3. General Description

A: CAUTION

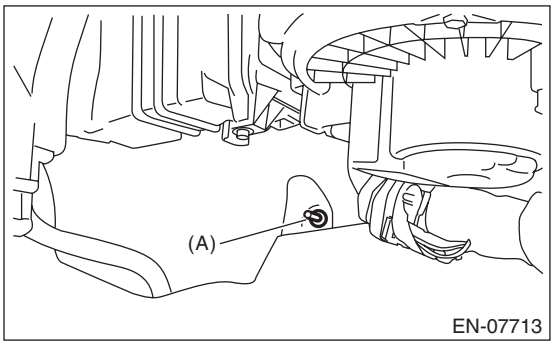
1) Airbag system wiring harness is routed near the ECM, main relay and fuel pump relay.

CAUTION:
• Do not use electrical test equipment on the airbag system circuit.
• Be careful not to damage the airbag system wiring harness when servicing the ECM, TCM, main relay and fuel pump relay.

2) Never connect the battery in reverse polarity. Doing so will damage the ECM instantly, and other parts will also be damaged.
3) Do not disconnect the battery terminals while the engine is running. A large counter electromotive force will be generated in the generator, and this voltage may damage electronic parts such as ECM etc.
4) Before disconnecting the connectors of each sensor and ECM, be sure to turn the ignition switch to OFF. Perform the Clear Memory Mode after connecting the connectors. <Ref. to EN(H4DOTC)(diag)-53, Clear Memory Mode.>
5) When measuring the voltage or resistance of individual sensor or all electrical control modules, use a tapered pin with a diameter of less than 0.6 mm (0.024 in). Do not insert the pin 4 mm (0.16 in) or more into the part.

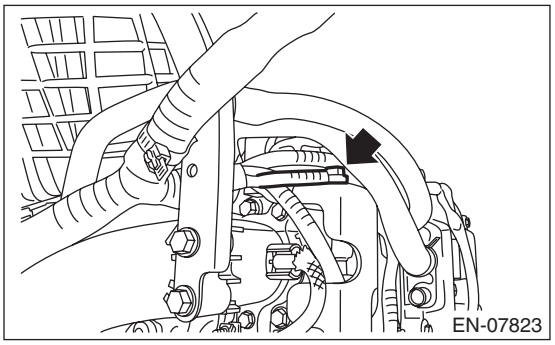
CAUTION:
When replacing the ECM, be careful not to use the wrong spec. ECM to avoid any damage on the fuel injection system.

NOTE:
When replacing the ECM of the models with Immobilizer, immobilizer system must be registered. To do so, all ignition keys and ID cards need to be prepared. For detailed operation procedures, refer to “PC application help for Subaru Select Monitor”.
6) Take care not to allow water to get into the connectors when servicing or washing the vehicle in rainy weather. Avoid exposure to water even if the connectors are waterproof.
7) Use ECM mounting stud bolts at the body side grounding point when measuring voltage and resistance inside the passenger compartment.



(A) Stud bolt

8) Use the engine ground terminal or engine assembly as the grounding point to chassis when measuring the voltage and resistance in engine compartment.



9) Every MFI-related part is a precision part. Do not drop them.
10) Observe the following cautions when installing a radio in vehicle.

CAUTION:
• The antenna must be kept as far apart as possible from control module. (ECM is installed at the back of the glove box.)
• The antenna feeder must be placed as far apart as possible from the ECM and engine control system harness.
• Carefully adjust the antenna for correct matching.
• When mounting a large power type radio, pay special attention to the three items mentioned above.
• Incorrect installation of the radio may affect the operation of ECM.

11) When disconnecting the fuel hose, release the fuel pressure. <Ref. to FU(H4DOTC)-66, RELEASING OF FUEL PRESSURE, PROCEDURE, Fuel.>

12) For the model with ABS, the ABS warning light may illuminate when performing driving test with jacked-up or lifted-up condition, but this is not a system malfunction. The reason for this is the speed difference between the front and rear wheels. When engine control system diagnosis is finished, perform the VDC memory clearance procedure of self-diagnosis function. <Ref. to VDC(diag)-25, Clear Memory Mode.>

B: INSPECTION

Before performing diagnostics, check the following item which might affect engine problems.

1. BATTERY

1) Measure the battery voltage and specific gravity of the electrolyte.

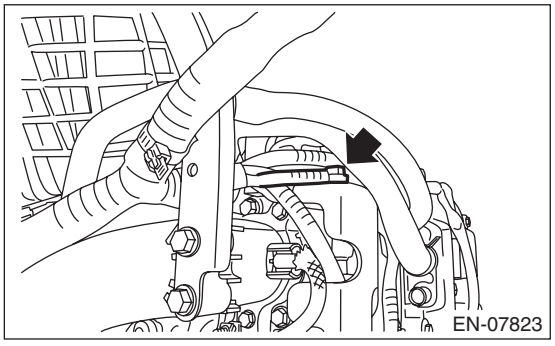
Standard voltage: 12 V

Specific gravity: 1.260 or more

2) Check the condition of the main and other fuses, and harnesses and connectors. Also check for proper grounding.

2. ENGINE GROUND

Make sure that the engine ground terminal is properly connected to the engine.



C: NOTE

- The on-board diagnostic (OBD) system detects and indicates a fault in various inputs and outputs of the complex electronic control. Malfunction indicator light in the combination meter indicates occurrence of a fault or trouble.
- Further, against such a failure of sensors as may disable the drive, the fail-safe function is provided to ensure the minimal drivability.
- The OBD system incorporated with the vehicles within this type of engine complies with OBD-II regulations. The OBD system monitors the components and the system malfunction listed in “Engine Section” which affects on emissions.
- When the system decides that a malfunction occurs, malfunction indicator light illuminates. At the same time of the malfunction indicator light illumination or blinking, a DTC and a freeze frame engine conditions are stored into on-board computer.
- The OBD system stores freeze frame engine condition data (engine load, engine coolant temperature, fuel trim, engine speed and vehicle speed, etc.) into on-board computer when it detects a malfunction.
- Freeze frame engine condition data are stored until the DTCs are cleared. However when such malfunctions as fuel trim fault and misfire are detected with the freeze frame engine condition data stored, they are rewritten into those related to the fuel trim fault and misfire.
- When the malfunction does not occur again for three consecutive driving cycles*, malfunction indicator light is turned off, but DTC remains at on-board computer.

*: One driving cycle means the period between the ignition switch ON and the ignition switch OFF after driving.

- When performing diagnosis, connect the Subaru Select Monitor or general scan tool to the vehicle.

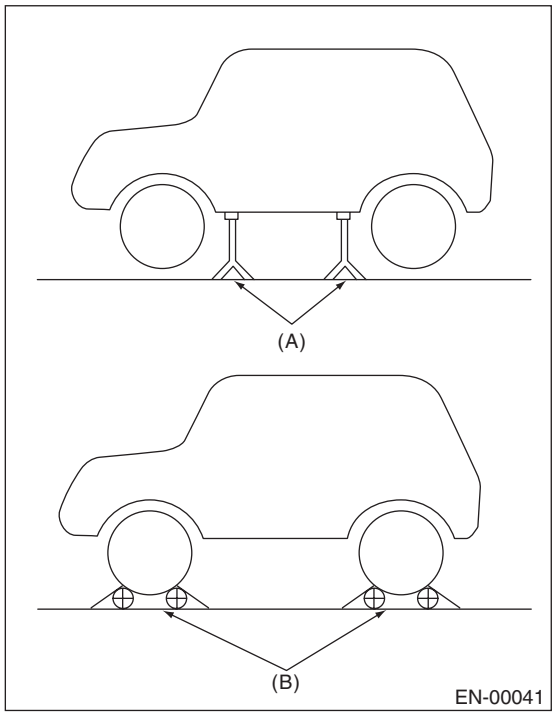
1. PREPARATION FOR THE INSPECTION MODE

1) Check that the battery voltage is 12 V or more and fuel remains approx. half [20 — 40 ℓ (5.3 — 10.6 US gal, 4.4 — 8.8 Imp gal)].
2) Lift up the vehicle using a garage jack and place it on rigid racks, or drive the vehicle onto free rollers.

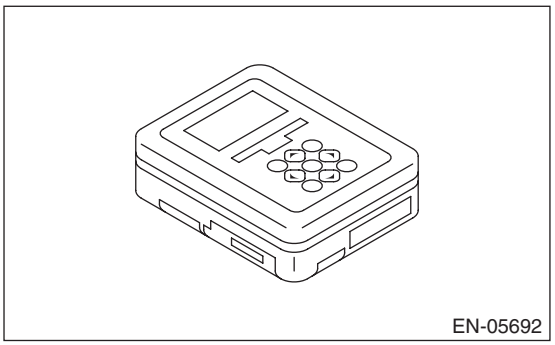
WARNING:
• Before lifting up the vehicle, ensure parking brake is applied.
• Do not use a pantograph jack in place of a rigid rack.
• Secure a rope or wire to the front or rear towing hooks to prevent the lateral runout of front wheels.
• Before rotating the wheels, make sure that there is no one in front of the vehicle. Besides while the wheels are rotating, make sure that no one approaches the vehicle front side.
• Make sure that there is nothing around the wheels. For AWD model, pay attention to all four wheels.
• While servicing, do not depress or release the clutch pedal or accelerator pedal quickly regardless of the engine speed. Quick operation may cause the vehicle to drop off the free roller.
• To prevent the vehicle from slipping due to vibration, do not place anything between rigid rack and the vehicle.



(A) Rigid rack
(B) Free roller

2. SUBARU SELECT MONITOR

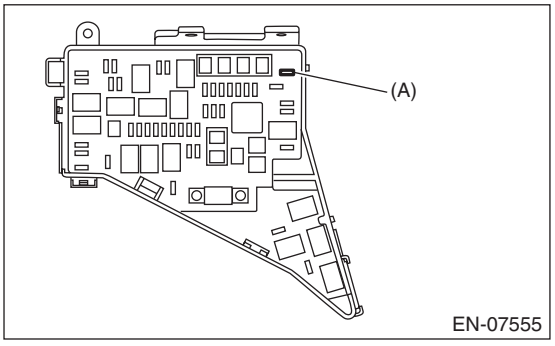
1) Check that no DTC remains after clearing memory. <Ref. to EN(H4DOTC)(diag)-53, Clear Memory Mode.>
2) Warm up the engine.
3) Prepare the Subaru Select Monitor kit. <Ref. to EN(H4DOTC)(diag)-8, PREPARATION TOOL, General Description.>



4) Prepare PC with Subaru Select Monitor installed.
5) Connect the USB cable to SDI (Subaru Diagnosis Interface) and USB port on the personal computer (dedicated port for the Subaru Select Monitor).

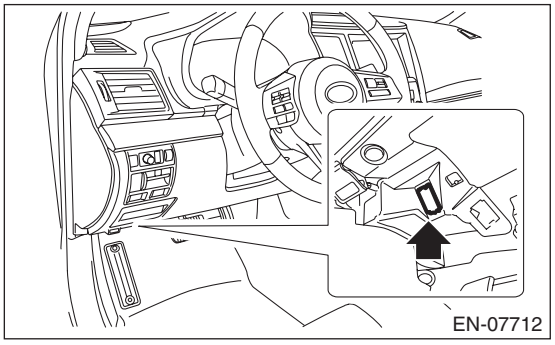
NOTE:
The dedicated port for the Subaru Select Monitor means the USB port which was used to install the Subaru Select Monitor.
6) Connect the diagnosis cable to SDI.
7) Install the delivery (test) mode fuse (A) of the main fuse box.

CAUTION:
Do not use any fuses that are installed on the vehicle.



8) Connect SDI to data link connector located in the lower portion of the instrument panel (on the driver's side).

CAUTION:
Do not connect the scan tools except for Subaru Select Monitor and general scan tool.



9) Start the PC.
10) Turn the ignition switch to ON (engine OFF) and run the "PC application for Subaru Select Monitor".
11) On «Main Menu» display, select {Each System Check}.
12) On «System Selection Menu» display, select {Engine Control System}.
13) Click the [OK] button after the information of engine type has been displayed.
14) On «Engine Diagnosis» display, select {Dealer Check Mode Procedure}.
15) When the "Perform Inspection (Dealer Check) Mode ?" is shown on the screen, click the [Next] button.
16) Perform subsequent procedures as instructed on the display screen.

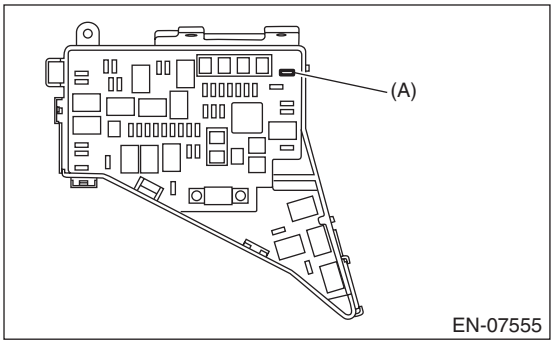
- If trouble still remains in the memory, the corresponding DTC appears on the display screen.

NOTE:
- For detailed operation procedures, refer to "PC application help for Subaru Select Monitor".
- For details concerning DTC, refer to "List of Diagnostic Trouble Code (DTC)".
  <Ref. to EN(H4DOTC)(diag)-75, List of Diagnostic Trouble Code (DTC).>
- Release the parking brake.
- The speed difference between front and rear wheels may illuminate the ABS warning light, but this does not indicate a malfunction. When engine control system diagnosis is finished, perform the VDC memory clearance procedure of self-diagnosis function. <Ref. to VDC(diag)-25, Clear Memory Mode.>

3. GENERAL SCAN TOOL

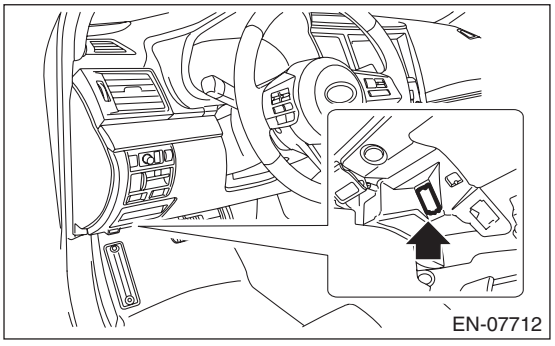
1) Check that no DTC remains after clearing memory. <Ref. to EN(H4DOTC)(diag)-32, MODE $04 (CLEAR/RESET EMISSION-RELATED DIAGNOSTIC INFORMATION), OPERATION, General Scan Tool.>
2) Warm up the engine.
3) Install the delivery (test) mode fuse (A) of the main fuse box.

CAUTION:
Do not use any fuses that are installed on the vehicle.



4) Connect the general scan tool to data link connector located in the lower portion of the instrument panel (on the driver's side).

CAUTION:
Do not connect the scan tools except for Subaru Select Monitor and general scan tool.



5) Start the engine.

NOTE:
Depress the clutch pedal when starting engine.
6) Turn the neutral position switch to ON by operating shift lever.
7) Keep the engine speed in 2,500 — 3,000 rpm range for 40 seconds.

8) Place the shift lever in 1st gear and drive the vehicle at 5 to 10 km/h (3 to 6 MPH).

NOTE:
- For AWD model, release the parking brake.
- The speed difference between front and rear wheels may illuminate the ABS warning light, but this does not indicate a malfunction. When engine control system diagnosis is finished, perform the VDC memory clearance procedure of self-diagnosis function. <Ref. to VDC(diag)-25, Clear Memory Mode.>

9) Using the general scan tool, check for DTC and record the result(s).

NOTE:
- For detailed operation procedures, refer to the general scan tool operation manual.
- For details concerning DTC, refer to “List of Diagnostic Trouble Code (DTC)”.

<Ref. to EN(H4DOTC)(diag)-75, List of Diagnostic Trouble Code (DTC).>

12.Drive Cycle

A: PROCEDURE

It is necessary to perform the drive cycle listed below if DTC is not found in the Inspection Mode. It is possible to complete diagnosis of the DTC by performing the indicated drive cycle. AF:DTC P0133 O2 SENSOR CIRCUIT SLOW RESPONSE (BANK 1 SENSOR 1)

1. OUTLINE OF DIAGNOSIS

Detect the slow response of front oxygen (A/F) sensor.
Front oxygen (A/F) sensor cover has some ventilation holes for exhaust gas. Clogged ventilation holes are diagnosed.
When the holes are clogged, the A/F output variation becomes slow comparing with the actual A/F variation because oxygen which reaches the zirconia layer is insufficient. Therefore, if the sensor cover holes are clogged, the rich to lean judgment in the ECM is delayed when the actual change from rich to lean occurs.
Judge as NG when the actual movement in comparison to the ECM control amount is slow.

BE:DTC P0301 CYLINDER 1 MISFIRE DETECTED

1. OUTLINE OF DIAGNOSIS

Detect the presence of misfire occurrence. (Revolution fluctuation method)
Monitoring Misfire which influences exhaust deterioration (1.5 times of FTP) and catalyst damage is made obligatory by the law. Misfire affecting these two has two patterns below. :

- Intermittent misfire (The same cylinder misfires in random, or different cylinders misfire in random.): FTP 1.5 times misfire
- Every time misfire (The same cylinder misfires every time.): FTP 1.5 times misfire, Catalyst damage misfire

The following detecting methods are adopted for these detection.
1) Intermittent misfire: FTP 1.5 times misfire

- 180° Interval Difference Method
- 360° Interval Difference Method (whole range)
- 720° Interval Difference Method (3,000 rpm or more)

2) Misfire every time: FTP 1.5 times misfire, Catalyst damage misfire

3. GENERAL DRIVING CYCLE

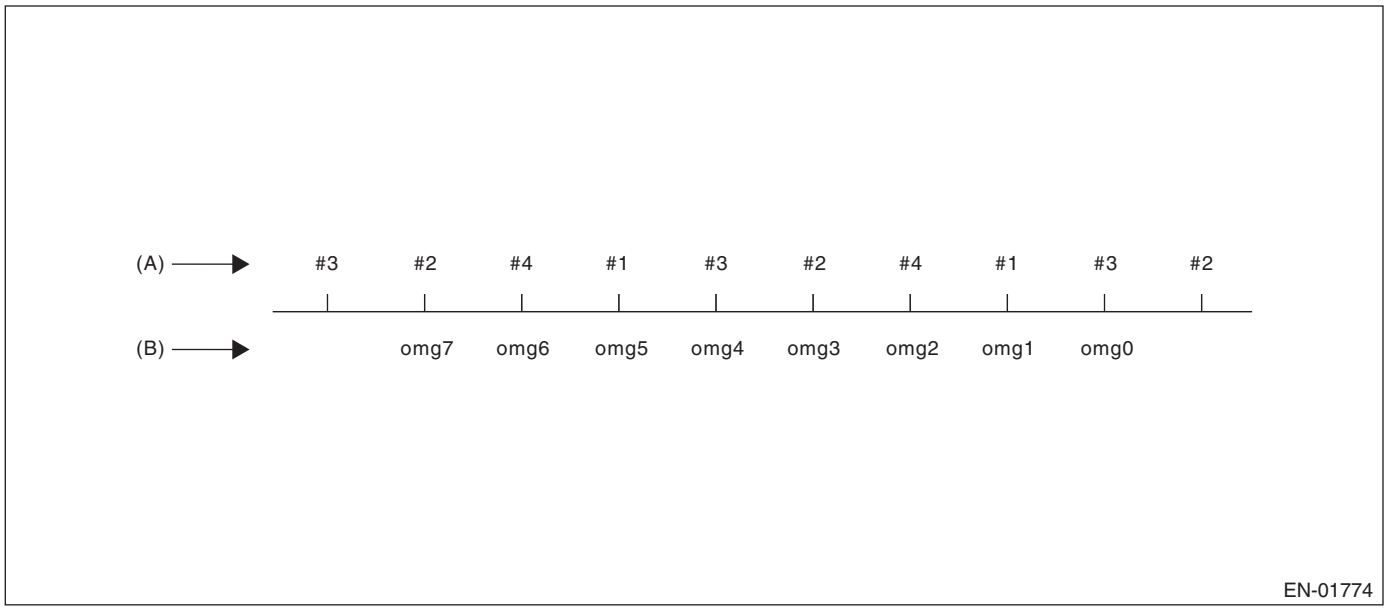
• If conditions are met, it is possible to detect the misfires from idling to high engine speed. However, to avoid excessive load or harm to the engine, perform diagnosis at idle.
• Perform the diagnosis continuously.

4. DIAGNOSTIC METHOD

When a misfire occurs, the engine speed will decrease and the crankshaft position speed will change. Calculate the interval difference value (diagnostic value) from crankshaft position speed by the following formula, and judge whether a misfire is occurring or not comparing the calculated result with judgment value. Count the number of misfires, if the misfire ratio is higher during 1000 revs. or 200 revs., judge corresponding cylinders as NG.

Diagnostic value calculation (Calculate from angle speed) →	Misfire detection every single ignition (Compare diagnostic value with judgment value) →	NG judgment (Misfire occurrence judgment required by the law) (Compare number of misfire with judgment value)
	• 180° Interval Difference Method • 360° Interval Difference Method • 720° Interval Difference Method	• FTP 1.5 times misfire NG judgment • Catalyst damage misfire NG judgment

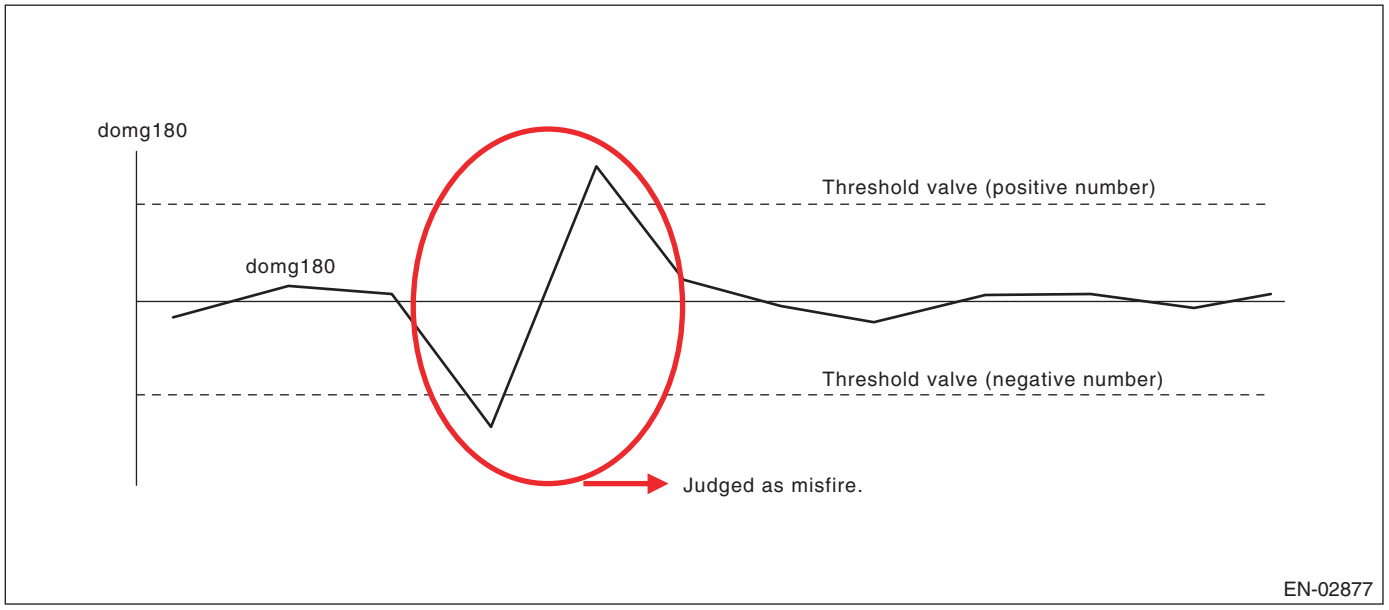
As shown in the following figure, pick a cylinder as the standard and name it omg 0. And the former crankshaft position speed is named omg 1, the second former crankshaft position speed is named omg 2, the third is named omg 3, etc.



(A) Ignition order (B) Crankshaft position speed

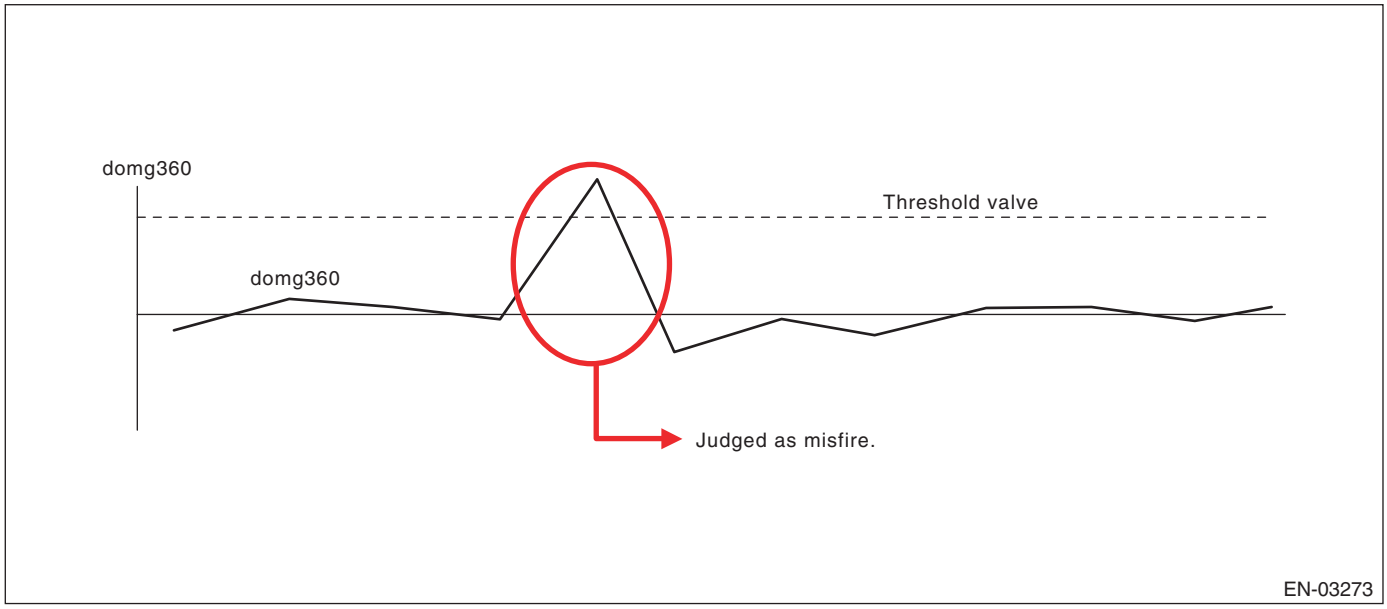
180° Interval Difference Method

Diagnostic value	domg 180 = (omg 1 – omg 0) – (omg 5 – omg 1)/4
Judge as a misfire in the following cases. • domg 180 > judgment value of positive side • domg 180 ≤ judgment value of negative side (Diagnostic value before 180° CA)	



360° Interval Difference Method

Diagnostic value	domg 360 = (omg 1 – omg 0) – (omg 3 – omg 2)
Misfire judgment	domg 360 > Judgment value → Judge as misfire



720° Interval Difference Method

Diagnostic value	domg 720 = (omg 1 – omg 0) – (omg 5 – omg 4)
Misfire judgment	domg 720 > Judgment value → Judge as misfire

BV:DTC P0442 EVAPORATIVE EMISSION CONTROL SYSTEM LEAK DETECTED (SMALL LEAK)

1. OUTLINE OF DIAGNOSIS

The evaporative system monitor detects leak up to 0.020 inch in the fuel tank and evaporative emissions system. If the fuel cap is not present or has not been correctly tightened after a refueling event, a malfunction is also detected. These malfunctions are detected by monitoring the fuel tank and system pressure during an intrusive pull-down pressure test. Pull down is accomplished via the purge valve while the engine is running. Monitors run during the first idle after engine start and while driving.
The diagnostic is classified into two monitors. The first monitor detects a 0.040 inch leak, fuel cap loose/off, and canister purge valve stuck open/close whilst the other monitor detects a 0.020 inch leak when the vehicle is moving or during the first idle. Failures, DTCs and monitor methods are as follows.

Monitor 1

- **P0457 Fuel cap loose/off or CPC valve stuck open/close**
- **P0442 0.040 inch leak check**

This monitor detects CPC valve stuck open/close, fuel cap loose/off, and 0.040 inch leak in the evaporative emission system by monitoring the fuel tank system pressure an intrusive pull-down pressure test. The monitor consists of Modes Z, A, B, C and D. There are three judgment times for these malfunctions. CPC valve stuck open is performed in Mode Z, CPC valve stuck closed or fuel cap loose/off is in Mode B, 0.040 inch leak is in Mode D.

Mode	Description of each mode	Required time for each mode
Mode Z (Monitoring of CPC stuck open)	CPC valve: Closed CCV: Closed The system requires 3000 ms to measure the pressure difference. (1) Pressure difference < 0.9 kPa (6.5 mmHg, 0.3 inHg) → Judged as “Fail of CPC stuck open” **[P0457]** (2) Pressure difference ≥ 0.4 kPa (3 mmHg, 0.1 inHg) → Move to Mode A	3000 ms
Mode A (Estimation of Evap. Generation)	The system requires 10000 ms to measure the pressure increase (evpp1), and then move to Mode B.	10000 ms
Mode B (Negative Pressure Introduction/ Monitoring of Fuel cap off or CPC stuck close)	CPC valve: Open Negative pressure is introduced to the fuel tank. (1) Elapsed time in Mode B ≥ 10000 ms and (Minimum tank pressure) – (Initial tank pressure) > –0.3 kPa (–2.5 mmHg, –0.1 inHg) → Judged as “Fail of Fuel cap off or CPC stuck close” **[P0457]** (2) Elapsed time in Mode B ≥ 10000 ms + 25000 ms → Judged as “Fail of Fuel cap off or CPC stuck close” **[P0457]** (3) Fuel tank pressure ≤ –1.4 kPa (–10.5 mmHg, –0.4 inHg) → Move to Mode C	Average: 7 s (Depends on the tank condition)
Mode C (Keeping Negative Pressure / Pass in Mode C)	CPC valve: Closed When the tank pressure comes up to the target pressure (–1.4 kPa (–10.5 mmHg, –0.4 inHg)), the monitor moves to Mode D. If the fuel tank pressure does not exceed the –1.4 kPa (–10.5 mmHg, –0.4 inHg) after 23635 ms, the system judges as “Pass in Mode C” and moves to “Final Judgment”.	Average: 7 s (Depends on the tank condition)
Mode D (Pressure Measurement / Pass Fail in Mode D)	The monitor requires 10000 ms to measure the pressure change (evpp2) and calculates the monitor value (evpp2 – 1.5 × evpp1), where Mode A (evpp1) is the generated vapor pressure. The calculated value (evpp2 – 1.5 × evpp1) is then compared to a calibrated threshold table as a function of fuel temperature and fuel level. The system judges as a “Pass/Fail in Mode D” and then moves to “Final Judgment”. (1) evpp2 – 1.5 × evpp1 > Fail Threshold (Map 1) → “Fail in Mode D” (2) evpp2 – 1.5 × evpp1 ≤ Pass Threshold (Map 1) → “Pass in Mode D”	10000 ms
Final Judgment (Pass / Fail)	The monitor is completed in the following order (1) Judged as “Fail in Mode D” → “Fail of 0.040 inch leak” **[P0442]** (2) Judged as “Pass in Mode C / Mode D” → “Pass of 0.040 inch leak”	0.128 s

Monitor 2

P0456 0.020 inch leak check

This monitor detects a very small leak (0.020 inch) in the evaporative emissions system by monitoring the fuel tank and system pressure during an intrusive pull-down pressure test. Pull down is accomplished via the purge valve while the engine is running. The monitor runs during the first idle after engine start and also while the vehicle is running.

Mode A (Estimation of Evap. Generation)	CPC valve: Closed CCV: Closed Low vapor flag At the beginning of the monitor test when; → Fuel temperature is lower than Map 2 listed value → Intake air temperature is lower than Map 3 listed value The system sets “Low vapor flag = ON”. Low vapor flag is used in Mode A, Mode C, and Mode D. The system measures the generated vapor pressure increase (△ P1) in the specific time period (*1), and then moves to Mode B. (*1) Low vapor flag OFF: 10000 ms, Low vapor flag ON: 128 ms	Low vapor flag OFF 10000 ms Low vapor flag ON 128 ms

Mode C (Keeping Negative Pressure / Pass in Mode C)	CPC valve: Closed After a calibrated time period (*2) has elapsed since the tank pressure comes up to the target pressure (–1.3 kPa (–10 mmHg, –0.4 inHg)), move to Mode D. If the fuel tank pressure does not exceed the target pressure (–1.3 kPa (–10 mmHg, –0.4 inHg)) after Map 4 (ms), the system is judged as “Pass in Mode C” and moves to “Final Judgment”. The calculated value (△ P2- △ P1) is then compared to a calibrated threshold table as a function of fuel temperature and fuel level. Monitor 2 (vehicle running condition)

Mode	Description of each mode	Required time for each mode
Mode A-1 (Zero adjust)	CPC valve: Closed Fuel tank pressure is adjusted to zero. If the fuel tank pressure is close to the ambient pressure, the system waits 5000 ms for stabilization of the tank pressure prior to moving to Mode A-2.	Average: 7 s (Depends on the tank condition)
Mode A-2 (Estimation of Evap. Generation)	CCV: Closed The system requires 30000 ms to measure the pressure increase (P1), and then move to Mode B.	30000 ms
Mode B (Negative Pressure Introduction)	CPC valve: Open Negative pressure is introduced to the fuel tank via engine manifold vacuum. When the fuel tank pressure reaches the target pressure (–2 kPa (–15 mmHg, –0.6 inHg)), the monitor moves to Mode C.	Average: 22 s (Depends on the tank condition)
Mode C (Keeping Negative Pressure)	CPC valve: Closed When the tank pressure comes up to target pressure (–2 kPa (–15 mmHg, –0.6 inHg)) or the calibrated period (Map 9) has passed, move to Mode D.	Average: 5 s (Depends on the tank condition)
Mode D (Pressure Measurement / Pass Fail in Mode D)	The system calculates the integrated pressure change (ptepap1sum) which is compensated by “P1” (the generated vapor pressure), ptepap1sum (n) = ptepap1sum (n–1) + ptepap1 – (–2 kPa (–15 mmHg, –0.6 inHg)) ptepap1 = (Fuel tank pressure) – (“P1”) / (Mode A-2 time) × (Elapsed time in Mode D) When the calibrated period (Map 10) has passed or the tank pressure reaches the Ambient pressure (0 kPa (0 mmHg, 0 inHg)), the system compares the monitor value (ptepap1sum) to a calibrated threshold table as a function of elapsed time in Mode D and fuel level. The system judges as “Pass/Fail in Mode D” and then moves to “Final Judgment”. (1) ptepap1sum > Fail Threshold (Map 11) → “Fail in Mode D” (2) ptepap1sum ≤ Pass Threshold (Map 12) → “Pass in Mode D”	Average: 134 s (Depends on the tank condition)
Final Judgment (Pass / Fail)	The monitor is completed in the following order (1) Judged as “Fail in Mode D” → Fail of 0.020 inch leak **[P0456]** (2) Judged as “Pass in Mode D” → Pass of 0.020 inch leak	0.128 s

3. GENERAL DRIVING CYCLE

Monitor 1

Perform the diagnosis when the cumulative time of canister purge after engine start becomes 120 seconds or more, at a vehicle speed of 32 km/h (20 MPH) or more.
If judgment cannot be made, repeat the diagnosis after a predetermined interval has passed.

Monitor 2 (first idle condition)

Perform the diagnosis only once at the fast idle (the idling before starting to move) after soaking of 5 hours or more, in conditions that A/F feedback has been executed and catalytic converter has been warmed up (approx. 25 seconds after engine start).
If judgment cannot be made, or the diagnosis cannot be performed at fast idle, do not repeat the diagnosis in this driving cycle.

Monitor 2 (vehicle running condition)

Perform this procedure only when the diagnosis cannot be completed at fast idle.
Perform the diagnosis when the cumulative time of canister purge after engine start becomes 120 seconds or more, at a vehicle speed of 30 km/h (18.6 MPH) or more.
If judgment cannot be made, repeat the diagnosis after a predetermined interval has passed.

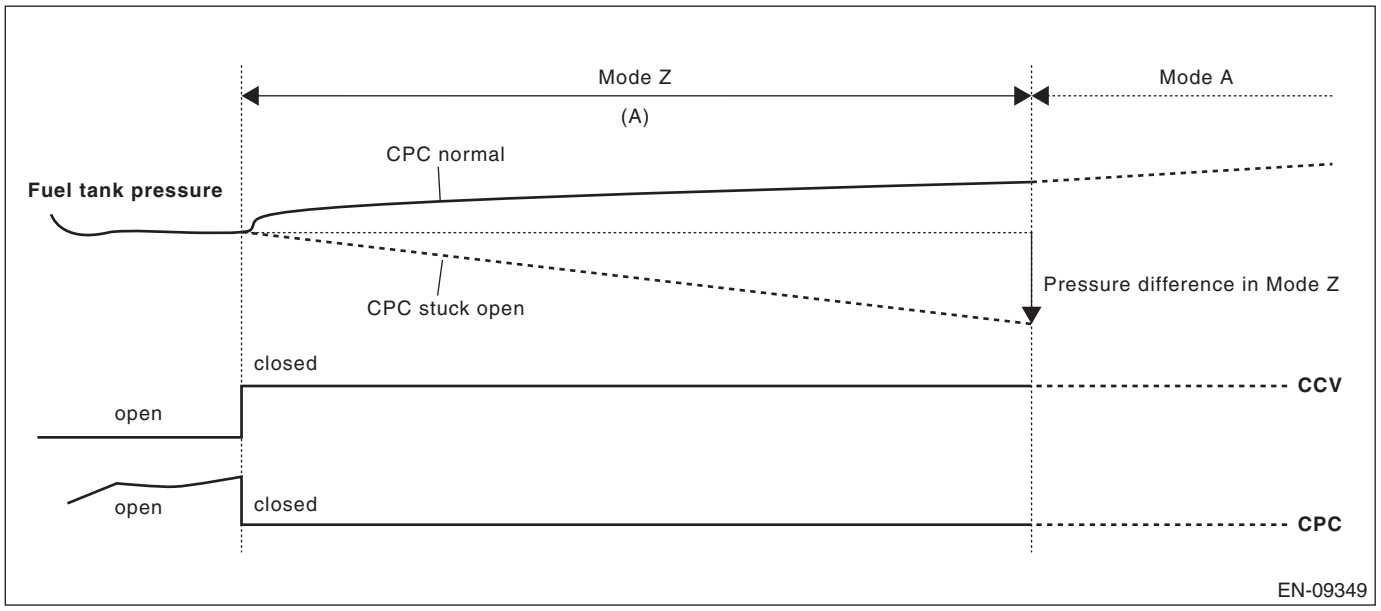
4. DIAGNOSTIC METHOD

- **Monitor 1**

• CPC valve stuck open

At the beginning of the Monitor 1, system performs CPC valve stuck open monitor in Mode Z. CPC valve and CCV are closed and the fuel tank pressure is monitored. The pressure transition over a calibrated time is then used to determine if the CPC valve is stuck open.

CPC valve stuck open test at Mode Z of Monitor 1



(A) 3000 ms

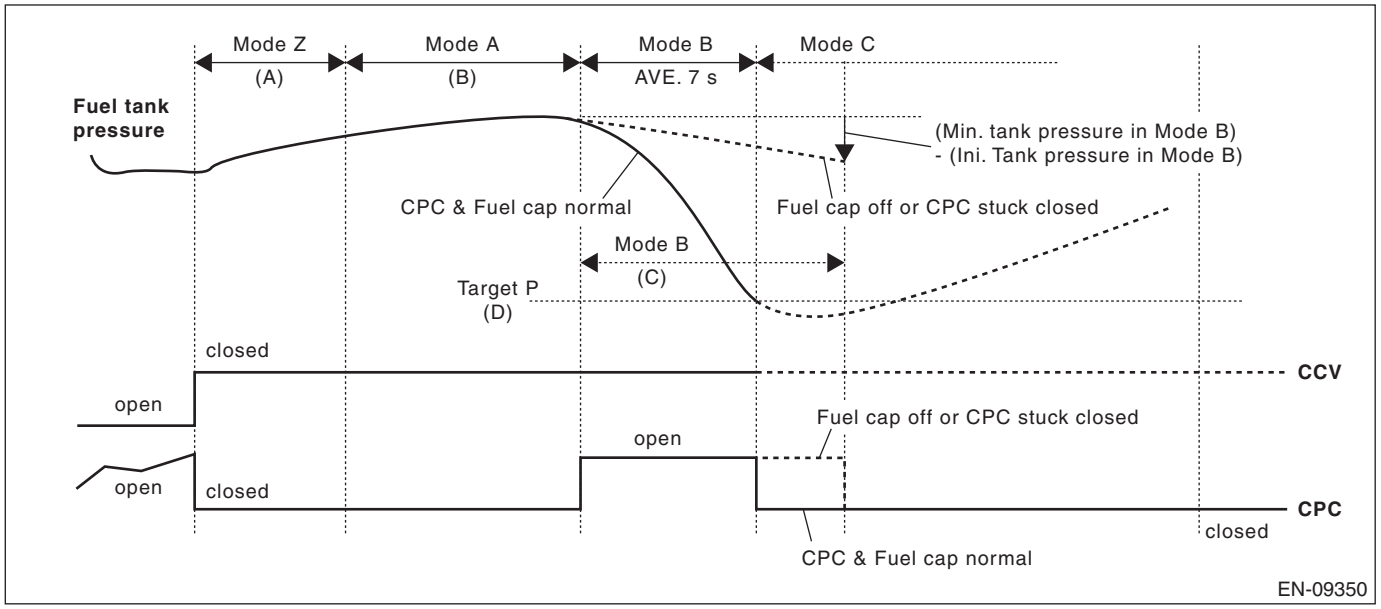
Judgment

- Pressure difference in Mode Z < 0.9 kPa (6.5 mmHg, 0.3 inHg) → Fail [CPC valve stuck open]: **P0457**
- Pressure difference in Mode Z ≥ 0.4 kPa (3 mmHg, 0.1 inHg) → Pass → move to **Mode A**

• Fuel cap loose/off and CPC valve stuck close

Fuel cap loose/off and CPC valve stuck close monitor is performed in Mode B of Monitor 1. The engine lowers the fuel tank pressure using intake manifold vacuum via the operation of the CPC valve. The pressure transition over a calibrated time is then used to determine if the Fuel cap loose/off or CPC valve stuck closed.

Fuel cap off or CPC stuck close at Mode B of Monitor 1



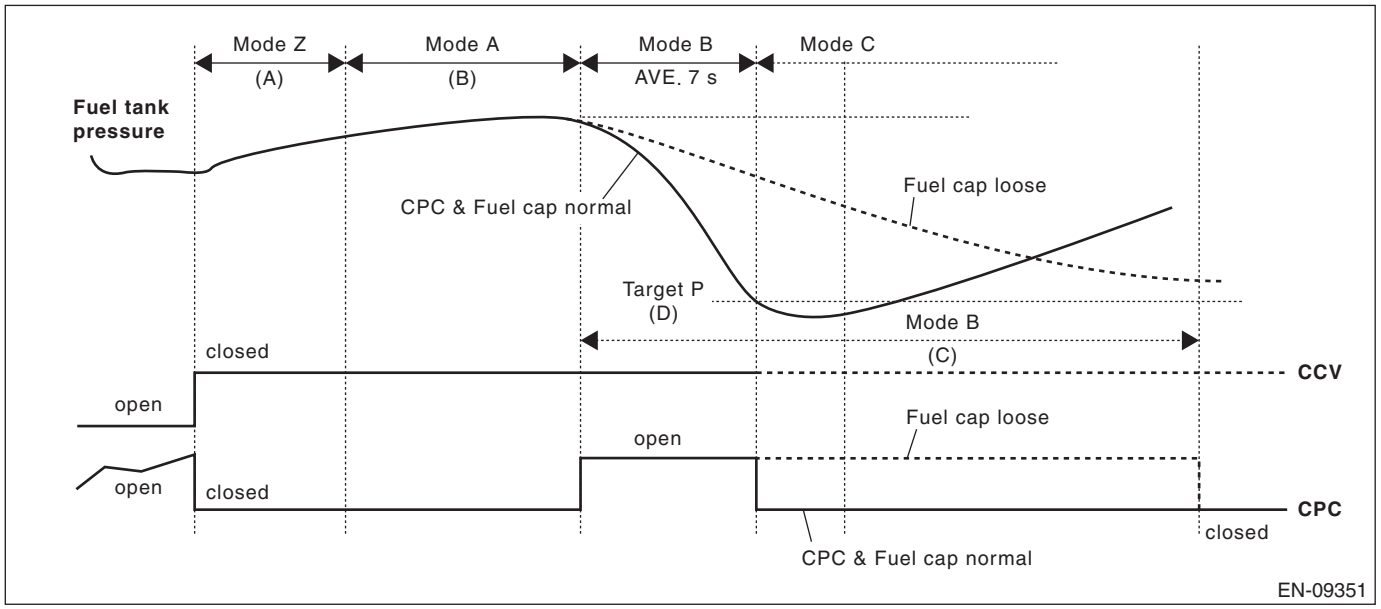
(A) 3000 ms (B) 10000 ms (C) 10000 ms

(D) –1.4 kPa (–10.5 mmHg, –0.4 inHg)

Judgment

- Elapsed time in Mode B ≥ 10000 ms and (Minimum tank pressure in Mode B) – (Initial tank pressure in Mode B) > –0.3 kPa (–2.5 mmHg, –0.1 inHg) → Fail [Fuel cap off or CPC valve stuck close]: **P0457**
- Fuel tank pressure ≤ –1.4 kPa (–10.5 mmHg, –0.4 inHg) → Pass → move to **Mode C**

Fuel cap loose at Mode B of Monitor 1



(A) 3000 ms (B) 10000 ms (C) 10000 ms + 25000 ms

(D) –1.4 kPa (–10.5 mmHg, –0.4 inHg)

Judgment
- Elapsed time in Mode B ≥ 10000 ms + 25000 ms → Fail [Fuel cap loose]: **P0457**
- Fuel tank pressure ≤ –1.4 kPa (–10.5 mmHg, –0.4 inHg) → Pass → move to **Mode C**

• 0.040 inch leak check

0.040 inch evaporative leak monitor is executed through Mode A to Mode D of Monitor 1. The engine lowers the fuel tank pressure using intake manifold vacuum via the canister purge operation during engine running. Once the tank pressure reaches a calibrated target (below atmospheric pressure) the purge valve is closed and the fuel tank pressure is monitored. The pressure transition over a calibrated time period is then used to determine if the fuel tank system has a leak.

- evpp2 – 1.5 × evpp1 ≤ Map 1 → Pass [No Leak]

- **Monitor 2 (first idle condition)**

0.020 inch leak check at first idle condition

An intrusive evaporative leak monitor test is run following the first engine start after a calibrated engine off soak period. The engine lowers the fuel tank pressure using intake manifold vacuum via the purge valve operation during engine idle. Once the tank pressure reaches a calibrated target (below atmospheric pressure) the purge valve is closed and the fuel tank pressure is monitored. The pressure transition over a calibrated time period is then used to determine if the fuel tank system has a leak.

- **Monitor 2 (vehicle running condition)**

0.020 inch Monitor during Vehicle Running (moving) Conditions

While the vehicle is vehicle running, the diagnostic intrusively pulls-down the fuel tank pressure using manifold vacuum via the purge valve. Once the tank pressure reaches a calibrated target (below atmospheric pressure) the purge valve is closed and the fuel tank pressure is monitored. The pressure transition over a calibrated time period is then used to determine if the fuel tank system has a leak.

BY:DTC P0451 EVAPORATIVE EMISSION CONTROL SYSTEM PRESSURE SENSOR

1. OUTLINE OF DIAGNOSIS

Detect malfunctions of tank pressure sensor output property by the following two diagnoses.

- **DRIFT DIAGNOSIS**

To detect drift malfunction and offset malfunction of tank pressure sensor, activate ECM in the predetermined soaking time after turning the ignition switch OFF, and check that the tank pressure sensor input value is equivalent to the barometric pressure.

For vehicles equipped with pressure control valve, be sure to open the pressure control valve when performing the diagnosis, because the pressure inside the tank increases if the ambient temperature rises during soaking.

When there is no pressure variation, which should have occurred in the tank considering the operation status, judge as NG.

C: CAUTION

• Wear appropriate work clothing, including a cap, protective goggles and protective shoes when performing any work.
• Remove contamination including dirt and corrosion before removal, installation or disassembly.
• Keep the disassembled parts in order and protect them from dust and dirt.
• Before removal, installation or disassembly, be sure to clarify the failure. Avoid unnecessary removal, installation, disassembly and replacement.
• Vehicle components are extremely hot after driving. Be wary of receiving burns from heated parts.
• Be sure to tighten fasteners including bolts and nuts to the specified torque.
• Place shop jacks or rigid racks at the specified points.
• Before disconnecting connectors of sensors or units, be sure to disconnect the ground cable from battery.
• Place “NO OPEN FLAMES” signs near the working area.
• Prepare a container and cloth to prevent scattering of fuels when performing work where fuels can be spilled. If the oil spills, wipe it off immediately to prevent from penetrating into floor or flowing out for environmental protection.
• Follow all government and local regulations concerning disposal of refuse when disposing fuel.

C: CAUTION

• Wear appropriate work clothing, including a cap, protective goggles and protective shoes when performing any work.
• Remove contamination including dirt and corrosion before removal, installation or disassembly.
• Keep the disassembled parts in order and protect them from dust and dirt.
• Before removal, installation or disassembly, be sure to clarify the failure. Avoid unnecessary removal, installation, disassembly and replacement.
• Vehicle components are extremely hot after driving. Be wary of receiving burns from heated parts.
• Be sure to tighten fasteners including bolts and nuts to the specified torque.
• Place shop jacks or rigid racks at the specified points.
• Before disconnecting connectors of sensors or units, be sure to disconnect the ground cable from battery.
• All parts should be thoroughly cleaned, paying special attention to engine oil passages, pistons and bearings.
• Before applying liquid gasket, completely remove the old liquid gasket and degrease it.
• Rotating parts and sliding parts such as piston, bearing and gear should be coated with oil prior to assembly.
• All removed parts, if to be reused, should be reinstalled in the original positions and directions.
• Bolts, nuts and washers should be replaced with new parts as required.
• Even if necessary inspections have been made in advance, proceed with assembly work while making rechecks.
• Remove or install the engine in an area where chain hoists, lifting devices, etc. are available for ready use.
• Be sure not to damage coated surfaces of body panels with tools, or not to stain seats and windows with coolant or oil. Place a cover over fender, as required, for protection.
• Prior to starting work, prepare the following:
Service tools, clean cloth, containers to catch coolant and oil, wire ropes, chain hoist, transmission jacks, etc.
• Lift up or lower the vehicle when necessary. Make sure to support the correct positions.

B: ADJUSTMENT

1. PROCEDURE TO ADJUST THE SUBARU SUPER COOLANT CONCENTRATION

CAUTION:
Use the SUBARU Super Coolant with a 50 — 60% concentration in order to obtain maximum anti-freeze and anti-rust performance.
To adjust the concentration of SUBARU Super Coolant according to temperature, find the proper SUBARU Super Coolant concentration in the table, and add diluting water to the SUBARU Super Coolant (concentrated type) until it reaches the proper dilution.

Relationship of Subaru Super Coolant concentration and freezing temperature			
SUBARU Super Coolant concentration	50%	55%	60%
Freezing temperature	–36°C (–33°F)	–41°C (–42°F)	–50°C (–58°F)

3. Engine Oil

A: INSPECTION

CAUTION:
If the engine oil is spilt over exhaust pipe or the under cover, wipe it off with cloth to avoid emitting smoke or causing a fire.

1) Park the vehicle on a level surface.
2) Remove the oil level gauge and wipe away the oil.
3) Reinsert the oil level gauge all the way. Be sure that the oil level gauge is correctly inserted and properly orientated.
4) Pull out the oil level gauge again, and check the oil level. If the engine oil level is below “L” line, make sure that there is no oil leakage from the engine, then add oil to raise the level up to the “F” line.
5) Start the engine to circulate the oil in engine room.
6) After turning off the engine, wait a few minutes for the oil to return to the oil pan before checking the level.

NOTE:
• Just after driving or while the engine is warm, engine oil level may be exceeding the “F” line. This is caused by thermal expansion of engine oil.
• To prevent overfilling of engine oil, do not add oil above “F” line when the engine is cold.
• As the oil level gauge is used for daily inspection, standard of “F” line and “L” line of the oil level gauge is set for the condition that engine is cold.

3. General Description

A: CAUTION

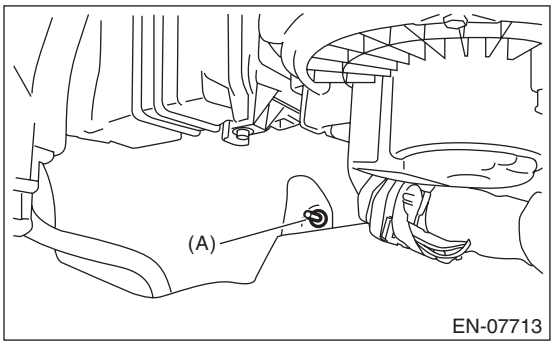
1) Airbag system wiring harness is routed near the ECM, main relay and fuel pump relay.

CAUTION:
• Do not use electrical test equipment on the airbag system circuit.
• Be careful not to damage the airbag system wiring harness when servicing the ECM, TCM, main relay and fuel pump relay.

2) Never connect the battery in reverse polarity. Doing so will damage the ECM instantly, and other parts will also be damaged.
3) Do not disconnect the battery terminals while the engine is running. A large counter electromotive force will be generated in the generator, and this voltage may damage electronic parts such as ECM etc.
4) Before disconnecting the connectors of each sensor and ECM, be sure to turn the ignition switch to OFF. Perform the Clear Memory Mode after connecting the connectors. <Ref. to EN(H6DO)(diag)-57, Clear Memory Mode.>
5) When measuring the voltage or resistance of individual sensor or all electrical control modules, use a tapered pin with a diameter of less than 0.6 mm (0.024 in). Do not insert the pin 4 mm (0.16 in) or more into the part.

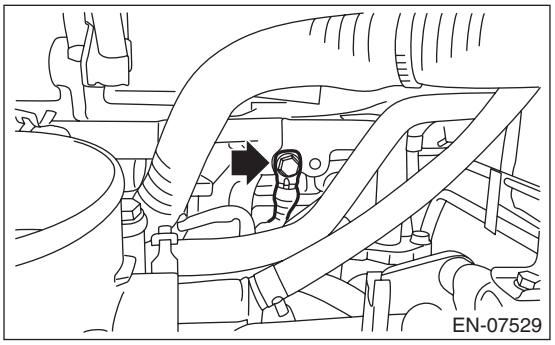
CAUTION:
When replacing the ECM, be careful not to use the wrong spec. ECM to avoid any damage on the fuel injection system.

NOTE:
When replacing the ECM of the models with Immobilizer, immobilizer system must be registered. To do so, all ignition keys and ID cards need to be prepared. Refer to the “PC application help for Subaru Select Monitor”.
6) Take care not to allow water to get into the connectors when servicing or washing the vehicle in rainy weather. Avoid exposure to water even if the connectors are waterproof.
7) Use ECM mounting stud bolts at the body side grounding point when measuring voltage and resistance inside the passenger compartment.



(A) Stud bolt

8) Use the engine ground terminal or engine assembly as the grounding point to chassis when measuring the voltage and resistance in engine compartment.



9) Every MFI-related part is a precision part. Do not drop them.
10) Observe the following cautions when installing a radio in vehicle.

CAUTION:
• The antenna must be kept as far apart as possible from control module. (ECM is installed at the back of the glove box.)
• The antenna feeder must be placed as far apart as possible from the ECM and engine control system harness.
• Carefully adjust the antenna for correct matching.
• When mounting a large power type radio, pay special attention to the three items mentioned above.
• Incorrect installation of the radio may affect the operation of ECM.

11) When disconnecting the fuel hose, release the fuel pressure. <Ref. to FU(H6DO)-59, RELEASING OF FUEL PRESSURE, PROCEDURE, Fuel.>

12) For the model with ABS, the ABS warning light may illuminate when performing driving test with jacked-up or lifted-up condition, but this is not a system malfunction. The reason for this is the speed difference between the front and rear wheels. When engine control system diagnosis is finished, perform the VDC memory clearance procedure of self-diagnosis function. <Ref. to VDC(diag)-25, Clear Memory Mode.>

B: INSPECTION

Before performing diagnostics, check the following item which might affect engine problems.

1. BATTERY

1) Measure the battery voltage and specific gravity of the electrolyte.

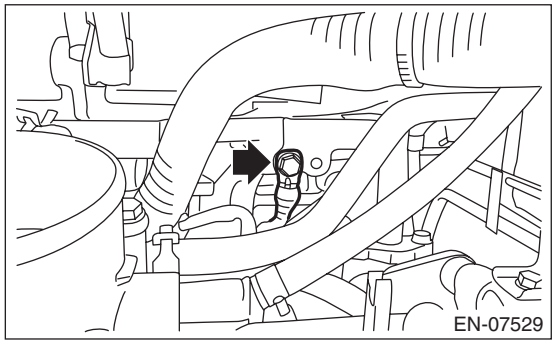
Standard voltage: 12 V

Specific gravity: 1.260 or more

2) Check the condition of the main and other fuses, and harnesses and connectors. Also check for proper grounding.

2. ENGINE GROUND

Make sure that the engine ground terminal is properly connected to the engine.



C: NOTE

- The on-board diagnostic (OBD) system detects and indicates a fault in various inputs and outputs of the complex electronic control. Malfunction indicator light in the combination meter indicates occurrence of a fault or trouble.
- Further, against such a failure of sensors as may disable the drive, the fail-safe function is provided to ensure the minimal drivability.
- The OBD system incorporated with the vehicles within this type of engine complies with OBD-II regulations. The OBD system monitors the components and the system malfunction listed in “Engine Section” which affects on emissions.
- When the system decides that a malfunction occurs, malfunction indicator light illuminates. At the same time of the malfunction indicator light illumination or blinking, a DTC and a freeze frame engine conditions are stored into on-board computer.
- The OBD system stores freeze frame engine condition data (engine load, engine coolant temperature, fuel trim, engine speed and vehicle speed, etc.) into on-board computer when it detects a malfunction.
- Freeze frame engine condition data are stored until the DTCs are cleared. However when such malfunctions as fuel trim fault and misfire are detected with the freeze frame engine condition data stored, they are rewritten into those related to the fuel trim fault and misfire.
- When the malfunction does not occur again for three consecutive driving cycles*, malfunction indicator light is turned off, but DTC remains at on-board computer.

*: One driving cycle means the period between the ignition switch ON and the ignition switch OFF after driving.

- When performing diagnosis, connect the Subaru Select Monitor or general scan tool to the vehicle.

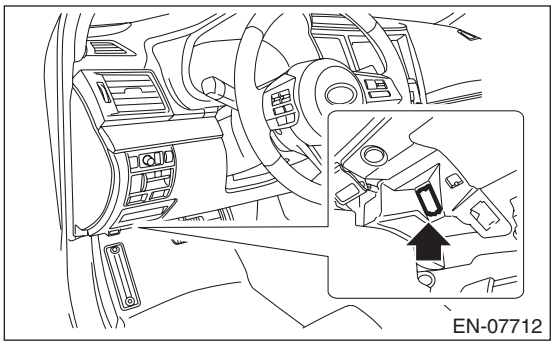
8. General Scan Tool

A: OPERATION

1. HOW TO USE GENERAL SCAN TOOL

1) Prepare a scan tool (general scan tool) required by SAE J1978.
2) Connect the general scan tool to data link connector located in the lower portion of the instrument panel (on the driver's side).



3) Using the general scan tool, call up each data. General scan tool functions consist of:
   (1) MODE $01: Current powertrain diagnostic data
   (2) MODE $02: Powertrain freeze frame data
   (3) MODE $03: Emission-related powertrain DTC
   (4) MODE $04: Clear/Reset emission-related diagnostic information
   (5) MODE $06: Request on-board monitoring test results for intermittently monitored systems
   (6) MODE $07: Request on-board monitoring test results for continuously monitored systems
   (7) MODE $09: Request vehicle information
4) Read out the data according to repair procedures. (For detailed operation procedure, refer to the general scan tool operation manual.)

NOTE:
For details concerning DTC, refer to "List of Diagnostic Trouble Code (DTC)". <Ref. to EN(H6DO)(diag)-85, List of Diagnostic Trouble Code (DTC).>

2. MODE $01 (CURRENT POWERTRAIN DIAGNOSTIC DATA)

Refer to data denoting the current operating condition of analog input/output, digital input/output or the powertrain system.
A list of the support data and PID (Parameter Identification) codes are shown in the following table.

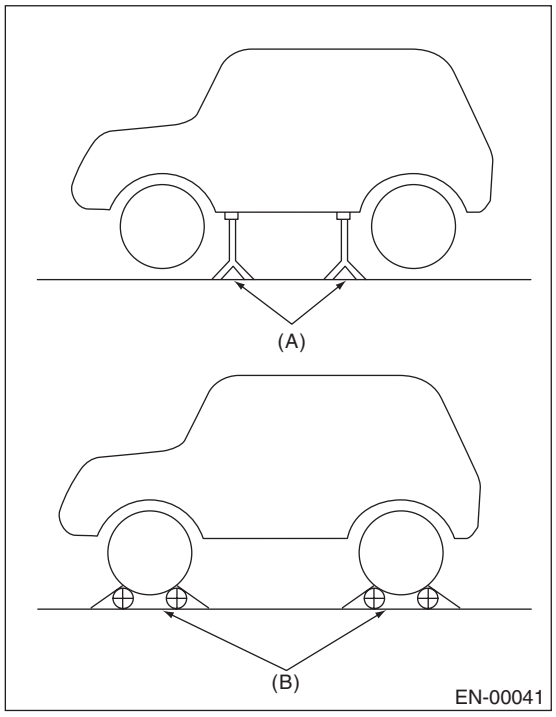
1. PREPARATION FOR THE INSPECTION MODE

1) Check that the battery voltage is 12 V or more and fuel remains approx. half [20 — 40 ℓ (5.3 — 10.6 US gal, 4.4 — 8.8 Imp gal)].
2) Lift up the vehicle using a garage jack and place it on rigid racks, or drive the vehicle onto free rollers.

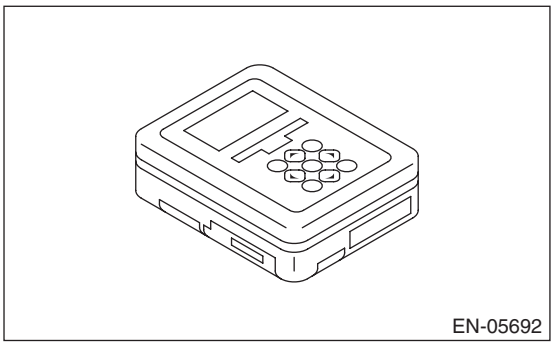
WARNING:
• Before lifting up the vehicle, ensure parking brake is applied.
• Do not use a pantograph jack in place of a rigid rack.
• Secure a rope or wire to the front or rear towing hooks to prevent the lateral runout of front wheels.
• Before rotating the wheels, make sure that there is no one in front of the vehicle. Besides while the wheels are rotating, make sure that no one approaches the vehicle front side.
• Make sure that there is nothing around the wheels. For AWD model, pay attention to all four wheels.
• While servicing, do not depress or release the clutch pedal or accelerator pedal quickly regardless of the engine speed. Quick operation may cause the vehicle to drop off the free roller.
• To prevent the vehicle from slipping due to vibration, do not place anything between rigid rack and the vehicle.



(A) Rigid rack
(B) Free roller

2. SUBARU SELECT MONITOR

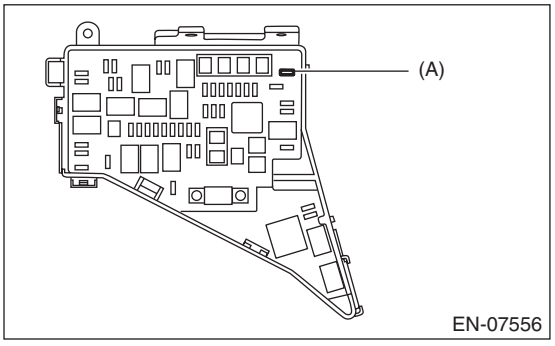
1) Check that no DTC remains after clearing memory. <Ref. to EN(H6DO)(diag)-57, Clear Memory Mode.>
2) Warm up the engine.
3) Prepare the Subaru Select Monitor kit. <Ref. to EN(H6DO)(diag)-8, PREPARATION TOOL, General Description.>



4) Prepare PC with Subaru Select Monitor installed.
5) Connect the USB cable to SDI (Subaru Diagnosis Interface) and USB port on the personal computer (dedicated port for the Subaru Select Monitor).

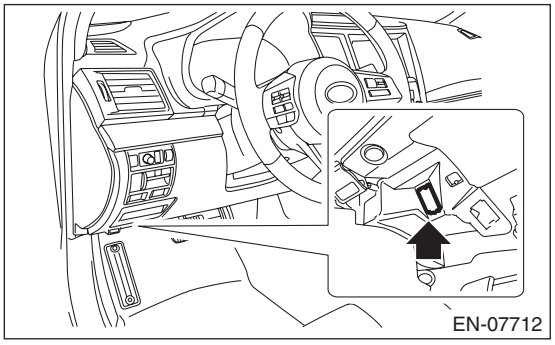
NOTE:
The dedicated port for the Subaru Select Monitor means the USB port which was used to install the Subaru Select Monitor.
6) Connect the diagnosis cable to SDI.
7) Install the delivery (test) mode fuse (A) of the main fuse box.

CAUTION:
Do not use any fuses that are installed on the vehicle.



8) Connect SDI to data link connector located in the lower portion of the instrument panel (on the driver's side).

CAUTION:
Do not connect the scan tools except for Subaru Select Monitor and general scan tool.



9) Start the PC.
10) Turn the ignition switch to ON (engine OFF) and run the "PC application for Subaru Select Monitor".
11) On «Main Menu» display, select {Each System Check}.
12) On «System Selection Menu» display, select {Engine Control System}.
13) Click the [OK] button after the information of engine type has been displayed.
14) On «Engine Diagnosis» display, select {Dealer Check Mode Procedure}.
15) When the "Perform Inspection (Dealer Check) Mode ?" is shown on the screen, click the [Next] button.
16) Perform subsequent procedures as instructed on the display screen.

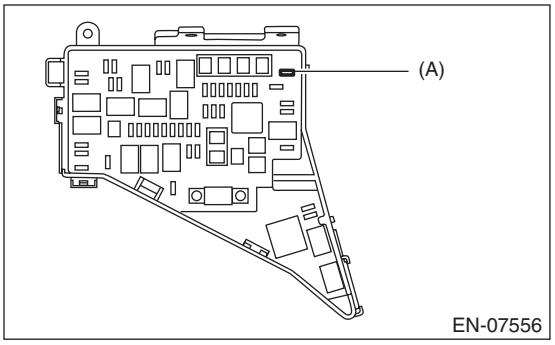
- If trouble still remains in the memory, the corresponding DTC appears on the display screen.

NOTE:
- For detailed operation procedures, refer to "PC application help for Subaru Select Monitor".
- For details concerning DTC, refer to "List of Diagnostic Trouble Code (DTC)". <Ref. to EN(H6DO)(diag)-85, List of Diagnostic Trouble Code (DTC).>
- Release the parking brake.
- The speed difference between front and rear wheels may illuminate the ABS warning light, but this does not indicate a malfunction. When engine control system diagnosis is finished, perform the VDC memory clearance procedure of self-diagnosis function. <Ref. to VDC(diag)-25, Clear Memory Mode.>

3. GENERAL SCAN TOOL

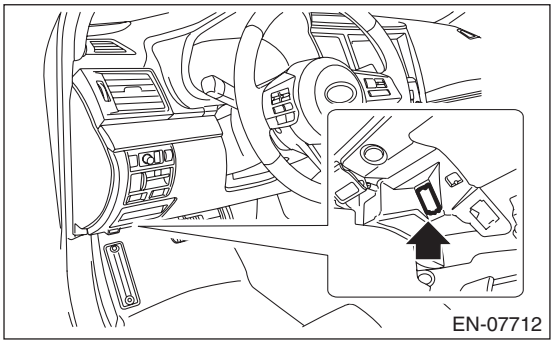
1) Check that no DTC remains after clearing memory. <Ref. to EN(H6DO)(diag)-32, MODE $04 (CLEAR/RESET EMISSION-RELATED DIAGNOSTIC INFORMATION), OPERATION, General Scan Tool.>
2) Warm up the engine.
3) Install the delivery (test) mode fuse (A) of the main fuse box.

CAUTION:
Do not use any fuses that are installed on the vehicle.



4) Connect the general scan tool to data link connector located in the lower portion of the instrument panel (on the driver's side).

CAUTION:
Do not connect the scan tools except for Subaru Select Monitor and general scan tool.



5) Start the engine.

NOTE:
Ensure the selector lever is placed in the "P" range before starting.
6) Turn the neutral position switch to ON using select lever.
7) Depress the brake pedal to turn the brake switch ON.
8) Keep the engine speed in 2,500 — 3,000 rpm range for 40 seconds.

9) Shift the select lever in the “D” range and drive the vehicle at 5 to 10 km/h (3 to 6 MPH).

NOTE:
• For AWD model, release the parking brake.
• The speed difference between front and rear wheels may illuminate the ABS warning light, but this does not indicate a malfunction. When engine control system diagnosis is finished, perform the VDC memory clearance procedure of self-diagnosis function. <Ref. to VDC(diag)-25, Clear Memory Mode.>

10) Using the general scan tool, check for DTC and record the result(s).

NOTE:

• For details concerning DTC, refer to “List of Diagnostic Trouble Code (DTC)”.
<Ref. to EN(H6DO)(diag)-85, List of Diagnostic Trouble Code (DTC).>

12.Drive Cycle

A: PROCEDURE

It is necessary to perform the drive cycle listed below if DTC is not found in the Inspection Mode. It is possible to complete diagnosis of the DTC by performing the indicated drive cycle. After the repair for the DTC, perform a necessary drive cycle and make sure the function recovers and the DTC is recorded.

1. PREPARATION FOR DRIVE CYCLE

1) Check that the battery voltage is 12 V or more and fuel remains approx. half [20 — 40 ℓ (5.3 — 10.6 US gal, 4.4 — 8.8 Imp gal)].
2) After performing the diagnostics and Clear Memory Mode, check that no DTC remains. <Ref. to EN(H6DO)(diag)-57, Clear Memory Mode.>
3) Check the delivery (test) mode fuse is removed.

NOTE:
• Perform the drive cycle after warming up the engine except when the engine coolant temperature at engine start is specified.
• Perform the drive cycle twice if the DTC in the list is marked with *. After completing the first drive cycle, stop the engine and perform second diagnosis in same condition.

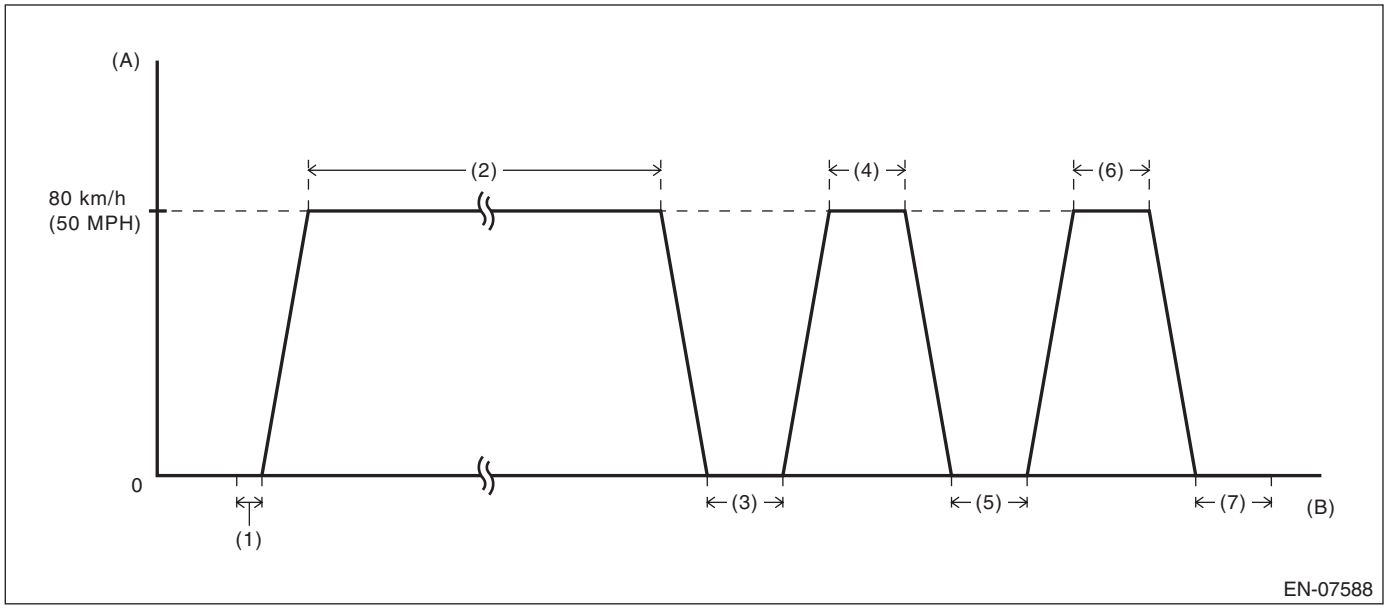
1) Make sure that the engine coolant temperature is less than 30°C (86°F).

2) Drive according to the drive pattern described below.



(A) Vehicle speed

(B) Elapsed time

(1) Idle the engine for 10 seconds or more after engine start.

(2) Drive for 8 minutes or more at a constant speed of 80 km/h (50 MPH) or more.

(3) Stop the vehicle and idle for 30 seconds or more.

(4) Drive for 30 seconds or more at a constant speed of 80 km/h (50 MPH) or more.

(6) Drive for 30 seconds or more at a constant speed of 80 km/h (50 MPH) or more.

(7) Stop the vehicle and idle for 30 seconds.

NOTE:
- There is no given transition time between idling and cruising.
- Driving at constant speed only on a downhill causes smaller engine load and may result in failure to obtain a right diagnostic result.
