For the diagnostic procedure, refer to DTC P0304.  Ref. to [ENGINE \(DIAGNOSTICS\) \(H4DOTC\)>Diagnostic Procedure with Diagnostic Trouble Code \(DTC\)>DTC P0304 CYLINDER 4 MISFIRE DETECTED.](#)

1. OUTLINE OF DIAGNOSIS

Detect the presence of misfire occurrence. (Revolution fluctuation method)

Monitoring misfire which influences exhaust deterioration (1.5 times of FTP) and catalyst damage is made obligatory by the law. Misfire affecting these two has two patterns below:

- Intermittent misfire (the same cylinder misfires in random, or different cylinders misfire in random): FTP 1.5 times misfire
- Every time misfire (the same cylinder misfires every time): FTP 1.5 times misfire, catalyst damage misfire

The following detecting methods are adopted for these detection.

1. Intermittent misfire: FTP 1.5 times misfire
 - 180° Interval Difference Method
 - 360° Interval Difference Method
 - 720° Interval Difference Method
2. Misfire every time: FTP 1.5 times misfire, catalyst damage misfire
 - 180° Interval Difference Method
 - 360° Interval Difference Method

2. EXECUTION CONDITION

Secondary Parameters	Execution condition
Battery voltage	≥ 8 V
Fuel shut-off function	≠ Fuel cut
Engine speed	400 rpm — 6000 rpm
Intake manifold pressure	<ul style="list-style-type: none">• Normal ignition 19.1 kPa — 47 kPa (Changes based on the engine speed and atmospheric pressure.)• Idling ignition 19.3 kPa — 46.2 kPa (Changes based on the engine speed and

	atmospheric pressure.)
Time elapsed after engine start	≥ 2 crankshaft revolutions
Following condition A or B is met	
A: Engine coolant temperature at engine starting	> -7° (19°F)
B: Following conditions (b1) and (b2) are met	≤ -7° (19°F)
(b1) Engine coolant temperature at engine starting	
(b2) Engine coolant temperature	≥ 21° (70°F)

3. GENERAL DRIVING CYCLE

- If conditions are met, it is possible to detect the misfires from idling to high engine speed. However, in case any engine load or breakage occurs, perform with the engine at idle.
- Perform the diagnosis continuously.

4. DIAGNOSTIC METHOD

When a misfire occurs, the engine speed will decrease and the crankshaft position speed will change. Calculate the interval difference value (diagnostic value) from crankshaft position speed by the following formula, and judge whether a misfire is occurring or not comparing the calculated result with judgment value. Count the number of misfires, if the misfire ratio is higher during 1000 revs. or 200 revs., judge corresponding cylinders as NG.

Diagnostic value calculation (Calculate from angle speed) →	Misfire detection every single ignition (Compare diagnostic value with judgment value) →	NG judgment (Misfire occurrence judgment required by the law) (Compare number of misfire with judgment value)

Is the value of [Mani. Absolute Pressure] 53.3 kPa (400 mmHg, 15.75 inHg) or more?

Yes

Make sure that the EGR control valve, manifold absolute pressure sensor and throttle body are installed securely.

No

 [Go to 2.](#)

2. CHECK EGR CONTROL VALVE.

Remove the EGR control valve.

Are there any holes, clogged lines or foreign matters in the EGR system?

Yes

1. OUTLINE OF DIAGNOSIS

Detect EGR system malfunction.

Intake manifold pressure (negative pressure) is constant because the throttle valve is fully closed during deceleration fuel cut. At this time, when the EGR control valve is opened/closed, the intake manifold pressure will change. EGR System OK/NG is judged by the range of this change.

5. DIAGNOSTIC METHOD

Measure the pressure values when the enable conditions are established, and perform diagnosis by calculating those results.

1. Label the intake manifold pressure value as PMOF1, which is observed when enable conditions are established, and set the EGR target step to 55 steps (nearly full open).
2. Label the intake manifold pressure value as PMON, which is observed after one second has passed since EGR target step was set to 55 steps (when the enable conditions were established), and set the EGR target step to 0.
3. Label the intake manifold pressure as PMOF2, which is observed after one second has passed since EGR target step was set to 0 (after two seconds have passed since the enable conditions were established).

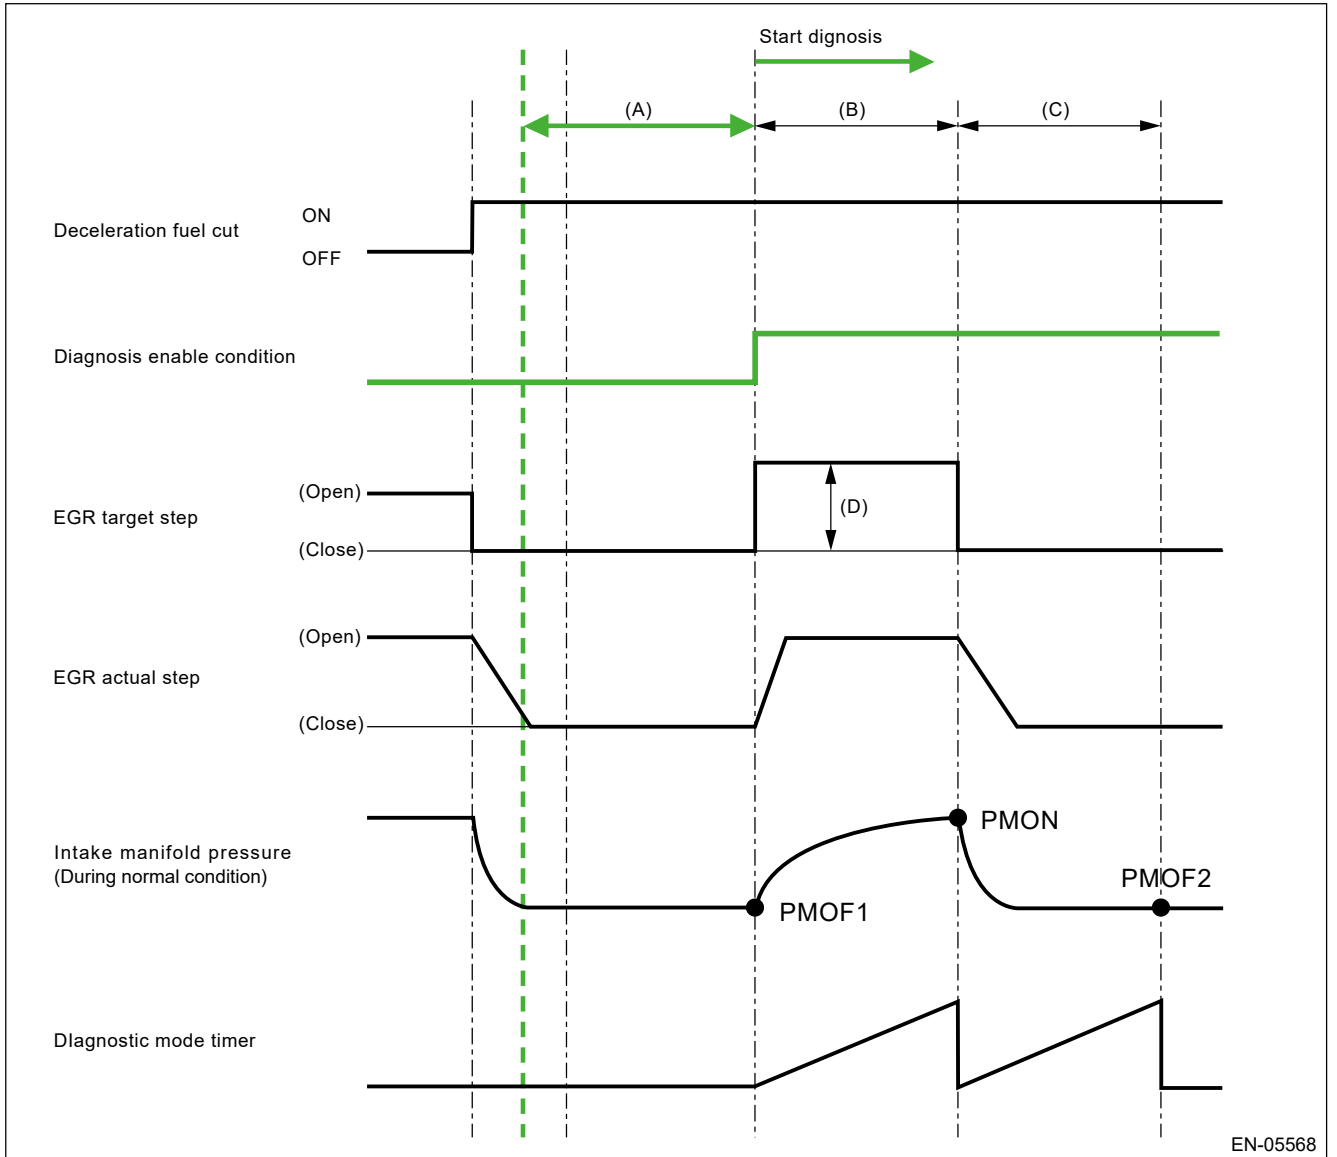

Judge as NG when the following conditions are established.

Are there holes, cracks, clogging, or disconnection, misconnection of hoses or pipes in evaporative emission control system?

Yes

1. OUTLINE OF DIAGNOSIS

This diagnosis judges whether the Evaporative Leak Check Module operation is normal or not, and whether the evaporative emission system has leak and clogging or not.

To purge the canister, after driving, perform the five hours soaking after ignition switch OFF in order to stabilize the evaporative gas status. * After 5 or 7 or 9.5 hours passed, ECM is activated by soaking timer, and the leak check is started.

Judges whether the Evaporative Leak Check Module operation is normal or not, by measuring the reference pressure status via reference orifice (0.02 inch orifice). Judge as malfunction if the reference pressure is out of specified range. Then, judge whether there is a leak or not, by comparing the pressure (leak pressure) when the reference pressure and the evaporative emission system are in negative pressure condition. Judge as system leak in the evaporative emission system if the leak pressure is higher than reference pressure. Judge as clogging of pipe if the leak pressure becomes lower than the reference pressure within the specified amount of time.

0.02 inch leak and 0.04 inch leak can be distinguished by measuring the leak pressure.

The diagnosis results are stored inside ECM until the engine is started again.

*: When the test conditions are not met in 5 hours, perform diagnosis at elapsed time of 7 hours.

When the test conditions are not met in 7 hours, perform diagnosis at elapsed time of 9.5 hours.

1. OUTLINE OF DIAGNOSIS

Monitor Method

This monitor intrusively performs a functional check to detect incorrect purge flow when the engine is running in very high boost conditions.

Theory of operation: At very high boost conditions, the pressure drop caused by the air filter creates a slight vacuum in the high pressure purge line. Refer to following Figure 1.

Phase 1: The monitor removes the air in EVAP system by closing the ELCM switching valve and ELCM pump is intrusively activated when the solenoid valve for high pressure purge is open and all enable conditions are satisfied. In the case of normal condition, ELCM pressure (gauge) will

decrease to reach the threshold value. However, if the hose is disconnected, the ELCM pressure will remain above the threshold value.

Phase 2: Since there is a possibility that a large amount of EVAP vapor is generated during Phase 1, the monitor may determine a false fail. To prevent this condition, the EVAP system is sealed and the pressure is measured again after a predetermined time (following Phase 1). If the measured pressure exceeds a second threshold value, the monitor is cancelled. If the pressure does not reach the second threshold value, the monitor determines a malfunction (disconnection).

1. OUTLINE OF DIAGNOSIS

This diagnostic monitor performs a functional check of the fuel system to determine an air-fuel ratio cylinder imbalance.

This diagnosis is composed of two monitors.

The outline of "monitor A1" is as follows. When an air-fuel ratio cylinder imbalance occurs, the primary oxygen sensor output signal will oscillate with increased amplitude. This monitor utilizes this behavior to make a diagnosis. The monitor integrates the difference between the amplification value and the mean value of the first oxygen sensor output signal and compares it to a threshold to make a judgment.

The outline of "monitor B1" is as follows. Similarly, when an imbalance occurs, the engine speed also fluctuates with increased amplitude. This monitor utilizes this behavior to make a diagnosis. For reference, it should be noted that this imbalance monitor method is actually similar to the current misfire diagnostic monitor, and the parameter "domg360" (units: degrees CA) is shared between the imbalance and misfire monitors. The imbalance monitor is performed during idle condition when the engine is warm. The monitor integrates the count of "domg360" which exceeds a threshold in 1000 revolution.

When both the "monitor A1" value and the "monitor B1" value exceed a predetermined threshold, this monitor determines a malfunction and stores a fault code.

MONITOR A1

When there is an air-fuel ratio cylinder imbalance malfunction, the primary oxygen sensor output fluctuates widely compared with a normal sensor, as shown by the chain line in Figure 1 below.

This monitor makes a diagnosis based on this phenomenon. Each primary oxygen sensor signal (PS) and mean value of the primary oxygen sensor signal (MS) is calculated from the primary oxygen sensor signal. The absolute values of (PS - MS) are sampled every 4 ms as shown in the figure. Diagnostic value 1 (DV1) is obtained by integrating the absolute value of (PS - MS) for 2500 times. A malfunction is determined when DV1 exceeds the threshold. The judgment values are determined experimentally.

Figure 1. Compare malfunctioned primary oxygen sensor output with a normal sensor

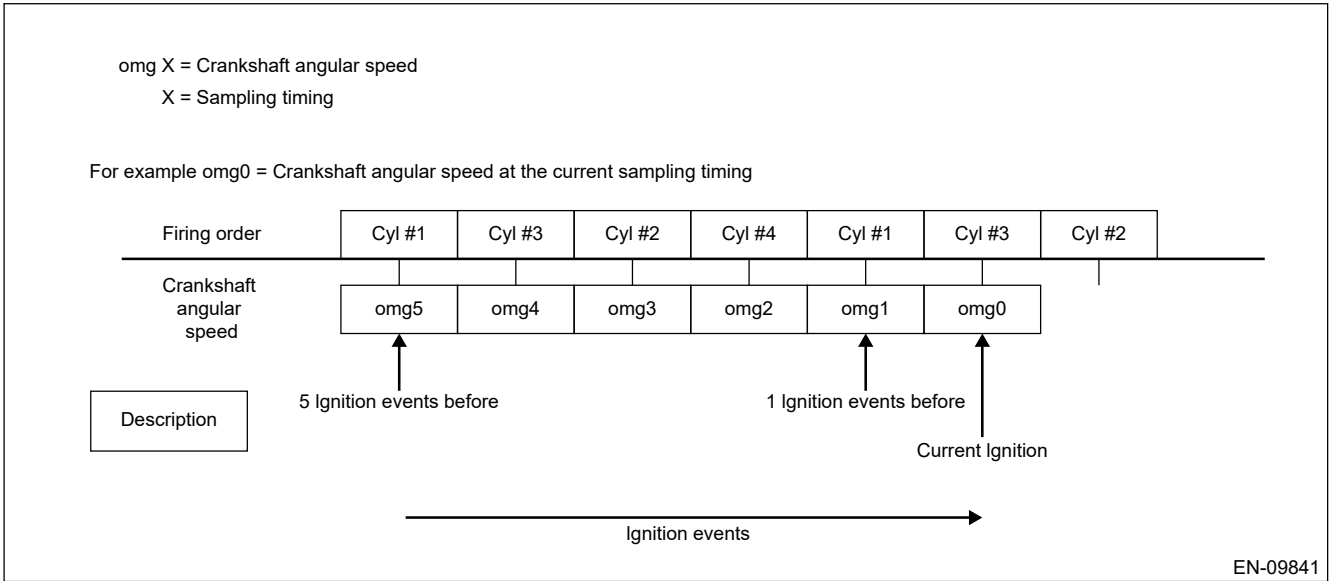

MONITOR B1

Method used: Difference method of 360 degrees CA

Monitor value: $\text{domg360} = (\text{omg } 1 - \text{omg } 0) - (\text{omg } 3 - \text{omg } 2) = \text{angular speed}$

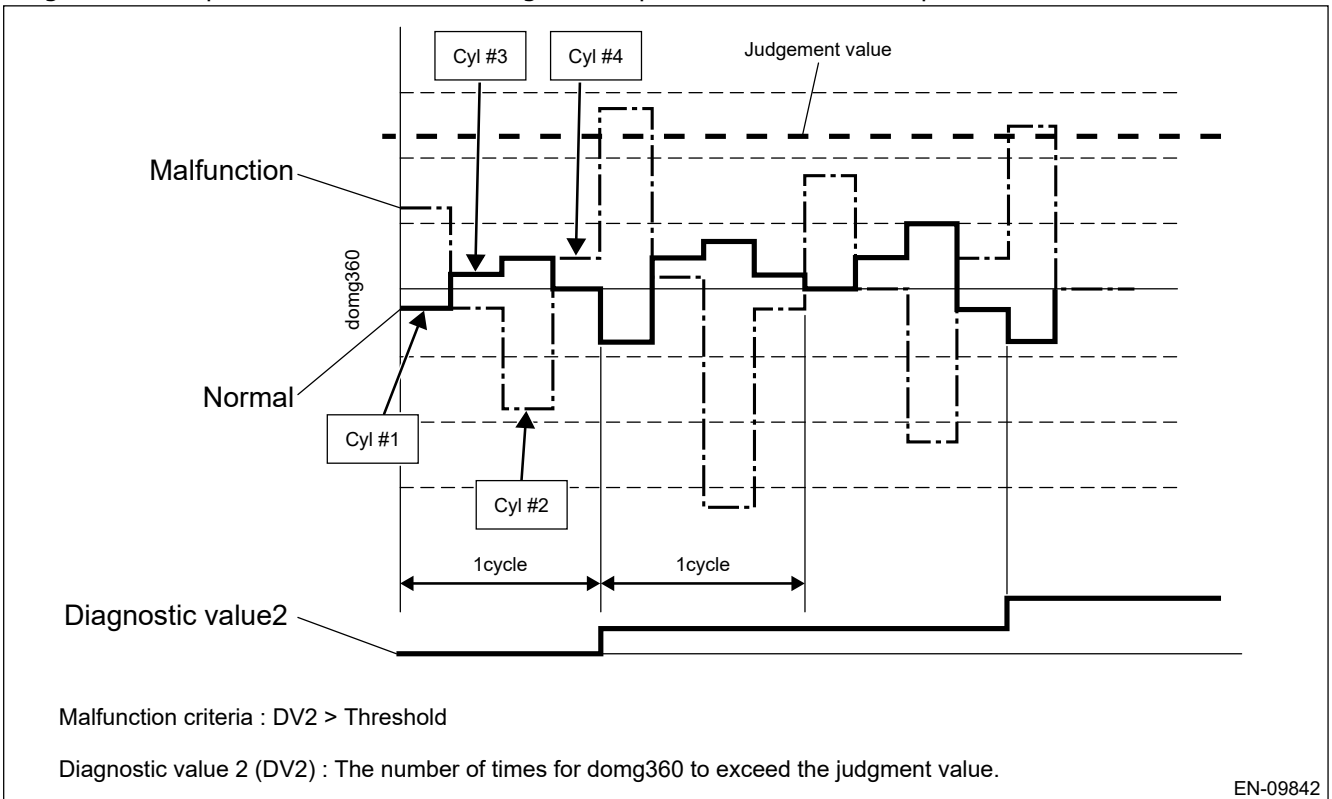

Each crankshaft angular speed is defined as Figure 2 below.

Figure 2. Description of domg360 output

This method uses the fact that the domg360 of lean conditioned cylinder caused by imbalance malfunction indicates big value, as shown by the chain line in Figure 3 below. The number of times for domg360 to exceed the judgment value in 1000 revolutions (500 cycles) is calculated as diagnostic value 2 (DV2). A malfunction is determined when DV2 exceeds the threshold.

Figure 3. Compare malfunctioned domg360 output with a normal output

ENGINE (DIAGNOSTICS)(H4DOTC) > Drive Cycle

PROCEDURE

It is necessary to perform the drive cycle listed below if DTC is not found in the Inspection Mode. It is possible to complete diagnosis of the DTC by performing the indicated drive cycle. After the repair for the DTC, perform a necessary drive cycle and make sure the function recovers and the DTC is recorded.

1. PREPARATION FOR DRIVE CYCLE

1. Check that the battery voltage is 12 V or more and fuel remains approx. half [20 — 40 L (5.3—10.6 US gal, 4.4—8.8 Imp gal)].
2. After performing the diagnostics and clearing memory, check that no DTC remains.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DOTC\)>Clear Memory Mode.](#)

Note:

Perform the drive cycle after warming up the engine except when the engine coolant temperature at engine start is specified.

- Hold the select lever in "P" range or "N" range at idling.

3. Drive according to the drive pattern described below.

- (A) Vehicle speed (B) Elapsed time
- (1) Idle the engine for 2 minutes or more. (4) Drive for 30 seconds or more at a constant speed of 80 km/h (50 MPH) or more. (6) Drive for 30 seconds or more at a constant speed of 80 km/h (50 MPH) or more.
- (2) Drive for a total period of 15 minutes or more at a speed of 80 km/h (50 MPH) or more. (5) Stop the vehicle and idle for 30 seconds or more. (7) Stop the vehicle and idle for 30 seconds.
- (3) Stop the vehicle and idle for 30 seconds or more.

Note:

- In pattern (2), it is acceptable to decelerate to less than 80 km/h (50 MPH) or to stop the vehicle depending on the traffic conditions. Drive the vehicle at 80 km/h (50 MPH) or more until the total driving time reaches or exceeds 15 minutes.
- There is no given transition time between idling and cruising.
- Driving at constant speed only on a downhill causes smaller engine load and may result in failure to obtain a right diagnostic result.
- If the ignition switch is turned to OFF during driving cycle F, perform this driving cycle again after satisfying the conditions listed in the table.

8. DRIVE CYCLE I

--	--	--

DTC	Item	Condition
P0455	EVAP SYSTEM (CPC) LEAK DETECTED (LARGE LEAK)	Engine coolant temperature: 5 – 45°C (41 – 113°F) Intake air temperature sensor #11: 5 – 50°C (41 – 122°F)

P2402	EVAP SYSTEM LEAK DETECTION PUMP CONTROL CIRCUIT HIGH	
P2404	EVAP SYSTEM LEAK DETECTION PUMP SENSE CIRCUIT RANGE/PERFORMANCE	
P2420	EVAP SYSTEM SWITCHING VALVE CONTROL CIRCUIT HIGH	

Caution:

Be careful of the state of the battery when performing the drive cycle I consecutively. Performing the drive cycle I consecutively without the engine running may cause a low battery voltage and battery discharge.

Note:

- If it is necessary to perform drive cycle I consecutively, drive the vehicle under the following conditions to release accumulated evaporating gas. Performing the drive cycle I consecutively without starting the engine causes a large amount of evaporating gas to accumulate in the canister, which hinders an accurate diagnosis.
 - After engine is warmed up.
 - Drive for 10 minutes or more at a speed of 48 km/h (30 MPH) or more (duration of drive can be an accumulation)
- To obtain an accurate diagnostic result, perform the procedures according to the following points.
 - Do not refuel gas immediately before performing drive cycle I. There will be a large amount of evaporating gas immediately after refuel, which may cause a less accurate diagnostic performance.
 - Do not shake the vehicle while performing drive cycle I. Shaking the vehicle causes evaporating gas to increase inside the fuel tank, which may cause a less accurate diagnostic performance.
 - Do not perform any service operation including installation or removal of parts or connectors while performing drive cycle I. Performing service operation could affect on the functions of related parts, which may cause a less accurate diagnostic performance.
- Perform **MODE \$08** when using a general scan tool.

Diagnostic procedure:

1. Prepare the Subaru Select Monitor.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DOTC\)>General Description>PREPARATION TOOL.](#)
2. Prepare PC with Subaru Select Monitor installed.
3. Connect the USB cable to the DST-i and the USB port on the personal computer (dedicated port for the Subaru Select Monitor).

Note:

The dedicated port for the Subaru Select Monitor means the USB port which was used to install the Subaru Select Monitor.

4. Connect the diagnosis cable to DST-i.
5. Connect the DST-i to the data link connector located in the lower portion of the instrument panel (on the driver's side).

Caution:

Do not connect the scan tools except for Subaru Select Monitor and general scan tool.

6. Start the PC.
7. Turn the ignition switch to ON (engine OFF) and run the "PC application for Subaru Select Monitor".
8. On [Main Menu] display, select inspection for each system.
9. On [Select System] display, select [Engine Control System].
10. Click the [OK] button after the information of engine type has been displayed.
11. On the Engine Diagnosis display, select [Generic OBDII].
12. On the OBD menu display, select [Evaporative System Leak Test].
13. On [Evaporative System Leak Test] display, select [Evaporative System Leak Test].
14. On [Evaporative System Leak Test is running. Press Cancel to exit this function.] display, click [OK] button to perform evaporative system leak test.
15. When [Conditions have been enabled to control this function. Turn the ignition switch off to terminate the test.] display appears, wait for 30 minutes without clicking the [OK] button.

Caution:

Do not leave the vehicle for an extended period of time after the test is complete. This may cause early deterioration of the battery or discharged battery.

Note:

- Clicking [OK] button brings [Evaporative System Leak Test] display back, although the test is continuing.
- The Subaru Select Monitor screen does not change after the evaporative system leak test is complete or when the test is aborted by turning off the ignition switch.
- If "Test conditions are not correct" display appears, use Subaru Select Monitor to check that the values in [Coolant Temp.] and [Coolant Temp.] satisfy the conditions. If the conditions are satisfied, make the necessary preparation for the drive cycle again. [Ref. to Target Not Found](#)

16. After 30 minutes passed from the start of step 14), click [OK] button to return to the [Evaporative System Leak Test] display.
17. Return to the OBD menu display, and select [On-board monitor test result].
18. Check TID \$C1 —\$CA of MID \$3C in [On-board monitor test result].

Note:

Perform MODE \$06 and check when using a general scan tool.

Warning:

When performing drive cycle N on a public road, pay sufficient attention to the traffic condition and give the highest priority to safe driving.

1. Check the data in condition column of table by using the Subaru Select Monitor or general scan tool.

Note:

- **Subaru Select Monitor**

- **General scan tool**
For detailed operation procedures, refer to the general scan tool operation manual.

2. While the conditions in the list are satisfied, race the engine at the speed of approx. 2500 rpm for 40 seconds or more.
3. Start to move the vehicle, then accelerate the vehicle to 50 km/h (31.1 MPH) or more.
4. When the speed reaches 50 km/h (31.1 MPH) or more, release the accelerator pedal and brake pedal to decelerate the vehicle without shifting the gear. At this time, select an appropriate gear beforehand so that the engine speed falls within the range from 2500 rpm to 1900 rpm for 5 seconds or more.

Note:

- **The vehicle speed does not matter so long as the engine speed can maintain from 2500 rpm to 1900 rpm for 5 seconds or more.**
Example: On a downhill grade, it can be performed with a low speed gear and at a low vehicle speed.
- **When it is performed with the electrical load such as the air conditioner, etc. turned OFF or the vehicle driven on a downhill grade, the engine speed decreases slowly. Therefore, the continuous time can be maintained easily.**

5. Bring the vehicle to a stop in a safe place, and idle it for 5 minutes or more.

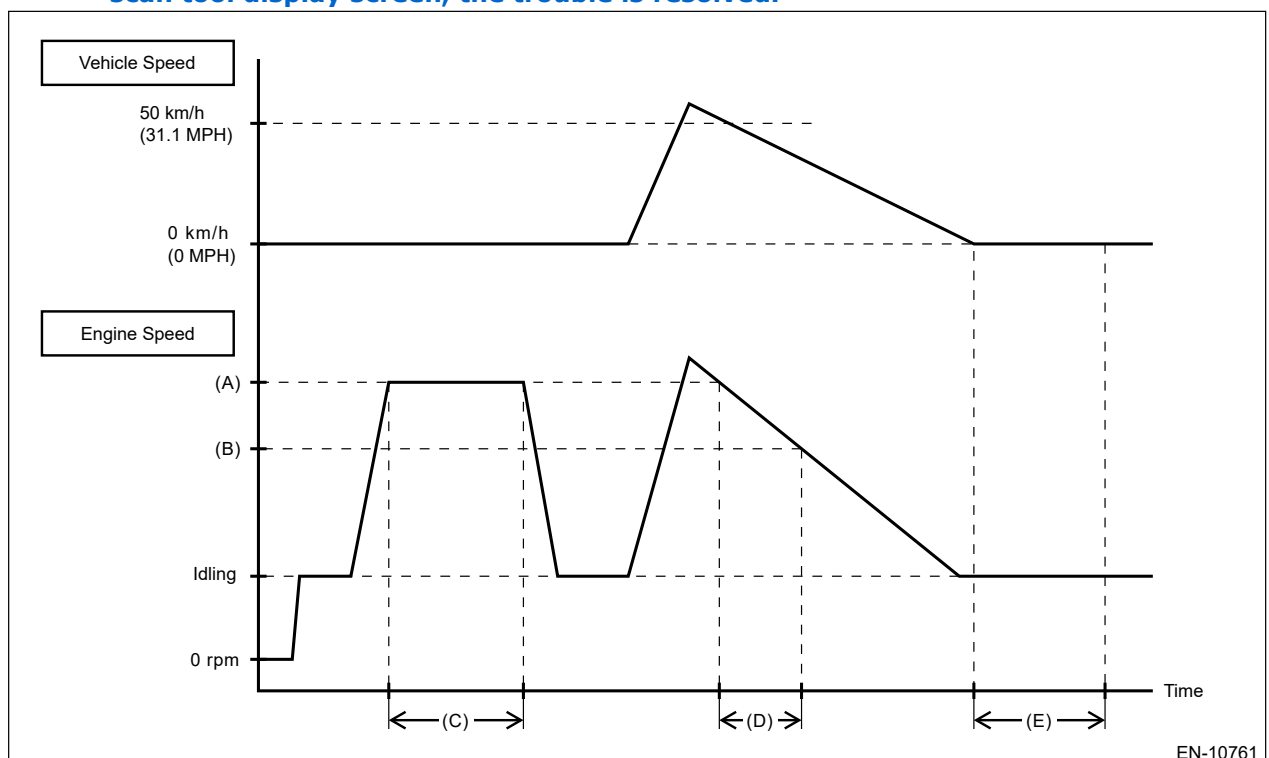

Note:

Driving method while vehicle is driven to a stop at safe place is not restricted.

6. With the vehicle idling, read the temporary diagnostic code of DTC using Subaru Select Monitor or general scan tool.

Note:

- **Refer to "Read Diagnostic Trouble Code (DTC)" for detailed operation procedure.** 
- **Ref. to ENGINE (DIAGNOSTICS)(H4DOTC)>Read Diagnostic Trouble Code (DTC).**

Note:

- For measurement of the waveform of the crankshaft position sensor, we recommend using the DST-i oscilloscope function or a general oscilloscope.
- Perform measurement after warming up the engine.
- Set the select lever in "P" range or "N" range, or the shift lever in neutral.
- Turn the A/C to OFF.
- Turn all the accessory switches to OFF.
- At idling

ENGINE (DIAGNOSTICS)(H4DOTC) > General Description

CAUTION

1. Airbag system wiring harness is routed near the ECM, main relay and fuel pump relay.

Caution:

- **Do not use electrical test equipment on the airbag system circuits.**
 - **Be careful not to damage the airbag system wiring harness when servicing the ECM, TCM, main relay and fuel pump relay.**
2. Never connect the battery in reverse polarity. Doing so will damage the ECM instantly, and other parts will also be damaged.
 3. Do not disconnect the battery cables while the engine is running. A large counter electromotive force will be generated in the generator, and this voltage may damage electronic parts such as ECM etc.
 4. When disconnecting the connectors of the electrical components, always be sure to turn the ignition switch to OFF. Perform the Clear Memory after connecting the connectors.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DOTC\)>Clear Memory Mode.](#)
 5. When measuring the voltage or resistance of individual sensors or all electrical control modules, use a tapered pin with a diameter of 0.6 mm (0.024 in) or less and touch it to the tip of terminal.

EN-10982

Never insert the tapered pin into the terminal because it deforms inside which may lead to a malfunction.

Caution:

When replacing the ECM, be careful not to use the ECM of wrong specification to avoid any damage on the fuel injection system.

Note:

When replacing the ECM of the models with immobilizer, immobilizer system must be registered. For detailed procedures, refer to "REGISTRATION MANUAL FOR IMMOBILIZER".

6. The ECM connector is waterproof. When measuring the ECM connector terminal voltages, or the resistance between the ECM connector terminals, use the ST.

ST 18460AA030 CHECK BOARD

7. Take care not to allow water to get into the connectors when servicing or washing the vehicle in rainy weather. Avoid exposure to water even if the connectors are waterproof.
8. Use the ground terminal of the bulkhead harness for the grounding point when measuring voltage and resistance inside the passenger compartment.

9. Use the engine ground terminal or engine assembly for the grounding point when measuring the voltage and resistance in engine compartment.

10. All parts related to the engine control system are precision parts. Do not drop or otherwise apply impact. Do not reuse the parts that are dropped accidentally.
11. Do not connect the wiring of electrical parts directly to the battery terminals. It may cause erroneous operation of the charge control, leading to early deterioration of the battery or discharged battery.
12. Observe the following cautions when installing a radio in vehicle.

Caution:

- **The antenna must be kept as far apart as possible from the ECM.**  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DOTC\)>Electrical Component Location>LOCATION > CONTROL MODULE.](#)
 - **The antenna feeder must be placed as far apart as possible from the ECM and engine control system harness.**
 - **Carefully adjust the antenna for correct matching.**
 - **When mounting a large power type radio, pay special attention to the three items mentioned above.**
 - **Incorrect installation of the radio may affect the operation of ECM.**
13. When disconnecting the fuel hose, be sure to release the fuel pressure beforehand.  [Ref. to FUEL INJECTION \(FUEL SYSTEMS\)\(H4DOTC\)>Fuel>PROCEDURE > RELEASING OF FUEL PRESSURE.](#)
 14. Warning lights may illuminate when performing driving test with jacked-up or lifted-up condition, but this is not a system malfunction. The reason for this is the rotating speed difference between the front and rear wheels. When engine control system diagnosis is finished, perform the VDC memory clearance procedure of self-diagnosis function.  [Ref. to BRAKE CONTROL \(DIAGNOSTICS\)>Clear memory.](#)

ENGINE (DIAGNOSTICS)(H4DOTC) > General Description

INSPECTION

Before performing diagnostics, check the following item which might affect engine problems.

1. BATTERY

1. Check the battery.  [Ref. to STARTING/CHARGING SYSTEMS\(H4DO\)>Battery Current & Temperature Sensor>INSPECTION.](#)
2. Check the condition of the main and other fuses, and harnesses and connectors. Also check for proper grounding.

2. ENGINE GROUND

Make sure that the engine ground terminal has no contamination, corrosion or looseness and is properly connected to the engine.

ENGINE (DIAGNOSTICS)(H4DOTC) > General Description

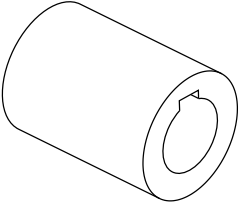

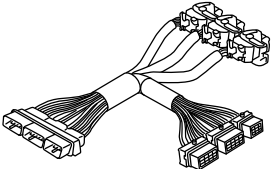

NOTE

- The on-board diagnostic (OBD) system detects and indicates a fault in various inputs and outputs of the complex electronic control. Malfunction indicator light in the combination meter indicates occurrence of a fault or trouble.
- Further, against any failure of sensors that would cause the vehicle to stop running, the fail-safe function is provided to ensure the minimal drivability.
- The OBD system incorporated with the vehicles within this type of engine complies with OBD-II regulations. The OBD system monitors the components and the system malfunction listed in "Engine Section" which affects on emissions.
- When the system decides that a malfunction occurs, malfunction indicator light illuminates. At the same time of the malfunction indicator light illumination or blinking, a DTC and a freeze frame engine conditions are stored into on-board computer.
- The OBD system stores freeze frame engine condition data (engine load, engine coolant temperature, fuel trim, engine speed and vehicle speed, etc.) into on-board computer when it detects a malfunction.
- Freeze frame engine condition data are stored until the DTCs are cleared. However when such malfunctions as fuel trim fault and misfire are detected with the freeze frame engine condition data stored, they are rewritten into those related to the fuel trim fault and misfire.
- When the malfunction does not occur again for three consecutive driving cycles*, malfunction indicator light is turned off, but DTC remains at on-board computer.
*: One driving cycle means the period between the ignition switch ON and the ignition switch OFF after driving.
- When performing diagnosis, connect the Subaru Select Monitor or general scan tool to the vehicle.

1. Check that the battery voltage is 12 V or more and fuel remains approx. half [20 — 40 L (5.3 — 10.6 US gal, 4.4 — 8.8 Imp gal)].
2. Clear the memory.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DOTC\)>Clear Memory Mode.](#)
3. Read the diagnostic trouble code (DTC) and check that no DTC is displayed.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DOTC\)>Read Diagnostic Trouble Code \(DTC\).](#)

Note:

If the DTC is displayed on the screen, the trouble is still present. Perform the diagnosis using “Diagnostic Procedure with Diagnostic Trouble Code (DTC)”.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DOTC\)>Diagnostic Procedure with Diagnostic Trouble Code \(DTC\).](#) **After solving the DTC, repeat from step 2).**

4. Start the engine, and run the engine at idle for 10 seconds or more.
5. Read the readiness code using Subaru Select Monitor and check that the concerned DTC is not displayed. For detailed operation procedures, refer to “PC application help for Subaru Select Monitor”.

Note:

- **The readiness code shows self-diagnosis status of each DTC. If any DTC is displayed when you select the readiness code, the self-diagnosis of the DTC is not executed or completed. After the self-diagnosis is complete, DTC will no longer be displayed regardless of the diagnostic result.**
- **Self-diagnosis is executed every time when the ignition switch is turned to ON. Therefore, even after the self-diagnosis is complete and nothing is displayed on the readiness code display, if you turn the ignition switch to ON again after turning it OFF, some DTCs may be displayed on the readiness code display.**
- **After you repair a DTC and perform the Inspection Mode or the drive cycle, use the readiness code to check if the self-diagnosis of the DTC is completed. If the concerned DTC is displayed, the self-diagnosis of the DTC is not complete. Repeat from step 4).**

6. Read the diagnostic trouble code (DTC) and check the DTC.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DOTC\)>Read Diagnostic Trouble Code \(DTC\).](#)

Note:

If the DTC is displayed on the screen, the trouble is still present. Perform the diagnosis using “Diagnostic Procedure with Diagnostic Trouble Code (DTC)”.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DOTC\)>Diagnostic Procedure with Diagnostic Trouble Code \(DTC\).](#) **After solving the DTC, repeat from step 2).**

3. FREEZE FRAME DATA

Note:

- ECM updates the freeze frame data every 0.5 seconds, and always keeps the last three records. Time-series freeze frame data includes the last three freeze frame data and the freeze frame data when the DTC is detected.
- In the time-series freeze frame data, freeze frame data at detection, one block before, two blocks before, and three blocks before are displayed.
- Time lag between the freeze frame at detection and the freeze frame data of one block before changes within the range of 0 – 0.5 seconds. This is because the freeze frame data at detection is recorded when the DTC is actually detected, while the freeze frame data of one block before is updated every 0.5 seconds.

EN-21304

- (A) 0.5 seconds timer (D) «Two blocks before» (F) «Detect»
 (B) 0.5 seconds (E) «One block before» (G) Changes within the range of 0 – 0.5 seconds, depending on the timing of DTC detection.
 (C) «Three blocks before»

- When more than one DTCs are recorded, the time-series freeze frame data is recorded only for the first-detected DTC, and for the next DTC, just the freeze frame data of Detect is recorded. And for the subsequent DTCs, no freeze frame data is recorded.

- When performing diagnosis, you can utilize the time-series freeze frame data to guess the vehicle status when the DTC was detected.
 - For detailed operation procedures, refer to “PC application help for Subaru Select Monitor”.
 - A list of the support data is shown in the following table.

PROCEDURE

Caution:

- Start the diagnosis after the engine has started. (Cruise control main switch does not turn on even if it is pressed before the engine starts.)
- When performing diagnosis, observe the legal speed limit on the road.
- ECM cancel code, ACC cancel code and lane keep assist code are not the diagnostic trouble codes (DTCs). These codes will also appear when the cruise control or the active lane keep is cancelled by the driver's operation. Do not confuse them.
- Be sure to get an assistant to support the diagnosis while driving, and have him/her operate the select monitor.
- Be sure to record the following data before performing the Clear Memory. (Data must be obtained before inspection because the Clear Memory operation deletes previous faults and temporary stop history.)
 - All Diagnostic Trouble Codes (DTCs)
 - DTC of stereo camera (current malfunction, past malfunction)
 - Freeze frame data of stereo camera
 - ACC cancel code of stereo camera
 - Lane keep assist code of stereo camera
 - EyeSight temporary stop code of stereo camera
 - Data monitor of stereo camera(To obtain the data concerning camera adjustment information, previous trouble or temporary stop history, all data must be measured for two – three seconds after the engine has started.)
- When a temporary stop occurs, stereo camera may be affected by a small amount of dirt that would not be perceived by the driver. In this case, cleaning the windshield glass is effective.  [Ref. to EyeSight \(DIAGNOSTICS\)>General Description>INSPECTION > WINDSHIELD GLASS AND DASHBOARD.](#)

1. PREPARATION BEFORE INSPECTION. 

Using the Check List for Interview, confirm the condition of the malfunction occurrence from the user.  [Ref. to EyeSight \(DIAGNOSTICS\)>Check List for Interview>CHECK.](#)

Is there any component that obviously seems to affect the malfunction?

Yes

Repair or replace the component that seems to affect the malfunction.

No

 [Go to 2.](#)

2. CHECK DTC. 

Read the DTC using Subaru Select Monitor.  [Ref. to EyeSight \(DIAGNOSTICS\)>Diagnostic Code\(s\)_Display.](#)

OPERATION

1. On [Main Menu] display, select [Each System].
2. On [Select System] display, select [Engine Control System].
3. Drive vehicle at 40 km/h (25 MPH) or more and set the cruise control.

Caution:

- **When performing diagnosis, observe the legal speed limit on the road.**
- **The cancel code will also appear when the cruise control is cancelled by the driver's operation. Do not confuse them.**
- **Be sure to get an assistant to support the diagnosis while driving, and have him/her operate the select monitor.**

4. When the set speed is canceled by itself (without any cancel operations such as applying brake) or when the cruise control could not be set by performing the setting operation, select [Cancel Code(s) Display] on the engine malfunction diagnosis screen.

Note:

The [Current] and [The past] are contained in the cancel code. The latest code recognized during current test drive is displayed in [Current]. Cancel codes resulting from fault diagnosis of switches relating to the system and cruise control are also displayed in [The past].

5. Perform Engine Clear Memory operation.  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DOTC\)>Clear Memory Mode.](#)  [Ref. to ENGINE \(DIAGNOSTICS\)\(H4DO\)>Clear Memory Mode.](#)

Ref. to ENGINE (DIAGNOSTICS) (H4DO)>Basic Diagnostic Procedure>PROCEDURE.  Ref. to ENGINE (DIAGNOSTICS) (H4DOTC)>Basic Diagnostic Procedure.
C0	Pre-Collision Second Braking Activation	Because the pre-collision secondary brake operated three times between engine starting and stopping, the temporary stop is performed. (This is not a normal driving operation, or the system may be malfunctioning.) (During CRUISE MAIN ON, "Temporary stop" is displayed in the multi-information display.)	This code may be displayed when the pre-collision brake is operated intentionally. Turn the ignition switch to OFF, and restart after a while. If the operation returns from the temporary stop status, it is normal. When temporary stop status continues with a code other than C0 after restart, perform diagnosis according to the code. When temporary stop status continues with the code of C0 after restart, the stereo camera may be malfunctioning. Replace the stereo camera.  Ref. to EyeSight>Stereo Camera>REMOVAL.
A0	CAN Diagnosis	The voltage dropped below 10 V immediately after IGN ON. (During CRUISE MAIN ON, "Temporary stop" is displayed in the multi-information display.)	This code may be displayed when the engine is not started for a while with the ignition switch ON and when the engine has started after that. This is a normal operation. If this is not the case, the supply voltage may be malfunctioning.  Ref. to EyeSight (DIAGNOSTICS)>Diagnostic Procedure with Diagnostic Trouble Code (DTC)>DTC B2814 POWER SUPPLY LOW VOLTAGE.

F9	EPS Input Control Suspended	The operation stopped temporarily because an assist limitation (overheat prevention control) was operated in order to prevent the electric power steering malfunction due to overheat.	This code may be displayed when the steering wheel is operated repeatedly while the vehicle is stopped or running in very low speed. After stopping the engine, leave the vehicle for approximately 30 minutes to cool down, and restart the engine. If the operation returns from the temporary stop status, it is normal.
		The operation stopped temporarily because of an electric power steering voltage decrease.	This code may be displayed when battery power is low. Replace or charge the battery, and restart the engine. If the operation returns from the temporary stop status, it is normal.
		The operation stopped temporarily because of an electric power steering bus off.	Electric power steering detected a failure and was disconnected from CAN line.

2. CHECK LIST (CAMERA TEMPORARY STOP)

Even when the set status of the adaptive cruise control is canceled or when a temporary stop status occurs, the EyeSight temporary stop code will not be retained for the following conditions.

- When the VDC operation is stopped by pressing the VDC OFF switch
- When the pre-collision brake operation is stopped by pressing the pre-collision brake OFF switch
- When the lane departure warning is stopped by pressing the lane departure warning OFF switch
- Immediately after the engine start

When these cases does not apply but the EyeSight temporary stop code is displayed, perform the inspection according to the following items.

CAUTION

1. AIRBAG SYSTEM

Airbag system wiring harness is routed near the cruise control command switch.

Caution:

- **Do not use the electrical test equipment on the airbag system wiring harnesses and connector circuits.**
- **Be careful not to damage the airbag system wiring harness when servicing the cruise control command switch.**

2. EyeSight

Caution:

- **Do not hold the camera unit of the stereo camera.**
- **Do not touch the lens on the stereo camera.**
- **Do not clean the lens of the stereo camera.**
- **When cleaning the windshield glass, use care so that the glass cleaner, etc. does not come in contact with the lens of the stereo camera.**
- **Do not make an impact or apply excessive force to the stereo camera.**
- **Do not disassemble the stereo camera.**
- **Do not change the installation position of the stereo camera or do not modify the surrounding structure.**
- **If the stereo camera or windshield glass is removed or replaced, always adjust or check the stereo camera.**
- **When lifting up the vehicle to rotate the tires, turn off the pre-crash function.**
- **Stereo camera axis may be displaced even in a minor collision. So be sure to adjust the stereo camera even when the EyeSight warning light is not illuminated or when the "Stereo Camera Temporary Stop" is not displayed on the multi-information display.**
- **When removing the stereo camera cover assembly, cover it with a copy paper or similar dust-free paper to avoid any interference to the camera lens, and tape the paper while being careful not to let the adhesive surface contact the glass surface. Be sure to remove the paper after the procedure.  [Ref. to EyeSight>Stereo Camera>REMOVAL.](#)**

INSPECTION

1. BATTERY

Check the battery.  [Ref. to STARTING/CHARGING SYSTEMS\(H4DO\)>Battery>INSPECTION.](#)  [Ref. to STARTING/CHARGING SYSTEMS\(H4DOTC\)>General Description.](#)

2. WINDSHIELD GLASS AND DASHBOARD

Remove the windshield glass and dashboard in front of the stereo camera.

Standard:

There must be no oil film, dirt, scratch or fogging that obstructs the forward visibility of the stereo camera.

Do not stick or attach the aftermarket parts on the prohibited area (D) shown in the figure below.

Even outside the prohibited area, if the abnormal operation occurs due to the reflection of the light or the reflection on the glass, change the adhering position or installation position.

- Application of stickers or antennas, installation of wide-type mirror
 - This will affect the visibility of the stereo camera, causing the function not to operate correctly.
- Placement of navigation unit, ETC or other things on the dashboard
 - These things will be reflected on the windshield glass, affecting the recognition of the stereo camera, thus causing the function not to operate correctly.

Note:

- **Clean the windshield glass if dirt or fogging is found on the glass. Repair or replace the glass if damage is found.**
 - **When cleaning the inner side of the windshield glass, be careful not to touch the lens of the stereo camera. Take care so that the glass cleaner is not applied to the lens. As with the removal procedure of the stereo camera, cover the opening of camera cover with a copy paper or similar dust-free paper before the procedure, in order to avoid any interference to the camera lens, and tape the paper while being careful not to let the adhesive surface contact the glass surface. Be sure to remove the paper after the procedure. 📄 [Ref. to EyeSight>Stereo Camera>REMOVAL.](#)**
 - **When replacing the windshield glass, be sure to replace the part for the EyeSight.**
 - **If the glass is removed or replaced, always perform the stereo camera adjustment and inspection.**
- **If the damage is found in the glass repair prohibited area shown in the figure below, replace the glass.**
 - **Damage in the prohibited area can affect the recognition of the stereo camera even if it is repaired, and thereby EyeSight function may not operate properly.**

- **Install the ETC transponder inside the area (A) shown in the figure below.**
- Before installing, attach a full-scale copy of the following figure onto the windshield glass surface to install the parts to correct positions.**
 - **Align the position with respect to the end of the ceramic area.**
 - **Prepare a full-scale copy in which the reference dimension on the upper part of the figure actually has 4 inch long.**
 - **Only the transponder with a thickness of 1.5 inches or less can be used.**

ADA00477

- Relocate any aftermarket parts out of the prohibited area.
- Do not touch the lens on the stereo camera. Do not clean the lens of the stereo camera. (If the lens surface is touched, the lens hood must be replaced as it is impossible to clean the lens surface for ensuring quality.)

3. REAR VIEW MIRROR

Check the rear view mirror condition.

Standard:

The rear view mirror other than genuine parts shall not be used. (Wide mirrors shall not be used)

The visibility of the stereo camera shall not be blocked.

- This will affect the visibility of the stereo camera, causing the system not to operate correctly.

4. FRONT WIPER

Check the wiping condition of windshield glass.

Standard:

Use Subaru genuine part only for wiper blade body and blade rubber.

— Using the part other than genuine part will affect the recognition of the stereo camera, which may cause the function not to operate correctly.

Do not continue to use damaged blade rubber.

— The windshield glass may be damaged. If the wiping performance decreases or any distinct streak is found, replace it as soon as possible.

Note:

Clean the windshield glass if oil film or dirt is found.

5. TIRE INFLATION PRESSURE

Check the tire air pressure.

Standard:

Adjust to the specified air pressure.  [Ref. to WHEEL AND TIRE SYSTEM>General Description>SPECIFICATION.](#)

Do not install worn tire or tires with excessive wear difference.

Install tires with specified size.

6. STEREO CAMERA

Check the lens filter on the left and right camera lenses of the stereo camera for fingerprints or lens filter for cracks or etc. through the windshield glass.

Note:

- Do not remove the camera or camera cover to check the lens.
- When spider's web or insects are found in the visibility of the camera or lens hood, remove it using the air blow not to touch the lens surface. Do not cover them with hand or cloth.
- Thin and uniform adhesion of dust, dirt or tobacco stains to the lens filter surface resulting from normal use will not be an obstacle. Do not attempt to clean in such cases.
- If an oil film such as a fingerprint or any excessive dirt adheres, or if the lens filter cracks, replace the stereo camera.  [Ref. to EyeSight>Stereo Camera.](#)
- If the fingerprint adhesions or cracks occur on the lens filter, the following failures may arise.
 - The vehicle may not be able to detect the preceding vehicle or obstacle due to the effects of the headlight of the oncoming vehicle.
 - The vehicle may not be able to detect the preceding vehicle or obstacle due to the effects of the brake light operation of the preceding vehicle.
 - All the functions of the EyeSight may be suspended by the self-diagnosis function equipped with the camera.
 - When the lens filter is broken, the vehicle may not be able to detect the preceding vehicle or obstacle all day and all night.
- Even if the lens filter is not touched, applying the force to the black hood securing the lens filter may tension the lens filter to crack it.
- Do not clean the lens filter with any cleaner. It is quite difficult to uniformly clean both of the right and left lenses, and such an attempt just ends up spreading dirt and will cause problems as same as those from oil film.

7. LOAD ON THE ROOF

Check that load on the roof is not sticking out to the front of the stereo camera.

Standard:

The load on the roof is placed outside the prohibited area (A) shown in the figure below.  [Ref. to WHEEL AND TIRE SYSTEM>General Description>SPECIFICATION.](#)

ADA00688

OPERATION

1. GENERAL DESCRIPTION

For on-board diagnosis function of the EyeSight, use the Subaru Select Monitor.

The on-board diagnosis function operates in three categories, which are used depending on the type of problems.

1. Diagnosis with diagnostic trouble code (DTC):

When the electrical failure occurs in the EyeSight, DTC is detected from the stereo camera. If the DTC is detected, the relevant DTC is displayed by illuminating or blinking the EyeSight warning light. To check the details concerning the DTC, use the Subaru Select Monitor.

2. Diagnosis with cancel code and lane keep assist code:

(1) This category of diagnosis requires actual driving of the vehicle in order to determine the cause in such a case when the set speed is cancelled during cruise control driving or the control is cancelled during active lane keep driving although any cancel condition is not entered.

(2) With ECM cancel code and stereo camera ACC cancel code, cancel condition (Code No.) is stored when detected during cruise control driving. With lane keep assist code of stereo camera, cancel condition (Code No.) is stored if active lane keeping does not operate or if control cancel occurs during active lane keep driving.

Caution:

- **With ECM cancel code, not only the cruise control "cancel" occurred (although the driver does not input the "cancel" operation), but also the "cancel" condition input by the driver is stored.**
- **The latest memory contents of the ECM cancel code (latest code) is cleared when the ignition switch is turned to OFF. However, memory contents set by the diagnosis of faulty switches related to the system and cruise control will remain as trouble history (memory code) after the ignition switch is turned to OFF.**

3. Real-time Diagnosis:

Real-time diagnosis function is used to determine whether or not the input signal system is in good order, according to signal emitted from switches, sensors, etc.

(1) Vehicle cannot be driven at cruise speed when the problem occurs in the cruise control system or relevant circuits.

(2) Monitor the signal conditions from switches and sensors.

2. BASIC OPERATION

CAUTION

Caution:

- Do not use the electrical test equipment on the airbag system wiring harnesses and connector circuits.
- Be careful not to damage the airbag system wiring harness.
- While diagnostic items are being checked, do not operate radios, portable telephones, etc. which emit electromagnetic waves near or inside the vehicle.

- When turning the ignition switch to ON or OFF while diagnostic items are being checked, do not allow keys with different ID codes close to the ignition switch. If the ignition key is on a key holder, remove it from the key holder before performing diagnoses.

- When repeatedly turning the ignition switch to ON or OFF while diagnostic items are being checked, it should be switched in cycles of "ON" for at least 5 seconds → "OFF" for at least 8 seconds.

(2) Sec.

- **If the engine fails to start with a registered ignition key, detach the ignition key from ignition switch and wait for approx. 1 second until security indicator light begins to flash. And then start the engine again.**
- **Before performing the diagnostics, obtain all keys for the vehicle from the owner.**
- **Do not register a body integrated unit already registered to another vehicle to diagnose failures or inspect functions.**

The starter relay control is performed in immobilizer system. When the body integrated unit detects a nonconformity of reference code, it immediately outputs a starter relay cut signal to ECM, and then ECM stops the starter relay operation. In this case, engine does not start, and DTC is not recorded in ECM. Therefore, check DTC on the body integrated unit to identify the cause of the engine not starting.

CAUTION

1. SRS AIRBAG SYSTEM

The airbag system wiring harness is routed near the keyless access with push button start system.

Caution:

- **Do not use the electrical test equipment on all airbag system wiring harnesses and connectors.**
- **Be careful not to damage the wiring harness of the airbag system when servicing the keyless access with push button start system.**

2. KEYLESS ACCESS WITH PUSH BUTTON START SYSTEM

Note:

- **Using the function setting (ECM customizing), check that the keyless access system is not OFF.**  [Ref. to SECURITY AND LOCKS>Function Setting \(Customize\)>OPERATION.](#)
- **The dark current is approx. 400 mA if there is communication between the vehicle and access key.**
- **The dark current is approx. 40 mA if there is no communication between the vehicle and access key.***

* **No communication with the vehicle means that the keyless access function has been cancelled or that the access key has not been near the vehicle for 15 minutes or more after door locking.**

1. Keyless access door unlock function check

- (1) While carrying the access key with all doors locked by keyless lock operation, check the followings: When you grip the outer handle of the driver's front door, the door unlocks; When you grip the outer handle of the passenger's front door, all doors unlock, and then the answer-back function operates (hazard lights blink twice). (Setting can be changed by customizing of the body integrated unit.)
- (2) In the keyless access door unlock detection area, hold the access key at the same height as the outer handle (approx. 80 cm from the ground) and in the direction shown in the figure, and check that the vehicle becomes unlock mode [access key LED (red) blinks] at 40 to 80 cm from the vehicle.

Note:

Check the access key battery if the LED (red) does not illuminates when the access key button is pressed.  [Ref. to SECURITY AND LOCKS>Access Key>INSPECTION.](#)

2. Keyless access door lock function check

- (1) When carrying the access key outside of the vehicle with all doors closed and unlocked, check that when

the touch sensor (lock) on the surface of door outer handle of front door is touched, all doors will lock and the answer-back function operates (hazard light blinks once).

Caution:

If the access key is within the vehicle but not within the detection area (in the instrument panel, on the rear tray, in the glove box, on the floor, in the door trim pocket or in the luggage room), then lockout protection will not function when the doors are locked and the access key will be locked into the vehicle.

- (2) To check the operating range of keyless access door lock, hold the access key at a height of 10 cm below the bottom edge of the door glass (approx. 80 cm above the ground), point it in the direction shown in the figure at a distance of approx. 30 cm from the vehicle, and check that all doors lock and the answer-back function operates (hazard light blinks once) when you touch the touch sensor (lock).

- (3) Check the passenger's side door in the same manner.

Note:

- **When the door does not lock even if the touch sensor (lock) is touched, touch the touch sensors (lock) located at the upper and lower part of the door handle by holding with your hand.**
- **Since communication is not possible within close range (20 cm or less) of the door outer handle, the access key may not operate if you touch the touch sensor (lock) with the same hand you are holding the access key.**
- **If the lockout prevention buzzer sounds, it is possible that the interior transmitter has radio wave leakage.**

3. Check of the keyless access rear gate function

- (1) With the rear gate locked, check that the all doors unlock and rear gate opens simultaneously and the answer-back function operates (hazard light blinks twice) when you press the rear gate opener button while carrying the access key.

Note:

- **For vehicles with power rear gate, the rear gate opens automatically. Holding down the button switches the operation to manual mode.**
- **The hazard light for the answer-back function blinks twice on vehicles without power rear gate, and four times on vehicles with power rear gate.**

- (2) To check the range of keyless access rear gate open operation, hold the access key behind and in the center of the vehicle at the same height as the rear gate opener button (90 cm from the ground), point it in the direction shown in the figure at a distance of 40 to 80 cm from the vehicle, and check that all doors unlock, the rear gate opens, and the answer-back function operates (hazard light blinks twice) when you press the rear gate opener button.

SL-10301

(3) With the rear gate unlocked, check that all doors lock and the answer-back function operates (hazard light blinks once) when you press the rear lock button while carrying the access key.

4. Keyless access ignition switching function check

(1) With the ignition OFF, enter the vehicle while carrying the access key. With the shift lever in the P range, check that the push button ignition switch indicator is illuminated in green when you depress the brake pedal, and check that the engine starts when you press the push button ignition switch while the indicator illuminated in green.

(2) While carrying the access key, check that the status changes as follows each time you press the push button ignition switch without depressing the brake pedal: 'Ignition OFF'→'ACC ON'→'Ignition ON'→'Ignition OFF'. However, if the shift lever is a range other than the P range and the push button ignition switch is pressed from ignition ON, then the status does not change to ignition OFF and instead will change to ACC ON.

(3) After the vehicle has stopped, press the push button ignition switch and ignition is turned OFF (engine stopped • all power supplies OFF). However, if the shift lever is in any range except for the P range and the push button ignition switch is pressed with the vehicle stopped, then the ignition is not turned OFF and instead the power supplies changes to ACC ON. Check that the steering lock operates if the door is opened in the ignition OFF state (shift P range).

(4) To check the range of the keyless access ignition operation, check that the engine can start when you set the access key at the check position on the seat in the direction indicated in the figure.

SL-03099

Caution:

The access key may not be correctly detected even though it is within the detection area within the passenger room, if it is in the instrument panel, on the rear tray, in the glove box, on the floor, in the door trim pocket or in the luggage room.

Note:

Perform the check multiple times, once each with the access key positioned on the driver's seat, on the passenger's seat, and on the rear seat in 2 locations.

5. Lockout protection function check (in the passenger room)

Caution:

Open one of the windows before performing this check in order to prevent the key from being locked inside the vehicle.

- (1) Position the access key on the driver's or passenger's seat.
- (2) Close all doors. (With all doors unlocked)
- (3) Check that the doors do not lock and the lockout protection buzzer (exterior) sounds for 2 seconds when you touch the touch sensor (lock) of either the driver's or passenger's door.

6. Keyless access cancel function check

- (1) After setting the keyless access cancel function, check that all keyless access and start system (keyless access) functions are inoperable. (For cancel setting, refer to  [Ref. to SECURITY AND LOCKS>Function Setting_\(Customize\)>OPERATION..](#))

Note:

When keyless access is cancelled, door lock and unlock can be operated by access key button operation and the starter system can be operated by passing the access key over the push button ignition switch with the access key button toward you.

SL-10020

7. Access key diagnostic mode

- (1) Connect the Subaru Select Monitor and select [Diagnosis] on [Start] display.
- (2) On [Vehicle selection] display, input the target vehicle information and select [OK].
- (3) On [Main Menu] display, select [Each System].
- (4) On [Select System] display, select [Keyless Access with Push Button Start], and then select [Enter].
- (5) On [Select Function] display, select [Work Support].
- (6) On [Work Support] display, select [Keyless access system check].
- (7) Select the transmitter to check from the items.
- (8) Check that the door lock buzzer sounds (short blips, a continuous beeping sound for the center room antenna) when the access key is near the selected transmitter or antenna.

KEYLESS ACCESS WITH PUSH BUTTON START(DIAGNOSTICS) > Subaru Select Monitor COMMUNICATION FOR INITIALIZING IMPOSSIBLE

CAUTION/NOTE INTRO

Note:
 Confirm that the LAN system is working before the diagnosis.
 Subaru Select Monitor communication is open or shorted.

START

KEYLESS ACCESS WITH PUSH BUTTON START(DIAGNOSTICS) > Subaru Select Monitor **OPERATION**

For detailed operation procedures, refer to "Application help".

PROCEDURE

Caution:

- **Subaru Select Monitor is required for reading DTC, performing diagnosis, reading current data, customizing and active test (compulsory drive).**
- **Remove foreign matter (dust, water, oil, etc.) from each control module connector during removal and installation.**
- **For model with immobilizer or model with keyless access, registration of immobilizer may be needed after the replacement of controller etc. For detailed procedure, refer to the "REGISTRATION MANUAL FOR IMMOBILIZER".**

Note:

- **To check harness for open or short circuits, shake the suspected trouble spot or connector.**
- **Perform the diagnosis, and when the control module is replaced as a result of judgment that malfunction is the control module, re-check that the control module was actually malfunctioning. Replace to a new control module, and confirm that the malfunction is eliminated. Then, install the previously removed control module again and check that the malfunction reproduces again.**

LAN SYSTEM (DIAGNOSTICS) > CAN Communication Circuit Check

PROCEDURE

Note:

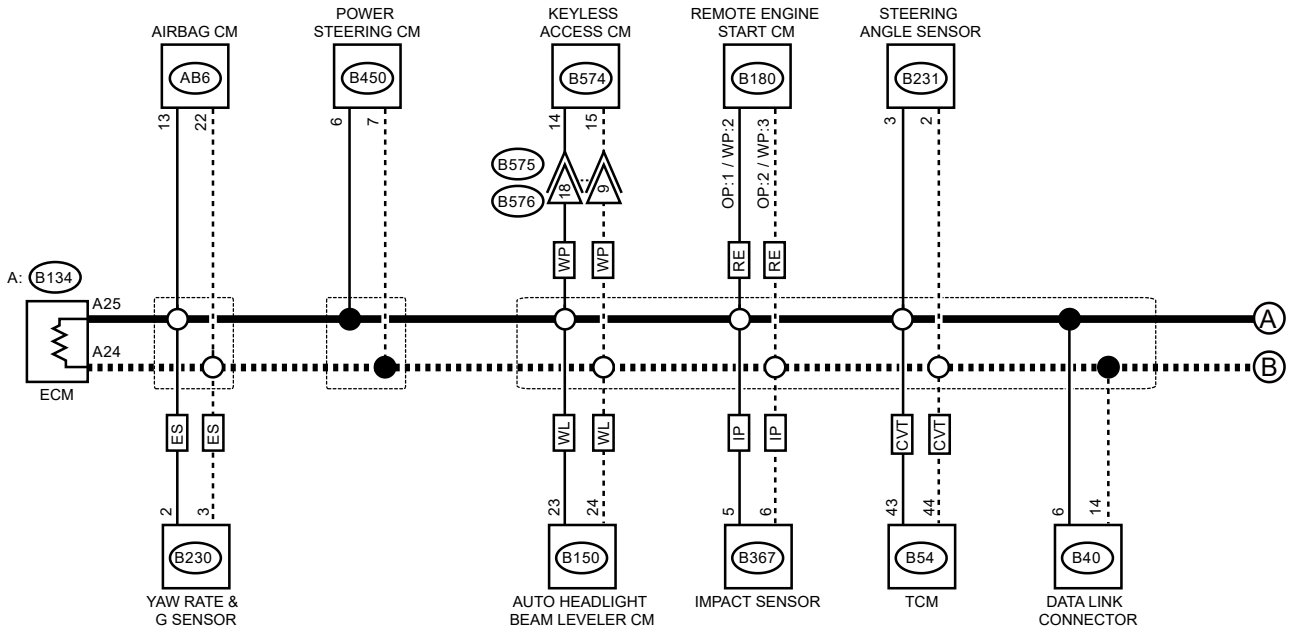

- When measuring the resistance of CAN communication circuit, measure it in sleep status.
To enter sleep status
 - With ignition switch OFF and key or switch operation stopped, keep the doors, trunk, and rear gate all closed for one minute or more.
 - On models with keyless access function, keep the access key 2 m or more away from the vehicle.
- When the bus line is measured, combined resistance of the end resistance (120 Ω) in ECM and the end resistance (120 Ω) in VDC CM can be measured. The combined resistance is approximately 53 – 61 Ω with the stabilizing circuit included. If the measured resistance value becomes 52 Ω or less, main wiring harness or related lines may be shorted. Or, the combined resistance may have changed because of a resistance other than the end resistance created on the circuit. If the measured value is 62 Ω or more, there may be a malfunction such as open circuit in one of the end resistances, in the stabilizing circuit, or in the main wiring harness.
Also, even when the resistance value falls within approx. 53 – 61 Ω, related lines may be open if an error of communication for initializing or a CAN system U-code has occurred. (The resistance cannot be between approx. 53 – 61 Ω if the main wiring harness is open.)

LAN SYSTEM (DIAGNOSTICS) > General Description

CAUTION

1. SRS AIRBAG SYSTEM

Airbag system wiring harness is routed near the body integrated unit and twisted pair line.

Caution:

- **Do not use the electrical test equipment on all airbag system wiring harnesses and connectors.**
- **Be careful not to damage the airbag system wiring harness when servicing the body integrated unit and LAN system.**

2. LAN SYSTEM

- Bus line of LAN system is twisted pair line. Be careful not to by-pass or partly unbind the twisted pair line.
- Do not make clearance between bus lines (CAN High, CAN Low).
- Difference of bus line length should be within 10 cm (3.94 in).
- Fray near the connector should be within 8 cm (3.14 in).

(A) Bypass wire connection

- If the characteristics of the twisted pair line are changed, it may extremely weaken against noise.
- When repairing the harness, connect the wires using soldering and protect it with electrical tape etc.

(A) Soldering and protection with electrical tape

3. TIME STAMP

There are three types of record data for the information of time stamp, and they are stored together with diagnostic codes.

Note:

Depending on DTCs, time stamp may not be stored.

a. **Trip Count [count]**

This indicates the number of times that the ignition has been turned to ON since the vehicle was manufactured. The ignition ON count of when the diagnostic code is stored is displayed on the diagnostic code check screen.

Note:

Subaru Select Monitor 4 screen (A/C system diagnostic code and time stamp)

Code	Description & trouble part	Trouble occurrence record	Trip Count [count]	Time Count	Group
B14E1	AIR MIX DOOR ACTUATOR STEPPING MOTOR CIRCUIT WIRE BREAK (DRIVER'S SEAT)	Detected on the first time	983	18000	Common
B14E7	HEATER CORE REAR SENSOR CIRCUIT WIRE BREAK	Detected on the 2nd time	984	117800	Common

The current Trip Count can be checked at "Current Data Display & Save" in "Integ. unit mode". By comparing the current Trip Count and the Trip Count of when the diagnostic code was stored, it is possible to determine that it is how many ignition-ON operations ago that DTC was stored.

b. **Time Count**

The elapsed time from when the ignition is turned to ON to when the diagnostic code is stored is displayed on the diagnostic code check screen. It is possible to determine the length of time that passed between when the user started driving and when the diagnostic code was stored. Therefore, if Trip Count until the vehicle-received-date is determined by interviewing the user, it is possible to estimate where the user was driving when the diagnostic code was stored, using the information such as Trip Count and Time Count. This estimate is useful information to perform diagnosis including checking of repeatability.

Note:

Subaru Select Monitor 4 screen (A/C system diagnostic code and time stamp)

Code	Description & trouble part	Trouble occurrence record	Trip Count [count]	Time [msec]	Group
B14E1	AIR MIX DOOR ACTUATOR STEPPING MOTOR CIRCUIT WIRE BREAK (DRIVER'S SEAT)	Detected on the first time	983	18000	Common
B14E7	HEATER CORE REAR SENSOR CIRCUIT WIRE BREAK	Detected on the 2nd time	984	117800	Common

When multiple diagnostic codes are recorded for one trouble, it is extremely important to determine the diagnostic code that was stored first. (It is important to perform the diagnosis for the first recorded diagnostic code.) In this case, it is also possible to immediately determine which diagnostic code was recorded first, using the information such as Trip Count and Time Count.

c. **Group**

Each unit individually counts the elapsed time since the ignition is turned to ON. However, these time counts may have some errors, and therefore, the control modules need to be adjusted to the time carried by the master-time unit (the body integrated unit). When the count is set as common,

it means that each control module is already adjusted to the master time, and the display for the master integrated unit is always indicated as "Common". When the count is indicated as "Originally", it means that the time is not synchronized with the master time. In this case, check the communication between the corresponding control module and integrated unit. When all controls other than the body integrated unit is indicated as "Originally", perform the basic inspection for the body integrated unit.  [Ref. to BODY CONTROL\(DIAGNOSTICS\)>Basic Diagnostic Procedure.](#)

Note:

Subaru Select Monitor 4 screen (A/C system diagnostic code and time stamp)

Code	Description & trouble part	Trouble occurrence record	Trip Count [count]	Time Count [msec]	Group
B14E1	AIR MIX DOOR ACTUATOR STEPPING MOTOR CIRCUIT WIRE BREAK (DRIVER'S SEAT)	Detected on the first time	983	18000	Common
B14E7	HEATER CORE REAR SENSOR CIRCUIT WIRE BREAK	Detected on the 2nd time	984	117800	Common

Even when multiple diagnostic codes are stored in multiple control modules, it is possible to determine the code stored first through the categorizing feature.

Note:

Troubleshooting for CAN system U-code occurrence

When the first stored diagnostic code is a U-code for CAN system, perform the troubleshooting as a U code combination, instead of a U code alone. In addition, when CAN open circuit occurs, communication of the diagnostic device itself becomes impossible beyond the particular areas. However, trouble positions can also be determined by the combination of initial communication success/failure. Thus, by performing the basic diagnostic procedure in LAN system, trouble positions can be determined efficiently on the principle above. 1. MODULE INSTALLATION CHECK.

1. Using the check sheet for communication for initializing, check the vehicle installation module (module targeted for CAN communication).
2. Write "-" marks in the field for installation check (A) if the vehicle to be inspected does not have relevant module.
3. Write "-" marks in all blank fields on the same row that the "-" mark has filled in.

Was the module installation check above performed?

Yes

 [Go to 2.](#)

No

Perform the module installation check,  [Go to 2.](#)

2. CHECK DTC (BUS OFF DETECTION / DATA NOT RECEIVED).

Check the DTC.  [Ref. to LAN SYSTEM \(DIAGNOSTICS\)>Diagnostic Trouble Code \(DTC\).](#)

Note:

It becomes impossible for CAN diagnostic module to read DTC, if there is a current malfunction of open harness (data not received). If this occurs, perform the "Check using the check sheet of communication for initializing"  [Ref. to LAN SYSTEM \(DIAGNOSTICS\)>Subaru Select Monitor>COMMUNICATION FOR INITIALIZING IMPOSSIBLE > CHECK USING THE CHECK SHEET OF COMMUNICATION FOR INITIALIZING.](#), and use this check sheet to confirm that the corresponding part becomes the past malfunction.

Is DTC bus off or data not received?

Yes

Perform the diagnosis for the displayed DTCs.

No

Perform the communication check, and go to 3.  [Go to 3.](#)

3. CHECK DTC (BUS OFF DETECTION / DATA NOT RECEIVED).

Mark "X" in the field corresponding to the DTCs that has been detected by each module in the DTC check sheet.

Were all the corresponding field in the DTC check sheet filled?

Yes

 [Go to 4.](#)

No

Fill all the corresponding field in the DTC check sheet,  [Go to 4.](#)

4. ENTER HERE. CHECK CAN COMMUNICATION LINE.

Check the CAN communication line by referring to the example of DTC data not received.

Is CAN communication line faulty?

Yes

Repair or replace the faulty portion of the harness.

No

Perform the diagnosis for the displayed DTCs.

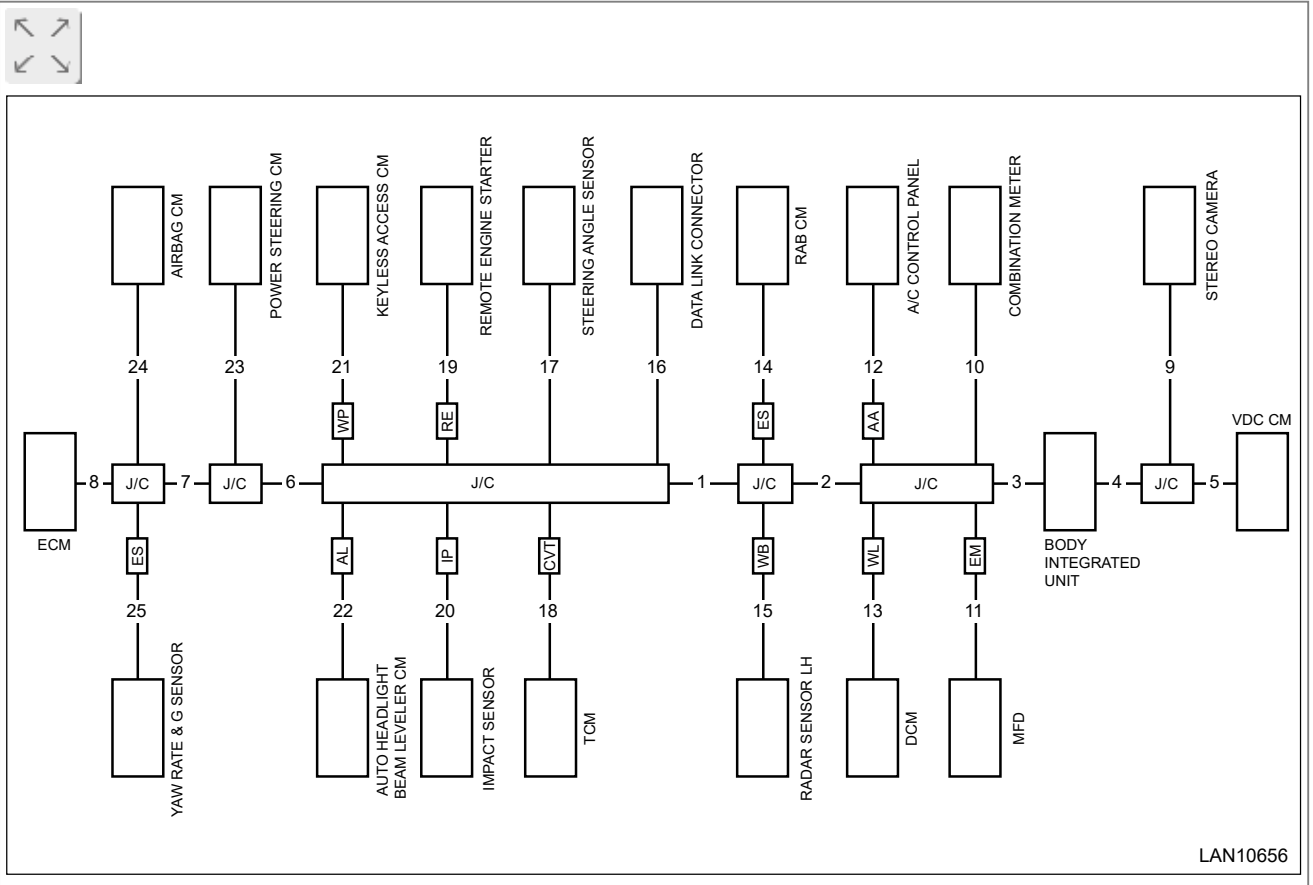

2. EXAMPLE OF DTC DATA NOT RECEIVED

Note:

Only the sheet for bus off, data no-receive entry is shown.

(This is because, when data error occurs at the bus off, data no-receive condition, the diagnosis for these problems is performed first.)

LAN SYSTEM (DIAGNOSTICS) > Subaru Select Monitor

COMMUNICATION FOR INITIALIZING IMPOSSIBLE

Diagnosis:

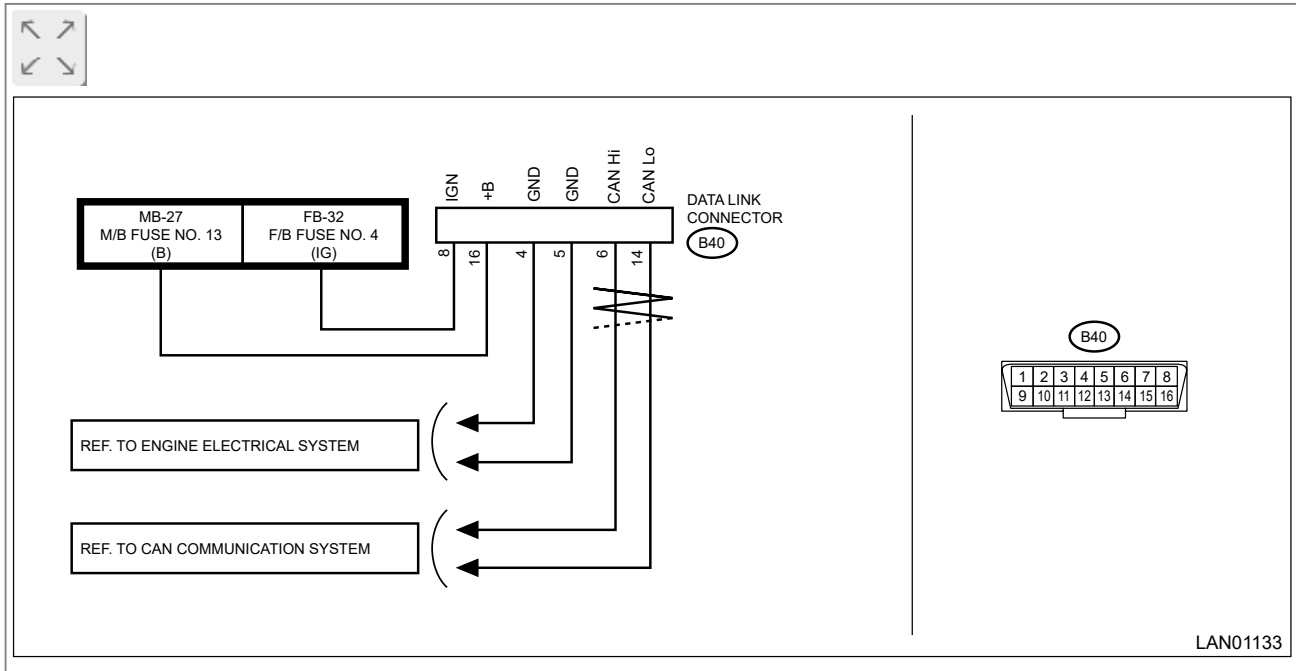

Subaru Select Monitor communication line is open or shorted.

Trouble symptom:

Not communicable with Subaru Select Monitor.

Wiring diagram:

CAN communication system  [Ref. to WIRING SYSTEM>CAN Communication System>WIRING DIAGRAM.](#)

1. CHECK SUBARU SELECT MONITOR.

1. Connect the Subaru Select Monitor to another vehicle.
2. Check communication condition between Subaru Select Monitor and vehicle.

Is communication performed normally?

Yes

 [Go to 2.](#)

No

Subaru Select Monitor unit or diagnosis cable is faulty. Or check the fuse on the vehicle side.

2. CHECK HARNESS (OPEN CIRCUIT).

Use a tester to check for continuity in the ground circuit.

Connector & terminal

(B40) No. 4 — Chassis ground:

(B40) No. 5 — Chassis ground:

Is there continuity?

Yes

 [Go to 3.](#)

No

Repair or replace the open circuit.

3. CHECK POWER SUPPLY CIRCUIT FOR DATA LINK CONNECTOR.

1. Turn the ignition switch to ON.
2. Using a tester, check the power supply of data link connector.

Connector & terminal

(B40) No. 8 (+) — Chassis ground (–):

(B40) No. 16 (+) — Chassis ground (–):

Is the voltage 10 V or more?

Yes

 [Go to 4.](#)

No

Check the fuse and power supply circuit for data link connector.

4. CHECK COMMUNICATION FOR INITIALIZING ERROR.

Perform the communication for initializing with each module by connecting the Subaru Select Monitor. (For systems whose module can communicate with diagnostic devices)

Is the communication possible with all modules?

Yes

The circuit has returned to a normal condition at this time. Reproduce the failure, and then perform the diagnosis again.

Note:

In this case, temporary poor contact of connector, temporary open or short circuit of harness may be the cause.

No

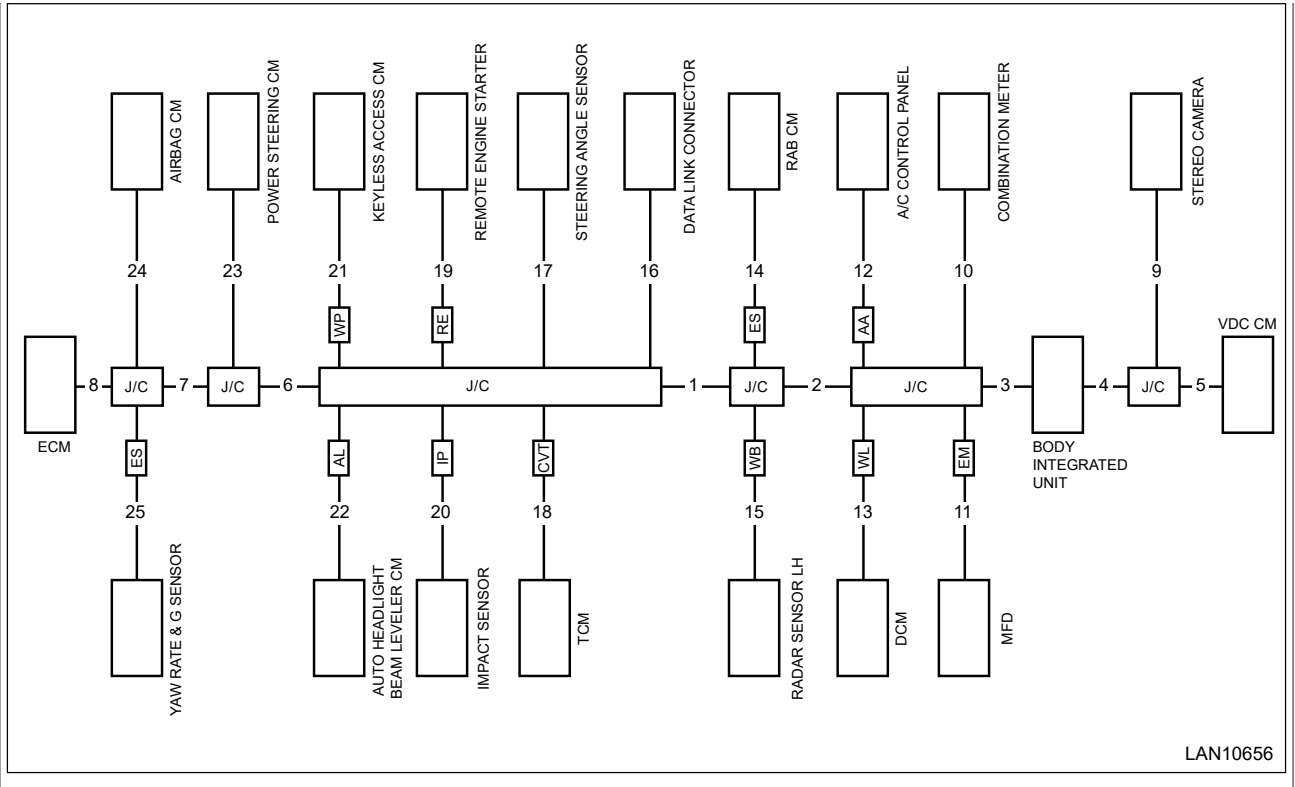

Perform the inspection using the check sheet of communication for initializing.  [Ref. to LAN SYSTEM \(DIAGNOSTICS\)>Subaru Select Monitor>COMMUNICATION FOR INITIALIZING IMPOSSIBLE > CHECK USING THE CHECK SHEET OF COMMUNICATION FOR INITIALIZING.](#)

OCCUPANT DETECTION(DIAGNOSTICS) > General Description

CAUTION

1. The occupant detection system (passenger seat only) control module and the occupant detection sensor are fixed to the seat cushion frame. Never remove the occupant detection control module or the occupant detection sensor from the seat cushion frame.
2. Do not replace the seat cushion pad and seat cushion cover alone. Always replace seat cushion & frame assembly as a set. The seat cushion pad, cushion frame, and seat cushion cover are adjusted as a set at the time of manufacture. If cushion pads and cushion frames are combined from those of other vehicles or other sets, the occupant detection system may not operate properly.
3. Never connect the battery in reverse polarity. Occupant detection system may be destroyed instantly.
4. Do not disconnect the battery cables while the engine is running. A large counter electromotive force will be generated in the generator, and this voltage may damage electronic parts such as occupant detection control module.
5. Before disconnecting the connectors of each sensor and control module, be sure to turn the ignition switch to OFF and wait for 60 seconds or more. Occupant detection control module may be damaged.
6. Every occupant detection system-related part is a precision part. Do not drop them.

Caution:

- **Do not use electrical test equipment on wiring harness and connector circuits of the airbag system.**
- **Be careful not to damage the airbag system wiring harness when servicing the occupant detection system.**
- **Refer to CAUTION in Airbag System when repairing the occupant detection system.**  [Ref. to AIRBAG SYSTEM>General Description>CAUTION.](#)

REVERSE AUTOMATIC BRAKING (DIAGNOSTICS) > General Description

SYSTEM BLOCK DIAGRAM

The Reverse Automatic Braking system is a system to avoid collision or reduce collision damage by informing with sound and operating the brake automatically, when the vehicle may collide with walls or obstacles on the rear during reversing.

REVERSE AUTOMATIC BRAKING (DIAGNOSTICS) > Inspection Mode

PROCEDURE

It is possible to diagnose the DTC by performing the indicated inspection mode.

After correcting the DTC, perform a necessary inspection mode and make sure that the function is resumed correctly and the DTC is recorded.

- 1.** Turn the ignition switch to ON, and wait for 6 seconds or more. (*1)
- 2.** Confirm that the RAB warning light (RAB malfunction indicator light) of MID in the combination meter is off.
- 3.** Read the DTC and check that the DTC is not displayed. (*2)

*1: Even with normal condition, "RAB warning light (RAB OFF indicator light)" illuminates for 6 seconds after turning the ignition switch to ON, and then goes off after 6 seconds.

*2: Perform all DTC diagnosis within 3 seconds after the ignition switch is turned to ON. It is not necessary to shift the gear in the R range to operate the function.

REVERSE AUTOMATIC BRAKING (DIAGNOSTICS) > Warning Light Illumination Pattern

INSPECTION

- When the Reverse Automatic Braking is error
"RAB" illuminates in MID in the combination meter.
- When the Reverse Automatic Braking is stopped temporarily
"RAB OFF" illuminates in MID in the combination meter.

Note:

- **Even with normal condition, "RAB warning light (RAB OFF indicator light)" illuminates for 6 seconds after turning the ignition switch to ON, and then goes off after 6 seconds.**

REVERSE AUTOMATIC BRAKING (DIAGNOSTICS) > Work Support

LIST

DTC DETECTING CONDITION:

Low battery signals received 20 times from each transmitter.

Trouble symptom:

Tire pressure warning light blinks 25 times and then illuminates.

1. REPRODUCTION OF FAILURE.

1. Perform the drive test.
Drive the vehicle at 40 km/h (25 MPH) or faster for at least 10 minutes.
2. Read the DTC.  [Ref. to TIRE PRESSURE MONITOR\(DIAGNOSTICS\)>Diagnostic Trouble Code \(DTC\).](#)

Is DTC displayed as current malfunction?

Yes

 [Go to 2.](#)

No

When DTC is displayed as "Past faults", the system has returned to a normal condition at this time. Reproduce the failure, and then perform the diagnosis again.

Note:

In this case, there may be temporary poor communication due to radio wave environment inside/outside the vehicle.

2. CHECK TRANSMITTER.

1. Replace all transmitters and register their IDs.  [Ref. to TIRE PRESSURE MONITOR\(DIAGNOSTICS\)>Register Transmitter \(ID\).](#)
2. Clear the memory and perform a driving test.

Is the fault eliminated?

1. SRS AIRBAG SYSTEM

The airbag system wiring harness is routed near the TPMS CM or the TPMS & keyless entry CM connector.

Caution:

- Do not use electrical test equipment on any of the airbag system wiring harness circuits.
- Be careful not to damage the wiring harness of the airbag system, when servicing the TPMS CM or TPMS & keyless entry CM.

- If the transmitter is replaced, ID registration for the transmitter is required.  [Ref. to TIRE PRESSURE MONITOR\(DIAGNOSTICS\)>Register Transmitter \(ID\)>OPERATION.](#)
- When adjusting tire pressure indoors in winter, there is a big temperature difference between the indoor facilities and outside. Once the car is outside where the temperature is lower, the air pressure in the tires will drop, causing the tire pressure warning light to illuminate, even if the pressure in the tires was adjusted to standard values indoors. To avoid this, it is necessary to adjust the tire pressure to the high side in consideration of the difference in temperature between inside and outside according to the following table.
- P225/55R18 (turbo model)

TIRE PRESSURE MONITOR(DIAGNOSTICS) > Register Transmitter (ID)

OPERATION

Perform the registration procedure of the transmitter in the following cases:

- Transmitter is replaced.
- TPMS CM or TPMS & keyless entry CM is replaced.

Note:

- **If registration of the transmitter ID is not possible after two attempts, replace the TPMS CM or TPMS & keyless entry CM.  [Ref. to WHEEL AND TIRE SYSTEM>Tire Pressure Monitoring System.](#)**
- **During the registration, turn the ignition switch to OFF and end the Subaru Select Monitor. Or if the registration is not performed for 5 minutes or more, the registration mode is cancelled.**
- **When rotating tires, there is no affect on the performance or functions of the tire pressure monitoring control module even if the transmitter (ID) is not registered, however, the tire position displayed on the Subaru Select Monitor will be incorrect.**

1. Adjust all tire pressures to the specifications.
2. Connect the Subaru Select Monitor and select [Diagnosis] on [Start] display.
3. On [Vehicle selection] display, input the target vehicle information and select [OK].
4. On [Main Menu] display, select [Each System].

- (2) Transmitter registration tool

Note:

- **The registration order of transmitter ID is not specified.**

- **The transmitter registration tool is used by touching the side wall area near the transmitter.**
- **When registration of each tire is completed, [ID registration completed] is displayed on the Select Monitor screen.**
- **If registration procedure stop in the halfway (turning ignition switch to OFF, wrong registration order, etc), proceed from step 5).**

- 10.** When ID registration is completed, the tire pressure warning light remains lit for approximately 2 seconds, to end the registration. Switch the screen to [Data Monitor] of Subaru Select Monitor.  [Ref. to TIRE PRESSURE MONITOR\(DIAGNOSTICS\)>Data Monitor.](#)

CAUTION

1. The airbag system wiring harness is routed near the TCM.

Caution:

- **All the airbag system wiring harnesses and connectors are colored yellow. Do not use an electric test equipment to check these circuits.**
- **Be careful not to damage the airbag system wiring harness when performing diagnostics or servicing the TCM.**

2. When measuring the voltage or resistance of individual sensors or all electrical control modules, use a tapered pin with a diameter of 0.6 mm (0.024 in) or less and touch it to the tip of terminal. Never insert the tapered pin into the terminal because it deforms inside which may lead to malfunction.

Caution:

If the tapered pin (or similar) was inserted in the connector terminal, replace the connector.

3. The TCM connector is waterproof. When measuring the TCM connector terminal voltage, or the resistance between the terminals, use the ST.

TRANSMISSION (DIAGNOSTICS) > Learning Control

GENERAL DESCRIPTION

- Follow the messages displayed on the Subaru Select Monitor when working.
- When the following work is performed, perform learning work for the transmission.
Replacement of TCM/Replacement or disassembly of transmission assembly/Replacement of control valve body/Clearing AT leaning value is executed.

PROCEDURE

1. PREPARATION FOR LEARNING

1. Warm up or cool down until the ATF temperature displayed on the Subaru Select Monitor is 40 — 65°C (104 — 149°F).
2. After stopping the vehicle, shift the select lever to "P" range.
3. Fully apply the parking brake.
4. Lift up the vehicle.

Caution:

While working, be sure to keep the lower edge of the tires 30 cm or more above the ground as vehicle will vibrate.

5. Connect the Subaru Select Monitor to data link connector.
6. Turn the ignition switch to ON.
7. Turn off all switches causing an electrical load, such as headlights, A/C, seat heater and rear defogger, etc.
8. Set SI-DRIVE to I mode. (Vehicles with SI-DRIVE)

2. SIMPLE LEARNING

Note:

Simple learning is performed with the vehicle lifted, without actually running the vehicle.

Caution:

Do not turn the power of the Subaru Select Monitor OFF during work, and do not disconnect the data link connector.

1. On [Start] display, select [Diagnosis].
2. On [Vehicle selection] display, enter vehicle information and select [OK].
3. On [Main Menu] display, select [Each System].
4. On [Select System] display, select [Transmission].
5. On [Select Function] display, select Work Support.
6. On [Work Support] display, select [AT learning mode].
7. Follow the messages displayed on the screen when working.

Note:

During AT learning in progress, AT OIL TEMP light in the combination meter starts flashing at 2 Hz and the learning operation starts. When the AT OIL TEMP light which was flashing at 2 Hz goes off, the following message is displayed on the display.

8. When AT learning normally ended. is displayed, simple AT learning is completed.

Note:

- **If communication error occurs during learning, retry the "AT learning mode" from the beginning.**
- **If the message Execute AT learning again after fixing troubles of the vehicle appears during learning, select OK and display the DTC list. After repairing the locations indicated by the DTC, start the "AT learning mode" over from the beginning.**
- **When communication error occurs during learning, select lever does not shift occasionally. If select lever does not shift, turn the ignition switch to OFF before operating the select lever.**
