 5. When measuring the voltage or resistance of individual sensors or all electrical control modules, use a tapered pin with a diameter of 0.6 mm (0.024 in) or less and touch it to the tip of terminal.

Never insert the tapered pin into the terminal because it deforms inside which may lead to a malfunction.

Caution:

When replacing the ECM, be careful not to use the ECM of wrong specification to avoid any damage on the fuel injection system.

Note:

When replacing the ECM of the models with immobilizer, immobilizer system must be registered. For detailed procedures, refer to "REGISTRATION MANUAL FOR IMMOBILIZER".

6. Take care not to allow water to get into the connectors when servicing or washing the vehicle in rainy weather. Avoid exposure to water even if the connectors are waterproof.
7. Use ECM mounting stud bolts for the grounding point when measuring voltage and resistance inside the passenger compartment.

(A) Stud bolt

8. Use the engine ground terminal or engine assembly for the grounding point when measuring the voltage and resistance in engine compartment.

9. All parts related to the engine control system are precision parts. Do not drop or otherwise apply impact. Do not reuse the parts that are dropped accidentally.

10. Observe the following cautions when installing a radio in vehicle.

Caution:

- **The antenna must be kept as far apart as possible from the ECM.**  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DO\)>Electrical Component Location>LOCATION > CONTROL MODULE.](#)
- **The antenna feeder must be placed as far apart as possible from the ECM and engine control system harness.**
- **Carefully adjust the antenna for correct matching.**
- **When mounting a large power type radio, pay special attention to the three items mentioned above.**
- **Incorrect installation of the radio may affect the operation of ECM.**

11. When disconnecting the fuel hose, release the fuel pressure.  [Ref. to FUEL INJECTION \(FUEL SYSTEMS\)\(H4DO\)>Fuel>PROCEDURE > RELEASING OF FUEL PRESSURE.](#)

12. Warning lights may illuminate when performing driving test with jacked-up or lifted-up condition, but this is not a system malfunction. The reason for this is the rotating speed difference between the front and rear wheels. When engine control system diagnosis is finished, perform the VDC memory clearance procedure of self-diagnosis function.  [Ref. to BRAKE CONTROL \(DIAGNOSTICS\)>Clear memory.](#)

ENGINE (DIAGNOSTICS)(H4DO) > General Description

INSPECTION

Before performing diagnostics, check the following item which might affect engine problems.

1. BATTERY

1. Check the battery.  [Ref. to STARTING/CHARGING SYSTEMS\(H4DO\)>Battery>INSPECTION.](#)
2. Check the condition of the main and other fuses, and harnesses and connectors. Also check for proper grounding.

2. ENGINE GROUND

Make sure that the engine ground terminal has no contamination, corrosion or looseness and is properly connected to the engine.

ENGINE (DIAGNOSTICS)(H4DO) > General Description

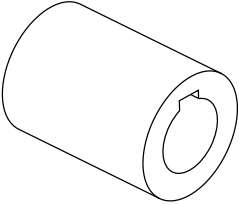

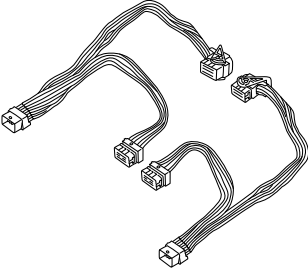

NOTE

- The on-board diagnostic (OBD) system detects and indicates a fault in various inputs and outputs of the complex electronic control. Malfunction indicator light in the combination meter indicates occurrence of a fault or trouble.
- Further, against such a failure of sensors as may disable the drive, the fail-safe function is provided to ensure the minimal drivability.
- The OBD system incorporated with the vehicles within this type of engine complies with OBD-II regulations. The OBD system monitors the components and the system malfunction listed in "Engine Section" which affects on emissions.
- When the system decides that a malfunction occurs, malfunction indicator light illuminates. At the same time of the malfunction indicator light illumination or blinking, a DTC and a freeze frame engine conditions are stored into on-board computer.
- The OBD system stores freeze frame engine condition data (engine load, engine coolant temperature, fuel trim, engine speed and vehicle speed, etc.) into on-board computer when it detects a malfunction.
- Freeze frame engine condition data are stored until the DTCs are cleared. However when such malfunctions as fuel trim fault and misfire are detected with the freeze frame engine condition data stored, they are rewritten into those related to the fuel trim fault and misfire.
- When the malfunction does not occur again for three consecutive driving cycles*, malfunction indicator light is turned off, but DTC remains at on-board computer.
*: One driving cycle means the period between the ignition switch ON and the ignition switch OFF after driving.
- When performing diagnosis, connect the Subaru Select Monitor or general scan tool to the vehicle.

1. Check that the battery voltage is 12 V or more and fuel remains approx. half [20 — 40 L (5.3 — 10.6 US gal, 4.4 — 8.8 Imp gal)].
2. Clear the memory.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DO\)>Clear Memory Mode.](#)
3. Read the diagnostic trouble code (DTC) and check that no DTC is displayed.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DO\)>Read Diagnostic Trouble Code \(DTC\).](#)

Note:

If the DTC is displayed on the screen, the trouble is still present. Perform the diagnosis using "Diagnostic Procedure with Diagnostic Trouble Code (DTC)".  **[Ref. to ENGINE \(DIAGNOSTICS\)\(H4DO\)>Diagnostic Procedure with Diagnostic Trouble Code \(DTC\).](#) After solving the DTC, repeat from step 2).**

4. Start the engine, and run the engine at idle for 10 seconds or more.
5. Read the readiness code using Subaru Select Monitor and check that the concerned DTC is not displayed. For detailed operation procedures, refer to "PC application help for Subaru Select Monitor".

Note:

- The readiness code shows self-diagnosis status of each DTC. If any DTC is displayed when you select the readiness code, the self-diagnosis of the DTC is not executed or completed. After the self-diagnosis is complete, DTC will no longer be displayed regardless of the diagnostic result.
- Self-diagnosis is executed every time when the ignition switch is turned to ON. Therefore, even after the self-diagnosis is complete and nothing is displayed on the readiness code display, if you turn the ignition switch to ON again after turning it OFF, some DTCs may be displayed on the readiness code display.
- After you repair a DTC and perform the Inspection Mode or the drive cycle, use the readiness code to check if the self-diagnosis of the DTC is completed. If the concerned DTC is displayed, the self-diagnosis of the DTC is not complete. Repeat from step 4).

6. Read the diagnostic trouble code (DTC) and check the DTC.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DO\)>Read Diagnostic Trouble Code \(DTC\).](#)

Note:

If the DTC is displayed on the screen, the trouble is still present. Perform the diagnosis using "Diagnostic Procedure with Diagnostic Trouble Code (DTC)".  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DO\)>Diagnostic Procedure with Diagnostic Trouble Code \(DTC\).](#) After solving the DTC, repeat from step 2).

3. FREEZE FRAME DATA

Note:

- ECM updates the freeze frame data every 0.5 seconds, and always keeps the last three records. Time-series freeze frame data includes the last three freeze frame data and the freeze frame data when the DTC is detected.
- In the time-series freeze frame data, freeze frame data at detection, one block before, two blocks before, and three blocks before are displayed.
- Time lag between the freeze frame at detection and the freeze frame data of one block before changes within the range of 0 – 0.5 seconds. This is because the freeze frame data at detection is recorded when the DTC is actually detected, while the freeze frame data of one block before is updated every 0.5 seconds.

EN-21304

- (A) 0.5 seconds timer (D) «Two blocks before» (F) «Detect»
 (B) 0.5 seconds (E) «One block before» (G) Changes within the range of 0 – 0.5 seconds, depending on the timing of DTC detection.
 (C) «three blocks before»

- When more than one DTCs are recorded, the time-series freeze frame data is recorded only for the first-detected DTC, and for the next DTC, just the freeze frame data of Detect is recorded. And for the subsequent DTCs, no freeze frame data is recorded.
 - When performing diagnosis, you can utilize the time-series freeze frame data to guess the vehicle status when the DTC was detected.
 - For detailed operation procedures, refer to “PC application help for Subaru Select Monitor”.

Battery voltage	≥ 10.9 V

Elapsed time after external load (power steering, neutral position switch) change	≥ 3 s
Exhaust AVCS position learning	In operation

Diagnosis 1

Judgment value

Malfunction Criteria	Threshold Value
Crankshaft position when camshaft position sensor signal is input – Learning value	$> 10^{\circ}\text{CA}$

Diagnosis 2

Judgment value

Malfunction Criteria	Threshold Value

For the diagnostic procedure, refer to DTC P013A.  Ref. to [ENGINE \(DIAGNOSTICS\) \(H4DOTC\)>Diagnostic Procedure with Diagnostic Trouble Code \(DTC\)>DTC P013A O2 SENSOR SLOW RESPONSE - RICH TO LEAN BANK 1 SENSOR 2.](#)

1. OUTLINE OF DIAGNOSIS

Detect the slow response of lean → rich for rear oxygen sensor output.
 After the deceleration fuel cut has occurred, detect the trouble by calculating the time when the rear oxygen sensor output passes through the predetermined range of voltages.
 Judge as NG when the response time is larger than the threshold value.

2. COMPONENT DESCRIPTION

EN-10447

- (A) Electromotive force
- (B) Air fuel ratio
- (C) Lean
- (D) Rich
- (E) Theoretical air fuel ratio
- (F) Comparative voltage

3. EXECUTION CONDITION

Secondary Parameters	Execution condition
Battery voltage	≥ 10.9 V
Main feedback	In operation
Deceleration fuel cut for 5000 ms or more	Experienced

4. GENERAL DRIVING CYCLE

Always perform the diagnosis continuously.

5. DIAGNOSTIC METHOD

Detect the trouble by calculating the response time of the rear oxygen sensor after fuel cut.
