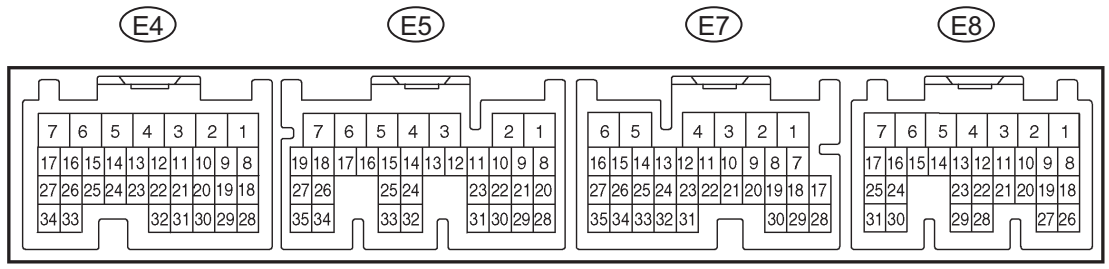
Tester Ranges	0.2 V/DIV, 10 msec./DIV
Conditions	Idling

HINT:
The wavelength becomes shorter as the engine rpm increases.

2. Inspect ECM (2TR-FE)

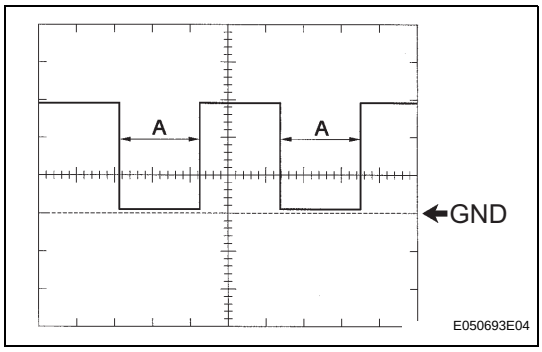
(a) Connect the connector to the ECM and inspect the wire harness side connector from the back side, as shown in the table below.

From Back Side:



Symbols (Terminals No.)	Wiring Colors	Terminal Descriptions	Conditions	STD Voltages
ACT (E7-25) - E1 (E4-3)	L - BR	Magnet clutch ON Permit signal	Start engine Operate A/C system Accelerator pedal: released → depressed	10 to 14 → Below 1.0 V
THWO (E7-14) - E2 (E4-28)	GR-B - BR	Engine coolant temperature sensor signal	Ignition switch: ON	Pulse generation (See waveform 1)
TACH (E7-1) - E1 (E4-3)	B-W - BR	Engine speed signal	Engine idling	Pulse generation (See waveform 2)

AC

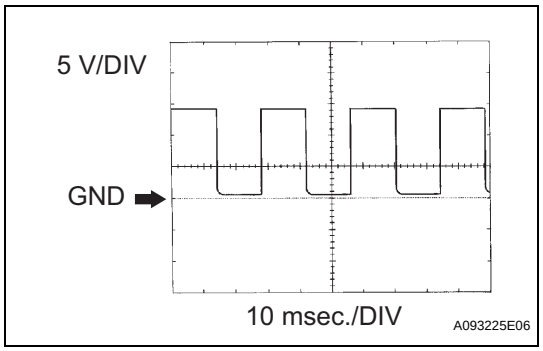


(1) WAVEFORM 1:
Engine coolant temperature sensor signal

ECM Terminal Names	Between THWO and E2
Tester Ranges	5 V/DIV, 0.1 sec./DIV
Conditions	Ignition switch ON

A changes in accordance with the engine coolant temperature.

Coolant Temperature	Below 30°	Approx. 75°C	Above 90°F
A	Approx. 16 ms	Approx. 204 ms	Approx. 262 ms



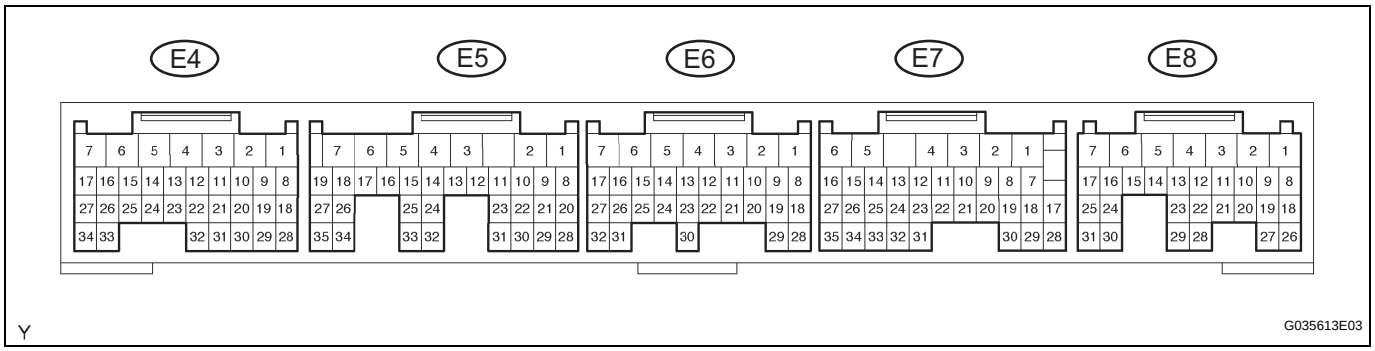
(2) WAVEFORM 2:
Engine speed signal

ECM Terminal Names	Between TACH and E1
Tester Ranges	5 V/DIV, 10 msec./DIV
Conditions	Idling

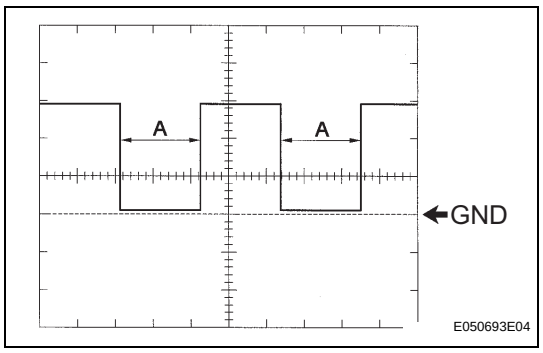
HINT:
The wavelength becomes shorter as the engine rpm increases.

3. INSPECT ECM (1GR-FE)

(a) Connect the connector to the ECM and inspect the wire harness side connector from the back side, as shown in the table below.



Symbols (Terminals No.)	Wiring Colors	Terminal Descriptions	Conditions	STD Voltages
ACT (E7-25) - E1 (E6-1)	L - BR	Magnet clutch ON permit signal	Start engine Operate A/C system Accelerator pedal: released → depressed	10 to 14 → Below 1.0 V
THWO (E7-14) - E2 (E4-28)	GR-B - BR	Engine coolant temperature sensor signal	Ignition switch: ON	Pulse generation (See waveform 1)
TACH (E7-1) - E1 (E6-1)	B-W - BR	Engine speed signal	Engine idling	Pulse generation (See waveform 2)



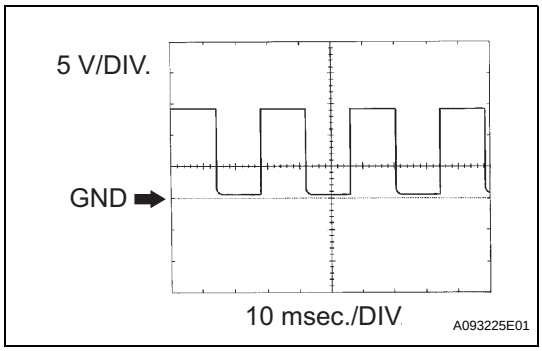
(1) WAVEFORM 1:
Engine coolant temperature sensor signal

ECM Terminal Names	Between THWO and E2
Tester Ranges	5 V/DIV, 0.1 sec./DIV
Conditions	Ignition switch ON

A changes in accordance with the engine coolant temperature.

Coolant Temperature	Below 30°	Approx. 75°	Above 90°
A	Approx. 16ms	Approx. 204ms	Approx. 262ms

AC



(2) WAVEFORM 2:
Engine speed signal

ECM Terminal Names	Between TACH and E1
Tester Ranges	5 V/DIV, 10 msec./DIV
Conditions	Idling

HINT:
The wavelength becomes shorter as the engine rpm increases.

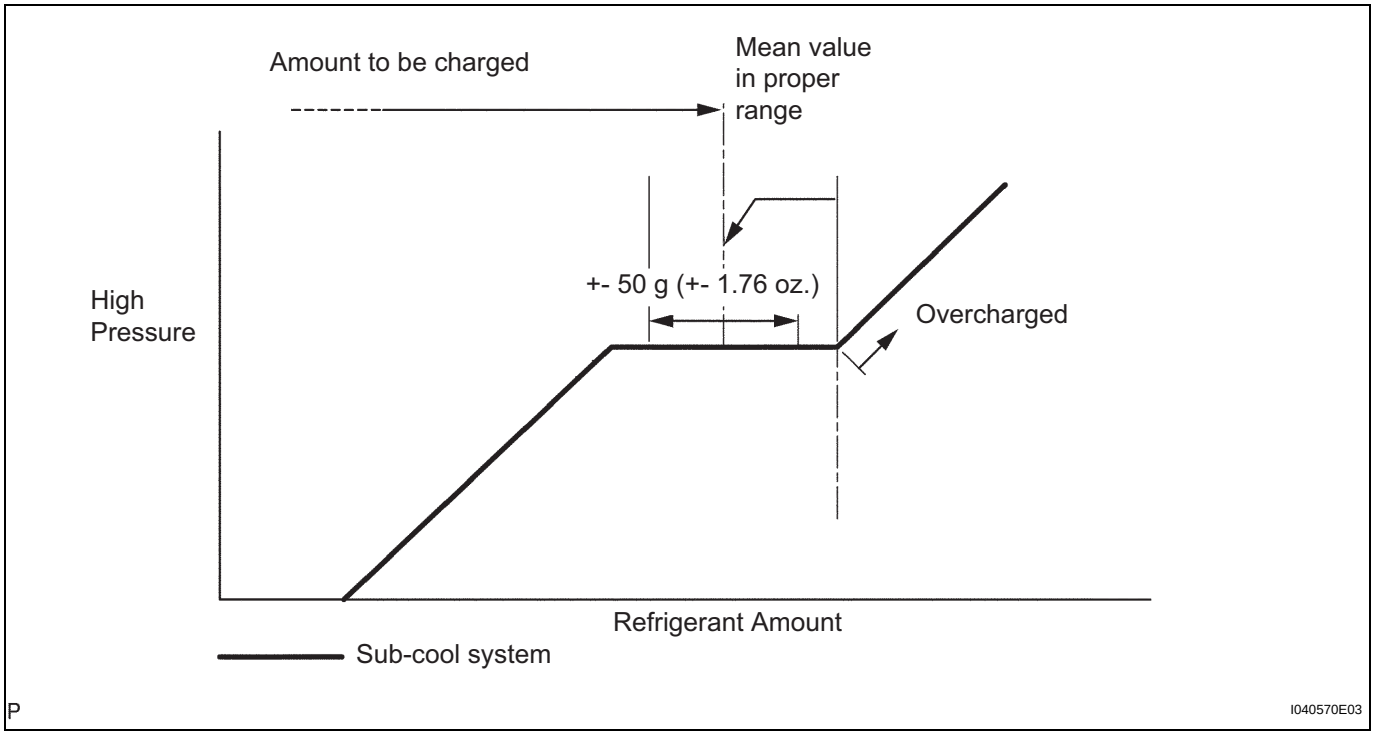
REPLACEMENT

1. DISCHARGE REFRIGERANT FROM REFRIGERATION SYSTEM

(a) Start up the engine.
(b) Turn the A/C switch to ON.
(c) Operate the cooler compressor with an engine speed of approximately 1,000 rpm for 5 to 6 minutes to circulate the refrigerant and collect the compressor oil remaining in each component into the cooler compressor.
(d) Stop the engine.
(e) Using SST, let the refrigerant gas out.
SST 07110-58060 (07117-58080, 07117-58090, 07117-78050, 07117-88060, 07117-88070, 07117-88080)

2. CHARGE REFRIGERANT

(a) Perform vacuum purging using a vacuum pump.
(b) Charge refrigerant HFC-134a (R134a).
Standard:
570 to 630 g (20.10 to 22.22 oz.)
SST 07110-58060 (07117-58060, 07117-58070, 07117-58080, 07117-58090, 07117-78050, 07117-88060, 07117-88070, 07117-88080)
NOTICE:
Do not start the engine before charging it with refrigerant as the cooler compressor does not work properly without any refrigerant. This could cause the compressor to overheat.



3. WARM UP ENGINE

NOTICE:

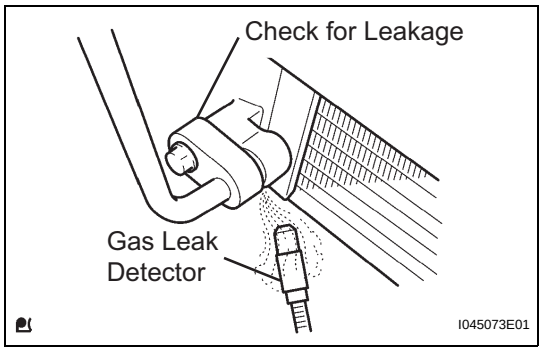
Warm up the engine at less than 2,000 rpm for 2 minutes or more after charging it with refrigerant.

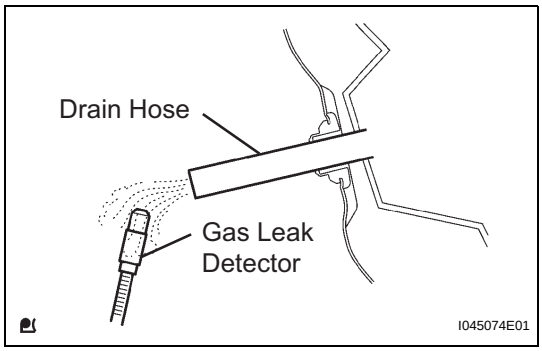
4. CHECK FOR REFRIGERANT LEAKAGE

(a) After recharging the refrigerant gas, check for refrigerant gas leakage using a halogen leak detector.

(b) Perform the operation under these conditions:
- Stop the engine.
- Secure good ventilation (the gas leak detector may react to volatile gases other than refrigerant, such as evaporated gasoline or exhaust gas).
- Repeat the test 2 or 3 times.
- Make sure that some refrigerant remains in the refrigeration system.
  When compressor is off: approximately 392 to 588 kPa (4 to 6 kgf/cm^2, 57 to 85 psi)

(c) Using a gas leak detector, check the refrigerant line for leakage.





(d) Bring the gas leak detector close to the drain hose with the detector power off.
HINT:
- After the blower motor has stopped, leave the cooling unit for more than 15 minutes.
- Place the gas leak detector sensor under the drain hose.
- When bringing the gas leak detector close to the drain hose, make sure that the gas leak detector does not react to the volatile gases.

If such reaction is unavoidable, the vehicle must be lifted up.

(e) If a gas leak is not detected from the drain hose, remove the blower motor control from the cooling unit. Insert the gas leak detector sensor into the unit and perform the test.

(f) Disconnect the pressure switch connector and leave it for approximately 20 minutes. Bring the gas leak detector close to the pressure switch and perform the test.

REMOVAL

1. **PRECAUTION**
   RS-1

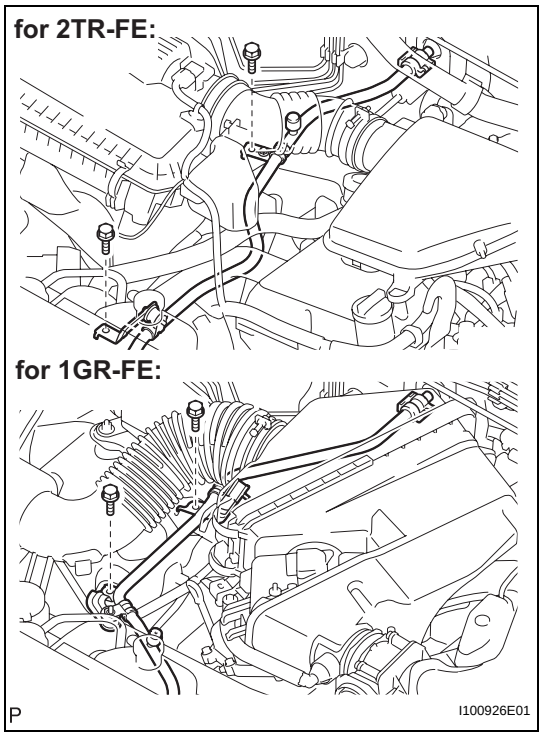
2. **DISCHARGE REFRIGERANT FROM REFRIGERATION SYSTEM (See page AC-18)**

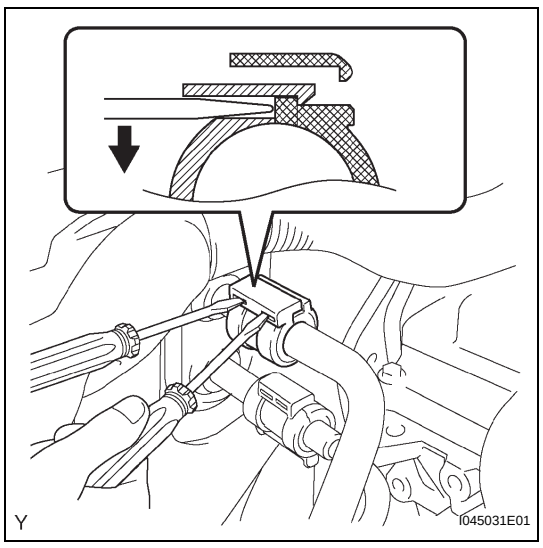
3. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   Wait at least for 90 seconds after disconnecting the cable to prevent the airbag from working.

4. **DRAIN ENGINE COOLANT (for 2TR-FE) (See page CO-3)**

5. **DRAIN ENGINE COOLANT (for 1GR-FE) (See page CO-3)**

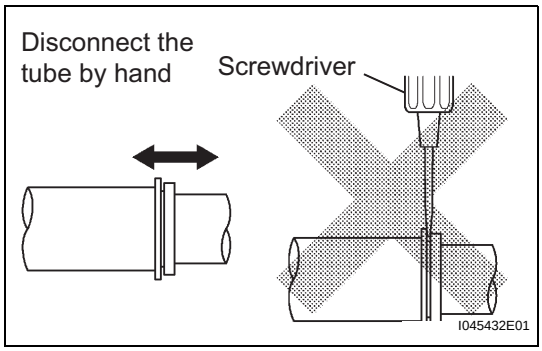
6. **DISCONNECT SUCTION HOSE SUB-ASSEMBLY**
   (a) Remove the 2 bolts and separate the suction hose sub-assembly.





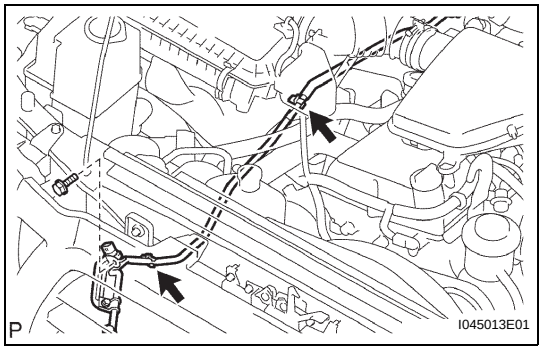
(b) Insert 2 screwdrivers into the 2 piping clamp slots, and while holding them down, disengage the piping clamp claws and the piping clamp.

AC



(c) Disconnect the suction hose sub-assembly.
NOTICE:
- **Do not use a screwdriver or any other tool to disconnect the hose.**
- **Seal the openings of the disconnected parts using vinyl tape to prevent moisture and foreign matter from entering.**

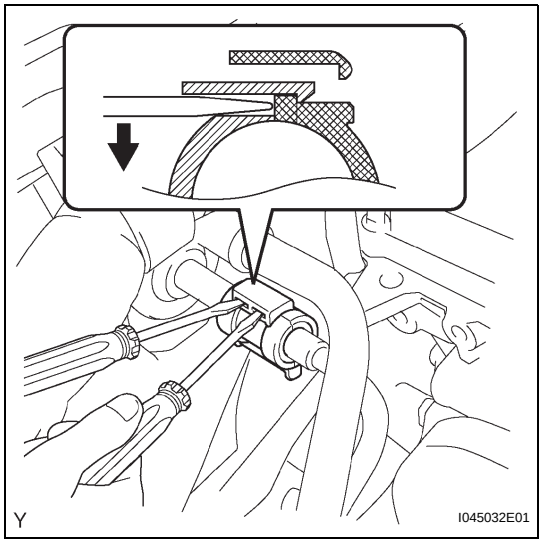
(d) Remove the 2 O-rings from the suction hose sub-assembly.



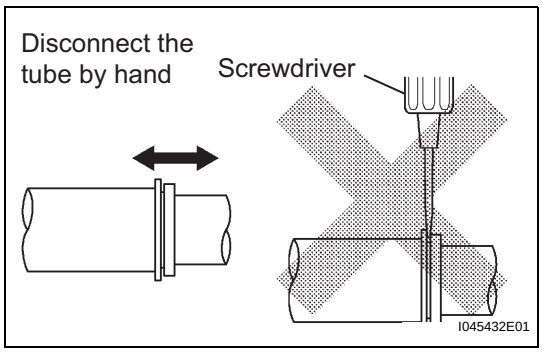
7. DISCONNECT AIR CONDITIONING TUBE ASSEMBLY

(a) Remove the bolt.

(b) Disengage the 2 clamps and separate the air conditioning tube assembly.



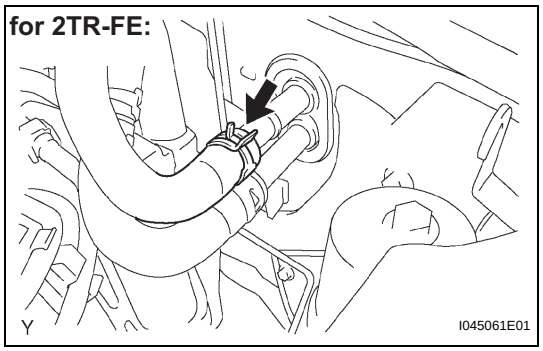
(c) Insert 2 screwdrivers into the 2 piping clamp slots, and while holding them down, disengage the piping clamp claws and the piping clamp.



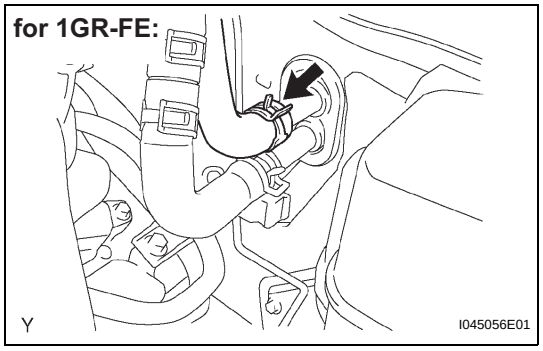
(d) Disconnect the air conditioner tube.
NOTICE:
- **Do not use a screwdriver or any other tool to disconnect the tube.**
- **Seal the openings of the disconnected parts using vinyl tape to prevent moisture and foreign matter from entering.**

(e) Remove the 2 O-rings from the air conditioner tube.

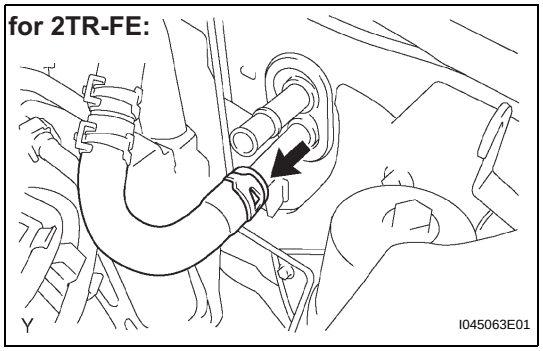
AC



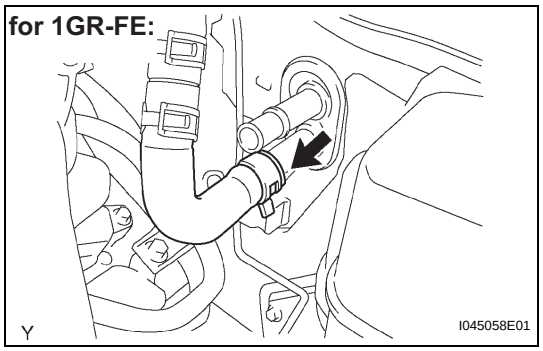
8. **DISCONNECT HEATER WATER INLET HOSE (for 2TR-FE)**
   (a) Using pliers, grip the claws of the clip, slide the clip and disconnect the heater water inlet hose from the heater unit.



9. **DISCONNECT HEATER WATER INLET HOSE (for 1GR-FE)**
   (a) Using pliers, grip the claws of the clip, slide the clip and disconnect the heater water inlet hose from the heater unit.



10. **DISCONNECT HEATER WATER OUTLET HOSE (for 2TR-FE)**
    (a) Using pliers, grip the claws of the clip, slide the clip and disconnect the heater water outlet hose from the heater unit.



11. **DISCONNECT HEATER WATER OUTLET HOSE (for 1GR-FE)**
    (a) Using pliers, grip the claws of the clip, slide the clip and disconnect the heater water outlet hose from the heater unit.

12. **REMOVE FRONT WIPER ARM HEAD CAP (See page WW-7)**

13. **REMOVE FRONT WIPER ARM LH (See page WW-8)**

14. **REMOVE FRONT WIPER ARM RH (See page WW-8)**

15. **REMOVE FRONT FENDER TO COWL SIDE SEAL LH (See page WW-8)**

16. **REMOVE FRONT FENDER TO COWL SIDE SEAL RH (See page WW-8)**

17. **REMOVE COWL TOP VENTILATOR LOUVER SUB-ASSEMBLY (See page WW-8)**

18. **PLACE FRONT WHEELS FACING STRAIGHT AHEAD**

19. **REMOVE LOWER NO. 2 STEERING WHEEL COVER (See page RS-558)**

20. **REMOVE LOWER NO. 3 STEERING WHEEL COVER (See page RS-558)**
21. **REMOVE HORN BUTTON ASSEMBLY (See page RS-558)**
22. **REMOVE STEERING WHEEL ASSEMBLY (See page SR-9)**
23. **REMOVE STEERING COLUMN COVER LOWER (See page SR-9)**
24. **REMOVE STEERING COLUMN COVER UPPER (See page SR-10)**
25. **REMOVE SPIRAL CABLE SUB-ASSEMBLY (See page RS-566)**
26. **REMOVE WINDSHIELD WIPER SWITCH ASSEMBLY (See page WW-17)**
27. **REMOVE FRONT FLOOR FOOTREST (See page IR-1)**
28. **REMOVE FRONT DOOR SCUFF PLATE LH (for Regular Cab) (See page IR-40)**
29. **REMOVE FRONT DOOR SCUFF PLATE LH (for Access Cab) (See page IR-61)**
30. **REMOVE FRONT DOOR SCUFF PLATE LH (for Double Cab) (See page IR-12)**
31. **REMOVE FRONT DOOR SCUFF PLATE RH (for Regular Cab) (See page IR-41)**
32. **REMOVE FRONT DOOR SCUFF PLATE RH (for Access Cab) (See page IR-61)**
33. **REMOVE FRONT DOOR SCUFF PLATE RH (for Double Cab) (See page IR-12)**
34. **REMOVE COWL SIDE TRIM BOARD LH (for Regular Cab) (See page IR-40)**
35. **REMOVE COWL SIDE TRIM BOARD LH (for Access Cab) (See page IR-61)**
36. **REMOVE COWL SIDE TRIM BOARD LH (for Double Cab) (See page IR-12)**
37. **REMOVE COWL SIDE TRIM BOARD RH (for Regular Cab) (See page IR-40)**
38. **REMOVE COWL SIDE TRIM BOARD RH (for Access Cab) (See page IR-61)**
39. **REMOVE COWL SIDE TRIM BOARD RH (for Double Cab) (See page IR-12)**
40. **SEPARATE FRONT DOOR OPENING TRIM WEATHERSTRIP LH**
    (a) Separate the front door opening trim weatherstrip LH.

AC

41. **SEPARATE FRONT DOOR OPENING TRIM WEATHERSTRIP RH**
    (a) Separate the front door opening trim weatherstrip RH.
42. **REMOVE FRONT PILLAR GARNISH LH (for Regular Cab) (See page IR-41)**
43. **REMOVE FRONT PILLAR GARNISH LH (for Access Cab) (See page IR-62)**
44. **REMOVE FRONT PILLAR GARNISH LH (for Double Cab) (See page IR-13)**
45. **REMOVE FRONT PILLAR GARNISH RH (for Regular Cab) (See page IR-41)**
46. **REMOVE FRONT PILLAR GARNISH RH (for Access Cab) (See page IR-63)**
47. **REMOVE FRONT PILLAR GARNISH RH (for Double Cab) (See page IR-14)**
48. **REMOVE INSTRUMENT PANEL UNDER TRAY (for Pedal Type Parking Brake) (See page IP-9)**
49. **REMOVE INSTRUMENT PANEL HOLE COVER (for Lever Type Parking Brake) (See page IP-9)**
50. **REMOVE CONSOLE UPPER REAR PANEL SUB-ASSEMBLY (for Automatic Transmission on Separate Seat Type) (See page IP-9)**
51. **REMOVE CONSOLE UPPER REAR PANEL SUB-ASSEMBLY (for Manual Transmission on Separate Seat Type) (See page IP-9)**
52. **REMOVE REAR CONSOLE BOX ASSEMBLY (for Separate Seat Type) (See page IP-10)**
53. **REMOVE INSTRUMENT PANEL CUP HOLDER TRAY (for Automatic Transmission on Separate Seat Type) (See page IP-10)**
54. **REMOVE FRONT CONSOLE BOX (for Automatic Transmission on Separate Seat Type) (See page IP-10)**
55. **REMOVE FRONT CONSOLE BOX (for Manual Transmission on Separate Seat Type) (See page IP-11)**
56. **REMOVE FRONT CONSOLE BOX (for Automatic Transmission on Bench Seat Type) (See page IP-11)**
57. **REMOVE FRONT CONSOLE BOX (for Manual Transmission on Bench Seat Type) (See page IP-11)**
58. **REMOVE AIR CONDITIONING CONTROL ASSEMBLY (See page IP-12)**
59. **REMOVE RADIO RECEIVER ASSEMBLY (See page AV-69)**

60. **SEPARATE HOOD LOCK CONTROL LEVER SUB-ASSEMBLY (See page ED-3)**

61. **REMOVE LOWER NO. 1 INSTRUMENT PANEL FINISH PANEL (See page IP-12)**

62. **REMOVE INSTRUMENT CLUSTER FINISH PANEL SUB-ASSEMBLY (See page IP-12)**

63. **REMOVE COMBINATION METER ASSEMBLY (See page IP-13)**

64. **REMOVE INSTRUMENT CLUSTER CENTER FINISH PANEL SUB-ASSEMBLY (See page IP-13)**

65. **REMOVE GLOVE COMPARTMENT DOOR ASSEMBLY (See page IP-13)**

66. **REMOVE LOWER INSTRUMENT PANEL FINISH PANEL SUB-ASSEMBLY RH (See page IP-13)**

67. **REMOVE LOWER INSTRUMENT PANEL LH (See page IP-14)**

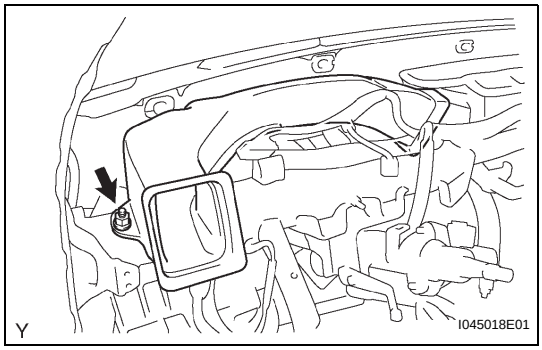
68. **REMOVE INSTRUMENT LOWER COVER SUB-ASSEMBLY (See page IP-14)**

69. **REMOVE INSTRUMENT SIDE PANEL RH (See page IP-14)**

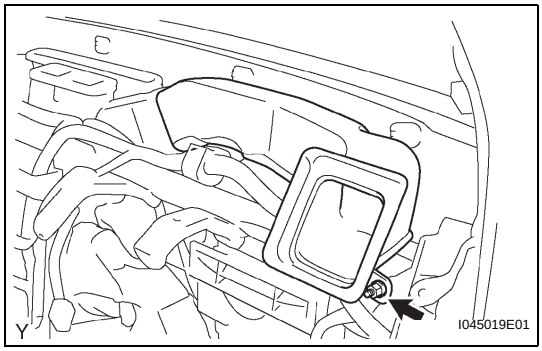
70. **DISCONNECT PASSENGER AIRBAG CONNECTOR (See page RS-576)**

71. **REMOVE INSTRUMENT PANEL SUB-ASSEMBLY W/ PASSENGER AIRBAG ASSEMBLY (See page IP-14)**

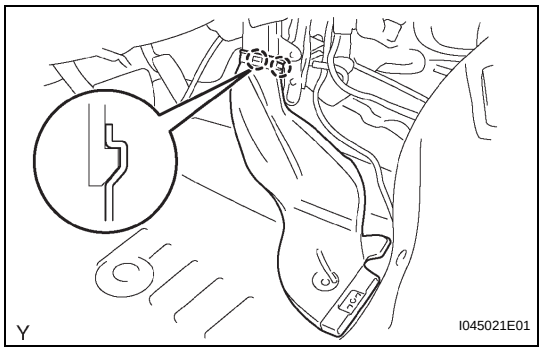
72. **REMOVE NO. 1 HEATER TO REGISTER DUCT**
    (a) Remove the nut and heater to register duct.



73. **REMOVE NO. 3 HEATER TO REGISTER DUCT**
    (a) Remove the nut and heater to register duct.



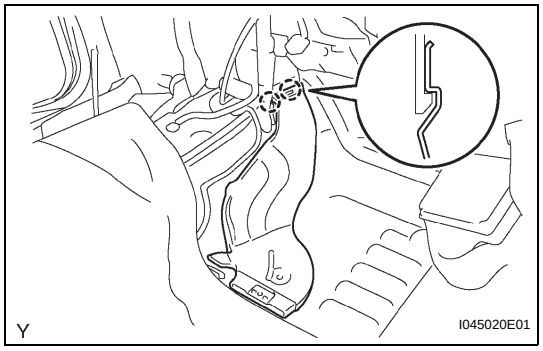
AC



74. REMOVE NO. 2 REAR AIR DUCT (for Double Cab)

(a) Fold back the floor carpet.

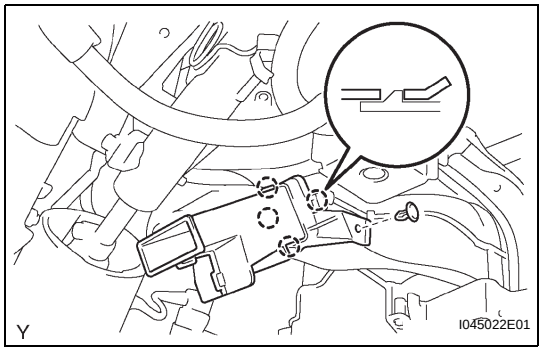
(b) Disengage the 2 claws and remove the air duct rear.



75. REMOVE NO. 1 REAR AIR DUCT (for Double Cab)

(a) Fold back the floor carpet.

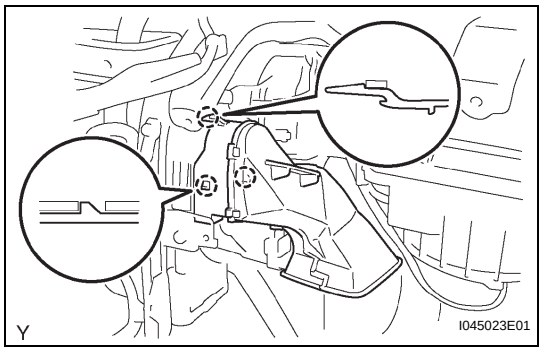
(b) Disengage the 2 claws and remove the air duct rear.



76. REMOVE AIR DUCT ASSEMBLY LH

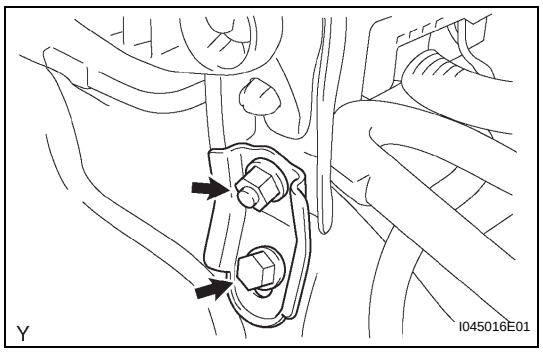
(a) Remove the clip.

(b) Disengage the 4 claws and remove the air duct assembly heater.



77. REMOVE AIR DUCT ASSEMBLY RH

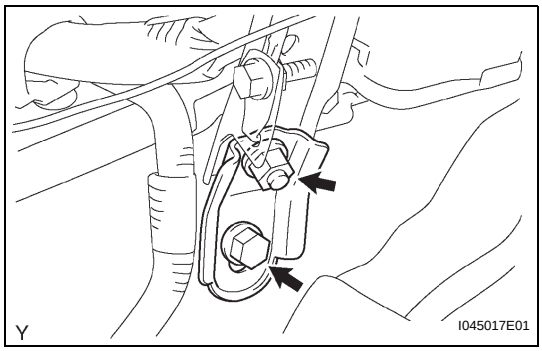
(a) Disengage the 3 claws and remove the air duct assembly.



78. REMOVE NO. 1 INSTRUMENT PANEL BRACE MOUNTING BRACKET

(a) Remove the bolt, nut and instrument panel brace mounting bracket LH.

AC



(b) Remove the bolt, nut and instrument panel brace mounting bracket RH.

79. REMOVE STEERING COLUMN HOLE COVER (See page SR-10)

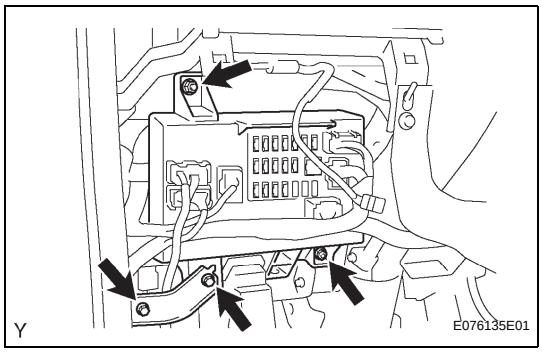
80. SEPARATE STEERING SLIDING YOKE (See page SR-11)

81. REMOVE STEERING COLUMN ASSEMBLY (See page SR-11)

82. REMOVE PARKING BRAKE CONTROL LEVER ASSEMBLY (for Lever Type Parking Brake) (See page PB-6)

83. REMOVE ECM (for 2TR-FE) (See page ES-467)

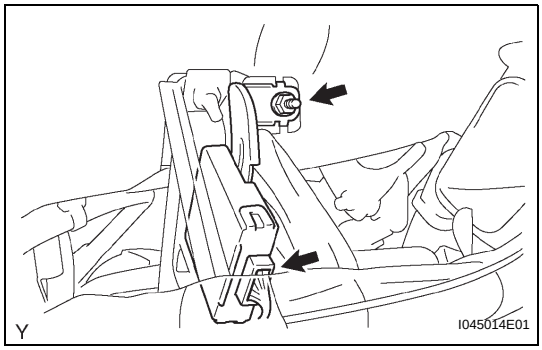
84. REMOVE ECM (for 1GR-FE) (See page ES-428)



85. SEPARATE DRIVER SIDE JUNCTION BLOCK

(a) Remove the 2 bolts and bracket.

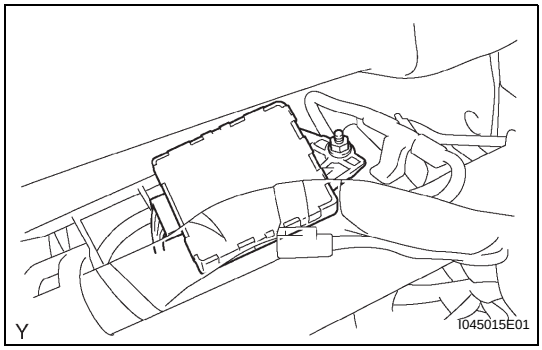
(b) Remove the 2 nuts and separate the driver side junction block assembly.



86. REMOVE TRANSPONDER KEY ECU ASSEMBLY

(a) Disconnect the connector.

(b) Remove the nut and the transponder key ECU assembly.



87. REMOVE AIR CONDITIONER AMPLIFIER ASSEMBLY

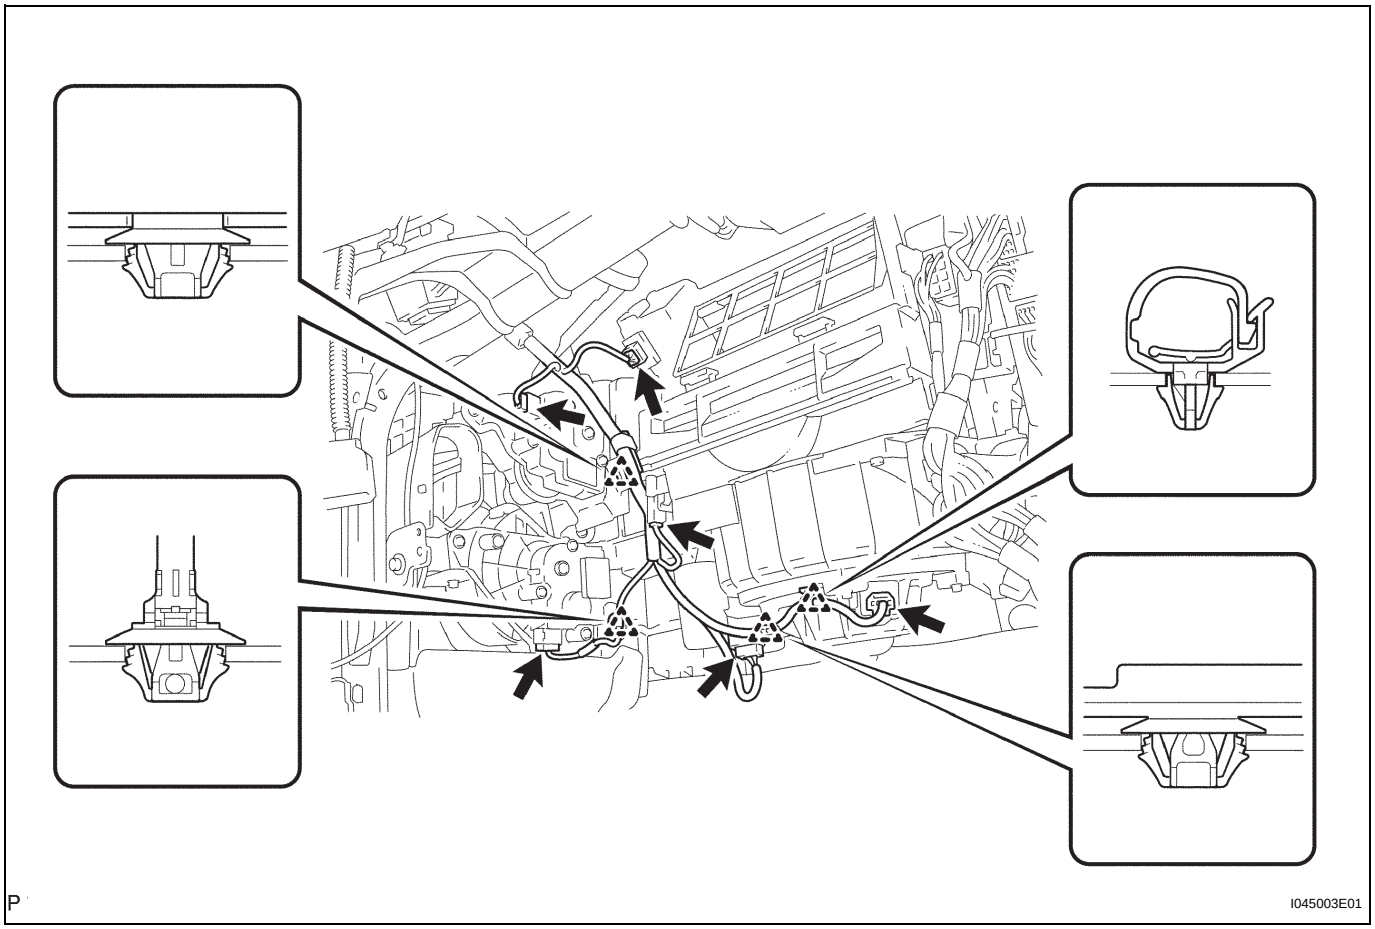
(a) Disconnect the connector.

(b) Remove the nut and the air conditioner amplifier assembly.

AC

88. REMOVE AIR CONDITIONING UNIT ASSEMBLY

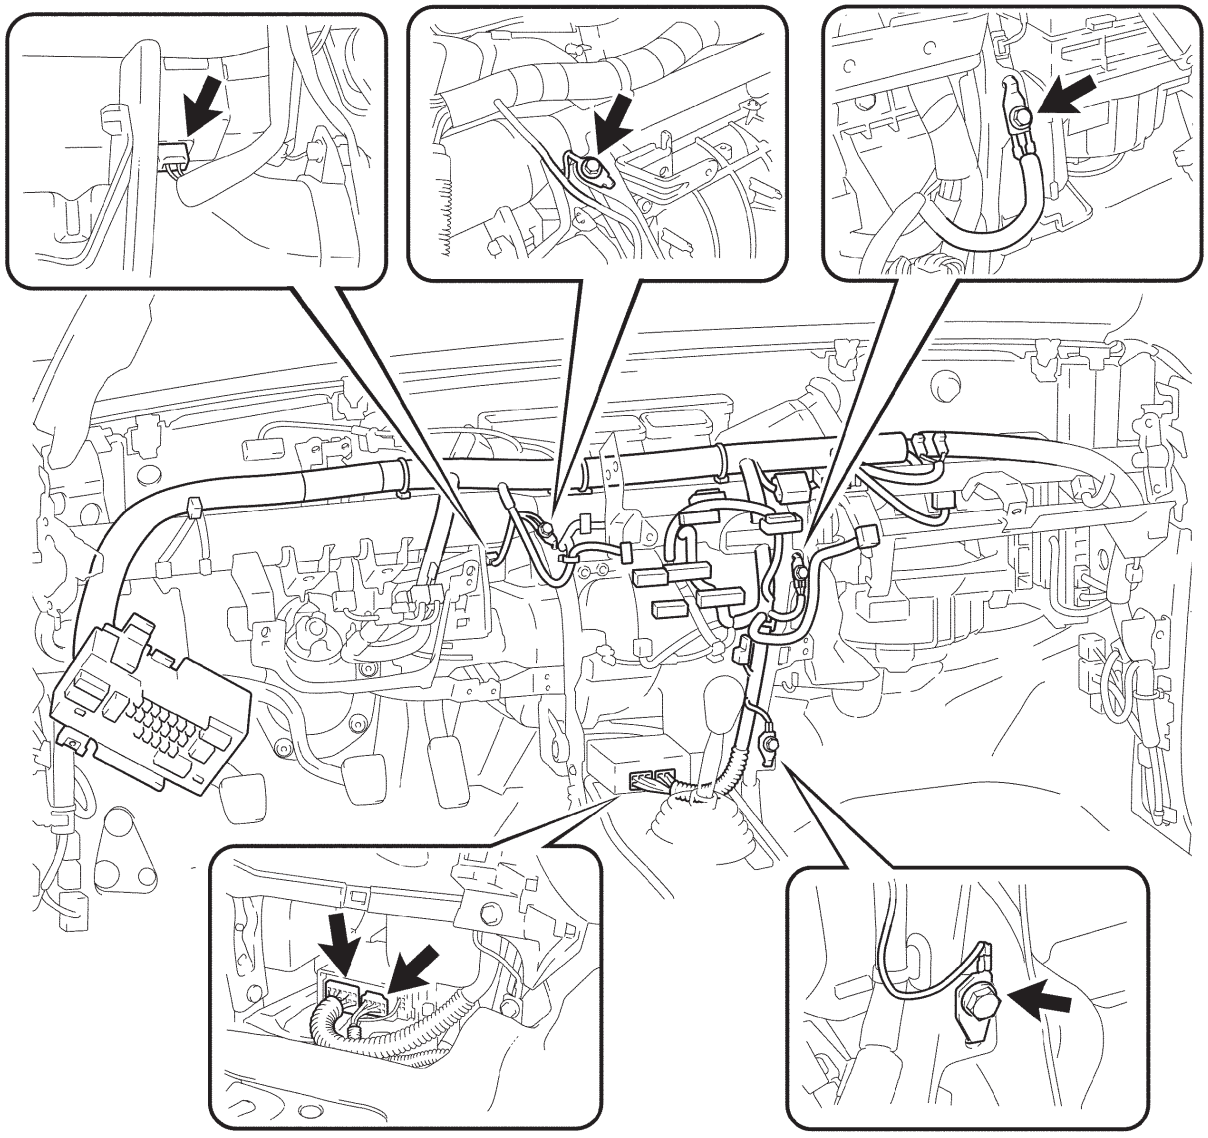
(a) Disengage the 4 clamps and disconnect the 6 connectors from the air conditioning unit assembly.



(b) Remove the 3 bolts.

(c) Disconnect the connector.

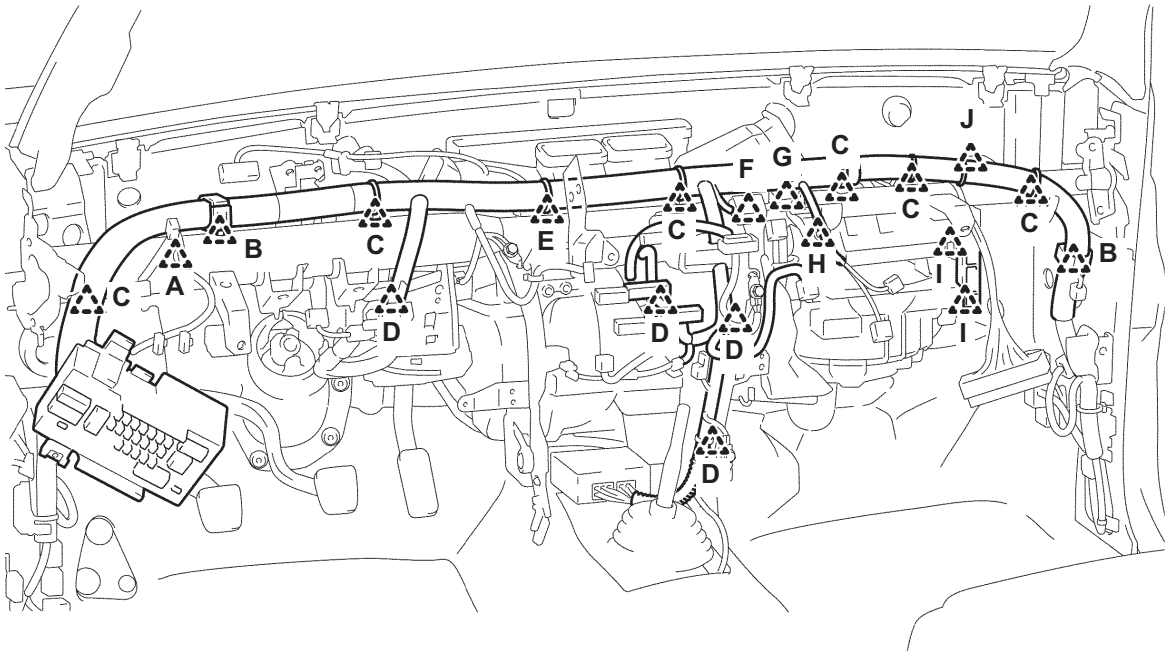
(d) Disconnect the 2 airbag connectors (see page 60-6).



P

I045002E01

(e) Disengage the 20 clamps.



Type A: 	**Type B:** 	**Type C:** 	**Type D:** Type E: 	**Type F:** 	**Type G:** 	**Type H:** Type I: 	**Type J:** 		

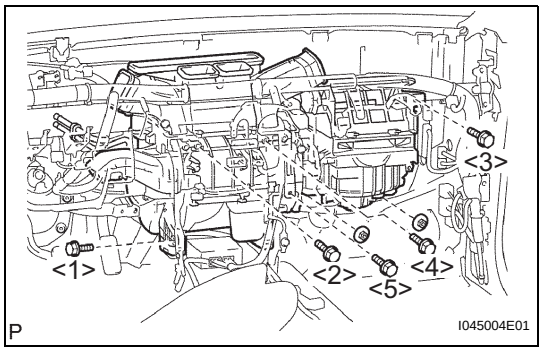
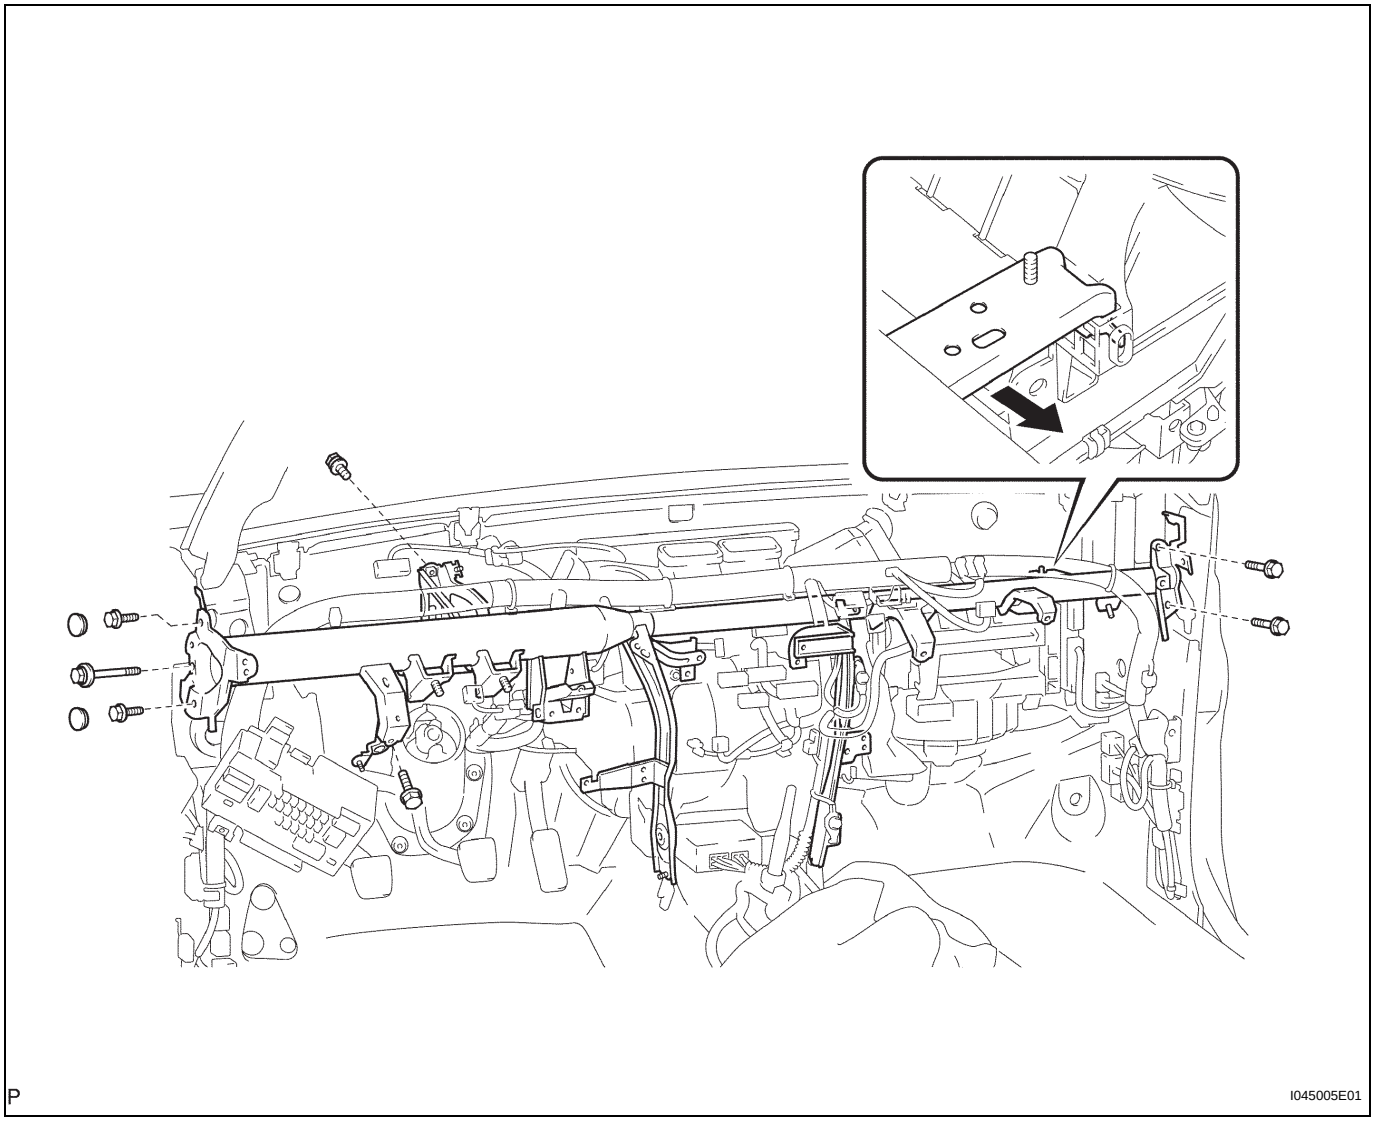
P

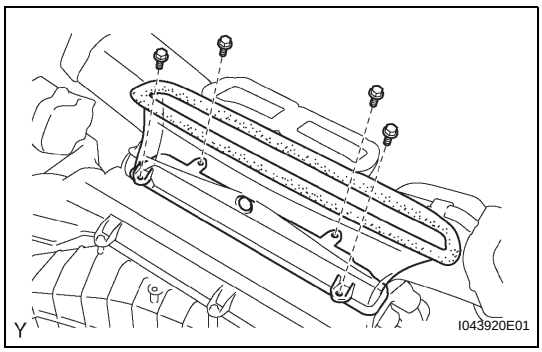
I045001E01

AC



(f) Remove the 5 bolts and 2 nuts.
(g) Remove the 2 caps and 7 bolts.
(h) Disengage the reinforcement hook of the air conditioning unit, and remove the reinforcement.
(i) Remove the air conditioner unit assembly.

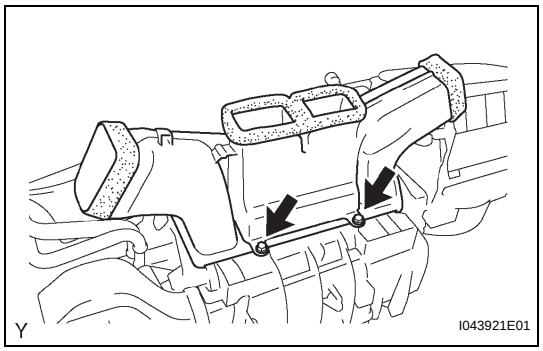




DISASSEMBLY

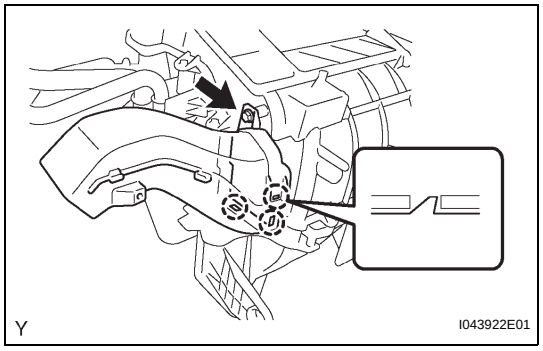
1. REMOVE DEFROSTER NOZZLE ASSEMBLY LOWER

(a) Remove the 4 bolts and the defroster nozzle assembly lower.



2. REMOVE HEATER TO REGISTER CENTER DUCT

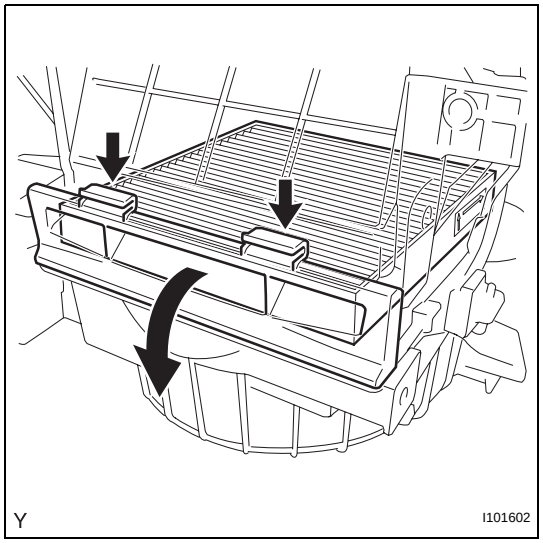
(a) Remove the 2 bolts and heater to register duct center.



3. REMOVE NO. 1 AIR DUCT

(a) Remove the bolt.

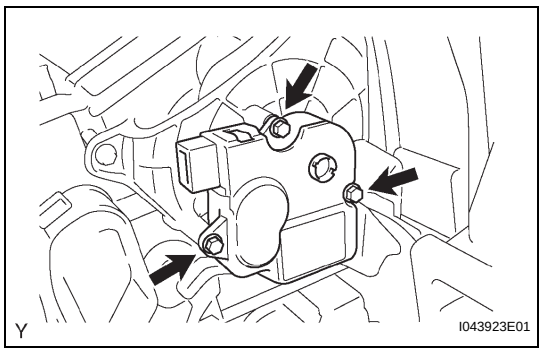
(b) Disengage the 3 claws and remove the air duct.



4. REMOVE AIR FILTER

(a) Push down on the 2 tabs and open the filter door.

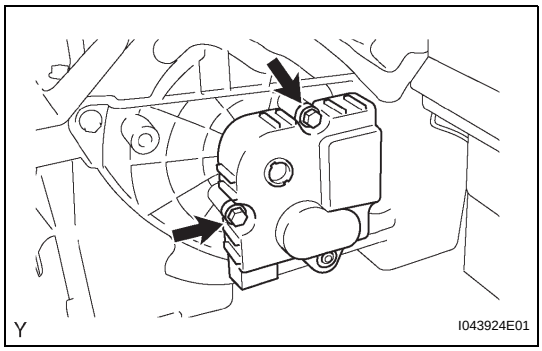
(b) Remove the air filter.



5. REMOVE MODE CONTROL SERVO MOTOR

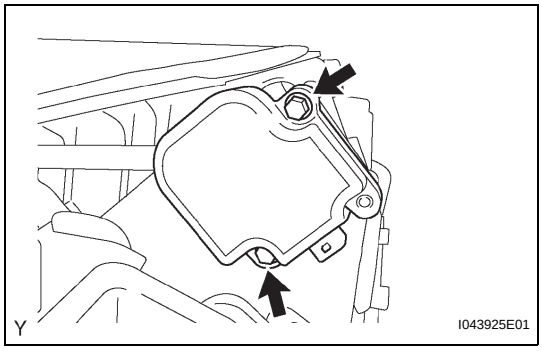
(a) Remove the 3 bolts and mode control servo motor.

AC



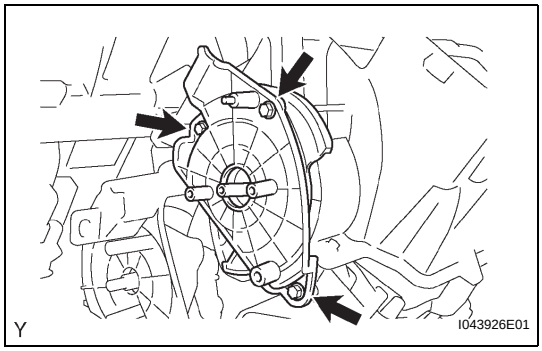
6. REMOVE AIR MIX CONTROL SERVO MOTOR

(a) Remove the 2 bolts and air mix control servo motor.



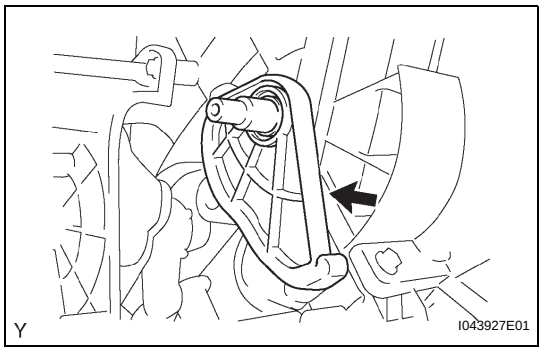
7. REMOVE AIR INLET CONTROL SERVO MOTOR

(a) Remove the 2 bolts and air inlet control servo motor.

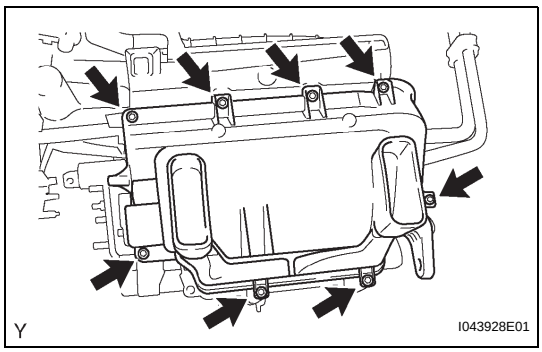


8. REMOVE HEATER RADIATOR ASSEMBLY

(a) Remove the 3 bolts and temperature mounting plate.

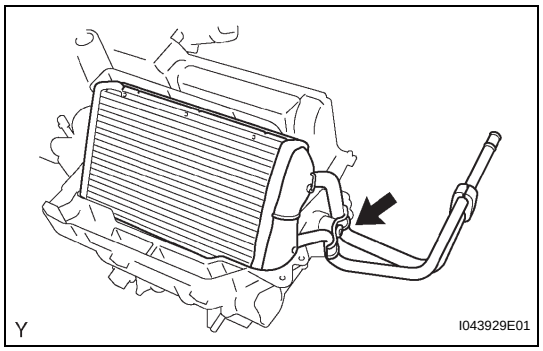


(b) Remove the temperature cam.

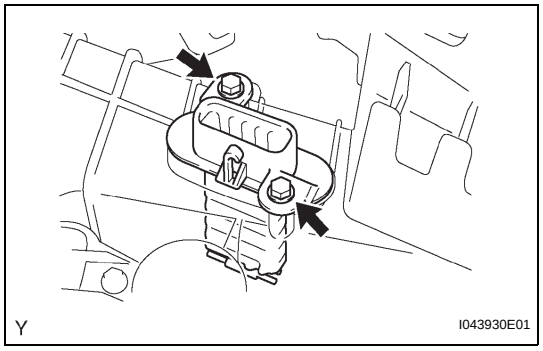


(c) Remove the 8 bolts and heater cover case.

AC

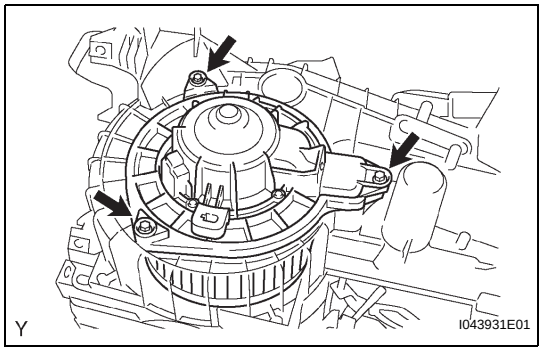


(d) Using "Torx" socket wrench T30, remove the bolt, clamp and heater radiator assembly.



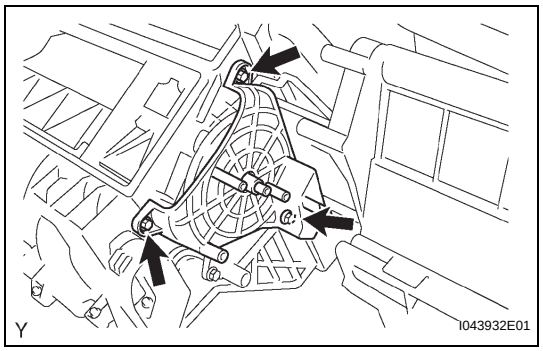
9. REMOVE BLOWER RESISTOR

(a) Remove the 2 bolts and blower resistor.



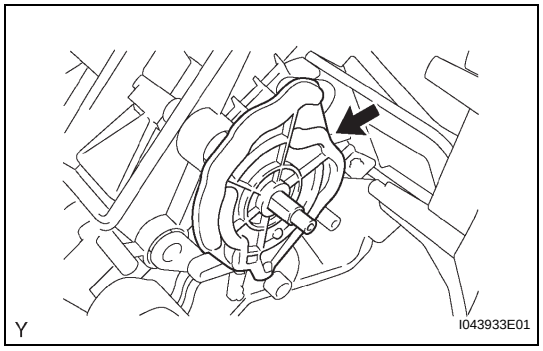
10. REMOVE BLOWER MOTOR

(a) Remove the 3 bolts and blower motor.



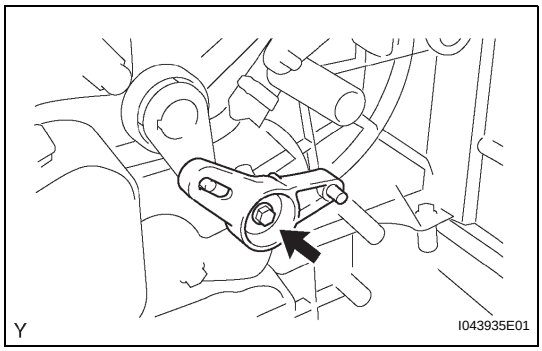
11. REMOVE EVAPORATOR CORE

(a) Remove the 3 bolts and mode mounting plate.

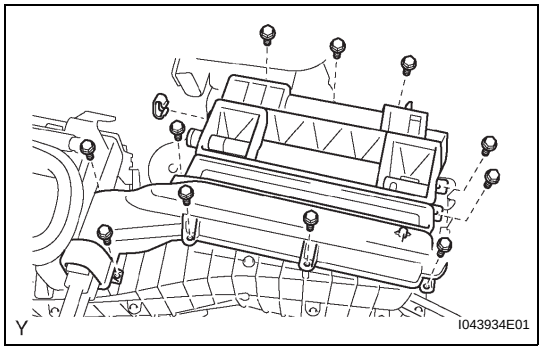


(b) Remove the mode cam.

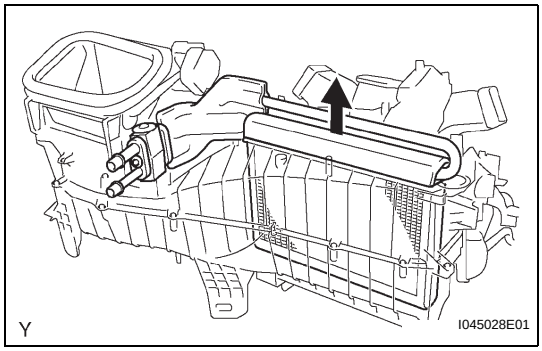
AC



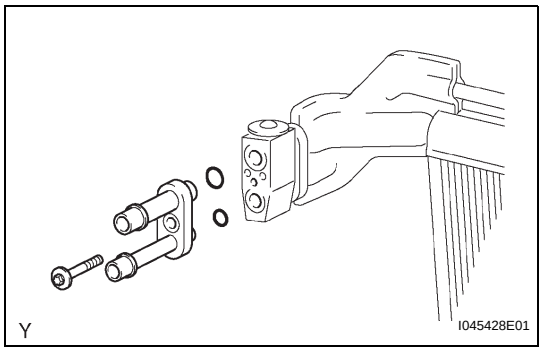
(c) Remove the bolt and heater pivot.



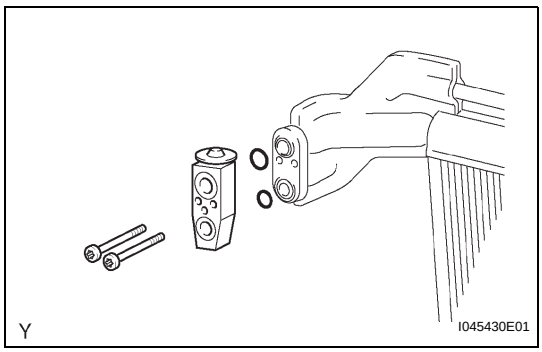
(d) Disengage the clip and remove the 11 bolts and mode case.



(e) Remove the evaporator core.
HINT:
If a new evaporator is installed, add compressor oil to the evaporator as follows.
Compressor oil:
RL-897 or equivalent
Add 40 cc (1.4 fl.oz.)

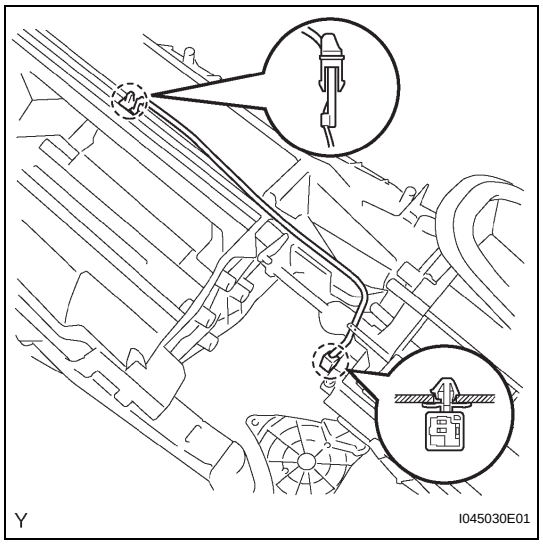


12. REMOVE VALVE TO CONNECTOR TUBE
(a) Using "Torx" socket wrench E10, remove the bolt and valve to connector tube.
(b) Remove the 2 seal washers from the air conditioning tube assembly.



13. REMOVE EXPANSION VALVE
(a) Using "Torx" socket wrench T25, remove the 2 bolts and expansion valve.
(b) Remove the 2 seal washers from the expansion valve.

AC



14. REMOVE COOLER THERMISTOR SENSOR

(a) Disengage the 2 clamps and remove the cooler thermistor sensor.

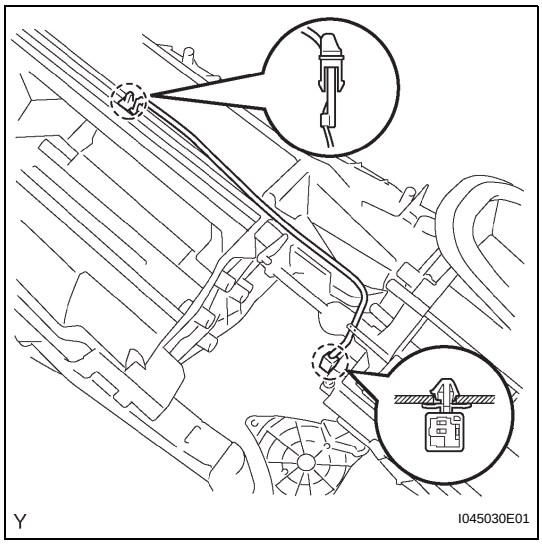
15. REMOVE NO. 1 COOLER UNIT DRAIN HOSE

REASSEMBLY

1. INSTALL NO. 1 COOLER UNIT DRAIN HOSE

2. INSTALL COOLER THERMISTOR SENSOR

(a) Engage the 2 clamps and install the cooler thermistor sensor.

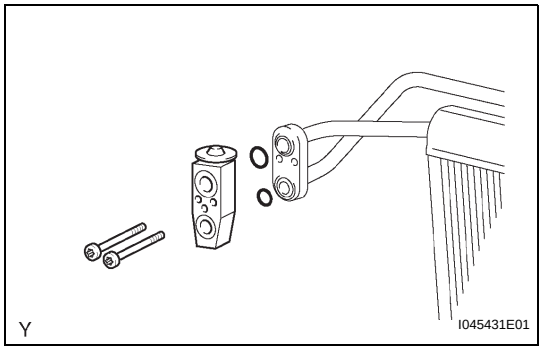


3. INSTALL EXPANSION VALVE

(a) Apply sufficient compressor oil to 2 new seal washers and the fitting surface of the expansion valve.
Compressor oil:
RL-897 or equivalent

(b) Install the 2 seal washers onto the expansion valve.

(c) Using "Torx" socket wrench T25, install the expansion valve with the 2 bolts.
Torque: 7.0 N*m (71 kgf*cm, 62 in.*lbf)

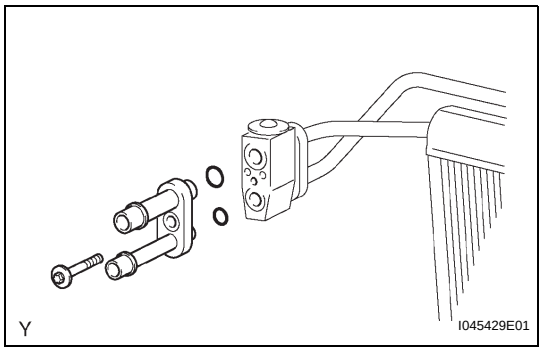


4. INSTALL VALVE TO CONNECTOR TUBE

(a) Apply sufficient compressor oil to 2 new seal washers and fitting surface of the valve to connector tube.
Compressor oil:
RL-897 or equivalent

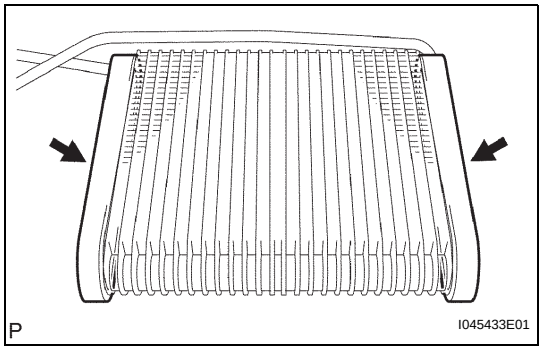
(b) Install the 2 seal washers onto the valve to connector tube.

(c) Using "Torx" socket wrench E10, install the air conditioning tube assembly with the bolt.
Torque: 25 N*m (255 kgf*cm, 18 ft.*lbf)

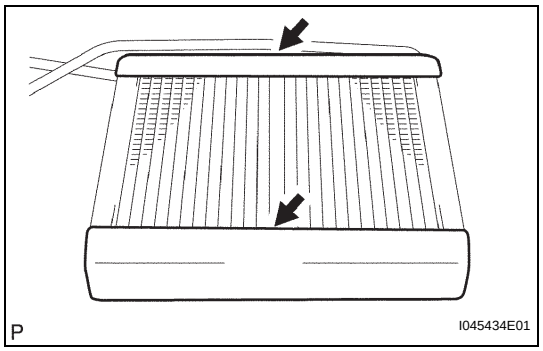


5. INSTALL EVAPORATOR CORE

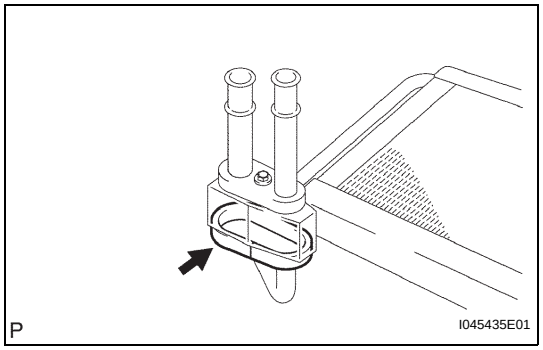
(a) Attach the evaporator side seal to both sides of the evaporator.



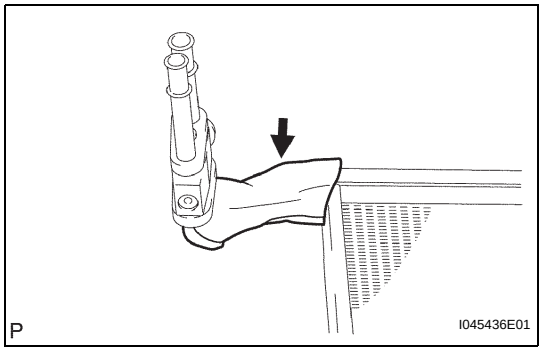
AC



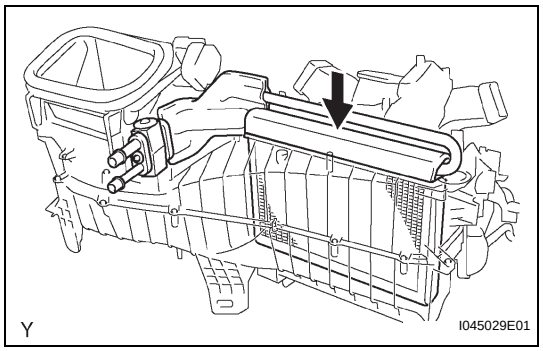
(b) Attach the evaporator top seal to the upper side and the evaporator bottom seal to the lower side of the evaporator.



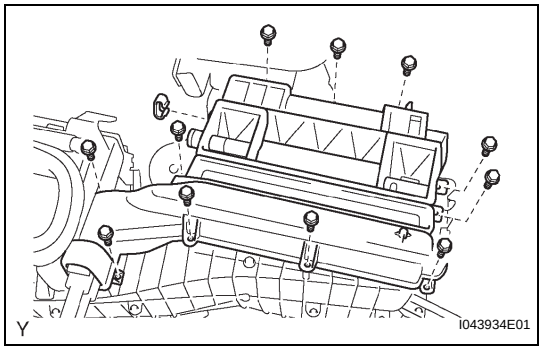
(c) Align and apply the expansion valve seal to the periphery of the expansion valve protrusions on the back side of the expansion valve.



(d) Align and attach the 2 different seals to the evaporator inlet and outlet pipes.

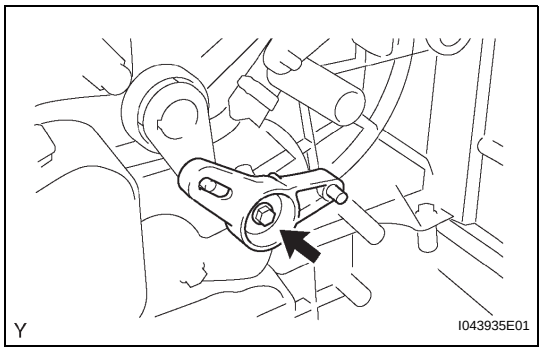


(e) Install the evaporator core.

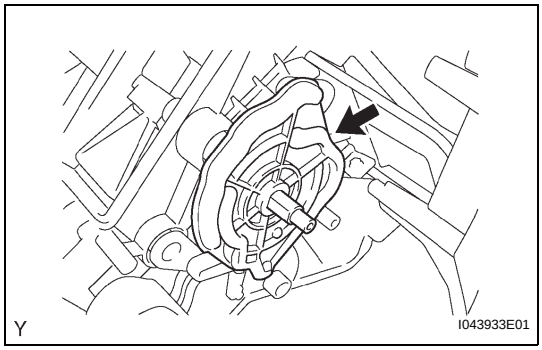


(f) Install the mode case with the clip and 11 bolts.
Torque: 2.0 N*m (20 kgf*cm, 18 in.*lbf)

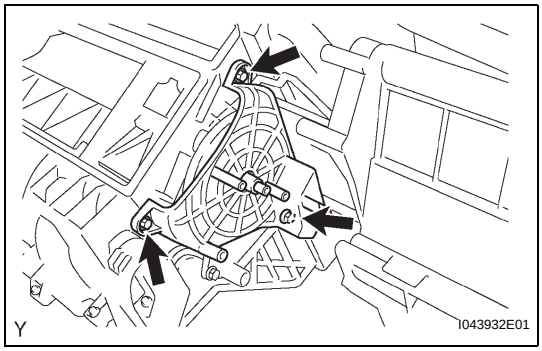
AC



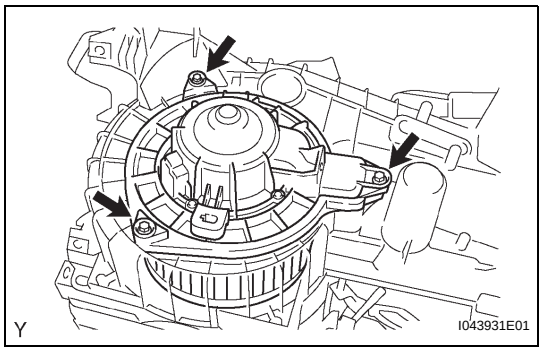
(g) Install the heater pivot with the bolt.
Torque: 2.0 N*m (20 kgf*cm, 18 in.*lbf)



(h) Install the mode cam.

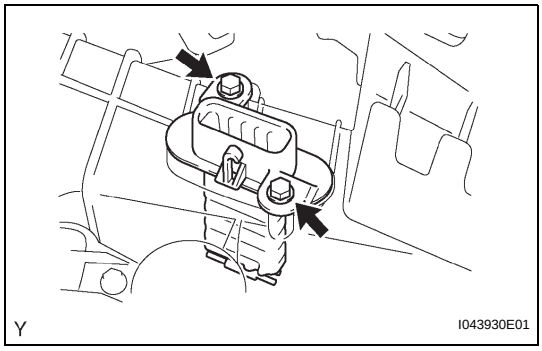


(i) Install the mode mounting plate with the 3 bolts.
Torque: 2.0 N*m (20 kgf*cm, 18 in.*lbf)



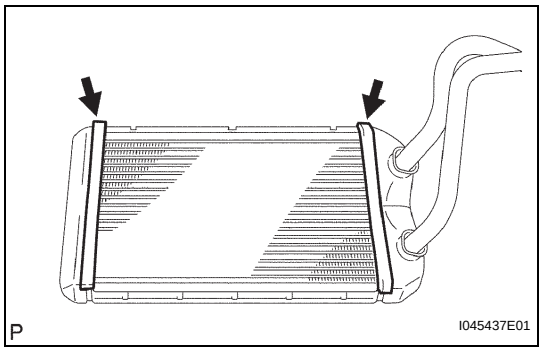
6. INSTALL BLOWER MOTOR

(a) Install the blower motor with the 3 bolts.
Torque: 2.0 N*m (20 kgf*cm, 18 in.*lbf)



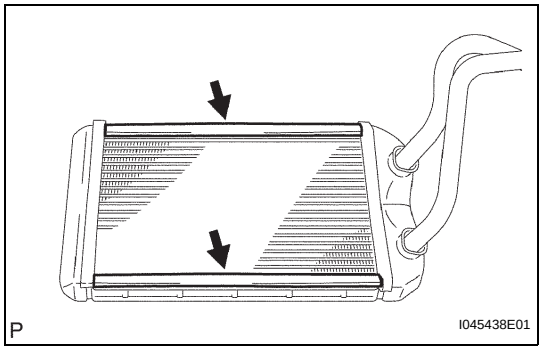
7. INSTALL BLOWER RESISTOR

(a) Install the blower resistor with the 2 bolts.
Torque: 2.0 N*m (20 kgf*cm, 18 in.*lbf)

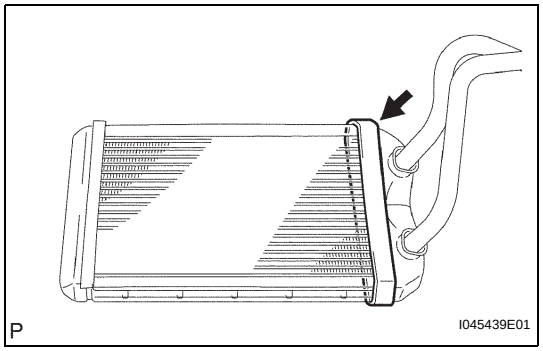


8. INSTALL HEATER RADIATOR ASSEMBLY

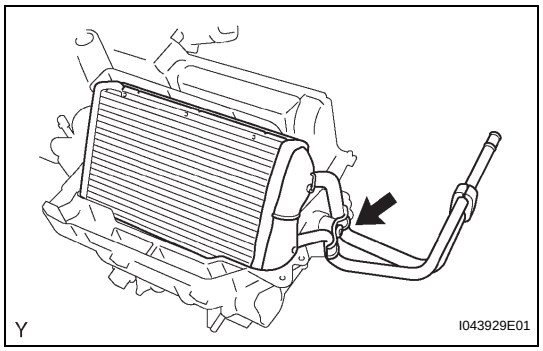
(a) Apply the heater core short seal to both sides of the heater core.



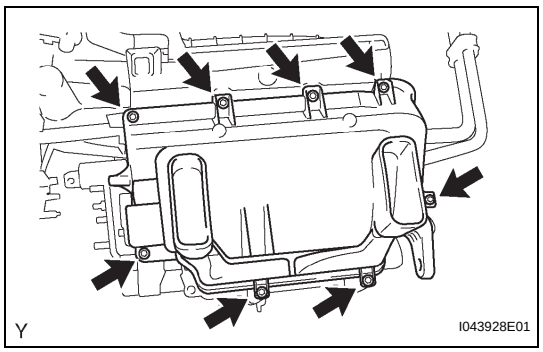
(b) Apply the heater core long seal to the upper and lower sides of the heater core.



(c) Apply the heater core header seal to the right side of the heater core.

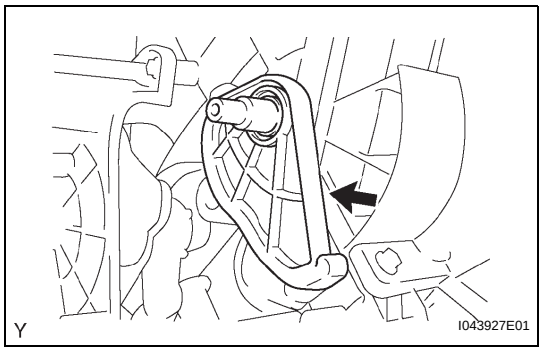


(d) Using "Torx" socket wrench T30, install the heater radiator assembly with the bolt and clamp.
Torque: 4.0 N*m (41 kgf*cm, 35 in.*lbf)

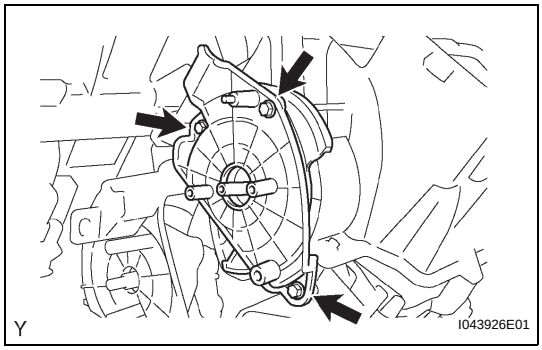


(e) Install the heater cover case with the 8 bolts.
Torque: 2.0 N*m (20 kgf*cm, 18 in.*lbf)

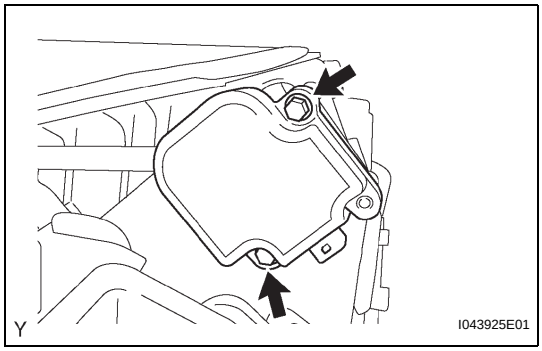
AC



(f) Install the temperature cam.

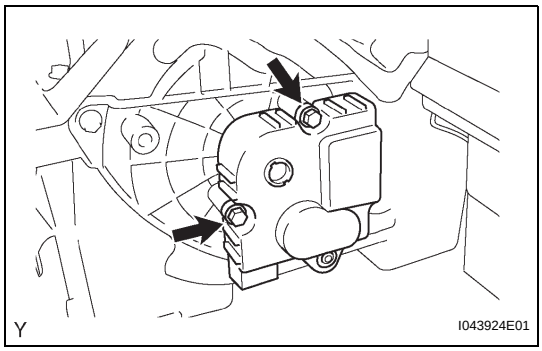


(g) Install the temperature mounting plate with the 3 bolts.
Torque: 2.0 N*m (20 kgf*cm, 18 in.*lbf)



9. INSTALL AIR INLET CONTROL SERVO MOTOR

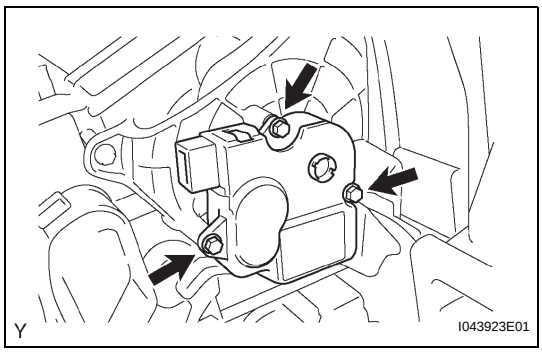
(a) Install the air inlet control servo motor with the 2 bolts.
Torque: 2.0 N*m (20 kgf*cm, 18 in.*lbf)



10. INSTALL AIR MIX CONTROL SERVO MOTOR

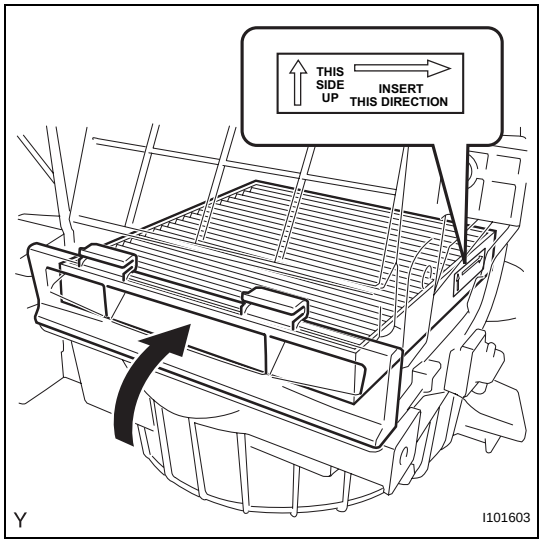
(a) Install the air mix control servo motor with the 2 bolts.
Torque: 2.0 N*m (20 kgf*cm, 18 in.*lbf)

AC



11. INSTALL MODE CONTROL SERVO MOTOR

(a) Install the mode control servo motor with the 3 bolts.
Torque: 2.0 N*m (20 kgf*cm, 18 in.*lbf)



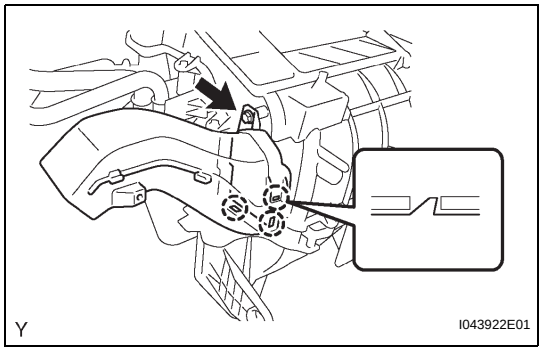
12. INSTALL AIR FILTER

(a) Install the air filter.

NOTICE:

Check the installation direction as shown and install the air filter.

(b) Engage the 2 tabs and close the filter door.

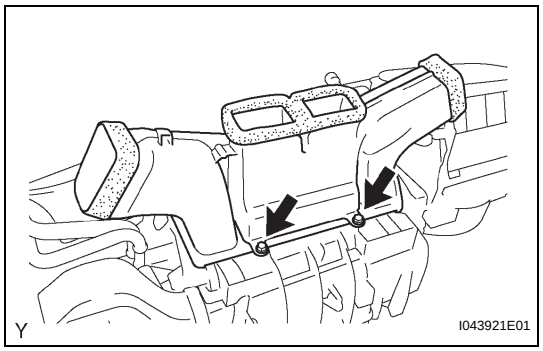


13. INSTALL NO. 1 AIR DUCT

(a) Engage the 3 claws and install the air duct.

(b) Install the bolt.

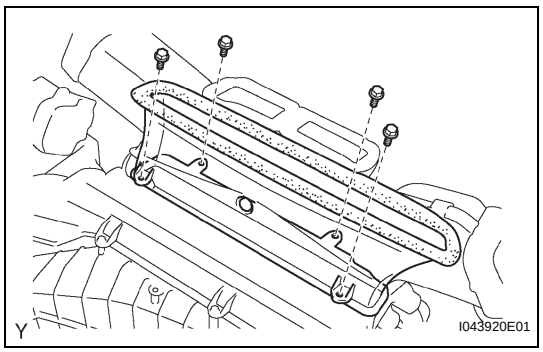
Torque: 2.0 N*m (20 kgf*cm, 18 in.*lbf)



14. INSTALL HEATER TO REGISTER CENTER DUCT

(a) Install the heater to register duct center with the 2 bolts.

Torque: 2.0 N*m (20 kgf*cm, 18 in.*lbf)



15. INSTALL DEFROSTER NOZZLE ASSEMBLY LOWER

(a) Install the defroster nozzle assembly lower with the 4 bolts.

Torque: 2.0 N*m (20 kgf*cm, 18 in.*lbf)

INSTALLATION

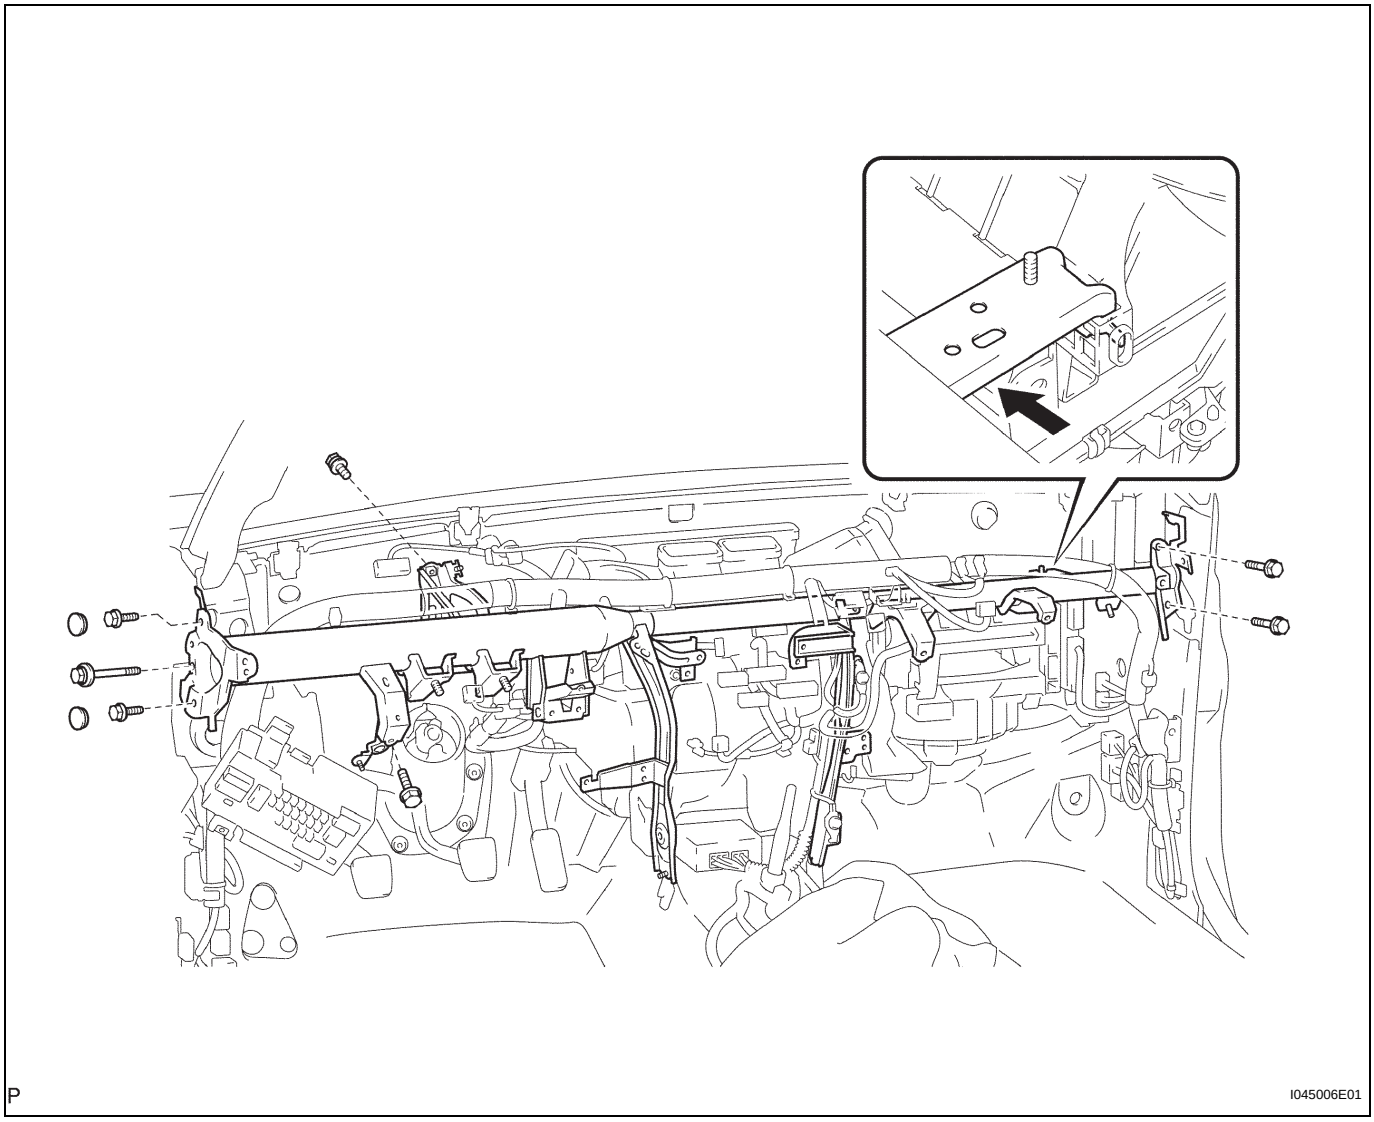
1. INSTALL AIR CONDITIONING UNIT ASSEMBLY

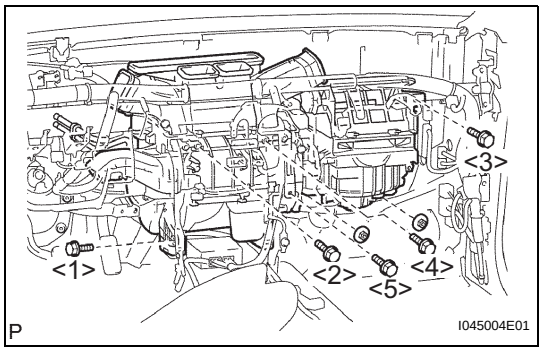
(a) Provisionally install the air conditioning unit assembly.

(b) Insert the bracket hook into the holes of the reinforcement bracket, and provisionally install the reinforcement.

(c) Install the instrument panel reinforcement with the 7 bolts.

(d) Install the 2 caps.

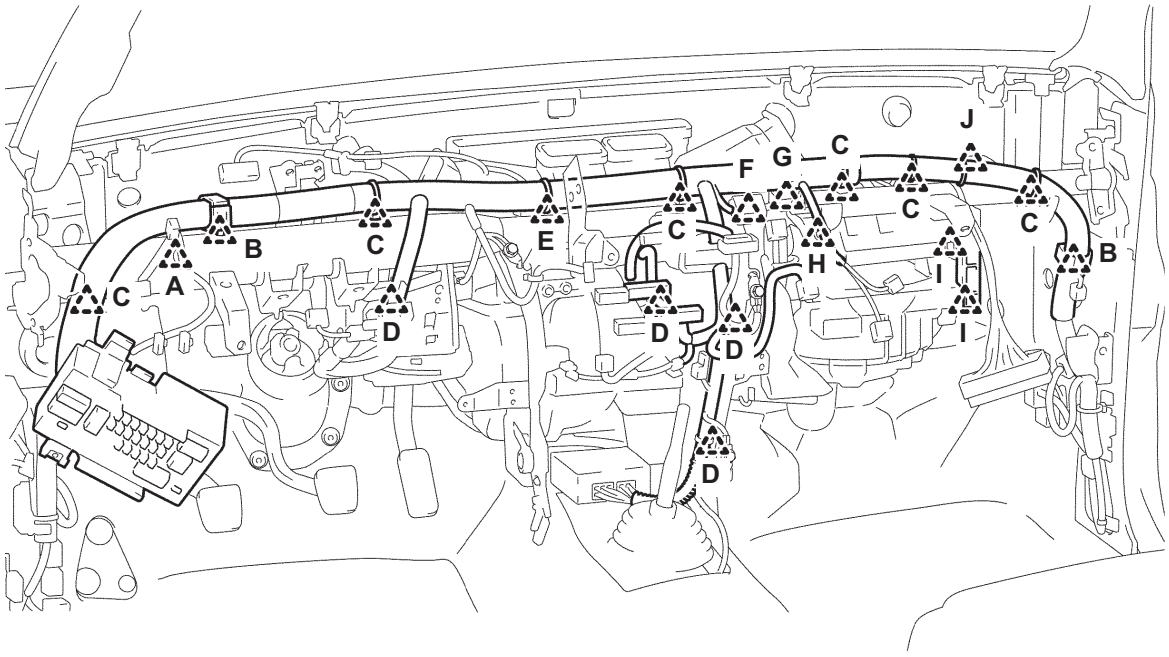




(e) Install the 5 bolts.
Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)
NOTICE:
Tighten the bolts in the sequence order shown in the illustration to install the air conditioner unit assembly.

(f) Install the 2 nuts.
Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)

(g) Engage the 20 clamps.



Type A: 	**Type B:** 	**Type C:** 	**Type D:** Type E: 	**Type F:** 	**Type G:** 	**Type H:** Type I: 	**Type J:** 		

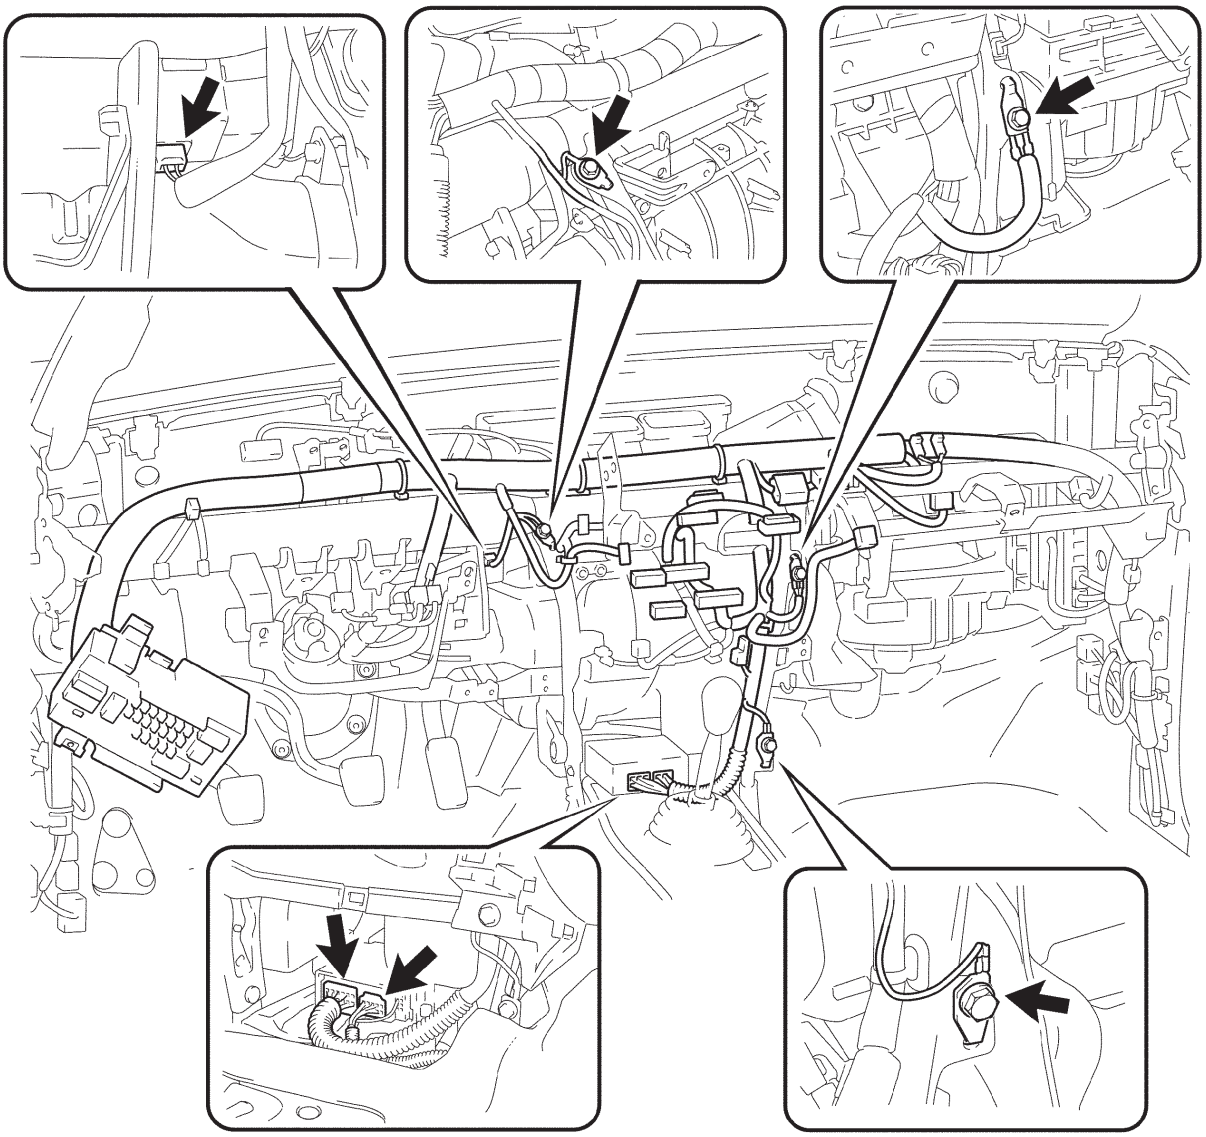
P

I045001E01

(h) Connect the connector.
(i) Connect the 2 airbag connectors (see page 60-6).

AC

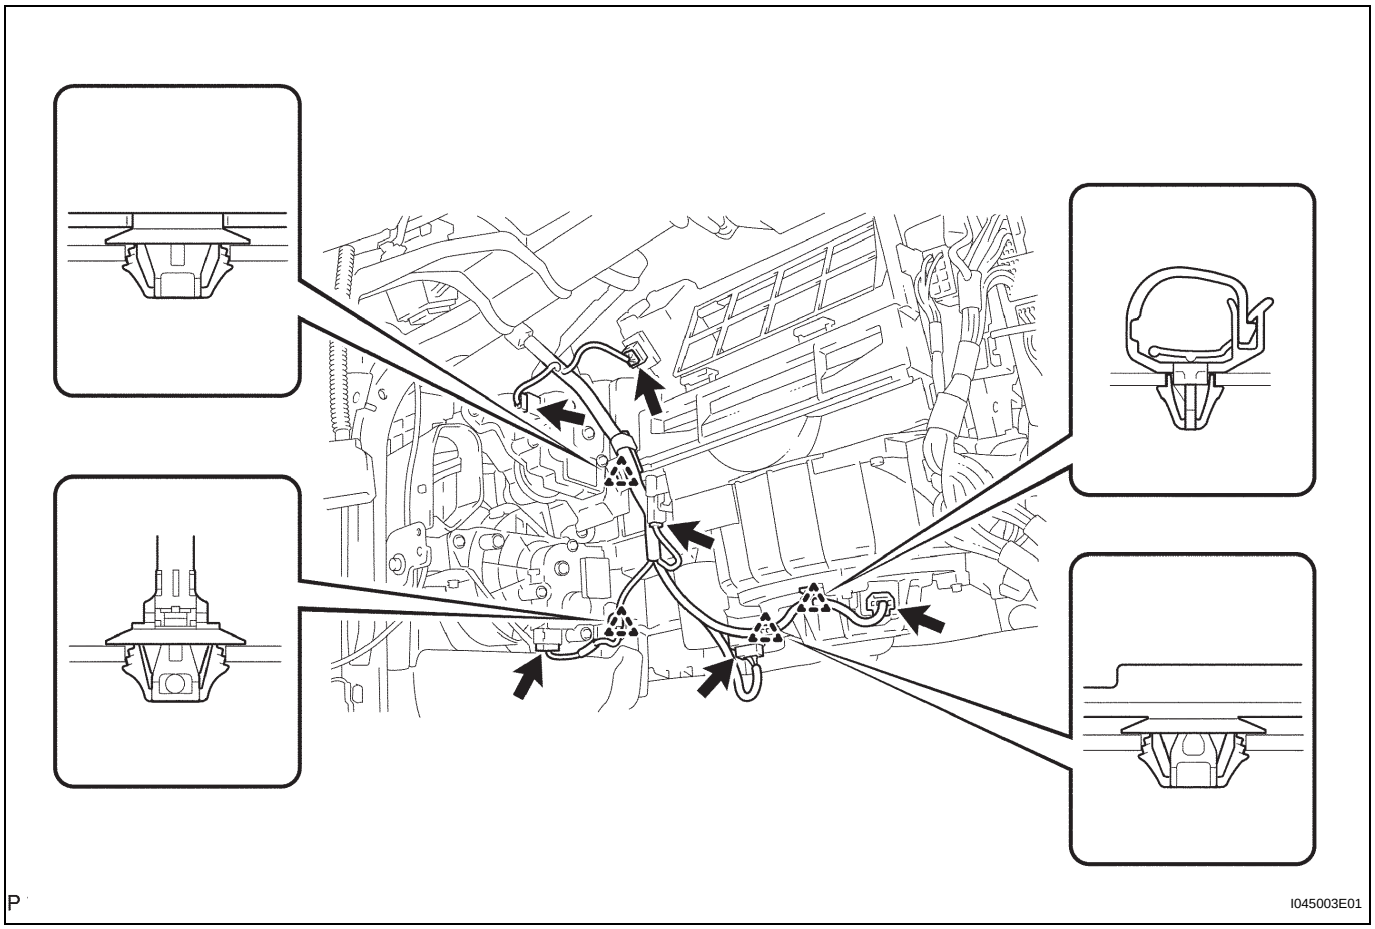
(j) Install the 3 bolts.

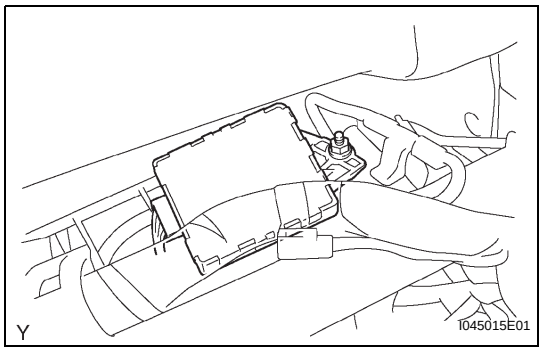


P

I045002E01

(k) Engage the 2 clamps and connect the 6 connectors to the air conditioning unit assembly.



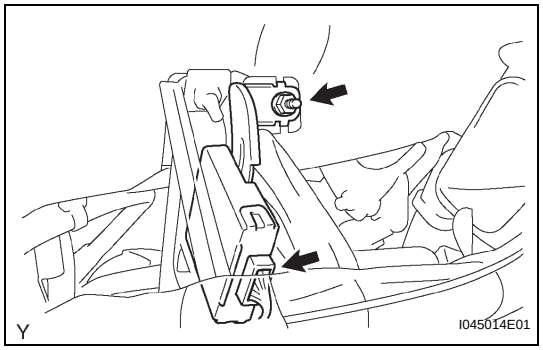


2. INSTALL AIR CONDITIONER AMPLIFIER ASSEMBLY

(a) Install the air conditioner amplifier assembly with the nut.

Torque: 7.0 N*m (71 kgf*cm, 62 in.*lbf)

(b) Connect the connector.

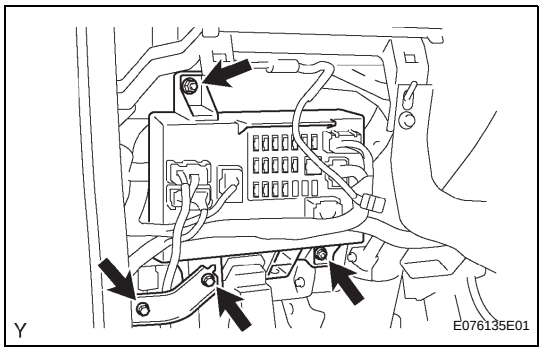


3. INSTALL TRANSPONDER KEY ECU ASSEMBLY

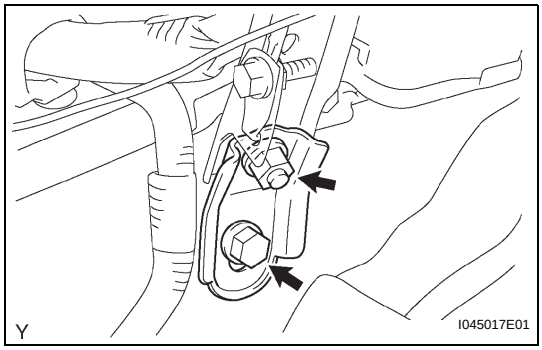
(a) Install the transponder key ECU assembly with the nut.

(b) Connect the connector.

AC

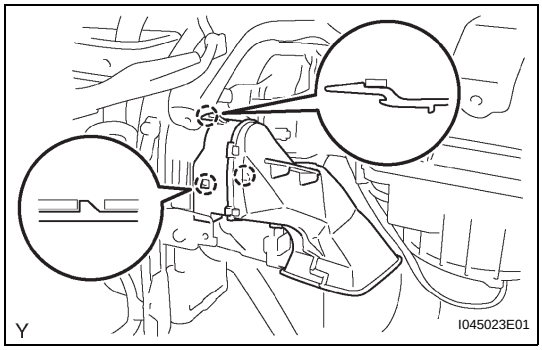


4. **INSTALL DRIVER SIDE JUNCTION BLOCK**
   (a) Install the driver side junction block assembly with the 2 nuts.
   Torque: 8.0 N*m (82 kgf*cm, 71 in.*lbf)
   (b) Install the bracket with the 2 bolts.
   Torque: 8.0 N*m (82 kgf*cm, 71 in.*lbf)
5. **INSTALL ECM (for 2TR-FE) (See page ES-467)**
6. **INSTALL ECM (for 1GR-FE) (See page ES-429)**
7. **INSTALL PARKING BRAKE CONTROL LEVER ASSEMBLY (for Lever Type Parking Brake) (See page PB-7)**
8. **INSTALL STEERING COLUMN ASSEMBLY (See page SR-16)**
9. **INSTALL STEERING SLIDING YOKE (See page SR-17)**
10. **INSTALL STEERING COLUMN HOLE COVER (See page SR-17)**



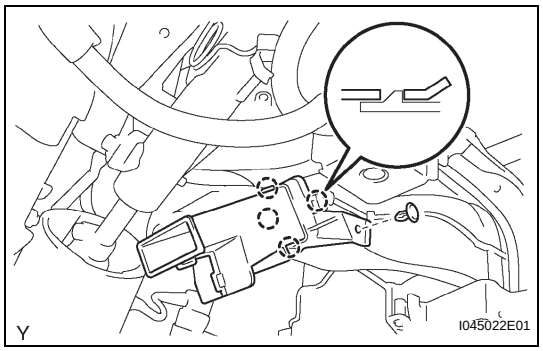
11. **INSTALL NO. 1 INSTRUMENT PANEL BRACE MOUNTING BRACKET**
    (a) Install the instrument panel brace mounting bracket RH with the bolt and nut.

    (b) Install the instrument panel brace mounting bracket LH with the bolt and nut.



12. **INSTALL AIR DUCT ASSEMBLY RH**
    (a) Engage the 3 claws and install the air duct assembly.

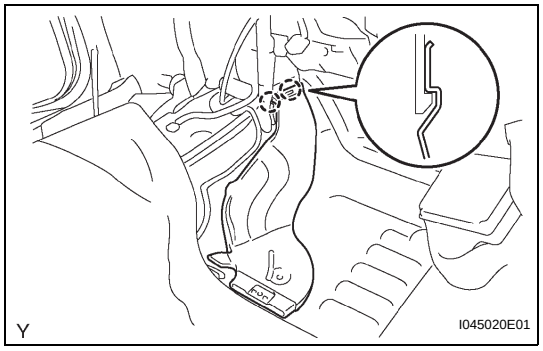
AC



13. INSTALL AIR DUCT ASSEMBLY LH

(a) Engage the 4 claws and remove the air duct assembly heater.

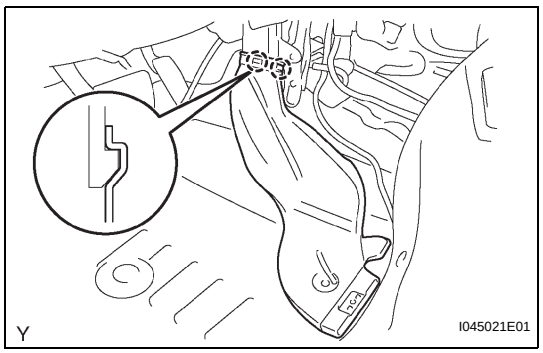
(b) Engage the clip.



14. INSTALL NO. 1 REAR AIR DUCT (for Double Cab)

(a) Engage the 2 claws and install the air duct rear.

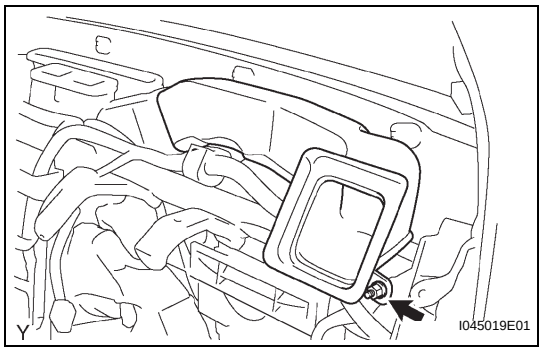
(b) Put the floor carpet back down.



15. INSTALL NO. 2 REAR AIR DUCT (for Double Cab)

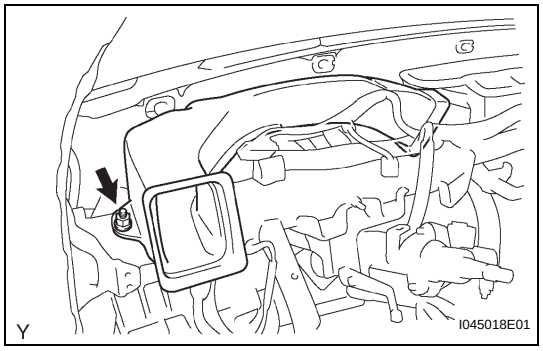
(a) Engage the 2 claws and install the air duct rear.

(b) Put the floor carpet back down.



16. INSTALL NO. 3 HEATER TO REGISTER DUCT

(a) Install the heater to register duct with the nut.



17. INSTALL NO. 1 HEATER REGISTER DUCT

(a) Install the heater to register duct with the nut.

18. INSTALL INSTRUMENT PANEL SUB-ASSEMBLY W/ PASSENGER AIRBAG ASSEMBLY (See page IP-18)

19. CONNECT PASSENGER AIRBAG CONNECTOR

20. INSTALL INSTRUMENT SIDE PANEL RH (See page IP-20)

21. INSTALL INSTRUMENT LOWER COVER SUB-ASSEMBLY (See page IP-20)

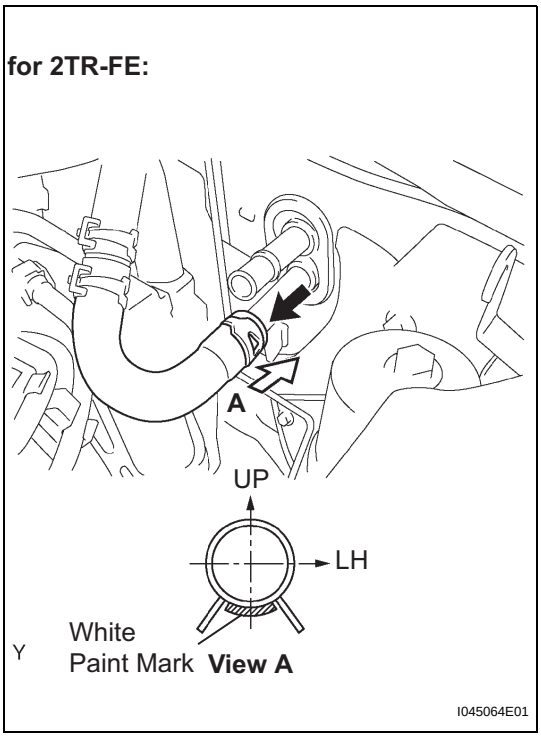
AC

22. INSTALL LOWER INSTRUMENT PANEL LH (See page IP-20)
23. INSTALL INSTRUMENT PANEL LOWER FINISH PANEL SUB-ASSEMBLY RH (See page IP-20)
24. INSTALL GLOVE COMPARTMENT DOOR ASSEMBLY (See page IP-20)
25. INSTALL INSTRUMENT CLUSTER CENTER FINISH PANEL SUB-ASSEMBLY (See page IP-21)
26. INSTALL COMBINATION METER ASSEMBLY (See page IP-21)
27. INSTALL INSTRUMENT CLUSTER FINISH PANEL SUB-ASSEMBLY (See page IP-21)
28. INSTALL LOWER NO. 1 INSTRUMENT PANEL FINISH PANEL (See page IP-22)
29. CONNECT HOOD LOCK CONTROL LEVER SUB-ASSEMBLY (See page ED-8)
30. INSTALL RADIO RECEIVER ASSEMBLY (See page AV-70)
31. INSTALL AIR CONDITIONING CONTROL ASSEMBLY (See page IP-22)
32. INSTALL FRONT CONSOLE BOX (for Manual Transmission on Bench Seat Type) (See page IP-22)
33. INSTALL FRONT CONSOLE BOX (for Automatic Transmission on Bench Seat Type) (See page IP-23)
34. INSTALL FRONT CONSOLE BOX (for Manual Transmission on Separate Seat Type) (See page IP-23)
35. INSTALL FRONT CONSOLE BOX (for Automatic Transmission on Separate Seat Type) (See page IP-24)
36. INSTALL INSTRUMENT PANEL CUP HOLDER TRAY (for Automatic Transmission on Separate Seat Type) (See page IP-24)
37. INSTALL REAR CONSOLE BOX ASSEMBLY (for Separate Seat Type) (See page IP-24)
38. INSTALL CONSOLE UPPER REAR PANEL SUB-ASSEMBLY (for Manual Transmission on Separate Seat Type) (See page IP-25)
39. INSTALL CONSOLE UPPER REAR PANEL SUB-ASSEMBLY (for Automatic Transmission on Separate Seat Type) (See page IP-25)
40. INSTALL INSTRUMENT PANEL HOLE COVER (for Lever Type Parking Brake) (See page IP-25)
41. INSTALL INSTRUMENT PANEL UNDER TRAY (for Pedal Type Parking Brake) (See page IP-25)

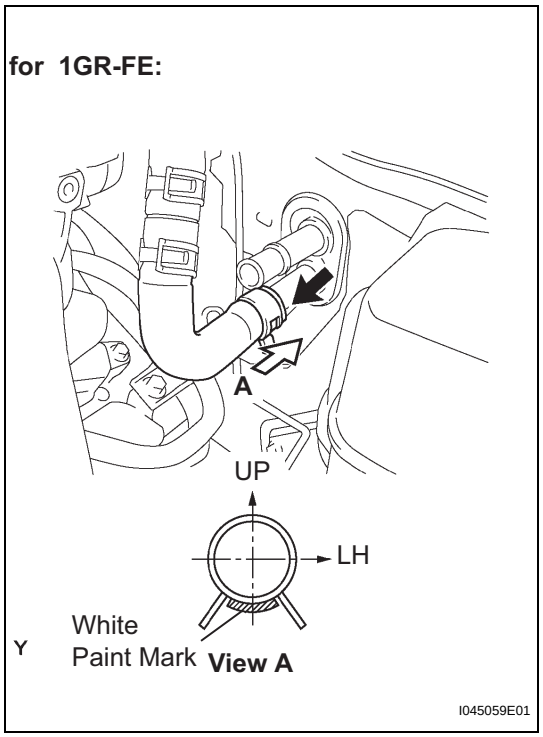
42. INSTALL FRONT PILLAR GARNISH LH (for Regular Cab) (See page IR-51)
43. INSTALL FRONT PILLAR GARNISH LH (for Access Cab) (See page IR-74)
44. INSTALL FRONT PILLAR GARNISH LH (for Double Cab) (See page IR-28)
45. INSTALL FRONT PILLAR GARNISH RH (for Regular Cab) (See page IR-52)
46. INSTALL FRONT PILLAR GARNISH RH (for Access Cab) (See page IR-74)
47. INSTALL FRONT PILLAR GARNISH RH (for Double Cab) (See page IR-28)
48. INSTALL FRONT DOOR OPENING TRIM WEATHERSTRIP LH
49. INSTALL FRONT DOOR OPENING TRIM WEATHERSTRIP RH
50. INSTALL COWL SIDE TRIM BOARD LH (for Regular Cab) (See page IR-52)
51. INSTALL COWL SIDE TRIM BOARD LH (for Access Cab) (See page IR-75)
52. INSTALL COWL SIDE TRIM BOARD LH (for Double Cab) (See page IR-29)
53. INSTALL COWL SIDE TRIM BOARD RH (for Regular Cab) (See page IR-52)
54. INSTALL COWL SIDE TRIM BOARD RH (for Access Cab) (See page IR-75)
55. INSTALL COWL SIDE TRIM BOARD RH (for Double Cab) (See page IR-29)
56. INSTALL FRONT DOOR SCUFF PLATE LH (for Regular Cab) (See page IR-52)
57. INSTALL FRONT DOOR SCUFF PLATE LH (for Access Cab) (See page IR-75)
58. INSTALL FRONT DOOR SCUFF PLATE LH (for Double Cab) (See page IR-29)
59. INSTALL FRONT DOOR SCUFF PLATE RH (for Regular Cab) (See page IR-52)
60. INSTALL FRONT DOOR SCUFF PLATE RH (for Access Cab) (See page IR-75)
61. INSTALL FRONT DOOR SCUFF PLATE RH (for Double Cab) (See page IR-29)
62. INSTALL FRONT FLOOR FOOTREST (See page IR-1)
63. INSTALL WINDSHIELD WIPER SWITCH ASSEMBLY (See page WW-19)

64. **INSTALL SPIRAL CABLE SUB-ASSEMBLY (See page RS-567)**
65. **CENTER SPIRAL CABLE (See page RS-567)**
66. **INSTALL STEERING COLUMN COVER UPPER (See page RS-568)**
67. **INSTALL STEERING COLUMN COVER LOWER (See page RS-568)**
68. **INSTALL STEERING WHEEL ASSEMBLY (See page SR-18)**
69. **INSTALL HORN BUTTON ASSEMBLY (See page RS-558)**
70. **INSTALL NO. 3 STEERING WHEEL COVER LOWER (See page RS-559)**
71. **INSTALL NO. 2 STEERING WHEEL COVER LOWER (See page RS-559)**
72. **INSTALL COWL TOP VENTILATOR LOUVER SUB-ASSEMBLY (See page WW-10)**
73. **INSTALL FRONT FENDER TO COWL SIDE SEAL RH (See page WW-10)**
74. **INSTALL FRONT FENDER TO COWL SIDE SEAL LH (See page WW-11)**
75. **INSTALL FRONT WIPER ARM RH (See page WW-11)**
76. **INSTALL FRONT WIPER ARM LH (See page WW-12)**
77. **INSTALL FRONT WIPER ARM HEAD CAP (See page WW-12)**
78. **INSTALL HEATER WATER OUTLET HOSE (for 2TR-FE)**
    (a) Install the heater water outlet hose onto the heater unit.
    NOTICE:
    Make sure that the hose clip and mark are at the correct angle when installing.

for 2TR-FE:



AC

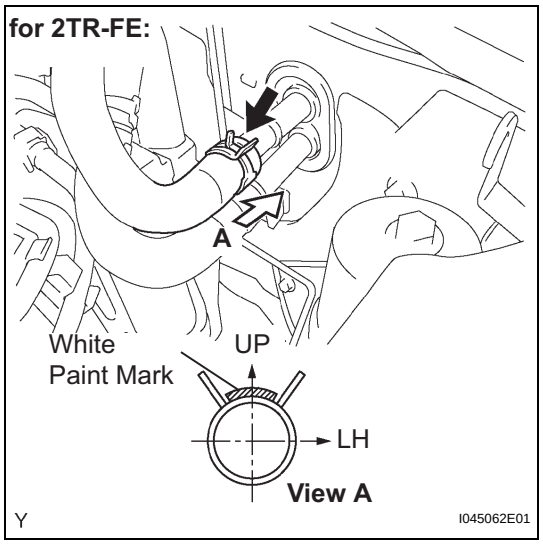


79. INSTALL HEATER WATER OUTLET HOSE (for 1GR-FE)

(a) Install the heater water outlet hose onto the heater unit.

NOTICE:

Make sure that the hose clip and mark are at the correct angle when installing.

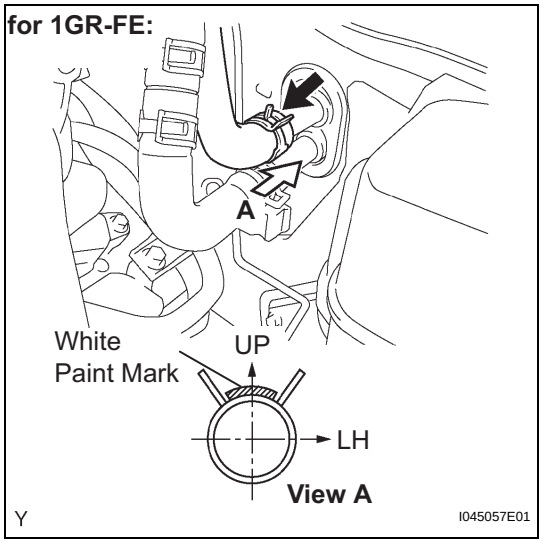


80. INSTALL HEATER WATER INLET HOSE (for 2TR-FE)

(a) Install the heater water inlet hose onto the heater unit.

NOTICE:

Make sure that the hose clip and mark are at the correct angle when installing.



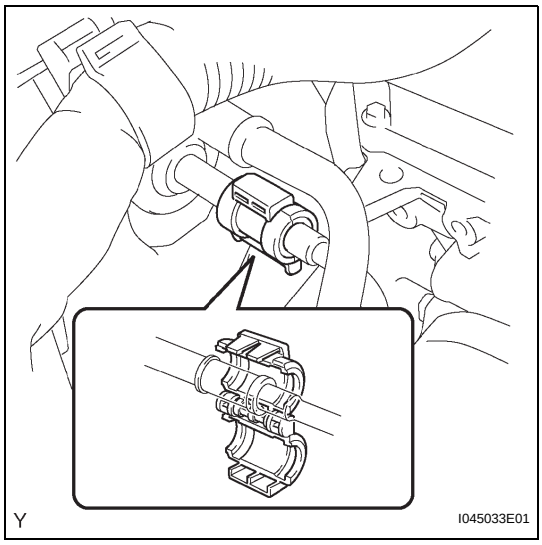
81. INSTALL HEATER WATER INLET HOSE (for 1GR-FE)

(a) Install the heater water inlet hose onto the heater unit.

NOTICE:

Make sure that the hose clip and mark are at the correct angle when installing.

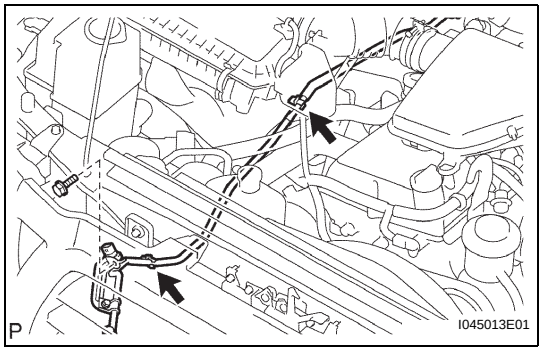
AC



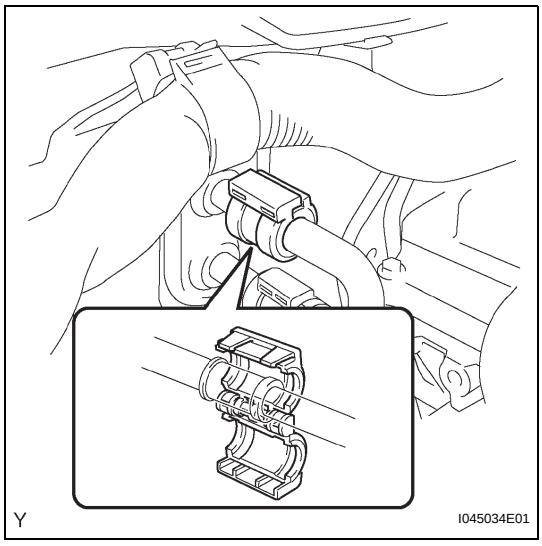
82. INSTALL AIR CONDITIONING TUBE ASSEMBLY

(a) Apply compressor oil to 2 new O-rings and install them onto the hose.
Compressor oil:
RL-897 or equivalent

(b) Install the air conditioner tube and piping clamp.
HINT:
Check that the claw of the piping clamp is correctly fitted.



(c) Install the bracket with the bolt and 2 clamps.
Torque: 7.5 N*m (76 kgf*cm, 66 in.*lbf)

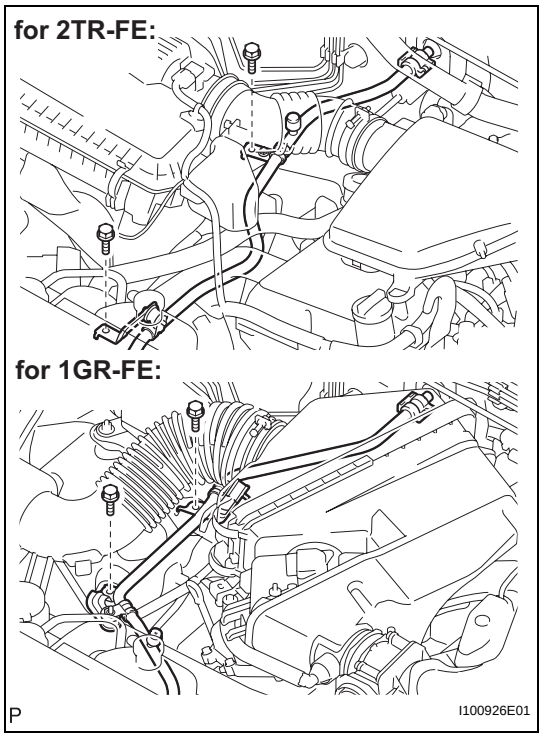


83. INSTALL SUCTION HOSE SUB-ASSEMBLY

(a) Apply compressor oil to 2 new O-rings and install them onto the pipe.
Compressor oil:
RL-897 or equivalent

(b) Install the suction hose and piping clamp.
HINT:
Check that the claws of the piping clamp are correctly fitted.

AC



(c) Install the bracket with the 2 bolts.
Torque: 7.5 N*m (76 kgf*cm, 66 in.*lbf)

84. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

85. **ADD ENGINE COOLANT (for 2TR-FE) (See page CO-3)**

86. **ADD ENGINE COOLANT (for 1GR-FE) (See page CO-3)**

87. **CHECK FOR ENGINE COOLANT LEAKAGE (for 2TR-FE) (See page CO-2)**

88. **CHECK FOR ENGINE COOLANT LEAKAGE (for 1GR-FE) (See page CO-4)**

89. **CHARGE REFRIGERANT (See page AC-18)**

90. **WARM UP ENGINE (See page AC-19)**

91. **CHECK FOR REFRIGERANT LEAKAGE (See page AC-19)**

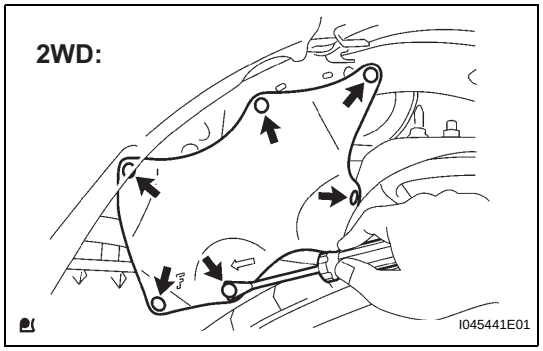
92. **PLACE FRONT WHEELS FACING STRAIGHT AHEAD**

93. **INSPECT SRS WARNING LIGHT**
(See page RS-28)

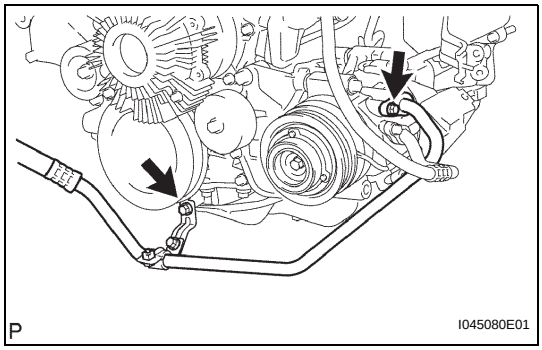
REMOVAL

1. **DISCHARGE REFRIGERANT FROM REFRIGERATION SYSTEM (See page AC-18)**
2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
3. **REMOVE FRONT WHEEL LH**
4. **REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY (for 2TR-FE) (See page EM-21)**
5. **REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY (for 1GR-FE) (See page EM-166)**
6. **REMOVE V-BANK COVER (for 1GR-FE) (See page ES-414)**
7. **REMOVE RADIATOR SUPPORT TO FRAME SEAL LH (for 1GR-FE) (See page CO-15)**
8. **REMOVE FAN SHROUD (for 1GR-FE) (See page CO-15)**
9. **REMOVE FAN AND GENERATOR V BELT (for 2TR-FE) (See page EM-5)**
10. **REMOVE FAN AND GENERATOR V BELT (for 1GR-FE) (See page EM-5)**
11. **REMOVE GENERATOR ASSEMBLY (for 1GR-FE) (See page CH-7)**
12. **REMOVE FRONT FENDER APRON SEAL UPPER**
    (a) Using a clip remover, disengage the 5 clips and remove the front fender apron seal upper. (4WD, PRE RUNNER)

    (b) Using a clip remover, disengage the 6 clips and remove the front fender apron seal upper. (2WD)



AC



13. DISCONNECT SUCTION HOSE SUB-ASSEMBLY (for 2TR-FE)

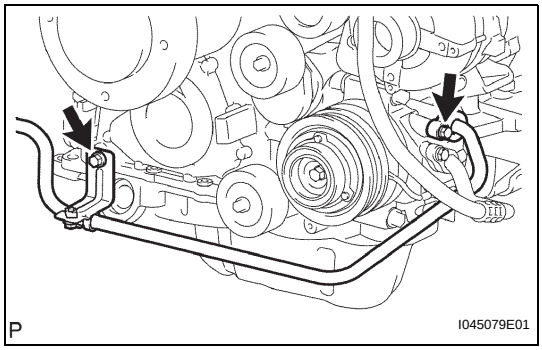
(a) Remove the bolt and separate the suction hose sub-assembly.

(b) Remove the bolt and disconnect the suction hose sub-assembly.

(c) Remove the seal washer from the suction hose sub-assembly.

NOTICE:

Seal the opening of the disconnected parts using vinyl tape to prevent moisture and foreign matter from entering.



14. DISCONNECT SUCTION HOSE SUB-ASSEMBLY (for 1GR-FE)

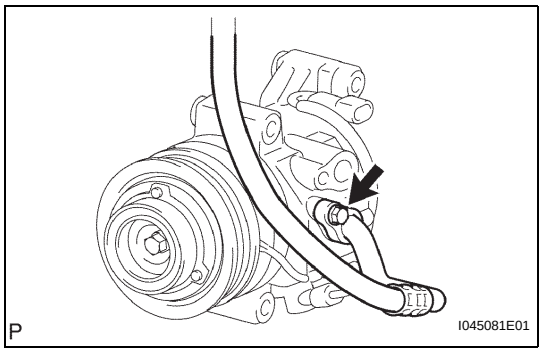
(a) Remove the bolt and separate the suction hose sub-assembly.

(b) Remove the bolt and disconnect the suction hose sub-assembly.

(c) Remove the seal washer from the suction hose sub-assembly.

NOTICE:

Seal the opening of the disconnected parts using vinyl tape to prevent moisture and foreign matter from entering.



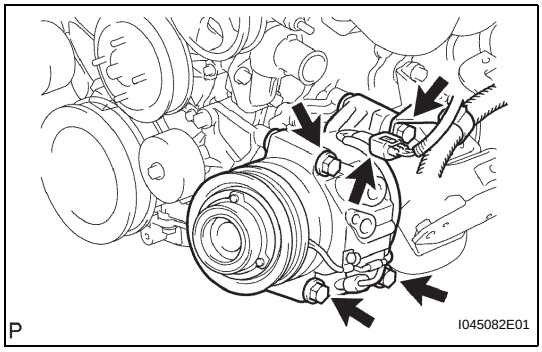
15. DISCONNECT DISCHARGE HOSE SUB-ASSEMBLY

(a) Remove the bolt and disconnect the cooler refrigerant discharge hose sub-assembly.

(b) Remove the seal washer from the cooler refrigerant discharge hose sub-assembly.

NOTICE:

Seal the opening of the disconnected parts using vinyl tape to prevent moisture and foreign matter from entering.

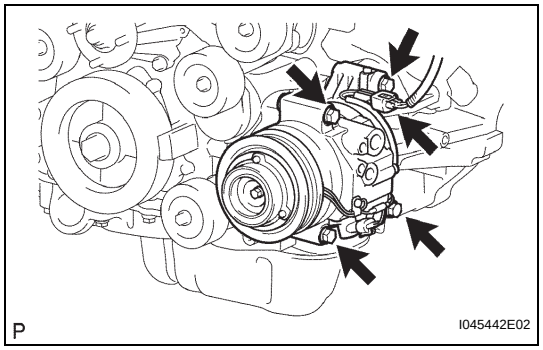


16. REMOVE COMPRESSOR AND MAGNETIC CLUTCH (for 2TR-FE)

(a) Disconnect the connector.

(b) Remove the 4 bolts and harness bracket, and remove the cooler compressor and magnetic clutch.

AC

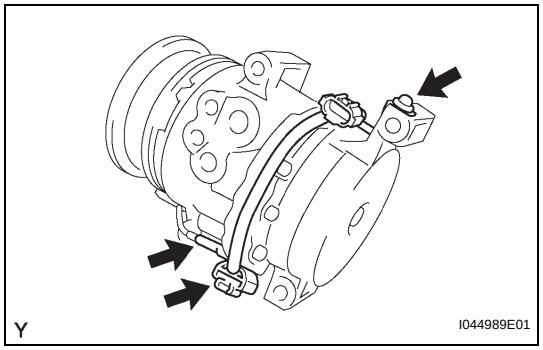


17. REMOVE COMPRESSOR AND MAGNETIC CLUTCH (for 1GR-FE)

(a) Disconnect the connector.

(b) Remove the 4 bolts and cooler compressor and magnetic clutch.

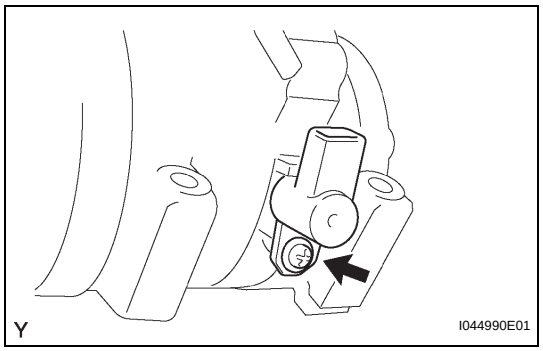
DISASSEMBLY



1. REMOVE COOLER BRACKET

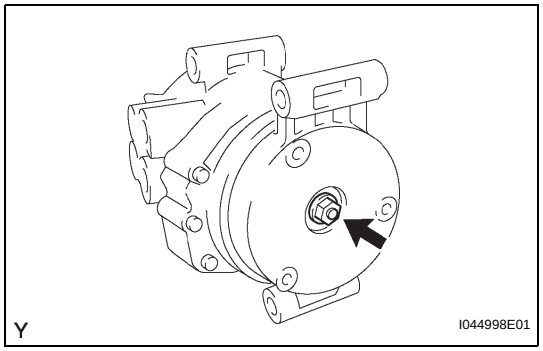
(a) Disconnect the 2 connectors.

(b) Remove the screw and the cooler bracket.



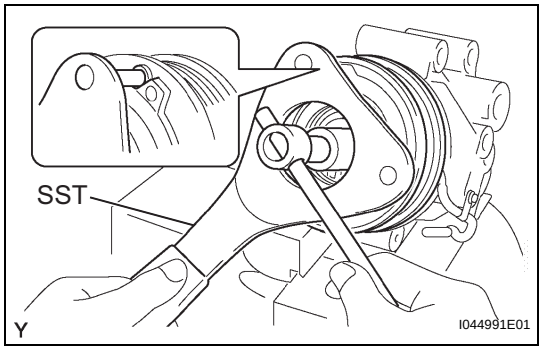
2. REMOVE COMPRESSOR PICK UP SENSOR

(a) Remove the screw and the compressor pick up sensor.



3. REMOVE PRESSURE RELIEF VALVE

(a) Remove the pressure relief valve and O-ring.

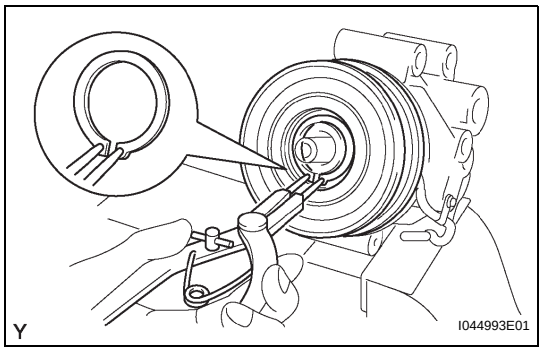


4. REMOVE MAGNET CLUTCH ASSEMBLY

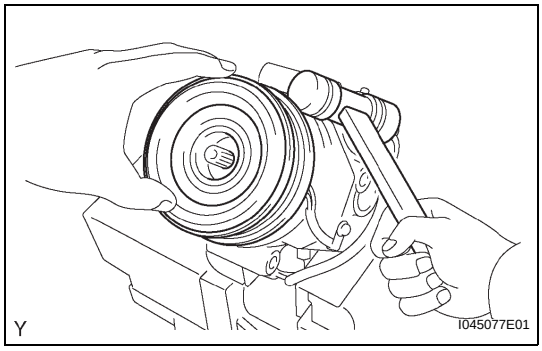
(a) Using SST, hold the magnet clutch hub.
SST 07112-76060

(b) Remove the bolt, magnet clutch hub and compressor spacer.
HINT:
There is no set number of magnet clutch washers since they are used for adjusting.

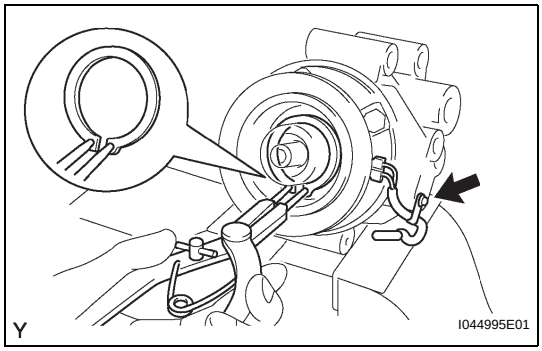
AC



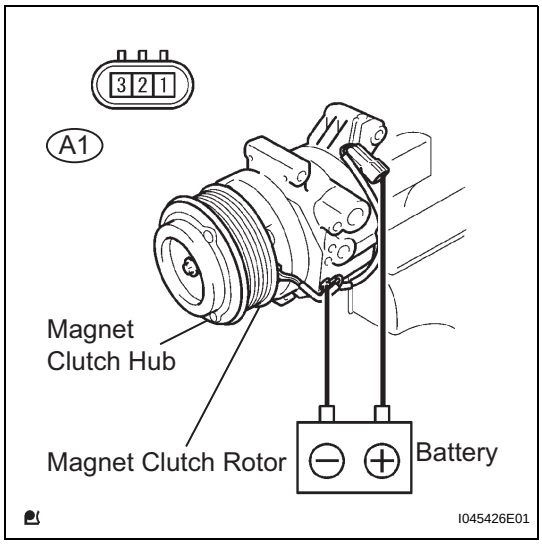
(c) Using SST, remove the snap ring and magnet clutch rotor.
SST 95994-10020
NOTICE:
Take care not to damage the seal cover of the bearing when removing the snap ring.



(d) When the magnet clutch rotor and snap ring are difficult to remove, use a plastic hammer to tap them off the shaft.
NOTICE:
Be careful not to damage the pulley when tapping the rotor.



(e) Remove the screw and separate the wire harness.
(f) Using SST, remove the snap ring and magnet clutch stator.
SST 95994-10020

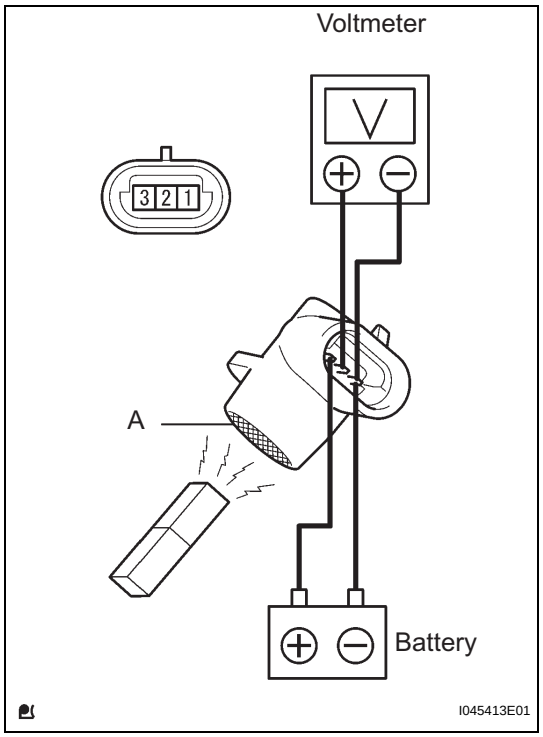


INSPECTION

1. INSPECT MAGNET CLUTCH ASSEMBLY

(a) Inspect the magnet clutch assembly.
(b) Confirm that the magnet clutch hub and magnet clutch rotor lock when the battery positive lead is connected to terminal 1 (MG+) of the magnet clutch, and the negative lead is connected to the earth wire. If the operation is not as specified, replace the magnet clutch assembly.

AC



2. INSPECT COMPRESSOR PICK UP SENSOR

(a) Check the compressor pick up sensor voltage.

(1) Connect the positive (+) lead from the battery to terminal 3 (SSR-) and the negative (-) lead to terminal 1 (MG+), and measure the voltage between terminals 1 (MG+) and 2 (SSR+).

Standard:

2.0 to 3.0 V

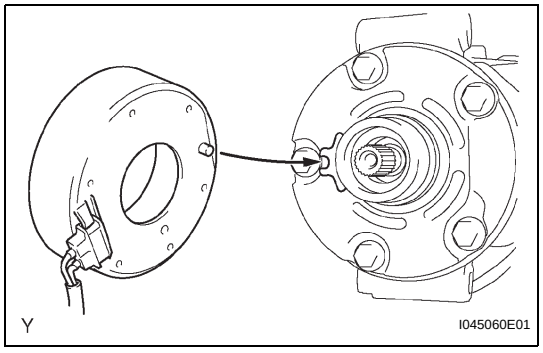
(2) When surface A of the compressor pick up sensor is close to the S-pole, the voltage between terminals 1 (MG+) and 2 (SSR+) increases. When it is close to the N-pole, the voltage between the terminals decreases.

If the result is not as specified, replace the compressor pick up sensor.

REASSEMBLY

1. INSTALL MAGNET CLUTCH ASSEMBLY

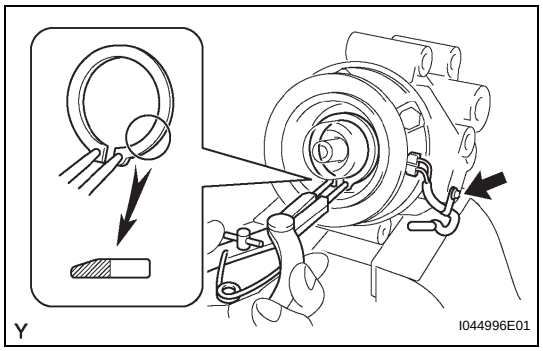
(a) Install the magnet clutch stator with the parts shown in the illustration matched.



(b) Using SST, install a new snap ring with the chamfered side facing up.

SST 95994-10020

(c) Install the wire harness with the screw.

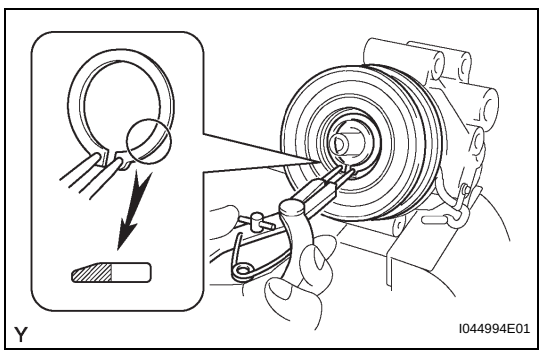


(d) Using SST, install the magnet clutch rotor and a new snap ring with the chamfered side facing up.

SST 95994-10020

NOTICE:

Take care not to damage the seal cover of the bearing when installing the snap ring.

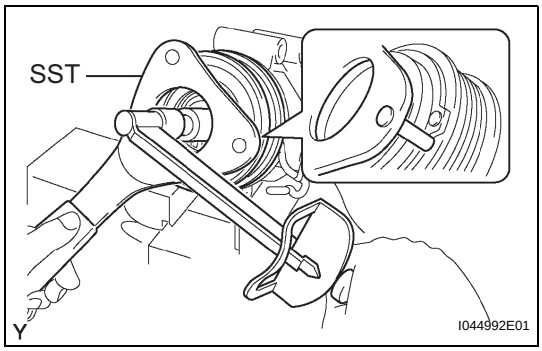


(e) Install the compressor spacer and magnet clutch hub.

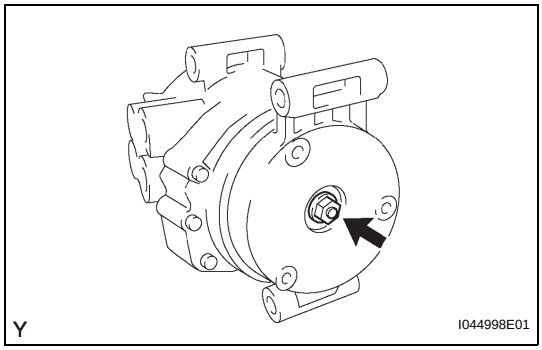
NOTICE:

Do not change the combination of the compressor spacer used before disassembly.

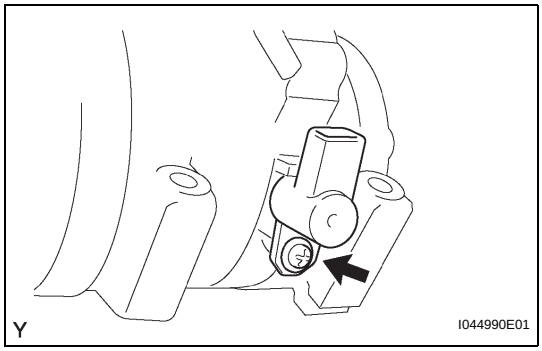
AC



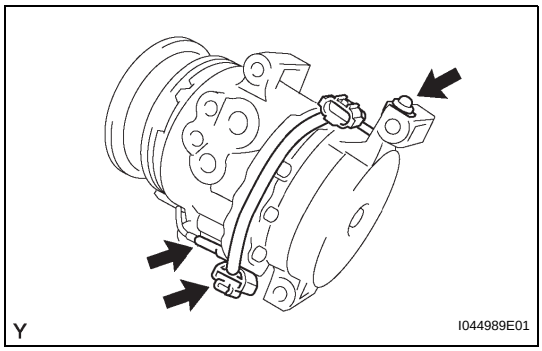
(f) Using SST, hold the magnet clutch hub and install the new bolt.
SST 07112-76060
Torque: 13.5 N*m (138 kgf*cm, 10 ft.*lbf)
NOTICE:
Make sure that there is no foreign matter or oil on the compressor shaft, bolt, and clutch hub.
HINT:
Use new bolt (88329-04050) for clutch installation.



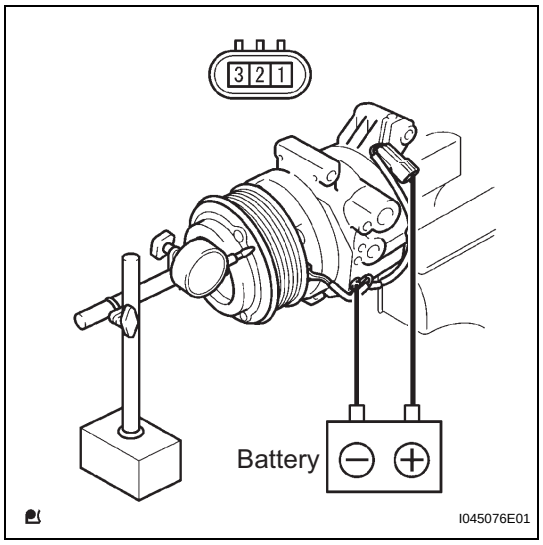
2. INSTALL PRESSURE RELIEF VALVE
(a) Install a new O-ring onto the pressure relief valve.
(b) Install the pressure relief valve.
Torque: 8.0 N*m (82 kgf*cm, 71 in.*lbf)



3. INSTALL COMPRESSOR PICK UP SENSOR
(a) Install the compressor pick up sensor with the screw.
Torque: 4.0 N*m (41 kgf*cm, 35 in.*lbf)



4. INSTALL COOLER BRACKET
(a) Install the cooler bracket with the screw.
(b) Connect the 2 connectors.



5. INSPECT MAGNET CLUTCH CLEARANCE

(a) Clamp the compressor and magnetic clutch in a vise.

(b) Set the dial indicator to the magnet clutch hub.

(c) Connect the battery positive lead to terminal 1 (MG+) of the magnet clutch connector and the negative lead to the earth wire. Turn the magnet clutch on and off and measure the clearance.

Standard clearance:

0.30 to 0.60 mm (0.012 to 0.024 in.)

If the measured value is not within the standard clearance, remove the magnet clutch hub and adjust the clearance using compressor spacer to obtain the standard clearance.

Compressor spacer thickness:

0.2 mm (0.008 in.)
0.3 mm (0.012 in.)
0.5 mm (0.020 in.)

NOTICE:

Adjustment should be performed with 3 or less magnet clutch washers.

(d) Remove the compressor and magnetic clutch from the vise.

INSTALLATION

1. ADJUST COMPRESSOR OIL

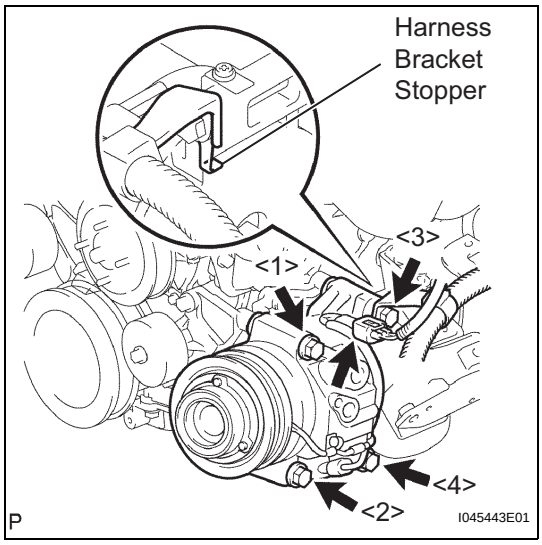
(a) When replacing the compressor and magnetic clutch with new ones, after gradually discharging the refrigerant gas from the service valve, drain the following volume of oil from new compressor and magnetic clutch before installation.

Standard:

(Oil capacity inside a new compressor and magnetic clutch: 150 + 15 cc (5.1 + 0.51 fl.oz.)) - (Remaining oil amount in the removed compressor and magnetic clutch) = (Oil amount to be removed when replacing the compressor)

NOTICE:

- **When checking the compressor oil level, observe the precautions on the cooler removal/installation.**
- **If a new compressor and magnetic clutch are installed without removing some oil remaining in the pipes of the vehicle, the oil amount becomes too large. This prevents heat exchange in the refrigerant cycle and causes refrigerant failure.**
- **If the volume of oil remaining in the removed compressor and magnetic clutch is too small, check for oil leakage.**
- **Be sure to use RL-897 for compressor oil.**



2. INSTALL COMPRESSOR AND MAGNETIC CLUTCH (for 2TR-FE)

(a) Provisionally tighten the compressor and magnetic clutch with the 4 bolts and harness bracket.

NOTICE:

The harness bracket stopper should be in contact with compressor case.

(b) Tighten the compressor and magnetic clutch with the 4 bolts.

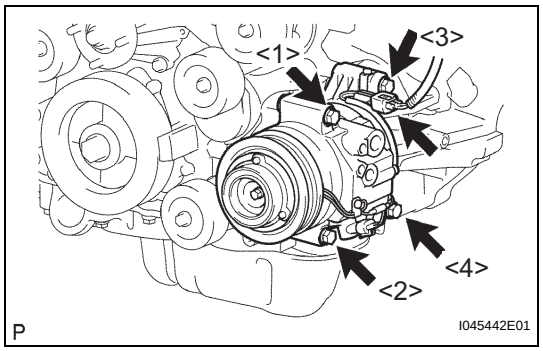
Torque: 21 N*m (214 kgf*cm, 16 ft.*lbf)

NOTICE:

Tighten the bolts in the sequence order shown in the illustration to install the compressor and magnetic clutch.

(c) Connect the connector.

AC



3. INSTALL COMPRESSOR AND MAGNETIC CLUTCH (for 1GR-FE)

(a) Provisionally tighten the compressor and magnetic clutch with the 4 bolts.

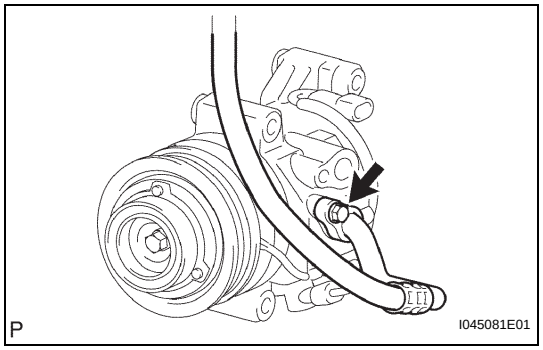
(b) Tighten the compressor and magnetic clutch with the 4 bolts.

Torque: 21 N*m (214 kgf*cm, 16 ft.*lbf)

NOTICE:

Tighten the bolts in the sequence order shown in the illustration to install the compressor and magnetic clutch.

(c) Connect the connector.



4. INSTALL DISCHARGE HOSE SUB-ASSEMBLY

(a) Remove the attached vinyl tape from the hose.

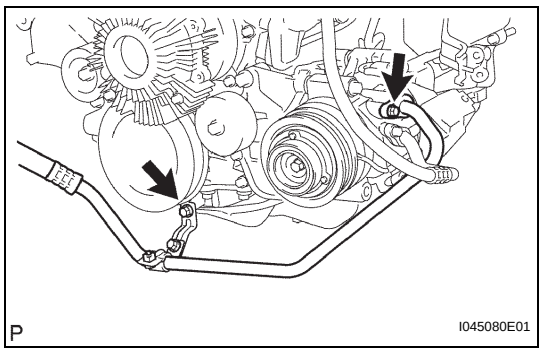
(b) Apply sufficient compressor oil to a new seal washer and fitting surface of the compressor and magnetic clutch.

Compressor oil:
RL-897 or equivalent

(c) Install the seal washer onto the cooler refrigerant discharge hose sub-assembly.

(d) Install the cooler refrigerant discharge hose sub-assembly onto the compressor and magnetic clutch with the bolt.

Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)



5. INSTALL SUCTION HOSE SUB-ASSEMBLY (for 2TR-FE)

(a) Remove the attached vinyl tape from the hose.

(b) Apply sufficient compressor oil to a new seal washer and fitting surface of the compressor and magnetic clutch.

Compressor oil:
RL-897 or equivalent

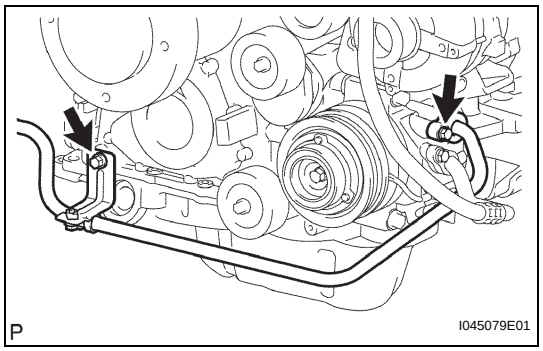
(c) Install the seal washer onto the suction hose sub-assembly.

(d) Install the suction hose sub-assembly onto the compressor and magnetic clutch with the bolt.

Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)

(e) Install the suction hose sub-assembly with the bolt.

Torque: 7.5 N*m (76 kgf*cm, 66 in.*lbf)



6. INSTALL SUCTION HOSE SUB-ASSEMBLY (for 1GR-FE)

(a) Remove the attached vinyl tape from the hose.

(b) Apply sufficient compressor oil to a new seal washer and fitting surface of the compressor and magnetic clutch.

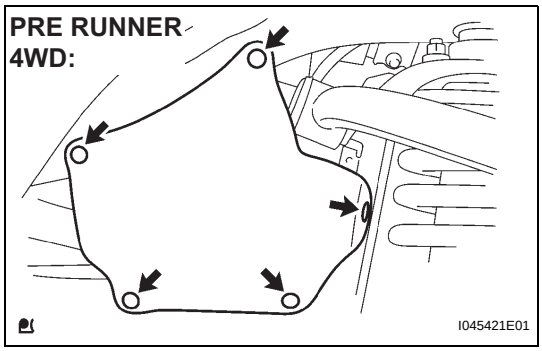
Compressor oil:
RL-897 or equivalent

(c) Install the seal washer onto the suction hose sub-assembly.

(d) Install the suction hose sub-assembly onto the compressor and magnetic clutch with the bolt.

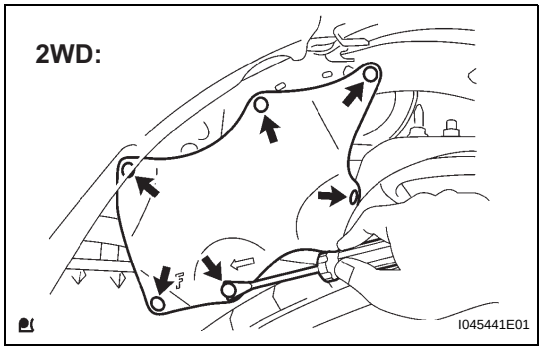
Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)

(e) Install the suction hose sub-assembly with the bolt.
Torque: 7.5 N*m (76 kgf*cm, 66 in.*lbf)



7. INSTALL FRONT FENDER APRON SEAL UPPER

(a) Install the front fender apron seal upper with the 5 clips. (4WD, PRE RUNNER)



(b) Install the front fender apron seal upper with the 6 clips. (2WD)

8. INSTALL GENERATOR ASSEMBLY (for 1GR-FE) (See page CH-13)

9. INSTALL FAN AND GENERATOR V BELT (for 2TR-FE) (See page EM-6)

10. INSPECT FAN AND GENERATOR V BELT (for 2TR-FE) (See page EM-5)

11. INSTALL FAN AND GENERATOR V BELT (for 1GR-FE) (See page EM-5)

12. INSTALL FAN SHROUD (for 1GR-FE) (See page CO-20)

13. INSTALL RADIATOR SUPPORT TO FRAME SEAL LH (for 1GR-FE)

14. INSTALL V-BANK COVER (for 1GR-FE) (See page EM-166)

15. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY (for 2TR-FE) (See page EM-35)

16. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY (for 1GR-FE) (See page EM-166)

17. INSTALL FRONT WHEEL LH
Torque: 113 N*m (1152 kgf*cm, 83 ft.*lbf)

18. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

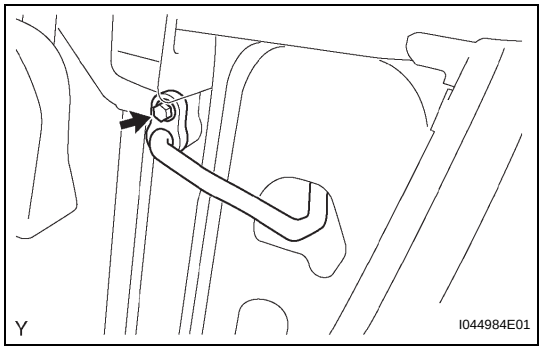
19. CHARGE REFRIGERANT (See page AC-18)

20. WARM UP ENGINE (See page AC-19)

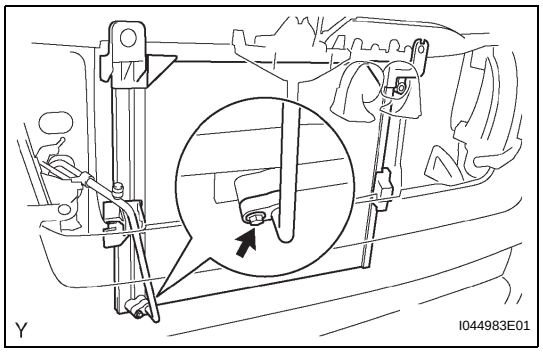
21. CHECK FOR REFRIGERANT LEAKAGE (See page AC-19)

REMOVAL

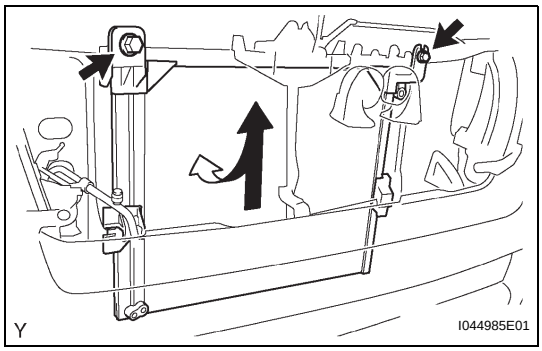
1. **DISCHARGE REFRIGERANT FROM REFRIGERATION SYSTEM (See page AC-18)**
2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
3. **DRAIN ENGINE COOLANT (for 2TR-FE) (See page CO-3)**
4. **DRAIN ENGINE COOLANT (for 1GR-FE) (See page CO-3)**
5. **REMOVE RADIATOR GRILLE (See page ET-4)**
6. **REMOVE RADIATOR SUPPORT TO FRAME SEAL LH (for 2TR-FE) (See page CO-12)**
7. **REMOVE RADIATOR SUPPORT TO FRAME SEAL LH (for 1GR-FE) (See page CO-15)**
8. **REMOVE FAN SHROUD (for 2TR-FE) (See page CO-13)**
9. **REMOVE FAN SHROUD (for 1GR-FE) (See page CO-15)**
10. **REMOVE RADIATOR ASSEMBLY (for 2TR-FE) (See page CO-14)**
11. **REMOVE RADIATOR ASSEMBLY (for 1GR-FE) (See page CO-15)**
12. **DISCONNECT DISCHARGE HOSE SUB-ASSEMBLY**
    (a) Remove the bolt and disconnect the discharge hose sub-assembly from the cooler condenser assembly.
    (b) Remove the seal washer from the discharge hose sub-assembly.
    NOTICE:
    Seal the openings of the disconnected parts using vinyl tape to prevent moisture and foreign matter from entering.



13. **DISCONNECT AIR CONDITIONING TUBE ASSEMBLY**
    (a) Remove the bolt and disconnect the air conditioning tube assembly from the cooler condenser assembly.
    (b) Remove the seal washer from the air conditioning tube assembly.
    NOTICE:
    Seal the openings of the disconnected parts using vinyl tape to prevent moisture and foreign matter from entering.



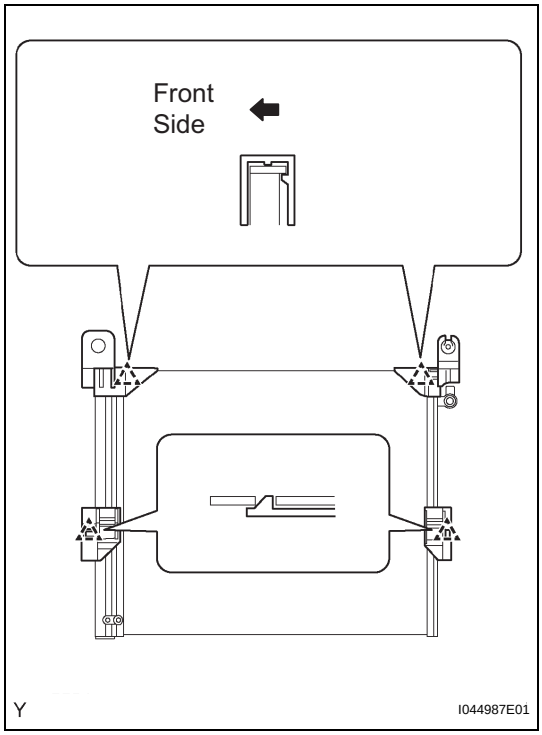
AC



14. REMOVE COOLER CONDENSER ASSEMBLY

(a) Remove the 2 bolts.

(b) Lift the condenser up, disengage the fitting of the condenser lower bracket and remove the condenser from the rear side of the vehicle.



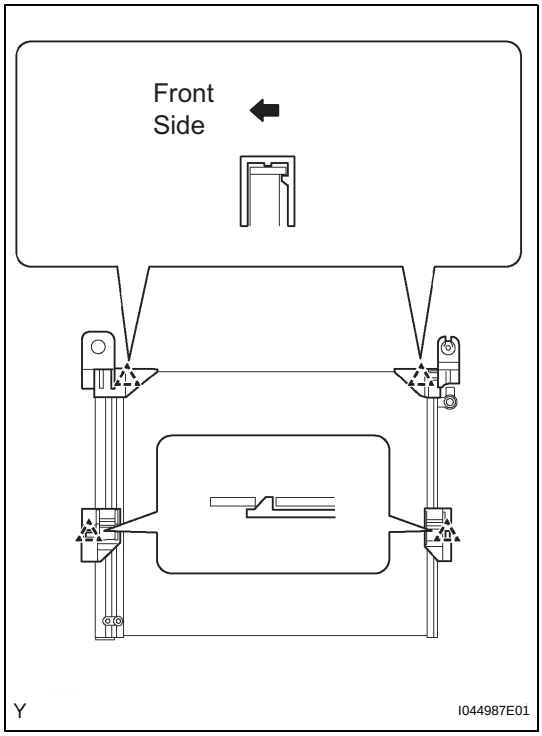
(c) Using a screwdriver, disengage the claw and remove the condenser upper bracket LH.
HINT:
Tape up the screwdriver tip before use.

(d) Using a screwdriver, disengage the claw and remove the condenser upper bracket RH.
HINT:
Tape up the screwdriver tip before use.

(e) Using a screwdriver, disengage the claw and remove the condenser lower bracket LH.
HINT:
Tape up the screwdriver tip before use.

(f) Using a screwdriver, disengage the claw and remove the condenser lower bracket RH.

(g) Remove the condenser.
HINT:
At the time of installation, please refer to the following instructions. If installing a new condenser, add compressor oil to the condenser.
Compressor oil:
RL-897 or equivalent
Add 40 cc (1.4 fl.oz.)



INSTALLATION

1. INSTALL COOLER CONDENSER ASSEMBLY

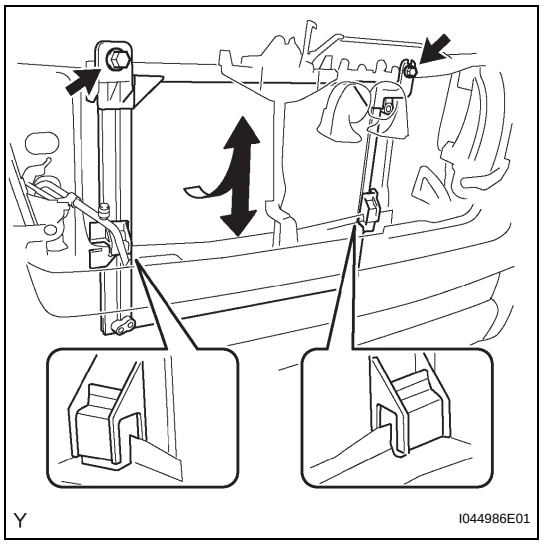
(a) Engage the claw and install the condenser upper bracket LH.

(b) Engage the claw and install the condenser upper bracket RH.

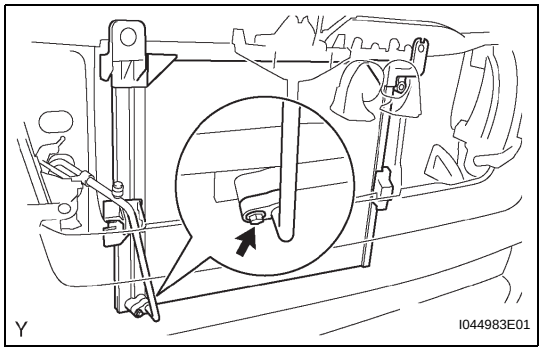
(c) Engage the claw and install the condenser lower bracket LH.

(d) Engage the claw and install the condenser lower bracket RH.

AC

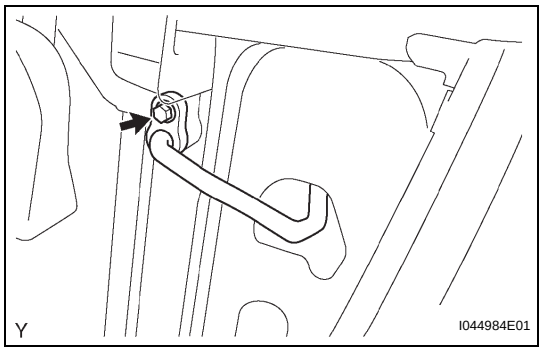


(e) Lift the condenser up from the rear side of the vehicle, and install the condenser lower brackets onto the upper part of the radiator lower supports with the 2 bolts.
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)



2. INSTALL AIR CONDITIONING TUBE ASSEMBLY

(a) Remove the attached vinyl tape from the pipe and the connecting part of the cooler condenser assembly.
(b) Apply sufficient compressor oil to a new seal washer and the fitting surface of the pipe joint.
Compressor oil:
RL-897 or equivalent
(c) Install the seal washer onto the air conditioning tube assembly.
(d) Install the air conditioning tube assembly onto the cooler condenser assembly with the bolt.
Torque: 7.5 N*m (76 kgf*cm, 66 in.*lbf)



3. INSTALL DISCHARGE HOSE SUB-ASSEMBLY

(a) Remove the attached vinyl tape from the hose and the connecting part of the cooler condenser assembly.
(b) Apply sufficient compressor oil to a new seal washer and the fitting surface of the hose joint.
Compressor oil:
RL-897 or equivalent
(c) Install the seal washer onto the discharge hose sub-assembly.
(d) Install the discharge hose sub-assembly onto the cooler condenser assembly with the bolt.
Torque: 7.5 N*m (76 kgf*cm, 66 in.*lbf)

4. INSTALL RADIATOR ASSEMBLY (for 2TR-FE) (See page CO-17)

5. INSTALL RADIATOR ASSEMBLY (for 1GR-FE) (See page CO-19)

6. INSTALL FAN SHROUD (for 2TR-FE) (See page CO-18)

7. INSTALL FAN SHROUD (for 1GR-FE) (See page CO-20)

8. **INSTALL RADIATOR SUPPORT TO FRAME SEAL LH (for 2TR-FE) (See page CO-19)**
9. **INSTALL RADIATOR SUPPORT TO FRAME SEAL LH (for 1GR-FE)**
10. **INSTALL RADIATOR GRILLE (See page ET-11)**
11. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
    Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
12. **ADD ENGINE COOLANT (for 2TR-FE) (See page CO-3)**
13. **ADD ENGINE COOLANT (for 1GR-FE) (See page CO-3)**
14. **CHECK FOR ENGINE COOLANT LEAKAGE (for 2TR-FE) (See page CO-2)**
15. **CHECK FOR ENGINE COOLANT LEAKAGE (for 1GR-FE) (See page CO-4)**
16. **CHARGE REFRIGERANT (See page AC-18)**
17. **WARM UP ENGINE (See page AC-19)**
18. **CHECK FOR REFRIGERANT LEAKAGE (See page AC-19)**

SYSTEM DESCRIPTION

1. SRS (SUPPLEMENTAL RESTRAINT SYSTEM) AIRBAG SYSTEM

(a) General Description

(1) The SRS airbag system consists of the following airbag and main components:

Airbag	Regular Cab Model	Access Cab Model	Double Cab Model
Driver Airbag	Standard	Standard	Standard
Front Passenger Airbag	Standard	Standard	Standard
Side Airbag	-	-	Option
Curtain Shield Airbag	-	-	Option

Main Components	Features
Center Airbag Sensor Assembly	• Controls airbag deployment • Activates dual stage control for driver and front passenger airbags • Detects malfunctions in SRS airbag system
Occupant Classification ECU	Determines front passenger seat occupant conditions through occupant classification sensors
Front Airbag Sensor	Detect intensity of frontal collisions though electrical deceleration sensor
Side Airbag Sensor	Detect intensity of side collision through electrical deceleration sensor
Curtain Shield Airbag Sensors	Detect intensity of side rear collision through electrical deceleration sensor
Occupant Classification Sensors	Detect occupant weight on front passenger seat
Seat Position Sensor	Detects driver seat position
Seat Belt Buckle Switches	Detect whether of not seat belt fastened
Airbag ON/OFF Indicator	Illuminates ON or OFF light to indicate front and side passenger airbag deployment availability
SRS Warning Light	Illuminates to indicate existence of malfunctions in SRS airbag system
Airbag Cut-Off Switch	Prohibits deployment of front passenger airbag when switched to OFF

2. AIRBAG DEPLOYMENT

(a) Front Collisions

(1) The driver and front passenger airbags are in case of frontal collisions. These airbags deploy by dual stage control. In order to activate dual stage control, the center airbag sensor assembly monitors the following information through the components shown in the table below:

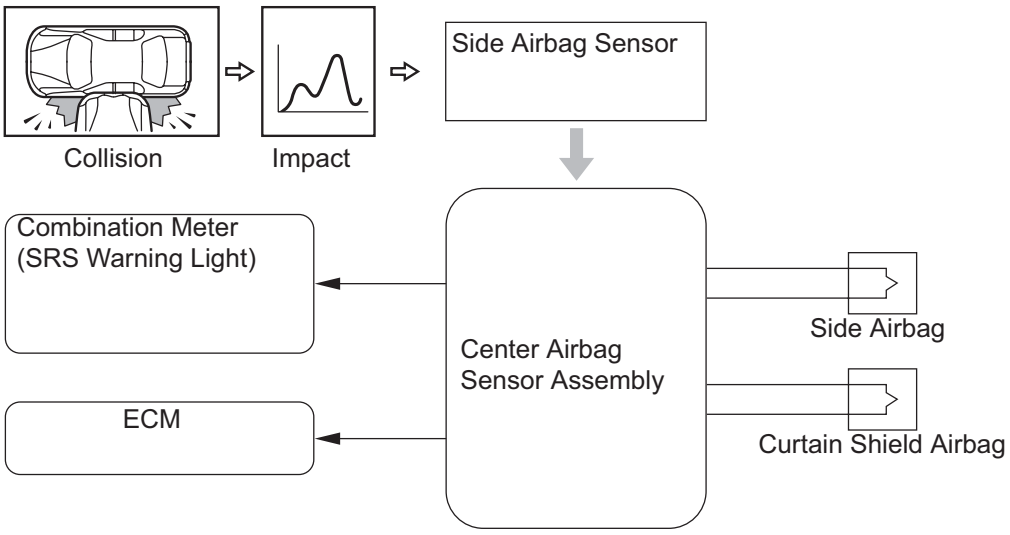
RS

Seat	Information	Models with Bench Seat	Models with Separate Seat
Driver	Intensity of Impact	Front Airbag Sensor (RH or LH)	Same As Left
Driver	Driver Seat Position	Seat Position Sensor	Same As Left
Driver	Seat Belt Position	Seat Belt Buckle Switches	Same As Left
Front Passenger	Intensity of Impact	Front Airbag Sensor (RH or LH)	Same As Left
Front Passenger	Occupant Weight	Occupant Classification Sensor	Four Occupant Classification Sensors
Front Passenger	Seat Belt Condition	Seat Belt Buckle Switches	Same As Left

(b) Side Collisions

(1) The side and curtain shield airbags are in case of side collisions. The side airbags are installed in the seat backs of the driver seat and the front passenger seat, and the curtain shield airbags are installed in the upper areas of the right and left center pillars. If a side airbag sensor detects an impact, the airbag sensor assembly center causes the side and curtain shield airbags to be deployed simultaneously.

Airbag Deployment for Side Collisions:



Y H101814E01

(c) Rear Side Collisions

(1) The curtain shield airbags are in case of rear side collisions. The curtain shield airbags are installed in the upper areas of the right and left center pillars. If a curtain shield airbag sensor detects an impact, the airbag sensor assembly center causes a curtain shield airbag to be deployed.

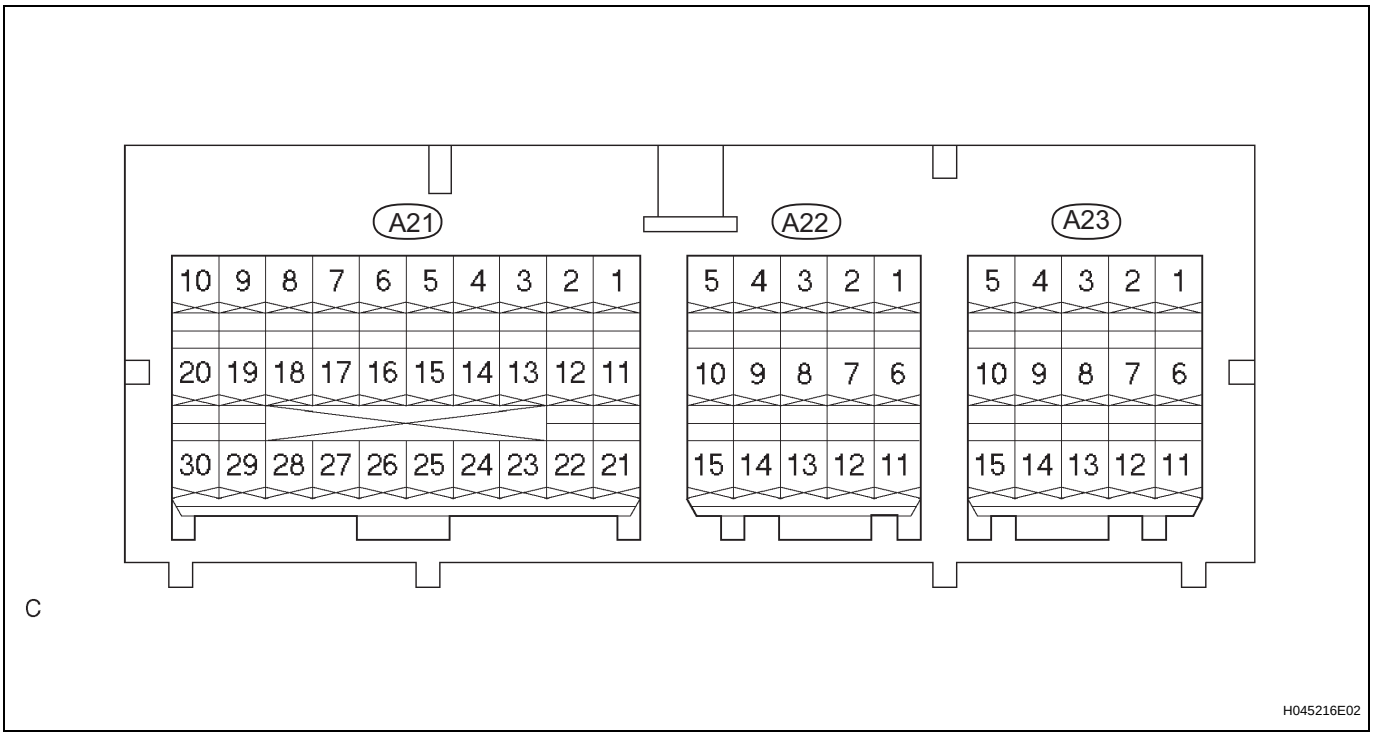
Symptom	Suspected area	See page
When ignition switch in ON position, SRS warning light occasionally comes on approximately 6 seconds after engine start.	SRS warning light circuit malfunction (SRS Warning Light Remains ON).	RS-341
SRS warning light always comes on even when DTC not set.	SRS warning light circuit malfunction (SRS Warning Light Remains ON).	RS-341
With ignition switch in ON position, SRS warning light does not come on.	SRS warning light circuit malfunction (SRS Warning Light does not Come On).	RS-346
Although SRS warning light operates normaly, neither DTCs normal system indication displayed.	TC and CG Terminal Circuit	RS-349
Although terminals TC and CG not connected, DTC or normal system indication displayed.	TC and CG Terminal Circuit	RS-349

TERMINALS OF ECU

1. CENTER AIRBAG SENSOR ASSEMBLY



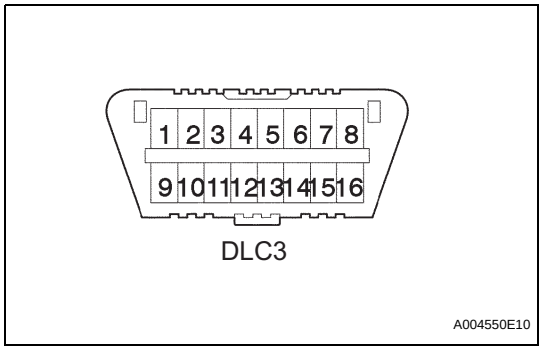
Terminal No.	Terminal Symbol	Destination
A21-1	P2+	Front passenger airbag assembly (Front passenger side squib 2nd step)
A21-2	P2-	Front passenger airbag assembly (Front passenger side squib 2nd step)
A21-3	P-	Front passenger airbag assembly (Front passenger side squib)
A21-4	P+	Front passenger airbag assembly (Front passenger side squib)
A21-5	D+	Steering pad (Driver side squib)
A21-6	D-	Steering pad (Driver side squib)
A21-7	D2-	Steering pad (Driver side squib 2nd step)
A21-8	D2+	Steering pad (Driver side squib 2nd step)
A21-11(*1)	MSW+	Airbag cut-off switch
A21-12(*1)	MSW-	Airbag cut-off switch
A21-13	PBEW	Passenger seat belt warning light assembly
A21-14	LA	Combination meter assembly
A21-15	TC	DLC3
A21-16	SIL	DLC3
A21-17	P-AB	Passenger seat belt warning light assembly
A21-21	IG2	IGN fuse (Power Source)
A21-22	GSW2	ECM
A21-23	PAON	Passenger seat belt warning light assembly
A21-24(*3)	GSW3	Occupant classification ECU
A21-25	E1	Ground
A21-26	E2	Ground
A21-27	-SR	Front airbag sensor RH
A21-28	-SL	Front airbag sensor LH
A21-29	+SR	Front airbag sensor RH
A21-30	+SL	Front airbag sensor LH
A22-1	PD-	Front seat outer belt assembly LH (Front pretensioner squib LH)

Terminal No.	Terminal Symbol	Destination
A22-2	PD+	Front seat outer belt assembly RH (Front pretensioner squib RH)
A22-6(*2)	ICD-	Curtain shield airbag assembly LH (Curtain shield squib LH)
A22-7(*2)	ICD+	Curtain shield airbag assembly LH (Curtain shield squib LH)
A22-8(*2)	BBD+	Side airbag sensor assembly LH
A22-9(*2)	SFD+	Front seat airbag assembly LH (Side squib LH)
A22-10(*2)	SFD-	Front seat airbag assembly LH (Side squib LH)
A22-11	DBE+	Front seat inner belt assembly LH
A22-12	DBE-	Front seat inner belt assembly LH
A22-13	DSP-	Seat position sensor
A22-14	DSP+	Seat position sensor
A22-15 (*2)	BBD-	Side airbag sensor assembly LH
A23-4	PP+	Front seat outer belt assembly RH (Front pretensioner squib RH)
A23-5	PP-	Front seat outer belt assembly RH (Front pretensioner squib RH)
A23-6(*2)	SFP-	Front seat airbag assembly RH (Side squib RH)
A23-7(*2)	SFP+	Front seat airbag assembly RH (Side squib RH)
A23-8(*2)	BBP+	Side airbag sensor assembly RH
A23-9 (*2)	ICP+	Curtain shield airbag assembly RH (Curtain shield squib RH)
A23-10 (*2)	ICP-	Curtain shield airbag assembly RH (Curtain shield squib RH)
A23-11(*2)	BBP-	Side airbag sensor assembly RH
A23-12	FSP+	Occupant classification ECU
A23-13	FSP-	Occupant classification ECU

*1:Except double cab

*2:With side and curtain shield airbag

*3:Bench Seat



DIAGNOSIS SYSTEM

1. CHECK DLC3

(a) The vehicle's ECU uses the ISO 9141-2 for communication protocol. The terminal arrangement of the DLC3 complies with SAE J1962 and matches the ISO 15765-4 format.

RS

Symbols (Terminals No.)	Terminal Description	Condition	Specified condition
SIL (7) - SG (5)	Bus + line	During transmission	Pulse generation
CG (4) - Body ground	Chassis ground	Always	Below 1 Ω
BAT (16) - Body ground	Battery positive	Always	10 to 14 V

HINT:

If the display shows a communication error message when connecting the cable of the intelligent tester to the DLC3, turning the engine switch on (IG) and operating the intelligent tester, there is a problem on the vehicle side or tool side.

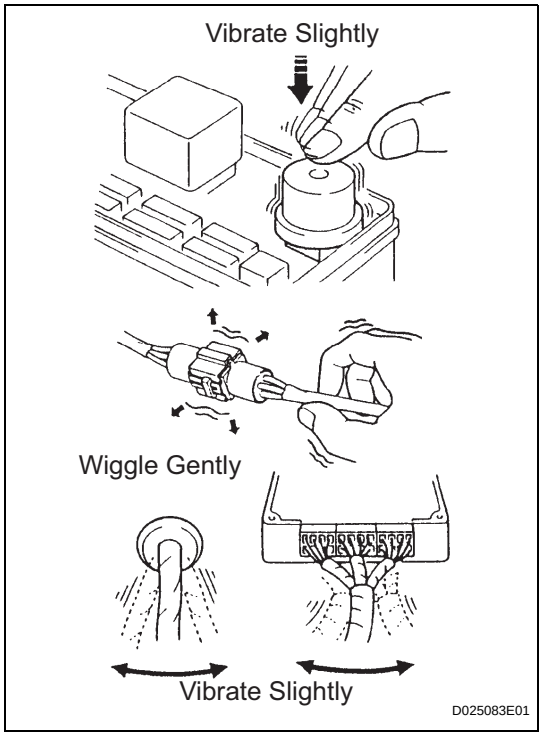
- If communication is normal when the tool is connected to another vehicle, inspect the DLC3 on the original vehicle.
- If communication is still not possible when the tool is connected to another vehicle, the problem is probably in the tool itself. Consult the Service Department listed in the tool's instruction manual.

2. SYMPTOM SIMULATION

HINT:

The most difficult case in troubleshooting is when no symptoms occur. In such cases, a thorough customer problem analysis must be carried out. Then the same or similar conditions and environment in which the problem occurred in the customer's vehicle should be simulated. No matter how experienced or skilled a technician may be, if he proceeds to troubleshoot without confirming the problem symptoms, he will likely overlook something important and make a wrong guess at some points in the repair operation.

This leads to a standstill in troubleshooting.



(a) Vibration method: When vibration seems to be the major cause.

HINT:

Perform the simulation method only during the primary check period (for approximately 6 seconds after the engine switch is turned on (IG)).

(1) Slightly vibrate the part of the sensor considered to be the problem cause with your fingers and check whether the malfunction occurs.

HINT:

Shaking the relays too strongly may result in open relays.

(2) Slightly shake the connector vertically and horizontally.

(3) Slightly shake the wire harness vertically and horizontally.

The connector joint and fulcrum of the vibration are the major areas to be checked thoroughly.

3. FUNCTION OF SRS WARNING LIGHT

(a) Primary check.

(1) Turn the engine switch off. Wait for at least 2 seconds, then turn the engine switch on (IG). The SRS warning light comes on for approximately 6 seconds and the diagnosis of the airbag system (including the seat belt pretensioners) is performed.

HINT:

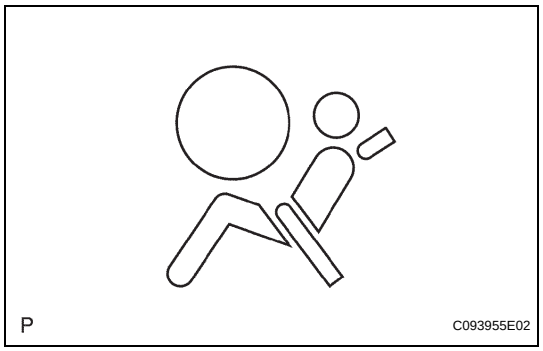
If trouble is detected during the primary check, the SRS warning light remains on even after the primary check period (for approximately 6 seconds) has elapsed.

RS

(b) Constant check.
(1) After the primary check, the center airbag sensor assembly constantly monitors the airbag system for trouble.
HINT:
If trouble is detected during the constant check, the center airbag sensor assembly functions as follows:
- The SRS warning light comes on.
- The SRS warning light goes off, and then comes on. This blinking pattern indicates a source voltage drop. The SRS warning light goes off 10 seconds after the source voltage returns to normal.

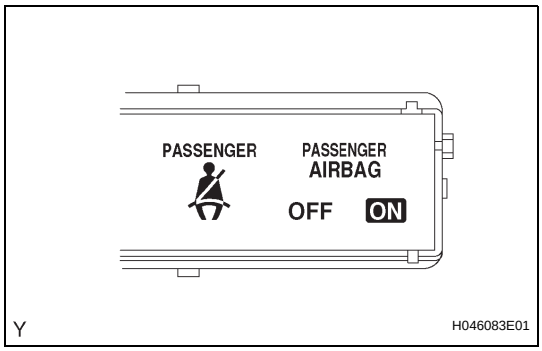
(c) Review.
(1) When the airbag system is normal:
The SRS warning light comes on only during the primary check period (for approximately 6 seconds after the engine switch is turned on (IG)).
(2) When the airbag system has trouble:
- The SRS warning light remains on even after the primary check period has elapsed.
- The SRS warning light goes off after the primary check, but comes on again during the constant check.
- The SRS warning light does not come on when turning the engine switch from off to on (IG).

HINT:
The center airbag sensor assembly keeps the SRS warning light on if the airbag has been deployed.



4. SRS WARNING LIGHT CHECK

(a) Turn the engine switch on (IG), and check that the SRS warning light comes on for approximately 6 seconds (primary check).
(b) Check that the SRS warning light goes off approximately 6 seconds after the engine switch is turned on (IG) (constant check).
HINT:
When any of the following symptoms occur, refer to the "Problem Symptoms Table" (See page RS-26).
- The SRS warning light comes on occasionally, after the primary check period has elapsed.
- The SRS warning light comes on, but a DTC is not output.
- The engine switch is turned from off to on (IG), but the SRS warning light does not come on.



5. PASSENGER AIRBAG ON/OFF INDICATOR CHECK

(a) Turn the ignition switch to the ON position.

(b) Check that the passenger airbag ON/OFF indicator (ON and OFF) comes on for approximately 4 seconds, then turns off for approximately 2 seconds.

HINT:

Refer to the table in step 4 regarding the passenger airbag ON/ OFF indicator when the ignition switch is turned to the ON position and approximately 6 seconds have passed.

6. RELEASE METHOD OF ACTIVATION PREVENTION MECHANISM

(a) The activation prevention mechanism is built into the connector for the squib circuit of the SRS. As explained in the troubleshooting section, insert a piece of paper that is the same thickness as the male terminal between the terminal and the short spring to release it (refer to the illustrations on the next 3 pages).

CAUTION:

Never release the activation prevention mechanism on the squib connector even when inspecting with the squib disconnected.

NOTICE:

- **Do not release the activation prevention mechanism unless specially directed by the troubleshooting procedure.**
- **To prevent the terminal and the short spring from being damaged, always use a piece of paper of the same thickness as the male terminal.**

DTC CHECK / CLEAR

1. SUPPLEMENTAL RESTRAINT SYSTEM DTC CHECK (USING SST CHECK WIRE)

(a) Check the DTCs (Present DTCs).

(1) Turn the ignition switch to the ON position, and wait for approximately 60 seconds.

(2) Using SST, connect terminals TC and CG of the DLC3.

SST 09843-18040

NOTICE:

Connect the terminals to the correct positions to avoid a malfunction.

(b) Check the DTCs (Past DTCs).

(1) Using SST, connect terminals TC and CG of the DLC3.

SST 09843-18040

NOTICE:

Connect the terminals to the correct positions to avoid a malfunction.

(2) Turn the ignition switch to the ON position, and wait for approximately 60 seconds.

(c) Read the DTCs.

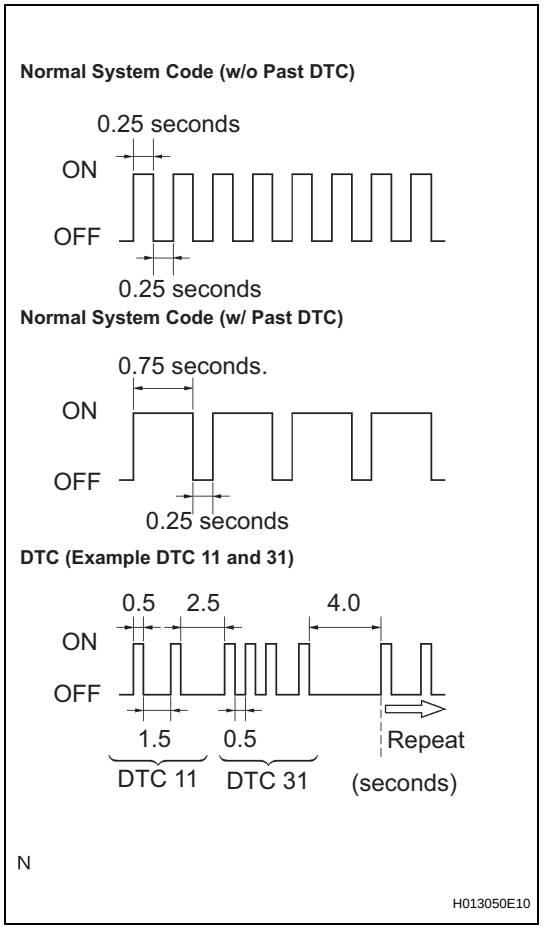
(1) Read the blinking patterns of the DTCs. Examples, the blinking patterns for the normal system indication, the past DTC indication, and the present DTC indication are shown in the illustration.

- Normal system indication
  The SRS warning light blinks twice per second.
- Past DTC indication
  When any past DTCs are stored in the center airbag sensor assembly, the SRS warning light blinks only once per second.
- Present DTC indication
  The first blinking indicates the first digit of a 2-digit DTC. The second blinking occurs after a 1.5-second pause to indicate the second digit.

If there are more than one DTC, there is a 2.5-second pause after each one. After all the DTC are displayed, there is a 4.0-second pause, and they are repeated.

HINT:

- If 2 or more malfunctions are found, the indication begins with the smaller numbered code.
- If DTCs are indicated without connecting the terminals, proceed to the "TC and CG Terminal Circuit" (See page RS-349).



RS

2. DTC CLEAR (USING SST CHECK WIRE)

(a) Clear the DTCs.

(1) When the ignition switch is turned off (turned to the lock position), the DTCs are cleared.
HINT:
Depending on the DTCs, the DTCs may not be cleared by turning off the ignition switch. In this case, proceed to the next procedure.

(2) Using SST, connect terminals TC and CG of the DLC3, and then turn the ignition switch to the ON position.
SST 09843-18040

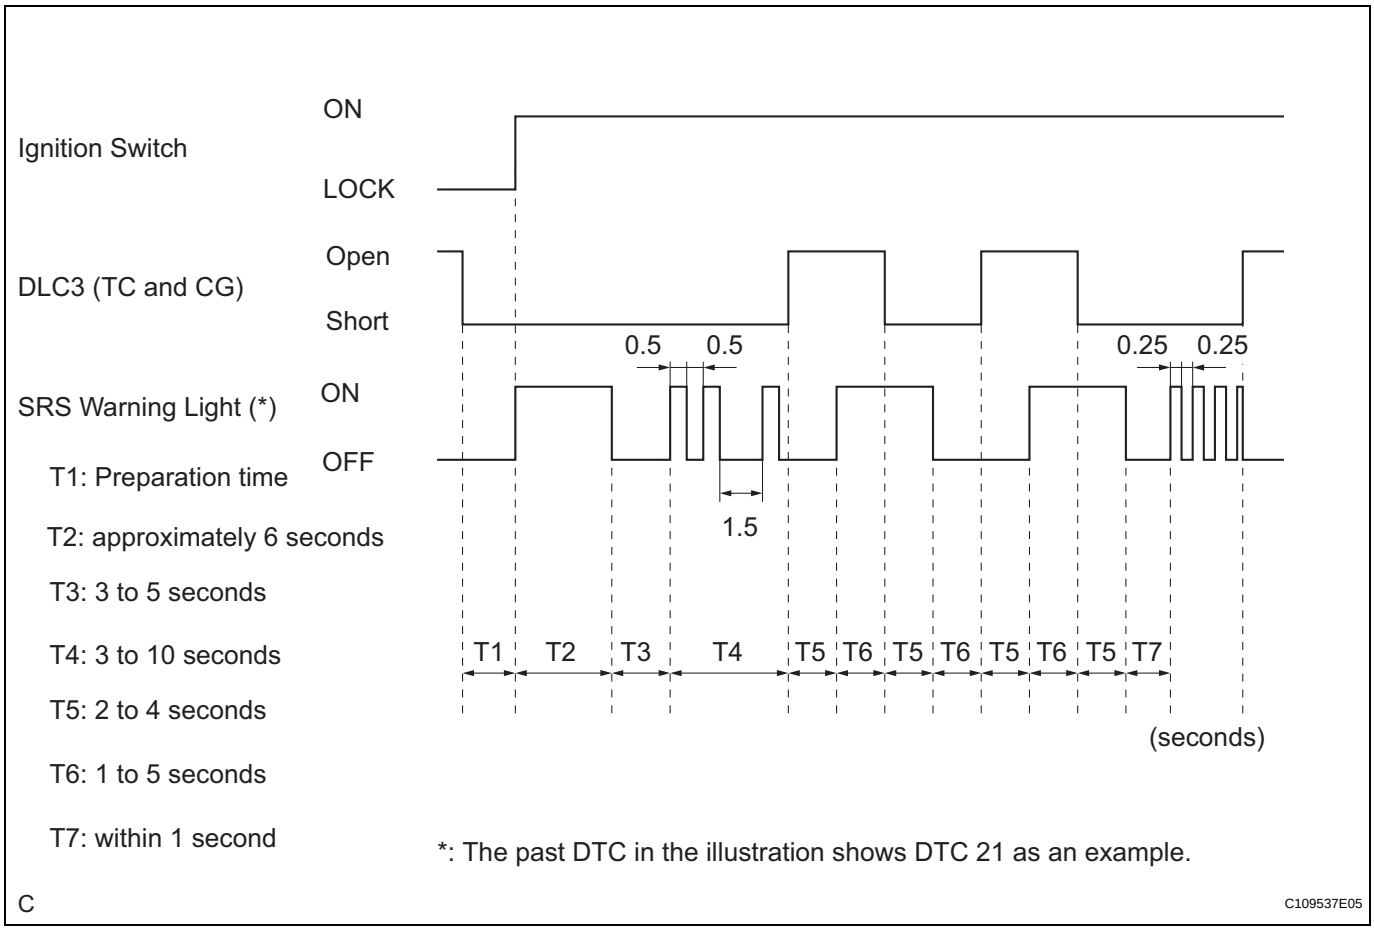
(3) Disconnect terminal TC of the DLC3 within 3 to 10 seconds after the DTCs being output, and check if the SRS warning light comes on within 3 seconds.

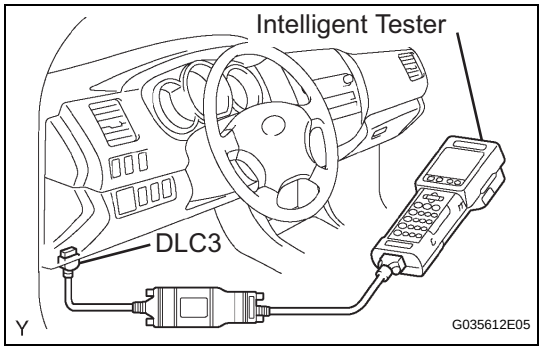
(4) Within 2 to 4 seconds of the SRS warning light coming on, connect terminals TC and CG of the DLC3.

(5) The SRS warning light should turn off within 2 to 4 seconds after connecting terminals TC and CG of the DLC3. Then, disconnect terminal TC within 2 to 4 seconds after the SRS warning light turning off.

(6) The SRS warning light comes on again within 2 to 4 seconds after disconnecting terminal TC. Then, reconnect terminals TC and CG within 2 to 4 seconds after the SRS warning light coming on, connect terminals TC and CG of the DLC3.

(7) Check if the SRS warning light turns off 2 to 4 seconds after connecting terminals TC and CG of the DLC3. Also check if the normal system indication is displayed within 1 second of the SRS warning light turning off.
If DTCs are not cleared, repeat this procedure until the codes are cleared.



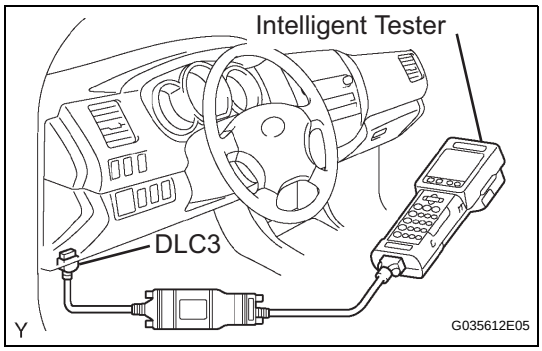


3. SUPPLEMENTAL RESTRAINT SYSTEM DTC CHECK (USING INTELLIGENT TESTER)

(a) Check the DTCs.
(1) Connect the intelligent tester to the DLC3.
(2) Turn the ignition switch to the ON position and turn the tester on.
(3) Check the DTCs by following the prompts on the tester screen.
HINT:
Refer to the intelligent tester operator manual for further details.

(b) Clear the DTCs.
(1) Connect the intelligent tester to the DLC3.
(2) Turn the ignition switch to the ON position and turn the tester on.
(3) Clear the DTCs by following the prompts on the tester screen.
HINT:
Refer to the intelligent tester operator's manual for further details.

RS



CHECK MODE PROCEDURE

1. CHECK MODE (SIGNAL CHECK): (USING INTELLIGENT TESTER)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to the ON position and turn the tester on.
(c) Select the SIGNAL CHECK on the tester, and proceed checking with the tester.

DATA LIST / ACTIVE TEST

HINT:
By accessing the DATA LIST displayed on the intelligent tester, you can perform such functions as reading the values of switches and sensors without removing any parts. Reading the DATA LIST is the first step of troubleshooting and is one method to shorten labor time.

1. DATA LIST FOR CENTER AIRBAG SENSOR ASSEMBLY

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to the ON position and turn the tester on.
(c) Follow the display on the tester screen to enter the "DATA LIST".
(d) Check the condition by referring to the table below.

Item	Measure Item/ Range (Display)	Normal Condition	Diagnostic Note
D SEAT POSITION	Seat position (Driver side)/ FORWARD: Seat position is forward BKWARD: Seat position is rearward FAIL: A failure is detected	FORWARD/BKWARD	-
PASSENGER CLASS(*1)	Passenger classification/ NG: Date is not determined NONE: Vacant CHILD: Child (less than 36 kg (79.37 lb)) is seated SMALL: Adult (36 to 54 kg (79.37 to 119.05 lb)) is seated REGULAR: Adult (More than 54 kg (119.05 lb)) is seated FAIL: A failure is detected	NG/NONE/CHILD/SMALL/ REGULAR	-

P BUCKLE SW	Buckle switch (Right side)/ UNSET: The seat belt is not fastened SET: The seat belt is fastened NG: Data is not determined	UNSET/SET	-
DISPLAY TYPE	Display type identification information/ LR: The display is indicated by LH/RH DP: The display is indicated by Driver/Passenger	DP	-

*1: Separate Seat

DIAGNOSTIC TROUBLE CODE CHART

If a DTC is displayed during the DTC check, check the circuit listed for the DTC in the table below (refer to the appropriate page).

HINT:

- When the SRS warning light remains on and the normal system code is output, a decrease in the source voltage is likely to occur. This malfunction is not stored in the memory of the center airbag sensor assembly. If the power source voltage returns to normal, the SRS warning light will automatically go off.
- When 2 or more DTCs are indicated, the DTC with the lowest number appears first.
- If a DTC is not listed on the DTC chart, the center airbag sensor may have malfunctioned.
- In the case of any malfunctions concerning open circuits, shorts to ground, or shorts to B+ due to squibs, other DTCs may not be set. In this case, repair the malfunction currently indicated and then perform malfunction diagnosis again.
- Mark in the check mode column:
  -: DTC does not correspond to check mode.
  ○: DTC corresponds to check mode.
- When DTC B1650/32 is set as a result of troubleshooting the Supplemental Restraint System (SRS), perform troubleshooting for the occupant classification system.

DTC	B1000/31	Center Airbag Sensor Assembly Malfunction

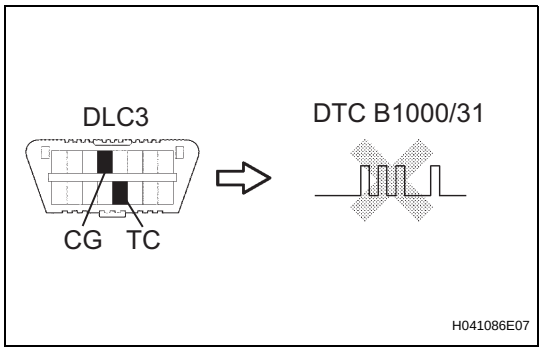
DESCRIPTION

The center airbag sensor assembly consists of parts such as the airbag sensor, the safing sensor, the drive circuit, the diagnostic circuit and the ignition control.
When the center airbag sensor assembly receives signals from the airbag sensor, it determines whether or not the SRS should be activated.
B1000/31 is set when a malfunction is detected in the center airbag sensor assembly .

DTC No.	DTC Detecting Condition	Trouble Area
B1000/31	• Center airbag sensor assembly malfunction	• Center airbag sensor assembly

HINT:
When any other DTCs are set simultaneously with B1000/31, repair the malfunctions indicated by those DTCs first.

1	CHECK CENTER AIRBAG SENSOR ASSEMBLY



(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(d) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(e) Clear any DTCs stored in the memory (See page RS-34).
(f) Turn the ignition switch to the LOCK position.
(g) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(h) Check for DTCs (See page RS-34).
OK:
DTC B1000/31 is not output.

NG → **REPLACE CENTER AIRBAG SENSOR ASSEMBLY**

OK

USE SIMULATION METHOD TO CHECK

RS

DTC	B1610/13	Front Airbag Sensor RH Circuit Malfunction

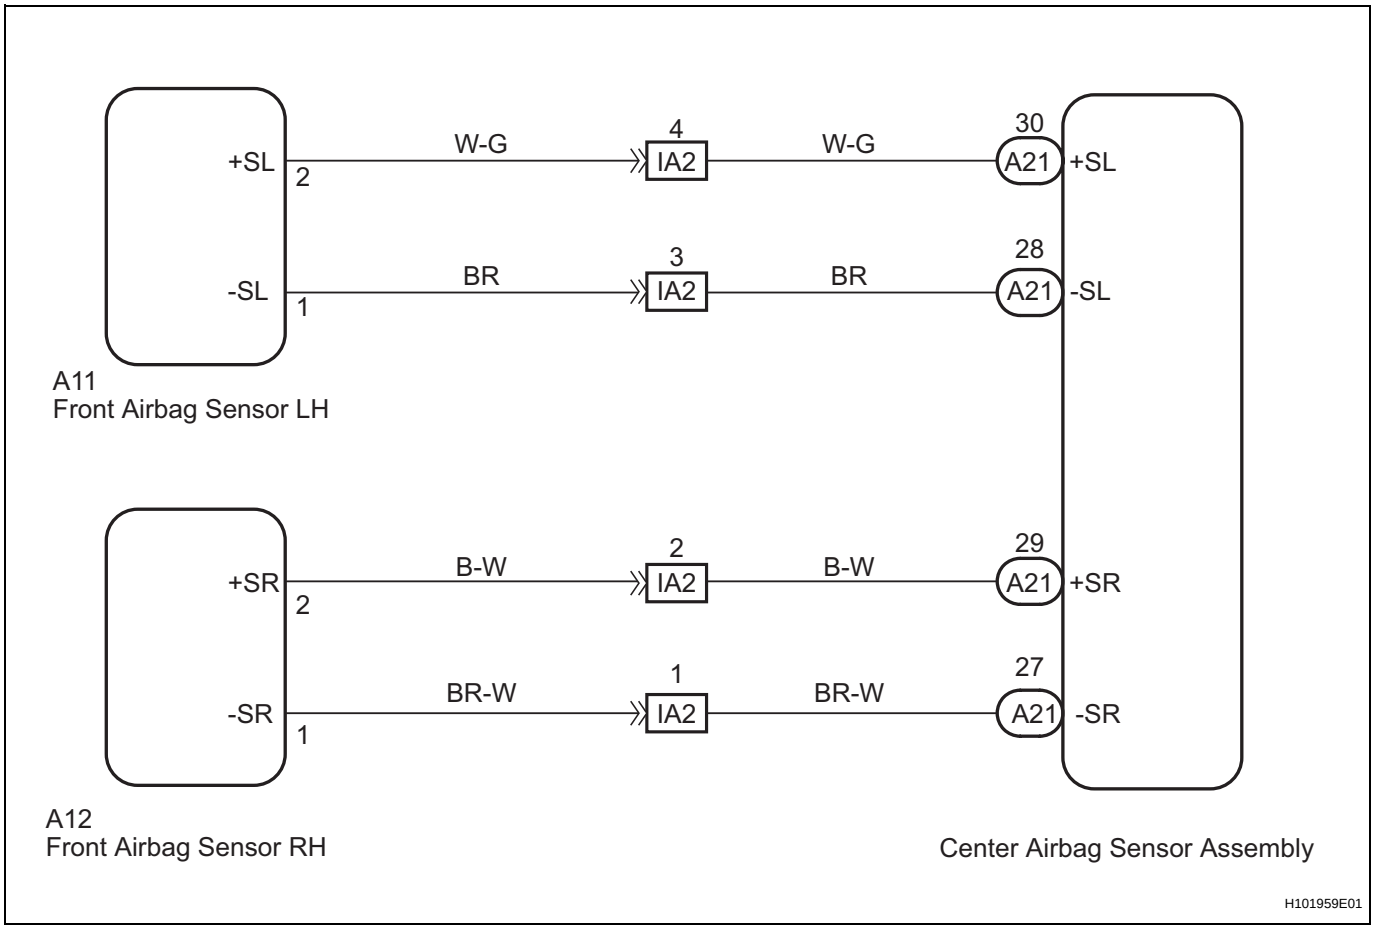
DTC	B1615/14	Front Airbag Sensor LH Circuit Malfunction

DESCRIPTION

The front airbag sensor RH consists of parts such as the diagnostic circuit and the frontal detection sensor.
The configuration of the front airbag sensor LH is the same as that of the RH.
When the center airbag sensor assembly receives signals from the frontal deceleration sensor, it determines whether or not the SRS should be activated.
DTC B1610/13 is set when a malfunction is detected in the front airbag sensor RH circuit.
DTC B1615/14 is set when a malfunction is detected in the front airbag sensor LH circuit.

DTC No.	DTC Detecting Condition	Trouble Areas
B1610/13	• The center airbag sensor assembly receives a line short signal, an open signal, a short to ground signal or a short to B+ signal in the front airbag sensor RH circuit for 2 seconds • Front airbag sensor RH malfunction • Center airbag sensor assembly malfunction	• Front airbag sensor RH • Center airbag sensor assembly • Instrument panel wire • Engine room main wire
B1615/14	• The center airbag sensor assembly receives a line short signal, an open signal, a short to ground signal or a short to B+ signal in the front airbag sensor LH circuit for 2 seconds • Front airbag sensor LH malfunction • Center airbag sensor assembly malfunction	• Front airbag sensor LH • Center airbag sensor assembly • Instrument panel wire • Engine room main wire

WIRING DIAGRAM



RS

CAUTION:
In order to prevent unexpected airbag deployment, disconnect the following connectors before inspecting parts such as wire harnesses, if the application of tester probes to the center airbag sensor assembly connector is necessary.
(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Disconnect the connectors from the center airbag sensor assembly.
(d) Disconnect the connectors from the steering pad.
(e) Disconnect the connector from the front passenger airbag assembly.
(f) Disconnect the connector from the front seat outer belt assembly LH.
(g) Disconnect the connector from the front seat outer belt assembly RH.
HINT:
Skip the following steps if side and curtain shield airbags are not fitted.
(h) Disconnect the connector from the front seat airbag assembly LH.
(i) Disconnect the connector from the front seat airbag assembly RH.
(j) Disconnect the connector from the curtain shield airbag assembly LH.
(k) Disconnect the connector from the curtain shield airbag assembly RH.

1 CHECK DTC

(a) Proceed to the appropriate step according to DTC readings.
(1) Check the DTC (See page RS-34).
Result

Result	Proceed to
DTC B1610/13 is output.	A
DTC B1615/14 is output.	B
DTC B1610/13 and B1615/14 are output.	C
Neither DTC B1610/13 nor B1615/14 is output.	D

B → **Go to step 14**

C → **Go to step 26**

D → **USE SIMULATION METHOD TO CHECK**

A

RS

2 CHECK CONNECTION OF CONNECTORS

(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Check that the connectors are properly connected to the center airbag sensor assembly and the airbag sensor front RH.
OK:
The connectors are properly connected.

NG → **CONNECT CONNECTORS**

OK

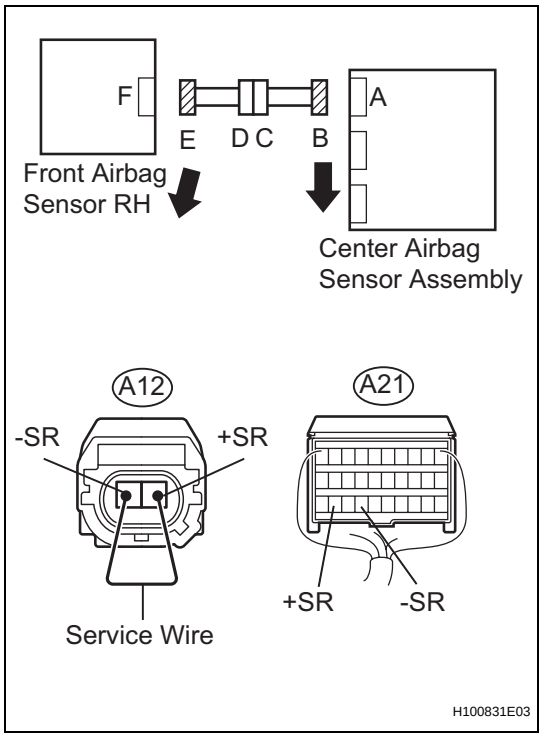
3	CHECK CONNECTOR

(a) Check that the connectors (on the center airbag sensor assembly side and airbag sensor front RH side) are not damaged (See page IN-34).
OK:
The connectors are not deformed or damaged.

NG → **REPAIR OR REPLACE WIRE HARNESS**

OK

4	CHECK FRONT AIRBAG SENSOR RH CIRCUIT (FOR OPEN)



(a) Disconnect the connectors from the center airbag sensor assembly and the front airbag sensor RH.
(b) Using a service wire, connect A12-2 (+SR) and A12-1 (-SR) of connector E.
NOTICE:
Do not forcibly insert the service wires into the terminals of the connector when connecting.
(c) Measure the resistance.
Standard resistance

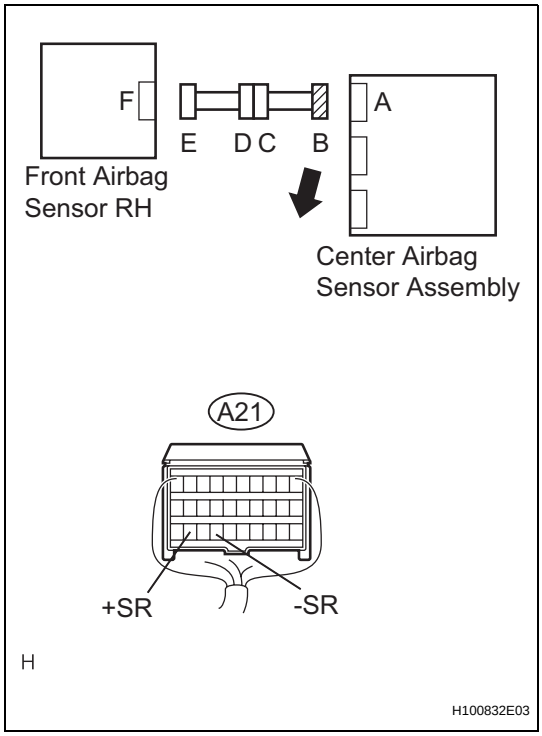
Tester connection	Condition	Specified Condition
A21-29 (+SR) - A21-27 (-SR)	Always	Below 1 Ω

NG → **Go to step 10**

OK

RS

5 CHECK FRONT AIRBAG SENSOR RH CIRCUIT (FOR SHORT)



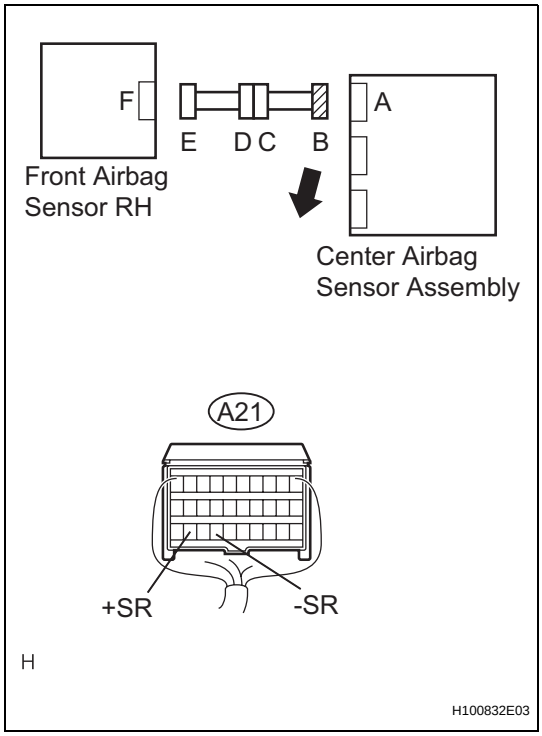
(a) Disconnect the service wire from connector E.
(b) Measure the resistance.
Standard resistance

Tester connection	Condition	Specified Condition
A21-29 (+SR) - A21-27 (-SR)	Always	1 MΩ or higher

NG → **Go to step 11**

OK

6 CHECK FRONT AIRBAG SENSOR RH CIRCUIT (TO B+)



(a) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(b) Turn the ignition switch to the ON position.
(c) Measure the voltage.
Standard voltage

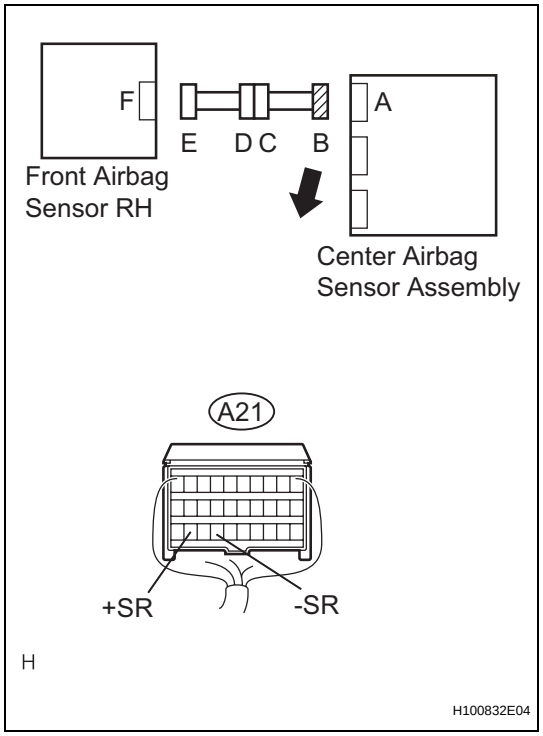
Tester connection	Condition	Specified Condition
A21-29 (+SR) - Body ground	Ignition switch ON	Below 1 V
A21-27 (-SR) - Body ground	Ignition switch ON	Below 1 V

NG → **Go to step 12**

OK

RS

7 CHECK FRONT AIRBAG SENSOR RH CIRCUIT (TO GROUND)



(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Measure the resistance.

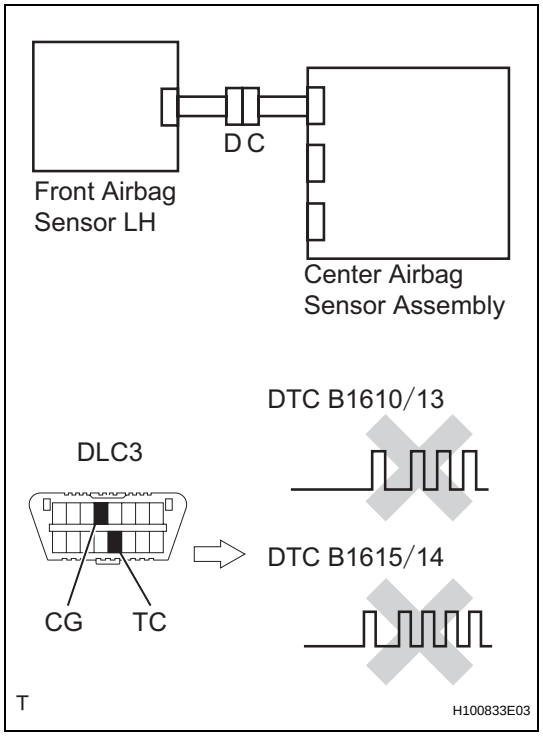
Standard resistance

Tester connection	Condition	Specified Condition
A21-29 (+SR) - Body ground	Always	1 MΩ or higher
A21-27 (-SR) - Body ground	Always	1 MΩ or higher

NG → **Go to step 13**

OK

8 CHECK FRONT AIRBAG SENSOR RH



(a) Connect the connectors to the center airbag sensor assembly.
(b) Interchange the airbag sensor front RH with the front airbag sensor LH and connect the connectors to them.
(c) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(d) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(e) Clear any DTCs stored in the memory (See page RS-34).
(f) Turn the ignition switch to the LOCK position.
(g) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(h) Check for DTCs (See page RS-34).

Result

Result	Proceed to

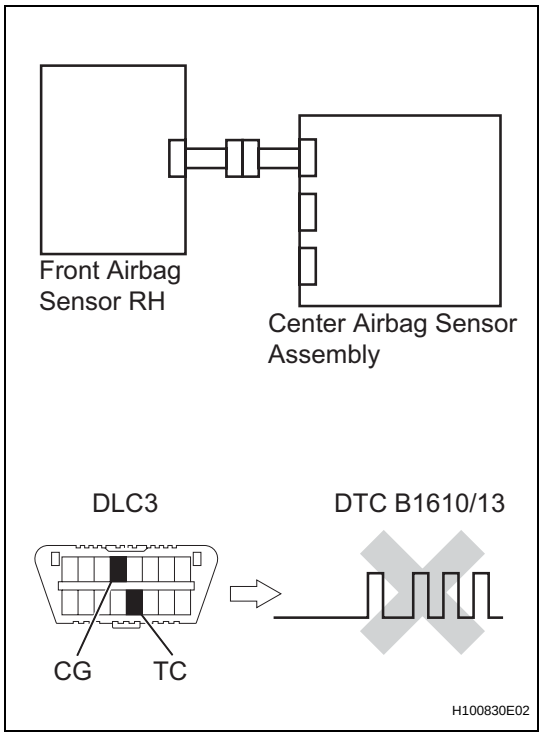
9	REPLACE CENTER AIRBAG SENSOR ASSEMBLY



(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Replace the center airbag sensor assembly (See page RS-602).

HINT:
Perform the inspection using parts from a normal vehicle when possible.

(d) Connect the connectors to the center airbag sensor assembly.
(e) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(f) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(g) Clear any DTCs stored in the memory (See page RS-34).
(h) Turn the ignition switch to the LOCK position.
(i) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(j) Check for DTCs (See page RS-34).

OK:
DTC B1610/13 is not output.

HINT:
DTCs other than B1610/13 may be output at this time, but they are not related to this check.

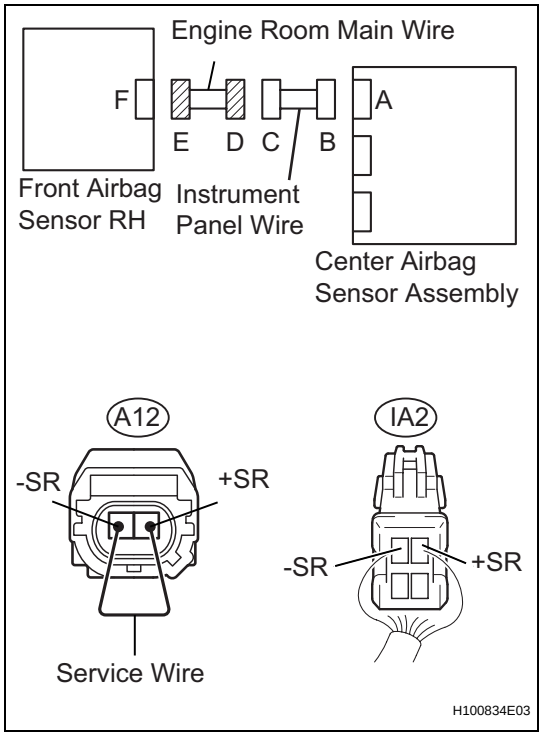
NG → **REPLACE FRONT AIRBAG SENSOR RH**

OK

END

RS

10	CHECK ENGINE ROOM MAIN WIRE (FOR OPEN)



(a) Disconnect the engine room main wire connector from the instrument panel wire.

HINT:

The service wire has already been inserted into connector E.

(b) Measure the resistance.

Standard resistance

Tester Connection	Condition	Specified Condition
IA2 -1 (-SR) - IA2-2 (+SR)	Always	Below 1 Ω

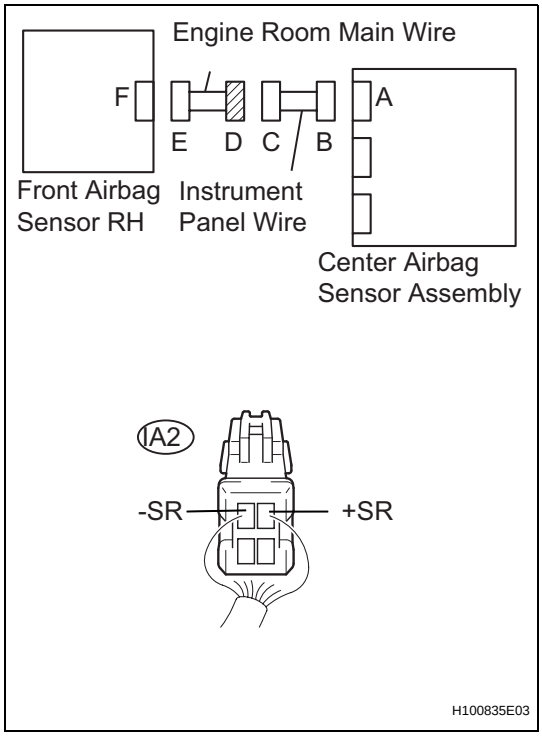
NG → **REPAIR OR REPLACE ENGINE ROOM MAIN WIRE**

OK

REPAIR OR REPLACE INSTRUMENT PANEL WIRE

RS

11	CHECK ENGINE ROOM MAIN WIRE (FOR SHORT)



(a) Disconnect the engine room main wire connector from the instrument panel wire.
(b) Measure the resistance.
Standard resistance

END

DTC	B1620/21	Driver Side - Side Airbag Sensor Circuit Malfunction

DTC	B1625/22	Front Passenger Side - Side Airbag Sensor Circuit Malfunction

DESCRIPTION

The side airbag sensor assembly LH consists of parts such as the safing sensor, the diagnostic circuit and the lateral deceleration sensor. The configuration of the side airbag sensor assembly RH is the same as that of the LH.

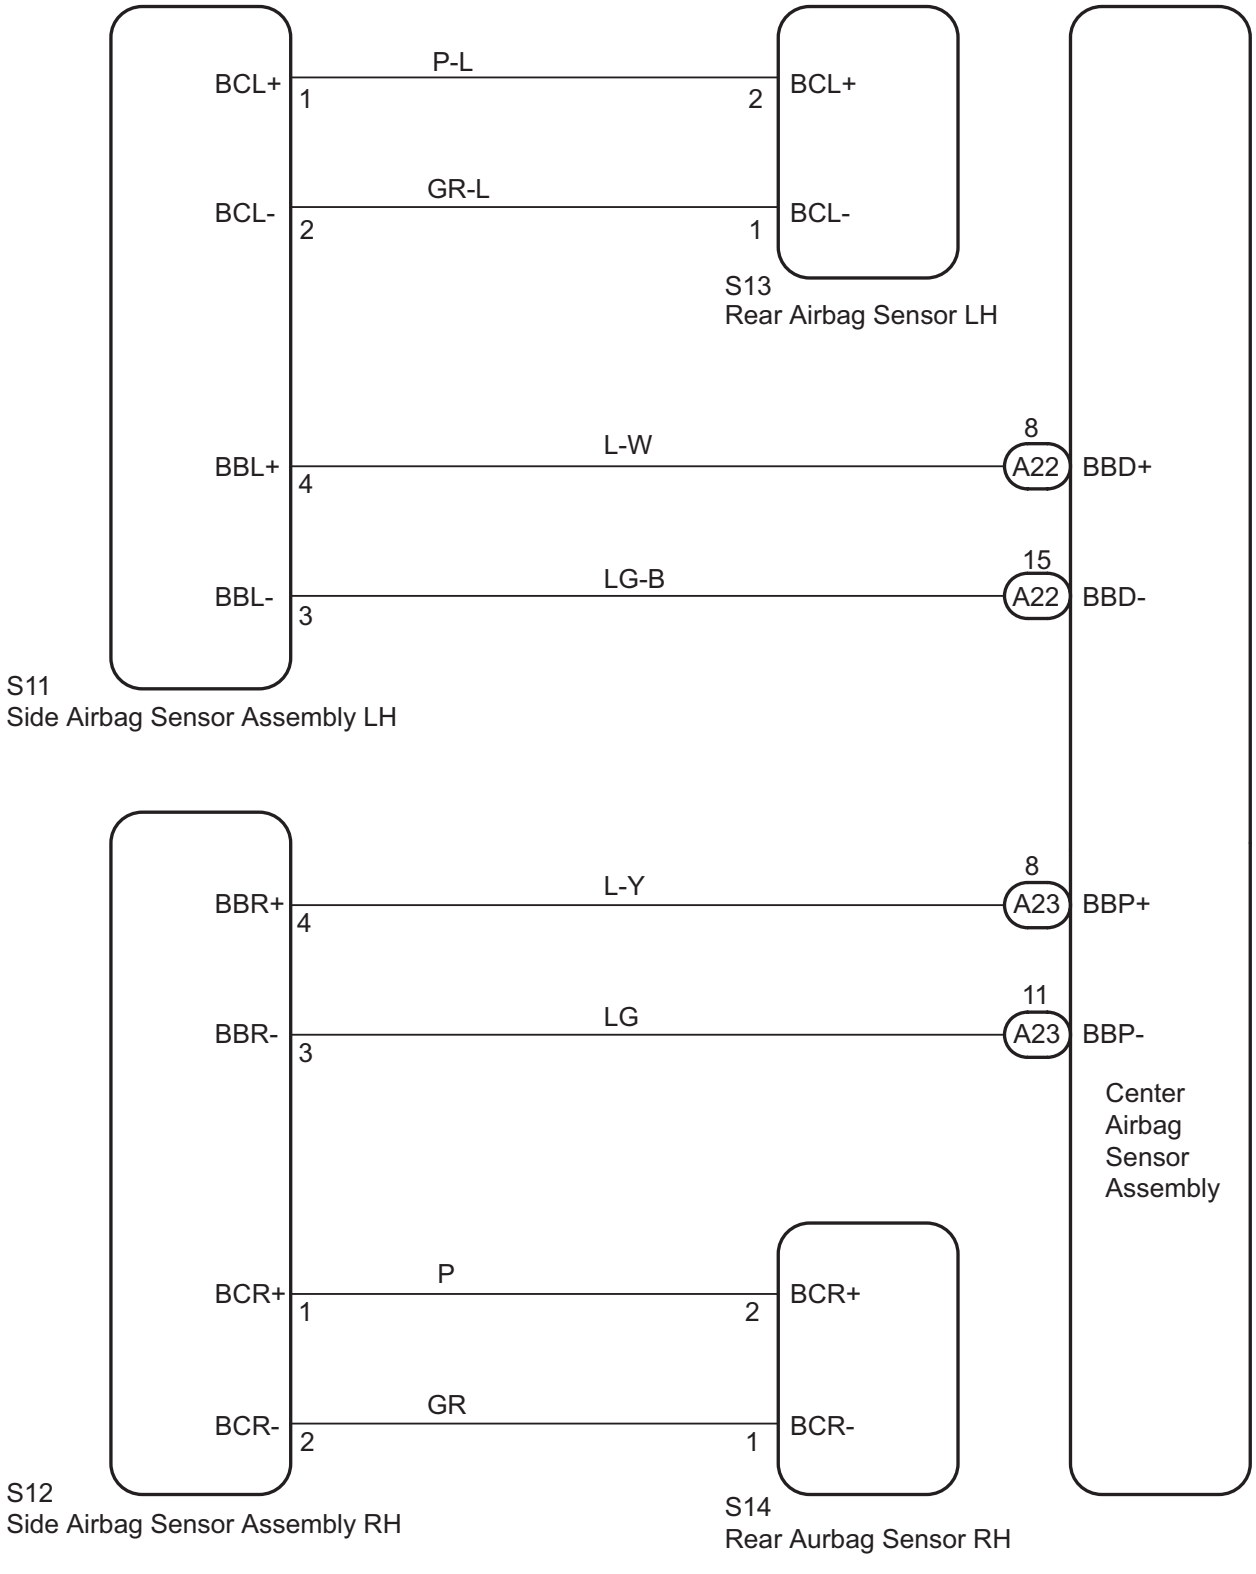
When the airbag sensor assembly center receives signals from the lateral deceleration sensor, it determines whether or not the SRS should be activated.

DTC B1620/21 is set when a malfunction is detected in the side airbag sensor assembly (driver seat side) circuit.

DTC B1625/22 is set when a malfunction is detected in the side airbag sensor assembly (front passenger seat side) circuit.

DTC No.	DTC Detecting Conditions	Trouble Areas
B1620/21	• The center airbag sensor assembly receives a line short circuit signal, an open circuit signal, a short circuit to ground signal or a short circuit to B+ signal in the side airbag sensor assembly (Driver seat side) circuit for 2 seconds • Side airbag sensor assembly LH malfunction • Rear airbag sensor LH malfunction • Center airbag sensor assembly malfunction	• Side airbag sensor assembly LH • Rear airbag sensor LH • Center airbag sensor assembly • No. 2 floor wire
B1625/22	• The center airbag sensor assembly receives a line short circuit signal, an open circuit signal, a short circuit to ground signal or a short circuit to B+ signal in the side airbag sensor assembly (Front passenger seat side) circuit for 2 seconds • Side airbag sensor assembly RH malfunction • Rear airbag sensor RH malfunction • Center airbag sensor assembly malfunction	• Side airbag sensor assembly RH • Rear airbag sensor RH • Center airbag sensor assembly • Floor wire

WIRING DIAGRAM



RS

NOTICE:
In order to prevent unexpected airbag deployment, disconnect the following connectors before inspecting parts such as wire harnesses, if the application of tester probes to the center airbag sensor assembly connector is necessary.
(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Disconnect the connectors from the center airbag sensor assembly.
(d) Disconnect the connectors from the steering pad.
(e) Disconnect the connector from the front passenger airbag assembly.
(f) Disconnect the connector from the front seat airbag assembly LH.
(g) Disconnect the connector from the front seat airbag assembly RH.
HINT:
Skip the following steps if side and curtain shield airbags are not fitted.
(h) Disconnect the connector from the curtain shield airbag assembly LH.
(i) Disconnect the connector from the curtain shield airbag assembly RH.
(j) Disconnect the connector from the front seat outer belt assembly LH.
(k) Disconnect the connector from the front seat outer belt assembly RH.

OK

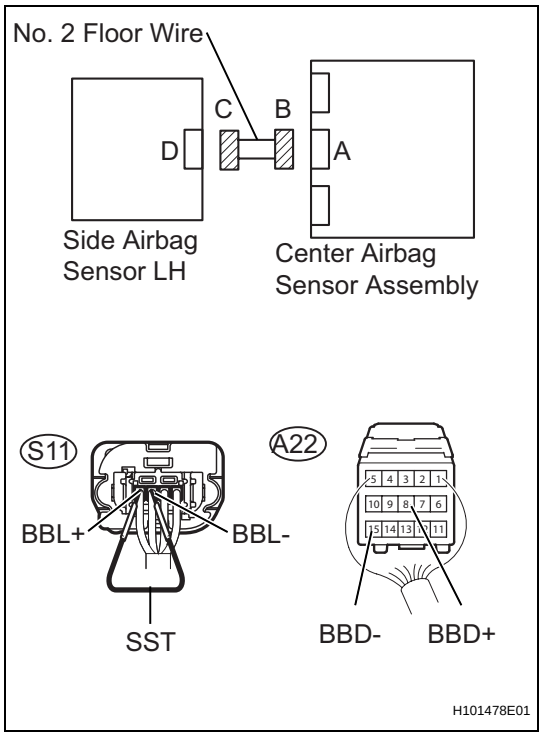
4	CHECK NO. 2 FLOOR WIRE (FOR OPEN)



SST 09843-18040

(a) Disconnect the connectors from the center airbag sensor assembly and the side airbag sensor assembly LH.
(b) Using SST, connect S11-4 (BBL+) and S11-3 (BBL-) of connector C.
(c) Measure the resistance.
Standard resistance

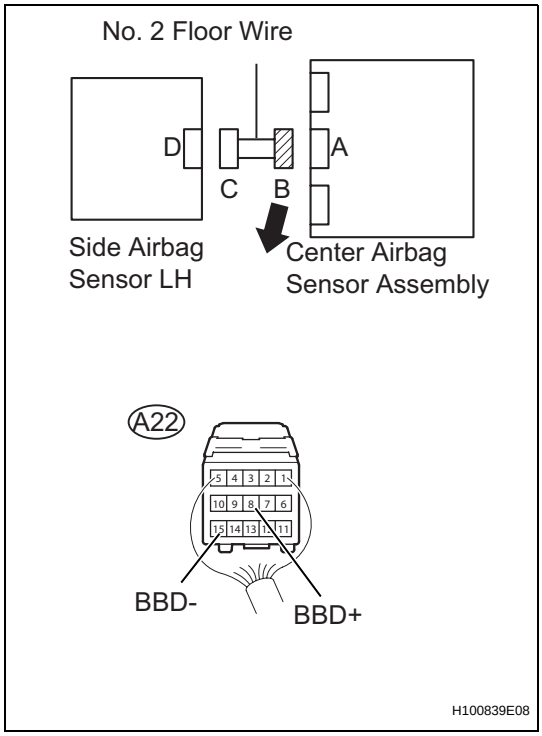
Tester Connection	Condition	Specified Condition
A22-8 (BBD+) - A22-15 (BBD-)	Always	Below 1 Ω

NG → **REPAIR OR REPLACE NO. 2 FLOOR WIRE**

OK

RS

5 CHECK NO. 2 FLOOR WIRE (FOR SHORT)



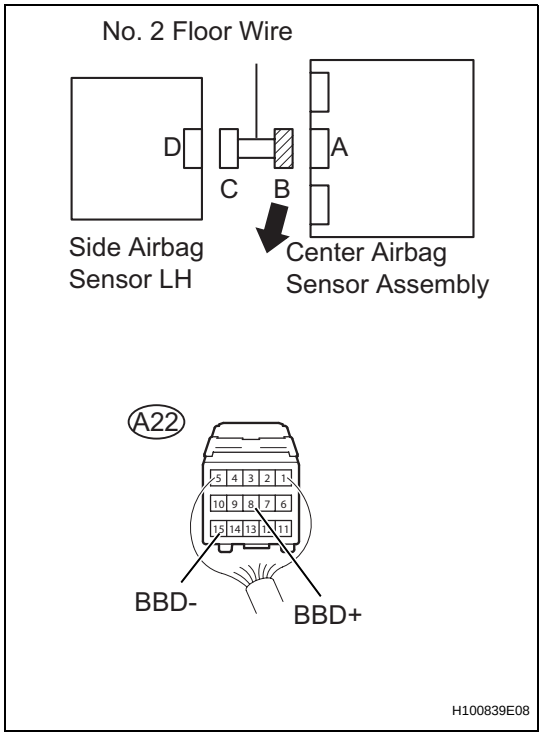
(a) Disconnect the SST from connector C.
(b) Measure the resistance.
Standard resistance

Tester Connection	Condition	Specified Condition
A22-8 (BBD+) - A22-15 (BBD-)	Always	1 MΩ or Higher

NG → REPAIR OR REPLACE NO. 2 FLOOR WIRE

OK

6 CHECK NO. 2 FLOOR WIRE (TO B+)



(a) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(b) Turn the ignition switch to the ON position.
(c) Measure the voltage.
Standard voltage

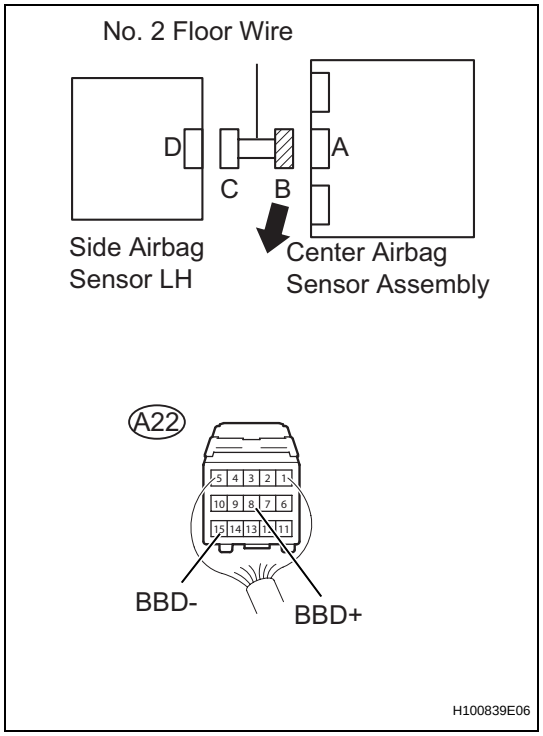
Tester Connection	Condition	Specified Condition
A22-8 (BBD+) - Body ground	Ignition switch ON	Below 1 V
A22-15 (BBD-) - Body ground	Ignition switch ON	Below 1 V

NG → REPAIR OR REPLACE NO. 2 FLOOR WIRE

OK

RS

7 CHECK NO. 2 FLOOR WIRE (TO GROUND)



(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Measure the resistance.

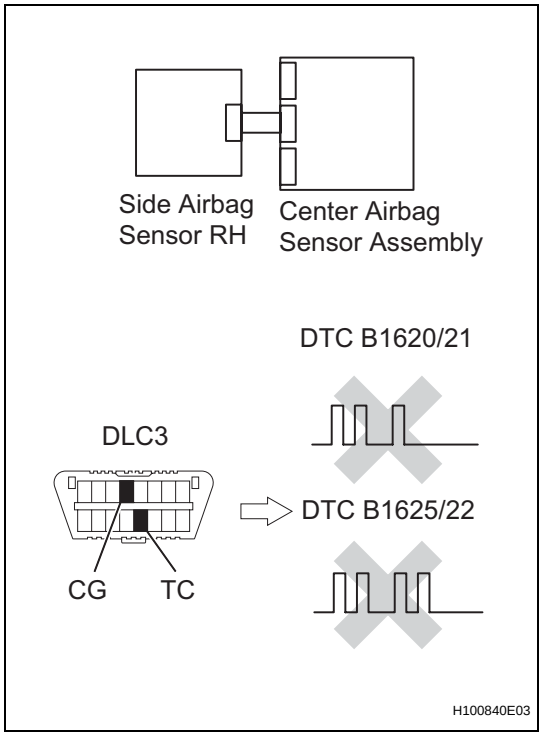
Standard resistance

Tester Connection	Condition	Specified Condition
A22-8 (BBD+) - Body ground	Always	1 MΩ or Higher
A22-15 (BBD-) - Body ground	Always	1 MΩ or Higher

NG → REPAIR OR REPLACE NO. 2 FLOOR WIRE

OK

8 CHECK SIDE AIRBAG SENSOR ASSEMBLY LH



(a) Connect the connectors to the center airbag sensor assembly.
(b) Interchange the side airbag sensor assembly RH with the side airbag sensor assembly LH and connect the connectors to them.
(c) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(d) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(e) Clear the DTCs stored in the memory (See page RS-34).
(f) Turn any ignition switch to the LOCK position.
(g) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(h) Check for DTCs (See page RS-34).

Result

Result	Proceed to
DTC B1620/21 is output.	A

Neither DTC B1620/21 nor B1625/22 is output.	C

B → REPLACE REAR AIRBAG SENSOR LH

C → USE SIMULATION METHOD TO CHECK

RS

A

9	CHECK CONNECTION OF CONNECTORS

(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Check that the connectors are properly connected to the rear airbag sensor LH.
OK:
The connectors are properly connected.

NG → **CONNECT CONNECTORS**

OK

10	CHECK CONNECTORS

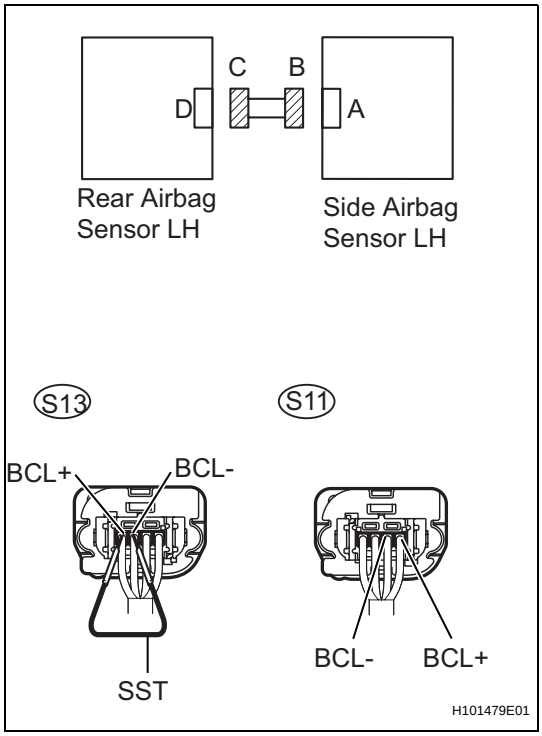
(a) Check that the connectors (on the side airbag sensor assembly LH side and rear airbag sensor LH side) are not damaged (See page IN-34).
OK:
The connectors are not deformed or damaged.

NG → **REPAIR OR REPLACE WIRE HARNESS**

OK

11	CHECK NO. 2 FLOOR WIRE (FOR OPEN)

SST 09843-18040



(a) Disconnect the connectors from the side airbag sensor assembly LH and the rear airbag sensor LH.
(b) Using SST, connect S13-1 (BCL-) and S13-2 (BCL+) of connector C.
(c) Measure the resistance.
Standard resistance

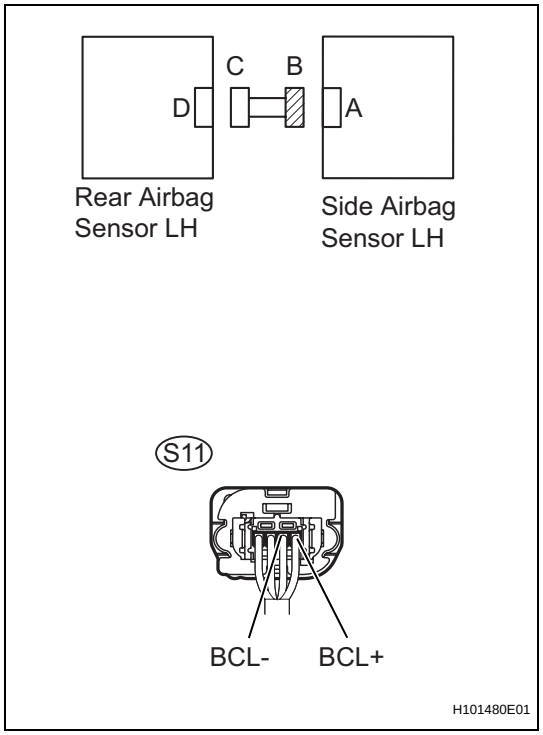
Tester Connection	Condition	Specified Condition
S11-1 (BCL+) - S11-2 (BCL-)	Always	Below 1 Ω

NG → **REPAIR OR REPLACE NO. 2 FLOOR WIRE**

RS

OK

12 CHECK NO. 2 FLOOR WIRE (FOR SHORT)



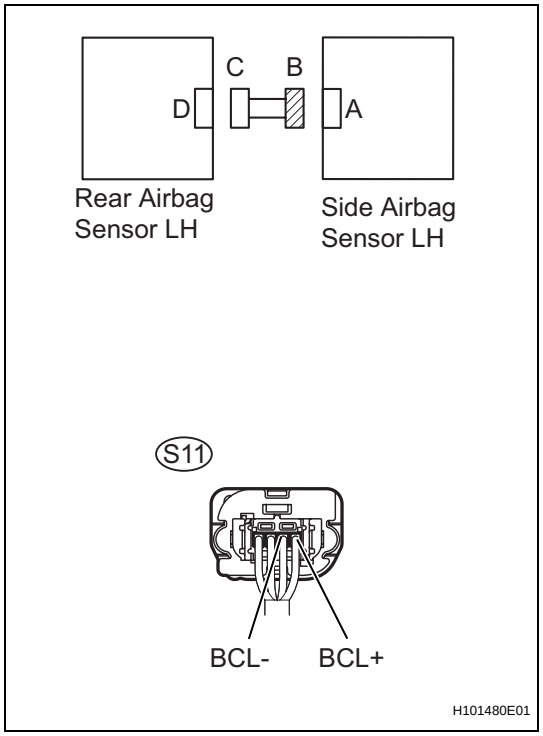
(a) Disconnect the SST from connector C.
(b) Measure the resistance.
Standard resistance

Tester Connection	Condition	Specified Condition
S11-1 (BCL+) - S11-2 (BCL-)	Always	1 MΩ or Higher

NG → REPAIR OR REPLACE NO. 2 FLOOR WIRE

OK

13 CHECK NO. 2 FLOOR WIRE (TO B+)



(a) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(b) Turn the ignition switch to the ON position.
(c) Measure the voltage.
Standard voltage

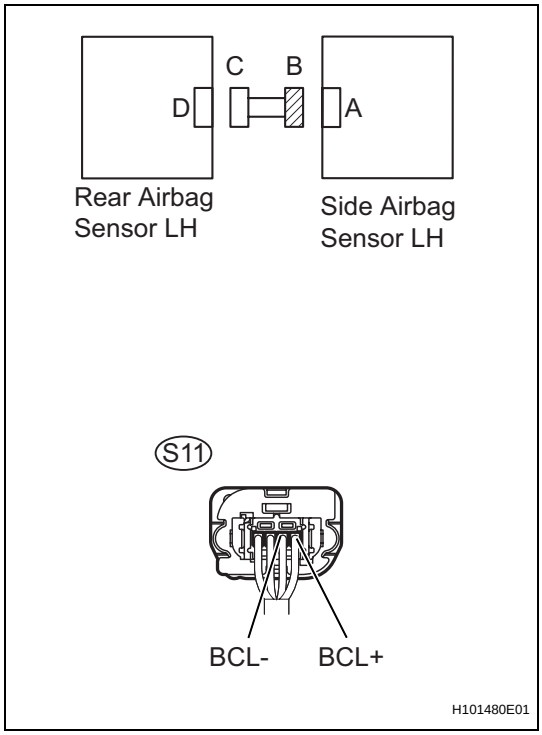
Tester Connection	Condition	Specified Condition
S11-1 (BCL+) - Body ground	Ignition switch ON	Below 1 V
S11-2 (BCL-) - Body ground	Ignition switch ON	Below 1 V

NG → REPAIR OR REPLACE NO. 2 FLOOR WIRE

RS

OK

14 CHECK NO. 2 FLOOR WIRE (TO GROUND)



(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Measure the resistance.

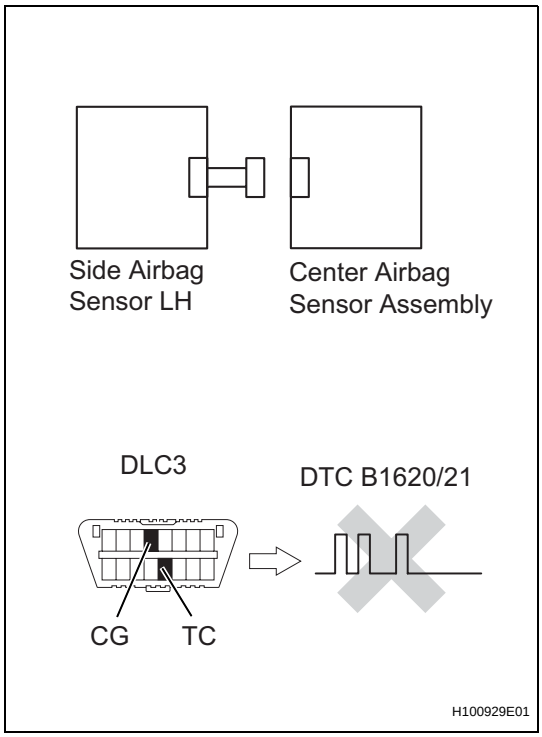
Standard resistance

Tester Connection	Condition	Specified Condition
S11-1 (BCL+) - Body ground	Always	1 MΩ or Higher
S11-2 (BCL-) - Body ground	Always	1 MΩ or Higher

NG → **REPAIR OR REPLACE NO. 2 FLOOR WIRE**

OK

15 CHECK DTC



(a) Connect the connectors to the center airbag sensor assembly.
(b) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(c) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(d) Clear any DTCs stored in the memory (See page RS-34).
(e) Turn the ignition switch to the LOCK position.
(f) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(g) Check for DTCs (See page RS-34).

OK:

DTC B1620/21 is not output.

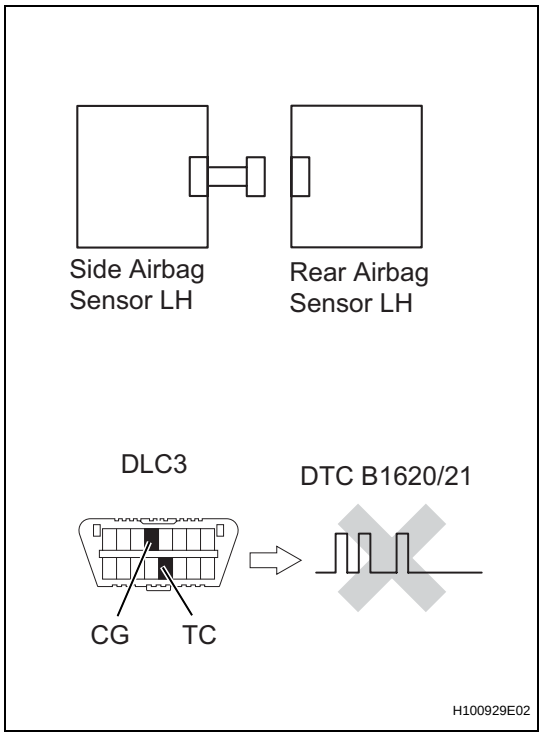
HINT:
DTCs other than B1620/21 may be output at this time, but they are not related to this check.

OK → **REPLACE REAR AIRBAG SENSOR LH**

RS

NG

16	REPLACE CENTER AIRBAG SENSOR ASSEMBLY



(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Replace the center airbag sensor assembly (See page RS-602).

HINT:
Perform the inspection using parts from a normal vehicle when possible.

(d) Connect the connectors to the center airbag sensor assembly.
(e) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(f) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(g) Clear any DTCs stored in the memory (See page RS-34).
(h) Turn the ignition switch to the LOCK position.
(i) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(j) Check for DTCs (See page RS-34).

OK:
B1620/21 is not output.

HINT:
DTCs other than B1620/21 may be output at this time, but they are not related to this check.

NG → **REPLACE SIDE AIRBAG SENSOR ASSEMBLY LH**

OK

END

RS

17	CHECK CONNECTION OF CONNECTORS

(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Check that the connectors are properly connected to the center airbag sensor assembly and the side airbag sensor assembly RH.

OK:
The connectors are properly connected.

NG → **CONNECT CONNECTORS**

OK

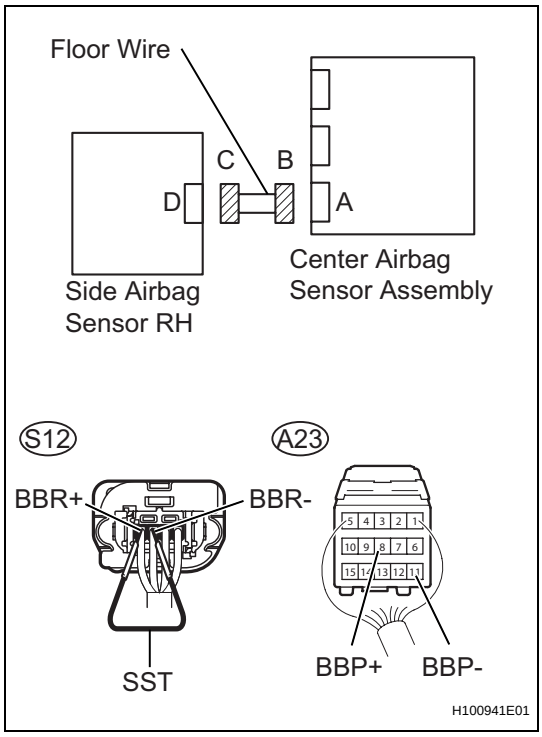
18	CHECK CONNECTORS

(a) Check that the connectors (on the center airbag sensor assembly side and side airbag sensor assembly RH side) are not damaged (See page IN-34).
OK:
The connectors are not deformed or damaged.

NG → **REPAIR OR REPLACE WIRE HARNESS**

OK

19	CHECK FLOOR WIRE (FOR OPEN)



SST 09843-18040

(a) Disconnect the connectors from the center airbag sensor assembly and the side airbag sensor assembly RH.
(b) Using SST, connect S12-4 (BBR+) and S12-3 (BBR-) of connector C.
(c) Measure the resistance.
Standard resistance

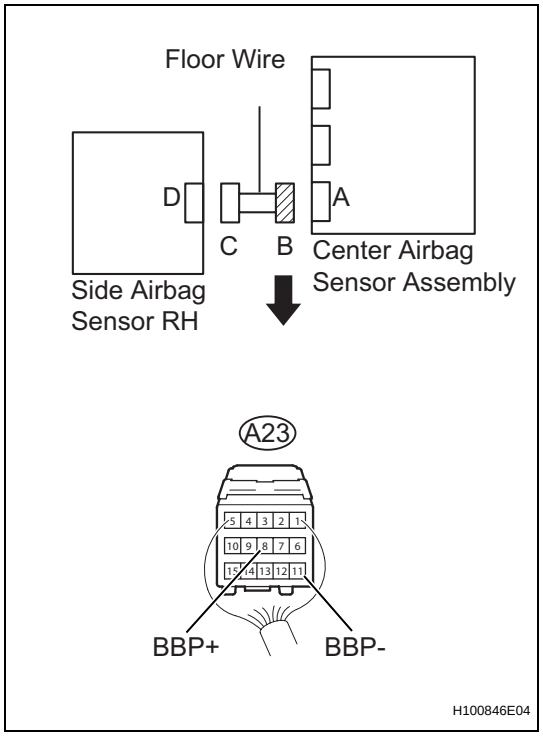
Tester Connection	Condition	Specified Condition
A23-8 (BBP+) - A23-11 (BBP-)	Always	Below 1 Ω

NG → **REPAIR OR REPLACE FLOOR WIRE**

RS

OK

20 CHECK FLOOR WIRE (FOR SHORT)



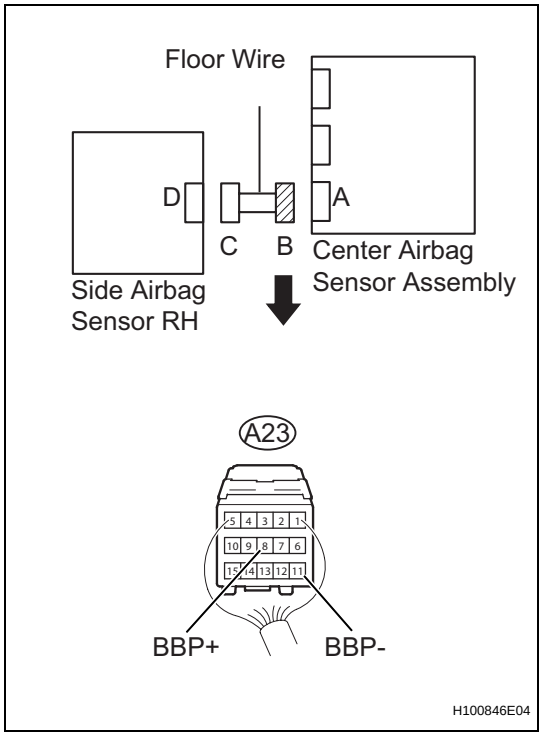
(a) Disconnect the SST from connector C.
(b) Measure the resistance.
Standard resistance

Tester Connection	Condition	Specified Condition
A23-8 (BBP+) - A23-11 (BBP-)	Always	1 MΩ or Higher

NG → **REPAIR OR REPLACE FLOOR WIRE**

OK

21 CHECK FLOOR WIRE (TO B+)



(a) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(b) Turn the ignition switch to the ON position.
(c) Measure the voltage.
Standard voltage

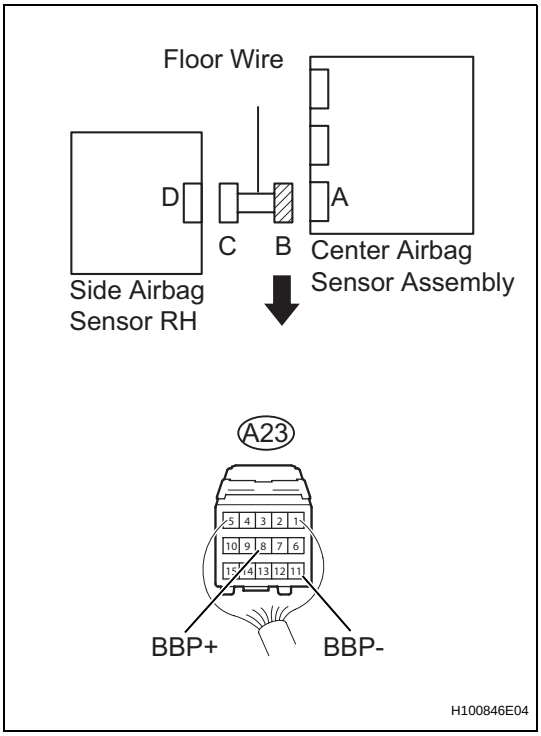
Tester Connection	Condition	Specified Condition
A23-8 (BBP+) - Body ground	Ignition switch	Below 1 V
A23-11 (BBP-) - Body ground	Ignition switch	Below 1 V

NG → **REPAIR OR REPLACE FLOOR WIRE**

OK

RS

22 CHECK FLOOR WIRE (TO GROUND)



(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.

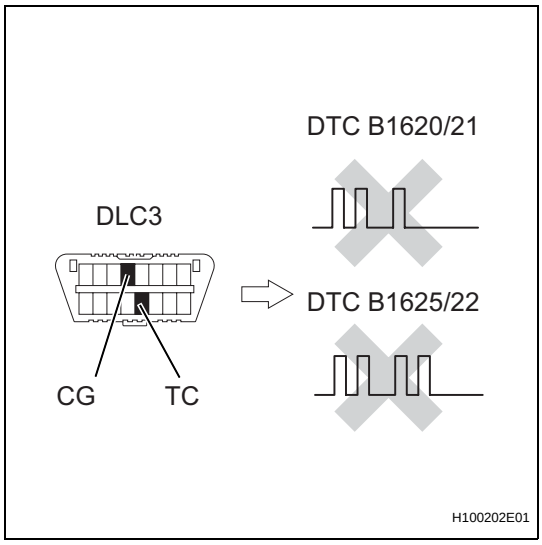
57	CHECK SIDE AIRBAG SENSOR ASSEMBLY RH



(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Connect the connectors to the rear airbag sensor LH and the rear airbag sensor RH.
(d) Replace the center airbag sensor assembly (See page RS-602).

HINT:
Perform the inspection using parts from a normal vehicle when possible.

(e) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(f) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(g) Clear any DTCs stored in the memory (See page RS-34).
(h) Turn the ignition switch to the LOCK position.
(i) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(j) Check for DTCs (See page RS-34).

OK:
DTC B1620/21 and B1625/22 are not output.

HINT:
DTCs other than B1620/21 and B1625/22 may be output at this time, but they are not related to this check.

NG → **REPLACE REAR AIRBAG SENSOR LH AND REAR AIRBAG SENSOR RH**

OK

END

DTC	B1630/23	Driver Side Rear Airbag Sensor Circuit Malfunction

DTC	B1635/24	Front Passenger Side Rear Airbag Sensor Circuit Malfunction

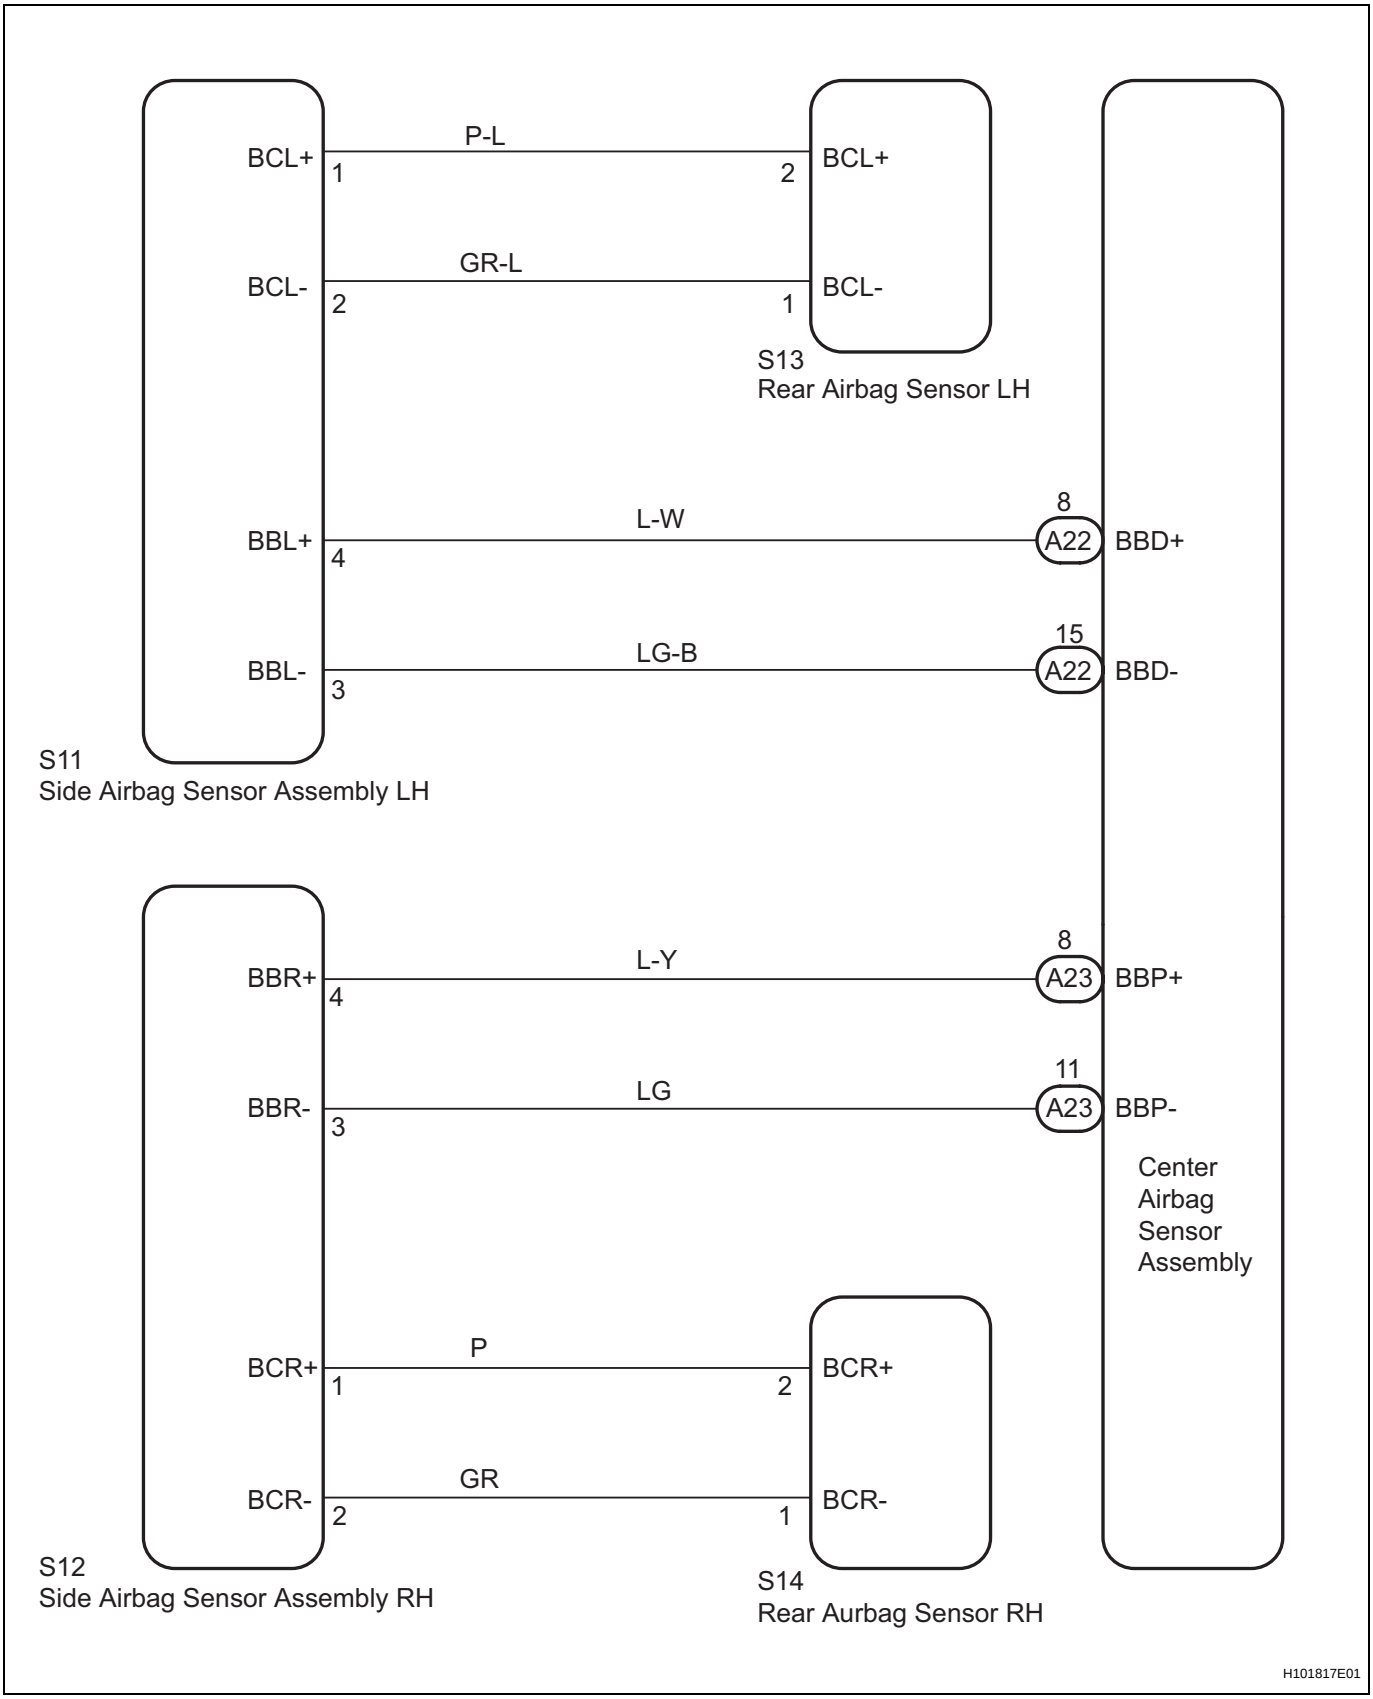
DESCRIPTION

The airbag sensor LH consists of parts such as the safing sensor, the diagnostic circuit and the lateral deceleration sensor. The configuration of the rear airbag sensor RH is the same as that of the LH.
When the center airbag sensor assembly receives signals from the lateral deceleration sensor, it determines whether or not the SRS should be activated.
DTC B1630/23 is set when a malfunction is detected in the curtain shield airbag sensor (driver seat side) circuit.
DTC B1635/24 is set when a malfunction is detected in the curtain shield airbag sensor (front passenger seat side) circuit.

DTC No.	DTC Detections Conditions	Trouble Areas
B1630/23	• The center airbag sensor assembly receives an open circuit signal in the curtain shield airbag sensor (Driver seat side) circuit for 2 seconds • Rear airbag sensor LH malfunction • Side airbag sensor assembly LH malfunction • Center airbag sensor assembly center malfunction	• Rear airbag sensor LH • Side airbag sensor assembly LH • Center center airbag sensor assembly • No. 2 floor wire
B1635/24	• The center airbag sensor assembly receives an open circuit signal in the curtain shield airbag sensor (Front passenger seat side) circuit for 2 seconds • Rear airbag sensor RH malfunction • Side airbag sensor assembly RH malfunction • Center airbag sensor assembly center malfunction	• Rear airbag sensor RH • Side airbag sensor assembly RH • Center center airbag sensor assembly • Floor wire

HINT:
Troubleshoot DTC B1620/21 first when the DTC B1620/21 and B1630/23 are output simultaneously.

WIRING DIAGRAM



RS

CAUTION:
In order to prevent unexpected airbag deployment, disconnect the following connectors before inspecting parts such as wire harnesses, if the application of tester probes to the center airbag sensor assembly connector is necessary.
(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds
(c) Disconnect the connectors from the center airbag sensor assembly.
(d) Disconnect the connectors from the steering pad.
(e) Disconnect the connector from the front passenger airbag assembly.
(f) Disconnect the connector from the front seat airbag assembly LH.
(g) Disconnect the connector from the front seat airbag assembly RH.
HINT:
Skip the following steps if side and curtain shield airbags are not fitted.
(h) Disconnect the connector from the curtain shield airbag assembly LH.
(i) Disconnect the connector from the curtain shield airbag assembly RH.
(j) Disconnect the connector from the front seat outer belt assembly LH.
(k) Disconnect the connector from the front seat outer belt assembly RH.

(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Check that the connectors are properly connected to the side airbag sensor assembly LH and the rear airbag sensor LH.
OK:
The connectors are properly connected.

NG → **CONNECT CONNECTORS**

OK

RS

3	CHECK CONNECTORS

(a) Check that the connectors (on the side airbag sensor assembly LH side and rear airbag sensor LH side) are not damaged (See page IN-34).

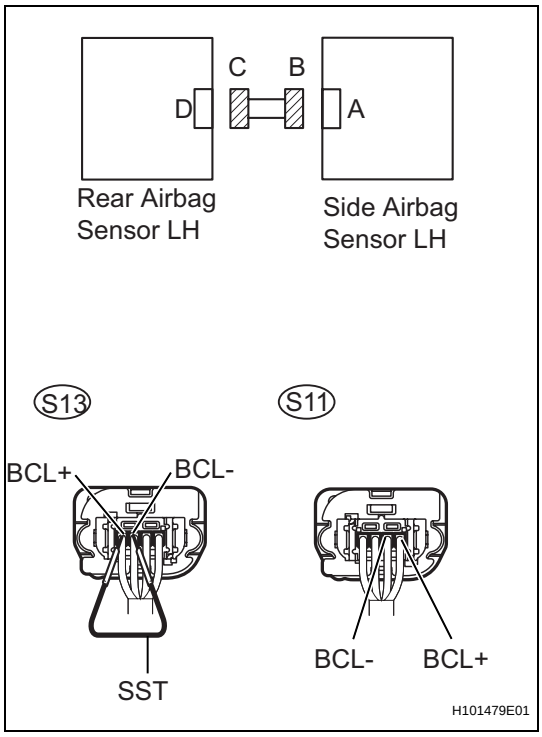
OK:

The connectors are not deformed or damaged.

NG → **REPAIR OR REPLACE WIRE HARNESS**

OK

4	CHECK NO. 2 FLOOR WIRE (FOR OPEN)



SST 09843-18040

(a) Disconnect the connectors from the side airbag sensor assembly LH and the rear airbag sensor LH.

(b) Using SST, connect S13-2 (BCL+) and S13-1 (BCL-) of connector C.

(c) Measure the resistance.

Standard resistance

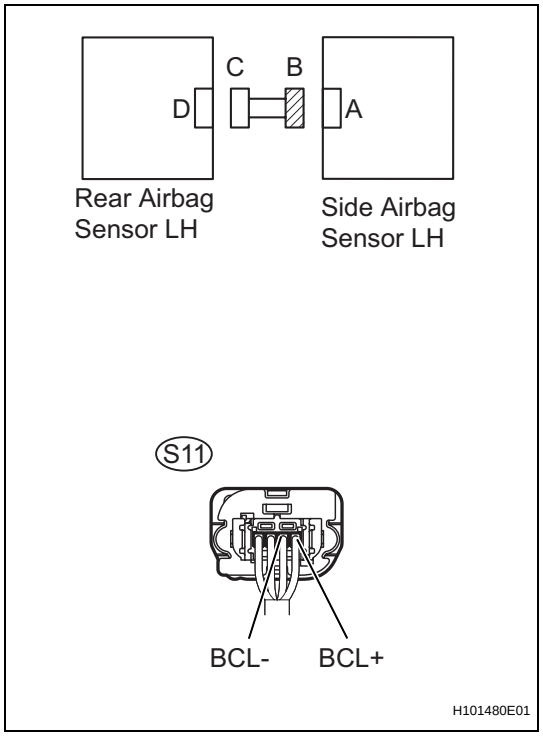
Tester Connection	Condition	Specified Condition
S11-1 (BCL+) - S11-2 (BCL-)	Always	Below 1 Ω

NG → **REPAIR OR REPLACE NO. 2 FLOOR WIRE**

RS

OK

5 CHECK NO. 2 FLOOR WIRE (FOR SHORT)



(a) Disconnect the SST from connector C.
(b) Disconnect the connectors from the side airbag sensor assembly LH and rear airbag sensor LH.
(c) Measure the resistance.

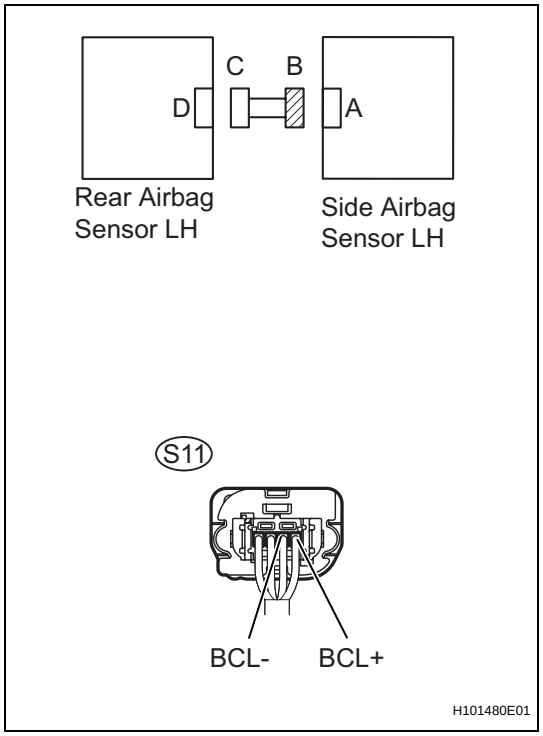
Standard resistance

Tester Connection	Condition	Specified Condition
S11-1 (BCL+) - S11-2 (BCL-)	Always	1 MΩ or Higher

NG → REPAIR OR REPLACE NO. 2 FLOOR WIRE

OK

6 CHECK NO. 2 FLOOR WIRE (TO B+)



(a) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(b) Turn the ignition switch to the ON position.
(c) Measure the voltage.

Standard voltage

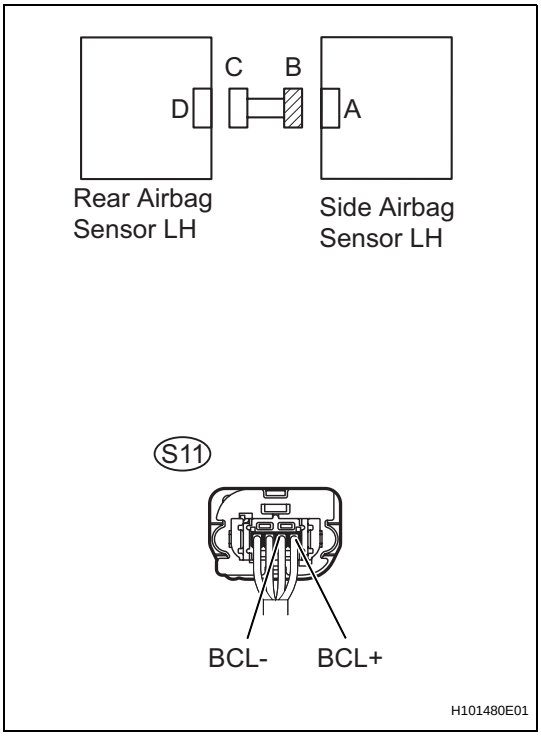
Tester Connection	Condition	Specified Condition
S11-1 (BCL+) - Body ground	Ignition switch ON	Below 1 V
S11-2 (BCL-) - Body ground	Ignition switch ON	Below 1 V

NG → REPAIR OR REPLACE NO. 2 FLOOR WIRE

OK

RS

7 CHECK NO. 2 FLOOR WIRE (TO GROUND)



(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Measure the resistance.

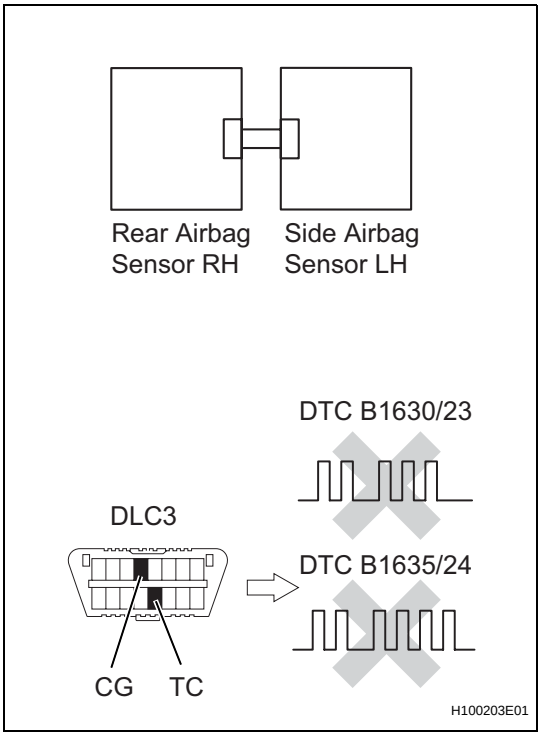
Standard resistance

Tester Connection	Condition	Specified Condition
S11-1 (BCL+) - Body ground	Always	1 MΩ or Higher
S11-2 (BCL-) - Body ground	Always	1 MΩ or Higher

NG → REPAIR OR REPLACE NO. 2 FLOOR WIRE

OK

8 CHECK REAR AIRBAG SENSOR LH



(a) Connect the connector to the side airbag sensor assembly LH.
(b) Interchange the rear airbag sensor LH with the rear airbag sensor RH and connect the connectors to them.
(c) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(d) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(e) Clear any DTCs stored in the memory (See page RS-34).
(f) Turn the ignition switch to the LOCK position.
(g) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(h) Check for DTCs (See page RS-34).

Result

Result	Proceed to
DTC B1630/23 is output.	A

DTC	B1650/32	Occupant Classification System Malfunction

DESCRIPTION

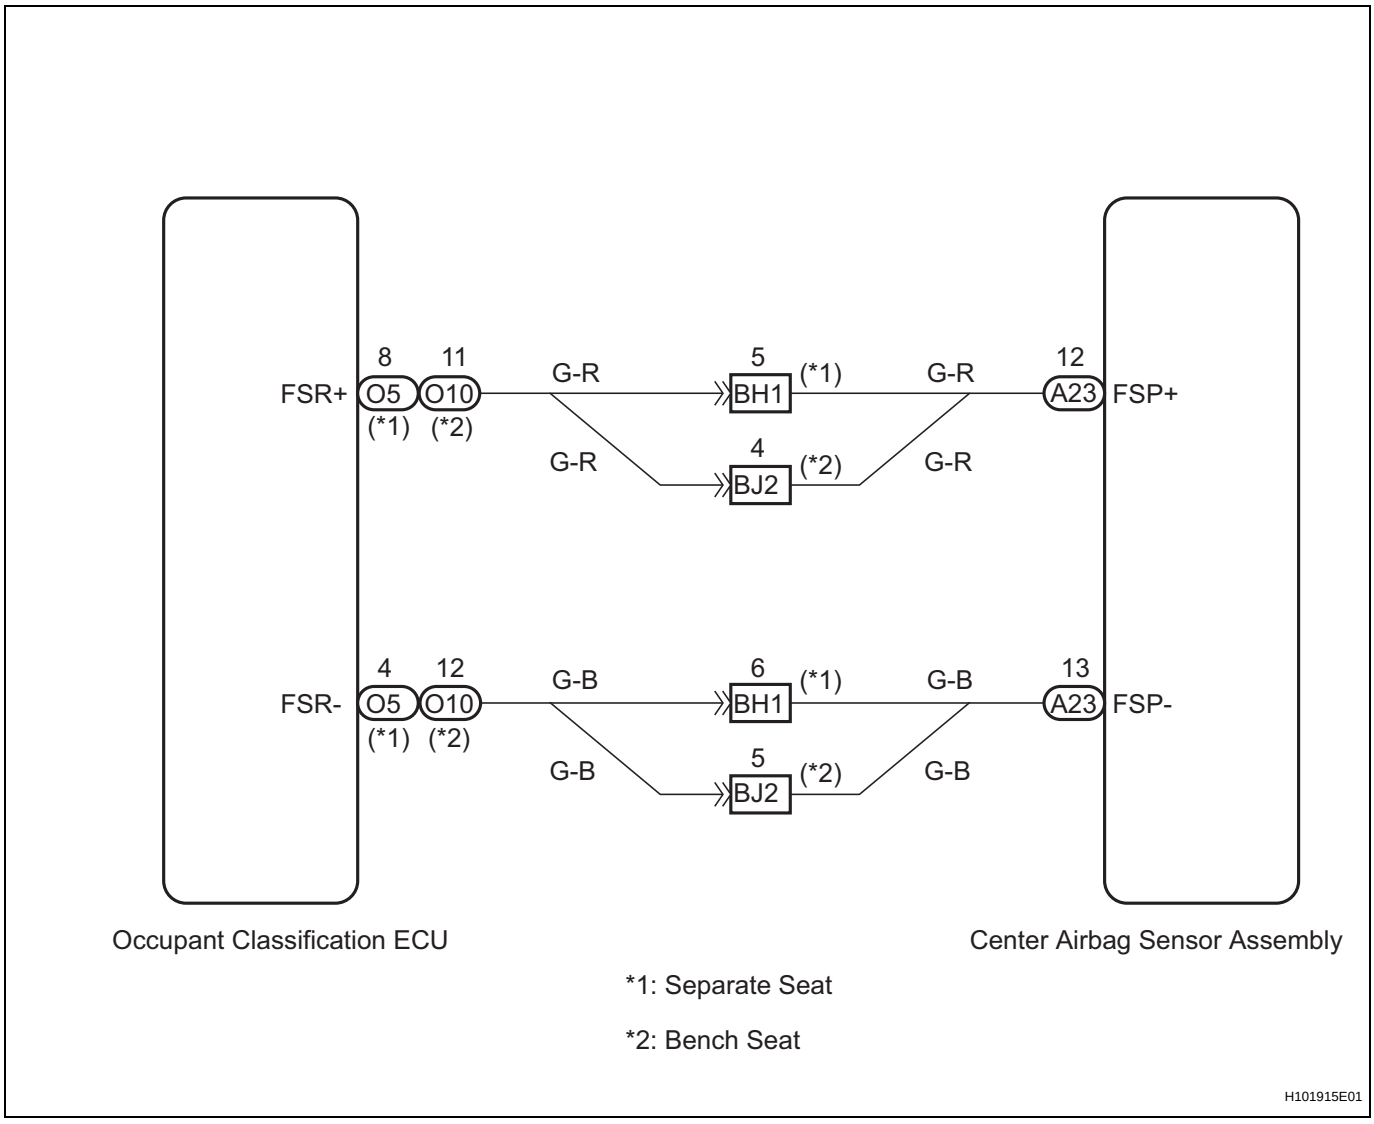
The occupant classification system circuit consists of the center airbag sensor assembly and the occupant classification system.

When the center airbag sensor assembly receives signals from the occupant classification ECU, it determines whether or not the front passenger airbag assembly, front seat airbag assembly RH and seat belt pretensioner RH should be operated.

DTC B1650/32 is set when a malfunction is detected in the occupant classification system circuit.

DTC No.	DTC Detecting Conditions	Trouble Areas
B1650/32	• Occupant classification system malfunction • The center airbag sensor assembly receives a line short circuit signal, an open circuit signal, a short circuit to ground signal or a short circuit to B+ signal in the occupant classification system circuit for 2 seconds • Center airbag sensor assembly malfunction	• Occupant classification system • Center airbag sensor assembly • Floor wire • No. 1 seat wire

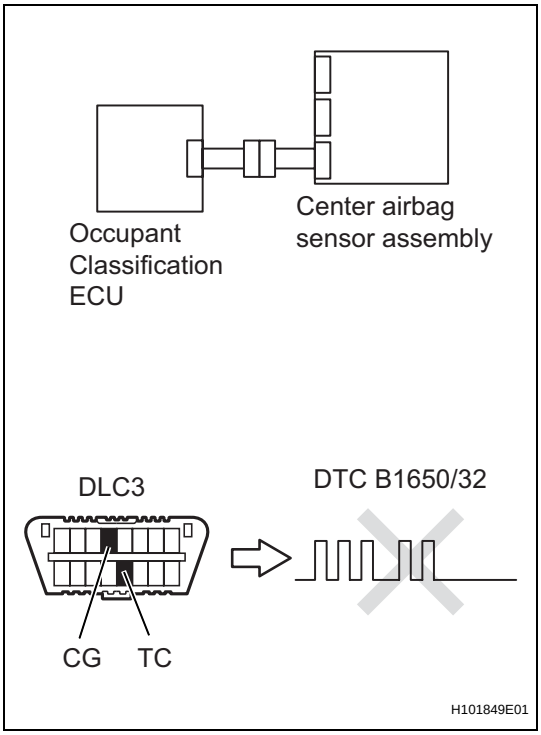
WIRING DIAGRAM



RS

CAUTION:
In order to prevent unexpected airbag deployment, disconnect the following connectors before inspecting parts such as wire harnesses, if the application of tester probes to the center airbag sensor assembly connector is necessary.
(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Disconnect the connectors from the center airbag sensor assembly.
(d) Disconnect the connectors from the steering pad.
(e) Disconnect the connector from the front passenger airbag assembly.
(f) Disconnect the connector from the front seat airbag assembly LH.
(g) Disconnect the connector from the front seat airbag assembly RH.
HINT:
Skip the following steps if side and curtain shield airbags are not fitted.
(h) Disconnect the connector from the curtain shield airbag assembly LH.
(i) Disconnect the connector from the curtain shield airbag assembly RH.
(j) Disconnect the connector from the front seat outer belt assembly LH.
(k) Disconnect the connector from the front seat outer belt assembly RH.

1	CHECK DTC (CENTER AIRBAG SENSOR ASSEMBLY)



(a) Turn the ignition switch to the ON position.
(b) Clear any DTCs stored in the memory (See page RS-34).
(c) Turn the ignition switch to the LOCK position.
(d) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(e) Check for DTCs (See page RS-34).
OK:
DTC B1650/32 is not output.
HINT:
DTCs other than B1650/32 may be output at this time, but they are not related to this check.

OK → **USE SIMULATION METHOD TO CHECK**

NG

2	CHECK DTC (OCCUPANT CLASSIFICATION ECU)

(a) Turn the ignition switch to the ON position, and wait for at least 10 seconds.
(b) Using the intelligent tester, check for DTCs of the occupant classification ECU (See page RS-362).
OK:
DTC is not output.

RS

NG → GO TO DTC CHART

OK

3	CHECK CONNECTION OF CONNECTORS

(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Check that the connectors are properly connected to the center airbag sensor assembly and the occupant classification ECU.
OK:
The connectors are properly connected.

NG → CONNECT CONNECTORS

OK

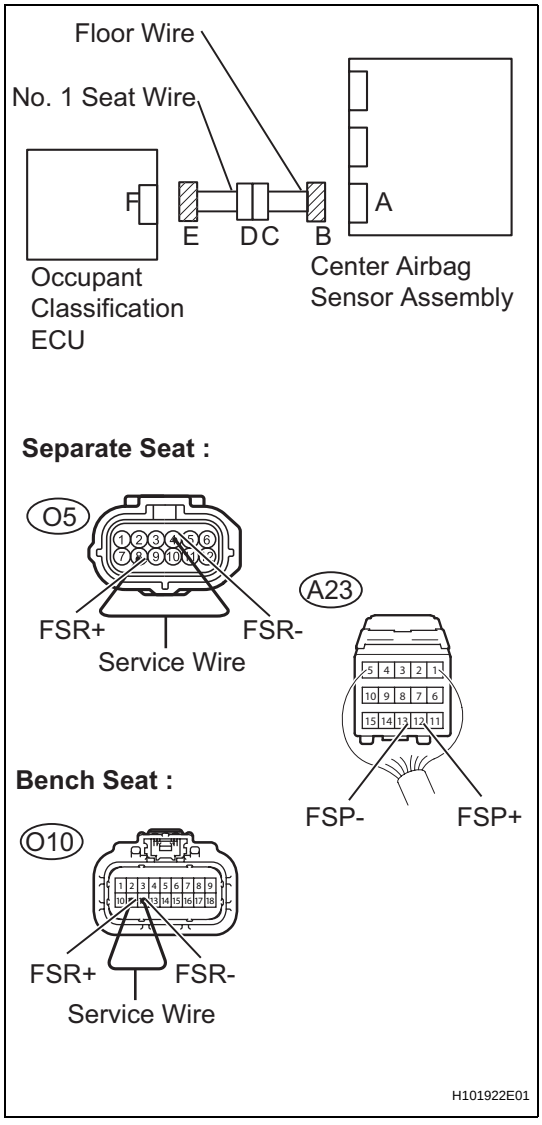
4	CHECK CONNECTORS

(a) Check that the connectors (on the center airbag sensor assembly side and occupant classification ECU side) are not damaged (See page IN-34).
OK:
The connectors are not deformed or damaged.

NG → REPAIR OR REPLACE WIRE HARNESS

OK

5	CHECK OCCUPANT CLASSIFICATION SYSTEM CIRCUIT (FOR OPEN)



(a) Disconnect the connectors from the center airbag sensor assembly and the occupant classification ECU.

(b) Separate Seat :
Using a service wire, connect O5-8 (FSR+) and O5-4 (FSR-) of connector E.

NOTICE:
Do not forcibly insert a service wire into the terminals of the connector when connecting.

(c) Bench Seat :
Using a service wire, connect O10-11 (FSR+) and O10-12 (FSR-) of connector E.

NOTICE:
Do not forcibly insert a service wire into the terminals of the connector when connecting.

(d) Measure the resistance.
Standard resistance

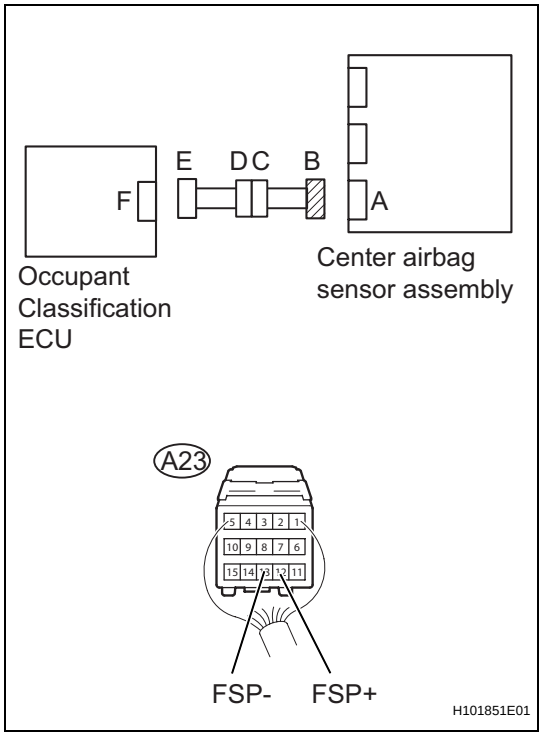
Tester Connection	Condition	Specified Condition
A23-12 (FSP+) - A23-13 (FSP-)	Always	Below 1 Ω

NG → **Go to step 13**

OK

RS

6 CHECK OCCUPANT CLASSIFICATION SYSTEM CIRCUIT (FOR SHORT)



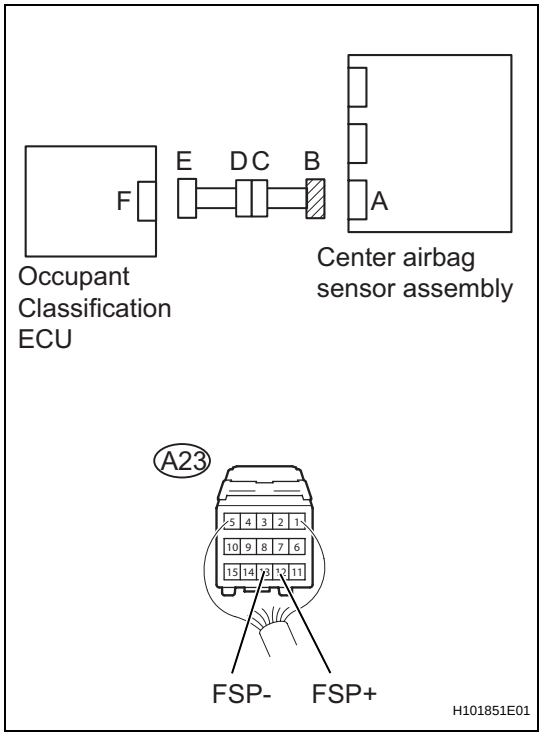
(a) Disconnect the service wire from connector E.
(b) Measure the resistance.
Standard resistance

Tester Connection	Condition	Specified Condition
A23-12 (FSP+) - A23-13 (FSP-)	Always	1 MΩ or Higher

NG → **Go to step 14**

OK

7 CHECK OCCUPANT CLASSIFICATION SYSTEM CIRCUIT (TO B+)



(a) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(b) Turn the ignition switch to the ON position.
(c) Measure the voltage.
Standard voltage

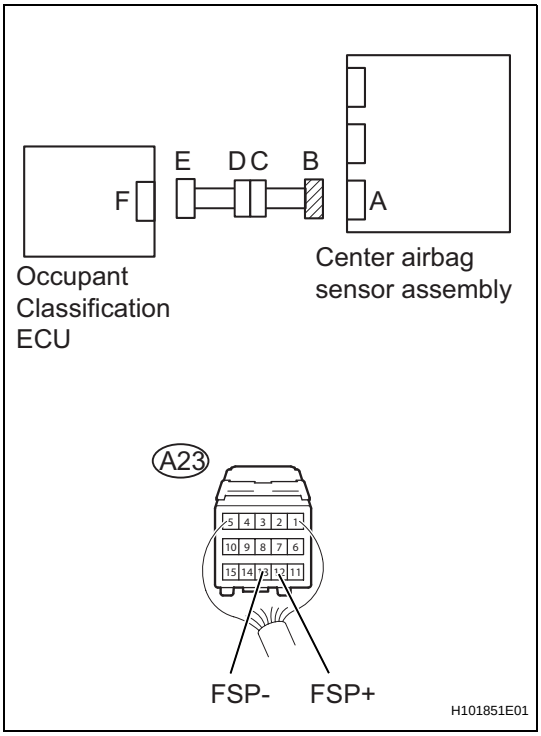
Tester Connection	Condition	Specified Condition
A23-12 (FSP+) - Body ground	Ignition switch ON	Below 1 V
A23-13 (FSP-) - Body ground	Ignition switch ON	Below 1 V

NG → **Go to step 15**

OK

RS

8 CHECK OCCUPANT CLASSIFICATION SYSTEM CIRCUIT (TO GROUND)



(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Measure the resistance.

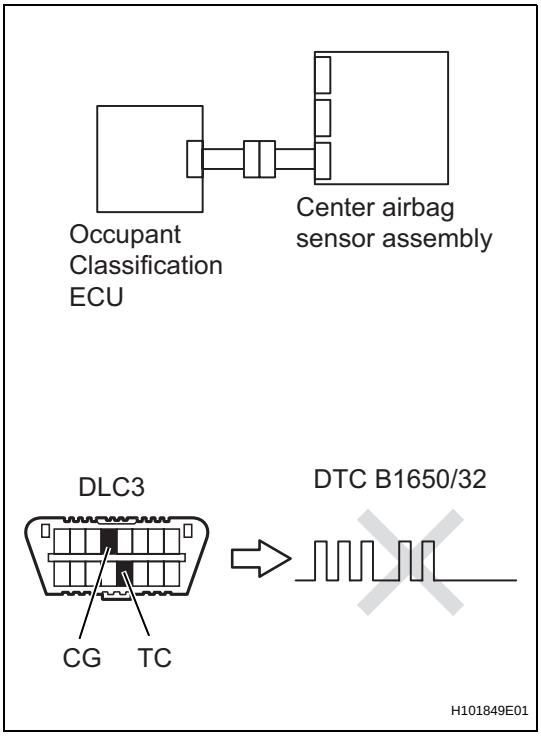
Standard resistance

Tester Connection	Condition	Specified Condition
A23-12 (FSP+) - Body ground	Always	1 MΩ or Higher
A23-13 (FSP-) - Body ground	Always	1 MΩ or Higher

NG → **Go to step 16**

OK

9 CHECK CENTER AIRBAG SENSOR ASSEMBLY



(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Replace the center airbag sensor assembly (See page RS-602).

HINT:
Perform the inspection using parts from a normal vehicle when possible.

(d) Connect the connectors to the center airbag sensor assembly.
(e) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(f) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(g) Clear any DTCs stored in the memory (See page RS-34).
(h) Turn the ignition switch to the LOCK position.
(i) Turn the ignition switch to the ON position, and wait for at least 60 seconds.
(j) Check for DTCs (See page RS-34).

Result

Result	Proceed to
DTC B1650/32 is output (for separate seat)	A

RS

Result	Proceed to
DTC B1650/32 is not output (for bench seat)	B
DTC B1650/32 is not output	C

HINT:
DTCs other than B1650/32 may be output at this time, but they are not related to this check.

B	Go to step 17
C	END

A

10 REPLACE OCCUPANT CLASSIFICATION ECU

(a) Turn the ignition switch to the LOCK position.
(b) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(c) Replace the occupant classification ECU (See page RS-631).

NEXT

11 PERFORM ZERO POINT CALIBRATION

(a) Connect the negative (-) terminal cable to the battery.
(b) Connect the intelligent tester to the DLC3.
(c) Turn the ignition switch to the ON position.
(d) Using the intelligent tester, perform the zero point calibration (See page RS-357).
OK:
COMPLETED is displayed on the tester.

NEXT

12 PERFORM SENSITIVITY CHECK

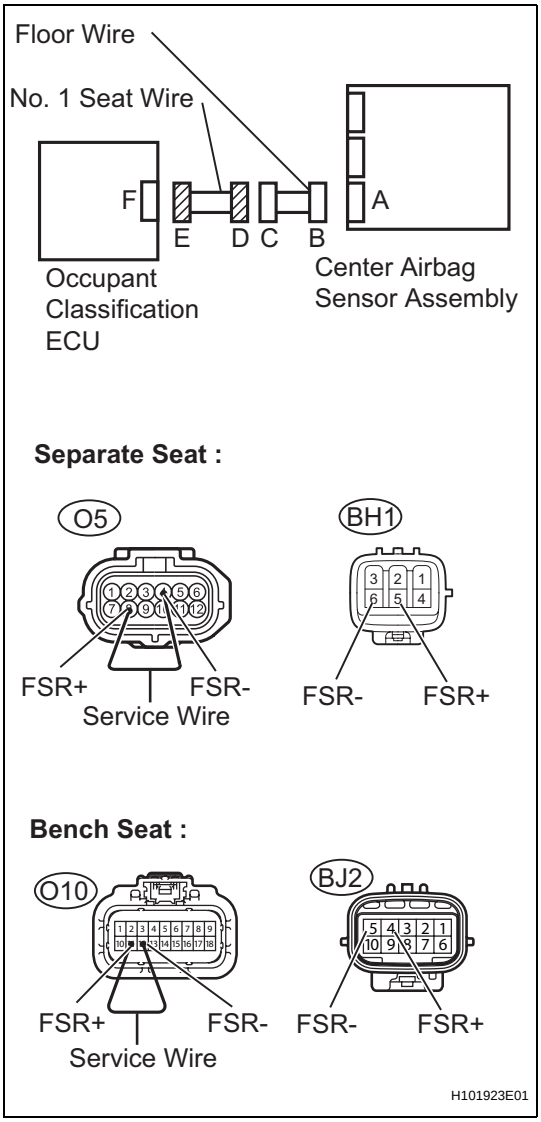
(a) Using the intelligent tester, perform the sensitivity check (See page RS-357).
Standard Value:
27 to 33 kg (59.52 to 72.75 lb)

NEXT

END

RS

13	CHECK NO. 1 SEAT WIRE (FOR OPEN)



(a) Disconnect the No. 1 seat wire connector from the instrument panel wire.

HINT:

The service wire has already been inserted into connector E.

(b) Measure the resistance.

Standard resistance

Tester Connection	Condition	Specified Condition
BH1-5 (FSR+) - BH1-6 (FSR-) *1	Always	Below 1 Ω
BJ2-4 (FSR+) - BJ2-5 (FSR-) *2	Always	Below 1 Ω

*1 : Separate Seat

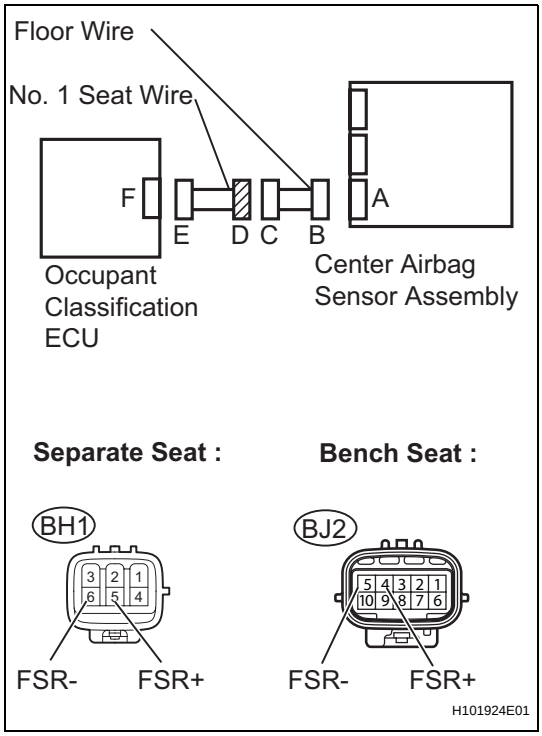
15	CHECK NO. 1 SEAT WIRE (TO B+)



(a) Disconnect the No. 1 seat wire connector from the instrument panel wire.
(b) Connect the negative (-) terminal cable to the battery, and wait for at least 2 seconds.
(c) Turn the ignition switch to the ON position.
(d) Measure the voltage.

Standard voltage

Tester Connection	Condition	Specified Condition
BH1-5 (FSR+) - Body ground *1	Ignition switch ON	Below 1 V
BH1-6 (FSR-) - Body ground *1	Ignition switch ON	Below 1 V
BJ2-4 (FSR+) - Body ground *2	Ignition switch ON	Below 1 V
BJ2-5 (FSR-) - Body ground *2	Ignition switch ON	Below 1 V

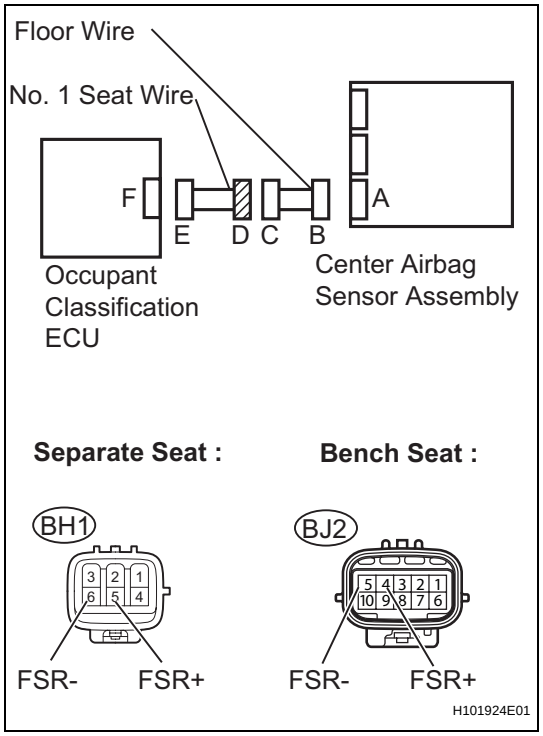
*1 : Separate Seat
*2 : Bench Seat

NG → **REPAIR OR REPLACE NO. 1 SEAT WIRE**

OK

REPAIR OR REPLACE FLOOR WIRE

16 CHECK NO. 1 SEAT WIRE (TO GROUND)



(a) Disconnect the No. 1 seat wire connector from the instrument panel wire.
(b) Measure the resistance.
Standard resistance

Tester Connection	Condition	Specified Condition
BH1-5 (FSR+) - Body ground *1	Always	1 MΩ or Higher
BH1-6 (FSR-) - Body ground *1	Always	1 MΩ or Higher
BJ2-4 (FSR+) - Body ground *2	Always	1 MΩ or Higher
BJ2-5 (FSR-) - Body ground *2	Always	1 MΩ or Higher

*1 : Separate Seat
*2 : Bench Seat

NG → **REPAIR OR REPLACE NO. 1 SEAT WIRE**

OK

REPAIR OR REPLACE FLOOR WIRE

17 REPLACE OCCUPANT CLASSIFICATION ECU

(a) Turn the ignition switch to the ON position.
(b) Using the intelligent tester, read the current setting data stored in the occupant classification ECU (See page RS-476).
HINT:
If the previous ECU data cannot be stored in the intelligent tester, replace the front seat cushion assembly (with occupant classification ECU, occupant classification sensor).
(c) Turn the ignition switch to the LOCK position.
(d) Disconnect the negative (-) terminal cable from the battery, and wait for at least 90 seconds.
(e) Replace the occupant classification ECU (See page RS-634).
(f) Connect the negative (-) terminal cable to the battery.
(g) Turn the ignition switch to the ON position.
(h) Using an intelligent tester, write the setting data read from the previously installed occupant classification ECU into the newly installed occupant classification ECU (See page RS-476).

RS

NEXT

18	PERFORM SENSITIVITY CHECK

(a) Perform the sensitivity check (See page RS-480).

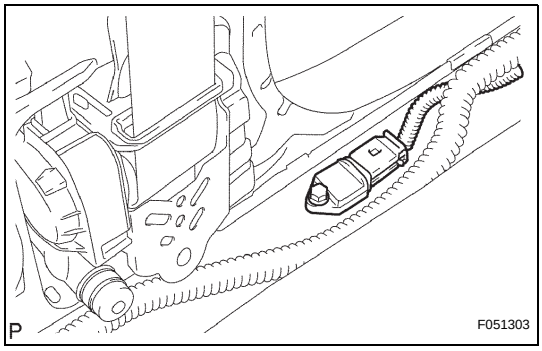
NEXT

END

REMOVAL

HINT:
Use the same procedures for the RH side and LH side.

1. **PRECAUTION**
   (See page RS-1)
2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   Wait for at least 90 seconds after disconnecting the cable to prevent the airbag from working.
3. **REMOVE FRONT DOOR SCUFF PLATE LH (See page IR-12)**
4. **REMOVE REAR DOOR SCUFF PLATE LH (See page IR-13)**
5. **REMOVE FRONT DOOR OPENING TRIM WEATHERSTRIP LH (See page IR-13)**
6. **REMOVE REAR DOOR OPENING TRIM WEATHERSTRIP LH (See page IR-13)**
7. **REMOVE LAP BELT OUTER ANCHOR COVER (See page IR-15)**
8. **REMOVE CENTER PILLAR LOWER GARNISH LH (See page IR-15)**
9. **REMOVE SIDE AIRBAG SENSOR**
   (a) Remove the bolt and the side airbag sensor.
   (b) Disconnect the connector from the side airbag sensor.



INSTALLATION

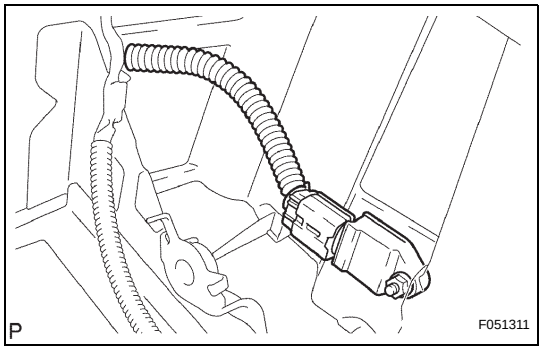
HINT:
Use the same procedures for the RH side and LH side.

1. **REMOVE SIDE AIRBAG SENSOR**
   (a) Check that the ignition switch is OFF.
   (b) Check that the cable is disconnected from the battery negative (-) terminal.
   CAUTION:
   After disconnecting the cable from the terminal, wait for at least 90 seconds before starting the operation.
   (c) Install the side airbag sensor with the bolt.
   Torque:
   9.0 N*m (80 kgf*cm, 80 in.*lbf)
   NOTICE:
   - **Installation of the connector is done with the sensor assembly installed. Make sure that the sensor assembly is installed to the specified torque.**
   - **If the sensor assembly has been dropped, or there are cracks, dents or other defects in the case, bracket or connector, replace the sensor assembly with a new one.**
   - **When installing the sensor assembly, make sure that the SRS wiring does not interfere with other parts and is not pinched between other parts.**
   - **After installation, shake the sensor assembly to check that it is not loose.**
   (d) Check that there is no slack in the installation parts of the side airbag sensor.
   (e) Connect the connector to the side airbag sensor.
2. **INSTALL CENTER PILLAR LOWER GARNISH LH (See page IR-26)**
3. **INSTALL LAP BELT OUTER ANCHOR COVER (See page IR-27)**
4. **INSTALL REAR DOOR OPENING TRIM WEATHERSTRIP LH (See page IR-28)**
5. **INSTALL FRONT DOOR OPENING TRIM WEATHERSTRIP LH (See page IR-29)**
6. **INSTALL REAR DOOR SCUFF PLATE LH (See page IR-29)**
7. **INSTALL FRONT DOOR SCUFF PLATE LH (See page IR-29)**
8. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
   Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
9. **INSPECT SRS WARNING LIGHT**
   (See page RS-28)

REMOVAL

HINT:
Use the same procedures for RH side and LH side.

1. **PRECAUTION**
   (See page RS-1)
2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   Wait for at least 90 seconds after disconnecting the cable to prevent the airbag from working.
3. **REMOVE REAR SEAT BACK HINGE COVER (See page SE-71)**
4. **REMOVE REAR SEAT BACK ASSEMBLY LH (See page SE-71)**
5. **REMOVE REAR SEAT BACK HINGE SUB-ASSEMBLY LH (See page SE-71)**
6. **REMOVE REAR DOOR SCUFF PLATE LH (See page IR-13)**
7. **REMOVE REAR DOOR OPENING TRIM WEATHERSTRIP LH (See page SB-54)**
8. **REMOVE LUGGAGE COMPARTMENT SIDE TRAY (See page IR-16)**
9. **REMOVE QUARTER TRIM LOWER PANEL LH (See page IR-17)**
10. **REMOVE QUARTER INSIDE TRIM BOARD LH (See page SB-54)**
11. **REMOVE REAR SEAT OUTER BELT ASSEMBLY LH (See page SB-55)**
12. **REMOVE REAR AIRBAG SENSOR**
    (a) Disconnect the connector from the rear airbag sensor.
    (b) Remove the nut and the rear airbag sensor.



RS

INSTALLATION

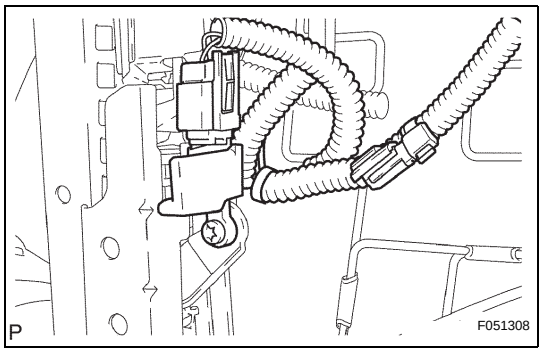
HINT:
Use the same procedures for the RH side and LH side.

1. **INSTALL REAR AIRBAG SENSOR**
   (a) Check that the ignition switch is OFF.
   (b) Check that the cable is disconnected from the battery negative (-) terminal.
   CAUTION:
   After disconnecting the cable from the terminal, wait for at least 90 seconds before starting the operation.
   (c) Install the rear airbag sensor with the nut.
   Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)
   NOTICE:
   - **Installation of the connector is done with the sensor assembly installed. Make sure the sensor assembly is installed to the specified torque.**
   - **If the sensor assembly has been dropped, or there are cracks, dents or other defects in the case, bracket or connector, replace the sensor assembly with a new one.**
   - **When installing the sensor assembly, make sure that the SRS wiring does not interfere with any other parts and is not pinched between other parts.**
   - **After installation, shake the sensor assembly to check that it is not loose.**
2. **INSTALL REAR SEAT OUTER BELT ASSEMBLY LH (See page SB-55)**
3. **INSTALL QUARTER INSIDE TRIM BOARD LH (See page SB-56)**
4. **INSTALL QUARTER TRIM LOWER PANEL LH (See page IR-25)**
5. **INSTALL LUGGAGE COMPARTMENT SIDE TRAY (See page IR-25)**
6. **INSTALL REAR DOOR OPENING TRIM WEATHERSTRIP LH (See page SB-57)**
7. **INSTALL REAR DOOR SCUFF PLATE LH (See page IR-29)**
8. **INSTALL REAR SEAT BACK HINGE SUB-ASSEMBLY LH (See page SE-77)**
9. **INSTALL REAR SEAT BACK ASSEMBLY LH (See page SE-77)**
10. **INSTALL REAR SEAT BACK HINGE COVER (See page SE-78)**
11. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
    Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

12. INSPECT SRS WARNING LIGHT

REMOVAL

1. **PRECAUTION**
2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   Wait for at least 90 seconds after disconnecting the cable to prevent the airbag from working.
3. **REMOVE SEAT TRACK COVER (See page SE-23)**
4. **REMOVE FRONT SEAT ASSEMBLY (See page SE-23)**
5. **REMOVE SEAT POSITION SENSOR**
   (a) Disconnect the connector from the seat position sensor.
   (b) Using a "torx" socket wrench (T30), remove the "torx" screw and the seat position sensor.



INSTALLATION

1. **INSTALL SEAT POSITION SENSOR**
   (a) Check that the ignition switch is OFF.
   (b) Check that the cable is disconnected from the battery negative (-) terminal.
   CAUTION:
   After disconnecting the cable from the terminal, wait for at least 90 seconds before starting the operation.
   NOTICE:
   - **Installation of the connector is done with the sensor assembly installed. Make sure the sensor assembly is installed to the specified torque.**
   - **If the sensor assembly has been dropped, or there are cracks, dents or other defects in the case, bracket or connector, replace the sensor assembly with a new one.**
   - **When installing the sensor assembly, make sure that the SRS wiring does not interfere with any other parts and is not pinched between other parts.**
   - **After installation, shake the sensor assembly to check that it is not loose.**

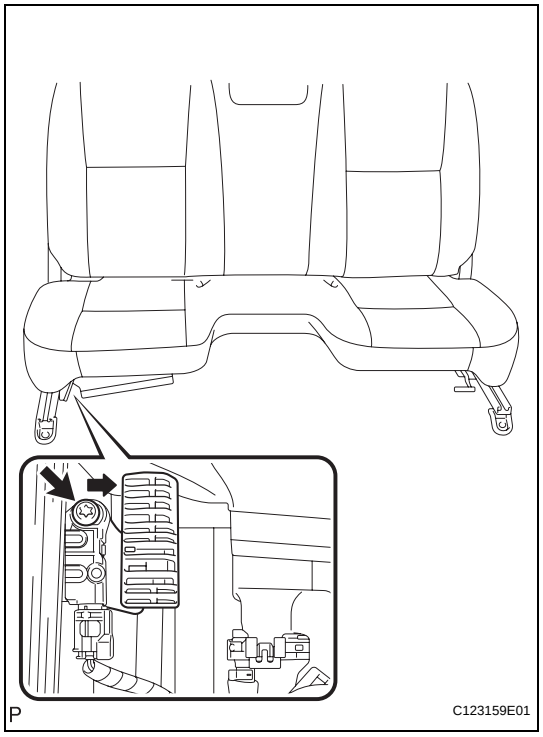
   (c) Using a "torx" socket wrench (T30), tighten the "torx" screw to install the seat position sensor.
   Torque: 8.0 N*m (82 kgf*cm, 71 in.*lbf)
   (d) Make sure that the clearance between the seat position sensor and the seat rail is within 0.6 mm (0.023 in.) and 2 mm (0.079 in.).
   (e) Check that there is no slack in the installation parts of the seat position sensor.
   (f) Connect the connector to the seat position sensor.
2. **INSTALL FRONT SEAT ASSEMBLY (See page SE-34)**
3. **INSTALL SEAT TRACK COVER (See page SE-34)**
4. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
   Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
5. **INSPECT SRS WARNING LIGHT**
   (See page RS-28)

REMOVAL

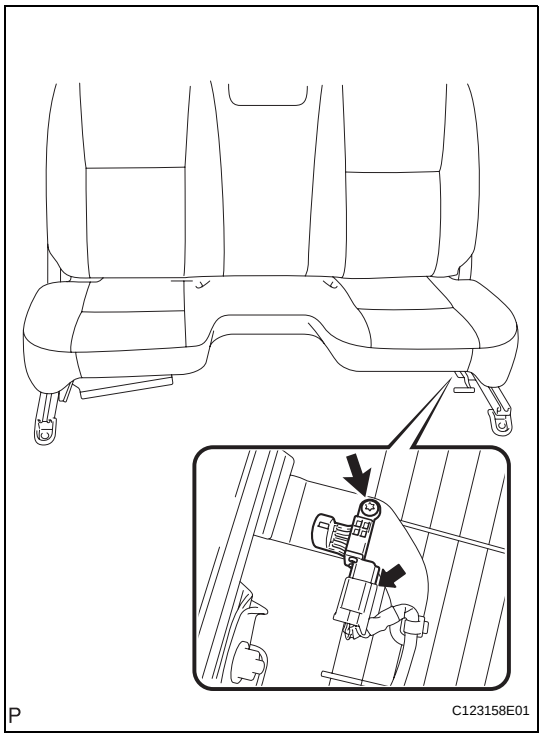
NOTICE:

- **If the wiring connector for the SRS is disconnected with the ignition switch in the ON position, DTCs will be recorded.**
- **Never use SRS parts from another vehicle. When replacing the parts, replace them with new ones.**
- **Never reuse a seat position sensor if an airbag has previously deployed in a collision.**

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   Wait for at least 90 seconds after disconnecting the cable to prevent the airbag from working.
2. **REMOVE FRONT SEAT INNER BELT ASSEMBLY LH (See page SB-12)**
3. **REMOVE FRONT SEAT INNER BELT ASSEMBLY RH (See page SB-12)**
4. **REMOVE FRONT SEAT HEADREST ASSEMBLY (See page SE-53)**
5. **REMOVE FRONT SEAT ASSEMBLY (See page SE-53)**
6. **REMOVE SEAT POSITION SENSOR PROTECTOR (for RHD)**
   (a) Remove the seat slide position sensor protector from the seat position airbag sensor.
7. **REMOVE SEAT POSITION SENSOR (for RHD)**
   (a) Disconnect the connector from the seat position sensor.
   (b) Using "Torx" socket wrench T30, remove the "Torx" screw and the seat position sensor.



RS



8. REMOVE SEAT POSITION SENSOR (for LHD)

(a) Disconnect the connector from the seat position sensor.

(b) Using "Torx" socket wrench T30, remove the "Torx" screw and the seat position sensor.

INSTALLATION

1. INSTALL SEAT POSITION SENSOR (for RHD)

(a) Check that the ignition switch is OFF.

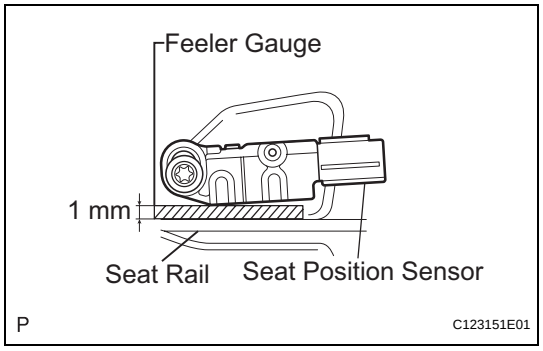
(b) Check that the cable is disconnected from the negative battery (-) terminal.

CAUTION:

After disconnecting the cable from the terminal, wait for at least 90 seconds before starting the operation.

NOTICE:

- **Installation of the connector is done with the sensor assembly installed. Make sure the sensor assembly is installed to the specified torque.**
- **If the sensor assembly has been dropped, or there are cracks, dents or other defects in the case, bracket or connector, replace the sensor assembly with a new one.**
- **When installing the sensor assembly, make sure that the SRS wiring does not interfere with any other parts and is not pinched between other parts.**



(c) Using "Torx" socket wrench T30, tighten the "Torx" screw to install the seat position sensor.

Torque: 8.0 N*m (82 kgf*cm, 71 in.*lbf)

(d) Make sure that the clearance between the seat position sensor and the seat rail is between 0.6 mm (0.023 in.) and 2 mm (0.079 in.). Check that there is no slack in the installation parts of the seat position sensor.

(e) Connect the connector to the seat position sensor.

2. INSTALL SEAT POSITION SENSOR PROTECTOR (for RHD)

(a) Install a new seat position protector onto the seat position sensor.

3. INSTALL SEAT POSITION SENSOR (for LHD)

(a) Check that the ignition switch is OFF.

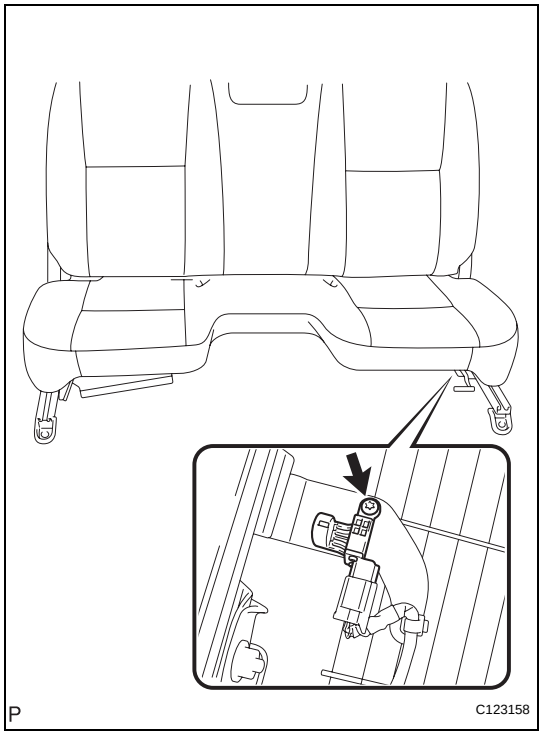
(b) Check that the cable is disconnected from the negative battery (-) terminal.

CAUTION:

After disconnecting the cable from the terminal, wait for at least 90 seconds before starting the operation.

NOTICE:

- **Installation of the connector is done with the sensor assembly installed. Make sure the sensor assembly is installed to the specified torque.**
- **If the sensor assembly has been dropped, or there are cracks, dents or other defects in the case, bracket or connector, replace the sensor assembly with a new one.**



- **When installing the sensor assembly, make sure that the SRS wiring does not interfere with any other parts and is not pinched between other parts.**
- **After installation, shake the sensor assembly to check that it is not loose.**

(c) Using "Torx" socket wrench T30, tighten the "Torx" screw to install the seat position sensor.
Torque: 8.0 N*m (82 kgf*cm, 71 in.*lbf)

(d) Make sure that the clearance between the seat position sensor and the seat rail is within 0.6 mm (0.023 in.) and 2 mm (0.079 in.).

(e) Check that there is no slack in the installation parts of the seat position sensor.

(f) Connect the connector to the seat position sensor.

4. **INSTALL FRONT SEAT ASSEMBLY (See page SE-67)**
5. **INSTALL FRONT SEAT HEADREST ASSEMBLY (See page SE-68)**
6. **INSTALL FRONT SEAT INNER BELT ASSEMBLY LH (See page SB-13)**
7. **INSTALL FRONT SEAT INNER BELT ASSEMBLY RH (See page SB-14)**
8. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
9. **INSPECT SRS WARNING LIGHT**
(See page RS-28)

ON-VEHICLE INSPECTION

1. **INSPECT FRONT SEAT CUSHION ASSEMBLY (w/ Occupant Classification ECU, Occupant Classification Sensor) (for Vehicle not Involved in Collision)**
   (a) Perform a diagnostic system check (See page RS-487).

2. **INSPECT FRONT SEAT CUSHION ASSEMBLY (w/ Occupant Classification ECU, Occupant Classification Sensor) (for Vehicle Involved in Collision)**
   (a) Perform a diagnostic system check (See page RS-487).
   (b) Even if the airbag was not deployed, check if there is any damage to the seat position sensor. If there are any defects as mentioned below, replace the seat position sensor with a new one:
   - Cracks, dents or chips on the sensor housing.
   - Cracks or other damage to the connector.

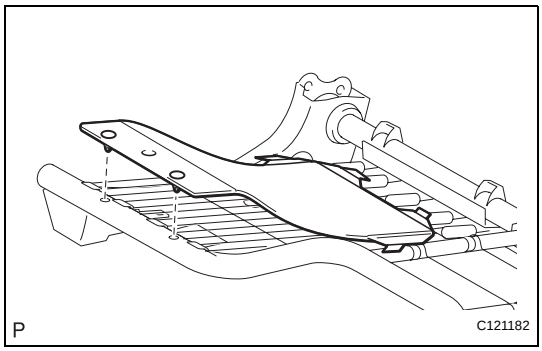
   CAUTION:
   Be sure to follow the correct removal and installation procedures.

REMOVAL

NOTICE:

- **If the wiring connector of the SRS is disconnected with the ignition switch in the ON position, DTCs will be recorded.**
- **Never use SRS parts from another vehicle. When replacing the parts, replace them with new ones.**
- **Never reuse an occupant classification sensor if an airbag has previously deployed in a collision.**
- **Remove the front seat cushion cover pad and front seat cushion cover together, in order to avoid occupant classification sensor malfunctions.**

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY**
   Wait for 90 seconds after disconnecting the cable to prevent the airbag from working.
2. **REMOVE FRONT SEAT INNER BELT ASSEMBLY LH (See page SB-12)**
3. **REMOVE FRONT SEAT INNER BELT ASSEMBLY RH (See page SB-12)**
4. **REMOVE FRONT SEAT ASSEMBLY (See page SE-53)**
5. **REMOVE OCCUPANT CLASSIFICATION ECU (See page RS-635)**
6. **REMOVE FRONT SEAT HINGE COVER LH (See page SE-55)**
7. **REMOVE FRONT SEAT HINGE COVER RH (See page SE-55)**
8. **REMOVE FRONT SEATBACK ASSEMBLY (See page SE-55)**
9. **REMOVE FRONT SEAT TRACK LOWER FRONT BRACKET LH (See page SE-57)**
10. **REMOVE FRONT SEAT TRACK LOWER FRONT BRACKET RH (See page SE-57)**
11. **REMOVE FRONT SEAT TRACK LOWER REAR BRACKET LH (See page SE-57)**
12. **REMOVE FRONT SEAT TRACK LOWER REAR BRACKET RH (See page SE-57)**
13. **REMOVE FRONT SEAT OUTER TRACK ASSEMBLY LH (See page SE-57)**
14. **REMOVE FRONT SEAT OUTER TRACK ASSEMBLY RH (See page SE-57)**
15. **REMOVE FRONT SEAT CUSHION SPRING ASSEMBLY (See page SE-57)**



16. REMOVE OCCUPANT CLASSIFICATION SENSOR

(a) Disconnect the connector from the occupant classification sensor.
(b) Remove the wiring harness clamp.
(c) Disengage the clamps from the seat cushion frame.
(d) Remove the 2 clips and the occupant classification sensor.

INSTALLATION

NOTICE:

- **Install new parts from prepared service kits.**
- **Never use SRS parts from another vehicle. When replacing the parts, replace them with new ones.**
- **Never reuse an occupant classification sensor involved in a collision when the airbag has deployed.**
- **If the occupant classification sensor has been dropped, or there are any cracks, dents or other defects in the case, bracket or connector, replace it with a new one.**
- **When installing the occupant classification sensor, make sure that the SRS wiring does not interfere with other parts and that it is not pinched between other parts.**
- **After installing, shake the occupant classification sensor to check that there is no looseness.**
- **Remove the front seat cushion cover pad and front seat cushion cover together, in order to avoid occupant classification sensor malfunctions.**

1. INSTALL OCCUPANT CLASSIFICATION SENSOR

(a) Install the occupant classification sensor with the 2 clips.

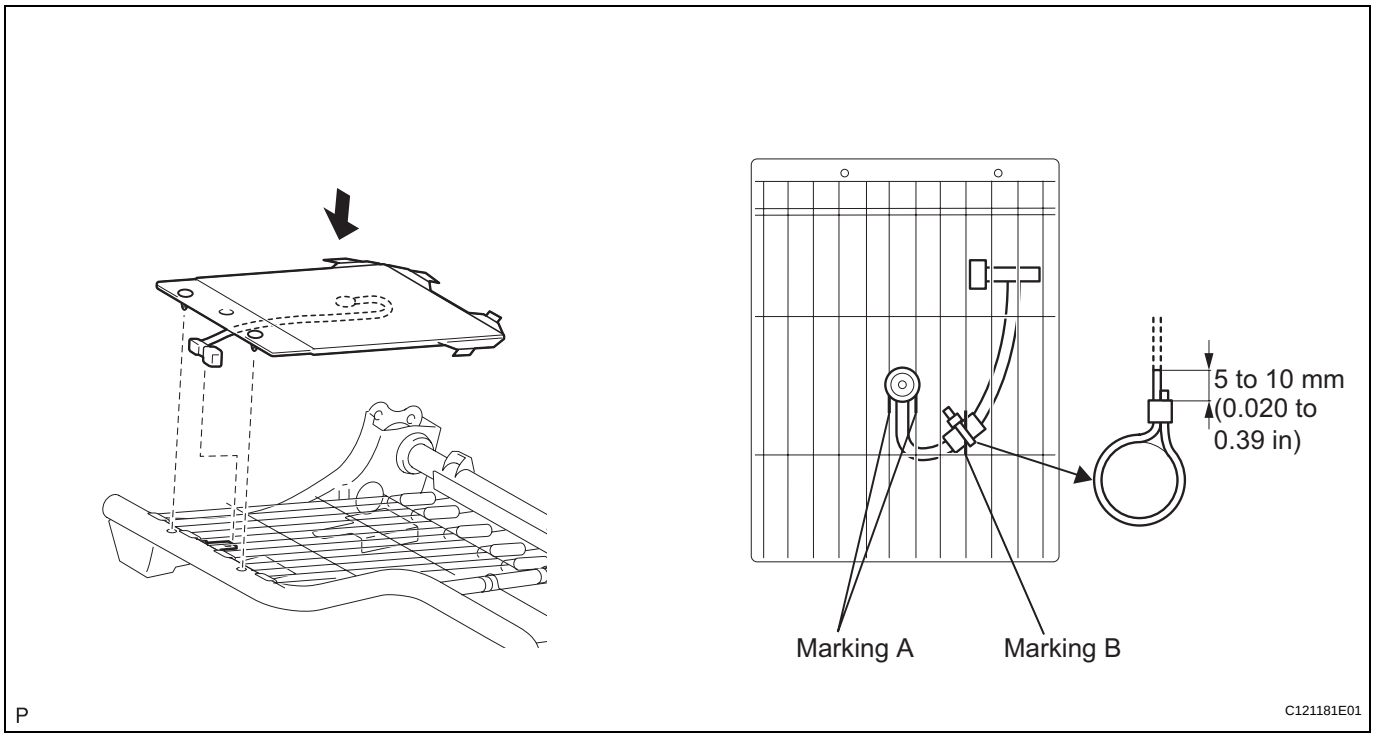
(b) Engage the clamps to the seat cushion frame.

(c) Pass the tube of the occupant classification sensor through marked portion A and then fix it at marked portion B on the front seat cushion spring assembly with the wiring harness clamp, as shown in the illustration on the following page.

HINT:

Cut the wiring harness clamp leaving 5 to 10 mm (0.20 to 0.39 in.) at the end.

(d) Connect the connector to the occupant classification sensor.



2. **INSTALL FRONT SEAT CUSHION SPRING ASSEMBLY (See page SE-62)**
3. **INSTALL FRONT SEAT OUTER TRACK ASSEMBLY LH (See page SE-62)**
4. **INSTALL FRONT SEAT OUTER TRACK ASSEMBLY RH (See page SE-62)**
5. **INSTALL FRONT SEAT TRACK LOWER REAR BRACKET LH (See page SE-63)**
6. **INSTALL FRONT SEAT TRACK LOWER REAR BRACKET RH (See page SE-63)**
7. **INSTALL FRONT SEAT TRACK LOWER FRONT BRACKET LH (See page SE-63)**
8. **INSTALL FRONT SEAT TRACK LOWER FRONT BRACKET RH (See page SE-63)**
9. **INSTALL OCCUPANT CLASSIFICATION ECU (See page RS-635)**
10. **INSTALL FRONT SEATBACK ASSEMBLY (See page SE-66)**
11. **INSTALL FRONT SEAT HINGE COVER LH (See page SE-66)**
12. **INSTALL FRONT SEAT HINGE COVER RH (See page SE-66)**
13. **INSTALL FRONT SEAT ASSEMBLY (See page SE-67)**

14. **INSTALL FRONT SEAT HEADREST ASSEMBLY (See page SE-68)**
15. **INSTALL FRONT SEAT INNER BELT ASSEMBLY LH (See page SB-13)**
16. **INSTALL FRONT SEAT INNER BELT ASSEMBLY RH (See page SB-14)**
17. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
    Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
18. **PERFORM ZERO POINT CALIBRATION AND SENSITIVITY CHECK**
    (See page RS-480)
19. **INSPECT SRS WARNING LIGHT**
    (See page RS-28)

REMOVAL

1. PRECAUTION

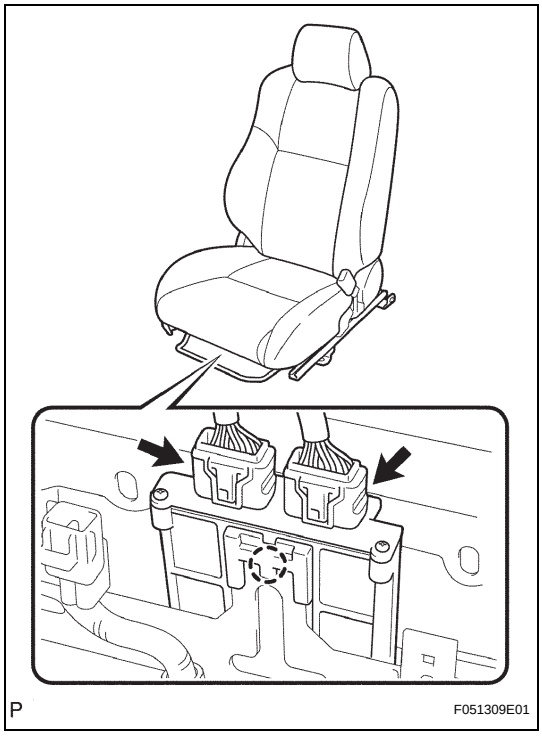
2. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

Wait for at least 90 seconds after disconnecting the cable to prevent the airbag from working.

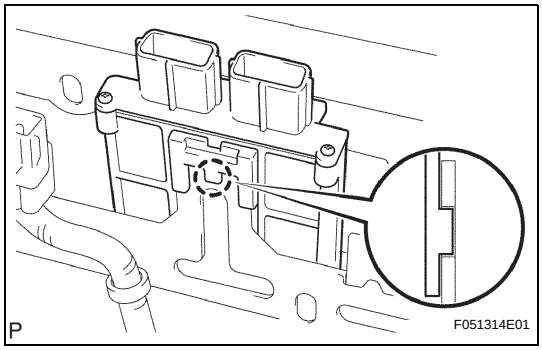
3. REMOVE FRONT SEAT ASSEMBLY RH

4. REMOVE OCCUPANT CLASSIFICATION ECU

(a) Disconnect the connector from the occupant classification ECU.



(b) Disengage the claw and remove the occupant classification ECU.



INSTALLATION

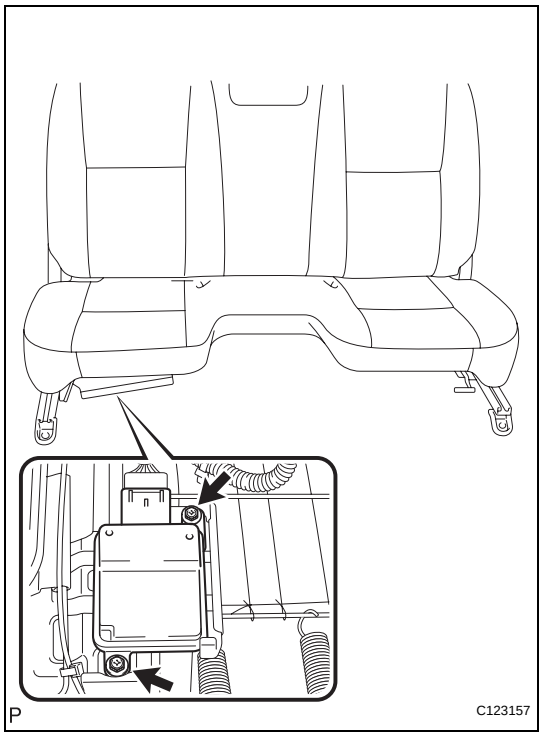
1. **INSTALL OCCUPANT CLASSIFICATION ECU**
   (a) Check that the ignition switch is OFF.
   (b) Check that the cable is disconnected from the battery negative (-) terminal is disconnected.
   CAUTION:
   After removing the cable from the terminal, wait for at least 90 seconds before starting the operation.
   (c) Engage the claw and install the occupant classification ECU.
   NOTICE:
   - **If the occupant classification ECU has been dropped, or there are cracks, dents or other defects in the case or connector, replace it with a new one.**
   - **When installing the occupant classification ECU, make sure that the SRS wiring does not interfere with any other parts and that it is not pinched between other parts.**
   (d) Connect the connector to the occupant classification ECU.
2. **INSTALL FRONT SEAT ASSEMBLY RH**
3. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
   Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
4. **OCCUPANT CLASSIFICATION ECU INITIALIZATION**
5. **INSPECT SRS WARNING LIGHT**
   (See page RS-28)

REMOVAL

NOTICE:

- **If the wiring connector of the SRS is disconnected with the ignition switch in the ON position, DTCs will be recorded.**
- **Never use SRS parts from another vehicle. When replacing the parts, replace them with new ones.**
- **Never reuse an occupant classification ECU if an airbag has previously deployed in a collision.**
- **Remove the front seat cushion cover pad and front seat cushion cover together, in order to avoid occupant classification sensor malfunctions.**

1. **READ IN OCCUPANT CLASSIFICATION ECU DATA (See page RS-476)**
2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   Wait for 90 seconds after disconnecting the cable to prevent the airbag from working.
3. **REMOVE FRONT SEAT INNER BELT ASSEMBLY LH (See page SB-12)**
4. **REMOVE FRONT SEAT INNER BELT ASSEMBLY RH (See page SB-12)**
5. **REMOVE FRONT SEAT HEADREST ASSEMBLY (See page SE-53)**
6. **REMOVE FRONT SEAT ASSEMBLY (See page SE-53)**
7. **REMOVE OCCUPANT CLASSIFICATION ECU**
   (a) Disconnect the connector from the the occupant classification ECU.
   (b) Remove the 2 bolts and the occupant classification ECU.

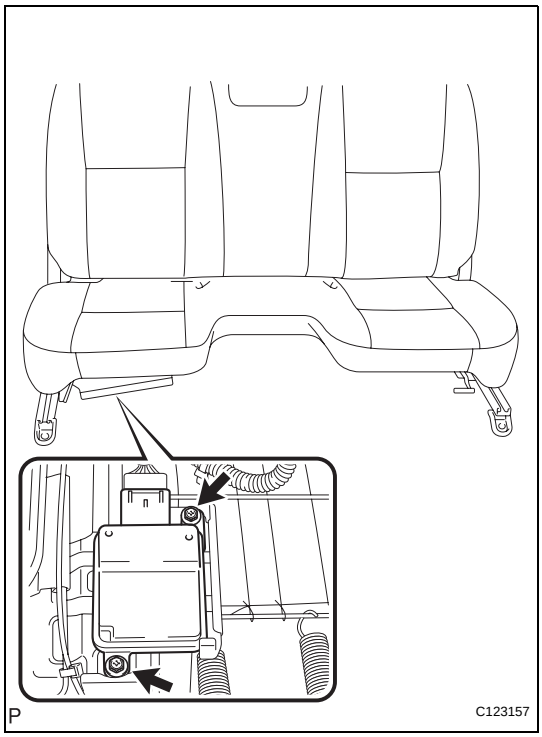


RS

INSTALLATION

NOTICE:

- **Never use SRS parts from another vehicle. When replacing the parts, replace them with new ones.**
- **Never reuse an occupant classification ECU involved in a collision when the airbag has deployed.**
- **If the occupant classification ECU has been dropped, or there are any cracks, dents or other defects in the case, bracket or connector, replace it with a new one.**
- **When installing the occupant classification ECU, make sure that the SRS wiring does not interfere with other parts and that it is not pinched between other parts.**
- **After installing, shake the occupant classification ECU to check that there is no looseness.**
- **Remove the front seat cushion cover pad and front seat cushion cover together, in order to avoid occupant classification sensor malfunctions.**



1. INSTALL OCCUPANT CLASSIFICATION ECU

(a) Check that the ignition switch is OFF.

(b) Check that the negative battery (-) terminal is disconnected.

CAUTION:
After disconnecting the negative battery terminal, wait for at least 90 seconds before starting the operation.

(c) Install the occupant classification ECU with the 2 bolts.

Torque: 3.0 N*m (31 kgf*cm, 27 in.*lbf)

(d) Connect the connector to the occupant classification ECU.

NOTICE:

- **If the occupant classification ECU has been dropped, or there are any cracks, dents or other defects in the case or connector, replace it with a new one.**
- **When installing the occupant classification ECU, make sure that the SRS wiring does not interfere with other parts and that it is not pinched between other parts.**
- **When replacing the occupant classification ECU, replace the bolt with a new one.**

2. INSTALL FRONT SEAT ASSEMBLY (See page SE-67)

3. INSTALL FRONT SEAT HEADREST ASSEMBLY (See page SE-68)

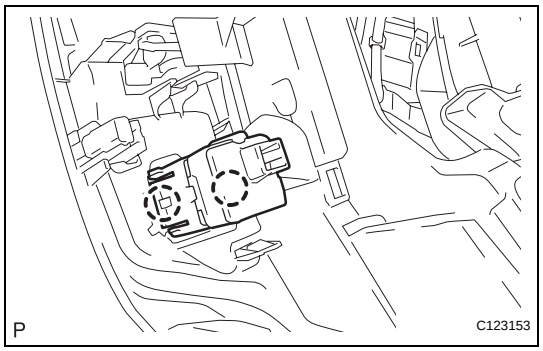
4. INSTALL FRONT SEAT INNER BELT ASSEMBLY LH (See page SB-13)

5. INSTALL FRONT SEAT INNER BELT ASSEMBLY RH (See page SB-14)

6. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

RS

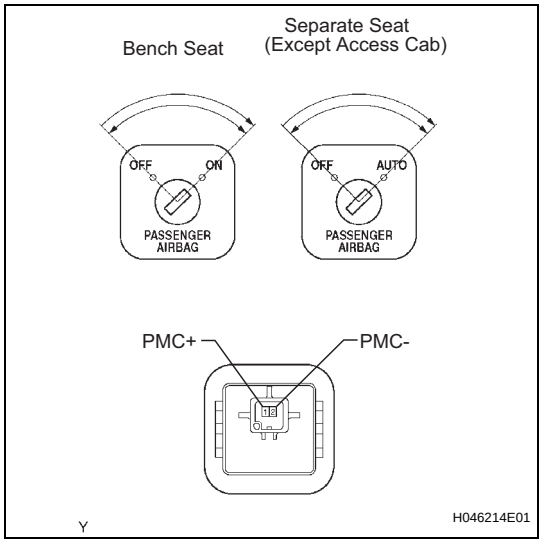
7. **INSERT OCCUPANT CLASSIFICATION ECU DATA (See page RS-476)**
8. **PERFORM ZERO POINT CALIBRATION AND SENSITIVITY CHECK**
   (See page RS-480)
9. **INSPECT SRS WARNING LIGHT**
   (See page RS-28)



13. REMOVE AIRBAG CUT OFF SWITCH

(a) Disconnect the airbag cut off switch connector.

(b) Remove the instrument cluster finish panel sub-assembly center while holding the 2 claws of the airbag cut off switch.



INSPECTION

1. INSPECT AIRBAG CUT OFF SWTCH

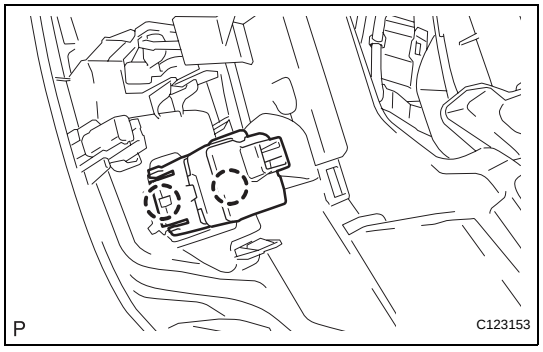
(a) Check the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Standard :

Switch Connection	Tester Condition	Specified Condition
OFF	1 (MSW+) - 2 (MSW-)	80 to 120Ω
ON	1 (MSW+) - 2 (MSW-)	320 to 480Ω

If the result is not as specified, replace the air bag cut off switch.

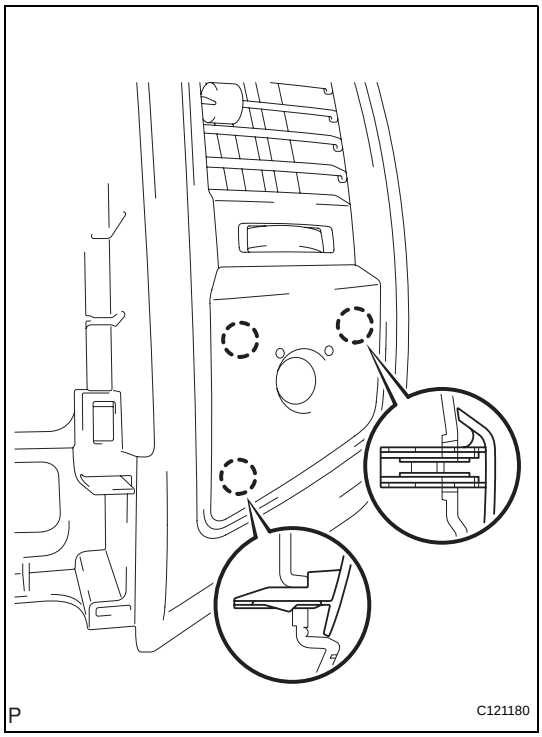


INSTALLATION

1. INSTALL AIRBAG CUT-OFF SWITCH

(a) Engage the 2 claws of the cut off switch with the instrument cluster finish panel sub-assembly center.

(b) Attach the connector to the airbag cut off switch.



2. **INSTALL SWITCH BASE HOLE COVER**
   (a) Disengage the 3 claws and install the switch base hole cover.
3. **INSTALL CENTER INSTRUMENT CLUSTER FINISH PANEL SUB-ASSEMBLY (See page IP-21)**
4. **INSTALL INSTRUMENT CLUSTER FINISH PANEL SUB-ASSEMBLY (See page IP-21)**
5. **INSTALL INSTRUMENT LOWER PANEL LH (See page IP-20)**
6. **INSTALL NO.1 LOWER INSTRUMENT PANEL FINISH PANEL (See page IP-22)**
7. **CONNECT HOOD LOCK CONTROL LEVER SUB-ASSEMBLY (See page ED-8)**
8. **INSTALL RADIO RECEIVER ASSEMBLY WITH BRACKET (See page AV-70)**
9. **INSTALL AIR CONDITIONING CONTROL ASSEMBLY (See page IP-22)**
10. **INSTALL INSTRUMENT PANEL HOLE COVER (for Lever Type Parking Brake) (See page IP-25)**
11. **INSTALL INSTRUMENT PANEL UNDER TRAY (for Pedal Type Parking Brake) (See page IP-25)**
12. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
    Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
13. **INSPECT SRS WARNING LIGHT**
    (See page RS-28)

SYSTEM DESCRIPTION

When the ignition switch ON, this system detects the condition of the seat belts based on the signals from the front seat inner belt switches (for driver side only) and the occupant detection sensor or weight sensor (front passenger side only).

For bench seat:

The weight sensor, which is built into the seat cushion of the front passenger seat, is used to detect whether or not the front passenger seat is occupied.

For separate seat:

The occupant detection sensor, which is built into the seat cushion of the front passenger seat, is used to detect whether or not the front passenger seat is occupied.

PROBLEM SYMPTOMS TABLE

HINT:
Proceed to the troubleshooting for each circuit in the table below.

SEAT BELT WARNING SYSTEM

Symptom	Suspected area	See page
Driver side seat belt warning light does not blink	GAUGE fuse	-
	Front seat inner belt assembly LH (bench seat type)	SB-13
	Front seat inner belt assembly LH (separate seat type)	SB-9
	Combination meter assembly	ME-47
	Multiplex network body ECU	-
	Wire harness	-
Passenger side seat belt warning light does not blink	IG1 fuse	-
	Front seat outer belt assembly RH (bench seat type)	RS-545
	Front seat inner belt assembly RH (bench seat type)	SB-13
	Front seat inner belt assembly RH (separate seat type)	SB-9
	Occupant classification sensor (bench seat type)	RS-626
	Occupant classification sensor (separate seat type)	RS-434
	Occupant classification ECU (bench seat type)	RS-634
	Occupant classification ECU (separate seat type)	RS-630
	Hazard warning signal switch assembly	ME-51
	Center air bag sensor assembly	RS-602
	Wire harness	-

REMOVAL

CAUTION:
Some of these service operations affect the SRS airbag system. Read the precautionary notices concerning the SRS airbag system before servicing (w/ Front Seat Side Airbag) (See page RS-1).

1. **REMOVE CABLE FROM NEGATIVE BATTERY TERMINAL**
   Wait for at least 90 seconds after disconnecting the cable to prevent the air bag from working (w/ Front Seat Side Airbag).

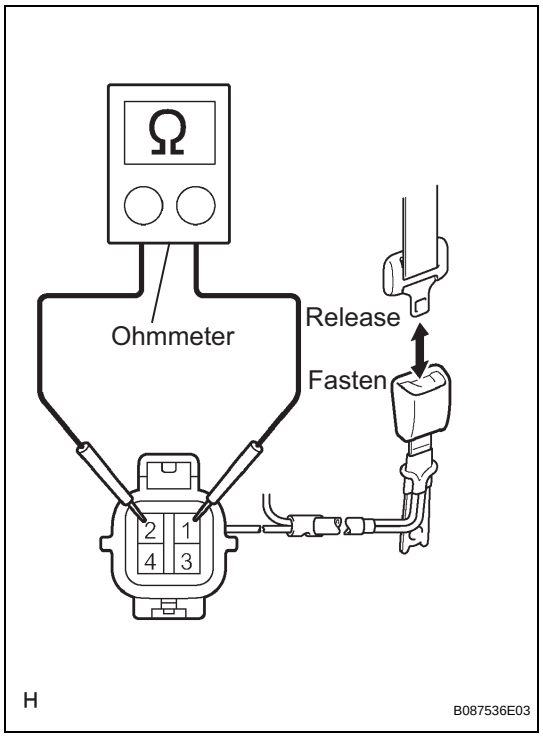
2. **REMOVE SEAT TRACK COVER**
   (a) for Separate Seat Type Driver Side:
      (1) Remove the seat track cover (See page SE-23).
   (b) for Separate Seat Type Front Passenger Side:
      (1) Remove the seat track cover (See page SE-38).
   (c) for Separate Folding Seat Type:
      (1) Remove the seat track cover (See page SE-5).

3. **REMOVE FRONT SEAT ASSEMBLY**
   (a) for Separate Seat Type Driver Side:
      (1) Remove the front seat assembly (See page SE-23).
   (b) for Separate Seat Type Front Passenger Side:
      (1) Remove the front seat assembly (See page SE-38).
   (c) for Separate Folding Seat Type:
      (1) Remove the front seat assembly (See page SE-5).

4. **REMOVE FRONT SEAT INNER BELT ASSEMBLY**
   (a) for Separate Seat Type Driver Side:
      (1) Using a clip remover, remove the wire harness clamp and 2 connector clamps.
      (2) Remove the wire harness clamp.
      (3) Disconnect the seat position sensor connector.
      (4) Remove the nut and front seat inner belt.

   (b) for Separate Seat Type Front Passenger Side and Separate Folding Seat Type:
      (1) Disconnect the seat wire connector.
      (2) Using a clip remover, remove the connector clamp.
      (3) Remove the wire harness clamp.
      (4) Remove the nut and front seat inner belt.

SB



INSPECTION

1. INSPECT FRONT SEAT INNER BELT ASSEMBLY LH

(a) for Separate Seat Type Driver Side:

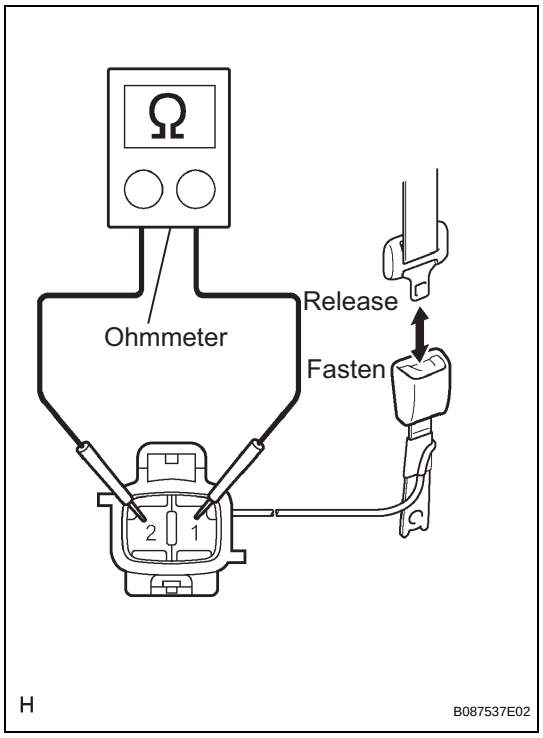
(1) Check the resistance.

1. Using an ohmmeter, measure the resistance between the terminals.

Standard resistance

Tester Connection	Condition	Specified Condition
1 - 2	Fasten seat belt	10 kΩ or higher
1 - 2	Release seat belt	Below 1 Ω

If the result is not as specified, replace the front seat inner belt.



(b) for Separate Seat Type Front Passenger Side and Separate Folding Seat Type:

(1) Check the resistance.

1. Using an ohmmeter, measure the resistance between the terminals.

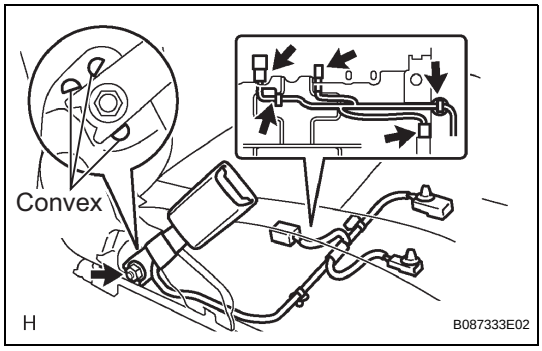
Standard resistance

Tester Connection	Condition	Specified Condition
1 - 2	Fasten seat belt	10 kΩ or higher
1 - 2	Release seat belt	Below 1 Ω

If the result is not as specified, replace the front seat inner belt.

INSTALLATION

CAUTION:
Some of these service operations affect the SRS airbag system. Read the precautionary notices concerning the SRS airbag system before servicing (w/ Front Seat Side Airbag) (See page RS-1).



1. INSTALL FRONT SEAT INNER BELT ASSEMBLY

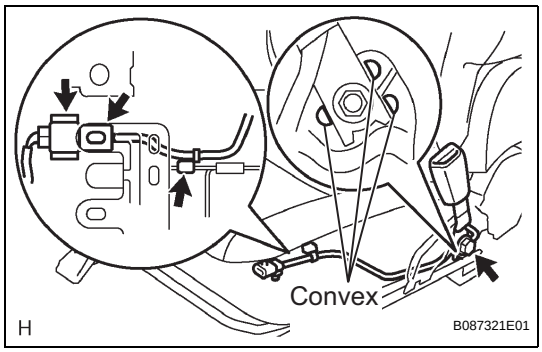
(a) for Separate Seat Type Driver Side:

(1) Install the front seat inner belt with the nut.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)
NOTICE:
Be careful not to place the front seat inner belt over the convex areas of the front seat with adjuster frame.

(2) Check that the front seat inner belt rotates smoothly.

(3) Connect the seat position sensor connector.

(4) Install the 2 wire harness clamps and 2 connector clamps.



(b) for Separate Seat Type Front Passenger Side and Separate Folding Seat Type:

(1) Install the front seat inner belt with the nut.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)
NOTICE:
Be careful not to place the front seat inner belt over the convex areas of the front seat with adjuster frame.

(2) Check that the front seat inner belt rotates smoothly.

(3) Install the wire harness clamp and connector clamp.

(4) Connect the seat wire connector.

2. INSTALL FRONT SEAT ASSEMBLY

(a) for Separate Seat Type Driver Side:

(1) Install the front seat assembly (See page SE-34).

(b) for Separate Seat Type Front Passenger Side:

(1) Install the front seat assembly (See page SE-47).

(c) for Separate Folding Seat Type:

(1) Install the front seat assembly (See page SE-18).

3. INSTALL SEAT TRACK COVER

(a) for Separate Seat Type Driver Side:

(1) Install the seat track cover (See page SE-34).

(b) for Separate Seat Type Front Passenger Side:

(1) Install the seat track cover (See page SE-48).

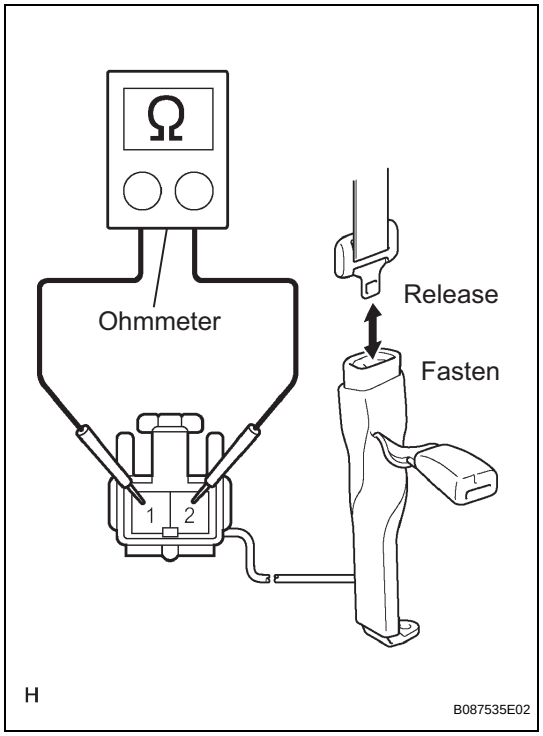
(c) for Separate Folding Seat Type:

(1) Install the seat track cover (See page SE-19).

4. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

SB

5. INSPECT SRS WARNING LIGHT (w/ Front Seat Side Airbag)
(See page RS-28)



INSPECTION

1. INSPECT FRONT SEAT INNER BELT ASSEMBLY LH

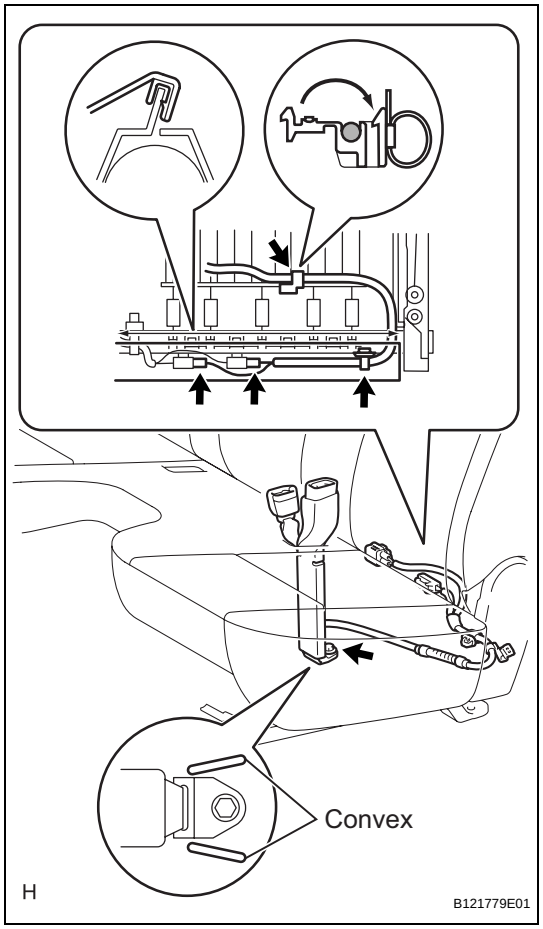
(a) Check the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Standard resistance

Tester Connection	Condition	Specified condition
1 - 2	Fasten seat belt	10 kΩ or higher
1 - 2	Release seat belt	Below 1 Ω

If the result is not as specified, replace the front seat inner belt.



INSTALLATION

1. INSTALL FRONT SEAT INNER BELT ASSEMBLY LH

(a) Slide the front seat to the most forward position.

(b) Install the front seat inner belt with the bolt.

Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)

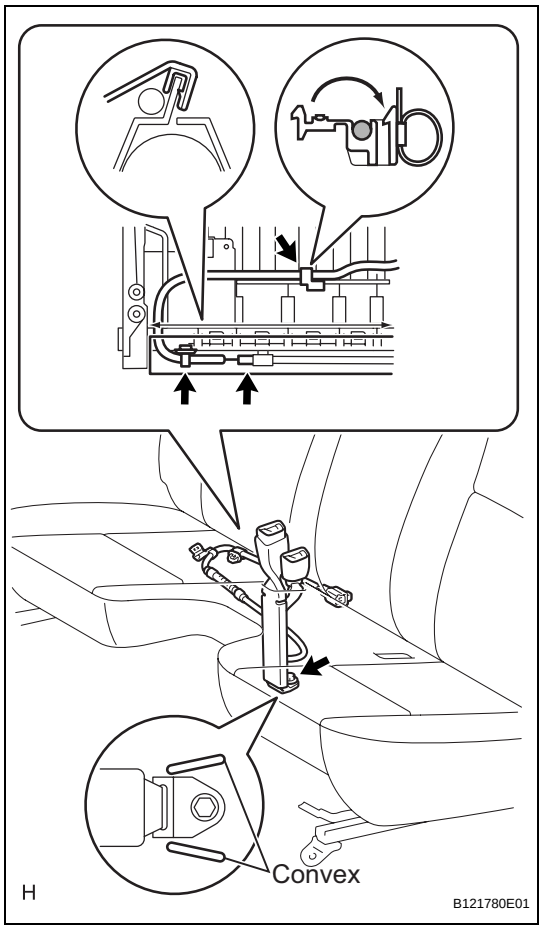
NOTICE:

Be careful not to place the front seat inner belt over the convex areas of the floor panel.

(c) Install the 2 wiring harness clamps.

(d) Connect the 2 connectors.

(e) Engage the hook.



2. INSTALL FRONT SEAT INNER BELT ASSEMBLY RH

(a) Slide the front seat to the most forward position.

(b) Install the front seat inner belt with the bolt.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)
NOTICE:
Be careful not to place the front seat inner belt over the convex areas of the floor panel.

(c) Install the 2 wiring harness clamps.

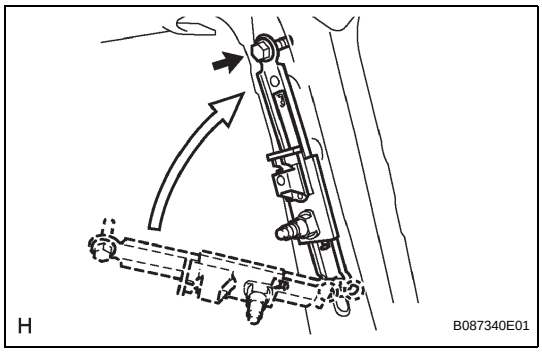
(d) Connect the connector.

(e) Engage the hook.

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

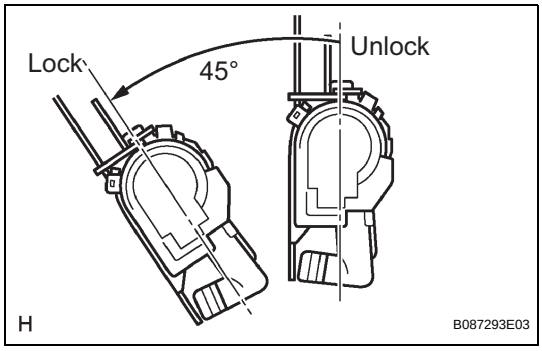
INSTALLATION

CAUTION:
Some of these service operations affect the SRS airbag system. Read the precautionary notices concerning the SRS airbag system before servicing (See page RS-1).



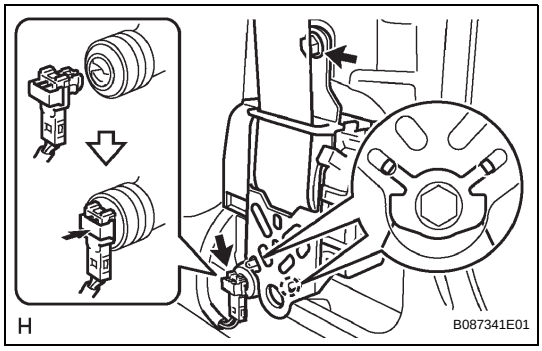
1. INSTALL FRONT SHOULDER BELT ANCHOR ADJUSTER ASSEMBLY

(a) Insert the 2 claws of the front shoulder belt anchor adjuster into the hole in the body and mount the bolt.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)



2. INSTALL FRONT SEAT OUTER BELT ASSEMBLY

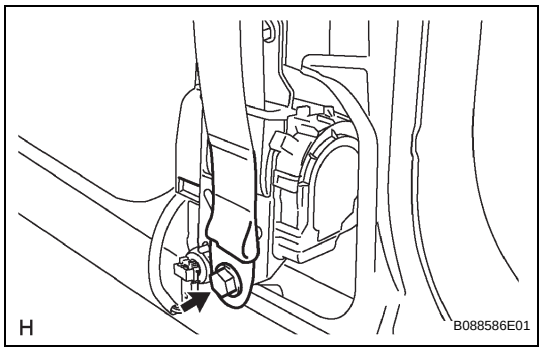
(a) Check the amount of inclination required to lock the retractor.
(1) Gently incline the retractor from its initial position. Check that the belt does not lock when the retractor is inclined 15° or less in any directions. Also check that the belt locks when the inclination of the retractor is 45° or more.
NOTICE:
Do not disassemble the retractor.
If operation is not as specified, replace the front seat outer belt.



(b) Hook the lower stay of the retractor onto the 2 body hooks.
(c) Install the retractor with the bolt.
Torque: 8.5 N*m (85 kgf*cm, 75 in.*lbf)
(d) Connect the pretensioner connector as shown in the illustration.

(e) Install the shoulder anchor with the nut.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)
(f) Check that the shoulder anchor rotates smoothly.

SB



(g) Install the floor anchor of the front seat outer belt with the bolt.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)

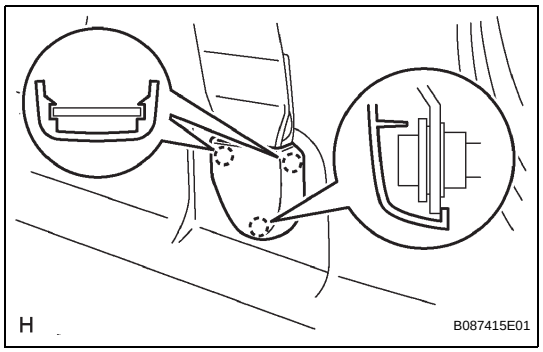
(h) Check the ELR lock.
NOTICE:
- **The check should be performed with the front seat outer belt installed.**
- **Do not allow the anchor part of the front seat outer belt and the protruding parts of the floor panel to overlap.**

(1) With the belt installed, check that the belt locks when it is pulled out quickly.
If operation is not as specified, replace the front seat outer belt.

(i) Remove the bolt and floor anchor.

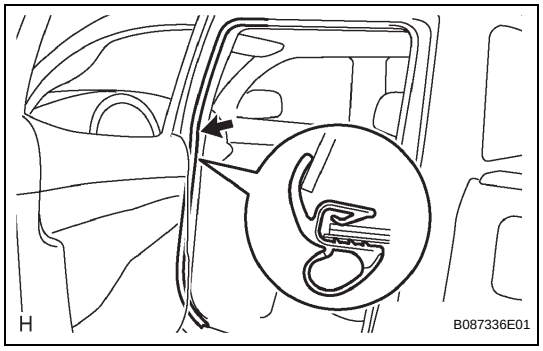
3. INSTALL CENTER PILLAR UPPER GARNISH (See page IR-26)

4. INSTALL CENTER PILLAR LOWER GARNISH (See page IR-26)



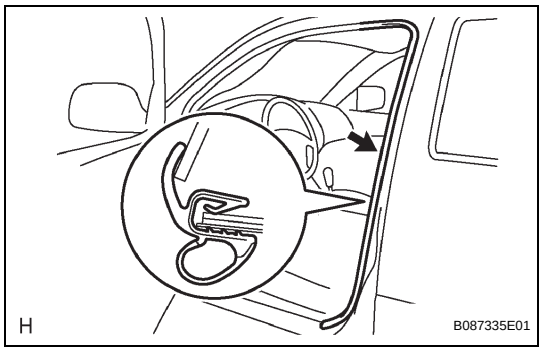
5. INSTALL LAP BELT OUTER ANCHOR COVER

(a) Engage the 3 claws and install the lap belt outer anchor cover.



6. INSTALL REAR DOOR OPENING TRIM WEATHERSTRIP

(a) Install the rear door opening trim weatherstrip.



7. INSTALL FRONT DOOR OPENING TRIM WEATHERSTRIP

(a) Install the front door opening trim weatherstrip.

8. INSTALL REAR DOOR SCUFF PLATE (See page IR-29)

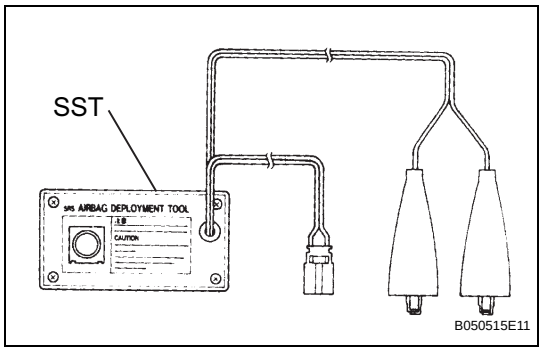
9. INSTALL FRONT DOOR SCUFF PLATE (See page IR-29)

10. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

11. INSPECT SRS WARNING LIGHT
(See page RS-28)

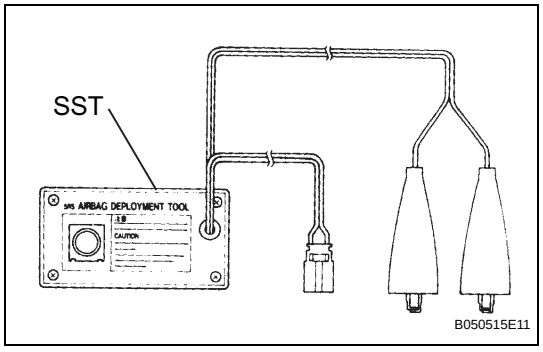
DISPOSAL

HINT:
When scrapping vehicles equipped with a seat belt pretensioner or disposing of a front seat outer belt (with seat belt pretensioner), always first activate the seat belt pretensioner in accordance with the procedures described below. If any abnormality occurs during activation of the seat belt pretensioner, contact the SERVICE DEPARTMENT of TOYOTA MOTOR SALES, U.S.A., INC. When disposing of a front seat outer belt assembly (with seat belt pretensioner) that was activated in a collision, start by step 2-(f) in this section.



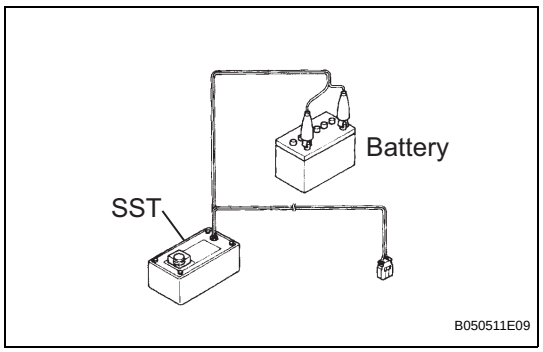
CAUTION:

- **Never dispose of a front seat outer belt assembly that has an inactivated pretensioner.**
- **The seat belt pretensioner produces a loud, exploding sound when it activates. Perform the operation where it will not be a nuisance to persons nearby.**
- **When activating a front sear outer belt (with seat belt pretensioner), stand at least 10 m (33ft) away from the front seat outer belt.**
- **Use gloves and safety glasses when handling a front seat belt with an activated pretensioner.**
- **Always wash your hands with water after completing activation.**
- **Do not apply water to a front seat outer belt that has an activated pretensioner.**
- **When activating the seat belt pretensioner, always use the specified SST (SRS air bag deployment tool).**
- **Perform operation in a place away from electrical interference.**



1. DISPOSE OF FRONT SEAT OUTER BELT ASSEMBLY (When Installed in Vehicle)

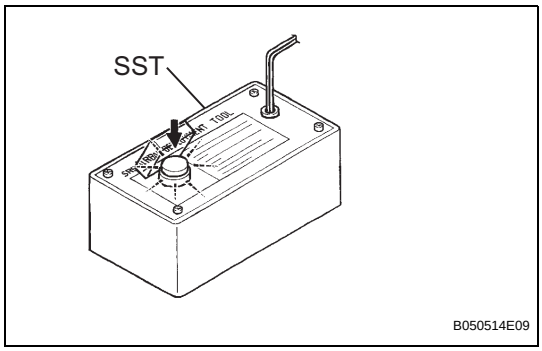
HINT:
Prepare a battery to power activation of the seat belt pretensioner.



(a) Check whether SST is functioning.
SST 09082-00700, 09082-00770
CAUTION:
When activating the seat belt pretensioner, always use the specified SST.

(1) Connect SST red clip to the battery positive (+) terminal and the black clip to the battery negative (-) terminal.
HINT:
Do not connect the yellow connector. The yellow connector is used to connect to the seat belt pretensioner.

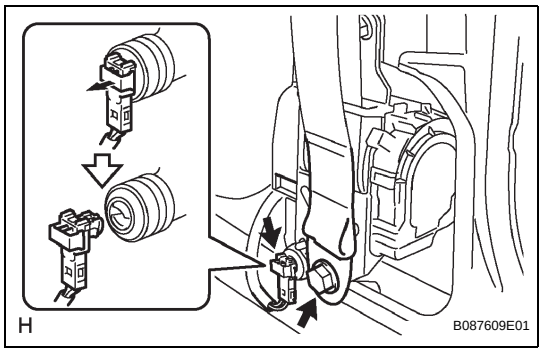
SB



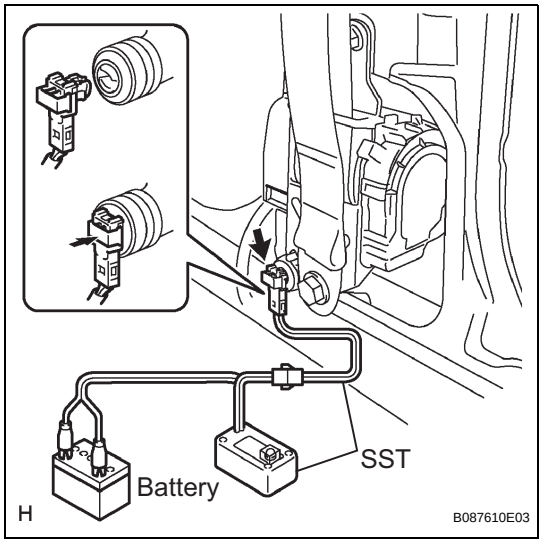
(2) Press SST activation switch and check that the LED of SST activation switch turns on.
CAUTION:
If the LED turns on when the activation switch is not being pressed, SST may be malfunctioning. Do not use SST.

(b) Disconnect SST from the battery.

(c) Disconnect the pretensioner connector.
(1) Disconnect cable from negative battery terminal.
(2) Remove the front door scuff plate (See page SB-16).
(3) Remove the rear door scuff plate (See page SB-16).
(4) Remove the front door opening trim weatherstrip (See page SB-16).
(5) Remove the rear door opening trim weatherstrip (See page SB-16).
(6) Remove the lap belt outer anchor cover (See page SB-16).
(7) Remove the center pillar lower garnish (See page SB-16).

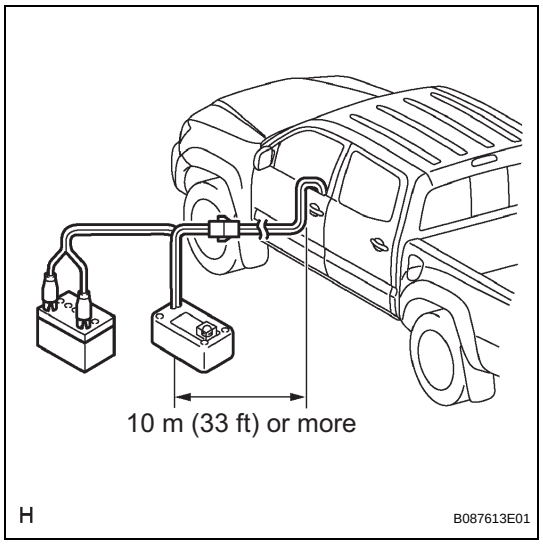


(8) Install the floor anchor with the bolt.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)
(9) Disconnect the pretensioner connector as shown in the illustration.



(d) Connect the SST.
(1) Connect SST, then connect the yellow connector to the seat belt pretensioner.
SST 09082-00700, 09082-00770
NOTICE:
To avoid damaging SST connector and wire harness, do not lock the secondary lock of the twin lock.

SB



(2) Move SST at least 10 m (33 ft) away from the front of the vehicle.
(3) Close all the doors and windows of the vehicle.
HINT:
Do not close the windows fully. Leave a gap for inserting SST wire harness.
NOTICE:
Take care not to damage SST wire harness.
(4) Connect SST red clip to the battery positive (+) terminal and the black clip to the battery negative (-) terminal.

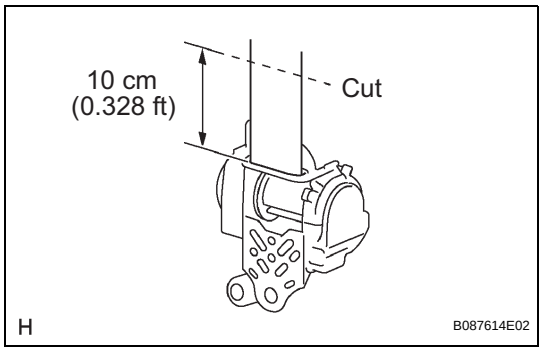
(e) Activate the seat belt pretensioner.
(1) Confirm that no one is inside the vehicle or within 10 m (33 ft) of the vehicle.
(2) Press SST activation switch and activate the seat belt pretensioner.
HINT:
The seat belt pretensioner operates simultaneously with SST activation switch LED light.

(f) Dispose of the outer belt (with the seat belt pretensioner).
CAUTION:
- **Do not touch the outer belt for at least 30 minutes after the seat belt pretensioner has been activated. It is very hot.**
- **Use gloves and safety glasses when handling an outer belt with a pretensioner that has been activated.**
- **Always wash your hands with water after completing the operation.**
- **Do not apply water to a front seat outer belt that has an activated pretensioner.**

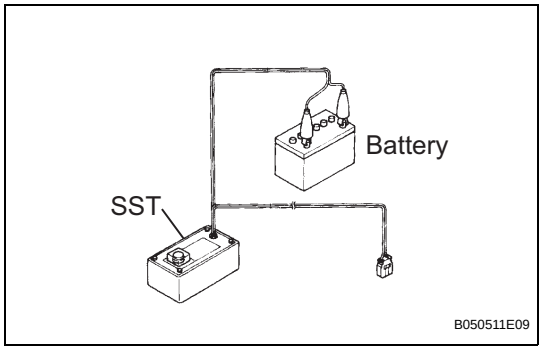
HINT:
When scrapping a vehicle, activate the seat belt pretensioner, and then scrap the vehicle with the activated outer belt still installed.

2. DISPOSE OF FRONT SEAT OUTER BELT ASSEMBLY (When not Installed in Vehicle)
NOTICE:
Be sure to follow the procedures listed below when activating the seat belt pretensioner.
HINT:
Prepare a battery as the power source to activate the seat belt pretensioner.
(a) Remove the front seat outer belt (See page SB-16).

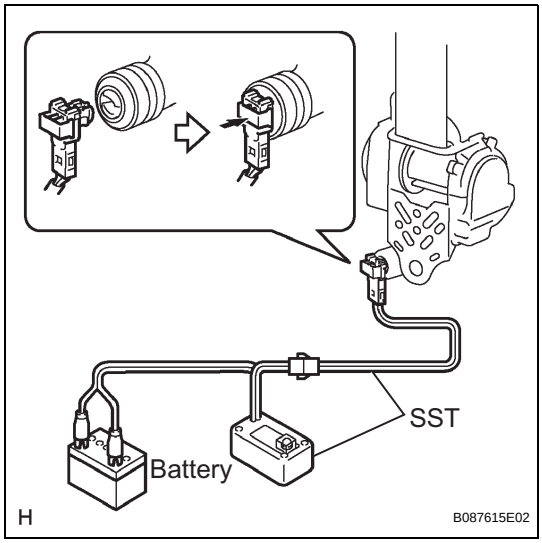
SB



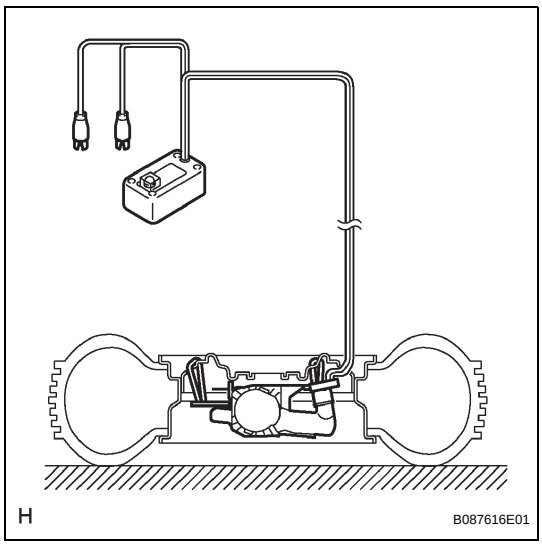
(b) Wind the seat belt with the retractor.
(c) When the seat belt is sufficiently wound, cut the seat belt approximately 10 cm (0.328 ft) from the retractor, as shown in the illustration.
HINT:
The retractor resistance increases in correlation with how much the seat belt is wound.



(d) Check whether SST is functioning (see step 2-(a)).
SST 09082-00700, 09082-00770
CAUTION:
When activating the seat belt pretensioner, always use the specified SST.

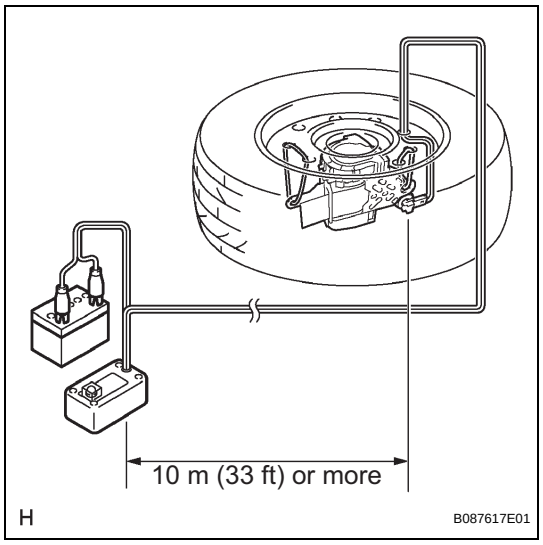


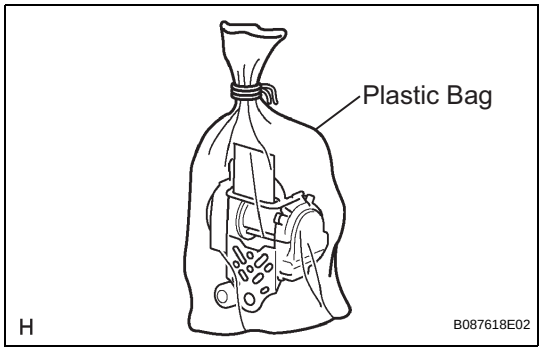
(e) Connect SST.
(1) Connect SST, then connect them to the seat belt pretensioner.
NOTICE:
To avoid damaging SST connector and wire harness, do not lock the secondary lock of the twin lock.



(2) Place the outer belt on the ground and cover it with a tire with a wheel attached.
NOTICE:
Set up the front seat outer belt assembly shown in the illustration.

SB





(3) Move SST at least 10 m (33 ft) away from the wheel.

NOTICE:

Take care not to damage SST wire harness.

(f) Activate the seat belt pretensioner.

(1) Connect SST red clip to the battery positive (+) terminal and the black clip to the battery negative (-) terminal.

(2) Check that no one is within 10 m (33 ft) of the wheel.

(3) Press SST activation switch and activate the seat belt pretensioner.

HINT:

The seat belt pretensioner operates simultaneously with SST activation switch LED light.

(g) Dispose of the outer belt (with the seat belt pretensioner).

CAUTION:

- **Do not touch the outer belt for at least 30 minutes after the seat belt pretensioner has been activated. It is very hot.**
- **Use gloves and safety glasses when handling an outer belt assembly with a pretensioner that has been activated.**
- **Always wash your hands with water after completing operation.**
- **Do not apply water to an outer belt assembly that has an activated pretensioner.**

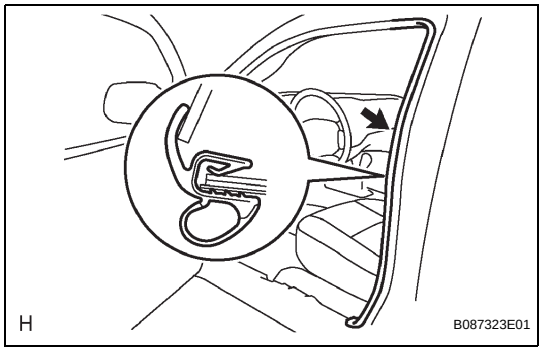
(1) Remove the wheel and SST.

(2) Place the outer belt in a plastic bag, tie the end tightly and dispose of it in the same way as other general parts.

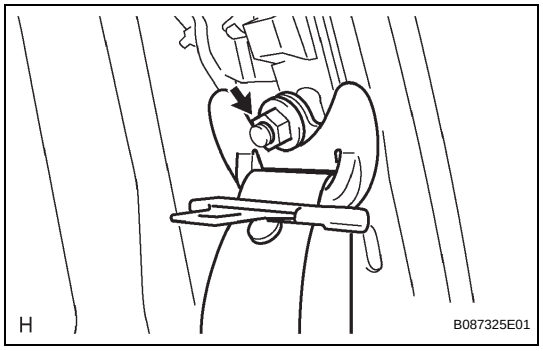
REMOVAL

CAUTION:
Some of these service operations affect the SRS airbag system. Read the precautionary notices concerning the SRS airbag system before servicing (See page RS-1).

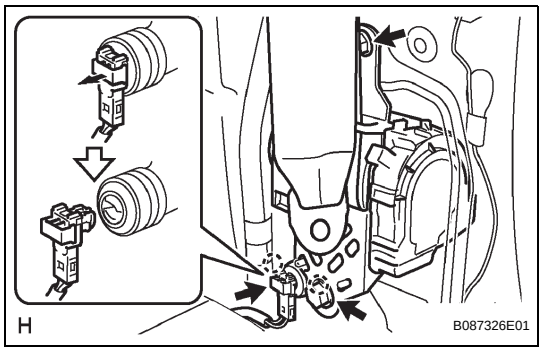
1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   Wait for at least 90 seconds after disconnecting the cable to prevent the airbag from working.
2. **REMOVE FRONT DOOR SCUFF PLATE (See page IR-40)**
3. **REMOVE FRONT DOOR OPENING TRIM WEATHERSTRIP**
   (a) Separate the front door opening trim weatherstrip to the extent which allows the removal of the quarter trim lower panel and quarter inside trim board.



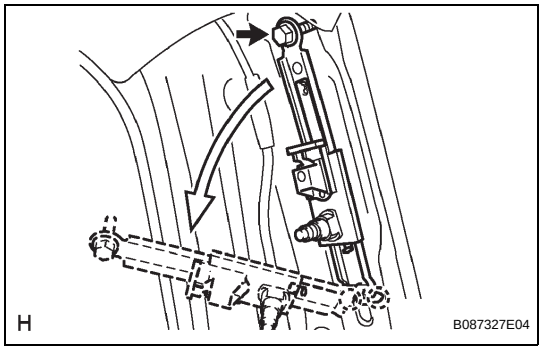
4. **REMOVE BACK PANEL TRIM COVER (See page IR-42)**
5. **REMOVE BACK PANEL UPPER GARNISH (See page IR-43)**
6. **REMOVE JACK ASSEMBLY (for Separate Seat Type)**
7. **REMOVE BACK PANEL TRIM COVER (for Separate Seat Type) (See page IR-43)**
8. **REMOVE BACK PANEL TRIM (for Separate Seat Type) (See page IR-43)**
9. **REMOVE QUARTER TRIM LOWER PANEL (See page IR-43)**
10. **REMOVE QUARTER INSIDE TRIM BOARD (See page IR-44)**
11. **REMOVE FRONT SEAT OUTER BELT ASSEMBLY**
    (a) Remove the bolt and shoulder anchor.



SB

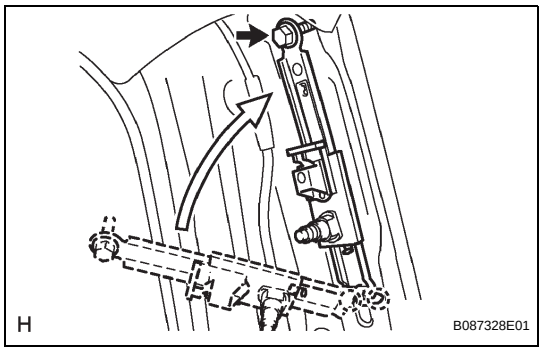


(b) Disconnect the pretensioner connector as shown in the illustration.
(c) Remove the 2 bolts and retractor.

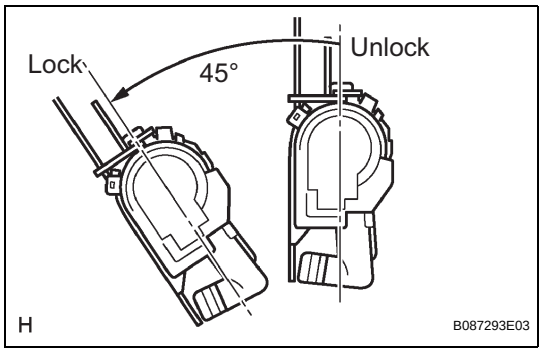


12. REMOVE FRONT SHOULDER BELT ANCHOR ADJUSTER ASSEMBLY
(a) Remove the bolt.
(b) Disengage the 2 claws and remove the front shoulder belt anchor adjuster.

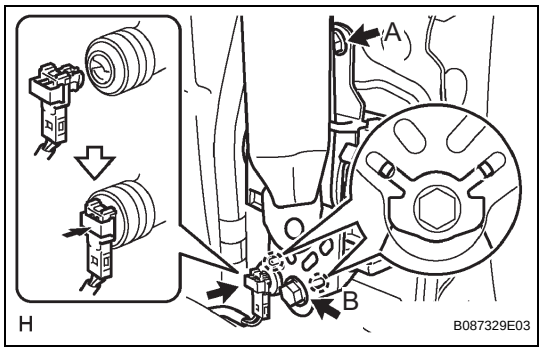
INSTALLATION



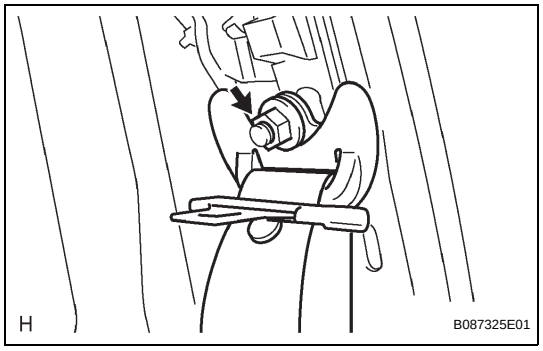
1. INSTALL FRONT SHOULDER BELT ANCHOR ADJUSTER ASSEMBLY
(a) Insert the 2 claws of the front shoulder belt anchor adjuster into the hole in body and mount the bolt.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)



2. INSTALL FRONT SEAT OUTER BELT ASSEMBLY
(a) Check the amount of inclination required to lock the retractor.
(1) Gently incline the retractor from its initial position. Check that belt does not lock when the retractor is inclined 15° or less in any directions. Also check that the belt locks when the inclination of the retractor is 45° or more.
NOTICE:
Do not disassemble the retractor.
If operation is not as specified, replace the front seat outer belt.



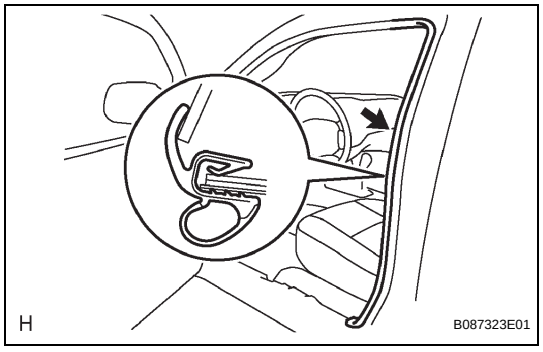
(b) Hook the lower stay of the retractor onto the 2 body hooks.
(c) Tighten bolt A, and then tighten bolt B.
Torque: 8.5 N*m (85 kgf*cm, 75 in.*lbf) for bolt A
42 N*m (430 kgf*cm, 31 ft.*lbf) for bolt B
(d) Connect the pretensioner connector as shown in the illustration.



(e) Install the shoulder anchor with the nut.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)
(f) Check that the shoulder anchor rotates smoothly.
(g) Check the ELR lock.
NOTICE:
- **The check should be performed with the front seat outer belt installed.**
- **Do not allow the anchor part of the front seat belt outer and the protruding parts of the floor panel to overlap.**

(1) With the belt installed, check that the belt locks when it is pulled out quickly.
If operation is not as specified, replace the front seat outer belt.

3. **INSTALL QUARTER INSIDE TRIM BOARD (See page IR-48)**
4. **INSTALL QUARTER TRIM LOWER PANEL (See page IR-49)**
5. **INSTALL BACK PANEL TRIM (for Separate Seat Type) (See page IR-49)**
6. **INSTALL JACK ASSEMBLY (for Separate Seat Type)**
7. **INSTALL BACK PANEL UPPER GARNISH (See page IR-50)**
8. **INSTALL BACK PANEL TRIM COVER (See page IR-50)**

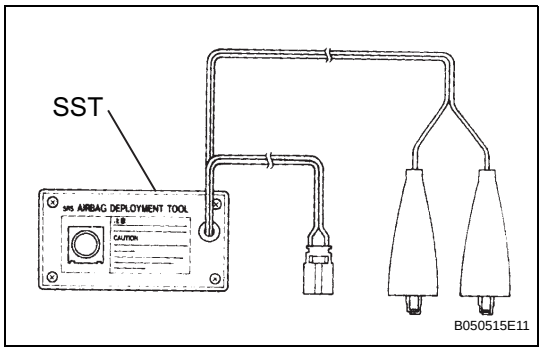


9. **INSTALL FRONT DOOR OPENING TRIM WEATHERSTRIP**
(a) Install the front door opening trim weatherstrip.
10. **INSTALL FRONT DOOR SCUFF PLATE (See page IR-52)**
11. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
12. **INSPECT SRS WARNING LIGHT**
(See page RS-28)

SB

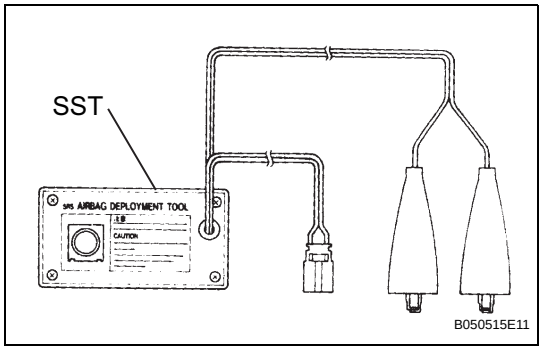
DISPOSAL

HINT:
When scrapping vehicles equipped with a seat belt pretensioner or disposing of a front seat outer belt (with seat belt pretensioner), always first activate the seat belt pretensioner in accordance with the procedures described below. If any abnormality occurs during activation of the seat belt pretensioner, contact the SERVICE DEPARTMENT of TOYOTA MOTOR SALES, U.S.A., INC. When disposing of a front seat outer belt assembly (with seat belt pretensioner) that was activated in a collision, start by step 2-(f) in this section.



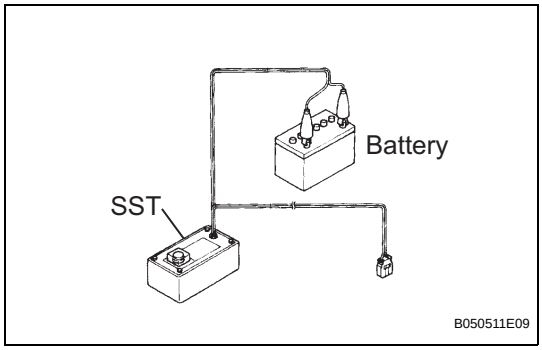
CAUTION:

- **Never dispose of a front seat outer belt assembly that has an inactivated pretensioner.**
- **The seat belt pretensioner produces a loud, exploding sound when it activates. Perform the operation where it will not be a nuisance to persons nearby.**
- **When activating a front seat outer belt (with seat belt pretensioner), stand at least 10 m (33 ft) away from the front seat outer belt.**
- **Use gloves and safety glasses when handling a front seat belt with an activated pretensioner.**
- **Always wash your hands with water after completing activation.**
- **Do not apply water to a front seat outer belt that has an activated pretensioner.**
- **When activating the seat belt pretensioner, always use the specified SST (SRS air bag deployment tool).**
- **Perform operation in a place away from electrical interference.**



1. DISPOSE OF FRONT SEAT OUTER BELT ASSEMBLY (When Installed in Vehicle)

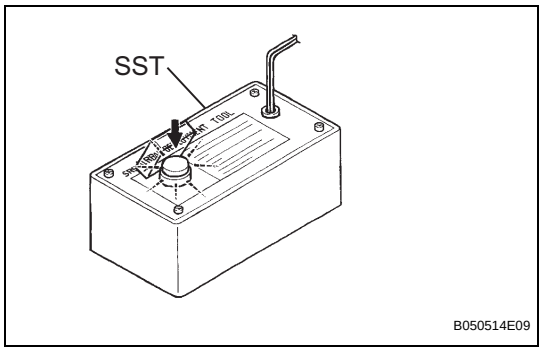
HINT:
Prepare a battery to power activation of the seat belt pretensioner.



(a) Check whether SST is functioning.
SST 09082-00700, 09082-00770
CAUTION:
When activating the seat belt pretensioner, always use the specified SST.

(1) Connect SST red clip to the battery positive (+) terminal and the black clip to the battery negative (-) terminal.
HINT:
Do not connect the yellow connector. The yellow connector is used to connect to the seat belt pretensioner.

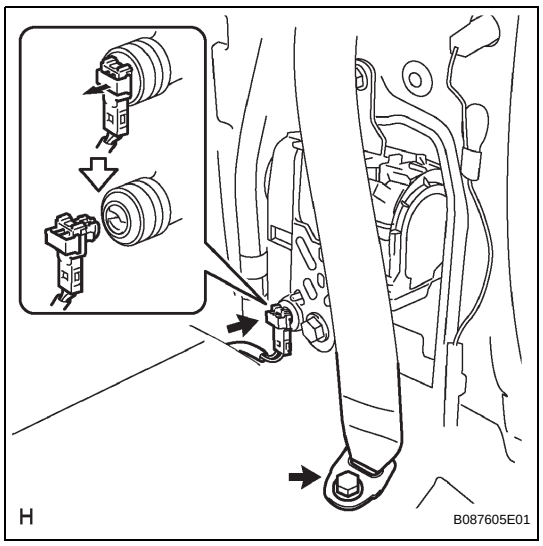
SB



(2) Press SST activation switch and check that the LED of SST activation switch turns on.
CAUTION:
If the LED turns on when the activation switch is not being pressed, SST may be malfunctioning. Do not use SST.

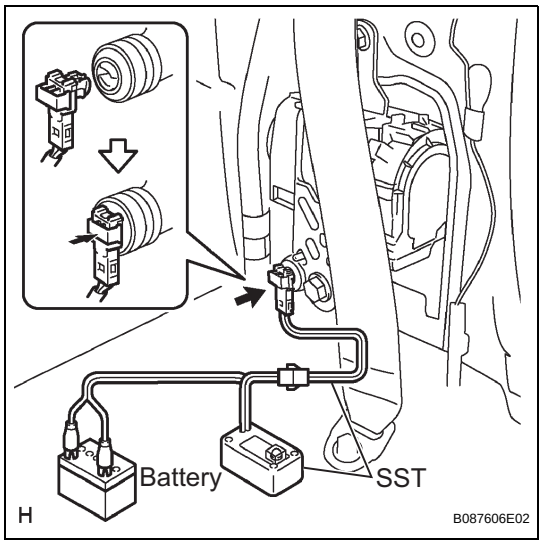
(b) Disconnect SST from the battery.

(c) Disconnect the pretensioner connector.
(1) Disconnect cable from negative battery terminal.
(2) Remove the front door scuff plate (See page SB-27).
(3) Remove the front door opening trim weatherstrip (See page SB-27).
(4) Remove the back panel trim cover (See page SB-27).
(5) Remove the back panel upper garnish (See page SB-27).
(6) Remove the jack (for Separate Seat Type).
(7) Remove the back panel trim cover (for Separate Seat Type) (See page SB-27).
(8) Remove the back panel trim (for Separate Seat Type) (See page SB-27).
(9) Remove the quarter trim lower panel (See page SB-27).

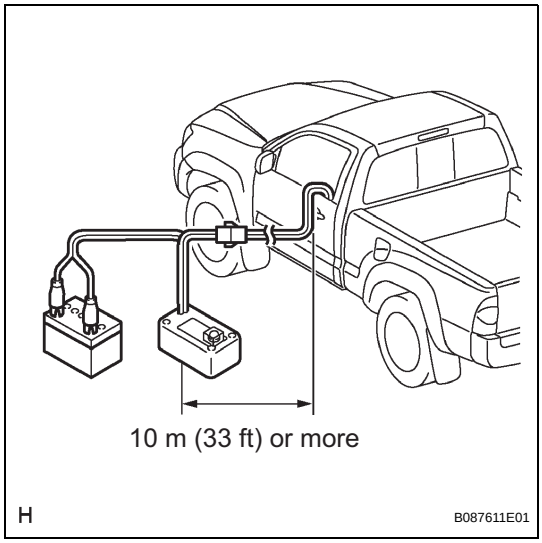


(10) Install the floor anchor with the bolt.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)

(11) Disconnect the pretensioner connector as shown in the illustration.



(d) Connect the SST.
(1) Connect SST, then connect the yellow connector to the seat belt pretensioner.
SST 09082-00700, 09082-00770
NOTICE:
To avoid damaging SST connector and wire harness, do not lock the secondary lock of the twin lock.



(2) Move SST at least 10 m (33 ft) away from the front of the vehicle.
(3) Close all the doors and windows of the vehicle.
HINT:
Do not close the windows fully. Leave a gap for inserting SST wire harness.
NOTICE:
Take care not to damage SST wire harness.
(4) Connect SST red clip to the battery positive (+) terminal and the black clip to the battery negative (-) terminal.

(e) Activate the seat belt pretensioner.
(1) Confirm that no one is inside the vehicle or within 10 m (33 ft) of the vehicle.
(2) Press SST activation switch and activate the seat belt pretensioner.
HINT:
The seat belt pretensioner operates simultaneously with SST activation switch LED light.

(f) Dispose of the outer belt (with the seat belt pretensioner).
CAUTION:
- **Do not touch the outer belt for at least 30 minutes after the seat belt pretensioner has been activated. It is very hot.**
- **Use gloves and safety glasses when handling an outer belt with a pretensioner that has been activated.**
- **Always wash your hands with water after completing the operation.**
- **Do not apply water to a front seat outer belt that has an activated pretensioner.**

HINT:
When scrapping a vehicle, activate the seat belt pretensioner, and then scrap the vehicle with the activated outer belt still installed.

SB

2. DISPOSE OF FRONT SEAT OUTER BELT ASSEMBLY (When not Installed in Vehicle)

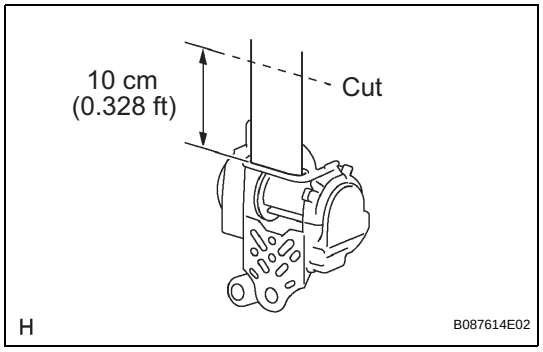
NOTICE:

- **When only disposing of the front seat outer belt (with the seat belt pretensioner), never use the customers vehicle to activate the seat belt pretensioner.**
- **Be sure to follow the procedures listed below when activating the seat belt pretensioner.**

HINT:

Prepare a battery as the power source to activate the seat belt pretensioner.

(a) Remove the front seat outer belt (See page SB-27).



(b) Wind the seat belt with the retractor.

(c) When the seat belt is sufficiently wound, cut the seat belt approximately 10 cm (0.328 ft) from the retractor, as shown in the illustration.

HINT:

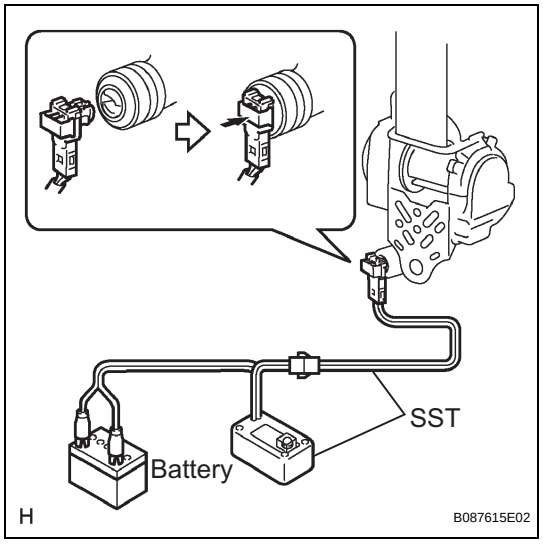
The retractor resistance increases in correlation with how much the seat belt is wound.

(d) Check whether SST is functioning (see step 2-(a)).

SST 09082-00700, 09082-00770

CAUTION:

When activating the seat belt pretensioner, always use the specified SST.

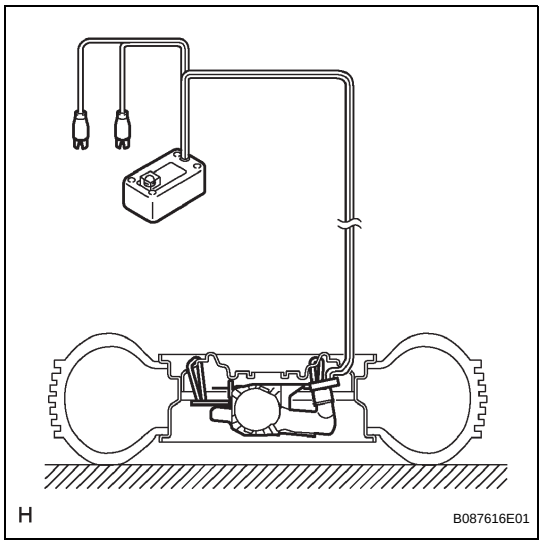


(e) Connect SST.

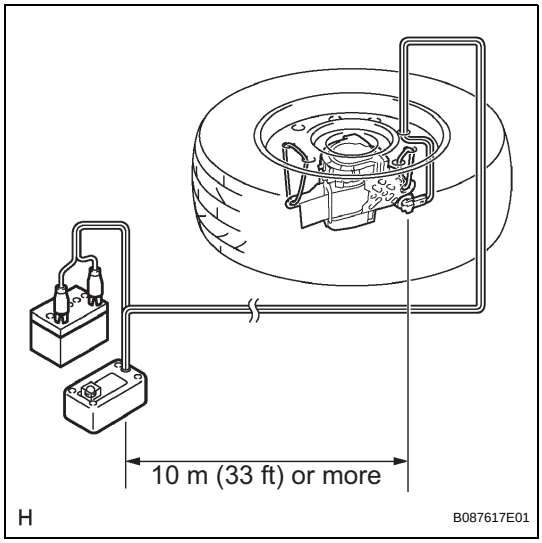
(1) Connect SST, then connect them to the seat belt pretensioner.

NOTICE:

To avoid damaging SST connector and wire harness, do not lock the secondary lock of the twin lock.

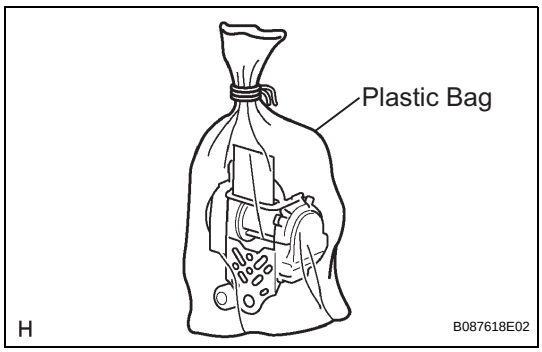


(2) Place the outer belt on the ground and cover it with a tire with a wheel attached.
NOTICE:
Set up the front seat outer belt assembly as shown in the illustration.



(3) Move SST at least 10 m (33 ft) away from the wheel.
NOTICE:
Take care not to damage SST wire harness.

(f) Activate the seat belt pretensioner.
(1) Connect SST red clip to the battery positive (+) terminal and the black clip to the battery negative (-) terminal.
(2) Check that no one is within 10 m (33 ft) of the wheel.
(3) Press SST activation switch and activate the seat belt pretensioner.
HINT:
The seat belt pretensioner operates simultaneously with SST activation switch LED light.



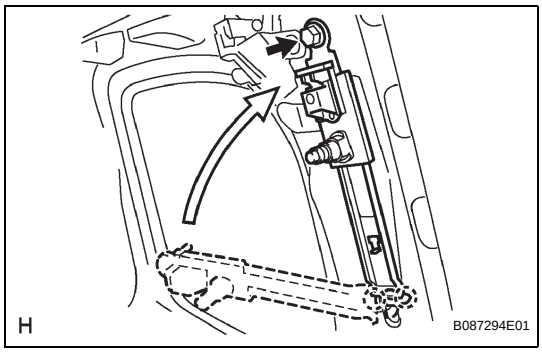
(g) Dispose of the outer belt (with the seat belt pretensioner).
CAUTION:
- **Do not touch the outer belt for at least 30 minutes after the seat belt pretensioner has been activated. It is very hot.**
- **Use gloves and safety glasses when handling an outer belt assembly with a pretensioner that has been activated.**
- **Always wash your hands with water after completing operation.**
- **Do not apply water to an outer belt assembly that has an activated pretensioner.**

(1) Remove the wheel and SST.
(2) Place the outer belt in a plastic bag, tie the end tightly and dispose of it in the same way as other general parts.

SB

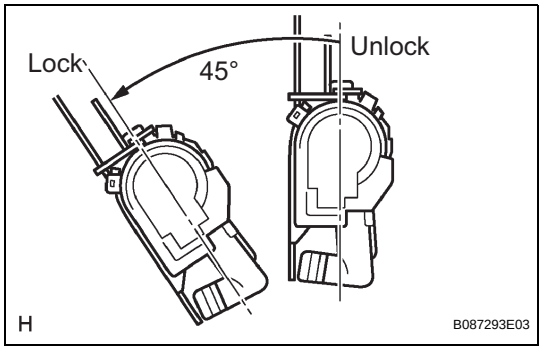
INSTALLATION

CAUTION:
Some of these service operations affect the SRS airbag system. Read the precautionary notices concerning the SRS airbag system before servicing (See page RS-1).



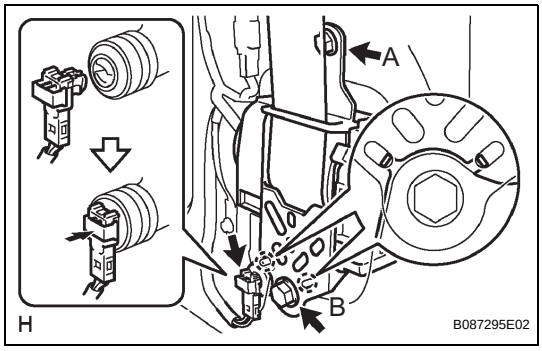
1. INSTALL FRONT SHOULDER BELT ANCHOR ADJUSTER ASSEMBLY

(a) Insert the 2 claws of the front shoulder belt anchor adjuster into the hole in the body and mount the bolt.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)

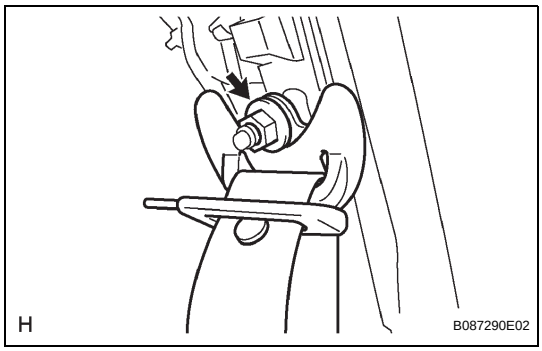


2. INSTALL FRONT SEAT OUTER BELT ASSEMBLY

(a) Check the amount of inclination required to lock the retractor.
(1) Gently incline the retractor from its initial position. Check that the belt does not lock when the retractor is inclined 15° or less in any directions. Also check that the belt locks when the inclination of the retractor is 45° or more.
NOTICE:
Do not disassemble the retractor.
If operation is not as specified, replace the front seat outer belt.

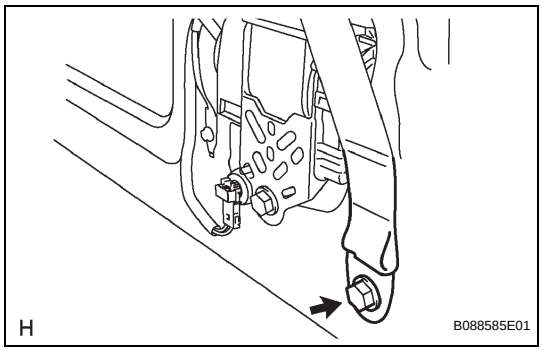


(b) Hook the lower stay of the retractor onto the 2 body hooks.
(c) Tighten bolt A, and then tighten bolt B.
Torque: 8.5 N*m (85 kgf*cm, 75 in.*lbf) for bolt A
42 N*m (430 kgf*cm, 31 ft.*lbf) for bolt B
(d) Connect the pretensioner connector as shown in the illustration.



(e) Install the shoulder anchor with the nut.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)
(f) Check that the shoulder anchor rotates smoothly.

SB

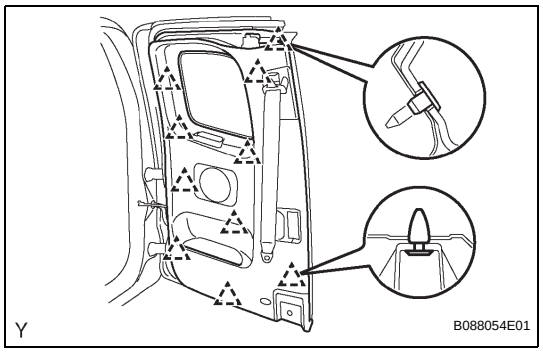


(g) Install the floor anchor of the front seat outer belt with the bolt.
(h) Check the ELR lock.
NOTICE:
- **The check should be performed with the front seat outer belt installed.**
- **Do not allow the anchor part of the front seat belt outer and the protruding parts of the door panel to overlap.**

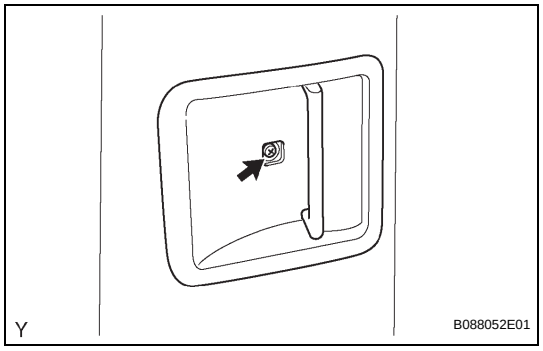
(1) With the belt installed, check that the belt locks when it is pulled out quickly.
If operation is not as specified, replace the front seat outer belt.

(i) Remove the bolt and floor anchor.

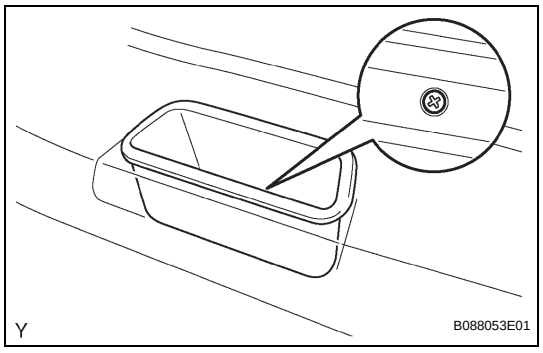
3. INSTALL ACCESS PANEL INSIDE HANDLE SUB-ASSEMBLY (See page ED-62)



4. INSTALL REAR DOOR TRIM BOARD SUB-ASSEMBLY
(a) Engage the 9 clips and install the rear door trim board.
(b) Install the clip.



5. INSTALL ACCESS PANEL INSIDE HANDLE BEZEL
(a) Install the access panel inside handle bezel with the screw.
(b) Close the cover.



6. INSTALL DOOR PULL HANDLE
(a) Install the door pull handle with the screw.

7. INSTALL LAP BELT OUTER ANCHOR COVER (See page ED-63)

8. INSTALL ACCESS PANEL REAR WEATHERSTRIP (See page ED-64)

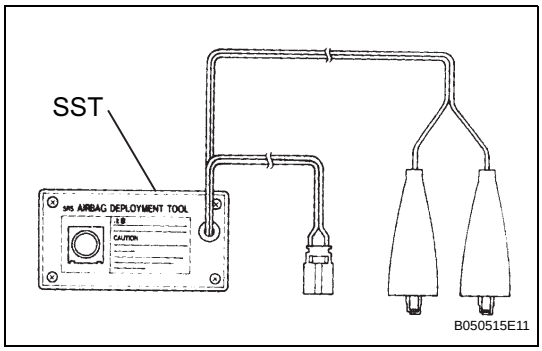
9. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

10. INSPECT SRS WARNING LIGHT
(See page RS-28)

SB

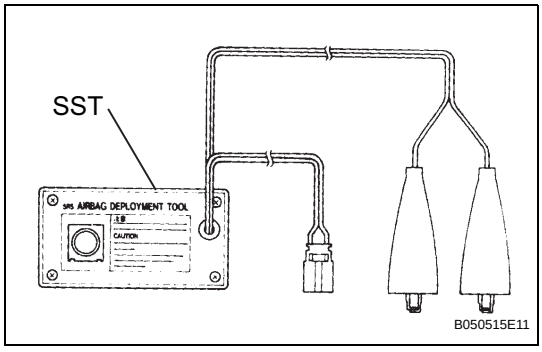
DISPOSAL

HINT:
When scrapping vehicles equipped with a seat belt pretensioner or disposing of a front seat outer belt (with seat belt pretensioner), always first activate the seat belt pretensioner in accordance with the procedures described below. If any abnormality occurs during activation of the seat belt pretensioner, contact the SERVICE DEPARTMENT of TOYOTA MOTOR SALES, U.S.A., INC. When disposing of a front seat outer belt assembly (with seat belt pretensioner) that was activated in a collision, start by step 2-(f) in this section.



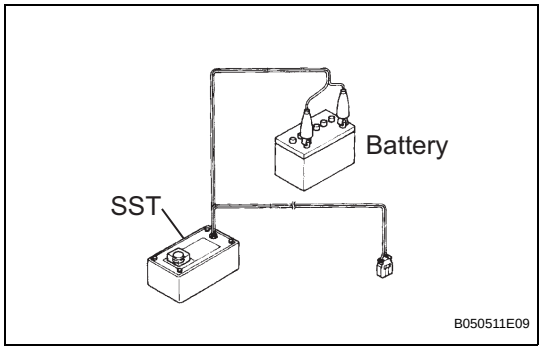
CAUTION:

- **Never dispose of a front seat outer belt assembly that has an inactivated pretensioner.**
- **The seat belt pretensioner produces a loud, exploding sound when it activates. Perform the operation where it will not be a nuisance to persons nearby .**
- **When activating a front seat outer belt (with seat belt pretensioner), stand at least 10 m (33 ft) away from the front seat outer belt.**
- **Use gloves and safety glasses when handling a front seat belt with an activated pretensioner.**
- **Always wash your hands with water after completing activation.**
- **Do not apply water to a front seat outer belt that has an activated pretensioner.**
- **When activating the seat belt pretensioner, always use the specified SST (SRS air bag deployment tool).**
- **Perform operation in a place away from electrical interference.**



1. DISPOSE OF FRONT SEAT OUTER BELT ASSEMBLY (When Installed in Vehicle)

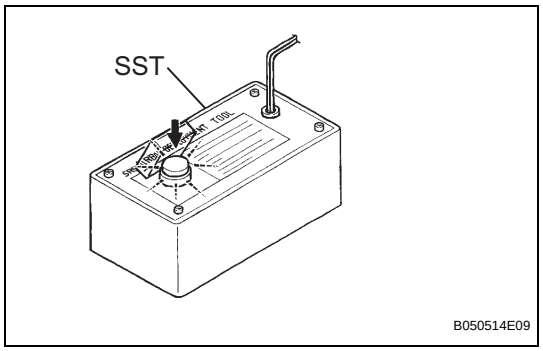
HINT:
Prepare a battery to power activation of the seat belt pretensioner.



(a) Check whether SST is functioning.
SST 09082-00700, 09082-00770
CAUTION:
When activating the seat belt pretensioner, always use the specified SST.

(1) Connect SST red clip to the battery positive (+) terminal and the black clip to the battery negative (-) terminal.
HINT:
Do not connect the yellow connector. The yellow connector is used to connect to the seat belt pretensioner.

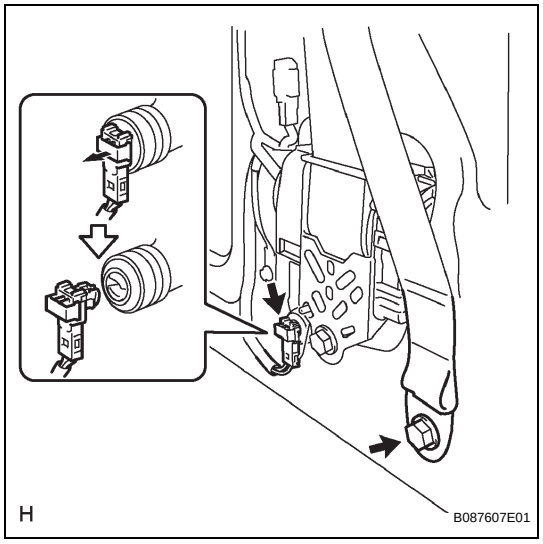
SB



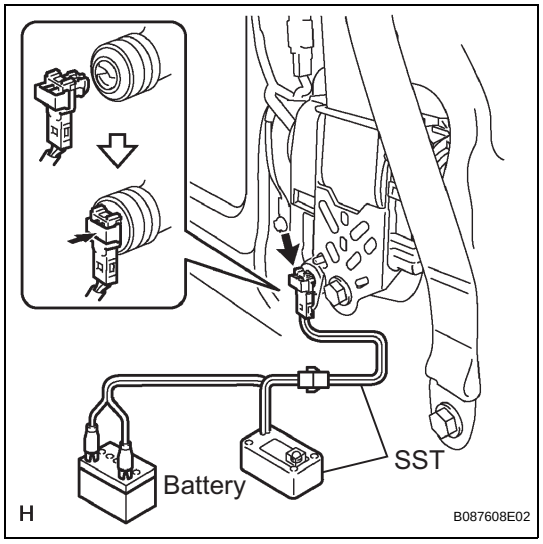
(2) Press SST activation switch and check that the LED of SST activation switch turns on.
CAUTION:
If the LED turns on when the activation switch is not being pressed, SST may be malfunctioning. Do not use SST.

(b) Disconnect SST from the battery.

(c) Disconnect the pretensioner connector.
(1) Disconnect cable from negative battery terminal.
(2) Remove the access panel rear weatherstrip (See page SB-36).
(3) Remove the lap belt outer anchor cover (See page SB-36).
(4) Remove the door pull handle (See page SB-36).
(5) Remove the access panel inside handle bezel (See page SB-36).
(6) Remove the rear door trim board (See page SB-37).

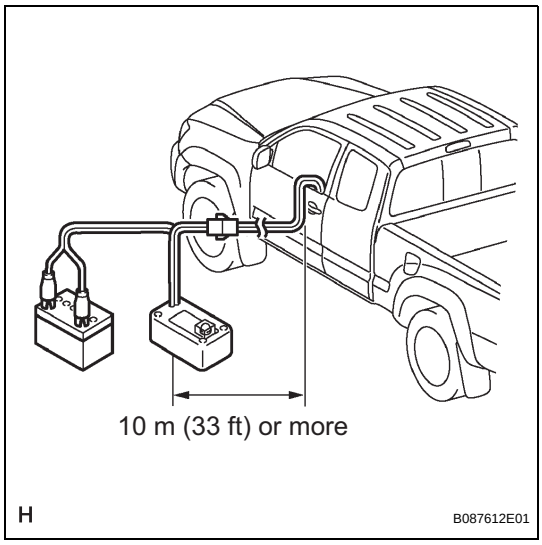


(7) Install the floor anchor with the bolt.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)
(8) Disconnect the pretensioner connector as shown in the illustration.



(d) Connect the SST.
(1) Connect SST, then connect the yellow connector to the seat belt pretensioner.
SST 09082-00700, 09082-00770
NOTICE:
To avoid damaging SST connector and wire harness, do not lock the secondary lock of the twin lock.

SB



(2) Move SST at least 10 m (33 ft) away from the front of the vehicle.
(3) Close all the doors and windows of the vehicle.
HINT:
Do not close the windows fully. Leave a gap for inserting SST wire harness.
NOTICE:
Take care not to damage SST wire harness.
(4) Connect SST red clip to the battery positive (+) terminal and the black clip to the battery negative (-) terminal.

(e) Activate the seat belt pretensioner.
(1) Confirm that no one is inside the vehicle or within 10 m (33 ft) of the vehicle.
(2) Press SST activation switch and activate the seat belt pretensioner.
HINT:
The seat belt pretensioner operates simultaneously with SST activation switch LED light.

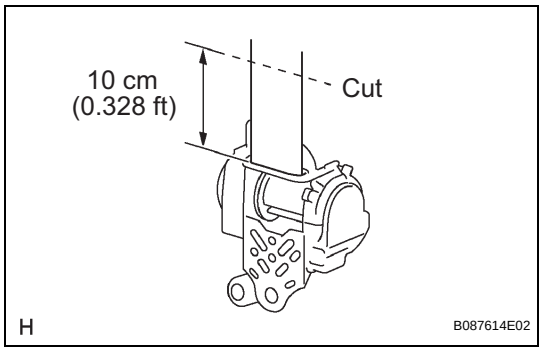
(f) Dispose of the outer belt (with the seat belt pretensioner).
CAUTION:
- **Do not touch the outer belt for at least 30 minutes after the seat belt pretensioner has been activated. It is very hot.**
- **Use gloves and safety glasses when handling an outer belt with a pretensioner that has been activated.**
- **Always wash your hands with water after completing the operation.**
- **Do not apply water to a front seat outer belt that has an activated pretensioner.**

HINT:
When scrapping a vehicle, activate the seat belt pretensioner, and then scrap the vehicle with the activated outer belt still installed.

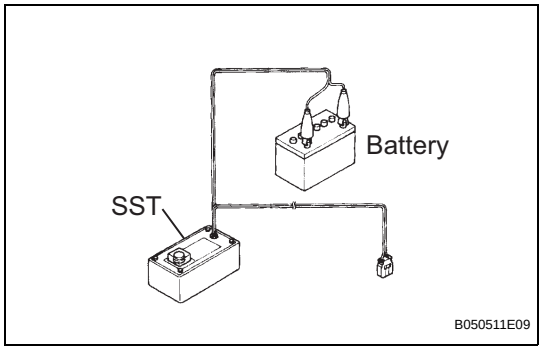
2. DISPOSE OF FRONT SEAT OUTER BELT ASSEMBLY (When not Installed in Vehicle)
NOTICE:
- **When only disposing of the front seat outer belt (with the seat belt pretensioner), never use the customers vehicle to activate the seat belt pretensioner.**
- **Be sure to follow the procedures listed below when activating the seat belt pretensioner.**

HINT:
Prepare a battery as the power source to activate the seat belt pretensioner.
(a) Remove the front seat outer belt (See page SB-36).

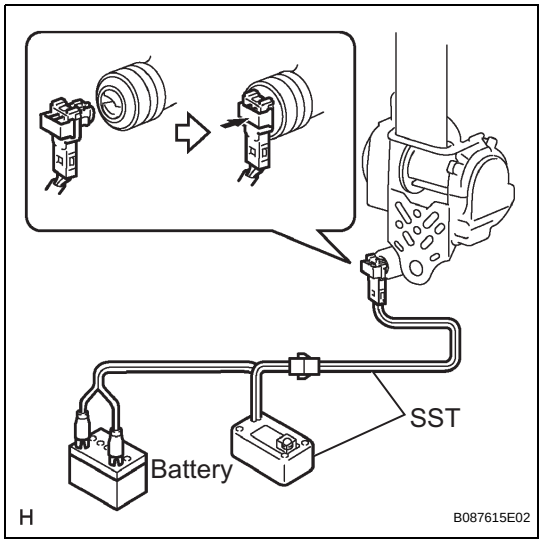
SB



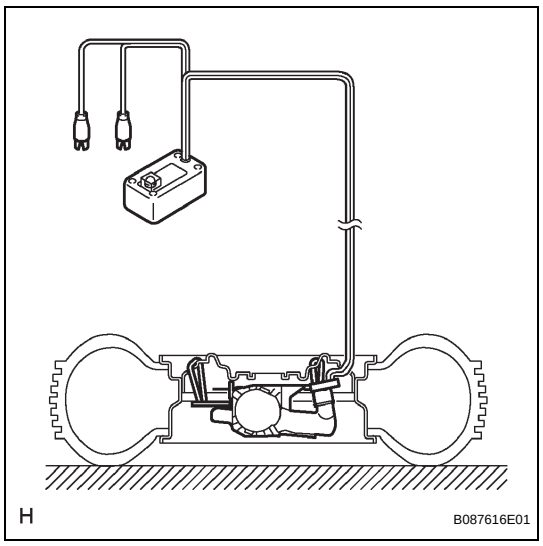
(b) Wind the seat belt with the retractor.
(c) When the seat belt is sufficiently wound, cut the seat belt approximately 10 cm (0.328 ft) from the retractor, as shown in the illustration.
HINT:
The retractor resistance increases in correlation with how much the seat belt is wound.



(d) Check whether SST is functioning (see step 2-(a)).
SST 09082-00700, 09082-00770
CAUTION:
When activating the seat belt pretensioner, always use the specified SST.

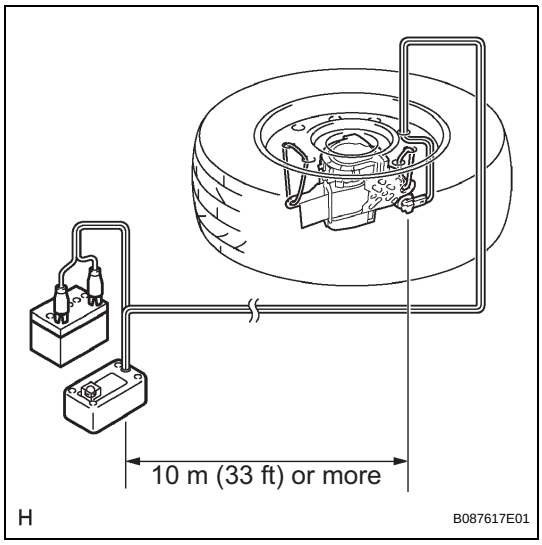


(e) Connect SST.
(1) Connect SST, then connect them to the seat belt pretensioner.
NOTICE:
To avoid damaging SST connector and wire harness, do not lock the secondary lock of the twin lock.



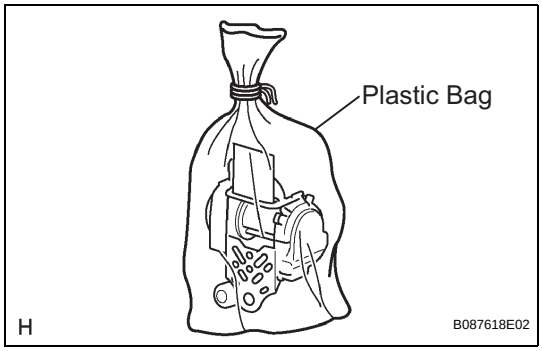
(2) Place the outer belt on the ground and cover it with a tire with a wheel attached.
NOTICE:
Set up the front seat outer belt assembly as shown in the illustration.

SB



(3) Move SST at least 10 m (33 ft) away from the wheel.
NOTICE:
Take care not to damage SST wire harness.

(f) Activate the seat belt pretensioner.
(1) Connect SST red clip to the battery positive (+) terminal and the black clip to the battery negative (-) terminal.
(2) Check that no one is within 10 m (33 ft) of the wheel.
(3) Press SST activation switch and activate the seat belt pretensioner.
HINT:
The seat belt pretensioner operates simultaneously with SST activation switch LED light.



(g) Dispose of the outer belt (with the seat belt pretensioner).
CAUTION:
- **Do not touch the outer belt for at least 30 minutes after the seat belt pretensioner has been activated. It is very hot.**
- **Use gloves and safety glasses when handling an outer belt assembly with a pretensioner that has been activated.**
- **Always wash your hands with water after completing operation.**
- **Do not apply water to an outer belt assembly that has an activated pretensioner.**

(1) Remove the wheel and SST.
(2) Place the outer belt in a plastic bag, tie the end tightly and dispose of it in the same way as other general parts.

REGISTRATION

1. DESCRIPTION OF CODE REGISTRATION

(a) When adding master keys and sub-keys (additional registration).

(1) Register the key code (immobiliser code) in the transponder key ECU assembly.

Target ECU	See step
Transponder key ECU assembly	Procedure "A"

(b) When replacing the transponder key ECU assembly (new registration):

(1) Register the key code (immobiliser code) in the transponder key ECU assembly.

Target ECU	See step
Transponder key ECU assembly	Procedure "B"

(2) Register the ECU COMMUNICATION ID between the ECM and the transponder key ECU assembly.

Target ECU	See step
ECM	Procedure "C"

(c) When replacing the ECM:

(1) Register the ECU COMMUNICATION ID between the ECM and the transponder key ECU assembly.

Target ECU	See step
Transponder key ECU assembly	Procedure "C"

(d) Erasure of key code:

(1) Erasure the key code.

Target ECU	See step
Transponder key ECU assembly	Procedure "D"

2. KEY REGISTRATION IN AUTOMATIC REGISTRATION (PROCEDURE "B")

(a) When an ignition key is inserted into the ignition cylinder, the key code (immobiliser code) registration is automatic. In this mode, a maximum of 4 key codes for 3 master keys and 1 sub-key can be registered. Any order of registration for the master keys and sub-keys is fine because the transponder key ECU assembly can distinguish the types of keys.

HINT:

- When a new transponder key ECU assembly is installed, key codes (immobiliser codes) must be registered with ignition keys.
- New transponder key ECU assemblies are automatically set to automatic key code registration mode.

Automatic Key Code Registration (New Registration)

Procedure	Security Indicator Condition
1. Start (Procedure "E")	Blinking occurs until the first key is inserted.

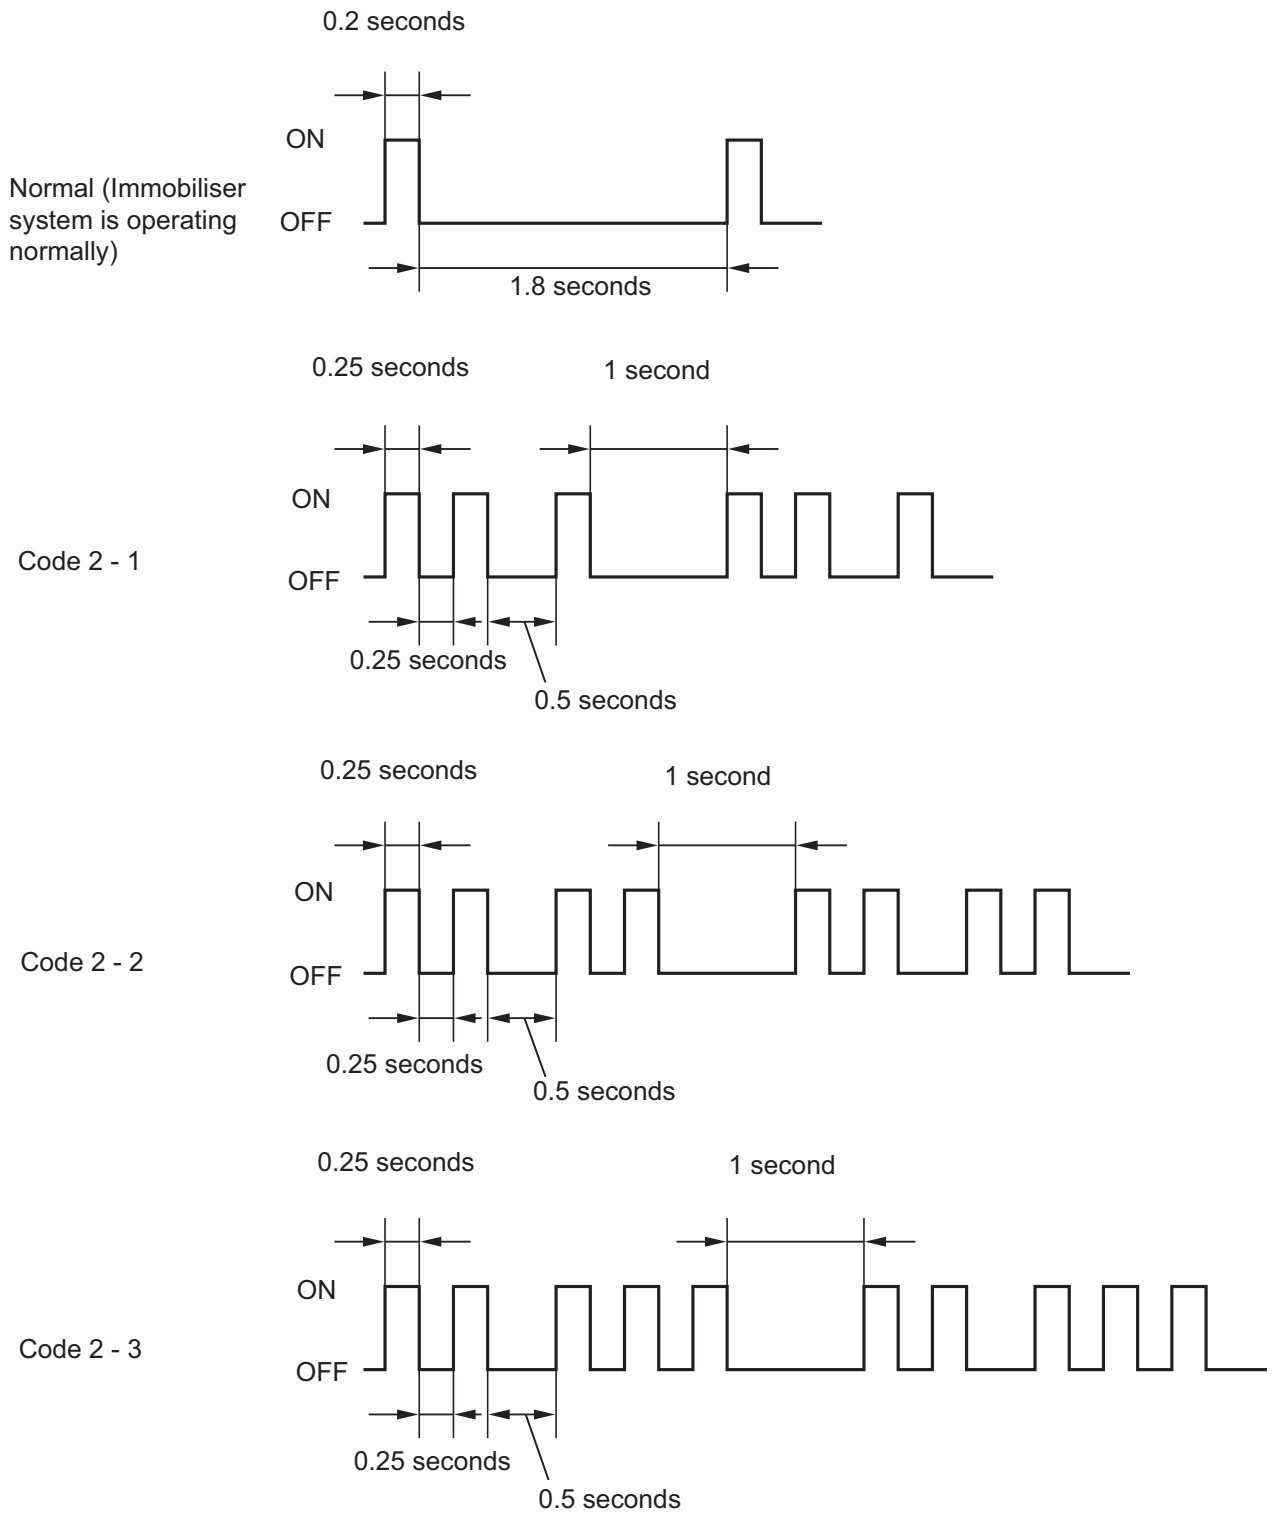
Procedure	Security Indicator Condition
2. Insert the key into the ignition key cylinder.	ON
3. Registration begins. HINT: The registration will be completed approx. 1 second after the key is inserted.	OFF HINT: Approx. 1 second
4. Remove the key.	ON HINT: When the maximum number of the key codes is registered, the security indicator remains off until the last key registered is removed. After it is removed, the security indicator starts blinking.
5. Register another key? Yes: Go to procedure "E". No: Go to procedure "F".	
6. End (Procedure "F")	

HINT:

- When no key is inserted in the ignition key cylinder in automatic key code registration mode, the security indicator remains ON.
- When the immobiliser system is operating normally and the key is pulled out, the security indicator blinks continuously.

- If the key code registration has failed in automatic key code registration mode, code 2-1 will be output from the security indicator. Trying to re-register an already registered key will cause code 2-2 to be output when the key is inserted. If the number of registered key codes exceeds the limit, code 2-3 will be output from the security indicator. The output details are shown below.

Security Indicator:



HINT:
The automatic key code registration mode can be forced to end when 1 or more key codes (immobiliser code) for the master key has been registered.

EI

(b) Finish the automatic key code registration mode. The automatic key code registration mode can be forced to end when at least 1 key code for the master key has been registered.
(1) Turn the ignition switch ON and OFF 5 times within 10 seconds using the already registered master key.

3. PERFORM REGISTRATION OF ADDITIONAL KEY (PROCEDURE "A")

(a) Register an additional key by using the intelligent tester.
HINT:
- A maximum of 5 master key codes and 3 sub-key codes can be registered.
- Registration mode will end if each step is not completed within the specified time.
- When the ignition cylinder or the key cylinder set is replaced, remove the transmitter module from the original master key. Then install this transmitter module to a new key and use the new key as the master key. If necessary, use this master key to register other keys.

NOTICE:
When the ignition key cylinder has been replaced, locking and unlocking doors is possible with the new master key's transmitter module (taken from the original master key). However, the new master key will not be able to lock and unlock doors through the door key cylinder. Keep the original master key. If the new master key's transmitter module's battery fails, the original master key can be used to lock and unlock doors through the door key cylinder.

Additional Registration

Procedure	Time (Completion of operation)	Security indicator Condition
1. Start	-	The indicator will blink until the first key is inserted.
2. Insert the already registered master key in the ignition key cylinder and turn the ignition switch on.		
3. Intelligent tester operation: (1) Select IMMOBILISER. (2) Select ID UTILITY. (3) Select TRANS CODE REG. HINT: After completing the above operation, proceed to the next step in accordance with the prompts on the tester screen.	Within 120 seconds	OFF
4. Remove the master key.	Within 20 seconds of the instruction on the tester.	ON
5. Insert the key to be registered in the ignition key cylinder.	Within 10 seconds	
6. After 60 sec. the key is registered. HINT: Security indicator goes off.	-	Blinking
7. Next		OFF
8. End		

EI

HINT:

- A brief outline of the procedures for key code registration is shown on this page. For more detailed information, please refer to the intelligent tester screen's instructions.
- When the immobiliser system is operating normally and the key is pulled out, the security indicator blinks continuously.
- If the key code registration has failed in automatic key code registration mode, code 2-1 will be output from the security indicator. Trying to re-register an already registered key will cause code 2-2 to be output when the key is inserted. If the number of registered key codes exceeds the limit, code 2-3 will be output from the security indicator. The output details are shown in step 2 (new registration).

4. ERASURE OF KEY CODE (PROCEDURE "D")

(a) Erase key codes using the intelligent tester.

HINT:

- All key codes are erased except for the master key, which is used for erasing the key codes. In order to use a key whose code has been erased, a new key code must be registered.
- Registration will be cancelled if each step is not completed within the specified time.
- Conduct this operation with the driver door closed.

Erasing Key Code

Procedure	Time (Completion of operation)	Security Indicator Condition
1. Start	-	The indicator will blink until the first key is inserted.
2. Insert the already registered master key in the ignition key cylinder and turn the ignition switch on.		
3. Intelligent tester operation: (1) Select IMMOBILISER. (2) Select ID UTILITY. Select TRANS CODE REG. HINT: After completing the above operation, proceed to the next step in accordance with the prompts on the tester screen.	Within 120 seconds	OFF
4. Remove the master key.	Within 10 seconds of the instruction on the tester.	ON for 1 sec. then OFF
5. Next	-	Blinking
6. End		

HINT:

- A brief outline of procedures for key code erasure is shown on this page. For more detailed information, please refer to the intelligent tester screen's instructions.
- When the immobiliser system is operating normally and the key is pulled out, the security indicator blinks continuously.

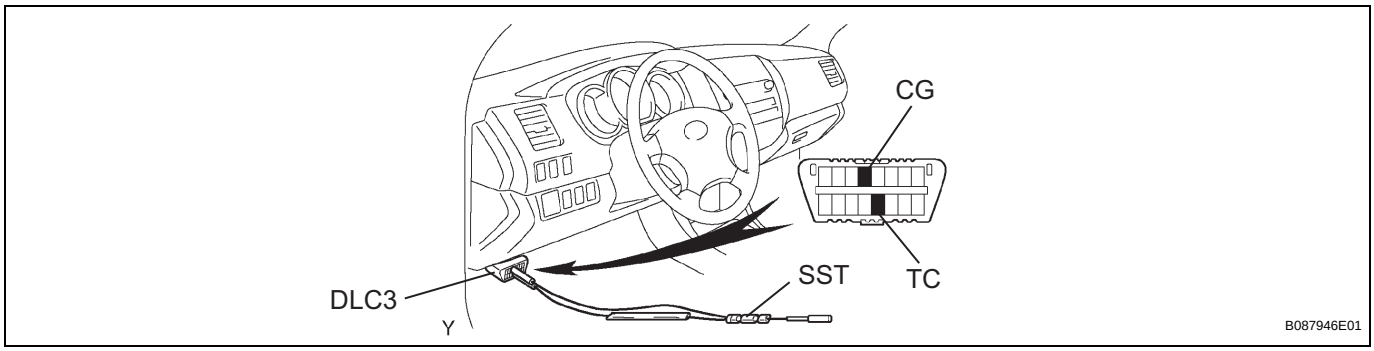
EI

5. REGISTRATION OF ECU COMMUNICATION ID (PROCEDURE "C")

NOTICE:

- **The ECU COMMUNICATION ID should be registered when the transponder key ECU assembly and/or the ECM is replaced in order to match these ECM COMMUNICATION ID**
- **The engine cannot be started unless the ECM COMMUNICATION ID matches.**

(a) Register the ECU communication ID



(1) Before operation, make sure that no key is in the ignition key cylinder.
(2) Using SST, connect terminals TC and CG of the DLC3. SST 09843-18040
(3) Insert a key, of which the key code has already been registered, into the ignition key cylinder.
(4) Turn the ignition switch ON (do not start the engine) and leave it as is for 30 minutes.
(5) Turn the ignition switch OFF and disconnect terminals TC and CG.
(6) Check that the engine starts.
HINT:
After the engine has been started, delete DTC 2799 (indicating immobiliser communication failures in the ECM) by following either one of the operations below with the ignition switch OFF:
    - Delete the DTC using intelligent tester.
    - Disconnect the negative battery cable from the battery terminal for at least 30 seconds.

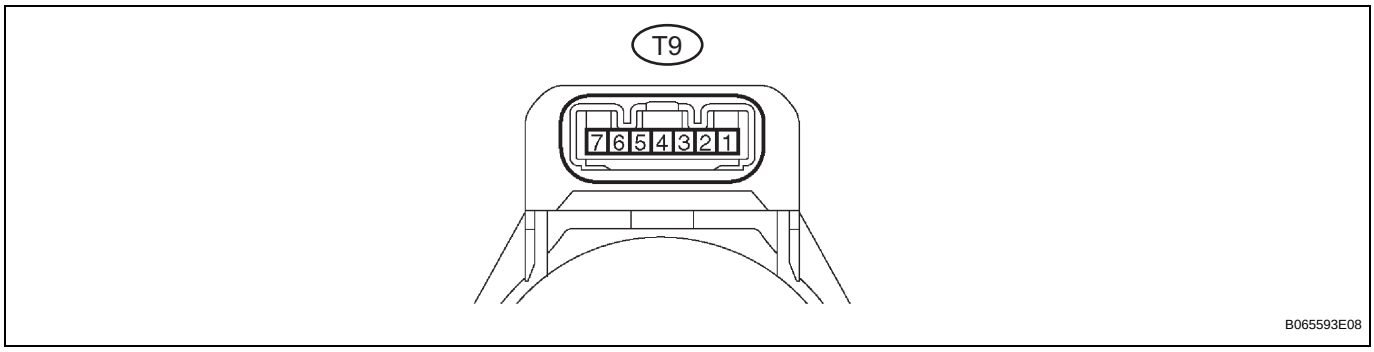
PROBLEM SYMPTOMS TABLE

Immobiliser function

Symptom	Suspected area	See page
Engine does not start	ECU power source circuit	EI-37
	Transponder key ECU assembly	EI-13
	SFI system (2TR-FE)	ES-29
	SFI system (1GR-FE)	ES-28

TERMINALS OF ECU

1. CHECK TRANSPONDER KEY AMPLIFIER



(a) Disconnect the T9 amplifier connector.
(b) Measure the resistance of the wire harness side connector.

Standard resistance:

Symbols (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
AGND (T9-7) - Body ground	L - Body ground	Ground	Always	Below 1 Ω

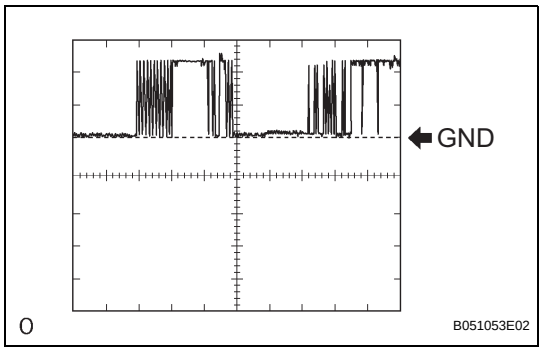
If the result is not as specified, there may be a malfunction on the wire harness side.
(c) Reconnect the T9 amplifier connector.
(d) Measure the resistance and voltage of the connector.

Standard:

Symbols (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
VC5 (T9-1) - AGND(T9-7)	GR-B - L	Power source	No key in ignition key cylinder	0 V
VC5 (T9-1) - AGND(T9-7)	GR-B - L	Power source	Key inserted	4.6 to 5.4 V
CODE (T9-4) - AGND (T9-7)	P-G - L	Demodulated signal of key code data	No key in ignition key cylinder → Key inserted	Pulse generation (see waveform 1)
TXCT (T9-5) - AGND (T9-7)	LG-R - L	Key code output signal	No key in ignition key cylinder → Key inserted	Pulse generation (see waveform 2)
AGND (T9-7) - Body ground	L - Body ground	Ground	Always	Below 1 Ω

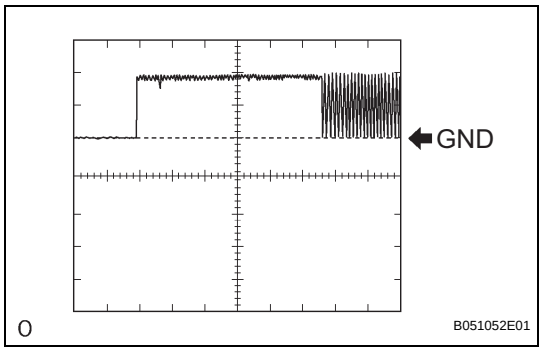
If the result is not as specified, there may be a malfunction on the amplifier.

(e) Inspect using an oscilloscope.
(1) Waveform 1



Terminal	CODE (T9-4) - AGND (T9-7)
Tool Setting	2 V/DIV., 20 msec/DIV.
Condition	No key in ignition key cylinder → Key inserted

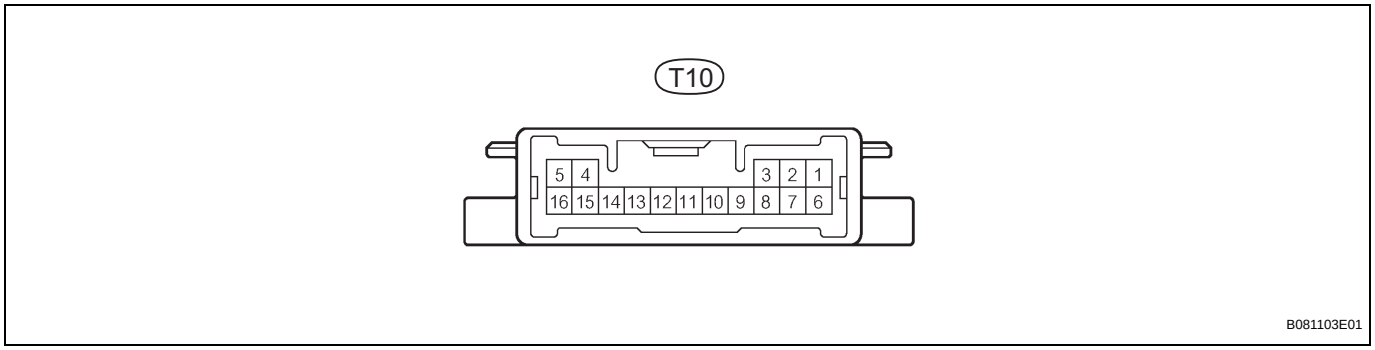
EI



(2) Waveform 2

Terminal	TXCT (T9-5) - AGND (T9-7)
Tool Setting	2 V/DIV., 20 msec/DIV.
Condition	No key in ignition key cylinder → Key inserted

2. CHECK TRANSPONDER KEY ECU ASSEMBLY



(a) Disconnect the T10 ECU connector.
(b) Measure the resistance and voltage of the wire harness side connector.

Standard:

Symbols (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
GND (T10-16) - Body ground	W-B - Body ground	Ground	Always	Below 1 Ω
+B (T10-1) - GND (T10-16)	R - W-B	Battery	Always	10 to 14 V
IG (T10-2) - GND (T10-16)	O - W-B	Ignition switch	Ignition switch OFF	0 V
IG (T10-2) - GND (T10-16)	O - W-B	Ignition switch	Ignition switch ON	10 to 14 V
KSW (T10-3) - AGND (T10-5)	G-B - L	Unlock warning switch	No key in ignition key cylinder	10 kΩ or higher
KSW (T10-3) - AGND (T10-5)	G-B - L	Unlock warning switch	Key inserted	Below 1Ω

If the result is not as specified, there may be a malfunction on the wire harness side.
(c) Reconnect the T10 ECU connector.
(d) Measure the voltage of the connector.

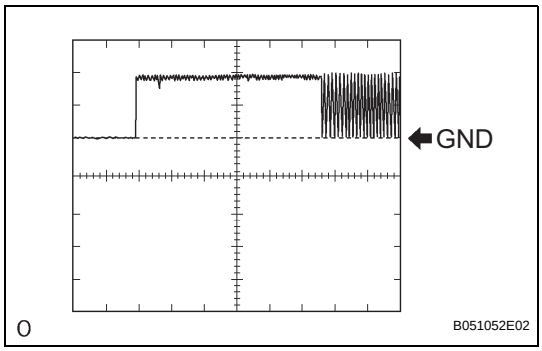
Standard voltage:

Symbols (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
VC5 (T10-14) - GND (T10-16)	GR-B - W-B	Power source	No key in ignition key cylinder	0 V
VC5 (T10-14) - GND (T10-16)	GR-B - W-B	Power source	Key inserted	4.6 to 5.4 V
TXCT (T10-4) - GND (T10-16)	LG-R - W-B	Transponder key amplifier communication signal	No key in ignition key cylinder → Key inserted	Pulse generation (see waveform 1)
CODE (T10-15) - GND (T10-16)	P-G - W-B	Transponder key amplifier communication signal	No key in ignition key cylinder → Key inserted	Pulse generation (see waveform 2)
EFIO (T10-13) - GND (T10-16)	L-W - W-B	ECM output signal	Ignition switch OFF → ON	Pulse generation (see waveform 3)
EFII (T10-12) - GND (T10-16)	LG-B - W-B	ECM input signal	Ignition switch OFF → ON	Pulse generation (see waveform 4)

If the result is not as specified, there may be a malfunction on the ECU.

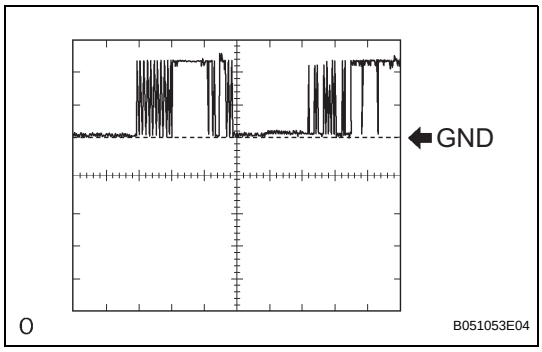
(e) Inspect using an oscilloscope.

(1) Waveform 1



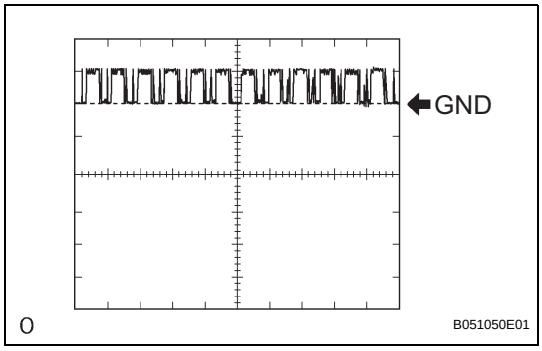
Terminal	TXCT (T10-4) - GND (T10-16)
Tool Setting	2.5 V/DIV., 20 msec/DIV.
Condition	No key in ignition key cylinder → Key inserted

(2) Waveform 2 (Reference)



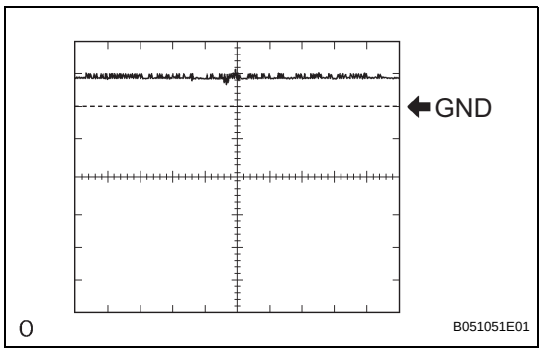
Terminal	CODE (T10-15) - GND (T10-16)
Tool Setting	2.5 V/DIV., 20 msec/DIV.
Condition	No key in ignition key cylinder → Key inserted

(3) Waveform 3



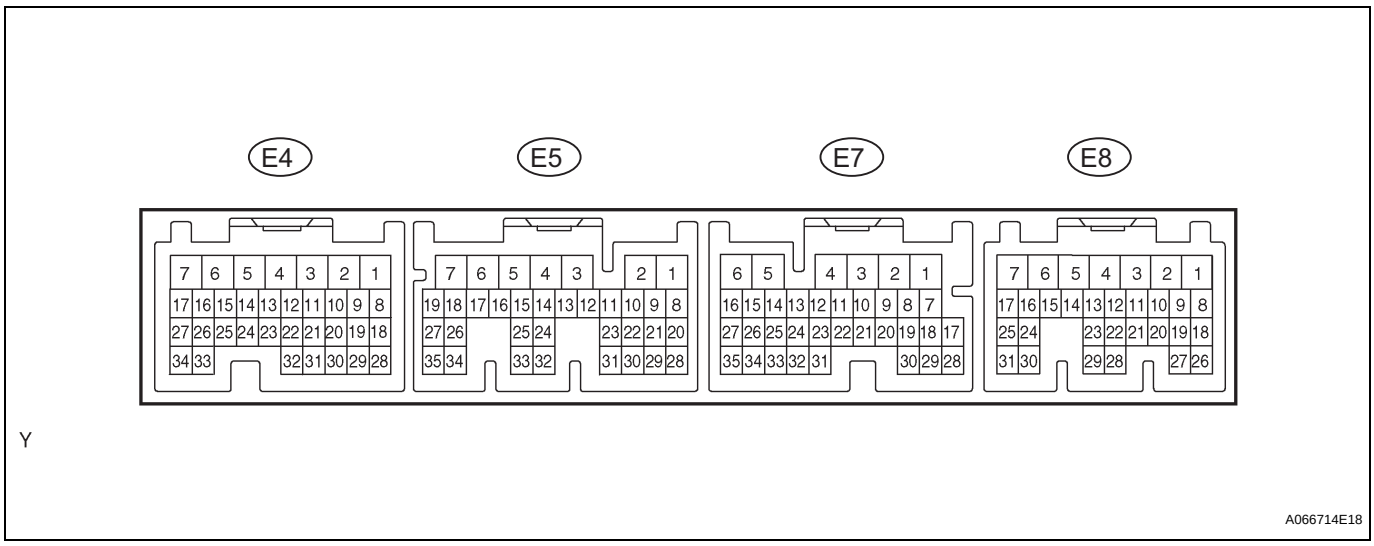
Terminal	EFIO (T10-13) - GND (T10-16)
Tool Setting	12 V/DIV., 100 msec/DIV.
Condition	Ignition switch OFF → ON

(4) Waveform 4



Terminal	EFII (T10-12) - GND (T10-16)
Tool Setting	10 V/DIV., 100 msec/DIV.
Condition	Ignition switch OFF → ON

3. CHECK ECM (2TR-FE)



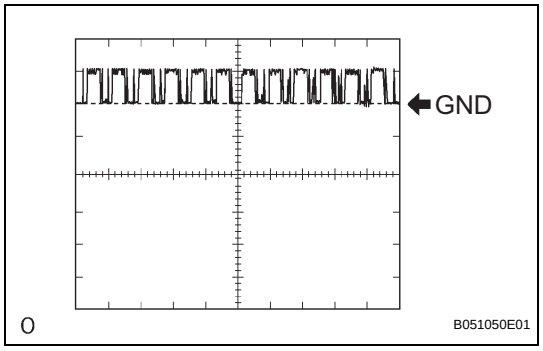
(a) Disconnect the E7 and E8 ECM connectors.
(b) Measure the resistance and voltage of the wire harness side connector.

Standard:

Symbols (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
IMI (E7-16) - EOM (E8-29)	L-W - W-B	Transponder key ECU input signal	Ignition switch OFF → ON	Pulse generation (see waveform 1)
IMO (E7-15) - EOM (E8-29)	LG-B - W-B	Transponder key ECU output signal	Ignition switch OFF → ON	Pulse generation (see waveform 2)
EOM (E8-29) - Body ground	W-B - Body ground	Ground	Always	Below 1 Ω

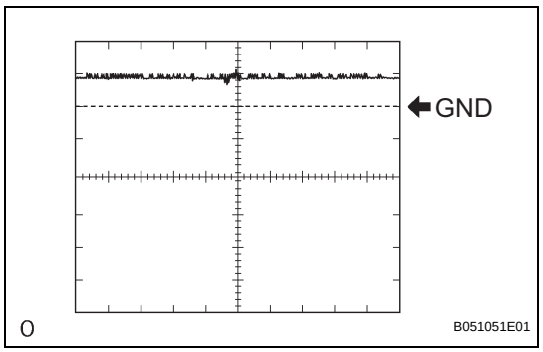
If the result is not as specified, the ECM may have a malfunction.

(c) Inspect using an oscilloscope.
(1) Waveform 1



Terminal	IMI (E7-16) - EOM (E8-29)
Tool Setting	12 V/DIV., 100 msec/DIV.
Condition	Ignition switch OFF → ON

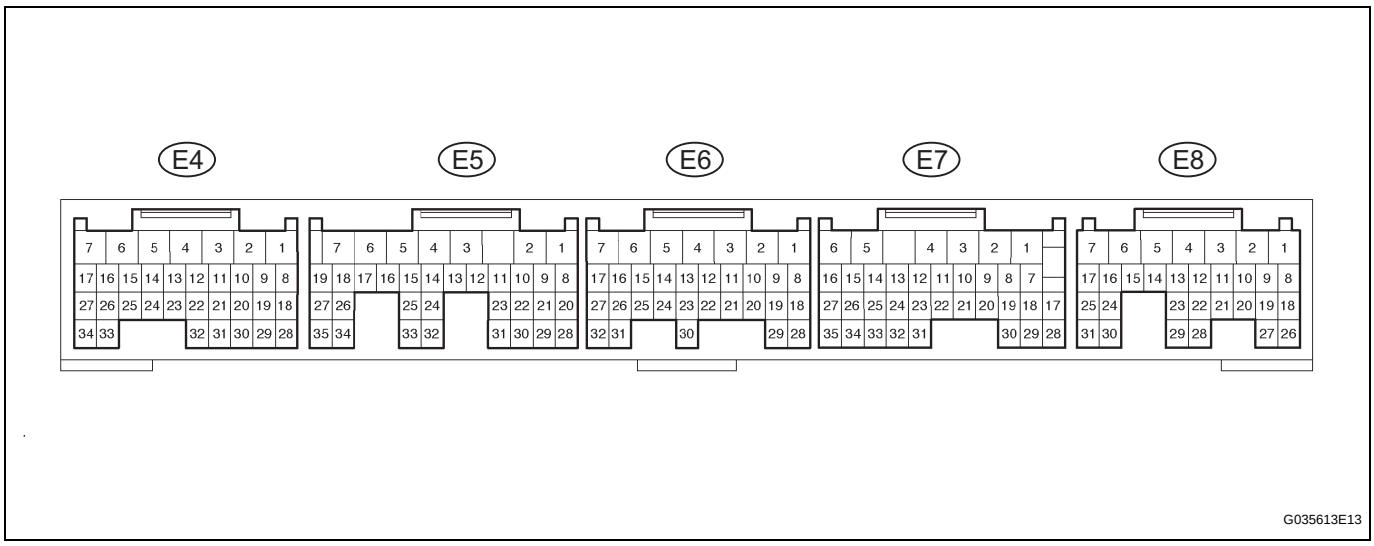
(2) Waveform 2



Terminal	IMO (E7-15) - EOM (E8-29)
Tool Setting	10 V/DIV., 100 msec/DIV.
Condition	Ignition switch OFF → ON

EI

4. CHECK ECM (1GR-FE)



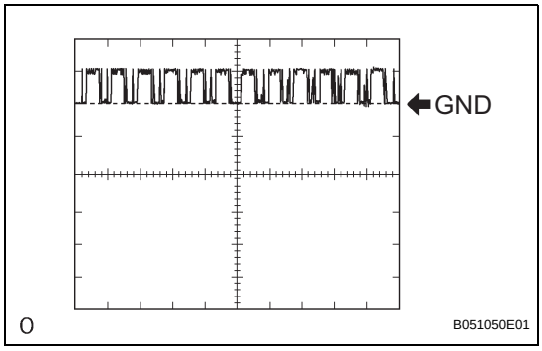
(a) Disconnect the E7 ECM connectors.
(b) Measure the resistance and voltage of the wire harness side connector.

Standard:

Symbols (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
IMI (E7-16) - EOM (E7-35)	L-W - W-B	Transponder key ECU input signal	Ignition switch OFF → ON	Pulse generation (see waveform 1)
IMO (E7-15) - EOM (E7-35)	LG-B - W-B	Transponder key ECU output signal	Ignition switch OFF → ON	Pulse generation (see waveform 2)
EOM (E7-35) - Body ground	W-B - Body ground	Ground	Always	Below 1 Ω

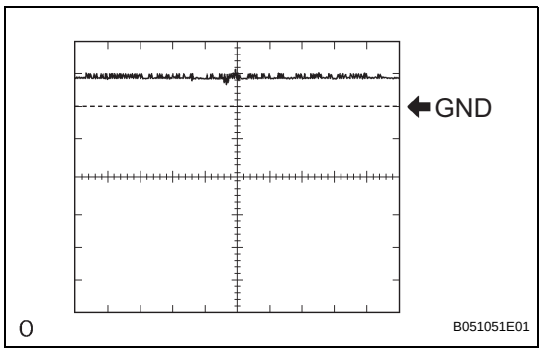
If the result is not as specified, the ECM may have a malfunction.

(c) Inspect using an oscilloscope.
(1) Waveform 1



Terminal	IMI (E7-16) - EOM (E7-35)
Tool Setting	12 V/DIV., 100 msec/DIV.
Condition	Ignition switch OFF → ON

(2) Waveform 2



Terminal	IMO (E7-15) - EOM (E7-35)
Tool Setting	10 V/DIV., 100 msec/DIV.
Condition	Ignition switch OFF → ON

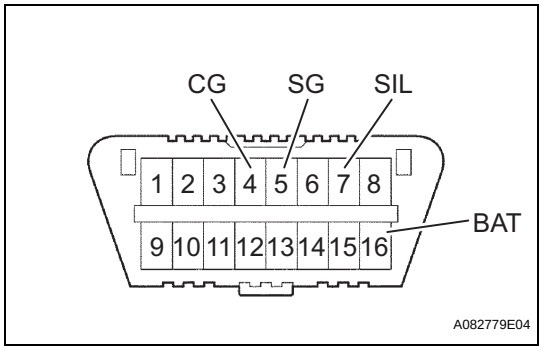
EI

DIAGNOSIS SYSTEM

1. DESCRIPTION

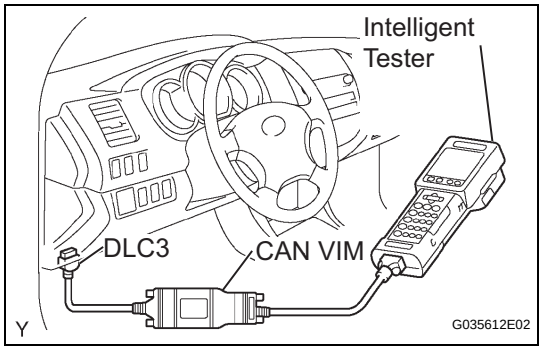
(a) The ECM controls the vehicle's immobiliser system functions. immobiliser system data and the DTCs can be read through the vehicle's DLC3. In some cases, a malfunction may be occurring in the immobiliser system even though the security indicator light is not illuminated. When the system seems to be malfunctioning, use the intelligent tester to check for a malfunctions and perform repairs.

2. CHECK DLC3



Symbols (Terminals No.)	Terminal Description	Condition	Specified Condition
SIL (7) - SG (5)	Bus "+" line	During transmission	Pulse generation
CG (4) - Body ground	Chassis ground	Always	Below 1 Ω
SG (5) - Body ground	Signal ground	Always	Below 1 Ω
BAT (16) - Body ground	Battery positive	Always	11 to 14 V

If the result is not as specified, the DLC3 may have a malfunction. Repair or replace the harness and connector.



HINT:

Connect the cable of the intelligent tester with CAN VIM to the DLC3, turn the ignition switch ON and attempt to use the tester. If the screen displays the message UNABLE TO CONNECT TO VEHICLE, there is a problem either with the vehicle or with the tester.

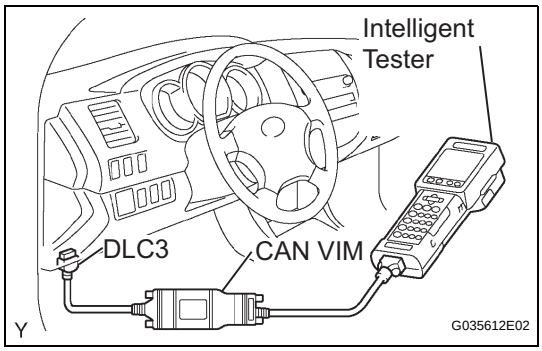
- If communication is normal when the tester is connected to another vehicle, inspect the DLC3 of the original vehicle.
- If communication is still not possible when the tester is connected to another vehicle, the problem is probably in the tester itself. Consult the Service Department listed in the tester's instruction manual.

3. INSPECT BATTERY VOLTAGE

Standard voltage:

11 to 14 V

If the voltage is below 11 V, recharge or replace the battery before proceeding.



DTC CHECK / CLEAR

1. CHECK DTC

(a) Connect the intelligent tester with CAN VIM to the DLC3.
(b) Turn the ignition switch ON.
(c) Read the DTCs by following the directions on the tester's screen.
HINT:
Refer to the intelligent tester operator's manual for further details.

2. CLEAR DTC

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Erase the DTCs by following the directions on the tester's screen.
HINT:
Refer to the intelligent tester operator's manual for further details.

DATA LIST / ACTIVE TEST

1. READ DATA LIST

HINT:

Using the intelligent tester's DATA LIST allows switch, sensor, actuator and other item values to be read without removing any parts. Reading the DATA LIST early in troubleshooting is one way to save time.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Read the DATA LIST.

Transponder key ECU assembly

Item	Measurement Item / Display (Range)	Normal Condition	Diagnostic Note
KEY SW	Unlock warning switch signal/ ON or OFF	ON: Key is in ignition key cylinder OFF: No key is in ignition key cylinder	-
IG SW	Ignition switch signal / ON or OFF	ON: Ignition switch ON OFF: Ignition switch OFF or ACC	-
IMMOBILISER	Immobiliser system status / SET or UNSET	SET: Without key UNSET: Ignition switch ON	-
PERMIT (START)	Start control system starting control / OK or NG	OK: Start control system starting is permitted NG: Start control system starting is not permitted	-
RESPONSE	Transponder chip data / OK or NG	OK: Data OK NG: Data error	-
FRAME	Transponder chip data / OK or NG	OK: Data OK NG: Data error	-

REG CODE SPACE	Memory space for key codes registration / NOT FUL or FULL	NOT FUL: Possible to register more key codes Full: Cannot register any more key codes	-
+B	+B judgment / NORMAL or BREAK	NORMAL: Battery supply is normal BREAK: Battery supply is malfunctioning	-
ANTENNA COIL	Antenna coil condition / NORMAL or FAIL	NORMAL: Antenna coil is normal FAIL: Antenna coil is malfunctioning	-
G-CODE SUPPORT	G code judgment / NOT SUPPORT or SUPPORT	NOT SUPPORT: G-code is not supported SUPPORT: G-code is supported	-
G-CODE DECISION	G code judgment / YES or NO	-	-
WIRELS C-CODE	REGD or NOT REGD	-	-

2. PERFORM ACTIVE TEST

HINT:

Perform the intelligent tester's ACTIVE TEST allows relay, VSV, actuator and other items to be operated without removing any parts. Performing the ACTIVE TEST early in troubleshooting is one way to save time. The DATA LIST can be displayed during the ACTIVE TEST.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Perform the ACTIVE TEST according to the display on the tester.

ECM DTC CHART

DTC No.	Detection Item	Trouble Areas	See page
B2799	Engine Immobiliser System	Wire harness and connector ECM	EI-35

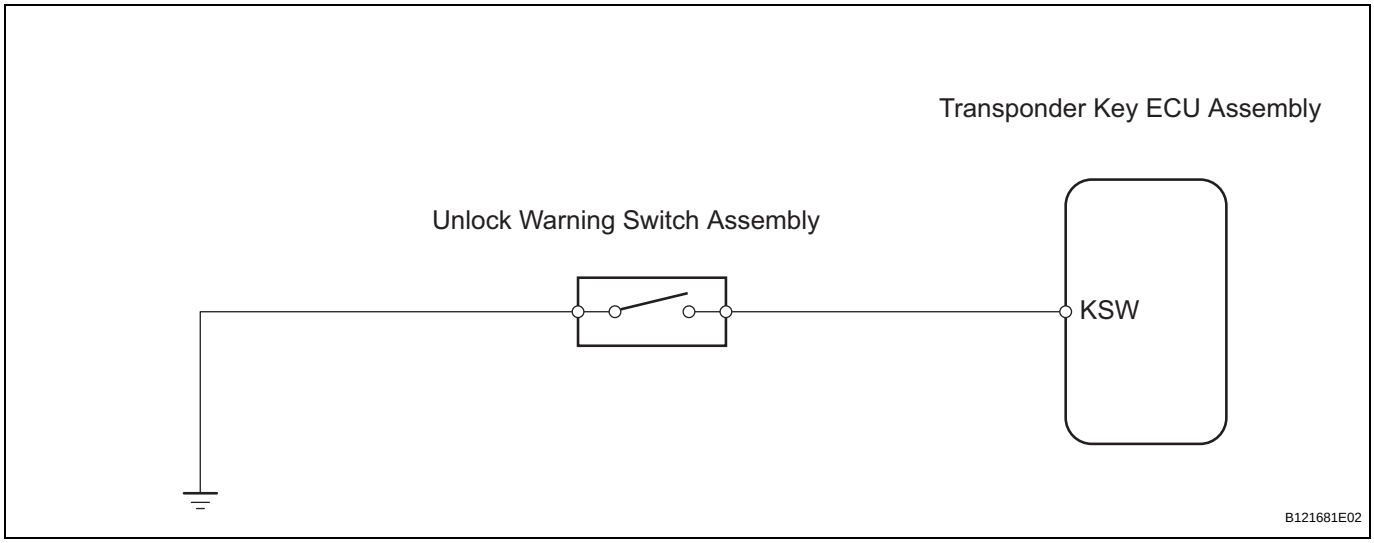
DTC	B2780	Push Switch / Key Unlock Warning Switch Malfunction

DESCRIPTION

This DTC will be output if the transponder key ECU does not detect that the unlock warning switch is ON even when the key is inserted into the ignition key cylinder. Under normal conditions, the unlock warning switch is ON when the key is inserted into the ignition key cylinder.

DTC No.	DTC Detection Condition	Trouble Areas
B2780	Unlock warning switch ON is not detected when when the key is inserted into the ignition key cylinder	• Unlock warning switch assembly • Wire harness and connector • Transponder key ECU assembly

WIRING DIAGRAM



1	READ VALUE OF INTELLIGENT TESTER (UNLOCK WARNING SWITCH)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON with the key that cannot start the engine.
(c) On the intelligent tester, enter the following menus: DIAGNOSIS / ENHANCED OBD II / DATA LIST / IMMOBILISER / KEY SW. Read the values.

EI

Transponder key ECU assembly

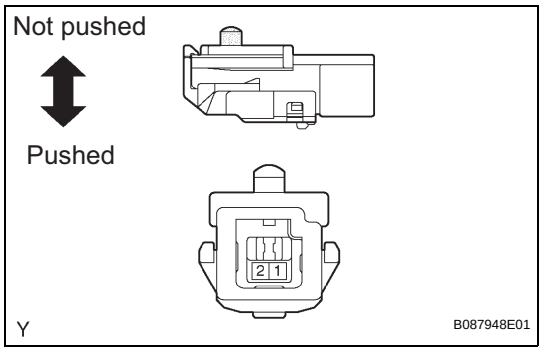
Item	Measurement Item/ ON or OFF	Normal Condition	Diagnostic Note
KEY SW	Unlock warning switch signal / ON or OFF	OFF: No key is in ignition key cylinder ON: Key is in ignition key cylinder	-

OK:
"ON" (key is in ignition key cylinder) appears on the screen.

OK	REPLACE TRANSPONDER KEY ECU ASSEMBLY

NG

2 INSPECT UNLOCK WARNING SWITCH ASSEMBLY



(a) Remove the unlock warning switch.
(b) Measure the resistance of the switch.
Standard resistance

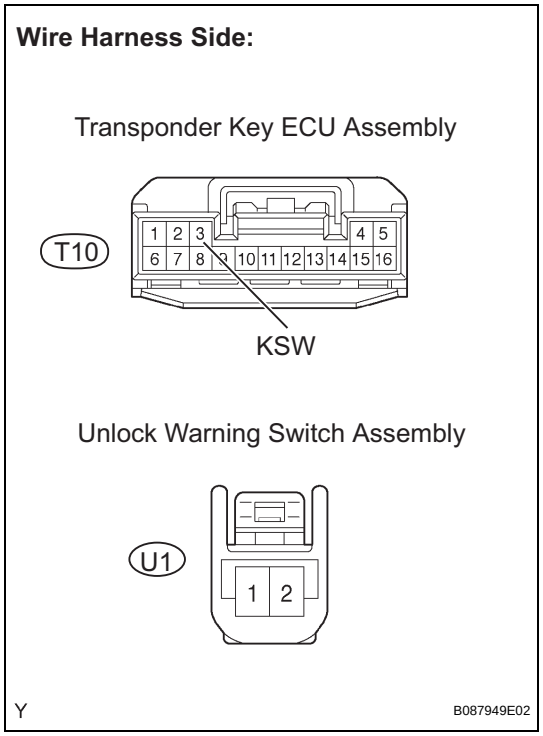
Tester Connection	Switch Condition	Specified Condition
1-2	Pushed	Below 1Ω
1-2	Not pushed	10 kΩ or higher

(c) Reinstall the unlock warning switch.

NG → **REPLACE UNLOCK WARNING SWITCH ASSEMBLY**

OK

3 CHECK HARNESS AND CONNECTOR (TRANSPONDER KEY ECU - UNLOCK WARNING SWITCH)



(a) Disconnect the T10 ECU connector.
(b) Disconnect the U1 switch connector.
(c) Measure the resistance of the wire harness side connectors.
Standard resistance

Tester Connection	Specified Condition
T10-3 (KSW) - U1-1	Below 1 Ω
U1-2 - Body ground	Below 1 Ω

(d) Reconnect the unlock warning switch connector.
(e) Reconnect the ECU connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE TRANSPONDER KEY ECU ASSEMBLY

EI

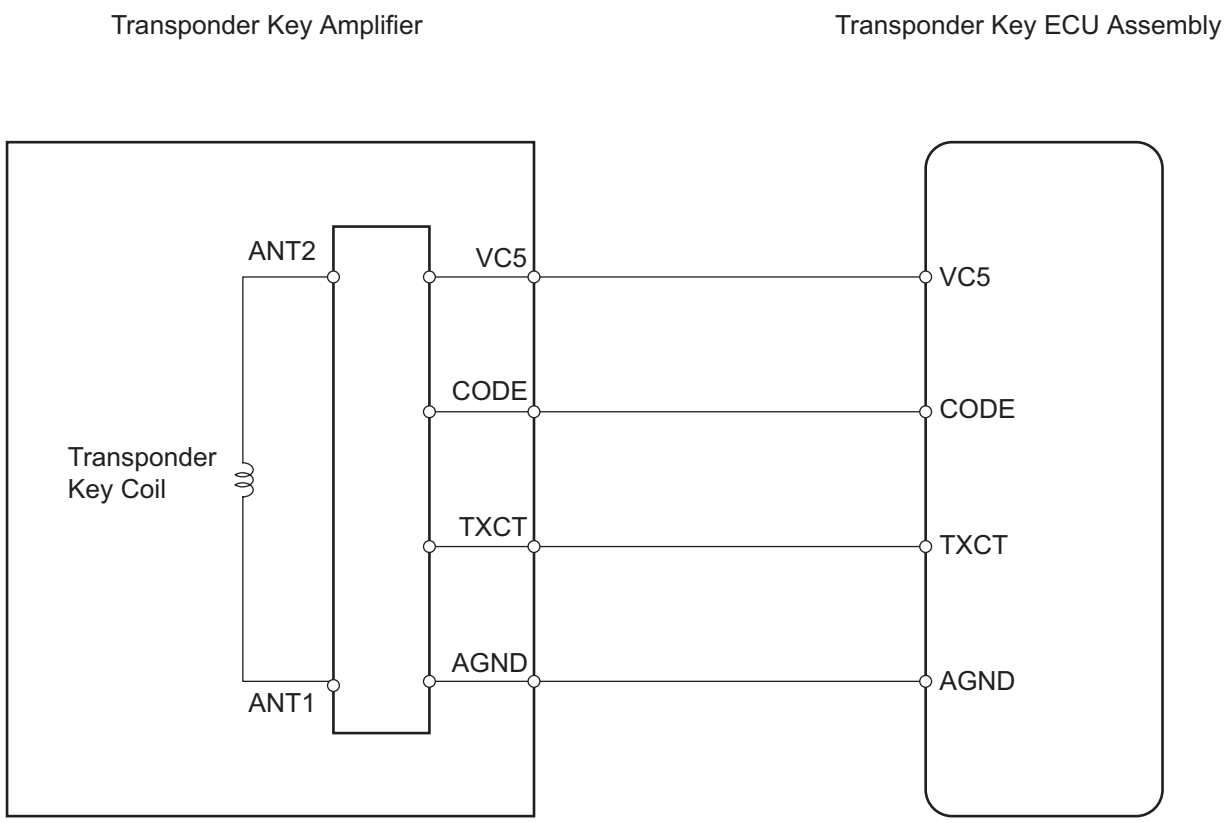
DTC	B2784	Antenna Coil Open / Short

DESCRIPTION

The transponder key coil receives key code signals from key's transponder chip. The coil is built into the transponder key amplifier, which amplifies the key code signals and output the signals to the transponder key ECU.

DTC No.	DTC Detection Condition	Trouble Area
B2784	Open or short in antenna coil circuit	• Wire harness and connector • Transponder key amplifier • Transponder key ECU assembly

WIRING DIAGRAM



EI

1	READ VALUE OF INTELLIGENT TESTER (TRANSPONDER KEY COIL)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON with the key that cannot start the engine.

(c) On the intelligent tester, enter the following menus: DIAGNOSIS/ENHANCED OBD II/DATA LIST/ IMMOBILISER/ ANTENNA COIL. Read the values.

Transponder key ECU assembly

Item	Measurement Item / Display (Range)	Normal Condition	Diagnostic Note
ANTENNA COIL	Transponder key coil condition / NORMAL or FAIL	NORMAL: Transponder key coil is normal FAIL: Transponder key coil is malfunctioning	-

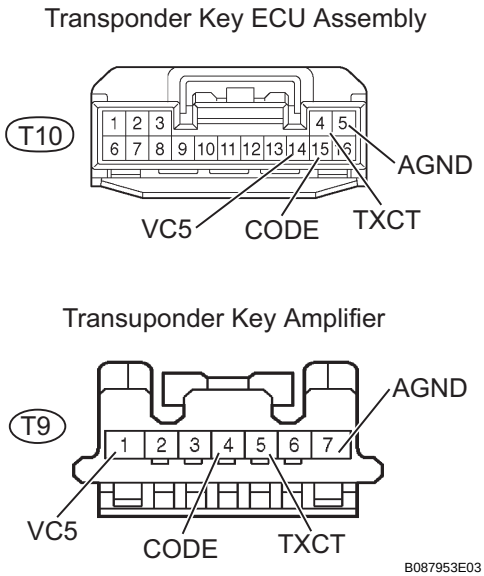
OK:
"NORMAL" (Transponder key coil is normal) appears on the screen.

OK → **REPLACE TRANSPONDER KEY ECU ASSEMBLY**

NG

2 CHECK HARNESS AND CONNECTOR (TRANSPONDER KEY ECU ASSEMBLY - TRANSPONDER KEY AMPLIFIER)

Wire Harness Side:



(a) Disconnect the T10 ECU connector.
(b) Disconnect the T9 amplifier connector.
(c) Measure the resistance of the wire harness side connectors.

Standard resistance

Tester Connection	Specified Condition
T10-14 (VC5) - T9-1 (VC5)	Below 1Ω
T10-15 (CODE) - T9-4 (CODE)	Below 1Ω
T10-4 (TXCT) - T9-5 (TXCT)	Below 1Ω
T10-5 (AGND) - T9-7 (AGND)	Below 1Ω
T10-14 (VC5) or T9-1 (VC5) - Body ground	10 kΩ or higher
T10-15 (CODE) or T9-4 (CODE) - Body ground	10 kΩ or higher
T10-4 (TXCT) or T9-5 (TXCT) - Body ground	10 kΩ or higher
T10-5 (AGND) or T9-7 (AGND) - Body ground	10 kΩ or higher

(d) Reconnect the ECU connector.
(e) Reconnect the amplifier connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE TRANSPONDER KEY AMPLIFIER

EI

DTC	B2793	Transponder Chip Malfunction

DESCRIPTION

This DTC is output when: 1) during key code registration, a key malfunction occurs; or 2) the key code was unable to be registered properly. Follow the inspection procedure below.

DTC No.	DTC Detection Condition	Trouble Area
B2793	Transponder chip malfunction	Key

1	RE-REGISTER KEY

(a) Delete the DTC (see page EI-19).
(b) Re-register the key (see page EI-6), and check that the engine starts with the key.
OK:
Engine starts.

NG → **REPLACE KEY**

OK ↓

NORMAL (INSPECTION FINISHED)

DTC	B2794	Unmatched Encryption Code

DESCRIPTION

This DTC is output when a key with an incomplete key code is inserted into the ignition key cylinder.

DTC No.	DTC Detection Condition	Trouble Area
B2794	Key with incomplete key code is inserted	Key

1	RE-REGISTER KEY

(a) Delete the DTC (see page EI-19).
(b) RE-register the key (see page EI-6), and check that the engine starts with the key.
OK:
Engine starts.

NG → **REPLACE KEY**

OK

END

DTC	B2795	Unmatched Key Code

DESCRIPTION

This DTC is output when a key with a key code that has not been registered in the ECU is inserted into the ignition key cylinder.

DTC No.	DTC Detection Condition	Trouble Area
B2795	Key with unregistered key code is inserted	Key

1	RE-REGISTER KEY

(a) Delete the DTC (see page EI-19).
(b) Reregister the key, and check that the engine starts with the key (see page EI-6).

OK:
Engine starts.

NG → **REPLACE KEY**

OK

NORMAL (INSPECTION FINISHED)

DTC	B2796	No Communication in Immobiliser System

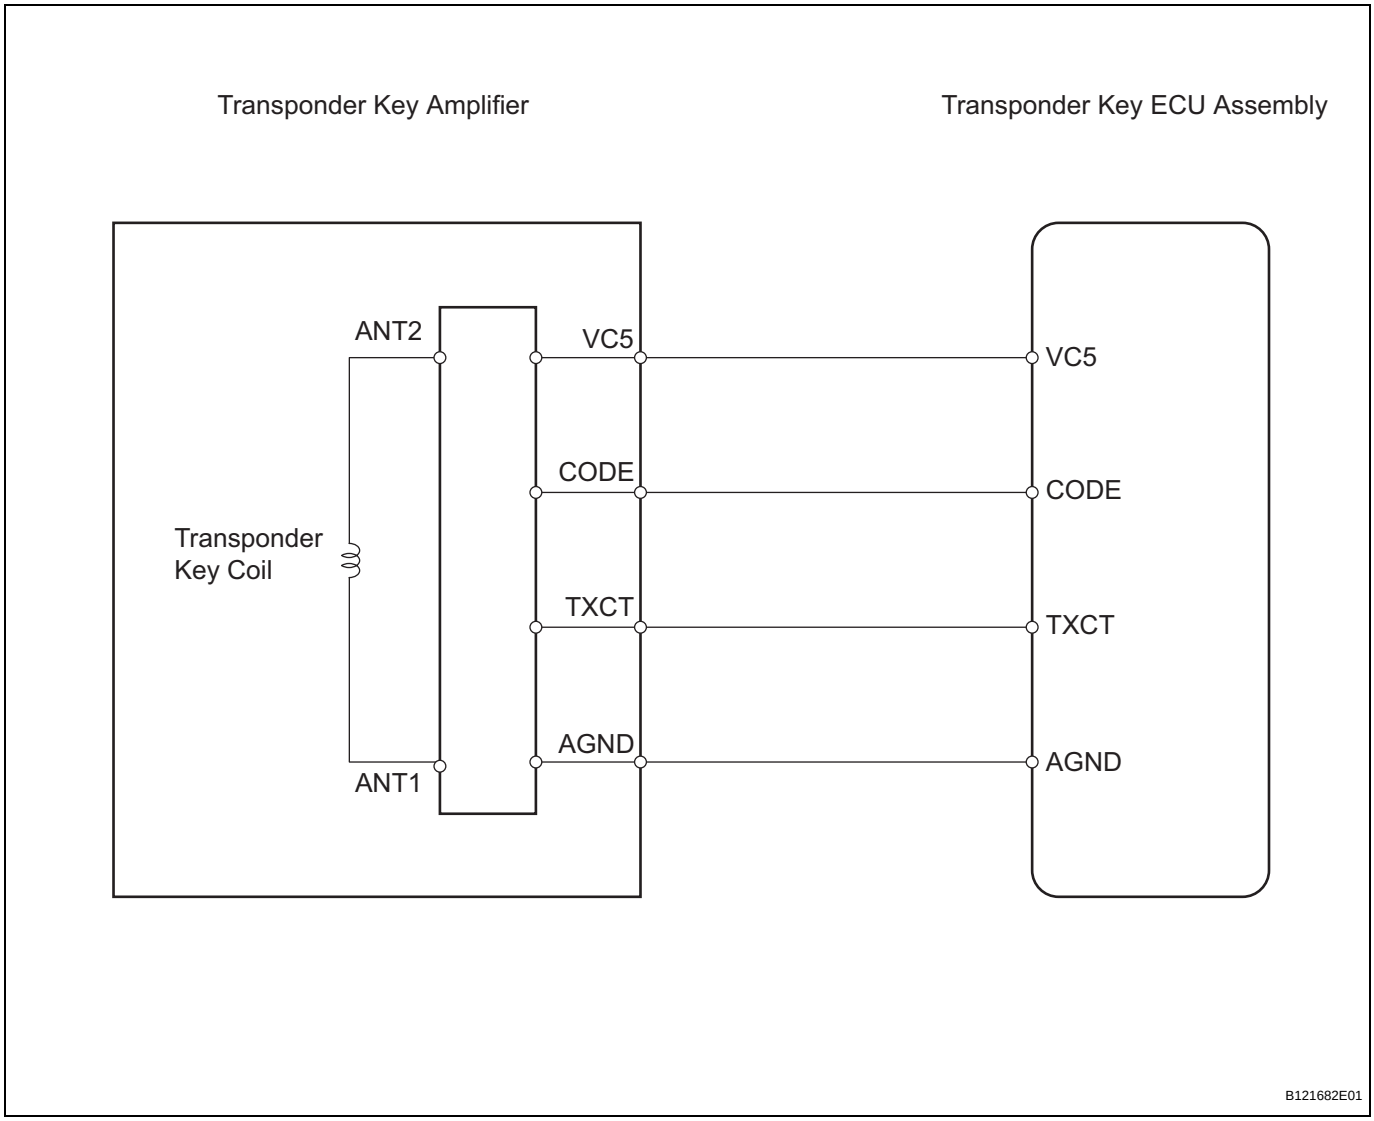
DTC	B2798	Communication Malfunction No. 2

DESCRIPTION

When a key is inserted into the ignition key cylinder but no communication occurs between the key and transponder key ECU assembly, DTC B2796 is output. When a key is inserted into the ignition key cylinder but a communication error occurs between the key and transponder key ECU assembly, DTC B2798 is output.

DTC No.	DTC Detection Conditions	Trouble Areas
B2796	No communication	• Key • Wire harness and connector • Transponder key amplifier • Transponder key ECU assembly
B2798	Communication error	Key

WIRING DIAGRAM



EI

1	READ VALUE OF INTELLIGENT TESTER (ENGINE IMMOBILISER SYSTEM)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON with the key that cannot start the engine.
(c) On the intelligent tester enter the following menus: DIAGNOSIS / ENHANCED OBD II / DATA LIST / IMMOBILISER / IMMOBILISER. Read the values.

Transponder key ECU assembly

Item	Measurement Item / Display (Range)	Normal Condition	Diagnostic Note
IMMOBILISER	Immobiliser system status / SET or UNSET	UNSET: Ignition switch ON SET: Without key	-

OK:
"UNSET" (ignition switch ON) appears on the screen.

OK → **REPLACE TRANSPONDER KEY ECU ASSEMBLY**

NG

2	CHECK WHETHER ENGINE STARTS WITH OTHER KEYS

(a) Check whether the engine starts with the vehicle's other keys.
OK:
Engine starts.

OK → **RE- REGISTER OR REPLACE KEY THAT CANNOT START ENGINE**

NG

3	READ VALUE OF INTELLIGENT TESTER

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON with the key that will not start the engine.
(c) On the intelligent tester, enter the following menus: DIAGNOSIS / ENHANCED OBD II / DATA LIST / IMMOBILISER / ANTENNA COIL. Read the values.

EI

Transponder key ECU assembly

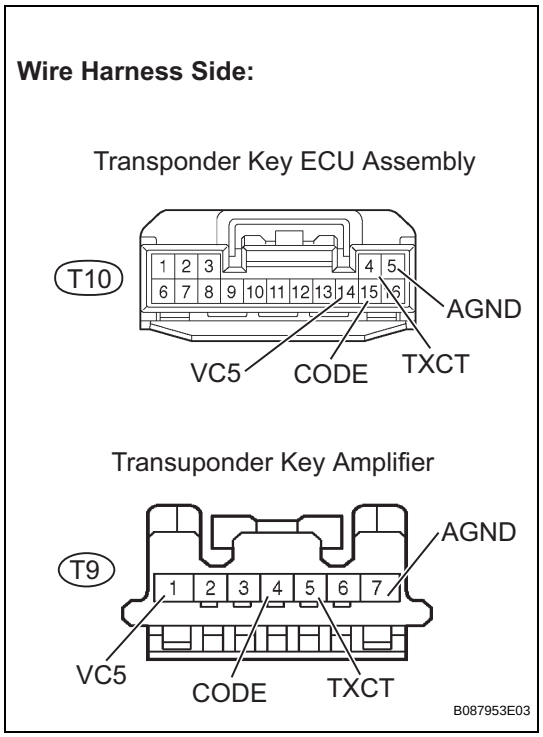
Item	Measurement Item / Display (Range)	Normal Condition	Diagnostic Note
ANTENNA COIL	Transponder key coil condition / NORMAL or FAIL	NORMAL: Transponder key coil is normal FAIL: Transponder key coil is malfunctioning	-

OK:
NORMAL (transponder key coil is normal) appears on screen.

OK → **REPLACE TRANSPONDER KEY AMPLIFIER**

NG

4	CHECK HARNESS AND CONNECTOR (TRANSPONDER KEY ECU ASSEMBLY - TRANSPONDER KEY AMPLIFIER)



(a) Disconnect the T10 ECU connector.
(b) Disconnect the T9 amplifier connector.
(c) Measure the resistance of the wire harness side connectors.

Standard resistance

Tester Connection	Specified Condition
T10-14 (VC5) - T9-1 (VC5)	Below 1Ω
T10-15 (CODE) - T9-4 (CODE)	Below 1Ω
T10-4 (TXCT) - T9-5 (TXCT)	Below 1Ω
T10-5 (AGND) - T9-7 (AGND)	Below 1Ω
T10-14 (VC5) or T9-1 (VC5) - Body ground	10 kΩ or higher
T10-15 (CODE) or T9-4 (CODE) - Body ground	10 kΩ or higher
T10-4 (TXCT) or T9-5 (TXCT) - Body ground	10 kΩ or higher
T10-5 (AGND) or T9-7 (AGND) - Body gorund	10 kΩ or higher

(d) Reconnect the ECU connector.
(e) Reconnect the amplifier connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

5	REPLACE TRANSPONDER KEY AMPLIFIER (OPERATION)

(a) After replacing the transponder key amplifier with a normally functioning amplifier, check that the engine starts.

OK:

Engine starts.

NG → **REPLACE TRANSPONDER KEY ECU ASSEMBLY**

OK

NORMAL (TRANSPONDER KEY AMPLIFIER DEFECTIVE)

EI

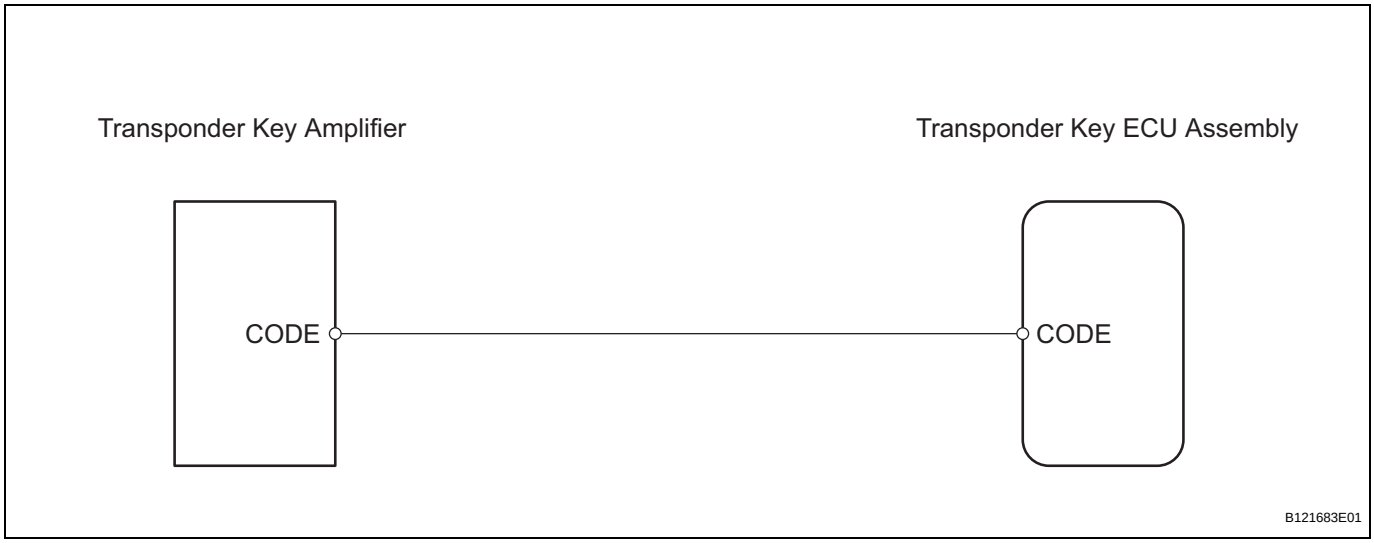
DTC	B2797	Communication Malfunction No. 1

DESCRIPTION

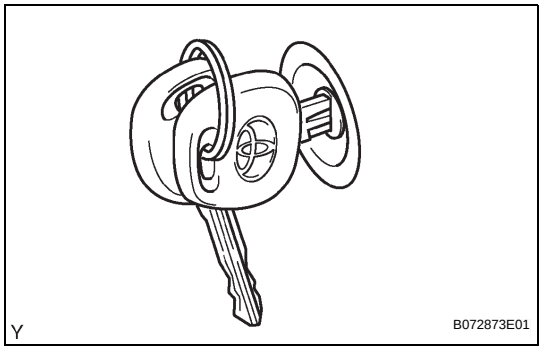
This DTC is output when a communication error occurs between the transponder key amplifier and transponder key ECU. Some possible reasons for the communication error are: 1) 2 or more ignition keys are positioned too close together, or 2) noise is occurring in the communication line.

DTC No.	DTC Detection Conditions	Trouble Areas
B2797	Keys are positioned too close each other, or noise occurred in communication line	• Key • Wire harness and connector • Transponder key amplifier • Transponder key ECU assembly

WIRING DIAGRAM



1	CHECK KEYS



(a) Check if the ignition key being used is near other ignition keys, as shown in the illustration. Also, check if the key ring is in contact with the key grip.

Result

Result	Proceed to
The key is near other keys and/ or the key rings is in contact with key grip.	**A**
The key is not near other keys and/or the key ring is not in contact with the key grip.	**B**

B → **Go to step 3**

A

2	CHECK FOR DTCS

(a) Separate the keys from each other and/or remove the key ring.

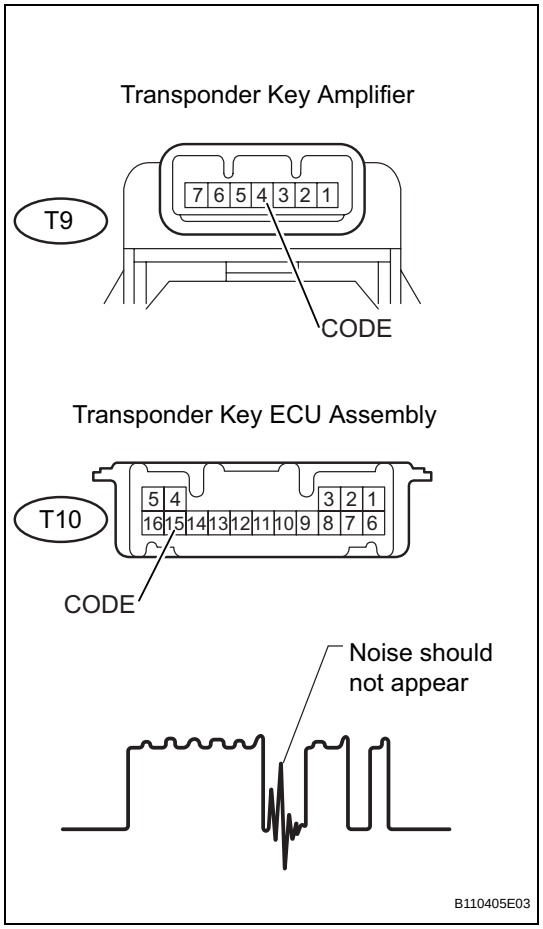
EI

(b) Delete the DTC (see page EI-19).
(c) Insert a key into the ignition cylinder. Remove it. Repeat for all the other keys.
(d) Check that no code is output.
OK:
No code is output

OK → **NORMAL (INSPECTION FINISHED)**

NG

3 CHECK TRANSPONDER KEY ECU ASSEMBLY



(a) Using an oscilloscope or the intelligent tester check for noise in the waveform between the terminals of the T9 amplifier connector and T10 ECU connector.
OK:
No noise is present (see illustration)

Tester Connection	Specified Condition
T10-15 (CODE) - T9-4 (CODE)	No noise is present

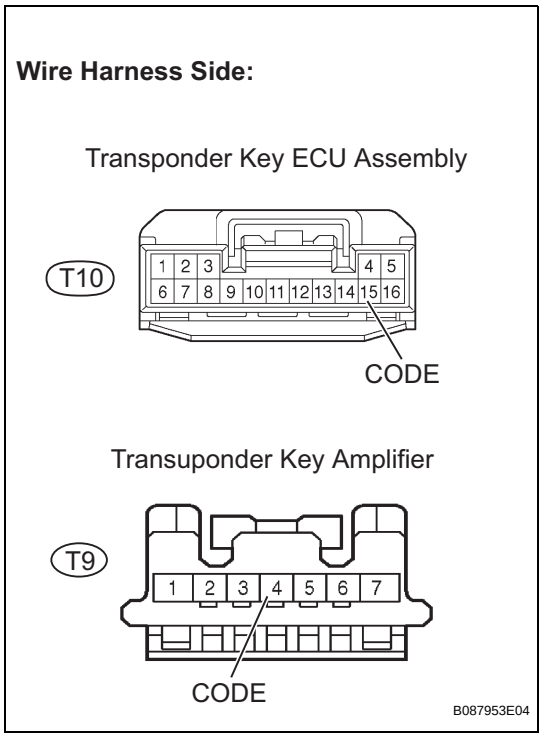
Tool Setting	5 V/div. 20 ms/DIV.
Condition	Ignition switch: OFF → ON

NG → **FIND CAUSE OF NOISE AND REMOVE IT**

OK

EI

4	CHECK HARNESS AND CONNECTOR (TRANSPONDER KEY ECU ASSEMBLY - TRANSPONDER KEY AMPLIFIER)



(a) Disconnect the T10 ECU connector.
(b) Disconnect the T9 amplifier connector.
(c) Measure the resistance of the wire harness side connectors.

Standard resistance

Tester Connection	Specified Condition
T10-15 (CODE) - T9-4 (CODE)	Below 1Ω

(d) Reconnect the ECU connector.
(e) Reconnect the amplifier connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

5	REPLACE TRANSPONDER KEY AMPLIFIER (OPERATION)

(a) After replacing the transponder key amplifier with a normally functioning amplifier, check that the engine starts.

OK:

Engine starts.

NG → **REPLACE TRANSPONDER KEY ECU ASSEMBLY**

OK

END (TRANSPONDER KEY AMPLIFIER DEFECTIVE)

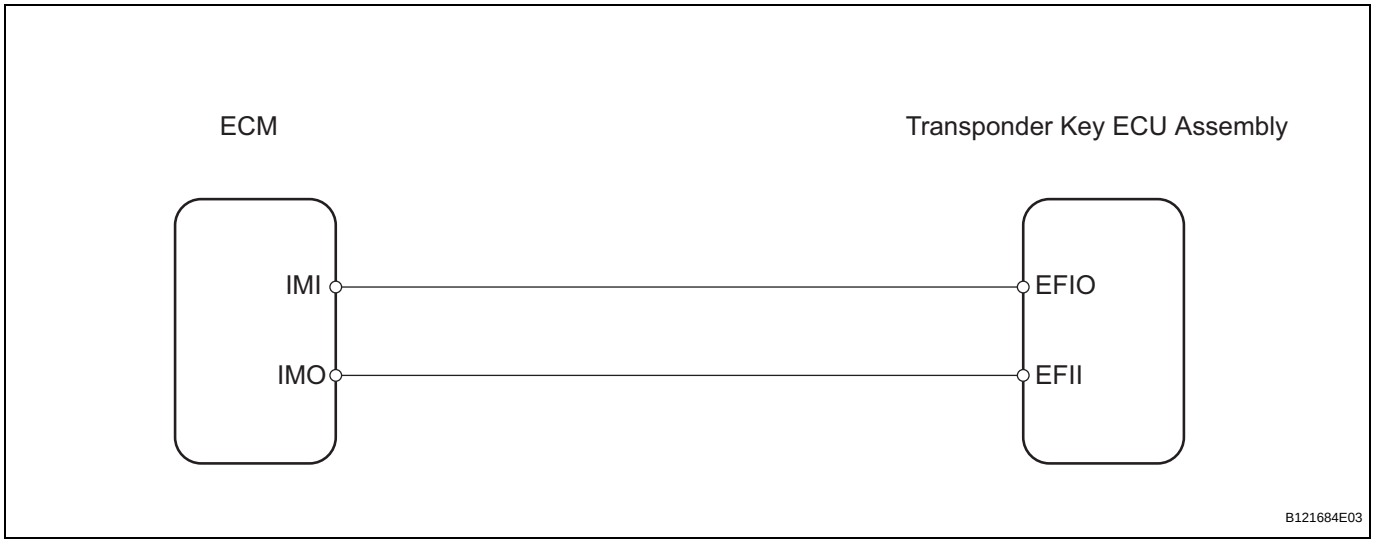
DTC	B2799	Engine Immobiliser System

DESCRIPTION

This DTC is output when one of the following occurs: 1) the ECM detected errors in its own communications with the immobiliser code ECU; 2) the ECM detects errors in the communication lines; or 3) the ECU communication ID between the immobiliser code ECU and ECM is different and an engine start is attempted. Before troubleshooting for this DTC, make sure no certification ECU DTCs are present. If present, troubleshoot the certification ECU DTCs first.

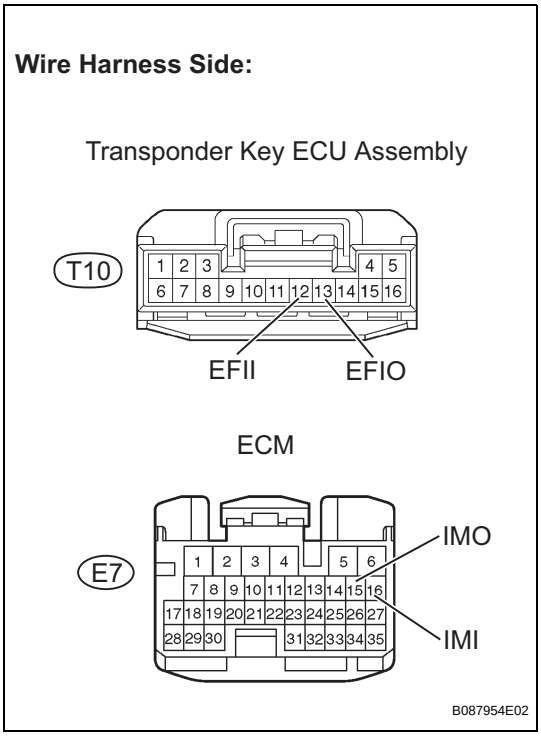
DTC No.	DTC Detection Condition	Trouble Area
B2799	• Error in communication between ECM and transponder key ECU, and in communication line • Communication ID is different during communication with transponder key ECU	• Wire harness and connector • ECM

WIRING DIAGRAM



1	CHECK HARNESS AND CONNECTOR (TRANSPONDER KEY ECU ASSEMBLY - ECM)

Wire Harness Side:



(a) Disconnect the T10 ECU connector.
(b) Disconnect the E7 ECM connector.
(c) Measure the resistance of the wire harness side connectors.

Standard resistance

Tester Connection	Specified Condition
T10-13 (EFIO) - E7-16 (IMI)	Below 1 Ω
T10-12 (EFII) - E7-15 (IMO)	Below 1 Ω
T10-13 (EFIO) or E7-16 (IMI) - Body ground	10 kΩ or higher
T10-12 (EFII) or E7-15 (IMO) - Body ground	10 kΩ or higher

(d) Reconnect the ECU connector.
(e) Reconnect the amplifier connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

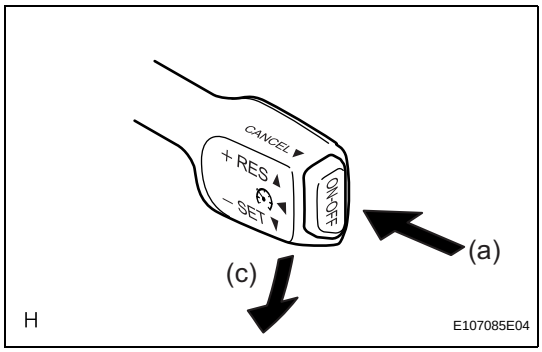
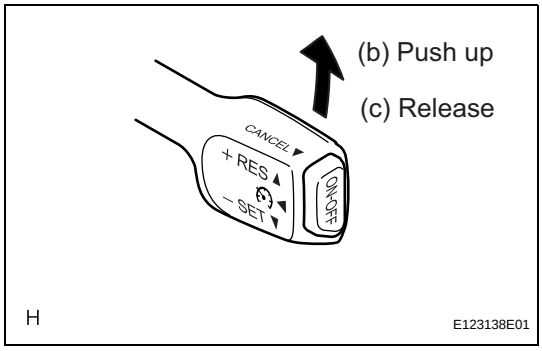
ROAD TEST

HINT:
'SET' and '-', 'RES' and '+', 'ON-OFF' functions share the same switch. Operate the cruise control main switch according to the directions indicated on the switch.



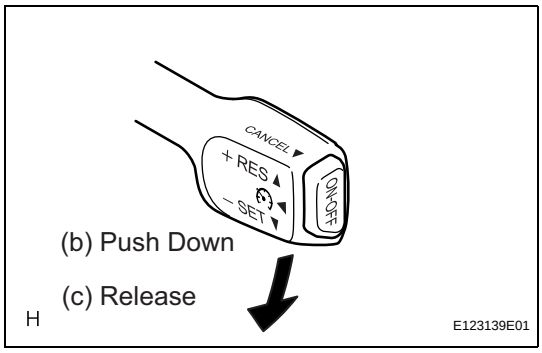
1. INSPECT 'SET' FUNCTION

(a) Push the ON-OFF button on.
(b) Drive at the vehicle at a desired speed 25 mph (40 km/h) or higher.
(c) Push down the control switch lever to "-/SET" to set the cruising speed.
(d) After releasing the lever, check that the vehicle cruises at the set speed.



2. INSPECT '+' FUNCTION

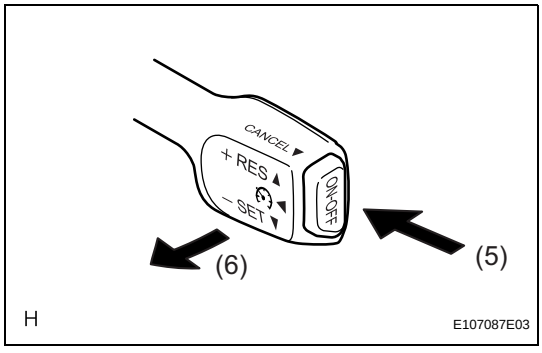
(a) Set a desired speed as in step 1.
(b) Check that the vehicle speed increases while the control switch lever is pushed up to "+/RES".
(c) Check that the vehicle cruises at the newly set speed when the switch is released.
(d) Momentarily (approximately 0.6 seconds) push up the control switch lever to the "+/RES", and then release it. Check that the vehicle speed increases by approximately 1 mph (1.6 km/h) with each lever operation (Tap-up function).



3. INSPECT '-' FUNCTION

(a) Set a desired speed as in step 1.
(b) Check that the vehicle speed decreases while the control switch lever is pushed down to "-/SET".
(c) Check that the vehicle cruises at the newly set speed when the switch is released.
(d) Momentarily (approximately 0.6 seconds) push down the control switch to "-/SET", and then release it. Check that the vehicle speed decreases by approximately 1 mph (1.6 km/h) with each lever operation (Tap-down function).
HINT:
- The cruise control system automatically cancels when the vehicle speed decreases to below 25 mph (40 km/h).

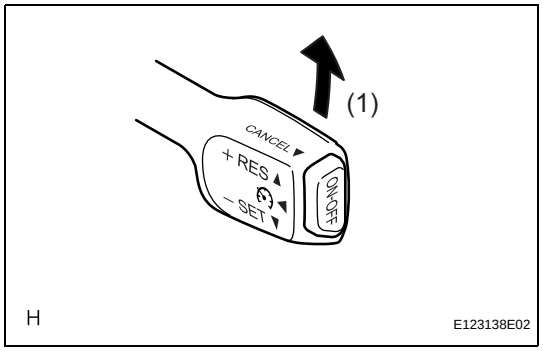
CC



4. INSPECT 'CANCEL' FUNCTION

(a) Set a desired speed as in step 1.
(b) Check that the system cancels cruise control when one of the following is conducted:
(1) Depressing the brake pedal
(2) Depressing the clutch pedal (M/T)
(3) Shifting into any position except D and 3 while driving (A/T: 2TR-FE)
(4) Shifting into any position except D and 4 while driving (A/T: 1GR-FE)

(5) Pushing the cruise control main switch ON-OFF button off
(6) Pulling the cruise control switch lever to "CANCEL"



5. INSPECT ' RES (RESUME)' FUNCTION

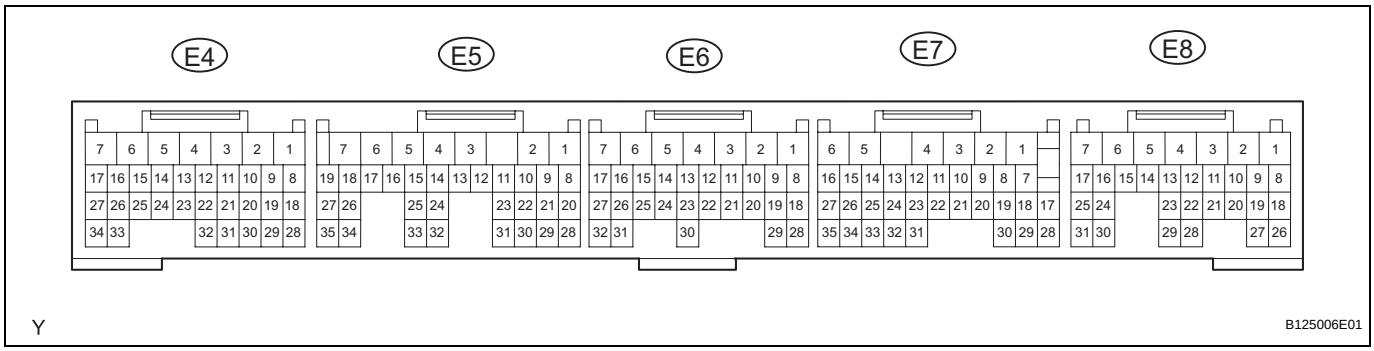
(a) Set a desired speed as in step 1.
(1) After cancelling the cruise control according to any of the above operations except (5), push up the switch lever to "+/RES" at a speed of 25 mph (40 km/h) or higher.
(2) Check that the vehicle resumes the previously set speed.
HINT:
The 'RES' function does not resume the set speed when the vehicle speed decreases to below 25 mph (40 km/h).

PROBLEM SYMPTOMS TABLE

Symptom	Suspected area	See page
Main switch cannot be turned ON (Indicator light on the combination meter does not come on)	1. Cruise control switch circuit	CC-24
	2. CRUISE MAIN indicator light circuit	CC-28
	3. ECM (1GR-FE)	ES-428
	3. ECM (2TR-FE)	ES-467
Desired speed cannot be set (Indicator light on the combination meter comes on when the main switch is turned ON, but goes off when operating the "SET" function)	1. Cruise control switch circuit	CC-24
	2. ECM (1GR-FE)	ES-428
	2. ECM (2TR-FE)	ES-467
Desired speed cannot be set (Indicator light on the combination comes on when the main switch is turned ON and it remains ON, while operating the "SET" function)	1. Cruise control switch circuit	CC-24
	2. Stop light switch circuit	CC-16
	3. Clutch switch circuit (M/T)	CC-21
	3. Park/neutral position switch circuit (A/T: 1GR-FE)	AT-43
	3. Park/neutral position switch circuit (A/T: 2TR-FE)	AT-34
	4. Combination meter system	ME-20
	5. ECM (1GR-FE)	ES-428
	5. ECM (2TR-FE)	ES-467
While cruise control driving, the set speed is canceled (Indicator light remains ON)	1. Cruise control switch circuit	CC-24
	2. Vehicle speed sensor circuit (1GR-FE)	ES-238
	2. Vehicle speed sensor circuit (2TR-FE)	ES-243
	3. Stop light switch circuit	CC-16
	4. CRUISE MAIN indicator light circuit	CC-28
	5. Clutch switch circuit (M/T)	CC-21
	5. Park/neutral position switch circuit (A/T: 1GR-FE)	AT-43
	5. Park/neutral position switch circuit (A/T: 2TG-FE)	AT-34
	6. ECM (1GR-FE)	ES-428
	6. ECM (2TR-FE)	ES-467
Hunting occurs (Speed is not constant)	1. Vehicle speed sensor circuit (1GR-FE)	ES-238
	1. Vehicle speed sensor circuit (2TR-FE)	ES-243
	2. ECM (1GR-FE)	ES-428
	2. ECM (2TR-FE)	ES-467
Speed setting cannot be canceled ("CANCEL" function failure only)	1. Cruise control switch circuit	CC-24
	2. ECM (1GR-FE)	ES-428
	2. ECM (2TR-FE)	ES-467
DTC is not output, or is output when should not be	1. DLC3 circuit	CC-32
	2. ECM (1GR-FE)	ES-428
	3. ECM (2TR-FE)	ES-467
CRUISE MAIN indicator light does not come on	1. Cruise control switch circuit	CC-24
	2. CRUISE MAIN indicator light circuit	CC-28
	3. ECM (1GR-FE)	ES-428
	3. ECM (2TR-FE)	ES-428
	4. Combination meter assembly	ME-20

TERMINALS OF ECU

1. ECM (1GR-FE)



Symbols (Terminals No.)	Wiring Color	Terminal Description	Condition	Specified Condition

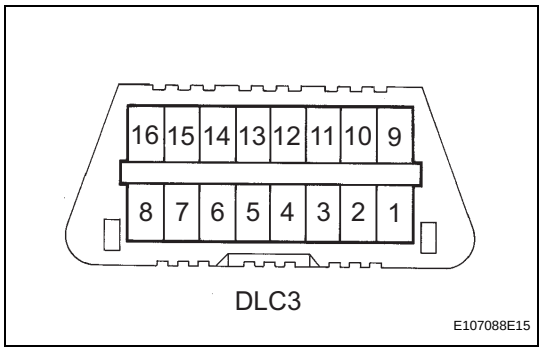
DIAGNOSIS SYSTEM

1. DESCRIPTION

The ECM stores DTCs (Diagnostic Trouble Codes) when trouble occurs on the vehicle. The diagnosis system allows reading of DTCs stored in the ECM when a intelligent tester is connected to the DLC3 (Data Link Connector 3). If the CRUISE MAIN indicator light does not come on after a DTC check, it means that a malfunction has occurred in the cruise control system. Use a intelligent tester or SST to check for DTCs.

2. CHECK DLC3

(a) The ECM uses ISO 9141-2 for data communication. The terminal arrangement of the DLC3 complies with SAE J1962 and matches the ISO 9141-2 format.

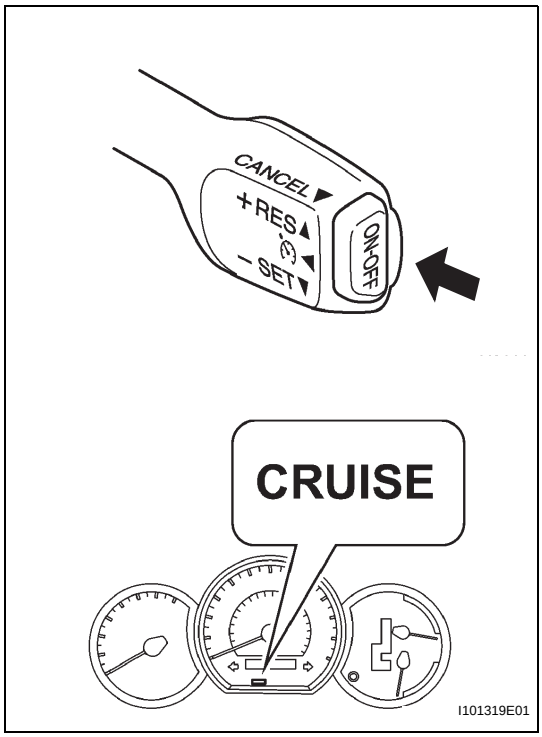


Terminal No.	Tester connection	Condition	Specification
4	Chassis ground - Body Ground	Always	Below 1 Ω
16	Battery positive - Body Ground	Always	9 to 14 V

HINT:

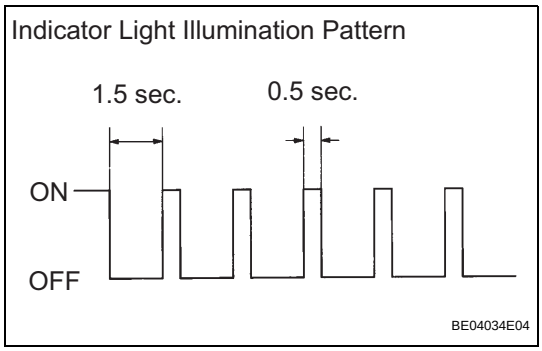
If the intelligent tester display shows "UNABLE TO CONNECT TO VEHICLE" after connecting the tester to the DLC3 and turning the ignition to the ON position, there is a problem in either the vehicle or the tester itself.

- If communication is normal when connecting the tester to another vehicle, inspect the DLC3 on the original vehicle.
- If communication is still not possible when connecting the tester to another vehicle, it suggests the problem exists in the tester. In this case, consult the Service Department listed in the tester's instruction manual.



3. CHECK INDICATOR

(a) Turn the ignition switch to the ON position.



(b) Check that the CRUISE MAIN indicator light comes on when the cruise control main switch ON-OFF button is pushed on, and that the indicator light goes off when the ON-OFF button is pushed off.

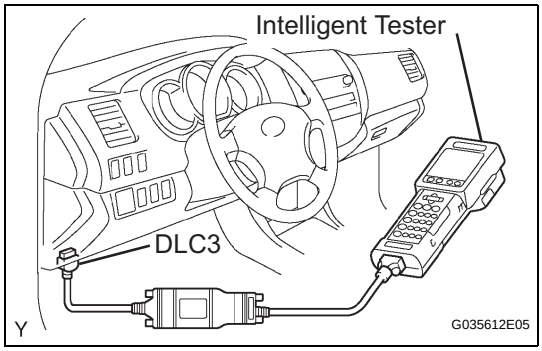
HINT:

If there is a problem with the ON/OFF illumination of the indicator light, inspect the cruise main indicator light circuit (See page CC-28).

HINT:

If a malfunction occurs in the vehicle speed sensor, stop light switch assembly or other related parts while cruise control driving, the ECM actuates AUTO CANCEL of the cruise control. Then the CRUISE MAIN indicator light starts to blink, to inform the driver of the malfunction. At the same time, data of the malfunction is stored as a diagnostic trouble code (DTC).

DTC CHECK / CLEAR



1. DTC CHECK/CLEAR

(a) Check DTCs using the intelligent tester.
  (1) Turn the ignition switch off.
  (2) Connect the intelligent tester to the DLC3.
  (3) Turn the ignition switch to the ON position.
  (4) Read DTCs on the tester screen.

(b) Clear the DTCs using the intelligent tester.
  (1) Turn the ignition switch off.
  (2) Turn the ignition switch to the ON position.
  (3) Clear the DTCs by following the prompts on the tester screen.

  HINT:

  - The intelligent tester has a "Snapshot" function which records the monitored data.

CC

- Refer to the intelligent tester operator's manual for further details.

DATA LIST / ACTIVE TEST

1. READ DATA LIST

(a) While the intelligent tester is connected to the DLC3 with the ignition switch in the ON position, the CRUISE CONTROL data list can be displayed. Follow the prompts on the tester screen to access the data list.

ECM (Cruise control):

Item	Measurement Item / Display (Range)	Normal Condition	Diagnostic Note
VEHICLE SPD	Vehicle speed / min.: 0 mph(0 km/h), max.: 158 mph (255 km/h)	Actual vehicle speed	-
MEMORY SPD	Cruise control memorized speed / min.: 22.5 mph (36 km/h), max.: 125 mph(200 km/h)	Actual stored vehicle speed	-
CRUISE CONTROL	Cruise control system active condition / ON or OFF	ON: Cruise control activated OFF: Cruise control inactivated	-
MAIN SW (MAIN)	Main switch signal (Main CPU) / ON or OFF	ON: Main switch ON (Pushed on) OFF: Main switch OFF (Pushed off)	"3"
MAIN SW (SUB)	Main switch signal (Sub CPU) / ON or OFF	ON: Main switch ON (Pushed on) OFF: Main switch OFF (Pushed off)	"3"
CCS READY M	Cruise control system standby condition (Main CPU) / ON or OFF	ON/OFF: Change ON/OFF each main switch is pushed in	"1"
CCS READY S	Cruise control system standby condition (Sub CPU) / ON or OFF	ON/OFF: Change ON/OFF each main switch is pushed in	"1"
CCS INDICATOR M	Cruise indicator signal (Main CPU) / ON or OFF	ON: "CCS READY" ON OFF: "CCS READY" OFF	"2"
CANCEL SW	CANCEL switch signal / ON or OFF	ON: CANCEL switch ON OFF: CANCEL switch OFF	-
-/SET SW	-/SET switch signal / ON or OFF	ON: SET / COAST switch ON OFF: SET / COAST switch OFF	-
+/SET SW	+/SET switch signal / ON or OFF	ON: RES / ACC switch ON OFF: RES / ACC switch OFF	-
STP LIGHT SW M	Stop light switch signal (Main CPU) / ON or OFF	ON: Brake pedal depressed OFF: Brake pedal released	-
STP LIGHT SW S2	Stop light switch-2 signal (Sub CPU) / ON or OFF	ON: Brake pedal depressed OFF: Brake pedal released	-
STP LIGHT SW S1	Stop light switch-1 signal (Sub CPU) / ON or OFF	ON: Brake pedal depressed OFF: Brake pedal released	-
SHIFT D POS	PNP switch signal (D position) / ON or OFF	ON: Shift lever on D OFF: Shift lever not on D	-

HINT:

- "3" is OK but "1" is NG → ECM failure
- "1" is OK but "2" is NG → DTC output or ECM failure
- "3" is OK but CRUISE indicator does not come on → CRUISE main indicator, wire harness or ECM failure

DIAGNOSTIC TROUBLE CODE CHART

If a trouble code is indicated while checking DTCs, inspect the circuit listed for that code in the table below, and proceed to the applicable page.

DTC No.	Detection Item	Trouble Area	See page
P0500	Vehicle Speed Sensor Circuit Malfunction	Combination meter assembly Vehicle speed sensor Vehicle speed sensor circuit ECM	CC-15
P0503	Vehicle Speed Sensor Circuit Malfunction	Combination meter assembly Veicle speed sensor Vehicle speed sensor circuit ECM	CC-15
P0571	Stop Light Switch Circuit Malfunction	Stop light switch assembly Stop light switch assembly circuit ECM	CC-16
P0607	Input Signal Circuit Malfunction	ECM	CC-20

DTC	P0500	Vehicle Speed Sensor Circuit Malfunction

DTC	P0503	Vehicle Speed Sensor Circuit Malfunction

DESCRIPTION

1GR-FE: (See page ES-238)
2TR-FE: (See page ES-243)

DTC No.	DTC Detection Conditions	Trouble Areas
P0500	This trouble code is output when the vehicle speed signal from the vehicle speed sensor is cut for 0.14 seconds or more while the cruise control is in operation.	• Combination meter assembly • Vehicle speed sensor • Vehicle speed sensor signal circuit • ECM
P0503	Momentary interruption and noise are detected when a rapid change of vehicle speed occurs while the cruise control is in operation.	• Combination meter assembly • Vehicle speed sensor • Vehicle speed sensor signal circuit • ECM

DTC	P0571	Stop Light Switch Circuit Malfunction

DESCRIPTION

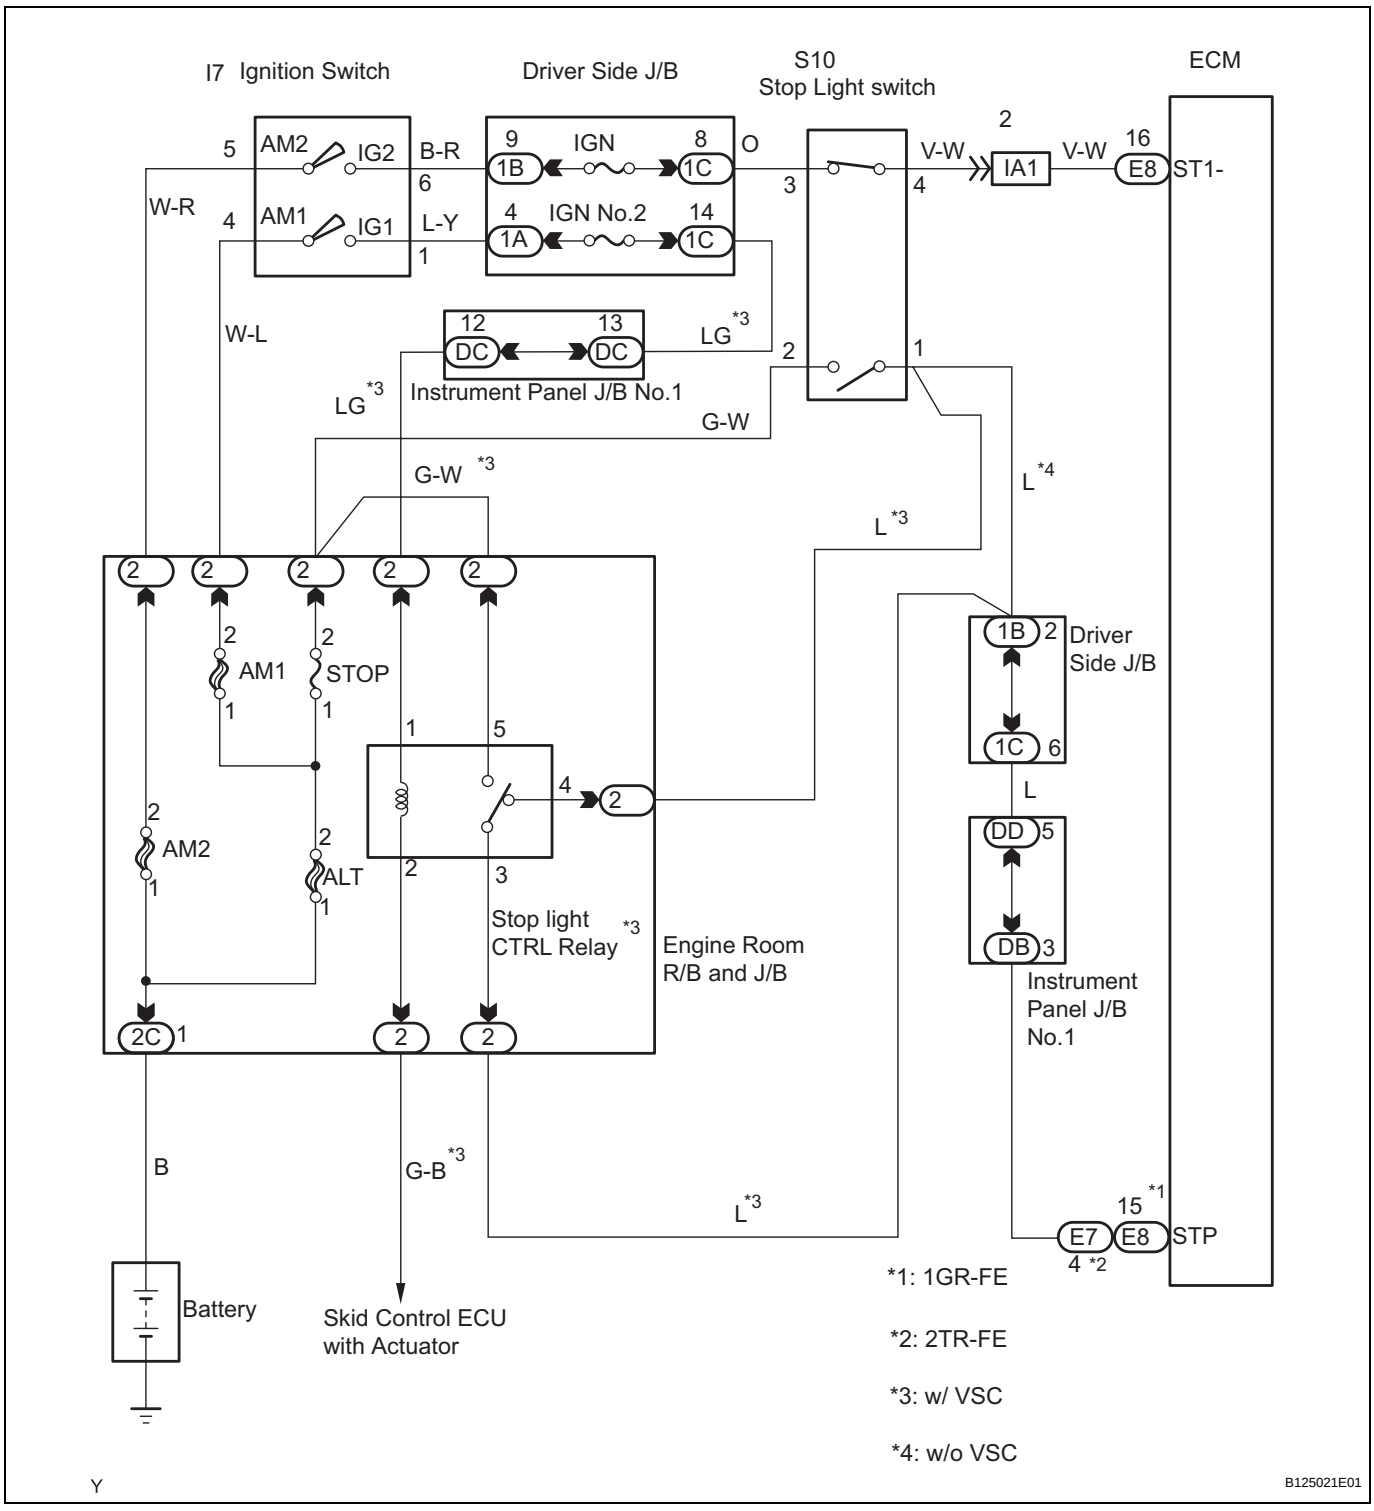
The cruise control system cancels cruising when the ECM detects that the brake pedal is depressed while cruise control driving. The stop light switch assembly sends signals to the ECM according to the brake pedal conditions. When the brake pedal is free, terminal ST1- is the positive (+) battery voltage, and terminal STP voltage is below 1 V. While depressing the brake pedal, terminal ST1- is below 1 V, and STP is positive (+) battery voltage. Under braking, the ECM cancels cruise control as one of the manual cancel functions.

The ECM outputs this trouble code when the voltage of terminals ST1- and STP are both below 1 V for 0.5 seconds or more at the same moment.

The fail-safe function operates to enable normal driving even if there is a malfunction in the stop light signal circuit.

DTC No.	DTC Detected Conditions	Trouble Areas
P0571	ECM detects a malfunction of the stop light switch circuit under both of the following conditions. • Voltage of terminal STP is below 1 V for 0.5 seconds or more. • Voltage of terminal ST1- is below 1 V for 0.5 seconds or more.	• Stop light switch assembly • Stop light switch assembly circuit • ECM

WIRING DIAGRAM



1	INSPECT STOP LIGHT SWITCH OPERATION (FOR STOP LIGHT)

(a) Check that the stop lights come on while the brake pedal is depressed, and go off when the brake pedal is released.

CC

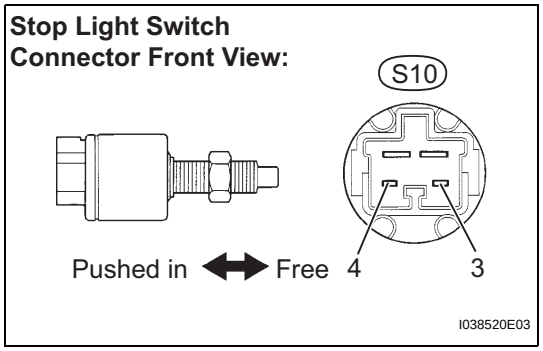
OK

Brake pedal condition	Stop light condition
Depressed	ON
Released	OFF

NG → **INSPECT STOP LIGHT SWITCH CIRCUIT**

OK

2 INSPECT STOP LIGHT SWITCH OPERATION (FOR BACK-UP SIGNAL)



(a) Turn the ignition switch off.
(b) Disconnect the stop light switch assembly connector.
(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance

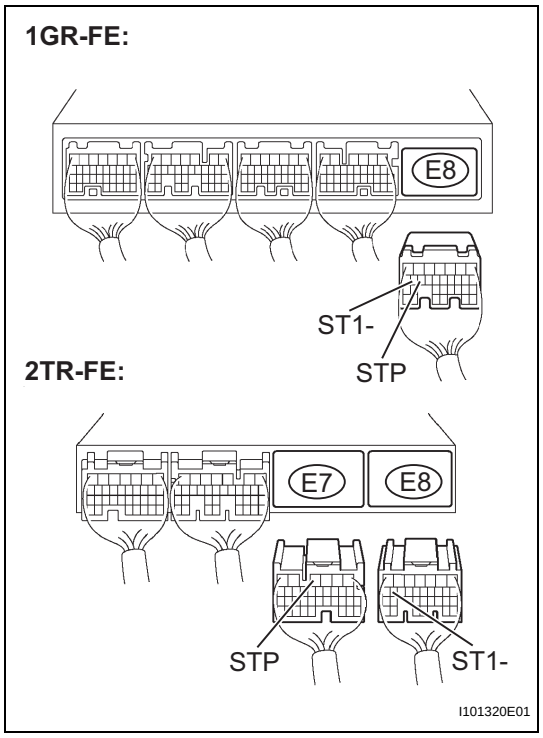
Tester connection	Switch condition	Stop light condition
S10-3 - S10-4	Switch pin free (Brake pedal depressed)	10 kΩ or higher
S10-3 - S10-4	Switch pin pushed in (Brake pedal released)	Below 1Ω

(d) Reconnect the stop light switch assembly connector.

NG → **REPLACE STOP LIGHT SWITCH ASSEMBLY**

OK

3 INSPECT ECM (STP SIGNAL)



(a) Reconnect the stop light switch assembly connector.
(b) 1GR-FE: Disconnect the E8 ECM connector.
(c) 2TR-FE: Disconnect the E7 and E8 ECM connectors.
(d) Turn the ignition switch to the ON position.
(e) Measure the voltage according to the value(s) in the table below.

Standard Voltage(1GR-FE)

Tester connection	Brake pedal condition	Specification
STP (E8-15) - Body ground	Depressed	10 to 14 V
STP (E8-15) - Body ground	Released	Below 1V

Standard Voltage(2TR-FE)

Tester connection	Brake pedal condition	Specification
STP (E7-4) - Body ground	Depressed	10 to 14 V
STP (E7-4) - Body ground	Released	Below 1V

(f) Measure the voltage according to the value(s) in the table below.

CC

Standard Voltage(1GR-FE)

Tester connection	Brake pedal condition	Specification
ST1 (E8-16) - Body ground	Depressed	Below 1V
ST1 (E8-16) - Body ground	Released	10 to 14 V

Standard Voltage(2TR-FE)

Tester connection	Brake pedal condition	Specification
ST1 (E8-16) - Body ground	Depressed	Below 1V
STP (E8-16) - Body ground	Released	10 to 14 V

(g) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (STOP LIGHT SWITCH ASSEMBLY - ECM)**

OK

REPLACE ECM

DTC	P0607	Input Signal Circuit Malfunction

DESCRIPTION

This DTC indicates the internal abnormalities of the ECM.

DTC No.	DTC Detection condition	Trouble Area
P0607	The ECM has a supervisory CPU and a control ECU inside. When each input STP signal is different for 0.15 seconds or more, this trouble code is output. This trouble code is output after 0.4 seconds has passed from the time the cruise cancel input signal (STP input) is input into the ECM.	ECM

HINT:

When a trouble code is detected, fail-safe continues until the ignition switch is turned off.

1	REPLACE ECM

NEXT

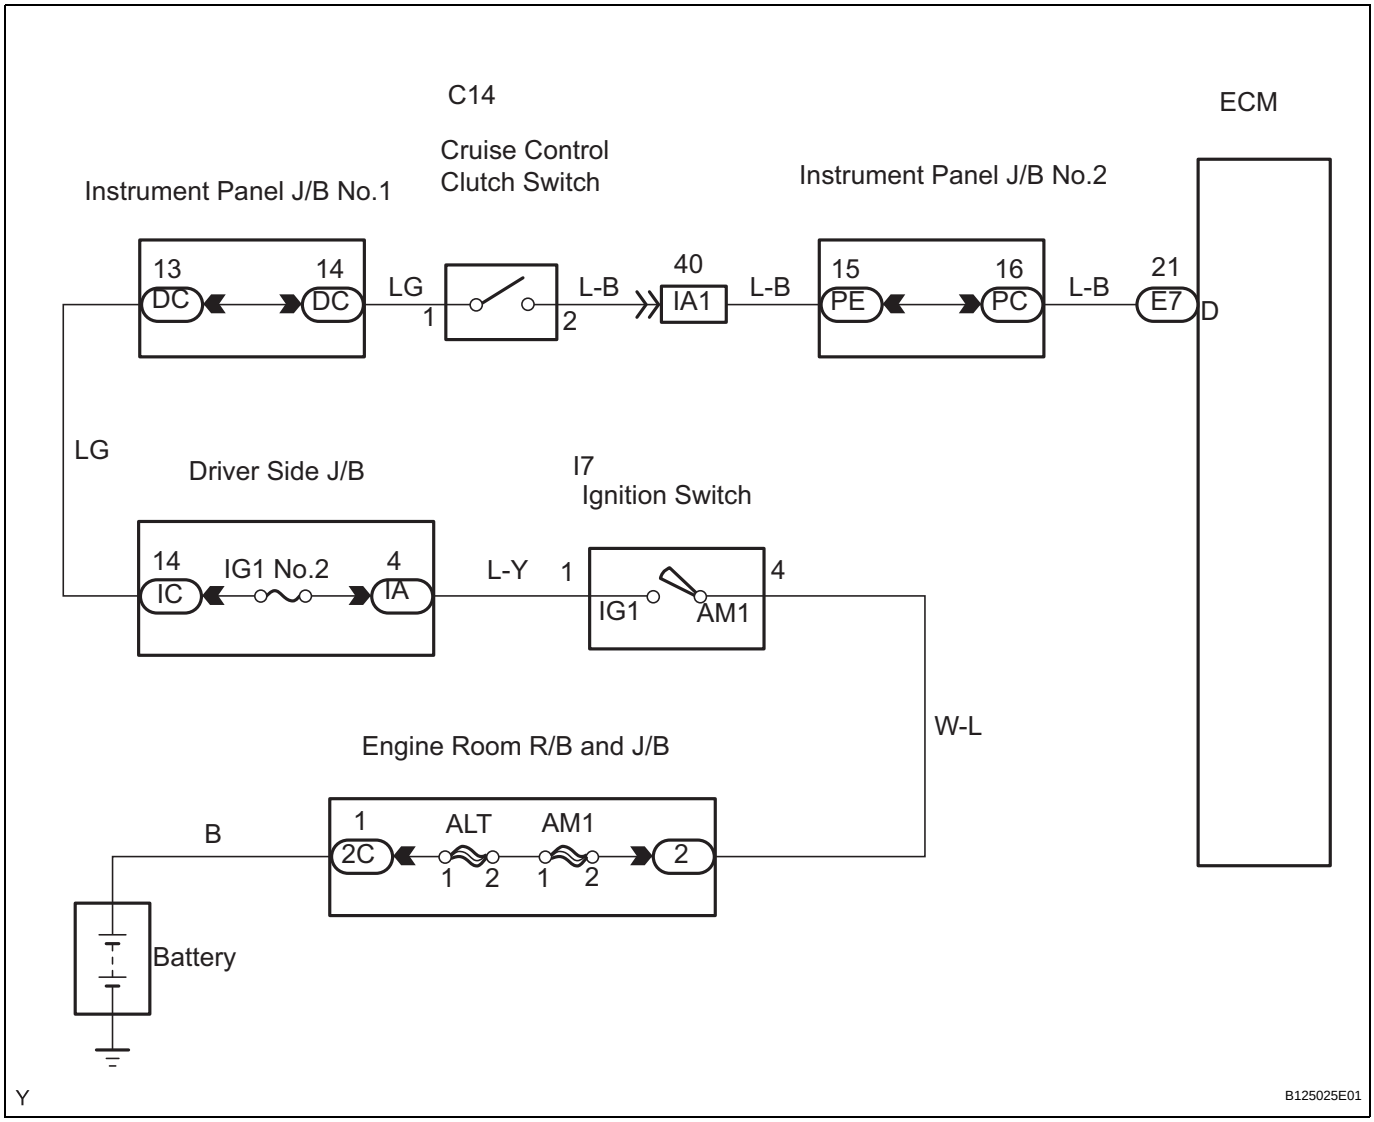
END

Clutch Switch Circuit

DESCRIPTION

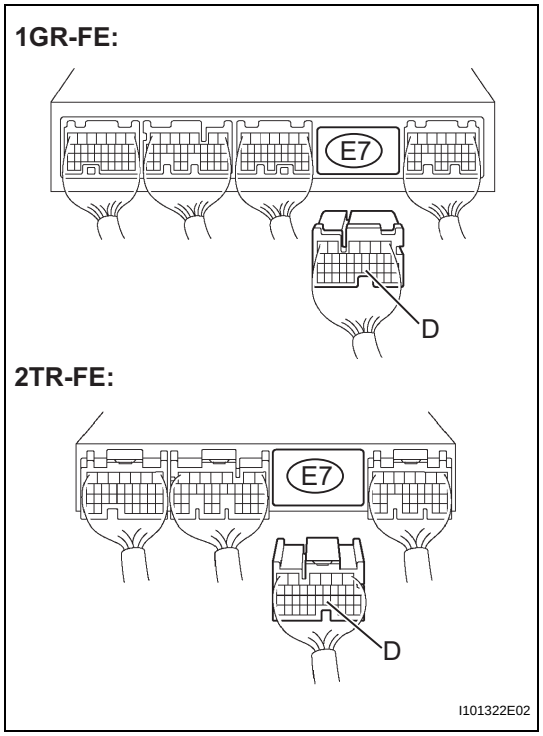
Clutch switch circuit inspection is necessary for M/T vehicles.
When the clutch pedal is released, the ECM receives the positive (+) battery voltage through the IG1 No.2 fuse and ignition switch. While the clutch pedal is depressed, the clutch switch assembly sends a signal to terminal D of the ECM. The ECM cancels cruise control when terminal D receives the signal (voltage of below 1 V).

WIRING DIAGRAM



CC

1 CHECK HARNESS AND CONNECTOR (ECM - BATTERY)



(a) Turn the ignition switch OFF.
(b) Disconnect the E7 ECM connector.
(c) Turn the ignition switch to the ON position.
(d) Measure the voltage according to the value(s) in the table below.

Standard Voltage

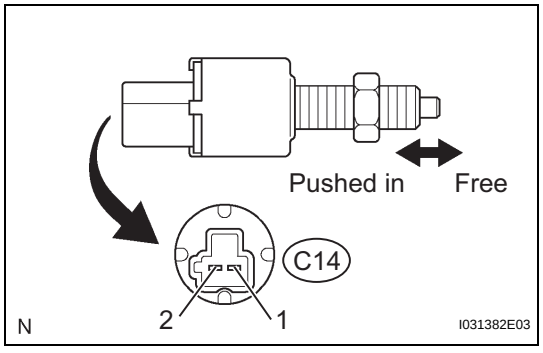
Tester connection	Clutch Pedal condition	Specification
D(E7-21) - Body ground	Depressed	Below 1 V
D(E7-21) - Body ground	Released	10 to 14 V

(e) Reconnect the ECM connector.

OK → **PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE**

NG

2 INSPECT CLUTCH SWITCH ASSEMBLY



(a) Turn the ignition switch off.
(b) Disconnect the clutch switch C14 connector.
(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester connection	Clutch Pedal condition	Specification
C14-1 - C14-2	Switch pin free (Clutch pedal depressed)	10 kΩ or higher
C14-1 - C14-2	Switch pin pushed in (Clutch pedal released)	Below 1 Ω

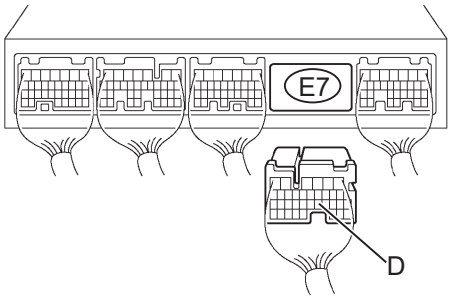
(d) Reconnect the clutch switch connector.

NG → **REPLACE CLUTCH SWITCH ASSEMBLY**

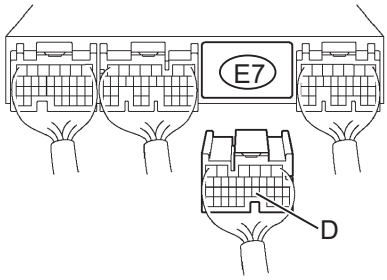
OK

3	CHECK HARNESS AND CONNECTOR (CLUTCH SWITCH ASSEMBLY - BODY GROUND)

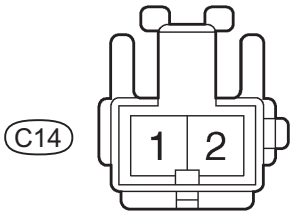
1GR-FE:



2TR-FE:



Clutch Switch Connector Front View on Wire Harness Side:



I101323E01

(a) Disconnect the E7 ECM connector.
(b) Disconnect the C14 clutch switch connector.
(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester connection	Clutch Pedal condition	Specification
C14-2 - Body ground	Always	10 kΩ or higher
C14-2 - D (E7-21)	Always	Below 1 Ω

(d) Reconnect the clutch switch connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (CLUTCH SWITCH ASSEMBLY - ECM)**

OK

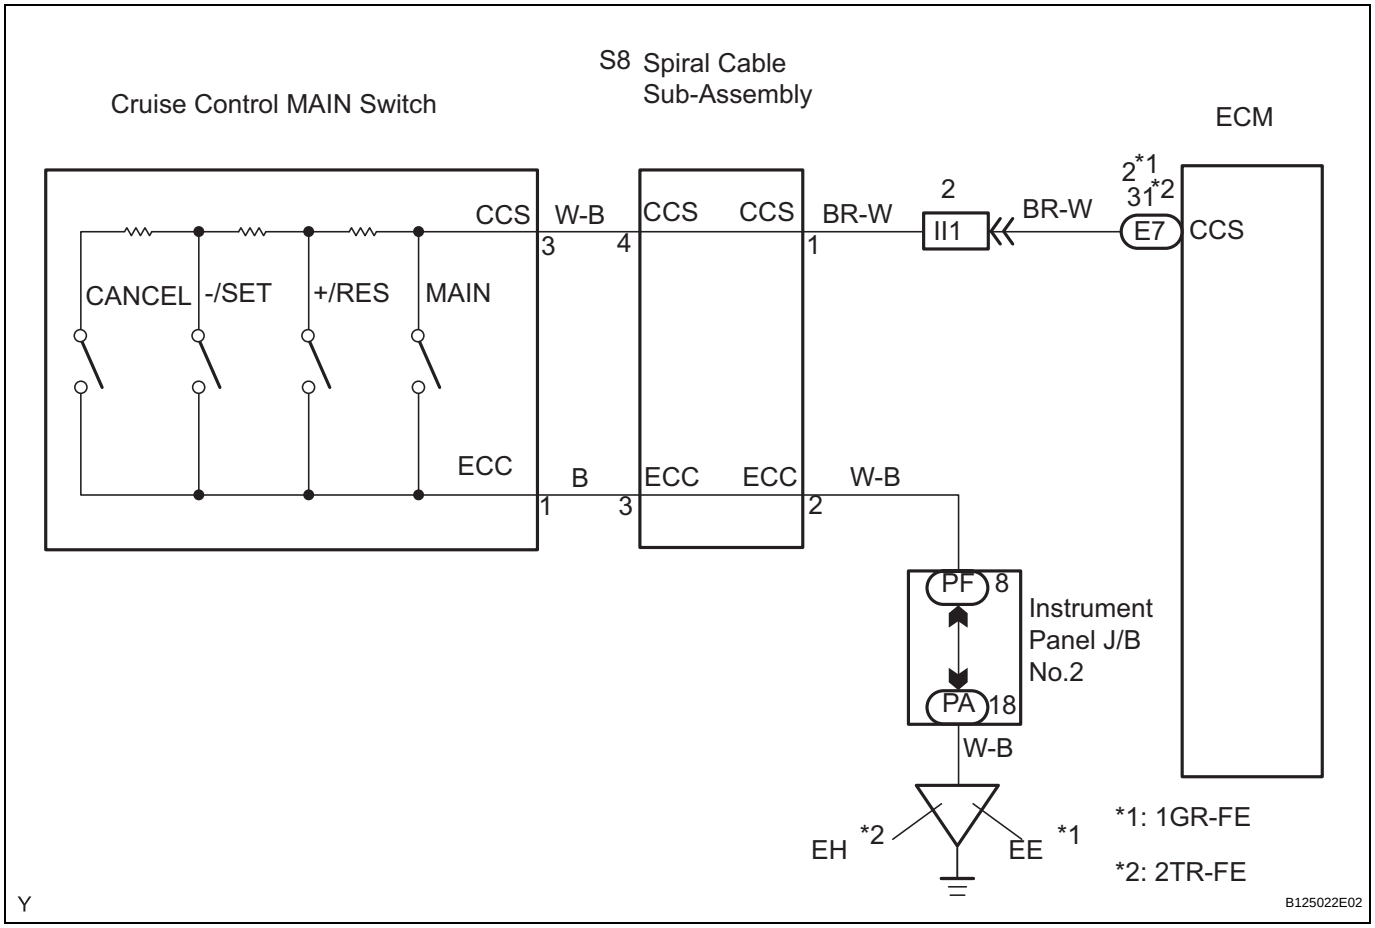
CHECK AND REPAIR HARNESS OR CONNECTOR (CLUTCH SWITCH ASSEMBLY - BATTERY)

Cruise Control Switch Circuit

DESCRIPTION

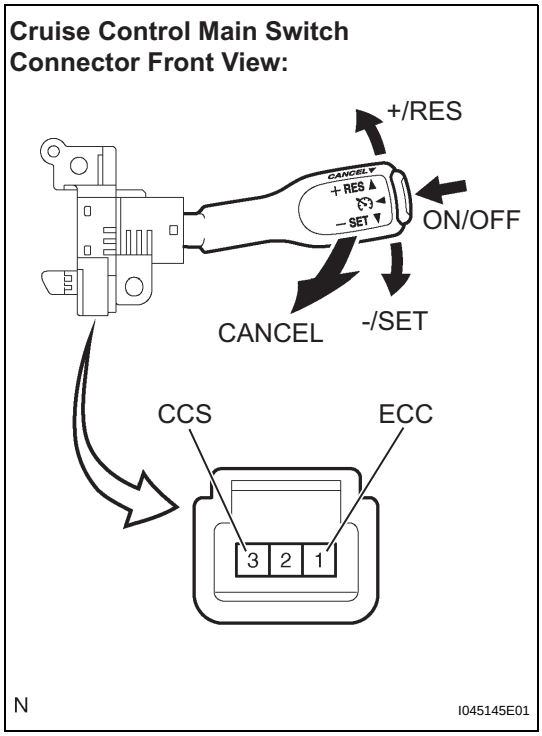
This circuit sends signals to the ECM depending on the cruise control main switch condition.
The battery supplies the positive (+) battery voltage to the cruise control main switch. Then terminal CCS of the ECM receives the voltage as the signal according to the switch condition.

WIRING DIAGRAM



CC

1	INSPECT CRUISE CONTROL MAIN SWITCH



(a) Turn the ignition switch off.
(b) Disconnect the cruise control main switch connector.
(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester Connection	Switch Condition	Specified Condition
1 - 3	+ / RES	235 to 245 Ω
1 - 3	- / SET	617 to 643 Ω
1 - 3	CANCEL	1,509 to 1,571 Ω
1 - 3	Main Switch OFF	10 kΩ or higher
1 - 3	Main Switch ON	Below 1 Ω

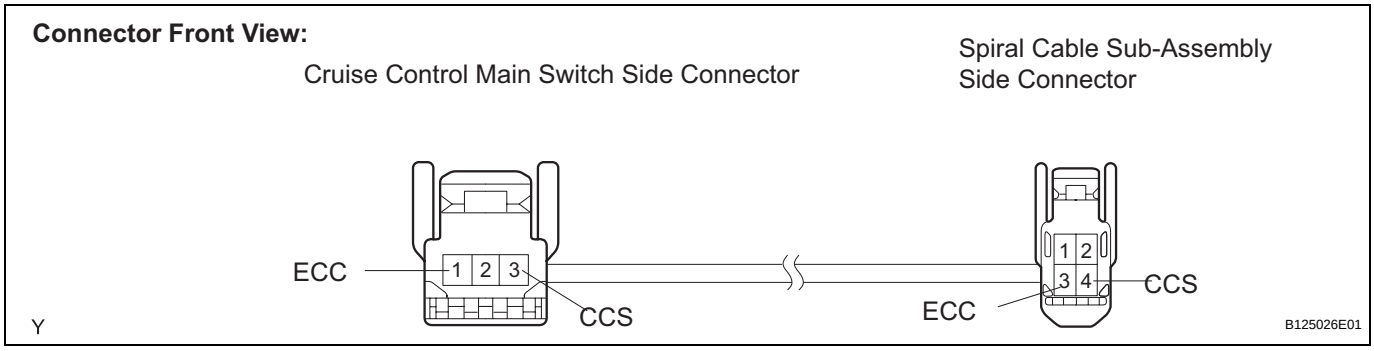
(d) Reconnect the cruise control main switch connector.

NG → REPLACE CRUISE CONTROL MAIN SWITCH

OK

2	CHECK HARNESS AND CONNECTOR (CRUISE CONTROL MAIN SWITCH - SPIRAL CABLE SUB-ASSEMBLY)

(a) Disconnect the spiral cable side connector.



(b) Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester Connection	Condition	Specified Condition
Terminal 1 (ECC) main switch side - Terminal 3 (ECC) spiral cable side	Always	Below 1 Ω
Terminal 3 (ECC) main switch side - Terminal 4 (ECC) spiral cable side	Always	Below 1 Ω

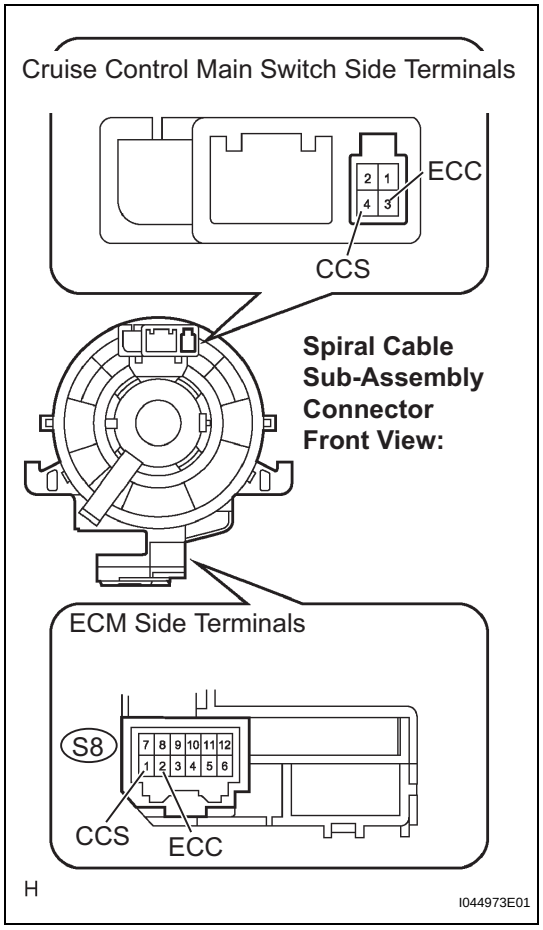
(c) Reconnect the spiral cable side connector.

CC

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3 INSPECT SPIRAL CABLE SUB-ASSEMBLY



(a) Disconnect the spiral cable connector on the ECM side.
(b) Measure the resistance according to the value(s) in the table below.

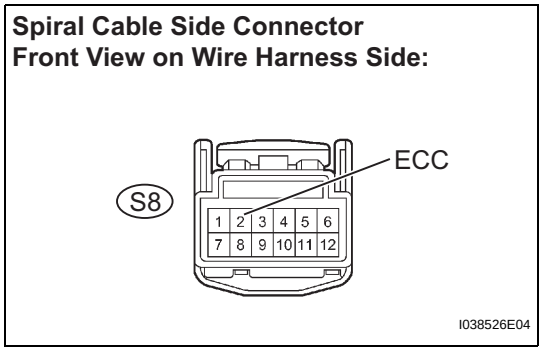
Standard Resistance

Tester Connection	Condition	Specified Condition
Terminal 4 (ECC) main switch side - CCS (S8-1)	Always	Below 1 Ω
Terminal 3 (ECC) main switch side - ECC (S8-2)	Always	Below 1 Ω

NG → **REPLACE SPIRAL CABLE SUB-ASSEMBLY**

OK

4 CHECK HARNESS AND CONNECTOR (SPIRAL CABLE SUB-ASSEMBLY - BODY GROUND)



(a) Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester Connection	Condition	Specified Condition
ECC (S8-2) - Body ground	Always	Below 1 Ω

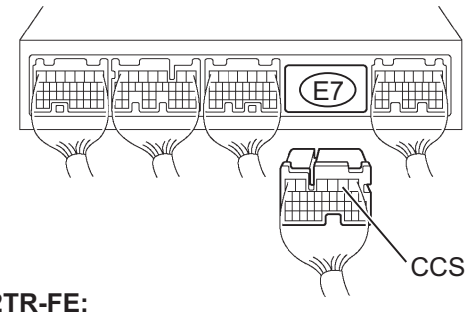
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SPIRAL CABLE SUB-ASSEMBLY - BODY GROUND)**

OK

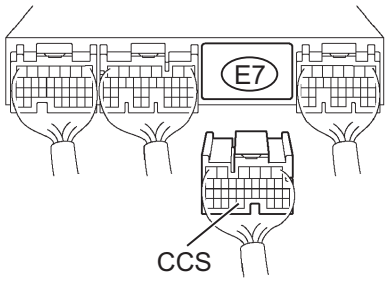
CC

5	CHECK HARNESS AND CONNECTOR (SPIRAL CABLE SUB-ASSEMBLY - ECM)

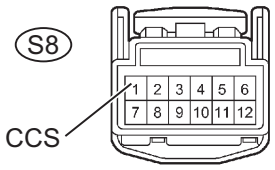
1GR-FE:



2TR-FE:



Spiral Cable Side Connector Front View on Wire Harness Side:



I101321E01

(a) Disconnect the E7 ECM connector.
(b) Measure the resistance according to the value(s) in the table below.

Standard Resistance (1GR-FE)

Tester Connection	Condition	Specified Condition
CCS (E7-2) - CCS (S8-1)	Always	Below 1 Ω
CCS (E7-2) - Body ground	Always	10 kΩ or higher

Standard Resistance (2TR-FE)

Tester Connection	Condition	Specified Condition
CCS (E7-31) - CCS (S8-1)	Always	Below 1 Ω
CCS (E7-31) - Body ground	Always	10 kΩ or higher

(c) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SPIRAL CABLE SUB-ASSEMBLY - ECM)**

OK

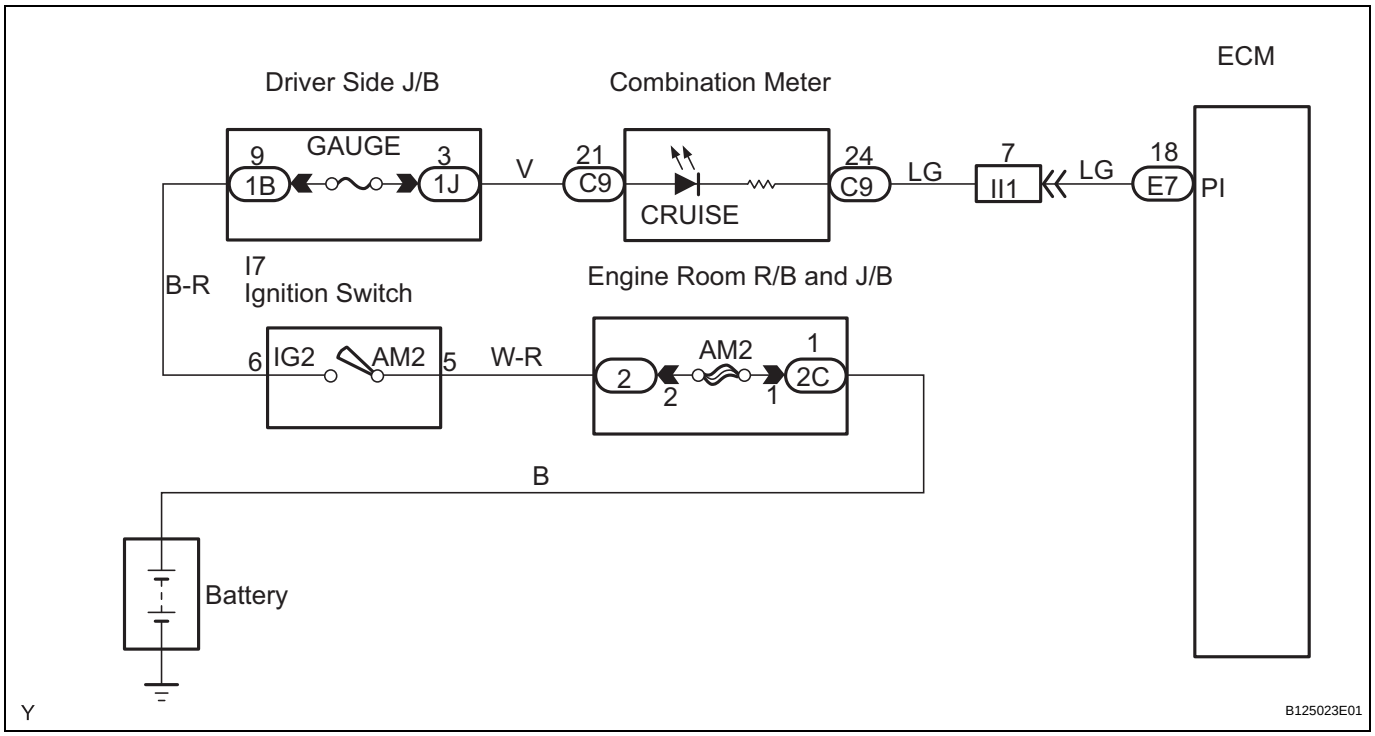
PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE

Cruise Main Indicator Light Circuit

DESCRIPTION

When the CRUISE CONTROL MAIN switch is turned off, cruise control does not operate.

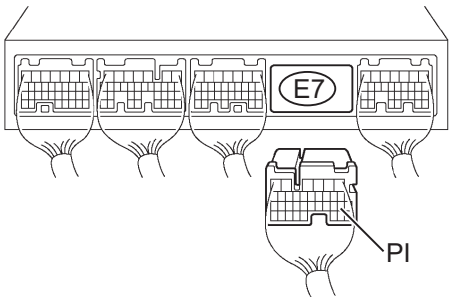
WIRING DIAGRAM



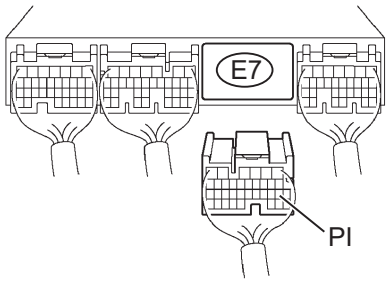
CC

1	CHECK HARNESS AND CONNECTOR (ECM - BATTERY)

1GR-FE:



2TR-FE:



I101322E01

NG

(a) Turn the ignition switch off.
(b) Disconnect the E7 ECM connector.
(c) Measure the voltage according to the value(s) in the table below.

Standard Voltage (1GR-FE)

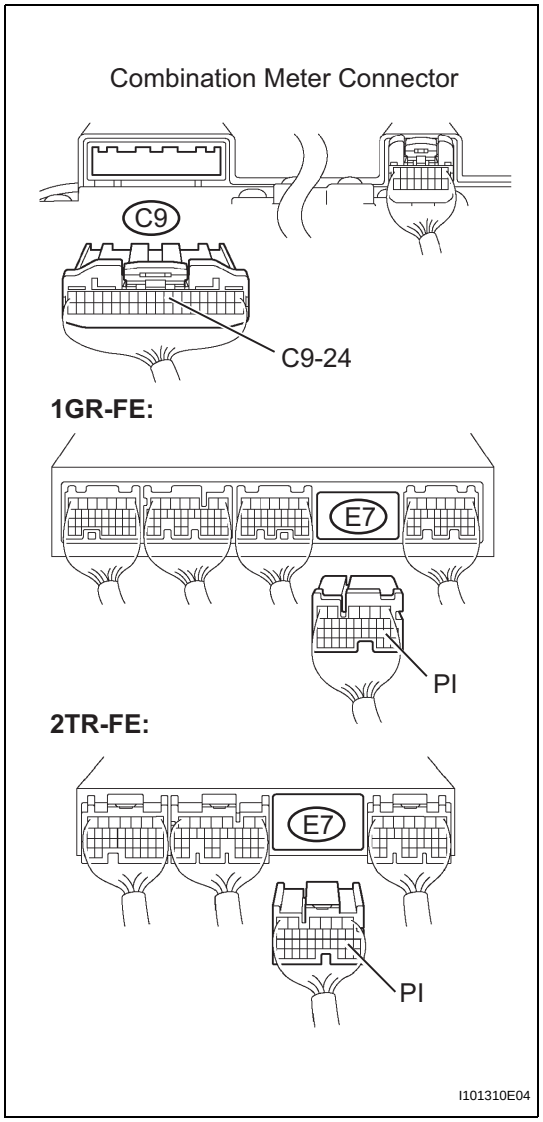
Tester connection	Condition	Specification
PI (E7-18) - Body ground	Ignition ON	10 to 14 V

Standard Voltage (2TR-FE)

Tester connection	Condition	Specification
PI (E7-18) - Body ground	Ignition ON	10 to 14 V

OK → **PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE**

2 CHECK HARNESS AND CONNECTOR (COMBINATION METER ASSEMBLY - ECM)



(a) Turn the ignition switch off.
(b) Disconnect the E7 ECM connector.
(c) Disconnect the combination meter C9 connector.
(d) Measure the resistance according to the value(s) in the table below.

Standard Resistance

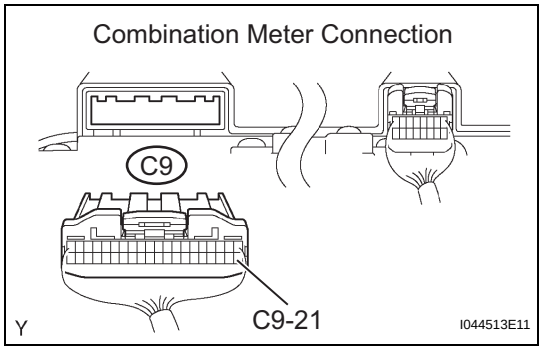
Tester connection	Condition	Specification
C9-24 - PI (E7-18)	Always	Below 1Ω
C9-24 - Body ground	Always	10 kΩ or higher

(e) Reconnect the combination meter connector.
(f) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (COMBINATION METER ASSEMBLY - ECM)**

OK

3 CHECK HARNESS AND CONNECTOR (COMBINATION METER ASSEMBLY - BATTERY)



(a) Disconnect the C9 combination meter connector.
(b) Measure the voltage according to the value(s) in the table below.

Standard Voltage

Tester connection	Condition	Specification
C9-21 - Body ground	Ignition ON	10 to 14 V

(c) Reconnect the combination meter connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (COMBINATION METER - BATTERY)**

CC

OK

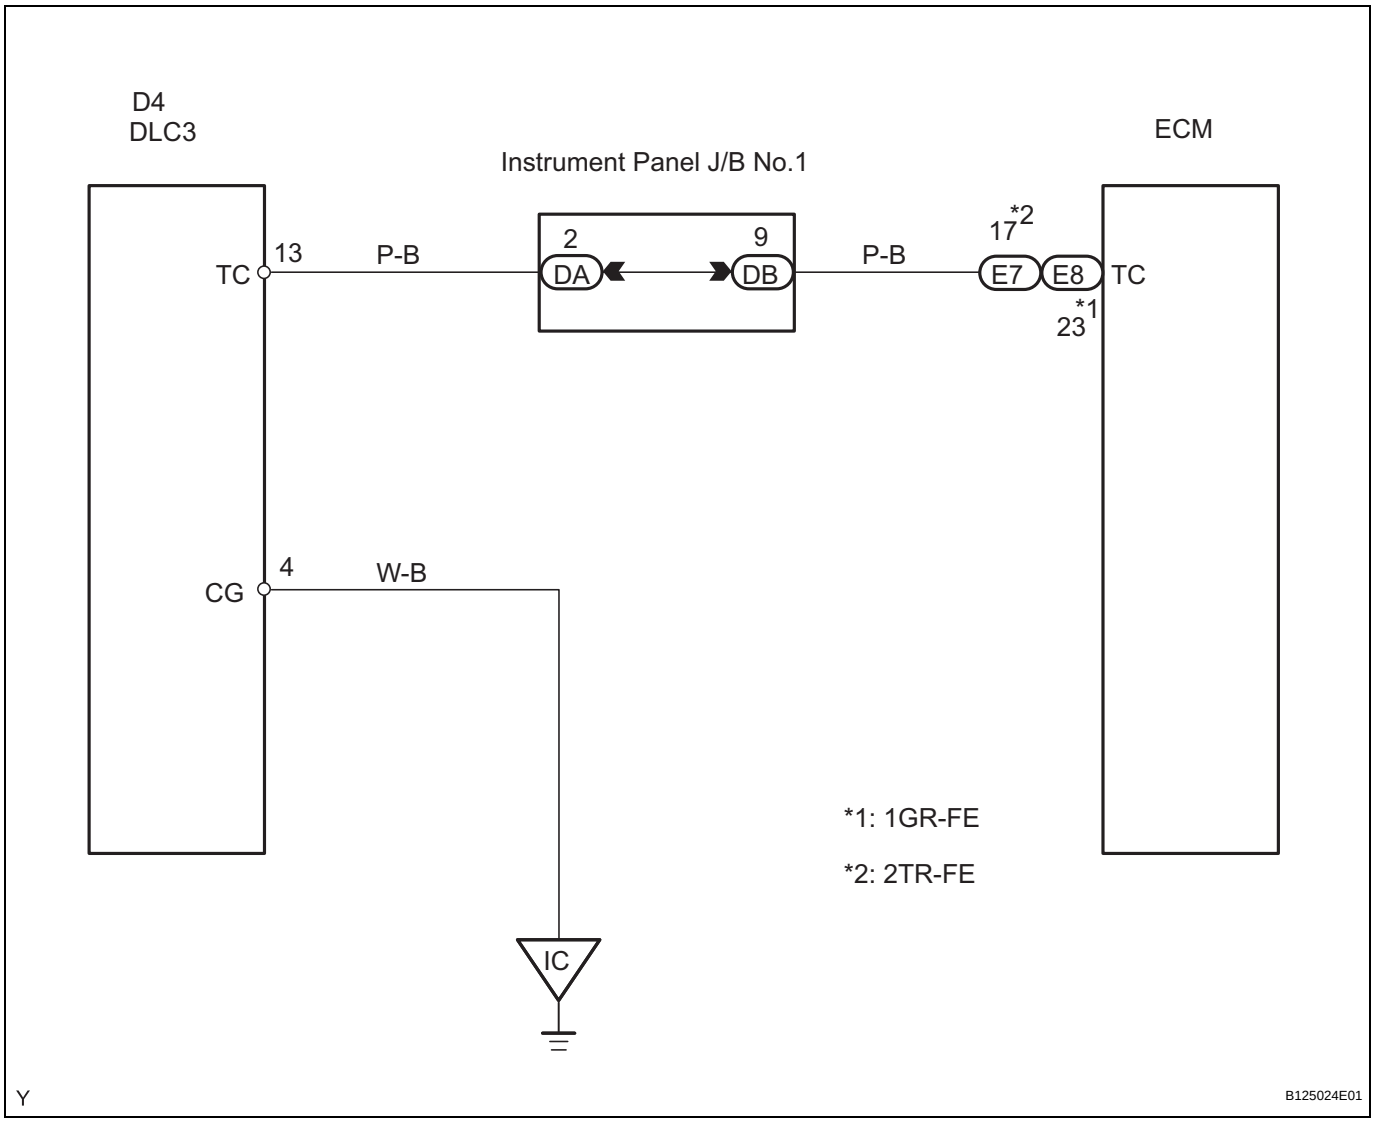
REPLACE COMBINATION METER ASSEMBLY

TC and CG Terminal Circuit

DESCRIPTION

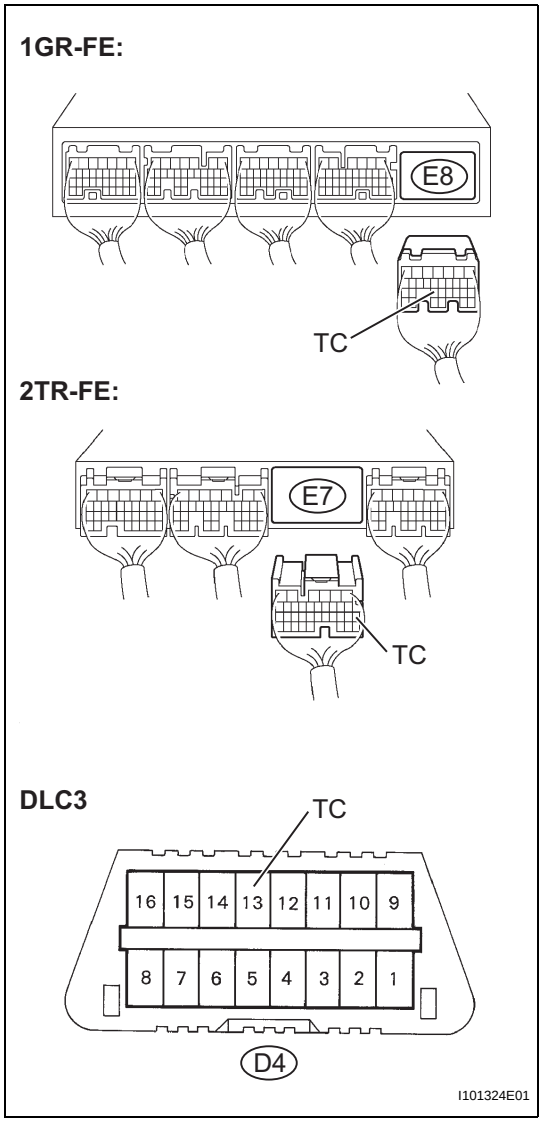
The DLC3 circuit enables reading of Diagnostic Trouble Codes (DTCs) with no intelligent testers by connecting terminals TC and CG of the DLC3 connector.
Stored DTCs are displayed in blinking patterns of the CRUISE MAIN indicator light located on the combination meter.

WIRING DIAGRAM



HINT:
When a particular warning light blinks continuously, a ground short in the wiring of terminal TC of the DLC3 or an internal ground short in the relevant ECU is suspected.

1 CHECK HARNESS AND CONNECTOR (TC of DLC3 - ECM)



(a) Turn the ignition switch off.
(b) 1GR-FE:
Disconnect the E8 connector of the ECM.
(c) 2TR-FE:
Disconnect the E7 connector of the ECM.
(d) Measure the resistance according to the value(s) in the table below.

Standard Resistance (1GR-FE)

Tester connection	Condition	Specification
TC (D4-13) - TC (E8-23)	Always	Below 1 Ω

Standard Resistance (2TR-FE)

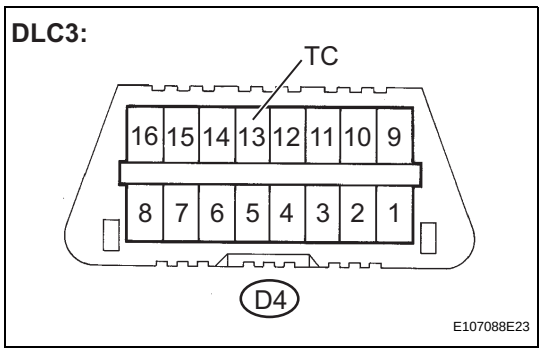
Tester connection	Condition	Specification
TC (D4-13) - TC (E7-17)	Always	Below 1 Ω

(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (TC of DLC3 - ECM)**

OK

2 CHECK HARNESS AND CONNECTOR (TC of DLC3 - BODY GROUND)



(a) Measure the resistance according to the value(s) in the table below.

Standard Resistance

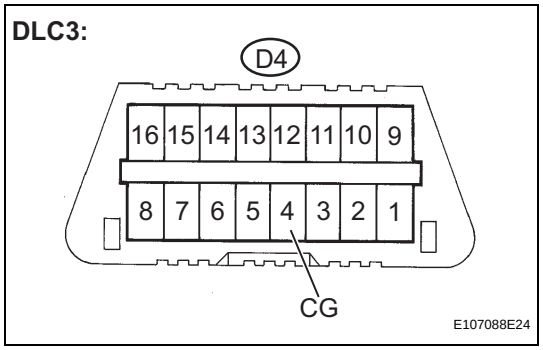
Tester connection	Condition	Specification
TC (D4-13) - Body ground	Always	10 kΩ or higher

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (TC CIRCUIT)**

OK

CC

3	CHECK HARNESS AND CONNECTOR (CG of DLC3 - BODY GROUND)



(a) Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester connection	Condition	Specification
CG (D4-4) - Body ground	Always	Below 1 Ω

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (CG of DLC3 - BODY GROUND)**

OK

REPLACE ECM

DATA LIST / ACTIVE TEST

1. DATA LIST

HINT:

By reading the DATA LIST displayed on an intelligent tester, you can check values, including those of the switches, sensors, and actuators, without removing any parts. Reading the DATA LIST as the first step of troubleshooting is one method of shortening diagnostic time.

NOTICE:

In the table below, the values listed under Normal Condition are for reference only. Do not depend solely on these values when determining whether or not a part is faulty.

(a) Warm up the engine.
(b) Turn the ignition switch OFF.
(c) Connect an intelligent tester to the DLC3.
(d) Turn the ignition switch ON.
(e) Turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST.
(g) Check the values by referring to the table below.

Intelligent Tester Display	Measurement Item:Range (Display)	Normal Condition *	Diagnostic Note
INJECTOR	Injection period of No. 1 cylinder: Min.: 0 ms, Max.: 32.64 ms	1.6 to 2.4 ms: Idling	-
IGN ADVANCE	Ignition timing advance for No. 1 cylinder/ Min.: -64 deg., Max.: 63.5 deg.	BTDC 7 to 24°: Idling	-
CALC LOAD	Calculated load by ECM: Min.: 0 %, Max.: 100 %	• 11.4 to 16.4 %: Idling • 13.1 to 18.9 %: Running without load (2,500 rpm)	-
VEHICLE LOAD	Vehicle load: Min.: 0 %, Max.: 25,700 %	Actual vehicle load	-
MAF	Air flow rate from MAF meter: Min.: 0 g/sec, Max.: 655 g/sec	3.2 to 4.7 g/sec: Idling 13.1 to 18.9 g/sec: 2,500 rpm	If value approximately 0.0 g/sec: • Mass air flow meter power source circuit open • VG circuit open or short If value 160.0 g/sec or more: • E2G circuit open
ENGINE SPD	Engine speed: Min.: 0 rpm, Max.: 16,383 rpm	650 to 750 rpm: Idling	-
VEHICLE SPD	Vehicle speed: Min.: 0 km/h, Max.: 255 km/h	Actual vehicle speed	Speed indicated on speedometer
COOLANT TEMP	Engine coolant temperature: Min.: -40°C, Max.: 140°C	80 to 100°C (176 to 212°F):After warming up	• If value -40°C (-40°F): sensor circuit open • If value 140°C (284°F) or more: sensor circuit shorted
INTAKE AIR	Intake air temperature: Min.: -40°C, Max.: 140°C	Equivalent to ambient air temperature	• If value -40°C (-40°F): sensor circuit open • If value 140°C (284°F) or more: sensor circuit shorted
AIR-FUEL RATIO	Air-fuel ratio: Min.: 0, Max.: 1.999	0.8 to 1.2: During idling	-
PURGE DENSITY	Learning value of purge density/ Min.: -50 %, Max.: 350 %	-40 to 0 %: Idling	Service data
PURGE FLOW	Purge flow: Min.: 0 %, Max.: 102.4 %	0 to 100 %: Idling	-

Intelligent Tester Display	Measurement Item:Range (Display)	Normal Condition *	Diagnostic Note
EVAP PURGE VSV	EVAP (Purge) VSV control duty: Min.: 0 %, Max.: 100 %	0 to 100 %: During idling	Order signal from ECM
VAPOR PRESS PUMP	Vapor pressure: Min.: 33.853 kPa, Max.: 125.596 kPa	Approximately 100 kPa: Ignition switch ON	EVAP system pressure monitored by canister pressure sensor
VAPOR PRESS CALC	Vapor pressure: (calculated) Min.: -5.632 kPa, Max.: 7,153,264 kPa	Approximately 100 kPa: Ignition switch ON	EVAP system pressure monitored by canister pressure sensor
KNOCK CRRT VAL	Correction learning value of knocking: Min.: -64° CA, Max.: 1,984° CA	0 to 22 °CA: Driving, 44 mph (70 km/h)	Service data
KNOCK FB VAL	Feedback value of knocking: Min.: -64° CA, Max.: 1,984° CA	-22 to 0 °CA Driving, 44 mph (70 km/h)	Service data
CLUTCH	Clutch current Min.: 0 A, Max.: 2.49 A	-	-
ETCS MAG CLUTCH	Electromagnetic clutch: ON or OFF	-	-
EVAP VAPOR PRES	EVAP vapor pressure: Min.: 0 kPa, Max.: 327.675 kPa	Approximately 100 kPa: Ignition switch ON	-
ACCEL POS #1	Absolute Accelerator Pedal Position (APP) No. 1: Min.: 0 %, Max.: 100 %	10 to 22 %: Accelerator pedal released 54 to 86 %: Accelerator pedal fully depressed	-
ACCEL POS #2	Absolute APP No. 2: Min.: 0 %, Max.: 100 %	12 to 42 %: Accelerator pedal released 66 to 98 %: Accelerator pedal fully depressed	-
ACCEL POS #1	APP sensor No. 1 voltage: Min.: 0 V, Max.: 4.98 V	-	ETCS freeze data
ACCEL POS #2	APP sensor No. 2 voltage: Min.: 0 V, Max.: 4.98 V	-	ETCS freeze data
ACCEL POS #1	APP sensor No. 1 voltage: Min.: 0 V, Max.: 5 V	0.5 to 1.1 V: Accelerator pedal released. 2.6 to 4.5t V: Accelerator pedal fully depressed.	-
ACCEL POS #2	APP sensor No. 2 voltage: Min.: 0 V, Max.: 5 V	1.2 to 2.0 V: Accelerator pedal released. 3.4 to 5.0 V: Accelerator pedal fully depressed.	-
ACCEL IDL POS	Whether or not accelerator pedal position sensor detecting idle: ON or OFF	ON: Idling	-
THRTL LEARN VAL	Throttle valve fully closed (learned value): Min.: 0 V, Max.: 5 V	0.4 to 0.8 V	-
ACCEL SSR #1 AD	Accelerator fully closed value No.1 (AD): Min.: 0, Max.: 4.98 V	-	ETCS service data
ACCEL LRN VAL#1	Accelerator fully closed learning value No.1: Min.: 0, Max.: 124.512	-	ETCS service data
ACCEL LRN VAL#2	Accelerator fully closed learning value No.2: Min.: 0, Max.: 124.512	-	ETCS service data
FAIL #1	Whether or not fail safe function executed: ON or OFF	ON: ETCS has failed	-
FAIL #2	Whether or not fail safe function executed: ON or OFF	ON: ETCS has failed	-

Intelligent Tester Display	Measurement Item:Range (Display)	Normal Condition *	Diagnostic Note
ST1	Starter signal: ON or OFF	ON: Cranking	-
SYS GUARD JUDGE	System guard: ON or OFF	-	ETCS service data
OPN MALFUNCTION	Open side malfunction: ON or OFF	-	ETCS service data
THROTTLE POS	Absolute throttle position sensor: Min.: 0 %, Max.: 100 %	• 10 to 24 %: Throttle fully closed • 64 to 96 %: Throttle fully open	Read value with intrusive operation (active test)
THROTTL IDL POS	Whether or not throttle position sensor detecting idle: ON or OFF	ON: Idling	-
THRTL REQ POS	Throttle requirement position: Min.: 0 V, Max.: 5 V	0.5 to 1.0 V: Idling	-
THROTTLE POS	Throttle sensor positioning: Min.: 0 %, Max.: 100 %	0 to 10 %: Idling	Calculated value based on VTA1
THROTTLE POS #2	Throttle sensor positioning #2: Min.: 0 %, Max.: 100 %	-	Calculated value based on VTA2
THROTTLE POS #1	Throttle position sensor No. 1 output voltage: Min.: 0 V, Max.: 4.9 V	-	ETCS freeze data
THROTTLE POS #2	Throttle position sensor No.2 output voltage: Min.: 0 V, Max.: 4.9 V	-	ETCS freeze data
THROTTLE POS #1	Throttle position No. 1: Min.: 0 V, Max.: 5 V	• 0.5 to 1.2 V: Throttle fully closed • 3.2 to 4.8 V: Throttle fully opened	-
THROTTLE POS #2	Throttle position No. 2: Min.: 0 V, Max.: 5 V	• 2.0 to 2.9 V: Throttle fully closed • 4.6 to 5.0 V: Throttle fully open	Read value with intrusive operation (active test)
THRTL COMND VAL	Throttle position command value: Min.: 0 V, Max.: 4.98 V	0.5 to 4.8 V	ETCS service data
THROTTLE SSR #1	Throttle sensor opener position No. 1: Min.: 0 V, Max.: 4.98 V	0.6 to 1.0 V	ETCS service data
THROTTLE SSR #2	Throttle sensor opener position No. 2: Min.: 0 V, Max.: 4.98 V	2.0 to 2.6 V	ETCS service data
THRTL SSR #1 AD	Throttle sensor opener position No.1 (AD): Min.: 0 V, Max.: 4.98 V	0.6 to 0.9 V	ETCS service data
THROTTLE MOT	Throttle motor current: Min.: 0 A, Max.: 80 A	0 to 3.0 A: Idling	-
THROTTLE MOT	Whether or not throttle motor control permitted: ON or OFF	ON: Idling	Read value with ignition switch ON (Do not start engine)
THROTTLE MOT	Throttle motor: Min.: 0 %, Max.: 100 %	0.5 to 40 %: Idling	-
THROTTLE MOT	Throttle motor current: Min.: 0 A, Max.: 19.92 A	0 to 3.0 A: Idling	-
THROTL OPN DUTY	Throttle motor opening duty ratio: Min.: 0 %, Max.: 100 %	0 to 40 %: During idling	When accelerator pedal depressed, duty ratio increased
THROTL CLS DUTY	Throttle motor closed duty ratio: Min.: 0 %, Max.: 100 %	0 to 40 %: During idling	When accelerator pedal released quickly, duty ratio increased
THRTL MOT (OPN)	Throttle motor duty ratio (open): Min.: 0 %, Max.: 100 %	-	ETCS service data

ES

*1: If no idling conditions are specified, the transmission gear selector lever should be in the N or P position, and the A/C switch and all accessory switches should be OFF.

2. ACTIVE TEST

HINT:

Performing an ACTIVE TEST enables components including the relays, VSV (Vacuum Switching Valve), and actuators, to be operated without removing any parts. The ACTIVE TEST can be performed with an intelligent tester. Performing an ACTIVE TEST as the first step of troubleshooting is one method of shortening diagnostic time.

DATA LIST can be displayed during ACTIVE TESTs.

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST.
(e) Perform the ACTIVE TEST by referring to the table below.

Intelligent Tester Displays	Test Details	Control Ranges	Diagnostic Notes
INJ VOL	Change injection volume	Between -12.5 % and 24.8 %	• All injectors tested at same time • Perform test at less than 3,000 rpm • Injection volume can be changed in 0.1 % graduations within control range

Intelligent Tester Displays	Test Details	Control Ranges	Diagnostic Notes
A/F CONTROL	Change injection volume	Lower by 12.5 % or increase by 25 %	• Perform test at less than 3,000 rpm • A/F CONTROL enables checking and graphing of A/F (Air Fuel Ratio) sensor and Heated Oxygen (HO2) sensor voltage outputs • To conduct test, select following menu items: ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press YES and ENTER followed by F4
FUEL PMP SP CTL	Fuel pump speed control	ON (low speed)/OFF (high speed)	-
INTAKE CTL VSV1	ACIS VSV	ON/OFF	-
EVAP VSV (ALONE)	Activate EVAP VSV control	ON/OFF	-
VVT CTRL B1	Turn on and off OCV (Oil Control Valve)	ON/OFF	• Engine stalls or idles roughly when OCV turned ON • Normal engine running or idling when OCV off
VVT CTRL B2	Turn on and off OCV (Oil Control Valve)	ON/OFF	• Engine stalls or idles roughly when OCV turned ON • Normal engine running or idling when OCV off
A/C CUT SIG	Control A/C cut signal	ON/OFF	-
FUEL PUMP/SPD	Activate fuel pump (C/OPN Relay)	ON/OFF	-
TC/TE1	Turn on and off TC and TE1 connection	ON/OFF	• ON: TC and TE1 connected • OFF: TC and TE1 disconnected
FC IDL PROHBT	Prohibit idling fuel cut control	ON/OFF	-
ETCS OPEN SLOW	Throttle actuator	ON: throttle valve opens slowly	Test possible when following conditions met: • Ignition switch ON • Engine does not start • Fully depressing accelerator pedal (APP: 58 degrees or more)
ETCS CLOSE SLOW	Throttle actuator	ON: throttle valve closes slowly	Same as above
ETCS OPEN FAST	Throttle actuator	ON: throttle valve opens fast	Same as above
ETCS CLOSE FAST	Throttle actuator	ON: throttle valve closes fast	Same as above
FUEL CUT #1	Cylinder #1 injector fuel cut	ON/OFF	Test possible during vehicle stopping and engine idling.
FUEL CUT #2	Cylinder #2 injector fuel cut	ON/OFF	Same as above
FUEL CUT #3	Cylinder #3 injector fuel cut	ON/OFF	Same as above
FUEL CUT #4	Cylinder #4 injector fuel cut	ON/OFF	Same as above
FUEL CUT #5	Cylinder #5 injector fuel cut	ON/OFF	Same as above
FUEL CUT #6	Cylinder #6 injector fuel cut	ON/OFF	Same as above
VVT B1	Control the VVT (bank 1)	-128 to 127 % This value added to present OCV control duty 100 %: Maximum advance -100 % : Maximum retard	Engine stall or rough idle when VVT actuator operated by 100 %. Test possible during idle.
VVT B2	Control the VVT (bank 2)	Between -128 % and 127 %	Same as above
VACUUM PUMP	Leak detection pump	ON/OFF	-
VENT VALVE	Vent valve	ON/OFF	-

3. SYSTEM CHECK

HINT:

Performing a SYSTEM CHECK enables the system, which consists of multiple actuators, to be operated without removing any parts. In addition, it can show whether or not any DTCs are set, and can detect potential malfunctions in the system. The SYSTEM CHECK can be performed with an intelligent tester.

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK.
(e) Perform the SYSTEM CHECK by referring to the table below.

Intelligent Tester Displays	Test Details	Recommended Fuel Temperatures	Diagnostic Notes
EVAP SYS CHECK (AUTO OPERATION)	Perform 5 steps in order to operate EVAP key-off monitor automatically	35°C (95°F) or less	• If no DTCs in PENDING CODE after performing this test, system functioning normally • Refer to EVAP Inspection Procedure (See page ES-351)
EVAP SYS CHECK (MANUAL OPERATION)	Perform 5 steps in order to operate EVAP key-off monitor manually	35°C (95°F) or less	• Used to detect malfunctioning parts • Refer to EVAP Inspection Procedure (See page ES-351)

DTC	P0010	Camshaft Position "A" Actuator Circuit (Bank 1)

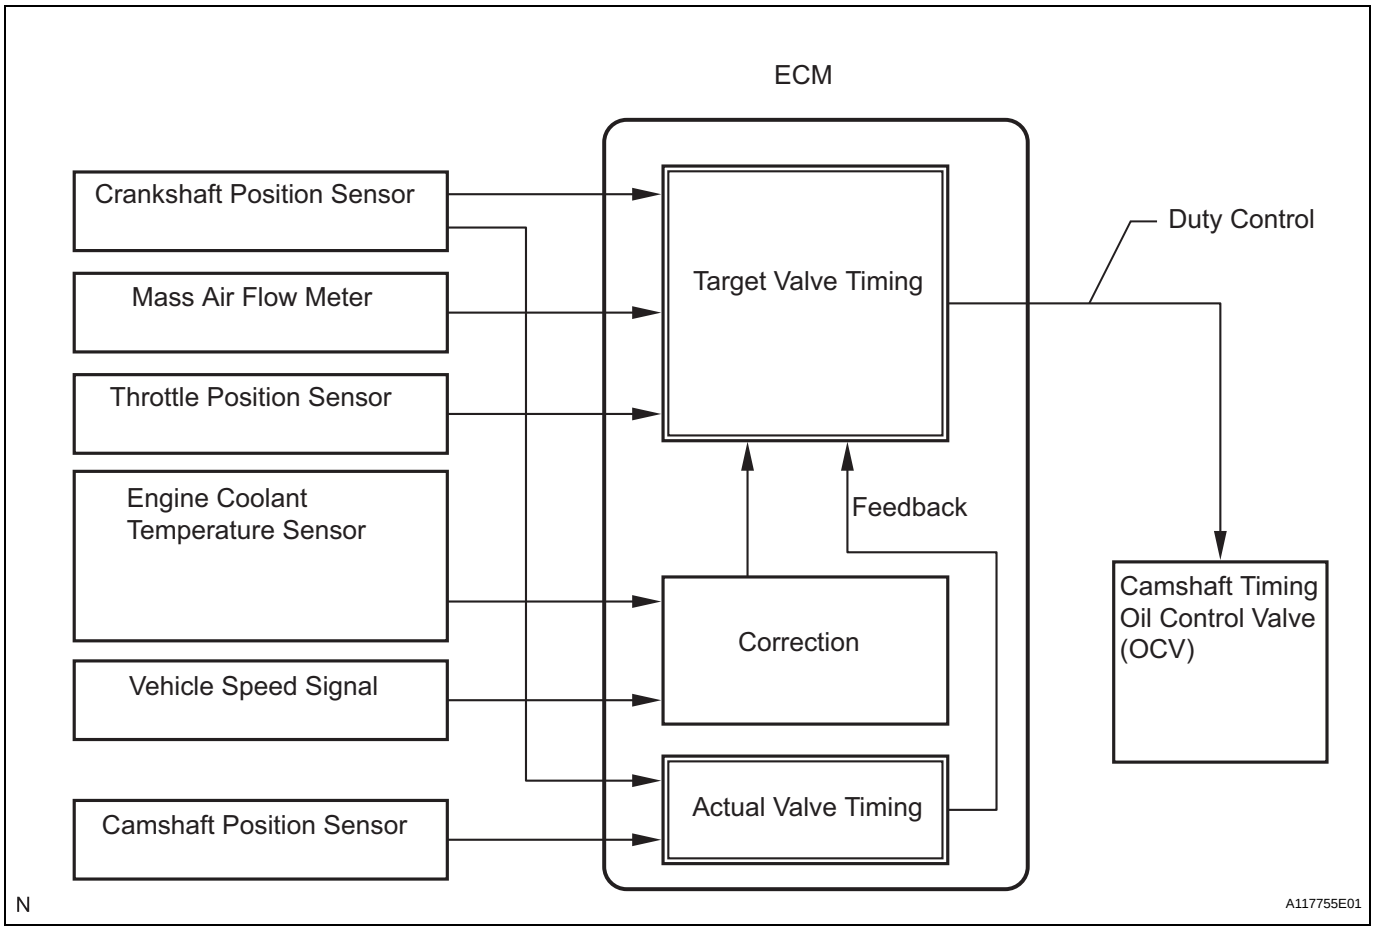
DTC	P0020	Camshaft Position "A" Actuator Circuit (Bank 2)

HINT:
This DTC relates to the Oil Control Valve (OCV).

DESCRIPTION

ES

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature.
The ECM controls the OCV, based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.



DTC No.	DTC Detection Conditions	Trouble Areas
P0010	Open or short in OCV (bank 1) circuit (1 trip detection logic)	• Open or short in OCV (bank 1) circuit • OCV (bank 1) • ECM

DTC No.	DTC Detection Conditions	Trouble Areas
P0020	Open or short in OCV (bank 2) circuit (1 trip detection logic)	• Open or short in OCV (bank 2) circuit • OCV (bank 2) • ECM

MONITOR DESCRIPTION

The ECM optimizes the valve timing using the VVT system to control the intake camshaft. The VVT system includes the ECM, the OCV and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
After the ECM sends the target duty-cycle signal to the OCV, the ECM monitors the OCV current to establish an actual duty-cycle. The ECM determines the existence of a malfunction and sets the DTC when the actual duty-cycle ratio varies from the target duty-cycle ratio.

MONITOR STRATEGY

Related DTCs	P0010: VVT OCV (bank 1) open/short P0020: VVT OCV (bank 2) open/short
Required Sensors/Components (Main)	VVT OCV (Variable Valve Timing Oil Control Valve)
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	1 second
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
All of the following conditions are met	-
Ignition switch	ON
Starter	OFF
Time after ignition switch OFF to ON	0.5 seconds or more

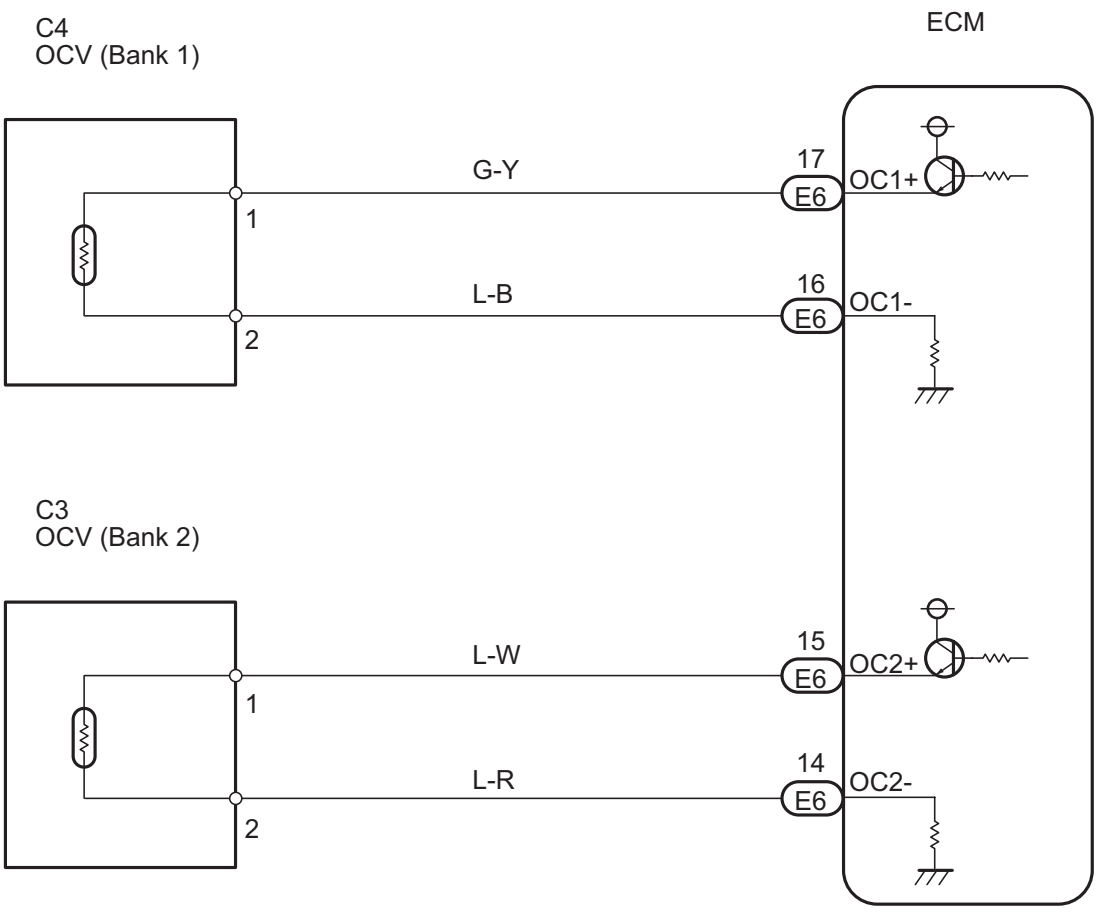
TYPICAL MALFUNCTION THRESHOLDS

One of the following conditions is met	-
A. All of the following conditions are met	-
a. Battery voltage	11 V or more, and less than 13 V
b. Target duty ratio	Less than 70 %
c. Output signal duty ratio	100 % or more
B. All of the following conditions are met	-
a. Battery voltage	13 V or more
b. Target duty ratio	Less than 80 %
c. Output signal duty ratio	100 % or more
C. All of the following conditions are met	-
a. Current cut status	Not cut
b. Output signal duty ratio	3 % or less

COMPONENT OPERATING RANGE

VVT OCV duty ratio	More than 3 %, and Less than 100 %

WIRING DIAGRAM



HINT:
- If DTC P0010 is displayed, check the bank 1 VVT system circuit.
- Bank 1 refers to the bank that include cylinder No. 1.
- If DTC P0020 is displayed, check the bank 2 VVT system circuit.
- Bank 2 refers to the bank that does not includes cylinder No. 1.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

(a) Connect an intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1 or VVT CTRL B2.

(e) Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

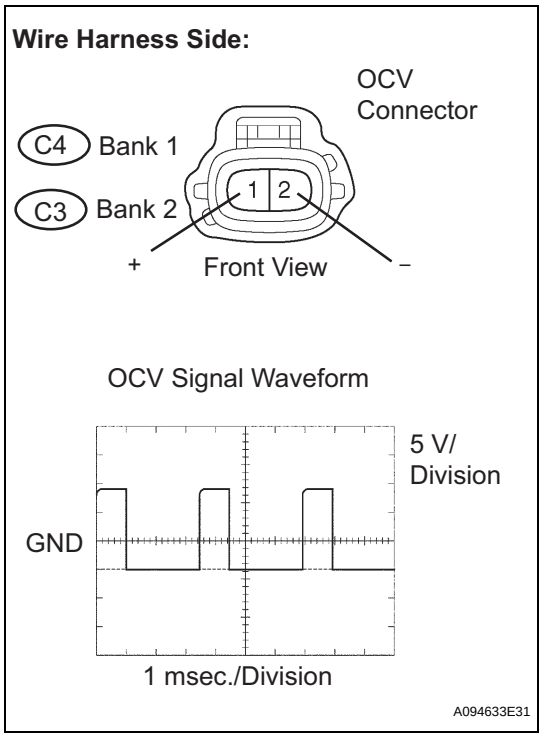
OK

Tester Operations	Specified Conditions
OCV OFF	Normal engine speed
OCV ON	Engine idles roughly or stalls (soon after OCV switched from OFF to ON)

OK → **CHECK FOR INTERMITTENT PROBLEMS**

NG

2 INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (OCV SIGNAL)



(a) Disconnect the C4 or C3 OCV connector.
(b) While idling, check the waveform between the terminals of the C4 or C3 OCV connector using an oscilloscope.
Standard

Tester Connections	Specified Conditions
+ (C4-1) - - (C4-2)	Correct waveform shown
+ (C3-1) - - (C3-2)	

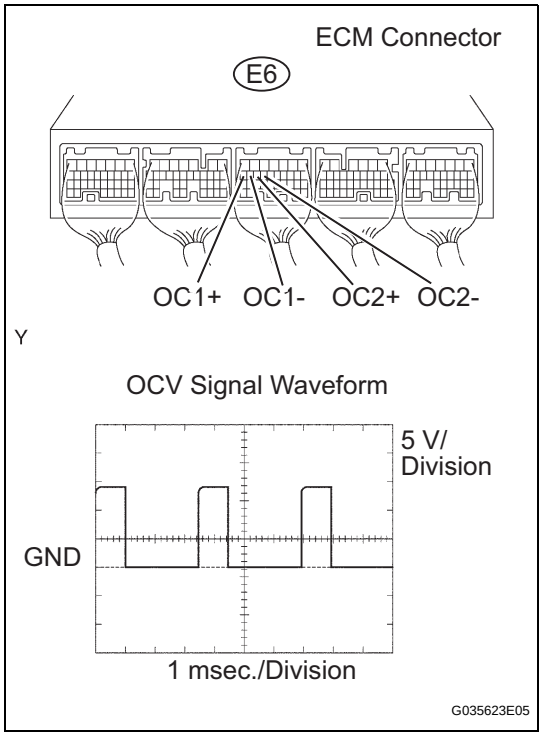
(c) Reconnect the OCV connector.

OK → **REPLACE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**

NG

ES

3	INSPECT ECM (OCV SIGNAL)



(a) Inspect the ECM using an oscilloscope.
(b) While idling, check the waveform between the terminals of the E6 ECM connector.

Standard

Tester Connections	Specified Conditions
OC1+ (E6-17) - OC1- (E6-16)	Correct waveform as shown in illustration
OC2+ (E6-15) - OC2- (E6-14)	

NG → **REPLACE ECM**

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR

ES

DTC	P0011	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)

DTC	P0012	Camshaft Position "A" - Timing Over-Retarded (Bank 1)

DTC	P0021	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 2)

DTC	P0022	Camshaft Position "A" - Timing Over-Retarded (Bank 2)

HINT:
If DTC P0011, P0012, P0021 or P0022 is present, check the VVT (Variable Valve Timing) system.

DESCRIPTION

Refer to DTC P0010 (See page ES-66).

DTC No.	DTC Detection Conditions	Trouble Areas
P0011 P0021	Advanced cam timing: With warm engine and engine speed of between 500 rpm and 4,000 rpm, all conditions (a), (b) and (c) met (1 trip detection logic) (a) Difference between target and actual intake valve timings more than 5°CA (Crankshaft Angle) for 4.5 seconds (b) Current intake valve timing fixed (timing changes less than 5°CA in 5 seconds) (c) Variations in VVT controller timing more than 19°CA of maximum delayed timing (advanced)	• Valve timing • Oil control valve (OCV) • OCV filter • Camshaft timing gear assembly • ECM
P0012 P0022	Retarded cam timing: With warm engine and engine speed of between 500 rpm and 4,000 rpm, all conditions (a), (b) and (c) met (2 trip detection logic) (a) Difference between target and actual intake valve timings more than 5°CA (Crankshaft Angle) for 4.5 seconds (b) Current intake valve timing fixed (timing changes less than 5°CA in 5 seconds) (c) Variations in VVT controller timing 19°CA or less of maximum delayed timing (retarded)	

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, the Oil Control Valve (OCV) and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft. If the difference between the target and actual intake valve timings is large, and changes in actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and sets a DTC.
Example:
A DTC is set when the following conditions 1), 2) and 3) are met:
1) The difference between the target and actual intake valve timings is more than 5°CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2) It takes 5 seconds or more to change the valve timing by 5°CA.
3) After above conditions 1) and 2) are met, the OCV is forcibly activated 63 times or more.
DTCs P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.

DTCs P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will not run unless the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C [167°F] or more).
- The vehicle has been driven at more than 40 mph (64 km/h) for 3 minutes.
- The engine has idled for 3 minutes.

MONITOR STRATEGY

Related DTCs	P0011: Advanced camshaft timing (bank 1) P0012: Retard camshaft timing (bank 1) P0021: Advanced camshaft timing (bank 2) P0022: Retard camshaft timing (bank 2)
Required Sensors/Components (Main)	VVT OCV and VVT Actuator
Required Sensors/Components (Related)	Crankshaft position sensor, Camshaft position sensor and Engine coolant temperature sensor
Frequency of Operation	Once per driving cycle
Duration	Within 10 seconds
MIL Operation	P0011 and P0021: Immediate P0012 and P0022: 2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0100 - P0103 (MAF sensor) P0115 - P0118 (ECT sensor) P0125 (Insufficient ECT for closed loop) P0335 (CKP sensor) P0340 (CMP sensor) P0351 - P0356 (igniter)
Battery voltage	11 V or more
Throttle position learning	Completed
Engine RPM	500 to 4,000 rpm
Engine coolant temperature	75 to 100°C (167 to 212°F)

TYPICAL MALFUNCTION THRESHOLDS

OCV activation	9.5 seconds or more
Response of valve timing	1 sec/°CA or more (valve timing does not change)

If the difference between the target and actual camshaft timings is greater than the specified value, the ECM operates the VVT actuator.
Then, the ECM monitors the camshaft timing change for 5 seconds.

WIRING DIAGRAM

Refer to DTC P0010 (See page ES-68).

HINT:

Abnormal bank	Advanced timing over (Valve timing is out of specified range)	Retarded timing over (Valve timing is out of specified range)
Bank 1	P0011	P0012
Bank 2	P0021	P0022

- If DTC P0011 or P0012 is displayed, check the bank 1 VVT system circuit.
- Bank 1 refers to the bank that includes cylinder No. 1.

- If DTC P0021 or P0022 is displayed, check the bank 2 VVT system circuit.
- Bank 2 refers to the bank that does not include cylinder No. 1.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed to
P0011, P0012, P0021 or P0022	A
P0011, P0012, P0021 or P0022 and other DTCs	B

HINT:
If any DTCs other than P0011, P0012, P0021 or P0022 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	PREFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

(a) Connect an intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1.
(e) Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

OK

Tester Operations	Specified Conditions
OCV OFF	Normal engine speed
OCV ON	Engine idles roughly or stalls (soon after OCV switched from OFF to ON)

NG → Go to step 4

OK

3	CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

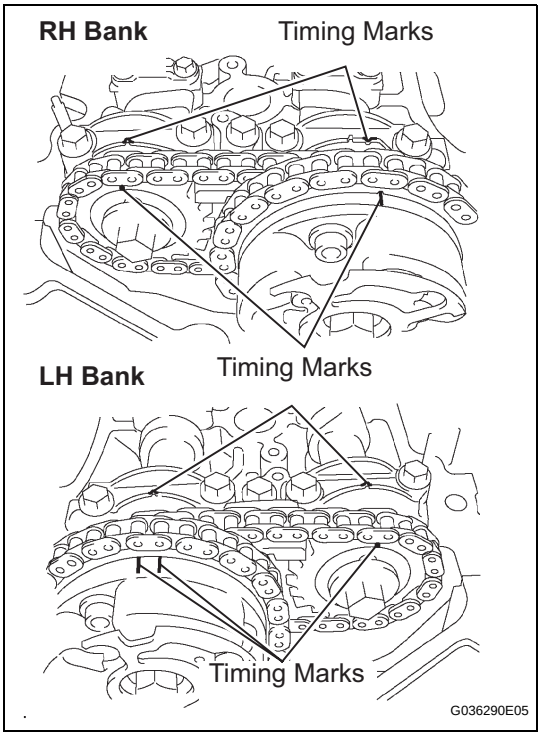
(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (See page ES-38).
(d) Start the engine and warm it up.

(e) Switch the ECM from normal mode to check mode using the tester (See page ES-41).
(f) Drive the vehicle for more than 10 minutes.
(g) Read DTCs using the tester.
OK:
No DTC output.

OK → **END**

NG

4 CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

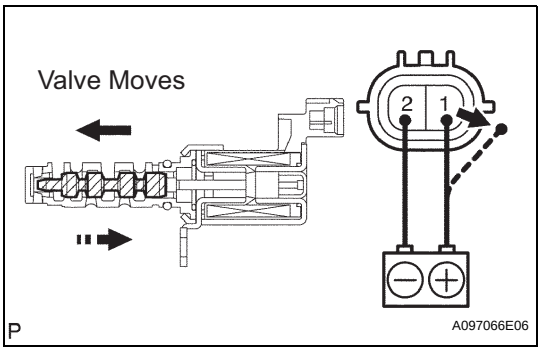


(a) Remove the cylinder head cover (See page EM-57 or EM-74).
(b) Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.
(c) Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.
OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.
(d) Reinstall the cylinder head cover (See page EM-57 or EM-74).

NG → **ADJUST VALVE TIMING**

OK

5 INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (OCV)



(a) Remove the OCV.
(b) Measure the resistance between the terminals of the OCV.
Standard resistance:
6.9 to 7.9 Ω at 20°C (68°F)
(c) Apply the positive battery voltage to terminal 1 and negative battery voltage to terminal 2. Check the valve operation.
OK:
Valve moves quickly.
(d) Reinstall the OCV.

NG → **REPLACE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**

OK

6	INSPECT OIL CONTROL VALVE FILTER

OK:
Filter is not clogged.

NG → **CLEAN OIL CONTROL VALVE FILTER**

OK

7	REPLACE CAMSHAFT TIMING GEAR ASSEMBLY

ES

NEXT

8	CHECK IF DTC OUTPUT RECURS

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (See page ES-38).
(d) Start the engine and warm it up.
(e) Switch the ECM from normal mode to check mode using the tester (See page ES-41).
(f) Drive the vehicle for more than 10 minutes.
(g) Confirm that no DTC is set using the tester.
Standard:
No DTC output.
HINT:
DTC P0011, P0012, P0021 or P0022 is output when foreign objects in engine oil are caught in some parts of the system. These codes will stay registered even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

OK → **SYSTEM OK**

REPLACE ECM

DTC	P0016	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A)

DTC	P0018	Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor A)

DESCRIPTION

Refer to DTC P0335 (See page ES-182).

DTC No.	DTC Detection Conditions	Trouble Areas
P0016	Deviations in crankshaft and camshaft position sensor1 signals (2 trip detection logic)	• Mechanical system (Timing chain has jumped tooth or chain stretched) • ECM
P0018	Deviations in crankshaft and camshaft position sensor2 signals (2 trip detection logic)	

ES

MONITOR DESCRIPTION

The ECM optimizes the valve timing by using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, the Oil Control Valve (OCV) and the VVT controller.
The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
The ECM calibrates the intake valve timing by setting the intake camshaft to the most retarded angle while the engine is idling. The ECM closes the OCV to retard the cam. The ECM stores this value as the VVT learning value. When the difference between the target and actual intake valve timings is 5°CA (Crankshaft Angle) or less, the ECM stores it.
If the VVT learning value matches the following conditions, the ECM determines the existence of a malfunction in the VVT system, and sets the DTC.

- VVT learning value: Less than 22.5°CA, or more than 45.2°CA.
- Above condition continues for 18 seconds or more.

This DTC indicates that the intake camshaft has been installed toward the crankshaft at an incorrect angle, caused by factors such as the timing chain having jumped a tooth.
This monitor begins to run after the engine has idled for 5 minutes.

MONITOR STRATEGY

Related DTCs	P0016: Camshaft Timing Misalignment at idling
Required Sensors/Components (Main)	VVT actuator
Required Sensors/Components (Related)	Camshaft position sensor, Crankshaft position sensor
Frequency of Operation	Once per driving cycle
Duration	Within 1 minute
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0011 (VVT system 1 - advance) P0012 (VVT system 1 - retard) P0021 (VVT system 2 - advance) P0022 (VVT system 2 - retard) P0115 - P0118 (ECT sensor)
Engine RPM	500 to 1,000 rpm

TYPICAL MALFUNCTION THRESHOLDS

Duration of following condition	18 seconds or more
Valve timing when camshaft retarded maximum	Less than 22.5 CA°, or more than 45.2 CA°

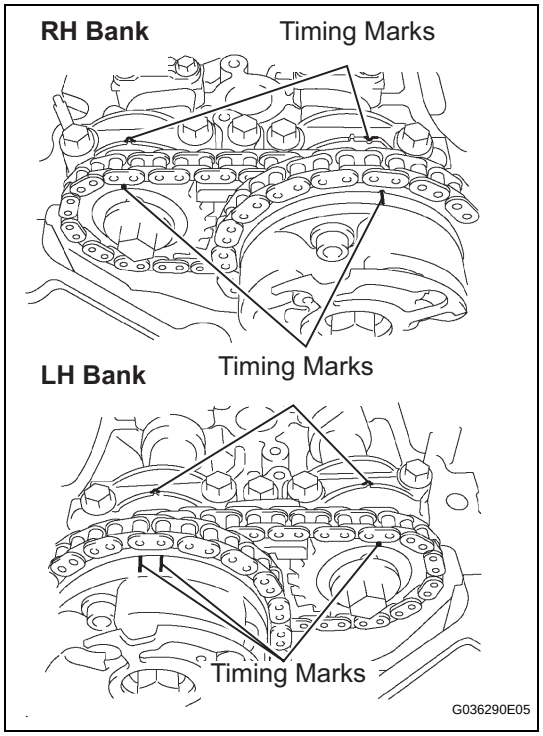
WIRING DIAGRAM

Refer to DTC P0335 (See page ES-184).

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

ES

1	CHECK VALVE TIMING (CHECK FOR LOOSE AND A JUMPED TOOTH OF TIMING CHAIN)



(a) Remove the cylinder head cover (See page EM-25(For 2WD), EM-46(For 4WD)).
(b) Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.
(c) Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°) and align the marks as above.
OK:
Timing marks on camshaft timing gears are aligned as shown in illustration.
(d) Reinstall the cylinder head cover.

NG → **ADJUST VALVE TIMING (REPAIR OR REPLACE TIMING CHAIN)**

OK

REPLACE ECM

DTC	P0031	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)
DTC	P0032	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)
DTC	P0051	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)
DTC	P0052	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)

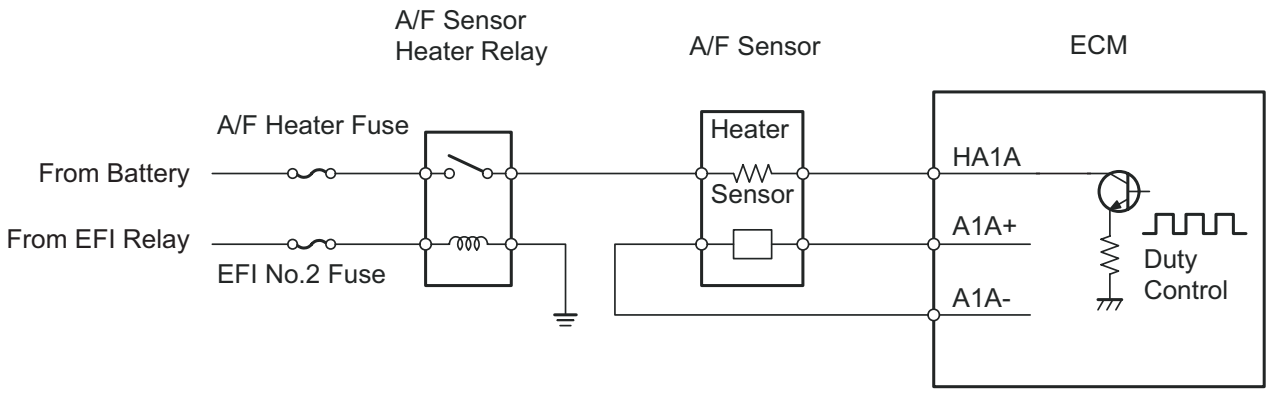
ES

HINT:
- Although the DTC titles say the oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

DESCRIPTION

Refer to DTC P2195 (See page ES-304).
HINT:
- When any of these DTCs are set, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned OFF.
- The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.

Reference (Bank 1 Sensor 1 System Diagram)



DTC No.	DTC Detection Conditions	Trouble Areas
P0031 P0051	Air-Fuel Ratio (A/F) sensor heater current less than 0.8 A (1 trip detection logic)	• Open in A/F sensor heater circuit • A/F sensor heater • A/F sensor heater relay • ECM

DTC No.	DTC Detection Conditions	Trouble Areas
P0032 P0052	Air-Fuel Ratio (A/F) sensor heater current more than 10 A (1 trip detection logic)	• Short in A/F sensor heater circuit • A/F sensor heater • A/F sensor heater relay • ECM

HINT:
- Bank 1 refers to the bank that includes cylinder No. 1.
- Bank 2 refers to the bank that does not include cylinder No. 1.
- Sensor 1 refers to the sensor closest to the engine assembly.
- Sensor 2 refers to the sensor farthest away from the engine assembly.

MONITOR DESCRIPTION

The ECM uses information from the Air-Fuel Ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.
The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.
The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.
The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor will be inaccurate, as a result, the ECM will be unable to regulate air-fuel ratio properly.
When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and sets a DTC.
Example:
The ECM sets DTC P0032 or P0052 when the current in the A/F sensor heater is more than 10 A. Conversely, when the heater current is less than 0.8 A, DTC P0031 or P0051 is set.

MONITOR STRATEGY

Related DTCs	P0031: A/F sensor heater (bank 1) open/short (Low electrical current) P0032: A/F sensor heater (bank 1) open/short (High electrical current) P0051: A/F sensor heater (bank 2) open/short (Low electrical current) P0052: A/F sensor heater (bank 2) open/short (High electrical current)
Required Sensors/Components (Main)	A/F sensor heater (bank 1 and 2)
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	10 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	None

P0031 and P0051:

Battery voltage	10.5 V or more
A/F sensor heater duty-cycle ratio	50 % or more
Time after engine start	10 seconds or more

P0032 and P0052:

Time after engine start	10 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

P0031 and P0051:

A/F sensor heater current	Less than 0.8 A

P0032 and P0052:

A/F sensor heater current	More than 10 A

COMPONENT OPERATING RANGE

ES

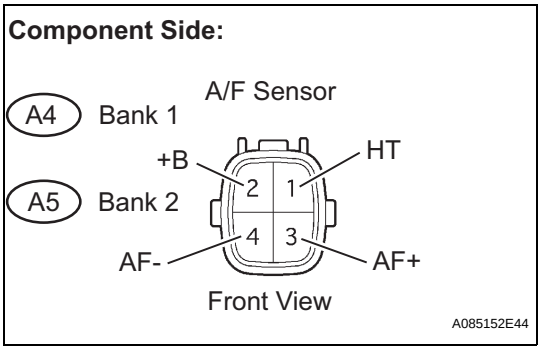
A/F sensor heater current	1.8 to 3.4 A at 20°C (68°F)

WIRING DIAGRAM

Refer to DTC P2195 (See page ES-309).

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



(a) Disconnect the A4 or A5 A/F sensor connector.
(b) Measure the resistance between the terminals of the A/F sensor connector.
Standard Resistance

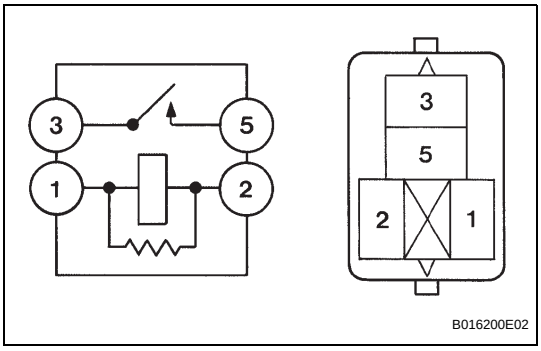
Tester Connections	Specified Conditions
HT (1) - +B (2)	1.8 to 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 kΩ or higher

(c) Reconnect the A/F sensor connector.

NG → REPLACE AIR FUEL RATIO SENSOR

OK

2 INSPECT AIR FUEL RATIO SENSOR HEATER RELAY



(a) Remove the A/F sensor heater relay from the engine room relay block.
(b) Check the A/F sensor heater relay resistance.
Standard Resistance

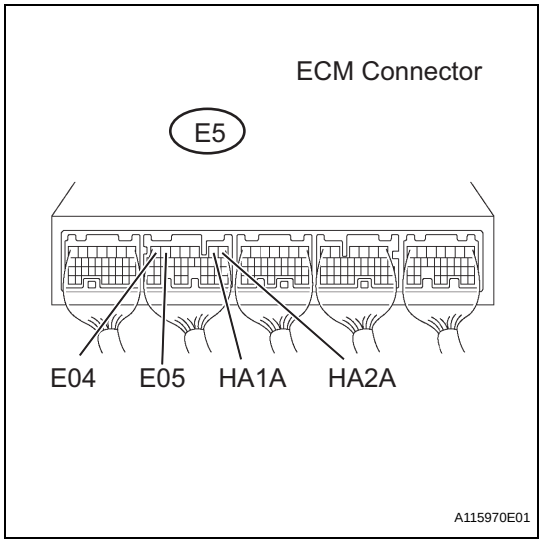
Tester Connections	Specified Conditions
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the A/F sensor heater relay.

NG → REPLACE AIR FUEL RATIO SENSOR HEATER RELAY

OK

3 INSPECT ECM (HA1A OR HA2A VOLTAGE)



(a) Turn the ignition switch ON.
(b) Measure the voltage between the terminals of the E5 ECM connector.

Standard Voltage

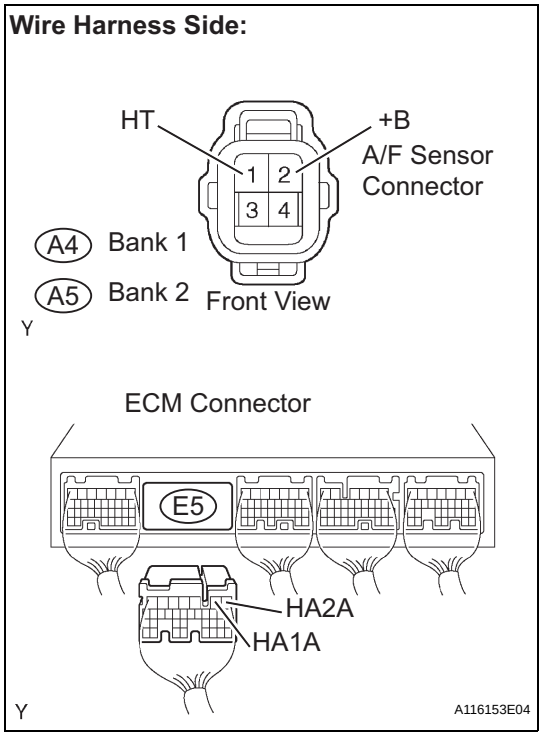
Tester Connections	Specified Conditions
HA1A (E5-2) - E04 (E5-7)	9 to 14 V
HA2A (E5-1) - E05 (E5-6)	

HINT:
- The HA1A means the A/F sensor bank 1 sensor 1.
- The HA2A means the A/F sensor bank 2 sensor 1.

OK → REPLACE ECM

NG

4 CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM, A/F SENSOR - A/F SENSOR HEATER RELAY)



(a) Check the harness and the connector between the ECM and the A/F sensor.
  (1) Disconnect the A4 or A5 A/F sensor connector.
  (2) Disconnect the E5 ECM connector.
  (3) Check the resistance.

Standard Resistance (Check for open)

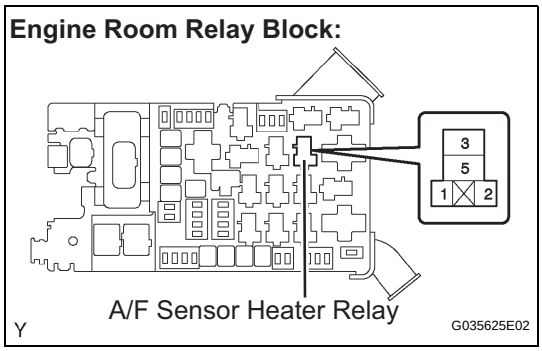
Tester Connections	Specified Conditions
HT (A4-1) - HA1A (E5-2)	Below 1 Ω
HT (A5-1) - HA2A (E5-1)	

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
HT (A4-1) or HA1A (E5-2) - Body ground	10 kΩ or higher
HT (A5-1) or HA2A (E5-1) - Body ground	

  (4) Reconnect the A/F sensor connector.
  (5) Reconnect the ECM connector.

(b) Check the harness and the connector between the A/F sensor and A/F sensor heater relay.
  (1) Disconnect the A4 or A5 A/F sensor connector.
  (2) Remove the A/F sensor heater relay from the engine room relay block.



(3) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
+B (A4-2) - A/F sensor heater relay (3)	Below 1 Ω
+B (A5-2) - A/F sensor heater relay (3)	

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
+B (A4-2) or A/F sensor heater relay (3) - Body ground	10 kΩ or higher
+B (A5-2) or A/F sensor heater relay (3) - Body ground	

(4) Reconnect the A/F sensor connector.
(5) Reinstall the A/F sensor heater relay.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

DTC	P0037	Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)
DTC	P0038	Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)
DTC	P0057	Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)
DTC	P0058	Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)

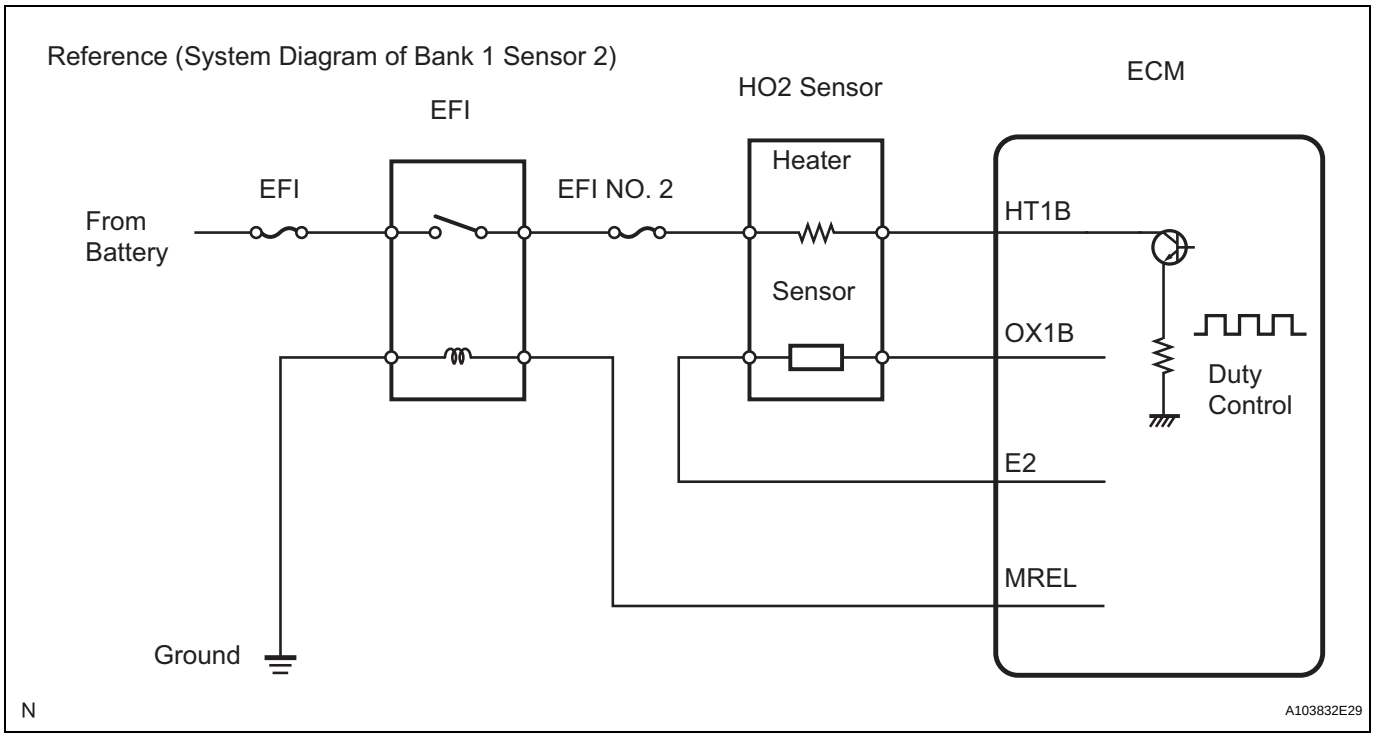
ES

HINT:
Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.

DESCRIPTION

Refer to DTC P0136 (See page ES-128).
HINT:

- When any of these DTCs are set, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned OFF.
- The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the B+ side of the circuit.



DTC No.	DTC Detection Conditions	Trouble Areas
P0037 P0057	Heated Oxygen (HO2) sensor heater current less than 0.3 A (1 trip detection logic)	• Open in HO2 sensor heater circuit • HO2 sensor heater • EFI relay • ECM

DTC No.	DTC Detection Conditions	Trouble Areas
P0038 P0058	Heated Oxygen (HO2) sensor heater current more than 2 A (1 trip detection logic)	• Short in HO2 sensor heater circuit • HO2 sensor heater • EFI relay • ECM

HINT:
- Bank 1 refers to the bank that includes cylinder No. 1.
- Bank 2 refers to the bank that does not include cylinder No. 1.
- Sensor 1 refers to the sensor closest to the engine assembly.
- Sensor 2 refers to the sensor farthest away from the engine assembly.

MONITOR DESCRIPTION

ES

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor. When the current in the sensor heater is outside the standard operating range, the ECM interprets this as a malfunction in the sensor heater and sets a DTC.
Example:
The ECM sets DTC P0038 or P0058 when the current in the HO2 sensor heater is more than 2 A. Conversely, when the heater current is less than 0.3 A, DTC P0037 or P0057 is set.

MONITOR STRATEGY

Related DTCs	P0037: Heated oxygen sensor heater (bank 1) open/short (Low electrical current) P0038: Heated oxygen sensor heater (bank 1) open/short (High electrical current) P0057: Heated oxygen sensor heater (bank 2) open/short (Low electrical current) P0058: Heated oxygen sensor heater (bank 2) open/short (High electrical current)

Frequency of Operation	Continuous
Duration	P0037 and P0057: 0.5 seconds P0038 and P0058: 0.3 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	None
Battery voltage	10.5 V or more
Engine	Running
Starter	OFF
Catalyst intrusive monitoring	Not operating
Intrusive heating	Not operating

P0037 and P0057 (Low current):

When the following conditions are met	0.5 seconds or more
(a) Following conditions are met	-
Learned heater current during heater OFF	Completed
Intrusive heating	Not operating
Heating is OFF	Less than 0.1 seconds
Heater current	Less than 0.3 A
Intrusive heating for high current monitor	Not operating

(b) Following condition are met	-
Time after heaters are OFF	1 seconds or more

P0038 and P0058 (High current):

When the following conditions are met	0.3 seconds or more
(a) Following conditions are met	-
Learned heater current during heater OFF	Completed
Intrusive heating	Not operating
Heating is OFF	Less than 0.1 seconds
Heater current	2 A or more
(b) Following condition is met	-
Time after heaters are OFF	1 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

P0037 and P0057 (Low current):

Following conditions are met	-
Heater	ON
Heater current	Less than 0.3 A
Intrusive heating	Operating

P0038 and P0058 (High current):

Either A or B is met	-
A. Following conditions are met	With intrusive heating
Heater	ON
Heater current	2 A or more
B. Following conditions are met	Without intrusive heating
Intrusive heating of learned heater current	Operating
Learned heater current during heater OFF	Operating
Heater current	More than 2 A

COMPONENT OPERATING RANGE

Heated Oxygen (HO2) sensor heater current	0.4 to 1 A (when engine idles, HO2 sensor warmed up and battery voltage 11 to 14 V)

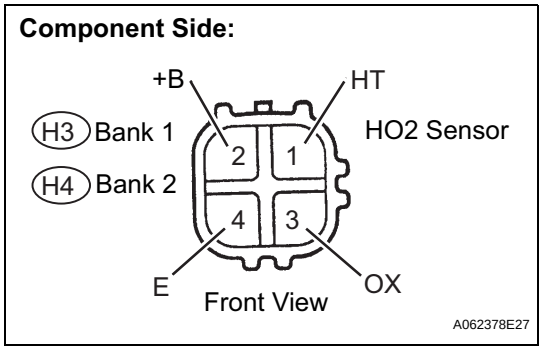
WIRING DIAGRAM

Refer to DTC P0136 (See page ES-135).

HINT:

- If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



(a) Disconnect the H3 or H4 Heated Oxygen (HO2) sensor connector.
(b) Measure the resistance between the terminals of the HO2 sensor connector.
Standard Resistance (Bank 1, 2 sensor 2)

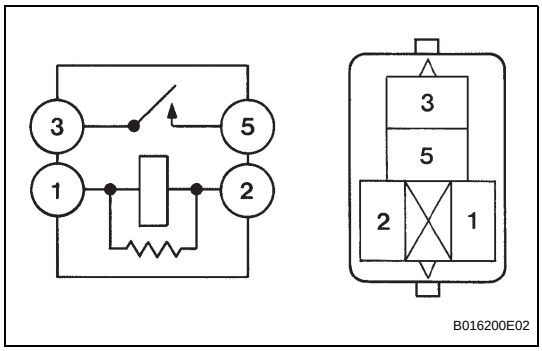
Tester Connections	Specified Conditions
HT (1) - +B (2)	11 to 16 Ω at 20°C (68°F)
HT (1) - E (4)	10 kΩ or higher

(c) Reconnect the HO2 sensor connector.

NG → REPLACE HEATED OXYGEN SENSOR

OK

2 INSPECT EFI RELAY



(a) Remove the EFI relay from the engine room relay block.
(b) Check the EFI relay resistance.
Standard Resistance

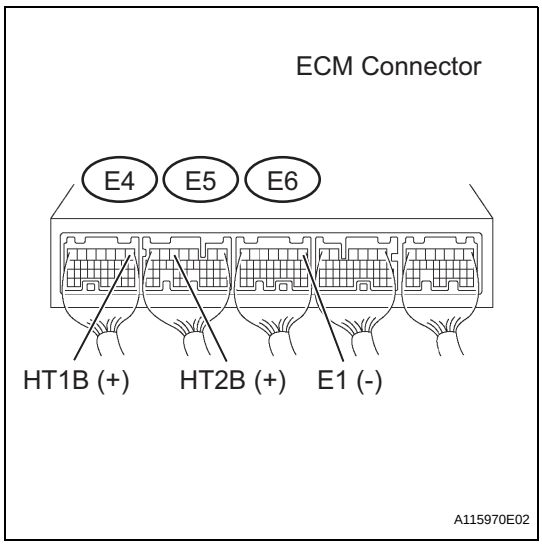
Terminal Connections	Specified Conditions
3-5	10 kΩ or higher
3-5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the EFI relay.

NG → REPLACE EFI RELAY

OK

3 INSPECT ECM (HT1B OR HT2B VOLTAGE)



(a) Turn the ignition switch ON.
(b) Measure the voltage between the terminals of the E4, E5 and E6 ECM connectors.
Standard Voltage

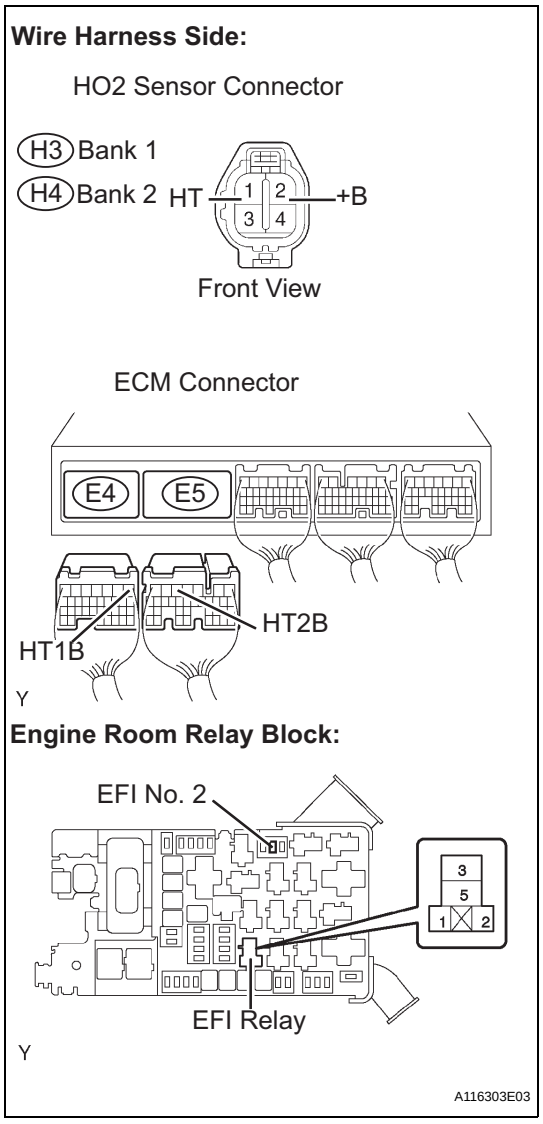
Terminal Connections	Specified Conditions
HT1B (E4-1) - E1 (E6-1)	9 to 14 V
HT2B (E5-5) - E1 (E6-1)	

HINT:
- The HT1B means the heated oxygen sensor bank 1 sensor 2.
- The HT2B means the heated oxygen sensor bank 2 sensor 2.

OK → REPLACE ECM

NG

4	CHECK HARNESS AND CONNECTOR (HO2 SENSOR - ECM, HO2 SENSOR - EFI RELAY)



(a) Check the harness and connector between the ECM and HO2 sensor.
  (1) Disconnect the H3 or H4 HO2 sensor connector.
  (2) Disconnect the E4 or E5 ECM connector.
  (3) Check the resistance.

Standard Resistance (Check for open)

Terminal Connections	Specified Conditions
HT (H3-1) - HT1B (E4-1)	Below 1 Ω
HT (H4-1) - HT2B (E5-5)	

Standard Resistance (Check for short)

Terminal Connections	Specified Conditions
HT (H3-1) or HT1B (E4-1) - Body ground	10 kΩ or higher
HT (H4-1) or HT2B (E5-5) - Body ground	

  (4) Reconnect the HO2 sensor connector.
  (5) Reconnect the ECM connector.

(b) Check the harness and connector between the HO2 sensor and EFI relay.
  (1) Inspect the EFI No. 2 fuse.
    • Remove the EFI No. 2 fuse from the engine room relay block.
    • Check the EFI No. 2 fuse resistance.

Standard Resistance:
Below 1 Ω

    • Reinstall the EFI No. 2 fuse.
  (2) Disconnect the H3 or H4 HO2 sensor connector.
  (3) Remove the EFI relay from the engine room relay block.
  (4) Check the resistance.

Standard Resistance (Check for open)

Terminal Connections	Specified Conditions
+B (H3-2) - EFI relay (3)	Below 1 Ω
+B (H4-2) - EFI relay (3)	

Standard Resistance (Check for short)

Terminal Connections	Specified Conditions
+B (H3-2) or EFI relay (3) - Body ground	10 kΩ or higher
+B (H4-2) or EFI relay (3) - Body ground	

  (5) Reconnect the HO2 sensor connector.
  (6) Reinstall the EFI relay.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

DTC	P0100	Mass or Volume Air Flow Circuit

DTC	P0102	Mass or Volume Air Flow Circuit Low Input

DTC	P0103	Mass or Volume Air Flow Circuit High Input

DESCRIPTION

The Mass Air Flow (MAF) meter is a sensor that measures the amount of air flowing through the throttle valve.

The ECM uses this information to determine the fuel injection time and to provide appropriate air-fuel ratio.

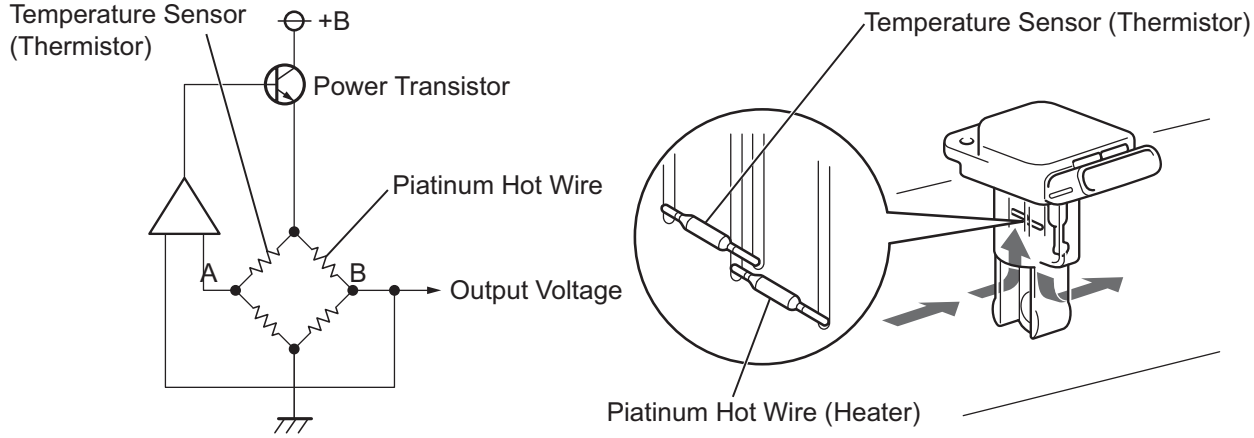
Inside the MAF meter, there is a heated platinum wire which is exposed to the flow of intake air.

By applying a specific electrical current to the wire, the ECM heats it to a given temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components in the MAF meter. The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume.

The circuit is constructed so that the platinum hot wire and the temperature sensor provide a bridge circuit, and the power transistor is controlled so that the potentials of A and B remain equal to maintain the predetermined temperature.

HINT:

When any of these DTCs are set, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is calculated by the ECM, according to the engine RPM and throttle valve position. Fail-safe mode continues until a pass condition is detected.



DTC No.	DTC Detection Conditions	Trouble Areas
P0100	Open or short in Mass Air Flow (MAF) meter circuit for 3 seconds (1 trip detection logic)	• Open or short in MAF meter circuit • MAF meter • ECM
P0102	Open in Mass Air Flow (MAF) meter circuit for 3 seconds (1 trip detection logic)	• Open in MAF meter circuit • Short in ground circuit • MAF meter • ECM
P0103	Short in Mass Air Flow (MAF) meter circuit for 3 seconds (1 trip detection logic)	• Short in MAF meter circuit (+B circuit) • MAF meter • ECM

HINT:
When any of these DTCs are set, check the air-flow rate by selecting the following menu items on an intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / MAF.

Mass Air Flow Rate (g/sec)	Malfunctions
Approximately 0.0	• Open in Mass Air Flow (MAF) meter power source circuit • Open or short in VG circuit
271.0 or more	• Open in EVG circuit

MONITOR DESCRIPTION

If there is a defect in the MAF meter or an open or short circuit, the voltage level deviates from the normal operating range. The ECM interprets this deviation as a malfunction in the MAF meter and sets a DTC.
Example:
When the sensor voltage output remains less than 0.2 V, or more than 4.9 V, for more than 3 seconds, the ECM sets a DTC.
If the malfunction is not repaired successfully, a DTC is set 3 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0100: Mass air flow meter range check (Fluctuating) P0102: Mass air flow meter range check (Low voltage) P0103: Mass air flow meter range check (High voltage)

Frequency of Operation	Continuous
Duration	3 seconds
MIL Operation	Immediate: Engine RPM less than 4,000 rpm 2 driving cycles: Engine RPM 4,000 rpm or more
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

TYPICAL MALFUNCTION THRESHOLDS

P0100:

Mass air flow meter voltage	Less than 0.2 V or more than 4.9 V

P0102:

Mass air flow meter voltage	Less than 0.2 V

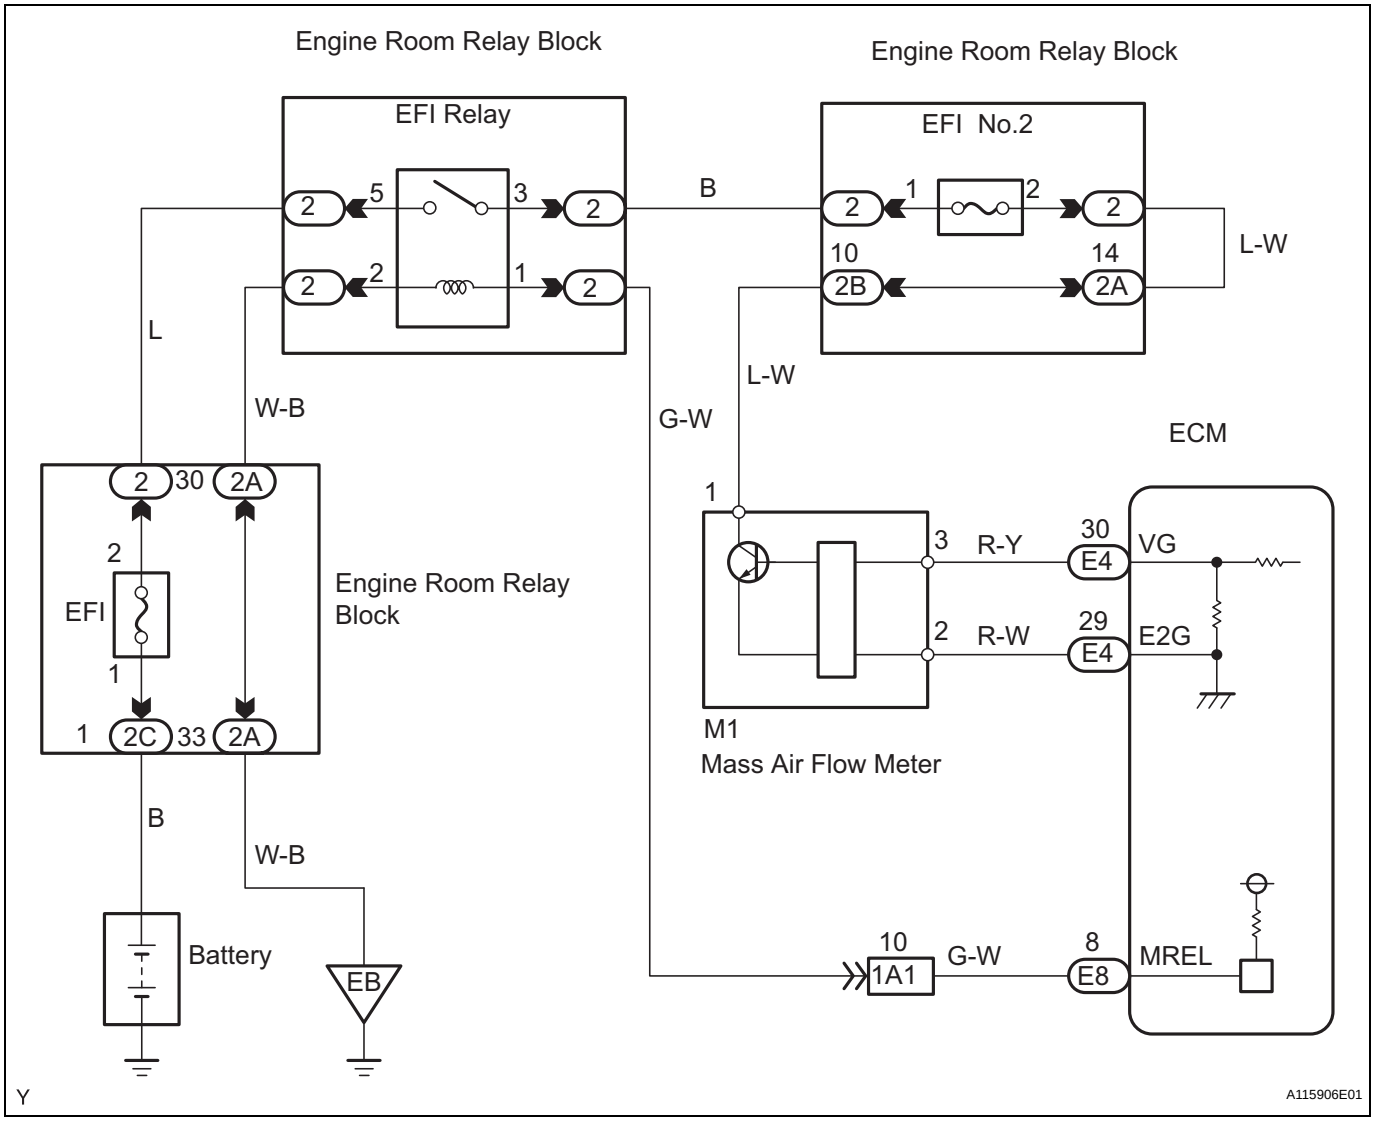
P0103:

Mass air flow meter voltage	More than 4.9 V

COMPONENT OPERATING RANGE

Mass air flow meter voltage	Between 0.4 V and 2.2 V

WIRING DIAGRAM



HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	READ VALUE USING INTELLIGENT TESTER (MASS AIR FLOW RATE)

(a) Connect an intelligent tester to the DLC3.
(b) Start the engine.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / MAF.
(e) Read the values displayed on the tester.

Result

Mass Air Flow Rate (g/sec)	Proceed to
0.0	A
271.0 or more	B

Mass Air Flow Rate (g/sec)	Proceed to
Between 1.0 and 270.0 (*1)	C

*1: The value must be changed when the throttle valve is open or closed.

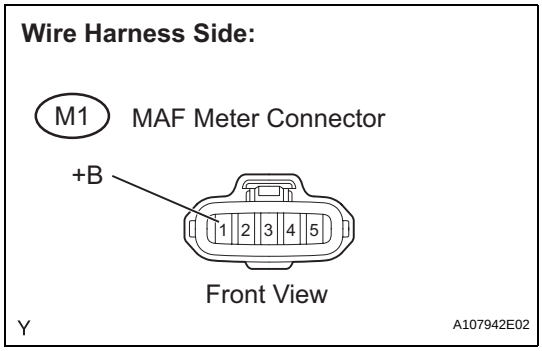
B → Go to step 6

C → CHECK FOR INTERMITTENT PROBLEMS

A

ES

2 INSPECT MASS AIR FLOW METER (POWER SOURCE VOLTAGE)



(a) Disconnect the M1 Mass Air Flow (MAF) meter connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminal of the wire harness side connector and body ground.
Standard Voltage

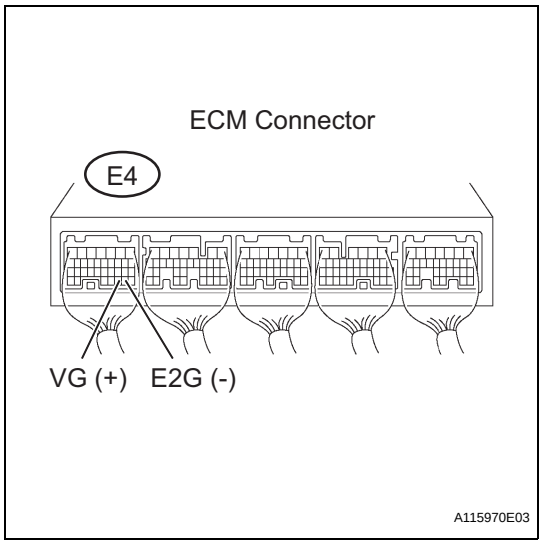
Tester Connections	Specified Conditions
+B (M1-1) - Body ground	9 to 14 V

(d) Reconnect the MAF meter connector.

NG → Go to step 5

OK

3 INSPECT ECM (VG VOLTAGE)



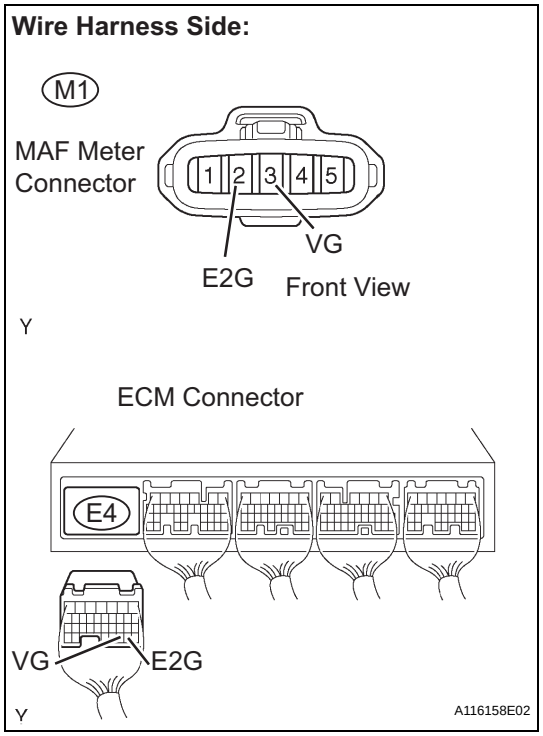
(a) Start the engine.
(b) Measure the voltage between the terminals of the E4 ECM connector.
HINT:
The transmission gear selector lever should be in the P or N position and the A/C switch should be turned OFF.
Standard Voltage

Tester Connections	Conditions	Specified Conditions
VG (E4-30) - E2G (E4-29)	Engine idling	0.5 to 3.0 V

OK → REPLACE ECM

NG

4	CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)



(a) Disconnect the M1 MAF meter connector.
(b) Disconnect the E4 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
VG (M1-3) - VG (E4-30)	Below 1 Ω
E2G (M1-2) - E2G (E4-29)	

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
VG (M1-3) or VG (E4-30) - Body ground	10 kΩ or higher

(d) Reconnect the MAF meter connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE MASS AIR FLOW METER

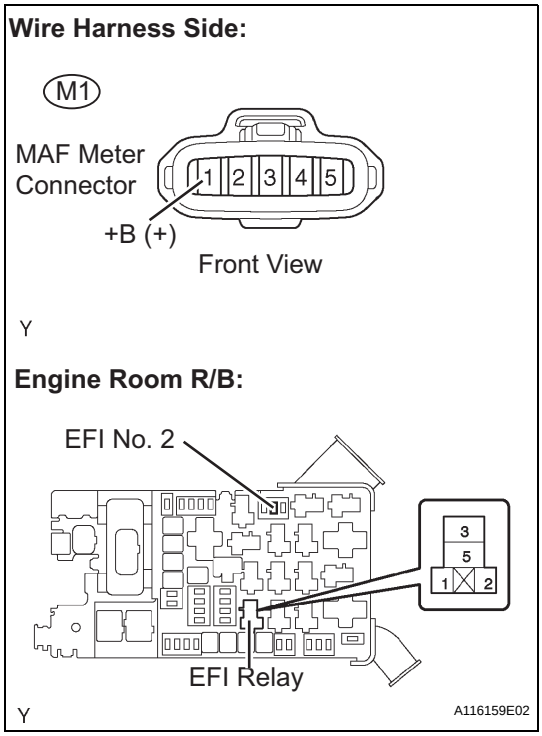
5	CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - EFI RELAY)



(a) Inspect the EFI NO. 2 fuse.
  (1) Remove the EFI NO. 2 fuse from the engine room relay block.
  (2) Check the EFI NO. 2 fuse resistance.
    Standard Resistance:
    Below 1 Ω
  (3) Reinstall the EFI NO. 2 fuse.
(b) Disconnect the M1 MAF meter connector.
(c) Remove the EFI relay from the engine room relay block.
(d) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
+B (M1-1) - EFI relay (3)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
+B (M1-1) or EFI relay (3) - Body ground	10 kΩ or higher

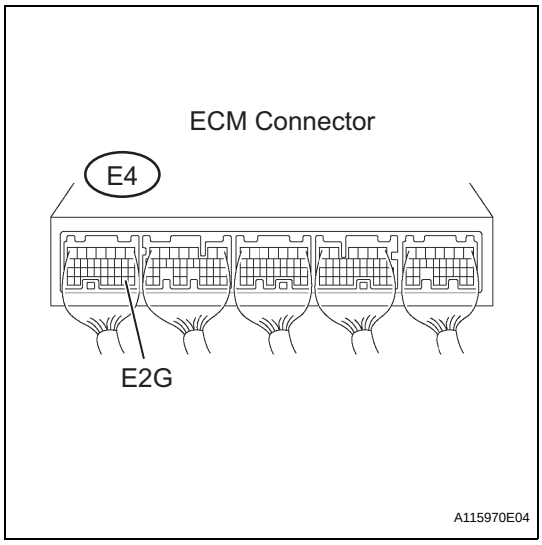
(e) Reconnect the MAF meter connector.
(f) Reinstall the EFI relay.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

CHECK ECM POWER SOURCE CIRCUIT

6	INSPECT ECM (SENSOR GROUND)



(a) Check the resistance.

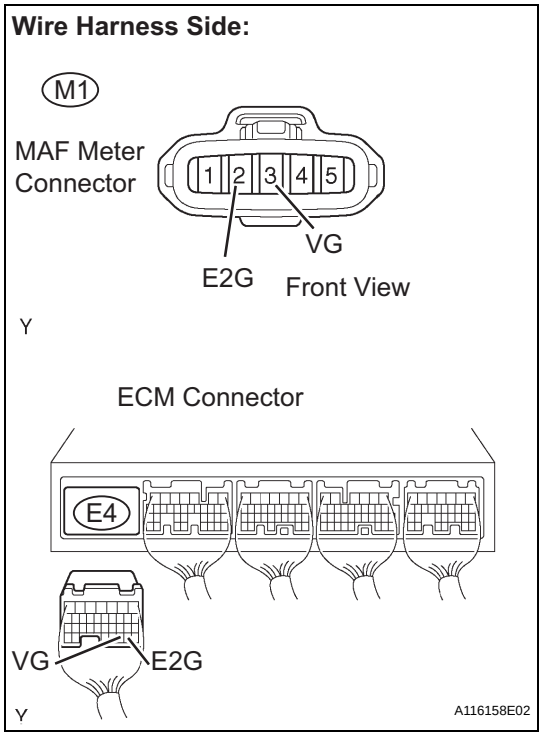
Standard Resistance

Tester Connections	Specified Conditions
E2G (E4-29) - Body ground	Below 1 Ω

NG → **REPLACE ECM**

OK

7	CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)



(a) Disconnect the M1 MAF meter connector.
(b) Disconnect the E4 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
VG (M1-3) - VG (E4-30)	Below 1 Ω
E2G (M1-2) - E2G (E4-29)

REPLACE MASS AIR FLOW METER

ES

DTC	P0101	Mass or Volume Air Flow Circuit Range / Performance Problem

DESCRIPTION

Refer to DTC P0100 (See page ES-89).

DTC No.	DTC Detection Conditions	Trouble Areas
P0101	• High voltage: Conditions (a), (b) and (c) continue for more than 10 seconds (2 trip detection logic) (a) Engine speed less than 2,000 rpm (b) Engine coolant temperature 70°C (158°F) or higher (c) Voltage output of Mass Air Flow (MAF) meter more than 2.2 V (varies with Throttle Position [TP] sensor voltage) • Low voltage: Conditions (a) and (b) continue for more than 10 seconds (2 trip detection logic) (a) Engine speed more than 300 rpm (b) Voltage output of MAF meter less than 0.83 V (varies with TP sensor voltage)	• MAF meter

MONITOR DESCRIPTION

The MAF meter is a sensor that measures the amount of air flowing through the throttle valve. The ECM uses this information to determine the fuel injection time and to provide an appropriate air-fuel ratio. Inside the MAF meter, there is a heated platinum wire which is exposed to the flow of intake air. By applying a specific electrical current to the wire, the ECM heats it to a specific temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components of the MAF meter. The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume.

If there is a defect in the sensor, or an open or short in the circuit, the voltage level deviates from the normal operating range. The ECM interprets this deviation as a malfunction in the MAF meter and sets the DTC.

Example:

If the voltage is more than 2.2 V, or less than 0.83 V while idling, the ECM determines that there is a malfunction in the MAF meter and sets the DTC.

MONITOR STRATEGY

Related DTCs	P0101: Mass air flow meter rationality
Required Sensors/Components (Main)	Mass air flow meter
Required Sensors/Components (Related)	Crankshaft position sensor, engine coolant temperature sensor and throttle position sensor
Frequency of Operation	Continuous
Duration	10 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (insufficient ECT for closed loop) P0335 (CKP sensor) P0340 (CMP sensor)

Mass Air Flow Meter Rationality (High Voltage):

Engine speed	Less than 2,000 rpm
Engine coolant temperature	70°C (158°F) or more
Mass air flow meter voltage	4.9 V or less

Mass Air Flow Meter Rationality (Low Voltage):

Engine speed	More than 300 rpm
Mass air flow meter voltage	0.2 V or more
Fuel cut	OFF

TYPICAL MALFUNCTION THRESHOLDS

Mass Air Flow Meter Rationality (High Voltage):

Mass air flow meter voltage	More than 2.2 V (varies with throttle position sensor voltage)

Mass Air Flow Meter Rationality (Low Voltage):

Mass air flow meter voltage	Less than 0.83 V (varies with throttle position sensor voltage)

WIRING DIAGRAM

Refer to DTC P0100 (See page ES-91).

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0101)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0101 and other DTCs	A
P0101	B

HINT:
If any DTCs other than P0101 are output, troubleshoot those DTCs first.

B → REPLACE MASS AIR FLOW METER

A → GO TO DTC CHART

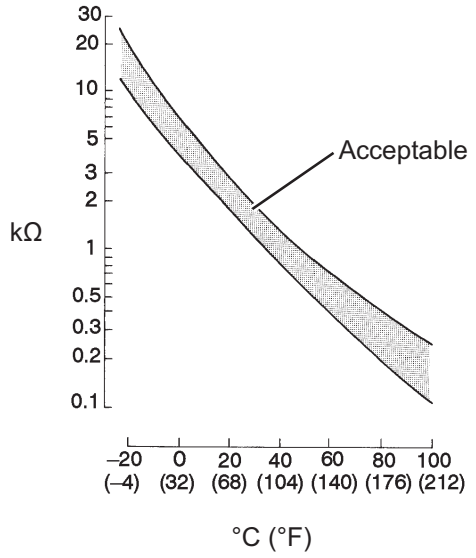
DTC	P0110	Intake Air Temperature Circuit

DTC	P0112	Intake Air Temperature Circuit Low Input

DTC	P0113	Intake Air Temperature Circuit High Input

DESCRIPTION

(Figure 1)



The Intake Air Temperature (IAT) sensor, mounted on the Mass Air Flow (MAF) meter, monitors the IAT. The IAT sensor has a built in thermistor with a resistance that varies according to the temperature of the intake air. When the IAT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (see Fig. 1).

The IAT sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R.

Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies.

Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve drivability.

HINT:

When any of DTCs P0110, P0112 and P0113 are set, the ECM enters fail-safe mode. During fail-safe mode, the IAT is estimated to be 20°C (68°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC No.	Proceed To	DTC Detection Conditions	Trouble Areas
P0110	Step 1	Open or short in Intake Air Temperature (IAT) sensor circuit for 0.5 seconds (1 trip detection logic)	• Open or short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0112	Step 4	Short in Intake Air Temperature (IAT) sensor circuit for 0.5 seconds (1 trip detection logic)	• Short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0113	Step 2	Open in Intake Air Temperature (IAT) sensor circuit for 0.5 seconds (1 trip detection logic)	• Open in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM

HINT:
When any of these DTCs are set, check the IAT by selecting the following menu items on an intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / INTAKE AIR.

Temperature Displayed	Malfunctions
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the Intake Air Temperature (IAT). When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a malfunction in the IAT sensor and sets a DTC.
Example:
If the sensor voltage output is more than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the IAT sensor circuit, and sets DTC P0113. Conversely, if the voltage output is less than 0.18 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and sets DTC P0112.
If the malfunction is not repaired successfully, a DTC is set 0.5 seconds after the engine is next started.

REPLACE ECM

ES

DTC	P0115	Engine Coolant Temperature Circuit

DTC	P0117	Engine Coolant Temperature Circuit Low Input

DTC	P0118	Engine Coolant Temperature Circuit High Input

DESCRIPTION

A thermistor is built into the Engine Coolant Temperature (ECT) sensor, of which the resistance value varies according to the ECT.
The structure of the sensor and its connection to the ECM are the same as those of the Intake Air Temperature (IAT) sensor.

ES

HINT:
When any of DTCs P0115, P0117 and P0118 are set, the ECM enters fail-safe mode. During fail-safe mode, the ECT is estimated to be 80°C (176°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC No.	Proceed To	DTC Detection Conditions	Trouble Areas
P0115	Step 1	Open or short in Engine Coolant Temperature (ECT) sensor circuit for 0.5 seconds (1 trip detection logic)	• Open or short in ECT sensor circuit • ECT sensor • ECM
P0117	Step 4	Short in Engine Coolant Temperature (ECT) sensor circuit for 0.5 seconds (1 trip detection logic)	• Short in ECT sensor circuit • ECT sensor • ECM
P0118	Step 2	Open in Engine Coolant Temperature (ECT) sensor circuit for 0.5 seconds (1 trip detection logic)	• Open in ECT sensor circuit • ECT sensor • ECM

HINT:
When any of these DTCs are set, check the ECT by selecting the following menu items on an intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.

Temperature Displayed	Malfunctions
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to monitor the ECT. The ECT sensor has a thermistor with a resistance that varies according to the temperature of the engine coolant. When the coolant temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops.
These variations in resistance are reflected in the voltage output from the sensor. The ECM monitors the sensor voltage and uses this value to calculate the ECT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the ECT sensor and sets a DTC.
Example:
If the sensor voltage output is more than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the ECT sensor circuit, and sets DTC P0118. Conversely, if the voltage output is less than 0.14 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and sets DTC P0117.
If the malfunction is not repaired successfully, a DTC is set 0.5 seconds after the engine is next started.

DTC	P0116	Engine Coolant Temperature Circuit Range / Performance Problem

DESCRIPTION

Refer to DTC P0115 (See page ES-104).

DTC No.	DTC Detection Conditions	Trouble Areas
P0116	Case 1: Engine Coolant Temperature (ECT) between 35°C and 60°C (95°F and 140°F) when engine started, and conditions (a) and (b) met (2 trip detection logic) (a) Vehicle driven at varying speeds (accelerated and decelerated) (b) ECT remains within 3°C (5.4°F) of initial ECT Case 2: ECT more than 60°C (140°F) when engine started, and conditions (a) and (b) met (6 trip detection logic) (a) Vehicle driven at varying speeds (accelerated and decelerated) (b) ECT measurements remain within 1°C (1.8°F) of initial ECT on 6 successive occasions	• ECT sensor

ES

MONITOR DESCRIPTION

The ECT sensor is used to monitor the ECT. The ECT sensor has a built-in thermistor with a resistance that varies according to the temperature of the engine coolant. When the ECT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in the resistance are reflected in the voltage output from the ECT sensor.
The ECM monitors the sensor voltage and uses this value to calculate the ECT. If the sensor voltage output deviates from the normal operating range, the ECM interprets this deviation as a malfunction in the ECT sensor and sets the DTC.
Examples:

- Upon starting the engine, the ECT is between 35°C and 60°C (95°F and 140°F). If after driving for 250 seconds, the ECT remains within 3°C (5.4°F) of the starting temperature, the DTC is set (2 trip detection logic).
- Upon starting the engine, the ECT is over 60°C (140°F). If after driving for 250 seconds, the ECM remains within 1°C (1.8°F) of the starting temperature, the DTC is set (6 trip detection logic).

MONITOR STRATEGY

Related DTCs	P0116: Engine coolant temperature sensor output stuck at low engine coolant temperature P0116: Engine coolant temperature sensor output stuck at high engine coolant temperature

Required Sensors/Components (Related)	Crankshaft position sensor, intake air temperature sensor and mass air flow meter
Frequency of Operation	Continuous
Duration	250 seconds or more
MIL Operation	2 driving cycles: ECT sensor output stuck at low engine coolant temperature 6 driving cycles: ECT sensor output stuck at high engine coolant temperature
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Engine Coolant Temperature Sensor Output Stuck at Low Engine Coolant Temperature:

Monitor runs whenever following DTCs not present	P0100 to P0103: Mass air flow meter
Cumulative idle off period	250 seconds or more
Speed increase by 18.6 mph (30 km/h) or more	10 times or more
Engine coolant temperature at engine start	35 to 60°C (95 to 140°F)
Intake air temperature at engine start	-6.7°C (20°F) or more

Engine Coolant Temperature Sensor Output Stuck at High Engine Coolant Temperature:

Monitor runs whenever following DTCs not present	P0100 to P0103: Mass air flow meter
Engine coolant temperature at engine start	60°C (140°F) or more
Intake air temperature at engine start	-6.7°C (20°F) or more
Stop and go*1	Once or more
Steady driving and stop*2	Once or more
Engine running time after engine start	0.3 seconds or more

*1: The vehicle is stopped for 20 seconds or more and accelerated to more than 43.5 mph (70 km/h) within 40 seconds.

*2: Following these steps: 1) the vehicle is driven at 40.4 mph (65 km/h) or more for 30 seconds or more and the vehicle speed reaches 43.5 mph (70 km/h); 2) the vehicle is decelerated from 40.4 mph (65 km/h) to 1.86 mph (3 km/h) or less within 35 seconds; and 3) the vehicle is stopped for 10 seconds.

ES

TYPICAL MALFUNCTION THRESHOLDS

Engine Coolant Temperature Sensor Output Stuck at Low Engine Coolant Temperature:

Variation of engine coolant temperature	Less than 3°C (5.4°F)

Engine Coolant Temperature Sensor Output Stuck at High Engine Coolant Temperature:

Variation of engine coolant temperature	1°C (1.8°F) or less

COMPONENT OPERATING RANGE

Engine coolant temperature	Varies with actual engine coolant temperature

WIRING DIAGRAM

Refer to DTC P0115 (See page ES-105).

HINT:

- If any of DTCs P0115, P0117, P0118 or P0125 are set simultaneously with DTC P0116, the ECT sensor may have an open or a short circuit. Troubleshoot those DTCs first.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the airfuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	**CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0116)**

(a) Connect an intelligent tester to the DLC3.

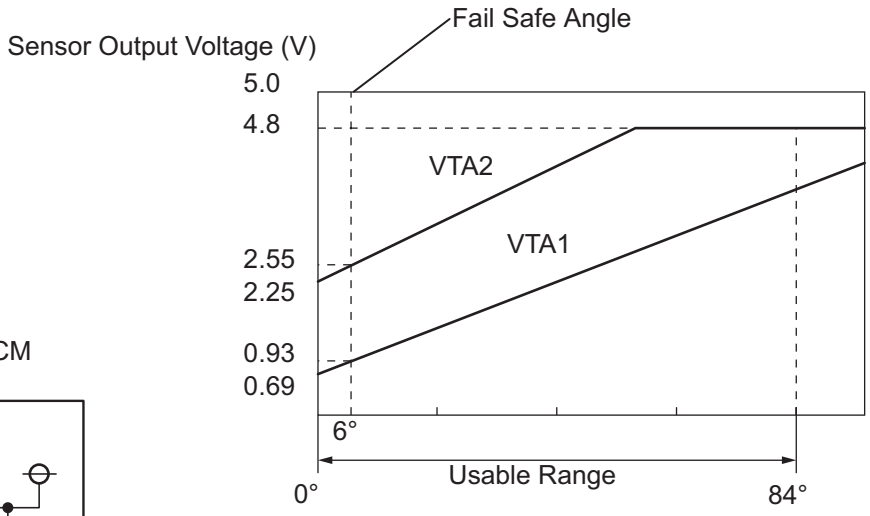
DTC	P0223	Throttle / Pedal Position Sensor / Switch "B" Circuit High Input
DTC	P2135	Throttle / Pedal Position Sensor / Switch "A" / "B" Voltage Correlation

ES

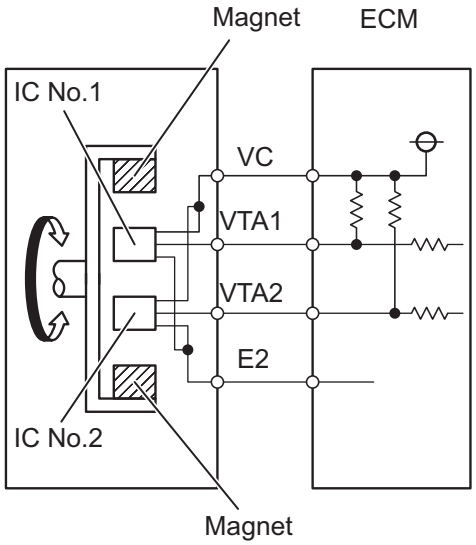
HINT:
These DTCs relate to the Throttle Position (TP) sensor.

DESCRIPTION

This ETCS (Electronic Throttle Control System) does not use a throttle cable. The Throttle Position (TP) sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type, and uses Hall-effect elements, in order to yield accurate signals, even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has two sensor circuits which each transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel-cut control.



Throttle Position Sensor



Note:
The throttle Valve opening angle detected by the sensor terminal VTA1 is expressed as percentages.

Between 10 % and 24 %: Throttle valve fully closed

Between 66 % and 96 %: Throttle valve fully open

Approximately 19 %: Fail-safe angle (6°)

Y

A115896E01

DTC No.	DTC Detection Conditions	Trouble Areas
P0120	Output voltage of VTA1 quickly fluctuates beyond lower and upper malfunction thresholds for 2 seconds (1 trip detection logic)	• Throttle Position (TP) sensor (built into throttle body) • ECM
P0122	Output voltage of VTA1 0.2 V or less for 2 seconds (1 trip detection logic)	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	Output voltage of VTA1 4.535 V or more for 2 seconds (1 trip detection logic)	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	Output voltage of VTA2 quickly fluctuates beyond lower and upper malfunction thresholds for 2 seconds (1 trip detection logic)	• TP sensor (built into throttle body) • ECM

DTC No.	DTC Detection Conditions	Trouble Areas
P0222	Output voltage of VTA2 1.75 V or less for 2 seconds (1 trip detection logic)	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	Output voltage of VTA2 4.8 V or more, and VTA1 between 0.2 V and 2.02 V, for 2 seconds (1 trip detection logic)	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) met (1 trip detection logic) (a) Difference between output voltages of VTA1 and VTA2 0.02 V or less for 0.5 seconds or more (b) Output voltage of VTA1 0.2 V or less, and VTA2 1.75 V or less, for 0.4 seconds or more	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

ES

HINT:

- When any of these DTCs are set, check the throttle valve opening angle by selecting the following menu items on an intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / THROTTLE POS AND THROTTLE POS #2.
- THROTTLE POS denotes the VTA1 signal (expressed in percentages), and THROTTLE POS #2 denotes the VTA2 signal (expressed in voltages).

Reference (Normal Condition)

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
THROTTLE POS	**10 to 24 %**	**64 to 96 %**
THROTTLE POS #2	**2.1 to 3.1 V**	**4.5 to 5.0 V**

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.

- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and sets a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and sets a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and sets a DTC.

If the malfunction is not repaired successfully, a DTC is set 2 seconds after the engine is next started.

TYPICAL MALFUNCTION THRESHOLDS

P0120:

VTA1 voltage	0.2 V or less, or 4.535 V or more

P0122:

VTA1 voltage	0.2 V or less

P0123:

VTA1 voltage	4.8 V or more

P0220:

VTA2 voltage	1.75 V or less, or 4.8 V or more

P0222:

VTA2 voltage	1.75 V or less

P0223:

VTA2 voltage when VTA1 0.2 V or more	4.8 V or more

P2135:

Either of following conditions A or B met:	-
Condition A	-
Difference between VTA1 and VTA2 voltages	0.02 V or less
Condition B	-
VTA1 voltage	0.2 V or less
VTA2 voltage	1.75 V or less

COMPONENT OPERATING RANGE

VTA1 voltage	0.69 to 4.05 V
VTA2 voltage	2.25 to 4.8 V

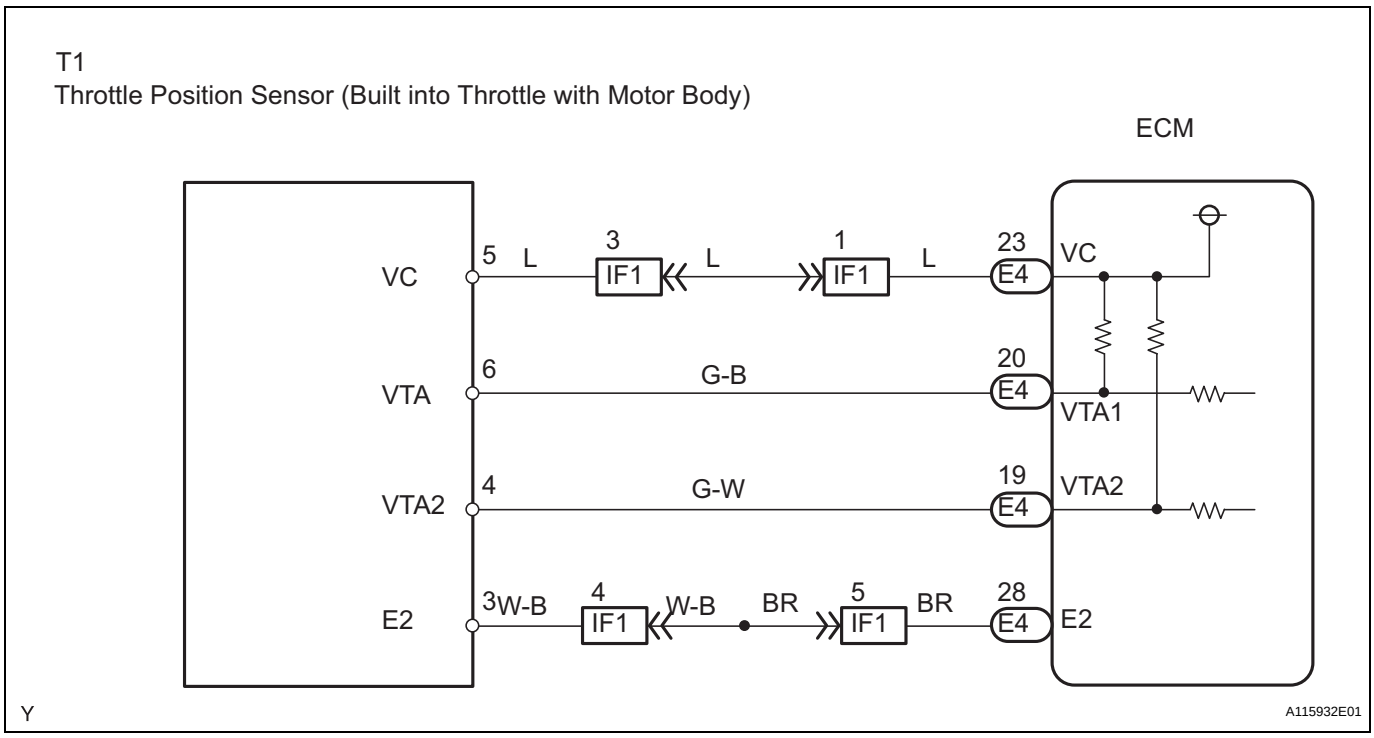
FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, are set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed.

If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.

Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

WIRING DIAGRAM



HINT:

- If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	READ VALUE OF INTELLIGENT TESTER (THROTTLE POS AND THROTTLE POS #2)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / THROTTLE POS and THROTTLE POS #2.
(d) Check the values displayed on the tester.

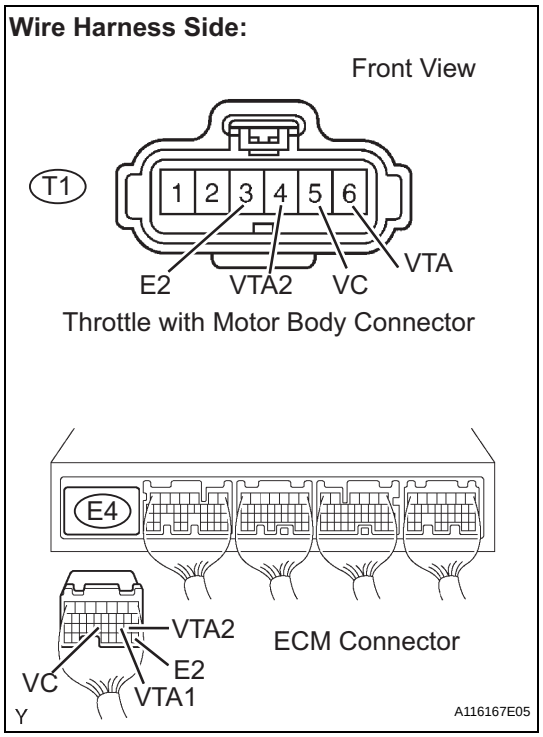
2 CHECK HARNESS AND CONNECTOR (THROTTLE POSITION SENSOR - ECM)



(a) Disconnect the T1 throttle with motor body connector.
(b) Disconnect the E4 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
VC (T1-5) - VC (E4-23)	Below 1 Ω
VTA (T1-6) - VTA1 (E4-20)	
VTA2 (T1-4) - VTA2 (E4-19)	
E2 (T1-3) - E2 (E4-28)	

Standard Resistance (Check for short)

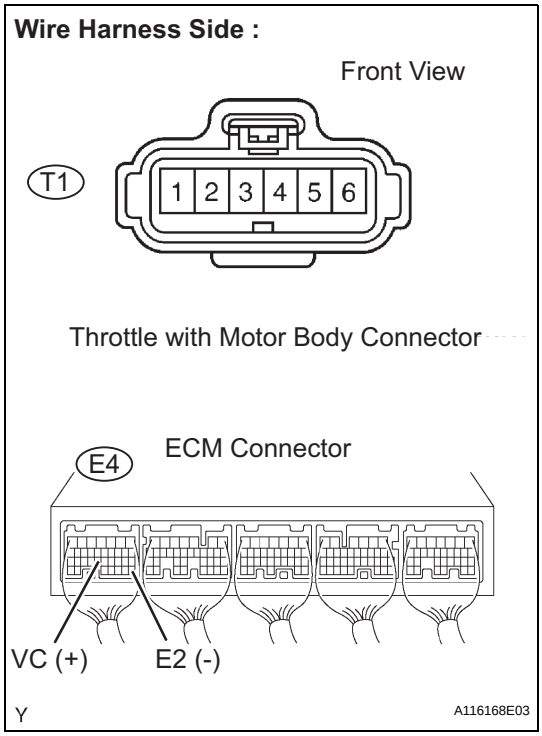
Tester Connections	Specified Conditions
VC (T1-5) or VC (E4-23) - Body ground	10 kΩ or higher
VTA (T1-6) or VTA1 (E4-20) - Body ground	
VTA2 (T1-4) or VTA2 (E4-19) - Body ground	

(d) Reconnect the throttle with motor body connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3	INSPECT ECM (VC VOLTAGE)



(a) Disconnect the T1 throttle with motor body connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals of the E4 ECM connector.

Standard Voltage

Tester Connections	Specified Conditions
VC (E4-23) - E2 (E4-28)	4.5 to 5.0 V

(d) Reconnect the throttle with motor body connector.

NG → REPLACE ECM

OK

4	REPLACE THROTTLE WITH MOTOR BODY ASSEMBLY

NEXT

5	CHECK WHETHER DTC OUTPUT RECURS (THROTTLE POSITION SENSOR DTCS)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (See page ES-38).
(d) Start the engine.
(e) Allow the engine to idle for 15 seconds or more.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

Result

Display (DTC Output)	Proceed To

REPLACE ECM

DTC	P0121	Throttle / Pedal Position Sensor / Switch "A" Circuit Range / Performance Problem

HINT:
This DTC relates to the Throttle Position (TP) sensor.

DESCRIPTION

Refer to DTC P0120 (See page ES-112).

DTC No.	DTC Detection Conditions	Trouble Areas
P0121	Difference between VTA1 and VTA2 voltages less than 0.8 V, or more than 1.6 V for 2 seconds (1 trip detection logic)	• TP sensor (built into throttle body)

ES

MONITOR DESCRIPTION

The ECM uses the TP sensor to monitor the throttle valve opening angle.
This sensor transmits two signals: VTA1 and VTA2. VTA1 is used to detect the throttle opening angle and VTA2 is used to detect malfunctions in VTA1. The ECM performs several checks to confirm the proper operation of the TP sensor and VTA1.
For each throttle opening angle, a specific voltage difference is expected between the outputs of VTA1 and VTA2. If the voltage output difference between the two signals deviates from the normal operating range, the ECM interprets this as a malfunction of the TP sensor. The ECM illuminates the MIL and sets the DTC.
If the malfunction is not repaired successfully, the DTC is set 2 seconds after the engine is next started.

DTC	P0125	Insufficient Coolant Temperature for Closed Loop Fuel Control

DESCRIPTION

Refer to DTC P0115 (See page ES-104).

DTC No.	DTC Detection Conditions	Trouble Areas
P0125	Engine coolant temperature (ECT) does not reach closed-loop enabling temperature for 20 minutes (this period varies with engine start ECT) (2 trip detection logic)	• Cooling system • Engine coolant temperature sensor • Thermostat

MONITOR DESCRIPTION

The resistance of the ECT sensor varies in proportion to the actual ECT. The ECM supplies a constant voltage to the sensor and monitors the signal output voltage of the sensor. The signal voltage output varies according to the changing resistance of the sensor. After the engine is started, the ECT is monitored through this signal. If the ECT sensor indicates that the engine is not yet warm enough for closed-loop fuel control, despite a specified period of time having elapsed since the engine was started, the ECM interprets this as a malfunction in the sensor or cooling system and sets the DTC.
Example:
The ECT is 0°C (32°F) at engine start. After 5 minutes running time, the ECT sensor still indicates that the engine is not warm enough to begin closed-loop fuel (air-fuel ratio feedback) control. The ECM interprets this as a malfunction in the sensor or cooling system and sets the DTC.

MONITOR STRATEGY

Related DTCs	P0125: Insufficient engine coolant temperature for closed-loop fuel control

OK

REPLACE ENGINE COOLANT TEMPERATURE SENSOR

DTC	P0128	Coolant Thermostat (Coolant Temperature Below Thermostat Regulating Temperature)

HINT:
This DTC relates to the thermostat.

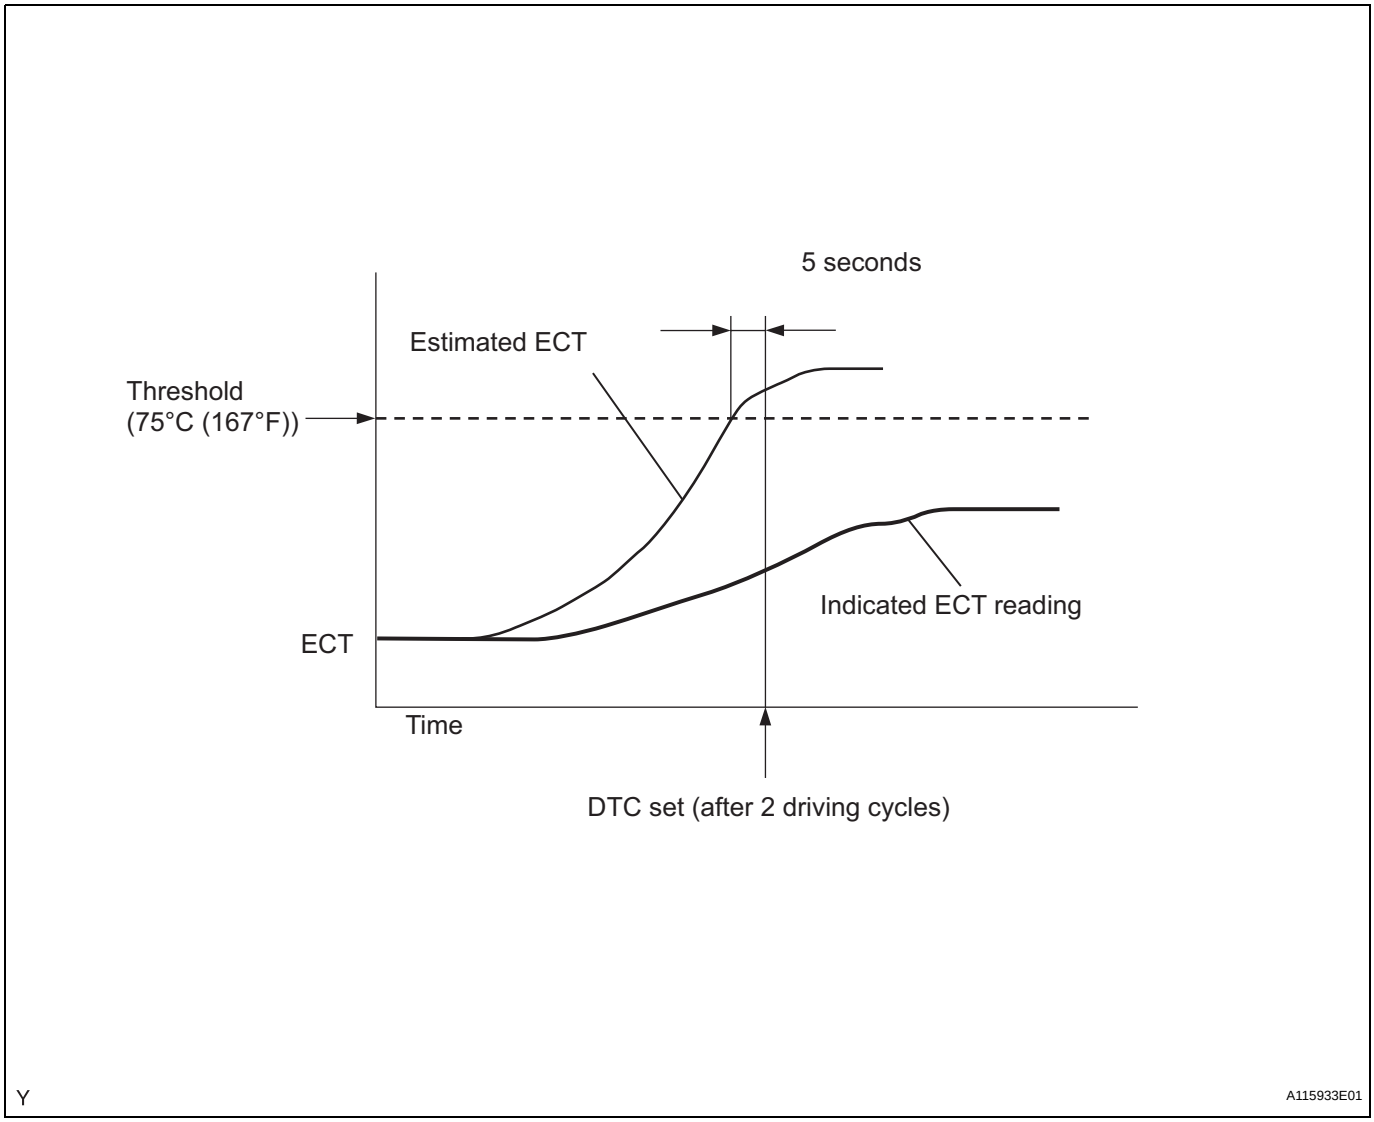
DESCRIPTION

This DTC is set when the Engine Coolant Temperature (ECT) does not reach 75°C (167°F) despite sufficient engine warm-up time.

DTC No.	DTC Detection Conditions	Trouble Areas
P0128	Conditions (a), (b) and (c) are met for 5 seconds (2 rip detection logic) (a) Cold start (b) Engine warmed up (c) ECT less than 75°C (167°F)	• Thermostat • Cooling system • ECT sensor • ECM

ES

MONITOR DESCRIPTION



The ECM estimates the ECT based on the starting temperature, engine loads, and engine speeds. The ECM then compares the estimated temperature with the actual ECT. When the estimated ECT reaches 75°C (167°F), the ECM checks the actual ECT. If the actual ECT is less than 75°C (167°F), the ECM interprets this as a malfunction in the thermostat or the engine cooling system and sets the DTC.

MONITOR STRATEGY

Related DTCs	P0128: Coolant Thermostat

DTC	P0136	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)
DTC	P0137	Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2)
DTC	P0138	Oxygen Sensor Circuit High Voltage (Bank 1 Sensor 2)
DTC	P0156	Oxygen Sensor Circuit Malfunction (Bank 2 Sensor 2)
DTC	P0157	Oxygen Sensor Circuit Low Voltage (Bank 2 Sensor 2)
DTC	P0158	Oxygen Sensor Circuit High Voltage (Bank 2 Sensor 2)

HINT:
Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.

DESCRIPTION

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC (Three-Way Catalytic Converter) is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel level. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.
The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).
When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. less than 0.45 V).
Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel level, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. more than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.
The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

P0138 P0158	• High voltage (short): During active air-fuel ratio control, following conditions (a) and (b) met for certain period of time (2 trip detection logic) (a) HO2 sensor voltage output 0.59 V or more (b) Target air-fuel ratio lean • Extremely high voltage (short): HO2 sensor voltage output exceeds 1.2 V for more than 10 seconds (2 trip detection logic)	• Short in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • ECM internal circuit malfunction

MONITOR DESCRIPTION

1. Active Air-Fuel Ratio Control

The ECM usually performs air-fuel ratio feedback control so that the Air-Fuel Ratio (A/F) sensor output indicates a near stoichiometric air-fuel level. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

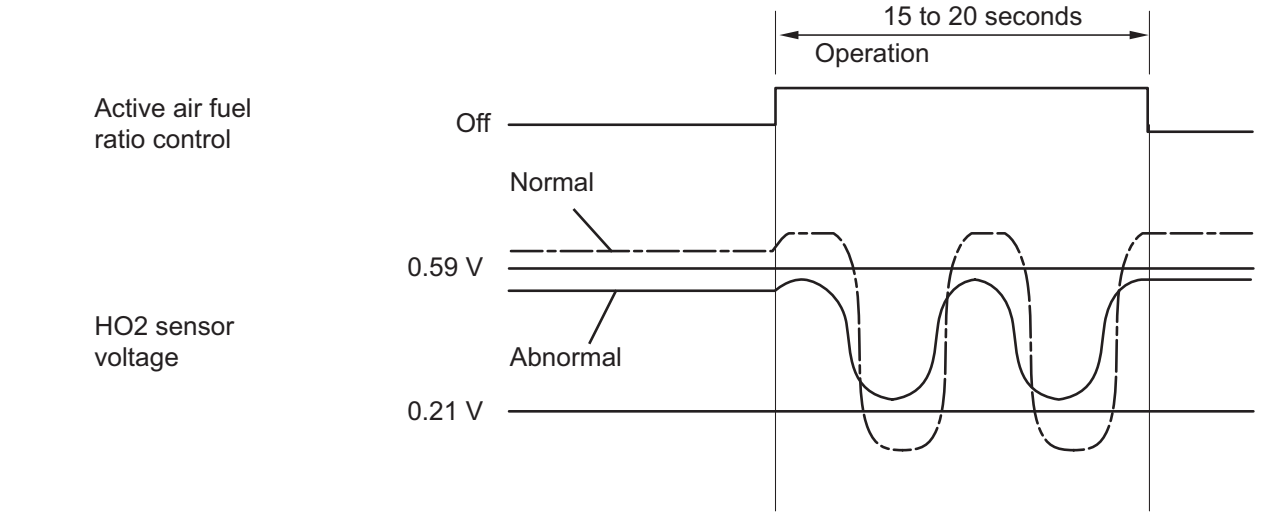
Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, one of the following DTCs is set: DTC P0136 or P0156 (abnormal voltage output), P0137 or P0157 (open circuit) or P0138 or P0158 (short circuit).

2. Abnormal Voltage Output of HO2 Sensor (DTCs P0136 and P0156)

ES

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to less than 0.21 V and does not increase to more than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and sets DTCs P0136 and P0156.

HO2 SENSOR CIRCUIT MALFUNCTION (P0136 and P0156: ABNORMAL VOLTAGE)



Y

A115540E01

3. Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTCs P0137 and P0157 or P0138 and P0158)

During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor noticeably decreases, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

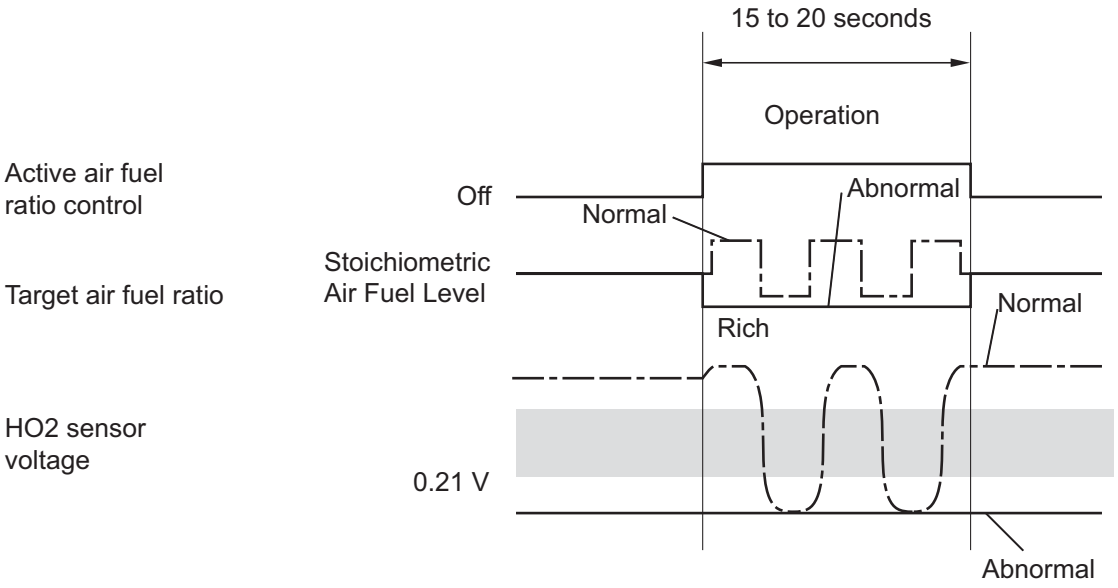
While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and sets DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or more (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and sets DTC P0138 or P0158.

HINT:

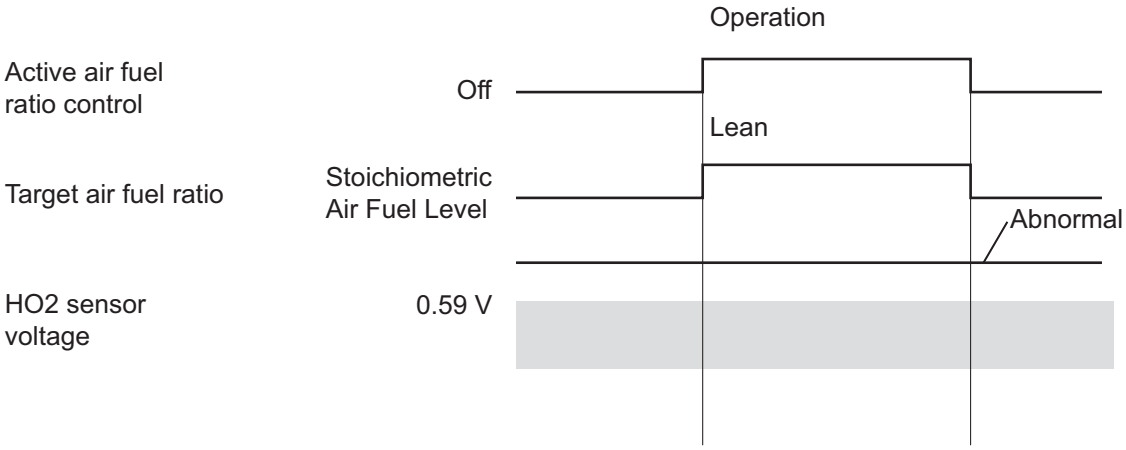
DTC P0138 or P0158 is also set if the HO2 sensor voltage output is more than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated, based on the calculated OSC value (See page ES-203).

HO2 SENSOR CIRCUIT LOW VOLTAGE (P0137 and P0157: OPEN)



HO2 SENSOR CIRCUIT HIGH VOLTAGE (P0138 and P0158: SHORT)

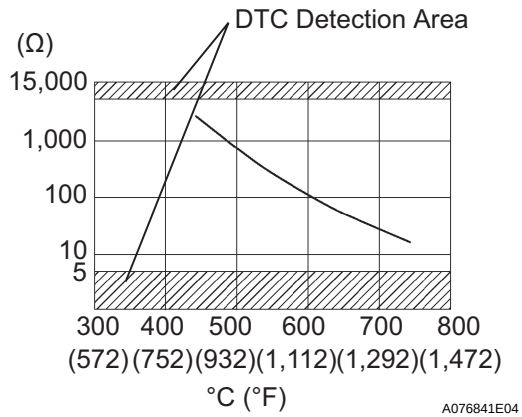


Y

A115541E01

ES

Relationship between element temperature and impedance:



4. High or Low Impedance of Heated Oxygen (HO2) Sensor (DTCs P0136 and P0156 or P0137 and P0157)

During normal air-fuel ratio feedback control, there are small variations in the exhaust gas oxygen concentration. In order to continuously monitor the slight variation of the HO2 sensor signal while the engine is running, the impedance* of the sensor is measured by the ECM. The ECM determines that there is a malfunction in the sensor when the measured impedance deviates from the standard range.

*: The effective resistance in an alternating current electrical circuit.

HINT:

- The impedance cannot be measured using an ohmmeter.
- DTCs P0136 and P0156 indicate the deterioration of the HO2 sensor. The ECM sets the DTCs by calculating the impedance of the sensor when the typical enabling conditions are satisfied (2 driving cycle).
- DTCs P0137 and P0157 indicate an open or short circuit in the HO2 sensor (2 driving cycle). The ECM sets the DTCs when the impedance of the sensor exceeds the threshold 15 kΩ.

MONITOR STRATEGY

Related DTCs	P0136: Heated oxygen sensor output voltage (Output voltage) (bank 1) P0136: Heated oxygen sensor impedance (Low) (bank 1) P0137: Heated oxygen sensor output voltage (Low voltage) (bank 1) P0137: Heated oxygen sensor impedance (High) (bank 1) P0138: Heated oxygen sensor output voltage (High voltage) (bank 1) P0138: Heated oxygen sensor output voltage (Extremely high) (bank 1) P0156: Heated oxygen sensor output voltage (Output voltage) (bank 2) P0156: Heated oxygen sensor impedance (Low) (bank 2) P0157: Heated oxygen sensor output voltage (Low voltage) (bank 2) P0157: Heated oxygen sensor impedance (High) (bank 2) P0158: Heated oxygen sensor output voltage (High voltage) (bank 2) P0158: Heated oxygen sensor impedance (Extremely high) (bank 2)
Required Sensors/Components (Main)	Heated oxygen sensor
Required Sensors/Components (Related)	Crankshaft position sensor, engine coolant temperature sensor, mass air flow meter and throttle position sensor
Frequency of Operation	Once per driving cycle: Active air-fuel ratio control detection Continuous: Others
Duration	20 seconds: Heated oxygen sensor output (Output voltage, High voltage, Low voltage) 30 seconds: Heated oxygen sensor impedance (Low) 90 seconds: Heated oxygen sensor impedance (High) 10 seconds: Heated oxygen sensor voltage (Extremely high)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS
All:

Monitor runs whenever following DTCs not present	P0031, P0032, P0051, P0052 (A/F sensor heater - Sensor 1) P0037, P0038, P0057, P0058 (O2 sensor heater - Sensor 2) P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for closed loop) P0171, P0172 (Fuel system) P0300 - P0306 (Misfire) P0335 (CKP sensor) P0340 (CMP sensor) P0500 (VSS) P2196, P2198 (A/F sensor - rationality) P2A00, P2A03 (A/F sensor - slow response)

ES

Heated Oxygen Sensor Output Voltage (Output Voltage, High Voltage and Low Voltage):

Active air-fuel ratio control	Executing
Active air-fuel ratio control begins when all of following conditions met:	-
Battery voltage	11 V or more
Engine coolant temperature	75 °C (167°F) or more
Idling	OFF
Engine RPM	Less than 3,200 rpm
A/F sensor status	Activated
Fuel system status	closed loop
Fuel cut	OFF (for 10 seconds or more)
Engine load	10 to 70 %
Shift position	4 th or more

Heated Oxygen Sensor Impedance (Low):

Battery voltage	11 V or more
Estimated sensor temperature	Less than 700°C (1,292°F)
ECM monitor	Completed
DTC P0606	Not set

Heated Oxygen Sensor Impedance (High):

Battery voltage	11 V or more
Estimated sensor temperature	520°C (968°F) or more
ECM monitor	Completed
DTC P0606	Not set

Heated Oxygen Sensor Output Voltage (Extremely High):

Battery voltage	11 V or more
Time after engine start	2 seconds or more

TYPICAL MALFUNCTION THRESHOLDS
Heated Oxygen Sensor Output Voltage (Output voltage):

Either of following conditions met:	1 or 2
1. All of following conditions (a), (b) and (c) met	-
(a) Commanded air-fuel ratio	14.3 or less
(b) Rear HO2 sensor voltage	0.21 to 0.59 V
(c) OSC (Oxygen Storage Capacity of Catalyst)	2.5 g or more
2. All of following conditions (d), (e) and (f) met	-
(d) Commanded air-fuel ratio	14.9 or more

(e) Rear HO2 sensor voltage	0.21 to 0.59 V
(f) OSC	2.5 g or more

Heated Oxygen Sensor Output Voltage (Low output voltage):

All of following conditions (a), (b) and (c) met	-
(a) Commanded air-fuel ratio	14.3 or less
(b) Rear HO2 sensor voltage	Less than 0.21 V
(c) OSC (Oxygen Storage Capacity of Catalyst)	2.5 g or more

Heated Oxygen Sensor Output Voltage (High output voltage):

All of following conditions (a), (b) and (c) met	-
(a) Commanded air-fuel ratio	14.9 or more
(b) Rear HO2 sensor voltage	More than 0.59 V
(c) OSC (Oxygen Storage Capacity of Catalyst)	2.5 g or more

ES

Heated Oxygen Sensor Impedance (Low):

Duration of following condition met	30 seconds or more
Heated oxygen sensor impedance	Less than 5 Ω

Heated Oxygen Sensor Impedance (High):

Duration of following condition met	90 seconds or more
Heated oxygen sensor impedance	15 kΩ or more

Heated Oxygen Sensor Output Voltage (Extremely High):

Duration of following condition met	10 seconds or more
Heated oxygen sensor voltage	1.2 V or more

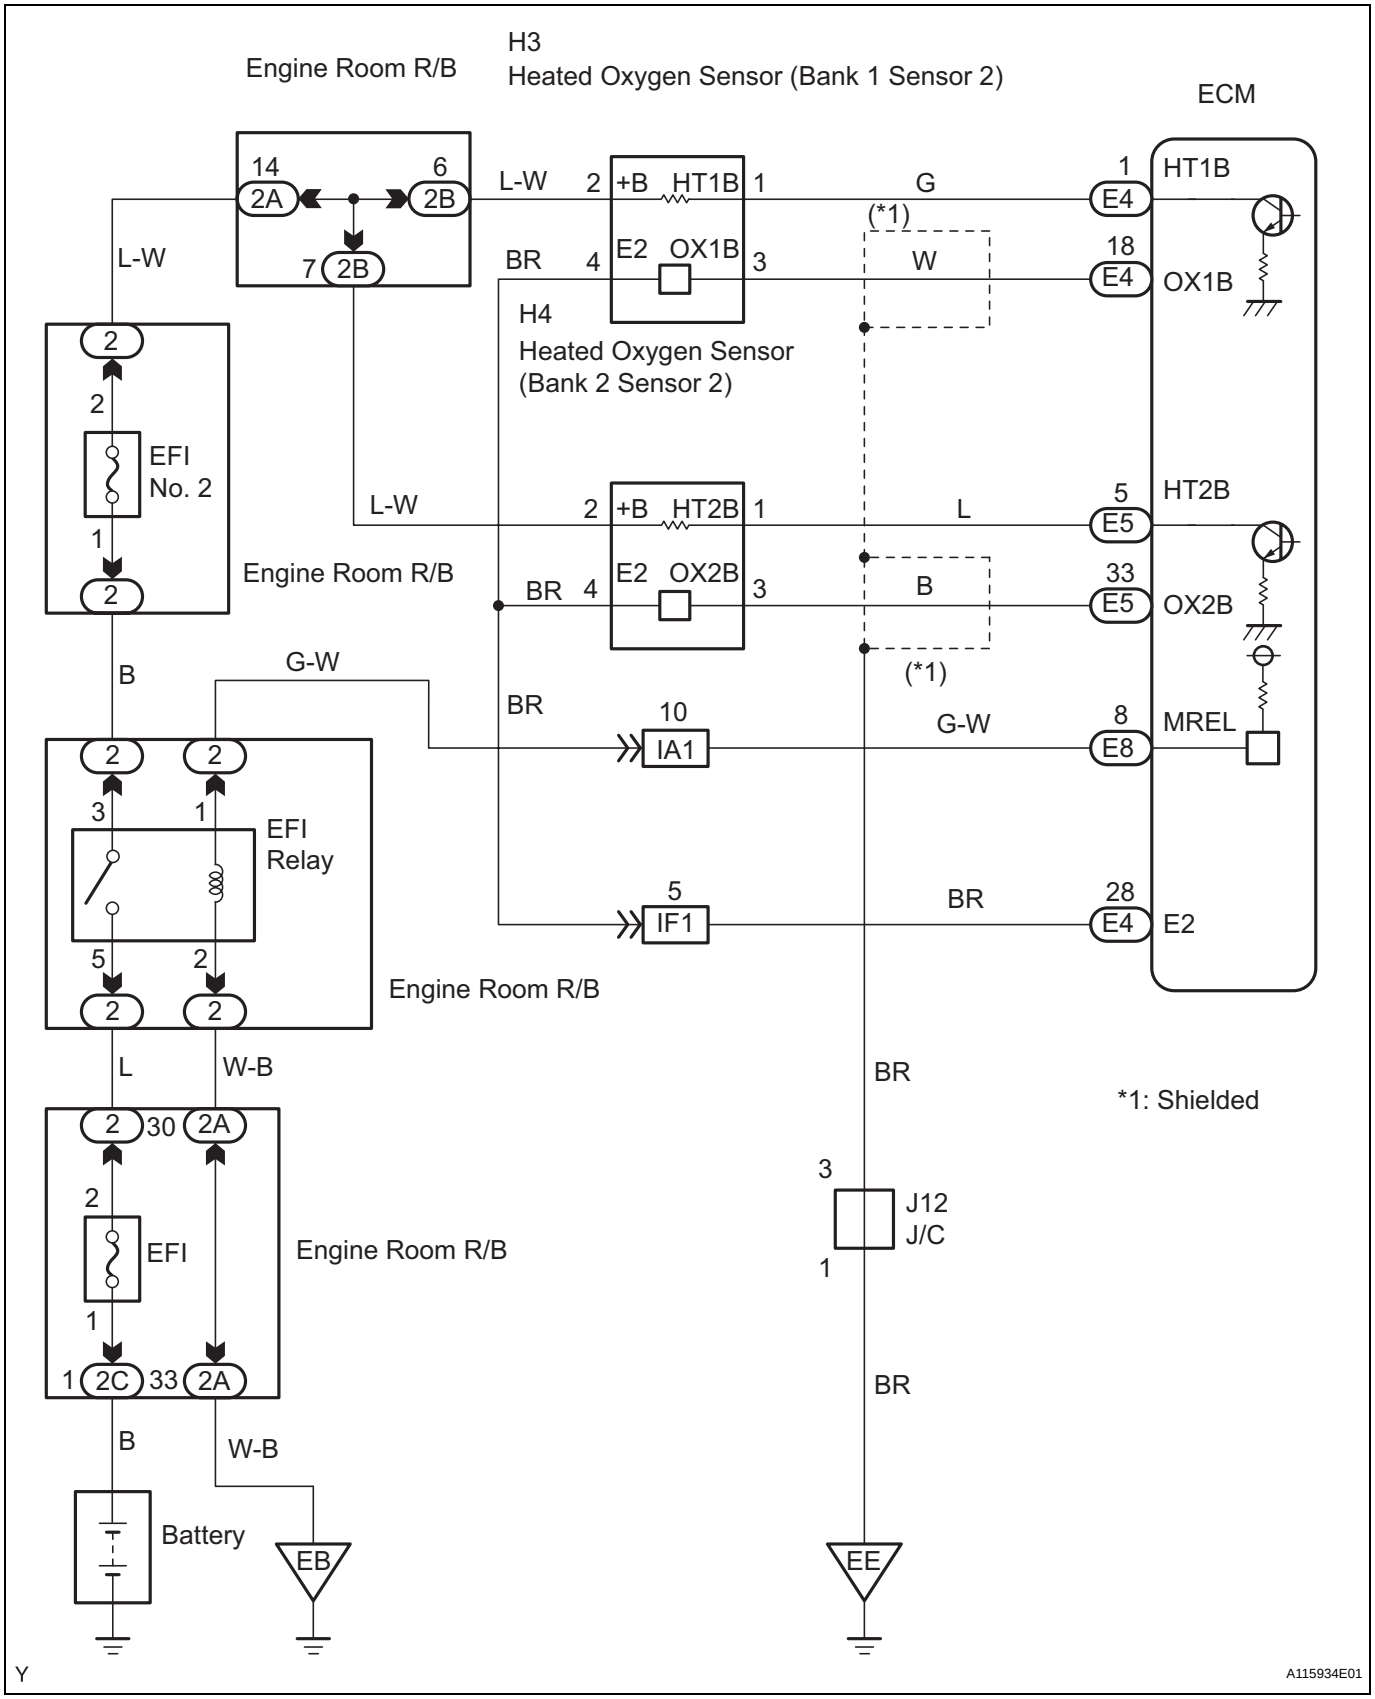
COMPONENT OPERATING RANGE

Duration of following condition met	30 seconds or more
Heated oxygen sensor voltage	Varies between 0.1 V and 0.9 V

MONITOR RESULT

Detailed information on Checking Monitor Status (See page ES-19).

WIRING DIAGRAM



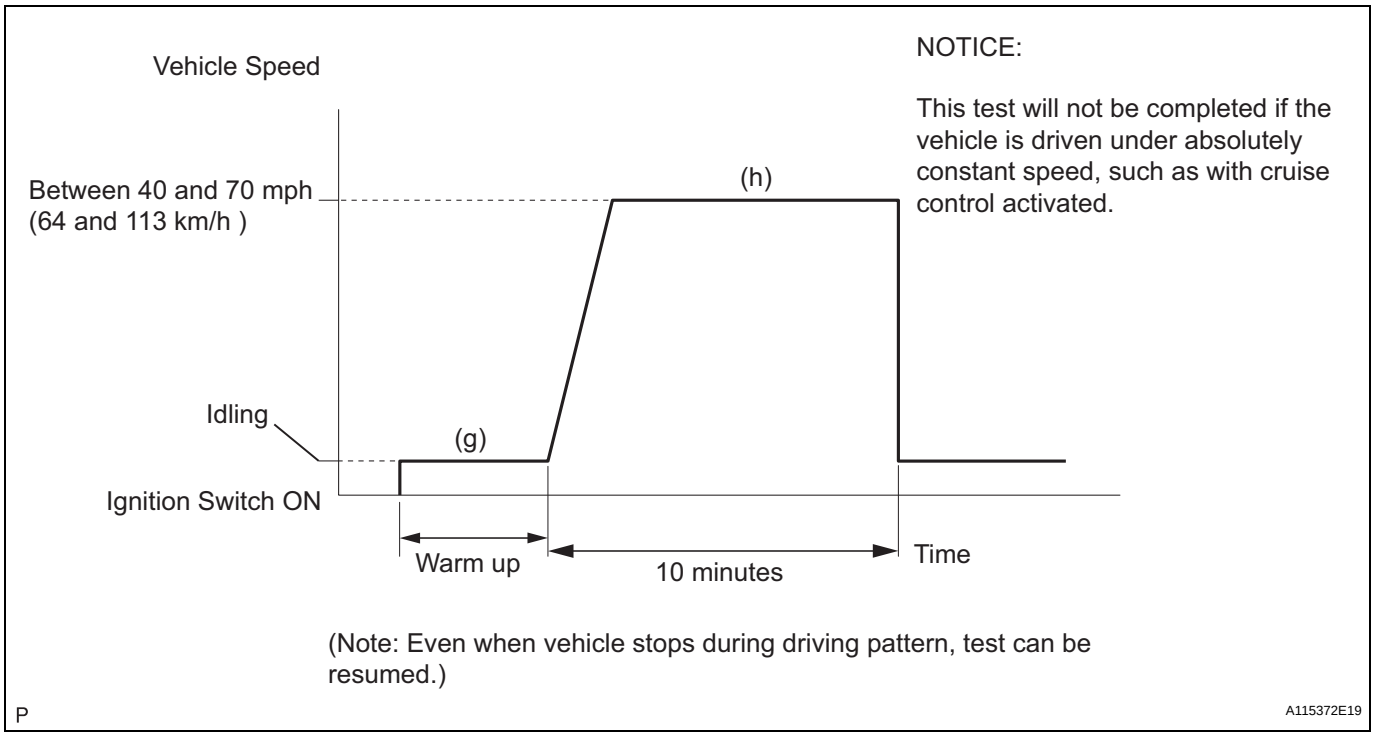
CONFIRMATION DRIVING PATTERN

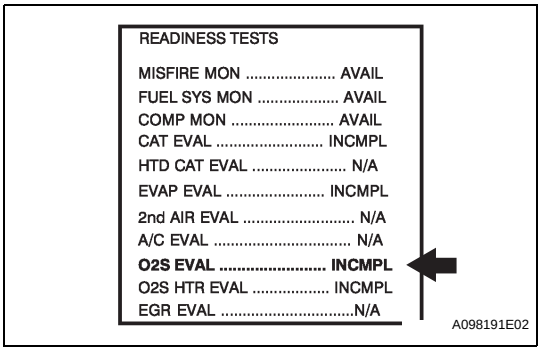
HINT:

- This confirmation driving pattern is used in the "PERFORM CONFIRMATION DRIVING PATTERN" procedure of the following diagnostic troubleshooting procedure.
- Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor. (The catalyst monitor is performed simultaneously.) This is very useful for verifying the completion of a repair.

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.





(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (See page ES-38).
(e) Select the following menu items: DIAGNOSIS / CARB OBD II / READINESS TESTS.
(f) Check that O2S EVAL is INCMPL (incomplete).
(g) Start the engine and warm it up.
(h) Drive the vehicle at between 40 mph and 70 mph (64 km/h and 113 km/h) for at least 10 minutes.
(i) Note the state of the Readiness Tests items. Those items will change to COMPL (complete) as O2S EVAL monitor operates.

(j) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES and check if any DTCs (any pending DTCs) are set.
HINT:
If O2S EVAL does not change to COMPL, and any pending DTCs fail to set, extend the driving time.

HINT:
Intelligent tester only:
Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using an intelligent tester.
(1) Connect an intelligent tester to the DLC3.
(2) Start the engine and turn the tester ON.
(3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(4) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(6) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2) displayed on the tester.
HINT:
- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 or AFS B2S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 or AFS B2S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 or O2S B2S2 (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 or O2S B2S2 (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:
The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.55 V Less than 0.4 V		
2	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.55 V Less than 0.4 V		

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
3	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output Voltage Almost no reaction		Output Voltage Almost no reaction		

ES

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2, and press the YES button and then the ENTER button followed by the F4 button.

HINT:

- If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.
- If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be set.
- If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be set.

1	CHECK ANY OTHER DTCS OUTPUT

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0138 or P0158	A
P0137 or P0157	B
P0136 or P0156	C

B → Go to step 14

C → Go to step 7

A

2	READ VALUE OF INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / O2S B1S2 or O2S B2S2.
(d) Allow the engine to idle.
(e) Read the Heated Oxygen (HO2) sensor output voltage while idling.

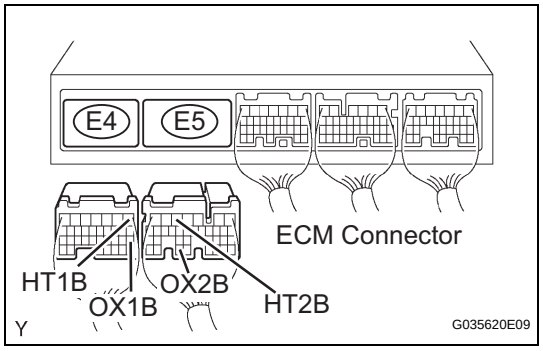
Result

HO2 Sensor Output Voltages	Proceed To
More than 1.2 V	A
Less than 1.0 V	B

B → Go to step 5

A

3	CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT)



(a) Turn the ignition switch OFF and wait for 5 minutes.
(b) Disconnect the E4 or E5 ECM connector.
(c) Check the resistance.
Standard Resistance

Tester Connections	Specified Conditions
HT1B (E4-1) - OX1B (E4-18)	10 kΩ or higher
HT2B (E5-5) - OX2B (E5-33)	

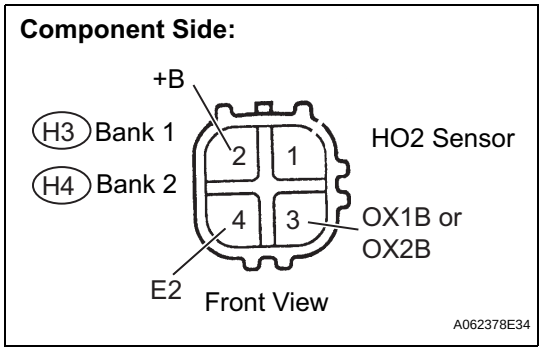
(d) Reconnect the ECM connector.

NG → Go to step 4

OK

REPLACE ECM

4	INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)



(a) Disconnect the H3 or H4 HO2 sensor connector.
(b) Check the resistance.
Standard Resistance

Tester Connections	Specified Conditions
+B (2) - E2 (4)	10 kΩ or higher
+B (2) - OX1B or OX2B (3)	

(c) Reconnect the HO2 sensor connector.

NG → REPLACE HEATED OXYGEN SENSOR

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR

5	PERFORM CONFIRMATION DRIVING PATTERN

NEXT

ES

6	CHECK WHETHER DTC OUTPUT RECURS (DTC P0138 or P0158)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0138 or P0158	A
No output	B

B → **CHECK FOR INTERMITTENT PROBLEMS**

A

REPLACE HEATED OXYGEN SENSOR

7	READ VALUE OF INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Start the engine.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / O2S B1S2 or O2S B2S2.
(e) After warming up the engine, run the engine at an engine speed of 2,500 rpm for 3 minutes.
(f) Read the output voltage of the HO2 sensor when the engine rpm is suddenly increased.
HINT:
Quickly accelerate the engine to 4,000 rpm 3 times using the accelerator pedal.
Standard:
Fluctuates between 0.4 V or less and 0.5 V or more.

NG → **Go to step 14**

OK

8	PERFORM CONFIRMATION DRIVING PATTERN

NEXT

9	CHECK WHETHER DTC OUTPUT RECURS (DTC P0136 or P0156)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

ES

Result

Display (DTC Output)	Proceed To
P0136 or P0156	A
No output	B

B → CHECK FOR INTERMITTENT PROBLEMS

A

10	REPLACE HEATED OXYGEN SENSOR

NEXT

11	PERFORM CONFIRMATION DRIVING PATTERN

NEXT

12	CHECK WHETHER DTC OUTPUT RECURS (DTC P0136 or P0156)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0136 or P0156	A
No output	B

B → REPAIR COMPLETED

A

13	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

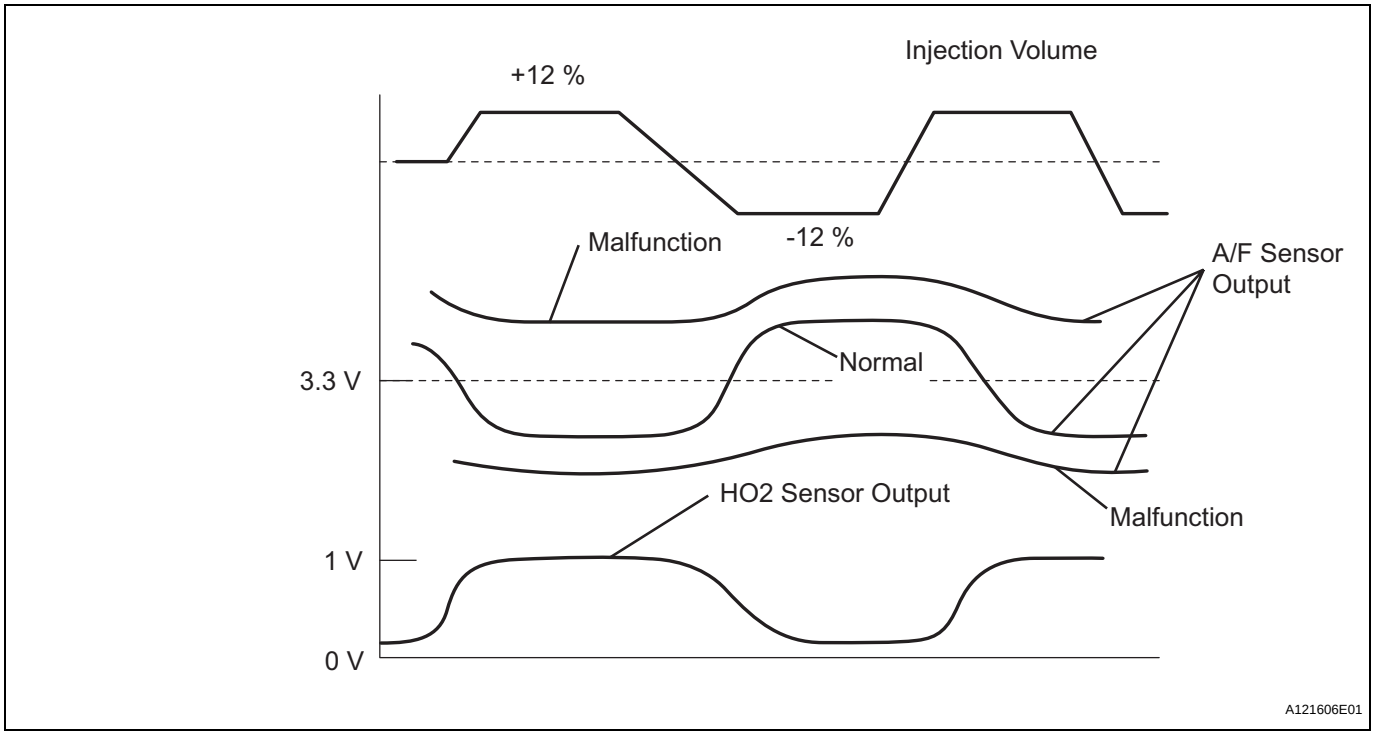
(a) Connect an intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / INJ VOL.
(e) Change the fuel injection volume using the tester, monitoring the voltage output of Air-Fuel Ratio (A/F) and HO2 sensors displayed on the tester.
HINT:
- Change the fuel injection volume within the range of -12 % and +12 %. The injection volume can be changed in 1 % graduations within the range.
- The A/F sensor is displayed as AFS B1S1 or AFS B2S1, and the HO2 sensor is displayed as O2S B1S2 or O2S B2S2, on intelligent testers.

ES

Result

Tester Display (Sensor)	Voltage Variations	Proceed To
AFS B1S1 (A/F) AFS B2S1 (A/F)	Alternates between more and less than 3.3 V	OK
AFS B1S1 (A/F) AFS B2S1 (A/F)	Remains at more than 3.3 V	NG
AFS B1S1 (A/F) AFS B2S1 (A/F)	Remains at less than 3.3 V	NG

HINT:
A normal HO2 sensor voltage (O2S B1S2 or O2S B2S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or more than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.



NG → **REPLACE AIR FUEL RATIO SENSOR**

OK

CHECK AND REPAIR EXTREMELY RICH OR LEAN ACTUAL AIR FUEL RATIO (INJECTOR, FUEL PRESSURE, GAS LEAKAGE FROM EXHAUST SYSTEM, ETC.)

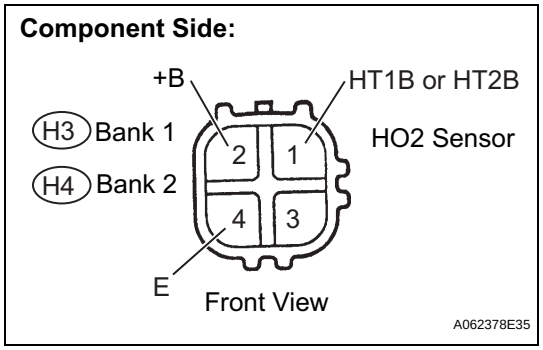
14 CHECK EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → **REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT**

OK

15 INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



(a) Disconnect the H3 or H4 HO2 sensor connector.
(b) Measure the resistance between the terminals of the HO2 sensor connector.
Standard Resistance

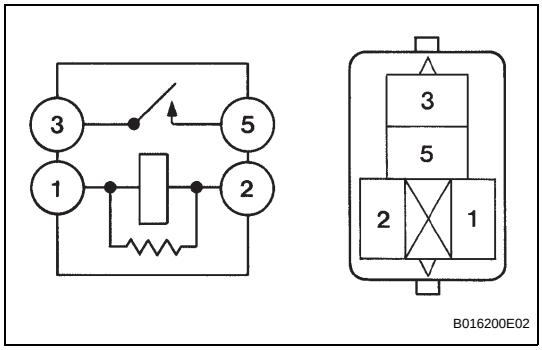
Tester Connections	Specified Conditions
HT1B or HT2B (1) - +B (2)	11 to 16 Ω at 20°C (68°F)
HT1B or HT2B (1) - E2 (4)	10 kΩ or higher

(c) Reconnect the HO2 sensor connector.

NG → **REPLACE HEATED OXYGEN SENSOR**

OK

16 INSPECT EFI RELAY



(a) Remove the EFI relay from the engine room R/B.
(b) Check the EFI relay resistance.

Standard Resistance

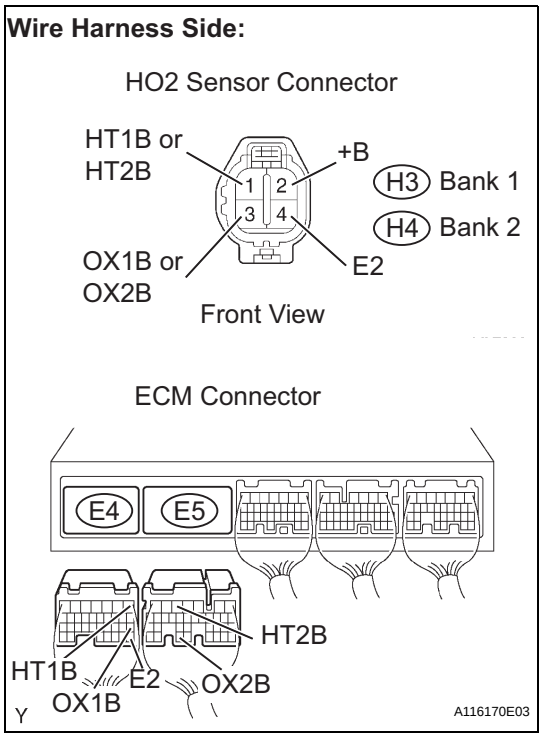
Terminal Connections	Specified Conditions
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the EFI relay.

NG → REPLACE EFI RELAY

OK

17 CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)



(a) Disconnect the H3 or H4 HO2 sensor connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the +B terminal of the HO2 sensor connector and body ground.

Standard Voltage

Terminal Connections	Specified Conditions
+B (H3-2) - Body ground	9 to 14 V
+B (H4-2) - Body ground	

(d) Turn the ignition switch OFF.
(e) Disconnect the E4 and E5 ECM connectors.
(f) Check the resistance.

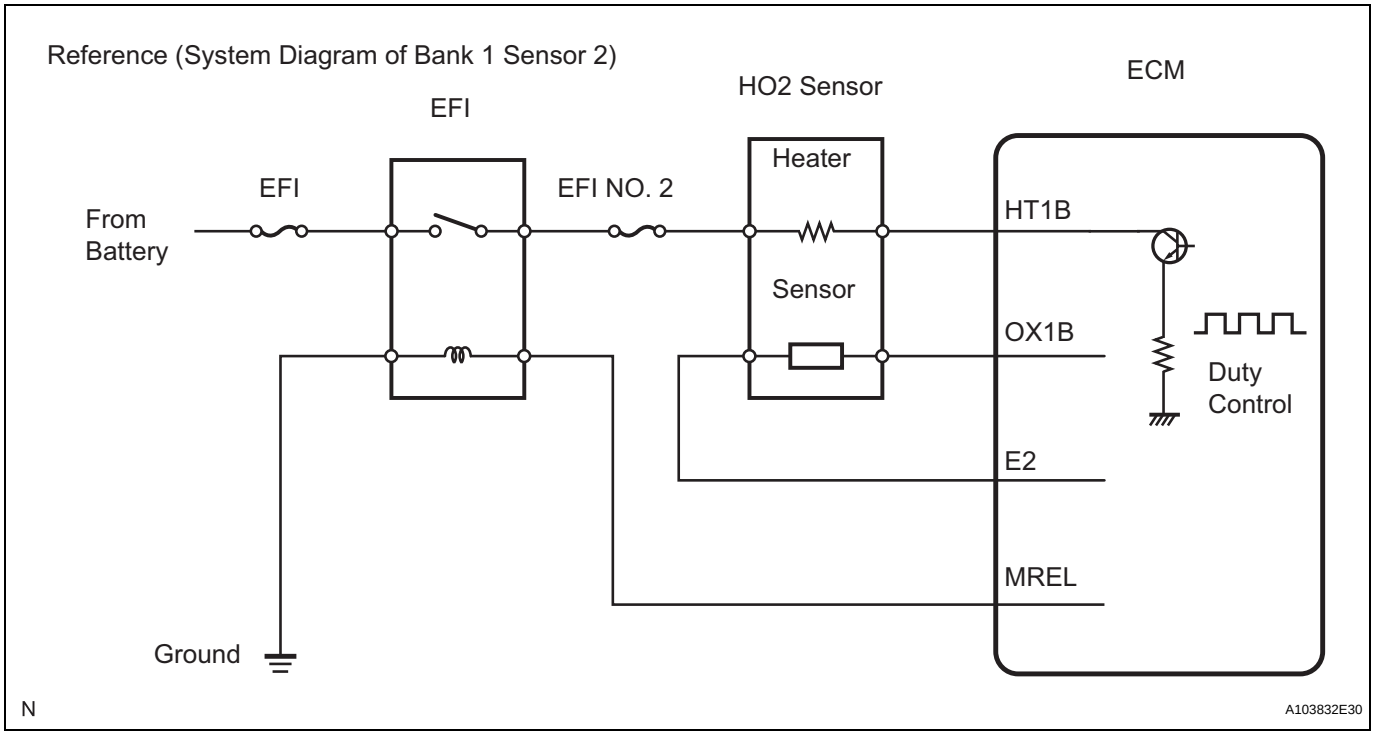
Standard Resistance (Check for open)

Terminal Connections	Specified Conditions
HT1B (H3-1) - HT1B (E4-1)	Below 1 Ω
OX1B (H3-3) - OX1B (E4-18)	
E2 (H3-4) - E2 (E4-28)	
HT2B (H4-1) - HT2B (E5-5)	
OX2B (H4-3) - OX2B (E5-33)	
E2 (H4-4) - E2 (E4-28)	

Standard Resistance (Check for short)

Terminal Connections	Specified Conditions
HT1B (H3-1) or HT1B (E4-1) - Body ground	10 kΩ or higher
OX1B (H3-3) or OX1B (E4-18) - Body ground	
HT2B (H4-1) or HT2B (E5-5) - Body ground	
OX2B (H4-3) or OX2B (E5-33) - Body ground	

(g) Reconnect the HO2 sensor connector.
(h) Reconnect the ECM connectors.



ES

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

REPLACE HEATED OXYGEN SENSOR

DTC	P0171	System Too Lean (Bank 1)

DTC	P0172	System Too Rich (Bank 1)

DTC	P0174	System Too Lean (Bank 2)

DTC	P0175	System Too Rich (Bank 2)

DESCRIPTION

ES

The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim consists of both the short-term and long-term fuel trims.

The short-term fuel trim is fuel compensation that is used to constantly maintain the air-fuel ratio at stoichiometric levels. The signal from the Air-Fuel Ratio (A/F) sensor indicates whether the air-fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air-fuel ratio is rich and an increase in the fuel injection volume if it is lean.

Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel trim to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short- term fuel trim compensation.

If both the short-term and long-term fuel trims are lean or rich beyond predetermined values, it is interpreted as a malfunction, and the ECM illuminates the MIL and sets a DTC.

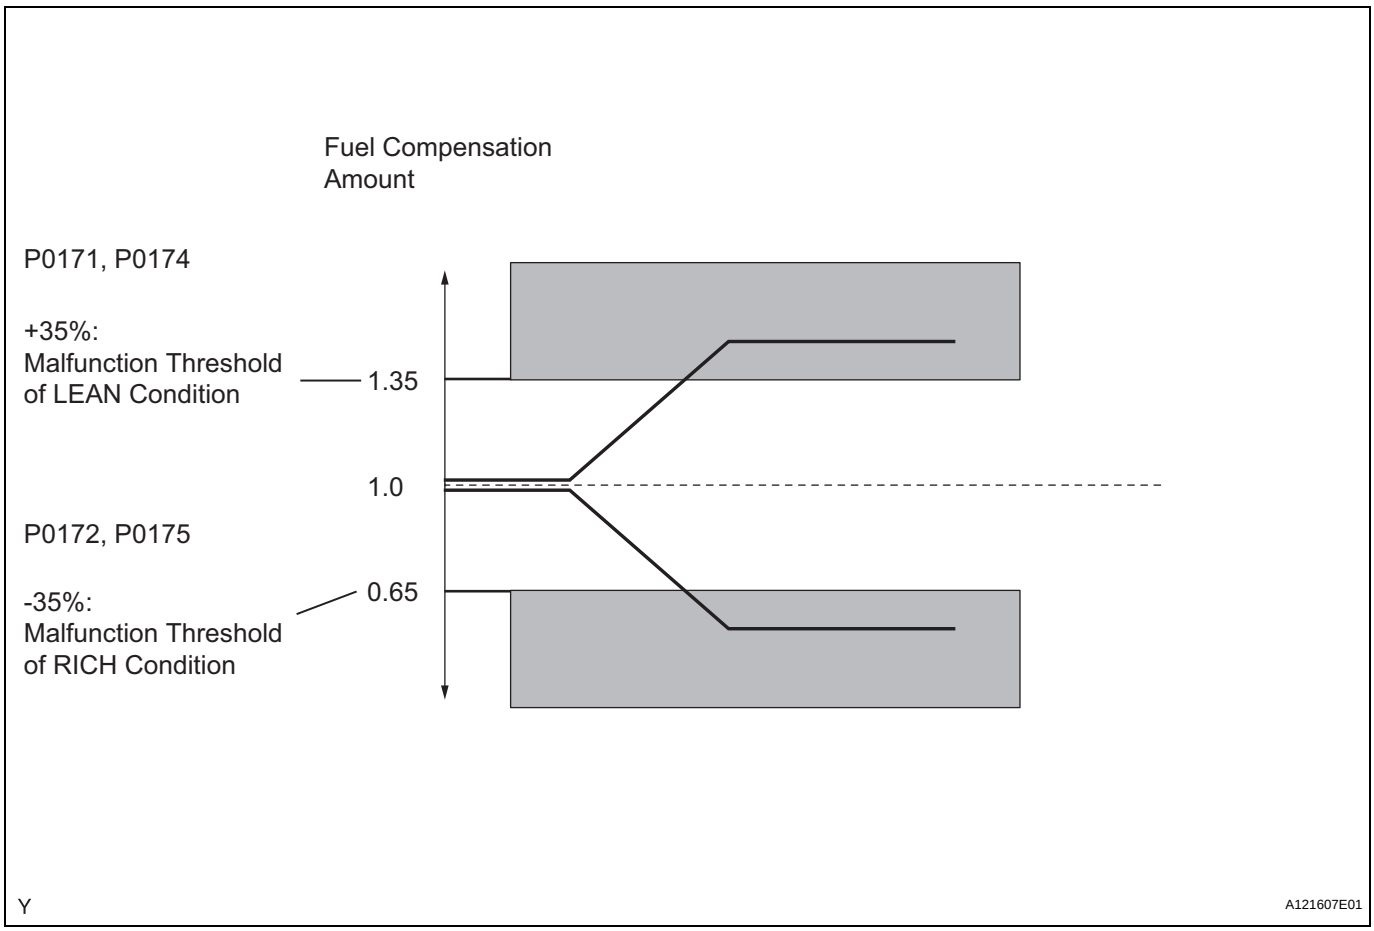
DTC No.	DTC Detection Conditions	Trouble Areas
P0171 P0174	With warm engine and stable air-fuel ratio feedback, fuel trim considerably in error to lean side (2 trip detection logic)	• Air induction system • Injector blockage • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor heater (bank 1, 2 sensor 1) • A/F sensor heater relay • A/F sensor heater and A/F sensor heater relay circuits • PCV valve and hose • PCV hose connections • ECM
P0172 P0175	With warm engine and stable air-fuel ratio feedback, fuel trim considerably in error to rich side (2 trip detection logic)	• Injector leakage or blockage • MAF meter • ECT sensor • Ignition system • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor heater (bank 1, 2 sensor 1) • A/F sensor heater relay • A/F sensor heater and A/F sensor heater relay circuits • ECM

HINT:

- When DTC P0171 or P0174 is set, the actual air-fuel ratio is on the lean side. When DTC P0172 or P0175 is set, the actual air-fuel ratio is on the rich side.
- If the vehicle runs out of fuel, the air-fuel ratio is lean and DTC P0171 or P0174 may be set. The MIL is then illuminated.
- When the total of the short-term and long-term fuel trim values is within the malfunction threshold (and the engine coolant temperature is more than 75°C [167°F]), the system is functioning normally.

MONITOR DESCRIPTION

Under closed-loop fuel control, fuel injection volumes that deviate from those estimated by the ECM cause changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim values. Deviations from the ECM's estimated fuel injection volumes also affect the average fuel trim learning value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learning value of the air- fuel ratio). If the average fuel trim learning value exceeds the malfunction thresholds, the ECM interprets this a fault in the fuel system and sets a DTC.
Example:
The average fuel trim learning value is more than +35 % or less than -35 %, the ECM interprets this as a fuel system malfunction.



MONITOR STRATEGY

Related DTCs	P0171: Fuel trim Lean (bank 1) P0172: Fuel trim Rich (bank 1) P0174: Fuel trim Lean (bank 2) P0175: Fuel trim Rich (bank 2)

Frequency of Operation	Continuous
Duration	Within 10 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Fuel-trim:

Monitor runs whenever following DTCs not present	P0010, P0020 (OCV Bank 1, 2) P0011 (VVT System 1 - Advance) P0012 (VVT System 1 - Retard) P0021 (VVT System 2 - Advance) P0022 (VVT System 2 - Retard) P0031, P0032, P0051, P0052 (A/F sensor heater - Sensor 1) P0100 - P0103 (MAF meter) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for closed loop) P0335 (CKP sensor) P0340 (CMP sensor) P0351 - P0356 (Igniter) P0500 (VSS)
Fuel system status	Closed-loop
Battery voltage	11 V or more
Throttle position learning	Completed
Either of following conditions 1 or 2 set	-
1. Engine RPM	Below 1,100 rpm
2. Intake air amount per revolution	0.22 g/rev or more
Catalyst monitor	No executed

TYPICAL MALFUNCTION THRESHOLDS

Fuel-trim:

Purge-cut	Executing
Either of following conditions 1 or 2 met	-
1. Average between short-term fuel trim and long-term fuel trim	35 % or more at 80°C (176°F) of ECT
2. Average between short-term fuel trim and long-term fuel trim	-35 % or less at 80°C (176°F) of ECT

WIRING DIAGRAM

Refer to DTC P2195 (See page ES-309).

HINT:
Intelligent tester only:
Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using an intelligent tester.
(1) Connect an intelligent tester to the DLC3.
(2) Start the engine and turn the tester ON.
(3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(4) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(6) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2) displayed on the tester.
HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.

- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 or AFS B2S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 or AFS B2S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 or O2S B2S2 (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 or O2S B2S2 (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:
The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

ES

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		-
	Output voltage More than 3.35 V Less than 3.0 V		Output voltage More than 0.55 V Less than 0.4 V		
2	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output voltage Almost no reaction		Output voltage More than 0.55 V Less than 0.4 V		
3	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output voltage More than 3.35 V Less than 3.0 V		Output voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output voltage Almost no reaction		Output voltage Almost no reaction		

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2, and press the YES button and then the ENTER button followed by the F4 button.

HINT:

- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0171, P0172, P0174 OR P0175)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

ES

Result

Display (DTC output)	Proceed To
P0171, P0172, P0174 or P0175	A
P0171, P0172, P0174 or P0175 and other DTCs	B

HINT:
If any DTCs other than P0171, P0172, P0174 or P0175 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

A

2	CHECK PCV HOSE CONNECTIONS

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**

OK

3	CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

4	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

(a) Connect an intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.

(e) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).

(f) Monitor the voltage outputs of A/F and HO2 sensors (AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2) displayed on the tester.
HINT:
- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 or AFS B2S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 or AFS B2S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 or O2S B2S2 (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 or O2S B2S2 (HO2)	-12.5 %	Lean	Less than 0.4

Result:

Status AFS B1S1 or AFS B2S1	Status O2S B1S2 or O2S B2S2	A/F Condition and A/F Sensor Condition	Misfires	Suspected Trouble Areas	Proceed To
Lean/Rich	Lean/Rich	Normal	-	-	C
Lean	Lean	Actual air-fuel ratio lean	May occur	• PCV valve and hose • PCV hose connections • Injector blockage • Gas leakage from exhaust system • Air induction system • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor	A
Rich	Rich	Actual air-fuel ratio rich	-	• Injector blockage or blockage • Gas leakage from exhaust system • Ignition system • Fuel pressure • MAF meter • ECT sensor	
Lean	Lean/Rich	A/F sensor malfunction	-	• A/F sensor	B
Rich	Lean/Rich	A/F sensor malfunction	-	• A/F sensor	

Lean: During A/F CONTROL, the A/F sensor output voltage (AFS) is consistently more than 3.35 V, and the HO2 sensor output voltage (O2S) is consistently less than 0.4 V.
Rich: During A/F CONTROL, the AFS is consistently less than 3.0 V, and the O2S is consistently more than 0.55 V.
Lean/Rich: During A/F CONTROL of the ACTIVE TEST, the output voltage of the heated oxygen sensor alternates correctly.

B	**Go to step 11**

C → Go to step 15

A

5	READ VALUE OF INTELLIGENT TESTER (COOLANT TEMP)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.
(d) Read the COOLANT TEMP twice, when the engine is both cold and warmed up.
Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (176°C and 212°F).

NG → **REPLACE ENGINE COOLANT TEMPERATURE SENSOR**

OK

6	READ VALUE OF INTELLIGENT TESTER (MAF)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / MAF and COOLANT TEMP.
(d) Allow the engine to idle until the COOLANT TEMP reaches 75°C (167°F) or more.
(e) Read the MAF with the engine in an idling condition and at an engine speed of 2,500 rpm.
Standard:
MAF while engine idling: Between 3.2 g/sec and 4.7 g/sec (shift position: N, A/C: OFF).
MAF at engine speed of 2,500 rpm: Between 13.1 g/sec and 18.9 g/sec (shift position: N, A/C: OFF).

NG → **REPLACE MASS AIR FLOW METER**

OK

7	CHECK FUEL PRESSURE

(a) Check the fuel pressure (See page FU-6).

NG → **REPAIR OR REPLACE FUEL SYSTEM**

OK

8	CHECK EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → **REPAIR OR REPLACE EXHAUST SYSTEM**

OK

9	CHECK SPARK AND IGNITION

HINT:
If the spark plugs or ignition system malfunctions, engine misfire may occur. The misfire count can be read using an intelligent tester. Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / CYL #1 (to CYL #6).

NG → **REPAIR OR REPLACE IGNITION SYSTEM**

OK

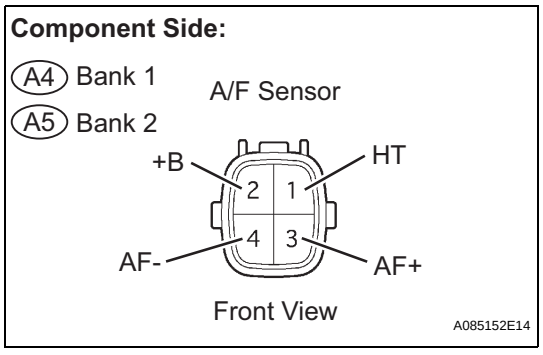
10	INSPECT FUEL INJECTOR ASSEMBLY (INJECTION AND VOLUME)

HINT:
If the injectors malfunction, engine misfire may occur. The misfire count can be read using an intelligent tester. Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / CYL #1 (to CYL #6).

NG → **REPLACE FUEL INJECTOR ASSEMBLY**

OK

11	INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



(a) Disconnect the A4 or A5 A/F sensor connector.
(b) Measure the resistance between the terminals of the A/F sensor connector.
Standard Resistance

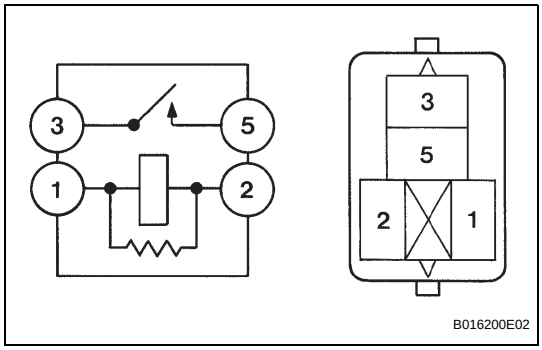
Tester Connections	Specified Conditions
HT (1) - +B (2)	1.8 Ω to 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 kΩ or higher

(c) Reconnect the A/F sensor connector.

NG → **REPLACE AIR FUEL RATIO SENSOR**

OK

12 INSPECT AIR FUEL RATIO SENSOR HEATER RELAY



(a) Remove the A/F sensor heater relay from the engine room R/B.
(b) Check the A/F sensor heater relay resistance.

Standard Resistance

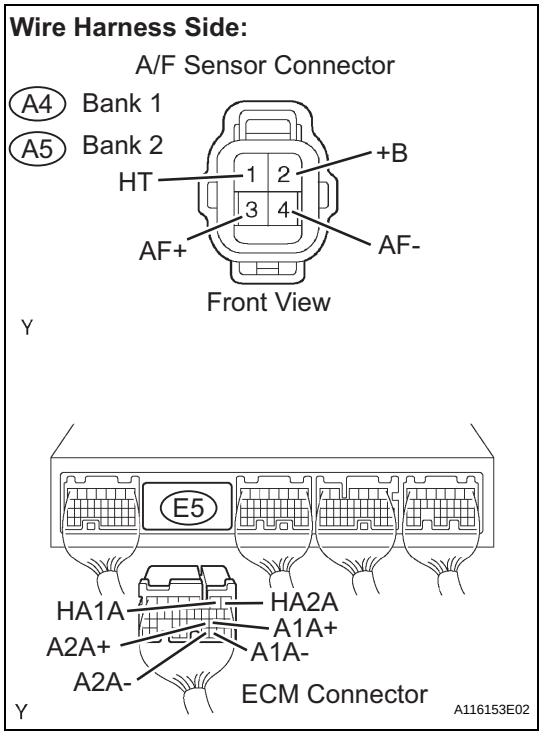
Tester Connections	Specified Conditions
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the A/F sensor heater relay.

NG → **REPLACE AIR FUEL RATIO SENSOR HEATER RELAY**

OK

13 CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)



(a) Disconnect the A4 or A5 A/F sensor connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the +B terminal of the A/F sensor connector and body ground.

Standard Voltage

Tester Connections	Specified Conditions
+B (A4-2) - Body ground	9 to 14 V
+B (A5-2) - Body ground	

(d) Turn the ignition switch OFF.
(e) Disconnect the E5 ECM connector.
(f) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
HT (A4-1) - HA1A (E5-2)	Below 1 Ω
AF+ (A4-3) - A1A+ (E5-22)	
AF- (A4-4) - A1A- (E5-30)	
HT (A5-1) - HA2A (E5-1)	
AF+ (A5-3) - A2A+ (E5-23)	
AF- (A5-4) - A2A- (E5-31)	

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
HT (A4-1) or HA1A (E5-2) - Body ground	10 kΩ or higher
AF+ (A4-3) or A1A+ (E5-22) - Body ground	
AF- (A4-4) or A1A- (E5-30) - Body ground	
HT (A5-1) or HA2A (E5-1) - Body ground	
AF+ (A5-3) or A2A+ (E5-23) - Body ground	
AF- (A5-4) or A2A- (E5-31) - Body ground	

(g) Reconnect the ECM connector.
(h) Reconnect the A/F sensor connector.

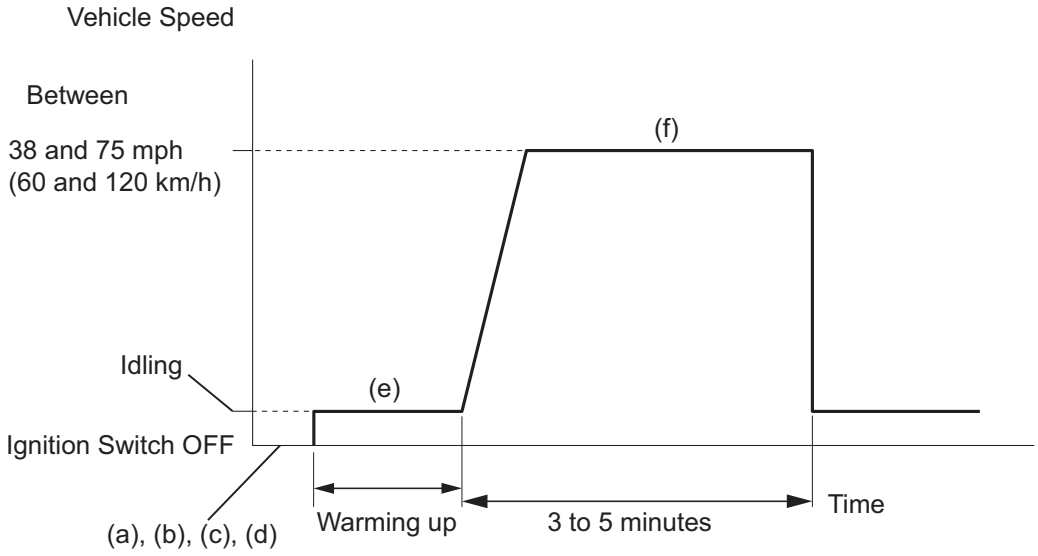
14	REPLACE AIR FUEL RATIO SENSOR

(a) Replace the A/F sensor (See page EC-17).

NEXT

15	PERFORM CONFIRMATION DRIVING PATTERN



(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (See page ES-38).
(d) Switch the ECM from normal mode to check mode using the tester (See page ES-41).
(e) Start the engine and warm it up with all the accessories switched OFF.
(f) Drive the vehicle at between 38 mph and 75 mph (60 km/h and 120 km/h) and at an engine speed of between 1,400 rpm and 3,200 rpm for 3 to 5 minutes.
HINT:
If the system is still malfunctioning, the MIL will be illuminated during step (f).
NOTICE:
If the conditions in this test are not strictly followed, no malfunction will be detected.

NEXT

16	CHECK WHETHER DTC OUTPUT RECURS (DTC P0171, P0172, P0174 OR P0175)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCS.

Result

Display (DTC output)	Proceed To
No output	A
P0171, P0172, P0174 or P0175	B

B → Go to step 5

A

END

DTC	P0230	Fuel Pump Primary Circuit

DESCRIPTION

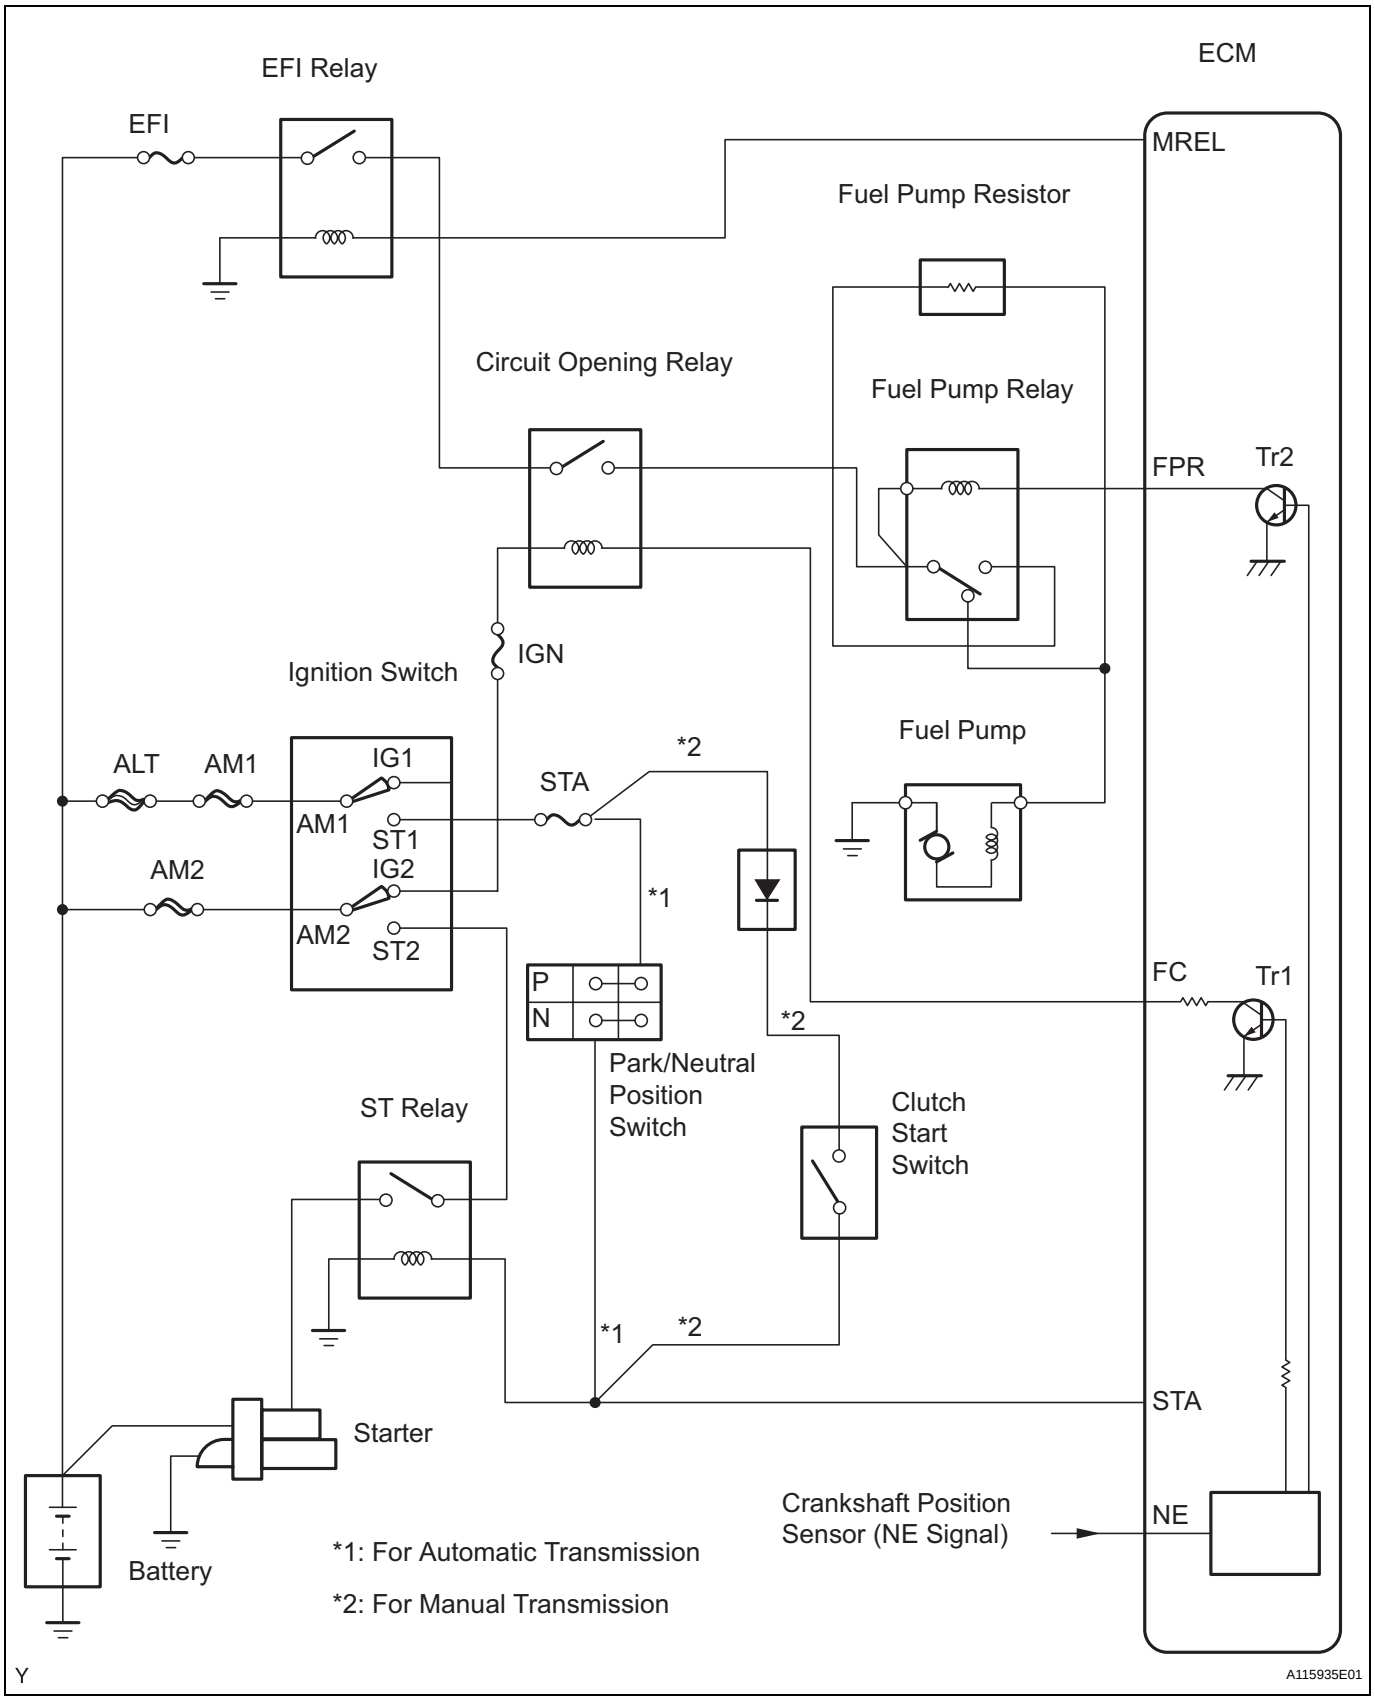
As shown in the illustration, when the engine is cranked, current flows from terminal ST1 of the ignition switch into the ECM and the ST (starter) relay coil and also current flows to terminal STA of the ECM (STA signal).

When the STA signal and NE signal are input to the ECM, Tr1 (power transistor 1) is turned ON, current flows to the coil of the circuit opening relay, the relay switches on, power is supplied to the fuel pump, and the fuel pump operates.

While the NE signal is generated (engine running), the ECM keeps the Tr1 ON (circuit opening relay ON) and the fuel pump also keeps operating.

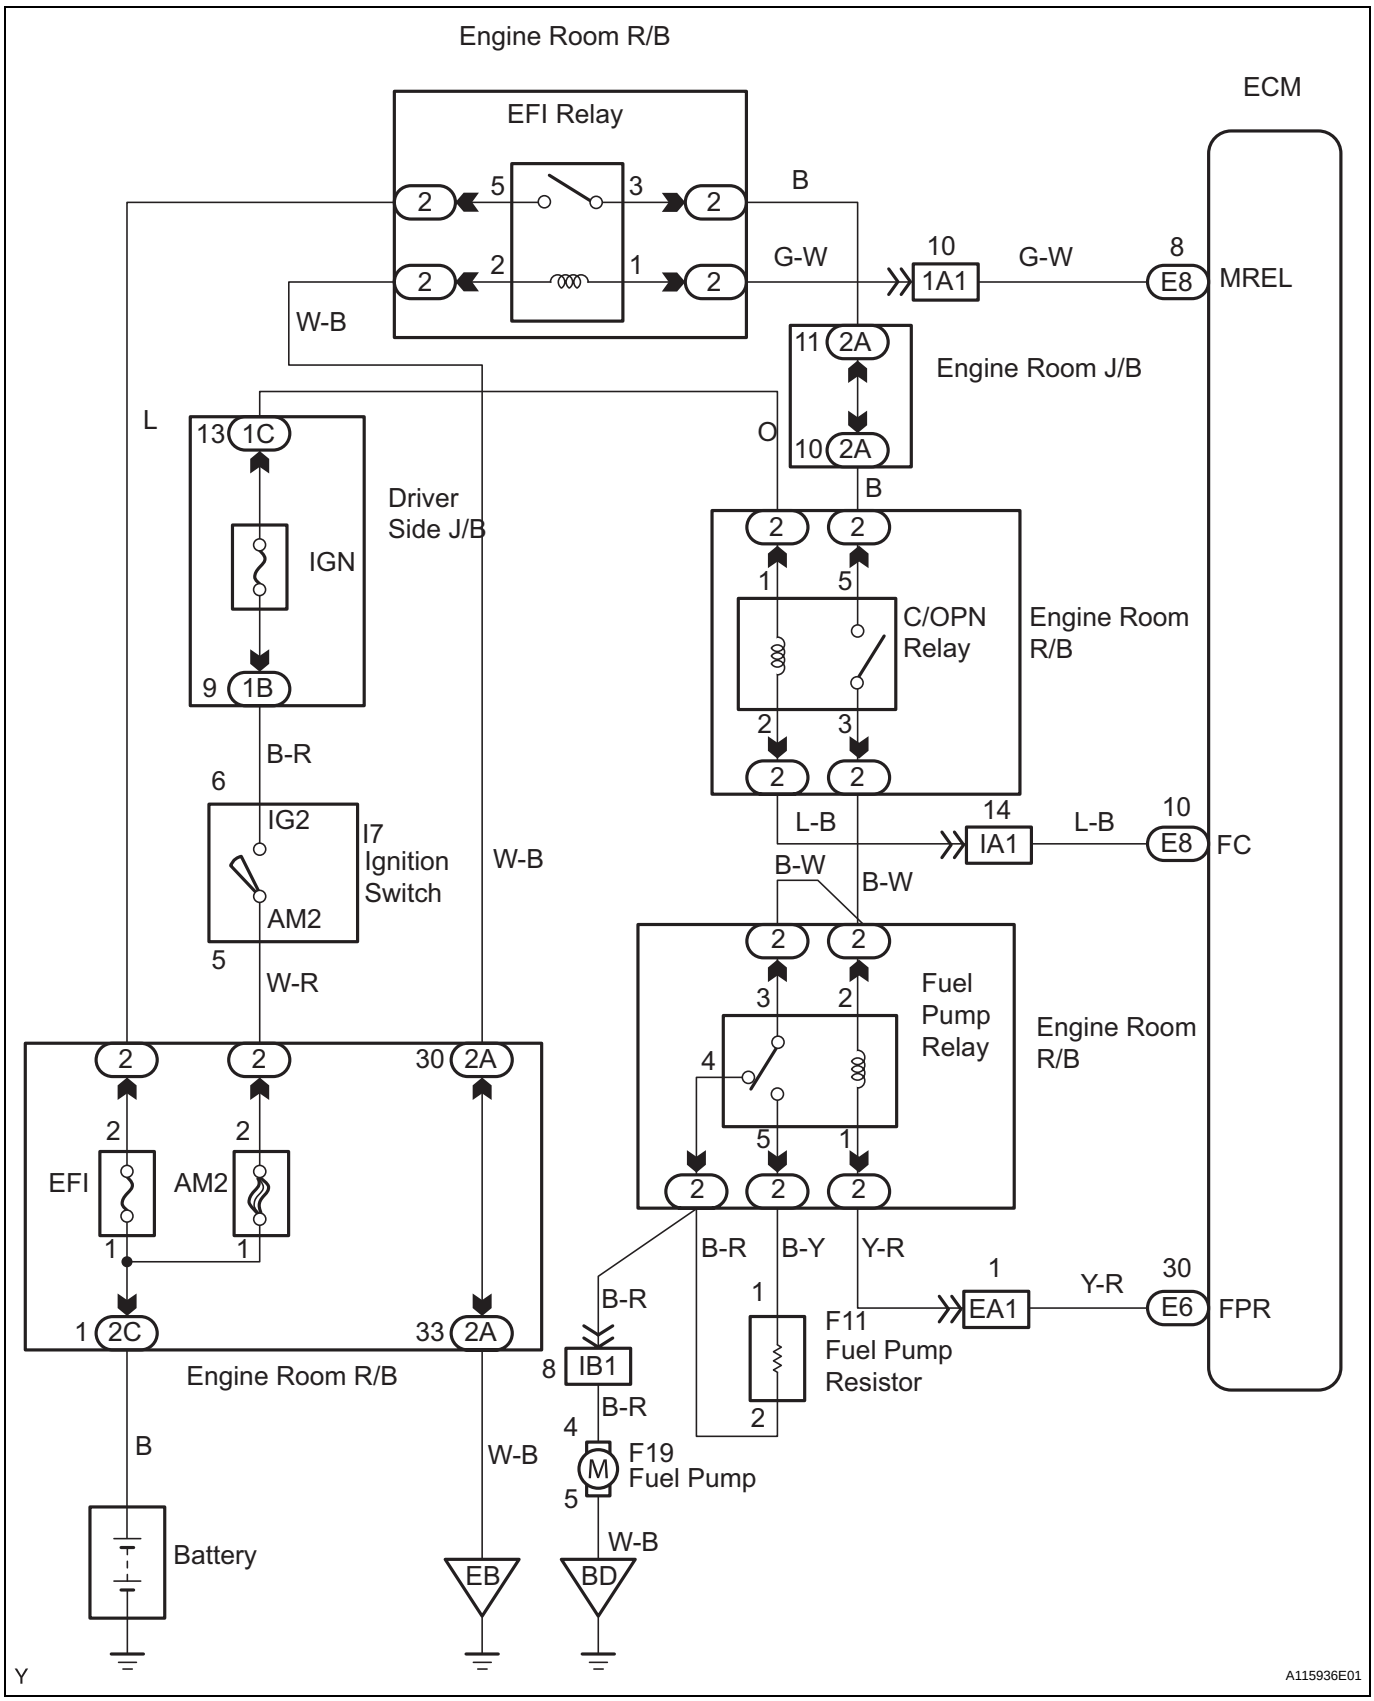
The fuel pump speed is controlled at two levels (high speed or low speed) by engine condition (starting, light load, heavy load). When the engine starts (STA ON), Tr2 (power transistor 2) in the ECM is OFF, so the fuel pump relay closes and positive battery voltage is applied directly to the fuel pump. The fuel pump operates at high speed.

During idling or under light loads, Tr2 goes ON, and then power is supplied to the fuel pump via the fuel pump resistor. The fuel pump operates at low speed.



DTC No	DTC Detection Condition	Trouble Areas
P0230	Open or short in fuel pump relay circuit (1 trip detection logic)	• Open or short in fuel pump relay circuit • Fuel pump relay • ECM

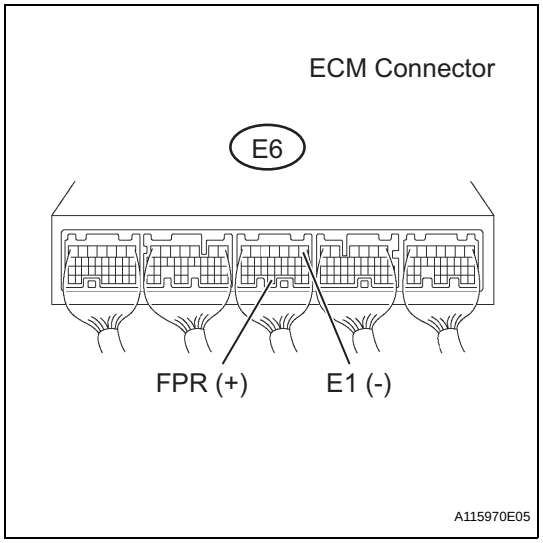
WIRING DIAGRAM



HINT:
This DTC chart is on the premise that the engine is started normally. If the engine is difficult to start, proceed to the problem symptoms table (See page ES-28).

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 CHECK ECM (FPR VOLTAGE)



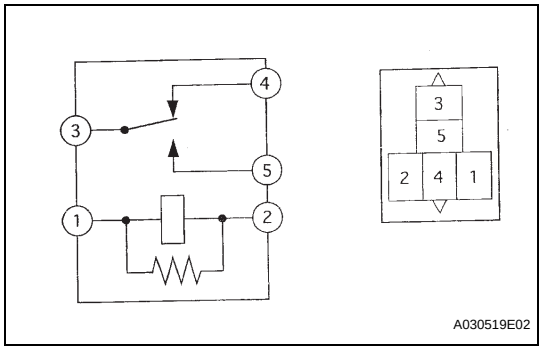
(a) Measure the voltage between the terminals of the E6 ECM connector.
Standard Voltage

Tester Connections	Conditions	Specified Conditions
FPR (E6-30) - E1 (E6-1)	STA signal ON	9 to 14 V
FPR (E6-30) - E1 (E6-1)	STA signal OFF	0 to 3 V

NG → **REPLACE ECM**

OK

2 INSPECT FUEL PUMP RELAY ASSEMBLY



(a) Remove the fuel pump relay from the engine room R/B.
(b) Check the fuel pump relay resistance.
Standard Resistance

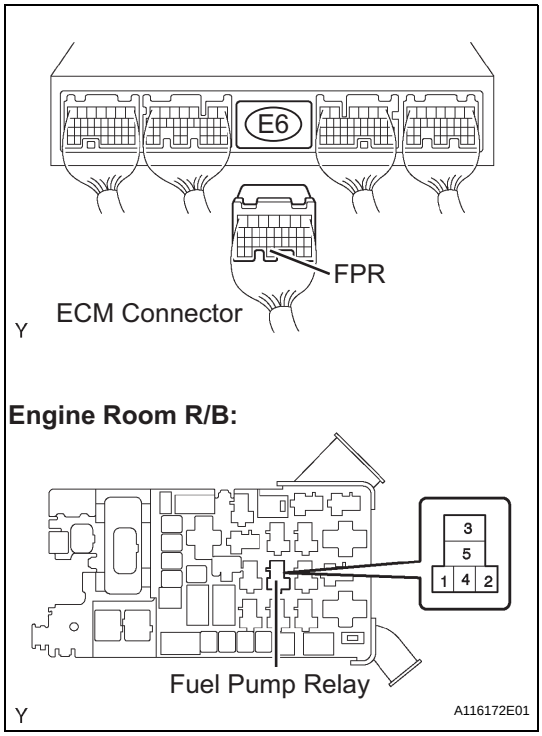
Tester Connections	Specified Conditions
3 - 4	Below 1 Ω
3 - 5	10 kΩ or higher
3 - 4	10 kΩ or higher (when battery voltage applied to terminals 1 and 2)
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the fuel pump relay.

NG → **REPLACE FUEL PUMP RELAY ASSEMBLY**

OK

3	CHECK HARNESS AND CONNECTOR (F/PMP RELAY - ECM)



(a) Remove the fuel pump relay from the engine room R/B.
(b) Disconnect the E6 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
Fuel pump relay (1) - FPR (E6-30)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
Fuel pump relay (1) or FPR (E6-30) - Body ground	10 kΩ or higher

(d) Reinstall the fuel pump relay.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

DTC	P0300	Random / Multiple Cylinder Misfire Detected

DTC	P0301	Cylinder 1 Misfire Detected

DTC	P0302	Cylinder 2 Misfire Detected

DTC	P0303	Cylinder 3 Misfire Detected

DTC	P0304	Cylinder 4 Misfire Detected

DTC	P0305	Cylinder 5 Misfire Detected

DTC	P0306	Cylinder 6 Misfire Detected

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increase in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent this increase in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted when the crankshaft rotation speed variations exceed predetermined thresholds. If the misfire exceeds the threshold levels, and could cause emission deterioration, the ECM illuminates the MIL and sets a DTC.

DTC No.	DTC Detection Conditions	Trouble Areas
P0300	Simultaneous misfiring of several cylinders detected (2 trip detection logic)	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306	Misfiring of specific cylinder detected (2 trip detection logic)	

HINT:

When DTCs for misfiring cylinders are randomly set, but DTC P0300 is not set, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only set when several misfiring cylinders are detected at the same time.

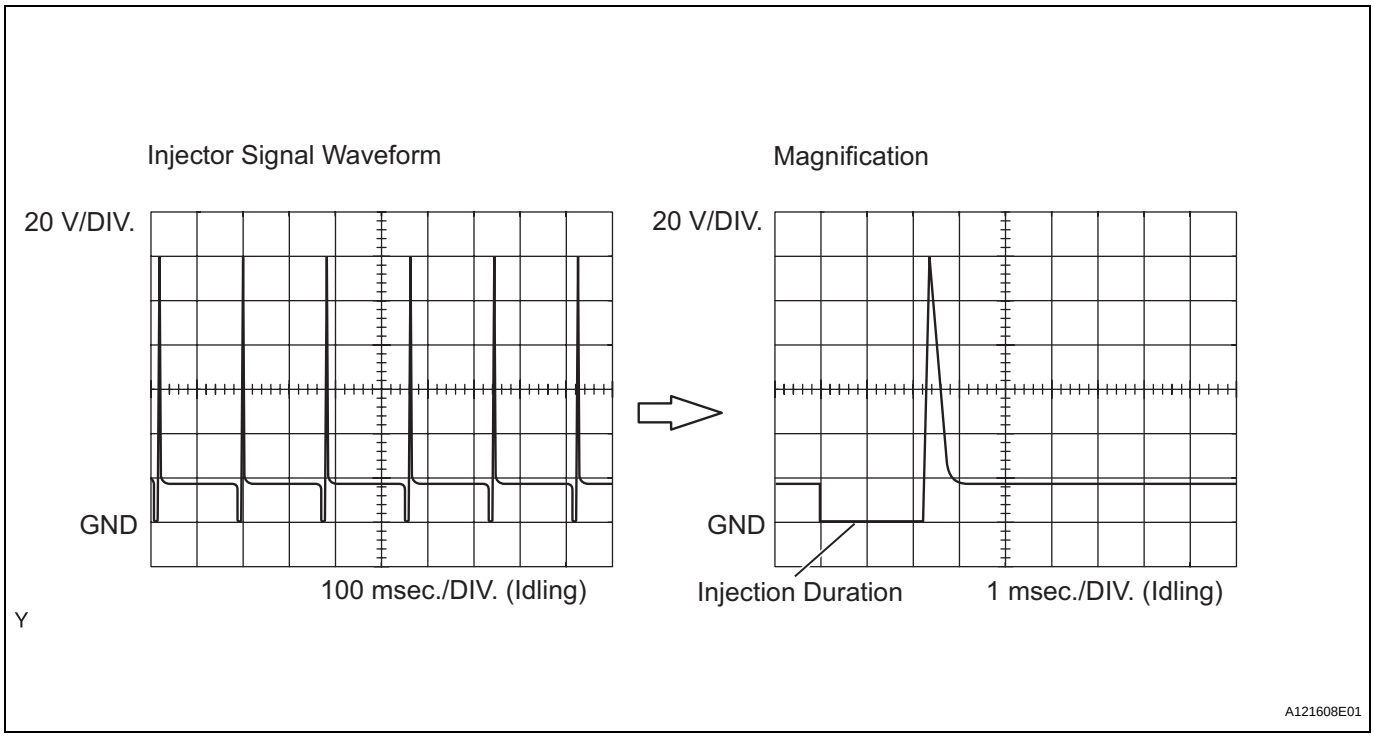
Reference: Inspection using an oscilloscope.

With the engine idling, check the waveform between terminals #10 to #60 and E1 of the ECM connectors.

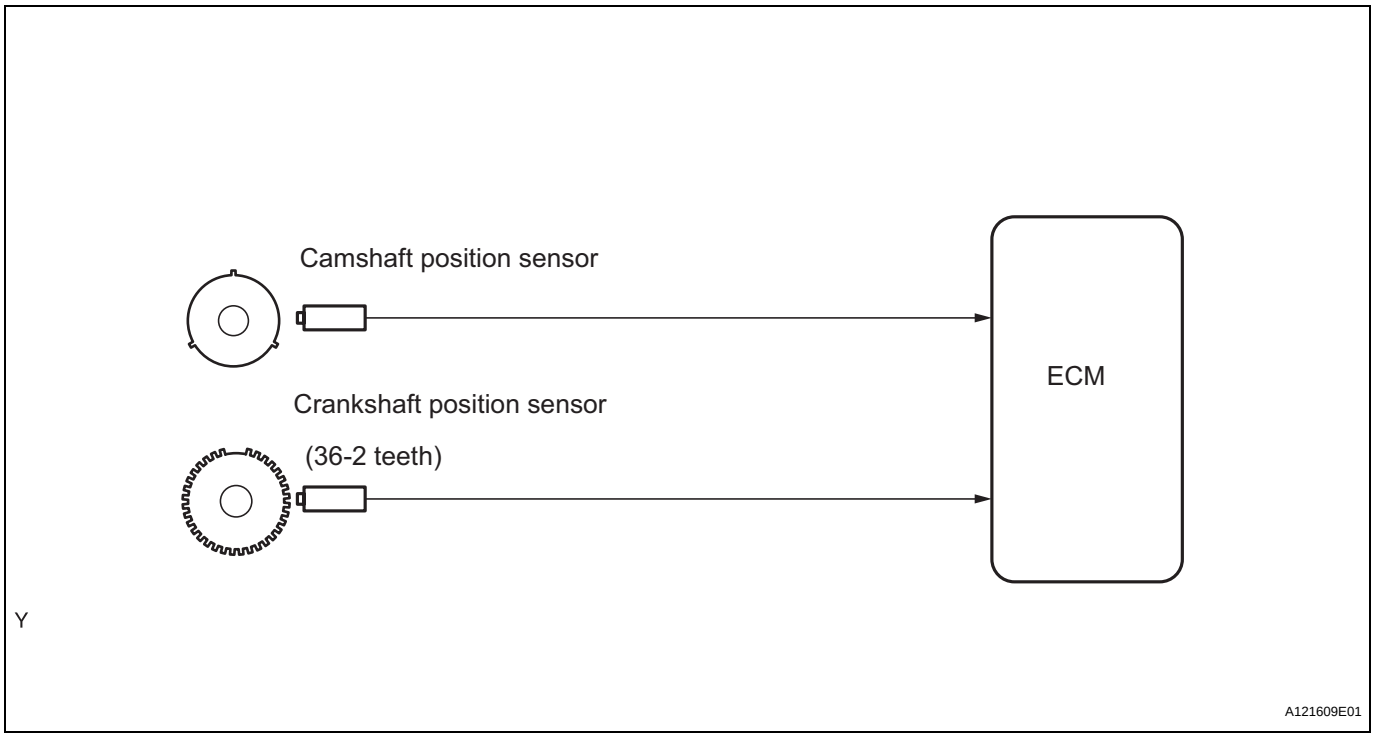
Items	Contents
Terminals	#10 to #60 - E01
Equipment Settings	20 V/Division, 100 or 1 ms/Division

Items	Contents
Conditions	Idling

HINT:
The correct waveform is as shown.



MONITOR DESCRIPTION



The ECM illuminates the MIL and sets a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

- Within the first 1,000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 20 to 50 misfires per 1,000 crankshaft revolutions) occurs once.

- After the first 1,000 crankshaft revolutions, an excessive misfiring rate (approximately 20 to 50 misfires per 1,000 crankshaft revolutions) occurs 4 times in sequential crankshaft revolutions.

The ECM flashes the MIL and sets a DTC when either one of the following conditions, which could cause the Three-Way Catalytic Converter (TWC) damage, is detected (2 trip detection logic).

- In every 200 crankshaft revolutions at a high engine rpm, the threshold misfiring percentage is recorded once.
- In every 200 crankshaft revolutions at a normal engine rpm, the threshold misfiring percentage is recorded 3 times.

MONITOR STRATEGY

Related DTCs	P0300: Multiple cylinder misfire P0301: Cylinder 1 misfire P0302: Cylinder 2 misfire P0303: Cylinder 3 misfire P0304: Cylinder 4 misfire P0305: Cylinder 5 misfire P0306: Cylinder 6 misfire
Required Sensors/Components (Main)	Injector, Ignition coil, Spark plug
Required Sensors/Components (Related)	Crankshaft, Camshaft, Engine coolant temperature and Intake air temperature sensors and Mass air flow meter
Frequency of Operation	Continuous
Duration	1,000 to 4,000 crankshaft revolutions: Emission related misfire 200 to 600 crankshaft revolutions: Catalyst damaged misfire
MIL Operation	2 driving cycles: Emission related misfire MIL flashes immediately: Catalyst damaged misfire
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Misfire:

Monitor runs whenever following DTCs not present	P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for closed loop) P0327 - P0333 (knock sensor) P0335 (CKP sensor) P0340 (CMP sensor) P0500 (VSS)
Battery voltage	8 V or more
Throttle position learning	Completed
VVT system	Not operated by scan tool
Engine RPM	Manual Transmission: 450 to 5,400 rpm Automatic Transmission: 400 to 5,400 rpm
Both of following conditions 1 and 2 met	-
1. Engine Coolant Temperature (ECT)	-10°C (14°F) or more
2. Either of following conditions (a) or (b) met	-
(a) ECT at engine start	More than -7°C (19°F)
(b) ECT	More than 20°C (68°F)
Fuel cut	OFF

Monitor period of emission-related-misfire:

First 1,000 revolutions after engine start, or check mode	Crankshaft 1,000 revolutions
Except above	Crankshaft 1,000 revolutions x 4

Monitor period of catalyst-damaged-misfire (MIL blinks):

All of following conditions 1, 2 and 3 met	Crankshaft 200 revolutions

1. Driving cycles	1st
2. Check mode	OFF
3. Engine RPM	Less than 2,800 rpm
Except above	Crankshaft 200 revolutions x 3

TYPICAL MALFUNCTION THRESHOLDS

Monitor period of emission-related-misfire:

Misfire rate	2.9 % or more (Manual transmission) 2 % or more (Automatic transmission)
Either of following conditions (a) or (b) met	-
(a) First 1,000 revolutions after engine start or check mode	Crankshaft 1,000 revolutions
(b) Except above	Crankshaft 1,000 revolutions x 4

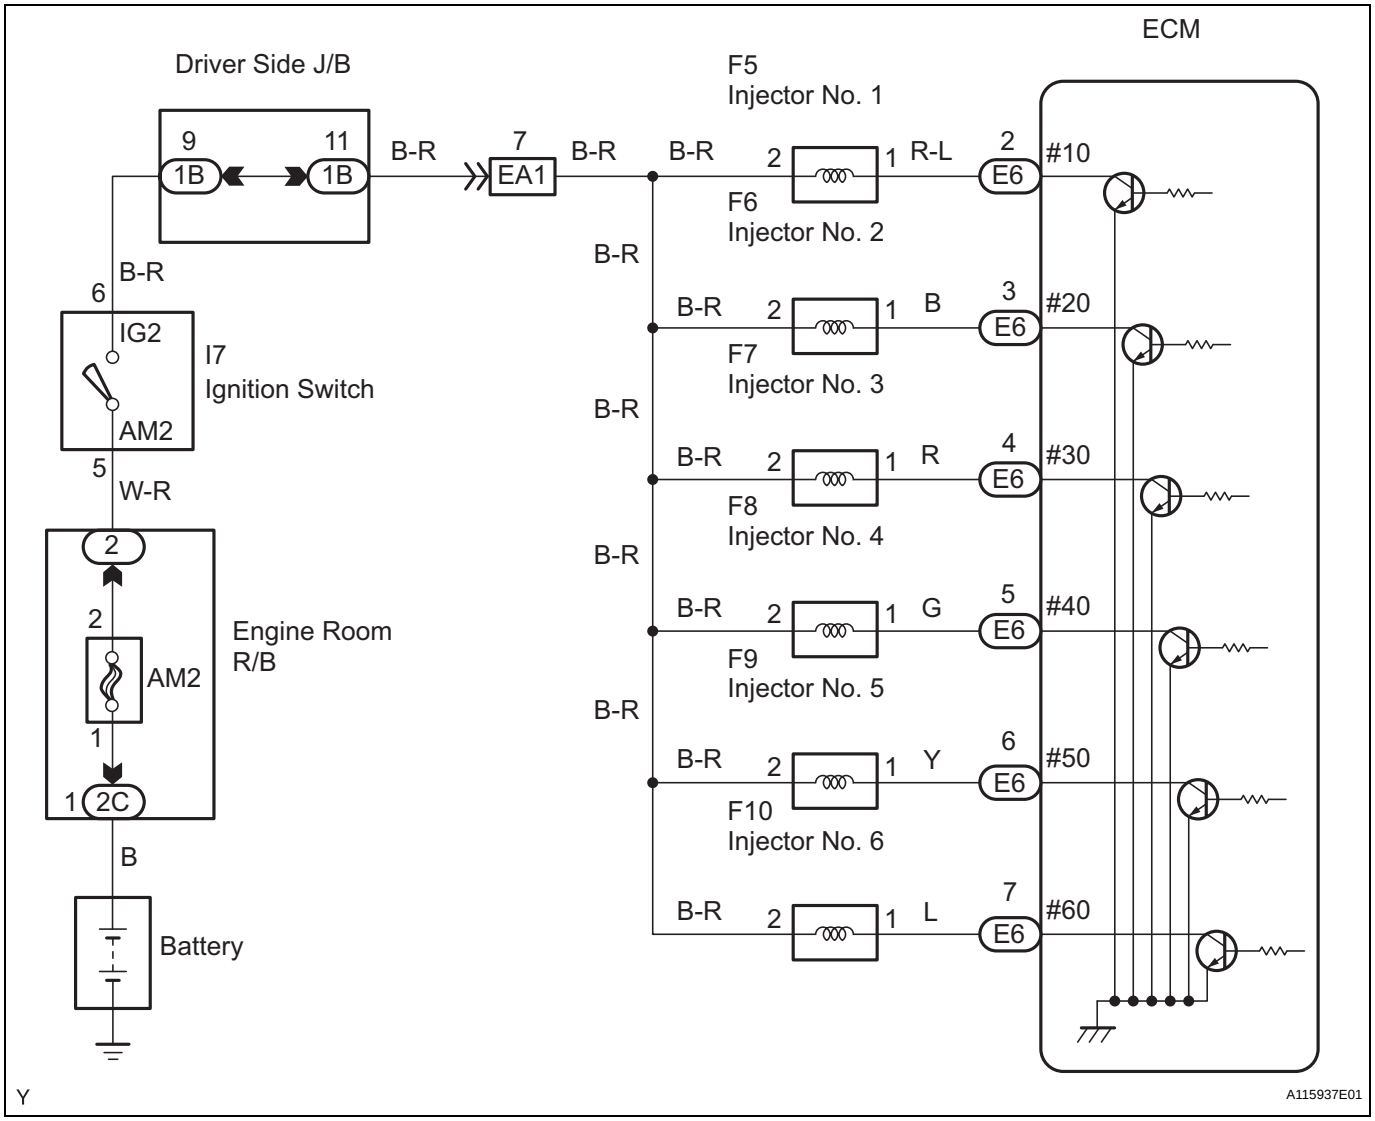
Monitor period of catalyst-damage-misfire (MIL blinks):

Number of misfires per 200 revolutions	77 or more (varies with intake air amount and RPM)
Either of following conditions (a) or (b) met	-
(a) All of following conditions A, B and C met	Crankshaft 200 revolutions x 3
A. Driving cycles	1st
B. Check mode	OFF
C. Engine RPM	Below 2,800 rpm
(b) Except above	Crankshaft 200 revolutions

MONITOR RESULT

Detailed information on Checking Monitor Status (See page ES-19).

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Record the DTC(s) and freeze frame data.
(e) Using the tester, switch the ECM from normal mode to check mode (See page ES-41).
(f) Read the misfire counts of each cylinder (CYL #1 to #6) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
(g) Drive the vehicle several times with the conditions, such as engine rpm and engine load, shown in MISFIRE RPM and MISFIRE LOAD in the DATA LIST.
HINT:
In order to store misfire DTCs, it is necessary to drive the vehicle for the period of time shown in the table below, with the MISFIRE RPM and MISFIRE LOAD in the DATA LIST.

Engine RPM	Duration
Idling	3.5 minutes or more
1,000	3 minutes or more
2,000	1.5 minutes or more
3,000	1 minute or more

(h) Check whether misfires have occurred by checking DTCs and freeze frame data.
HINT:
Do not turn the ignition switch OFF until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be erased.
(i) Record the DTC(s), freeze frame data and misfire counts.
(j) Turn the ignition switch OFF and wait for at least 5 seconds.

HINT:
- If any DTCs other than the misfire DTCs are output, troubleshoot those DTCs first.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.
- If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.
- The misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:
  (1) The fuel tank is low full.
  (2) Improper fuel is used.
  (3) The spark plugs have been contaminated.
  (4) The problem is complex.
- After finishing repairs, check the misfire counts of the cylinders (CYL #1, #2, #3, #4, #5 and #6).
- Be sure to confirm that no misfiring cylinder DTCs are set again by conducting the confirmation driving pattern, after repairs.
- For 6 and 8 cylinder engines, the ECM intentionally does not set the specific misfiring cylinder DTCs at high engine RPM. If misfires occur only in high engine RPM areas, only DTC P0300 is set.
  In the event of DTC P0300 being present, perform the following operations:
  (1) Clear DTCs (See page ES-38).
  (2) Start the engine and conduct the confirmation driving pattern.
  (3) Read the misfiring rates of each cylinder or DTC(s) using the tester.
  (4) Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.
  (5) After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not set.
- When one of SHORT FT #1, LONG FT #1, SHORT FT #2 or LONG FT #2 in the freeze frame data is outside the range of +-20 %, the air-fuel ratio may be rich (-20 % or less) or lean (+20 % or more).
- When the COOLANT TEMP in the freeze frame data is less than 75°C (167°F), the misfires have occurred only while warming up the engine.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE DTCS)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC output)	Proceed To
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306	A
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306 and other DTCs	B

HINT:
If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305 and P0306 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2 READ VALUE OF INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / MISFIRE / MISFIRE RPM and MISFIRE LOAD.
(d) Read and note the MISFIRE RPM and MISFIRE LOAD (engine load) values.
HINT:
The MISFIRE RPM and MISFIRE LOAD indicate the vehicle conditions under which the misfire occurred.

NEXT

3 CHECK PCV HOSE CONNECTIONS

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK

4 CHECK MISFIRE COUNT (CYL #1, #2, #3, #4, #5 AND #6)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (See page ES-38).
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / MISFIRE / CYL #1, #2, #3, #4, #5 and #6.
(f) Allow the engine to idle.
(g) Read each value of CYL #1 to #6 displayed on the tester.
If no misfire counts occur in any cylinders, perform the following operations:
  (1) Shift the gear selector lever to the D position.
  (2) Repeat steps (e) to (g) above.
  (3) Check the CYL #1 to #6.
  (4) If misfire counts are still not displayed, perform steps (h) and (i) and then check the misfire counts again.
(h) Drive the vehicle with the MISFIRE RPM and MISFIRE LOAD noted in step 2.

ES

(i) Read the CYL #1 to #6 or DTCs displayed on the tester.

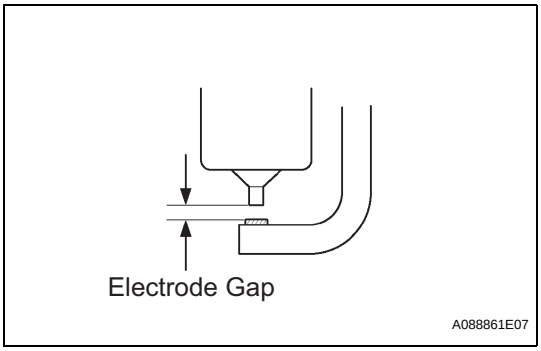
Result

Misfire count	Proceed To
One or two cylinders have misfire counts	A
Three cylinders or more have misfire counts	B

B → **Go to step 13**

A

5 CHECK SPARK PLUG



(a) Remove the ignition coil and the spark plug of the misfiring cylinder.
(b) Measure the spark plug electrode gap.
Standard:
Between 1.0 mm and 1.1 mm (0.039 in. and 0.043 in.)
(c) Check the electrode for carbon deposits.
Recommended spark plug

Manufactures	Products
DENSO	K20HR-U11
NGK	LFR6C-11

NOTICE:
If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.
(d) Reinstall the ignition coil and the spark plug.

NG → **REPLACE SPARK PLUG**

OK

6 CHECK SPARKS AND IGNITION

(a) Disconnect the injector connectors, in order to prevent the engine from starting.
(b) Install the spark plug to the ignition coil.
(c) Attach the spark plug assembly to the cylinder head cover.
(d) Crank the engine for less than 2 seconds and check the spark.
OK:
Sparks jump across electrode gap
(e) Reconnect the injector connectors.

NG → **Go to step 8**

OK

7	CHECK CYLINDER COMPRESSION PRESSURE OF MISFIRING CYLINDER

(a) Measure the cylinder compression pressure of the misfiring cylinder.

OK → **Go to step 9**

NG

REPAIR OR REPLACE MALFUNCTION PARTS

ES

8	CHANGE NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

(a) Change the installed spark plug to a spark plug that functions normally.

(b) Perform a spark test.

CAUTION:
Always disconnect each injector connector.
NOTICE:
Do not crank the engine for more than 2 seconds.

(1) Install the spark plug to the ignition coil and connect the ignition coil connector.
(2) Disconnect the injector connector.
(3) Ground the spark plug.
(4) Check if sparks occur while the engine is being cranked.

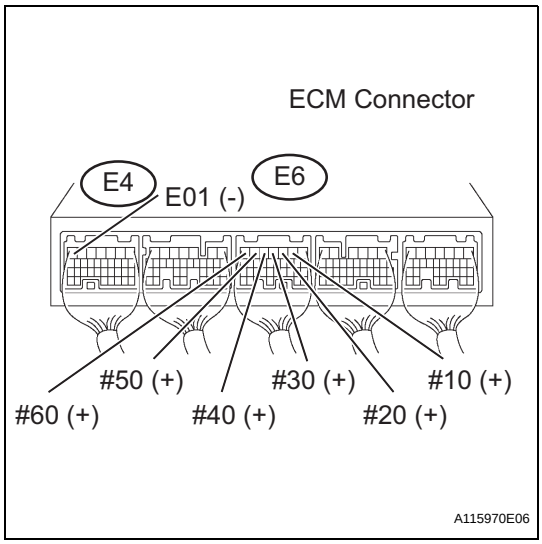
OK:
Sparks jump across electrode gap.

NG → **REPLACE IGNITION COIL ASSEMBLY THEN CONFIRM THAT THERE IS NO MISFIRE**

OK

REPLACE SPARK PLUG

9	INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10,#20,#30,#40.#50 AND/OR #60 VOLTAGE)



(a) Turn the ignition switch ON.
(b) Measure the voltage between the terminals of the E6 and E4 ECM connectors.

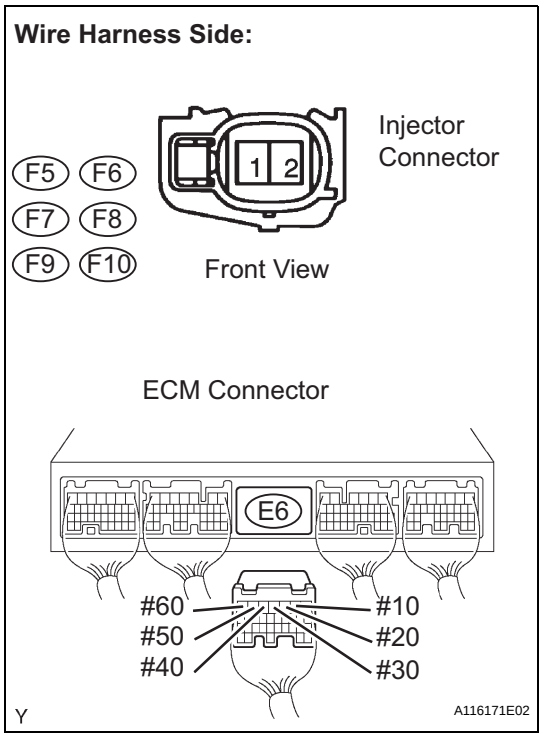
Standard Voltage

Tester Connections	Specified Conditions
#10 (E6-2) - E01 (E4-7)	9 to 14 V
#20 (E6-3) - E01 (E4-7)	
#30 (E6-4) - E01 (E4-7)	
#40 (E6-5) - E01 (E4-7)	
#50 (E6-6) - E01 (E4-7)	
#60 (E6-7) - E01 (E4-7)	

OK → Go to step 11

NG

10	CHECK HARNESS AND CONNECTOR (INJECTOR - ECM)



(a) Disconnect the injector connector (of the misfiring cylinder).
(b) Disconnect the E6 ECM connector.
(c) Turn the ignition switch ON.
(d) Measure the resistance and voltage between the injector and the ECM connector terminals.

Standard (Cylinder No. 1)

Tester Connections	Specified Conditions
F5-2 - Ground	11 to 14 V
F5-1 - Ground	10 kΩ or higher
F5-1 - #10 (E6-2)	Below 1 Ω

Standard (Cylinder No. 2)

Tester Connections	Specified Conditions
F6-2 - Ground	11 to 14 V
F6-1 - Ground	10 kΩ or higher
F6-1 - #20 (E6-3)	Below 1 Ω

Standard (Cylinder No. 3)

Tester Connections	Specified Conditions
F7-2 - Ground	11 to 14 V
F7-1 - Ground	10 kΩ or higher
F7-1 - #30 (E6-4)	Below 1 Ω

Standard (Cylinder No. 4)

Tester Connections	Specified Conditions
F8-2 - Ground	11 to 14 V
F8-1 - Ground	10 kΩ or higher

Tester Connections	Specified Conditions
F8-1 - #40 (E6-5)	Below 1 Ω

Standard (Cylinder No. 5)

Tester Connections	Specified Conditions
F9-2 - Ground	11 to 14 V
F9-1 - Ground	10 kΩ or higher
F9-1 - #50 (E6-6)	Below 1 Ω

Standard (Cylinder No. 6)

Tester Connections	Specified Conditions
F10-2 - Ground	11 to 14 V
F10-1 - Ground	10 kΩ or higher
F10-1 - #60 (E6-7)	Below 1 Ω

(e) Reconnect the injector connector.
(f) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

11 CHECK FUEL INJECTOR OF MISFIRING CYLINDER

(a) Check the injector injection (whether fuel volume is high or low, and whether injection pattern is poor).

NG → **REPLACE FUEL INJECTOR ASSEMBLY**

OK

12 CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

NG → **ADJUST VALVE CLEARANCE**

OK

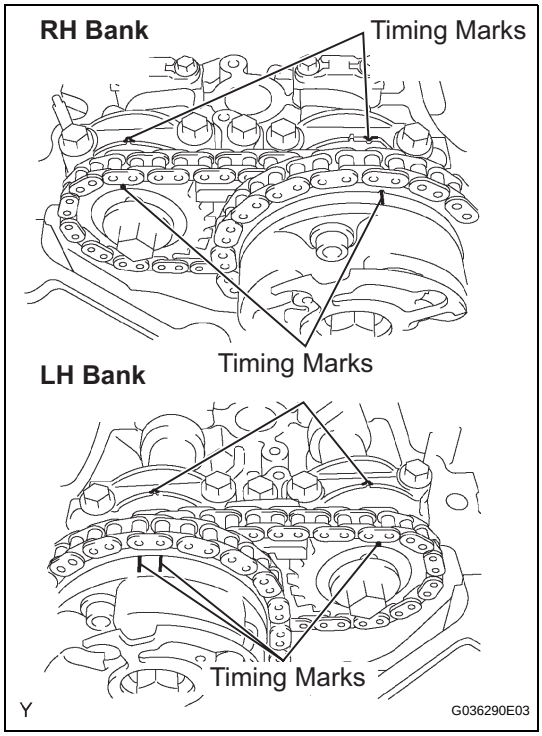
13 CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

14	CHECK VALVE TIMING



(a) Remove the cylinder head cover.
(b) Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.
(c) Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°) and align the marks as above.
OK:
Timing marks on camshaft timing gears are aligned as shown in illustration.
(d) Reinstall the cylinder head cover.

NG → **ADJUST VALVE TIMING**

OK

15	CHECK FUEL PRESSURE

(a) Check the fuel pressure (See page FU-6).

NG → **CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER**

OK

16	READ VALUE OF INTELLIGENT TESTER (COOLANT TEMP)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.
(e) Read the COOLANT TEMP twice, when the engine is both cold and warmed up.
Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (176°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR

OK

17	READ VALUE OF INTELLIGENT TESTER (MAF)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / MAF and COOLANT TEMP.
(e) Allow the engine to idle until the COOLANT TEMP reaches 75°C (167°F) or more.
(f) Read the MAF with the engine in an idling condition and at an engine speed of 2,500 rpm.
Standard:
MAF while engine idling: Between 3.2 g/sec and 4.7 g/sec (shift position: N, A/C: OFF).
MAF at engine speed of 2,500 rpm: Between 13.1 g/sec and 18.9 g/sec (shift position: N, A/C: OFF).

NG → REPLACE MASS AIR FLOW METER

OK

CHECK FOR INTERMITTENT PROBLEMS

DTC	P0327	Knock Sensor 1 Circuit Low Input (Bank 1 or Single Sensor)

DTC	P0328	Knock Sensor 1 Circuit High Input (Bank 1 or Single Sensor)

DTC	P0332	Knock Sensor 2 Circuit Low Input (Bank 2)

DTC	P0333	Knock Sensor 2 Circuit High Input (Bank 2)

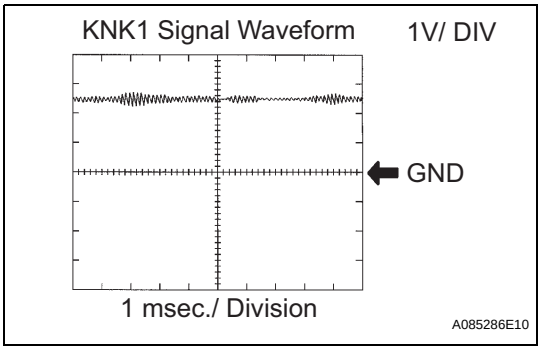
ES

DESCRIPTION

A flat type knock sensor (non-resonant type) has a structure that can detect vibrations over a wide band of frequencies: between approximately 6 kHz and 15 kHz.
Knock sensors are fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed. The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.

DTC No.	DTC Detection Conditions	Trouble Areas
P0327 P0332	Output voltage of knock sensor 1 or 2 is 0.5 V or less (1 trip detection logic)	• Short in knock sensor 1 or 2 circuit • Knock sensor 1 or 2 • ECM
P0328 P0333	Output voltage of knock sensor 1 or 2 is 4.5 V or more (1 trip detection logic)	• Open in knock sensor 1 or 2 circuit • Knock sensor 1 or 2 • ECM

HINT:
When any of DTCs P0327, P0328, P0332 and P0333 are set, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the ignition switch is turned OFF.



Reference: Inspection using an oscilloscope
The correct waveform is as shown.

Items	Contents
Terminals	KNK1 - EKNK or KNK2 - EKN2
Equipment Settings	0.01 to 10 V/Division, 0.01 to 10 msec./Division
Conditions	Keep engine speed at 4,000 rpm with warm engine

MONITOR DESCRIPTION

If the output voltage transmitted by the knock sensor remains low or high for more than 1 second, the ECM interprets this as a malfunction in the sensor circuit, and sets a DTC.
The monitor for DTCs P0327 and P0328 begins to run when 5 seconds have elapsed since the engine was started.
If the malfunction is not repaired successfully, any of DTC P0327, P0328, P0332 or P0333 is set 5 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0327: Knock sensor (Bank 1) open/short (Low voltage) P0328: Knock sensor (Bank 1) open/short (High voltage) P0332: Knock sensor (Bank 2) open/short (Low voltage) P0333: Knock sensor (Bank 2) open/short (High voltage)
Required Sensors/Components (Main)	Knock sensor (Bank 1 and 2)
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	1 second
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Battery voltage	10.5 V or more
Time after engine start	5 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

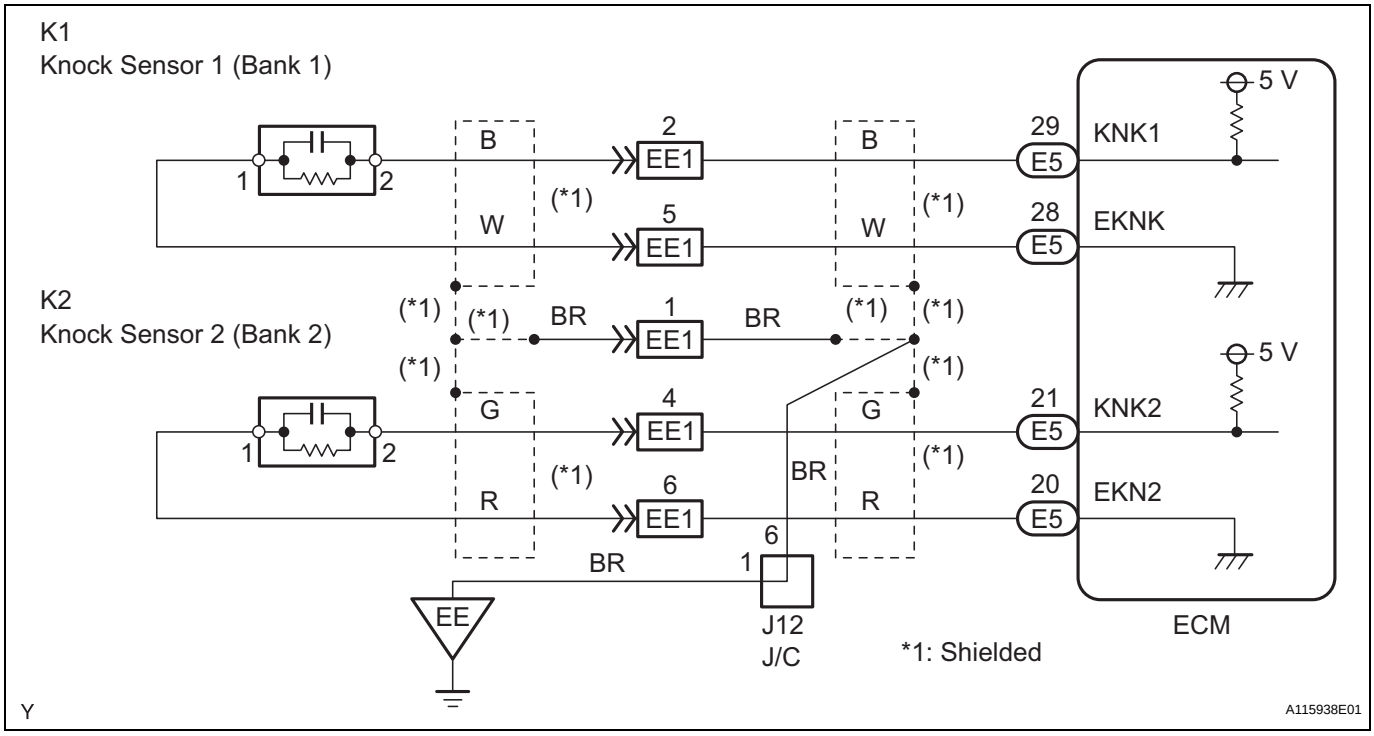
Knock Sensor Range Check (Low voltage) P0327 and P0332:

Knock sensor voltage	Less than 0.5 V

Knock Sensor Range Check (High voltage) P0328 and P0333:

Knock sensor voltage	More than 4.5 V

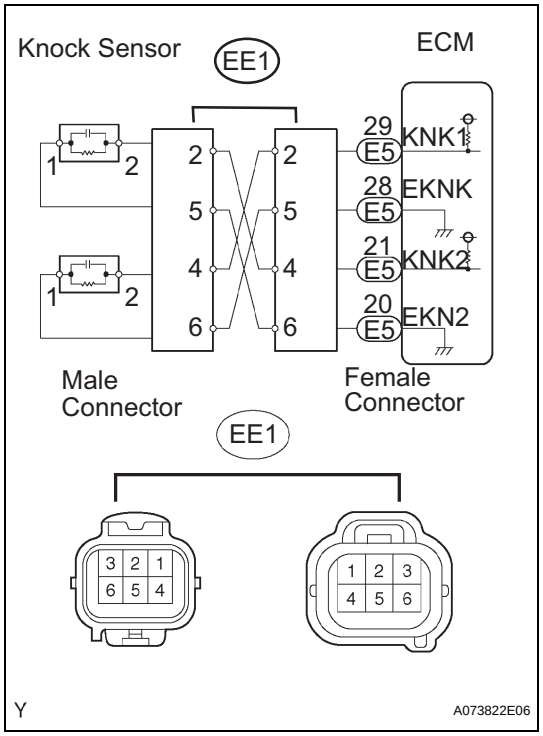
WIRING DIAGRAM



HINT:

- DTCs P0327 and P0328 are for the bank 1 knock sensor circuit.
- DTCs P0332 and P0333 are for the bank 2 knock sensor circuit.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	READ OUTPUT DTC (CHECK KNOCK SENSOR CIRCUIT)



(a) Disconnect the EE1 connector.
(b) Using lead wires, connect the connectors as follows.

Male Connector - Female Connector
Terminal 2 - Terminal 4
Terminal 5 - Terminal 6
Terminal 4 - Terminal 2
Terminal 6 - Terminal 5

(c) Warm up the engine.
(d) Run the engine at 3,000 rpm for 10 seconds or more.
(e) Connect an intelligent tester to the DLC3.
(f) Turn the ignition switch ON and turn the tester ON.
(g) Select the item: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(h) Read DTCs.

Result

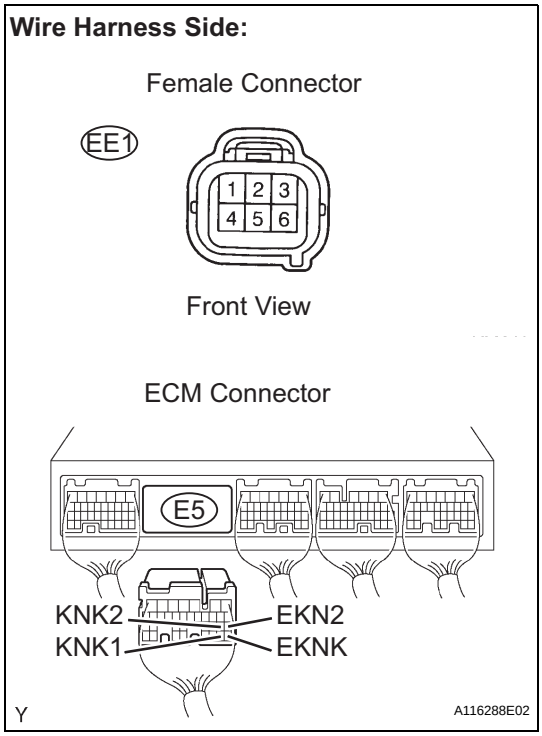
Display	Proceed to
DTCs same as when vehicle brought in P0327, P0328 → P0327, P0328 or P0332, P0333 → P0332, P0333	**A**
DTCs different from when vehicle brought in P0327, P0328 → P0332, P0333 or P0332, P0333 → P0327, P0328	**B**

(i) Reconnect the EE1 connector.

B → **Go to step 4**

A

2	CHECK HARNESS AND CONNECTOR (CONNECTOR - ECM)



(a) Disconnect the EE1 connector.
(b) Disconnect the E5 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
EE1 female connector 2 - KNK1 (E5-29)	Below 1 Ω
EE1 female connector 5 - EKNK (E5-28)	
EE1 female connector 4 - KNK2 (E5-21)	
EE1 female connector 6 - EKN2 (E5-20)	

Standard Resistance (Check for short)

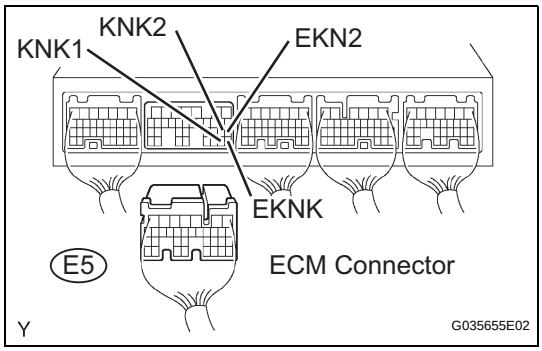
Tester Connections	Specified Conditions
EE1 female connector 2 or KNK1 (E5-29) - Body ground	10 kΩ or higher
EE1 female connector 5 or EKNK (E5-28) - Body ground	
EE1 female connector 4 or KNK2 (E5-21) - Body ground	
EE1 female connector 6 or EKN2 (E5-20) - Body ground	

(d) Reconnect the EE1 connector.
(e) Reconnect the ECM connector.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3	INSPECT ECM



(a) Disconnect the E5 ECM connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the ECM terminals.

Standard Voltage

Tester Connections	Specified Conditions
KNK1 (E5-29) - EKNK (E5-28)	4.5 to 5.5 V
KNK2 (E5-21) - EKN2 (E5-20)	

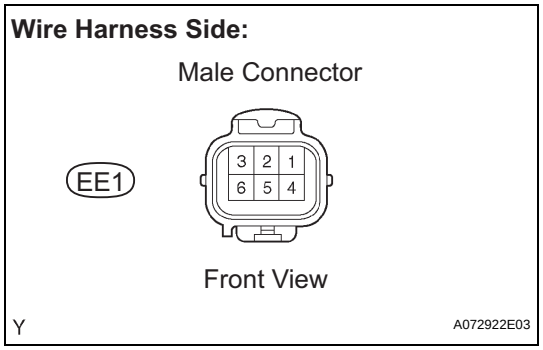
(d) Reconnect the ECM connector.

NG → REPLACE ECM

OK

CHECK FOR INTERMITTENT PROBLEMS

4 INSPECT KNOCK SENSOR



(a) Disconnect the EE1 connector.
(b) Check the resistance between the terminals of the EE1 male connector.

Standard Resistance

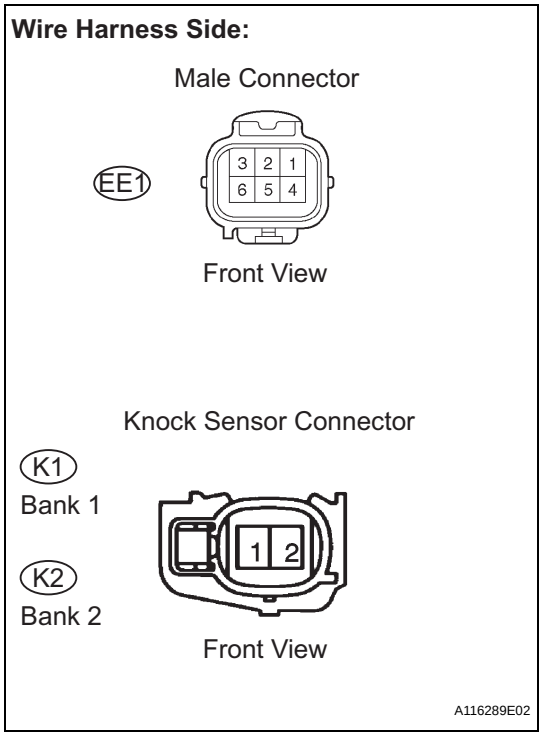
Tester Connections	Specified Conditions
EE1 male connector 2 - 5	120 to 280 kΩ
EE1 male connector 4 - 6	

(c) Reconnect the EE1connector.

OK → **CHECK FOR INTERMITTENT PROBLEMS**

NG

5 CHECK HARNESS AND CONNECTOR (CONNECTOR - KNOCK SENSOR)



HINT:
- If DTC P0327 or P0328 has changed to P0332 or P0333, check the knock sensor circuit on the right bank side.
- If DTC P0332 or P0333 has changed to P0327 or P0328, check the knock sensor circuit on the left bank side.

(a) Disconnect the EE1 connector.
(b) Disconnect the K1 and K2 knock sensor connectors.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
EE1 male connector 2 - K1-2	Below 1 Ω
EE1 male connector 5 - K1-1	
EE1 male connector 4 - K2-2	
EE1 male connector 6 - K2-1	

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
EE1 male connector 2 or K1-2 - Body ground	10 kΩ or higher
EE1 male connector 5 or K1-1 - Body ground	
EE1 male connector 4 or K2-2 - Body ground	
EE1 male connector 6 or K2-1 - Body ground	

(d) Reconnect the EE1 connector.
(e) Reconnect the knock sensor connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE KNOCK SENSOR

DTC	P0335	Crankshaft Position Sensor "A" Circuit

DTC	P0339	Crankshaft Position Sensor "A" Circuit Intermittent

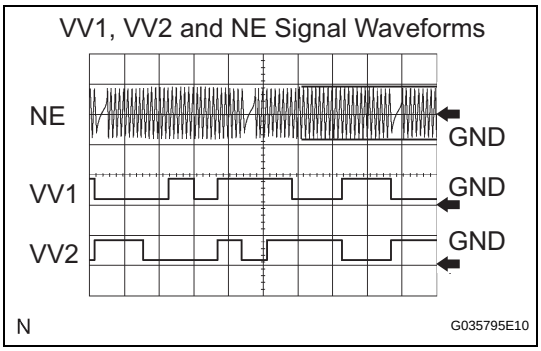
DESCRIPTION

The Crankshaft Position (CKP) sensor system consists of a CKP sensor plate and a pickup coil. The sensor plate has 34 teeth and is installed on the crankshaft. The pickup coil is made of an iron core and a magnet.

The sensor plate rotates and, as each tooth passes through the pickup coil, a pulse signal is created. The pickup coil generates 34 signals per engine revolution. Based on these signals, the ECM calculates the crankshaft position and engine RPM. Using these calculations, the fuel injection time and ignition timing are controlled.

ES

DTC No.	DTC Detection Conditions	Trouble Areas
P0335	• No CKP sensor signal to ECM while cranking (1 trip detection logic) • No CKP sensor signal to ECM at engine speed of 600 rpm or more (1 trip detection logic)	• Open or short in CKP sensor circuit • CKP sensor • Sensor plate (CKP sensor plate) • ECM
P0339	Under conditions (a), (b) and (c), no CKP sensor signal to ECM for 0.05 seconds or more (1 trip detection logic) (a) Engine speed 1,000 rpm or more (b) Starter signal OFF (c) 3 seconds or more have lapsed since starter signal switched from ON to OFF	



Reference: Inspection using an oscilloscope

HINT:

- The correct waveform is shown above.
- VV1+ and VV2+ stand for the VVT sensor signal, and NE+ stands for the CKP sensor signal.

Items	Contents
Terminals	VV1+ - VV1- VV2+ - VV2- NE+ - NE-
Equipment Settings	5 V/DIV, 20msec./DIV.
Conditions	Cranking or idling

MONITOR DESCRIPTION

If there is no signal from the CKP sensor despite the engine revolving, the ECM interprets this as a malfunction of the sensor.

If the malfunction is not repaired successfully, a DTC is set 10 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0335: Crankshaft position sensor range check during cranking P0335: Crankshaft position sensor range check during engine running
Required Sensors/Components (Main)	Crankshaft Position (CKP) sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	Conditions met for 3 times: CKP sensor range check during cranking 0.016 seconds: CKP sensor range check during engine running
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	None

Case 1:

Time after starter OFF to ON	0.3 seconds or more
Number of camshaft position sensor signal pulse	6 times
Battery voltage	7 V or more
Ignition switch	ON

Case 2:

Starter	OFF
Engine RPM	600 rpm or more
Time after starter from ON to OFF	3 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

Case 1:

Number of CKP sensor signal pulse	132 or less, or 174 or more

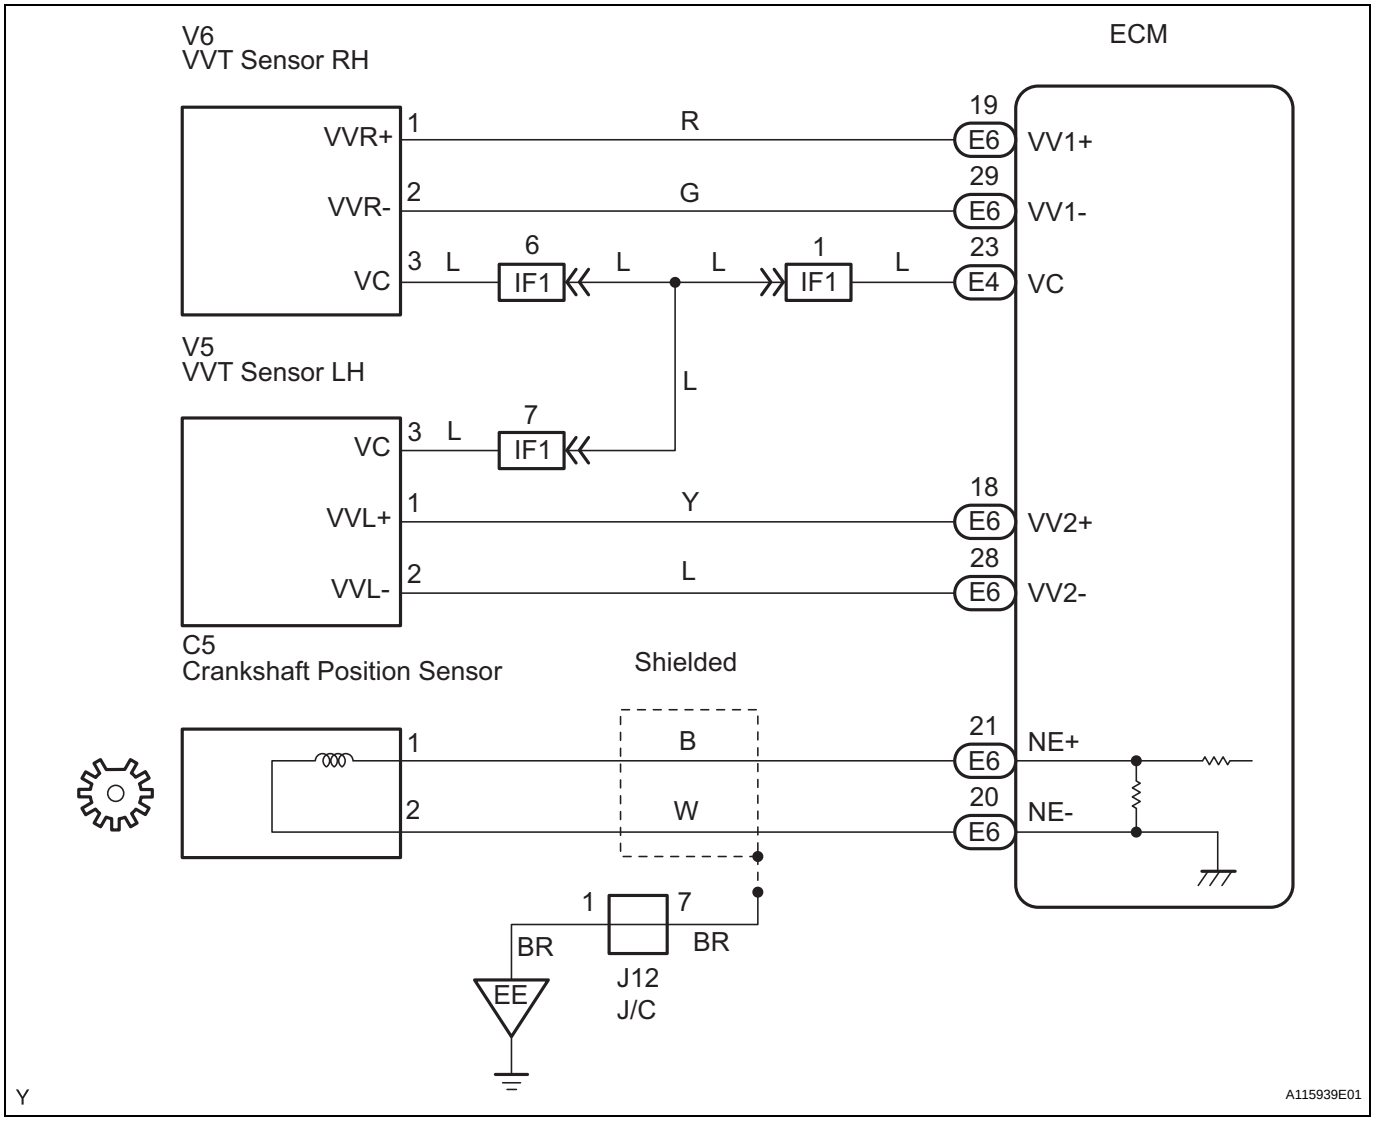
Case 2:

Engine speed signal	No signal

COMPONENT OPERATING RANGE

CKP sensor	• CKP sensor output voltage fluctuates while crankshaft revolving • 34 CKP sensor signals per crankshaft revolution

WIRING DIAGRAM



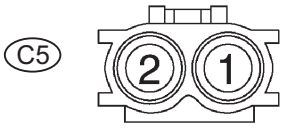
HINT:

- If no problem is found by this diagnostic troubleshooting procedure, troubleshoot the engine mechanical systems.
- Check the engine speed. The engine speed can be checked by using an intelligent tester. To check, follow the operation below:
  (a) Connect an intelligent tester to the DLC3.
  (b) Start the engine.
  (c) Turn the tester ON
  (d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / ENGINE SPD.
  The engine speed may be indicated as zero despite the engine revolving normally. This is caused by a lack of NE signals from the Crankshaft Position (CKP) sensor. Alternatively, the engine speed may be indicated as lower than the actual engine speed, if the CKP sensor voltage output is insufficient.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 INSPECT CRANKSHAFT POSITION SENSOR (RESISTANCE)

Component Side:

Crankshaft Position Sensor



Front View

A078431E04

(a) Disconnect the C5 Crankshaft Position (CKP) sensor connector.
(b) Measure the resistance between terminals 1 and 2.

Standard Resistance

Tester Connections	Specified Conditions
1 - 2	1,630 Ω to 2,740 Ω at cold
1 - 2	2,065 Ω to 3,225 Ω at hot

HINT:
Terms cold and hot refer to the temperature of the coils.
Cold means approximately -10° to 50°C (14° to 122°F).
Hot means approximately 50° to 100°C (122° to 212°F).

(c) Reconnect the CKP sensor connector.

NG → **REPLACE CRANKSHAFT POSITION SENSOR**

OK

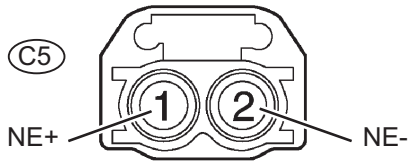
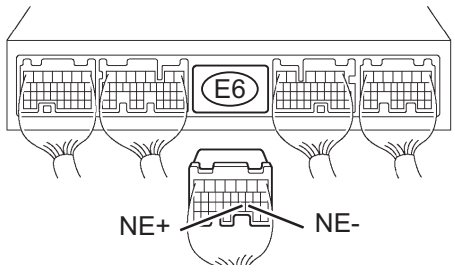
Crankshaft Position Sensor Connector



Front View

Wire Harness Side:

ECM Connector



Y

A116290E02

(a) Disconnect the C5 CKP sensor connector.
(b) Disconnect the E6 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
NE+ (C5-1) - NE+ (E6-21)	Below 1 Ω
NE- (C5-2) - NE- (E6-20)	

Standard Resistance (Check for short)

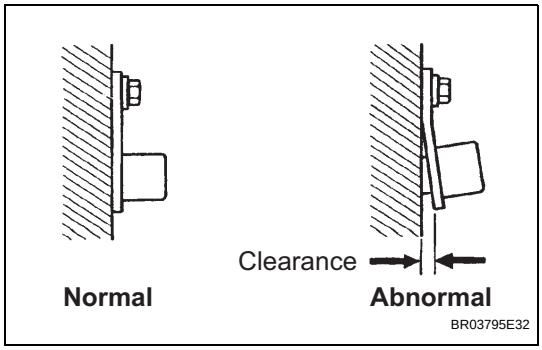
Tester Connections	Specified Conditions
NE+ (C5-1) or NE+ (E6-21) - Body ground	10 kΩ or higher
NE- (C5-2) or NE- (E6-20) - Body ground	

(d) Reconnect the ECM connector.
(e) Reconnect the CKP sensor connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3	CHECK SENSOR INSTALLATION (CRANKSHAFT POSITION SENSOR)



(a) Check the CKP sensor installation.
OK:
Sensor is installed correctly.

NG → **TIGHTEN SENSOR**

ES

OK

4	CHECK CRANKSHAFT POSITION SENSOR PLATE (TEETH OF SENSOR PLATE(CRANKSHAFT))

(a) Check the teeth of the sensor plate.
OK:
Sensor plate does not have any cracks or deformation.

NG → **REPLACE CRANKSHAFT POSITION SENSOR PLATE**

OK

REPLACE ECM

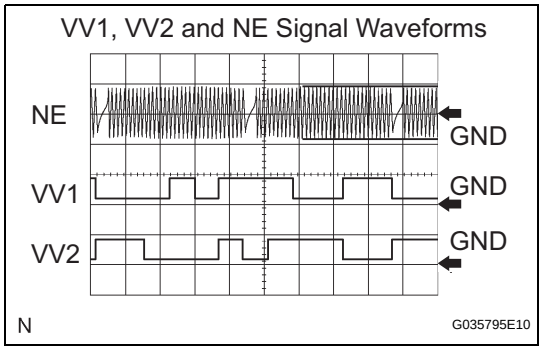
DTC	P0340	Camshaft Position Sensor "A" Circuit (Bank 1 or Single Sensor)
DTC	P0342	Camshaft Position Sensor "A" Circuit Low Input (Bank 1 or Single Sensor)
DTC	P0343	Camshaft Position Sensor "A" Circuit High Input (Bank 1 or Single Sensor)
DTC	P0345	Camshaft Position Sensor "A" Circuit (Bank 2)
DTC	P0347	Camshaft Position Sensor "A" Circuit Low Input (Bank 2)
DTC	P0348	Camshaft Position Sensor "A" Circuit High Input (Bank 2)

DESCRIPTION

The Variable Valve Timing (VVT) sensor (VV signal) consists of a magnet, iron core and pickup coil. The VV signal plate has 3 teeth on its outer circumference and is installed on the camshaft timing pulley. When the camshafts rotate, the protrusion on the signal plate and the air gap on the pickup coil change, causing fluctuations in the magnetic field and generating a voltage in the pickup coil.

This sensor monitors a timing rotor located on the camshaft and is used to detect the camshaft angle by the ECM. The camshaft rotation synchronizes with the crankshaft rotation, and this sensor communicates the rotation of the camshaft timing rotor as a pulse signal to the ECM. Based on this signal, the ECM controls fuel injection time and ignition timing.

DTC No.	DTC Detection Conditions	Trouble Areas
P0340 P0345	• Input voltage to ECM remains 0.3 V or less, or 4.7 V or higher for more than 5 seconds, when 2 or more seconds have elapsed after turning ignition switch ON (2 trip detection logic) • No VVT sensor signal to ECM during cranking (1 trip detection logic)	• Open or short in VVT sensor circuit • VVT sensor • Camshaft timing pulley • Jumped tooth of timing chain • ECM
P0342 P0347	Output voltage of VVT sensor 0.3 V or less for 5 seconds (1 trip detection logic)	
P0343 P0348	Output voltage of VVT sensor 4.7 V or more for 5 seconds (1 trip detection logic)	



Reference: Inspection using an oscilloscope
HINT:
- The correct waveform is shown above.
- VV1+ and VV2+ stand for the VVT sensor signal, and NE+ stands for the CKP sensor signal.

Items	Contents
Terminals	NE+ - NE- VV1+ - VV1- VV2+ - VV2-
Equipment Settings	5V/Division, 20ms/Division
Conditions	Cranking or idling

MONITOR DESCRIPTION

If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

MONITOR STRATEGY

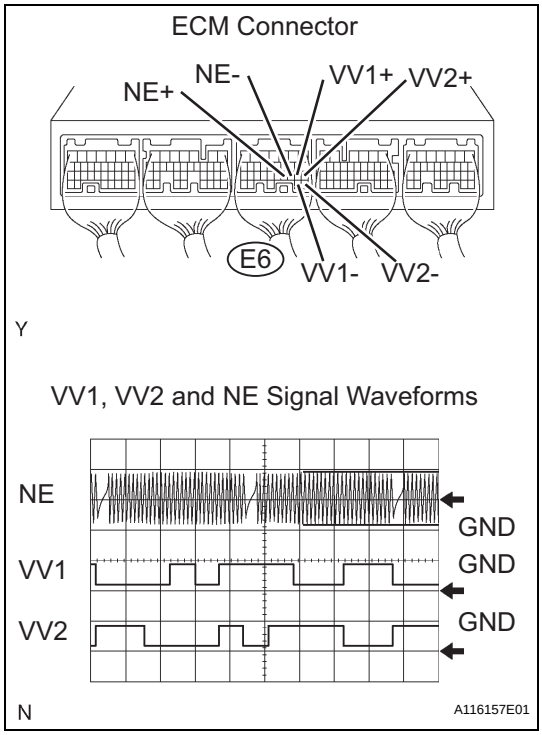
VVT sensor voltage	0.3 to 4.7 V

WIRING DIAGRAM

Refer to DTC P0335 (See page ES-184).

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 CHECK ECM TERMINAL VOLTAGE



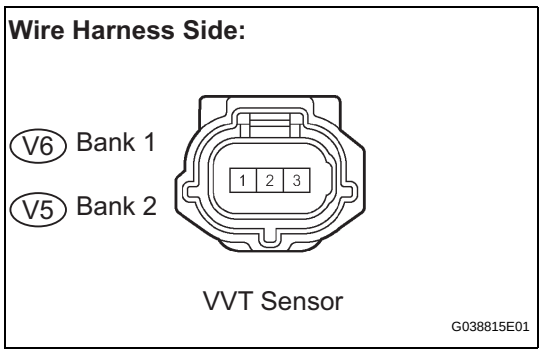
(a) Inspect the ECM using an oscilloscope.
(1) While the engine is idling, check the waveform between the terminals of the ECM connector.
Standard

Tester Connections	Specified Conditions
VV1+ (E6-19) - VV1- (E6-29)	Correct waveform as shown in illustration
VV2+ (E6-18) - VV2- (E6-28)	
NE+ (E6-21) - NE- (E6-20)	

NG → **REPLACE VVT SENSOR**

OK

2 CHECK VVT SENSOR (SENSOR POWER SOURCE)



(a) Disconnect the V6 or V5 VVT sensor connector.
(b) Measure the voltage between the terminals of the VVT sensor.
Standard Voltage

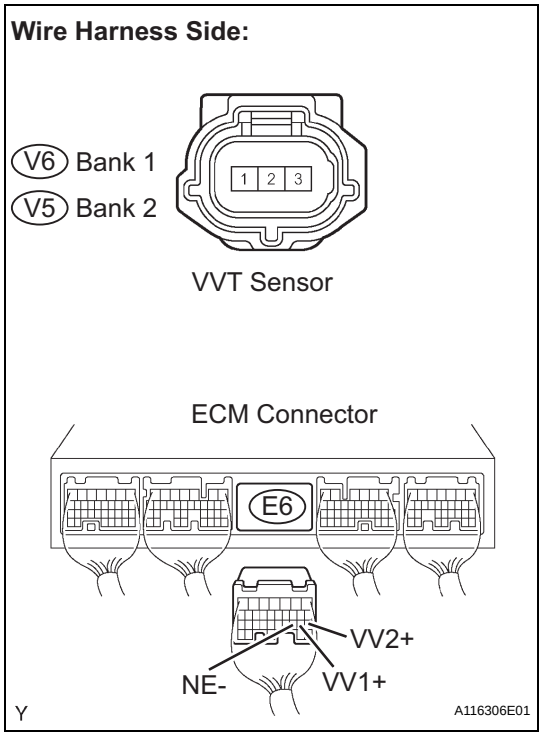
Tester Connection	Specified Condition
3 - Body ground	4.5 to 5.0 V

(c) Reconnect the VVT sensor connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3	CHECK HARNESS AND CONNECTOR (VVT SENSOR - ECM)



(a) Disconnect the V5 or V6 VVT sensor connector.
(b) Disconnect the E6 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
VVT sensor (V6-1) - VV1+ (E6-19)	Below 1 Ω
VVT sensor (V5-1) - VV2+ (E6-18)	
VVT sensor (V6-2) - VV1- (E6-29)	
VVT sensor (V5-2) - VV2- (E6-28)	

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
VVT sensor (V6-1) or VV1+ (E6-19) - Body ground	10 kΩ or higher
VVT sensor (V5-1) or VV2+ (E6-18) - Body ground	
VVT sensor (V6-2) or VV1- (E6-29) - Body ground	
VVT sensor (V5-2) or VV2- (E6-28) - Body ground	

(d) Reconnect the VVT sensor connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK ↓

4	CHECK SENSOR INSTALLATION (VVT SENSOR)

NG → **TIGHTEN SENSOR**

OK ↓

5	CHECK CAMSHAFT TIMING GEAR ASSEMBLY (TEETH PLATE)

(a) Check the teeth of the signal plate.

OK:

Sensor plate teeth do not have any cracks or deformation.

NG → **REPLACE CAMSHAFT TIMING GEAR ASSEMBLY**

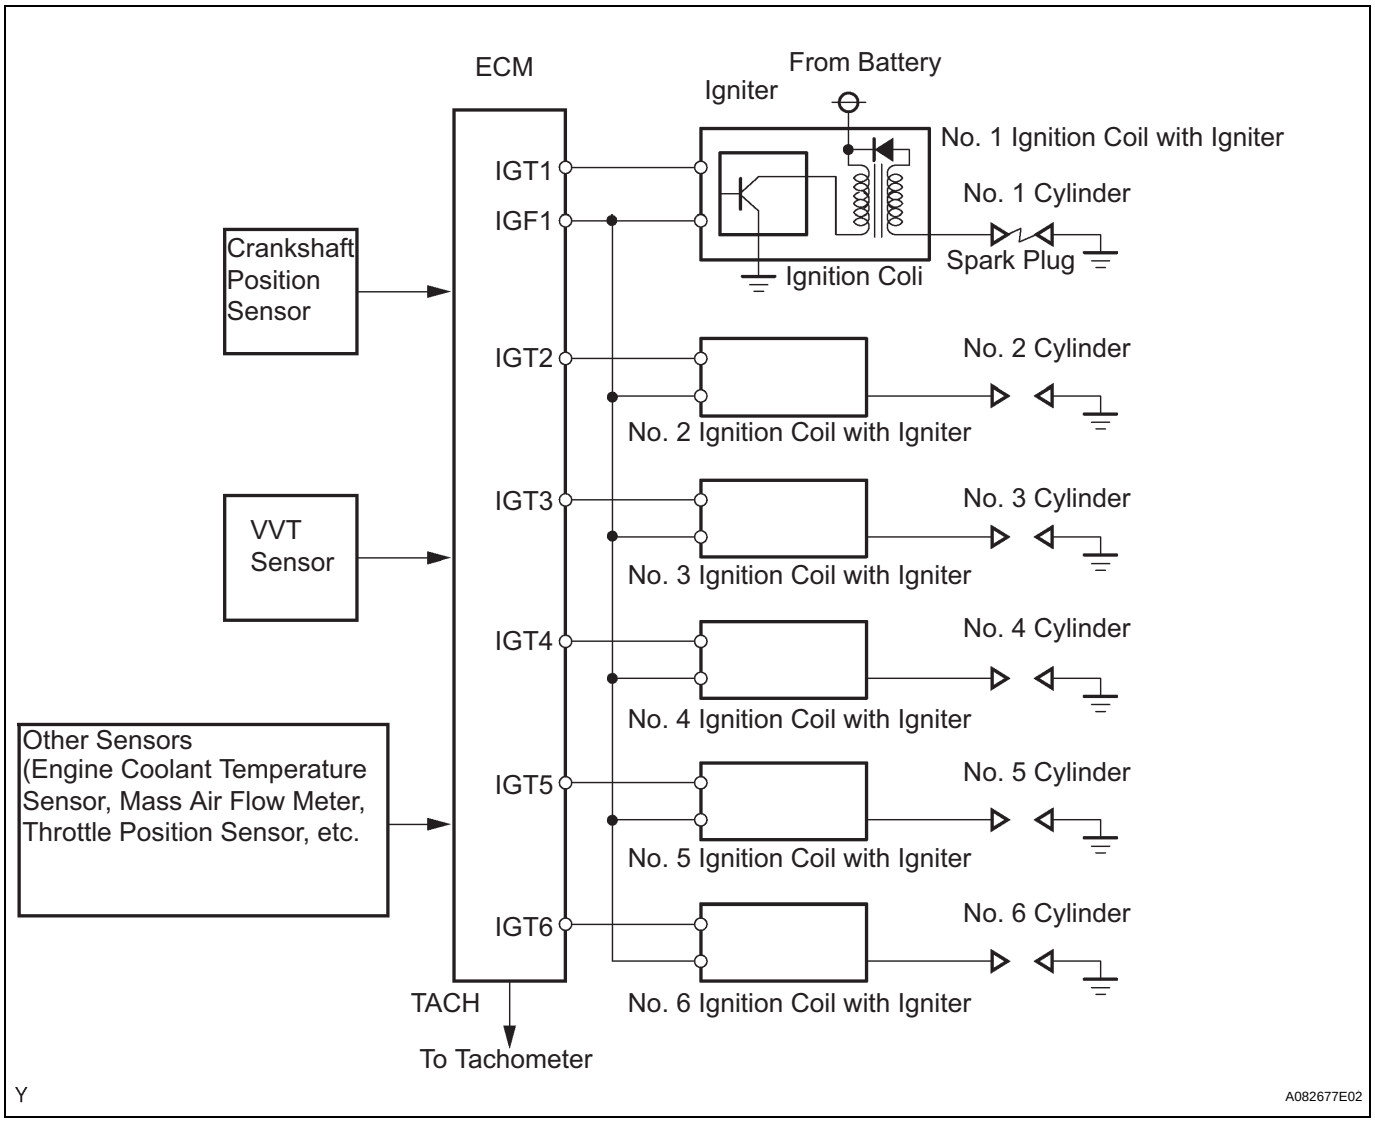
REPLACE ECM

DTC	P0351	Ignition Coil "A" Primary / Secondary Circuit
DTC	P0352	Ignition Coil "B" Primary / Secondary Circuit
DTC	P0353	Ignition Coil "C" Primary / Secondary Circuit
DTC	P0354	Ignition Coil "D" Primary / Secondary Circuit
DTC	P0355	Ignition Coil "E" Primary / Secondary Circuit
DTC	P0356	Ignition Coil "F" Primary / Secondary Circuit

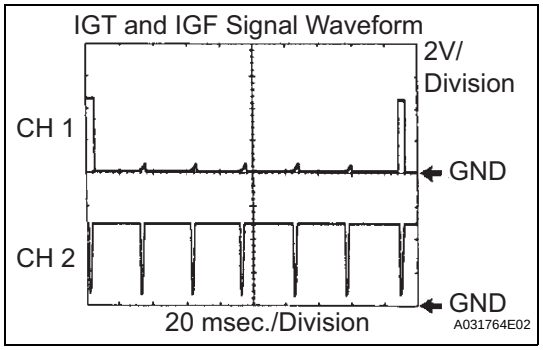
HINT:
- These DTCs indicate malfunctions relating to the primary circuit.
- If DTC P0351 is set, check No. 1 ignition coil with igniter circuit.
- If DTC P0352 is set, check No. 2 ignition coil with igniter circuit.
- If DTC P0353 is set, check No. 3 ignition coil with igniter circuit.
- If DTC P0354 is set, check No. 4 ignition coil with igniter circuit.
- If DTC P0355 is set, check No. 5 ignition coil with igniter circuit.
- If DTC P0356 is set, check No. 6 ignition coil with igniter circuit.

DESCRIPTION

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrodes to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM, for each cylinder ignition.



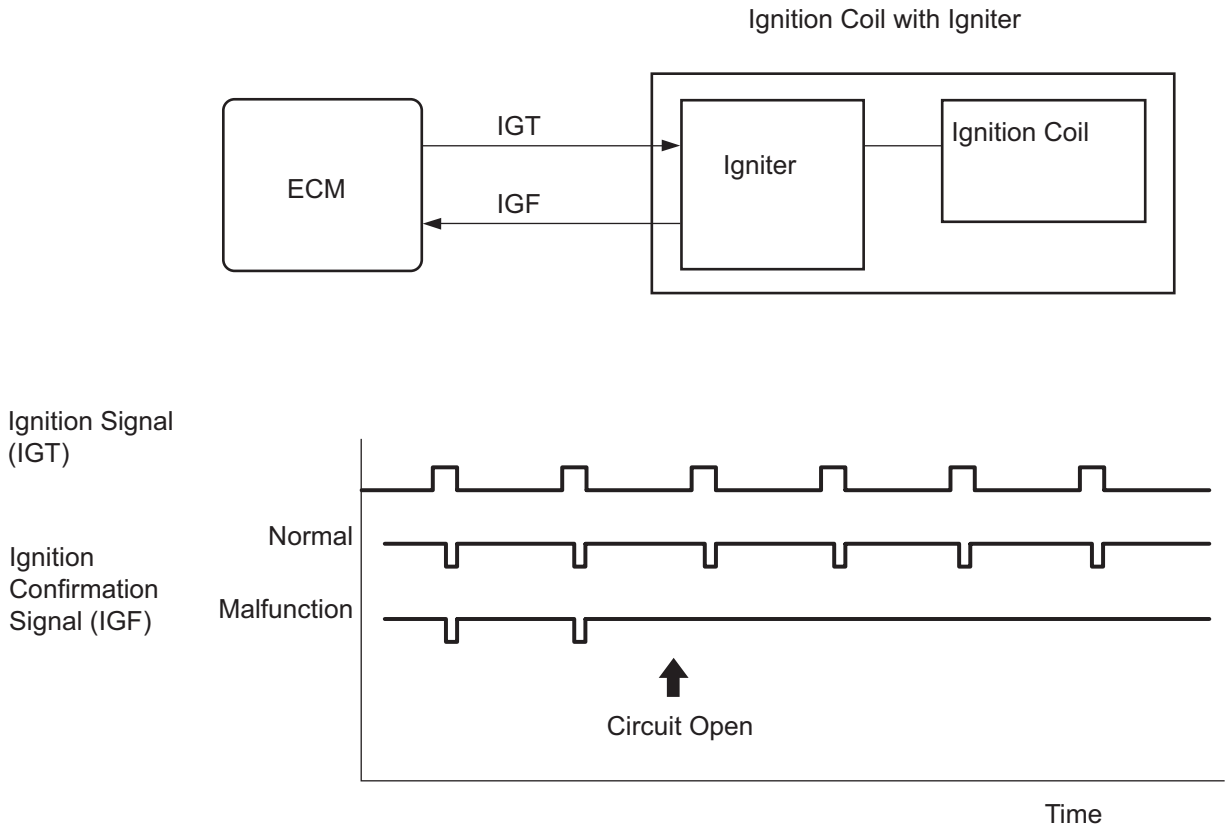
DTC No.	DTC Detection Conditions	Trouble Areas
P0351 P0352 P0353 P0354 P0355 P0356	No IGF signal to ECM while engine running (1 trip detection logic)	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 6) between ignition coil with igniter and ECM • No. 1 to No. 6 ignition coils with igniters • ECM



Reference: Inspection using an oscilloscope
While cranking or idling, check the waveform between terminals IGT(1 to 6) and E1, and IGF1 and E1 of the ECM connector.

Items	Contents
Terminals	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6 - E1 CH2: IGF1 - E1
Equipment Settings	2 V/Division, 20 ms/Division
Conditions	Cranking or idling

MONITOR DESCRIPTION



Y

A115898E01

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and sets a DTC.
If the malfunction is not repaired successfully, a DTC is set 1second after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0351: Igniter (Cylinder 1) malfunction P0352: Igniter (Cylinder 2) malfunction P0353: Igniter (Cylinder 3) malfunction P0354: Igniter (Cylinder 4) malfunction P0355: Igniter (Cylinder 5) malfunction P0356: Igniter (Cylinder 6) malfunction

Required Sensors/Components (Main)	Igniter (Cylinder 1 to 6)
Required Sensors/Components (Related)	Crankshaft position sensor
Frequency of Operation	Continuous
Duration	0.256 seconds and 4 sparks
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Either of following conditions 1 or 2 met	-
1. Following conditions (a) and (b) met:	-
(a) Engine RPM	500 rpm or less
(b) Battery voltage	6 V or more
2. Following conditions (a) and (b) met:	-
(a) Engine RPM	More than 500 rpm
(b) Battery voltage	10 V or more
(c) Number of sparks after CPU is reset	5 sparks or more

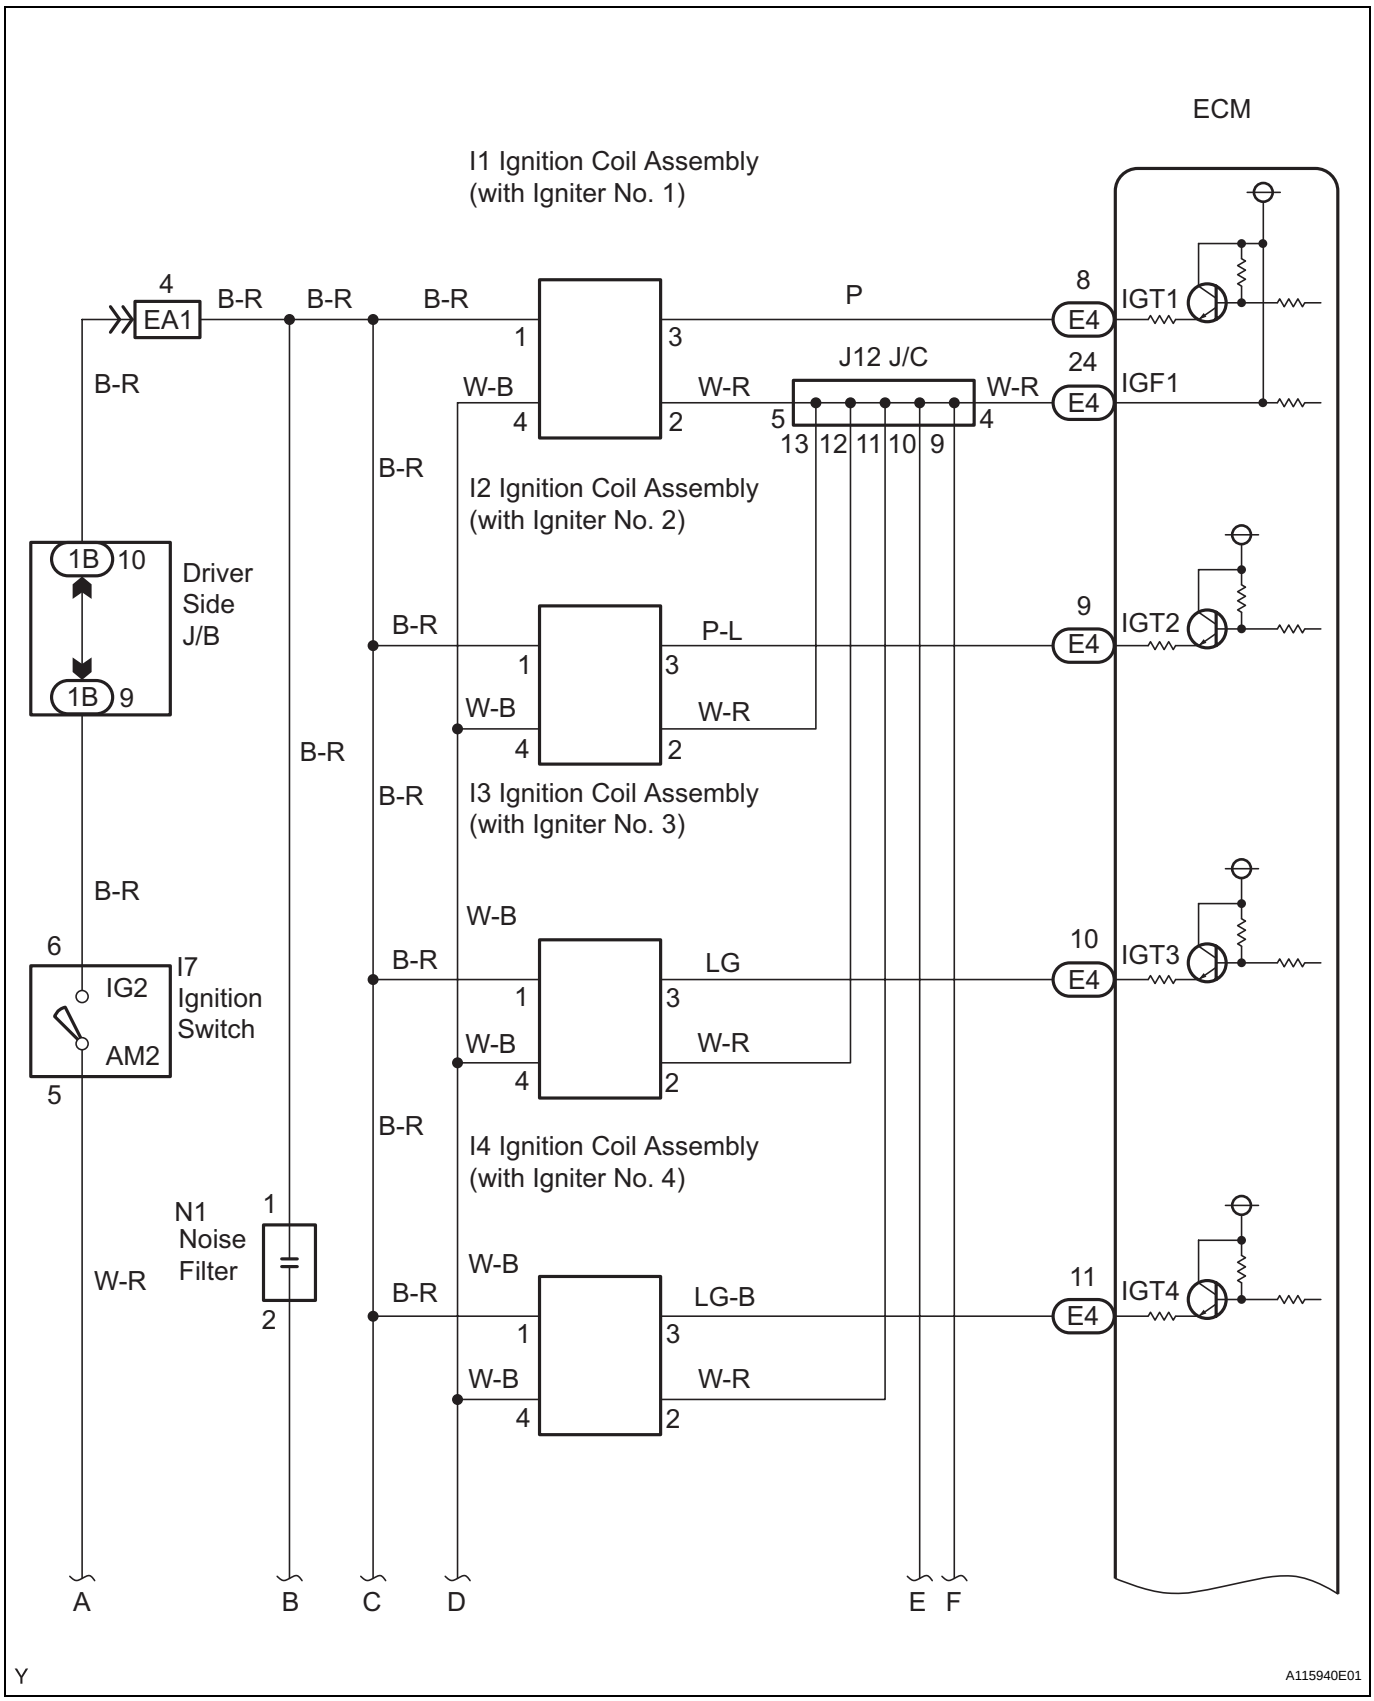
TYPICAL MALFUNCTION THRESHOLDS

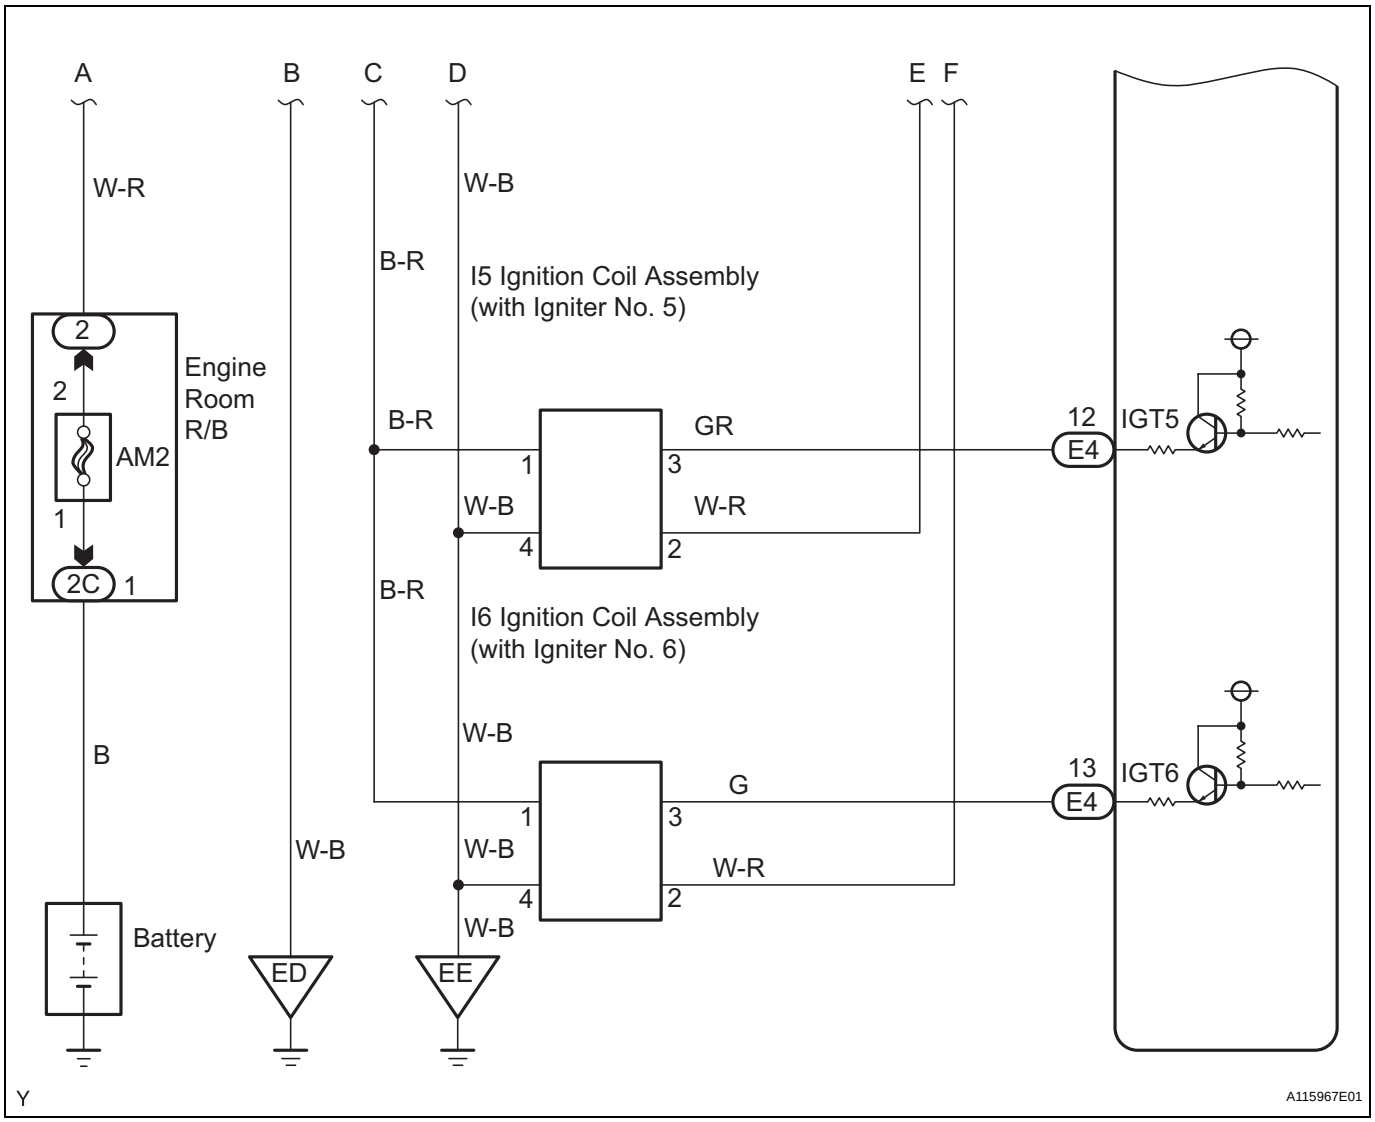
Ignition signal fail count	More than 2 times
Ignition signal fail count is on the right:	When IGF does not return despite sending IGT.

COMPONENT OPERATING RANGE

IGF signal	Igniter transmits IGF signal when it receives IGT signal from ECM

WIRING DIAGRAM





ES

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

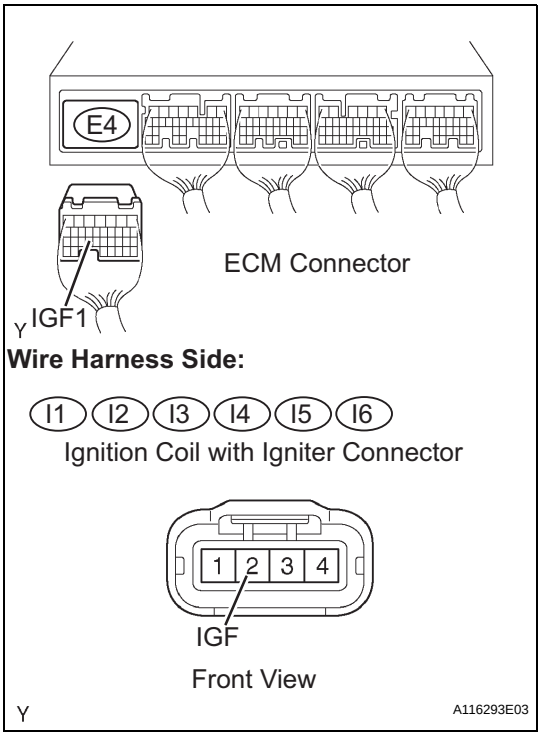
1	CHECK SPARK PLUG AND SPARK OF MISFIRING CYLINDER

(a) Check the spark plug and sparks of the misfiring cylinder (See page IG-3).

NG → Go to step 4

OK

2	CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM (IGF1 SIGNAL TERMINAL))



(a) Disconnect the I1, I2, I3, I4, I5 or I6 ignition coil with igniter connector.
(b) Disconnect the E4 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
IGF (I1-2) - IGF1 (E4-24)	Below 1 Ω
IGF (I2-2) - IGF1 (E4-24)	
IGF (I3-2) - IGF1 (E4-24)	
IGF (I4-2) - IGF1 (E4-24)	
IGF (I5-2) - IGF1 (E4-24)	
IGF (I6-2) - IGF1 (E4-24)	

Standard Resistance (Check for short)

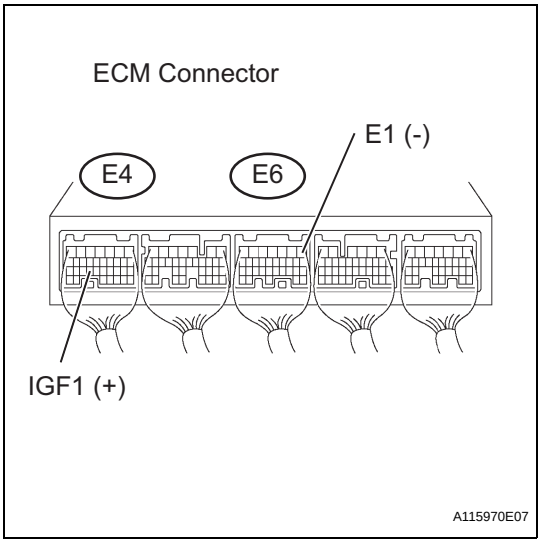
Tester Connections	Specified Conditions
IGF (I1-2) or IGF1 (E4-24) - Body ground	10 kΩ or higher
IGF (I2-2) or IGF1 (E4-24) - Body ground	
IGF (I3-2) or IGF1 (E4-24) - Body ground	
IGF (I4-2) or IGF1 (E4-24) - Body ground	
IGF (I5-2) or IGF1 (E4-24) - Body ground	
IGF (I6-2) or IGF1 (E4-24) - Body ground	

(d) Reconnect the ECM connector.
(e) Reconnect the ignition coil with igniter connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3	INSPECT ECM (IGF1 VOLTAGE)



(a) Disconnect the ignition coil connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals of the E4 and E6 ECM connectors.

Standard Voltage

Tester Connection	Specified Condition
IGF1 (E4-24) - E1 (E6-1)	4.5 to 5.5 V

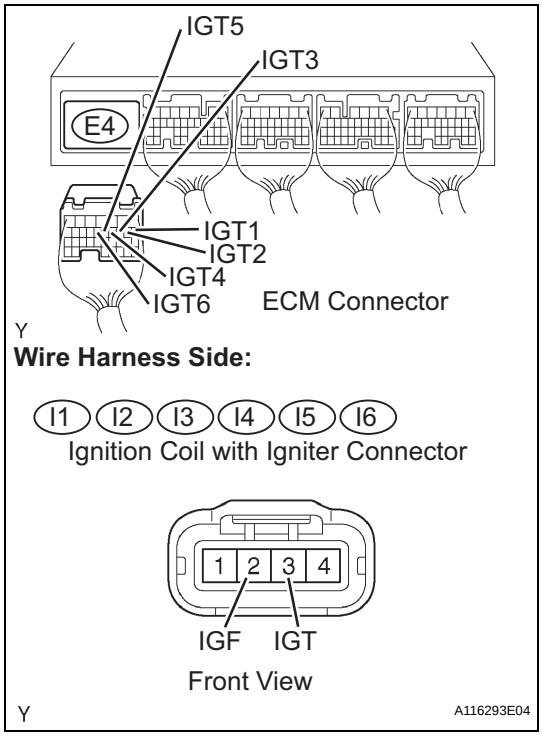
(d) Reconnect the ignition coil connector.

NG → **REPLACE ECM**

OK

REPLACE IGNITION COIL ASSEMBLY

4	CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM (IGT SIGNAL TERMINAL))



(a) Disconnect the I1, I2, I3, I4, I5 or I6 ignition coil with igniter connector.
(b) Disconnect the E4 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
IGT (I1-3) - IGT1 (E4-8)	Below 1 Ω
IGT (I2-3) - IGT2 (E4-9)	
IGT (I3-3) - IGT3 (E4-10)	
IGT (I4-3) - IGT4 (E4-11)	
IGT (I5-3) - IGT5 (E4-12)	
IGT (I6-3) - IGT6 (E4-13)	

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
IGT (I1-3) or IGT1 (E4-8) - Body ground	10 kΩ or higher
IGT (I2-3) or IGT2 (E4-9) - Body ground	
IGT (I3-3) or IGT3 (E4-10) - Body ground	
IGT (I4-3) or IGT4 (E4-11) - Body ground	
IGT (I5-3) or IGT5 (E4-12) - Body ground	
IGT (I6-3) or IGT6 (E4-13) - Body ground	

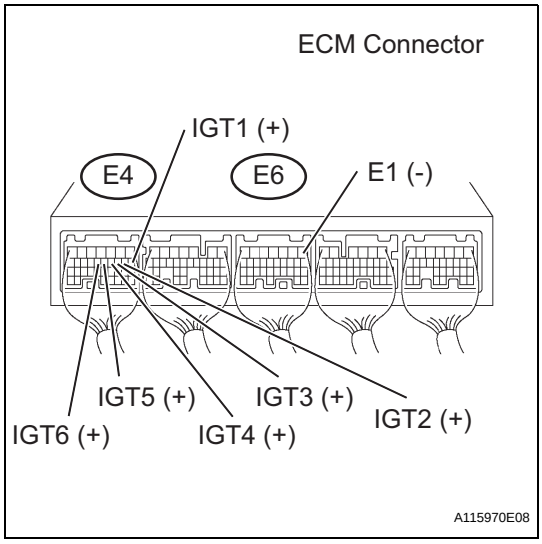
(d) Reconnect the ECM connector.
(e) Reconnect the ignition coil with igniter connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

ES

5	INSPECT ECM (IGT1, IGT2, IGT3, IGT4, IGT5, OR IGT6 VOLTAGE)



(a) Measure the voltage between the terminals of the E4 and E6 ECM connectors.

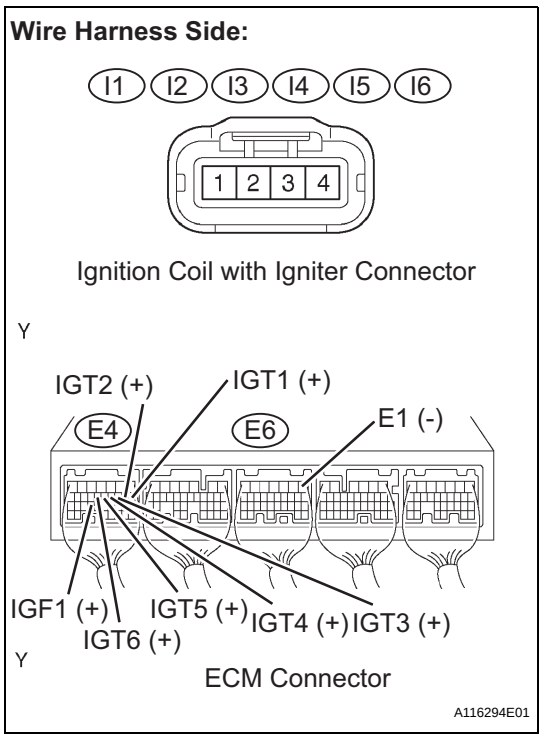
Standard Voltage

Tester Connections	Specified Conditions
IGT1 (E4-8) - E1 (E6-1)	0.1 to 4.5 V
IGT2 (E4-9) - E1 (E6-1)	
IGT3 (E4-10) - E1 (E6-1)	
IGT4 (E4-11) - E1 (E6-1)	
IGT5 (E4-12) - E1 (E6-1)	
IGT6 (E4-13) - E1 (E6-1)	

NG → **REPLACE ECM**

OK

6	INSPECT ECM (IGT1, IGT2, IGT3, IGT4, IGT5, OR IGT6 VOLTAGE)



(a) Disconnect the I1, I2, I3, I4, I5 or I6 ignition coil connector.

(b) Measure the voltage between the terminals of the E4 and E6 ECM connectors.

Standard Voltage

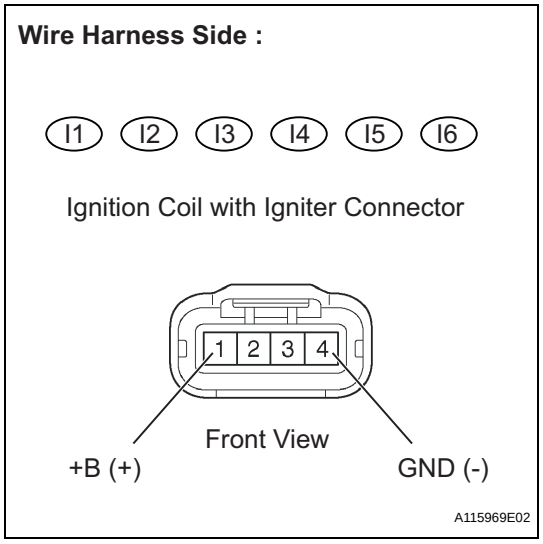
Tester Connections	Specified Conditions
IGT1 (E4-8) - E1 (E6-1)	4.5 V or more
IGT2 (E4-9) - E1 (E6-1)	
IGT3 (E4-10) - E1 (E6-1)	
IGT4 (E4-11) - E1 (E6-1)	
IGT5 (E4-12) - E1 (E6-1)	
IGT6 (E4-13) - E1 (E6-1)	

(c) Reconnect the ignition coil connector.

NG → **Go to step 8**

OK

7 INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)



(a) Disconnect the I1, I2, I3, I4, I5 or I6 ignition coil with igniter connector.

(b) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
GND (I1-4) - Body ground	Below 1 Ω
GND (I2-4) - Body ground	
GND (I3-4) - Body ground	
GND (I4-4) - Body ground	
GND (I5-4) - Body ground	
GND (I6-4) - Body ground	

(c) Turn the ignition switch ON.

(d) Measure the voltage between the terminals of the wire harness side connector.

Standard Voltage

Tester Connections	Specified Conditions
+B (I1-1) - GND (I1-4)	9 to 14 V
+B (I2-1) - GND (I2-4)	
+B (I3-1) - GND (I3-4)	
+B (I4-1) - GND (I4-4)	
+B (I5-1) - GND (I5-4)	
+B (I6-1) - GND (I6-4)	

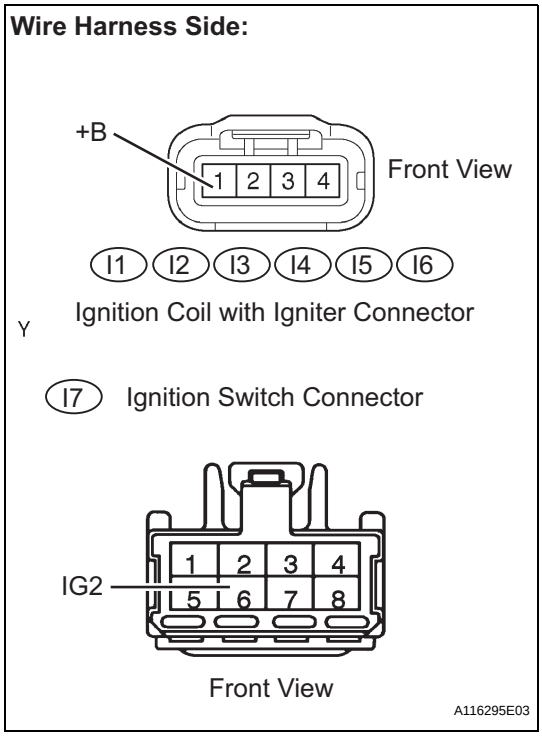
(e) Reconnect the ignition coil with igniter connector.

OK → **REPLACE IGNITION COIL ASSEMBLY**

NG

ES

8	CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - IGNITION SWITCH)



(a) Disconnect the I1, I2, I3, I4, I5 or I6 ignition coil with igniter connector.
(b) Disconnect the I7 ignition switch connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
+B (I1-1) - IG2 (I7-6)	Below 1 Ω
+B (I2-1) - IG2 (I7-6)	
+B (I3-1) - IG2 (I7-6)	
+B (I4-1) - IG2 (I7-6)	
+B (I5-1) - IG2 (I7-6)	
+B (I6-1) - IG2 (I7-6)	

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
+B (I1-1) or IG2 (I7-6) - Body ground	10 kΩ or higher
+B (I2-1) or IG2 (I7-6) - Body ground	
+B (I3-1) or IG2 (I7-6) - Body ground	
+B (I4-1) or IG2 (I7-6) - Body ground	
+B (I5-1) or IG2 (I7-6) - Body ground	
+B (I6-1) or IG2 (I7-6) - Body ground	

(d) Reconnect the ignition coil with igniter connector.
(e) Reconnect the ignition switch connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE IGNITION COIL ASSEMBLY

DTC	P0420	Catalyst System Efficiency Below Threshold (Bank 1)

DTC	P0430	Catalyst System Efficiency Below Threshold (Bank 2)

MONITOR DESCRIPTION

The ECM uses sensors mounted in front of and behind the Three-Way Catalytic Converter (TWC) to monitor its efficiency.

The first sensor, the Air-Fuel Ratio (A/F) sensor, sends pre-catalyst information to the ECM. The second sensor, the Heated Oxygen (HO2) sensor, sends post-catalyst information to the ECM.

In order to detect any deterioration in the TWC, the ECM calculates the Oxygen Storage Capacity (OSC) of the TWC. This calculation is based on the voltage output of the HO2 sensor while performing active air-fuel ratio control, rather than the conventional detecting method, which uses the locus ratio.

The OSC value is an indication of the oxygen storage capacity of the TWC. When the vehicle is being driven with a warm engine, active air-fuel ratio control is performed for approximately 15 to 20 seconds. When it is performed, the ECM deliberately sets the air-fuel ratio to lean or rich levels. If a rich-lean cycle of the HO2 sensor is long, the OSC becomes greater. There is a direct correlation between the OSCs of the HO2 sensor and the TWC.

The ECM uses the OSC value to determine the state of the TWC. If any deterioration has occurred, it illuminates the MIL and sets a DTC.

DTC No.	DTC Detection Conditions	Trouble Areas
P0420	OSC value smaller than standard value under active air-fuel ratio control (2 trip detection logic)	• Gas leakage from exhaust system • A/F sensor (bank 1 sensor 1) • HO2 sensor (bank 1 sensor 2) • Exhaust manifold (TWC)
P0430	OSC value smaller than standard value under active air-fuel ratio control (2 trip detection logic)	• Gas leakage from exhaust system • A/F sensor (bank 2 sensor 1) • HO2 sensor (bank 2 sensor 2) • Exhaust manifold (TWC)

HINT:

- Bank 1 refers to the bank that includes cylinder No. 1.
- Bank 2 refers to the bank that does not include cylinder No. 1.
- Sensor 1 refers to the sensor closest to the engine assembly.
- Sensor 2 refers to the sensor farthest away from the engine assembly.

MONITOR STRATEGY

Related DTCs	P0420: Catalyst Deterioration P0430: Catalyst Deterioration
Required Sensors/Components (Main)	A/F sensor and heated oxygen sensor
Required Sensors/Components (Related)	Intake air temperature sensor, mass air flow meter, crankshaft position sensor and engine coolant temperature sensor
Frequency of Operation	Once per driving cycle
Duration	30 seconds or more
MIL Operation	2 driving cycles
Sequence of Operation	None

Battery voltage	11 V or more
IAT	-10°C (14°F) or more
Engine coolant temperature sensor	75°C (167°F) or more
Atmospheric pressure coefficient	0.75 or more
Delay time after IDCE ON	Less than 5 seconds
Engine RPM	Less than 3,200 rpm
A/F sensor status	Activated
Fuel system status	Closed loop
Delay time after fuel cut	10 seconds or more
Engine load	10 to 70 %
All of the following conditions are met	Condition 1, 2 and 3
1. Mass air flow rate	5 to 70 g/sec
2. Front catalyst temperature (estimated)	650 to 840°C (1,202 to 1,544°F)
3. Rear catalyst temperature (estimated)	100 to 900°C (212 to 1,652°F)

TYPICAL MALFUNCTION THRESHOLDS

Oxygen Storage Capacity (OSC) of Three-Way Catalytic Converter (TWC)	Less than 0.04 g

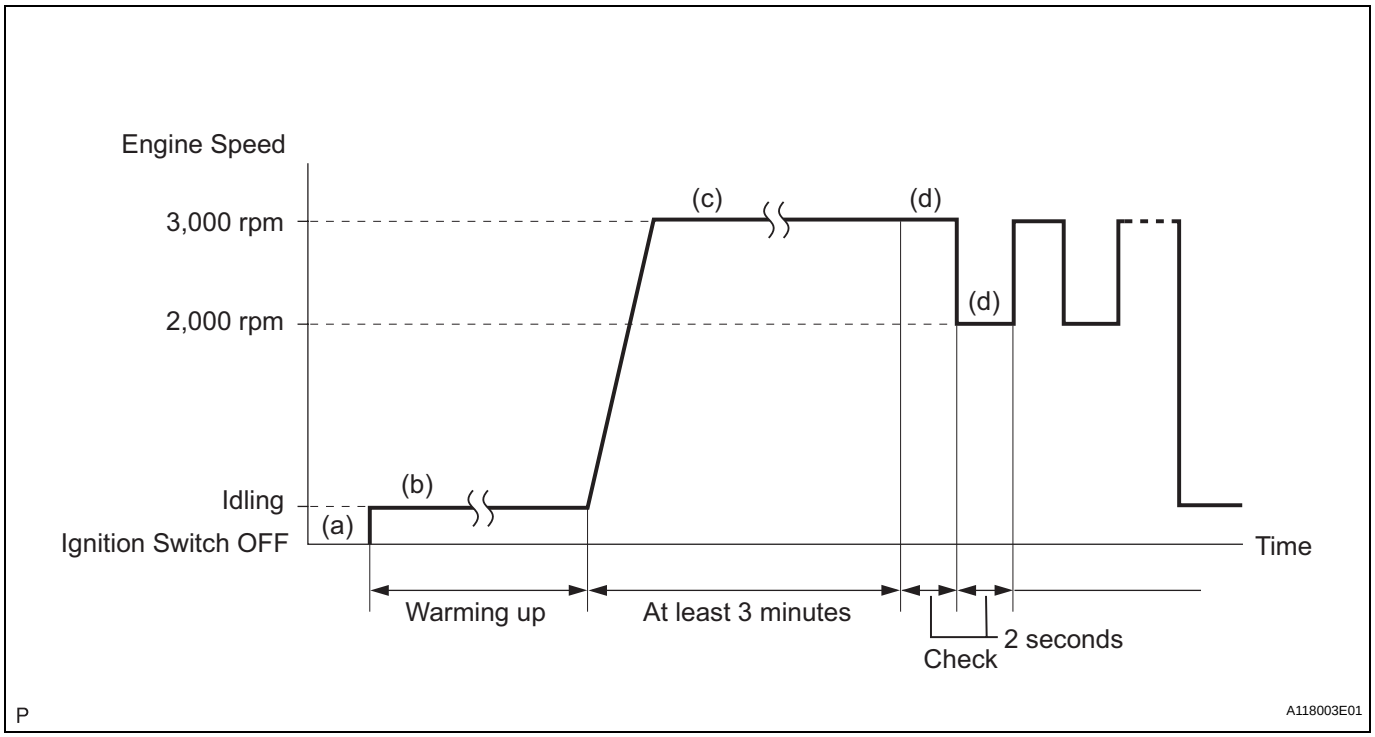
MONITOR RESULT

Detailed information on Checking Monitor Status (See page ES-19).

CONDITIONING FOR SENSOR TESTING

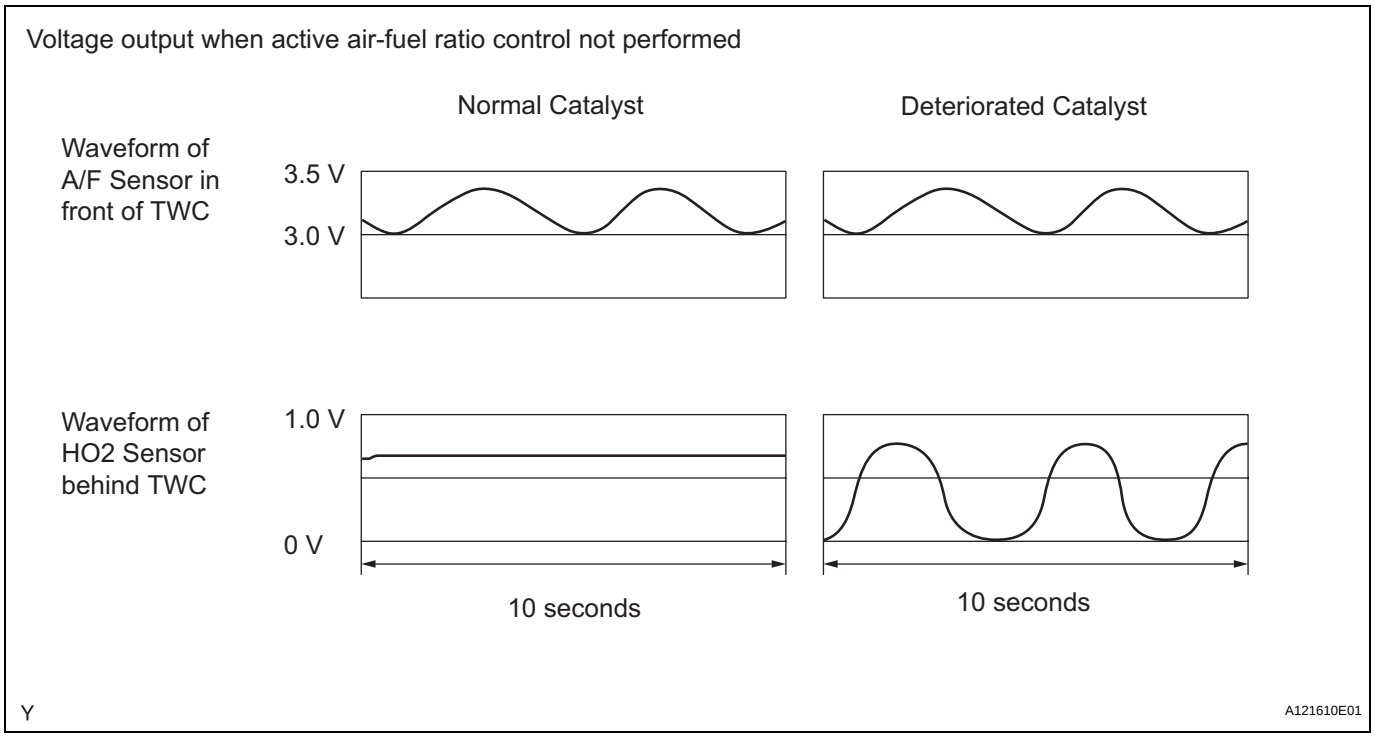
HINT:

Perform the operation with the engine speeds and time durations described below prior to checking the waveforms of the A/F and HO2 sensors. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.



(a) Connect an intelligent tester to the DLC3.
(b) Start the engine and warm it up with all the accessories switched OFF, until the engine coolant temperature stabilizes.
(c) Run the engine at an engine speed of between 2,500 rpm and 3,000 rpm for at least 3 minutes.
(d) While running the engine at 3,000 rpm for 2 seconds and 2,000 rpm for 2 seconds, check the waveforms of the A/F and HO2 sensors using the tester.
HINT:

- If either of the voltage outputs of the Air-Fuel Ratio (A/F) or Heated Oxygen (HO2) sensor does not fluctuate, or either of the sensors makes a noise, the sensor may be malfunctioning.
- If the voltage outputs of both the sensors remain lean or rich, the air-fuel ratio may be extremely lean or rich. In such cases, perform the following A/F CONTROL using an intelligent tester.
- If the Three-Way Catalytic Converter (TWC) has deteriorated, the HO2 sensor (located behind the TWC) voltage output fluctuates up and down frequently, even under normal driving conditions (active air-fuel ratio control is not performed).



CONDITIONING FOR SENSOR TESTING

HINT:
Intelligent tester only:
Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using an intelligent tester.
(1) Connect an intelligent tester to the DLC3.
(2) Start the engine and turn the tester ON.
(3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(4) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(6) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2) displayed on the tester.
HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 or AFS B2S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 or AFS B2S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 or O2S B2S2 (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 or O2S B2S2 (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:
The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		-
	Output voltage More than 3.35 V Less than 3.0 V		Output voltage More than 0.55 V Less than 0.4 V		
2	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output voltage Almost no reaction		Output voltage More than 0.55 V Less than 0.4 V		
3	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output voltage More than 3.35 V Less than 3.0 V		Output voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output voltage Almost no reaction		Output voltage Almost no reaction		

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2, and press the YES button and then the ENTER button followed by the F4 button.

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0420 AND/OR P0430)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0420 and/or P0430	A

Display (DTC Output)	Proceed To
P0420 and/or P0430 and other DTCs	B

HINT:
If any DTCs other than P0420 or P0430 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

ES

(a) Connect an intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2) displayed on the tester.
HINT:
- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 or AFS B2S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 or AFS B2S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 or O2S B2S2 (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 or O2S B2S2 (HO2)	-12.5 %	Lean	Less than 0.4

Result

Status AFS B1S1 or AFS B2S1	Status O2S B1S2 or O2S B2S2	A/F Condition and A/F and HO2 Sensors Conditions	Misfires	Main Suspected Trouble Areas	Proceed To
Lean/Rich	Lean/Rich	Normal	-	• Three-Way Catalytic Converter (TWC) • Gas leakage from exhaust system	A
Lean	Lean/Rich	A/F sensor malfunction	-	• A/F sensor	B
Rich	Lean/Rich	A/F sensor malfunction	-	• A/F sensor	
Lean/Rich	Lean	HO2 sensor malfunction	-	• HO2 sensor • Gas leakage from exhaust system	C
Lean/Rich	Rich	HO2 sensor malfunction	-	• HO2 sensor • Gas leakage from exhaust system	

Status AFS B1S1 or AFS B2S1	Status O2S B1S2 or O2S B2S2	A/F Condition and A/F and HO2 Sensors Conditions	Misfires	Main Suspected Trouble Areas	Proceed To
Lean	Lean	Actual air-fuel ratio lean	May occur	• Extremely rich or lean actual air-fuel ratio • Gas leakage from exhaust system	A
Rich	Rich	Actual air-fuel ratio rich	-	• Extremely rich or lean actual air-fuel ratio • Gas leakage from exhaust system	

Lean: During A/F CONTROL, the A/F sensor output voltage (AFS) is consistently more than 3.35 V, and the HO2 sensor output voltage (O2S) is consistently less than 0.4 V.
Rich: During A/F CONTROL, the AFS is consistently less than 3.0 V, and the O2S is consistently more than 0.55 V.
Lean/Rich: During A/F CONTROL of the ACTIVE TEST, the output voltage of the HO2 sensor alternates correctly.

DTC	P043E	Evaporative Emission System Reference Orifice Clog Up

DTC	P043F	Evaporative Emission System Reference Orifice High Flow

DTC SUMMARY

DTCs	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logics
P043E	Reference orifice clogged	Leak detection pump creates negative pressure through reference orifice, and EVAP system pressure measured to determine 0.02 inch leak criterion. 0.02 inch leak criterion measured at start and at end of leak check. If system pressure lower than -4.85 kPa (-36.38 mmHg)*, ECM determines that reference orifice has clogging malfunction.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM • Leakage from EVAP system	While ignition switch OFF	2 trips
P043F	Reference orifice high-flow	Leak detection pump creates negative pressure through reference orifice, and EVAP system pressure measured to determine 0.02 inch leak criterion. 0.02 inch leak criterion generated at start and at end of leak check. If system pressure higher than -1.06 kPa (-7.95 mmHg)*, ECM determines that reference orifice has high-flow malfunction.			

*: The threshold values vary according to the atmospheric pressure measured at the beginning of the EVAP system monitor. The values described in the table above are based on an atmospheric pressure of 100 kPa (750.1 mmHg) (absolute pressure).
HINT:
The reference orifice is located inside the canister pump module.

DESCRIPTION

The circuit description can be found in the EVAP System (See page ES-351).

Refer to the EVAP System (See page ES-351).

MONITOR DESCRIPTION

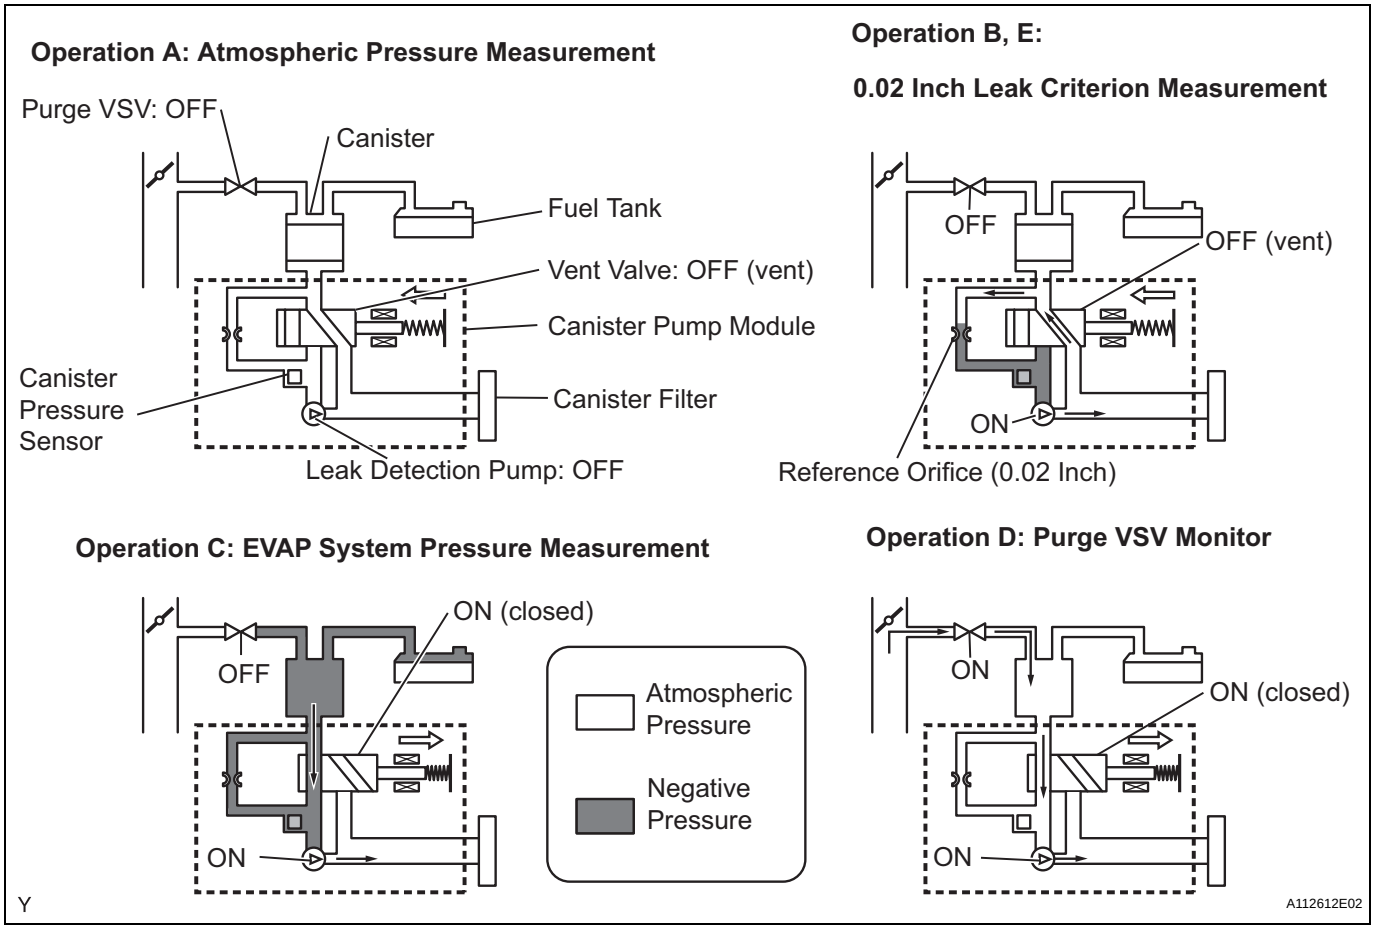
5 hours* after the ignition switch is turned OFF, the electric leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.
HINT:
*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds

Sequence	Operations	Descriptions	Duration
B	First 0.02 inch leak criterion measurement	In order to determine 0.02 inch leak criterion, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as they will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak criterion measurement	After second 0.02 inch leak criterion measurement, leak check performed by comparing first and second 0.02 inch leak criterion. If stabilized system pressure higher than second 0.02 inch leak criterion, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

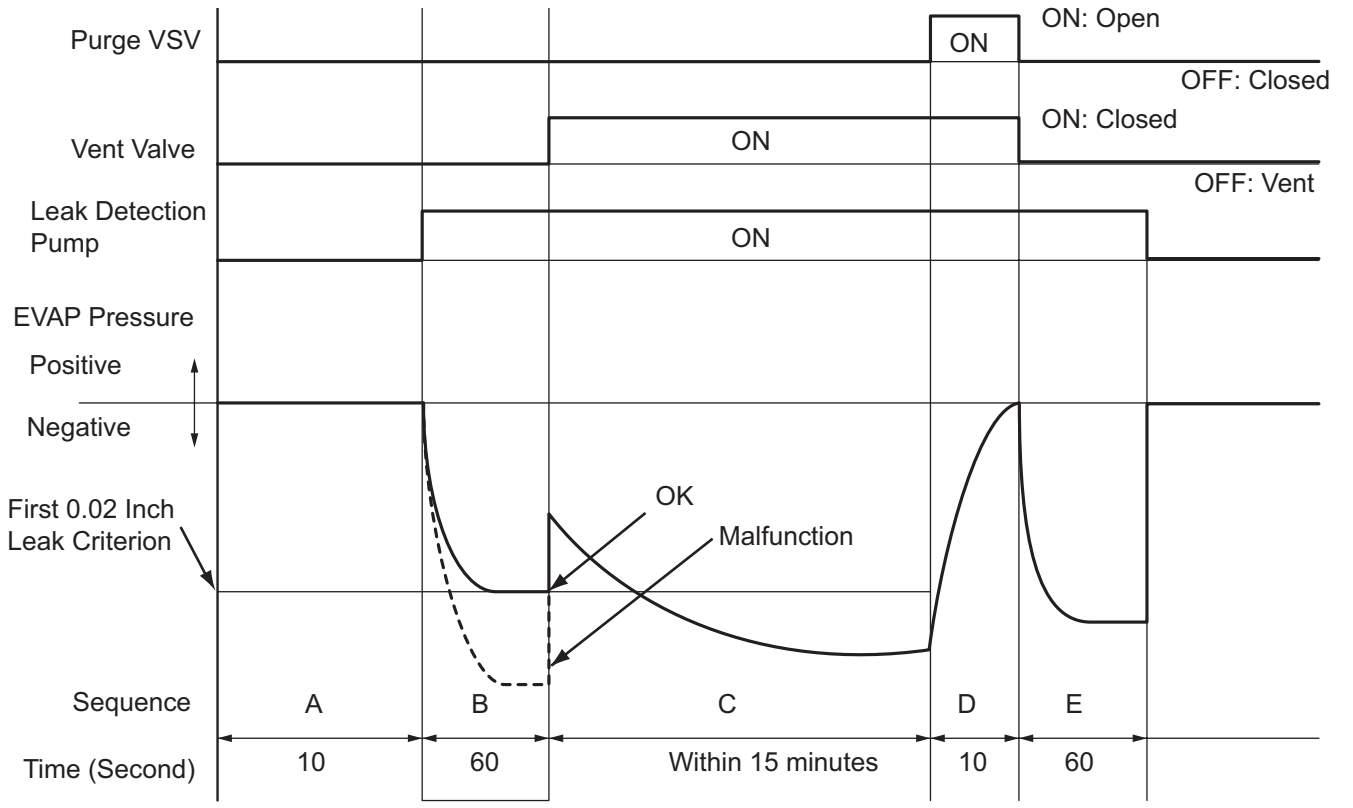
ES

* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.



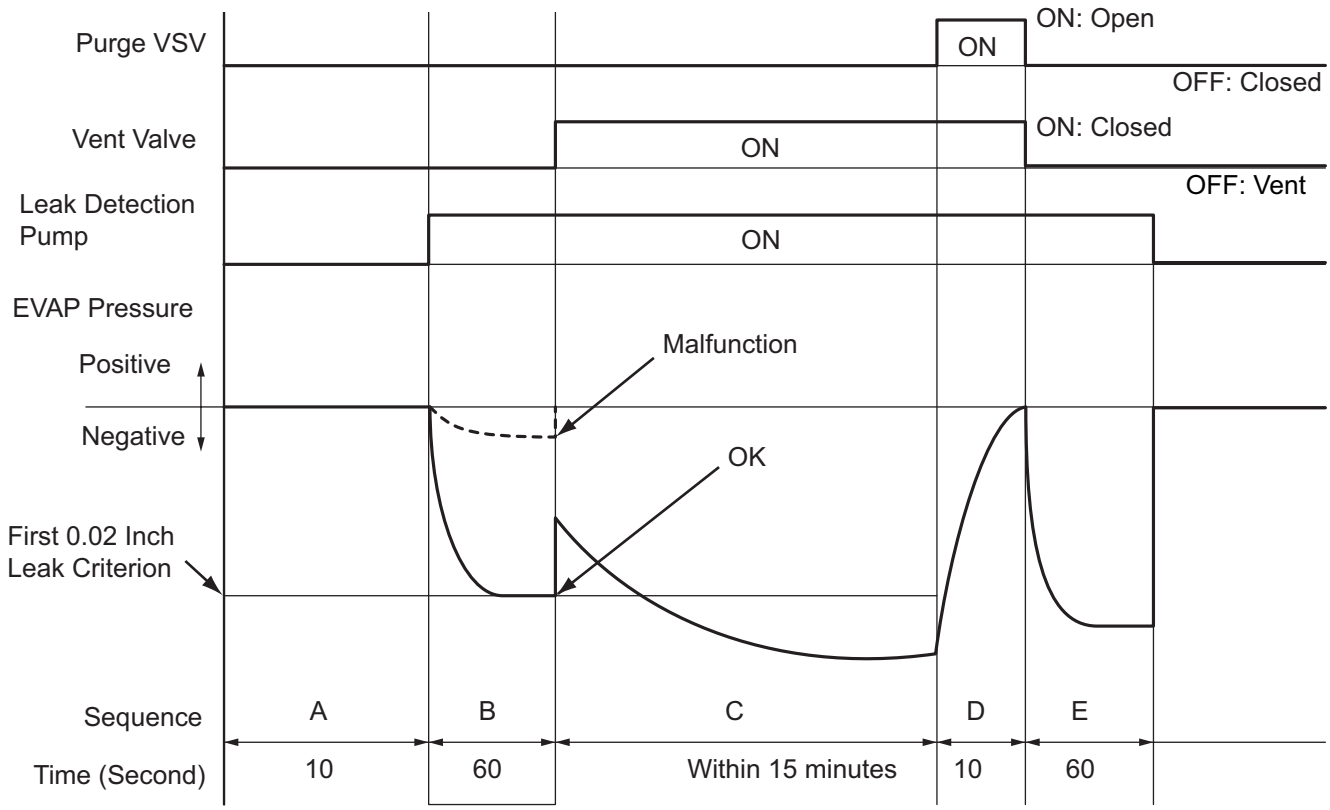
1. P043E: Reference orifice clogged
   In operation B, the leak detection pump creates negative pressure (vacuum) through the reference orifice. The EVAP system pressure is then measured by the ECM, using the canister pressure sensor, to determine the 0.02 inch leak criterion. If the pressure is lower than -4.85 kPa (-36.38 mmHg)*, the ECM interprets this as a clog malfunction in the reference orifice, and stops the EVAP (Evaporative Emission) system monitor. The ECM then illuminates the MIL and sets the DTC (2 trip detection logic).
   *: The threshold varies according to the atmospheric pressure measured in operation A. The value described above is based on an atmospheric pressure of 100 kPa (750.1 mmHg): absolute pressure.

EVAP Pressure when Reference Orifice Clogged:



2. P043F: Reference orifice high-flow
In operation B, the leak detection pump creates negative pressure (vacuum) through the reference orifice. The EVAP system pressure is then measured by the ECM using the canister pressure sensor to determine the 0.02 inch leak criterion. If the pressure is higher than -1.06 kPa (-7.95 mmHg)*, the ECM interprets this as a high-flow malfunction in the reference orifice, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (2 trip detection logic).
*: The threshold varies according to the atmospheric pressure measured in operation A. The value described above is based on a atmospheric pressure of 100 kPa (750.1 mmHg): absolute pressure.

EVAP Pressure when Reference Orifice High-flow Malfunction:



MONITOR STRATEGY

Required Sensors/Components	Canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 15 minutes (varies with amount of fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever these DTCs not present	None
EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	525 to 825 mmHg (70 to 110 kPa)
Battery voltage	10.5 V or more
Vehicle speed	Below 2.5 mph (4 km/h)
Ignition switch	OFF
Engine condition	Not running

Fuel tank pressure sensor malfunction (P0450, P0452 and/or P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of following conditions met before IG switch OFF	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. Purge flow	Executed
ECT	4.4° to 35°C (40° to 95°F)
IAT	4.4° to 35°C (40° to 95°F)

Example of restart time

First time	7 hours
Second time	9 hours and 30 minutes

ES

1. Key-off monitor sequence is 1 to 8

1. Atmospheric pressure

Next sequence is run if following condition set	-
Atmospheric pressure change for 10 sec.	Less than 2.25 mmHg (0.3 kPa) for 1 second

2. First 0.02 inch leak criterion

Next sequence is run if all of following conditions set	Conditions 1, 2 and 3
1. Fuel tank pressure when 4 seconds after 0.02 inch leak criterion measurement began	-7.5 mmHg (-1 kPa) or less
2. 0.02 inch leak criterion	-33.38 to -7.93 mmHg (-4.85 to -1.057 kPa)
3. 0.02 inch leak criterion	Saturated within 55 seconds

3. Vent valve stuck closed check

Next sequence is run if following condition set	-
Fuel tank pressure change for 10 seconds after vent valve ON (closed)	2.25 mmHg (0.3 kPa) or more

4. Vacuum introduction

Next sequence is run if both of following condition set	-
1. Vacuum introduction time	12 minutes or less
2. Fuel tank pressure	Fuel tank pressure was standard

5. Purge VSV stuck closed check

Next sequence is run if following condition set	-
Fuel tank pressure change for 10 seconds after purge VSV ON (open)	2.25 mmHg (0.3 kPa) or more

6. Second 0.02 inch leak criterion measurement

Next sequence is run if all of following conditions set	Conditions 1, 2, 3 and 4
1. Fuel tank pressure when 4 seconds after 0.02 inch leak criterion measurement began	-7.5 mmHg (-1 kPa) or less
2. 0.02 inch leak criterion	-36.4 to -7.92 mmHg (-4.85 to -1.057 kPa)
3. 0.02 inch leak criterion	Saturated within 55 seconds
4. 0.02 inch leak criterion difference between first and second	5.25 mmHg (0.7 kPa) or less

7. Leak check

Next sequence is run if following condition set	-
Arrival pressure when vacuum introduced for EVAP system	Leak detection criteria or less

8. Atmospheric pressure

Monitor is complete if following	-
Atmospheric pressure difference between sequences 1 and 8	2.25 mmHg (0.3 kPa) or less

TYPICAL MALFUNCTION THRESHOLDS

One of following conditions met	-
Fuel tank pressure when 4 seconds after 0.02 inch leak criterion measurement began	More than -7.5 mmHg (-1 kPa)
0.02 inch leak criterion	Less than -36.4 mmHg (-4.85 kPa)
0.02 inch leak criterion	-7.9 mmHg (-1.057 kPa) or more
0.02 inch leak criterion	Not saturated
0.02 inch leak criterion difference between first and second	5.3 mmHg (0.7 kPa) or more

"Saturated" indicates that the EVAP pressure change is less than 0.75 mmHg (0.1 kPa) in 30 seconds.

MONITOR RESULT

Detailed information on Checking Monitor Status (See page ES-19).

DTC	P0441	Evaporative Emission Control System Incorrect Purge Flow

DTC SUMMARY

DTCs	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P0441	Purge VSV (Vacuum Switching Valve) stuck open	Leak detection pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. 0.02 inch leak criterion measured at start and at end of leak check. If stabilized pressure higher than [second 0.02 inch leak criterion x 0.2], ECM determines that purge VSV stuck open	• Purge VSV • Connector/wire harness (Purge VSV - ECM) • ECM • Canister pump module • Leakage from EVAP system	While ignition Switch OFF	2 trip
	Purge VSV stuck closed	After EVAP leak check performed, purge VSV turned ON (open), and atmospheric air introduced into EVAP system. 0.02 inch leak criterion measured at start and at end of leak check. If pressure does not return to near atmospheric pressure, ECM determines that purge VSV stuck closed	• Purge VSV • Connector/wire harness (Purge VSV - ECM) • ECM • Canister pump module • Leakage from EVAP system	While ignition Switch OFF	2 trip
	Purge flow	While engine running, following conditions successively met: • Negative pressure not created in EVAP system when purge VSV turned ON (open) • EVAP system pressure change less than 0.5 kPa (3.75 mmHg) when vent valve turned ON (closed) • Atmospheric pressure change before and after purge flow monitor less than 0.1 kPa (0.75 mmHg)	• Purge VSV • Connector/wire harness (Purge VSV - ECM) • Leakage from EVAP line (Purge VSV - Intake manifold) • ECM	While engine running	2 trip

DESCRIPTION

The circuit description can be found in the EVAP System (See page ES-351).

Refer to the EVAP System (See page ES-351).

MONITOR DESCRIPTION

The two monitors, Key-Off and Purge Flow, are used to detect malfunctions relating to DTC P0441. The Key-Off monitor is initiated by the ECM internal timer, known as the soak timer, 5 hours* after the ignition switch is turned OFF. The purge flow monitor runs while the engine is running.

1. KEY-OFF MONITOR

5 hours* after the ignition switch is turned OFF, the electric leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

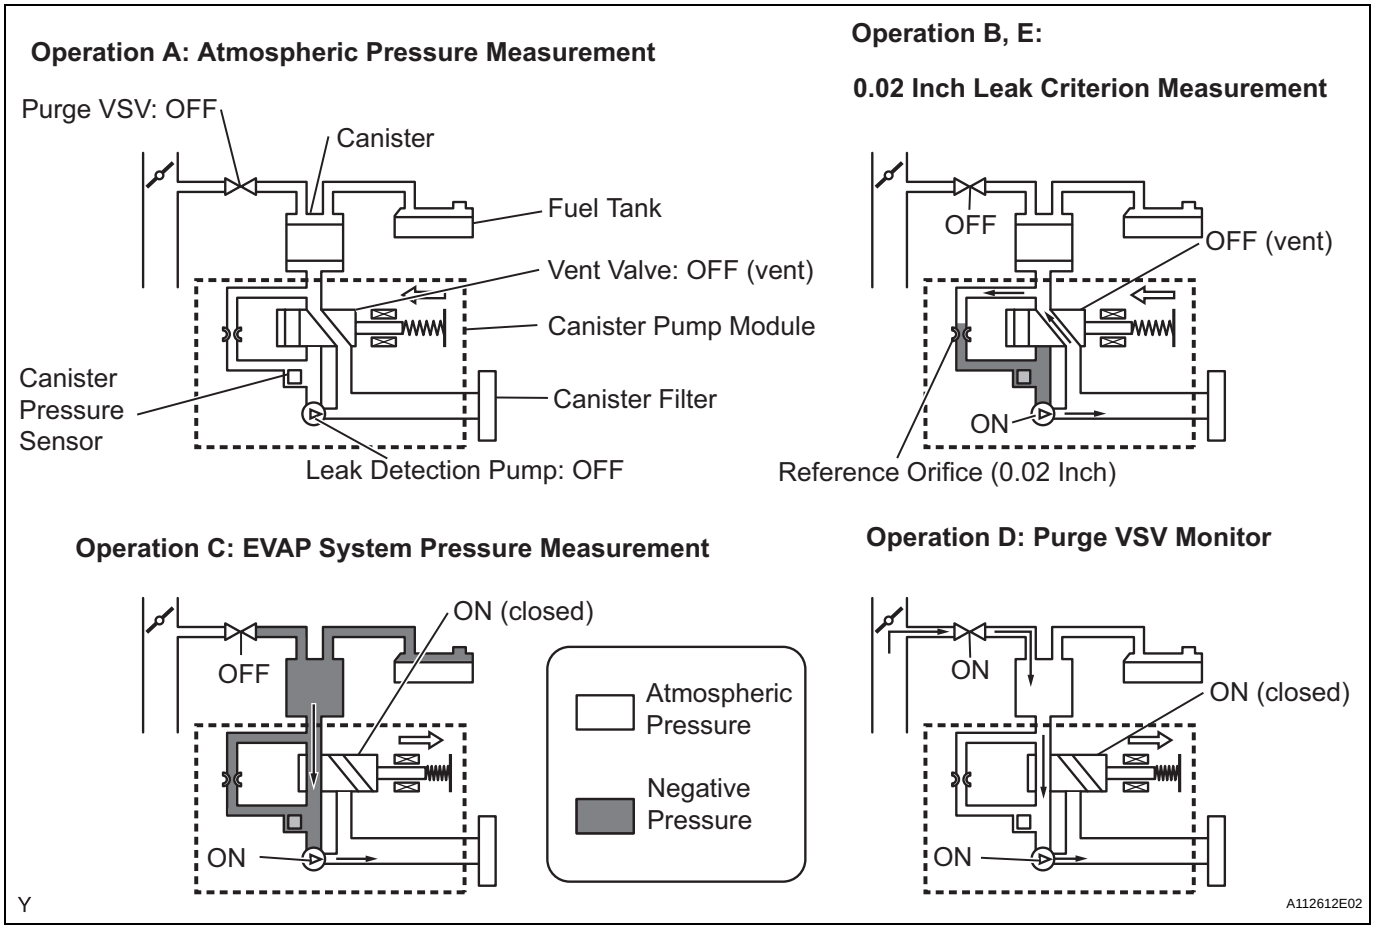
HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

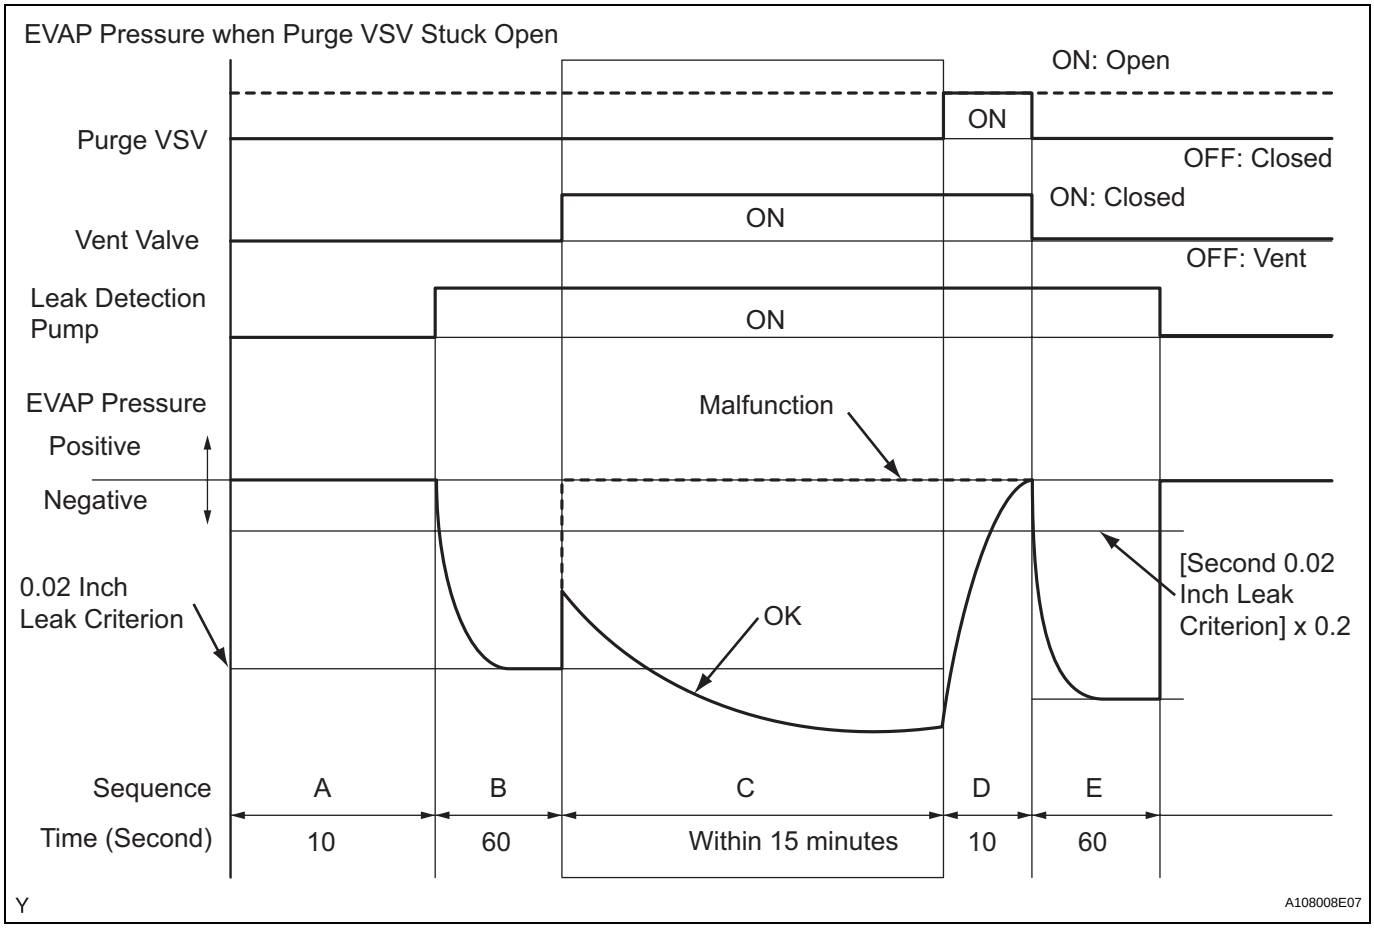
Sequence	Operation	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned OFF.	-

Sequence	Operation	Descriptions	Duration
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak criterion measurement	In order to determine 0.02 inch leak criterion, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as they will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak criterion measurement	After second 0.02 inch leak criterion measurement, leak check performed by comparing first and second 0.02 inch leak criterion. If stabilized system pressure higher than second 0.02 inch leak criterion, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

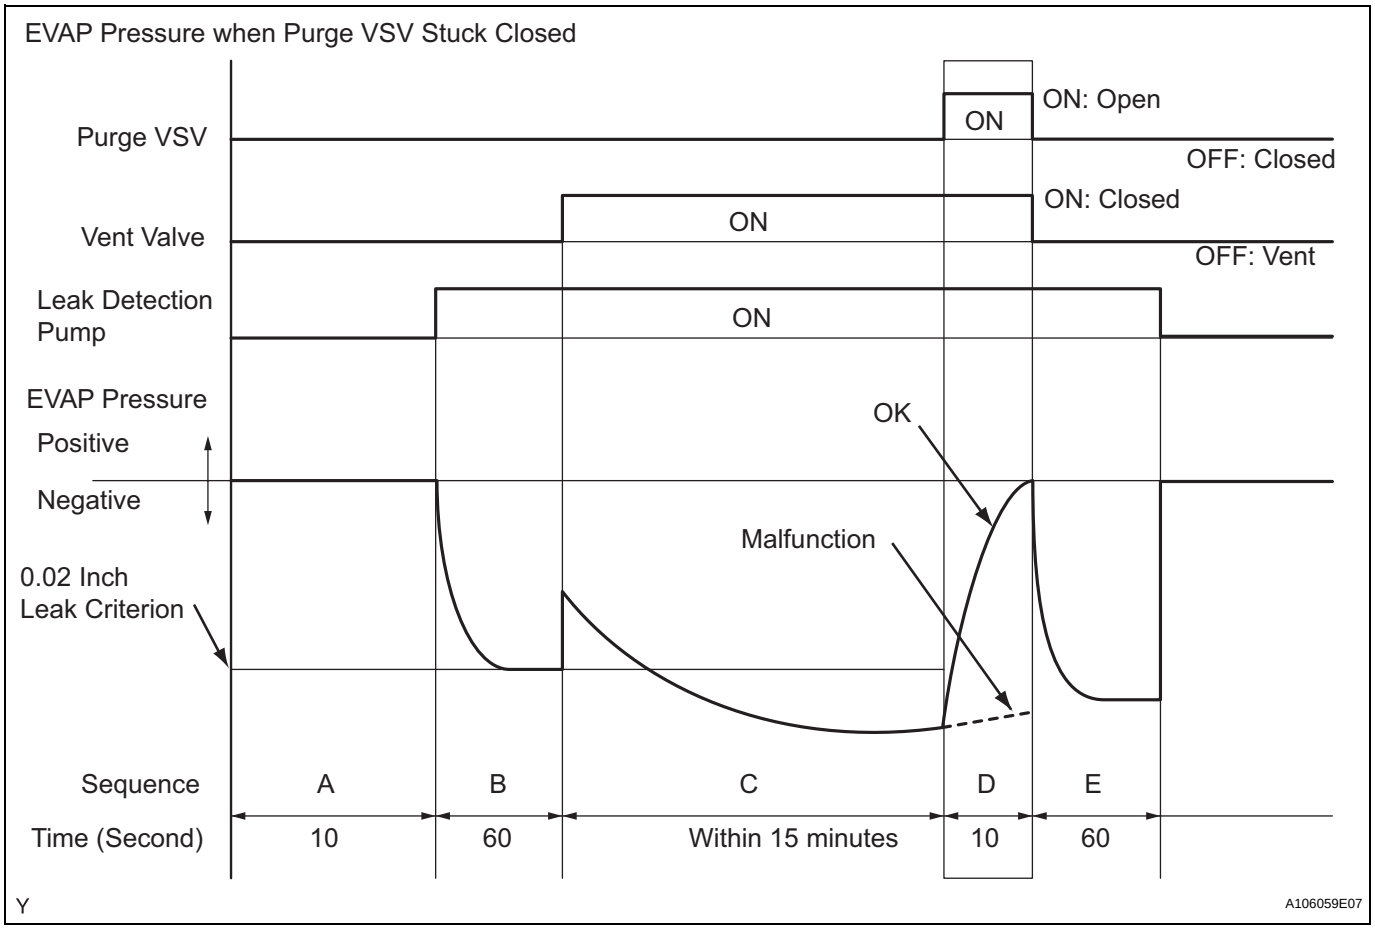
* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

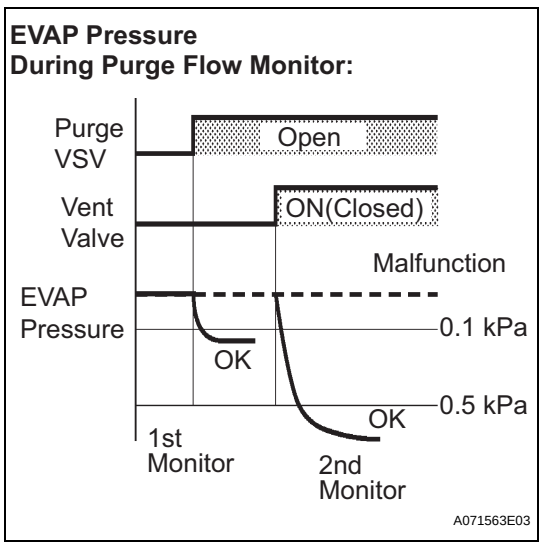


1. Purge VSV stuck open
   In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The EVAP system pressure is then measured by the ECM using the canister pressure sensor. If the stabilized system pressure is higher than [second 0.02 inch leak criterion x 0.2], the ECM interprets this as the purge VSV (Vacuum Switching Valve) being stuck open. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).



2. Purge VSV stuck closed
In operation D, the canister pressure sensor measures the EVAP (Evaporative Emission) system pressure. Pressure measurement for the purge VSV monitor is begun when the purge VSV is turned ON (open) after the EVAP leak check. When the measured pressure indicates an increase of 0.3 kPa (2.25 mmHg) or more, the purge VSV is functioning normally. If the pressure does not increase, the ECM interprets this as the being stuck closed. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).





2. PURGE FLOW MONITOR

The purge flow monitor consists of the two step monitors. The 1st monitor is conducted every time and the 2nd monitor is activated if necessary.

- The 1st monitor
  While the engine is running and the purge VSV (Vacuum Switching Valve) is ON (open), the ECM monitors the purge flow by measuring the EVAP pressure change. If negative pressure is not created, the ECM begins the 2nd monitor.
- The 2nd monitor
  The vent valve is turned ON (closed) and the EVAP pressure is then measured. If the variation in the pressure is less than 0.5 kPa (3.75 mmHg), the ECM interprets this as the purge VSV being stuck closed, and illuminates the MIL and sets DTC P0441 (2 trip detection logic).

Atmospheric pressure check:
In order to ensure reliable malfunction detection, the variation between the atmospheric pressures, before and after conduction of the purge flow monitor, is measured by the ECM.

OBD II MONITOR SPECIFICATIONS

1. Key-off Monitor

Monitor Strategy

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 15 minutes (varies with fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa (525 to 825 mmHg)
Battery voltage	10.5 V or higher
Vehicle speed	4 km/h (2.5 mph) or less
Ignition switch	OFF
EVAP control system pressure sensor	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of the following conditions 1 and 2 are met before key off	-
1. Duration that vehicle has been driven	5 minutes or more
2. EVAP purge operation	Performed
ECT	4.4 to 35°C (40 to 95°F)
IAT	4.4 to 35°C (40 to 95°F)

Example of restart time

First time	7 hours
Second time	9 hours and 30 minutes

2. Key-off monitor sequence 1 to 8

1. Atmospheric pressure measurement

Next sequence is run if the following condition set	-
Atmospheric pressure change	Less than 2.25 mmHg (0.3 kPa) for 1 second

2. First 0.02 inch leak criterion measurement

Next sequence is run if the following conditions set	Conditions 1, 2 and 3
1. EVAP pressure just after 0.02 inch leak criterion measurement start	-7.5 mmHg (-1 kPa) or less
2. 0.02 inch leak criterion	-33.38 to -7.93 mmHg (-4.85 to 1.057 kPa)
3. 0.02 inch leak criterion	Saturated within 55 seconds

3. Vent valve stuck closed check

Next sequence is run if the following condition set	-
EVAP pressure change after vent valve is ON	2.25 mmHg (0.3 kPa) or more

4. Vacuum introduction

Next sequence is run if the following condition set	-
Vacuum introduction time	12 minutes or less

5. Purge VSV stuck closed check

Next sequence is run if the following condition set	-
EVAP pressure change after purge VSV is open	2.25 mmHg (0.3 kPa) or more

6. Second 0.02 inch leak criterion measurement

Next sequence is run if the following conditions set	Conditions 1, 2, 3 and 4
1. EVAP pressure just after 0.02 inch leak criterion measurement	-7.5 mmHg (-1 kPa) or less
2. 0.02 inch leak criterion	-36.4 to -7.92 mmHg (-4.85 to -1.057 kPa)
3. 0.02 inch leak criterion	Saturated within 55 seconds
4. 0.02 inch leak criterion difference between first and second	5.25 mmHg (0.7 kPa) or less

7. Leak check

Next sequence is run if the following condition set	-
EVAP pressure when vacuum introduction is complete	Leak detection criteria or less

8. Atmospheric pressure measurement

EVAP monitor is complete if the following condition set	-
Atmospheric pressure difference between sequences 1 and 8	2.25 mmHg (0.3 kPa) or less

Typical Malfunction Thresholds

Purge VSV stuck open	-
FTP when vacuum introduction complete	Higher than reference pressure x 0.2
Purge VSV stuck closed	-
FTP change for 10 seconds after purge VSV ON (open)	Less than 0.3 kPa (2.25 mmHg)

"Saturated" indicates that the EVAP pressure change is less than 0.1 kPa (0.75 mmHg) in 30 seconds.

OBD II MONITOR SPECIFICATIONS

1. Purge Flow Monitor

Monitor Strategy

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 10 minutes (varies with fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTC not present	None
Engine	Running
ECT	4.4°C (40°F) or more
IAT	4.4°C (40°F) or more
EVAP control system pressure sensor	Not detected
Purge VSV	Not detected by scan tool
EVAP system check	Not detected by scan tool
Battery voltage	10 V or higher
Purge duty cycle	8% or more

2. TYPICAL MALFUNCTION THRESHOLDS

Purge Flow Monitor:

Both of the following conditions are met	Conditions 1 or 2
1. FTP change when purge operation started	Less than 0.1 kPa (0.75 mmHg)
2. FTP change during purge operation when vent valve closed	Less than 0.5 kPa (3.75 mmHg)

MONITOR RESULT

DTC	P0450	Evaporative Emission Control System Pressure Sensor / Switch

DTC	P0451	Evaporative Emission Control System Pressure Sensor Range / Performance

DTC	P0452	Evaporative Emission Control System Pressure Sensor / Switch Low Input

DTC	P0453	Evaporative Emission Control System Pressure Sensor / Switch High Input

DTC SUMMARY

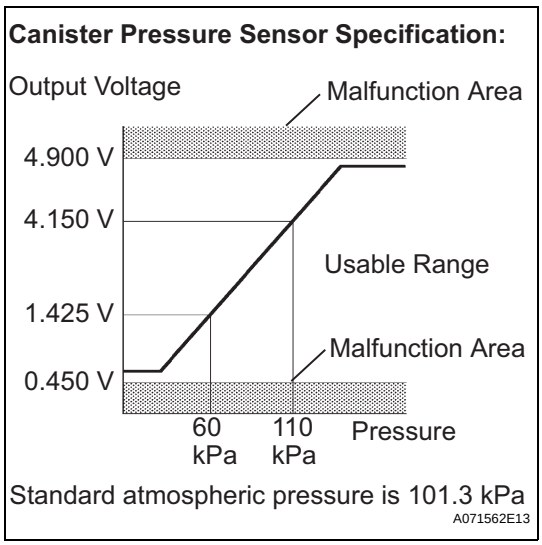
DTC	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection logic
P0450	Canister pressure sensor voltage abnormal fluctuation	Sensor output voltage rapidly fluctuates beyond upper and lower malfunction thresholds for 0.5 seconds.	• Canister pump module • ECM	• EVAP monitoring (ignition OFF) • Ignition ON	1 trip
P0451	Canister pressure sensor noise	Sensor output voltage fluctuates frequently in certain time period.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM	• EVAP monitoring (ignition OFF) • Engine running	2 trip
	Canister pressure sensor voltage fixed	Sensor output voltage does not vary in certain time period.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM	• EVAP monitoring (ignition OFF)	2 trip
P0452	Canister pressure sensor voltage low	Sensor output voltage less than 0.45 V for 0.5 seconds.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM	• Ignition ON • EVAP monitoring (ignition OFF)	1 trip
P0453	Canister pressure sensor voltage high	Sensor output voltage more than 4.9 V for 0.5 seconds.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM	• Ignition ON • EVAP monitoring (ignition OFF)	1 trip

HINT:
The canister pressure sensor is built into the canister pump module.

DESCRIPTION

The circuit description can be found in the EVAP System (See page ES-351).

MONITOR DESCRIPTION



(a) DTC P0450: Canister pressure sensor voltage abnormal fluctuation
If the canister pressure sensor voltage output rapidly fluctuates between less than 0.45 V and more than 4.9 V, the ECM interprets this as an open or short circuit malfunction in the canister pressure sensor or its circuit, and stops the EVAP (Evaporative Emission) system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).
(b) DTC P0451: Canister pressure sensor noise or stuck
If the canister pressure sensor voltage output fluctuates rapidly for 10 seconds, the ECM stops the EVAP system monitor. The ECM interprets this as noise from the canister pressure sensor, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC.
Alternatively, if the sensor voltage output does not change for 10 seconds, the ECM interprets this as the sensor being stuck, and stops the monitor. The ECM then illuminates the MIL and sets the DTC (Both the malfunctions are detected by 2 trip detection logic).
(c) DTC P0452: Canister pressure sensor voltage low
If the canister pressure sensor voltage output is below 0.45 V, the ECM interprets this as an open or short circuit malfunction in the canister pressure sensor or its circuit, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).
(d) DTC P0453: Canister pressure sensor voltage high
If the canister pressure sensor voltage output is 4.9 V or more, the ECM interprets this as an open or short circuit malfunction in the canister pressure sensor or its circuit, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).

MONITOR STRATEGY

Required Sensors/Components	Canister pump module
Frequency of Operation	Once per driving cycle: P0451 sensor stuck Continuous: P0451 sensor noise, P0450, P0452 and P0453
Duration	-
MIL Operation	Immediate: P0450, P0452 and P0453 2 driving cycles: P0451
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

P0451 (Noise monitor):

Monitor runs whenever these DTCs not present	None
Atmospheric pressure (absolute pressure)	70 kPa (525 mmHg) or more, less than 110 kPa (825 mmHg)
Battery voltage	10.5 V or more

Intake air temperature	4.4° to 35°C (40° to 95°F)
Either of following conditions met	A or B
A. Engine	Running
B. Soak time (ignition switch OFF time)	5 hours

Example of restart time

First time	7 hours
Second time	9 hours and 30 minutes

P0451 (Fixed monitor):

Monitor runs whenever these DTCs not present	None
Atmospheric pressure	Less than 70 kPa (525 mmHg), or 110 kPa (825 mmHg) or more
Battery voltage	10.5 V or more
Intake air temperature	4.4° to 35°C (40° to 95°F)
Soak time (ignition switch OFF time)	5 hours

ES

Example of restart time

First time	7 hours
Second time	9 hours and 30 minutes

P0450, P0452 and P0453:

Monitor runs whenever these DTCs not present	None
Either of following conditions met	(a) or (b)
(a) Ignition switch	ON
(b) Soak timer	ON

TYPICAL MALFUNCTION THRESHOLDS

P0450: Canister pressure sensor chattering

EVAP pressure	Less than 42.1 kPa (317 mmHg), or more than 123.8 kPa (928.5 mmHg)

P0451: Canister pressure sensor noise

Pressure variation indicated by canister pressure sensor in 10 seconds	More than +-0.3 kPa (+-2.25 mmHg) 10 times

P0451: Canister pressure sensor voltage fixed

0.02 inch leak criterion variation indicated by canister pressure sensor in 10 seconds	Less than 0.65 kPa (4.87 mmHg)

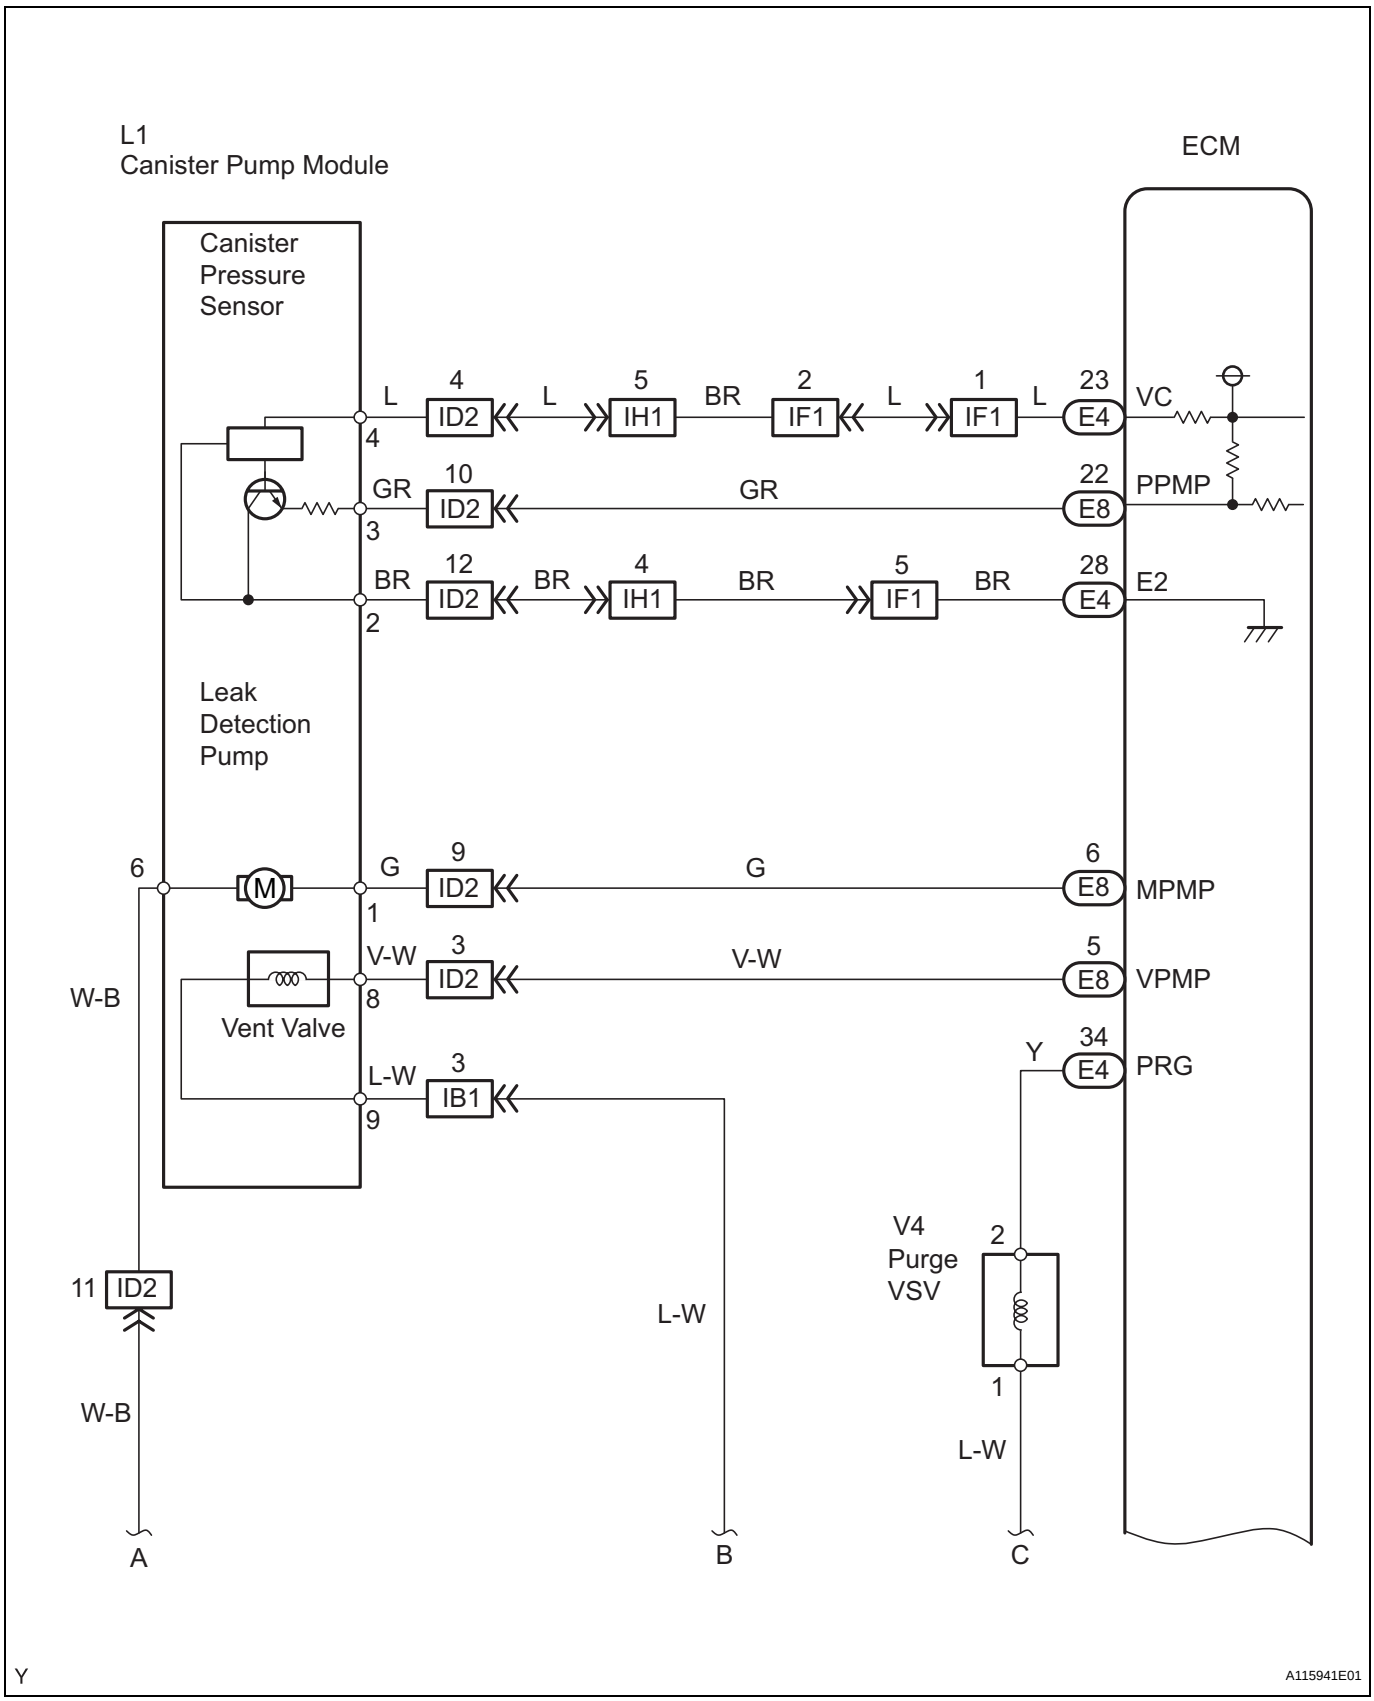
P0452: Canister pressure sensor low voltage

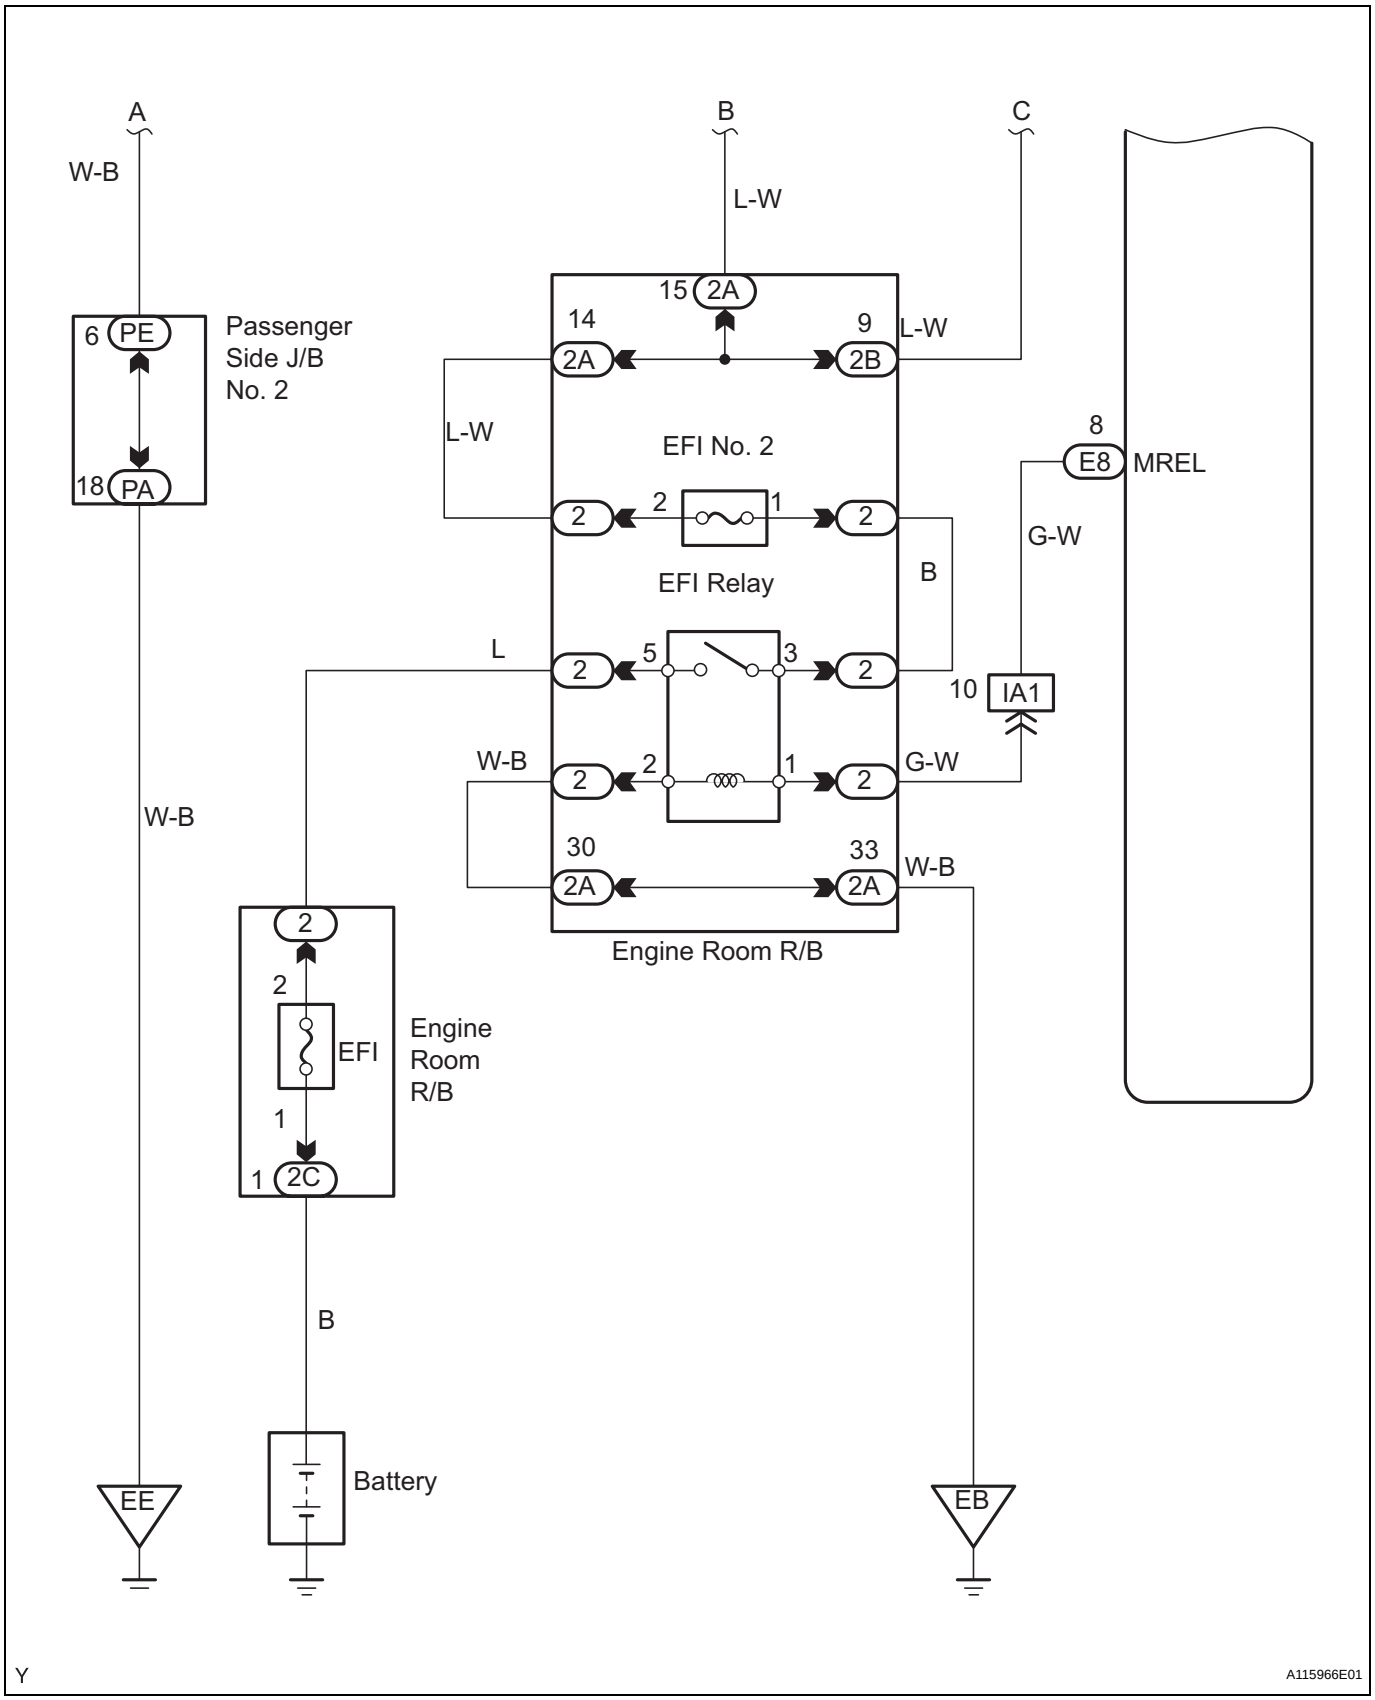
EVAP pressure	Less than 42.1 kPa (317 mmHg)

P0453: Canister pressure sensor high voltage

EVAP pressure	More than 123.8 kPa (928.5 mmHg)

WIRING DIAGRAM





NOTICE:

- **When a vehicle is brought into the workshop, leave it as it is. Do not change the vehicle condition. For example, do not tighten the fuel cap.**
- **Do not disassemble the canister pump module.**

- **An intelligent tester is required to conduct the following diagnostic troubleshooting procedure.**

1	CONFIRM DTC AND EVAP PRESSURE

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON (do not start the engine).
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / VAPOR PRESS.
(g) Read the EVAP (Evaporative Emission) pressure displayed on the tester.

ES

Result

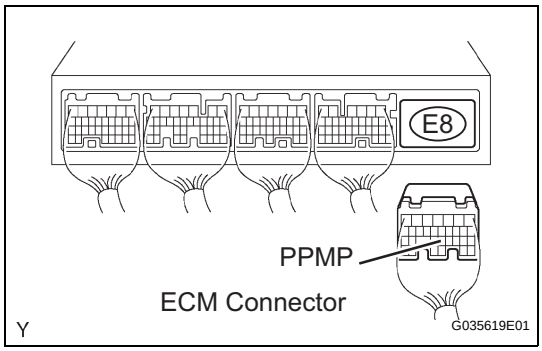
Display (DTC Output)	Test Results	Suspected Trouble Areas	Proceed to
P0451	-	• Canister pressure sensor	C
P0452	Less than 45 kPa (430 mmHg)	• Wire harness/connector (ECM - canister pressure sensor) • Canister pressure sensor • Short in ECM circuit	A
P0453	More than 120 kPa (900 mmHg)	• Wire harness/connector (ECM - canister pressure sensor) • Canister pressure sensor • Open in ECM circuit	B

B → Go to step 4

C → GO TO EVAP INSPECTION PROCEDURE

A

2	CHECK HARNESS AND CONNECTOR (CANISTER PUMP MODULE - ECM)



(a) Turn the ignition switch OFF.
(b) Disconnect the E8 ECM connector.
(c) Measure the resistance between the PPMP terminal of the ECM connector and the body ground.

Result

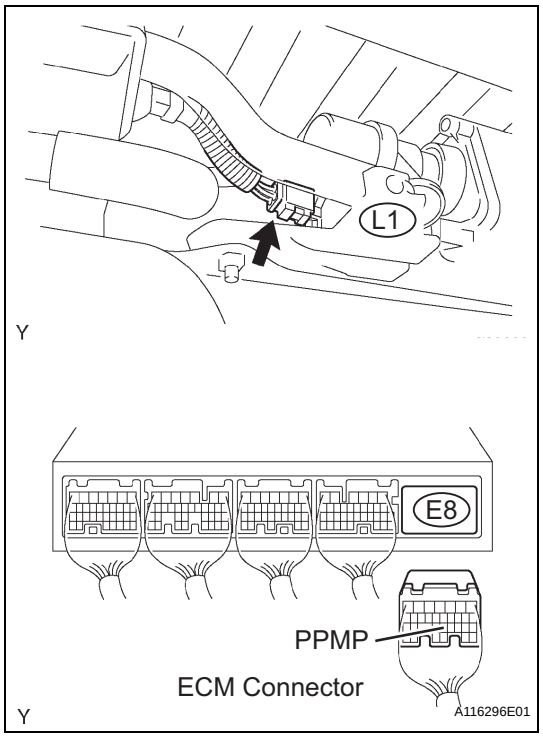
Test Results	Suspected Trouble Areas	Proceed To
10 Ω or less	• Wire harness/connector (ECM - canister pressure sensor) • Short in canister pressure sensor circuit	A
10 kΩ or more	• Wire harness/connector (ECM - canister pressure sensor) • Short in ECM circuit	B

(d) Reconnect the ECM connector.

B → Go to step 7

A

3	CHECK HARNESS AND CONNECTOR (CANISTER PUMP MODULE - ECM)



(a) Disconnect the L1 canister connector.
(b) Disconnect the E8 ECM connector.
(c) Check the resistance between the PPMP terminal of the ECM connector and the body ground.

ES

Result

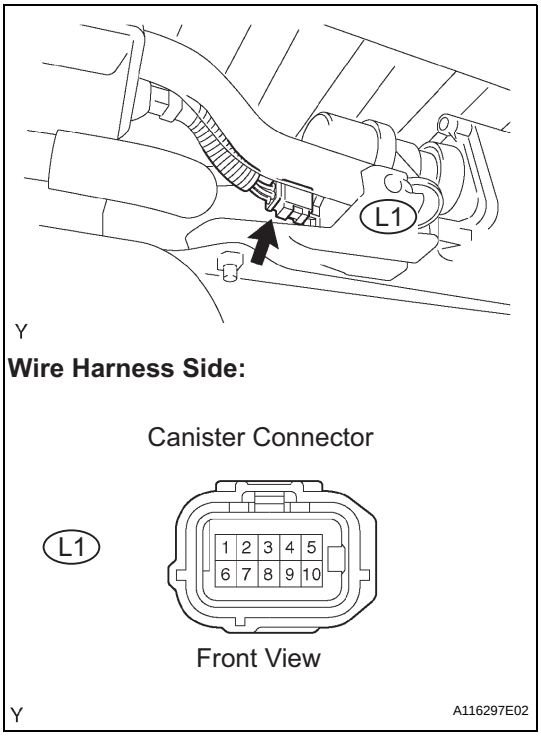
Test Results	Suspected Trouble Areas	Proceed To
10 kΩ or more	• Short in canister pressure sensor circuit	A
10 Ω or less	• Short in wire harness/connector (ECM - canister pressure sensor)	B

(d) Reconnect the canister connector.
(e) Reconnect the ECM connector.

A → Go to step 5

B → Go to step 6

4	CHECK HARNESS AND CONNECTOR (CANISTER PUMP MODULE - ECM)



(a) Disconnect the L1 canister connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage and resistance of the L1 canister connector.

Standard

Tester Connections	Specified Conditions
L1-4 - Body ground	Between 4.5 V and 5.5 V
L1-3 - Body ground	
L1-2 - Body ground	100 Ω or less

Result

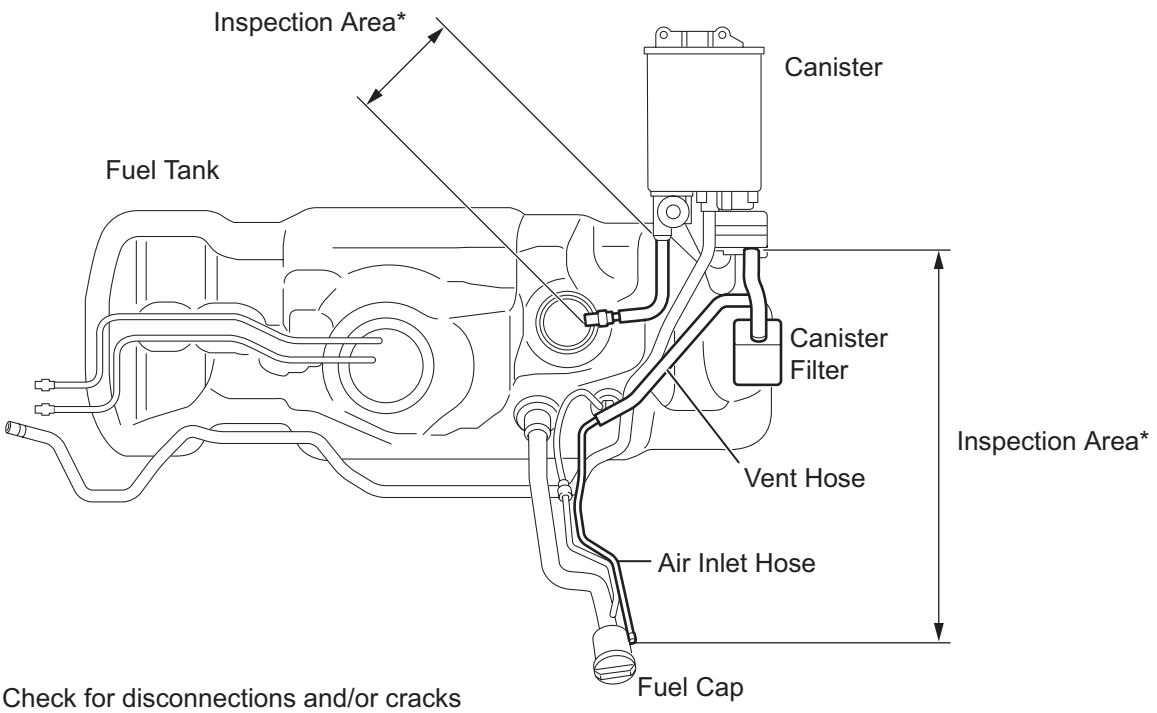
Test Results	Suspected Trouble Areas	Proceed To
Voltage and resistance within standard ranges	• Open in canister pressure sensor circuit	A
Voltage and resistance outside standard ranges	• Open in wire harness/connector (ECM - canister pressure sensor)	B

(d) Reconnect the canister connector.

A	Go to step 5
B	Go to step 6

5	REPLACE CANISTER ASSEMBLY

(a) Replace the canister assembly (See page EC-9).



NOTICE:
When replacing the canister, check the canister pump module interior and related pipes for water, fuel or other liquids. If liquids are present, check for disconnections and/or cracks in the following: 1) the pipe from the air inlet port to the canister pump module;2) the canister filter; and 3) the fuel tank vent hose.

NEXT	Go to step 8

6	REPAIR OR REPLACE HARNESS AND CONNECTOR

HINT:
If the exhaust tail pipe has been removed, go to the next step before reinstalling it.

NEXT	Go to step 8

7	REPLACE ECM

NEXT	Go to step 8

8	CHECK WHETHER DTC OUTPUT RECURS (AFTER REPAIR)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Wait for at least 60 seconds.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
HINT:
If no pending DTC is displayed on the tester, the repair has been successfully completed.

NEXT

COMPLETED

DTC	P0455	Evaporative Emission Control System Leak Detected (Gross Leak)

DTC	P0456	Evaporative Emission Control System Leak Detected (Very Small Leak)

DTC SUMMARY

DTC	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection logic
P0455	EVAP gross leak	Leak detection pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. 0.02 inch leak criterion measured at start and at end of leak check. If stabilized pressure higher than [second 0.02 inch leak criterion x 0.2], ECM determines that EVAP system has large leakage.	• Fuel cap (loose) • Leakage from EVAP line (Canister - Fuel tank) • Leakage from EVAP line (Purge VSV - Canister) • Canister pump module • Leakage from fuel tank • Leakage from canister	While ignition switch OFF	2 trip
P0456	EVAP small leak	Leak detection pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. 0.02 inch leak criterion measured at start and at end of leak check. If stabilized pressure higher than second 0.02 inch leak criterion, ECM determines that EVAP system has small leakage.	Same above	While ignition switch OFF	2 trip

ES

DESCRIPTION

The circuit description can be found in the EVAP System (See page ES-351).

Refer to the EVAP System (See page ES-351).

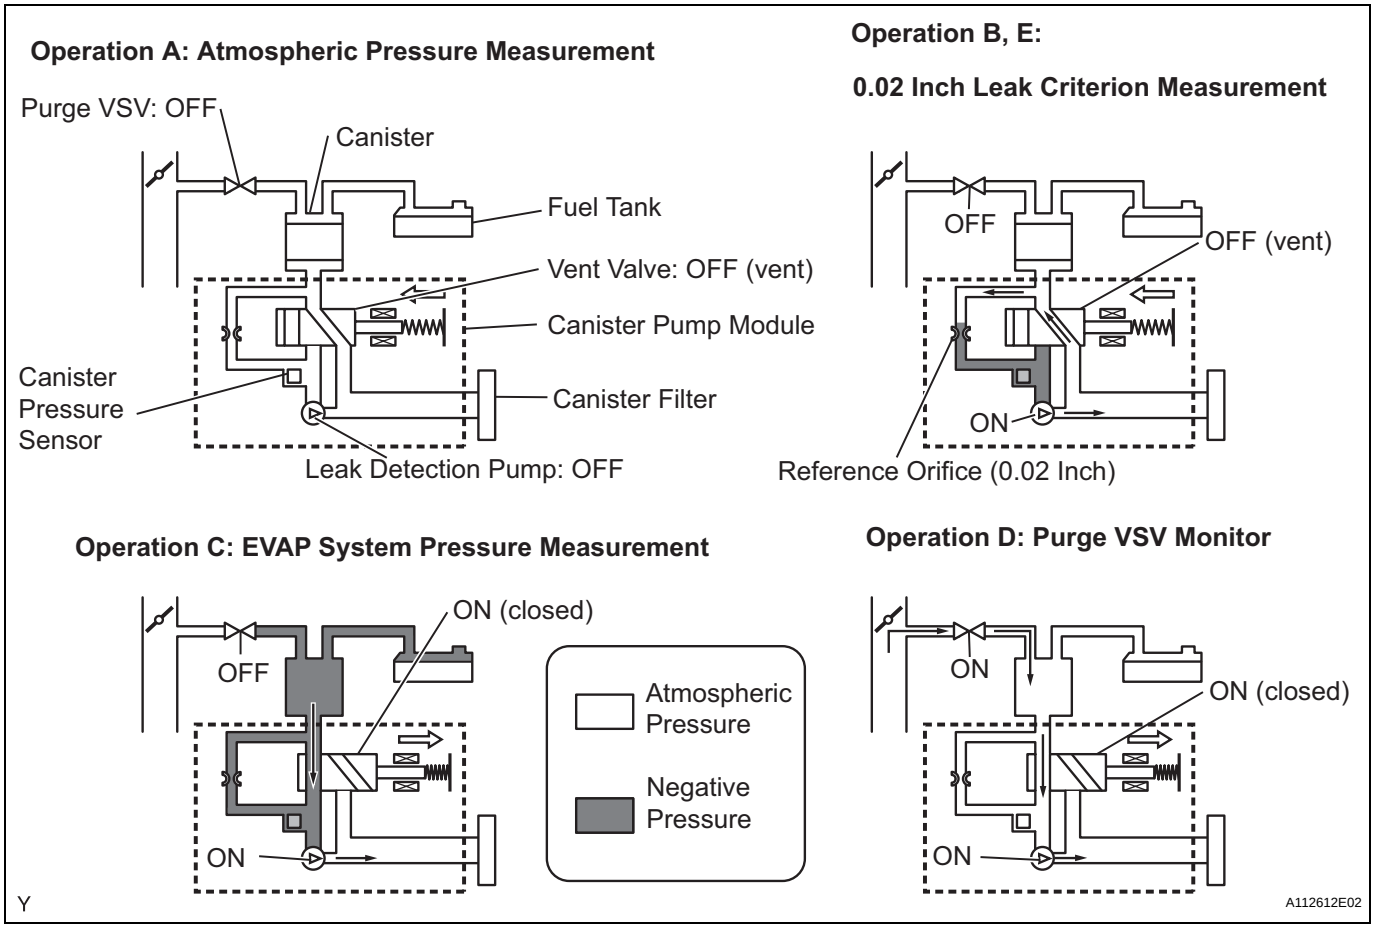
MONITOR DESCRIPTION

5 hours* after the ignition switch is turned OFF, the electric leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.
HINT:
*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak criterion measurement	In order to determine 0.02 inch leak criterion, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as they will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*

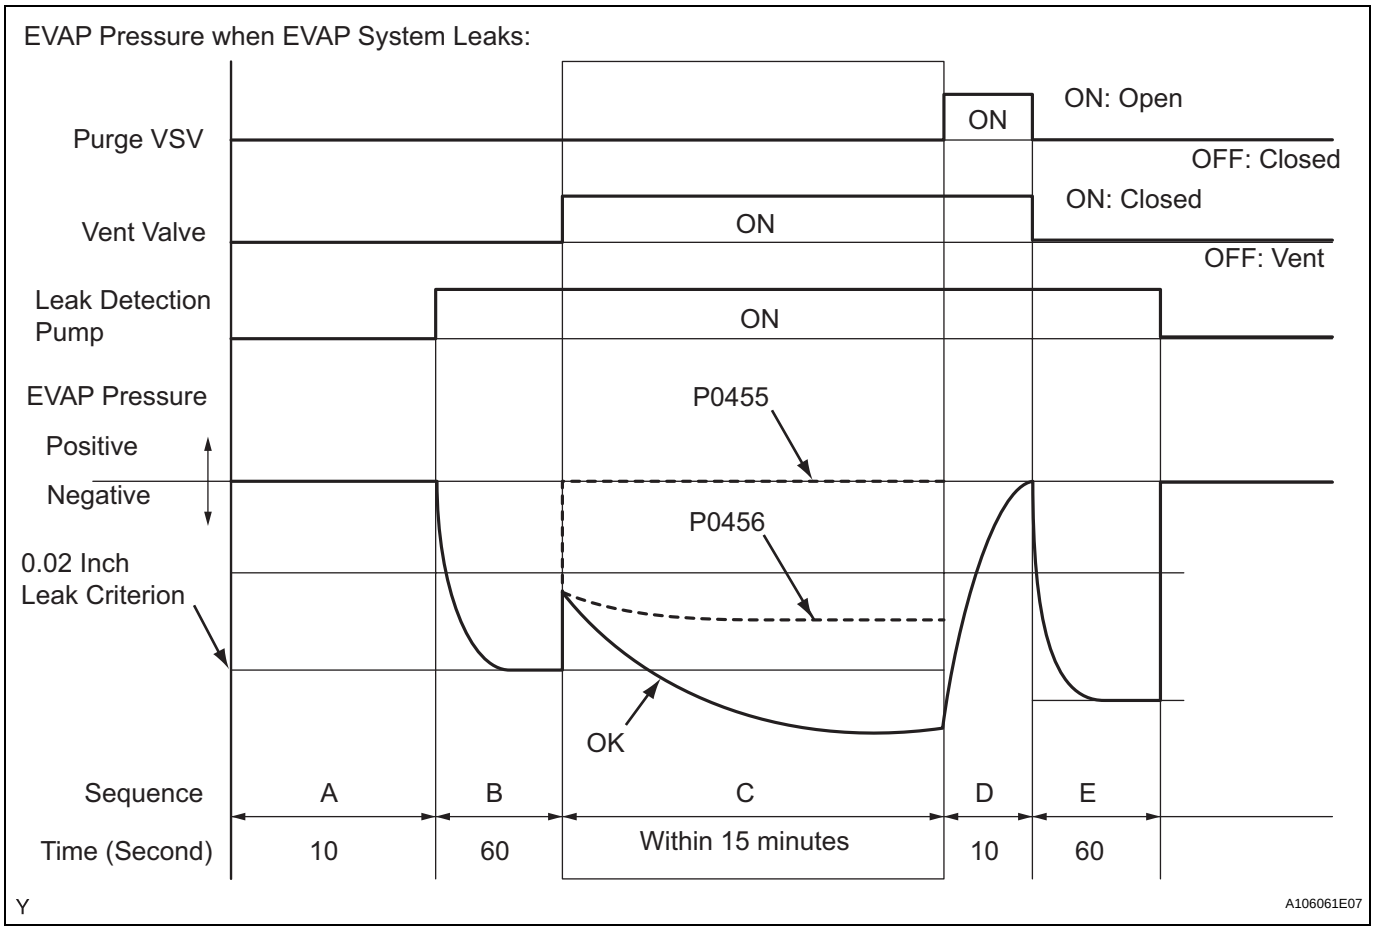
Sequence	Operations	Descriptions	Duration
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak criterion measurement	After second 0.02 inch leak criterion measurement, leak check performed by comparing first and second 0.02 inch leak criterion. If stabilized system pressure higher than second 0.02 inch leak criterion, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.



1. P0455: EVAP (Evaporative Emission) gross leak
   In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP system and the EVAP system pressure is measured. If the stabilized system pressure is higher than [second 0.02 inch leak criterion x 0.2] (near atmospheric pressure), the ECM determines that the EVAP system has a large leakage, illuminates the MIL and sets the DTC (2 trip detection logic).

2. P0456: EVAP very small leak
   In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP system and the EVAP system pressure is measured. If the stabilized system pressure is higher than second 0.02 inch leak criterion, the ECM determines that the EVAP system has a small leakage, illuminates the MIL and sets the DTC (2 trip detection logic).



MONITOR STRATEGY

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 15 minutes (varies with amount of fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever these DTCs not present	None
EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	525 to 825 mmHg (70 to 110 kPa)
Battery voltage	10.5 V or more
Vehicle speed	Below 2.5 mph (4 km/h)
Ignition switch	OFF
Engine condition	Not running
Fuel tank pressure sensor malfunction (P0450, P0451, P0452 and/or P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool

Leak detection pump	Not operated by scan tool
Both of following conditions met before IG switch OFF	Conditions 1 and 2
1. Duration that vehicle driven	5 min. or more
2. Purge flow	Executed
ECT	4.4° to 35°C (40° to 95°F)
IAT	4.4° to 35°C (40° to 95°F)

1. Key-off monitor sequence 1 to 8

1. Atmospheric pressure

Next sequence is run if following condition set	-
Atmospheric pressure change for 10 seconds	Less than 2.25 mmHg (0.3 kPa) for 1 seconds

2. First 0.02 inch leak criterion

Next sequence is run if all of following conditions set	Conditions 1, 2 and 3
1. FTP when 4 seconds after 0.02 inch leak criterion measurement	-7.5 mmHg (-1 kPa) or less
2. 0.02 inch leak criterion	-36.28 to -7.93 mmHg (-4.85 to -1.057 kPa)
3. 0.02 inch leak criterion	Saturated within 55 seconds

3. Vent valve stuck closed check

Next sequence is run if following condition set	-
Fuel tank pressure change for 10 seconds after vent valve ON (closed)	2.25 mmHg (0.3 kPa) or more

4. Vacuum introduction

Next sequence is run if both of following conditions set	-
1. Vacuum introduction time	Saturated within 12 minutes
2. Fuel tank pressure	Fuel tank pressure was standard

5. Purge VSV stuck closed check

Next sequence is run if following condition set	-
Fuel tank pressure change for 10 seconds after purge VSV ON (open)	2.25 mmHg (0.3 kPa) or more

6. Second 0.02 inch leak criterion measurement

Next sequence is run if all of following conditions set	Conditions 1, 2, 3 and 4
1. Fuel tank pressure when 4 sec. after 0.02 inch leak criterion measurement	-7.5 mmHg (-1 kPa) or less
2. 0.02 inch leak criterion	-36.4 to -7.92 mmHg (-4.85 to -1.057 kPa)
3. 0.02 inch leak criterion	Saturated within 55 seconds
4. 0.02 inch leak criterion difference between first and second	5.25 mmHg (0.7 kPa) or less

7. Leak check

Next sequence is run if following condition set	-
Fuel tank pressure when vacuum introduction was complete	Second 0.02 inch leak criterion or less

8. Atmospheric pressure

Monitor is complete if following conditions set	-
Atmospheric pressure difference between sequences 1 and 8	2.25 mmHg (0.3 kPa) or less

TYPICAL MALFUNCTION THRESHOLDS

P0455: EVAP gross leak

Fuel tank pressure when vacuum introduction complete	Higher than 0.02 inch leak criterion x 0.2

P0456: EVAP small leak

Fuel tank pressure when vacuum introduction complete	Between 1 and 2
Condition 1	Higher than second 0.02 inch leak criterion

Condition 2	Lower than 0.02 inch leak criterion x 0.2
Atmospheric pressure (absolute pressure)	70 kPa (525 mmHg) or more, and less than 110 kPa (825 mmHg)

"Saturated" indicates that the EVAP pressure change is less than 0.1 kPa (0.75 mmHg) in 30 seconds.

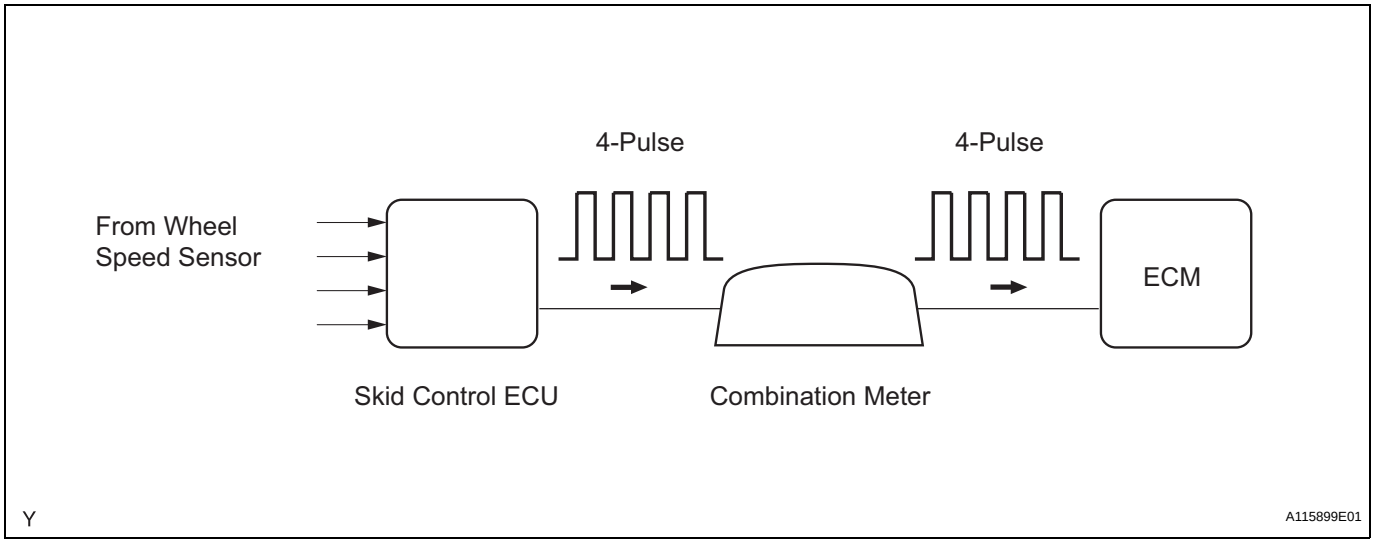
MONITOR RESULT

Detailed information on Checking Monitor Status (See page ES-19).

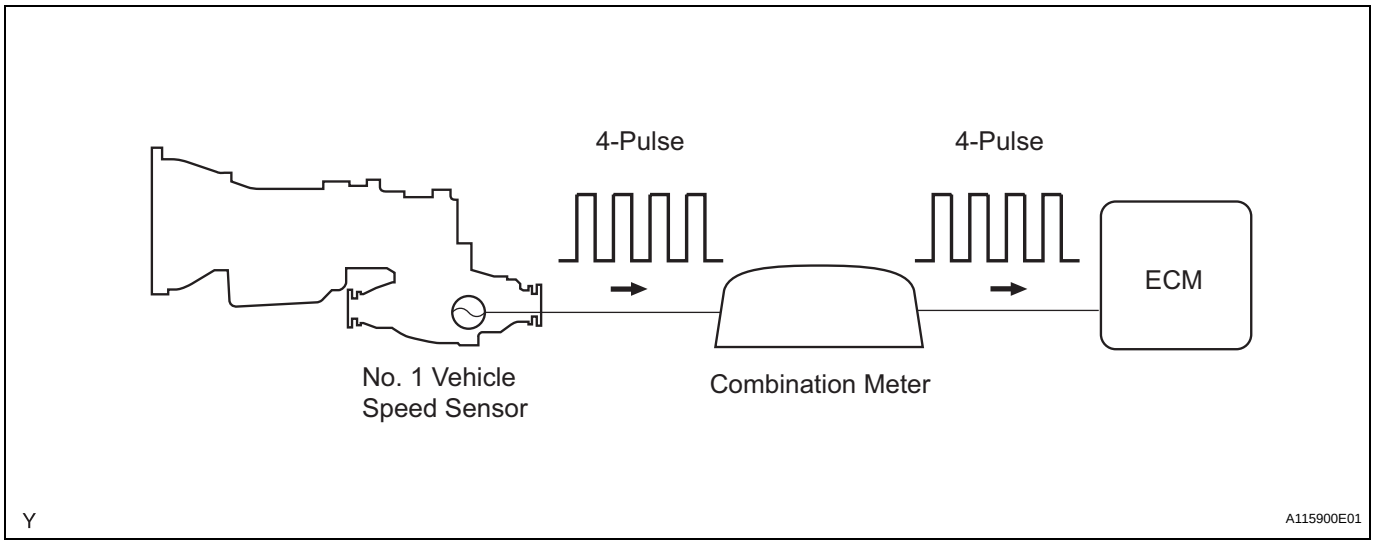
DTC	P0500	Vehicle Speed Sensor "A"

DESCRIPTION

Automatic Transaxle Models:
Vehicles, which are equipped with ABS (Anti-lock Brake System), detect the vehicle speed using the skid control ECU and wheel speed sensor. The wheel speed sensor monitors the wheel rotation speed and sends a signal to the skid control ECU. The skid control ECU converts the wheel speed signal into a 4-pulse signal and transmits it to the ECM via the combination meter. The ECM determines the vehicle speed based on the frequency of the pulse signal.



Manual Transaxle Models:
Vehicles, which are equipped with manual transaxle, detect the vehicle speed using the No. 1 vehicle speed sensor. The No. 1 vehicle speed sensor transmits a 4-pulse signal for every revolution of the rotor shaft, which is rotated by the transaxle or transfer output shaft via the driven gear. The 4-pulse signal is converted into a more precise rectangular waveform by the waveform shaping circuit inside the combination meter. The signal is then transmitted to the ECM. The ECM determines the vehicle speed based on the frequency of the pulse signal.



DTC No.	DTC Detection Conditions	Trouble Areas
P0500	ECM detects following conditions simultaneously 500 times (1 trip detection logic) • No SP1 (speed sensor) signal while ECM detects SP2 (No. 2 speed sensor) signal • Vehicle speed 6 mph (9 km/h) or more for 4 seconds • Park/Neutral position switch OFF (shift lever other than P and N positions) • Transfer lever in other than N position (4WD)	• Open or short in speed signal circuit • Combination meter • ECM • Skid control ECU

MONITOR DESCRIPTION

Automatic Transaxle Models:
The ECM assumes that the vehicle is being driven, while the vehicle speed sensor signal is being transmitted by the combination meter. If there is no signal from the combination meter, despite the ECM detecting the speed signal from the speed sensor No. 2, the ECM interprets this as a malfunction in the speed signal circuit. The ECM then illuminates the MIL and sets a DTC.
Manual Transaxle Models:
The ECM assumes that the vehicle is being driven, when the indicated engine speed is more than 2,000 rpm and the engine load calculated by the ECM is more than certain level. If there is no signal from the vehicle speed sensor, despite these conditions being met, the ECM interprets this as a malfunction in the speed signal circuit. The ECM then illuminates the MIL and sets a DTC.

ES

MONITOR STRATEGY

Related DTCs	P0500: Vehicle speed sensor "A" pulse input error
Required Sensors/Components (Main)	Vehicle Speed Sensor (VSS), Combination meter and Skid control ECU
Required Sensors/Components (Related)	Park/neutral Position (PNP) switch, Engine Coolant Temperature (ECT) sensor, Crankshaft Position (CKP) sensor and Mass Air Flow (MAF) meter
Frequency of Operation	Continuous
Duration	8 seconds: Manual transmission Conditions met 500 times: Automatic transmission
MIL Operation	Immediate: Manual transmission 2 driving cycles: Automatic transmission
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

Manual Transmission:

Engine coolant temperature	70°C (158°F) or more
Engine speed	2,000 to 6,800 rpm
Fuel cut at high engine speed	Not executing
Engine load	38.5 % at 2,000 rpm 40 % at 3,600 rpm 43.5 % at 5,200 rpm 50 % at 6,800 rpm

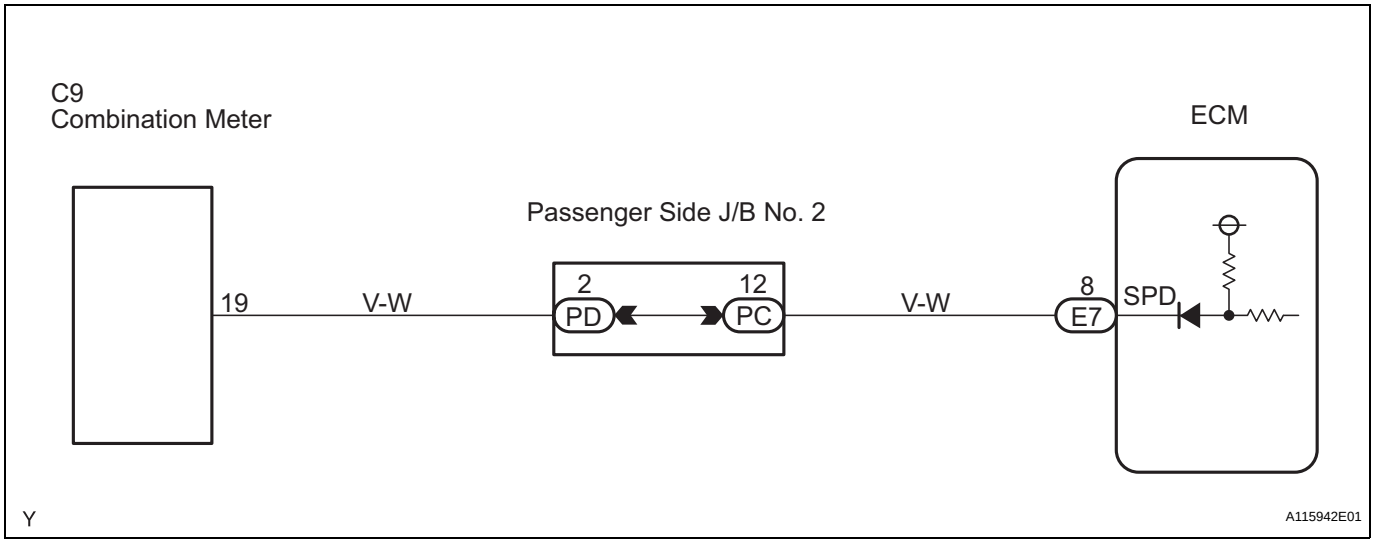
Automatic Transmission:

Time after following conditions met:	4 seconds or more
Ignition switch	ON
Park/neutral position switch	OFF
Vehicle speed	5.59 mph (9 km/h) or more
Time after ignition switch OFF to ON	More than 0.5 seconds

TYPICAL MALFUNCTION THRESHOLDS

Vehicle speed sensor signal	No pulse input

WIRING DIAGRAM



HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

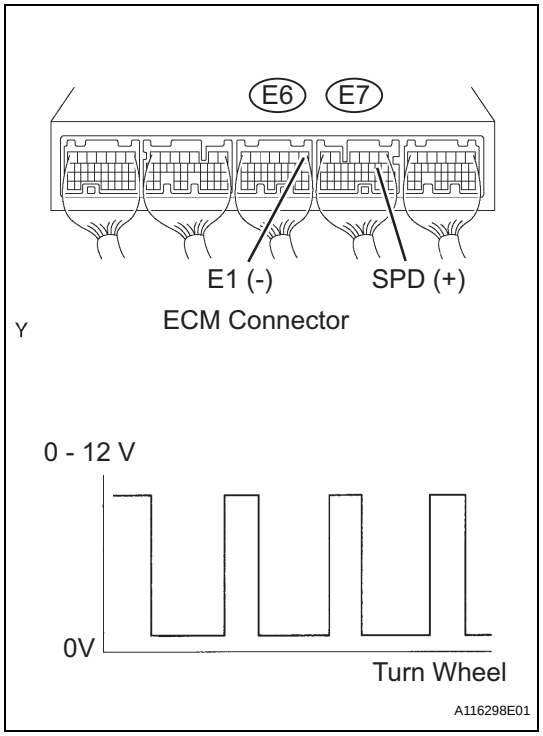
1	**CHECK OPERATION OF SPEEDOMETER**

(a) Drive the vehicle and check if the operation of the speedometer in the combination meter is normal.
HINT:
The vehicle speed sensor is operating normally if the speedometer reading is normal.

NG → **CHECK SPEEDOMETER CIRCUIT**

OK

2	INSPECT ECM (SPD VOLTAGE)



(a) Shift the transmission gear selector lever to the neutral position.
(b) Jack up the vehicle.
(c) Turn the ignition switch ON.
(d) Check the voltage between the terminals of the E6 and E7 ECM connectors as the wheel is turned slowly.

Standard

Tester Connections	Specified Conditions
SPD (E7-8) - E1 (E6-1)	Voltage generated intermittently

HINT:
The output voltage should fluctuate up and down similarly to the diagram on the left when the wheel is turned slowly.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

ES

DTC	P0504	Brake Switch "A" / "B" Correlation

DESCRIPTION

The stop light switch is a duplex system that transmits two signals: STP and ST1-. These two signals are used by the ECM to monitor whether or not the brake system is working properly. If the signals, which indicate the brake pedal is being depressed and released, are detected simultaneously, the ECM interprets this as a malfunction in the stop light switch and sets the DTC.

HINT:

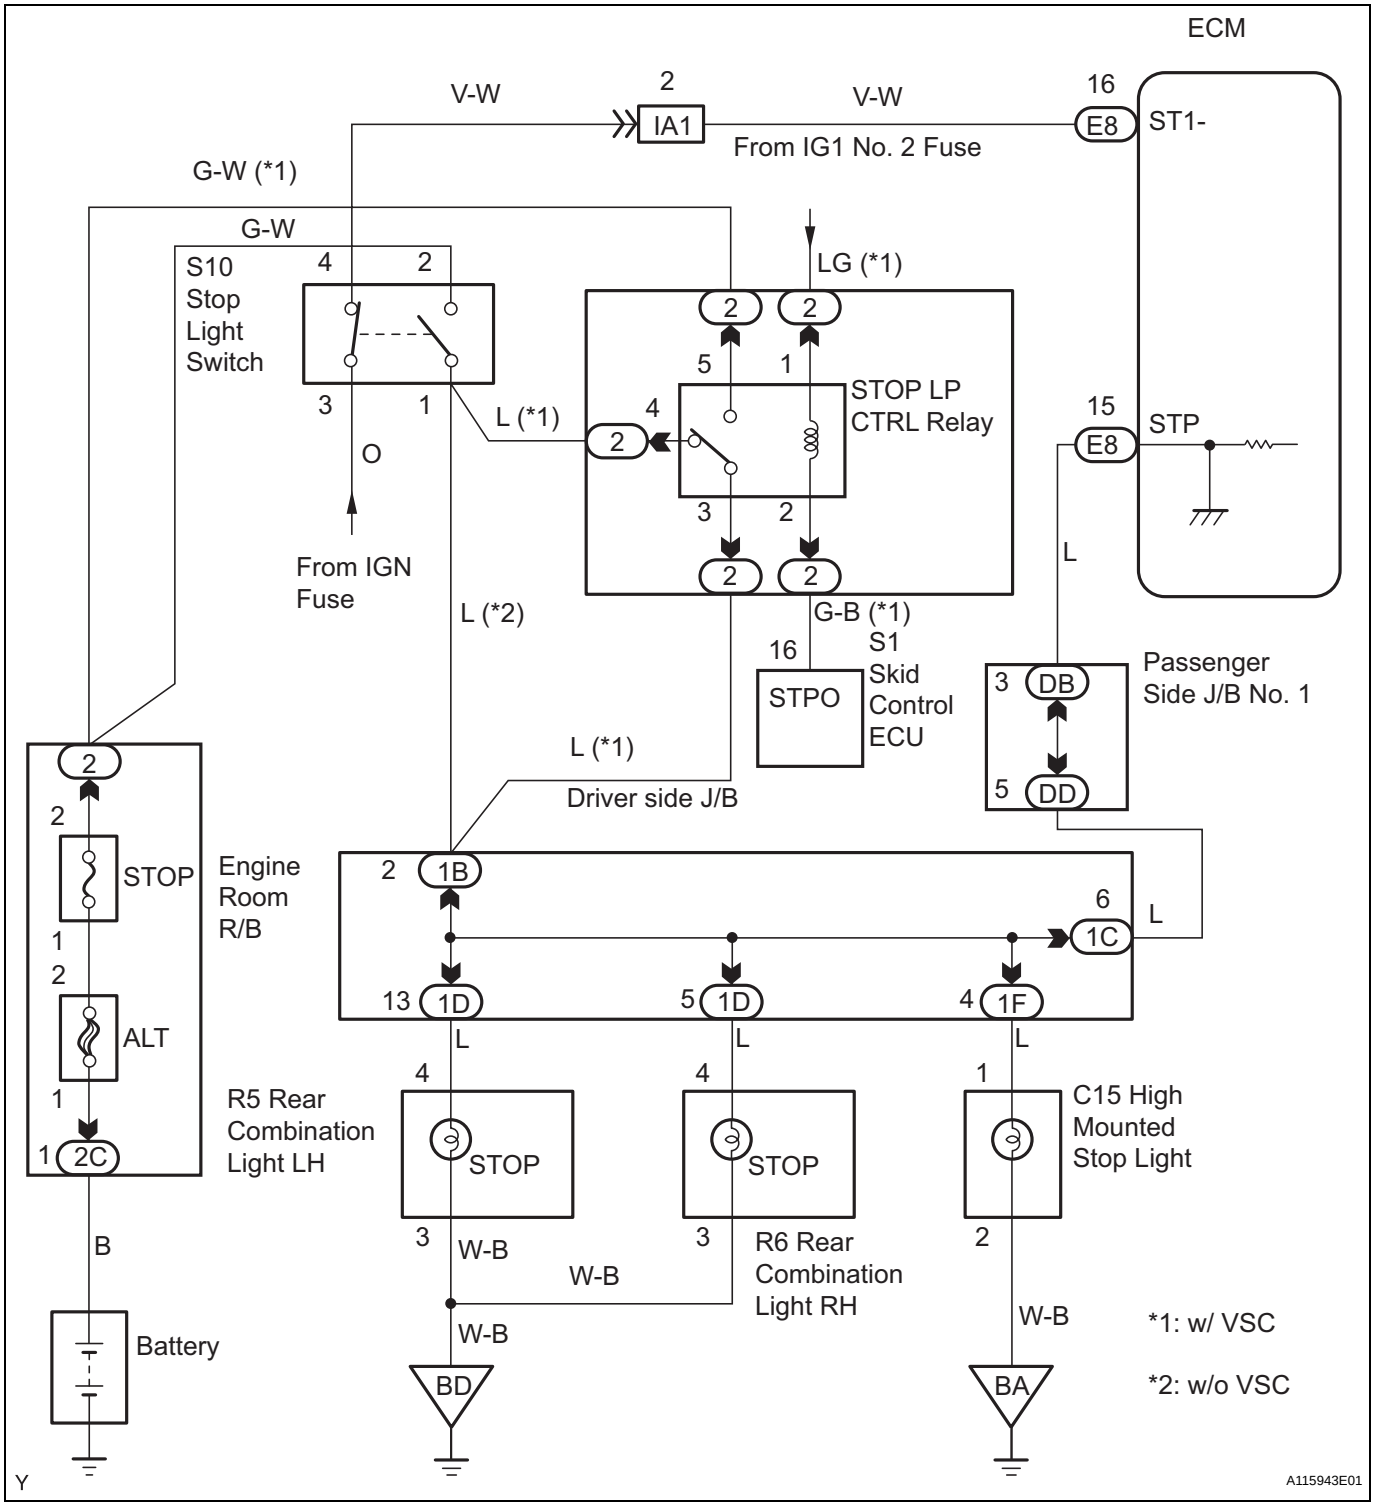
The normal conditions are as shown in the table below. The signals can be read using an intelligent tester.

Signals	Brake Pedal Released	In Transition	Brake Pedal Depressed
STP	OFF	ON	ON
ST1-	ON	ON	OFF

ES

DTC No.	DTC Detection Conditions	Trouble Areas
P0504	Conditions (a), (b) and (c) continue for 0.5 seconds or more (1 trip detection logic) (a) Ignition switch ON (b) Brake pedal released (c) STP signal OFF when ST1- signal OFF	• Short in stop light switch signal circuit • STOP fuse • Stop light switch • ECM

WIRING DIAGRAM



HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK OPERATION OF STOP LIGHT

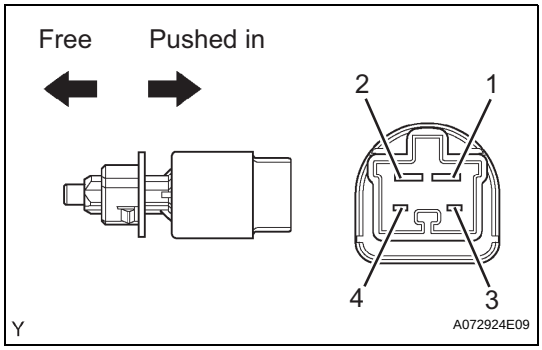
(a) Check whether the stop lights turn on and off normally when the brake pedal is depressed and released.
OK:
Stop lights turn ON when brake pedal is depressed.

NG → **REPAIR OR REPLACE STOP LIGHT SWITCH CIRCUIT**

OK

ES

2	INSPECT STOP LIGHT SWITCH ASSEMBLY



(a) Remove the stop light switch assembly.
(b) Check the resistance.
Standard Resistance

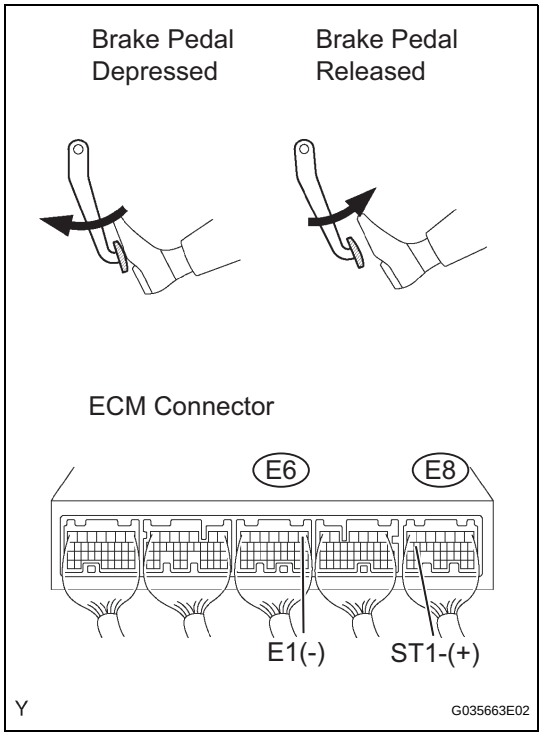
Switch Positions	Tester Connections	Specified Conditions
Switch pin free	1 - 2	Below 1 Ω
Switch pin free	3 - 4	10 kΩ or higher
Switch pin pushed in	1 - 2	10 kΩ or higher
Switch pin pushed in	3 - 4	Below 1 Ω

(c) Reinstall the stop light switch assembly.

NG → **REPLACE STOP LIGHT SWITCH ASSEMBLY**

OK

3	READ VALUE OF INTELLIGENT TESTER (STP SIGNAL AND ST1 - VOLTAGE)



(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STOP LIGHT SW.
(d) Check the STP signal when the brake pedal is depressed and released.
Standard

Brake Pedal Operations	Specified Conditions
Depressed	STP signal ON
Released	STP signal OFF

(e) Measure the voltage between the terminals of the E8 and E6 ECM connectors.
Standard Voltage

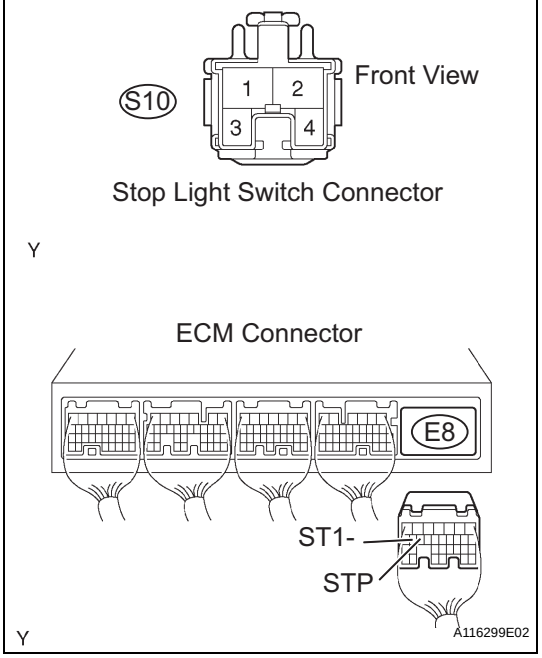
Tester Connections	Brake Pedal Operations	Specified Conditions
ST1 - (E8-16) - E1 (E6-1)	Depressed	Below 1.5 V
ST1 - (E8-16) - E1 (E6-1)	Released	7.5 to 14 V

OK → **CHECK FOR INTERMITTENT PROBLEMS**

NG

4	CHECK HARNESS AND CONNECTOR (STOP LIGHT SWITCH - ECM)

Wire Harness Side:



(a) Disconnect the S10 stop light switch connector.
(b) Disconnect the E8 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
Stop light switch (S10-1) - STP (E8-15)	Below 1 Ω
Stop light switch (S10-4) - ST1- (E8-16)	

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
Stop light switch (S10-1) or STP (E8-15) - Body ground	10 kΩ or higher
Stop light switch (S10-4) or ST1- (E8-16) - Body ground	

(d) Reconnect the stop light switch connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

ES

OK

REPLACE ECM

DTC	P0505	Idle Control System Malfunction

DESCRIPTION

The idling speed is controlled by the ETCS (Electronic Throttle Control System). The ETCS is comprised of: 1) the one valve type throttle body; 2) the throttle actuator, which operates the throttle valve; 3) the Throttle Position (TP) sensor, which detects the opening angle of the throttle valve; 4) the Accelerator Pedal Position (APP) sensor, which detects the accelerator pedal position; and 5) the ECM, which controls the ETCS. Based on the target idling speed, the ECM controls the throttle actuator to provide the proper throttle valve opening angle.

DTC No.	DTC Detection Conditions	Trouble Areas
P0505	Idling speed continues to vary greatly from target idling speed (2 trip detection logic)	• ETCS • Air induction system • PCV hose connection • ECM

ES

MONITOR DESCRIPTION

The ECM monitors the idling speed and idling air flow volume to conduct Idle Speed Control (ISC). The ECM determines that the ISC system is malfunctioning if the following conditions apply:

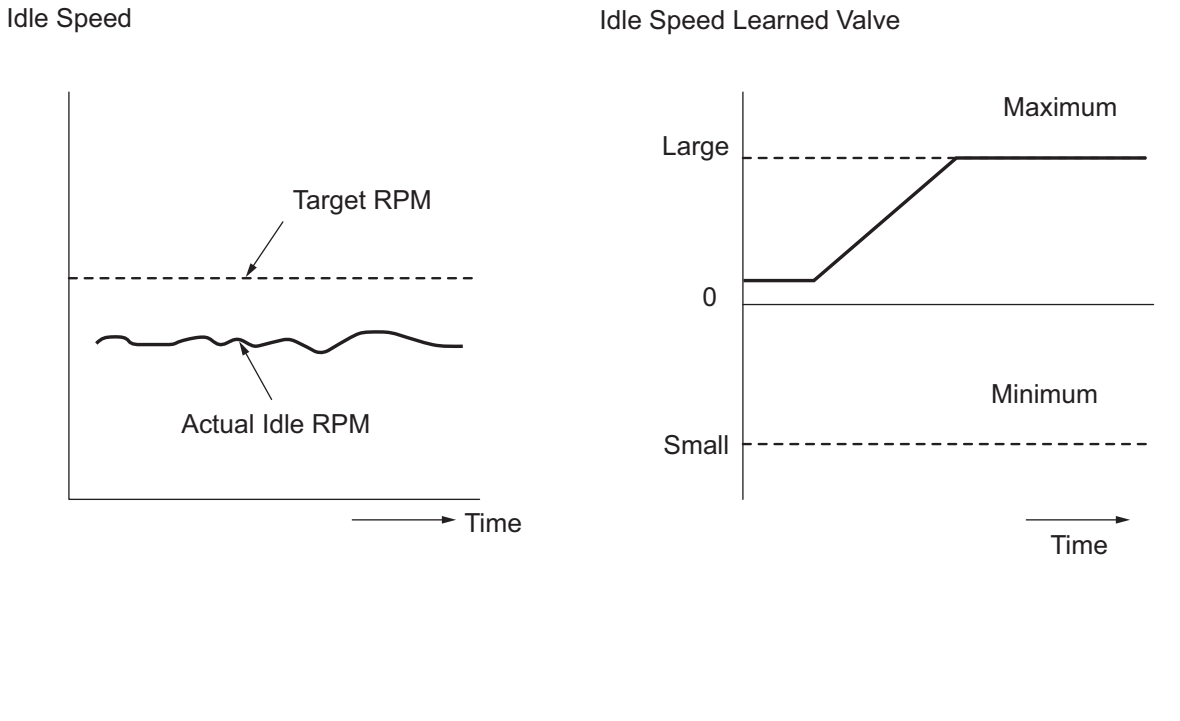
- The learned idling air flow volume remains at the maximum or minimum volume 5 times or more during a drive cycle.
- While driving at 6 mph (10 km/h) or more, the actual engine idling speed varies from the target idling speed by between 100 rpm and 200 rpm, 5 times or more during a drive cycle.

Example:

If the actual idling speed varies from the target idling speed by more than 200 rpm* 5 times during a drive cycle, the ECM illuminates the MIL and sets the DTC.

*: Threshold idling speed varies with engine load.

Example



Y A121611E01

ES

MONITOR STRATEGY

Related DTCs	P0505: ISC Function
Required Sensors/Components (Main)	ETCS
Required Sensors/Components (Related)	Crankshaft position sensor, Engine coolant temperature sensor, and Vehicle speed sensor
Frequency of Operation	Continuous
Duration	10 minutes
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Functional check:

Monitor runs whenever following DTCs not present	None
Engine	Running

TYPICAL MALFUNCTION THRESHOLDS

Functional check:

Either of following conditions 1 or 2 met	-
1. Frequency that following conditions (a) and (b) met	5 times or more
(a) Engine RPM - target engine RPM (A/C OFF and NSW OFF)	Below -100 rpm, or 150 rpm or more
(b) ISC feedback correction amount	-0.17 L/sec or less, or 2.08 L/sec or more
2. Frequency that following conditions (c) and (d) met	Once
(c) Engine RPM - target engine RPM (A/C OFF and NSW OFF)	Below -100 rpm, or 150 rpm or more
(d) ISC airflow rate (learning value)	1.3 L/sec. or less, or 8.5 L/sec. or more

HINT:

- The following conditions may also cause DTC P0505 to be set:
  (1) The floor carpet overlapping slightly onto the accelerator pedal, causing the accelerator pedal to be slightly depressed and therefore the throttle valve position to be slightly open.
  (2) The accelerator pedal being not fully released.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

ES

1 CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0505)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0505	A
P0505 and other DTCs	B

HINT:
If any DTCs other than P0505 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

A

2 CHECK PCV HOSE CONNECTIONS

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**

OK

3 CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

4	CHECK THROTTLE VALVE

(a) Check the throttle valve condition.

NG → **REPLACE THROTTLE W/MOTOR BODY ASSEMBLY**

OK

REPLACE ECM

DTC	P050A	Cold Start Idle Air Control System Performance

DTC	P050B	Cold Start Ignition Timing Performance

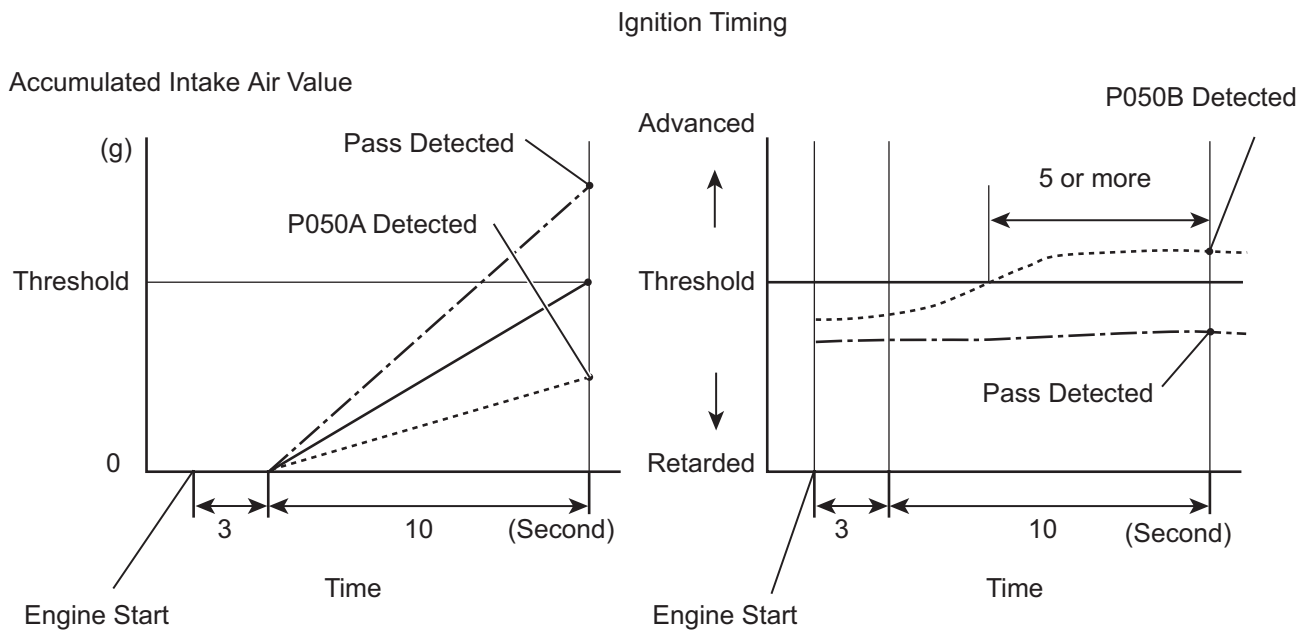
DESCRIPTION

The Electronic Throttle Control System (ETCS) controls the engine idling speed. The ETCS operates the throttle actuator to open and close the throttle valve, and adjusts the intake air amount to achieve the target idling speed.
In addition, the ECM retards the ignition timing and the ETCS increases the intake air amount to quickly increase the catalyst temperature at cold start to reduce emissions.

ES

DTC No.	DTC Detection Conditions	Trouble Areas
P050A	Accumulated intake air amount during 10 seconds of idling after cold start, less than threshold (2 trip detection logic)	• Throttle body assembly • Mass air flow meter • Air induction system • PCV hose connections • VVT system • Air cleaner filter element • ECM
P050B	Ignition timing retard value insufficient for 5 seconds or more during 10 seconds of P050A monitoring duration at cold start (2 trip detection logic)	

MONITOR DESCRIPTION



The ECM monitors the intake air amount during idling and the ignition timing.
When the Engine Coolant Temperature (ECT) is between -10°C and 50 °C (14°F and 122°F), the ECM calculates the idling intake air amount for 10 seconds, beginning 3 seconds after the engine starts.
When the accumulated value is below the threshold, the ECM interprets this as a malfunction in the Idle Speed Control (ISC) system at cold start.

The ECM also monitors the ignition timing at cold start, and judges it to be incorrect when it is advanced to the same value for a warm engine for 5 seconds or more of the 10 second monitoring period.
Example:
P050A is detected when all conditions below are met (2 trip detection logic).
1. The ECT is between -10°C and 50°C (14°F and 122°F) when the engine starts.
2. The engine idles for 13 seconds after engine start.
3. The accumulated intake air amount is below the threshold.

The ECM sets the DTC and illuminates the MIL 13 seconds after the engine is next started.

NOTICE:

When the negative battery terminal is disconnected during inspection or repairs, the ISC learning values are cleared. The ISC learning must be performed by warming up the engine and idling for 5 minutes with the ECT at 75°C (167°F) or more because DTCs cannot be detected with the ISC learning values cleared.

MONITOR STRATEGY

Related DTCs	P050A: Idle speed control problem at cold P050B: Idle ignition timing problem at cold
Required Sensors/Components (Main)	Mass air flow meter
Required Sensors/Components (Related)	Engine Coolant Temperature (ECT) sensor, Throttle position sensor, Vehicle speed sensor
Frequency of Operation	Once per driving cycle
Duration	10 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

P050A:

Battery voltage	8 V or more
Time after engine start	3 seconds or more
Starter	OFF
ECT at engine start	-10°C (14°F) or more
ECT	-10°C to 50°C (14°F to 122°F)
Engine idling time	3 seconds or more
Fuel-cut	OFF
Vehicle speed	Less than 1.875 mph (3 km/h)
Time after shift position changed (Automatic Transmission)	1 second or more
Atmospheric pressure	76 kPa (570 mmHg) or more

P050B:

Battery voltage	8 V or more
Time after engine start	3 seconds or more
Starter	OFF
ECT at engine start	-10°C (14°F) or more
ECT	-10°C to 50°C (14°F to 122°F)
Engine idling time	3 seconds or more
Fuel-cut	OFF
Vehicle speed	Less than 1.875 mph (3 km/h)

TYPICAL MALFUNCTION THRESHOLDS

P050A:

Accumulated air flow amount (Manual Transmission)	Varies with ECT (Example: Less than 42.5 g)
Accumulated air flow amount (Automatic Transmission)	Varies with ECT (Example: Less than 47.5 g)

P050B:

Accumulated time when ignition timing retard value insufficient	5 seconds or more

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

ES

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P050A AND/OR P050B)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read the DTCs.

Result

Display (DTC Output)	Proceed To
P050A and/or P050B	A
P050A and/or P050B and other DTCs	B

HINT:
If any DTCs other than P050A and P050B are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	READ VALUE OF INTELLIGENT TESTER (FUEL TRIM)

HINT:
Calculate the total fuel trim values to check the characteristic deviation of the mass air flow meter.
(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / SHORT FT #1 and LONG FT #1.
(e) Read the values displayed on the tester.
(f) Add together the SHORT FT #1 and LONG FT #1 values to obtain the total FUEL TRIM.

OK:
Total of the SHORT FT #1 and LONG FT #1 values is between -20 % and 20 %.

OK → **Go to step 14**

NG

3	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (PURGE VSV)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / EVAP VSV.
(e) Disconnect the hose (connected to the canister) from the purge VSV.
(f) Start the engine.
(g) Using the tester, turn off the purge VSV (EVAP VSV: OFF).
(h) Use your finger to confirm that the purge VSV has no suction.
OK:
Purge VSV has no suction.
(i) Using the tester, turn on the purge VSV (EVAP VSV: ON).
(j) Use your finger to confirm that the purge VSV has suction.
OK:
Purge VSV has suction.

NG → **Go to step 9**

OK

4	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1.

NG → **Go to step 10**

OK

5	CHECK PCV HOSE CONNECTIONS

OK:
PCV hose is connected correctly and is not damaged.

NG → **Go to step 11**

OK

6	CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → **Go to step 12**

OK

ES

7	CHECK AIR CLEANER FILTER ELEMENT SUB-ASSEMBLY

NEXT → **Go to step 13**

OK

8	REPLACE MASS AIR FLOW METER

NEXT → **Go to step 19**

9	REPLACE PURGE VSV

NEXT → **Go to step 19**

10	CHECK AND REPAIR VVT SYSTEM

NEXT → **Go to step 19**

11	REPAIR OR REPLACE PCV HOSE

NEXT → **Go to step 19**

12	REPAIR OR REPLACE AIR INDUCTION SYSTEM

NEXT → **Go to step 19**

13	REPLACE AIR CLEANER FILTER ELEMENT SUB-ASSEMBLY

NEXT → **Go to step 19**

14	READ VALUE OF INTELLIGENT TESTER (ENGINE SPD)

NG → Go to step 17

OK

15	CHECK THROTTLE VALVE

(a) Check for deposits around the throttle valve and throttle valve condition.

OK:

No deposits around the throttle valve and throttle valve moves smoothly

NG → Go to step 18

OK

16	REPLACE ECM

NEXT → Go to step 19

17	REPAIR OR REPLACE CRANKSHAFT POSITION SENSOR CIRCUIT

NEXT → Go to step 19

18	REPAIR OR REPLACE THROTTLE BODY ASSEMBLY

NEXT → Go to step 19

19	CHECK WHETHER DTC OUTPUT RECURS (DTC P050A AND/OR P050B)

NOTICE:

In this operation, the engine must be cold (the same level as the engine coolant temperature recorded in the freeze frame data).

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Clear DTCs (See page ES-38).
(e) Switch the ECM from normal mode to check mode using the tester (See page ES-41).
(f) Start the engine to idle for a minute.

OK:

Stable fast idling.

(g) Read DTCs.

OK:
No DTC output.

NEXT

END

DTC	P0560	System Voltage

DESCRIPTION

The battery supplies electricity to the ECM even when the ignition switch is in the OFF position. This power allows the ECM to store data such as DTC history, freeze frame data and fuel trim values. If the battery voltage falls below a minimum level, these memories are cleared and the ECM determines that there is a malfunction in the power supply circuit. When the engine is next started, the ECM illuminates the MIL and sets the DTC.

DTC No.	DTC Detection Conditions	Trouble Areas
P0560	Open in ECM back up power source circuit (1 trip detection logic)	• Open in back up power source circuit • EFI fuse • ECM

HINT:
If DTC P0560 is set, the ECM does not store other DTCs.

MONITOR STRATEGY

Related DTCs	P0560: ECM system voltage
Required Sensors/Components (Main)	ECM
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	3 seconds
MIL Operation	Immediate (MIL illuminated after next engine start)
Sequence of Operation	None

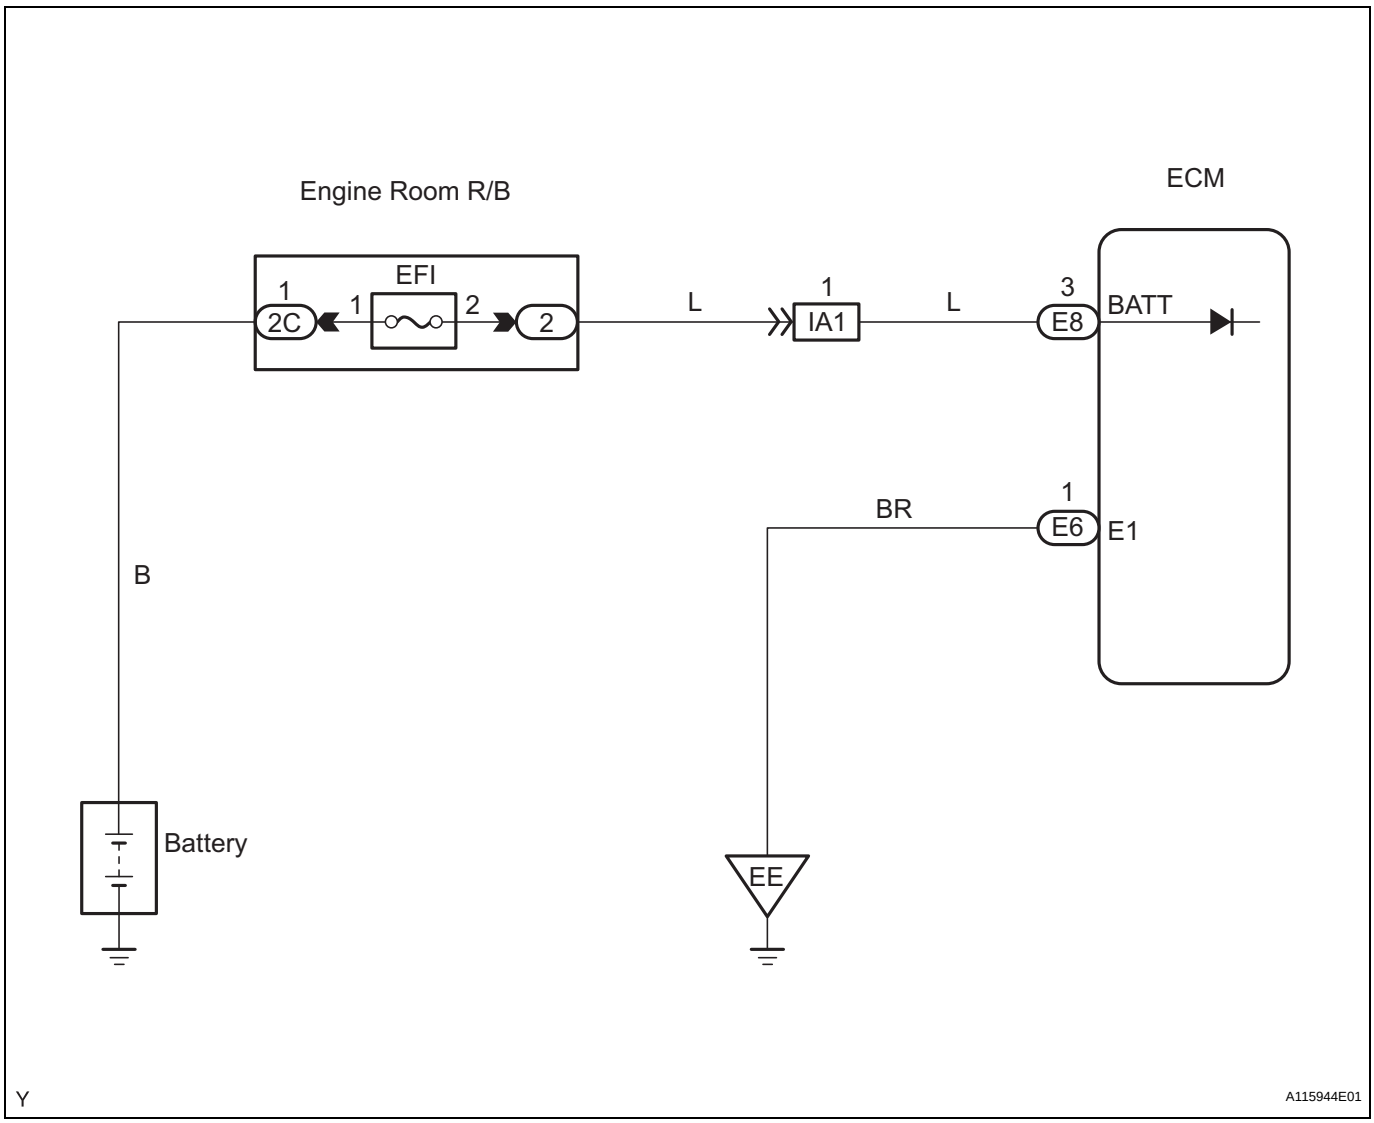
TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Stand-by RAM	Initialized

TYPICAL MALFUNCTION THRESHOLDS

ECM power source	Less than 3.5 V

WIRING DIAGRAM

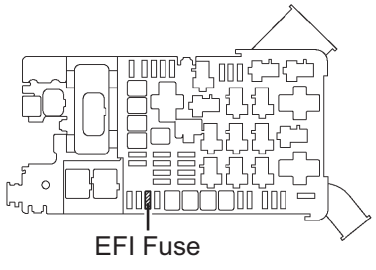


ES

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK FUSE (EFI FUSE)

Engine Room R/B:

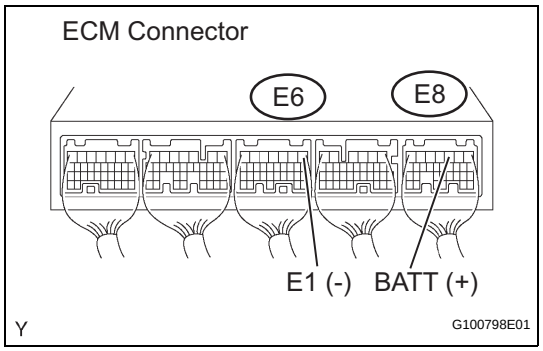


(a) Remove the EFI fuse from the engine room R/B.
(b) Check the resistance.
Standard Resistance:
Below 1 Ω
(c) Reinstall the EFI fuse.

NG → **CHECK FOR SHORT IN ALL HARNESSES AND COMPONENTS CONNECTED TO FUSE**

OK

2 INSPECT ECM (BATT VOLTAGE)



(a) Measure the voltage between the terminals of the E8 and E6 ECM connectors.

Standard Voltage

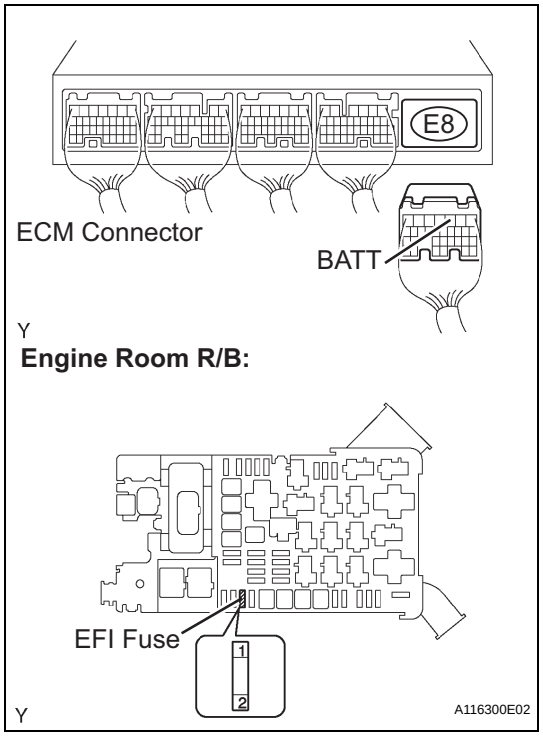
Tester Connections	Specified Conditions
BATT (E8-3) - E1 (E6-1)	9 to 14 V

NG → **Go to step 3**

OK

REPLACE ECM

3 CHECK HARNESS AND CONNECTOR (ECM - EFI FUSE, EFI FUSE - BATTERY)



(a) Check the harness and the connector between the EFI fuse and ECM.
   (1) Remove the EFI fuse from the engine room R/B.
   (2) Disconnect the E8 ECM connector.
   (3) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
EFI fuse (2) - BATT (E8-3)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
EFI fuse (2) or BATT (E8-3) - Body ground	10 kΩ or higher

   (4) Reconnect the ECM connector.
   (5) Reinstall the EFI fuse.

(b) Check the harness and the connector between the EFI fuse and battery.
   (1) Remove the EFI fuse from the engine room R/B.
   (2) Disconnect the positive battery terminal.
   (3) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
Battery positive terminal - EFI fuse (1)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
Battery positive terminal or EFI fuse (1) - Body ground	10 kΩ or higher

   (4) Reconnect the positive battery terminal.

ES

(5) Reinstall the EFI fuse.

CHECK AND REPLACE ENGINE ROOM RELAY BLOCK

DTC	P0604	Internal Control Module Random Access Memory (RAM) Error

DTC	P0606	ECM / PCM Processor

DTC	P0607	Control Module Performance

DTC	P0657	Actuator Supply Voltage Circuit / Open

DESCRIPTION

The ECM continuously monitors its own internal memory status, internal circuits, and output signals transmitted to the throttle actuator. This self-check insures that the ECM is functioning properly. If any malfunction is detected, the ECM sets the appropriate DTC and illuminates the MIL.
The ECM memory status is diagnosed by internal mirroring of the main CPU and the sub CPU to detect Random Access Memory (RAM) errors. The two CPUs also perform continuous mutual monitoring. The ECM illuminates the MIL and sets a DTC if: 1) outputs from the two CPUs are different or deviate from the standards, 2) the signals sent to the throttle actuator deviate from the standards, 3) a malfunction is found in the throttle actuator supply voltage, and 4) any other ECM malfunction is found.

DTC No.	DTC Detection Conditions	Trouble Areas
P0604 P0606 P0607 P0657	ECM internal error (1 trip detection logic)	ECM

MONITOR STRATEGY

Related DTCs	P0604: ECM RAM error P0606: ECM range check P0607: ECM CPU malfunction P0657: ETCS power supply
Required Sensors/Components (Main)	ECM
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	P0604: 6 times or more P0606: Within 16 seconds P0607 and P0657: Within 1 second
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

TYPICAL MALFUNCTION THRESHOLDS

ECM RAM errors (P0604):

RAM mirror check	fail

ECM CPU range check (P0606):

Either of following conditions met:	-
Difference between throttle valve position of main CPU and throttle valve position of sub CPU	0.3 V or more
Difference between accelerator pedal position of main CPU and accelerator pedal position of sub CPU	0.3 V or more

ECM CPU malfunction (P0607):

Either A or B met	-
A. Following conditions met	
CPU reset	1 time or more
Learned TP - learned APP	0.4 V or more
Throttle actuator	OFF
B. CPU reset	2 times or more

Electronic throttle control system power supply function of ECM malfunctions (P0657):

ETCS (Electronic Throttle Control System) power supply when ignition switch turned ON	7 V or more

ES

Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0604/P0606/P0607/P0657)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Enter the following menus: DIAGNOSIS / ENHANCED II / DTC INFO / CURRENT CODES.
(e) Read the DTC.

Result

Display (DTC output)	Proceed to
P0604, P0606, P0607, P0657	A
No output DTC	B

B → GO TO DTC CHART

A

REPLACE ECM

DTC	P0617	Starter Relay Circuit High

DESCRIPTION

While the engine is being cranked, the positive battery voltage is applied to terminal STA of the ECM. If the ECM detects the Starter Control (STA) signal while the vehicle is being driven, it determines that there is a malfunction in the STA circuit. The ECM then illuminates the MIL and sets the DTC.
This monitor runs when the vehicle is driven at 12.4 mph (20 km/h) for over 20 seconds.

DTC No.	DTC Detection Conditions	Trouble Areas
P0617	When conditions (a), (b) and (c) met, positive (+B) battery voltage 10.5 V or more applied to ECM for 20 seconds (1 trip detection logic) (a) Vehicle speed more than 12.4 mph (20 km/h) (b) Engine speed more than 1,000 rpm (c) STA signal ON	• Park/Neutral Position (PNP) switch (A/T*) • Clutch start switch (M/T*) • Starter relay circuit • Ignition switch • ECM

*: A/T denotes Automatic Transmission models and M/T denotes Manual Transmission models.

MONITOR STRATEGY

Related DTCs	P0617: Starter signal
Required Sensors/Components (Main)	STARTER relay, PNP switch, Clutch start switch and Ignition switch
Required Sensors/Components (Related)	Vehicle Speed Sensor (VSS), Crankshaft Position (CKP) sensor
Frequency of Operation	Continuous
Duration	20 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Battery voltage	10.5 V or more
Vehicle speed	12.4 mph (20 km/h) or more
Engine speed	1,000 rpm or more

TYPICAL MALFUNCTION THRESHOLDS

Starter signal	ON

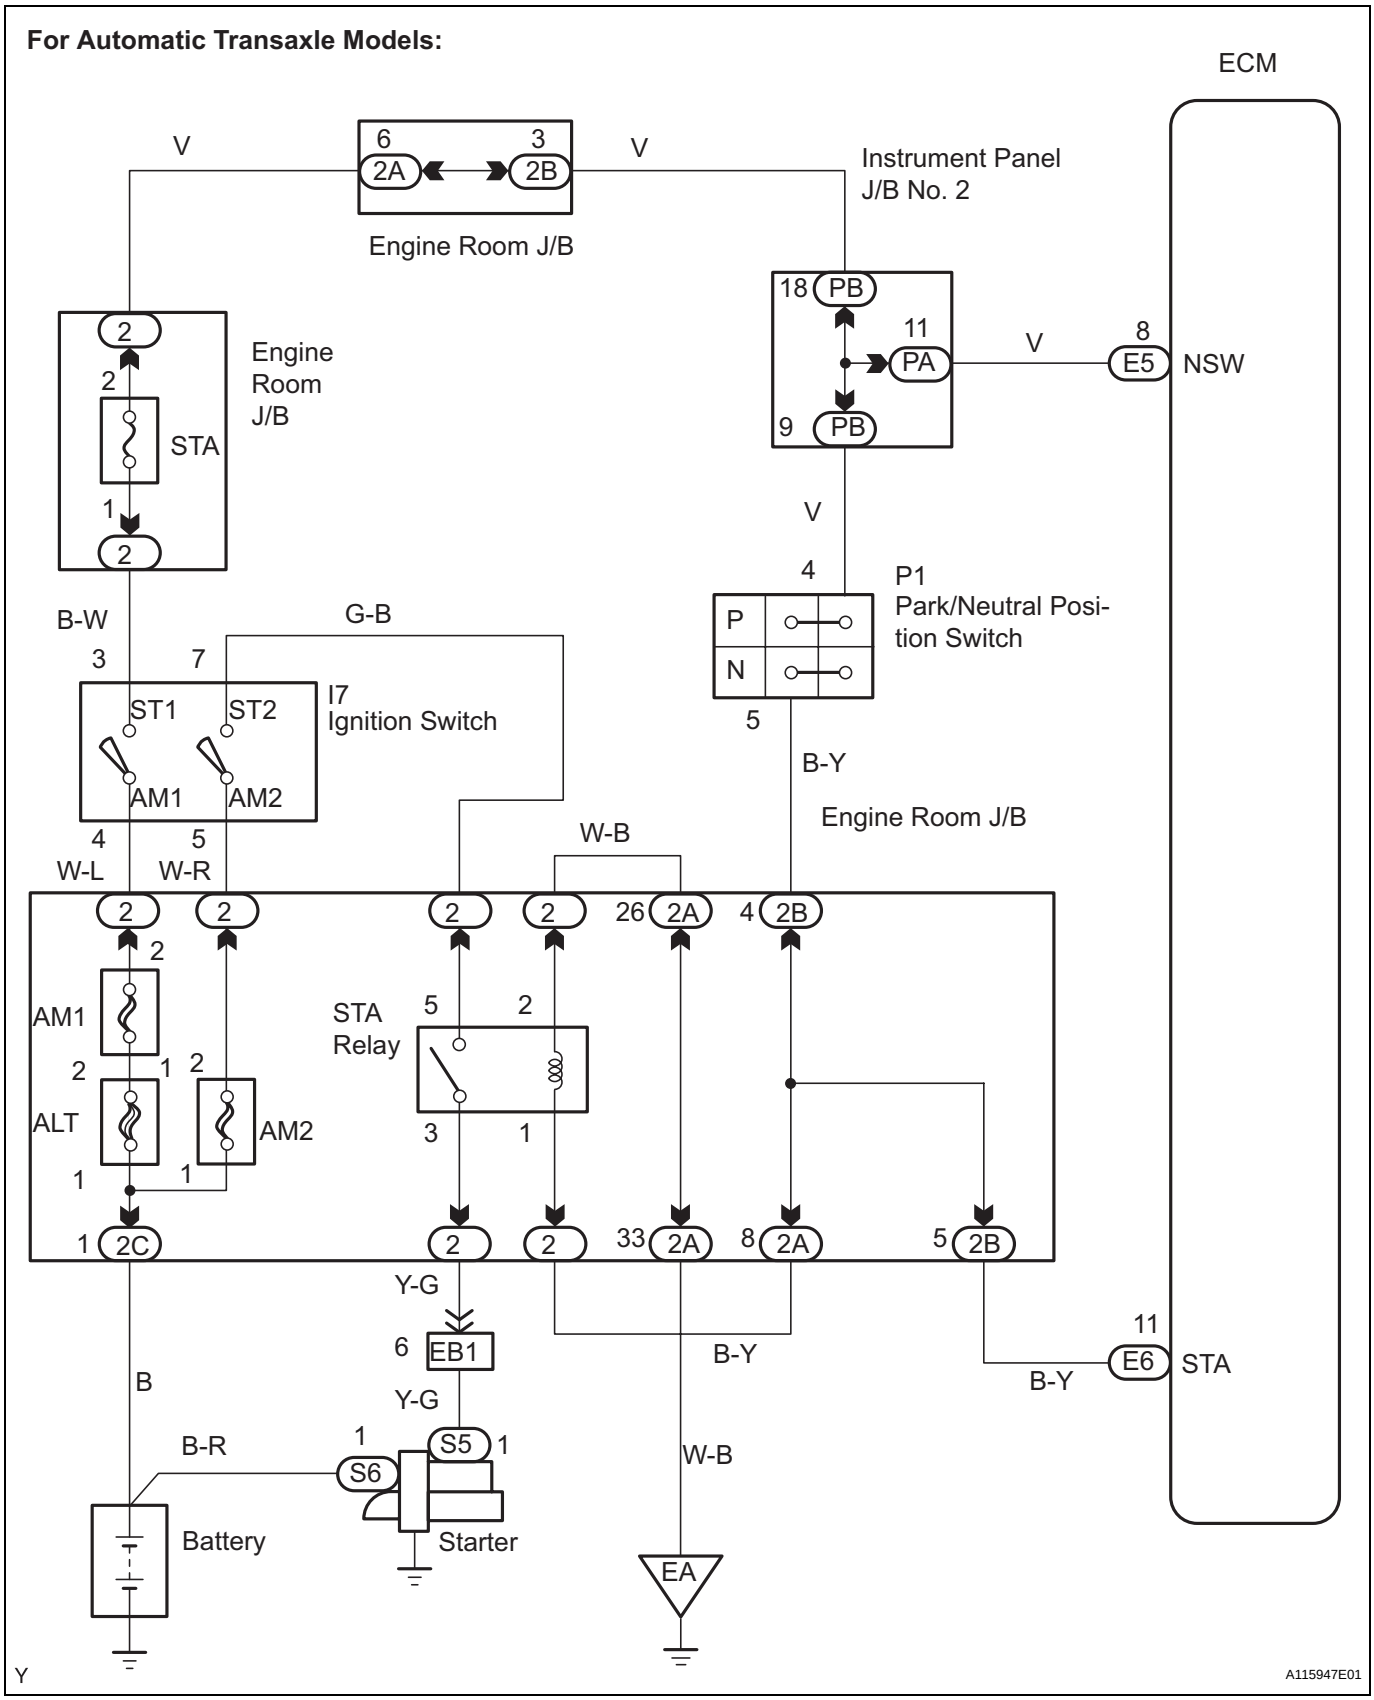
ES



HINT:

- The following troubleshooting flowchart is based on the premise that the engine is cranked normally. If the engine will not crank, proceed to the problem symptoms table (See page ES-28).

- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 READ VALUE OF INTELLIGENT TESTER (STARTER SIGNAL)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STARTER SIG.
(d) Check the value displayed on the tester when the ignition switch is turned to ON and START positions.

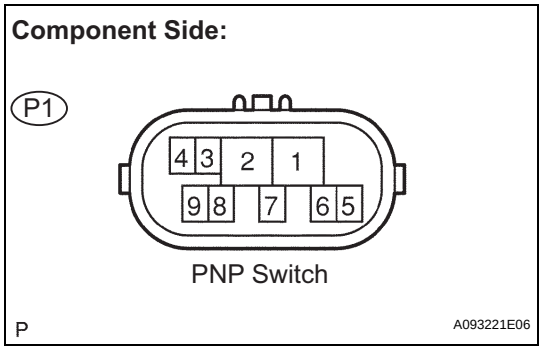
OK

Ignition Switch Positions	ON	START
STARTER SIG	OFF	ON

OK → REPLACE ECM

NG

2 INSPECT PARK/NEUTRAL POSITION SWITCH OR CLUTCH START SWITCH

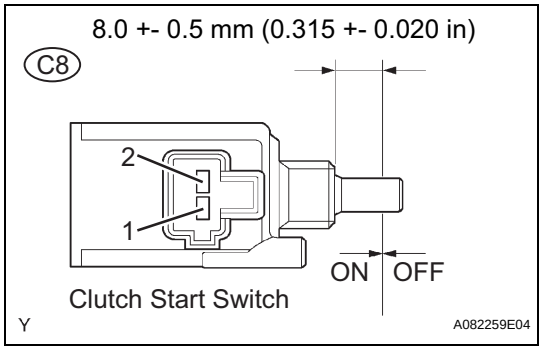


(a) Inspect the Park/Neutral Position (PNP) switch (For Automatic Transmission models).
(1) Disconnect the P1 PNP switch connector.
(2) Check the resistance when the transmission gear selector lever is moved to each position.

Standard Resistance

Gear Selector Lever Positions	Tester Connections	Specified Conditions
P	2 - 6, 4 - 5	Below 1 Ω
R	1 - 2	
N	2 - 9, 4 - 5	
D	2 - 7	
2	2 - 3	
L	2 - 8	

(3) Reconnect the PNP switch connector.



(b) Inspect the clutch start switch (For Manual Transmission models).
(1) Disconnect the C8 clutch start switch connector.
(2) Check the resistance when the clutch start switch is ON and OFF.

Standard Resistance

Ignition Switch Positions	Tester Connections	Specified Conditions
ON (pushed)	1 - 2	Below 1 Ω
OFF (free)	1 - 2	10 kΩ or higher

(3) Reconnect the clutch start switch connector.

NG → REPLACE PARK / NEUTRAL POSITION SWITCH ASSEMBLY (THEN CHECK CRANKING HOLDING FUNCTION CIRCUIT)

OK

3 READ VALUE OF INTELLIGENT TESTER (STARTER SIGNAL)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STARTER SIG.
(d) Check the value displayed on the tester when the ignition switch is turned to ON and START positions.

OK

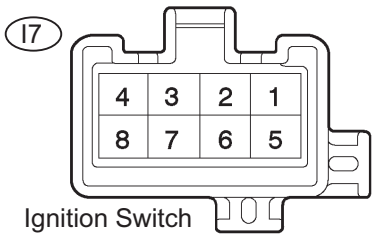
Ignition Switch Positions	ON	START
STARTER SIG	OFF	ON

OK → SYSTEM OK

NG

4 INSPECT IGNITION OR STARTER SWITCH ASSEMBLY

Component Side:



(a) Disconnect the I7 ignition switch connector.
(b) Check the resistance.

Standard Resistance

Ignition Switch Positions	Tester Connections	Specified Conditions
LOCK	All Terminals	10 kΩ or higher
ACC	2 - 4	Below 1 Ω
ON	1 - 2, 1 - 4, 5 - 6	
START	1 - 3, 1 - 4, 3 - 4, 5 - 6, 5 - 7, 6 - 7	

(c) Reconnect the ignition switch connector.

NG → REPLACE IGNITION OR STARTER SWITCH ASSEMBLY

OK

5 READ VALUE OF INTELLIGENT TESTER (STARTER SIGNAL)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STARTER SIG.
(d) Check the value displayed on the tester when the ignition switch is turned to ON and START positions.

OK

Ignition Switch Positions	ON	START
STARTER SIG	OFF	ON

OK → SYSTEM OK

NG

REPAIR OR REPLACE HARNESS OR CONNECTOR

DTC	P0630	VIN not Programmed or Mismatch - ECM / PCM

DESCRIPTION

DTC P0630 is set when the Vehicle Identification Number (VIN) is not stored in the Engine Control Module (ECM) or the input VIN is not accurate. Input the VIN with an intelligent tester.

DTC No.	DTC Detection Conditions	Trouble Areas
P0630	• VIN not stored in ECM • Input VIN in ECM not accurate	• ECM

MONITOR STRATEGY

Related DTCs	P0630: VIN not programmed
Required Sensors/Components (Main)	ECM
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Battery voltage	8 V or more
Ignition switch	ON
Starter	OFF

TYPICAL MALFUNCTION THRESHOLDS

VIN code	Not programmed

COMPONENT OPERATING RANGE

VIN code	Programmed

1	READ CURRENT DTC

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0630	**A**
P0630 and other DTCs	**B**

If any DTCs other than P0630 are output, troubleshoot those DTCs first.

NOTICE:
If P0630 is set, the VIN must be input to the ECM using an intelligent tester. However, all DTCs are cleared automatically by the tester when inputting the VIN. If DTCs other than P0630 are set, check them first.

B	GO TO DTC CHART

DTC	P0724	Brake Switch "B" Circuit High

DESCRIPTION

The purpose of this circuit is to prevent the engine from stalling, while driving in lock-up condition, when brakes are suddenly applied.
When the brake pedal is depressed, this switch sends a signals to the ECM. Then the ECM cancels the operation of the lock-up clutch while braking is in progress.

DTC No.	DTC Detection Conditions	Trouble Areas
P0724	The stop light switch remains ON even when the vehicle repeats 5 cycles of STOP (less than 1.86 mph (3 km/h)) and GO (18.65 mph (30 km/h)or more) (2 trip detection logic)	• Short in stop light switch signal circuit • Stop light switch • ECM

ES

MONITOR DESCRIPTION

This DTC indicates that the stop light switch remains ON. When the stop light switch remains ON during "stop and go" driving, the ECM interprets this as a fault in the stop light switch and the MIL comes on and the ECM stores the DTC. The vehicle must stop (less than 1.86 mph (3 km/h)) and go (18.65 mph (30 km/h) or more) 5 times during 2 driving cycles, in order to detect a malfunction.

MONITOR STRATEGY

Related DTCs	P0724: Stop light switch/Range check/Rationality
Required sensors/Components (Main)	Stop light switch
Required sensors/Components (Related)	Speed sensor
Frequency of Operation	Continuous
Duration	5 times
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

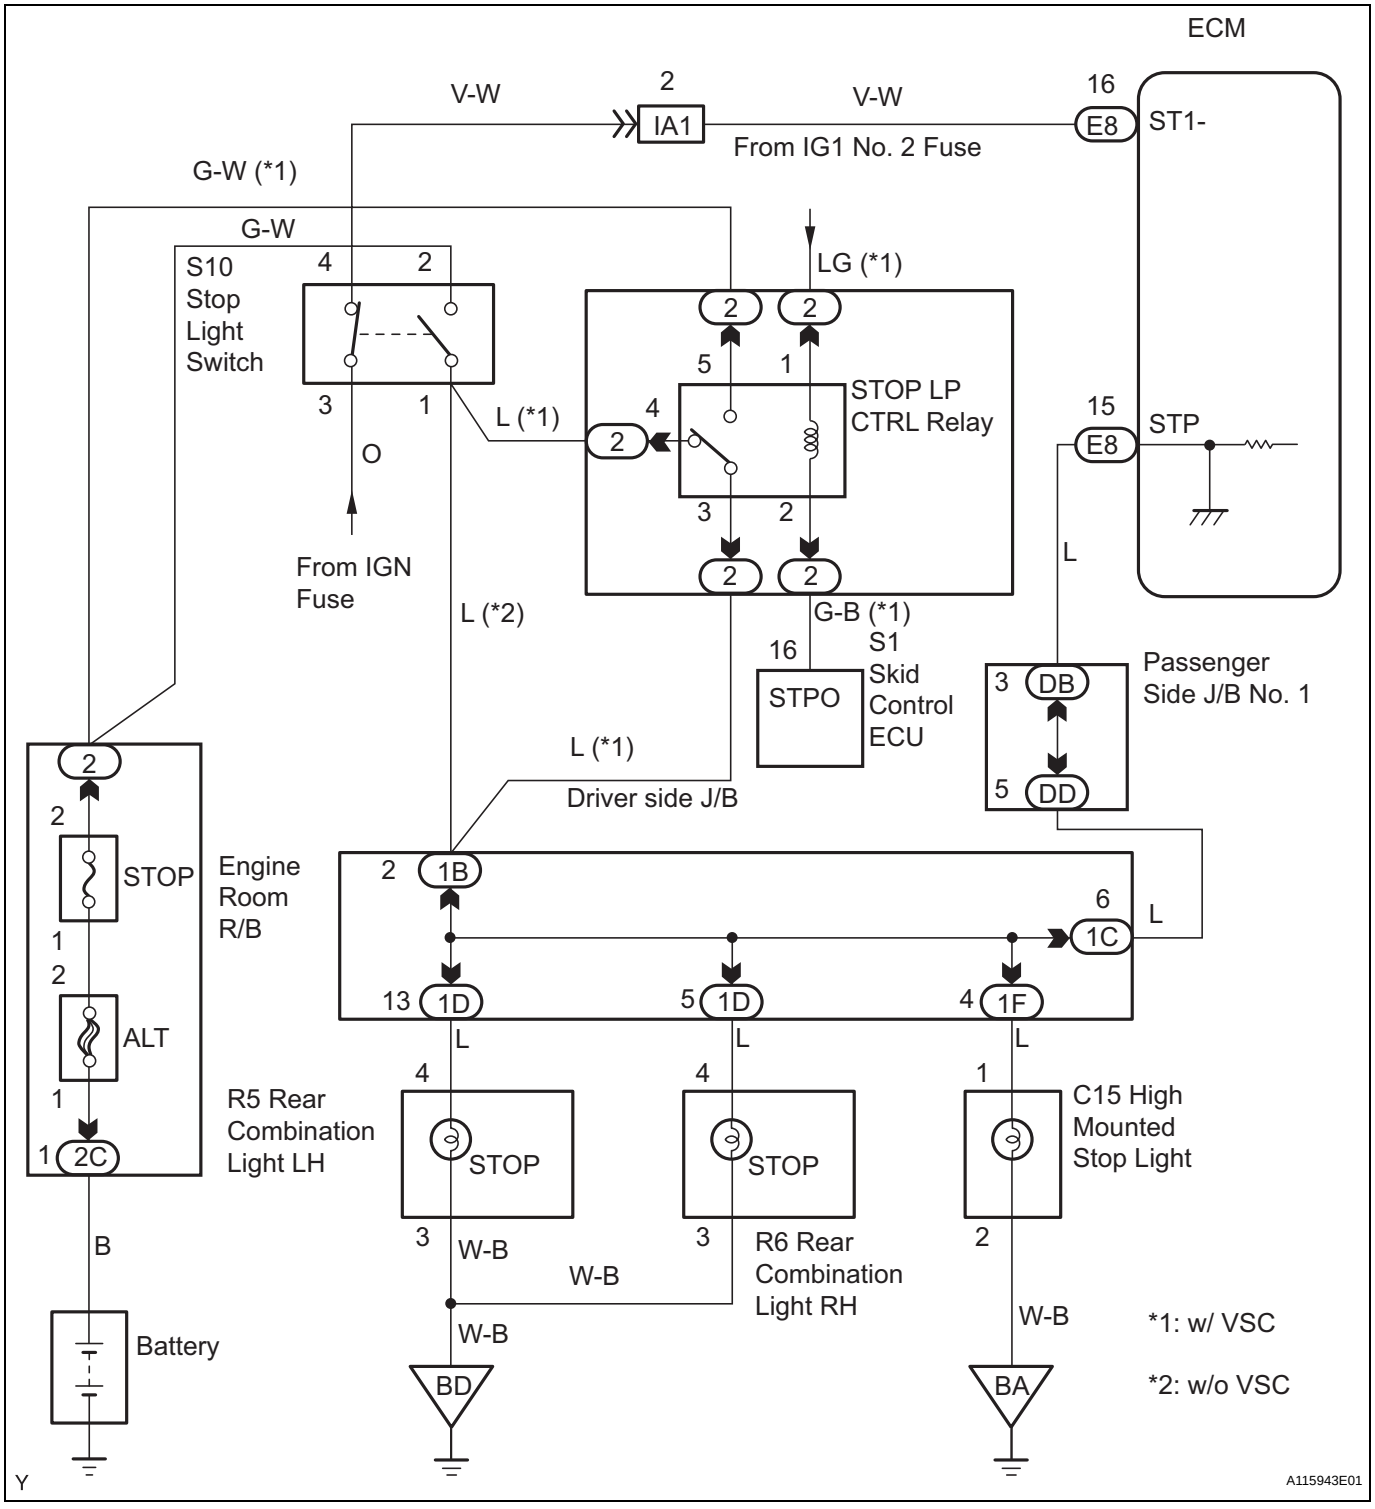
The stop light switch remains ON during GO and STOP 5 times.
GO and STOP are defined as follows;

Monitor will run whenever following DTCs not present	None
GO: Vehicle speed	18.65 mph (30 km/h) or more
STOP: Vehicle speed	Less than 1.86 mph (3 km/h)

TYPICAL MALFUNCTION THRESHOLDS

Stop light switch status	Stuck ON

WIRING DIAGRAM



HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	READ VALUE OF INTELLIGENT TESTER (STOP LIGHT SW)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STOP LIGHT SW.
(d) Read the values displayed on the tester.

OK

Item	Measurement Item: Range (display)	Normal Condition
STOP LIGHT SW	Stop light switch status: ON or OFF	• ON: Brake pedal is depressed • OFF: Brake pedal is released

3	CHECK HARNESS AND CONNECTOR (STOP LIGHT SWITCH - ECM) (See page ES-251)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

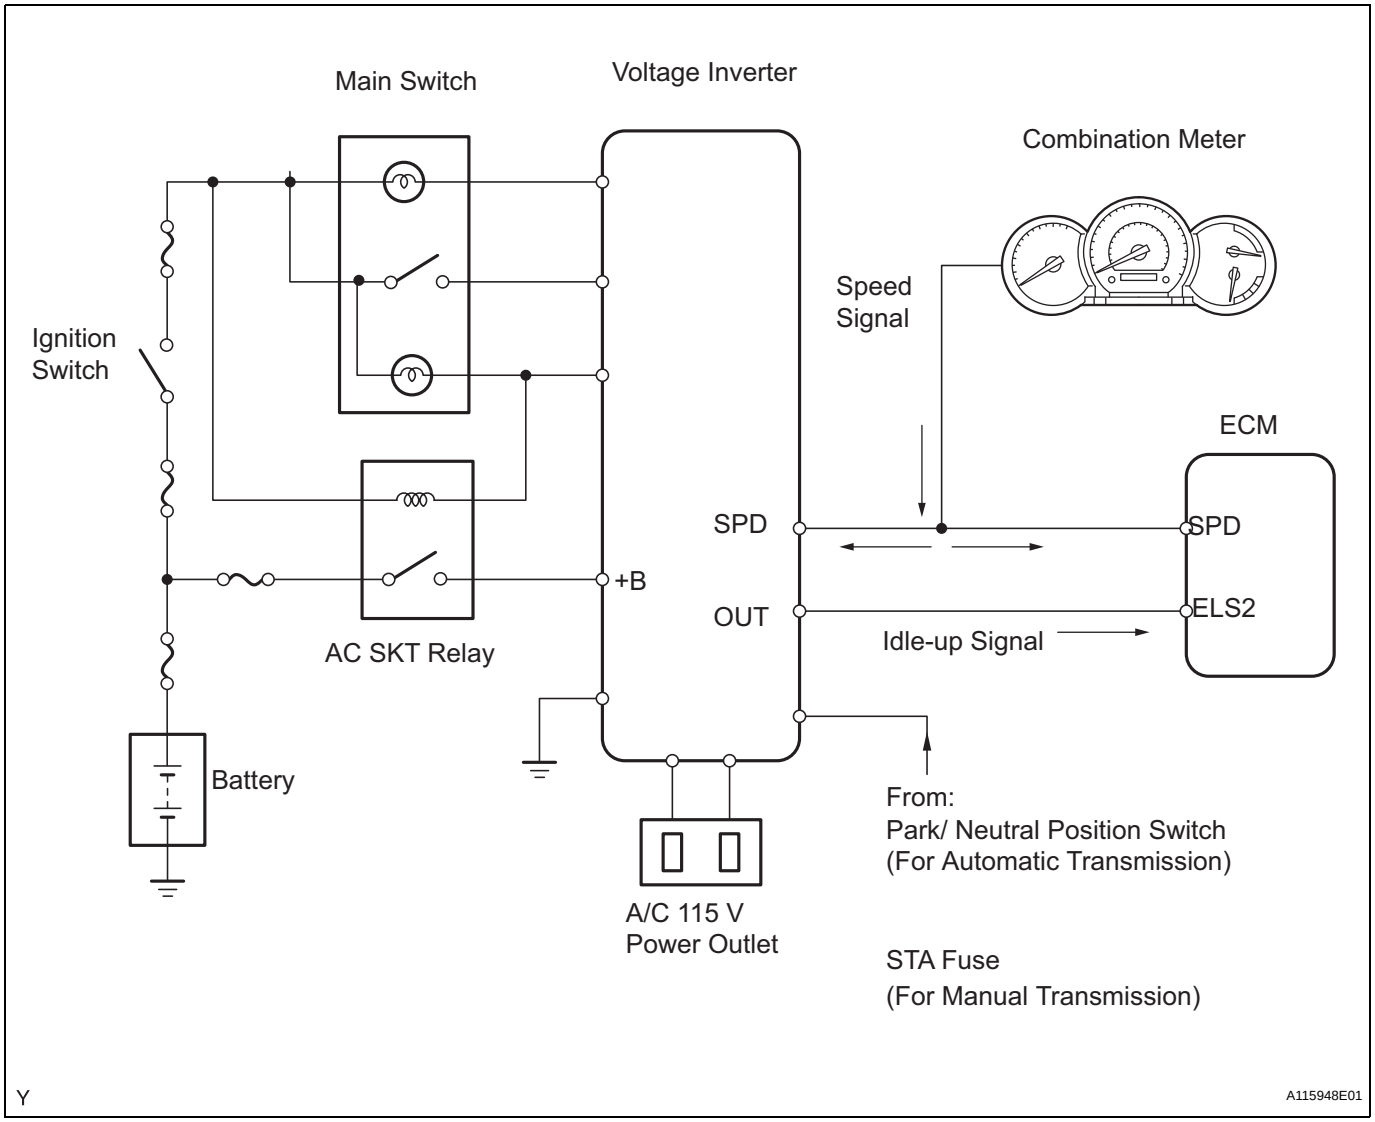
OK

REPLACE ECM

DTC	P1500	AC Inverter Malfunction

DESCRIPTION

This vehicle is equipped with a voltage inverter, which supplies power to various electrical appliances. When the main switch of the voltage inverter is turned ON, the inverter relay turns ON, and the inverter then converts the 12 V Direct Current (DC) of the battery into an 115 V Alternating Current (AC). The voltage inverter can output a maximum of 400W from an outlet.
When the AC 115 V is output, a load is applied to the engine. The ECM controls the engine idling speed according to the vehicle speed and engine load. A speed signal is input to the inverter and an idle-up signal is transmitted to the ECM.



DTC No.	DTC Detection Conditions	Trouble Areas
P1500	While vehicle running, idle-up signal input to ECM for 10 seconds	• Open or short in speed signal circuit • Short between idle-up signal and +B circuits • Voltage inverter • ECM

MONITOR DESCRIPTION

While the engine is idling, the ECM performs idle-up according to the power supply of the inverter to stabilize the engine idling speed.

When the vehicle is stationary and the inverter input exceeds 8.3 A, the inverter sends an idle-up signal from the OUT terminal of the inverter to the ELS2 terminal of the ECM.
If the idle-up signal is input into the ECM for 10 seconds while the vehicle is running, the ECM interprets this as a malfunction in the inverter circuit and sets the DTC.

MONITOR STRATEGY

Related DTCs	P1500: Voltage inverter performance
Required Sensors/Components (Main)	Voltage inverter
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	10 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

ES

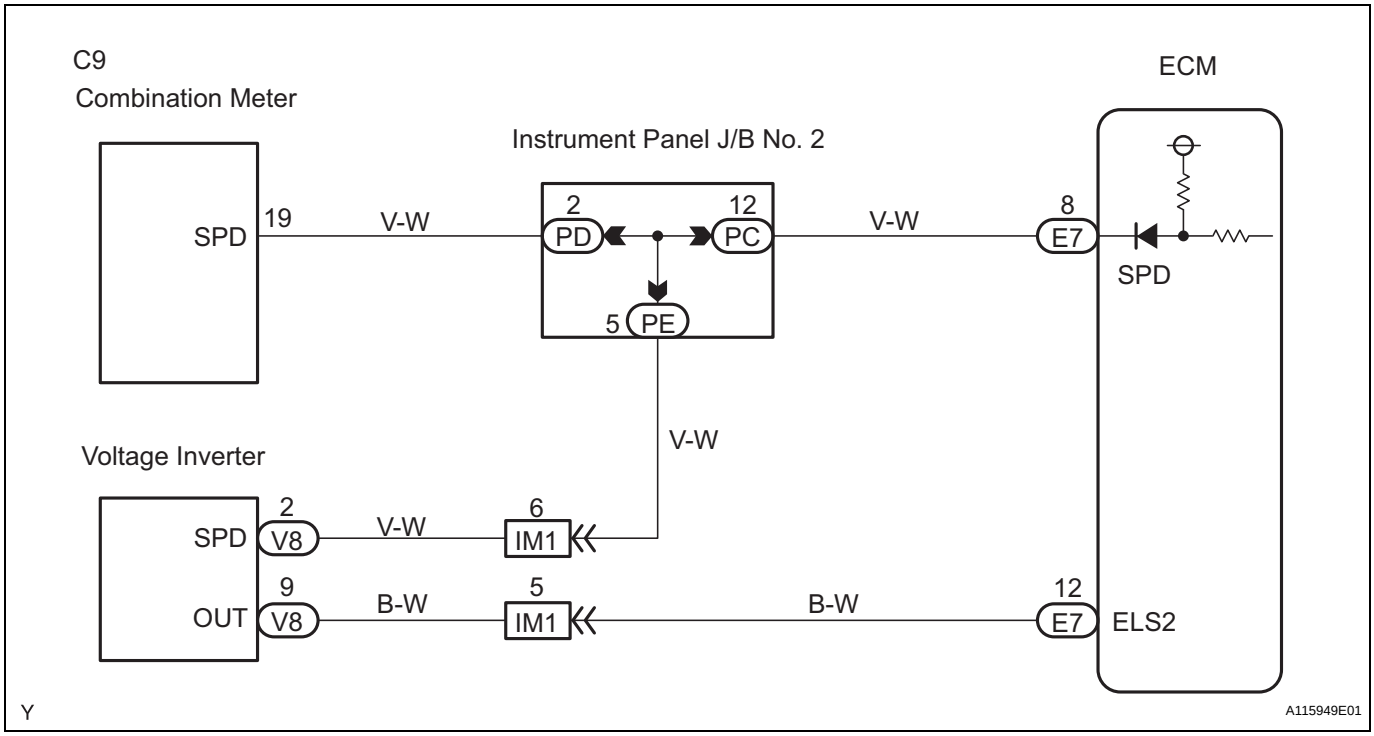
TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Vehicle speed	3.11 mph (5 km/h) or more
Battery voltage	8 V or more
Ignition switch	ON
Starter	OFF

TYPICAL MALFUNCTION THRESHOLDS

Electric load signal 2	ON

WIRING DIAGRAM



1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P1500)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC output)	Proceed To
P1500	A
P1500 and other DTCs	B

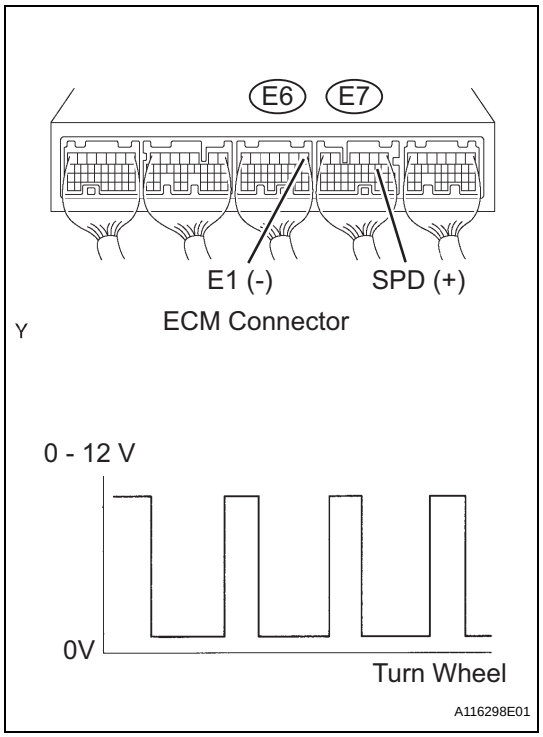
ES

HINT:
If any DTCs other than P1500 are output, troubleshoot those DTCs first.

NG → **GO TO DTC CHART**

OK

2	INSPECT VOLTAGE INVERTER ASSEMBLY (SPD SIGNAL)



(a) Shift the transmission gear selector lever to the neutral position.
(b) Jack up the vehicle.
(c) Turn the ignition switch ON.
(d) Check the voltage between the terminals of the ECM connectors as the wheel is turned slowly.

Standard

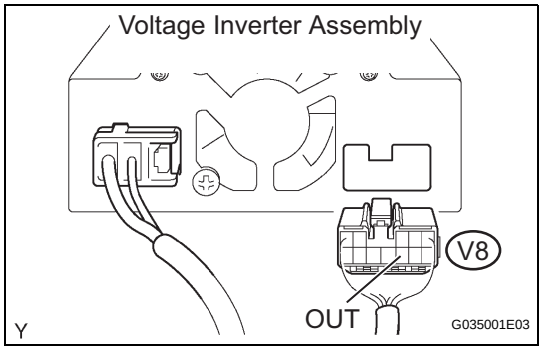
Tester Connections	Specified Conditions
SPD (E7-8) - E1 (E6-1)	Voltage generated intermittently

HINT:
The output voltage should fluctuate up and down similarly to the diagram on the left when the wheel is turned slowly.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3 **INSPECT ECM**



(a) Disconnect the V8 inverter connector.
(b) Start the engine.
(c) Measure the voltage between the OUT terminal of inverter and the body ground.
Standard Voltage

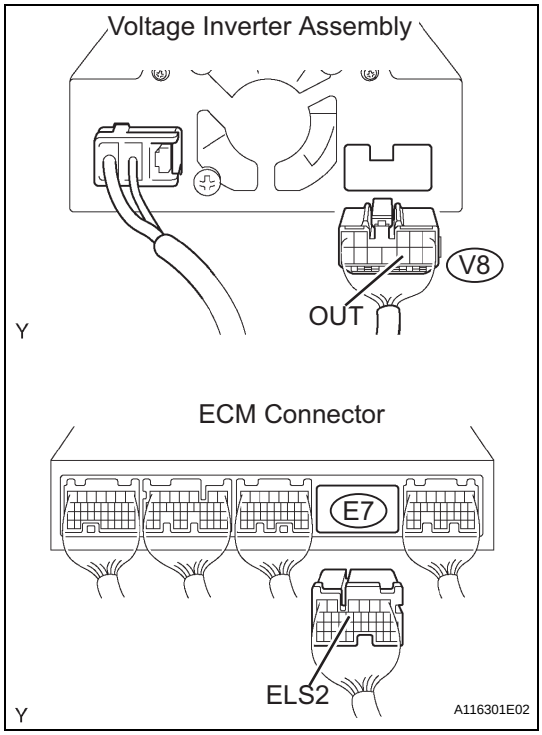
Tester Connections	Specified Conditions
OUT (V8-9) - Body ground	1 V or less

(d) Reconnect the inverter connector.

OK → **REPLACE VOLTAGE INVERTER ASSEMBLY**

NG

4 **CHECK HARNESS AND CONNECTOR (ECM - INVERTER, INVERTER - POWER SOURCE)**



(a) Disconnect the V8 inverter connector.
(b) Disconnect the E7 ECM connector.
(c) Turn the ignition switch ON.
(d) Measure the voltage between the terminals of the wire harness side connectors and body ground.
Standard Voltage (Check for short in idling up signal circuit)

Tester Connections	Specified Conditions
OUT (V8-9) - Body ground	1 V or less
ELS2 (E7-12) - Body ground	

(e) Reconnect the inverter connector and the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

DTC	P2102	Throttle Actuator Control Motor Circuit Low

DTC	P2103	Throttle Actuator Control Motor Circuit High

SYSTEM DESCRIPTION

The throttle actuator is operated by the ECM and opens and closes the throttle valve using gears.
The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.
HINT:
This ETCS (Electronic Throttle Control System) does not use a throttle cable.

ES

DTC No.	DTC Detection Conditions	Trouble Areas
P2102	Conditions (a) and (b) continue for 2.0 seconds (1 trip detection logic) (a) Throttle actuator duty ratio 80 % or more (b) Throttle actuator current 0.5 A or less	• Open in throttle actuator circuit • Throttle actuator • ECM
P2103	Throttle actuator current 7 A or more for 0.6 seconds (1 trip detection logic)	• Short in throttle actuator circuit • Throttle actuator • Throttle valve • Throttle body assembly • ECM

MONITOR DESCRIPTION

The ECM monitors the electrical current through the electronic actuator, and detects malfunctions and open circuits in the throttle actuator based on this value. If the current is outside the standard range, the ECM determines that there is a malfunction in the throttle actuator. In addition, if the throttle valve does not function properly (for example, stuck on), the ECM determines that there is a malfunction. The ECM then illuminates the MIL and sets a DTC.
Example:
When the electrical current is more than 10 A, or less than 0.5 A and the throttle actuator duty ratio exceeds 80 %, the ECM interprets this as the current being outside the standard range, and illuminates the MIL and sets a DTC.
If the malfunction is not repaired successfully, a DTC is set when the engine is quickly revved to a high rpm several times after the engine has idled for 5 seconds after engine start.

MONITOR STRATEGY

Related DTCs	P2102: Throttle actuator current (low current) P2103: Throttle actuator current (high current)
Required Sensors/Components (Main)	Throttle actuator (throttle body)
Required Sensors/Components (Related)	None
Frequency of Operation	Continuous
Duration	P2102: 2 seconds P2103: 0.1 seconds or 0.6 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

P2102:

Electronic throttle actuator	ON
Electronic throttle actuator drive duty	80 % or more

Electronic throttle actuator power supply voltage	8 V or more
Motor current change during latest 0.016 sec	Less than 0.2 A

P2103:

Electronic throttle actuator	ON
Either of the following conditions 1 or 2 met:	-
1. Electronic throttle actuator power supply voltage	8 V or more
2. Electronic throttle actuator power	ON
Battery voltage	8 V or more
Starter	OFF

TYPICAL MALFUNCTION THRESHOLDS

ES

P2102:

Motor current	Less than 0.5 A

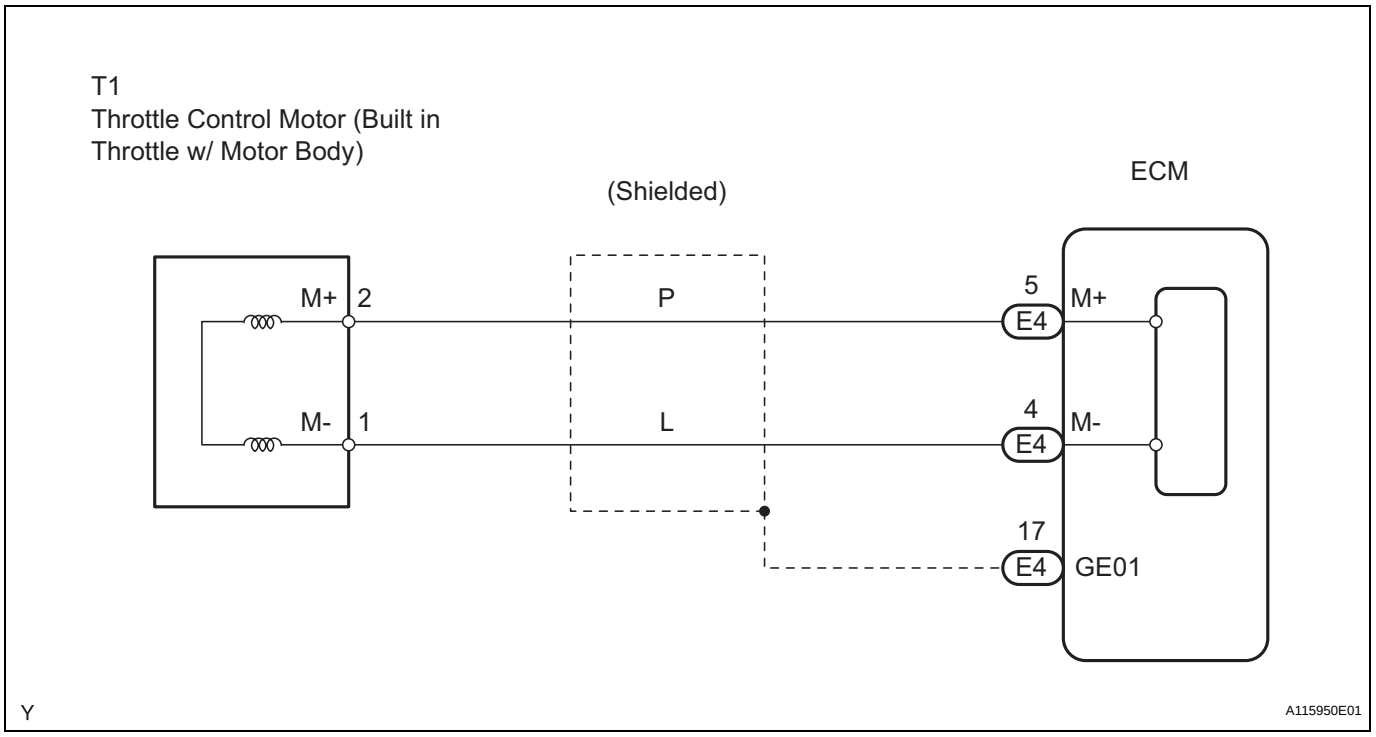
P2103:

Hybrid IC diagnosis signal	Fail
Hybrid IC current limitter port	Fail

FAIL-SAFE

When either of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

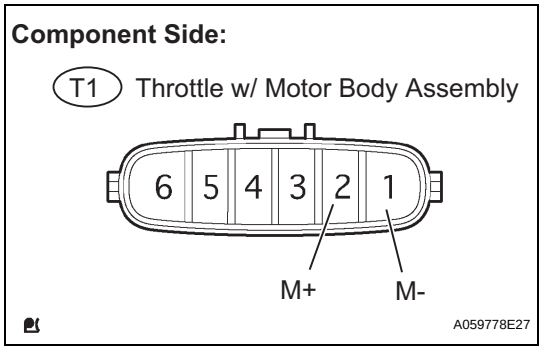
WIRING DIAGRAM



HINT:

- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.
- The throttle actuator current (THROTTLE MOT) and the throttle actuator duty ratio (THROTTLE OPN / THROTTLE CLS) can be read using an intelligent tester. However the ECM shuts off the throttle actuator current when the ETCS malfunctions.

1 INSPECT THROTTLE W/MOTOR BODY ASSEMBLY (RESISTANCE OF THROTTLE CONTROL MOTOR)



(a) Disconnect the T1 throttle w/ motor body connector.
(b) Measure the resistance between the terminals of the throttle control motor.

Standard Resistance

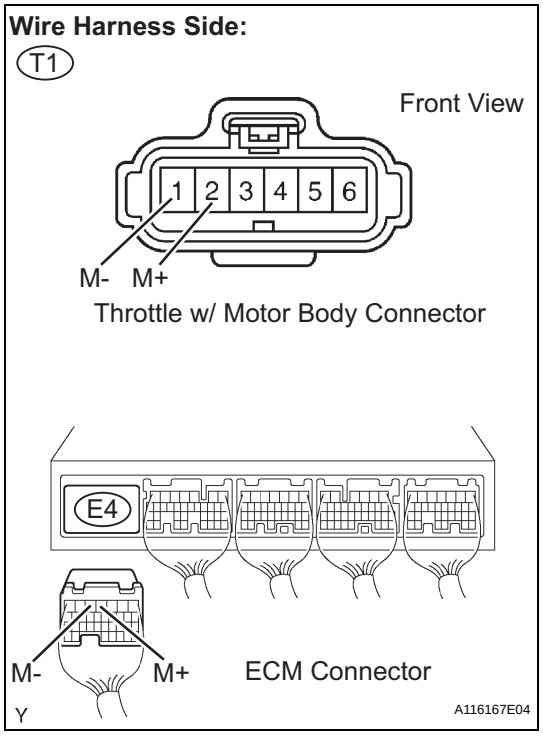
Tester Connections	Specified Conditions
M+ (T1-2) - M- (T1-1)	0.3 to 100 Ω at 20°C (68°F)

(c) Reconnect the throttle w/ motor body connector.

NG → **REPLACE THROTTLE W/MOTOR BODY ASSEMBLY**

OK

2 CHECK HARNESS AND CONNECTOR (THROTTLE CONTROL MOTOR - ECM)



(a) Disconnect the T1 throttle w/ motor body connector.
(b) Disconnect the E4 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
M+ (T1-2) - M+ (E4-5)	Below 1 Ω
M- (T1-1) - M- (E4-4)	

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
M+ (T1-2) or M+ (E4-5) - Body ground	10 kΩ or higher
M- (T1-1) or M- (E4-4) - Body ground	

(d) Reconnect the throttle w/ motor body connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3	INSPECT THROTTLE W/MOTOR BODY ASSEMBLY

(a) Check for foreign objects between the throttle valve and the housing.

NG → **REMOVE FOREIGN OBJECT AND CLEAN THROTTLE BODY**

OK

4	INSPECT THROTTLE VALVE

(a) Check if the throttle valve opens and closes smoothly.

NG → **REPLACE THROTTLE W/MOTOR BODY ASSEMBLY**

OK

REPLACE ECM

DTC	P2111	Throttle Actuator Control System - Stuck Open

DTC	P2112	Throttle Actuator Control System - Stuck Closed

SYSTEM DESCRIPTION

The throttle actuator is operated by the ECM, and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM in order that it can control the throttle actuator, and therefore the throttle valve, appropriately in response to driver inputs.
HINT:
This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC No.	DTC Detection Conditions	Trouble Areas
P2111	ECM signals throttle actuator to close, but stuck (1 trip detection logic)	• Throttle actuator • Throttle body assembly • Throttle valve
P2112	ECM signals throttle actuator to open, but stuck (1 trip detection logic)	

MONITOR DESCRIPTION

The ECM determines that there is a malfunction in the ETCS when the throttle valve remains at a fixed angle despite a high drive current from the ECM. The ECM illuminates the MIL and sets a DTC.
If the malfunction is not repaired successfully, a DTC is set when the accelerator pedal is fully depressed and released quickly (to fully open and close the throttle valve) after the engine is next started.

MONITOR STRATEGY

Related DTCs	P2111: Throttle actuator stuck open P2112: Throttle actuator stuck closed
Required Sensors/Components (Main)	Throttle actuator
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

ALL:

Monitor runs whenever following DTCs not present	None

P2111 (Throttle actuator stuck open):

All of following conditions met	-
System guard*	ON
Throttle motor current	2 A or more
Throttle motor close duty	80 % or more

P2112 (Throttle actuator stuck closed):

All of following conditions met	-
System guard*	ON
Throttle motor current	2 A or more
Throttle motor open duty	80 % or more
* System guard set when following conditions met	-
Throttle motor	ON

Motor duty calculation	Executing
TPS fail determination	Fail determined
Motor current-cut operation	Not executing
Actuator power supply voltage	4 V or more
Motor fail determination	Fail determined

TYPICAL MALFUNCTION THRESHOLDS

P2111 (Throttle actuator stuck open):

TP sensor voltage change for 0.016 seconds	Less than 0.1 V for 0.5 seconds or more

P2112 (Throttle actuator stuck closed):

TP sensor voltage change for 0.016 seconds	Less than 0.1 V for 0.5 seconds or more

ES

FAIL-SAFE

When either of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed.
If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

WIRING DIAGRAM

Refer to DTC P2102 (See page ES-280).

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2111 or P2112)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P2111 or P2112	A
P2111 or P2112 and other DTCs	B

HINT:
If any DTCs other than P2111 or P2112 are output, troubleshoot those DTCs first.

B	GO TO DTC CHART

A

2	INSPECT THROTTLE W/MOTOR BODY ASSEMBLY (VISUALLY CHECK THROTTLE VALVE)

(a) Check for contamination between the throttle valve and the housing. If necessary, clean the throttle body. And check that the throttle valve moves smoothly.
OK:
Throttle valve is not contaminated with foreign objects and moves smoothly.

NG → **REPLACE THROTTLE W/MOTOR BODY ASSEMBLY**

ES

OK

3	CHECK WHETHER DTC OUTPUT RECURS (DTC P2111 OR P2112)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (See page ES-38).
(e) Start the engine, and fully depress and release the accelerator pedal quickly (to fully open and close the throttle valve).

CHECK FOR INTERMITTENT PROBLEMS

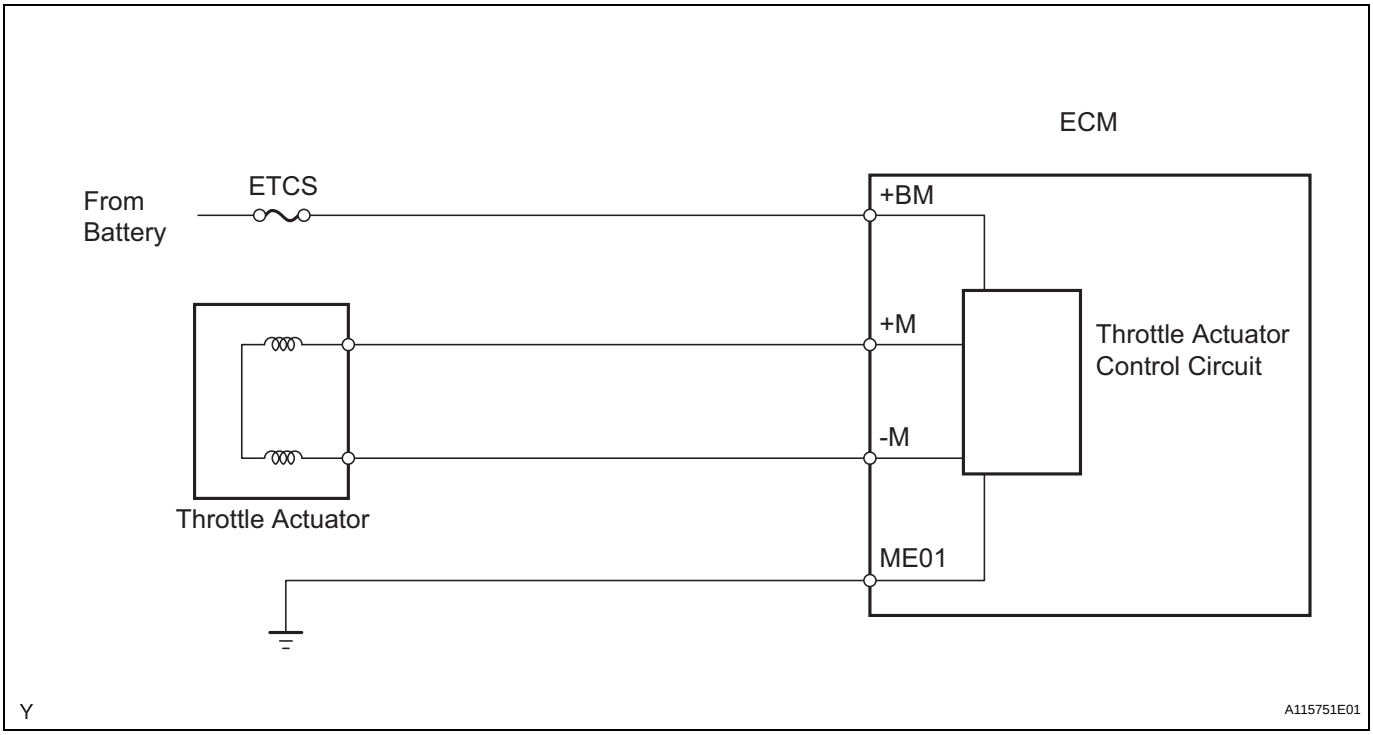
DTC	P2118	Throttle Actuator Control Motor Current Range / Performance

DESCRIPTION

The ETCS (Electronic Throttle Control System) has a dedicated power supply circuit. The voltage (+BM) is monitored and when it is low (less than 4 V), the ECM determines that there is a malfunction in the ETCS and cuts off the current to the throttle actuator.
When the voltage becomes unstable, the ETCS itself becomes unstable. For this reason, when the voltage is low, the current to the throttle actuator is cut. If repairs are made and the system returns to normal, turn the ignition switch OFF. The ECM then allows the current to flow to the throttle actuator so that it can be restarted.

ES

HINT:
The ETCS does not use a throttle cable.



DTC No.	DTC Detection Conditions	Trouble Areas
P2118	Open in ETCS power source (+BM) circuit (1 trip detection logic)	• Open in ETCS power source circuit • ETCS fuse • ECM

MONITOR DESCRIPTION

The ECM monitors the battery supply voltage applied to the throttle actuator.
When the power supply voltage (+BM) drops to below 4 V for 0.8 seconds or more, the ECM interprets this as an open in the power supply circuit (+BM). The ECM illuminates the MIL and sets the DTC.
If the malfunction is not repaired successfully, the DTC is set 5 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P2118: Throttle actuator power supply
Required Sensors/Components (Main)	Throttle actuator, throttle valve, ETCS fuse
Required Sensors/Components (Related)	None
Frequency of Operation	Continuous
Duration	0.8 seconds

MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Electronic throttle actuator power	ON
Battery voltage	8 V or more

TYPICAL MALFUNCTION THRESHOLDS

Electronic throttle actuator power supply voltage (+BM)	Less than 4 V

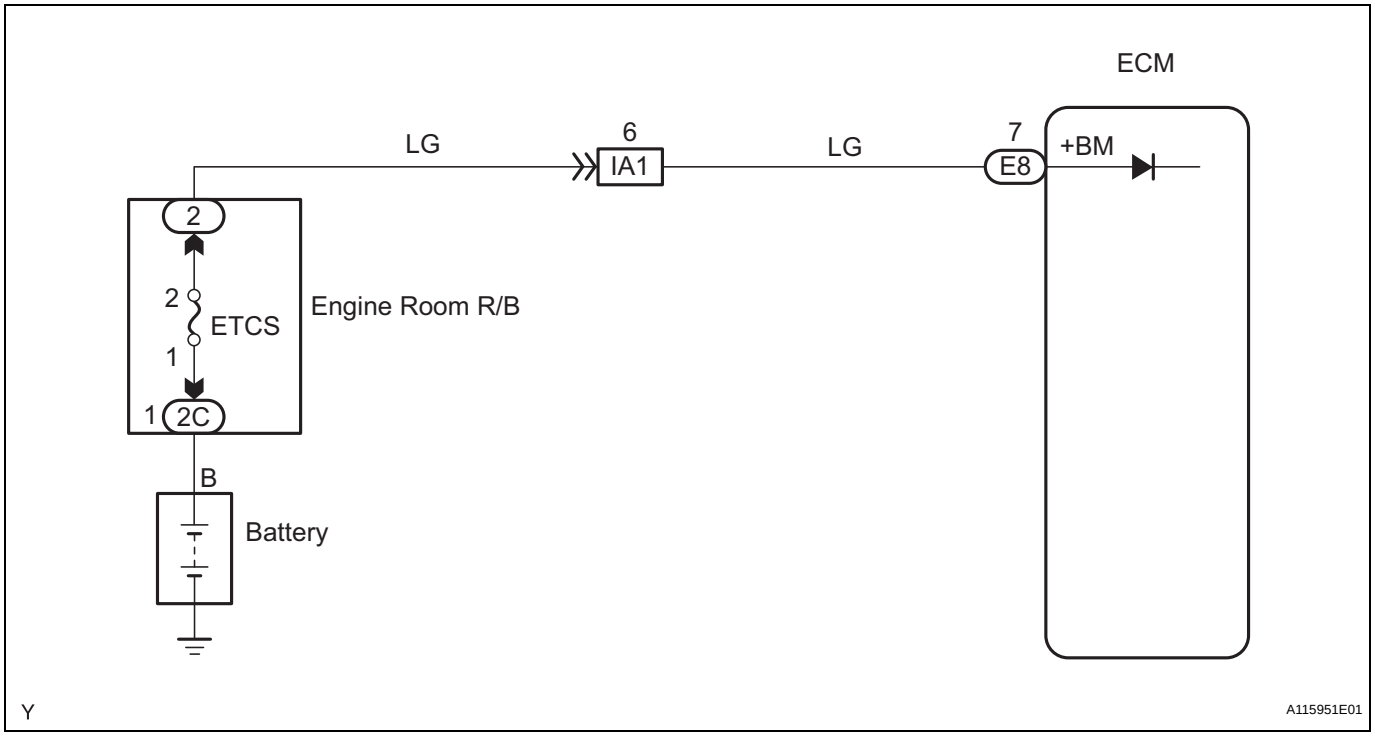
COMPONENT OPERATING RANGE

Throttle actuator power supply voltage	9 to 14 V

FAIL-SAFE

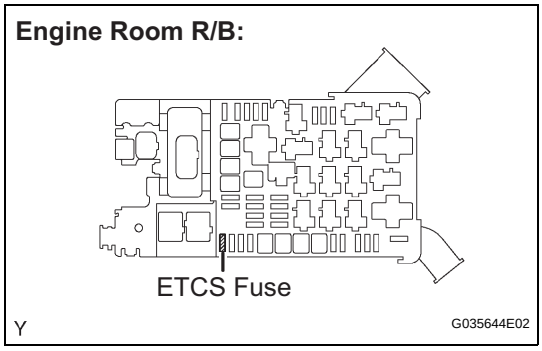
When this DTC, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

WIRING DIAGRAM



HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 CHECK FUSE (ETCS FUSE)

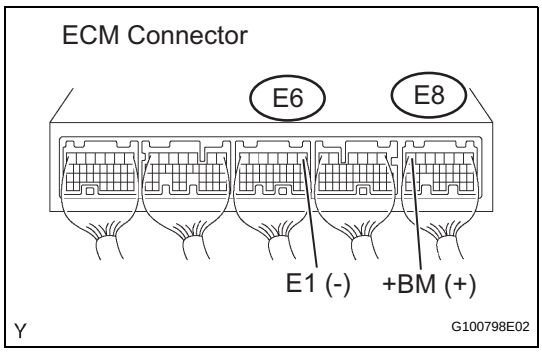


(a) Remove the ETCS fuse from the engine room R/B.
(b) Check the ETCS fuse resistance.
Standard resistance:
Below 1 Ω
(c) Reinstall the ETCS fuse.

NG → **CHECK FOR SHORT IN ALL HARNESS AND COMPONENTS CONNECTED TO FUSE**

OK

2 INSPECT ECM (+BM VOLTAGE)



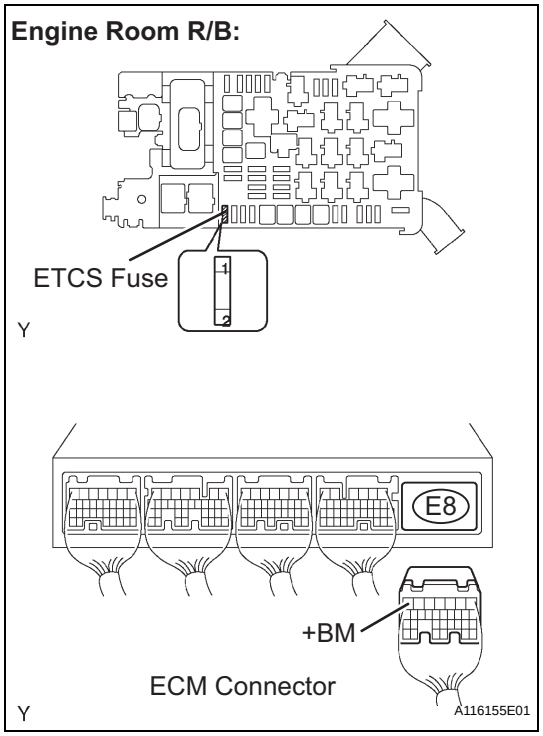
(a) Measure the voltage between the terminals of the E8 and E6 ECM connectors.
Standard Voltage

Tester Connections	Specified Conditions
+BM (E8-7) - E1 (E6-1)	9 to 14 V

OK → **CHECK FOR INTERMITTENT PROBLEMS**

NG

3	CHECK HARNESS AND CONNECTOR (ECM - ETCS FUSE, ETCS FUSE - BATTERY)



(a) Check the harness and connector between the ETCS fuse and ECM.
  (1) Remove the ETCS fuse from the engine room R/B.
  (2) Disconnect the E8 ECM connector.
  (3) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
ETCS fuse (2) - +BM (E8-7)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
ETCS fuse (2) or +BM (E8-7) - Body ground	10 kΩ or higher

  (4) Reinstall the ETCS fuse.
  (5) Reconnect the ECM connector.

(b) Check the harness and connector between the ETCS fuse and positive battery cable.
  (1) Remove the ETCS fuse from the engine room R/B.
  (2) Disconnect the positive battery cable.
  (3) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
Positive battery cable - ETCS fuse (1)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
Positive battery cable or ETCS fuse (1) - Body ground	10 kΩ or higher

  (4) Reinstall the ETCS fuse.
  (5) Reconnect the positive battery cable.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

ES

DTC	P2119	Throttle Actuator Control Throttle Body Range / Performance

SYSTEM DESCRIPTION

The Electronic Throttle Control System (ETCS) is composed of the throttle actuator, Throttle Position (TP) sensor, Accelerator Pedal Position (APP) sensor, and ECM. The ECM operates the throttle actuator to regulate the throttle valve in response to driver inputs. The TP sensor detects the opening angle of the throttle valve, and provides the ECM with feedback so that the throttle valve can be appropriately controlled by the ECM.

DTC No.	DTC Detection Conditions	Trouble Areas
P2119	Throttle valve opening angle continues to vary greatly from target opening angle (1 trip detection logic)	• ETCS • ECM

ES

MONITOR DESCRIPTION

The ECM determines the actual opening angle of the throttle valve from the TP sensor signal. The actual opening angle is compared to the target opening angle commanded by the ECM. If the difference between these two values is outside the standard range, the ECM interprets this as a malfunction in the ETCS. The ECM then illuminates the MIL and sets the DTC.
If the malfunction is not repaired successfully, the DTC is set when the accelerator pedal is quickly released (to close the throttle valve) after the engine speed reaches 5,000 rpm by the accelerator pedal being fully depressed (fully open the throttle valve).

MONITOR STRATEGY

Related DTCs	P2119: ETCS malfunction
Required Sensors/Components (Main)	Throttle actuator
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	1 second
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
System guard*	ON
*System guard set when following conditions met	-
Throttle motor	ON
Motor duty calculation	Executing
TPS fail determination	Fail determined
Motor current-cut operation	Not executing
Actuator power supply	4 V or more
Motor fail determination	Fail determined

TYPICAL MALFUNCTION THRESHOLDS

Either of following conditions A or B met	-
A. Commanded closed TP - current closed TP	0.3 V or more for 1 second
B. Commanded open TP - current open TP	0.3 V or more for 0.6 seconds

FAIL-SAFE

When this DTC, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

WIRING DIAGRAM

Refer to DTC P2102 (See page ES-280).

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

ES

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2119)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P2119	A
P2119 and other DTCs	B

HINT:
If any DTCs other than P2119 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	CHECK WHETHER DTC OUTPUT RECURS (DTC P2119)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (See page ES-38).
(e) Allow the engine to idle for 15 seconds.
CAUTION:
Exercise extreme care and take precautions at steps (f) and (g) below. Failure to do so may result in the vehicle unexpectedly rolling away.
(f) Securely apply the parking brake and move the gear selector lever to the D position.

(g) While depressing the brake pedal securely, fully depress the accelerator pedal for 5 seconds.
(h) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(i) Read DTCs.
HINT:
The voltage output of the throttle position sensor can be checked during step (g) using an intelligent tester. Variations in the voltage output indicate that the throttle actuator is in operation. To check the voltage output using an intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / THROTTLE POS #1.
OK:
No DTC output.

NG → **REPLACE THROTTLE W/MOTOR BODY ASSEMBLY**

OK

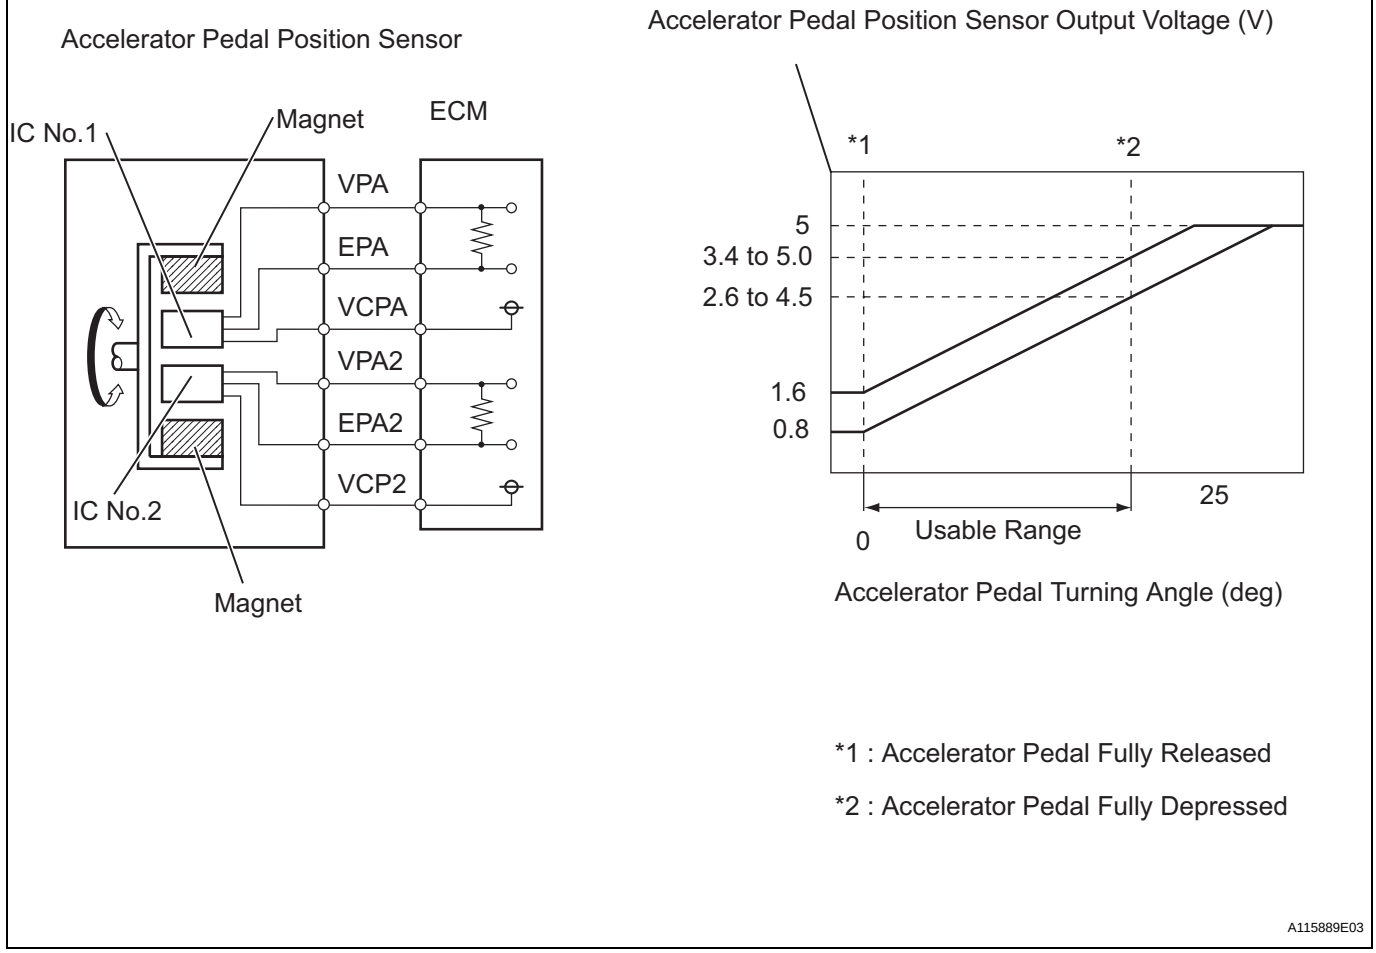
NORMAL

DTC	P2120	Throttle / Pedal Position Sensor / Switch "D" Circuit
DTC	P2122	Throttle / Pedal Position Sensor / Switch "D" Circuit Low Input
DTC	P2123	Throttle / Pedal Position Sensor / Switch "D" Circuit High Input
DTC	P2125	Throttle / Pedal Position Sensor / Switch "E" Circuit
DTC	P2127	Throttle / Pedal Position Sensor / Switch "E" Circuit Low Input
DTC	P2128	Throttle / Pedal Position Sensor / Switch "E" Circuit High Input
DTC	P2138	Throttle / Pedal Position Sensor / Switch "D" / "E" Voltage Correlation

HINT:
These DTCs relate to the Accelerator Pedal Position (APP) sensor.

DESCRIPTION

HINT:
This ETCS (Electronic Throttle Control System) does not use a throttle cable.
The Accelerator Pedal Position (APP) sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type, and uses Hall-effect elements, in order to yield accurate signals, even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0 V and 5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.
The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.



DTC No.	DTC Detection Conditions	Trouble Areas
P2120	VPA fluctuates rapidly beyond upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic)	• Accelerator Pedal Position (APP) sensor • ECM
P2122	VPA 0.4 V or less for 0.5 seconds or more when accelerator pedal fully released (1 trip detection logic)	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA 4.8 V or more for 2.0 seconds or more (1 trip detection logic)	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic)	• APP sensor • ECM
P2127	VPA2 1.2 V or less for 0.5 seconds or more when accelerator pedal fully released (1 trip detection logic)	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic) (a) VPA2 4.8 V or more (b) VPA between 0.4 V and 3.45 V	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic) (a) Difference between VPA and VPA2 0.02 V or less (b) VPA 0.4 V or less and VPA2 1.2 V or less	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:
When any of these DTCs are set, check the APP sensor voltage by selecting the following menu items on an intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / ACCEL POS #1 and ACCEL POS #2.

Trouble Areas	ACCEL POS #1 When AP Released	ACCEL POS #2 When AP Released	ACCEL POS #1 When AP Depressed	ACCEL POS #2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:
- Accelerator pedal positions are expressed as voltages.
- AP denotes for Accelerator Pedal.

ES

MONITOR DESCRIPTION

When either of the output voltages of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and sets a DTC.
Example:
When the output voltage of VPA drops to below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is set.
If the malfunction is not repaired successfully, a DTC is set 2 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P2120: Accelerator Pedal Position (APP) sensor 1 range check (fluctuating) P2122: APP sensor 1 range check (low voltage) P2123: APP sensor 1 range check (high voltage) P2125: APP sensor 2 range check (fluctuating) P2127: APP sensor 2 range check (low voltage) P2128: APP sensor 2 range check (high voltage) P2138: APP sensor range check (correlation)
Required Sensors/Components (Main)	APP sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds: P2120, P2122, P2125 and P2127 2.0 seconds: P2123, P2128 and P2138
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Ignition switch	ON
Electronic throttle actuator power	ON

TYPICAL MALFUNCTION THRESHOLDS

P2120:

Either of the following conditions is met:	Condition 1 or 2
1. VPA1 voltage when VPA2 voltage is V or more	0.4 V or less
2. VPA1 voltage	4.8 V or more

P2122:

VPA1 voltage when VPA2 voltage is 0.04 V or more	0.4 V or less

P2123:

VPA1 voltage	4.8 V or more

P2125:

Either of the following conditions is met:	Condition 1 or2
1. VPA2 voltage when VPA1 is 0.04 V or more	1.2 V or less
2. VPA2 voltage when VPA1 is 0.4 to 3.45 V	4.8 V or more

P2127:

VPA2 voltage when VPA1 0.04 V or more	1.2 V or less

P2128:

VPA2 voltage when VPA1 0.4 to 3.45 V	4.8 V or more

P2138:

Either of following conditions A or B met:	-
Condition A	-
Difference between VPA1 and VPA 2 voltages	0.02 V or less
Condition B	-
VPA1 voltage	0.4 V or less
VPA2 voltage	1.2 V or less

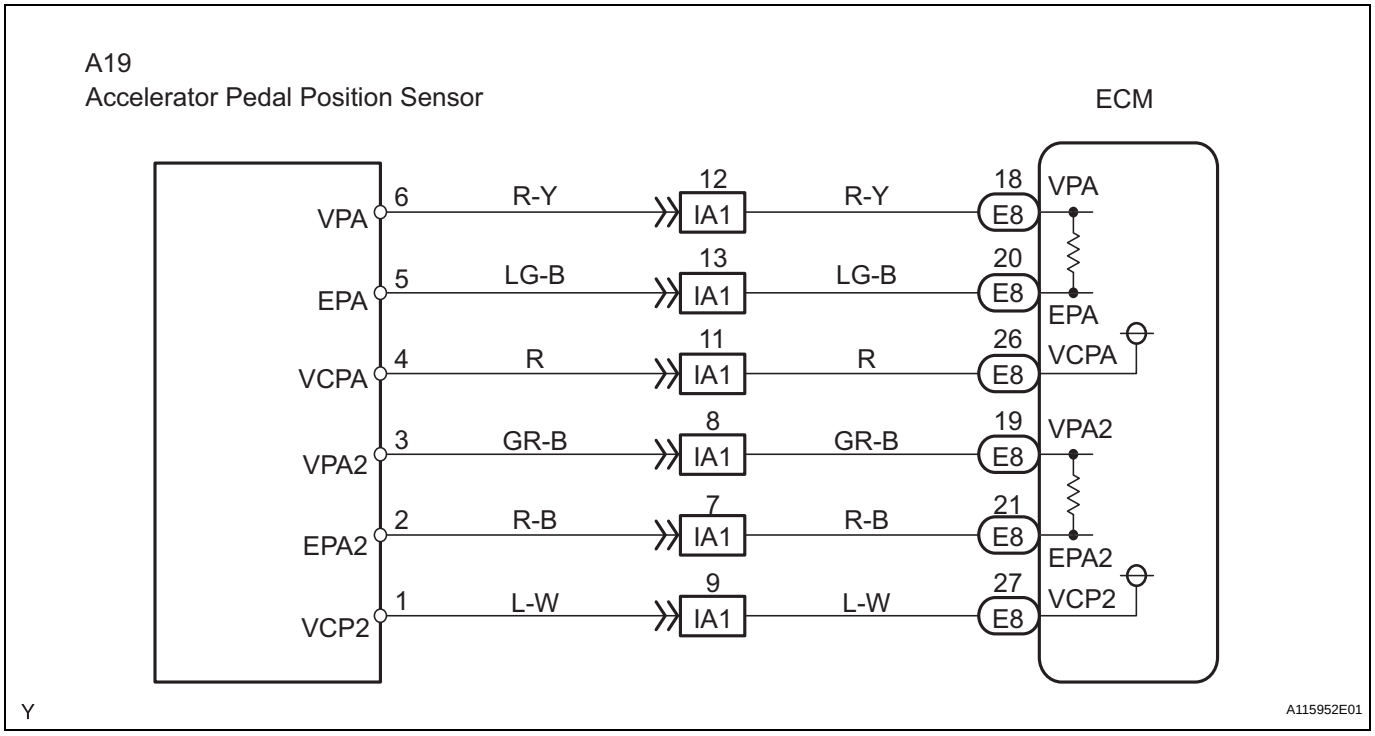
COMPONENT OPERATING RANGE

VPA1 voltage	0.4 V to 4.8 V
VPA2 voltage	1.2 V to 4.8 V

FAIL-SAFE

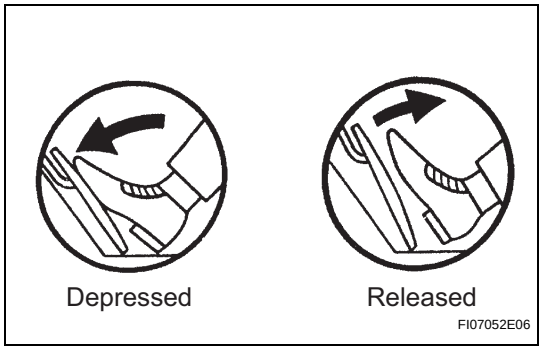
When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are set, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is turned OFF.

WIRING DIAGRAM



HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	READ VALUE OF INTELLIGENT TESTER (ACCEL POS #1 AND ACCEL POS #2)



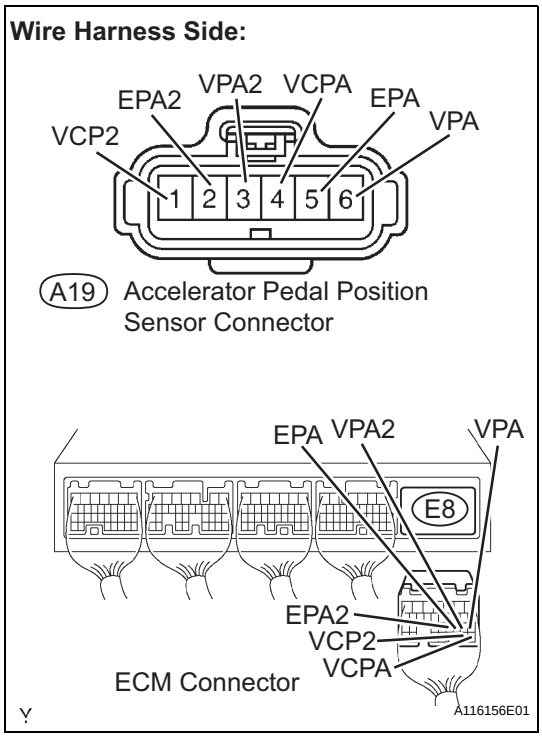
(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / ACCEL POS #1 and ACCEL POS #2.
(d) Read the value displayed on the tester.
Standard Voltage

Accelerator Pedal Operations	ACCEL POS #1 (AP#1)	ACCEL POS #2 (AP#2)
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

OK → **Go to step 5**

NG

2	CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)



(a) Disconnect the A19 Accelerator Pedal Position (APP) sensor connector.
(b) Disconnect the E8 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
VPA (A19-6) - VPA (E8-18)	Below 1 Ω
EPA (A19-5) - EPA (E8-20)	
VCPA (A19-4) - VCPA (E8-26)

REPLACE ECM

DTC	P2121	Throttle / Pedal Position Sensor / Switch "D" Circuit Range / Performance

HINT:
This DTC relates to the Accelerator Pedal Position (APP) sensor.

DESCRIPTION

Refer to DTC P2120 (See page ES-293).

DTC No.	DTC Detection Conditions	Trouble Areas
P2121	Difference between VPA and VPA2 less than 0.4 V, or more than 1.2 V for 0.5 seconds (1 trip detection logic)	• Accelerator position sensor • ECM

ES

MONITOR DESCRIPTION

The accelerator pedal position sensor is mounted on the accelerator pedal bracket. The accelerator pedal position sensor has 2 sensor elements and 2 signal outputs: VPA and VPA2. VPA is used to detect the actual accelerator pedal angle (used for engine control) and VPA2 is used to detect malfunctions in VPA. When the difference between the voltage outputs of VPA and VPA2 deviates from the standard, the ECM determines that the accelerator pedal position sensor is a malfunctioning. The ECM turns on the MIL and the DTC is set.

MONITOR STRATEGY

Related DTCs	P2121: Accelerator pedal position (APP) sensor rationality
Required Sensors/Components (Main)	APP sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Either of following conditions 1 or 2 met:	-
1. Ignition switch	ON
2. Throttle actuator power	ON

TYPICAL MALFUNCTION THRESHOLDS

Difference between VPA voltage (learned value) and VPA2 voltage (learned value)	Less than 0.4 V, or more than 1.2 V

FAIL-SAFE

The accelerator pedal position sensor has two (main and sub) sensor circuits. If a malfunction occurs in either of the sensor circuits, the ECM detects the abnormal signal voltage difference between the two sensor circuits and switches to limp mode. In limp mode, the functioning circuit is used to calculate the accelerator pedal opening angle to allow the vehicle to continue driving. If both circuits malfunction, the ECM regards the opening angle of the accelerator pedal as being fully closed. In this case, the throttle valve remains closed as if the engine is idling.
If a pass condition is detected and then the ignition switch is turned OFF, the fail-safe operation stops and the system returns to a normal condition.

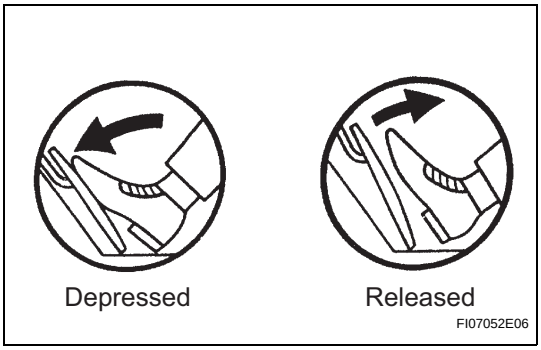
WIRING DIAGRAM

Refer to DTC P2120 (See page ES-297).

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	READ VALUE OF INTELLIGENT TESTER (ACCEL POS #1 AND ACCEL POS #2)

ES



(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / ACCEL POS #1 and ACCEL POS #2.
(d) Read the values displayed on the tester.

Standard Voltage

Accelerator Pedal Operations	ACCEL POS #1 (AP#1)	ACCEL POS #2 (AP#2)
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

OK → Go to step 3

DTC	P2197	Oxygen (A/F) Sensor Signal Stuck Lean (Bank 2 Sensor 1)
DTC	P2198	Oxygen (A/F) Sensor Signal Stuck Rich (Bank 2 Sensor 1)

ES

HINT:
- Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

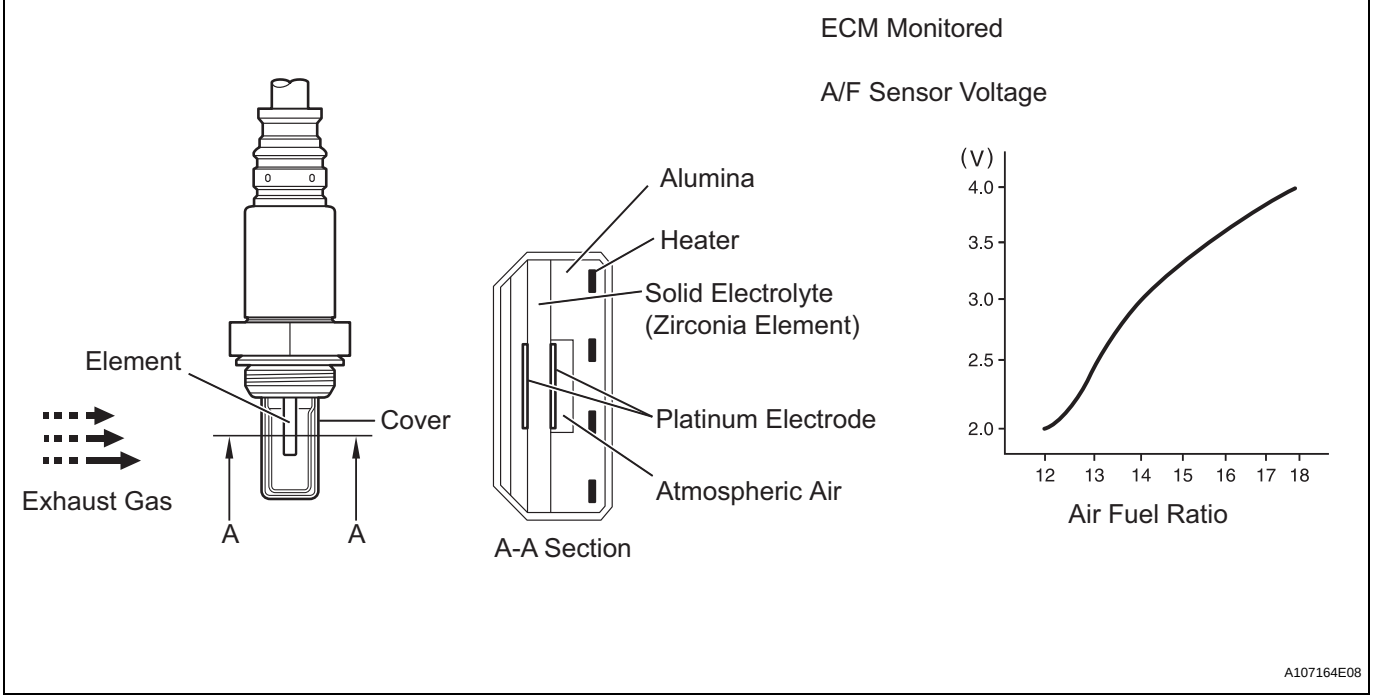
DESCRIPTION

The A/F sensor generates a voltage* that corresponds to the actual air-fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air-fuel ratio. The ECM determines the deviation from the stoichiometric air-fuel ratio level, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air-fuel ratio accurately.

The A/F sensor is the planar type and is integrated with the heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor, in order to facilitate accurate oxygen concentration detection. In addition, the sensor and heater portions are narrower than the conventional type. The heat generated by the heater is conducted to the solid electrolyte though the alumina, therefore the sensor activation is accelerated.

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.

*: Value changes inside the ECM. Since the A/F sensor is the current output element, a current is converted in to a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.



DTC No.	DTC Detection Conditions	Trouble Areas
P2195 P2197	Conditions (a) and (b) continue for 10 seconds or more (2 trip detection logic) (a) Air-Fuel Ratio (A/F) sensor voltage more than 3.8 V (b) Heated Oxygen (HO2) sensor voltage 0.15 V or more	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor (bank 1, 2 sensor 1) heater • A/F sensor heater relay • A/F sensor heater and relay circuits • Air induction system • Fuel pressure • Injector • ECM
P2195 P2197	While fuel-cut operation performed (during vehicle deceleration), air-furl ratio (A/F) sensor current 3.6 mA or more for 3 seconds (2 trip detection logic)	• A/F sensor • ECM
P2196 P2198	Conditions (a) and (b) continue for 10 seconds or more (2 trip detection logic) (a) A/F sensor voltage less than 2.8 V (b) HO2 sensor voltage less than 0.6 V	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor (bank 1, 2 sensor 1) heater • A/F sensor heater relay • A/F sensor heater and relay circuits • Air induction system • Fuel pressure • Injector • ECM
P2196 P2198	While fuel-cut operation performed (during vehicle deceleration), air-furl ratio (A/F) sensor current less than 1.57 mA for 3 seconds (2 trip detection logic)	• A/F sensor • ECM

HINT:

- DTCs P2195 and P2196 indicate malfunctions related to bank 1 A/F sensor circuit.
- DTCs P2197 and P2198 indicate malfunctions related to bank 2 A/F sensor circuit.
- Bank 1 refers to the bank that includes cylinder No. 1.
- Bank 2 refers to the bank that includes cylinder No. 2.
- When any of these DTCs are set, check the A/F sensor voltage output by selecting the following menu items on an intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / AFS B1S1 or AFS B2S1.
- Short-term fuel trim values can also be read using an intelligent tester.

ES

- The ECM regulates the voltages at the A1A+, A2A+, A1A- and A2A- terminals of the ECM to a constant level. Therefore, the A/F sensor voltage output cannot be confirmed without using an intelligent tester.
- If a A/F sensor malfunction is detected, the ECM sets a DTC.

MONITOR DESCRIPTION

Sensor voltage detection monitor

Under the air-fuel ratio feedback control, if the A/F sensor voltage output indicates rich or lean for a certain period of time, the ECM determines that there is a malfunction in the A/F sensor. The ECM illuminates the MIL and sets a DTC.

Example:

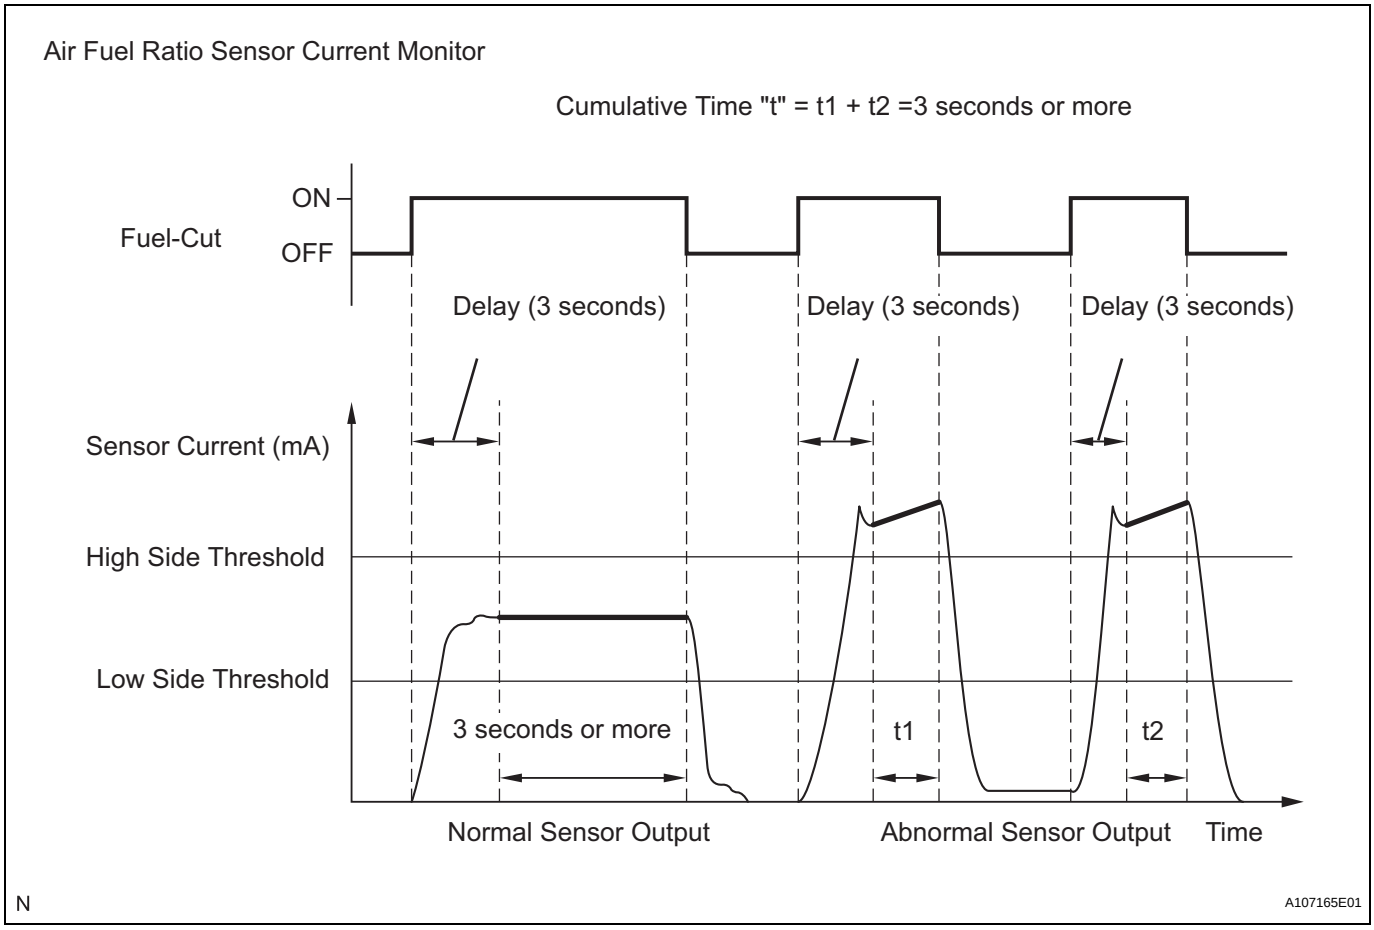
If the A/F sensor voltage output is less than 2.8 V (very rich condition) for 10 seconds, despite the HO2 sensor voltage output being less than 0.6 V, the ECM sets DTC P2196. Alternatively, if the A/F sensor voltage output is more than 3.8 V (very lean condition) for 10 seconds, despite the HO2 sensor voltage output being 0.15 V or more, DTC P2195 is set.

ES

Sensor current detection monitor

A rich air-fuel mixture causes a low A/F sensor current, and a lean air-fuel mixture causes a high A/F sensor current. Therefore, the sensor output becomes low during acceleration, and it becomes high during deceleration with the throttle valve fully closed. The ECM monitors the A/F sensor current during fuel-cut and detects any abnormal current values.

If the A/F sensor output is 3.6 mA or more for more than 3 seconds of cumulative time, the ECM interprets this as a malfunction in the A/F sensor and sets DTC P2195 (high-side stuck). If the A/F sensor output is 1.57 mA or less for more than 3 seconds of cumulative time, the ECM sets DTC P2196 (low-side stuck).



MONITOR STRATEGY

Related DTCs	P2195: A/F sensor (Bank 1) signal stuck lean P2196: A/F sensor (Bank 1) signal stuck rich P2197: A/F sensor (Bank 2) signal stuck lean P2198: A/F sensor (Bank 2) signal stuck rich
Required Sensors/Components (Main)	A/F sensor
Required Sensors/Components (Related)	HO2 sensor
Frequency of Operation	Continuous
Duration	10 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

ALL

The monitor will run whenever these DTCs are not present	P0031, P0032, P0051, P0052 (A/F sensor heater - Sensor 1) P0037, P0038, P0057, P0058 (O2 Sensor heater - Sensor 2) P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for closed loop) P0136, P0156 (O2 Sensor - Sensor 2) P0171, P0172 (Fuel system) P0300 - P0306 (Misfire) P0335 (CKP sensor) P0340, P0341 (CMP sensor) P0500 (VSS)

Sensor voltage detection monitor (Lean side malfunction P2195, P2197):

Time while all of following conditions met	2 seconds or more
Rear HO2 sensor voltage	0.15 V or more
Time after engine start	30 seconds or more
A/F sensor status	Activated
Fuel system status	Closed-loop
Engine	Running

Sensor voltage detection monitor (Rich side malfunction P2196, P2198):

Time while all of following conditions met	2 seconds or more
Rear HO2 sensor voltage	Below 0.6 V
Time after engine start	30 seconds or more
A/F sensor status	Activated
Fuel system status	Closed-loop
Engine	Running

Sensor Current detection monitor (P2195, P2196, P2197 P2198):

Battery voltage	11 V or more
Atmospheric pressure	570 mmHg or higher
Air-fuel ratio sensor status	Activated
Pass/Malfunction determination in this driving cycle	Not determined
Engine coolant temperature	75°C (167°F) or more
Continuous time of fuel cut	3 to 10 seconds

TYPICAL MALFUNCTION THRESHOLDS

Sensor voltage detection monitor (Lean side malfunction P2195, P2197):

A/F sensor voltage	More than 3.8 V

Sensor voltage detection monitor (Rich side malfunction P2196, P2198):

A/F sensor voltage	Less than 2.8 V

Sensor current detection monitor (High side malfunction P2195, P2197):

Following condition met for:	3 seconds or more
Air-fuel ratio sensor current during fuel cut	3.6 mA or more

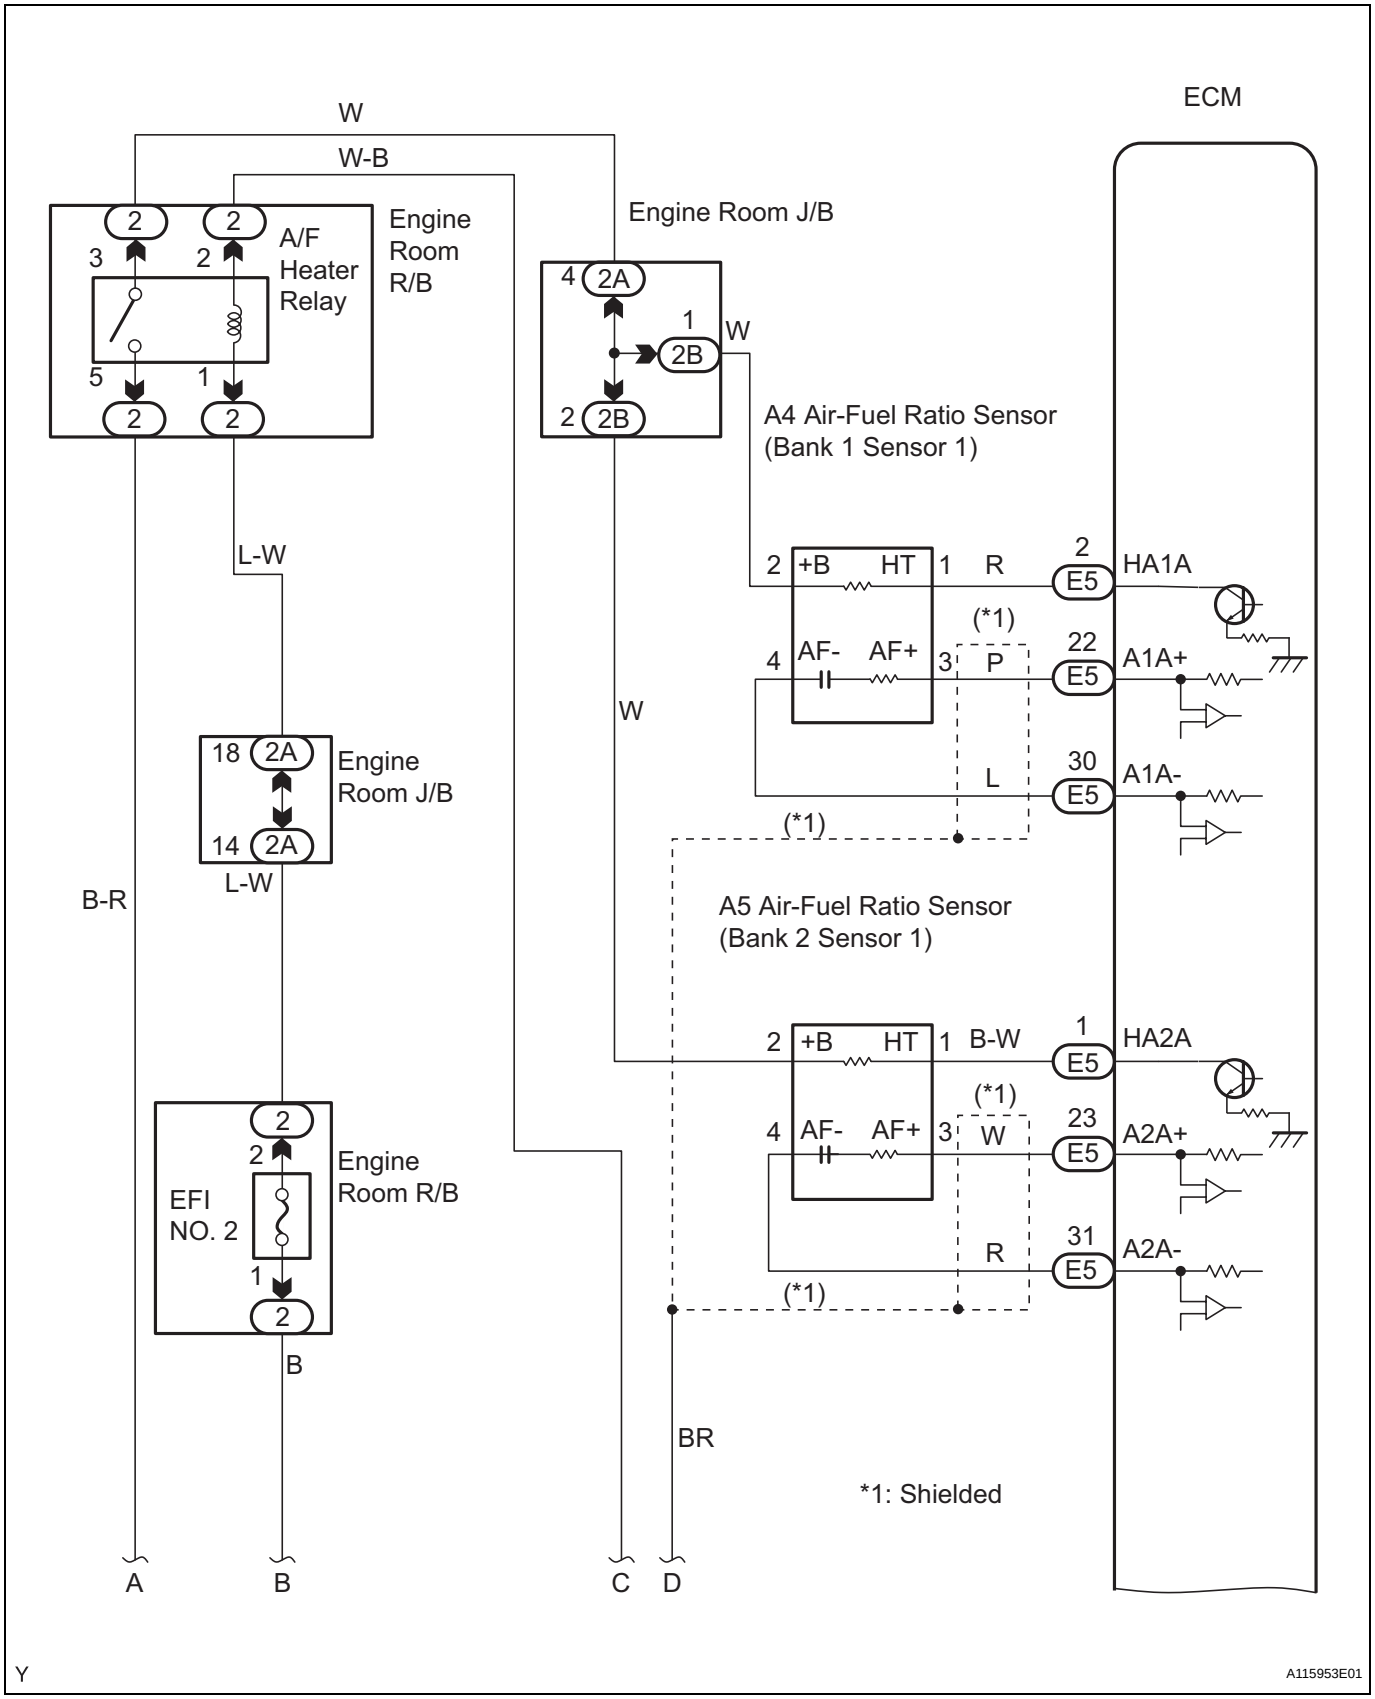
Sensor current detection monitor (Rich side malfunction P2196, P2198):

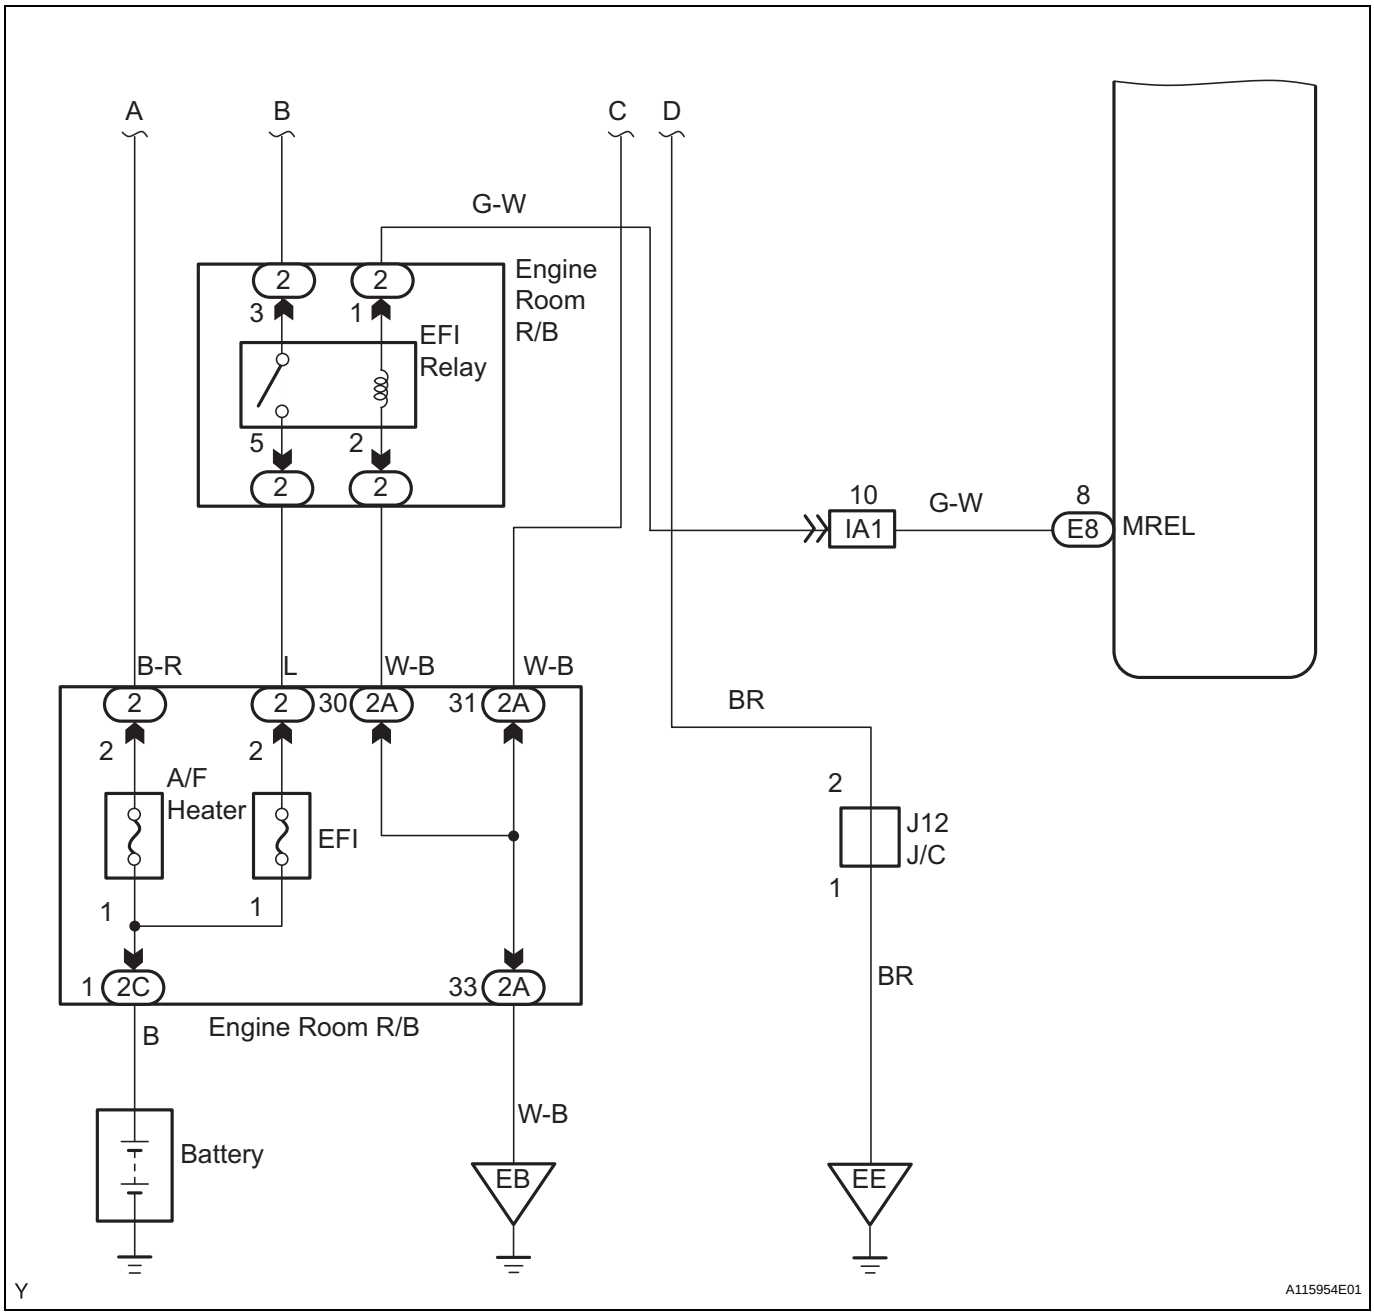
Following condition met for:	3 seconds or more
Air-fuel ratio sensor current during fuel cut	Less than 1.57 mA

MONITOR RESULT

Detailed information on Checking Monitor Status (See page ES-19).

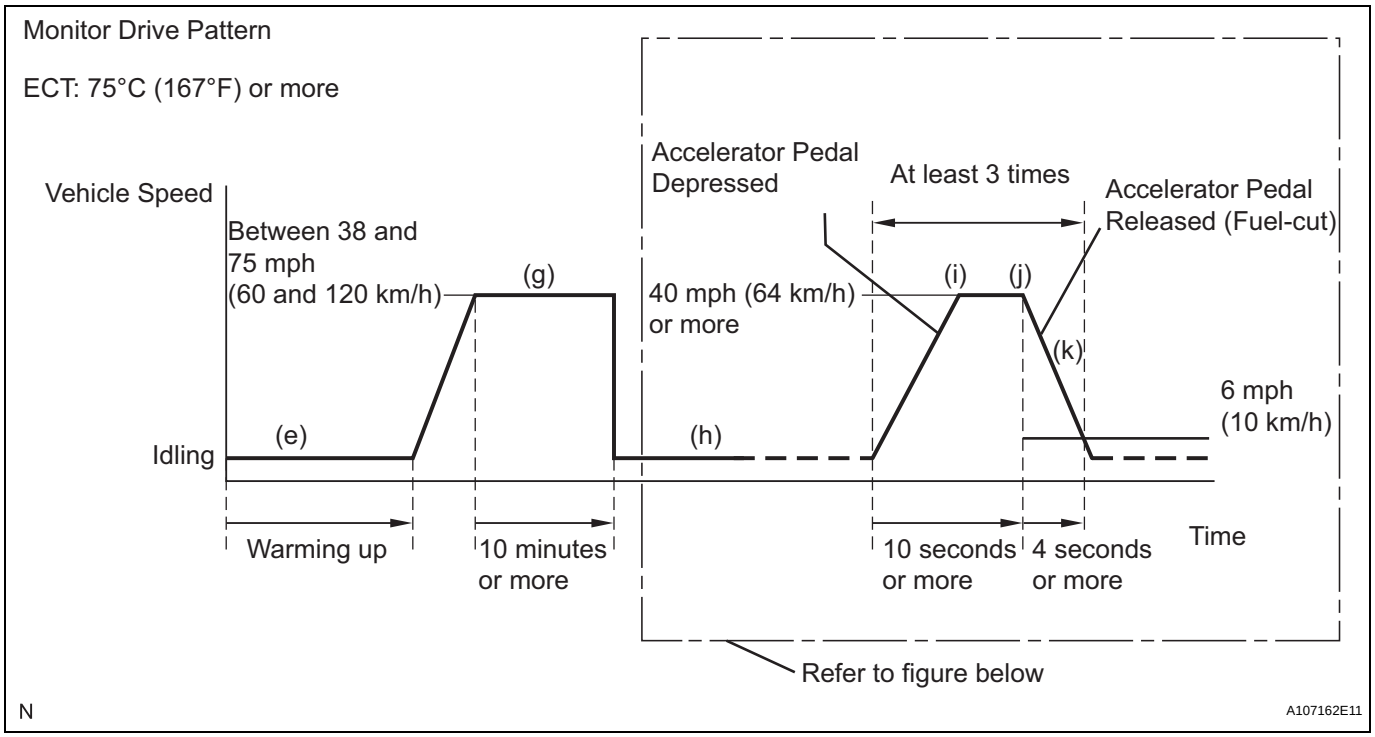
WIRING DIAGRAM

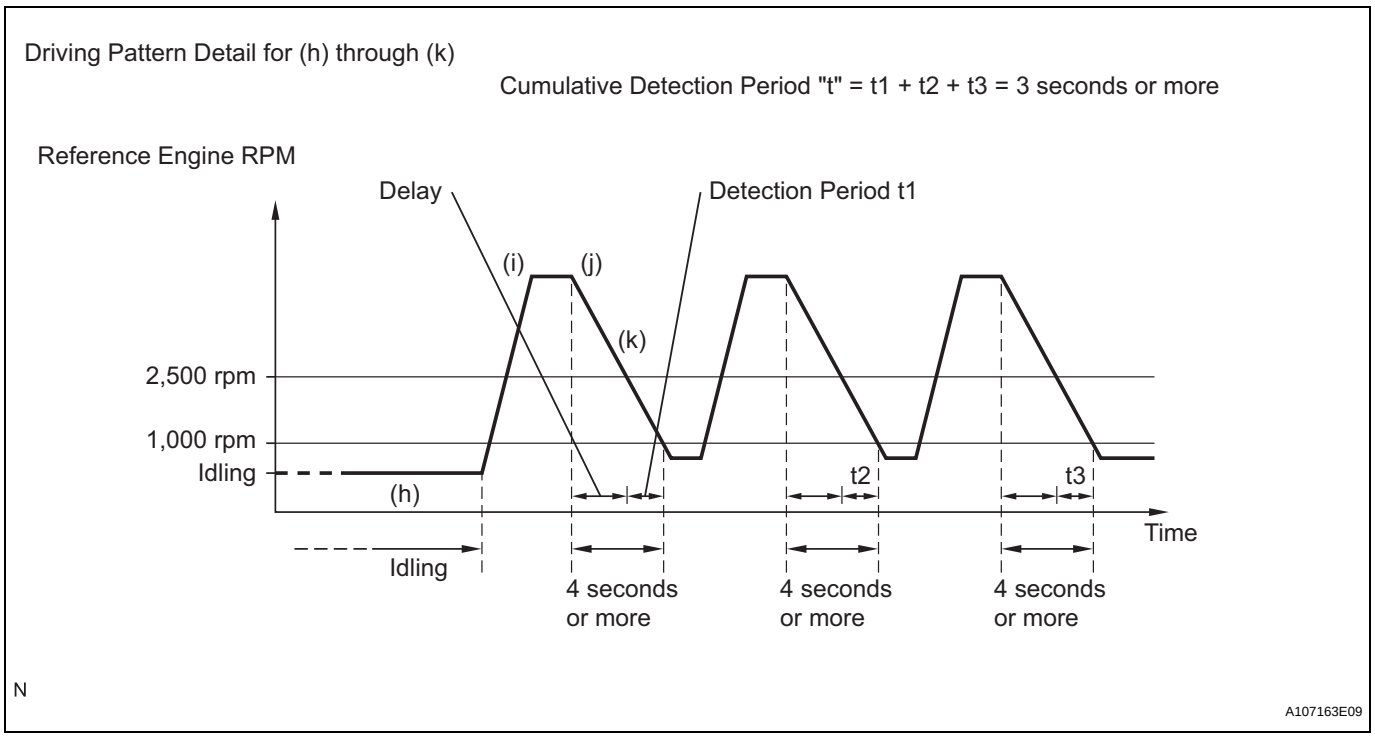




CONFIRMATION DRIVING PATTERN

This confirmation driving pattern is used in the "PERFORM CONFIRMATION DRIVING PATTERN" procedure of the following diagnostic troubleshooting procedure.





(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (See page ES-38).
(e) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
(f) Select the following menu items to check the fuel-cut status: DIAGNOSIS / ENHANCED OBD II / DATA LIST / USER DATA / FC IDLE.
(g) Drive the vehicle at between 38 mph (60 km/h) and 75 mph (120 km/h) for at least 10 minutes.
(h) Change the transmission to 2nd gear.

(i) Drive the vehicle at proper vehicle speed to perform fuel-cut operation (refer to the following HINT).
HINT:
Fuel-cut is performed when the following conditions are met:
- Accelerator pedal fully released.
- Engine speed is 2,500 rpm or more (fuel injection returns at 1,000 rpm).

(j) Accelerate the vehicle to 40 mph (64 km/h) or more by depressing the accelerator pedal for at least 10 seconds.
(k) Soon after performing step (j) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal, in order to execute fuel-cut control.
(l) Allow the vehicle to decelerate until the vehicle speed declines to less than 6 mph (10 km/h).
(m) Repeat steps from (h) through (k) above at least 3 times in one driving cycle.
HINT:
Completion of all A/F sensor monitors is required to change the value in TEST RESULT.

ES

CAUTION:
Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.

HINT:
Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using an intelligent tester.
(1) Connect an intelligent tester to the DLC3.
(2) Start the engine and turn the tester ON.
(3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(4) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(6) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2) displayed on the tester.
HINT:
- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 or AFS B2S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 or AFS B2S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 or O2S B2S2 (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 or O2S B2S2 (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:
The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		-
	Output voltage More than 3.35 V Less than 3.0 V		Output voltage More than 0.55 V Less than 0.4 V		
2	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output voltage Almost no reaction		Output voltage More than 0.55 V Less than 0.4 V		
3	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output voltage More than 3.35 V Less than 3.0 V		Output voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output voltage Almost no reaction		Output voltage Almost no reaction		

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2, and press the YES button and then the ENTER button followed by the F4 button.

HINT:

- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P2195, P2196, P2197 OR P2198)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

ES

Result

Display (DTC Output)	Proceed To
P2195, P2196, P2197 or P2198	A
P2195, P2196, P2197 or P2198 and other DTCs	B

HINT:
If any DTCs other than P2195, P2196, P2197 or P2198 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

A

ES

2 READ VALUE OF INTELLIGENT TESTER (TEST VALUE OF A/F SENSOR)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (See page ES-38).
(d) Allow the vehicle to drive in accordance with the drive pattern described in the CONFIRMATION DRIVING PATTERN.
(e) Select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / MONITOR STATUS.
(f) Check that the status of O2S MON is COMPL.
If the status is still INCMPL, drive the vehicle according to the driving pattern again.
HINT:
- AVAIL indicates that the component has not been monitored yet.
- COMPL indicates that the component is functioning normally.
- INCMPL indicates that the component is malfunctioning.

(g) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / TEST RESULT / RANGE B1S1, then press the ENTER button.
(h) Check the test value of the A/F sensor output current during fuel-cut.

Result

Test Value	Proceed To
Within normal range (1.57 mA or more, and less than 3.6 mA)	A
Outside normal range (Less than 1.57 mA, or 3.6 mA or more)	B

B → **Go to step 20**

A

3 READ VALUE OF INTELLIGENT TESTER (OUTPUT VOLTAGE OF A/F SENSOR)

(a) Connect an intelligent tester to the DLC3.
(b) Start the engine.
(c) Turn the tester ON.

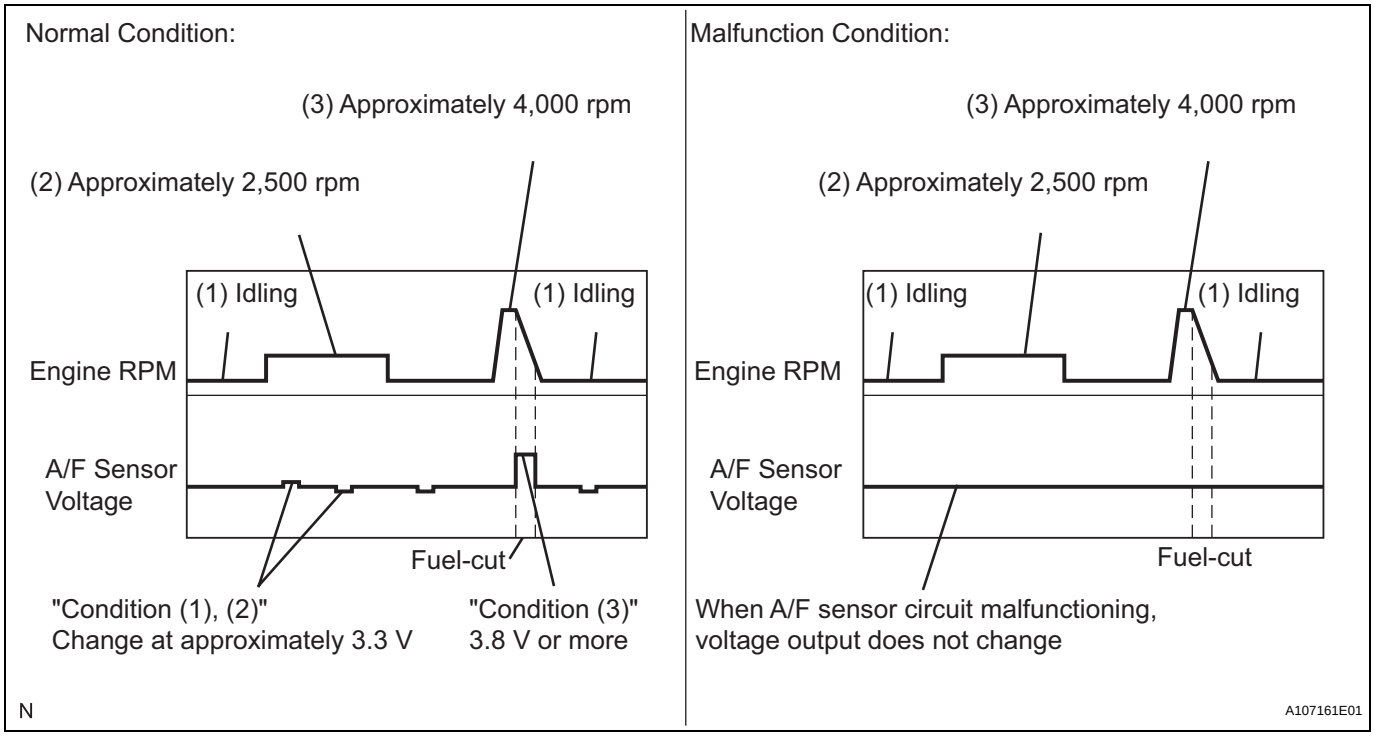
(d) Warm up the Air-Fuel Ratio (A/F) sensor at an engine speed of 2,500 rpm for 90 seconds.
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SNAPSHOT / MANUAL SNAPSHOT / USER DATA / AFS B1S1 or AFS B2S1 and ENGINE SPD.
(f) Check the A/F sensor voltage three times, when the engine is in each of the following conditions:
  (1) While idling (check for at least 30 seconds)
  (2) At an engine speed of approximately 2,500 rpm (without any sudden changes in engine speed)
  (3) Raise the engine speed to 4,000 rpm and then quickly release the accelerator pedal so that the throttle valve is fully closed.

ES

Standard

Conditions	A/F Sensor Voltage Variations	Reference
(1) and (2)	Changes at approximately 3.3 V	Between 3.1 V and 3.5 V
(3)	Increases to 3.8 V or more	This occurs during engine deceleration (when fuel-cut performed)

HINT:
For more information, see the diagrams below.



HINT:
- If the output voltage of the A/F sensor remains at approximately 3.3 V (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have an open circuit. (This will also happen if the A/F sensor heater has an open circuit.)
- If the output voltage of the A/F sensor remains at either approximately 3.8 V or more, or 2.8 V or less (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have a short circuit.

- The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and results in a momentary increase in the A/F sensor output voltage.
- The ECM must establish a closed throttle valve position learning value to perform fuel cut. If the battery terminal has been reconnected, the vehicle must be driven over 10 mph (16 km/h) to allow the ECM to learn the closed throttle valve position.
- When the vehicle is driven:
  The output voltage of the A/F sensor may be below 2.8 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The A/F sensor is functioning normally.
- The A/F sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the A/F sensor or ECM will show a constant voltage result.

NG → **Go to step 10**

OK

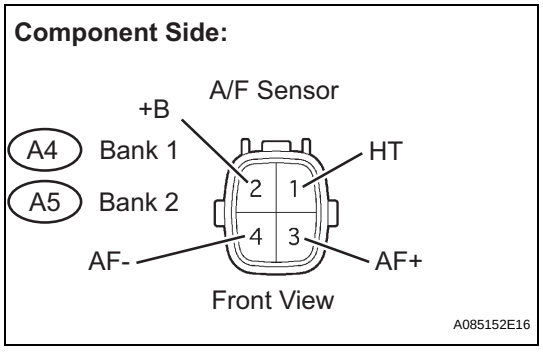
DTC CAUSED BY RUNNING OUT OF FUEL

10	INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

Component Side:



(a) Disconnect the A4 or A5 A/F sensor connector.
(b) Measure the resistance between the terminals of the A/F sensor connector.

Standard Resistance

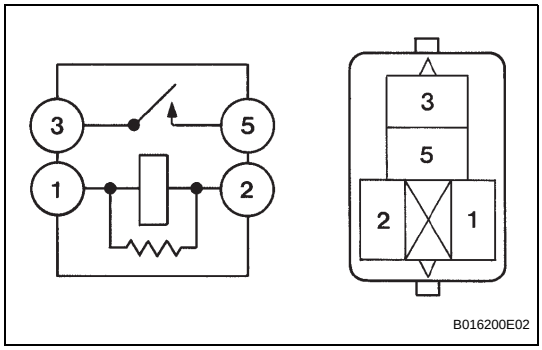
Tester Connections	Specified Conditions
HT (1) - +B (2)	1.8 to 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 kΩ or higher

(c) Reconnect the A/F sensor connector.

NG → **REPLACE AIR FUEL RATIO SENSOR**

OK

11 INSPECT AIR FUEL RATIO SENSOR HEATER RELAY



(a) Remove the A/F sensor heater relay from the engine room R/B.
(b) Check the A/F sensor heater relay resistance.

Standard Resistance

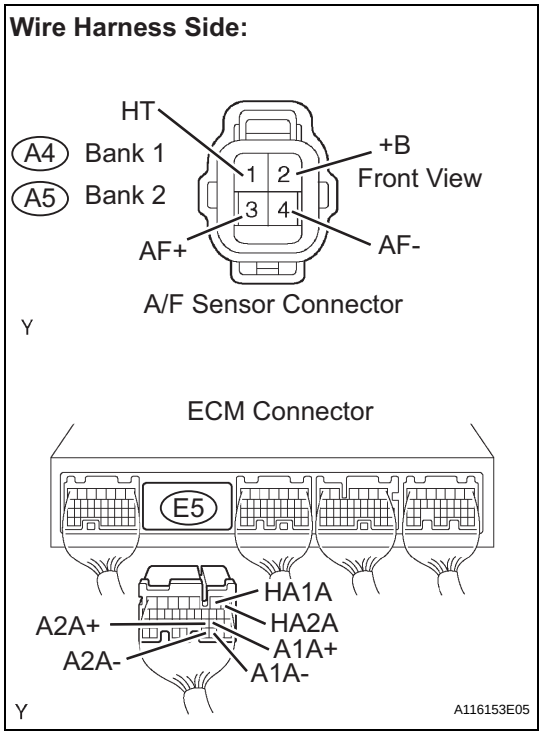
Tester Connections	Specified Conditions
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the A/F sensor heater relay.

NG → **REPLACE AIR FUEL RATIO SENSOR HEATER RELAY**

OK

12 CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)



(a) Disconnect the A4 or A5 A/F sensor connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the +B terminal of the A/F sensor connector and body ground.

Standard Voltage

Tester Connections	Specified Conditions
+B (A4-2) - Body ground	9 to 14 V
+B (A5-2) - Body ground	

(d) Turn the ignition switch OFF.
(e) Disconnect the E5 ECM connector.
(f) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
HT (A4-1) - HA1A (E5-2)	Below 1 Ω
AF+ (A4-3) - A1A+ (E5-22)	
AF- (A4-4) - A1A- (E5-30)	
HT (A5-1) - HA2A (E5-1)	
AF+ (A5-3) - A2A+ (E5-23)	
AF- (A5-4) - A2A- (E5-31)	

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
HT (A4-1) or HA1A (E5-2) - Body ground	10 kΩ or higher
AF+ (A4-3) or A1A+ (E5-22) - Body ground	
AF- (A4-4) or A1A- (E5-30) - Body ground	
HT (A5-1) or HA2A (E5-1) - Body ground	
AF+ (A5-3) or A2A+ (E5-23) - Body ground	
AF- (A5-4) or A2A- (E5-31) - Body ground	

(g) Reconnect the ECM connector.
(h) Reconnect the A/F sensor connector.

DTC	P2256	Oxygen (A/F) Sensor Reference Ground Circuit High (Bank 2 Sensor 1)

HINT:
- Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

DESCRIPTION

Refer to DTC P2195 (See page ES-304).

DTC No.	DTC Detection Conditions	Trouble Areas
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (2 trip detection logic) (a) AF+ voltage 0.5 V or less (b) (AF+) - (AF-) = 0.1 V or less • Case 2: A/F sensor admittance: Less than 0.022 1/Ω (2 trip detection logic)	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor heater • A/F sensor heater relay • A/F sensor heater and relay circuits • ECM
P2239 P2242	AF+ voltage more than 4.5 V for 5.0 seconds or more (2 trip detection logic)	
P2252 P2255	AF- voltage 0.5 V or less for 5.0 seconds or more (2 trip detection logic)	
P2253 P2256	AF- voltage more than 4.5 V for 5.0 seconds or more (2 trip detection logic)	

HINT:
- DTC P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.

- DTC P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.
- Bank 1 refers to the bank that includes cylinder No. 1.
- Bank 2 refers to the bank that includes cylinder No. 2.

MONITOR DESCRIPTION

The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or voltage output deviates greatly from the standard range, the ECM determines that there is an open or short malfunction in the A/F sensor circuit.

MONITOR STRATEGY

Related DTCs	P2238: A/F sensor (Bank 1) open circuit between AF+ and AF- P2238: A/F sensor (Bank 1) short circuit between AF+ and AF- P2238: A/F sensor (Bank 1) short circuit between AF+ and GND P2239: A/F sensor (Bank 1) short circuit between AF+ and +B P2241: A/F sensor (Bank 2) open circuit between AF+ and AF- P2241: A/F sensor (Bank 2) short circuit between AF+ and AF- P2241: A/F sensor (Bank 2) short circuit between AF+ and GND P2242: A/F sensor (Bank 2) short circuit between AF+ and +B P2252: A/F sensor (Bank 1) short circuit between AF- and GND P2253: A/F sensor (Bank 1) short circuit between AF- and +B P2255: A/F sensor (Bank 2) short circuit between AF- and GND P2256: A/F sensor (Bank 2) short circuit between AF- and +B
Required Sensors/Components (Main)	A/F sensor
Required Sensors/Components (Related)	Engine Coolant Temperature (ECT) sensor, Crankshaft position sensor
Frequency of Operation	Once per driving cycle

MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

P2238 and P2241 (open circuit between AF+ and AF-):

AF+ terminal voltage	0.5 to 4.5 V
AF- terminal voltage	0.5 to 4.5 V
Difference between AF+ and AF- terminal voltages	0.1 to 0.8 V
ECT	20°C (68°F) or more
Engine condition	Running
Fuel-cut	OFF
A/F sensor heater	ON
Battery voltage	11 V or more
Ignition switch	ON
Time after ignition switch is OFF to ON	5 seconds or more

Others:

Battery voltage	11 V or more
Ignition switch	ON
Time after ignition switch is OFF to ON	5 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

P2238 and P2241 (Open circuit between AF+ and AF-):

A/F sensor admittance	Below 0.022 1/Ω

P2238 and P2241 (Short circuit between AF+ and GND):

AF+ terminal voltage	0.5 V or less

P2238 and P2241 (Short circuit between AF+ and AF-):

Difference between AF+ and AF- terminal voltages	0.1 V or less

P2239 and P2242 (Short circuit between AF+ and +B):

AF+ terminal voltage	More than 4.5 V

P2252 and P2255 (Short circuit between AF- and GND):

AF- terminal voltage	0.5 V or less

P2253 and P2256 (Short circuit between AF- and +B):

AF- terminal voltage	More than 4.5 V

ES

WIRING DIAGRAM

Refer to DTC P2195 (See page ES-309).

HINT:
Intelligent tester only:
Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using an intelligent tester.
(1) Connect an intelligent tester to the DLC3.
(2) Start the engine and turn the tester ON.
(3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(4) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(6) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2) displayed on the tester.
HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 or AFS B2S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 or AFS B2S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 or O2S B2S2 (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 or O2S B2S2 (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:
The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

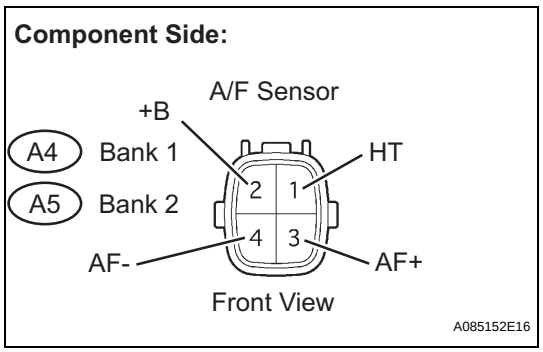
Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		-
	Output voltage More than 3.35 V Less than 3.0 V		Output voltage More than 0.55 V Less than 0.4 V		
2	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output voltage Almost no reaction		Output voltage More than 0.55 V Less than 0.4 V		
3	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output voltage More than 3.35 V Less than 3.0 V		Output voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output voltage Almost no reaction		Output voltage Almost no reaction		

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2, and press the YES button and then the ENTER button followed by the F4 button.

HINT:

Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



(a) Disconnect the A4 or A5 A/F sensor connector.

(b) Measure the resistance between the terminals of the A/F sensor connector.

Standard Resistance

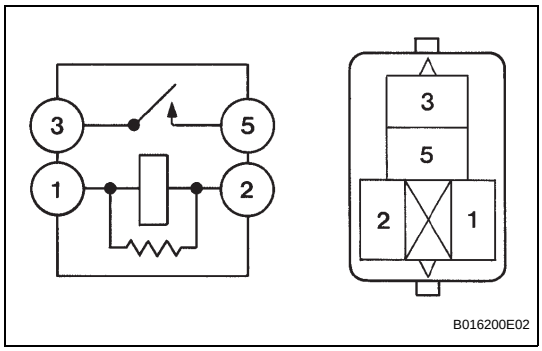
Tester Connections	Specified Conditions
HT (1) - +B (2)	1.8 to 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 kΩ or higher

(c) Reconnect the A/F sensor connector.

NG → REPLACE AIR FUEL RATIO SENSOR

OK

2 INSPECT AIR FUEL RATIO SENSOR HEATER RELAY



(a) Remove the A/F sensor heater relay from the engine room R/B.
(b) Check the A/F sensor heater relay resistance.
Standard Resistance

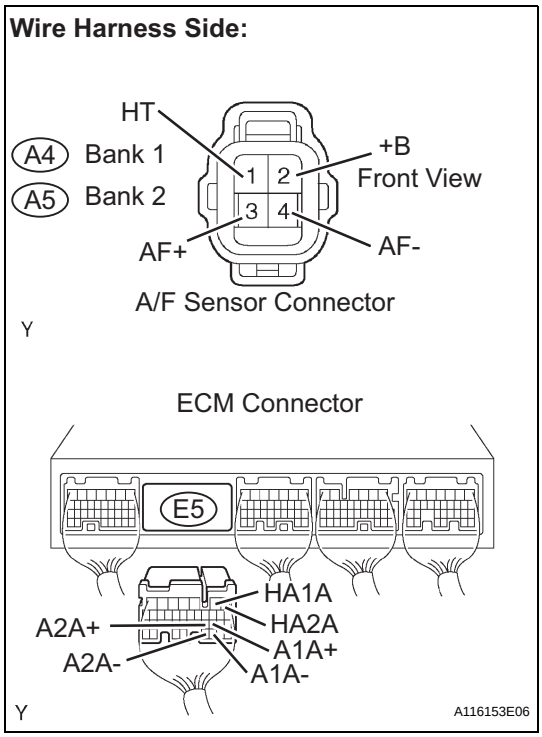
Tester Connections	Specified Conditions
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the A/F sensor heater relay.

NG → REPLACE AIR FUEL RATIO SENSOR HEATER RELAY

OK

3 CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)



(a) Disconnect the A4 or A5 A/F sensor connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the +B terminal of the A/F sensor connector and body ground.
Standard Voltage

Tester Connections	Specified Conditions
+B (A4-2) - Body ground	9 to 14 V
+B (A5-2) - Body ground	

(d) Turn the ignition switch OFF.
(e) Disconnect the E5 ECM connector.
(f) Check the resistance.
Standard Resistance (Check for open)

Tester Connections	Specified Conditions
HT (A4-1) - HA1A (E5-2)	Below 1 Ω
AF+ (A4-3) - A1A+ (E5-22)	
AF- (A4-4) - A1A- (E5-30)	
HT (A5-1) - HA2A (E5-1)	
AF+ (A5-3) - A2A+ (E5-23)	
AF- (A5-4) - A2A- (E5-31)	

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
HT (A4-1) or HA1A (E5-2) - Body ground	10 kΩ or higher
AF+ (A4-3) or A1A+ (E5-22) - Body ground	
AF- (A4-4) or A1A- (E5-30) - Body ground	
HT (A5-1) or HA2A (E5-1) - Body ground	
AF+ (A5-3) or A2A+ (E5-23) - Body ground	
AF- (A5-4) or A2A- (E5-31) - Body ground	

(g) Reconnect the ECM connector.
(h) Reconnect the A/F sensor connector.

REPLACE ECM

DTC	P2401	Evaporative Emission System Leak Detection Pump Control Circuit Low

DTC	P2402	Evaporative Emission System Leak Detection Pump Control Circuit High

DTC SUMMARY

DTCs	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P2401	Leak detection pump stuck OFF	Leak detection pump creates negative pressure through reference orifice, and EVAP system pressure measured to determine leak criterion. 0.02 inch leak criterion is measured at start and at end of leak check. If system pressure higher than -1.06 kPa (-7.95 mmHg)*, or lower than -4.85 kPa (-36.38 mmHg)*, ECM determines that leak detection pump stuck OFF.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM • Leakage from EVAP system	While ignition switch OFF	2 trip
P2402	Leak detection pump stuck ON	Leak detection pump creates negative pressure through reference orifice, and EVAP system pressure measured to determine leak criterion. If system pressure higher than -1.06 kPa (-7.95 mmHg)*, or lower than -4.85 kPa (-36.38 mmHg)*, ECM determines that leak detection pump stuck ON.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM	While ignition switch OFF	2 trip

*: The threshold values vary according to the atmospheric pressure measured in operation A. The values described in the table above are based on an atmospheric pressure of 100 kPa (750.1 mmHg).
HINT:
The leak detection pump is built into the canister pump module.

DESCRIPTION

The circuit description can be found in the EVAP System (See page ES-351).

Refer to the EVAP System (See page ES-351).

MONITOR DESCRIPTION

5 hours* after the ignition switch is turned OFF, the electric leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.
HINT:
*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

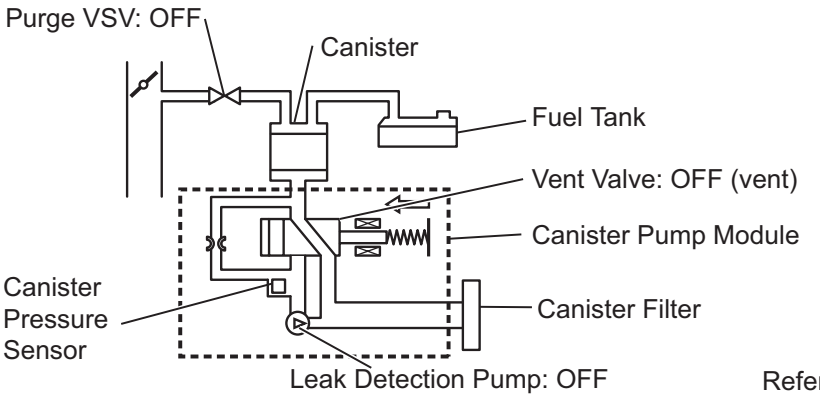
Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak criterion measurement	In order to determine 0.02 inch leak criterion, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds

Sequence	Operations	Descriptions	Duration
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as it will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak criterion measurement	After second 0.02 inch leak criterion measurement, leak check performed by comparing first and second 0.02 inch leak criterions. If stabilized system pressure higher than second 0.02 inch leak criterion, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

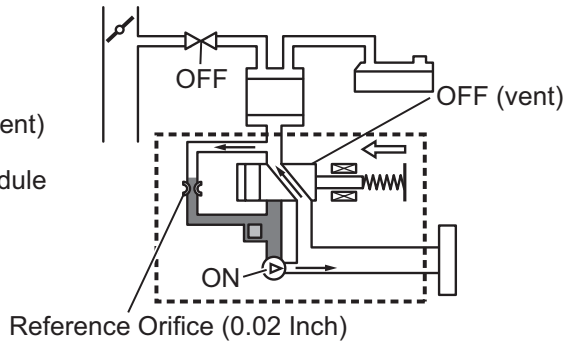
ES

Operation A: Atmospheric Pressure Measurement

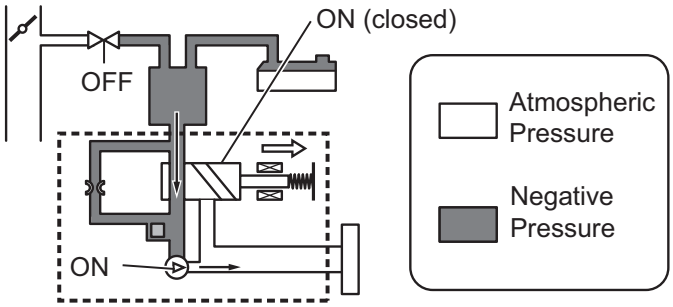


Operation B, E:

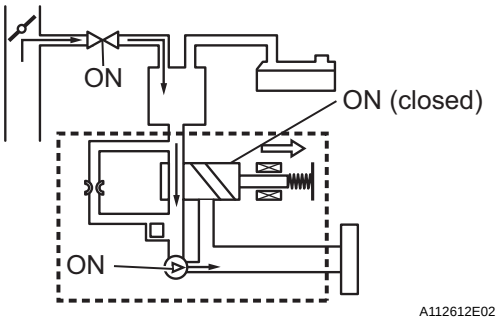
0.02 Inch Leak Criterion Measurement



Operation C: EVAP System Pressure Measurement



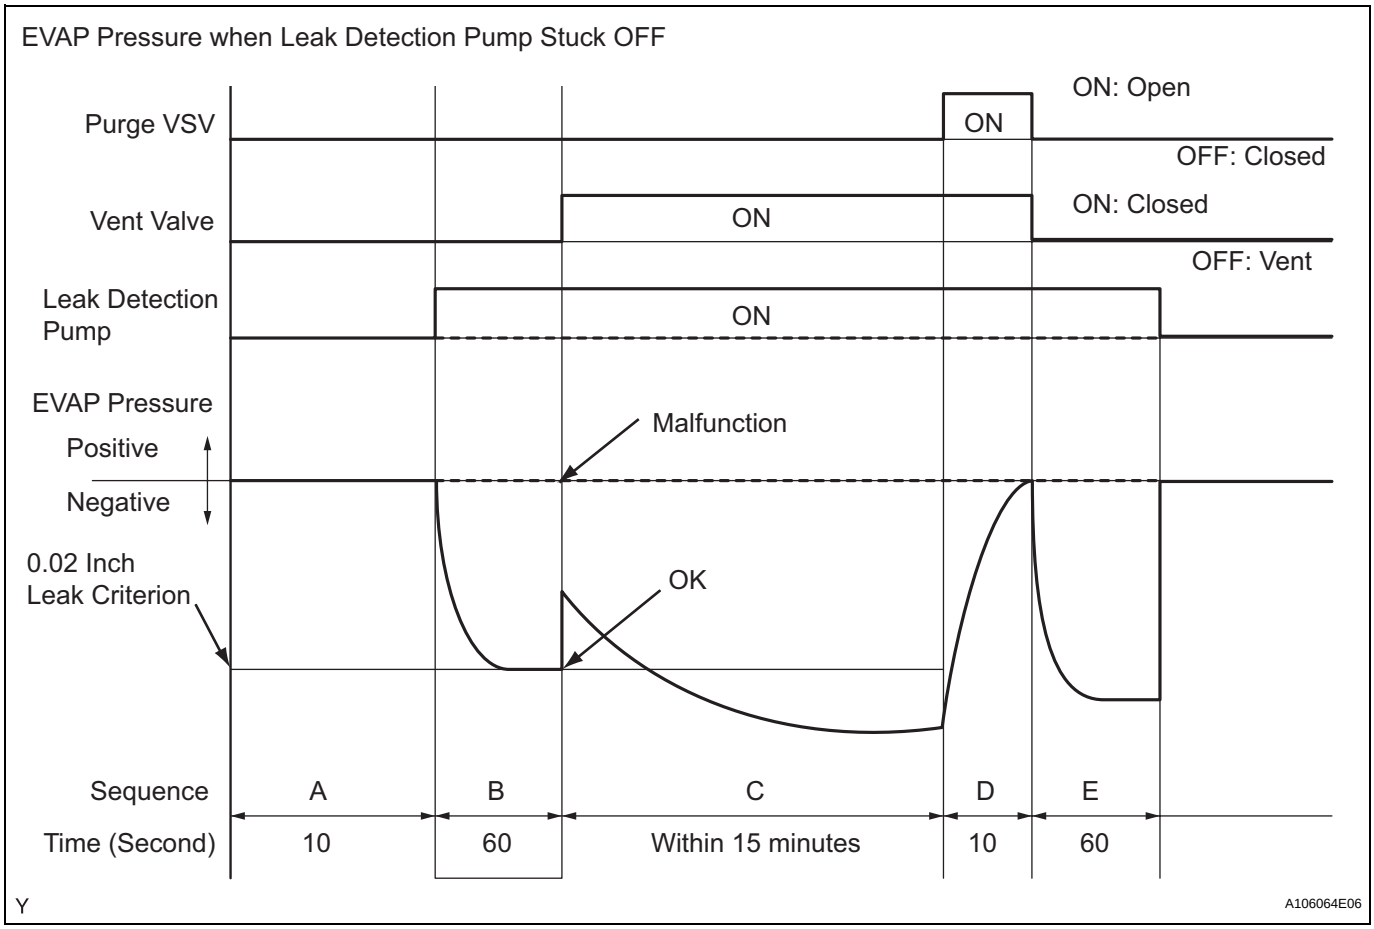
Operation D: Purge VSV Monitor



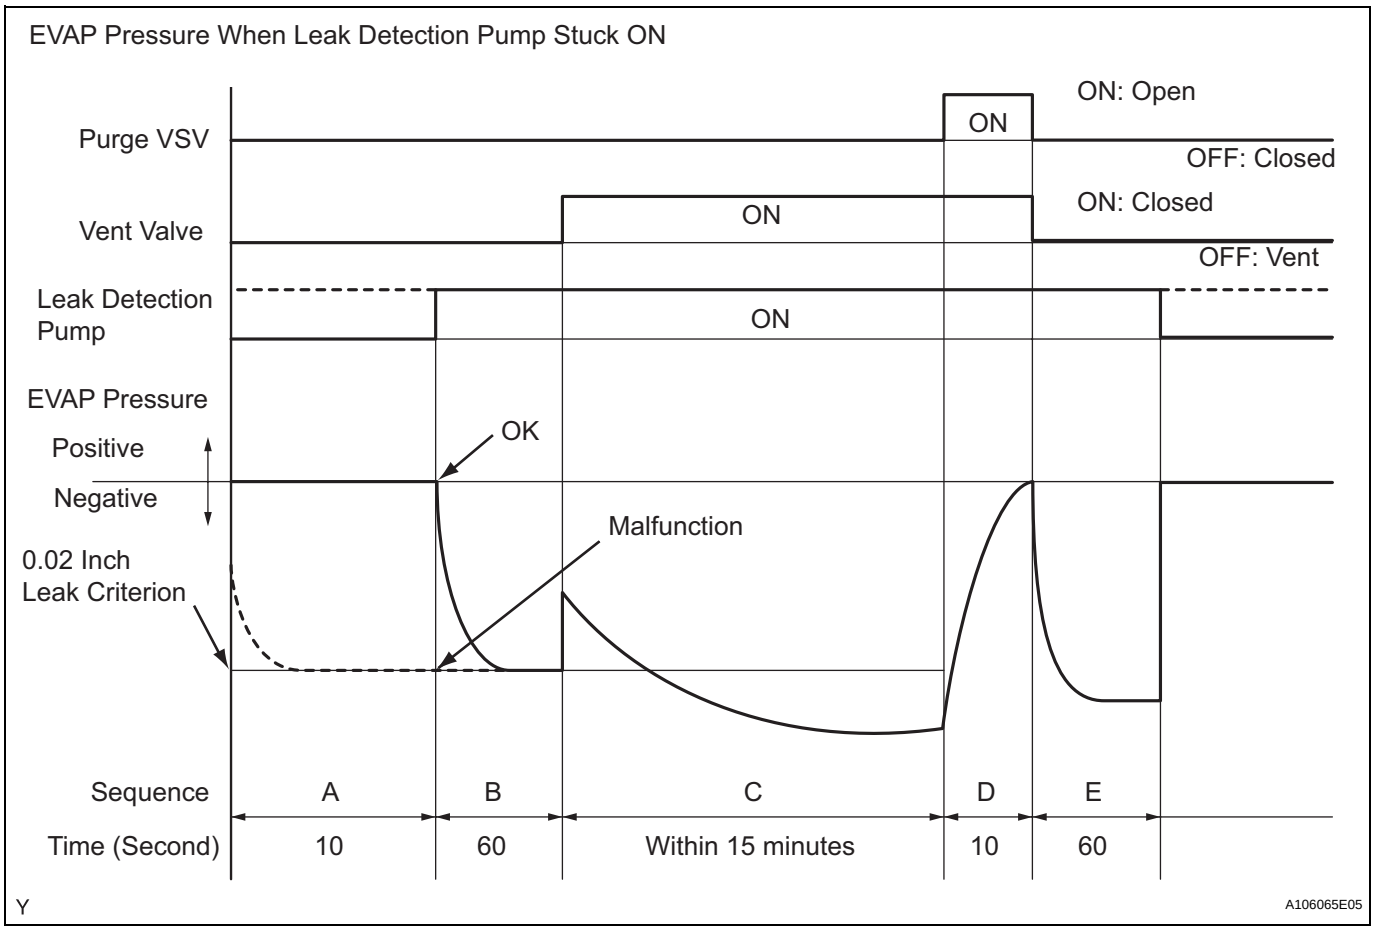
Y

A112612E02

1. P2401: Leak detection pump stuck OFF
   In operation B, the leak detection pump creates negative pressure (a vacuum) through the reference orifice. The EVAP (Evaporative Emission) system pressure is then measured by the ECM, using the canister pressure sensor, to determine the 0.02 inch leak criterion. If the pressure is higher than -1.06 kPa (-7.95 mmHg)*, or lower than -4.85 kPa (-36.38 mmHg)*, the ECM interprets this as the leak detection pump being stuck OFF (not operating). The ECM illuminates the MIL and sets the DTC (2 trip detection logic).
   *: The thresholds vary according to the atmospheric pressure measured in operation A. The values described above are based on an atmospheric pressure of 100 kPa (750.1 mmHg): absolute pressure.



2. P2402: Leak detection pump stuck ON
In operation B, the leak detection pump creates negative pressure (a vacuum) through the reference orifice. The EVAP (Evaporative Emission) system pressure is then measured by the ECM, using the canister pressure sensor, to determine the 0.02 inch leak criterion. If the pressure is higher than -1.06 kPa (-7.95 mmHg)*, or lower than -4.85 kPa (-36.38 mmHg)*, the ECM interprets this as the leak detection pump being stuck ON (remaining ON all the time). The ECM illuminates the MIL and sets the DTC (2 trip detection logic).
*: The thresholds vary according to the atmospheric pressure measured in operation A. The values described above are based on an atmospheric pressure of 100 kPa (750.1 mmHg): absolute pressure.



HINT:
The detection logic of DTCs P2401 and P2402 is the same because in both cases the 0.02 inch leak criterion measured in operation B is compared to the atmospheric pressure registered in operation A. The ECM calculates the difference between these pressures by deducting [the 0.02 inch leak criterion] from [the stored atmospheric pressure], and uses this to monitor the EVAP system pressure change.

MONITOR STRATEGY

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 15 minutes (varies with amount of fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	525 to 825 mmHg (70 to 110 kPa)
Battery voltage	10.5 V or more
Vehicle speed	Below 2.5 mph (4 km/h)
Ignition switch	OFF
Engine condition	Not running
Fuel tank pressure sensor malfunction (P0450, P0451, P0452 and/or P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of following conditions met before IG switch OFF	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. Purge flow	Executed
ECT	4.4° to 35°C (40° to 95°F)
IAT	4.4° to 35°C (40° to 95°F)

1. Key-off monitor sequence is 1 to 8

1. Atmospheric pressure

Next sequence is run if following condition set	-
Atmospheric pressure change for 10 seconds	Less than 2.25 mmHg (0.3 kPa) for 1 second

2. First 0.02 inch leak criterion

Next sequence is run if all of following conditions set	Conditions 1, 2 and 3
1. Fuel tank pressure when 4 seconds after 0.02 inch leak criterion measurement	-7.5 mmHg (-1 kPa) or less
2. 0.02 inch leak criterion	-36.38 to -7.93 mmHg (-4.85 to -1.057 kPa)
3. 0.02 inch leak criterion	Saturated within 55 seconds

3. Vent valve stuck closed check

Next sequence is run if following condition set	-
Fuel tank pressure change for 10 seconds after vent valve ON (closed)	2.25 mmHg (0.3 kPa) or more

4. Vacuum introduction and leak

Next sequence is run if both of following conditions set	-
1. Vacuum introduction time	Saturated within 12 minutes
2. Fuel tank pressure	Fuel tank pressure was standard

5. Purge VSV stuck closed check

Next sequence is run if following condition set	-
Fuel tank pressure change for 10 seconds after purge VSV ON (open)	2.25 mmHg (0.3 kPa) or more

6. Second 0.02 inch leak criterion measurement

Next sequence is run if all of following conditions set	Conditions 1, 2, 3 and 4
1. Fuel tank pressure when 4 seconds after 0.02 inch leak criterion measurement	-7.5 mmHg (-1 kPa) or less
2. 0.02 inch leak criterion	-36.4 to -7.92 mmHg (-4.85 to -1.057 kPa)
3. 0.02 inch leak criterion	Saturated within 55 seconds
4. 0.02 inch leak criterion difference between first and second	5.25 mmHg (0.7 kPa) or less

7. Leak check

Next sequence is run if following condition set	-
Fuel tank pressure when vacuum introduction was complete	Second 0.02 inch leak criterion or less

8. Atmospheric pressure

Monitor is complete if following condition set	-
Atmospheric pressure difference between sequences 1 and 8	2.25 mmHg (0.3 kPa) or less

TYPICAL MALFUNCTION THRESHOLDS

One of following conditions met	-
Fuel tank pressure when 4 seconds after 0.02 inch leak criterion measurement began	More than -7.5 mmHg (-1 kPa)
0.02 inch leak criterion	Less than -36.4 mmHg (-4.85 kPa)
0.02 inch leak criterion	-7.9 mmHg (-1.057 kPa) or more
0.02 inch leak criterion	Not saturated
0.02 inch leak criterion difference between first and second	5.2 mmHg (0.7 kPa) or more

"Saturated" indicates that the EVAP pressure change is less than 0.75 mmHg (0.1 kPa) in 30 seconds.

MONITOR RESULT

Detailed information on Checking Monitor Status (See page ES-19).

DTC	P2419	Evaporative Emission System Switching Valve Control Circuit Low

DTC	P2420	Evaporative Emission System Switching Valve Control Circuit High

DTC SUMMARY

DTCs	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P2419	Vent valve stuck closed	Leak detection pump creates negative pressure through reference orifice and EVAP system pressure measured to determine leak criterion. If system pressure higher than -1.06 kPa (-7.95 mmHg)* 4 seconds after leak detection pump turned ON, ECM determines that vent valve stuck closed.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM	While ignition switch OFF	2 trip
P2420	Vent valve stuck open (vent)	Leak detection pump creates negative pressure through reference orifice and EVAP system pressure measured to determine leak criterion. 0.02 inch leak criterion measured at start and at end of leak check. If system pressure does not increase by more than 0.3 kPa (2.25 mmHg) within 10 seconds when vent valve turned ON, ECM determines that vent valve stuck closed.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM • Leakage from EVAP system	While ignition switch OFF	2 trip

*: The threshold value varies according to the atmospheric pressure measured in operation A. The value described above is based on an atmospheric pressure of 100 kPa (750.1 mmHg): absolute pressure.
HINT:
The vent valve is built into the canister pump module.

DESCRIPTION

The circuit description can be found in the EVAP System (See page ES-351).

Refer to the EVAP System (See page ES-351).

MONITOR DESCRIPTION

5 hours* after the ignition switch is turned OFF, the electric leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.
HINT:
*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

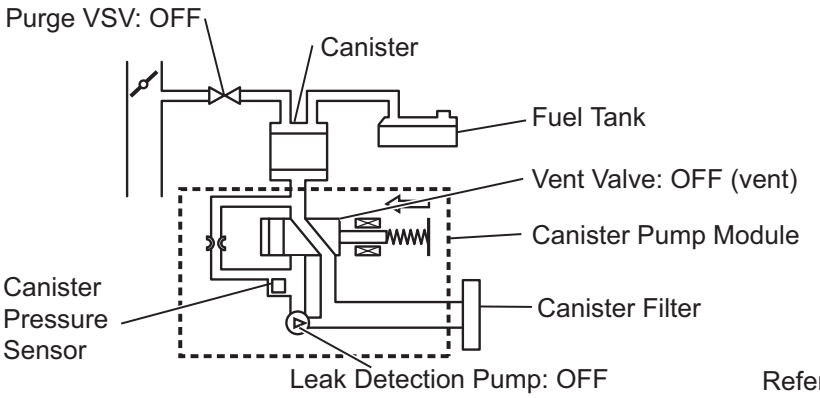
Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds

Sequence	Operations	Descriptions	Duration
B	First 0.02 inch leak criterion measurement	In order to determine 0.02 inch leak criterion, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as they will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak criterion measurement	After second 0.02 inch leak criterion measurement, leak check performed by comparing first and second 0.02 inch leak criterions. If stabilized system pressure higher than second 0.02 inch leak criterion, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

ES

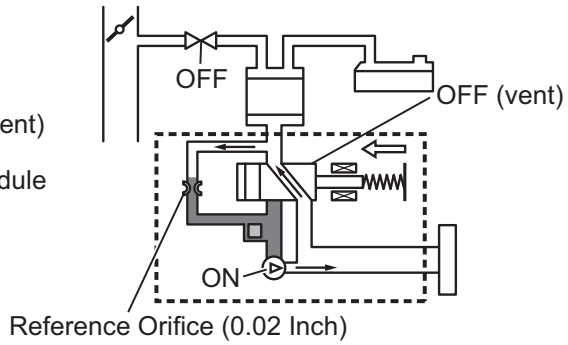
* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

Operation A: Atmospheric Pressure Measurement

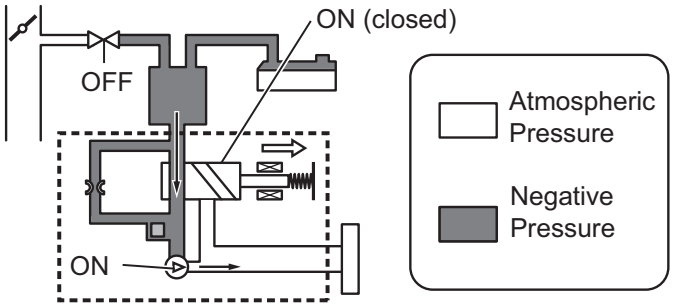


Operation B, E:

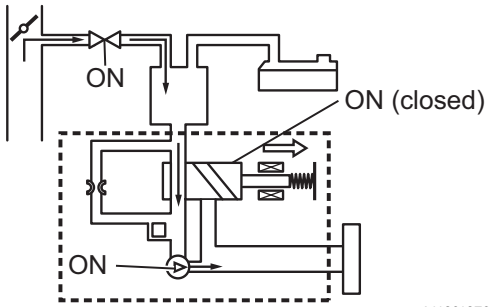
0.02 Inch Leak Criterion Measurement



Operation C: EVAP System Pressure Measurement



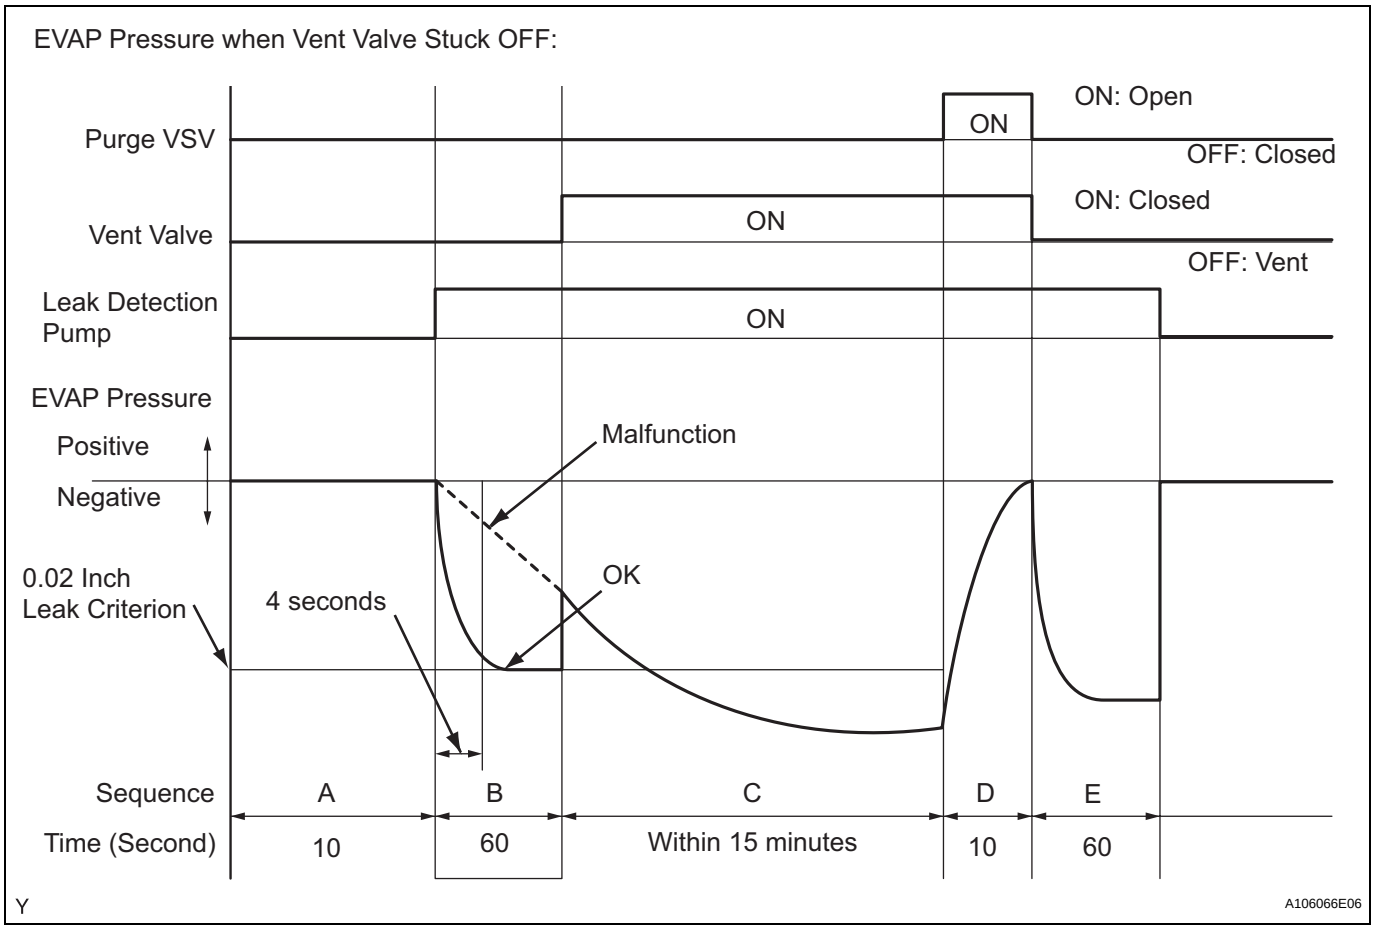
Operation D: Purge VSV Monitor



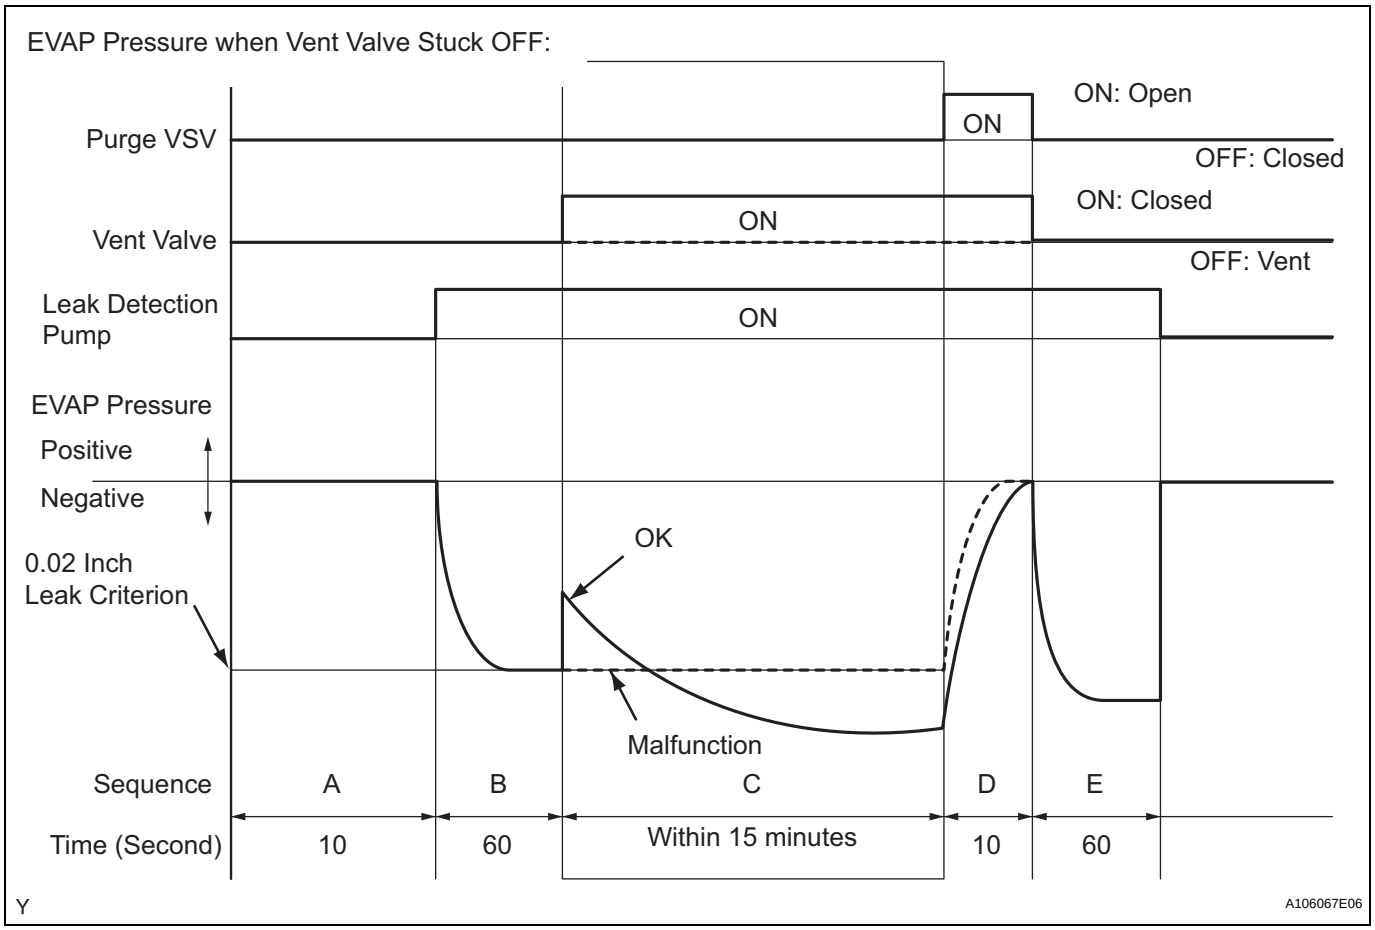
Y

A112612E02

1. P2419: Vent valve stuck closed
   In operation B, the leak detection pump creates negative pressure (a vacuum) through the reference orifice. The EVAP (Evaporative Emission) system pressure is then measured by the ECM, using the canister pressure sensor, to determine the 0.02 inch leak criterion. If the pressure exceeds -1.06 kPa (-7.95 mmHg)* 4 seconds after the leak detection pump is turned ON, the ECM interprets this as the vent valve being stuck closed. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).
   *: The threshold varies according to the atmospheric pressure measured in operation A. The value described above is based on an atmospheric pressure of 100 kPa (750.1 mmHg): absolute pressure.



2. P2420: Vent valve stuck open (vent)
   In operation C, the vent valve turns ON (closes) and the EVAP (Evaporative Emission) system pressure is then measured by the ECM, using the canister pressure sensor, to conduct an EVAP leak check. If the pressure does not increase when the vent valve is open, the ECM interprets this as the vent valve being stuck open. The ECM illuminates the MIL and sets the DTC.



MONITOR STRATEGY

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 15 minutes (varies with amount of fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
EVAP key-off monitor runs when all of following conditions met	-

DTC	P2610	ECM / PCM Internal Engine Off Timer Performance

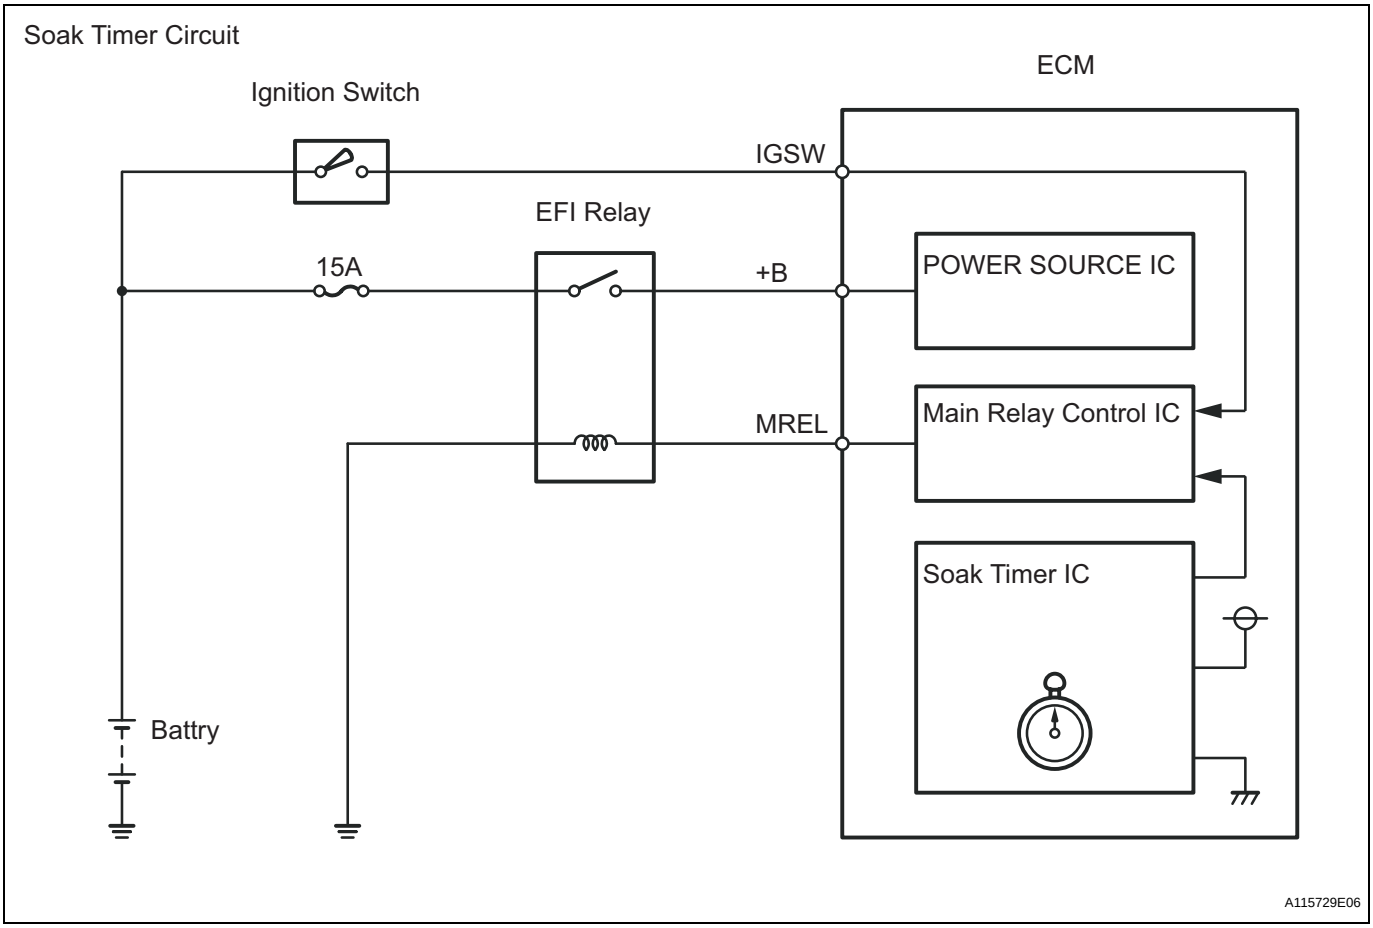
DTC SUMMARY

DTC	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P2610	Soak timer (built into ECM)	ECM internal malfunction	ECM	Engine running	2 trip

DESCRIPTION

ES

To ensure the accuracy of the EVAP (Evaporative Emission) monitor values, the soak timer, which is built into the ECM, measures 5 hours (+-15 minutes) from when the ignition switch is turned OFF, before the monitor is run. This allows the fuel to cool down, which stabilizes the fuel tank pressure. When 5 hours have elapsed, the ECM turns on.



MONITOR DESCRIPTION

5 hours after the ignition switch is turned OFF, the soak timer activates the ECM to begin the EVAP system monitor. While the engine is running, the ECM monitors the synchronization of the soak timer and the CPU clock. If these two are not synchronized, the ECM interprets this as a malfunction, illuminates the MIL and sets the DTC (2 trip detection logic).

MONITOR STRATEGY

Required Sensors/Components	ECM
Frequency of Operation	Once per driving cycle

Duration	10 minutes
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTC not present	None
Ignition switch	ON
Engine	Running
Battery voltage	8 V or more
Starter	OFF

TYPICAL MALFUNCTION THRESHOLDS

Soak timer measurement when ECM CPU clock counts 10 minutes	Less than 7 minutes, or more than 13 minutes

HINT:
- DTC P2610 is set if an internal ECM problem is detected. Diagnostic procedures are not required. ECM replacement is required.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	**REPLACE ECM**

NEXT

2	**CHECK WHETHER DTC OUTPUT RECURS**

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Clear DTCs (See page ES-38).
(d) Start the engine and wait for 10 minutes or more.
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC / INFO / PENDING CODEs.
(f) If no pending DTC is displayed, the repair has been successfully completed.

NEXT

END

DTC	P2A00	A/F Sensor Circuit Slow Response (Bank 1 Sensor 1)

DTC	P2A03	A/F Sensor Circuit Slow Response (Bank 2 Sensor 1)

HINT:
- DTC P2A00 indicates malfunctions related to the bank 1 A/F sensor.
- DTC P2A03 indicates malfunctions related to the bank 2 A/F sensor.
- Bank 1 refers to the bank that includes cylinder No. 1.
- Bank 2 refers to the bank that includes cylinder No. 2.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

ES

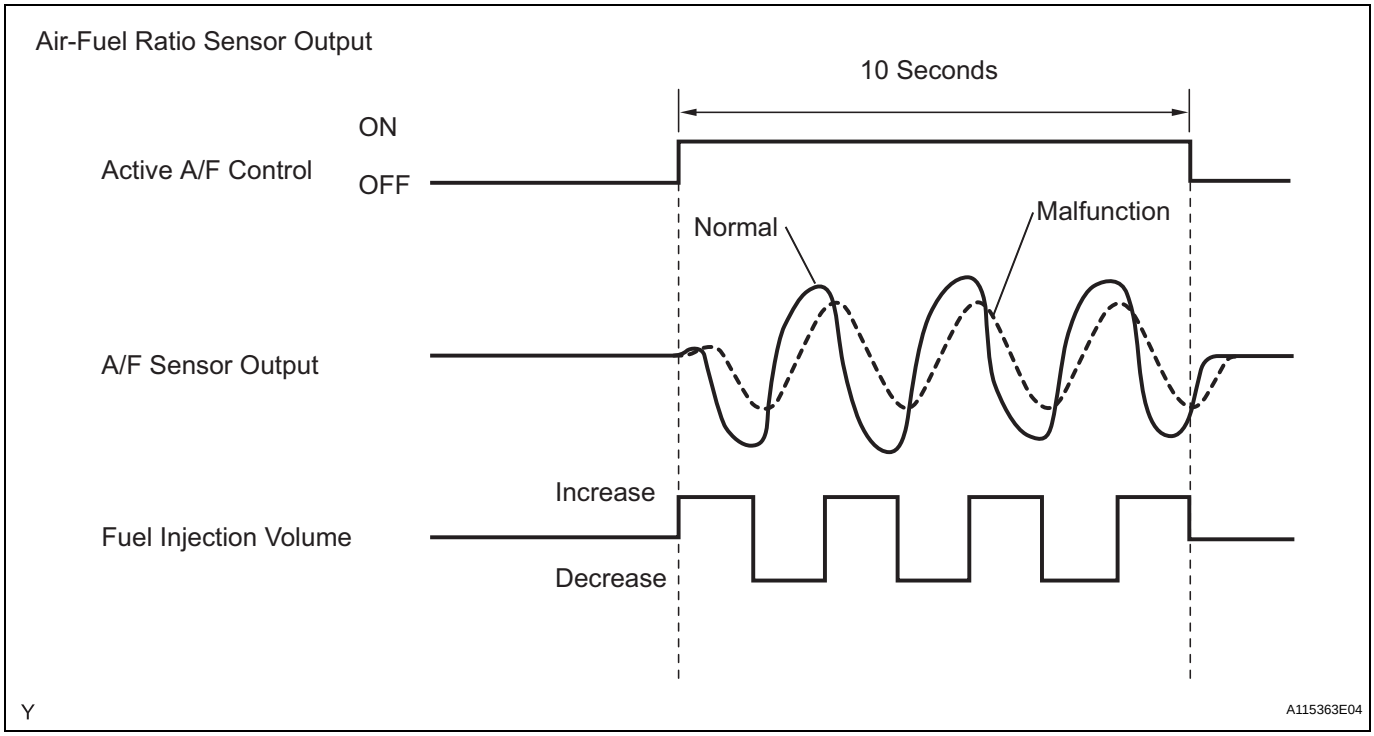
DESCRIPTION

Refer to DTC P2195 (See page ES-304).

DTC No.	DTC Detection Conditions	Trouble Areas
P2A00 P2A03	Calculated value for air-fuel ratio (A/F) sensor response rate deterioration level is less than threshold	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor • ECM

MONITOR DESCRIPTION

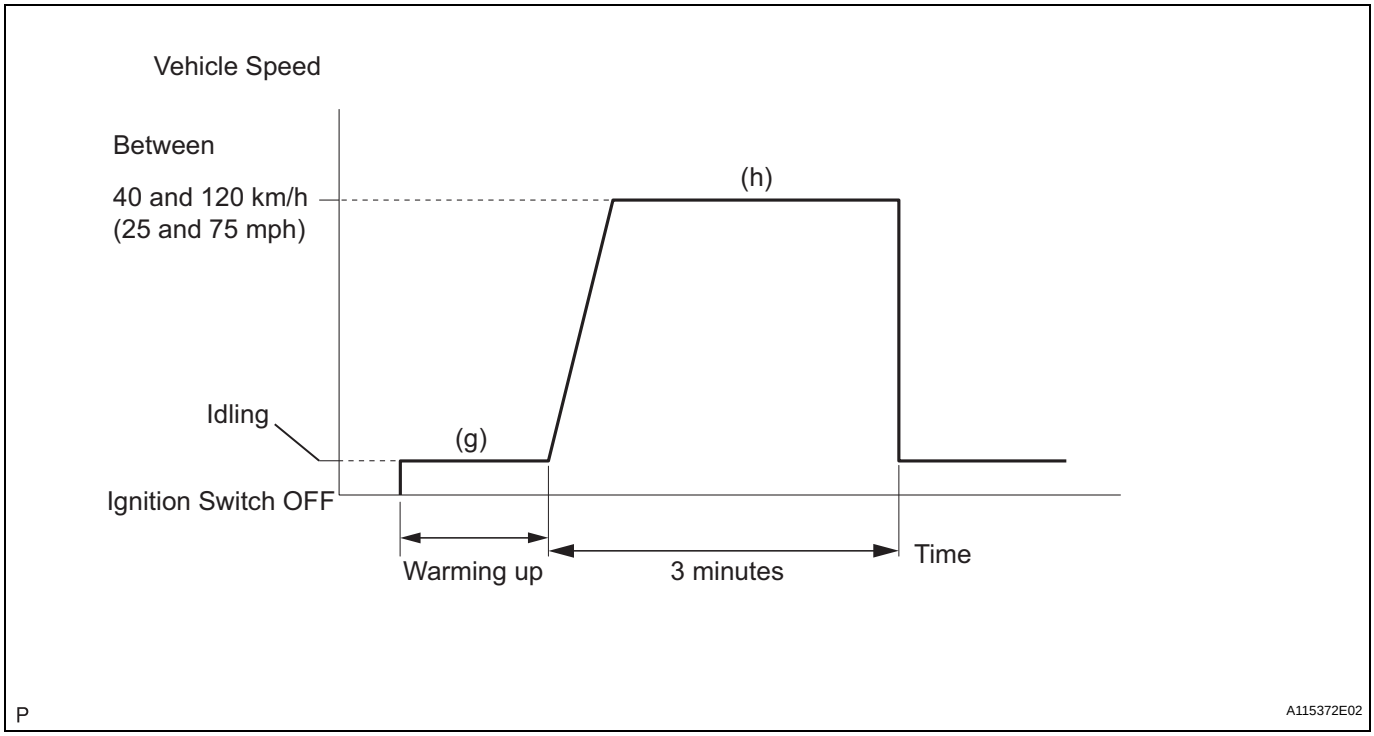
After engine is warmed up, the ECM performs air-fuel ratio feedback control to maintain the air-fuel ratio at the stoichiometric level. In addition, active A/F ratio control is performed for approximately 10 seconds after preconditions are met in order to measure the A/F sensor response rate. During active A/F ratio control, the ECM forcibly increases and decreases the injection volume a certain amount, based on the stoichiometric air-fuel ratio learned during normal air-fuel ratio control, and measures the A/F sensor response rate. The ECM receives a signal from the A/F sensor while performing active A/F ratio control and uses it to calculate the A/F sensor response rate deterioration level.
If the value for A/F sensor response rate deterioration level is less than the threshold, the ECM interprets this as a malfunction and sets the DTC.

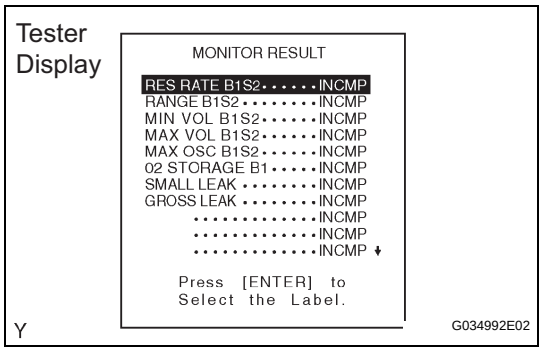


CONFIRMATION DRIVING PATTERN

HINT:

Performing this confirmation pattern will activate the A/F sensor response monitor.





(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (See page ES-38).
(e) Select the following menu items: DIAGNOSIS /ENHANCED OBD II / MONITOR INFO / MONITOR RESULT.
(f) Check that AFS B1 is INCOMPL.
(g) Start the engine and warm it up.
(h) Drive the vehicle at between 25 mph and 75 mph (40 km/h and 120 km/h) for 3 minutes. However, the vehicle should be driven at a constant speed.
(i) Check the monitor result values on an intelligent tester by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / TEST RESULT.
(j) If the values indicated on the tester do not change, perform READINESS MONITOR DRIVE PATTERN for the A/F sensor and the heated oxygen sensor (See page ES-23).
HINT:
Completion of all A/F sensor monitors is required to change the value in TEST RESULT.
(k) Note the value of the Monitor Result.
(l) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
(m) Check if any DTCs (any pending DTCs) are set.

MONITOR STRATEGY

Related DTCs	P2A00: A/F sensor (Bank 1) slow response P2A03: A/F sensor (Bank 2) slow response
Required Sensors/Components (Main)	A/F sensor
Required Sensors/Components (Related)	Vehicle speed sensor, Crankshaft position sensor
Frequency of Operation	Once per driving cycle
Duration	10 to 15 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0031, P0032, P0051, P0052 (A/F sensor heater - Sensor 1) P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for Closed Loop) P0171, P0172 (Fuel system) P0300 - P0306 (Misfire) P0335 (CKP sensor) P0340, P0341 (CMP sensor) P0442 - P0456 (EVAP system) P0500 (VSS) P2196, P2198 (A/F sensor - rationality)

A/F sensor active control	Executing
Engine coolant temperature	75°C (167°F) or more
Battery voltage	11 V or more
Malfunction determination in this driving cycle	Not yet
Fuel-cut	OFF
Engine RPM	Less than 4,000 rpm
A/F sensor status	Activated
Delay time after fuel-cut ended	5 seconds or more
Engine load	10 to 70 %
Estimated catalyst temperature	500 to 800°C (932 to 1,472°F)
Shift position	2 or more
Intake air amount	3 to 10.5 g/sec

TYPICAL MALFUNCTION THRESHOLDS

Response rate deterioration level	Less than 0.2 V

MONITOR RESULT

Detailed information on Checking Monitor Status (See page ES-19).

WIRING DIAGRAM

Refer to DTC P2195 (See page ES-309).

HINT:
Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using an intelligent tester.
(1) Connect an intelligent tester to the DLC3.
(2) Start the engine and turn the tester ON.
(3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(4) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(6) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2) displayed on the tester.
HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 or AFS B2S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 or AFS B2S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 or O2S B2S2 (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 or O2S B2S2 (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:
The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Area
1	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		-
	Output voltage More than 3.35 V Less than 3.0 V		Output voltage More than 0.55 V Less than 0.4 V		
2	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output voltage Almost no reaction		Output voltage More than 0.55 V Less than 0.4 V		
3	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output voltage More than 3.35 V Less than 3.0 V		Output voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output voltage Almost no reaction		Output voltage Almost no reaction		

- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2, and press the YES button and then the ENTER button followed by the F4 button.
- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

HINT:

- DTC P2A00 or P2A03 may be also set, when the air-fuel ratio is stuck rich or lean.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2A00 AND/OR P2A03)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.

(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P2A00 and/or P2A03	A
P2A00 and/or P2A03 and other DTCs	B

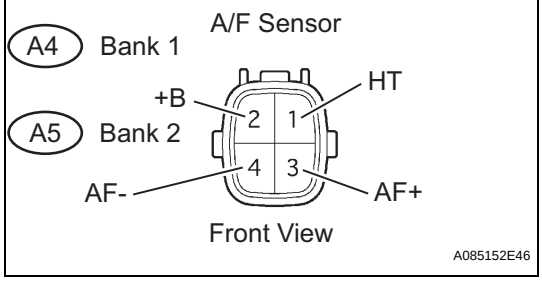
HINT:
If any DTCs other than P2A00 or P2A03 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

A

2 INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

Component Side:



(a) Disconnect the A4 or A5 A/F sensor connector.
(b) Measure the resistance between the terminals of the A/F sensor connector.
Standard Resistance

Tester Connections	Specified Conditions
HT (1) - +B (2)	1.8 to 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 kΩ or higher

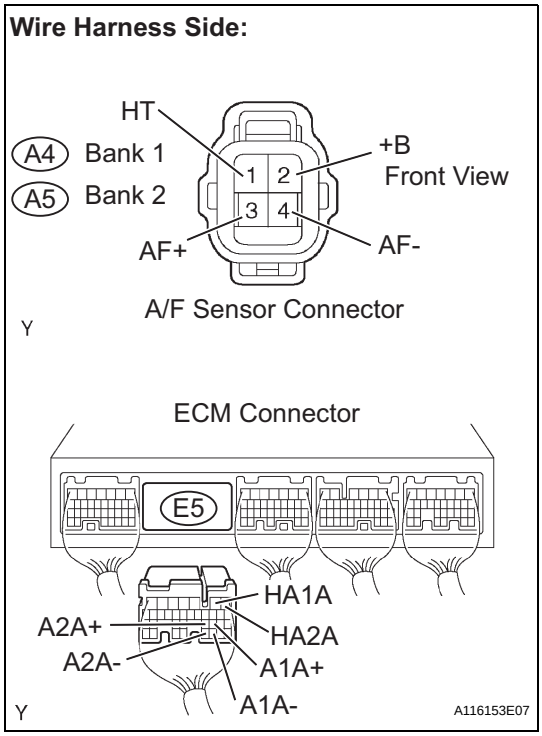
(c) Reconnect the A/F sensor connector.

NG → **REPLACE AIR FUEL RATIO SENSOR**

OK

ES

3	CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)



(a) Disconnect the A4 or A5 A/F sensor connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the +B terminal of the A/F sensor connector and body ground.

Standard Voltage

Tester Connections	Specified Conditions
+B (A4-2) - Body ground	9 to 14 V
+B (A5-2) - Body ground	

(d) Turn the ignition switch OFF.
(e) Disconnect the E5 ECM connector.
(f) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
HT (A4-1) - HA1A (E5-2)	Below 1 Ω
AF+ (A4-3) - A1A+ (E5-22)	
AF- (A4-4) - A1A- (E5-30)	
HT (A5-1) - HA2A (E5-1)	
AF+ (A5-3) - A2A+ (E5-23)	
AF- (A5-4) - A2A- (E5-31)	

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
HT (A4-1) or HA1A (E5-2) - Body ground	10 kΩ or higher
AF+ (A4-3) or A1A+ (E5-22) - Body ground	
AF- (A4-4) or A1A- (E5-30) - Body ground	
HT (A5-1) or HA2A (E5-1) - Body ground	
AF+ (A5-3) or A2A+ (E5-23) - Body ground	
AF- (A5-4) or A2A- (E5-31) - Body ground	

(g) Reconnect the ECM connector.
(h) Reconnect the A/F sensor connector.

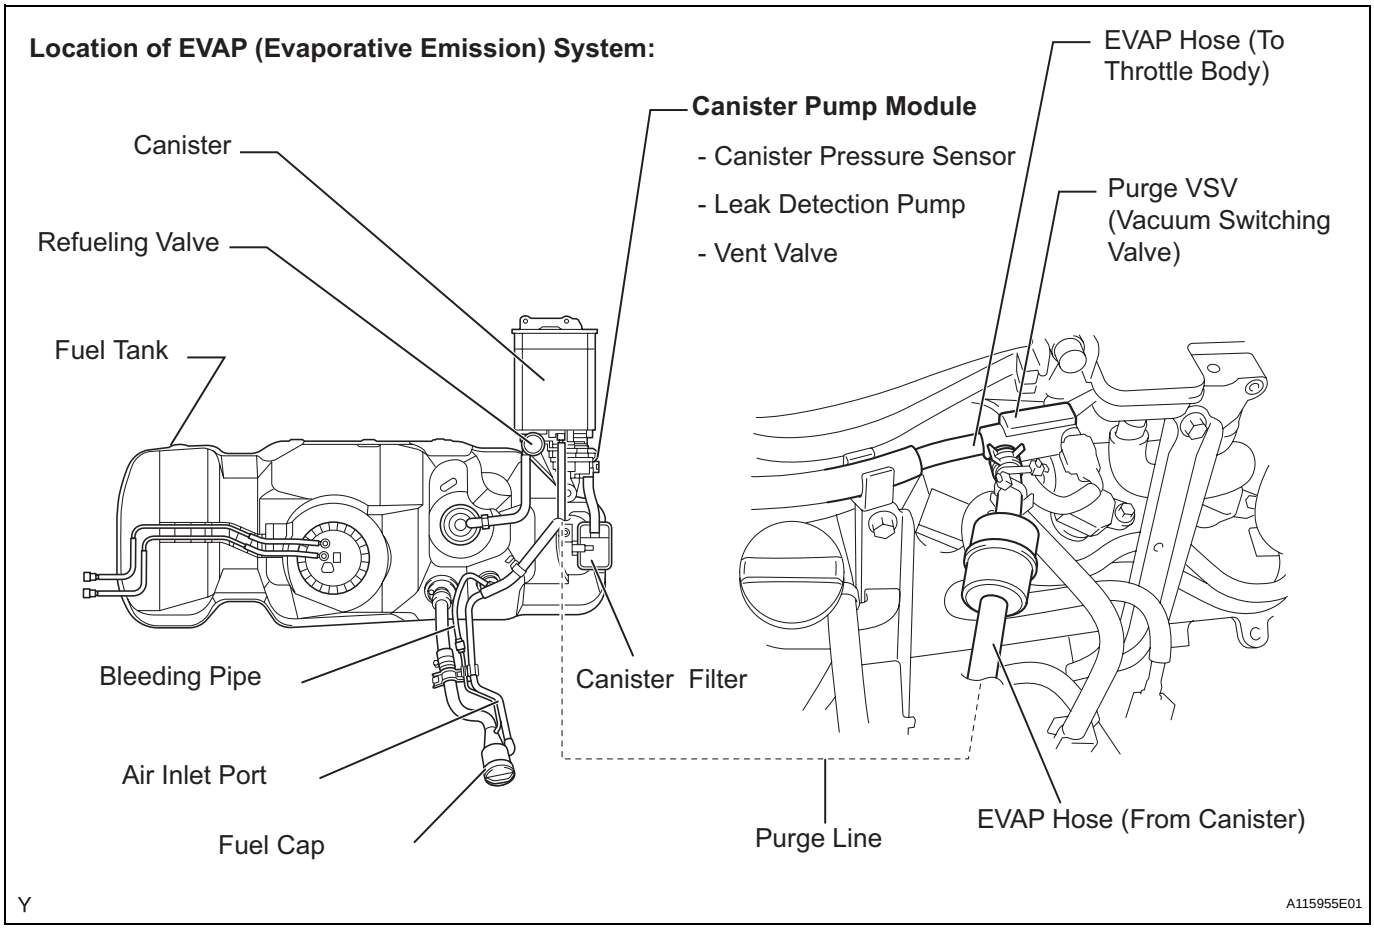
Y

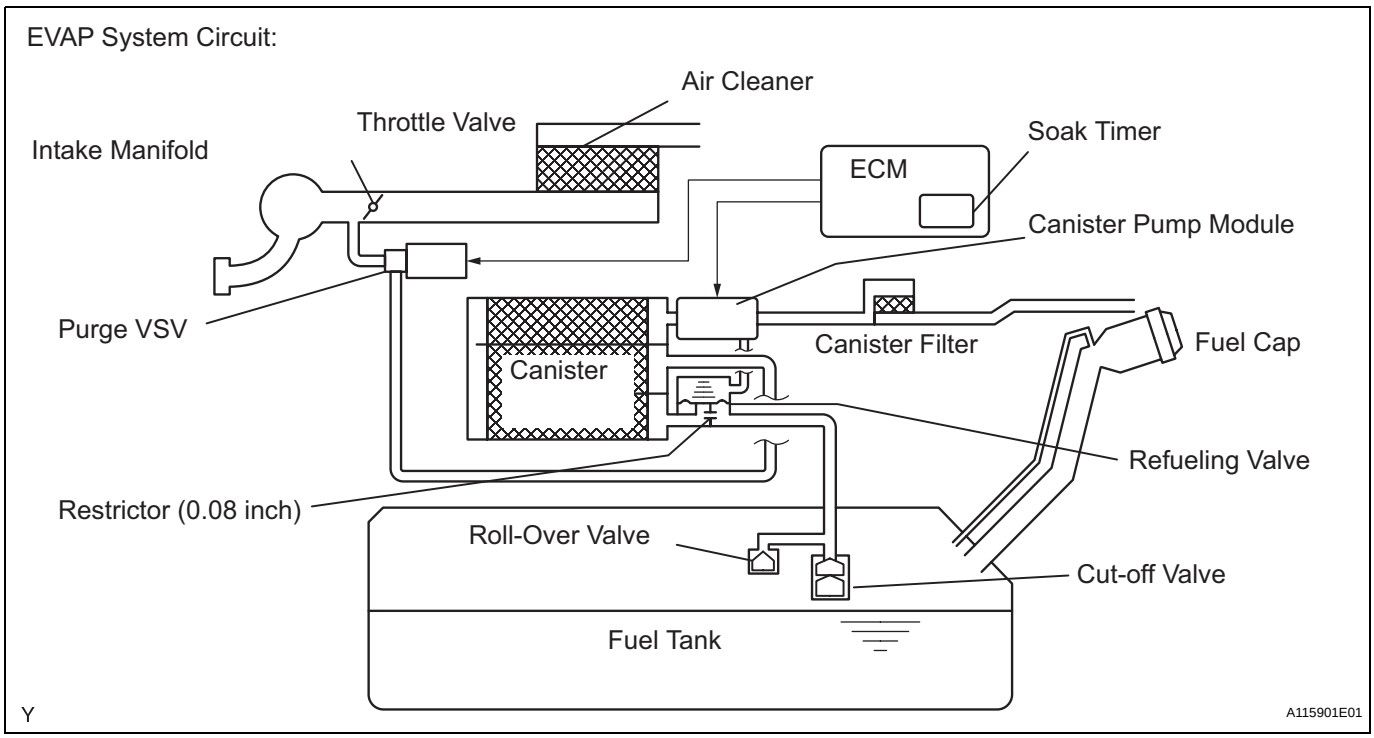
A106731E14

NOTICE:
If the 0.02 inch leak criterion difference between the first and second checks is greater than the specification, the DTCs corresponding to the leak criterion (P043E, P043F, P2401, P2402 and P2419) will be all stored.

DESCRIPTION



NOTICE:
The canister is located near the fuel tank, underneath the body.



NOTICE:
In this vehicle's EVAP system, turning ON the vent valve does not seal off the EVAP system. To check for leaks in the EVAP system, disconnect the air inlet vent hose and apply pressure from the atmosphere side of the canister.

While the engine is running, if a predetermined condition (closed-loop etc.) is met, the purge VSV is opened by the ECM and stored fuel vapors in the canister are purged to the intake manifold. The ECM changes the duty cycle ratio of the purge VSV to control purge flow volume.

The purge flow volume is also determined by the intake manifold pressure. Atmospheric pressure is allowed into the canister through the vent valve to ensure that the purge flow is maintained when the negative pressure (vacuum) is applied to the canister.

The following two monitors run to confirm appropriate EVAP system operation.

1. Key-off monitor

This monitor checks for EVAP (Evaporative Emission) system leaks and canister pump module malfunctions. The monitor starts 5 hours* after the ignition switch is turned OFF. More than 5 hours are required to allow enough time for the fuel to cool down to stabilize the fuel tank pressure, thus making the EVAP system monitor more accurate.

The electric leak detection pump creates negative pressure (vacuum) in the EVAP system and the pressure is measured. Finally, the ECM monitors for leaks from the EVAP system, and malfunctions in both the canister pump module and purge VSV, based on the EVAP pressure.

HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

2. Purge flow monitor

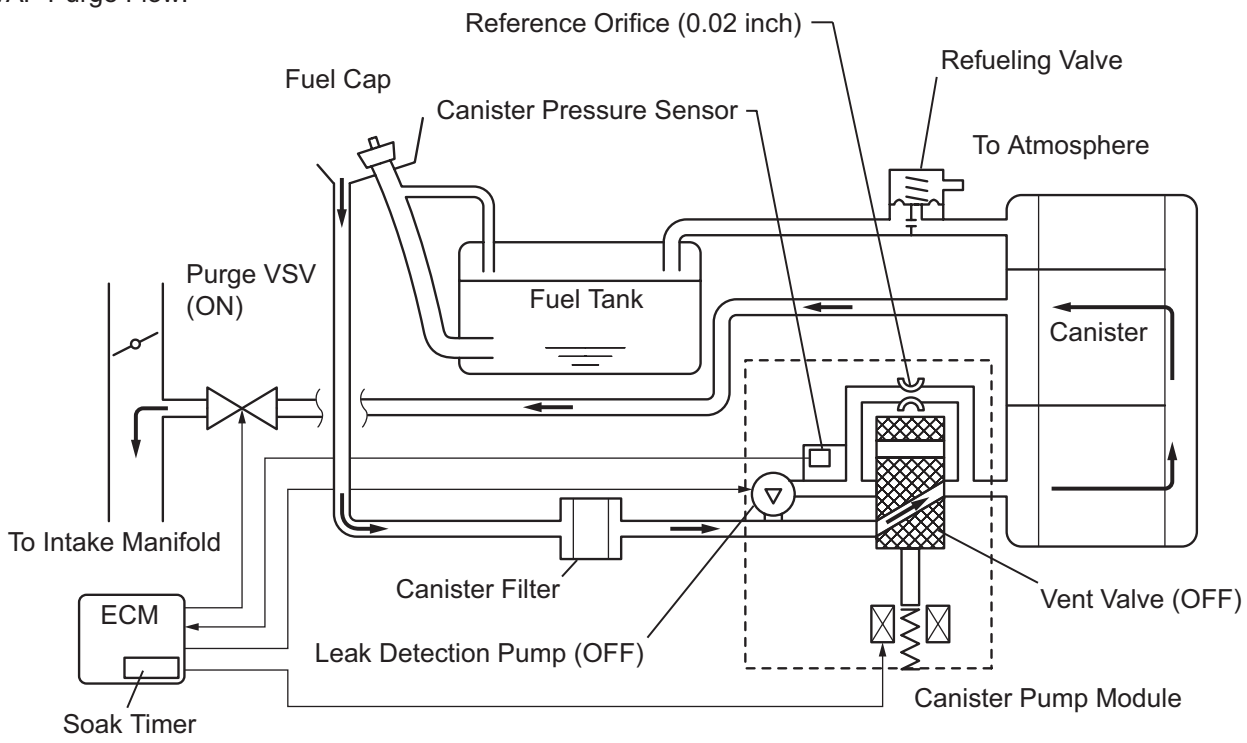
The purge flow monitor consists of the two monitors. The 1st monitor is always conducted every time and the 2nd monitor is activated if necessary.

- The 1st monitor
  While the engine is running and the purge VSV (Vacuum Switching Valve) is ON (open), the ECM monitors the purge flow by measuring the EVAP pressure change. If negative pressure is not created, the ECM begins the 2nd monitor.
- The 2nd monitor
  The vent valve is turned OFF (open) and the EVAP pressure is then measured. If the variation in the pressure is less than 0.5 kPa (3.75 mmHg), the ECM interprets this as the purge VSV being stuck closed, and illuminates the MIL and sets DTC P0441 (2 trip detection logic).

Atmospheric pressure check:

In order to ensure reliable malfunction detection, the variation between the atmospheric pressures, before and after conduction of the purge flow monitor, is measured by the ECM.

EVAP Purge Flow:

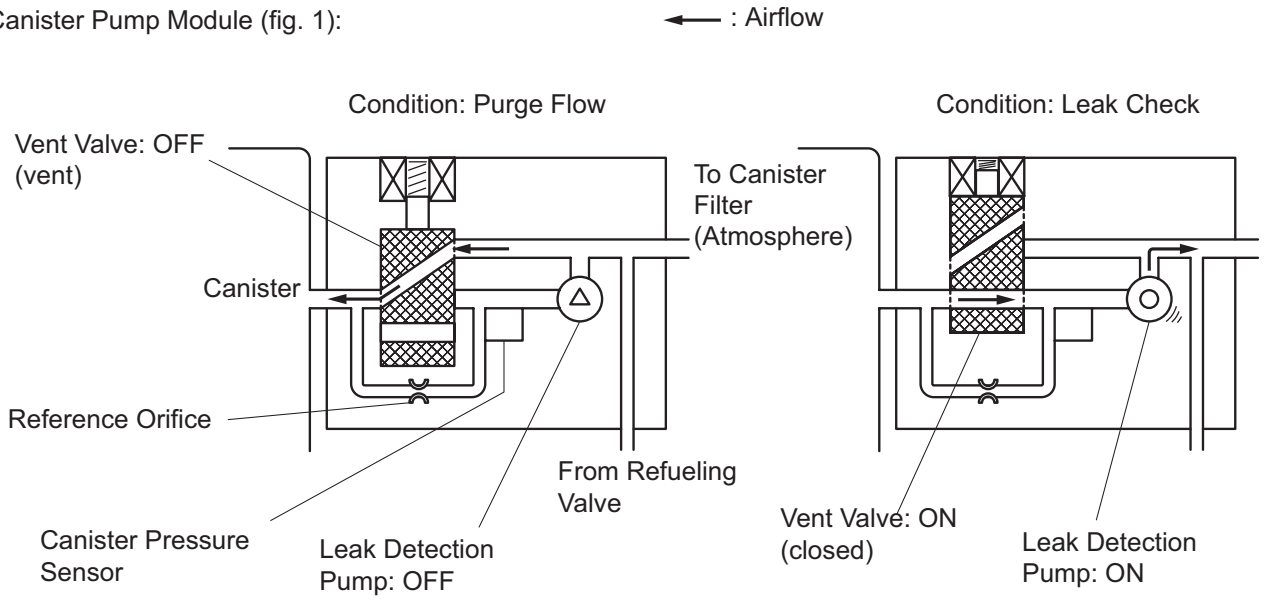


Y

A122571E01

Components	Operations
Canister	Contains activated charcoal to absorb EVAP (Evaporative Emissions) generated in fuel tank.
Cut-off valve	Located in fuel tank. Valve floats and closes when fuel tank 100 % full.
Purge VSV (Vacuum Switching Valve)	Opens or closes line between canister and intake manifold. ECM uses purge VSV to control EVAP purge flow. In order to discharge EVAP absorbed by canister to intake manifold, ECM opens purge VSV. EVAP discharge volume to intake manifold controlled by purge VSV duty cycle ratio (current-carrying time). (Open: ON, Close: OFF)
Refueling valve	Controls EVAP pressure from fuel tank to canister. Valve consists of diaphragm, spring and restrictor (diameter: 0.08 inch). When fuel vapor and pressure inside fuel tank increase, valve opens. While EVAP purged, valve closes and restrictor prevents large amount of vacuum from affecting pressure in fuel tank. Valve opened while refueling. When valve open, adding fuel into fuel tank possible.
Roll-over valve	Located in fuel tank. Valve closes by its own weight when vehicle overturns to prevent fuel from spilling out.
Soak timer	Built into ECM. To ensure accurate EVAP monitor, measures 5 hours (+-15 min) after ignition switch turned OFF. This allows fuel to cool down, stabilizing fuel tank pressure. When approx 5 hours elapsed, ECM activates (refer to fig. 3).
Canister pump module	Consists of (a) to (d) below. Canister pump module cannot be disassembled.
(a) Vent valve	Vents and closes EVAP system. When ECM turns valve ON, EVAP system closed. When, ECM turns valve OFF, EVAP system vented. Negative pressure (vacuum) created in EVAP system to check for EVAP leaks by closing purge VSV, turning on vent valve (closed) and operating leak detection pump (refer to fig. 1).
(b) Canister pressure sensor	Indicates pressure as voltages. ECM supplies regulated 5 V to canister pressure sensor, and uses feedback from sensor to monitor EVAP system pressure (refer to fig. 2).
(c) Leak detection pump	Creates negative pressure (vacuum) in EVAP system for leak check.
(d) Reference orifice	Has opening with 0.02 inch diameter. Vacuum produced through orifice by closing purge VSV, turning off vent valve and operating leak detection pump, to monitor 0.02 inch leak criterion. 0.02 inch leak criterion indicates small leak of EVAP.

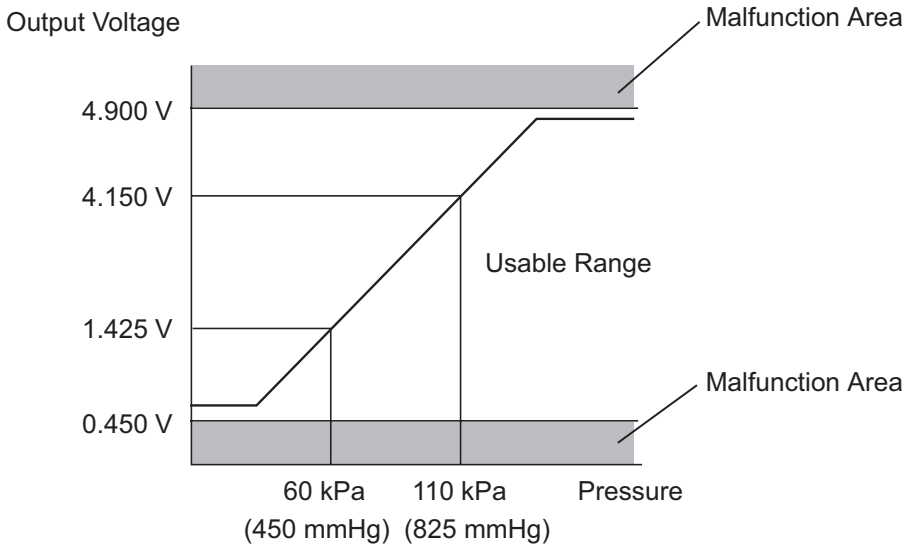
Canister Pump Module (fig. 1):



Y

A115902E01

Canister Pressure Sensor Specification (fig. 2):

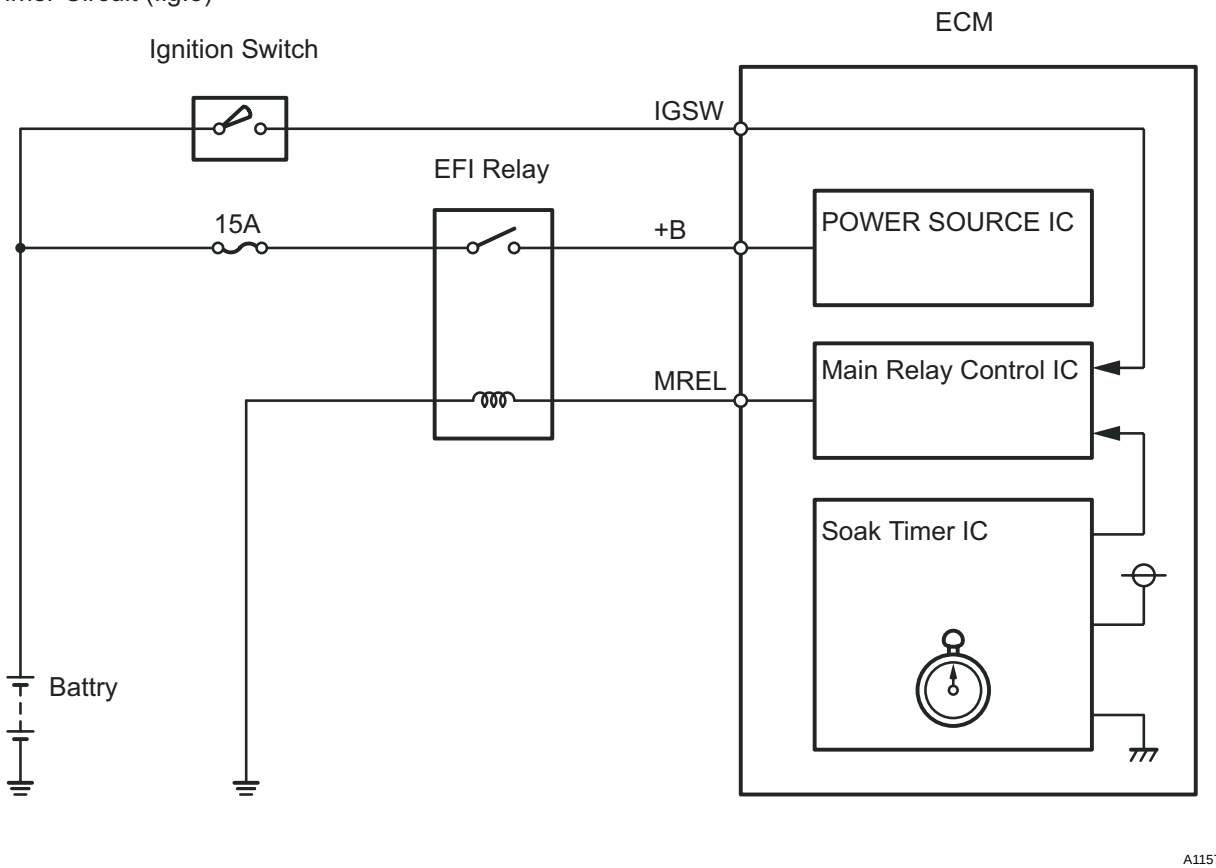


HINT:

Standard atmospheric pressure is 101.3 kPa (760 mmHg)

A115543E07

Soak Timer Circuit (fig.3)



WIRING DIAGRAM

Refer to DTC P0450 (See page ES-226).

NOTICE:

An intelligent tester is required to conduct the following diagnostic troubleshooting procedure.

HINT:

- Using an intelligent tester monitor results enables the EVAP (Evaporative Emission) system to be confirmed.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	**CONFIRM DTC**

(a) Turn the ignition switch OFF and wait for 10 seconds.
(b) Turn the ignition switch ON.
(c) Turn the ignition switch OFF and wait for 10 seconds.
(d) Connect an intelligent tester to the DLC3.
(e) Turn the ignition switch ON and turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Confirm DTCs and freeze frame data.
If any EVAP system DTCs are set, the malfunctioning area can be determined using the table below.

DTCs / Malfunctioning Areas	P043E P043F	P0441	P0450	P0451	P0452	P0453	P0455	P0456	P2401 P2402	P2419	P2420

2	PERFORM EVAP SYSTEM CHECK (AUTO OPERATION)

NOTICE:
- **The EVAP SYSTEM CHECK (AUTO OPERATION) consists of five steps performed automatically by the intelligent tester. It takes a maximum of approximately 18 minutes.**
- **Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90 % full because the cut-off valve may be closed and making the leak check of the fuel tank unavailable.**
- **Do not run the engine in this step.**

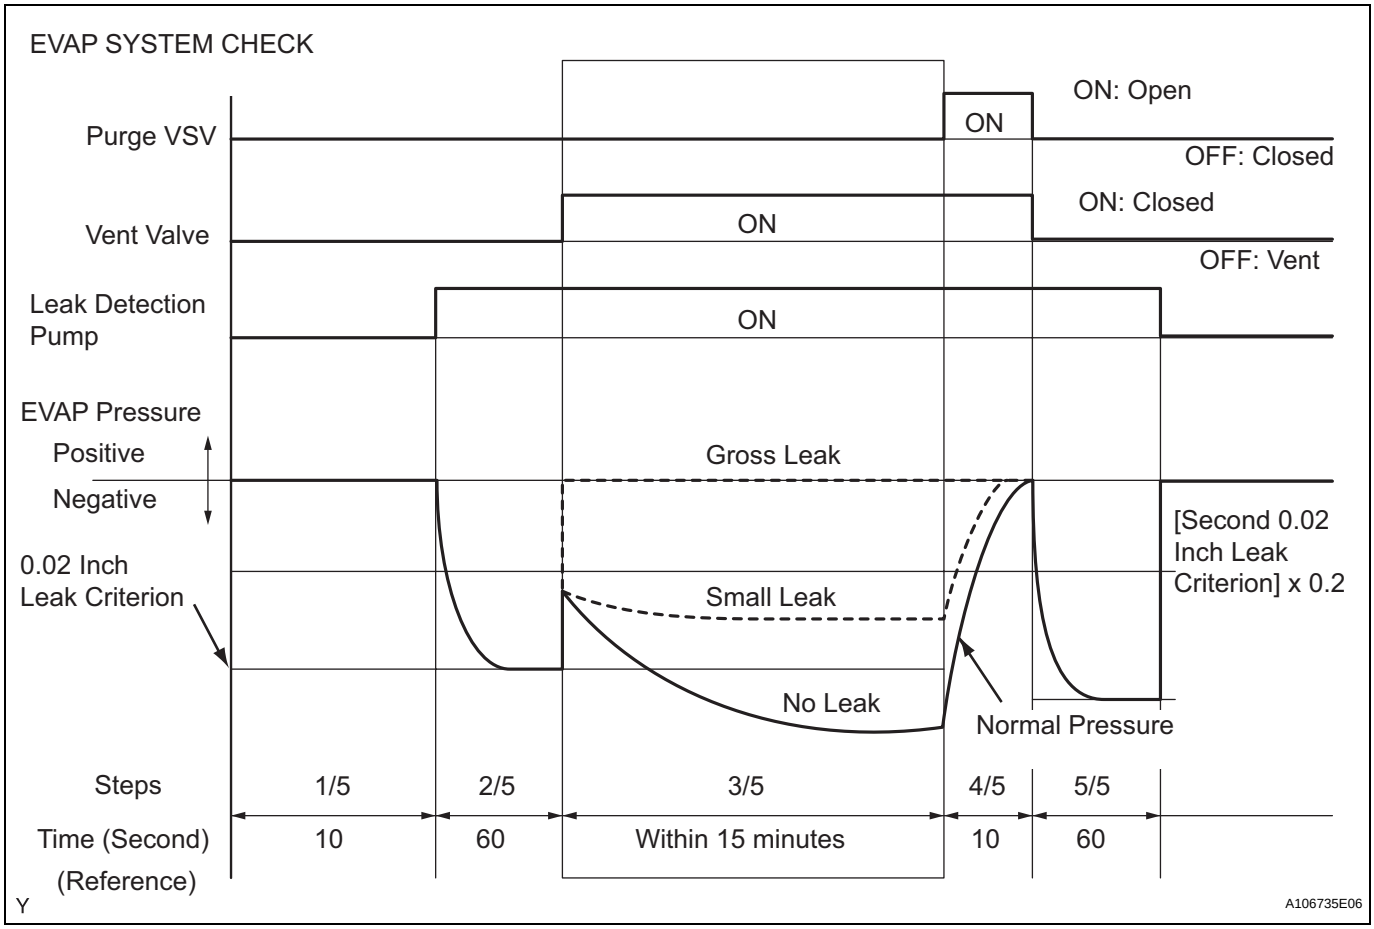
- **When the temperature of the fuel is 35°C(95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).**

(a) Clear DTCs (See page ES-38).
(b) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / AUTO OPERATION.
(c) After the EVAP SYSTEM CHECK is completed, check for pending DTCs by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
HINT:
If no pending DTC is displayed, perform the MONITOR CONFIRMATION (see "Diagnostic Help" menu). After this confirmation, check for pending DTCs. If no DTC is displayed, the EVAP system is normal.

ES

NEXT

3	PERFORM EVAP SYSTEM CHECK (MANUAL OPERATION)



NOTICE:

- **In the EVAP SYSTEM CHECK (MANUAL OPERATION), the series of 5 EVAP SYSTEM CHECK steps are performed manually by the intelligent tester.**

- **Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90 % full because the cut-off valve may be closed and making the leak check of the fuel tank unavailable.**
- **Do not run the engine in this step.**
- **When the temperature of the fuel is 35°C(95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).**

(a) Clear DTCs (See page ES-38).

(b) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / MANUAL OPERATION.

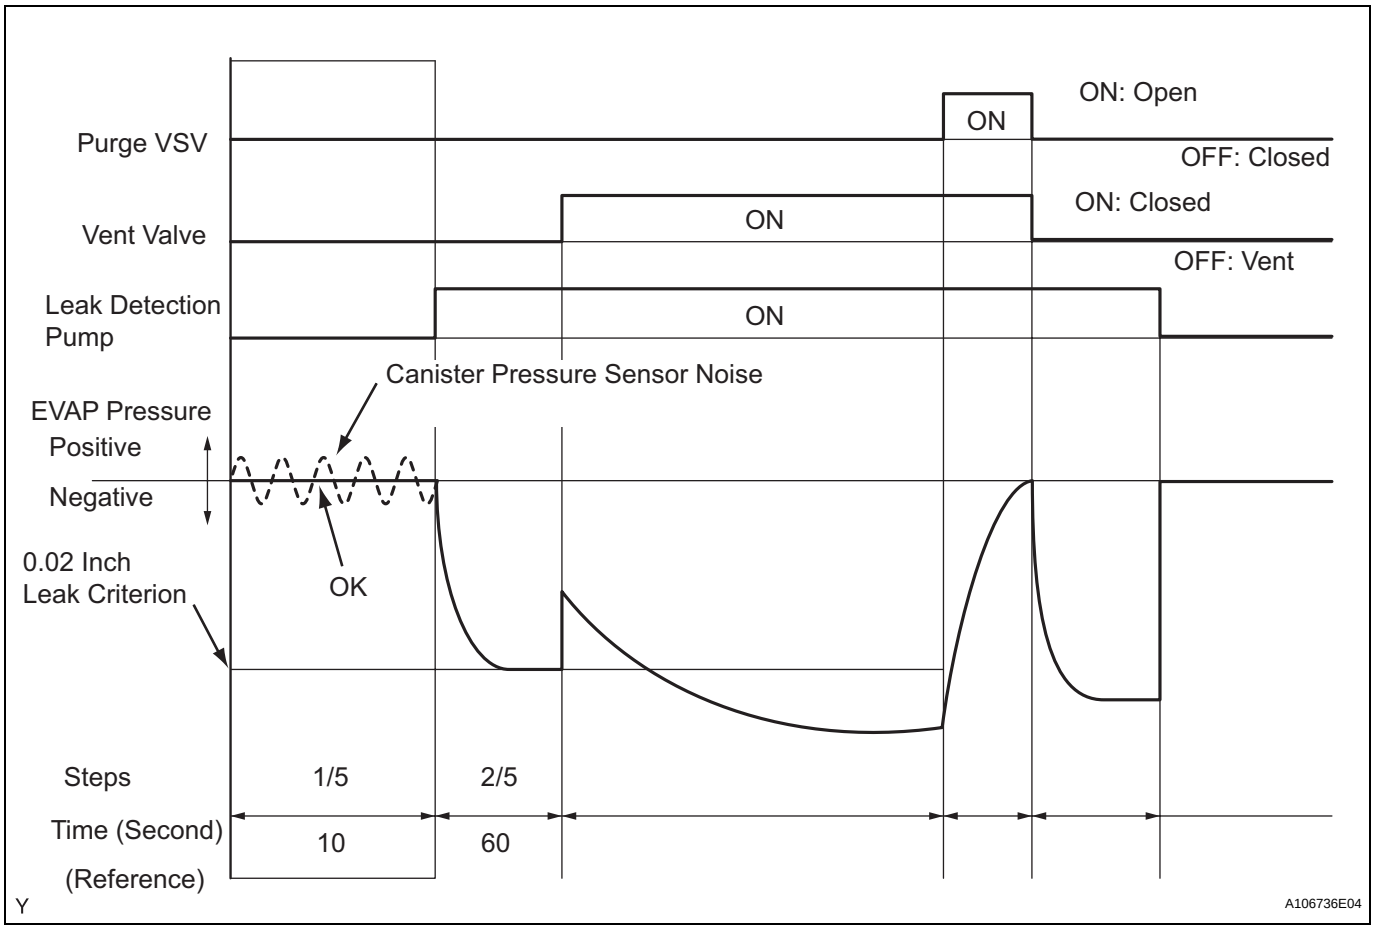
NEXT

4	PERFORM EVAP SYSTEM CHECK (STEP 1/5)



(a) Check the EVAP pressure in step 1/5.

Result

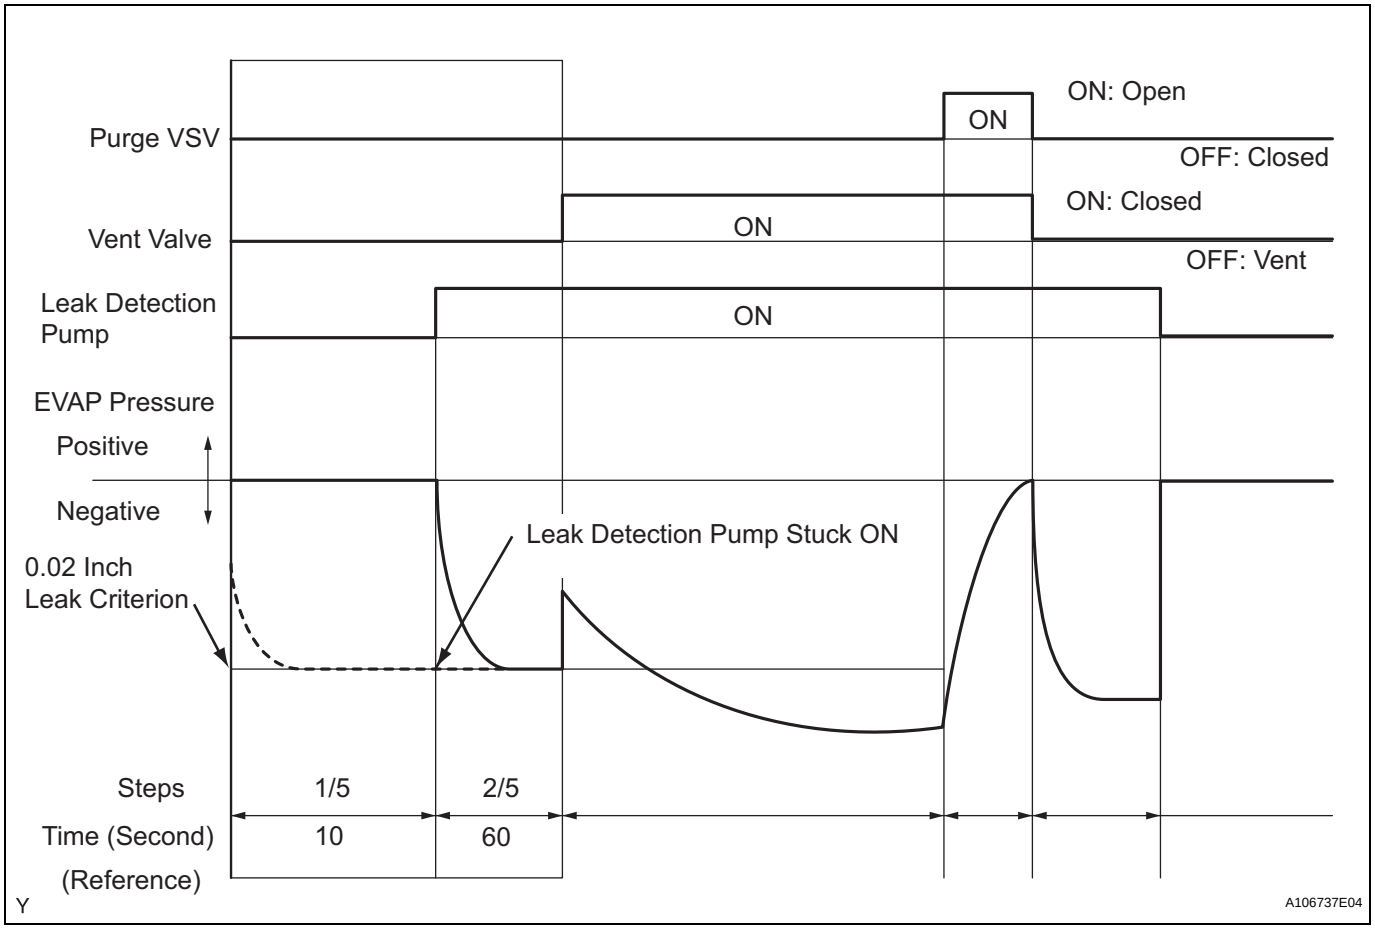
DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	Virtually no variation in EVAP pressure	Not yet determined	A
P0451	EVAP pressure fluctuates by +-0.3 kPa (2.25 mmHg) or more	Canister pressure sensor noise	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in step 1.

B → Go to step 30

A

5	PERFORM EVAP SYSTEM CHECK (STEP 1/5 TO 2/5)



(a) Check the EVAP pressure in steps 1/5 and 2/5.

Result

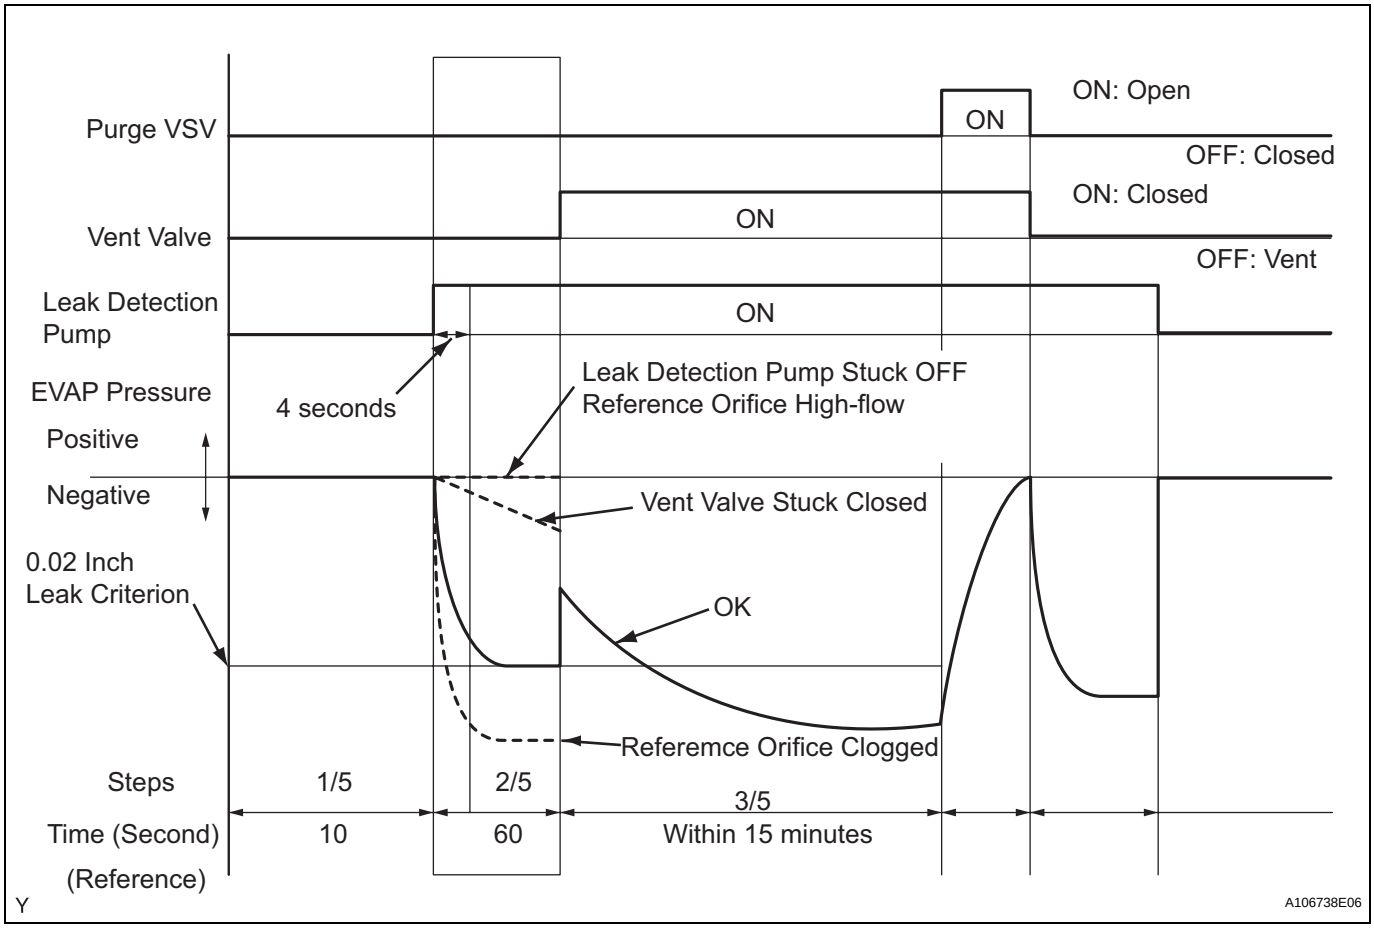
DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	Virtually no variation in EVAP pressure during step 1/5. Then decreases to 0.02 inch leak criterion*	Not yet determined	A
P2402	Small difference between EVAP pressures during steps 1/5 and 2/5	Leak detection pump stuck ON	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in step 1.
HINT:
The first 0.02 inch leak criterion is the value determined in step 2/5.

B → Go to step 23

A

6	PERFORM EVAP SYSTEM CHECK (STEP 2/5)



HINT:
Make a note of the pressures checked in steps (a) and (b) below.
(a) Check the EVAP pressure 4 seconds after the leak detection pump is activated*.
(b) Check the EVAP pressure again when it has stabilized. This pressure is the 0.02 inch leak criterion.
*: The leak detection pump begins to operate as step 1/5 is proceeded to step 2/5.

Result

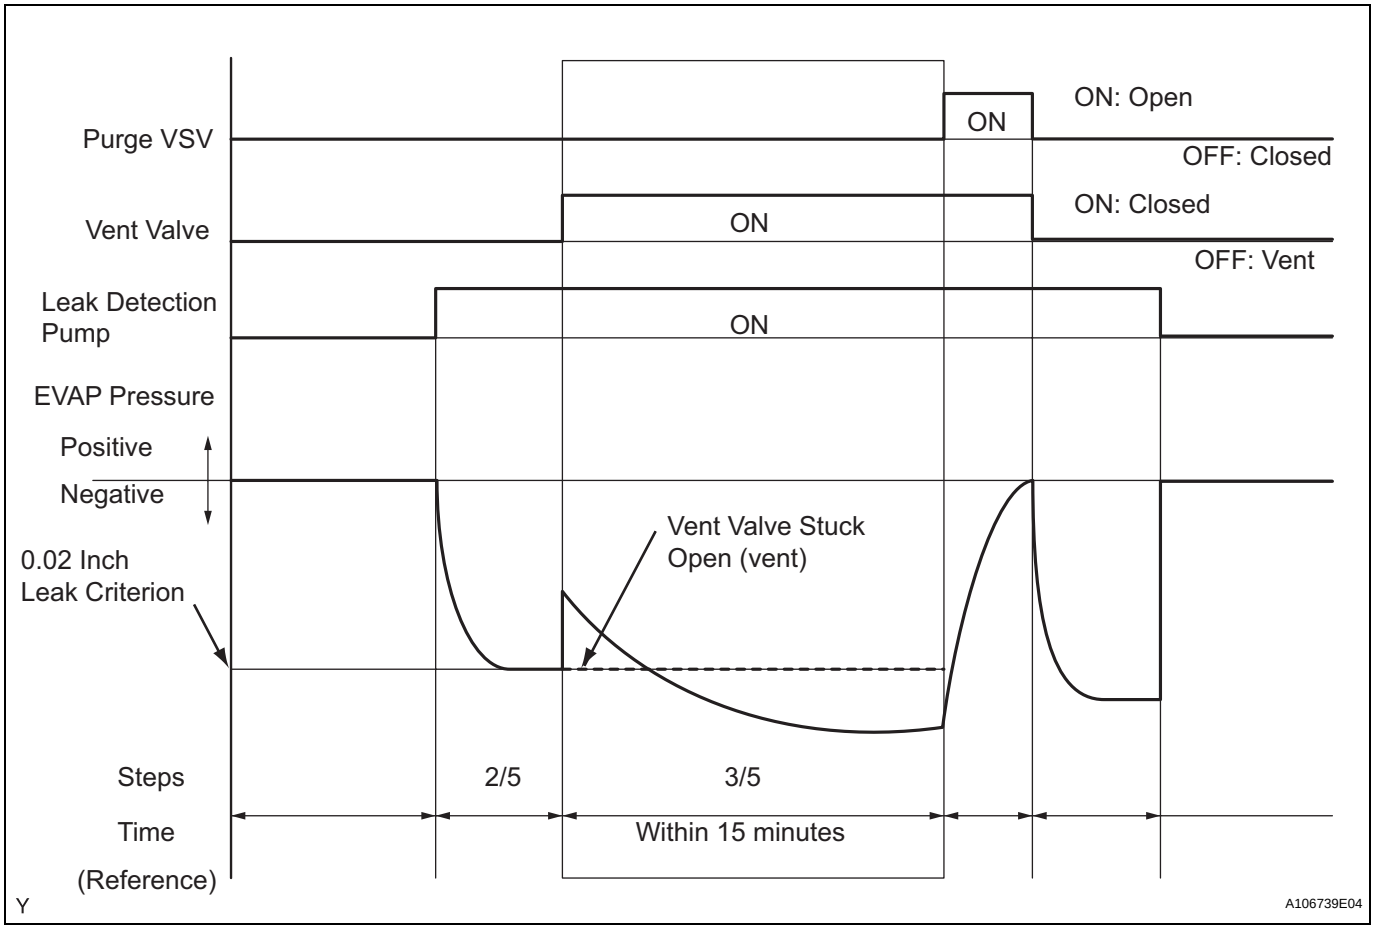
DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	EVAP pressure in step (b) between -4.85 kPa and -1.06 kPa (-36.38 mmHg and -7.95 mmHg)	Not yet determined	A
P043F and P2401	EVAP pressure in step (b) -1.06 kPa (-7.95 mmHg) or more	• Reference orifice high-flow • Leak detection pump stuck OFF	B
P043E	EVAP pressure in step (b) below -4.85 kPa (-36.38 mmHg)	Reference orifice clogged	C
P2419	EVAP pressure in step (a) more than -1.06 kPa (-7.95 mmHg)	Vent valve stuck closed	D

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in step 1.

B	Go to step 11
C	Go to step 30
D	Go to step 19

A

7	PERFORM EVAP SYSTEM CHECK (STEP 2/5 TO 3/5)



(a) Check the EVAP pressure increase in step 3/5.

Result

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	EVAP pressure increases by 0.3 kPa (2.25 mmHg) or more within 10 seconds of proceeding from step 2/5 to step 3/5	Not yet determined	A
P2420	No variation in EVAP pressure despite proceeding from step 2/5 to step 3/5	Vent valve stuck open (vent)	B
P0451	No variation in EVAP pressure during steps 1/5 through 3/5	Canister pressure sensor malfunction stuck	C

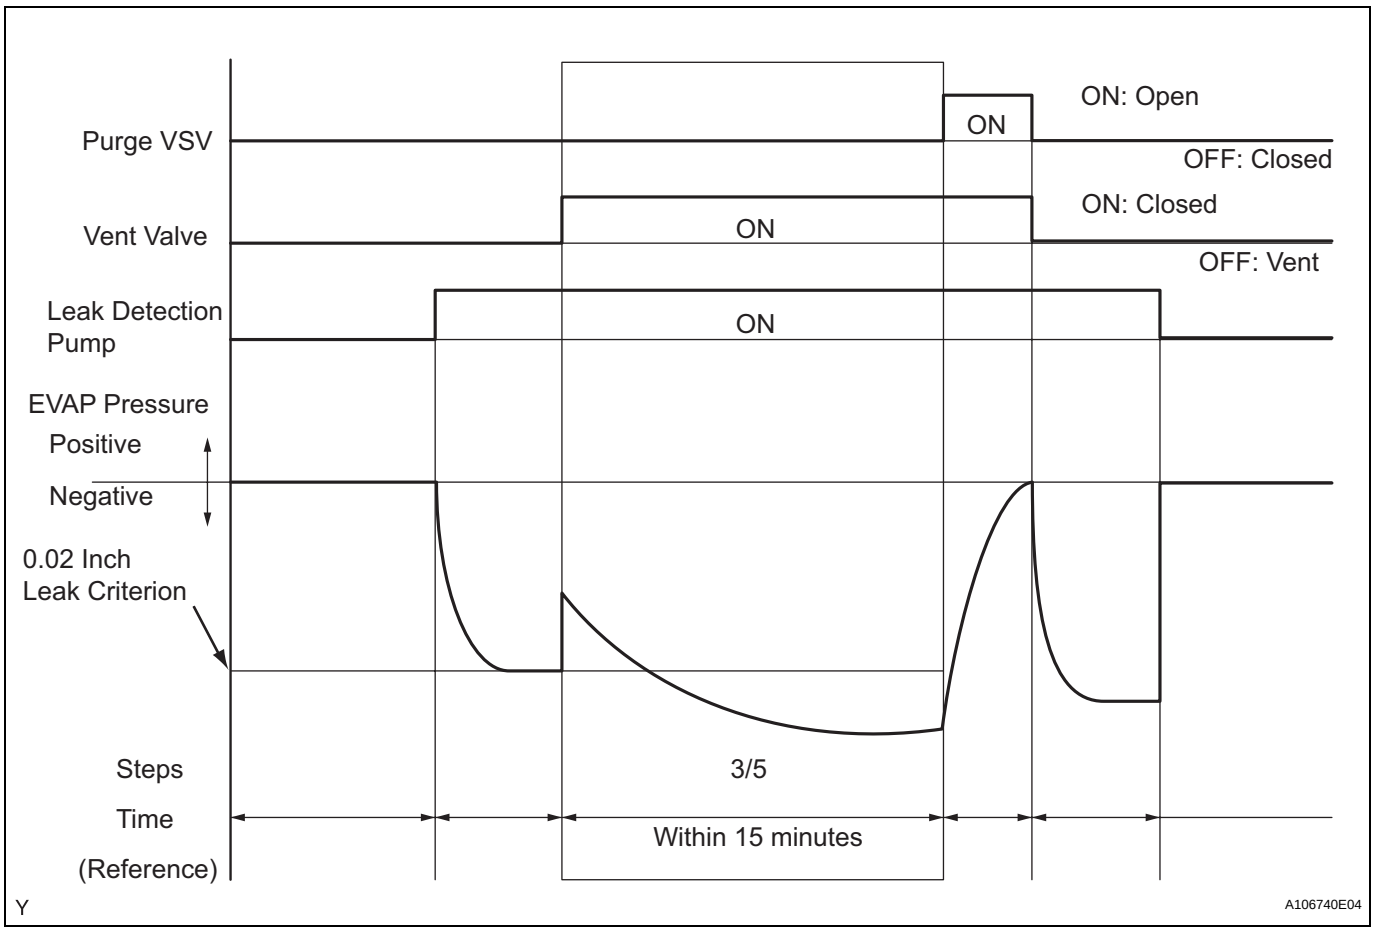
*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in step 1.

B	Go to step 20

C → Go to step 30

A

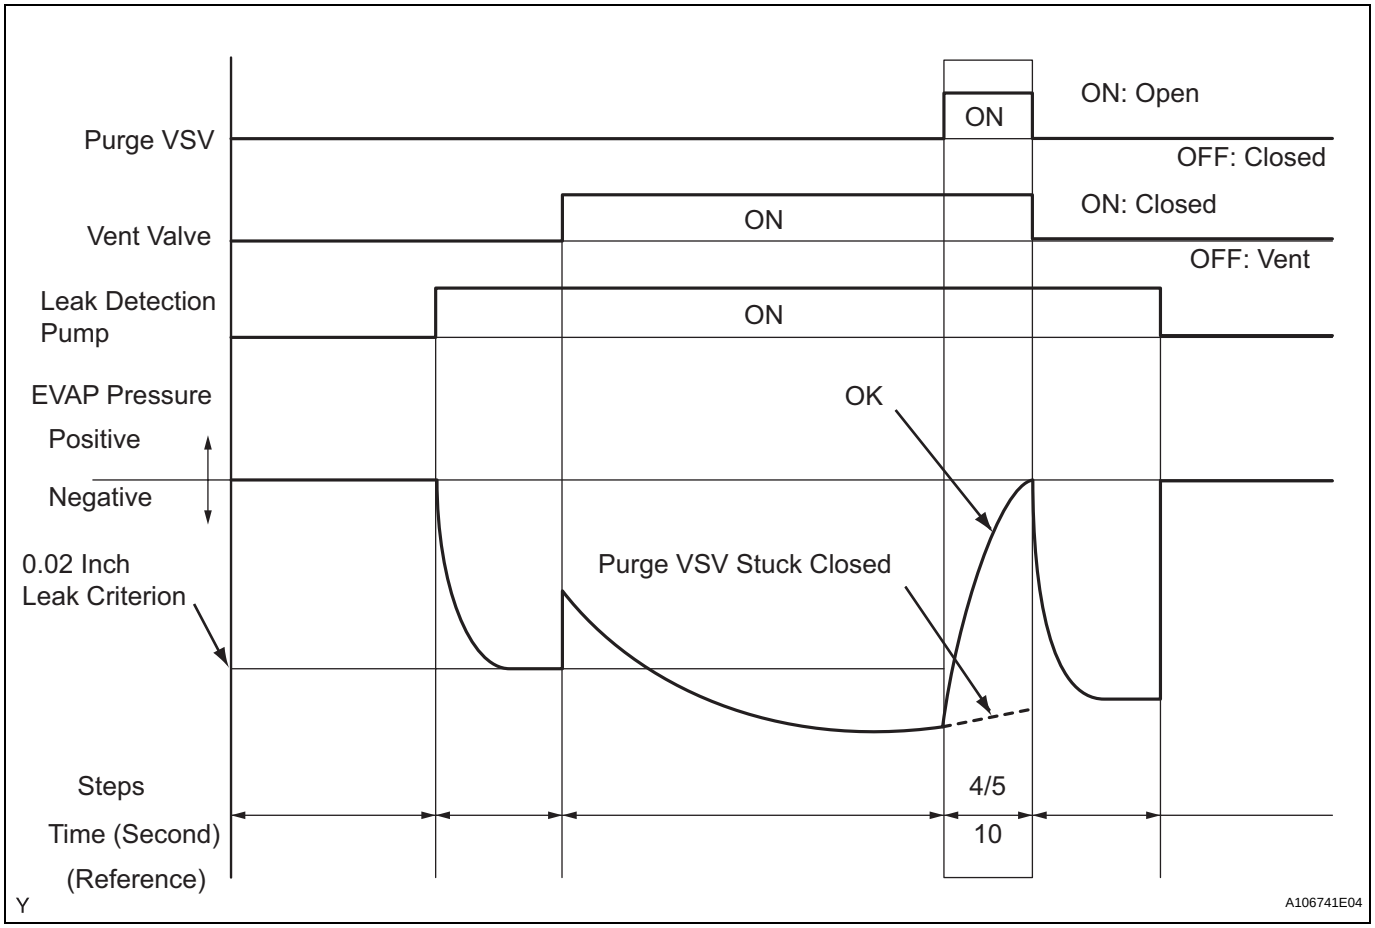
8	PERFORM EVAP SYSTEM CHECK (STEP 3/5)



(a) Wait until the EVAP pressure change is less than 0.1 kPa (0.75 mmHg) for 30 seconds.
(b) Measure the EVAP pressure and record it.
HINT:
A few minutes are required for the EVAP pressure to become saturated. When there is little fuel in the fuel tank, it takes up to 15 minutes (900 seconds).

NEXT

9	PERFORM EVAP SYSTEM CHECK (STEP 4/5)



(a) Check the EVAP pressure in step 4/5.

Result

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	EVAP pressure increases by 0.3 kPa (2.25 mmHg) or more within 10 seconds of proceeding from step 3/5 to step 4/5	Not yet determined	A
P0441	EVAP pressure increases by 0.3 kPa (2.25 mmHg) or more within 10 seconds of proceeding from step 3/5 to step 4/5	Problems in EVAP hose between purge VSV and intake manifold	B
P0441	Variation in EVAP pressure less than 0.3 kPa (2.25 mmHg) for 10 seconds, after proceeding from step 3/5 to step 4/5	Purge VSV stuck closed	C

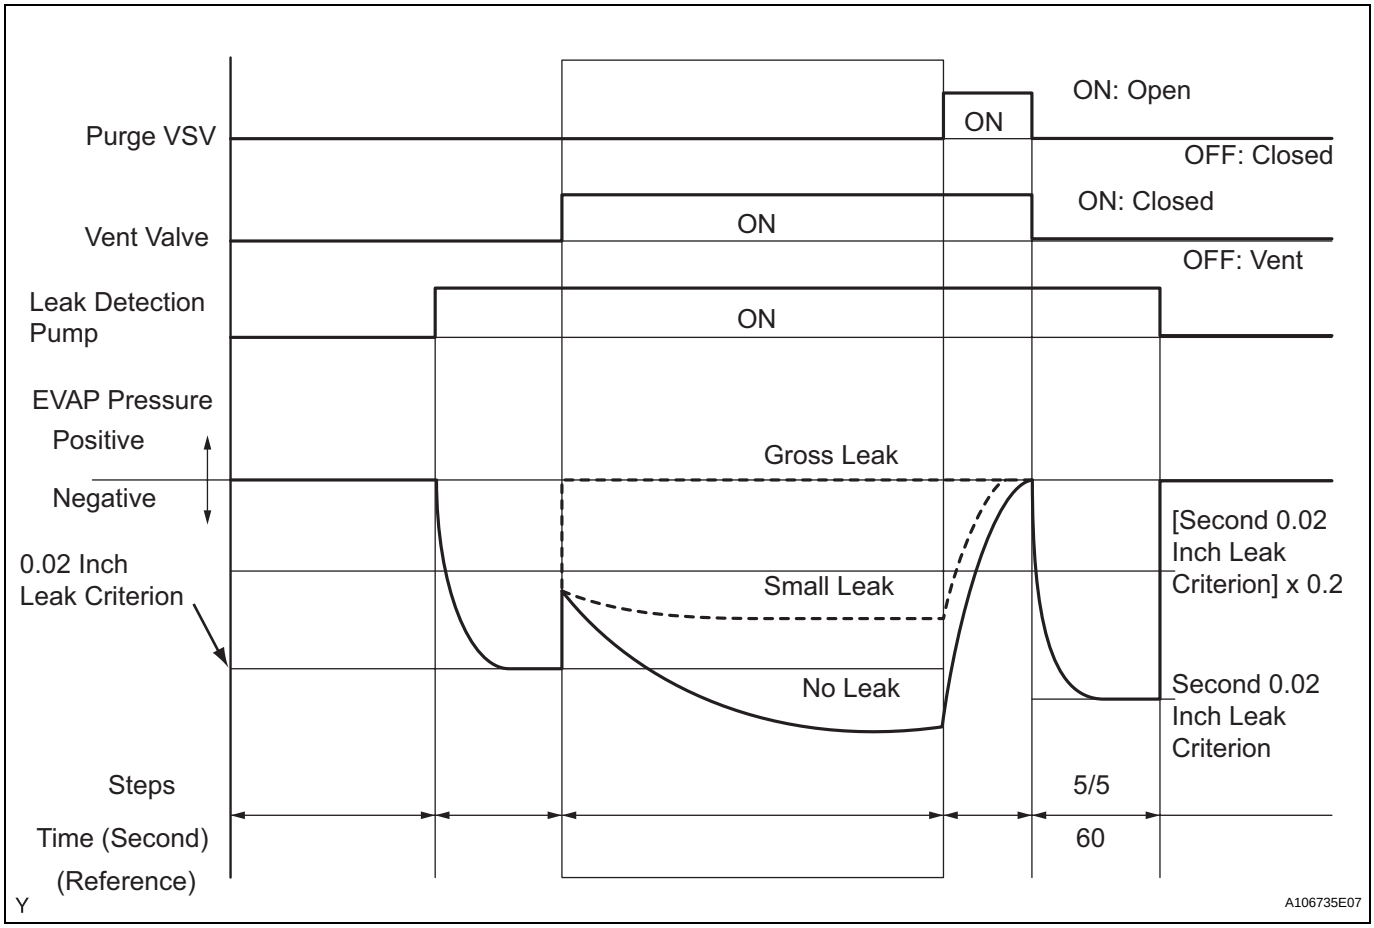
*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in step 1.

B → Go to step 15

C → Go to step 12

A

10	PERFORM EVAP SYSTEM CHECK (STEP 5/5)



(a) Check the EVAP pressure in step 5/5.
(b) Compare the EVAP pressure in step 3/5 and the second 0.02 inch leak criterion (step 5/5).

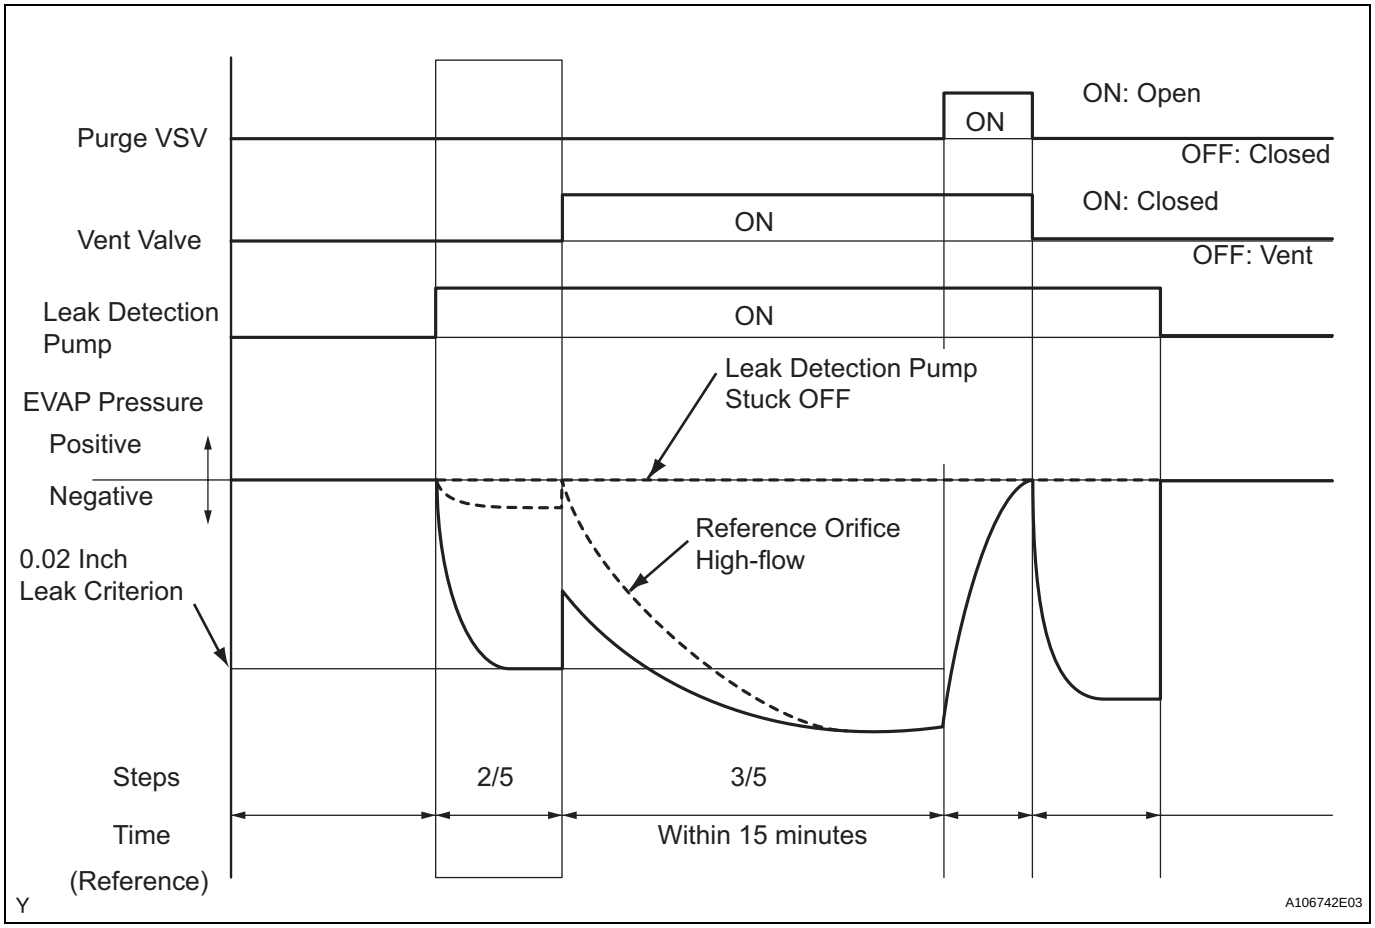
Result

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	EVAP pressure (step 3/5) lower than second 0.02 inch leak criterion (step 5/5)	Not yet determined (no leakage from EVAP system)	A
P0441 and P0455	EVAP pressure (step 3/5) higher than [second 0.02 inch leak criterion (step 5/5) x 0.2]	• Purge VSV stuck open • EVAP gross leak	B
P0456	EVAP pressure (step 3/5) higher than second 0.02 inch leak criterion (step 5/5)	EVAP small leak	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in step 1.

A	Go to step 36
B	Go to step 12

11	PERFORM EVAP SYSTEM CHECK (STEP 3/5)



(a) Check the EVAP pressure in step 3/5.

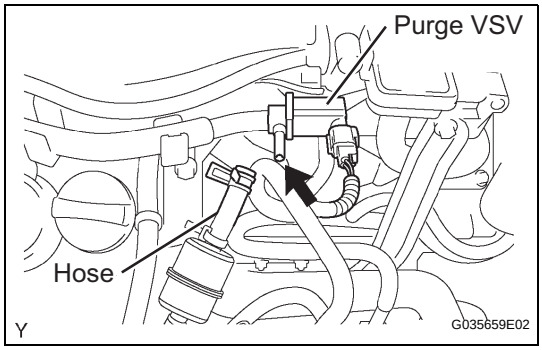
Result

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
P043F	EVAP pressure less than [0.02 inch leak criterion] measured at 2/5	Reference orifice high-flow	A
P2401	EVAP pressure almost same as [0.02 inch leak criterion] measured at 2/5	Leak detection pump stuck OFF	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in step 1.
HINT:
The first 0.02 inch leak criterion is the value determined in step 2/5.

A	Go to step 30
B	Go to step 23

12	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (PURGE VSV)



(a) Select the following menu items: DIAGNOSIS / ENHANCED OBD II/ ACTIVE TEST / EVAP VSV.
(b) Disconnect the hose (connected to the canister) from the purge VSV.
(c) Start the engine.
(d) Using the tester, turn off the purge VSV (EVAP VSV: OFF).
(e) Use your finger to confirm that the purge VSV has no suction.
(f) Using the tester, turn on the purge VSV (EVAP VSV: ON).
(g) Use your finger to confirm that the purge VSV has suction.

Result

Test Results	Suspected Trouble Areas	Proceed To
No suction when purge VSV turned OFF, and suction applied when turned ON	Purge VSV normal	A
Suction applied when purge VSV turned OFF	Purge VSV stuck open	B
No suction when purge VSV turned ON	• Purge VSV stuck closed • Problems with EVAP hose between purge VSV and throttle body	C

(h) Reconnect the hose.

B → **Go to step 14**

C → **Go to step 15**

A

13	CHECK FUEL CAP ASSEMBLY

(a) Check that the fuel cap is correctly installed and confirm the fuel cap meets OEM specifications.
(b) Confirm that the fuel cap is tightened until a few click sounds are heard.
HINT:
If an EVAP tester is available, check the fuel cap using the tester.
(1) Remove the fuel cap and install it onto a fuel cap adaptor.
(2) Connect an EVAP tester pump hose to the adaptor, and pressurize the cap to 3.2 to 3.7 kPa (24 to 28 mmHg) using an EVAP tester pump.
(3) Seal the adaptor and wait for 2 minutes.
(4) Check the pressure. If the pressure is 2 kPa (15 mmHg) or more, the fuel cap is normal.
(5) Reinstall the fuel cap.

Result

Test Results	Suspected Trouble Areas	Proceed To
Fuel cap correctly installed	-	A

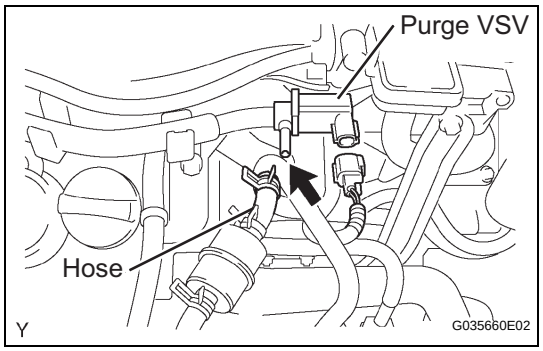
Test Results	Suspected Trouble Areas	Proceed To
Fuel cap loose	• Fuel cap improperly installed • Defective fuel cap • Fuel cap does not meet OEM specifications	B
No fuel cap	-	C

A → Go to step 29

B → Go to step 27

C → Go to step 28

14 INSPECT VACUUM SWITCHING VALVE ASSEMBLY NO.1



(a) Turn the ignition switch OFF.
(b) Disconnect the B19 purge VSV connector.
(c) Disconnect the hose (connected to the canister) from the purge VSV.
(d) Start the engine.
(e) Use your finger to confirm that the purge VSV has no suction.

Result

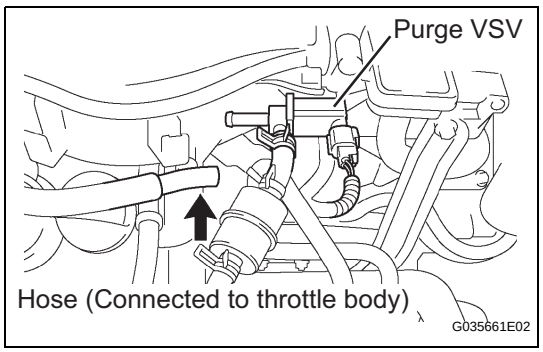
Test Results	Suspected Trouble Areas	Proceed To
No suction	ECM	A
Suction applied	Purge VSV	B

(f) Reconnect the purge VSV connector.
(g) Reconnect the hose.

A → Go to step 35

B → Go to step 31

15 CHECK EVAP HOSE (PURGE VSV - THROTTLE BODY)



(a) Disconnect the hose (connected to the throttle body) from the purge VSV.
(b) Start the engine.
(c) Use your finger to confirm that the hose has suction.

Result

Test Results	Suspected Trouble Areas	Proceed To
Suction applied	EVAP hose between purge VSV and throttle body normal	A

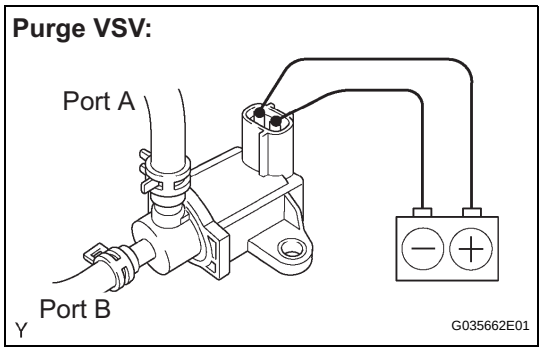
Test Results	Suspected Trouble Areas	Proceed To
No suction	• Throttle body • EVAP hose between purge VSV and throttle body	B

(d) Reconnect the hose.

B → Go to step 26

A

16 INSPECT VACUUM SWITCHING VALVE ASSEMBLY NO.1 (PURGE VSV)



(a) Remove the purge VSV.
(b) Apply battery voltage to the terminals of the purge VSV.
(c) Using an air gun, confirm that air flows from port A to port B.

Result

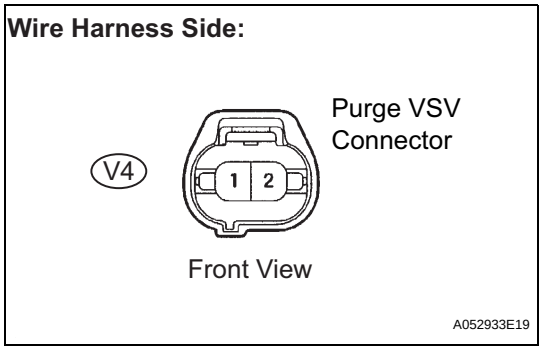
Test Results	Suspected Trouble Areas	Proceed To
Air flows	Purge VSV normal	A
No air flow	Purge VSV	B

(d) Reinstall the purge VSV.

B → Go to step 31

A

17 CHECK HARNESS AND CONNECTOR (POWER SOURCE OF PURGE VSV)



(a) Disconnect the V4 purge VSV connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between terminal 1 of the purge VSV connector and the body ground.

Result

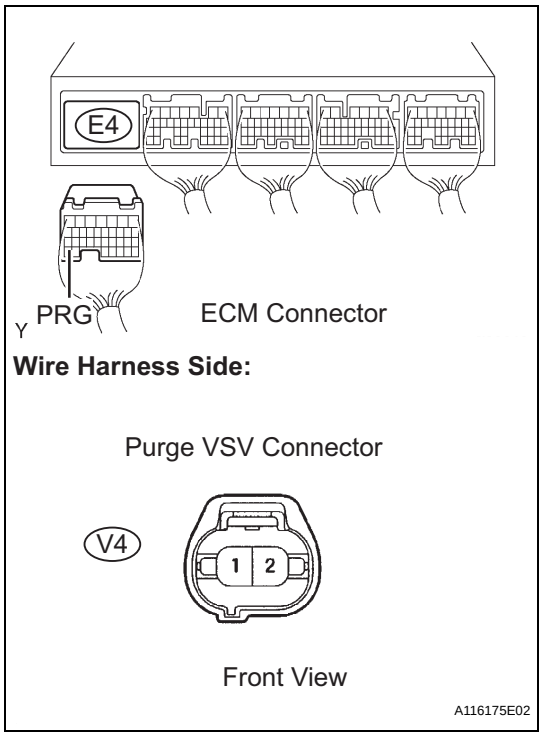
Test Results	Suspected Trouble Areas	Proceed To
Between 11 V and 14 V	Normal	A
Other than result above	Wire harness or connectors between purge VSV and ECM	B

(d) Reconnect the purge VSV connector.

B → Go to step 32

A

18 CHECK HARNESS AND CONNECTOR (PURGE VSV - ECM)



(a) Disconnect the E4 ECM connector and the V4 purge VSV connector.
(b) Check the resistance.
Standard Resistance

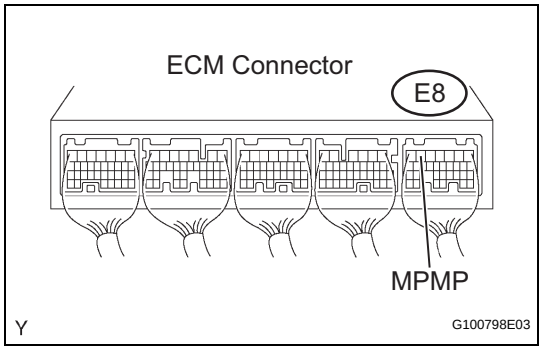
Tester Connections	Specified Conditions
E4-34 (PRG) - V4-2	Below 1 Ω
E4-34 (PRG) - Body ground	10 kΩ or higher
V4-2 - Body ground	10 kΩ or higher

(c) Reconnect the purge VSV connector.
(d) Reconnect the ECM connector.

OK	Go to step 35
NG	Go to step 32

ES

19 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FOR VENT VALVE)



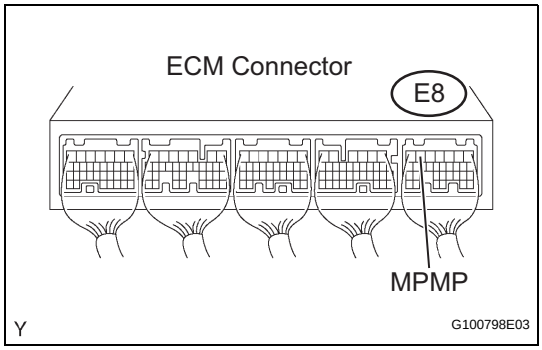
(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VENT VALVE (ALONE).
(d) Measure the voltage between terminal VPMP of the ECM connector and the body ground when the vent valve is turned ON (close) and OFF (vent) using the tester.

Result

Test Results	Suspected Trouble Areas	Proceed To
Between 9 V and 14 V when OFF Below 3 V when ON	Vent valve	A
Below 3 V when OFF and ON	ECM	B

A	Go to step 22
B	Go to step 35

20	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FOR VENT VALVE)



(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VENT VALVE (ALONE).
(d) Measure the voltage between terminal VPMP of the ECM connector and the body ground when the vent valve is turned ON (close) and OFF (vent) using the tester.

ES

Result

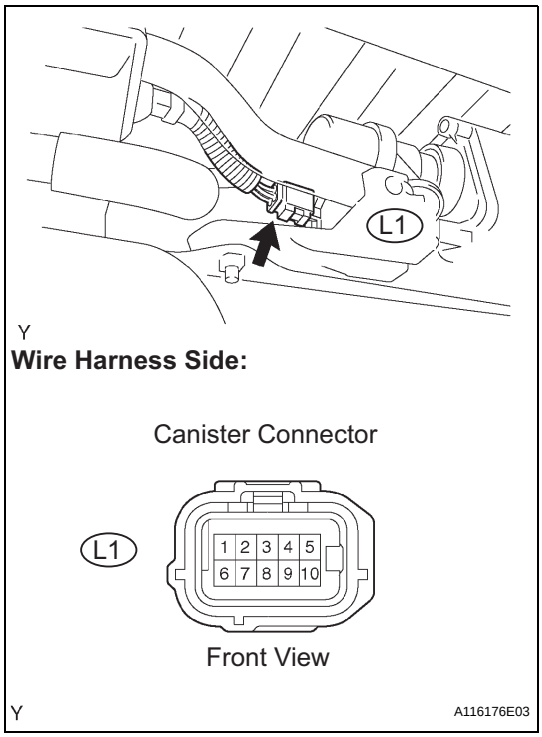
Test Results	Suspected Trouble Areas	Proceed To
Below 3 V when OFF and ON	Power source of vent valve	A
Between 9 V and 14 V when OFF Below 3 V when ON	Vent valve	B
Between 9 V and 14 V when OFF and ON	ECM	C

B → Go to step 22

C → Go to step 35

A

21	INSPECT CANISTER PUMP MODULE (POWER SOURCE FOR VENT VALVE)



(a) Turn the ignition switch OFF.
(b) Disconnect the L1 canister connector.
(c) Turn the ignition switch ON.
(d) Measure the voltage between terminal 9 of the canister connector and the body ground.

Result

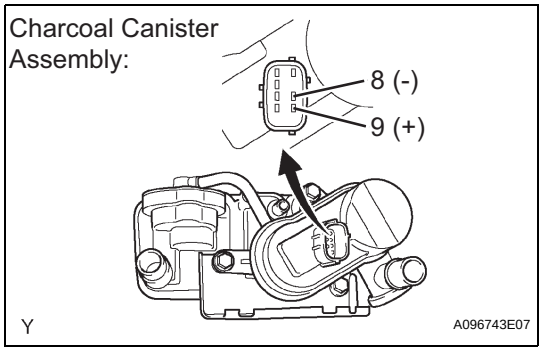
Test Results	Suspected Trouble Areas	Proceed To
Between 9 V and 14 V	Normal	A
Between 0 V and 3 V	Power source wire harness of vent valve	B

(e) Reconnect the canister connector.

B → **Go to step 32**

A

22 INSPECT CANISTER PUMP MODULE (VENT VALVE OPERATION)



(a) Turn the ignition switch OFF.
(b) Disconnect the L1 canister connector.
(c) Apply the battery voltage to terminals 9 and 8 of the canister pump module.
(d) Touch the canister pump module to confirm the vent valve operation.

Result

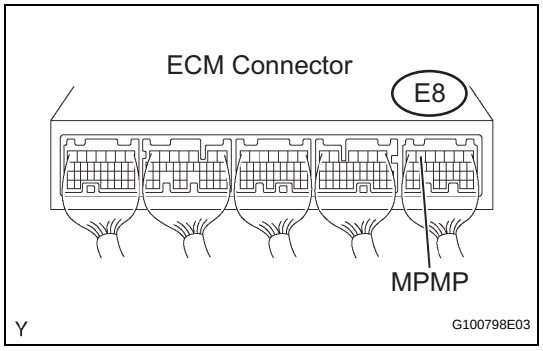
Test Results	Suspected Trouble Areas	Proceed To
Operating	Wire harness between vent valve and ECM	A
Not operating	Vent valve	B

(e) Reconnect the canister connector.

A → **Go to step 32**

B → **Go to step 30**

23 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FOR CANISTER PUMP MODULE (LEAK DETECTION PUMP))



(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VACUUM PUMP.
(d) Measure the voltage between terminal MPMP of the ECM connector and the body ground when the leak detection pump is turned ON and OFF using the tester.

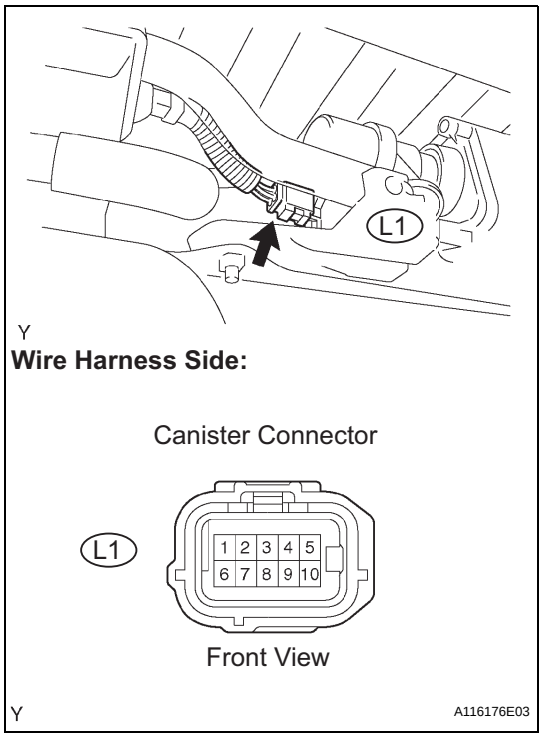
Result

Test Results	Suspected Trouble Areas	Proceed To
Between 0 V and 3 V when OFF Between 9 V and 14 V when ON	ECM normal	A
Between 9 V and 14 V when OFF Between 0 V and 3 V when ON	ECM	B

B → Go to step 35

A

24 CHECK HARNESS AND CONNECTOR (CANISTER PUMP MODULE - ECM)



(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch OFF.
(c) Disconnect the L1 canister connector.
(d) Turn the ignition switch ON and turn the tester ON.
(e) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VACUUM PUMP.
(f) Turn the leak detection pump ON.
(g) Measure the voltage between terminal 1 of the canister connector and the body ground.

Result

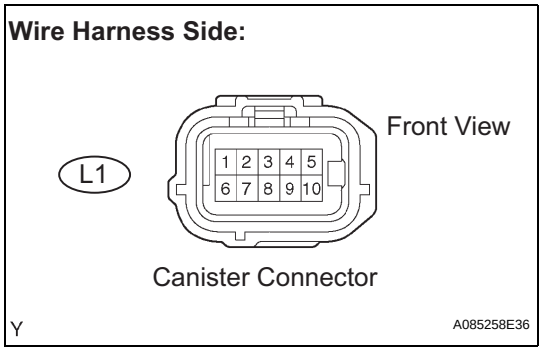
Test Results	Suspected Trouble Areas	Proceed To
Between 9 V and 14 V	Normal	A
Between 0 V and 3 V	Wire harness between ECM and leak detection pump	B

(h) Reconnect the canister connector.

B → Go to step 32

A

25 CHECK HARNESS AND CONNECTOR (CANISTER PUMP MODULE - GROUND)



(a) Disconnect the L1 canister connector.
(b) Turn the ignition switch OFF.
(c) Check the resistance between terminal 6 of the canister connector and the body ground.

Result

Test Results	Suspected Trouble Areas	Proceed To
Below 1 Ω	Leak detection pump	A
10 kΩ or more	Wire harness between leak detection pump and body ground	B

(d) Reconnect the canister connector.

A	Go to step 30
B	Go to step 32

26 INSPECT THROTTLE W/MOTOR BODY ASSEMBLY (EVAP PURGE PORT)

ES

(a) Stop the engine.
(b) Disconnect the EVAP hose from the throttle body.
(c) Start the engine.
(d) Use your finger to confirm that the port of the throttle body has suction.

Result

Test Results	Suspected Trouble Areas	Proceed To
Suction applied	EVAP hose between throttle body and purge VSV	A
No suction	Throttle body	B

(e) Reconnect the EVAP hose.

A	Go to step 33
B	Go to step 34

27 CORRECTLY REINSTALL OR REPLACE FUEL CAP ASSEMBLY

HINT:
- When reinstalling the fuel cap, tighten it until a few click sounds are heard.
- When replacing the fuel cap, use a fuel cap that meets OEM specifications, and install it until a few click sounds are heard.

NEXT	Go to step 37

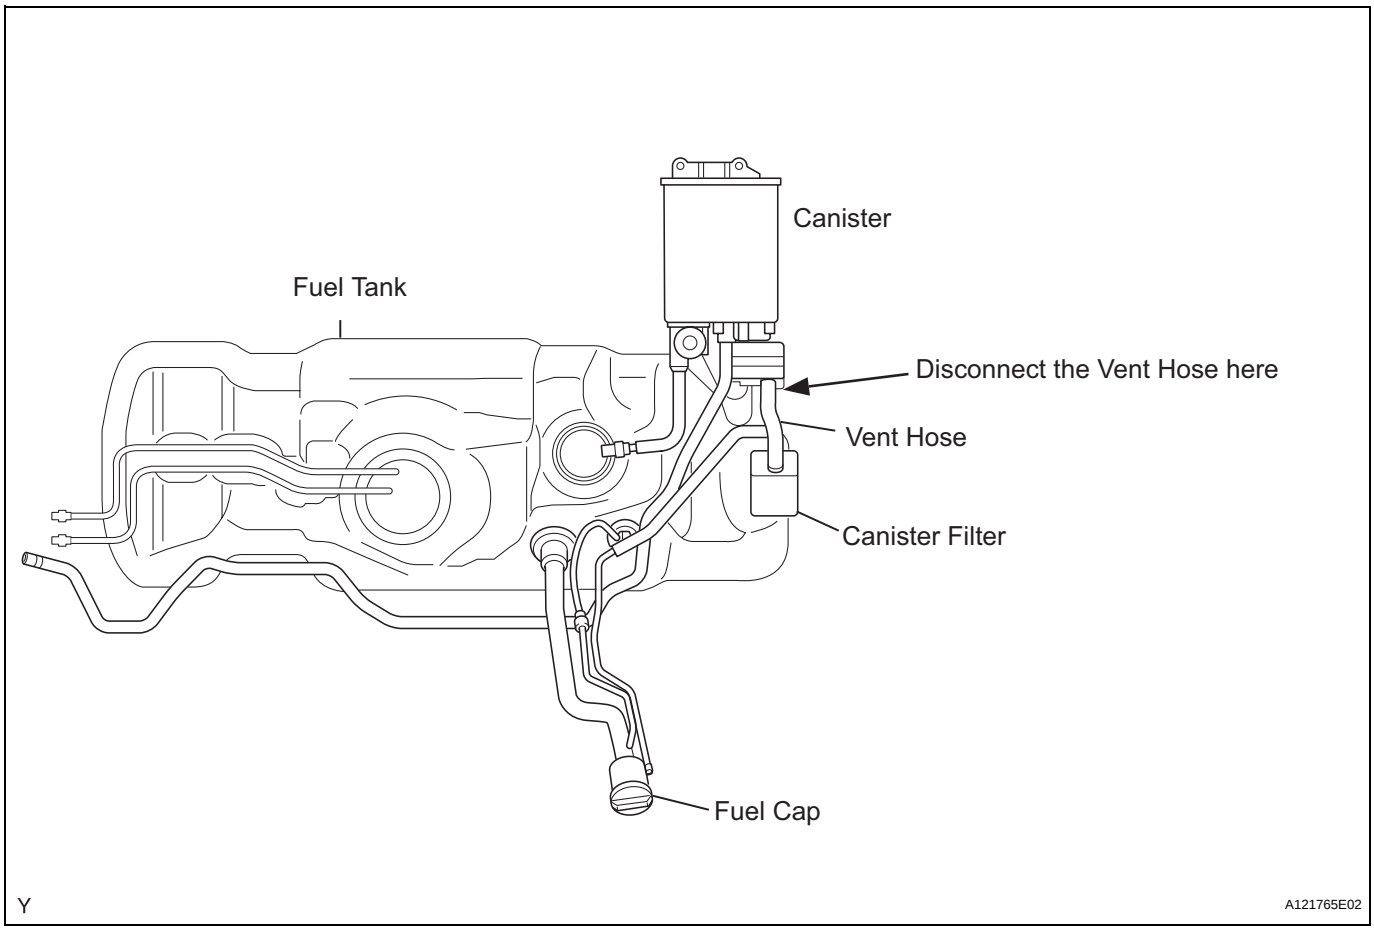
28 REPLACE FUEL CAP ASSEMBLY

HINT:
When installing the fuel cap, tighten it until a few click sounds are heard.

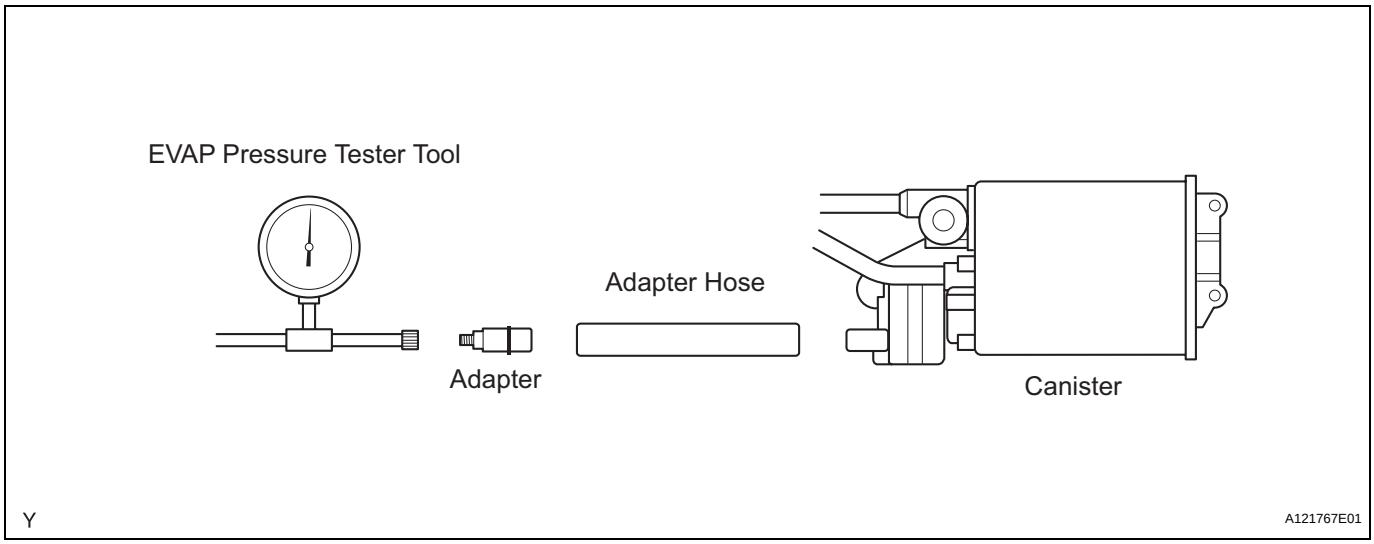
NEXT	Go to step 37

29 REPAIR LOCATE EVAP LEAK

(a) Reinstall the fuel cap.
(b) Disconnect the vent hose.



(c) Connect the EVAP pressure tester tool to the canister with the adapter.



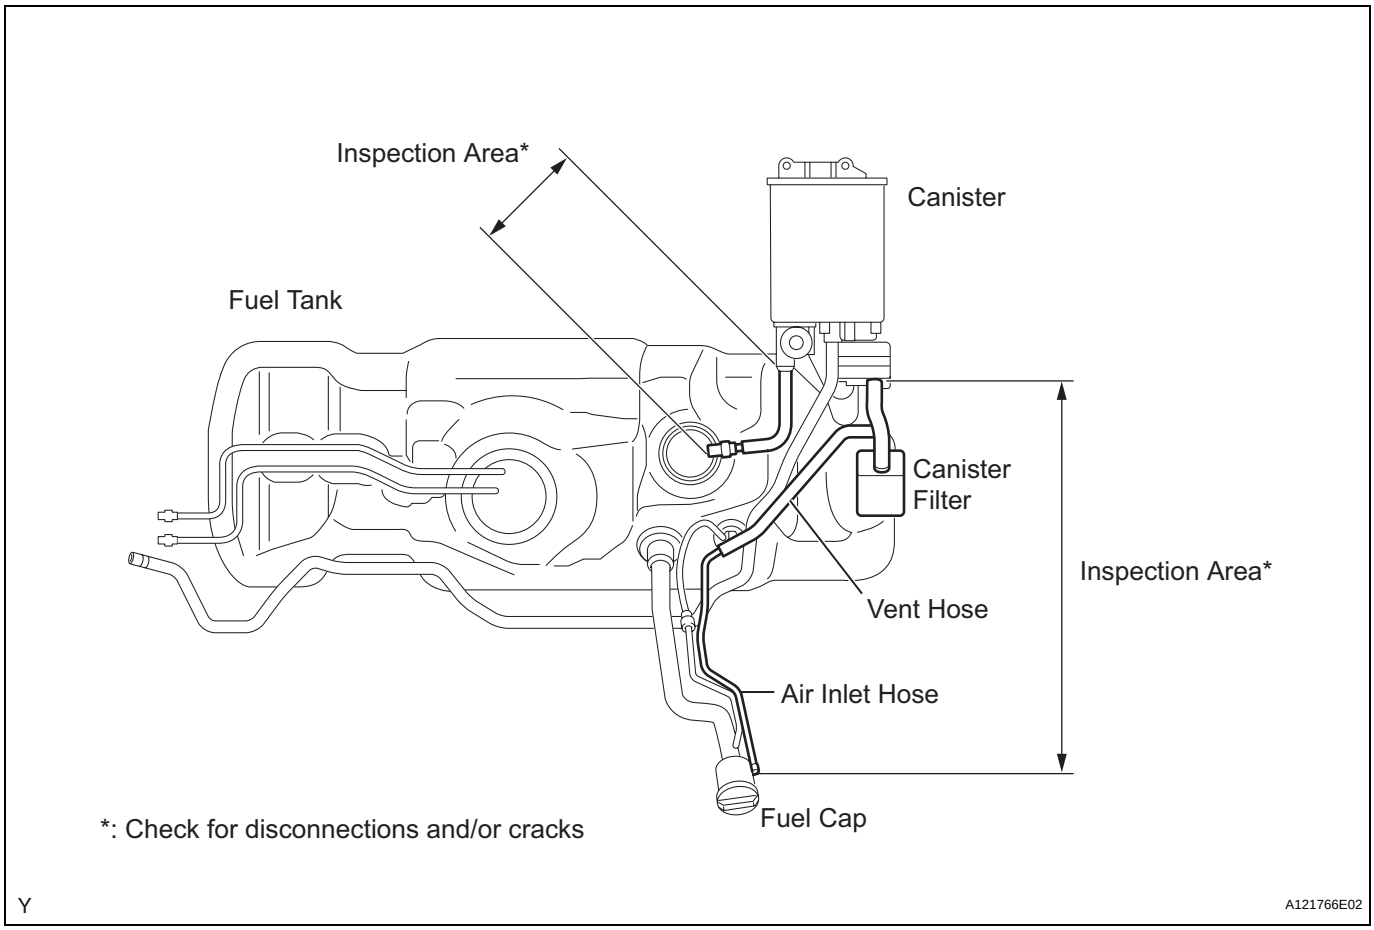
(d) Pressurize the EVAP system to 3.2 to 3.7 kPa (24 to 28 mmHg).
(e) Apply soapy water to the piping and connecting parts of the EVAP system.
(f) Look for areas where bubbles appear. This indicates leak point.
(g) Repair or replace the leak point.

HINT:
Disconnect the hose between the canister and the fuel tank from the canister. Block the canister side and conduct an inspection. In this way, the fuel tank can be excluded as an area suspected of causing fuel leaks.

NEXT	Go to step 37

30	REPLACE CANISTER ASSEMBLY

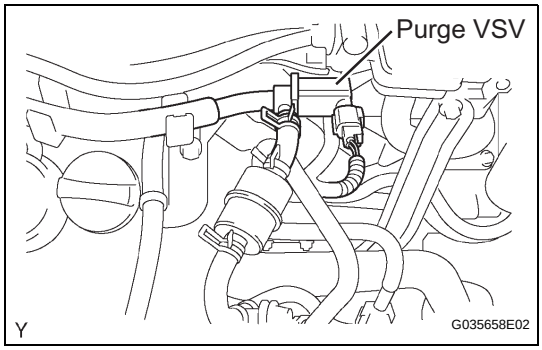
(a) Replace the canister assembly (See page EC-9).



NOTICE:
When replacing the canister, check the canister pump module interior and related pipes for water, fuel or other liquids. If liquids are present, check for disconnections and/or cracks in the following: 1) the pipe from the air inlet port to the canister pump module: 2) the canister filter; and 3) the fuel tank vent hose.

NEXT	Go to step 37

31	REPLACE VACUUM SWITCHING VALVE ASSEMBLY NO.1 (PURGE VSV)



(a) Disconnect the connector and the hoses from the purge VSV.
(b) Remove the purge VSV.
(c) Install a new purge VSV.
(d) Reconnect the connector and hoses.

NEXT → Go to step 37

ES

32	REPAIR OR REPLACE HARNESS AND CONNECTOR

NEXT → Go to step 37

33	REPLACE EVAP HOSE (THROTTLE BODY - PURGE VSV)

NEXT → Go to step 37

34	INSPECT THROTTLE W/MOTOR BODY ASSEMBLY

(a) Remove the throttle body (See page ES-414).
(b) Check that the EVAP purge port of the throttle body is not clogged. If necessary, replace the throttle body.

NEXT → Go to step 37

35	REPLACE ECM

(a) Replace the ECM (See page ES-428).

NEXT → Go to step 37

36	REPAIR OR REPLACE PARTS AND COMPONENTS INDICATED BY OUTPUT DTCS

(a) Repair the malfunctioning areas indicated by the DTCs that had been confirmed when the vehicle was brought in.

NEXT → Go to step 37

37	PERFORM EVAP SYSTEM CHECK (AUTO OPERATION)

NOTICE:

- **In the EVAP SYSTEM CHECK (AUTO OPERATION), the series of 5 EVAP SYSTEM CHECK steps is performed automatically. It takes a maximum of approximately 18 minutes.**
- **Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90 % full because the cut-off valve may be closed and making the leak check of the fuel tank unavailable.**
- **Do not run the engine in this step.**
- **When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing an EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).**

(a) Clear DTCs (See page ES-38).

(b) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / AUTO OPERATION.

(c) After the SYSTEM CHECK is completed, check for pending DTCs by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
HINT:
If no pending DTC is found, the repair has been successfully completed.

NEXT

COMPLETED

CONFIRMATION DRIVING PATTERN

HINT:
After a repair, check the Monitor Status by performing the Key-Off Monitor Confirmation and Purge Flow Monitor Confirmation described below.

1. Key-off monitor confirmation

(a) Preconditions
The monitor will not run unless:
- The vehicle has been driven for 10 minutes or more (in a city area or on a free way)
- The fuel tank is less than 90 % full
- The altitude is less than 8,000 ft (2,400 m)
- The Engine Coolant Temperature (ECT) is between 4.4°C to 35°C (40°F to 95°F)
- The Intake Air Temperature (IAT) is between 4.4°C to 35°C (40°F to 95°F)
- The vehicle remains stationary (the vehicle speed is 0 mph [0 km/h])

(b) Monitor Conditions
1. Allow the engine to idle for at least 5 minutes.
2. Turn the ignition switch OFF and wait for 6 hours (8 or 10.5 hours).
HINT:
Do not start the engine until checking MONITOR STATUS. If the engine is started, the steps described above must be repeated.

(c) Monitor Status
1. Connect an intelligent tester to the DLC3.
2. Turn the ignition switch ON and turn the tester ON.
3. Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR STATUS.
4. Check the Monitor Status displayed on the tester.
HINT:
If INCMP is displayed, the monitor is not completed. Make sure that the preconditions have been met, and perform the Monitor Conditions again.

2. Purge flow monitor confirmation (P0441)

HINT:
Perform this monitor confirmation after the Key-Off Monitor Confirmation shows COMPL (complete).

(a) Preconditions
The monitor will not run unless:
- The vehicle has been driven for 10 minutes or more (in a city area or on a free way)
- The ECT is between 4.4°C to 35°C (40°F to 95°F)
- The IAT is between 4.4°C to 35°C (40°F to 95°F)

(b) Monitor Conditions
1. Release the pressure from the fuel tank by removing and reinstalling the fuel cap.
2. Warm the engine up until the ECT reaches more than 75°C (167°F).
3. Increase the engine speed to 3,000 rpm once.
4. Allow the engine to idle and turn A/C ON for 1 minute.

(c) Monitor Status
1. Turn the ignition switch OFF (where ON or the engine is running).
2. Connect an intelligent tester to the DLC3.
3. Turn the ignition switch ON and turn the tester ON.
4. Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR STATUS.
5. Check the Monitor Status displayed on the tester.
HINT:
If INCMP is displayed, the monitor is not completed. Make sure that the preconditions have been met, and perform the Monitor Conditions again.

MONITOR RESULT

Detailed information on Checking Monitor Status (See page ES-38).

The test value and test limit information are described as shown in the following table. This information is included under MONITOR RESULT in the emissions-related DTC sections:
- MID (Monitor Identification Data) is assigned to each emissions-related component.
- TID (Test Identification Data) is assigned to each test value.
- Scaling is used to calculate the test value indicated on generic OBD II scan tools.

Thermostat

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
$3D	$C9	Multiply by 0.001 [kPa]	Test value for small leak (P0456) Refer to pressure D*	Minimum test limit for small leak	Maximum test limit for small leak
$3D	$CA	Multiply by 0.001 [kPa]	Test value for gross leak (P0455) Refer to pressure E*	Minimum test limit for gross leak	Maximum test limit for gross leak
$3D	$CB	Multiply by 0.001 [kPa]	Test value for leak detection pump stuck OFF (P2401) Refer to pressure A*	Minimum test limit for leak detection pump stuck OFF	Maximum test limit for leak detection pump stuck OFF
$3D	$CD	Multiply by 0.001 [kPa]	Test value for leak detection pump stuck ON (P2402) Refer to pressure A*	Minimum test limit for leak detection pump stuck ON	Maximum test limit for leak detection pump stuck ON
$3D	$CE	Multiply by 0.001 [kPa]	Test value for vent valve stuck OFF (vent) (P2420) Refer to pressure C*	Minimum test limit for vent valve stuck ON	Maximum test limit for vent valve stuck ON

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
$3D	$CF	Multiply by 0.001 [kPa]	Test value for vent valve stuck ON (P2419) Refer to pressure A*	Minimum test limit for vent valve stuck OFF	Maximum test limit for vent valve stuck OFF
$3D	$D0	Multiply by 0.001 [kPa]	Test value for reference orifice low flow (P043E) Refer to pressure B*	Minimum test limit for reference orifice low flow	Maximum test limit for reference orifice low flow
$3D	$D1	Multiply by 0.001 [kPa]	Test value for reference orifice high flow (P043F) Refer to pressure A*	Minimum test limit for reference orifice high flow	Maximum test limit for reference orifice high flow
$3D	$D4	Multiply by 0.001 [kPa]	Test value for purge VSV stuck closed (P0441) Refer to pressure F*	Minimum test limit for purge VSV stuck closed	Maximum test limit for purge VSV stuck closed
$3D	$D5	Multiply by 0.001 [kPa]	Test value for purge VSV stuck open (P0441) Refer to pressure E*	Minimum test limit for purge VSV stuck open	Maximum test limit for purge VSV stuck open
$3D	$D7	Multiply by 0.001 [kPa]	Test value for purge flow (P0441) Refer to pressure G*	Minimum test limit for purge flow	Maximum test limit for purge flow

* Pressures A to G are indicated as shown in the diagram below.

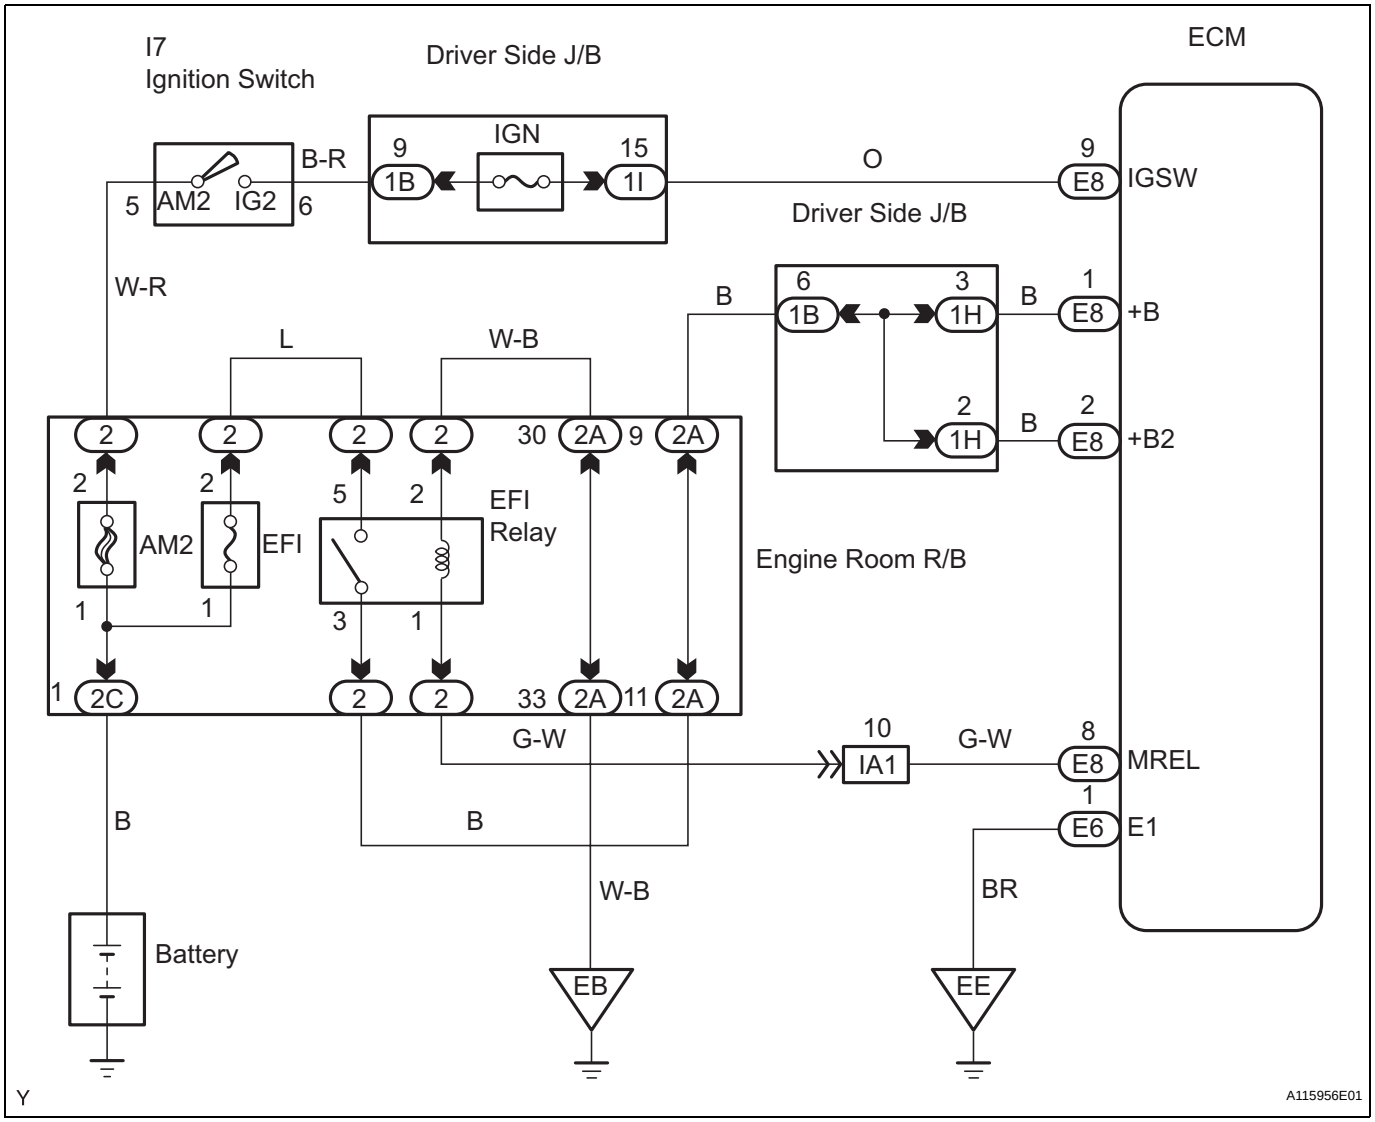
A106747E08

ECM Power Source Circuit

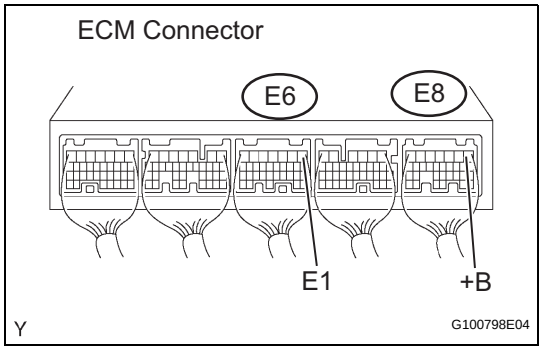
DESCRIPTION

When the ignition switch is turned ON, the battery voltage is applied to terminal IGSW of the ECM. The ECM MREL output signal causes a current to flow to the coil, closing the contacts of the EFI relay and supplying power to terminal +B of the ECM.
If the ignition switch is turned OFF, the ECM holds the EFI relay ON for a maximum of 2 seconds to allow for the initial setting of the throttle valve.

WIRING DIAGRAM



1 **INSPECT ECM (+B VOLTAGE)**



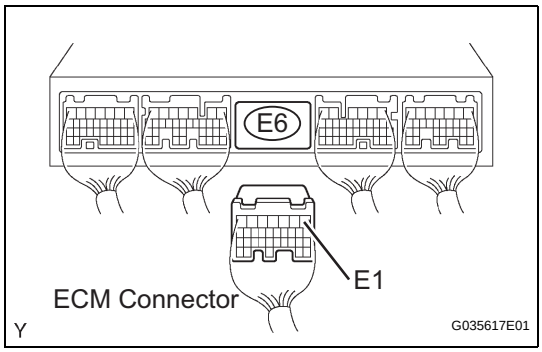
(a) Turn the ignition switch ON.
(b) Measure the voltage between the terminals of the E8 and E6 ECM connectors.
Standard Voltage

Tester Connections	Specified Conditions
+B (E8-1) - E1 (E6-1)	9 to 14 V

OK → **PROCEED TO NEXT CIRCUIT INSPECTION SHOWN ON PROBLEM SYMPTOMS TABLE**

NG

2 **CHECK HARNESS AND CONNECTOR (ECM - BODY GROUND)**



(a) Disconnect the E6 ECM connector.
(b) Check the resistance.
Standard Resistance (Check for open)

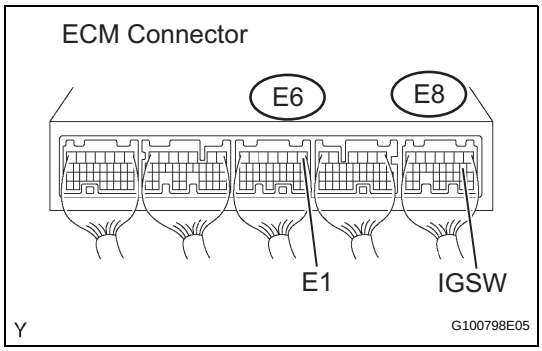
Tester Connections	Specified Conditions
E1 (E6-1) - Body ground	Below 1 Ω

(c) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3 **INSPECT ECM (IGSW VOLTAGE)**



(a) Turn the ignition switch ON.
(b) Measure the voltage between the terminals of the E8 and E6 ECM connectors.
Standard Voltage

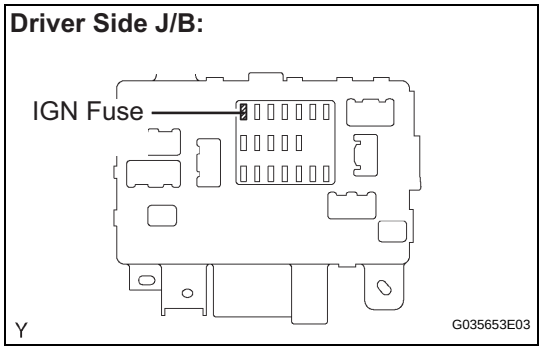
Tester Connections	Specified Conditions
IGSW (E8-9) - E1 (E6-1)	9 to 14 V

OK → **Go to step 6**

NG

ES

4 CHECK FUSE (IGN FUSE)

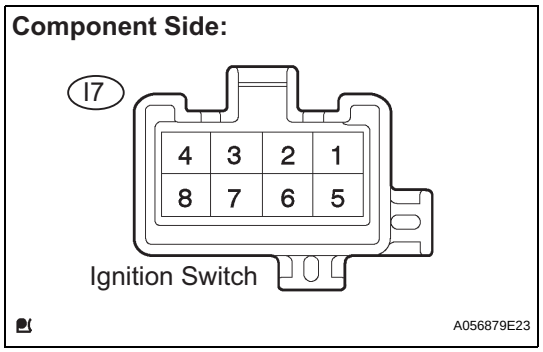


(a) Remove the IGN fuse from the driver side J/B.
(b) Check the IGN fuse resistance.
Standard Resistance:
Below 1 Ω
(c) Reinstall the IGN fuse.

NG → **CHECK FOR SHORT IN ALL HARNESSES AND COMPONENTS CONNECTED TO FUSE**

OK

5 INSPECT IGNITION OR STARTER SWITCH ASSEMBLY



(a) Disconnect the I7 ignition switch connector.
(b) Check the resistance.
Standard Resistance

Ignition Switch Positions	Tester Connections	Specified Conditions
LOCK	All Terminals	10 kΩ or higher
ACC	2-4	Below 1 Ω
ON	1-2, 1-4, 5-6	
START	1-3, 1-4, 3-4, 5-6, 5-7, 6-7	

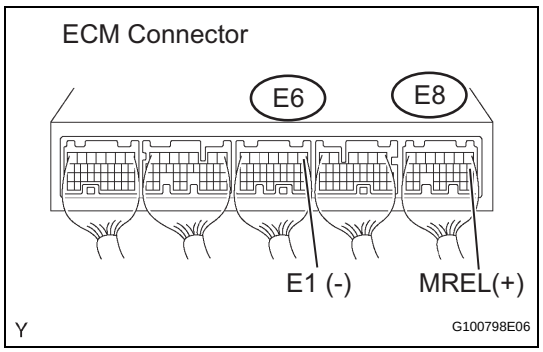
(c) Reconnect the ignition switch connector.

NG → **REPLACE IGNITION OR STARTER SWITCH ASSEMBLY**

OK

CHECK AND REPLACE HARNESS AND CONNECTOR (BATTERY - IGNITION SWITCH, IGNITION SWITCH - ECM)

6 INSPECT ECM (MREL VOLTAGE)



(a) Turn the ignition switch ON.
(b) Measure the voltage between the terminals of the E6 and E8 ECM connectors.
Standard Voltage

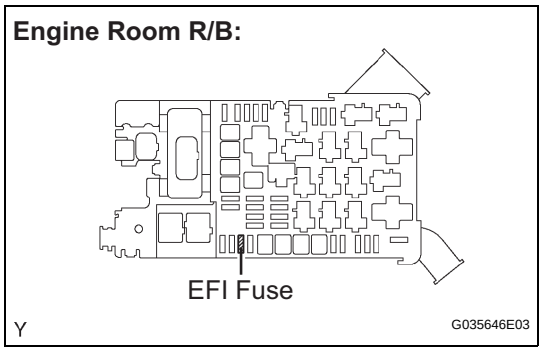
Tester Connections	Specified Conditions
MREL (E8-8) - E1 (E6-1)	9 to 14 V

NG → **REPLACE ECM**

ES

OK

7	CHECK FUSE (EFI FUSE)



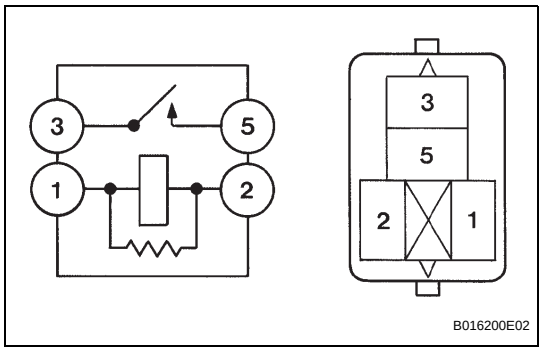
(a) Remove the EFI fuse from the engine room R/B.
(b) Check the EFI fuse resistance.
Standard Resistance:
Below 1 Ω
(c) Reinstall the EFI fuse.

NG → **CHECK FOR SHORT IN ALL HARNESSES AND COMPONENTS CONNECTED TO FUSE**

ES

OK

8	INSPECT EFI RELAY



(a) Remove the EFI relay from the engine room R/B.
(b) Check the EFI relay resistance.
Standard Resistance

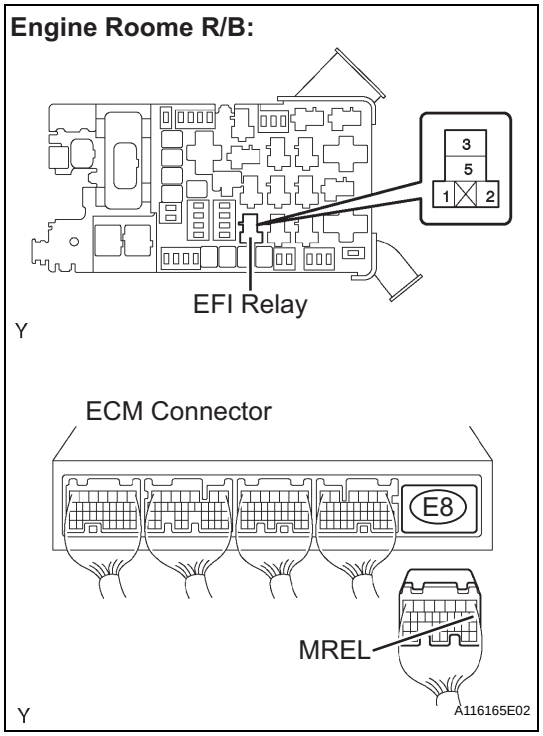
Tester Connections	Specified Conditions
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the EFI relay.

NG → **REPLACE EFI RELAY**

OK

9	CHECK HARNESS AND CONNECTOR (EFI RELAY- ECM, EFI RELAY - BODY GROUND)



(a) Check the harness and connector between the EFI relay and ECM.
  (1) Remove the EFI relay from the engine room R/B.
  (2) Disconnect the E8 ECM connector.
  (3) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
EFI relay (1) - MREL (E8-8)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
EFI relay (1) or MREL (E8-8) - Body ground	10 kΩ or higher

  (4) Reinstall the EFI relay.
  (5) Reconnect the ECM connector.

(b) Check the harness and connector between the EFI relay and body ground.
  (1) Remove the EFI relay from the engine room R/B.
  (2) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
EFI relay (2) - Body ground	Below 1 Ω

  (3) Reinstall the EFI relay.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

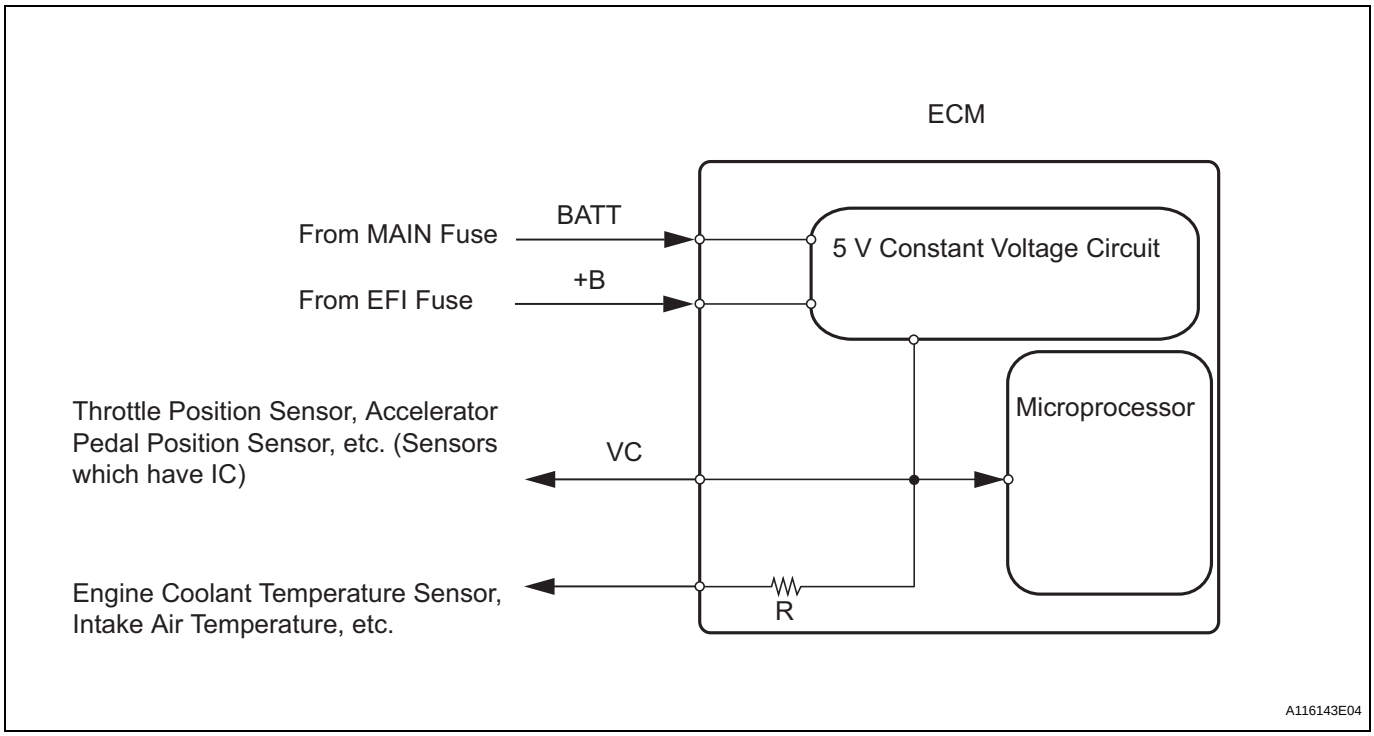
CHECK AND REPAIR HARNESS AND CONNECTOR (TERMINAL +B OF ECM - BATTERY POSITIVE TERMINAL)

ES

VC Output Circuit

DESCRIPTION

The ECM constantly generates 5 V power from the battery voltage supplied to the +B (BATT) terminal to operate the microprocessor. The ECM also provides this power to the sensors through the VC output circuit.



When the VC circuit is short-circuited, the microprocessor in the ECM and sensors that are supplied power through the VC circuit are inactivated because the power is not supplied from the VC circuit. Under this condition, the system does not start up and the MIL does not illuminate even if the system malfunctions.

HINT:

Under normal conditions, the MIL is illuminated for several seconds when the ignition switch is first turned ON. The MIL goes off when the engine is started.

WIRING DIAGRAM

Refer to the following pages.

- Throttle position sensor circuit (See page ES-112).
- Canister pump module circuit (See page ES-351).
- Accelerator pedal circuit (See page ES-293).

1	**CHECK MIL**

(a) Check that the Malfunction Indicator Lamp (MIL) lights up when turning the ignition switch ON.

OK:

MIL lights up

OK	**SYSTEM OK**

NG

2 CHECK CONNECTION BETWEEN INTELLIGENT TESTER AND ECM

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Check the communication between an intelligent tester and ECM.

Result

Result	Proceed to
Communication is possible	A
Communication is not possible	B

A → **GO TO MIL CIRCUIT**

B

3 CHECK MIL (THROTTLE BODY)

(a) Disconnect the throttle body connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

(d) Reconnect the throttle body connector.

A → **REPLACE THROTTLE BODY**

B

4 CHECK MIL (ACCELERATOR PEDAL)

(a) Disconnect the accelerator pedal connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

(d) Reconnect the accelerator pedal connector.

A → **REPLACE ACCELERATOR PEDAL ASSEMBLY**

B

ES

5	CHECK MIL (CANISTER PUMP MODULE)

(a) Disconnect the canister pump module connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

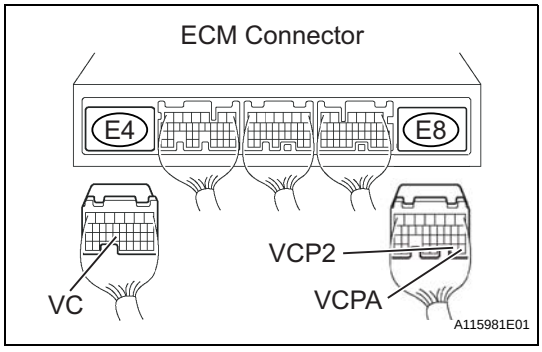
(d) Reconnect the canister pump module connector.

ES

A → **REPLACE CHARCOAL CANISTER ASSEMBLY**

B

6	CHECK HARNESS AND CONNECTOR



(a) Disconnect the throttle body connector.
(b) Disconnect the accelerator pedal connector.
(c) Disconnect the canister pump module connector.
(d) Disconnect the ECM connector.
(e) Measure the resistance of the wire harness side connector.

Standard Resistance (check for short)

Tester Connection	Specified Condition
VC (E4-23) - Body ground	10 kΩ or higher
VCPA (E8-26) - Body ground	
VCP2 (E8-27) - Body ground	

(f) Reconnect the throttle body connector.
(g) Reconnect the accelerator pedal connector.
(h) Reconnect the canister pump module connector.
(i) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

Fuel Pump Control Circuit

DESCRIPTION

Refer to DTC P0230 (See page ES-158).

WIRING DIAGRAM

Refer to DTC P0230 (See page ES-160).

1	CHECK FUEL PUMP OPERATION

(a) Check if there is pressure in the fuel inlet hose.
HINT:
If there is fuel pressure, you will hear the sound of fuel flowing.

OK → **Go to step 10**

NG

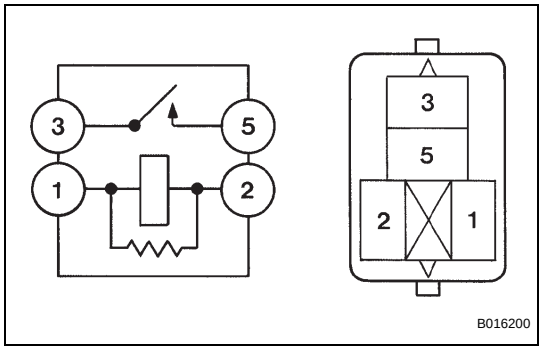
2	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE CIRCUIT OPENING RELAY)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / FUEL PUMP/ SPD.
(d) Check whether operating sounds can be heard while operating the relay using the tester.
OK:
Operating sounds can be heard from relay.

OK → **Go to step 5**

NG

3	INSPECT CIRCUIT OPENING RELAY



(a) Remove the circuit opening relay from the engine room R/B.
(b) Check the circuit opening relay resistance.
Standard Resistance

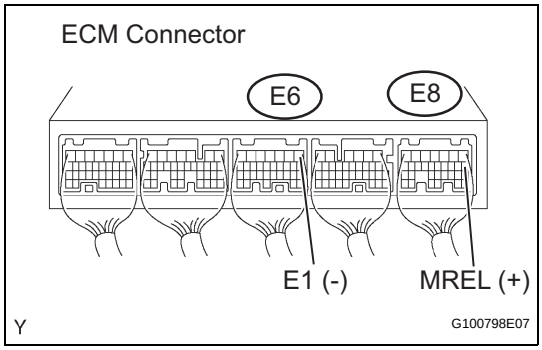
Tester Connections	Specified Conditions
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the circuit opening relay.

NG → **REPLACE CIRCUIT OPENING RELAY**

OK

4	INSPECT ECM (FC VOLTAGE)



(a) Turn the ignition switch ON.
(b) Measure the voltage between the terminals of the E8 and E6 ECM connectors.

Standard Voltage

Tester Connections	Specified Conditions
FC (E8-10) - E1 (E6-1)	9 to 14 V

OK → REPLACE ECM

NG

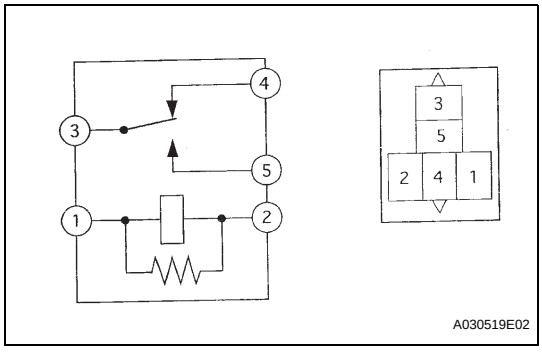
CHECK AND REPLACE HARNESS AND CONNECTOR (ECM - CIRCUIT OPENING RELAY - IGNITION)

5	INSPECT ECM POWER SOURCE CIRCUIT

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

6	INSPECT FUEL PUMP RELAY ASSEMBLY



(a) Remove the fuel pump relay from the engine room R/B.
(b) Check the fuel pump relay resistance.

Standard Resistance

Tester Connections	Specified Conditions
3 - 4	Below 1 Ω
3 - 5	10 kΩ or higher
3 - 4	10 kΩ or higher (when battery voltage applied to terminals 1 and 2)
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

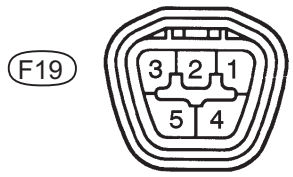
(c) Reinstall the fuel pump relay.

NG → REPLACE FUEL PUMP RELAY ASSEMBLY

OK

7	INSPECT FUEL PUMP ASSEMBLY

Component Side:



Fuel Pump

A074356E09

(a) Inspect the fuel pump resistance.
  (1) Measure the resistance between terminals 4 and 5.
  Standard Resistance:
  0.2 to 3.0 Ω at 20°C (68°F)

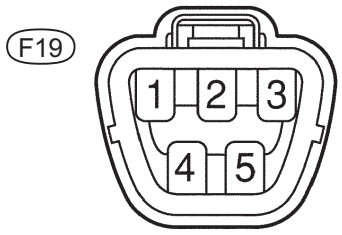
(b) Inspect the fuel pump operation.
  (1) Apply battery voltage to both terminals. Check that the pump operates.
  NOTICE:
  - **These tests must be done quickly (within 10 seconds) to prevent the coil from burning out.**
  - **Keep the fuel pump as far away from the battery as possible.**
  - **Always do the switching at the battery side.**

NG → **REPLACE FUEL PUMP ASSEMBLY**

OK

8	CHECK HARNESS AND CONNECTOR (FUEL PUMP - FUEL PUMP RELAY, FUEL PUMP - BODY GROUND)

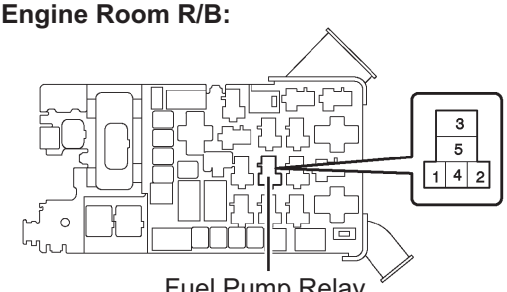
Wire Harness Side:



P

Fuel Pump Connector

Engine Room R/B:



Fuel Pump Relay

Y

A116166E01

(a) Check the harness and connector between the fuel pump and fuel pump relay.
  (1) Disconnect the F19 fuel pump connector.
  (2) Remove the fuel pump relay from the engine room R/B.
  (3) Check the resistance.
  Standard Resistance (Check for open)

Tester Connections	Specified Conditions
Fuel pump (F19-4) - Fuel pump relay (4)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
Fuel pump (F19-4) or Fuel pump relay (4) - Body ground	10 kΩ or higher

  (4) Reconnect the fuel pump connector.
  (5) Reinstall the fuel pump relay.

(b) Check the harness and connector between the fuel pump and body ground.
  (1) Disconnect the fuel pump connector.
  (2) Check the resistance.
  Standard Resistance (Check for open)

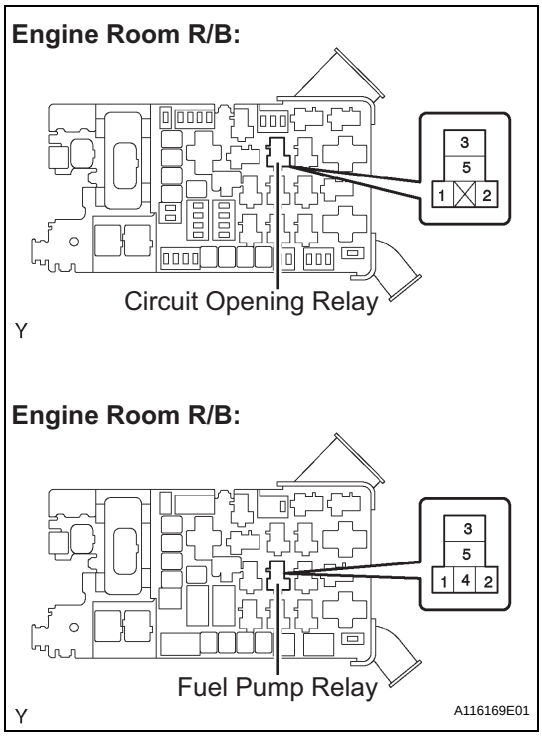
Tester Connections	Specified Conditions
Fuel pump (F19-5) - Body ground	Below 1 Ω

  (3) Reconnect the fuel pump connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

9	CHECK HARNESS AND CONNECTOR (CIRCUIT OPENING RELAY - FUEL PUMP RELAY)



(a) Remove the circuit opening relay from the engine room R/B.
(b) Remove the fuel pump relay from the engine room R/B.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
Circuit opening relay (3) - Fuel pump relay (3)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
Circuit opening relay (3) or Fuel pump relay (3) - Body ground	10 kΩ or higher

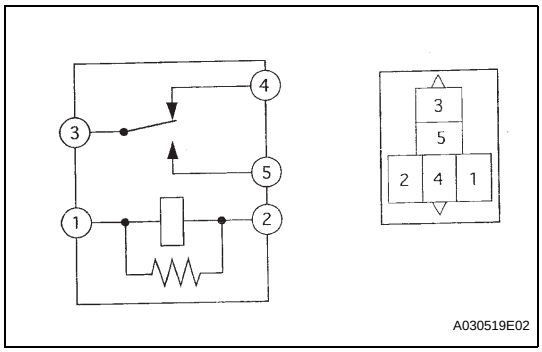
(d) Reinstall the circuit opening relay.
(e) Reinstall the fuel pump relay.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

CHECK AND REPAIR HARNESS AND CONNECTOR (EFI RELAY - CIRCUIT OPENING RELAY)

10	INSPECT FUEL PUMP RELAY ASSEMBLY



(a) Remove the fuel pump relay from the engine room R/B.
(b) Check the fuel pump relay resistance.

Standard Resistance

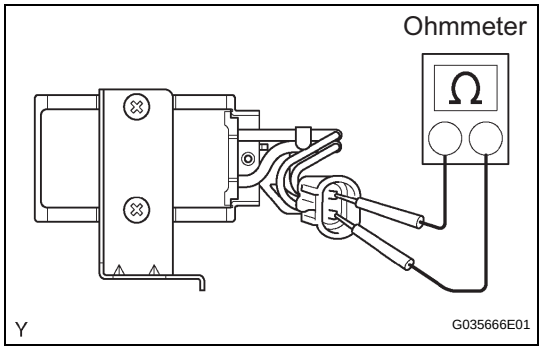
Tester Connections	Specified Conditions
3 - 4	Below 1 Ω
3 - 5	10 kΩ or higher
3 - 4	10 kΩ or higher (when battery voltage applied to terminals 1 and 2)
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the fuel pump relay.

NG → REPLACE FUEL PUMP RELAY ASSEMBLY

OK

11	INSPECT FUEL PUMP RESISTER (RESISTANCE)

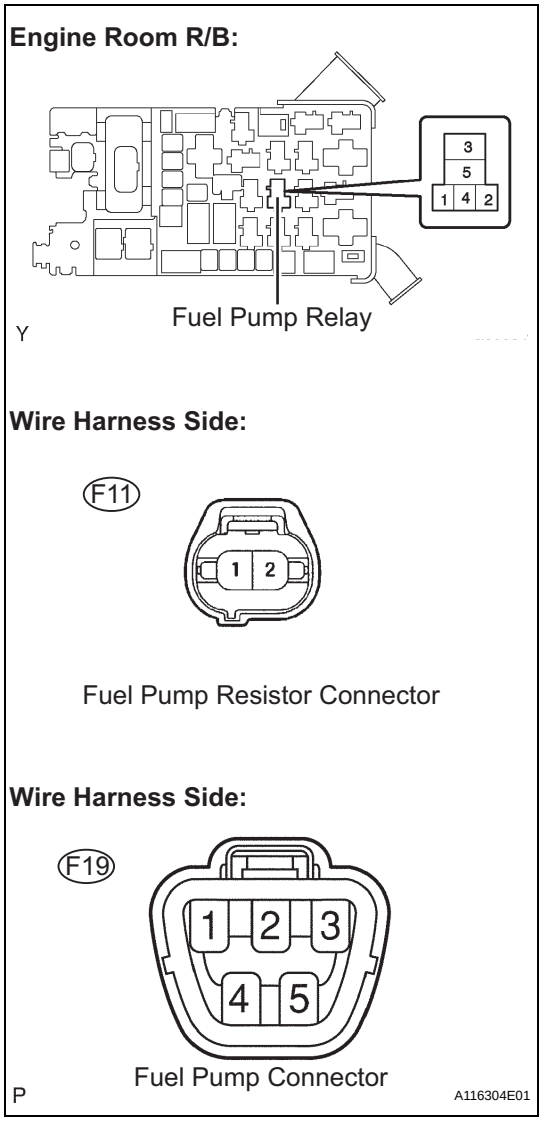


(a) Inspect the fuel pump resistor resistance.
  (1) Measure the resistance.
    Standard Resistance:
    0.70 to 0.76 Ω at 20°C (68°F)

NG → **REPLACE FUEL PUMP RESISTER**

OK

12	CHECK HARNESS AND CONNECTOR (FUEL PUMP RELAY - FUEL PUMP RESISTOR - FUEL PUMP)



(a) Check the harness and connector between the fuel pump relay and fuel pump resistor.
  (1) Remove the fuel pump relay from the engine room R/B.
  (2) Disconnect the F11 fuel pump resistor connector.
  (3) Check the resistance.
    Standard Resistance (Check for open)

Tester Connections	Specified Conditions
Fuel pump relay (5) - Fuel pump resistor (F11-1)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
Fuel pump relay (5) or Fuel pump resistor (F11-1) - Body ground	10 kΩ or higher

  (4) Reinstall the fuel pump relay.
  (5) Reconnect the fuel pump resistor connector.

(b) Check the harness and connector between the fuel pump resistor and fuel pump.
  (1) Disconnect the F11 fuel pump resistor connector.
  (2) Disconnect the fuel pump connector.
  (3) Check the resistance.
    Standard Resistance (Check for open)

Tester Connections	Specified Conditions
Fuel pump resistor (F11-2) - Fuel pump (F19-4)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
Fuel pump resistor (F11-2) or Fuel pump (F19-4) - Body ground	10 kΩ or higher

  (4) Reconnect the fuel pump resistor connector.
  (5) Reconnect the fuel pump connector.

NG → PROCEED TO NEXT CIRCUIT INSPECTION SHOWN ON PROBLEM SYMPTOMS TABLE

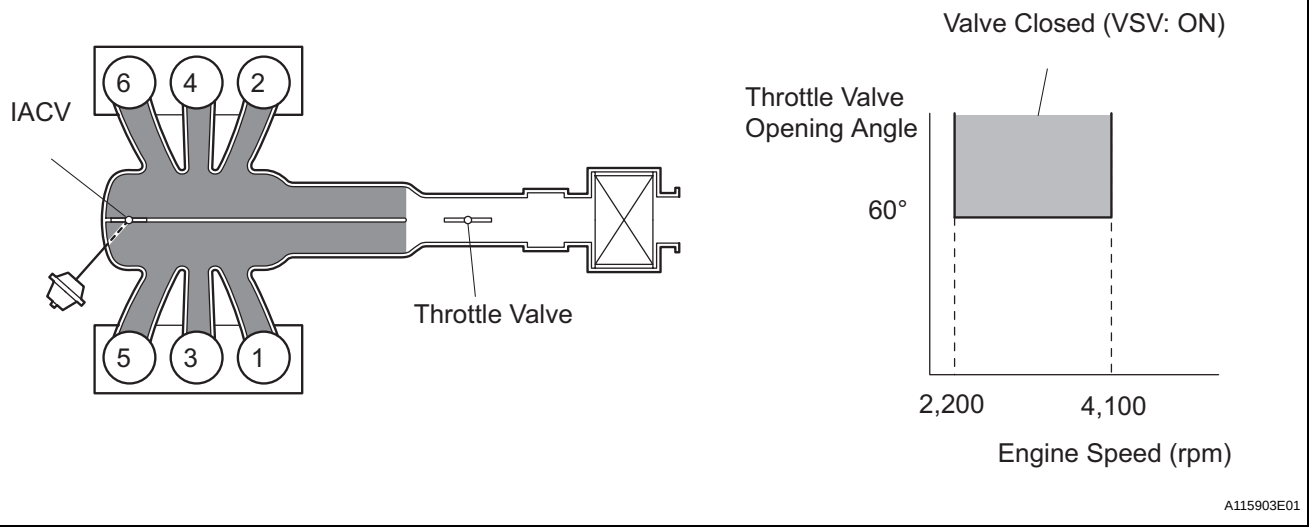
NG

REPAIR OR REPLACE HARNESS OR CONNECTOR

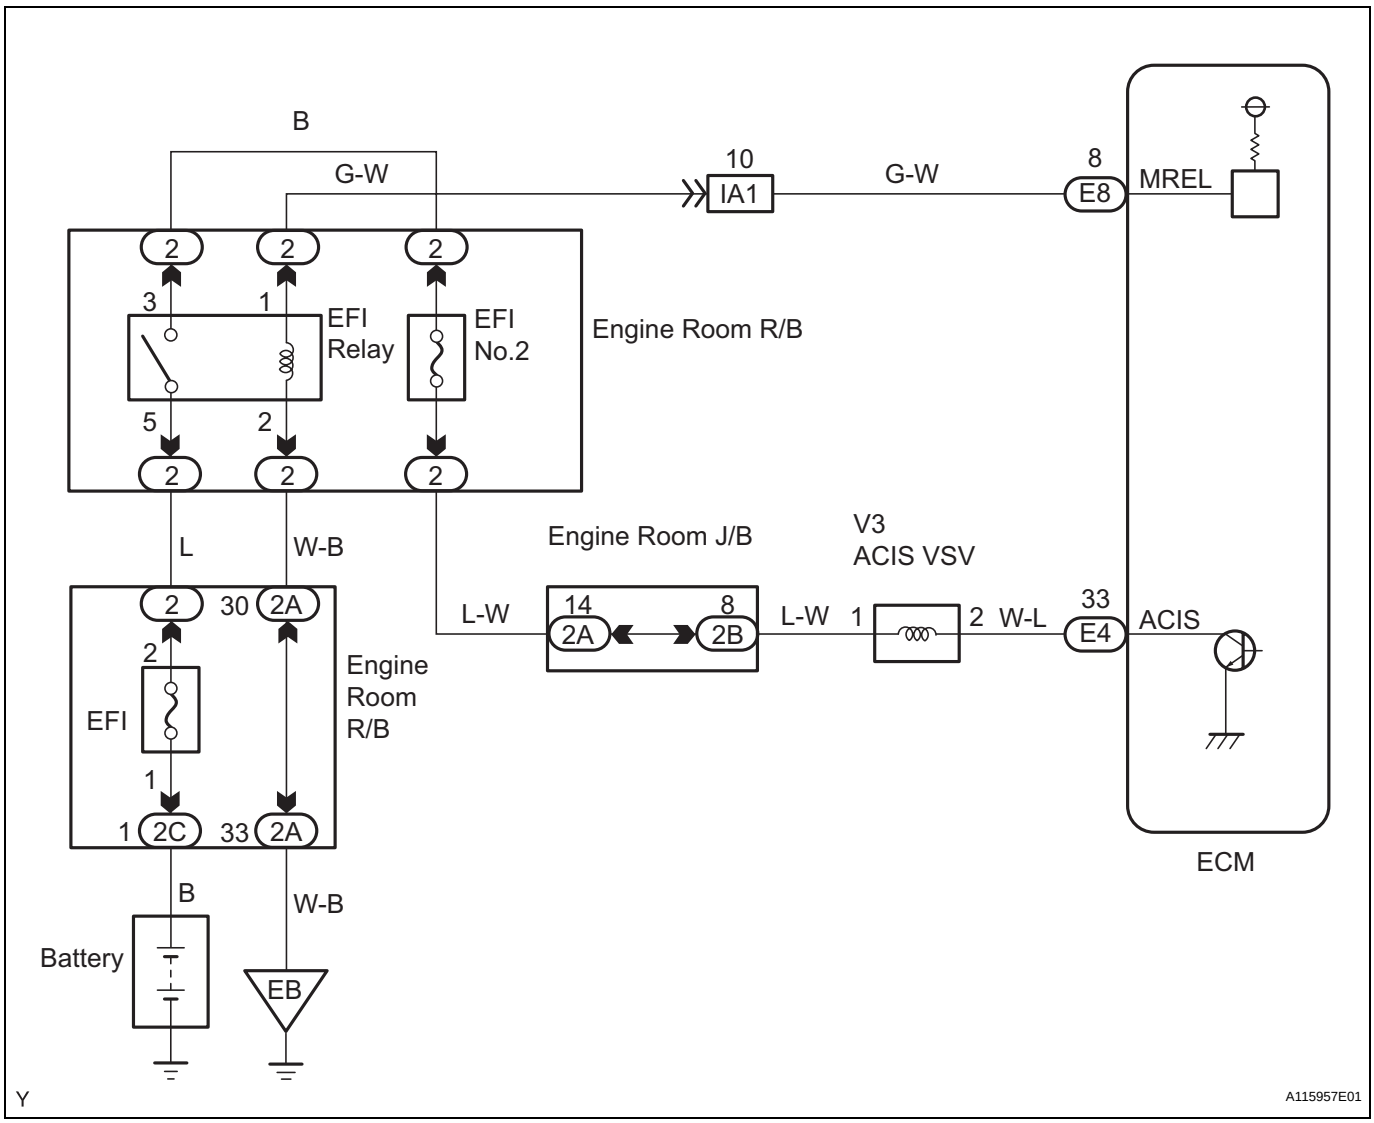
ACIS Control Circuit

DESCRIPTION

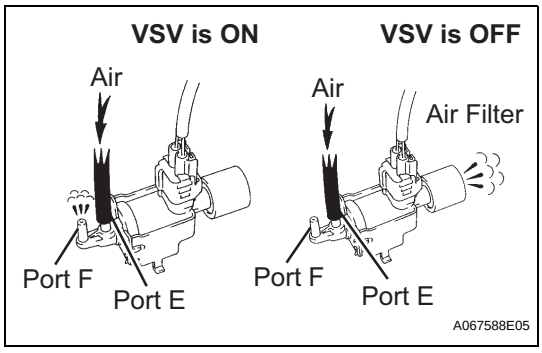
This circuit opens and closes the Intake Air Control Valve (IACV) in response to changes in the engine load in order to increase the intake efficiency (ACIS: Acoustic Control Induction System).
When the engine speed is between 2,200 rpm and 4,100 rpm and the throttle valve opening angle is 60° or more, the ECM supplies current to the VSV (ON status), to close the IACV. Under other conditions, the VSV is usually OFF and the IACV is open.



WIRING DIAGRAM



1	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE VSV FOR ACIS)



(a) Disconnect the vacuum hose.
(b) Connect an intelligent tester to the DLC3.
(c) Turn the ignition switch ON and turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / INTAKE CTL VSV1. Operate the VSV for ACIS.
(e) Check the VSV operation when it is operated using an intelligent tester.

OK

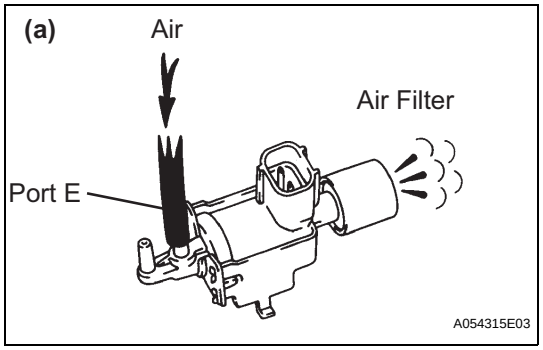
Tester Operations	Specified Conditions
VSV ON	Air from port E flows out through port F
VSV OFF	Air from port E flows out through air filter

(f) Reconnect the vacuum hose.

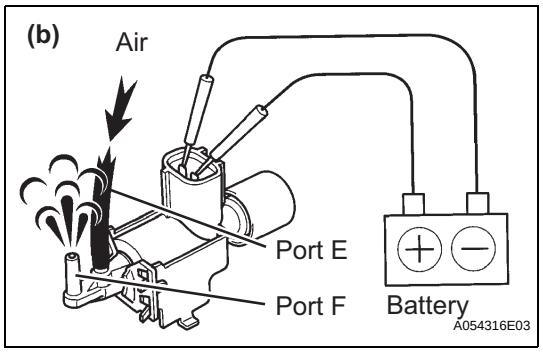
OK	Go to step 4

NG

2	CHECK VSV FOR ACIS (OPERATION)



(a) Check that air flows from port E to the air filter.



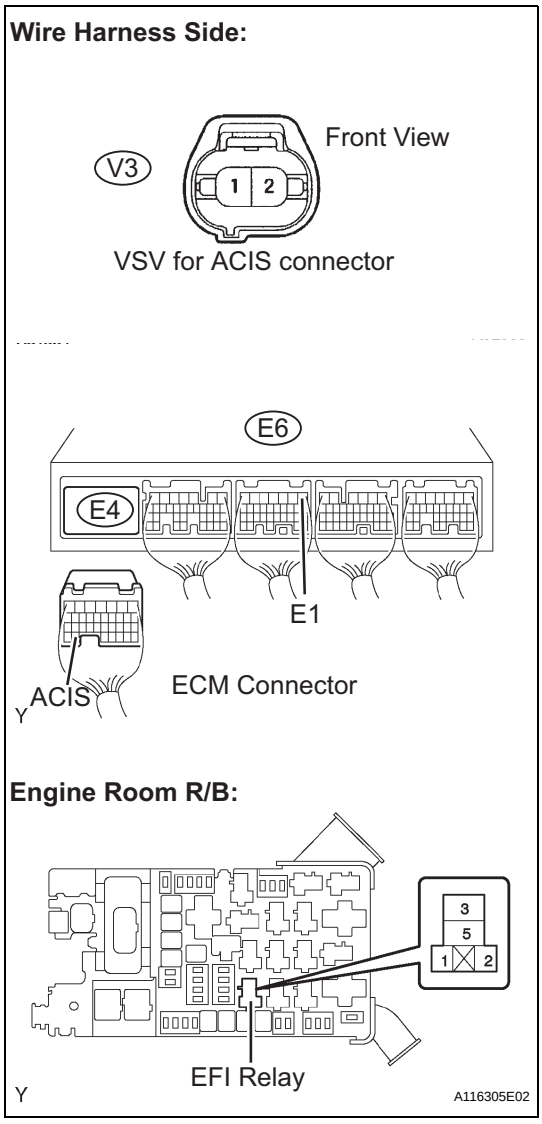
(b) Apply positive battery voltage across the terminals.
(c) Check that air flows from port E to port F.

NG → REPLACE VSV FOR ACIS

OK

ES

3	CHECK HARNESS AND CONNECTOR (VSV FOR ACIS - ECM, VSV FOR ACIS - EFI RELAY)



(a) Check the wire harness and connectors between the VSV for ACIS and ECM.
  (1) Disconnect the V3 VSV for ACIS connector.
  (2) Disconnect the E4 ECM connector.
  (3) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
VSV for ACIS (V3-2) - ACIS (E4-33)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
VSV for ACIS (V3-2) or ACIS (E4-33) - E1 (E6-1)	10 kΩ or higher

  (4) Reconnect the VSV for ACIS connector.
  (5) Reconnect the ECM connector.

(b) Check the wire harness between the VSV for ACIS and EFI relay.
  (1) Disconnect the V3 VSV for ACIS connector.
  (2) Remove the EFI relay from the engine room R/B.
  (3) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
VSV for ACIS (V3-1) - EFI relay terminal 3 of R/B	Below 1 Ω

  (4) Reconnect the VSV for ACIS connector.
  (5) Reinstall the EFI relay.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

4	CHECK VACUUM HOSES (INTAKE MANIFOLD - INTAKE AIR CONTROL VALVE, INTAKE AIR CONTR)

(a) Check that the vacuum hose is connected correctly.
(b) Check the vacuum hose for looseness and disconnection.
(c) Check the vacuum hose for cracks, holes and damage.

NG → **REPAIR OR REPLACE VACUUM HOSES**

OK

5	INSPECT INTAKE AIR CONTROL VALVE (INTAKE AIR SURGE TANK)

NG → REPLACE INTAKE AIR CONTROL VALVE (INTAKE AIR SURGE TANK)

OK

REPLACE ECM

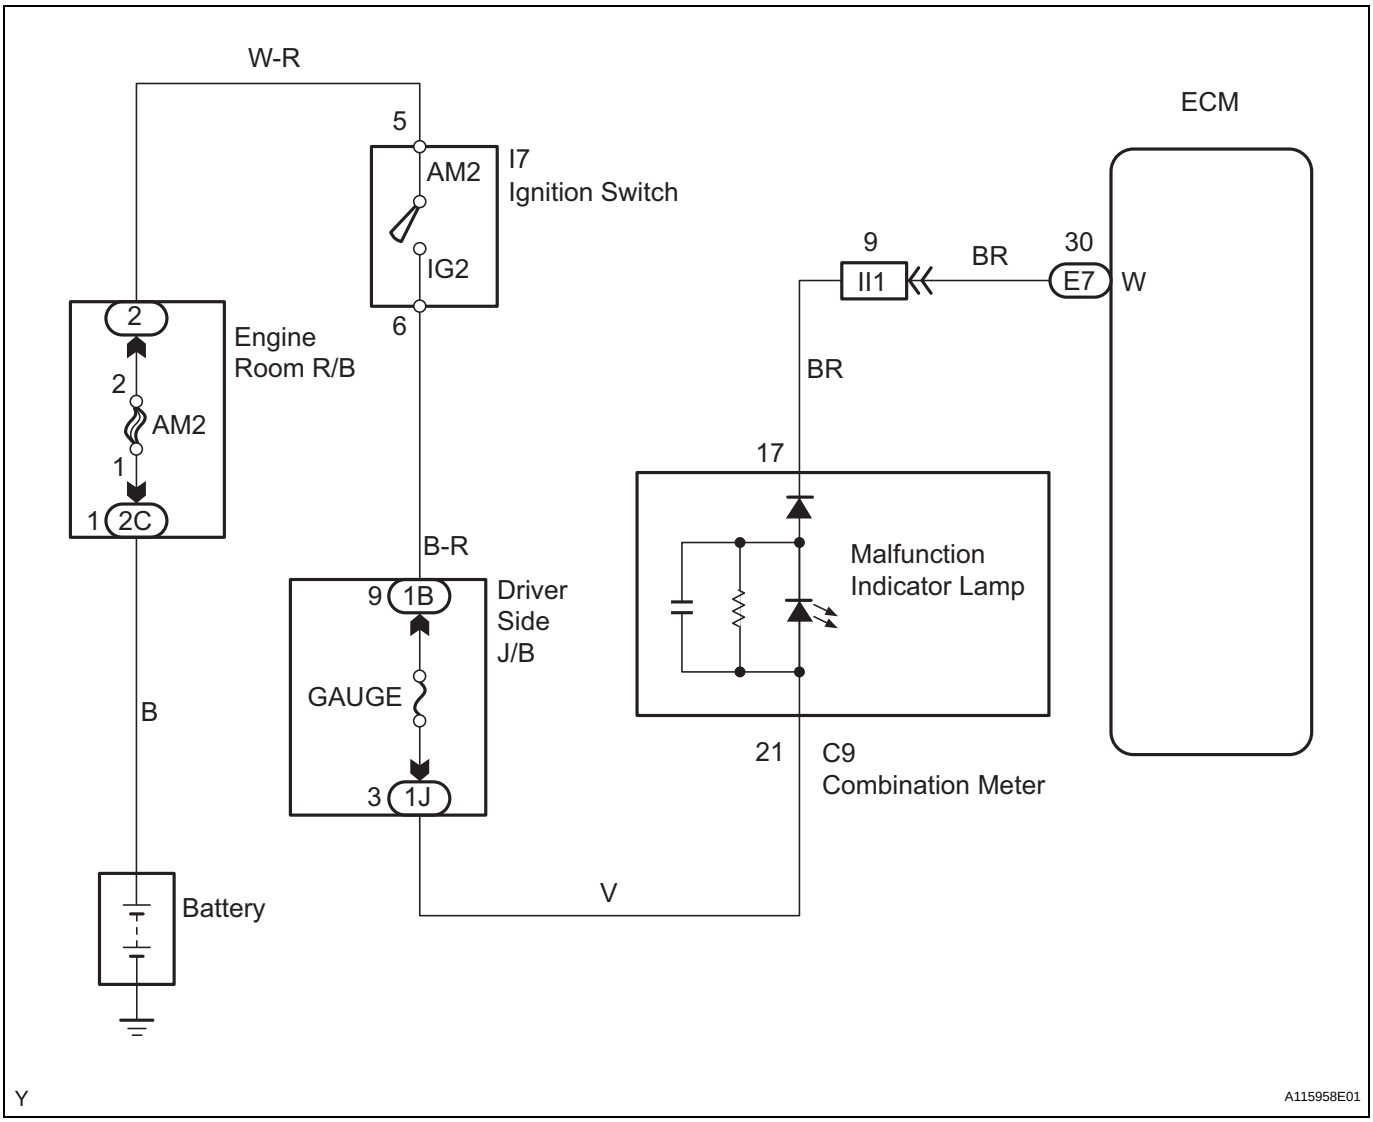
MIL Circuit

DESCRIPTION

The MIL (Malfunction Indicator Lamp) is used to indicate vehicle malfunction detections by the ECM.
By turning the ignition switch ON, power is supplied to the MIL circuit, and the ECM provides the circuit ground which illuminates the MIL.
The MIL operation can be checked visually: When the ignition switch is first turned ON, the MIL should be illuminated and should then turn OFF. If the MIL remains illuminated or is not illuminated, conduct the following troubleshooting procedure using an intelligent tester.

WIRING DIAGRAM

ES



1	CHECK THAT MIL IS ILLUMINATED

(a) Perform troubleshooting in accordance with the chart below.

Result

MIL Condition	Proceed To
MIL remains ON	A
MIL does not illuminate	B

B → **Go to step 4**

A

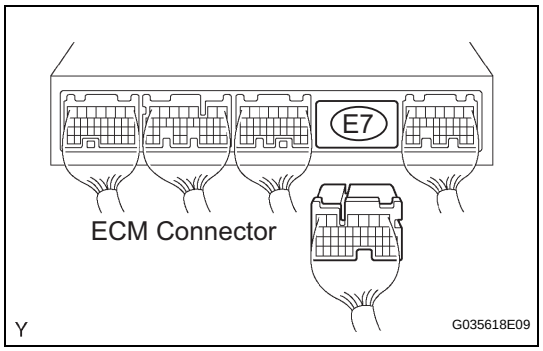
2 CHECK WHETHER MIL TURNS OFF

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Check whether any DTCs have been stored (See page ES-38). Note them down if necessary.
(e) Clear DTCs (See page ES-38).
(f) Check if the MIL turns off.
OK:
MIL should turn off.

OK → **REPAIR CIRCUIT INDICATED BY OUTPUT DTC**

NG

3 CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT IN WIRE HARNESS)



(a) Disconnect the E7 ECM connector.
(b) Turn the ignition switch ON.
(c) Check that MIL is not illuminated.
OK:
MIL is not illuminated.
(d) Reconnect the ECM connector.

OK → **REPLACE ECM**

NG

CHECK AND REPAIR HARNESS AND CONNECTOR (COMBINATION METER - ECM)

4 CHECK THAT MIL IS ILLUMINATED

(a) Check if the MIL is illuminated when the ignition switch is turns ON.
OK:
MIL should be illuminated.

OK → **SYSTEM OK**

NG

5	CHECK THAT ENGINE STARTS

(a) Turn the ignition switch ON.
(b) Start the engine.
Result

Result	Proceed To
Engine starts	A
Engine does not start*	B

HINT:
*: An intelligent tester cannot communicate with the ECM.

B → GO TO VC OUTPUT CIRCUIT

A

6	INSPECT COMBINATION METER ASSEMBLY (MIL CIRCUIT)

(a) See the combination meter troubleshooting procedure (See page ME-65).

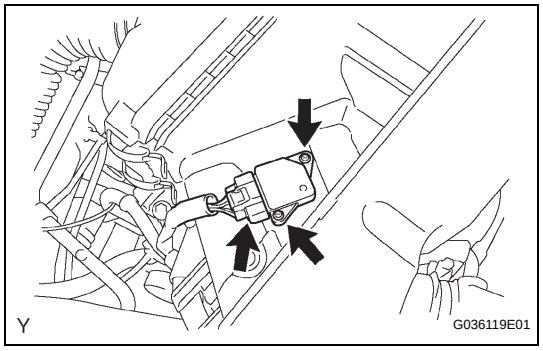
NG → REPAIR OR REPLACE BULB OR COMBINATION METER ASSEMBLY

OK

CHECK AND REPAIR HARNESS AND CONNECTOR (COMBINATION METER - ECM)

REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
2. **REMOVE V-BANK COVER (See page ES-414)**
3. **REMOVE MASS AIR FLOW METER**
   (a) Disconnect the connector.
   (b) Remove the 2 screws, then remove the mass air flow meter.



INSTALLATION

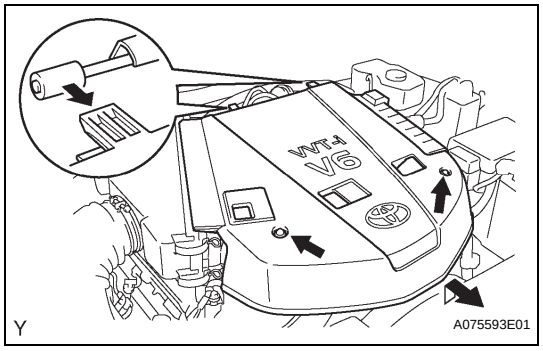
1. **INSTALL MASS AIR FLOW METER**
2. **INSTALL V-BANK COVER (See page ES-416)**
3. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
   Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

INSTALLATION

1. **INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**
   (a) Install the 2 camshaft timing oil control valves with the 2 bolts.
   Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)
   (b) Connect the 2 connectors.
2. **INSTALL INTAKE AIR SURGE TANK (See page FU-17)**
3. **INSTALL AIR CLEANER ASSEMBLY (See page ES-416)**
4. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
   Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
5. **ADD ENGINE COOLANT (See page CO-3)**
6. **CHECK FOR ENGINE COOLANT LEAKAGE (See page CO-4)**
7. **INSTALL V-BANK COVER (See page ES-416)**

REMOVAL

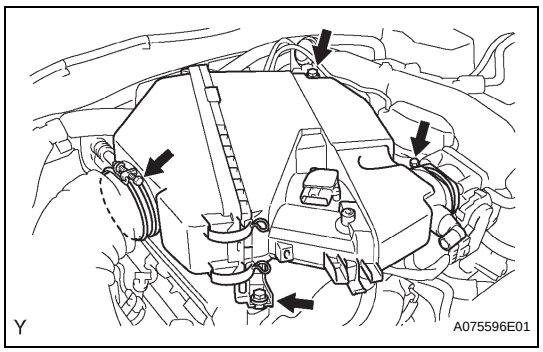
1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
2. **DRAIN ENGINE COOLANT (See page CO-3)**
3. **REMOVE V-BANK COVER**
   (a) Remove the 2 nuts, then remove the V-bank cover.



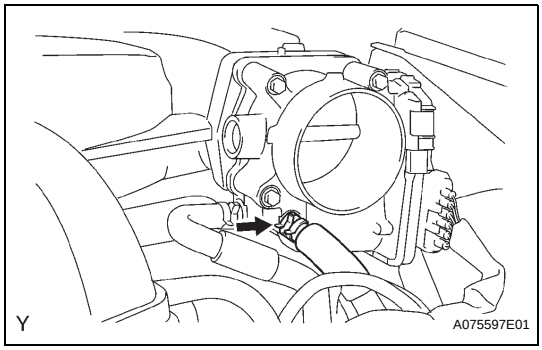
4. **REMOVE AIR CLEANER ASSEMBLY**
   (a) Disconnect the ventilation hose No. 2.

   (b) Disconnect the vacuum hose.
   (c) Disconnect the mass air flow meter connector.
   (d) Remove the 2 wire harness clamps.

   (e) Loosen the 2 hose clamps.
   (f) Remove the 2 bolts, then remove the air cleaner.

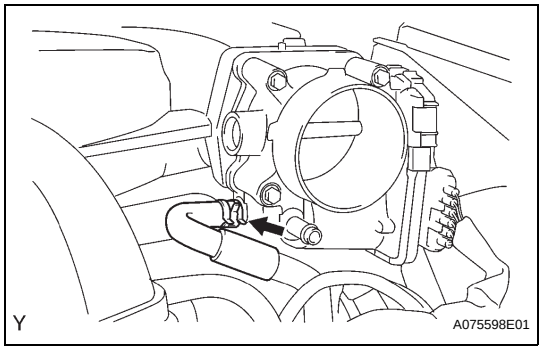


ES

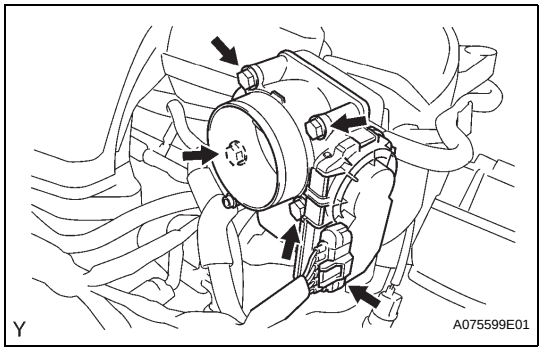


5. REMOVE THROTTLE WITH MOTOR BODY ASSEMBLY

(a) Disconnect the water by-pass hose No. 5.

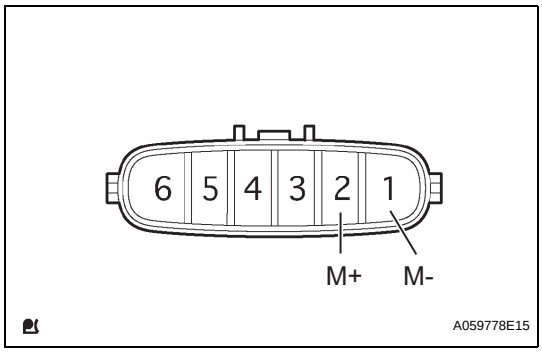


(b) Disconnect the water by-pass hose No. 4.



(c) Disconnect the throttle motor connector.

(d) Remove the 4 bolts, then remove the throttle w/ motor body and gasket.



INSPECTION

1. INSPECT THROTTLE WITH MOTOR BODY ASSEMBLY

(a) Check the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

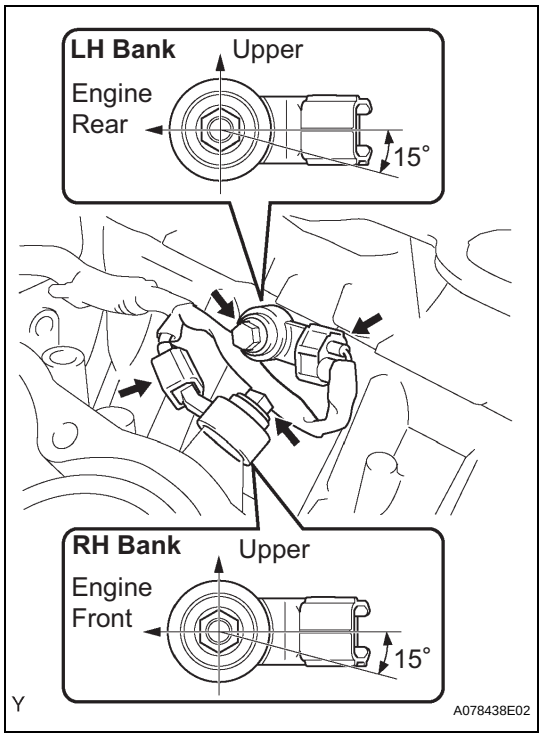
Standard

Tester Connection	Specified Condition
1 (M-) - 2 (M+)	0.3 to 100 Ω at 20°C (68°F)

If the result is not as specified, replace the throttle with motor body assembly.

INSTALLATION

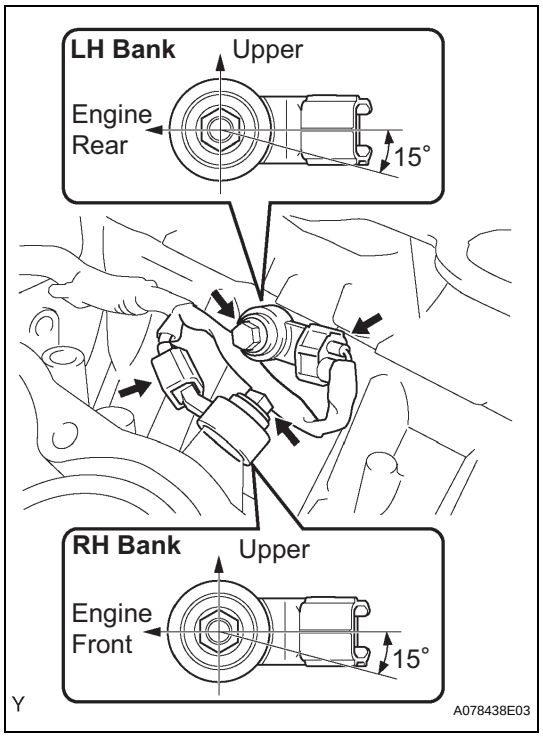
1. **INSTALL THROTTLE WITH MOTOR BODY ASSEMBLY**
   (a) Install a new gasket and the throttle with motor body with the 4 bolts.
   Torque: 11 N*m (112 kgf*cm, 9 ft.*lbf)
   (b) Connect the throttle motor connector.
   (c) Connect the water by-pass hose No. 4.
   (d) Connect the water by-pass hose No. 5.
2. **INSTALL AIR CLEANER ASSEMBLY**
   (a) Install the air cleaner with the 2 bolts.
   Torque: 8.0 N*m (82 kgf*cm, 71 in.*lbf)
   (b) Connect the ventilation hose No. 2.
3. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
   Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
4. **ADD ENGINE COOLANT (See page CO-3)**
5. **CHECK FOR ENGINE COOLANT LEAKAGE (See page CO-4)**
6. **INSTALL V-BANK COVER**
   (a) Install the V-bank cover with the 2 nuts.
   Torque: 7.5 N*m (76 kgf*cm, 66 in.*lbf)



INSTALLATION

1. **INSTALL KNOCK SENSOR**
   (a) Install the 2 knock sensors with the 2 bolts as shown in the illustration.
   Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)
   (b) Connect the 2 knock sensor connectors.
2. **INSTALL WATER OUTLET PIPE NO.1**
   (a) Install the water outlet pipe with the 3 bolts.
   Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)
   (b) Install the 4 wire harness clamps.
3. **CONNECT HEATER WATER INLET HOSE**
4. **INSPECT CYLINDER HEAD SET BOLT (See page EM-95)**
5. **INSTALL CYLINDER HEAD SUB-ASSEMBLY (See page EM-96)**
6. **INSTALL CAMSHAFT BEARING NO.2**
7. **INSTALL CAMSHAFTS (See page EM-97)**
8. **INSTALL CHAIN TENSIONER ASSEMBLY NO.2 (See page EM-98)**
9. **INSTALL CAMSHAFT TIMING GEARS AND NO.2 CHAIN (RH BANK) (See page EM-99)**
10. **INSTALL CHAIN VIBRATION DAMPER NO.1 (See page EM-142)**
11. **INSTALL WATER BY-PASS JOINT RR (See page EM-99)**
12. **INSTALL INTAKE MANIFOLD (See page EM-99)**
13. **INSTALL EXHAUST MANIFOLD SUB-ASSEMBLY RH (See page EM-99)**
14. **INSTALL MANIFOLD STAY (See page EM-100)**
15. **INSTALL EXHAUST PIPE ASSEMBLY FRONT (See page EX-3)**
16. **INSTALL EXHAUST FRONT PIPE ASSEMBLY NO.2 (See page EX-3)**
17. **INSTALL COOL AIR INLET NO.1**
    (a) Install the cool air inlet with the 2 bolts.
    Torque: 12 N*m (122 kgf*cm, 9.0 ft.*lbf)
18. **INSTALL CHAIN TENSIONER SLIPPER**
19. **INSTALL CHAIN TENSIONER ASSEMBLY NO.1 (See page EM-48)**
20. **INSTALL CHAIN SUB-ASSEMBLY (See page EM-27)**
21. **INSTALL TIMING CHAIN OR BELT COVER SUB-ASSEMBLY**
    (See page LU-20)

22. **INSTALL ENGINE ASSEMBLY**
(See page EM-190)
23. **INSTALL BATTERY**
24. **ADD ENGINE COOLANT (See page CO-3)**
25. **ADD ENGINE OIL (See page LU-5)**
26. **CHECK FOR ENGINE COOLANT LEAKAGE (See page CO-4)**
27. **CHECK FOR ENGINE OIL LEAKAGE**
28. **CHECK FOR FUEL LEAKAGE**
29. **CHECK FOR EXHAUST GAS LEAKAGE**
30. **INSPECT IGNITION TIMING (See page EM-1)**
31. **INSPECT ENGINE IDLING SPEED (See page EM-2)**
32. **INSPECT CO/HC (See page EM-3)**



INSTALLATION

1. **INSTALL KNOCK CONTROL SENSOR**
   (a) Install the 2 knock sensors with the 2 bolts as shown in the illustration.
   Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)
   (b) Connect the 2 knock sensor connectors.
2. **INSTALL WATER OUTLET PIPE NO.1**
   (a) Install the water outlet pipe with the 3 bolts.
   Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)
   (b) Install the 4 wire harness clamps.
3. **CONNECT HEATER WATER INLET HOSE**
4. **INSPECT CYLINDER HEAD SET BOLT (See page EM-117)**
5. **INSTALL CYLINDER HEAD SUB-ASSEMBLY (See page EM-118)**
6. **INSTALL CAMSHAFT BEARING NO.2**
7. **INSTALL CAMSHAFTS (See page EM-119)**
8. **INSTALL CHAIN TENSIONER ASSEMBLY NO.2 (See page EM-120)**
9. **INSTALL CAMSHAFT TIMING GEARS AND NO.2 CHAIN (RH BANK) (See page EM-121)**
10. **INSTALL CHAIN VIBRATION DAMPER NO.1 (See page EM-164)**
11. **INSTALL WATER BY-PASS JOINT RR (See page EM-121)**
12. **INSTALL INTAKE MANIFOLD (See page EM-121)**
13. **CONNECT FUEL PIPE SUB-ASSEMBLY NO.2 (See page FU-17)**
14. **CONNECT FUEL PIPE SUB-ASSEMBLY NO.1 (See page FU-17)**
15. **INSTALL EXHAUST MANIFOLD SUB-ASSEMBLY RH (See page EM-122)**
16. **INSTALL MANIFOLD STAY**
    (a) Install the 2 manifold stays with the 6 bolts.
    Torque: 40 N*m (408 kgf*cm, 30 ft.*lbf)
17. **INSTALL EXHAUST PIPE ASSEMBLY FRONT (See page EX-3)**
18. **INSTALL EXHAUST FRONT PIPE ASSEMBLY NO.2 (See page EX-3)**
19. **INSTALL COOL AIR INLET NO.1**
    (a) Install the cool air inlet with the 2 bolts.
20. **INSTALL CHAIN TENSIONER SLIPPER**
21. **INSTALL CHAIN TENSIONER ASSEMBLY NO.1 (See page EM-48)**

22. **INSTALL CHAIN SUB-ASSEMBLY (See page EM-48)**
23. **INSTALL TIMING CHAIN OR BELT COVER SUB-ASSEMBLY**
    (See page LU-38)
24. **INSTALL DIFFERENTIAL CARRIER ASSEMBLY FRONT (for 4WD)**
    (See page DF-38)
25. **INSTALL POWER STEERING LINK ASSEMBLY**
    (See page PS-67)
26. **INSTALL BATTERY**
27. **ADD ENGINE OIL (See page LU-5)**
28. **ADD ENGINE COOLANT (See page CO-3)**
29. **ADD DIFFERENTIAL OIL (for 4WD)**
30. **INSPECT DIFFERENTIAL OIL (for 4WD) (See page DF-8)**
31. **ADD POWER STEERING FLUID (See page PS-3)**
32. **BLEED POWER STEERING FLUID (See page PS-2)**
33. **CHECK FOR ENGINE OIL LEAKAGE**
34. **CHECK FOR ENGINE COOLANT LEAKAGE (See page CO-4)**
35. **CHECK FOR FUEL LEAKAGE**
36. **CHECK FOR EXHAUST GAS LEAKAGE**
37. **CHECK POWER STEERING FLUID LEAKAGE**
38. **INSPECT AND ADJUST FRONT WHEEL ALIGNMENT**
    (See page SP-7)
39. **INSTALL V-BANK COVER (See page ES-416)**
40. **INSPECT IGNITION TIMING (See page EM-1)**
41. **INSPECT ENGINE IDLING SPEED (See page EM-2)**
42. **INSPECT CO/HC (See page EM-3)**
43. **INSPECT COMPRESSION (See page EM-2)**

ADJUSTMENT

1. VEHICLE PREPARATION FOR HEADLIGHT AIM ADJUSTMENT

(a) Prepare the vehicle:
- Ensure that there is no damage or deformation to the body around the headlights.
- Fill the fuel tank.
- Make sure that the oil is filled to the specified level.
- Make sure that the coolant is filled to the specified level.
- Inflate the tires to the appropriate pressure.
- Place the spare tire, tools, and jack in their original positions.
- Unload the trunk.
- Sit a person of average weight (68 kg, 150 lb) in the driver side seat.

2. PREPARATION FOR HEADLIGHT AIMING (for Using a Tester)

(a) Prepare the vehicle for headlight aim check.

(b) Perform adjustment in accordance with the headlight tester instructions.

3. PREPARATION FOR HEADLIGHT AIMING (for Using a Screen)

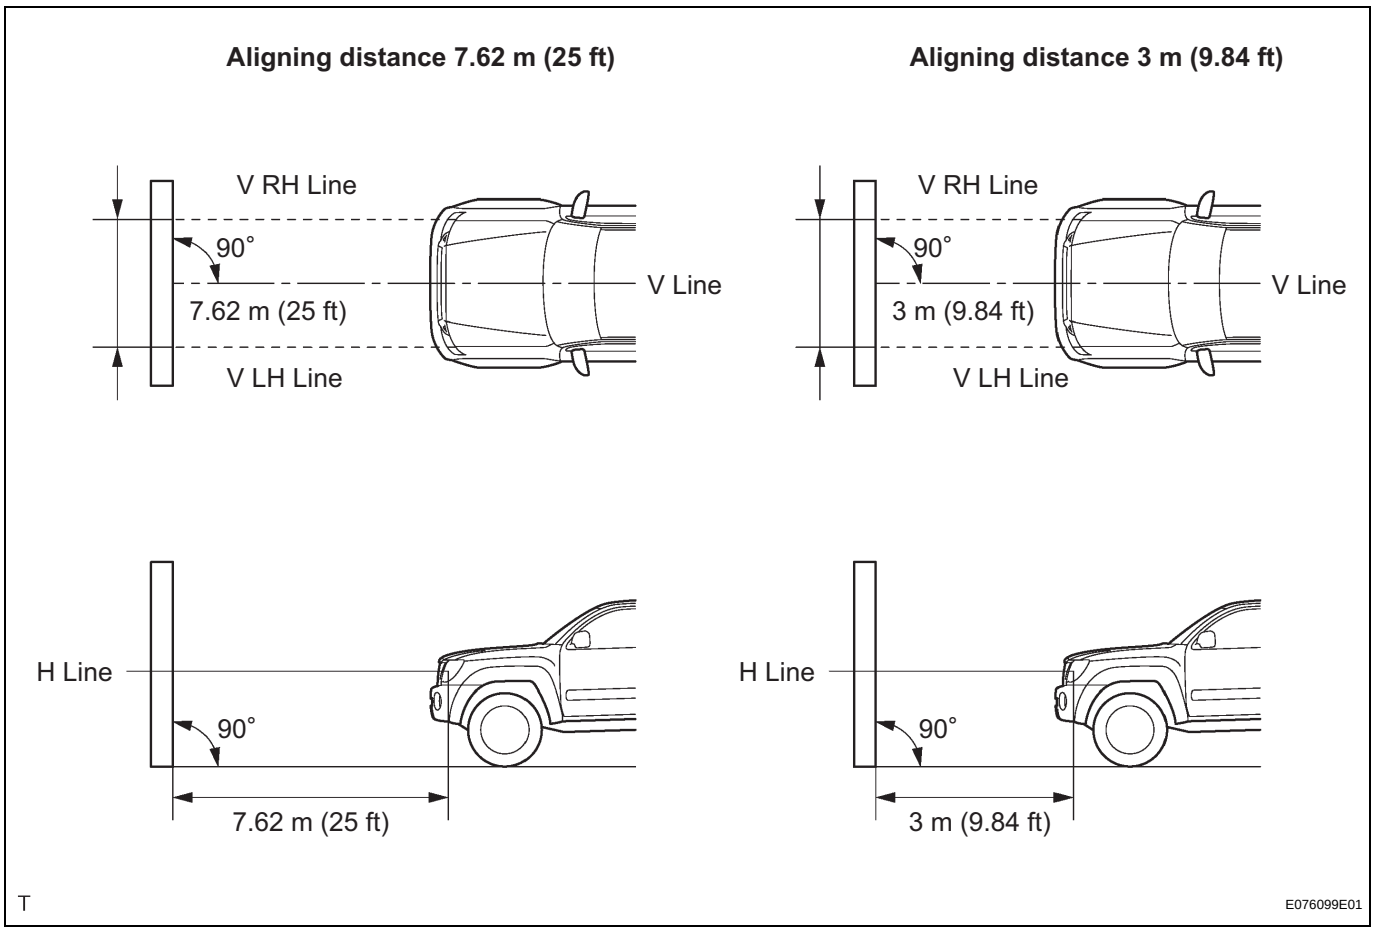
(a) Prepare the vehicle according to the following conditions:
- Place the vehicle in a location that is dark enough to clearly observe the cutoff line. The cutoff line is a distinct line, below which light from the headlights can be observed and above which it cannot.
- Place the vehicle at a 90° angle to the wall.
- Keep a 7.62 m (25 ft) distance between the center of the headlight bulb and the wall.
- Place the vehicle on a level surface.
- Bounce the vehicle up and down to settle the suspension.

NOTICE:
A distance of 7.62 m (25 ft) between the vehicle (center of the headlight bulb) and the wall is necessary for proper aim adjustment. If unavailable to secure a distance of 7.62 m (25 ft), secure a distance of exactly 3 m (9.84 ft) to check and adjust the headlight aim. (Since the target zone will change with the distance, follow the instructions shown in the illustration.)

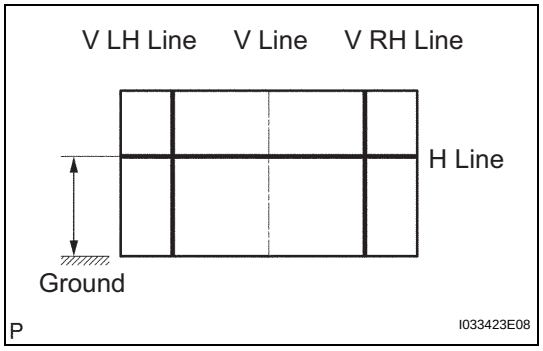
(b) Prepare a piece of thick white paper (approximately 2 m (6.6 ft) (height) x 4 m (13.1 ft) (width)) to use as a screen.

(c) Draw a vertical line down the center of screen (V line).

(d) Set the screen as shown in the illustration.



HINT:
- Stand the screen perpendicular to the ground.
- Align the V line on the screen with the center of the vehicle.



(e) Draw base lines (H line, V LH, V RH lines) on the screen as shown in the illustration.
HINT:
- The base lines differ for "low-beam inspection" and "high-beam inspection".
- Follow the same procedures as for "high-beam inspection".
- Mark the headlight bulb center marks on the screen. If the center mark cannot be observed on the headlight, use the center of the headlight bulb or the manufacturer name marked on the headlight as the center mark.

(1) H Line (Headlight height):
Draw a horizontal line across the screen so that it passes through the center marks. The H line should be at the same height as the headlight bulb center marks of the low-beam headlights.

(2) V LH Line, V RH Line (Center mark position of left-hand (LH) and right-hand (RH) headlights):
Draw two vertical lines so that they intersect the H line at each center mark (aligned with the center of the low-beam headlight bulbs).

4. HEADLIGHT AIMING INSPECTION

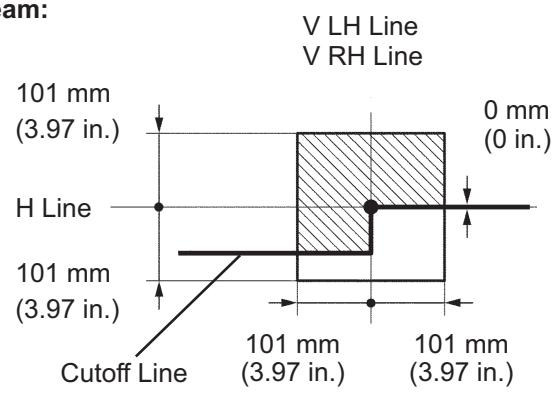
(a) Cover the headlight or disconnect the connector of the headlight on the opposite side to prevent light from the headlight not being inspected from affecting headlight aiming inspection.
NOTICE:
Do not keep the headlight covered for more than 3 minutes. The headlight lens is made of synthetic resin, and may easily melt or be damaged due to heat.

(b) Start the engine.
NOTICE:
Engine rpm must be 1,500 or more.

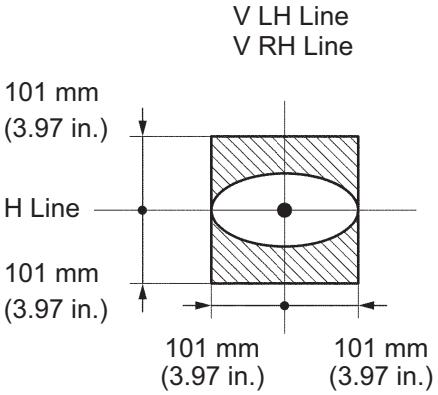
(c) Turn on the headlight and make sure that the cutoff line falls within the specified area, as shown in the illustration.

Aligning distance 7.62 m (25 ft):

Low Beam:

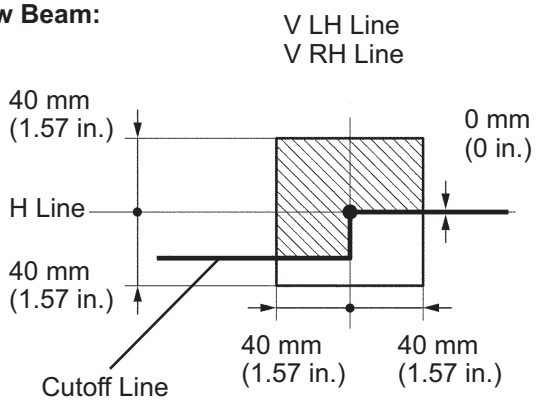


High Beam:

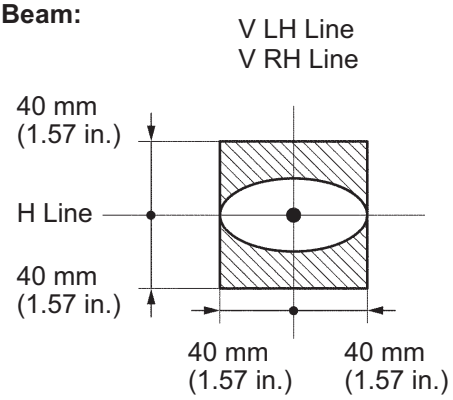


Aligning distance 3 m (9.84 ft):

Low Beam:



High Beam:

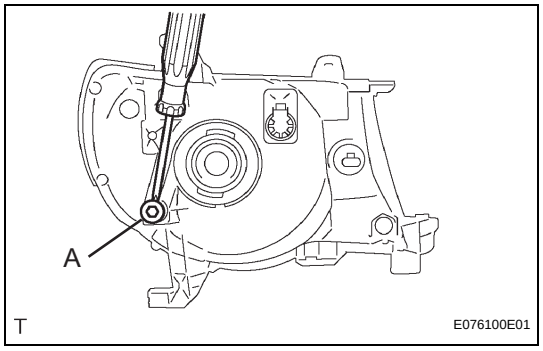


E113067E01

HINT:

- Alignment distance is 7.62 m (25 ft):
  The cutoff line is 101 mm (3.97 in.) above and below the H line as well as to the left and right of the V line with low-beam (SAEJ599).

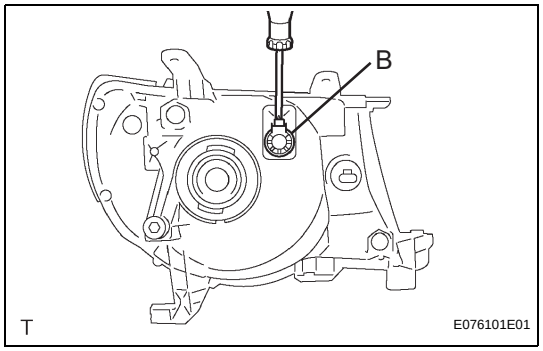
- Alignment distance is 3 m (9.84 ft):
  The cutoff line is 40 mm (1.57 in.) above and below the H line as well as to the left and right of the V line with low-beam (SAEJ599).
- Alignment distance is 7.62 m (25 ft):
  The cutoff line is 101 mm (3.97 in.) above and below the H line as well as to the left and right of the V line with high-beam (SAEJ599).
- Alignment distance is 3 m (9.84 ft):
  The cutoff line is 40 mm (1.57 in.) above and below the H line as well as to the left and right of the V line with high-beam (SAEJ599).
- Alignment distance is 7.62 m (25 ft):
  The cutoff line is 0 mm (0 in.) below the H line with low-beam.
- Alignment distance is 3 m (9.84 ft):
  The cutoff line is 0 mm (0 in.) below the H line with low-beam.



5. HEADLIGHT AIMING ADJUSTMENT

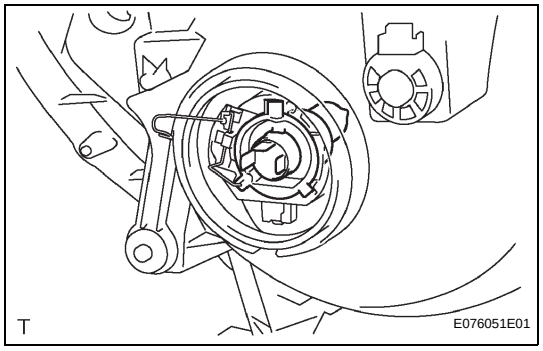
(a) Adjust the aim vertically:
Adjust the headlight aim into the specified range by turning aiming screw A with a screwdriver.
NOTICE:
The final turn of the aiming screw should be made in the clockwise direction. If the screw is tightened excessively, loosen it and then retighten it, so that the final turn of the screw is in the clockwise direction.

(b) Perform low-beam aim adjustment.
HINT:
The headlight aim moves up when turning the aiming screw clockwise, and moves down when turning the aiming screw counterclockwise.



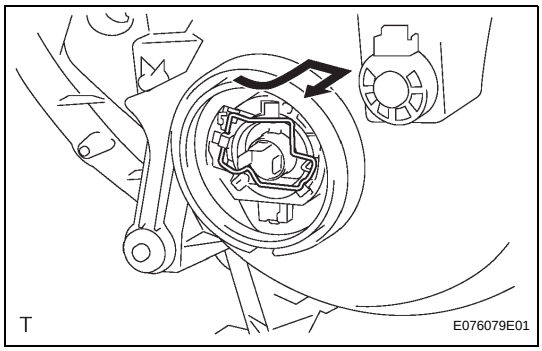
(c) Adjust the aim horizontally:
Adjust the headlight aim into the specified range by turning aiming screw B with a screwdriver.
NOTICE:
The final turn of the aiming screw should be made in the clockwise direction. If the screw is tightened excessively, loosen it and then retighten it, so that the final turn of the screw is in the clockwise direction.

INSTALLATION

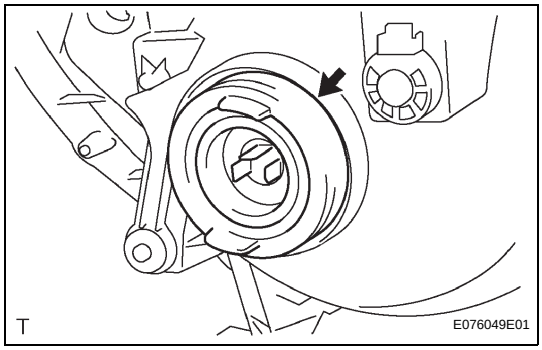


1. INSTALL NO. 1 HEADLIGHT, BULB

(a) Install the No. 1 headlight bulb.



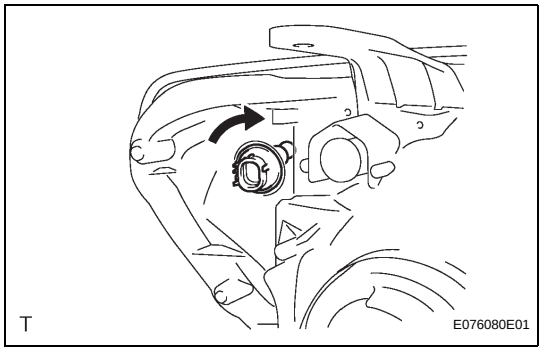
(b) Lock the set spring by moving it in the direction indicated by the arrow in the illustration.



(c) Install the socket cover.

2. INSTALL CLEARANCE LIGHT BULB

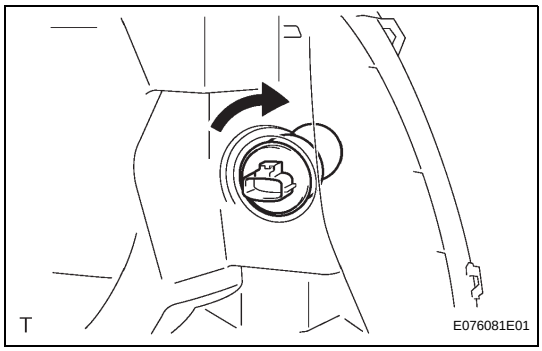
(a) Install the clearance light bulb into the light socket.



(b) To install the clearance light bulb socket and bulb, turn them in the direction indicated by the arrow in the illustration.

3. INSTALL FRONT TURN SIGNAL LIGHT BULB

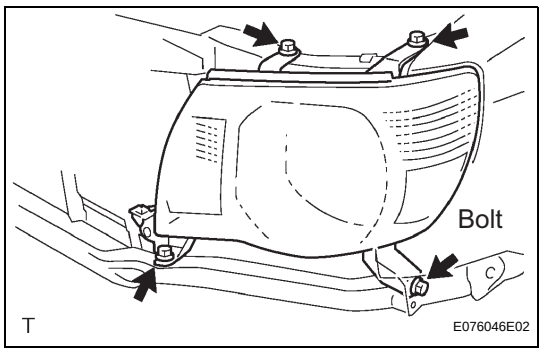
(a) Install the front turn signal light bulb into the light socket.



(b) To install the front turn signal light bulb socket and bulb, turn them in the direction indicated by the arrow in the illustration.

4. INSTALL HEADLIGHT ASSEMBLY

(a) Connect the 3 connectors.



(b) Install the LH headlight assembly with the bolt and 3 screws.
Torque: 2.0 N*m (20 kgf*cm, 17 in.*lbf)

5. INSTALL FRONT BUMPER FILLER (See page ET-9)

6. INSTALL FRONT BUMPER COVER (See page ET-11)

7. INSTALL RADIATOR GRILLE (See page ET-11)

8. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

9. **VEHICLE PREPARATION FOR HEADLIGHT AIM ADJUSTMENT (See page LI-5)**
10. **PREPARATION FOR HEADLIGHT AIMING (for Using a Tester) (See page LI-5)**
11. **PREPARATION FOR HEADLIGHT AIMING (for Using a Screen) (See page LI-5)**
12. **HEADLIGHT AIMING INSPECTION (See page LI-7)**
13. **HEADLIGHT AIMING ADJUSTMENT (See page LI-9)**

REPAIR

HINT:

- Use the same procedures for the RH and LH.
- The procedures listed below are for the LH side.
- If the area where the headlight unit LH is installed is damaged, the repairs listed below can be performed inexpensively through the use of a repair use bracket. This may only be done if the headlight assembly LH itself is not damaged.

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
2. **REMOVE RADIATOR GRILLE (See page ET-4)**
3. **REMOVE FRONT BUMPER COVER (See page ET-4)**
4. **REMOVE FRONT BUMPER FILLER (See page ET-6)**
5. **REMOVE HEADLIGHT ASSEMBLY (See page LI-4)**
6. **INSTALL HEADLIGHT PROTECTOR UPPER RETAINER**

   HINT:

   - If the installation area of the LH headlight assembly is damaged, use the supply bracket for low-cost repair.
   - Ensure that the LH headlight assembly is not damaged.

   (a) Cut off the portion indicated by the shaded portion in the illustration and smooth the surface with sandpaper.

   NOTICE:

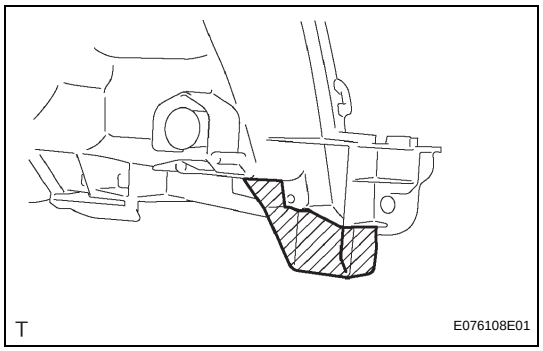
   After cutting off the shaded portion, place the LH headlight protector upper retainer LH against the bosses and gradually file away the shaded portion until installation is possible.

   (b) Install the headlight protector upper retainer LH with the 2 screws.

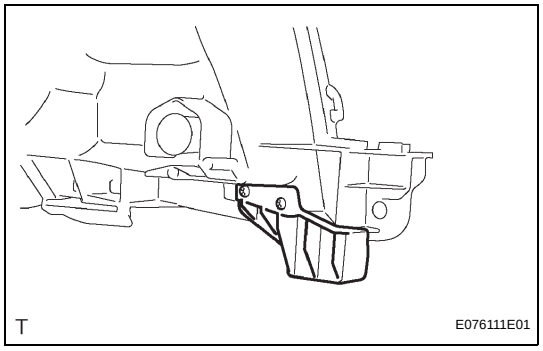
7. **INSTALL HEADLIGHT PROTECTOR LOWER RETAINER**

   HINT:

   - If the installation area of the LH headlight assembly is damaged, use the supply bracket for low-cost repair.
   - Ensure that the LH headlight assembly is not damaged.

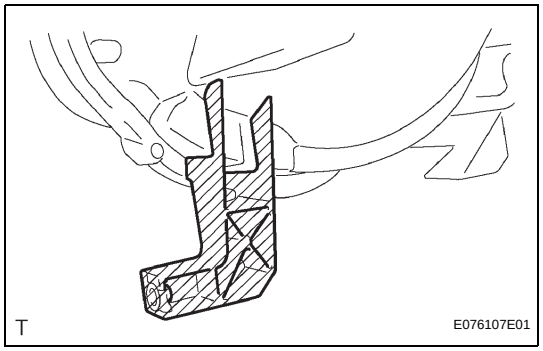


(a) Cut off the portion indicated by the shaded portion in the illustration and smooth the surface with sandpaper.
NOTICE:
After cutting off the shaded portion, place the headlight protector lower retainer LH against the bosses and gradually file away the shaded portion until installation is possible.

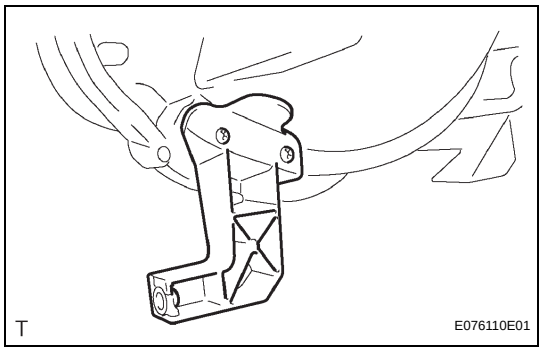


(b) Install the headlight protector lower retainer LH with the 2 screws.

8. INSTALL HEADLIGHT LOWER BRACKET
HINT:
- If the installation area of the LH headlight assembly is damaged, use the supply bracket for low-cost repair.
- Make sure that the LH headlight assembly is not damaged.



(a) Cut off the portion indicated by the shaded portion in the illustration and smooth the surface with sandpaper.
NOTICE:
After cutting off the shaded portion, place the headlight lower bracket LH against the bosses and gradually file away the shaded portion until installation is possible.



(b) Install the headlight lower bracket LH with the 2 screws.

9. INSTALL HEADLIGHT ASSEMBLY

10. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

11. INSTALL FRONT BUMPER FILLER (See page ET-9)

12. INSTALL FRONT BUMPER COVER (See page ET-11)

13. INSTALL RADIATOR GRILLE (See page ET-11)

14. VEHICLE PREPARATION FOR HEADLIGHT AIM ADJUSTMENT (See page LI-5)

15. PREPARE FOR HEADLIGHT AIMING (for Using a Tester) (See page LI-5)

16. PREPARE FOR HEADLIGHT AIMING (for Using a Screen) (See page LI-5)

17. HEADLIGHT AIMING INSPECTION (See page LI-7)

18. HEADLIGHT AIMING ADJUSTMENT (See page LI-9)

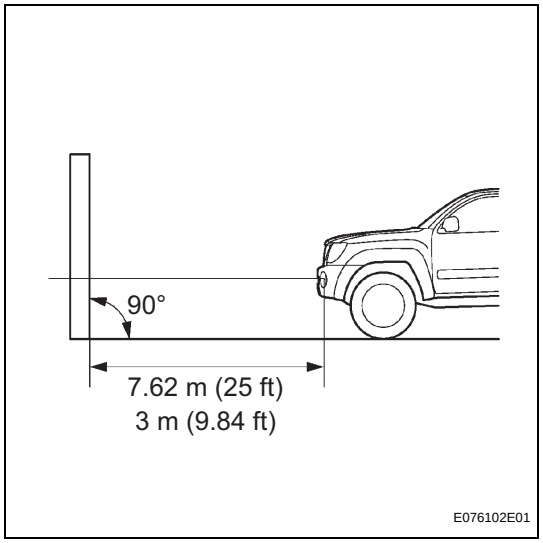
ADJUSTMENT

1. VEHICLE PREPARATION FOR FOG LIGHT AIM ADJUSTMENT

(a) Prepare the vehicle:

HINT:

- Ensure that there is no damage or deformation to the body around the fog lights.
- Fill the fuel tank.
- Make sure that the oil is filled to the specified level.
- Make sure that the coolant is filled to the specified level.
- Inflate the tires to the appropriate pressure.
- Place the spare tire, tools, and jack in their original positions.
- Unload the trunk.
- Sit a person of average weight (68 kg, 150 lb) in the driver side seat.



2. PREPARATION FOR FOG LIGHT AIMING

(a) Prepare the vehicle according to the following conditions:

HINT:

- Place the vehicle in a location that is dark enough to clearly observe the cutoff line. The cutoff line is a distinct line, below which light from the headlights can be observed and above which it cannot.
- Place the vehicle at a 90° angle to the wall.
- Keep a 7.62 m (25 ft) distance between the center of the fog light bulb and the wall.
- Place the vehicle on a level surface.
- Bounce the vehicle up and down to settle the suspension.

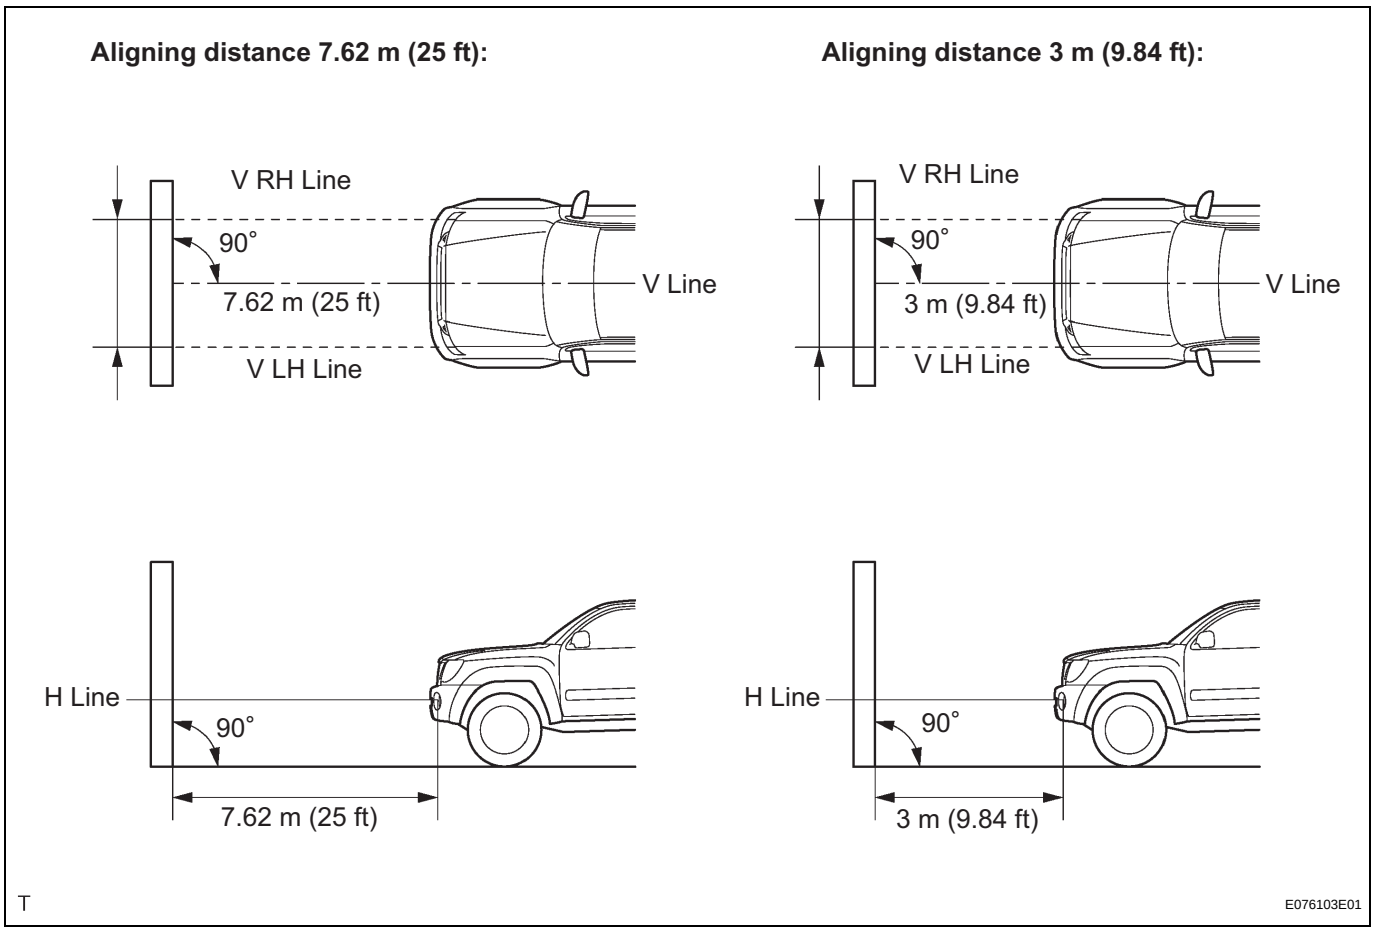
NOTICE:

A distance of 7.62 m (25 ft) between the vehicle (center of the fog light bulb) and the wall is necessary for proper aim adjustment. If unavailable to secure a distance of 7.62 m (25 ft), secure a distance of exactly 3 m (9.84 ft) to check and adjust the fog light aim. (Since the target zone will change with the distance, follow the instructions shown in the illustration.)

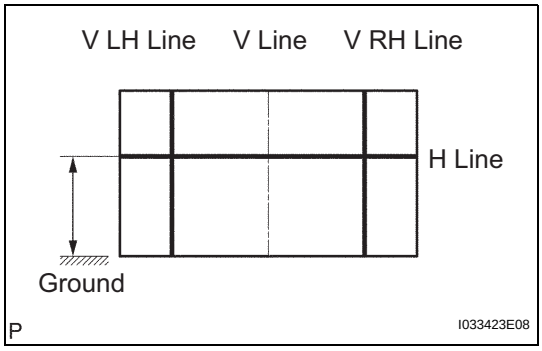
(b) Prepare a piece of thick white paper (approximately 2 m (6.6 ft) (height) x 4 m (13.1 ft) (width)) to use as a screen.

(c) Draw a vertical line down the center of screen (V line).

(d) Set the screen as shown in the illustration.



HINT:
- Stand the screen perpendicular to the ground.
- Align the V line on the screen with the center of the vehicle.



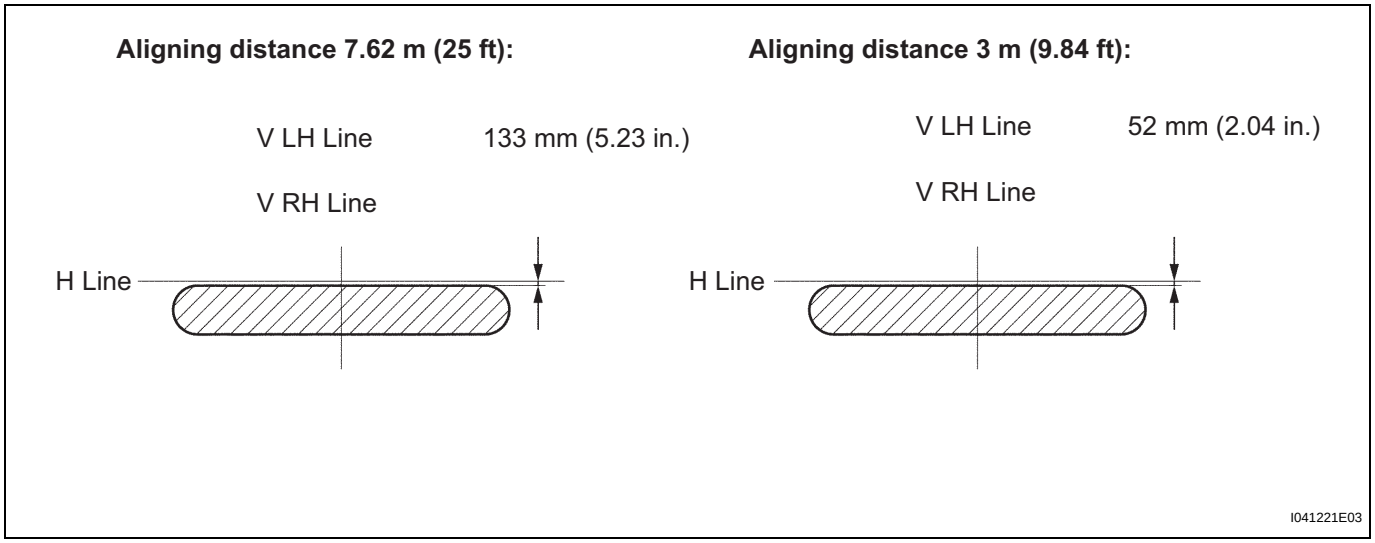
(e) Draw base lines (H line, V LH, V RH lines) on the screen as shown in the illustration.
HINT:
Mark the fog light bulb center marks on the screen. If the center mark cannot be observed on the fog light, use the center of the fog light bulb or the manufacturer's name marked on the fog light as the center mark.
(1) H Line (Fog light height):
Draw a horizontal line across the screen so that it passes through the center marks. The H line should be at the same height as the fog light bulb center marks of the low-beam fog lights.
(2) V LH Line, V RH Line (Center mark position of left-hand (LH) and right-hand (RH) fog lights):
Draw two vertical lines so that they intersect the H line at each center mark.

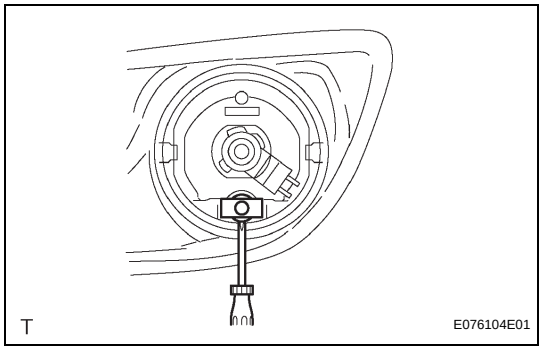
3. FOG LIGHT AIMING INSPECTION

(a) Cover the fog light or disconnect the connector of the fog light on the opposite side to prevent light from the fog light not being inspected from affecting fog light aiming inspection.

(b) Start the engine.
NOTICE:
Engine rpm must be 1,500 or more.

(c) Turn on the fog light and make sure that the cutoff line falls within the specified area, as shown in the illustration.

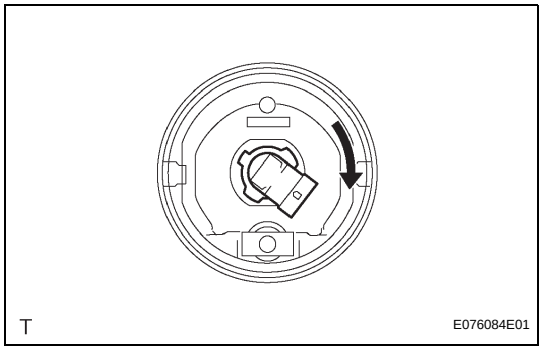




4. FOG LIGHT AIMING ADJUSTMENT

(a) Adjust the fog light aim into the specified range by turning the aiming screw with a screwdriver.
NOTICE:
The final turn of the aiming screw should be made in the clockwise direction. If the screw is tightened excessively, Loosen it and then retighten it, so that the final turn of the screw is in the clockwise direction.

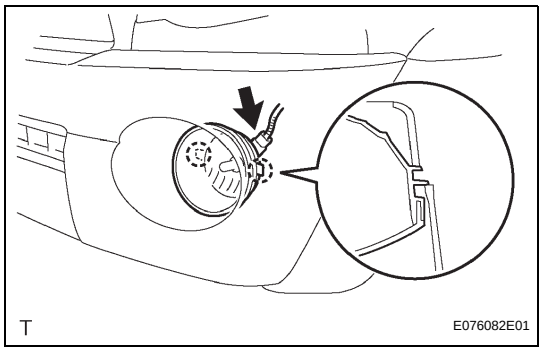
INSTALLATION



1. INSTALL FOG LIGHT ASSEMBLY

(a) Install the fog light bulb into the light socket.

(b) To install the fog light bulb socket and bulb, turn them in the direction indicated by the arrow in the illustration.



(c) Engage the 2 claws and install the fog light assembly LH.

(d) Connect the connector.

2. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

3. VEHICLE PREPARATION FOR FOG LIGHT AIM ADJUSTMENT (See page LI-14)

4. PREPARATION FOR FOG LIGHT AIMING (See page LI-14)

5. FOG LIGHT AIMING INSPECTION (See page LI-16)

6. FOG LIGHT AIMING ADJUSTMENT (See page LI-17)

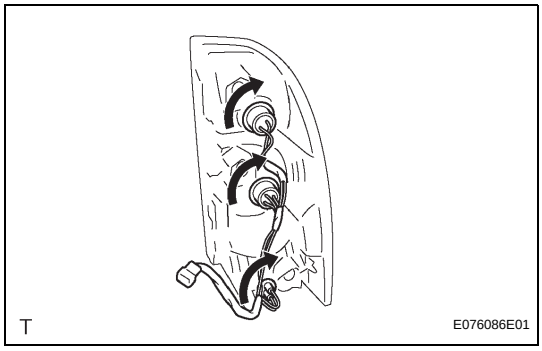
INSTALLATION

1. INSTALL REAR COMBINATION LIGHT ASSEMBLY

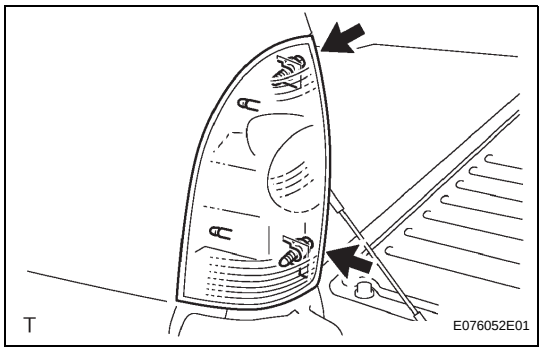
(a) Install the 3 light bulbs into the 3 light sockets.

(b) To install the 3 light bulb sockets and 3 bulbs, turn them in the direction indicated by the arrow in the illustration.

(c) Install the wire harness clamp.



(d) Connect the connector, then install the tail light (rear combination light) assembly LH with the 2 bolts.
Torque: 5.4 N*m (55 kgf*cm, 48 in.*lbf)



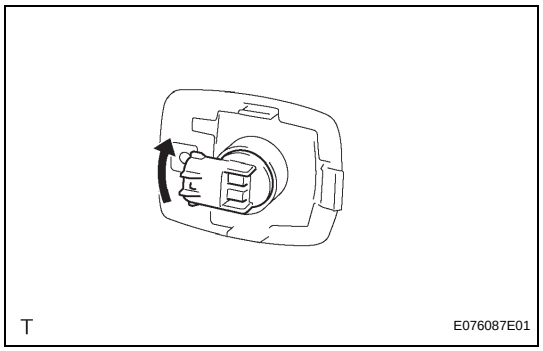
2. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

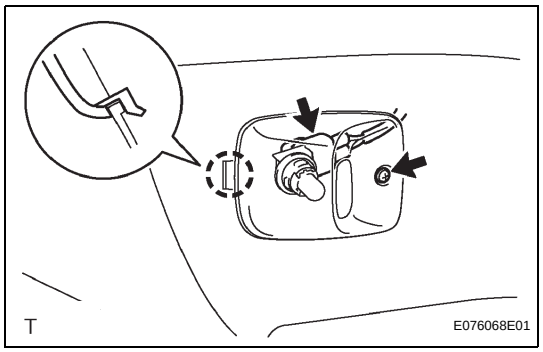
INSTALLATION

1. REMOVE LICENSE PLATE LIGHT ASSEMBLY

(a) Install the license plate light bulb into the light socket.

(b) To install the license plate light bulb socket and bulb, turn them in the direction indicated by the arrow in the illustration.





(c) Install the license plate light assembly with the screw.

2. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

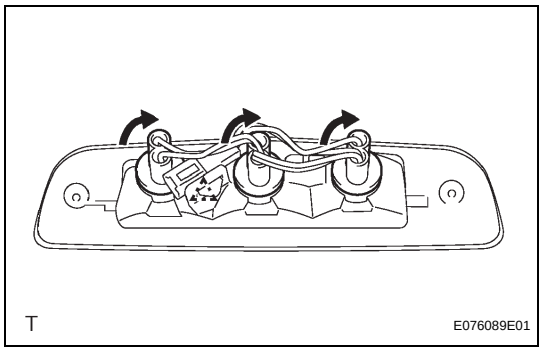
INSTALLATION

1. INSTALL CENTER STOP LIGHT ASSEMBLY

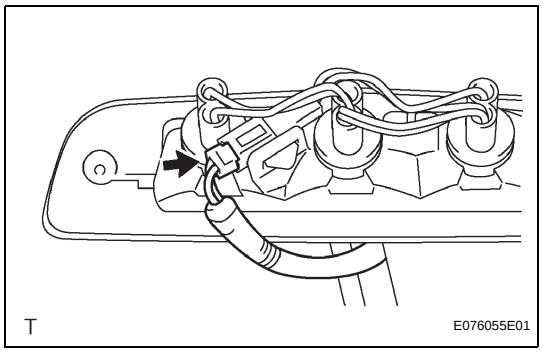
(a) Install the 3 center stop light bulbs into the 3 light sockets.

(b) To install the 3 center stop light sockets and bulbs, turn them in the direction indicated by the arrow in the illustration.

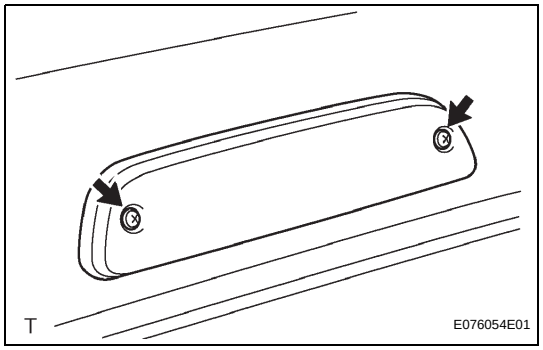
(c) Install the wire harness clamp.



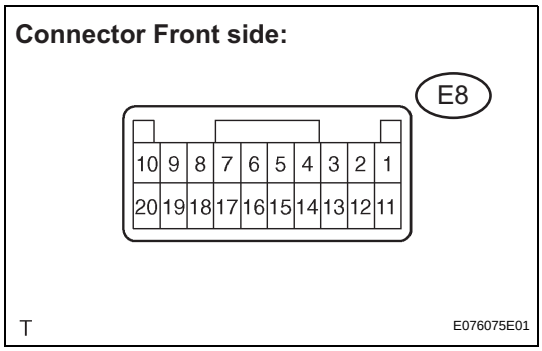
(d) Connect the connector.



(e) Install the center stop light assembly with the 2 screws.



2. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)



INSPECTION

1. INSPECT HEADLIGHT DIMMER SWITCH ASSEMBLY

(a) Check the resistance of the light control switch.

(1) Measure the resistance using an ohmmeter, and check the results in accordance with the value(s) in the table below.

Standard

Tester Connection	Condition	Specified Condition
-	OFF	10 kΩ or higher
12-18	TAIL	Below 1Ω
12-18-20	HEAD	Below 1Ω

If the result is not as specified, replace the headlight dimmer switch assembly.

(b) Check the resistance of the headlight dimmer switch.

(1) Measure the resistance using an ohmmeter, and check the results in accordance with the value(s) in the table below.

Standard

Tester Connection	Condition	Specified Condition
11-12-17	FLASH	Below 1Ω
12-16	LOW BEAM	Below 1Ω
11-12	HI BEAM	Below 1Ω

If the result is not as specified, replace the headlight dimmer switch assembly.

(c) Check the resistance of the turn signal switch.

(1) Measure the resistance using an ohmmeter, and check the results in accordance with the value(s) in the table below.

Standard

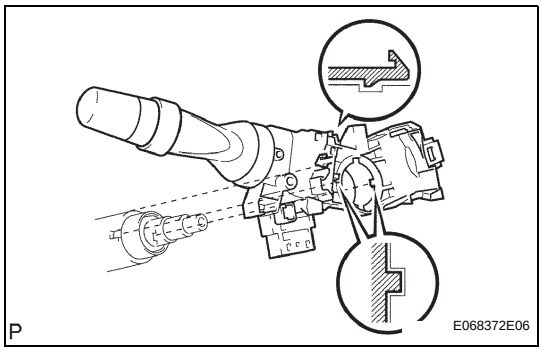
Tester Connection	Condition	Specified Condition
12-13	Right turn	Below 1Ω
-	Neutral	10 kΩ or higher
12-15	Left turn	Below 1Ω

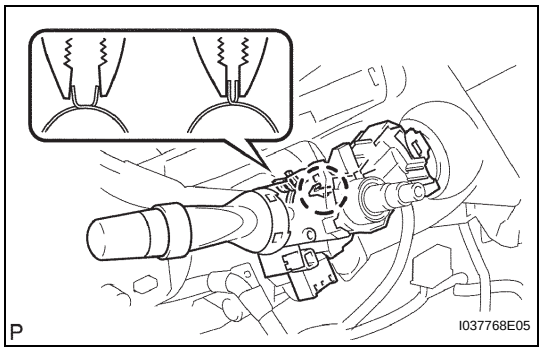
If the result is not as specified, replace the headlight dimmer switch assembly.

INSTALLATION

1. INSTALL HEADLIGHT DIMMER SWITCH ASSEMBLY

(a) Engage the 2 claws and install the headlight dimmer switch assembly as shown in the illustration.





(b) Install the headlight dimmer switch assembly with the clamp.
(c) Connect the connector.

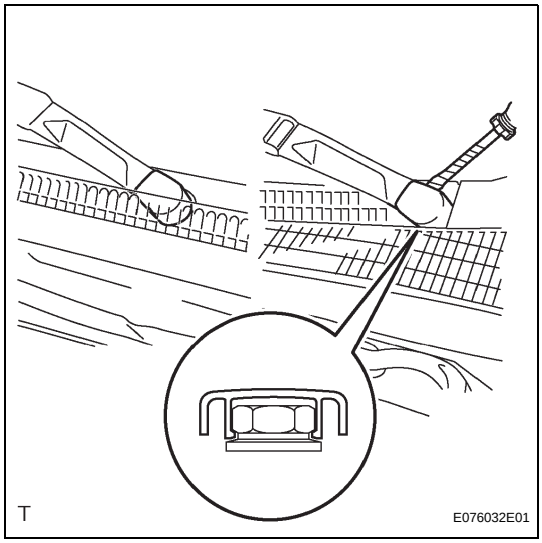
2. **INSTALL WINDSHIELD WIPER SWITCH ASSEMBLY (See page WW-19)**
3. **INSTALL SPIRAL CABLE SUB-ASSEMBLY (See page RS-567)**
4. **INSTALL STEERING COLUMN UPPER COVER (See page SR-18)**
5. **INSTALL STEERING COLUMN LOWER COVER (See page SR-18)**
6. **CENTER SPIRAL CABLE (See page RS-567)**
7. **INSTALL STEERING WHEEL ASSEMBLY (See page SR-18)**
8. **INSPECT STEERING WHEEL CENTER POINT**
9. **INSPECT HORN BUTTON ASSEMBLY**
10. **INSTALL HORN BUTTON ASSEMBLY**
11. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
    Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
12. **INSPECT SRS WARNING LIGHT**
13. **INSTALL NO. 3 STEERING WHEEL LOWER COVER (See page RS-559)**
14. **INSTALL NO. 2 STEERING WHEEL LOWER COVER (See page RS-559)**

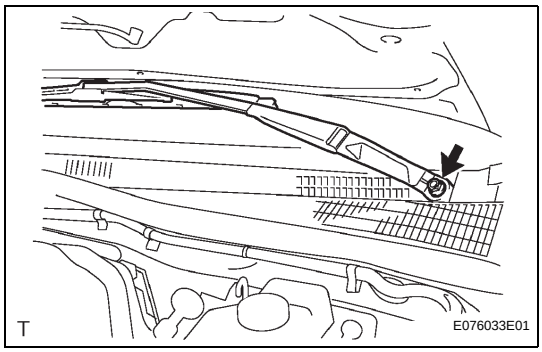
REMOVAL

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

2. REMOVE FRONT WIPER ARM HEAD CAP

(a) Using a screwdriver wrapped with protective tape, remove the 2 front wiper arm head caps.



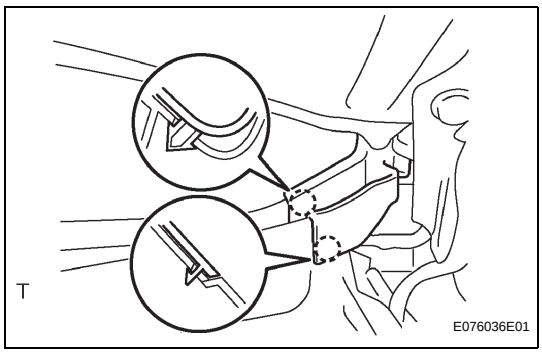


3. REMOVE FRONT WIPER ARM LH

(a) Operate the wiper, then stop the windshield wiper motor assembly at the automatic stop position.
(b) Remove the nut and front wiper arm LH.

4. REMOVE FRONT WIPER ARM RH

HINT:
Perform the same procedure as above on the opposite side.

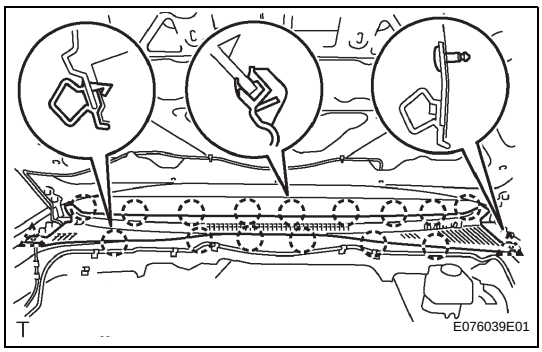


5. REMOVE FRONT FENDER TO COWL SIDE SEAL LH

(a) Disengage the 2 claws and remove the front fender to cowl side seal LH.

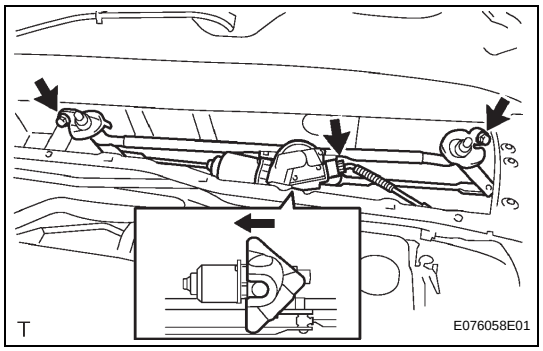
6. REMOVE FRONT FENDER TO COWL SIDE SEAL RH

HINT:
Perform the same procedure as above on the opposite side.



7. REMOVE COWL TOP VENTILATOR LOUVER SUB-ASSEMBLY

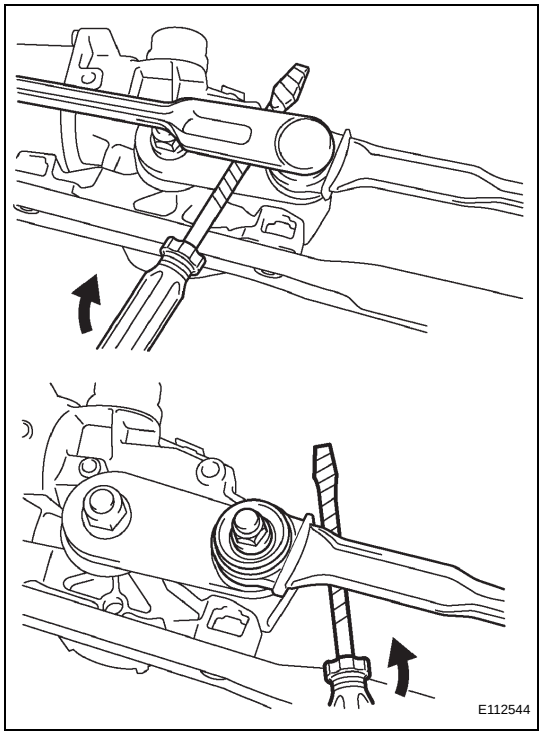
(a) Disengage the 2 clips.
(b) Disengage the 15 claws, then remove the cowl top ventilator louver sub-assembly.



8. REMOVE WINDSHIELD WIPER MOTOR AND LINK

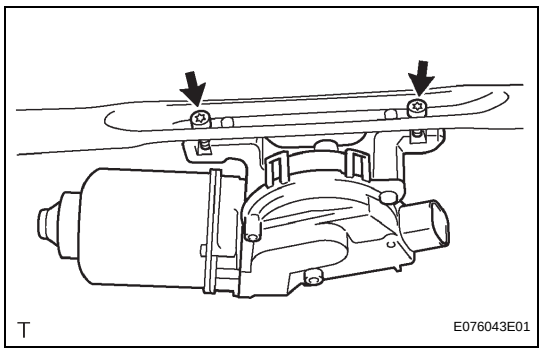
(a) Disconnect the connector, then remove the 2 bolts.

(b) Slide the wiper link assembly to the passenger side seat side. Disengage the meshing of the rubber pin, then remove the windshield wiper motor & link assembly.



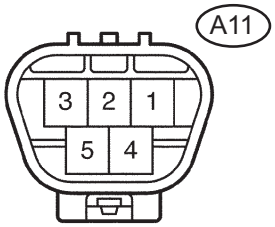
9. REMOVE FRONT WIPER MOTOR

(a) Using a screwdriver wrapped with protective tape, disengage the meshing of the 2 rods at the crank arm pivot of the windshield wiper motor assembly.



(b) Using a "Torx" socket wrench (T30), remove the 2 screws and windshield wiper motor assembly.

Windshield Wiper Motor Assembly Connector Front View:



P

E113073E01

INSPECTION

1. INSPECT FRONT WIPER MOTOR

(a) Check the LO operation.

(1) Connect the battery positive (+) lead to terminal 1 (+1) of the connector and the battery negative (-) lead to terminal 5 (E), then check that the windshield wiper motor assembly operates at low speed (LO).
If the motor does not operate, replace the windshield wiper motor assembly.

(b) Check the HI operation.

(1) Connect the battery positive (+) lead to terminal 4 (+2) of the connector and the battery negative (-) lead to terminal 5 (E), then check that the motor operates at high speed (HI).

INSTALLATION

1. INSTALL FRONT WIPER MOTOR

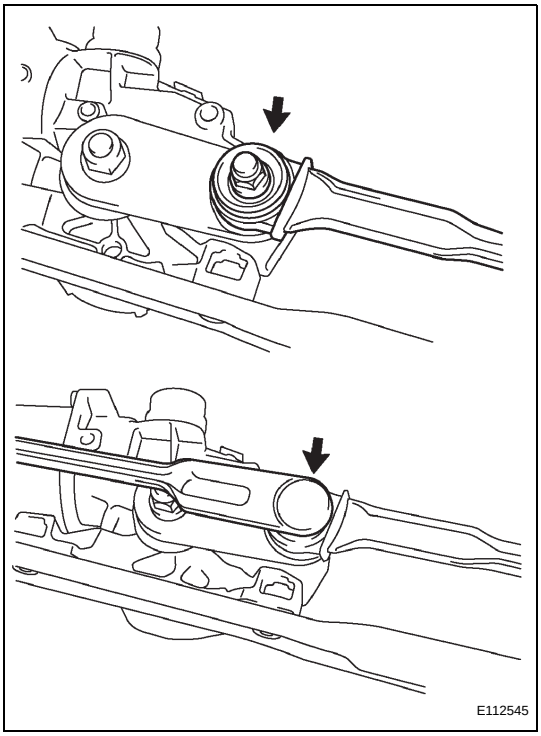
(a) Apply DENSO No. 50 grease to the crank arm pivot of the windshield wiper motor assembly.

(b) Using a "Torx" socket wrench (T30), install the windshield wiper motor assembly with the 2 screws.
Torque: 7.5 N*m (76 kgf*cm, 66 in.*lbf)

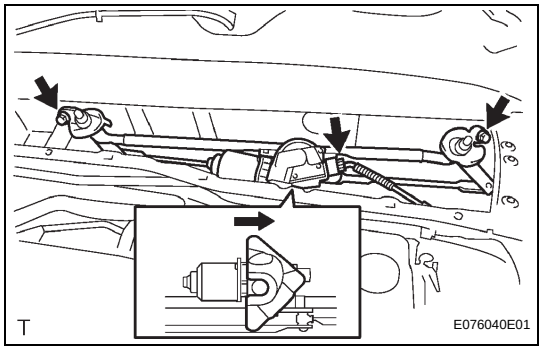
T

E076043E01

(c) Install the 2 rods onto the crank arm pivot of the windshield wiper motor assembly.



E112545



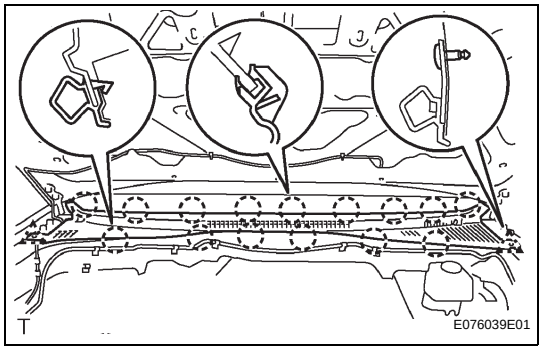
2. INSTALL WINDSHIELD WIPER MOTOR AND LINK

(a) Slide the wiper motor assembly to the driver side seat side as shown in the illustration and engage the rubber pin with the body.

(b) Install the windshield wiper link assembly with the 2 bolts.

Torque: 5.5 N*m (56 kgf*cm, 49 in.*lbf)

(c) Connect the connector.



3. INSTALL COWL TOP VENTILATOR LOUVER SUB-ASSEMBLY

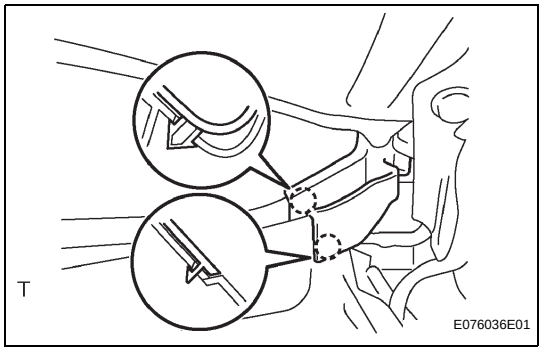
(a) Engage the 15 claws and install the cowl top ventilator louver sub-assembly.

(b) Engage the 2 clips

4. INSTALL FRONT FENDER TO COWL SIDE SEAL RH

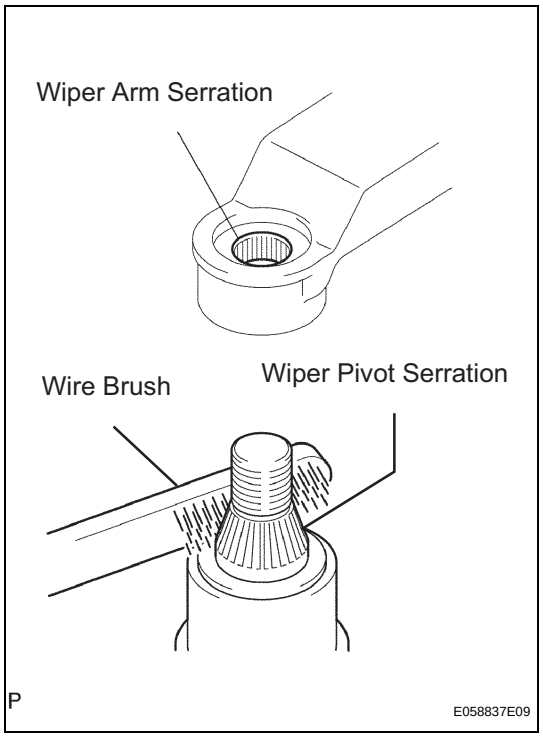
HINT:

Perform the same procedure as above on the opposite side.



5. INSTALL FRONT FENDER TO COWL SIDE SEAL LH

(a) Engage the 2 claws and install the front fender onto cowl side seal LH.

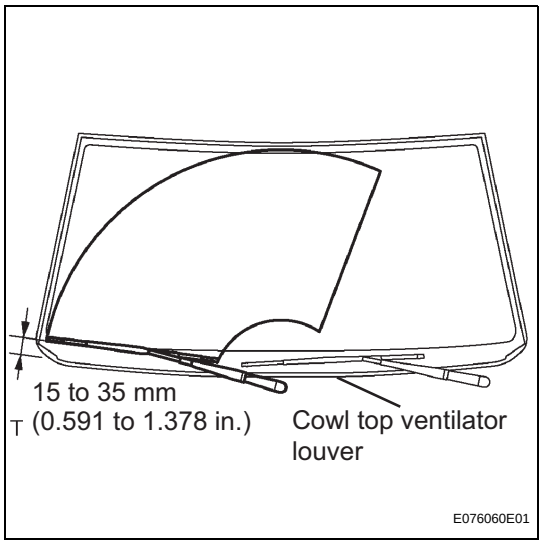


6. INSTALL FRONT WIPER ARM RH

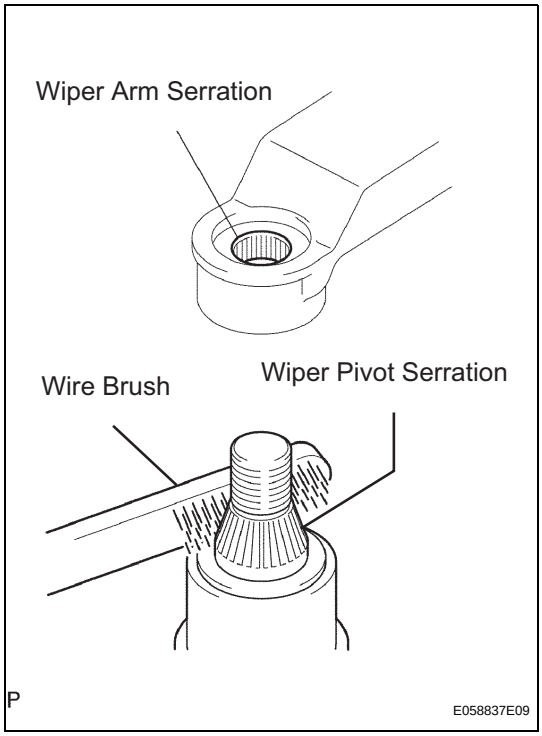
(a) Scrape any metal powder off the serration part of the wiper arm with a round file or equivalent (when reinstalling).

(b) Clean the wiper pivot serration with a wire brush.

(c) Operate the wiper, then stop the windshield wiper motor assembly at the automatic stop position.



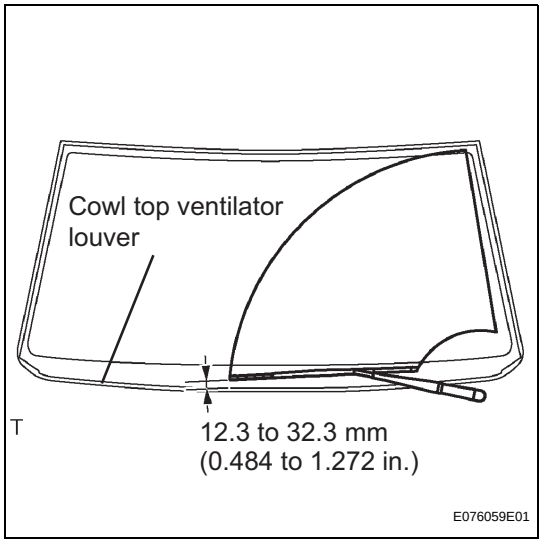
(d) Install the front wiper arm RH onto the position with the nut as shown in the illustration.
Torque: 21 N*m (209 kgf*cm, 15 ft.*lbf)
HINT:
Hold down the arm hinge by hand to fasten the nut.



7. INSTALL FRONT WIPER ARM LH

(a) Scrape any metal powder off the serration part of the wiper arm with a round file or equivalent (when reinstalling).

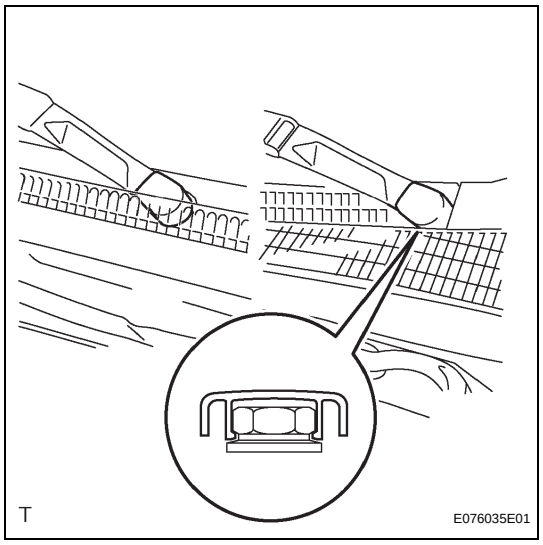
(b) Clean the wiper pivot serration with a wire brush.



(c) Install the front wiper arm LH onto the position with the nut as shown in the illustration.
Torque: 21 N*m (209 kgf*cm, 15 ft.*lbf)
HINT:
Hold down the arm hinge by hand to fasten the nut.

(d) Operate the front wipers while spraying water or washer fluid on the windshield. Ensure that there is no interference between the blades and pillar.

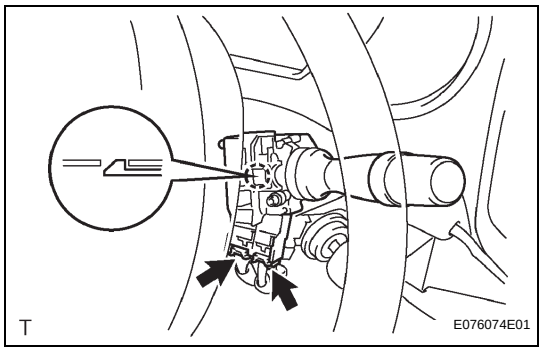
8. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)



9. INSTALL FRONT WIPER ARM HEAD CAP

(a) Engage the claw and install the 2 front wiper arm head caps.

(3) Connect the voltmeter positive terminal to terminal 3 (+1) of the E7 connector and the voltmeter negative terminal to terminal 2 (EW) of the E11 connector. Turn the washer switch on and off, and check the voltage between terminals 3 (+1) of the E7 connector and 2 (EW) of the E11 connector.



INSTALLATION

1. **INSTALL WIPER SWITCH**
   (a) Engage the claw and install the windshield wiper switch assembly.
   (b) Connect the 2 connectors.
2. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
   Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
3. **INSTALL STEERING COLUMN UPPER COVER (See page SR-18)**
4. **INSTALL STEERING COLUMN LOWER COVER (See page SR-18)**

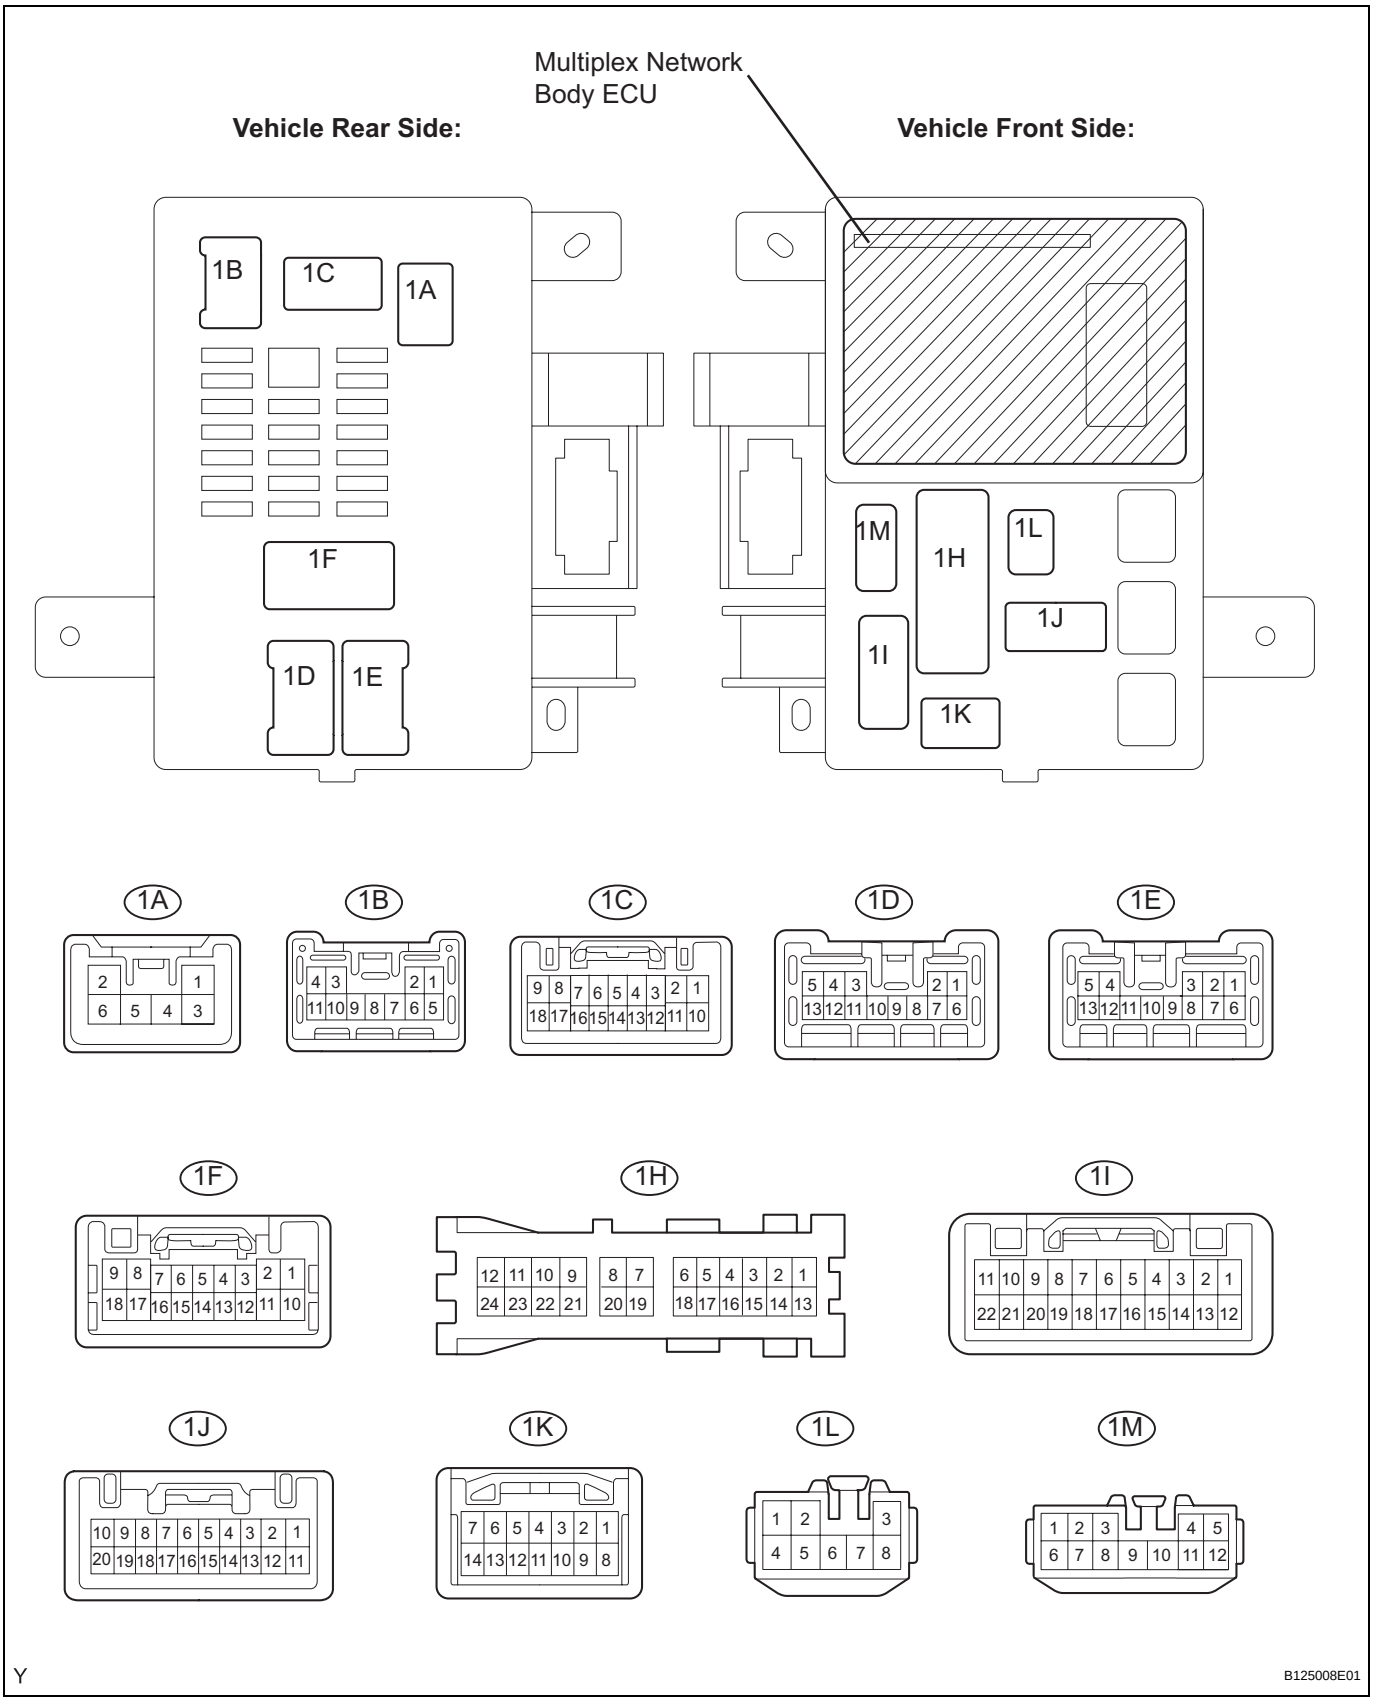
PROBLEM SYMPTOMS TABLE

Power door lock control system

Symptom	Suspected area	See page
All doors cannot be locked/unlocked simultaneously	DR LOCK fuse	DL-10
	J/B fuse	
	ECU-B fuse	
	ALT fuse	
	Power window regulator master switch assembly	
	Front door lock assembly LH	
	Door control switch aassembly	
	Driver side J/B assembly (multiplex network body ECU)	
	Wire harness	
Key lock-on prevention function does not work properly (manual operation and key-linked lock are available)	Unlock warning switch assembly	DL-29
	Front door courtesy light switch assembly (driver side)	
	Driver side J/B assembly (multiplex network body ECU)	
	Wire harness	

TERMINALS OF ECU

1. CHECK DRIVER SIDE JUNCTION BLOCK ASSEMBLY (MULTIPLEX NETWORK BODY ECU)



(a) Disconnect the 1A, 1C, 1F, 1H, 1I and 1K driver side J/B connectors.
(b) Disconnect the B5 multiplex network body ECU connectors.
(c) Measure the voltage and resistance of each of the wire harness side connectors.

Standard:

Symbols (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
ALTB (1A-6) - Body ground	L - Body ground	+B (power system, generator system) power supply	Always	10 to 14 V
ECUB (1C-16) - Body ground	R - Body ground	+B (ECUB) power supply	Always	10 to 14 V
GND (1H-18) - Body ground	W-B - Body ground	Ground	Always	Below 1 Ω
KSW (1K-10) - Body ground	G-B - Body ground	Key unlock warning switch input	No key in ignition key cylinder	10 kΩ or higher
			Key inserted in ignition key cylinder	Below 1 Ω
DCTY (1F-7) - Body ground	G-Y - Body ground	Driver side courtesy switch input	Driver side door closed	10 kΩ or higher
			Driver side door open	Below 1 Ω
PCTY (1I-8) - Body ground	R-B - Body ground	Pssenger side courtesy switch input	Passenger side door closed	10 kΩ or higher
			Passenger side door open	Below 1 Ω
L1 (1I-7) - Body ground L1 (1I-18) - Body ground	L-W - Body ground	Door control switch (master switch and passenger side switch) lock input	Door control switch (master switch or passenger side switch) OFF	10 kΩ or higher
			Door control switch (master switch or passenger side switch) LOCK	Below 1 Ω
UL1 (1I-3) - Body ground UL1 (1I-1) - Body ground	GR - Body ground	Door control switch (master switch and passenger side switch) lock input	Door control switch (master switch or passenger side switch) OFF	10 kΩ or higher
			Door control switch (master switch or passenger side switch) UNLOCK	Below 1 Ω
LSWD (B5-20) - Body ground	W-R - Body ground	Driver side door lock position switch input	Driver side door UNLOCK	10 kΩ or higher
			Driver side door LOCK	Below 1 Ω
LSWP (B5-11) - Body ground	B-W - Body ground	Driver side door lock position switch input	Driver side door UNLOCK	10 kΩ or higher
			Driver side door LOCK	Below 1 Ω
L2 (1I-17) - Body ground	V - Body ground	Driver side door key-linked door lock input	Driver side door key cylinder OFF	10 kΩ or higher
			Driver side door key cylinder LOCK	Below 1 Ω
L2 (1I-4) - Body ground	V - Body ground	Passenger side door key-linked door lock input	Passenger side door key cylinder OFF	10 kΩ or higher
			Passenger side door key cylinder LOCK	Below 1 Ω
UL3 (B5-23) - Body ground	G-B - Body ground	Driver side door key-linked door unlock input	Driver side door key cylinder OFF	10 kΩ or higher
			Driver side door key cylinder UNLOCK	Below 1 Ω

Symbols (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
UL2 (1I-19) - Body ground	P - Body ground	Passenger side door key-linked door unlock input	Passenger side door key cylinder OFF	10 kΩ or higher
			Passenger side door key cylinder UNLOCK	Below 1 Ω

If the result is not as specified, there may be a malfunction on the wire harness side.

(d) Reconnect the 1A, 1C, 1F, 1H, 1I and 1K J/B connectors.

(e) Reconnect the B5 multiplex network body ECU connectors.

(f) Measure the voltage of the connectors.

Standard:

Symbols (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
ACT+ (1H-24) - Body ground ACT+ (1H-23) - Body ground ACT+ (1F-1) - Body ground ACT+ (1H-22) - Body ground	L-R - Body ground	Door lock motor LOCK drive output (all doors)	Door control switch (master switch or passenger side switch) or door key cylinder (driver or passenger side) OFF	Below 1 V
			Door control switch (master switch or passenger side switch) or door key cylinder (driver or passenger side) LOCK	10 to 14 V
ACTD (B5-3) - Body ground	L-B - Body ground	Door lock motor UNLOCK drive output (driver side doors)	Door control switch (master switch or passenger side switch) or door key cylinder (driver or passenger side) OFF	Below 1 V
			Door control switch (master switch or passenger side switch) or door key cylinder (driver or passenger side) LOCK	10 to 14 V
ACT- (1H-5) - Body ground ACT- (1F-2) - Body ground ACT- (1H-4) - Body ground	L-B - Body ground	Door lock motor LOCK drive output (passenger and rear LH and rear RH side door)	Door control switch (master switch or passenger side switch) or door key cylinder (driver or passenger side) OFF	Below 1 V
			Door control switch (master switch or passenger side switch) or door key cylinder (driver or passenger side) LOCK	10 to 14 V

If the result is not as specified, the multiplex network body ECU may have a malfunction.

ON-VEHICLE INSPECTION

1. CHECK ELECTRICAL DOOR LOCK OPERATION

(a) Check the basic function.

(1) The door control switch (manual operation): 1) pushing LOCK locks all the doors and 2) pushing UNLOCK unlocks all the doors.

(2) The door key cylinder lock function: turning the driver or passenger side door key cylinder to the LOCK position locks all the doors.

(3) The door key cylinder unlock function: 1) turning the driver or passenger side door key cylinder to the UNLOCK position once unlocks only the driver side door, and 2) turning it to the UNLOCK position again within 3 seconds unlocks all the doors (2-step unlock function).

(b) Check the key lock-in prevention function.

NOTICE:

To prevent the key from being locked in the vehicle, the following inspection should be made with the driver side door window open.

(1) Have the key inserted into the ignition key cylinder.

(2) With the driver side door open, turn the driver side door lock knob to the LOCK position and check that all the doors unlock immediately.

(3) With the driver side door open, push LOCK on the door control switch (manual operation) and check that all the doors unlock immediately.

(4) With the driver side door open, turn the driver side door lock knob to the LOCK position, hold it for 2 seconds or more and then close the driver side door. Check that all the doors unlock.

(c) Check the security function.

(1) Close all the doors and leave the driver side door window open so that the door control switch can be operated from outside the vehicle.

(2) Pull out the key, open the driver side door and then close and lock the door without using the key. Check that pushing UNLOCK on the door control switch (manual operation) from outside the vehicle does not unlock the doors.

(3) Pull out the key, close and lock the driver side door by key operation. Check that pushing UNLOCK on the door control switch (manual operation) from outside the vehicle does not unlock the doors.

(4) Pull out the key, close the driver side door and lock the door by wireless door lock operation. Check that pushing UNLOCK on the door control switch (manual operation) from outside the vehicle does not unlock the doors.
HINT:
Check that the security function is canceled when any of the following conditions are met:
- The ignition switch is turned ON.
- The driver side door is unlocked using the key.
- UNLOCK on the door control switch (manual operation) is pushed after the door control knob is turned to the UNLOCK position manually.
- The doors are unlocked with wireless operation.

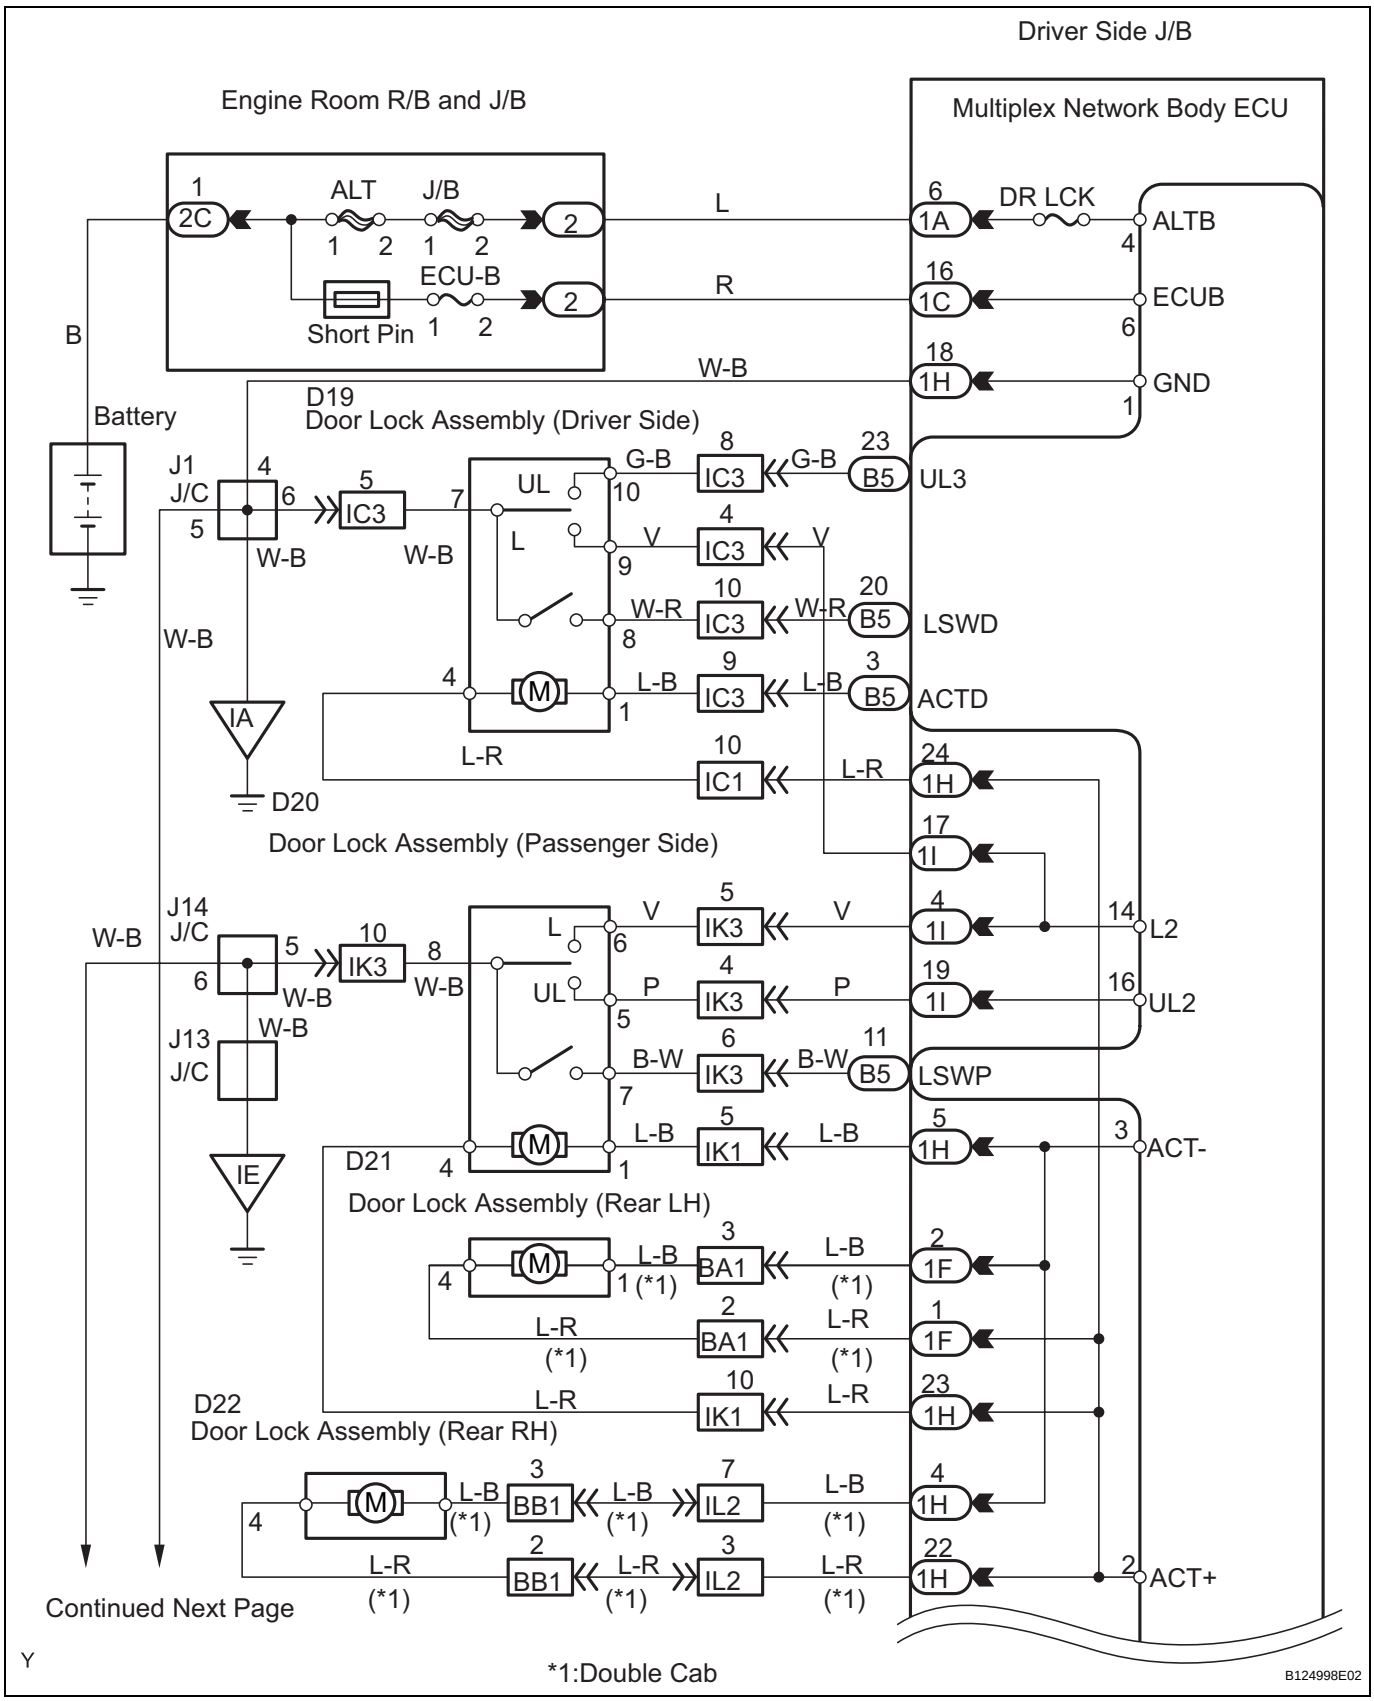
(d) Check the illumination function.
(1) Set the room light switch to the DOOR position.
(2) With all doors locked, check that all the doors unlock when the driver side door lock cylinder is turned to the UNLOCK position using the key. At the same time, the room light should turn ON.
(3) Check that the room light turns off in approximately 15 seconds if the doors have not been opened.

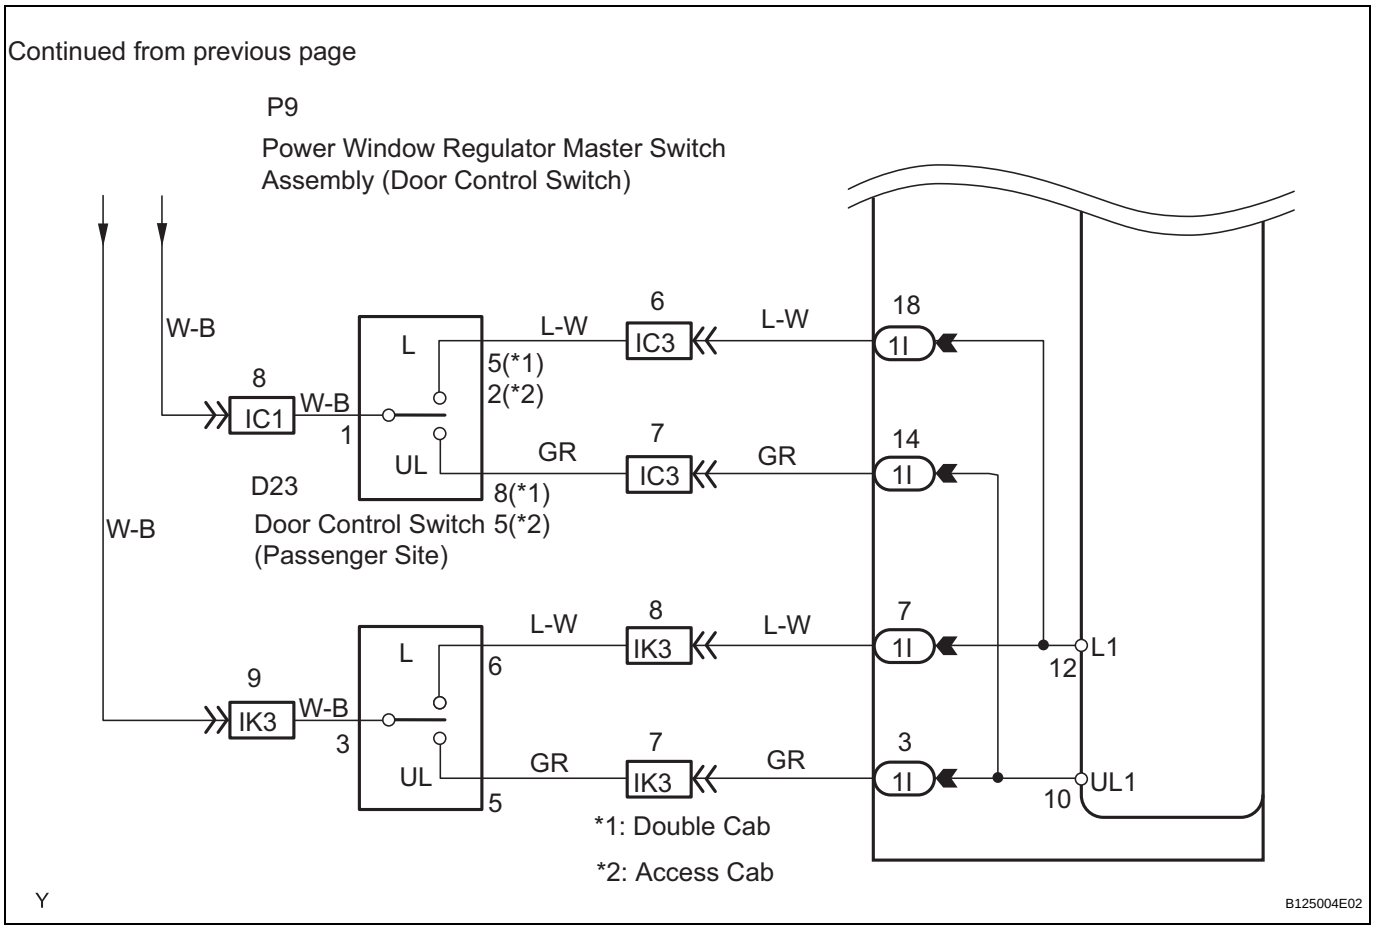
All Doors cannot be Locked / Unlocked Simultaneously

DESCRIPTION

The multiplex network body ECU activates the door lock motors with switch signals from the master switch, door control switch and driver/passenger side door key cylinder.

WIRING DIAGRAM





1	INSPECT ALL DOORS LOCK/UNLOCK OPERATION

All the doors can be locked/unlocked simultaneously using the following items:

- Door control switch on the master switch (switch operation)
- Door control switch on the front passenger side (switch operation)
- Door key cylinder linked with driver and passenger side door lock (key operation)

If all the doors cannot be locked/unlocked simultaneously, proceed to the next step according to the malfunctioning part shown in the table below.

Result:

Malfunctioning Part	Proceed to
Driver side doors	A
Passenger side doors	B
All items are malfunctioning	C

B	**Go to step 3**
C	**Go to step 14**

DL

A

2 INSPECT DRIVER SIDE DOORS LOCK/UNLOCK OPERATION

Malfunctioning Part	Proceed to
Door control switch on master switch	A
Driver side door key cylinder	B
Door control switch on master switch and driver side door key cylinder	C

A → **Go to step 4**

B → **Go to step 6**

C → **Go to step 9**

3 INSPECT PASSENGER SIDE DOORS LOCK/UNLOCK OPERATION

Malfunctioning Part	Proceed to
Door control switch on passenger side switch	A
Passenger side door key cylinder	B
Door control switch on passenger side and passenger side door key cylinder	C

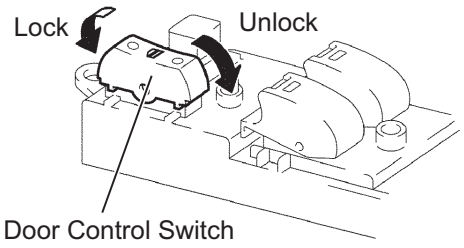
A → **Go to step 16**

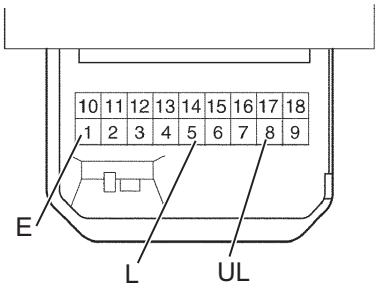
B → **Go to step 18**

C → **Go to step 21**

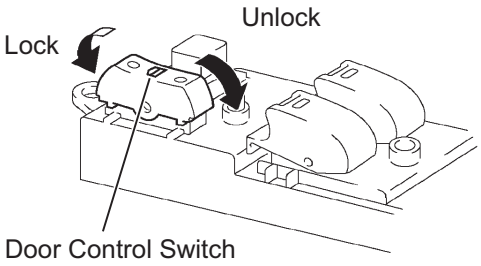
4	**INSPECT POWER WINDOW REGULATOR MASTER SWITCH ASSEMBLY (DOOR CONTROL SWITCH)**

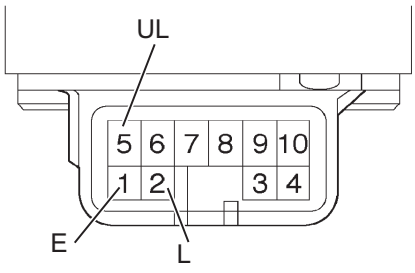
Component Side (Double Cab):





Component Side (Access Cab):





Y

B128473E01

(a) Remove the power window regulator master switch assembly.

(b) Measure the resistance of the door control switch.

Standard (Double cab)

Tester Connection	Switch Condition	Specified Condition
1 (E) - 5 (L)	Lock	Below 1 Ω
1 (E) - 5 (L) 1 (E) - 8 (UL)	OFF	10 kΩ or higher
1 (E) - 8 (UL)	Unlock	Below 1 Ω

Standard (Access cab)

Tester Connection	Switch Condition	Specified Condition
1 (E) - 2 (L)	Lock	Below 1 Ω
1 (E) - 2 (L) 1 (E) - 5 (UL)	OFF	10 kΩ or higher
1 (E) - 5 (UL)	Unlock	Below 1 Ω

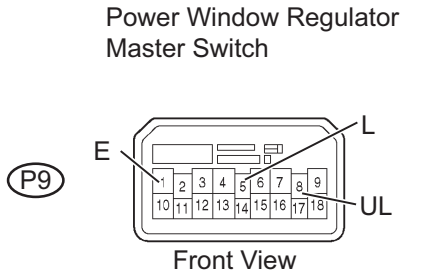
(c) Reinstall the power window regulator master switch assembly.

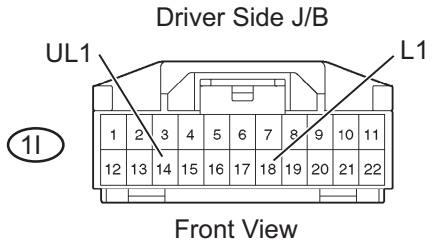
NG → **REPLACE POWER WINDOW REGULATOR MASTER SWITCH ASSEMBLY**

OK

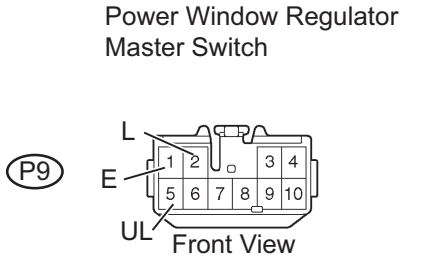
5	CHECK HARNESS AND CONNECTOR (MASTER SWITCH (SWITCH) - DRIVER SIDE J/B AND BODY GROUND)

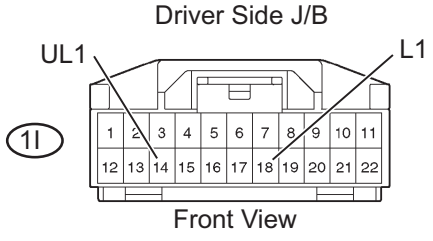
Wire Harness Side (Double Cab):





Wire Harness Side (Access Cab):





Y

B128474E01

(a) Disconnect the P9 power window regulator master switch connector.
(b) Disconnect the 1I driver side J/B connector.
(c) Measure the resistance.

Standard (Double cab)

Tester Connection	Specified Condition
P9-5 (L) - 1I-18 (L1)	Below 1 Ω
P9-8 (UL) - 1I-14 (UL1)	Below 1 Ω
P9-1 (E) - Body ground	Below 1 Ω
P9-5 (L) or 1I-18 (L1) - Body ground	10 kΩ or higher
P9-8 (UL) or 1I-14 (UL1) - Body ground	10 kΩ or higher

Standard (Access cab)

Tester Connection	Specified Condition
P9-2 (L) - 1I-18 (L1)	Below 1 Ω
P9-5 (UL) - 1I-14 (UL1)	Below 1 Ω
P9-1 (E) - Body ground	Below 1 Ω
P9-2 (L) or 1I-18 (L1) - Body ground	10 kΩ or higher
P9-5 (UL) or 1I-14 (UL1) - Body ground	10 kΩ or higher

(d) Reconnect the power window regulator master switch connector.
(e) Reconnect the driver side J/B connector.

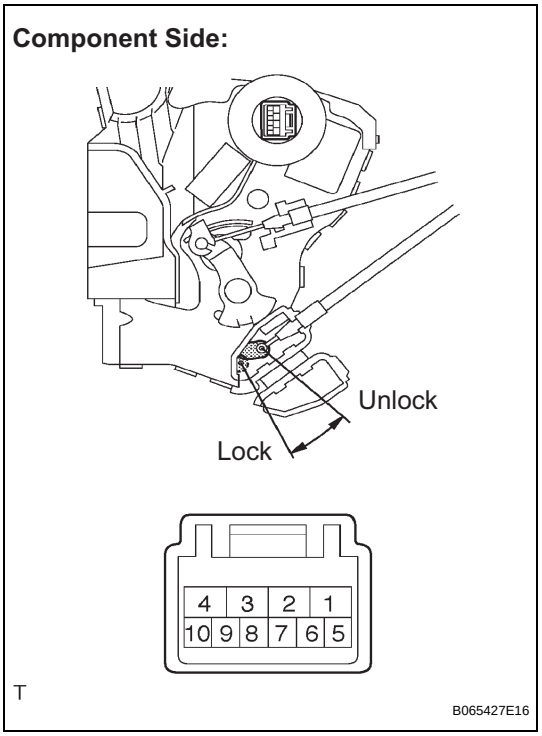
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE DRIVER SIDE JUNCTION BLOCK

6 INSPECT FRONT DOOR LOCK ASSEMBLY LH (DOOR LOCK MOTOR)

Component Side:



(a) Apply battery voltage to the door lock and check operation of the door lock motor.
NOTICE:
Do not apply battery voltage to any terminals except terminals 1 and 4.
OK

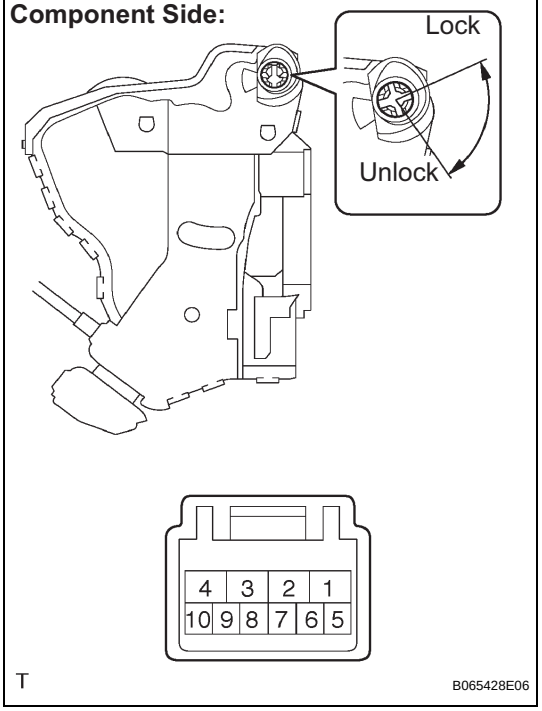
Terminal No	Specified Condition
Battery positive (+) → Terminal 4 Battery negative (-) → Terminal 1	Lock
Battery positive (+) → Terminal 1 Battery negative (-) → Terminal 4	Unlock

NG → **REPLACE FRONT DOOR LOCK ASSEMBLY LH**

OK

7 INSPECT FRONT DOOR LOCK ASSEMBLY LH (DOOR LOCK AND UNLOCK SWITCH AND POSITION SWITCH)

Component Side:



(a) Measure the resistance of the door lock and unlock switch and position switch.
Standard (Door lock and unlock switch)

Tester Connection	Door Lock Condition	Specified Condition
7 - 9	Lock	Below 1 Ω
7 - 9, 7 - 10	OFF	10 kΩ or higher
7 - 10	Unlock	Below 1 Ω

Standard (Position switch)

Tester Connection	Door Lock Condition	Specified Condition

DL

OK

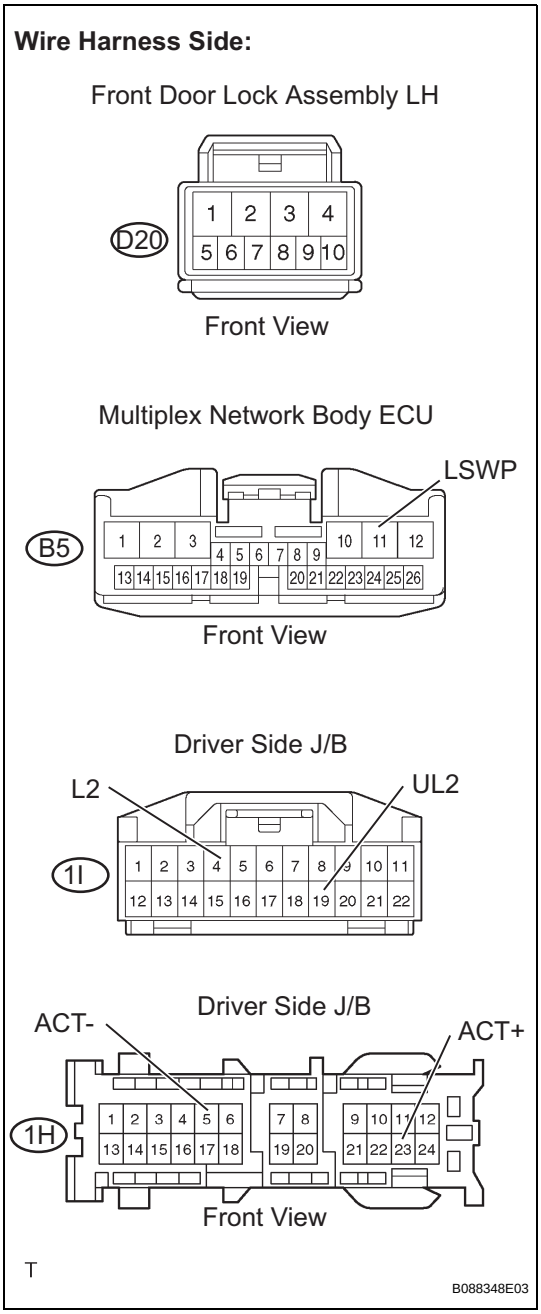
23	CHECK HARNESS AND CONNECTOR (FRONT DOOR LOCK RH - ECU, DRIVER SIDE J/B AND BODY GROUND)



(a) Disconnect the D20 front door lock connector.
(b) Disconnect the B5 multiplex network body ECU connector.
(c) Disconnect the 1H and 1I driver side J/B connectors.
(d) Measure the resistance.

Standard

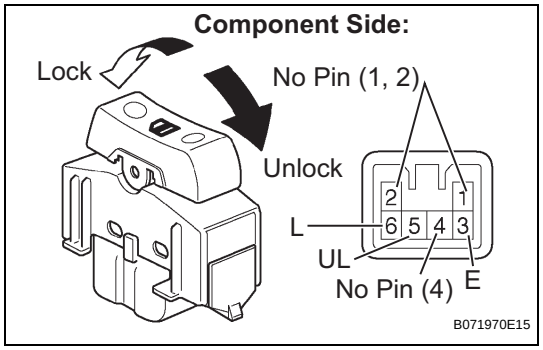
Tester Connection	Specified Condition
D20-4 - 1H-23 (ACT+)	Below 1 Ω
D20-1 - 1H-5 (ACT-)	Below 1 Ω
D20-6 - 1I-4 (L2)	Below 1 Ω
D20-5 - 1I-19 (UL2)	Below 1 Ω
D20-7 - B5-11 (LSWP)	Below 1 Ω
D20-8 - Body ground	Below 1 Ω
D20-4 or 1H-23 (ACT+) - Body ground	10 kΩ or higher
D20-1 or 1H-5 (ACT-) - Body ground	10 kΩ or higher
D20-6 or 1I-4 (L2) - Body ground	10 kΩ or higher
D20-5 or 1I-19 (UL2) - Body ground	10 kΩ or higher
D20-7 or B5-11 (LSWP) - Body ground	10 kΩ or higher

(e) Reconnect the front door lock connector.
(f) Reconnect the multiplex network body ECU connector.
(g) Reconnect the driver side J/B connectors.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

24 INSPECT DOOR CONTROL SWITCH ASSEMBLY



(a) Remove the door control switch (passenger side).
(b) Measure the resistance of the door control switch.
Standard

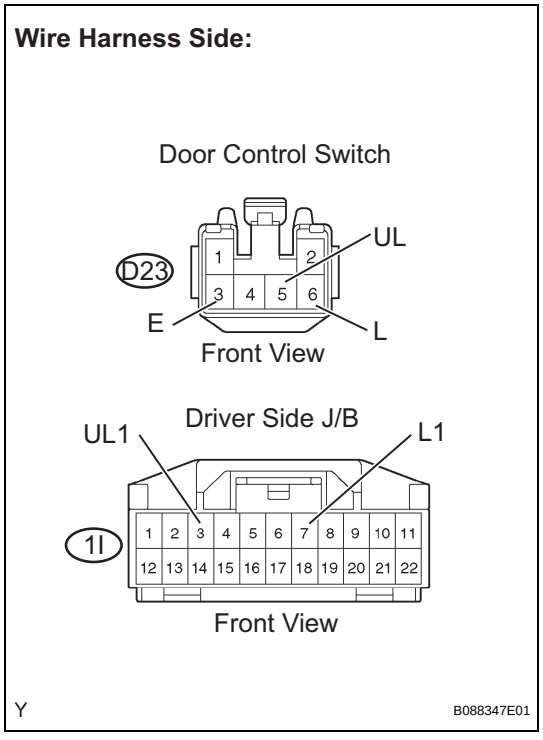
Tester Connection	Switch Condition	Specified Condition
3 (E) - 6 (L)	Lock	Below 1 Ω
3 (E) - 5 (UL) 3 (E) - 6 (L)	OFF	10 kΩ or higher
3 (E) - 5 (UL)	Unlock	Below 1 Ω

(c) Reinstall the door control switch.

NG → **REPLACE DOOR CONTROL SWITCH ASSEMBLY**

OK

25 CHECK HARNESS AND CONNECTOR (DOOR CONTROL SWITCH - DRIVER SIDE J/B AND BODY GROUND)



(a) Disconnect the D23 door control switch connector.
(b) Disconnect the 1I driver side J/B connector.
(c) Measure the resistance.
Standard

Tester Connection	Specified Condition
D23-6 (L) - 1I-7 (L1)	Below 1 Ω
D23-5 (UL) - 1I-3 (UL1)	Below 1 Ω
D23-3 (E) - Body ground	Below 1 Ω
D23-6 (L) or 1I-7 (L1) - Body ground	10 kΩ or higher
D23-5 (UL) or 1I-3 (UL1) - Body ground	10 kΩ or higher

(d) Reconnect the door control switch connector.
(e) Reconnect the driver side J/B connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

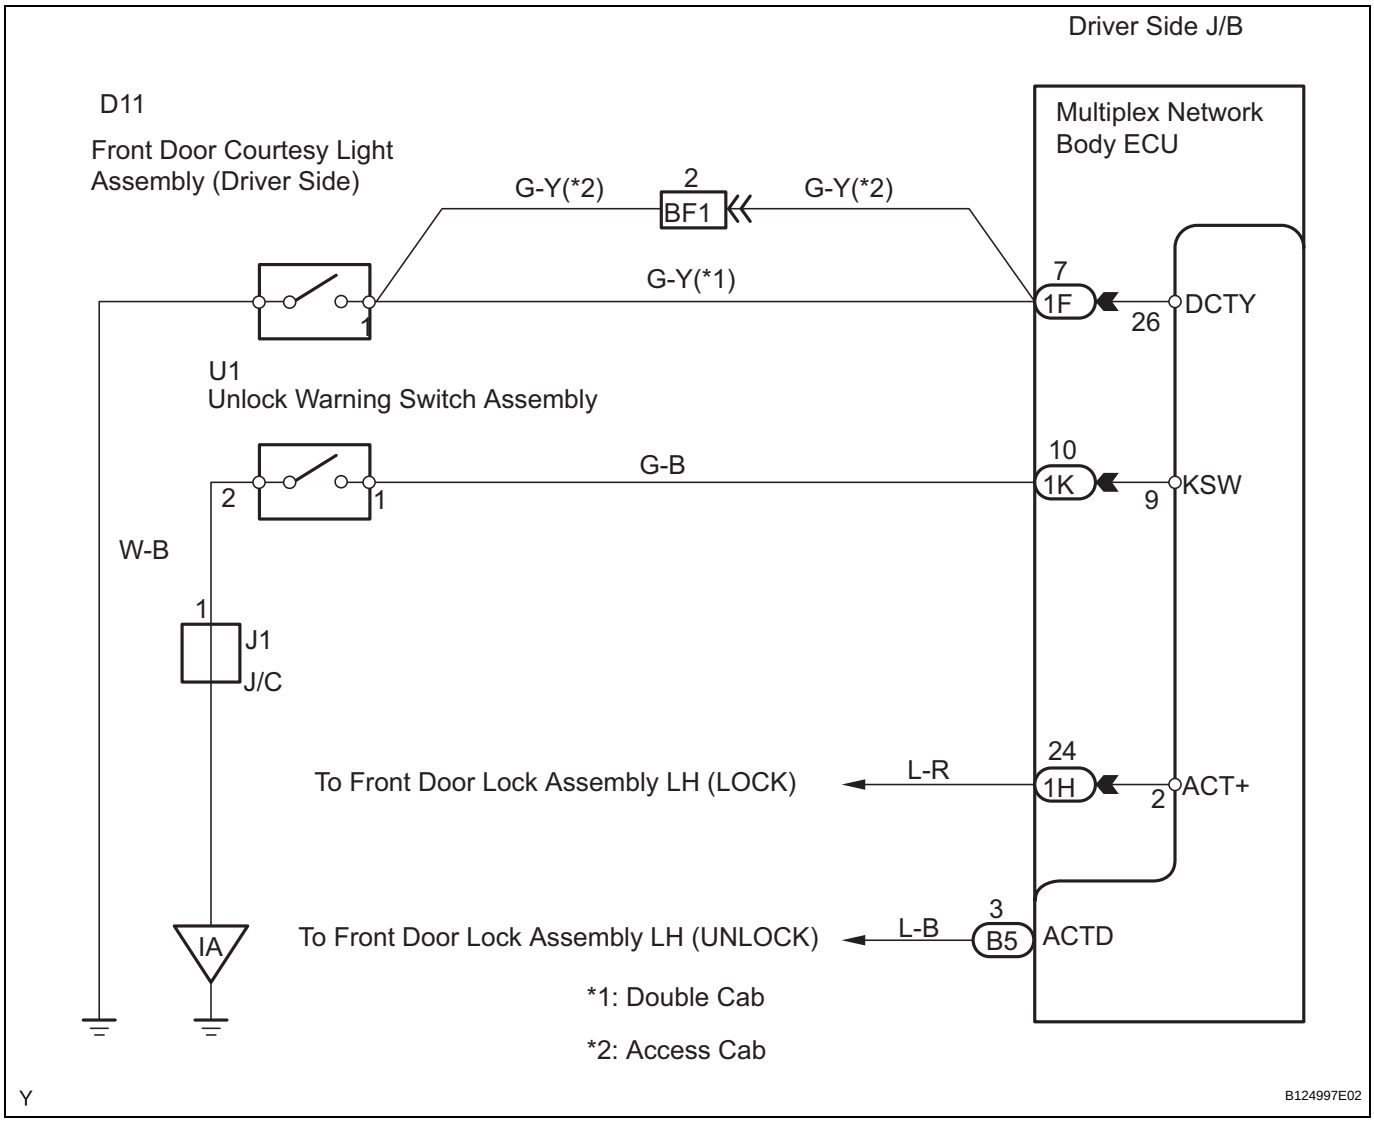
REPLACE DRIVER SIDE JUNCTION BLOCK

Key Lock-in Prevention Function does not Work Properly

DESCRIPTION

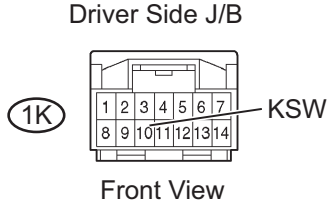
To prevent the key from being locked in the vehicle, the multiplex network body ECU prevents the doors from being locked by monitoring 2 switches: 1) the unlock warning switch, which turns ON when the key is inserted into the ignition key cylinder; and 2) the driver side courtesy light switch, which turns ON when the driver side door is opened.

WIRING DIAGRAM



1 CHECK HARNESS AND CONNECTOR (DRIVER SIDE JUNCTION BLOCK - BODY GROUND)

Wire Harness Side:



B063404E02

(a) Disconnect the 1K driver side J/B connector.
(b) Measure the resistance.
Standard

Tester Connection	Connection	Specified Condition
1K-10 (KSW) - Body ground	No key in ignition key cylinder	10 kΩ or higher
1K-10 (KSW) - Body ground	Key inserted in ignition key cylinder	Below 1 Ω

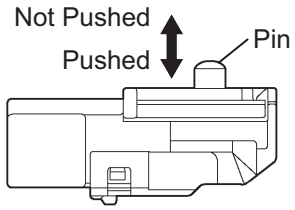
(c) Reconnect the driver side J/B connector.

OK → **Go to step 4**

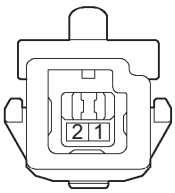
NG

2 INSPECT UNLOCK WARNING SWITCH ASSEMBLY

Component Side:



Unlock Warning Switch Assembly (Driver Side)



Y

I044492E01

(a) Remove the unlock warning switch.
(b) Measure the resistance.
Standard

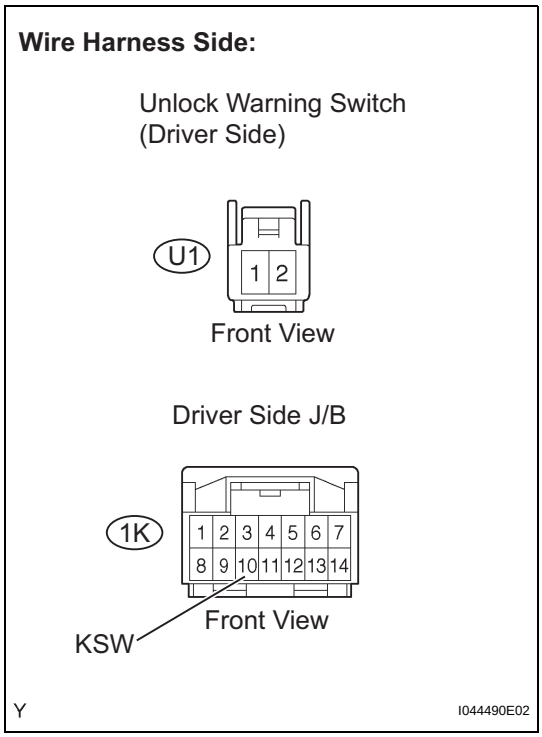
Tester Connection	Switch Connection	Specified Condition
1 - 2	Not pushed	10 kΩ or higher
1 - 2	Pushed	Below 1 Ω

(c) Reinstall the unlock warning switch.

NG → **REPLACE UNLOCK WARNING SWITCH ASSEMBLY**

OK

3	CHECK HARNESS AND CONNECTOR (SWITCH ASSEMBLY - DRIVER SIDE J/B ASSEMBLY AND BODY GROUND)



(a) Disconnect the U1 unlock warning switch connector.
(b) Disconnect the 1K driver side J/B connector.
(c) Measure the resistance of the wire harness side connectors.

Standard

Tester Connection	Specified Condition
U1-1 - 1K-10 (KSW)	Below 1 Ω
U1-2 - Body ground	Below 1 Ω

(d) Reconnect the unlock warning switch connector.
(e) Reconnect the driver side J/B connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

4	CHECK FRONT DOOR COURTESY LIGHT SWITCH ASSEMBLY (DRIVER SIDE)

(a) Move the room light switch to the DOOR position and open the driver side door. Check that the room light turns ON.

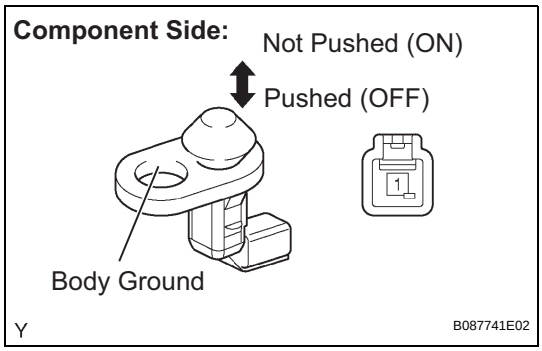
OK:

Room light turns ON.

OK → **REPLACE DRIVER SIDE JUNCTION BLOCK ASSEMBLY**

NG

5	INSPECT FRONT DOOR COURTESY LIGHT SWITCH ASSEMBLY (DRIVER SIDE)



(a) Remove the front door courtesy light switch assembly.
(b) Measure the resistance of the switch.

Standard

Tester Connection	Switch Condition	Specified Condition
1 - Body ground	Not pushed (ON)	Below 1 Ω
1 - Body ground	Pushed (OFF)	10 kΩ or higher

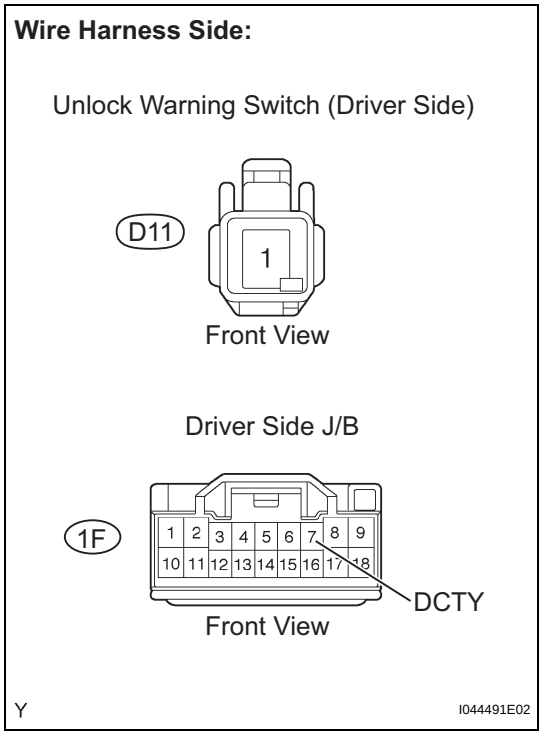
(c) Reinstall the front door courtesy light switch assembly.

DL

NG → **REPLACE FRONT DOOR COURTESY LIGHT SWITCH ASSEMBLY**

OK

6	**CHECK HARNESS AND CONNECTOR (SWITCH ASSEMBLY (DRIVER SIDE) - DRIVER SIDE J/B ASSEMBLY)**



(a) Disconnect the D11 front door courtesy light switch connector.
(b) Disconnect the 1F driver side J/B connector.
(c) Measure the resistance.

Standard

Tester Connection	Specified Condition
D11-1 - 1F-7 (DCTY)	Below 1 Ω

(d) Reconnect the front door courtesy light switch connector.
(e) Reconnect the driver side J/B connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE DRIVER SIDE JUNCTION BLOCK

SYSTEM DESCRIPTION

1. WIRELESS DOOR CONTROL SYSTEM DESCRIPTION

(a) This system locks and unlocks the vehicle's doors remotely. The wireless control system has the following features:

- The door control receiver performs the code identification process and the multiplex network body ECU operates the door lock control. A serial data link is provided for communication between the door control receiver and the multiplex network body ECU.
- A key-holder type transmitter is used and it contains the following 3 switches: the door lock switch, door unlock switch and panic switch.

(b) The wireless door lock control system has the following functions:

Function	Outline
All doors lock operation	Pressing LOCK switch locks all doors.
All doors unlock operation (2-step unlock operation)	Pressing UNLOCK switch once unlocks driver side door. Pressing UNLOCK switch again within 3 seconds unlocks remaining doors.
Answer-back operation	Hazard warning lights flash once when doors are locked, and flash twice when doors are unlocked. These flashes indicate that operation has been completed.
Panic alarm operation	Holding down PANIC switch sets off theft deterrent alarm, which consists of sounding horn, flashing headlights, taillights and hazard warning lights and turning room light on.
Automatic lock function	If no doors are opened within 30 seconds of being unlocked by wireless door lock remote control, all doors lock again automatically.
Repeat function	If a door is not locked in response to locking operation of transmitter, multiplex network body ECU outputs lock signal after 1 second.
Illumination entry function	With all doors locked, pressing UNLOCK switch causes room light to illuminate simultaneously with unlocking operation.
Security function	Sends signal as rolling code.
Transmitter recognition code registration function	Enables registering (writing and storing) of 4 different transmitter recognition codes in EERPOM, which is built into multiplex network body ECU.

HOW TO PROCEED WITH TROUBLESHOOTING

HINT:

- The wireless door lock control system troubleshooting procedures are based on the premise that the power door lock system is operating normally. Check the power door lock system first before troubleshooting the wireless door lock control system.
- Use these procedures to troubleshoot the wireless door lock control system.
- *: Use the intelligent tester.

REGISTRATION

1. REGISTER RECOGNITION CODES

HINT:

- Recognition code registration is necessary when the door control transmitter or the door control receiver is replaced with a new one.
- Add Mode is used to register new recognition codes while retaining the previously registered codes. This mode is used when new transmitters are added. If the number of registered codes exceeds 4, the previously registered codes will be erased in order, starting from the first registered code.
- Rewrite Mode is used to erase all the previously registered recognition codes in order to register new recognition codes. This mode is used when the transmitter or the door control receiver is replaced with a new one.
- Confirmation Mode is used to confirm how many recognition codes have already been registered before any additional recognition codes are registered.
- Prohibition Mode is used to erase all the registered codes and disable the wireless door lock function. This mode is used when the transmitters are lost.
- The registration procedure described on the following pages must be performed in order.

(a) Check that the following conditions are met.
- No key in the ignition key cylinder.
- Only driver side door is open.

(b) Insert the key into the ignition key cylinder, and remove it twice within 5 seconds.

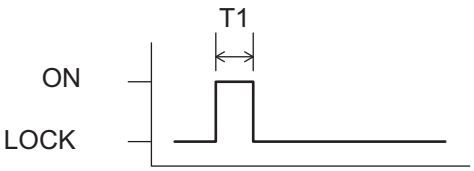
(c) Perform the following operations within 40 seconds.
(1) Close and open the driver side door twice.
(2) Insert the key into the ignition key cylinder, then remove it.

(d) Perform the following operations within 40 seconds.
(1) Close and open the driver side door twice.
(2) Insert the key into the ignition key cylinder and close all doors.

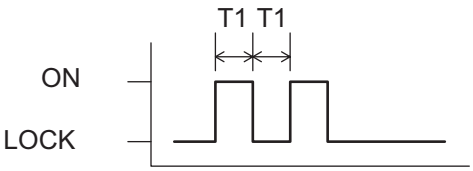
(e) Perform the following operations within 40 seconds.
(1) Turn the ignition switch from LOCK to ON and back to LOCK 1 to 5 times at approximately 1 second intervals to select a mode (see the table below).

Number of ON-LOCK operations of ignition switch:

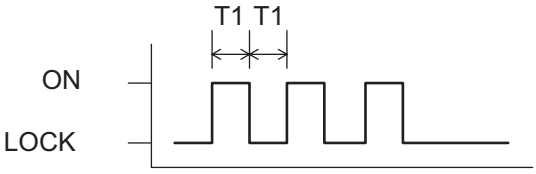
Add Mode ON-LOCK operation: Once



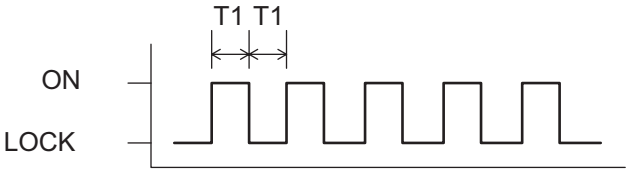
Rewrite Mode ON-LOCK operation: Twice



Confirmation Mode ON-LOCK operation: 3 times



Prohibition Mode ON-LOCK operation: 5 times



T1: Approximately 1 second

B111914E03

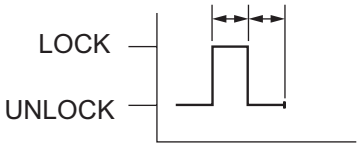
HINT:
If the number of ignition switch ON-LOCK operations is 0, 4, 6 or more, there will be no response (power DOOR LOCK and UNLOCK operation) to show which mode has been selected.

(2) Remove the key from the ignition key cylinder.

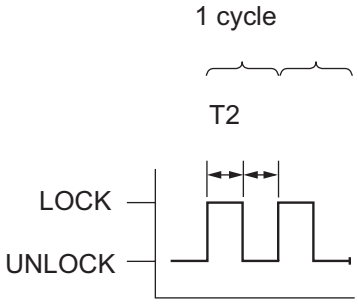
(f) The main body ECU automatically performs power door LOCK-UNLOCK operations to indicate which mode has been selected.

Response to mode selection (Power door lock operation):

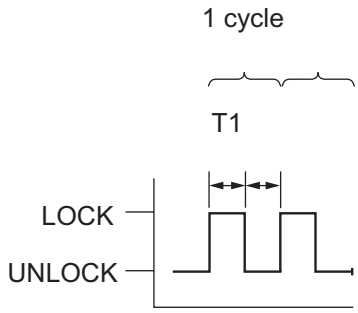
Add Mode LOCK-UNLOCK operation: Once



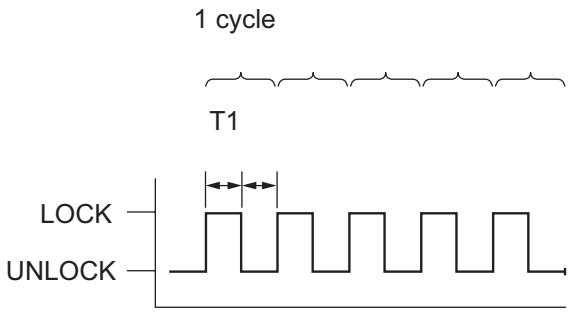
Confirmation Mode LOCK-UNLOCK operation: The number of registerd codes (1 to 5 times)



Rewrite Mode LOCK-UNLOCK operation: Twice



Prohibition Mode LOCK-UNLOCK operation: 5 times



T1: Approximately 1 second T2: Approximately 2 seconds

Y

B106703E01

HINT:

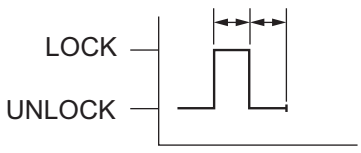
- In Confirmation Mode, LOCK-UNLOCK operation will occur once for each recognition code that has been registered. For example, if 2 recognition codes have been registered, the LOCK-UNLOCK operation will occur twice.
- In Confirmation Mode, if no recognition codes have been registered, LOCK-UNLOCK operation will occur 11 times.
- If Confirmation Mode or Prohibition Mode is selected, the operation ends after the response to the selected mode is completed.

(g) Register a new recognition code (Add Mode or Rewrite Mode) in accordance with the following procedure.
  (1) Within 45 seconds of Add Mode or Rewrite Mode being selected, press the LOCK and UNLOCK switches on the transmitter switch of the key simultaneously for 1.0 to 1.5 seconds. Within 3 seconds of moving your finger away from the switches, press either switch of the key for more than 1.0 second.
  (2) Within 5 seconds of the transmitter switch being released, the LOCK-UNLOCK operation will be automatically performed once if the registration of the recognition code is correctly completed. If the LOCK-UNLOCK operation is performed twice, the registration of the recognition code has failed, so perform the registration procedure from the beginning once again.

Response to registration completion:

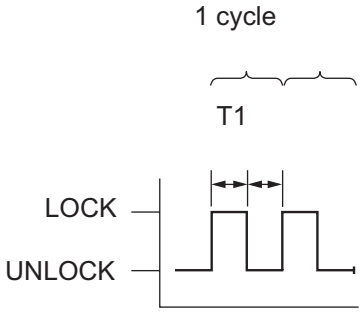
LOCK-UNLOCK Occurs Once

Registration of recognition code has been completed.



LOCK-UNLOCK Occurs Twice

Registration of recognition code has failed.



T1: Approximately 1 second

Y

B106704E01

(h) If multiple transmitters need to be registered, repeat the registration of a new recognition code procedure within 45 seconds of the previous registration.
(i) If any of the following conditions is met, the registration mode will end.
  (1) The key is inserted into the ignition key cylinder.
  (2) Any doors are opened.

(3) 45 seconds or more elapse after code registration.

(j) Registration of the recognition codes (Add Mode and Rewrite Mode) is completed.

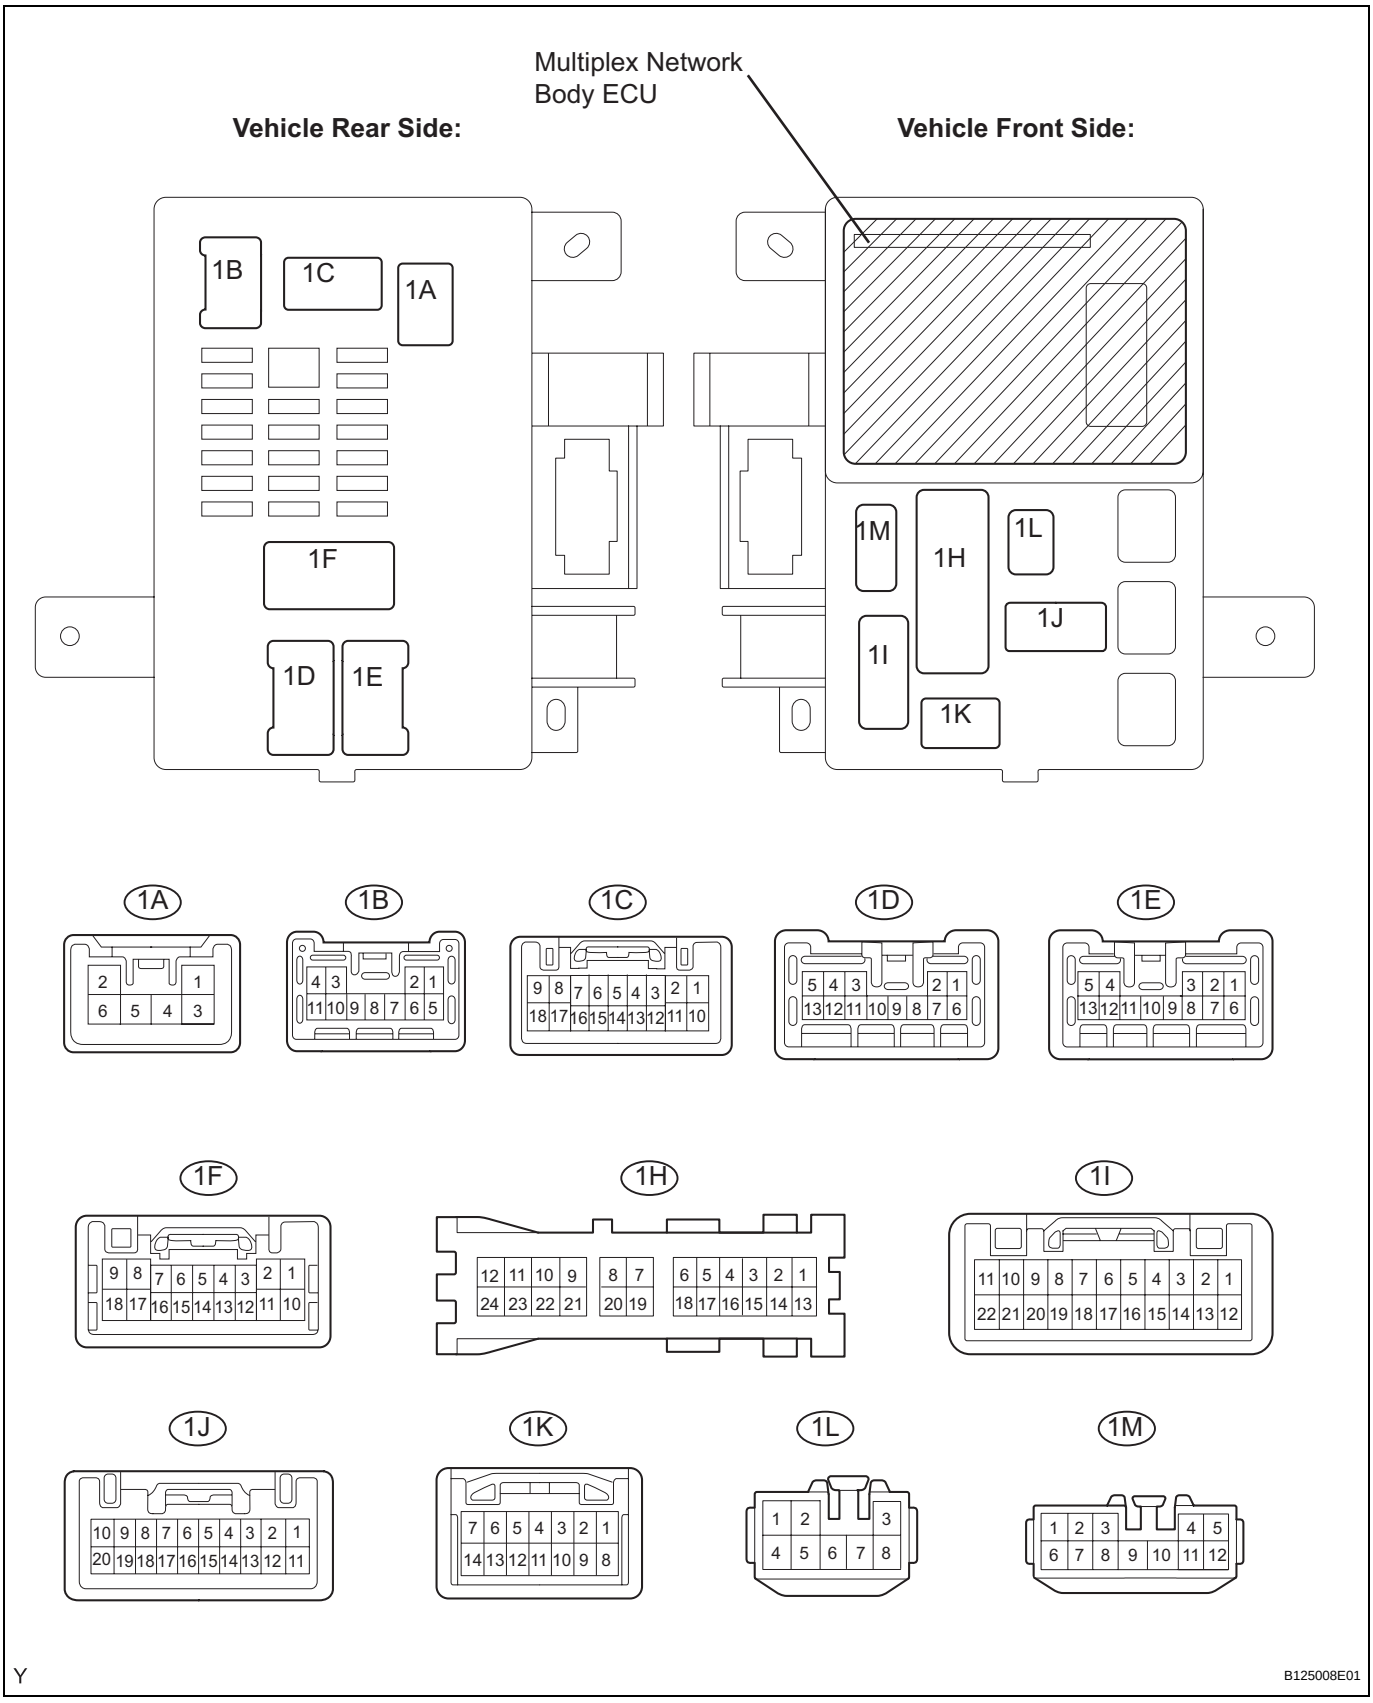
PROBLEM SYMPTOMS TABLE

Wireless Doorlock Control

Symptom	Suspected area	See page
Only wireless control function is inoperative	Transmitter battery	DL-47
	Door control transmitter	
	Door control receiver	
	Unlock warning switch assembly	
	Wire harness	
	Driver side J/B assembly (Multiplex network body ECU)	
No answer-back (hazard waning light)	Turn signal flasher relay	DL-54
	Wire harness	
	Driver side J/B assembly (Multiplex network body ECU)	

TERMINALS OF ECU

1. CHECK COWL SIDE JUNCTION BLOCK RH ASSEMBLY (MULTIPLEX NETWORK BODY ECU)



(a) Disconnect the 1A, 1C, 1F, 1H, 1I, 1J, and 1K driver side J/B connectors.
(b) Measure the resistance and voltage of the wire harness side connectors.

Standard:

Symbols (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
IG (1A-4) - Body ground	L-Y - Body ground	Ignition power supply	Ignition switch OFF	0 V
			Ignition switch ON	10 to 14 V
ECUB (1C-16) - Body ground	R - Body ground	+B (ECUB) power supply	Always	10 to 14 V
ALTB (1A-6) - Body ground	L - Body ground	+B (power system, generator system) power supply	Always	10 to 14 V
KSW (1K-10) - Body ground	G-B - Body ground	Key unlock warning switch input	No key in ignition key cylinder	10 kΩ or higher
			Key inserted in ignition key cylinder	Below 1 Ω
DCTY (1F-7) - Body ground	G-Y - Body ground	Driver side courtesy switch input	Driver side door Closed	10 kΩ or higher
			Driver side door Open	Below 1 Ω
PCTY (1I-8) - Body ground	R-B - Body ground	Passenger side courtesy switch input	Passenger side door Closed	10 kΩ or higher
			Passenger side door Open	Below 1 Ω
RCTY (1F-6) - Body ground	P-B - Body ground	Rear LH side courtesy switch input	Rear LH side door Closed	10 kΩ or higher
			Rear LH side door Open	Below 1 Ω
RCTY (1J-15) - Body ground	P-B - Body ground	Rear LH side courtesy switch input	Rear LH side door Closed	10 kΩ or higher
			Rear LH side door Open	Below 1 Ω
GND (1H-18) - Body ground	W-B - Body ground	Ground	Always	Below 1 Ω

If the result is not as specified, there may be a malfunction on the wire harness side.

(c) Reconnect the driver side J/B connectors.
(d) Measure the voltage of the connectors.

Standard:

Symbols (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
HAZ (1L-8) - Body ground	W - Body ground	Hazard light drive	Answer-back ON	Pulse generation
			Answer-back OFF	10 to 14 V
RDA (B5-7) - Body ground	L - Body ground	Door control receiver input	No key in ignition key cylinder and all doors closed and transmitter switch OFF	Below 1 V
			No key in ignition key cylinder and all doors closed and transmitter switch ON	Approx. 6 to 7 V

If the result is not as specified, there may be a malfunction on the driver side J/B assembly (multiplex network body ECU).

ON-VEHICLE INSPECTION

1. NOTICES WHEN CHECKING

(a) Wireless door LOCK / UNLOCK function:
The wireless door lock control function operates only when the following 3 conditions are met.
(1) No key is inserted the ignition key cylinder.
(2) All the doors are closed.
(3) The power door lock system is functioning normally.
HINT:
The UNLOCK function operates even when one of the doors is open.

(b) Remote panic function:
This wireless control function operates only when the following condition is met.
(1) The ignition switch is in the LOCK position.
HINT:
The key can be inserted. However the ignition switch must be in the LOCK position.

(c) The wireless transmitter operational area differs depending on the situation.
(1) The operational area differs depending on the user, the way the transmitter is held and the location.
(2) In certain areas, the operational area is reduced due to the vehicle body shape and the influence of the surroundings.
(3) Since the transmitter uses faint electric waves, the operational area may be reduced if noise or strong electric waves occur in the area where the transmitter is used. In some cases, the transmitter may not function.
(4) When the battery weakens, the operational area is reduced or the transmitter may not function.
HINT:
If the transmitter has had prolonged exposure to direct sunlight, such as on the instrument panel, the battery may weaken or other problems may occur.

2. CHECK WIRELESS DOOR LOCK CONTROL SYSTEM

HINT:
- The switches described below transmit signals and are built into the door control transmitter.
- The operational area must be taken into account while checks are being made.

(a) Put the vehicle under conditions that allow the wireless control functions to operate.

(b) Check the basic functions.
(1) Check that all the doors lock when the LOCK switch is pressed.

(2) Check that only the driver side door unlocks when the UNLOCK switch is pressed once, and that the remaining doors unlock when the UNLOCK switch is pressed again within 3 seconds.

(c) Check the chattering prevention function.
(1) Check that pressing a switch causes the switch's operation to occur only once. Also check that when the switch is held down, the operation is not repeated continuously. Then, make sure that when the switch is pressed repetitively at approximately 1 second intervals, the switch's operation occurs each time.

(d) Check the automatic locking function.
(1) Check that if all the doors are unlocked with the UNLOCK switch and none of the doors are opened or locked within approximately 30 seconds, the doors automatically relock.
(2) Check that if all of the doors are unlocked with the UNLOCK switch and a door is opened or locked within approximately 30 seconds, the automatic locking function does not operate.

(e) Check the switch operation fail-safe function.
(1) Check that the doors cannot be locked by a switch while the key is in the ignition key cylinder. However, this does not apply when the system is in recognition code registration mode.

(f) Check the operation stop function when a door is open or not completely closed.
(1) Check that if a door is open or not completely closed, the doors cannot be locked by the LOCK switch.

(g) Check the repeat function.
(1) Check that if the LOCK switch is pressed while the movement of the driver side door control knob (in the unlocked state) is restricted, the repeat function attempts to lock all of the doors again 1 second later.

(h) Check the answer-back function.
(1) When the LOCK switch is pressed, check that the lights flash once simultaneously with the locking of all the doors.
(2) When the UNLOCK switch is pressed once, check that the lights flash twice simultaneously with the unlocking of the driver side door.
(3) When the UNLOCK switch is pressed again within 3 seconds, check that the lights flash twice simultaneously with the unlocking of all the doors.

(i) Check the illuminated entry function.
(1) When all the doors are locked, pressing the UNLOCK switch causes the room light (when the light switch is in the DOOR position) to illuminate simultaneously with the unlock operation.
(2) Check that the room light turns off in approximately 15 seconds if doors have not been opened.

(j) Check the remote panic function.
(1) Check that if the PANIC switch is pushed once, the theft deterrent alarm function sounds the horn, flashes the headlights, taillights and hazzard warning lights and turns the room light on. And, with the theft alarm function active, check that pressing panic or unlock switch on the transmitter causes the horn to stop sounding and the headlights, taillights and hazzard warning lights to stop flashing and the room light to turn off.

3. INSPECT DOOR CONTROL RECEIVER

(a) Disconnect the D7 door control receiver connector.

(b) Measure the voltage and resistance of the wire harness side connector.

Standard Voltage

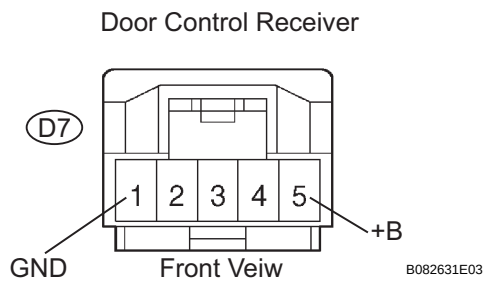
Tester Connection	Specified Condition
D7-5 (+B) - Body ground	10 to 14 V

Standard Resistance

Tester Connection	Specified Condition
D7-1 (GND) - Body ground	Below 1 Ω

If the result is not as specified, there may be a malfunction on the wire harness side.

Wire Harness Side:



(c) Reconnect the door control receiver connector.

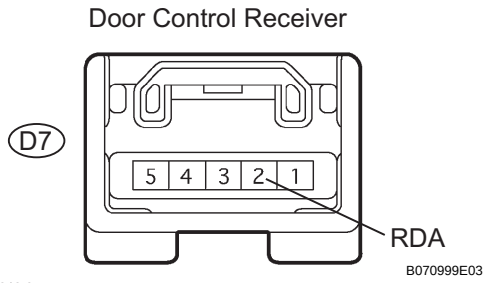
(d) Measure the voltage of the connector.

Standard Voltage

Tester Connection	Condition	Specified Condition
D7-2 (RDA) - Body ground	Each transmitter switch OFF (No key in ignition key cylinder and all doors closed)	Below 1 V
D7-2 (RDA) - Body ground	Each transmitter switch ON (No key in ignition key cylinder and all doors closed)	Alternates between 6 V and 7 V

If the result is not as specified, there may be a malfunction on the receiver.

Component Side:

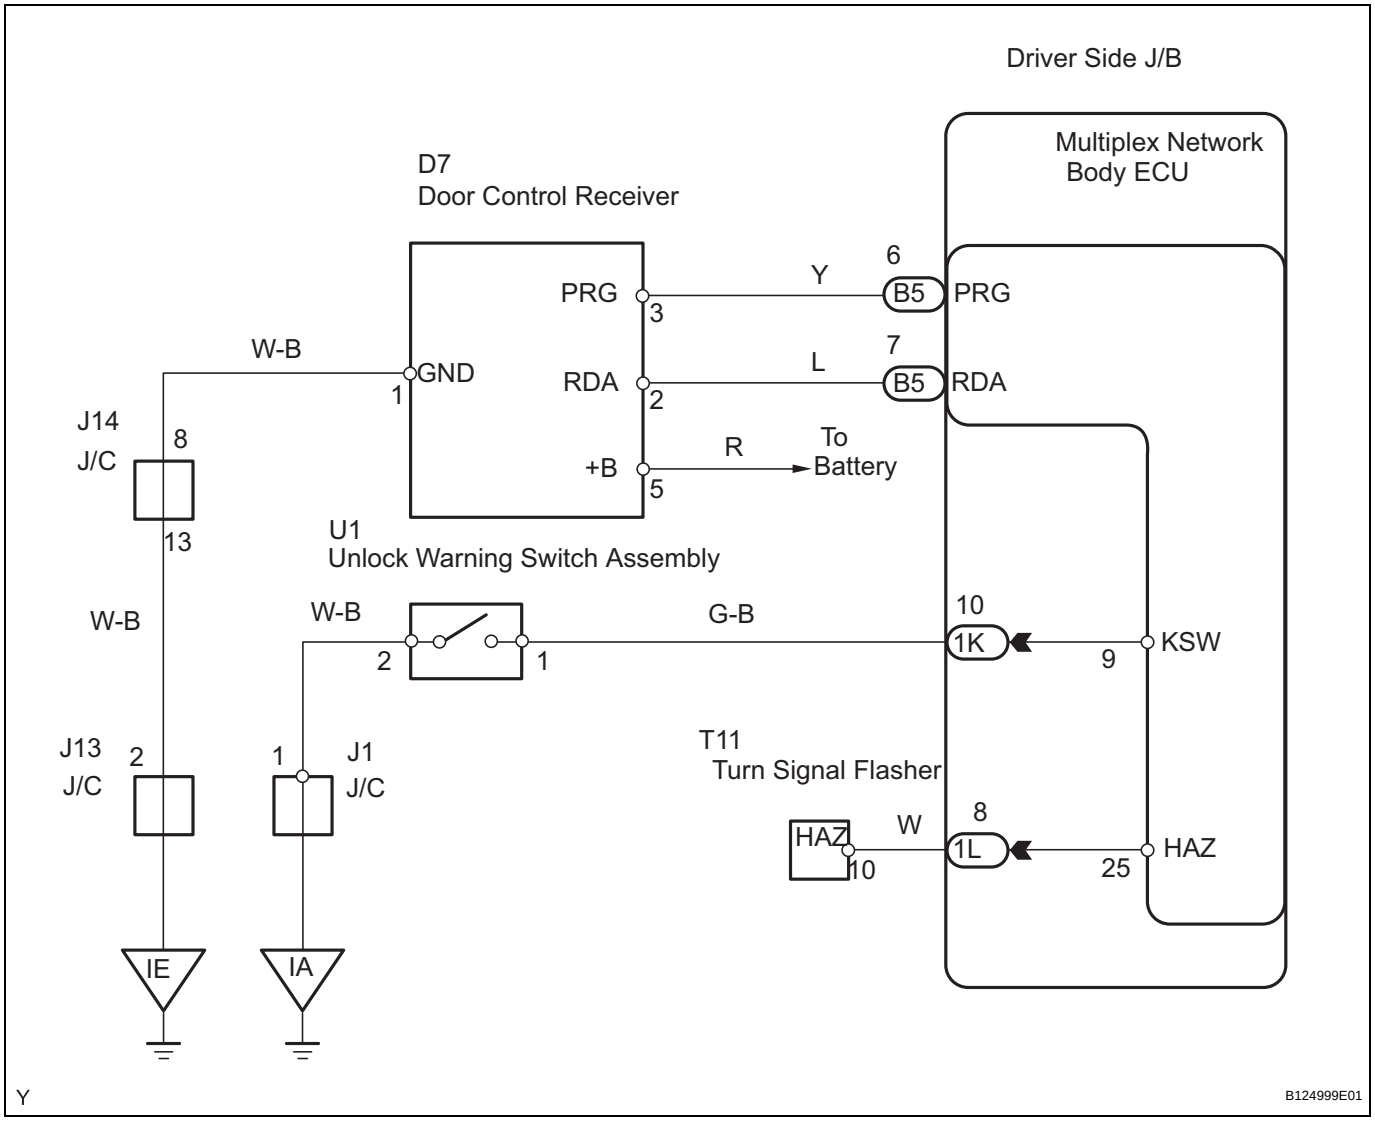


Only Wireless Control Function is Inoperative

DESCRIPTION

The door control receiver receives signals from the transmitter and sends these signals to the multiplex network body ECU. The multiplex network body ECU then controls the door operation by sending LOCK/UNLOCK signals to the appropriate door lock actuator.

WIRING DIAGRAM



1	CHECK WIRELESS DOOR LOCK CONTROL FUNCTIONS

OK → NORMAL

NG

2	REPLACE TRANSMITTER BATTERY

(a) After replacing the transmitter battery with a new or correctly functioning one, check that the doors can be locked and unlocked by using the transmitter LOCK/UNLOCK switch.
OK:
Doors can be locked and unlocked with transmitter.

OK → **END**

NG

3	CHECK WIRELESS DOOR LOCK FUNCTIONS (STANDARD OPERATION)

(a) Check standard LOCK/UNLOCK switch operation.
NOTICE:
Standardized test procedure: press the transmitter switch for 1 second, directing the beam at the driver side door outside handle from a distance of 1 m (3.28 ft). The transmitter should be pointed directly at the door handle, i.e. at a 90° angle to the vehicle body.

OK → **NORMAL**

NG

4	CONFIRM ROOM LIGHT ON

(a) Check that the room laight comes on.
OK:
Room light comes on.

NG → **REPAIR OR REPLACE ROOM LIGHT ASSEMBLY**

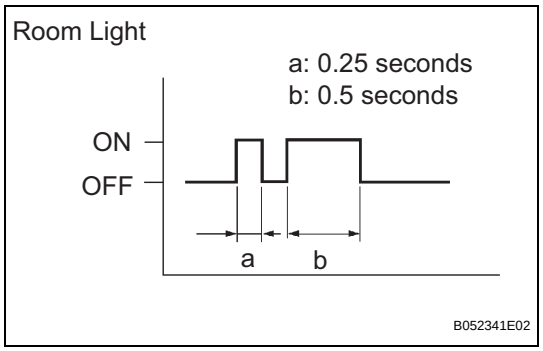
OK

5	SWITCH TO SELF-DIAGNOSTIC MODE

(a) Switch to self-diagnostic mode by operating the ignition key cylinder.
(1) Put the vehicle into its initial condition (See page DL-43), and insert the key into the ignition key cylinder and remove it.
(2) Within 5 seconds of the key being removed (step 1), insert the key into the ignition key cylinder again (ignition key in the LOCK position). Then turn the ignition switch ON and return it to the LOCK position.

(3) Within 30 seconds of the ignition switch being returned to the LOCK position (step 2), perform the following 9 times: turn the ignition switch ON and return it to the LOCK position.
NOTICE:
If the change to self-diagnostic mode has failed, the system returns to normal mode.
HINT:
- Turning the ignition switch ON after step (a)-(3) has been completed ends self-diagnostic mode.
- Do not lock or unlock any doors during self-diagnostic mode.

(b) Check that the system has switched to self-diagnostic mode by checking the blinking frequency of the room light.
OK:
The room light output should be as shown in the timing chart on the left.

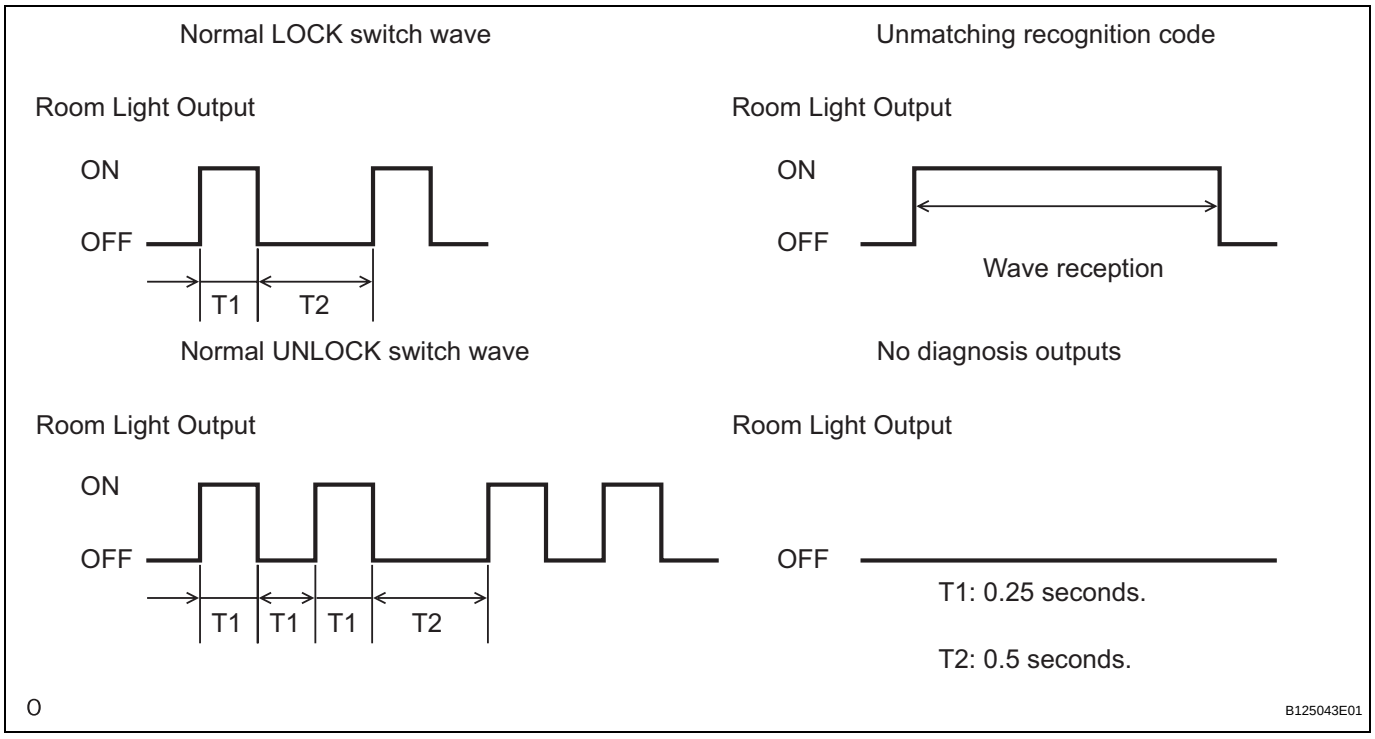


NG → **Go to step 9**

OK

6 CHECK BY SELF-DIAGNOSTIC MODE

(a) Inspect the diagnosis outputs when the door control transmitter switch is held down. The diagnosis outputs can be checked with the outputs of the room light.



DL

Result

Result	Proceed to
Normal waves (room light blinking) for LOCK and UNLOCK switches are output.	A
An unmatching recognition code is output and room light stays ON.	B
No diagnosis outputs are present and the room light is OFF.	C

B → **REPLACE DRIVER SIDE JUNCTION BLOCK**

C → **Go to step 8**

A

7 REGISTER RECOGNITION CODE

(a) Check that the system can switch to rewrite mode or add mode and a recognition code can be registered.
OK:
Recognition code can be registered.

NG → **Go to step 15**

OK

NORMAL

8 CHECK RESPONSE OF DOOR CONTROL RECEIVER

(a) Prepare a new or correctly functioning door control transmitter switch for the same vehicle model. Press and hold a switch on the transmitter and check that an unmatching recognition code is output.
OK:
Unmatching recognition code is output.

NG → **Go to step 12**

OK

REPLACE DOOR CONTROL TRANSMITTER

9 CONFIRM INPUT METHOD OF SELF-DIAGNOSTIC MODE

Result

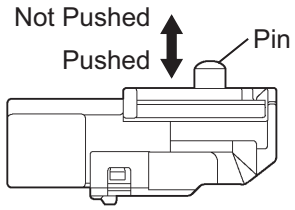
Result	Proceed to
The method for changing the system to self-diagnostic mode works.	A
The method for changing the system to self-diagnostic mode does not work.	B

B → **Go to step 5**

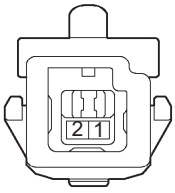
A

10 INSPECT UNLOCK WARNING SWITCH ASSEMBLY

Component Side:



Unlock Warning Switch Assembly (Driver Side)



Y I044492E01

(a) Remove the unlock warning switch.
(b) Measure the resistance.
Standard Resistance

Tester Connection	Switch Condition	Specified Condition
1 - 2	Not pushed	10 kΩ or higher
1 - 2	Pushed	Below 10 Ω

(c) Reinstall the unlock warning switch.

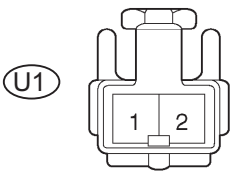
NG → **REPLACE UNLOCK WARNING SWITCH ASSEMBLY**

OK

11 CHECK HARNESS AND CONNECTOR (UNLOCK WARNING SWITCH - DRIVER SIDE J/B AND BODY GROUND)

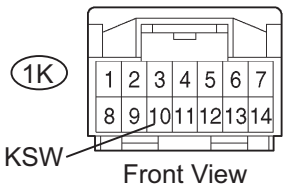
Wire Harness Side:

Unlock Warning Switch



Front View

Driver Side J/B



Front View

Y B087976E02

(a) Disconnect the U1 unlock warning switch connector.
(b) Disconnect the 1K driver side J/B connector.
(c) Check the resistance.
Standard Resistance

Tester Connection	Specified Condition
U1-1 - 1K-10 (KSW)	Below 1 Ω
U1-2 - Body ground	Below 1 Ω

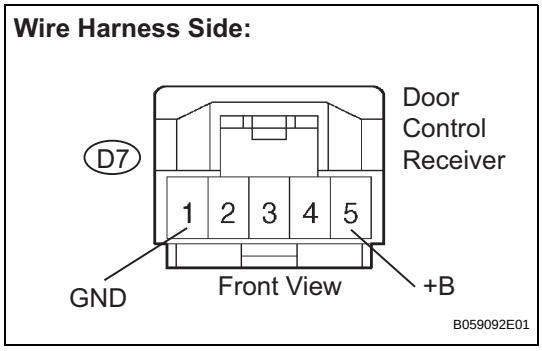
(d) Reconnect the unlock warning switch connector.
(e) Reconnect the driver side J/B connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

DL

OK

12	CHECK HARNESS AND CONNECTOR (DOOR CONTROL RECEIVER - BATTERY AND BODY GROUND)



(a) Disconnect the D7 door control receiver connector.
(b) Check the voltage and resistance.
Standard

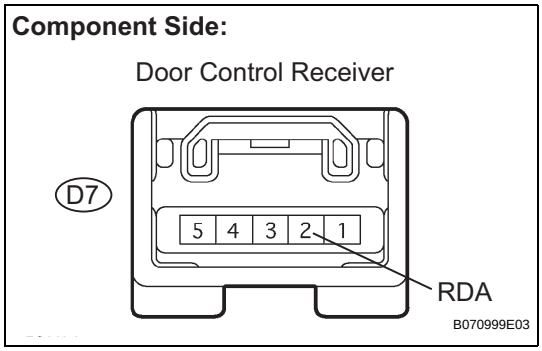
Tester Connection	Specified Condition
D7-5 (+B) - Body ground	10 to 14 V
D7-1 (GND) - Body ground	Below 1 Ω

(c) Reconnect the door control receiver connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

13	CHECK DOOR CONTROL RECEIVER (OUTPUT)



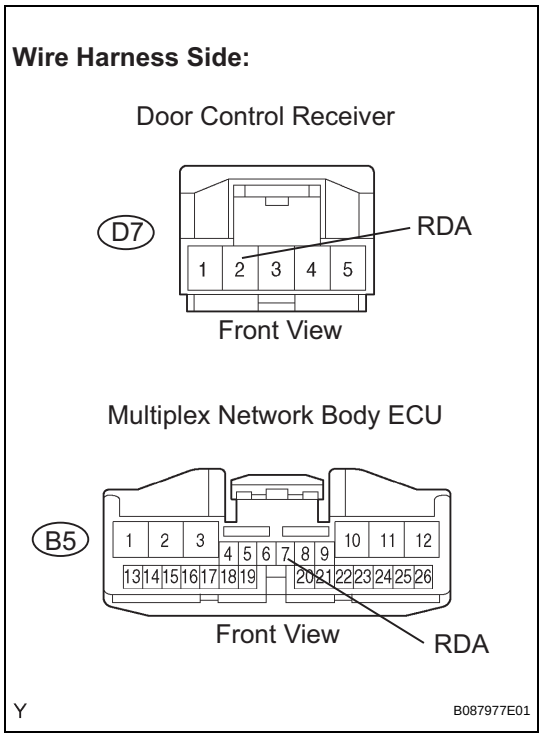
(a) Turn the ignition switch ON.
(b) Measure the voltage of the connector.
Standard Voltage

Tester Connection	Condition	Specified Condition
D7-2 (RDA) - Body ground	Each transmitter switch OFF (No key in ignition key cylinder and all doors closed)	Below 1 V
D7-2 (RDA) - Body ground	Each transmitter switch ON (No key in ignition key cylinder and all doors closed)	Alternates between 6V and 7V

NG → **Go to step 15**

OK

14	CHECK HARNESS AND CONNECTOR (DOOR CONTROL RECEIVER - DRIVER SIDE J/B (ECU AND GROUND))



(a) Disconnect the D7 door control receiver connector.
(b) Disconnect the B5 multiplex network body ECU connector.
(c) Check the resistance.

Standard Resistance

Tester Connection	Specified Condition
D7-2 (RDA) - B5-7 (RDA)	Below 1 Ω
D7-2 (RDA) - Body ground	10 kΩ or higher
B5-7 (RDA) - Body ground	10 kΩ or higher

(d) Reconnect the door control receiver connector.
(e) Reconnect the multiplex network body ECU connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

15	REPLACE DOOR CONTROL RECEIVER WITH NORMAL ONE

NG → **REPLACE DRIVER SIDE JUNCTION BLOCK**

OK

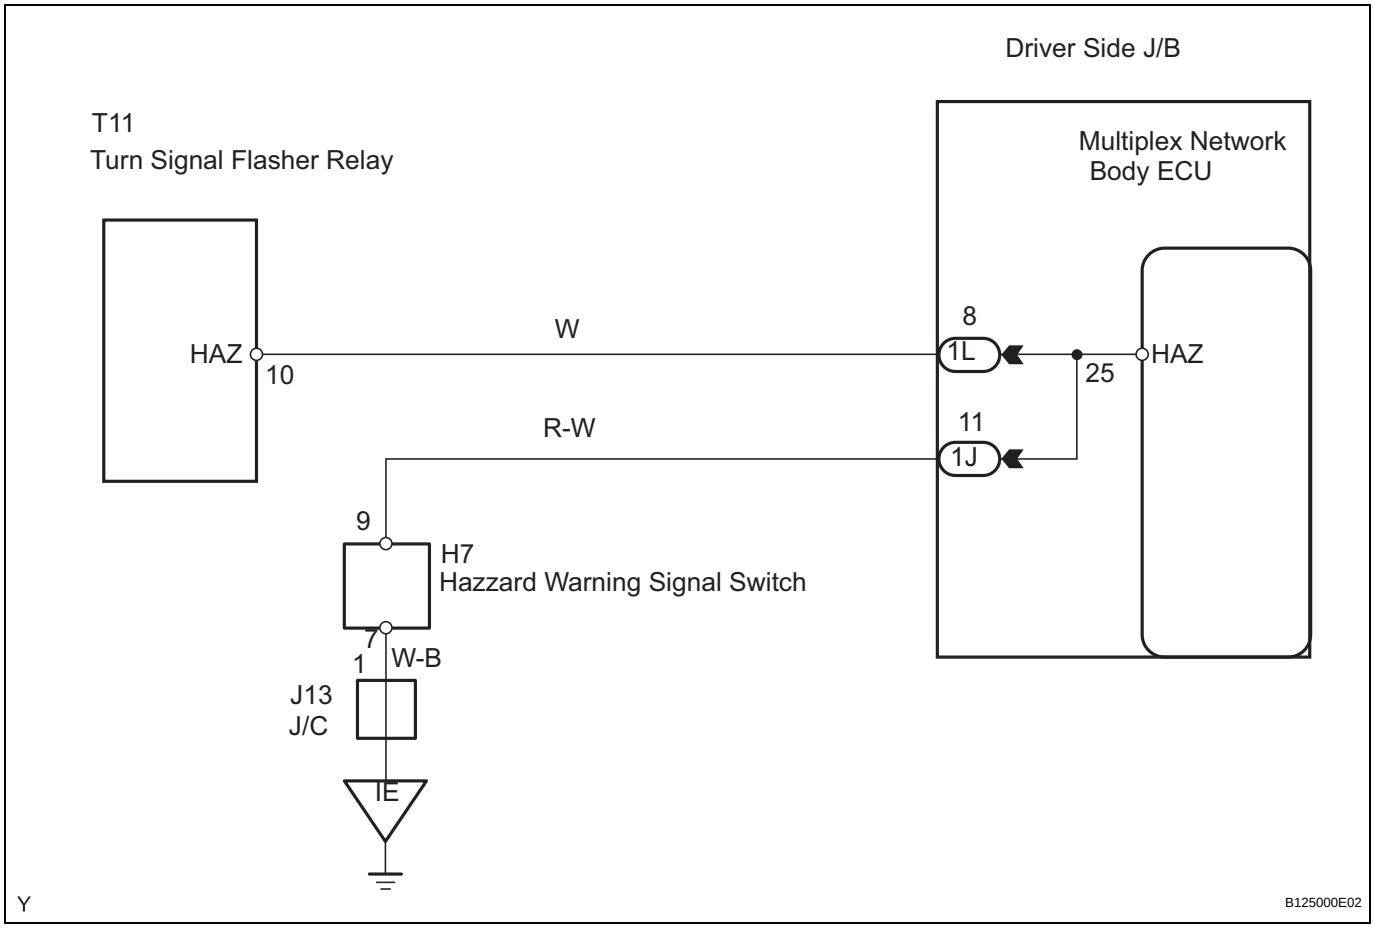
REPLACE DOOR CONTROL RECEIVER

No Answer-Back

DESCRIPTION

In some cases, wireless control functions are normal but the hazard warning light answer-back function is not. In such a case, the multiplex network body ECU hazard warning light signal output may be malfunctioning.

WIRING DIAGRAM



1	CHECK WIRELESS DOOR LOCK FUNCTIONS

(a) Check that the wireless door lock functions by operating the transmitter switch.

HINT:
When the wireless door LOCK/UNLOCK operation functions normally, it can be assumed that the transmitter signal is being properly input to the multiplex network body ECU.

NG → GO TO FLOW CHART

OK

2	CHECK HAZARD WARNING LIGHTS

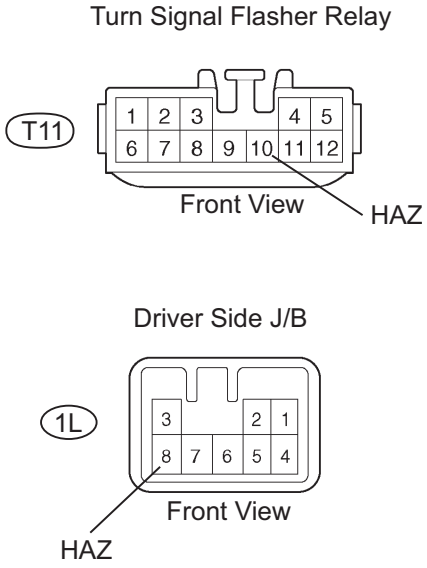
(a) Check that the hazard warning lights blink when the hazard warning signal switch is pressed.
OK:
Hazard warning lights blink.

NG → **REPAIR OR REPLACE HAZARD WARNING SWITCH ASSEMBLY**

OK

3	CHECK HARNESS AND CONNECTOR (TURN SIGNAL FLASHER RELAY - DRIVER SIDE J/B ASSEMBLY)

Wire Harness Side:



(a) Disconnect the T11 turn signal flasher relay connector.
(b) Disconnect the 1L driver side J/B connector.
(c) Check the resistance.
Standard Rresistance

Tester Connection	Specified Condition
T11-10 (HAZ) - 1L-8 (HAZ)	Below 1 Ω

(d) Reconnect the turn signal flasher relay connector.
(e) Reconnect the driver side J/B connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE DRIVER SIDE JUNCTION BLOCK (MULTIPLEX NETWORK BODY ECU)

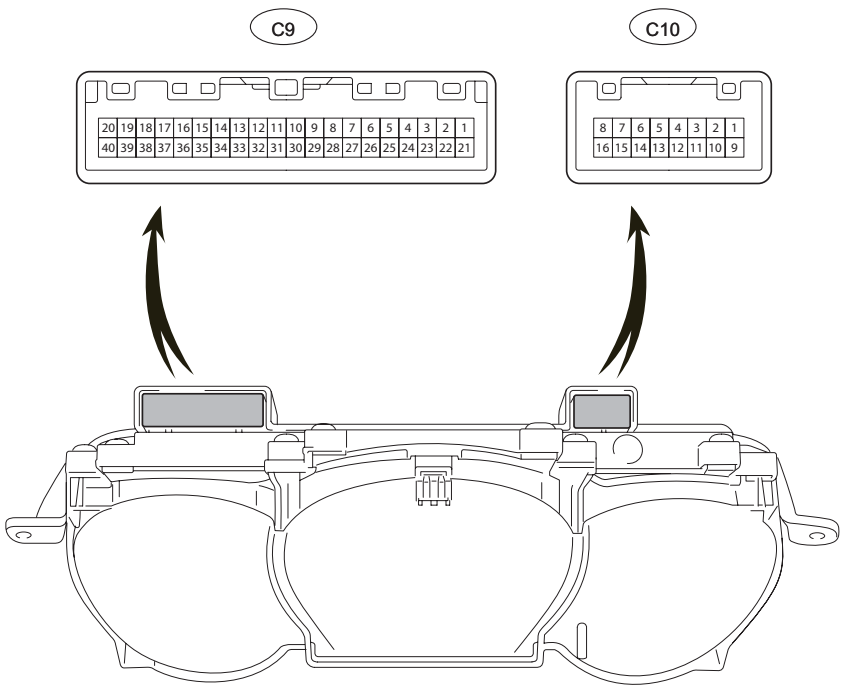
TERMINALS OF ECU

1. COMBINATION METER ASSEMBLY

Combination Meter:



Y

B125019E01

Symbols (Terminals No.)	Wiring Color	Terminal Description	Condition	Specified Condition
+B (C9-1) - Body ground	R - Body ground	Battery	Always	10 to 14 V
SIGNAL EARTH (C9-2) - Body ground	W-B - Body ground	Ground	Always	Below 1 Ω
SPEED SIGNAL (C9-3) - Body ground	W - Body ground	Vehicle speed signal (input)	Ignition switch ON and wheel turning slowly	Pulse generation (See waveform 1)
FUEL EARTH (C9-4) - Body ground	Y-B - Body ground	Ground	Always	Below 1 Ω
SPEED SIGNAL (C9-6) - Body ground	R-Y - Body ground	Vehicle speed signal (input)	Ignition switch ON and wheel turning slowly	Pulse generation (See waveform 1)
TACHO (C9-7) - Body ground	B-W - Body ground	Tachometer signal	Idling	Pulse generation (See waveform 2)
FUEL SENDER (C9-8) - Body ground	O - Body ground	Fuel level signal	Ignition switch ON, fuel level FULL → EMPTY	Below 1 V → 4 to 7 V
TEMP IMPUT (C9-9) - Body ground	GR-B - Body ground	Engine coolant temperature	Ignition switch ON, engine coolant temperature 90°C(194°F)	Pulse generation (See waveform 3)
D-BELT (C9-10) - Body ground	B-O - Body ground	Seat belt condition signal (Driver side)	D-BELT indicator light ON	Below 1 V
			D-BELT indicator light OFF	10 to 14 V
KEY UNLOCK (C9-11) - Body ground	G-B - Body ground	Key switch condition signal	Key inserted	Below 1 V
			Key removed	10 to 14 V
D DOOR INPUT (C9-12) - Body ground	G-Y - Body ground	Driver side door open	Driver side door open	Below 1 V
			Driver side door closed	10 to 14 V

Symbols (Terminals No.)	Wiring Color	Terminal Description	Condition	Specified Condition
CHG- (C9-16) - Body ground	GR - Body ground	Change signal	Ignition switch ON	10 to 14 V
			Ignition switch OFF	Below 1 V
MIL (C9-17) - Body ground	BR - Body ground	MIL signal	MIL ON	Below 1 V
			MIL OFF	10 to 14 V
ALL DOOR INPUT (C9-18) - Body ground	G-W - Body ground	All door condition signal	All doors open	Below 1 V
			All doors closed	10 to 14 V
4P OUT (C9-19) - Body ground	V-W - Body ground	Vehicle speed signal (Input)	Ignition switch ON and wheel turning slowly	Pulse generation (See waveform 1)
ILL- (C9-20) - Body ground	BR-W - Body ground	Ground	Always	Below 1 Ω
IGN+ (C9-21) - Body ground	V - Body ground	Ignition switch signal (ON)	Ignition switch OFF	Below 1 V
			Ignition switch ON	10 to 14 V
TIRE PRESSURE (C9-23) - Body ground	L - Body ground	Tire pressure signal	Tire pressure indicator light ON	6.7 to 12 V
			Tire pressure indicator light OFF	Below 1 V
CRUISE (C9-24) - Body ground	LG - Body ground	Cruise signal	Cruise indicator ON	Below 1 V
			Cruise indicator OFF	10 to 14 V
OIL PRESSURE (C9-25) - Body ground	LG-B - Body ground	Oil pressure signal	Oil pressure warning light ON	Below 1 V
			Oil pressure warning light OFF	10 to 14 V
TURN R (C9-27) - Body ground	L-Y - Body ground	Turn signal R	Ignition switch ON, turn signal RH indicator OFF	Below 1 V
			Ignition switch ON, turn signal RH indicator ON	10 to 14 V
TURN L (C9-28) - Body ground	L-B - Body ground	Turn signal L	Ignition switch ON, turn signal LH indicator OFF	Below 1 V
			Ignition switch ON, turn signal LH indicator ON	10 to 14 V
HEAD (C9-32) - Body ground	R-B - Body ground	HEAD light signal	HEAD warning light ON	Below 1 V
			HEAD warning light OFF	10 to 14 V
AIRBAG (C9-33) - Body ground	B-Y - Body ground	AIRBAG signal	AIRBAG warning light ON	Below 1 V
			AIRBAG warning light OFF	10 to 14 V
AUTO LSD (C9-35) - Body ground	LG-R - Body ground	AUTO LSD signal	AUTO LSD indicator light ON	Below 1 V
			AUTO LSD indicator light OFF	10 to 14 V
SLIP (C9-36) - Body ground	R-W - Body ground	SLIP signal	SLIP warning light ON	Below 1 V
			SLIP warning light OFF	10 to 14 V
VSC OFF (C9-37) - Body ground	L-W - Body ground	VSC OFF signal	VSC OFF indicator ON	Below 1 V
			VSC OFF indicator OFF	10 to 14 V
VSC TRAC (C9-38) - Body ground	Y - Body ground	VSC TRAC signal	VSC TRAC indicator ON	Below 1 V
			VSC TRAC indicator OFF	10 to 14 V
A/T OIL TEMP (C9-39) - Body ground	P - Body ground	A/T oil temperature signal	A/T OIL TEMP warning light ON	Below 1 V
			A/T OIL TEMP warning light OFF	10 to 14 V
ILL+ (C9-40) - Body ground	G - Body ground	Illumination signal	Illumination switch OFF, rheostat maximum	Below 1 V
			Illumination switch ON (wake up), rheostat maximum	10 to 14 V

Symbols (Terminals No.)	Wiring Color	Terminal Description	Condition	Specified Condition
A/T P (C10-1) - Body ground	G-B - Body ground	A/T sift position signal (P)	A/T P indicator OFF	Below 1 V
			A/T P indicator ON	10 to 14 V
A/T R (C10-2) - Body ground	R-W - Body ground	A/T sift position signal (R)	A/T R indicator OFF	Below 1 V
			A/T R indicator ON	10 to 14 V
A/T N (C10-3) - Body ground	L-W - Body ground	A/T sift position signal (N)	A/T N indicator OFF	Below 1 V
			A/T N indicator ON	10 to 14 V
A/T D (C10-4) - Body ground	W - Body ground	A/T sift position signal (D)	A/T D indicator OFF	Below 1 V
			A/T D indicator ON	10 to 14 V
A/T 4 (C10-5) - Body ground	B - Body ground *1 Y - Body ground *2	A/T sift position signal (4)	A/T 4 indicator OFF	Below 1 V
			A/T 4 indicator ON	10 to 14 V
A/T 3 (C10-6) - Body ground	Y - Body ground *1 R-Y - Body ground *2	A/T sift position signal (3)	A/T 3 indicator OFF	Below 1 V
			A/T 3 indicator ON	10 to 14 V

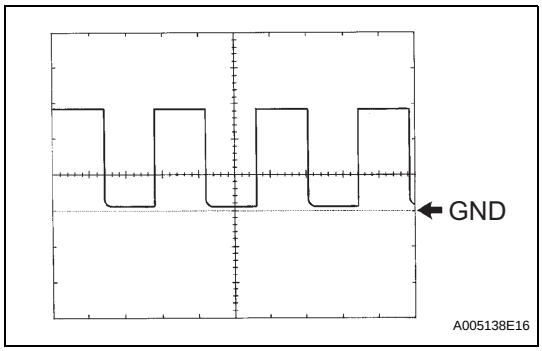
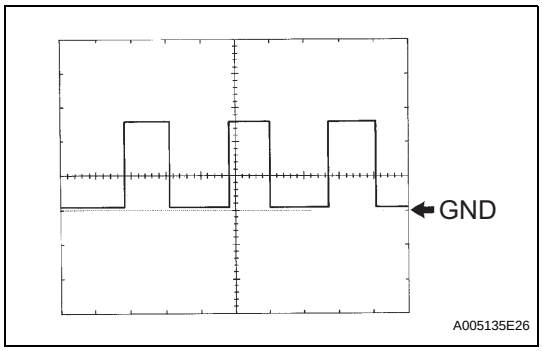
			A/T 2 indicator ON	10 to 14 V
A/T L (C10-8) - Body ground	G-Y - Body ground	A/T sift position signal (L)	A/T L indicator OFF	Below 1 V
			A/T L indicator ON	10 to 14 V
ACTIVE ABS (C10-9) - Body ground	O - Body ground	ACTIVE ABS signal	ACTIVE ABS warning light ON	Below 1 V
			ACTIVE ABS warning light OFF	10 to 14 V
ACTIVE BRAKE (C10-10) - Body ground	B-W - Body ground	ACTIVE BRAKE signal	ACTIVE BRAKE warning light ON	Below 1 V
			ACTIVE BRAKE warning light OFF	10 to 14 V
BRAKE LEVEL (C10-11) - Body ground	LG - Body ground	BRAKE signal	BRAKE warning light ON	Below 1 V
			BRAKE warning light OFF	10 to 14 V
BEAM+ (C10-12) - Body ground	P - Body ground	Hi-Beam signal	Hi-Beam OFF	Below 1 V
			Hi-Beam ON	10 to 14 V
DAC (C10-13) - Body ground	L-B - Body ground	DAC TRAC signal	DAC TRAC warning light ON	Below 1 V
			DAC TRAC warning light OFF	10 to 14 V
RR DIFF LOCK (C10-14) - Body ground	L-Y - Body ground	RR DIFF LOCK signal	RR DIFF LOCK warning light ON	Below 1 V
			RR DIFF LOCK warning light OFF	10 to 14 V
4LO (C10-16) - Body ground	BR-W - Body ground	4LO TRAC signal	4LO indicator light ON	Below 1 V
			4LO indicator light OFF	10 to 14 V
4WD (C10-15) - Body ground	R - Body ground	4WD signal	4WD indicator OFF	Below 1 V
			4WD indicator ON	10 to 14 V

*1: 1GR-FE
*2: 2TR-FE



(a) Waveform 1: Using an oscilloscope

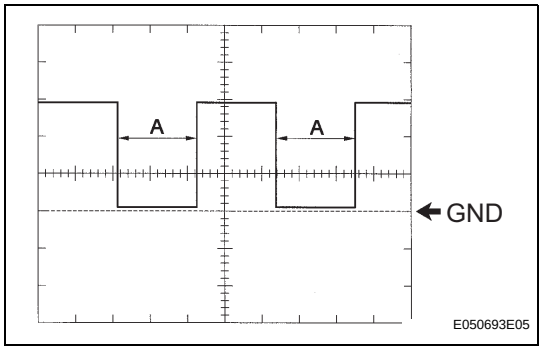
Item	Condition
Tool setting	5 V/DIV., 10 ms/DIV
Vehicle condition	Engine idle speed



(b) Waveform 2: Using an oscilloscope

Item	Condition
Tool setting	5 V/DIV., 20 ms/DIV
Vehicle condition	Driving at approx. 20 km/h (12 mph)

HINT:
As vehicle speed increases, the cycle of the signal waveform narrows.



(c) Waveform 3: Using an oscilloscope

Item	Condition
Tool setting	5 V/DIV., 0.1 sec./DIV
Vehicle condition	Ignition switch ON

HINT:
A changes in accordance with the engine coolant temperature.

Coolant temperature	Below 30°C	Approximately 75°C	Above 90°C
A	Approximately 16 ms	Approximately 204 ms	Approximately 262 ms

DIAGNOSIS SYSTEM

1. CHECK DLC3

If the result is not as specified, the DLC3 may have a malfunction. Repair or replace the harness and connector.

Tester Connection	Condition	Specified Condition
7 (Bus "+" line) - 5 (Signal ground)	During transmission	Pulse generation
4 (Chassis ground) - Body ground	Always	Below 1 Ω
5 (Signal ground) - Body ground	Always	Below 1 Ω
16 (B+) - Body ground	Always	9 to 14 V

HINT:
If the display shows UNABLE TO CONNECT TO VEHICLE when you have connected the cable of the intelligent tester to the DLC3, turned the ignition switch to the ON position and operated the tester, a problem exists in either the vehicle or tester.

- If communication is normal when the tester is connected to another vehicle, inspect the DLC3 on the original vehicle.
- If communication is still impossible when the tester is connected to another vehicle, the problem is probably with the tester itself. Consult the Service Department listed in the tester's instruction manual.

DIAGNOSIS SYSTEM

1. CHECK DLC3

If the result is not as specified, the DLC3 may have a malfunction. Repair or replace the harness and connector.

Tester Connection	Condition	Specified Condition
7 (Bus "+" line) - 5 (Signal ground)	During transmission	Pulse generation
4 (Chassis ground) - Body ground	Always	Below 1 Ω
5 (Signal ground) - Body ground	Always	Below 1 Ω
16 (B+) - Body ground	Always	9 to 14 V

HINT:
If the display shows UNABLE TO CONNECT TO VEHICLE when you have connected the cable of the intelligent tester to the DLC3, turned the ignition switch to the ON position and operated the tester, a problem exists in either the vehicle or tester.

- If communication is normal when the tester is connected to another vehicle, inspect the DLC3 on the original vehicle.
- If communication is still impossible when the tester is connected to another vehicle, the problem is probably with the tester itself. Consult the Service Department listed in the tester's instruction manual.

DATA LIST / ACTIVE TEST

1. DATA LIST

(a) By reading the DATA LIST displayed on the intelligent tester, you can check values, including those of the switches, sensors, actuators without removing any parts. Reading the DATA LIST as the first step of troubleshooting is one method of shortening diagnostic time.
(1) Warm up the engine.
(2) Turn the ignition switch OFF.
(3) Connect the intelligent tester to the DLC3.
(4) Turn the ignition switch to the ON position.
(5) Operate the intelligent tester according to the display and select "DATA LIST".

ECM :

Item	Measurement Item/ Range (Display)	Normal Condition	Diagnostic Note
VEHICLE SPEED	Vehicle speed/ Min.: 0 mph (0 km/h), Max.: 153 mph (255 km/h)	Almost same as actual vehicle speed (When driving)	-
ENGINE SPD	Engine speed/ Min.: 0 rpm, Max.: 16,383 rpm	Almost same as actual engine speed (When engine is running)	-
COOLANT TEMP	Engine coolant temperature / Min.: -40°C (-40°F), Max.: 140°C (284°F)	After warning up: 80 to 95°C (176 to 203°F)	If value is -40°C (-40°F), sensor circuit is open. If value is 140°C (284°F), sensor circuit is shorted.

ON-VEHICLE INSPECTION

1. INSPECT SPEEDOMETER

(a) Check the operation.

(1) Using a speedometer tester, inspect the speedometer for acceptable indication error and check the operation of the odometer.

Reference:
km/h (Canada)

Standard Indication	Acceptable Range
20 km/h	17.5 to 21.5 km/h
40 km/h	38.0 to 42.0 km/h
60 km/h	58.0 to 63.0 km/h
80 km/h	78.0 to 84.0 km/h
100 km/h	98.5 to 104.5 km/h
120 km/h	119.0 to 125.0 km/h
140 km/h	139.0 to 146.0 km/h
160 km/h	159.0 to 167.0 km/h
180 km/h	179.0 to 188.0 km/h
200 km/h	199.0 to 209.0 km/h
220 km/h	219.0 to 230.0 km/h
240 km/h	239.0 to 251.0 km/h

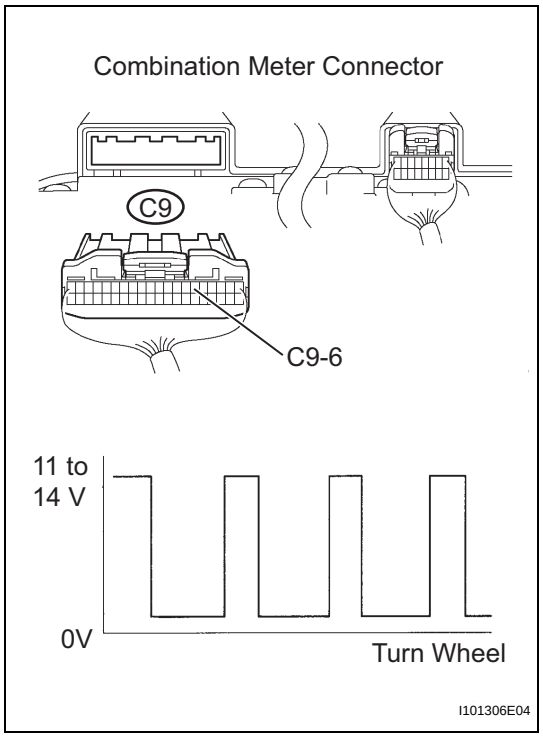
Reference:
mph (U.S.A.)

Standard Indication	Acceptable Range
20 mph	20.0 to 23.0 mph
40 mph	40.0 to 43.5 mph
60 mph	60.0 to 64.0 mph
80 mph	80.0 to 84.5 mph
100 mph	100.0 to 105.0 mph
120 mph	120.0 to 125.5 mph
140 mph	140.0 to 146.0 mph

NOTICE:
Tire wear and excessively high or low tire pressure affect indication errors.

(2) Check the deflection width of the speedometer indicator.

Reference:
Below 0.5 km/h (0.3 mph)



2. INSPECT OUTPUT OF VEHICLE SPEED

(a) Shift the transmission gear selector lever to the neutral position.
(b) Jack up the vehicle.
(c) Turn the ignition switch to ON.
(d) Check the voltage while the wheel is turning slowly.
Standard

Tester Connections	Specified Conditions
C9-6 - Body ground	Voltage generated intermittently

HINT:
The output voltage should fluctuate up and down as shown in the diagram on the left when the wheel is turning slowly.

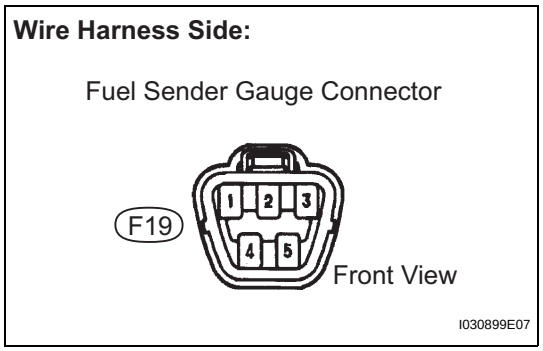
3. INSPECT TACHOMETER

(a) Check the operation.
(1) Connect the tune-up test tachometer and start the engine.
NOTICE:
- **Reversing the connection of the tachometer will damage the transistors and the insides of the diodes.**
- **When removing or installing the tachometer, be careful not to drop or strike it.**

(2) Compare the result of the test with the standard indication.
DC 13.5 V, at 25°C (77°F)

Reference

Standard Indication (USA) (RPM) Standard Indication (CANADA) (r/min)	1GR-FE: Acceptable Range (USA) (RPM) Acceptable Range (CANADA) (r/min) Data in ( ) are for reference	2TR-FE Acceptable Range (USA) (RPM) Acceptable Range (CANADA) (r/min) Data in ( ) are for reference
700	630 to 770	630 to 770
1,000	(900 to 1,100)	(900 to 1,100)
2,000	(1,850 to 2,150)	(1,850 to 2,150)
3,000	2,800 to 3,200	2,800 to 3,200
4,000	(3,800 to 4,200)	(3,800 to 4,200)
5,000	4,800 to 5,100	4,800 to 5,200
6,000	(5,750 to 6,250)	(5,750 to 6,250)



4. INSPECT FUEL RECEIVER GAUGE

(a) Disconnect the fuel sender gauge connector.
(b) Turn the ignition switch to the ON position, then check the position of the receiver gauge needle.
OK:
Needle position is on (EMPTY).
(c) Connect terminals 2 and 3 on the wire harness side connector of the fuel sender gauge.
(d) Turn the ignition switch to the ON position, then check the position of the receiver gauge needle.
OK:
Needle position is on (FULL).
(e) Reconnect the fuel sender gauge connector.

5. INSPECT FUEL LEVEL WARNING LIGHT

(a) Disconnect the fuel sender gauge connector.

(b) Turn the ignition switch to the ON position, then check that the fuel level needle indicates EMPTY and the fuel level warning light comes on.

OK:

Fuel level warning light comes on.

(c) Reconnect the fuel sender gauge connector.

6. INSPECT LOW ENGINE OIL PRESSURE WARNING LIGHT

(a) Disconnect the low oil pressure switch connector.

(b) Turn the ignition switch to the ON position.

(c) Ground the terminal of the wire harness side connector, then check the low oil pressure warning light.

OK:

Low oil pressure warning light comes on.

(d) Reconnect the low oil pressure switch connector.

7. INSPECT BRAKE WARNING LIGHT

(a) Inspect the parking brake warning light.

(1) Disconnect the parking brake switch connector.

(2) Turn the ignition switch to the ON position.

(3) Ground the terminal of the wire harness side connector, then check the parking brake warning light.

OK:

Brake warning light comes on.

(4) Reconnect the parking brake switch connector.

(b) Inspect the brake fluid level warning light.

(1) Disconnect the brake fluid level warning switch connector.

(2) Turn the ignition switch to the ON position.

(3) Connect a terminal to the other terminal of the wire harness side connector, then check the brake fluid level warning switch.

OK:

Brake warning light comes on.

(4) Reconnect the brake fluid level warning switch connector.

8. INSPECT BRAKE FLUID LEVEL WARNING SWITCH

(a) Remove the reservoir tank cap and strainer.

(b) Disconnect the brake fluid level warning switch connector.

(c) Measure the resistance between the terminals.

Standard Resistance:

Float up (switch off): 10 kΩ or higher

(d) Use a syphon or a similar tool, to take fluid out of the reservoir tank.

(e) Measure the resistance between the terminals.

Standard Resistance:

Float down (switch on): Below 1 Ω

(f) Pour the fluid back in the reservoir tank.

(g) Reconnect the brake fluid level warning switch connector.
(h) Reinstall the reservoir tank cap and strainer.

9. INSPECT WASHER FLUID LEVEL WARNING SWITCH

(a) Disconnect the washer level warning switch connector.
(b) Turn the ignition switch to the ON position.
(c) Ground the terminal of the wire harness side connector, then check the washer level warning light.
OK:
Washer level warning light comes on.
(d) Reconnect the washer level warning switch connector.

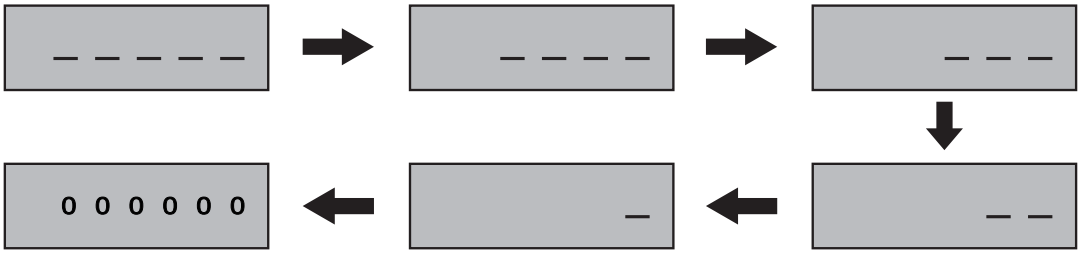
10. MAINTENANCE LIQUID RESETTING PROCEDURE

Indicator Condition

State	Condition	Specified State
Blinking	**The vehicle has run 4,500 miles since the previous setting**	**The indicator blinks for 15 seconds after the ignition switch is turned to the ON position (including 3 seconds for a valve check).**
Continuously Illuminated	**The vehicle has run 5,000 miles since the previous setting**	**The indicator is continuously illuminated after the ignition switch is turned to the ON position.**

(a) Turn the ignition switch to the ON position.
(b) Set the ODO/TRIP indication to ODO.
(c) While pressing the reset switch, turn the ignition switch OFF and ON again.
(d) Press the reset switch for more than 5 seconds. (The oil maintenance indicator illuminates for 3 seconds, and then flashes in accordance with the distance run*.)
HINT:
- *: If the distance run is less than 4,500 mile, the indicator turns off. If the distance run is between 4,500 mile and 4999 miles, the indicator flashes for 2 seconds.
- If the distance run is more than 5,000 mile, the indicator turns off. If the reset switch is not pressed for at least 5 seconds, the reset procedure fails.
- The ODO/TRIP indicator indicates as follows while the reset switch is pressed for 5 seconds.

ODO/TRIP Indication:

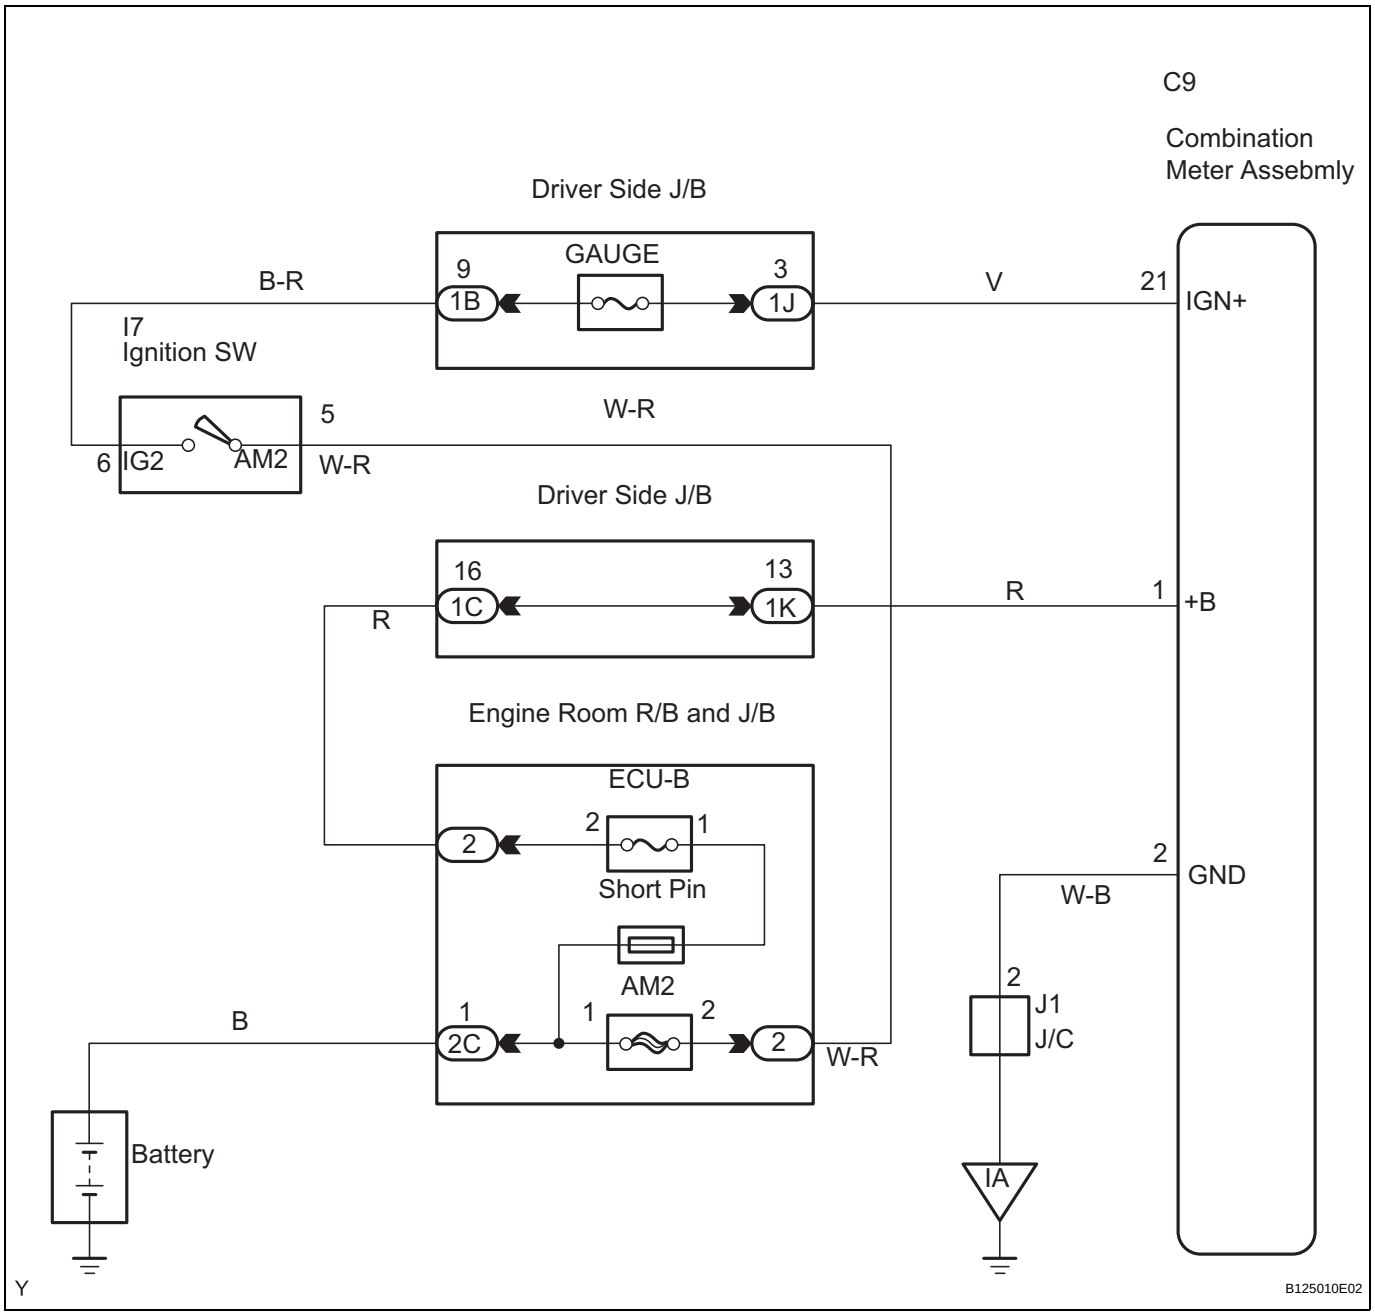


Y

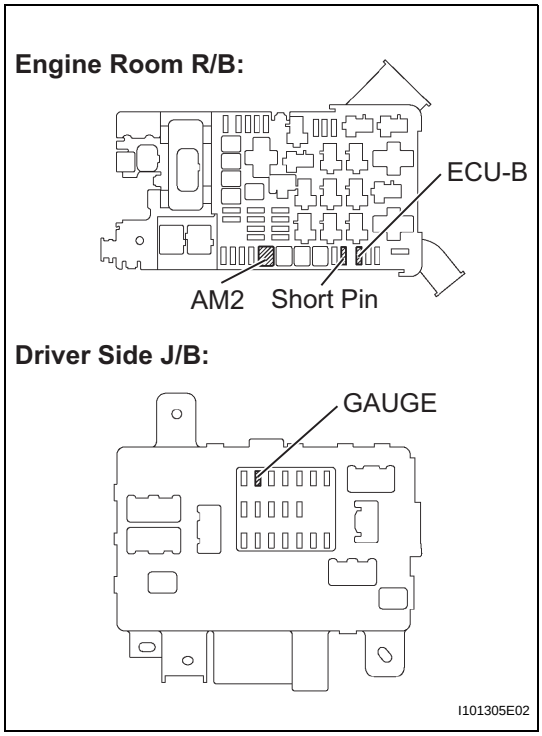
B125032E01

Entire Combination Meter does not Operate

WIRING DIAGRAM



1	CHECK FUSE

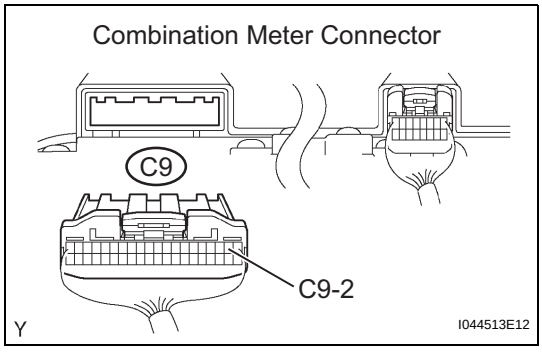


(a) Remove the ECU-B fuse, AM2 fuse and short pin from the engine room R/B.
(b) Remove the GAUGE fuse from the driver side J/B.
(c) Measure the resistance.
Standard Resistance:
Below 1 Ω
(d) Reinstall the fuses and short pin.

NG → **INSPECT FOR SHORT CIRCUIT IN HARNESS AND ALL COMPONENTS CONNECTED TO FUSE**

OK

2	INSPECT COMBINATION METER ASSEMBLY



(a) Disconnect the C9 combination meter connector.
(b) Measure the resistance.
Standard Resistance

Tester Connection	Condition	Specified Condition
C9-2 - Body ground	Always	Below 1 Ω

(c) Measure the voltage.
Standard Voltage

Tester Connection	Condition	Specified Condition
C9-1 - Body ground	Always	10 to 14 V
C9-21 - Body ground	Ignition switch ON	10 to 14 V

(d) Reconnect the combination meter connector.

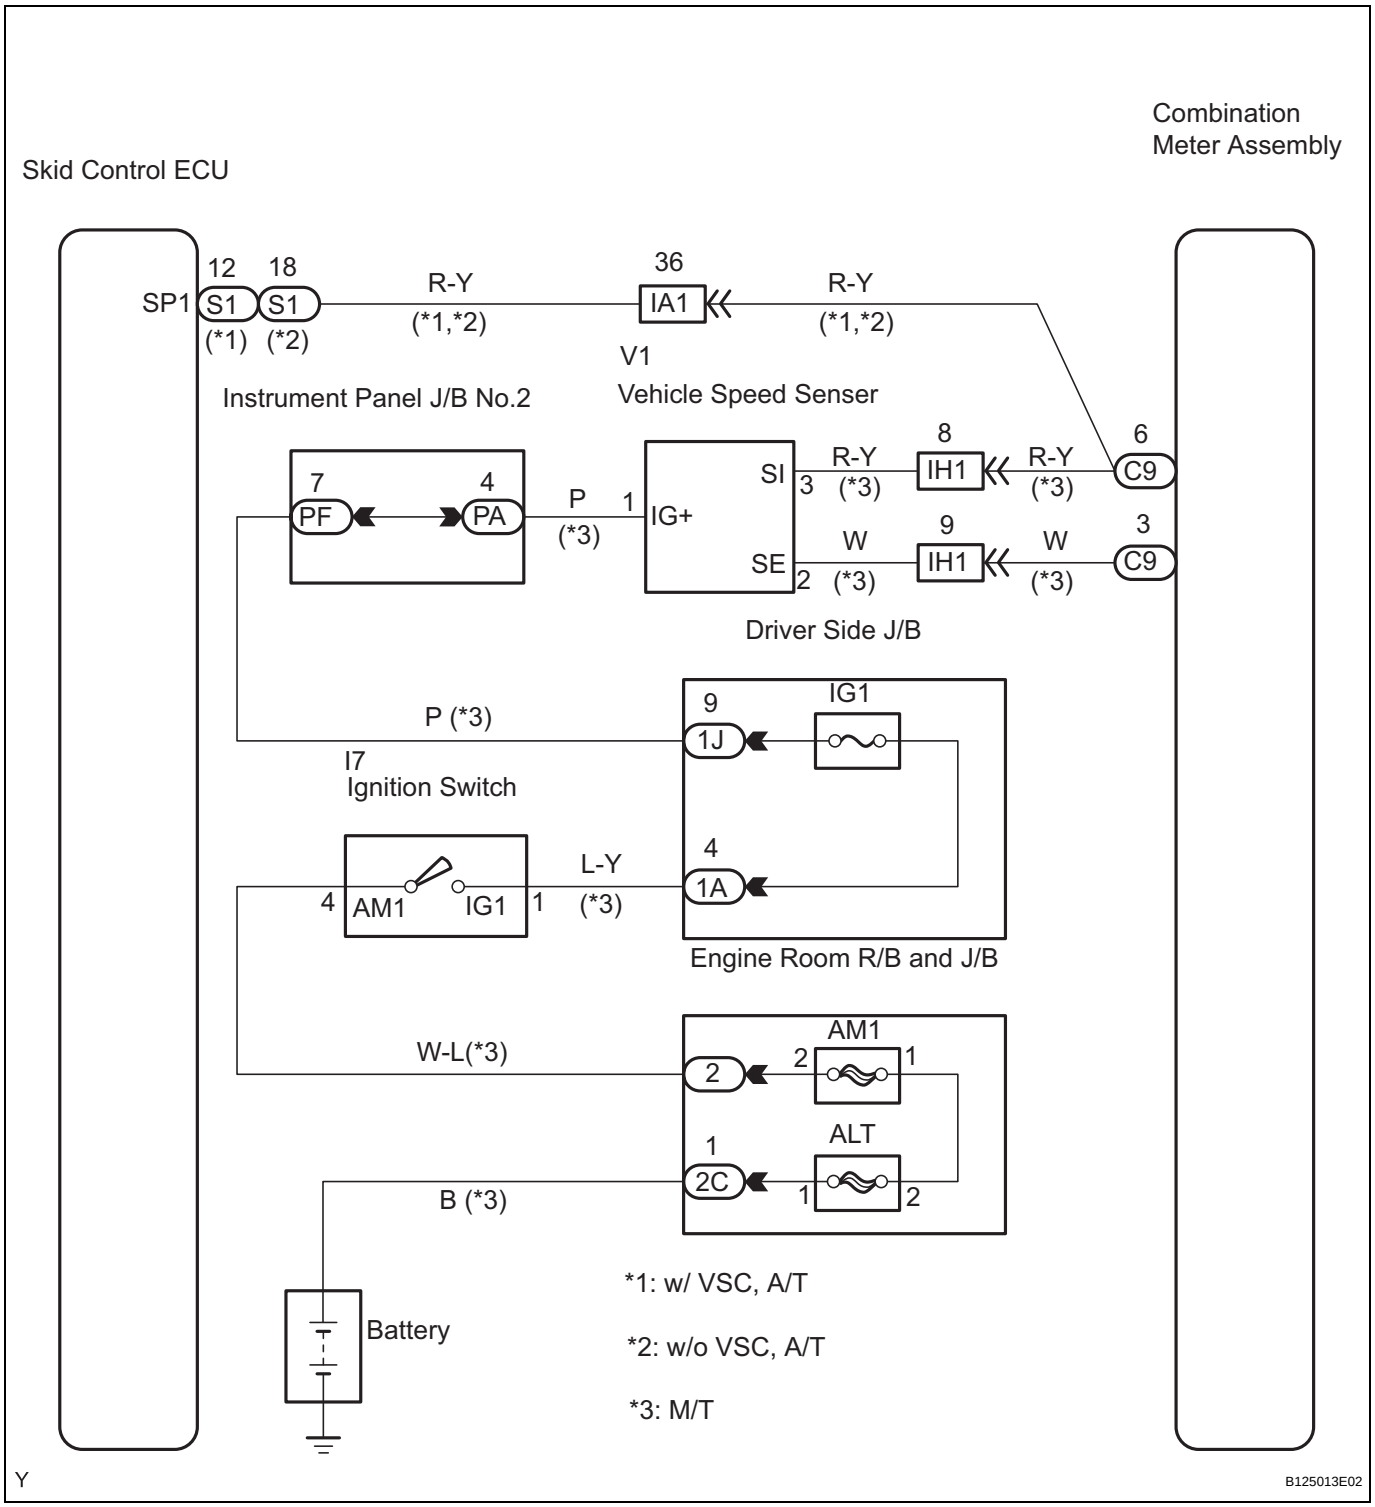
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE COMBINATION METER ASSEMBLY

Speedometer Malfunction

WIRING DIAGRAM



1	READ VALUE OF INTELLIGENT TESTER (VEHICLE SPEED)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.

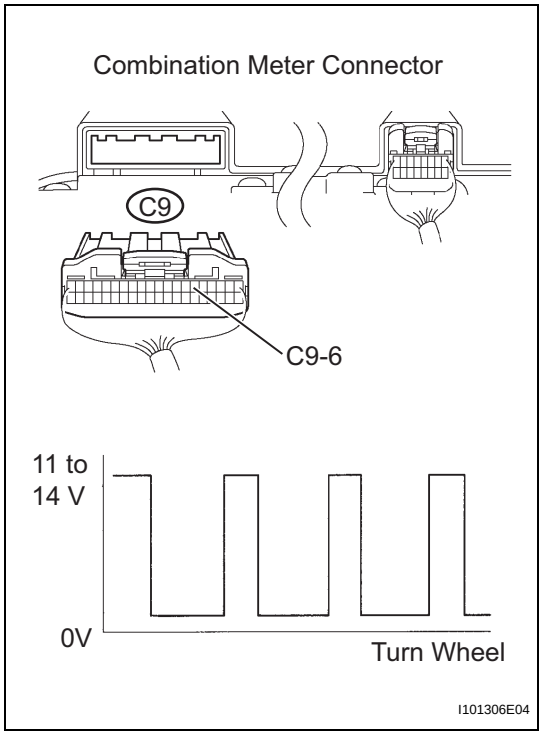
ME

(c) Turn the tester ON.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / VEHICLE SPD.
(e) Read the value displayed on the tester.
OK:
Vehicle speed displayed on the tester is almost the same as the actual vehicle speed.

NG → **GO TO BRAKE CONTROL SYSTEM**

OK

2 INSPECT COMBINATION METER ASSEMBLY



(a) Shift the transmission gear selector lever to the neutral position.
(b) Jack up the vehicle.
(c) Turn the ignition switch to ON.
(d) Check the voltage while the wheel is turning slowly.
Standard Voltage

Tester Connection	Specified Condition
C9-6 - Body ground	Voltage generated intermittently

HINT:
The output voltage should fluctuate up and down as shown in the diagram on the left when the wheel is turning slowly.
Result

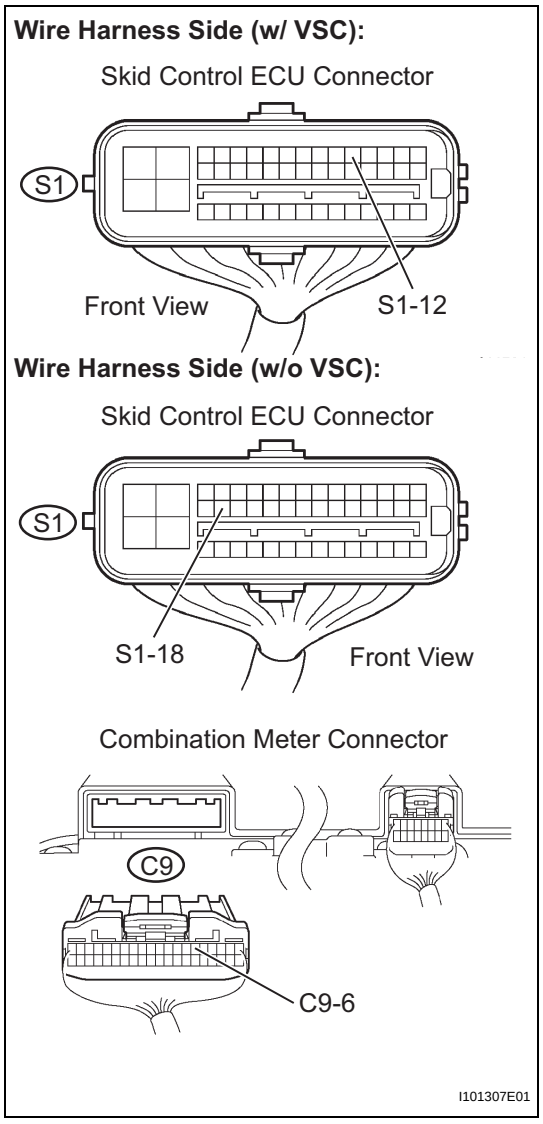
Result	Proceed to
As shown in the illustration	A
Different from the illustration (A/T)	B
Different from the illustration (M/T)	C

A → **REPLACE COMBINATION METER ASSEMBLY**

C → **Go to step 4**

B

3	**CHECK HARNESS AND CONNECTOR (SKID CONTROL ECU - COMBINATION METER ASSEMBLY)**



(a) Disconnect the C9 combination meter connector.
(b) With VSC: Disconnect the S1 skid control ECU connector.
(c) Without VSC: Disconnect the S1 combination meter connector.
(d) Measure the resistance.

Standard Resistance:

With VSC

Tester Connection	Specified Condition
S1-12 - C9-6	Below 1 Ω
S1-12 or C9-6 - Body ground	10 kΩ or higher

Without VSC

Tester Connection	Specified Condition
S1-18 - C9-6	Below 1 Ω
S1-18 or C9-6 - Body ground	10 kΩ or higher

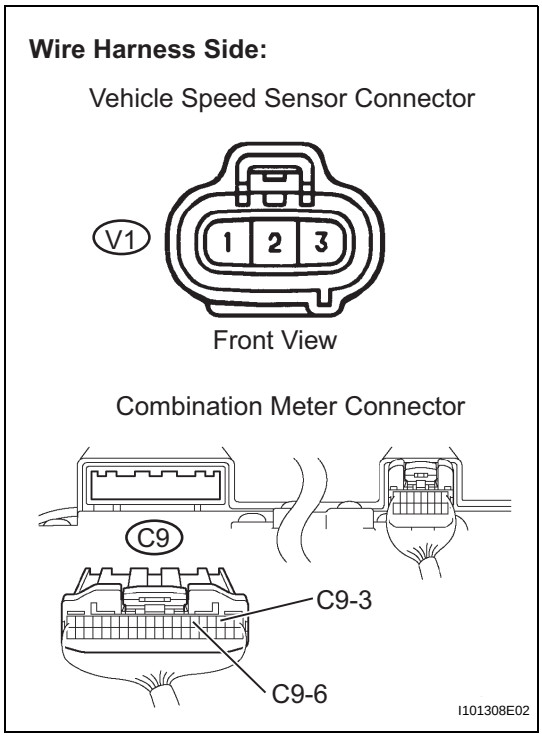
(e) Reconnect the skid control ECU connector.
(f) Reconnect the combination meter connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

GO TO BRAKE CONTROL SYSTEM

4	**CHECK HARNESS AND CONNECTOR (VEHICLE SPEED SENSOR - COMBINATION METER ASSEMBLY)**



(a) Disconnect the C9 combination meter connector.
(b) Disconnect the V1 vehicle speed sensor connector.
(c) Measure the resistance.

Standard Resistance

Tester Connection	Specified Condition
C9-6 - V1-3	Below 1 Ω
C9-3 - V1-2	Below 1 Ω
C9-6 or V1-3 - Body ground	10 kΩ or higher
C9-6 or V1-3 - Body ground	10 kΩ or higher

(d) Measure the voltage.

Standard Voltage

Tester Connection	Condition	Specified Condition
V1-1 - Body ground	Ignition switch OFF → ON	Below 1 V → 10 to 14 V

(e) Reconnect the vehicle speed sensor connector.
(f) Reconnect the combination meter connector.

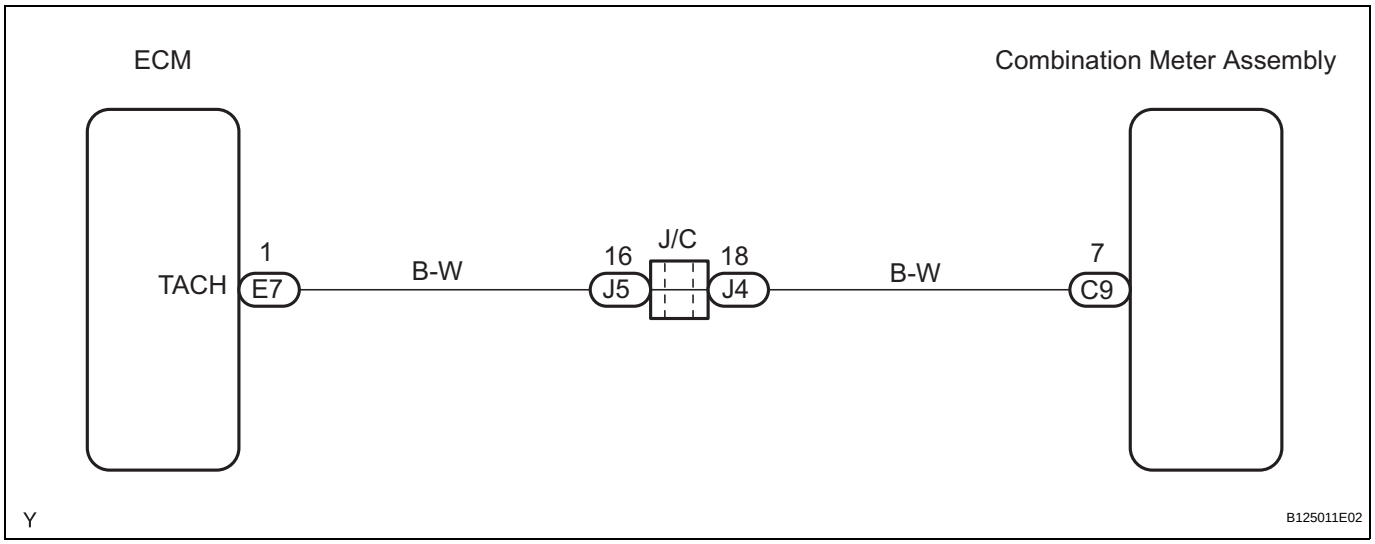
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE COMBINATION METER ASSEMBLY

Tachometer Malfunction

WIRING DIAGRAM



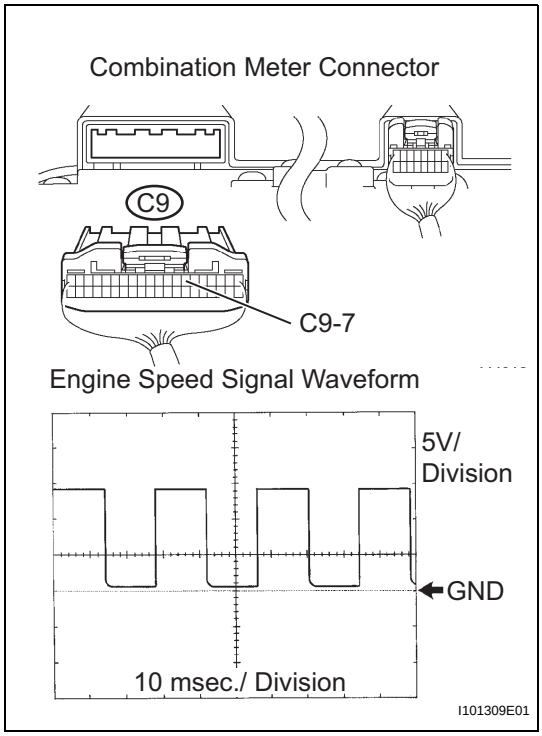
1	READ VALUE OF INTELLIGENT TESTER (ENGINE SPEED)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / ENGINE SPD.
(e) Read the value displayed on the tester.
OK:
Engine speed displayed on the tester is almost the same as the actual engine speed.

NG → **GO TO ENGINE CONTROL SYSTEM**

OK

2	INSPECT COMBINATION METER ASSEMBLY



(a) Inspect the combination meter using an oscilloscope.
(b) While the engine is running, check the waveform between the terminals of the C9 combination meter connector and body ground.

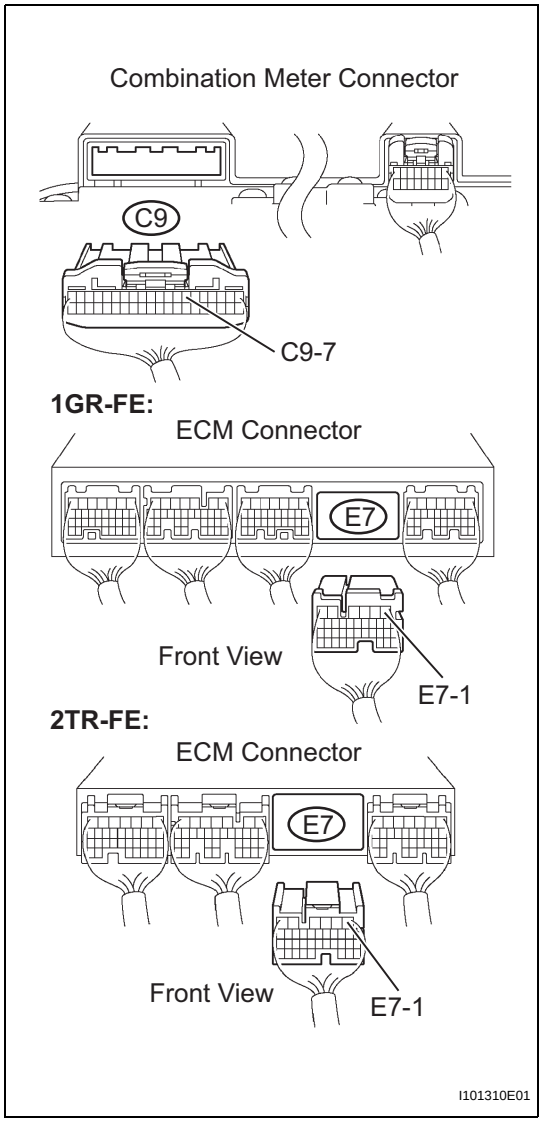
Standard

Tester Connection	Specified Condition
C9-7 - Body ground	Correct waveform shown

OK → **REPLACE COMBINATION METER ASSEMBLY**

NG

3	CHECK HARNESS AND CONNECTOR (COMBINATION METER ASSEMBLY - ECM)



(a) Disconnect the C9 combination meter connector.
(b) Disconnect the E7 ECM connector.
(c) Measure the resistance.

Standard Resistance

Tester Connection	Specified Condition
C9-7 - E7-1	Below 1 Ω
C9-7 or E7-1 - Body ground	10 kΩ or higher

(d) Reconnect the ECM connector.
(e) Reconnect the combination meter connector.

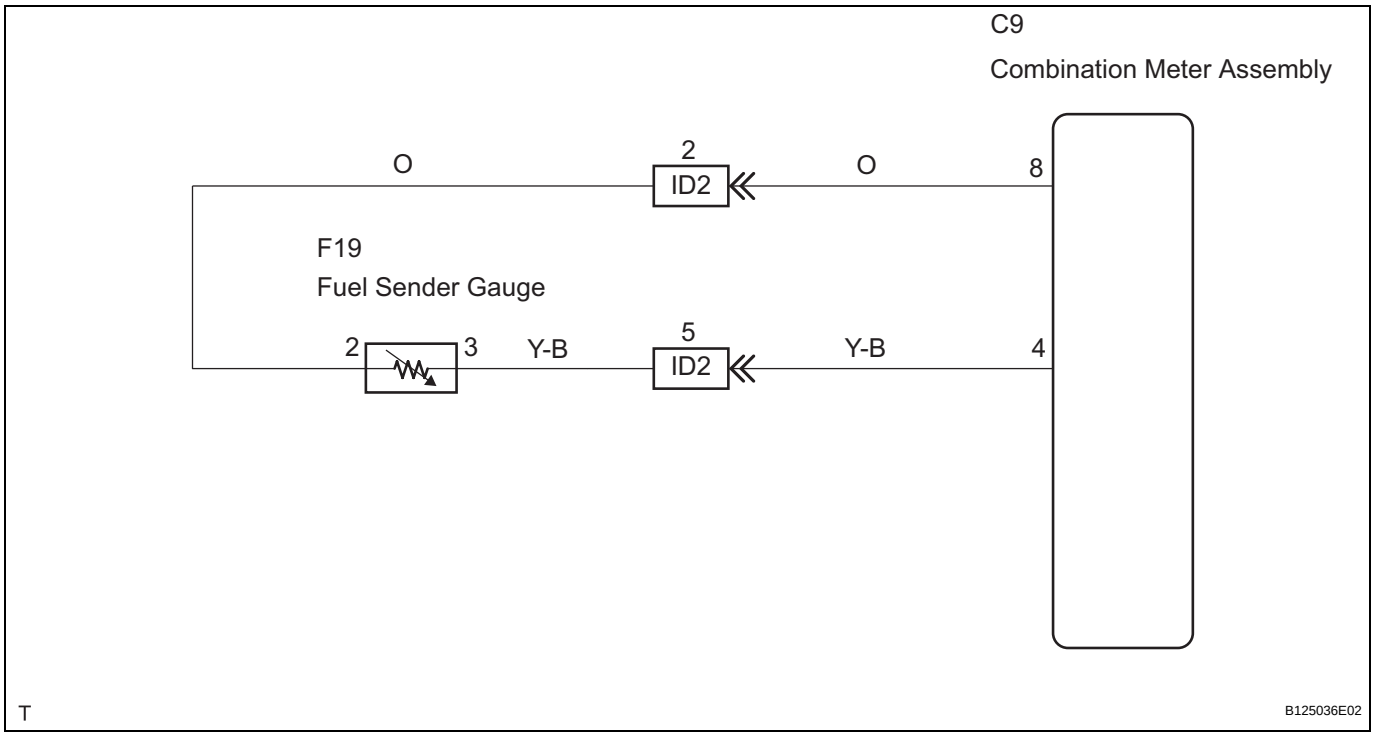
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

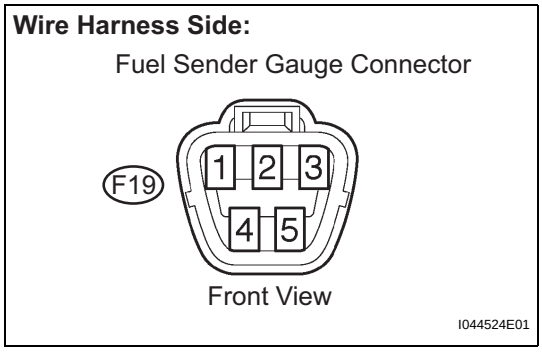
REPLACE ECM

Fuel Gauge Malfunction

WIRING DIAGRAM



1 CHECK HARNESS AND CONNECTOR



(a) Disconnect the F19 fuel sender gauge connector.
(b) Check the meter indicator conditions.
Standard

Wire Connection	Condition	Specified Condition
2 - 3	Short circuit (Ignition switch ON)	Fuel gauge indicates "F" or more (Combination meter)

(c) Measure the voltage.
Standard Voltage

Tester Connection	Condition	Specified Condition
2 - Body ground	Ignition switch ON	4 to 7 V

NOTICE:
- **Perform the check quickly (shorter than 10 seconds).**
- **Keep the battery as far away from the fuel pump as possible.**
- **Always do the switching at the battery side.**

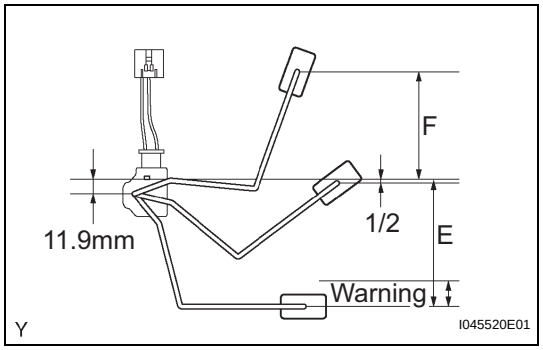
(d) Reconnect the fuel sender gauge connector.

NG → **Go to step 3**

OK

ME

2 INSPECT FUEL SENDER GAUGE ASSEMBLY



(a) Remove the fuel sender gauge assembly.
(b) Check that the float position is between E and F.
(c) Measure the resistance between terminals 2 and 3 of the fuel sender gauge connector.

Standard Resistance

Float Level	Float Position (mm (in.))	Specified Condition
F	81.5 (3.21) to 86.5 (3.41)	5.0 to 6.0 Ω
1/2	3.4 (0.13)	59.0 Ω
Warning	80.4 (3.17)	98.8 Ω
E	97.9 (3.85) to 102.9 (4.05)	107.5 to 112.5 Ω

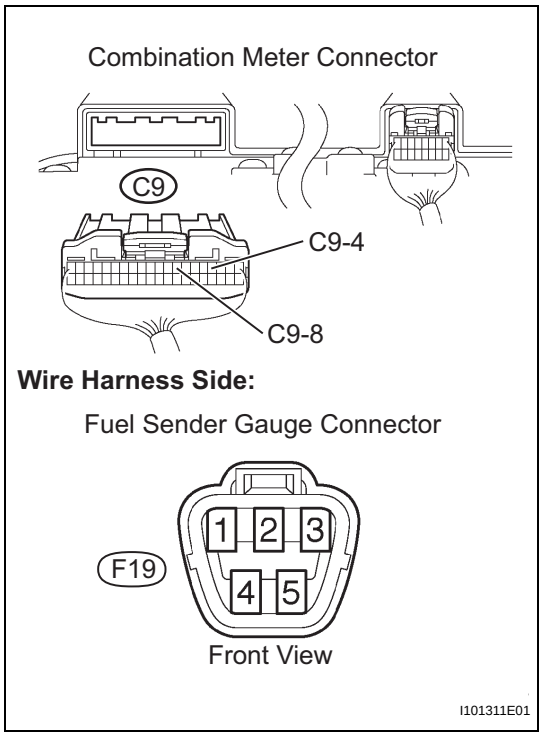
(d) Reinstall the fuel sender gauge assembly.

NG → **REPLACE FUEL SENDER GAUGE ASSEMBLY**

OK

REPLACE COMBINATION METER ASSEMBLY

3 CHECK HARNESS AND CONNECTOR (FUEL SENDER GAUGE - COMBINATION METER ASSEMBLY)



(a) Disconnect the C9 combination meter connector.
(b) Disconnect the F19 fuel sender gauge connector.
(c) Measure the resistance.

Standard Resistance

Tester Connection	Specified Condition
C9-4 - F19-3	Below 1 Ω
C9-8 - F19-2	Below 1 Ω
C9-4 or F19-3 - Body ground	10 kΩ or higher
C9-8 or F19-2 - Body ground	10 kΩ or higher

(d) Reconnect the fuel sender gauge connector.
(e) Reconnect the combination meter connector.

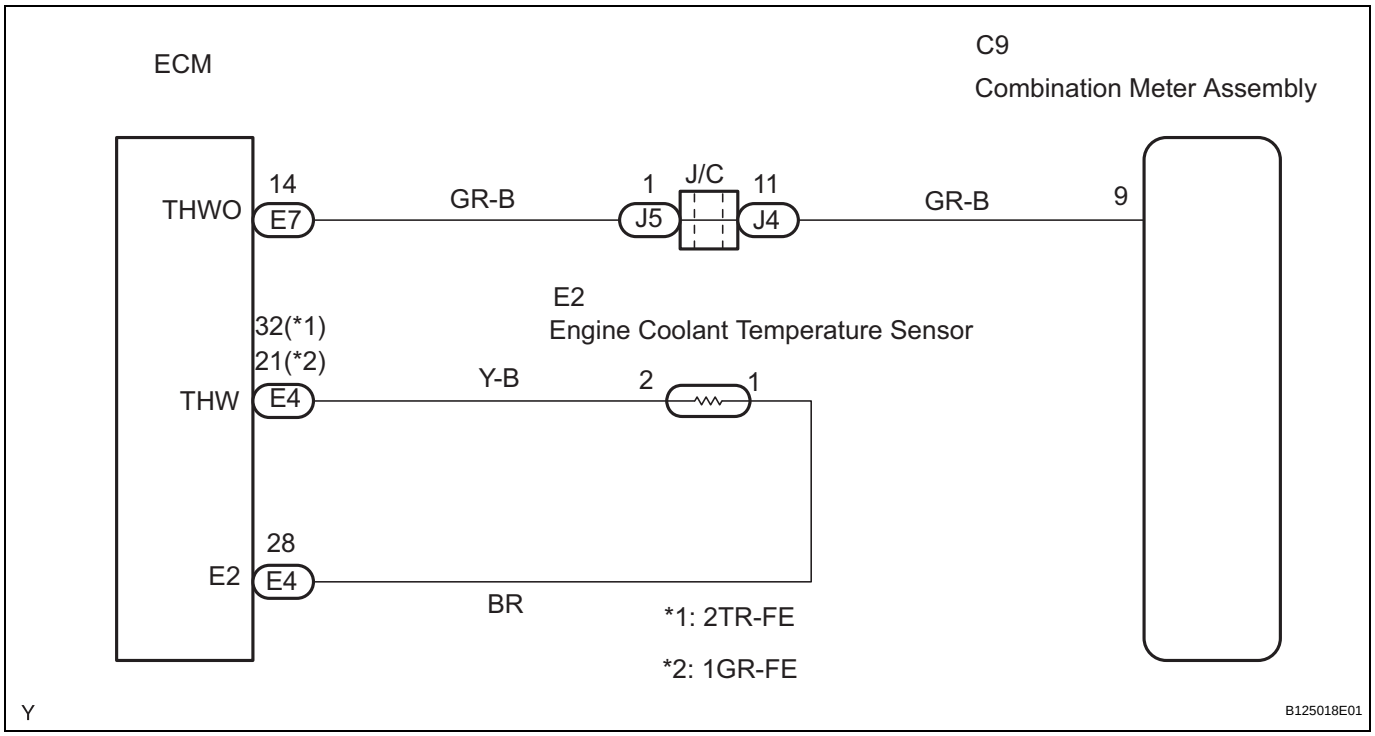
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE COMBINATION METER ASSEMBLY

Malfunction in Water Temperature Warning Light

WIRING DIAGRAM



HINT:

- Start the inspection from step 1 when using an intelligent tester and start from step 2 when not using an intelligent tester.
- If there is an open or short in the engine coolant temperature sensor circuit, the ECM outputs DTCs. Troubleshoot those DTCs by following the SFI System.
  2TR-FE: (See page ES-10)
  1GR-FE: (See page ES-10)

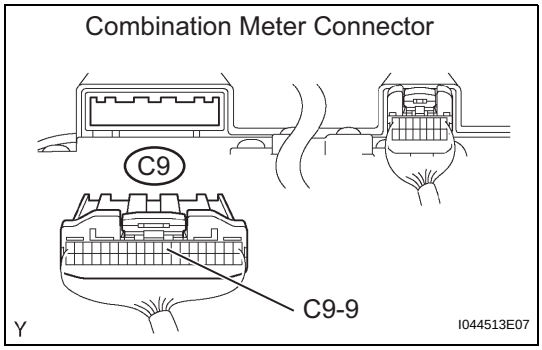
1	READ VALUE OF INTELLIGENT TESTER (ENGINE COOLANT TEMPERATURE)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / COOLANT TEMP.
(e) Read the value displayed on the tester.
Standard:
Between 80°C and 97°C (176°F and 207°F) with the engine warmed up.

NG → **GO TO ENGINE CONTROL SYSTEM**

OK

2 INSPECT COMBINATION METER ASSEMBLY



(a) Disconnect the C9 combination meter connector.
(b) Measure the voltage.
Standard Voltage

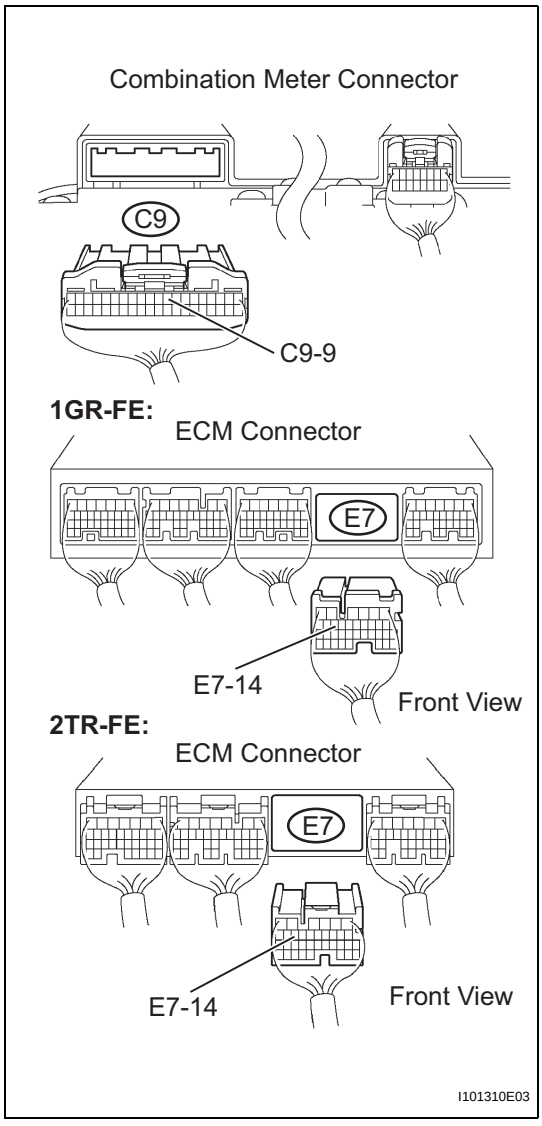
Tester Condition	Condition	Specified Condition
C9-9 - Body ground	Ignition switch ON, Coolant temperature is 90°C (194°F)	10 to 14 V

(c) Reconnect the combination meter connector.

OK → **REPLACE COMBINATION METER ASSEMBLY**

NG

3 CHECK HARNESS AND CONNECTOR (COMBINATION METER ASSEMBLY - ECM)



(a) Disconnect the C9 combination meter connector.
(b) Disconnect the E7 ECM connector.
(c) Measure the resistance.
Standard Resistance

Tester Connection	Specified Condition
C9-9 - E7-14	Below 1 Ω
C9-9 or E7-14 - Body ground	10 kΩ or higher

(d) Reconnect the ECM connector.
(e) Reconnect the combination meter connector.

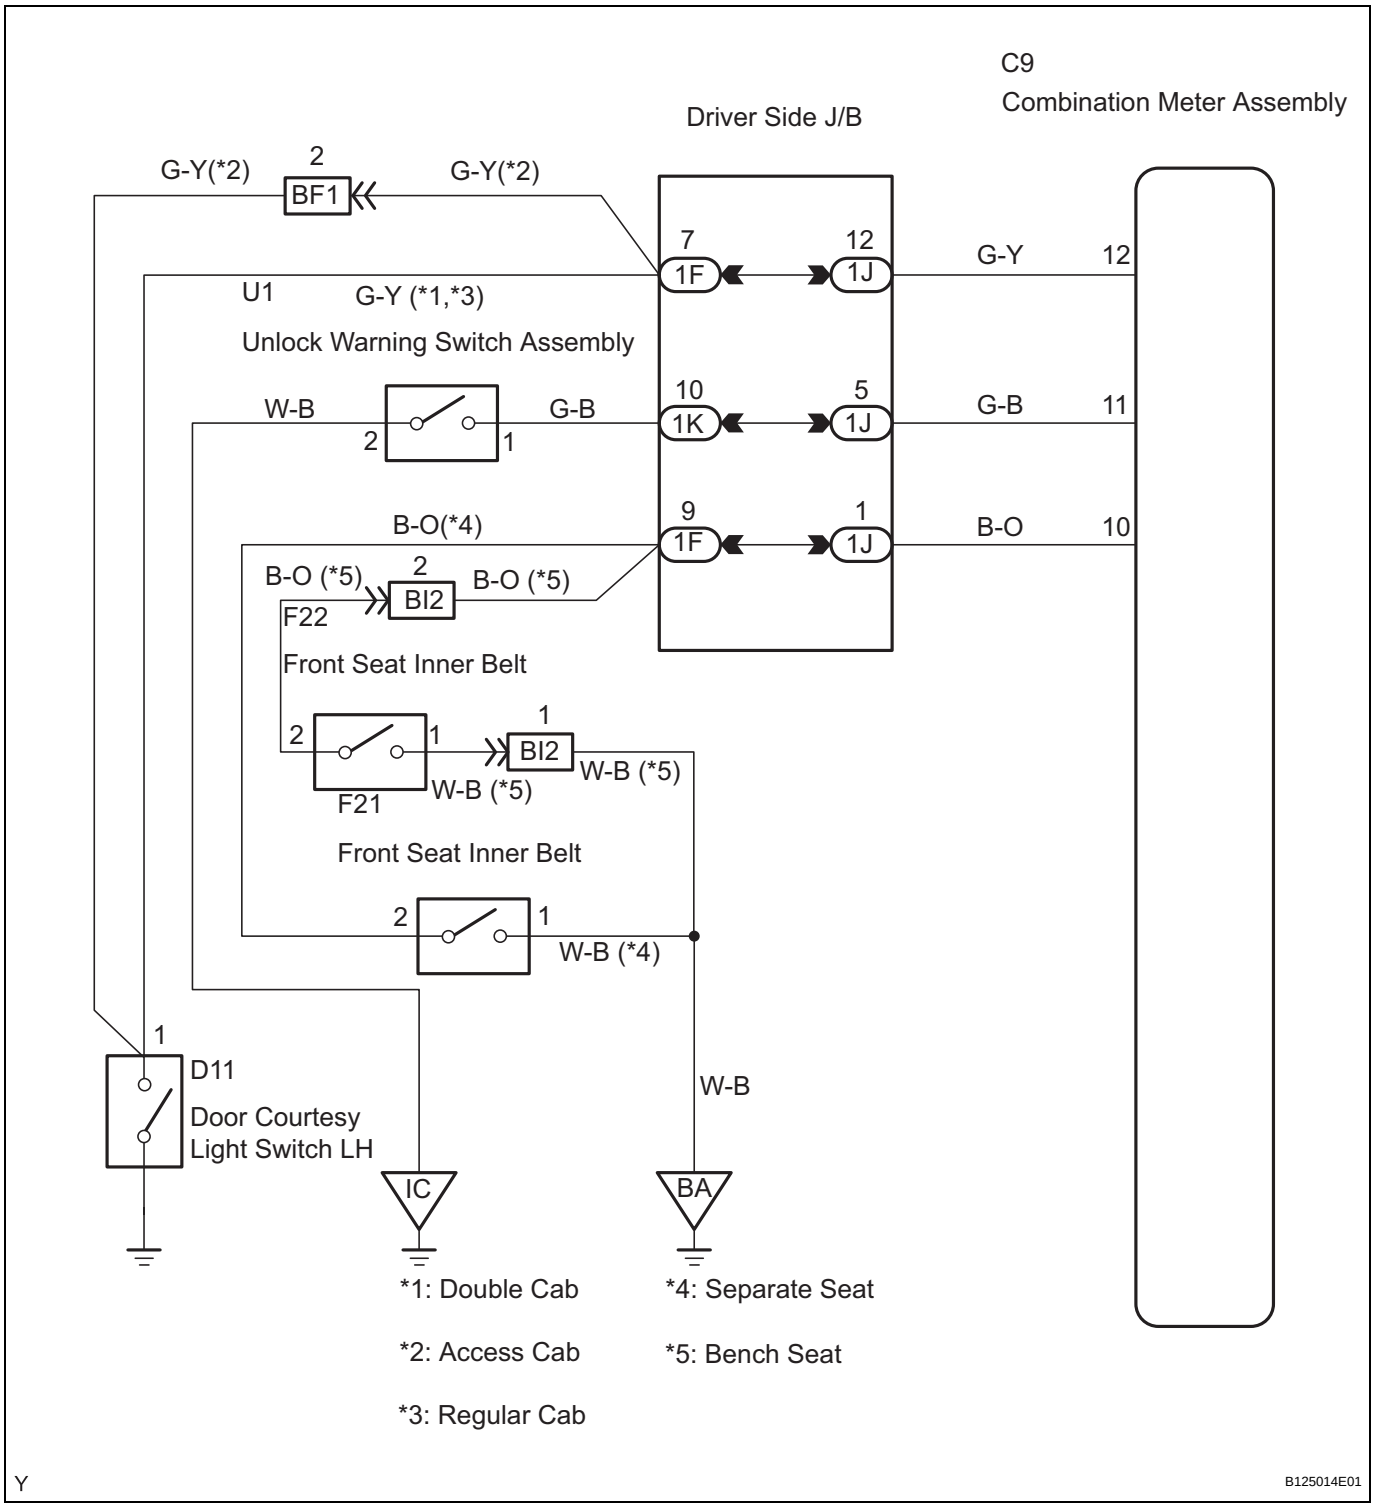
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

Warning Buzzer does not Sound

WIRING DIAGRAM



1	CHECK BUZZER

(a) Operate the buzzers and check that the buzzers for seat belt warning, key reminder warning and light reminder warning sound normally.

No warning buzzers sound.	A
Seat belt warning does not sound. (Bench seat)	B
Seat belt warning does not sound. (Separate seat)	C
Key reminder warning does not sound.	D

HINT:
Key reminder buzzer: Ignition switch is off, key is inserted, door is open.
Seat belt buzzer: Ignition switch is on, seat belt is unfastened.

A → **REPLACE COMBINATION METER ASSEMBLY**

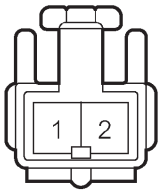
C → **Go to step 4**

D → **Go to step 6**

B

2	INSPECT FRONT SEAT INNER BELT ASSEMBLY (DRIVER SIDE)

Component Side:



Front Seat Inner Belt Assembly (Driver Side)

I045519E01

(a) Disconnect the F22 front seat inner belt assembly (driver side) connector.
(b) Measure the resistance.
Standard Resistance

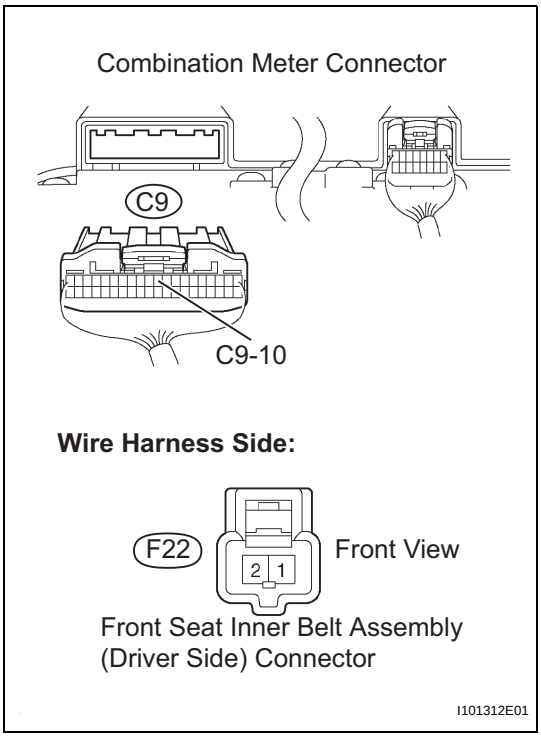
Tester Connection	Condition	Specified Condition
1 - 2	Seat belt fastened	10 kΩ or higher
1 - 2	Seat belt unfastened	Below 1 Ω

(c) Reconnect the front seat inner belt assembly (driver side) connector.

NG → **REPLACE FRONT SEAT INNER BELT ASSEMBLY (DRIVER SIDE)**

OK

3	CHECK HARNESS AND CONNECTOR (FRONT SEAT INNER BELT (DRIVER SIDE) - COMBINATION METER)



(a) Disconnect the C9 combination meter connector.
(b) Disconnect the F22 front seat inner belt assembly (driver side) connector.
(c) Measure the resistance.
Standard Resistance

Tester Connection	Specified Condition
C9-10 - F22-2	Below 1 Ω
C9-10 or F22-2 - Body ground	10 kΩ or higher

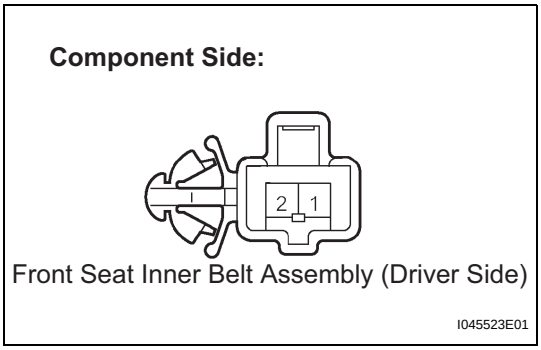
(d) Reconnect the front seat inner belt assembly (driver side) connector.
(e) Reconnect the combination meter connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE COMBINATION METER ASSEMBLY

4	INSPECT FRONT SEAT INNER BELT ASSEMBLY (DRIVER SIDE)



(a) Disconnect the F21 front seat inner belt assembly (driver side) connector.
(b) Measure the resistance.
Standard Resistance

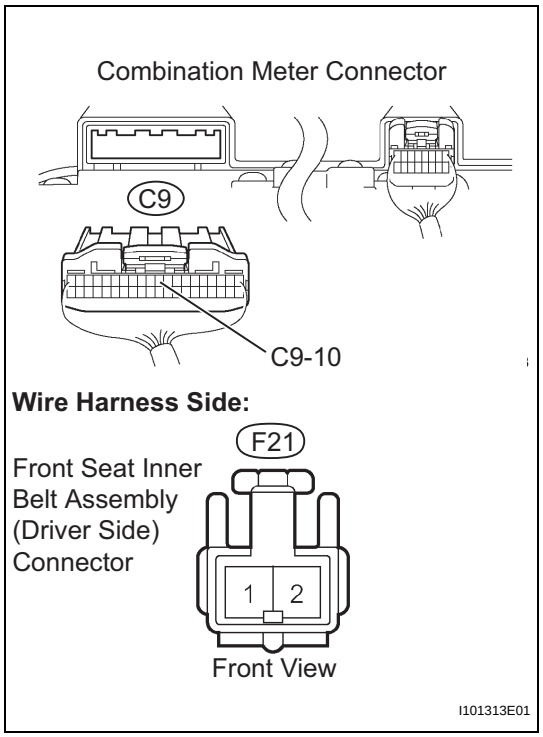
Tester Connection	Condition	Specified Condition
1 - 2	Seat belt fastened	10 kΩ or higher
1 - 2	Seat belt unfastened	Below 1 Ω

(c) Reconnect the front seat inner belt assembly (driver side) connector.

NG → **REPLACE FRONT SEAT INNER BELT ASSEMBLY (DRIVER SIDE)**

OK

5 CHECK HARNESS AND CONNECTOR (FRONT SEAT INNER BELT (DRIVER SIDE) - COMBINATION METER)



(a) Disconnect the C9 combination meter connector.
(b) Disconnect the F21 front seat inner belt assembly (driver side) connector.
(c) Measure the resistance.

Standard Resistance

Tester Connection	Specified Condition
C9-10 - F21-2	Below 1 Ω
C9-10 or F21-2 - Body ground	10 kΩ or higher

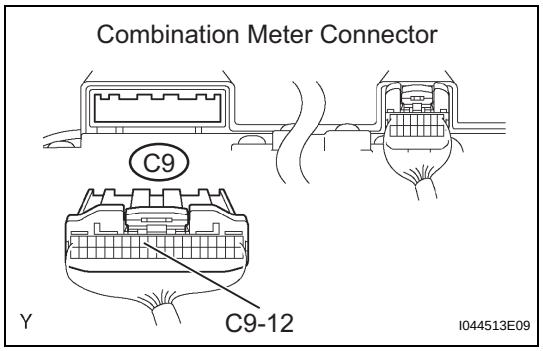
(d) Reconnect the front seat inner belt assembly (driver side) connector.
(e) Reconnect the combination meter connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE COMBINATION METER ASSEMBLY

6 INSPECT COMBINATION METER ASSEMBLY



(a) Disconnect the C9 combination meter connector.
(b) Measure the resistance.

Standard Resistance

Tester Connection	Condition	Specified Condition
C9-12 - Body ground	Driver side door closed	10 kΩ or higher
C9-12 - Body ground	Driver side door open	Below 1 Ω

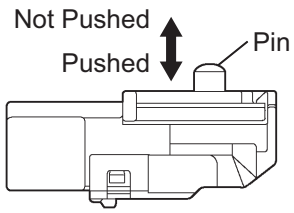
(c) Reconnect the combination meter connector.

OK → **REPLACE COMBINATION METER ASSEMBLY**

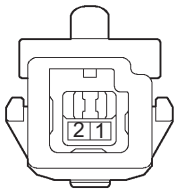
NG

7	INSPECT UNLOCK WARNING SWITCH ASSEMBLY

Component Side:



Unlock Warning Switch Assembly
(Driver Side)



Y I044492E01

(a) Remove the U1 unlock warning switch assembly.
(b) Measure the resistance.
Standard Resistance

Tester Connection	Switch Condition	Specified Condition
1 - 2	Not pushed	10 kΩ or higher
1 - 2	Pushed	Below 1 Ω

(c) Reinstall the unlock warning switch assembly.

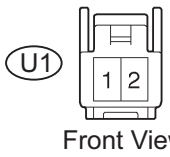
NG → **REPLACE UNLOCK WARNING SWITCH ASSEMBLY**

OK

8	CHECK HARNESS AND CONNECTOR (SWITCH (DRIVER SIDE) - J/B (BODY ECU) AND BODY GROUND)

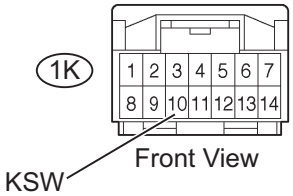
Wire Harness Side:

Unlock Warning Switch Connector
(Driver Side)



Front View

Driver Side J/B Connector



Front View

Y I044490E01

(a) Disconnect the U1 unlock warning switch assembly connector.
(b) Disconnect the 1K driver side J/B connector.
(c) Measure the resistance.
Standard Resistance

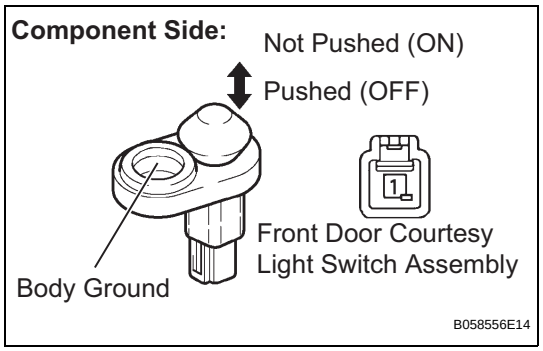
Tester Connection	Specified Condition
(U1-1) - KSW (1K-10)	Below 1 Ω
(U1-2) - Body ground	Below 1 Ω

(d) Reconnect the unlock warning switch assembly connector.
(e) Reconnect the driver side J/B connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

9	INSPECT FRONT DOOR COURTESY LIGHT SWITCH ASSEMBLY (DRIVER SIDE)



(a) Remove the front door courtesy light switch assembly.
(b) Measure the resistance.
Standard Resistance

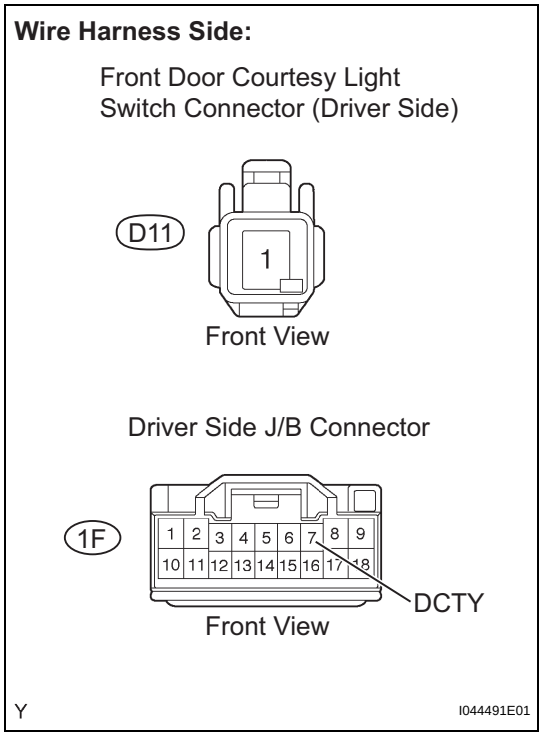
Tester Connection	Condition	Specified Condition
1 - Body ground	Not pushed (ON)	Below 1 Ω
1 - Body ground	Pushed (OFF)	10 kΩ or higher

(c) Reinstall the front door courtesy light switch assembly.

NG → **REPLACE FRONT DOOR COURTESY LIGHT SWITCH ASSEMBLY**

OK

10	CHECK HARNESS AND CONNECTOR (FRONT DOOR COURTESY LIGHT SWITCH LH - BODY ECU)



(a) Disconnect the D11 front door courtesy light switch assembly connector.
(b) Disconnect the 1F driver side J/B connector.
(c) Measure the resistance.
Standard Resistance

Tester Connection	Specified Condition
(D11-1) - DCTY (1F-7)	Below 1 Ω

(d) Reconnect the front door courtesy light switch assembly connector.
(e) Reconnect the driver side J/B connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

IDENTIFICATION OF NOISE SOURCE

1. Radio Description

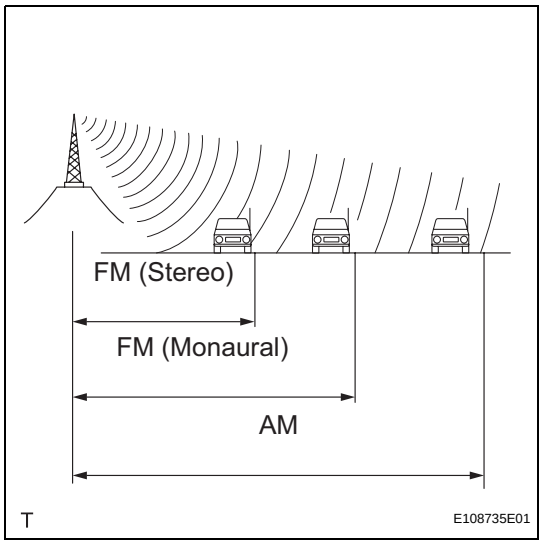
(a) Radio frequency band

(1) The radio wave bands used in radio broadcasting are as follows:

Frequency	30 kHz	300 kHz	3 MHz	30 MHz	300 MHz
Designation	LF	MF	HF	VHF	
Radio Wave		AM ⟷		FM ⟷	
Modulation		Amplitude modulation		Frequency modulation	

LF: Low frequency MF: Medium frequency HF: High frequency VHF: Very high frequency

E108734E02

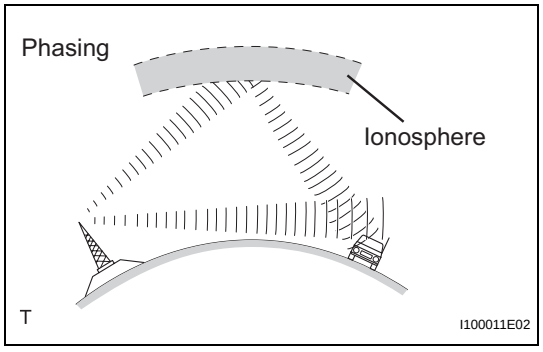


(b) Service area

(1) There is a great difference in the size of the service areas for AM and FM broadcasting. Sometimes an FM stereo broadcast cannot be received even though AM can be received very clearly.
FM stereo has a smaller service area, ant it also picks up static and other types of interference (noise) easily.

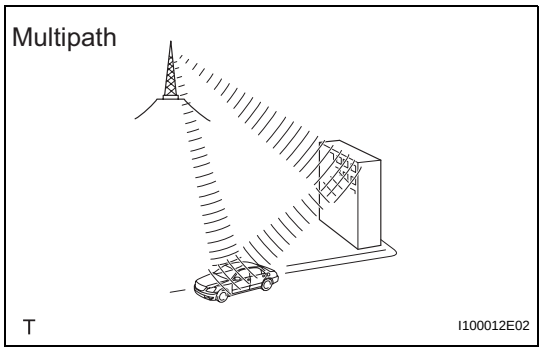
(c) Radio reception problems

HINT:
Besides the problem of static, there are other problems, such as phasing, multipath and fade-out. These problems are caused not by electrical noise but by the nature of the radio waves themselves.

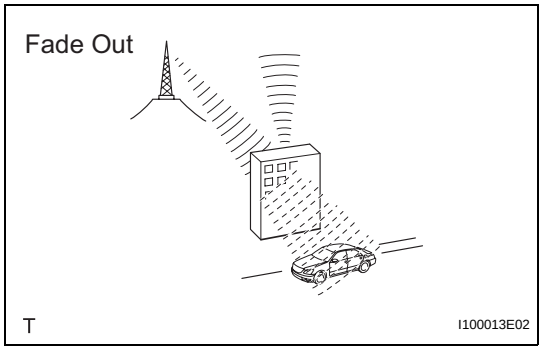


(1) Phasing

Besides electrical interference, AM broadcasts are also susceptible to other types of interference, especially at night. This is because AM radio waves bounce off the ionosphere at night. These radio waves then interfere with the signals that reach the vehicle's antenna directly from the same transmitter. This type of interference is called phasing.



(2) Multipath
Interference caused by reflection of radio waves against obstructions is called multipath. Multipath occurs when radio signals emitted from the broadcast transmitter antenna are reflected against tall buildings or mountains and interfere with other signals which are received directly.



(3) Fade-out
FM radio waves tend to be reflected against obstructions such as tall buildings or mountains because FM frequency is higher than AM. For this reason, FM signals often seem to gradually disappear or fade away as the vehicle goes behind those obstructions. This phenomenon is called fade-out.

(d) Noise problem
It is very important for technicians to clearly understand a customer's complaint about noise. Use the following table to diagnose the phenomena.

Radio Wave	Condition in Which Noise Occurs	Probable Cause
AM	Noise occurs in a specified area	Strong possibility of foreign noise
	Noise occurs when listening to faint broadcasting	The same program may be broadcasted from some local stations. If the program is the same, one of those may be tuned in.
	Noise occurs only at night	Strong possibility of an interfering beat from a distant broadcast.
FM	Noise occurs at a specific place while driving	Strong possibility of multipath noise and phasing noise caused by changes of FM frequency.

HINT:
If the condition when the noise occurs is not described above, find out the cause based on the reception problems. Refer to the description about multipath and phasing mentioned previously.

(e) Identify the conditions under which the noise occurs, and check the noise filter on the relevant part.

Conditions under Which Noise Occurs	Noise Type
Noise increases when the accelerator pedal is depressed, but stops when the engine is stopped.	Generator noise
Noise occurs during A/C or heater operation.	Blower motor noise
Noise occurs when the vehicle accelerates rapidly on an unpaved road or after the ignition switch is turned on.	Fuel pump noise
Noise occurs when the horn switch is pressed and released or when pressed and held.	Horn noise
Quiet noise occurs while the engine is running, but stops when the engine is stopped.	Ignition noise
Noise occurs synchronously with the blink of the turn signal.	Flasher noise
Noise occurs during window washer operation.	Washer noise
Noise occurs while the engine is running, and continues even after the engine is stopped.	Engine coolant temperature sensor noise

Conditions under Which Noise Occurs	Noise Type
Noise occurs during wiper operation.	Wiper noise
Noise occurs when the brake pedal is depressed.	Stop light switch noise
Others	Start electricity stored on the vehicle

Reference:

- First ensure that the noise is not coming from the outside. Failure to do so makes noise source detection difficult and may lead to a misdiagnosis.
- Noise should be removed in descending order of loudness.
- Tuning the radio so that no station is received makes the noise more noticeable, making recognition of the phenomenon easier.

PROBLEM SYMPTOMS TABLE

HINT:
Inspect the fuse and relay before confirming the suspected area as shown in the table below.

AV

Radio receiver assembly

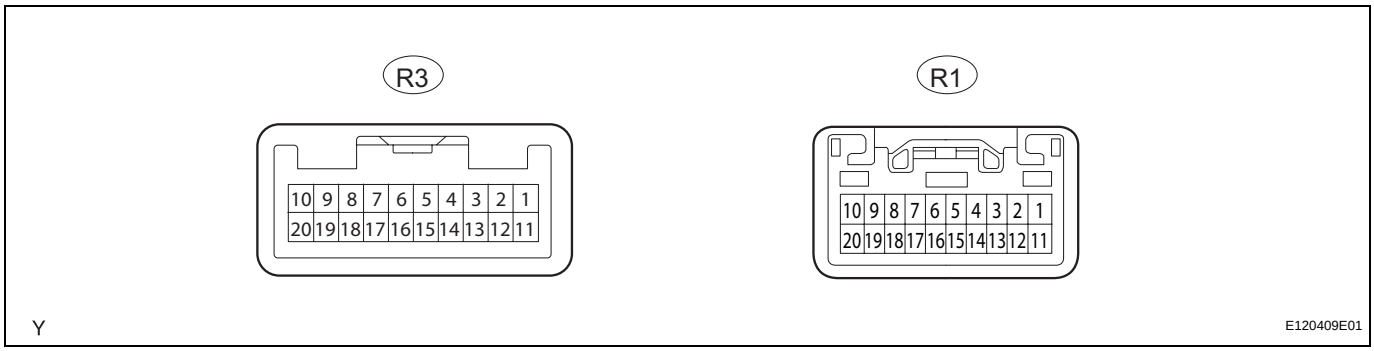
Symptom	Suspected area	See page
Pressing power switch does not start system	1. Power source circuit (radio receiver assembly)	AV-64
	2. Radio receiver assembly	AV-69
Radio receiver cannot be dimmed at night	1. Illumination circuit	AV-40
	2. Radio receiver assembly	AV-69
No sound can be heard (Separate amplifier)	1. Power source circuit (radio receiver assembly)	AV-64
	2. Power source circuit (stereo component amplifier assembly)	AV-66
	3. AMP sound signal circuit	AV-58
	4. Speaker circuit	AV-47
	5. AVC-LAN circuit	AV-62
	6. AMP mute signal circuit	AV-56
	7. Stereo component amplifier assembly	AV-90
	8. Radio receiver assembly	AV-69
No sound can be heard (Build-in amplifier)	1. Power source circuit (radio receiver assembly)	AV-64
	2. Speaker circuit	AV-47
	3. Radio receiver assembly	AV-69
Sound quality is bad in all modes (volume is too low) (Separate amplifier)	1. Power source circuit (radio receiver assembly)	AV-64
	2. Power source circuit (stereo component amplifier assembly)	AV-66
	3. Speaker circuit	AV-47
	4. AMP sound signal circuit	AV-58
	5. Sound quality is bad in all modes (volume is too low)	AV-28
Sound quality is bad in all modes (volume is too low) Built-in amplifier	1. Power source circuit (radio receiver assembly)	AV-64
	2. Speaker circuit	AV-47
	3. Sound quality is bad in all modes (volume is too low)	AV-28
Noise occurs	Noise occurs	AV-27
Radio broadcast cannot be received (bad reception)	Radio broadcast cannot be received (bad reception)	AV-35
CD cannot be inserted or is ejected immediately after insertion	1. Power source circuit (radio receiver assembly)	AV-64
	2. CD cannot be inserted or is ejected immediately after insertion	AV-31
CD cannot be eject	1. Power source circuit (radio receiver assembly)	AV-64
	2. CD cannot be ejected	AV-30
Sound quality is bad only when playing CD (volume is too low)	Sound quality is bad only when playing CD (volume is too low)	AV-29
CD sound skips	CD sound skips	AV-33

Steering pad switch

Symptom	Suspected area	See page
Audio system cannot be operated with steering pad switch	1. Steering pad switch circuit	AV-37
	2. Radio receiver assembly	AV-69

TERMINALS OF ECU

1. RADIO RECEIVER ASSEMBLY (SEPARATE AMPLIFIER)



Symbols (Terminal No.)	Wiring Color	Terminal Description	Condition	Specification
SWG (R3-6) - Body ground	W-R - Body ground	Steering pad switch ground	Always	Below 1 Ω
SW1 (R3-7) - GND (R1-20)	V-W - BR	Steering pad switch signal	Steering pad switch not operating	4 V or more
			Seek+ switch pushed	Approx. 0.5 V
			Seek- switch pushed	Approx. 0.9 V
			VOL+ switch pushed	Approx. 2.0 V
			VOL- switch pushed	Approx. 3.4 V
SW2 (R3-8) - GND (R1-20)	Y-B - BR	Steering pad switch signal	Steering pad switch not operating	4 V or more
			MODE switch pushed	Below 2.5 V
B (R1-1) - GND (R1-20)	L-Y - BR	Battery	Always	10 to 14 V
TX+ (R1-5) - GND (R1-20)	O - BR	AVC-LAN communication signal	Ignition switch ACC	2 to 3 V
MUTE (R1-7) - GND (R1-20)	V - BR	Mute signal	Audio system is playing	Above 3.5 V
			Audio system is playing	Below 1 V
R+ (R1-8) - GND (R1-20)	B - BR	Sound signal (Right)	Audio system is playing	Waveform synchronized with sounds is output.
L+ (R1-9) - GND (R1-20)	R - BR	Sound signal (Left)	Audio system is playing	Waveform synchronized with sounds is output.
SGND (R1-10) - Body ground	Shielded - Body ground	Shielded ground	Always	Below 1 Ω
ACC (R1-11) - GND (R1-20)	GR - BR	Accessory (ON)	Ignition switch OFF	Below 1 V
			Ignition switch ON	10 to 14 V
TX- (R1-15) - GND (R1-20)	R-W - BR	AVC-LAN communication signal	Ignition switch ACC	2 to 3 V
R- (R1-18) - GND (R1-20)	W - BR	Sound signal (Right)	Audio system is playing	Waveform synchronized with sounds is output
L- (R1-19) - GND (R1-20)	G - BR	Sound signal (Left)	Audio system is playing	Waveform synchronized with sounds is output
GND (R1-20) - Body ground	BR - Body ground	Ground	Always	Below 1 Ω

2. RADIO RECEIVER ASSEMBLY (BUILT-IN AMPLIFIER)

			Ignition switch ON	10 to 14 V

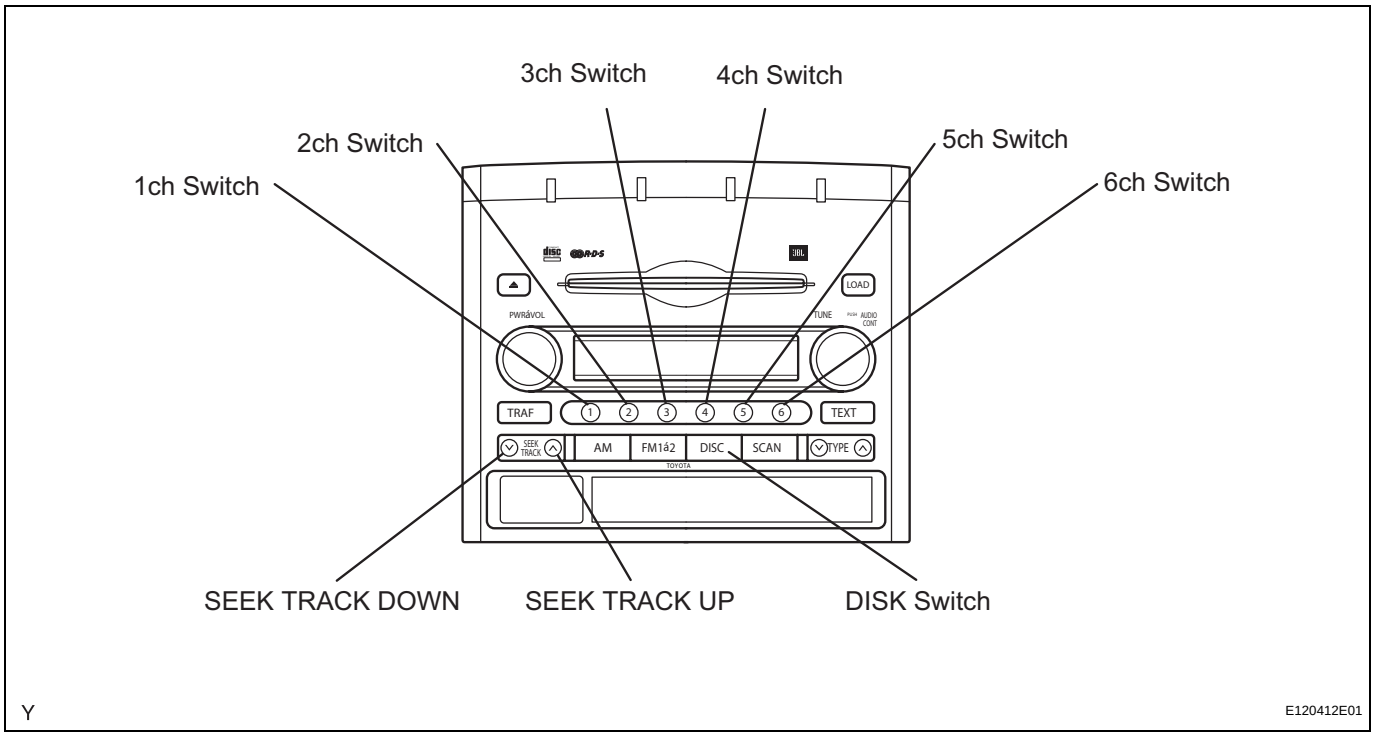
DTC CHECK / CLEAR

1. DIAGNOSTIC CHECK



(a) Start diagnostic mode (All elements come on during SW check mode).
  (1) Turn off the audio system and turn the ignition switch to the ACC position. While pressing the preset switches 1ch and 6ch at the same time, press the DISC switch 3 times.
  (2) Reference:
    - When the system enters diagnostic mode, a beep sound is emitted 3 times and all the elements come on during SW check mode.
    - It takes approximately 40 seconds to complete the check.
    - Turn on all the elements in the LCD.
    - When pressing the switch, confirm that a beep sound is emitted.

(b) Service check screen.
  (1) Press the SEEK TRACK UP switch to enter the service check screen.
  (2) In service check mode, the system check and the diagnostic memory check are performed, and the check results are displayed by component codes in ascending order (physical address).

Terms	Description
Component code (Physical address)	Three-digit code (in hexadecimal) given to each device comprising AVC-LAN. Corresponding to its function, individual symbol provided.
Logical address	Two-digit code (in hexadecimal) given to each function and device unit in each device comprising AVC-LAN.

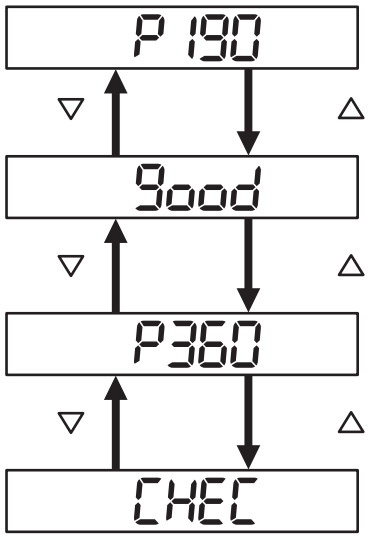
AV

Code No. (physical address) List

Code No. physical address	Equipment Name
190	Radio receiver assembly (Audio head unit)
440	Stereo component amplifier assembly

(c) Finish diagnostic mode.
  (1) Press the DISC switch for 2 seconds or more, or turn the ignition switch off.

(d) Service check mode result display (for checking the current and the past system conditions).
  (1) Press the SEEK TRACK UP/DOWN switch to see the check result of each component.



P: indicates physical address

190: physical address

good: indicates that component is normal.

P: indicates physical address

360: physical address

CHEC: indicates that check is needed

△ : SEEK TRACK UP

▽ : SEEK TRACK DOWN

The illustration shows the case that the system has 2 components with the codes 190 and 360,and that one of them (code360) requires a check.
The check result is displayed by a component code in ascending order.The component device code is displayed first, and then the check result follows.

P

E120413E01

The illustration shows the case that the system has 2 components with the codes 190 and 360, and that one of them (code 360) requires a check.
The check result is displayed by a component code in ascending order. The component device code is displayed first, and then the check result follows.

(2) Check the result display.

Display	Original Language	Description	Action to be Taken
good	Good (normal)	No DTCs are detected in either system check mode nor diagnostic memory mode.	-
NCON	No connection	The system recognized the component when it was registered, but the component gives no response to the diagnostic mode ON request.	Check the power source circuit and the communication circuit of the component indicated by the component code (physical address).
ECHN	Exchange	One or more DTCs for Exchange are detected in either system check mode or diagnostic memory mode.	Go to detailed information mode to check the trouble area, referring to the DTC list.
CHEC	Check	When no DTCs are detected for Exchange, one or more DTCs for Check are detected in either system check mode or diagnostic memory mode.	Go to detailed information mode to check the trouble area, referring to the DTC list.
OLD	Old version	Old DTC application is identified and DTC is detected in either system check mode or diagnostic memory mode.	-
NRES	No response	The device gives no response to any one of system check mode ON request, system check result request or diagnostic memory request.	Check the power source circuit and the communication circuit of the component indicated by the component code (physical address).

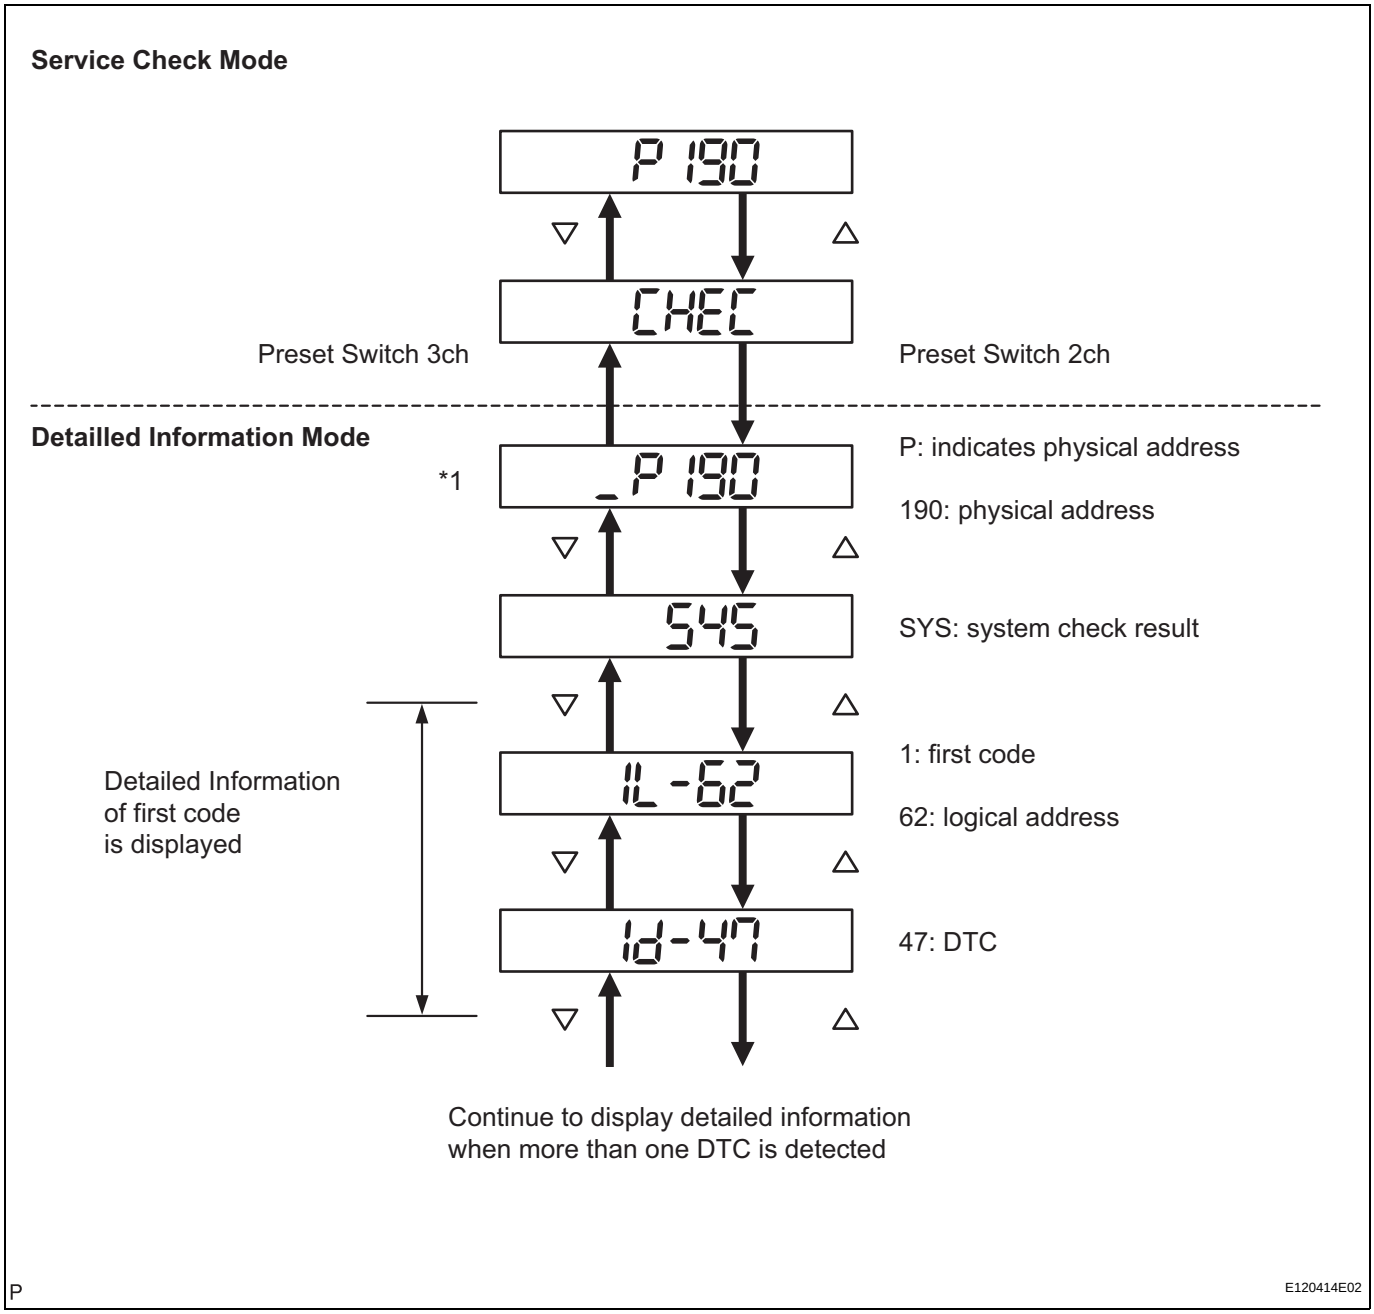
(3) To perform the service check again, press the preset switch 1 ch.

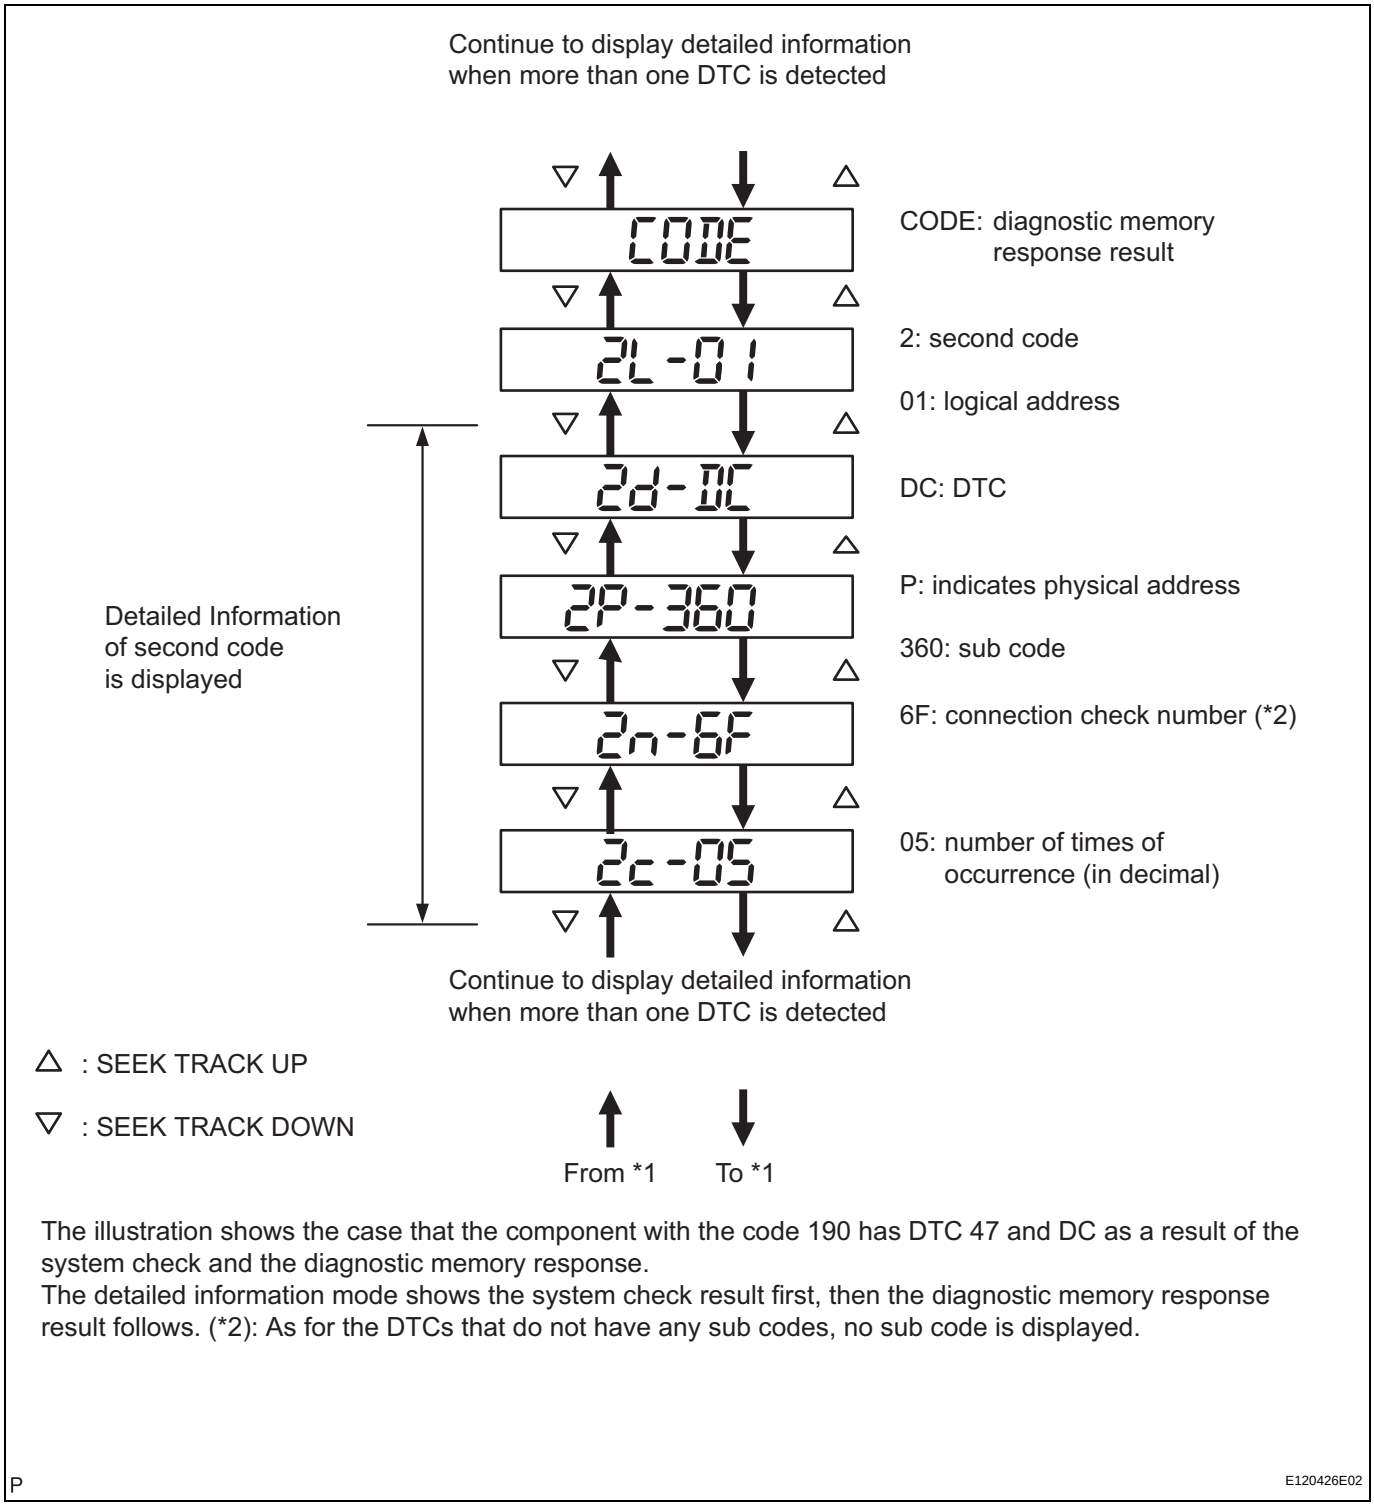
(e) Detailed information mode (when displaying the DTC for a troubled component)

(1) With CHEC or ECHN being displayed, press the preset switch 2ch to go to detailed information mode.

(2) Press the SEEK TRACK UP/DOWN switch to display the system check result (SYS) and diagnostic memory response (CODE).

AV





The illustration shows the case that the component with the code 190 has DTC 47 and DC as a result of the system check and the diagnostic memory response.
The detailed information mode shows the system check result first, then the diagnostic memory response result follows. (*2): As for the DTCs that do not have any sub codes, no sub code is displayed.

P

E120426E02

The illustration shows the case that the component with the code 190 has DTC 47 and DC as a result of the system check and the diagnostic memory response.
The detailed information mode shows the system check result first, then the diagnostic memory response result follows. (*2): As for the DTCs that do not have any sub codes, no sub code is displayed.

(3) Displayed items in detailed information mode

Division Code for DTC display	Description	The order of detailed information displayed when the TUNE UP switch is pressed. (The order is reversed when the TUNE DOWN switch is pressed.)
SYS	System check result is displayed.	Logical address → DTC
CODE	Diagnostic memory check result is displayed.	Logical address → DTC → Sub code → Connection confirmation number → The number of times of occurrence

(4) Check the trouble area referring to the DTC list.
(5) To return to the service check mode, press the preset switch 3ch.

2. DTC CLEAR

(a) Clearing an individual DTC memory (when clearing the memory of the DTC detected in the past individually)
(1) Press the preset switch 5ch for 2 seconds or more while ECHN is displayed in service check mode or detailed information mode.
HINT:
- A beep sound is emitted once when the DTC memory is completely cleared.
- When the DTC memory is cleared, only the component code (physical address) is displayed for the target component.
- To check DTCs, press the preset switch 1ch and perform the service check again.

(b) Clearing all the DTC memories (when clearing all the memories of DTCs detected in the past)
(1) Start diagnostic mode after repairing the trouble area.
(2) Press the preset switch 5ch for 2 seconds or more (CLR is displayed at this time).
HINT:
- A beep sound is emitted once when the DTC memories are completely cleared.
- When the DTC memories for all the components are cleared, only the component codes (physical address) are displayed.

(3) Press the preset switch 1ch to perform the service check again, and check that no DTCs are displayed for any component codes (physical address).

(c) Finish diagnostic mode
(1) Press DISC for 2 seconds or more, or turn the ignition switch off.

Noise Occurs

1	CHECK SPEAKER INSTALLATION

(a) Check the speaker installation condition.
  (1) Check that each speaker is securely installed.
    OK:
      The malfunction disappears.

HINT:
The radio is equipped with a noise prevention system that blocks excessively loud noise. If such noise occurs, check that all wiring is proper and that the antenna installation part ground and noise-prevention equipment are installed.

Conditions under Which Noise Occurs	Noise Type
Noise increases when accelerator pedal is depressed, but stops when engine is stopped.	Generator noise
Noise occurs during A/C or heater operation.	Blower motor noise
Noise occurs when vehicle accelerates rapidly on unpaved road or after ignition switch is turned on.	Fuel pump noise
Noise occurs when horn switch is pressed and released or when pressed and held.	Horn noise
Quiet noise occurs while engine is running, but stops when engine is stopped.	Ignition noise
Noise occurs synchronously with blink of turn signal.	Flasher noise
Noise occurs during window washer operation.	Washer noise
Noise occurs while engine is running, and continues even after engine is stopped.	Water temperature sensor noise
Noise occurs during wiper operation.	Wiper noise
Noise occurs when brake pedal is depressed.	Stop light switch noise
Others	Static electricity stored on vehicle

HINT:
- Identify the conditions under which the noise occurs, and check the noise filter on the relevant part.
- First ensure that the noise is not coming from outside. Failure to do so makes noise source detection difficult and may lead to a misdiagnosis.
- Noise should be removed in descending order of loudness.

NG → **INSTALL SPEAKER PROPERLY**

OK

IDENTIFY NOISE SOURCE

Sound Quality is Bad in All Modes

1	**ADJUST SOUND QUALITY**

AV

(a) Adjust the sound quality.
(1) Operate the radio receiver assembly to adjust the sound quality.
OK:
Malfunction disappears.

OK → **SYSTEM IS OK**

NG

2	**REPLACE STEREO COMPONENT AMPLIFIER ASSEMBLY**

(a) Replace the stereo component amplifier assembly and recheck.
OK:
The malfunction disappears.

NG → **REPLACE RADIO RECEIVER ASSEMBLY**

OK

SYSTEM IS OK

Sound Quality is Bad Only when CD is Played (Volume is Too Low)

1	OPERATION USING ANOTHER CD

(a) Replace the CD with another one and recheck.
  (1) Check the installation of the radio receiver assembly.
  OK:
  The malfunction disappears.

NG → **REPLACE RADIO RECEIVER ASSEMBLY**

OK

CD IS FAULTY

CD cannot be Ejected

AV

1	CHECK OPERATION

(a) Press EJECT and check operation.
(1) Press the CD EJECT switch of the radio receiver assembly for 2 seconds or more to see if the CD is ejected.
OK:
The CD is ejected.

HINT:
If the CD is not ejected, bring the vehicle in for repair.
Do not attempt to remove the CD by force.

NG → **REPLACE RADIO RECEIVER ASSEMBLY**

OK

2	OPERATION USING ANOTHER CD

(a) Replace the CD with another and recheck.
(1) Replace the CD with another normal one to see whether the same trouble occurs again.
OK:
The malfunction disappears.

NG → **REPLACE RADIO RECEIVER ASSEMBLY**

OK

CD IS FAULTY

CD cannot be Inserted or is Ejected Right After Insertion

1	CHECK CD

(a) Check whether a normal CD is inserted.
  (1) Make sure that the CD is a normal audio CD, and that there is no deformation, flaw, stain, burr or other defect on the CD.
  OK:
  A normal audio CD is inserted.

HINT:
- Translucent or oddly-shaped CDs cannot be played.
- Computer CD-ROMs (even those with music) and CD-R discs cannot be played.
- Playing an 8 cm CD does not require an adapter.

NG → **CD IS FAULTY**

OK

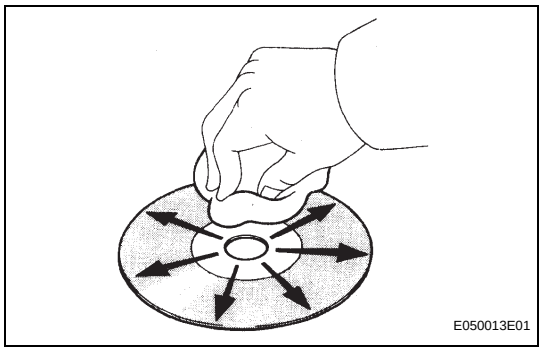
2	CHECK WHETHER CD IS INSERTED PROPERLY

(a) Check whether the CD is inserted properly.
  (1) Check whether or not the CD is inserted upside down.
  OK:
  Not upside down.

NG → **INSERT CD PROPERLY**

OK

3	CLEAN CD



(a) Clean the disc.
  (1) If the disc gets dirty, clean the disc by wiping the surface from the center to the outside, in a radial direction, with a soft cloth as shown in the illustration.
  OK:
  The malfunction disappears.

NOTICE:
Do not use a conventional record cleaner or anti-static preservative.
OK:
Not upside down.

OK → **CD WAS DIRTY**

NG

4	OPERATION USING ANOTHER CD

(a) Replace the CD with another and recheck.
(1) Replace the CD with another normal one to see whether the same trouble occurs again.
OK:
The malfunction disappears.

NG → **REPLACE RADIO RECEIVER ASSEMBLY**

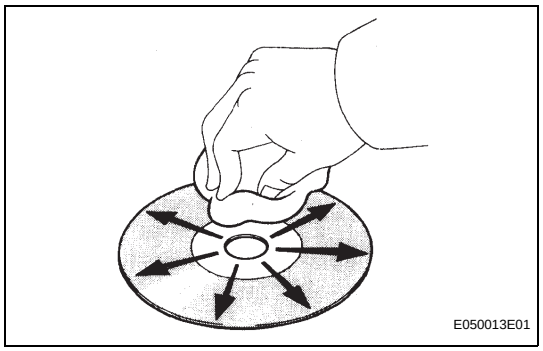
OK

CD IS FAULTY

CD Sound Skips

HINT:
The sound may skip when driving on an unpaved road.

1	CLEAN CD



(a) Clean the disc.
(1) If the disc gets dirty, clean the disc by wiping the surface from the center to the outside, in a radial direction, with a soft cloth as shown in the illustration.
NOTICE:
Do not use a conventional record cleaner or anti-static preservative.
OK:
The malfunction disappears.

NG → **CD WAS DIRTY**

OK

2	OPERATION USING ANOTHER CD

(a) Replace the CD with another and recheck.
(1) Replace the CD with another normal one to see whether the same trouble occurs again.
OK:
The malfunction disappears.

NG → **CD IS FAULTY**

OK

3	CHECK RADIO RECEIVER INSTALLATION

(a) Check the radio receiver assembly installation condition.
(1) Check that the radio receiver assembly is installed properly.
OK:
Installed properly.

NG → **INSTALL RADIO RECEIVER PROPERLY**

OK

4	CHECK WHETHER RAPID TEMPERATURE CHANGE OCCURRED IN CABIN

(a) Check whether or not a rapid temperature change occurred in the cabin.
OK:
A rapid temperature change occurred.

HINT:
A rapid temperature change creates condensation inside the CD player, which may prevent CDs from being played.

NG → **REPLACE RADIO RECEIVER ASSEMBLY**

AV

OK

CONDENSATION DUE TO TEMPERATURE CHANGE (LET IT SIT FOR A WHILE BEFORE USING)

Radio Broadcast cannot be Received (Bad Reception)

1	CHECK WHETHER RADIO AUTO-SEARCH FUNCTIONS PROPERLY

(a) Check whether the radio auto-search functions properly.
  (1) Perform the auto-search of the radio and check that it functions normally.
  OK:
  The radio auto-search functions properly.

OK → **REPLACE RADIO RECEIVER ASSEMBLY**

NG

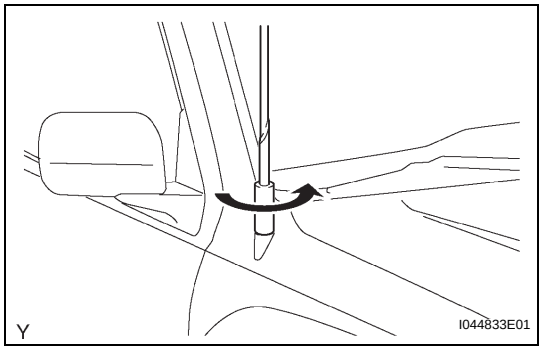
2	CHECK OPTIONAL COMPONENTS

(a) Check the optional component (sun shade film, telephone antenna, etc.).
  (1) Check whether or not any optional component, such as the sunshade film and the telephone antenna, is installed.
  OK:
  An optional component is installed.

OK → **EFFECT FROM OPTIONAL COMPONENTS**

NG

3	CHECK ANTENNA FOR NOISE PRODUCTION



(a) Check for noise with the antenna.
  (1) Remove the pull top antenna pole sub-assembly by turning it in the direction of the arrow as shown in the illustration.
  (2) With the ignition switch ON (ACC), turn on the radio and choose the AM mode.

  (3) Place the tip of a screwdriver on the antenna of the antenna assembly, and check that noise is heard from the speaker. Noise occurs.
  OK:
  Noise occurs.

OK → **REPLACE PULL TOP ANTENNA POLE SUB-ASSEMBLY**

NG

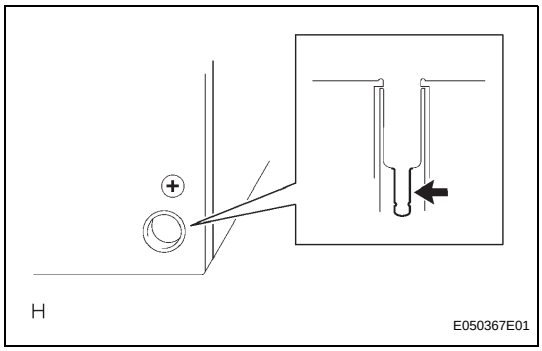
4	INSPECT RADIO RECEIVER ASSEMBLY (ANTENNA)

AV

(a) Prepare for the check.
  (1) Remove the antenna plug of the radio receiver assembly.
(b) Check for noise.
  (1) With the radio receiver assembly connector connected, turn the ignition switch to ACC.
  (2) Turn on the radio and choose the AM mode.
  (3) Place a flat-head screwdriver or metal such as a thin wire on the antenna jack of the radio receiver assembly and check that noise is heard from the speaker.

OK:

Noise occurs.



NG → **REPLACE RADIO RECEIVER ASSEMBLY**

OK

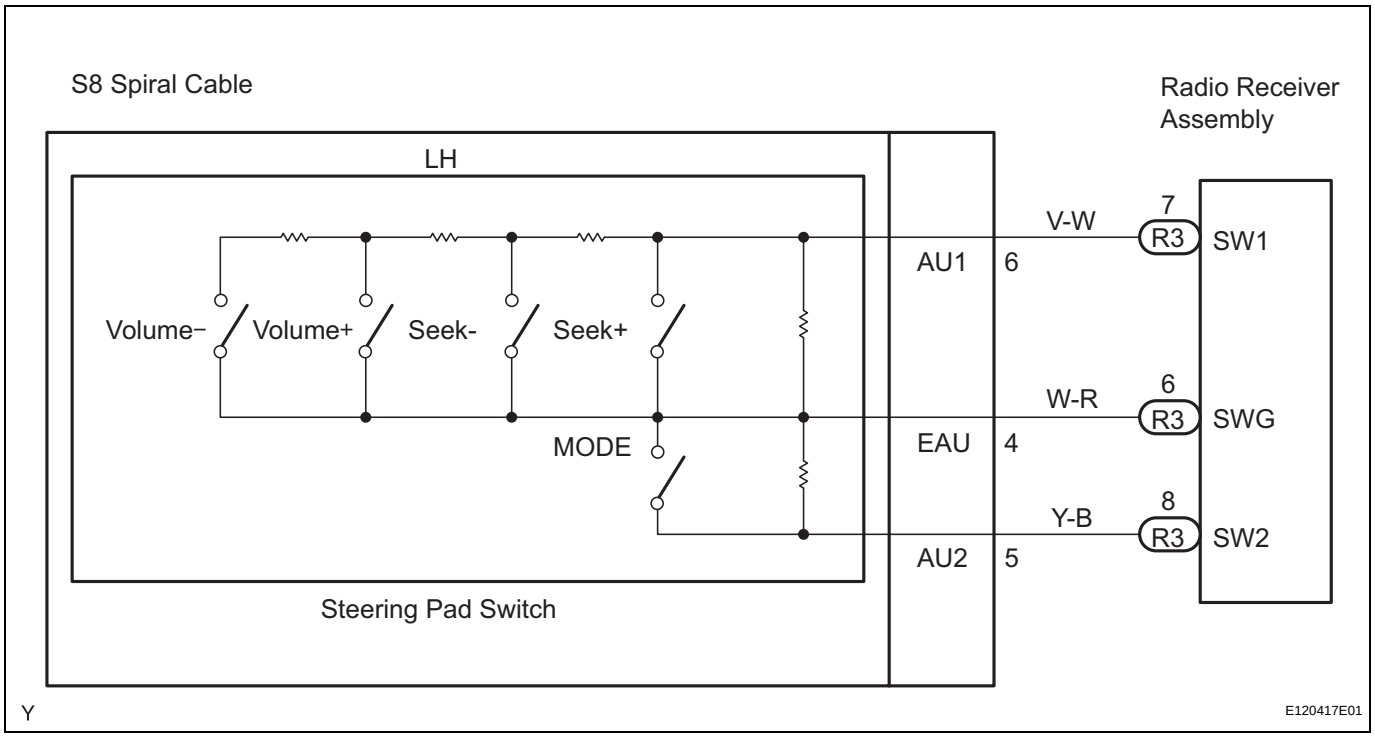
REPLACE ANTENNA CORD SUB-ASSEMBLY

Steering Pad Switch Circuit

DESCRIPTION

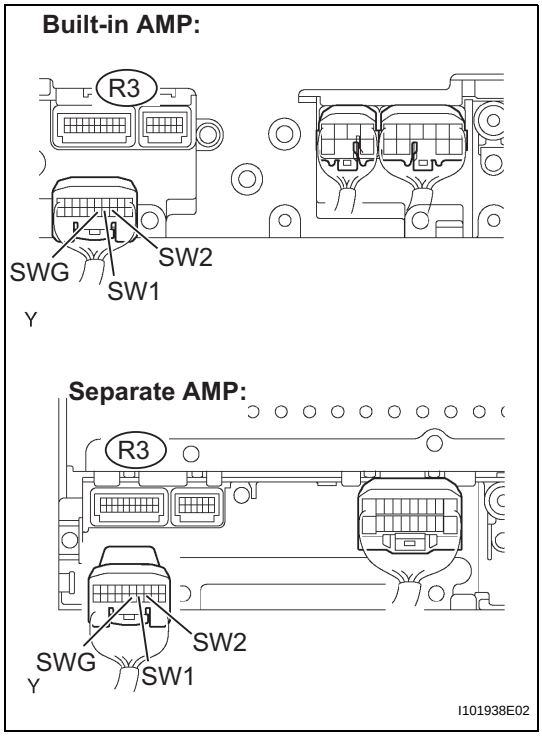
This circuit sends an operation signal from the steering pad switch to the radio receiver assembly.
If there is an open in the circuit, the audio system cannot be operated by the steering pad switch.
If there is a short in the circuit, the same condition as that when the switch is continuously depressed occurs.
Therefore, the radio receiver assembly cannot be operated by the steering pad switch, and also the radio receiver assembly itself does not function.

WIRING DIAGRAM



AV

1 INSPECT RADIO RECEIVER ASSEMBLY



(a) Disconnect the R3 radio receiver assembly connector.
(b) Measure the resistance.

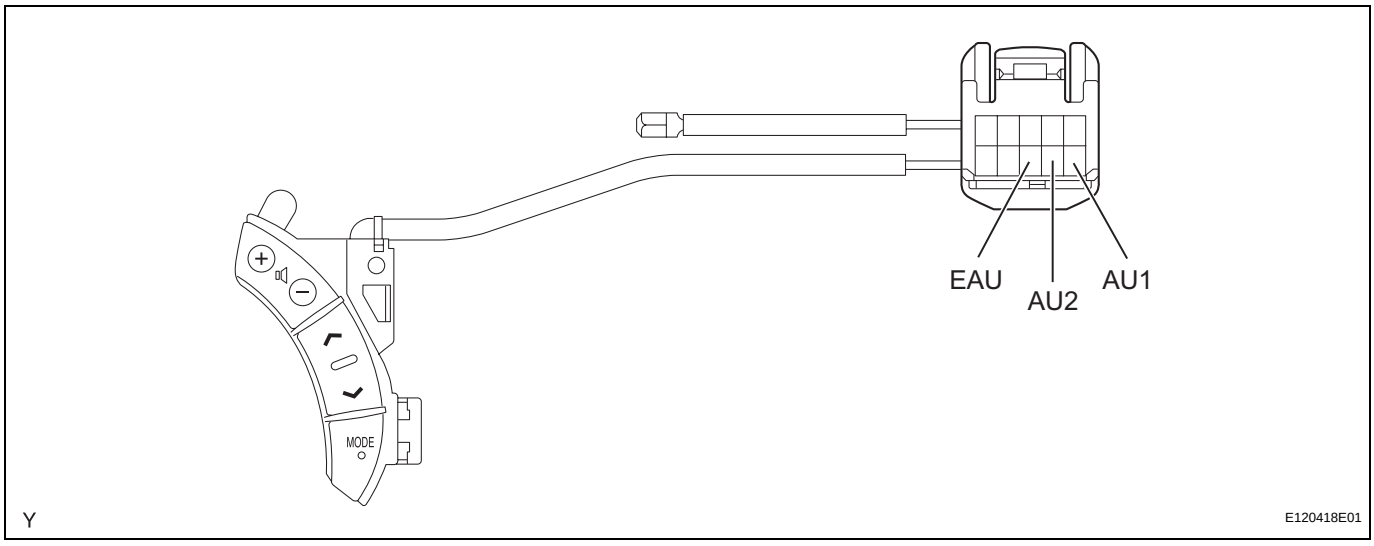
Standard

Tester Connection	Condition	Specified Condition
SW1 (R3-7) - SWG (R3-6)	No switch is pushed	Approx. 100 kΩ
SW1 (R3-7) - SWG (R3-6)	SEEK+ switch is pushed	Approx. 0 Ω
SW1 (R3-7) - SWG (R3-6)	SEEK- switch is pushed	Approx. 0.3 kΩ
SW1 (R3-7) - SWG (R3-6)	VOL+ switch is pushed	Approx. 1 kΩ
SW1 (R3-7) - SWG (R3-6)	VOL- switch is pushed	Approx. 3.1 kΩ
SW2 (R3-8) - SWG (R3-6)	No switch is pushed	Approx. 100 kΩ
SW2 (R3-8) - SWG (R3-6)	MODE switch is pushed	Approx. 0 Ω

OK → **PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE**

NG

2 INSPECT STEERING PAD SWITCH LH (AU1, AU2, EAU)



(a) Disconnect the steering pad switch LH connector.
(b) Measure the resistance.

Standard

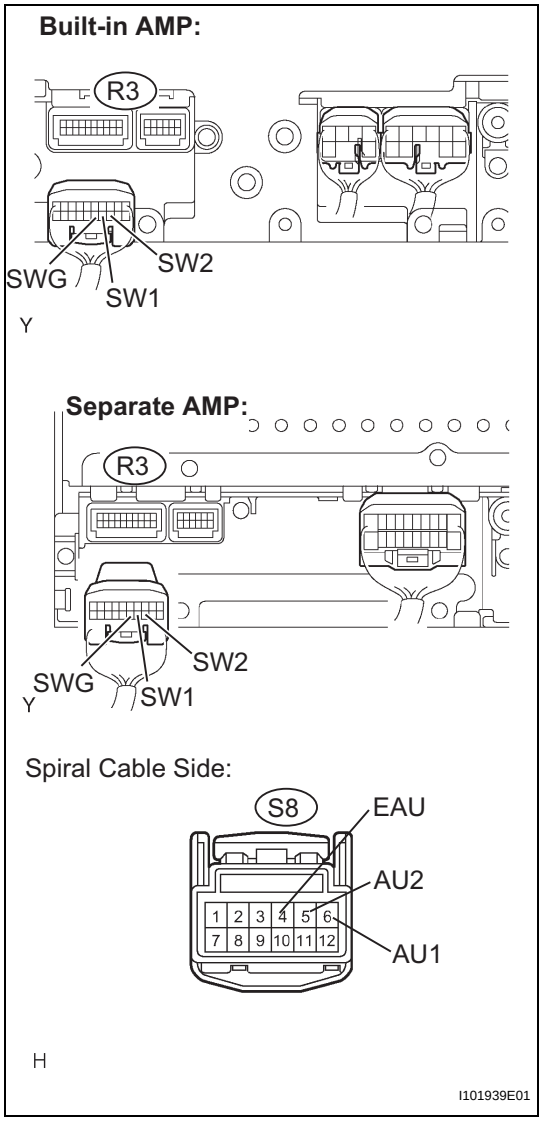
Tester Connection	Condition	Specified Condition
AU1 - EAU	No switch is pushed	Approx. 100 kΩ
AU1 - EAU	SEEK+ switch is pushed	Approx. 0 Ω
AU1 - EAU	SEEK- switch is pushed	Approx. 0.3 kΩ

Tester Connection	Condition	Specified Condition
AU1 - EAU	VOL+ switch is pushed	Approx. 1 kΩ
AU1 - EAU	VOL- switch is pushed	Approx. 3.1 kΩ
AU2 - EAU	No switch is pushed	Approx. 100 kΩ
AU2 - EAU	MODE switch is pushed	Approx. 0 Ω

NG → **REPLACE STEERING PAD SWITCH LH**

OK

3 CHECK HARNESS AND CONNECTOR (SPIRAL CABLE SUB-ASSEMBLY - RADIO RECEIVER ASSEMBLY)



(a) Disconnect the S8 spiral cable sub-assembly connector.
(b) Disconnect the R3 radio receiver assembly connector.
(c) Check the resistance.

Standard

Tester Connection	Specified Condition
SW1 (R3-7) - AU1 (S8-6)	Below 1Ω
SW2 (R3-8) - AU2 (S8-5)	Below 1Ω
SWG (R3-6) - EAU (S8-4)	Below 1Ω
SW1 (R3-7) - Body ground	10 kΩ or higher
SW2 (R3-8) - Body ground	10 kΩ or higher
SWG (R3-6) - Body ground	10 kΩ or higher

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

REPLACE SPIRAL CABLE SUB-ASSEMBLY

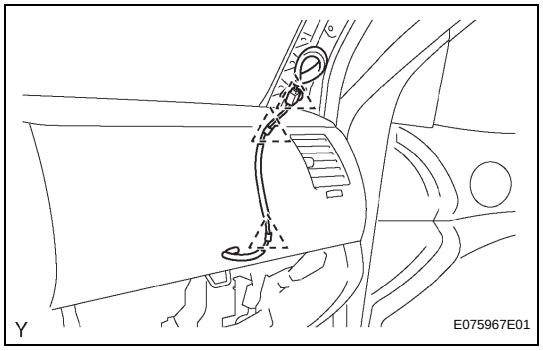
INSTALLATION

1. INSTALL WITH HOLDER ANTENNA ASSEMBLY

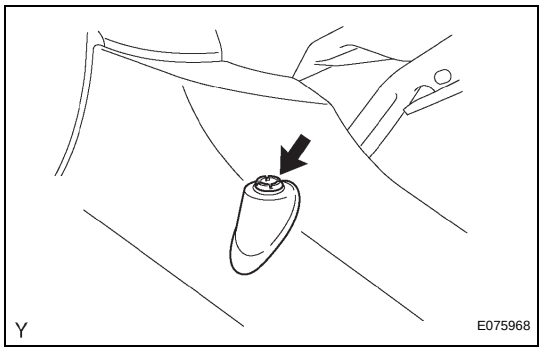
(a) Tie the string inside the pillar to the new antenna assembly (with holder).

(b) Using the string, fit the antenna assembly (with holder) into the pillar.

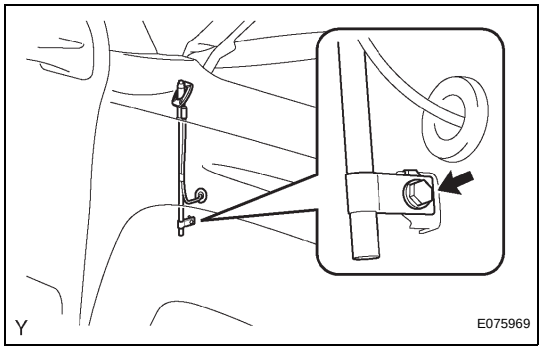
(c) Connect the connector and install the 3 clamps.



(d) Install the antenna ornament with the nut.



(e) Install the with holder antenna assembly with the bolt.



2. INSTALL PULL TOP ANTENNA POLE SUB - ASSEMBLY (See page AV-102)

3. INSTALL FRONT PILLAR GARNISH RH (See page IR-28)

4. INSTALL ASSIST GRIP SUB-ASSEMBLY (See page IR-23)

5. INSTALL INSTRUMENT PANEL LOWER FINISH PANEL SUB-ASSEMBLY RH (See page IP-20)

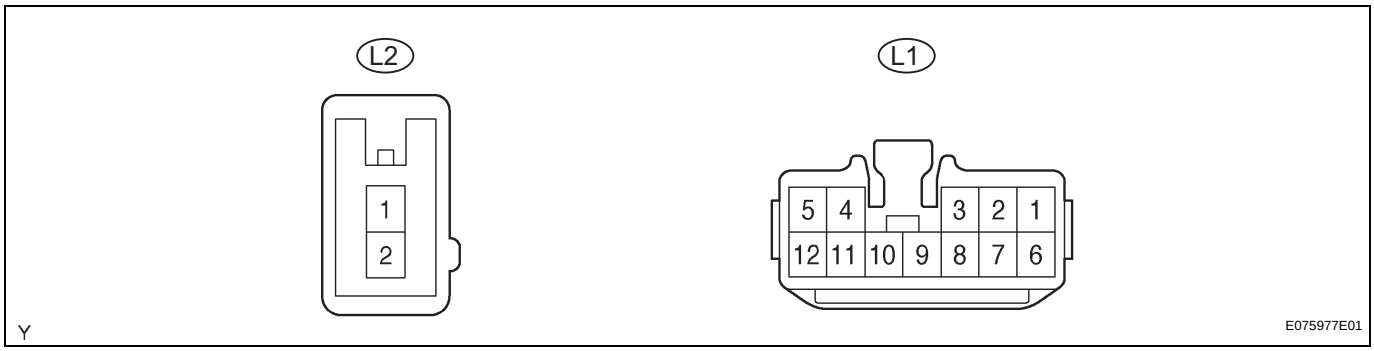
6. INSTALL GLOVE COMPARTMENT DOOR ASSEMBLY (See page IP-20)

7. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

AV

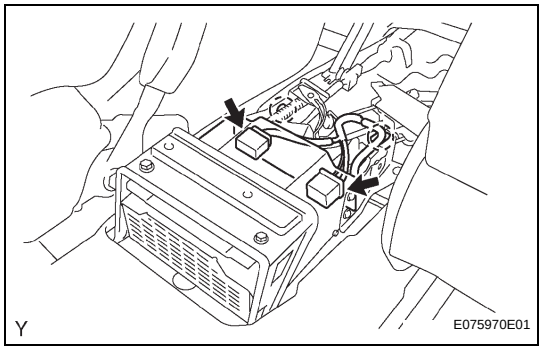
INSPECTION

1. INSPECT VOLTAGE INVERTER ASSEMBLY



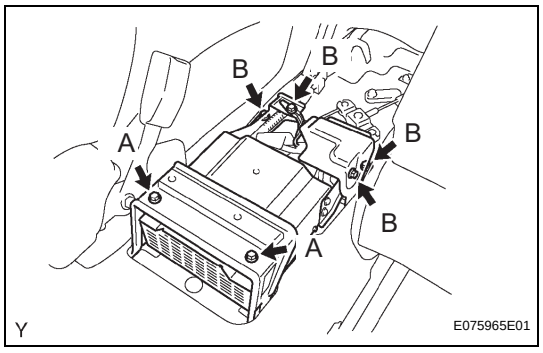
Tester Connection	Condition	Specified Condition
+B(L2-2)-PGND(L2-1)	IG switch ON	10 to 14V
AC1(L1-5)-PGND(L2-1)	IG switch ON, main switch ON	Pulse generation
P/T(L1-1)-Body Ground	Always	Below 1 Ω
AC2(L1-11)-PGND(L2-1)	IG switch ON, main switch ON	Pulse generation

INSTALLATION



1. INSTALL VOLTAGE INVERTER ASSEMBLY

(a) Connect the 2 connectors and install the 2 wire harness clamps.



(b) Install the 6 bolts.

Torque: 7.5 N*m (76 kgf*cm, 66 in.*lbf) for bolt A

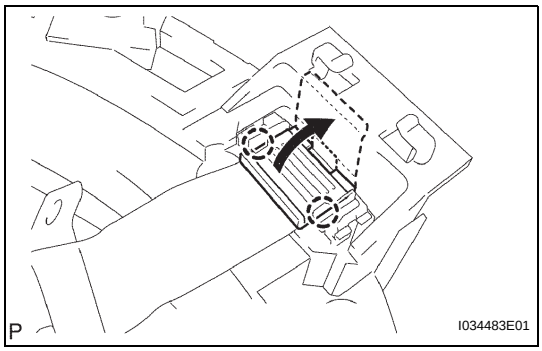
Torque: 15 N*m (153 kgf*cm, 11 ft.*lbf) for bolt B

2. INSTALL REAR CONSOLE BOX ASSEMBLY (See page IP-24)

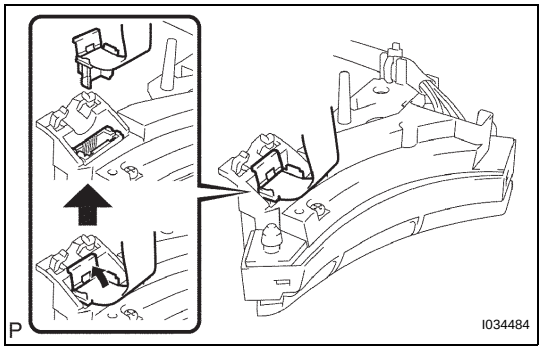
3. INSTALL CONSOLE UPPER REAR PANEL SUB-ASSEMBLY (See page IP-25)

4. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)



(e) Disengage the 2 claws and open the latch on the top of the connector as shown in the illustration.

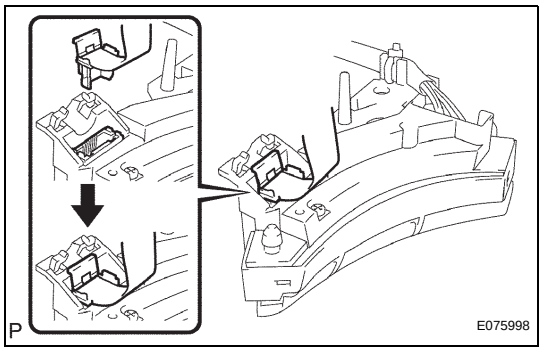


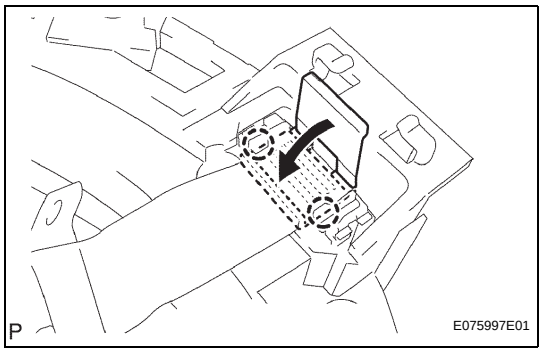
(f) Pull out the connector while pinching the latch with fingers and disconnect the steering pad switch cable from the steering pad switch LH.

INSTALLATION

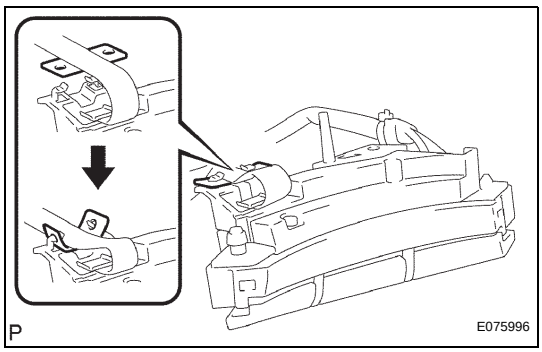
1. INSTALL STEERING PAD SWITCH LH

(a) Install the steering pad switch cable onto the steering pad switch LH while holding the connector cover.

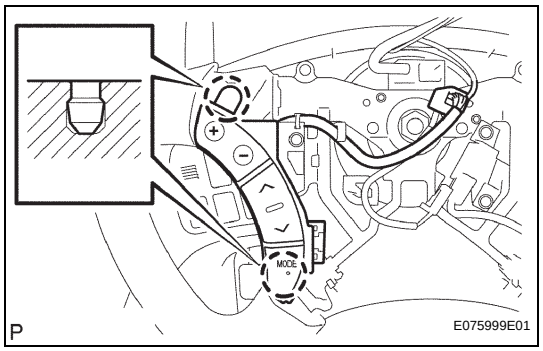




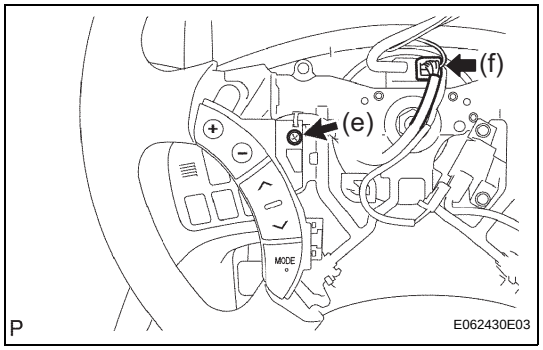
(b) Hold the connector cover down to engage the 2claws as shown in the illustration.



(c) Install the tab of the steering pad switch cable onto the steering pad switch LH as shown in the illustration.



(d) Engage the 2 pins and install the steering pad switch LH.



(e) Install the screw.
(f) Connect the connector.

2. **INSTALL HORN BUTTON ASSEMBLY (See page RS-558)**
3. **INSTALL NO. 3 LOWER STEERING WHEEL COVER (See page SR-18)**
4. **INSTALL NO. 2 LOWER STEERING WHEEL COVER (See page SR-18)**
5. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
   Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
6. **INSPECT HORN BUTTON ASSEMBLY (See page RS-557)**
7. **INSPECT SRS WARNING LIGHT (See page SR-18)**

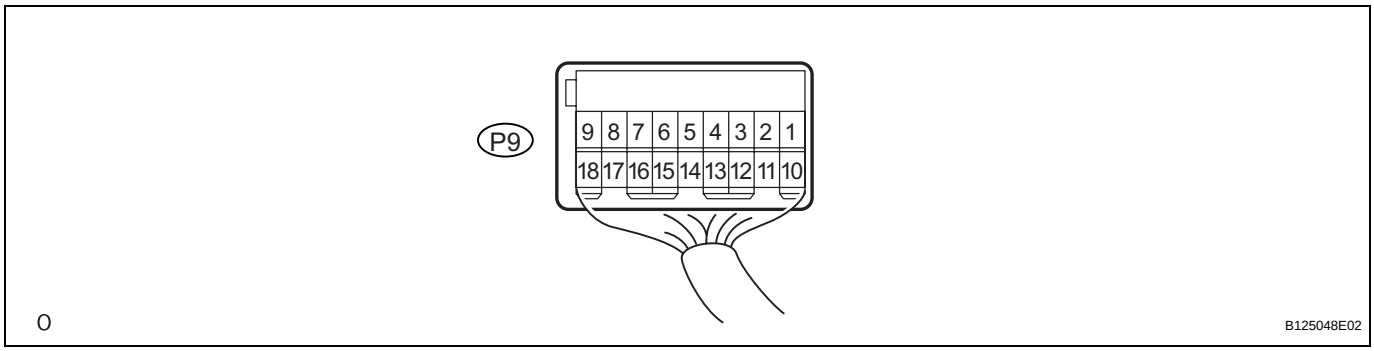
TERMINALS OF ECU

1. CHECK POWER WINDOW REGULATOR MASTER SWITCH (FOR DOUBLE CAB):



(a) Disconnect the P9 power window regulator master switch connector.
(b) Measure the voltage and resistance of each of the wire harness side connector terminals.

Standard:

Symbol (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
E (P9-1) - Body ground	W-B - Body ground	Ground	Always	Below 1 Ω
B (P9-7) - E (P9-1)	R - W-B	Regulator motor power supply	Always	10 to 14 V
B (P9-7) - E (P9-1)	R - W-B	Master switch power supply	Ignition switch OFF	0 V
B (P9-7) - E (P9-1)	R - W-B	Master switch power supply	ignition switch ON	10 to 14 V
DU (P9-4) - DD (P9-9)	L - L-B	•Power window motor UP output •Power window motor DOWN output	Always	Below 1 Ω

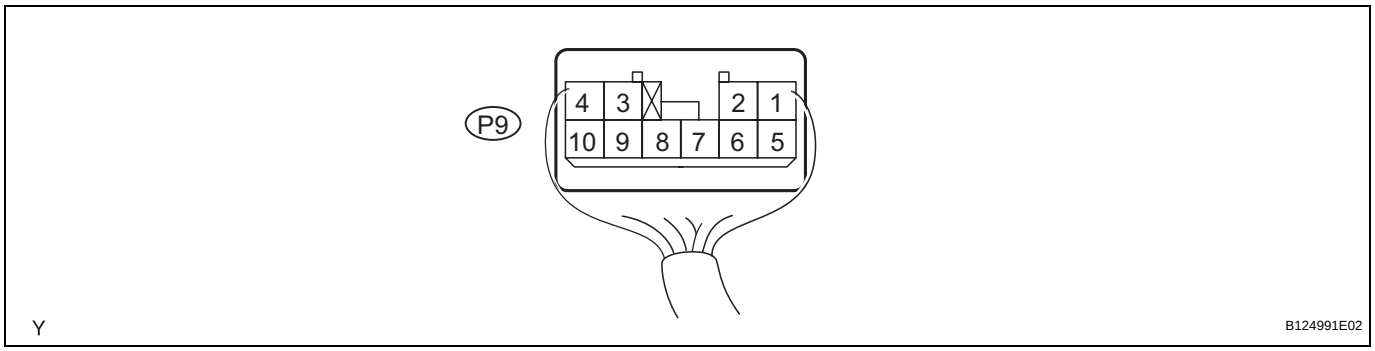
If the result is not as specified, there may be a malfunction on the wire harness side.
(c) Reconnect the power window regulator master switch connector.
(d) Measure the voltage of the connector terminals.

Symbol (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
DU (P9-4) - E (P9-1)	L - W-B	Power window motor UP output	Ignition switch ON, driver side power window switch OFF	0 V
DU (P9-4) - E (P9-1)	L - W-B	Power window motor UP output	Ignition switch ON, driver side power window switch UP	10 to 14 V
DD (P9-9) - E (P9-1)	L-B - W-B	Power window motor DOWN output	Ignition switch ON, driver side power window switch OFF	0 V
DD (P9-9) - E (P9-1)	L-B - W-B	Power window motor DOWN output	Ignition switch ON, driver side power window switch DOWN (manual operation)	10 to 14 V
DD (P9-9) - E (P9-1)	L-B - W-B	Power window motor DOWN output	Ignition switch ON, driver side power window fully closed → driver side power window switch DOWN (AUTO operation) → driver side power window fully open	0 V → 10 to 14 V → 0 V

If the result is not as specified, the switch may have a malfunction.

(e) Check the illumination.
   (1) When the ignition switch is turned to ON from OFF with the connector connected, check that the illumination (YELLOW) AUTO lights up.

2. CHECK POWER WINDOW REGULATOR MASTER SWITCH (FOR ACCESS CAB):



(a) Disconnect the P9 power window regulator master switch connector.
(b) Measure the voltage and resistance of each of the wire harness side connector terminals.

Standard:

Symbol (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
E (P9-1) - Body ground	W-B - Body ground	Ground	Always	Below 1 Ω
B (P9-9) - E (P9-1)	R - W-B	Regulator motor power	Always	10 to 14 V
B (P9-9) - E (P9-1)	R - W-B	Master switch power supply	Ignition switch OFF	0 V
B (P9-9) - E (P9-1)	R - W-B	Master switch power supply	ignition switch ON	10 to 14 V
DU (P9-3) - DD (P9-4)	L - L-B	•Power window motor UP output •Power window motor DOWN output	Always	Below 1 Ω

If the result is not as specified, there may be a malfunction on the wire harness side.

(c) Reconnect the power window regulator master switch connector.
(d) Measure the voltage of the connector terminals.

Symbol (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
DU (P9-4) - E (P9-1)	L - W-B	Power window motor UP output	Ignition switch ON, driver side power window switch OFF	0 V
DU (P9-4) - E (P9-1)	L - W-B	Power window motor UP output	Ignition switch ON, driver side power window switch UP	10 to 14 V
DD (P9-9) - E (P9-1)	L-B - W-B	Power window motor DOWN output	Ignition switch ON, driver side power window switch OFF	0 V
DD (P9-9) - E (P9-1)	L-B - W-B	Power window motor DOWN output	Ignition switch ON, driver side power window switch DOWN (manual operation)	10 to 14 V

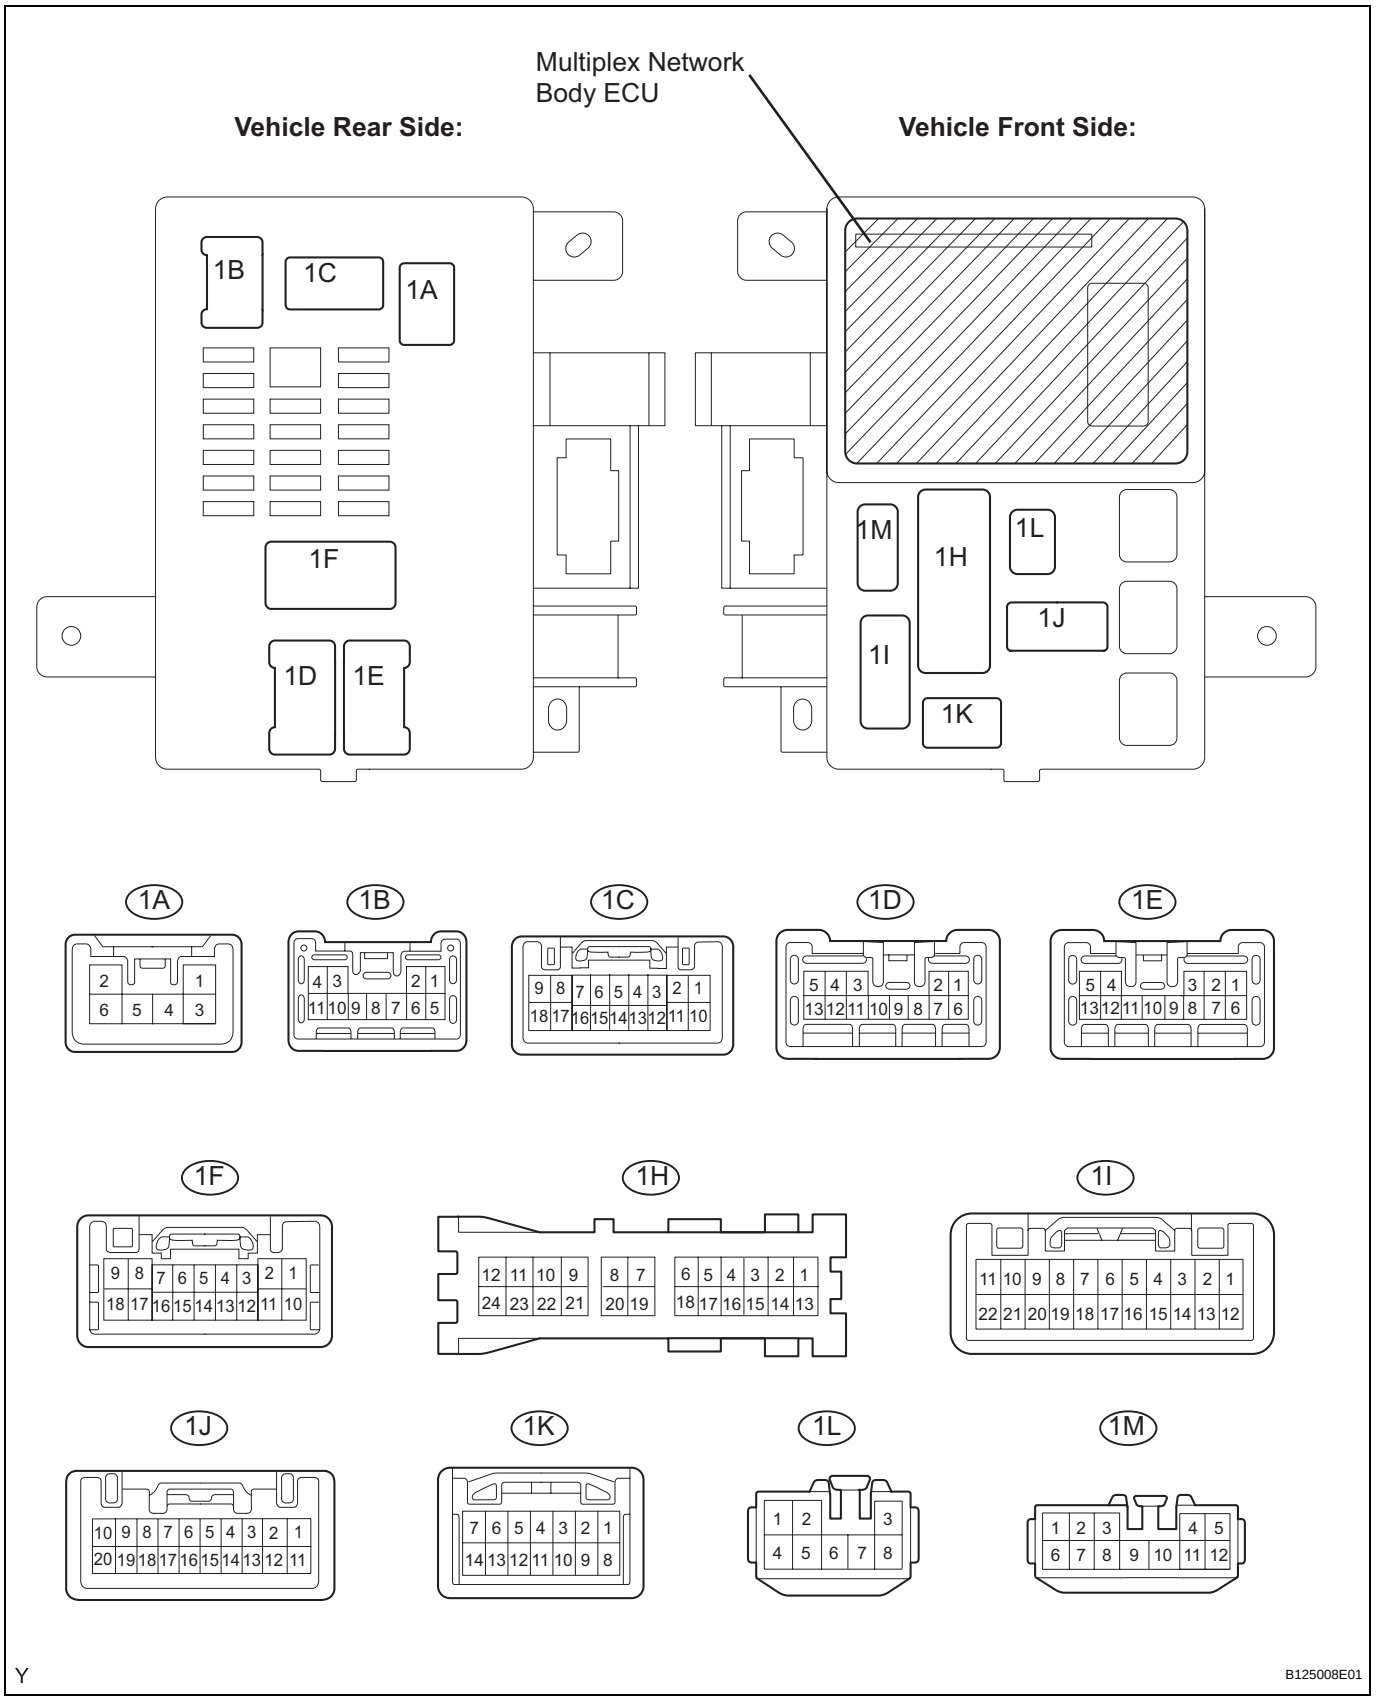
Symbol (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
DD (P9-9) - E (P9-1)	L-B - W-B	Power window motor DOWN output	Ignition switch ON, driver side power window fully closed → driver side power window switch DOWN (AUTO operation) → driver side power window fully open	0 V → 10 to 14 V → 0 V

If the result is not as specified, the switch may have a malfunction.

(e) Check the illumination.

(1) When the ignition switch is turned to ON from OFF with the connector connected, check that the illumination (YELLOW) AUTO lights up.

3. CHECK DRIVER SIDE J/B ASSEMBLY (MULTIPLEX NETWORK BODY ECU)



(a) Disconnect the 1A, 1C, 1F, 1H, 1I and 1K driver side J/B connectors.

(b) Measure the voltage and resistance between each terminal of the wire harness side connectors and body ground.

Standard:

Symbol (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
ECUB (1C-16) - Body ground	R - Body ground	+B (ECUB) power supply	Always	10 to 14 V
ALTB (1A-6) - Body ground	L - Body ground	+B (power system, generator system) power supply	Always	10 to 14 V
PWS (1H-10) - Body ground	W-B - Body ground	PWR Relay ON signal	Ignition switch OFF	0 V
			Ignition switch ON	10 to 14 V
KSW (1K-10) - Body ground	G-B - Body ground	Key unlock warning switch input	No key in ignition key cylinder	10 kΩ or higher
			Key inserted ignition key cylinder	Below 1 Ω
DCTY (1F-7) - Body ground	G-Y - Body ground	Driver side courtesy switch input	Driver side door CLOSED	10 kΩ or higher
			Driver side door OPEN	Below 1 Ω
PCTY (1I-8) - Body ground	R-B - Body ground	Passenger side courtesy switch input	Passenger side door CLOSED	10 kΩ or higher
			Passenger side door OPEN	Below 1 Ω
GND (1H-18) - Body ground	W-B - Body ground	Ground	Always	Below 1 Ω

If the result is not as specified, there may be a malfunction on the wire harness side.

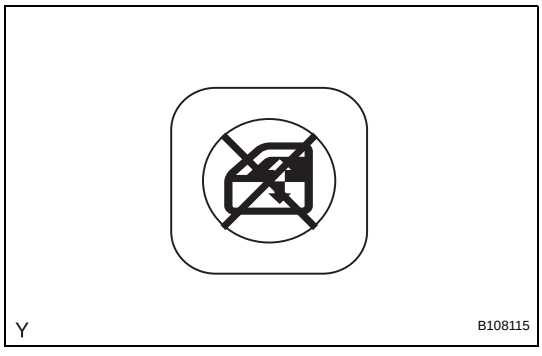
(c) Reconnect the driver side J/B connectors.

(d) Measure the voltage between each terminal of the connector and body ground.

Standard:

Symbol (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
KSW (1K-10) - Body ground	G-B - Body ground	Key unlock warning switch input	No key in ignition key cylinder	10 to 14 Vr
			Key inserted ignition key cylinder	0 V

If the result is not as specified, the driver side J/B assembly (multiplex network body ground ECU) may have a malfunction.



ON-VEHICLE INSPECTION

1. CHECK WINDOW LOCK SWITCH

(a) Check that the passenger side power window and rear door side power window operations are disabled when the window lock switch of the power window regulator master switch assembly is pressed.

(b) Check that the passenger side power window and rear door side power window can be operated when the window lock switch is pressed again.

2. CHECK MANUAL UP/DOWN FUNCTION

(a) Check that the driver side power window operates as follows:

OK:

Condition	Master Switch	Switch Operation	Power Window
Ignition switch ON	Driver side	Pulled up	UP (closes)
Ignition switch ON	Driver side	Pushed halfway down	DOWN (opens)

(b) Check that the power windows, except the driver side power window, operate as follows:

OK:

Condition	Master Switch	Switch Operation	Power Window
• Ignition switch ON • Window lock switch OFF	Front passenger side	Pulled up	UP (closes)
• Ignition switch ON • Window lock switch OFF	Front passenger side	Pushed down	DOWN (opens)
• Ignition switch ON • Window lock switch OFF	Rear LH	Pulled up	UP (closes)
• Ignition switch ON • Window lock switch OFF	Rear LH	Pushed down	DOWN (opens)
• Ignition switch ON • Window lock switch OFF	Rear RH	Pulled up	UP (closes)
• Ignition switch ON • Window lock switch OFF	Rear RH	Pushed down	DOWN (opens)

3. CHECK AUTO DOWN FUNCTION

(a) Check that the driver side power window operates as follows:

OK:

Condition	Master Switch	Switch Operation	Power Window
Ignition switch ON	Driver side	Pushed fully down	AUTO DOWN (fully opens)

(b)

4. CHECK REMOTE UP/DOWN FUNCTION

(a) Check that the power windows except the driver side power window operate as follows:

OK:

Condition	Master Switch	Switch Operation	Power Window
• Ignition switch ON • Window lock switch OFF	Front passenger side	Pulled up	UP (closes)
• Ignition switch ON • Window lock switch OFF	Front passenger side	Pushed down	DOWN (opens)
• Ignition switch ON • Window lock switch OFF	Rear LH	Pulled up	UP (closes)
• Ignition switch ON • Window lock switch OFF	Rear LH	Pushed down	DOWN (opens)
• Ignition switch ON • Window lock switch OFF	Rear RH	Pulled up	UP (closes)
• Ignition switch ON • Window lock switch OFF	Rear RH	Pushed down	DOWN (opens)

Remote Up / Down Function does not Operate

DESCRIPTION

With the ignition switch ON, the power window regulator master switch assembly transmits remote switch signals to the passenger side power window and rear door power window regulator switches. Then, the regulator switches drive the power window regulator motors.

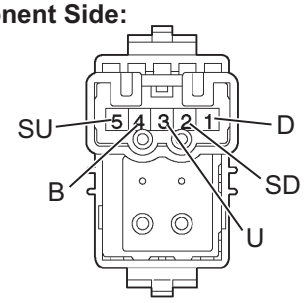
2	INSPECT POWER WINDOW REGULATOR SWITCH ASSEMBLY (SWITCH OPERATION)

Component Side:



(a) Remove the power window regulator switch.
(b) Disconnect the P14 power window regulator switch connector.
(c) Measure the resistance between the terminals of the connector when the switch is operated.

Standard

Tester Connection	Regulator Switch	Specified Condition
P14-1 (D) - P14-2 (SD) P14-3 (U) - P14-4 (B)	UP	Below 1 Ω
P14-1 (D) - P14-2 (SD) P14-3 (U) - P14-5 (SU)	OFF	Below 1 Ω
P14-1 (D) - P14-4 (B) P14-3 (U) - P14-5 (SU)	DOWN	Below 1 Ω

(d) Reconnect the power window regulator switch connector.
(e) Reinstall the power window regulator switch.

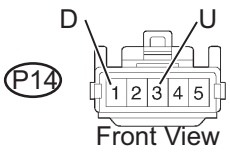
NG → **REPLACE POWER WINDOW REGULATOR SWITCH ASSEMBLY**

OK

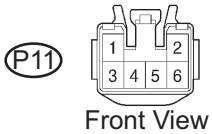
3	CHECK HARNESS AND CONNECTOR (REGULATOR SWITCH - REGULATOR MOTOR AND BODY GROUND)

Wire Harness Side:

Power Window Regulator Switch Assembly (Passenger Side)



Power Window Regulator Motor Assembly RH (Passenger Side)



B063164E05

(a) Disconnect the P14 power window regulator switch connector.
(b) Disconnect the P11 power window regulator motor connector.
(c) Measure the resistance.

Standard

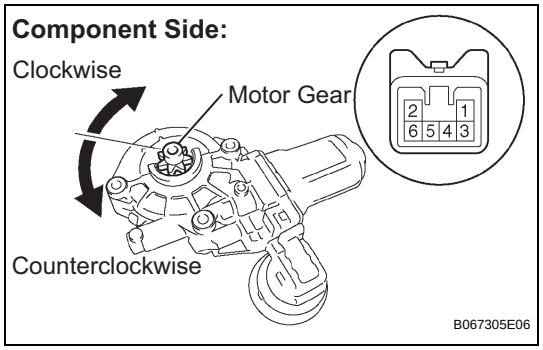
Tester Connection	Specified Condition
P14-1 (D) - P11-1	Below 1 Ω
P14-3 (U) - P11-2	Below 1 Ω
P14-1 (D) - Body ground	10 kΩ or higher
P14-3 (U) - Body ground	10 kΩ or higher

(d) Reconnect the power window regulator switch connector.
(e) Reconnect the power window regulator motor connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

4	**INSPECT POWER WINDOW REGULATOR MOTOR ASSEMBLY RH**



(a) Remove the power window regulator motor.
(b) Apply battery voltage to connector terminals 1 and 2.
(c) Check that the motor smoothly rotates.
NOTICE:
Do not apply battery voltage to any terminals except terminals 1 and 2.
OK

Terminal No.	Specified Condition
Battery positive (+) → 1 Battery negative (-) → 2	Motor gear rotates clockwise
Battery positive (+) → 2 Battery negative (-) → 1	Motor gear rotates counterclockwise

(d) Reinstall the power window regulator motor.

NG → **REPLACE POWER WINDOW REGULATOR MOTOR ASSEMBLY RH**

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR (MASTER SWITCH - REGULATOR SWITCH)

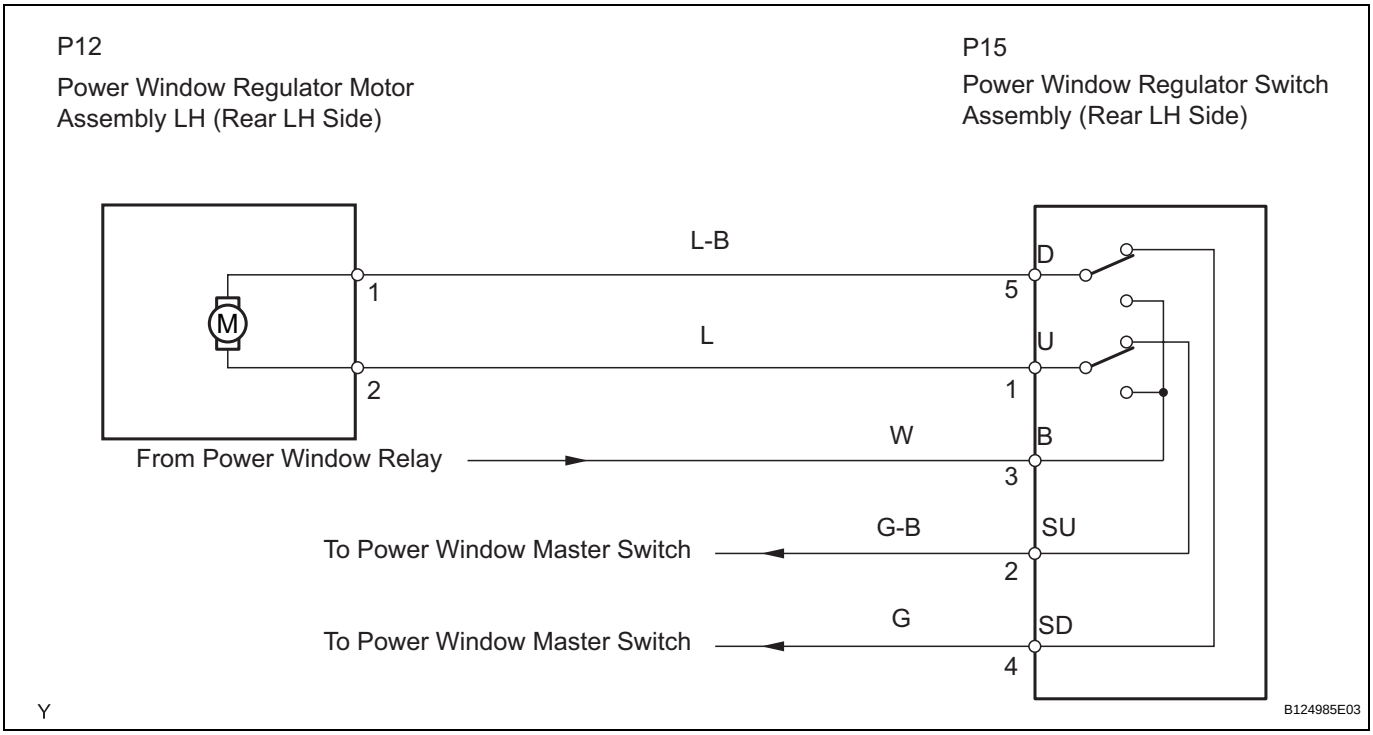
Rear Power Window LH does not Operate with Rear Power Window Switch LH

DESCRIPTION

If the rear LH side manual UP/DOWN function does not operate, the power window regulator motor assembly, the power window regulator switch assembly or the wire harness may be malfunctioning.

WIRING DIAGRAM

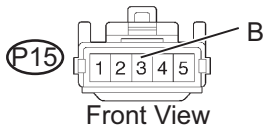
WS



1	CHECK REAR POWER WINDOW REGULATOR SWITCH ASSEMBLY (B VOLTAGE)

Wire Harness Side:

Power Window Regulator Switch Assembly (Rear LH Side)



B062901E05

(a) Disconnect the P15 power window regulator switch connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage.

Standard

Tester Connection	Condition	Specified Condition
P15-3 (B) - Body ground	Ignition switch ON	10 to 14 V

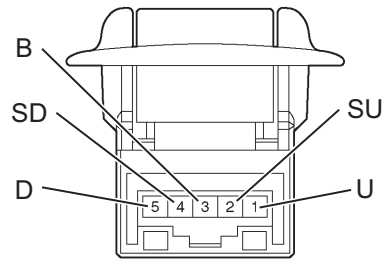
(d) Reconnect the power window regulator switch connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (DRIVER SIDE J/B - REGULATOR SWITCH)**

OK

2	**INSPECT POWER WINDOW REGULATOR SWITCH ASSEMBLY (REAR LH) (SWITCH OPERATION)**

Component Side:



(a) Remove the power window regulator switch.
(b) Disconnect the P15 power window regulator switch connector.
(c) Measure the resistance between the terminals of the connector when the switch is operated.
Standard

Tester Connection	Regulator Switch	Specified Condition
P15-5 (D) - P15-4 (SD) P15-1 (U) - P15-3 (B)	UP	Below 1 Ω
P15-5 (D) - P15-4 (SD) P15-1 (U) - P15-2 (SU)	OFF	Below 1 Ω
P15-5 (D) - P15-3 (B) P15-1 (U) - P15-2 (SU)	DOWN	Below 1 Ω

(d) Reconnect the power window regulator switch connector.
(e) Reinstall the power window regulator switch.

NG → **REPLACE REAR POWER WINDOW REGULATOR SWITCH ASSEMBLY**

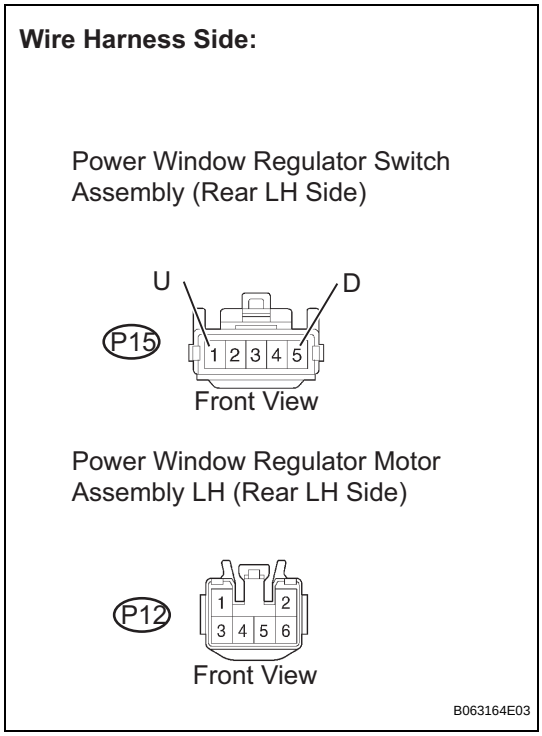
OK

3	**CHECK HARNESS AND CONNECTOR (REGULATOR SWITCH - REGULATOR MOTOR AND BODY GROUND)**

Wire Harness Side:

Power Window Regulator Switch Assembly (Rear LH Side)

Power Window Regulator Motor Assembly LH (Rear LH Side)



(a) Disconnect the P15 power window regulator switch connector.
(b) Disconnect the P12 power window regulator motor connector.
(c) Measure the resistance.
Standard

Tester Connection	Specified Condition
P15-5 (D) - P12-1	Below 1 Ω
P15-1 (U) - P12-2	Below 1 Ω
P15-5 (D) - Body ground	10 kΩ or higher
P15-1 (U) - Body ground	10 kΩ or higher

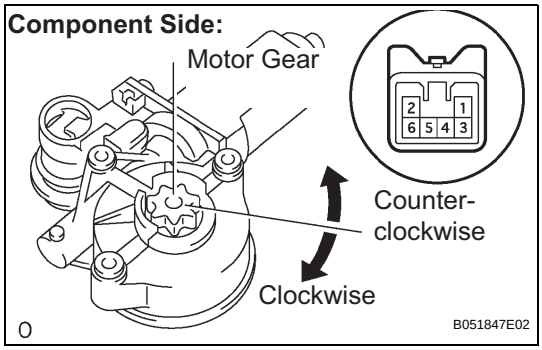
(d) Reconnect the power window regulator switch connector.
(e) Reconnect the power window regulator motor connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

WS

4	INSPECT POWER WINDOW REGULATOR MOTOR ASSEMBLY (REAR LH)



(a) Remove the power window regulator motor.
(b) Apply battery voltage to connector terminals 1 and 2.
(c) Check that the motor smoothly rotates.
NOTICE:
Do not apply battery voltage to any terminals except terminals 1 and 2.
OK

Terminal No.	Specified Condition
Battery positive (+) → 2 Battery negative (-) → 1	Motor gear rotates clockwise
Battery positive (+) → 1 Battery negative (-) → 2	Motor gear rotates counterclockwise

(d) Reinstall the power window regulator motor.

NG → **REPLACE POWER WINDOW REGULATOR MOTOR ASSEMBLY (REAR LH)**

OK

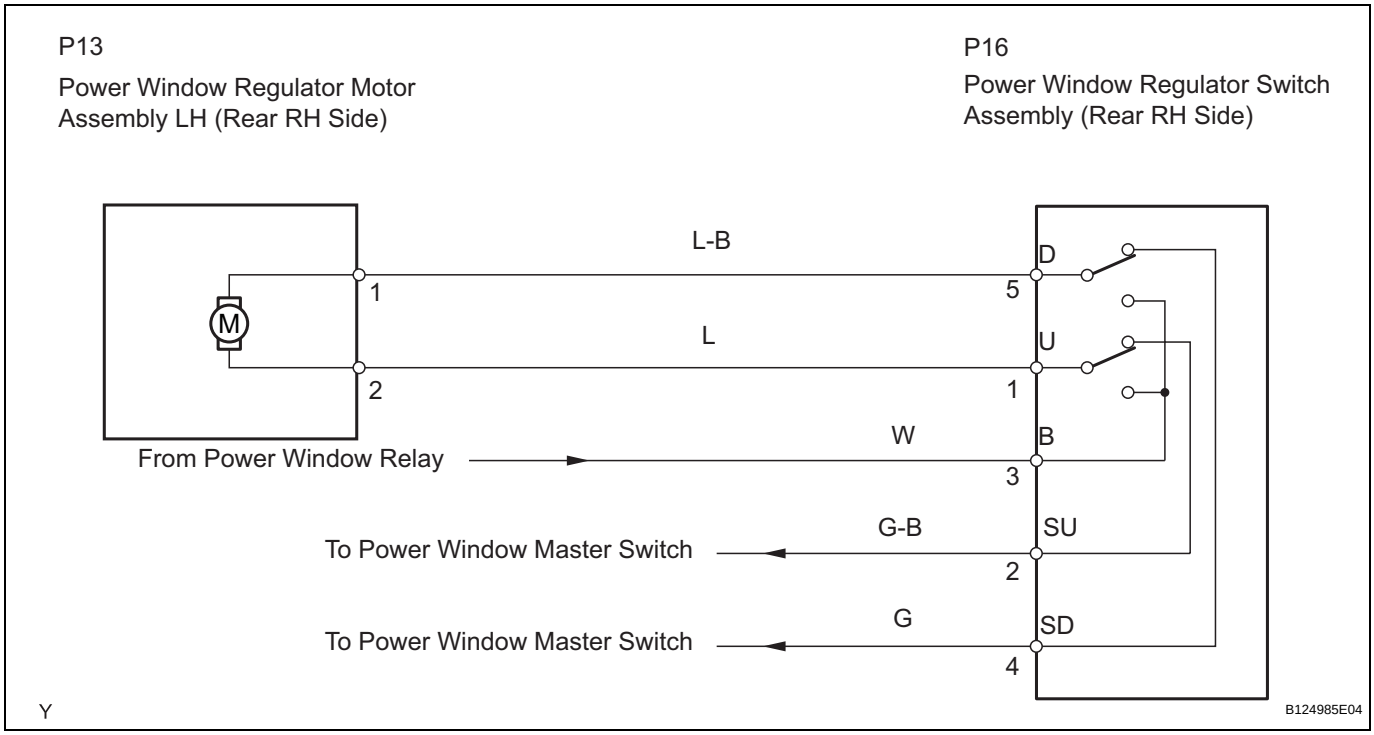
REPAIR OR REPLACE HARNESS OR CONNECTOR (MASTER SWITCH - REGULATOR SWITCH)

Rear Power Window RH does not Operate with Rear Power Window Switch RH

DESCRIPTION

If the rear RH side manual UP/DOWN function does not operate, the power window regulator motor assembly, the power window regulator switch assembly or the wire harness may be malfunctioning.

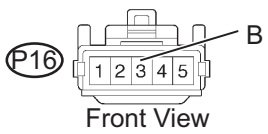
WIRING DIAGRAM



1	CHECK REAR POWER WINDOW REGULATOR SWITCH ASSEMBLY (B VOLTAGE)

Wire Harness Side:

Power Window Regulator Switch Assembly (Rear RH Side)



(a) Disconnect the P16 power window regulator switch connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage.

Standard

Tester Connection	Condition	Specified Condition
P16-3 (B) - Body ground	Ignition switch ON	10 to 14 V

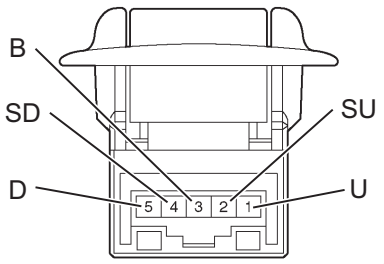
(d) Reconnect the power window regulator switch connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (DRIVER SIDE J/B - REGULATOR SWITCH)**

OK

2	INSPECT REAR POWER WINDOW REGULATOR SWITCH ASSEMBLY (SWITCH OPERATION)

Component Side:



(a) Remove the power window regulator switch.
(b) Disconnect the P16 power window regulator switch connector.
(c) Measure the resistance between the terminals of the connector when the switch is operated.

Standard

Tester Connection	Regulator Switch	Specified Condition
P16-5 (D) - P16-4 (SD) P16-1 (U) - P16-3 (B)	UP	Below 1 Ω
P16-5 (D) - P16-4 (SD) P16-1 (U) - P16-2 (SU)	OFF	Below 1 Ω
P16-1 (D) - P16-3 (B) P16-1 (U) - P16-2 (SU)	DOWN	Below 1 Ω

(d) Reconnect the power window regulator switch connector.
(e) Reinstall the power window regulator switch.

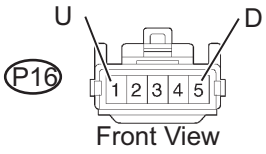
NG → **REPLACE REAR POWER WINDOW REGULATOR SWITCH ASSEMBLY**

OK

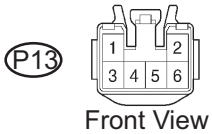
3	CHECK HARNESS AND CONNECTOR (REGULATOR SWITCH - REGULATOR MOTOR AND BODY GROUND)

Wire Harness Side:

Power Window Regulator Switch Assembly (Rear RH Side)



Power Window Regulator Motor Assembly RH (Rear RH Side)



B063164E04

(a) Disconnect the P16 power window regulator switch connector.
(b) Disconnect the P13 power window regulator motor connector.
(c) Measure the resistance.

Standard

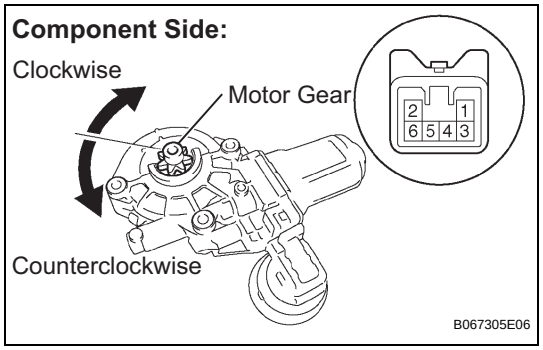
Tester Connection	Specified Condition
P16-5 (D) - P13-1	Below 1 Ω
P16-1 (U) - P13-2	Below 1 Ω
P16-5 (D) - Body ground	10 kΩ or higher
P16-1 (U) - Body ground	10 kΩ or higher

(d) Reconnect the power window regulator switch connector.
(e) Reconnect the power window regulator motor connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

4	**INSPECT POWER WINDOW REGULATOR MOTOR ASSEMBLY (REAR RH)**



(a) Remove the power window regulator motor.
(b) Apply battery voltage to connector terminals 1 and 2.
(c) Check that the motor smoothly rotates.
NOTICE:
Do not apply battery voltage to any terminals except terminals 1 and 2.
OK

Terminal No.	Specified Condition
Battery positive (+) → 1 Battery negative (-) → 2	Motor gear rotates clockwise
Battery positive (+) → 2 Battery negative (-) → 1	Motor gear rotates counterclockwise

(d) Reinstall the power window regulator motor.

NG → **REPLACE POWER WINDOW REGULATOR MOTOR ASSEMBLY (REAR RH)**

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR (REGULATOR MASTER SWITCH - REGULATOR SWITCH)

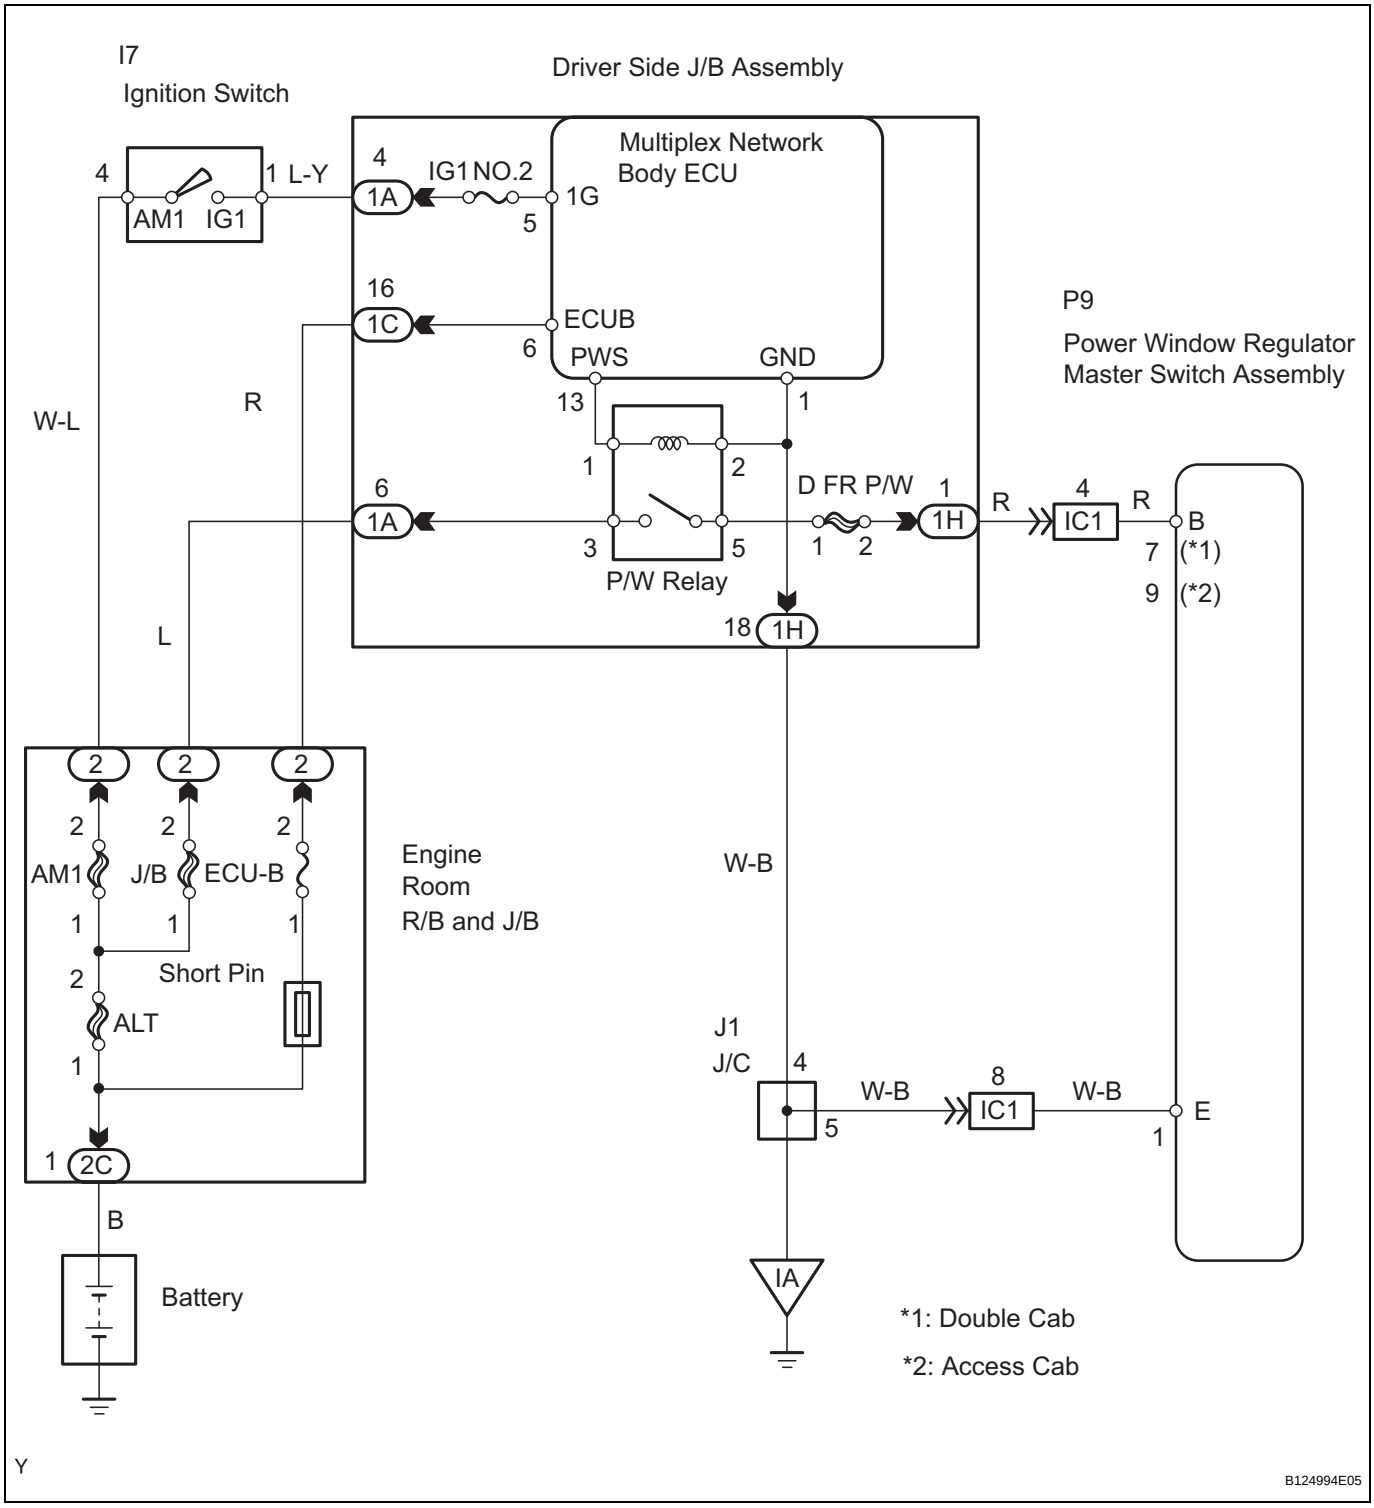
WS

Power Windows do not Operate at All

DESCRIPTION

If none of the door windows operate, there may be a failure in the supply of power to the power window regulator master switch assembly, or the power window regulator master switch itself may be malfunctioning.

WIRING DIAGRAM



1	**INSPECT FUSE (D FR P/W, IG1 NO.2, ECU-B, AM1, J/B)**

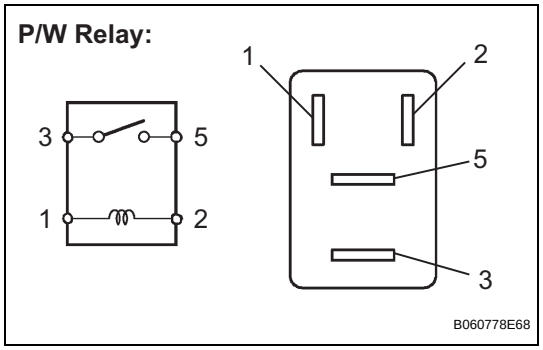
(a) Remove the D FR P/W and IG1 No.2 fuses from the driver side J/B.
(b) Remove the ECU-B, AM1 and J/B fuses from the engine room R/B.
(c) Measure the resistance.
Standard resistance:
Below 1 Ω
(d) Reinstall the D FR P/W and IG1 No.2 fuses.
(e) Reinstall the ECU-B, AM1 and J/B fuses.

NG → **REPLACE FUSE**

OK

2	**INSPECT RELAY (P/W)**

P/W Relay:



(a) Remove the P/W relay from the driver side J/B.
(b) Measure the resistance.
Standard voltage

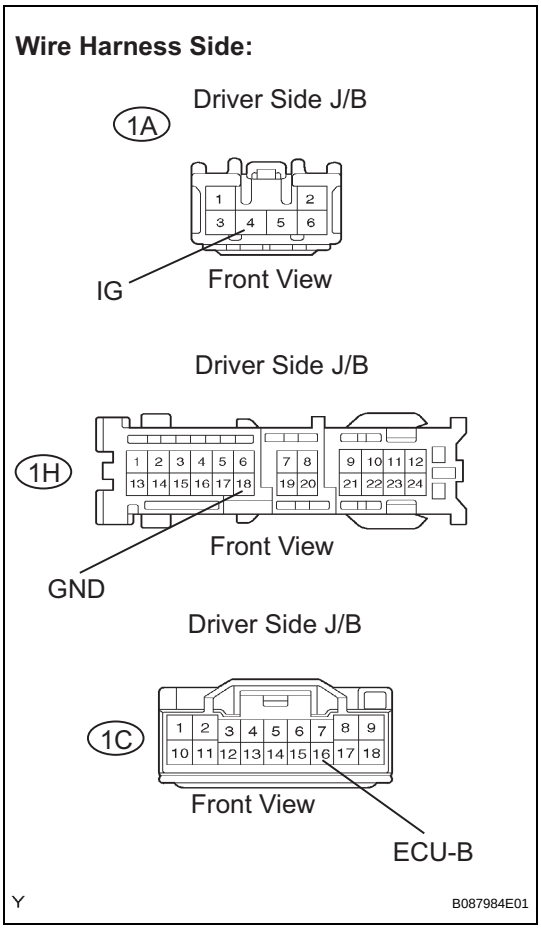
Tester Connection	Specified Condition
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

(c) Reinstall the P/W relay.

NG → **REPLACE RELAY**

OK

3	CHECK HARNESS AND CONNECTOR (FOR POWER SOURCE OF DRIVER SIDE J/B ASSEMBLY)



(a) Disconnect the 1A,1C, and 1H driver side J/B connectors.

(b) Measure the voltage and resistance.

Standard voltage

Tester Connection	Condition	Specified Condition
1A-6 - Body ground	Constant	10 to 14 V
1C-16 (ECU-B) - Body ground	Constant	10 to 14 V
1A-4 (IG) - Body ground	Ignition switch ON	10 to 14 V

Standard resistance

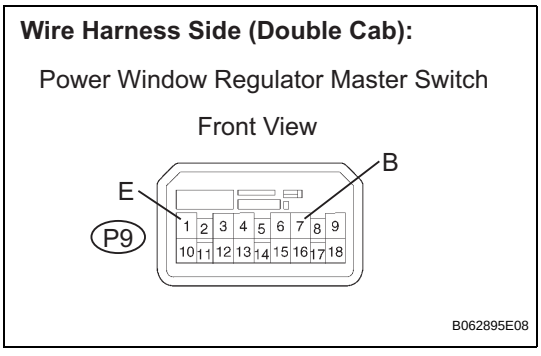
Tester Connection	Condition	Specified Condition
1H-18 (GND) - Body ground	Constant	Below 1 Ω

(c) Reconnect the driver side J/B connectors.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

4	CHECK HARNESS AND CONNECTOR (POWER WINDOW REGULATOR MASTER SWITCH ASSEMBLY - BODY GROUND)



(a) Disconnect the P9 power window regulator master switch connector.

(b) Measure the voltage or resistance.

Standard voltage:

Double cab

Tester Connection	Condition	Specified Condition
P9-7 (B) - Body ground	Ignition switch ON	10 to 14 V

Access cab

Tester Connection	Condition	Specified Condition
P9-9 (B) - Body ground	Ignition switch ON	10 to 14 V

Standard resistance:

Double cab

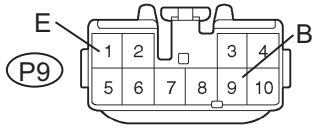
Tester Connection	Condition	Specified Condition
P9-1 (E) - Body ground	Constant	Below 1 Ω

Access cab

Tester Connection	Condition	Specified Condition
P9-1 (E) - Body ground	Constant	Below 1 Ω

Wire Harness Side (Access Cab):

Power Window Regulator Master Switch



Front View

Y B087982E01

(c) Reconnect the power window regulator master switch connector.

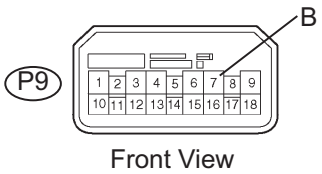
OK → **REPLACE POWER WINDOW REGULATOR MASTER SWITCH ASSEMBLY**

NG

5 CHECK HARNESS AND CONNECTOR (DRIVER SIDE J/B - POWER WINDOW REGULATOR MASTER SWITCH)

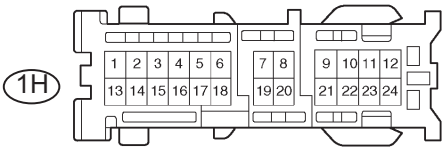
Wire Harness Side (Double Cab):

Power Window Regulator Master Switch



Front View

Driver Side J/B



Front View

Y B087985E01

(a) Disconnect the 1H driver side J/B connectors.
(b) Disconnect the P9 power window regulator master switch connector.
(c) Measure the resistance.

Standard resistance (Double cab)

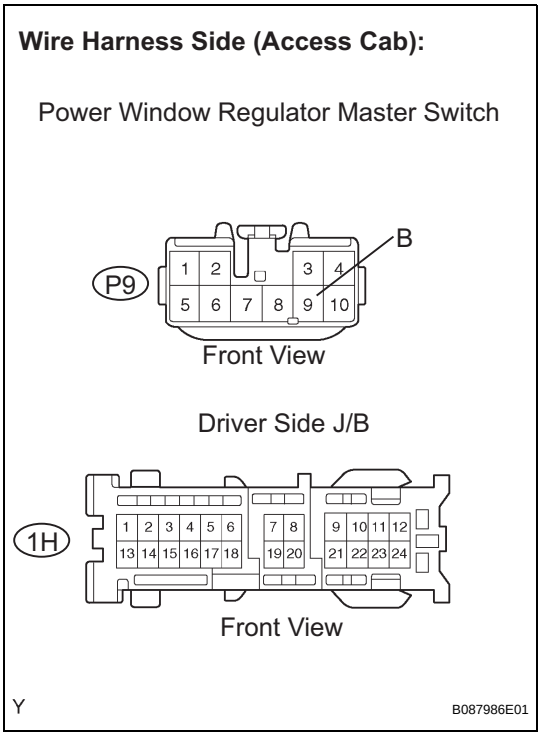
Tester Connection	Specified Condition
1H-1 - P9-7 (B)	Below 1 Ω

Standard resistance (Access cab)

Tester Connection	Specified Condition
1H-1 - P9-9 (B)	Below 1 Ω

(d) Reconnect the driver side J/B connector.

WS



(e) Reconnect the power window regulator master switch connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

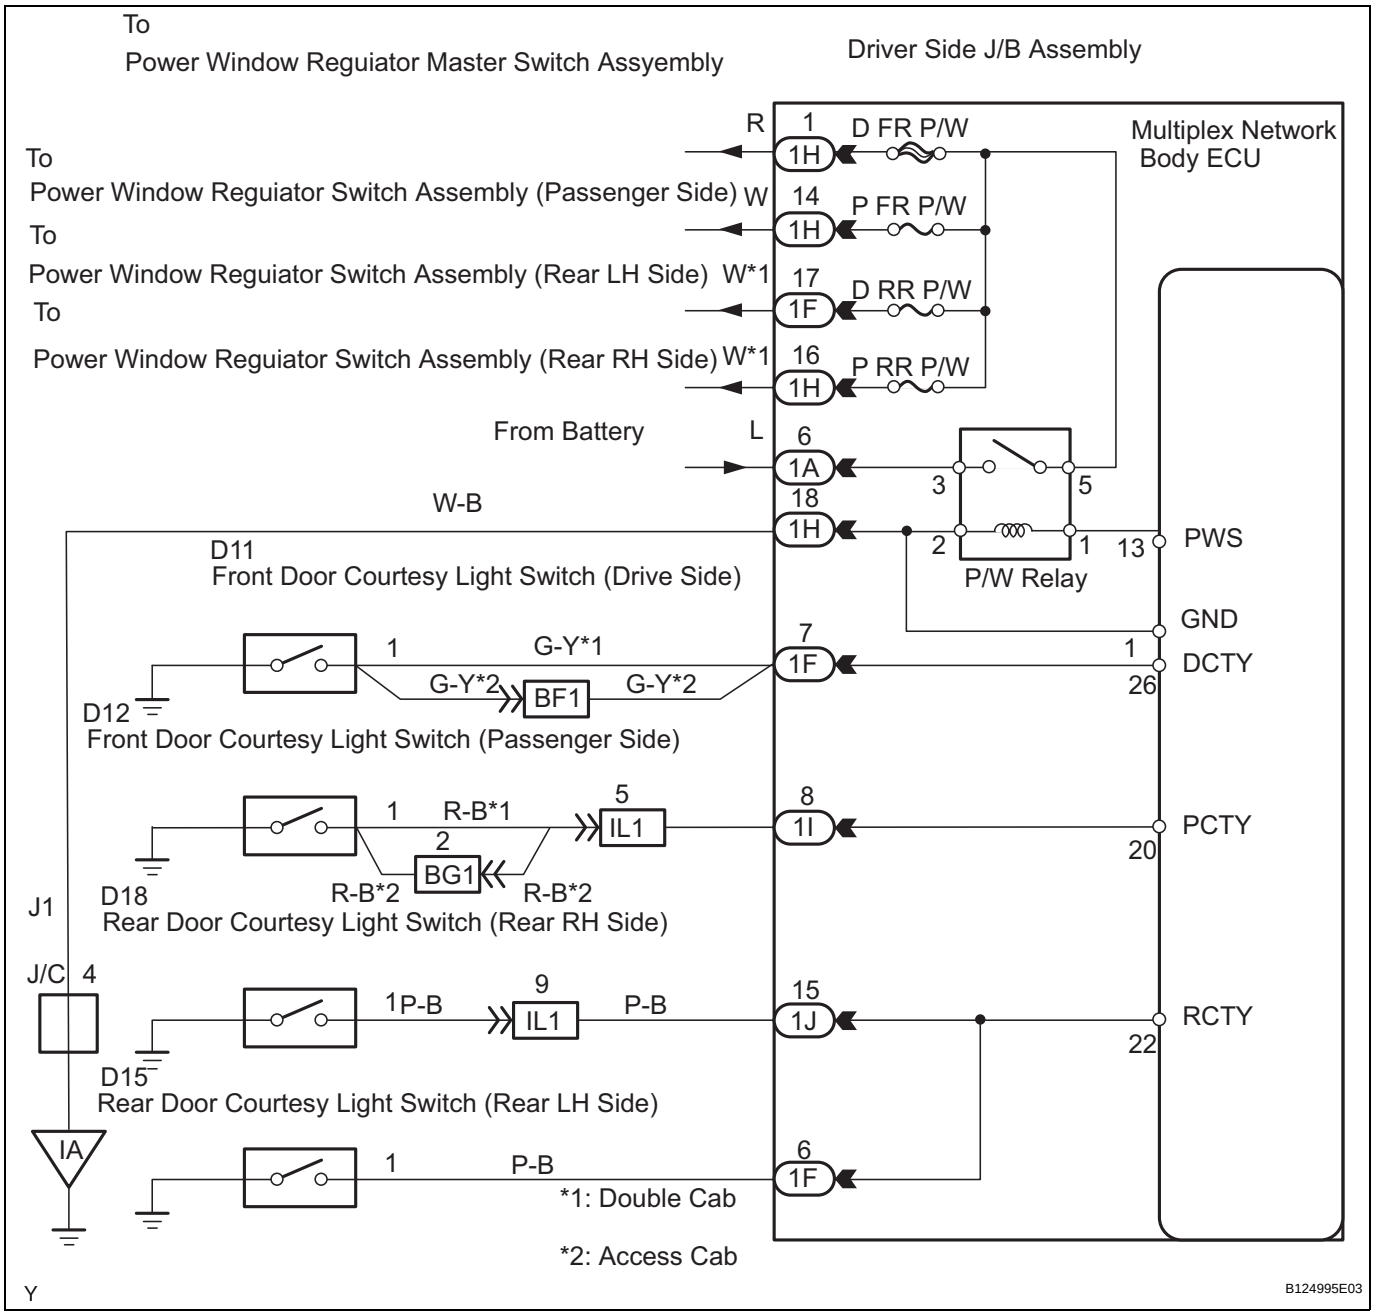
REPLACE DRIVER SIDE JUNCTION BLOCK

Power Window can be Operated After Ignition Switch is Turned OFF Even if Operative Conditions are not Met

DESCRIPTION

The multiplex network body ECU keeps power supplied to the power window regulator master switch assembly and the regulator switch for 43 seconds after the ignition switch is turned OFF. However, if either front door is opened, if a signal from any of the front door courtesy light switches is input to the ECU during this period, or if 43 seconds pass with no action being taken, the body ECU cuts power to the master switch assembly.

WIRING DIAGRAM



1	CHECK OPERATION FUNCTION AFTER IGNITION SWITCH IS TURNED OFF

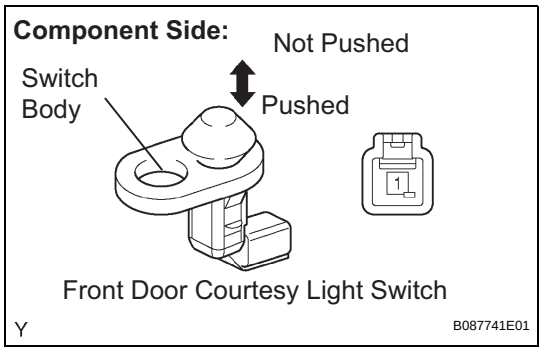
(a) After the ignition switch is turned OFF:
  (1) Either front door is opened within 43 seconds but the power window can still operate. Proceed to A.
  (2) 43 seconds pass and the power window can still operate. Proceed to B.

B → **REPLACE POWER WINDOW REGULATOR SWITCH ASSEMBLY**

WS

A

2	INSPECT FRONT DOOR COURTESY LIGHT SWITCH ASSEMBLY



(a) Remove the front door courtesy light switch.
(b) Measure the switch resistance.

Standard resistance

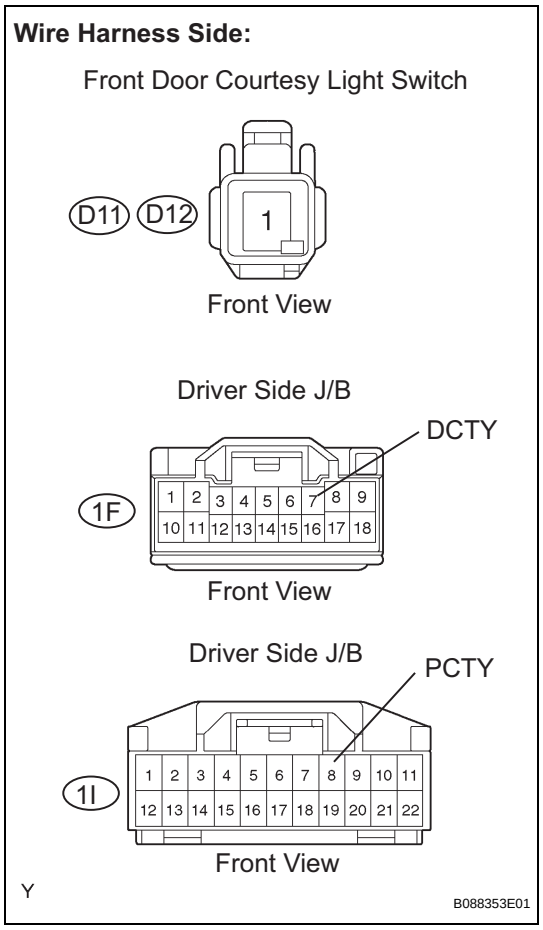
Tester Connection	Condition	Specified Condition
1 - Switch body	Switch pushed	10 kΩ or higher
1 - Switch body	Switch not pushed	Below 1 Ω

(c) Reinstall the front door courtesy light switch.

NG → **REPLACE FRONT DOOR COURTESY LIGHT SWITCH ASSEMBLY**

OK

3	**CHECK HARNESS AND CONNECTOR (FRONT DOOR COURTESY LIGHT SWITCH - DRIVER SIDE J/B (ECU))**



(a) Disconnect the D11 and D12 front door courtesy light switch connector.
(b) Disconnect the 1F and 1I driver side J/B connector.
(c) Measure the resistance.
Standard resistance

Tester Connection	Specified Condition
D11-1 - DCTY (1F-7)	Below 1 Ω
D12-1 - PCTY (1I-8)	Below 1 Ω

(d) Reconnect the front door courtesy light switch connector.
(e) Reconnect the driver side J/B connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE DRIVER SIDE JUNCTION BLOCK (MULTIPLEX NETWORK BODY ECU)

WS

REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
2. **REMOVE FRONT WIPER ARM HEAD CAP (See page WW-7)**
3. **REMOVE FRONT WIPER ARM LH (See page WW-8)**
4. **REMOVE FRONT WIPER ARM RH (See page WW-8)**
5. **REMOVE FRONT FENDER TO COWL SIDE SEAL LH (See page WW-8)**
6. **REMOVE FRONT FENDER TO COWL SIDE SEAL RH**
   HINT:
   Follow the same procedures as for the fender to cowl side seal LH.
7. **REMOVE COWL TOP VENTILATOR LOUVER SUB-ASSEMBLY (See page WW-8)**
8. **REMOVE INNER REAR VIEW MIRROR ASSEMBLY (See page MI-4)**
9. **REMOVE FRONT DOOR OPENING TRIM WEATHERSTRIP LH**
   (a) Separate the front door opening trim weatherstrip to the extent which allows the removal of the front pillar garnish.
10. **REMOVE FRONT DOOR OPENING TRIM WEATHERSTRIP RH**
    HINT:
    Follow the same procedures as for the front door opening trim weatherstrip LH.
11. **REMOVE FRONT PILLAR GARNISH LH (for Regular Cab) (See page IR-41)**
12. **REMOVE FRONT PILLAR GARNISH LH (for Access Cab) (See page IR-62)**
13. **REMOVE FRONT PILLAR GARNISH LH (for Double Cab) (See page IR-13)**
14. **REMOVE FRONT PILLAR GARNISH RH (for Regular Cab)**
    HINT:
    Follow the same procedures as for the front pillar garnish LH.
15. **REMOVE FRONT PILLAR GARNISH RH (for Access Cab)**
    HINT:
    Follow the same procedures as for the front pillar garnish LH.

16. **REMOVE FRONT PILLAR GARNISH RH (for Double Cab)**
HINT:
Follow the same procedures as for the front pillar garnish LH.

17. **REMOVE ROOF CONSOLE BOX ASSEMBLY (for Access Cab) (See page IR-66)**

18. **REMOVE ROOF CONSOLE BOX ASSEMBLY (for Double Cab) (See page IR-18)**

19. **REMOVE ASSIST GRIP PLUG (w/ Curtain Shield Airbag) (See page IR-19)**

20. **REMOVE ASSIST GRIP SUB-ASSEMBLY (for Double Cab) (See page IR-18)**

21. **REMOVE VISOR ASSEMBLY LH (for Regular Cab) (See page IR-45)**

22. **REMOVE VISOR ASSEMBLY LH (for Access Cab) (See page IR-67)**

23. **REMOVE VISOR ASSEMBLY RH (for Double Cab) (See page IR-19)**

24. **REMOVE VISOR ASSEMBLY RH (for Regular Cab)**
HINT:
Follow the same procedures as for the LH visor.

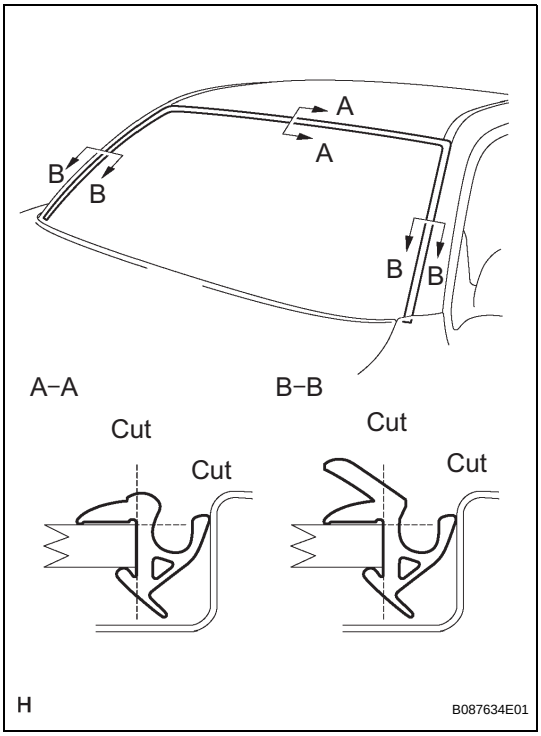
25. **REMOVE VISOR ASSEMBLY RH (for Access Cab)**
HINT:
Follow the same procedures as for the LH visor.

26. **REMOVE VISOR ASSEMBLY RH (for Double Cab)**
HINT:
Follow the same procedures as for the LH visor.

27. **REMOVE VISOR HOLDER (for Regular Cab) (See page IR-45)**

28. **REMOVE VISOR HOLDER (for Access Cab) (See page IR-67)**

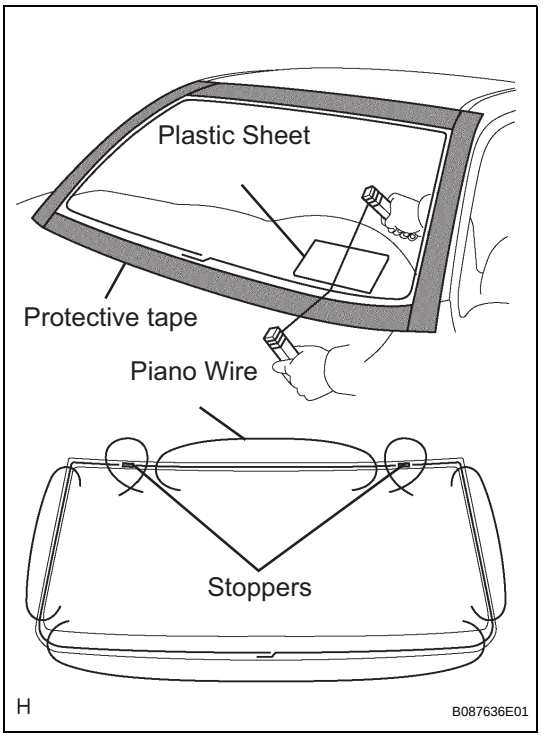
29. **REMOVE VISOR HOLDER (for Double Cab) (See page IR-19)**



30. REMOVE WINDSHIELD UPPER MOLDING OUTER

(a) Using a knife, cut off the windshield upper moulding outer, as shown in the illustration.
NOTICE:
Be careful not to damage the vehicle body with the knife.

(b) Remove the windshield upper moulding outer.
HINT:
Make a partial cut in the windshield upper moulding outer. Then pull and remove it by hand.



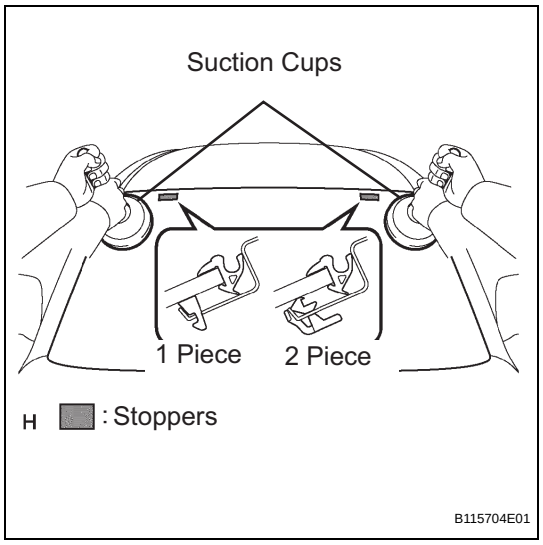
31. REMOVE WINDSHIELD GLASS

(a) Apply protective tape to the outer circumference of the windshield glass, as shown in the illustration.

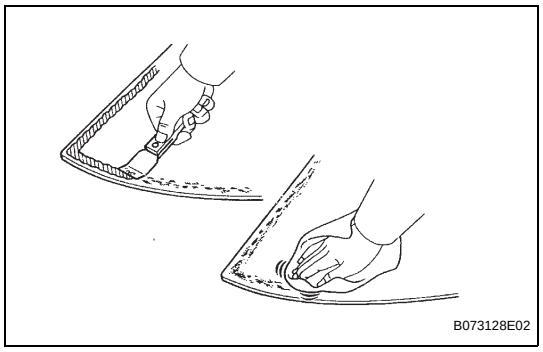
(b) From the interior, insert piano wires between the vehicle body and windshield glass, as shown in the illustration.

(c) Tie objects that can serve as handles (for example, wooden blocks) to all wire ends.
NOTICE:
- **When separating the windshield glass from the vehicle, be careful not to damage the vehicle's paint or exterior/interior ornaments.**
- **To prevent the safety pad from being scratched when removing the windshield glass, place a plastic sheet between the piano wire and safety pad.**

(d) Cut through the adhesive by pulling the piano wire around the windshield glass.



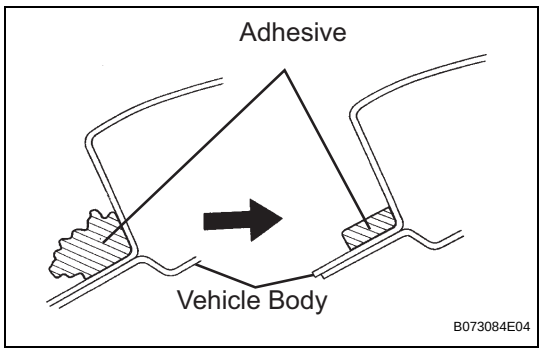
(e) Disengage the 2 stoppers.
(f) Using suction cups, remove the windshield glass.
NOTICE:
Leave as much adhesive on the vehicle body as possible when removing the windshield glass.



INSTALLATION

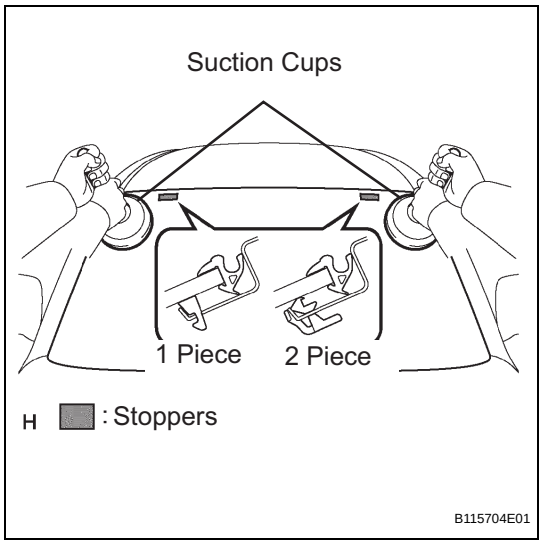
1. CLEAN WINDSHIELD GLASS

(a) Using a scraper, remove the damaged stoppers, dam and adhesive stuck to the windshield glass.
(b) Clean the outer circumference of the windshield glass with white gasoline.
NOTICE:
- **Do not touch the windshield glass surface after cleaning it.**
- **Even if using a new windshield glass, clean the windshield glass with white gasoline.**

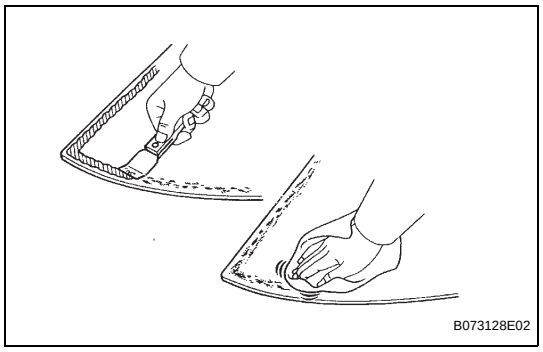


2. CLEAN VEHICLE BODY

(a) Clean and shape the contact surface of the vehicle body.
(1) Using a knife, cut away any rough adhesive on the contact surface of the vehicle body to ensure the appropriate surface shape.
NOTICE:
Be careful not to damage the vehicle body.
HINT:
Leave as much adhesive on the vehicle body as possible.
(2) Clean the contact surface of the vehicle body with a shop rag saturated with cleaner.
HINT:
Even if all the adhesive has been removed, clean the vehicle body.



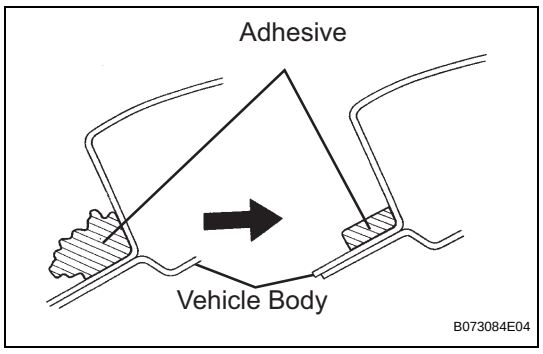
(e) Disengage the 2 stoppers.
(f) Using suction cups, remove the windshield glass.
NOTICE:
Leave as much adhesive on the vehicle body as possible when removing the windshield glass.



INSTALLATION

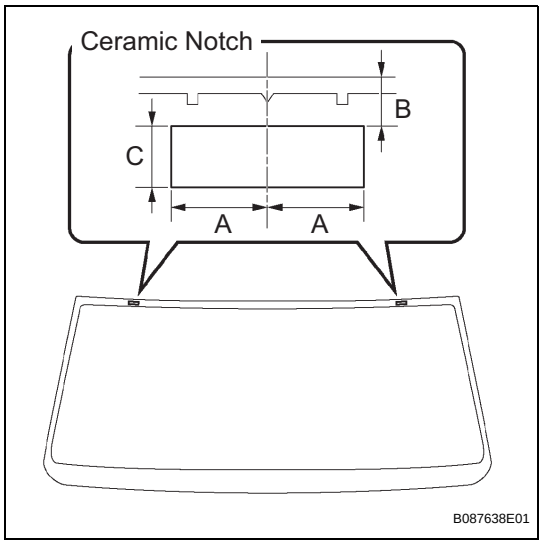
1. CLEAN WINDSHIELD GLASS

(a) Using a scraper, remove the damaged stoppers, dam and adhesive stuck to the windshield glass.
(b) Clean the outer circumference of the windshield glass with white gasoline.
NOTICE:
- **Do not touch the windshield glass surface after cleaning it.**
- **Even if using a new windshield glass, clean the windshield glass with white gasoline.**



2. CLEAN VEHICLE BODY

(a) Clean and shape the contact surface of the vehicle body.
(1) Using a knife, cut away any rough adhesive on the contact surface of the vehicle body to ensure the appropriate surface shape.
NOTICE:
Be careful not to damage the vehicle body.
HINT:
Leave as much adhesive on the vehicle body as possible.
(2) Clean the contact surface of the vehicle body with a shop rag saturated with cleaner.
HINT:
Even if all the adhesive has been removed, clean the vehicle body.



3. INSTALL NO. 2 WINDSHIELD GLASS STOPPER

(a) Apply Primer G to the installation part of the stoppers.

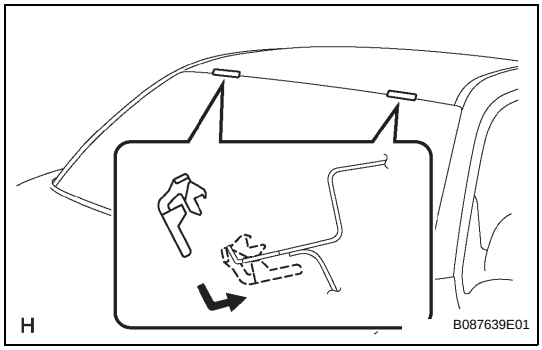
NOTICE:

- **Allow the primer to dry for 3 minutes or more.**
- **Throw away any leftover Primer G.**
- **Do not apply too much Primer G.**

(b) Install 2 new stoppers onto the windshield glass, as shown in the illustration.

Specification

Area	Measurement
A	40 mm (1.575 in.)
B	9.4 mm (0.37 in.)
C	12.5 mm (0.482 in.)



4. INSTALL NO. 1 WINDSHIELD GLASS STOPPER

(a) Install 2 new stoppers onto the vehicle body, as shown in the illustration.

5. INSTALL WINDSHIELD GLASS ADHESIVE DAM

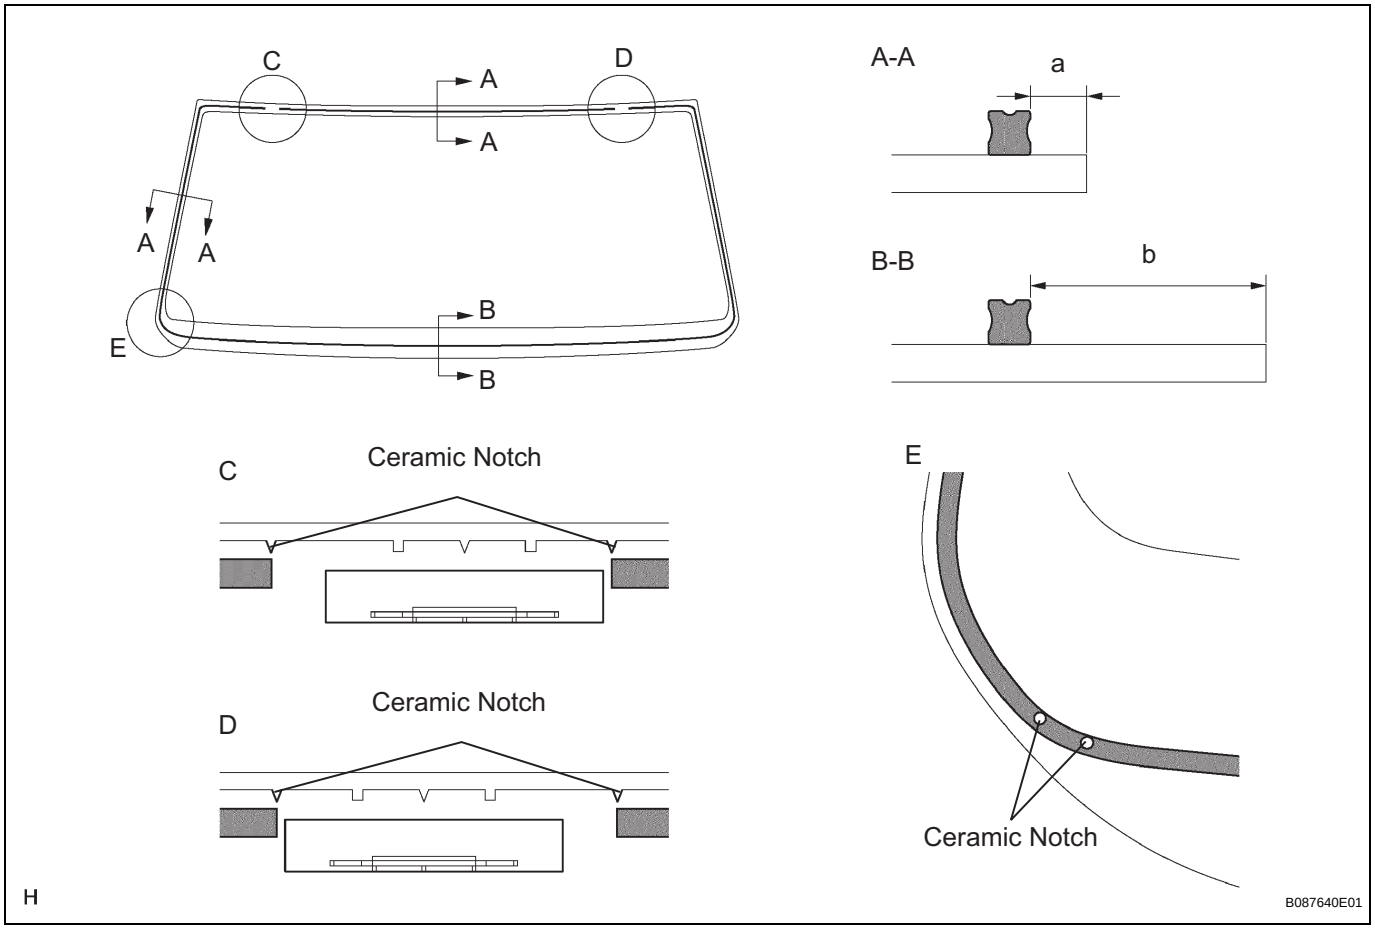
(a) Apply Primer G to the illustration part of the dam.

NOTICE:

- **Allow the primer to dry for 3 minutes or more.**
- **Throw away any leftover Primer G.**
- **Do not apply too much Primer G.**

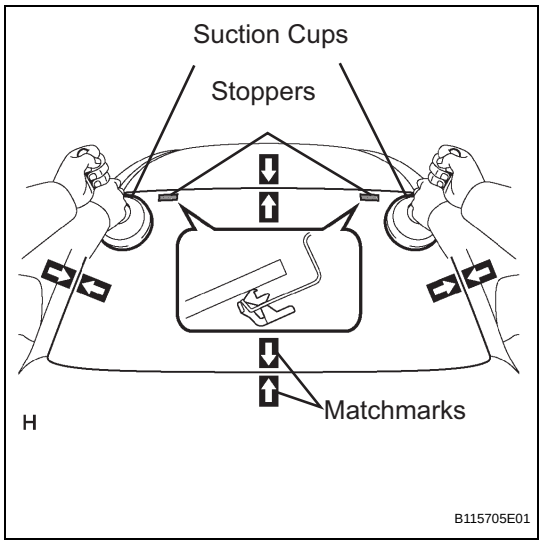
WS

(b) Install 3 new dams. Install the 3 new dams by applying double-sided tape all the way around the windshield glass except where the stoppers are installed, as shown in the illustration.



Specification

Area	Measurement
a	7.0 mm (0.276 in.)
b	30.9 mm (1.217 in.)



6. INSTALL WINDSHIELD GLASS

(a) Position the windshield glass.

(1) Using suction cups, place the windshield glass in the correct position.

(2) Check that the whole contact surface of the windshield glass rim is perfectly even.

(3) Place matchmarks over the windshield glass and vehicle body.

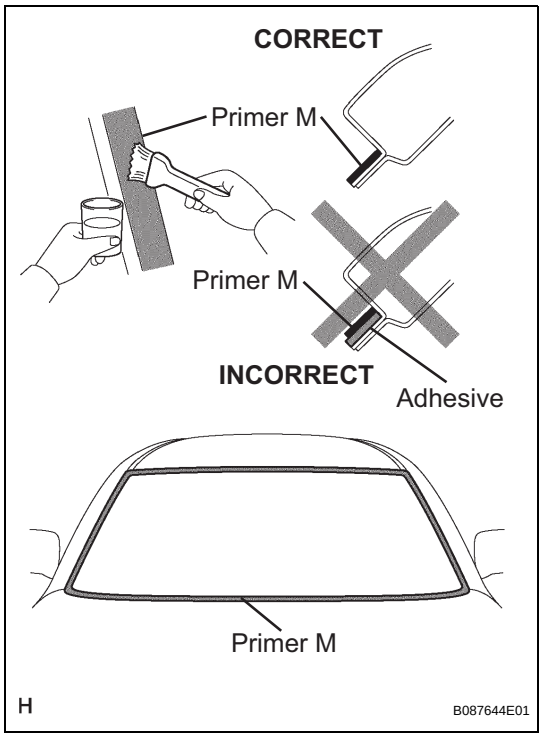
NOTICE:

Check that the stoppers are attached to the vehicle body correctly.

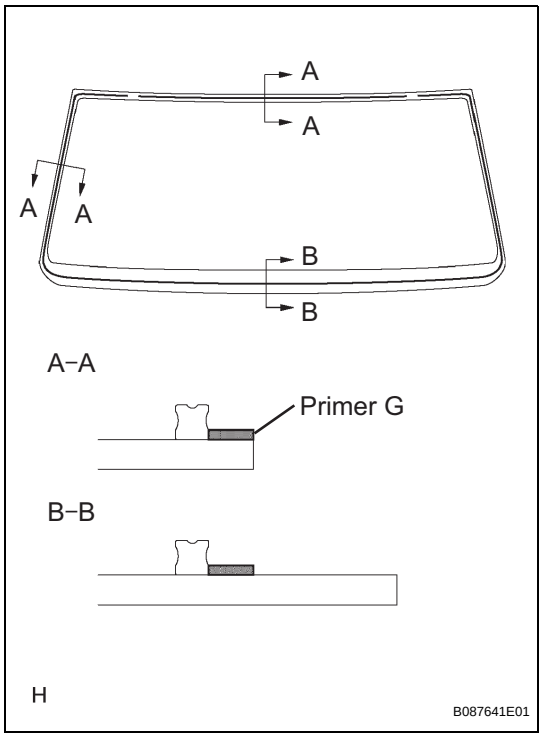
HINT:

When reusing the windshield glass, check and correct the matchmark positions.

(4) Using suction cups, remove the windshield glass.



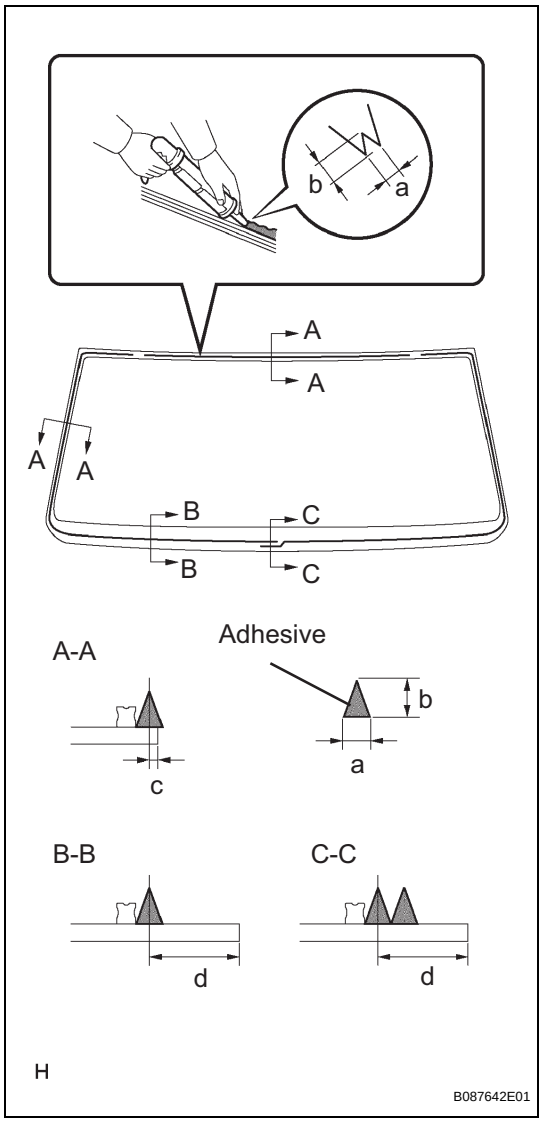
(b) Using a brush, apply Primer M to the exposed part of the vehicle body.
NOTICE:
- **Allow the primer to dry for 3 minutes or more.**
- **Do not apply Primer M to the adhesive.**
- **Throw away any leftover Primer M.**
- **Do not apply too much Primer M.**



(c) Using a brush or sponge, apply Primer G to the edge of the windshield glass and contact surface.
NOTICE:
- **Allow the primer to dry for 3 minutes or more.**
- **Throw away any leftover Primer G.**
- **Do not apply too much Primer G.**

HINT:
If Primer G is applied to any areas other than that which is specified, wipe off the primer with a clean shop rag before it dries.

WS

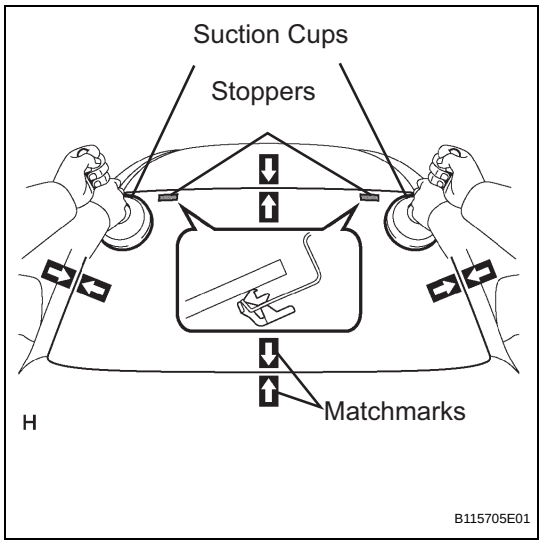


(d) Apply adhesive.
Adhesive:
Part No. 08850-00801 or equivalent
(1) Cut off the tip of the cartridge nozzle, as shown in the illustration.
HINT:
After cutting off the tip, use all adhesive within the times indicated in the table bellow.
Usage time frame

Temperature	Usage Time Frame
35°C (95°F)	15 minutes
20°C (68°F)	1 hour 40 minutes
5°C (41°F)	8 hours

(2) Load the sealer gun with the cartridge.
(3) Apply adhesive to the windshield glass as shown in the illustration.
Specification

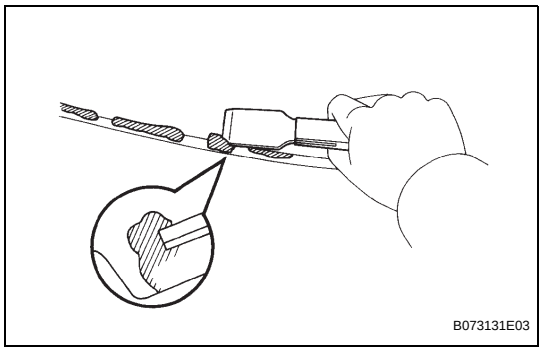
Area	Measurement
a	8 mm (0.315 in.)
b	12 mm (0.472 in.)
c	3 mm (0.118 in.)
d	26.9 mm (1.059 in.)



(e) Install the windshield glass onto the vehicle body.
(1) Using suction cups, position the windshield glass so that the matchmarks are aligned. Press it in gently along the rim
NOTICE:
- **Allow the primer to dry for 3 minutes or more.**
- **Check that the stoppers are attached to the vehicle body correctly.**
- **Check that the vehicle body and windshield glass have a small gap between them.**

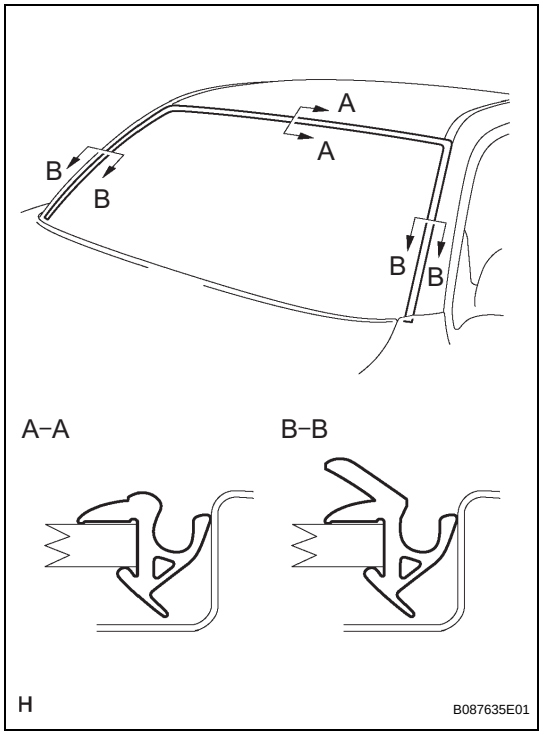
(2) Lightly press the front surface of the windshield glass to ensure that the windshield glass is securely fitted to the vehicle body.

WS



(3) Using a scraper, remove any excessive or protruding adhesive.
HINT:
Apply adhesive to the windshield glass rim.

WS



7. INSTALL WINDSHIELD UPPER MOULDING OUTER

(a) Using a brush or sponge, apply Primer G to the edge of the windshield glass and contact surface.
NOTICE:
- **Allow the primer to dry for 3 minutes or more.**
- **Throw away any leftover Primer G.**
- **Do not apply too mush Primer G.**

(b) Install the windshield upper moulding outer before the adhesive dries.
NOTICE:
Do not drive vehicle for the amount of time indicated in the table below.
Minimum time

Temperature	Minimum time prior to driving vehicle
35°C (95°F)	1 hour 30 minutes
20°C (68°F)	5 hours
5°C (41°F)	24 hours

8. INSTALL COWL TOP VENTILATOR LOUVER SUB-ASSEMBLY (See page WW-10)

9. INSTALL FRONT FENDER TO COWL SIDE SEAL LH (See page WW-11)

10. INSTALL FRONT FENDER TO COWL SIDE SEAL RH
HINT:
Follow the same procedures as for the fender to cowl side seal LH.

11. INSTALL FRONT WIPER ARM LH (See page WW-12)

12. INSTALL FRONT WIPER ARM RH (See page WW-11)

13. INSTALL FRONT WIPER ARM HEAD CAP (See page WW-12)

14. CHECK FOR LEAKAGE AND REPAIR

(a) Conduct a leak test after the adhesive has completely hardened.

(b) Seal any leakage with auto glass sealer.

15. INSTALL VISOR HOLDER (for Regular Cab) (See page IR-47)

16. INSTALL VISOR HOLDER (for Access Cab) (See page IR-70)

17. **INSTALL VISOR HOLDER (for Double Cab) (See page IR-22)**
18. **INSTALL VISOR ASSEMBLY LH (for Regular Cab) (See page IR-48)**
19. **INSTALL VISOR ASSEMBLY LH (for Access Cab) (See page IR-70)**
20. **INSTALL VISOR ASSEMBLY LH (for Double Cab) (See page IR-22)**
21. **INSTALL VISOR ASSEMBLY RH (for Regular Cab)**
    HINT:
    Follow the same procedures as for the LH visor.
22. **REMOVE VISOR ASSEMBLY RH (for Access Cab)**
    HINT:
    Follow the same procedures as for the LH visor.
23. **REMOVE VISOR ASSEMBLY RH (for Double Cab)**
    HINT:
    Follow the same procedures as for the LH visor.
24. **INSTALL ASSIST GRIP PLUG (w/ Curtain Shield Airbag) (See page IR-23)**
25. **INSTALL ASSIST GRIP SUB-ASSEMBLY (for Double Cab) (See page IR-23)**
26. **INSTALL ROOF CONSOLE BOX ASSEMBLY (for Access Cab) (See page IR-70)**
27. **INSTALL ROOF CONSOLE BOX ASSEMBLY (for Double Cab) (See page IR-23)**
28. **INSTALL FRONT PILLAR GARNISH LH (for Regular Cab) (See page IR-51)**
29. **INSTALL FRONT PILLAR GARNISH LH (for Access Cab) (See page IR-74)**
30. **INSTALL FRONT PILLAR GARNISH LH (for Double Cab) (See page IR-28)**
31. **INSTALL FRONT PILLAR GARNISH RH (for Regular Cab)**
    HINT:
    Follow the same procedures as for the front pillar garnish LH.
32. **REMOVE FRONT PILLAR GARNISH RH (for Access Cab)**
    HINT:
    Follow the same procedures as for the front pillar garnish LH.
33. **REMOVE FRONT PILLAR GARNISH RH (for Double Cab)**
    HINT:
    Follow the same procedures as for the front pillar garnish LH.

34. INSTALL FRONT DOOR OPENING TRIM WEATHERSTRIP LH

(a) Install the front door opening trim weatherstrip.

35. INSTALL FRONT DOOR OPENING TRIM WEATHERSTRIP RH

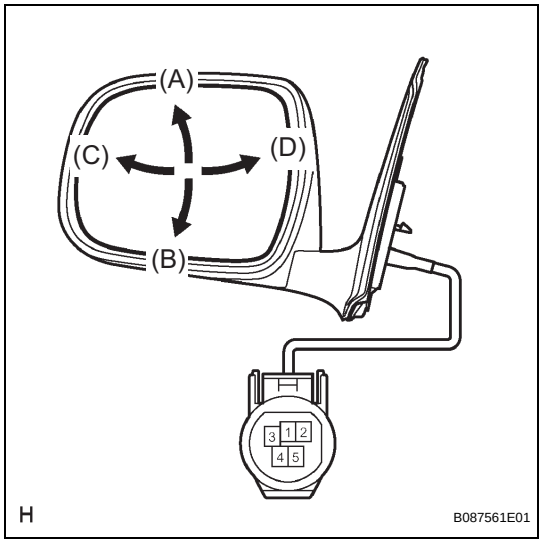
HINT:

Follow the same procedures as for the front opening trim weatherstrip LH.

36. INSTALL INNER REAR VIEW MIRROR ASSEMBLY (See page MI-5)

37. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)



INSPECTION

1. INSPECT OUTER REAR VIEW MIRROR ASSEMBLY LH

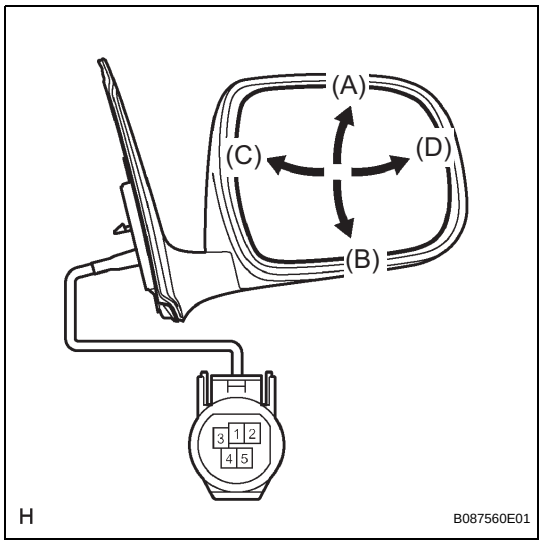
(a) Check the operation.

(1) Apply battery voltage to the terminals and check the operation of the mirror face, as shown in the table and illustration.

Standard

Measurement Condition	Mirror Operation
Battery positive (+) - 3 (MV) Battery negative (-) - 1 (M+)	Turns upward (A)
Battery positive (+) - 1 (M+) Battery negative (-) - 3 (MV)	Turns downward (B)
Battery positive (+) - 2 (MH) Battery negative (-) - 1 (M+)	Turns left (C)
Battery positive (+) - 1 (M+) Battery negative (-) - 2 (MH)	Turns right (D)

If the result is not as specified, replace the outer rear view mirror.



2. INSPECT OUTER REAR VIEW MIRROR ASSEMBLY RH

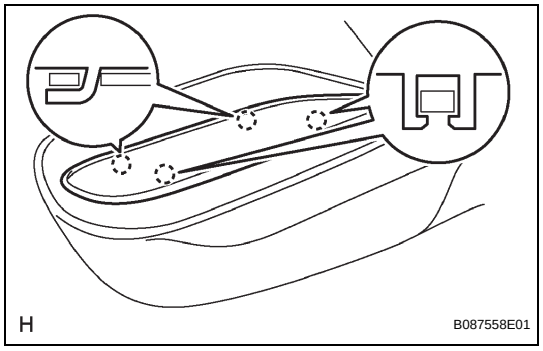
(a) Check the operation.

(1) Apply battery voltage to the terminals and check the operation of the mirror face, as shown in the table and illustration.

Standard

Measurement Condition	Mirror Operation
Battery positive (+) - 3 (MV) Battery negative (-) - 1 (M+)	Turns upward (A)
Battery positive (+) - 1 (M+) Battery negative (-) - 3 (MV)	Turns downward (B)
Battery positive (+) - 2 (MH) Battery negative (-) - 1 (M+)	Turns left (C)
Battery positive (+) - 1 (M+) Battery negative (-) - 2 (MH)	Turns right (D)

If the result is not as specified, replace the outer rear view mirror.



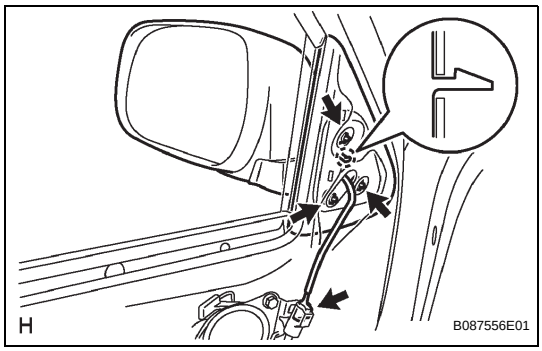
INSTALLATION

1. REMOVE OUTER REAR VIEW MIRROR

(a) Engage the 2 claws into the outer rear view mirror.

(b) Engage the 2 claws and install the outer rear view mirror.

MI



2. **REMOVE OUTER REAR VIEW MIRROR ASSEMBLY**
   (a) Engage the claw and install the outer rear view mirror.
   (b) Tighten the 3 nuts.
   Torque: 8.0 N*m (80 kgf*cm, 71 in.*lbf)
   (c) Connect the outer rear view mirror connector (w/ Power Mirror).
3. **REMOVE FRONT DOOR TRIM PANEL ASSEMBLY (w/ Power Window) (See page ED-29)**
4. **REMOVE FRONT DOOR TRIM PANEL ASSEMBLY (w/ o Power Window) (See page ED-48)**
5. **REMOVE POWER WINDOW REGULATOR MASTER SWITCH ASSEMBLY (for Double Cab) (See page ED-30)**
6. **REMOVE POWER WINDOW REGULATOR MASTER SWITCH ASSEMBLY (for Access Cab) (See page ED-30)**
7. **REMOVE FRONT DOOR WINDOW REGULATOR HANDLE ASSEMBLY (See page ED-49)**
8. **REMOVE FRONT DOOR LOWER FRAME BRACKET GARNISH (w/ Power Window) (See page ED-30)**
9. **REMOVE FRONT DOOR LOWER FRAME BRACKET GARNISH (w/o Power Window) (See page ED-49)**
10. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
    Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

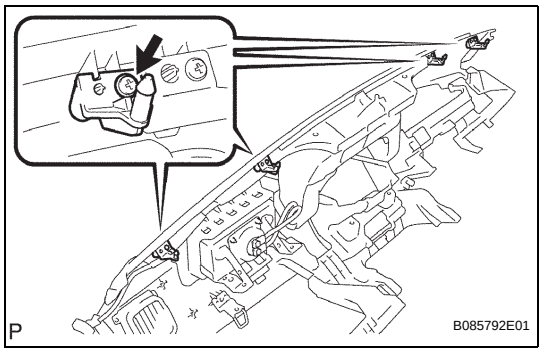
MI

INSTALLATION

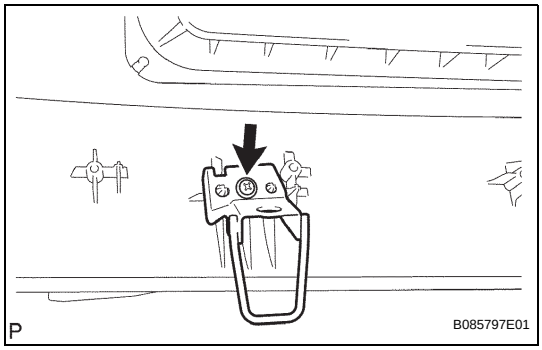
1. **INSTALL INSTRUMENT PANEL CUSHION**

2. **INSTALL NO. 1 INSTRUMENT PANEL PIN**
   (a) Install the 4 No. 1 instrument panel pins with the 4 screws <D>.

3. **INSTALL ANTENNA CORD SUB-ASSEMBLY (See page AV-95)**

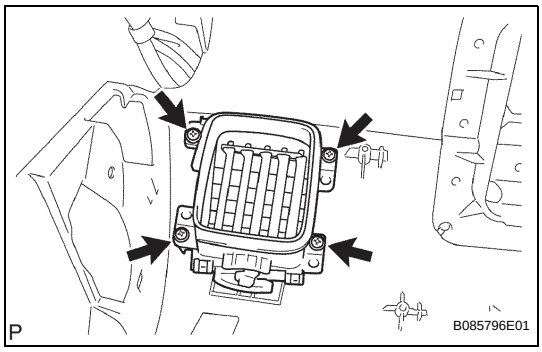


4. **INSTALL INSTRUMENT PANEL CENTER BRACKET SUB-ASSEMBLY**
   (a) Install the instrument panel center bracket sub-assembly with the screw <D>.

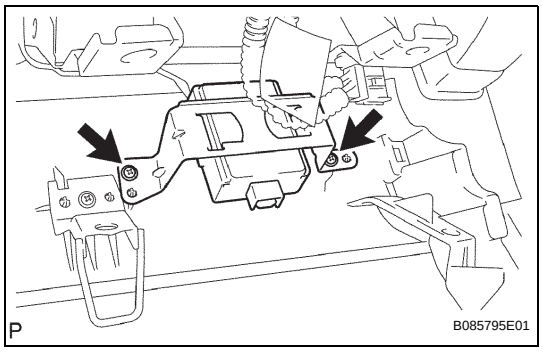


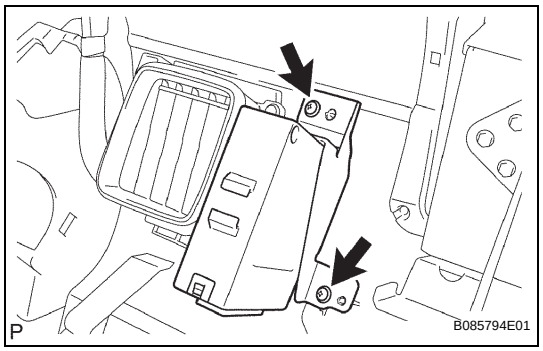
5. **INSTALL NO.1 INSTRUMENT PANEL REGISTER ASSEMBLY**
   (a) Install the instrument panel register with the 4 screws <D> with the fins closed.

6. **INSTALL FRONT PASSENGER AIRBAG ASSEMBLY**



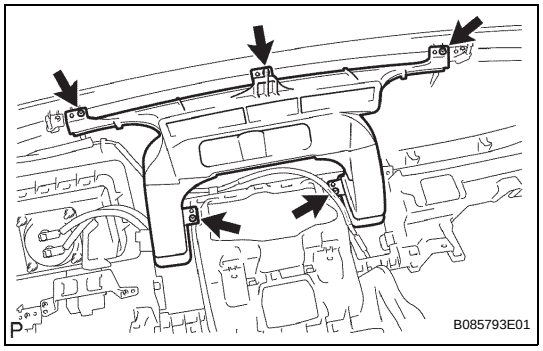
7. **INSTALL DOOR CONTROL RECEIVER**
   (a) Install the door control receiver with the 2 screws <D>.





8. INSTALL FOUR WHEEL DRIVE CONTROL ECU

(a) Install the four wheel drive control ECU with the 2 screws <D>.
Torque: 1.2 N*m (12 kgf*cm, 11 in.*lbf)



9. INSTALL DEFROSTER NOZZLE ASSEMBLY W/ NO.2 HEATER TO REGISTER DUCT

(a) Install the defroster nozzle w/ No. 2 heater to register duct with the 5 screws <D>.

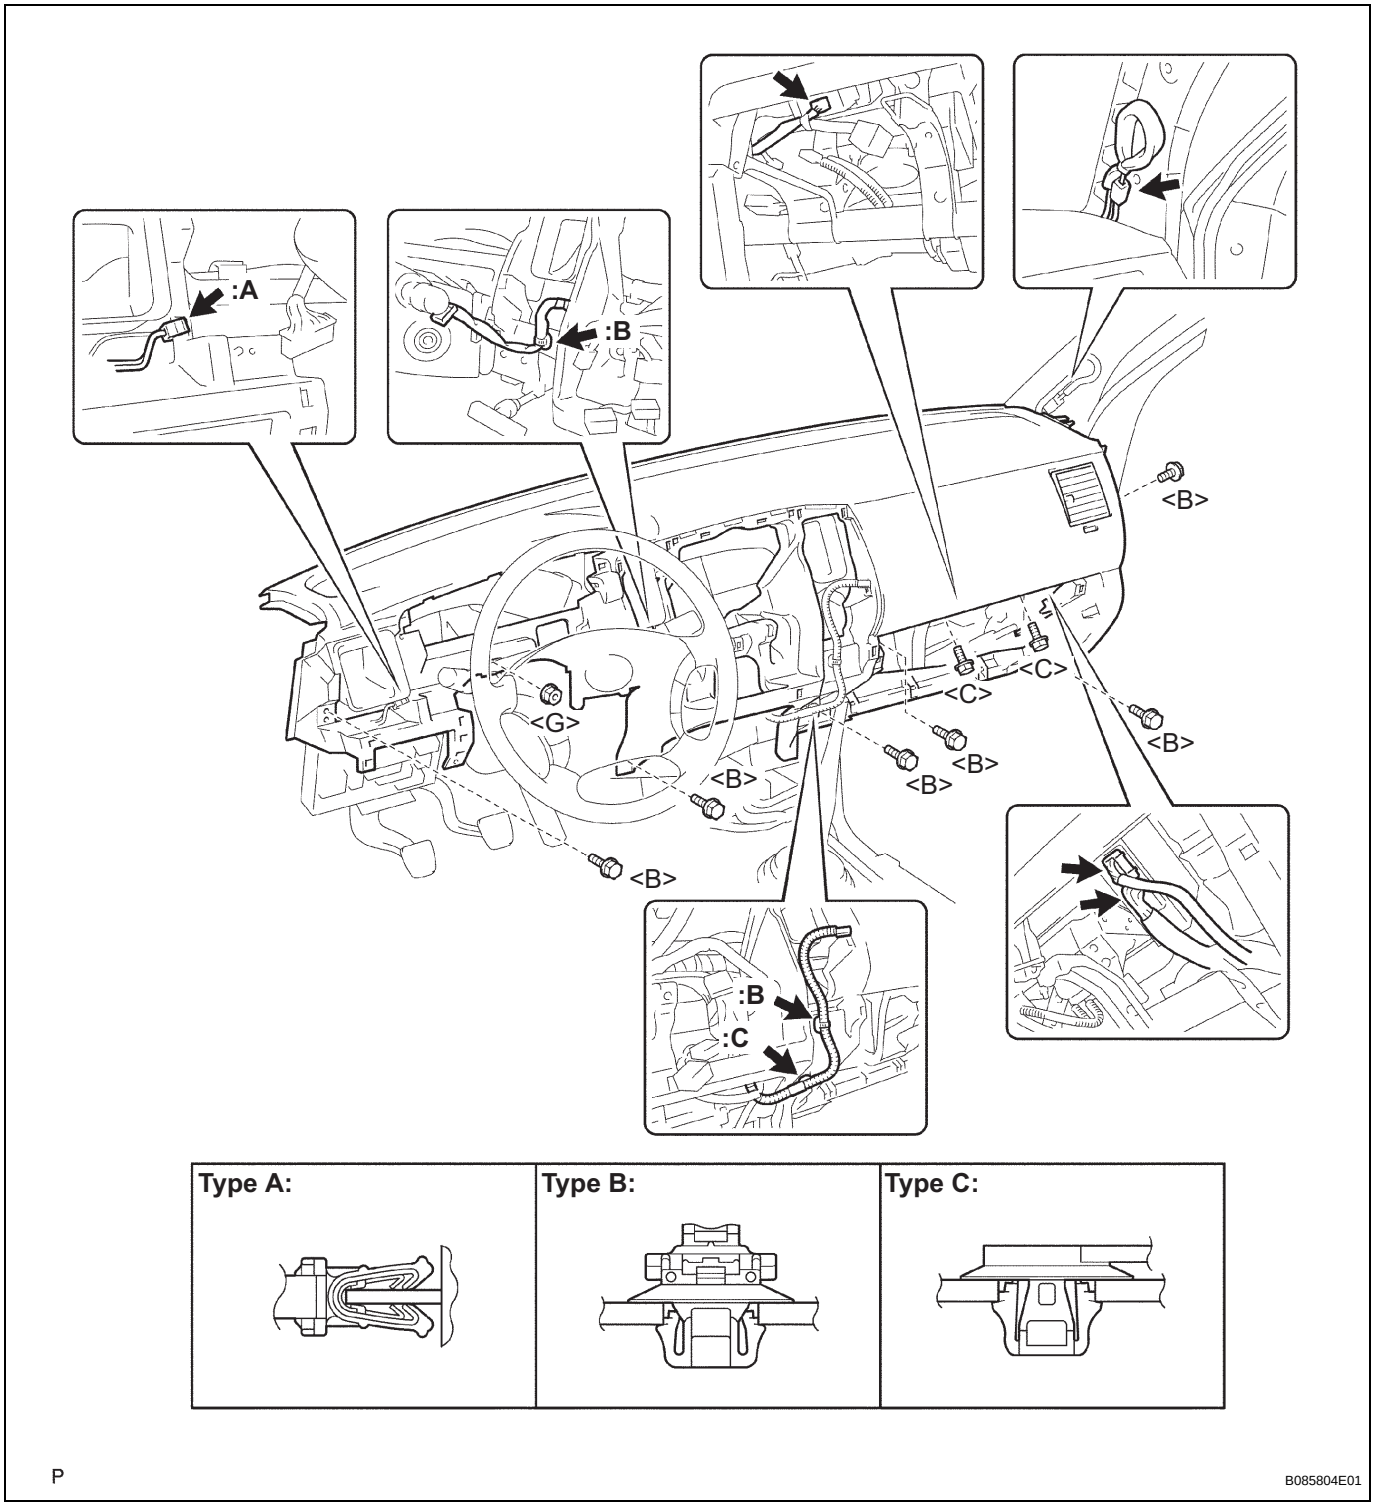
10. INSTALL INSTRUMENT PANEL SUB-ASSEMBLY W/ PASSENGER AIRBAG ASSEMBLY

(a) Install the instrument panel sub-assembly w/ passenger air bag assembly with the 8 bolts and nut.
Torque: 20 N*m (205 kgf*cm, 15 ft.*lbf) for bolt <C>

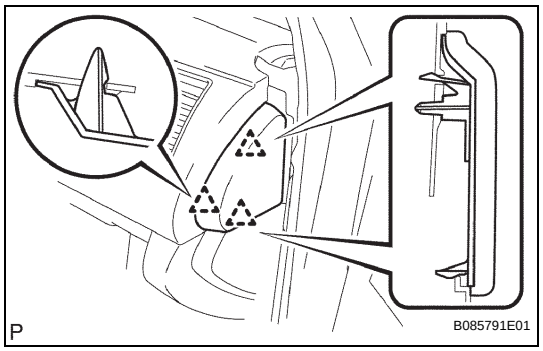
(b) Engage the 5 clamps and connect the 4 connectors.

IP

(c) Remove the protective tape from the steering column cover upper and steering wheel sub-assembly.

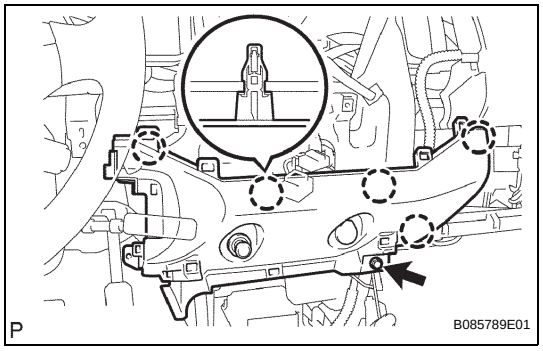


11. CONNECT PASSENGER AIRBAG CONNECTOR



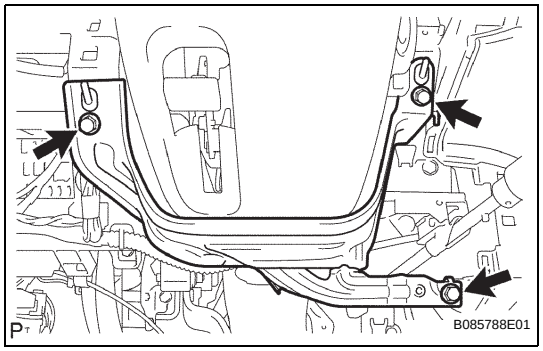
12. INSTALL INSTRUMENT SIDE PANEL RH

(a) Engage the 3 claws and install the instrument side RH.



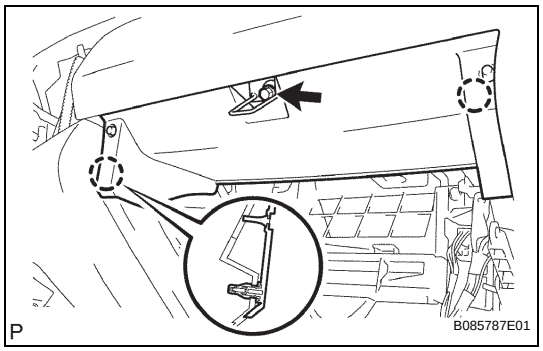
13. INSTALL INSTRUMENT LOWER COVER SUB-ASSEMBLY

(a) Connect the 2 connectors.
(b) Engage the 5 clips and install the instrument lower cover.
(c) Install the bolt <B>.



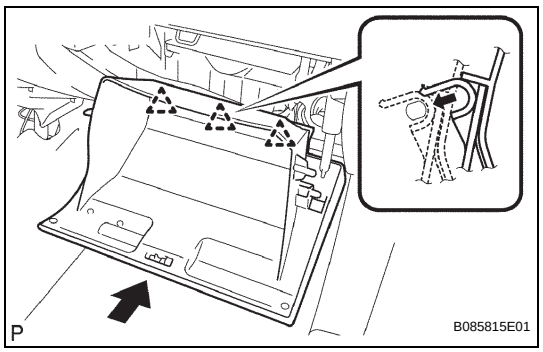
14. INSTALL LOWER INSTRUMENT PANEL LH

(a) Install the lower instrument panel LH with the 3 bolts <B>.



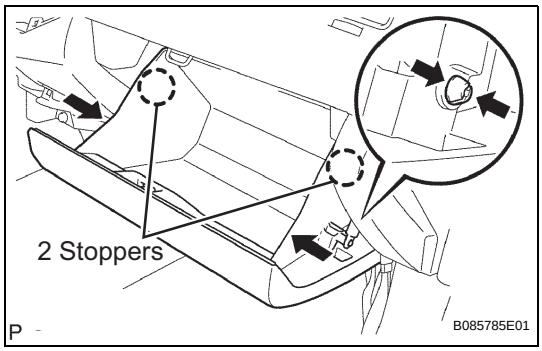
15. INSTALL INSTRUMENT PANEL LOWER FINISH PANEL SUB-ASSEMBLY RH

(a) Engage the 2 clips and install the instrument panel lower finish panel sub-assembly RH.
(b) Install the bolt <B>.

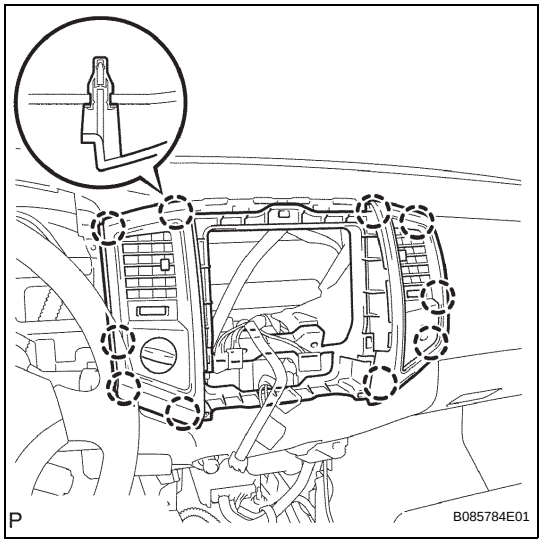


16. INSTALL GLOVE COMPARTMENT DOOR ASSEMBLY

(a) Install the glow compartment door assembly with 3 hinges, holding it horizontal.

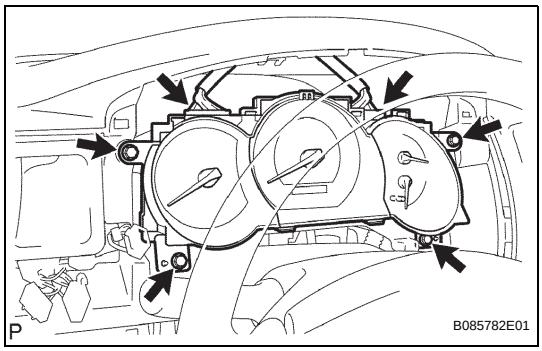


(b) Slightly deform the upper part of the glove compartment door assembly, and install the glove compartment door assembly.
(c) Install the glove compartment door stopper onto the glove compartment door.



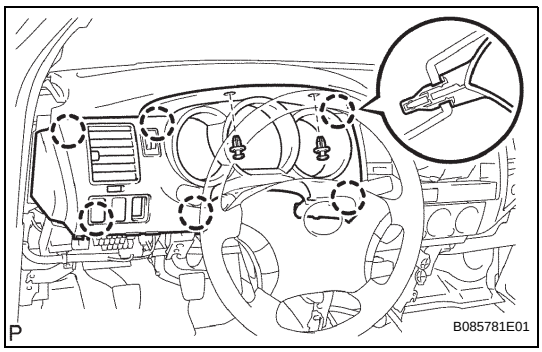
17. INSTALL INSTRUMENT CLUSTER CENTER FINISH PANEL SUB-ASSEMBLY

(a) Engage the 10 clips and install the instrument cluster center finish panel sub-assembly.



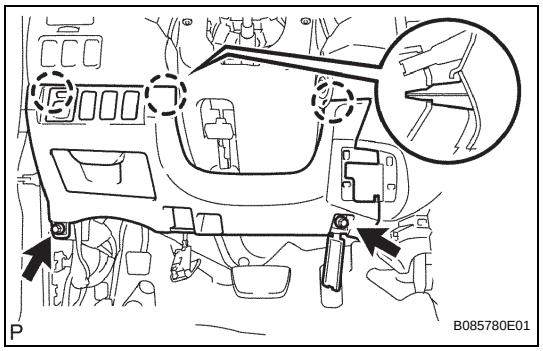
18. INSTALL COMBINATION METER ASSEMBLY

(a) Connect the 2 connectors.
(b) Install the combination meter assembly with the 4 screws <E>.
Torque: 7.0 N*m (71 kgf*cm, 62 in.*lbf)



19. INSTALL INSTRUMENT CLUSTER FINISH PANEL SUB-ASSEMBLY

(a) Connect the connectors.
(b) Engage the 6 clips and install the instrument cluster finish panel sub-assembly.
(c) Install the 2 clips.

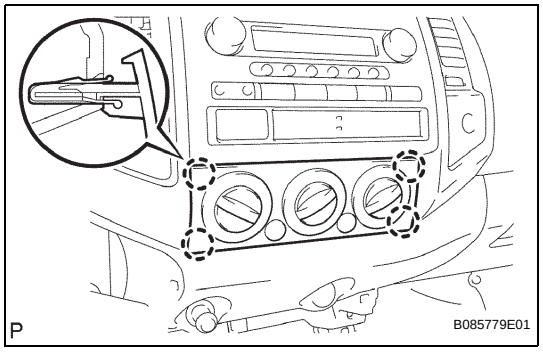


20. INSTALL LOWER NO. 1 INSTRUMENT PANEL FINISH PANEL

(a) Connect the connectors.
(b) Engage the 3 clips and install the lower NO. 1 instrument panel finish panel sub-assembly.
(c) Install the 2 bolts <B>.

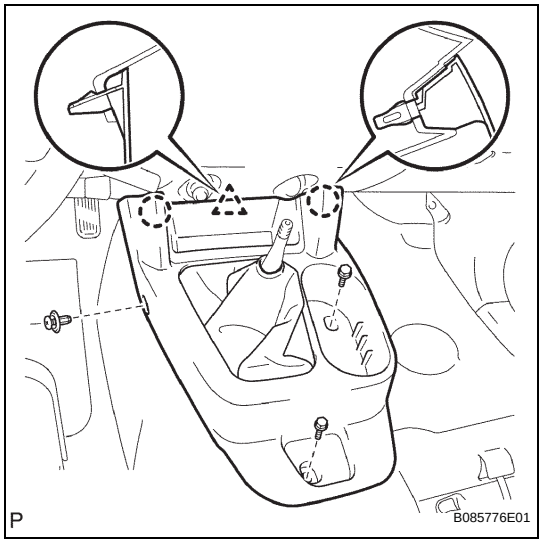
21. CONNECT HOOD LOCK CONTROL LEVER SUB-ASSEMBLY (See page ED-8)

22. INSTALL RADIO RECEIVER ASSEMBLY (See page AV-70)



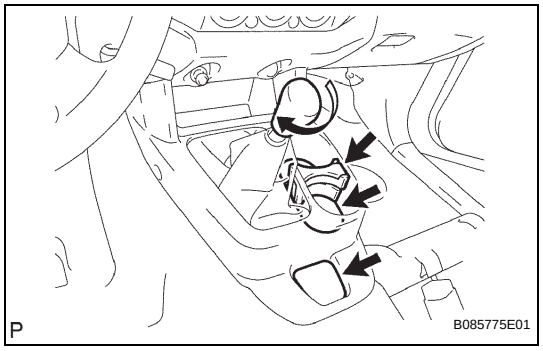
23. INSTALL AIR CONDITIONING CONTROL ASSEMBLY

(a) Connect the 2 connectors.
(b) Engage the 4 clips and install the air conditioning control assembly.

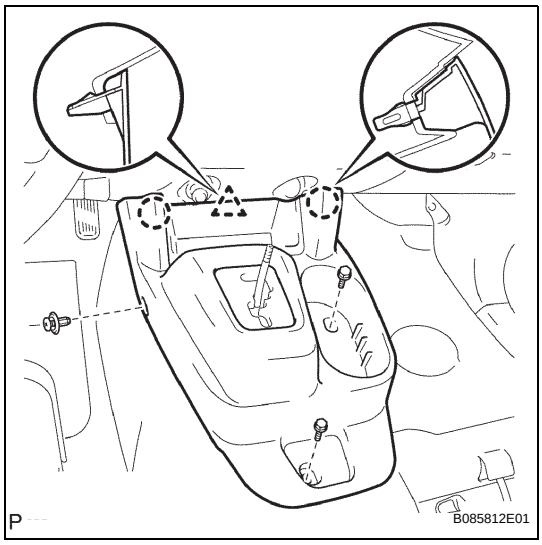


24. INSTALL FRONT CONSOLE BOX (for Manual Transmission on Bench Seat Type)

(a) Engage the 2 clips and claw, and install the front console box.
(b) Install the clip and 2 bolts <A>.

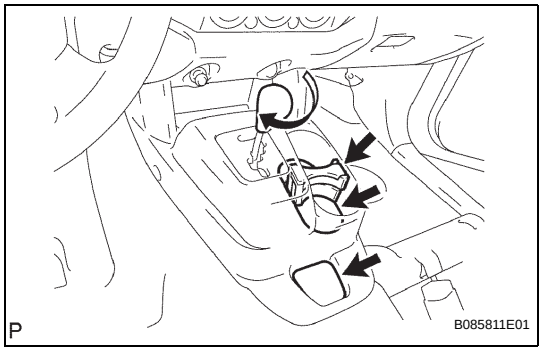


(c) Install the No. 2 box bottom mat.
(d) Install the instrument panel cup holder.
(e) Install the box bottom mat.
(f) Install the shift knob.

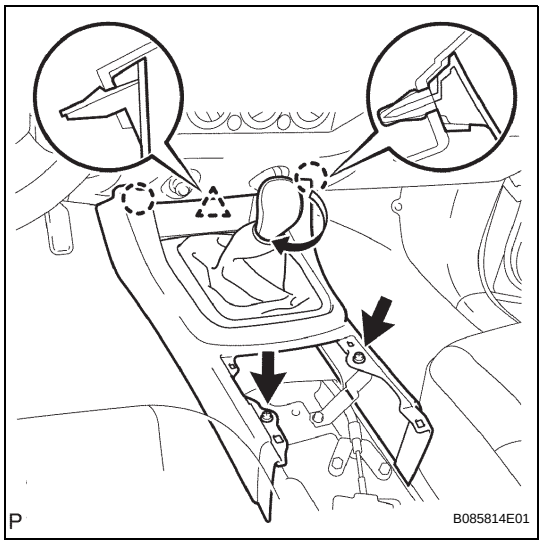


25. INSTALL FRONT CONSOLE BOX (for Automatic Transmission on Bench Seat Type)

(a) Engage the 2 clips and claw, and install the front console box.
(b) Install the clip and 2 bolts <A>.

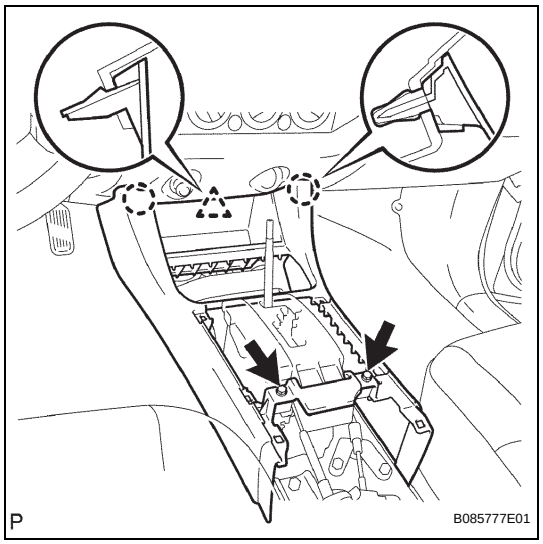


(c) Install the No. 2 box bottom mat.
(d) Install the instrument panel cup holder.
(e) Install the box bottom mat.
(f) Install the shift knob.



26. INSTALL FRONT CONSOLE BOX (for Manual Transmission on Separate Seat Type)

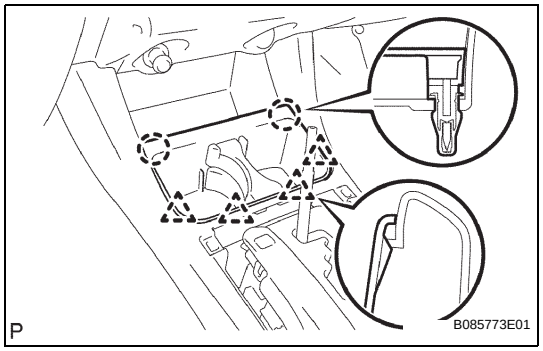
(a) Engage the 2 clips and claw, and install the front console box.
(b) Install the 2 screws <F>.
(c) Install the shift knob.



27. INSTALL FRONT CONSOLE BOX (for Automatic Transmission on Separate Seat Type)

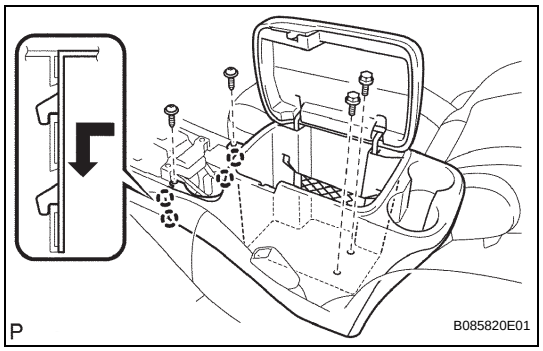
(a) Engage the 2 clips and claw, and install the front console box.

(b) Install the 2 screws <F>.



28. INSTALL INSTRUMENT PANEL CUP HOLDER TRAY (for Automatic Transmission on Separate Seat Type)

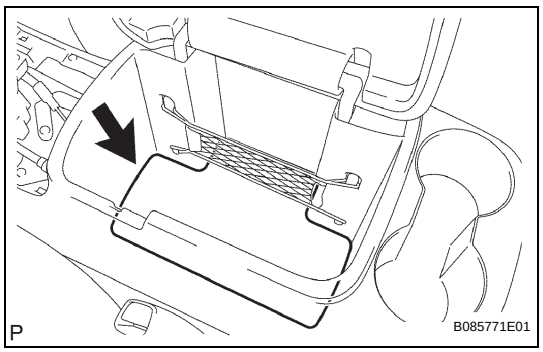
(a) Engage the 2 clips and 4 claws, and install the instrument panel cup holder tray.



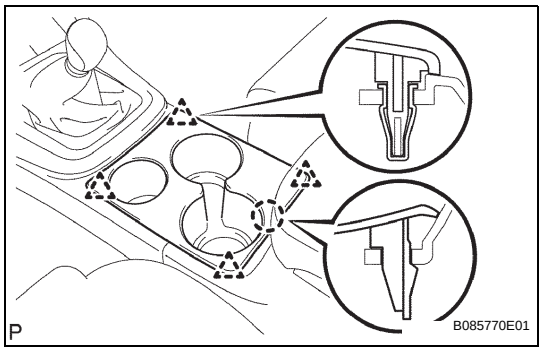
29. INSTALL REAR CONSOLE BOX ASSEMBLY (for Separate Seat Type)

(a) Engage the 4 claws and install the console box rear.

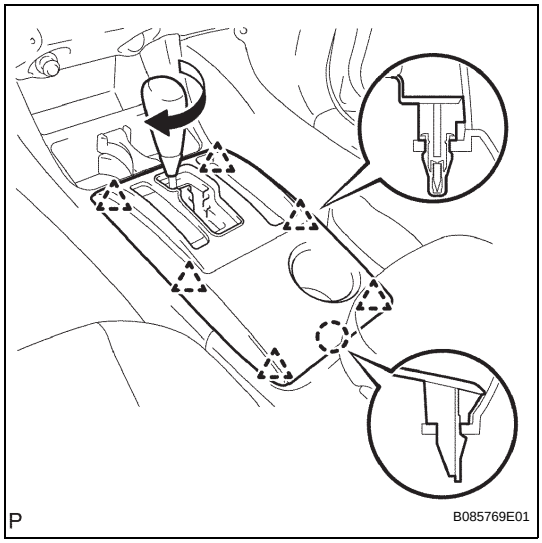
(b) Install the 2 screws <F> and 2 bolts <B>.



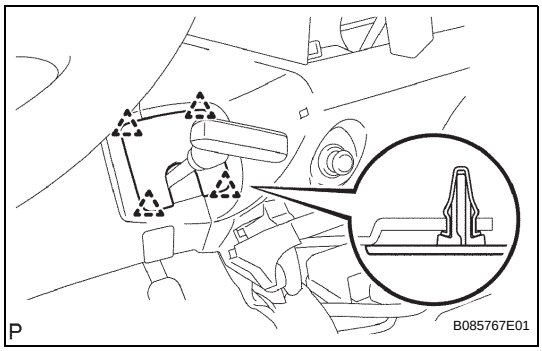
(c) Install the console box carpet.



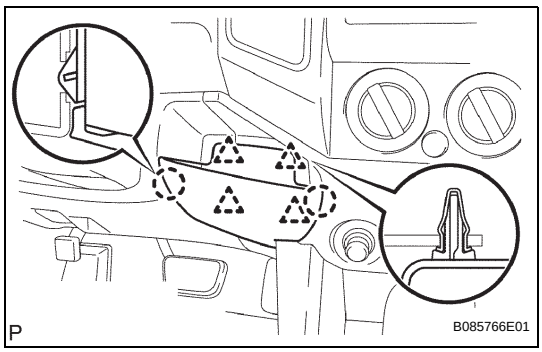
30. **INSTALL CONSOLE UPPER REAR PANEL SUB-ASSEMBLY (for Manual Transmission on Separate Seat Type)**
    (a) Engage the 4 clips and claw, and remove the console upper panel sub-assembly.



31. **INSTALL CONSOLE UPPER REAR PANEL SUB-ASSEMBLY (for Automatic Transmission on Separate Seat Type)**
    (a) Engage the 6 clips and claw, and remove the console upper rear panel.
    (b) Install the shift knob.



32. **INSTALL INSTRUMENT PANEL HOLE COVER (for Lever Type Parking Brake)**
    (a) Engage the 4 clips and install the instrument panel hole cover.



33. **INSTALL INSTRUMENT PANEL UNDER TRAY (for Pedal Type Parking Brake)**
    (a) Engage the 4 clips and 2 claws, and install the instrument panel under tray.

34. **INSTALL FRONT PILLAR GARNISH LH (for Regular Cab) (See page IR-51)**

35. **INSTALL FRONT PILLAR GARNISH LH (for Access Cab) (See page IR-74)**

36. **INSTALL FRONT PILLAR GARNISH LH (for Double Cab) (See page IR-28)**

37. **INSTALL FRONT PILLAR GARNISH RH (for Regular Cab) (See page IR-52)**

38. **INSTALL FRONT PILLAR GARNISH RH (for Access Cab) (See page IR-74)**

39. **INSTALL FRONT PILLAR GARNISH RH (for Double Cab) (See page IR-28)**
40. **INSTALL FRONT DOOR OPENING TRIM WEATHERSTRIP LH**
41. **INSTALL FRONT DOOR OPENING TRIM WEATHERSTRIP RH**
42. **INSTALL COWL SIDE TRIM BOARD LH (for Regular Cab) (See page IR-52)**
43. **INSTALL COWL SIDE TRIM BOARD LH (for Access Cab) (See page IR-75)**
44. **INSTALL COWL SIDE TRIM BOARD LH (for Double Cab) (See page IR-29)**
45. **INSTALL COWL SIDE TRIM BOARD RH (for Regular Cab) (See page IR-52)**
46. **INSTALL COWL SIDE TRIM BOARD RH (for Access Cab) (See page IR-75)**
47. **INSTALL COWL SIDE TRIM BOARD RH (for Double Cab) (See page IR-29)**
48. **INSTALL FRONT DOOR SCUFF PLATE LH (for Regular Cab) (See page IR-52)**
49. **INSTALL FRONT DOOR SCUFF PLATE LH (for Access Cab) (See page IR-75)**
50. **INSTALL FRONT DOOR SCUFF PLATE LH (for Double Cab) (See page IR-29)**
51. **INSTALL FRONT DOOR SCUFF PLATE RH (for Regular Cab) (See page IR-52)**
52. **INSTALL FRONT DOOR SCUFF PLATE RH (for Access Cab) (See page IR-75)**
53. **INSTALL FRONT DOOR SCUFF PLATE RH (for Double Cab) (See page IR-29)**
54. **INSTALL FRONT FLOOR FOOTREST (See page IR-1)**
55. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
    Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
56. **INSPECT SRS WARNING LIGHT**
    (See page RS-28)

IP

DATA LIST / ACTIVE TEST

1. DATA LIST

HINT:

By reading the DATA LIST displayed on a intelligent tester, you can check values, including those of the switches, sensors, and actuators, without removing any parts. Reading the DATA LIST as the first step of troubleshooting is one method of shortening diagnostic time.

NOTICE:

In the table below, the values listed under Normal Conditions are for reference only. Do not depend solely on these values when determining whether or not a part is faulty.

(a) Warm up the engine.
(b) Turn the ignition switch to OFF
(c) Connect a intelligent tester to the DLC3.
(d) Turn the ignition switch to ON.
(e) Turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST.
(g) Check the values by referring to the table below.

Intelligent Tester Display	Measurement Item: Range (Display)	Normal Condition *	Diagnostic Note
INJECTOR	Injection period of No. 1 cylinder: Min.: 0 ms, Max.: 32.64 ms	1.8 to 3.8 ms: Idling	-
IGN ADVANCE	Ignition timing advance for No. 1 cylinder: Min.: -64 deg., Max.: 63.5 deg.	BTDC 4 to 17°: Idling	-
CALC LOAD	Calculated load by ECM: Min.: 0 %, Max.: 100 %	• 11 to 26 %: Idling • 12 to 27 %: Running without load (2,500 rpm)	-
VEHICLE LOAD	Vehicle load: Min.: 0 %, Max.: 25700 %	Actual vehicle load	-
MAF	Air flow rate from MAF meter: Min.: 0 g/sec, Max.: 655.35 g/sec	2.0 to 4.5 g/sec: Idling	If value approximately 0.0 g/sec: • Mass air flow meter power source circuit open • VG circuit open or short If value 160.0 g/sec or more: • E2G circuit open
ENGINE SPD	Engine speed: Min.: 0 rpm, Max.: 16,383.75 rpm	650 +- 50 rpm: Idling	-
VEHICLE SPD	Vehicle speed: Min.: 0 km/h, Max.: 255 km/h	Actual vehicle speed	Speed indicated on speedometer
COOLANT TEMP	Engine coolant temperature: Min.: -40°C, Max.: 140°C	80 to 100°C (176 to 212°F): After warming up	• If value -40°C (-40°F): sensor circuit open • If value 140°C (284°F): sensor circuit shorted
INTAKE AIR	Intake air temperature: Min.: -40°C, Max.: 140°C	Equivalent to ambient air temperature	• If value -40°C (-40°F): sensor circuit open • If value 140°C (284°F): sensor circuit shorted
SECONDARY AIR	Secondary air injection system status: ON or OFF	ON: Secondary air system operation	-
AIR-FUEL RATIO	Air-fuel ratio: Min.: 0, Max.: 1.999	0.8 to 1.2: Idling	-

Intelligent Tester Display	Measurement Item: Range (Display)	Normal Condition *	Diagnostic Note
PURGE DENSITY	Learning value of purge density: Min.: -50, Max.: 350	-40 to 0 %: Idling	Service data
PURGE FLOW	Purge flow: Min.: 0 %, Max.: 102.4 %	0 to 100 %: Idling	-
EVAP PURGE VSV	EVAP (Purge) VSV control duty: Min.: 0 %, Max.: 100 %	0 to 100 %: During idling	Order signal from ECM
VAPOR PRESS	Vapor pressure: Min.: 33.853 kPa, Max.: 125.596 kPa	Approximately 100 kPa: Ignition switch ON	EVAP system pressure monitored by canister pressure sensor
VAPOR PRESS CALC	Calculated EVAP system pressure: Min.: -5.632 kPa, Max.: 715.264 kPa	Approximately 100 kPa: Ignition switch ON	-
KNOCK CRRT VAL	Correction learning value of knocking: Min.: -64 °CA, Max.: 1,984 °CA	0 to 19 °CA: Driving, 44 mph (70 km/h)	Service data
KNOCK FB VAL	Feedback value of knocking: Min.: -64 °CA, Max.: 1,984 °CA	-19 to 0 °CA Driving, 44 mph (70 km/h)	Service data
EVAP VAPOR PRES	EVAP vapor pressure: Min.: 0 kPa, Max.: 327.675 kPa	Approximately 100 kPa: Ignition switch ON	-
ACCEL POS #1	Absolute No. 1 Accelerator Pedal Position (APP): Min.: 0 %, Max.: 100 %	10 to 22 %: Accelerator pedal released 54 to 86 %: Accelerator pedal fully depressed	-
ACCEL POS #2	Absolute No. 2 APP: Min.: 0 %, Max.: 100 %	12 to 42 %: Accelerator pedal released 66 to 98 %: Accelerator pedal fully depressed	-
ACCEL POS #1	No. 1 APP sensor voltage: Min.: 0 V, Max.: 4.98 V	-	ETCS freeze data
ACCEL POS #2	No. 2 APP sensor voltage: Min.: 0 V, Max.: 4.98 V	-	ETCS freeze data
ACCEL POS #1	No. 1 APP sensor voltage: Min.: 0 V, Max.: 5 V	0.5 to 1.1 V: accelerator pedal released 2.6 to 4.5 V: or pedal fully depressed	-
ACCEL POS #2	No. 2 APP sensor voltage: Min.: 0 V, Max.: 5 V	1.2 to 2.0 V: accelerator pedal released 3.4 to 5.3 V: accelerator pedal fully depressed.	-
ACCEL IDL POS	Whether or not accelerator pedal position sensor detecting idle: ON or OFF	ON: Idling	-
THRTL LEARN VAL	Throttle valve fully closed (learned value): Min.: 0 V, Max.: 5 V	0.4 to 0.8 V	-
ACCEL SSR #1 AD	No.1 Accelerator fully closed value (AD): Min.: 0 V, Max.: 4.9804 V	-	ETCS service data
ACCEL LRN VAL#1	No.1 Accelerator fully closed learning value: Min.: 0, Max.: 124.512	-	ETCS service data
ACCEL LRN VAL#2	No.2 Accelerator fully closed learning value: Min.: 0, Max.: 124.512	-	ETCS service data
FAIL #1	Whether or not fail safe function executed: ON or OFF	ON: ETCS has failed	-
FAIL #2	Whether or not fail safe function executed: ON or OFF	ON: ETCS has failed	-
ST1	Starter signal: ON or OFF	ON: Cranking	-

Intelligent Tester Display	Measurement Item: Range (Display)	Normal Condition *	Diagnostic Note
SYSGUARD JUDGE	System guard: ON or OFF	-	ETCS service data
OPN MALFUNCTION	Open side malfunction: ON or OFF	-	ETCS service data
THROTTLE POS	Absolute throttle position sensor: Min.: 0 %, Max.: 100 %	• 10 to 24 %: Throttle fully closed • 64 to 96 %: Throttle fully open	Read value with intrusive operation (active test)
THROTTL IDL POS	Whether or not throttle position sensor detecting idle: ON or OFF	ON: Idling	-
THRTL REQ POS	Throttle requirement position: Min.: 0 V, Max.: 5 V	0.5 to 1.0 V: Idling	-
THROTTLE POS	Throttle sensor positioning: Min.: 0 % Max.: 100 %	0 to 10 %: Idling	Calculated value based on VTA1
THROTTLE POS #2	Throttle sensor positioning #2: Min.: 0 %, Max.: 100 %	-	Calculated value based on VTA2
THROTTLE POS #1	No. 1 Throttle position sensor output voltage: Min.: 0 V, Max.: 4.9 V	-	ETCS freeze data
THROTTLE POS #2	No.2 Throttle position sensor output voltage: Min.: 0 V, Max.: 4.9 V	-	ETCS freeze data
THROTTLE POS #1	No. 1 Throttle position: Min.: 0 V, Max.: 5 V	• 0.5 to 1.2 V: Throttle fully closed • 3.2 to 4.8 V: Throttle fully opened	-
THROTTLE POS #2	No. 2 Throttle position: Min.: 0 V, Max.: 5 V	• 2.0 to 2.9 V: Throttle fully closed • 4.6 to 5.5 V: Throttle fully open	Read value with intrusive operation (active test)
THRTL COMND VAL	Throttle position command value: Min.: 0 V, Max.: 4.9804 V	0.5 to 4.8 V	ETCS service data
THROTTLE SSR #1	No. 1 Throttle sensor opener position: Min.: 0 V, Max.: 4.9804 V	0.6 to 1.0 V	ETCS service data
THROTTLE SSR #2	No. 2 Throttle sensor opener position: Min.: 0 V, Max.: 4.9804 V	2.0 to 2.6 V	ETCS service data
THRTL SSR #1 AD	No.1 Throttle sensor opener position (AD): Min.: 0 V, Max.: 4.9804 V	0.6 to 0.9 V	ETCS service data
THROTTLE MOT	Whether or not throttle motor control permitted: ON or OFF	ON: Idling	Read value with ignition switch ON (Do not start engine)
THROTTLE MOT	Throttle motor current: Min.: 0 A, Max.: 80 A	0 to 3.0 A: Idling	-
THROTTLE MOT	Throttle motor: Min.: 0 % Max.: 100 %	0.5 to 40 %: Idling	-
THROTTLE MOT	Throttle motor current: Min.: 0 A, Max.: 19.92 A	0 to 3.0 A: Idling	-
THROTL OPN DUTY	Throttle motor opening duty ratio: Min.: 0 %, Max.: 100 %	0 to 40 %: Idling	When accelerator pedal depressed, duty ratio increased
THROTL CLS DUTY	Throttle motor closed duty ratio:: Min.: 0 %, Max.: 100 %	0 to 40 %: Idling	When accelerator pedal released quickly, duty ratio increased
THRTL MOT (OPN)	Throttle motor duty ratio (open): Min.: 0 %, Max.: 100 %	-	ETCS service data
THRTL MOT (CLS)	Throttle motor duty ratio (close): Min.: 0 %, Max.: 100 %	-	ETCS service data

Intelligent Tester Display	Measurement Item: Range (Display)	Normal Condition *	Diagnostic Note
O2S B1 S2	Heated oxygen sensor output voltage for bank 1 sensor 2: Min.: 0 V, Max.: 1.275 V	0 to 0.9 V: Driving 44 mph (70 km/h)	Performing INJ VOL or A/F CONTROL function of ACTIVE TEST enables technician to check voltage output of sensor
AFS B1 S1	A/F sensor output voltage for bank 1 sensor 1: Min.: 0 V, Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing INJ VOL or A/F CONTROL function of ACTIVE TEST enables technician to check voltage output of sensor
TOTAL FT #1	Total fuel trim of bank 1 Average value for fuel trim system of bank 1: Min.: -0.5, Max.: 0.496	-0.2 to 0.2: Idling	-
SHORT FT #1	Short-term fuel trim of bank 1: Min.: -100 %, Max.: 99.2%	0 +- 20 %	Short-term fuel compensation used to maintain air-fuel ratio at stoichiometric air-fuel ratio
LONG FT #1	Long-term fuel trim of bank 1: Min.: -100 %, Max.: 99.2 %	0 +- 20 %	Overall fuel compensation carried out in long-term to compensate continual deviation of short-term fuel trim from central value
FUEL SYS #1	Fuel system status (Bank1): OL or CL or OL DRIVE or OL FAULT or CL FAULT	CL: Idling after warming up	• OL (Open Loop): Has not yet satisfied conditions to go closed loop • CL (Closed Loop): Using heated oxygen sensor as feedback for fuel control • OL DRIVE: Open loop due to driving conditions (fuel enrichment) • OL FAULT: Open loop due to detected system fault • CL FAULT: Closed loop but heated oxygen sensor, which used for fuel control malfunctioning
O2FT B1 S2	Short-term fuel trim associated with bank 1 sensor 2: Min.: -100 %, Max.: 99.2 %	-	-
AF FT B1 S1	Short-term fuel trim associated with bank 1 sensor 1: Min.: 0, Max.: 1.999	• Value less than 1 (0.000 to 0.999) = Lean • Stoichiometric air-fuel ratio=1 • Value greater than 1 (1.001 to 1.999) = Rich	-
CAT TEMP B1S1	Catalyst temperature (Bank 1, Sensor 1): Min.: -40, Max.: 6,513.5°C	-	-
CAT TEMP B1S2	Catalyst temperature (Bank 1, Sensor 2): Min.: -40, Max.: 6,513.5°C	-	-
INI COOL TEMP	Initial engine coolant temperature: Min.: -40°C, Max.: 140°C	Engine coolant temperature when engine started	Service data
INI INTAKE TEMP	Initial intake air temperature: Min.: -40°C, Max.: 140°C	Intake air temperature when engine started	Service data
INJ VOL	Injection volume (cylinder 1): Min.: 0 ml, Max.: 2.048 ml	0 to 0.5 ml	Quantity of fuel injection volume for 10 times
AIR PMP PRS(A)	Air pump pressure (absolute): Min.: 0 kPa, Max.: 320 kPa	Atmospheric pressure +2.5 kPa or more: Air pump ON, Air switching valve open Close to atmospheric pressure: Air pump OFF, Air switching valve close	(See page ES-354)

Intelligent Tester Display	Measurement Item: Range (Display)	Normal Condition *	Diagnostic Note
AIR PMP PLS PRS	Air pump pulsation pressure: Min.: 0 kPa, Max.: 639.9 kPa	-	Cumulative pulsation pressure calculated by ECM (See page ES-354)
STARTER SIG	Starter signal: ON or OFF	ON: Cranking	-
PS SW	Power steering signal: ON or OFF	ON: Power steering operation	-
PS SIGNAL	Power steering signal: ON or OFF	ON: When steering wheel first turned after battery terminals connected	This signal status usually ON until battery terminals disconnected
CTP SW	Closed throttle position switch: ON or OFF	• ON: Throttle fully closed • OFF: Throttle open	-
A/C SIG	A/C signal: ON or OFF	ON: A/C ON	-
ELECT LOAD SIG	Electrical load signal: ON or OFF	ON: Headlights or defogger turned ON	-
STOP LIGHT SW	Stop light switch: ON or OFF	ON: Brake pedal depressed.	-
+BM	Whether or not electronic throttle control system power input: ON or OFF	ON: Idling	-
+BM VOLTAGE	+BM voltage: Min.: 0, Max.: 19.92	10 to 15 V: Idling	ETCS service data
BATTERY VOLTAGE	Battery voltage: Min.: 0 V, Max.: 65.535 V	9 to 14 V: Idling	-
ACTUATOR POWER	Actuator power supply: ON or OFF	ON: Idling	ETCS service data
ATM PRESSURE	Atmospheric pressure: Min.: 0 kPa, Max.: 150 kPa	Equivalent to atmospheric pressure (absolute pressure)	-
SECOND AIR VSV	Secondary air injection system status	ON: Secondary air injection system operation	-
ACT VSV	A/C cut status for Active Test: ON or OFF	-	Active Test support data
EVAP (Purge) VSV	VSV status for EVAP control: ON or OFF	-	Active Test support data
FUEL PUMP / SPD	Fuel pump/speed status: ON or OFF	-	Active Test support data
VVT CTRL B1	VVT control status: ON or OFF	-	Active Test support data
VACUUM PUMP	Key-off EVAP system pump status: ON or OFF	-	Active Test support data
EVAP VENT VAL	Key-off EVAP system vent valve status: ON or OFF	-	Active Test support data
TC/TE1	TC and TE1 terminals of DLC3: ON or OFF	-	-
AI STATUS	Secondary air injection system operation prohibition: OK or NG	-	(See page ES-354)
VVTL AIM ANGL #1	VVT aim angle (bank 1): Min.: 0 %, Max.: 100 %	0 %: Idling	VVT duty signal value during intrusive operation
VVT CHNG ANGL #1	VVT change angle: Min.: 0°FR, Max.: 60°FR	0 to 5 °FR: Idling	Displacement angle during intrusive operation
VVT OCV DUTY B1	VVT OCV operation duty: Min.: 0 %, Max.: 100 %	0 %: Idling	Requested duty value for intrusive operation
FC IDL	Fuel cut idle: ON or OFF	ON: Fuel cut operation	FC IDL = "ON" when throttle valve fully closed and engine speed over 2,800 rpm

Intelligent Tester Display	Measurement Item: Range (Display)	Normal Condition *	Diagnostic Note
FC TAU	Fuel cut TAU: Fuel cut during very light load: ON or OFF	ON: Fuel cut operation	Fuel cut being performed under very light load to prevent engine combustion from becoming incomplete
IGNITION	Ignition counter: Min.: 0, Max.: 400	0 to 400	-
CYL #1, #2, #3, #4	Misfire ratio of cylinder 1 to 4: Min.: 0, Max.: 255	0 %	This item displayed in only idling
CYL ALL	All cylinders misfire rate: Min.: 0, Max.: 255	0 to 35	-
MISFIRE RPM	Engine RPM for first misfire range: Min.: 0 rpm, Max.: 6,375 rpm	0 rpm: Misfire 0	-
MISFIRE LOAD	Engine load for first misfire range: Min.: 0 g/rev, Max.: 3.98 g/rev	0 g/rev: Misfire 0	-
MISFIRE MARGIN	Misfire monitoring: MIn.: -100 %, Max.: 99.22 %	-100 to 99.2 %	Misfire detecting margin
#CODES	#Codes: Min.: 0, Max.: 255	-	Number of detected DTCs
CHECK MODE	Check mode: ON or OFF	ON: Check mode ON	(See page ES-43)
SPD TEST	Check mode result for vehicle speed sensor: COMPL or INCOMPL	-	-
AS TEST	Check mode result for secondary air injection system: COMPL or INCOMPL	-	-
MISFIRE TEST	Check mode result for misfire monitor: COMPL or INCOMPL	-	-
OXS1 TEST	Check mode result for HO2 sensor : COMPL or INCOMPL	-	-
A/F SSR TEST B1	Check mode result for air-fuel ratio sensor : COMPL or INCOMPL	-	-
MIL	MIL status: ON or OFF	ON: MIL ON	-
MIL ON RUN DIST	MIL ON Run Distance: Min.: 0 second, Max.: 65,535 seconds	Distance after DTC detected	-
MIL ON RUN TIME	Running time from MIL ON: Min.: 0 minute, Max.: 65,535 minutes	Equivalent to running time after MIL ON	-
ENG RUN TIME	Engine run time: Min.: 0 second, Max.: 65,535 seconds	Time after engine start	Service data
TIME DTC CLEAR	Time after DTC cleared: Min.: 0 minute, Max.: 65,535 minutes	Equivalent to time after DTCs erased	-
DIST DTC CLEAR	Distance after DTC cleared: Min.: 0 km/h, Max.: 65535 km/h	Equivalent to drive distance after DTCs erased	-
WU CYC DTC CLEAR	Warm-up cycle after DTC cleared: Min.: 0, Max.: 255	-	Number of warm-up cycles after DTC cleared
MODEL CODE	Model code:	-	Identifying model code: TRN2###
ENGINE TYPE	Engine type:	-	Identifying engine type: 2TR
CYLINDER NUMBER	Cylinder number: Min.: 0, Max.: 255	-	Identifying cylinder number: 4 or 6
TRANSMISSION	Transmission type:	-	Identifying transmission type: MT, ECT(5AT) or ECT(4AT)

Intelligent Tester Display	Measurement Item: Range (Display)	Normal Condition *	Diagnostic Note
DESTINATION	Destination	-	Identifying destination: A (America)
MODEL YEAR	Model year: Min.: 0, Max.: 255	-	Identifying model year: 200#
SYSTEM	System identification	-	Identifying engine system: GASLIN (gasoline engine)

*1: If no idling conditions are specified, transmission gear selector lever should be in the N or P position, and the A/C switch and all accessory switches should be OFF.

2. ACTIVE TEST

HINT:

Performing an ACTIVE TEST enables components including the relays, VSV (Vacuum Switching Valve), and actuators, to be operated without removing any parts. The ACTIVE TEST can be performed with a intelligent tester. Performing an ACTIVE TEST as the first step of troubleshooting is one method of shortening diagnostic time.

DATA LIST can be displayed during ACTIVE TESTs.

(a) Connect a intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST.
(e) Perform the ACTIVE TEST by referring to the table below.

ES

Intelligent Tester Displays	Test Details	Control Ranges	Diagnostic Notes
INJ VOL	Change injection volume	Between -12 % and 25 %	• All injectors tested at same time • Perform test at less than 3,000 rpm • Injection volume can be changed in 1 % graduations within control range
A/F CONTROL	Change injection volume	Lower by 12.5 % or increase by 25 %	• Perform test at less than 3,000 rpm • A/F CONTROL enables checking and graphing of A/F (Air Fuel Ratio) sensor and Heated Oxygen (HO2) sensor voltage outputs • To conduct test, select following menu items: ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press YES and ENTER followed by F4
EVAP VSV (ALONE)	Activate EVAP VSV control	ON/OFF	-
VVT CTRL B1	Turn on and off OCV (Oil Control Valve)	ON/OFF	• Engine stalls or idles roughly when OCV turned ON • Normal engine running or idling when OCV off
A/C CUT SIG	Control A/C cut signal	ON/OFF	-
FUEL PUMP/SPD	Activate fuel pump (C/OPN Relay)	ON/OFF	-

Intelligent Tester Displays	Test Details	Control Ranges	Diagnostic Notes
TC/TE1	Turn on and off TC and TE1 connection	ON/OFF	• ON: TC and TE1 connected • OFF: TC and TE1 disconnected
FC IDL PROHBT	Prohibit idling fuel cut control	ON/OFF	-
ETCS OPEN SLOW	Throttle actuator	ON: throttle valve opens slowly	Test possible when following conditions met: • Ignition switch ON • Engine does not start • Fully depressing accelerator pedal (APP: 58 degrees or more)
ETCS CLOSE SLOW	Throttle actuator	ON: throttle valve closes slowly	Same as above
ETCS OPEN FAST	Throttle actuator	ON: throttle valve opens fast	Same as above
ETCS CLOSE FAST	Throttle actuator	ON: throttle valve closes fast	Same as above
FUEL CUT #1	Cylinder #1 injector fuel cut	ON/OFF	Test possible during vehicle stopping and engine idling
FUEL CUT #2	Cylinder #2 injector fuel cut	ON/OFF	Same as above
FUEL CUT #3	Cylinder #3 injector fuel cut	ON/OFF	Same as above
FUEL CUT #4	Cylinder #4 injector fuel cut	ON/OFF	Same as above
VVT B1	VVT actuator	-128 to 127% OCV control duty ratio can be set to any value within this range 100%: Maximum advance -100%: Maximum retard	Engine stalls or idles roughly when VVT actuator is operated at 100 % or more. This test is possible while idling.
VENT VALVE (ALONE)	Activate vent valve (built into canister pump module)	ON/OFF	-
VCUUM PUMP	Activate leak detection pump (built into canister pump module)	ON/OFF	-

3. SYSTEM CHECK

HINT:

Performing a SYSTEM CHECK enables the system, which consists of multiple actuators, to be operated without removing any parts. In addition, it can show whether or not any DTCs (PENDING CODES) are set, and can detect potential malfunctions in the system. SYSTEM CHECK can be performed with a intelligent tester.

(a) Connect a intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK.
(d) Perform the SYSTEM CHECK by referring to the table below.
(e) Turn the ignition switch to OFF.

Intelligent Tester Displays	Test Details	Recommended Vehicle Conditions	Diagnostic Notes
EVAP SYS CHECK (AUTOMATIC OPERATION)	Perform 5 steps in order to operate EVAP key-off monitor automatically	Fuel temperature 35°C (95°F) or less	• If no DTCs in PENDING CODE after performing this test, system functioning normally • Refer to EVAP Inspection Procedure (See page ES-390)
EVAP SYS CHECK (MANUAL OPERATION)	Perform 5 steps in order to operate EVAP key-off monitor manually	Fuel temperature 35°C(95°F) or less	• Used to detect malfunctioning parts • Refer to EVAP Inspection Procedure (See page ES-390)

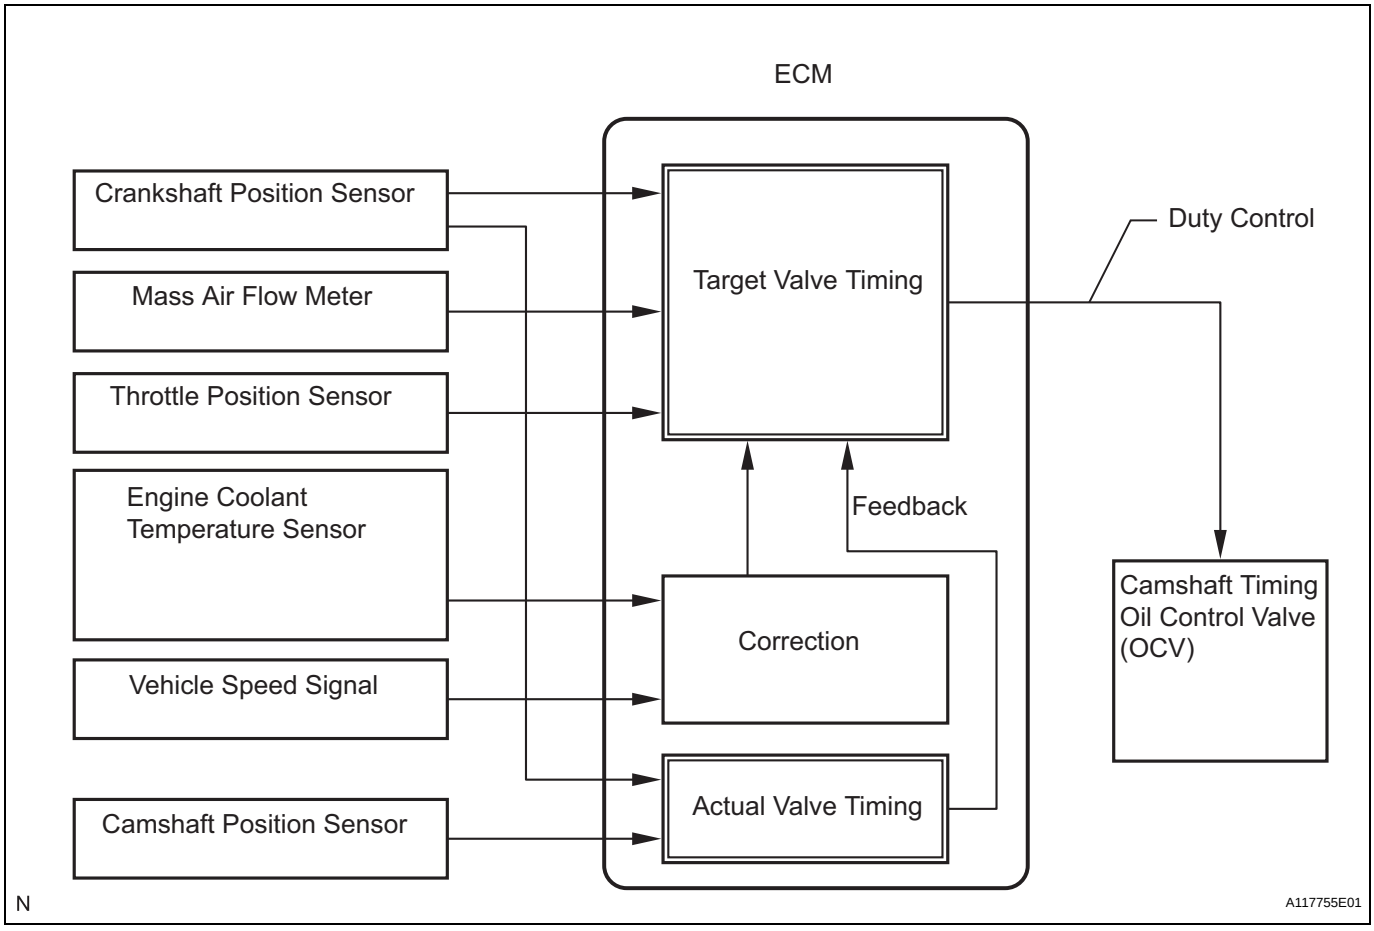
Intelligent Tester Displays	Test Details	Recommended Vehicle Conditions	Diagnostic Notes
AIR INJ CHECK (AUTOMATIC OPERATION)	Perform secondary air injection system operation automatically	With warm engine, ignition switch turned OFF once	• If no DTCs in PENDING CODE after performing this test, system functioning normally • Refer to inspection procedure for secondary air injection system DTCs • When performing AIR INJ CHECK operation after battery cable has been reconnected, wait for 7 minutes with ignition switch turned to ON or engine running • Turn ignition switch to OFF when SYSTEM CHECK finished
AIR INJ CHECK (MANUAL OPERATION)	Perform secondary air injection system operation manually Select monitor item 1, 2 or 3 1. Air pump: ON Air switching valve: OPEN 2. Air pump: OFF Air switching valve: CLOSE 3. Air pump: ON Air switching valve: CLOSE	With warm engine, ignition switch turned OFF once	• Used to detect malfunctioning parts • Refer to inspection procedure for secondary air injection system DTCs • When performing AIR INJ CHECK operation after battery cable has been reconnected, wait for 7 minutes with ignition switch turned to ON or engine running • Turn ignition switch to OFF when SYSTEM CHECK finishes

DTC	P0010	Camshaft Position "A" Actuator Circuit (Bank 1)

HINT:
This DTC relates to the Oil Control Valve (OCV).

DESCRIPTION

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature.
The ECM controls the OCV, based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.



DTC No.	DTC Detection Conditions	Trouble Areas
P0010	Open or short in OCV circuit(1 trip detection logic)	• Open or short in OCV circuit • OCV • ECM

MONITOR DESCRIPTION

The ECM optimizes the valve timing using the VVT system to control the intake camshaft. The VVT system includes the ECM, the OCV and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
After the ECM sends the target duty-cycle signal to the OCV, the ECM monitors the OCV current to establish an actual duty-cycle. The ECM determines the existence of a malfunction and sets the DTC when the actual duty-cycle ratio varies from the target duty-cycle ratio.

MONITOR STRATEGY

Related DTCs	P0010: VVT OCV range check
Required Sensors/Components (Main)	VVT OCV
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	1 second
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
All of following conditions met	-
Starter	OFF
Ignition switch	ON
Time after ignition switch off to on	0.5 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

One of following conditions met	-
A. All of following conditions met	-
Battery voltage	11 to 13 V
Target duty ratio	Less than 70 %
Output signal duty ratio	100 %
B. All of following conditions met	-
Battery voltage	13 V or more
Target duty ratio	Less than 80 %
Output signal duty ratio	100 %
C. All of following conditions met	-
Current cut status	Not cut
Output signal duty ratio	3 % or less

COMPONENT OPERATING RANGE

VVT OCV duty ratio	3 to 100%

ES

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

(a) Connect an intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1.
(e) Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

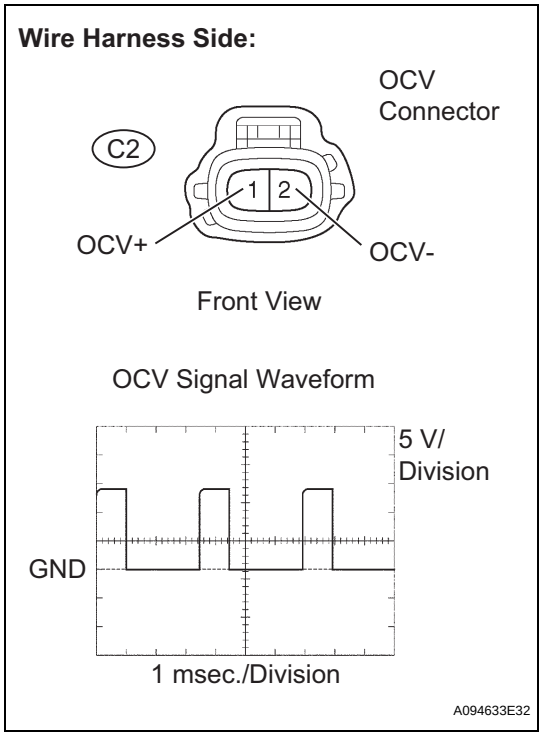
Result

Tester Operations	Specified Conditions
OCV OFF	Normal engine speed
OCV ON	Engine idles roughly or stalls (soon after OCV switched from OFF to ON)

OK → CHECK FOR INTERMITTENT PROBLEMS

NG

2 INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (OCV SIGNAL)



(a) Disconnect the C2 OCV connector.
(b) While idling, check the waveform between the terminals of the OCV connector using an oscilloscope.
Standard

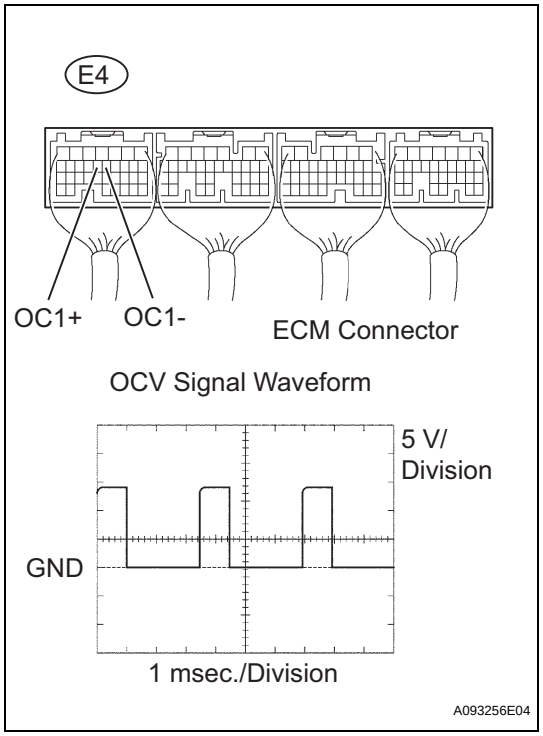
Tester Connections	Specified Conditions
OCV+ (C2-1) - OCV- (C2-2)	Correct waveform shown

(c) Reconnect the OCV connector.

OK → **REPLACE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**

NG

3 INSPECT ECM (OCV SIGNAL)



(a) Inspect the ECM using an oscilloscope.
(b) While idling, check the waveform between the terminals of the ECM connector.
Standard

Tester Connections	Specified Conditions
OC1+ (E4-13) - OC1- (E4-12)	Correct waveform shown

NG → **REPLACE ECM**

ES

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR

DTC	P0011	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)

DTC	P0012	Camshaft Position "A" - Timing Over-Retarded (Bank 1)

HINT:
If DTC P0011 or P0012 is present, check the VVT (Variable Valve Timing) system.

DESCRIPTION

Refer to DTC P0010 (See page ES-66).

DTC No.	DTC Detection Conditions	Trouble Areas
P0011	Advanced cam timing: With warm engine and engine speed of between 550 rpm and 4,000 rpm, all conditions (a), (b) and (c) met (1 trip detection logic): (a) Difference between target and actual intake valve timings more than 5°CA (Crankshaft Angle) (b) Current intake valve timing fixed (timing changes less than 1°CA in 1 second) (c) Variations in VVT controller timing more than 19°CA of maximum delayed timing (advanced)	• Valve timing • Oil control valve (OCV) • OCV filter • Camshaft timing gear assembly • ECM
P0012	Retarded cam timing: With warm engine and engine speed of between 550 rpm and 4,000 rpm, all conditions (a), (b) and (c) met (2 trip detection logic): (a) Difference between target and actual intake valve timings more than 5°CA (Crankshaft Angle) (b) Current intake valve timing fixed (timing changes less than 1°CA in 1 second) (c) Variations in VVT controller timing 19°CA or less of maximum delayed timing (retarded)	• Valve timing • Oil control valve (OCV) • OCV filter • Camshaft timing gear assembly • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, the Oil Control Valve (OCV) and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft. If the difference between the target and actual intake valve timings is large, and changes in actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and sets a DTC.
Example:
A DTC is set when the following conditions 1), 2) and 3) are met:
1) The difference between the target and actual intake valve timings is more than 5°CA (Crankshaft Angle).
2) It takes 1 second or more to change the valve timing by 1°CA.
3) After above conditions 1) and 2) are met, the OCV is forcibly activated certain times (63 times for P0011, 12 times for P0012) or more.
DTC P0011 (Advanced Cam Timing) is subject to 1 trip detection logic.
DTC P0012 (Retarded Cam Timing) is subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will not run unless the following conditions are met:
- The engine is warm (the engine coolant temperature is 70°C [158°F] or more).
- The vehicle has been driven at more than 40 mph (64 km/h) for 3 minutes.
- The engine has idled for 3 minutes.

MONITOR STRATEGY

Related DTCs	P0011: Advance camshaft timing P0012: Retard camshaft timing
Required Sensors/Components (Main)	VVT OCV and VVT actuator
Required Sensors/Components (Related)	Crankshaft position sensor, Camshaft position sensor and Engine coolant temperature sensor
Frequency of Operation	Once per driving cycle
Duration	Within 10 seconds
MIL Operation	P0011: Immediate P0012: 2 driving cycles
Sequence of Operation	None

ES

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0100 - P0103 (MAF meter) P0115 - P0118 (ECT sensor) P0125 (Insufficient ECT for closed loop) P0335 (CKP sensor) P0340 (CMP sensor) P0351 - P0354 (Igniter)
Battery voltage	11 V or more
Throttle position learning	Completed
Engine RPM	550 to 4,000 rpm
Engine coolant temperature	70 to 100°C (167 to 212°F)

TYPICAL MALFUNCTION THRESHOLDS

Advance:

Both of the following conditions are met	-
(a) Deviation of valve timing	More than 5° CA (crankshaft angle)
(b) Valve timing	No change at advanced valve timing

Retarded:

Both of the following conditions are met	-
(a) Deviation of valve timing	More than 5° CA (crankshaft angle)
(b) Valve timing	No change at retarded valve timing

If the difference between the target and actual camshaft timings is greater than the specified value, the ECM operates the VVT (Variable Valve Timing) actuator.
Then, the ECM monitors the camshaft timing change for 5 seconds.

WIRING DIAGRAM

Refer to DTC P0010 (See page ES-68).

NOTICE:
DTC P0011 or P0012 may be set when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain set even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.
HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011 OR P0012)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC output)	Proceed To
P0011 or P0012	A
P0011 or P0012 and other DTCs	B

HINT:
If any DTCs other than P0011 or P0012 are output, troubleshoot those DTCs first.

ES

B → GO TO DTC CHART

A

2	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1.
(e) Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

Result

Tester Operations	Specified Conditions
OCV OFF	Normal engine speed
OCV ON	Engine idles roughly or stalls (soon after OCV switched from OFF to ON)

NG → Go to step 4

OK

3	CHECK WHETHER DTC OUTPUT RECURS (DTC P0011 OR P0012)

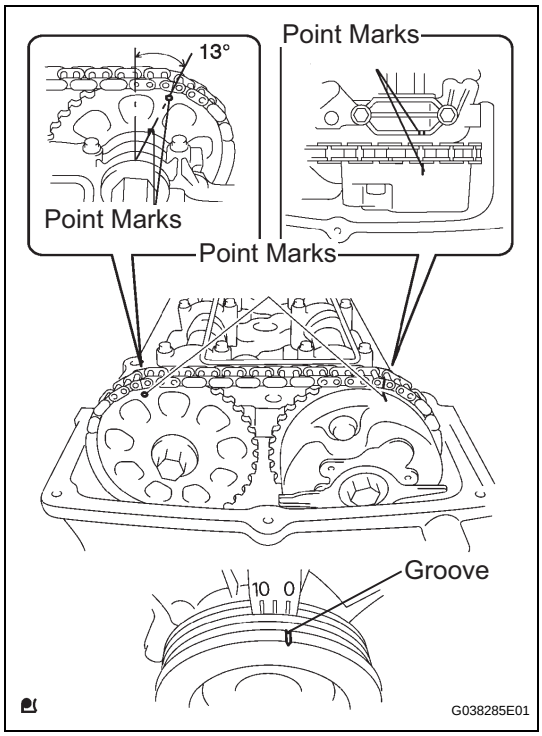
(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Clear DTCs (see page ES-40).
(d) Start the engine and warm it up.
(e) Switch the ECM from normal mode to check mode using the tester (see page ES-43).
(f) Drive the vehicle for more than 10 minutes.
(g) Read DTCs using the tester.

OK:
No DTC output.

OK → **END**

NG

4 CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

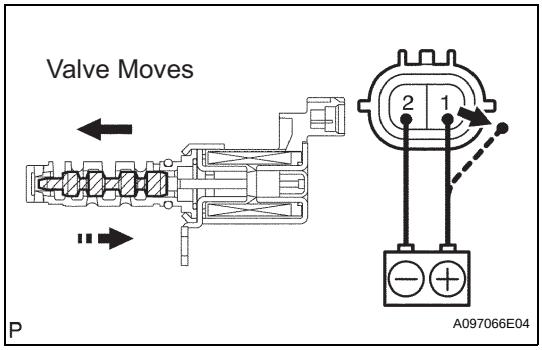


(a) Remove the cylinder head cover (see page EM-23).
(b) Turn the crankshaft pulley, and align its groove with the timing mark "0" on the timing chain cover.
(c) Check that the point marks on the camshaft timing gears are as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°) and align the marks as above.
OK:
Point marks on the camshaft timing gears are aligned as shown in illustration.
(d) Reinstall the cylinder head cover (see page EM-32).

NG → **ADJUST VALVE TIMING**

OK

5 INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (OCV)

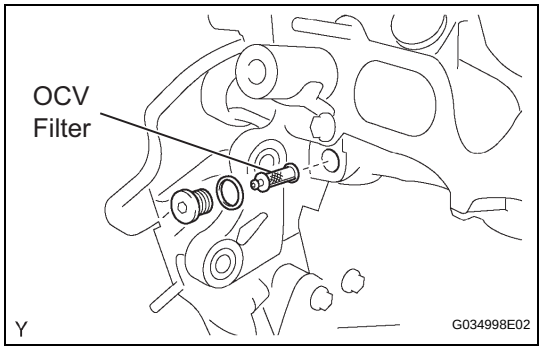


(a) Remove the OCV.
(b) Measure the resistance between the terminals of the OCV.
Standard Resistance:
6.9 to 7.9 Ωat 20°C (68°F)
(c) Apply the positive battery voltage to terminal 1 and negative battery voltage to terminal 2. Check the valve operation.
OK:
Valve moves quickly.
(d) Reinstall the OCV.

NG → **REPLACE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**

OK

6	INSPECT OIL CONTROL VALVE FILTER



(a) Remove the OCV filter.
(b) Check that the filter is not clogged.
OK:
Filter is not clogged.
(c) Reinstall the OCV filter.

NG → **CLEAN OIL CONTROL VALVE FILTER**

OK

REPLACE CAMSHAFT TIMING GEAR ASSEMBLY

DTC	P0016	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A)

DESCRIPTION

Refer to DTC P0335 (See page ES-171).

DTC No.	DTC Detection Condition	Trouble Area
P0016	Deviations in crankshaft and camshaft position sensor signals (2 trip detection logic)	• Mechanical system (Timing chain has jumped tooth or chain stretched) • ECM

MONITOR DESCRIPTION

The ECM optimizes the valve timing by using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, the Oil Control Valve (OCV) and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft. The ECM calibrates the intake valve timing by setting the intake camshaft to the most retarded angle while the engine is idling. The ECM closes the OCV to retard the cam. The ECM stores this value as the VVT learning value. When the difference between the target and actual intake valve timings is 5°CA (Crankshaft Angle) or less, the ECM stores it.

If the VVT learning value matches the following conditions, the ECM determines the existence of a malfunction in the VVT system, and sets the DTC.

- VVT learning value: Less than 33°CA, or more than 51°CA.
- Above condition continues for 18 seconds or more.

This DTC indicates that the intake camshaft has been installed toward the crankshaft at an incorrect angle, caused by factors such as the timing chain having jumped a tooth.

This monitor begins to run after the engine has idled for 5 minutes.

MONITOR STRATEGY

Related DTCs	P0016: Camshaft timing (bank 1) misalignment
Required Sensors/Components (Main)	VVT actuator
Required Sensors/Components (Related)	Camshaft position sensor, Crankshaft position sensor
Frequency of Operation	Once per driving cycle
Duration	Within 60 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0011 (VVT system 1 - advance) P0012 (VVT system 1 - retard) P0115 - P0118 (ECT sensor)
Engine RPM	550 to 1,000 rpm

TYPICAL MALFUNCTION THRESHOLDS

Valve timing when camshaft retarded maximum	Less than 33°, or more than 51°

WIRING DIAGRAM

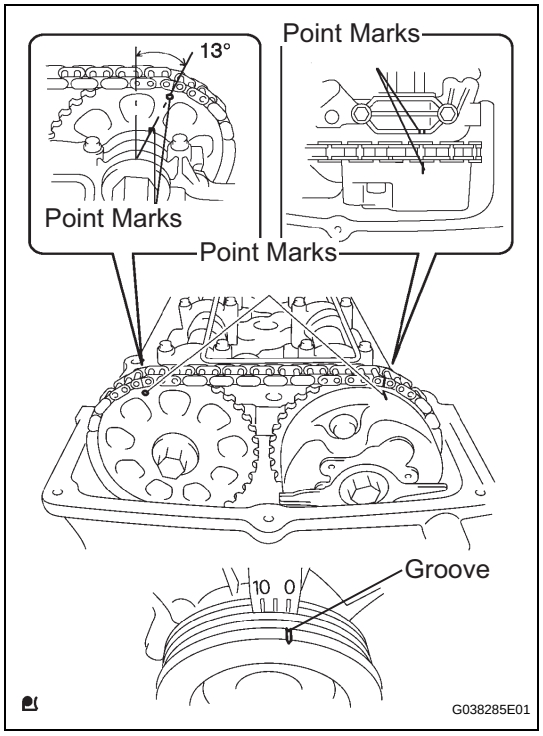
Refer to DTC P0335 (See page ES-173).

HINT:

- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.
- After replacing the ECM or adjusting intake valve timing, confirm that the DTC output does not recur.
  (a) Connect an intelligent tester to the DLC3.
  (b) Turn the ignition switch to ON.
  (c) Turn the tester ON.
  (d) Clear DTCs (see page ES-40).
  (e) Switch the ECM from normal mode to check mode using the tester (see page ES-43).
  (f) Start the engine and warm it up.
  (g) Allow the engine to idle for 1 minute or more, and then drive the vehicle for 1 minute or more.
  (h) Confirm that no DTC is set, using the tester.

ES

1	CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)



(a) Remove the cylinder head cover.
(b) Turn the crankshaft pulley, and align its groove with the timing mark "0" on the timing chain cover.
(c) Check that the point marks on the camshaft timing gears are as shown in the illustration.

If not, turn the crankshaft 1 revolution (360°) and align the marks as above.

OK:

Point marks on camshaft timing gears are aligned as shown in illustration.

(d) Reinstall the cylinder head cover.

NG → **ADJUST VALVE TIMING**

OK ↓

REPLACE ECM

DTC	P0031	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)

DTC	P0032	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)

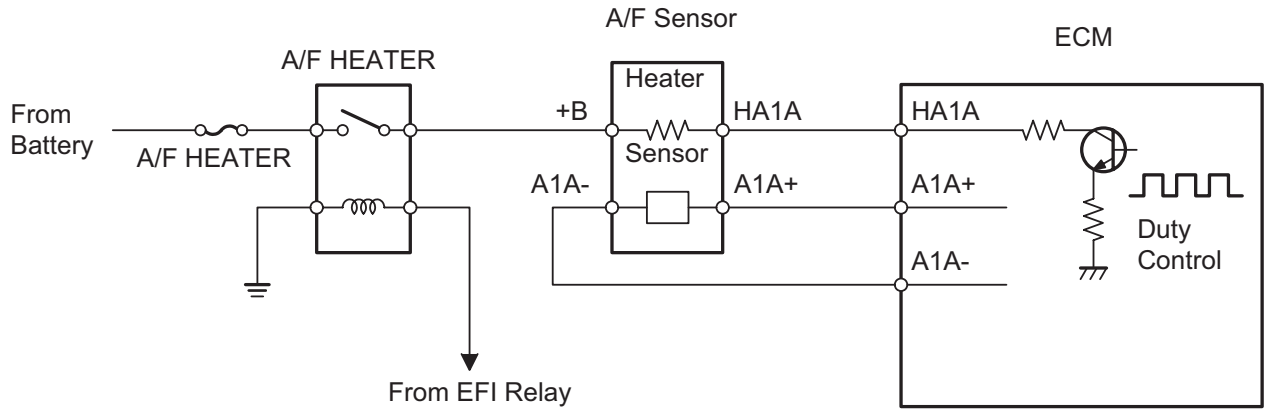
HINT:
- Although the DTC titles say the oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

DESCRIPTION

ES

Refer to DTC P2195 (See page ES-312).
HINT:
- When either of these DTCs are set, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned to OFF.
- The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.

Reference (Bank 1 Sensor 1 System Diagram)



P

A118002E04

DTC No.	DTC Detection Conditions	Trouble Areas
P0031	Air-Fuel Ratio (A/F) sensor heater current less than 0.8 A (1 trip detection logic)	• Open in A/F sensor heater circuit • A/F sensor heater • A/F HEATER relay • ECM
P0032	Air-Fuel Ratio (A/F) sensor heater current more than 10 A (1 trip detection logic)	• Short in A/F sensor heater circuit • A/F sensor heater • A/F HEATER relay • ECM

MONITOR DESCRIPTION

The ECM uses information from the Air-Fuel Ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.

The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.

The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor will be inaccurate, as a result, the ECM will be unable to regulate air-fuel ratio properly.

When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and sets a DTC.

Example:

The ECM sets DTC P0032 when the current in the A/F sensor heater is more than 10 A. Conversely, when the heater current is less than 0.8 A, DTC P0031 is set.

MONITOR STRATEGY

Related DTCs	P0031: A/F sensor heater range check (Low current) P0032: A/F sensor heater range check (High current)
Required Sensors/Components (Main)	A/F sensor heater
Required Sensors/Components (Related)	-

A/F sensor heater current	More than 10 A

COMPONENT OPERATING RANGE

A/F sensor heater current	1.8 to 3.4 A at 20°C (68°F)

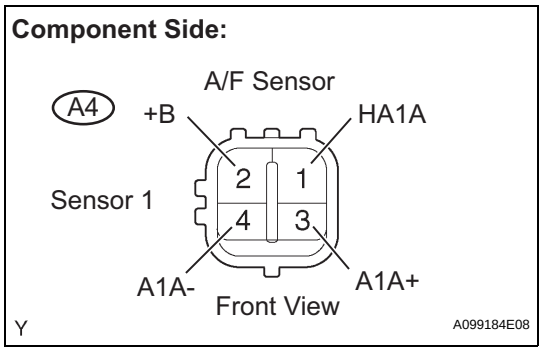
WIRING DIAGRAM

Refer to DTC P2195 (See page ES-316).

HINT:
Read freeze frame data using a intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

ES

1 INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



(a) Disconnect the A4 Air-Fuel Ratio (A/F) sensor connector.
(b) Measure the resistance between the terminals of the A/F sensor connector.
Standard Resistance

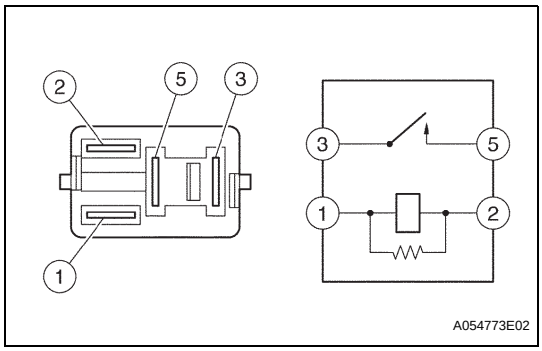
Tester Connections	Specified Conditions
HA1A (1) - +B (2)	1.8 Ωto 3.4 Ω at 20°C (68°F)
HA1A (1) - A1A- (4)	10 kΩ or higher

(c) Reconnect the A/F sensor connector.

NG → REPLACE AIR FUEL RATIO SENSOR

OK

2 INSPECT AIR FUEL RATIO SENSOR HEATER RELAY (A/F HEATER RELAY)



(a) Remove the A/F HEATER relay from the engine room R/B.
(b) Check the A/F HEATER relay resistance.
Standard Resistance

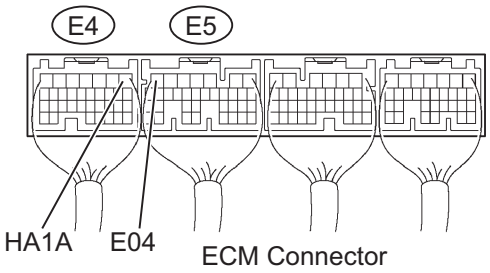
Tester Connections	Specified Conditions
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the A/F HEATER relay.

NG → REPLACE AIR FUEL RATIO SENSOR HEATER RELAY

OK

3 INSPECT ECM (HA1A VOLTAGE)



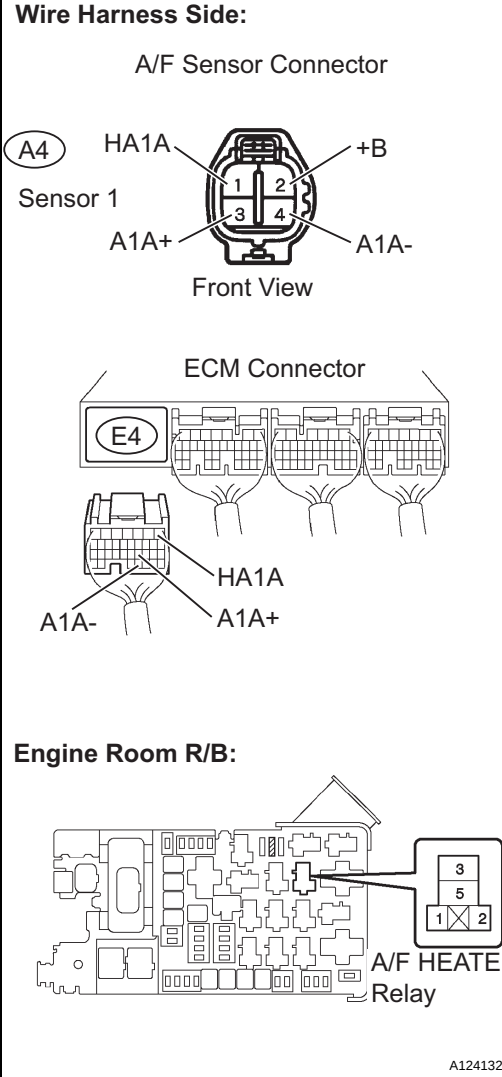
(a) Turn the ignition switch to ON.
(b) Measure the voltage between the terminals of the E4 and E5 ECM connectors.
Standard Voltage

Tester Connections	Specified Conditions
HA1A (E4-1) - E04 (E5-7)	9 to 14 V

OK → **REPLACE ECM**

NG

4 CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM, A/F SENSOR - A/F HEATER RELAY)



(a) Check the harness and connectors between the ECM and A/F sensor.
(1) Disconnect the A4 A/F sensor connector.
(2) Disconnect the E4 ECM connector.
(3) Check the resistance.
Standard Resistance (Check for open)

Tester Connections	Specified Conditions
HA1A (A4-1) - HA1A (E4-1)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
HA1A (A4-1) or HA1A (E4-1) - Body ground	10 kΩor higher

(4) Reconnect the A/F sensor connector.
(5) Reconnect the ECM connector.
(b) Check the harness and connector between the A/F sensor and A/F HEATER relay.
(1) Disconnect the A4 A/F sensor connector.
(2) Remove the A/F HEATER relay from the engine room R/B.
(3) Check the resistance.
Standard Resistance (Check for open)

Tester Connections	Specified Conditions
+B (A4-2) - A/F HEATER relay (3)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
+B (A4-2) or A/F HEATER relay (3) - Body ground	10 kΩor higher

(4) Reconnect the A/F sensor connector.
(5) Reinstall the A/F HEATER relay.

DTC	P0037	Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)

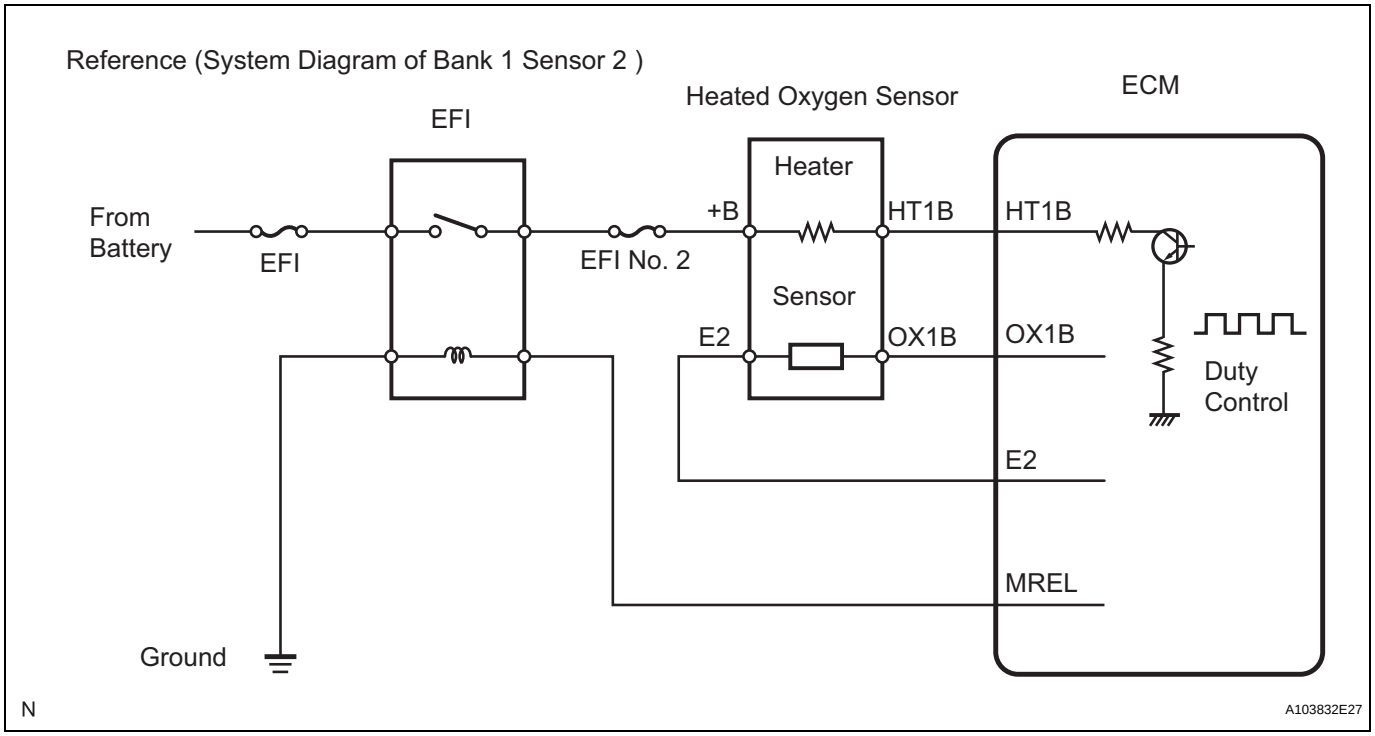
DTC	P0038	Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)

HINT:
Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.

DESCRIPTION

Refer to DTC P0136 (See page ES-126).
HINT:

- When either of these DTCs are set, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned to OFF.
- The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the B+ side of the circuit.



DTC No.	DTC Detection Conditions	Trouble Areas
P0037	Heated Oxygen (HO2) sensor heater current less than 0.3 A (1 trip detection logic)	• Open or short in HO2 sensor heater circuit • HO2 sensor heater • EFI relay • ECM
P0038	Heated Oxygen (HO2) sensor heater current more than 2 A (1 trip detection logic)	• Open or short in HO2 sensor heater circuit • HO2 sensor heater • EFI relay • ECM

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor. When the current in the sensor heater is outside the standard operating range, the ECM interprets this as a malfunction in the sensor heater and sets a DTC.
Example:
The ECM sets DTC P0038 when the current in the HO2 sensor heater is more than 2 A. Conversely, when the heater current is less than 0.3 A, DTC P0037 is set.

MONITOR STRATEGY

Related DTCs	P0037: Heated oxygen sensor heater range check (Low current) P0038: Heated oxygen sensor heater range check (High current)
Required Sensors/Components (Main)	Heated oxygen sensor heater
Required Sensors/Components (Related)	Vehicle speed sensor
Frequency of Operation	Continuous
Duration	P0037: 0.5 seconds P0038: 0.3 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

P0037:

Monitor runs whenever following DTCs not present	None
Battery voltage	10.5 V or more
All heaters turned OFF and intrusive heating operated when following conditions met:	(a) and (b)
(a) Heater	ON
(b) Heater current	Less than 0.3 A

P0038 Case 1:

Monitor runs whenever following DTCs not present	None
Battery voltage	10.5 V or more
Engine	Running
Starter	OFF
Intrusive operating	Not operating

P0038 Case 2:

Monitor runs whenever following DTCs not present	None
Battery voltage	10.5 V or more
All heaters turned OFF and intrusive heating operated when following conditions met:	(a) and (b)
(a) Heater	ON
(b) Heater current	More than 2 A

TYPICAL MALFUNCTION THRESHOLDS

P0037:

Heated oxygen sensor heater current during intrusive heating	Less than 0.3 A

P0038 Case 1:

Heated oxygen sensor heater current	More than 2 A

P0038 Case 2:

Heated oxygen sensor heater current during intrusive heating	2 A or more

COMPONENT OPERATING RANGE

Heated Oxygen (HO2) sensor heater current	0.4 to 1 A (when engine idles, HO2 sensor warmed up and battery voltage 11 to 14 V)

WIRING DIAGRAM

Refer to DTC P0136 (See page ES-133).

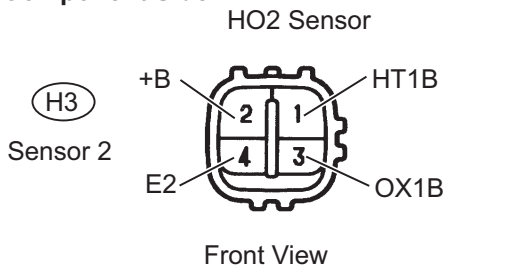
HINT:

- If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using a intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

ES

1 INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

Component Side:



(a) Disconnect the H3 Heated Oxygen (HO2) sensor connector.

(b) Measure the resistance between the terminals of the HO2 sensor connector.

Standard Resistance

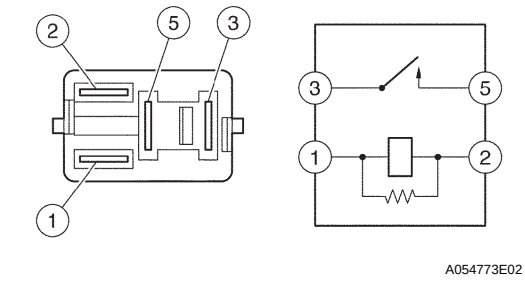
Tester Connections	Specified Conditions
HT1B (1) - +B (2)	11 to 16 Ωat 20°C (68°F)
HT1B (1) - E2 (4)	10 kΩ or higher

(c) Reconnect the HO2 sensor connector.

NG → **REPLACE HEATED OXYGEN SENSOR**

OK

2 INSPECT EFI RELAY



(a) Remove the EFI relay from the engine room R/B.

(b) Check the EFI relay resistance.

Standard Resistance

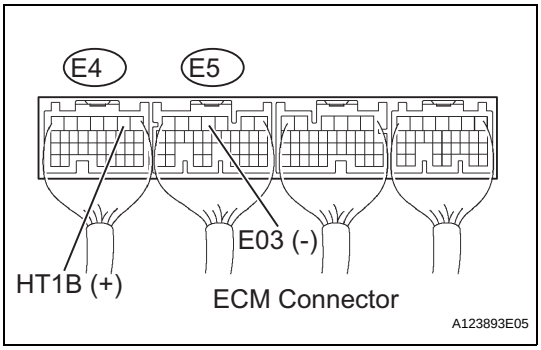
Tester Connections	Specified Conditions
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the EFI relay.

NG → **REPLACE EFI RELAY**

OK

3	INSPECT ECM (HT1B VOLTAGE)



(a) Turn the ignition switch to ON.
(b) Measure the voltage between the terminals of the ECM connectors.

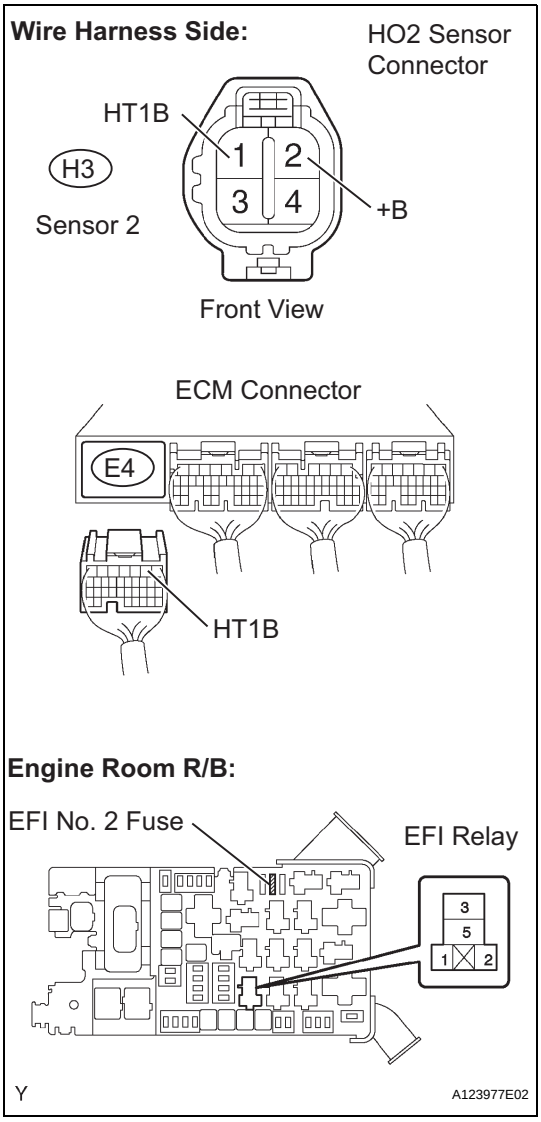
Standard Voltage

Tester Connections	Specified Conditions
HT1B (E4-2) - E03 (E5-4)	9 to 14 V

OK → REPLACE ECM

NG

4	CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM, HEATED OXYGEN SENSOR - EFI RELAY)



(a) Check the harness and connectors between the ECM and HO2 sensor.
  (1) Disconnect the H3 HO2 sensor connector.
  (2) Disconnect the E4 ECM connector.
  (3) Check the resistance.

Standard Resistance (Check for open):

Tester Connections	Specified Conditions
HT1B (H3-1) - HT1B (E4-2)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
HT1B (H3-1) or HT1B (E4-2) - Body ground	10 kΩ or higher

  (4) Reconnect the HO2 sensor connector.
  (5) Reconnect the ECM connector.

(b) Check the harness and connector between the HO2 sensor and EFI relay.
  (1) Inspect the EFI No. 2 fuse.
    • Remove the EFI No. 2 fuse from the engine room R/B.
    • Check the EFI No. 2 fuse resistance.
      Standard Resistance:
      Below 1 Ω
    • Reinstall the EFI No. 2 fuse.
  (2) Disconnect the H3 HO2 sensor connector.
  (3) Remove the EFI relay from the engine room R/B.
  (4) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
+B (H3-2) - EFI relay (3)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
+B (H3 - 2) or EFI relay (3) - Body ground	10 kΩ or higher

(5) Reconnect the HO2 sensor connector.
(6) Reinstall the EFI relay.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

DTC	P0100	Mass or Volume Air Flow Circuit

DTC	P0102	Mass or Volume Air Flow Circuit Low Input

DTC	P0103	Mass or Volume Air Flow Circuit High Input

DESCRIPTION

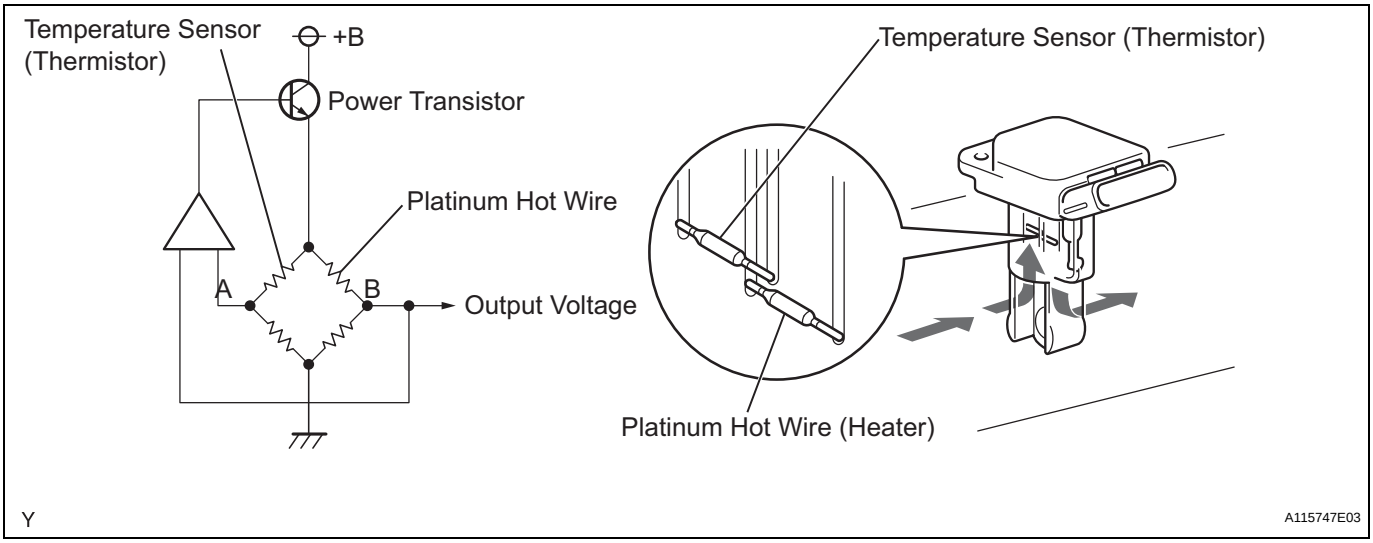
The Mass Air Flow (MAF) meter is a sensor that measures the amount of air flowing through the throttle valve.

The ECM uses this information to determine the fuel injection time and to provide appropriate air-fuel ratio. Inside the MAF meter, there is a heated platinum wire which is exposed to the flow of intake air. By applying a specific electrical current to the wire, the ECM heats it to a given temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components in the MAF meter. The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume.

The circuit is constructed so that the platinum hot wire and the temperature sensor provide a bridge circuit, and the power transistor is controlled so that the potentials of A and B remain equal to maintain the predetermined temperature.

HINT:

When any of these DTCs are set, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is calculated by the ECM, according to the engine RPM and throttle valve position. Fail-safe mode continues until a pass condition is detected.



DTC No.	DTC Detection Conditions	Trouble Areas
P0100	Mass Air Flow (MAF) meter voltage less than 0.2 V, or more than 4.9 V for 3 seconds	• Open or short in MAF meter circuit • MAF meter • ECM
P0102	Mass Air Flow (MAF) meter voltage less than 0.2 V for 3 seconds	• Open or short in MAF meter circuit • MAF meter • ECM
P0103	Mass Air Flow (MAF) meter more than 4.9 V for 3 seconds	• Open or short in MAF meter circuit • MAF meter • ECM

HINT:

When any of these DTCs are set, check the air-flow rate by selecting the following menu items on an intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / MAF.

Mass Air Flow Rate (g/sec)	Malfunctions
Approximately 0.0	• Open in Mass Air Flow (MAF) meter power source circuit • Open or short in VG circuit
271.0 or more	• Open in EVG circuit

MONITOR DESCRIPTION

If there is a defect in the MAF meter or an open or short circuit, the voltage level deviates from the normal operating range. The ECM interprets this deviation as a malfunction in the MAF meter and sets a DTC.
Example:
When the sensor voltage output remains less than 0.2 V, or more than 4.9 V, for more than 3 seconds, the ECM sets a DTC.
If the malfunction is not repaired successfully, a DTC is set 3 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0100: Mass air flow meter range check (Fluctuating) P0102: Mass air flow meter range check (Low voltage) P0103: Mass air flow meter range check (High voltage)
Required Sensors/Components (Main)	MAF meter
Required Sensors/Components (Related)	Crankshaft position sensor
Frequency of Operation	Continuous
Duration	3 seconds
MIL Operation	Immediate: Engine RPM less than 4,000 rpm 2 driving cycles: Engine RPM 4,000 rpm or more
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

TYPICAL MALFUNCTION THRESHOLDS

P0100:

MAF meter voltage	Less than 0.2 V, or more than 4.9 V

P0102:

MAF meter voltage	Less than 0.2 V

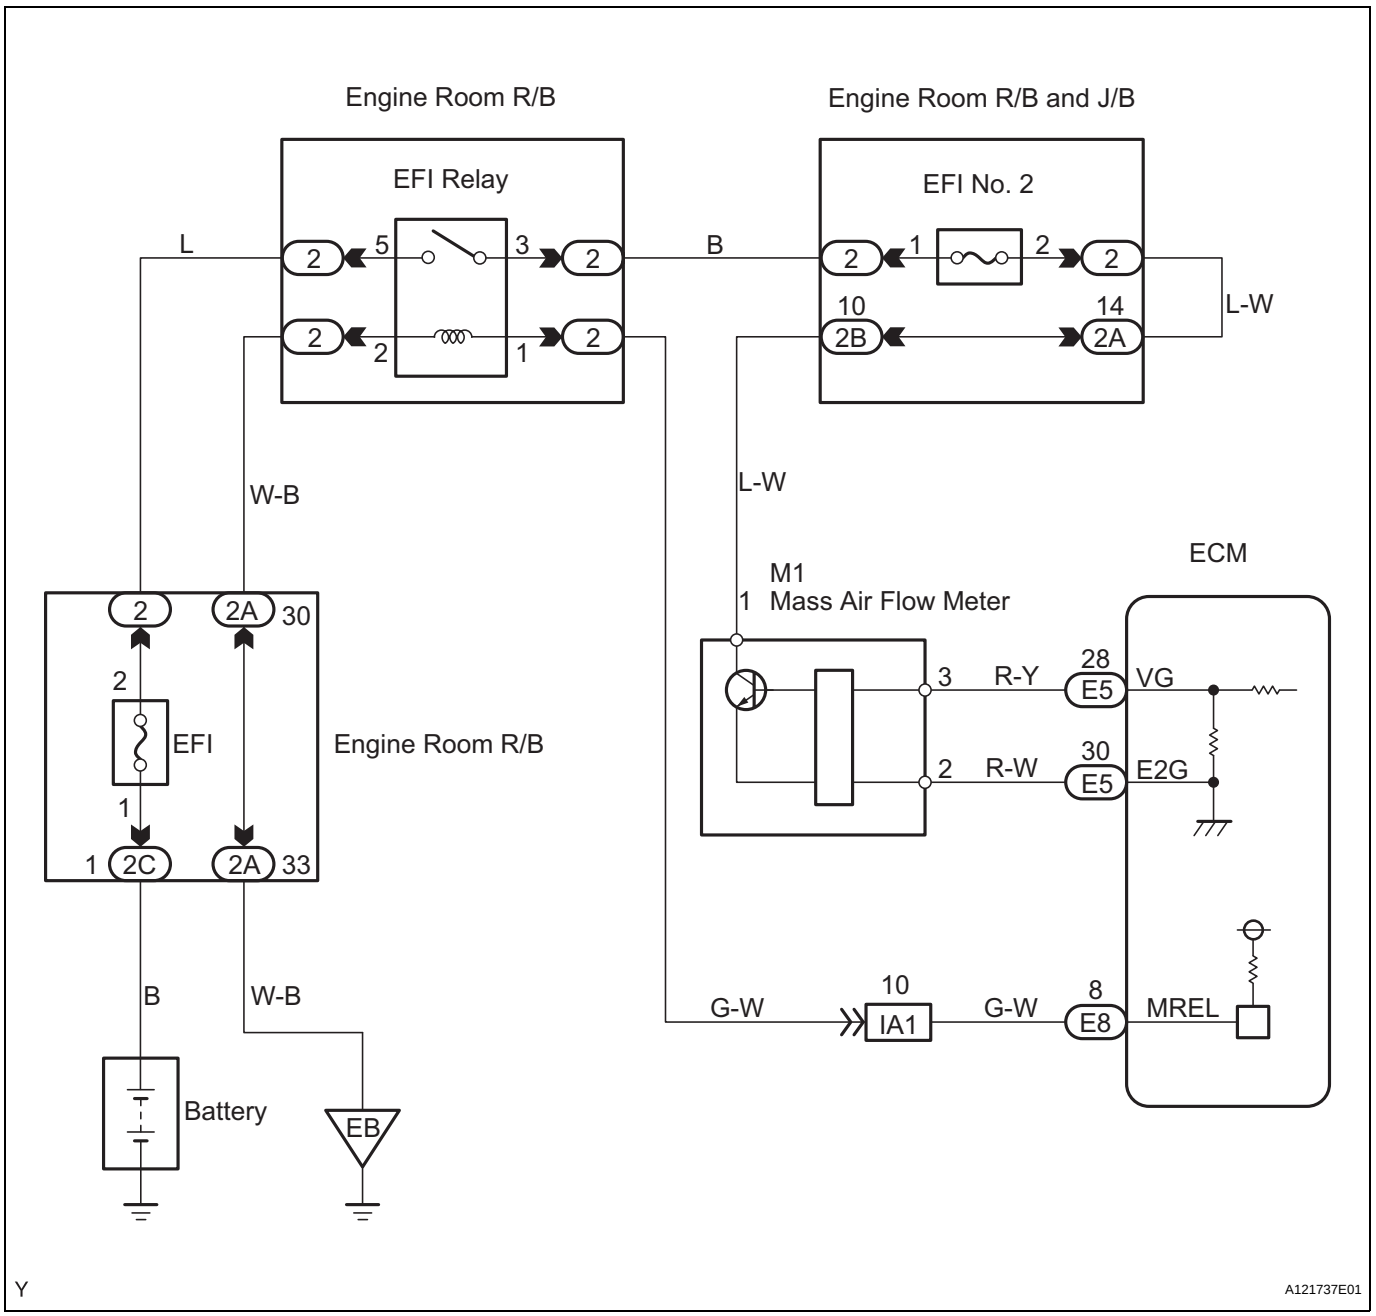
P0103:

MAF meter voltage	More than 4.9 V

COMPONENT OPERATING RANGE

MAF meter voltage	Between 0.4 V and 2.2 V

WIRING DIAGRAM



HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	READ DATA LIST (MASS AIR FLOW RATE)

(a) Connect an intelligent tester to the DLC3.
(b) Start the engine.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / MAF.

(e) Read the values displayed on the tester.
Result

Mass Air Flow Rate (g/sec)	Proceed To
0.0	A
271.0 or more	B
Between 1.0 and 270.0 (*1)	C

*1: The value must be changed when the throttle valve is open or closed.

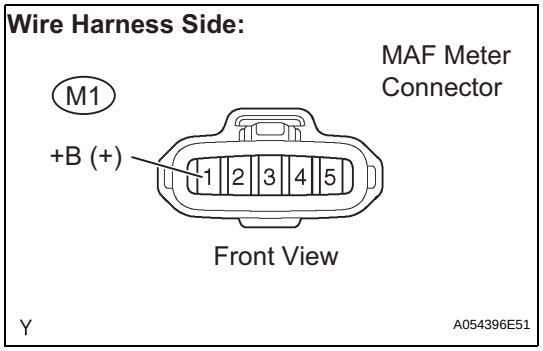
B → **Go to step 6**

C → **CHECK FOR INTERMITTENT PROBLEMS**

A

ES

2 INSPECT MASS AIR FLOW METER (POWER SOURCE VOLTAGE)



(a) Disconnect the M1 Mass Air Flow (MAF) meter connector.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between the terminal of the wire harness side connector and body ground.
Standard Voltage

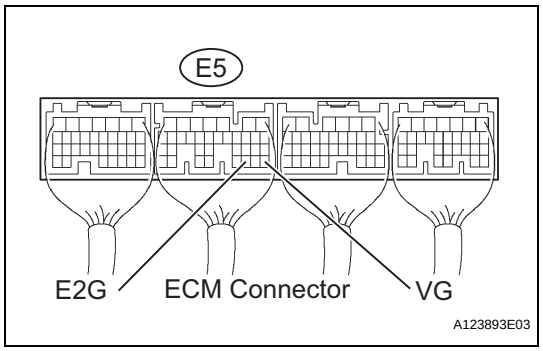
Tester Connections	Specified Conditions
+B (M1-1) - Body ground	9 to 14 V

(d) Reconnect the MAF meter connector.

NG → **Go to step 5**

OK

3 INSPECT ECM (VG VOLTAGE)



(a) Start the engine.
(b) Measure the voltage between the terminals of the ECM connector.
HINT:
The transmission gear selector lever should be in the P or N position and the A/C switch should be turned OFF.
Standard Voltage

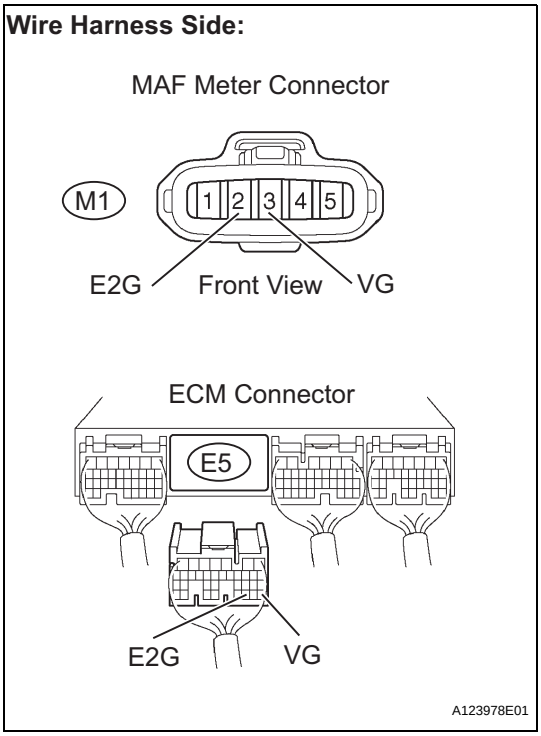
Tester Connections	Engine Conditions	Specified Conditions
VG (E5-28) - E2G (E5-30)	Engine idling	0.5 to 3.0 V

OK → **REPLACE ECM**

NG

4	CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

Wire Harness Side:



(a) Disconnect the M1 MAF meter connector.
(b) Disconnect the E5 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
VG (M1-3) - VG (E5-28)	Below 1 Ω
E2G (M1-2) - E2G (E5-30)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
VG (M1-3) or VG (E5-28) - Body ground	10 kΩ or higher

(d) Reconnect the MAF meter connector.
(e) Reconnect the ECM connector.

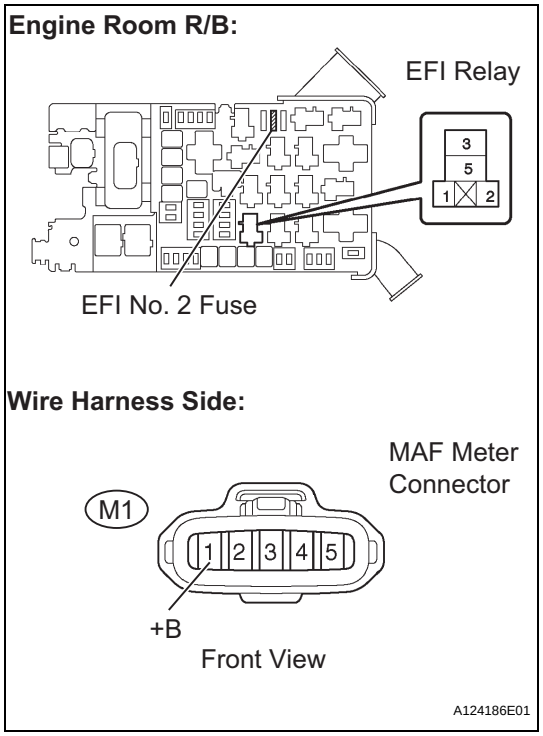
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE MASS AIR FLOW METER

ES

5 CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - EFI RELAY)



(a) Inspect the EFI No. 2 fuse.
  (1) Remove the EFI No. 2 fuse from the engine room R/B.
  (2) Check the EFI No. 2 fuse resistance.
    Standard Resistance:
    Below 1Ω
  (3) Reinstall the EFI No. 2 fuse.
(b) Remove the EFI relay from the engine room R/B.
(c) Disconnect the M1 MAF meter connector.
(d) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
+B (M1-1) - EFI relay (3)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
+B (M1-1) or EFI relay (3) - Body ground	10 kΩ or higher

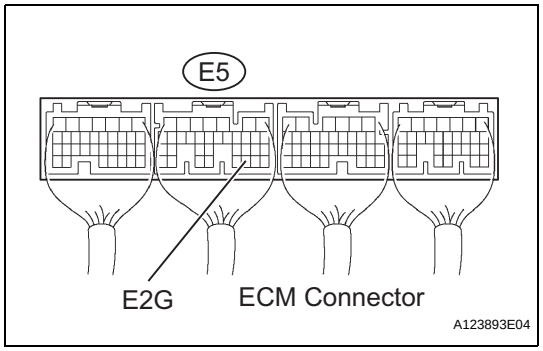
(e) Reconnect the MAF meter connector.
(f) Reinstall the EFI relay.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

INSPECT ECM POWER SOURCE CIRCUIT

6 INSPECT ECM (SENSOR GROUND)



(a) Check the resistance.

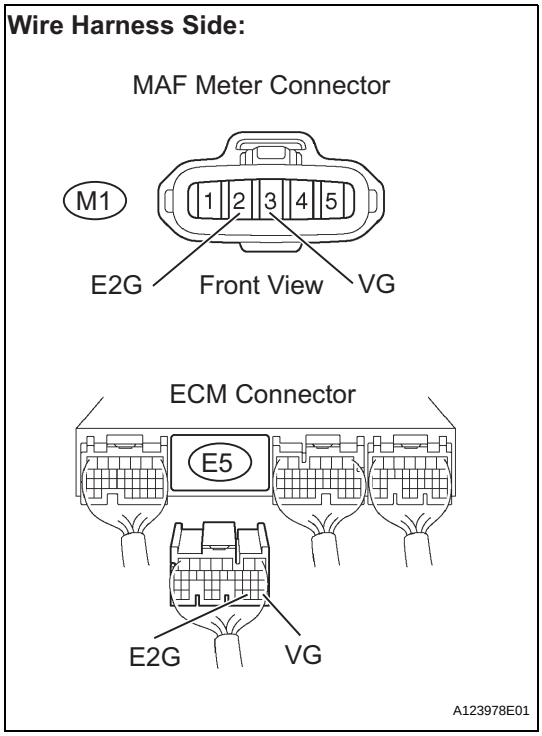
Standard Resistance

Tester Connections	Specified Conditions
E2G (E5-30) - Body ground	Below 1 Ω

NG → **REPLACE ECM**

OK

7	CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)



(a) Disconnect the M1 MAF meter connector.
(b) Disconnect the E5 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
VG (M1-3) - VG (E5-28)	Below 1 Ω
E2G (M1-2) - E2G (E5-30)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
VG (M1-3) or VG (E5-28) - Body ground	10 kΩ or higher

(d) Reconnect the MAF meter connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

DTC	P0101	Mass Air Flow Circuit Range / Performance Problem

DESCRIPTION

Refer to DTC P0100 (See page ES-88).

DTC No.	DTC Detection Conditions	Trouble Area
P0101	High voltage: Conditions (a), (b) and (c) continue for more than 10 seconds (2 trip detection logic): (a) Engine speed less than 2,000 rpm (b) Engine coolant temperature 70°C (158°F) or higher (c) Voltage output of Mass Air Flow (MAF) meter more than 2.2 V (varies with Throttle Position [TP] sensor voltage) Low voltage: Conditions (a) and (b) continue for more than 10 seconds (2 trip detection logic): (a) Engine speed more than 300 rpm (b) Voltage output of MAF meter less than 0.93 V (varies with TP sensor voltage)	MAF meter

ES

MONITOR DESCRIPTION

The MAF meter is a sensor that measures the amount of air flowing through the throttle valve. The ECM uses this information to determine the fuel injection time and to provide an appropriate air-fuel ratio. Inside the MAF meter, there is a heated platinum wire which is exposed to the flow of intake air. By applying a specific electrical current to the wire, the ECM heats it to a specific temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components of the MAF meter. The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume. If there is a defect in the sensor, or an open or short in the circuit, the voltage level deviates from the normal operating range. The ECM interprets this deviation as a malfunction in the MAF meter and sets the DTC.
Example:
If the voltage is more than 2.2 V, or less than 0.93 V while idling, the ECM determines that there is a malfunction in the MAF meter and sets the DTC.

MONITOR STRATEGY

A

GO TO DTC CHART

DTC	P0110	Intake Air Temperature Circuit

DTC	P0112	Intake Air Temperature Circuit Low Input

DTC	P0113	Intake Air Temperature Circuit High Input

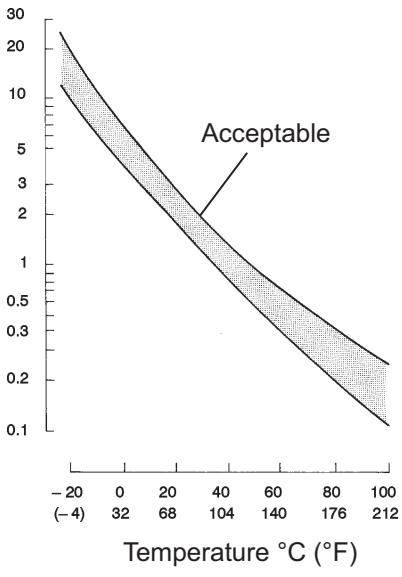
DESCRIPTION

The Intake Air Temperature (IAT) sensor, built into the Mass Air Flow (MAF) meter, monitors the intake air temperature. The IAT sensor has a thermistor that varies its resistance depending on the intake air temperature. When the intake air temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. The variations in resistance are reflected as voltage changes to the ECM terminal (see Fig. 1).

The IAT sensor is connected to the ECM. The 5 V power source voltage in the ECM is applied to the IAT sensor from terminal THA via resistor R.

Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve drivability.

Fig. 1



HINT:

When any of DTCs P0110,P0112 and P0113 are set, the ECM enters fail-safe mode. During fail-safe mode, the IAT is estimated to be 20°C (68°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC No.	Proceed To	DTC Detection Conditions	Trouble Areas
P0110	Step 1	Open or short in IAT sensor circuit for 0.5 seconds (1 trip detection logic)	• Open or short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0112	Step 4	Short in IAT sensor circuit for 0.5 seconds (1 trip detection logic)	• Short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0113	Step 2	Open in IAT sensor circuit for 0.5 seconds (1 trip detection logic)	• Open in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM

HINT:
When any of these DTCs are set, check the Intake Air Temperature (IAT) by selecting the following menu items on an intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / INTAKE AIR.

Temperature Displayed	Malfunctions
-40°C (-40°F)	Open circuit
140°C (284°F)	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the intake air temperature. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the IAT sensor and sets a DTC.
Example:
If the sensor voltage output is more than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the IAT sensor circuit, and sets DTC P0113. Conversely, if the voltage output is less than 0.18 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and sets DTC P0112.
If the malfunction is not repaired successfully, a DTC is set 0.5 seconds after the engine is next started.

DTC	P0115	Engine Coolant Temperature Circuit

DTC	P0117	Engine Coolant Temperature Circuit Low Input

DTC	P0118	Engine Coolant Temperature Circuit High Input

DESCRIPTION

A thermistor is built into the Engine Coolant Temperature (ECT) sensor, of which the resistance value varies according to the ECT.
The structure of the sensor and connection to the ECM is the same as the Intake Air Temperature (IAT) sensor.
HINT:
When any of DTCs P0115, P0117 and P0118 are set, the ECM enters fail-safe mode. During fail-safe mode, the ECT is estimated to be 80°C (176°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

ES

DTC No.	Proceed To	DTC Detection Condition	Trouble Area
P0115	Step 1	Open or short in ECT sensor circuit for 0.5 seconds (1 trip detection logic)	• Open or short in ECT sensor circuit • ECT sensor • ECM
P0117	Step 4	Short in ECT sensor circuit for 0.5 seconds (1 trip detection logic)	• Short in ECT sensor circuit • ECT sensor • ECM
P0118	Step 2	Open in ECT sensor circuit for 0.5 seconds (1 trip detection logic)	• Open in ECT sensor circuit • ECT sensor • ECM

HINT:
When any of these DTCs are set, check the ECT by selecting the following menu items on an intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.

Temperature Displayed	Malfunctions
-40°C (-40°F)	Open circuit
140°C (284°F)	Short circuit

MONITOR DESCRIPTION

The ECT sensor is used to monitor the engine coolant temperature. The ECT sensor has a thermistor that varies its resistance depending on the temperature of the engine coolant. When the coolant temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. The variations in resistance are reflected in the voltage output from the sensor. The ECM monitors the sensor voltage and uses this value to calculate the ECT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the ECT sensor and sets a DTC.
Example:
If the sensor voltage output is more than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the ECT sensor circuit, and sets DTC P0118. Conversely, if the voltage output is less than 0.14 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and sets DTC P0117.
If the malfunction is not repaired successfully, a DTC is set 0.5 seconds after the engine is next started.

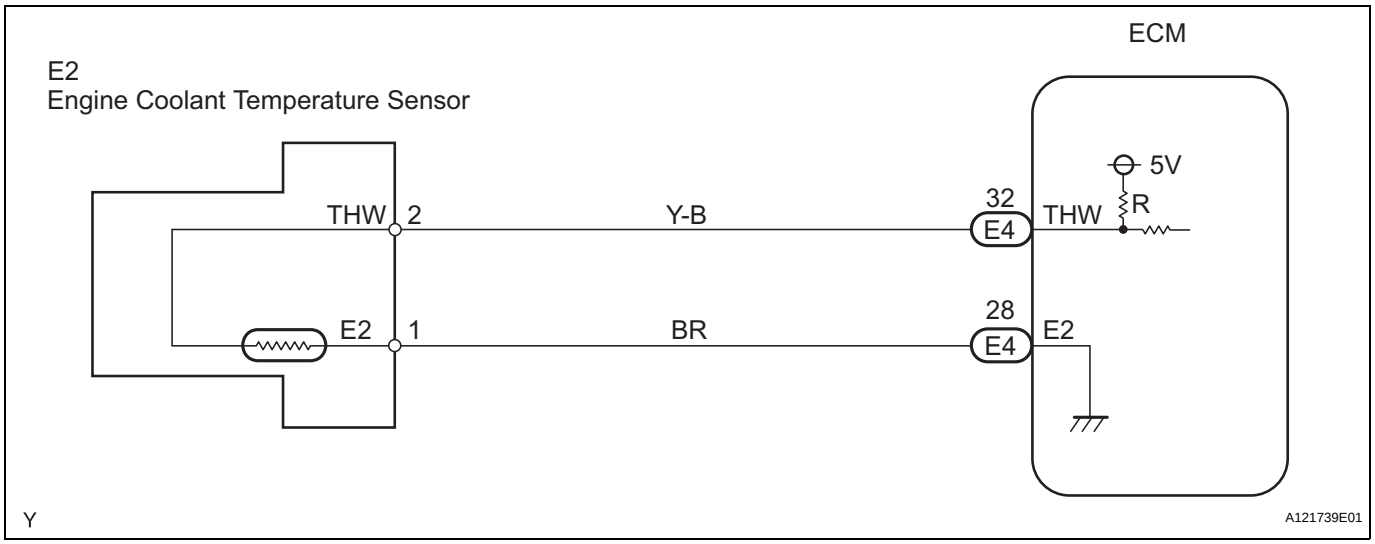
WIRING DIAGRAM



HINT:

- If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	READ DATA LIST (ENGINE COOLANT TEMPERATURE)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester ON.
(c) Select the following menus items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.
(d) Read the value displayed on the tester.

Standard:

Between 80°C and 97°C (176°F and 207°F) with warm engine.

Result

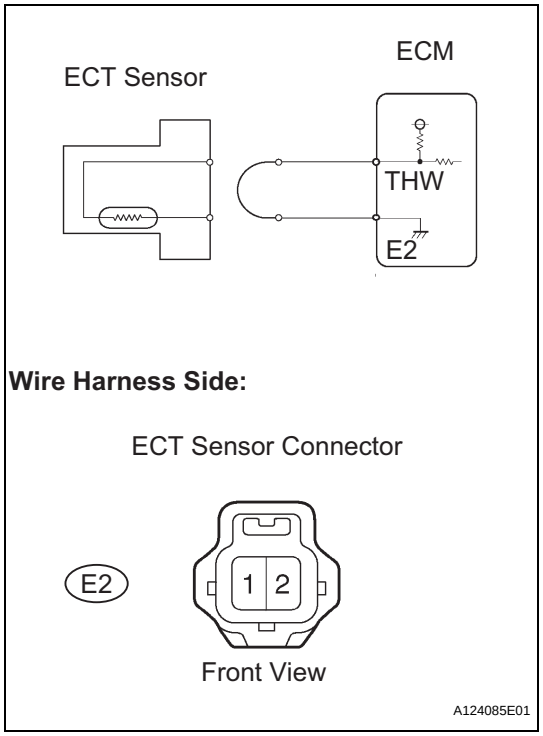
Temperature Displayed	Proceed to
-40°C (-40°F)	A
140°C (284°F)	B
Between 80°C and 97°C (176°F and 207°F)	C

HINT:
If there is an open circuit, the intelligent tester indicates -40°C (-40°F).
If there is a short circuit, the intelligent tester indicates 140°C (284°F).

B	Go to step 4
C	CHECK FOR INTERMITTENT PROBLEMS

A

2 READ DATA LIST (CHECK FOR OPEN IN WIRE HARNESS)

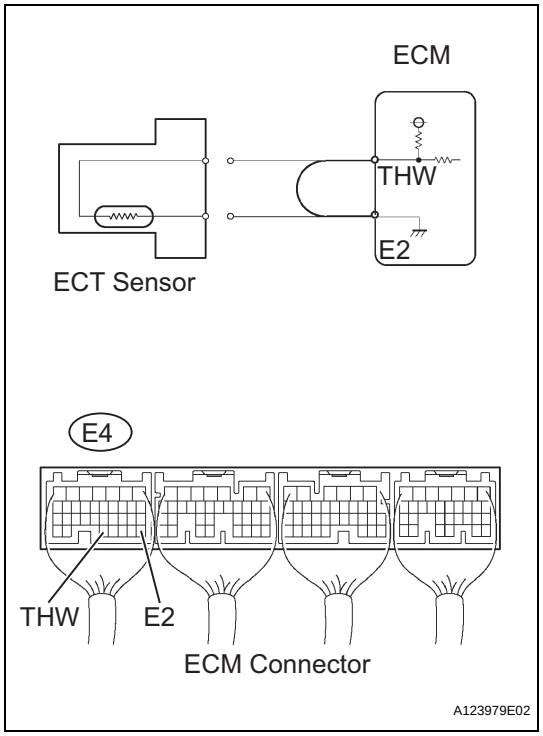


(a) Disconnect the E2 Engine Coolant Temperature (ECT) sensor connector.
(b) Connect terminals 1 and 2 of the ECT sensor connector on the wire harness side.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch to ON and turn the intelligent tester ON.
(e) Select the following menus items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.
(f) Read the value displayed on the tester.
Standard:
140°C (284°F)
(g) Reconnect the ECT sensor connector.

OK → **CONFIRM GOOD CONNECTION TO SENSOR. IF OK, REPLACE ENGINE COOLANT TEMPERATURE SENSOR**

NG

3 READ DATA LIST (CHECK FOR OPEN IN ECM)



(a) Disconnect the E2 ECT sensor connector.
(b) Connect terminals THW of the E2 of the ECM connector.
HINT:
Before checking, do a visual and contact pressure check for the ECM connector.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch to ON and turn the intelligent tester ON.
(e) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.
(f) Read the value displayed on the tester.
Standard:
140°C (284°F)
(g) Reconnect the ECT sensor connector.

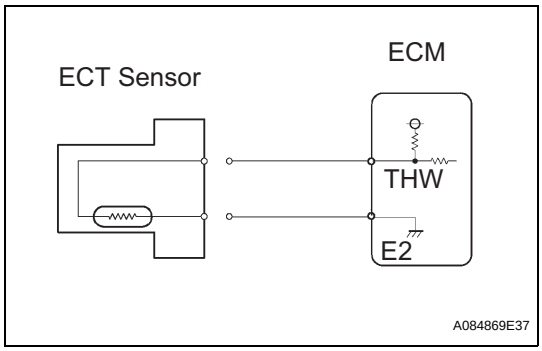
NG → **CONFIRM GOOD CONNECTION TO ECM. IF OK, REPLACE ECM**

ES

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR

4	READ DATA LIST (CHECK FOR SHORT IN WIRE HARNESS)

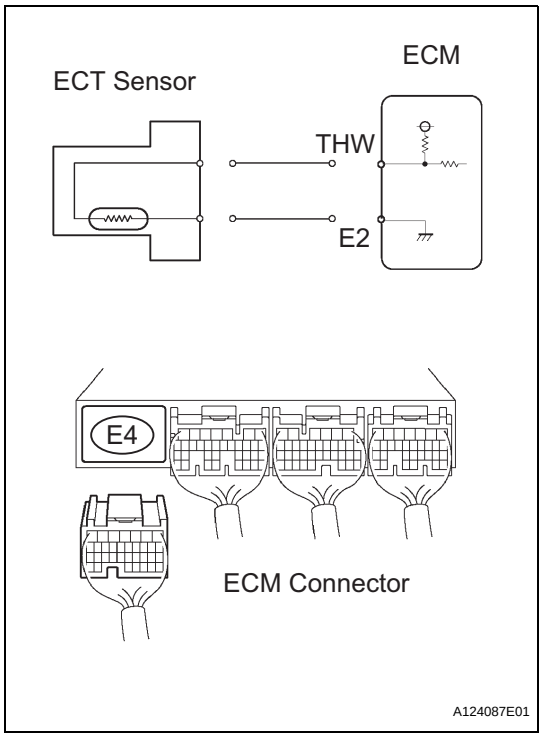


(a) Disconnect the E2 ECT sensor connector.
(b) Connect the intelligent tester to the DLC3.
(c) Turn the ignition switch to ON and turn the intelligent tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.
(e) Read the value displayed on the tester.
Standard:
-40°C (-40°F)
(f) Reconnect the ECT sensor connector.

OK → **REPLACE ENGINE COOLANT TEMPERATURE SENSOR**

NG

5	READ DATA LIST (CHECK FOR SHORT IN ECM)



(a) Disconnect the E4 ECM sensor connector.
(b) Connect the intelligent tester to the DLC3.
(c) Turn the ignition switch to ON and turn the intelligent tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.
(e) Read the value displayed on the tester.
Standard:
-40°C (-40°F)
(f) Reconnect the ECM sensor connector.

NG → **REPLACE ECM**

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR

DTC	P0116	Engine Coolant Temperature Circuit Range / Performance Problem

DESCRIPTION

Refer to DTC P0115 (See page ES-102).

DTC No.	DTC Detection Condition	Trouble Area
P0116	Case 1: Engine Coolant Temperature (ECT) between 35°C and 60°C (95°F and 140°F) when engine started, and conditions (a) and (b) met (2 trip detection logic): (a) Vehicle driven at varying speeds (accelerated and decelerated) (b) ECT remains within 3°C (5.4°F) of initial ECT Case 2: ECT more than 60°C (140°F) when engine started, and conditions (a) and (b) met (6 trip detection logic): (a) Vehicle driven at varying speeds (accelerated and decelerated) (b) ECT measurements remain within 1°C (1.8°F) of initial ECT on 6 successive occasions	• ECT sensor

MONITOR DESCRIPTION

The ECT sensor is used to monitor the ECT. The ECT sensor has a built-in thermistor with a resistance that varies according to the temperature of the engine coolant. When the ECT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in the resistance are reflected in the voltage output from the ECT sensor. The ECM monitors the sensor voltage and uses this value to calculate the ECT. If the sensor voltage output deviates from the normal operating range, the ECM interprets this deviation as a malfunction in the ECT sensor and sets the DTC.
Examples:

- Upon starting the engine, the ECT is between 35°C (95°F) and 60°C (140°F). If after driving for 250 seconds, the ECT still remains within 3°C (5.4°F) of the starting temperature, the DTC is set (2 trip detection logic).
- Upon starting the engine, the ECT is over 60°C (140°F). If, after driving for 250 seconds, the ECT remains within 1°C (1.8°F) of the starting temperature, the DTC is set (6 trip detection logic).

MONITOR STRATEGY

Related DTCs	P0116: Engine coolant temperature sensor output stuck at low engine coolant temperature P0116: Engine coolant temperature sensor output stuck at high engine coolant temperature
Required Sensors/Components (Main)	ECT sensor
Required Sensors/Components (Related)	Crankshaft position sensor, IAT sensor, MAF meter
Frequency of Operation	Continuous
Duration	1 second
MIL Operation	2 driving cycles: ECT sensor stuck (low ECT) 6 driving cycles: ECT sensor stuck (high ECT)
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0100 - P0103 (MAF meter)

ECT sensor stuck (low ECT):

Cumulative idle off period	250 seconds or more
Speed increase of 30 km/h (19 mph) or more	10 times or more

ECT	35 to 60°C (95 to 140°F)
IAT	-6.7°C (20°F) or more

ECT sensor stuck (high ECT):

ECT	60°C (140°F) or more
IAT	-6.7°C (20°F) or more
Stop and go*1	Once or more
Steady driving and stop*2	Once or more
Engine running time after engine start	0.3 seconds or more

HINT:

*1: Vehicle is stopped for 20 seconds or more and accelerated to more than 70 km/h (44 mph) within 40 seconds.

*2: Follow these steps: 1) vehicle is driven at 65 km/h (40 mph) or more for 30 seconds or more and the vehicle speed reaches 70 km/h (44 mph); 2) vehicle is decelerated from 65 km/h (40 mph) to 3 km/h (2 mph) or less within 35 seconds; and 3) vehicle is stopped for 10 seconds.

ES

TYPICAL MALFUNCTION THRESHOLDS

ECT sensor stuck (low ECT):

ECT change	Less than 3°C (5.4°F)

ECT sensor stuck (high ECT):

ECT change	1°C (1.8°F) or less

COMPONENT OPERATING RANGE

ECT	Varies with actual ECT

WIRING DIAGRAM

Refer to DTC P0115 (See page ES-103).

HINT:

- If any of DTCs P0115, P0117, P0118 or P0125 are set simultaneously with DTC P0116, the ECT sensor may have an open or a short circuit. Troubleshoot those DTCs first.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was LEAN or RICH, and other data from the time the malfunction occurred.

1	**CHECK ANY OTHER DTC OUTPUT (IN ADDITION TO DTC P0116)**

(a) Connect a intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC output)	Proceed to
P0116 and other DTCs	B
P0116	A

HINT:
If any DTCs other than P0116 are output, troubleshoot those DTCs first.

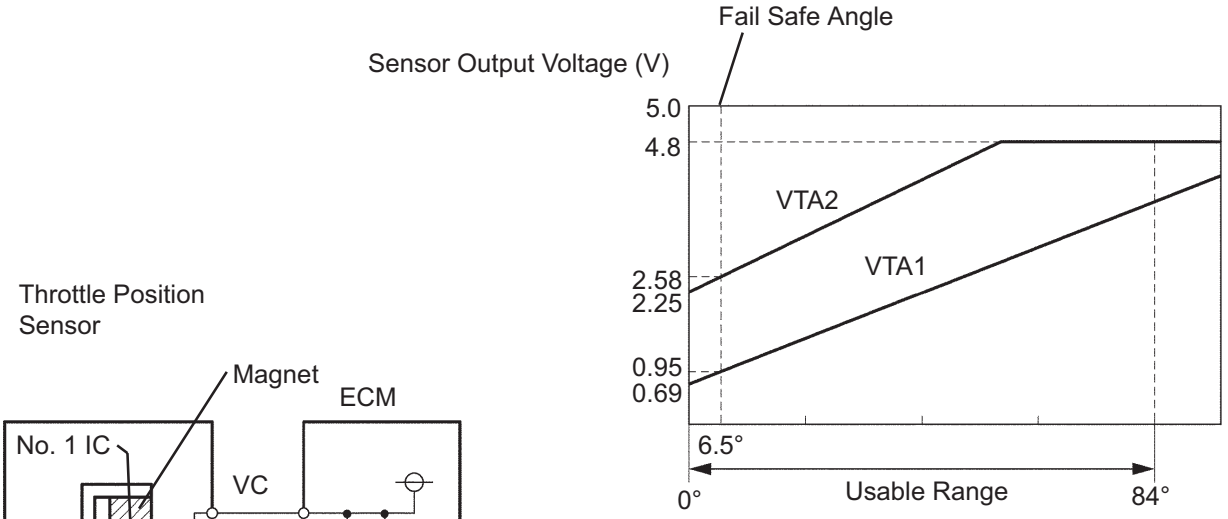
DTC	P0223	Throttle / Pedal Position Sensor / Switch "B" Circuit High Input
DTC	P2135	Throttle / Pedal Position Sensor / Switch "A" / "B" Voltage Correlation

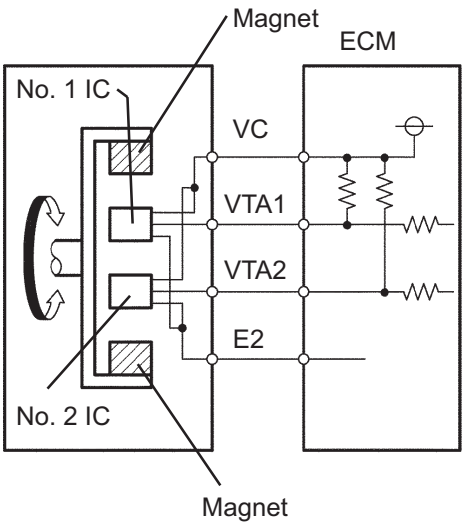
ES

HINT:
These DTCs relate to the Throttle Position (TP) sensor.

DESCRIPTION

HINT:
The Throttle Position (TP) sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type, and uses Hall-effect elements, in order to yield accurate signals, even in extreme driving conditions, such as at high speeds as well as very low speeds. The TP sensor has two sensor circuits which each transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel-cut control.





Note:

The throttle valve opening angle detected by the sensor terminal VTA1 is expressed as percentages.

Between 10 % and 22 %: Throttle valve fully closed

Between 66 % and 98 %: Throttle valve fully open

Approximately 19 %: Fail-safe angle (6.5°)

A019802E38

DTC No.	DTC Detection Condition	Trouble Area
P0120	Output voltage of VTA1 quickly fluctuates beyond lower and upper malfunction thresholds for 2 seconds (1 trip detection logic)	• Throttle position (TP) sensor (built into throttle body) • ECM
P0122	Output voltage of VTA1 0.2 V or less for 2 seconds (1 trip detection logic)	• Throttle position (TP) sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	Output voltage of VTA1 4.535 V or more for 2 seconds (1 trip detection logic)	• Throttle position (TP) sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuit • ECM
P0220	Output voltage of VTA2 quickly fluctuates beyond lower and upper malfunction thresholds for 2 seconds (1 trip detection logic)	• Throttle position (TP) sensor (built into throttle body) • ECM

DTC No.	DTC Detection Condition	Trouble Area
P0222	Output voltage of VTA2 1.75 V or less for 2 seconds (1 trip detection logic)	• Throttle position (TP) sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	Output voltage of VTA2 4.8 V or more when VTA1 between 0.2 V and 2.02 V (1 trip detection logic)	• Throttle position sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit Short between VC and VTA2 circuit • ECM
P2135	Either condition (a) or (b) met (1 trip detection logic): (a) Difference between output voltages of VTA1 and VTA2 0.02 V or less for 0.5 seconds or more (b) Output voltage of VTA1 0.2 V or less, and VTA2 1.75 V or less, for 0.4 seconds or more	• Short between VTA1 and VTA2 circuit • Throttle position sensor (built into throttle body) • ECM

HINT:

- When any of these DTCs are set, check the throttle valve opening angle by selecting the following menu items on an intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / THROTTLE POS AND THROTTLE POS #2.
- THROTTLE POS denotes the VTA1 signal (expressed in percentages), and THROTTLE POS #2 denotes the VTA2 signal (expressed in voltages).

Reference (Normal condition):

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
THROTTLE POS	10 to 22%	66 to 99%
THROTTLE POS #2	2.1 to 3.1 V	4.5 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.

- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and sets a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and sets a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and sets a DTC.

If the malfunction is not repaired successfully, a DTC is set 10 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0120: Throttle position sensor 1 range check (fluctuating) P0122: Throttle position sensor 1 range check (low voltage) P0123: Throttle position sensor 1 range check (high voltage) P0220: Throttle position sensor 2 range check (fluctuating) P0222: Throttle position sensor 2 range check (low voltage) P0223: Throttle position sensor 2 range check (high voltage) P2135: Throttle position sensor range check (correlation)

P0223:

VTA2 voltage when the VTA1 is 0.2 to 2.02 V	4.8 V or more

P2135:

Either of the following condition A or B is met	-
Condition A	-
Difference between VTA1 and VTA2 voltage	0.02 V or less
Condition B	-
VTA1 voltage	0.2 V or less
VTA2 voltage	1.75 V or less

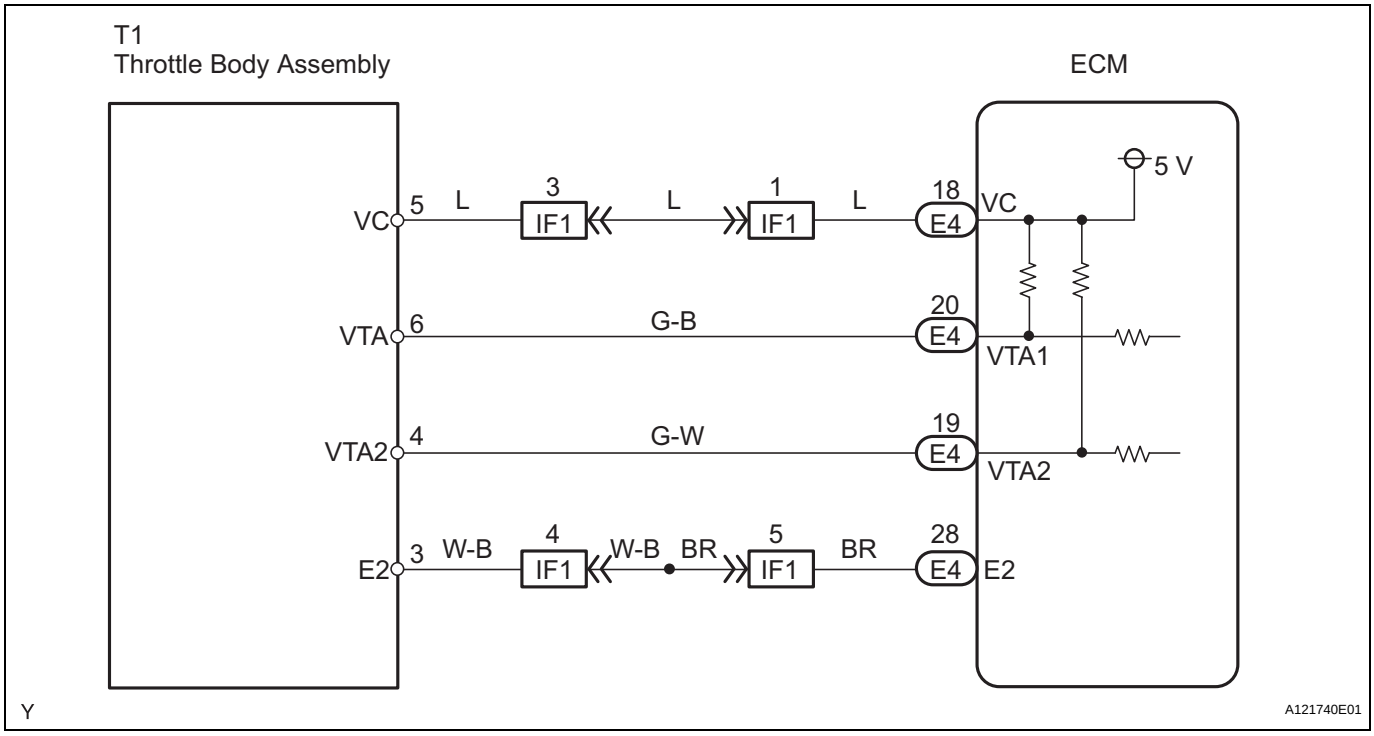
COMPONENT OPERATING RANGE

VTA1 voltage	0.69 to 4.05 V
VTA2 voltage	2.25 to 4.8 V

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, are set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6.5° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned to OFF.

WIRING DIAGRAM



HINT:

- If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	READ DATA LIST (THROTTLE POS #1, THROTTLE POS #2)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / THROTTLE POS #1 and THROTTLE POS #2.
(d) Check the values displayed on the tester.

Result

Throttle position expressed as percentage and voltage				Trouble Area	Proceed to
Accelerator pedal released		Accelerator pedal depressed			
THROTTLE POS #1 (VTA1)	THROTTLE POS #2 (VTA2)	THROTTLE POS #1 (VTA1)	THROTTLE POS #2 (VTA2)		
0%	0 to 0.2 V	0%	0 to 0.2 V	VC circuit open	A
100%	4.5 to 5.0 V	100%	4.5 to 5.0 V	E2 circuit open	A

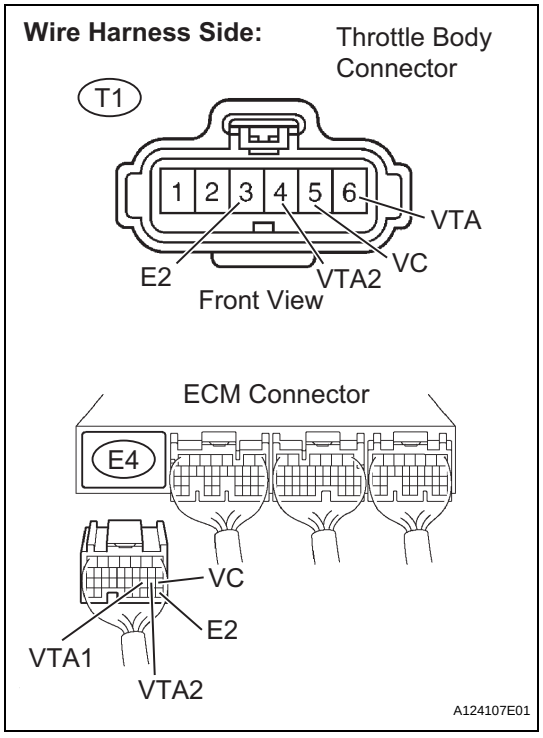
10 to 22%	2.1 to 3.1 V	66 to 98% (does not fail-safe)	4.5 to 5.0 V (does not fail-safe)	TP sensor circuit is normal	B

HINT:
- TP#1 denotes THROTTLE POS, and TP#2 denotes THROTTLE POS#2.
- AP denotes Accelerator Pedal.
- VTA1 is expressed as percentages, and VTA2 is expressed as voltages.

B → Go to step 5

A

2 CHECK HARNESS AND CONNECTOR (THROTTLE POSITION SENSOR - ECM)



(a) Disconnect the T1 throttle body connector.
(b) Disconnect the E4 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connection	Specified Condition
T1-5 (VC) - E4-18 (VC)	Below 1 Ω
T1-6 (VTA) - E4-20 (VTA1)	Below 1 Ω
T1-4 (VTA2) - E4-19 (VTA2)	Below 1 Ω
T1-3 (E2) - E4-28 (VTA2)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connection	Specified Condition
T1-5 (VC) or E4-18 (VC) - Body ground	10 kΩ or higher
T1-6 (VTA1) or E4-20 (VTA1) - Body ground	10 kΩ or higher
T1-4 (VTA2) or E4-19 (VTA2) - Body ground	10 kΩ or higher

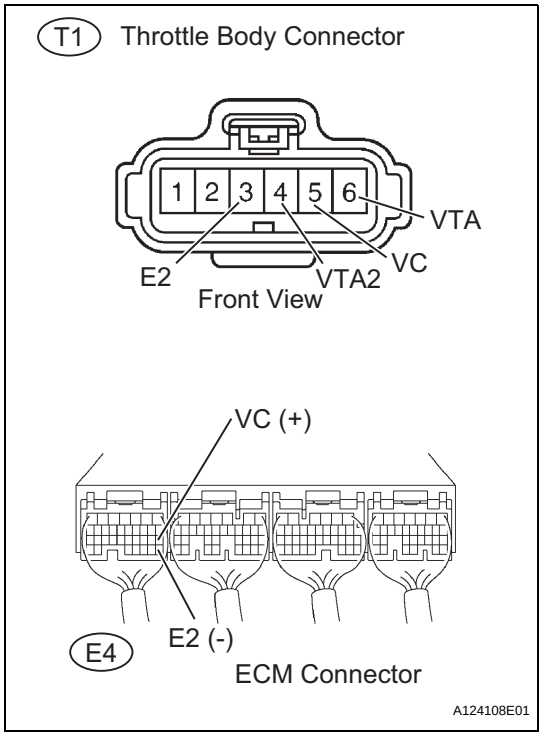
(d) Reconnect the throttle body connector.
(e) Reconnect the ECM connector.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

ES

3	INSPECT ECM (VC VOLTAGE)



(a) Disconnect the T1 throttle body connector.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between the terminals of the ECM connector.

Standard Voltage

Tester Connections	Specified Conditions
E4-18 (VC) - E4-28 (E2)	4.5 to 5.5 V

(d) Reconnect the throttle body connector.

NG → **REPLACE ECM**

OK

4	REPLACE THROTTLE BODY ASSEMBLY

NEXT

5	CHECK WHETHER DTC OUTPUT RECURS (THROTTLE POSITION SENSOR DTCS)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester ON.
(c) Clear the DTC.
(d) Start the engine.
(e) Allow the engine to idle for 15 seconds or more.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

Result

Display (DTC output)	Proceed to
P0120, P0122, P0123, P0220, P0222, P0223 and/or P2135	A
No output	B

B → **SYSTEM OK**

A

REPLACE ECM

DTC	P0121	Throttle / Pedal Position Sensor / Switch "A" Circuit Range / Performance Problem

HINT:
This DTC relates to the Throttle Position (TP) sensor.

DESCRIPTION

Refer to DTC P0120 (See page ES-110).

DTC No.	DTC Detection Conditions	Trouble Areas
P0121	Difference between VTA1 and VTA2 voltages less than 0.8 V, or more than 1.6 V for 2 seconds (1 trip detection logic)	• Throttle position (TP) sensor (built into throttle body)

ES

MONITOR DESCRIPTION

The ECM uses the TP sensor to monitor the throttle valve opening angle.
This sensor transmits two signals: VTA1 and VTA2. VTA1 is used to detect the throttle opening angle and VTA2 is used to detect malfunctions in VTA1. The ECM performs several checks to confirm the proper operation of the TP sensor and VTA1.
For each throttle opening angle, a specific voltage difference is expected between the outputs of VTA1 and VTA2. If the voltage output difference between the two signals deviates from the normal operating range, the ECM interprets this as a malfunction of the TP sensor. The ECM illuminates the MIL and sets the DTC. If the malfunction is not repaired successfully, the DTC is set 2 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0121: TP sensor rationality
Required Sensors/Components (Main)	TP sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	Within 2 seconds

A

REPLACE THROTTLE BODY

DTC	P0125	Insufficient Coolant Temperature for Closed Loop Fuel Control

DESCRIPTION

Refer to DTC P0115 (See page ES-102).

DTC No.	DTC Detection Condition	Trouble Area
P0125	Engine coolant temperature hardly changes for 70 seconds after engine start (2 trip detection logic)	• Engine Coolant Temperature (ECT) sensor • Cooling system • Thermostat
P0125	Engine coolant temperature hardly changes for 114 seconds after engine start (2 trip detection logic)	
P0125	Engine coolant temperature hardly changes for 1,200 seconds after engine start (2 trip detection logic)	

ES

MONITOR DESCRIPTION

The resistance of the ECT sensor varies in proportion to the actual ECT. The ECM supplies a constant voltage to the sensor and monitors the signal output voltage of the sensor. The signal voltage output varies according to the changing resistance of the sensor. After the engine is started, the ECT is monitored through this signal. If the ECT sensor indicates that the engine is not yet warm enough for closed-loop fuel control, despite a specified period of time having elapsed since the engine was started, the ECM interprets this as a malfunction in the sensor or cooling system and sets the DTC.
Example:
The ECT is 0°C(32°F) at engine start. After 70 seconds running time, the ECT sensor still indicates that the engine is not warm enough to begin closed-loop fuel (air-fuel ratio feedback) control. The ECM interprets this as a malfunction in the sensor or cooling system and sets the DTC.

MONITOR STRATEGY

Related DTCs	P0125: Insufficient engine coolant temperature for closed-loop fuel control
Required Sensors/Components (Main)	Thermostat, cooling system
Required Sensors/Components (Related)	Engine coolant temperature sensor and mass air flow meter
Frequency of Operation	Continuous
Duration	70 seconds: -0.34°C (31.38°F) or more 114 seconds: -11.45 to -0.34°C (11.39 to 31.38°F) 1200 seconds: Less than -11.45°C (11.39°F)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All

Monitor will run whenever these DTCs are not present	P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor)

Case 1

Engine coolant or intake air temperature at engine start	-0.34°C (31.38°F) or more
Engine	Running
Fuel cut	OFF

Case 2

Engine coolant or intake air temperature at engine start	Between -11.45°C (11.39°F) and -0.34°C (31.38°F)

Engine	Running
Fuel cut	OFF

Case 3

Engine coolant or intake air temperature at engine start	Lower than -11.45°C (11.39°F)
Engine	Running
Fuel cut	OFF
Idle	OFF

TYPICAL MALFUNCTION THRESHOLDS

Engine coolant temperature sensor output	Less than 8°C (46°F)

WIRING DIAGRAM

Refer to DTC P0115 (See page ES-103).

HINT:

- If any of DTCs P0115, P0116, P0117 or P0118 are set simultaneously with DTC P0125, the Engine Coolant Temperature (ECT) sensor may have an open or a short circuit. Troubleshoot those DTCs first.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was LEAN or RICH, and other data from the time the malfunction occurred.

1 CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0125)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC output)	Proceed to
P0125	A
P0125 and other DTCs	B

HINT:
If any DTCs other than P0125 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

A

2 INSPECT THERMOSTAT

(a) Remove the thermostat (See page CO-7).
(b) Check the valve opening temperature of the thermostat.

Standard:
80 to 84°C (176 to 183°F)

HINT:
In addition to the above check, confirm that the valve is completely closed when the temperature is below the standard.

(c) Reinstall the thermostat (See page CO-8).

NG → **REPLACE THERMOSTAT**

OK

3	CHECK COOLING SYSTEM

(a) Check for defects in the cooling system that might cause the system to be too cold, such as abnormal radiator fan operation or any modifications.

NG → **REPAIR OR REPLACE COOLING SYSTEM**

OK

REPLACE ENGINE COOLANT TEMPERATURE SENSOR

DTC	P0128	Coolant Thermostat (Coolant Temperature Below Thermostat Regulating Temperature)

HINT:
This DTC relates to the thermostat.

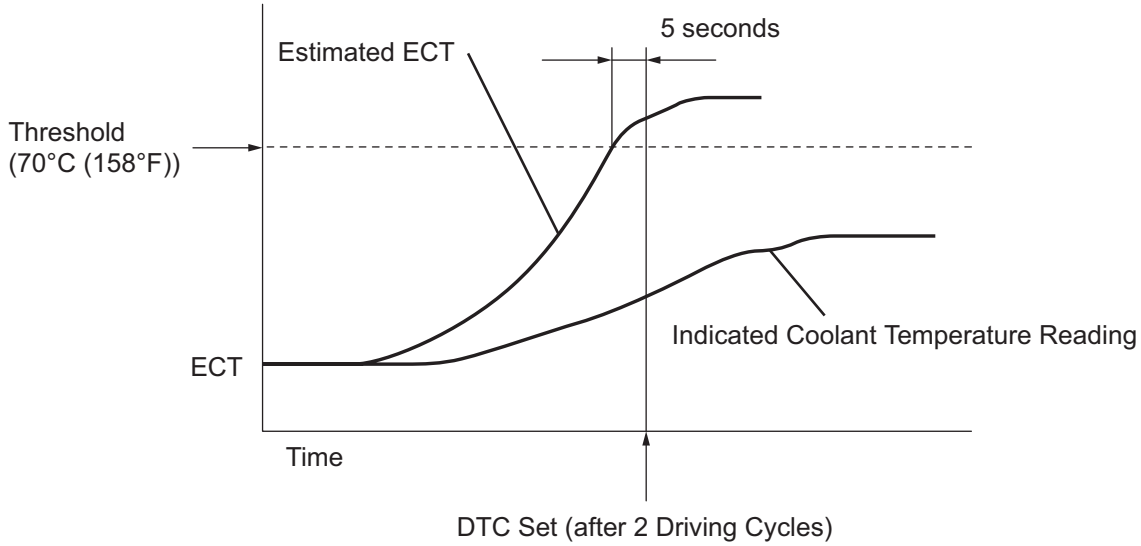
DESCRIPTION

This DTC is set when the Engine Coolant Temperature (ECT) does not reach 70°C (158°F) despite sufficient engine warm-up time.

DTC No.	DTC Detection Conditions	Trouble Areas
P0128	Conditions (a), (b) and (c) met for 5 seconds (2 trip detection logic): (a) Cold start (b) Engine warmed up (c) Engine Coolant Temperature (ECT) less than 70°C (158°F)	• Thermostat • Cooling system • ECT sensor • ECM

ES

MONITOR DESCRIPTION



The ECM estimates the ECT based on the starting temperature, engine loads, and engine speeds. The ECM then compares the estimated temperature with the actual ECT. When the estimated ECT reaches 70°C (158°F), the ECM checks the actual ECT. If the actual ECT is less than 70°C (158°F), the ECM interprets this as a malfunction in the thermostat or the engine cooling system and sets the DTC.

MONITOR STRATEGY

Related DTCs	P0128: Coolant Thermostat

Required Sensors / Components (Main)	Thermostat
Required Sensor / Components (Related)	Engine Coolant Temperature (ECT) sensor, Intake Air Temperature (IAT) sensor, Vehicle speed sensor
Frequency of Operation	Once per driving cycle
Duration	900 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0010, (OCV Bank 1) P0011 (VVT System 1 - Advance) P0012 (VVT System 1 - Retard) P0031, P0032 (A/F sensor heater - Sensor 1) P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor) P0125 (Insufficient ECT for closed loop) P0171, P0172 (Fuel system) P0300 - P0304 (Misfire) P0335 (CKP sensor) P0340, P0341 (CMP sensor) P0351 - P0358 (igniter) P0500 (VSS) P2196 (A/F sensor - rationality) P2A00 (A/F sensor - slow response)
Battery voltage	11 V or more
Throttle valve position learning	Completed
Either of following conditions 1 or 2 met:	-
1. All of following conditions (a), (b) and (c) met:	-
(a) ECT at engine start - IAT at engine start	-15°to 7°C (-27°to 12.6°F)
(b) ECT at engine start	-10°to 51°C (14°to 133°F)
(c) IAT at engine start	-10°to 51°C (14°to 133°F)
2. All of following conditions (d), (e) and (f) met:	-
(d) ECT at engine start - IAT at engine start	More than 7°C (12.6°F)
(e) ECT at engine start	51°C (133°F) or less
(f) IAT at engine start	-10°C (14°F) or more
Accumulated time at 80 mph (128 km/h) or more of vehicle speed	Less than 20 seconds

TYPICAL MALFUNCTION THRESHOLDS

Duration that following conditions A and B met	5 seconds or more
A. Simulated ECT	70°C (158°F) or more
B. Actual ECT	Below 70°C (158°F)

HINT:
Read freeze frame data using a intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	**CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0128)**

(a) Connect a intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.

(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result:

Display (DTC Output)	Proceed To
P0128	A
P0128 and other DTCs	B

HINT:
If any DTCs other than P0128 are output, troubleshoot those DTCs first.

(a) Check for defects in the cooling system that might cause the system to be too cold, such as abnormal radiator fan operation or any modifications.

NG → **REPAIR OR REPLACE COOLING SYSTEM**

OK

3 INSPECT THERMOSTAT

(a) Remove the thermostat (see page CO-7).
(b) Check the valve opening temperature of the thermostat.
Standard:
80° to 84°C (176° to 183°F)
HINT:
In addition to the above check, confirm that the valve is completely closed when the temperature is below the standard.
(c) Reinstall the thermostat (see page CO-8).

NG → **REPLACE THERMOSTAT**

OK

REPLACE ECM

DTC	P0136	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)

DTC	P0137	Heated Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2)

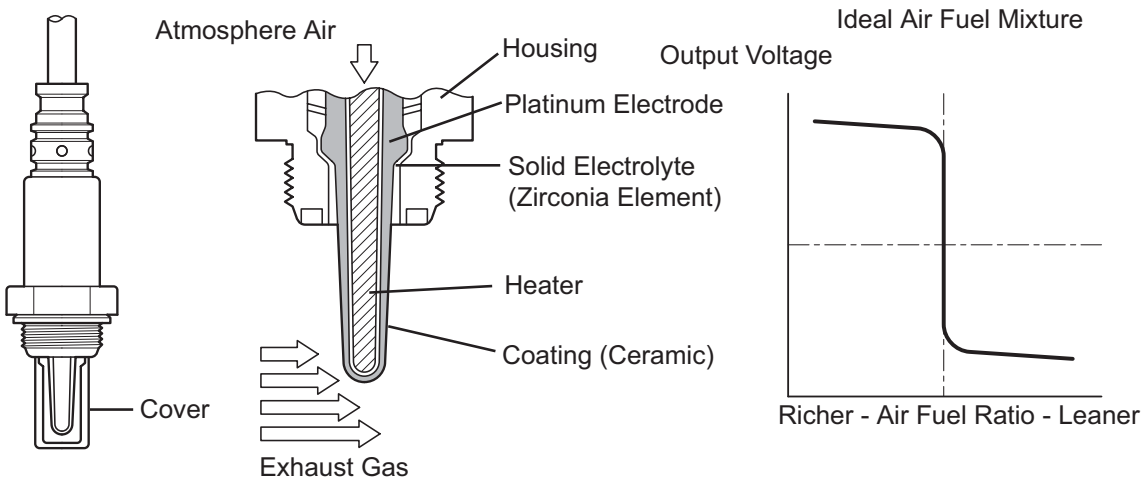
DTC	P0138	Oxygen Sensor Circuit High Voltage (Bank 1 Sensor 2)

HINT:
Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.

ES

DESCRIPTION

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel level. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.
The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).
When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. less than 0.45 V). Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel level, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. more than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.
The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.



DTC No.	DTC Detection Conditions	Trouble Areas
P0136	• Abnormal voltage output (active air-fuel ratio control): During active air-fuel ratio control, following conditions (a) and (b) met for certain period of time (1 trip detection logic): (a) Heated Oxygen (HO2) sensor voltage does not decrease to less than 0.21 V (b) HO2 sensor voltage does not increase to more than 0.59 V • Low impedance: Sensor impedance less than 5 Ωfor more than 30 seconds when ECM presumes sensor to being warmed up and operating normally (1 trip detection logic)	• Open or short in HO2 sensor (sensor 2) circuit • HO2 sensor (sensor 2) • HO2 sensor heater (sensor 2) • Air-fuel Ratio (A/F) sensor (sensor 1) • EFI relay • Gas leakage from exhaust system
P0137	• Low voltage (open): During active air-fuel ratio control, following conditions (a) and (b) met for certain period of time (1 trip detection logic): (a) HO2 sensor voltage output less than 0.21 V (b) Target air-fuel ratio rich • High impedance: Sensor impedance 15 kΩ or more for more than 90 seconds when ECM presumes sensor to being warmed up and operating normally (1 trip detection logic)	• Open in HO2 sensor (sensor 2) circuit • HO2 sensor (sensor 2) • HO2 sensor (sensor 2) heater • EFI relay • Gas leakage from exhaust system
P0138	• High voltage (short): During active air-fuel ratio control, following conditions (a) and (b) met for certain period of time (1 trip detection logic): (a) HO2 sensor voltage output less than 0.59 V or more (b) Target air-fuel ratio lean • Extremely high voltage (short) : HO2 sensor voltage output exceeds 1.2 V for more than 10 seconds (1 trip detection logic)	• Short in HO2 sensor (sensor 2) circuit • HO2 sensor (sensor 2) • ECM internal circuit malfunction

MONITOR DESCRIPTION

Active Air-Fuel Ratio Control

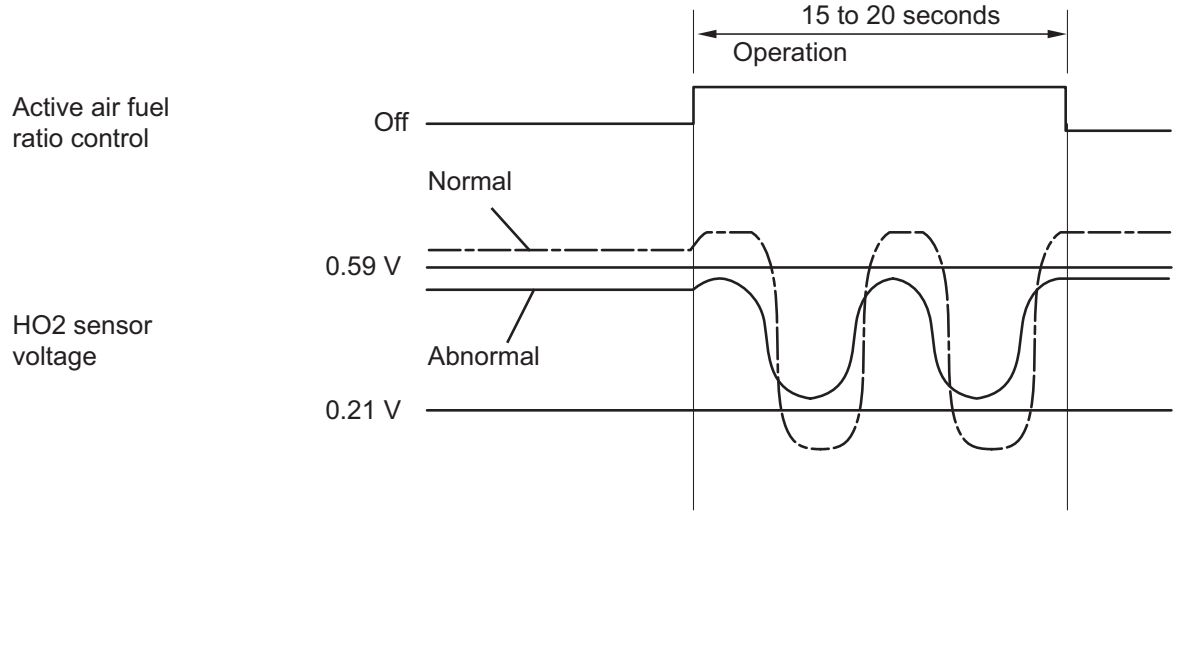
- The ECM usually performs air-fuel ratio feedback control so that the Air-Fuel Ratio (A/F) sensor output indicates a near stoichiometric air-fuel level. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).
- Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, one of the following DTCs is set: DTC P0136 (abnormal voltage output), P0137 (open circuit) and P0138 (short circuit).

Abnormal Voltage Output of HO2 Sensor (DTC P0136)

- While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to less than 0.21 V and does not increase to more than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and sets DTC P0136.

ES

HO2 SENSOR CIRCUIT MALFUNCTION (P0136: ABNORMAL VOLTAGE)

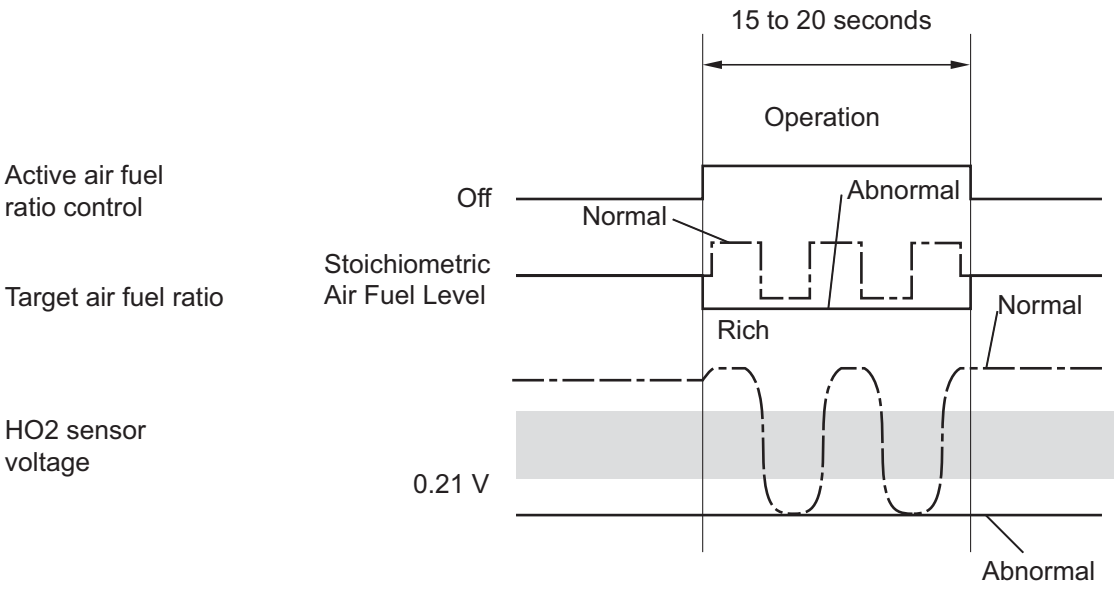


Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 or P0138)

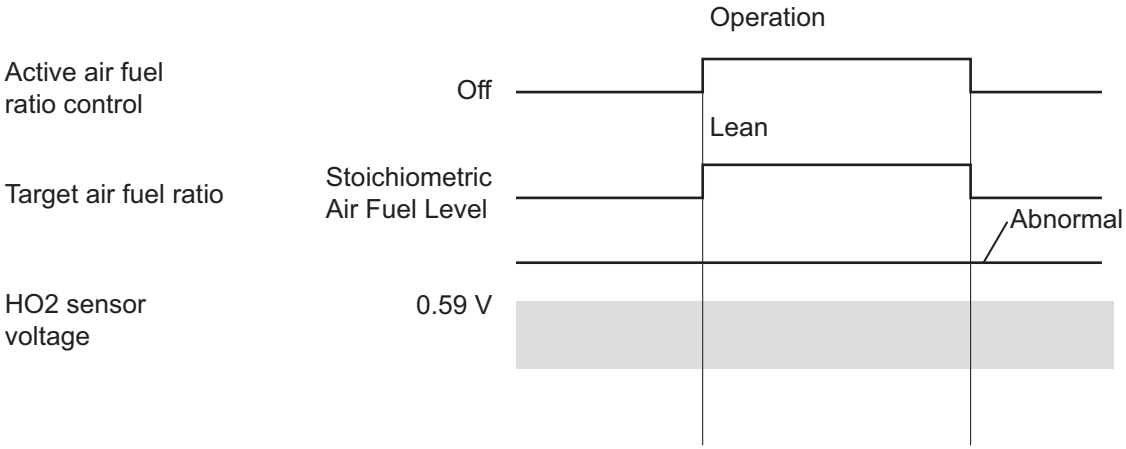
- During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three- Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor noticeably decreases, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.
- While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and sets DTC P0137. When the target air-fuel ratio is lean and the voltage output is 0.59 V or more (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and sets DTC P0138.
  HINT:
  DTC P0138 is also set if the HO2 sensor voltage output is more than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated, based on the calculated OSC value (see page ES-206).

HO2 SENSOR CIRCUIT LOW VOLTAGE (P0137: OPEN)



HO2 SENSOR CIRCUIT HIGH VOLTAGE (P0138: SHORT)

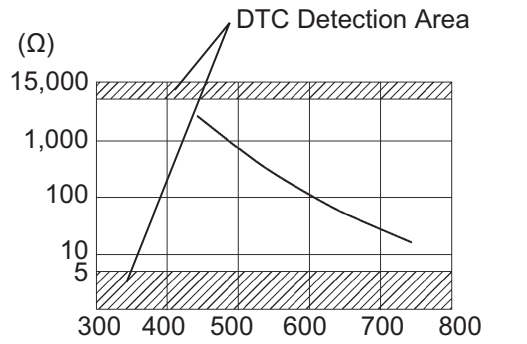


Y

A115541E03

High or Low Impedance of Heated Oxygen (HO2) Sensor (DTC P0136 or P0137)

Relationship between element temperature and impedance:



ES

- During normal air-fuel ratio feedback control, there are small variations in the exhaust gas oxygen concentration. In order to continuously monitor the slight variation of the HO2 sensor signal while the engine is running, the impedance* of the sensor is measured by the ECM. The ECM determines that there is a malfunction in the sensor when the measured impedance deviates from the standard range.
- *: The effective resistance in an alternating current electrical circuit.
  HINT:
  - The impedance cannot be measured using an ohmmeter.
  - DTC P0136 indicates the deterioration of the HO2 sensor. The ECM sets the DTC by calculating the impedance of the sensor when the typical enabling conditions are satisfied (1 driving cycle).
  - DTC P0137 indicates an open or short circuit in the HO2 sensor (1 driving cycle). The ECM sets the DTC when the impedance of the sensor exceeds the threshold 15 kΩ.

MONITOR STRATEGY

ES

Heated Oxygen Sensor Output Voltage (Output Voltage, High Voltage and Low Voltage):

Active air-fuel ratio control	Executing
Active air-fuel ratio control begins when all of following conditions met:	-
Battery voltage	11 V or more
Engine coolant temperature	70°C (158°F) or more
Idling	OFF
Engine RPM	Less than 4,000 rpm
A/F sensor status	Activated
Fuel cut	OFF (for 5 seconds or more)
Engine load	10 to 80 %
Shift position	4th or 5th (for M/T) 3rd, 4th or 5th (for A/T)

Heated Oxygen Sensor Impedance (Low):

Battery voltage	11 V or more
Estimated sensor temperature	Less than 700°C(1,292°F)
DTC P0606	Not set

Heated Oxygen Sensor Impedance (High):

Battery voltage	11 V or more
Estimated sensor temperature	More than 450°C(842°F)
DTC P0606	Not set

Heated Oxygen Sensor Output Voltage (Extremely High):

Battery voltage	11 V or more
Time after engine start	2 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

Heated Oxygen Sensor Output Voltage (Output voltage):

Either of following conditions met:	1 or 2
1. All of the following conditions (a), (b) and (c) met	-
(a) Commanded air-fuel ratio	14.3 or less
(b) Rear HO2 sensor voltage	0.21 to 0.59 V
(c) OSC (Oxygen Storage Capacity of Catalyst)	2.5 g or more
2. All of the following conditions (d), (e) and (f) met	-

(d) Commanded air-fuel ratio	14.9 or more
(e) Rear HO2 sensor voltage	0.21 to 0.59 V
(f) OSC (Oxygen Storage Capacity of Catalyst)	2.5 g or more

Heated Oxygen Sensor Output Voltage (Low output voltage):

All of the following conditions (a), (b) and (c) met	-
(a) Commanded air-fuel ratio	14.3 or less
(b) Rear HO2 sensor voltage	Less than 0.21 V
(c) OSC (Oxygen Storage Capacity of Catalyst)	2.5 g or more

Heated Oxygen Sensor Output Voltage (High output voltage):

All of the following conditions (a), (b) and (c) met	-
(a) Commanded air-fuel ratio	14.9 or more
(b) Rear HO2 sensor voltage	More than 0.59 V
(c) OSC (Oxygen Storage Capacity of Catalyst)	2.5 g or more

ES

Heated Oxygen Sensor Impedance (Low):

Duration of following condition met	30 seconds or more
Heated oxygen sensor impedance	Less than 5 Ω

Heated Oxygen Sensor Impedance (High):

Duration of following condition met	90 seconds or more
Heated oxygen sensor impedance	15 kΩ or more

Heated Oxygen Sensor Impedance (Extremely High):

Duration of following condition met	10 seconds or more
Heated oxygen sensor impedance	1.2 V or more

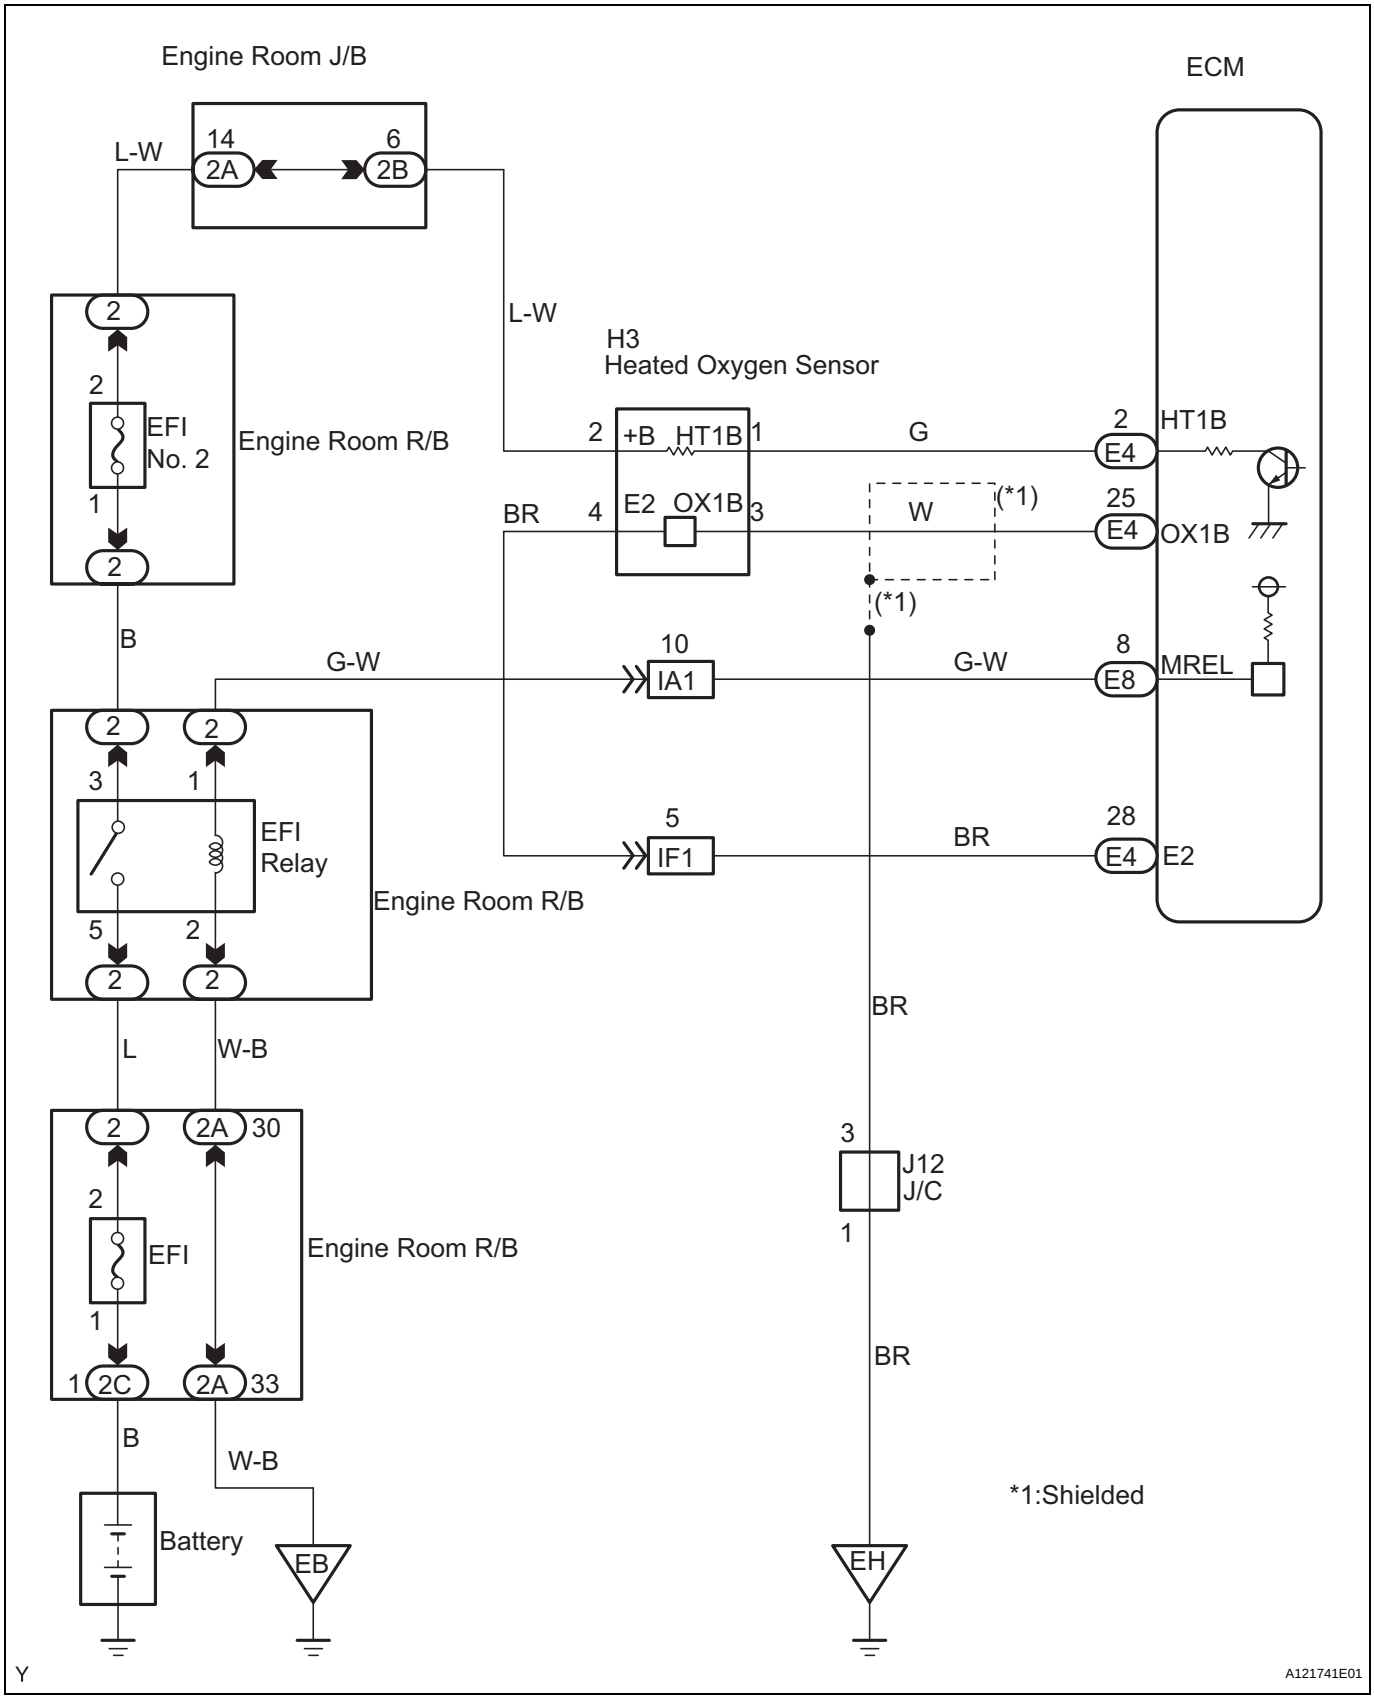
COMPONENT OPERATING RANGE

Duration of following condition met	30 seconds or more
Heated oxygen sensor voltage	Varies between 0.1 and 0.9 V

MONITOR RESULT

Refer to Checking Monitor Status (See page ES-21).

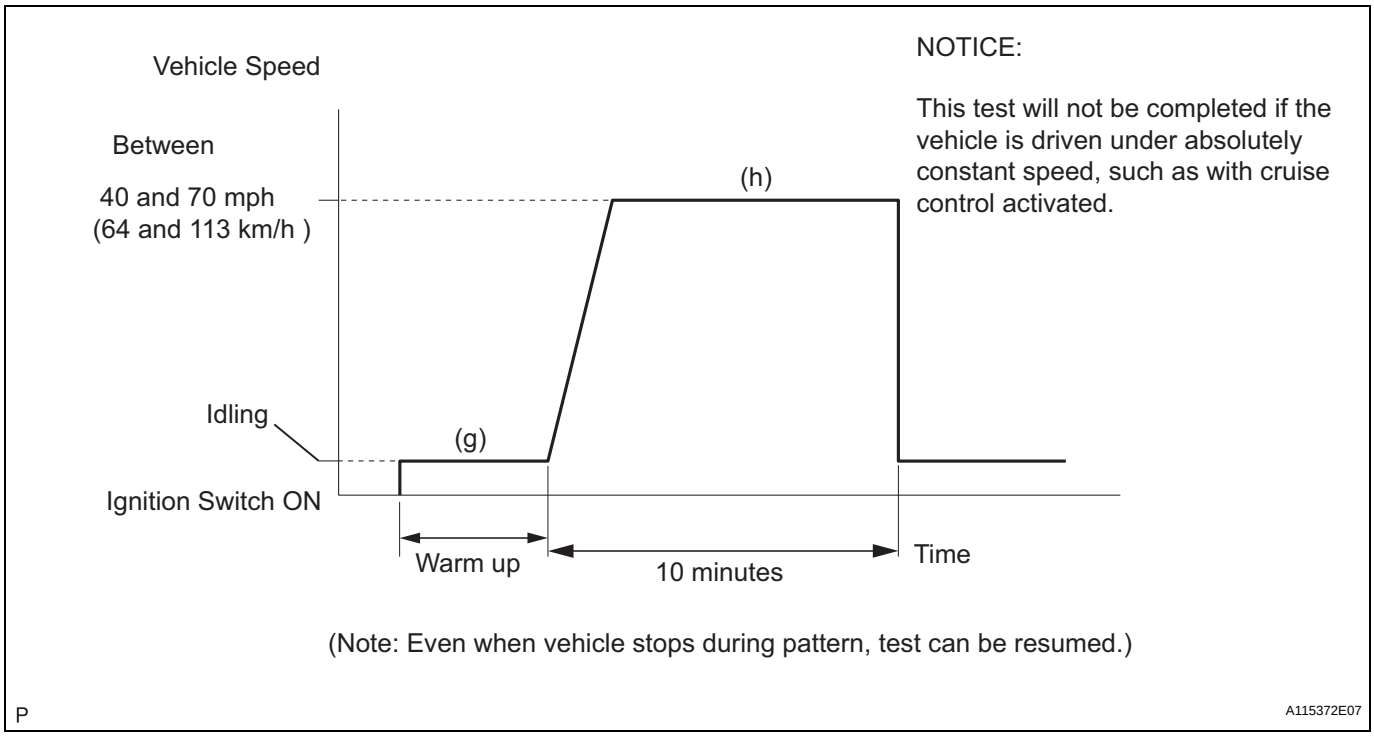
WIRING DIAGRAM

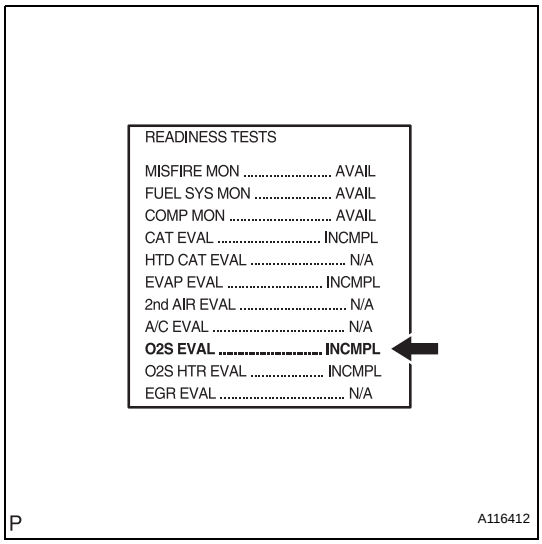


CONFIRMATION DRIVING PATTERN

HINT:

- This confirmation driving pattern is used in the "PERFORM CONFIRMATION DRIVING PATTERN" procedure of the following diagnostic troubleshooting procedure.
- Performing this confirmation pattern will activate the Heated Oxygen (HO2) sensor monitor. (The catalyst monitor is performed simultaneously.) This is very useful for verifying the completion of a repair.





(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester or scan tool ON.
(d) Clear DTCs (where set) (See page ES-40).
(e) If using an intelligent tester, select the following menu items: DIAGNOSIS / CARB OBD II / READINESS TESTS.
(f) Check that O2S EVAL is INCMPL (incomplete).
(g) Start the engine and warm it up.
(h) Drive the vehicle at between 40 mph and 70 mph (64 km/h and 113 km/h) for at least 10 minutes.

(i) Note the state of the Readiness Tests items. Those items will change to COMPL (complete) as O2S EVAL monitor operates.
(j) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES and check if any DTCs (any pending DTCs) are set.
HINT:
If O2S EVAL does not change to COMPL, and any pending DTCs fail to set, extend the driving time.

HINT:
Intelligent tester only :
Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using an intelligent tester.
(a) Connect an intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and OS2 B1S2) displayed on the tester.

HINT:
- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard Voltage

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (A/F)	+25%	Rich	Less than 3.0
AFS B1S1 (A/F)	-12.5%	Lean	More than 3.35
O2S B1S2	+25%	Rich	More than 0.5
O2S B1S2	-12.5%	Lean	Less than 0.4

NOTICE:
The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Area
1	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.55 V Less than 0.4 V		
2	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.55 V Less than 0.4 V		

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Area
3	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely lean or rich)
	Output Voltage Almost no reaction		Output Voltage Almost no reaction		

ES

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

HINT:

- If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.
- If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be set.

1	READ OUTPUT DTC

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC output)	Proceed to
P0138	A
P0137	B
P0136	C

B → Go to step 14

C → Go to step 7

A

2	READ DATA LIST (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.

(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / O2S B1S2.
(d) Allow the engine to idle.
(e) Read the Heated Oxygen (HO2) sensor output voltage while idling.
Result

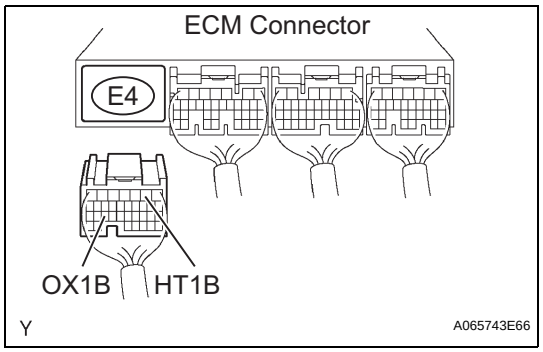
HO2 Sensor Output Voltages	Proceed to
More than 1.2 V	A
Less than 1.0 V	B

B → **Go to step 5**

A

ES

3 CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT)



(a) Turn the ignition switch to OFF and wait for 5 minutes.
(b) Disconnect the E4 ECM connector.
(c) Check the resistance.
Standard Resistance

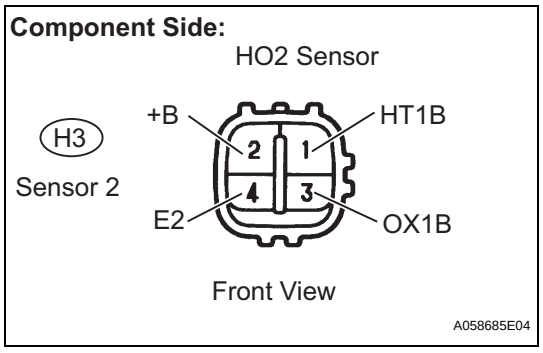
Tester Connection	Specified Condition
HT1B (E4-2) - OX1B (E4-25)	10 kΩ or higher

(d) Reconnect the ECM connector.

OK → **REPLACE ECM**

NG

4 INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)



(a) Disconnect the H3 HO2 sensor connector.
(b) Check the resistance.
Standard Resistance

Tester Connections	Specified Conditions
+B (H3-2) - E2 (H3-4)	10 kΩ or higher
+B (H3-2) - OX1B (H3-3)	10 kΩ or higher

(c) Reconnect the HO2 sensor connector.

NG → **REPLACE HEATED OXYGEN SENSOR**

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR

5	PERFORM CONFIRMATION DRIVING PATTERN

NEXT

6	CHECK WHETHER DTC OUTPUT RECURS (DTC P0138)

(a) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(b) Read DTCs.
Result

Display (DTC Output)	Proceed To
P0138	A
No output	B

B → CHECK FOR INTERMITTENT PROBLEMS

A

REPLACE HEATED OXYGEN SENSOR

7	READ DATA LIST (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Start the engine.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / O2S B1S2
(e) After warming up the engine, run the engine at an engine speed of 2,500 rpm for 3 minutes.
(f) Read the output voltage of the HO2 sensor when the engine rpm is suddenly increased.
HINT:
Quickly accelerate the engine to 4,000 rpm 3 times using the accelerator pedal.
Standard Voltage:
Fluctuates between 0.4 V or less and 0.5 V or more.

NG → Go to step 14

OK

8	PERFORM CONFIRMATION DRIVING PATTERN

NEXT

9	CHECK WHETHER DTC OUTPUT RECURS (DTC P0136)

(a) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(b) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0136	A
No output	B

B → CHECK FOR INTERMITTENT PROBLEMS

A

10	REPLACE HEATED OXYGEN SENSOR

NEXT

11	PERFORM CONFIRMATION DRIVING PATTERN

NEXT

12	CHECK WHETHER DTC OUTPUT RECURS (DTC P0136)

(a) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(b) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0136	A
No output	B

B → REPAIR COMPLETED

A

13	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / INJ VOL.
(e) Change the fuel injection volume using the tester, monitoring the voltage output of Air-Fuel Ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- Change the fuel injection volume within the range of -12 % and +12 %. The injection volume can be changed in 1 % graduations within the range.
- The A/F sensor is displayed as AFS B1S1, and the HO2 sensor is displayed as O2S B1S2, on intelligent testers.

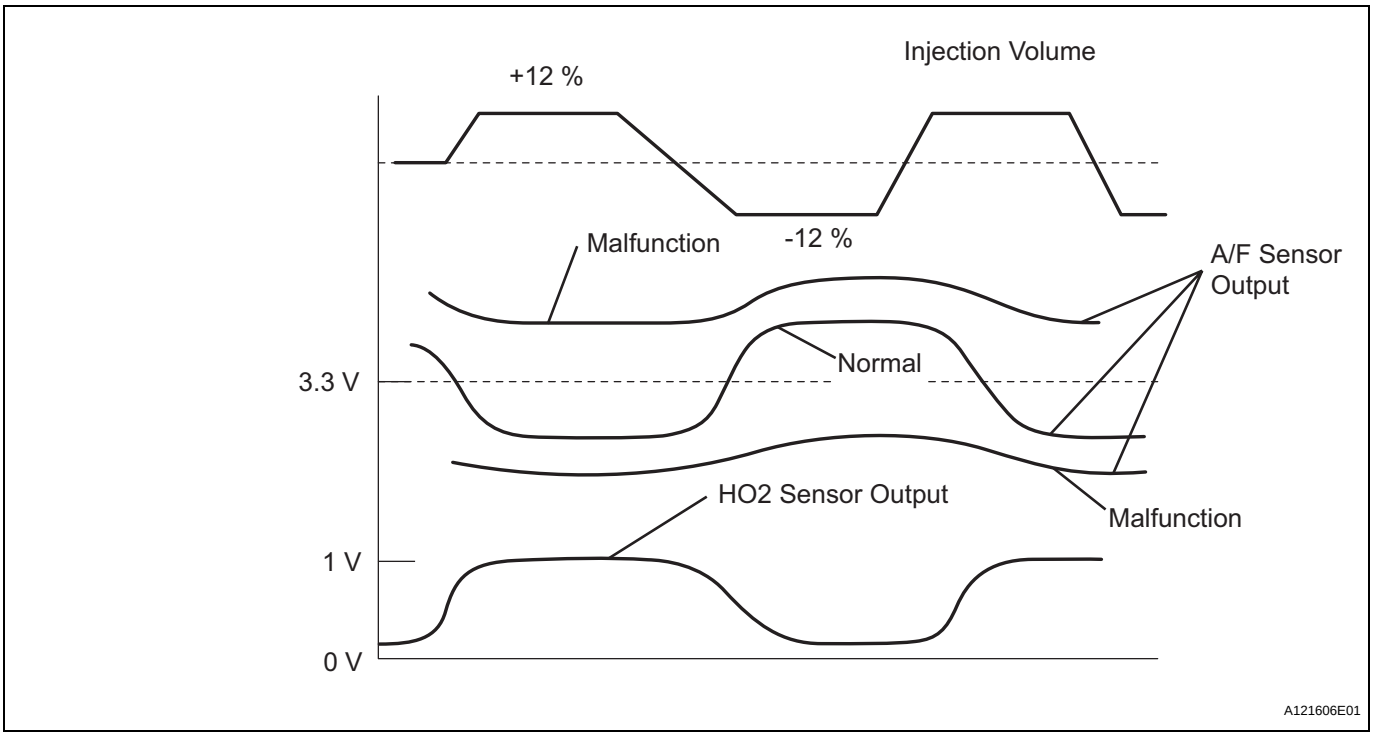
Result

Display (DTC Output)	Voltage Variations	Proceed To
AFS B1S1 (A/F)	Alternates between more and less than 3.3 V	OK
AFS B1S1 (A/F)	Remains at more than 3.3 V	NG
AFS B1S1 (A/F)	Remains at less than 3.3 V	NG

ES

HINT:

A normal HO2 sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or more than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.



NG → **REPLACE AIR FUEL RATIO SENSOR**

OK

CHECK AND REPAIR EXTREMELY RICH OR LEAN ACTUAL AIR FUEL RATIO (INJECTOR, FUEL PRESSURE, EXHAUST GAS LEAKAGE, ETC.)

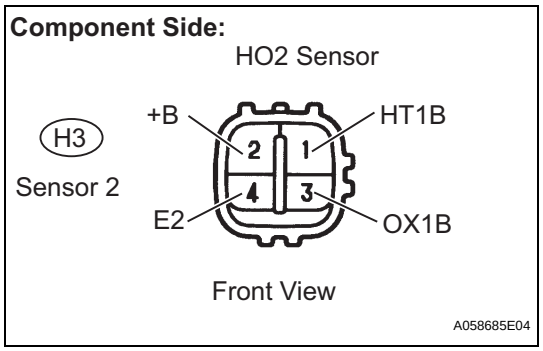
14	CHECK FOR EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → **REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT**

OK

15	INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



(a) Disconnect the H3 HO2 sensor connector.
(b) Measure the resistance between the terminals of the HO2 sensor connector.
Standard Resistance

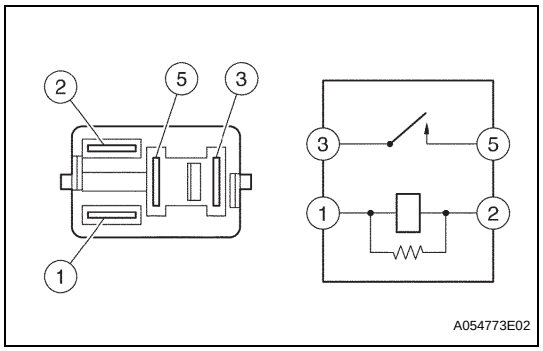
Tester Connections	Specified Conditions
HT1B (H3-1) - +B (H3-2)	11 to 16 Ω at 20°C (68°F)
HT1B (H3-1) - E2 (H3-4)	10 kΩ or higher

(c) Reconnect the HO2 sensor connector.

NG → **REPLACE HEATED OXYGEN SENSOR**

OK

16	INSPECT EFI RELAY



(a) Remove the EFI relay from the engine room R/B.
(b) Check the EFI relay resistance.
Standard Resistance

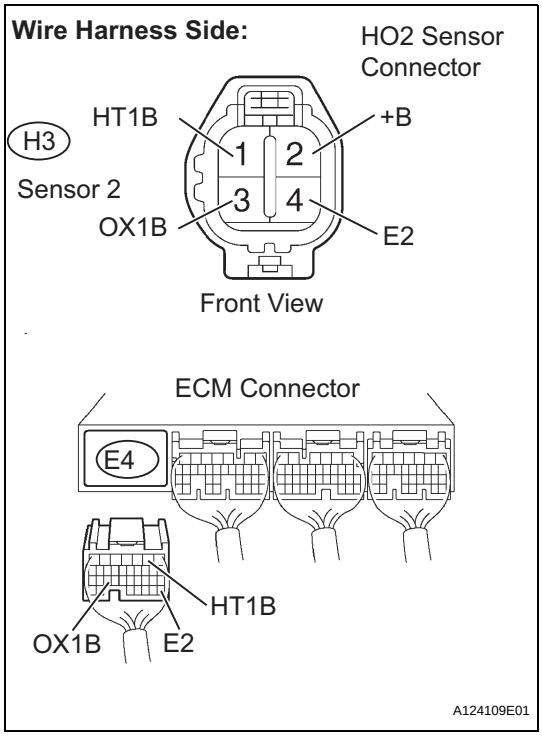
Tester Connections	Specified Conditions
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the EFI relay.

NG → **REPLACE EFI RELAY**

OK

17 CHECK HARNESS OR CONNECTOR (HEATED OXYGEN SENSOR - ECM)



(a) Disconnect the H3 HO2 sensor connector.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between the +B terminal of the HO2 sensor connector and body ground.

Standard Voltage

Tester Connections	Specified Conditions
+B (H3-1) - Body ground	9 to 14 V

(d) Turn the ignition switch to OFF.
(e) Disconnect the E4 ECM connector.
(f) Check the resistance.

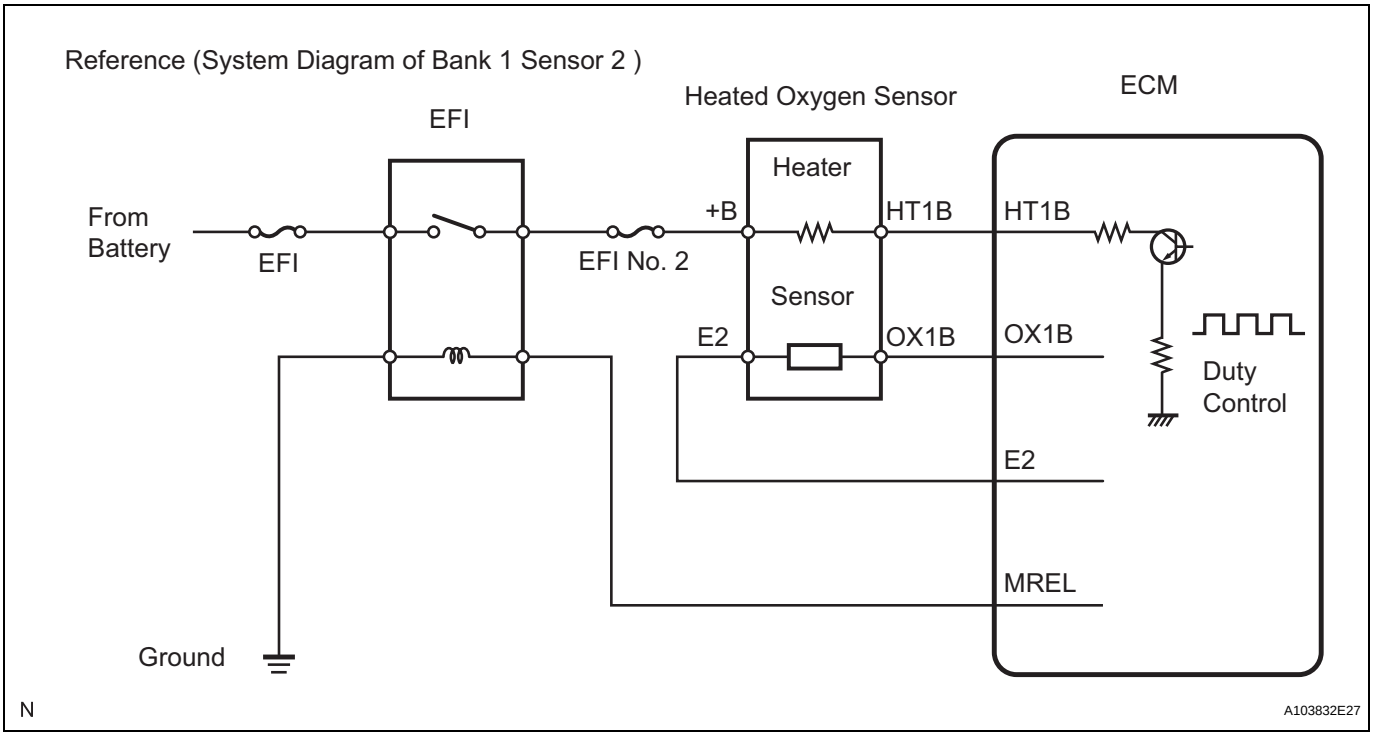
Standard Resistance (Check for open)

Tester Connections	Specified Conditions
HT1B (H3-1) - HT1B (E4-2)	Below 1 Ω
OX1B (H3-3) - OX1B (E4-25)	Below 1 Ω
E2 (H3-4) - E2 (E4-28)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
HT1B (H3-1) or HT1B (E4-2) - Body ground	10 kΩ or higher
OX1B (H3-3) or OX1B (E4-25) - Body ground	10 kΩ or higher
E2 (H3-4) or E2 (E4-28) - Body ground	10 kΩ or higher

(g) Reconnect the HO2 sensor connector.
(h) Reconnect the ECM connectors.



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE HEATED OXYGEN SENSOR

DTC	P0171	System Too Lean (Bank 1)

DTC	P0172	System Too Rich (Bank 1)

DESCRIPTION

The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim consists of both the short-term and long-term fuel trims.

The short-term fuel trim is fuel compensation that is used to constantly maintain the air-fuel ratio at stoichiometric levels. The signal from the Air-Fuel Ratio (A/F) sensor indicates whether the air-fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air-fuel ratio is rich and an increase in the fuel injection volume if it is lean.

Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel trim to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short- term fuel trim compensation.

ES

If both the short-term and long-term fuel trims are lean or rich beyond predetermined values, it is interpreted as a malfunction, and the ECM illuminates the MIL and sets a DTC.

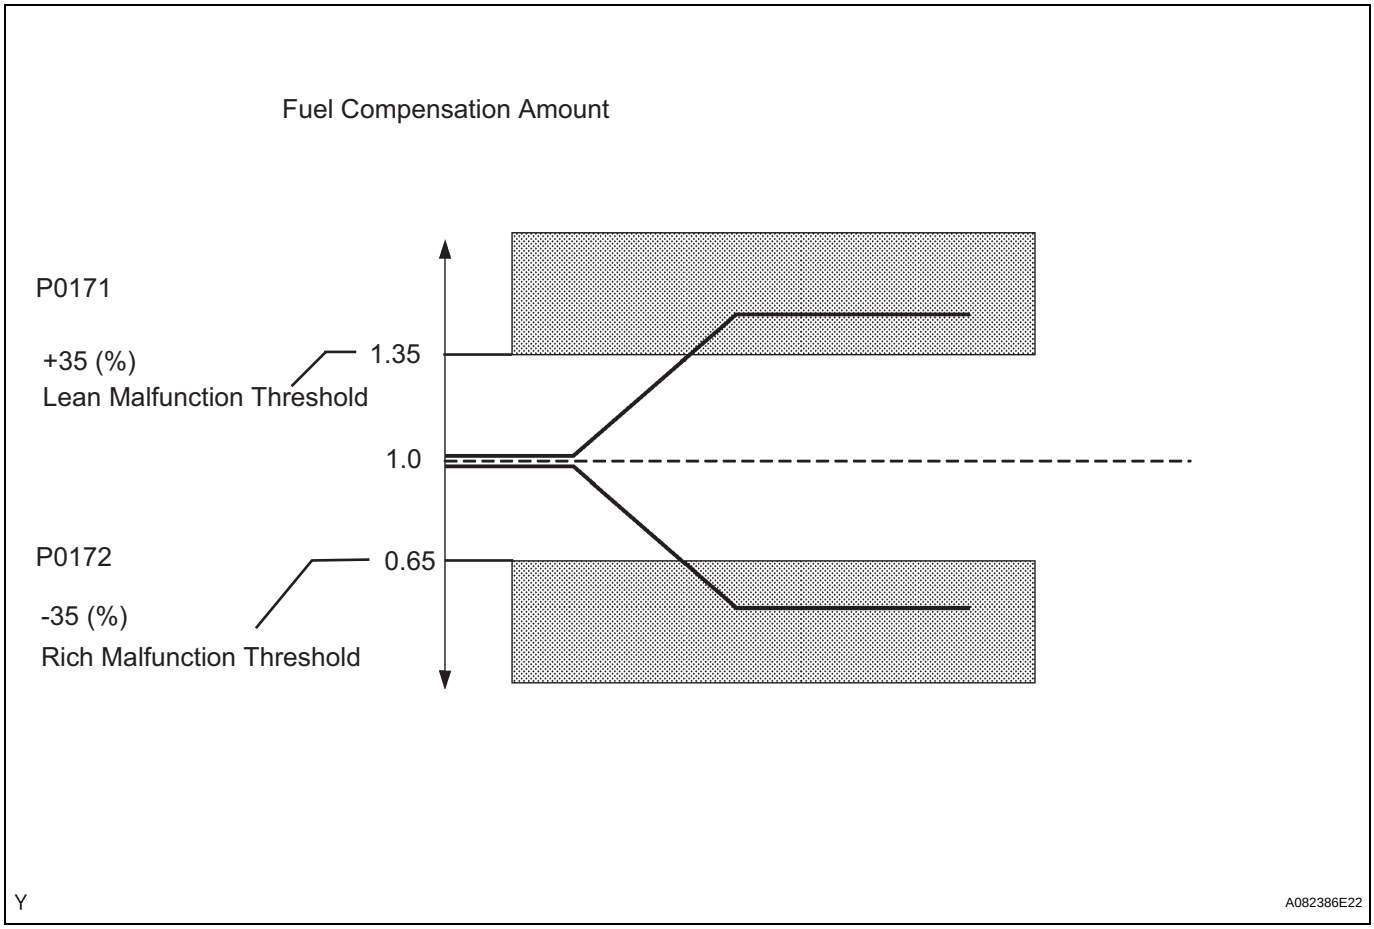
DTC No.	DTC Detection Conditions	Trouble Areas
P0171	With warm engine and stable air-fuel ratio feedback, fuel trim considerably in error to lean side (2 trip detection logic)	• Air induction system • Injector blockage • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Fuel pressure • Gas leakage from exhaust system • Open or short in Air-Fuel Ratio (A/F) sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater (sensor 1) • A/F HEATER relay • A/F sensor heater and A/F HEATER relay circuits • PCV valve and hose • PCV hose connections • ECM
P0172	With warm engine and stable air-fuel ratio feedback, fuel trim considerably in error to rich side (2 trip detection logic)	• Injector leakage or blockage • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Ignition system • Fuel pressure • Gas leakage from exhaust system • Open or short in Air-Fuel Ratio (A/F) sensor (sensor 1) circuit • A/F sensor (sensor1) • A/F sensor heater (sensor1) • A/F HEATER relay • A/F sensor heater and A/F HEATER relay circuits • ECM

HINT:

- When DTC P0171 is set, the actual air-fuel ratio is on the lean side. When DTC P0172 is set, the actual air-fuel ratio is on the rich side.
- If the vehicle runs out of fuel, the air-fuel ratio is lean and DTC P0171 may be set. The MIL is then illuminated.
- When the total of the short-term and long-term fuel trim values is within the malfunction threshold (and the engine coolant temperature is more than 75°C [167°F]), the system is functioning normally.

MONITOR DESCRIPTION

Under closed-loop fuel control, fuel injection volumes that deviate from those estimated by the ECM cause changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim values. Deviations from the ECM's estimated fuel injection volumes also affect the average fuel trim learning value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learning value of the air-fuel ratio). If the average fuel trim learning value exceeds the malfunction thresholds, the ECM interprets this as a fault in the fuel system and sets a DTC.
Example:
The average fuel trim learning value is more than +35 % or less than -35 %, the ECM interprets this as a fuel system malfunction.



MONITOR STRATEGY

Related DTCs	P0171: Fuel trim lean P0172: Fuel trim rich
Required Sensors/Components (Main)	Fuel system
Required Sensors/Components (Related)	Air-fuel ratio sensor, Mass air flow meter, Crankshaft position sensor
Frequency of Operation	Continuous
Duration	Within 10 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Fuel-trim:

Monitor runs whenever following DTCs not present	P0010, P0020 (OCV Bank 1, 2) P0011 (VVT System 1 - Advance) P0012 (VVT System 1 - Retard) P0021 (VVT System 2 - Advance) P0022 (VVT System 2 - Retard) P0031, P0032, P0051, P0052 (A/F sensor heater - Sensor 1) P0100 - P0103 (MAF meter) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for closed loop) P0335 (CKP sensor) P0340, P0341 (CMP sensor) P0500 (VSS) P2440 (A/R control valve stuck open) P2441 (A/R control valve stuck close) P2444 (AIP stuck ON) P2445 (AIP stuck OFF)
Fuel system status	Closed-loop
Battery voltage	11 V or more
Throttle position leaning	Completed
Either of following conditions A or B set	-
A. Engine RPM	Below 1,100 rpm
B. Intake air amount per revolution	0.22 g/rev. or more

ES

TYPICAL MALFUNCTION THRESHOLDS

Fuel-trim :

Purge-cut	Executing
Either of following conditions met	-
Average between short-term fuel trim and long-term fuel trim	35 % or more (varies with ECT)
Average between short-term fuel trim and long-term fuel trim	-35 % or less (varies with ECT)

WIRING DIAGRAM

Refer to DTC P2195 (See page ES-316).

HINT:
Intelligent tester only:
Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using an intelligent tester.

1. Connect an intelligent tester to the DLC3.
2. Start the engine and turn the tester ON.
3. Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
4. On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
5. Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
6. Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and OS2 B1S2) displayed on the tester.

HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.

- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (HO2)	+25 %	Rich	More than 0.5
O2S B1S2 (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:
The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

ES

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		
3	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich
	Output Voltage Almost no reaction		Output voltage Almost no reaction		

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

HINT:

- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.

1 CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0171 OR P0172)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0171 or P0172	A
P0171 or P0172, and other DTCs	B

HINT:
If any DTCs other than P0171 or P0172 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

A

2 CHECK PCV HOSE CONNECTIONS

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**

OK

3 CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

4 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

(a) Connect the intelligent tester to the DLC3.

(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the voltage outputs of A/F and HO2 sensors (AFS B1S1 and O2S B1S2) displayed on the tester.

HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

ES

Standard Voltage

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (HO2)	+25 %	Rich	More than 0.5
OS2 B1S2 (HO2)	-12.5 %	Lean	Less than 0.4

Result

Status AFS B1S1	Status O2S B1S2	A/F Condition and A/F Sensor Condition	Misfires	Suspected Trouble Areas	Proceed To
Lean/Rich	Lean/Rich	Normal	-	-	C
Lean	Lean	Actual air-fuel ratio lean	May occur	• PCV valve and hose • PCV hose connections • Injector blockage • Gas leakage from exhaust system • Air induction system • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature(ECT) sensor	A
Rich	Rich	Actual air-fuel ratio rich	-	• Injector leakage or blockage • Gas leakage from exhaust system • Ignition system • Fuel pressure • MAF meter • ECT sensor	A
Lean	Lean/Rich	A/F sensor malfunction	-	• A/F sensor	B
Rich	Lean/Rich	A/F sensor malfunction	-	• A/F sensor	B

Lean: During A/F CONTROL, the A/F sensor output voltage (AFS) is consistently more than 3.35 V, and the HO2 sensor output voltage (O2S) is consistently less than 0.4 V.
Rich: During A/F CONTROL, the AFS is consistently less than 3.0 V, and the O2S is consistently more than 0.5 V.
Lean/Rich: During A/F CONTROL of the ACTIVE TEST, the output voltage of the heated oxygen sensor alternates correctly.

C	**Go to step 15**

A

ES

5 READ DATA LIST (COOLANT TEMP)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.
(d) Read the COOLANT TEMP twice, when the engine is both cold and warmed up.
Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 75°C and 95°C (167°F and 203°F)

NG	**REPLACE ENGINE COOLANT TEMPERATURE SENSOR**

OK

6 READ DATA LIST (MAF)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / MAF and COOLANT TEMP.
(d) Allow the engine to idle until the COOLANT TEMP reaches 75°C (167°F) or more.
(e) Read the MAF with the engine in an idling condition and at an engine speed of 2,500 rpm.
Standard:
MAF while engine idling: Between 2.0 g/sec and 4.5 g/sec (shift position: N, A/C: OFF).
MAF at engine speed of 2,500 rpm: Between 8.0 g/sec and 14.7 g/sec (shift position: N, A/C: OFF).

NG	**REPLACE MASS AIR FLOW METER**

OK

7	CHECK FUEL PRESSURE

(a) Check the fuel pressure.

NG → REPAIR OR REPLACE FUEL SYSTEM

OK

8	CHECK FOR EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST SYSTEM

OK

9	CHECK FOR SPARK AND IGNITION

HINT:
If the spark plugs or ignition system malfunctions, engine misfire may occur. The misfire count can be read using an intelligent tester. Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / MISFIRE / CYL #1 (to CYL #4).

NG → REPAIR OR REPLACE IGNITION SYSTEM

OK

10	INSPECT FUEL INJECTOR ASSEMBLY (INJECTION AND VOLUME)

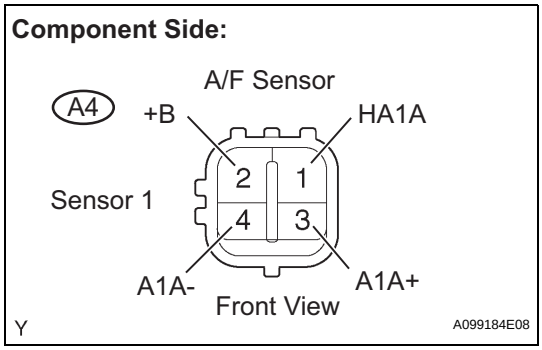
HINT:
If the injectors malfunction, engine misfire may occur. The misfire count can be read using an intelligent tester. Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / MISFIRE / CYL #1 (to CYL #4).

NG → REPLACE FUEL INJECTOR ASSEMBLY

OK

ES

11 INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



(a) Disconnect the A4 A/F sensor connector.
(b) Measure the resistance between the terminals of the A/F sensor connector.
Standard Resistance

Tester Connections	Specified Conditions
HA1A (1) - +B (2)	1.8 to 3.4 Ωat 20°C (68°F)
HA1A (1) - A1A- (4)	10 kΩ or higher

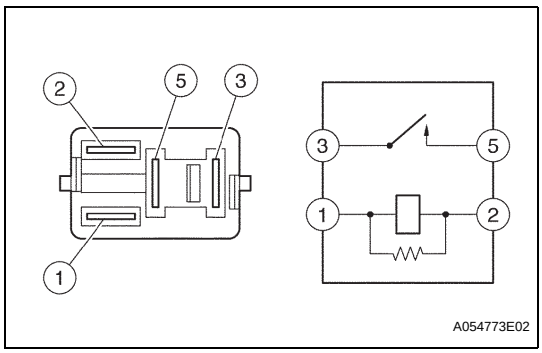
(c) Reconnect the A/F sensor connector.

NG → REPLACE AIR FUEL RATIO SENSOR

ES

OK

12 INSPECT AIR FUEL RATIO SENSOR HEATER RELAY



(a) Remove the A/F HEATER relay from the engine room R/B.
(b) Check the A/F HEATER relay resistance.
Standard Resistance

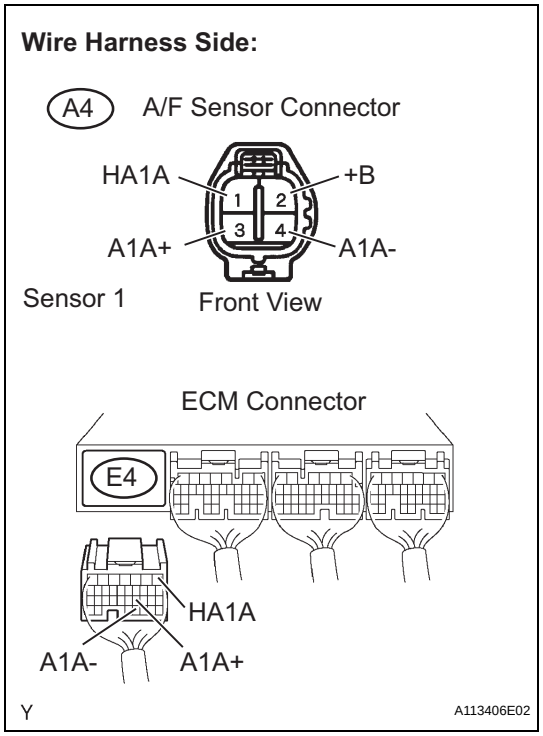
Tester Connections	Specified Condition
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

(c) Reinstall the A/F HEATER relay.

NG → REPLACE AIR FUEL RATIO SENSOR HEATER RELAY

OK

13 CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)



(a) Disconnect the A4 A/F sensor connector.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between the +B terminal of the A/F sensor connector and body ground.

Standard Voltage

Tester Connection	Specified Condition
+B (A4-2) - Body ground	9 to 14 V

(d) Turn the ignition switch to OFF.
(e) Disconnect the E4 ECM connector.
(f) Check the resistance.

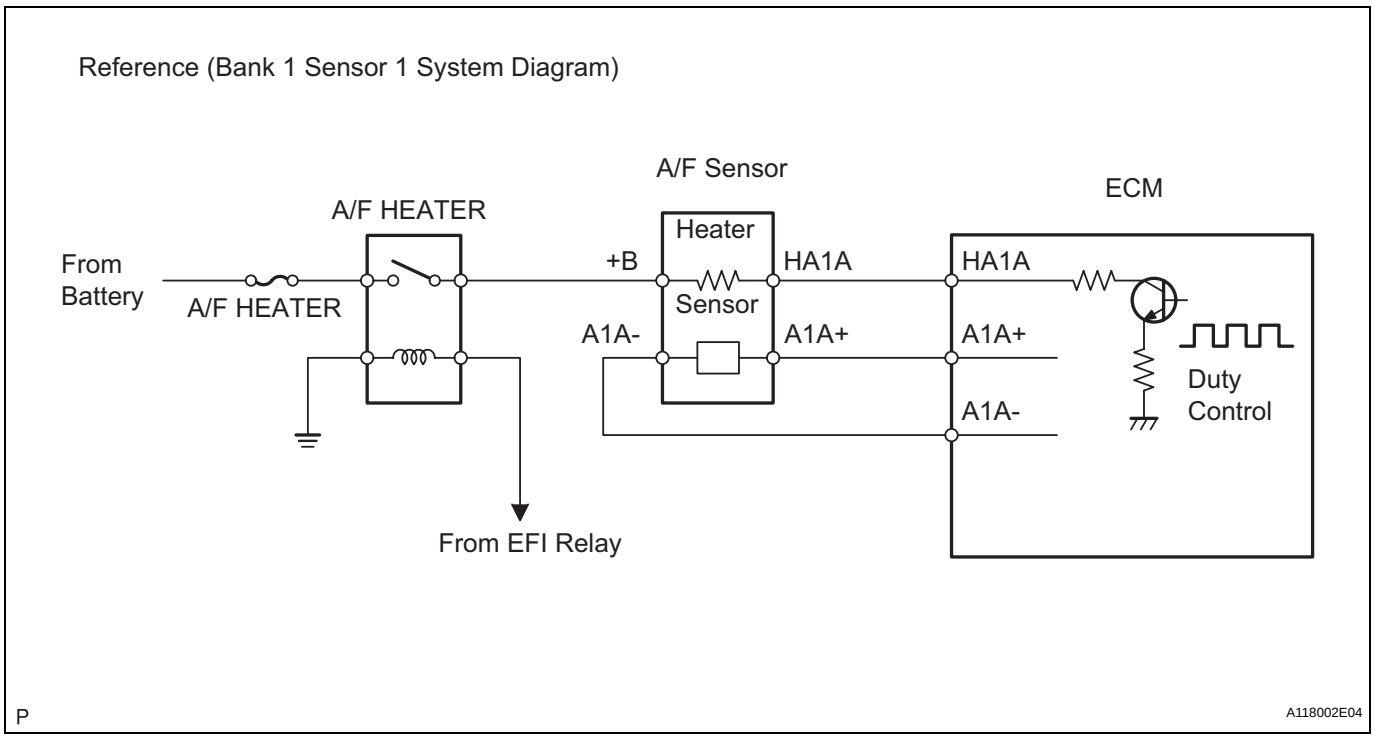
Standard Resistance (Check for open)

Tester Connections	Specified Conditions
HA1A (A4-1) - HA1A (E4-1)	Below 1 Ω
A1A+ (A4-3) - A1A+ (E4-21)	Below 1 Ω
A1A- (A4-4) - A1A- (E4-31)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
HA1A (A4-1) or HA1A (E4-1) - Body ground	10 kΩ or higher
A1A+ (A4-3) or A1A+ (E4-21) - Body ground	10 kΩ or higher
A1A- (A4-4) or A1A- (E4-31) - Body ground	10 kΩ or higher

(g) Reconnect the ECM connector.
(h) Reconnect the A/F sensor connector.



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

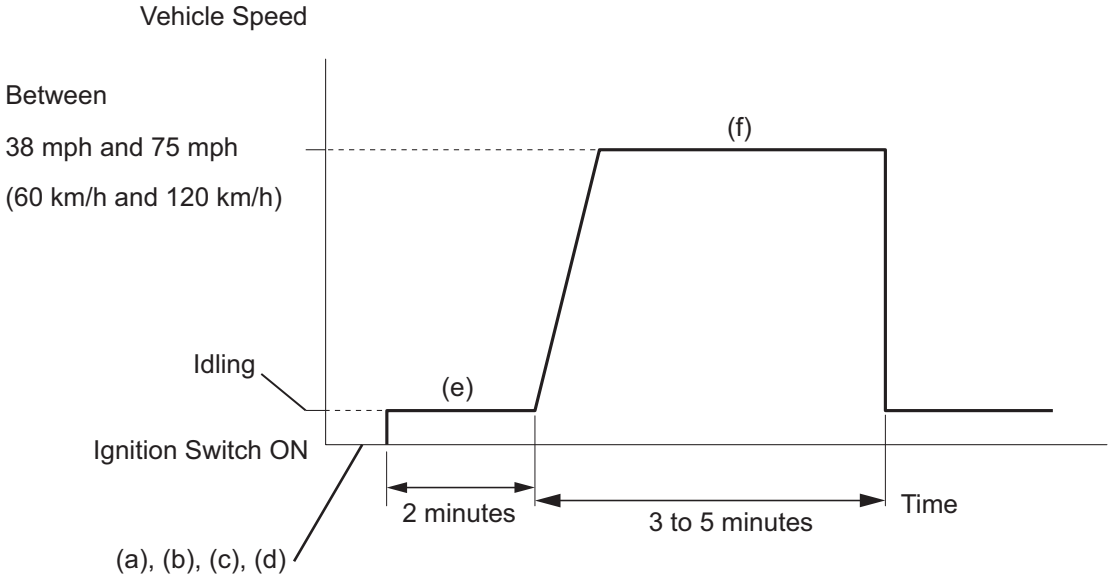
OK

14	REPLACE AIR FUEL RATIO SENSOR

NEXT

15	PERFORM CONFIRMATION DRIVING PATTERN

ES



(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Clear DTCs (see page ES-40).
(d) Switch the ECM from normal mode to check mode using the tester (see page ES-43).
(e) Start the engine and warm it up with all the accessories switched OFF.
(f) Drive the vehicle at between 38 mph and 75 mph (60 km/h and 120 km/h) and at an engine speed of between 1,400 rpm and 3,200 rpm for 3 to 5 minutes.
HINT:
If the system is still malfunctioning, the MIL will be illuminated during step (f).
NOTICE:
If the conditions in this test are not strictly followed, no malfunction will be detected.

NEXT

16	CHECK WHETHER DTC OUTPUT RECURS (DTC P0171 OR P0172)

(a) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(b) Read DTCs.

DTC	P0300	Random / Multiple Cylinder Misfire Detected

DTC	P0301	Cylinder 1 Misfire Detected

DTC	P0302	Cylinder 2 Misfire Detected

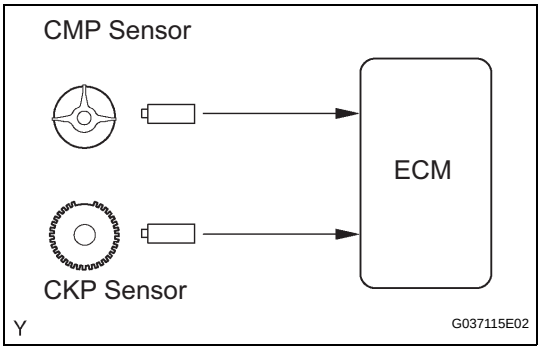
DTC	P0303	Cylinder 3 Misfire Detected

DTC	P0304	Cylinder 4 Misfire Detected

DESCRIPTION

ES

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increase in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent this increase in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted when the crankshaft rotation speed variations exceed predetermined thresholds.



If the misfire exceeds the threshold levels, and could cause emission deterioration, the ECM illuminates the MIL and sets a DTC.

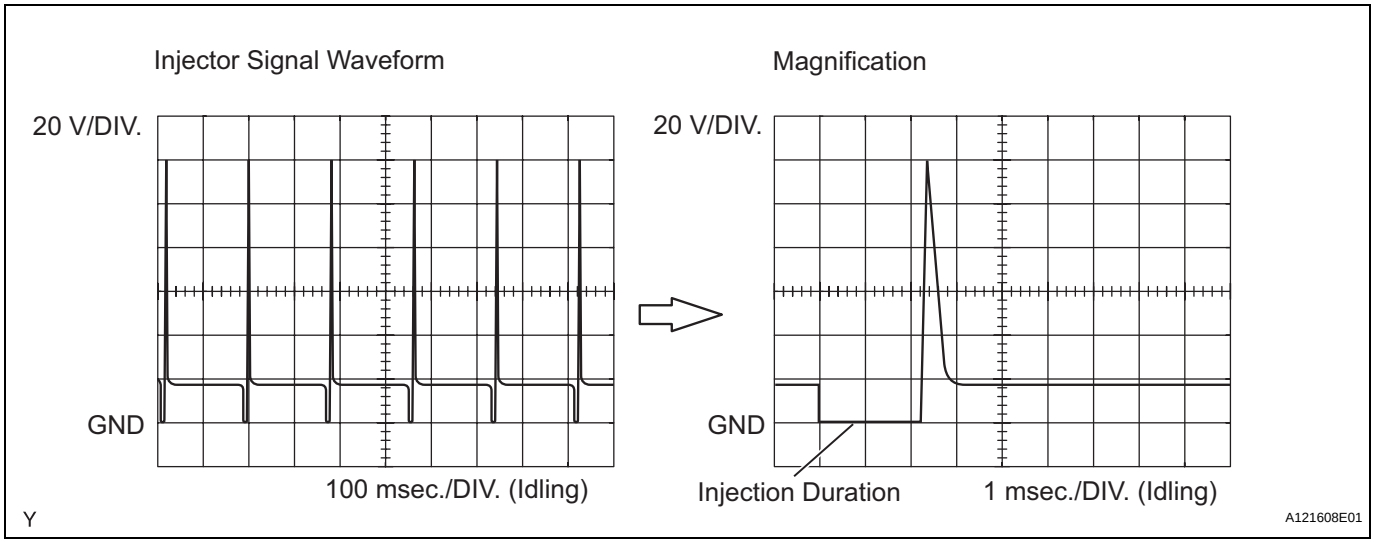
DTC No.	DTC Detection Conditions	Trouble Areas
P0300	Simultaneous misfiring of several cylinders detected (2 trip detection logic)	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Injector • Fuel pressure • Mass Air Flow (MAF) meter • Air induction system • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • ECM

DTC No.	DTC Detection Conditions	Trouble Areas
P0301 P0302 P0303 P0304	Misfiring of specific cylinder detected (2 trip detection logic)	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Injector • Fuel pressure • Air induction system • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • ECM

HINT:
When DTCs for misfiring cylinders are randomly set, but DTC P0300 is not set, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only set when several misfiring cylinders are detected at the same time.
Reference: Inspection using an oscilloscope
With the engine idling, check the waveform between terminals #10 to #40 and E01 of the ECM connectors.

Items	Contents
Terminals	# 10 to # 40 - E01
Equipment Settings	20 V/Division, 100 or 1 ms/Division
Conditions	Idling

HINT:
The correct waveform is as shown.



MONITOR DESCRIPTION

The ECM illuminates the MIL and sets a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

- Within the first 1,000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 20 to 50 misfires per 1,000 crankshaft revolutions) occurs once.
- After the first 1,000 crankshaft revolutions, an excessive misfiring rate (approximately 20 to 50 misfires per 1,000 crankshaft revolutions) occurs 4 times in sequential crankshaft revolutions.

The ECM flashes the MIL and sets a DTC when either one of the following conditions, which could cause the Three-Way Catalytic Converter (TWC) damage, is detected (2 trip detection logic).

- In every 200 crankshaft revolutions at a high engine rpm, the threshold misfiring percentage is recorded once.
- In every 200 crankshaft revolutions at a normal engine rpm, the threshold misfiring percentage is recorded 3 times.

MONITOR STRATEGY

Related DTCs	P0300: Multiple cylinder misfire P0301: Cylinder 1 misfire P0302: Cylinder 2 misfire P0303: Cylinder 3 misfire P0304: Cylinder 4 misfire
Required Sensors/Components (Main)	Injector, Ignition coil, Spark plug
Required Sensors/Components (Related)	Crankshaft, Camshaft, Engine coolant temperature and intake air temperature sensors and Mass air flow meter
Frequency of Operation	Continuous
Duration	1,000 to 4,000 crankshaft revolutions: Emission related misfire 200 to 600 crankshaft revolutions: Catalyst damaged misfire
MIL Operation	2 driving cycles: Emission related misfire MIL flashes immediately: Catalyst damaged misfire
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Misfire:

Monitor runs whenever following DTCs not present	
Battery voltage	8 V or more
Throttle position learning	Completed
VVT system	Not operated by scan tool
Engine RPM	400 to 5,800 rpm
Both of following conditions A and B met	-
A. Engine coolant Temperature (ECT)	-10°C (14°F) or more
B. Either of following conditions 1 or 2 met	-
1. ECT at engine start	More than -7°C (19°F)
2. ECT	More than 20°C (68°F)

TYPICAL MALFUNCTION THRESHOLDS

Monitor Period of Emission-related-misfire:

Misfire rate	1.538 % or more
Either of following conditions (a) or (b) met	-
(a) First 1,000 revolutions after engine start or check mode	Crankshaft 1,000 revolutions
(b) Except above	Crankshaft 1,000 revolutions x 4

Monitor Period of Catalyst-damaged-misfire (MIL blinks):

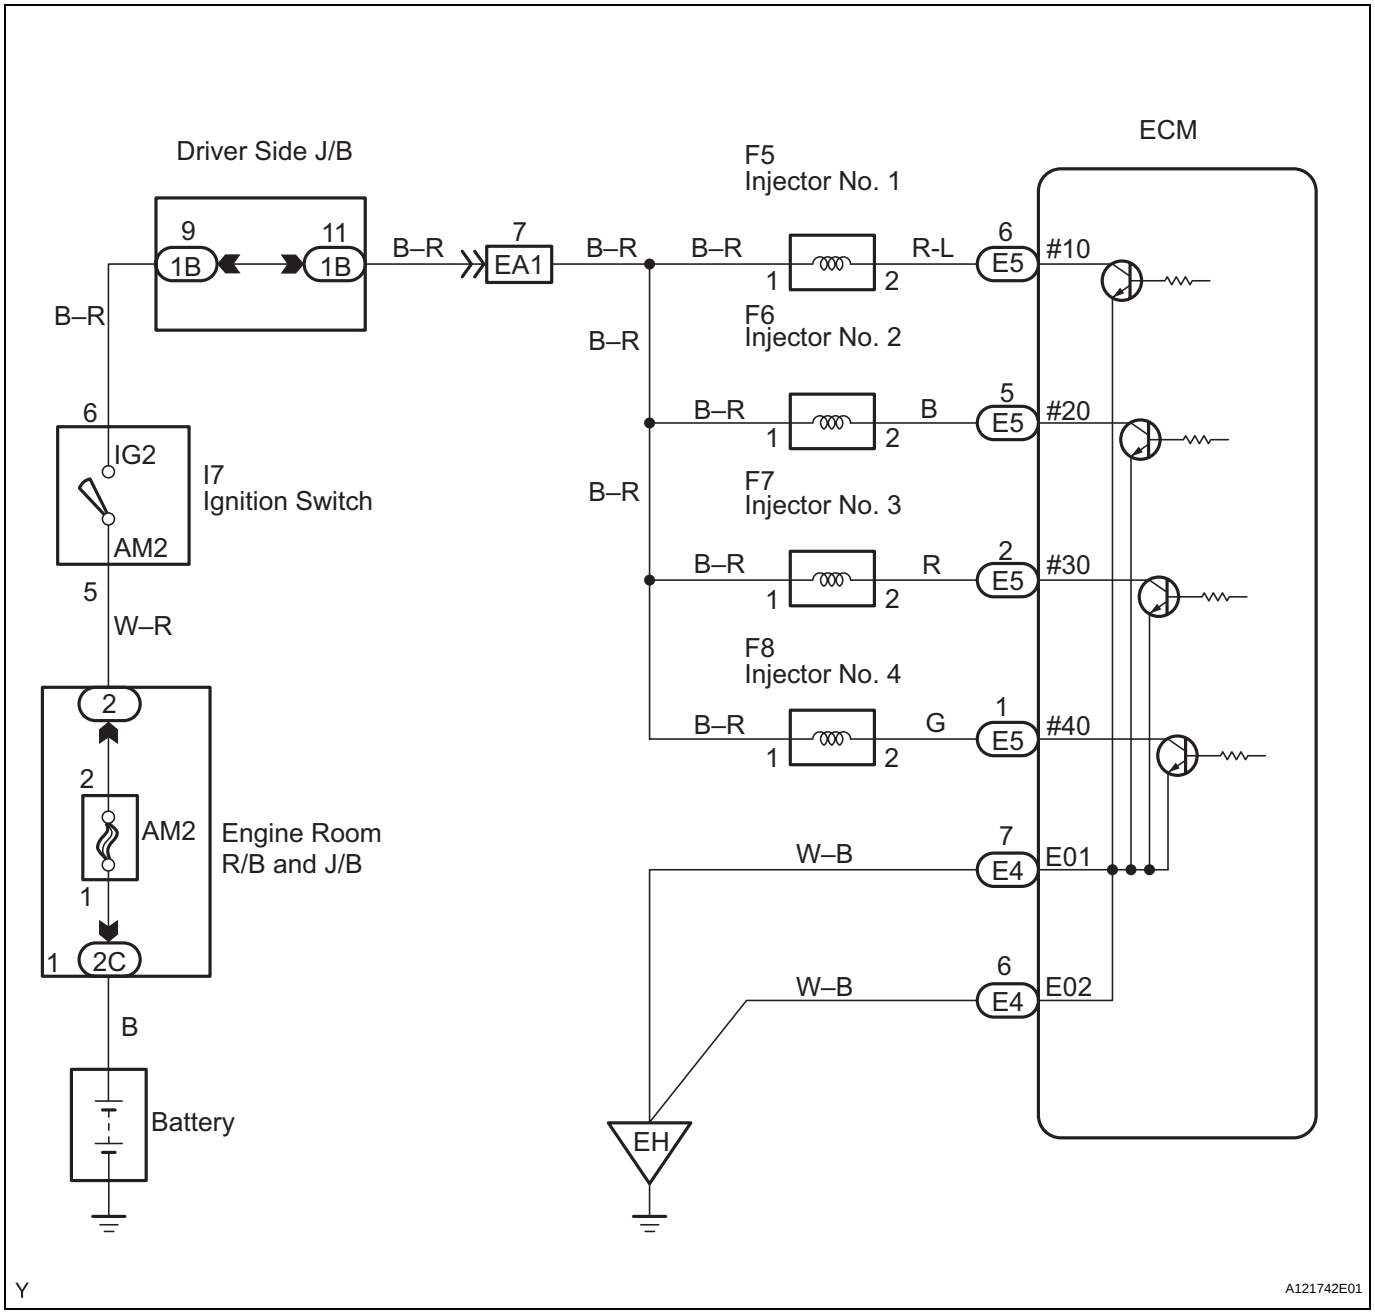
Number of misfire per 200 revolutions	97.14 or more (varies with intake air amount and engine RPM)
Either of following conditions (a) or (b) met	-
(a) All of following conditions A, B and C met	Crankshaft 200 revolutions x 3
A. Driving cycles	1st
B. Check mode	OFF
C. Engine RPM	Below 2,200 rpm
(b) Except above	Crankshaft 200 revolutions

MONITOR RESULT

Refer to Checking Monitor Status (See page ES-21).

WIRING DIAGRAM

Refer to DTC P0351 for the wiring diagram of the ignition system (See page ES-184).



CONFIRMATION DRIVING PATTERN

1. Connect an intelligent tester to the DLC3.
2. Turn the ignition switch to ON.
3. Turn the tester ON.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode.
6. Read the misfire counts of each cylinder (CYL #1 to #4) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.

7. Drive the vehicle several times with the conditions, such as engine rpm and engine load, shown in MISFIRE RPM and MISFIRE LOAD in the DATA LIST.
   HINT:
   In order to store misfire DTCs, it is necessary to drive the vehicle for the period of time shown in the table below, with the MISFIRE RPM and MISFIRE LOAD in the DATA LIST.

Engine RPM	Duration
Idling	3.5 minutes or more
1,000	3 minutes or more
2,000	1.5 minutes or more
3,000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.
   HINT:
   Do not turn the ignition switch to OFF until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be erased.
9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the ignition switch to OFF and wait for at least 5 seconds.

ES

HINT:
- If any DTCs other than the misfire DTCs are output, troubleshoot those DTCs first.
- Read freeze frame data using the intelligent tester. Freeze frame data record the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.
- If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.
- If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:
  (a) The fuel tank is low full.
  (b) Improper fuel is used.
  (c) The spark plugs have been contaminated.
  (d) The problem is complex.
- After finishing repairs, check the misfire counts of the cylinders (CYL #1, #2, #3 and #4).
- Be sure to confirm that no misfiring cylinder DTCs are set again by conducting the confirmation driving pattern, after repairs.
- For 6 and 8 cylinder engines, the ECM intentionally does not set the specific misfiring cylinder DTCs at high engine RPM. If misfires occur only in high engine RPM areas, only DTC P0300 is set.
  In the event of DTC P0300 being present, perform the following operations:
  (a) Clear the DTC (see page ES-40).
  (b) Start the engine and conduct the confirmation driving pattern.
  (c) Read the misfiring rates of each cylinder or DTC(s) using the tester or scan tool.
  (d) Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.
  (e) After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not set.
- When one of SHORT FT #1, LONG FT #1, SHORT FT #2 or LONG FT #2 in the freeze frame data is outside the range of +- 20 %, the air-fuel ratio may be rich (-20 % or less) or lean (+20 % or more).
- When the COOLANT TEMP in the freeze frame data is less than 75°C (167°F), the misfires have occurred only while warming up the engine.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE DTCS)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.

(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC output)	Proceed To
P0300, P0301, P0302, P0303 and/or P0304	A
P0300, P0301, P0302, P0303 and/or P0304 and other DTCs	B

HINT:
If any DTCs other than P0300, P0301, P0302, P0303 and P0304 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

A

2 READ DATA LIST (MISFIRE RPM AND MISFIRE LOAD)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / MISFIRE / MISFIRE RPM and MISFIRE LOAD.
(d) Read and note the MISFIRE RPM and MISFIRE LOAD (engine load) values.
HINT:
The MISFIRE RPM and MISFIRE LOAD indicate the vehicle conditions under which the misfire occurred.

NEXT

3 CHECK CONNECTION OF PCV HOSE

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**

OK

4 CHECK MISFIRE COUNT (CYL #1, #2, #3 AND #4)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-40).
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / MISFIRE / CYL #1, #2, #3 and #4.
(f) Allow the engine to idle.
(g) Read each value of CYL #1 to #4 displayed on the tester.
If no misfire counts occur in any cylinders, perform the following operations:

(1) Shift the gear selector lever to the D position.
(2) Repeat steps (e) to (g).
(3) Check the CYL #1 to #4.
(4) If misfire counts are still not displayed, perform steps (h) and (i) and then check the misfire counts again.

(h) Drive the vehicle with the MISFIRE RPM and MISFIRE LOAD noted in step 2.
(i) Read the CYL #1 to #4 or DTCs displayed on the tester.

Result

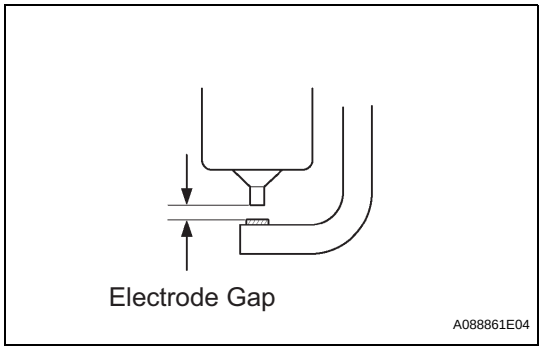
Misfire Count	Proceed To
One or two cylinders have misfire counts	A
Three cylinders or more have misfire counts	B

B → **Go to step 13**

ES

A

5 CHECK SPARK PLUG



(a) Remove the ignition coil and the spark plug of the misfiring cylinder.
(b) Measure the spark plug electrode gap.
Standard:
Between 1.0 mm and 1.3 mm (0.039 in. and 0.051 in.)
(c) Check the electrode for carbon deposits.
Recommended spark plug

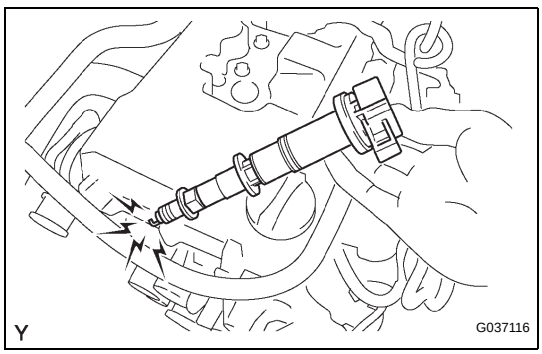
Manufacturers	Products
DENSO	SK20HR11
NGK	ILFR6C11

NOTICE:
If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → **REPLACE SPARK PLUG**

OK

6 CHECK SPARK AND IGNITION



(a) Disconnect the injector connectors, in order to prevent the engine from starting.
(b) Install the spark plug to the ignition coil.
(c) Attach the spark plug assembly to the cylinder head cover set bolt.
(d) Crank the engine for less than 2 seconds and check the spark.
OK:
Sparks jump across electrode gap
(e) Reconnect the injector connectors.

NG → **Go to step 8**

OK

7	CHECK CYLINDER COMPRESSION PRESSURE ON MISFIRING CYLINDER

(a) Measure the cylinder compression pressure of the misfiring cylinder.

OK → Go to step 9

NG

REPAIR OR REPLACE ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

ES

8	CHANGE NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

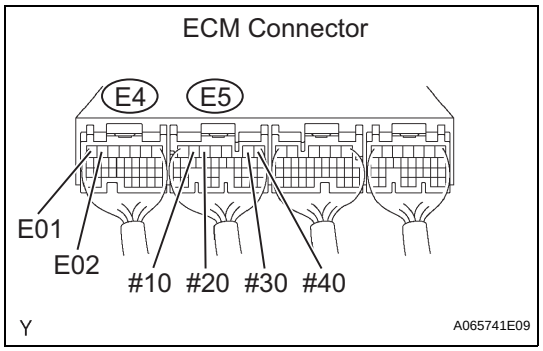
(a) Change the installed spark plug to a spark plug that functions normally.
(b) Perform a spark test.
CAUTION:
Always disconnect each injector connector.
NOTICE:
Do not crank the engine for more than 2 seconds.
(1) Install the spark plug to the ignition coil and connect the ignition coil connector.
(2) Disconnect the injector connector.
(3) Ground the spark plug.
(4) Check if sparks occur while the engine is being cranked.
OK:
Sparks jump across electrode gap.

OK → REPLACE SPARK PLUG

NG

REPLACE IGNITION COIL (THEN CONFIRM THAT THERE IS NO MISFIRE)

9	INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30,AND/OR #40 VOLTAGE)



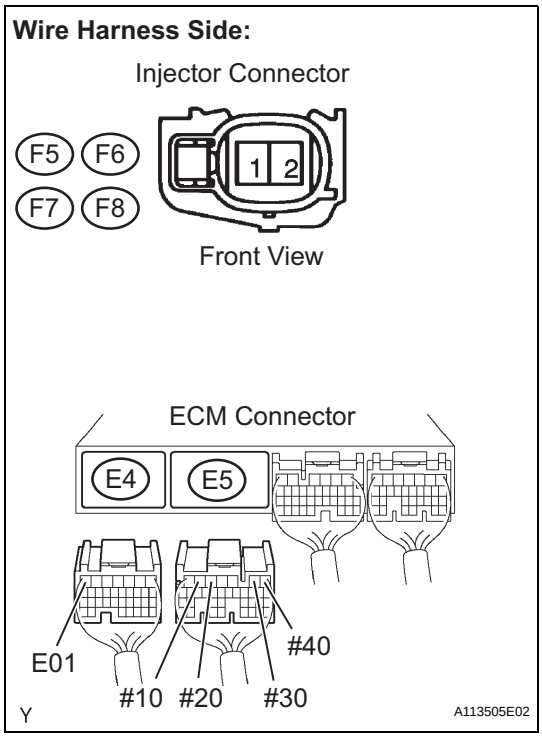
(a) Turn the ignition switch to ON.
(b) Measure the voltage between the terminals of the ECM connector.
Standard Voltage

Tester Connections	Specified Conditions
#10 (E5-6) - E01 (E4-7)	9 to 14 V
#20 (E5-5) - E01 (E4-7)	9 to 14 V
#30 (E5-2) - E01 (E4-7)	9 to 14 V
#40 (E5-1) - E01 (E4-7)	9 to 14 V

OK → Go to step 11

NG

10 CHECK HARNESS AND CONNECTOR (INJECTOR - ECM)



(a) Disconnect the injector connector (of the misfiring cylinder).
(b) Disconnect the E4 and E5 ECM connectors.
(c) Turn the ignition switch to ON.
(d) Measure the resistance and voltage between the injector and the ECM connector terminals.

Standard Resistance and Standard Voltage (No.1 Cylinder)

Tester Connections	Specified Conditions
F5-1 - Ground	11 to 14 V
F5-2 - Ground	10 kΩ or higher
F5-2 - #10 (E5-6)	Below 1 Ω

Standard Resistance and Standard Voltage (No.2 Cylinder)

Tester Connections	Specified Conditions
F6-1 - Ground	11 to 14 V
F6-2 - Ground	10 kΩ or higher
F6-2 - #20 (E5-5)	Below 1 Ω

Standard Resistance and Standard Voltage (No.3 Cylinder)

Tester Connections	Specified Conditions
F7-1 - Ground	11 to 14 V
F7-2 - Ground	10 kΩ or higher
F7-2 - #30 (E5-2)	Below 1 Ω

Standard Resistance and Standard Voltage (No.4 Cylinder)

Tester Connections	Specified Conditions
F8-1 - Ground	11 to 14 V
F8-2 - Ground	10 kΩ or higher
F8-2 - #40 (E5-1)	Below 1 Ω

(e) Reconnect the injector connector.
(f) Reconnect the ECM connector.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

11 CHECK FUEL INJECTOR (FUEL INJECTOR OF MISFIRING CYLINDER)

(a) Check the injector injection (whether fuel volume is high or low, and whether injection pattern is poor).

NG → REPLACE FUEL INJECTOR ASSEMBLY

OK

12 CHECK VALVE CLEARANCE (VALVE CLEARANCE OF MISFIRING CYLINDER)

NG → ADJUST VALVE CLEARANCE

OK

13 CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.

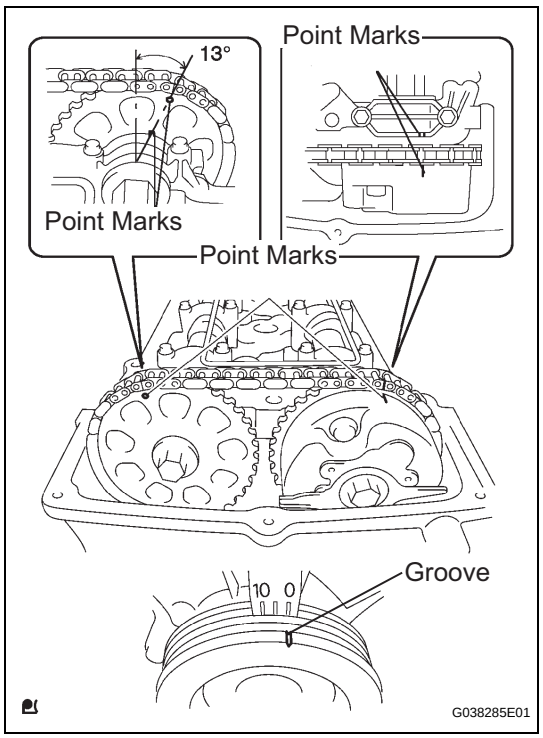
OK:

No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK

14 CHECK VALVE TIMING



(a) Remove the cylinder head cover (see page EM-23).

(b) Turn the crankshaft pulley, and align its groove with the timing mark "0" on the timing chain cover.

(c) Check that the point marks on the camshaft timing gears are as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°) and align the marks as above.

OK:

Point marks on camshaft timing gears are aligned as shown in illustration.

(d) Reinstall the cylinder head cover (see page EM-32).

NG → ADJUST VALVE TIMING

OK

15 CHECK FUEL PRESSURE

(a) Check the fuel pressure.

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK

16	READ DATA LIST (COOLANT TEMP)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.
(e) Read the COOLANT TEMP twice, when the engine is both cold and warmed up.

Standard:

With cold engine: Same as ambient air temperature.
With warm engine: Between 75°C and 95°C (167°F and 203°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR

OK

17	READ DATA LIST (MAF)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / MAF and COOLANT TEMP.
(e) Allow the engine to idle until the COOLANT TEMP reaches 75°C (167°F) or more.
(f) Read the MAF with the engine in an idling condition and at an engine speed of 2,500 rpm.

Standard:

MAF while engine idling: Between 2.0 g/sec and 4.5 g/sec (shift position: N, A/C: OFF).
MAF at engine speed of 2,500 rpm: Between 8.0 g/sec and 14.7 g/sec (shift position: N, A/C: OFF).

NG → REPLACE MASS AIR FLOW METER

OK

CHECK FOR INTERMITTENT PROBLEMS

DTC	P0327	Knock Sensor 1 Circuit Low Input (Bank 1 or Single Sensor)

DTC	P0328	Knock Sensor 1 Circuit High Input (Bank 1 or Single Sensor)

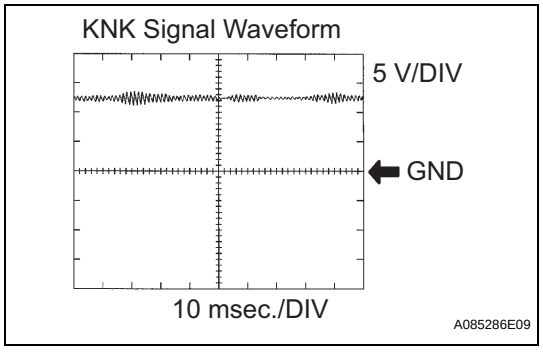
DESCRIPTION

A flat type knock sensor (non-resonant type) has a structure that can detect vibrations over a wide band of frequencies: between approximately 6 kHz and 15 kHz.
Knock sensors are fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed. The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.

ES

DTC No.	DTC Detection Condition	Trouble Area
P0327	Output voltage of knock sensor less than 0.5 V (1 trip detection logic)	• Short in knock sensor circuit • Knock sensor • ECM
P0328	Output voltage of knock sensor more than 4.5 V (1 trip detection logic)	• Open in knock sensor circuit • Knock sensor • ECM

HINT:
When any of DTCs P0327 and P0328 are set, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the ignition switch is turned to OFF.



Reference: Inspection using an oscilloscope
The correct waveform is shown.

Items	Contents
Terminals	KNK1 - EKNK
Equipment Settings	0.01 to 10 V/Division, 0.01 to 10 msec./Division
Conditions	Keep engine speed at 4,000 rpm with warm engine

MONITOR DESCRIPTION

If the output voltage transmitted by the knock sensor remains low or high for more than 1 second, the ECM interprets this as a malfunction in the sensor circuit, and sets a DTC.
The monitor for DTCs P0327 and P0328 begins to run when 5 seconds have elapsed since the engine was started.
If the malfunction is not repaired successfully, any of DTC P0327 or P0328 is set 5 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0327: Knock sensor range check (Low voltage) P0328: Knock sensor range check (High voltage)
Required Sensors/Components (Main)	Knock sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	1 second
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

ES

Monitor runs whenever following DTCs not present	None
Battery voltage	10.5 V or more
Time after engine start	5 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

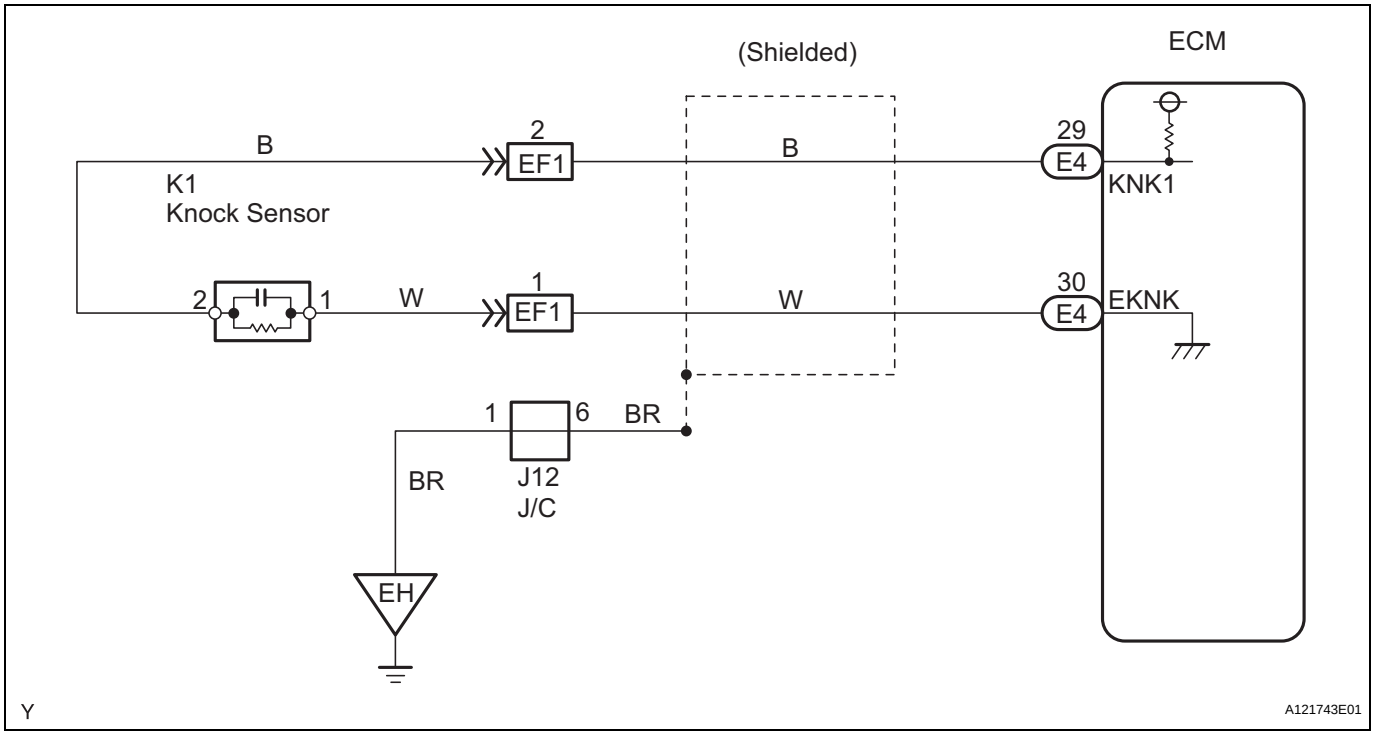
Knock Sensor Range Check (Low voltage) P0327:

Knock sensor voltage	Less than 0.5 V

Knock Sensor Range Check (High voltage) P0328:

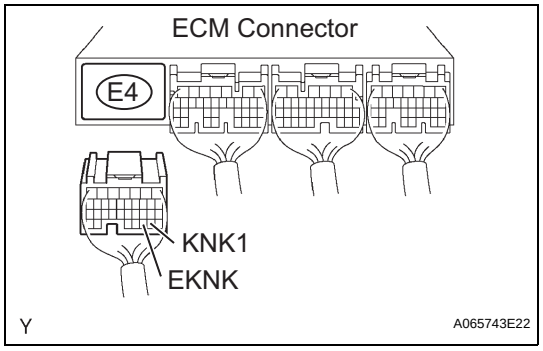
Knock sensor voltage	More than 4.5 V

WIRING DIAGRAM



HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 CHECK HARNESS AND CONNECTOR (ECM - KNOCK SENSOR)



(a) Disconnect the E4 ECM connector.
(b) Measure the resistance between the terminals of the ECM connector.
Standard Resistance

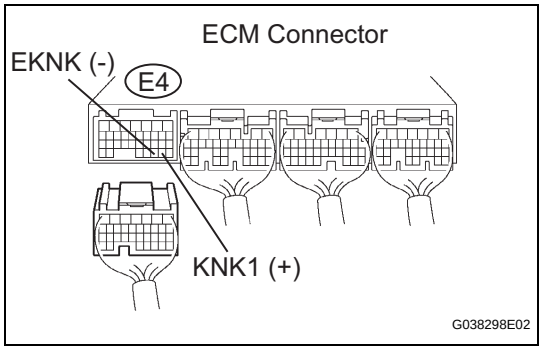
Tester Connections	Specified Conditions
KNK1 (E4-29) - EKNK (E4-30)	120 to 280 kΩ at 20 °C (68°F)

(c) Reconnect the ECM connector.

NG → **Go to step 3**

OK

2 INSPECT ECM (KNK1 VOLTAGE)



(a) Disconnect the ECM connector.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between the ECM terminals.
Standard Voltage

Tester Connections	Specified Conditions
KNK1 (E4-29) - EKNK (E4-30)	4.5 to 5.5 V

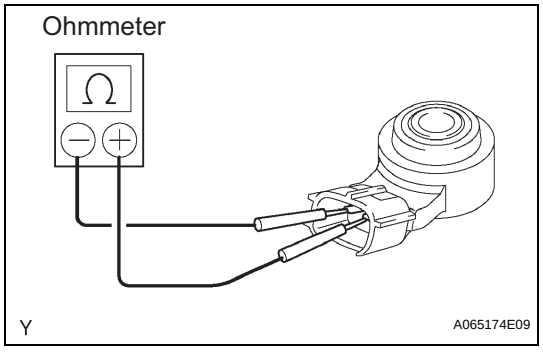
(d) Reconnect the ECM connector.

NG → **REPLACE ECM**

OK

CHECK FOR INTERMITTENT PROBLEMS

3 INSPECT KNOCK SENSOR



(a) Remove the knock sensor.
(b) Measure the resistance between the terminals.
Standard Resistance

Tester Connections	Specified Conditions
KNK1 (K1-2) - EKNK (K1-1)	120 to 280 kΩ at 20°C (68°F)

(c) Reinstall the knock sensor.

NG → **REPLACE KNOCK SENSOR**

ES

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR

DTC	P0335	Crankshaft Position Sensor "A" Circuit

DTC	P0339	Crankshaft Position Sensor "A" Circuit Intermittent

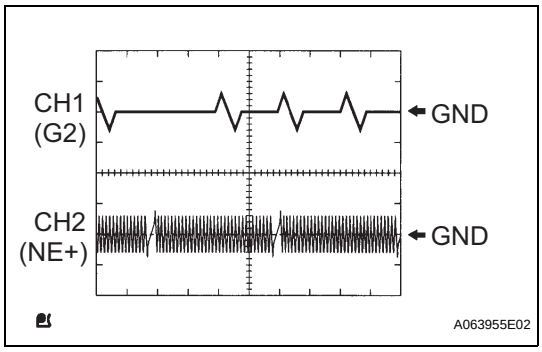
DESCRIPTION

The Crankshaft Position (CKP) sensor system consists of a CKP sensor plate and a pickup coil. The sensor plate has 34 teeth and is installed on the crankshaft. The pickup coil is made of an iron core and a magnet.

The sensor plate rotates and, as each tooth passes through the pickup coil, a pulse signal is created. The pickup coil generates 34 signals per engine revolution. Based on these signals, the ECM calculates the crankshaft position and engine RPM. Using these calculations, the fuel injection time and ignition timing are controlled.

ES

DTC No.	DTC Detection Conditions	Trouble Areas
P0335	• No Crankshaft Position (CKP) sensor signal to ECM while cranking (1 trip detection logic) • No CKP sensor signal to ECM at engine speed of 600 rpm or more (1 trip detection logic)	• Open or short in CKP sensor circuit • CKP sensor • Sensor plate (CKP sensor plate) • ECM
P0339	Under conditions (a), (b) and (c), no Crankshaft Position (CKP) sensor signal to ECM for 0.05 seconds or more (1 trip detection logic): (a) Engine speed 1,000 rpm or more (b) Starter signal OFF (c) 3 seconds or more have elapsed since starter signal switched from ON to OFF	• Open or short in CKP sensor circuit • CKP sensor • Sensor plate (CKP sensor plate) • ECM



Reference: Inspection using an oscilloscope

HINT:

- The correct waveform is shown on the left.
- G2 stands for the Camshaft Position (CMP) sensor signal, and NE+ stands for the CKP sensor signal.

Items	Contents
Terminals	CH1: G2 - NE- CH2: NE+ - NE-
Equipment Settings	5 V/Division, 20 ms/Division
Conditions	Cranking or idling

MONITOR DESCRIPTION

If there is no signal from the CKP sensor despite the engine revolving, the ECM interprets this as a malfunction of the sensor.

If the malfunction is not repaired successfully, a DTC is set 10 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0335: Crankshaft position sensor range check during cranking P0335: Crankshaft position sensor range check during engine running
Required Sensors/Components (Main)	Crankshaft Position (CKP) sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	Conditions met for 3 times
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

ES

Crankshaft Position Sensor Range Check during Cranking P0335:

Starter	ON
Minimum battery voltage while starter ON	Less than 11 V
Number of camshaft position sensor signal pulse	6 or more

Crankshaft Position Sensor Range Check during Engine Running P0335:

Engine speed	600 rpm or more
Starter	OFF
Time after starter from ON to OFF	3 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

Crankshaft Position Sensor Range Check during Cranking P0335:

Number of crankshaft position sensor signal pulse	132 or less, or 174 or more

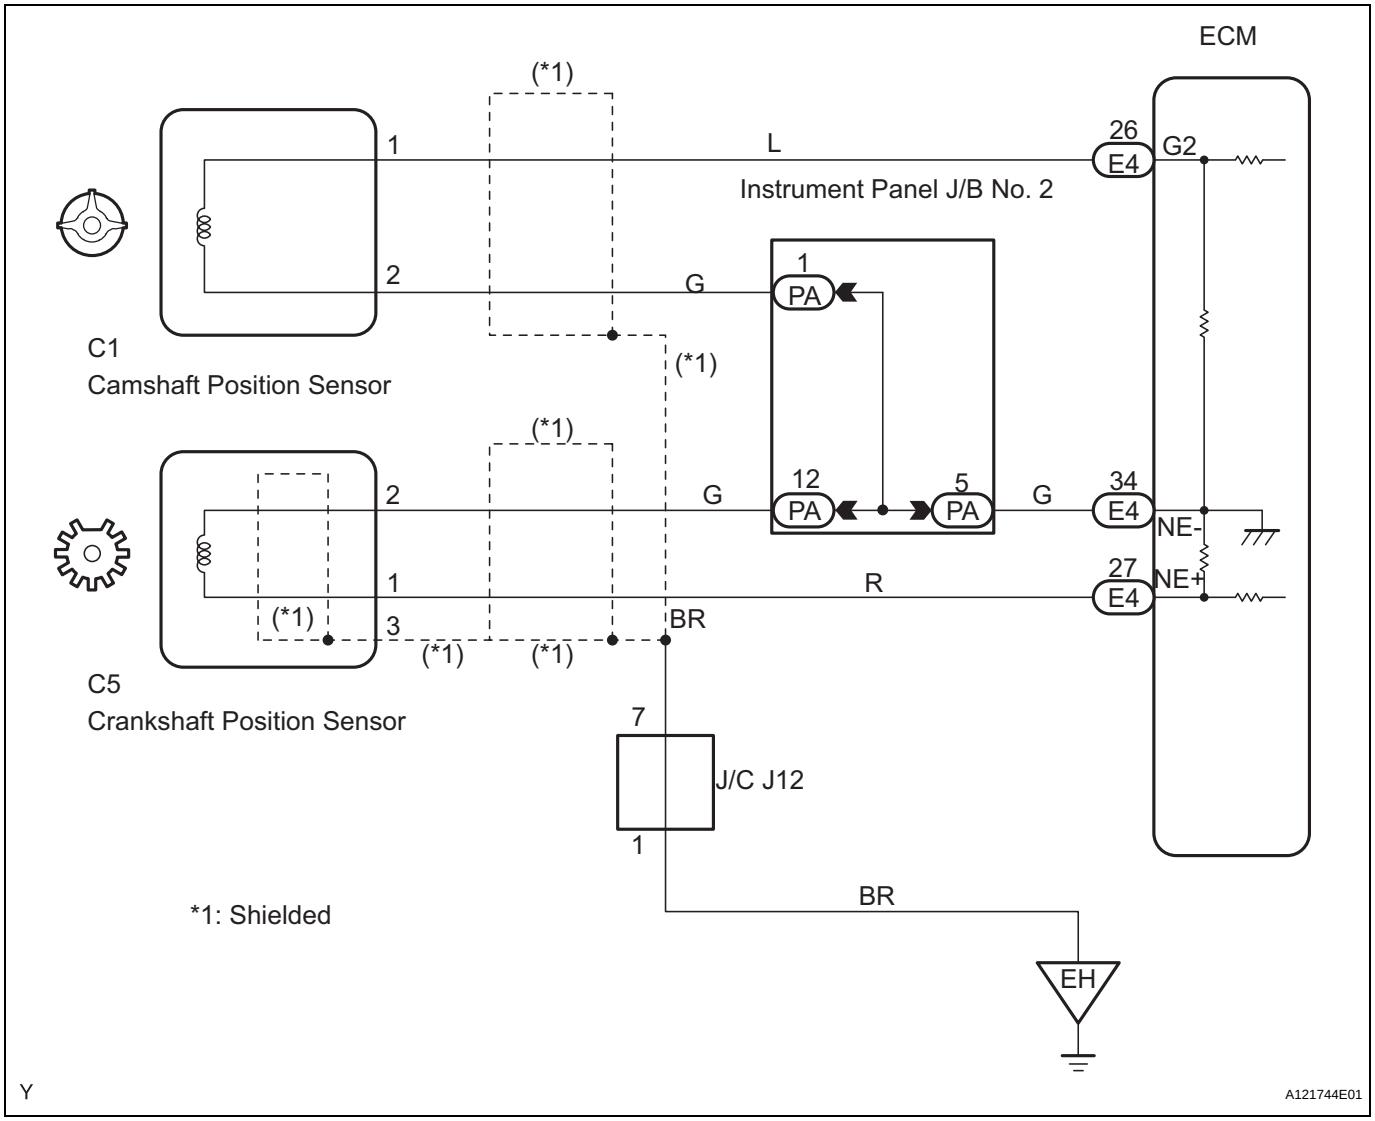
Crankshaft Position Sensor Range Check during Engine Running P0335:

CKP sensor signal	No signal

COMPONENT OPERATING RANGE

CKP sensor	• CKP sensor output voltage fluctuates while crankshaft revolving • 34 CKP sensor signals per crankshaft revolution

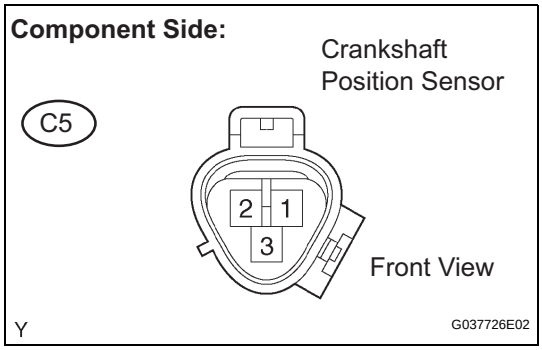
WIRING DIAGRAM



HINT:

- If no problem is found by this diagnostic troubleshooting procedure, troubleshoot the engine mechanical systems.
- Check the engine speed. The engine speed can be checked by using an intelligent tester. To check, follow the operation below:
  (a) Connect an intelligent tester to the DLC3.
  (b) Start the engine.
  (c) Turn the tester ON.
  (d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / ENGINE SPD.
  The engine speed may be indicated as zero despite the engine revolving normally. This is caused by a lack of NE signals from the Crankshaft Position (CKP) sensor. Alternatively, the engine speed may be indicated as lower than the actual engine speed, if the CKP sensor voltage output is insufficient.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 INSPECT CRANKSHAFT POSITION SENSOR (RESISTANCE)



(a) Disconnect the C5 Crankshaft Position (CKP) sensor connector.
(b) Measure the resistance between terminals 1 and 2.

Standard Resistance

Tester Connections	Specified Conditions
1 - 2	1,630 to 2,740 Ω at cold
1 - 2	2,065 to 3,225 Ω at hot

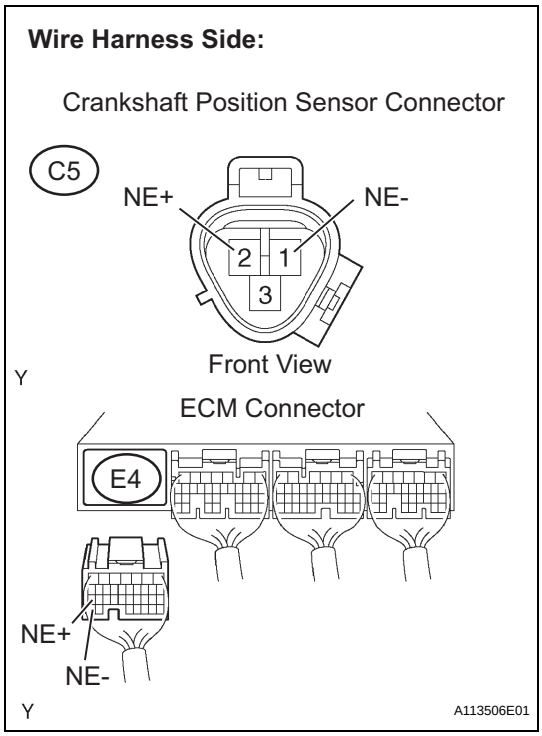
HINT:
Terms cold and hot refer to the temperature of the coils.
Cold means approximately -10° to 50°C (14°to 122°F).
Hot means approximately 50° to 100°C (122° to 212°F).

(c) Reconnect the CKP sensor connector.

NG → **REPLACE CRANKSHAFT POSITION SENSOR**

OK

2 CHECK HARNESS AND CONNECTOR (CRANKSHAFT POSITION SENSOR - ECM)



(a) Disconnect the C5 CKP sensor connector.
(b) Disconnect the E4 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
NE+ (C5-1) - NE+ (E4-27)	Below 1 Ω
NE- (C5-2) - NE- (E4-34)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
NE+ (C5-1) or NE+ (E4-27) - Body ground	10 kΩ or higher
NE- (C5-2) or NE- (E4-34) - Body ground	10 kΩ or higher

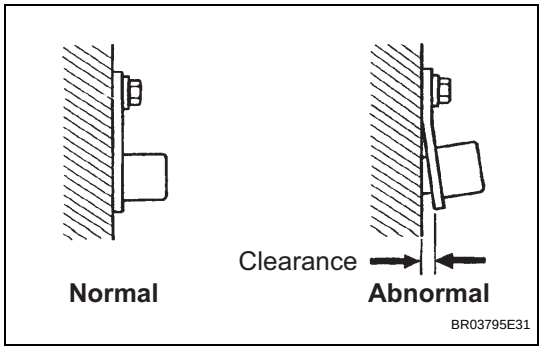
(d) Reconnect the ECM connector.
(e) Reconnect the CKP sensor connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

ES

3	CHECK CRANKSHAFT POSITION SENSOR (SENSOR INSTALLATION)



(a) Check the CKP sensor installation.
OK:
Sensor is installed correctly.

NG → **SECURELY REINSTALL SENSOR**

OK

4	CHECK CRANKSHAFT TIMING PULLEY (TEETH OF PLATE)

(a) Check the teeth of the sensor plate.
OK:
Sensor plate does not have any cracks or deformation.

NG → **REPLACE CRANKSHAFT POSITION SENSOR PLATE**

OK

REPLACE ECM

ES

DTC	P0340	Camshaft Position Sensor "A" Circuit (Bank 1 or Single Sensor)

DTC	P0341	Camshaft Position Sensor "A" Circuit Range / Performance (Bank 1 or Single Sensor)

DESCRIPTION

The Camshaft Position (CMP) sensor consists of a magnet and an iron core which is wrapped with copper wire, and is installed onto the cylinder head. When the camshaft rotates, each of 3 teeth on the camshaft passes through the CMP sensor. This activates the internal magnet in the sensor, generating a voltage in the copper wire. The camshaft rotation is synchronized with the crankshaft rotation. When the crankshaft turns twice the voltage is generated 3 times in the CMP sensor. The generated voltage in the sensor acts as a signal, allowing the ECM to locate the camshaft position. This signal is then used to control ignition timing, fuel injection timing, and the VVT system.

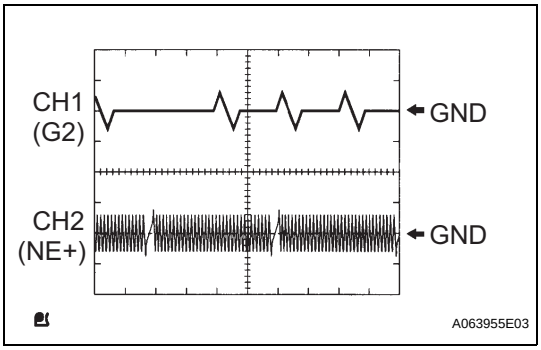
ES

DTC No.	DTC Detection Conditions	Trouble Areas
P0340	Case 1 • No Camshaft Position (CMP) sensor signal to ECM while cranking (2 trip detection logic) Case 2 • No CMP sensor signal to ECM at engine speed of 600 rpm or more (1 trip detection logic)	• Open or short in CMP sensor circuit • CMP sensor • Camshaft • Jumped tooth of timing chain • ECM
P0341	When crankshaft rotates twice, Camshaft Position (CMP) sensor signal input to ECM 12 times or more (1 trip detection logic)	• Open or short in CMP sensor circuit • CMP sensor • Camshaft • Jumped tooth of timing chain • ECM

HINT:

- DTC P0340 indicates a malfunction relating to the CMP sensor (+) circuit (the wire harness between the ECM and CMP sensor, and the CMP sensor itself).
- DTC P0341 indicates a malfunction relating to the CMP sensor (-) circuit (the wire harness between the ECM and CMP sensor, and the CMP sensor itself).

Reference: Inspection using an oscilloscope



HINT:

- The correct waveform is as shown above.
- G2 stands for the CMP sensor signal, and NE+ stands for the Crankshaft Position (CKP) sensor signal.

Items	Contents
Terminals	CH1: G2 - NE- CH2: NE+ - NE-
Equipment Settings	5 V/Division, 20 ms/Division
Conditions	Cranking or idling

MONITOR DESCRIPTION

If no signal is transmitted by the CMP sensor despite the engine revolving, or the rotation of the camshaft and the crankshaft is not synchronized, the ECM interprets this as a malfunction of the sensor.
If the malfunction is not repaired successfully, a DTC is set 10 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0340: Camshaft position sensor range check P0340: Camshaft position/crankshaft position misalignment P0341: Camshaft position sensor malfunction
Required Sensors/Components (Main)	Camshaft Position (CMP) sensor
Required Sensors/Components (Related)	Crankshaft Position (CKP) sensor
Frequency of Operation	Continuous
Duration	5 seconds
MIL Operation	2 driving cycles: CMP sensor range check Immediate: Camshaft position/crankshaft position misalignment and CMP sensor malfunction
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

Camshaft Position Sensor Range Check P0340:

Starter	ON
Minimal battery voltage while starter ON	Less than 11 V

Camshaft Position/Crankshaft Position Misalignment P0340:

Engine speed	600 rpm or more
Starter	OFF

Camshaft Position Sensor Malfunction P0341:

Starter	After OFF to ON timing

TYPICAL MALFUNCTION THRESHOLDS

Camshaft Position Sensor Range Check P0340:

CMP sensor signal	No signal

Camshaft Position/Crankshaft Position Misalignment P0340:

Camshaft position and crankshaft position phase	Misaligned

Camshaft Position Sensor Malfunction P0341:

Camshaft position and crankshaft position phase	Misaligned
CMP sensor signal per 2 crankshaft revolutions	12 signals or more

COMPONENT OPERATING RANGE

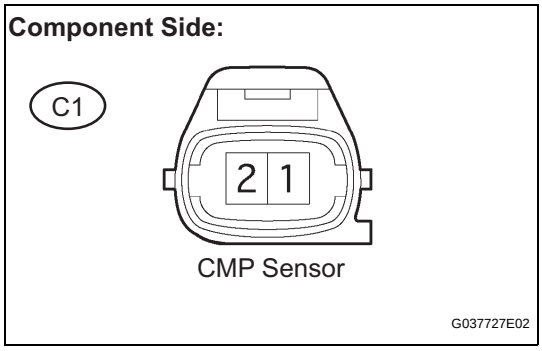
CMP sensor	• CMP sensor output voltage fluctuates while camshaft revolving • 3 CMP sensor signals per 2 crankshaft revolutions

WIRING DIAGRAM

Refer to DTC P0335 (See page ES-173).

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 INSPECT CAMSHAFT POSITION SENSOR (RESISTANCE)



(a) Disconnect the C1 Camshaft Position (CMP) sensor connector.
(b) Measure the resistance between terminals 1 and 2.

Standard Resistance

Tester Connections	Specified Conditions
1 - 2	835 to 1,400 Ω at cold
1 - 2	1,060 to 1,645 Ω at hot

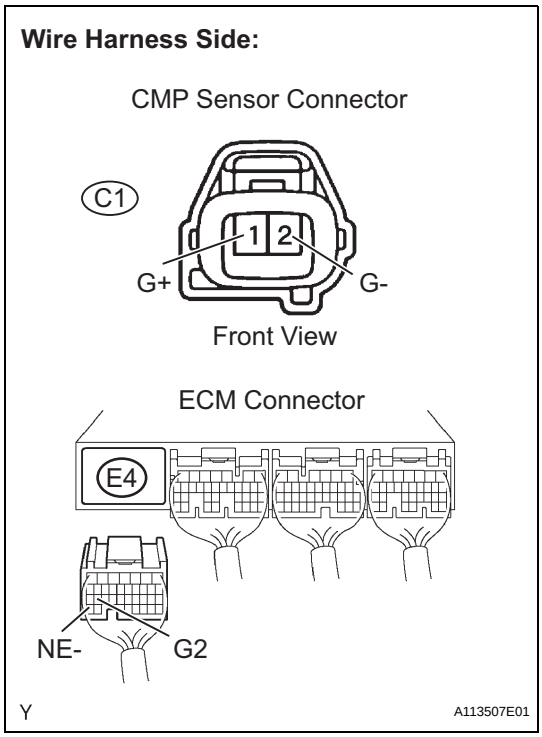
HINT:
Terms cold and hot refer to the temperature of the coils. Cold means approximately -10° to 50°C (14° to 122°F). Hot means approximately 50° to 100°C (122° to 212°F).

(c) Reconnect the CMP sensor connector.

NG → REPLACE CAMSHAFT POSITION SENSOR

OK

2 CHECK HARNESS AND CONNECTOR (CAMSHAFT POSITION SENSOR - ECM)



(a) Disconnect the C1 CMP sensor connector.
(b) Disconnect the E4 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
G+ (C1-1) - G2 (E4-26)	Below 1 Ω
G- (C1-2) - NE- (E4-34)	Below 1 Ω

Standard Resistance (Check for short)

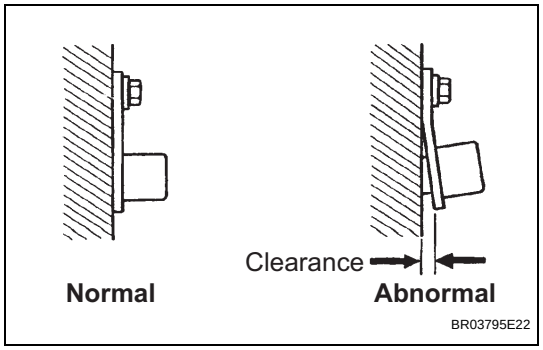
Tester Connections	Specified Conditions
G+ (C1-1) or G2 (E4-26) - Body ground	10 kΩ or higher
G- (C1-2) or NE- (E4-34) - Body ground	10 kΩ or higher

(d) Reconnect the ECM connector.
(e) Reconnect the CMP sensor connector.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3	CHECK SENSOR INSTALLATION (CAMSHAFT POSITION SENSOR)



(a) Check the CMP sensor installation.
OK:
Sensor is installed correctly.

NG → **SECURELY REINSTALL SENSOR**

OK

4	CHECK CAMSHAFT TIMING GEAR ASSEMBLY (TEETH OF SENSOR PLATE)

(a) Check the teeth of the sensor plate.
OK:
Sensor plate teeth do not have any cracks or deformation.

NG → **REPLACE CAMSHAFT TIMING GEAR ASSEMBLY**

OK

REPLACE ECM

ES

DTC	P0351	Ignition Coil "A" Primary / Secondary Circuit

DTC	P0352	Ignition Coil "B" Primary / Secondary Circuit

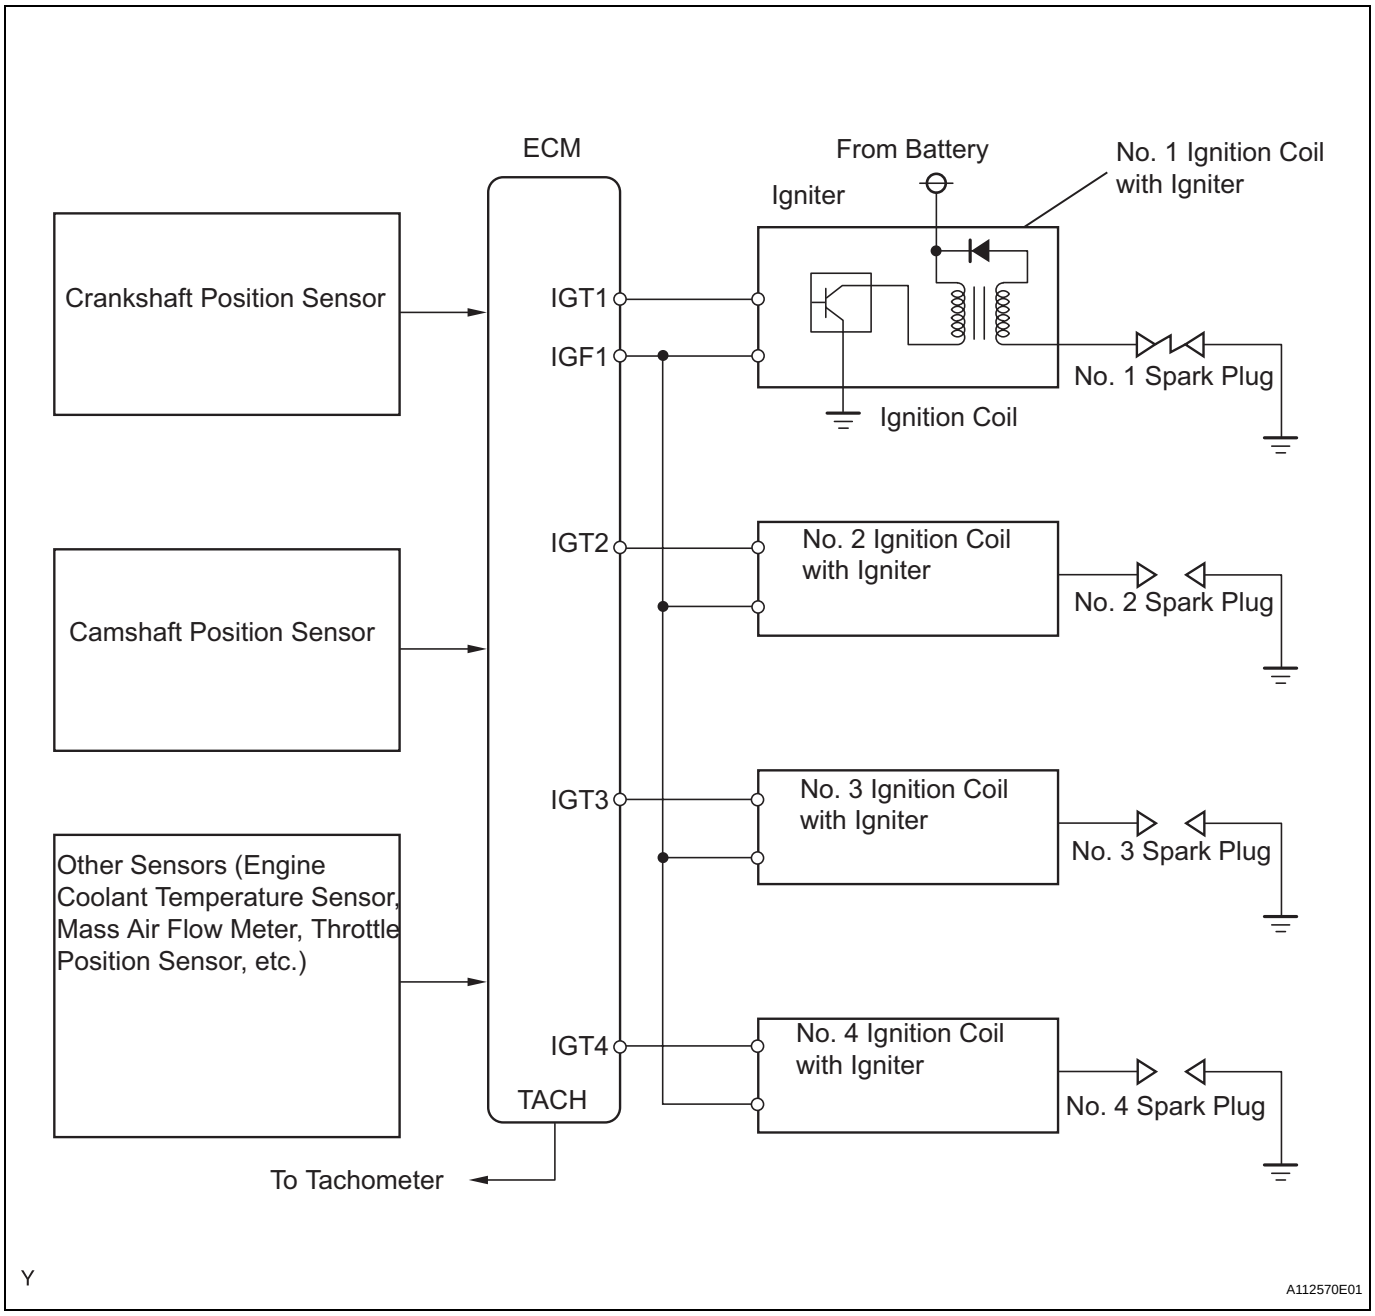
DTC	P0353	Ignition Coil "C" Primary / Secondary Circuit

DTC	P0354	Ignition Coil "D" Primary / Secondary Circuit

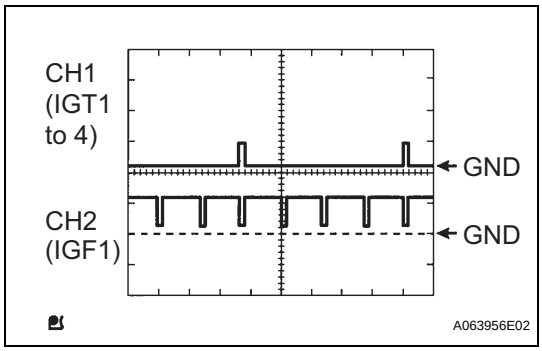
HINT:
- These DTCs indicate malfunctions relating to the primary circuit.
- If DTC P0351 is set, check No.1 ignition coil with igniter circuit.
- If DTC P0352 is set, check No.2 ignition coil with igniter circuit.
- If DTC P0353 is set, check No.3 ignition coil with igniter circuit.
- If DTC P0354 is set, check No.4 ignition coil with igniter circuit.

DESCRIPTION

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrodes to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM, for each cylinder ignition.



DTC No.	DTC Detection Conditions	Trouble Areas
P0351 P0352 P0353 P0354	No IGF signal to ECM while engine running (1 trip detection logic)	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 4) between ignition coil with igniter and ECM • No. 1 to No. 4 ignition coils with igniters • ECM

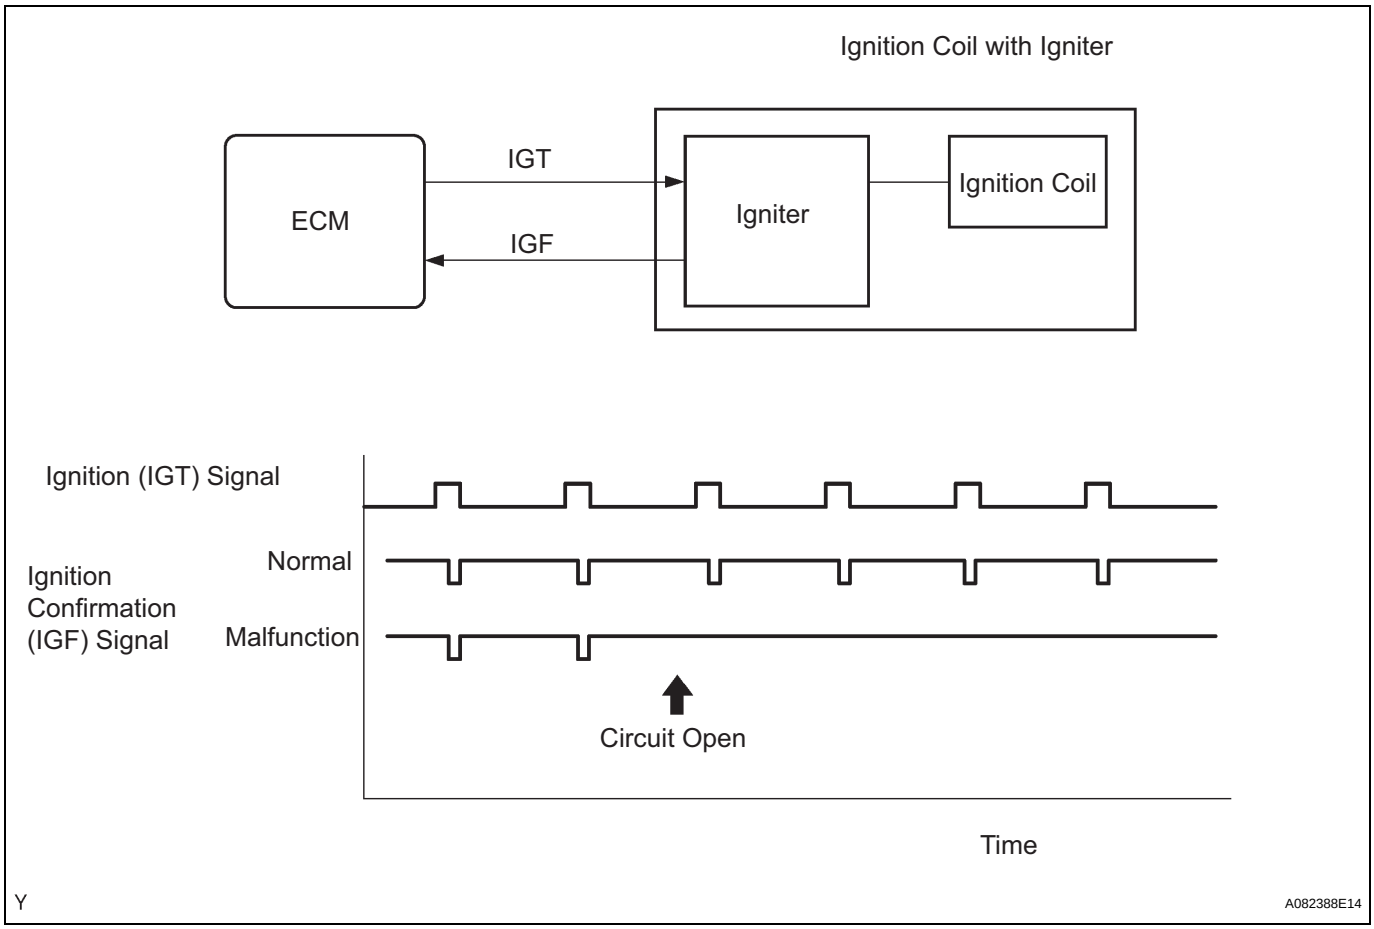


Reference: Inspection using an oscilloscope.
While cranking or idling, check the waveform between terminals IGT(1 to 4) and E1, and IGF1 and E1 of the ECM connector.

ES

Items	Contents
Terminals	CH1: IGT1, IGT2, IGT3, IGT4 - E1 CH2: IGF1 - E1
Equipment Settings	2 V/Division, 20 ms/Division
Conditions	Cranking or idling

MONITOR DESCRIPTION



If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and sets a DTC.
If the malfunction is not repaired successfully, a DTC is set 1second after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0351: Igniter (cylinder 1) malfunction P0352: Igniter (cylinder 2) malfunction P0353: Igniter (cylinder 3) malfunction P0354: Igniter (cylinder 4) malfunction
Required Sensors/Components (Main)	Igniter
Required Sensors/Components (Related)	Crankshaft position sensor
Frequency of Operation	Continuous
Duration	0.256 seconds and 4 sparks
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Either of following conditions met	-
Engine RPM	1,500 rpm or less
Starter	OFF

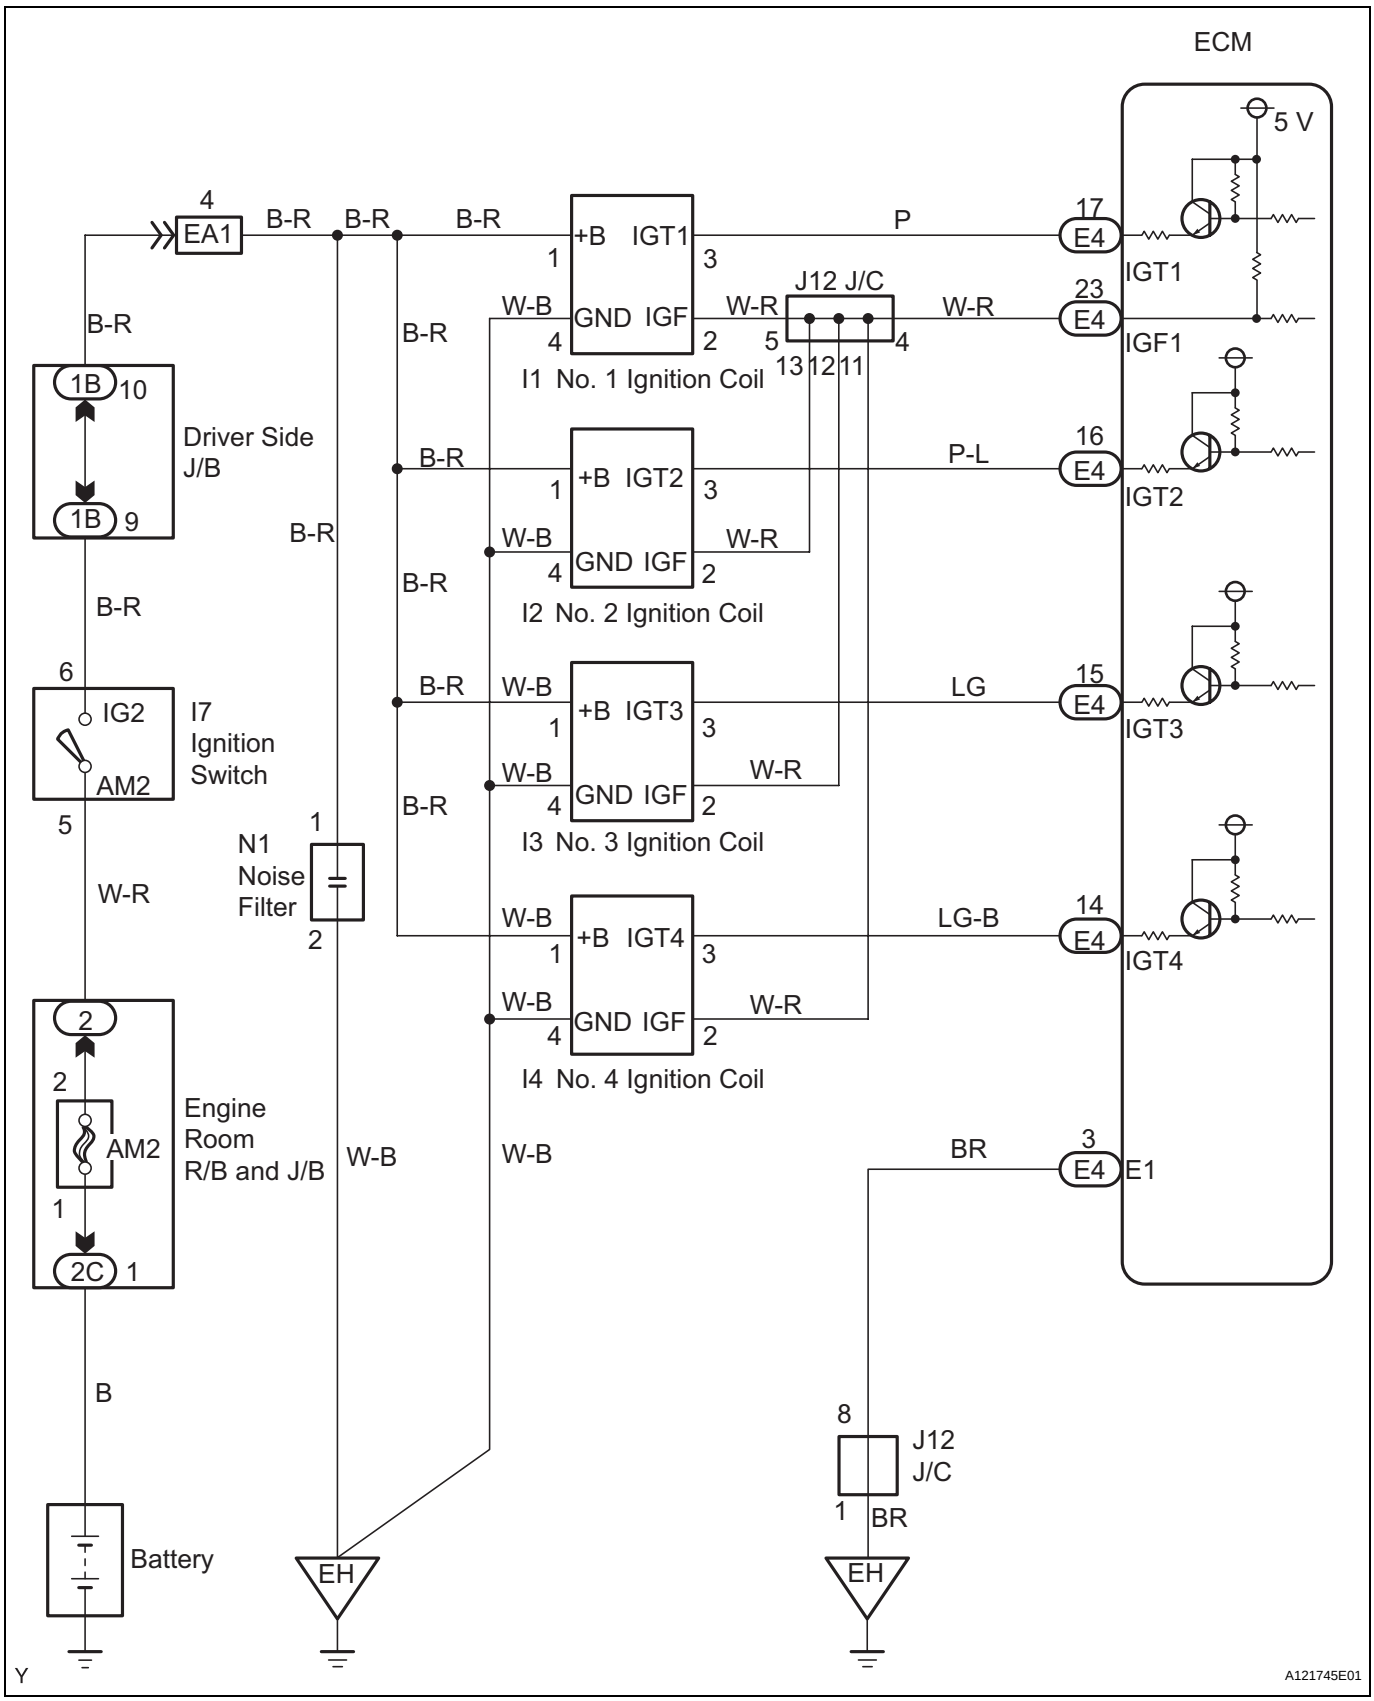
TYPICAL MALFUNCTION THRESHOLDS

IGF signal	ECM does not receive any IGF signal despite ECM sending IGT signal to igniter

COMPONENT OPERATING RANGE

IGF signal	Igniter transmits IGF signal when it receives IGT signal from ECM

WIRING DIAGRAM



HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 CHECK WHETHER DTC OUTPUT RECURS (DTC P0351, P0352, P0353 OR P0354)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-40).
(e) Shuffle arrangement of the ignition coils with igniters (among No. 1 to No. 4 cylinders).
NOTICE:
Do not shuffle the connectors.
(f) Perform a simulation test.
(g) Check DTCs displayed on the tester.

REPLACE IGNITION COIL ASSEMBLY

DTC	P0412	Secondary Air Injection System Switching Valve "A" Circuit

DESCRIPTION

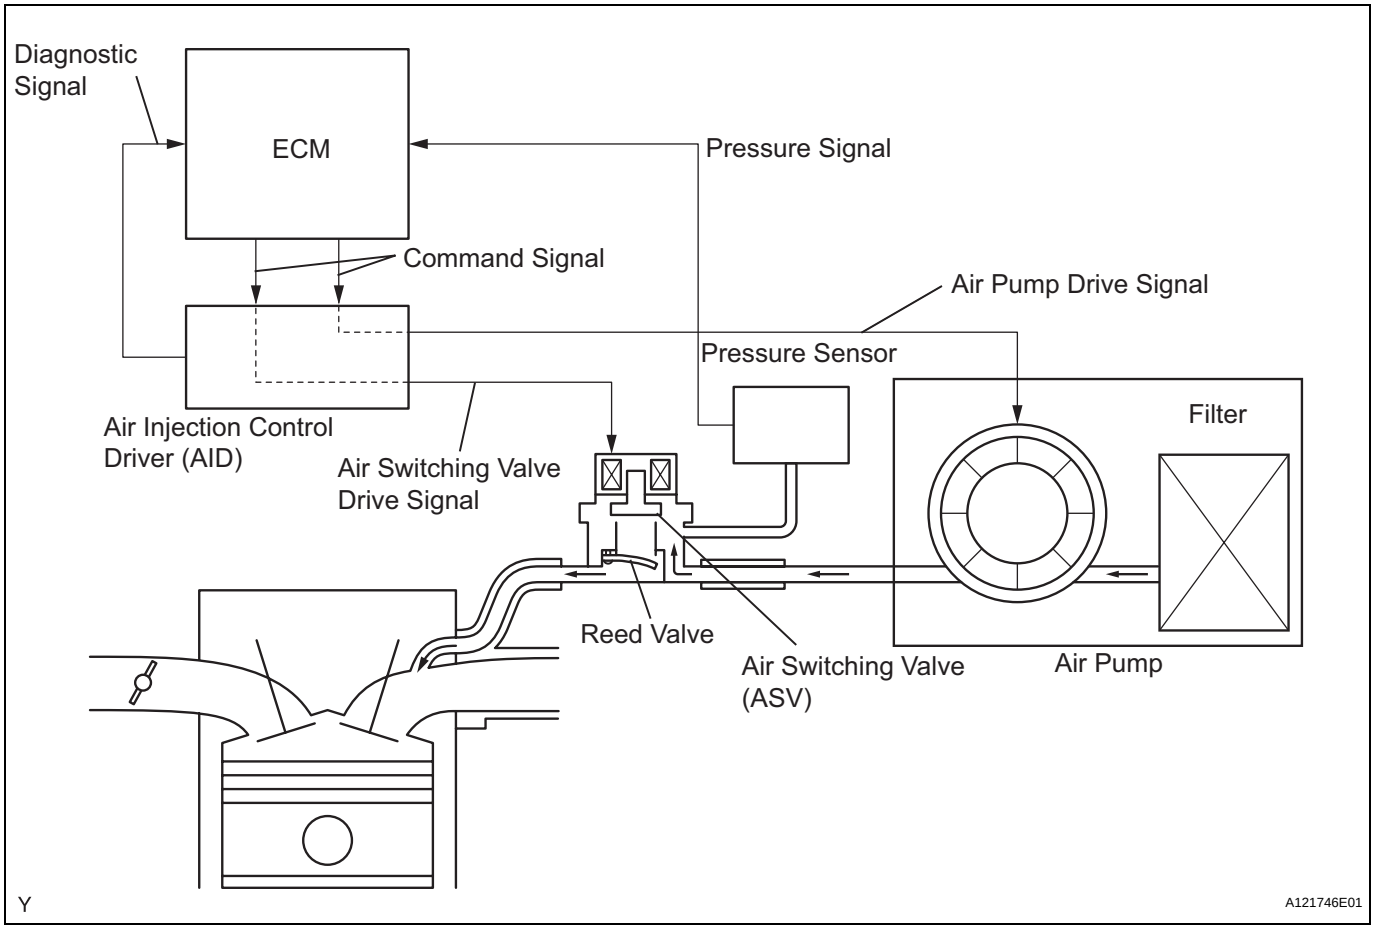
The Secondary Air Injection (AIR) system consists of an air pump, the Air Switching Valve (ASV), a pressure sensor, the Air Injection Control Driver (AID) and the ECM. For a short time after cold engine starts, the AIR system pumps secondary air to the exhaust port of the cylinder head to purify the exhaust emissions. The secondary air is supplied by the air pump and is pumped to the exhaust port through the ASV.

The AID drives the ASV and the air pump according to command signals transmitted by the ECM. The pressure sensor detects the pressure in the secondary air passage when the AIR system is ON and OFF, and transmits pressure signal to the ECM.

The AID is not only equipped to drive the pump and valve, but also with a diagnosis function to detect malfunctions in the AIR system circuit.

HINT:

As a large current is required to drive the air pump and ASV, an AID has been added to the previous system.



DTC No.	DTC Detection Conditions	Trouble Areas
P0412	After cold engine starts, all of following conditions met (1 trip detection logic): (a) Air Injection (AIR) system not operating (air pump OFF, Air Switching Valve [ASV] OFF) (b) Diagnostic signal from Air Injection Control Driver (AID) 40 % (c) Battery voltage 8 V or more	• Open in ASV drive circuit • Short between ASV drive and +B circuits • AID • ASV • ECM

DTC No.	DTC Detection Conditions	Trouble Areas
P0412	After cold engine starts, all of following conditions met (1 trip detection logic): (a) Air Injection (AIR) system operating (air pump ON, Air Switching Valve [ASV] ON) (b) Diagnostic signal from Air Injection Control Driver (AID) 40 % (c) Battery voltage 8 V or more	• Short between ASV drive circuit and body ground • AID • ASV • ECM

MONITOR DESCRIPTION

The Air Injection Control Driver (AID) detects open and short circuits according to the voltages of the air pump terminal (VB) and the Air Switching Valve (ASV) terminal (VV), and transmits diagnostic information as a signal to the ECM.

For a short time after cold engine starts, the ECM transmits command signals to the AID to drive the air pump and ASV.

ES

The AID transmits an ASV malfunction signal to the ECM if either of the following conditions is met:

- The voltage at the AID terminal relating to the ASV is low despite the AID receiving command signals from the ECM to drive the ASV.
- The voltage at the AID terminal relating to the ASV is high despite the AID receiving no command signals from the ECM to drive the ASV.

The ECM sets the DTC based on diagnostic signals from the AID.

MONITOR STRATEGY

Related DTCs	P0412: Secondary air injection system air switching valve circuit range check
Required Sensors/Components (Main)	Air injection control driver
Required Sensors/Components (Related)	Air switching valve
Frequency of Operation	Once per drive cycle
Duration	3 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Case 1:

Monitor runs whenever following DTCs not present	-
Secondary air injection system	Operating
Battery voltage	8 V or more
Ignition switch	ON
Time after ignition switch OFF to ON	0.5 seconds or more
Starter	OFF
Time after starter turned from ON to OFF	0.5 seconds or more

Case 2:

Monitor runs whenever following DTCs not present	-
Secondary air injection system	Not operating
Battery voltage	8 V or more
Ignition switch	ON
Time after ignition switch OFF to ON	0.5 seconds or more
Starter	OFF
Time after starter turned from ON to OFF	0.5 seconds or more

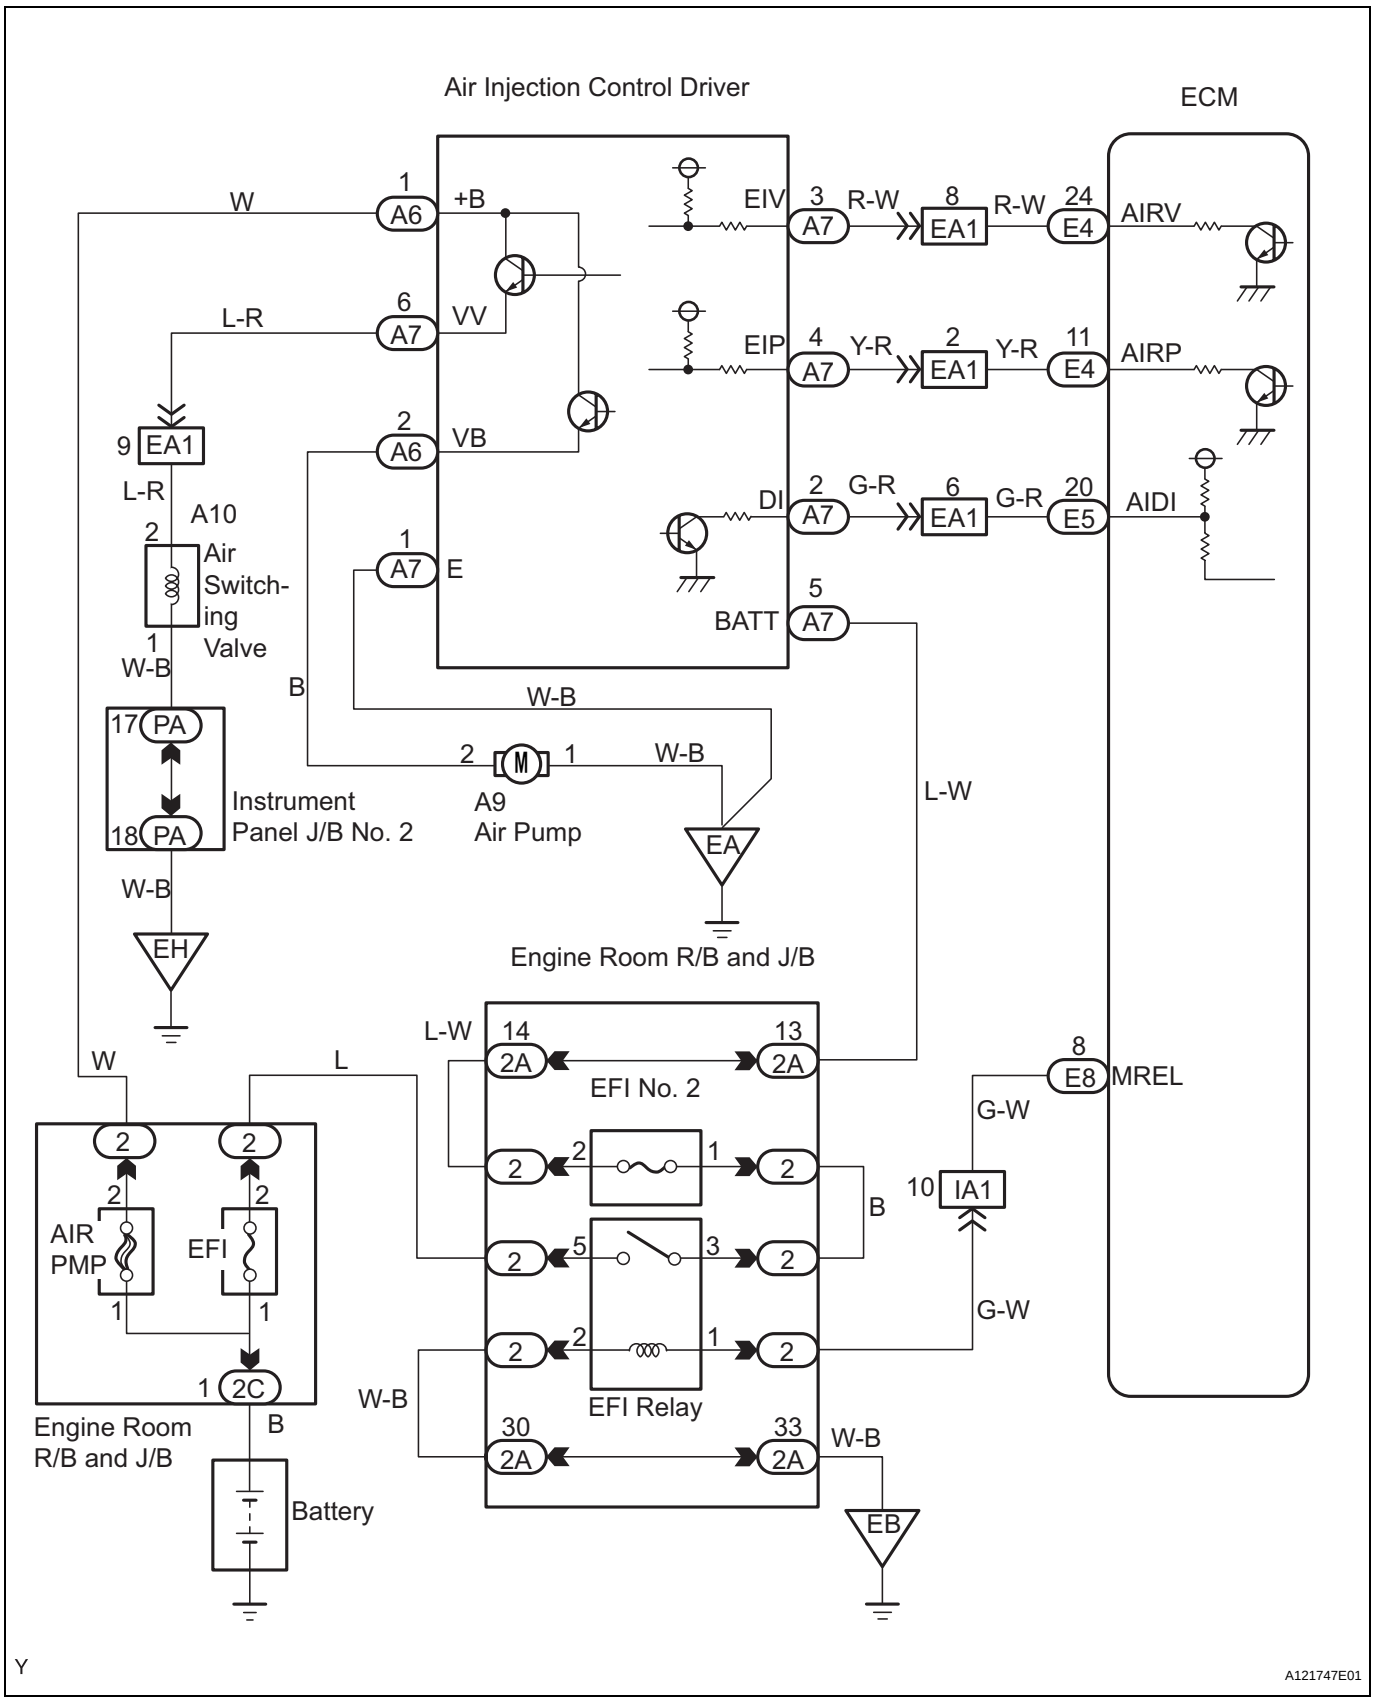
TYPICAL MALFUNCTION THRESHOLDS

Diagnostic signal duty ratio from air injection control driver	31 % or more, and 48 % or less

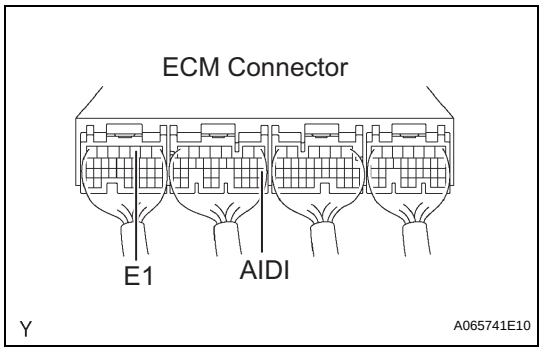
COMPONENT OPERATING RANGE

Diagnostic signal duty ratio from air injection control driver	70 % or more, and 90 % or less when secondary air injection system operating. 0 % when secondary air injection system not operating.

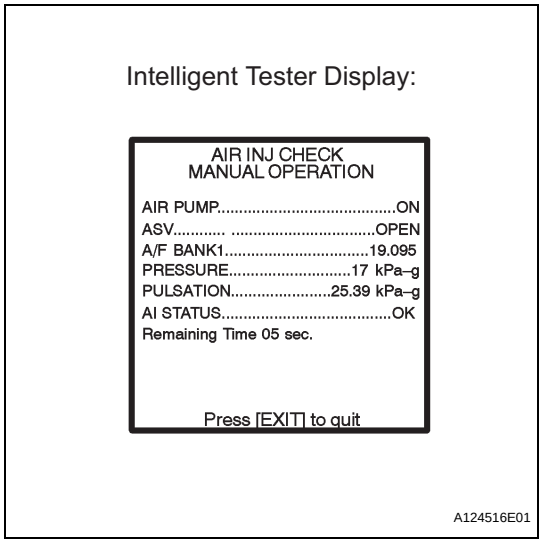
WIRING DIAGRAM



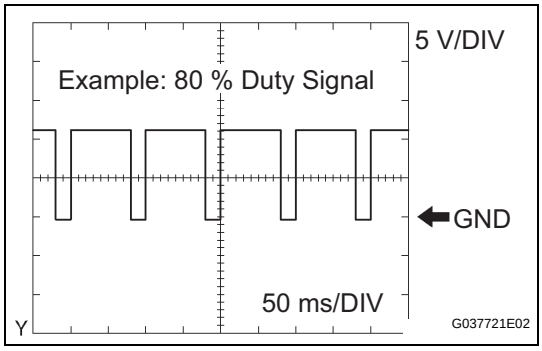
HINT:
Diagnostic information output by the AID can be confirmed by connecting an oscilloscope to the diagnostic information terminal of the AID. Reading the waveform while performing the AIR system intrusive operation provided in the SYSTEM CHECK function, allows the possible trouble areas to be narrowed down.
(a) Start the engine and warm it up.
(b) Turn the ignition switch to OFF.
(c) Connect an intelligent tester to the DLC3.
(d) Connect oscilloscope probes to the AIDI and E1 terminals of the ECM.



(e) Turn the ignition switch to ON and turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / MANUAL OPERATION / AP: ON, ASV: OPEN and AP: OFF, ASV CLOSE.
HINT:
When MANUAL OPERATION is selected, the tester initialization (atmospheric pressure measurement) is performed automatically. The initialization takes 10 seconds. After the initialization, AP and ASV operation can be selected.
(g) Start the engine.
(h) Perform the AIR system intrusive operation while the engine is idling.



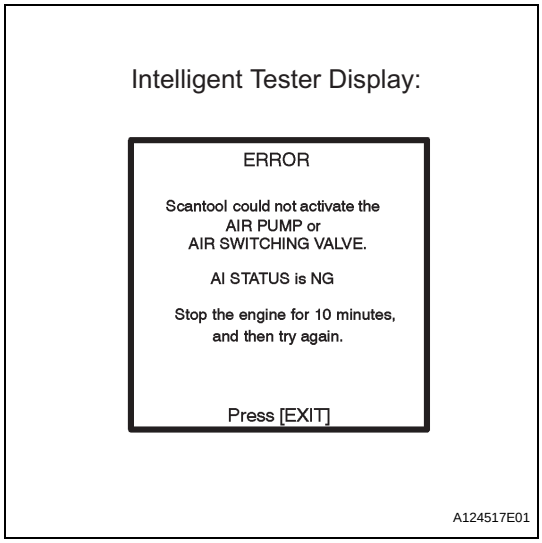
(i) Monitor the AID voltage output (duty ratio signal).



Oscilloscope range

Items	Contents
Terminals	CH1: AIDI - E1
Equipment Settings	5 V/Division, 20 to 50 ms/Division
Conditions	Idling

(j) Turn the ignition switch to OFF.



NOTICE:

- **This AIR INJECTION CHECK only allows technicians to operate the AIR system for a maximum of 5 seconds. Furthermore, the check can only be performed up to 4 times per trip. If the test is repeated, intervals of at least 30 seconds are required between checks. While AIR system operation using the intelligent tester is prohibited, the tester display indicates the prohibition (WAIT or ERROR).**
  If an ERROR as shown in the illustration is displayed on the tester during the test, stop the engine for 10 minutes, and then try again.
- **Performing the AIR INJ CHECK repetitively may cause damage to the AIR system. If necessary, leave an interval of several minutes between SYSTEM CHECK operations to prevent the system from overheating.**
- **When performing the AIR INJ CHECK operation after the battery cable has been reconnected, wait for 7 minutes with the ignition switch turned to ON or the engine running.**
- **Turn the ignition switch to OFF when the AIR INJ CHECK operation finishes.**

HINT:

- By using an intelligent tester to perform the AIR INJ CHECK operation in the SYSTEM CHECK, the air-fuel ratio and the pressure in the secondary air injection system passage can be checked while the secondary air injection system is operating. This helps technicians to troubleshoot the system when it malfunctions.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

REPLACE AIR INJECTION CONTROL DRIVER

DTC	P0418	Secondary Air Injection System Control "A" Circuit

DESCRIPTION

Refer to DTC P0412 (See page ES-189).

DTC No.	DTC Detection Conditions	Trouble Areas
P0418	After cold engine starts, all of following conditions met (1 trip detection logic): (a)Air Injection (AIR) system not operating (air pump OFF, Air Switching Valve [ASV] OFF) (b)Diagnostic signal from Air Injection Control Driver (AID) 20 % (c)Battery voltage 8 V or more	• Open in air pump drive circuit • Short between air pump drive and +B circuits • Air pump • AID • ECM
P0418	After cold engine starts, all of following conditions met (1 trip detection logic): (a)Air Injection (AIR) system operating (air pump ON, Air Switching Valve [ASV] ON) (b)Diagnostic signal from Air Injection Control Driver (AID) 20 % (c)Battery voltage 8 V or more	• Short between air pump drive circuit and body ground • Air pump • AID • ECM

ES

MONITOR DESCRIPTION

The Air Injection Control Driver (AID) detects open and short circuits according to the voltages of the air pump terminal (VB) and the Air Switching Valve (ASV) terminal (VV), and transmits diagnostic information as a signal to the ECM.

For a short time after cold engine starts, the ECM transmits command signals to the AID to drive the air pump and ASV.

The AID transmits an air pump malfunction signal to the ECM if either of the following conditions is met:

- The voltage at the AID terminal relating to the air pump is low despite the AID receiving command signals from the ECM to drive the air pump.
- The voltage at the AID terminal relating to the air pump is high despite the AID receiving no command signals from the ECM to drive the air pump.

The ECM sets the DTC based on diagnostic signals from the AID.

OK

REPLACE AIR INJECTION CONTROL DRIVER

ES

DTC	P0420	Catalyst System Efficiency Below Threshold (Bank 1)

MONITOR DESCRIPTION

The ECM uses sensors mounted in front of and behind the Three-Way Catalytic Converter (TWC) to monitor its efficiency.
The first sensor, the Air-Fuel Ratio (A/F) sensor, sends pre-catalyst information to the ECM. The second sensor, the Heated Oxygen (HO2) sensor, sends post-catalyst information to the ECM.
In order to detect any deterioration in the TWC, the ECM calculates the Oxygen Storage Capacity (OSC) of the TWC. This calculation is based on the voltage output of the HO2 sensor while performing active air-fuel ratio control, rather than the conventional detecting method, which uses the locus ratio.
The OSC value is an indication of the oxygen storage capacity of the TWC. When the vehicle is being driven with a warm engine, active air-fuel ratio control is performed for approximately 15 to 20 seconds. When it is performed, the ECM deliberately sets the air-fuel ratio to lean or rich levels. If a rich-lean cycle of the HO2 sensor is long, the OSC becomes greater. There is a direct correlation between the OSCs of the HO2 sensor and the TWC.
The ECM uses the OSC value to determine the state of the TWC. If any deterioration has occurred, it illuminates the MIL and sets the DTC.

DTC No.	DTC Detection Conditions	Trouble Areas
P0420	OSC value smaller than standard value under active air-fuel ratio control (2 trip detection logic)	• Front exhaust pipe • Gas leakage from exhaust system • Air-Fuel Ratio (A/F) sensor (sensor 1) • Heated Oxygen (HO2) sensor (sensor 2)

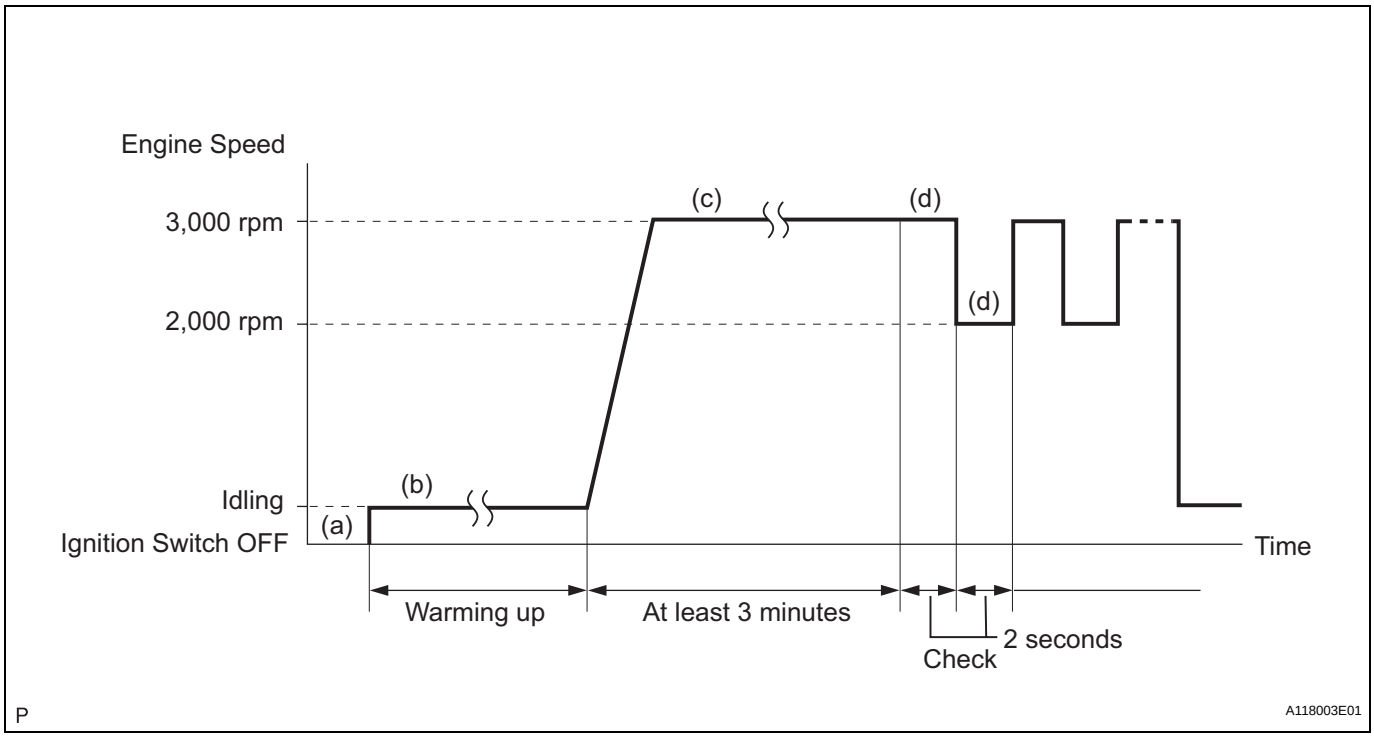
MONITOR RESULT

Refer to Checking Monitor Status (See page ES-21).

CONDITIONING FOR SENSOR TESTING

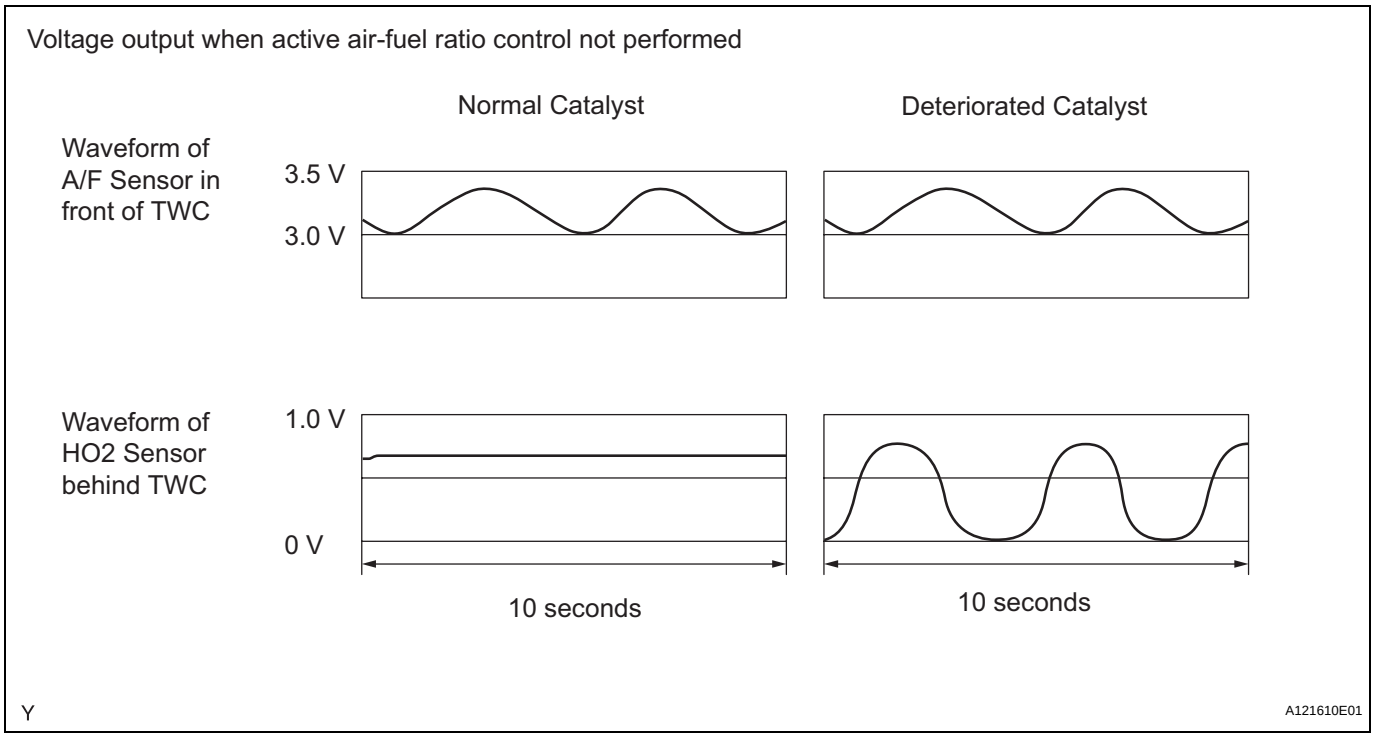
HINT:

Perform the operation with the engine speeds and time durations described below prior to checking the waveforms of the A/F and HO2 sensors. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.



(a) Connect an intelligent tester to the DLC3.
(b) Start the engine and warm it up with all the accessories switched OFF, until the engine coolant temperature stabilizes.
(c) Run the engine at an engine speed of between 2,500 rpm and 3,000 rpm for at least 3 minutes.
(d) While running the engine at 3,000 rpm for 2 seconds and 2,000 rpm for 2 seconds, check the waveforms of the A/F and HO2 sensors using the tester (refer to Conditioning for Sensor Testing).
HINT:

- If either of the voltage outputs of the Air-Fuel Ratio (A/F) or Heated Oxygen (HO2) sensor does not fluctuate, or either of the sensors makes a noise, the sensor may be malfunctioning.
- If the voltage outputs of both the sensors remain lean or rich, the air-fuel ratio may be extremely lean or rich. In such cases, perform the following A/F CONTROL using an intelligent tester.
- If the Three-Way Catalytic Converter (TWC) has deteriorated, the HO2 sensor (located behind the TWC) voltage output fluctuates up and down frequently, even under normal driving conditions (active air-fuel ratio control is not performed).



CONDITIONING FOR SENSOR TESTING

HINT:

- Intelligent tester only:
- Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
- The following instructions describe how to conduct the A/F CONTROL operation using an intelligent tester.

(a) Connect an intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and OS2 B1S2) displayed on the tester.

HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard Voltage

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (HO2)	+25 %	Rich	More than 0.5
O2S B1S2 (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:
The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		
3	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output Voltage Almost no reaction		Output Voltage Almost no reaction		

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0420)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0420	A

Display (DTC Output)	Proceed To
P0420 and other DTCs	B

HINT:
If any DTCs other than P0420 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and O2S B1S2) displayed on the tester.

HINT:
- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

DTC	P043E	Evaporative Emission System Reference Orifice Clog Up

DTC	P043F	Evaporative Emission System Reference Orifice High Flow

DTC SUMMARY

DTCs	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P043E	Reference orifice clogged	Leak detection pump creates negative pressure through reference orifice, and EVAP system pressure measured to determine leak pressure standard. 0.02 inch leak criterion measured at start and at end of leak check. If system pressure lower than -4.85 kPa (-36.38 mmHg)*, ECM determines that reference orifice has clogging malfunction.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM • Leakage from EVAP system	While ignition switch OFF	2 trip
P043F	Reference orifice high-flow	Leak detection pump creates negative pressure through reference orifice, and EVAP system pressure measured to determine leak pressure standard. 0.02 inch leak criterion measured at start and at end of leak check. If system pressure higher than -1.06 kPa (-7.95 mmHg)*, ECM determines that reference orifice has high-flow malfunction.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM • Leakage from EVAP system	While ignition switch OFF	2 trip

*: The threshold values vary according to the atmospheric pressure measured at the beginning of the EVAP system monitor. The values described in the table above are based on an atmospheric pressure of 100 kPa (750.1 mmHg) (absolute pressure).
HINT:
The reference orifice is located inside the canister pump module.

DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) System (see page ES-392).

Refer to the EVAP System (see page ES-397).

MONITOR DESCRIPTION

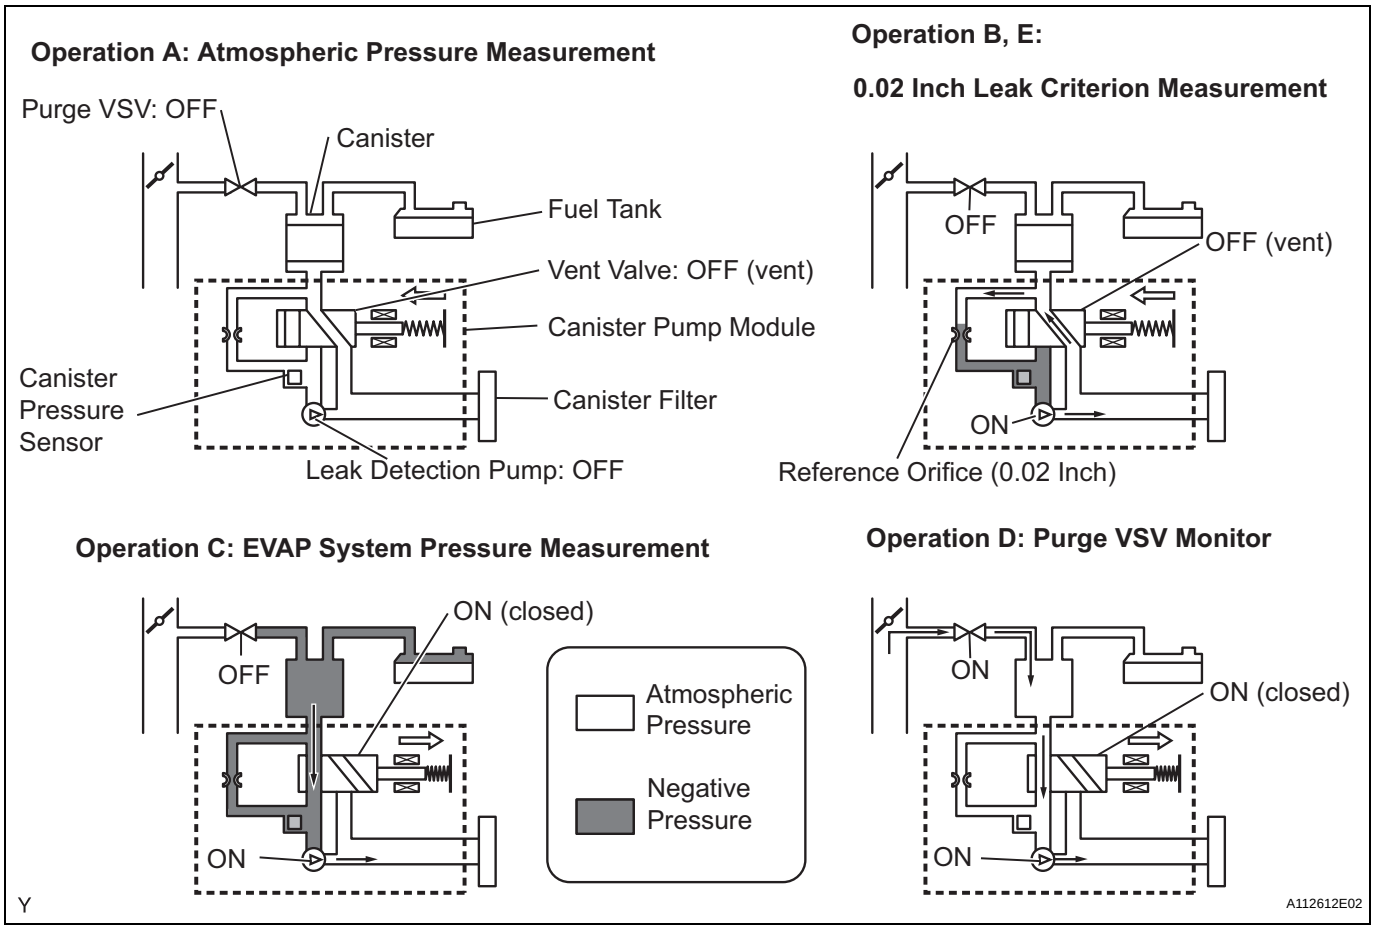
5 hours* after the ignition switch is turned to OFF, the electric leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned to OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak criterion (reference pressure) measurement	In order to determine 0.02 inch leak criterion, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as they will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak criterion (reference pressure) measurement	After second 0.02 inch leak pressure measurement, leak check performed by comparing first and second 0.02 inch leak criterion. If stabilized system pressure higher than second 0.02 inch leak criterion, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

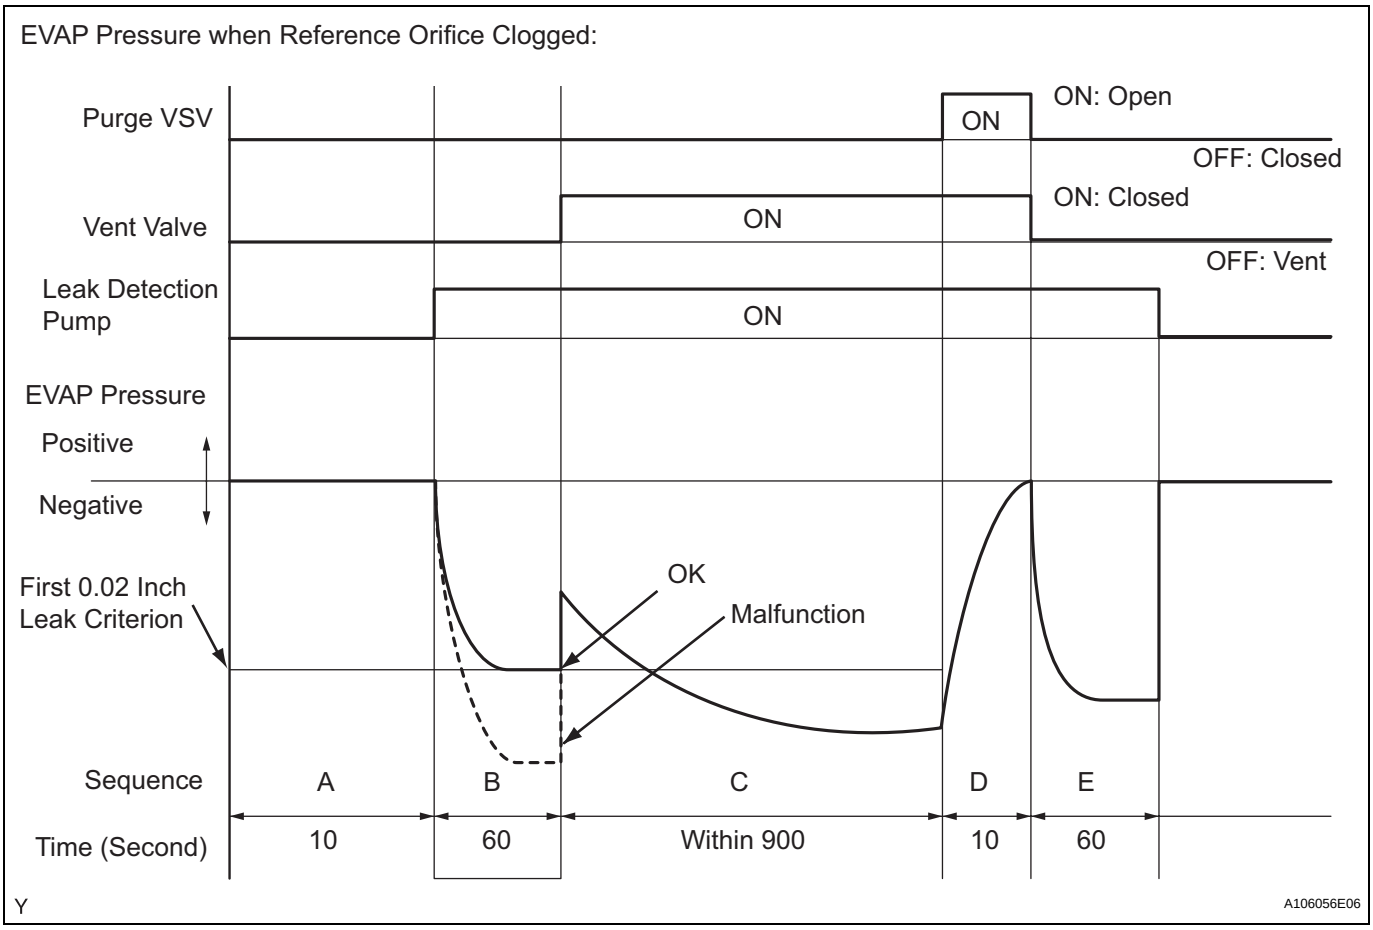
* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.



(a) P043E: Reference orifice clogged

In operation B, the leak detection pump creates negative pressure (vacuum) through the reference orifice. The EVAP system pressure is then measured by the ECM, using the pressure sensor, to determine the 0.02 inch leak criterion. If the pressure is lower than -4.85 kPa (-36.38 mmHg)*, the ECM interprets this as a clog malfunction in the reference orifice, and stops the EVAP (Evaporative Emission) system monitor. The ECM then illuminates the MIL and sets the DTC (2 trip detection logic).

*: The threshold varies according to the atmospheric pressure measured in operation A. The value described above is based on an atmospheric pressure of 100 kPa (750.1 mmHg): absolute pressure.

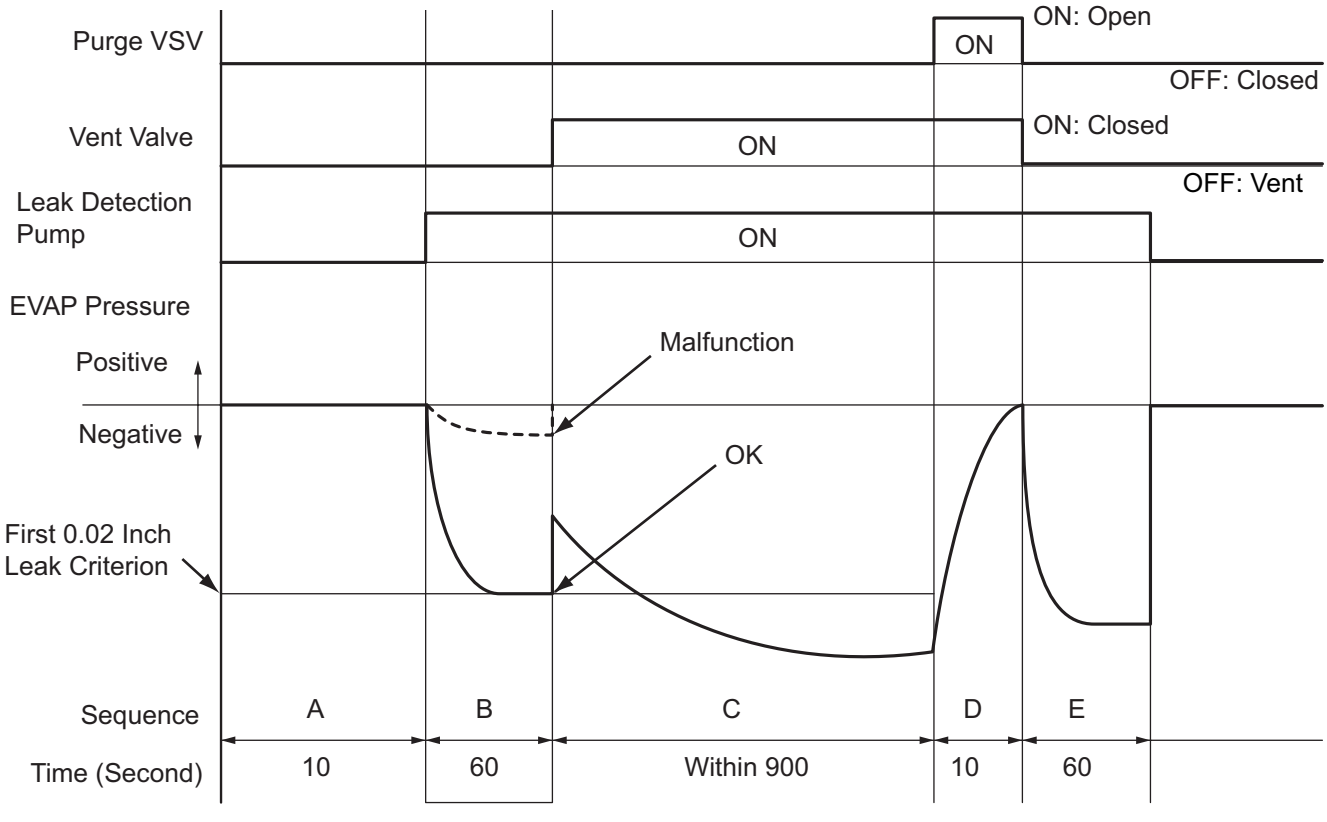


(b) P043F: Reference orifice high-flow

In operation B, the leak detection pump creates negative pressure (vacuum) through the reference orifice. The EVAP system pressure is then measured by the ECM using the canister pressure sensor to determine the 0.02 inch leak criterion. If the pressure is higher than -1.06 kPa (-7.95 mmHg)*, the ECM interprets this as a high-flow malfunction in the reference orifice, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (2 trip detection logic).

*: The threshold varies according to the atmospheric pressure measured in operation A. The value described above is based on a atmospheric pressure of 100 kPa (750.1 mmHg): absolute pressure.

EVAP Pressure when Reference Orifice High-flow Malfunction:



OBD II MONITOR SPECIFICATIONS

MONITOR STRATEGY

Required Sensors/Components	Canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 15 minutes (varies with amount of fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa (525 to 825 mmHg)
Battery voltage	10.5 V or more
Vehicle speed	Below 2.5 mph (4 km/h)
Ignition switch	OFF
FTP sensor malfunction (P0450, P0451, P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of following conditions met before IG switch OFF	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. Purge flow	Executed

ECT	4.4° to 35°C (40° to 95°F)
IAT	4.4° to 35°C (40° to 95°F)
Time after engine stopped	5 hours

Example of restart time

First time	7 hours
Second time	9 hours and 30 minutes

1. Key-off monitor sequence 1 to 8

1. Atmospheric pressure

Next sequence is run if following condition set	-
Atmospheric pressure change for 10 second	Less than 0.3 kPa (2.25 mmHg) for 1 second

2. First reference pressure

Next sequence is run if all of following conditions set	Condition 1, 2 and 3
1. FTP when 4 seconds after reference pressure measurement	-1 kPa (-7.5 mmHg) or less
2. Reference pressure	-4.85 to -1.057 kPa (-33.38 to -7.93 mmHg)
3. Reference pressure	Saturated within 60 seconds

3. Vent valve stuck closed check

Next sequence is run if following condition set	-
FTP change for 10 seconds after vent valve ON (closed)	0.3 kPa (2.25 mmHg) or more

4. Vacuum introduction and leak

Next sequence is run if both of following conditions set	Condition 1 and 2
1. Vacuum introduction time	12 minutes or less
2. FTP	Saturated within 12 minutes

5. Purge VSV stuck closed check

Next sequence is run if following condition set	-
FTP change for 10 seconds after purge VSV ON (open)	0.3 kPa (2.25 mmHg) or more

6. Second reference pressure measurement

Next sequence is run if all of following conditions set	Condition 1, 2, 3 and 4
1. FTP when 4 seconds after reference pressure measurement	-1 kPa (-7.5 mmHg) or less
2. Reference pressure	-4.85 to -1.057 kPa (-36.4 to -7.92 mmHg)
3. Reference pressure	Saturated within 60 seconds
4. Reference pressure difference between first and second	0.7 kPa (5.25 mmHg) or less

7. Leak check

Next sequence is run if following condition set	-
FTP when vacuum introduction was complete	Second reference pressure or less

8. Atmospheric pressure

Monitor is complete if following condition set	-
Atmospheric pressure difference between sequence 1 and 8	0.3 kPa (2.25 mmHg) or less

TYPICAL MALFUNCTION THRESHOLDS

"Saturated" indicates that the EVAP pressure change is less than 0.1 kPa (0.75 mmHg) in 30 seconds.

One of following conditions met	-
EVAP pressure just after reference pressure measurement start	More than -1 kPa (-7.5 mmHg)
Reference pressure	Less than -4.85 kPa (-36.4 mmHg)
Reference pressure	-1.057 kPa (-7.9 mmHg) or more
Reference pressure	Not saturated within 60 seconds

Difference between first and second reference pressure	0.7 kPa (5.3 mmHg) or more

MONITOR RESULT

Refer to Checking Monitor Status (See page ES-21) or (See page ES-422).

DTC	P0441	Evaporative Emission Control System Incorrect Purge Flow

DTC SUMMARY

DTCs.	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P0441	Purge VSV (Vacuum Switching Valve) stuck open	Leak detection pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. 0.02 inch leak criterion measured at start and at end of leak check. If stabilized pressure higher than [second 0.02 inch leak criterion x 0.2], ECM determines that purge VSV stuck open	• Purge VSV • Connector/wire harness (Purge VSV - ECM) • ECM • Canister pump module • Leakage from EVAP system	While ignition switch OFF	2 trip
P0441	Purge VSV stuck closed	After EVAP leak check performed, purge VSV turned ON (open), and atmospheric air introduced into EVAP system. 0.02 inch leak criterion measured at start and at end of the check. If pressure does not return to near atmospheric pressure, ECM determines that purge VSV stuck closed	• Purge VSV • Connector/wire harness (Purge VSV - ECM) • ECM • Canister pump module • Leakage from EVAP system	While ignition switch OFF	2 trip
P0441	Purge flow	While engine running, following conditions successively met: • Negative pressure not created in EVAP system when purge VSV turned ON (open) • EVAP system pressure change less than 0.5 kPa (3.75 mmHg) when vent valve turned ON (closed) • Atmospheric pressure change before and after purge flow monitor less than 0.1 kPa (0.75 mmHg)	• Purge VSV • Connector/wire harness (Purge VSV - ECM) • Leakage from EVAP line (Purge VSV - Intake manifold) • ECM	While engine running	2 trip

DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) System (see page ES-392).

Refer to the EVAP System (see page ES-397).

MONITOR DESCRIPTION

The two monitors, Key-Off and Purge Flow, are used to detect malfunctions relating to DTC P0441. The Key-Off monitor is initiated by the ECM internal timer, known as the soak timer, 5 hours* after the ignition switch is turned to OFF. The purge flow monitor runs while the engine is running.

1. KEY-OFF MONITOR

   5 hours* after the ignition switch is turned to OFF, the electric leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

   HINT:

   *: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned to OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak criterion (reference pressure) measurement	In order to determine 0.02 inch leak criterion, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as they will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds

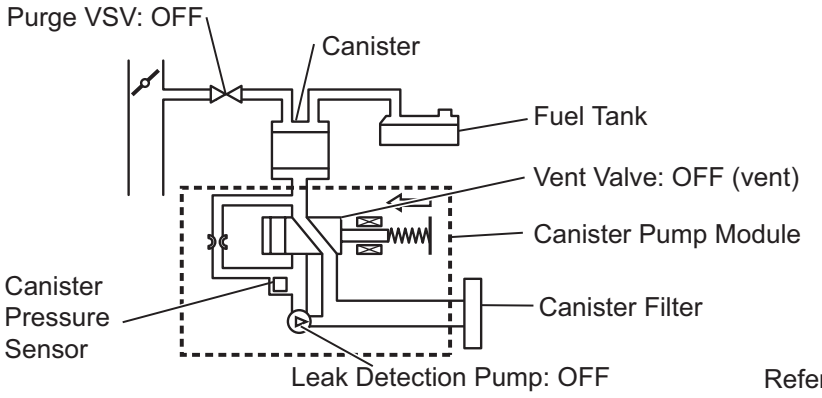
Sequence	Operations	Descriptions	Duration
E	Second 0.02 inch leak criterion (reference pressure) measurement	After second 0.02 inch leak criterion measurement, leak check performed by comparing first and second 0.02 inch leak criterion. If stabilized system pressure higher than second 0.02 inch leak criterion, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

HINT:

* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

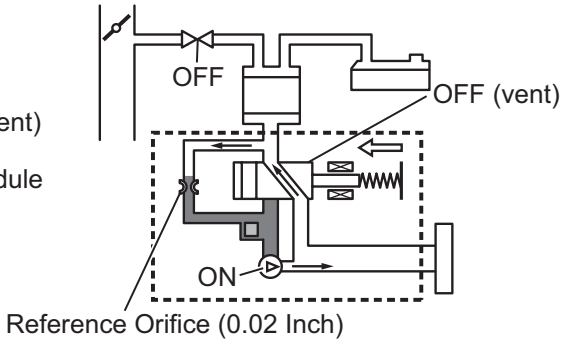
ES

Operation A: Atmospheric Pressure Measurement

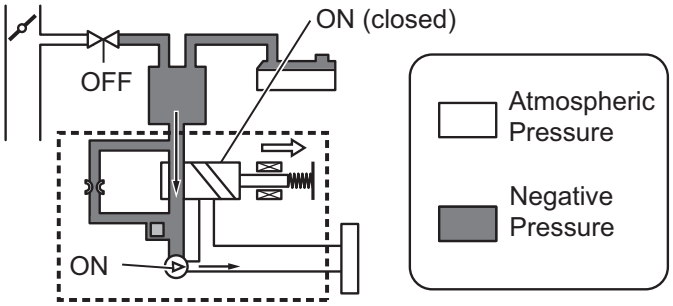


Operation B, E:

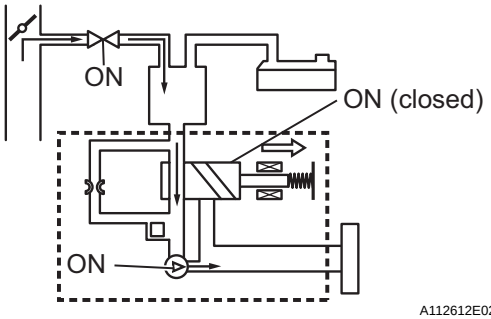
0.02 Inch Leak Criterion Measurement



Operation C: EVAP System Pressure Measurement



Operation D: Purge VSV Monitor

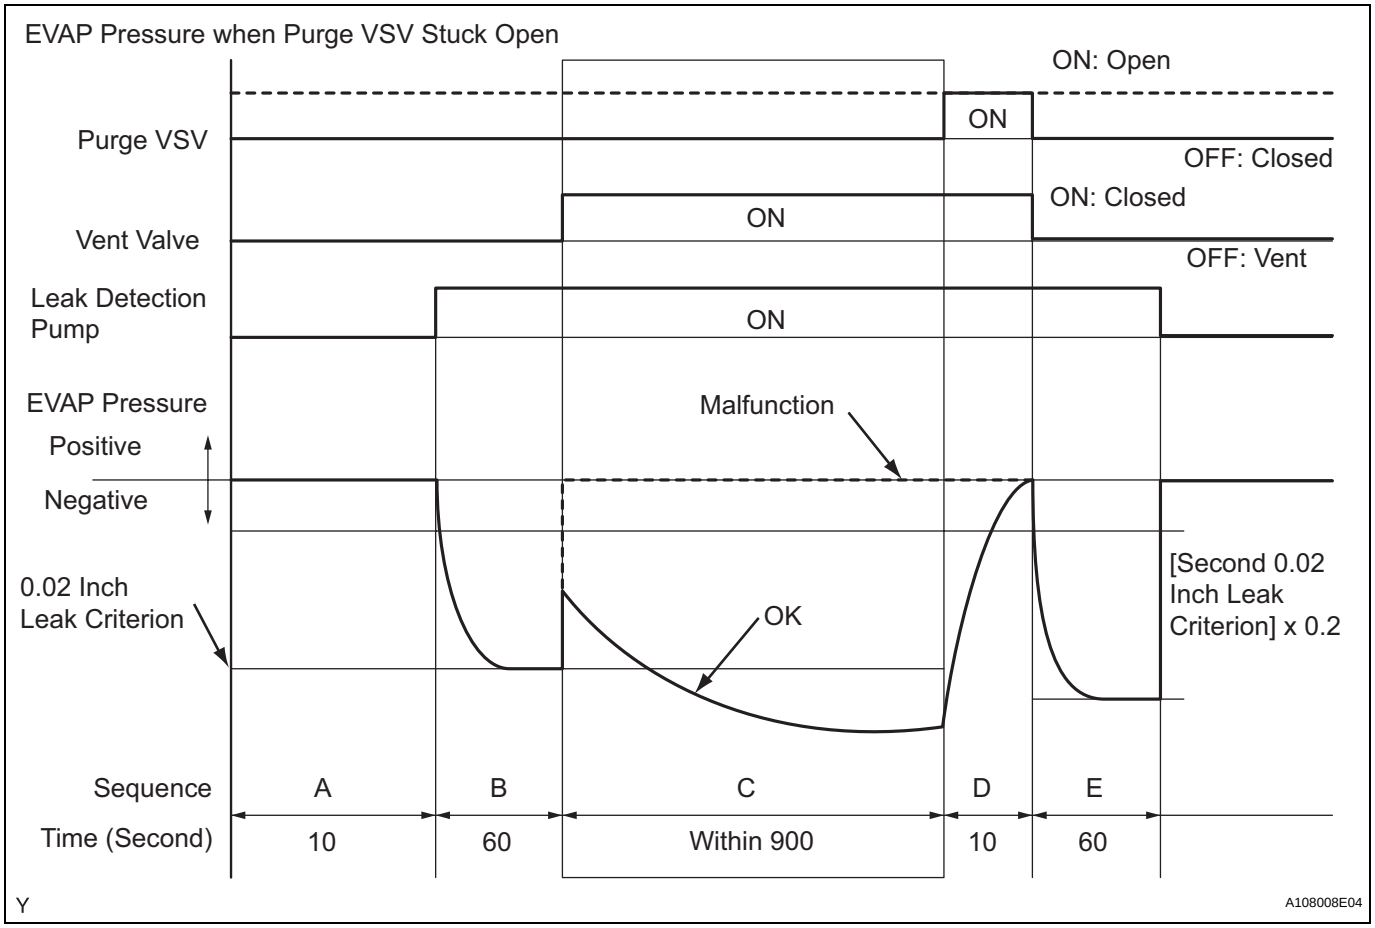


Y

A112612E02

(a) Purge VSV stuck open

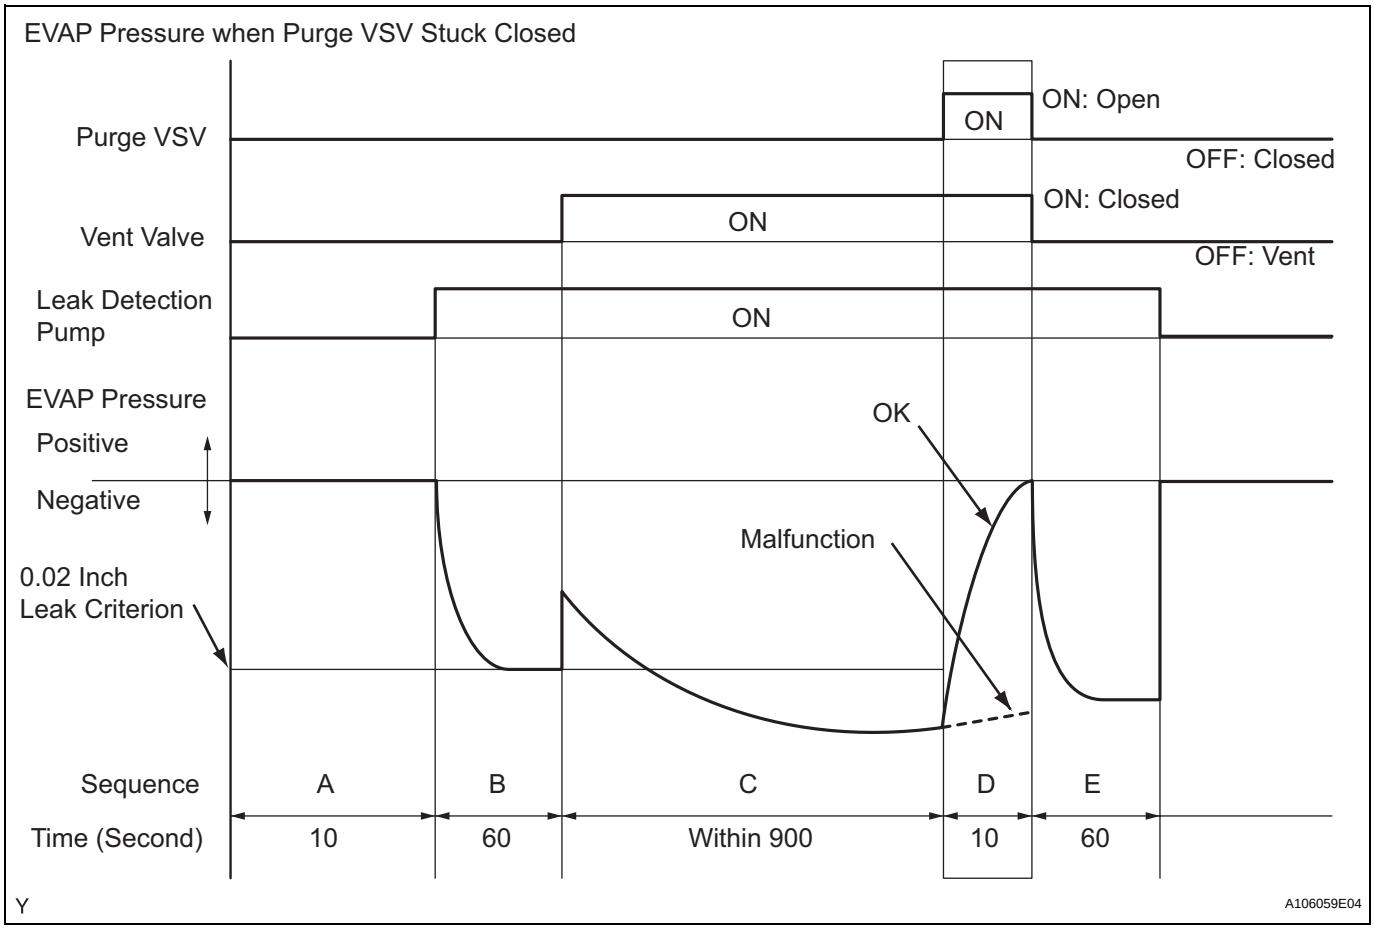
In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The EVAP system pressure is then measured by the ECM using the canister pressure sensor. If the stabilized system pressure is higher than [second 0.02 inch leak criterion x 0.2], the ECM interprets this as the purge VSV (Vacuum Switching Valve) being stuck open. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).



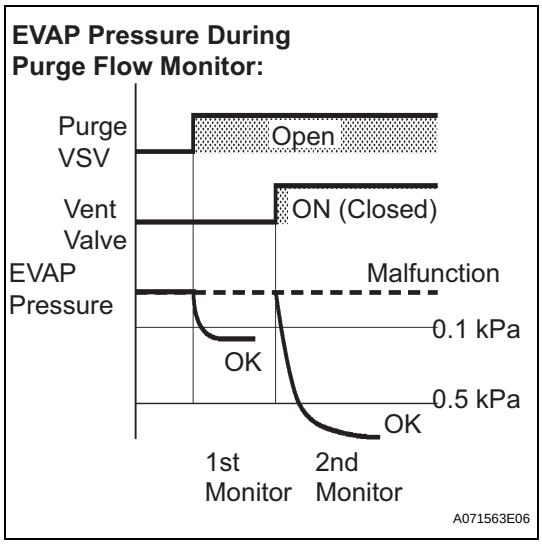
ES

(b) Purge VSV stuck closed

In operation D, the canister pressure sensor measures the EVAP (Evaporative Emission) system pressure. The pressure measurement for purge VSV monitor is begun when the purge VSV is turned ON (open) after the EVAP leak check. When the measured pressure indicates an increase of 0.3 kPa (2.25 mmHg) or more, the purge VSV is functioning normally. If the pressure does not increase, the ECM interprets this as the purge VSV being stuck closed. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).



2. PURGE FLOW MONITOR



The purge flow monitor consists of the two step monitors. The 1st monitor is conducted every time and the 2nd monitor is activated if necessary.

- The 1st monitor
  While the engine is running and the purge VSV (Vacuum Switching Valve) is ON (open), the ECM monitors the purge flow by measuring the EVAP pressure change. If negative pressure is not created, the ECM begins the 2nd monitor.
- The 2nd monitor
  The vent valve is turned ON (closed) and the EVAP pressure is then measured. If the variation in the pressure is less than 0.5 kPa (3.75 mmHg), the ECM interprets this as the purge VSV being stuck closed, and illuminates the MIL and sets DTC P0441 (2 trip detection logic).

Atmospheric pressure check:
In order to ensure reliable malfunction detection, the variation between the atmospheric pressures, before and after conduction of the purge flow monitor, is measured by the ECM.

OBD II MONITOR SPECIFICATIONS

1. Key-off Monitor

Monitor Strategy

Required Sensors/Components	Purge VSV and Canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 15 minutes (varies with fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

Typical Enabling Conditions

Monitor runs whenever following DTCs not present	None
EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa (525 to 825 mmHg)
Battery voltage	10.5 V or more
Vehicle speed	Below 2.5 mph (4 km/h)
Ignition switch	OFF
FTP sensor malfunction (P0450, P0451, P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of following conditions met before IG switch OFF	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. Purge flow	Executed
ECT	4.4° to 35°C (40° to 95°F)
IAT	4.4° to 35°C (40° to 95°F)
Time after engine stopped	5 hours

Example of restart time

First time	7 hours
Second time	9 hours and 30 minutes

2. Key-off monitor sequence 1 to 8

1. Atmospheric pressure

Next sequence is run if following condition set	-
Atmospheric pressure change for 10 second	Less than 0.3 kPa (2.25 mmHg) for 1 second

2. First reference pressure

Next sequence is run if all of following conditions set	Condition 1, 2 and 3
1. FTP when 4 seconds after reference pressure measurement	-1 kPa (-7.5 mmHg) or less
2. Reference pressure	-4.85 to -1.057 kPa (-33.38 to -7.93 mmHg)
3. Reference pressure	Saturated within 60 seconds

3. Vent valve stuck closed check

Next sequence is run if following condition set	-
FTP change for 10 seconds after vent valve ON (closed)	0.3 kPa (2.25 mmHg) or more

4. Vacuum introduction and leak

Next sequence is run if both of following conditions set	Condition 1 and 2
1. Vacuum introduction time	12 minutes or less
2. FTP	Saturated within 12 minutes

5. Purge VSV stuck closed check

Next sequence is run if following condition set	-
FTP change for 10 seconds after purge VSV ON (open)	0.3 kPa (2.25 mmHg) or more

6. Second reference pressure measurement

Next sequence is run if all of following conditions set	Condition 1, 2, 3 and 4
1. FTP when 4 seconds after reference pressure measurement	-1 kPa (-7.5 mmHg) or less
2. Reference pressure	-4.85 to -1.057 kPa (-36.4 to -7.92 mmHg)
3. Reference pressure	Saturated within 60 seconds
4. Reference pressure difference between first and second	0.7 kPa (5.25 mmHg) or less

7. Leak check

Next sequence is run if following condition set	-
FTP when vacuum introduction was complete	Second reference pressure or less

8. Atmospheric pressure

Monitor is complete if following condition set	-
Atmospheric pressure difference between sequence 1 and 8	0.3 kPa (2.25 mmHg) or less

Typical Malfunction Thresholds

Purge VSV stuck open	-
FTP when vacuum introduction complete	Higher than reference pressure x 0.2
Purge VSV stuck closed	-
FTP change for 10 seconds after purge VSV ON (open)	Less than 0.3 kPa (2.25 mmHg)

"Saturated" indicates that the EVAP pressure change is less than 0.1 kPa (0.75 mmHg) in 30 seconds.

DTC SUMMARY

DTC	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P0450	Canister pressure sensor voltage abnormal fluctuation	Sensor output rapidly fluctuates beyond upper and lower malfunction thresholds for 0.5 seconds.	• Canister pump module • ECM	• EVAP monitoring (ignition OFF) • Ignition ON	1 trip
P0451	Canister pressure sensor noise	Sensor output voltage fluctuates frequently in certain time period.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM	• EVAP monitoring (ignition OFF) • Engine running	2 trip
P0451	Canister pressure sensor voltage fixed	Sensor output voltage does not vary in certain time period.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM	• EVAP monitoring (ignition OFF)	2 trip
P0452	Canister pressure sensor voltage low	Sensor output less than 42.1 kPa for 0.5 seconds.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM	• Ignition ON • EVAP monitoring (ignition OFF)	1 trip
P0453	Canister pressure sensor voltage high	Sensor output more than 123.8 kPa for 0.5 seconds.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM	• Ignition ON • EVAP monitoring (ignition OFF)	1 trip

HINT:
The canister pressure sensor is built into the canister pump module.

DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) System (see page ES-392).

MONITOR DESCRIPTION

1. DTC P0450: Canister pressure sensor output abnormal fluctuation
   If the canister pressure sensor output rapidly fluctuates between less than 42.1 kPa and more than 123.8 kPa, the ECM interprets this as an open or short circuit malfunction in the canister pressure sensor or its circuit, and stops the EVAP (Evaporative Emission) system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).
2. DTC P0451: Canister pressure sensor noise or stuck
   If the canister pressure sensor voltage output fluctuates rapidly for 10 seconds, the ECM stops the EVAP system monitor. The ECM interprets this as noise from the canister pressure sensor, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC.
   Alternatively, if the sensor voltage output does not change for 10 seconds, the ECM interprets this as the sensor being stuck, and stops the monitor. The ECM then illuminates the MIL and sets the DTC. (Both the malfunctions are detected by 2 trip detection logic).
3. DTC P0452: Canister pressure sensor output low
   If the canister pressure sensor output is below 42.1 kPa, the ECM interprets this as an open or short circuit malfunction in the canister pressure sensor or its circuit, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).
4. DTC P0453: Canister pressure sensor output high
   If the canister pressure sensor output is 123.8 kPa or more, the ECM interprets this as an open or short circuit malfunction in the canister pressure sensor or its circuit, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).

MONITOR STRATEGY

Required Sensors/Components	Canister pump module
Frequency of Operation	Once per driving cycle: P0451 sensor fixed Continuous: P0451 sensor noise, P0450, P0452 and P0453
Duration	-
MIL Operation	Immediate: P0450, P0452 and P0453 2 driving cycles: P0451
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

P0451 (Noise monitor):

Monitor runs whenever these DTCs not present	None
Atmospheric pressure (absolute pressure)	70 kPa (525 mmHg) or more, less than 110 kPa (825 mmHg)
Battery voltage	10.5 V or more
Intake air temperature	4.4°to 35°C (40° to 95°F)
Either of following conditions met	A or B
A. Engine	Running
B. Soak time (ignition switch OFF time)	5 hours

Example of restart time

First time	7 hours
Second time	9 hours and 30 minutes

P0451 (Stuck monitor):

Monitor runs whenever these DTCs not present	None
Atmospheric pressure (absolute pressure)	Less than 70 kPa (525 mmHg), or 110 kPa (825 mmHg) or more
Battery voltage	10.5 V or more
Intake air temperature	4.4°to 35°C (40° to 95°F)
Soak time (ignition switch OFF time)	5 hours

Example of restart time

First time	7 hours
Second time	9 hours and 30 minutes

P0450, P0452 and P0453:

Monitor runs whenever these DTCs not present	None
Either of following conditions met	(a) or (b)
(a) Ignition switch	ON
(b) Soak timer	ON

TYPICAL MALFUNCTION THRESHOLDS

P0450: Canister pressure sensor chattering	-
Canister pressure sensor output	Less than 42.1 kPa, or more than 123.8 kPa

ES

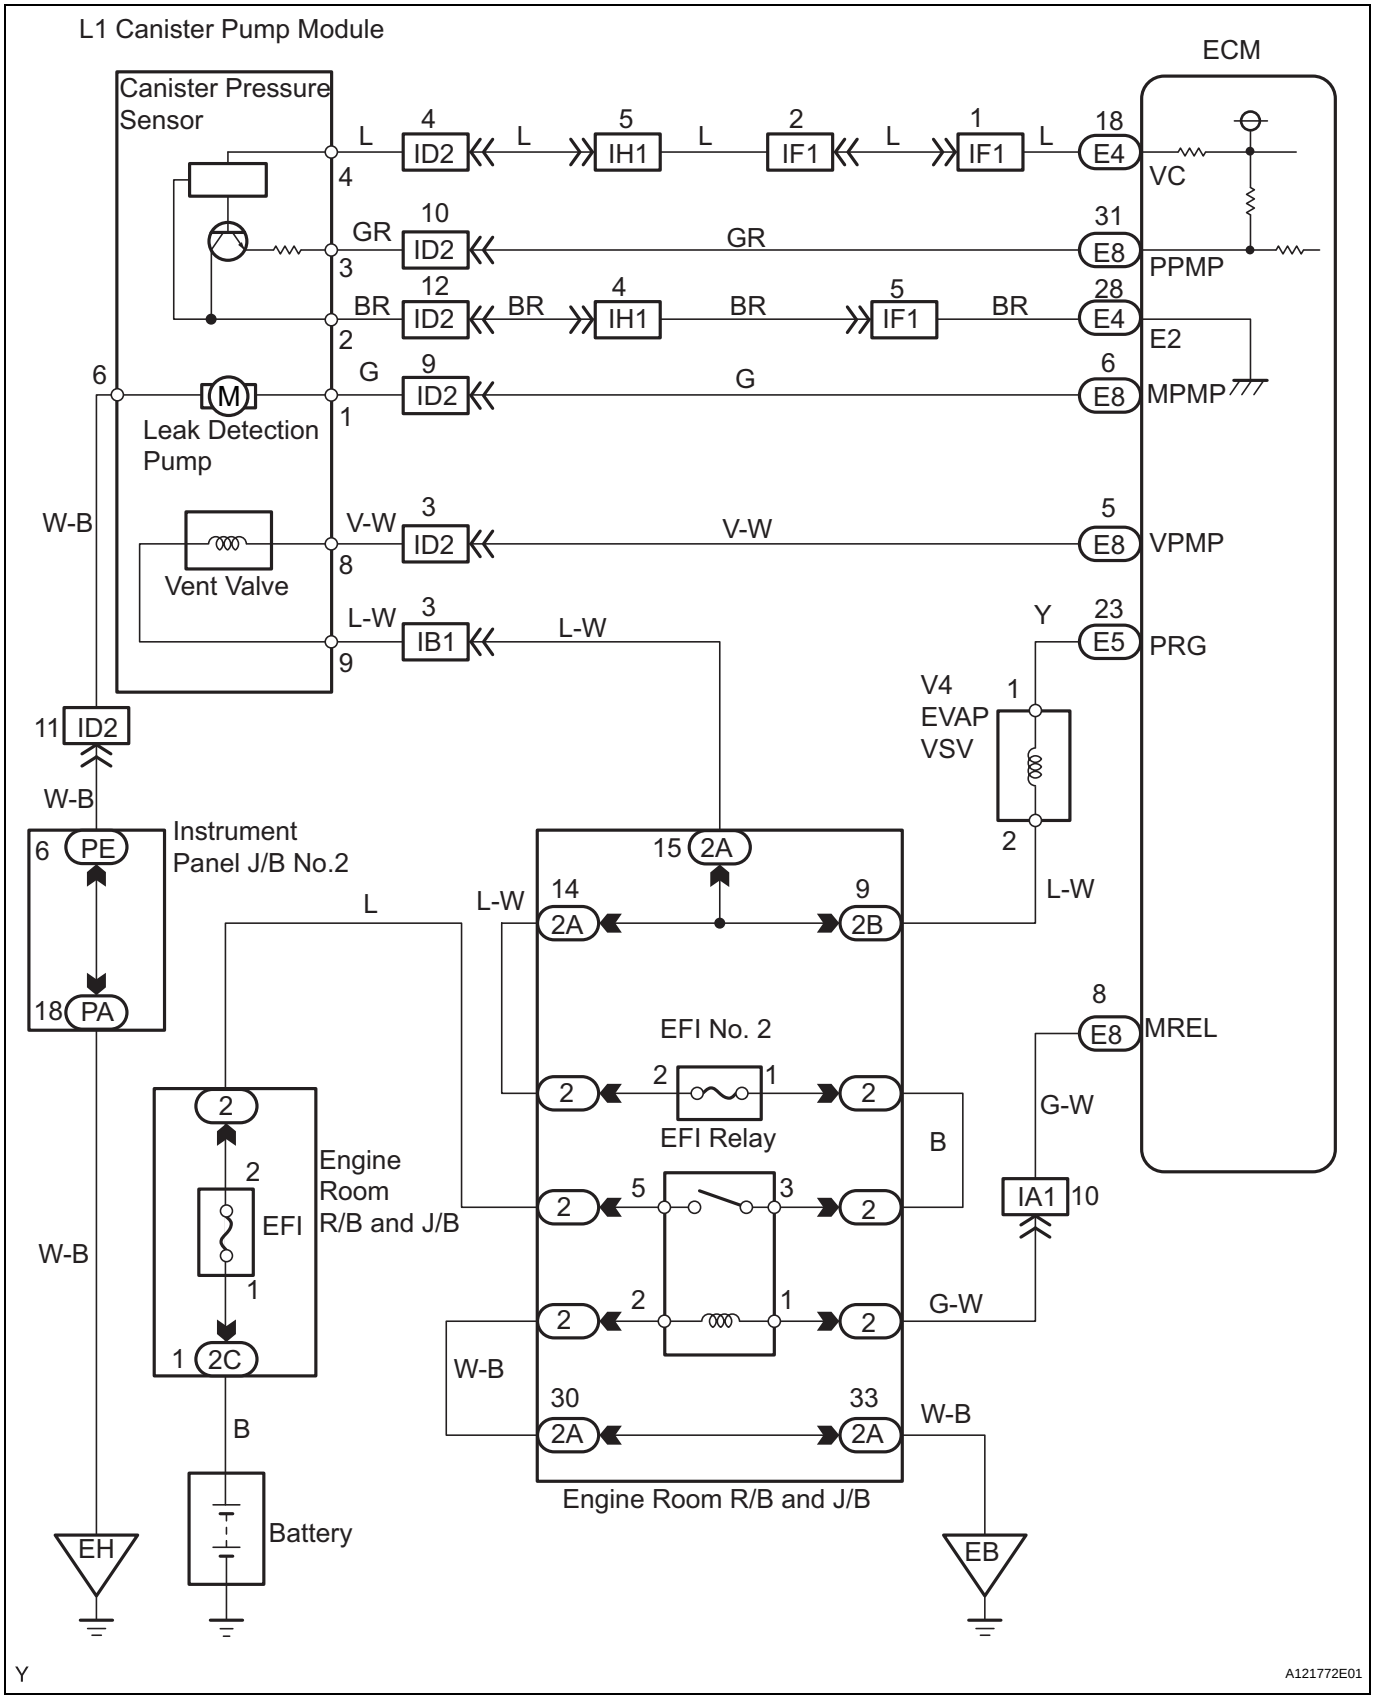
P0451: Canister pressure sensor noise	-
Pressure variation indicated by Canister pressure sensor in 10 seconds	More than +- 0.3 kPa (+- 2.25 mmHg) 10 times

P0451: Canister pressure sensor fixed	-
0.02 inch leak criterion variation indicated by canister pressure sensor in 10 seconds	Less than 0.65 kPa (4.87 mmHg)

P0452: Canister pressure sensor low	-
Canister pressure sensor output	Less than 42.1 kPa

P0453: Canister pressure sensor high	-
Canister pressure sensor output	More than 123.8 kPa

WIRING DIAGRAM



NOTICE:

- **When a vehicle is brought into the workshop, leave it as it is. Do not change the vehicle condition. For example, do not tighten the fuel tank cap.**

- **Do not disassemble the canister pump module.**
- **An intelligent tester is required to conduct the following diagnostic troubleshooting procedure.**

1	CONFIRM DTC AND EVAP PRESSURE

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON (do not start the engine).
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / EVAP / VAPOR PRESS.
(g) Read the EVAP (Evaporative Emission) pressure displayed on the tester.

ES

Result

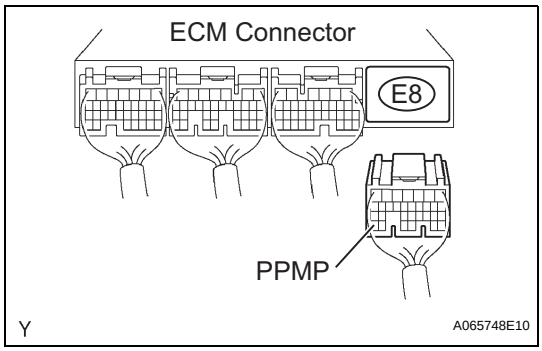
Display (DTC Output)	Test Results	Suspected Trouble Areas	Proceed To
P0451	-	Canister pressure sensor	C
P0452	Less than 45 kpa (430 mmHg)	• Wire harness/connector (ECM - Canister pressure sensor) • Canister pressure sensor • Short in ECM circuit	A
P0453	More than 120 kPa (900 mmHg)	• Wire harness/connector (ECM - Canister pressure sensor) • Canister pressure sensor • Open in ECM circuit	B

B → **Go to step 4**

C → **GO TO EVAP SYSTEM (EVAP SYSTEM INSPECTION PROCEDURE)**

A

2	CHECK HARNESS AND CONNECTOR (CANISTER PUMP MODULE - ECM)



(a) Turn the ignition switch to OFF.
(b) Disconnect the E8 ECM connector.
(c) Measure the resistance between PPMP terminal of the ECM connector and the body ground.

Result

Test Results	Suspected Trouble Areas	Proceed To
10 Ω or less	• Wire harness/connector (ECM - Canister pressure sensor) • Short in canister pressure sensor circuit	A
10 kΩ or more	• Wire harness/connector (ECM - Canister pressure sensor) • Short in ECM circuit	B

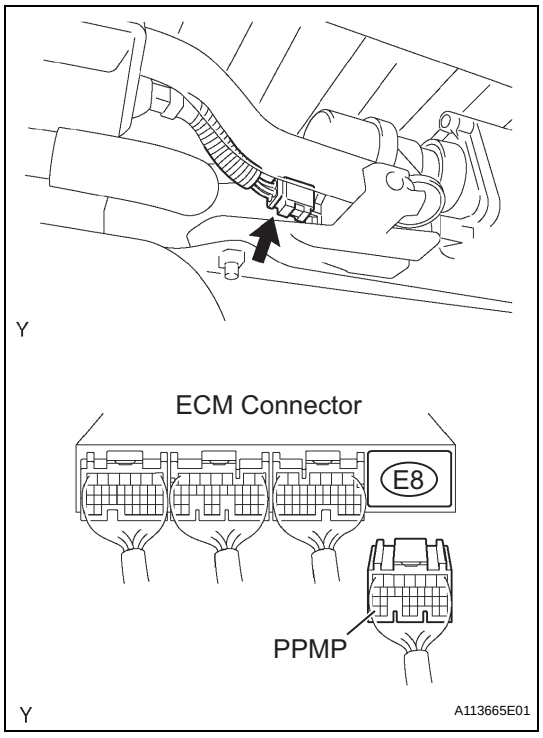
(d) Reconnect the ECM connector.

B → **Go to step 7**

A

ES

3 CHECK HARNESS AND CONNECTOR (CANISTER PUMP MODULE - ECM)



(a) Disconnect the L1 canister connector.
(b) Disconnect the E8 ECM connector.
(c) Check the resistance between PPMP terminal of the ECM connector and the body ground.

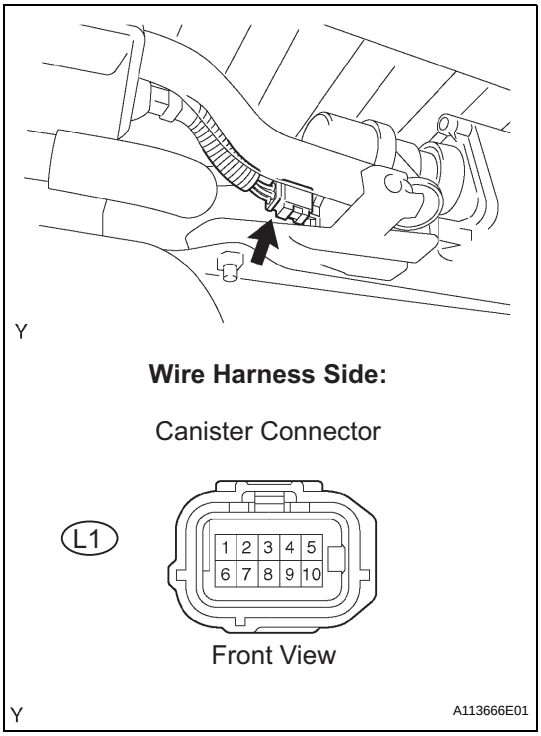
Result

Test Results	Suspected Trouble Areas	Proceed To
10 kΩ or more	Short in canister pressure sensor circuit	A
10 Ω or less	Short in wire harness/connector (ECM - Canister pressure sensor)	B

A → **Go to step 5**

B → **Go to step 6**

4	CHECK HARNESS AND CONNECTOR (CANISTER PUMP MODULE - ECM)



(a) Disconnect the L1 canister connector.
(b) Turn the ignition switch to ON.
(c) Measure the voltage and resistance of the canister connector.

Standard Voltage and Standard Resistance

Tester Connections	Specified Conditions
L1-4 - Body ground	4.5 to 5.0 V
L1-3 - Body ground	4.5 to 5.0 V
L1-2 - Body ground	100 Ω or less

Result

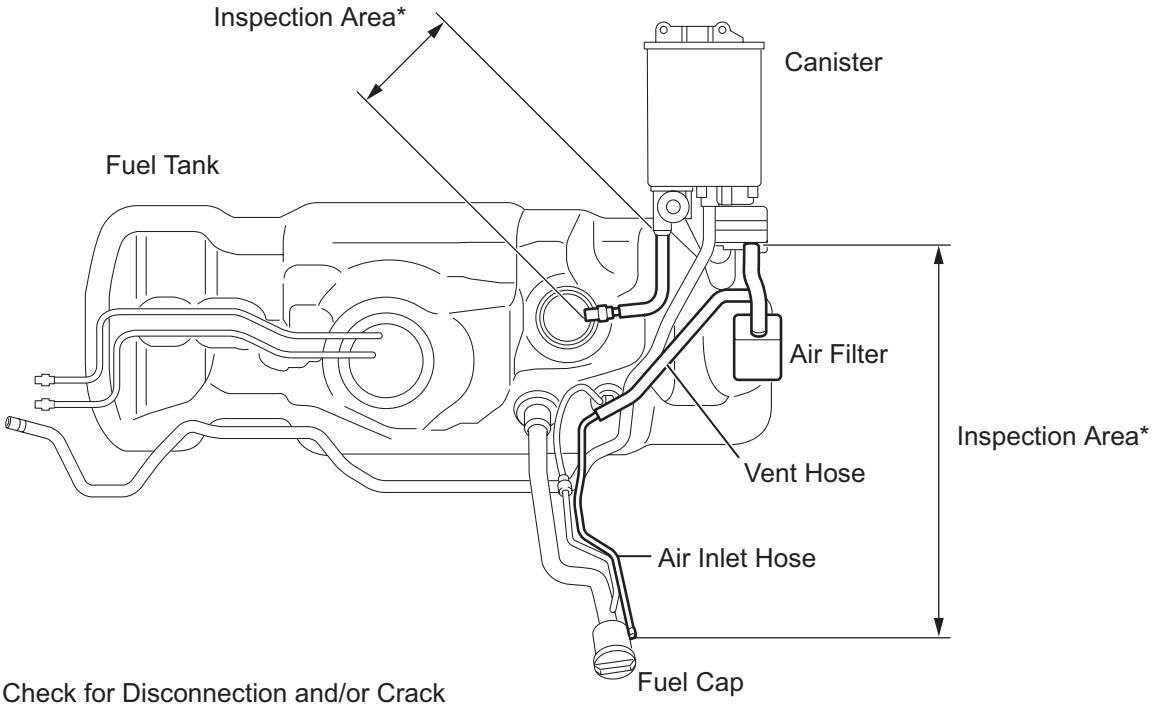
Test Results	Suspected Trouble Areas	Proceed To
Voltage and resistance within standard ranges	Open in canister pressure sensor circuit	A
Voltage and resistance outside standard ranges	Open in wire harness/connector (ECM - Canister pressure sensor)	B

(d) Reconnect the canister connector.

A	Go to step 5
B	Go to step 6

5	REPLACE CHARCOAL CANISTER ASSEMBLY

(a) Replace the canister assembly.



NOTICE:
When replacing the canister, check the canister pump module interior and related pipes for water, fuel or other liquids. If liquids are present, check for disconnections and/or cracks in the following: 1) the pipe from the air inlet port to the canister pump module; 2) the canister filter; and 3) the fuel tank vent hose.

NEXT	Go to step 8

6	REPAIR OR REPLACE WIRE HARNESS AND CONNECTOR

HINT:
If the exhaust tail pipe has been removed, go to the next step before reinstalling it.

NEXT	Go to step 8

7	REPLACE ECM

(a) Replace the ECM (See page ES-467).

NEXT	Go to step 8

8	CHECK WHETHER DTC OUTPUT RECURS (AFTER REPAIR)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Wait for at least 60 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO/ PENDING CODES.
HINT:
If no pending DTC is displayed on the tester, the repair has been successfully completed.

NEXT

ES

COMPLETED

DTC	P0455	Evaporative Emission Control System Leak Detected (Gross Leak)

DTC	P0456	Evaporative Emission Control System Leak Detected (Very Small Leak)

DTC SUMMARY

DTC	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P0455	EVAP gross leak	Leak detection pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. 0.02 inch leak criterion measured at start and at end of leak check. If stabilized pressure higher than [second 0.02 inch leak criterion x 0.2], ECM determines that EVAP system has large leakage.	• Fuel cap (loose) • Leakage from EVAP line (Canister - Fuel tank) • Leakage from EVAP line (Purge VSV - Canister) • Canister pump module • Leakage from fuel tank • Leakage from canister	While ignition switch OFF	2 trip
P0456	EVAP small leak	Leak detection pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. 0.02 inch leak criterion measured at start and at end of leak check. If stabilized pressure higher than second 0.02 inch leak criterion, ECM determines that EVAP system has small leakage.	Same above	While ignition switch OFF	2 trip

DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) System (see page ES-392).

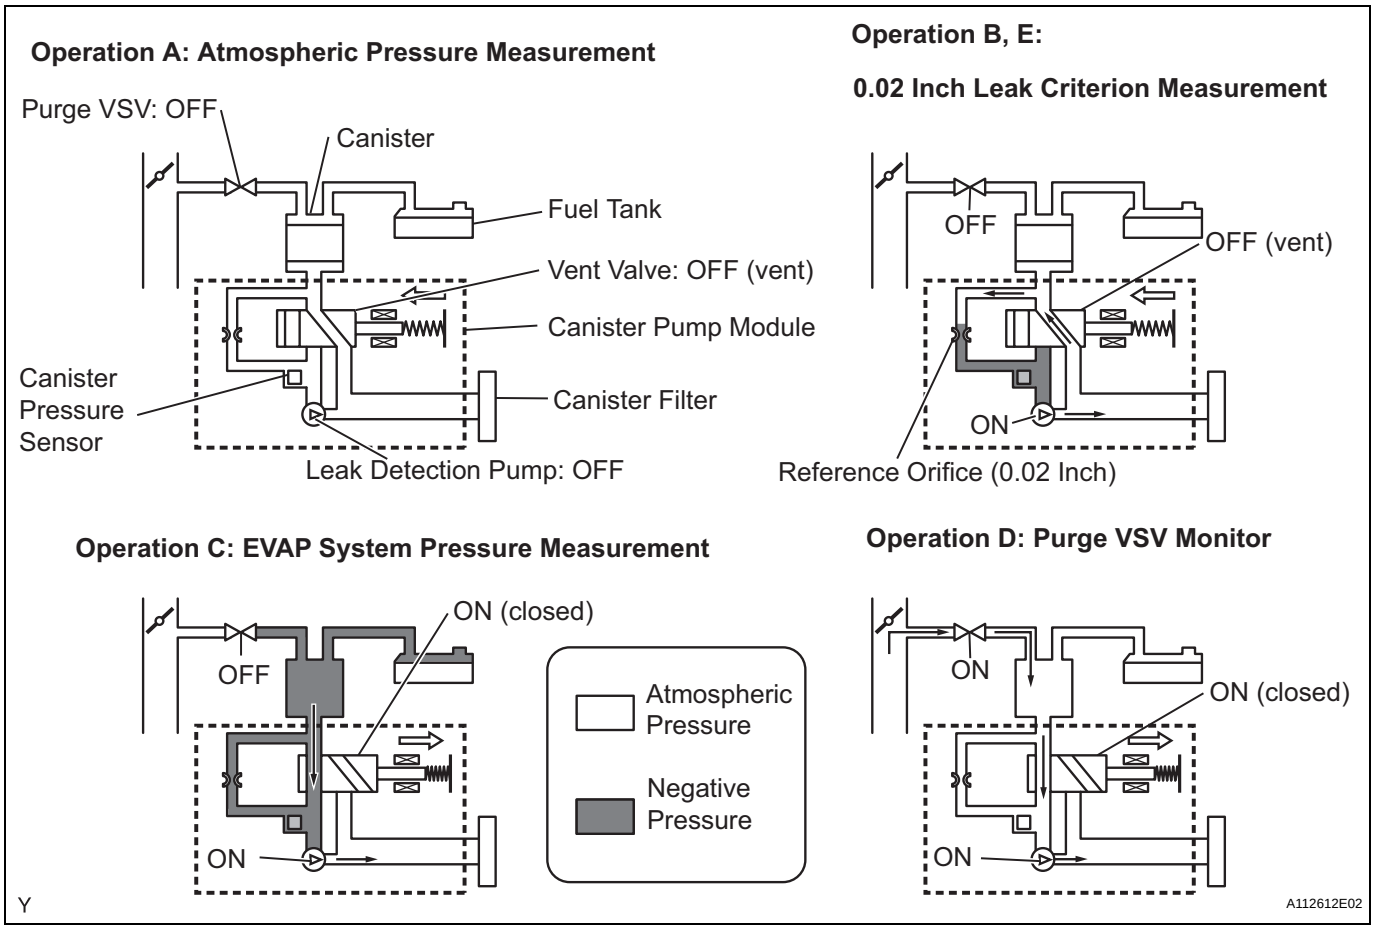
Refer to the EVAP System (see page ES-397).

MONITOR DESCRIPTION

5 hours* after the ignition switch is turned to OFF, the electric leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.
HINT:
*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned to OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak criterion (reference pressure) measurement	In order to determine 0.02 inch leak criterion, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as they will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak criterion (reference pressure) measurement	After second 0.02 inch leak criterion measurement, leak check performed by comparing first and second 0.02 inch leak criterion. If stabilized system pressure higher than second 0.02 inch leak criterion, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

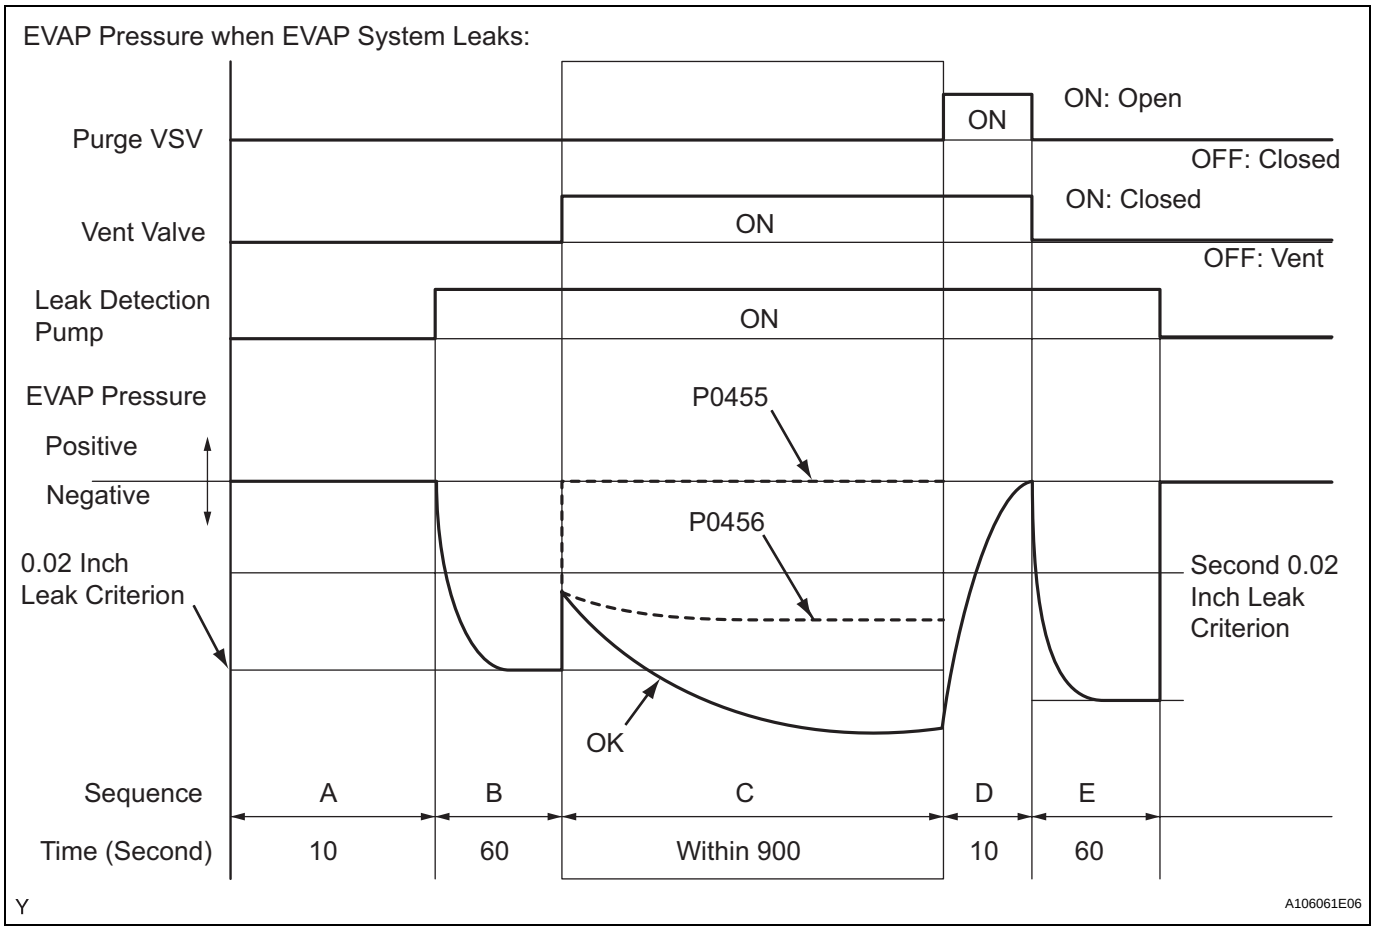
* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.



ES

1. P0455: EVAP (Evaporative Emission) gross leak
   In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP system and the EVAP system pressure is measured. If the stabilized system pressure is higher than [second 0.02 inch leak criterion x 0.2] (near atmospheric pressure), the ECM determines that the EVAP system has a large leakage, illuminates the MIL and sets the DTC (2 trip detection logic).

2. P0456: EVAP very small leak
In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP system and the EVAP system pressure is measured. If the stabilized system pressure is higher than second 0.02 inch leak criterion, the ECM determines that the EVAP system has a small leakage, illuminates the MIL and sets the DTC (2 trip detection logic).



MONITOR STRATEGY

Required Sensors/Components	Purge VSV and Canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 15 minutes (varies with amount of fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa (525 to 825 mmHg)
Battery voltage	10.5 V or more
Vehicle speed	Below 2.5 mph (4 km/h)
Ignition switch	OFF
FTP sensor malfunction (P0450, P0451, P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool

Both of following conditions met before IG switch OFF	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. Purge flow	Executed
ECT	4.4° to 35°C (40° to 95°F)
IAT	4.4° to 35°C (40° to 95°F)
Time after engine stopped	5 hours

Example of restart time

First time	7 hours
Second time	9 hours and 30 minutes

1. Key-off monitor sequence 1 to 8

1. Atmospheric pressure

Next sequence is run if following condition set	-
Atmospheric pressure change for 10 second	Less than 0.3 kPa (2.25 mmHg) for 1 second

ES

2. First reference pressure

Next sequence is run if all of following conditions set	Condition 1, 2 and 3
1. FTP when 4 seconds after reference pressure measurement	-1 kPa (-7.5 mmHg) or less
2. Reference pressure	-4.85 to -1.057 kPa (-33.38 to -7.93 mmHg)
3. Reference pressure	Saturated within 60 seconds

3. Vent valve stuck closed check

Next sequence is run if following condition set	-
FTP change for 10 seconds after vent valve ON (closed)	0.3 kPa (2.25 mmHg) or more

4. Vacuum introduction and leak

Next sequence is run if both of following conditions set	Condition 1 and 2
1. Vacuum introduction time	12 minutes or less
2. FTP	Saturated within 12 minutes

5. Purge VSV stuck closed check

Next sequence is run if following condition set	-
FTP change for 10 seconds after purge VSV ON (open)	0.3 kPa (2.25 mmHg) or more

6. Second reference pressure measurement

Next sequence is run if all of following conditions set	Condition 1, 2, 3 and 4
1. FTP when 4 seconds after reference pressure measurement	-1 kPa (-7.5 mmHg) or less
2. Reference pressure	-4.85 to -1.057 kPa (-36.4 to -7.92 mmHg)
3. Reference pressure	Saturated within 60 seconds
4. Reference pressure difference between first and second	0.7 kPa (5.25 mmHg) or less

7. Leak check

Next sequence is run if following condition set	-
FTP when vacuum introduction was complete	Second reference pressure or less

8. Atmospheric pressure

Monitor is complete if following condition set	-
Atmospheric pressure difference between sequence 1 and 8	0.3 kPa (2.25 mmHg) or less

2. Typical Malfunction Thresholds

"Saturated" indicates that the EVAP pressure change is less than 0.1 kPa (0.75 mmHg) in 30 seconds.

P0455: EVAP gross leak	-
FTP when vacuum introduction complete	Higher than reference pressure x 0.2

P0456: EVAP small leak	-
FTP when vacuum introduction complete	Between 1 and 2
Condition 1.	Higher than second reference pressure
Condition 2.	Lower than reference pressure x 0.2
Atmospheric pressure (absolute pressure)	70 kPa (525 mmHg) or more, and less than 110 kPa (825 mmHg)

MONITOR RESULT

Refer to Checking Monitor Status (See page ES-21) or (See page ES-422).

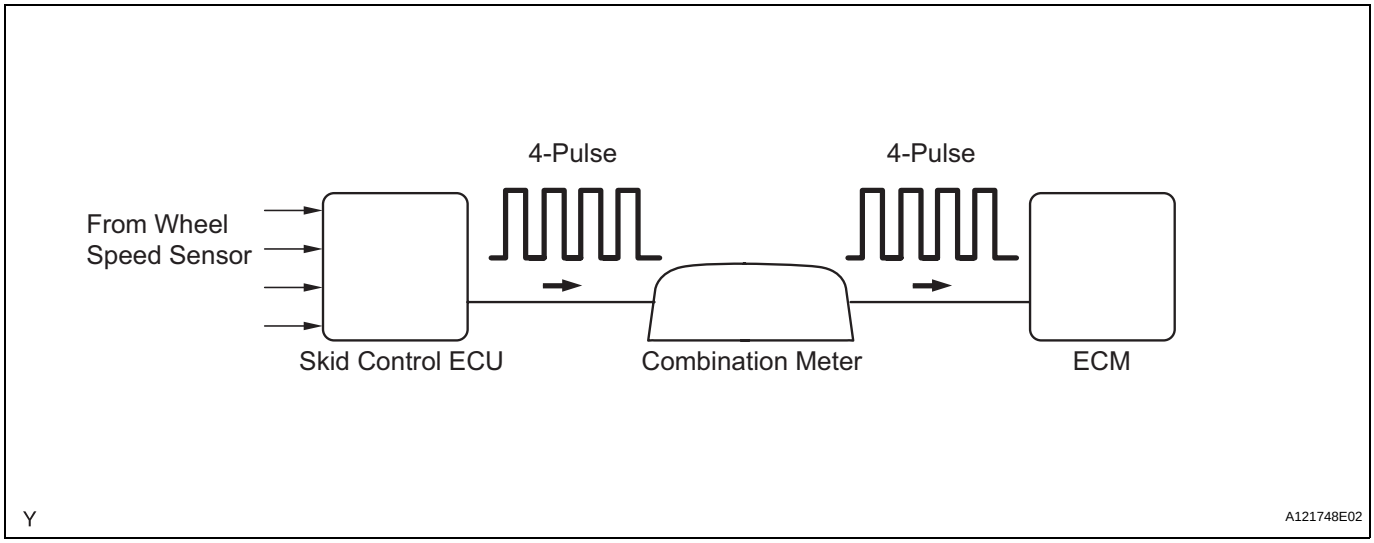
DTC	P0500	Vehicle Speed Sensor "A"

DTC	P0503	Vehicle Speed Sensor "A" Intermittent / Erratic / High

DESCRIPTION

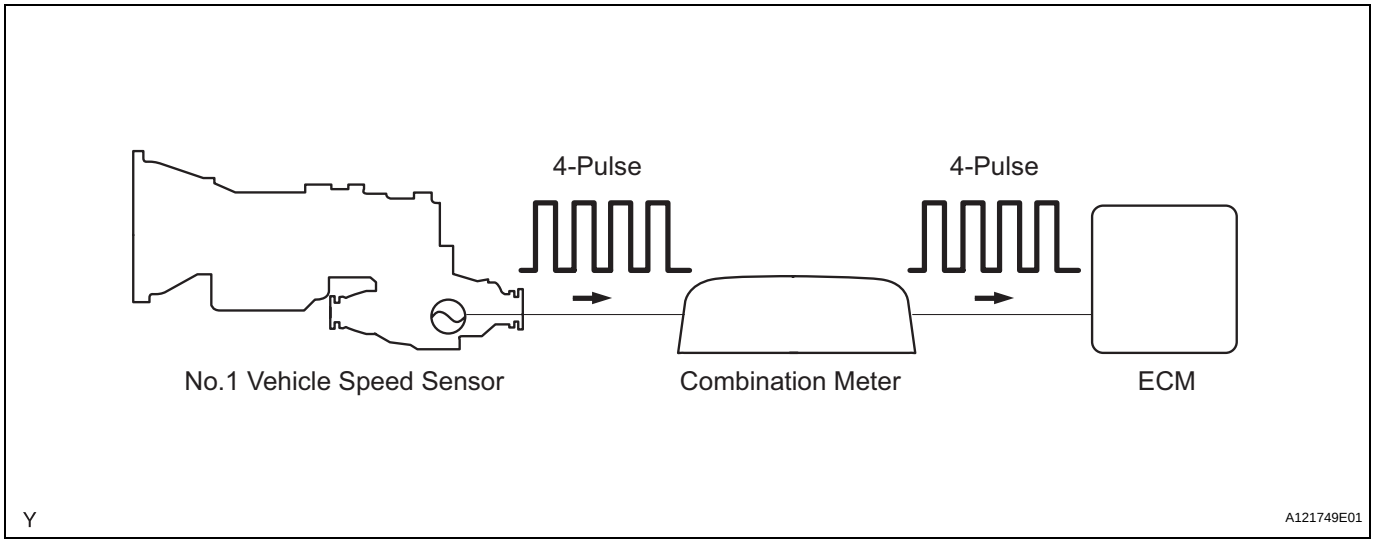
Automatic Transaxle Models:

Vehicles, which are equipped with ABS (Anti-lock Brake System), detect the vehicle speed using the skid control ECU and wheel speed sensor. The wheel speed sensor monitors the wheel rotation speed and sends a signal to the skid control ECU. The skid control ECU converts the wheel speed signal into a 4-pulse signal and transmits it to the ECM via the combination meter. The ECM determines the vehicle speed based on the frequency of the pulse signal.



Manual Transaxle Models:

Vehicles, which are equipped with manual transaxle, detect the vehicle speed using the No. 1 vehicle speed sensor. The No. 1 vehicle speed sensor transmits a 4-pulse signal for every revolution of the rotor shaft, which is rotated by the transaxle or transfer output shaft via the driven gear. The 4-pulse signal is converted into a more precise rectangular waveform by the waveform shaping circuit inside the combination meter. The signal is then transmitted to the ECM. The ECM determines the vehicle speed based on the frequency of the pulse signal.



DTC No.	DTC Detection Conditions	Trouble Areas
P0500	Automatic transmission: ECM detects following conditions simultaneously 500 times (1 trip detection logic) • No speed sensor signal while ECM detects No. 2 speed sensor signal • Vehicle speed 6 mph (9 km/h) or more for 4 seconds • Park/Neutral position switch OFF (shift lever other than P and N positions) Manual transmission: ECM detects following conditions simultaneously for 8 seconds or more (2 trip detection logic) • No speed sensor signal input • Engine speed 2,000 rpm or more • ECM detects high engine load • Transfer lever in other than N position (4WD)	• Open or short in speed signal circuit • Combination meter • ECM • Skid control ECU
P0503	Momentary interruption and noise are detected when a rapid change of vehicle speed occurs	• Open or short in speed signal circuit • Combination meter • ECM • Skid control ECU

ES

MONITOR DESCRIPTION

Automatic Transaxle Models:
The ECM assumes that the vehicle is being driven, while the vehicle speed sensor signal is being transmitted by the combination meter. If there is no signal from the combination meter, despite the ECM detecting the speed signal from the No. 2 speed sensor, the ECM interprets this as a malfunction in the speed signal circuit. The ECM then illuminates the MIL and sets the DTC.
Manual Transaxle Models:
The ECM assumes that the vehicle is being driven, when the indicated engine speed is more than 2,000 rpm and the engine load calculated by the ECM is more than certain level. If there is no signal from the vehicle speed sensor, despite these conditions being met, the ECM interprets this as a malfunction in the speed signal circuit. The ECM then illuminates the MIL and sets the DTC.

MONITOR STRATEGY

Related DTCs	P0500: Vehicle speed sensor "A" pulse input error
Required Sensors/Components (Main)	Vehicle Speed Sensor (VSS), Combination meter and Skid control ECU
Required Sensors/Components (Related)	Park/neutral Position (PNP) switch, Engine Coolant Temperature (ECT) sensor, Crankshaft Position (CKP) sensor and Mass Air Flow (MAF) meter
Frequency of Operation	Continuous
Duration	8 seconds: Manual transmission Conditions met 500 times: Automatic transmission
MIL Operation	2 driving cycles: Manual transmission 1 driving cycle: Automatic transmission
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

With Manual Transmission:

Engine coolant temperature	70°C (158°F) or more
Engine speed	2,000 rpm or more
Engine load	100 % when engine speed 2,000 rpm (threshold varies with engine speed)
Fuel cut at high engine speed	Not executing

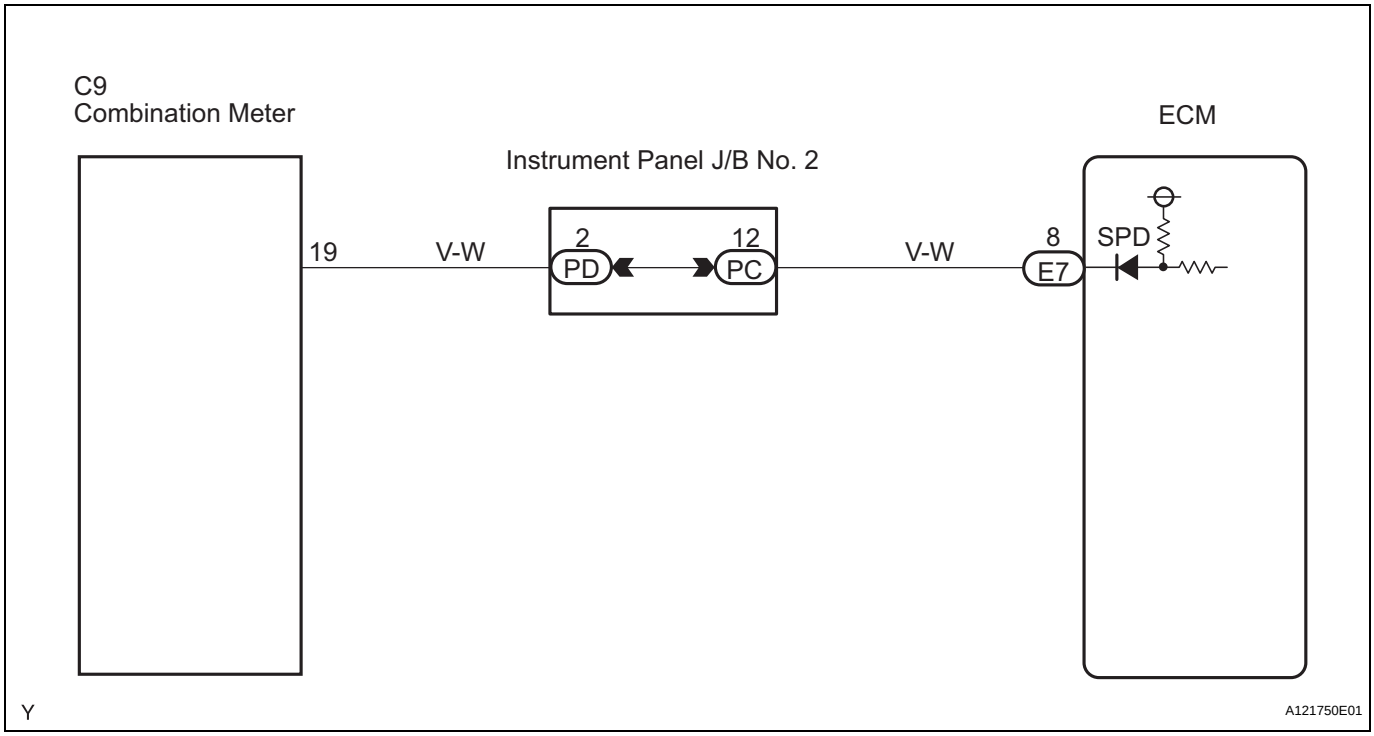
With Automatic Transmission:

Vehicle speed sensor output	48 pulses or more
Time after following conditions met:	4 seconds or more
Ignition switch	ON
Park/neutral position switch	OFF
Vehicle speed	5.59 mph (9 km/h)
Time after ignition switch turned to ON	0.5 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

Vehicle speed sensor signal	No pulse input

WIRING DIAGRAM



HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

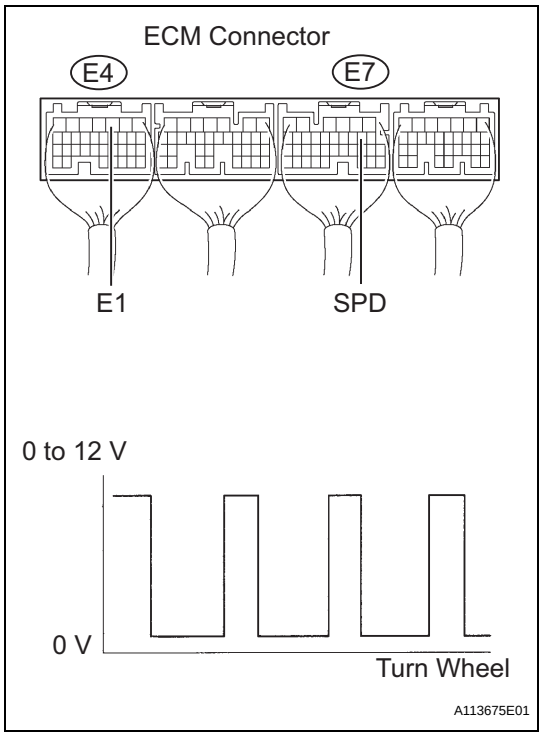
1	**CHECK OPERATION OF SPEEDOMETER**

(a) Drive the vehicle and check if the operation of the speedometer in the combination meter is normal.
HINT:
The vehicle speed sensor is operating normally if the speedometer reading is normal.

NG	**CHECK SPEEDOMETER CIRCUIT**

OK

2	INSPECT ECM (SPD VOLTAGE)



(a) Shift the transmission gear selector lever to the neutral position.
(b) Jack up the vehicle.
(c) Turn the ignition switch to ON.
(d) Check the voltage between the terminals of the ECM connectors as the wheel is turned slowly.

Standard Voltage

Tester Connections	Specified Conditions
SPD (E7-8) - E1 (E4-3)	Voltage generated intermittently

HINT:
The output voltage should fluctuate up and down similarly to the diagram on the left when the wheel is turned slowly.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

ES

DTC	P0504	Brake Switch "A" / "B" Correlation

DESCRIPTION

The stop light switch is a duplex system that transmits two signals: STP and ST1-. These two signals are used by the ECM to monitor whether or not the brake system is working properly. If the signals, which indicate the brake pedal is being depressed and released, are detected simultaneously, the ECM interprets this as a malfunction in the stop light switch and sets the DTC.

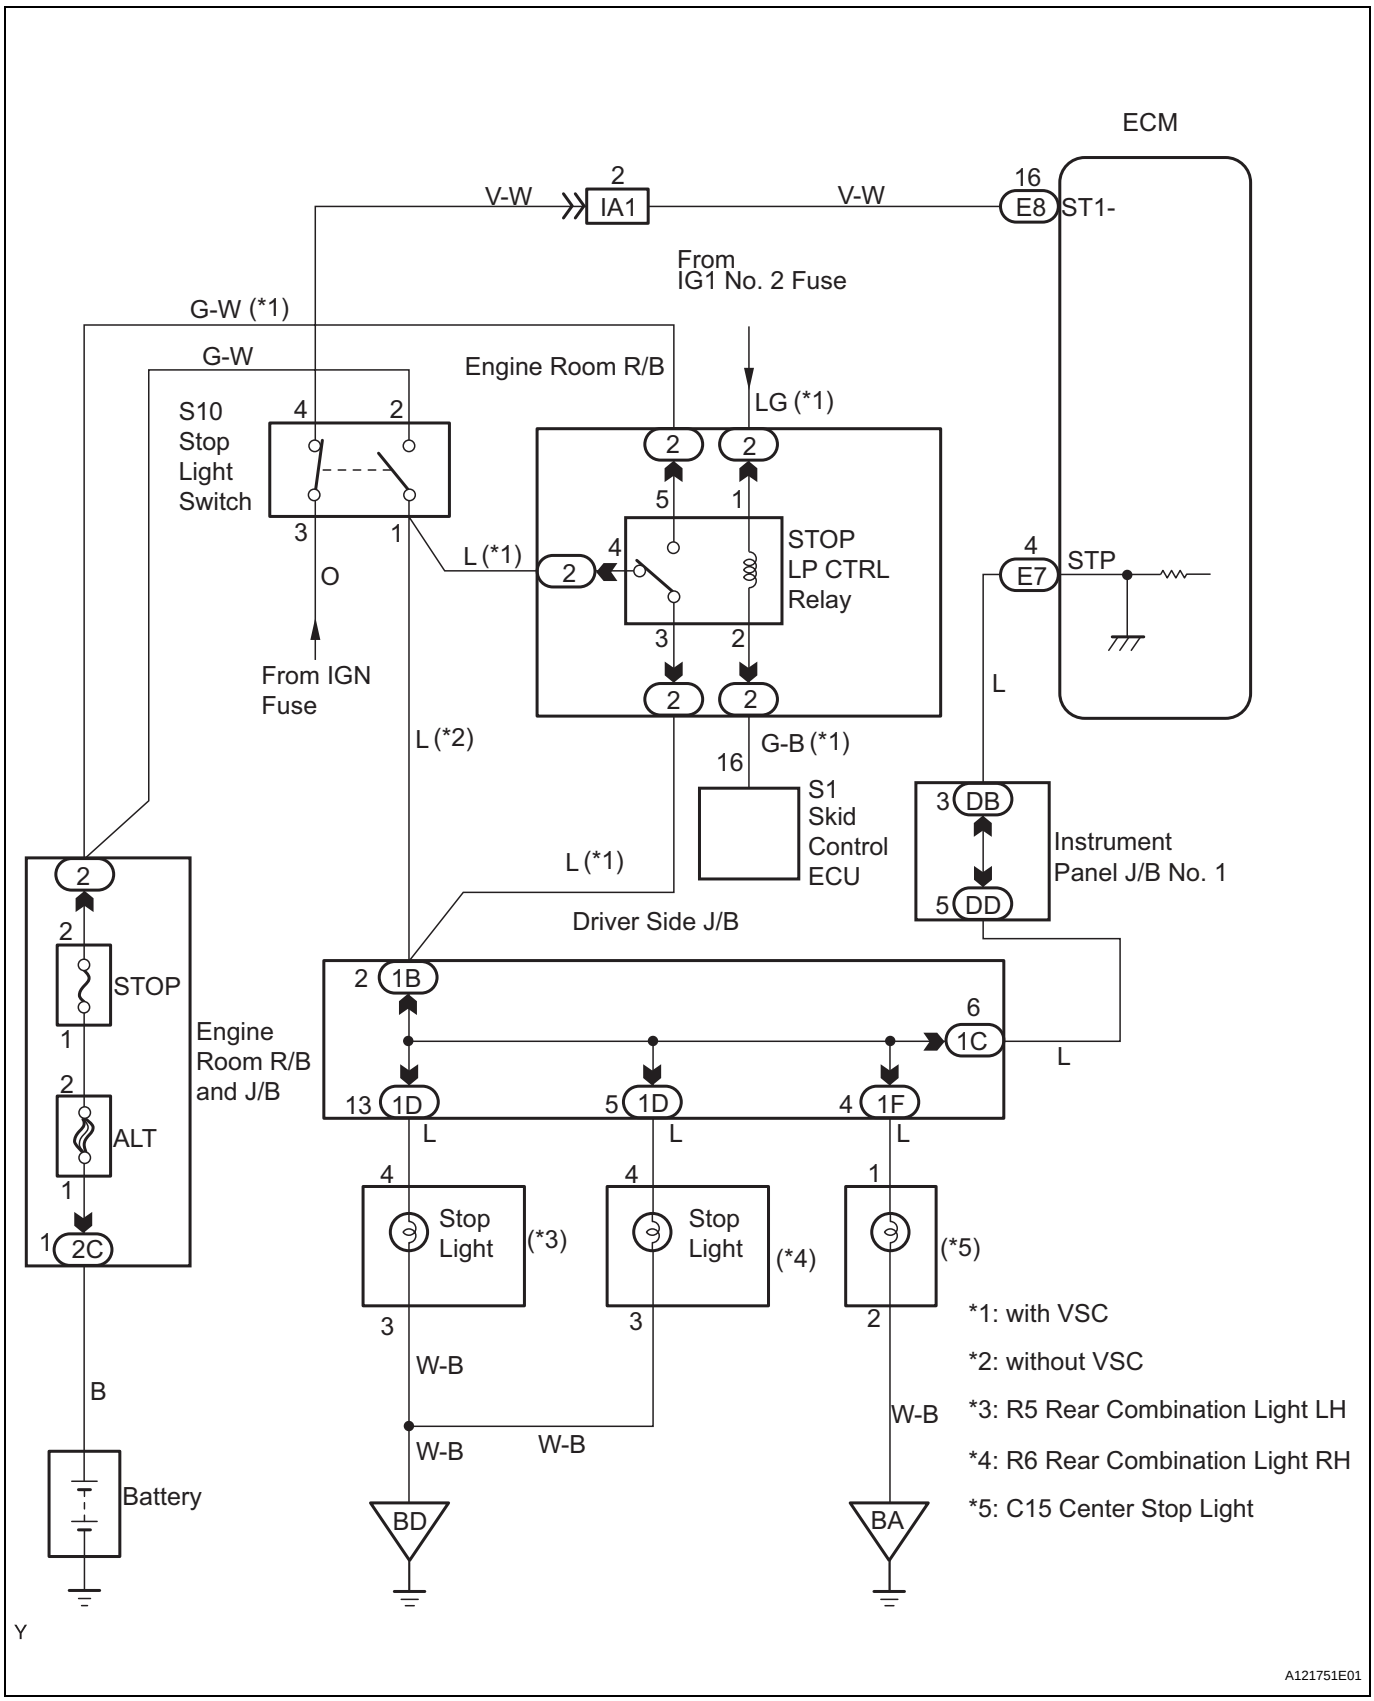
HINT:

The normal conditions are as shown in the table below. The signals can be read using an intelligent tester.

Signals	Brake Pedal Released	In Transition	Brake Pedal Depressed
STP	OFF	ON	ON
ST1-	ON	ON	OFF

DTC No.	DTC Detection Conditions	Trouble Areas
P0504	Conditions (a), (b) and (c) continue for 0.5 seconds or more (1 trip detection logic): (a) Ignition switch ON (b) Brake pedal released (c) STP signal OFF when ST1- signal OFF	• Short in stop light switch signal circuit • STOP fuse • Stop light switch • ECM

WIRING DIAGRAM



HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 CHECK OPERATION OF STOP LIGHT

(a) Check whether the stop lights turn on and off normally when the brake pedal is depressed and released.

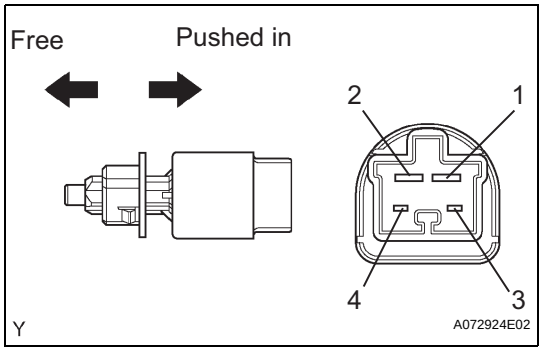
OK:

Stop lights turn ON when brake pedal is depressed.

NG → **REPAIR OR REPLACE STOP LIGHT SWITCH CIRCUIT**

OK

2 INSPECT STOP LIGHT SWITCH ASSEMBLY



(a) Remove the stop light switch assembly.

(b) Check the resistance.

Standard Resistance

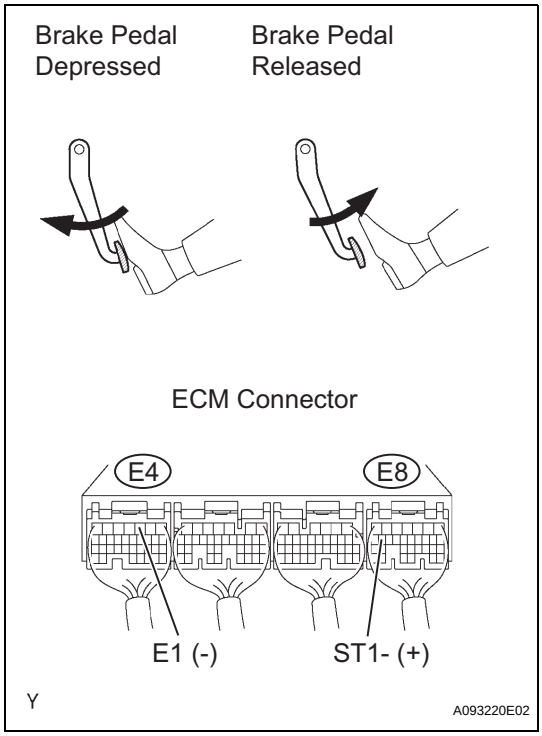
Switch Positions	Tester Connections	Specified Conditions
Switch pin free	1 - 2	Below 1 Ω
Switch pin free	3 - 4	10 kΩ or higher
Switch pin pushed in	1 - 2	10 kΩ or higher
Switch pin pushed in	3 - 4	Below 1 Ω

(c) Reinstall the stop light switch assembly.

NG → **REPLACE STOP LIGHT SWITCH ASSEMBLY**

OK

3 READ DATA LIST (STP SIGNAL AND ST1 - VOLTAGE)



(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STOP LIGHT SW.
(d) Check the STP signal when the brake pedal is depressed and released.

Standard

Brake Pedal Operations	Specified Conditions
Depressed	STP signal ON
Released	STP signal OFF

(e) Measure the voltage between the terminals of the ECM connectors.

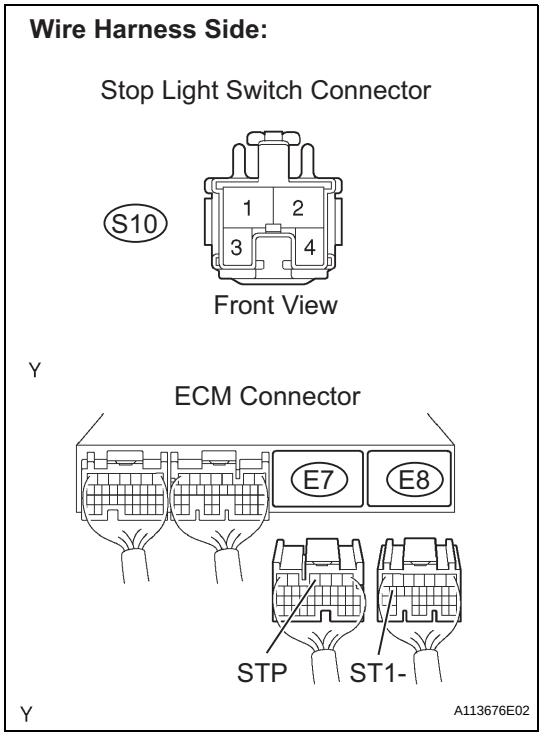
Standard Voltage

Tester Connections	Brake Pedal Operations	Specified Conditions
ST1- (E8-16) - E1 (E4-3)	Depressed	Below 1.5 V
ST1- (E8-16) - E1 (E4-3)	Released	7.5 to 14 V

OK → **CHECK FOR INTERMITTENT PROBLEMS**

NG

4 CHECK HARNESS AND CONNECTOR (STOP LIGHT SWITCH - ECM)



(a) Disconnect the S10 stop light switch connector.
(b) Disconnect the E7 and E8 ECM connectors.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
Stop light switch (S10-1) - STP (E7-4)	Below 1 Ω
Stop light switch (S10-4) - ST1- (E8-16)	Below 1 Ω

(d) Reconnect the stop light switch connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

DTC	P0505	Idle Control System Malfunction

DESCRIPTION

The idling speed is controlled by the ETCS (Electronic Throttle Control System). The ETCS is comprised of: 1) the one valve type throttle body; 2) the throttle actuator, which operates the throttle valve; 3) the Throttle Position (TP) sensor, which detects the opening angle of the throttle valve; 4) the Accelerator Pedal Position (APP) sensor, which detects the accelerator pedal position; and 5) the ECM, which controls the ETCS. Based on the target idling speed, the ECM controls the throttle actuator to provide the proper throttle valve opening angle.

DTC No.	DTC Detection Conditions	Trouble Areas
P0505	Idling speed continues to vary greatly from target idling speed (2 trip detection logic)	• Electronic Throttle Control System (ETCS) • Air induction system • PCV hose connection • ECM

ES

MONITOR DESCRIPTION

The ECM monitors the idling speed and idling air flow volume to conduct Idle Speed Control (ISC). The ECM determines that the ISC system is malfunctioning if the following conditions apply:
HINT:

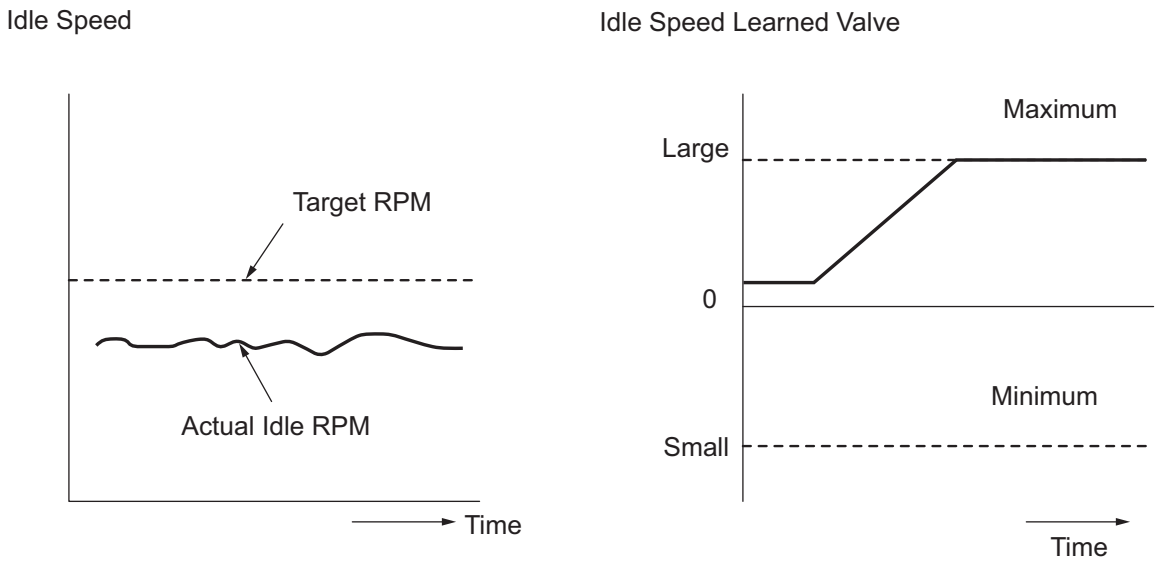
- The learned idling air flow volume remains at the maximum or minimum volume 5 times or more during a drive cycle.
- While driving at 6 mph (10 km/h) or more, the actual engine idling speed varies from the target idling speed by between 100 rpm and 150 rpm, 5 times or more during a drive cycle.

Example:

If the actual idling speed varies from the target idling speed by more than 200 rpm* 5 times during a drive cycle, the ECM illuminates the MIL and sets the DTC.
HINT:

*: Threshold idling speed varies with engine load.

Example



Y A121611E01

ES

MONITOR STRATEGY

Related DTCs	P0505: ISC Function
Required Sensors/Components (Main)	ETCS
Required Sensors/Components (Related)	Crankshaft position sensor, Engine coolant temperature sensor, and Vehicle speed sensor
Frequency of Operation	Continuous
Duration	10 minutes
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Engine	Running

TYPICAL MALFUNCTION THRESHOLDS

Following conditions met:	A and B
A. Frequency that both of following conditions 1 and 2 met:	5 times or more
1. Deviation in engine speed	Less than -100 rpm or more than 150 rpm (when shift position D and A/C OFF)
2. Vehicle condition	Stop after vehicle was driven by 6 mph (10 km/h) or more
B. Frequency that both of following conditions 3 and 4 met:	Once
3. Deviation in engine speed	Less than -100 rpm or more than 150 rpm (when shift position D and A/C OFF)

4. IAC flow rate learning value	0.5 L/sec or less, 6.4 L/sec or more

HINT:
- The following conditions may also cause DTC P0505 to be set: (1) The floor carpet overlapping slightly onto the accelerator pedal, causing the accelerator pedal to be slightly depressed and therefore the throttle valve position to be slightly open. (2) The accelerator pedal being not fully released.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0505)

ES

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0505	A
P0505 and other DTCs	B

HINT:
If any DTCs other than P0505 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

A

2 CHECK CONNECTION OF PCV HOSE

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**

OK

3 CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

4	CHECK THROTTLE VALVE

(a) Check the throttle valve condition.

NG → REPLACE THROTTLE BODY ASSEMBLY

OK

REPLACE ECM

DTC	P0560	System Voltage

MONITOR DESCRIPTION

The battery supplies electricity to the ECM even when the ignition switch is in the OFF position. This power allows the ECM to store data such as DTC history, freeze frame data and fuel trim values. If the battery voltage falls below a minimum level, these memories are cleared and the ECM determines that there is a malfunction in the power supply circuit. When the engine is next started, the ECM illuminates the MIL and sets the DTC.

DTC No.	DTC Detection Conditions	Trouble Areas
P0560	Open in ECM back up power source circuit (1 trip detection logic)	• Open in back up power source circuit • EFI fuse • ECM

HINT:

If DTC P0560 is set, the ECM does not store other DTCs.

MONITOR STRATEGY

Related DTCs	P0560: ECM system voltage
Required Sensors/Components (Main)	ECM
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	3 seconds
MIL Operation	Immediate (MIL illuminated after next engine start)
Sequence of Operation	None

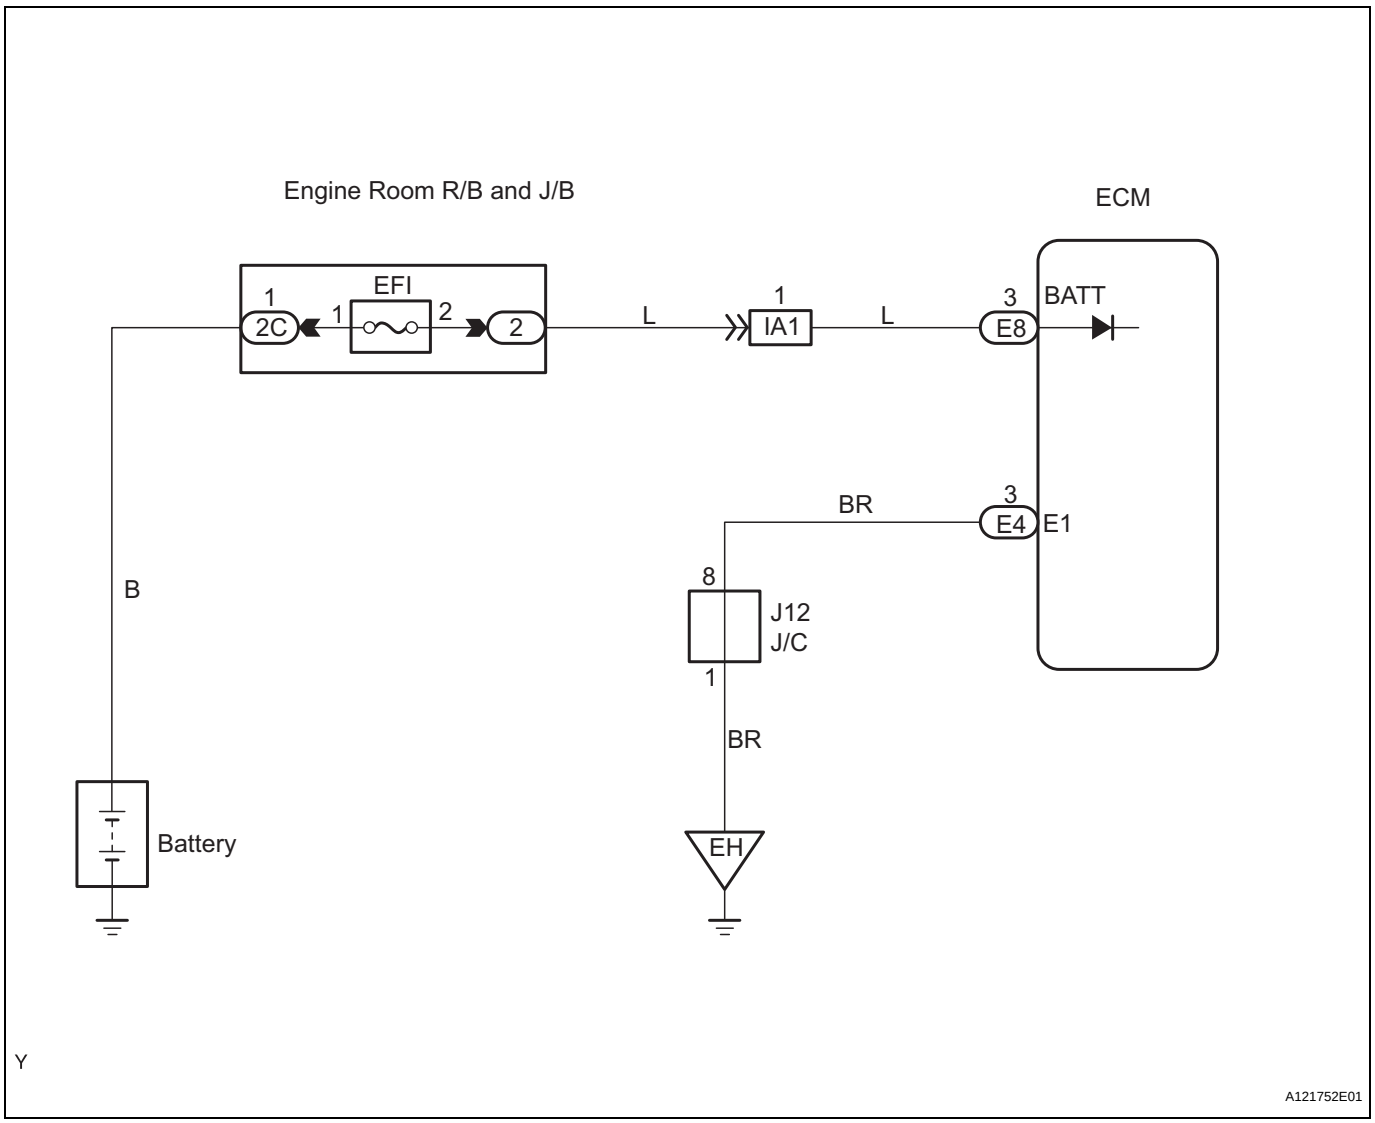
TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

TYPICAL MALFUNCTION THRESHOLDS

ECM power source	Less than 3.5 V

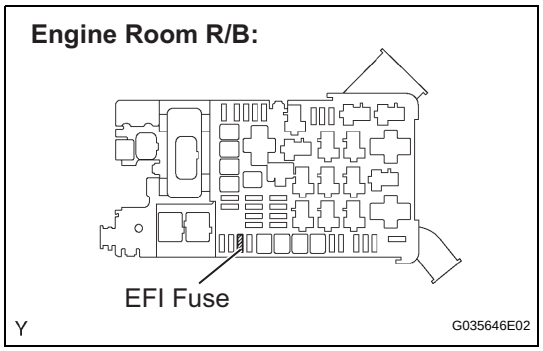
WIRING DIAGRAM



ES

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK FUSE (EFI FUSE)

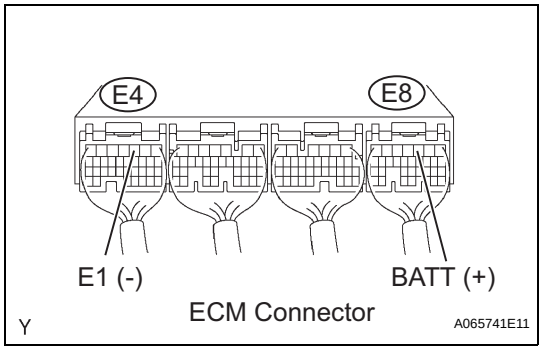


(a) Remove the EFI fuse from the engine room R/B.
(b) Check the resistance.
Standard Resistance:
Below 1 Ω
(c) Reinstall the EFI fuse.

NG	CHECK CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

2 INSPECT ECM (BATT VOLTAGE)



(a) Measure the voltage between the terminals of the ECM connectors.

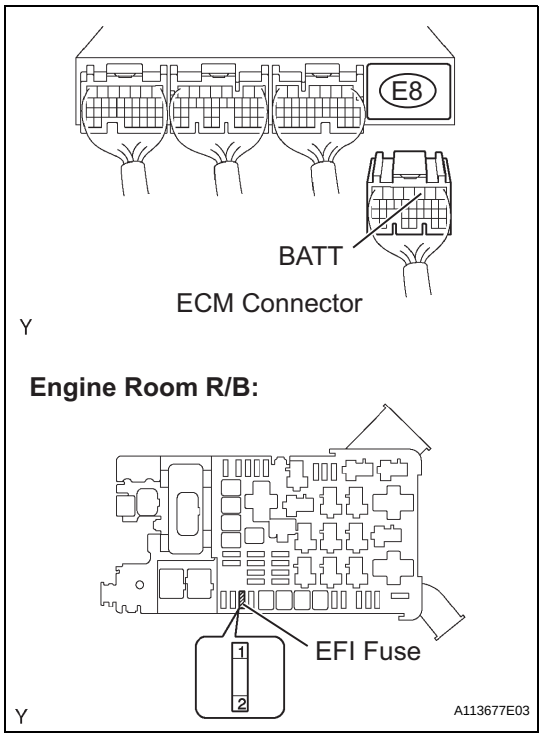
Standard Voltage

Tester Connections	Specified Conditions
BATT (E8-3) - E1 (E4-3)	9 to 14 V

OK → REPLACE ECM

NG

3 CHECK HARNESS AND CONNECTOR (ECM - EFI FUSE, EFI FUSE - BATTERY)



(a) Check the harness and the connector between the EFI fuse and ECM.
   (1) Remove the EFI fuse from the engine room R/B.
   (2) Disconnect the E8 ECM connector.
   (3) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
EFI fuse (2) - BATT (E8-3)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
EFI fuse (2) or BATT (E8-3) - Body ground	10 kΩ or higher

   (4) Reconnect the ECM connector.
   (5) Reinstall the EFI fuse.

(b) Check the harness and the connector between the EFI fuse and battery.
   (1) Remove the EFI fuse from the engine room R/B.
   (2) Disconnect the positive battery terminal.
   (3) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
Battery positive terminal - EFI fuse (1)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
Battery positive terminal or EFI fuse (1) - Body ground	10 kΩ or higher

   (4) Reconnect the positive battery terminal.
   (5) Reinstall the EFI fuse.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4	INSPECT BATTERY

(a) Check that the battery is not depleted.

NG → REPLACE BATTERY

OK

CHECK AND REPLACE ENGINE ROOM RELAY BLOCK ASSEMBLY

DTC	P0604	Internal Control Module Random Access Memory (RAM) Error

DTC	P0606	ECM / PCM Processor

DTC	P0607	Control Module Performance

DTC	P0657	Actuator Supply Voltage Circuit / Open

MONITOR DESCRIPTION

ES

The ECM continuously monitors its own internal memory status, internal circuits, and output signals transmitted to the throttle actuator. This self-check ensures that the ECM is functioning properly. If any malfunction is detected, the ECM sets the appropriate DTC and illuminates the MIL.
The ECM memory status is diagnosed by internal mirroring of the main CPU and the sub CPU to detect Random Access Memory (RAM) errors. The two CPUs also perform continuous mutual monitoring. The ECM illuminates the MIL and sets a DTC if: 1) outputs from the two CPUs are different or deviate from the standards, 2) the signals sent to the throttle actuator deviate from the standards, 3) a malfunction is found in the throttle actuator supply voltage, and 4) any other ECM malfunction is found.

DTC No.	DTC Detection Conditions	Trouble Areas
P0604 P0606 P0607 P0657	ECM internal error (1 trip detection logic)	ECM

MONITOR STRATEGY

Related DTCs	P0604: ECM RAM error P0606: ECM range check P0607: ECM CPU malfunction P0657: ETCS power supply
Required Sensors/Components (Main)	ECM
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	P0604: Conditions met for 6 times P0606: 1 second P0607 and P0657: Within 1 second
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

TYPICAL MALFUNCTION THRESHOLDS

ECM RAM errors (P0604):

RAM mirror check	Fail

ECM CPU range check (P0606):

Either of following conditions met:	-
Difference between throttle valve position of main CPU and throttle valve position of sub CPU	0.3 V or more

Difference between accelerator pedal position of main CPU and accelerator pedal position of sub CPU	0.3 V or more

ECM CPU malfunction (P0607):

CPU reset	Occurred

Electronic throttle control system power supply function of ECM malfunctions (P0657):

ETCS (Electronic Throttle Control System) power supply when ignition switch turned to ON	7 V or more

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

DTC	P0617	Starter Relay Circuit High

DESCRIPTION

While the engine is being cranked, the positive battery voltage is applied to terminal STA of the ECM. If the ECM detects the Starter Control (STA) signal while the vehicle is being driven, it determines that there is a malfunction in the STA circuit. The ECM then illuminates the MIL and sets the DTC.
This monitor runs when the vehicle is driven at 12.4 mph (20 km/h) for over 20 seconds.

DTC No.	DTC Detection Conditions	Trouble Areas
P0617	When conditions (a), (b) and (c) met, positive (+B) battery voltage 10.5 V or more applied to ECM for 20 seconds (1 trip detection logic): (a) Vehicle speed more than 12.4 mph (20 km/h) (b) Engine speed more than 1,000 rpm (c) STA signal ON	• Park/Neutral Position (PNP) switch (A/T*) • Clutch start switch (M/T*) • Starter relay circuit • Ignition switch • ECM

ES

*: A/T denotes Automatic Transaxle models and M/T denotes Manual Transaxle models.

MONITOR STRATEGY

Related DTCs	P0617: Starter signal
Required Sensors/Components (Main)	STARTER relay, PNP switch, Clutch start switch and Ignition switch
Required Sensors/Components (Related)	Vehicle Speed Sensor (VSS), Crankshaft Position (CKP) sensor
Frequency of Operation	Continuous
Duration	20 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

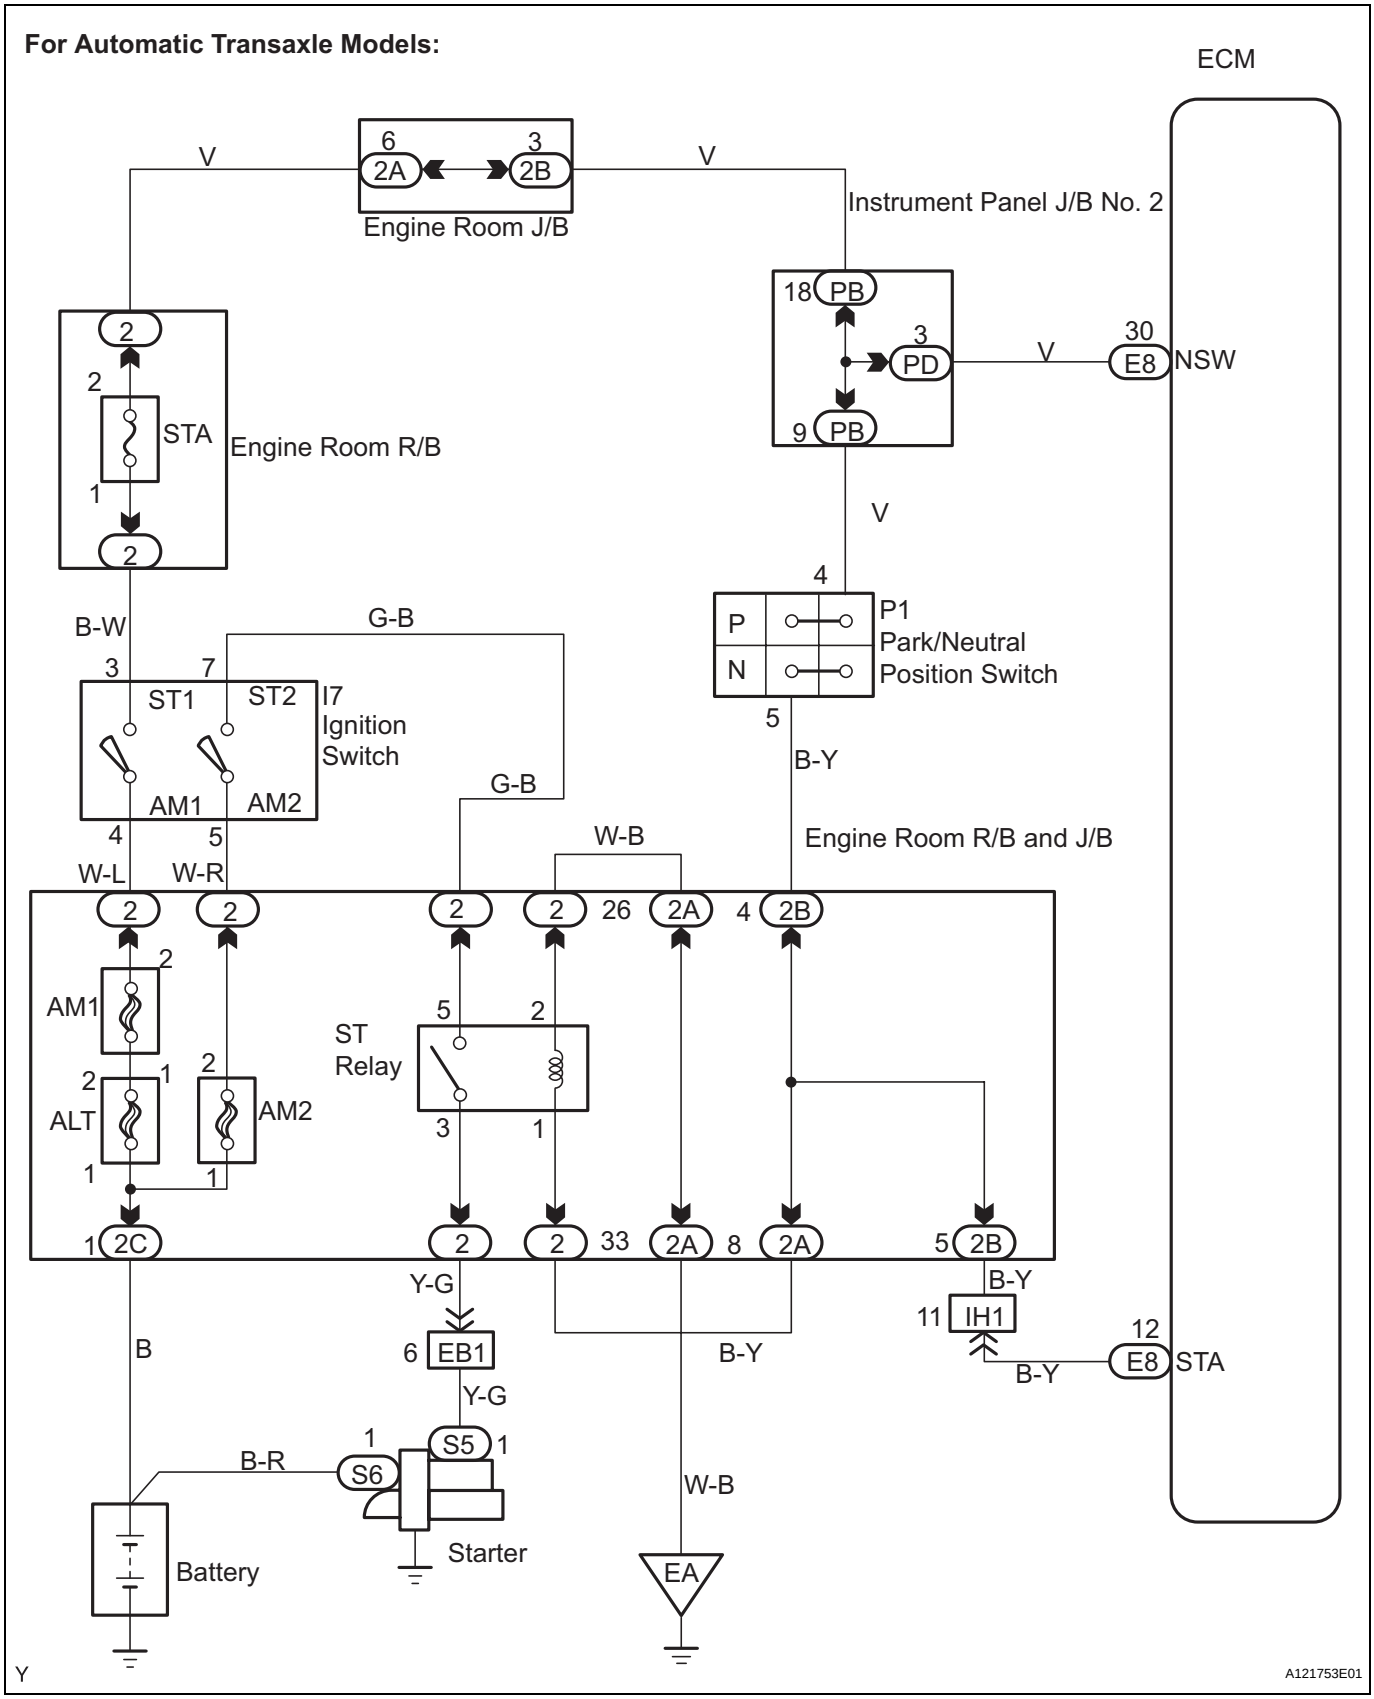
Monitor runs whenever following DTCs not present	None
Battery voltage	10.5 V or more
Vehicle speed	12.4 mph (20 km/h) or more
Engine speed	1,000 rpm or more

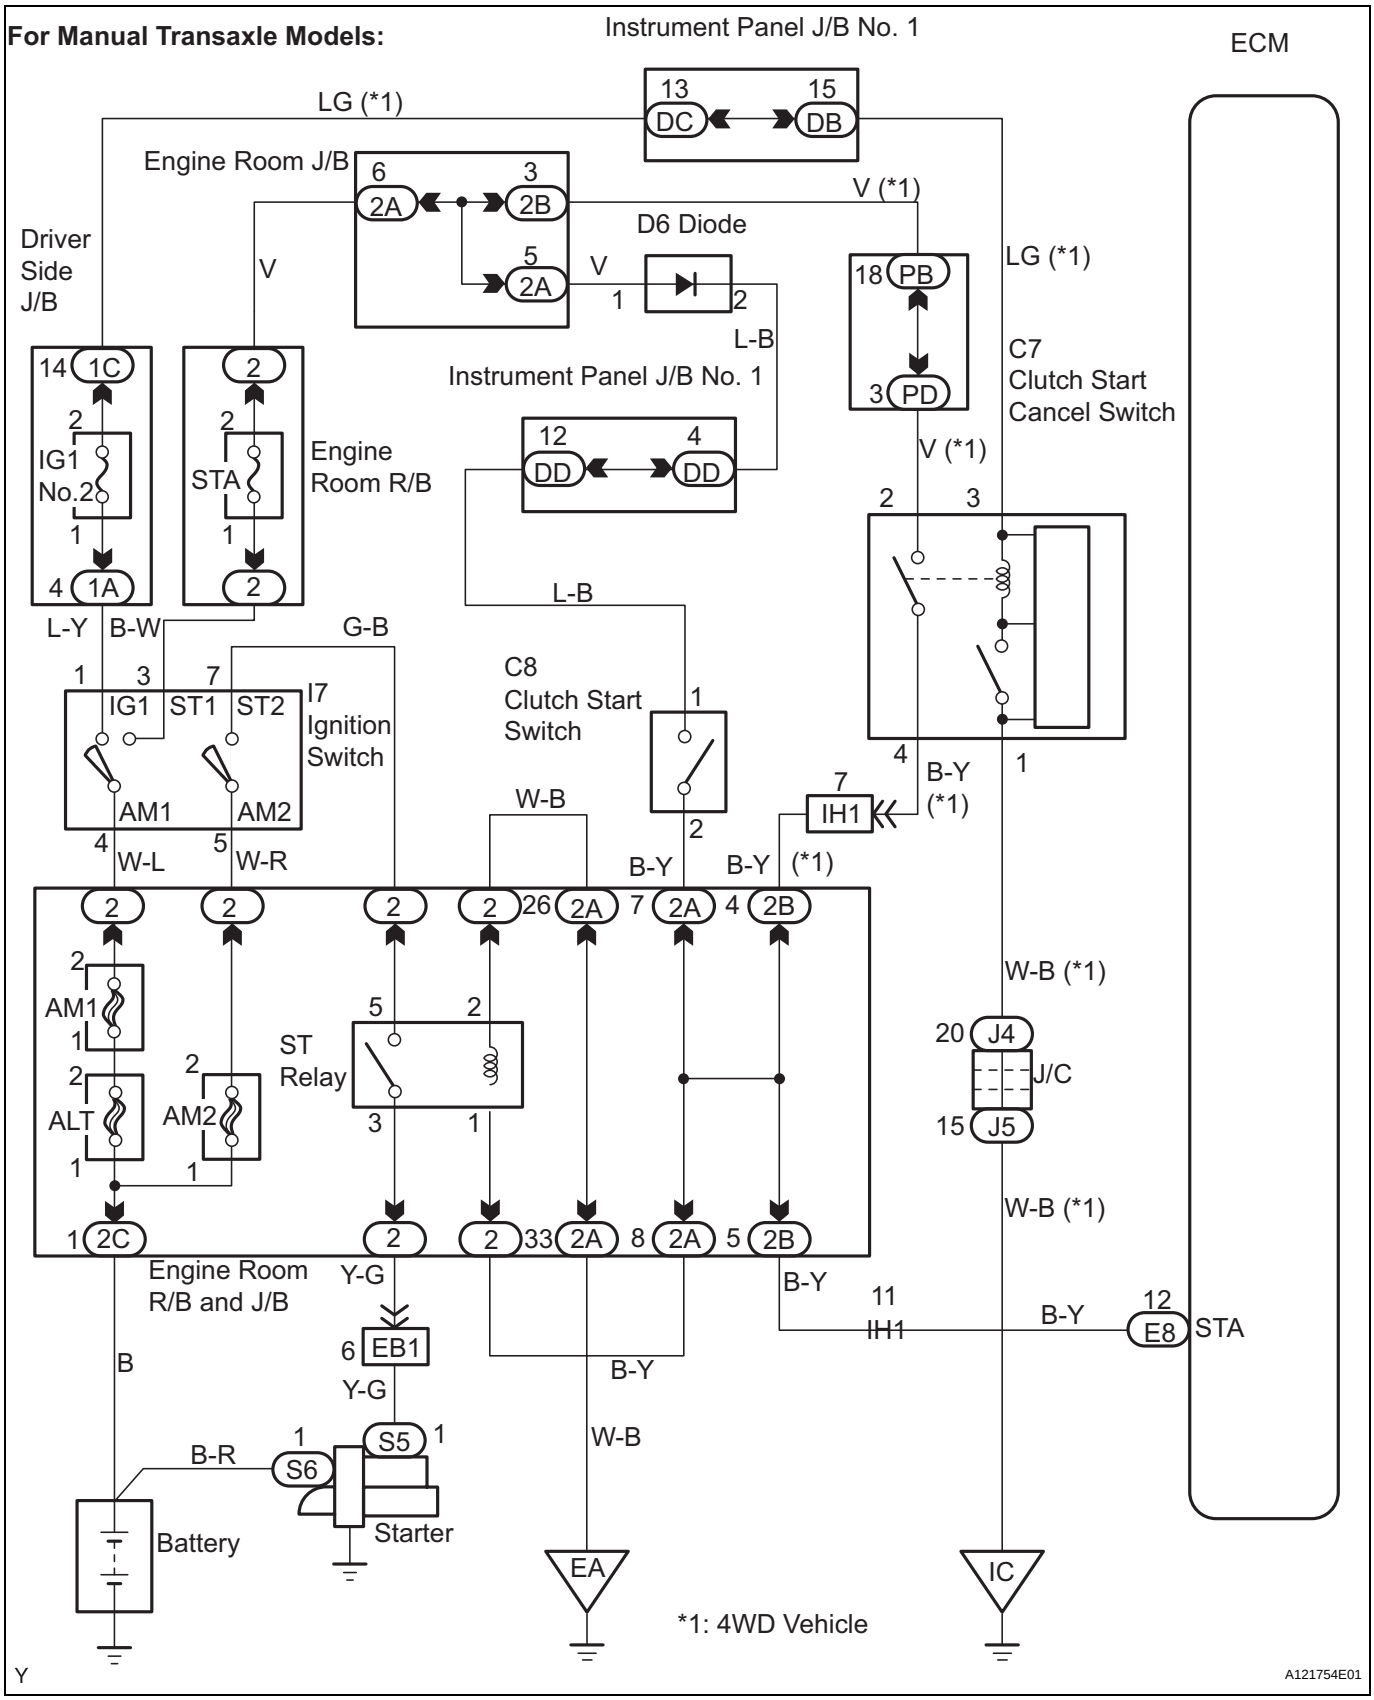
TYPICAL MALFUNCTION THRESHOLDS

Starter signal	ON

WIRING DIAGRAM

For Automatic Transaxle Models:





HINT:

- The following troubleshooting flowchart is based on the premise that the engine is cranked normally. If the engine will not crank, proceed to the problem symptoms table (See page ES-29).

- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 READ DATA LIST (STARTER SIGNAL)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STARTER SIG.
(d) Check the value displayed on the tester when the ignition switch is turned to the ON and START positions.

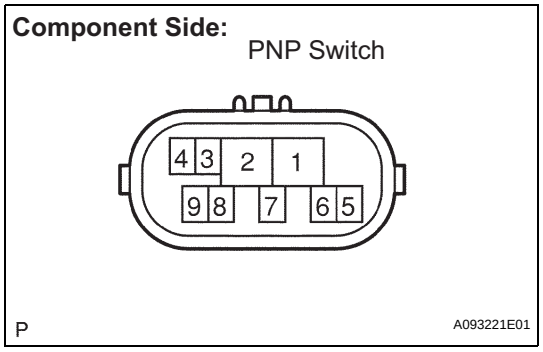
Result

Ignition Switch Positions	STARTER SIG
ON	OFF
START	ON

OK → REPLACE ECM

NG

2 INSPECT PARK / NEUTRAL POSITION SWITCH OR CLUTCH START SWITCH ASSEMBLY

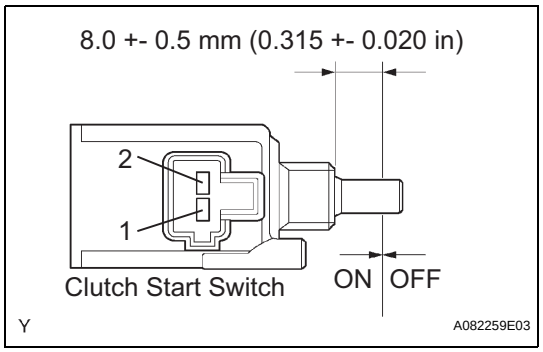


(a) Inspect the Park/Neutral Position (PNP) switch (for A/T models).
(1) Disconnect the P1 PNP switch connector.
(2) Check the resistance when the transmission gear selector lever is moved to each position.

Standard Resistance

Gear Selector Lever Positions	Tester Connections	Specified Conditions
P	2 - 6, 4 - 5	Below 1 Ω
R	1 - 2	Below 1 Ω
N	2 - 9, 4 - 5	Below 1 Ω
D	2 - 7	Below 1 Ω
2	2 - 3	Below 1 Ω
L	2 - 8	Below 1 Ω

(3) Reconnect the PNP switch connector.



(b) Inspect the clutch start switch (for M/T models).
(1) Disconnect the C8 clutch start switch connector.
(2) Check the resistance when the clutch start switch is ON and OFF.

Standard Resistance

Ignition Switch Positions	Tester Connections	Specified Conditions
ON (pushed)	1 - 2	Below 1 Ω
OFF (free)	1 - 2	10 kΩ or higher

(3) Reconnect the clutch start switch connector.

NG → REPLACE PARK / NEUTRAL POSITION SWITCH OR CLUTCH START SWITCH ASSEMBLY (GO TO STEP 3 AFTER REPLACEMENT)

OK

3 READ DATA LIST (STARTER SIGNAL)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STARTER SIG.
(d) Check the value displayed on the tester when the ignition switch is turned to the ON and START positions.

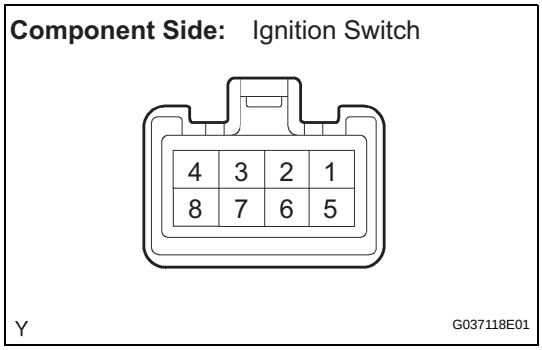
Result

Ignition Switch Positions	STARTER SIG
ON	OFF
START	ON

OK → SYSTEM OK

NG

4 INSPECT IGNITION OR STARTER SWITCH ASSEMBLY



(a) Disconnect the I7 ignition switch connector.
(b) Check the resistance.

Standard Resistance

Ignition Switch Positions	Tester Connections	Specified Conditions
LOCK	All Terminals	10 kΩ or higher
ACC	2-4	Below 1 Ω
ON	1-4, 1-6, 2-4, 3-4, 5-6	Below 1 Ω
START	1-4, 3-4, 5-6, 5-7	Below 1 Ω

(c) Reconnect the ignition switch connector.

NG → REPLACE IGNITION OR STARTER SWITCH ASSEMBLY (GO TO STEP 5 AFTER REPLACEMENT)

OK

5	READ DATA LIST (STARTER SIGNAL)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STARTER SIG.
(d) Check the value displayed on the tester when the ignition switch is turned to the ON and START positions.

Result

Ignition Switch Positions	STARTER SIG
ON	OFF
START	ON

OK → **SYSTEM OK**

NG

REPAIR OR REPLACE HARNESS OR CONNECTOR

DTC	P0630	VIN not Programmed or Mismatch - ECM / PCM

DESCRIPTION

DTC P0630 is set when the Vehicle Identification Number (VIN) is not stored in the Engine Control Module (ECM) or the input VIN is not accurate. Input the VIN with the intelligent tester.

DTC No.	DTC Detection Conditions	Trouble Areas
P0630	• VIN not stored in ECM • Input VIN in ECM not accurate	ECM

MONITOR STRATEGY

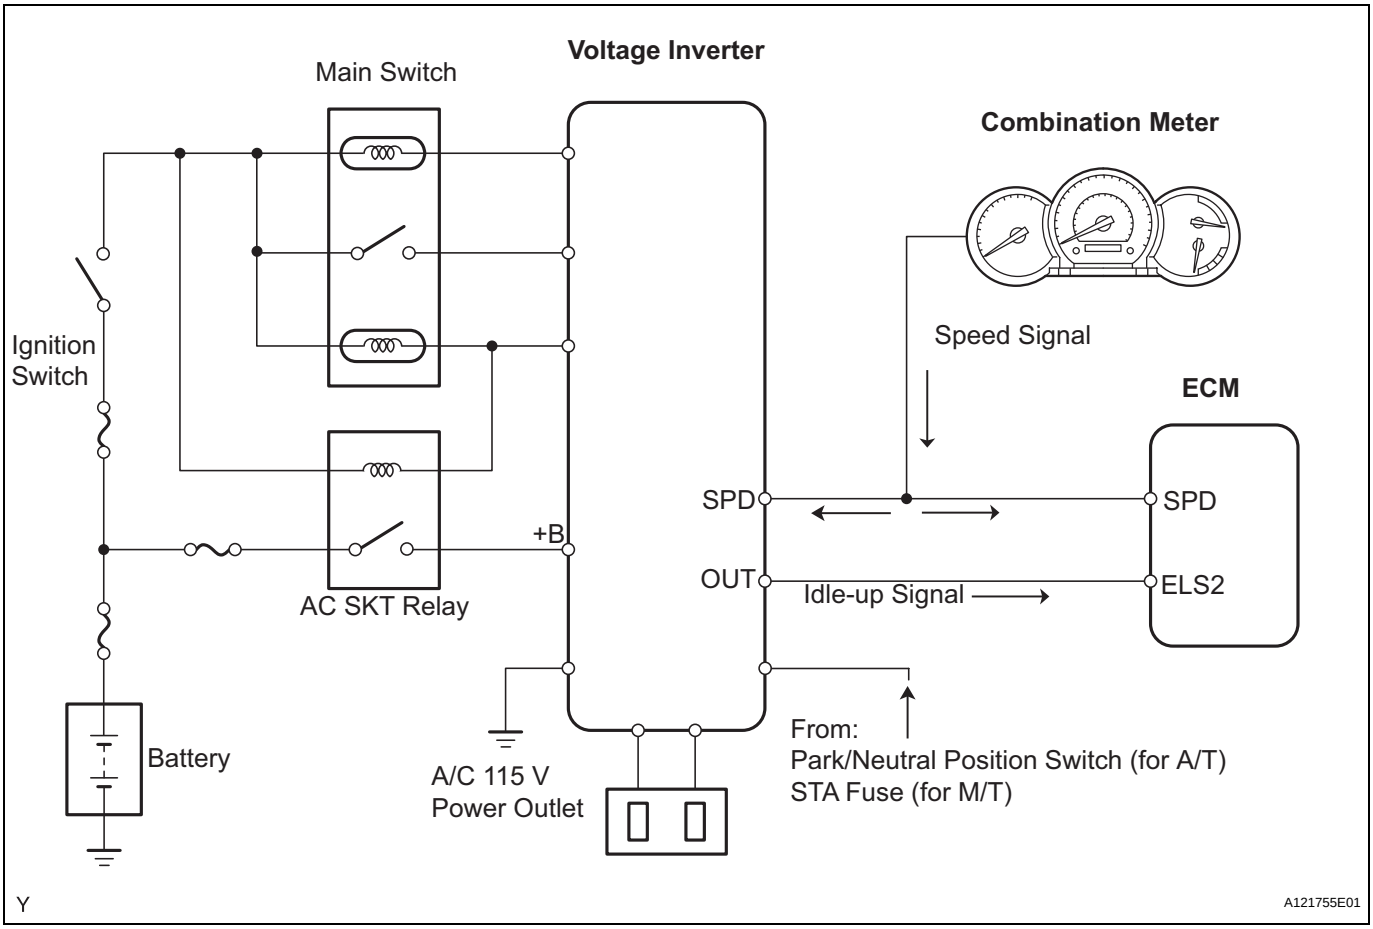
DTC	P1500	AC Inverter Malfunction

DESCRIPTION

This vehicle is equipped with a voltage inverter, which supplies power to various electrical appliances. When the main switch of the voltage inverter is turned ON, the inverter relay turns ON, and the inverter then converts the 12 V Direct Current (DC) of the battery into an 115 V Alternating Current (AC). The voltage inverter can output a maximum of 400W from an outlet.
When the AC 115 V is output, a load is applied to the engine. The ECM controls the engine idling speed according to the vehicle speed and engine load. A speed signal is input to the inverter and an idle-up signal is transmitted to the ECM.



DTC No.	DTC Detection Conditions	Trouble Areas
P1500	While vehicle running, idling-up signal input into ECM for 10 seconds	• Open in speed signal circuit • Short between idle-up signal and +B circuits • Voltage inverter • ECM

MONITOR DESCRIPTION

While the engine is idling, the ECM performs idle up according to the power supply of the inverter to stabilize the engine idling speed.
When the vehicle is stationary and the inverter input exceeds 8.3 A, the inverter sends an idle-up signal from the OUT terminal of the inverter to the ELS2 terminal of the ECM.
If the idle-up signal is input into the ECM for 10 seconds while the vehicle is running, the ECM interprets this as a malfunction in the inverter circuit and sets the DTC.

MONITOR STRATEGY

Related DTCs	P1500: Voltage inverter performance
Required Sensors/Components (Main)	Voltage inverter
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	10 seconds
MIL Operation	2 driving cycles

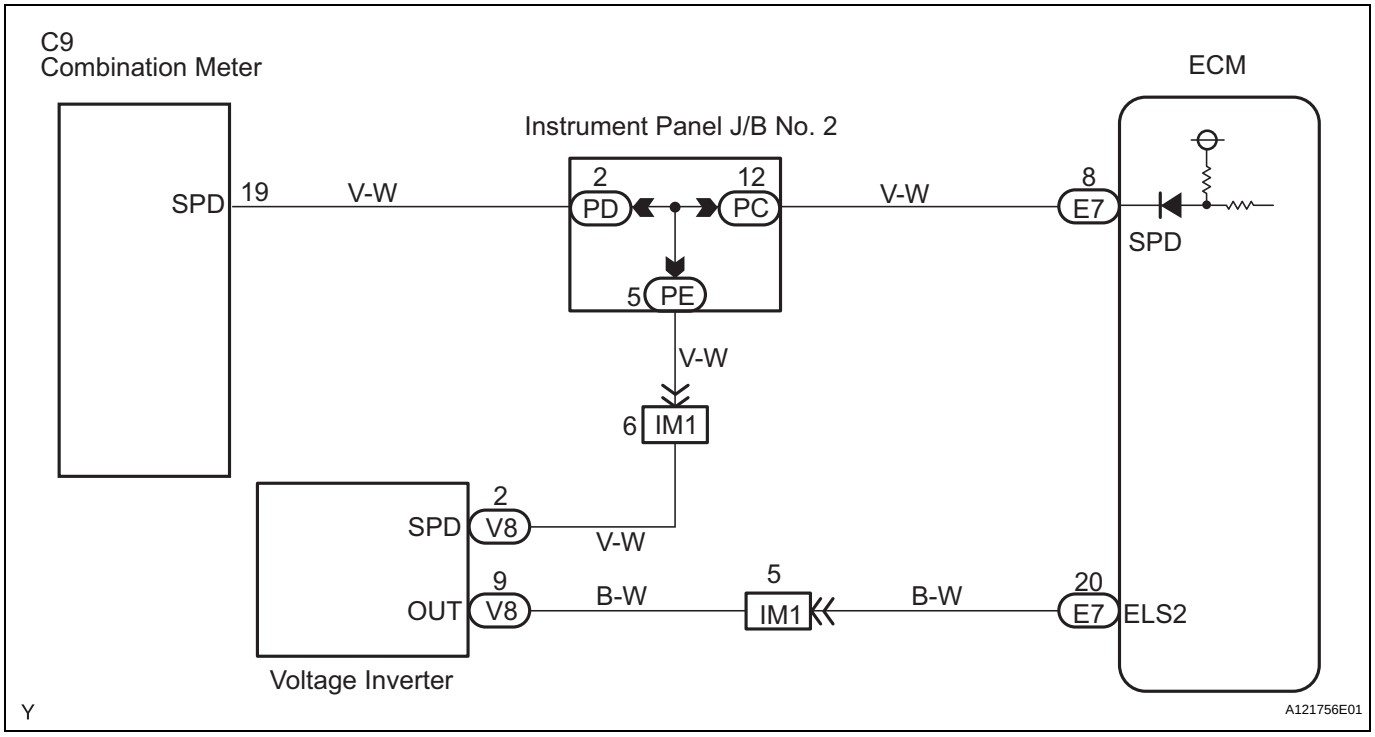
WIRING DIAGRAM



Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P1500)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

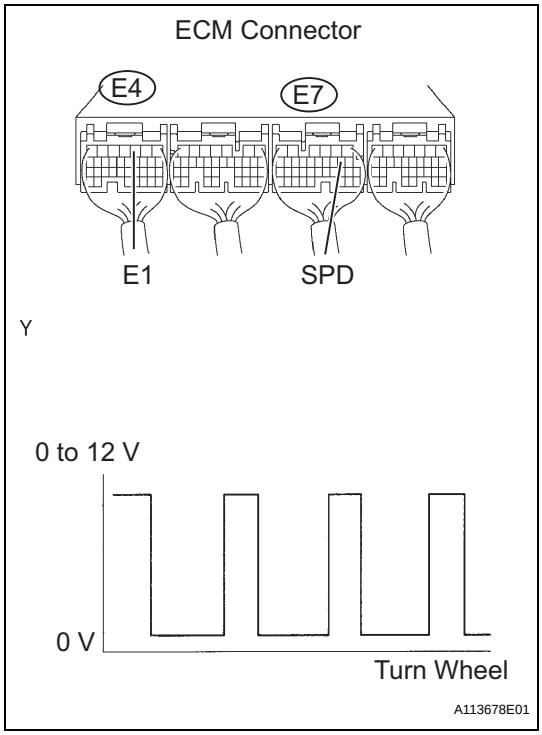
Display (DTC output)	Proceed To
P1500	A
P1500 and other DTCs.	B

If any DTCs other than P1500 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

A

2	INSPECT VOLTAGE INVERTER ASSEMBLY (SPD SIGNAL)



(a) Shift the transmission gear selector lever to the neutral position.
(b) Jack up the vehicle.
(c) Turn the ignition switch to ON.
(d) Check the voltage between the terminals of the ECM connectors as the wheel is turned slowly.

Standard Voltage

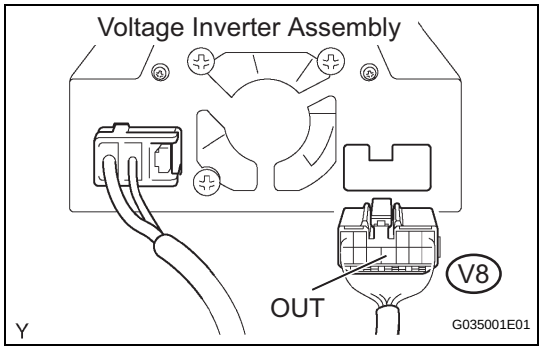
Tester Connections	Specified Conditions
SPD (E7--8) - E1 (E4-3)	Voltage generated intermittently

HINT:
The output voltage should fluctuate up and down similarly to the diagram on the left when the wheel is turned slowly.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3 INSPECT ECM (ELS VOLTAGE)



(a) Disconnect the V8 inverter connector.
(b) Start the engine.
(c) Measure the voltage between the OUT terminal of inverter and the body ground.
Standard Voltage

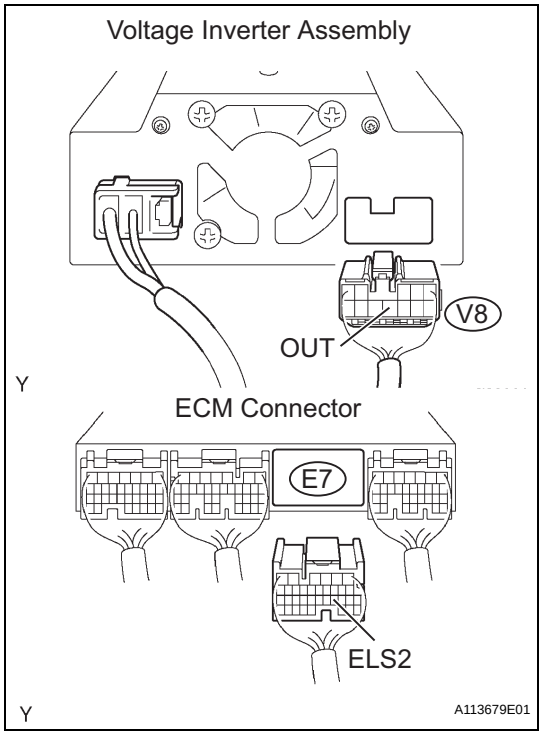
Tester Connections	Specified Conditions
OUT (V8-9) - Body ground	1 V or less

(d) Reconnect the inverter connector.

OK → **REPLACE VOLTAGE INVERTER ASSEMBLY**

NG

4 CHECK HARNESS AND CONNECTOR (ECM - INVERTER, INVERTER - POWER SOURCE)



(a) Disconnect the V8 inverter connector.
(b) Disconnect the E7 ECM connector.
(c) Turn the ignition to ON.
(d) Measure the voltage between the terminals of the wire harness and body ground.
Standard Voltage (Check for short in idling up signal circuit)

Tester Connections	Specified Conditions
OUT (V8-9) or ELS2 (E7-20) - Body ground	1 V or less

(e) Reconnect the inverter connector and the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

ES

DTC	P1613	Secondary Air Injection Driver Malfunction

DESCRIPTION

Refer to DTC P0412 (See page ES-189).

DTC No.	DTC Detection Conditions	Trouble Areas
P1613	Either of following conditions (1) or (2) met (1) All of following conditions met (1 trip detection logic): • Either of air pump or air switching valve not operating • Diagnostic signal from Air Injection Control Driver (AID) 80 % • Battery voltage 8 V or more (2) Both of following conditions met (1 trip detection logic): • Battery voltage 8 V or more • Diagnostic signal from AID abnormal (duty signal other than 0, 20, 40, 80 and 100 %)	• AID • Open in AID ground circuit
P1613	All of following conditions met (1 trip detection logic): (a) Air injection system operating (Air Switching Valve [ASV] ON and air pump ON) (b) Diagnostic signal from Air Injection Control Driver (AID) 0 % (c) Battery voltage 8 V or more	• Short in diagnostic information signal circuit (AID - ECM) • Open or short in air pump and air switching valve command signal circuit (AID - ECM) • Open in AID ground circuit • AID • ECM
P1613	Both of following conditions met (1 trip detection logic): (a) Battery voltage 8 V or more (b) Diagnostic signal from Air Injection Control Driver (AID) 100 %	• Open or short in AID power source circuit • Open in diagnostic information signal circuit (AID - ECM) • AID • ECM

MONITOR DESCRIPTION

For a short time after cold engine starts, the ECM transmits command signals to the Air Injection Control Driver (AID) to drive the air pump and the Air Switching Valve (ASV). The AID detects open and short circuits according to the voltages at the AID terminals to the air pump and ASV, and the circuit voltage of the AID power source, and transmits diagnostic information as a signal to the ECM.
If the Secondary Air Injection (AIR) system circuit or the AID itself malfunctions, the AID sends a malfunction signal (duty signal) as diagnostic information to the ECM (when the system is normal, a system normal signal is sent). The ECM sets the DTC based on the diagnostic information from the AID.
EXAMPLE:

1. The duty ratio of the diagnostic signal from the AID is 0 or 100 % (remains at 0 V or the same as battery voltage).
2. The duty ratio of the diagnostic signal from the AID shows an impossible ratio (other than 0, 20, 40, 80 and 100 %).
3. The AID outputs the normal signal (normal duty signal: 80 %) while the system is not operating.

MONITOR STRATEGY

Related DTCs	P1613: Secondary air injection system air injection control driver circuit range check
Required Sensors/Components (Main)	Air injection control driver
Required Sensors/Components (Related)	Air switching valve
Frequency of Operation	Once per drive cycle
Duration	3 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Case 1 and 4:

Monitor runs whenever following DTCs not present	None
Battery voltage	8 V or more
Ignition switch	ON
Starter	OFF

Case 2:

Monitor runs whenever following DTCs not present	None
Either a or b met:	-
a. Air pump	Not operating
b. Air switching valve	Not operating
Battery voltage	8 V or more
Ignition switch	ON
Starter	OFF

Case 3:

Monitor runs whenever following DTCs not present	None
Following conditions (a) and (b) met	-
a. Air pump	Operating
b. Air switching valve	Operating
Battery voltage	8 V or more
Ignition switch	ON
Starter	OFF

TYPICAL MALFUNCTION THRESHOLDS

Case 1:

One of following conditions met:	A, B, C or D
A. Diagnostic signal duty ratio from air injection control driver	1 % or more, and 10 % or less
B. Diagnostic signal duty ratio from air injection control driver	30 %
C. Diagnostic signal duty ratio from air injection control driver	49 %
D. Diagnostic signal duty ratio from air injection control driver	91 % or more, and 99 % or less

Case 2:

Diagnostic signal duty ratio from air injection control driver	70 % or more, and 90 % or less

Case 3:

Diagnostic signal duty ratio from air injection control driver	0 %

Case 4:

Diagnostic signal duty ratio from air injection control driver	100 %

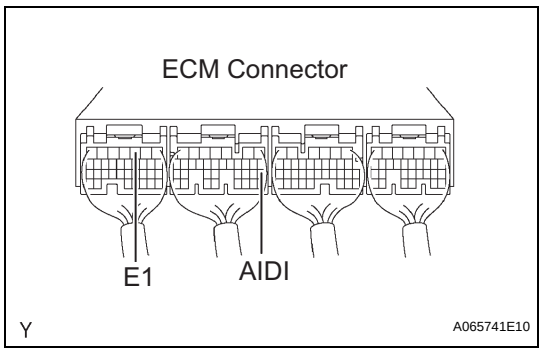
COMPONENT OPERATING RANGE

Diagnostic signal duty ratio from air injection control driver	70 % or more, and 90 % or less when secondary air injection system operating. 0 % when secondary air injection system not operating.

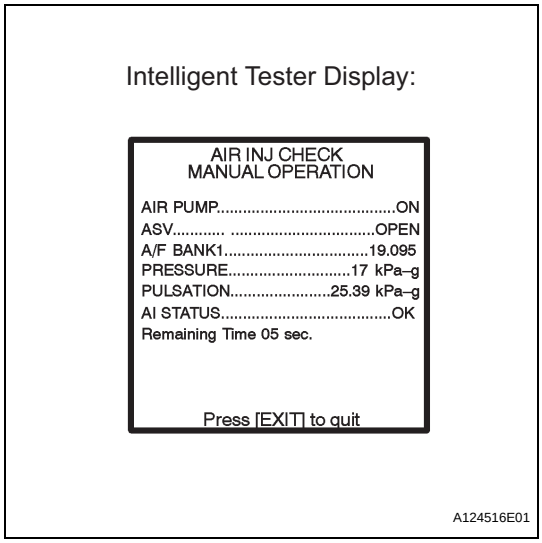
WIRING DIAGRAM

Refer to DTC P0412 (See page ES-192).

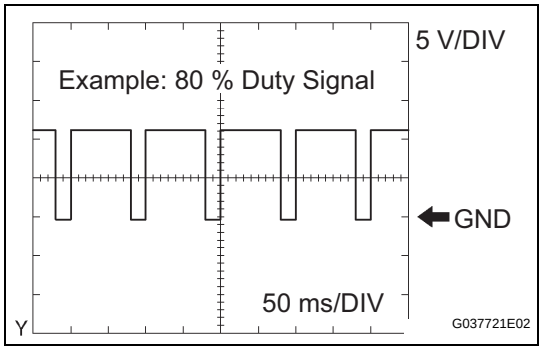
HINT:
Diagnostic information output by the AID can be confirmed by connecting an oscilloscope to the diagnostic information terminal of the AID. Reading the waveform while performing the AIR system intrusive operation provided in the SYSTEM CHECK function, allows the possible trouble areas to be narrowed down.
(a) Start the engine and warm it up.
(b) Turn the ignition switch to OFF.
(c) Connect an intelligent tester to the DLC3.



(d) Connect oscilloscope probes to the AIDI and E1 terminals of the ECM.
(e) Turn the ignition switch to ON and turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / MANUAL OPERATION / AP: ON, ASV: OPEN and AP: OFF, ASV CLOSE.
HINT:
When MANUAL OPERATION is selected, the tester initialization (atmospheric pressure measurement) is performed automatically. The initialization takes 10 seconds. After the initialization, AP and ASV operation can be selected.
(g) Start the engine.
(h) Perform the AIR system intrusive operation while the engine is idling.



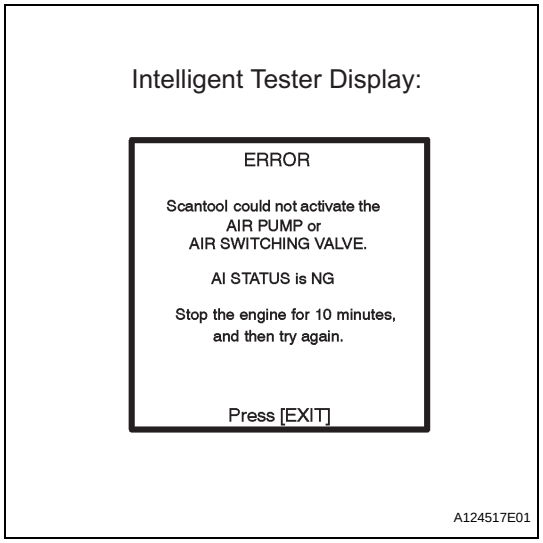
(i) Monitor the AID voltage output (duty ratio signal).



Oscilloscope range

Items	Contents
Terminals	CH1: AIDI - E1
Equipment Settings	5 V/Division, 20 to 50 ms/Division
Conditions	Idling

(j) Turn the ignition switch to OFF.



NOTICE:

- **This AIR INJECTION CHECK only allows technicians to operate the AIR system for a maximum of 5 seconds. Furthermore, the check can only be performed up to 4 times per trip. If the test is repeated, intervals of at least 30 seconds are required between checks. While AIR system operation using the intelligent tester is prohibited, the tester display indicates the prohibition (WAIT or ERROR).**
  If an ERROR as shown in the illustration is displayed on the tester during the test, stop the engine for 10 minutes, and then try again.
- **Performing the AIR INJ CHECK repetitively may cause damage to the AIR system. If necessary, leave an interval of several minutes between SYSTEM CHECK operations to prevent the system from overheating.**
- **When performing the AIR INJ CHECK operation after the battery cable has been reconnected, wait for 7 minutes with the ignition switch turned to ON or the engine running.**
- **Turn the ignition switch to OFF when the AIR INJ CHECK operation finishes.**

ES

HINT:

- By using an intelligent tester to perform the AIR INJ CHECK operation in the SYSTEM CHECK, the air-fuel ratio and the pressure in the secondary air injection system passage can be checked while the secondary air injection system is operating. This helps technicians to troubleshoot the system when it malfunctions.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P1613)

ES

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

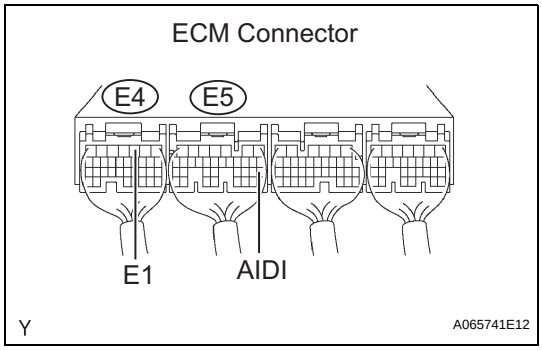
Display (DTC Output)	Proceed To
P1613	A
P1613 and other DTCs	B

If any DTCs other than P1613 are output, troubleshoot those DTCs first.

NG → GO TO DTC CHART

OK

2	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (AIDI VOLTAGE)



(a) Start the engine and warm it up.
(b) Turn the ignition switch to OFF.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch to ON and turn the tester ON.
(e) Select the following menu items:
DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / MANUAL OPERATION / AP: ON, ASV: OPEN and AP: OFF, ASV CLOSE.
HINT:
When MANUAL OPERATION is selected, the tester initialization (atmospheric pressure measurement) is performed automatically. The initialization takes 10 seconds. After the initialization, AP and ASV operation can be selected.
(f) Start the engine.
(g) Perform the AIR system intrusive operation while the engine is idling.
(h) Measure the voltage between the AIDI and E1 terminals of the ECM connector when the AIR system is ON and OFF.
(i) Turn the ignition switch to OFF.

NOTICE:

- **Do not perform the SYSTEM CHECK operation repetitively. It may cause the damage in the system. If necessary, leave an interval of several minutes between SYSTEM CHECK operations.**
- **When performing the AIR INJ CHECK operation after the battery cable has been reconnected, wait for 7 minutes with the ignition switch turned to ON or the engine running.**
- **Turn the ignition switch to OFF when the AIR INJ CHECK operation finishes.**

Result

Results	Suspected Trouble Areas	Proceed To
Fixed at low (1.6 V or less) even when AIR system ON (Air pump ON, ASV OPEN)	• Short between air pump or air switching valve command signal circuit and body ground • Open in air pump command signal circuit (between ECM and AID) • Open in ASV command signal circuit (between ECM and AID) • Open in AID ground circuit (between AID and body ground) • Diagnostic signal circuit ground short • AID • ECM	A
Fixed at high (12 V or more) even when AIR system OFF (Air pump OFF, ASV CLOSE)	• Open in diagnostic signal circuit (ECM - AID) • Short between +B and diagnostic signal circuits (ECM - AID) • Open in AID power source circuit • AID • ECM	B
Other than above: Fluctuating (duty signal other than 20, 40 and 80 %)	• AID • Open in AID ground circuit (between AID and body ground)	C

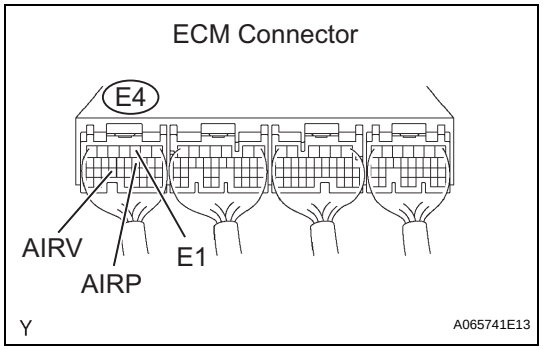
A

3 INSPECT ECM (AIRP AND AIRV VOLTAGE)



(a) Turn the ignition switch to ON.

(b) Measure the voltage between the terminals of the ECM connector.

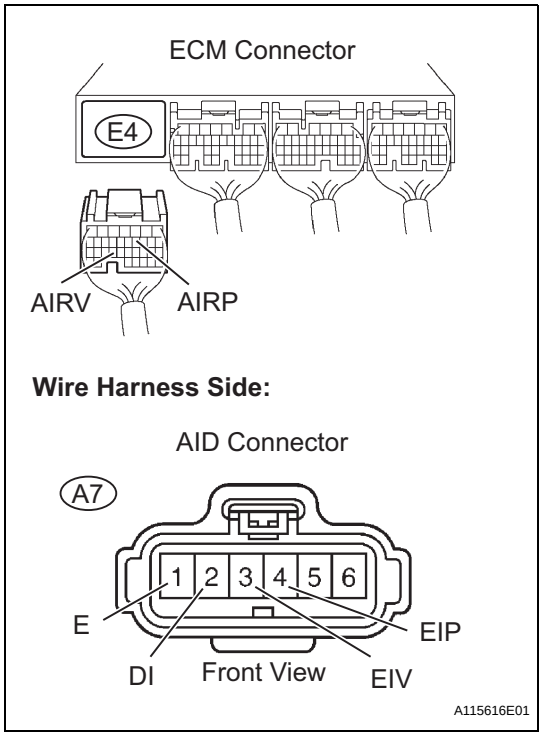
Standard Voltage

Tester Connections	Specified Conditions
AIRP (E4-11) - E1 (E4-3)	9 to 14 V (near battery voltage)
AIRV (E4-24) - E1 (E4-3)	9 to 14 V (near battery voltage)

OK → REPLACE ECM

NG

4	CHECK HARNESS AND CONNECTOR (ECM - AID, AID - BODY GROUND)



(a) Check for short in harness and connectors between the ECM and AID.
  (1) Disconnect the E4 ECM connector.
  (2) Disconnect the A7 AID connector.
  (3) Check the resistance.
  Standard Resistance (check for short)

Tester Connections	Specified Conditions
AIRP (E4-11) or EIP (A7-4) - Body ground	10 kΩ or higher
AIRV (E4-24) or EIV (A7-3) - Body ground	10 kΩ or higher

  (4) Reconnect the ECM connector and the AID connector.

(b) Check for open in harness and connector between the AID and body ground.
  (1) Disconnect the A7 AID connector.
  (2) Check the resistance.
  Standard Resistance (check for open)

Tester Connections	Specified Conditions
E (A7-1) - Body ground	Below 1 Ω

  (3) Reconnect the AID connector.

(c) Check for short in harness and connector between the diagnostic signal circuit and body ground.
  (1) Disconnect the A7 AID connector.
  (2) Turn the ignition switch to ON.
  (3) Measure the voltage between the terminals of the AID connector.
  Standard Voltage (check for short)

Tester Connections	Specified Conditions
DI (A7-2) - E (A7-1)	9 to 14 V (near battery voltage)

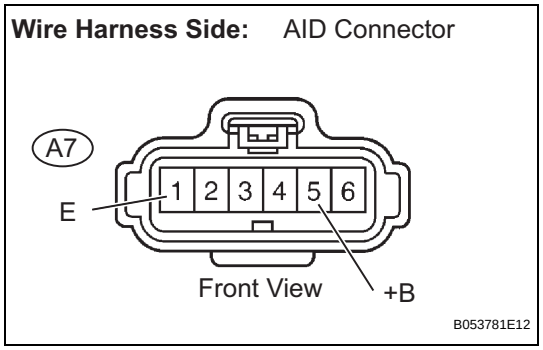
  (4) Reconnect the AID connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE AIR INJECTION CONTROL DRIVER

5 CHECK AIR INJECTION CONTROL DRIVER POWER SOURCE CIRCUIT



(a) Disconnect the A7 AID connector.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between the terminal of the AID and the body ground.
Standard Voltage

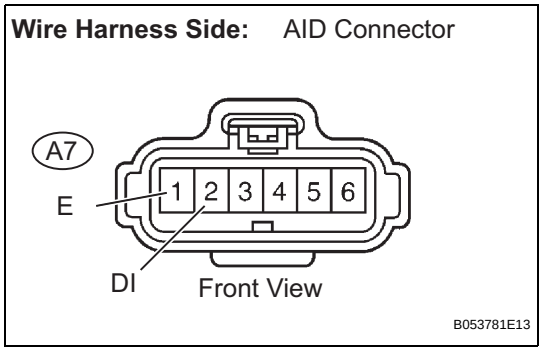
Tester Connections	Specified Conditions
+B (A7-5) - Body ground	9 to 14 V (near battery voltage)

(d) Reconnect the AID connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

6 INSPECT AIR INJECTION CONTROL DRIVER (DI TERMINAL VOLTAGE)



(a) Disconnect the A7 AID connector.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between the terminals of the AID connector.
Standard Voltage

Tester Connections	Specified Conditions
DI (A7-2) - E (A7-1)	9 to 14 V (near battery voltage)

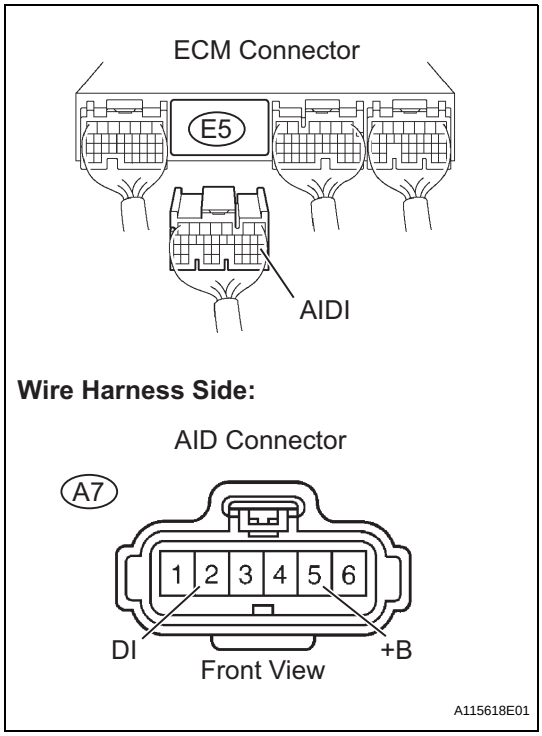
(d) Reconnect the AID connector.

OK → **REPLACE AIR INJECTION CONTROL DRIVER**

NG

ES

7	CHECK HARNESS AND CONNECTOR (ECM - AID)



(a) Disconnect the E5 ECM connector.
(b) Disconnect the A7 AID connector.
(c) Check the resistance.

Standard Resistance (check for open)

Tester Connections	Specified Conditions
DI (A7-2) - AIDI (E5-20)	Below 1 Ω

Standard Resistance (check for short)

Tester Connections	Specified Conditions
DI (A7-2) or AIDI (E5-20) - +B (A7-5)	10 kΩ or higher

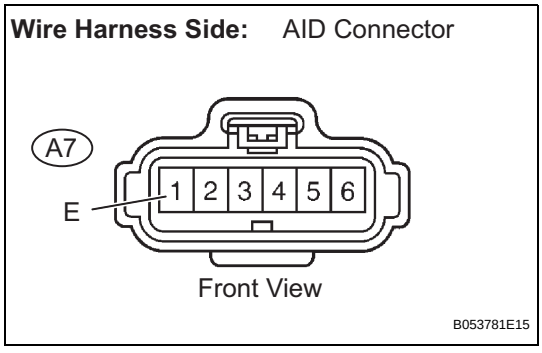
(d) Reconnect the ECM and AID connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

8	CHECK HARNESS OR CONNECTOR (AID - BODY GROUND)



(a) Disconnect the A7 AID connector.
(b) Check the resistance.

Standard Resistance (check for open)

Tester Connections	Specified Conditions
E (A7-1) - Body ground	Below 1 Ω

(c) Reconnect the AID connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

9	REPLACE AIR INJECTION CONTROL DRIVER

NEXT

10	CHECK WHETHER DTC OUTPUT RECURS (SYSTEM CHECK AUTOMATIC OPERATION)

(a) Start the engine and warm it up.
(b) Turn the ignition switch to OFF.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch to ON and turn the tester ON.
(e) Clear DTCs (where set) (see page ES-40).
(f) Select the following menu items:
DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / AUTOMATIC OPERATION.
(g) Start the engine after the tester initialization is finished.
(h) Perform the SYSTEM CHECK operation by pressing ENTER.
(i) After operating the AIR system, press the ENTER button to confirm the AIR system pending codes.
(j) Check PENDING DTCs.
(k) Turn the ignition switch to OFF.

OK:

No pending DTC output.

NOTICE:

- **When performing the AIR INJ CHECK operation after the battery cable has been reconnected, wait for 7 minutes with the ignition switch turned to ON or the engine running.**
- **Turn the ignition switch to OFF when the AIR INJ CHECK operation finishes.**

ES

DTC	P2102	Throttle Actuator Control Motor Circuit Low

DTC	P2103	Throttle Actuator Control Motor Circuit High

DESCRIPTION

The throttle actuator is operated by the ECM and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC No.	DTC Detection Conditions	Trouble Areas
P2102	Conditions (a) and (b) continue for 2.0 seconds (1 trip detection logic): (a) Throttle actuator duty ratio 80 % or more (b) Throttle actuator current 0.5 A or less	• Open in throttle actuator circuit • Throttle actuator • ECM
P2103	Either of following conditions met: • Hybrid IC diagnosis signal fail • Hybrid IC current limiter port fail	• Short in throttle actuator circuit • Throttle actuator • Throttle valve • Throttle body assembly • ECM

MONITOR DESCRIPTION

The ECM monitors the electrical current through the electronic actuator, and detects malfunctions and open circuits in the throttle actuator based on this value. If the current is outside the standard range, the ECM determines that there is a malfunction in the throttle actuator. In addition, if the throttle valve does not function properly (for example, stuck on), the ECM determines that there is a malfunction. The ECM then illuminates the MIL and sets a DTC.

Example:

When the electrical current is more than 10 A, or less than 0.5 A and the throttle actuator duty ratio exceeds 80 %, the ECM interprets this as the current being outside the standard range, and illuminates the MIL and sets a DTC.

If the malfunction is not repaired successfully, a DTC is set when the engine is quickly revved to a high rpm several times after the engine has idled for 5 seconds after engine start.

FAIL-SAFE

When either of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6.5° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned to OFF.

MONITOR STRATEGY

Related DTCs	P2102: Throttle actuator current (low current) P2103: Throttle actuator current (high current)
Required Sensors/Components (Main)	Throttle actuator (throttle body)
Required Sensors/Components (Related)	None
Frequency of Operation	Continuous
Duration	P2102: 2 seconds P2103: 0.6 seconds or conditions met 25 times

MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

P2102:

Duty ratio to open throttle actuator	80 % or more
Throttle actuator power supply	8 V or more

P2103:

Throttle actuator power supply	8 V or more

TYPICAL MALFUNCTION THRESHOLDS

ES

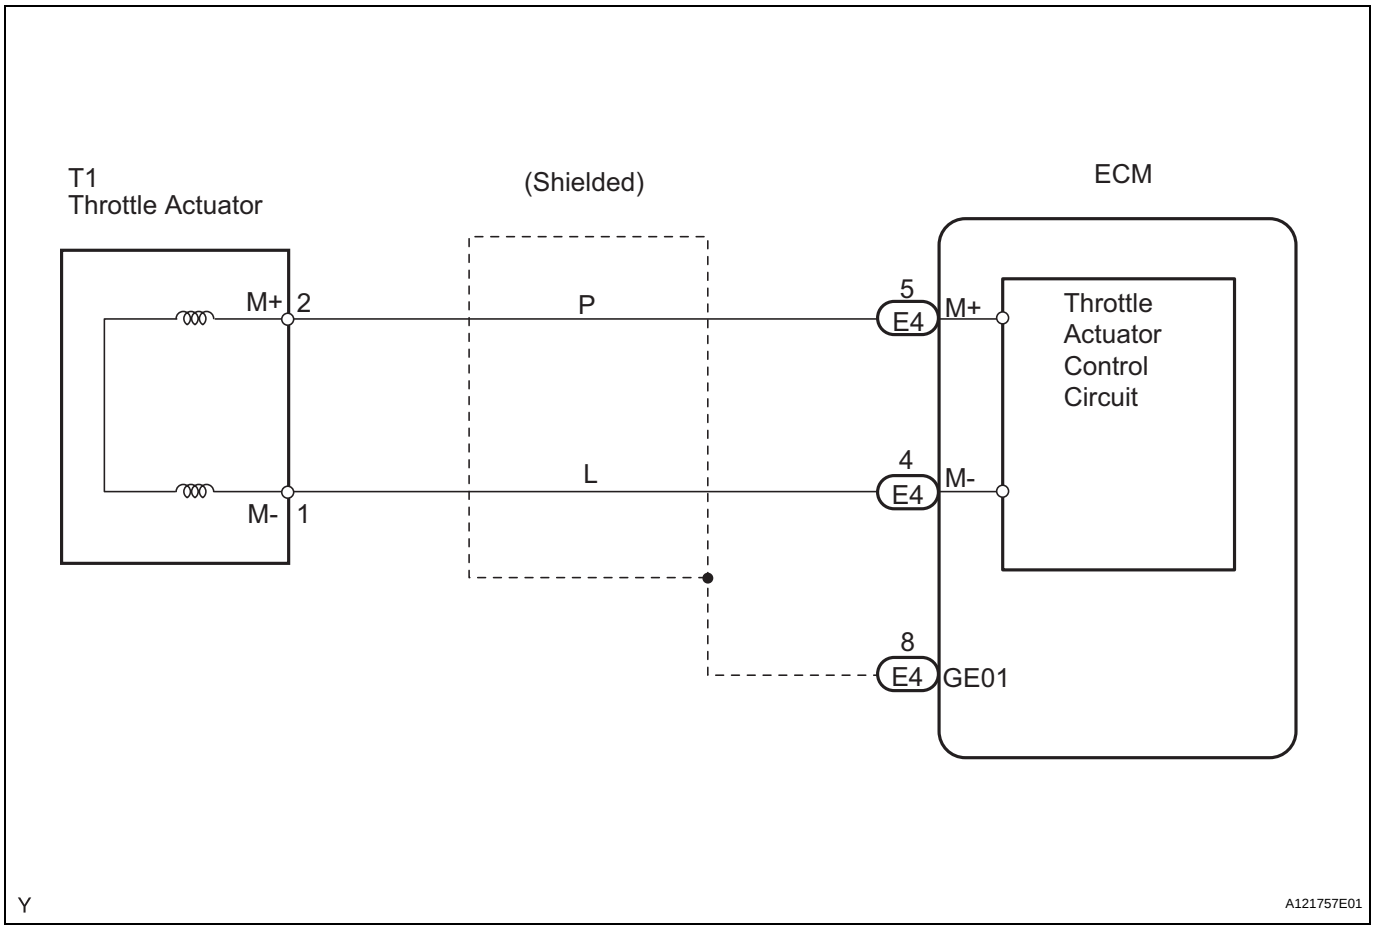
P2102:

Throttle actuator current	Less than 0.5 A

P2103:

Either of following conditions met:	A or B
A. Hybrid IC diagnosis signal	Fail
B. Hybrid IC current limiter port	Fail

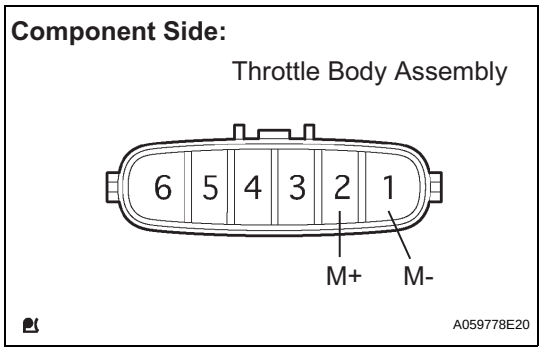
WIRING DIAGRAM



HINT:

- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.
- The throttle actuator current (THROTTLE MOT) and the throttle actuator duty ratio (THROTTLE OPN / THROTTLE CLS) can be read using an intelligent tester. However the ECM shuts off the throttle actuator current when the ETCS malfunctions.

1 INSPECT THROTTLE BODY ASSEMBLY (THROTTLE ACTUATOR RESISTANCE)



(a) Disconnect the T1 throttle body connector.
(b) Measure the resistance between the terminals of the throttle body.

Standard Resistance

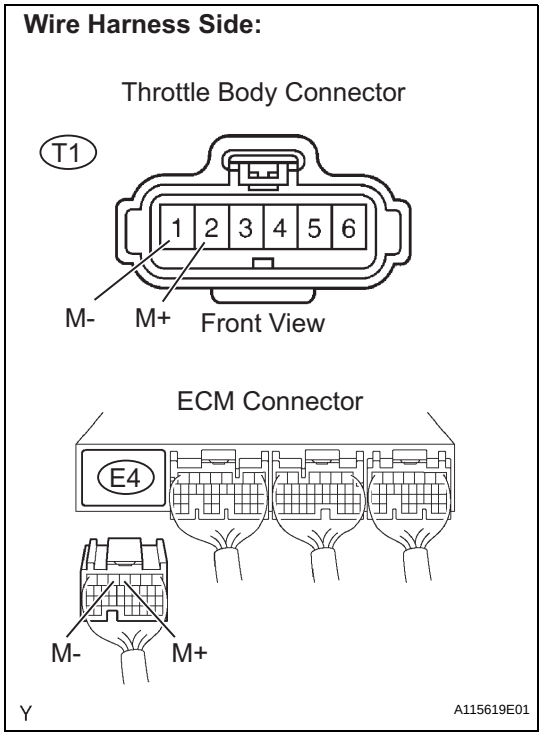
Tester Connections	Specified Conditions
M+ (2) - M- (1)	0.3 to 100 Ω at 20°C (68°F)

(c) Reconnect the throttle body connector.

NG → **REPLACE THROTTLE BODY**

OK

2 CHECK HARNESS AND CONNECTOR (THROTTLE ACTUATOR - ECM)



(a) Disconnect the T1 throttle body connector.
(b) Disconnect the E4 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
M+ (T1-2) - M+ (E4-5)	Below 1 Ω
M- (T1-1) - M- (E4-4)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
M+ (T1-2) or M+ (E4-5) - Body ground	10 kΩ or higher
M- (T1-1) or M- (E4-4) - Body ground	10 kΩ or higher

(d) Reconnect the throttle body connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3	INSPECT THROTTLE BODY

(a) Check for foreign objects between the throttle valve and the housing.

NG → **REMOVE FOREIGN OBJECT AND CLEAN THROTTLE BODY**

OK

4	INSPECT THROTTLE VALVE

(a) Check if the throttle valve opens and closes smoothly.

NG → **REPLACE THROTTLE BODY**

OK

REPLACE ECM

DTC	P2111	Throttle Actuator Control System - Stuck Open

DTC	P2112	Throttle Actuator Control System - Stuck Closed

DESCRIPTION

The throttle actuator is operated by the ECM, and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM in order that it can control the throttle actuator, and therefore the throttle valve, appropriately in response to driver inputs.
HINT:
This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC No.	DTC Detection Conditions	Trouble Areas
P2111	ECM signals throttle actuator to close, but stuck (1 trip detection logic)	• Throttle actuator circuit • Throttle body assembly • Throttle valve
P2112	ECM signals throttle actuator to open, but stuck (1 trip detection logic)	• Throttle actuator • Throttle body assembly • Throttle valve

MONITOR DESCRIPTION

The ECM determines that there is a malfunction in the ETCS when the throttle valve remains at a fixed angle despite a high drive current from the ECM. The ECM illuminates the MIL and sets a DTC.
If the malfunction is not repaired successfully, a DTC is set when the accelerator pedal is fully depressed and released quickly (to fully open and close the throttle valve) after the engine is next started.

MONITOR STRATEGY

Related DTCs	P2111: Throttle actuator stuck open P2112: Throttle actuator stuck closed
Required Sensors/Components (Main)	Throttle actuator
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	None

P2111 (Throttle actuator stuck open):

All of following conditions met	-
System guard*	ON
Throttle actuator current	2 A or more
Throttle actuator close duty ratio	80 % or more

P2112 (Throttle actuator stuck closed):

All of following conditions met	-
System guard*	ON
Throttle actuator current	2 A or more

Throttle actuator open duty-cycle	80 % or more
* System guard set when following conditions met	-
Throttle actuator	ON
Throttle actuator duty calculation	Executing
Throttle position sensor	Fail determined
Throttle actuator current-cut operation	Not executing
Throttle actuator power supply	4 V or more
Throttle actuator	Fail determined

TYPICAL MALFUNCTION THRESHOLDS

P2111 (Throttle actuator stuck open):

TP sensor voltage change	No change

P2112 (Throttle actuator stuck closed):

TP sensor voltage change	No change

FAIL-SAFE

When either of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6.5° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed.
If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned to OFF.

WIRING DIAGRAM

Refer to DTC P2102 (See page ES-287).

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2111 OR P2112)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P2111 or P2112	A
P2111 or P2112 and other DTCs	B

HINT:
If any DTCs other than P2111 or P2112 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2 CHECK THROTTLE BODY (VISUALLY CHECK THROTTLE VALVE)

(a) Check for contamination between the throttle valve and the housing. If necessary, clean the throttle body. And check that the throttle valve moves smoothly.
OK:
Throttle valve is not contaminated with foreign objects and moves smoothly.

NG → REPLACE THROTTLE BODY ASSEMBLY

ES

OK

3 CHECK WHETHER DTC OUTPUT RECURS (DTC P2111 OR P2112)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-40).
(e) Start the engine, and fully depress and release the accelerator pedal quickly (to fully open and close the throttle valve).
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

Result

Display (DTC Output)	Proceed To
No DTC	A
P2111 or P2112	B

B → REPLACE ECM

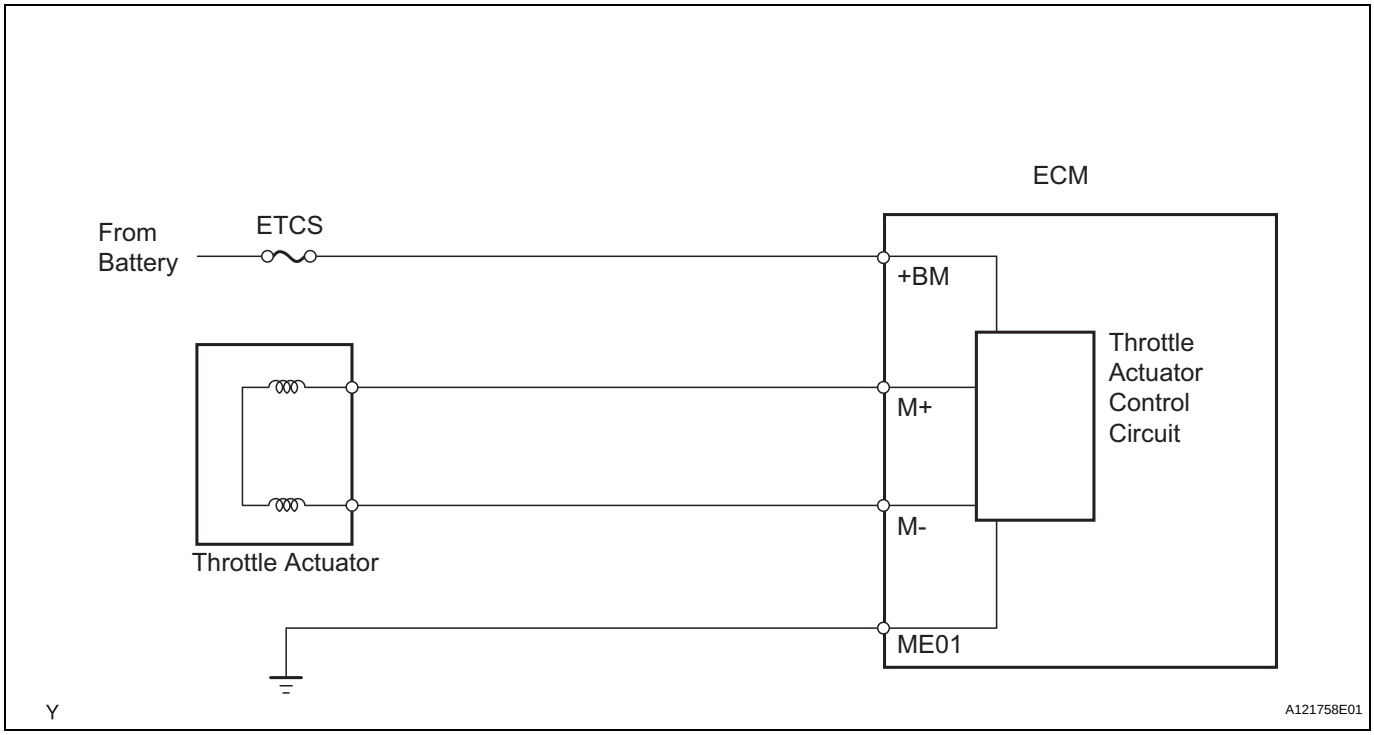
A

CHECK FOR INTERMITTENT PROBLEMS

DTC	P2118	Throttle Actuator Control Motor Current Range / Performance

DESCRIPTION

The ETCS (Electronic Throttle Control System) has a dedicated power supply circuit. The voltage (+BM) is monitored and when it is low (less than 4 V), the ECM determines that there is a malfunction in the ETCS and cuts off the current to the throttle actuator.
When the voltage becomes unstable, the ETCS itself becomes unstable. For this reason, when the voltage is low, the current to the throttle actuator is cut. If repairs are made and the system returns to normal, turn the ignition switch to OFF. The ECM then allows the current to flow to the throttle actuator so that it can be restarted.
HINT:
The ETCS does not use a throttle cable.



DTC No.	DTC Detection Conditions	Trouble Areas
P2118	Open in Electronic Throttle Control System (ETCS) power source (+BM) circuit (1 trip detection logic)	• Open in ETCS power source circuit • ETCS fuse • ECM

MONITOR DESCRIPTION

The ECM monitors the battery supply voltage applied to the throttle actuator.
When the power supply voltage (+BM) drops below 4 V for 0.8 seconds or more, the ECM interprets this as an open in the power supply circuit (+BM). The ECM illuminates the MIL and sets the DTC.
If the malfunction is not repaired successfully, the DTC is set 5 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P2118: Throttle actuator power supply
Required Sensors/Components (Main)	Throttle actuator, throttle valve, ETCS fuse
Required Sensors/Components (Related)	None
Frequency of Operation	Continuous
Duration	0.8 seconds

MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Battery voltage	More than 8 V

TYPICAL MALFUNCTION THRESHOLDS

Throttle actuator power supply voltage (+BM)	Less than 4 V

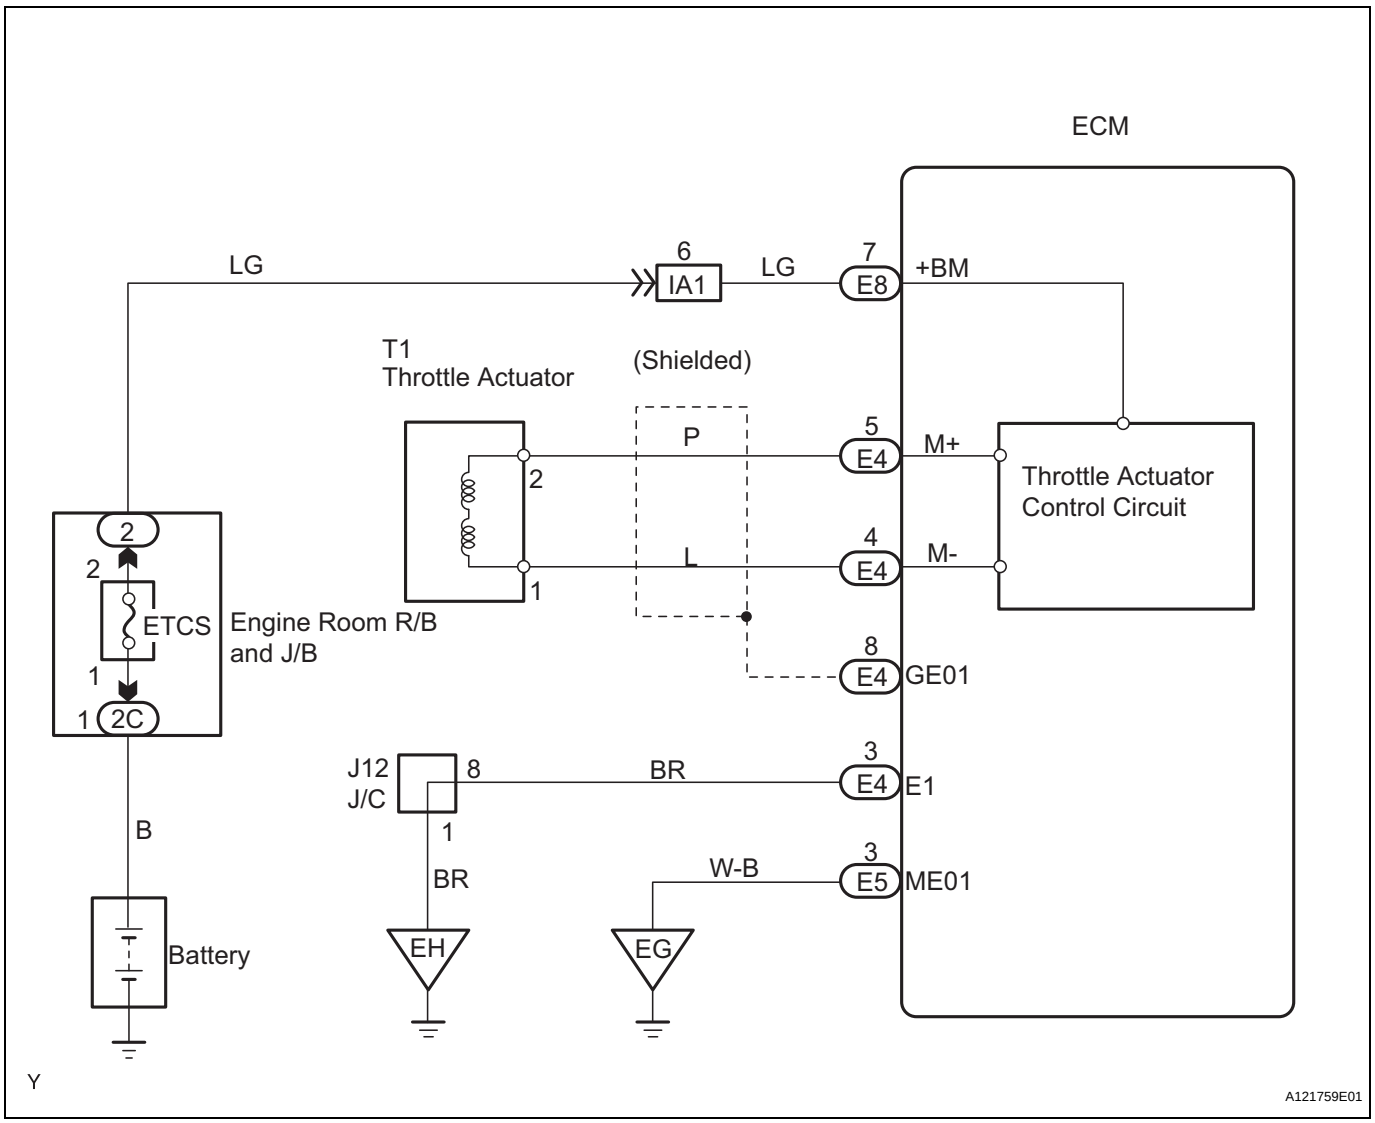
COMPONENT OPERATING RANGE

Throttle actuator power supply voltage	9 to 14 V

FAIL-SAFE

When this DTC, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6.5° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned to OFF.

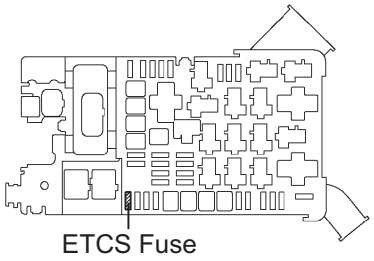
WIRING DIAGRAM



HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK FUSE (ETCS)

Engine Room R/B:

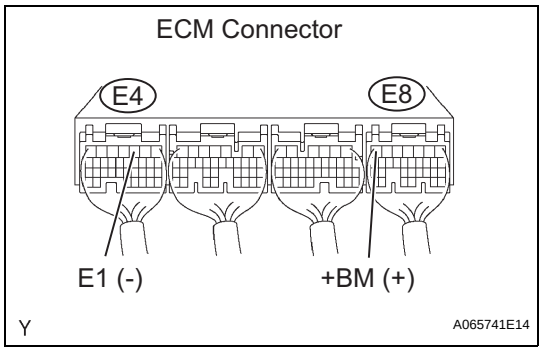


(a) Remove the ETCS fuse from the engine room R/B.
(b) Check the ETCS fuse resistance.
Standard Resistance:
Below 1 Ω
(c) Reinstall the ETCS fuse.

NG → **CHECK FOR SHORT IN ALL HARNESS AND COMPONENTS CONNECTED TO FUSE**

OK

2 INSPECT ECM (+BM VOLTAGE)



(a) Measure the voltage between the terminals of the ECM connectors.

Standard Voltage

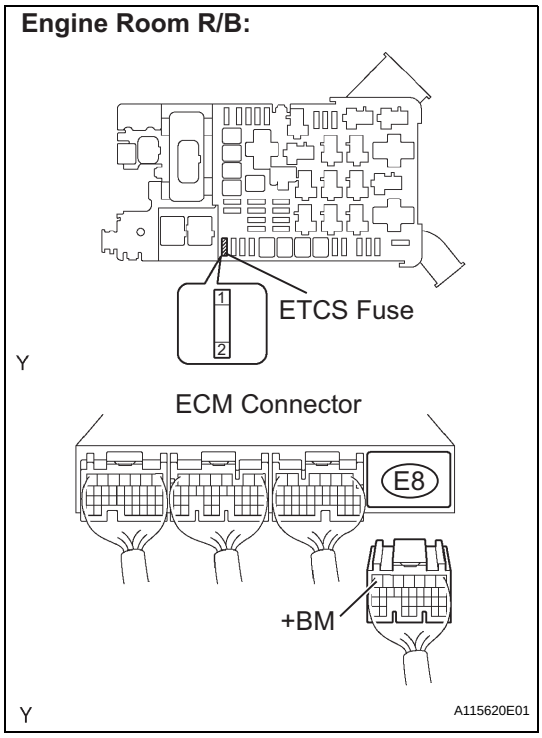
Tester Connections	Specified Conditions
+BM (E8-7) - E1 (E4-3)	9 to 14 V

OK → CHECK FOR INTERMITTENT PROBLEMS

ES

NG

3 CHECK HARNESS AND CONNECTOR (ECM - ETCS FUSE, FUSE - BATTERY)



(a) Check the harness and connector between the ETCS fuse and ECM.
   (1) Remove the ETCS fuse from the engine room R/B.
   (2) Disconnect the E8 ECM connector.
   (3) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
ETCS fuse (2) - +BM (E8-7)	Below 1 Ω

Standard Resistance (Check for short):

Tester Connections	Specified Conditions
ETCS fuse (2) or +BM (E8-7) - Body ground	10 kΩ or higher

   (4) Reinstall the ETCS fuse.
   (5) Reconnect the ECM connector.

(b) Check the harness and connector between the ETCS fuse and positive battery cable.
   (1) Remove the ETCS fuse from the engine room R/B.
   (2) Disconnect the positive battery cable.
   (3) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
Positive battery cable - ETCS fuse (1)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
Positive battery cable or ETCS fuse (1) - Body ground	10 kΩ or higher

   (4) Reinstall the ETCS fuse.
   (5) Reconnect the positive battery cable.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM

DTC	P2119	Throttle Actuator Control Throttle Body Range / Performance

DESCRIPTION

The Electronic Throttle Control System (ETCS) is composed of the throttle actuator, Throttle Position (TP) sensor, Accelerator Pedal Position (APP) sensor, and ECM. The ECM operates the throttle actuator to regulate the throttle valve in response to driver inputs. The TP sensor detects the opening angle of the throttle valve, and provides the ECM with feedback so that the throttle valve can be appropriately controlled by the ECM.

DTC No.	DTC Detection Conditions	Trouble Areas
P2119	Throttle valve opening angle continues to vary greatly from target opening angle (1 trip detection logic)	• Electronic Throttle Control System (ETCS) • ECM

ES

MONITOR DESCRIPTION

The ECM determines the actual opening angle of the throttle valve from the TP sensor signal. The actual opening angle is compared to the target opening angle commanded by the ECM. If the difference between these two values is outside the standard range, the ECM interprets this as a malfunction in the ETCS. The ECM then illuminates the MIL and sets the DTC.
If the malfunction is not repaired successfully, the DTC is set when the accelerator pedal is quickly released (to close the throttle valve) after the engine speed reaches 5,000 rpm by the accelerator pedal being fully depressed (fully open the throttle valve).

MONITOR STRATEGY

Related DTCs	P2119: ETCS malfunction
Required Sensors/Components (Main)	Throttle actuator
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	Within 1 second
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
System guard*	ON
*System guard set when following conditions met	-
Throttle actuator	ON
Throttle actuator duty calculation	Executing
TP sensor	Fail determined
Throttle actuator current-cut operation	Not executing
Throttle actuator power supply	4 V or more
Throttle actuator	Fail determined

TYPICAL MALFUNCTION THRESHOLDS

Either of following conditions A or B met	-
A. Commanded closed TP - current closed TP	0.3 V or more for 1 second
B. Commanded open TP - current open TP	0.3 V or more for 0.6 seconds

FAIL-SAFE

When this DTC, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6.5° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned to OFF.

WIRING DIAGRAM

Refer to DTC P2102 (See page ES-287).

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

ES

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2119)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.

(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P2119	A
P2119 and other DTCs	B

HINT:
If any DTCs other than P2119 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	CHECK WHETHER DTC OUTPUT RECURS (DTC P2119)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-40).
(e) Allow the engine to idle for 15 seconds.
CAUTION:
Exercise extreme care and take precautions at steps (f) and (g) below. Failure to do so may result in the vehicle unexpectedly rolling away.
(f) Securely apply the parking brake and move the gear selector lever to the D position.

(g) While depressing the brake pedal securely, fully depress the accelerator pedal for 5 seconds.
(h) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(i) Read DTCs.
HINT:
The voltage output of the throttle position sensor can be checked during step (g) using an intelligent tester. Variations in the voltage output indicate that the throttle actuator is in operation. To check the voltage output using the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / THROTTLE POS #1.

OK:

No DTC output.

NG → **REPLACE THROTTLE BODY**

OK

SYSTEM OK

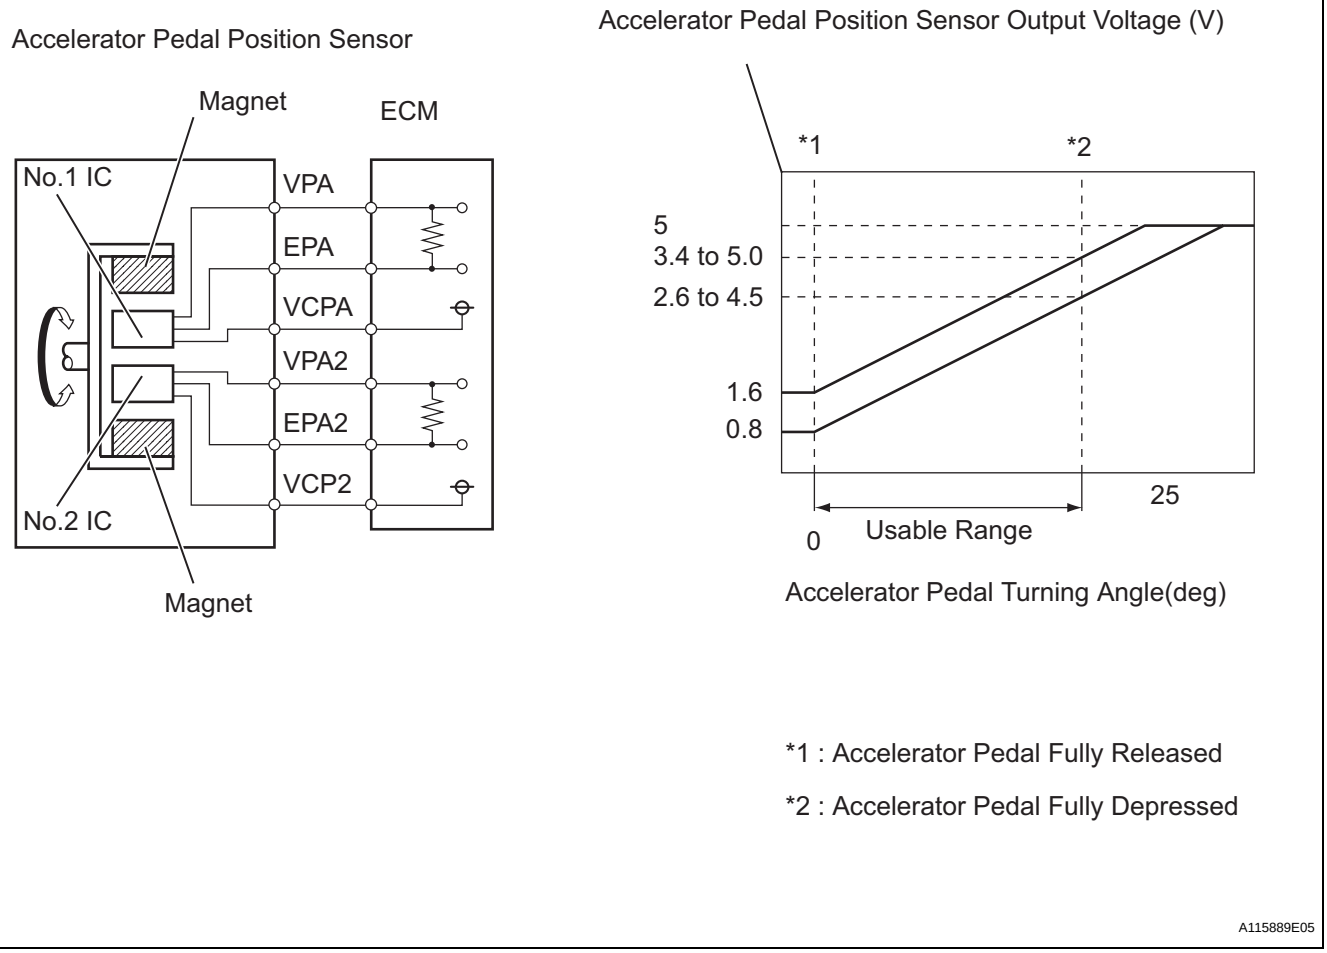
DTC	P2120	Throttle / Pedal Position Sensor / Switch "D" Circuit
DTC	P2122	Throttle / Pedal Position Sensor / Switch "D" Circuit Low Input
DTC	P2123	Throttle / Pedal Position Sensor / Switch "D" Circuit High Input
DTC	P2125	Throttle / Pedal Position Sensor / Switch "E" Circuit
DTC	P2127	Throttle / Pedal Position Sensor / Switch "E" Circuit Low Input
DTC	P2128	Throttle / Pedal Position Sensor / Switch "E" Circuit High Input
DTC	P2138	Throttle / Pedal Position Sensor / Switch "D" / "E" Voltage Correlation

HINT:
These DTCs relate to the Accelerator Pedal Position (APP) sensor.

DESCRIPTION

HINT:

- This ETCS (Electronic Throttle Control System) does not use a throttle cable.
- The Accelerator Pedal Position (APP) sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type, and uses Hall-effect elements, in order to yield accurate signals, even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0 V and 5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.
- The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.



DTC No.	DTC Detection Conditions	Trouble Areas
P2120	VPA fluctuates rapidly beyond upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic)	• Accelerator Pedal Position (APP) sensor • ECM
P2122	VPA 0.4 V or less for 0.5 seconds or more when accelerator pedal fully released (1 trip detection logic)	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA 4.8 V or more for 2.0 seconds or more (1 trip detection logic)	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic)	• APP sensor • ECM
P2127	VPA2 1.2 V or less for 0.5 seconds or more when accelerator pedal fully released (1 trip detection logic)	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 4.8 V or more (b) VPA between 0.4 V and 3.45 V	• APP sensor • Open in EPA2 circuit • ECM

DTC No.	DTC Detection Conditions	Trouble Areas
P2138	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) Difference between VPA and VPA2 0.02 V or less (b) VPA 0.4 V or less and VPA2 1.2 V or less	• Short in between VPA and VPA2 circuits • APP sensor • ECM

HINT:
When any of these DTCs are set, check the APP sensor voltage by selecting the following menu items on an intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / ACCEL POS #1 and ACCEL POS #2.

Trouble Areas	ACCEL POS #1 When AP Released	ACCEL POS #2 When AP Released	ACCEL POS #1 When AP Depressed	ACCEL POS #2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:
- Accelerator pedal positions are expressed as voltages.
- AP denotes for Accelerator Pedal.

MONITOR DESCRIPTION

When either of the voltage outputs of VPA or VPA2 deviates from the standard range, or the difference between the voltage outputs of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and sets a DTC.
Example:
When the voltage output of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is set.
If the malfunction is not repaired successfully, a DTC is set 2 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P2120: Accelerator pedal position sensor 1 (VPA) range check (fluctuating) P2122: Accelerator pedal position sensor 1 (VPA) range check (low voltage) P2123: Accelerator pedal position sensor 1 (VPA) range check (high voltage) P2125: Accelerator pedal position sensor 2 (VPA2) range check (fluctuating) P2127: Accelerator pedal position sensor 2 (VPA2) range check (low voltage) P2128: Accelerator pedal position sensor 2 (VPA2) range check (high voltage) P2138: Accelerator pedal position sensor correlation range check
Required Sensors/Components (Main)	Accelerator pedal position sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds: P2120, P2122, P2125 and P2127 2 seconds: P2123, P2128 and P2138
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Ignition switch	ON

TYPICAL MALFUNCTION THRESHOLDS

P2120:

VPA voltage	0.4 V or less or 4.8 V or more

P2122:

VPA voltage	0.4 V or less (when accelerator pedal fully released)

P2123:

VPA voltage	4.8 V or more

P2125:

VPA2 voltage	1.2 V or less or 4.8 V or more

P2127:

VPA2 voltage	1.2 V or less (when accelerator pedal fully released)

P2128:

Both of following conditions met:	A & B
A. VPA voltage	0.4 V or more and 3.45 V or less
B. VPA2 voltage	4.8 V or more

P2138:

Either of following condition met	A or B
A. Difference between VPA and VPA2 voltages	0.02 V or less
B. Both following conditions are met:	(1) & (2)
(1) VPA voltage	0.4 V or less
(2) VPA2 voltage	1.2 V or less

COMPONENT OPERATING RANGE

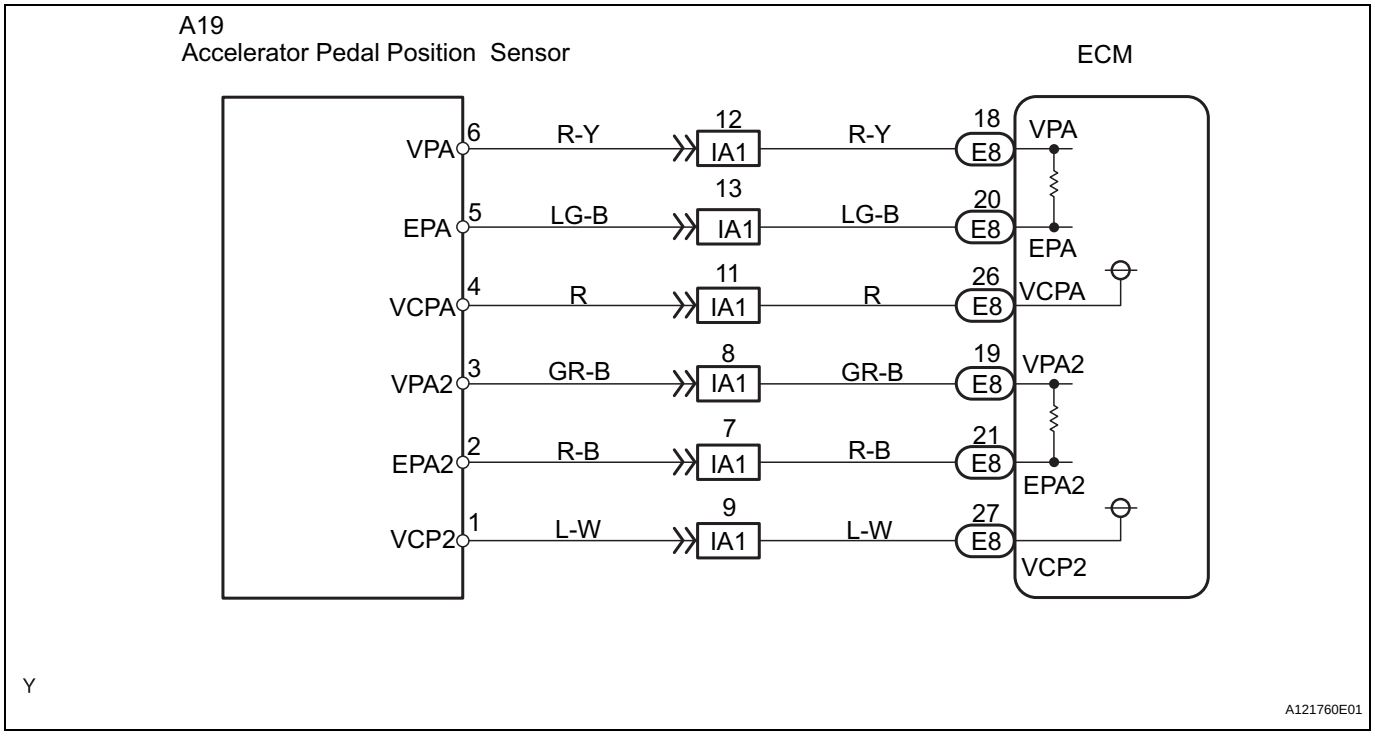
Parameter	Standard Value
VPA voltage	More than 0.4 V and less than 4.8 V
VPA2 voltage	More than 1.2 V and less than 4.8 V
Difference between VPA and VPA2 voltages	More than 0.02 V

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are set, the ECM enters fail-safe mode. If either of the 2 sensor circuit malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.

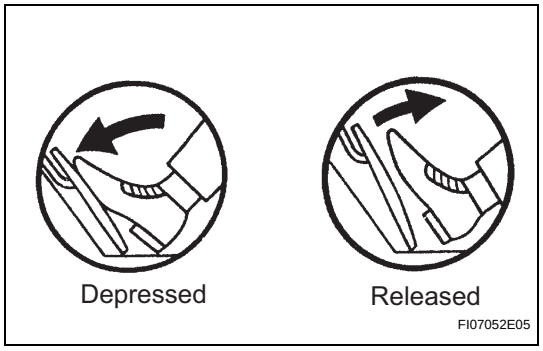
Fail-safe mode continues until a pass condition is detected, and the ignition switch is turned to OFF.

WIRING DIAGRAM



HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	READ DATA LIST (ACCEL POS #1 AND ACCEL POS #2)



(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS /ACCEL POS #1 and ACCEL POS #2.
(d) Read the values displayed on the tester.

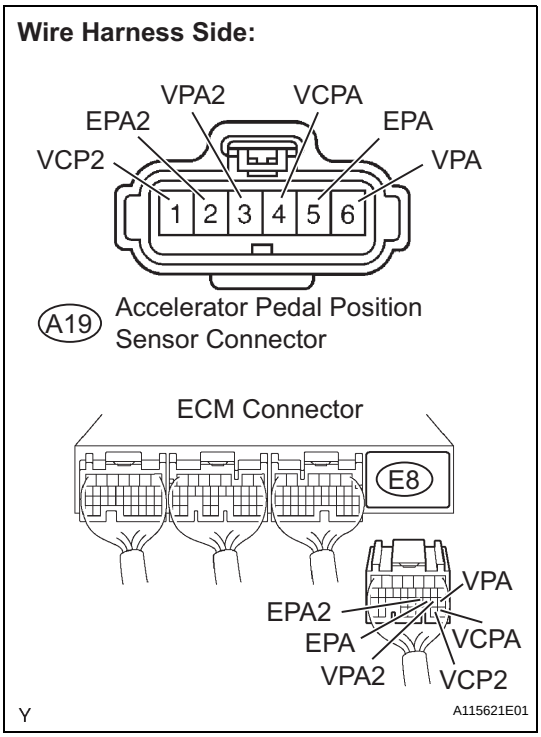
Standard Voltage

Accelerator Pedal Operations	ACCEL POS #1 (AP #1)	ACCEL POS #2 (AP #2)
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

OK → **Go to step 5**

NG

2	CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)



(a) Disconnect the A19 Accelerator Pedal Position (APP) sensor connector.
(b) Disconnect the E8 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
VPA (A19-6) - VPA (E8-18)	Below 1 Ω
EPA (A19-5) - EPA (E8-20)	Below 1 Ω
VCPA (A19-4) - VCPA (E8-26)	Below 1 Ω
VPA2 (A19-3) - VPA2 (E8-19)	Below 1 Ω
EPA2 (A19-2) - EPA2 (E8-21)	Below 1 Ω
VCP2 (A19-1) - VCP2 (E8-27)	Below 1 Ω

Standard Resistance (Check for short)

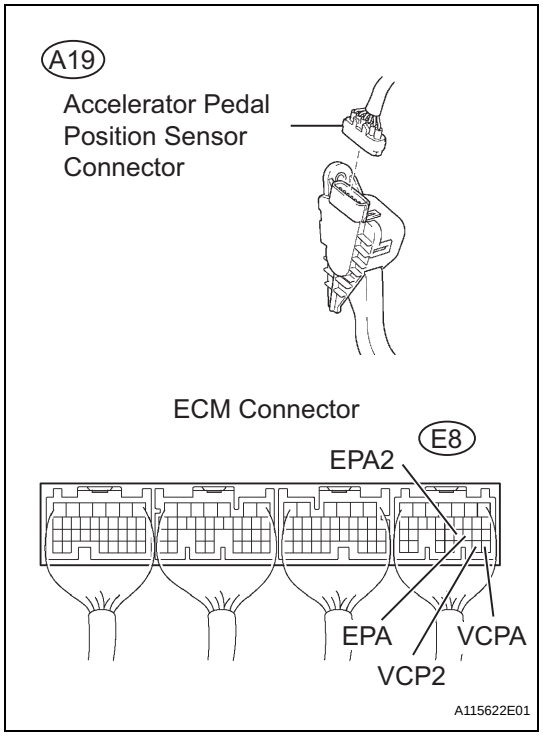
Tester Connections	Specified Conditions
VPA (A19-6) or VPA (E8-18) - Body ground	10 kΩ or higher
EPA (A19-5) or EPA (E8-20) - Body ground	10 kΩ or higher
VCPA (A19-4) or VCPA (E8-26) - Body ground	10 kΩ or higher
VPA2 (A19-3) or VPA2 (E8-19) - Body ground	10 kΩ or higher
EPA2 (A19-2) or EPA2 (E8-21) -Body ground	10 kΩ or higher
VCP2 (A19-1) or VCP2 (E8-27) - Body ground	10 kΩ or higher

(d) Reconnect the APP sensor connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3 INSPECT ECM (VCPA AND VCP2 VOLTAGE)



(a) Disconnect the APP sensor connector.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between the terminals of the ECM connector.

Standard Voltage

Tester Connections	Specified Conditions
VCPA (E8-26) - EPA (E8-20)	4.5 to 5.0 V
VCP2 (E8-27) - EPA2 (E8-21)	4.5 to 5.0 V

(d) Reconnect the APP sensor connector.

NG → **REPLACE ECM**

OK

4 REPLACE ACCELERATOR PEDAL ROD ASSEMBLY

NEXT

5 CHECK WHETHER DTC OUTPUT RECURS (ACCELERATOR PEDAL POSITION SENSOR DTCS)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Clear DTCs (see page ES-40).
(d) Allow the engine to idle for 15 seconds.
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(f) Read DTCs.

Result

Display (DTC Output)	Proceed To
P2120, P2122, P2123, P2125, P2127, P2128 and P2138	A
No output	B

B → **SYSTEM OK**

ES

A

REPLACE ECM

DTC	P2121	Throttle / Pedal Position Sensor / Switch "D" Circuit Range / Performance

HINT:
This DTC relates to the Accelerator Pedal Position (APP) sensor.

DESCRIPTION

Refer to DTC P2120 (See page ES-301).

DTC No.	DTC Detection Condition	Trouble Area
P2121	Difference between VPA and VPA2 exceeds threshold for 0.5 seconds	• Accelerator pedal position sensor circuit • Accelerator pedal position sensor • ECM

MONITOR DESCRIPTION

The accelerator pedal position sensor is mounted on the accelerator pedal bracket. The accelerator pedal position sensor has 2 sensor elements and 2 signal outputs: VPA and VPA2. VPA is used to detect the actual accelerator pedal angle (used for engine control) and VPA2 is used to detect malfunctions in VPA. When the difference between the voltage outputs of VPA and VPA2 deviates from the standard, the ECM determines that the accelerator pedal position sensor is malfunctioning. The ECM turns on the MIL and the DTC is set.

MONITOR STRATEGY

Related DTCs	P2121: Accelerator pedal position sensor malfunction
Required Sensors/Components (Main)	Accelerator pedal position sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

TYPICAL MALFUNCTION THRESHOLDS

Either of following conditions met:	
Difference between VTA sensor 1 voltage (learned value) and VTA2 sensor 2 voltage (learned value)	Less than 0.4 V, or more than 1.2 V

FAIL-SAFE

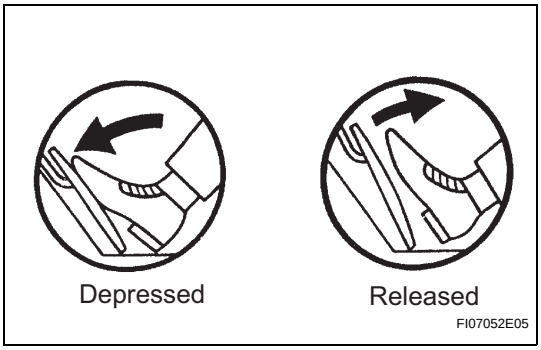
The accelerator pedal position sensor has two (main and sub) sensor circuits. If a malfunction occurs in either of the sensor circuits, the ECM detects the abnormal signal voltage difference between the two sensor circuits and switches to limp mode. In limp mode, the functioning circuit is used to calculate the accelerator pedal opening angle to allow the vehicle to continue driving. If both circuits malfunction, the ECM regards the opening angle of the accelerator pedal as being fully closed. In this case, the throttle valve remains closed as if the engine is idling.
If a pass condition is detected and then the ignition switch is turned to OFF, the fail-safe operation stops and the system returns to a normal condition.

WIRING DIAGRAM

Refer to DTC P2120 (See page ES-305).

HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	READ VALUE USING INTELLIGENT TESTER (ACCEL POS #1 AND ACCEL POS #2)



(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / ACCEL POS #1 and ACCEL POS #2.
(d) Read the values displayed on the tester.

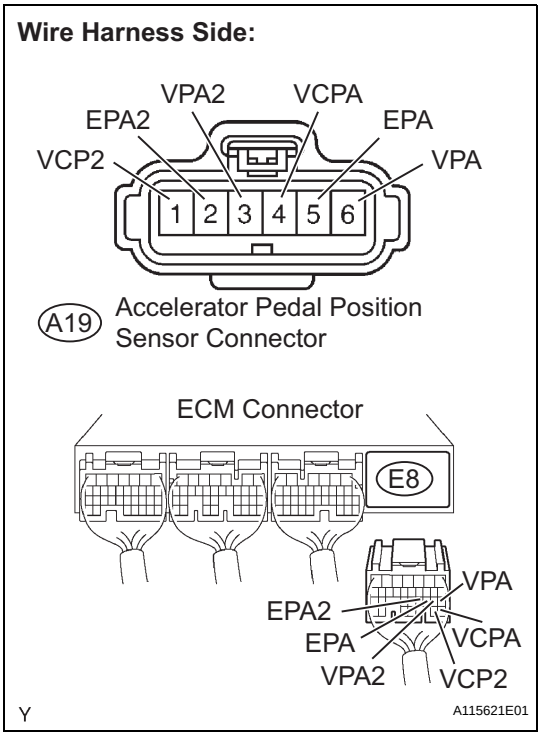
Standard Voltage

Accelerator Pedal Operations	ACCEL POS #1 (AP #1)	ACCEL POS #2 (AP #2)
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

OK → **Go to step 3**

NG

2	CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)



(a) Disconnect the A19 Accelerator Pedal Position (APP) sensor connector.
(b) Disconnect the E8 ECM connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
VPA (A19-6) - VPA (E8-18)	Below 1 Ω
EPA (A19-5) - EPA (E8-20)	Below 1 Ω
VCPA (A19-4) - VCPA (E8-26)	Below 1 Ω
VPA2 (A19-3) - VPA2 (E8-19)	Below 1 Ω
EPA2 (A19-2) - EPA2 (E8-21)	Below 1 Ω
VCP2 (A19-1) - VCP2 (E8-27)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
VPA (A19-6) or VPA (E8-18) - Body ground	10 kΩ or higher
EPA (A19-5) or EPA (E8-20) - Body ground	10 kΩ or higher
VCPA (A19-4) or VCPA (E8-26) - Body ground	10 kΩ or higher
VPA2 (A19-3) or VPA2 (E8-19) - Body ground	10 kΩ or higher

Tester Connections	Specified Conditions
EPA2 (A19-2) or EPA2 (E8-21) - Body ground	10 kΩ or higher
VCP2 (A19-1) or VCP2 (E8-27) - Body ground	10 kΩ or higher

(d) Reconnect the APP sensor connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3	REPLACE ACCELERATOR PEDAL ROD ASSEMBLY

NEXT

4	CHECK WHETHER DTC OUTPUT RECURS (ACCELERATOR PEDAL POSITION SENSOR DTCS)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Clear the DTC (see page ES-40).
(d) Start the engine.
(e) Allow the engine to idle for 15 seconds.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

Result

Display (DTC output)	Proceed to
P2121	A
No output	B

B → **SYSTEM OK**

A

REPLACE ECM

DTC	P2195	Oxygen (A/F) Sensor Signal Stuck Lean (Bank 1 Sensor 1)

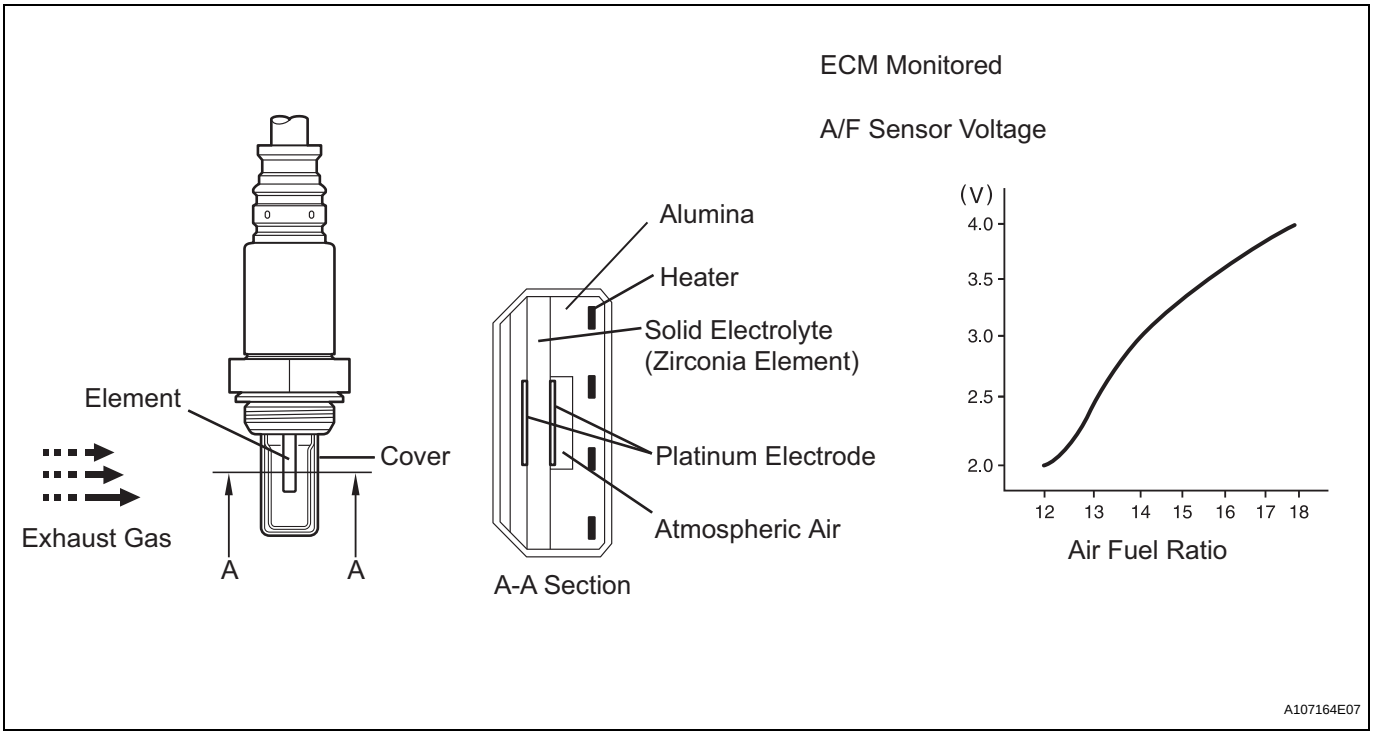
DTC	P2196	Oxygen (A/F) Sensor Signal Stuck Rich (Bank 1 Sensor 1)

HINT:
- Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

DESCRIPTION

ES

The A/F sensor generates a voltage* that corresponds to the actual air-fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air-fuel ratio. The ECM determines the deviation from the stoichiometric air-fuel ratio level, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air-fuel ratio accurately.
The A/F sensor is the planar type and is integrated with the heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor, in order to facilitate accurate air-fuel ratio detection. In addition, the sensor and heater portions are narrower than the conventional type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.
In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.
*: Value changes inside the ECM. Since the A/F sensor is the current output element, a current is converted to a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.



DTC No.	DTC Detection Conditions	Trouble Areas
P2195	Conditions (a) and (b) continue for 10 seconds or more (2 trip detection logic): (a) Air-Fuel Ratio (A/F) sensor voltage more than 3.8 V (b) Heated Oxygen (HO2) sensor voltage 0.15 V or more	• Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor (sensor 1) heater • A/F HEATER relay • A/F sensor heater and relay circuits • Air induction system • Fuel pressure • Injector • ECM
P2195	While fuel-cut operation performed (during vehicle deceleration), Air-Furl Ratio (A/F) sensor current 3.6 mA or more for 3 seconds. (2 trip detection logic)	• A/F sensor • ECM
P2196	Conditions (a) and (b) continue for 10 seconds or more (2 trip detection logic): (a) Air-Furl Ratio (A/F) sensor voltage less than 2.8 V (b) Heated Oxygen (HO2) sensor voltage less than 0.60 V	• Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor (sensor 1) heater • A/F HEATER relay • A/F sensor heater and relay circuits • Air induction system • Fuel pressure • Injector • ECM
P2196	While fuel-cut operation performed (during vehicle deceleration), Air-Furl Ratio (A/F) sensor current less than 1.0 mA for 3 seconds. (2 trip detection logic)	• A/F sensor • ECM

HINT:

- When either of theses DTCs is set, check the A/F sensor voltage output by selecting the following menu items on an intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / AFS B1S1.
- Short-term fuel trim values can also be read using an intelligent tester.
- The ECM regulates the voltages at the A1A+ and A1A- terminals of the ECM to a constant level. Therefore, the A/F sensor voltage output cannot be confirmed without using an intelligent tester.
- If the A/F sensor is malfunctioning, the ECM sets the DTC P2195 or P2196.

MONITOR DESCRIPTION

1. Sensor voltage detection monitor

Under the air-fuel ratio feedback control, if the A/F sensor voltage output indicates rich or lean for a certain period of time, the ECM determines that there is a malfunction in the A/F sensor. The ECM illuminates the MIL and sets a DTC.

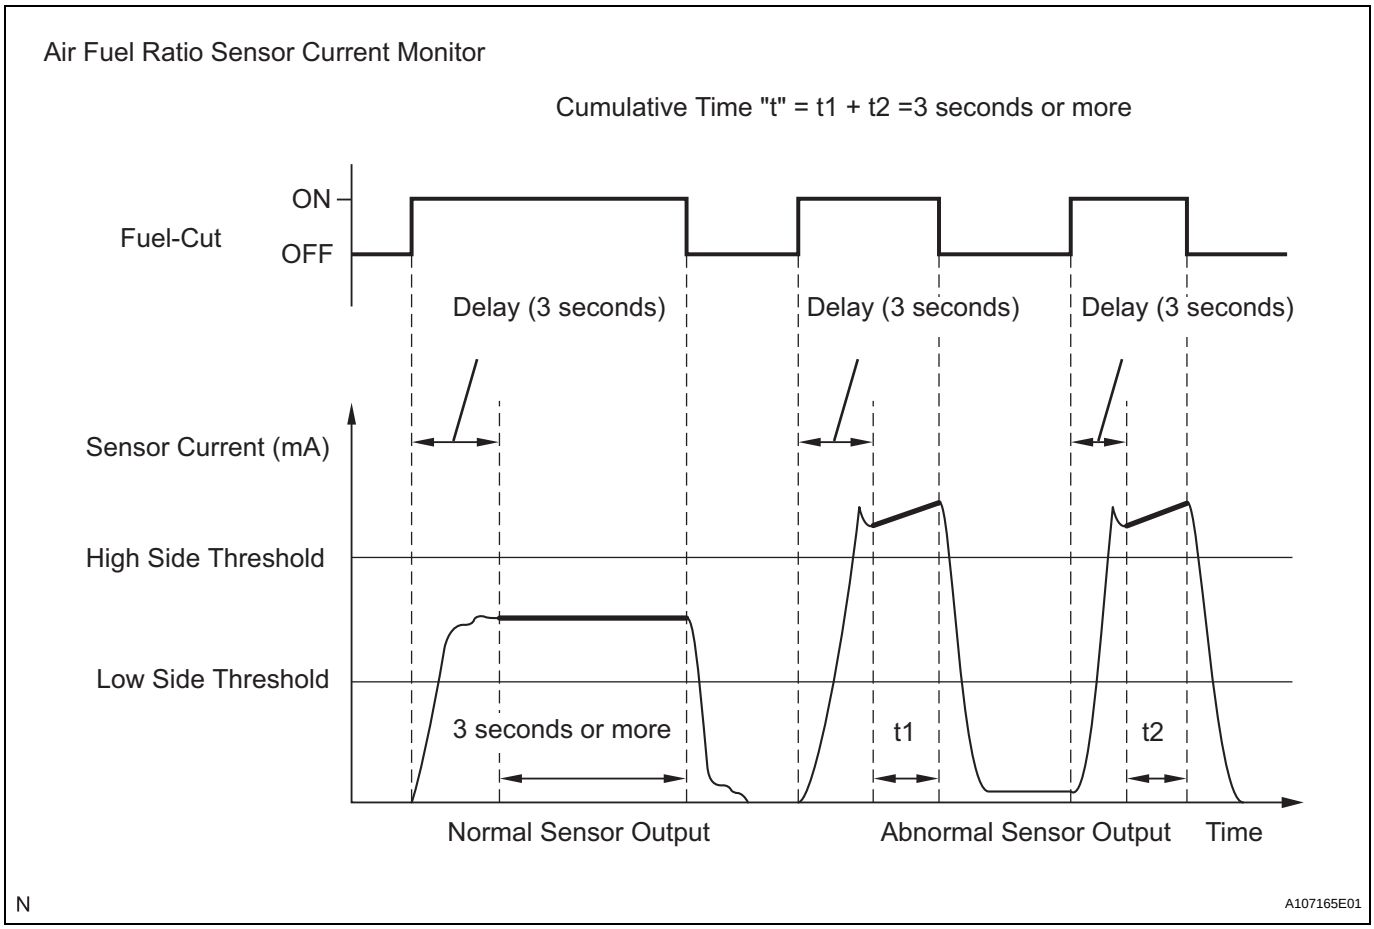
Example:

If the A/F sensor voltage output is less than 2.8 V (very rich condition) for 10 seconds, despite the rear HO2 sensor voltage output being less than 0.60 V, the ECM sets DTC P2196. Alternatively, if the A/F sensor voltage output is more than 3.8 V (very lean condition) for 10 seconds, despite the rear HO2 sensor voltage output being 0.15 V or more, DTC P2195 is set.

2. Sensor current detection monitor

A rich air-fuel mixture causes a low A/F sensor current, and a lean air-fuel mixture causes a high A/F sensor current. Therefore, the sensor output becomes low during acceleration, and it becomes high during deceleration with the throttle valve fully closed. The ECM monitors the A/F sensor current during fuel-cut and detects any abnormal current values.

If the A/F sensor output is 3.6 mA or more for more than 3 seconds of cumulative time, the ECM interprets this as a malfunction in the A/F sensor and sets DTC P2195 (high-side stuck). If the A/F sensor output is 1.0 mA or less for more than 3 seconds of cumulative time, the ECM sets DTC P2196 (low-side stuck).



MONITOR STRATEGY

Related DTCs	P2195: A/F sensor signal stuck lean P2196: A/F sensor signal stuck rich
Required Sensors/Components (Main)	A/F sensor
Required Sensors/Components (Related)	HO2 sensor
Frequency of Operation	Continuous
Duration	Within 10 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

The monitor will run whenever these DTCs are not present	P0031, P0032, P0051, P0052 (A/F sensor heater - Sensor 1) P0037, P0038, P0057, P0058 (O2 sensor heater - Sensor 2) P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for closed loop) P0136, P0156 (O2 Sensor - Sensor 2) P0171, P0172 (Fuel system) P0300 - P0308 (Misfire) P0335 (CKP sensor) P0340, P0341 (CMP sensor) P0500 (VSS) P2440 (A/R control valve stuck open) P2441 (A/R control valve stuck close) P2444 (AIP stuck ON) P2445 (AIP stuck OFF)

ES

Sensor voltage detection monitor (Lean side malfunction P2195):

Time while all of following conditions met	2 seconds or more
Rear HO2 sensor voltage	0.15 V or more
Time after engine start	30 seconds or more
A/F sensor status	Activated
Fuel system status	Closed-loop
Engine	Running

Sensor voltage detection monitor (Rich side malfunction P2196):

Time while all of following conditions met	2 seconds or more
Rear HO2 sensor voltage	Below 0.6 V
Time after engine start	30 seconds or more
A/F sensor status	Activated
Fuel system status	Closed-loop
Engine	Running

Sensor current detection monitor (P2195, P2196)

Battery voltage	11 V or more
Atmospheric pressure	75 kPa (570 mmHg) or higher
Air-fuel ratio sensor status	Activated
Engine coolant temperature	70°C (158°F) or more
Continuous time of fuel cut	3 seconds or more, and less than 10 seconds

TYPICAL MALFUNCTION THRESHOLDS

Sensor voltage detection monitor (Lean side malfunction P2195):

A/F sensor voltage	More than 3.8 V

Sensor voltage detection monitor (Rich side malfunction P2196):

A/F sensor voltage	Less than 2.8 V

Sensor current detection monitor (High side malfunction P2195):

Following condition met for:	3 seconds or more
Air-fuel ratio sensor current during fuel cut	3.6 mA or more

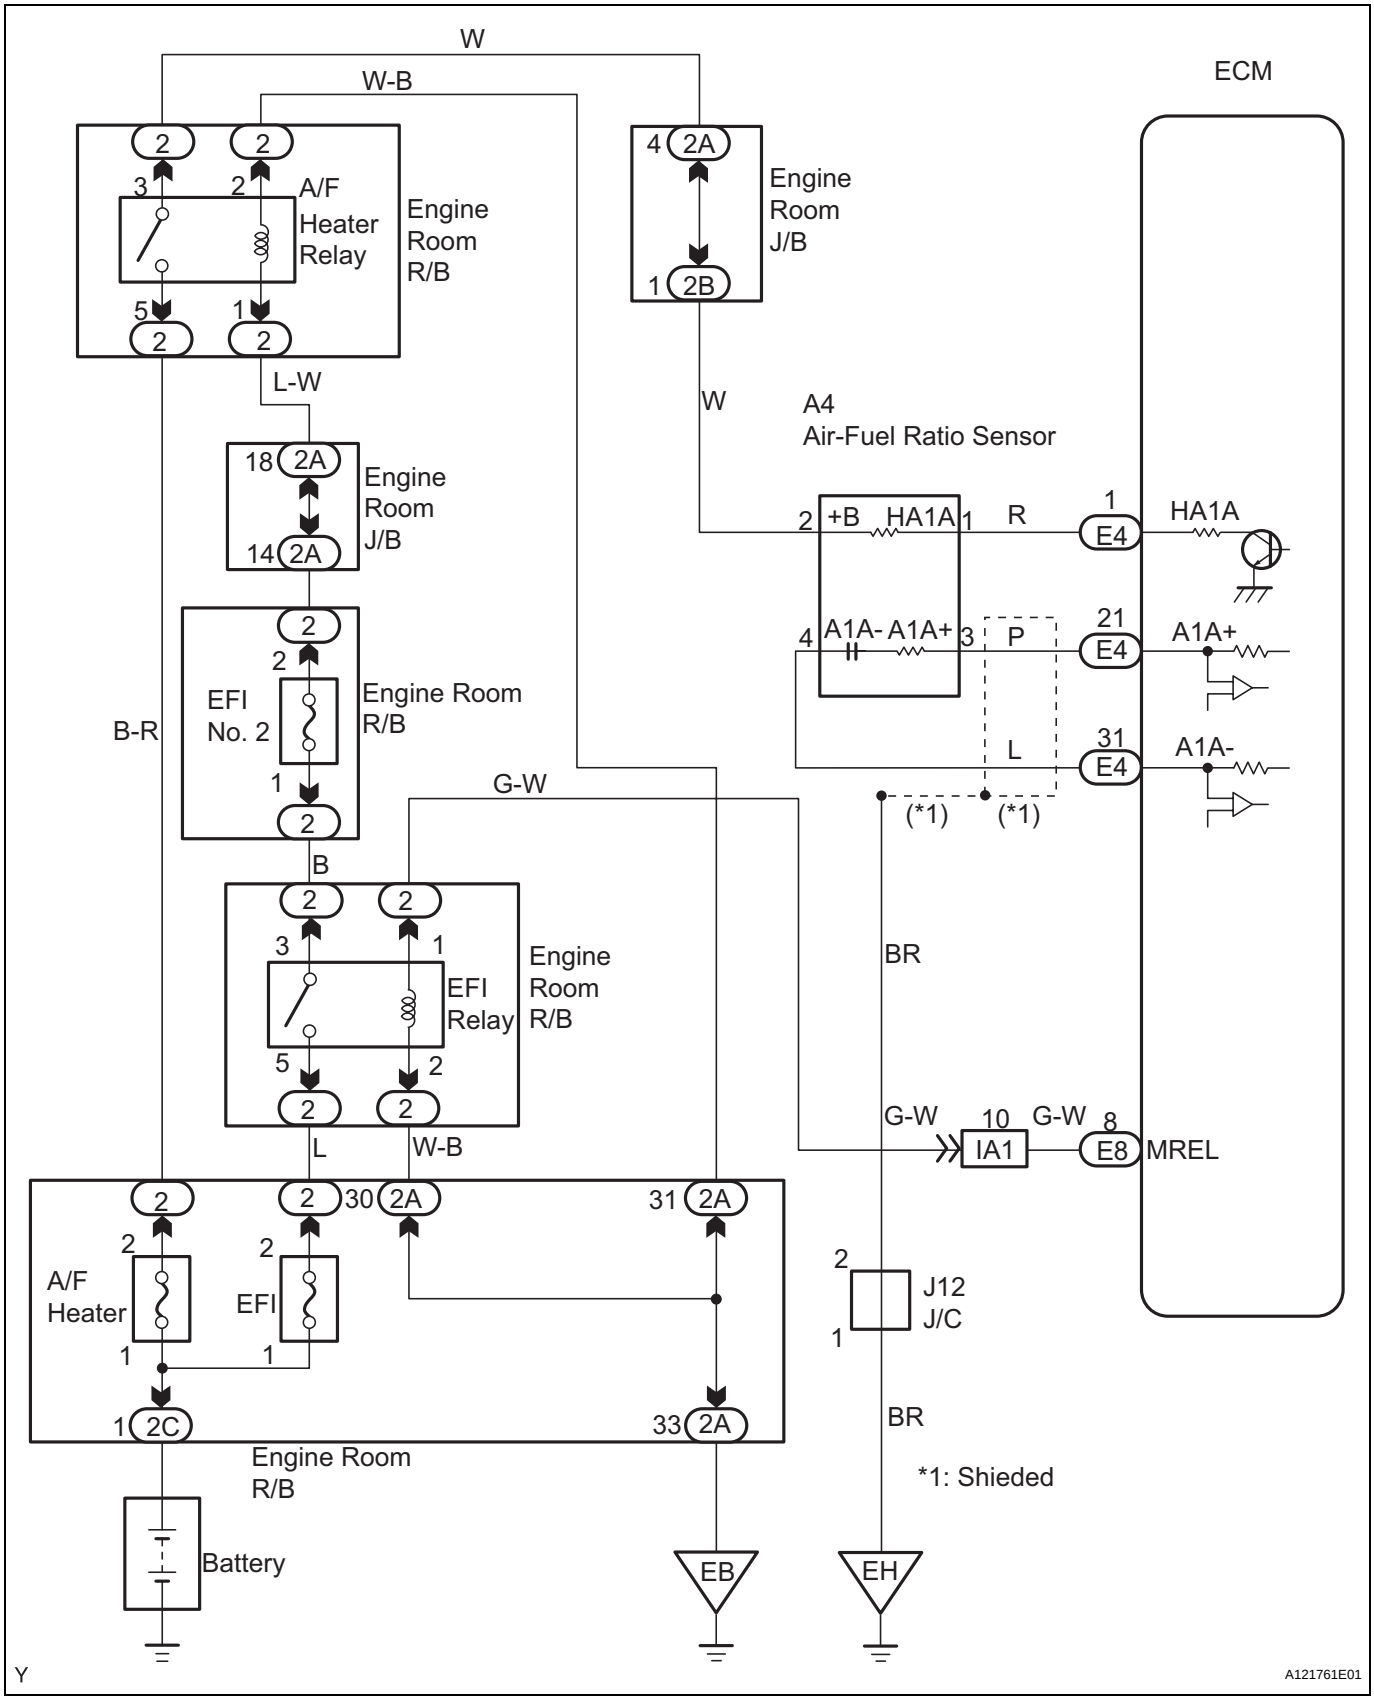
Sensor current detection monitor (Rich side malfunction P2196):

Following condition met for:	3 seconds or more
Air-fuel ratio sensor current during fuel cut	Less than 1 mA

MONITOR RESULT

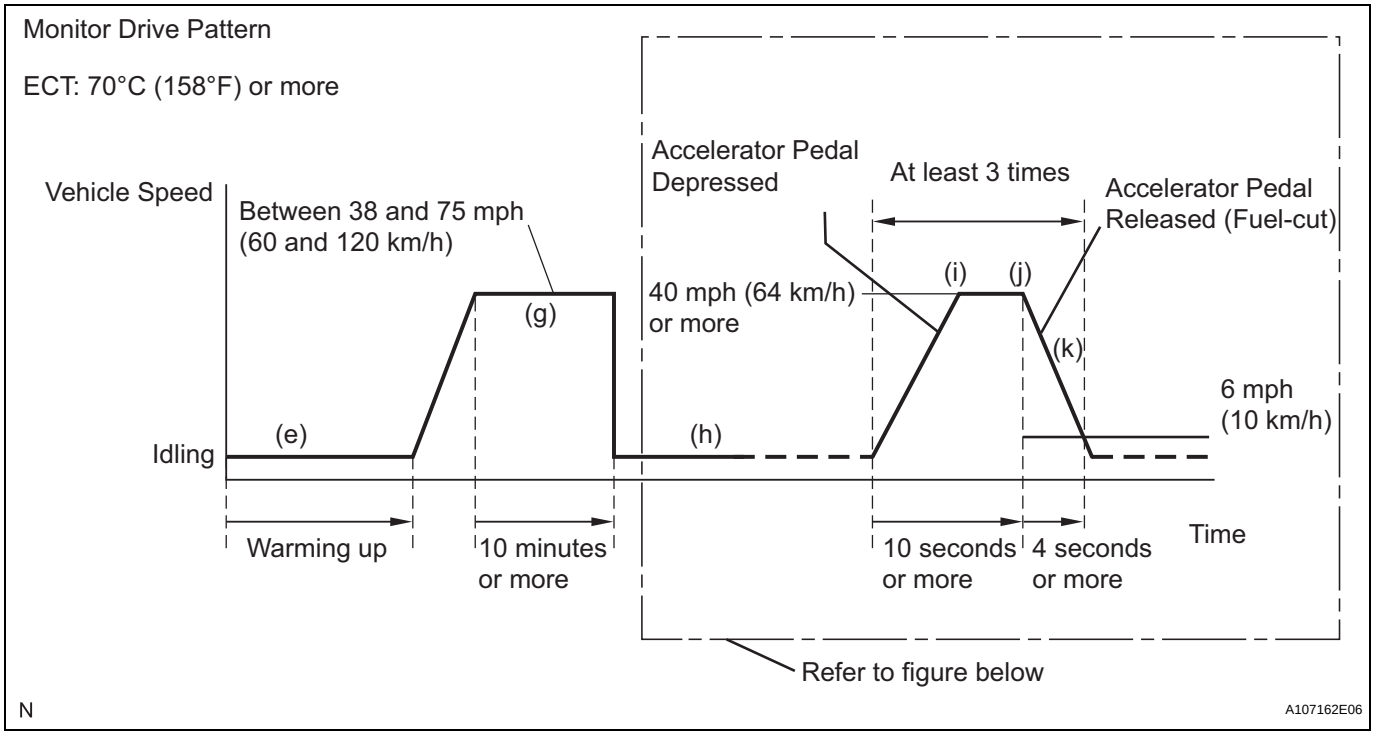
Refer to Checking Monitor Status (See page ES-21).

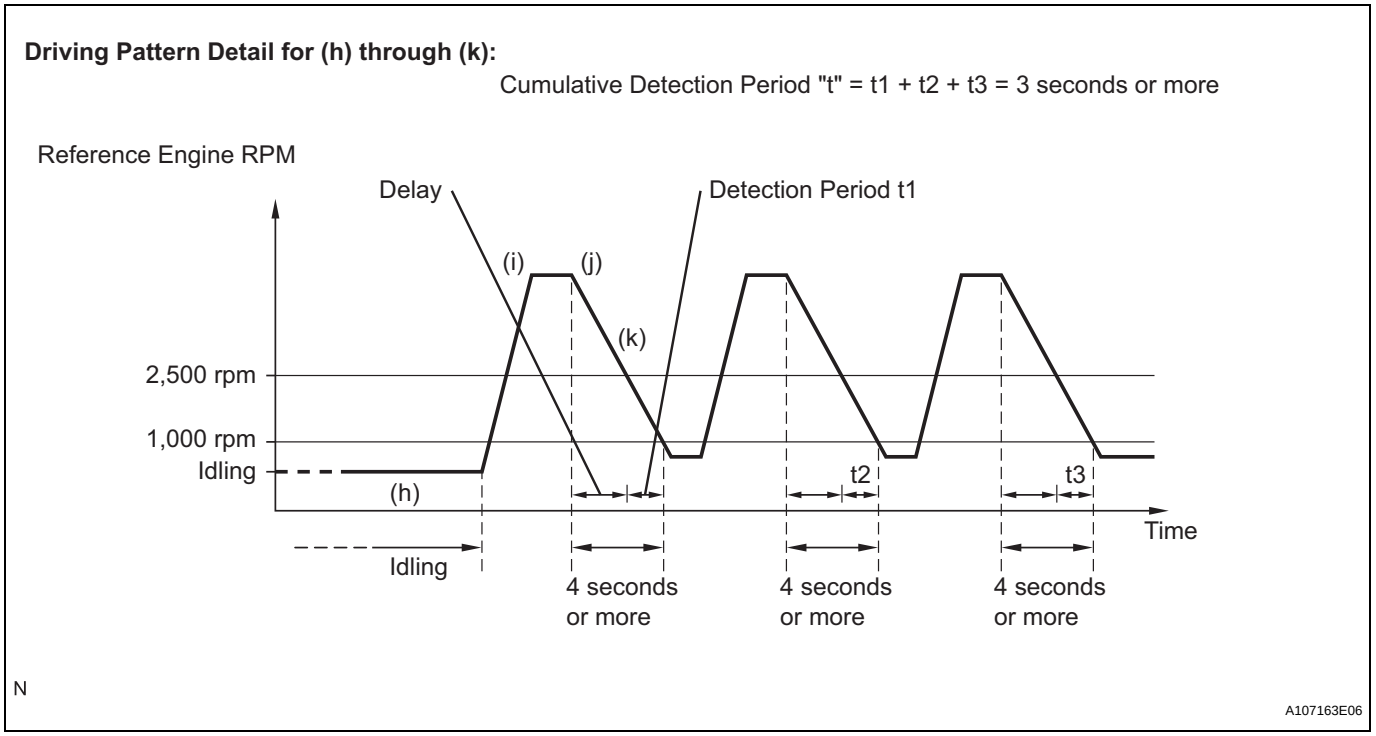
WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

This confirmation driving pattern is used in the "PERFORM CONFIRMATION DRIVING PATTERN" procedure of the following diagnostic troubleshooting procedure.





(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Clear DTCs (See page ES-40).
(e) Start the engine, and warm it up until the ECT reaches 70°C (158°F) or higher.
(f) On the intelligent tester, select the following menu items to check the fuel-cut status: DIAGNOSIS / ENHANCED OBD II / DATA LIST / USER DATA / FC IDLE.

(g) Drive the vehicle at between 38 mph (60 km/h) and 75 mph (120 km/h) for at least 10 minutes.
(h) Change the transmission to 2nd gear.
(i) Drive the vehicle at proper vehicle speed to perform fuel-cut operation (refer to the following HINT).
HINT:
Fuel-cut is performed when the following conditions are met:
- Accelerator pedal fully released.
- Engine speed is 2,500 rpm or more (fuel injection returns at 1,000 rpm).

(j) Accelerate the vehicle to 40 mph (64 km/h) or more by depressing the accelerator pedal for at least 10 seconds.
(k) Soon after performing step (j) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal, in order to execute fuel-cut control.
(l) Allow the vehicle to decelerate until the vehicle speed declines to less than 6 mph (10 km/h).
(m) Repeat steps from (h) through (k) above at least 3 times in one driving cycle.
HINT:
Completion of all A/F sensor monitors is required to change the value in TEST RESULT.

ES

CAUTION:
Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.

HINT:
Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using an intelligent tester.
1. Connect an intelligent tester to the DLC3.
2. Start the engine and turn the tester ON.
3. Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
4. On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
5. Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
6. Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and OS2 B1S2) displayed on the tester.

   NOTICE:
   - **The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.**
   - **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard Voltage

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (HO2)	+25 %	Rich	More than 0.5
O2S B1S2 (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:
The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		
3	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich
	Output Voltage Almost no reaction		Output voltage Almost no reaction		

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

HINT:

- DTC P2A00 may be set, when the air-fuel ratio is stuck rich or lean.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P2195 OR P2196)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

ES

Result

Display (DTC Output)	Proceed To
P2195 or P2196	A
P2195 or P2196 and other DTCs	B

If any DTCs relating to the A/F sensor (DTCs for the A/F sensor heater or A/F sensor admittance) are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2 READ DATA LIST (TEST VALUE OF A/F SENSOR)

ES

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Clear DTCs (see page ES-40).
(d) Allow the vehicle to drive in accordance with the drive pattern described in the CONFIRMATION DRIVING PATTERN.
(e) Select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / MONITOR STATUS.
(f) Check that the status of O2S MON is COMPL.
If the status is still INCMPL, drive the vehicle according to the driving pattern again.
HINT:
- AVAIL indicates that the component has not been monitored yet.
- COMPL indicates that the component is functioning normally.
- INCMPL indicates that the component is malfunctioning.

(g) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / TEST RESULT / RANGE B1S1, then press the ENTER button.
(h) Check the test value of the A/F sensor output current during fuel-cut.

Result

Test Value	Proceed To
Within normal range (1.0 mA or more, and less than 3.6 mA)	A
Outside normal range (Less than 1.0 mA, or 3.6 mA or more)	B

B → Go to step 20

A

3 READ DATA LIST (OUTPUT VOLTAGE OF A/F SENSOR)

(a) Connect an intelligent tester to the DLC3.
(b) Start the engine.
(c) Turn the tester ON.

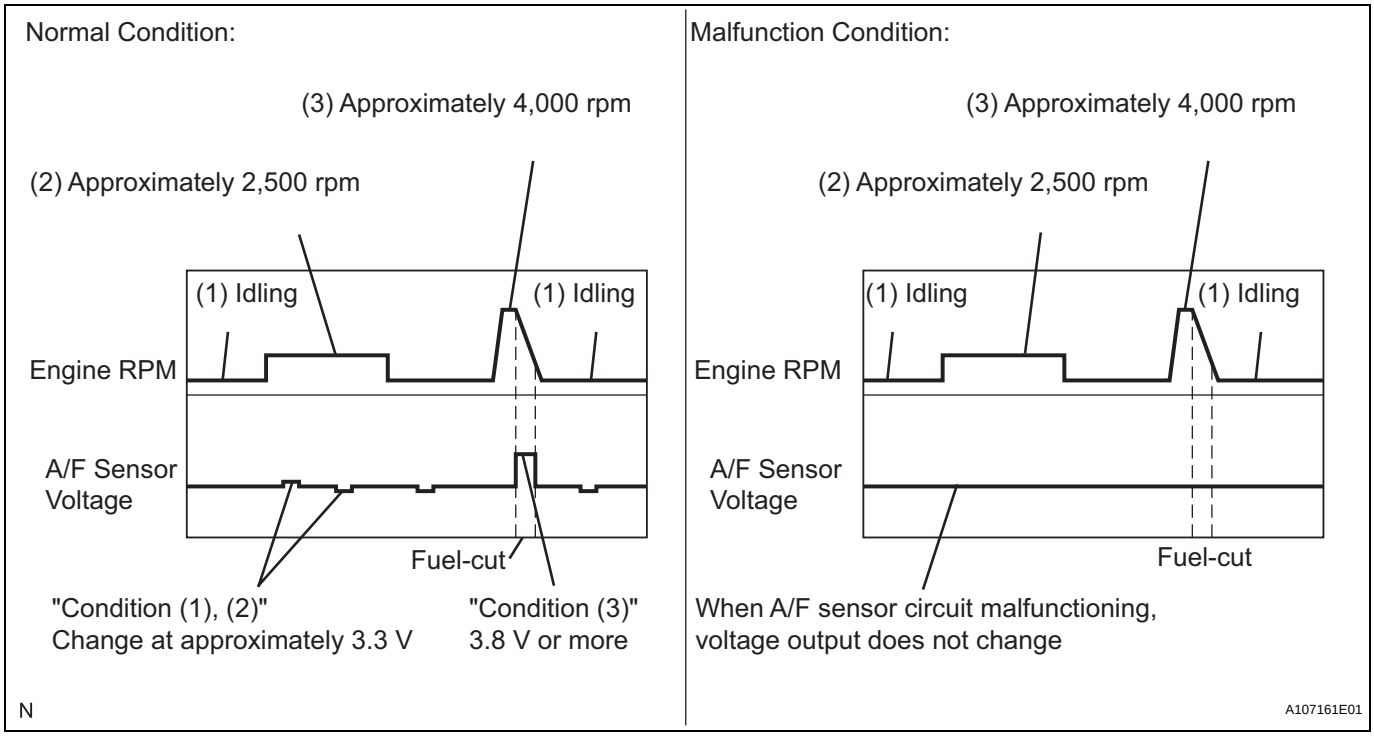
(d) Warm up the A/F sensor at an engine speed of 2,500 rpm for 90 seconds.
(e) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / USER DATA / AFS B1S1 and ENGINE SPD.
(f) Check the A/F sensor voltage three times, when the engine is in each of the following conditions:
  (1) While idling (check for at least 30 seconds)
  (2) At an engine speed of approximately 2,500 rpm (without any sudden changes in engine speed)
  (3) Raise the engine speed to 4,000 rpm and then quickly release the accelerator pedal so that the throttle valve is fully closed.

Standard Voltage

Conditions	A/F Sensor Voltage Variations	Reference
(1) and (2)	Changes at approximately 3.3 V	3.1 V and 3.5 V
(3)	Increases to 3.8 V or more	This occurs during engine deceleration (when fuel-cut performed)

ES

For more information, see the diagrams below.



HINT:

- If the output voltage of the A/F sensor remains at approximately 3.3 V (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have an open circuit. (This will also happen if the A/F sensor heater has an open circuit.)
- If the output voltage of the A/F sensor remains at either approximately 3.8 V or more, or 2.8 V or less (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have a short circuit.

- The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and results in a momentary increase in the A/F sensor output voltage.
- The ECM must establish a closed throttle valve position learning value to perform fuel cut. If the battery terminal has been reconnected, the vehicle must be driven over 10 mph (16 km/h) to allow the ECM to learn the closed throttle valve position.
- When the vehicle is driven:
  The output voltage of the A/F sensor may be below 2.8 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The A/F sensor is functioning normally.
- The A/F sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the A/F sensor or ECM will show a constant voltage result.

ES

NG → **Go to step 10**

OK

4	PERFORM CONFIRMATION DRIVING PATTERN

NEXT

5	CHECK WHETHER DTC OUTPUT RECURS (DTC P2195 OR P2196)

(a) Read DTCs using the intelligent tester.
(b) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.

Result

HINT:
- Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

DESCRIPTION

Refer to DTC P2195 (See page ES-312).

DTC No.	DTC Detection Conditions	Trouble Areas
P2238	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (2 trip detection logic) (a) A1A+ voltage 0.5 V or less (b) (A1A+) - (A1A-) = 0.1 V or less • Case 2: A/F sensor admittance: Less than 0.022 1/Ω (2 trip detection logic)	• Open or short in Air-Fuel Ratio (A/F) sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater • A/F HEATER relay • A/F sensor heater and relay circuits • ECM
P2239	A1A+ voltage more than 4.5 V for 5.0 seconds or more (2 trip detection logic)	• Open or short in Air-Fuel Ratio (A/F) sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater • A/F HEATER relay • A/F sensor heater and relay circuits • ECM
P2252	A1A- voltage 0.5 V or less for 5.0 seconds or more (2 trip detection logic)	• Open or short in Air-Fuel Ratio (A/F) sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater • A/F HEATER relay • A/F sensor heater and relay circuits • ECM
P2253	A1A- voltage more than 4.5 V for 5.0 seconds or more (2 trip detection logic)	• Open or short in Air-Fuel Ratio (A/F) sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater • A/F HEATER relay • A/F sensor heater and relay circuits • ECM

MONITOR DESCRIPTION

The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or voltage output deviates greatly from the standard range, the ECM determines that there is an open or short malfunction in the A/F sensor circuit.

MONITOR STRATEGY

Refer to DTC P2195 (See page ES-316).

HINT:
Intelligent tester only:
Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using an intelligent tester.

1. Connect an intelligent tester to the DLC3.
2. Start the engine and turn the tester ON.
3. Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
4. On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
5. Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
6. Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and OS2 B1S2) displayed on the tester.
   HINT:
   - The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
   - Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard Voltage

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (HO2)	+25 %	Rich	More than 0.5
O2S B1S2 (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:
The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
3	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich
	Output Voltage Almost no reaction		Output voltage Almost no reaction		

ES

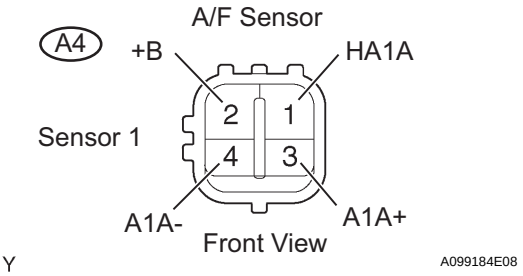
- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

HINT:

- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

Component Side:



(a) Disconnect the A4 Air-Fuel Ratio (A/F) sensor connector.
(b) Measure the resistance between the terminals of the A/F sensor connector.

Standard Resistance

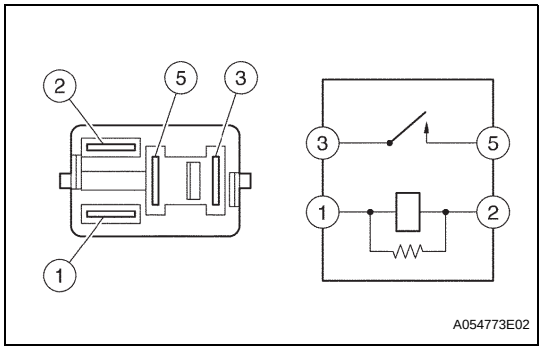
Tester Connections	Specified Conditions
HA1A (1) - +B (2)	1.8 to 3.4 Ω at 20°C (68°F)
HA1A (1) - A1A- (4)	10 kΩ or higher

(c) Reconnect the A/F sensor connector.

NG → **REPLACE AIR FUEL RATIO SENSOR**

OK

2 INSPECT AIR FUEL RATIO SENSOR HEATER RELAY (A/F HEATER RELAY)



(a) Remove the A/F HEATER relay from the engine room R/B.
(b) Check the A/F HEATER relay resistance.

Standard Resistance

Tester Connections	Specified Conditions
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

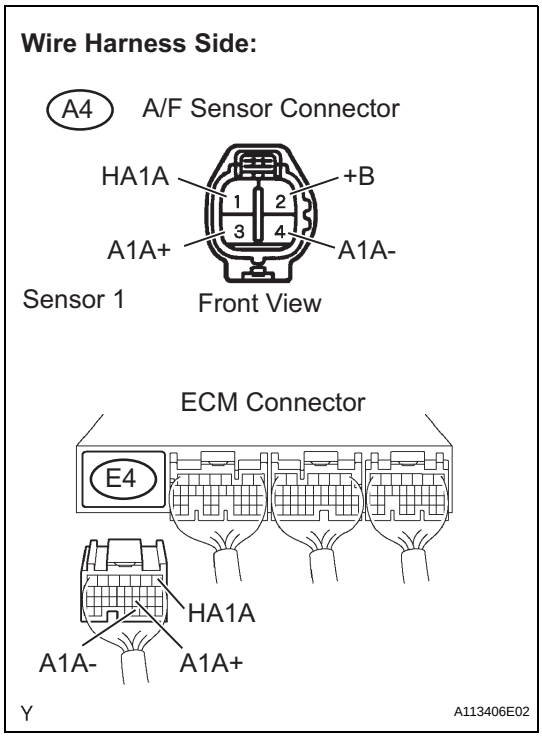
(c) Reinstall the A/F HEATER relay.

ES

NG → **REPLACE AIR FUEL RATIO SENSOR HEATER RELAY**

OK

3 CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)



(a) Disconnect the A4 A/F sensor connector.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between the +B terminal of the A/F sensor connector and body ground.

Standard Voltage

Tester Connections	Specified Conditions
+B (A4-2) - Body ground	9 to 14 V

(d) Turn the ignition switch to OFF.
(e) Disconnect the E4 ECM connector.
(f) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
HA1A (A4-1) - HA1A (E4-1)	Below 1 Ω
A1A+ (A4-3) - A1A+ (E4-21)	Below 1 Ω
A1A- (A4-4) - A1A- (E4-31)	Below 1 Ω

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
HA1A (A4-1) or HA1A (E4-1) - Body ground	10 kΩ or higher
A1A+ (A4-3) or A1A+ (E4-21) - Body ground	10 kΩ or higher
A1A- (A4-4) or A1A- (E4-31) - Body ground	10 kΩ or higher

(g) Reconnect the ECM connector.
(h) Reconnect the A/F sensor connector.

ES

DTC	P2401	Evaporative Emission Leak Detection Pump Stuck OFF

DTC	P2402	Evaporative Emission Leak Detection Pump Stuck ON

DTC SUMMARY

DTC No.	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P2401	Leak detection pump stuck OFF	Leak detection pump creates negative pressure through reference orifice, and EVAP system pressure measured to determine 0.02 inch leak criterion. 0.02 inch leak criterion measured at start and at end of leak check. If system pressure higher than -1.06 kPa (-7.95 mmHg)*, or lower than -4.85 kPa (-36.38 mmHg)*, ECM determines that leak detection pump stuck OFF.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM • Leakage from EVAP system	While ignition switch OFF	2 trip
P2402	Leak detection pump stuck ON	Leak detection pump creates negative pressure through reference orifice, and EVAP system pressure measured to determine 0.02 inch leak criterion. If system pressure higher than -1.06 kPa (-7.95 mmHg)*, or lower than -4.85 kPa (-36.38 mmHg)*, ECM determines that leak detection pump stuck ON.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • ECM	While ignition switch OFF	2 trip

*: The threshold values vary according to the atmospheric pressure measured in operation A. The values described in the table above are based on an atmospheric pressure of 100 kPa (750.1 mmHg).

HINT:

The leak detection pump is built into the canister pump module.

DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) System (see page ES-392).

Refer to the EVAP System (see page ES-397).

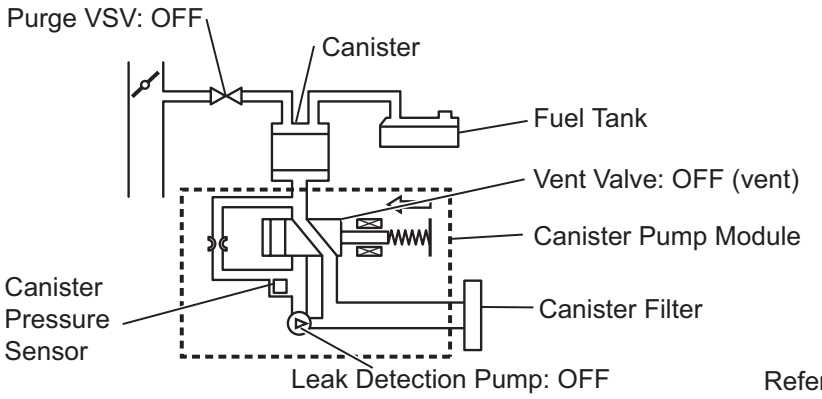
MONITOR DESCRIPTION

5 hours* after the ignition switch is turned to OFF, the electric leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.
HINT:
*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned to OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak criterion (reference pressure) measurement	In order to determine 0.02 inch leak criterion, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as they will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak criterion (reference pressure) measurement	After second 0.02 inch leak criterion measurement, leak check performed by comparing first and second 0.02 inch leak criterion. If stabilized system pressure higher than second 0.02 inch leak criterion, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

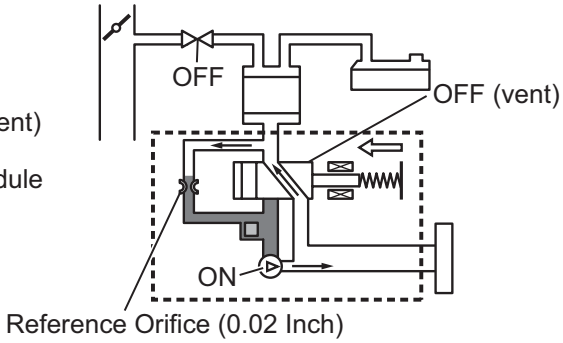
* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

Operation A: Atmospheric Pressure Measurement

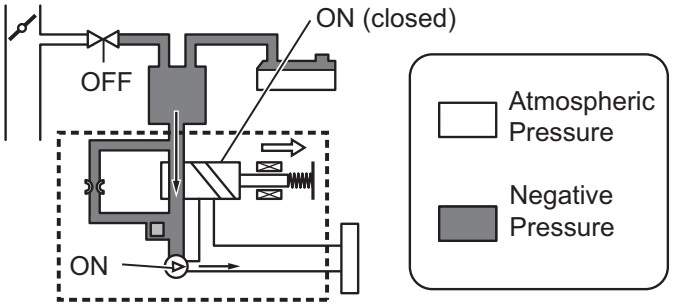


Operation B, E:

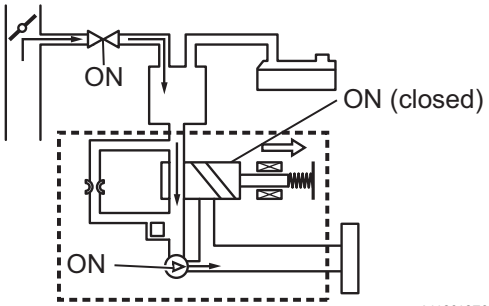
0.02 Inch Leak Criterion Measurement



Operation C: EVAP System Pressure Measurement



Operation D: Purge VSV Monitor

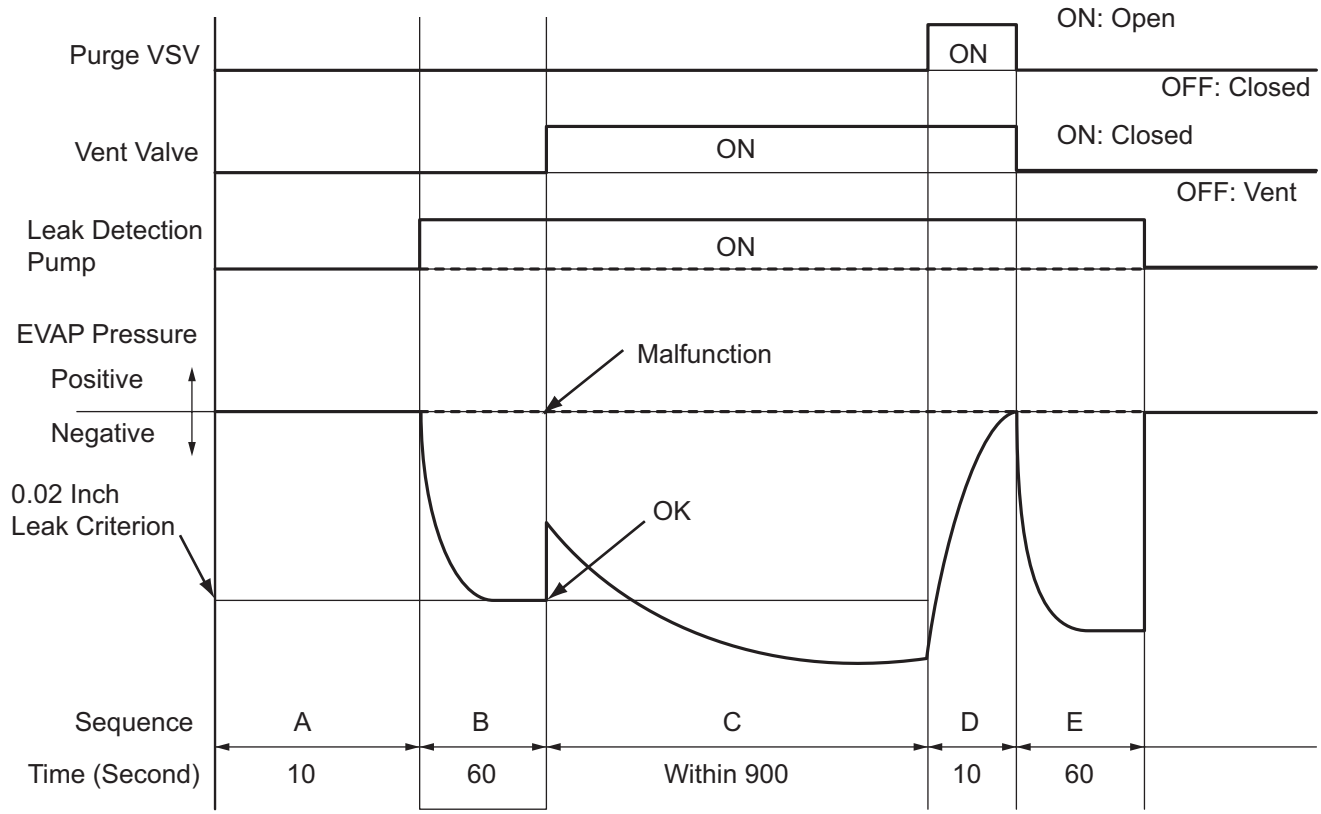


Y

A112612E02

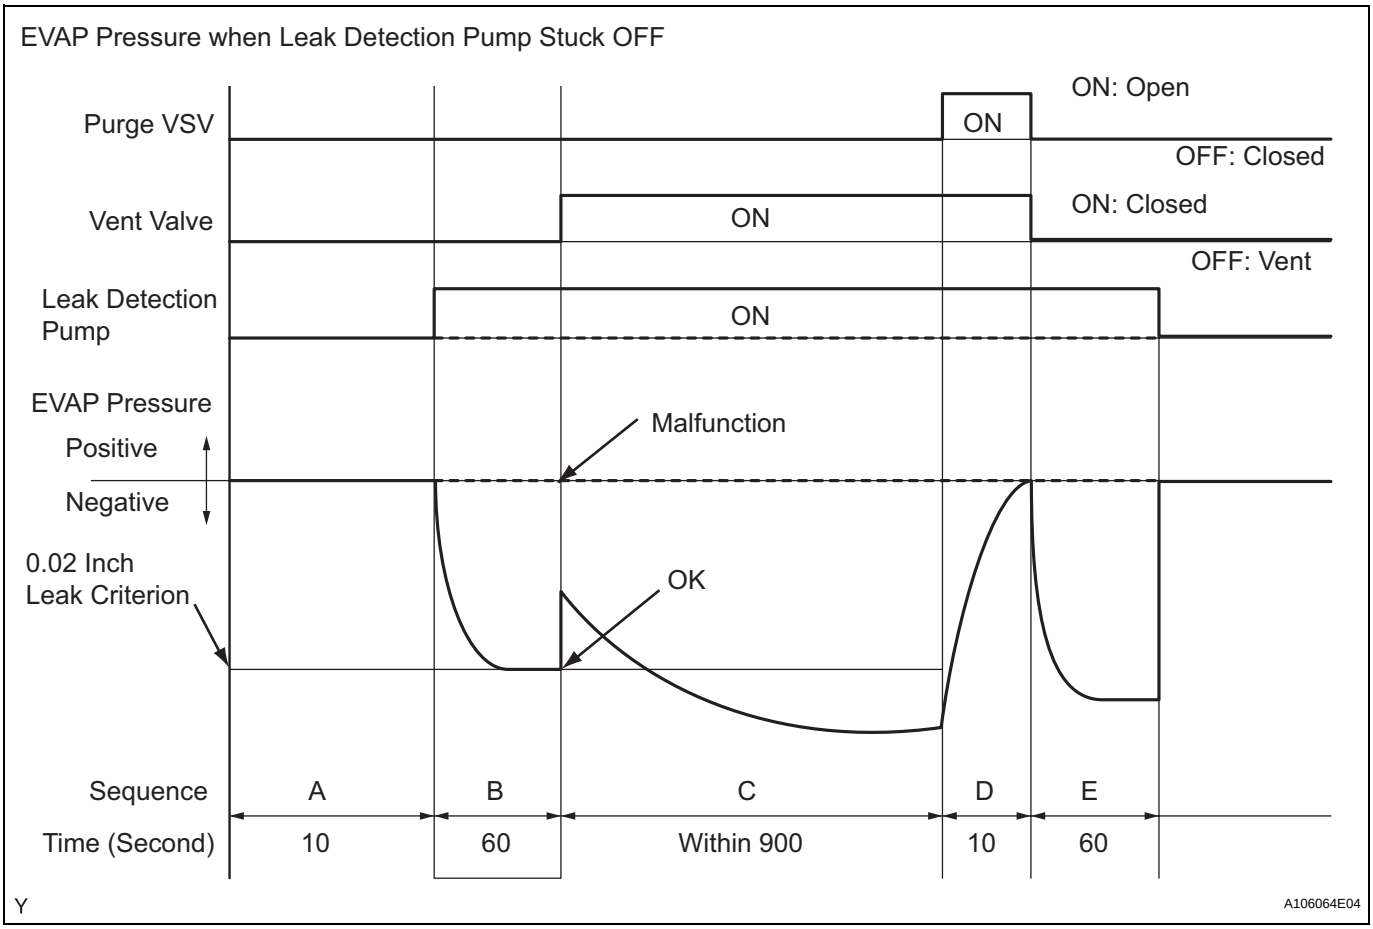
1. P2401: Leak detection pump stuck OFF
   In operation B, the leak detection pump creates negative pressure (a vacuum) through the reference orifice. The EVAP (Evaporative Emission) system pressure is then measured by the ECM, using the canister pressure sensor, to determine the 0.02 inch leak criterion. If the pressure is higher than -1.06 kPa (-7.95 mmHg)*, or lower than -4.85 kPa (-36.38 mmHg)*, the ECM interprets this as the leak detection pump being stuck OFF (not operating). The ECM illuminates the MIL and sets the DTC (2 trip detection logic).
   *: The thresholds vary according to the atmospheric pressure measured in operation A. The values described above are based on an atmospheric pressure of 100 kPa (750.1 mmHg): absolute pressure.

EVAP Pressure when Leak Detection Pump Stuck OFF



ES

2. P2402: Leak detection pump stuck ON
In operation B, the leak detection pump creates negative pressure (a vacuum) through the reference orifice. The EVAP (Evaporative Emission) system pressure is then measured by the ECM, using the canister pressure sensor, to determine the 0.02 inch leak criterion. If the pressure is higher than -1.06 kPa (-7.95 mmHg)*, or lower than -4.85 kPa (-36.38 mmHg)*, the ECM interprets this as the leak detection pump being stuck ON (remaining ON all the time). The ECM illuminates the MIL and sets the DTC (2 trip detection logic).
*: The thresholds vary according to the atmospheric pressure measured in operation A. The values described above are based on an atmospheric pressure of 100 kPa (750.1 mmHg): absolute pressure.



HINT:
The detection logic of DTCs P2401 and P2402 is the same because in both cases the 0.02 inch leak criterion measured in operation B is compared to the atmospheric pressure registered in operation A. The ECM calculates the difference between these pressures by deducting [the 0.02 inch leak criterion] from [the stored atmospheric pressure], and uses this to monitor the EVAP system pressure change.

MONITOR STRATEGY

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 15 minutes (varies with amount of fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Typical Enabling Conditions

Monitor runs whenever following DTCs not present	None

EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa (525 to 825 mmHg)
Battery voltage	10.5 V or more
Vehicle speed	Below 2.5 mph (4 km/h)
Ignition switch	OFF
FTP sensor malfunction (P0450, P0451, P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of following conditions met before IG switch OFF	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. Purge flow	Executed
ECT	4.4° to 35°C (40° to 95°F)
IAT	4.4° to 35°C (40° to 95°F)
Time after engine stopped	5 hours

Example of restart time

First time	7 hours
Second time	9 hours and 30 minutes

1. Key-off monitor sequence 1 to 8

1. Atmospheric pressure

Next sequence is run if following condition set	-
Atmospheric pressure change for 10 second	Less than 0.3 kPa (2.25 mmHg) for 1 second

2. First reference pressure

Next sequence is run if all of following conditions set	Condition 1, 2 and 3
1. FTP when 4 seconds after reference pressure measurement	-1 kPa (-7.5 mmHg) or less
2. Reference pressure	-4.85 to -1.057 kPa (-33.38 to -7.93 mmHg)
3. Reference pressure	Saturated within 60 seconds

3. Vent valve stuck closed check

Next sequence is run if following condition set	-
FTP change for 10 seconds after vent valve ON (closed)	0.3 kPa (2.25 mmHg) or more

4. Vacuum introduction and leak

Next sequence is run if both of following conditions set	Condition 1 and 2
1. Vacuum introduction time	12 minutes or less
2. FTP	Saturated within 12 minutes

5. Purge VSV stuck closed check

Next sequence is run if following condition set	-
FTP change for 10 seconds after purge VSV ON (open)	0.3 kPa (2.25 mmHg) or more

6. Second reference pressure measurement

Next sequence is run if all of following conditions set	Condition 1, 2, 3 and 4
1. FTP when 4 seconds after reference pressure measurement	-1 kPa (-7.5 mmHg) or less
2. Reference pressure	-4.85 to -1.057 kPa (-36.4 to -7.92 mmHg)
3. Reference pressure	Saturated within 60 seconds
4. Reference pressure difference between first and second	0.7 kPa (5.25 mmHg) or less

7. Leak check

Next sequence is run if following condition set	-
FTP when vacuum introduction was complete	Second reference pressure or less

8. Atmospheric pressure

Monitor is complete if following condition set	-
Atmospheric pressure difference between sequence 1 and 8	0.3 kPa (2.25 mmHg) or less

TYPICAL MALFUNCTION THRESHOLDS

One of following conditions met	-
FTP when 4 seconds after reference pressure measurement began	More than -1 kPa (-7.5 mmHg)
Reference pressure	Less than -4.85 kPa (-36.4 mmHg)
Reference pressure	-1.057 kPa (-7.9 mmHg) or more
Reference pressure	Not saturated within 60 seconds
Reference pressure difference between first and second	0.7 kPa (5.2 mmHg) or more

"Saturated" indicates that the EVAP pressure change is less than 0.1 kPa (0.75 mmHg) in 30 seconds.

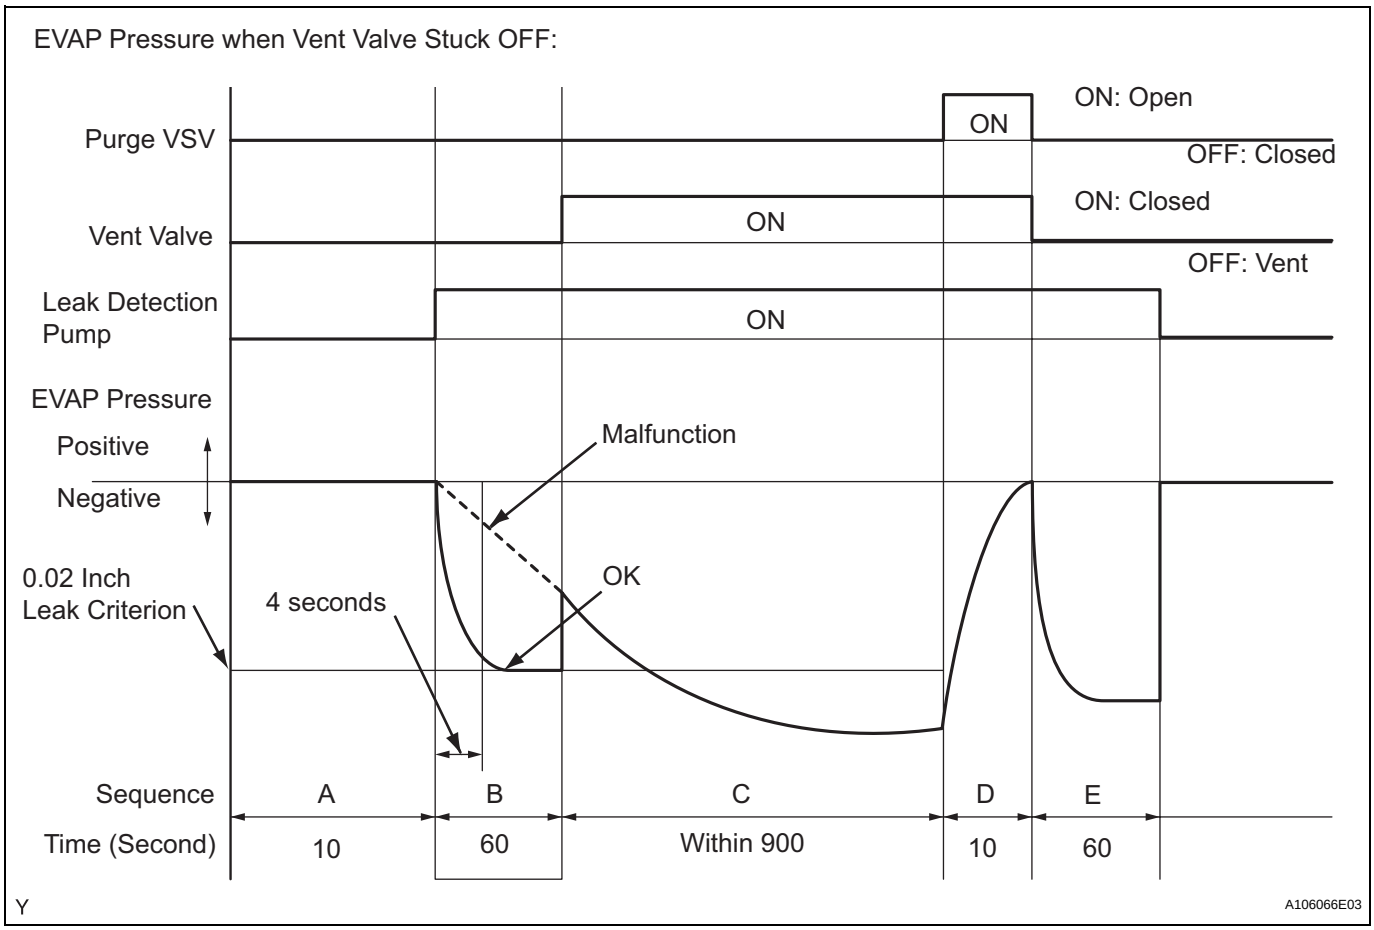
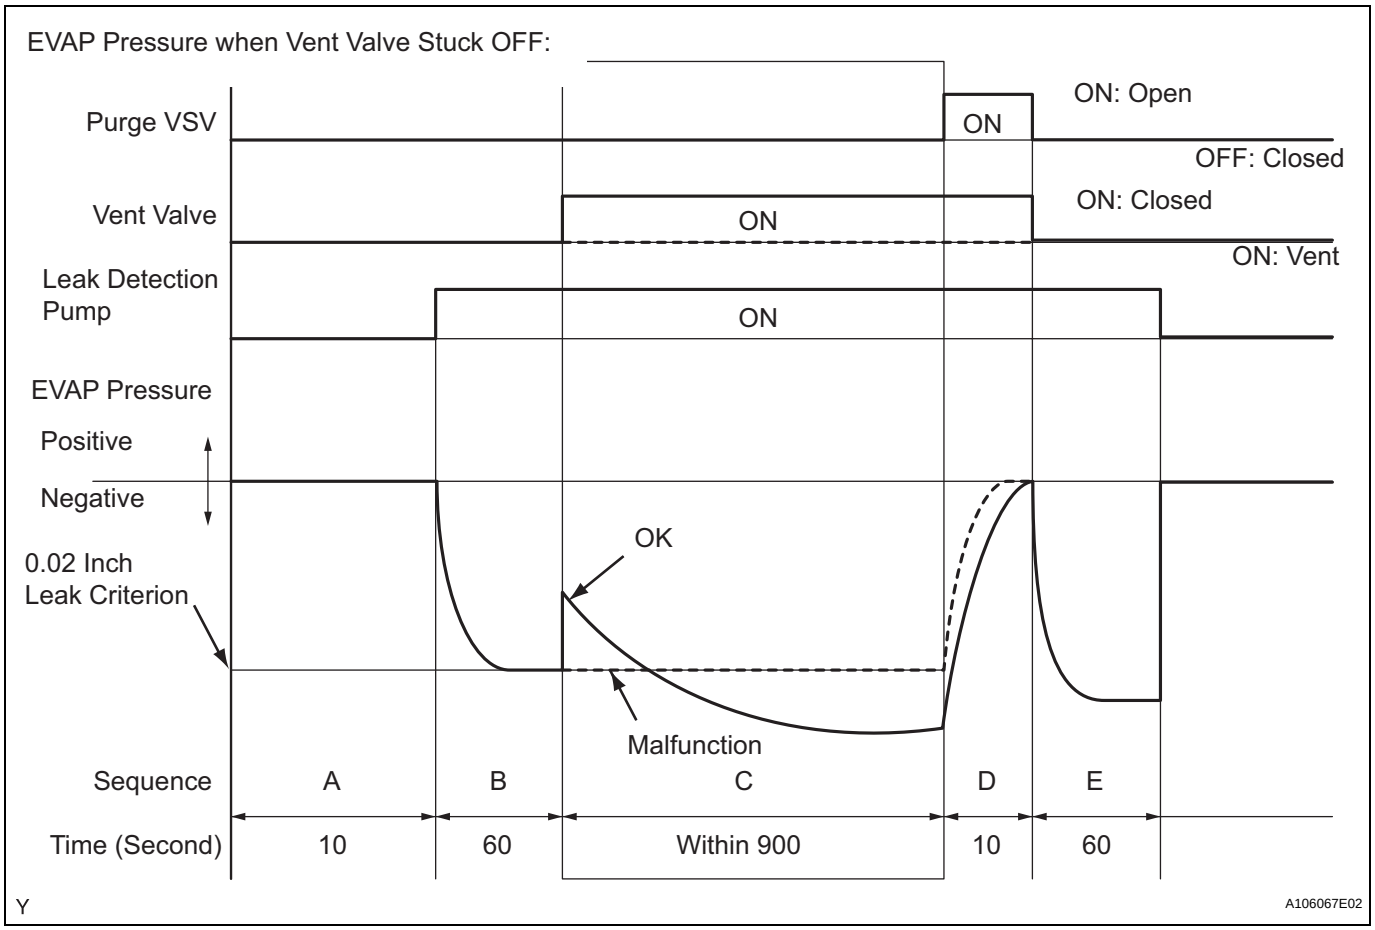
1. P2419: Vent valve stuck closed
   In operation B, the leak detection pump creates negative pressure (a vacuum) through the reference orifice. The EVAP (Evaporative Emission) system pressure is then measured by the ECM, using the canister pressure sensor, to determine the 0.02 inch leak criterion. If the pressure exceeds -1.06 kPa (-7.95 mmHg)* 4 seconds after the leak detection pump is turned ON, the ECM interprets this as the vent valve being stuck closed.
   The ECM illuminates the MIL and sets the DTC (2 trip detection logic).
   *: The threshold varies according to the atmospheric pressure measured in operation A. The value described above is based on an atmospheric pressure of 100 kPa (750.1 mmHg): absolute pressure.



2. P2420: Vent valve stuck open (vent)
In operation C, the vent valve turns ON (closes) and the EVAP (Evaporative Emission) system pressure is then measured by the ECM, using the canister pressure sensor, to conduct an EVAP leak check. If the pressure does not increase when the vent valve is open, the ECM interprets this as the vent valve being stuck open. The ECM illuminates the MIL and sets the DTC.



ES

OBD II MONITOR SPECIFICATIONS

MONITOR STRATEGY

Required Sensors/Components	Purge VSV and Canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 15 minutes (varies with amount of fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa (525 to 825 mmHg)
Battery voltage	10.5 V or more
Vehicle speed	Below 2.5 mph (4 km/h)
Ignition switch	OFF
FTP sensor malfunction (P0450, P0451, P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool

Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of following conditions met before IG switch OFF	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. Purge flow	Executed
ECT	4.4° to 35°C (40° to 95°F)
IAT	4.4° to 35°C (40° to 95°F)
Time after engine stopped	5 hours

Example of restart time

First time	7 hours
Second time	9 hours and 30 minutes

1. Key-off monitor sequence 1 to 8

1. Atmospheric pressure

Next sequence is run if following condition set	-
Atmospheric pressure change for 10 second	Less than 0.3 kPa (2.25 mmHg) for 1 second

2. First reference pressure

Next sequence is run if all of following conditions set	Condition 1, 2 and 3
1. FTP when 4 seconds after reference pressure measurement	-1 kPa (-7.5 mmHg) or less
2. Reference pressure	-4.85 to -1.057 kPa (-33.38 to -7.93 mmHg)
3. Reference pressure	Saturated within 60 seconds

3. Vent valve stuck closed check

Next sequence is run if following condition set	-
FTP change for 10 seconds after vent valve ON (closed)	0.3 kPa (2.25 mmHg) or more

4. Vacuum introduction and leak

Next sequence is run if both of following conditions set	Condition 1 and 2
1. Vacuum introduction time	12 minutes or less
2. FTP	Saturated within 12 minutes

5. Purge VSV stuck closed check

Next sequence is run if following condition set	-
FTP change for 10 seconds after purge VSV ON (open)	0.3 kPa (2.25 mmHg) or more

6. Second reference pressure measurement

Next sequence is run if all of following conditions set	Condition 1, 2, 3 and 4
1. FTP when 4 seconds after reference pressure measurement	-1 kPa (-7.5 mmHg) or less
2. Reference pressure	-4.85 to -1.057 kPa (-36.4 to -7.92 mmHg)
3. Reference pressure	Saturated within 60 seconds
4. Reference pressure difference between first and second	0.7 kPa (5.25 mmHg) or less

7. Leak check

Next sequence is run if following condition set	-
FTP when vacuum introduction was complete	Second reference pressure or less

8. Atmospheric pressure

Monitor is complete if following	-
Atmospheric pressure difference between sequence 1 and 8	0.3 kPa (2.25 mmHg) or less

TYPICAL MALFUNCTION THRESHOLDS

P2419: Vent valve stuck closed

One of the following conditions set	-

EVAP pressure just after reference pressure measurement start	-1 kPa (-7.5 mmHg) or more
Reference pressure	Less than -4.85 kPa (-36.4 mmHg)
Reference pressure	-1.057 kPa (-7.9 mmHg) or more
0.02 inch leak criterion	Not saturated within 60 seconds
Difference between first reference pressure and second reference pressure	More than 0.7 kPa (5.25 mmHg)

P2420: Vent valve stuck open (vent)

EVAP pressure change in 10 seconds when vent valve turned ON after measurement of 0.02 inch leak criterion	Less than 0.3 kPa (2.25 mmHg)

"Saturated" indicates that the EVAP pressure change is less than 0.286 kPa (2.14 mmHg) in 60 seconds.

MONITOR RESULT

Refer to Checking Monitor Status (See page ES-21) or (See page ES-422).

DTC	P2433	Secondary Air Injection System Air Flow / Pressure Sensor Circuit High Bank1

ES

DESCRIPTION

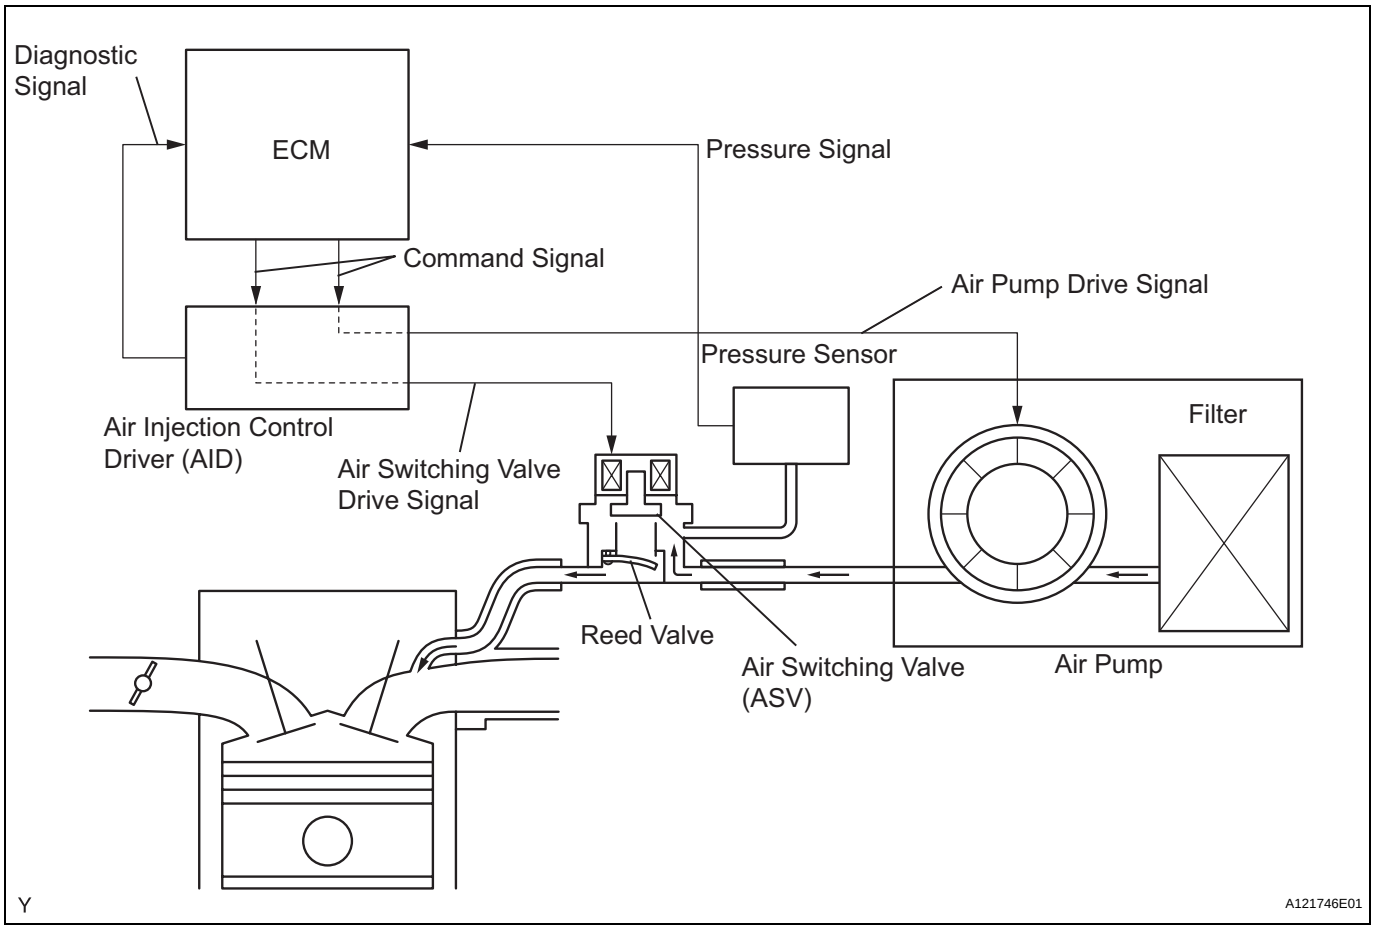
The Secondary Air injection (AIR) system consists of an air pump, the Air Switching Valve (ASV), a pressure sensor, the Air Injection Control Driver (AID) and the ECM. For a short time after cold engine starts, the AIR system pumps secondary air to the exhaust port of the cylinder head to purify the exhaust emissions. The secondary air is supplied by the air pump and is pumped to the exhaust port through the ASV.

The AID drives the ASV and the air pump according to command signals transmitted by the ECM. The pressure sensor detects the pressure in the secondary air passage when the AIR system is ON and OFF, and transmits pressure signal to the ECM.

The AID is not only equipped to drive the pump and valve, but also with a diagnosis function to detect malfunctions in the AIR system circuit.

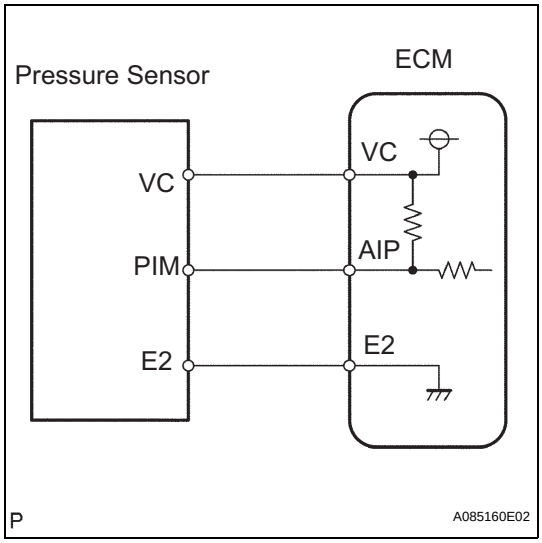
HINT:

As a large current is required to drive the air pump and ASV, an AID has been added to the previous system.



DTC No.	DTC Detection Conditions	Trouble Areas
P2430	While engine running, voltage output of pressure sensor indicates 0.1 V or less, or indicates 4.8V or more (1 trip detection logic	• Pressure sensor • Open or short in pressure sensor circuit • ECM
P2431	Pressure sensor indicates less than 45 kPa (338 mmHg), or more than 135 kPa (1,013 mmHg) (2 trip detection logic)	• Pressure sensor • Open or short in pressure sensor circuit • ECM
P2432	While engine running, voltage output of pressure sensor remains below 0.1 V (1 trip detection logic)	• Pressure sensor • Open or short in pressure sensor circuit • ECM
P2433	While engine running, voltage output of pressure sensor remains above 4.8 V (1 trip detection logic)	• Pressure sensor • Open or short in pressure sensor circuit • ECM

MONITOR DESCRIPTION



The ECM monitors the pressure in the secondary air passage using the pressure sensor located on the air switching valve in the secondary air injection system.
If there is a defect in the sensor or the sensor circuit, the voltage level deviates from the normal operating range, the ECM interprets this deviation as a malfunction in the pressure sensor or circuit and sets a DTC.

MONITOR STRATEGY

Related DTCs	P2430: Air flow/Pressure sensor circuit range check (Fluctuating) P2431: Air flow/Pressure sensor circuit rationality P2432: Air flow/Pressure sensor circuit range check (Low voltage) P2433: Air flow/Pressure sensor circuit range check (High voltage)
Required Sensors/Components (Main)	Pressure sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	P2430, P2432, P2433: 0.5 seconds P2431: 5 seconds
MIL Operation	P2430, P2432 and P2433: Immediate P2431: 2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

P2430, P2432 and P2433

Monitor runs whenever following DTCs not present	None
All of following conditions met:	-
Starter	OFF
Battery voltage	8 V or more
Ignition switch	ON

P2431 Case 1:

Monitor runs whenever following DTCs not present	None
All following conditions met for:	3 seconds or more
Secondary air injection system	Operating
Starter	OFF
Battery voltage	8 V or more
Ignition switch	ON

P2431 Case 2:

Monitor runs whenever following DTCs not present	None
All following conditions met for:	3 seconds or more
Secondary air injection system	Not operating
Starter	OFF
Battery voltage	8 V or more
Ignition switch	ON

TYPICAL MALFUNCTION THRESHOLDS

P2430:

Air pressure sensor voltage	Less than 0.1 V, or more than 4.8 V

P2432:

Air pressure sensor voltage	Less than 0.1 V

P2433:

Air pressure sensor voltage	More than 4.8 V

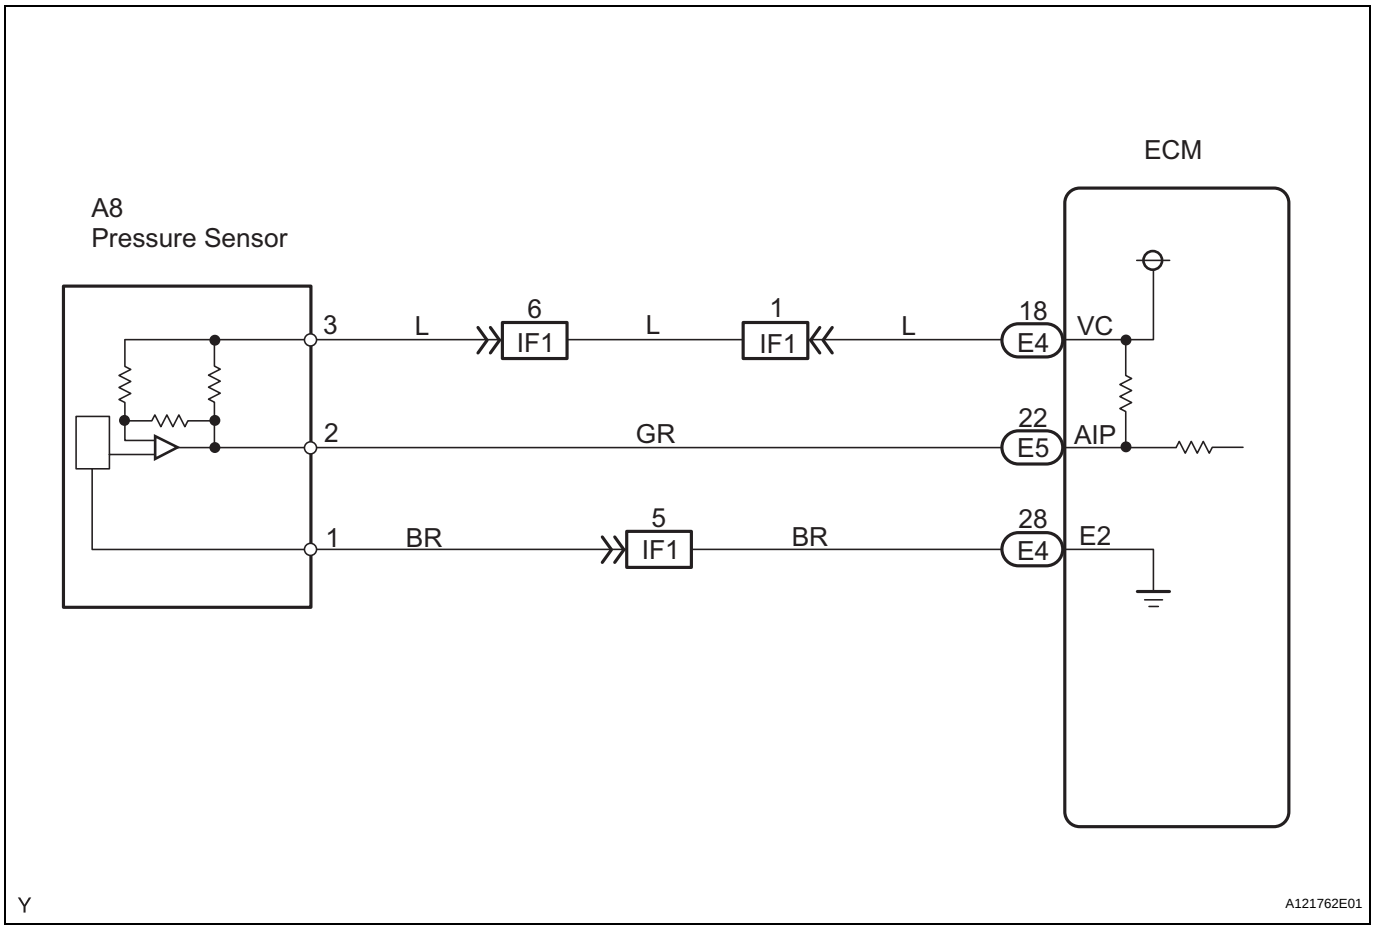
P2431:

Air Pressure	Less than 45 kPa (338 mmHg), or more than 135 kPa (1,013 mmHg)

COMPONENT OPERATING RANGE

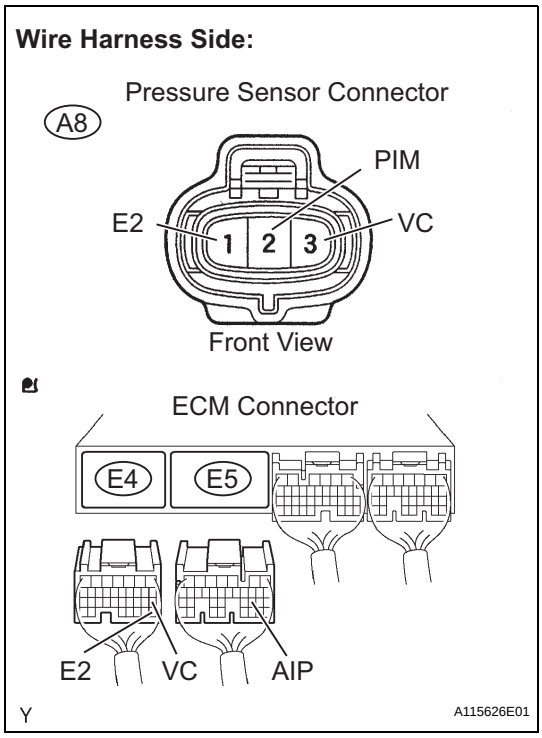
Air pressure sensor voltage	Between 0.1 V and 4.8 V

WIRING DIAGRAM



HINT:
Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 CHECK HARNESS AND CONNECTOR (PRESSURE SENSOR - ECM)



(a) Disconnect the A8 pressure sensor connector.
(b) Disconnect the E4 and E5 ECM connectors.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
Pressure sensor (A8-1) - E2 (E4-28)	Below 1 Ω
Pressure sensor (A8-2) - AIP (E5-22)	Below 1 Ω
Pressure sensor (A8-3) - VC (E4-18)	Below 1 Ω

Standard Resistance (Check for short)

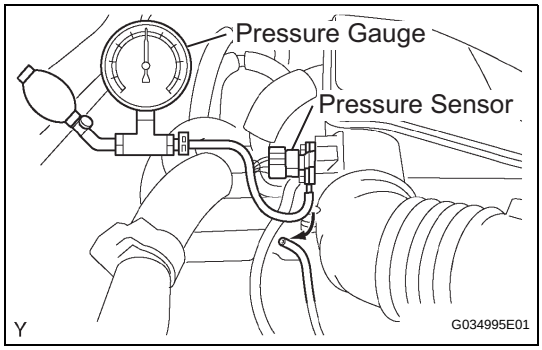
Tester Connections	Specified Conditions
Pressure sensor (A8-2) or AIP (E5-22) - Body ground	10 kΩ or higher
Pressure sensor (A8-3) or VC (E4-18) - Body ground	10 kΩ or higher

(d) Reconnect the pressure sensor connector.
(e) Reconnect the ECM connectors.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

2 INSPECT ECM (AIP VOLTAGE)



(a) Connect a pressure gauge to the air pressure sensor as shown in the illustration.
(b) Connect an intelligent tester to the DLC3.
(c) Turn the ignition switch to ON and turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / AIR PMP PRS(A).
(e) Check that the pressure displayed on the tester fluctuates when applying the pressure to the pressure sensor with the pressure gauge.
HINT:
The tester displays the air pump pressure (AIR PMP PRS(A)) as absolute pressure.

NG → **REPLACE PRESSURE SENSOR (TURBO PRESSURE SENSOR)**

OK

REPLACE ECM

DTC	P2440	Secondary Air Injection System Switching Valve Stuck Open Bank1

DTC	P2441	Secondary Air Injection System Switching Valve Stuck Close Bank1

DESCRIPTION

Refer to DTC P0412 (See page ES-189).

DTC No.	DTC Detection Conditions	Trouble Areas
P2440	Pressure sensor detects pulsation of exhaust gas despite ECM commanding Air Switching Valve (ASV) to close, while engine running (2 trip detection logic)	• ASV • Open or short in ASV circuit • Pressure sensor • Pressure sensor circuit • Air Injection Control Driver (AID) • ECM
P2441	Pressure sensor detects no pulsation of exhaust gas despite ECM commanding Air Switching Valve (ASV) to open, while engine running (2 trip detection logic)	• ASV • Open or short in ASV circuit • Vacuum hose (ASV - pressure sensor) • Air injection hose • Pressure sensor • Pressure sensor circuit • Air Injection Control Driver (AID) • ECM

HINT:
Air switching valve normal operation:
When the Air Switching Valve (ASV) is open, exhaust gas pulsation occurs in the secondary air passage.
When the ASV is closed, exhaust gas pulsation does not occur in the secondary air passage.

MONITOR DESCRIPTION

The ECM monitors the pressure in the secondary air passage using the pressure sensor connected to the ASV of the Secondary Air Injection (AIR) system.
If either of the following conditions occurs, the ECM interprets it as a malfunction of the secondary AIR system, and illuminates the MIL and sets a DTC:

- Exhaust gas pulsation is detected by the pressure sensor despite the ECM commanding the ASV to close.
- Exhaust gas pulsation is not detected by the pressure sensor despite the ECM commanding the ASV to open.

MONITOR STRATEGY

Related DTCs	P2440: Air control valve stuck open P2441: Air control valve stuck closed
Required Sensors/Components (Main)	Pressure sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Once per drive cycle
Duration	7 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	• P0010 - P0022: VVT system • P0031 - P0052: Front A/F sensor heater • P0100 - P0103: MAF sensor • P0110 - P0113: IAT sensor • P0115 - P0118: ECT sensor • P0120 - P2125: TP sensor • P0125: Closed loop • P0171 - P0175: Fuel trim • P0300 - P0308: Misfire • P0325 - P0333: Knock sensor • P0335: CKP sensor • P0340 - P0346: VVT sensor • P0351 - P0358: Igniter • P0441 - P2420: EVAP system • P0500: VSS • P1340: CMP sensor • P2195 - P2A03: A/F sensor • P2430 - P2433: AIR pressure sensor
Battery voltage	11 V or more
Atmospheric pressure	45 kPa (337.5 mmHg) or more

While secondary air injection ON:

Time after secondary injection operation begins	6 seconds or more
Secondary air injection pump	ON
Secondary air injection switching valve	ON
Engine speed	Less than 3,750 rpm
Delay time after engine started	6 seconds or more
Pressure sensor malfunction	Not detected

While secondary air injection OFF:

Secondary air injection pump	OFF
Engine speed	Less than 3,750 rpm
Secondary air injection system monitor during secondary air injection ON	Completed
Pressure sensor malfunction	Not detected

TYPICAL MALFUNCTION THRESHOLDS

Condition 1:

AIR pressure during AIR ON	2.5 kPa or more and pulse is generated

Condition 2:

AIR pressure during AIR ON	Less than 2.5 kPa and pulse is generated

Condition 3:

AIR pressure during AIR ON	2.5 kPa or more and pulse is not generated

Condition 4:

AIR pressure during AIR ON	Less than 2.5 kPa and pulse is not generated

Condition 5:

AIR pressure during AIR OFF	2.5 kPa or more and pulse is generated

Condition 6:

AIR pressure during AIR OFF	Less than 2.5 kPa and pulse is generated

Condition 7:

AIR pressure during AIR OFF	2.5 kPa or more and pulse is not generated

Condition 8:

AIR pressure during AIR OFF	Less than 2.5 kPa and pulse is not generated

P2440: ASV stuck open

Any of following conditions met:	(a), (b) or (c)
(a) Conditions 1 and 6	Met
(b) Conditions 1 and 5	Met
(c) Conditions 2 and 6	Met

P2441: ASV stuck closed

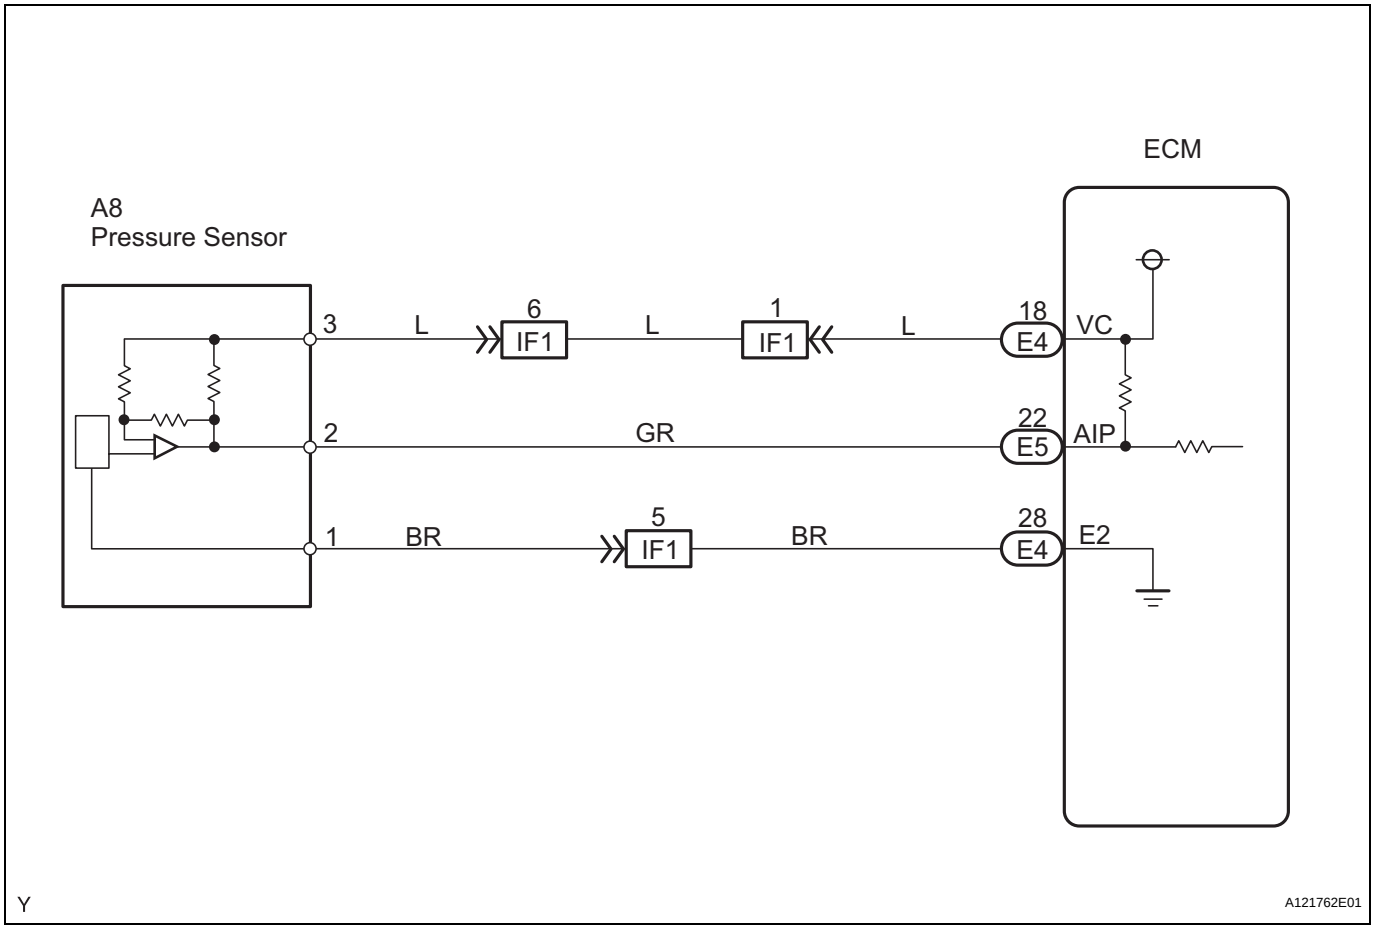
Any of following conditions met:	(a), (b) or (c)
(a) Conditions 3 and 7	Met
(b) Conditions 3 and 8	Met
(c) Conditions 4 and 8	Met

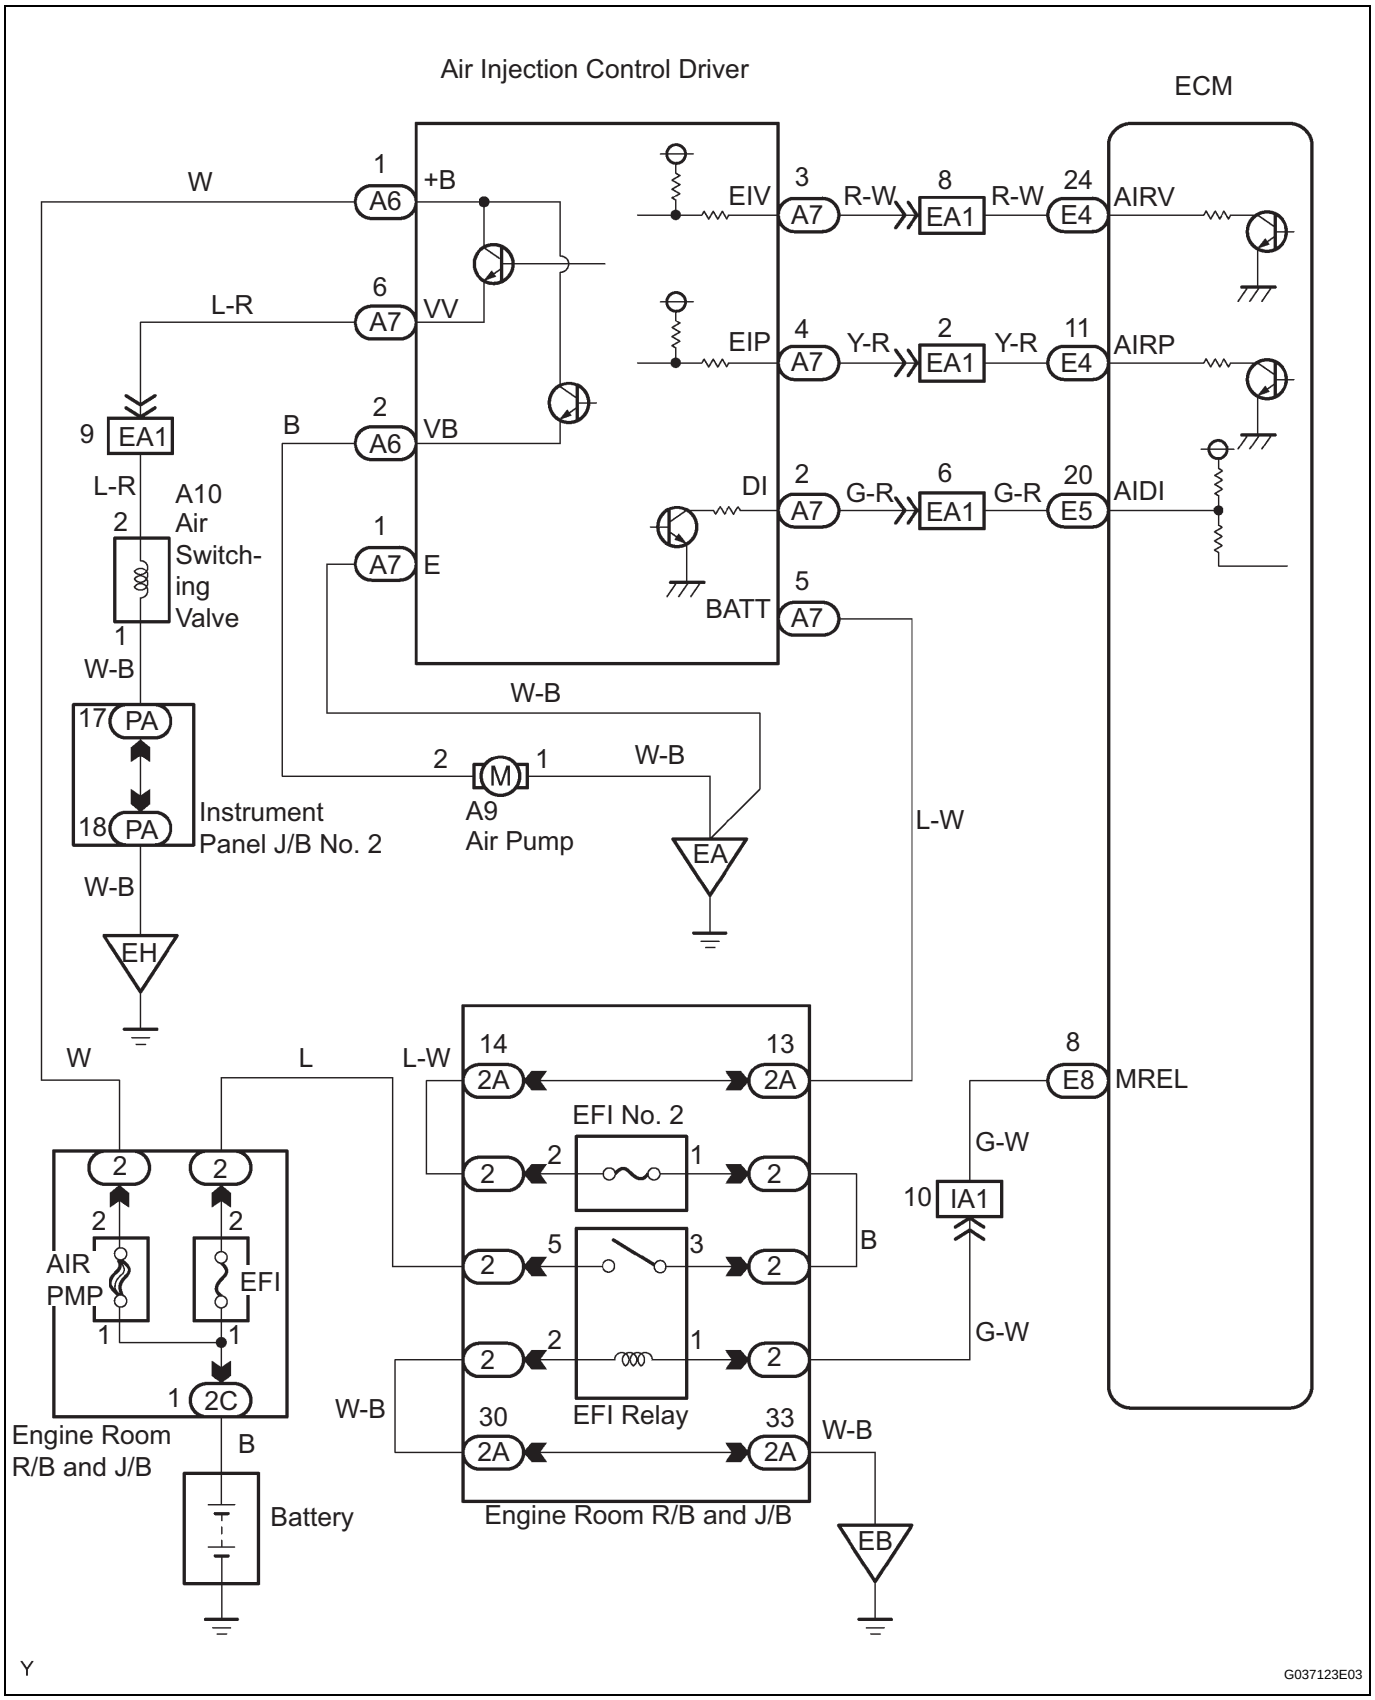
ES

MONITOR RESULT

Refer to Checking Monitor Status (See page ES-21).

WIRING DIAGRAM





HINT:
Determination by ECM monitoring:

The ECM locates malfunctions in the Secondary Air Injection (AIR) system by detecting the pressure in the AIR passage between the air pump and Air Switching Valve (ASV) and sets a DTC. Soon after cold engine starts, the monitor runs for a short time while the AIR system is both ON and OFF. The ECM detects both the pressure and the exhaust pulsation and compares them.
The following 4 patterns are AIR system pressure conditions in the AIR system passage.

Pressure condition in Secondary Air Injection System Case 1:

Air Pump	ON
Air Switching Valve	Open
Pressure	2.5 kPa or more
Pulsation Detection	Exhaust gas pulsation detected

Pressure condition in Secondary Air Injection System Case 2:

Air Pump	OFF
Air Switching Valve	Open
Pressure	Less than 2.5 kPa
Pulsation Detection	Exhaust gas pulsation detected

ES

Pressure condition in Secondary Air Injection System Case 3:

Air Pump	ON
Air Switching Valve	Closed
Pressure	2.5 kPa or more
Pulsation Detection	Slight pulsation detected

Pressure condition in Secondary Air Injection System Case 4:

Air Pump	OFF
Air Switching Valve	Open
Pressure	Less than 2.5 kPa
Pulsation Detection	Exhaust gas pulsation detected

If the detected pressure is high, the air pump is assumed to be ON and if it alternates sharply*, the ASV is assumed to be open. The ECM locates malfunctions from the combination of pressures detected when the AIR system is ON and OFF.
*: The exhaust pulsation value is calculated in the ECM. If the calculated value exceeds a certain level, the ECM determines that the exhaust pulsation is in the AIR system.
HINT:

- In case 3, as the pressure sensor detects a slight pump operation pulsation, the detected value is not constant. Since the pump outlet is blocked by closing the ASV, the average pressure is higher than in case 1 (approximately 20 to 30 kPa).
- In case 1, the average pressure is approximately 9 to 11 kPa. The value of 2.5 kPa indicated in the table above is a threshold for detecting pump malfunctions.

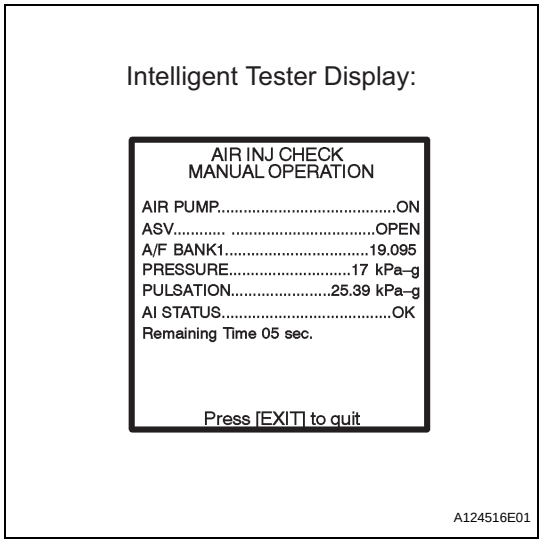
Detected Conditions while AIR operating: Air pump ON, ASV Open	Detected Conditions while AIR not operating: Air pump OFF, ASV Closed	ECM Determination	DTCs Output
Case 1	Case 4	Normal	-
Case 1	Case 2	ASV stuck open	P2440
Case 1	Case 3	Air pump stuck ON	P2444
Case 2	Case 4	Air pump stuck OFF	P2445
Case 3	Case 4	ASV stuck closed	P2441
Case 1	Case 1	ASV stuck open and Air pump stuck ON	P2440 and P2444
Case 2	Case 2	ASV stuck open and Air pump stuck OFF	P2440 and P2445
Case 3	Case 3	ASV stuck closed and Air pump stuck ON	P2441 and P2444

Detected Conditions while AIR operating: Air pump ON, ASV Open	Detected Conditions while AIR not operating: Air pump OFF, ASV Closed	ECM Determination	DTCs Output
Case 4	Case 4	ASV stuck closed and Air pump stuck OFF	P2441 and P2445

HINT:
- If the vacuum hose between the ASV and the pressure sensor is not connected correctly, case 4 may occur.
- By using an intelligent tester to perform the AIR INJ CHECK operation in the SYSTEM CHECK, the air-fuel ratio and the pressure in the secondary air injection system passage can be checked while the secondary air injection system is operating. This helps technicians to troubleshoot the system when it malfunctions. Furthermore, PENDING CODES also can be checked by performing SYSTEM CHECK / AUTOMATIC OPERATION after the repair.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

ES

SYSTEM CHECK:
The pressure in the secondary air passage can be checked using an intelligent tester.
(a) Start the engine and warm it up.



(b) Turn the ignition switch to OFF.
(c) Connect an intelligent tester to the DLC3.
(d) Turn the ignition switch to ON and turn the tester ON.
(e) Select the following menu items:
DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / MANUAL OPERATION / AP: ON, ASV: OPEN and AP: OFF, ASV CLOSE.
HINT:
When MANUAL OPERATION is selected, the tester initialization (atmospheric pressure measurement) is performed automatically. The initialization takes 10 seconds. After the initialization, AP and ASV operation can be selected.
(f) Start the engine.
(g) Perform the AIR system intrusive operation while the engine is idling.
(h) Check that the air pump (AIR PUMP), ASV and pressure in the AIR system passage (PRESSURE) displayed on the tester, indicate the conditions shown in the table below.

Standard

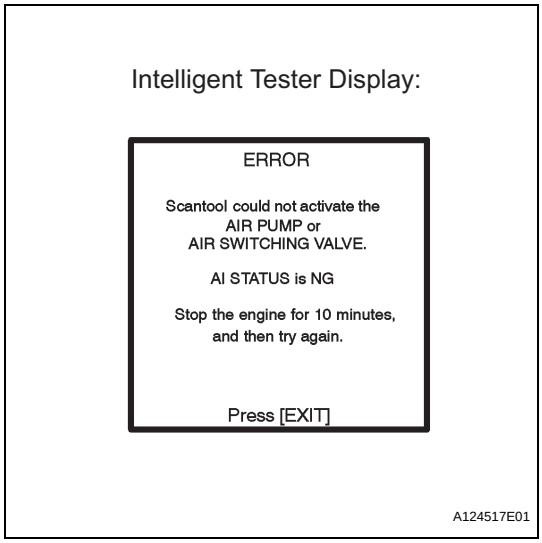
Intelligent Tester Operations	AIR PUMP	ASV	PRESSURE *1	PULSATION *2
AP: ON, ASV: OPEN	ON	OPEN	2.5 kPa or more	11.25 kPa or more

Intelligent Tester Operations	AIR PUMP	ASV	PRESSURE *1	PULSATION *2
AP: OFF, ASV: CLOSE	OFF	CLOSE	Less than 2.5 kPa	Less than 11.25 kPa

*1:
Average pumping pressure (gauge pressure). The pressure should be 2.5 kPa or more when the AIR system operates.

*2:
The cumulative exhaust pulsation calculated by the ECM. If the calculated value exceeds a certain level, the ECM determines that the exhaust pulsation is in the AIR system.

(i) Turn the ignition switch to OFF.



NOTICE:

- **This AIR INJECTION CHECK only allows technicians to operate the AIR system for a maximum of 5 seconds.**
  Furthermore, the check can only be performed up to 4 times per trip. If the test is repeated, intervals of at least 30 seconds are required between checks.
  While AIR system operation using the intelligent tester is prohibited, the tester display indicates the prohibition (WAIT or ERROR).
  If an ERROR as shown in the illustration is displayed on the tester during the test, stop the engine for 10 minutes, and then try again.
- **Performing the AIR INJ CHECK repetitively may cause damage to the AIR system. If necessary, leave an interval of several minutes between SYSTEM CHECK operations to prevent the system from overheating.**
- **When performing the AIR INJ CHECK operation after the battery cable has been reconnected, wait for 7 minutes with the ignition switch turned to ON or the engine running.**
- **Turn the ignition switch to OFF when the AIR INJ CHECK operation finishes.**

1	**CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO SECONDARY AIR INJECTION SYSTEM DTCS)**

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed To
P2440 and/or P2441	A
P2440 and/or P2441, and P0412	B
P2440 and/or P2441, and other DTCs (except P0412)	C

If any DTCs other than P2440 and/or P2441 are output, troubleshoot those DTCs first.

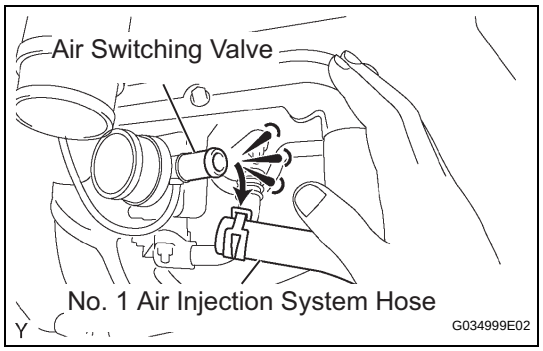
B → **GO TO AIR SWITCHING VALVE INSPECTION PROCEDURE**

C → **GO TO DTC CHART**

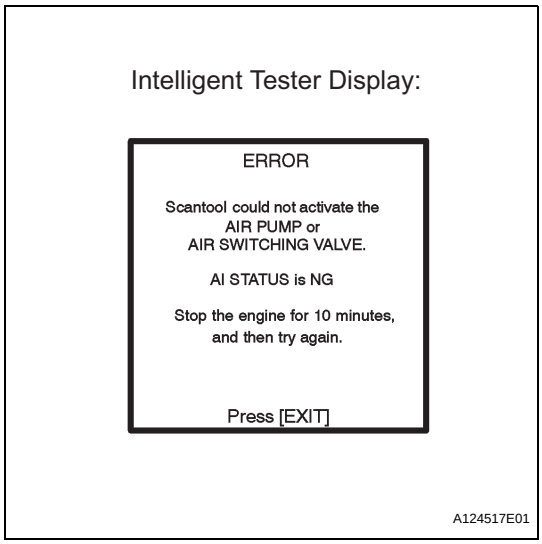
A

ES

2 PERFORM ACTIVE TEST USING INTELLIGENT TESTER



(a) Visual check
  (1) Start the engine and warm it up.
  (2) Turn the ignition switch to OFF.
  (3) Disconnect the No. 1 air injection system hose.
  (4) Connect the intelligent tester to the DLC3.
  (5) Turn the ignition switch to ON and turn the tester ON.
  (6) Select the following menu items:
  DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / MANUAL OPERATION / AP: ON, ASV: OPEN.
  HINT:
  When MANUAL OPERATION is selected, the tester initialization (atmospheric pressure measurement) is performed automatically. The initialization takes 10 seconds. After the initialization, AP and ASV operation can be selected.
  (7) Start the engine.
  (8) Perform the AIR system intrusive operation while the engine is idling.
  (9) Place your hand near the air switching valve port and check that the exhaust gas pressure pulsates when the ASV is turned ON.
  CAUTION:
  To avoid the danger of being burned by the exhaust gas, bring your hand close to the valve port slowly.
  (10) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / MANUAL OPERATION / AP: ON, ASV: CLOSE.
  (11) Check that the exhaust gas does not pulsate when the ASV is turned OFF.



(12) Turn the ignition switch to OFF.

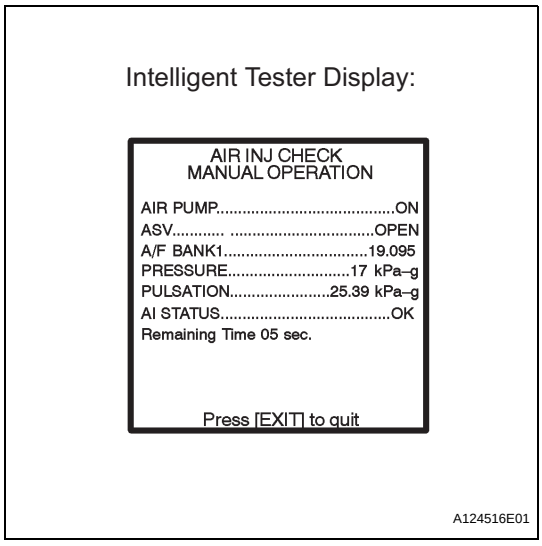
NOTICE:

- **This AIR INJECTION CHECK only allows technicians to operate the AIR system for a maximum of 5 seconds. Furthermore, the check can only be performed up to 4 times per trip. If the test is repeated, intervals of at least 30 seconds are required between checks.**
  While AIR system operation using the intelligent tester is prohibited, the tester display indicates the prohibition (WAIT or ERROR).
  If an ERROR as shown in the illustration is displayed on the tester during the test, stop the engine for 10 minutes, and then try again.
- **Performing the AIR INJ CHECK repetitively may cause damage to the AIR system. If necessary, leave an interval of several minutes between SYSTEM CHECK operations to prevent the system from overheating.**
- **When performing the AIR INJ CHECK operation after the battery cable has been reconnected, wait for 7 minutes with the ignition switch turned to ON or the engine running.**
- **Turn the ignition switch to OFF when the AIR INJ CHECK operation finishes.**

Standard

Air Pump Operations	ASV Operations	Exhaust Gas Pulsation
ON	OFF	Not detected
ON	ON	Detected

(13) Reconnect the No. 1 air injection system hose.
(14) Reconnect the air cleaner hose.



(b) Other inspection method:
The ASV operation can be confirmed by checking the cumulative pressure pulsation* provided in the SYSTEM CHECK.
Perform SYSTEM CHECK operation under MANUAL OPERATION.

*: The exhaust pulsation value is calculated in the ECM. If the calculated value exceeds a certain level, the ECM determines that the exhaust pulsation is in the AIR system.

(1) Start the engine and warm it up.
(2) Turn the ignition switch to OFF.
(3) Connect the intelligent tester to the DLC3.
(4) Turn the ignition switch to ON and turn the tester ON.
(5) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / MANUAL OPERATION / AP: ON, ASV OPEN and AP: OFF, ASV: CLOSE.

(6) Start the engine after the tester initialization is finished.
(7) Perform the AIR system intrusive operation while the engine is idling.
(8) Check that the air-fuel ratio and pressure in the secondary air injection system passage (PULSATION) displayed on the tester, indicate the conditions shown in the table below.
(9) Turn the ignition switch to OFF.

Result

AIR System Operations	Pulsation Conditions (ECM Calculation)	Air-Fuel Ratio (Reference)
AP: ON, ASV: OPEN	11.25 kPa or more	18 or more
AP: OFF, ASV: CLOSE	Less than 11.25 kPa	Approximately 14.5 (around stoichiometric air-fuel ratio)

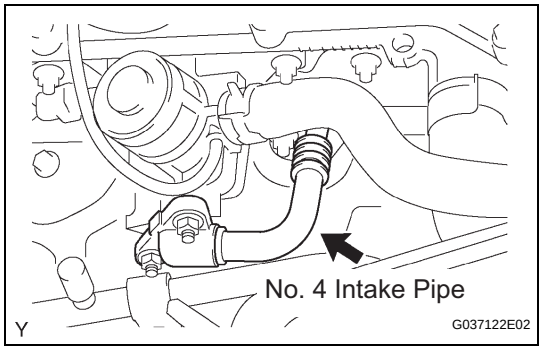
ES

REFERENCE:
If the air pump operation is confirmed as normal (See page ES-368), the air-fuel ratio detected in front of three-way catalytic converter changes in response to the secondary air pumped into the exhaust port when the air pump operates.

OK → **Go to step 9**

NG

3 INSPECT NO.4 INTAKE PIPE (BLOCKAGES AND LEAKAGES)



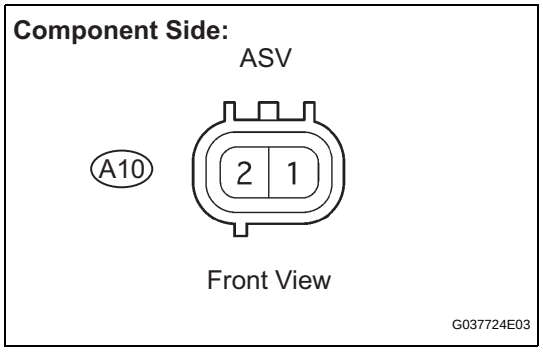
(a) Check that the No. 4 intake pipe is securely connected to both the exhaust manifold and the ASV.
(b) Inspect the No. 4 intake pipe for blockages and damage.
OK:
No blockages and damage on No. 4 intake pipe.

NG → **REPLACE NO.4 INTAKE PIPE**

OK

4 INSPECT AIR SWITCHING VALVE ASSEMBLY (AIR SWITCHING VALVE OPERATION)

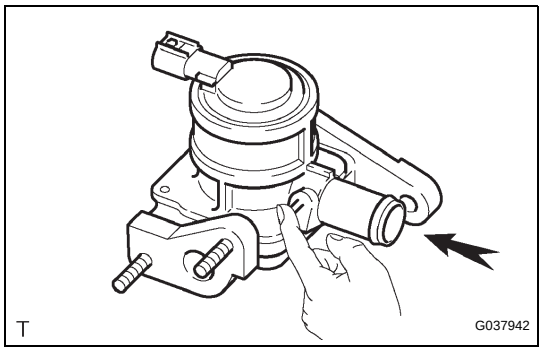
Component Side:



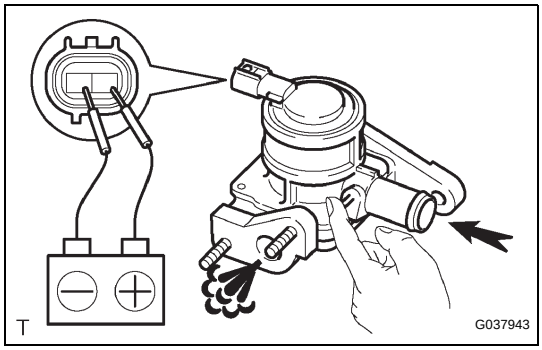
(a) Check the resistance.
(1) Using an ohmmeter, measure the resistance between the terminals.
Standard Resistance

Tester Connections	Specified Conditions
A10-1 - A10-2	3 to 10 Ω at 20°C (68°F)

If the result is not as specified, replace the ASV.



(b) Check the operation.
(1) Check that air does not flow from the ports.

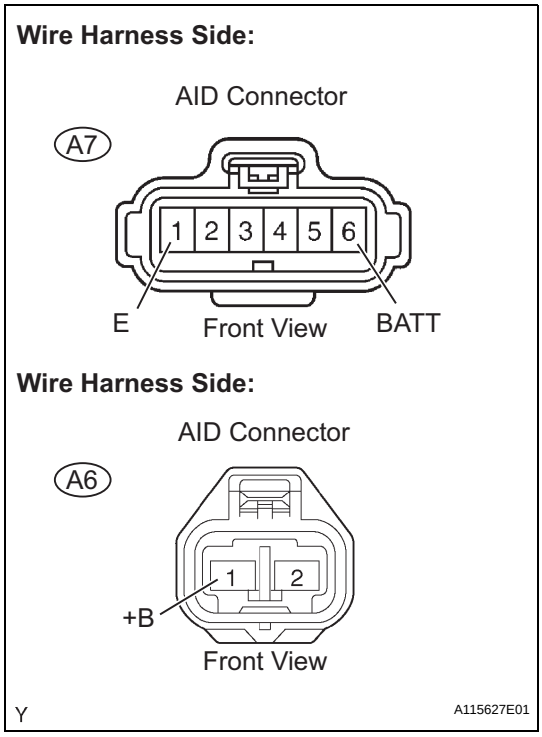


(2) Apply the battery positive voltage across the terminals.
(3) Check that air flows from the ports.
If the operation is not as specified, replace the ASV.
OK:
ASV operates correctly

NG → **REPLACE AIR SWITCHING VALVE ASSEMBLY**

OK

5	INSPECT AIR INJECTION CONTROL DRIVER (POWER SOURCE OF AIR INJECTION CONTROL DRIVER)



(a) Disconnect the A6 and A7 AID connectors.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between the terminals of the AID connector.
Standard Voltage

Tester Connections	Specified Conditions
BATT (A7-5) - Body ground	9 to 14 V (near battery voltage)
+B (A6-1) - Body ground	9 to 14 V (near battery voltage)

(d) Check the resistance.
Standard Resistance (Check for open)

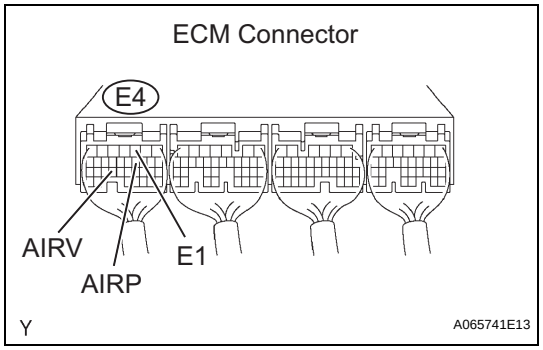
Tester Connections	Specified Conditions
E (A7-1) - Body ground	Below 1 Ω

(e) Reconnect the AID connectors.

NG → **REPAIR OR REPLACE AIR INJECTION CONTROL DRIVER POWER SOURCE CIRCUIT**

OK

6	PERFORM ACTIVE TEST USING INTELLIGENT TESTER



(a) Start the engine and warm it up.
(b) Turn the ignition switch to OFF.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch to ON and turn the tester ON.
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / MANUAL OPERATION / AP: ON, ASV: OPEN and AP: OFF, ASV: CLOSE.
(f) Start the engine after the tester initialization is finished.
(g) Operate the AIR system using the SYSTEM CHECK function and measure the voltage between the terminals of the ECM connector.
(h) Turn the ignition switch to OFF.

NOTICE:

- **Do not perform the SYSTEM CHECK operation repetitively. It may cause damage to the system. If necessary, leave an interval of several minutes between SYSTEM CHECK operations.**
- **When performing the AIR INJ CHECK operation after the battery cable has been reconnected, wait for 7 minutes with the ignition switch turned to ON or the engine running.**
- **Turn the ignition switch to OFF when the AIR INJ CHECK operation finishes.**

Standard Voltage

Intelligent Tester Operations	Voltmeter Connections	Specified Conditions
AP: ON, ASV: OPEN	AIRP (E4-11) - E1 (E4-3)	3.5 to 7.5 V
AP: OFF, ASV: CLOSE	AIRP (E4-11) - E1 (E4-3)	10 V or more
AP: ON, ASV: OPEN	AIRV (E4-24) - E1 (E4-3)	3.5 to 7.5 V
AP: OFF, ASV: CLOSE	AIRV (E4-24) - E1 (E4-3)	10 V or more

NG → Go to step 11

OK

7	REPLACE AIR INJECTION CONTROL DRIVER

NEXT

8	CHECK WHETHER DTC OUTPUT RECURS (DTC P2440 AND/OR P2441)

(a) Start the engine and warm it up.
(b) Turn the ignition switch to OFF.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch to ON and turn the tester ON.
(e) Clear DTCs (where set) (see page ES-40).
(f) Select the following menu items:

DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / AUTOMATIC OPERATION.

(g) Start the engine after the tester initialization is finished.
(h) Perform the SYSTEM CHECK operation by pressing ENTER.
(i) After operating the AIR system, press the ENTER button to confirm the AIR system pending codes.
(j) Check PENDING DTCs.
(k) Turn the ignition switch to OFF.

OK:

No pending DTC output.

NOTICE:

- **When performing the AIR INJ CHECK operation after the battery cable has been reconnected, wait for 7 minutes with the ignition switch turned to ON or the engine running.**
- **Turn the ignition switch to OFF when the AIR INJ CHECK operation finishes.**

NEXT

END

9	INSPECT VACUUM HOSES (AIR SWITCHING VALVE - PRESSURE SENSOR)

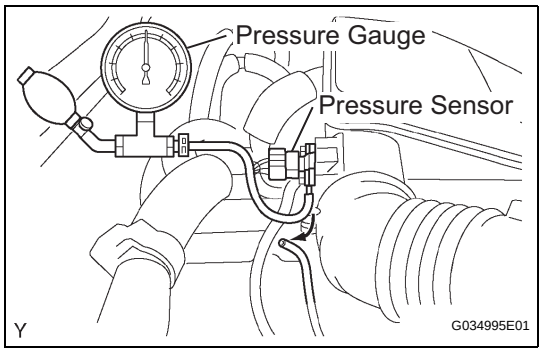
OK:

No blockage and no deformation in vacuum hose.

NG → **REPAIR OR REPLACE VACUUM HOSE**

OK

10	INSPECT ECM (AIP VOLTAGE)



(a) Connect a pressure gauge to the air pressure sensor as shown in the illustration.
(b) Connect the intelligent tester to the DLC3.
(c) Turn the ignition switch to ON and turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD ll / DATA LIST / AIR PMP PRS(A).
(e) Check that the pressure displayed on the tester fluctuates when applying pressure to the pressure sensor with the pressure gauge.

OK:

Pressure fluctuates in response to pressure applied with pressure gauge.

HINT:

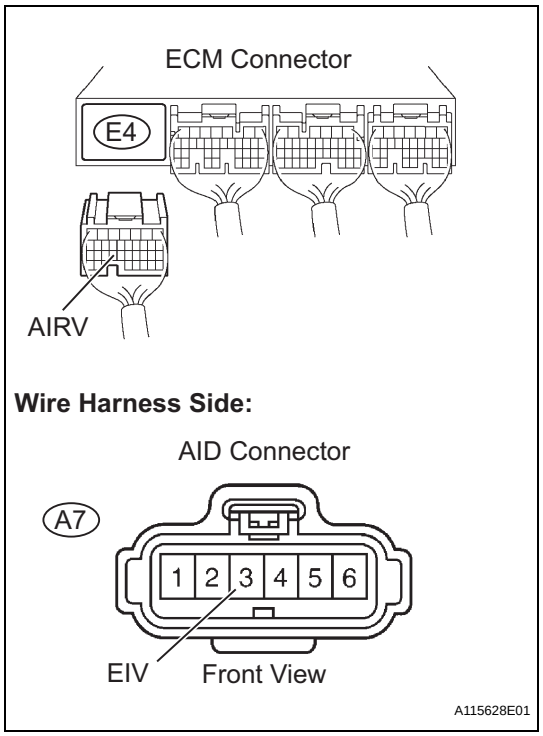
The tester displays the air pump pressure (AIR PMP PRS(A)) as absolute pressure.

NG → **REPLACE PRESSURE SENSOR (TURBO PRESSURE SENSOR)**

OK

CHECK FOR INTERMITTENT PROBLEMS

11 **CHECK HARNESS AND CONNECTOR (ECM - AIR INJECTION CONTROL DRIVER)**



(a) Disconnect the E4 ECM connector.
(b) Disconnect the A7 AID connector.
(c) Check the resistance.
Standard Resistance (Check for open)

Tester Connections	Specified Conditions
AIRV (E4-24) - EIV (A7-3)	Below 1 Ω

(d) Reconnect the ECM and AID connectors.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

REPLACE ECM

ES

DTC	P2444	Secondary Air Injection System Pump Stuck On Bank1

DTC	P2445	Secondary Air Injection System Pump Stuck Off Bank1

DESCRIPTION

Refer to P2440 (See page ES-354).

DTC No.	DTC Detection Conditions	Trouble Areas
P2444	Secondary air pressure more than 2.5 kPa (19 mmHg) despite ECM commanding air pump to turn off (2 trip detection logic)	• Short in air pump circuit • Open or short in pressure sensor circuit • Pressure sensor • Air Injection Control Driver (AID) • ECM
P2445	Secondary air pressure less than 2.5 kPa (19 mmHg) despite ECM commanding air pump to turn on (2 trip detection logic)	• Air pump • Open in air pump circuit • Air injection system piping • Vacuum hose (pressure sensor - air switching valve) • Pressure sensor • Open or short in pressure sensor circuit • Air Injection Control Driver (AID) • ECM

ES

MONITOR DESCRIPTION

The ECM monitors the pressure in the secondary air passage using the pressure sensor located on the Air Switching Valve (ASV) of the Secondary Air Injection (AIR) system. The sensor measures the pressure in the secondary air passage and transmits a signal to the ECM.
If either of the following conditions occurs, the ECM interprets it as a malfunction of the AIR system, and illuminates the MIL and sets a DTC:

- The pressure indicated by the pressure sensor does not reach threshold levels despite the ECM turning on the air pump.
- The pressure indicated by the pressure sensor exceeds threshold levels despite the ECM turning off the air pump.

MONITOR STRATEGY

Related DTCs	P2444: Air pump stuck ON P2445: Air pump stuck OFF
Required Sensors/Components (Main)	Pressure sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Once per drive cycle
Duration	7 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	• P0010 - P0022: VVT system • P0031 - P0052: Front A/F sensor heater • P0100 - P0103: MAF sensor • P0110 - P0113: IAT sensor • P0115 - P0118: ECT sensor • P0120 - P2125: TP sensor • P0125: Closed loop • P0171 - P0175: Fuel trim • P0300 - P0308: Misfire • P0325 - P0333: Knock sensor • P0335: CKP sensor • P0340 - P0346: VVT sensor • P0351 - P0358: Igniter • P0441 - P2420: EVAP system • P0500: VSS • P1340: CMP sensor • P2195 - P2A03: A/F sensor • P2430 - P2433: AIR pressure sensor
Battery voltage	11 V or more
Atmospheric pressure	45 kPa (337.5 mmHg) or more

While secondary air injection ON:

Secondary air injection pump	ON
Secondary air injection switching valve	ON
Engine speed	Less than 3,750 rpm
Delay time after engine started	6 seconds or more
Pressure sensor malfunction	Not detected

While secondary air injection OFF:

Secondary air injection pump	OFF
Engine speed	Less than 3,750 rpm
Secondary air injection system monitor during secondary air injection ON	Completed
Pressure sensor malfunction	Not detected

TYPICAL MALFUNCTION THRESHOLDS

Condition 1:

AIR pressure during AIR ON	2.5 kPa or more and pulse is generated

Condition 2:

AIR pressure during AIR ON	Less than 2.5 kPa and pulse is generated

Condition 3:

AIR pressure during AIR ON	2.5 kPa or more and pulse is not generated

Condition 4:

AIR pressure during AIR ON	Less than 2.5 kPa and pulse is not generated

Condition 5:

AIR pressure during AIR OFF	2.5 kPa or more and pulse is generated

Condition 6:

AIR pressure during AIR OFF	Less than 2.5 kPa and pulse is generated

Condition 7:

AIR pressure during AIR OFF	2.5 kPa or more and pulse is not generated

Condition 8:

AIR pressure during AIR OFF	Less than 2.5 kPa and pulse is not generated

P2444: AIR pump stuck ON

Both of following conditions met:	(a) and (b)
(a) Not condition 6	Met
(b) Not condition 8	Met

P2445: AIR pump stuck OFF

Both of following conditions met:	(a) and (b)
(a) Not condition 1	Met
(b) Not condition 3	Met

P2445: AIR insufficient

AIR amount	0 L/min or less

ES

MONITOR RESULT

Refer to Checking Monitor Status (See page ES-21).

WIRING DIAGRAM

Refer to DTC P2440 (See page ES-356).

HINT:
Determination by ECM monitoring:
The ECM locates malfunctions in the secondary Air Injection (AIR) system by detecting the pressure in the AIR passage between the air pump and Air Switching Valve (ASV) and sets a DTC. Soon after cold engine starts, the monitor runs for a short time while the AIR system is both ON and OFF. The ECM detects both the pressure and the exhaust pulsation and compares them.
The following 4 patterns are AIR system pressure conditions in the AIR system passage.

Pressure condition in Secondary Air Injection System Case 1:

Air Pump	ON
Air Switching Valve	Open
Pressure	2.5 kPa or more
Pulsation Detection	Exhaust gas pulsation detected

Pressure condition in Secondary Air Injection System Case 2:

Air Pump	OFF
Air Switching Valve	Open
Pressure	Less than 2.5 kPa
Pulsation Detection	Exhaust gas pulsation detected

Pressure condition in Secondary Air Injection System Case 3:

Air Pump	ON
Air Switching Valve	Closed
Pressure	2.5 kPa or more
Pulsation Detection	Slight pulsation detected

Pressure condition in Secondary Air Injection System Case 4:

Air Pump	OFF
Air Switching Valve	Closed
Pressure	Less than 2.5 kPa
Pulsation Detection	Exhaust pulsation not detected

If the detected pressure is high, the air pump is assumed to be ON and if it alternates sharply*, the ASV is assumed to be open. The ECM locates malfunctions from the combination of pressures detected when the AIR system is ON and OFF.

*: The exhaust pulsation value is calculated in the ECM. If the calculated value exceeds a certain level, the ECM determines that the exhaust pulsation is in the AIR system.

HINT:

- In case 3, as the pressure sensor detects a slight pump operation pulsation, the detected value is not constant. Since the pump outlet is blocked by closing the ASV, the average pressure is higher than in case 1 (approximately 20 to 30 kPa).
- In case 1, the average pressure is approximately 9 to 11 kPa. The value of 2.5 kPa indicated in the table above is a threshold for detecting pump malfunctions.

Detected Conditions while AIR operating: Air pump ON, ASV Open	Detected Conditions while AIR not operating: Air pump OFF, ASV Closed	ECM Determination	DTCs Output
Case 1	Case 4	Normal	-
Case 1	Case 2	ASV stuck open	P2440
Case 1	Case 3	Air pump stuck ON	P2444
Case 2	Case 4	Air pump stuck OFF	P2445
Case 3	Case 4	ASV stuck closed	P2441
Case 1	Case 1	ASV stuck open and Air pump stuck ON	P2440 and P2444
Case 2	Case 2	ASV stuck open and Air pump stuck OFF	P2440 and P2445
Case 3	Case 3	ASV stuck closed and Air pump stuck ON	P2441 and P2444
Case 4	Case 4	ASV stuck closed and Air pump stuck OFF	P2441 and P2445

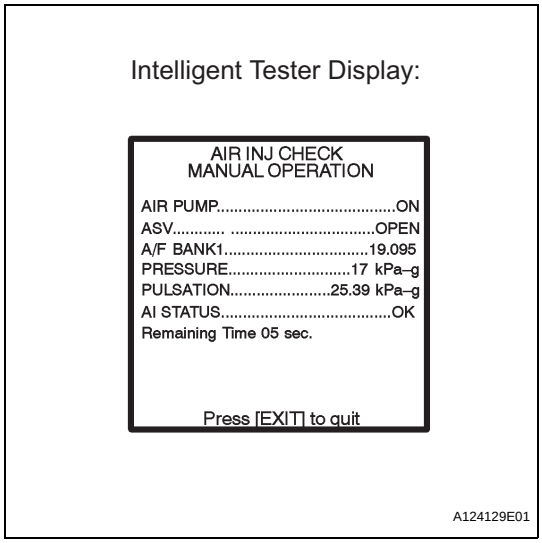
HINT:

- If the vacuum hose between the ASV and the pressure sensor is not connected correctly, case 4 may occur.
- By using an intelligent tester to perform the AIR INJ CHECK operation in the SYSTEM CHECK, the air-fuel ratio and the pressure in the secondary air injection system passage can be checked while the secondary air injection system is operating. This helps technicians to troubleshoot the system when it malfunctions. Furthermore, PENDING CODES also can be checked by performing SYSTEM CHECK / AUTOMATIC OPERATION after the repair.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

SYSTEM CHECK:

The pressure in the secondary air passage can be checked using an intelligent tester.

(a) Start the engine and warm it up.



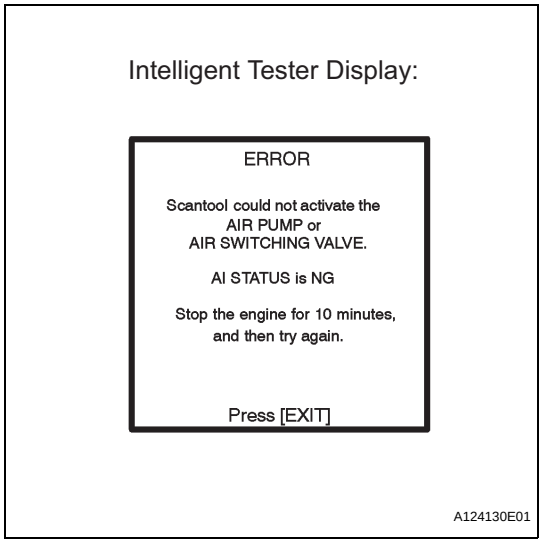
(b) Turn the ignition switch to OFF.
(c) Connect an intelligent tester to the DLC3.
(d) Turn the ignition switch to ON and turn the tester ON.
(e) Select the following menu items:
DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / MANUAL OPERATION / AP: ON, ASV: OPEN and AP: OFF, ASV CLOSE.
HINT:
When MANUAL OPERATION is selected, the tester initialization (atmospheric pressure measurement) is performed automatically. The initialization takes 10 seconds. After the initialization, AP and ASV operation canbe selected.
(f) Start the engine.
(g) Perform the AIR system intrusive operation while the engine is idling.
(h) Check that the air pump (AIR PUMP), ASV and pressure in the AIR system passage (PRESSURE) displayed on the tester, indicate the conditions shown in the table below.

Standard

Intelligent Tester Operations	AIR PUMP	ASV	PRESSURE *1	PULSATION *2
AP: ON, ASV: OPEN	ON	OPEN	2.5 kPa or more	11.25 kPa or more
AP: OFF, ASV: CLOSE	OFF	CLOSE	Less than 2.5 kPa	Less than 11.25 kPa

*1:
Average pumping pressure (gauge pressure). The pressure should be 2.5 kPa or more when the AIR system operates.
*2:
The cumulative exhaust pulsation calculated by the ECM. If the calculated value exceeds a certain level, the ECM determines that the exhaust pulsation is in the AIR system.

(i) Turn the ignition switch to OFF.



NOTICE:

- **This AIR INJECTION CHECK only allows technicians to operate the AIR system for a maximum of 5 seconds.**
  Furthermore, the check can only be performed up to 4 times per trip. If the test is repeated, intervals of at least 30 seconds are required between checks.
  While AIR system operation using the intelligent tester is prohibited, the tester display indicates the prohibition (WAIT or ERROR).
  If an ERROR as shown in the illustration is displayed on the tester during the test, stop the engine for 10 minutes, and then try again.
- **Performing the AIR INJ CHECK repetitively may cause damage to the AIR system. If necessary, leave an interval of several minutes between SYSTEM CHECK operations to prevent the system from overheating.**
- **When performing the AIR INJ CHECK operation after the battery cable has been reconnected, wait for 7 minutes with the ignition switch turned to ON or the engine running.**
- **Turn the ignition switch to OFF when the AIR INJ CHECK operation finishes.**

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2444 AND/OR P2445)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed To
P2444 and/or P2445	A
P2444 and/or P2445, and P0418	B
P2444 and/or P2445, and other DTCs (except P0418)	C

If any DTCs other than P2444, P2445 and/or P0418 are output, troubleshoot those DTCs first.

B	GO TO AIR PUMP INSPECTION PROCEDURE
C	GO TO DTC CHART

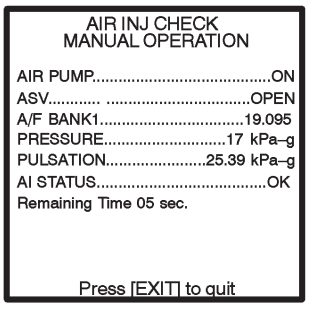
2	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (SECONDARY AIR INJECTION SYSTEM OPERATION)

Intelligent Tester Display:



A124129E01

(a) Start the engine and warm it up.
(b) Turn the ignition switch to OFF.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch to ON and turn the tester ON.
(e) Select the following menu items:
DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / MANUAL OPERATION / AP: ON, ASV: OPEN and AP: OFF, ASV CLOSE.
HINT:
When MANUAL OPERATION is selected, the tester initialization (atmospheric pressure measurement) is performed automatically. The initialization takes 10 seconds. After the initialization, AP and ASV operation can be selected.
(f) Start the engine.
(g) Perform the AIR system intrusive operation while the engine is idling.
(h) Check that the air pump (AIR PUMP), ASV and pressure in the AIR system passage (PRESSURE) status displayed on the tester, indicate the conditions shown in the table below.

Standard

Intelligent Tester Operations	AIR PUMP	ASV	PRESSURE*
AP: ON, ASV: OPEN	ON	ON	2.5 kPa or more
AP: OFF, ASV: CLOSE	OFF	OFF	Less than 2.5 kPa

*: Average pumping pressure. The pressure should be 2.5 kPa or more when the AIR system operates.

Intelligent Tester Display:

A124130E01

(i) Turn the ignition switch to OFF.

NOTICE:

- **This AIR INJECTION CHECK only allows technicians to operate the AIR system for a maximum of 5 seconds.**
  Furthermore, the check can only be performed up to 4 times per trip. If the test is repeated, intervals of at least 30 seconds are required between checks.
  While AIR system operation using the intelligent tester is prohibited, the tester display indicates the prohibition (WAIT or ERROR).
  If an ERROR as shown in the illustration is displayed on the tester during the test, stop the engine for 10 minutes, and then try again.
- **Performing the AIR INJ CHECK repetitively may cause damage to the AIR system. If necessary, leave an interval of several minutes between SYSTEM CHECK operations to prevent the system from overheating.**

- **When performing the AIR INJ CHECK operation after the battery cable has been reconnected, wait for 7 minutes with the ignition switch turned to ON or the engine running.**
- **Turn the ignition switch to OFF when the AIR INJ CHECK operation finishes.**

NG → **Go to step 4**

OK

3 CHECK WHETHER DTC OUTPUT RECURS (DTC P2444 AND/OR P2445)

(a) Start the engine and warm it up.
(b) Turn the ignition switch to OFF.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch to ON and turn the tester ON.
(e) Clear DTCs (where set) (see page ES-40).
(f) Select the following menu items:
DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / AUTOMATIC OPERATION.
(g) Start the engine after the tester initialization is finished.
(h) Perform the SYSTEM CHECK operation by pressing ENTER.
(i) After operating the AIR system, press the ENTER button to confirm the AIR system pending codes.
(j) Check PENDING DTCs.
(k) Turn the ignition switch to OFF.

NOTICE:

- **When performing the AIR INJ CHECK operation after the battery cable has been reconnected, wait for 7 minutes with the ignition switch turned to ON or the engine running.**
- **Turn the ignition switch to OFF when the AIR INJ CHECK operation finishes.**

Result

Display (DTC output)	Proceed To
P2444 and/or P2445	A
No pending DTC	B

B → **CHECK FOR INTERMITTENT PROBLEMS**

A

4 CHECK VACUUM HOSES (PRESSURE SENSOR - AIR SWITCHING VALVE)

(a) Check the vacuum hose connections with the pressure sensor and ASV.
(b) Inspect the vacuum hose for blockages and damage.

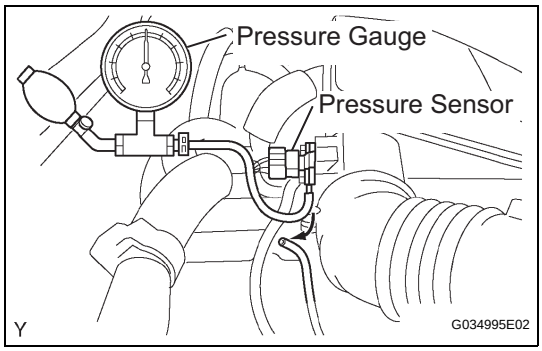
OK:

Vacuum hose has no blockages or damage.

NG → **REPAIR OR REPLACE VACUUM HOSE**

OK

5	INSPECT ECM (AIP VOLTAGE)

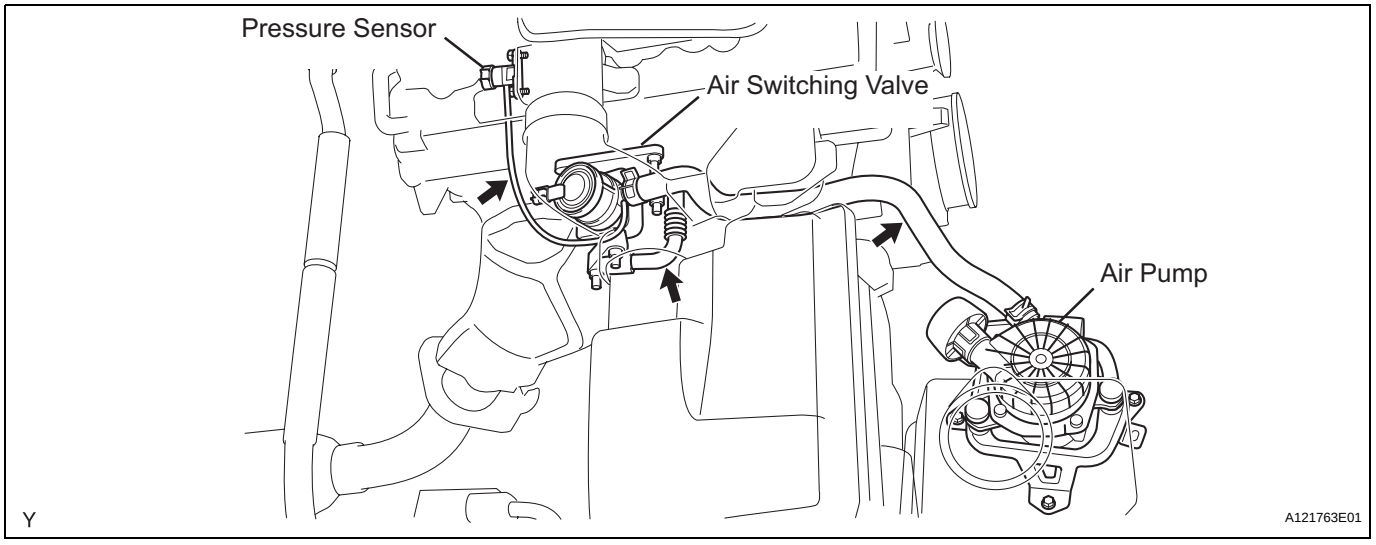


(a) Connect a pressure gauge to the air pressure sensor as shown in the illustration.
(b) Connect the intelligent tester to the DLC3.
(c) Turn the ignition switch to ON and the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD ll / DATA LIST / AIR PMP PRS(A).
(e) Check that the pressure displayed on the tester fluctuates when applying the pressure to the pressure sensor with the pressure gauge.
OK:
Pressure fluctuates in response to pressure applied with pressure gauge.
HINT:
The tester displays the air pump pressure (AIR PMP PRS(A)) as absolute pressure.

NG → **REPLACE PRESSURE SENSOR (TURBO PRESSURE SENSOR)**

OK

6	CHECK AIR INJECTION SYSTEM PIPE CONNECTIONS

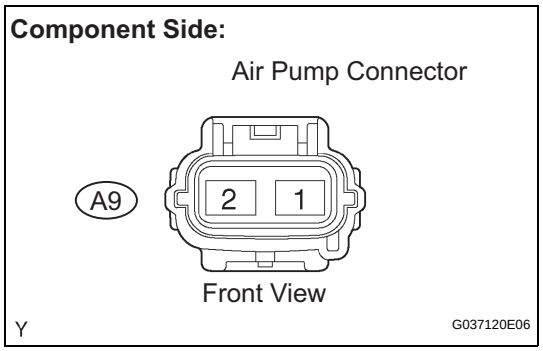


(a) Check that all the pipes and hoses between the air pump and ASV are securely connected.
(b) Inspect the pipes and hoses for blockages and damage.
OK:
AIR system piping has no blockages or damage.

NG → **REPAIR OR REPLACE AIR INJECTION SYSTEM PIPING**

OK

7 INSPECT AIR PUMP ASSEMBLY



(a) Check the resistance.
(1) Using an ohmmeter, measure the resistance between the terminals.
Standard Resistance

Tester Connections	Specified Conditions
Air pump (A9-1) - Air pump (A9-2)	0.4 to 10 Ω at 20°C (68°F)

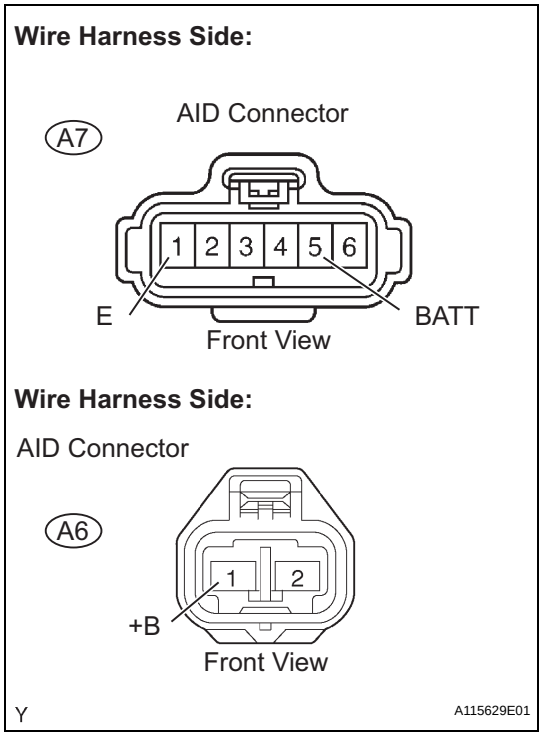
If the result is not as specified, replace the air pump.
HINT:
To check the air pump operation, use the AIR INJ CHECK function described in the SYSTEM CHECK.

ES

NG → **REPLACE AIR PUMP ASSEMBLY**

OK

8 INSPECT AIR INJECTION CONTROL DRIVER (AIR INJECTION CONTROL DRIVER POWER SOURCE CIRCUIT)



(a) Disconnect the A6 and A7 AID connectors.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between the terminals of the AID connector.
Standard Voltage

Tester Connections	Specified Conditions
BATT (A7-5) - Body ground	9 to 14 V (near battery voltage)
+B (A6-1) - Body ground	9 to 14 V (near battery voltage)

(d) Check the resistance.
Standard Resistance (Check for open)

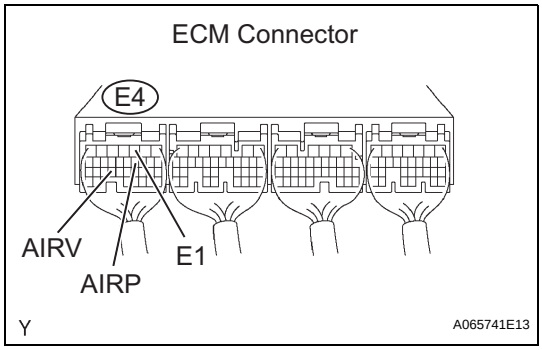
Tester Connections	Specified Conditions
E (A7-1) - Body ground	Below 1 Ω

(e) Reconnect the AID connector.

NG → **REPAIR OR REPLACE AIR INJECTION CONTROL DRIVER POWER SOURCE CIRCUIT**

OK

9	PERFORM ACTIVE TEST USING INTELLIGENT TESTER



(a) Start the engine and warm it up.
(b) Turn the ignition switch to OFF.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch to ON and turn the tester ON.
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / MANUAL OPERATION / AP: ON, ASV: OPEN and AP: OFF, ASV: CLOSE.
(f) Start the engine after the tester initialization is finished.
(g) Operate the AIR system using SYSTEM CHECK function and measure the voltage between the terminals of the ECM connector.
(h) Turn the ignition switch to OFF.

NOTICE:

- **Do not perform the SYSTEM CHECK operation repetitively. It may cause damage to the system. If necessary, leave an interval of several minutes between SYSTEM CHECK operations.**
- **When performing the AIR INJ CHECK operation after the battery cable has been reconnected, wait for 7 minutes with the ignition switch turned to ON or the engine running.**
- **Turn the ignition switch to OFF when the AIR INJ CHECK operation finishes.**

Standard Voltage

Intelligent Tester Operations	Voltmeter Connections	Specified Conditions
AP: ON, ASV: OPEN	AIRP (E4-11) - E1 (E4-3)	3.5 to 7.5 V
AP: OFF, ASV: CLOSE	AIRP (E4-11) - E1 (E4-3)	10 V or more
AP: ON, ASV: OPEN	AIRV (E4-24) - E1 (E4-3)	3.5 to 7.5 V
AP: OFF, ASV: CLOSE	AIRV (E4-24) - E1 (E4-3)	10 V or more

NG → Go to step 12

OK

10	REPLACE AIR INJECTION CONTROL DRIVER

NEXT

11	CHECK WHETHER DTC OUTPUT RECURS (DTC P2444 AND/OR P2445)

(a) Start the engine and warm it up.
(b) Turn the ignition switch to OFF.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch to ON and turn the tester ON.
(e) Clear DTCs (where set) (see page ES-40).
(f) Select the following menu items:

DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / AUTOMATIC OPERATION.

(g) Start the engine after the tester initialization is finished.
(h) Perform the SYSTEM CHECK operation by pressing ENTER.
(i) After operating the AIR system, press the ENTER button to confirm the AIR system pending codes.
(j) Check PENDING DTCs.
(k) Turn the ignition switch to OFF.

OK:

No pending DTC output.

NOTICE:

- **When performing the AIR INJ CHECK operation after the battery cable has been reconnected, wait for 7 minutes with the ignition switch turned to ON or the engine running.**
- **Turn the ignition switch to OFF when the AIR INJ CHECK operation finishes.**

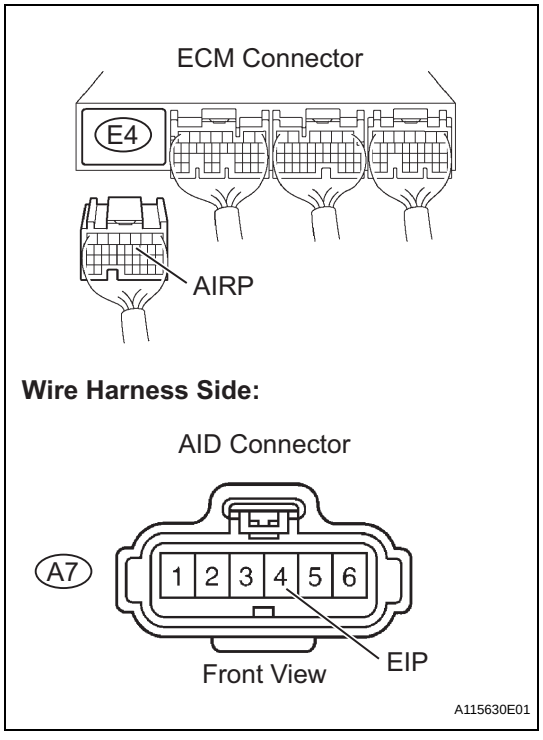
12 CHECK HARNESS AND CONNECTOR (ECM - AIR INJECTION CONTROL DRIVER)



(a) Disconnect the E4 ECM connector.
(b) Disconnect the A7 AID connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
AIRP (E4-11) - EIP (A7-4)	Below 1 Ω

(d) Reconnect the ECM and AID connectors.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

REPLACE ECM

DTC	P2610	ECM / PCM Internal Engine Off Timer Performance

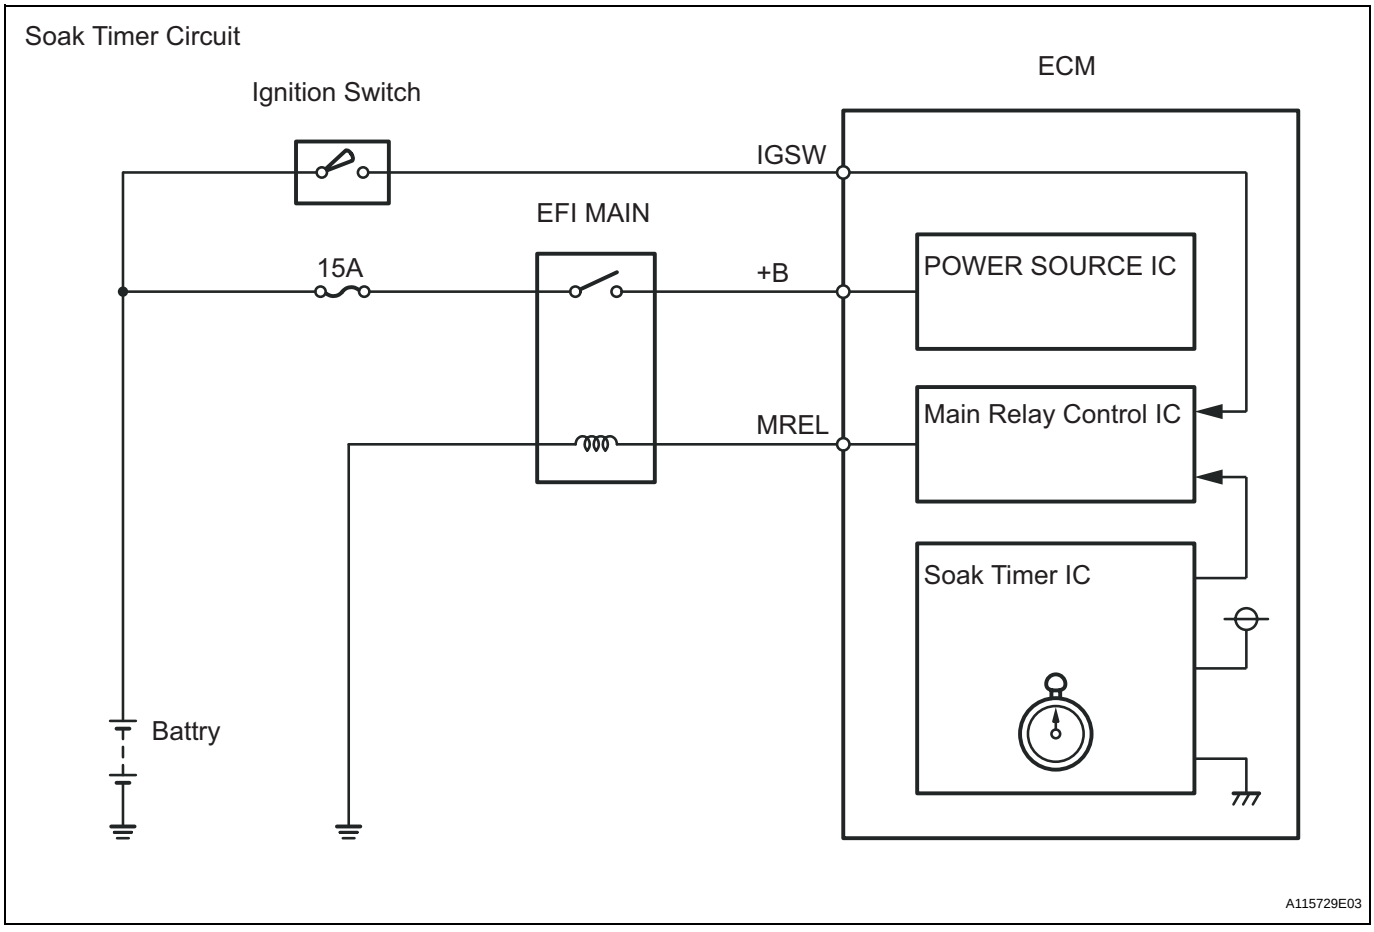
DTC SUMMARY

DTC	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P2610	Soak timer (built into ECM)	ECM internal malfunction	ECM	Engine running	2 trip

DESCRIPTION

ES

To ensure the accuracy of the EVAP (Evaporative Emission) monitor values, the soak timer, which is built into the ECM, measures 5 hours (+- 15 minutes) from when the ignition switch is turned to OFF, before the monitor is run. This allows the fuel to cool down, which stabilizes the Fuel Tank Pressure (FTP). When 5 hours have elapsed, the ECM turns on.



MONITOR DESCRIPTION

5 hours after the ignition switch is turned to OFF, the soak timer activates the ECM to begin the EVAP system monitor. While the engine is running, the ECM monitors the synchronization of the soak timer and the CPU clock. If these two are not synchronized, the ECM interprets this as a malfunction, illuminates the MIL and sets the DTC (2 trip detection logic).

MONITOR STRATEGY

Required Sensors/Components	ECM

Frequency of Operation	Once per driving cycle
Duration	10 minutes
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTC not present	None
Ignition switch	ON
Engine	Running
Battery voltage	8 V or more
Starter	OFF

TYPICAL MALFUNCTION THRESHOLDS

Soak timer measurement when ECM CPU clock counts 10 minutes	Less than 7 minutes or more than 13 minutes

HINT:

- DTC P2610 is set if an internal ECM problem is detected. Diagnostic procedures are not required. ECM replacement is required.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	**REPLACE ECM**

NEXT

2	**CHECK WHETHER DTC OUTPUT RECURS**

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Clear DTCs (See page ES-40).
(d) Start the engine and wait for 10 minutes or more.
(e) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
(f) If no pending DTC is displayed, the repair has been successfully completed.

NEXT

END

DTC	P2A00	A/F Sensor Circuit Slow Response (Bank 1 Sensor 1)

HINT:
Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

DESCRIPTION

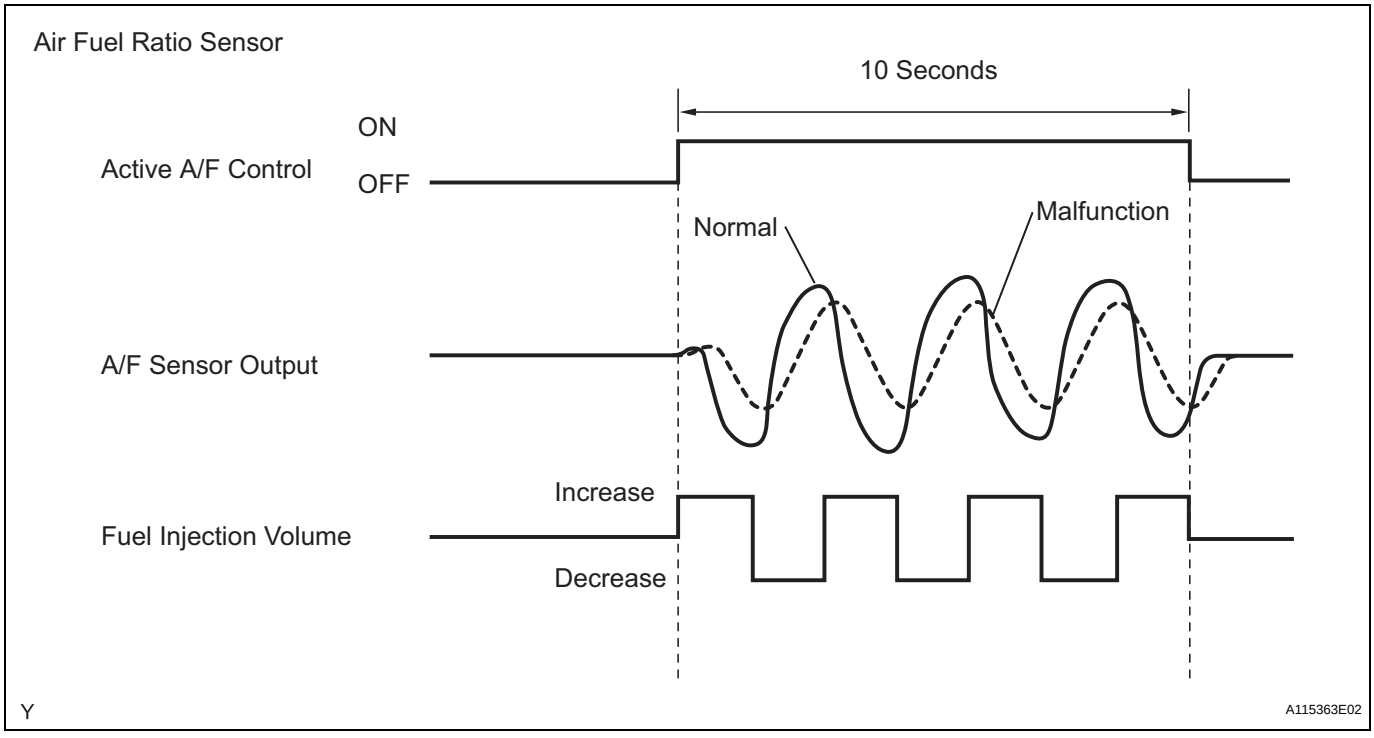
Refer to DTC P2195 (See page ES-312).

DTC No.	DTC Detection Conditions	Trouble Areas
P2A00	Calculated value for air-fuel ratio (A/F) sensor response rate deterioration level is less than threshold	• Open or short in A/F sensor circuit • A/F sensor • ECM

ES

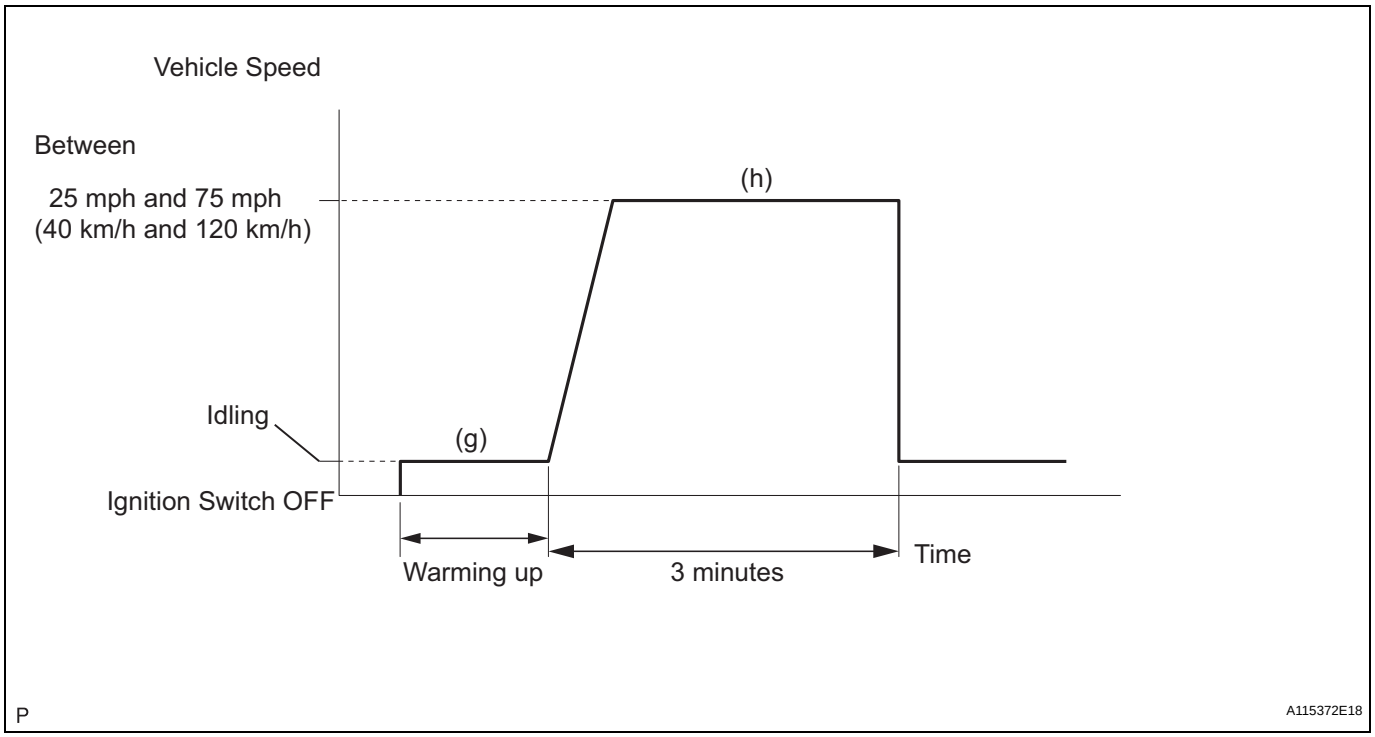
MONITOR DESCRIPTION

After engine is warmed up, the ECM performs air-fuel ratio feedback control to maintain the air-fuel ratio at the stoichiometric level. In addition, active A/F ratio control is performed for approximately 10 seconds after preconditions are met in order to measure the A/F sensor response rate. During active A/F ratio control, the ECM forcibly increases and decreases the injection volume a certain amount, based on the stoichiometric air-fuel ratio learned during normal air-fuel ratio control, and measures the A/F sensor response rate. The ECM receives a signal from the A/F sensor while performing active A/F ratio control and uses it to calculate the A/F sensor response rate deterioration level.
If the value for A/F sensor response rate deterioration level is less than threshold, the ECM interprets this as a malfunction and sets the DTC.

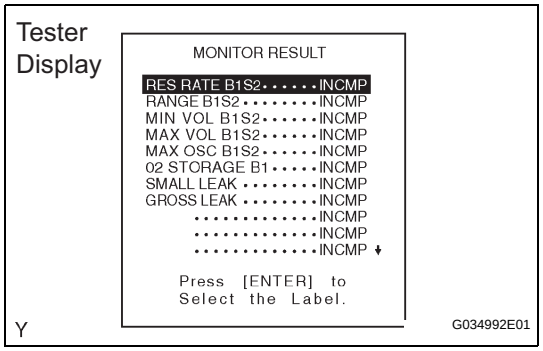


CONFIRMATION DRIVING PATTERN

HINT:
Performing this confirmation pattern will activate the A/F sensor response monitor.



(a) Connect an intelligent tester to the DLC3.



(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Clear DTCs (where set).
(e) Select the following menu items: DIAGNOSIS /ENHANCED OBD II / MONITOR INFO / MONITOR RESULT.
(f) Check that RES RATE B1S1 is INCOMP.
(g) Start the engine and warm it up.
(h) Drive the vehicle at between 25 mph and 75 mph (40 km/h and 120 km/h) for 3 minutes. However, the vehicle should be driven at a constant speed.
(i) Check the monitor result values on the intelligent tester by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / TEST RESULT.
(j) If the values indicated on the tester do not change, perform READINESS MONITOR DRIVE PATTERN for the A/F sensor and the heated oxygen sensor (see page ES-25).
HINT:
Completion of all A/F sensor monitors is required to change the value in TEST RESULT.
(k) Note the value of the Monitor Result.
(l) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
(m) Check if any DTCs (any pending DTCs) are set.

MONITOR STRATEGY

Related DTCs	P2A00: Air-Fuel Ratio (A/F) sensor slow response
Required Sensors/Components (Main)	A/F sensor
Required Sensors/Components (Related)	Vehicle speed sensor, Crankshaft position sensor
Frequency of Operation	Once per driving cycle
Duration	10 to 15 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0031, P0032, P0051, P0052 (A/F sensor heater - Sensor 1) P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for Closed Loop) P0171, P0172 (Fuel system) P0300 - P0308 (Misfire) P0335 (CKP sensor) P0340, P0341 (CMP sensor) P0442 - P0456 (EVAP system) P0500 (VSS) P2196, P2198 (A/F sensor - rationality) P2440 (A/R control valve stuck open) P2441 (A/R control valve stuck close) P2444 (AIP stuck ON) P2445 (AIP stuck OFF)

Intake air amount	3 to 14 g/sec

TYPICAL MALFUNCTION THRESHOLDS

Response rate deterioration level	Less than 0.2 V

MONITOR RESULT

Refer to Checking Monitor Status (See page ES-21).

WIRING DIAGRAM

Refer to DTC P2195 (See page ES-316).

HINT:
Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the A/F CONTROL operation using an intelligent tester.

1. Connect an intelligent tester to the DLC3.
2. Start the engine and turn the tester ON.
3. Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
4. On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
5. Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
6. Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and OS2 B1S2) displayed on the tester.
   HINT:
   - The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
   - Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard Voltage

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (HO2)	+25 %	Rich	More than 0.5
O2S B1S2 (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:
The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		
3	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
4	Injection volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output Voltage Almost no reaction		Output voltage Almost no reaction		

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

HINT:

- DTC P2A00 may be set, when the air-fuel ratio is stuck rich or lean.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.
- DTC P2A00 may also be set, when the sensor element is electrically clogged or contaminated.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2A00)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

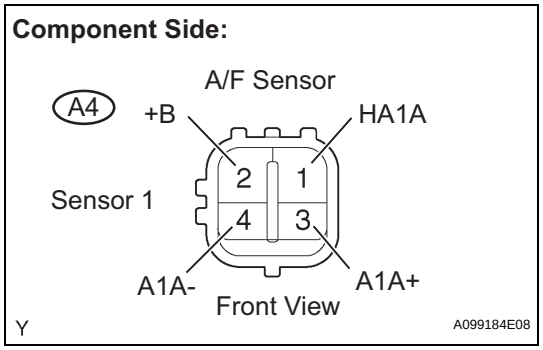
Display (DTC Output)	Proceed To
P2A00	A
P2A00 and other DTCs	B

If any DTCs relating to the A/F sensor (DTCs for the A/F sensor heater or A/F sensor admittance) are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2 INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



(a) Disconnect the A4 Air-Fuel Ratio (A/F) sensor connector.
(b) Measure the resistance between the terminals of the A/F sensor connector.

Standard Resistance

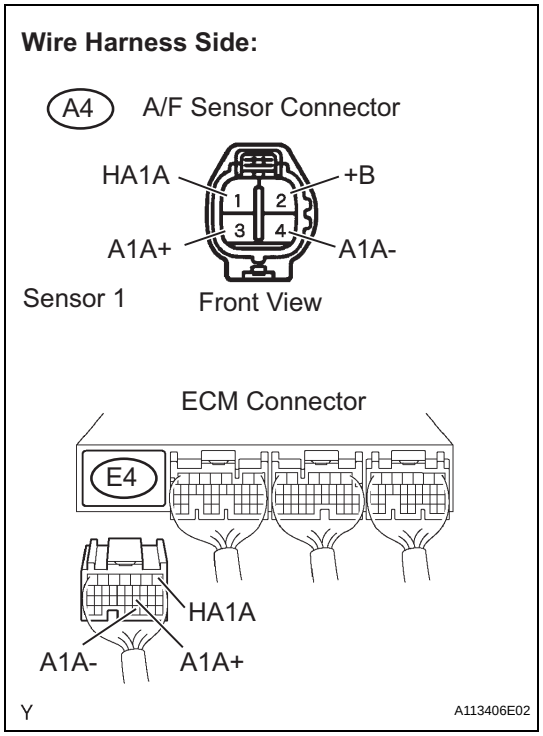
Tester Connections	Specified Conditions
HA1A (1) - +B (2)	1.8 to 3.4 Ω at 20°C (68°F)
HA1A (1) - A1A- (4)	10 kΩ or higher

(c) Reconnect the air-fuel ratio sensor connector.

NG → REPLACE AIR FUEL RATIO SENSOR

OK

3 CHECK HARNESS AND CONNECTOR (ECM - AIR FUEL RATIO SENSOR)



(a) Disconnect the A4 A/F sensor connector.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between the +B terminal of the A/F sensor connector and body ground.

Standard Voltage

Tester Connections	Specified Conditions
+B (A4-2) - Body ground	9 to 14 V

(d) Turn the ignition switch to OFF.
(e) Disconnect the E4 ECM connector.
(f) Check the resistance.

Standard Resistance (Check for open)

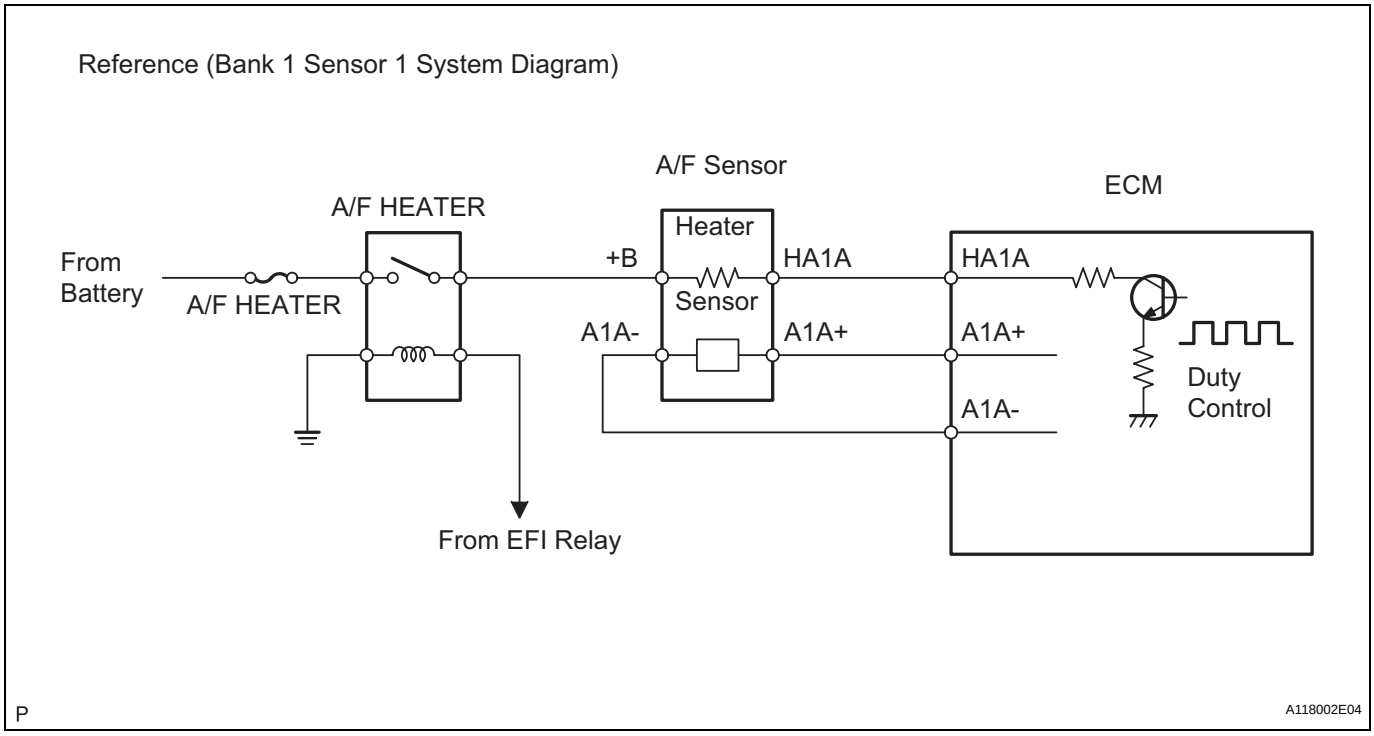
Tester Connections	Specified Conditions
HA1A (A4-1) - HA1A (E4-1)	Below 1 Ω
A1A+ (A4-3) - A1A+ (E4-21)	Below 1 Ω
A1A- (A4-4) - A1A- (E4-31)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
HA1A (A4-1) or HA1A (E4-1) - Body ground	10 kΩ or higher
A1A+ (A4-3) or A1A+ (E4-21) - Body ground	10 kΩ or higher
A1A- (A4-4) or A1A- (E4-31) - Body ground	10 kΩ or higher

(g) Reconnect the ECM connector.
(h) Reconnect the A/F sensor connector.

ES



ES

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

4	PERFORM CONFIRMATION DRIVING PATTERN

NEXT

5	CHECK WHETHER DTC OUTPUT RECURS (DTC P2A00)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
(d) Read pending DTCs.

Result

Display (DTC Output)	Proceed To
P2A00	A
No output	B

B → **CHECK FOR INTERMITTENT PROBLEMS**

A

6	REPLACE AIR FUEL RATIO SENSOR

NEXT

7	PERFORM CONFIRMATION DRIVING PATTERN

NEXT

8	CHECK WHETHER DTC OUTPUT RECURS (DTC P2A00)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
(d) Read pending DTCs.

ES

Result

Display (DTC Output)	Proceed To
No output	A
P2A00	B

B → CHECK EXTREMELY RICH OR LEAN ACTUAL AIR FUEL RATIO (REFER TO DTC P0171 PROCEDURE)

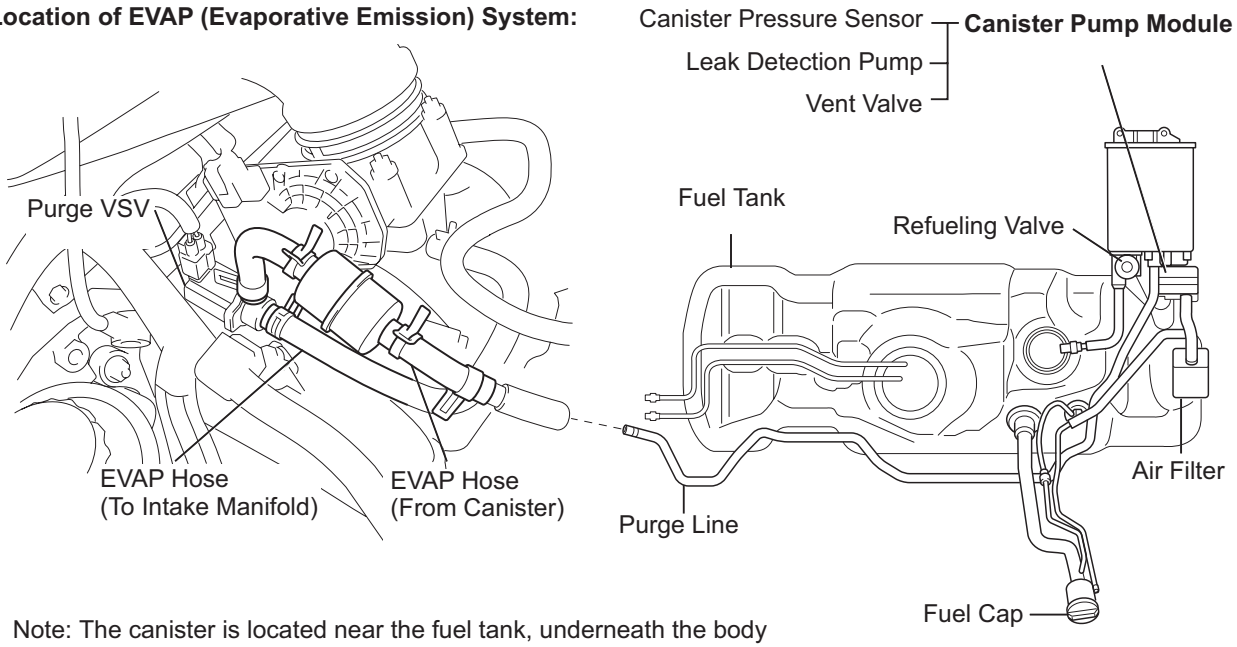
A106731E06

NOTICE:
If the 0.02 inch leak criterion difference between the first and second checks is greater than the specification, the DTCs corresponding to the leak criterion (P043E, P043F, P2401, P2402 and P2419) will be all stored.

ES

DESCRIPTION

Location of EVAP (Evaporative Emission) System:

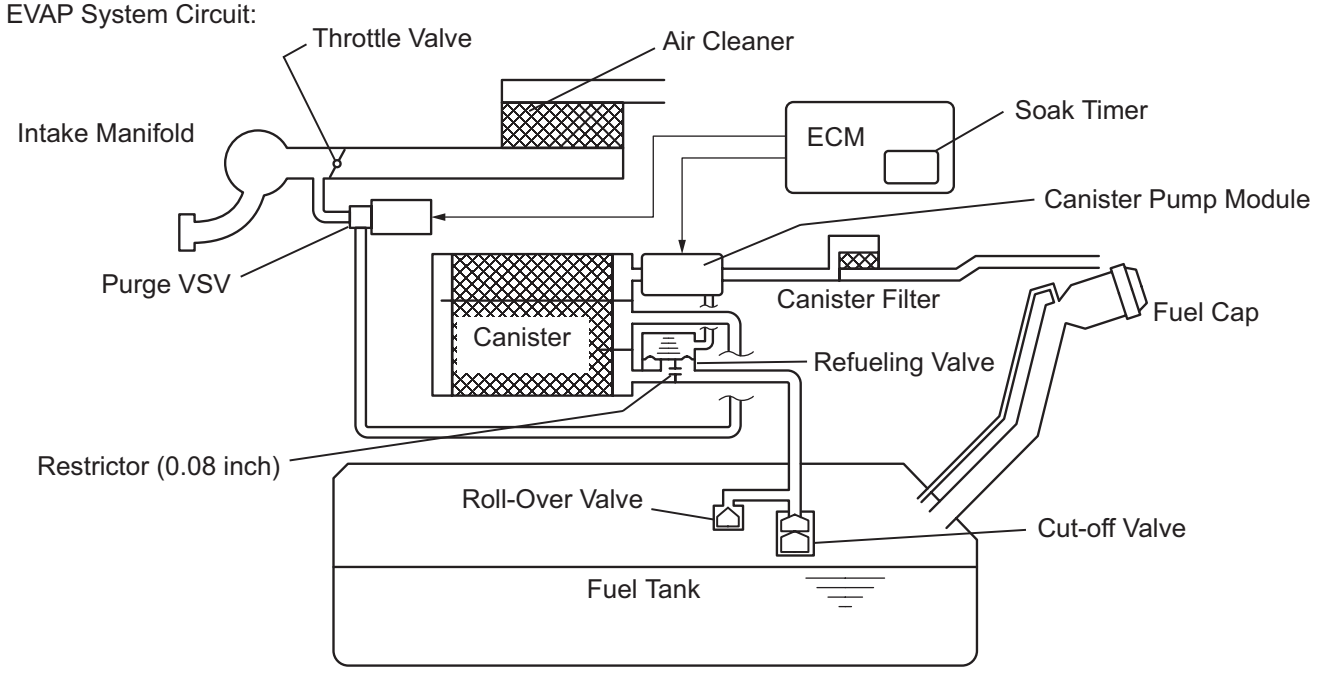


Note: The canister is located near the fuel tank, underneath the body

Y

A121764E01

EVAP System Circuit:



Y

A122570E01

NOTICE:
In this vehicle's EVAP system, turning ON the vent valve does not seal off the EVAP system. To check for leaks in the EVAP system, disconnect the air inlet vent hose and apply pressure from the atmosphere side of the canister.

While the engine is running, if a predetermined condition (closed-loop etc.) is met, the purge VSV is opened by the ECM and stored fuel vapors in the canister are purged to the intake manifold. The ECM changes the duty cycle ratio of the purge VSV to control purge flow volume.
The purge flow volume is also determined by the intake manifold pressure. Atmospheric pressure is allowed into the canister through the vent valve to ensure that the purge flow is maintained when the negative pressure (vacuum) is applied to the canister.
The following two monitors run to confirm appropriate EVAP system operation.

1. Key-off monitor

This monitor checks for EVAP (Evaporative Emission) system leaks and canister pump module malfunctions. The monitor starts 5 hours* after the ignition switch is turned to OFF. More than 5 hours are required to allow enough time for the fuel to cool down to stabilize the Fuel Tank Pressure (FTP), thus making the EVAP system monitor more accurate.
The leak detection pump creates negative pressure (vacuum) in the EVAP system and the pressure is measured. Finally, the ECM monitors for leaks from the EVAP system, and malfunctions in both the canister pump module and purge VSV, based on the EVAP pressure.
HINT:
*: If the engine coolant temperature is not below 35°C 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

2. Purge flow monitor

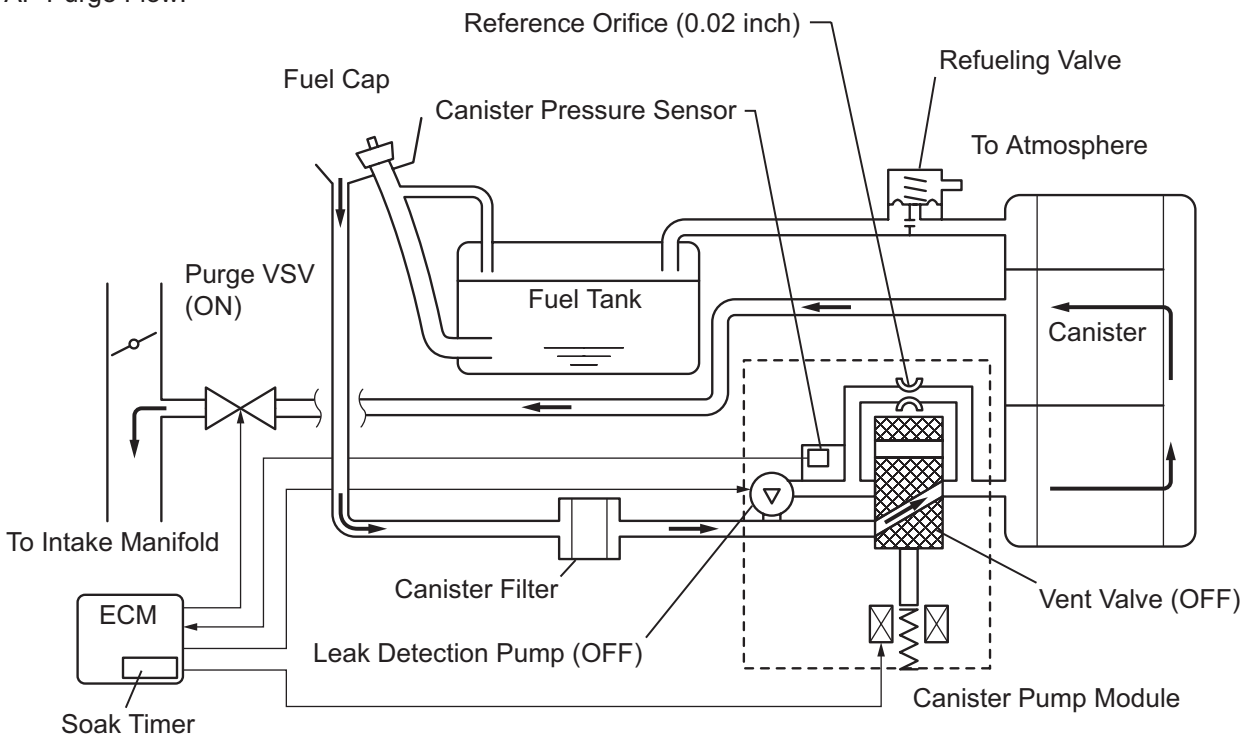
The purge flow monitor consists of the two monitors. The 1st monitor is always conducted every time and the 2nd monitor is activated if necessary.

- The 1st monitor
  While the engine is running and the purge VSV (Vacuum Switching Valve) is ON (open), the ECM monitors the purge flow by measuring the EVAP pressure change. If negative pressure is not created, the ECM begins the 2nd monitor.
- The 2nd monitor
  The vent valve is turned OFF (open) and the EVAP pressure is then measured. If the variation in the pressure is less than 0.5 kPa (3.75 mmHg), the ECM interprets this as the purge VSV being stuck closed, and illuminates the MIL and sets DTC P0441 (2 trip detection logic).

Atmospheric pressure check:
In order to ensure reliable malfunction detection, the variation between the atmospheric pressures, before and after conduction of the purge flow monitor, is measured by the ECM.

ES

EVAP Purge Flow:



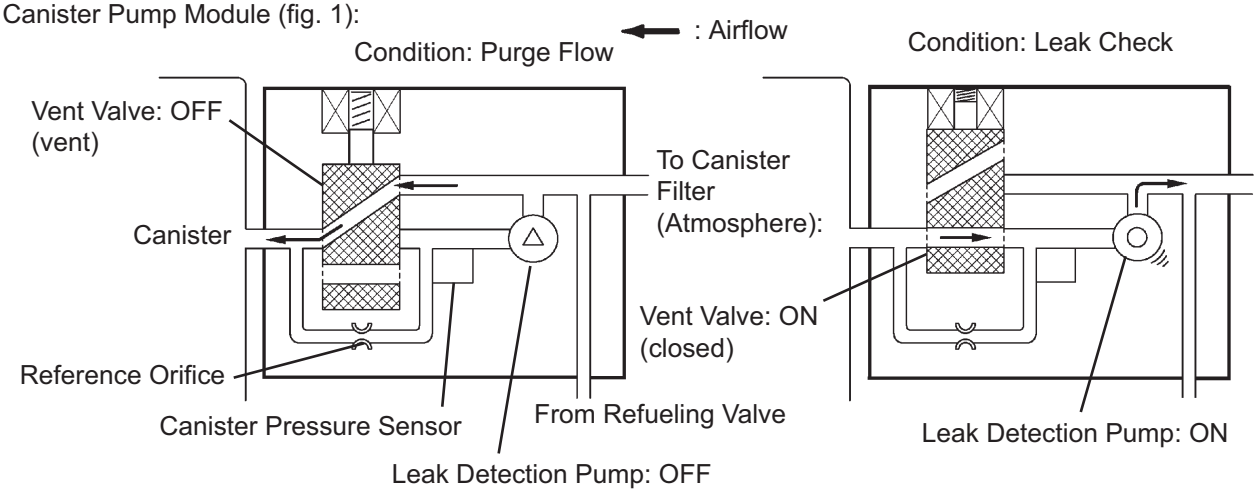
Y

A122571E01

Components	Operations
Canister	Contains activated charcoal to absorb EVAP (Evaporative Emissions) generated in fuel tank.
Cut-off valve	Located in fuel tank. Valve floats and closes when fuel tank 100 % full.
Purge VSV (Vacuum Switching Valve)	Opens or closes line between canister and intake manifold. ECM uses purge VSV to control EVAP purge flow. In order to discharge EVAP absorbed by canister to intake manifold, ECM opens purge VSV. EVAP discharge volume to intake manifold controlled by purge VSV duty cycle ratio (current-carrying time). (Open: ON, Close: OFF)
Refueling valve	Controls EVAP pressure from fuel tank to canister. Valve consists of diaphragm, spring and restrictor (diameter: 0.08 inch). When fuel vapor and pressure inside fuel tank increase, valve opens. While EVAP purged, valve closes and restrictor prevents large amount of vacuum from affecting pressure in fuel tank. Valve opened while refueling. When valve open, adding fuel into fuel tank possible.
Roll-over valve	Located in fuel tank. Valve closes by its own weight when vehicle overturns to prevent fuel from spilling out.
Soak timer	Built into ECM. To ensure accurate EVAP monitor, measures 5 hours (+- 15 min) after ignition switch turned to OFF. This allows fuel to cool down, stabilizing Fuel Tank Pressure (FTP). When approximately 5 hours elapsed, ECM activates.
Canister pump module	Consists of (a) to (d) below. Canister pump module cannot be disassembled.
(a) Vent valve	Vents and closes EVAP system. When ECM turns valve ON, EVAP system closed. When, ECM turns valve OFF, EVAP system vented. Negative pressure (vacuum) created in EVAP system to check for EVAP leaks by closing purge VSV, turning on vent valve (closed) and operating leak detection pump (refer to fig. 1).
(b) Canister pressure sensor	Indicates pressure as voltages. ECM supplies regulated 5 V to canister pressure sensor, and uses feedback from sensor to monitor EVAP system pressure (refer to fig 2).

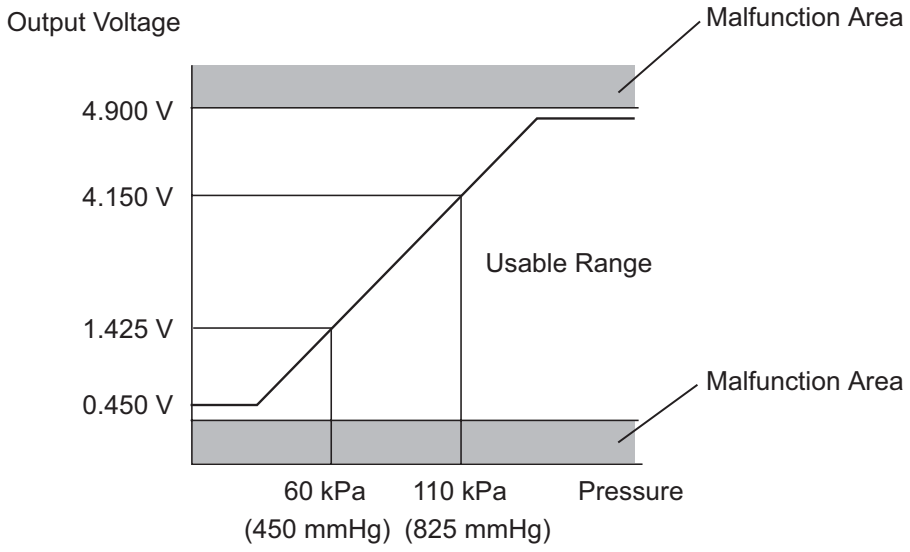
Components	Operations
(c) Leak detection pump	Creates negative pressure (vacuum) in EVAP system for leak check.
(d) Reference orifice	Has opening with 0.02 inch diameter. Vacuum produced through orifice by closing purge VSV, turning off vent valve and operating leak detection pump, to monitor 0.02 inch leak criterion. 0.02 inch leak criterion indicates small leak of EVAP.

Canister Pump Module (fig. 1):



A097611E07

Canister Pressure Sensor Specification (fig. 2):



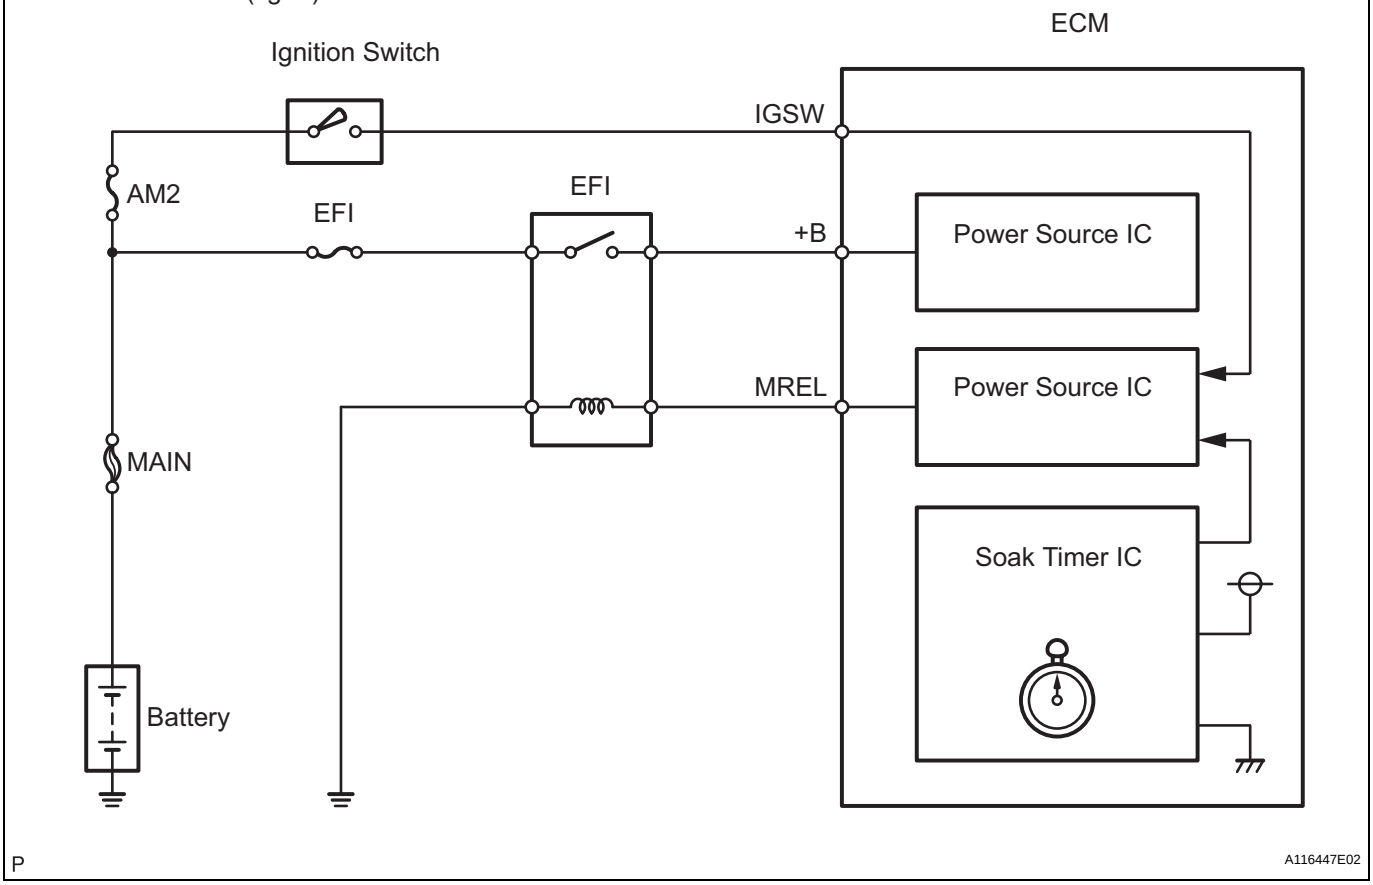
HINT:

Standard atmospheric pressure is 101.3 kPa (759.8mmHg)

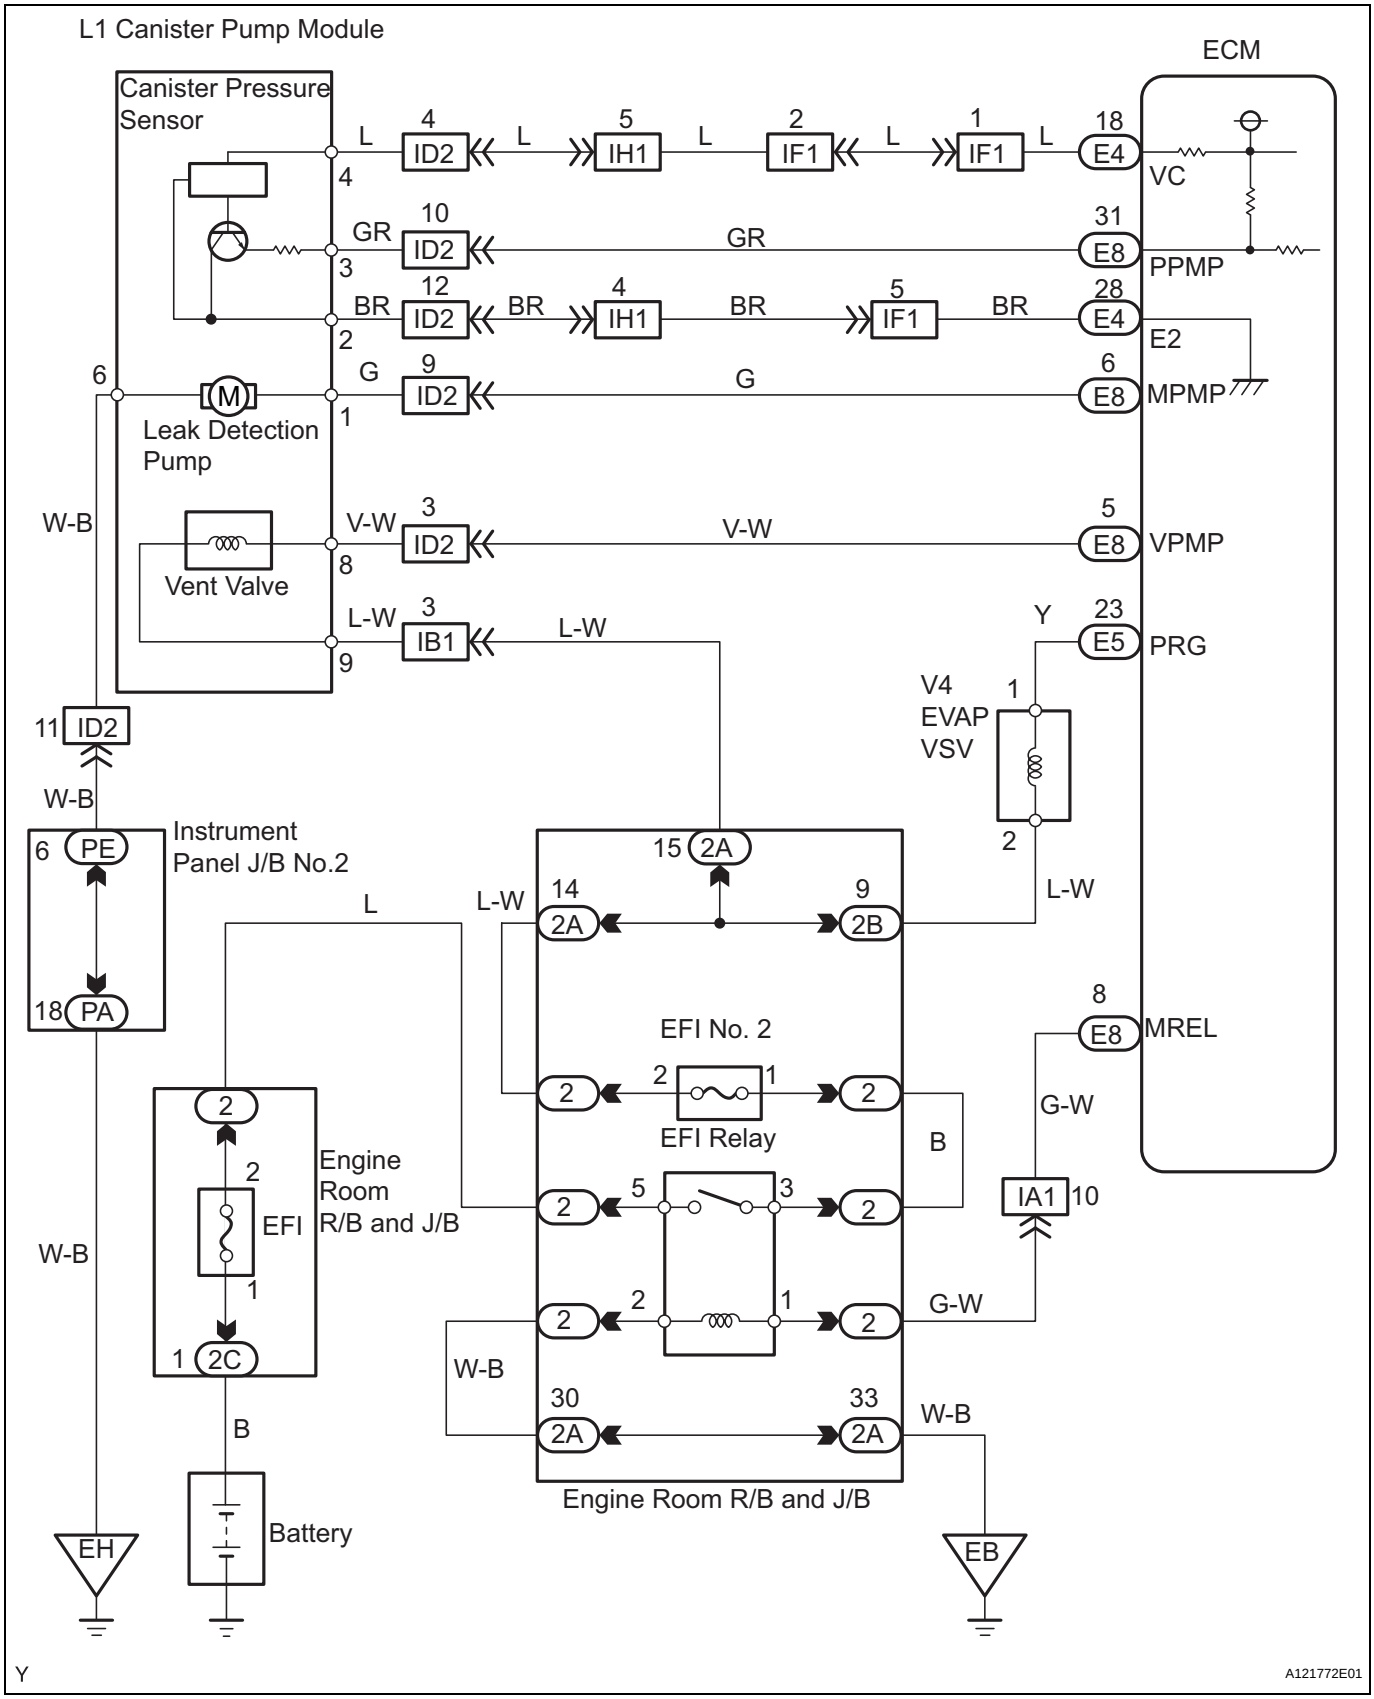
A115543E02

ES

Soak Timer Circuit (fig. 3):



WIRING DIAGRAM



NOTICE:
The intelligent tester is required to conduct the following diagnostic troubleshooting procedure.

HINT:

- Using intelligent tester monitor results enables the EVAP (Evaporative Emission) system to be confirmed.
- Read freeze frame data using an intelligent tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	**CONFIRM DTC**

(a) Turn the ignition switch to OFF and wait for 10 seconds.
(b) Turn the ignition switch to ON.
(c) Turn the ignition switch to OFF and wait for 10 seconds.
(d) Connect an intelligent tester to the DLC3.
(e) Turn the ignition switch to ON and turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Confirm DTCs and freeze frame data.
If any EVAP system DTCs are set, the malfunctioning area can be determined using the table below.
NOTICE:
If the 0.02 inch leak criterion difference between the first and second checks is greater than the specification, the DTCs corresponding to the leak criterion (P043E, P043F, P2401, P2402 and P2419) will all be stored.

2	PERFORM EVAP SYSTEM CHECK (AUTO OPERATION)

NOTICE:

- **The EVAP SYSTEM CHECK (AUTO OPERATION) consists of five steps performed automatically by the intelligent tester. It takes a maximum of approximately 18 minutes.**
- **Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90 % full because the cut-off valve may be closed and making the leak check of the fuel tank unavailable.**
- **Do not run the engine in this step.**
- **When the temperature of the fuel is 35°°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).**

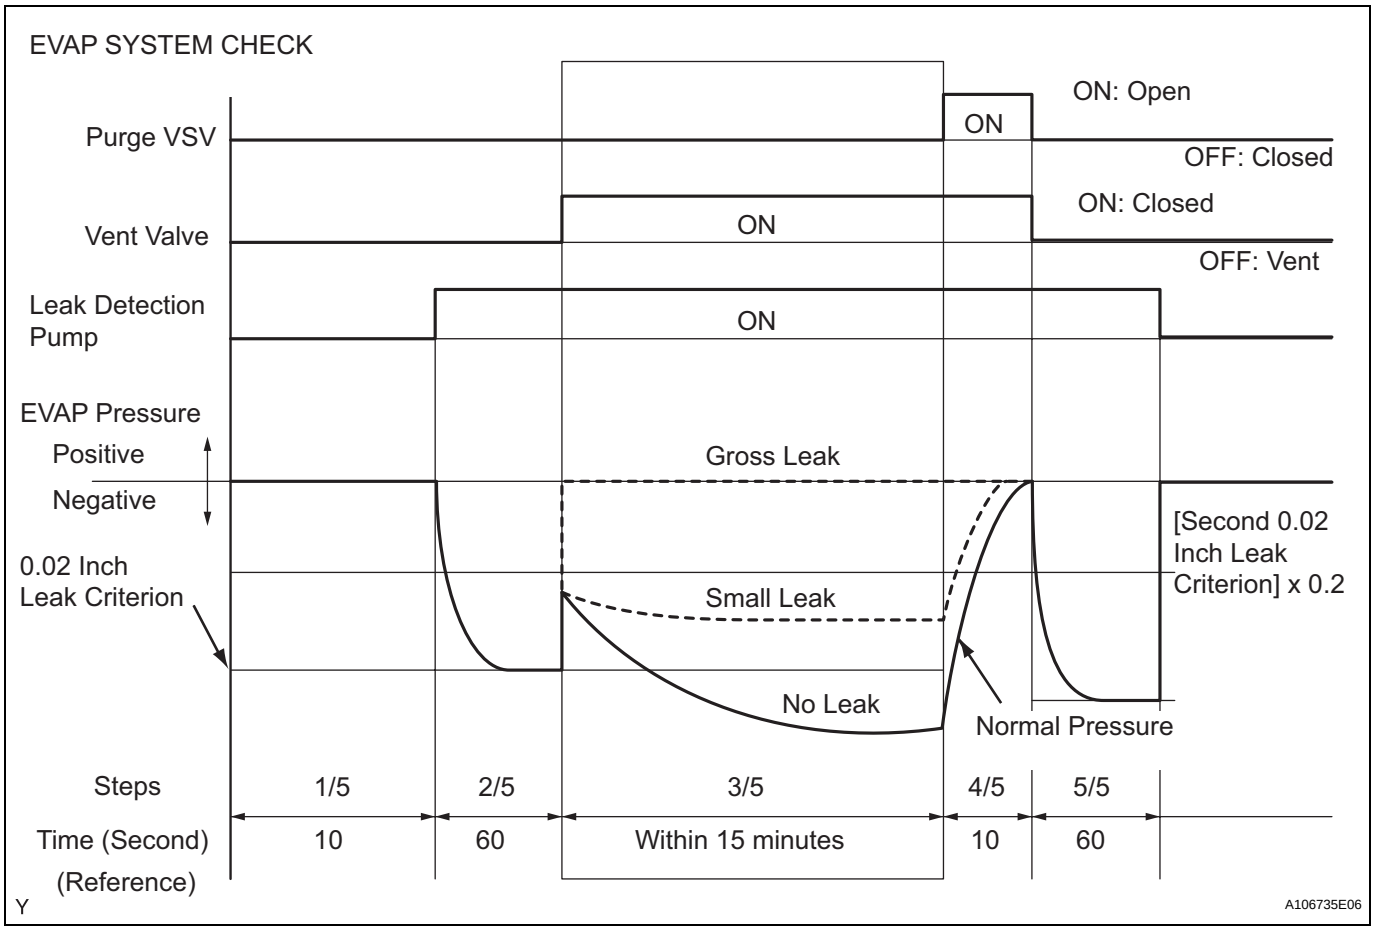
(a) Clear DTCs (see page ES-40).

(b) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / AUTO OPERATION.
(c) After the EVAP SYSTEM CHECK is completed, check for pending DTCs by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
HINT:
If no pending DTC is displayed, perform the Monitor Confirmation (see "Diagnostic Help" menu). After this confirmation, check for pending DTCs. If no DTC is displayed, the EVAP system is normal.

NEXT

ES

3	PERFORM EVAP SYSTEM CHECK (MANUAL OPERATION)



NOTICE:

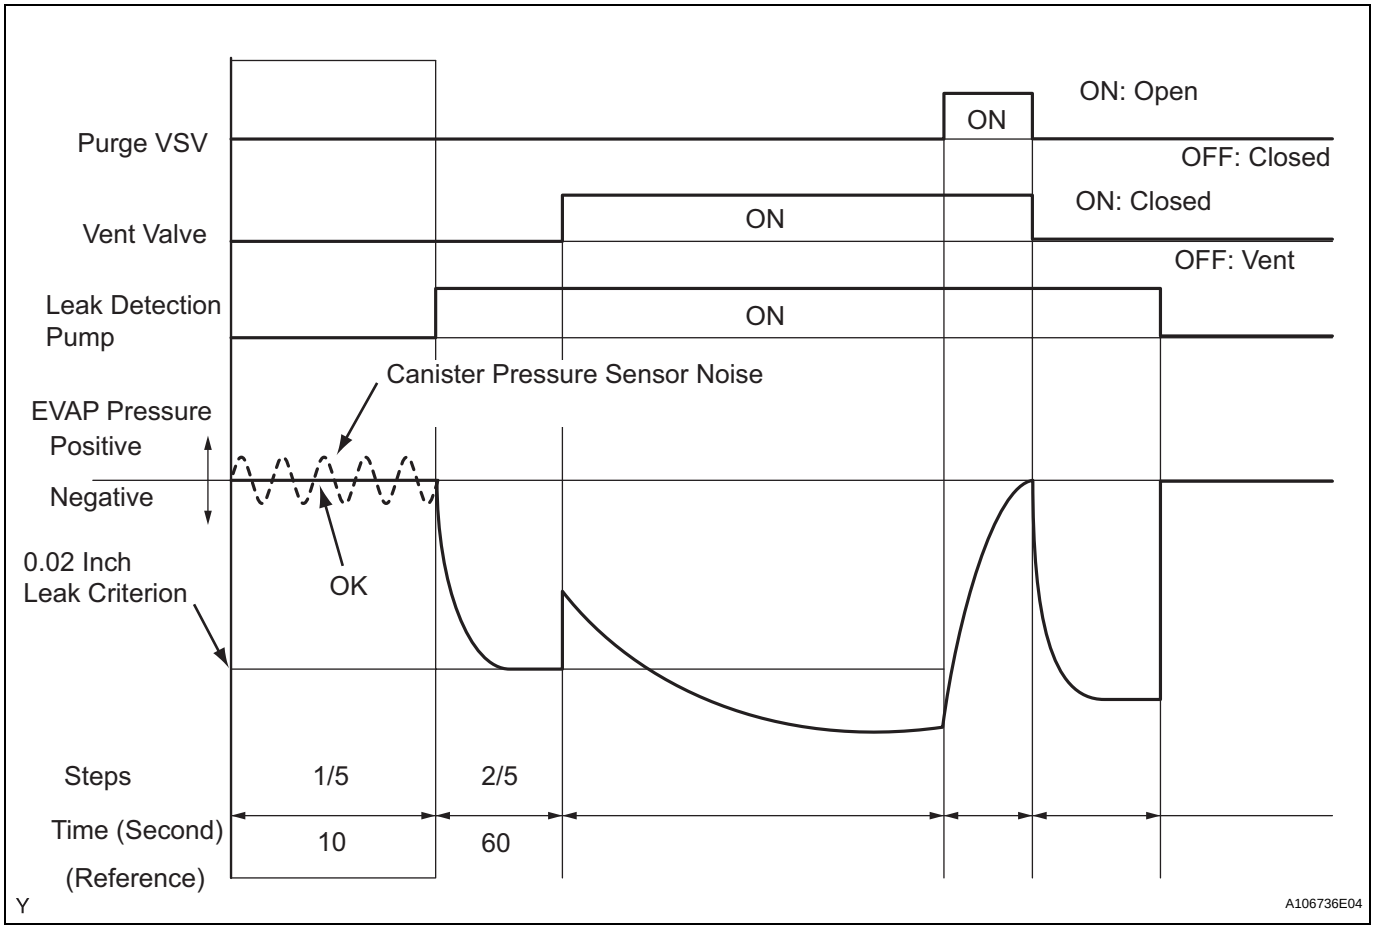
- **In the EVAP SYSTEM CHECK (MANUAL OPERATION), the series of 5 EVAP SYSTEM CHECK steps is performed manually by the intelligent tester.**
- **Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90 % full because the cut-off valve may be closed and making the leak check of the fuel tank unavailable.**
- **Do not run the engine in this step.**

- **When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).**

(a) Clear DTCs (see page ES-40).
(b) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / MANUAL OPERATION.

NEXT

4	PERFORM EVAP SYSTEM CHECK (STEP 1/5)



(a) Check the EVAP pressure in step 1/5.

Result

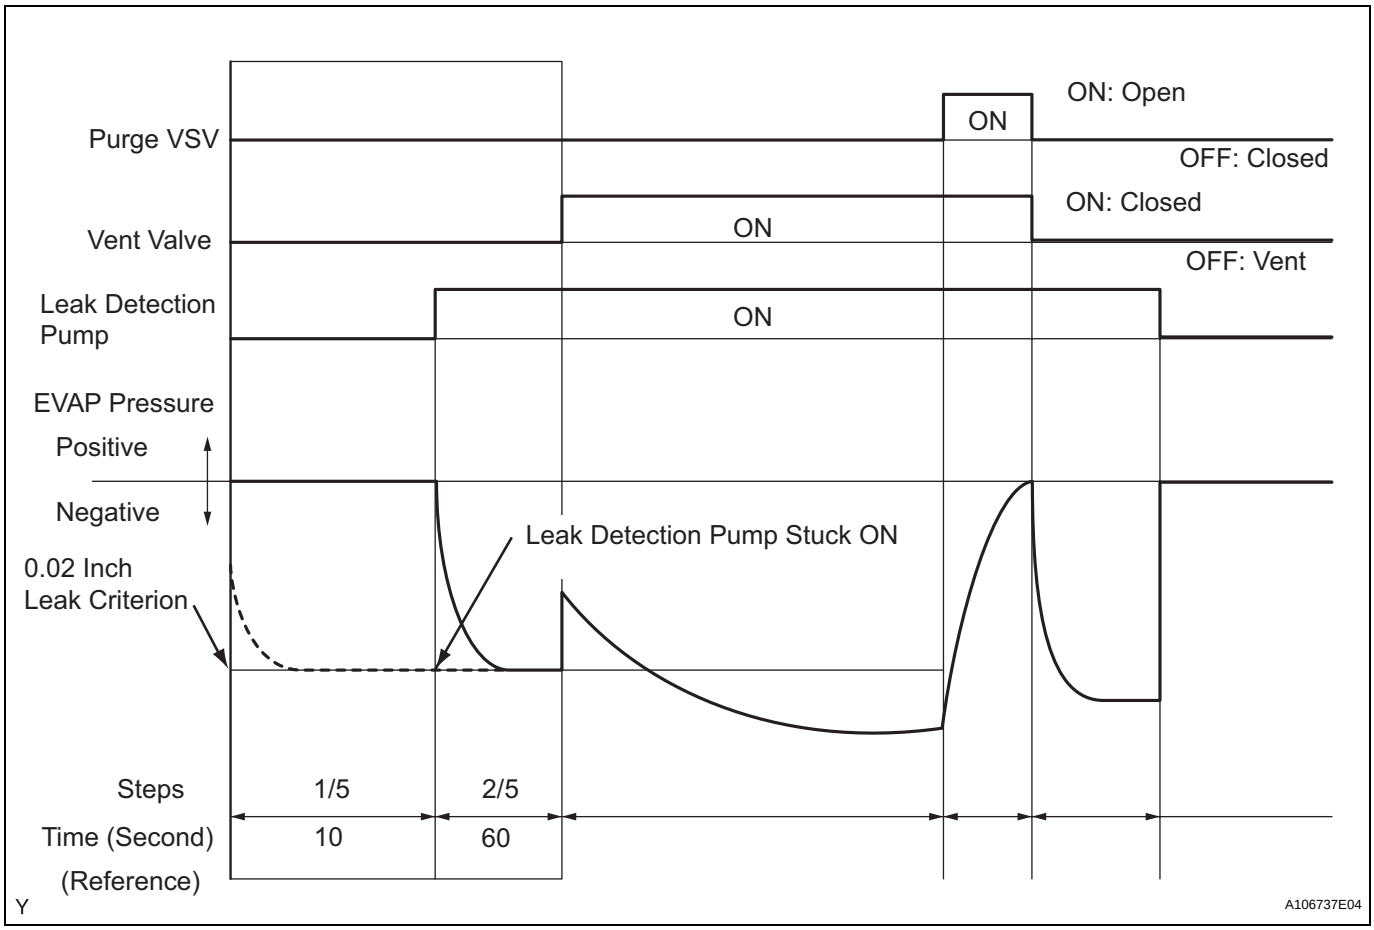
DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	Virtually no variation in EVAP pressure	Not yet determined	A
P0451	EVAP pressure fluctuates by +-0.3 kPa (2.25 mmHg) or more	Canister pressure sensor noise	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in step 1.

B	Go to step 30

A

5	PERFORM EVAP SYSTEM CHECK (STEP 1/5 TO 2/5)



(a) Check the EVAP pressure in step 1/5 and 2/5.

Result

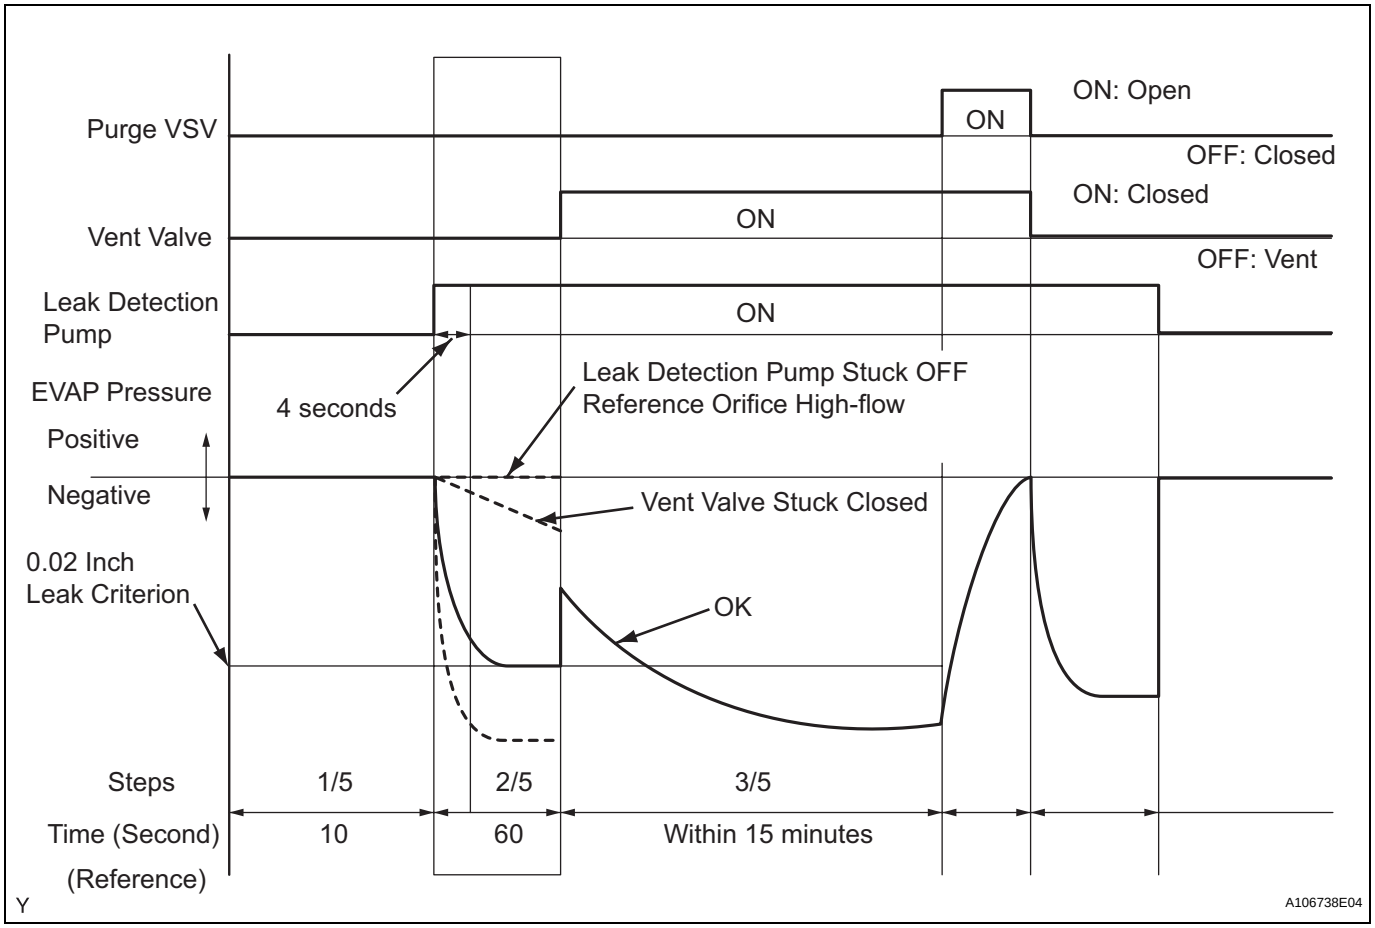
DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	Virtually no variation in EVAP pressure during step 1/5. Then decreases to 0.02 inch leak criterion	Not yet determined	A
P2402	Small difference between EVAP pressures during steps 1/5 and 2/5	Leak detection pump stuck ON	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in step 1.
HINT:
The first 0.02 inch leak criterion is the value determined in step 2/5.

B → Go to step 23

A

6	PERFORM EVAP SYSTEM CHECK (STEP 2/5)



HINT:
Make a note of the pressures checked in steps (a) and (b) below.

(a) Check the EVAP pressure 4 seconds after the leak detection pump is activated*.

(b) Check the EVAP pressure again when it has stabilized. This pressure is the 0.02 inch leak criterion.

*: The leak detection pump begins to operate as step 1/5 is proceeded to step 2/5.

Result

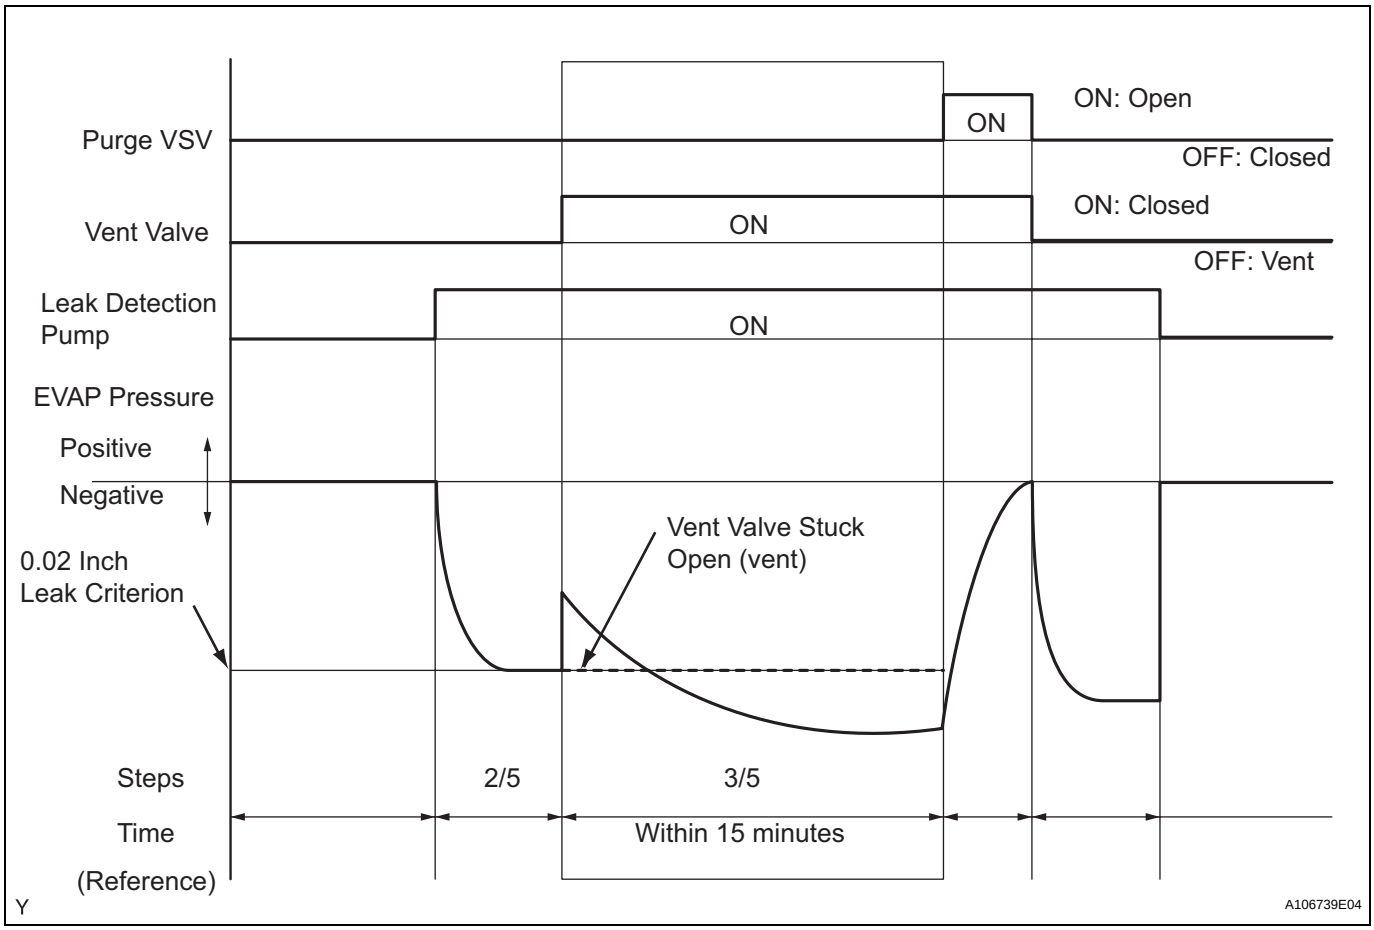
DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	EVAP pressure in step (b) between -4.85 kPa and -1.06 kPa (-36.38 mmHg and -7.95 mmHg)	Not yet determined	A
P043F and P2401	EVAP pressure in step (b) -1.06 kPa (-7.95 mmHg) or more	• Reference orifice high-flow • Leak detection pump stuck OFF	B
P043E	EVAP pressure in step (b) below -4.85 kPa (-36.38 mmHg)	Reference orifice clogged	C
P2419	EVAP pressure in step (a) more than -1.06 kPa (-7.95 mmHg)	Vent valve stuck closed	D

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in step 1.

B	Go to step 11
C	Go to step 30
D	Go to step 19

A

7	PERFORM EVAP SYSTEM CHECK (STEP 2/5 TO 3/5)



(a) Check the EVAP pressure increase in step 3/5.

Result

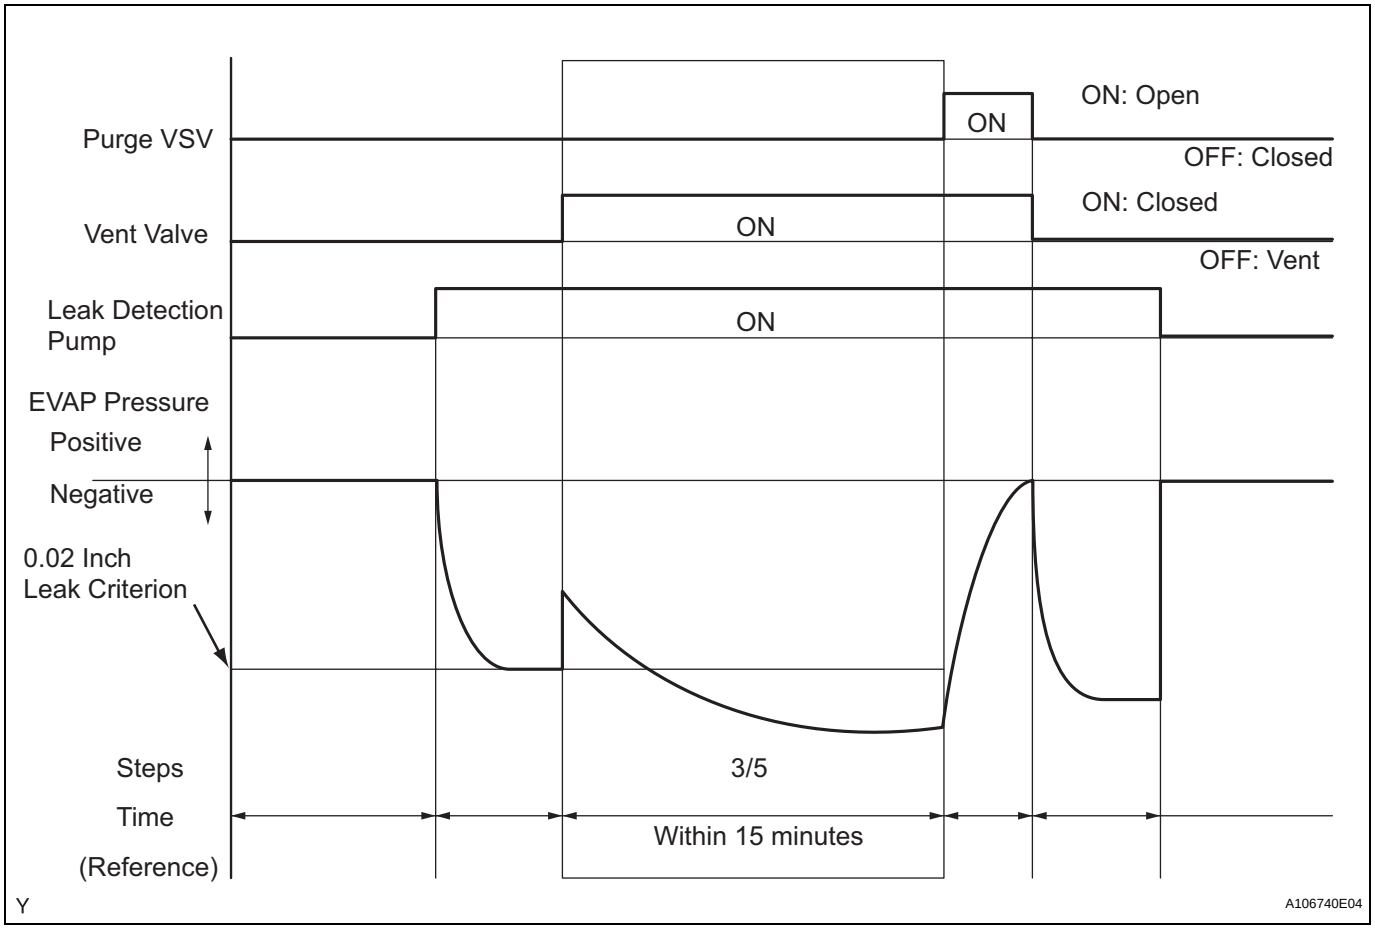
DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	EVAP pressure increases by 0.3 kPa (2.25 mmHg) or more within 10 seconds of proceeding from step 2/5 to step 3/5	Not yet determined	A
P2420	No variation in EVAP pressure despite proceeding from step 2/5 to step 3/5	Vent valve stuck open (vent)	B
P0451	No variation in EVAP pressure during steps 1/5 through 3/5	Canister pressure sensor malfunction stuck	C

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in step 1.

B	Go to step 20
C	Go to step 30

A

8	PERFORM EVAP SYSTEM CHECK (STEP 3/5)

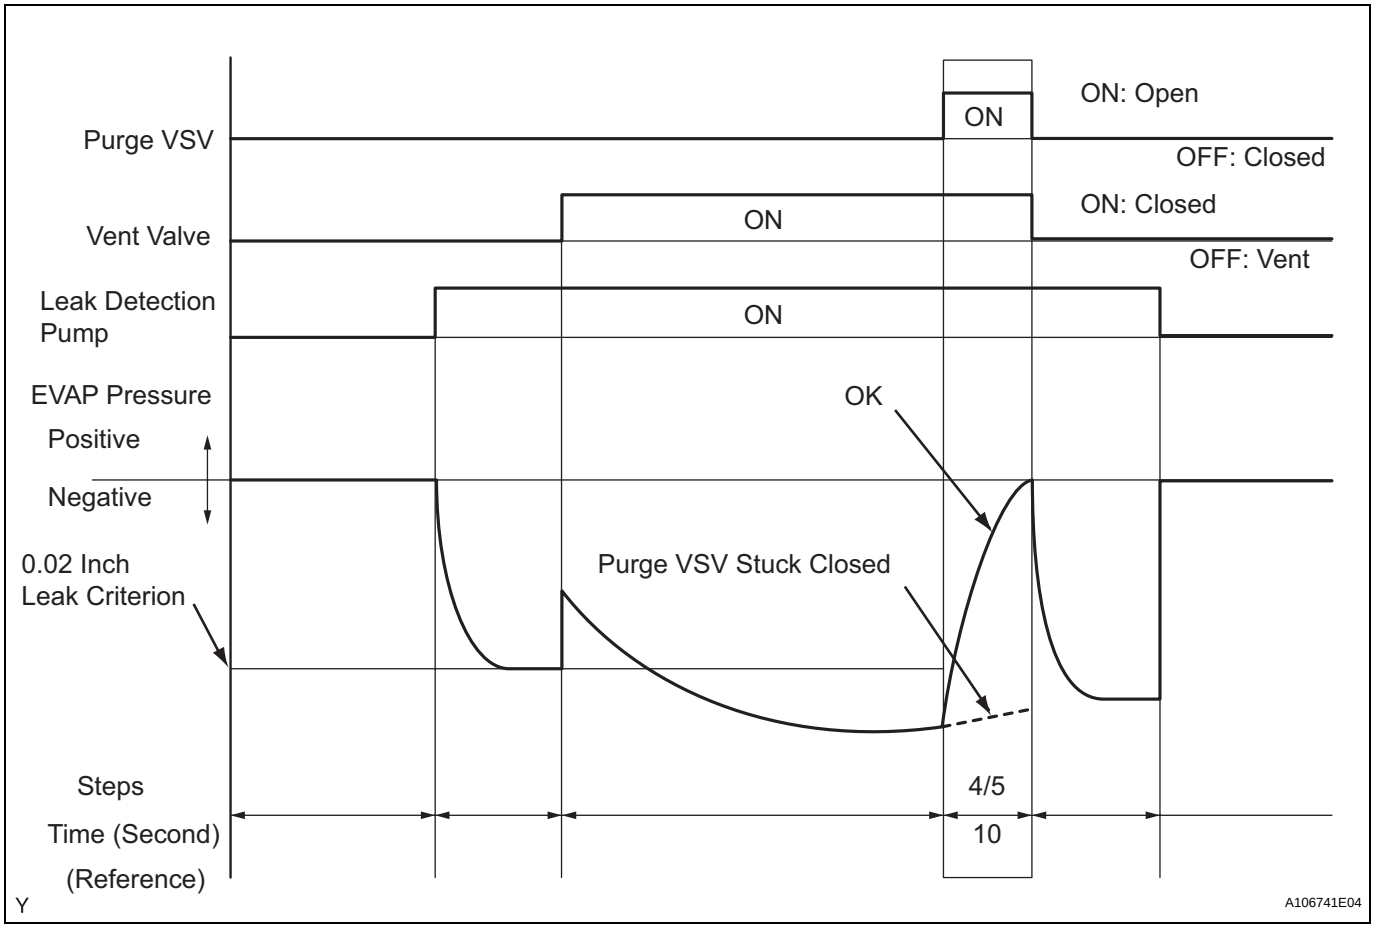


(a) Wait until the EVAP pressure change is less than 0.1 kPa (0.75 mmHg) for 30 seconds.

(b) Measure the EVAP pressure and record it.
HINT:
A few minutes are required for the EVAP pressure to become saturated. When there is little fuel in the fuel tank, it takes up to 15 minutes (900 seconds).

NEXT

9	PERFORM EVAP SYSTEM CHECK (STEP 4/5)



(a) Check the EVAP pressure in step 4/5.

Result

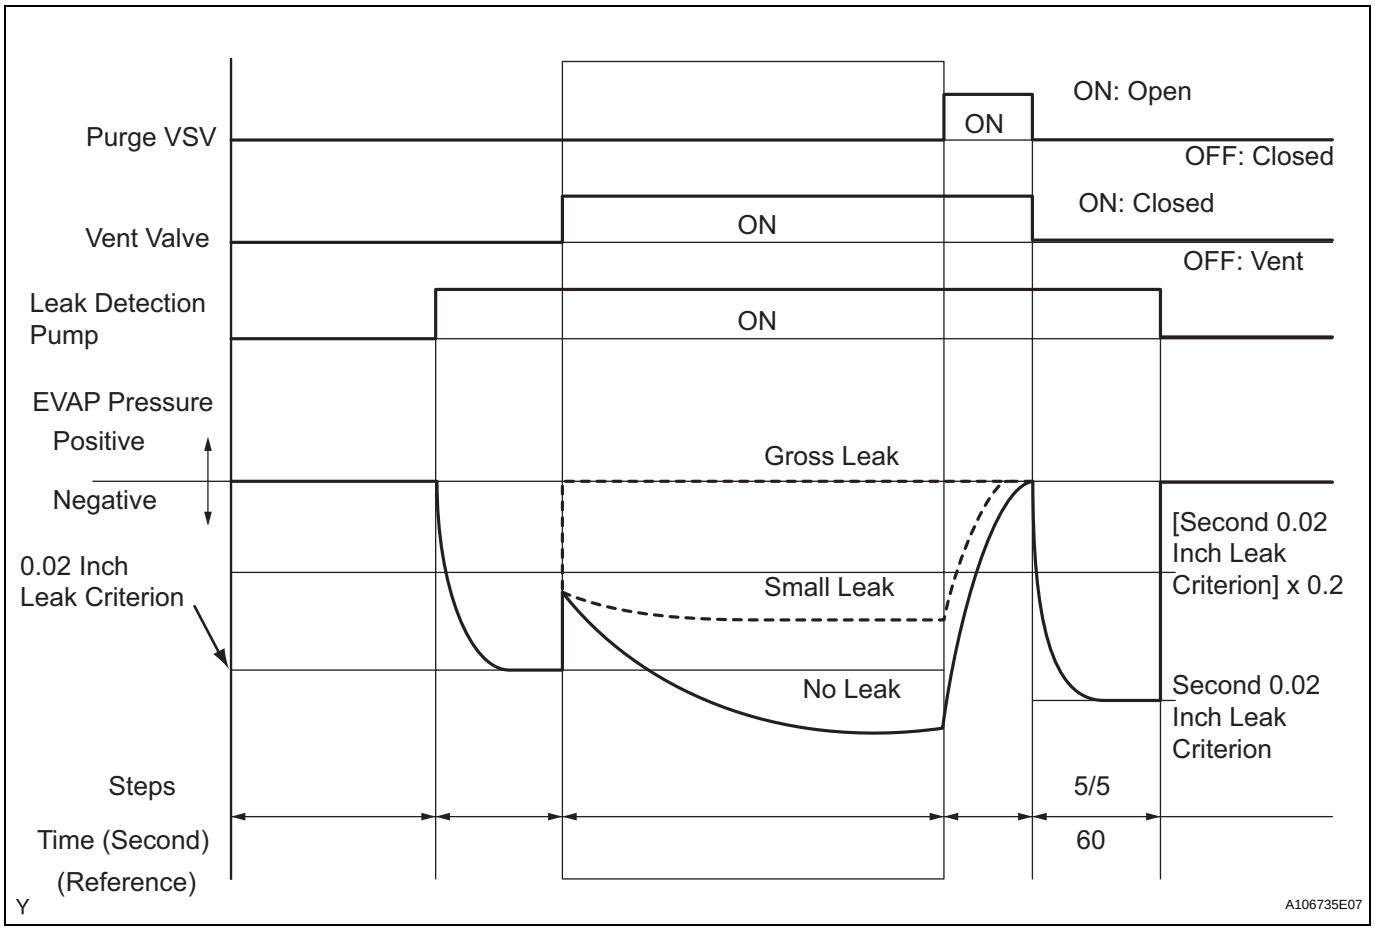
DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	EVAP pressure increases by 0.3 kPa (2.25 mmHg) or more within 10 seconds of proceeding from step 3/5 to step 4/5	Not yet determined	A
P0441	EVAP pressure increases by 0.3 kPa (2.25 mmHg) or more within 10 seconds of proceeding from step 3/5 to step 4/5	Problems in EVAP hose between pure VSV and intake manifold	B
P0441	Variation in EVAP pressure less than 0.3 kPa (2.25 mmHg) for 10 seconds, after proceeding from step 3/5 to step 4/5	Purge VSV stuck closed	C

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in step 1.

B	Go to step 15
C	Go to step 12

A

10	PERFORM EVAP SYSTEM CHECK (STEP 5/5)



(a) Check the EVAP pressure in step 5/5.
(b) Compare the EVAP pressure in step 3/5 and the second 0.02 inch leak criterion (step 5/5).

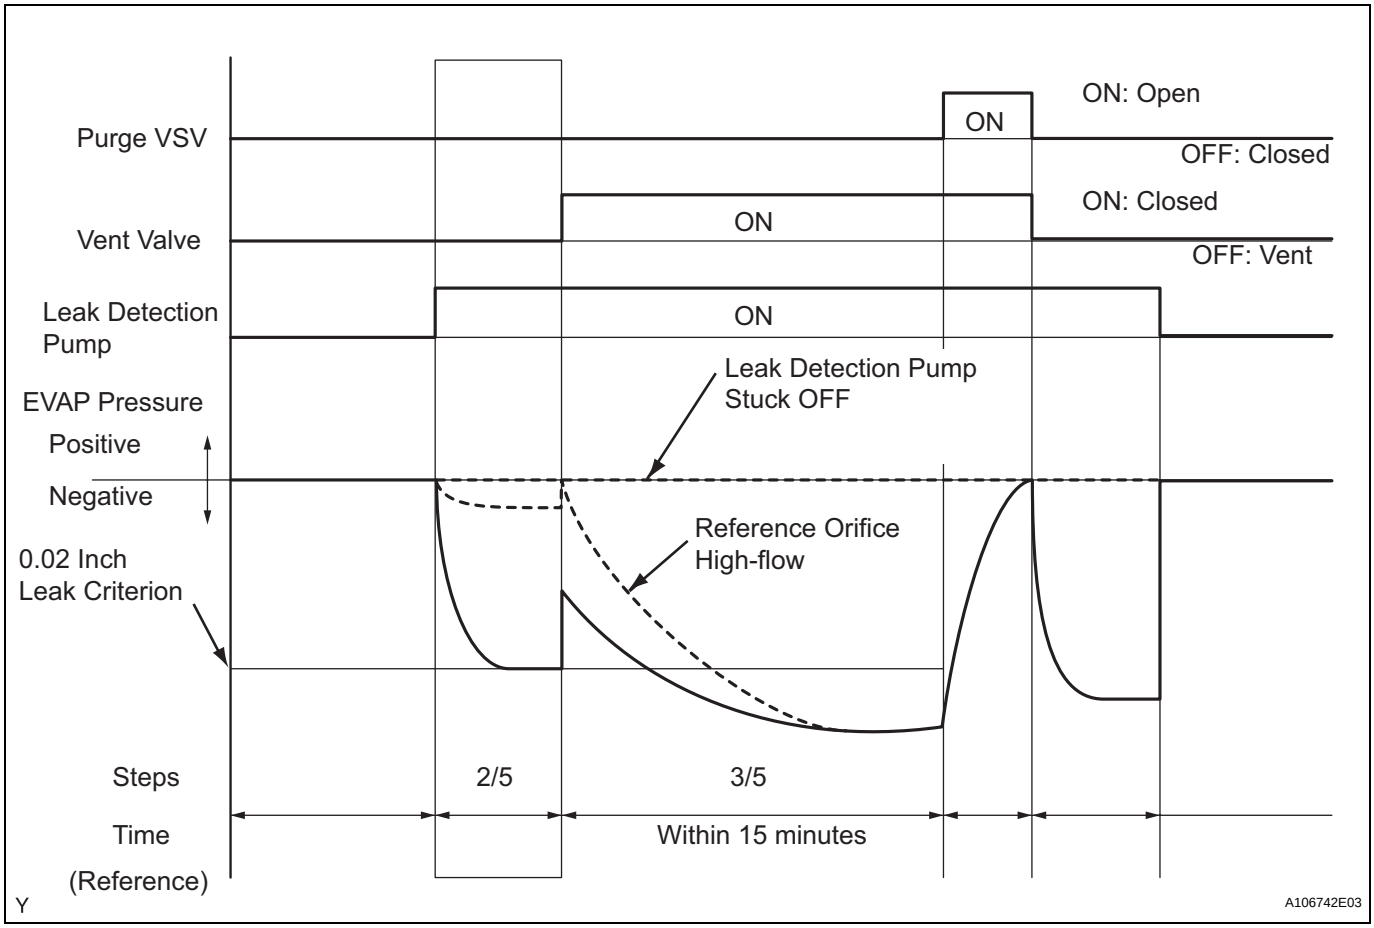
Result

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	EVAP pressure (step 3/5) lower than second 0.02 inch leak criterion (step 5/5)	Not yet determined (no leakage from EVAP system)	A
P0441 and P0455	EVAP pressure (step 3/5) higher than [second 0.02 inch leak criterion (step 5/5) x 0.2]	• Purge VSV stuck open • EVAP gross leak	B
P0456	EVAP pressure (step 3/5) higher than second 0.02 inch leak criterion (step 5/5)	EVAP small leak	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in step 1.

A	Go to step 36
B	Go to step 12

11	PERFORM EVAP SYSTEM CHECK (STEP 3/5)



(a) Check the EVAP pressure in step 3/5.

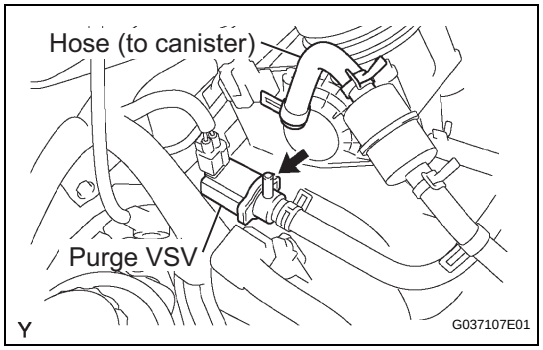
Result

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
P043F	EVAP pressure less than [0.02 inch leak criterion] measured at 2/5	Reference orifice high-flow	A
P2401	EVAP pressure almost same as [0.02 inch leak criterion] measured at 2/5	Leak detection pump stuck OFF	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in step 1.
HINT:
The first 0.02 inch leak criterion is the value determined in step 2/5.

A	Go to step 30
B	Go to step 23

12 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (PURGE VSV)



(a) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II/ ACTIVE TEST / EVAP VSV.
(b) Disconnect the hose (connected to the canister) from the purge VSV.
(c) Start the engine.
(d) Using the tester, turn off the purge VSV (EVAP VSV: OFF).
(e) Use your finger to confirm that the purge VSV has no suction.
(f) Using the tester, turn on the purge VSV (EVAP VSV: ON).
(g) Use your finger to confirm that the purge VSV has suction.

ES

Result

Test Results	Suspected Trouble Areas	Proceed To
No suction when Purge VSV turned OFF, and suction applied when turned ON	Purge VSV normal	A
Suction applied when purge VSV turned OFF	Purge VSV stuck open	B
No suction when purge VSV turned ON	• Purge VSV stuck closed • Problems with EVAP hose between purge VSV and intake manifold	C

(h) Reconnect the hose.

B → **Go to step 14**

C → **Go to step 15**

A

13 CHECK FUEL CAP ASSEMBLY

(a) Check that the fuel cap is correctly installed.
(b) Confirm that the fuel cap is tightened until a few click sounds are heard.
HINT:
If an EVAP tester is available, check the fuel cap using the tester.
(1) Remove the fuel cap and install it onto a fuel cap adaptor.
(2) Connect an EVAP tester pump hose to the adaptor, and pressurize the cap to 3.2 to 3.7 kPa (24 to 28 mmHg) using an EVAP tester pump.
(3) Seal the adaptor and wait for 2 minutes.
(4) Check the pressure. If the pressure is 2 kPa (15 mmHg) or more, the fuel cap is normal.
(c) Reinstall the fuel cap.

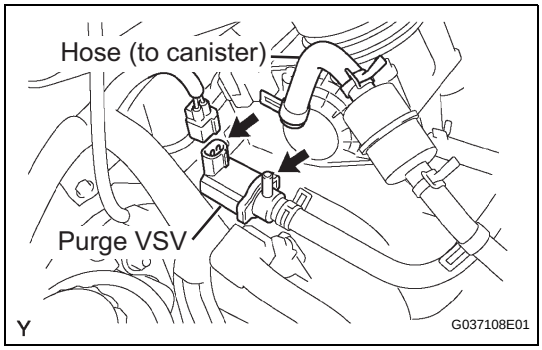
Result

Test Results	Suspected Trouble Areas	Proceed To
Fuel cap correctly installed	-	A
Fuel cap loose	• Fuel cap improperly installed • Defective fuel cap • Fuel cap does not meet OEM specifications	B
No fuel cap	-	C

A	Go to step 29
B	Go to step 27
C	Go to step 28

ES

14 INSPECT DUTY VACUUM SWITCHING VALVE (PURGE VSV)



(a) Turn the ignition switch to OFF.
(b) Disconnect the V4 purge VSV connector.
(c) Disconnect the hose (connected to the canister) from the purge VSV.
(d) Start the engine.
(e) Use your finger to confirm that the purge VSV has no suction.

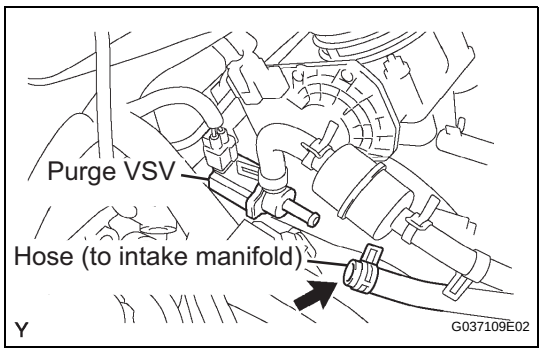
Result

Test Results	Suspected Trouble Areas	Proceed To
No suction	ECM	A
Suction applied	Purge VSV	B

(f) Reconnect the purge VSV connector.
(g) Reconnect the hose.

A	Go to step 35
B	Go to step 31

15 CHECK EVAP HOSE (PURGE VSV - INTAKE MANIFOLD)



(a) Disconnect the hose (connected to the intake manifold) from the purge VSV.
(b) Start the engine.
(c) Use your finger to confirm that the hose has suction.

Result

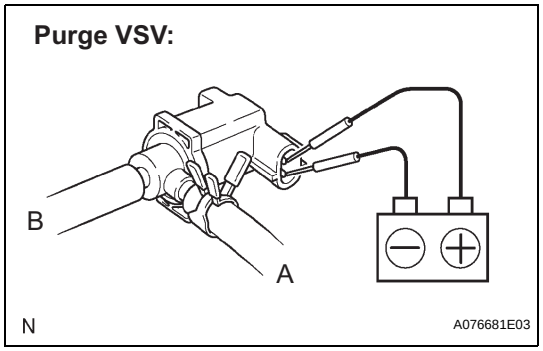
Test Results	Suspected Trouble Areas	Proceed To
Suction applied	EVAP hose between purge VSV and intake manifold normal	A
No suction	• Intake manifold port • EVAP hose between purge VSV and intake manifold	B

(d) Reconnect the hose.

B → Go to step 26

A

16 INSPECT DUTY VACUUM SWITCHING VALVE (PURGE VSV)



(a) Remove the purge VSV.
(b) Apply the battery voltage to the terminals of the purge VSV.
(c) Using an air gun, confirm that air flows from port A to port B.

Result

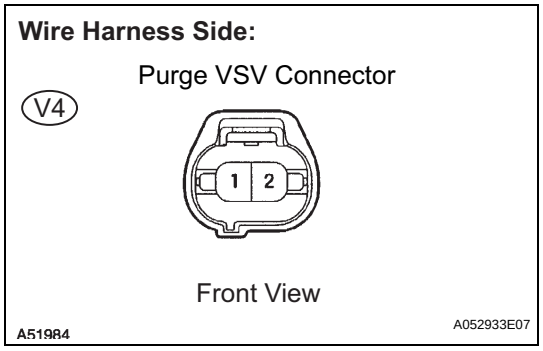
Test Results	Suspected Trouble Areas	Proceed To
Air flows	Purge VSV normal	A
No air flow	Purge VSV	B

(d) Install the purge VSV.

B → Go to step 31

A

17 CHECK HARNESS AND CONNECTOR (POWER SOURCE OF PURGE VSV)



(a) Disconnect the V4 purge VSV connector.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between terminal 1 of the purge VSV connector and the body ground.

Result

Test Results	Suspected Trouble Areas	Proceed To
Between 11 V and 14 V	Normal	A

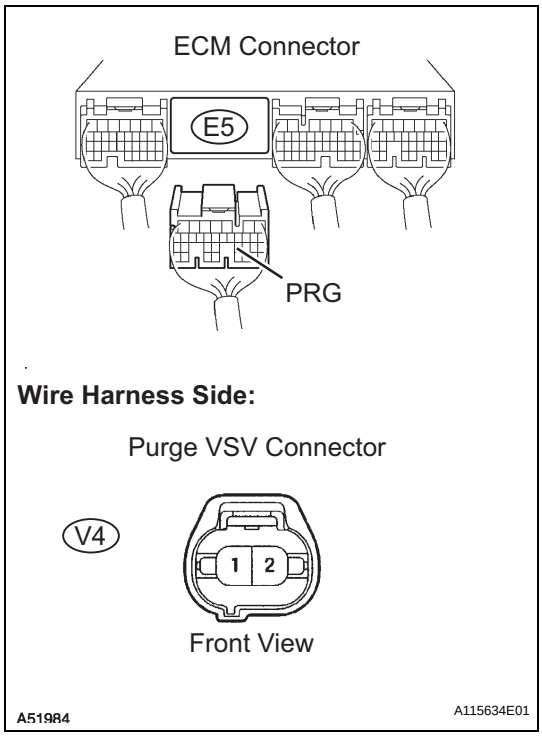
Test Results	Suspected Trouble Areas	Proceed To
Other than result above	Wire harness or connectors between purge VSV and ECM	B

(d) Reconnect the purge VSV connector.

B → **Go to step 32**

A

18 CHECK HARNESS AND CONNECTOR (PURGE VSV - ECM)



(a) Disconnect the E5 ECM connector and the V4 purge VSV connector.
(b) Check the resistance.

Standard Resistance

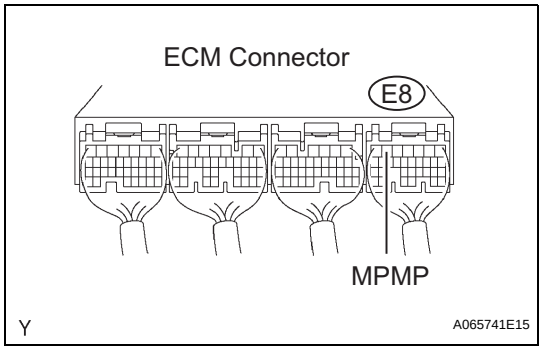
Tester Connections	Specified Conditions
PRG (E5-23) - Purge VSV (V4-1)	Below 1 Ω
PRG (E5-23) - Body ground	10 kΩ or higher
Purge VSV (V4-2) - Body ground	10 kΩ or higher

(c) Reconnect the purge VSV connector.
(d) Reconnect the ECM connector.

OK → **Go to step 35**

NG → **Go to step 32**

19 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FOR VENT VALVE)



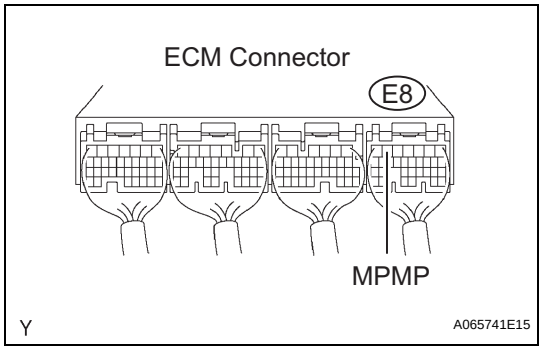
(a) Turn the ignition switch to ON.
(b) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VENT VALVE (ALONE).
(c) Measure the voltage between terminal VPMP of the ECM connector and the body ground when the vent valve is turned ON (close) and OFF (vent) using the tester.

Result

Test Results	Suspected Trouble Areas	Proceed To
Between 9 V and 14 V when OFF Below 3 V when ON	Vent valve	A
Below 3 V when OFF and ON	ECM	B

A	Go to step 22
B	Go to step 35

20 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FOR VENT VALVE)



(a) Turn the ignition switch to ON.
(b) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VENT VALVE (ALONE).
(c) Measure the voltage between terminal VPMP of the ECM connector and the body ground when the vent valve is turned ON (close) and OFF (vent) using the tester.

ES

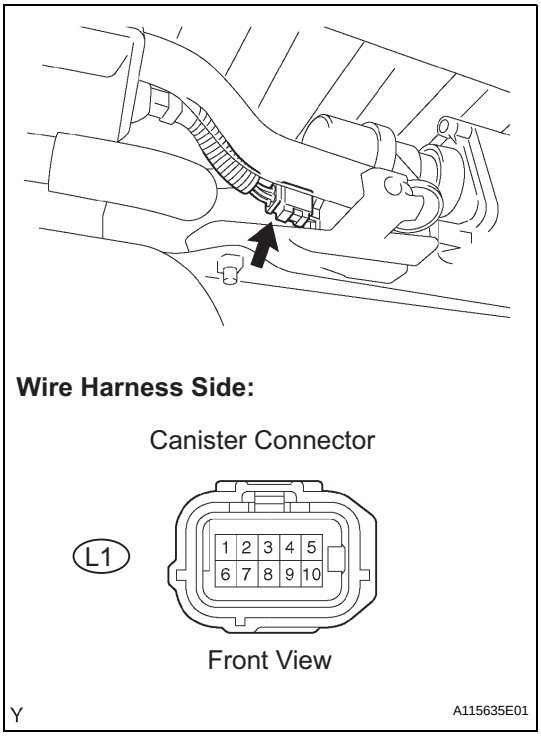
Result

Test Results	Suspected Trouble Areas	Proceed To
Below 3 V when OFF and ON	Power source of vent valve	A
Between 9 V and 14 V when OFF Below 3 V when ON	Vent valve	B
Between 9 V and 14 V when OFF and ON	ECM	C

B	Go to step 22
C	Go to step 35

A

21 INSPECT CANISTER PUMP MODULE (POWER SOURCE FOR VENT VALVE)



(a) Turn the ignition switch OFF.
(b) Disconnect the L1 canister connector.
(c) Turn the ignition switch to ON.
(d) Measure the voltage between terminal 9 of the canister connector and the body ground.

Result

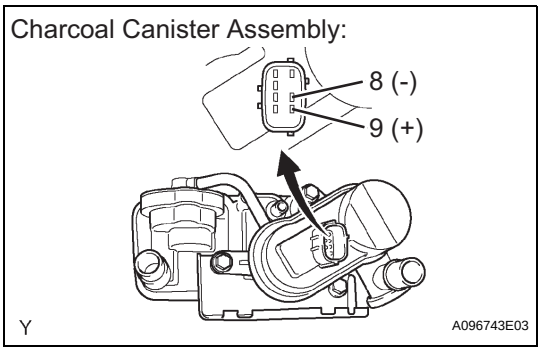
Test Results	Suspected Trouble Areas	Proceed To
Between 9 V and 14 V	Normal	A
Between 0 V and 3 V	Power source wire harness of vent valve	B

(e) Reconnect the canister connector.

B → **Go to step 32**

A

22 INSPECT CANISTER PUMP MODULE (VENT VALVE OPERATION)



(a) Turn the ignition switch to OFF.
(b) Disconnect the L1 canister connector.
(c) Apply the battery voltage to terminals 9 and 8 of the canister pump module.
(d) Touch the canister pump module to confirm the vent valve operation.

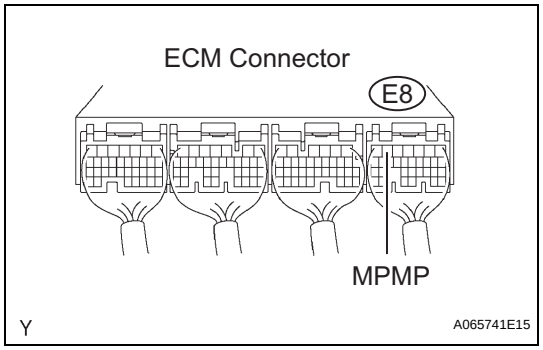
Result

Test Results	Suspected Trouble Areas	Proceed To
Operating	Wire harness between vent valve and ECM	A
Not operating	Vent valve	B

(e) Reconnect the canister connector.

A	Go to step 32
B	Go to step 30

23	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FOR CANISTER PUMP MODULE (LEAK DETECTION PUMP))



(a) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VACUUM PUMP (ALONE).

(b) Measure the voltage between MPMP terminal of the ECM connector and the body ground when the leak detection pump is turned ON and OFF using the tester.

ES

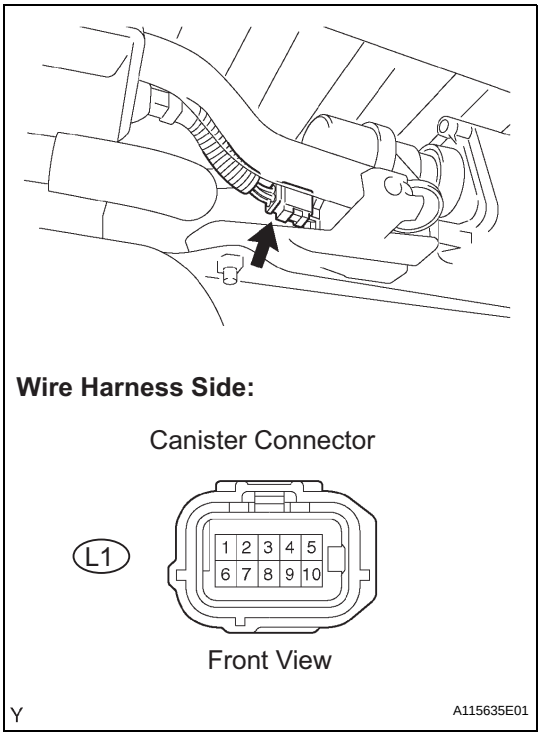
Result

Test Results	Suspected Trouble Areas	Proceed To
Between 0 V and 3 V when OFF Between 9 V and 14 V when ON	ECM normal	A
Between 9 V and 14 V when OFF Between 0 V and 3 V when ON	ECM	B

B	Go to step 35

A

24	CHECK HARNESS AND CONNECTOR (CANISTER PUMP MODULE - ECM)



(a) Turn the ignition switch to OFF.
(b) Disconnect the L1 canister connector.
(c) Turn the ignition switch to ON.
(d) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VACUUM PUMP (ALONE).
(e) Turn the leak detection pump ON.
(f) Measure the voltage between terminal 1 of the canister connector and the body ground.

ES

Result

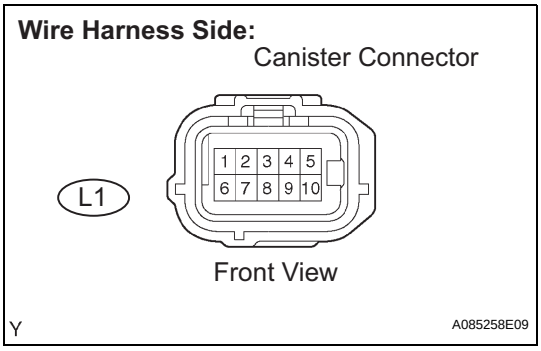
Test Results	Suspected Trouble Areas	Proceed To
Between 9 V and 14 V	Normal	A
Between 0 V and 3 V	Wire harness between ECM and leak detection pump	B

(g) Reconnect the canister connector.

B → Go to step 32

A

25	CHECK HARNESS AND CONNECTOR (CANISTER PUMP MODULE - GROUND)



(a) Disconnect the L1 canister connector.
(b) Turn the ignition switch to OFF.
(c) Check the resistance between terminal 6 of the canister connector and the body ground.

Result

Test Results	Suspected Trouble Areas	Proceed To
Below 1 Ω	Leak detection pump	A

Test Results	Suspected Trouble Areas	Proceed To
10 kΩ or higher	Wire harness between leak detection pump and body ground	B

(d) Reconnect the canister connector.

A	Go to step 30
B	Go to step 32

26 INSPECT INTAKE MANIFOLD (EVAP PURGE PORT)

(a) Stop the engine.
(b) Disconnect the EVAP hose from the intake manifold.
(c) Start the engine.
(d) Use your finger to confirm that the port of the intake manifold has suction.

ES

Result

Test Results	Suspected Trouble Areas	Proceed To
Suction applied	EVAP hose between intake manifold and purge VSV	A
No suction	Intake manifold	B

(e) Reconnect the EVAP hose.

A	Go to step 33
B	Go to step 34

27 CORRECTLY REINSTALL OR REPLACE FUEL CAP

HINT:
- When reinstalling the fuel cap, tighten it until a few click sounds are heard.
- When replacing the fuel cap, use a fuel cap that meets OEM specifications, and install it until a few click sounds are heard.

NEXT	Go to step 37

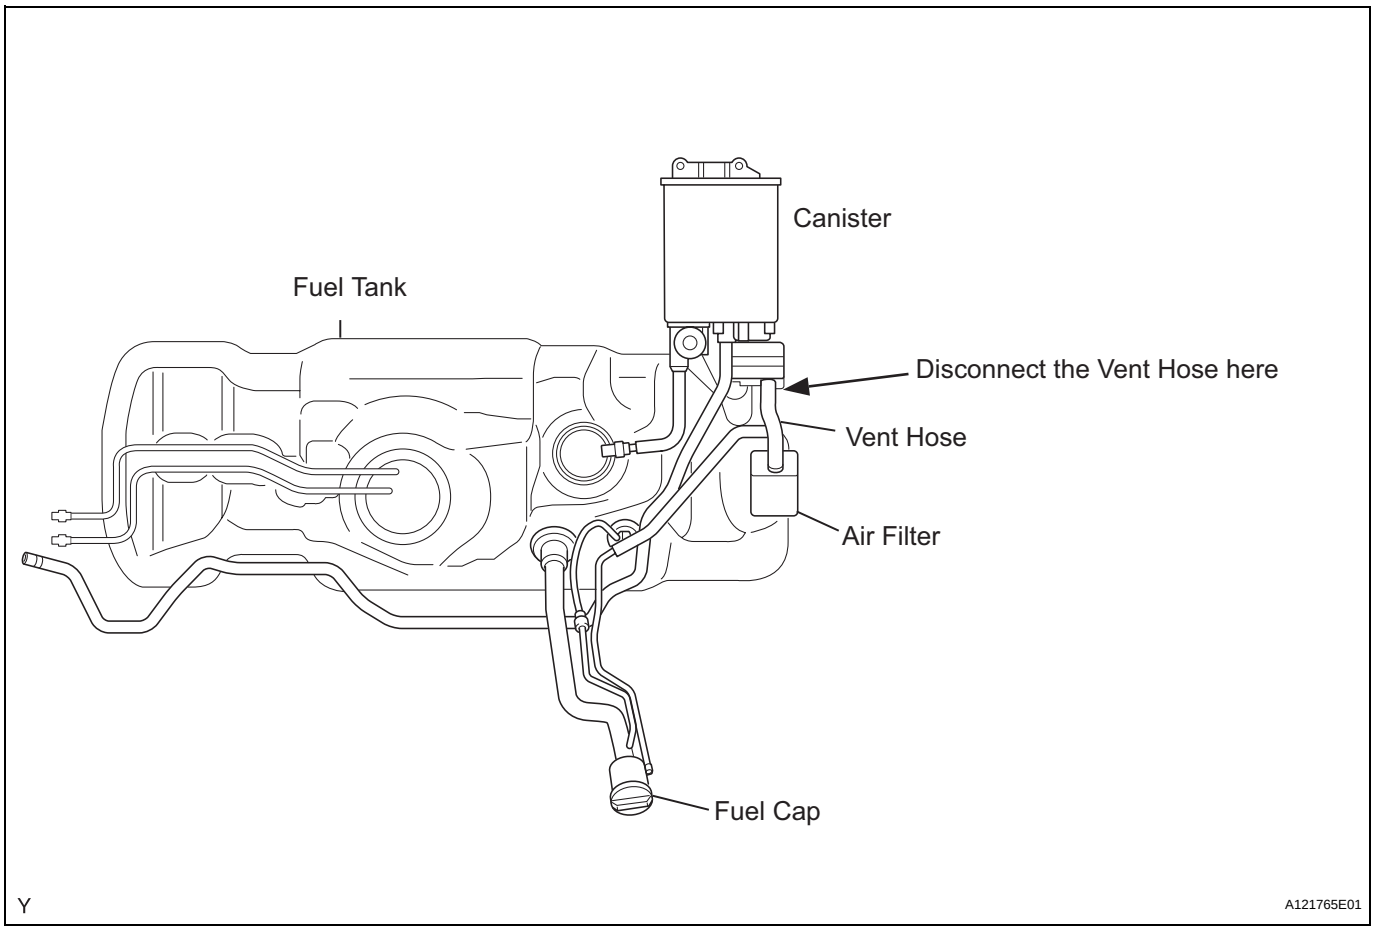
28 REPLACE FUEL CAP ASSEMBLY

HINT:
When installing the fuel cap, tighten it until a few click sounds are heard.

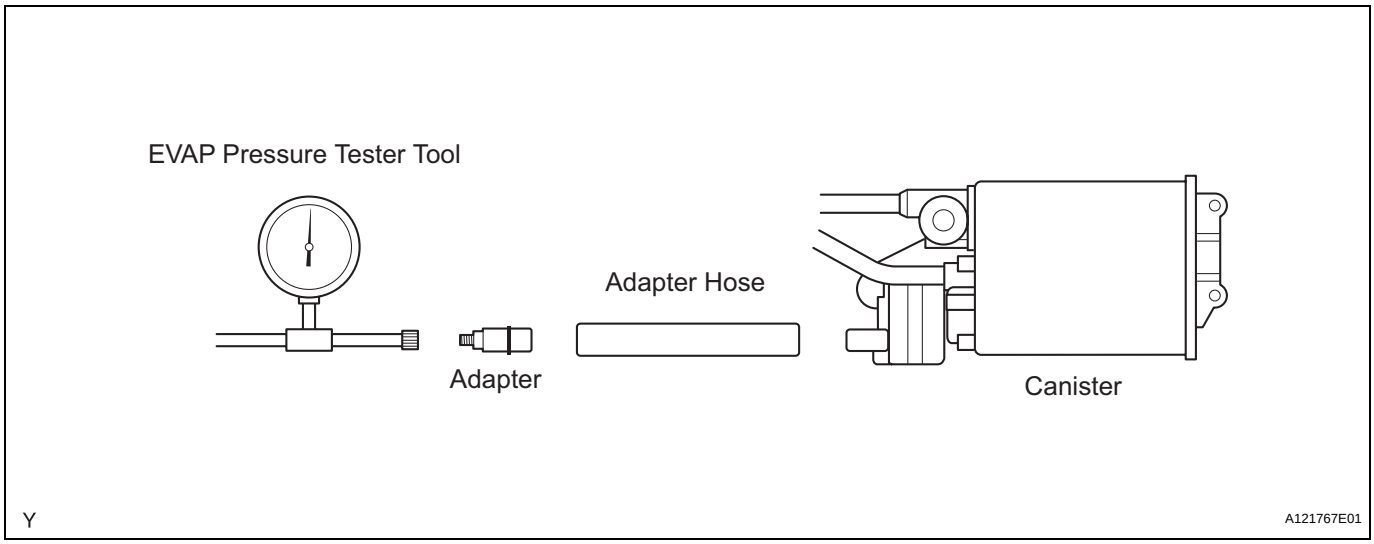
NEXT	Go to step 37

29 REPAIR EVAP LEAKING PART

(a) Reinstall the fuel cap.
(b) Disconnect the vent hose.



(c) Connect the EVAP pressure tester tool to the canister with the adapter.



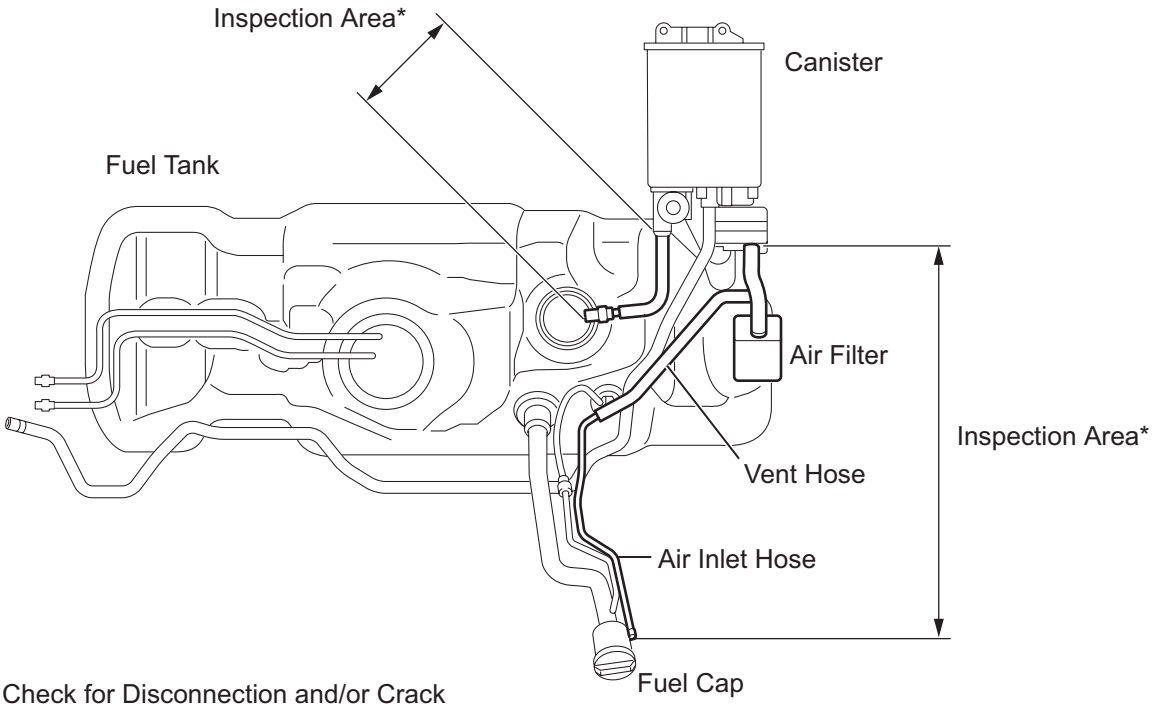
(d) Pressurize the EVAP system to 3.2 to 3.7 kPa (24 to 28 mmHg).
(e) Apply soapy water to the piping and connecting parts of the EVAP system.
(f) Look for areas where bubbles appear. This indicates leak point.
(g) Repair or replace the leak point.

HINT:
Disconnect the hose between the canister and the fuel tank from the canister. Block the canister side and conduct an inspection. In this way, the fuel tank can be excluded as an area suspected of causing fuel leaks.

NEXT	Go to step 37

30	REPLACE CHARCOAL CANISTER ASSEMBLY

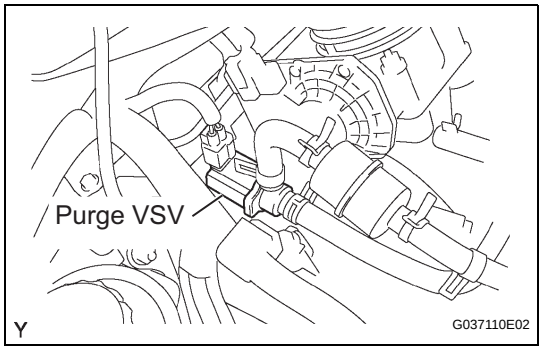
(a) Replace the canister assembly.



NOTICE:
When replacing the canister, check the canister pump module interior and related pipes for water, fuel or other liquids. If liquids are present, check for disconnections and/or cracks in the following: 1) the pipe from the air inlet port to the canister pump module; 2) the canister filter; and 3) the fuel tank vent hose.

NEXT	Go to step 37

31	REPLACE DUTY VACUUM SWITCHING VALVE (PURGE VSV)



(a) Disconnect the connector and the hoses from the purge VSV.
(b) Remove the purge VSV.
(c) Install a new purge VSV.
(d) Reconnect the connector and hoses.

NEXT → Go to step 37

ES

32	REPAIR OR REPLACE HARNESS AND CONNECTOR

NEXT → Go to step 37

33	REPLACE EVAP HOSE (INTAKE MANIFOLD - PURGE VSV)

NEXT → Go to step 37

34	INSPECT INTAKE MANIFOLD (EVAP PURGE PORT)

(a) Check that the EVAP purge port of the intake manifold is not clogged. If necessary, replace the intake manifold.

NEXT → Go to step 37

35	REPLACE ECM

(a) replace the ECM (See page ES-467).

NEXT → Go to step 37

36	REPAIR OR REPLACE PARTS AND COMPONENTS INDICATED BY OUTPUT DTCS

(a) Repair the malfunctioning areas indicated by the DTCs that had been confirmed when the vehicle was brought in.

NEXT → Go to step 37

37	PERFORM EVAP SYSTEM CHECK (AUTO OPERATION)

NOTICE:

- **The EVAP SYSTEM CHECK (AUTO OPERATION) consists of five steps performed automatically by the intelligent tester. It takes a maximum of approximately 18 minutes.**
- **Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90 % full because the cut-off valve may be closed and making the leak check of the fuel tank unavailable.**
- **Do not run the engine in this step.**
- **When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing an EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).**

(a) Clear DTCs (see page ES-40).

(b) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / AUTO OPERATION.

(c) After the SYSTEM CHECK is completed, check for pending DTCs by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
HINT:
If no pending DTC is found, the repair has been successfully completed.

NEXT

COMPLETED

CONFIRMATION DRIVING PATTERN

HINT:
After a repair, check Monitor Status by performing the Key-Off Monitor Confirmation and Purge Flow Monitor Confirmation described below.

1. KEY-OFF MONITOR CONFIRMATION

(a) Preconditions
The monitor will not run unless:
- The vehicle has been driven for 10 minutes or more (in a city area or on a free way)
- The fuel tank is less than 90 % full
- The altitude is less than 8,000 ft (2,400 m)
- The Engine Coolant Temperature (ECT) is between 4.4°C and 35°C (40°F and 95°F)
- The Intake Air Temperature (IAT) is between 4.4°C and 35°C (40°F and 95°F)
- The vehicle remains stationary (the vehicle speed is 0 mph [0 km/h])

(b) Monitor Conditions
1. Allow the engine to idle for at least 5 minutes.
2. Turn the ignition switch to OFF and wait for 6 hours (8 or 10.5 hours).
HINT:
Do not start the engine until checking MONITOR STATUS. If the engine is started, the steps described above must be repeated.

(c) Monitor Status
1. Connect an intelligent tester to the DLC3.
2. Turn the ignition switch to ON and turn the tester ON.
3. Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR STATUS.
4. Check the Monitor Status displayed on the tester.
HINT:
If INCMP is displayed, the monitor is not completed. Make sure that the preconditions have been met, and perform the Monitor Conditions again.

2. PURGE FLOW MONITOR CONFIRMATION (P0441)

HINT:
Perform this monitor confirmation after the Key-Off Monitor Confirmation shows COMPL (complete).

(a) Preconditions
The monitor will not run unless:
- The vehicle has been driven for 10 minutes or more (in a city area or on a free way)
- The ECT is between 4.4°C and 35°C (40°F and 95°F)
- The IAT is between 4.4°C and 35°C (40°F and 95°F)

(b) Monitor Conditions
1. Release the pressure from the fuel tank by removing and reinstalling the fuel cap.
2. Warm the engine up until the ECT reaches more than 75°C (167°F).
3. Increase the engine speed to 3,000 rpm once.
4. Allow the engine to idle and turn A/C ON for 1 minute.

(c) Monitor Status
1. Turn the ignition switch to OFF (where ON or the engine is running).
2. Connect an intelligent tester to the DLC3.
3. Turn the ignition switch to ON and turn the tester ON.
4. Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR STATUS.
5. Check the Monitor Status displayed on the tester.
HINT:
If INCMP is displayed, the monitor is not completed. Make sure that the preconditions have been met, and perform the Monitor Conditions again.

MONITOR RESULT

Refer to Checking Monitor Status (See page ES-21).

The test value and test limit information are described as shown in the following table. This information is included under MONITOR RESULT in the emissions-related DTC sections:
- MID (Monitor Identification Data) is assigned to each emissions-related component.
- TID (Test Identification Data) is assigned to each test value.
- Scaling is used to calculate the test value indicated on generic OBD II scan tools.

Thermostat

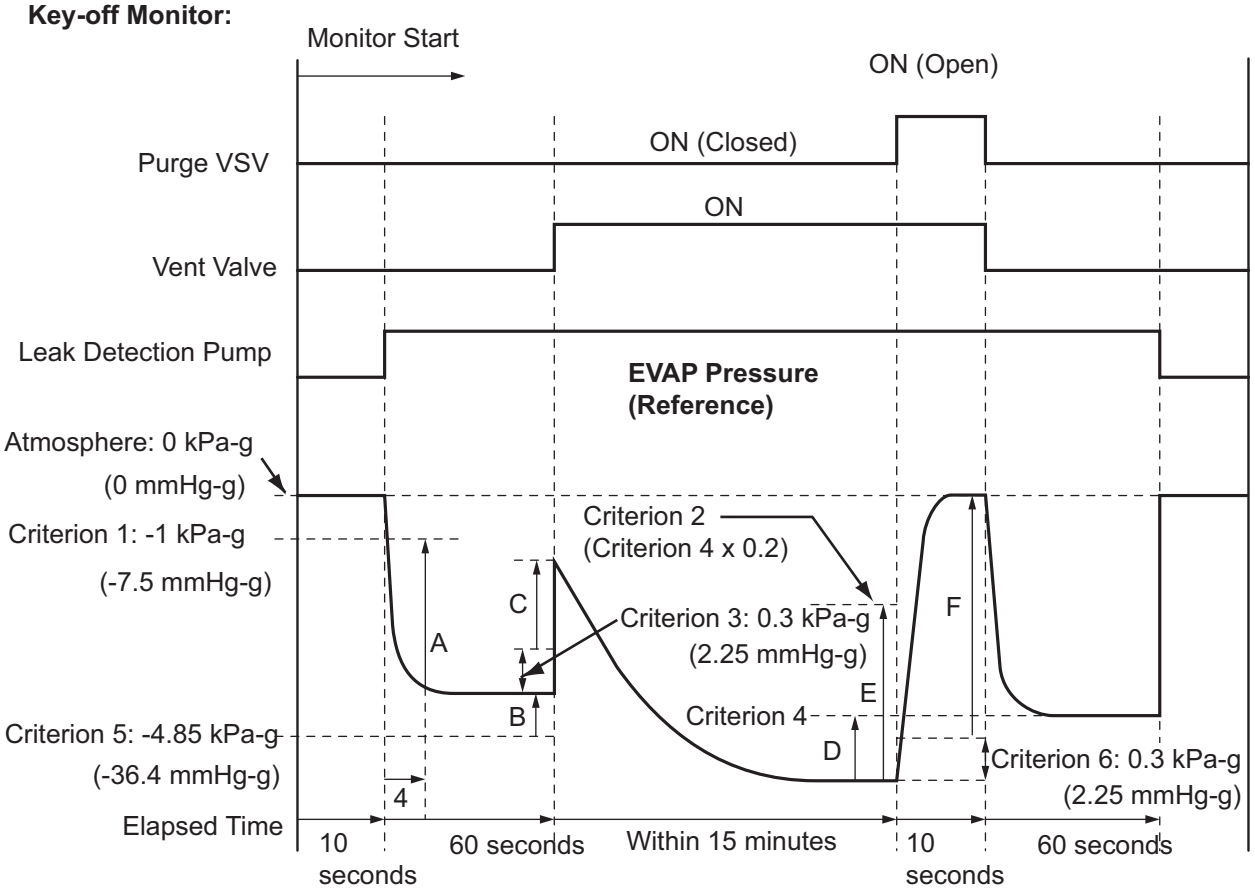
MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
$3D	$C9	Multiply by 0.001 [kPa]	Test value for small leak (P0456) Refer to pressure D*	Minimum test limit for small leak	Maximum test limit for small leak
$3D	$CA	Multiply by 0.001 [kPa]	Test value for gross leak (P0455) Refer to pressure E*	Minimum test limit for gross leak	Maximum test limit for gross leak
$3D	$CB	Multiply by 0.001 [kPa]	Test value for leak detection pump stuck OFF (P2401) Refer to pressure A*	Minimum test limit for leak detection pump stuck OFF	Maximum test limit for leak detection pump stuck OFF
$3D	$CD	Multiply by 0.001 [kPa]	Test value for leak detection pump stuck ON (P2402) Refer to pressure A*	Minimum test limit for leak detection pump stuck ON	Maximum test limit for leak detection pump stuck ON

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
$3D	$CE	Multiply by 0.001 [kPa]	Test value for vent valve stuck OFF (vent) (P2420) Refer to pressure C*	Minimum test limit for vent valve stuck ON	Maximum test limit for vent valve stuck ON
$3D	$CF	Multiply by 0.001 [kPa]	Test value for vent valve stuck ON (P2419) Refer to pressure A*	Minimum test limit for vent valve stuck OFF	Maximum test limit for vent valve stuck OFF
$3D	$D0	Multiply by 0.001 [kPa]	Test value for reference orifice low flow (P043E) Refer to pressure B*	Minimum test limit for reference orifice low flow	Maximum test limit for reference orifice low flow
$3D	$D1	Multiply by 0.001 [kPa]	Test value for reference orifice high flow (P043F) Refer to pressure A*	Minimum test limit for reference orifice high flow	Maximum test limit for reference orifice high flow
$3D	$D4	Multiply by 0.001 [kPa]	Test value for Purge VSV stuck closed (P0441) Refer to pressure F*	Minimum test limit for Purge VSV stuck closed	Maximum test limit for Purge VSV stuck closed
$3D	$D5	Multiply by 0.001 [kPa]	Test value for Purge VSV stuck open (P0441) Refer to pressure E*	Minimum test limit for Purge VSV stuck open	Maximum test limit for Purge VSV stuck open
$3D	$D7	Multiply by 0.001 [kPa]	Test value for purge flow (P0441) Refer to pressure G*	Minimum test limit for purge flow	Maximum test limit for purge flow

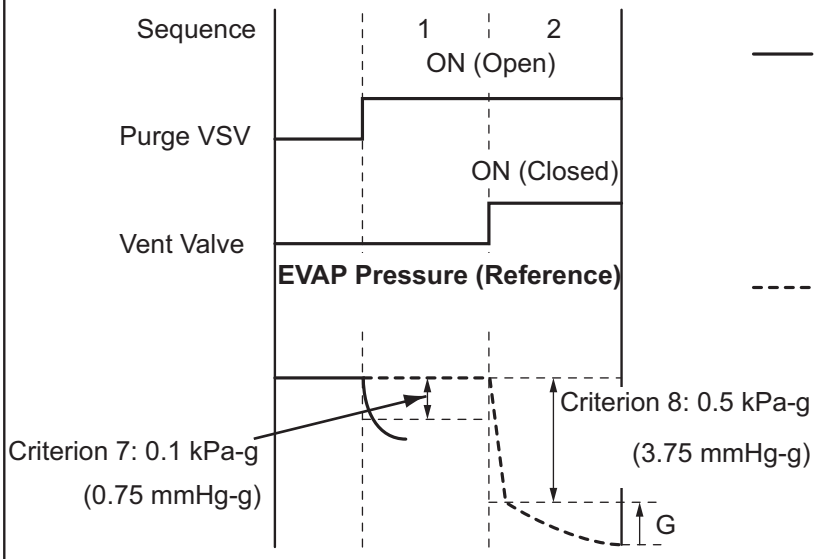
* Pressures A to G are indicated as shown in the diagram below.

ES

Key-off Monitor:



Purge Flow Monitor:



——— If pressure change in sequence 1 is greater than criterion 7, purge flow monitor is completed (functioning normally).

- - - - If pressure change in sequence 1 is smaller than criterion 7 and pressure change in sequence 2 is smaller than criterion 8, purge flow is insufficient.

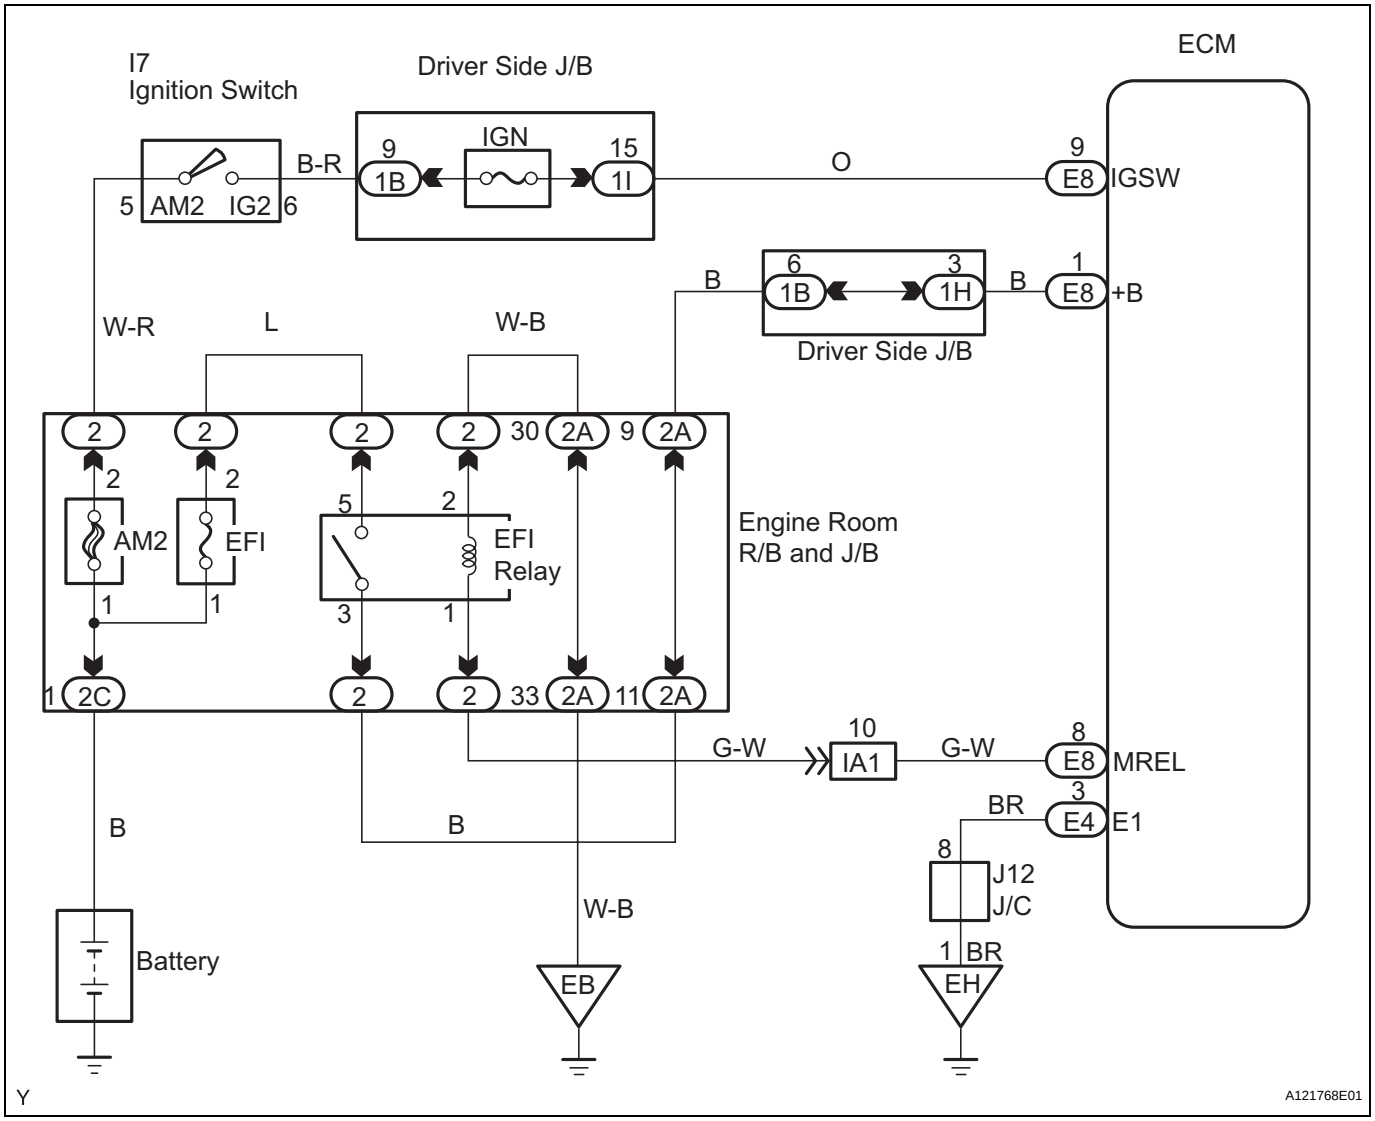
A106747E07

ECM Power Source Circuit

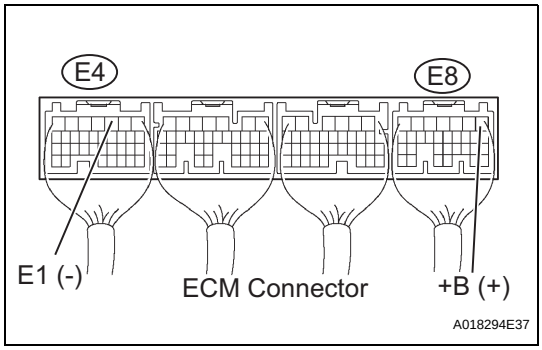
DESCRIPTION

When the ignition switch is turned to ON, the battery voltage is applied to terminal IGSW of the ECM. The ECM MREL output signal causes a current to flow to the coil, closing the contacts of the EFI relay and supplying power to terminal +B of the ECM.

WIRING DIAGRAM



1 **INSPECT ECM (+B VOLTAGE)**



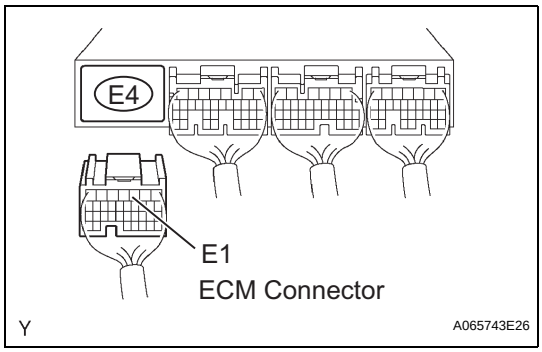
(a) Turn the ignition switch to ON.
(b) Measure the voltage between the terminals of the ECM connectors.
Standard Voltage

Tester Connections	Specified Conditions
+B (E8-1) - E1 (E4-3)	9 to 14 V

OK → **PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE**

ES **NG**

2 **CHECK HARNESS AND CONNECTOR (ECM - BODY GROUND)**



(a) Disconnect the negative battery cable.
(b) Disconnect the E4 ECM connector.
(c) Check the resistance.
Standard Resistance

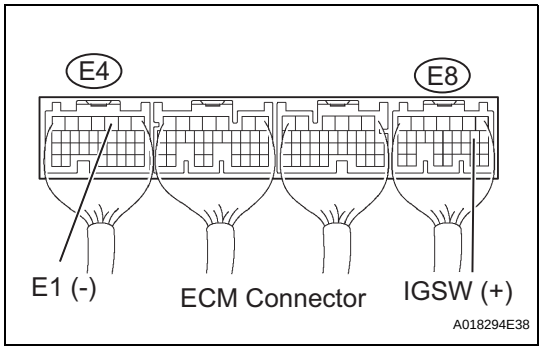
Tester Connections	Specified Conditions
E1 (E4-3) - Body ground	Below 1 Ω

(d) Reconnect the ECM connector.
(e) Reconnect the negative battery cable.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3 **INSPECT ECM (IGSW VOLTAGE)**



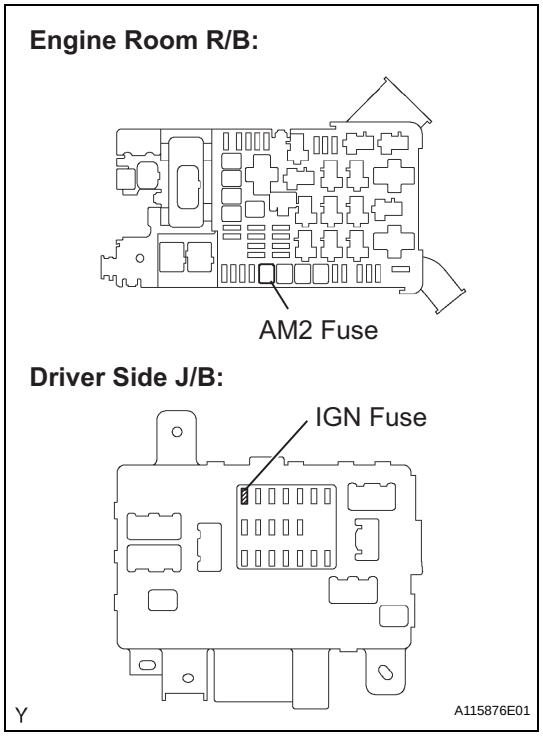
(a) Turn the ignition switch to ON.
(b) Measure the voltage between the terminals of the ECM connectors.
Standard Voltage

Tester Connections	Specified Conditions
IGSW (E8-9) - E1 (E4-3)	9 to 14 V

OK → **Go to step 6**

NG

4 CHECK FUSE (AM2 AND IGN)



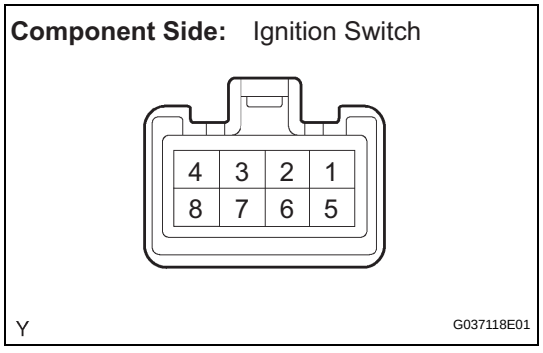
(a) Check the AM2 fuse.
  (1) Remove the AM2 fuse from the engine room R/B.
  (2) Check the AM2 fuse resistance.
    Standard Resistance:
    Below 1 Ω
  (3) Reinstall the AM2 fuse.

(b) Check the IGN fuse.
  (1) Remove the IGN fuse from the driver side J/B.
  (2) Check the IGN fuse resistance.
    Standard Resistance:
    Below 1 Ω
  (3) Reinstall the IGN fuse.

NG → **CHECK FOR SHORT IN ALL HARNESS AND COMPONENTS CONNECTED TO FUSE**

OK

5 INSPECT IGNITION OR STARTER SWITCH ASSEMBLY



(a) Disconnect the I7 ignition switch connector.

(b) Check the resistance.

Standard Resistance

Ignition Switch Positions	Tester Connections	Specified Conditions
LOCK	All Terminals	10 kΩ or higher
ACC	2-4	Below 1 Ω
ON	1-4, 1-6, 2-4, 3-4, 5-6	Below 1 Ω
START	1-4, 3-4, 5-6, 5-7	Below 1 Ω

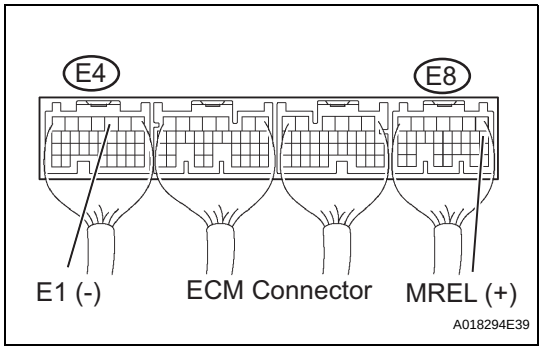
(c) Reconnect the ignition switch connector.

NG → **REPLACE IGNITION OR STARTER SWITCH ASSEMBLY**

OK

CHECK AND REPAIR HARNESS AND CONNECTOR (BATTERY - IGNITION SWITCH, IGNITION SWITCH - ECM)

6 INSPECT ECM (MREL VOLTAGE)



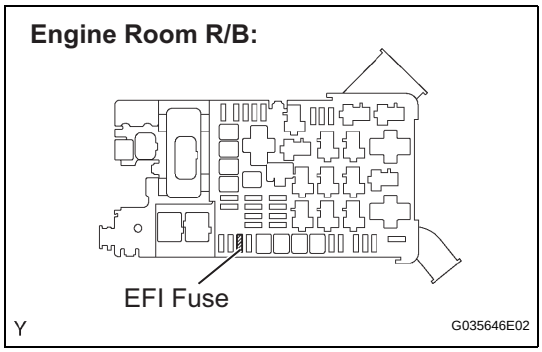
(a) Turn the ignition switch to ON.
(b) Measure the voltage between the terminals of the ECM connectors.
Standard Voltage

Tester Connections	Specified Conditions
MREL (E8-8) - E1 (E4-3)	9 to 14 V

NG → **REPLACE ECM**

OK

7 CHECK FUSE (EFI)

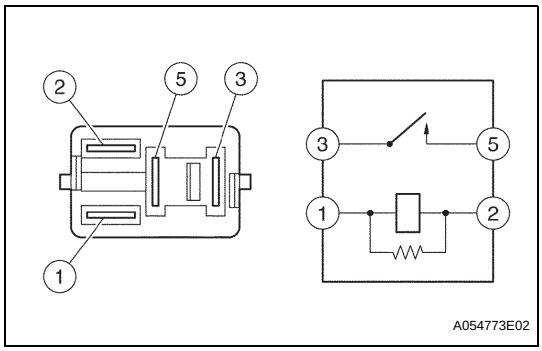


(a) Remove the EFI fuse from the engine room R/B.
(b) Check the EFI fuse resistance.
Standard Resistance:
Below 1 Ω
(c) Reinstall the EFI fuse.

NG → **CHECK FOR SHORT IN ALL HARNESS AND COMPONENTS CONNECTED TO FUSE**

OK

8 INSPECT EFI RELAY



(a) Remove the EFI relay from the engine room R/B.
(b) Check the EFI relay resistance.
Standard Resistance

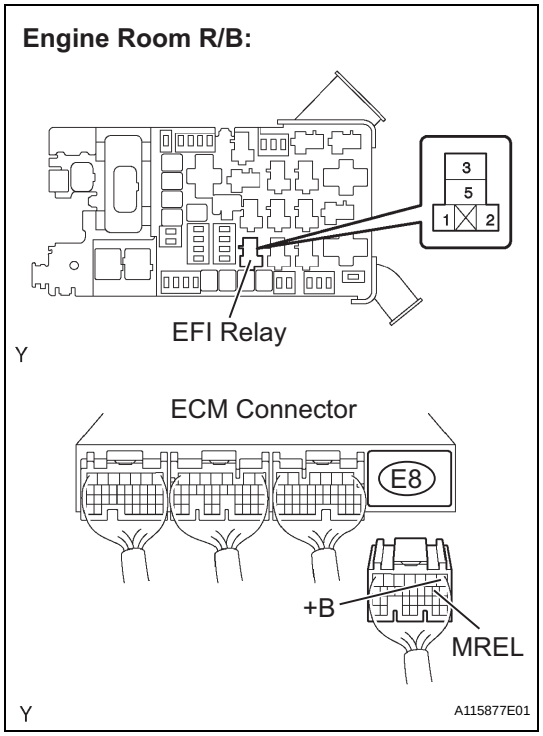
Tester Connections	Specified Conditions
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the EFI relay.

NG → **REPLACE EFI RELAY**

OK

9	CHECK HARNESS AND CONNECTOR (EFI RELAY - ECM, EFI RELAY - BODY GROUND)



(a) Check the harness and connector between the EFI relay and ECM.
  (1) Remove the EFI relay from the engine room R/B.
  (2) Disconnect the E8 ECM connector.
  (3) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
Engine room R/B (EFI relay terminal 1) - MREL (E8-8)	Below 1 Ω
Engine room R/B (EFI relay terminal 3) - +B (E8-1)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
Engine room R/B (EFI relay terminal 1) or MREL (E8-8) - Body ground	10 kΩ or higher
Engine room R/B (EFI relay terminal 3) or +B (E8-1) - Body ground	10 kΩ or higher

  (4) Reconnect the ECM connector.
  (5) Reinstall the EFI relay.

(b) Check the harness and connector between the EFI relay and body ground.
  (1) Remove the EFI relay from the engine room R/B.
  (2) Check the resistance.

Standard Resistance (Check for open):

Tester Connections	Specified Conditions
Engine room R/B (EFI relay terminal 2) - Body ground	Below 1 Ω

  (3) Reinstall the EFI relay.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

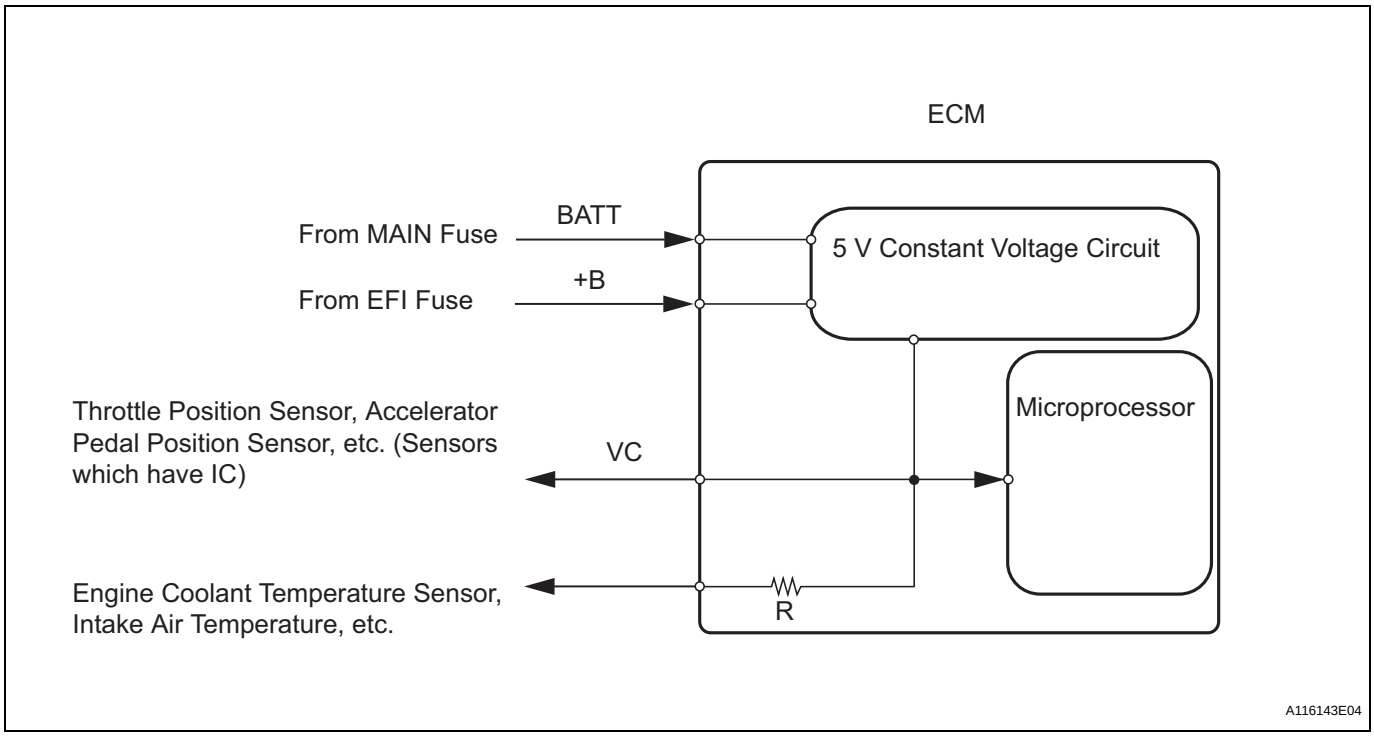
OK

CHECK AND REPLACE HARNESS AND CONNECTOR (TERMINAL 5 OF EFI RELAY - BATTERY POSITIVE TERMINAL)

VC Output Circuit

DESCRIPTION

The ECM constantly generates 5 V power from the battery voltage supplied to the +B (BATT) terminal to operate the microprocessor. The ECM also provides this power to the sensors through the VC output circuit.



When the VC circuit is short-circuited, the microprocessor in the ECM and sensors that are supplied power through the VC circuit are inactivated because the power is not supplied from the VC circuit. Under this condition, the system does not start up and the MIL does not illuminate even if the system malfunctions.

HINT:

Under normal conditions, the MIL is illuminated for several seconds when the ignition switch is first turned to ON. The MIL goes off when the engine is started.

WIRING DIAGRAM

Refer to the following pages.

- Throttle position sensor circuit (See page ES-114).
- Canister pump module circuit (See page ES-397).
- Secondary air injection pressure sensor circuit (See page ES-192).
- Accelerator pedal circuit (See page ES-305).

1	**CHECK MIL**

(a) Check that the Malfunction Indicator Lamp (MIL) lights up when turning the ignition switch ON.

OK:

MIL lights up

OK	**SYSTEM OK**

NG

2 CHECK CONNECTION BETWEEN INTELLIGENT TESTER AND ECM

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and intelligent tester ON.
(c) Check the communication between the intelligent tester and ECM.

Result	Proceed to
Communication is possible	A
Communication is not possible	B

A → **GO TO MIL CIRCUIT**

B

3 CHECK MIL (THROTTLE BODY)

(a) Disconnect the throttle body connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed to
MIL illuminates	**A**
MIL does not illuminate	**B**

A → **REPLACE THROTTLE BODY**

B

4 CHECK MIL (ACCELERATOR PEDAL)

(a) Disconnect the accelerator pedal connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed to
MIL illuminates	**A**
MIL does not illuminate	**B**

A → **REPLACE ACCELERATOR PEDAL ASSEMBLY**

B

5 CHECK MIL (PRESSURE SENSOR FOR SECONDARY AIR INJECTION)

(a) Disconnect the pressure sensor connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

A → **REPLACE PRESSURE SENSOR**

B

6 CHECK MIL (CANISTER PUMP MODULE)

(a) Disconnect the canister pump module connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

A → **REPLACE CHARCOAL CANISTER ASSEMBLY**

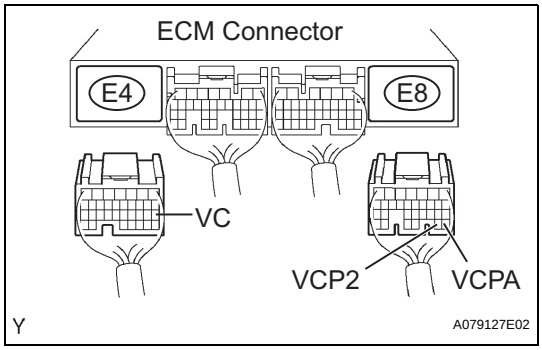
B

7 CHECK HARNESS AND CONNECTOR

(a) Disconnect the throttle body connector.
(b) Disconnect the accelerator pedal connector.
(c) Disconnect the pressure sensor connector.
(d) Disconnect the canister pump module connector.
(e) Disconnect the ECM connector.
(f) Measure the resistance of the wire harness side connector.

Standard Resistance (check for short)

Tester Connection	Specified Condition
VC (E4-18) - Body ground	10 kΩ or higher



NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

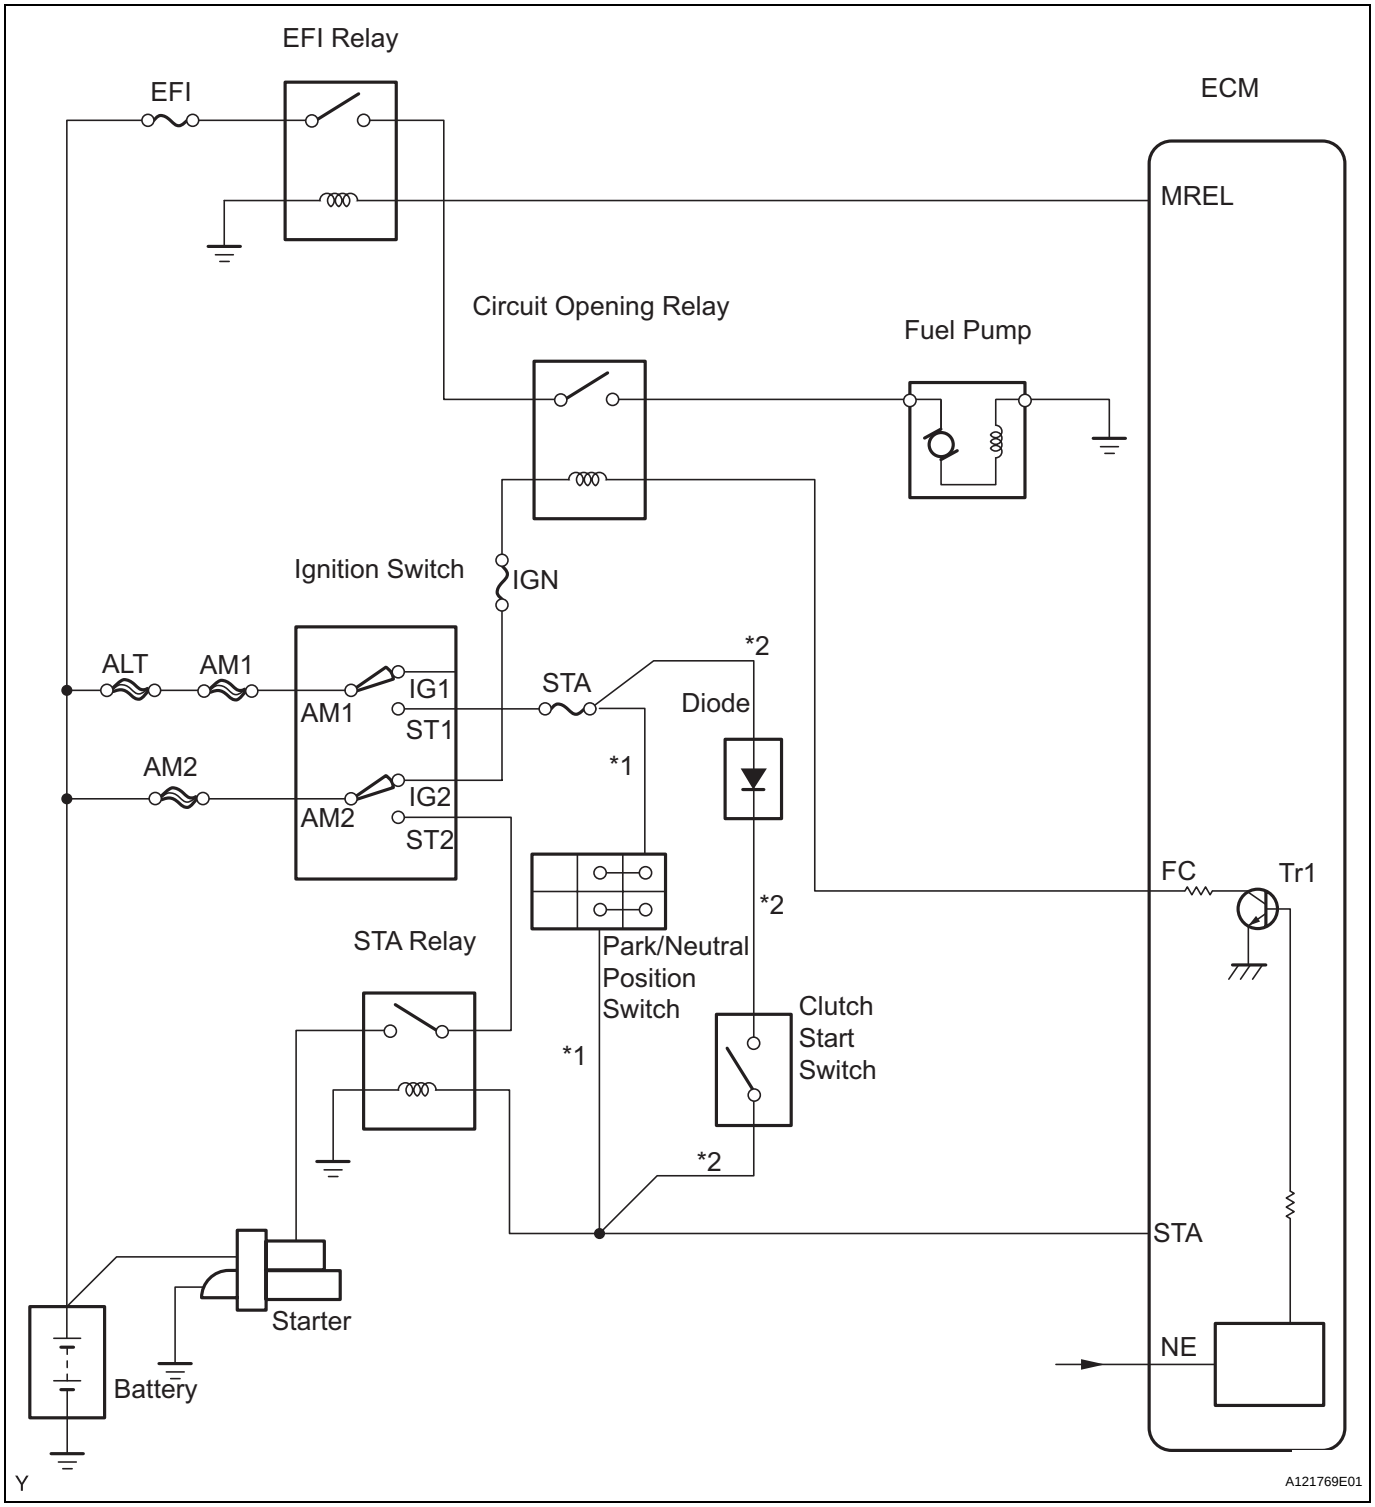
OK

REPLACE ECM

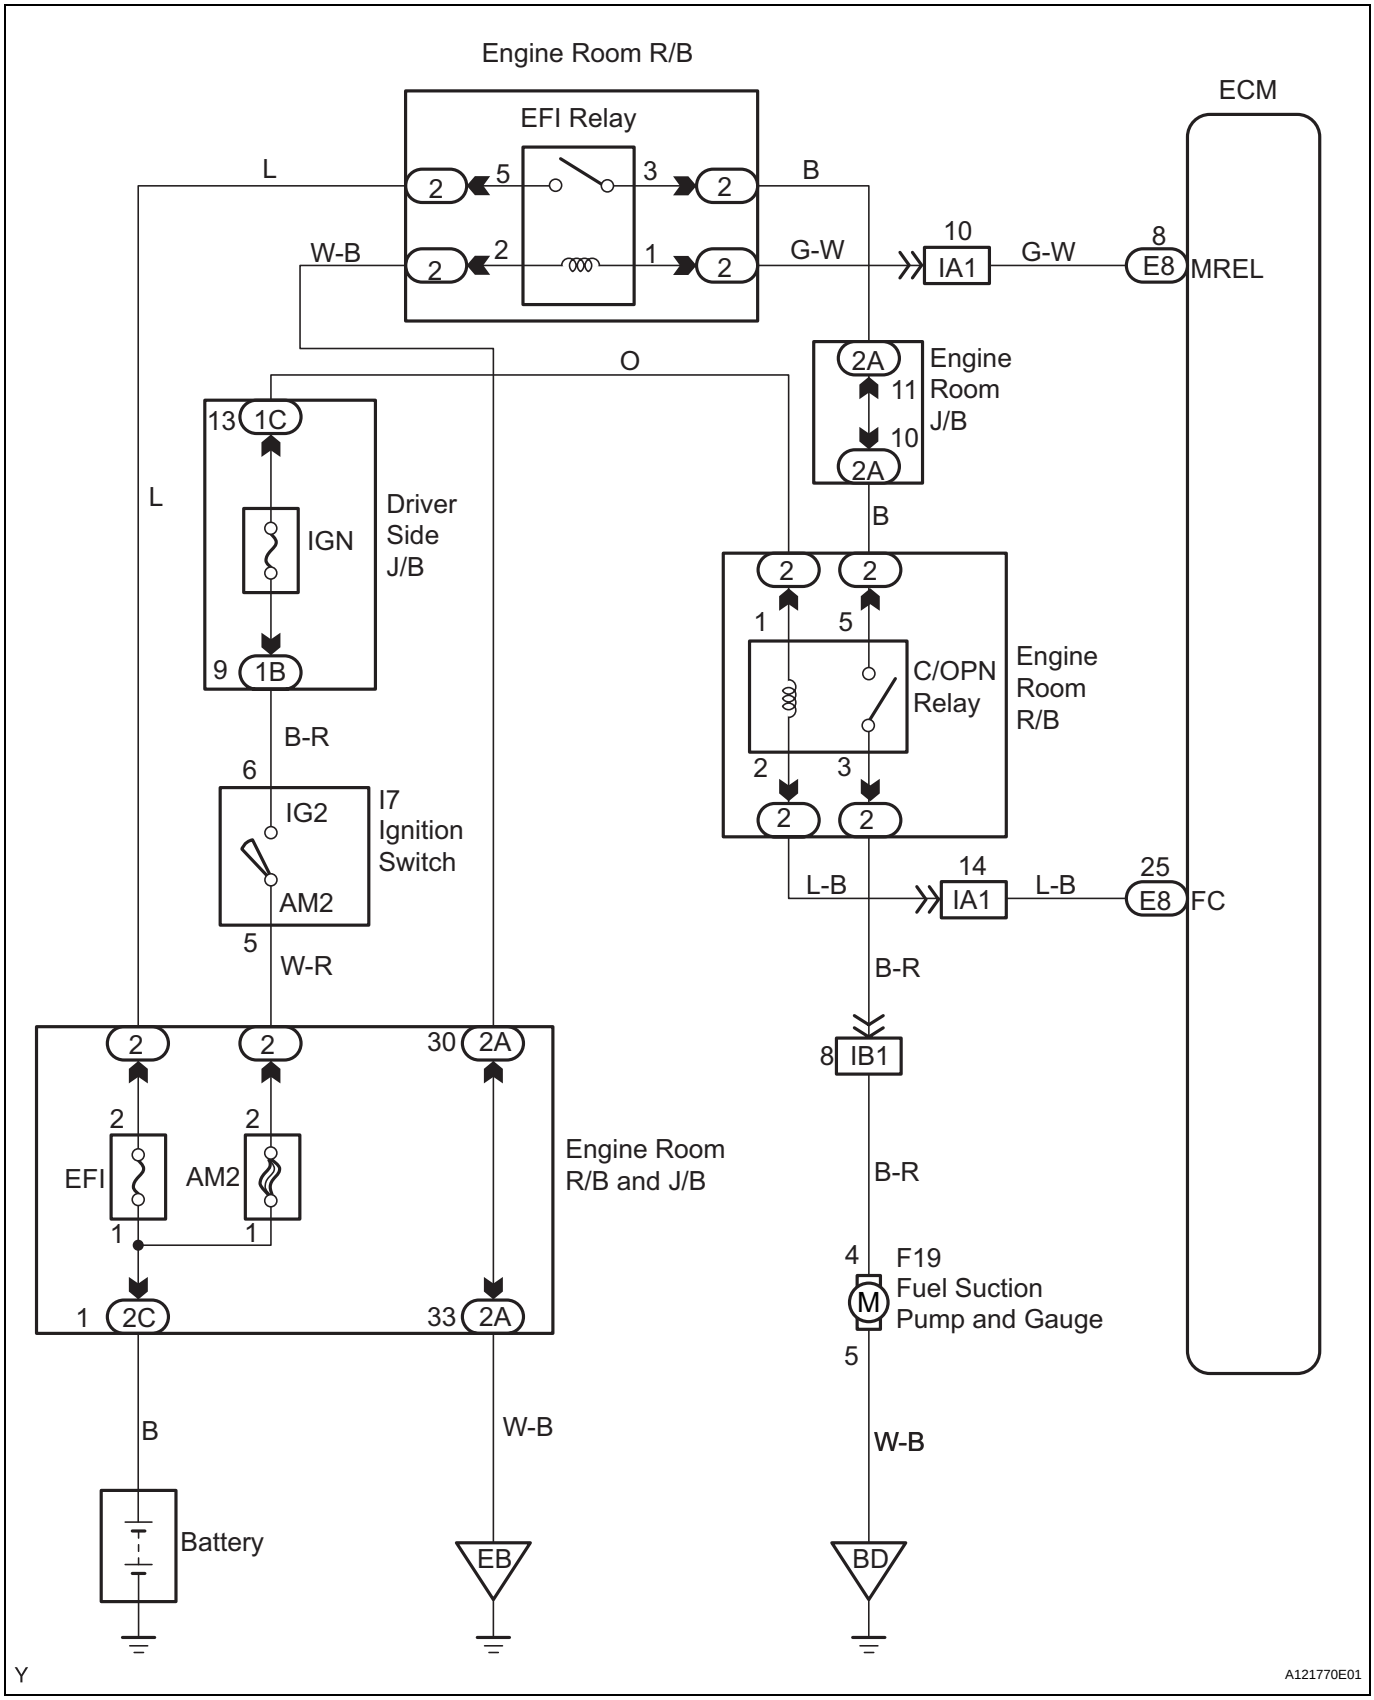
Fuel Pump Control Circuit

DESCRIPTION

When the engine is cranked, a current flows from terminal ST2 of the ignition switch into the STA (starter) relay coil and a current also flows into terminal STA of the ECM (STA signal).
When the STA and NE signals are received by the ECM, Tr (power transistor) is switched on, allowing a current to flow into the circuit opening relay coil. The circuit opening relay switches on, power is supplied to the fuel pump and the fuel pump operates.
While the NE signal is being generated (engine running), the ECM keeps Tr ON, therefore keeping the circuit opening relay ON, so that the fuel pump continues to operate.



WIRING DIAGRAM



1	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATION OF CIRCUIT OPENING RELAY)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / FUEL PUMP/ SPD.
(d) Check whether relay operating sounds can be heard while operating the relay using the tester.
OK:
Relay operating sounds can be heard from relay.

OK → **Go to step 7**

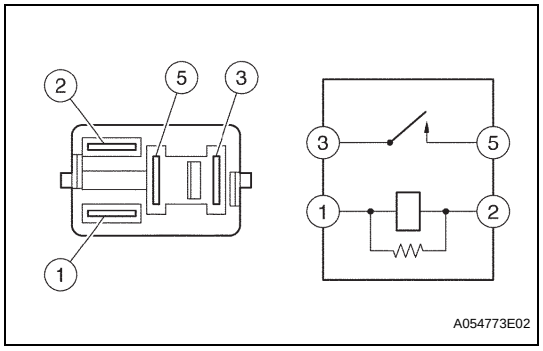
NG

2	INSPECT ECM POWER SOURCE CIRCUIT

NG → **REPAIR OR REPLACE POWER SOURCE CIRCUIT**

OK

3	INSPECT CIRCUIT OPENING RELAY (C/OPN RELAY)



(a) Remove the circuit opening (C/OPN) relay from the engine room R/B.
(b) Check the circuit opening relay resistance.
Standard Resistance

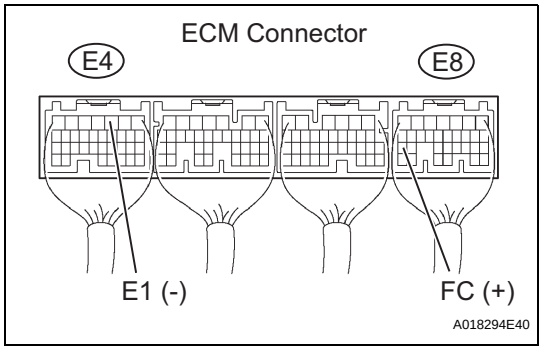
Tester Connections	Specified Conditions
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage applied to terminals 1 and 2)

(c) Reinstall the circuit opening relay.

NG → **REPLACE CIRCUIT OPENING RELAY**

OK

4	INSPECT ECM (FC VOLTAGE)



(a) Turn the ignition switch to ON.
(b) Measure the voltage between the terminals of the ECM connectors.

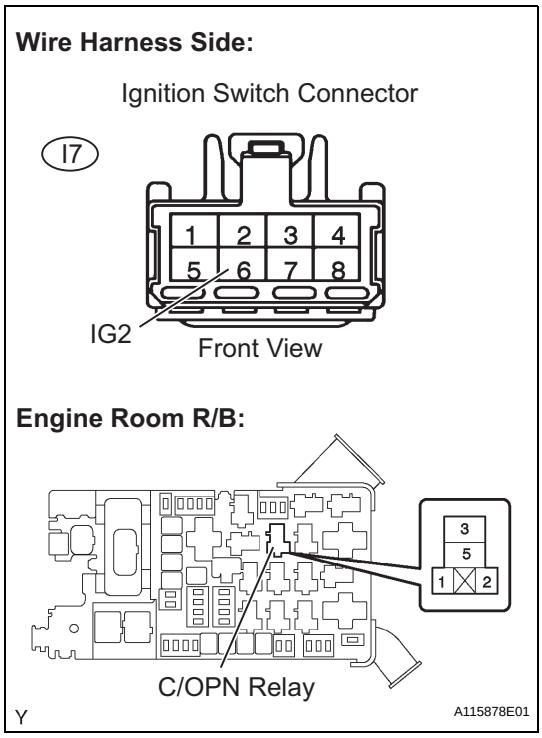
Standard Voltage

Tester Connections	Specified Conditions
FC (E8-25) - E1 (E4-3)	9 to 14 V

OK → **REPLACE ECM**

NG

5	CHECK HARNESS AND CONNECTOR (IGNITION SWITCH - CIRCUIT OPENING RELAY)



(a) Disconnect the I7 ignition switch connector.
(b) Remove the circuit opening (C/OPN) relay from the engine room R/B.
(c) Check the resistance.

Standard Resistance (Check for open)

Terminal Connections	Specified Conditions
IG2 (I7-6) - Engine room R/B (Circuit opening relay terminal 1)	Below 1 Ω

Standard Resistance (Check for short)

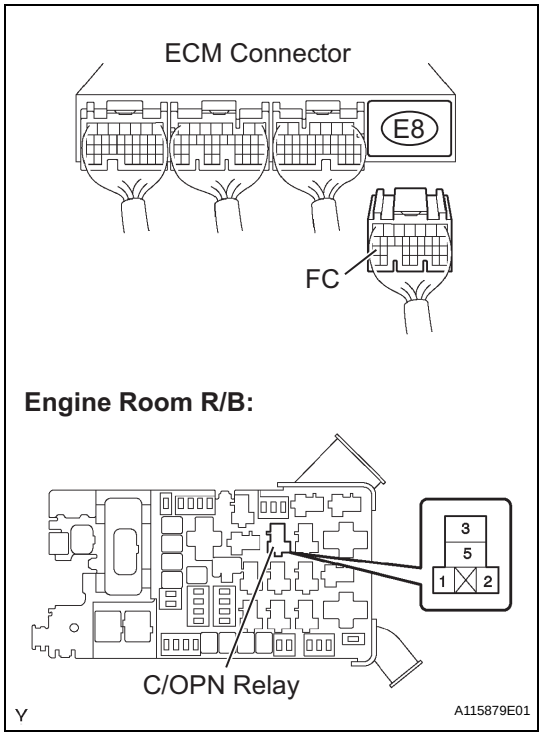
Terminal Connections	Specified Conditions
IG2 (I7-6) or Engine room R/B (Circuit opening relay terminal 1) - Body ground	10 kΩ or higher

(d) Reinstall the circuit opening relay.
(e) Reconnect the ignition switch connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

6	CHECK HARNESS AND CONNECTOR (ECM - CIRCUIT OPENING RELAY)



(a) Disconnect the E8 ECM connector.
(b) Remove the circuit opening (C/OPN) relay from the engine room R/B.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
FC (E8-25) - Engine room R/B (Circuit opening relay terminal 2)	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
FC (E8-25) or Engine room R/B (Circuit opening relay terminal 2) - Body ground	10 kΩ or higher

(d) Reinstall the circuit opening relay.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

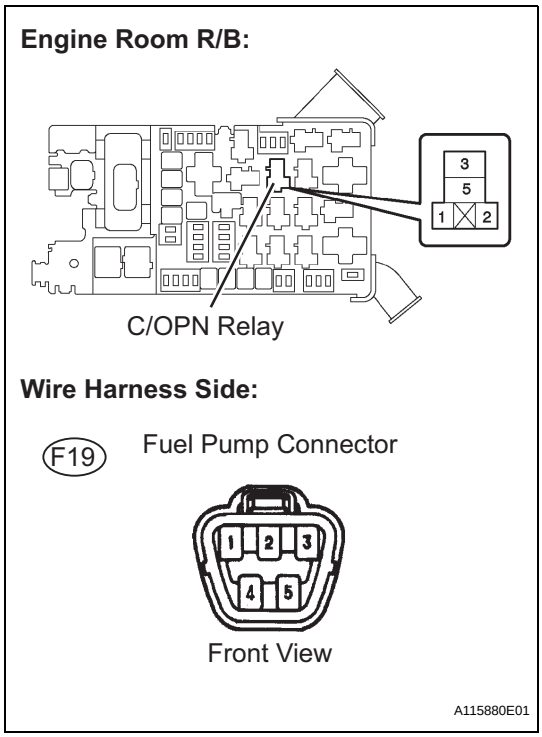
7	INSPECT FUEL PUMP ASSEMBLY

HINT:
Refer to Fuel Pump Inspection (See page FU-26).

NG → **REPLACE FUEL PUMP ASSEMBLY**

OK

8	CHECK HARNESS AND CONNECTOR (CIRCUIT OPENING RELAY - FUEL PUMP, FUEL PUMP - BODY GROUND)



(a) Remove the circuit opening (C/OPN) relay from the engine room R/B.
(b) Disconnect the F19 fuel pump connector.
(c) Check the resistance.

Standard Resistance (Check for open)

Tester Connections	Specified Conditions
Engine room R/B (Circuit opening relay terminal 3) - Fuel pump (F19-4)	Below 1 Ω
Fuel pump (F19-5) - Body ground	Below 1 Ω

Standard Resistance (Check for short)

Tester Connections	Specified Conditions
Engine room R/B (Circuit opening relay terminal 3) or Fuel pump (F19-4) - Body ground	10 kΩ or higher

(d) Reconnect the fuel pump connector.
(e) Reinstall the circuit opening relay.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

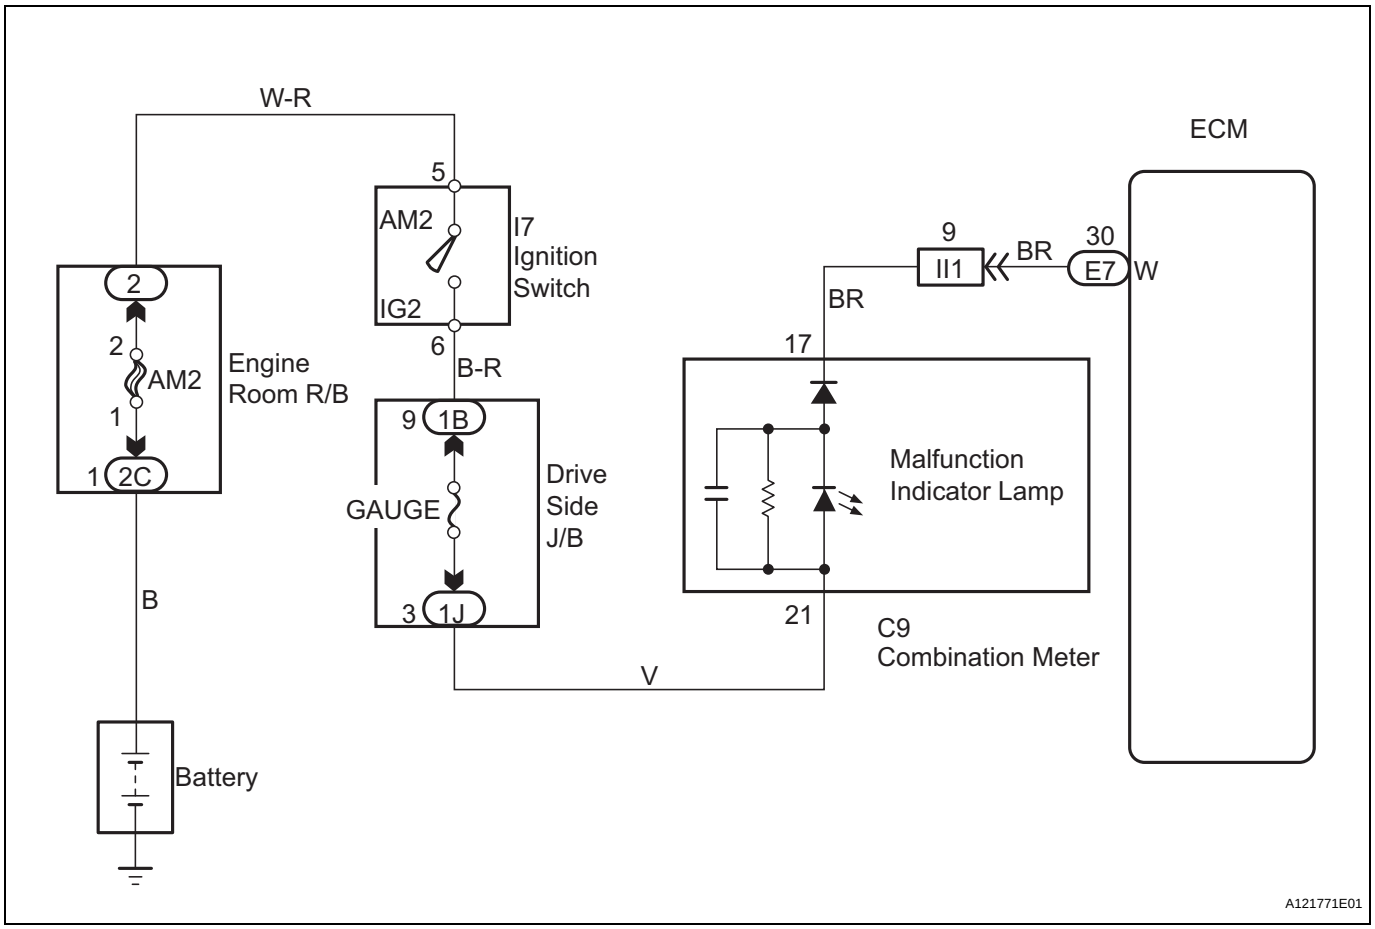
CHECK AND REPLACE HARNESS AND CONNECTOR (EFI RELAY - C/OPN RELAY)

MIL Circuit

DESCRIPTION

The MIL (Malfunction Indicator Lamp) is used to indicate vehicle malfunction detections by the ECM.
By turning the ignition switch to ON, power is supplied to the MIL circuit, and the ECM provides the circuit ground which illuminates the MIL.
The MIL operation can be checked visually: When the ignition switch is first turned to ON, the MIL should be illuminated and should then turn OFF. If the MIL remains illuminated or is not illuminated, conduct the following troubleshooting procedure using an intelligent tester.

WIRING DIAGRAM



ES

1	CHECK THAT MIL IS ILLUMINATED

(a) Perform troubleshooting in accordance with the chart below.

Result

MIL Condition	Proceed To
MIL remains ON	A
MIL does not illuminate	B

B	Go to step 4

A

2	CHECK WHETHER MIL TURNS OFF

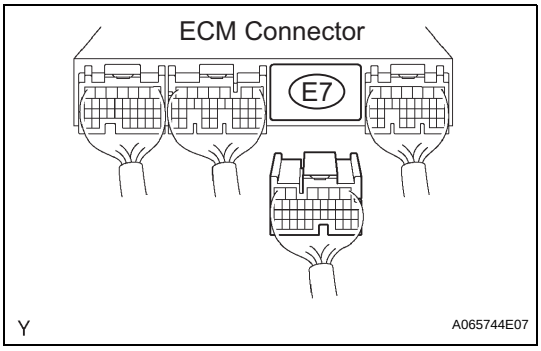
(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the tester ON.
(d) Check whether any DTCs have been stored (see page ES-40). Note them down if necessary.
(e) Clear DTCs (see page ES-40).
(f) Check if the MIL turns off.
OK:
MIL should turn off.

ES

OK → **REPAIR CIRCUITS INDICATED BY OUTPUT DTCS**

NG

3	CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT IN WIRE HARNESS)



(a) Disconnect the ECM connector.
(b) Turn the ignition switch to ON.
(c) Check that the MIL is not illuminated.
OK:
MIL is not illuminated.
(d) Reconnect the ECM connector.

OK → **REPLACE ECM**

NG

CHECK AND REPLACE HARNESS AND CONNECTOR

4	CHECK THAT MIL IS ILLUMINATED

(a) Check if the MIL is illuminated when the ignition switch is turned to ON.
OK:
MIL should be illuminated.

OK → **SYSTEM OK**

NG

5	CHECK THAT ENGINE STARTS

(a) Turn the ignition switch to ON
(b) Start the engine.

Result

Result	Proceed To
Engine starts	A
Engine does not start*	B

HINT:
*: The intelligent tester cannot communicate with the ECM.

B → **GO TO VC OUTPUT CIRCUIT**

A

6	INSPECT COMBINATION METER ASSEMBLY (MIL CIRCUIT)

(a) See the combination meter troubleshooting procedure (See page ME-7).

NG → **REPAIR OR REPLACE BULB OR COMBINATION METER ASSEMBLY**

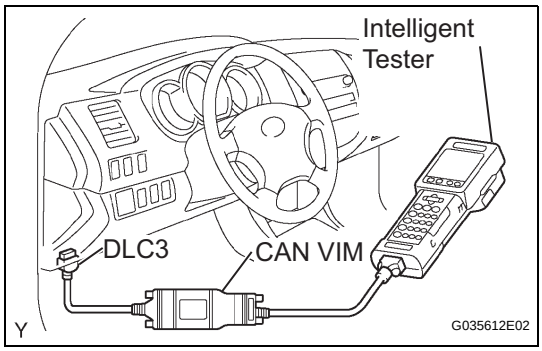
OK

CHECK AND REPLACE HARNESS AND CONNECTOR (COMBINATION METER - ECM)

ON-VEHICLE INSPECTION

1. INSPECT THROTTLE BODY ASSEMBLY

(a) Listen to the throttle control motor operating sounds.
  (1) Turn the ignition switch to ON.
  (2) When pressing the accelerator pedal, listen to the running sounds of the motor. Make sure no friction noises come from the motor.
  If friction noises exist, check the throttle body, wire harness and ECM.

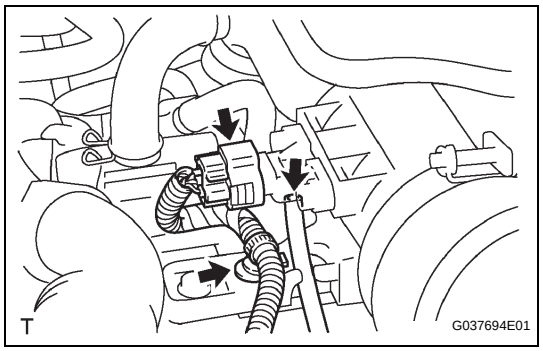


(b) Inspect the throttle position sensor.
  (1) Connect the intelligent tester to the DLC3.
  (2) Turn the ignition switch to ON.
  (3) Turn the intelligent tester ON.
  (4) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / THROTTLE POS.
  (5) Depress the accelerator pedal. When the throttle valve is fully opened, check that the THROTTLE POS value is within the specified range.
  Standard:
  60 % or more
  NOTICE:
  When checking the standard throttle valve opening percentage, the transmission should be in the neutral position.
  If the result is not as specified, check the throttle body, wire harness and ECM.

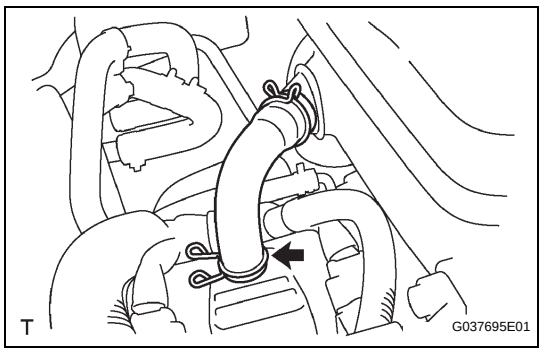
ES

REMOVAL

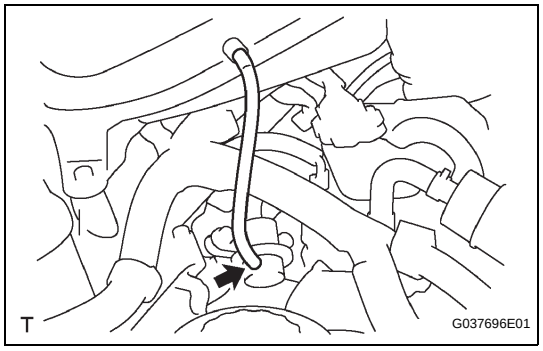
1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
2. **REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY (for 4WD and Pre-Runner)**
3. **DRAIN ENGINE COOLANT (See page CO-3)**
4. **REMOVE INTAKE AIR CONNECTOR**
   (a) Disconnect the pressure sensor connector.
   (b) Disengage the wire harness clamp.
   (c) Disconnect the vacuum hose.



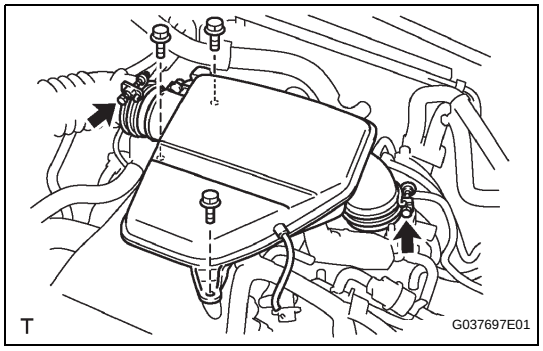
(d) Disconnect the No. 2 ventilation hose.

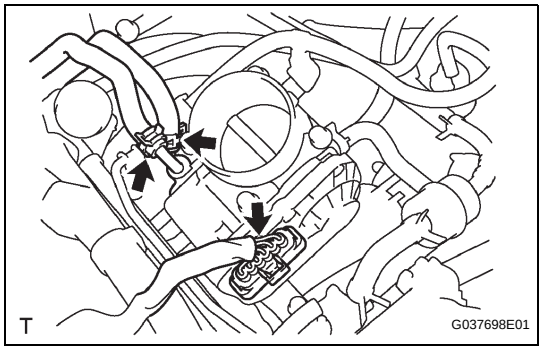


(e) Disconnect the vacuum hose.



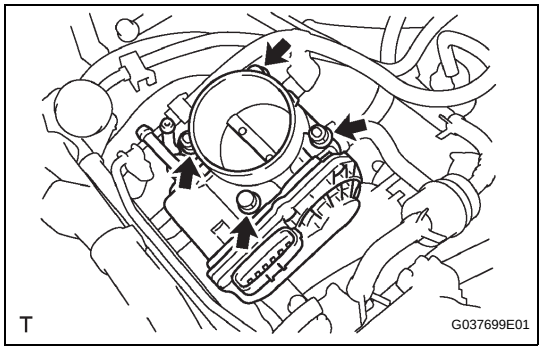
(f) Loosen the 2 hose clamp bolts.
(g) Remove the 3 bolts, then remove the intake air connector.



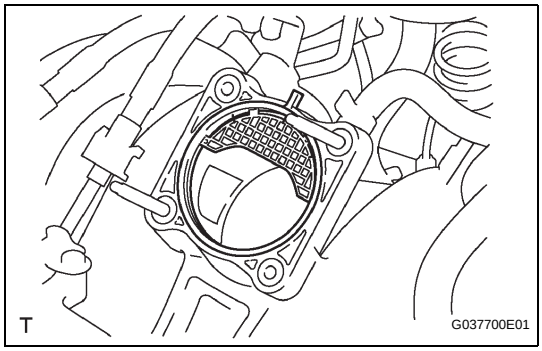


5. REMOVE THROTTLE WITH MOTOR BODY ASSEMBLY

(a) Disconnect the water by-pass hose.
(b) Disconnect the No. 2 water by-pass hose.
(c) Disconnect the throttle motor connector.



(d) Remove the 2 bolts and 2 nuts, then remove the throttle with motor body.

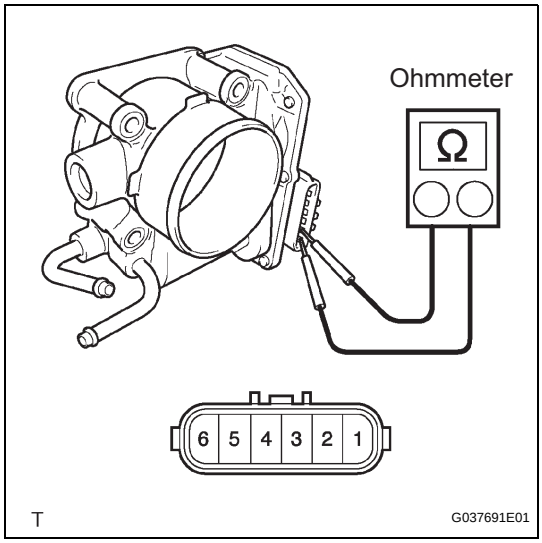


(e) Remove the gasket from the intake manifold.

INSPECTION

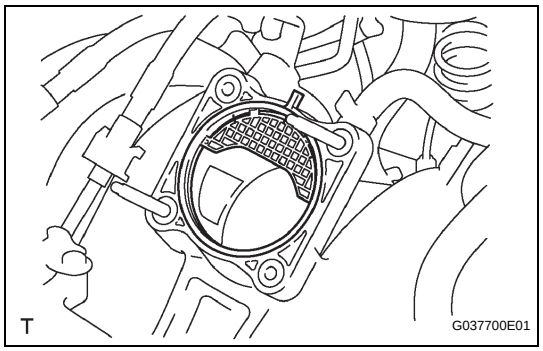
1. INSPECT THROTTLE WITH MOTOR BODY ASSEMBLY

(a) Check the resistance.
(1) Using an ohmmeter, measure the resistance between the terminals.
Standard



Tester Connection	Specified Condition
1(M-) - 2 (M+)	0.3 to 100 Ω at 20°C (68°F)
3 (E2) - 5 (VC)	2.0 to 4.0 kΩ at 20°C (68°F)

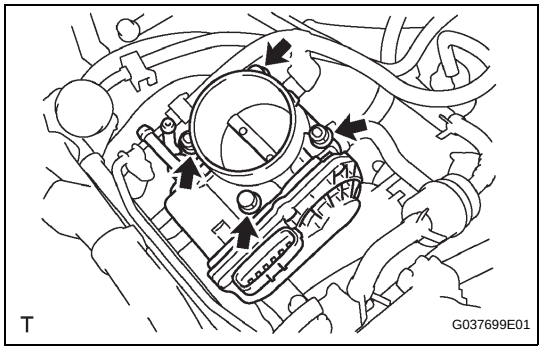
If the result is not as specified, replace the throttle body.



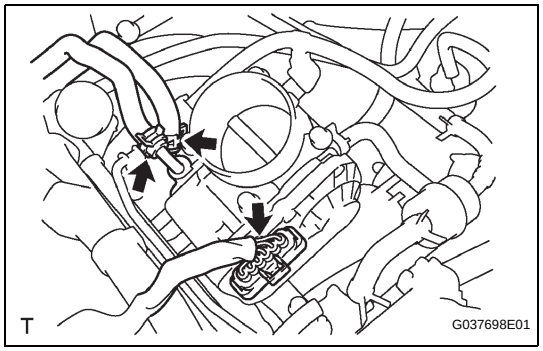
INSTALLATION

1. INSTALL THROTTLE WITH MOTOR BODY ASSEMBLY

(a) Install a new gasket onto the intake manifold.

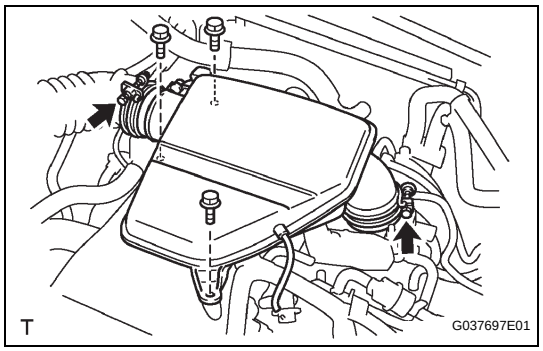


(b) Install the throttle with motor body with the 2 bolts and 2 nuts.
Torque: 9 N*m (92 kgf*cm, 80 in.*lbf)

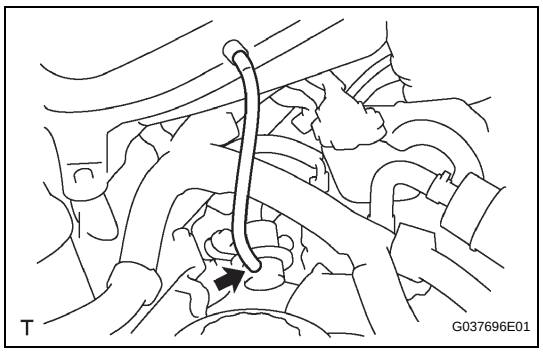


(c) Connect the water by-pass hose.
(d) Connect the water by-pass hose No. 2.
(e) Connect the throttle motor connector.

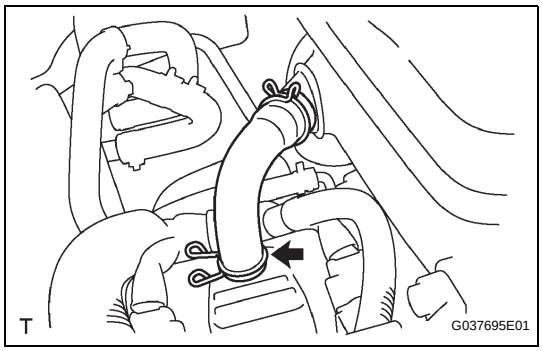
2. INSTALL INTAKE AIR CONNECTOR



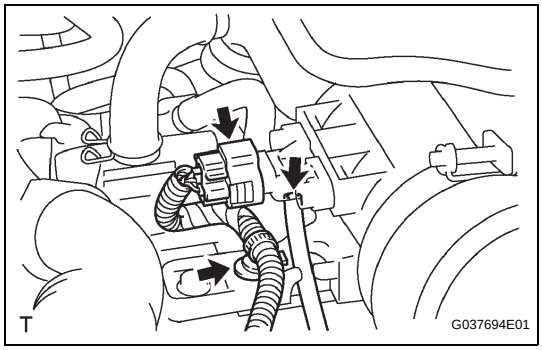
(a) Install the intake air connector with the 3 bolts.
Torque: 8 N*m (82 kgf*cm, 71 in.*lbf)
(b) Tighten the 2 hose clamp bolts.
Torque: 5 N*m (51 kgf*cm, 44 in.*lbf)



(c) Connect the vacuum hose.



(d) Connect the ventilation hose No. 2.



(e) Connect the vacuum hose.
(f) Engage the wire harness clamp.
(g) Connect the pressure sensor connector.

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

4. ADD ENGINE COOLANT (See page CO-3)

5. CHECK FOR ENGINE COOLANT LEAKAGE (See page CO-2)

6. INSTALL ENGINE UNDER COVER SUB-ASSEMBLY NO.1 (for 4WD and Pre-Runner)

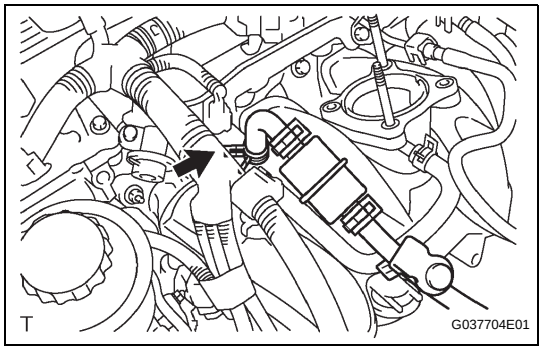
ES

ES

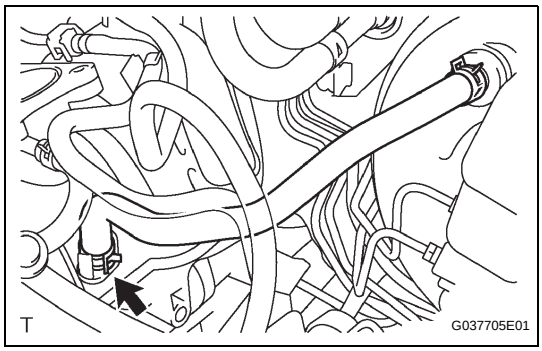
REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
2. **REMOVE ENGINE UNDER COVER SUB-ASSEMBLY (for 4WD and Pre-Runner)**
3. **DRAIN ENGINE COOLANT (See page CO-3)**
4. **REMOVE INTAKE AIR CONNECTOR (See page ES-452)**
5. **REMOVE THROTTLE WITH MOTOR BODY ASSEMBLY (See page ES-453)**
6. **DISCONNECT FUEL HOSE (See page FU-11)**
7. **DISCONNECT FUEL HOSE NO.2 (See page FU-11)**
8. **REMOVE INTAKE MANIFOLD**

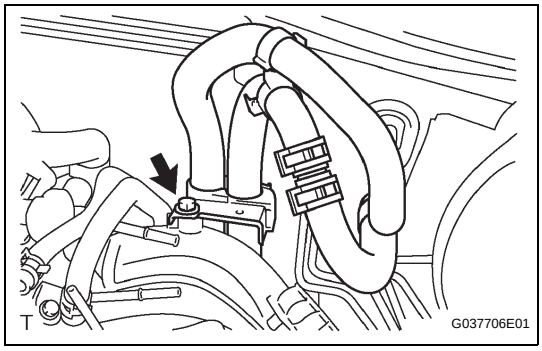
(a) Disconnect the fuel vapor feed hose from the VSV.

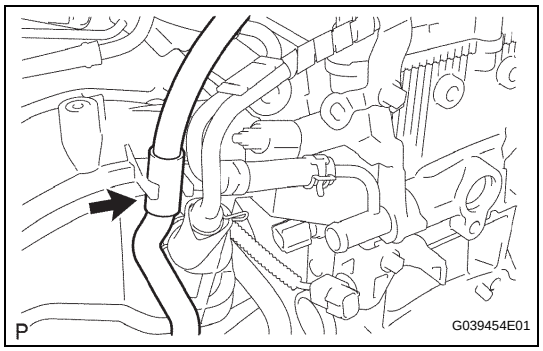


(b) Disconnect the vacuum hose.

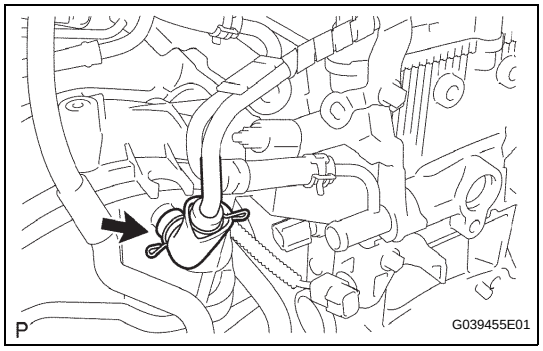


(c) Remove the bolt, then remove the clamp bracket.

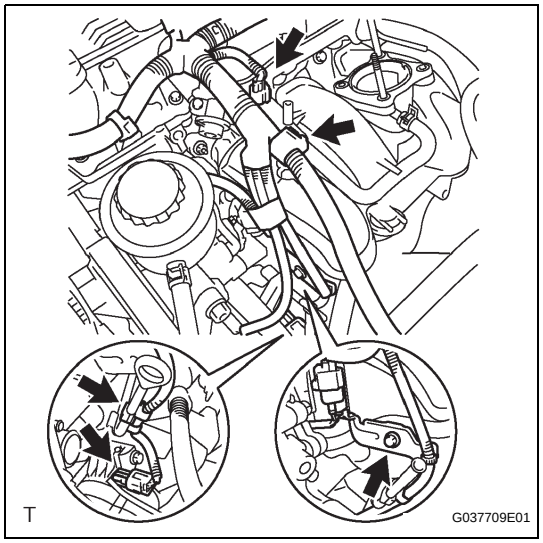




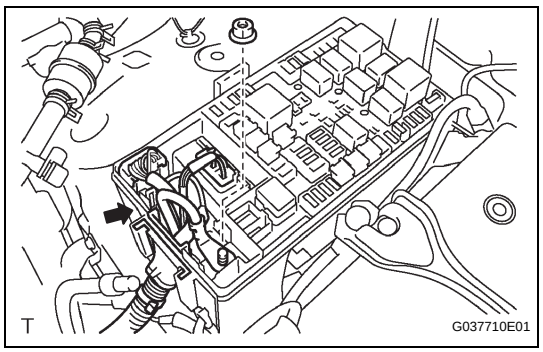
(d) Disconnect the water by-pass hose No. 2.



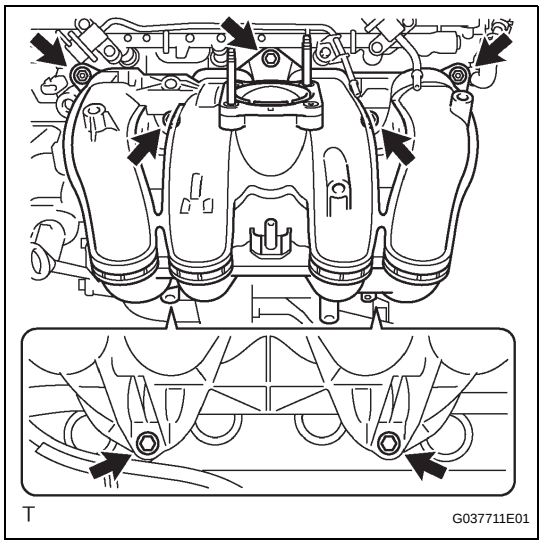
(e) Disconnect the ventilation hose No. 3.



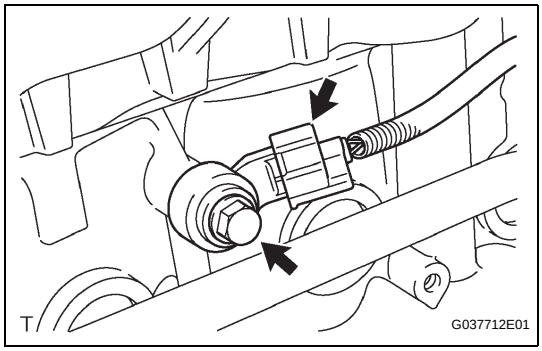
(f) Disconnect the VSV connector.
(g) Disengage the engine wire harness clamp.
(h) Disconnect the compressor magnetic clutch connector. (w/ AIR CONDITIONING)
(i) Disengage the wire harness clamp.
(j) Remove the bolt and harness clamp bracket.



(k) Disconnect the 3 connectors.
(l) Remove the nut shown in the illustration.
(m) Disconnect the engine wire harness from the relay block.

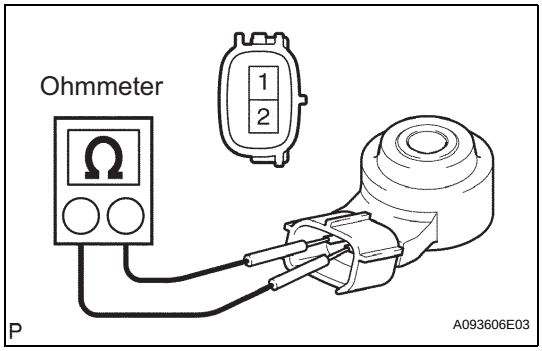


(n) Remove the 5 bolts and 2 nuts, then remove the intake manifold.



9. REMOVE KNOCK CONTROL SENSOR

(a) Disconnect the knock control sensor connector.
(b) Remove the bolt, then remove the knock control sensor.



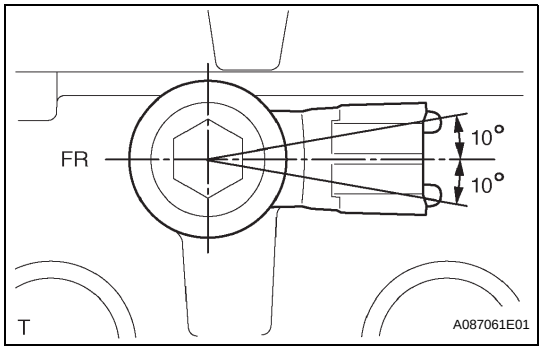
INSPECTION

1. INSPECT KNOCK SENSOR

(a) Check the resistance.
(1) Using an ohmmeter, measure the resistance between the terminals.
Standard

Tester Connection	Specified Condition
1 (Ground) - 2 (Output)	120 to 280 kΩ at 20°C (68°F)

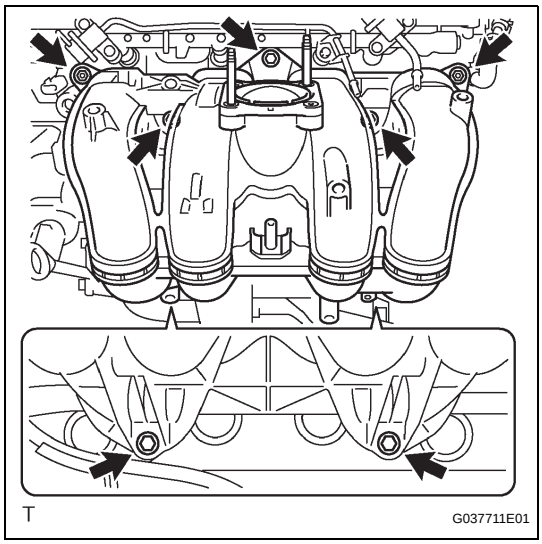
If the result is not as specified, replace the knock sensor.



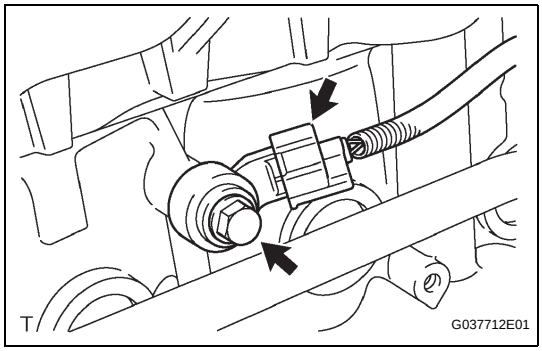
INSTALLATION

1. INSTALL KNOCK CONTROL SENSOR

(a) Install the knock control sensor with the bolt.
Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)
NOTICE:
Make sure that the knock sensor is at the correct angle when installing.
(b) Connect the knock control sensor connector.

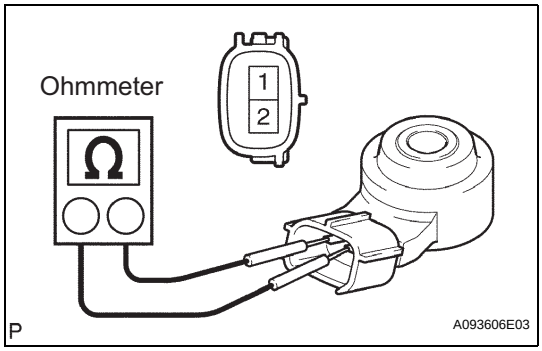


(n) Remove the 5 bolts and 2 nuts, then remove the intake manifold.



9. REMOVE KNOCK CONTROL SENSOR

(a) Disconnect the knock control sensor connector.
(b) Remove the bolt, then remove the knock control sensor.



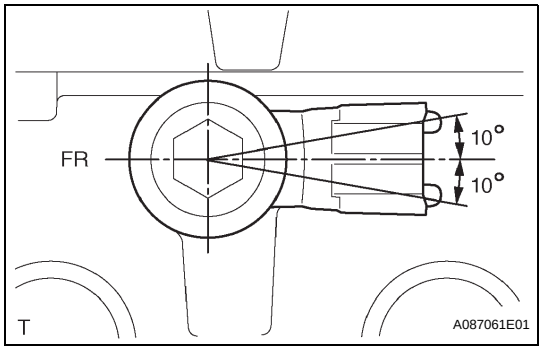
INSPECTION

1. INSPECT KNOCK SENSOR

(a) Check the resistance.
(1) Using an ohmmeter, measure the resistance between the terminals.
Standard

Tester Connection	Specified Condition
1 (Ground) - 2 (Output)	120 to 280 kΩ at 20°C (68°F)

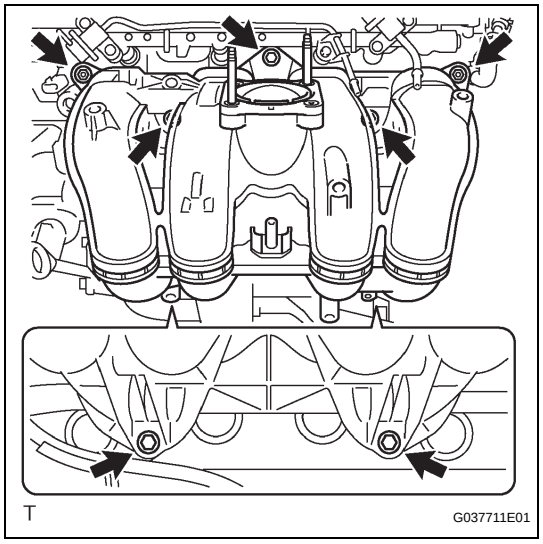
If the result is not as specified, replace the knock sensor.



INSTALLATION

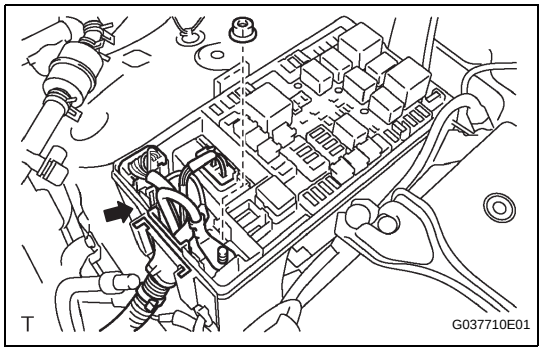
1. INSTALL KNOCK CONTROL SENSOR

(a) Install the knock control sensor with the bolt.
Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)
NOTICE:
Make sure that the knock sensor is at the correct angle when installing.
(b) Connect the knock control sensor connector.

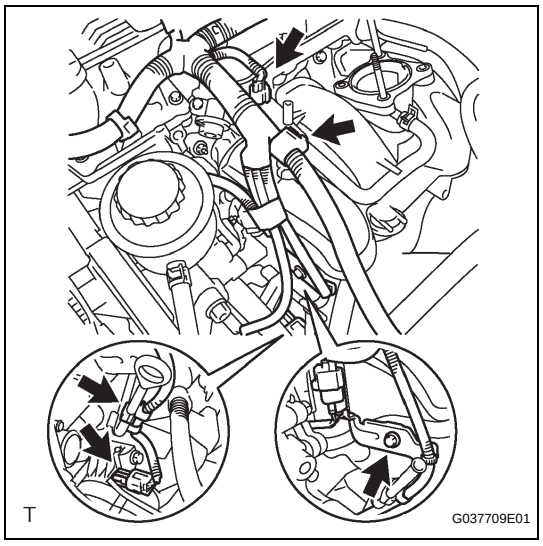


2. INSTALL INTAKE MANIFOLD

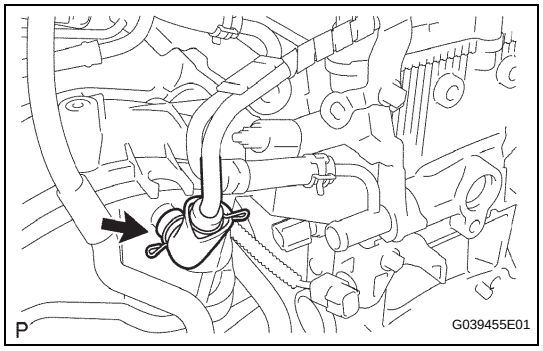
(a) Install a new gasket onto the intake manifold.
(b) Install the intake manifold with the 5 bolts and 2 nuts.
Torque: 25 N*m (255 kgf*cm, 18 ft.*lbf)



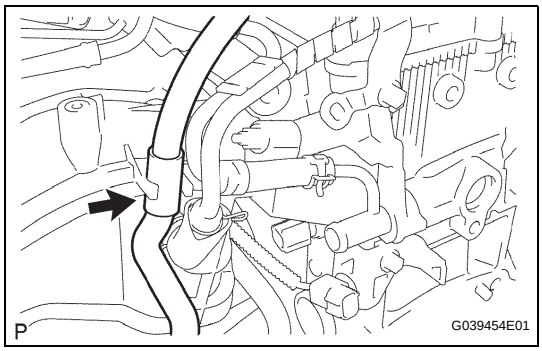
(c) Connect the engine wire harness to the relay block.
(d) Install the nut shown in the illustration.
Torque: 10 N*m (102 kgf*cm, 7 ft.*lbf)
(e) Connect the 3 connectors.



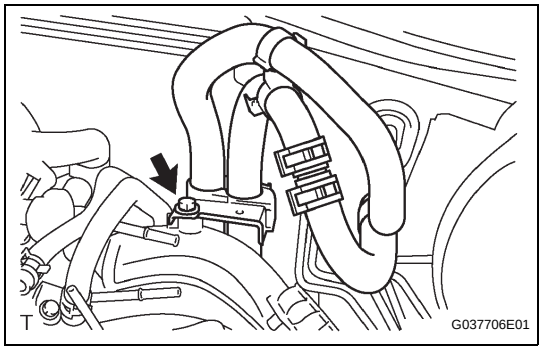
(f) Install the harness clamp bracket with the bolt.
Torque: 8.2 N*m (84 kgf*cm, 73 in.*lbf)
(g) Engage the wire harness clamp.
(h) Connect the compressor magnetic clutch connector. (w/ AIR CONDITIONING)
(i) Engage the engine wire harness clamp.
(j) Connect the VSV connector.



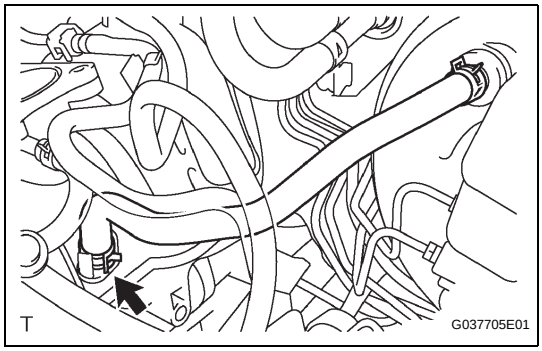
(k) Connect the ventilation hose No. 3.



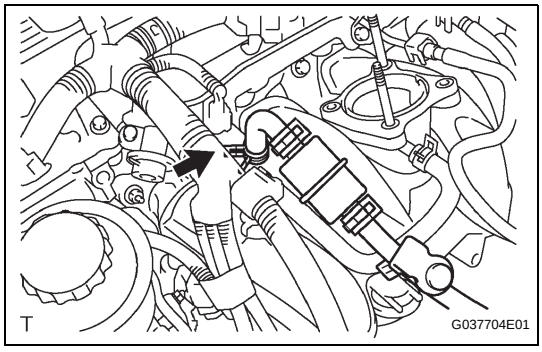
(l) Connect the water by-pass hose No. 2.



(m) Install the clamp bracket with the bolt.
Torque: 19 N*m (194 kgf*cm, 14 in.*lbf)



(n) Connect the vacuum hose.

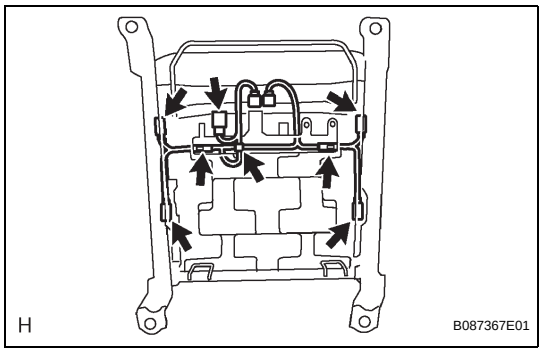


(o) Connect the fuel vapor feed hose to the VSV.

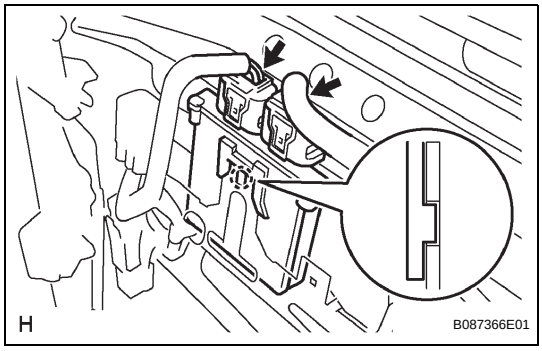
3. **CONNECT FUEL HOSE (See page FU-17)**
4. **CONNECT FUEL HOSE NO.2 (See page FU-17)**
5. **INSTALL THROTTLE WITH MOTOR BODY ASSEMBLY (See page ES-454)**
6. **INSTALL INTAKE AIR CONNECTOR (See page ES-455)**
7. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
   Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
8. **ADD ENGINE COOLANT (See page CO-3)**
9. **CHECK FOR ENGINE COOLANT LEAKAGE (See page CO-2)**
10. **CHECK FOR FUEL LEAKAGE**
11. **INSTALL ENGINE UNDER COVER SUB-ASSEMBLY NO.1 (for 4WD and Pre-Runner)**

REASSEMBLY

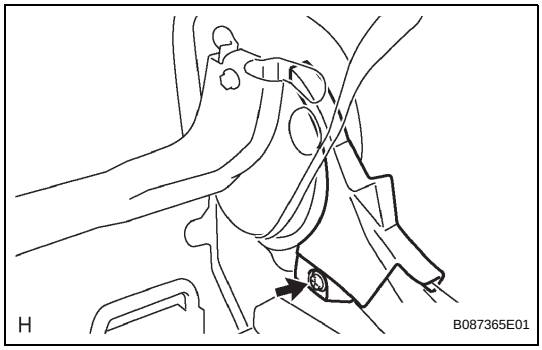
CAUTION:
Wear protective gloves. Sharp surfaces on the front seat back spring and front seat with adjuster frame could cause injuries to your hands.



1. INSTALL SEAT WIRE
(a) Install the 3 wire harness clamps and connector clamp.
(b) Connect the 4 connectors.

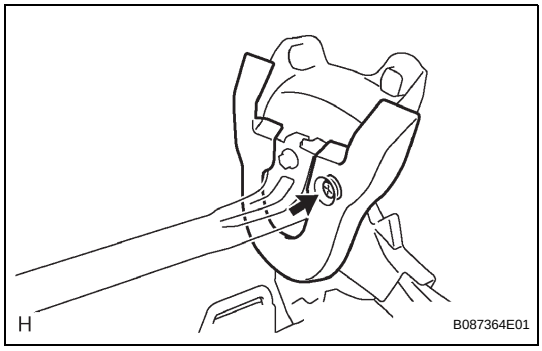


2. INSTALL OCCUPANT CLASSIFICATION ECU
(a) Engage the claw and install the occupant classification ECU.
(b) Connect the 2 connectors.



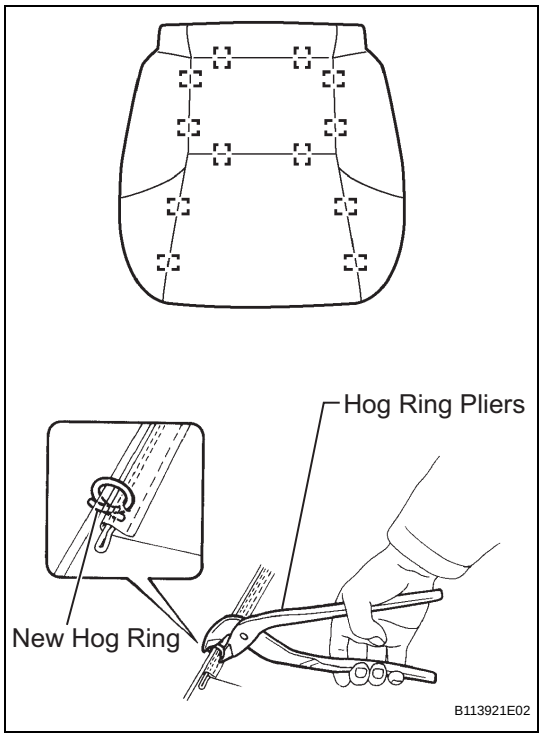
3. INSTALL RECLINING ADJUSTER OUTSIDE COVER LH
(a) Install the reclining adjuster outside cover with the screw.

4. INSTALL RECLINING ADJUSTER OUTSIDE COVER RH
HINT:
Follow the same procedures as for the reclining adjuster outside cover LH.



5. INSTALL RECLINING ADJUSTER INSIDE COVER LH
(a) Install the reclining adjuster inside cover with the screw.

6. INSTALL RECLINING ADJUSTER INSIDE COVER RH
HINT:
Follow the same procedures as for the reclining adjuster inside cover LH.

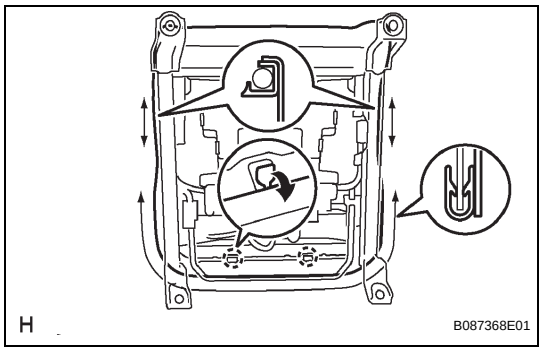


7. INSTALL FRONT SEAT CUSHION COVER

(a) Using hog ring pliers, install the front seat cushion cover with new hog rings.

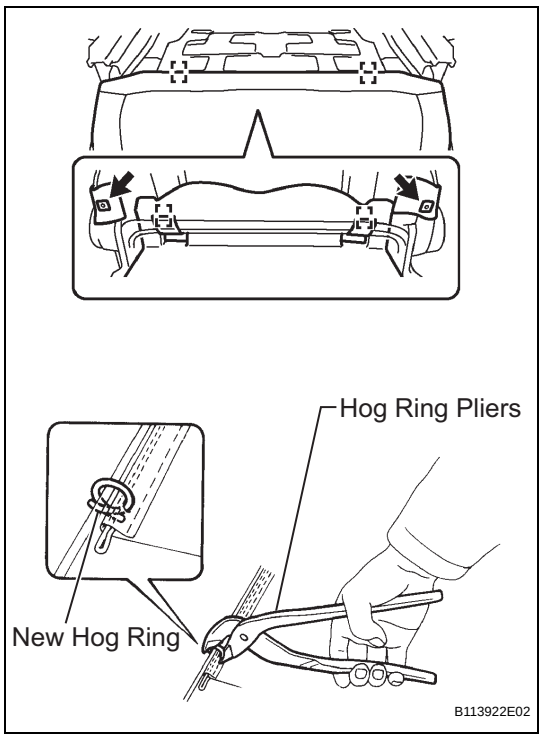
NOTICE:

- **Do not contaminate or scratch the front seat cushion cover.**
- **When installing the hog rings, minimize wrinkles as far as possible.**



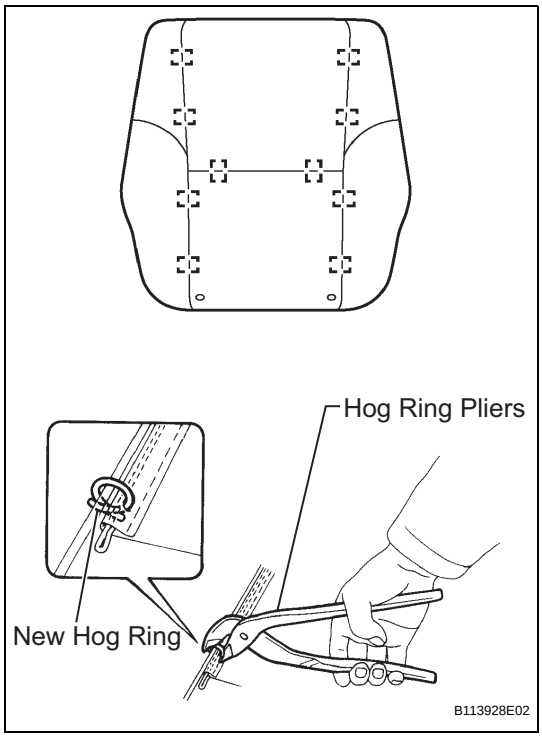
8. INSTALL FRONT SEAT CUSHION ASSEMBLY

(a) Engage the 2 claws and 3 hooks, and install the front seat cushion.



(b) Hook the front seat cushion cover to the front seat with adjuster frame.

(c) Using hog ring pliers, install new hog rings.

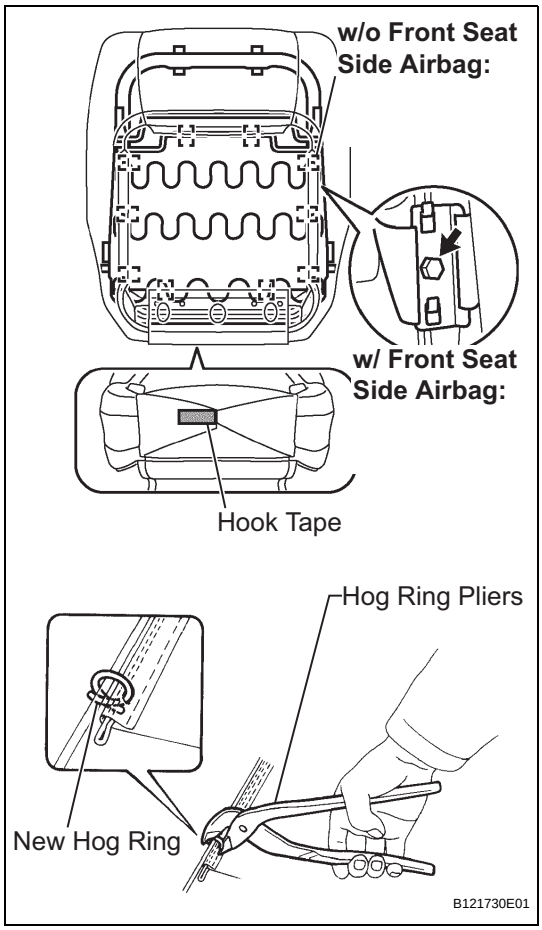


9. INSTALL FRONT SEAT BACK COVER

(a) Using hog ring pliers, install the front seat back cover with new hog rings.

NOTICE:

- **Do not contaminate or scratch the front seat back cover.**
- **When installing hog rings, minimize wrinkles as far as possible.**



10. INSTALL FRONT SEAT BACK SPRING ASSEMBLY

(a) w/ Front Seat Side Airbag:

(1) Install the front seat back spring into the front seat back pad.

(2) Install the hook tape.

(3) Using hog ring pliers, install new hog rings.

(4) Fully cover the air bag with the inner hook and tighten the bolt.

Torque: 5.5 N*m (55 kgf*cm, 49 in.*lbf)

NOTICE:

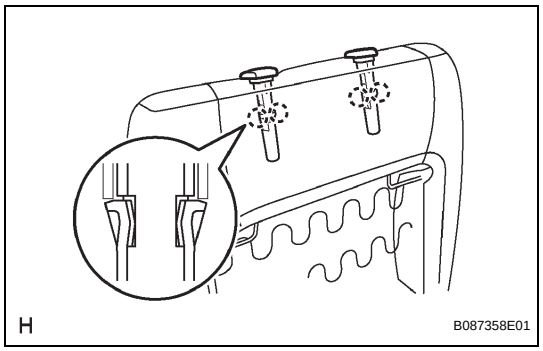
- **For vehicles with side air bag, the front seat back cover must be securely installed. Otherwise, the side air bag may not deploy properly.**
- **Make sure that the strap is not twisted after installing the inner hook.**
- **Install the inner hook securely.**

(b) w/o Front Seat Side Airbag:

(1) Install the front seat back spring into the front seat back pad.

(2) Install the hook tape.

(3) Using hog ring pliers, install new hog rings.

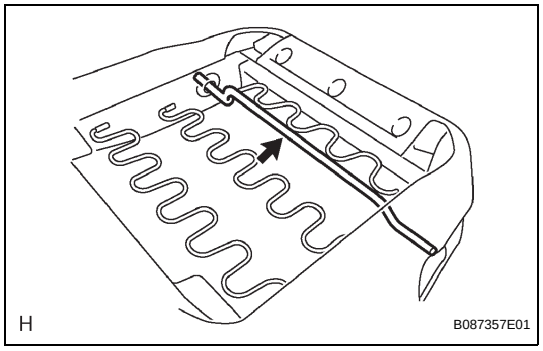


11. INSTALL FRONT SEAT HEADREST SUPPORT

HINT:

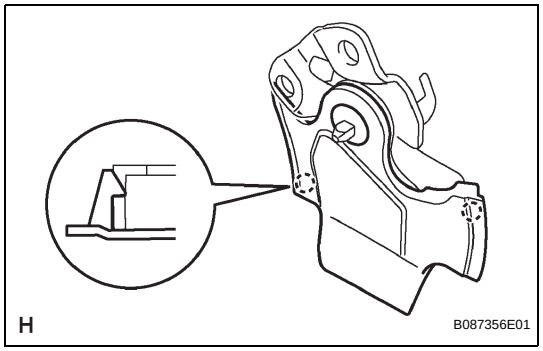
Follow the same procedures as for the opposite side.

(a) Engage the 2 claws and install the front seat headrest support.



12. INSTALL FRONT SEAT BACK LOCK HANDLE ROD

(a) Install the front seat back lock handle rod.



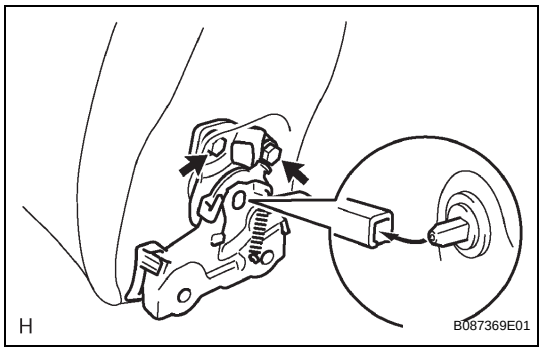
13. INSTALL FRONT SEAT HINGE COVER LH

(a) Engage the 2 claws and install the front seat hinge cover.

14. INSTALL FRONT SEAT HINGE COVER RH

HINT:

Follow the same procedures as for the seat hinge cover LH.



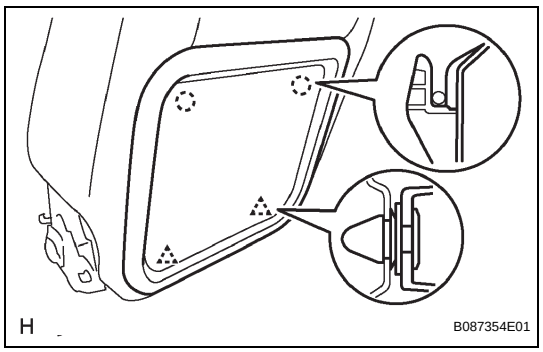
15. INSTALL FRONT SEAT BACK LOCK SUB-ASSEMBLY LH

(a) Install the front seat back lock with the 2 bolts.
Torque: 43 N*m (440 kgf*cm, 32 ft.*lbf)

16. INSTALL FRONT SEAT BACK LOCK SUB-ASSEMBLY RH

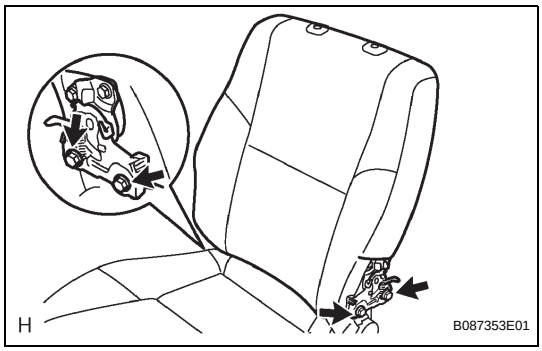
HINT:

Follow the same procedures as for the front seat back lock LH.



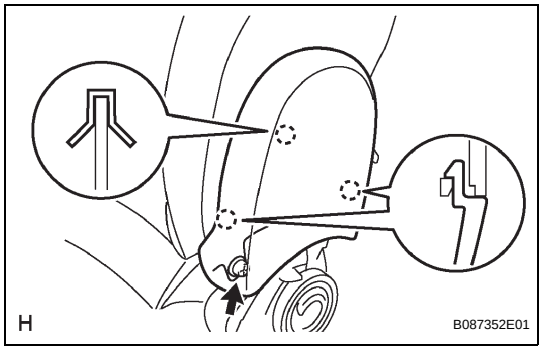
17. INSTALL FRONT SEAT BACK BOARD

(a) Engage the 2 claws and 2 clips, and install the front seat back board.



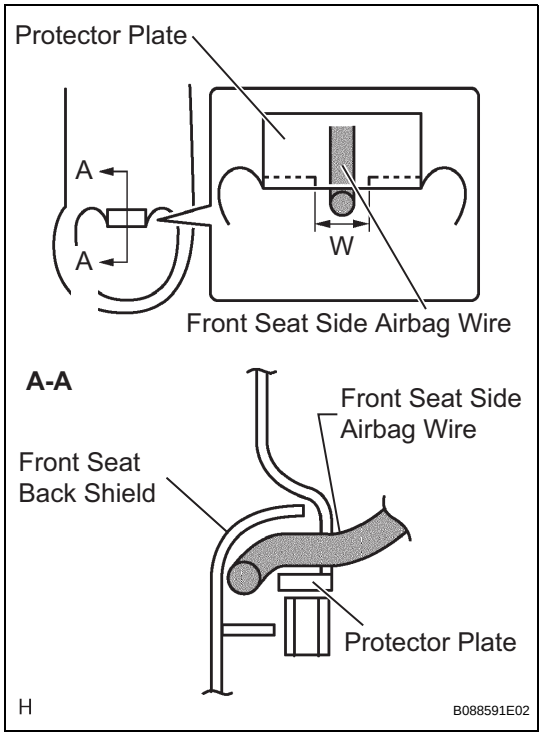
18. INSTALL FRONT SEAT BACK ASSEMBLY

(a) Install the front seat back with the 4 bolts.
Torque: 43 N*m (440 kgf*cm, 32 ft.*lbf)



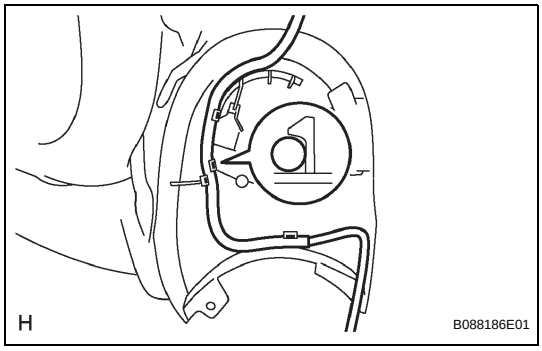
19. INSTALL FRONT SEAT BACK SHIELD LH

(a) Engage the 3 claws and install the front seat back shield.
(b) Tighten the screw.

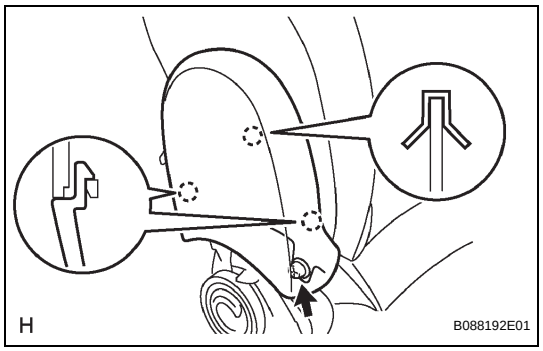


20. INSTALL FRONT SEAT BACK SHIELD RH

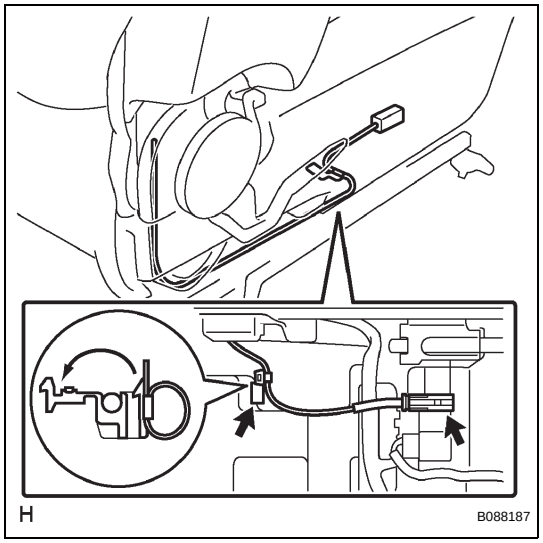
(a) w/ Front Seat Side Airbag:
(1) The front seat side air bag wire must pass between protector plate and the front seat back shield.
HINT:
Tune "W" to be able to thread the front seat side airbag wire and clips through.



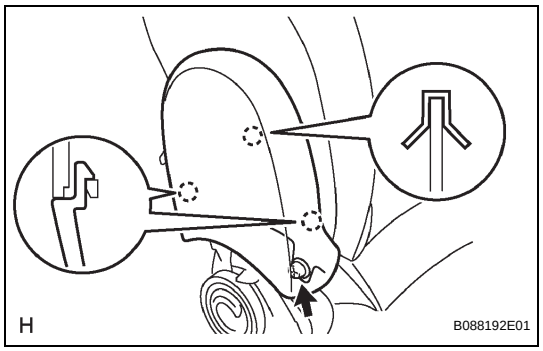
(2) Engage the 4 claws and install the front seat side air bag wire.



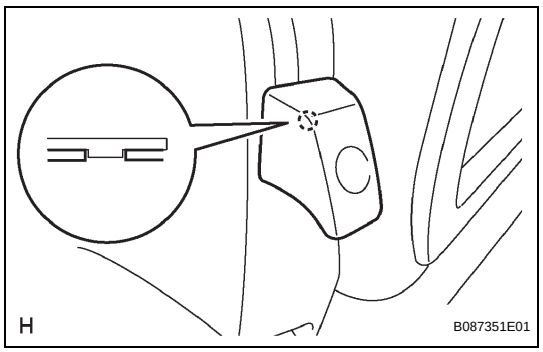
(3) Engage the 3 claws and install the front seat back shield.
(4) Tighten the screw.



(5) Install the wire harness clamp and connector clamp.



(b) w/o Front Seat Side Airbag:
(1) Engage the 3 claws and install the front seat back shield.
(2) Tighten the screw.

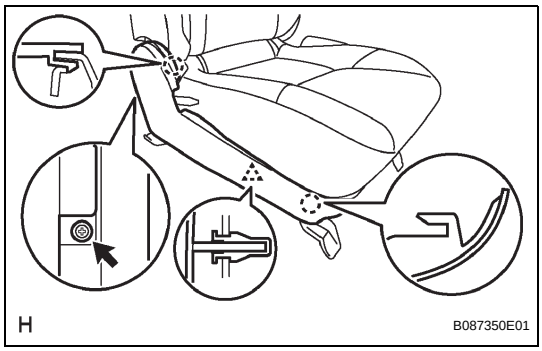


21. INSTALL RECLINING ADJUSTER RELEASE KNOB LH

(a) Engage the claw and install the reclining adjuster release handle.

22. INSTALL RECLINING ADJUSTER RELEASE KNOB RH

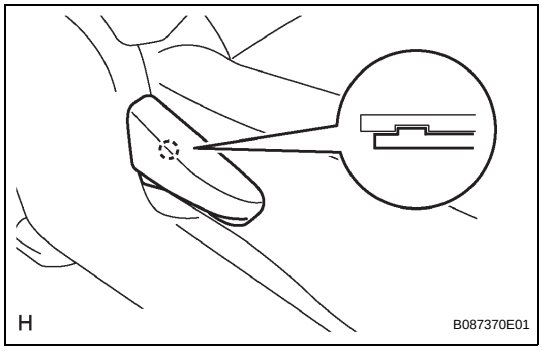
HINT:
Follow the same procedures as for the reclining adjuster release handle LH.



23. INSTALL FRONT SEAT CUSHION SHIELD

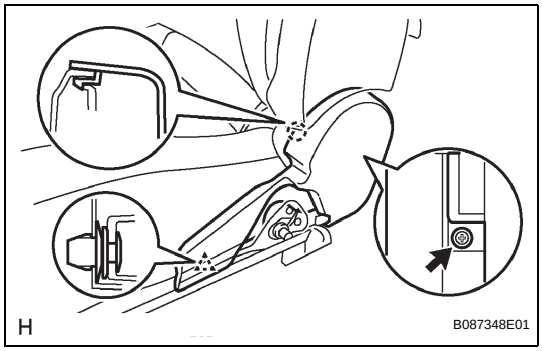
(a) Engage the 2 claws and clip, and install the front seat cushion shield.

(b) Tighten the screw.



24. INSTALL RECLINING ADJUSTER RELEASE HANDLE

(a) Engage the claw and install the reclining adjuster release handle.

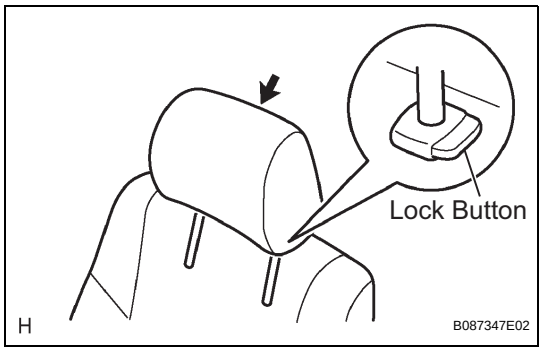


25. INSTALL FRONT SEAT CUSHION INNER SHIELD

(a) Engage the claw and clip, and install the front seat cushion inner shield.

(b) Tighten the screw.

26. INSTALL FRONT SEAT INNER BELT ASSEMBLY (See page SE-47)

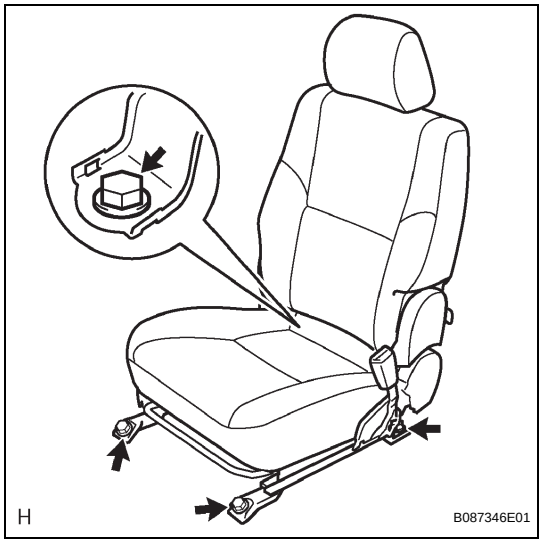


27. INSTALL FRONT SEAT HEADREST ASSEMBLY

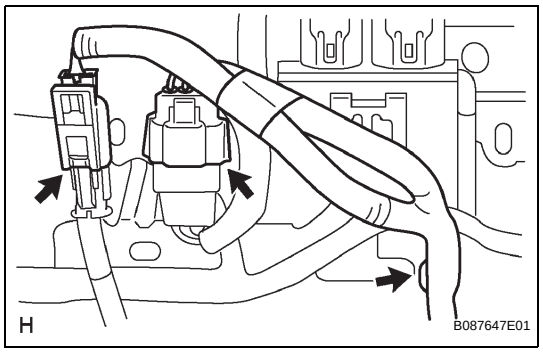
(a) Disengage the lock button of the front seat headrest support and install the front seat headrest.

INSTALLATION

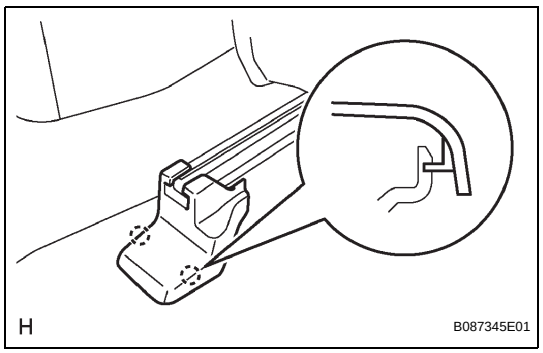
CAUTION:
Some of these service operations affect the SRS airbag system. Read the precautionary notices concerning the SRS airbag system before servicing (w/ Front Seat Side Airbag) (See page RS-1).



1. INSTALL FRONT SEAT ASSEMBLY
(a) Place the front seat in the cabin.
(b) Tighten the 2 bolts on the front side of the front seat.
Torque: 37 N*m (375 kgf*cm, 27 ft.*lbf)
(c) Tighten the 2 bolts on the rear side of the front seat.
Torque: 37 N*m (375 kgf*cm, 27 ft.*lbf)



(d) Install the wire harness clamp.
(e) Connect the connector.
(f) w/ Front Seat Side Airbag:
(1) Connect the connector.



2. INSTALL SEAT TRACK COVER
HINT:
Follow the same procedures as for the opposite side.
(a) Engage the 2 claws and install the seat track cover.

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

4. INSPECT SRS WARNING LIGHT (w/ Front Seat Side Airbag)
(See page RS-28)

SE

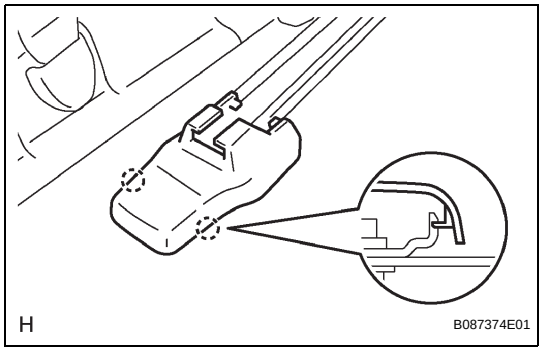
REMOVAL

CAUTION:
Some of these service operations affect the SRS airbag system. Read the precautionary notices concerning the SRS airbag system before servicing (w/ Front Seat Side Airbag) (See page RS-1).

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

Wait for at least 90 seconds after disconnecting the cable to prevent the airbag from working (w/ Front Seat Side Airbag).

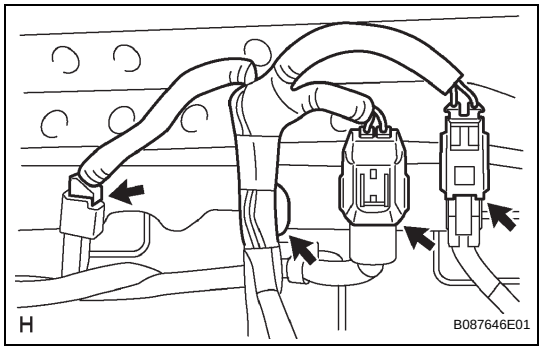
2. REMOVE SEAT TRACK COVER



HINT:
Follow the same procedures as for the opposite side.

(a) Disengage the 2 claws and remove the seat track cover.

3. REMOVE FRONT SEAT ASSEMBLY



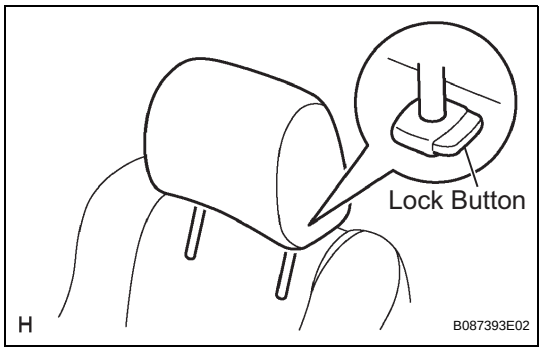
(a) Disconnect the 2 connectors.
(b) w/ Front Seat Side Airbag:
  (1) Disconnect the connector.
(c) Using a clip remover, remove the wire harness clamp.

(d) Remove the 4 bolts and front seat.

SE

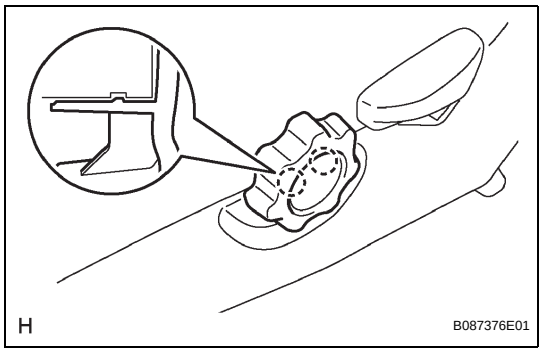
DISASSEMBLY

CAUTION:
Wear protective gloves. Sharp surface on the front seat with adjuster frame could cause injuries to your hands.



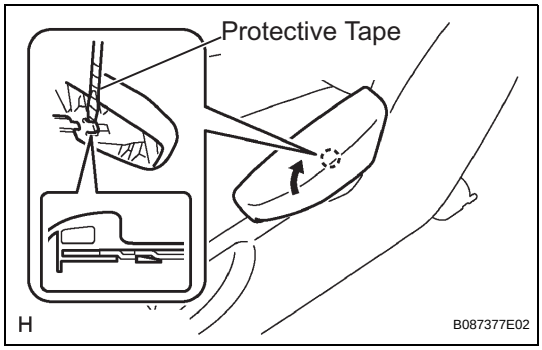
1. REMOVE FRONT SEAT HEADREST ASSEMBLY

(a) Disengage the lock button of the front seat headrest support and remove the front seat headrest.



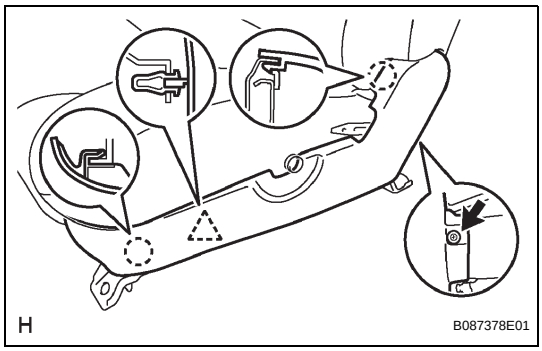
2. REMOVE LUMBAR ADJUSTER DIAL

(a) Pull the lumbar adjuster dial outward.



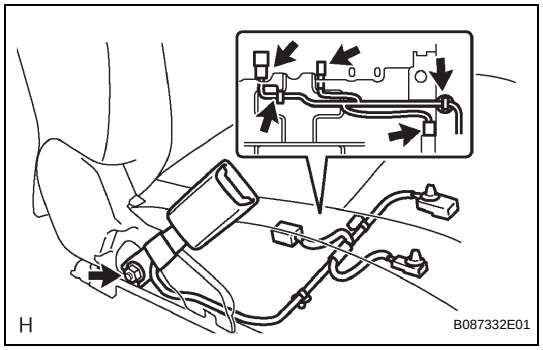
3. REMOVE RECLINING ADJUSTER RELEASE HANDLE

(a) Using a screwdriver with its tip taped in protective tape, disengage the claw and remove the reclining adjuster release handle.



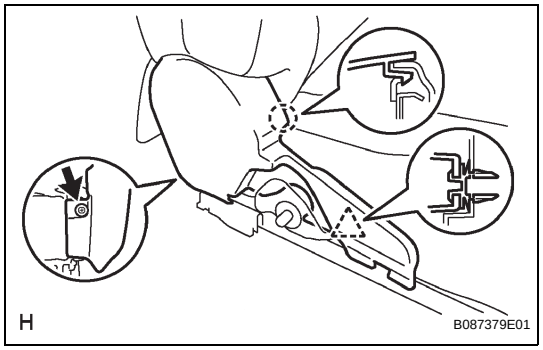
4. REMOVE FRONT SEAT CUSHION SHIELD LH

(a) Remove the screw.
(b) Disengage the 2 claws and clip, and remove the front seat cushion shield.



5. REMOVE FRONT SEAT INNER BELT ASSEMBLY

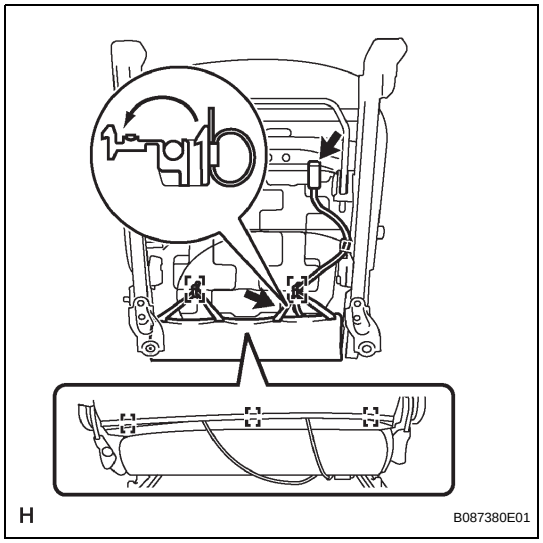
(a) Using a clip remover, remove the wire harness clamp and 2 connector clamps.
(b) Remove the wire harness clamp.
(c) Disconnect the seat position airbag sensor connector.
(d) Remove the nut and front seat inner belt.



6. REMOVE FRONT SEAT CUSHION INNER SHIELD

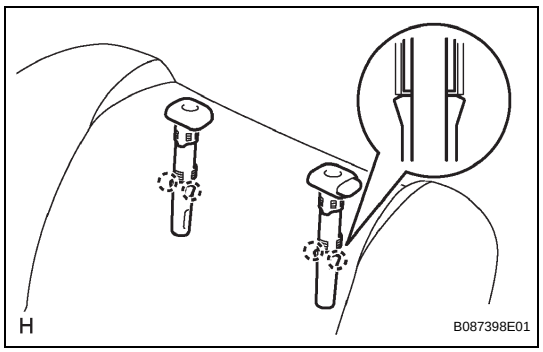
(a) Remove the screw.
(b) Disengage the claw and clip, and remove the front seat cushion inner shield.

SE

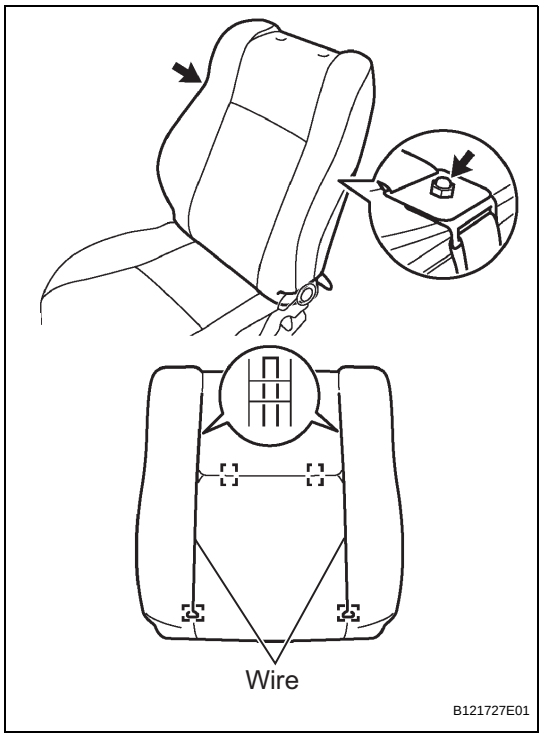


7. REMOVE FRONT SEAT HEADREST SUPPORT

(a) w/ Front Seat Side Airbag:
  (1) Using a clip remover, remove the connector clamp.
  (2) Remove the wire harness clamp.
(b) Remove the 5 hog rings.

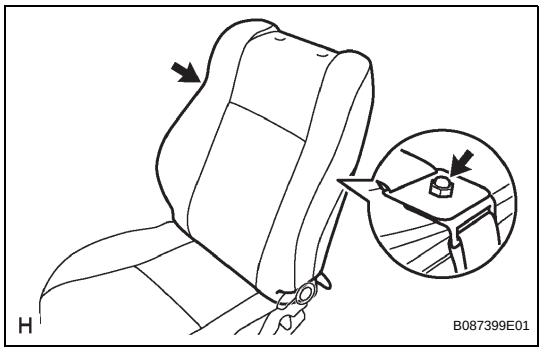


(c) Disengage the 2 claws and remove the front seat headrest support.
HINT:
Follow the same procedures as for the opposite side.

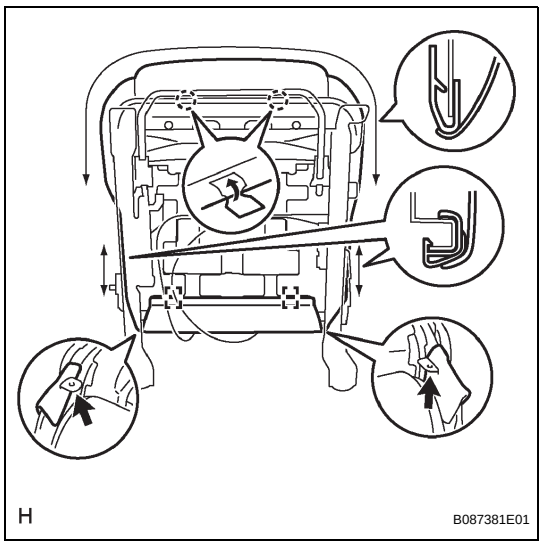


8. REMOVE FRONT SEAT BACK COVER

(a) Remove the 2 hog rings.
(b) Remove the 2 wires.

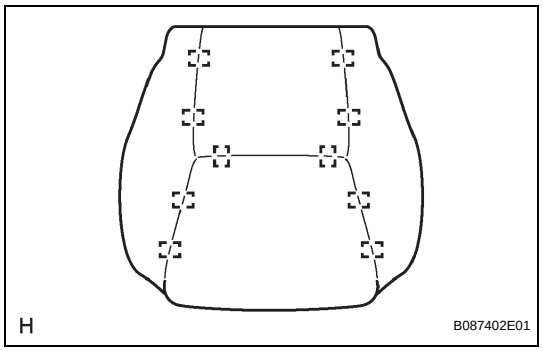


(c) w/ Front Seat Side Airbag:
  (1) Remove the nut and strap.
(d) Remove the 2 hog rings and front seat back cover.
(e) Remove the front seat back pad from the front seat frame adjuster.

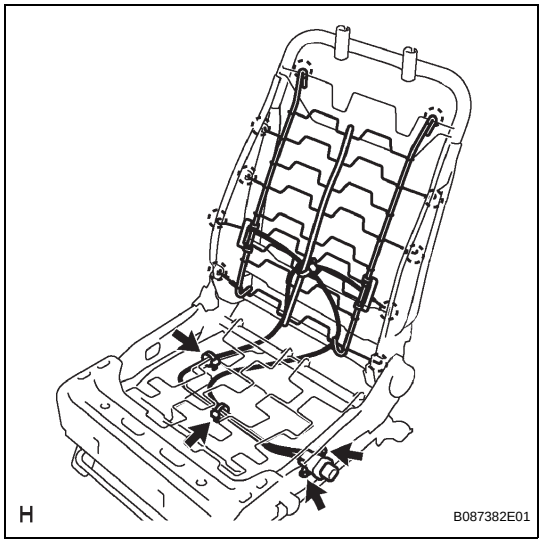


9. REMOVE FRONT SEAT CUSHION COVER

(a) Remove the front seat cushion cover from the front seat frame adjuster.
(b) Remove the 2 hog rings.
(c) Disengage the 2 claws and 3 hooks, and remove the front seat cushion pad together with the front seat cushion cover.



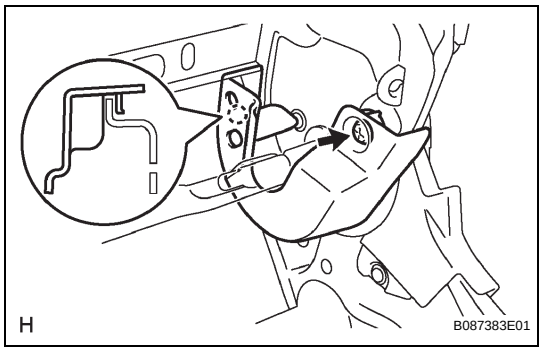
(d) Remove the 10 hog rings and front seat cushion cover.



10. REMOVE LUMBAR SUPPORT ADJUSTER ASSEMBLY

(a) Remove the 2 wiring harness clamps.
(b) Remove the 2 screws.
(c) Disengage the 10 hooks and lumbar support adjuster.

SE

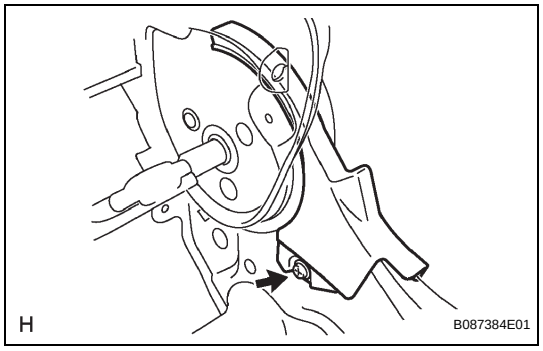


11. REMOVE RECLINING ADJUSTER INSIDE COVER LH

(a) Remove the screw.
(b) Disengage the claw and remove the reclining adjuster inside cover.

12. REMOVE RECLINING ADJUSTER INSIDE COVER RH

HINT:
Follow the same procedures as for the reclining adjuster inside cover LH.

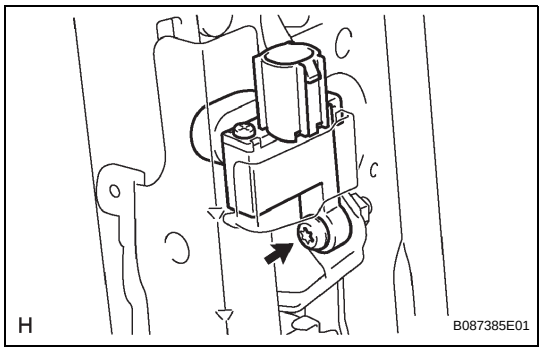


13. REMOVE RECLINING ADJUSTER OUTSIDE COVER LH

(a) Remove the screw and reclining adjuster outside cover.

14. REMOVE RECLINING ADJUSTER OUTSIDE COVER RH

HINT:
Follow the same procedures as for the reclining adjuster outside cover LH.

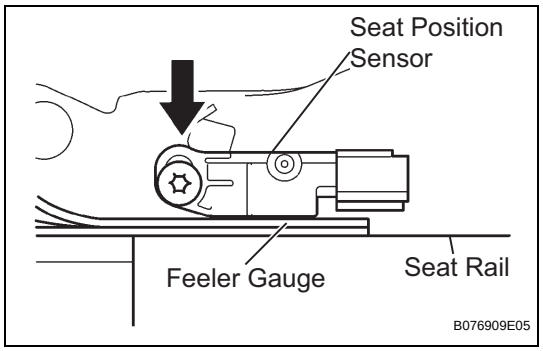


15. REMOVE SEAT POSITION SENSOR

(a) Using a "Torx" socket wrench T30, remove the screw and seat position sensor.

REASSEMBLY

CAUTION:
Wear protective gloves. Sharp surface on the front seat with adjuster frame could cause injuries to your hands.



1. INSTALL SEAT POSITION SENSOR

(a) Temporarily install the seat position sensor.

(b) Install a 1 mm (0.04 in.) feeler gauge between the slide rail and seat position sensor as shown in the illustration.

NOTICE:

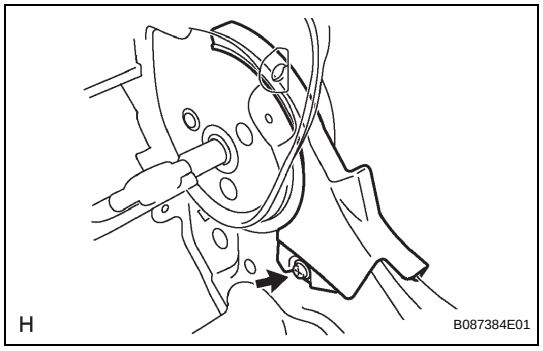
- **If the seat position sensor has been dropped, or there are any cracks, dents or other defects in the case, bracket or connector, replace the seat position sensor with a new one.**
- **When installing the seat position sensor, make sure that the SRS wiring does not interfere with other parts and is not pinched between other parts.**

HINT:

Make sure that the clearance between the seat position sensor and seat rail is within 0.6 to 2 mm (0.023 to 0.079 in.).

(c) Push the top of the seat position sensor. While holding the seat position sensor, tighten the seat position sensor using a "Torx" socket wrench T30.

Torque: 8.0 N*m (80 kgf*cm, 71 in.*lbf)



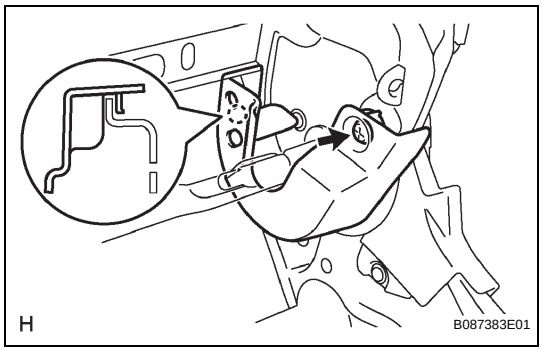
2. INSTALL RECLINING ADJUSTER OUTSIDE COVER LH

(a) Install the reclining adjuster outside cover with the screw.

3. INSTALL RECLINING ADJUSTER OUTSIDE COVER RH

HINT:

Follow the same procedures as for the reclining adjuster outside cover LH.



4. INSTALL RECLINING ADJUSTER INSIDE COVER LH

(a) Engage the claw and install the reclining adjuster inside cover.

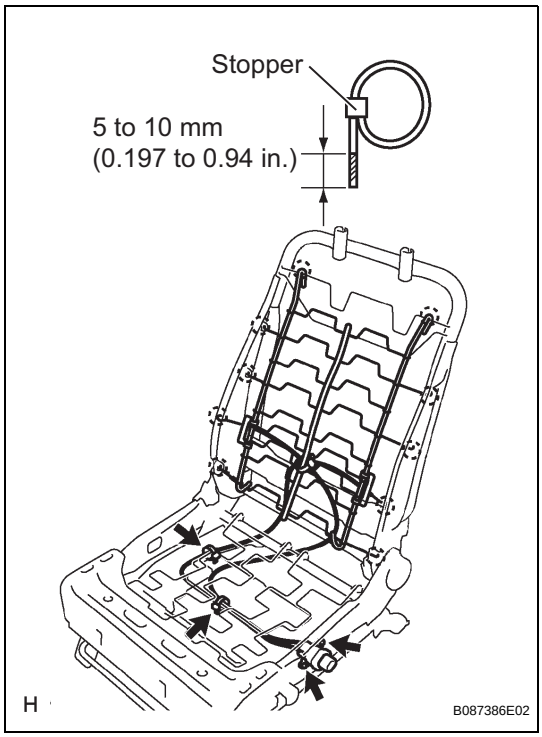
(b) Tighten the screw.

5. INSTALL RECLINING ADJUSTER INSIDE COVER RH

HINT:

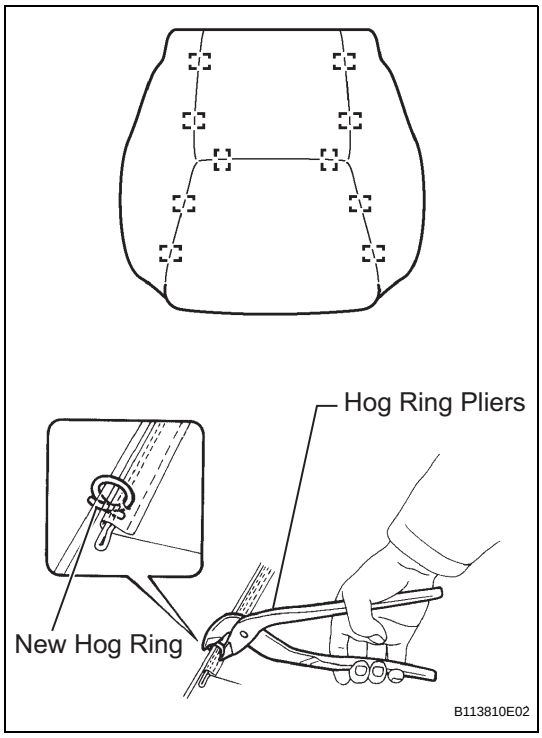
Follow the same procedures as for the reclining adjuster inside cover LH.

SE



6. INSTALL LUMBAR SUPPORT ADJUSTER ASSEMBLY

(a) Hook the 10 hooks.
(b) Install the lumbar support adjuster with the 2 screws.
(c) Install 2 new wiring harness clamps.
(d) Cut each wiring harness clamp 5 to10 mm (0.197 to 0.394 in.) from the stopper, as shown in the illustration.

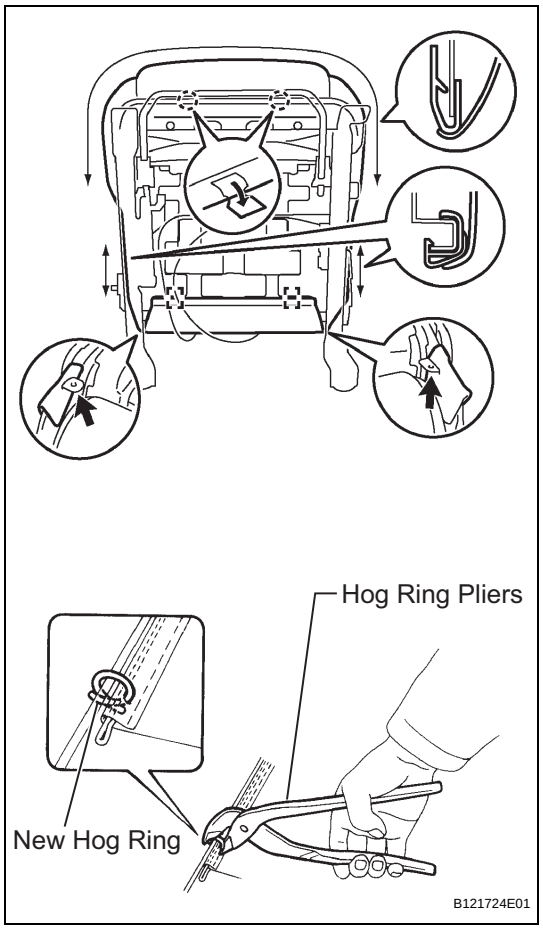


7. INSTALL FRONT SEAT CUSHION COVER

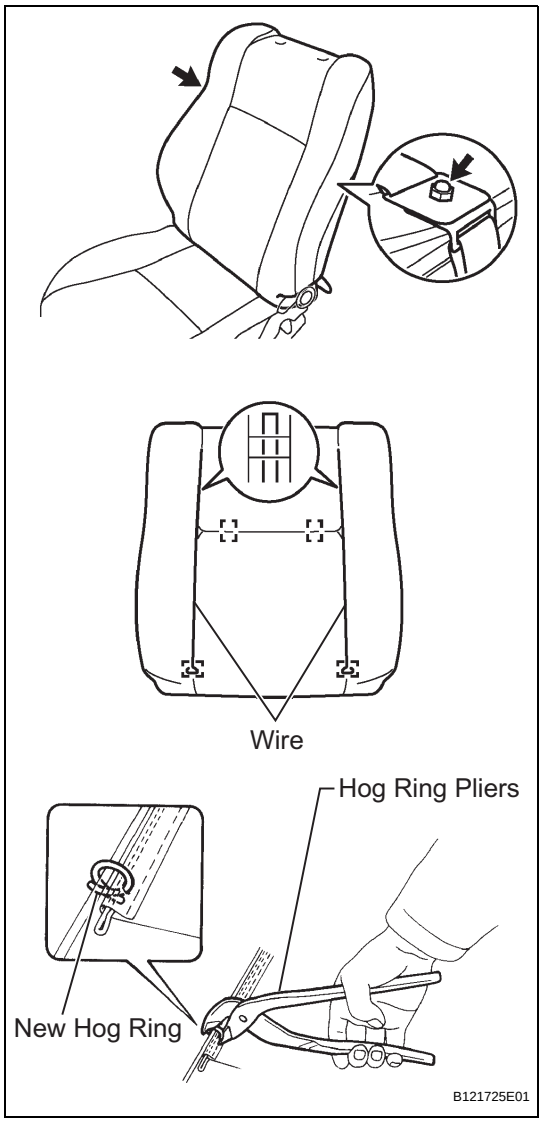
(a) Using hog ring pliers, install the front seat cushion cover with new hog rings.

NOTICE:

- **Do not contaminate or scratch the front seat cushion cover.**
- **When installing the hog rings, minimize wrinkles as far as possible.**



(b) Engage the 3 hooks and 2 claws, and install the front seat cushion pad together with the front seat cushion cover.
(c) Using hog ring pliers, install new hog rings.
(d) Hook the front seat cushion cover to the front seat frame adjuster.



8. INSTALL FRONT SEAT BACK COVER

(a) Install the front seat back pad onto the front seat frame adjuster.

(b) Using hog ring pliers, install the front seat back cover with new hog rings.

NOTICE:

- **Do not contaminate or scratch the front seat back cover.**
- **When installing the hog rings, minimize wrinkles as far as possible.**

(c) w/ Front Seat Side Airbag:

(1) Attach straps and tighten the nut.

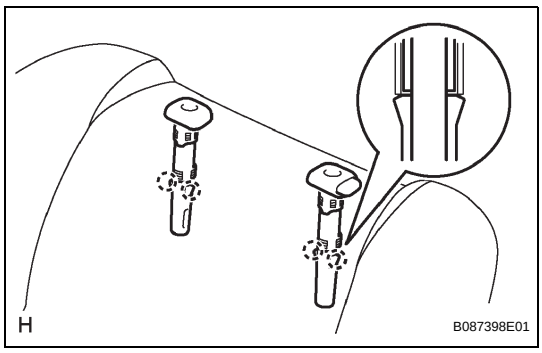
Torque: 5.5 N*m (55 kgf*cm, 49 in.*lbf)

NOTICE:

- **For vehicles with side air bag, the front seat back cover must be securely installed. Otherwise, the side air bag may not deploy properly.**
- **Make sure that the strap is not twisted after installing the inner hook.**
- **Install the inner hook securely.**

(d) Roll the front seat back cover down and install the 2 wires.

(e) Using hog ring pliers, install new hog rings.

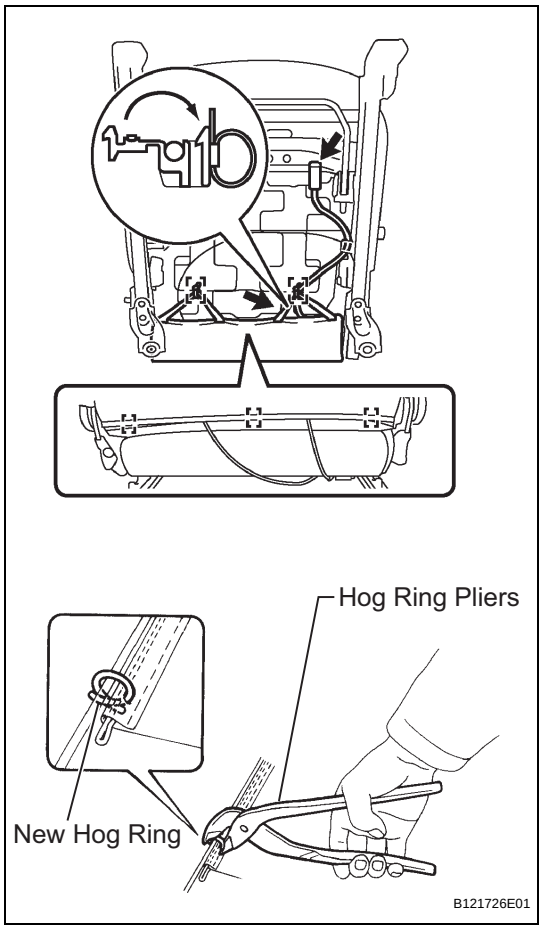


9. INSTALL FRONT SEAT HEADREST SUPPORT

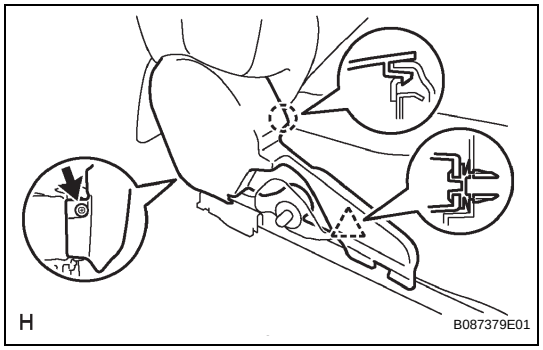
(a) Engage the 2 claws and install the front seat headrest support.

HINT:

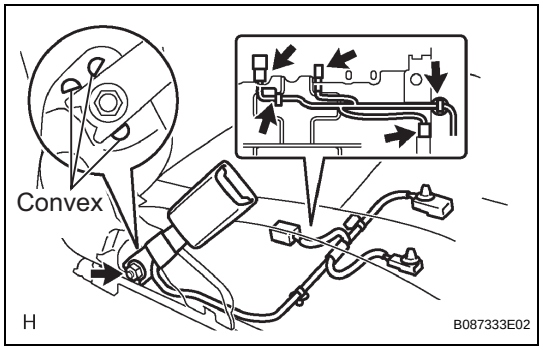
Follow the same procedures as for the opposite side.



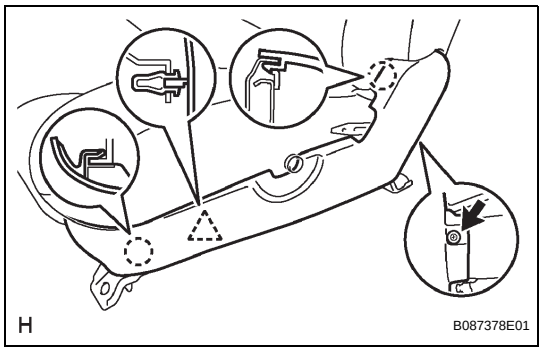
(b) Using hog ring pliers, install the new hog rings.
(c) w/ Front Seat Side Airbag:
  (1) Install the wire harness clamp and connector clamp.



10. INSTALL FRONT SEAT CUSHION INNER SHIELD
(a) Engage the claw and clip, and install the front seat cushion inner shield.
(b) Tighten the screw.



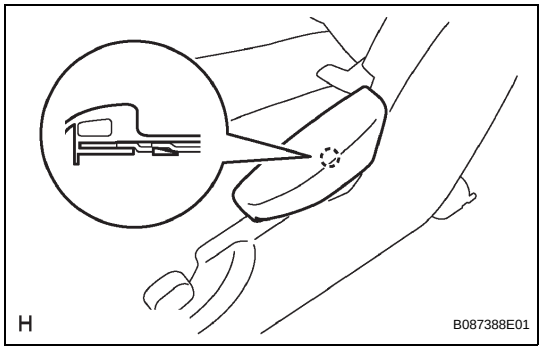
11. INSTALL FRONT SEAT INNER BELT ASSEMBLY
(a) Install the front seat inner belt with the nut.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)
NOTICE:
Be careful not to place the front seat inner belt over the convex areas of the front seat with adjuster frame.
(b) Check that the front seat inner belt rotates smoothly.
(c) Connect the seat position airbag sensor connector.
(d) Install the 2 wire harness clamps and 2 connector clamps.



12. INSTALL FRONT SEAT CUSHION SHIELD

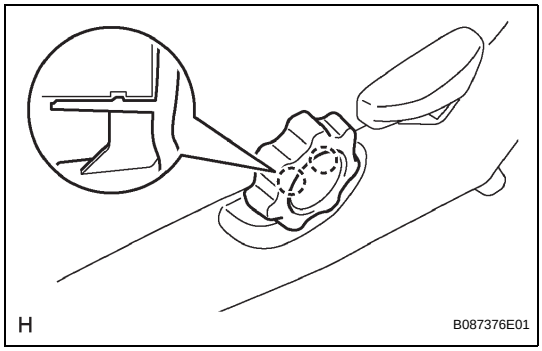
(a) Engage the 2 claws and clip, and install the front seat cushion shield.

(b) Tighten the screw.



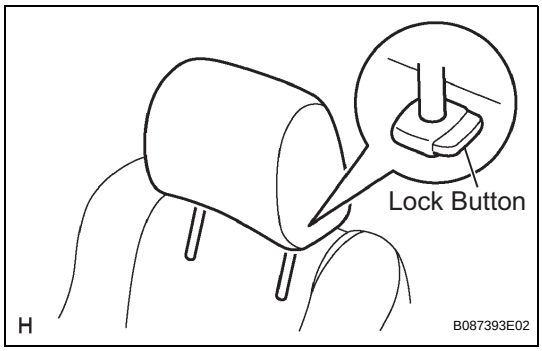
13. INSTALL RECLINING ADJUSTER RELEASE HANDLE

(a) Engage the claw and install the reclining adjuster release handle.



14. INSTALL LUMBAR ADJUSTER DIAL

(a) Line up the lumbar adjuster dial and push in it to engage.



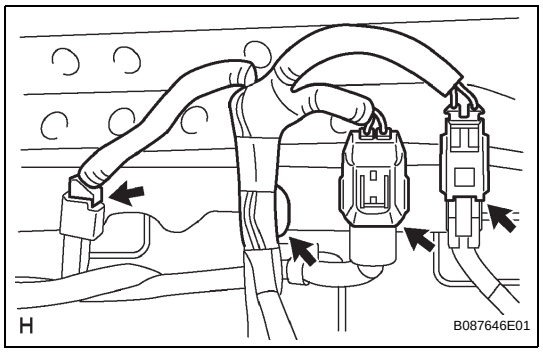
15. INSTALL FRONT SEAT HEADREST ASSEMBLY

(a) Disengage the lock button of the front seat headrest support and install the front seat headrest.

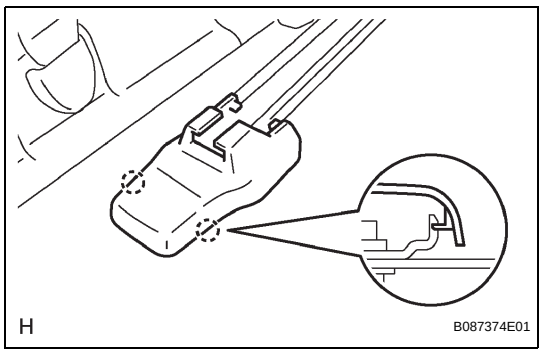
INSTALLATION

CAUTION:
Some of these service operations affect the SRS airbag system. Read the precautionary notices concerning the SRS airbag system before servicing (w/ Front Seat Side Airbag) (See page RS-1).

1. INSTALL FRONT SEAT ASSEMBLY
(a) Place the front seat in the cabin.
(b) Tighten the 2 bolts on the front side of the front seat.
Torque: 37 N*m (375 kgf*cm, 27 ft.*lbf)
(c) Tighten the 2 bolts on the rear side of the front seat.
Torque: 37 N*m (375 kgf*cm, 27 ft.*lbf)



(d) Install the wire harness clamp.
(e) Connect the 2 connectors.
(f) w/ Front Seat Side Airbag:
(1) Connect the connector.



2. INSTALL SEAT TRACK COVER
HINT:
Follow the same procedures as for the opposite side.
(a) Engage the 2 claws and install the seat track cover.

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

4. INSPECT SRS WARNING LIGHT
(See page RS-28)

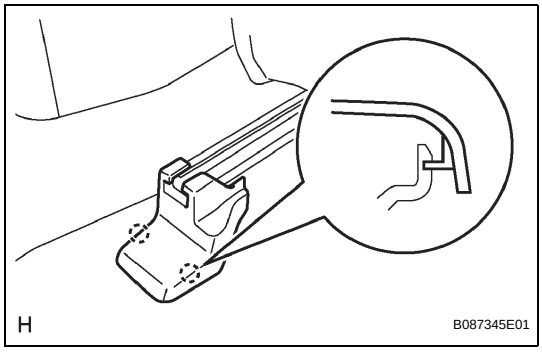
SE

REMOVAL

CAUTION:
Some of these service operations affect the SRS airbag system. Read the precautionary notices concerning the SRS airbag system before servicing (w/ Front Seat Side Airbag) (See page RS-1).

1. REMOVE CABLE FROM NEGATIVE BATTERY TERMINAL

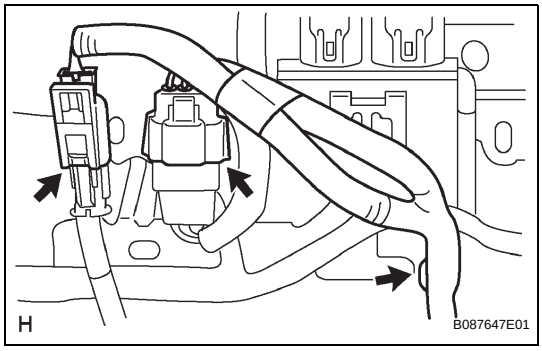
Wait for at least 90 seconds after disconnecting the cable to prevent the airbag from working (w/ Front Seat Side Airbag).



2. REMOVE SEAT TRACK COVER

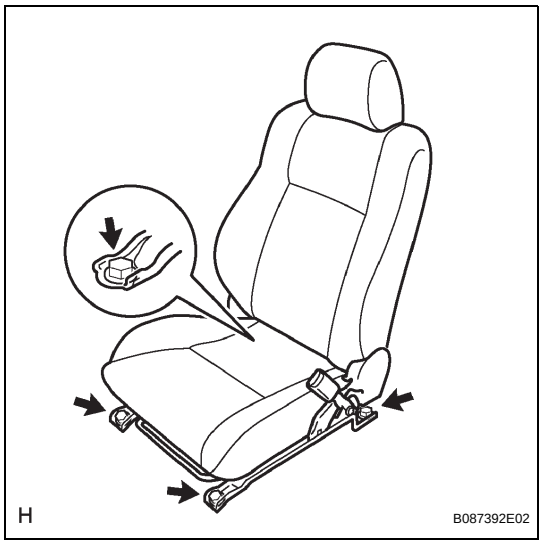
HINT:
Follow the same procedures as for the opposite side.

(a) Disengage the 2 claws and remove the seat track cover.



3. REMOVE FRONT SEAT ASSEMBLY

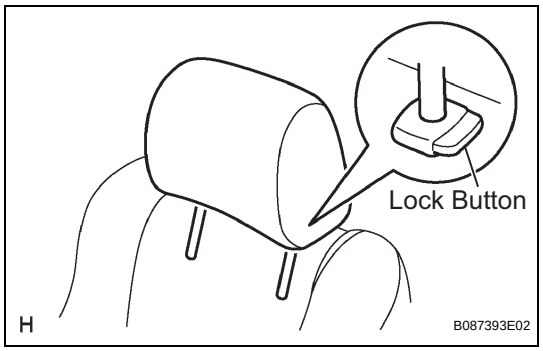
(a) Disconnect the connector.
(b) w/ Front Seat Side Airbag:
  (1) Disconnect the connector.
(c) Using a clip remover, remove the wire harness clamp.



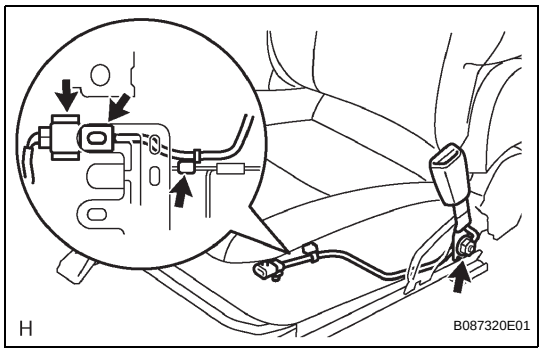
(d) Remove the 4 bolts and front seat.

DISASSEMBLY

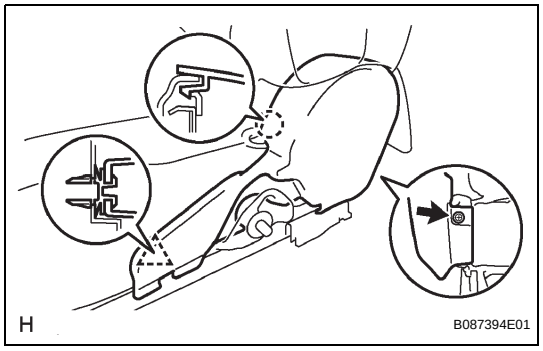
CAUTION:
Wear protective gloves. Sharp surface on the front seat with adjuster frame could cause injuries to your hands.



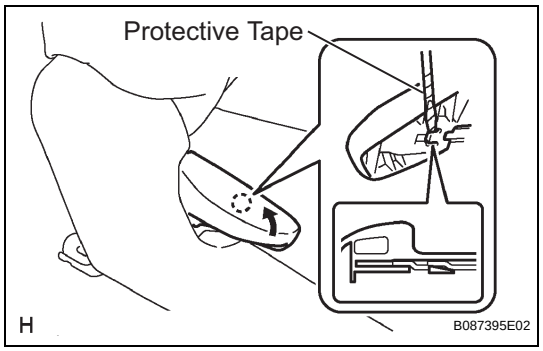
1. REMOVE FRONT SEAT HEADREST ASSEMBLY
(a) Disengage the lock button of the front seat headrest support and remove the front seat headrest.



2. REMOVE FRONT SEAT INNER BELT ASSEMBLY
(a) Disconnect the seat wire connector.
(b) Using a clip remover, remove the connector clamp.
(c) Remove the wire harness clamp.
(d) Remove the nut and front seat inner belt.

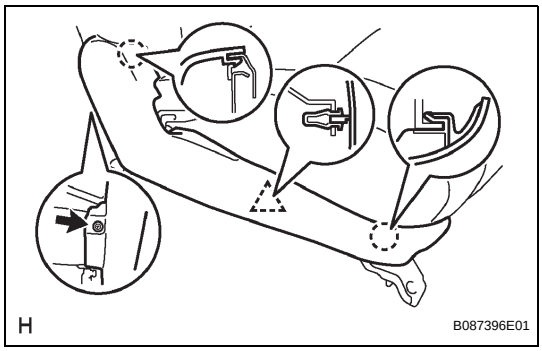


3. REMOVE FRONT SEAT CUSHION INNER SHIELD
(a) Remove the screw.
(b) Disengage the claw and clip, and remove the front seat cushion shield inner.



4. REMOVE RECLINING ADJUSTER RELEASE HANDLE
(a) Using a screwdriver with its tip taped in protective tape, disengage the claw and remove the reclining adjuster release handle.

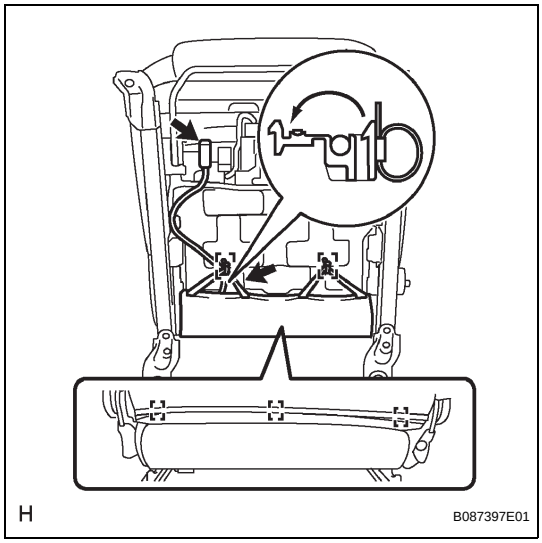
SE



5. REMOVE FRONT SEAT CUSHION SHIELD

(a) Remove the screw.

(b) Disengage the 2 claws and clip, and remove the front seat cushion shield.



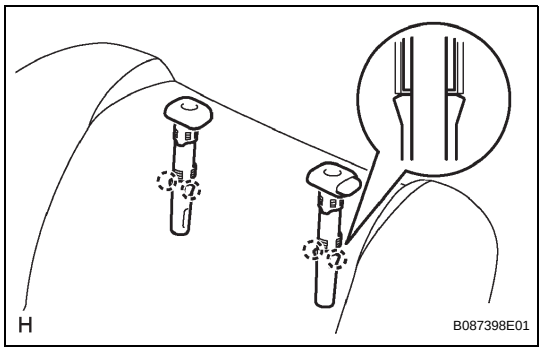
6. REMOVE FRONT SEAT HEADREST SUPPORT

(a) w/ Front Seat Side Airbag:

(1) Using a clip remover, remove the connector clamp.

(2) Remove the wire harness clamp.

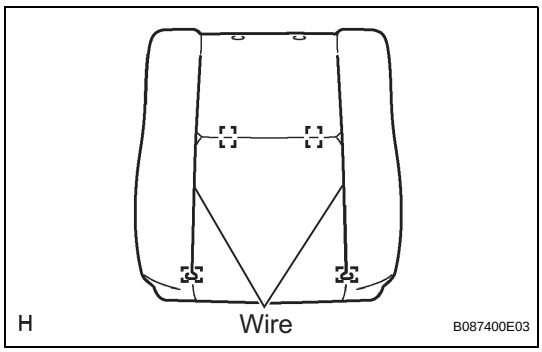
(b) Remove the 5 hog rings.



(c) Disengage the 2 claws and remove the front seat headrest support.

HINT:

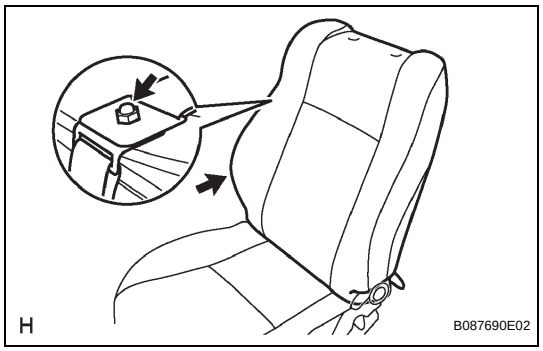
Follow the same procedures as for the opposite side.



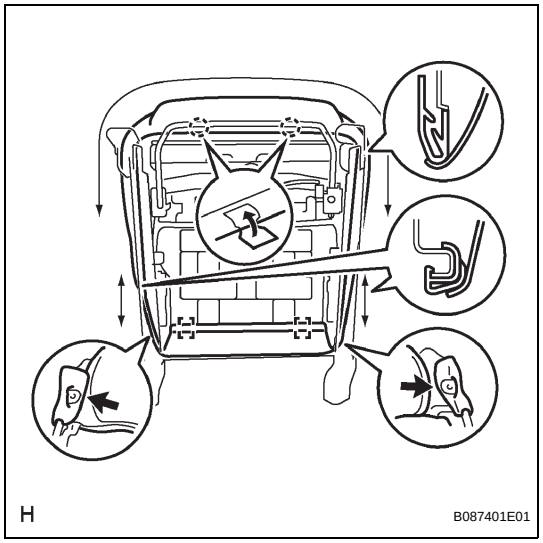
7. REMOVE FRONT SEAT BACK COVER

(a) Remove the 2 hog rings.

(b) Remove the 2 wires.



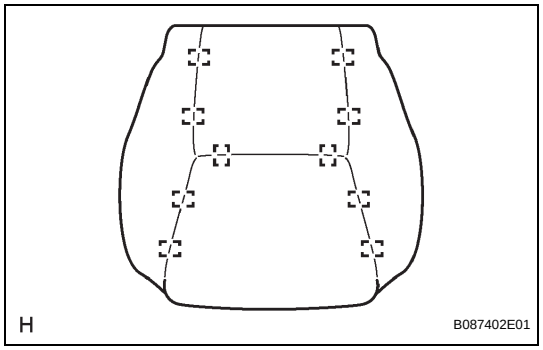
(c) w/ Front Seat Side Airbag:
  (1) Remove the nut and strap.
(d) Remove the 2 hog rings and front seat back cover.
(e) Remove the front seat back pad from the front seat frame adjuster.



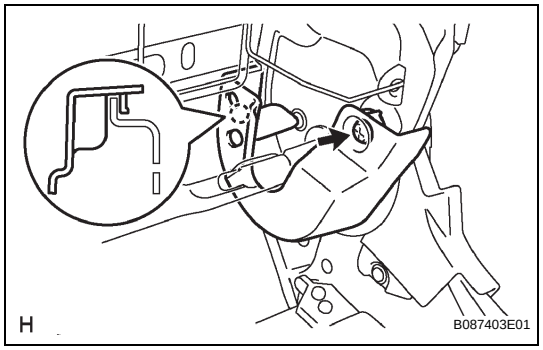
8. REMOVE FRONT SEAT CUSHION COVER

(a) Remove the front seat cushion cover from the front seat frame adjuster.
(b) Remove the 2 hog rings.
(c) Disengage the 2 claws and 3 hooks, and remove the front seat cushion pad together with the front seat cushion cover.

SE



(d) Remove the 10 hog rings and front seat cushion cover.

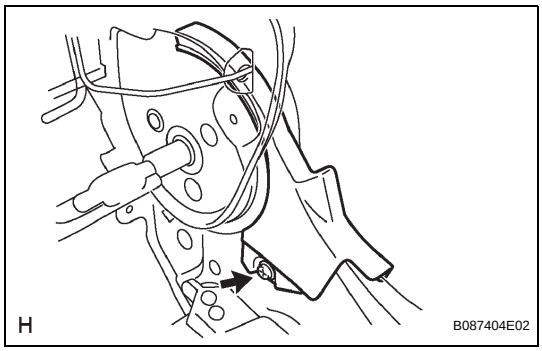


9. REMOVE RECLINING ADJUSTER INSIDE COVER LH

(a) Remove the screw.
(b) Disengage the claw and remove the reclining adjuster inside cover.

10. REMOVE RECLINING ADJUSTER INSIDE COVER RH

HINT:
Follow the same procedures as for the reclining adjuster inside cover LH.

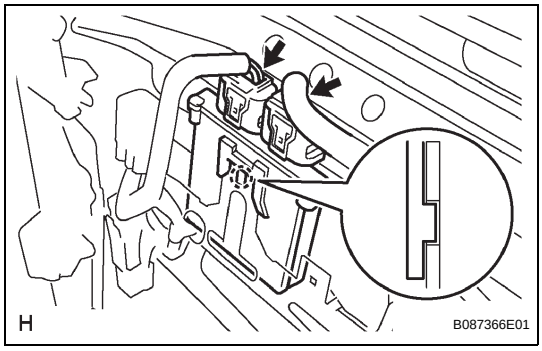


11. REMOVE RECLINING ADJUSTER OUTSIDE COVER LH

(a) Remove the screw and reclining adjuster outside cover.

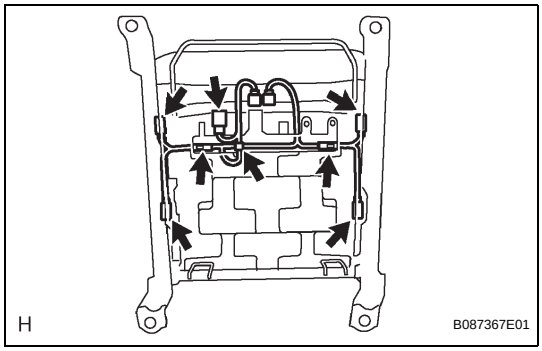
12. REMOVE RECLINING ADJUSTER OUTSIDE COVER RH

HINT:
Follow the same procedures as for the reclining adjuster outside cover LH.



13. REMOVE OCCUPANT CLASSIFICATION ECU

(a) Disconnect the 2 connectors.
(b) Disengage the claw and remove the occupant classification ECU.

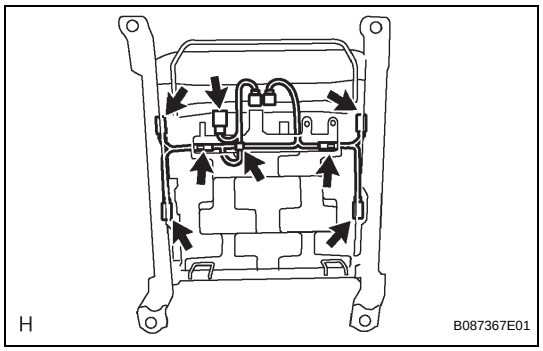


14. REMOVE SEAT WIRE

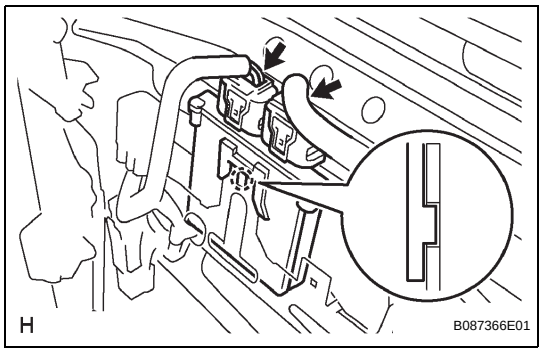
(a) Disconnect the 4 connectors.
(b) Using a clip remover, remove the 3 wire harness clamps.

REASSEMBLY

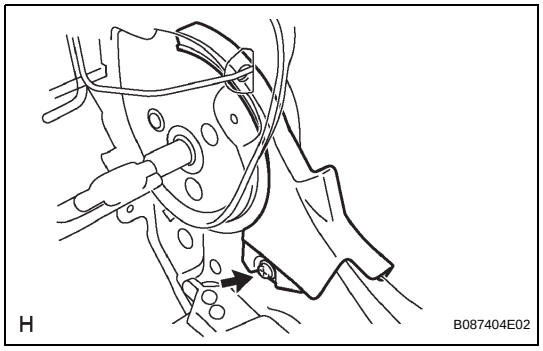
CAUTION:
Wear protective gloves. Sharp surface on the front seat with adjuster frame could cause injuries to your hands.



1. INSTALL SEAT WIRE
(a) Install the 3 wire harness clamps and connector clamp.
(b) Connect the 4 connectors.

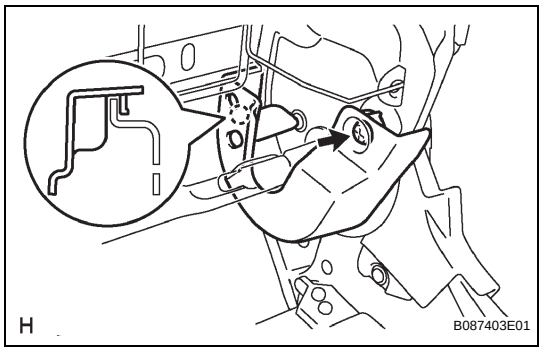


2. INSTALL OCCUPANT CLASSIFICATION ECU
(a) Engage the claw and install the occupant classification ECU.
(b) Connect the 2 connectors.



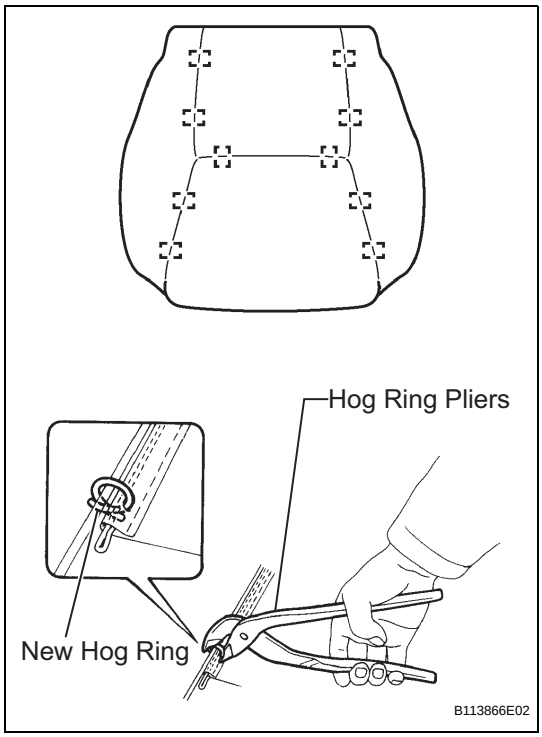
3. INSTALL RECLINING ADJUSTER OUTSIDE COVER LH
(a) Install the reclining adjuster outside cover with the screw.

4. INSTALL RECLINING ADJUSTER OUTSIDE COVER RH
HINT:
Follow the same procedures as for the reclining adjuster outside cover LH.



5. INSTALL RECLINING ADJUSTER INSIDE COVER LH
(a) Engage the claw and install the reclining adjuster inside cover.
(b) Tighten the screw.

6. INSTALL RECLINING ADJUSTER INSIDE COVER RH
HINT:
Follow the same procedures as for the reclining adjuster inside cover LH.

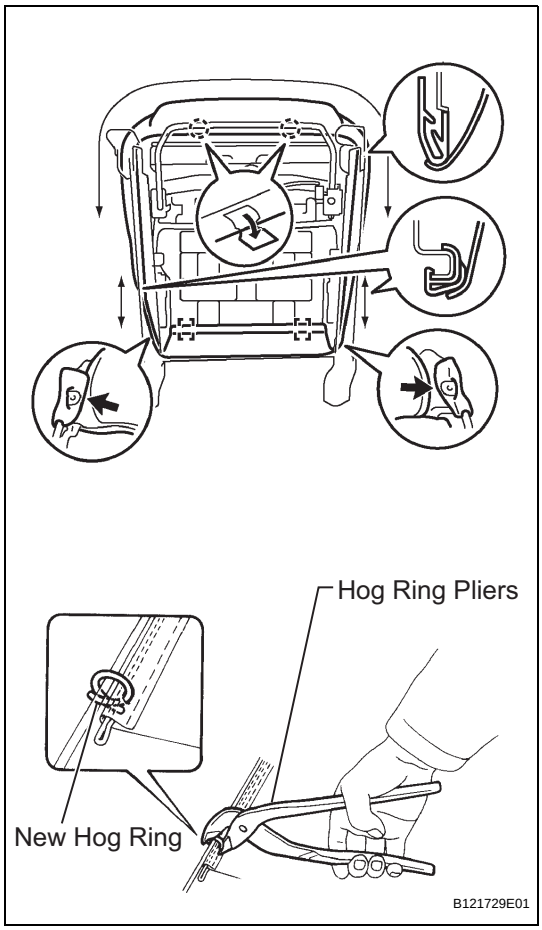


7. INSTALL FRONT SEAT CUSHION COVER

(a) Using hog ring pliers, install the front seat cushion cover with new hog rings.

NOTICE:

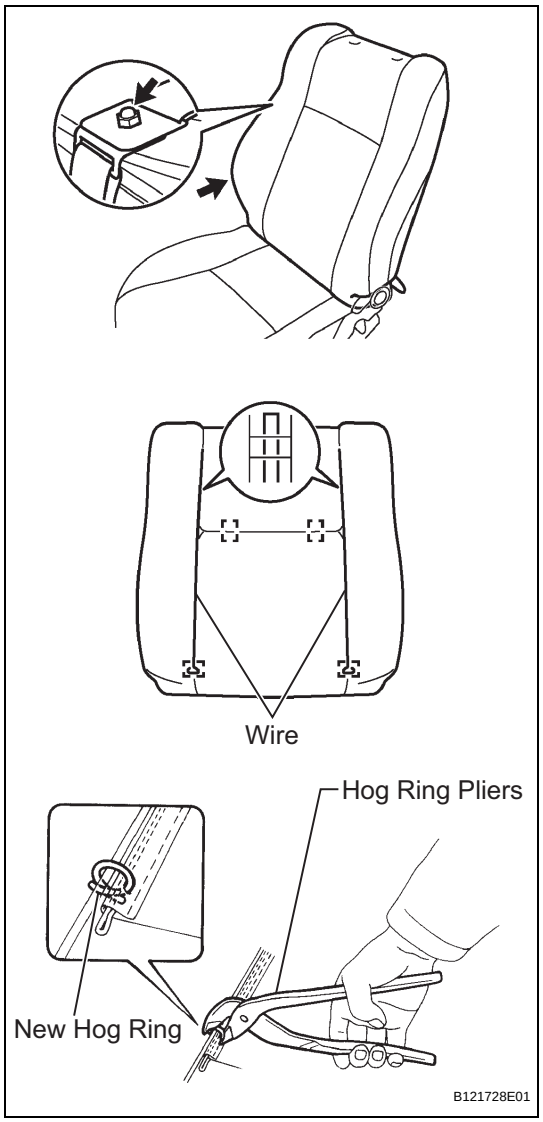
- **Do not contaminate or scratch the front seat cushion cover.**
- **When installing the hog rings, minimize wrinkles as far as possible.**



(b) Engage the 3 hooks and 2 claws, and install the front seat cushion pad together with the front seat cushion cover.

(c) Using hog ring pliers, install new hog rings.

(d) Hook the front seat cushion cover to the front seat frame adjuster.



8. INSTALL FRONT SEAT BACK COVER

(a) Install the front seat back pad onto the front seat frame adjuster.

(b) Using hog ring pliers, install the front seat back cover with new hog rings.

NOTICE:

- **Do not contaminate or scratch the front seat back cover.**
- **When installing the hog rings, minimize wrinkles as far as possible.**

(c) w/ Front Seat Side Airbag:

(1) Attach straps and tighten the nut.

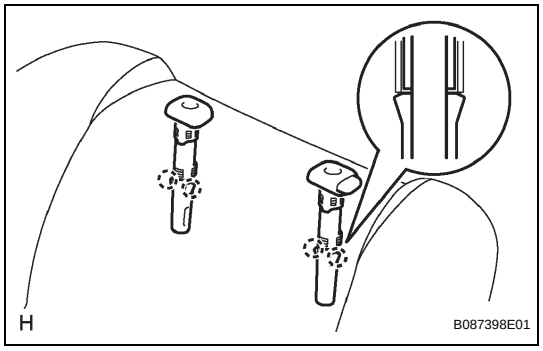
Torque: 5.5 N*m (55 kgf*cm, 49 in.*lbf)

NOTICE:

- **For vehicles with side air bag, the front seat back cover must be securely installed. Otherwise, the side air bag may not deploy properly.**
- **Make sure that the strap is not twisted after installing the inner hook.**
- **Install the inner hook securely.**

(d) Roll the front seat back cover down and install the 2 wires.

(e) Using hog ring pliers, install new hog rings.



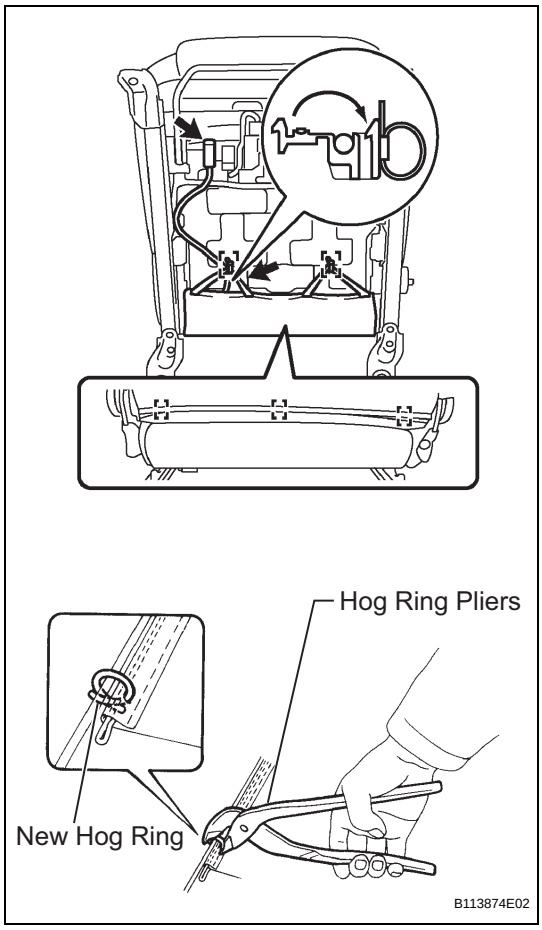
9. INSTALL FRONT SEAT HEADREST SUPPORT

(a) Engage the 2 claws and install the front seat headrest support.

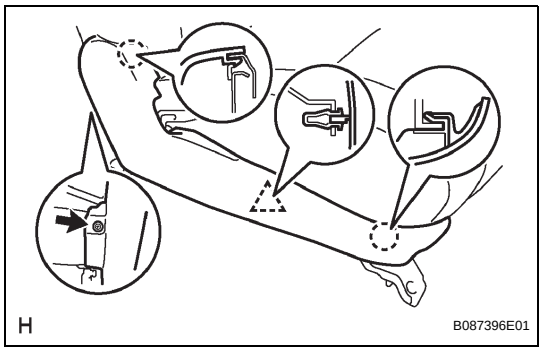
HINT:

Follow the same procedures as for the opposite side.

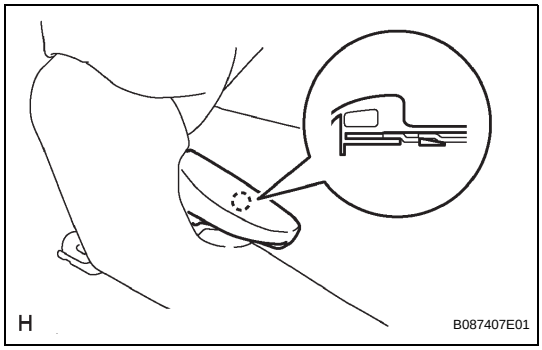
SE



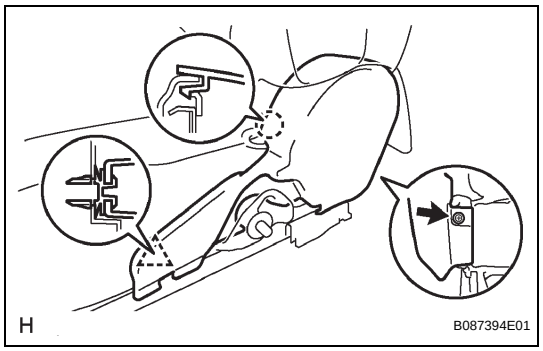
(b) Using hog ring pliers, install the new hog rings.
(c) Install the wire harness clamp and connector clamp.



10. INSTALL FRONT SEAT CUSHION SHIELD
(a) Engage the 2 claws and clip, and install the front seat cushion shield.
(b) Tighten the screw.



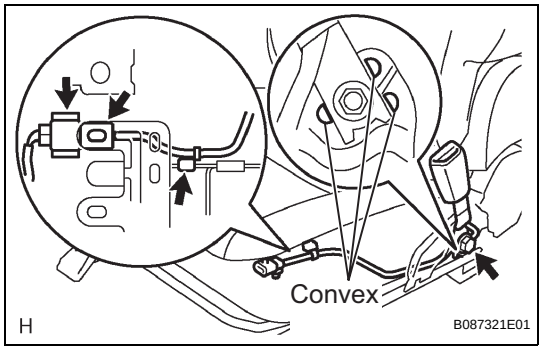
11. INSTALL RECLINING ADJUSTER RELEASE HANDLE
(a) Engage the claw and install the reclining adjuster release handle.



12. INSTALL FRONT SEAT CUSHION INNER SHIELD

(a) Engage the claw and clip, and install the front seat cushion inner shield.

(b) Tighten the screw.



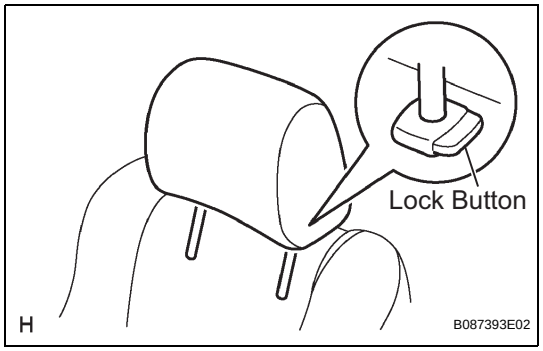
13. INSTALL FRONT SEAT INNER BELT ASSEMBLY

(a) Install the front seat inner belt with the nut.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)
NOTICE:
Be careful not to place the front seat inner belt over the convex areas of the front seat with adjuster frame.

(b) Check that the front seat inner belt rotates smoothly.

(c) Install the wire harness clamp and connector clamp.

(d) Connect the seat wire No. 1 connector.



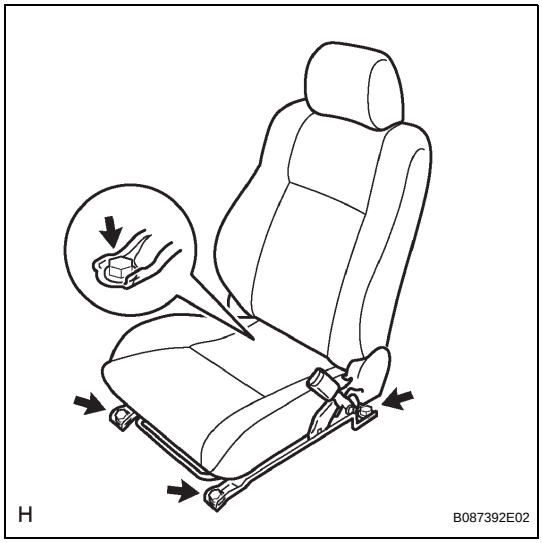
14. INSTALL FRONT SEAT HEADREST ASSEMBLY

(a) Disengage the lock button of the front seat headrest support and install the front seat headrest.

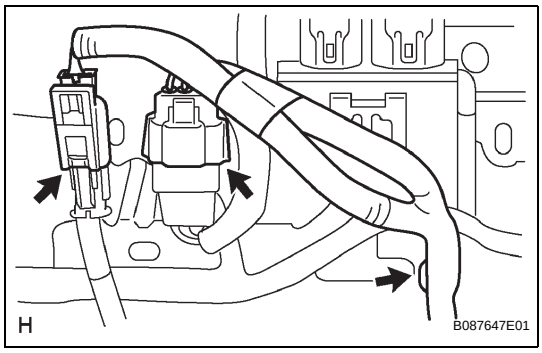
SE

INSTALLATION

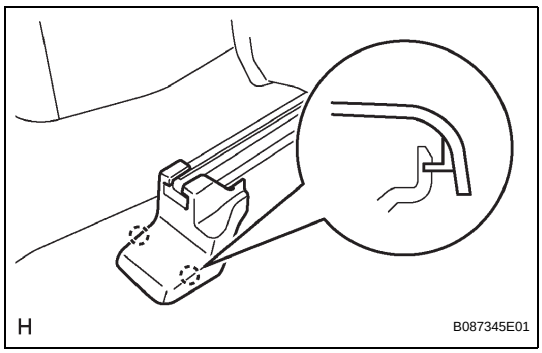
CAUTION:
Some of these service operations affect the SRS airbag system. Read the precautionary notices concerning the SRS airbag system before servicing (w/ Front Seat Side Airbag) (See page RS-1).



1. INSTALL FRONT SEAT ASSEMBLY
(a) Place the front seat in the cabin.
(b) Tighten the 2 bolts on the front side of the front seat.
Torque: 37 N*m (375 kgf*cm, 27 ft.*lbf)
(c) Tighten the 2 bolts on the rear side of the front seat.
Torque: 37 N*m (375 kgf*cm, 27 ft.*lbf)



(d) Install the wire harness clamp.
(e) Connect the connector.
(f) w/ Front Seat Side Airbag:
(1) Connect the connector.



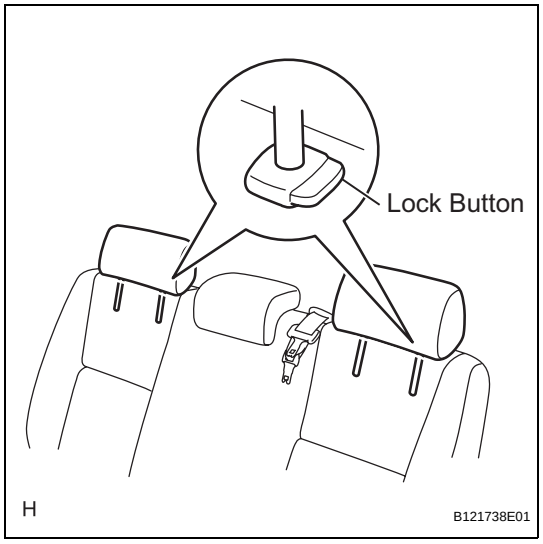
2. INSTALL SEAT TRACK COVER
HINT:
Follow the same procedures as for the opposite side.
(a) Engage the 2 claws and install the seat track cover.

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

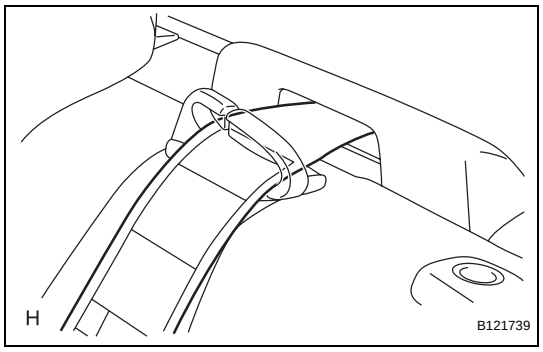
4. INSPECT SRS WARNING LIGHT (w/ Front Seat Side Airbag)
(See page RS-28)

REMOVAL

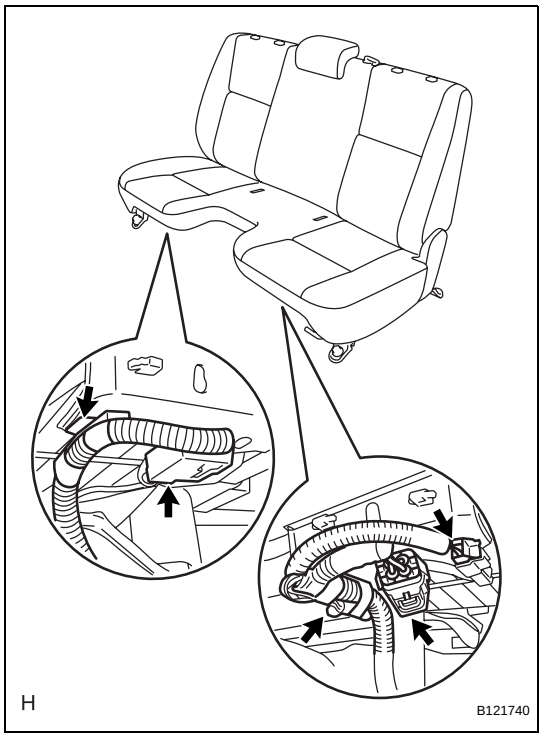
1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
2. **REMOVE FRONT SEAT INNER BELT ASSEMBLY LH (See page SB-12)**
3. **REMOVE FRONT SEAT INNER BELT ASSEMBLY RH (See page SB-12)**
4. **REMOVE FRONT SEAT HEADREST ASSEMBLY**
   (a) Push in the 2 lock buttons of the 2 front seat headrest supports and remove the 2 front seat headrests.



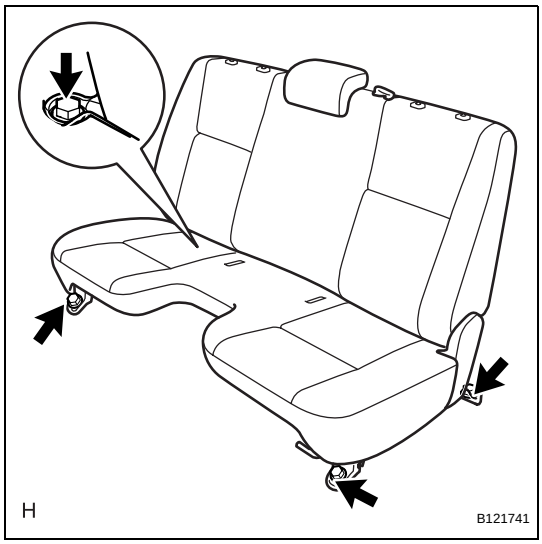
5. **REMOVE FRONT SEAT ASSEMBLY**
   (a) Remove the belt of the front center seat outer belt from the front center seat outer belt guide.



SE



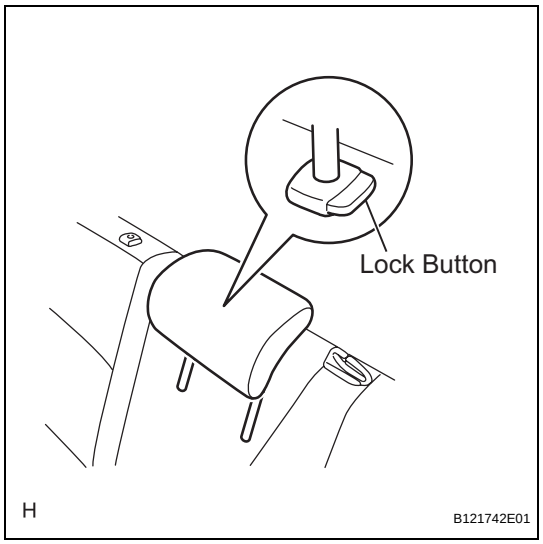
(b) Disconnect the 3 connectors.
(c) Using a clip remover, remove the 2 wiring harness clamps.



(d) Remove the 4 bolts and the front seat.

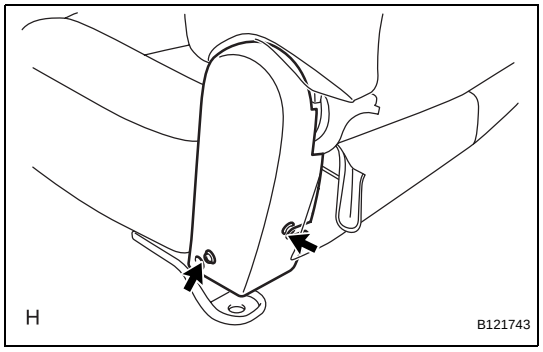
DISASSEMBLY

CAUTION:
Wear protective gloves. Sharp surfaces on the front seat back spring and the front seat cushion spring could cause injuries to your hands.
NOTICE:
Remove the front seat cushion pad and the front seat cushion cover together, in order to avoid occupant classification sensor malfunctions.



1. REMOVE FRONT CENTER SEAT HEADREST ASSEMBLY

(a) Push in the lock button of the front seat headrest support and remove the front center seat headrest.

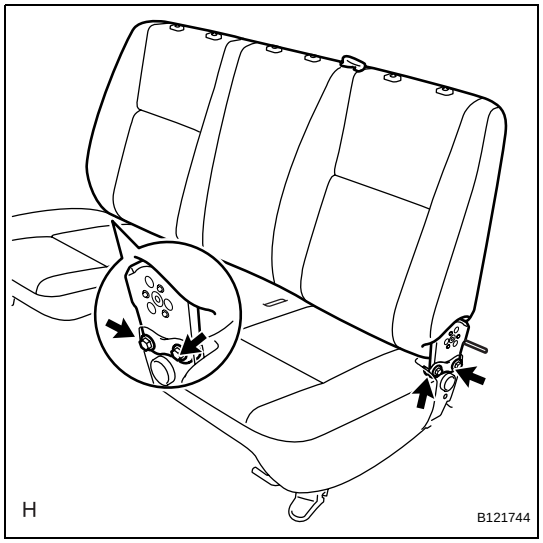


2. REMOVE FRONT SEAT HINGE COVER LH

(a) Remove the 2 screws and the front seat hinge cover.

3. REMOVE FRONT SEAT HINGE COVER RH

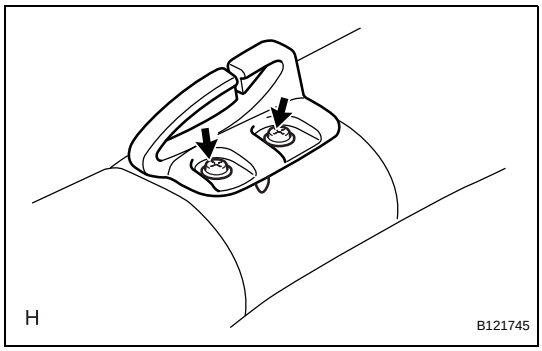
HINT:
Use the same procedure as for the LH side.



4. REMOVE FRONT SEAT BACK ASSEMBLY

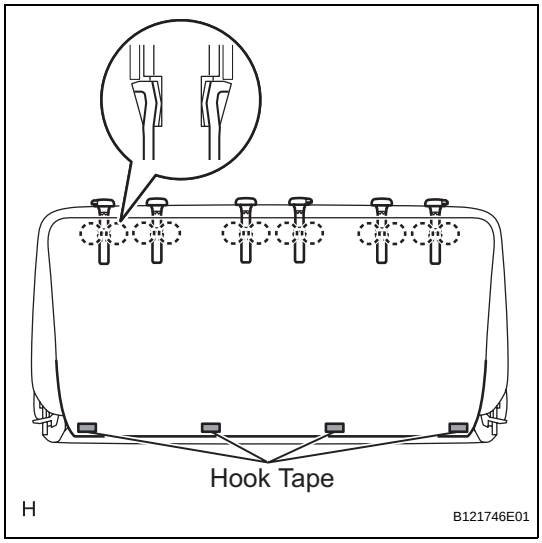
(a) Remove the 4 bolts and the front seat back.

SE



5. REMOVE FRONT CENTER SEAT OUTER BELT GUIDE

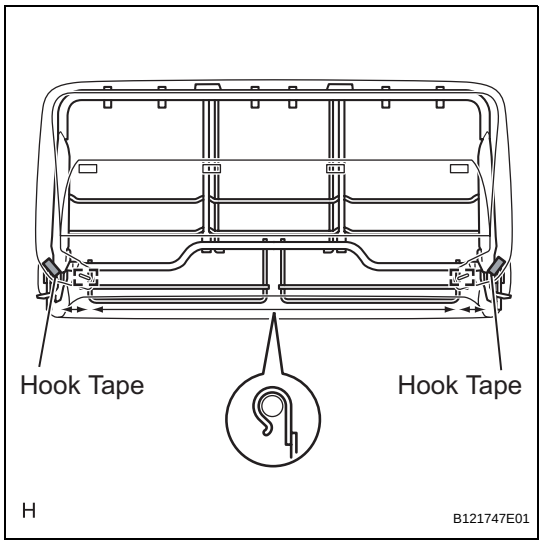
(a) Remove the 2 screws, the pin and the front center seat outer belt guide.



6. REMOVE FRONT SEAT HEADREST SUPPORT

(a) Remove the 4 pieces of hook tape and open the front seat back cover.

(b) Disengage the 12 claws and remove the 6 front seat headrest supports.

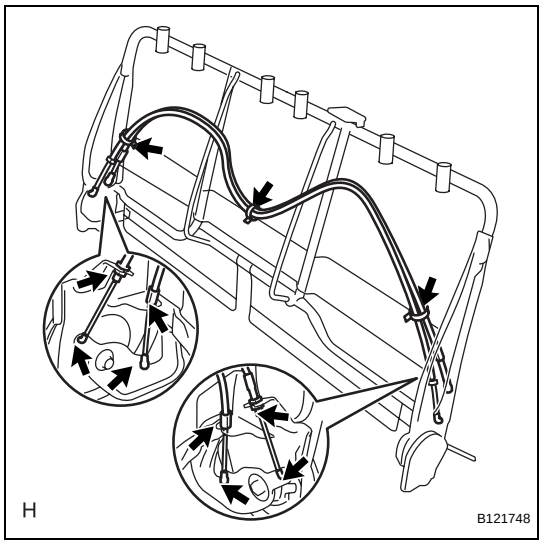


7. REMOVE FRONT SEAT BACK SPRING ASSEMBLY

(a) Remove the 2 hog rings.

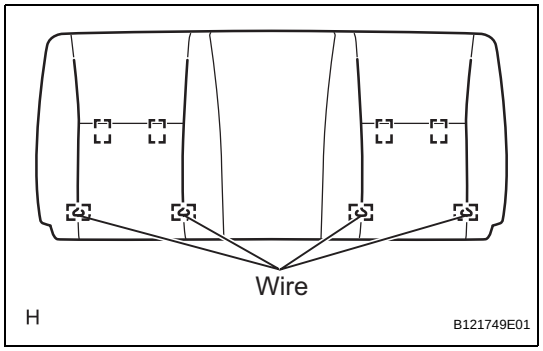
(b) Remove the 2 pieces of hook tape.

(c) Disengage the 4 hooks and remove the front seat back spring.



8. REMOVE FRONT SEAT RECLINING CONTROL CABLE ASSEMBLY

(a) Remove the 3 wiring harness clamps.
(b) Loosen the 2 nuts and remove the 2 screw caps.
(c) Remove the 2 casing caps.
(d) Remove the 4 cable ends and the 2 front seat reclining control cables.



9. REMOVE FRONT SEAT BACK COVER

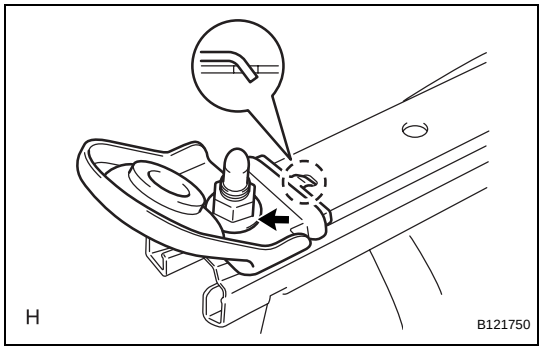
(a) Remove the 4 hog rings and the 4 wires.
(b) Remove the 4 hog rings and the front seat back cover.

10. REMOVE OCCUPANT CLASSIFICATION ECU (See page RS-635)

11. REMOVE SEAT POSITION SENSOR PROTECTOR (See page RS-620)

12. REMOVE SEAT POSITION SENSOR

(a) for Driver Side:
  (1) Remove the seat position sensor (See page RS-621).
(b) for Front Passenger Side:
  (1) Remove the seat position sensor (See page RS-621).

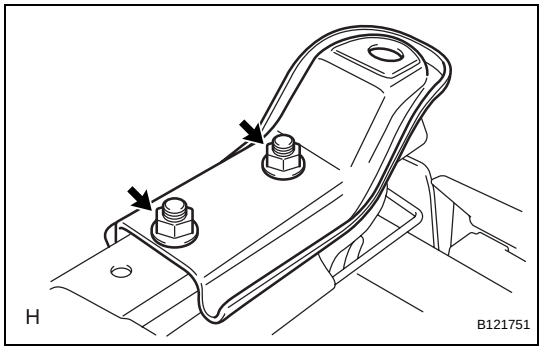


13. REMOVE FRONT SEAT TRACK FRONT BRACKET LH

(a) Remove the nut, the hook and the front seat track front bracket.

14. REMOVE FRONT SEAT TRACK FRONT BRACKET RH

HINT:
Use the same procedure as for the LH side.

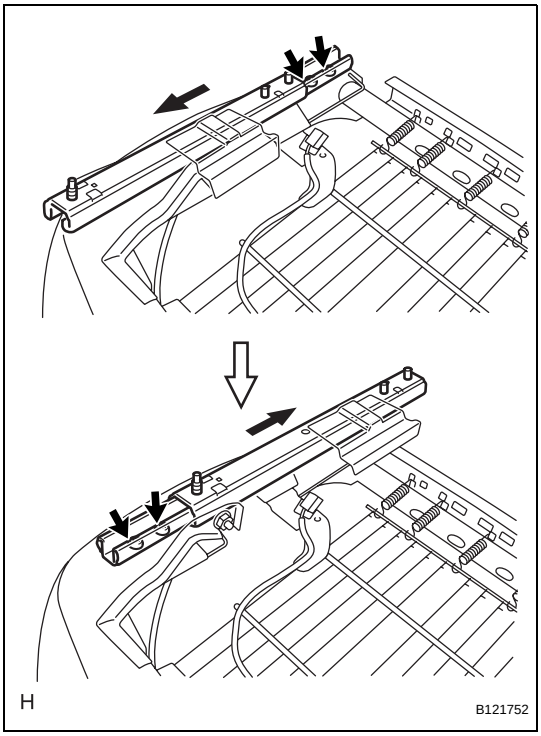


15. REMOVE FRONT SEAT TRACK REAR BRACKET LH

(a) Remove the 2 nuts and the front seat track rear bracket.

16. REMOVE FRONT SEAT TRACK REAR BRACKET RH

HINT:
Use the same procedure as for the LH side.

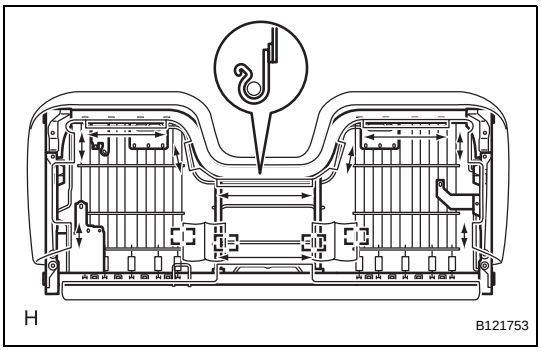


17. REMOVE FRONT SEAT TRACK OUTER ASSEMBLY LH

(a) Slide the front seat track outer to the most rearward position.
(b) Using "Torx" socket wrench T40, remove the 2 bolts.
(c) Slide the front seat track outer to the most forward position.
(d) Using "Torx" socket wrench T40, remove the 2 bolts and the front seat track outer.

18. REMOVE FRONT SEAT TRACK OUTER ASSEMBLY RH

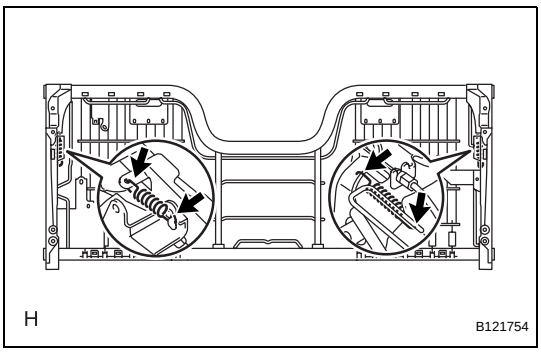
HINT:
Use the same procedure as for the LH side.



19. REMOVE FRONT SEAT CUSHION SPRING ASSEMBLY

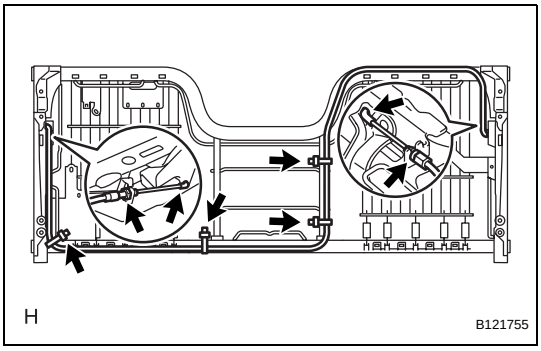
(a) Remove the 4 hog rings.
(b) Disengage the 10 hooks and remove the front seat cushion spring.

20. REMOVE OCCUPANT CLASSIFICATION SENSOR (See page RS-627)



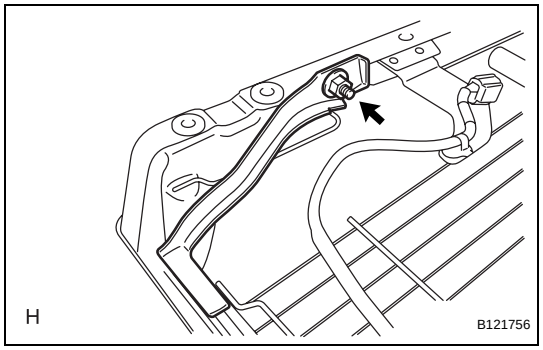
21. REMOVE SEAT TRACK SPRING

(a) Remove the 2 seat track springs.



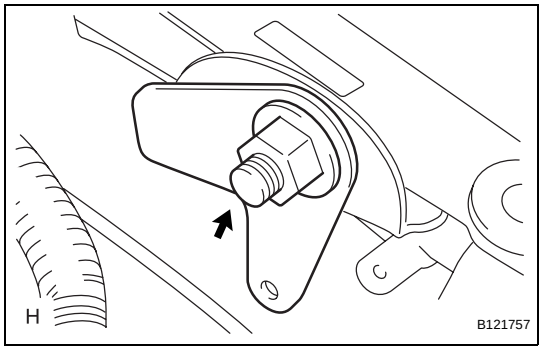
22. REMOVE FRONT SEAT SLIDE CONTROL CABLE ASSEMBLY

(a) Remove the 4 wiring harness clamps.
(b) Loosen the nut and remove the screw cap.
(c) Remove the casing cap.
(d) Remove the 2 cable ends and the front seat slide control cable.



23. REMOVE SEAT TRACK HANDLE SUB-ASSEMBLY LH

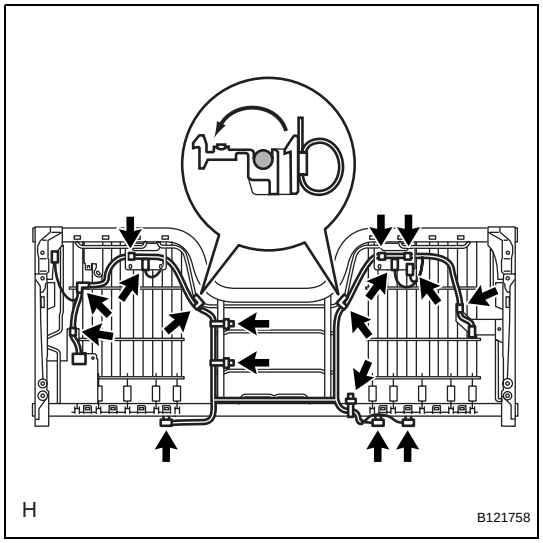
(a) Remove the nut and the seat track handle.



24. REMOVE SEAT TRACK HANDLE SUB-ASSEMBLY RH

(a) Remove the nut and the seat track handle.

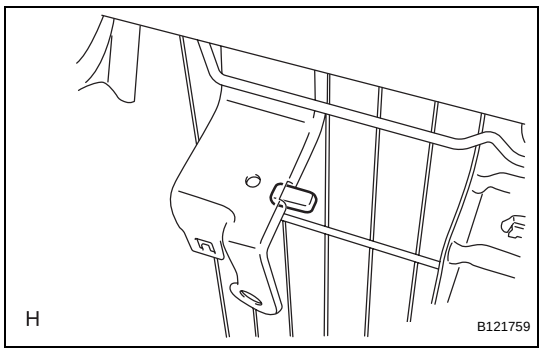
SE



25. REMOVE SEAT WIRE

(a) Remove the 5 wiring harness clamps.

(b) Using a clip remover, remove the 12 wiring harness clamps and the seat wire.

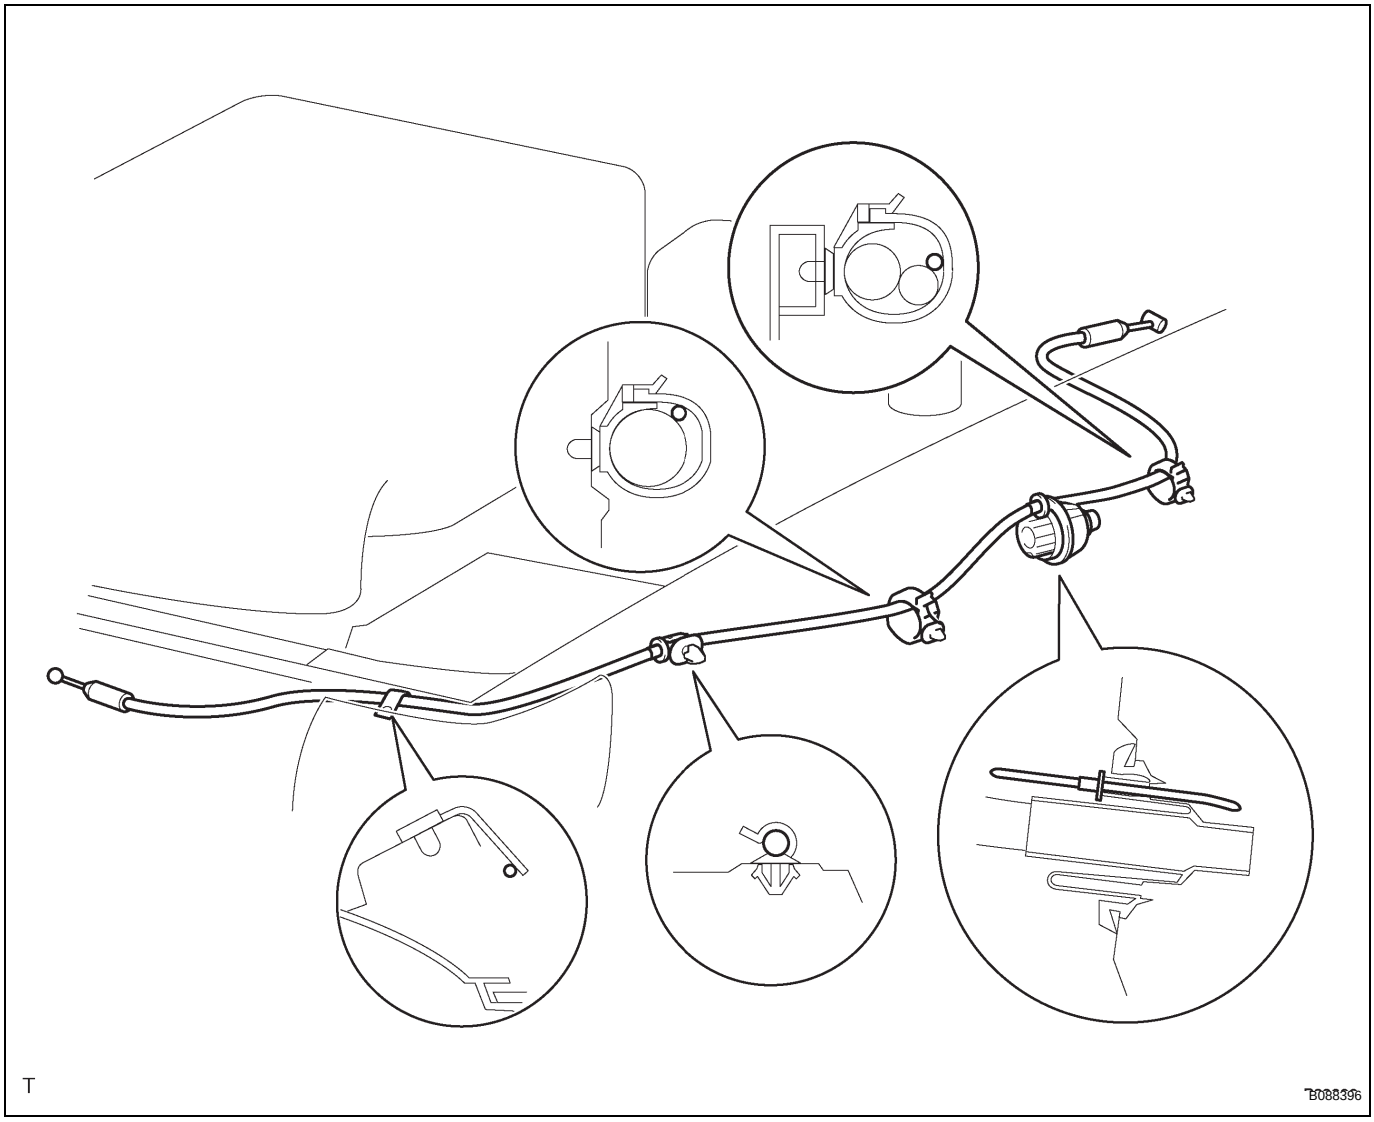


26. REMOVE FRONT SEAT CUSHION SPRING PROTECTOR

(a) Remove the front seat cushion spring protector.

REASSEMBLY

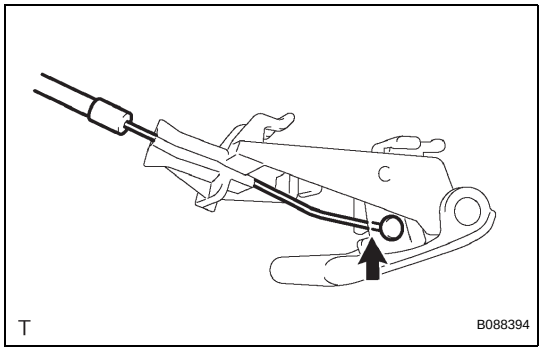
1. INSTALL HOOD LOCK CONTROL CABLE ASSEMBLY

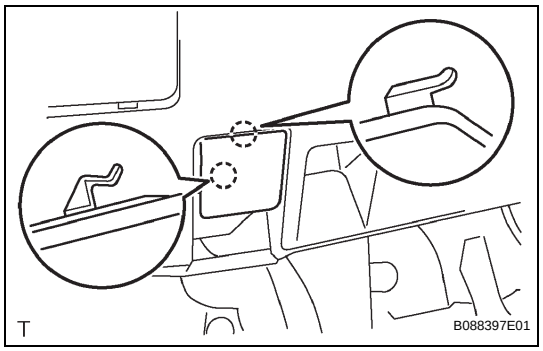


(a) Tie the string inside the wire harness grommet to the hood lock control cable assembly.
(b) Using the string, fit the hood lock control cable assembly into the wire harness grommet.

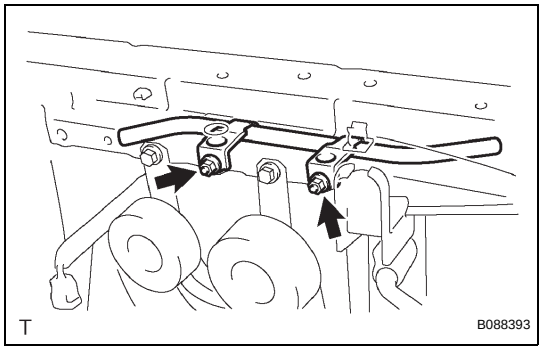
2. INSTALL HOOD LOCK CONTROL LEVER SUB-ASSEMBLY

(a) Connect the hood lock control cable assembly.



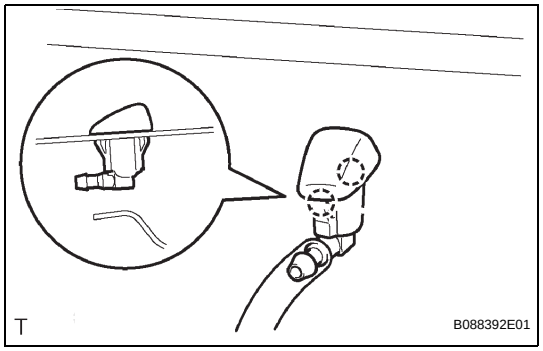


(b) Engage the 2 claws and install the hood lock control lever sub-assembly.



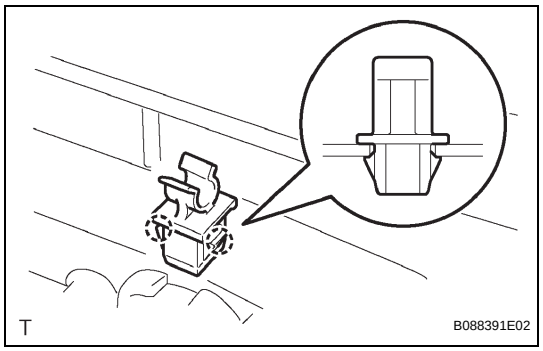
3. INSTALL HOOD LOCK CONTROL CABLE PROTECTOR SUB-ASSEMBLY

(a) Install the hood lock control cable protector sub-assembly with the 2 nuts.
Torque: 5.5 N*m (56 kgf*cm, 49 in.*lbf)



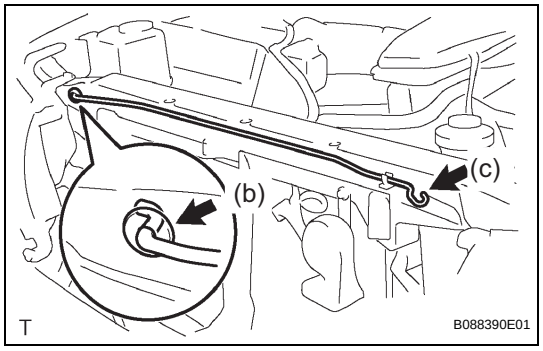
4. INSTALL WASHER NOZZLE SUB-ASSEMBLY

(a) Connect the washer hose.
(b) Engage the 2 claws and install the washer nozzle sub-assembly.



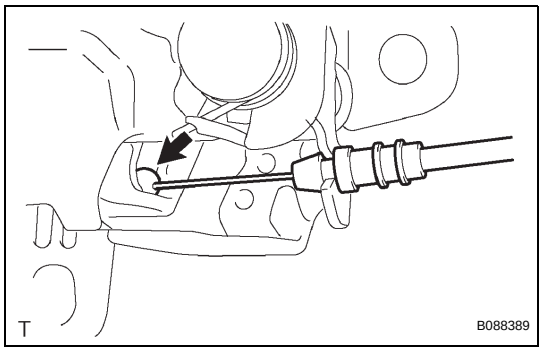
5. INSTALL HOOD SUPPORT

(a) Engage the 2 claws and install the hood stay holder.



(b) Install the grommet.
(c) Install the hood support.

ED



6. **INSTALL HOOD LOCK ASSEMBLY**
   (a) Connect the hood lock control cable assembly.

   (b) Install the hood lock assembly with the 3 bolts.
   Torque: 12 N*m (122 kgf*cm, 9 ft.*lbf)

7. **INSTALL NO. 2 HOOD LOCK RELEASE LEVER PROTECTOR (See page ED-5)**

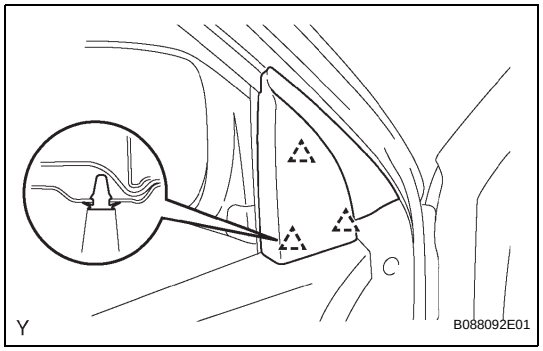
8. **INSTALL RADIATOR GRILLE (See page ET-11)**

DISASSEMBLY

HINT:
Use the same procedures for both the LH and RH sides.

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

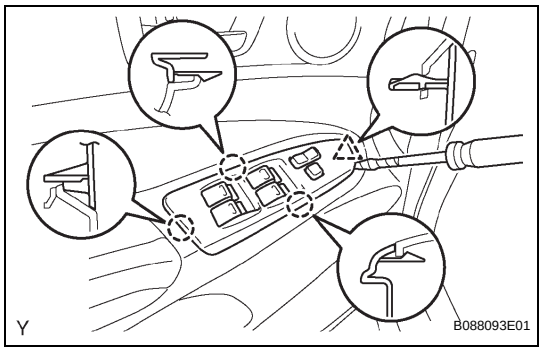
2. REMOVE FRONT DOOR LOWER FRAME BRACKET GARNISH LH



(a) Disengage the 3 clips and remove the front door lower frame bracket garnish LH.

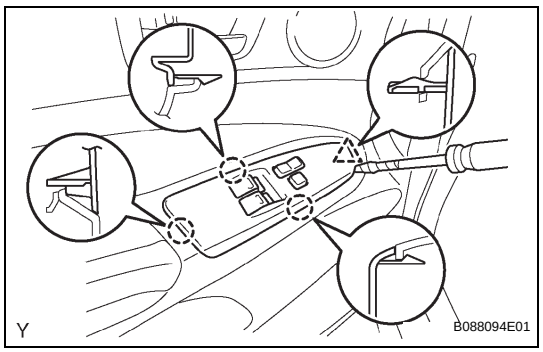
NOTICE:
Confirm that no clips remain on the door panel when the garnish is removed. Transfer any remaining clips to the garnish side before installing.

3. REMOVE POWER WINDOW REGULATOR MASTER SWITCH ASSEMBLY (for Double Cab)



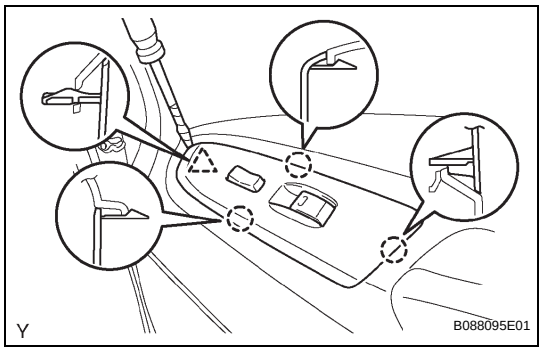
(a) Using a screwdriver with its tip wrapped in protective tape, disengage the 3 claws and clip, then remove the power window regulator master switch assembly.
(b) Disconnect the connector.

4. REMOVE POWER WINDOW REGULATOR MASTER SWITCH ASSEMBLY (for Access Cab)

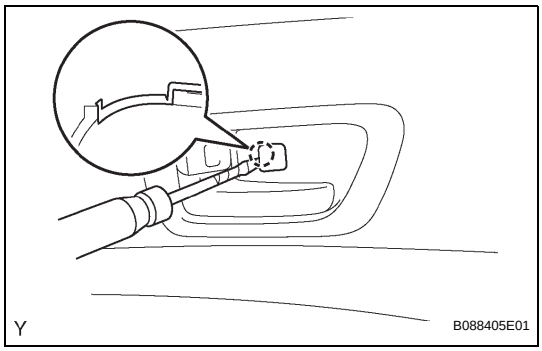


(a) Using a screwdriver with its tip wrapped in protective tape, disengage the 3 claws and clip, then remove the power window regulator master switch assembly.
(b) Disconnect the connector.

5. REMOVE POWER WINDOW REGULATOR SWITCH ASSEMBLY

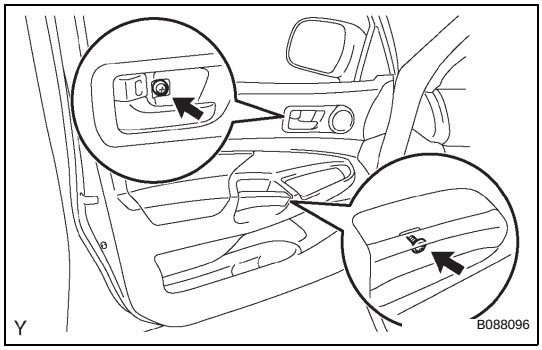


(a) Using a screwdriver with its tip wrapped in protective tape, disengage the 3 claws and clip, then remove the power window regulator switch assembly.
(b) Disconnect the connector.

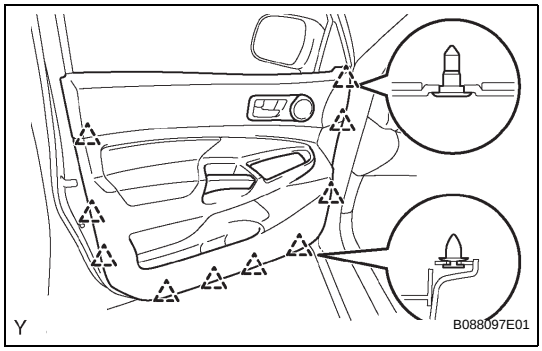


6. REMOVE FRONT DOOR TRIM PANEL ASSEMBLY LH

(a) Using a screwdriver with its tip wrapped in protective tape, open the cover.



(b) Remove the 2 screws.



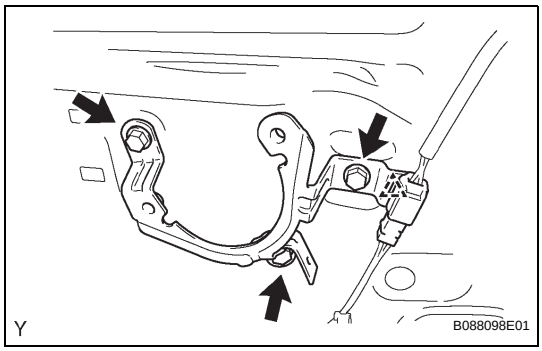
(c) Disengage the 10 clips and remove the front door trim panel assembly LH.

7. REMOVE FRONT NO. 1 SPEAKER ASSEMBLY

HINT:

- Regular cab (See page AV-76)
- Except regular cab (See page AV-78)

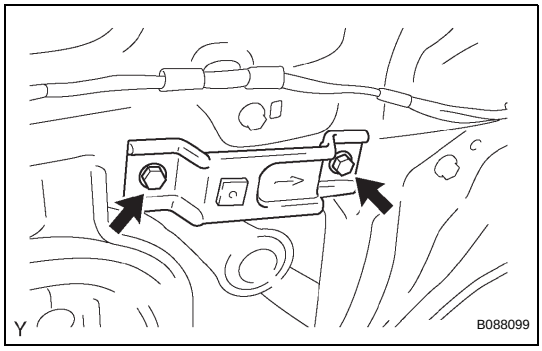
8. REMOVE FRONT NO. 2 SPEAKER ASSEMBLY (See page AV-83)



9. REMOVE FRONT NO. 1 SPEAKER BRACKET

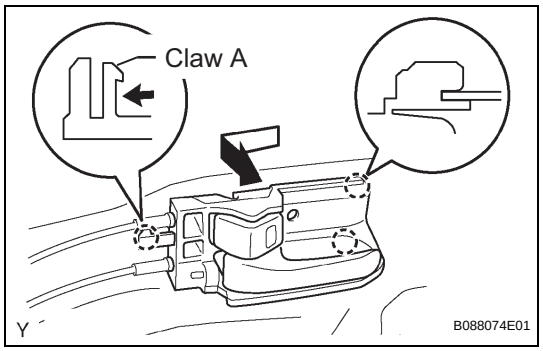
(a) Disconnect the wire harness clamp and connector.

(b) Remove the 3 screws and front No. 1 speaker bracket.



10. REMOVE NO. 1 DOOR TRIM BRACKET RH

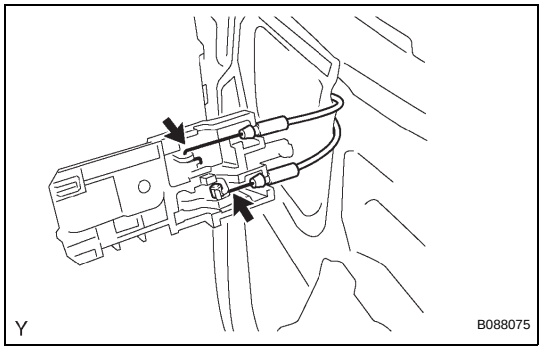
(a) Remove the 2 screws and No. 1 door trim bracket.



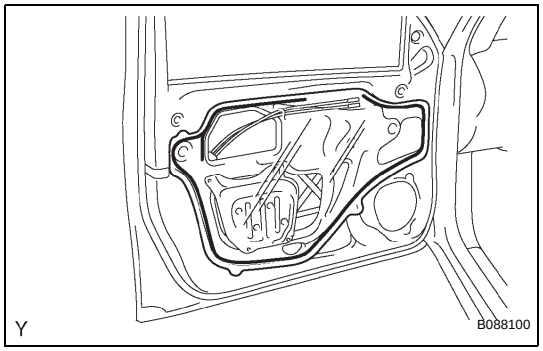
11. REMOVE FRONT DOOR INSIDE HANDLE SUB-ASSEMBLY LH

(a) Using a screwdriver with its tip wrapped in protective tape, disengage claw A as shown in the illustration.

(b) Move the front door inside handle sub-assembly LH in the direction indicated by the arrow mark in the illustration. This will release the claw and allow the removal of the front door inside handle sub-assembly LH.



(c) Disconnect the 2 cables from the front door inside handle sub-assembly LH.

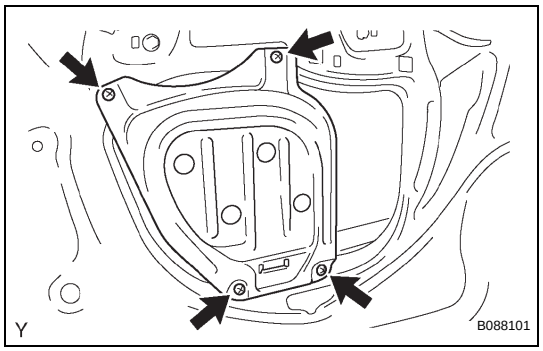


12. REMOVE FRONT DOOR SERVICE HOLE COVER LH

(a) Remove the front door service hole cover LH.
NOTICE:
Remove the remaining tape on the door side.

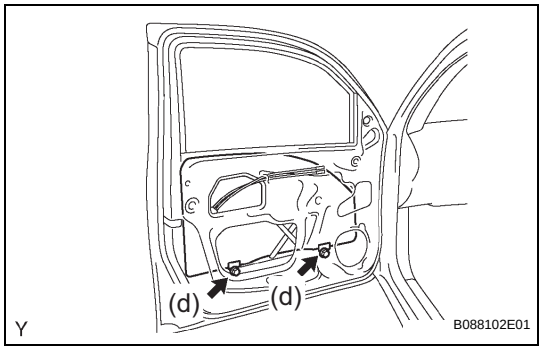
13. REMOVE OUTER REAR VIEW MIRROR ASSEMBLY LH (See page MI-8)

14. REMOVE FRONT DOOR BELT MOULDING LH (See page ET-32)



15. REMOVE FRONT DOOR INSIDE PANEL PLATE LH

(a) Remove the 4 screws and front door inside panel plate LH.



16. REMOVE FRONT DOOR GLASS SUB-ASSEMBLY LH

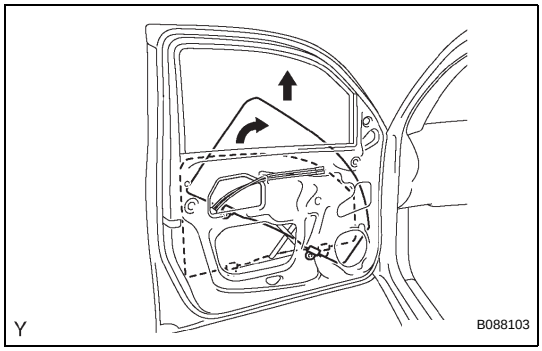
HINT:
Insert a shop rag inside the door panel to prevent the glass from being scratched.

(a) Driver side: Connect the power window regulator master switch.

(b) Passenger side: Connect the power window regulator switch.

(c) Move the front door glass sub-assembly LH until the 2 bolts appear in the service holes.

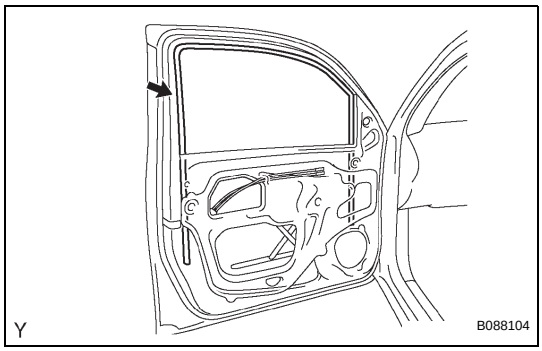
(d) Remove the 2 bolts.
NOTICE:
Be careful when removing the 2 bolts as the glass may fall and be damaged.



(e) Remove the front door glass sub-assembly LH in the direction indicated by the arrow marks in the illustration.
NOTICE:
Be careful not to damage the glass.

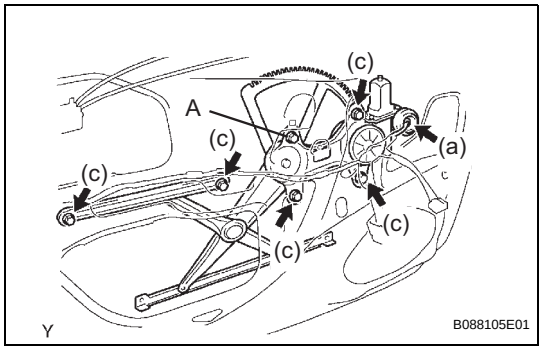
(f) Driver side: Disconnect the power window regulator master switch.

(g) Passenger side: Disconnect the power window regulator switch.



17. REMOVE FRONT DOOR GLASS RUN LH

(a) Remove the front door glass run LH.

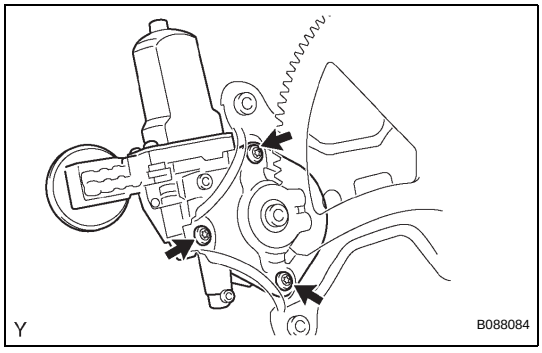


18. REMOVE FRONT DOOR WINDOW REGULATOR SUB-ASSEMBLY LH

(a) Disconnect the front door power window regulator connector.

(b) Loosen bolt A.

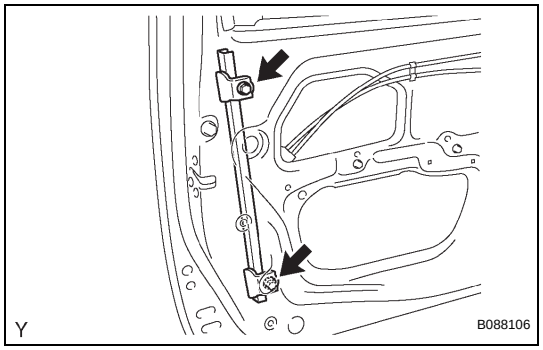
(c) Remove the 5 bolts, then remove the front door window regulator sub-assembly LH.
NOTICE:
Be careful when removing the bolts as the window regulator may fall and be damaged.
HINT:
Remove the window regulator through the service hole.



19. REMOVE POWER WINDOW REGULATOR MOTOR ASSEMBLY LH

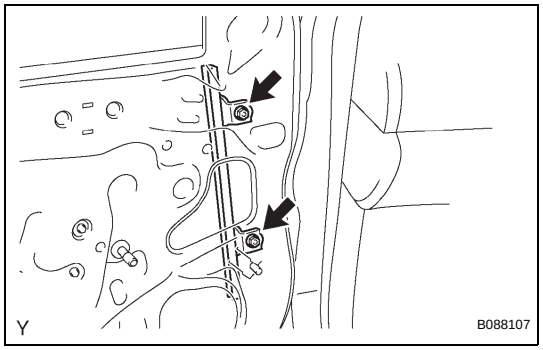
(a) Place matchmarks on the power window regulator motor gear and regulator gear.

(b) Using a torx driver T25, remove the 3 screws and power window regulator motor assembly LH.



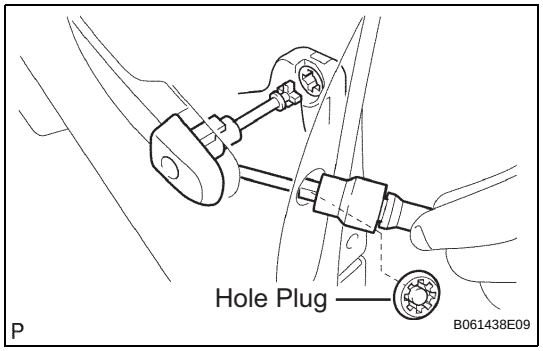
20. REMOVE FRONT DOOR REAR LOWER FRAME SUB-ASSEMBLY LH

(a) Remove the 2 bolts, then remove the front door rear lower frame sub-assembly LH.



21. REMOVE FRONT DOOR FRONT LOWER FRAME SUB-ASSEMBLY LH

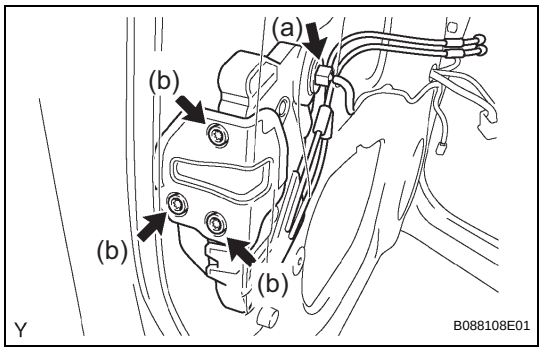
(a) Remove the 2 nuts, then remove the front door front lower frame sub-assembly LH.



22. REMOVE FRONT DOOR OUTSIDE HANDLE COVER LH

(a) Remove the hole plug.

(b) Using a torx socket wrench T30, loosen the screw and remove the front door outside handle cover LH.



23. REMOVE FRONT DOOR LOCK ASSEMBLY LH

(a) Disconnect the front door lock connector.

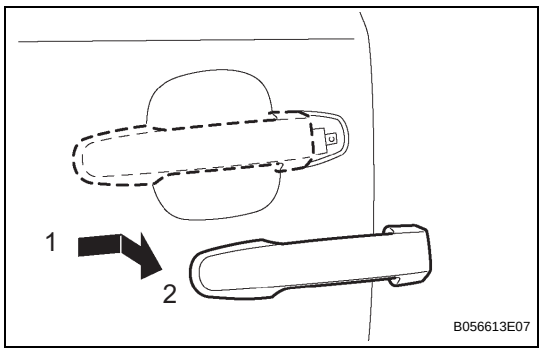
(b) Using a torx socket wrench T30, remove the 3 screws, then remove the front door lock assembly LH.

NOTICE:

Be careful when removing the 3 screws as the door lock may fall and be damaged.

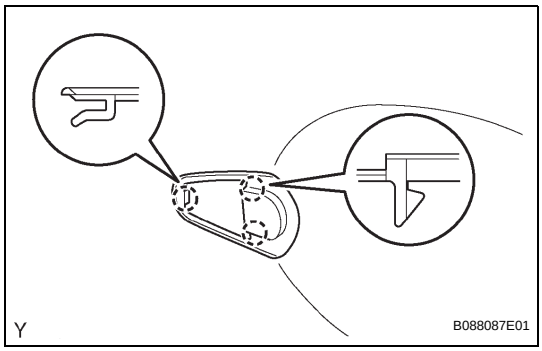
HINT:

Remove the door lock through the service hole.

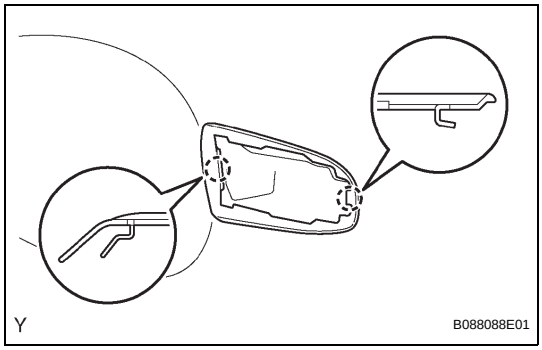


24. REMOVE FRONT DOOR OUTSIDE HANDLE ASSEMBLY LH

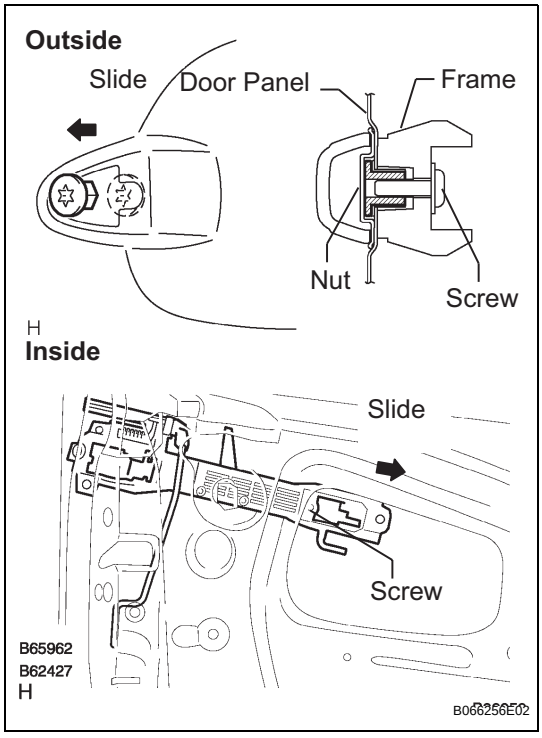
(a) Remove the front door outside handle assembly LH by sliding and pulling it in the direction indicated by the arrow mark in the illustration.



(b) Disengage the 3 claws and remove the front door outside handle front pad.



(c) Disengage the 2 claws and remove the front door outside handle rear pad.



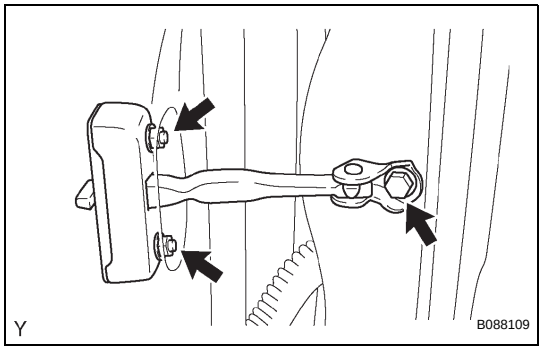
25. REMOVE FRONT DOOR OUTSIDE HANDLE FRAME SUB-ASSEMBLY LH

(a) Using a torx socket wrench T30, loosen the screw.

(b) Slide the outside handle frame sub-assembly to remove it.

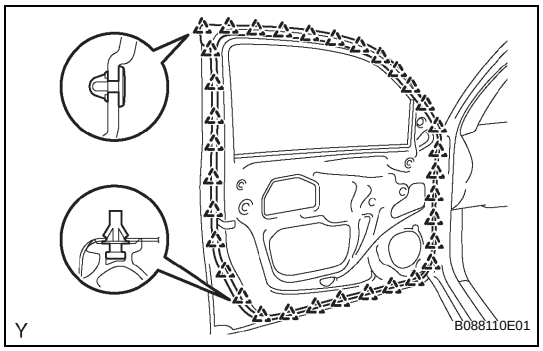
HINT:

Remove the outside handle frame sub-assembly through the service hole.



26. REMOVE FRONT DOOR CHECK ASSEMBLY LH

(a) Remove the 2 nuts and bolt, then remove the front door check assembly LH.

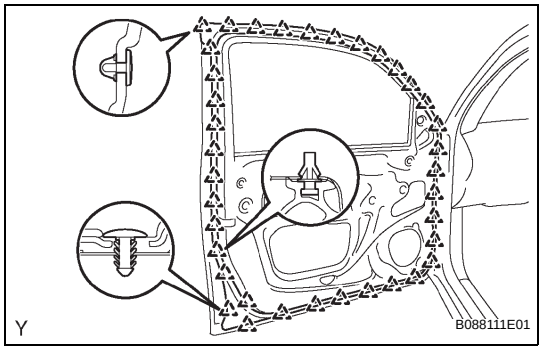


27. REMOVE FRONT DOOR WEATHERSTRIP LH (for Double Cab)

(a) Disengage the 34 clips and remove the front door weatherstrip LH.

NOTICE:

Remove the remaining tape on the door side.



28. REMOVE FRONT DOOR WEATHERSTRIP LH (for Access Cab)

(a) Disengage the 36 clips and remove the front door weatherstrip LH.

NOTICE:

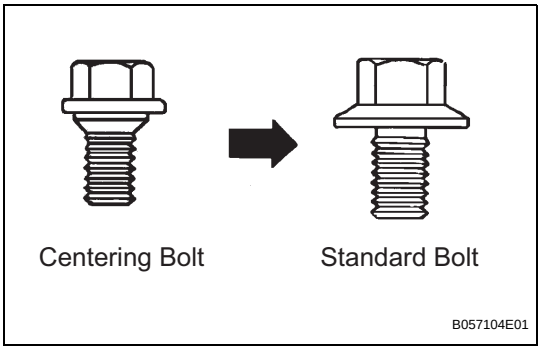
Remove the remaining tape on the door side.

ED

ADJUSTMENT

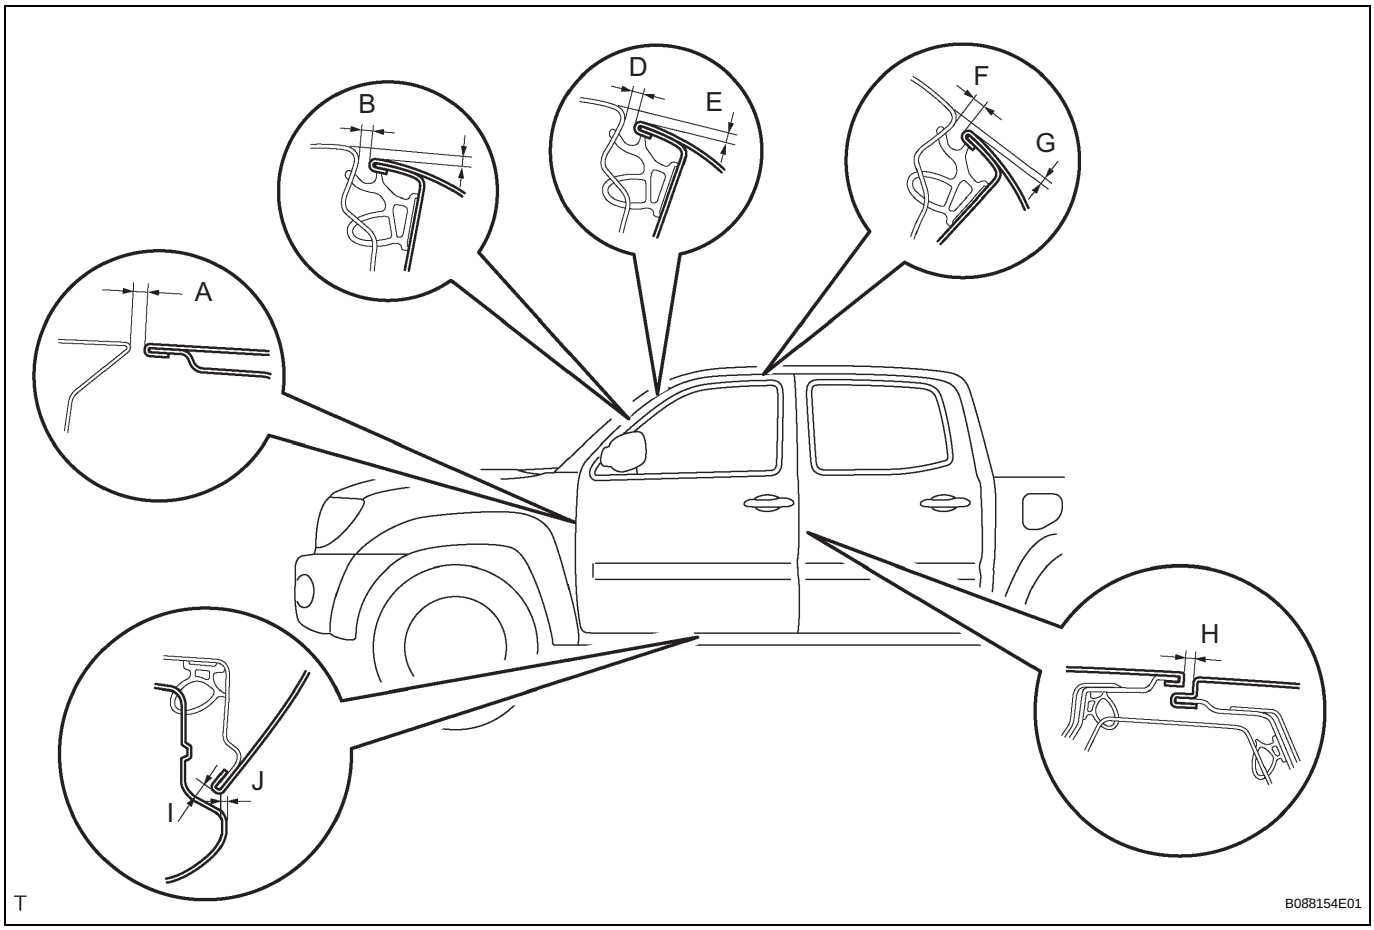
HINT:

- Before adjusting the positions of doors on vehicles equipped with side airbags and curtain shield airbags, be sure to disconnect the cable from the negative battery terminal. After making adjustments, inspect the SRS warning lamp, the side airbag system and the curtain shield airbag system for normal operation (See page RS-28).
- Use the same procedure for both the RH and LH sides.
- The procedures listed below are for the LH side.
- Centering bolts are used to mount the door hinge onto the vehicle body and door. The doors cannot be adjusted with the centering bolts on. Substitute the standard bolts (with washers) for the centering bolts when making adjustments.
- For bolts without torque specifications, check the standard bolt chart (See page SS-2).



ED

1. INSPECT FRONT DOOR PANEL SUB-ASSEMBLY LH (for Double Cab)



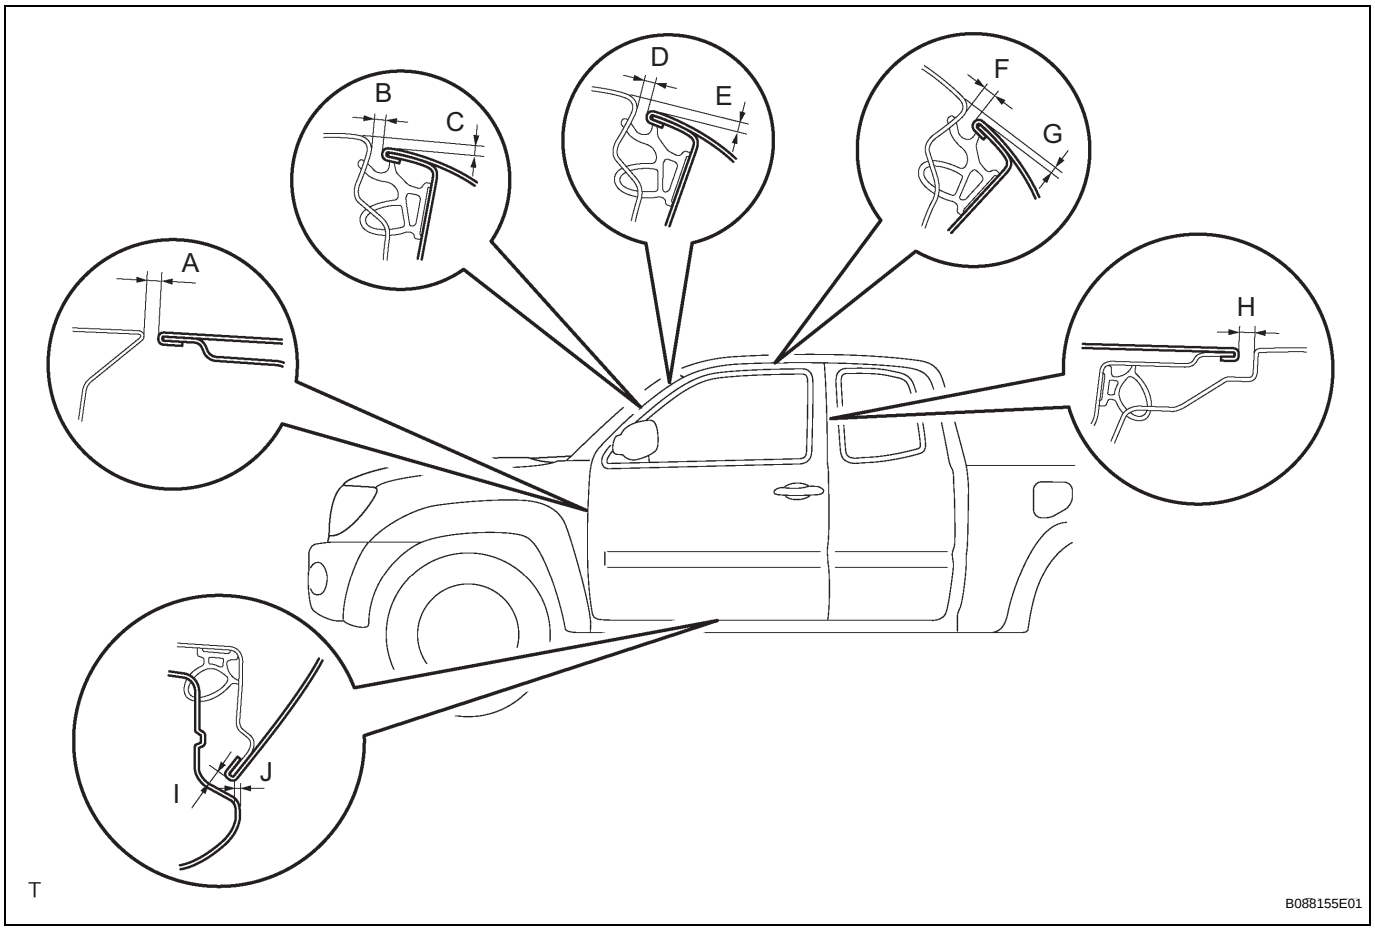
Check that the clearance measurements of areas A to J are within the standard ranges.

Standard:

Area	Measurement	Area	Measurement
A	4.6 +- 1.5 mm (0.181 +- 0.059 in.)	F	5.0 +- 1.5 mm (0.197 +- 0.059 in.)
B	5.0 +- 1.5 mm (0.197 +- 0.059 in.)	G	1.9 +- 1.5 mm (0.075 +- 0.059 in.)

C	3.0 +- 1.5 mm (0.118 +- 0.059 in.)	H	5.0 +- 1.5 mm (0.197 +- 0.059 in.)
D	5.0 +- 1.5 mm (0.197 +- 0.059 in.)	I	5.0 +- 1.5 mm (0.197 +- 0.059 in.)
E	2.7 +- 1.5 mm (0.106 +- 0.059 in.)	J	2.0 +- 1.5 mm (0.079 +- 0.059 in.)

2. INSPECT FRONT DOOR PANEL SUB-ASSEMBLY LH (for Access Cab)



(a) Check that the clearance measurements of areas A to J are within the standard ranges.

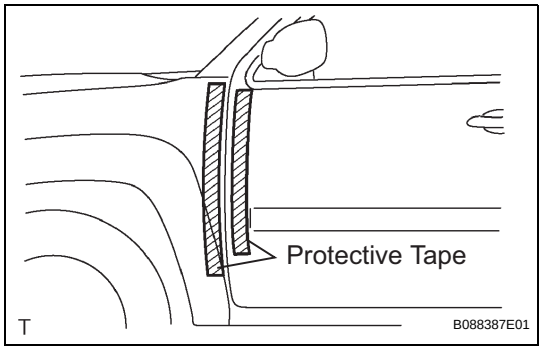
Standard:

Area	Measurement	Area	Measurement
A	4.6 +- 1.5 mm (0.181 +- 0.059 in.)	F	5.0 +- 1.5 mm (0.197 +- 0.059 in.)
B	5.0 +- 1.5 mm (0.197 +- 0.059 in.)	G	1.9 +- 1.5 mm (0.075 +- 0.059 in.)
C	3.0 +- 1.5mm (0.118 +- 0.059 in.)	H	6.0 +- 1.5mm (0.236 +- 0.059 in.)
D	5.0 +- 1.5 mm (0.197 +- 0.059 in.)	I	5.0 +- 1.5mm (0.197 +- 0.059 in.)
E	2.7 +- 1.5mm (0.106 +- 0.059 in.)	J	2.0 +- 1.5mm (0.079 +- 0.059 in.)

3. ADJUST FRONT DOOR PANEL SUB-ASSEMBLY LH

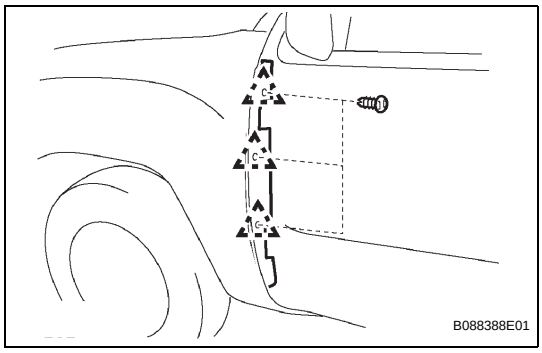
(a) Disconnect the cable from the negative battery terminal.
CAUTION:
Work must be started at least 90 seconds after the ignition switch is turned to OFF and and the cable is disconnected from the negative battery terminal. (The SRS is equipped with a back-up power source. If work is started within 90 seconds of disconnecting the cable from the negative battery terminal and the ignition switch being turned to OFF, the SRS may deploy.)

(b) Apply strips of protective tape to the door panel and fender panel, as shown in the illustration.



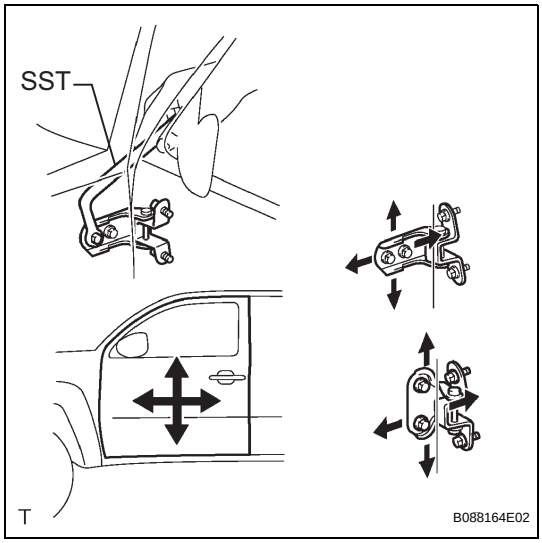
(c) Open the door, and then disengage the 3 clips.
HINT:
If any clips are damaged, replace them with new ones.

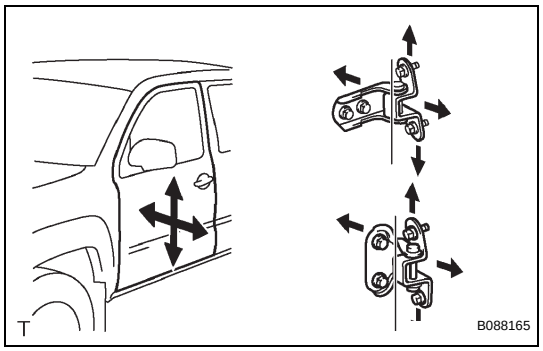
(d) Remove the front fender side panel protector LH from the gap between the fender and door.



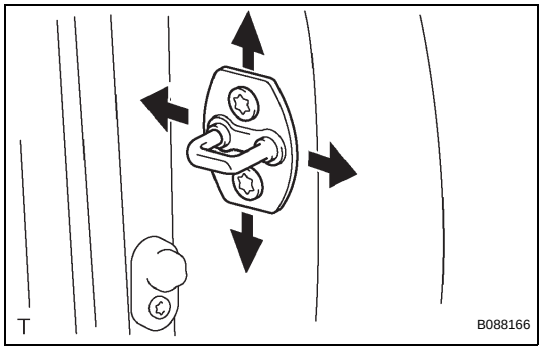
(e) Using SST, adjust the door horizontally and vertically by loosening the body side hinge bolts.
SST 09812-00010

(f) Tighten the body side hinge bolts after the adjustment.
Torque: 26 N*m (265 kgf*cm, 19 ft.*lbf)



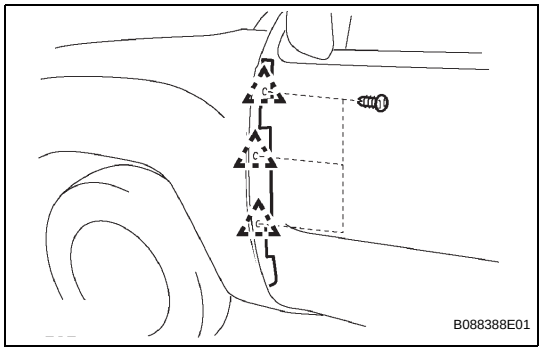


(g) Horizontally and vertically adjust the door by loosening the door side hinge bolts.
(h) Tighten the door side hinge bolts after the adjustment.
Torque: 26 N*m (265 kgf*cm, 19 ft.*lbf)



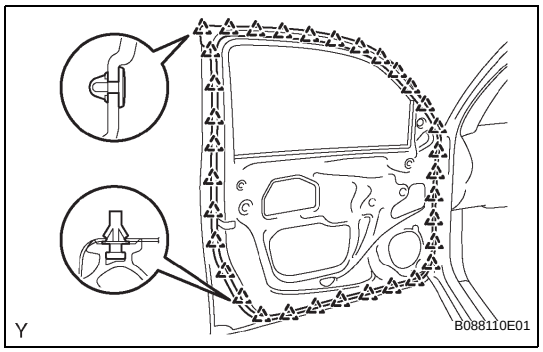
(i) Adjust the striker position by slightly loosening the striker mounting screws with a torx socket wrench T40 and hitting the striker with a plastic hammer.
(j) Using a torx socket wrench T40, tighten the striker mounting screws after the adjustment.
Torque: 23 N*m (235 kgf*cm, 17 ft.*lbf)

ED

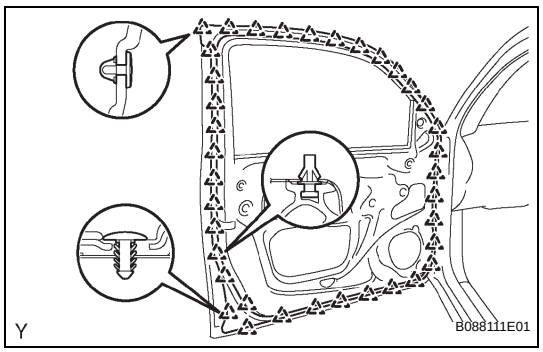


(k) Install the front fender side panel protector LH with the 3 clips.
(l) Connect the cable to the negative battery terminal.
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
(m) Inspect the SRS warning lamp (See page RS-28)

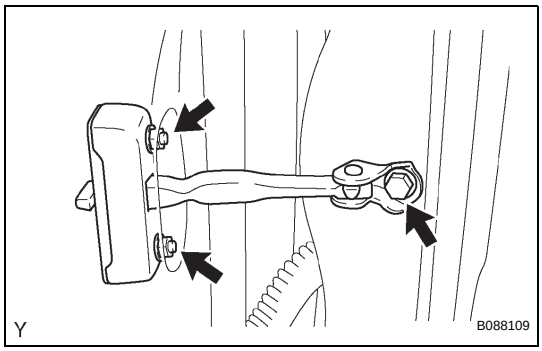
REASSEMBLY



1. INSTALL FRONT DOOR WEATHERSTRIP LH (for Double Cab)
(a) Engage the 34 clips and install a new front door weatherstrip LH.
(b) Remove the tab tape at both ends of 2-sided tape attached to the weather strip, and attach the weather strip to the door panel with the 2-sided tape.



2. INSTALL FRONT DOOR WEATHERSTRIP LH (for Access Cab)
(a) Engage the 36 clips and install a new front door weatherstrip LH.
(b) Remove the tab tape at both ends of 2-sided tape attached to the weather strip, and attach the weather strip to the door panel with the 2-sided tape.



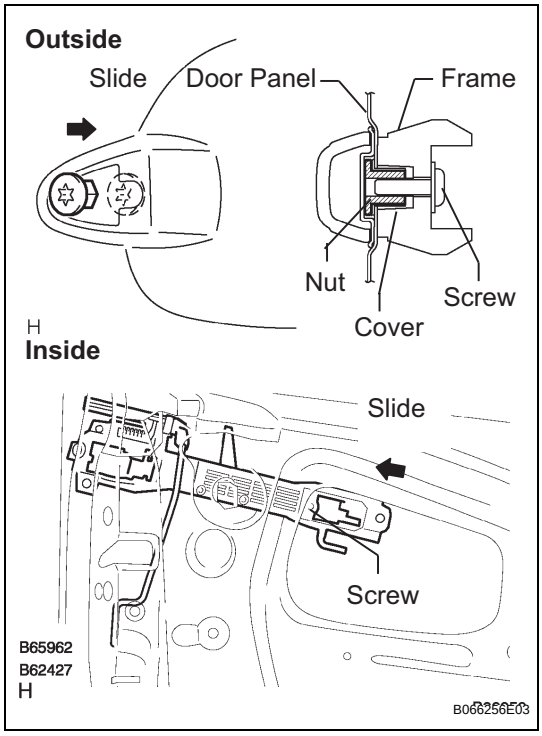
3. INSTALL FRONT DOOR CHECK ASSEMBLY LH

(a) Apply MP grease to the sliding areas of the check.

(b) Install the front door check assembly LH onto the door panel with the 2 nuts.
Torque: 5.5 N*m (56 kgf*cm, 49 in.*lbf)

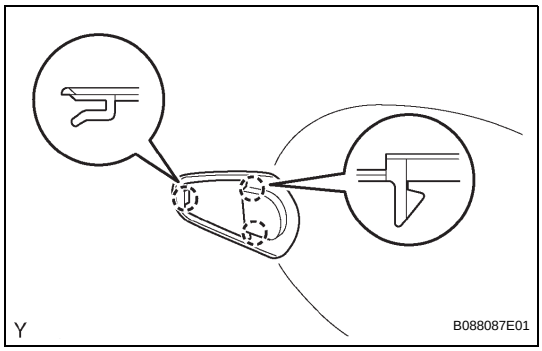
(c) Apply adhesive to the threads of the bolt.
Adhesive:
Part No. 08833-00070, THREE BOND 1324 or equivalent

(d) Install the front door check assembly LH onto the body panel with the bolt.
Torque: 30 N*m (306 kgf*cm, 22 ft.*lbf)



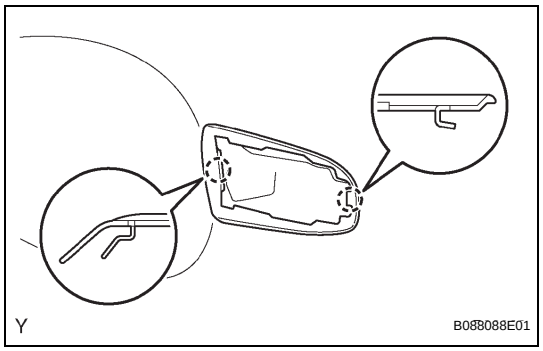
4. INSTALL FRONT DOOR OUTSIDE HANDLE FRAME SUB-ASSEMBLY LH

(a) Using a torx socket wrench T30 , install the outside handle frame sub-assembly with the screw.
Torque: 7.0 N*m (71 kgf*cm, 62 in.*lbf)
NOTICE:
A cover should be inserted between the nut and the door panel.

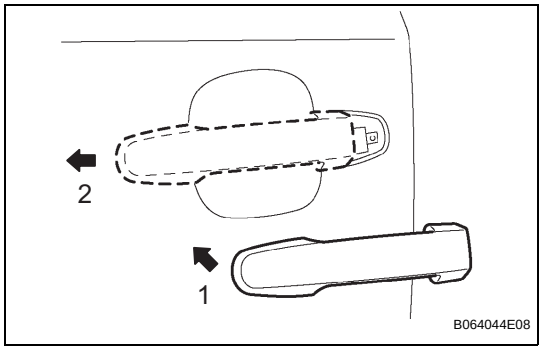


5. INSTALL FRONT DOOR OUTSIDE HANDLE ASSEMBLY LH

(a) Engage the 3 claws and install the front door outside handle front pad.



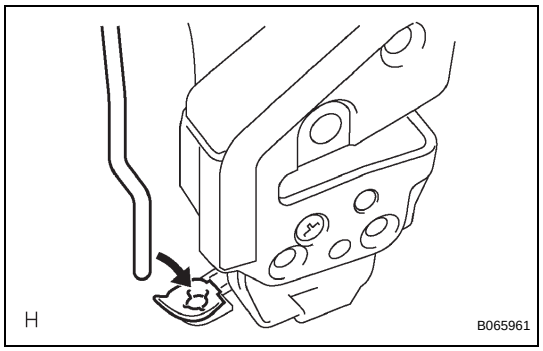
(b) Engage the 2 claws and install the front door outside handle rear pad.



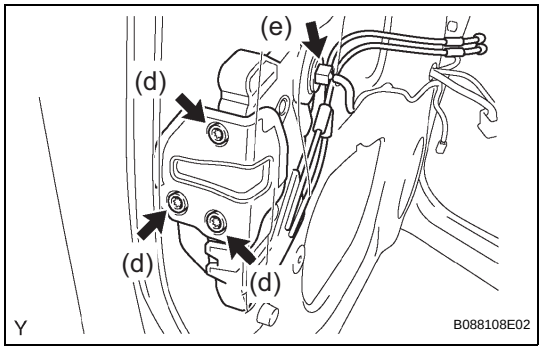
(c) Pushing the front door handle assembly outside LH in the direction of the arrow marks shown in the illustration, install the front door outside handle assembly LH.

6. INSTALL FRONT DOOR LOCK ASSEMBLY LH

(a) Apply MP grease to the sliding and rotating areas of the front door lock assembly LH.
NOTICE:
- **If reusing a door lock assembly that has been removed, replace the packing in the connecting part with new.**
- **Make sure that no grease or dirt adheres to the packing surface in the connecting part.**
- **Reusing removed packing or using damaged packing will allow water to penetrate through the connecting part, and will result in a malfunction of the door lock assembly.**



(b) Insert the door lock open rod into the front door lock assembly, then set it to the door panel.
NOTICE:
Make sure that the outside handle link is securely engaged with the door lock assembly.

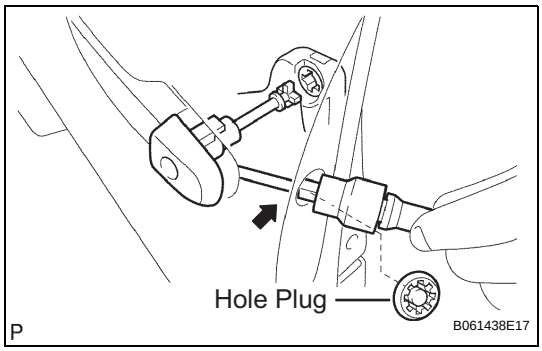


(c) Apply adhesive to the threads of the 3 screws.
Adhesive:
Part No. 08833-00070, THREE BOND 1324 or equivalent

(d) Using a torx socket wrench T30 , install the door lock assembly with the 3 screws.
Torque: 12 N*m (122 kgf*cm, 9 ft.*lbf)

(e) Connect the front door lock connector.

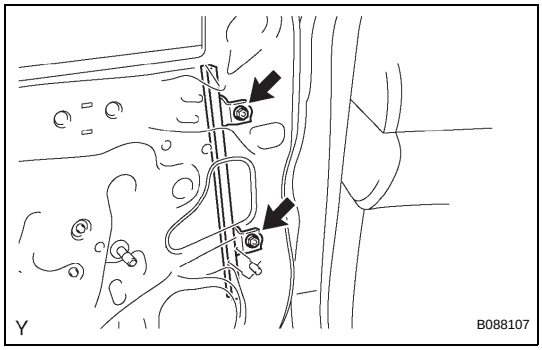
ED



7. INSTALL FRONT DOOR OUTSIDE HANDLE COVER LH

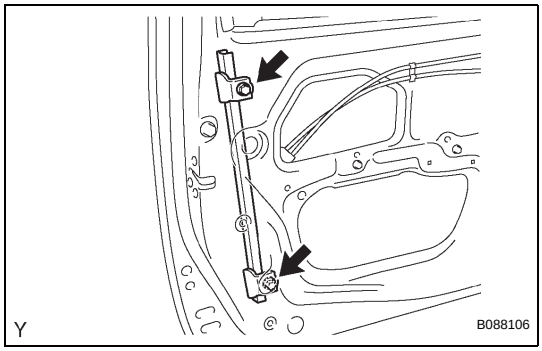
(a) Using a torx socket wrench T30 , install the front door outside handle cover LH with the screw.
Torque: 7.0 N*m (71 kgf*cm, 62 in.*lbf)

(b) Install the hole plug.



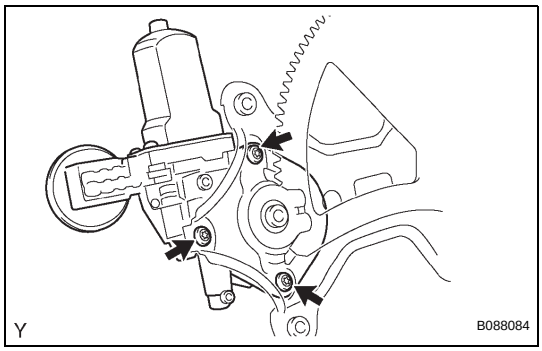
8. INSTALL FRONT DOOR FRONT LOWER FRAME SUB-ASSEMBLY LH

(a) Install the front door front lower frame sub-assembly LH with the 2 nuts.
Torque: 5.5 N*m (56 kgf*cm, 49 in.*lbf)



9. INSTALL FRONT DOOR REAR LOWER FRAME SUB-ASSEMBLY LH

(a) Install the front door rear lower frame sub-assembly LH with the 2 bolts.
Torque: 8.0 N*m (82 kgf*cm, 70 in.*lbf)



10. INSTALL POWER WINDOW REGULATOR MOTOR ASSEMBLY LH

(a) Align the matchmarks on the power window regulator motor gear and regulator gear.

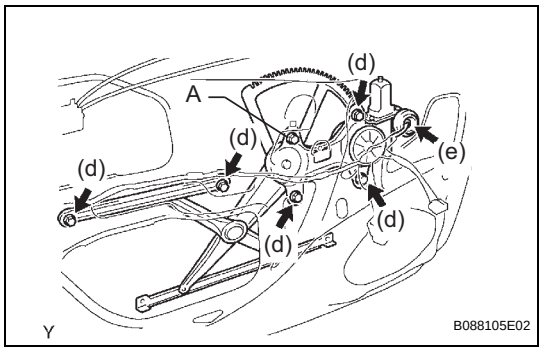
(b) Using a torx driver T25 , install the power window regulator motor assembly LH with the 3 screws.
Torque: 5.4 N*m (55 kgf*cm, 48 in.*lbf)
HINT:
Never rotate the motor assembly downward until the window glass installation is complete.

11. INSTALL FRONT DOOR WINDOW REGULATOR SUB-ASSEMBLY LH

(a) Apply MP grease to the sliding and rotating parts of the front door window regulator assembly LH.
NOTICE:
Do not apply grease to the window regulator spring.

(b) Loosely screw bolt A onto the front door window regulator sub-assembly LH.

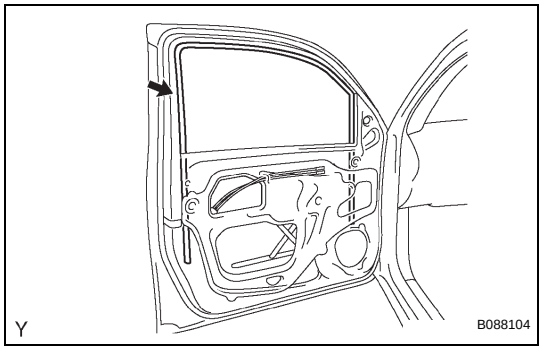
ED



(c) Insert the front door window regulator into the door panel. Use bolt A to hang the front door window regulator on the door panel.
NOTICE:
Be careful not to drop the window regulator as it may be damaged.

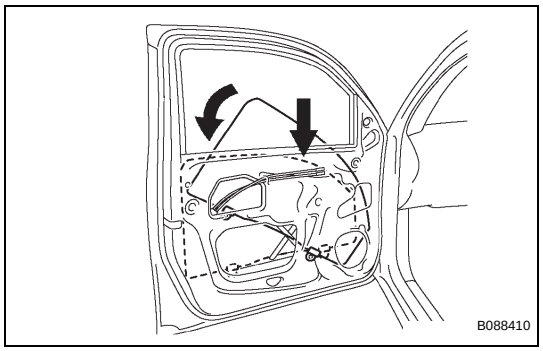
(d) Install the front door window regulator with the 5 bolts, and then tighten bolt A.
Torque: 11 N*m (112 kgf*cm, 8 ft.*lbf)

(e) Connect the front door power window regulator connector.



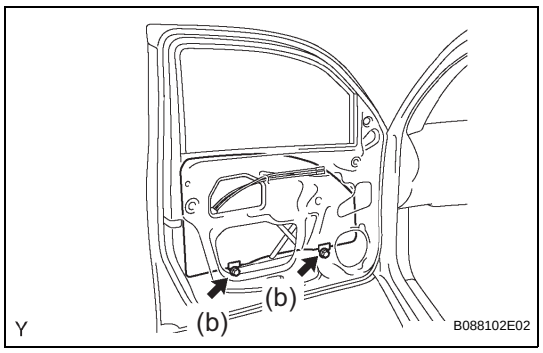
12. INSTALL FRONT DOOR GLASS RUN LH

(a) Install the front door glass run LH.



13. INSTALL FRONT DOOR GLASS SUB-ASSEMBLY LH

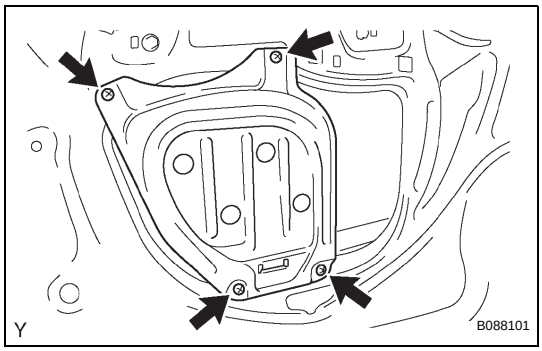
(a) Insert the front door glass sub-assembly LH into the door panel along the glass run as indicated by the arrow marks in the illustration.



(b) Install the front door glass sub-assembly LH into the front door window regulator sub-assembly LH with the 2 bolts.
Torque: 8.0 N*m (82 kgf*cm, 71 in.*lbf)

(c) Check the operation of the power window.
HINT:
When the door glass sub-assembly is not installed at the proper installation position, adjust the regulator position manually.
(1) Connect the power window switch to the wire harness and turn the ignition switch to ON.
(2) Repeat UP and DOWN operations several times manually.

ED

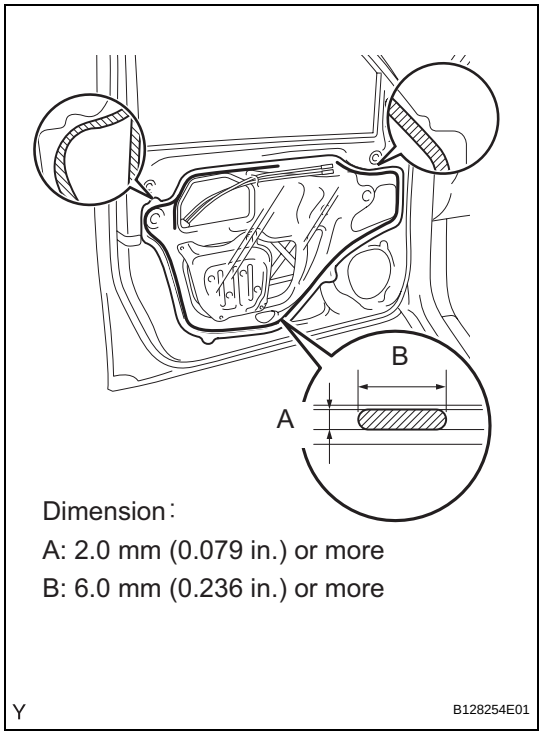


14. INSTALL FRONT DOOR INSIDE PANEL PLATE LH

(a) Install the front door inside panel plate LH with the 4 screws.

15. INSTALL FRONT DOOR BELT MOULDING LH (See page ET-33)

16. INSTALL OUTER REAR VIEW MIRROR ASSEMBLY LH (See page MI-10)



17. INSTALL FRONT DOOR SERVICE HOLE COVER LH

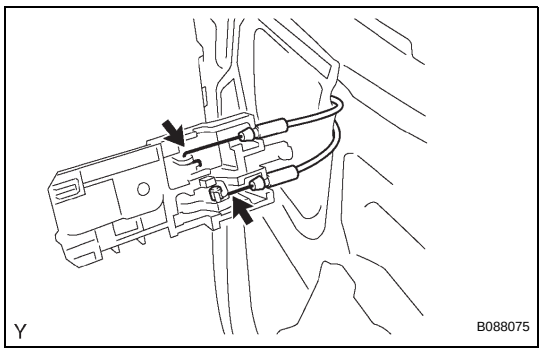
(a) Apply butyl tape to the door panel, then install the front door service hole cover LH as shown in the illustration.

Adhesive:

Part No. 08850-00065, Butyl Tape Set or equivalent

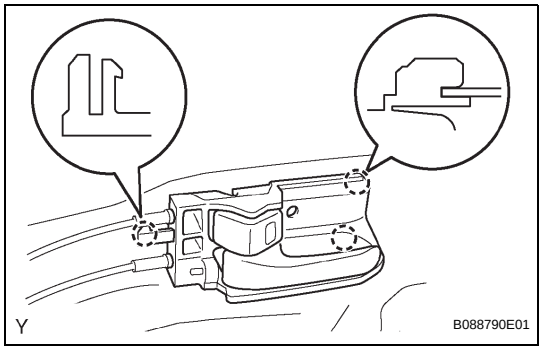
HINT:

- When installing the service hole cover, pull the links and connectors out through the service hole cover.
- There should be no wrinkles or folds after attaching the service hole cover.
- After attaching the service hole cover, check the quality of the seal.

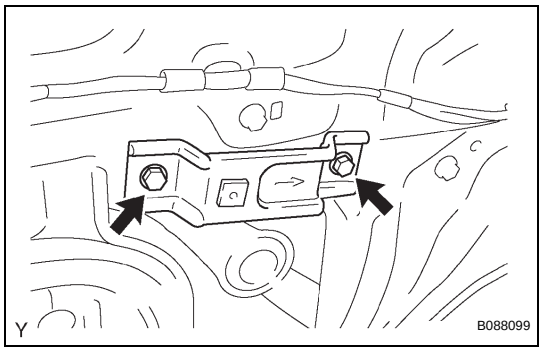


18. INSTALL FRONT DOOR INSIDE HANDLE SUB-ASSEMBLY LH

(a) Connect the 2 cables to the front door inside handle sub-assembly LH.

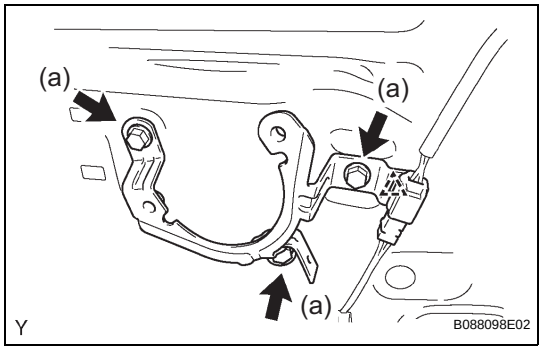


(b) Engage the 3 claws and install the front door inside handle sub-assembly LH onto the door panel.



19. INSTALL NO. 1 DOOR TRIM BRACKET RH

(a) Install the No. 1 door trim bracket with the 2 screws.



20. INSTALL FRONT NO. 1 SPEAKER BRACKET

(a) Install the front No. 1 speaker bracket with the 3 screws.

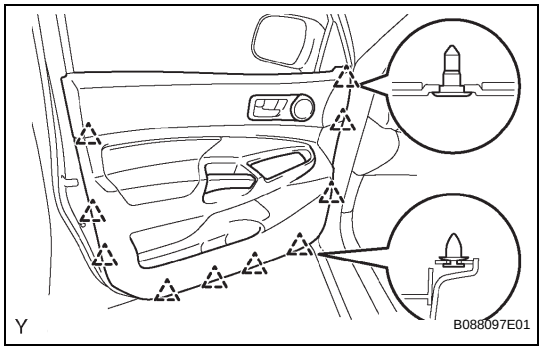
(b) Connect the wire harness clamp and connector.

21. INSTALL FRONT NO. 2 SPEAKER ASSEMBLY (See page AV-83)

22. INSTALL FRONT NO. 1 SPEAKER ASSEMBLY

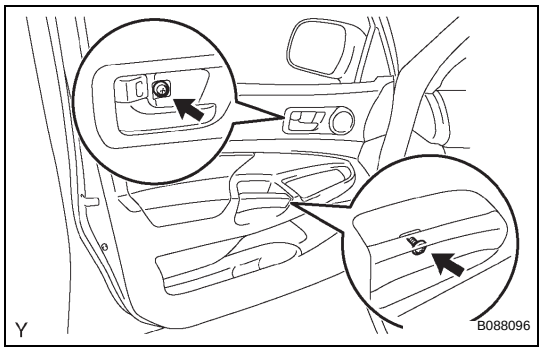
HINT:

- Regular cab (See page AV-76)
- Except regular cab (See page AV-79)

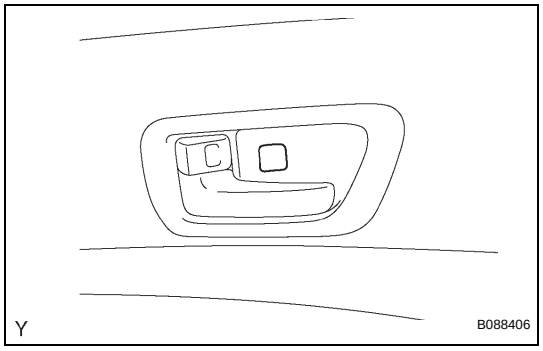


23. INSTALL FRONT DOOR TRIM PANEL ASSEMBLY LH

(a) Engage the 10 clips and install the front door trim panel assembly LH.

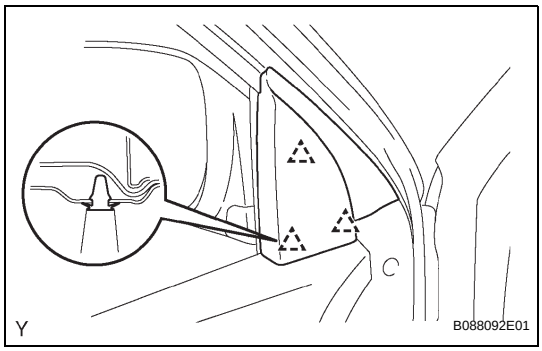


(b) Install the 2 screws.



(c) Close the cover.

ED

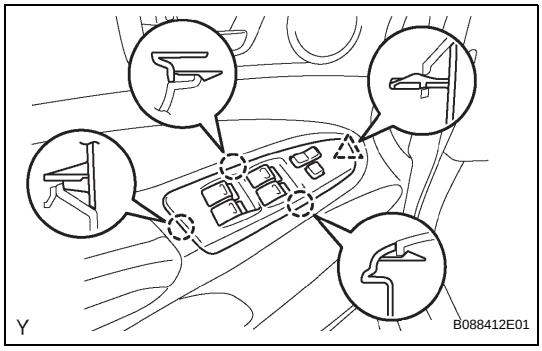


24. INSTALL FRONT DOOR LOWER FRAME BRACKET GARNISH LH

(a) Engage the 3 clips and install the front lower frame bracket garnish LH.

NOTICE:

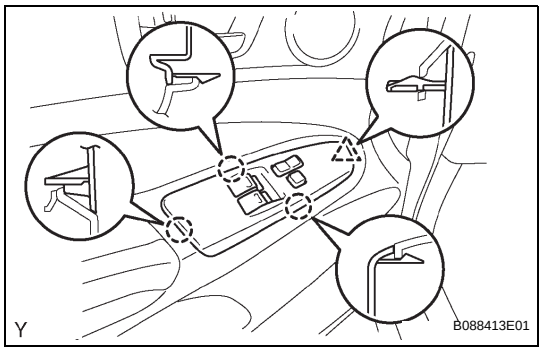
Confirm that no clips remain on the door panel before the garnish is installed. Transfer any remaining clips to the garnish side before installing it. Installing the garnish with any clips remaining on the door panel side could cause the clips to drop inside the door panel.



25. INSTALL POWER WINDOW REGULATOR MASTER SWITCH ASSEMBLY (for Double Cab)

(a) Connect the connector.

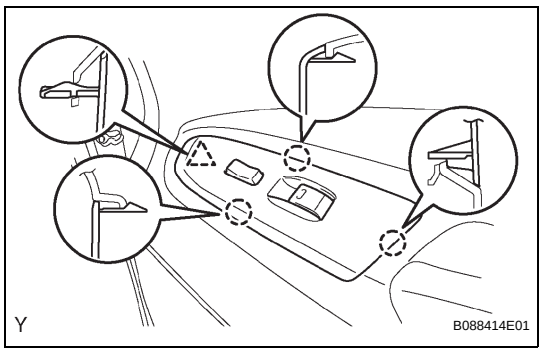
(b) Engage the 3 claws and clip, and install the power window regulator master switch assembly.



26. INSTALL POWER WINDOW REGULATOR MASTER SWITCH ASSEMBLY (for Access Cab)

(a) Connect the connector.

(b) Engage the 3 claws and clip, and install the power window regulator master switch assembly.



27. INSTALL POWER WINDOW REGULATOR SWITCH ASSEMBLY

(a) Connect the connector.

(b) Engage the 3 claws and clip, and install the power window regulator switch assembly.

28. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

ED

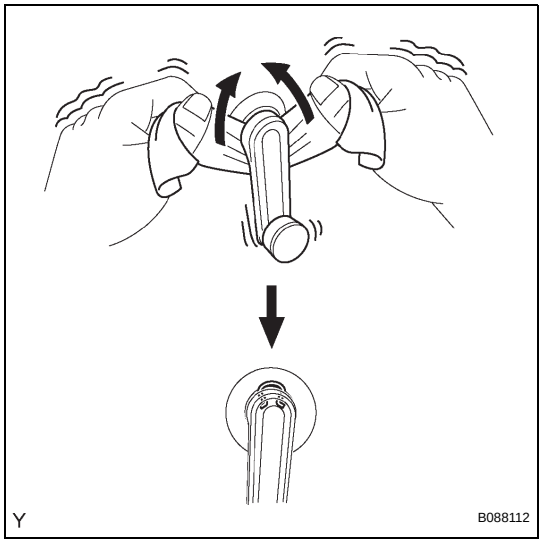
DISASSEMBLY

HINT:
Use the same procedures for the RH and LH sides.

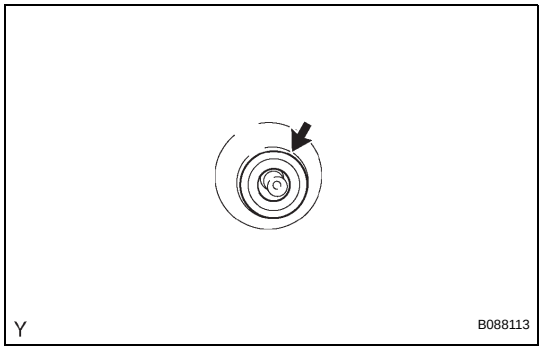
1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

2. REMOVE FRONT DOOR WINDOW REGULATOR HANDLE ASSEMBLY

(a) Pull out the snap ring with a cloth as shown in the illustration, then remove the door window regulator handle assembly.



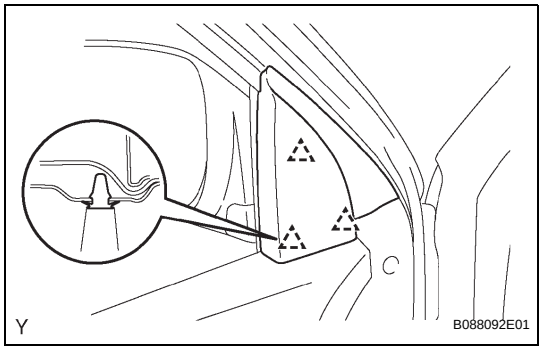
(b) Remove the window regulator handle plate.

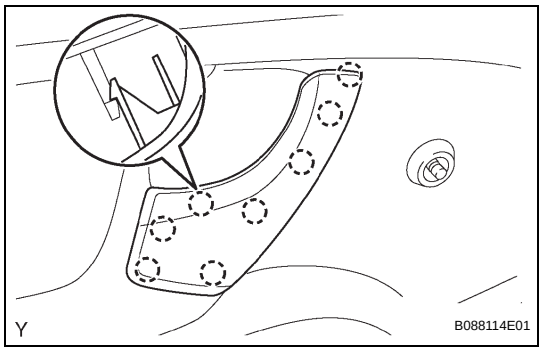


3. REMOVE FRONT DOOR LOWER FRAME BRACKET GARNISH LH

(a) Disengage the 3 clips and remove the front door lower frame bracket garnish LH.

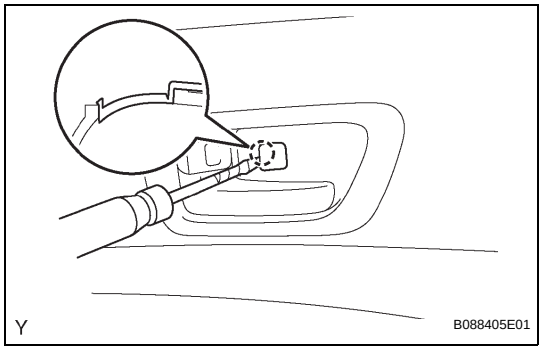
NOTICE:
Confirm that no clips remain on the door panel when the garnish is removed. Transfer any remaining clips to the garnish side before installing.



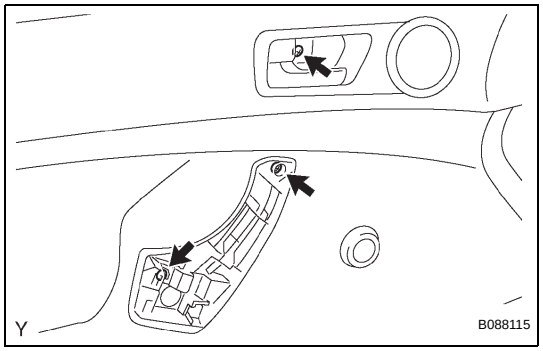


4. REMOVE FRONT DOOR TRIM PANEL ASSEMBLY LH

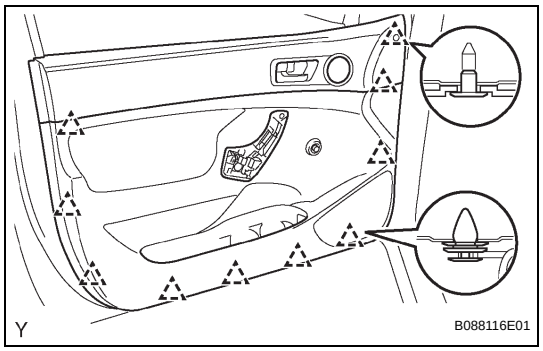
(a) Using a screwdriver with its tip wrapped in protective tape, disengage the 8 claws and remove the door assist grip cover LH.



(b) Using a screwdriver with its tip wrapped in protective tape, open the cover.



(c) Remove the 3 screws.



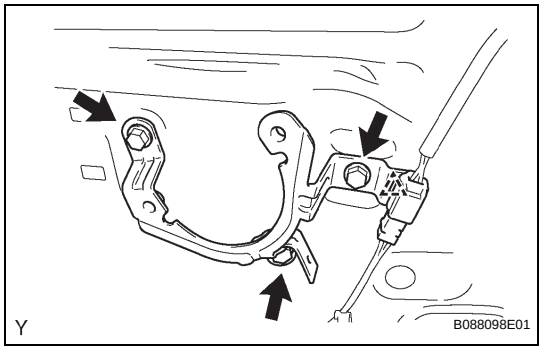
(d) Disengage the 10 clips and remove the front door trim panel assembly LH.

5. REMOVE FRONT NO. 1 SPEAKER ASSEMBLY

HINT:

- Regular cab (See page AV-76)
- Except regular cab (See page AV-78)

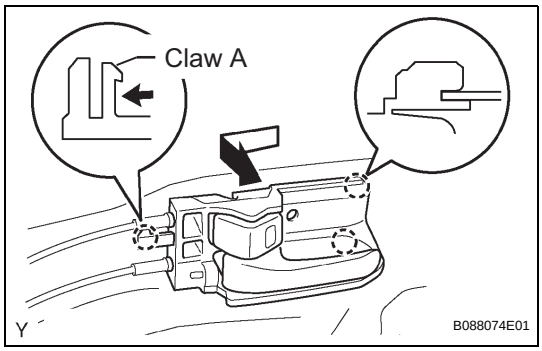
6. REMOVE FRONT NO. 2 SPEAKER ASSEMBLY (See page AV-83)



7. REMOVE FRONT NO. 1 SPEAKER BRACKET

(a) Remove the 3 screws and remove the front No. 1 speaker bracket.

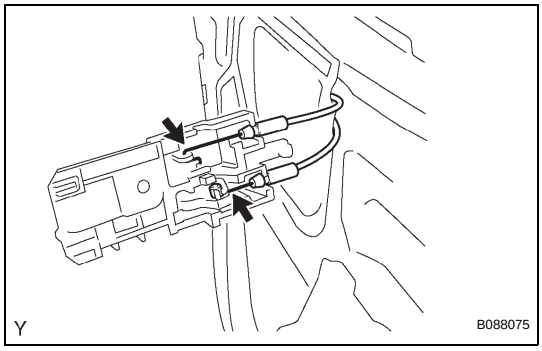
ED



8. REMOVE FRONT DOOR INSIDE HANDLE SUB-ASSEMBLY LH

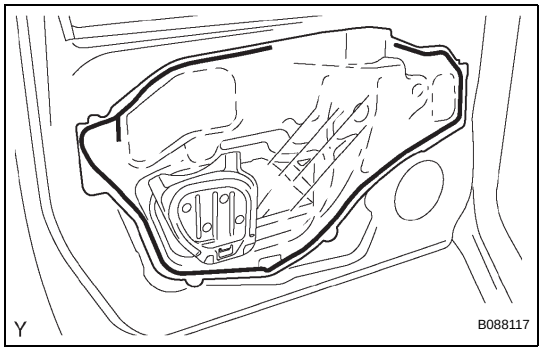
(a) Using a screwdriver with its tip wrapped in protective tape, disengage claw A as shown in the illustration.

(b) Move the front door inside handle sub-assembly LH in the direction indicated by the arrow mark in the illustration. This will release the claw and allow the removal of the front door inside handle sub-assembly LH.



(c) Disconnect the 2 cables from the front door inside handle sub-assembly LH.

ED



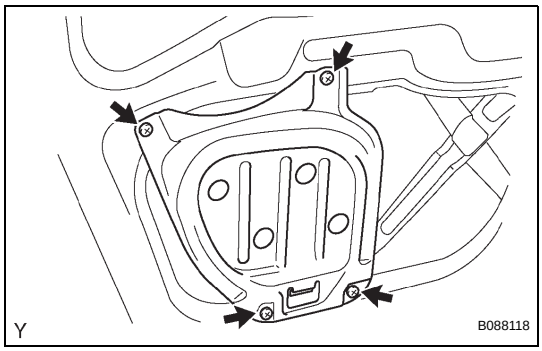
9. REMOVE FRONT DOOR SERVICE HOLE COVER LH

(a) Remove the front door service hole cover LH.

NOTICE:
Remove the remaining tape on the door side.

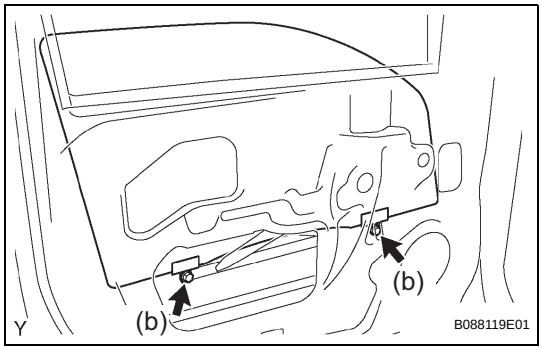
10. REMOVE OUTER REAR VIEW MIRROR ASSEMBLY LH (See page MI-8)

11. REMOVE FRONT DOOR BELT MOULDING LH (See page ET-32)



12. REMOVE FRONT DOOR INSIDE PANEL PLATE LH

(a) Remove the 4 screws and front door inside panel plate LH.



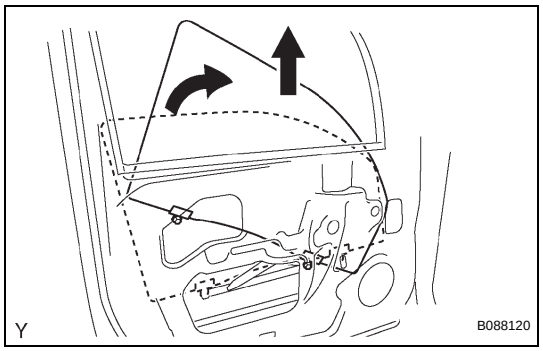
13. REMOVE FRONT DOOR GLASS SUB-ASSEMBLY LH

HINT:
Insert a shop rag inside the door panel to prevent the glass from being scratched.

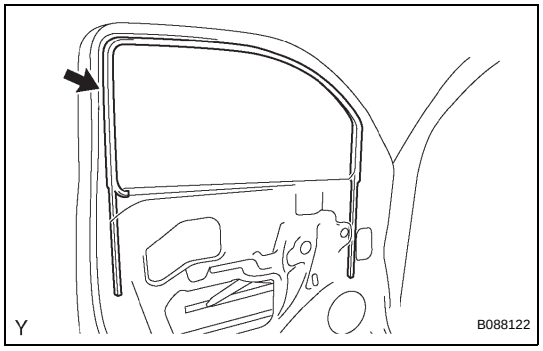
(a) Move the front door glass sub-assembly LH until the 2 bolts appear in the service holes.

(b) Remove the 2 bolts.

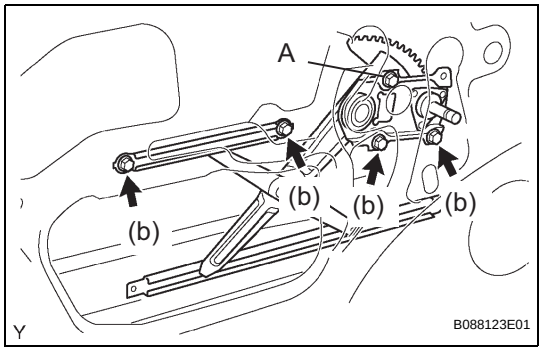
NOTICE:
Be careful when removing the 2 bolts as the glass may fall and be damaged.



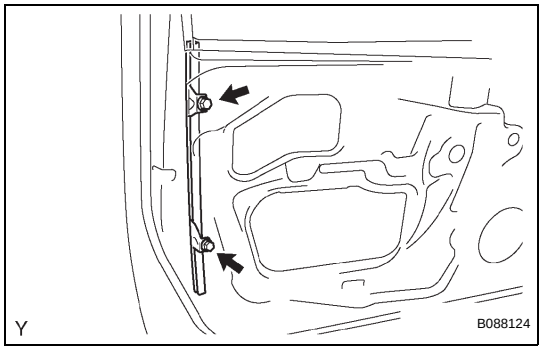
(c) Remove the front door glass sub-assembly LH by moving it in the direction indicated by the arrow marks in the illustration.
NOTICE:
Be careful not to damage the glass.



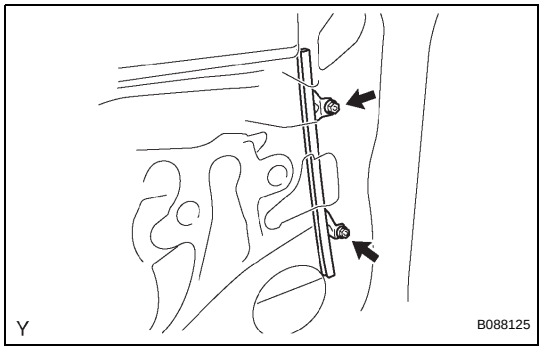
14. REMOVE FRONT DOOR GLASS RUN LH
(a) Remove the front door glass run LH.



15. REMOVE FRONT DOOR WINDOW REGULATOR SUB-ASSEMBLY LH
(a) Loosen bolt A.
(b) Remove the 4 bolts, then remove the front door window regulator sub-assembly LH.
NOTICE:
Be careful when removing the bolts as the window regulator may fall and be damaged.
HINT:
Remove the window regulator through the service hole.

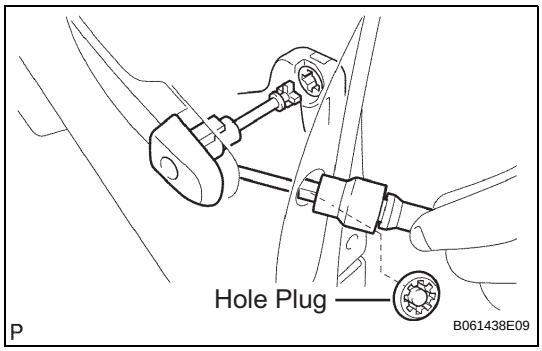


16. REMOVE FRONT DOOR REAR LOWER FRAME SUB-ASSEMBLY LH
(a) Remove the 2 bolts, then remove the front door rear lower frame sub-assembly LH.



17. REMOVE FRONT DOOR FRONT LOWER FRAME SUB-ASSEMBLY LH
(a) Remove the 2 nuts, then remove the front door front lower frame sub-assembly LH.

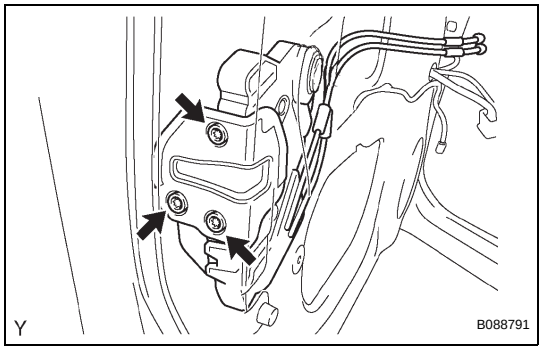
ED



18. REMOVE FRONT DOOR OUTSIDE HANDLE COVER LH

(a) Remove the hole plug.

(b) Using a torx socket wrench T30 , loosen the screw and remove the front door outside handle cover LH.



19. REMOVE FRONT DOOR LOCK ASSEMBLY LH

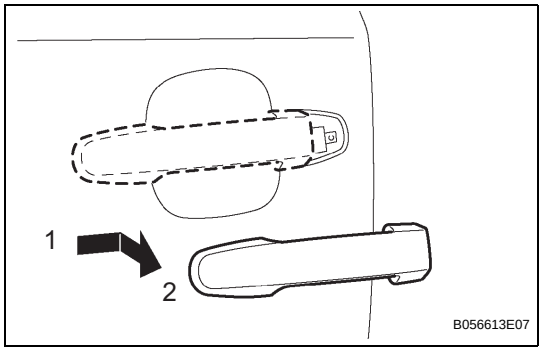
(a) Using a torx socket wrench T30 , remove the 3 screws and remove the front door lock assembly LH.

NOTICE:

Be careful when removing the 3 screws as the door lock may fall and be damaged.

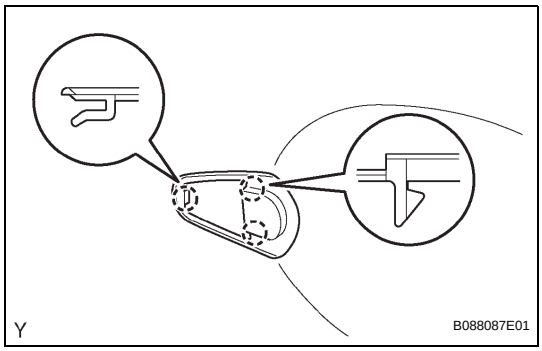
HINT:

Remove the door lock through the service hole.

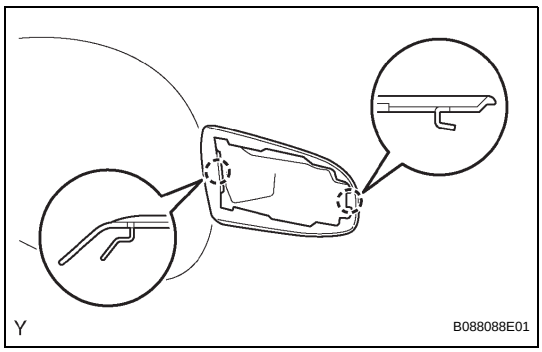


20. REMOVE FRONT DOOR OUTSIDE HANDLE ASSEMBLY LH

(a) Remove the front door outside handle assembly LH by sliding and pulling it in the direction indicated by the arrow mark in the illustration.

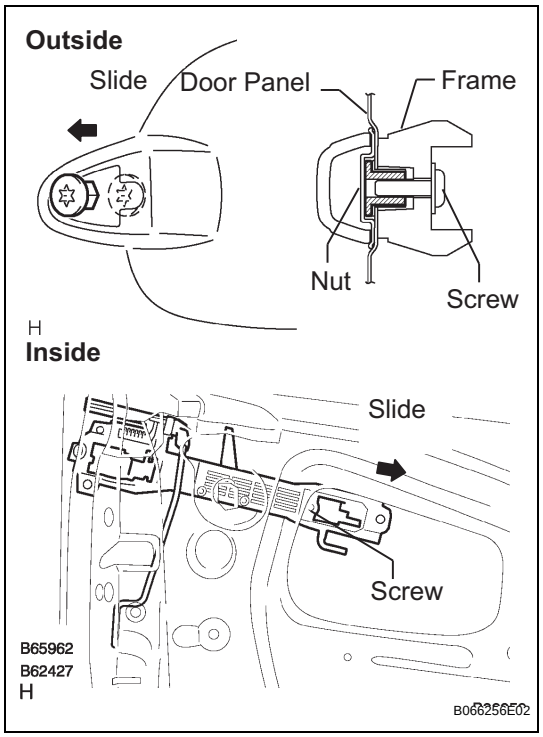


(b) Disengage the 3 claws and remove the front door outside handle front pad.



(c) Disengage the 2 claws and remove the front door outside handle rear pad.

ED



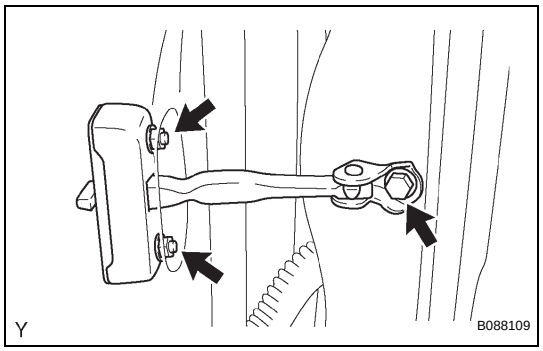
21. REMOVE FRONT DOOR OUTSIDE HANDLE FRAME SUB-ASSEMBLY LH

(a) Using a torx socket wrench T30 , loosen the screw.

(b) Slide the outside handle frame sub-assembly to remove it.

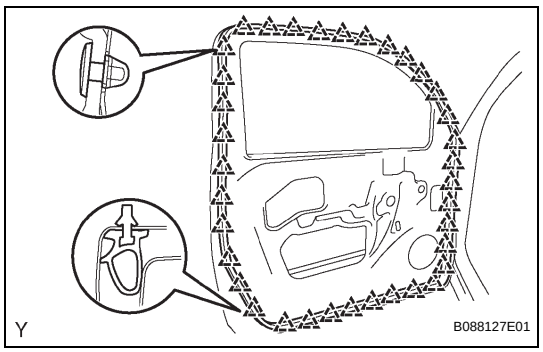
HINT:

Remove the outside handle frame sub-assembly through the service hole.



22. REMOVE FRONT DOOR CHECK ASSEMBLY LH

(a) Remove the 2 nuts and bolt, then remove the front door check assembly LH.

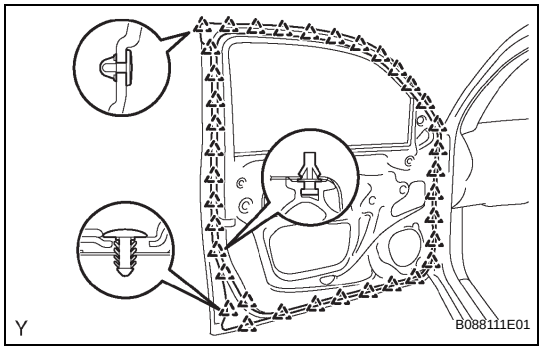


23. REMOVE FRONT DOOR WEATHERSTRIP LH (for Regular Cab)

(a) Disengage the 36 clips and remove the front door weatherstrip LH.

NOTICE:

Remove the remaining tape on the door side.



24. REMOVE FRONT DOOR WEATHERSTRIP LH (for Access Cab)

(a) Disengage the 36 clips and remove the front door weatherstrip LH.

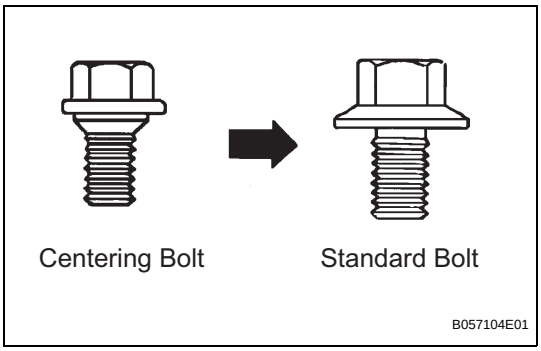
NOTICE:

Remove the remaining tape on the door side.

ADJUSTMENT

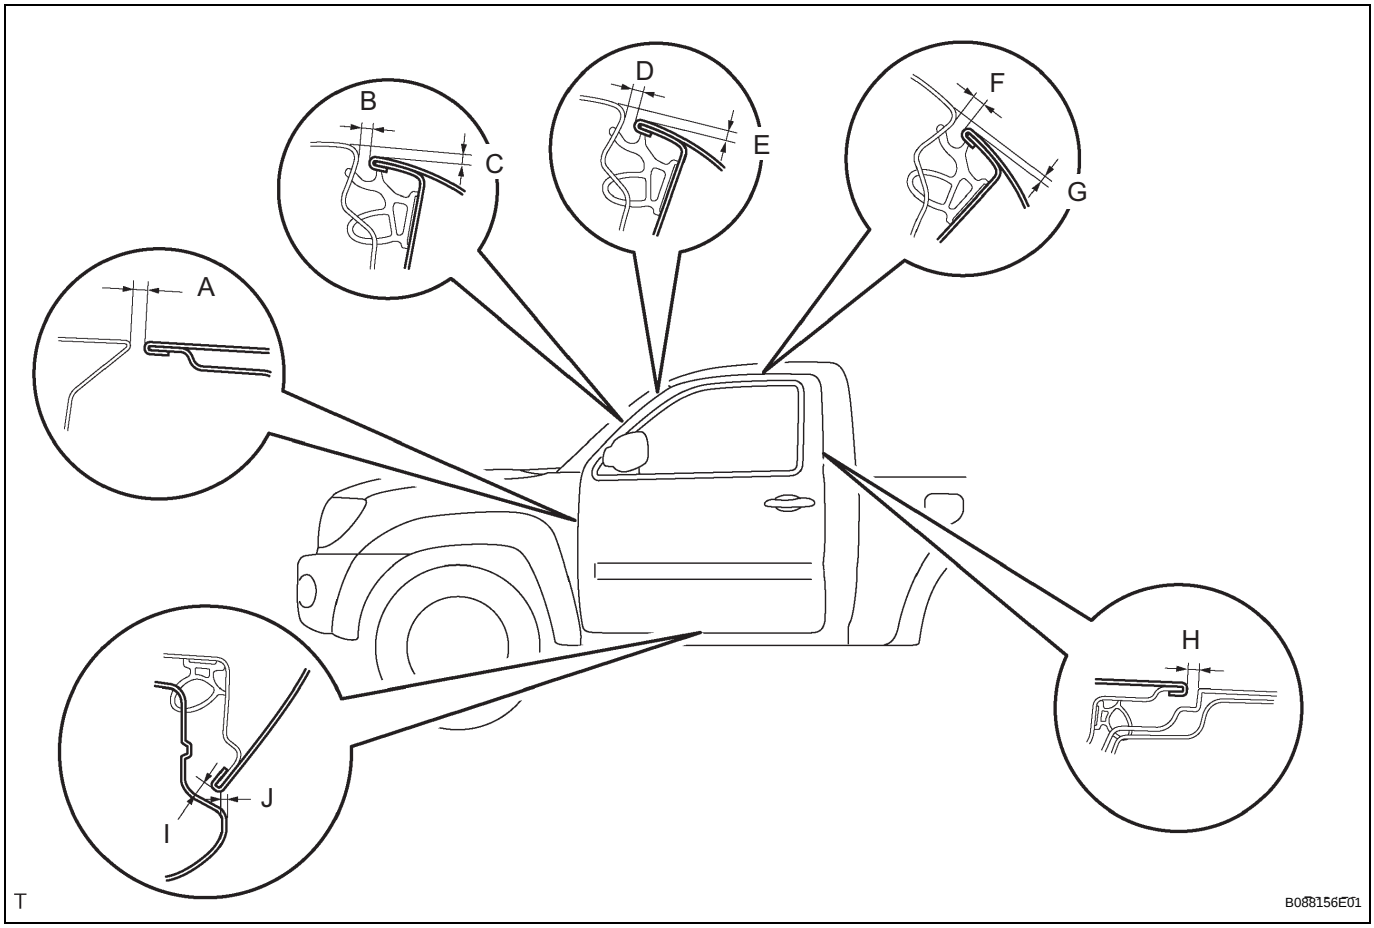
HINT:

- Before adjusting the positions of doors on vehicles equipped with side airbags and curtain shield airbags, be sure to disconnect the cable from the negative battery terminal. After making adjustments, inspect the SRS warning lamp, the side airbag system and the curtain shield airbag system for normal operation (See page RS-28).
- Use the same procedure for both the RH and LH sides.
- The procedures listed below are for the LH side.
- Centering bolts are used to mount the door hinge onto the vehicle body and door. The doors cannot be adjusted with the centering bolts on. Substitute the standard bolts (with washers) for the centering bolts when making adjustments.
- For bolts without torque specifications, check the standard bolt chart (See page SS-2).



1. INSPECT FRONT DOOR PANEL SUB-ASSEMBLY LH

(a) Check that the clearance measurements of areas A to J are within the standard ranges.



Standard:

Area	Measurement	Area	Measurement
A	4.6 +- 1.5 mm (0.181 +- 0.059 in.)	F	5.0 +- 1.5 mm (0.197 +- 0.059 in.)
B	5.0 +- 1.5 mm (0.197 +- 0.059 in.)	G	1.9 +- 1.5 mm (0.075 +- 0.059 in.)
C	3.0 +- 1.5 mm (0.118 +- 0.059 in.)	H	4.5 +- 1.5 mm (0.177 +- 0.059 in.)

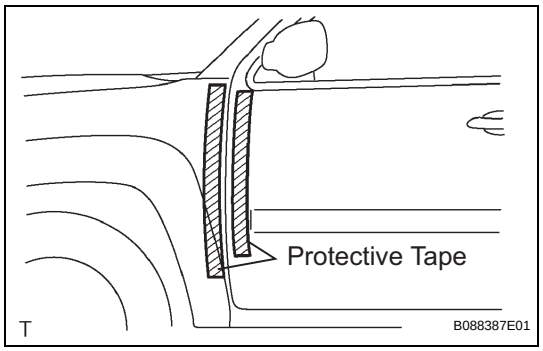
Area	Measurement	Area	Measurement
D	5.0 +- 1.5 mm (0.197 +- 0.059 in.)	I	5.0 +- 1.5 mm (0.197 +- 0.059 in.)
E	2.7 +- 1.5 mm (0.106 +- 0.059 in.)	J	2.0 +- 1.5 mm (0.079 +- 0.059 in.)

2. ADJUST FRONT DOOR PANEL SUB-ASSEMBLY LH

(a) Disconnect the cable from the negative battery terminal.

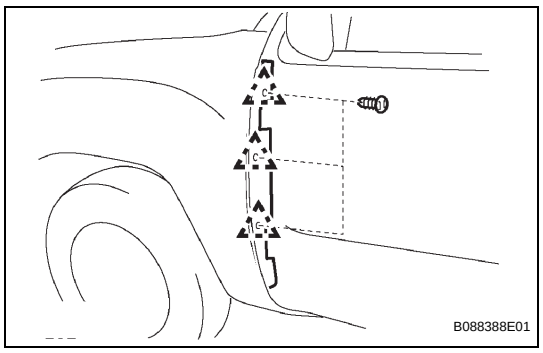
CAUTION:
Work must be started at least 90 seconds after the ignition switch is turned to OFF and the cable is disconnected from the negative battery terminal. (The SRS is equipped with a back-up power source. If work is started within 90 seconds of disconnecting the cable from the negative battery terminal and the ignition switch being turned to OFF, the SRS may deploy.)

(b) Apply strips of protective tape to the door panel and fender panel, as shown in the illustration.



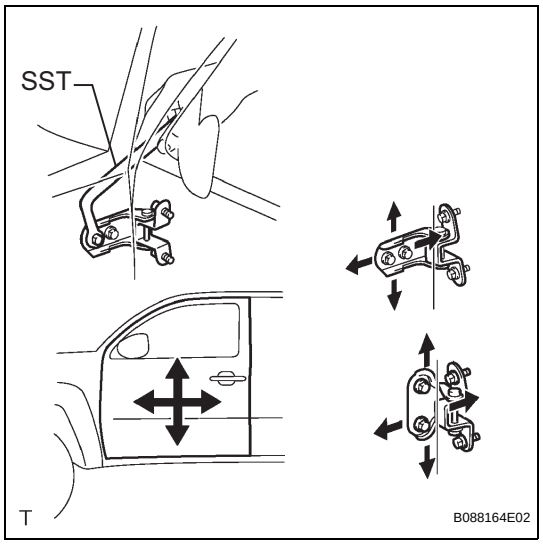
(c) Open the door, and then disengage the 3 clips.
HINT:
If any clips are damaged, replace them with new ones.

(d) Remove the front fender side panel protector LH from the gap between the fender and door.

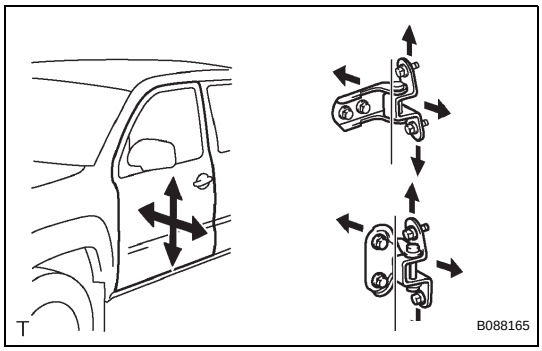


(e) Using SST, adjust the door horizontally and vertically by loosening the body side hinge bolts.
SST 09812-00010

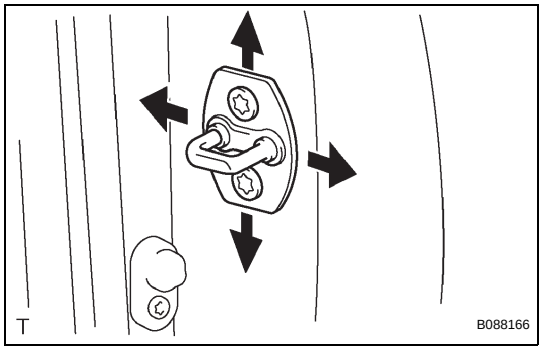
(f) Tighten the body side hinge bolts after the adjustment.
Torque: 26 N*m (265 kgf*cm, 19 ft.*lbf)



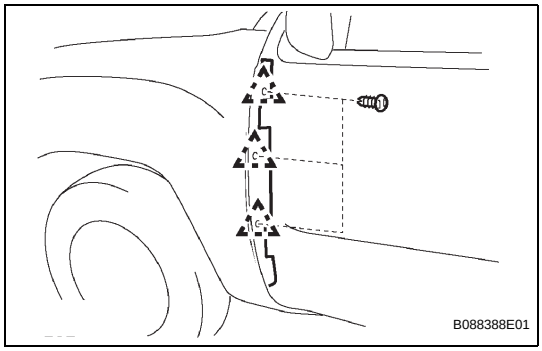
ED



(g) Horizontally and vertically adjust the door by loosening the door side hinge bolts.
(h) Tighten the door side hinge bolts after the adjustment.
Torque: 26 N*m (265 kgf*cm, 19 ft.*lbf)

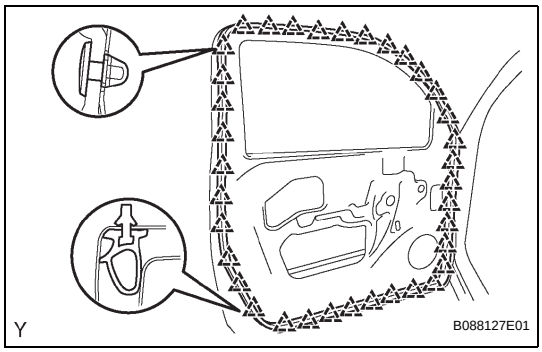


(i) Adjust the striker position by slightly loosening the striker mounting screws with a torx socket wrench T40 and hitting the striker with a plastic hammer.
(j) Using a torx socket wrench T40 , tighten the striker mounting screws after the adjustment.
Torque: 23 N*m (235 kgf*cm, 17 ft.*lbf)

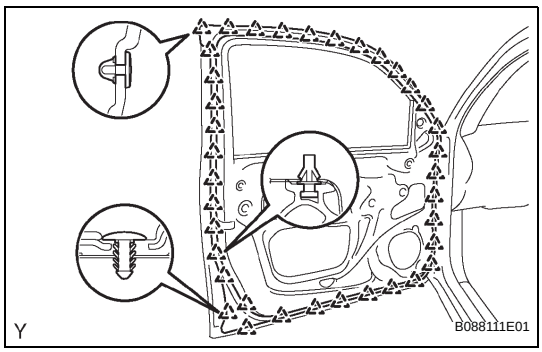


(k) Install the front fender side panel protector LH with the 3 clips.
(l) Connect the cable to the negative battery terminal.
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
(m) Inspect the SRS warning lamp (See page RS-28).

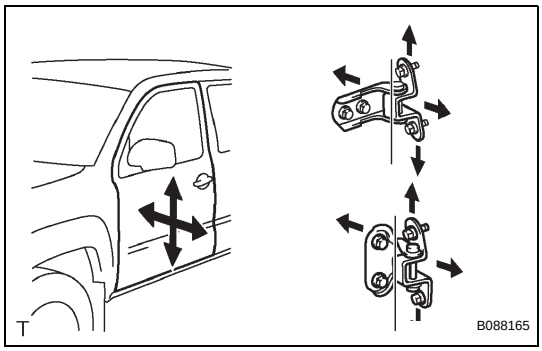
REASSEMBLY



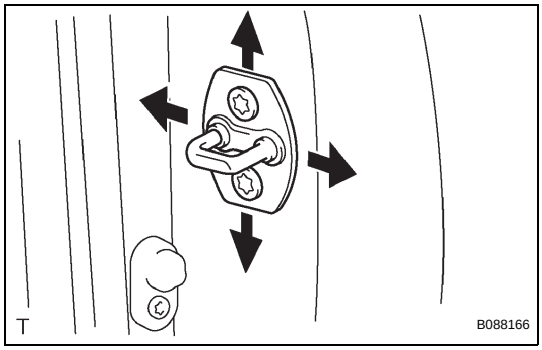
1. INSTALL FRONT DOOR WEATHERSTRIP LH (for Regular Cab)
(a) Engage the 36 clips and install a new front door weatherstrip LH.
(b) Remove the tab tape at both ends of 2-sided tape attached to the weather strip, and attach the weather strip to the door panel with the 2-sided tape.



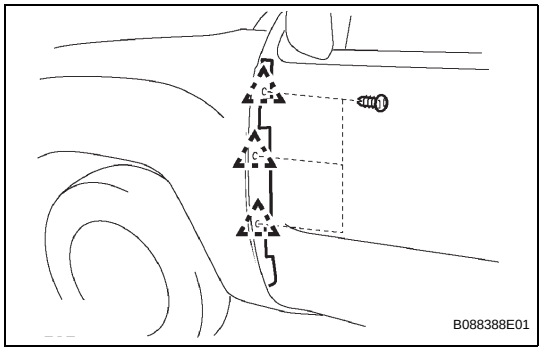
2. INSTALL FRONT DOOR WEATHERSTRIP LH (for Access Cab)
(a) Engage the 36 clips and install a new front door weatherstrip LH.
(b) Remove the tab tape at both ends of 2-sided tape attached to the weather strip, and attach the weather strip to the door panel with the 2-sided tape.



(g) Horizontally and vertically adjust the door by loosening the door side hinge bolts.
(h) Tighten the door side hinge bolts after the adjustment.
Torque: 26 N*m (265 kgf*cm, 19 ft.*lbf)

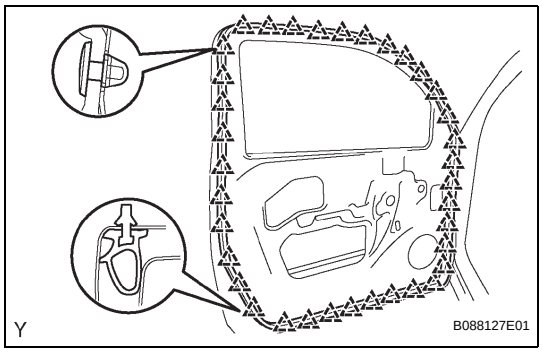


(i) Adjust the striker position by slightly loosening the striker mounting screws with a torx socket wrench T40 and hitting the striker with a plastic hammer.
(j) Using a torx socket wrench T40 , tighten the striker mounting screws after the adjustment.
Torque: 23 N*m (235 kgf*cm, 17 ft.*lbf)

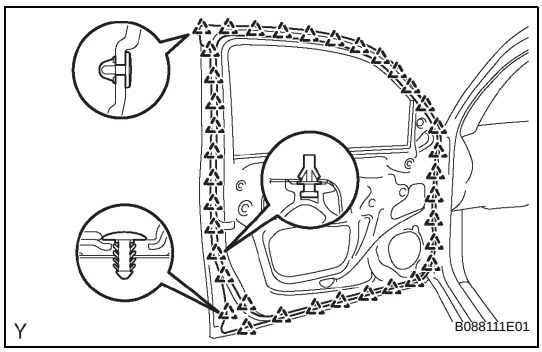


(k) Install the front fender side panel protector LH with the 3 clips.
(l) Connect the cable to the negative battery terminal.
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
(m) Inspect the SRS warning lamp (See page RS-28).

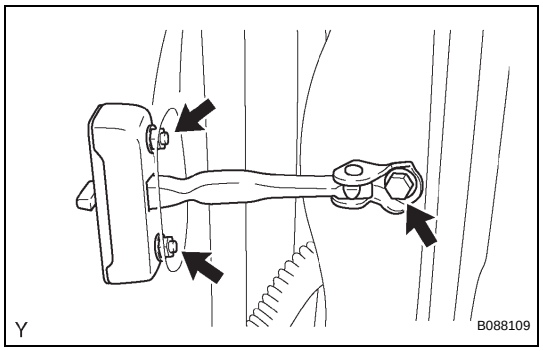
REASSEMBLY



1. INSTALL FRONT DOOR WEATHERSTRIP LH (for Regular Cab)
(a) Engage the 36 clips and install a new front door weatherstrip LH.
(b) Remove the tab tape at both ends of 2-sided tape attached to the weather strip, and attach the weather strip to the door panel with the 2-sided tape.



2. INSTALL FRONT DOOR WEATHERSTRIP LH (for Access Cab)
(a) Engage the 36 clips and install a new front door weatherstrip LH.
(b) Remove the tab tape at both ends of 2-sided tape attached to the weather strip, and attach the weather strip to the door panel with the 2-sided tape.



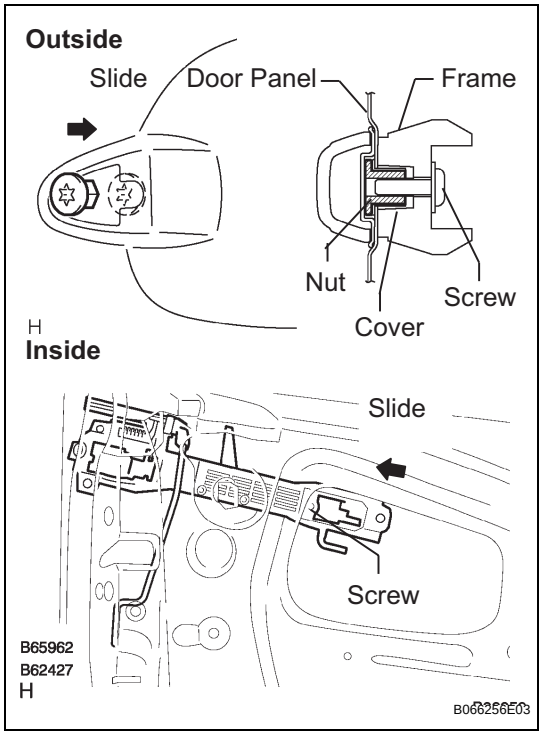
3. INSTALL FRONT DOOR CHECK ASSEMBLY LH

(a) Apply MP grease to the sliding areas of the check.

(b) Install the front door check assembly LH onto the door panel with the 2 nuts.
Torque: 5.5 N*m (56 kgf*cm, 49 in.*lbf)

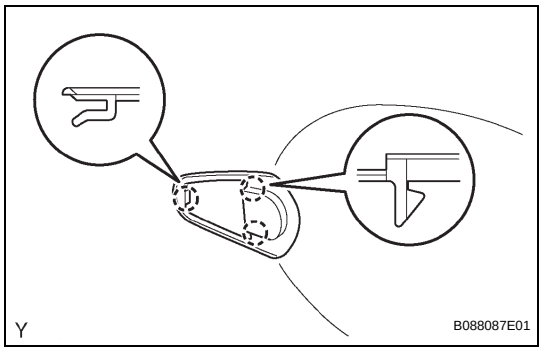
(c) Apply adhesive to the threads of the bolt.
Adhesive:
Part No. 08833-00070, THREE BOND 1324 or equivalent

(d) Install the front door check assembly LH onto the body panel with the bolt.
Torque: 30 N*m (306 kgf*cm, 22 ft.*lbf)



4. INSTALL FRONT DOOR OUTSIDE HANDLE FRAME SUB-ASSEMBLY LH

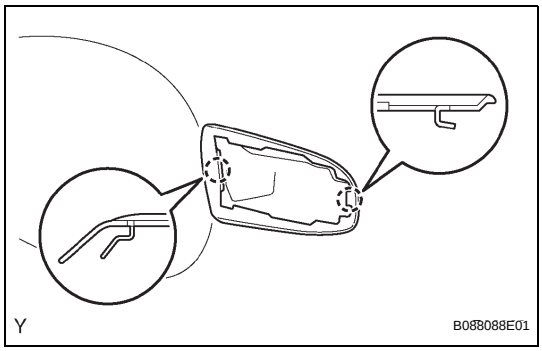
(a) Using a torx socket wrench T30 , install the outside handle frame sub-assembly with the screw.
Torque: 7.0 N*m (71 kgf*cm, 62 in.*lbf)
NOTICE:
A cover should be inserted between the nut and the door panel.



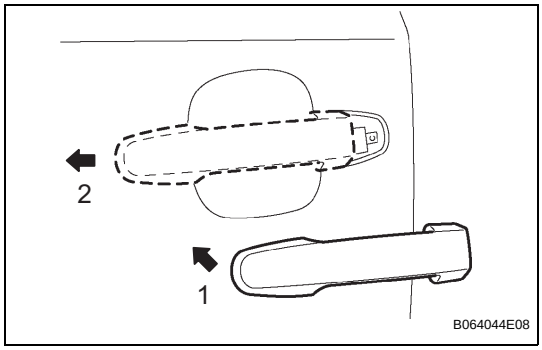
5. INSTALL FRONT DOOR OUTSIDE HANDLE ASSEMBLY LH

(a) Engage the 3 claws and install the front door outside handle front pad.

ED



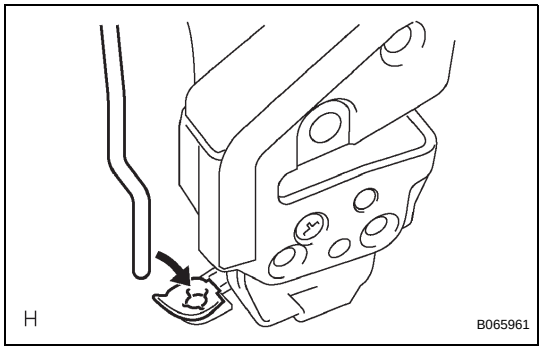
(b) Engage the 2 claws and install the front door outside handle rear pad.



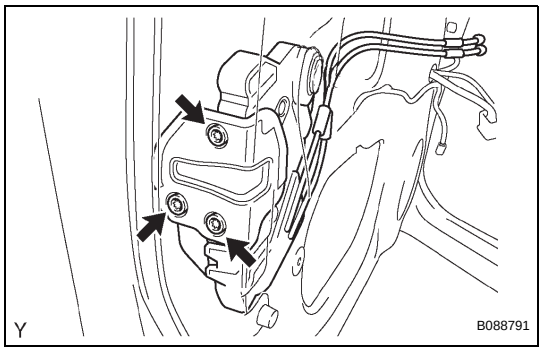
(c) Pushing the front door outside handle assembly LH in the direction of the arrow marks shown in the illustration, install the front door outside handle assembly LH.

6. INSTALL FRONT DOOR LOCK ASSEMBLY LH

(a) Apply MP grease to the sliding and rotating parts of the front door lock assembly LH.
NOTICE:
- **If reusing a door lock assembly that has been removed, replace the packing in the connecting part with new.**
- **Make sure that no grease and dirt adheres to the packing surface in the connecting part.**

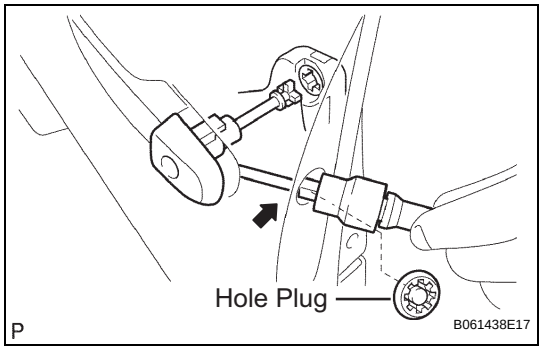


(b) Insert the door lock open rod into the front door lock assembly, then set it to the door panel.
NOTICE:
Make sure that the outside handle link is securely engaged with the door lock assembly.



(c) Apply adhesive to the threads of the screws.
Adhesive:
Part No. 08833-00070, THREE BOND 1324 or equivalent

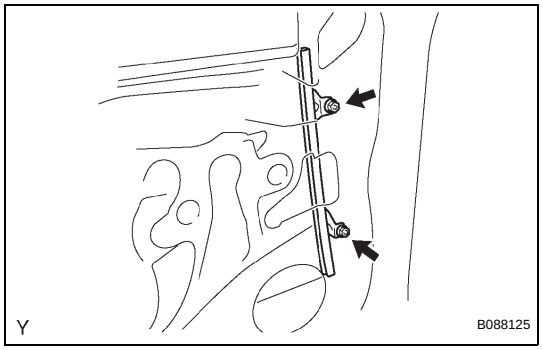
(d) Using a torx socket wrench T30 , install the front door lock assembly LH with the 3 screws.
Torque: 12 N*m (122 kgf*cm, 9 ft.*lbf)



7. INSTALL FRONT DOOR OUTSIDE HANDLE COVER LH

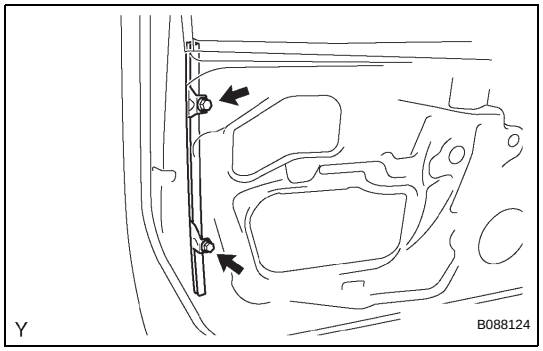
(a) Using a torx socket wrench T30 , install the front door outside handle cover LH with the screw.
Torque: 7.0 N*m (71 kgf*cm, 62 in.*lbf)

(b) Install the hole plug.



8. INSTALL FRONT DOOR FRONT LOWER FRAME SUB-ASSEMBLY LH

(a) Install the front door front lower frame sub-assembly LH with the 2 nuts.
Torque: 5.5 N*m (56 kgf*cm, 49 in.*lbf)

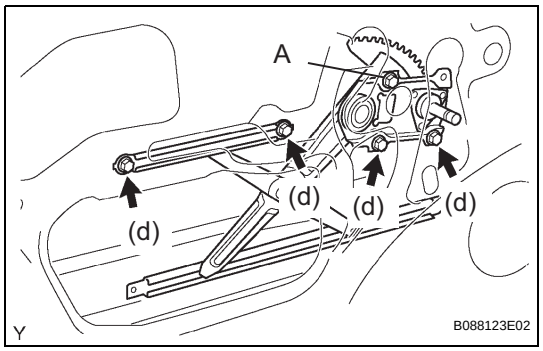


9. INSTALL FRONT DOOR REAR LOWER FRAME SUB-ASSEMBLY LH

(a) Install the front door rear lower frame sub-assembly LH with the 2 bolts.
Torque: 8.0 N*m (82 kgf*cm, 70 in.*lbf)

10. INSTALL FRONT DOOR WINDOW REGULATOR SUB-ASSEMBLY LH

(a) Apply MP grease to the sliding and rotating areas of the front door window regulator sub-assembly LH.
NOTICE:
Do not apply grease to the window regulator spring.

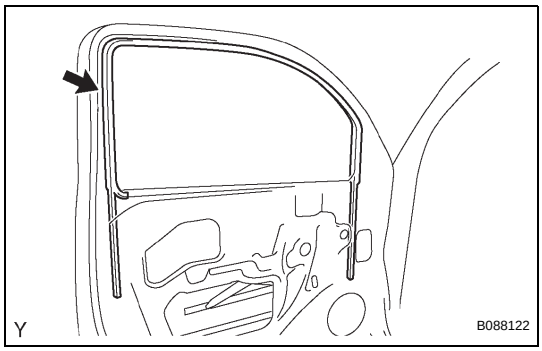


(b) Loosely screw bolt A onto the front door window regulator sub-assembly LH.

(c) Insert the front door window regulator into the door panel. Use bolt A to hang the front door window regulator on the door panel.
NOTICE:
Be careful not to drop the window regulator as it may be damaged.

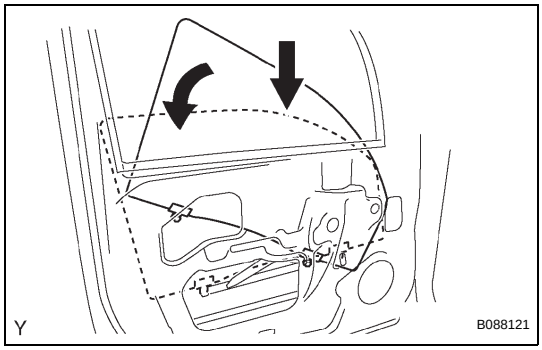
(d) Install the front door window regulator with the 4 bolts, and tighten bolt A.
Torque: 11 N*m (112 kgf*cm, 8 ft.*lbf)

ED



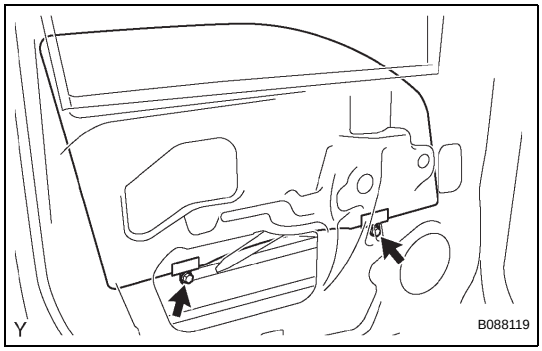
11. INSTALL FRONT DOOR GLASS RUN LH

(a) Install the front door glass run LH.

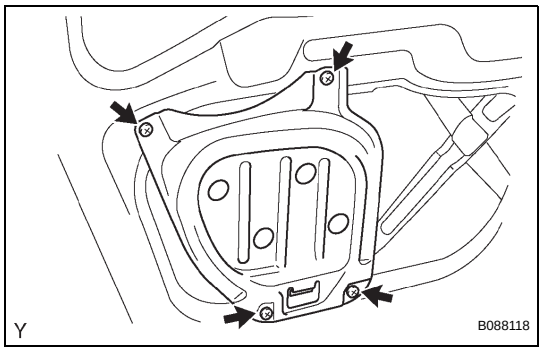


12. INSTALL FRONT DOOR GLASS SUB-ASSEMBLY LH

(a) Insert the front door glass sub-assembly LH into the door panel along the glass run as indicated by the arrow marks in the illustration.



(b) Install the front door glass sub-assembly LH onto the front door window regulator sub-assembly LH with the 2 bolts.
Torque: 8.0 N*m (82 kgf*cm, 71 in.*lbf)

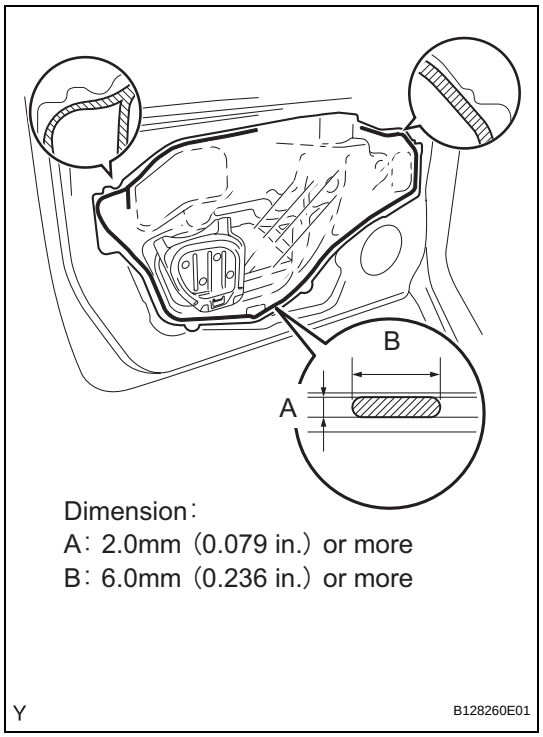


13. INSTALL FRONT DOOR INSIDE PANEL PLATE LH

(a) Install the front door inside panel plate LH.

14. INSTALL FRONT DOOR BELT MOULDING LH (See page ET-33)

15. INSTALL OUTER REAR VIEW MIRROR ASSEMBLY LH (See page MI-10)



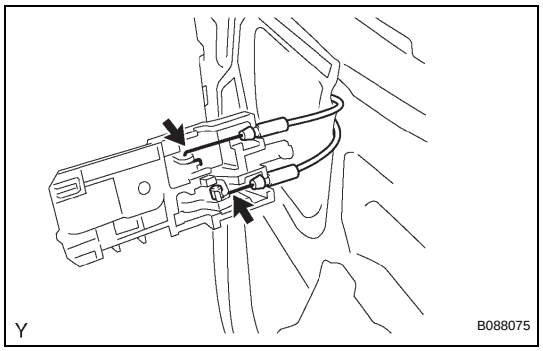
16. INSTALL FRONT DOOR SERVICE HOLE COVER LH

(a) Apply butyl tape to the door panel, and install the front door service hole cover LH as shown in the illustration.

Adhesive:
Part No. 08850-00065, Butyl Tape Set or equivalent

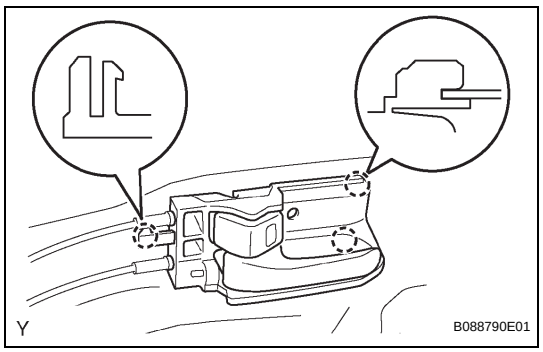
HINT:

- When installing the service hole cover, pull the links and connectors out through the service hole cover.
- There should be no wrinkles or folds after attaching the service hole cover.
- After attaching the service hole cover, check the quality of the seal.

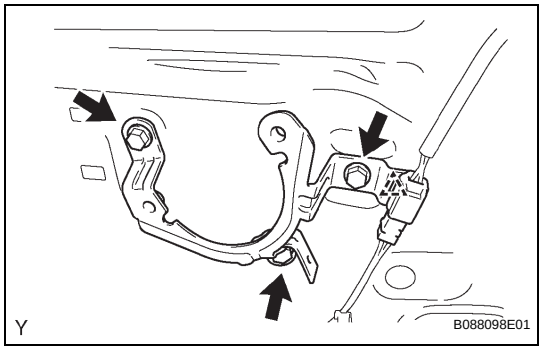


17. INSTALL FRONT DOOR INSIDE HANDLE SUB-ASSEMBLY LH

(a) Connect the 2 cables to the front door inside handle sub-assembly LH.



(b) Engage the 3 claws and install the front door inside handle sub-assembly LH onto the door panel.



18. INSTALL FRONT NO. 1 SPEAKER BRACKET

(a) Install the front No. 1 speaker bracket with the 3 screws.

(b) Connect the wire harness clamp and connector.

19. INSTALL FRONT NO. 2 SPEAKER ASSEMBLY (See page AV-83)

20. INSTALL FRONT NO. 1 SPEAKER ASSEMBLY

HINT:

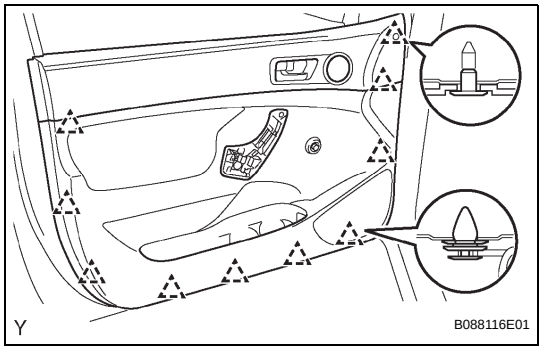
- Regular cab (See page AV-76)
- Except regular cab (See page AV-79)

ED

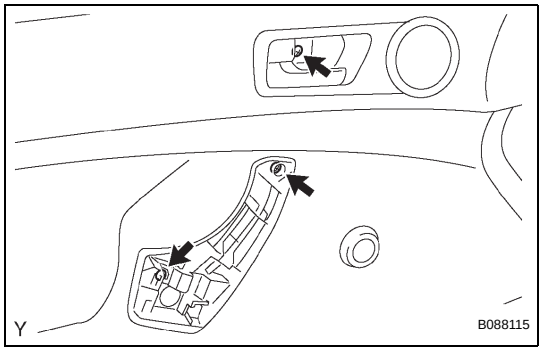
21. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

22. INSTALL FRONT DOOR TRIM PANEL ASSEMBLY LH

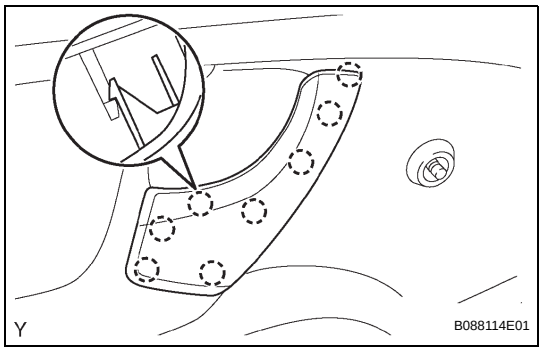
(a) Engage the 10 clips and install the front door trim panel assembly LH.



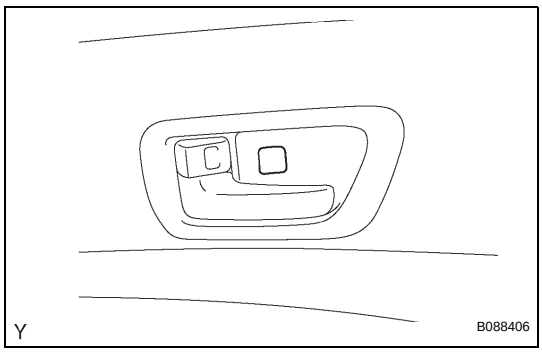
(b) Install the 3 screws.



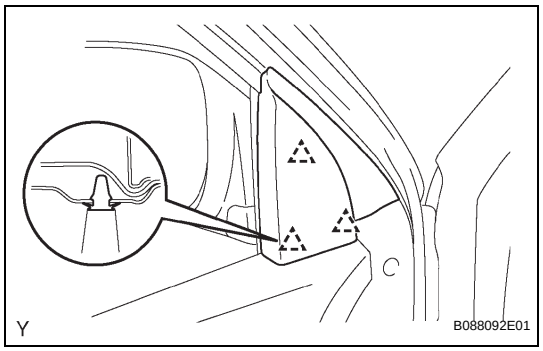
(c) Engage the 8 claws and install the door assist grip cover LH.



(d) Close the cover.



ED

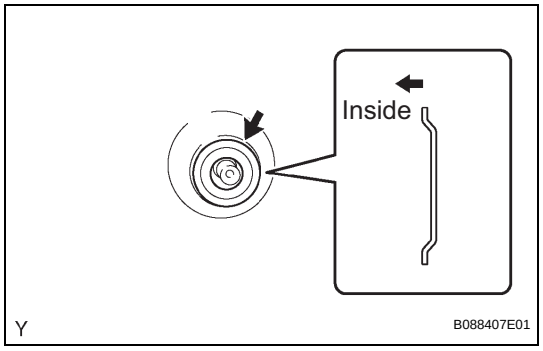


23. INSTALL FRONT DOOR LOWER FRAME BRACKET GARNISH LH

(a) Engage the 3 clips and install the front door lower frame bracket garnish LH.

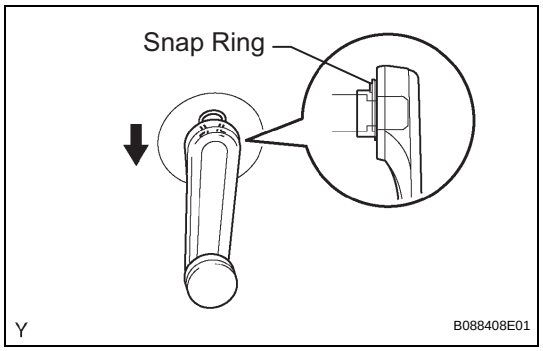
NOTICE:

Confirm that no clips remain on the door panel before the garnish is installed. Transfer any remaining clips to the garnish side before installing it. Installing the garnish with any clips remaining on the door panel side could cause the clips to drop inside the door panel.



24. INSTALL FRONT DOOR WINDOW REGULATOR HANDLE ASSEMBLY

(a) Install the window regulator handle plate.



(b) Install the front door window regulator handle assembly with the snap ring.

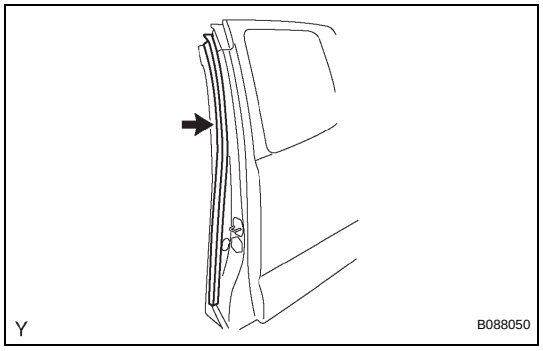
ED

DISASSEMBLY

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

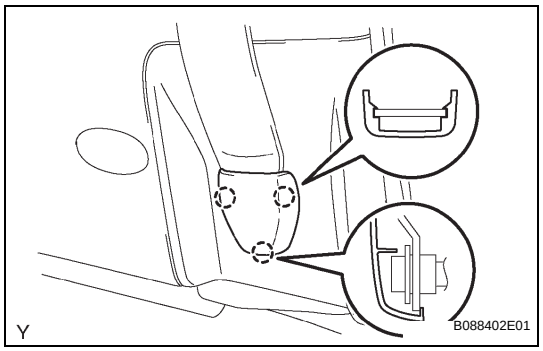
2. REMOVE ACCESS PANEL REAR WEATHERSTRIP LH

(a) Remove the access panel rear weatherstrip LH.



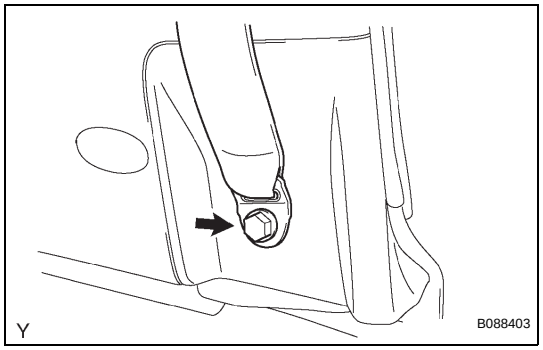
3. REMOVE LAP BELT OUTER ANCHOR COVER

(a) Disengage the 3 claws and remove the lap belt outer anchor cover.

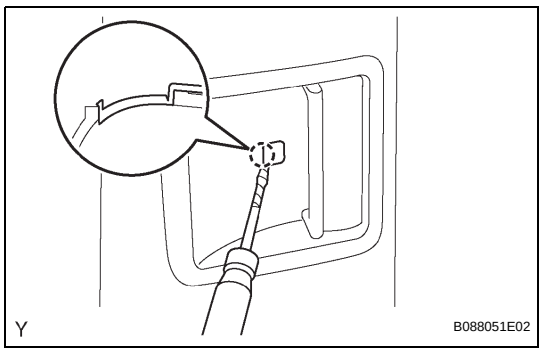


4. REMOVE REAR DOOR TRIM BOARD SUB-ASSEMBLY LH

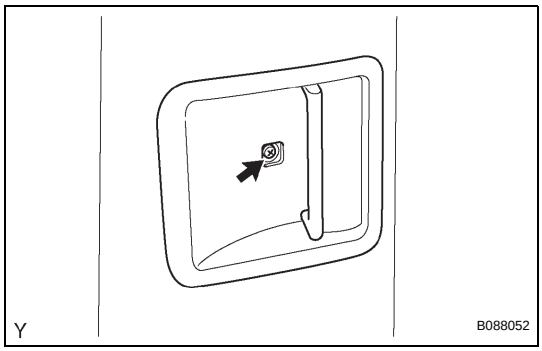
(a) Remove the bolt and separate the outer front seat belt assembly LH (floor side).



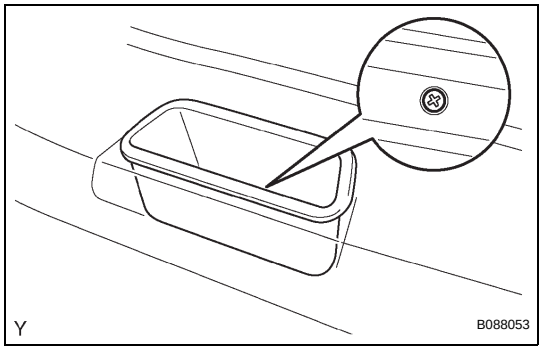
(b) Using a screwdriver with its tip wrapped in protective tape, open the cover.



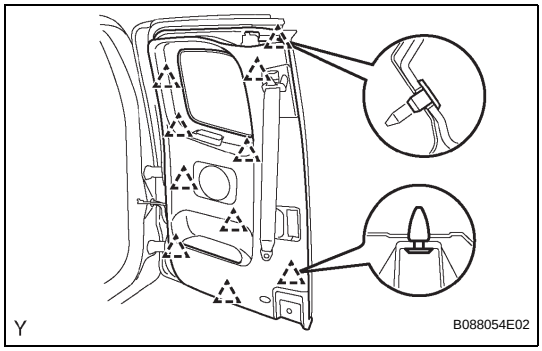
ED



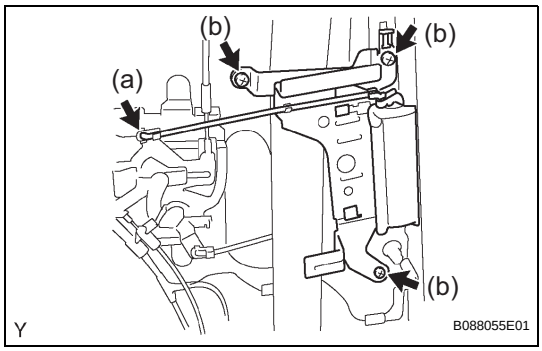
(c) Remove the screw, then remove the access panel inside handle bezel LH.



(d) Remove the screw, then remove the door pull handle.



(e) Remove the 10 clips.
(f) Remove the rear door trim board sub-assembly by sliding it upward.



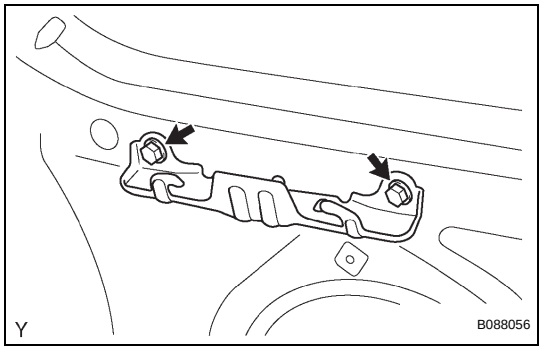
5. REMOVE ACCESS PANEL INSIDE HANDLE SUB-ASSEMBLY LH

(a) Disconnect the rod.
(b) Remove the 3 screws, then remove the access panel handle sub-assembly.

6. REMOVE FRONT SEAT OUTER BELT ASSEMBLY LH (See page SB-37)

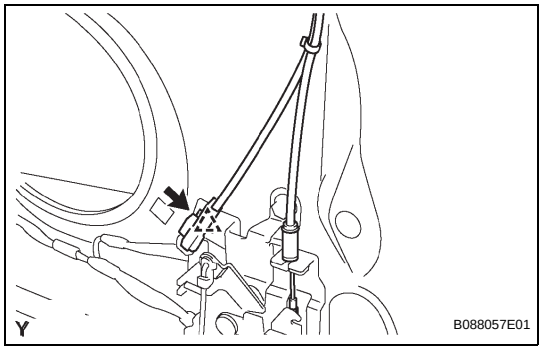
7. REMOVE FRONT SHOULDER BELT ANCHOR ADJUSTER ASSEMBLY (See page SB-37)

8. REMOVE REAR SPEAKER ASSEMBLY (See page AV-88)



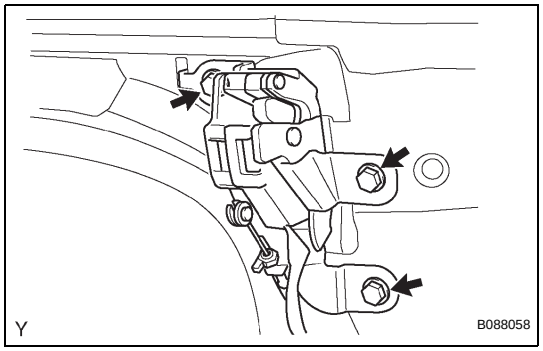
9. REMOVE NO. 1 DOOR TRIM BRACKET RH

(a) Remove the 2 screws and remove the No. 1 door trim bracket.

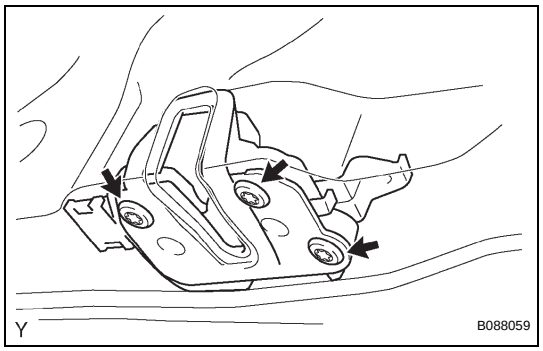


10. REMOVE ACCESS PANEL UPPER LOCK ASSEMBLY LH

(a) Disconnect the connector, connector clamp and the access lock control cable sub-assembly.

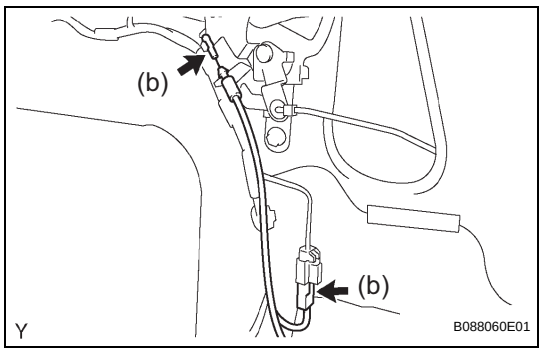


(b) Remove the 3 bolts, then remove the access panel upper lock assembly LH.



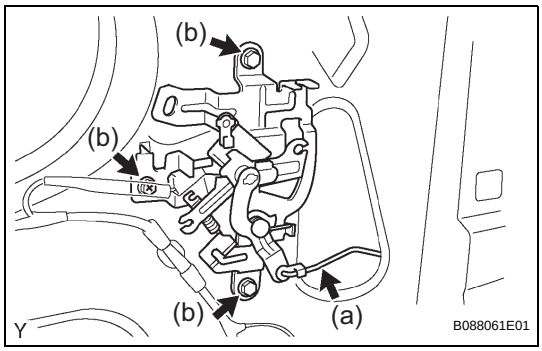
11. REMOVE ACCESS PANEL LOWER LOCK ASSEMBLY LH

(a) Using a torx socket wrench T30 , remove the 3 screws.



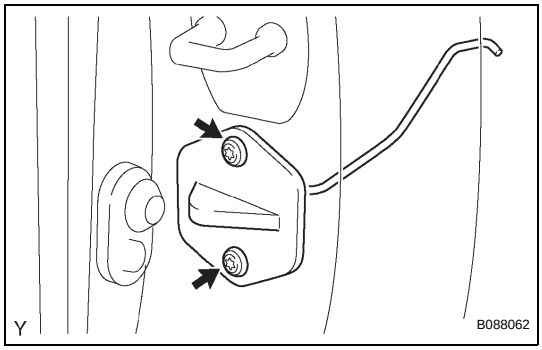
(b) Disconnect the connector and access lock control cable sub-assembly.

(c) Remove the access panel lower lock assembly LH by sliding it upward.



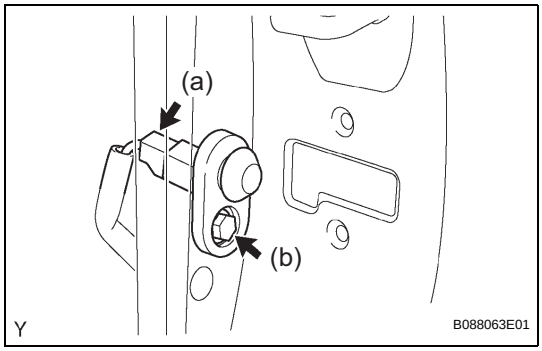
12. REMOVE ACCESS PANEL LOCK REMOTE CONTROL ASSEMBLY LH

(a) Disconnect the rod.
(b) Remove the 2 bolts and the screw, then remove the access panel lock remote control assembly LH.



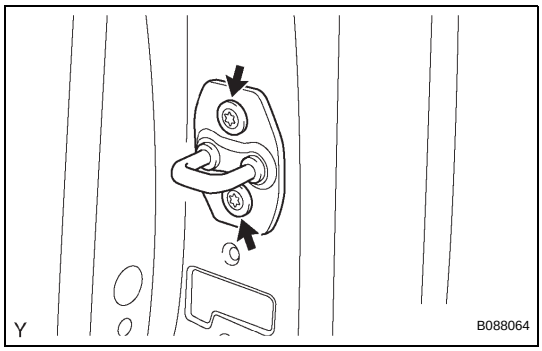
13. REMOVE REAR DOOR INSIDE LOCKING CABLE ASSEMBLY LH

(a) Using a torx socket wrench T25 , remove the 2 screws, then remove the access panel lock cancel lever assembly LH.



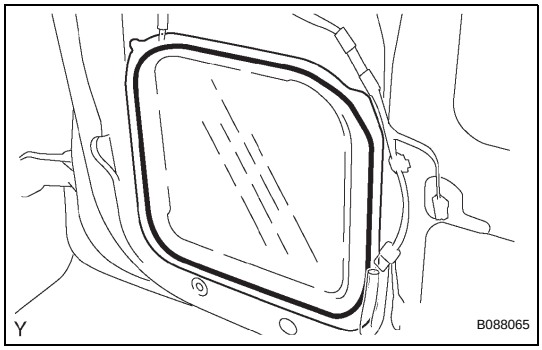
14. REMOVE FRONT DOOR COURTESY LAMP SWITCH ASSEMBLY

(a) Disconnect the connector.
(b) Remove the bolt, then remove the front door courtesy lamp switch.



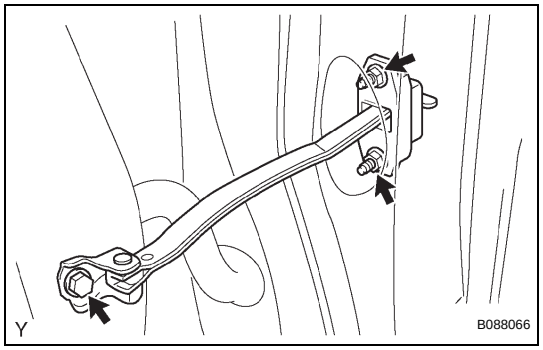
15. REMOVE FRONT DOOR LOCK STRIKER PLATE ASSEMBLY

(a) Using a torx socket wrench T40 , remove the 2 screws and door lock striker plate assembly.



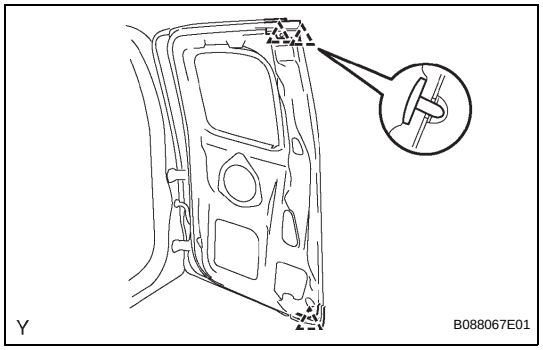
16. REMOVE REAR DOOR SERVICE HOLE COVER LH

(a) Remove the rear door service hole cover LH.



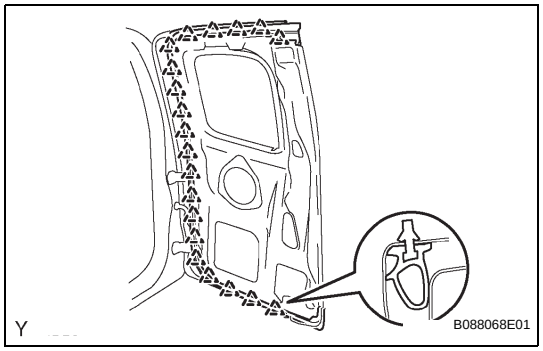
17. REMOVE REAR DOOR CHECK ASSEMBLY LH

(a) Remove the bolt and 2 nuts, then remove the access panel check assembly LH.



18. REMOVE REAR DOOR WEATHERSTRIP LH

(a) Disengage the 3 clips.



(b) Using a clip remover, disengage the 20 clips, then remove the rear door weatherstrip LH.

NOTICE:

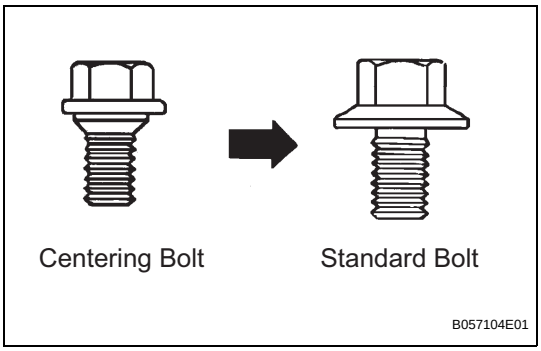
Remove the remaining tape on the door side.

ED

ADJUSTMENT

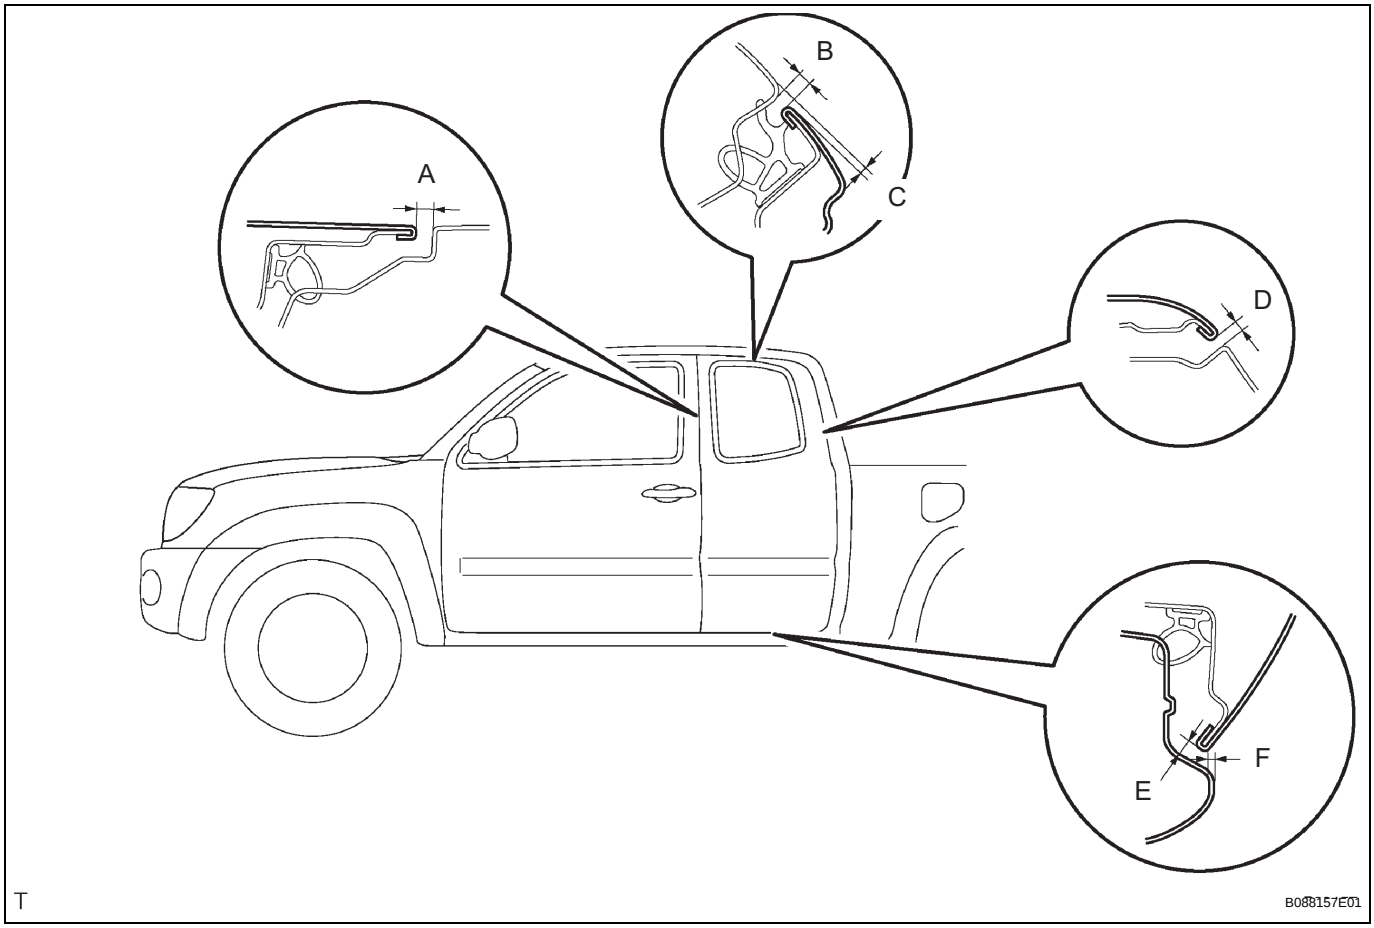
HINT:

- Before adjusting the positions of doors on vehicles equipped with side airbags and curtain shield airbags, be sure to disconnect the cable from the negative battery terminal. After making adjustments, inspect the SRS warning lamp, the side airbag system and the curtain shield airbag system for normal operation (See page RS-28).
- Use the same procedure for both the RH and LH sides.
- The procedures listed below are for the LH side.
- Centering bolts are used to mount the door hinge onto the vehicle body and door. The doors cannot be adjusted with the centering bolts on. Substitute the standard bolts (with washers) for the centering bolts when making adjustments.
- For bolts without torque specifications, check the standard bolt chart (See page SS-2).



1. INSPECT ACCESS PANEL SUB-ASSEMBLY LH

(a) Check that the clearance measurements of areas A to F are within the standard ranges.



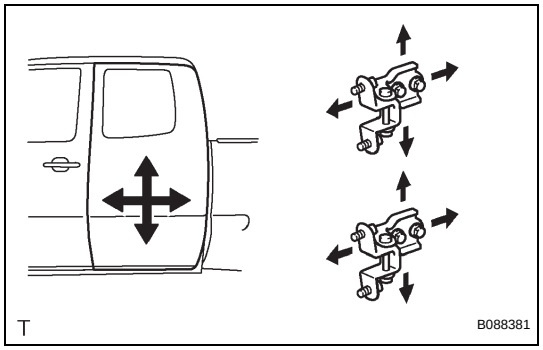
Standard:

Area	Measurement	Area	Measurement
A	6.0 +- 1.5 mm (0.236 +- 0.059 in.)	D	6.1 +- 1.5 mm (0.240 +- 0.059 in.)
B	5.0 +- 1.5 mm (0.197 +- 0.059 in.)	E	5.0 +- 1.5 mm (0.197 +- 0.059 in.)
C	1.8 +- 1.5 mm (0.071 +- 0.059 in.)	F	2.0 +- 1.5 mm (0.079 +- 0.059 in.)

2. ADJUST ACCESS PANEL SUB-ASSEMBLY LH

(a) Disconnect the cable from the negative battery terminal.

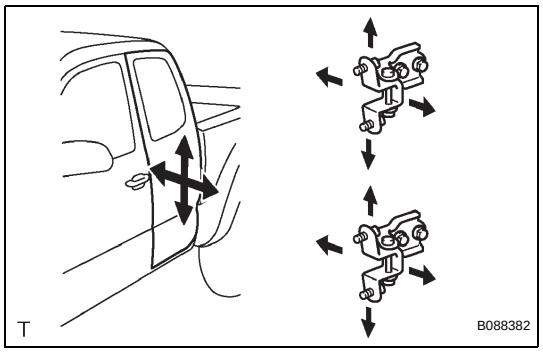
CAUTION:
Work must be started at least 90 seconds after the ignition switch is turned to OFF and the cable is disconnected from the negative battery terminal. (The SRS is equipped with a back-up power source. If work is started within 90 seconds of disconnecting the cable from the negative battery terminal and the ignition switch being turned to OFF, the SRS may deploy.)



(b) Loosen the body side hinge bolts and adjust the door position.

(c) Tighten the body side hinge bolts after the adjustment.

Torque: 26 N*m (265 kgf*cm, 19 ft.*lbf)



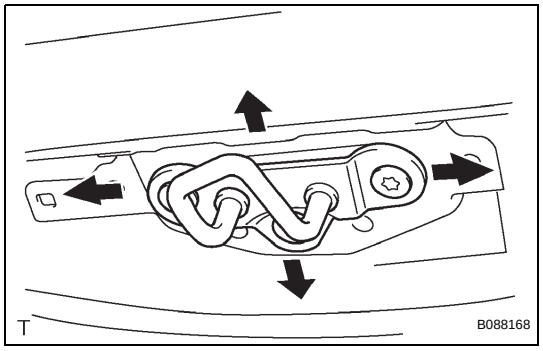
(d) Loosen the door side hinge bolts and adjust the door position.

(e) Tighten the door side hinge bolts after the adjustment.

Torque: 26 N*m (265 kgf*cm, 19 ft.*lbf)

(f) Remove roof side inner garnish cap LH (See page IR-62).

(g) Remove roof side inner garnish LH (See page IR-65).

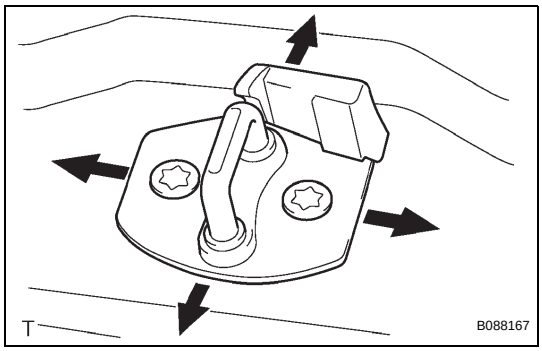


(h) Adjust the striker position by slightly loosening the striker mounting screws with a torx socket wrench T40 and hitting the striker with a plastic hammer (upper side).

(i) Using a torx socket wrench T40 , tighten the striker mounting screws after the adjustment.

Torque: 23 N*m (235 kgf*cm, 17 ft.*lbf)

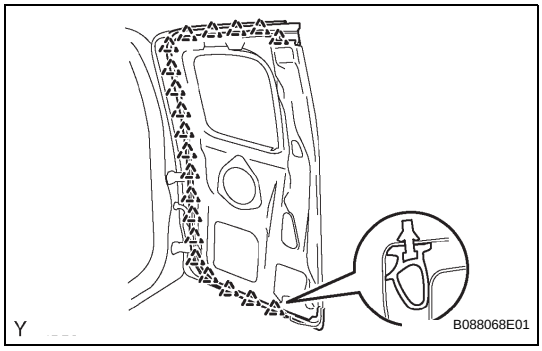
ED



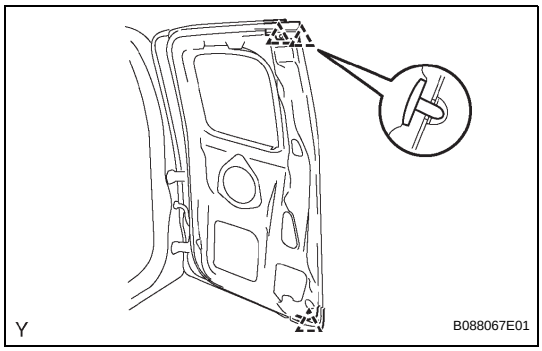
(j) Adjust the striker position by slightly loosening the striker mounting screws with a torx socket wrench T40 and hitting the striker with a plastic hammer (lower side).
(k) Using a torx socket wrench T40, tighten the striker mounting screws after the adjustment.
Torque: 23 N*m (235 kgf*cm, 17 ft.*lbf)
(l) Connect the cable to the negative battery terminal.
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
(m) Inspect the SRS warning lamp (See page RS-28).
(n) Install the roof side inner garnish LH (See page IR-71).
(o) Install the roof side inner garnish cap LH (See page IR-75).

REASSEMBLY

1. INSTALL REAR DOOR WEATHERSTRIP LH

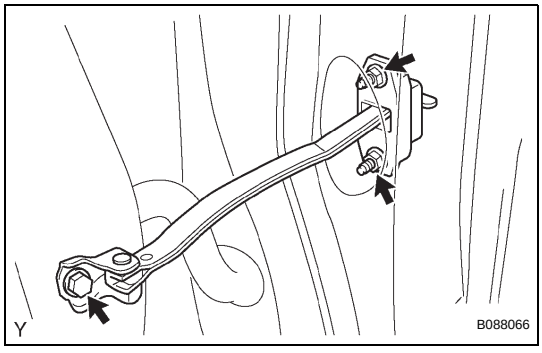


(a) Engage the 20 clips and install a new rear door weatherstrip LH.

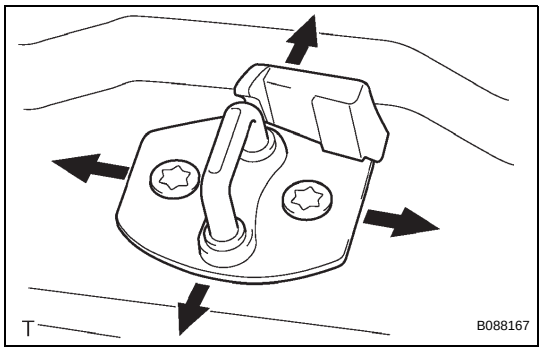


(b) Engage the 3 clips.
(c) Remove the tab tape at both ends of 2-sided tape attached to the weather strip, and attach the weather strip to the door panel with the 2-sided tape.

2. INSTALL REAR DOOR CHECK ASSEMBLY LH



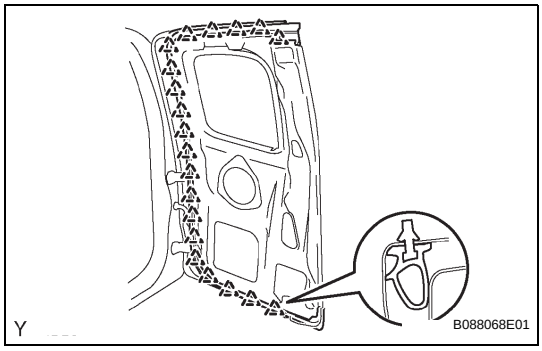
(a) Apply MP grease to the sliding areas of the check.
(b) Install the access panel check assembly LH onto the door panel with the 2 nuts.
Torque: 5.5 N*m (56 kgf*cm, 49 in.*lbf)
(c) Apply adhesive to the threads of the bolt.
Adhesive:
Part No. 08833-00070, THREE BOND 1324 or equivalent
(d) Install the access panel check assembly LH onto the body panel with the bolt.
Torque: 30 N*m (306 kgf*cm, 22 ft.*lbf)



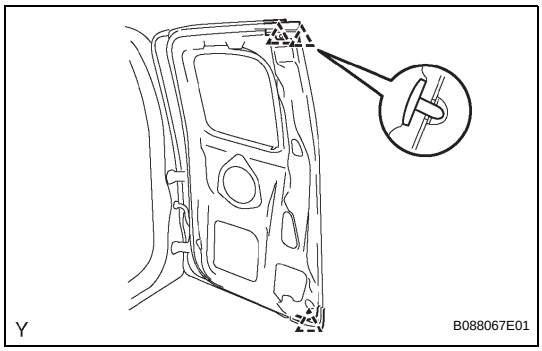
(j) Adjust the striker position by slightly loosening the striker mounting screws with a torx socket wrench T40 and hitting the striker with a plastic hammer (lower side).
(k) Using a torx socket wrench T40, tighten the striker mounting screws after the adjustment.
Torque: 23 N*m (235 kgf*cm, 17 ft.*lbf)
(l) Connect the cable to the negative battery terminal.
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
(m) Inspect the SRS warning lamp (See page RS-28).
(n) Install the roof side inner garnish LH (See page IR-71).
(o) Install the roof side inner garnish cap LH (See page IR-75).

REASSEMBLY

1. INSTALL REAR DOOR WEATHERSTRIP LH

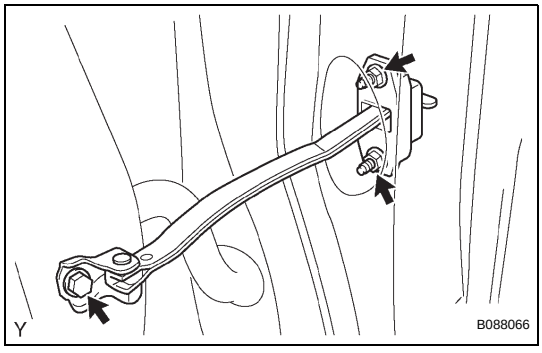


(a) Engage the 20 clips and install a new rear door weatherstrip LH.

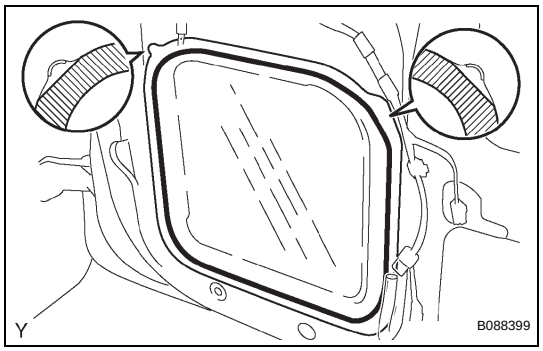


(b) Engage the 3 clips.
(c) Remove the tab tape at both ends of 2-sided tape attached to the weather strip, and attach the weather strip to the door panel with the 2-sided tape.

2. INSTALL REAR DOOR CHECK ASSEMBLY LH

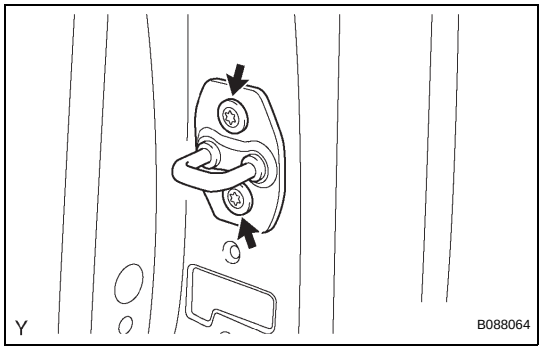


(a) Apply MP grease to the sliding areas of the check.
(b) Install the access panel check assembly LH onto the door panel with the 2 nuts.
Torque: 5.5 N*m (56 kgf*cm, 49 in.*lbf)
(c) Apply adhesive to the threads of the bolt.
Adhesive:
Part No. 08833-00070, THREE BOND 1324 or equivalent
(d) Install the access panel check assembly LH onto the body panel with the bolt.
Torque: 30 N*m (306 kgf*cm, 22 ft.*lbf)



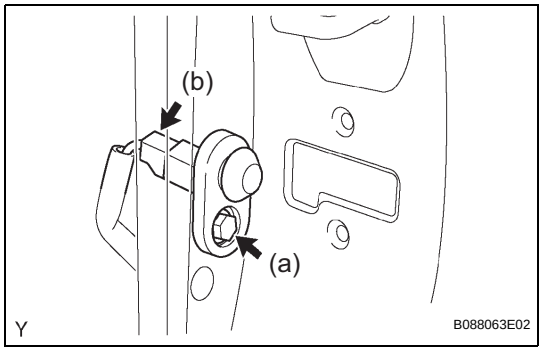
3. INSTALL REAR DOOR SERVICE HOLE COVER LH

(a) Install a new rear door service hole cover LH.
HINT:
After attaching the service hole cover, check the quality of the seal.



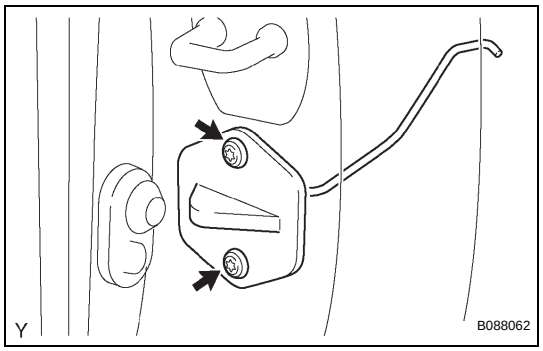
4. INSTALL FRONT DOOR LOCK STRIKER PLATE ASSEMBLY

(a) Using a torx socket wrench T40 , install the door lock striker plate assembly with the 2 screws.
Torque: 23 N*m (235 kgf*cm, 17 ft.*lbf)



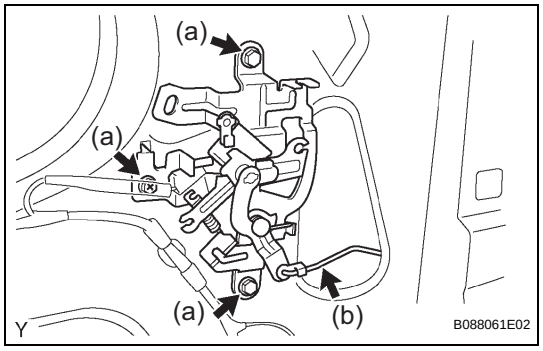
5. INSTALL FRONT DOOR COURTESY LAMP SWITCH ASSEMBLY

(a) Install the front door courtesy lamp switch with the bolt.
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)
(b) Connect the connector.



6. INSTALL REAR DOOR INSIDE LOCKING CABLE ASSEMBLY LH

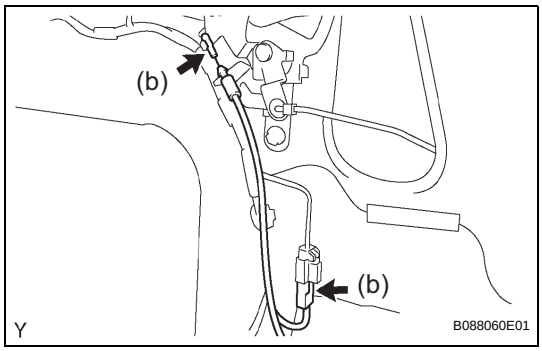
(a) Using a torx socket wrench T25 , install the access panel lock cancel lever assembly LH with the 2 screws.
Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)



7. INSTALL ACCESS PANEL LOCK REMOTE CONTROL ASSEMBLY LH

(a) Install the access panel lock remote control assembly LH with the 2 bolts and the screw.
Torque: 12 N*m (122 kgf*cm, 9 ft.*lbf)
(b) Connect the rod.

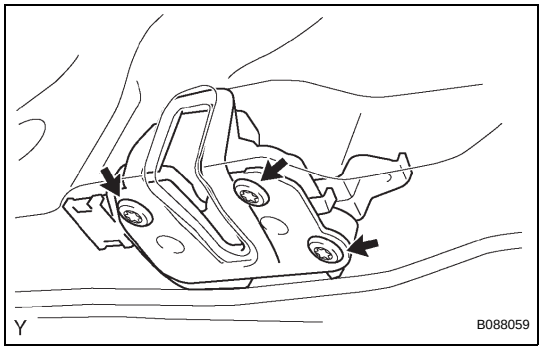
ED



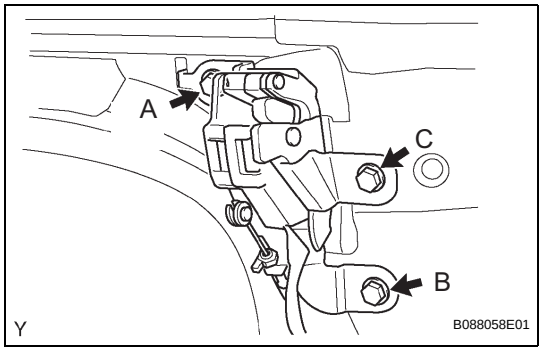
8. INSTALL ACCESS PANEL LOWER LOCK ASSEMBLY LH

(a) Install the access panel lower lock assembly LH onto the access door.

(b) Connect the connector and access lock control cable sub-assembly.



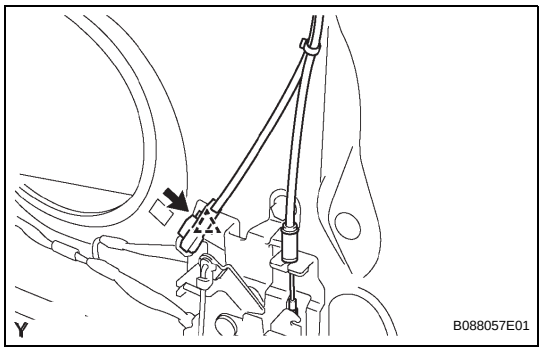
(c) Using a torx socket wrench T30 , install the 3 screws.
Torque: 12 N*m (122 kgf*cm, 9 ft.*lbf)



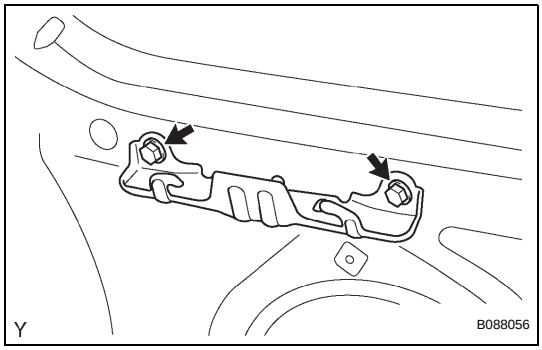
9. INSTALL ACCESS PANEL UPPER LOCK ASSEMBLY LH

(a) Provisionally install the access panel upper lock assembly LH with the 3 bolts.

(b) Tighten the 3 bolts in the order A to C as indicated.
Torque: 12 N*m (122 kgf*cm, 9 ft.*lbf)



(c) Connect the connector, connector clamp and access lock control cable sub-assembly.



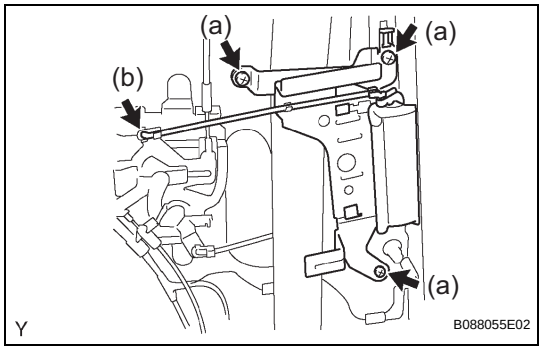
10. INSTALL NO. 1 DOOR TRIM BRACKET RH

(a) Install the No. 1 door trim bracket with the 2 screws.

11. INSTALL REAR SPEAKER ASSEMBLY (See page AV-88)

12. INSTALL FRONT SHOULDER BELT ANCHOR ADJUSTER ASSEMBLY (See page SB-38)

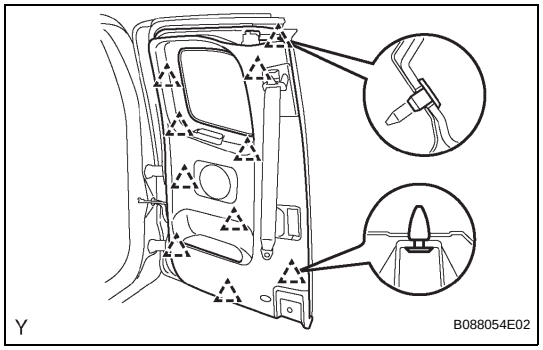
13. INSTALL FRONT SEAT OUTER BELT ASSEMBLY LH (See page SB-38)



14. INSTALL ACCESS PANEL INSIDE HANDLE SUB-ASSEMBLY LH

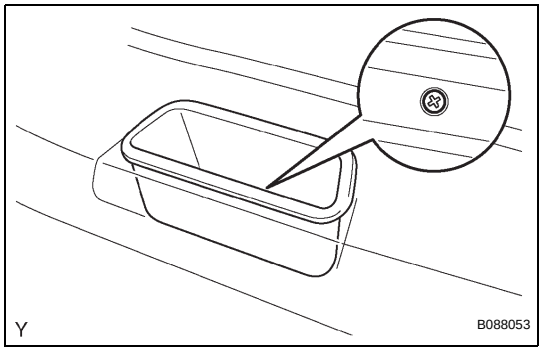
(a) Install the access panel inside handle sub-assembly inside LH with the 3 screws.

(b) Connect the rod.

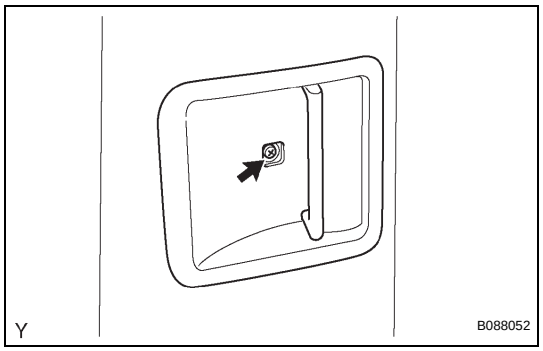


15. INSTALL REAR DOOR TRIM BOARD SUB-ASSEMBLY LH

(a) Install the rear door trim board sub-assembly LH.

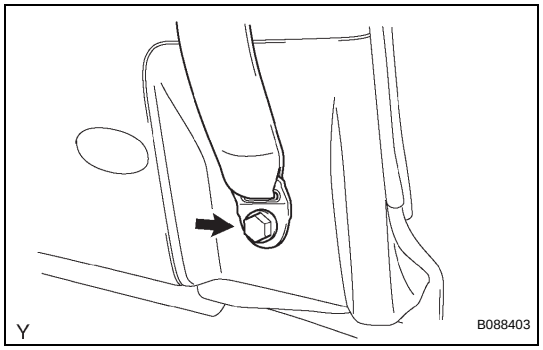


(b) Install the door pull handle with the screw.



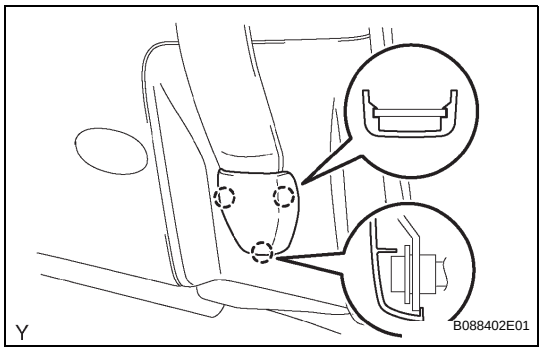
(c) Install the access panel inside handle bezel LH with the screw.

(d) Close the cover.



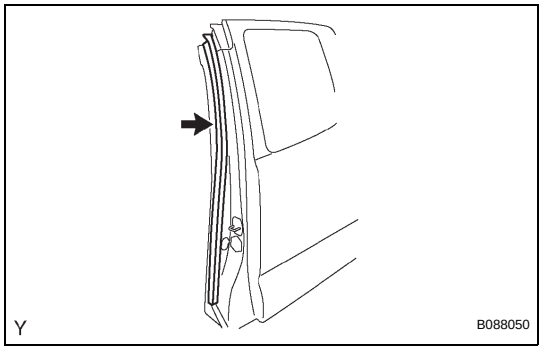
(e) Install the outer front seat belt assembly LH (floor side) with the bolt.
Torque: 42 N*m (428 kgf*cm, 31 ft.*lbf)

ED



16. INSTALL LAP BELT OUTER ANCHOR COVER

(a) Engage the 3 claws and install the lap belt outer anchor cover.



17. INSTALL ACCESS PANEL REAR WEATHERSTRIP LH

(a) Install the rear access panel weatherstrip LH.

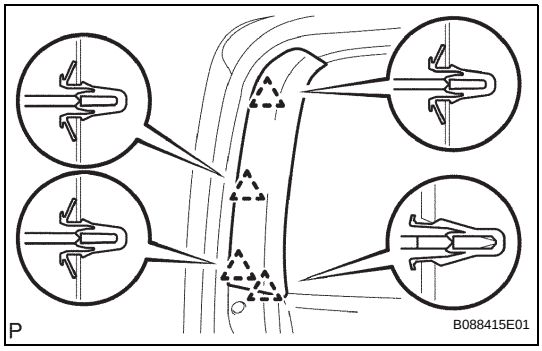
18. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

DISASSEMBLY

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

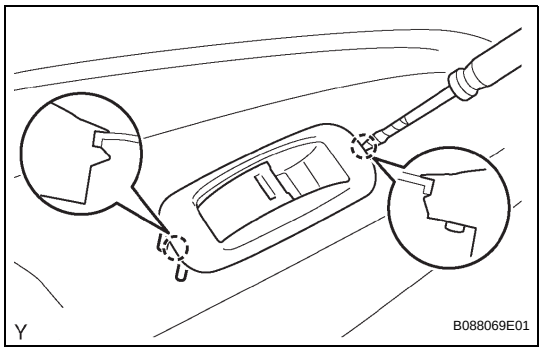
2. REMOVE REAR DOOR FRAME GARNISH LH



(a) Disengage the 4 clips and remove the rear door frame garnish LH.

NOTICE:
Confirm that no clips remain on the door panel when the garnish is removed. Transfer any remaining clips to the garnish side before installing.

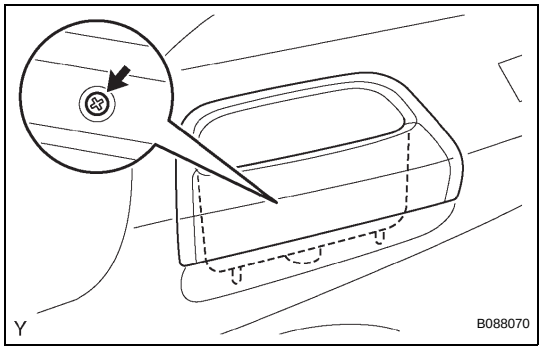
3. REMOVE REAR POWER WINDOW REGULATOR SWITCH ASSEMBLY



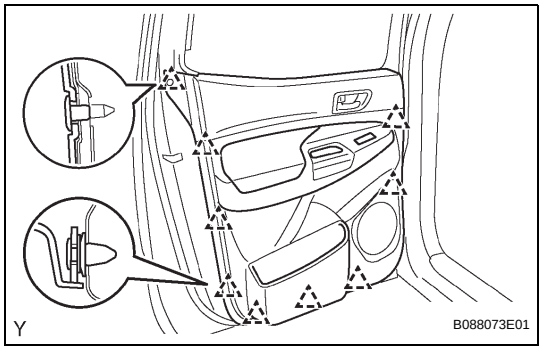
(a) Using a screwdriver with its tip wrapped in protective tape, disengage the 2 claws, then pull out the rear power window regulator switch assembly by pulling it toward the front of the vehicle.

(b) Disconnect the connector, then remove the rear power window regulator switch assembly.

4. REMOVE REAR DOOR TRIM PANEL ASSEMBLY LH

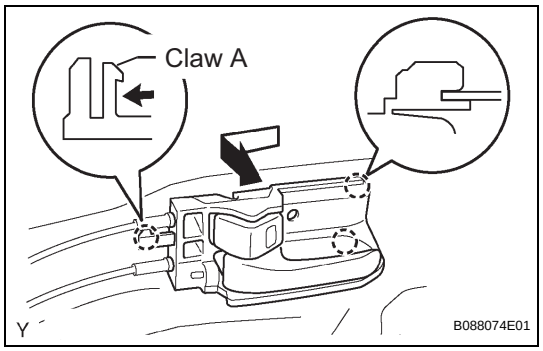


(a) Remove the screw, then remove the door assist grip assembly LH.



(b) Disengage the 9 clips.

(c) Remove the rear door trim panel assembly by sliding it upward.

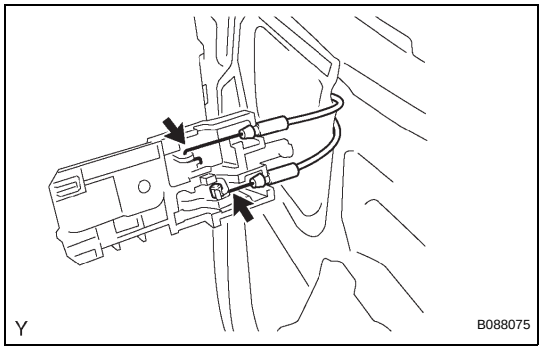


5. REMOVE REAR DOOR INSIDE HANDLE SUB-ASSEMBLY LH

(a) Using a screwdriver with its tip wrapped in protective tape, disengage claw A as shown in the illustration.

(b) Move the rear door inside handle sub-assembly LH in the direction indicated by the arrow mark in the illustration. This will release the claw and allow the removal of the rear door inside handle sub-assembly LH.

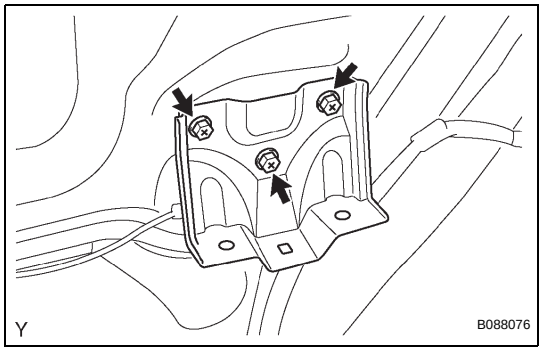
(c) Disconnect the 2 cables from the rear door inside handle sub-assembly LH.



6. REMOVE REAR SPEAKER ASSEMBLY

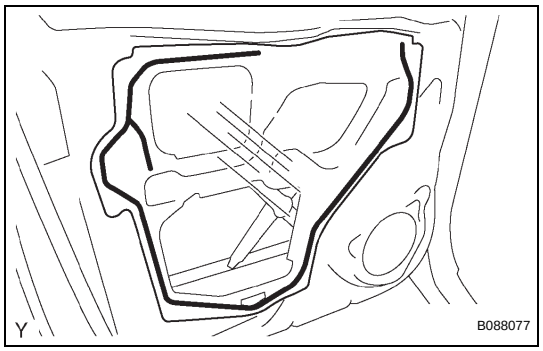
HINT:

- Access cab (See page AV-88)
- Double cab (See page AV-86)



7. REMOVE NO. 2 REAR DOOR TRIM BRACKET

(a) Remove the 3 screws and No. 2 rear door trim bracket.

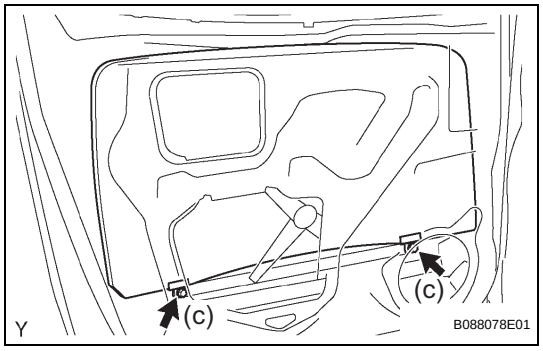


8. REMOVE REAR DOOR SERVICE HOLE COVER LH

(a) Remove the rear door service hole cover LH.

NOTICE:
Remove the remaining tape on the door side.

9. REMOVE REAR DOOR BELT MOULDING LH (See page ET-35)



10. REMOVE REAR DOOR GLASS SUB-ASSEMBLY LH

HINT:

Insert a shop rag inside the door panel to prevent the glass from being scratched.

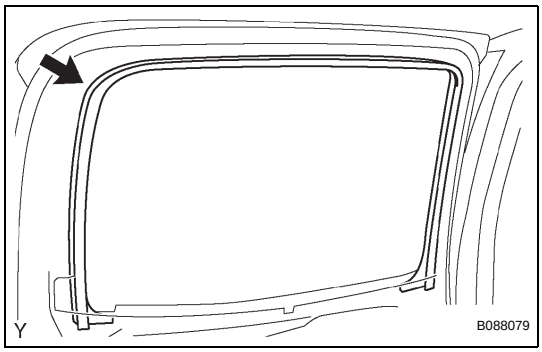
(a) Connect the power window regulator switch.

(b) Move the rear door glass sub-assembly LH until the 2 bolts appear in the service holes.

ED

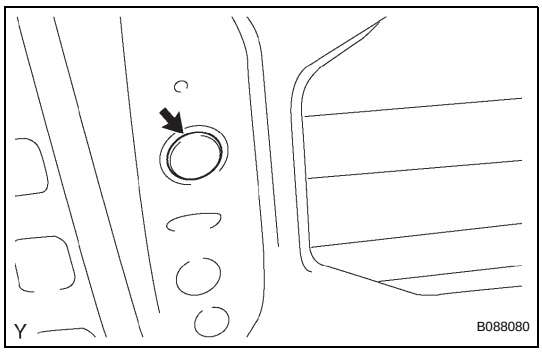
(c) Remove the 2 bolts and rear door glass sub-assembly LH.
NOTICE:
- **Be careful when removing the 2 bolts as the glass may fall and be damaged.**
- **Be careful not to damage the glass.**

(d) Disconnect the power window regulator switch.



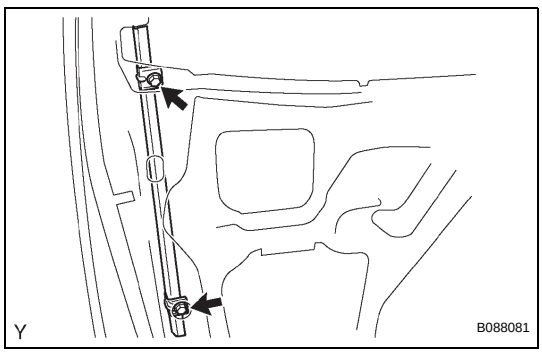
11. REMOVE REAR DOOR GLASS RUN LH

(a) Remove the rear door glass run LH.

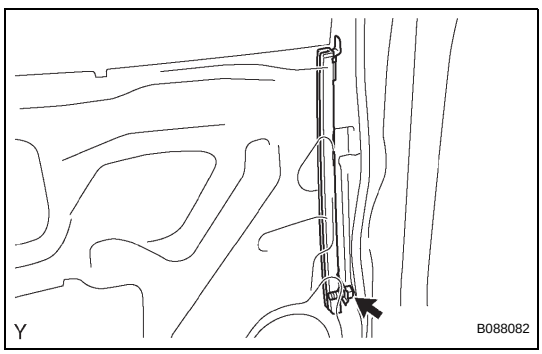


12. REMOVE REAR DOOR REAR LOWER WINDOW FRAME SUB-ASSEMBLY LH

(a) Remove the hole plug.

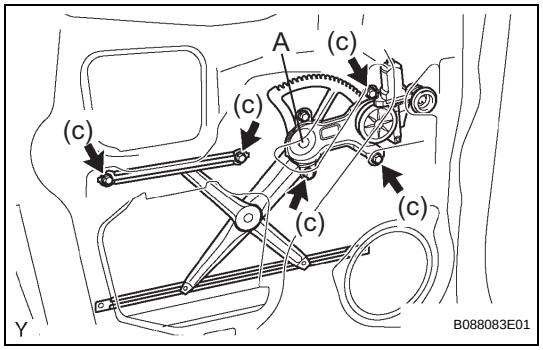


(b) Remove the 2 bolts and rear door rear lower window frame sub-assembly LH.



13. REMOVE REAR DOOR FRONT WINDOW GUIDE SUB-ASSEMBLY LH

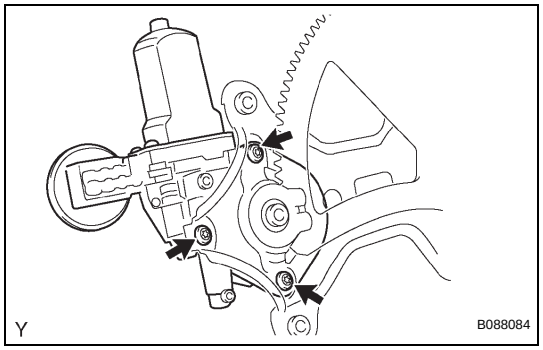
(a) Remove the bolt and rear door front window guide sub-assembly LH.



14. REMOVE REAR DOOR WINDOW REGULATOR SUB-ASSEMBLY LH

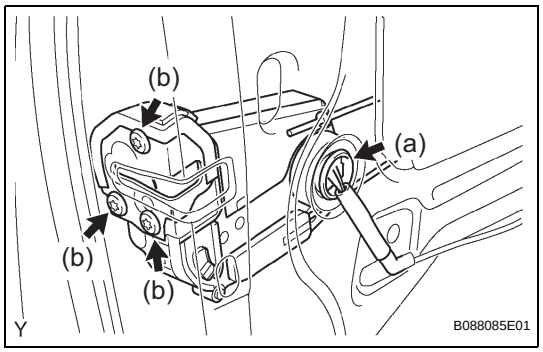
(a) Disconnect the connector.
(b) Loosen bolt A.
(c) Remove the 5 bolts, then remove the rear door window regulator sub-assembly LH.

NOTICE:
Be careful when removing the bolts as the window regulator may fall and be damaged.
HINT:
Remove the window regulator through the service hole.



15. REMOVE POWER WINDOW REGULATOR MOTOR ASSEMBLY LH

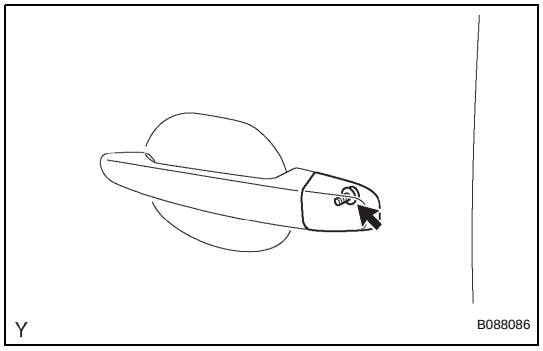
(a) Using a torx socket wrench T25 , remove the 3 screws and power window regulator motor assembly LH.



16. REMOVE REAR DOOR LOCK ASSEMBLY LH

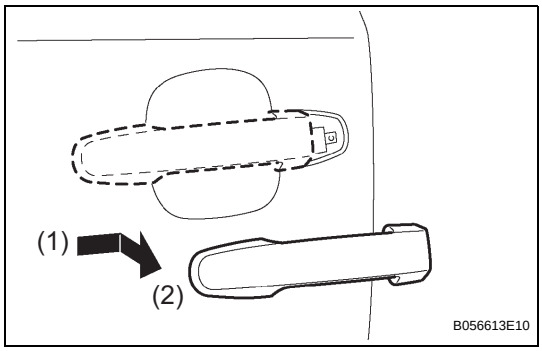
(a) Disconnect the connector.
(b) Using a torx socket wrench T30 , remove the 3 screws, then remove the rear door lock assembly LH.

NOTICE:
Be careful when removing the 3 screws as the door lock may fall and be damaged.
HINT:
Remove the door lock through the service hole.



17. REMOVE REAR DOOR OUTSIDE HANDLE COVER LH

(a) Using a torx socket wrench T30 , loosen the screw and remove the rear door outside handle cover.

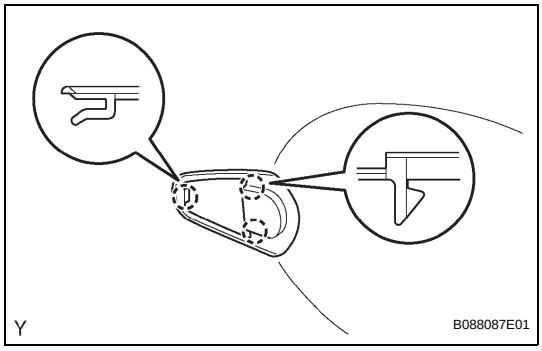


18. REMOVE REAR DOOR OUTSIDE HANDLE ASSEMBLY RH

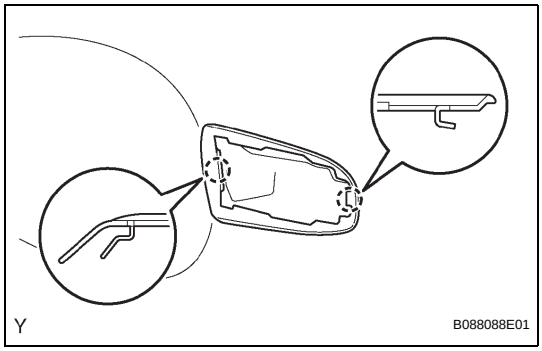
(a) Remove the outside handle by sliding and pulling it in the direction indicated by the arrow mark in the illustration.

NOTICE:

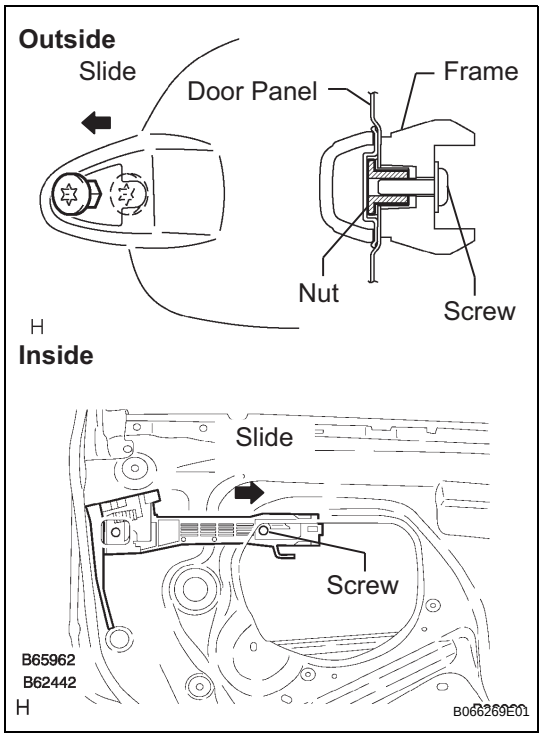
If the release plate is not pulled and held when removing the outside handle, the release plate will interfere with the outside handle. This will damage the release plate.



(b) Disengage the 3 claws and remove the outside handle front pad.



(c) Disengage the 2 claws and remove the outside handle rear pad.



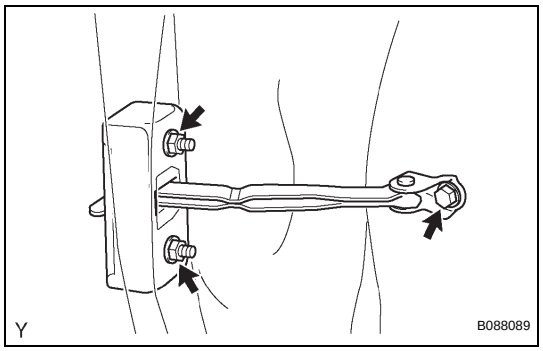
19. REMOVE REAR DOOR OUTSIDE HANDLE FRAME SUB-ASSEMBLY LH

(a) Using a torx socket wrench T30 , loosen the screw.

(b) Slide the rear door outside handle frame sub-assembly LH to remove it.

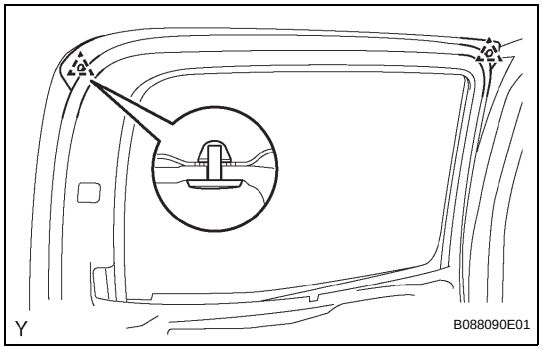
HINT:

Remove the rear door outside handle frame sub-assembly LH through the service hole.



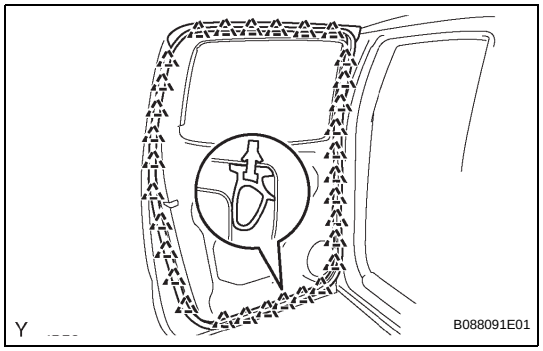
20. REMOVE REAR DOOR CHECK ASSEMBLY LH

(a) Remove the bolt and 2 nuts, then remove the rear door check assembly LH.



21. REMOVE REAR DOOR WEATHERSTRIP LH

(a) Disengage the 2 clips.

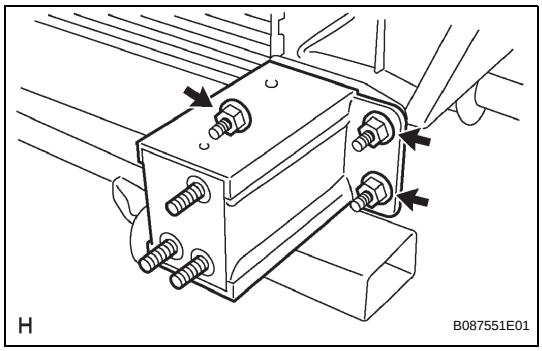


(b) Using a clip remover, disengage the 32 clips, then remove the rear door weatherstrip LH.

NOTICE:

Remove the remaining tape on the door side.

ED



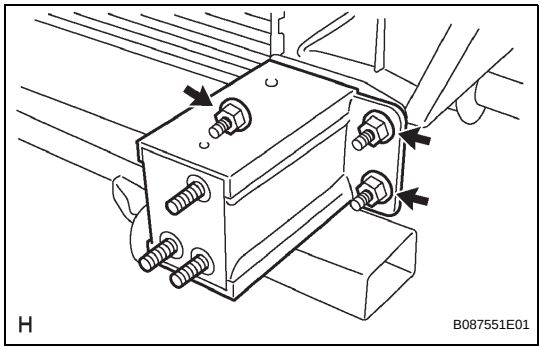
24. REMOVE FRONT BUMPER EXTENSION SUB-ASSEMBLY LH

(a) Remove the 3 nuts and front bumper extension.

25. REMOVE FRONT BUMPER EXTENSION SUB-ASSEMBLY RH

HINT:
Follow the same procedures as for the front bumper extension LH.

INSTALLATION

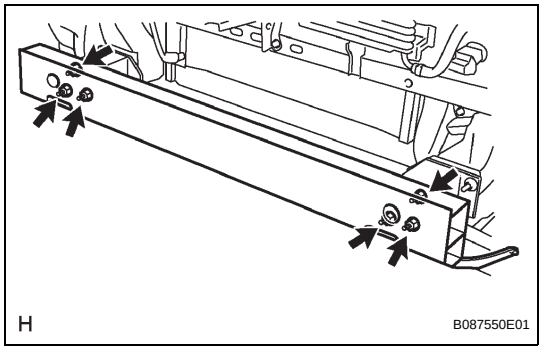


1. INSTALL FRONT BUMPER EXTENSION SUB-ASSEMBLY LH

(a) Install the front bumper extension with the 3 nuts.
Torque: 58 N*m (590 kgf*cm, 43 ft.*lbf)

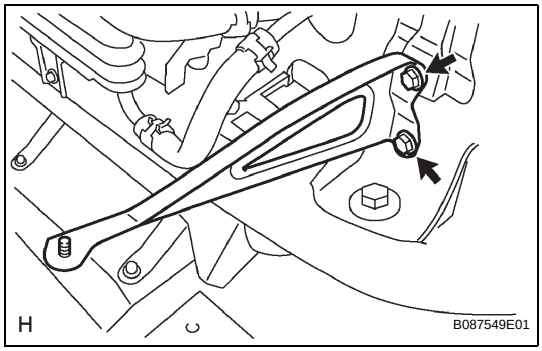
2. INSTALL FRONT BUMPER EXTENSION SUB-ASSEMBLY RH

HINT:
Follow the same procedures as for the front bumper extension LH.



3. INSTALL FRONT BUMPER REINFORCEMENT SUB-ASSEMBLY

(a) Install the front bumper reinforcement with the 6 nuts.
Torque: 58 N*m (590 kgf*cm, 43 ft.*lbf)

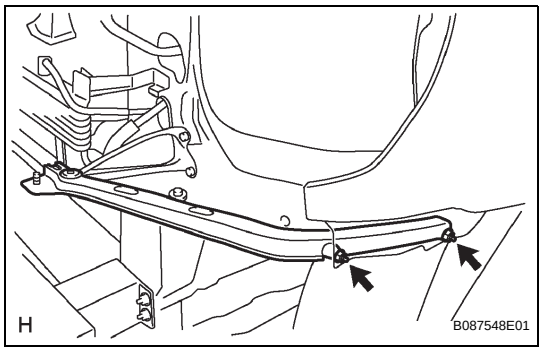


4. INSTALL FRONT BUMPER ARM MOUNTING BRACKET LH

(a) Install the front bumper arm mounting bracket with the 2 bolts.
Torque: 13 N*m (135 kgf*cm, 10 ft.*lbf)

5. INSTALL FRONT BUMPER ARM MOUNTING BRACKET RH

HINT:
Follow the same procedures as for the front bumper arm mounting bracket LH.



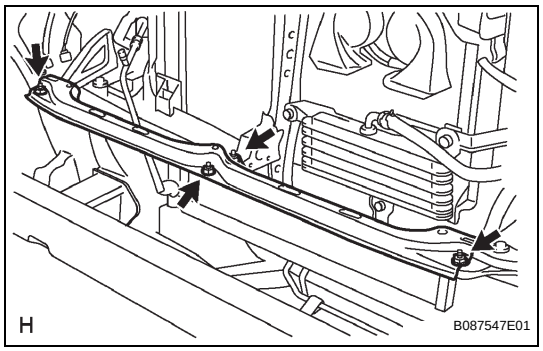
6. INSTALL FRONT BUMPER REINFORCEMENT EXTENSION LH

(a) Install the front bumper reinforcement extension with the 2 nuts.
Torque: 13 N*m (135 kgf*cm, 10 ft.*lbf)

7. INSTALL FRONT BUMPER REINFORCEMENT EXTENSION RH

HINT:
Follow the same procedures as for the front bumper reinforcement extension.

ET



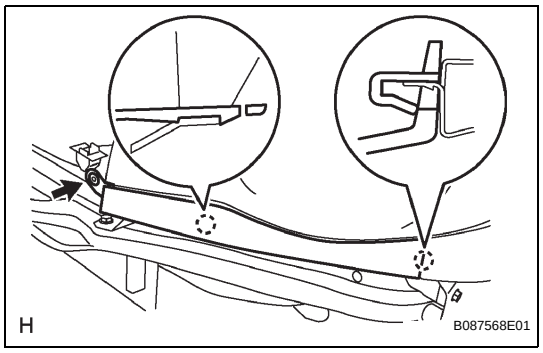
8. INSTALL FRONT BUMPER UPPER CENTER RETAINER

(a) Install the front bumper upper center retainer with the 4 nuts.
Torque: 13 N*m (135 kgf*cm, 10 ft.*lbf)

9. INSTALL HEADLIGHT ASSEMBLY LH (See page LI-10)

10. INSTALL HEADLIGHT ASSEMBLY RH

HINT:
Follow the same procedures as for the headlight LH.

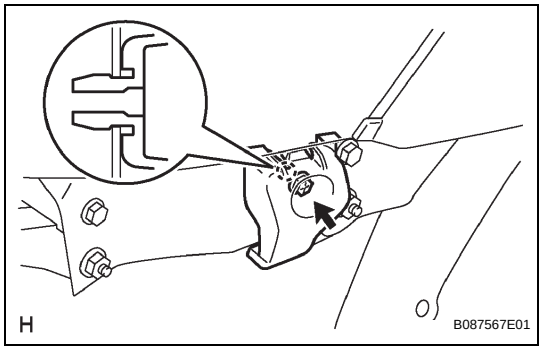


11. INSTALL FRONT BUMPER FILLER LH

(a) Engage the 2 claws and install the front bumper filler.
(b) Install the clip.

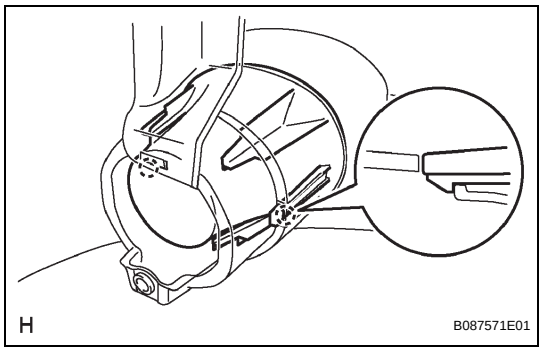
12. INSTALL FRONT BUMPER FILLER RH

HINT:
Follow the same procedures as for the front bumper filler LH.



13. INSTALL FRONT BUMPER SIDE SUPPORT

HINT:
Follow the same procedures as for the opposite side.
(a) Engage the claw and install the front bumper side support.
(b) Tighten the screw.

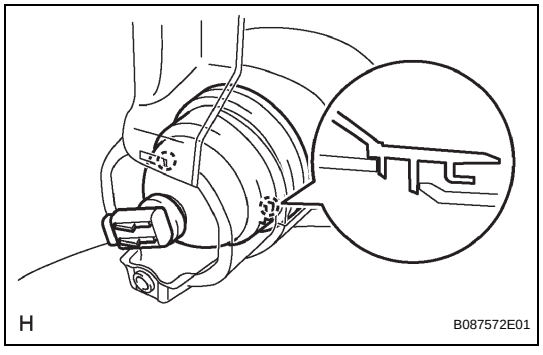


14. INSTALL FRONT BUMPER HOLE COVER LH (w/o Fog Light)

(a) Engage the 2 claws and install the front bumper hole cover.

15. INSTALL FRONT BUMPER HOLE COVER RH (w/o Fog Light)

HINT:
Follow the same procedures as for the front bumper hole cover LH.



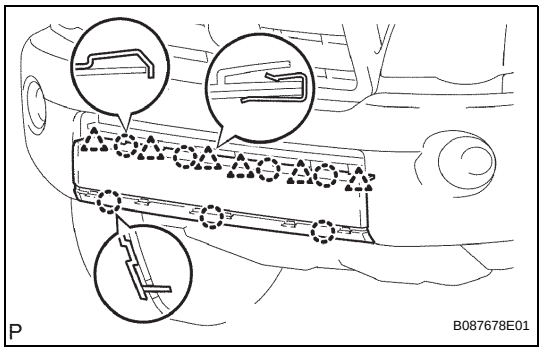
16. INSTALL FOG LIGHT ASSEMBLY LH (w/ Fog Light)

(a) Engage the 2 claws and install the fog light.

17. INSTALL FOG LIGHT ASSEMBLY RH (w/ Fog Light)

HINT:
Follow the same procedures as for the fog light LH.

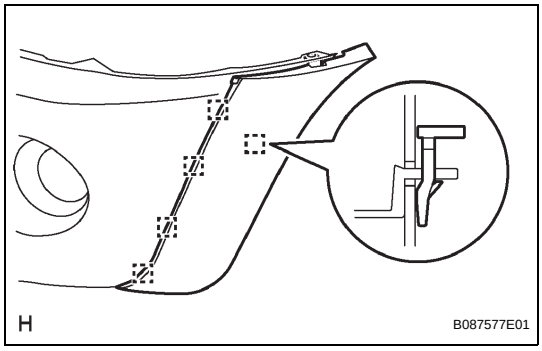
ET



18. INSTALL FRONT SPOILER CENTER COVER (for X-Runner)

(a) Engage the 7 claws and install the front spoiler center cover.

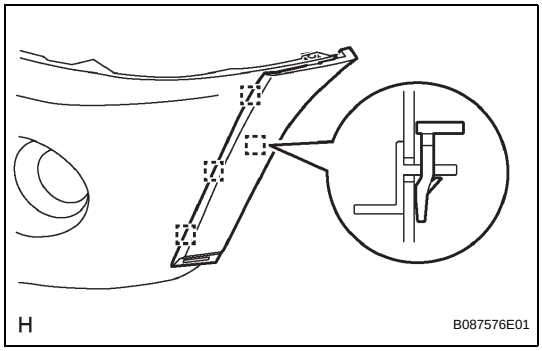
(b) Install the 6 retainers.



19. INSTALL FRONT BUMPER EXTENSION LH

(a) for 4WD and Pre Runner:

(1) Install the front bumper extension with the 5 retainers.



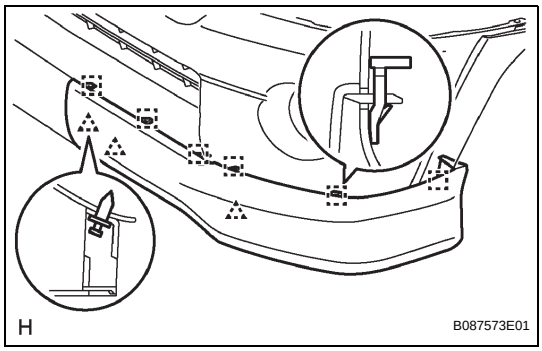
(b) for X-Runner:

(1) Install the front bumper extension with the 4 retainers.

20. INSTALL FRONT BUMPER EXTENSION RH

HINT:

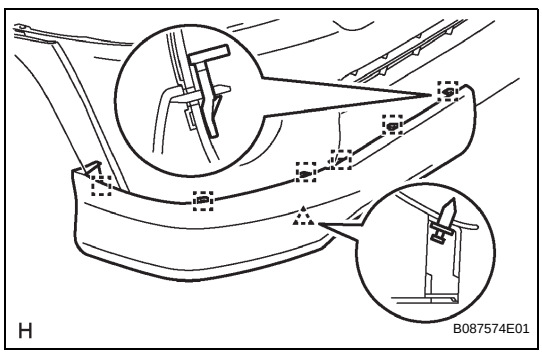
Follow the same procedures as for the front bumper extension LH.



21. INSTALL FRONT SPOILER COVER LH (for X-Runner)

(a) Install the front spoiler cover with the 6 retainers.

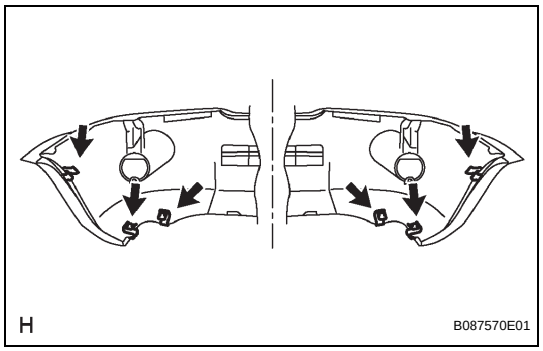
(b) Install the 3 clips.



22. INSTALL FRONT SPOILER COVER RH (for X-Runner)

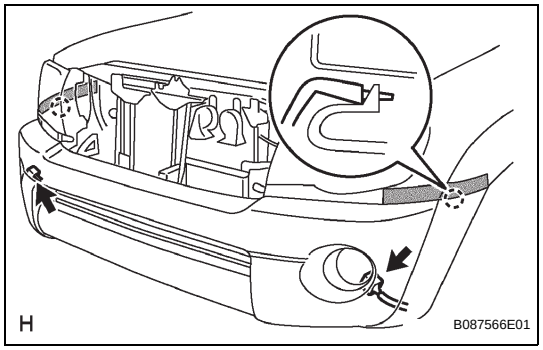
(a) Install the front spoiler cover with the 6 retainers.

(b) Install the clip.

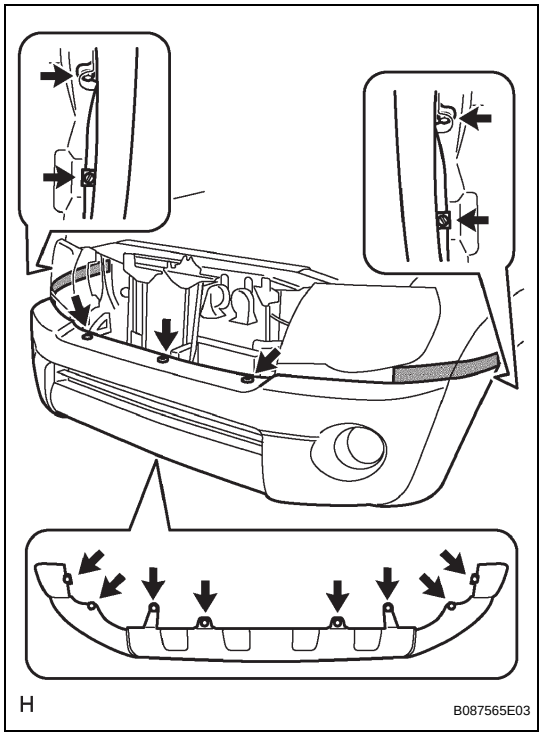


23. INSTALL FRONT BUMPER COVER

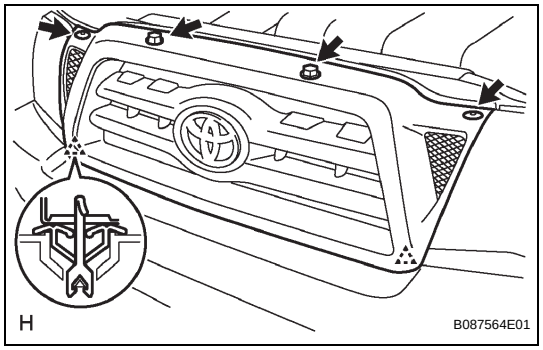
(a) Install the 6 clips.



(b) Engage the 2 claws and install the front bumper cover.
(c) Connect the 2 fog lamp connectors (w/ fog lamp).



(d) Install the 9 clips.
(e) Tighten the 6 screws.



24. INSTALL RADIATOR GRILLE

(a) Engage the 2 clips and install the radiator grille.
(b) Install the 2 clips.
(c) Tighten the 2 screws.

25. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

26. PREPARE VEHICLE FOR HEADLIGHT AIMING ADJUSTMENT (See page LI-5)

27. **PREPARE FOR HEADLIGHT AIMING (for Using a Tester) (See page LI-5)**
28. **PREPARE FOR HEADLIGHT AIMING (for Using a Screen) (See page LI-5)**
29. **INSPECT HEADLIGHT AIMING (See page LI-7)**
30. **ADJUST HEADLIGHT AIMING (See page LI-9)**
31. **PREPARE VEHICLE FOR FOG LIGHT AIMING ADJUSTMENT (See page LI-14)**
32. **PREPARE FOR FOG LIGHT AIMING (See page LI-14)**
33. **INSPECT FOG LIGHT AIMING (See page LI-16)**
34. **ADJUST FOG LIGHT AIMING (See page LI-17)**

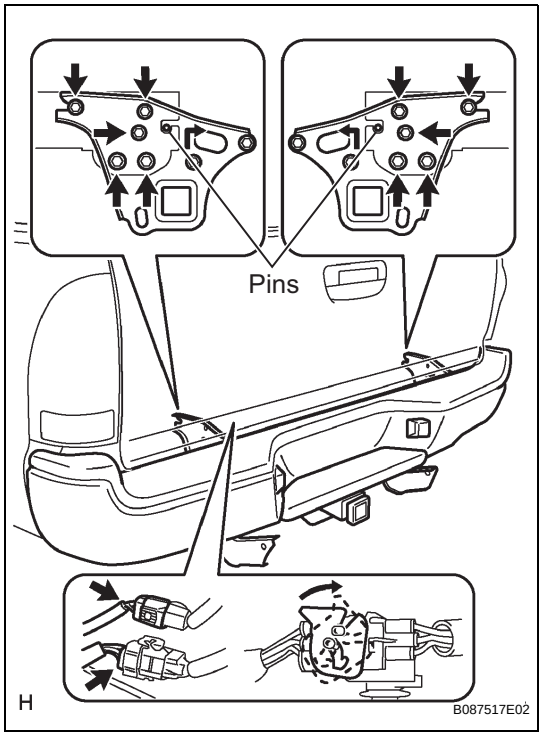
REMOVAL

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

2. REMOVE REAR BUMPER BAR

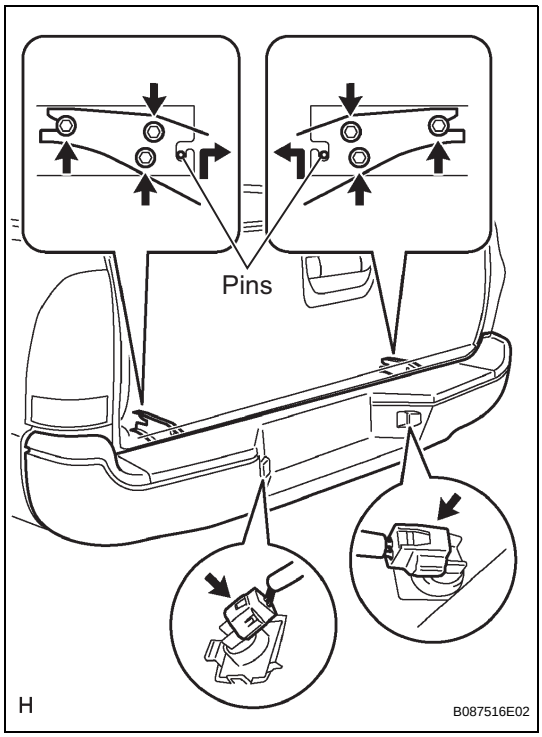
(a) w/ Towing hitch:

(1) Disconnect the 2 No. 3 wire frame connectors.
(2) Loosen 2 bolts A.
(3) Remove the 8 bolts.
(4) Disengage the 2 pins and remove the rear bumper bar.

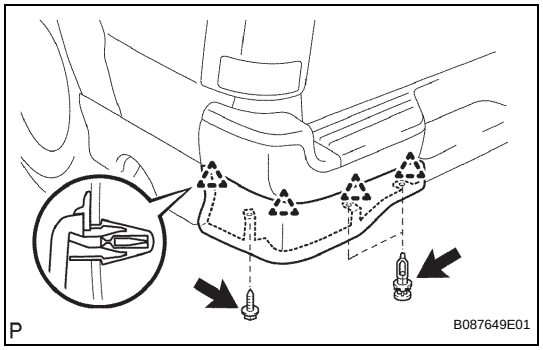


(b) w/o Towing hitch:

(1) Disconnect the 2 license lamp connectors.
(2) Loosen the 2 bolts.
(3) Remove the 4 bolts.
(4) Disengage the 2 pins and remove the rear bumper bar.



ET

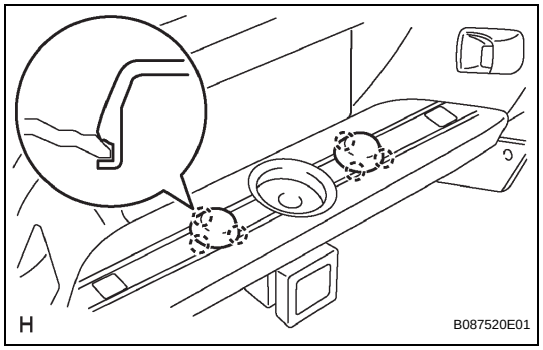


3. REMOVE REAR BUMPER SPOILER LH (for X-Runner)

(a) Using a clip remover, remove the 2 clips.
(b) Remove the screw.
(c) Disengage the 4 clips and remove the rear bumper spoiler.

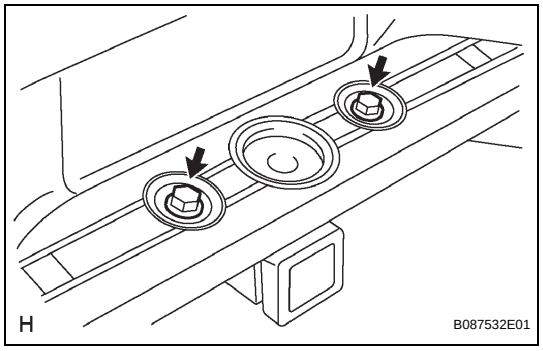
4. REMOVE REAR BUMPER SPOILER RH (for X-Runner)

HINT:
Follow the same procedures as for the rear bumper spoiler LH.

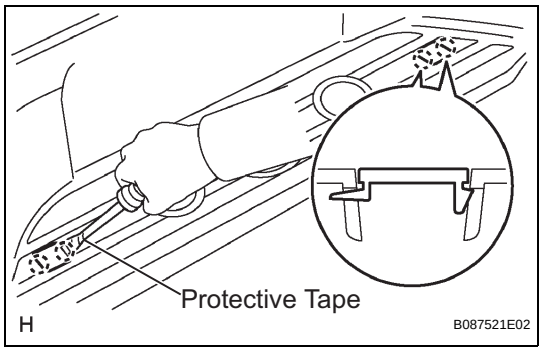


5. REMOVE REAR BUMPER COVER

(a) w/ Towing Hitch:
(1) Disengage the 3 claws and remove the receiver hitch cap.
HINT:
Follow the same procedures as for the opposite side.

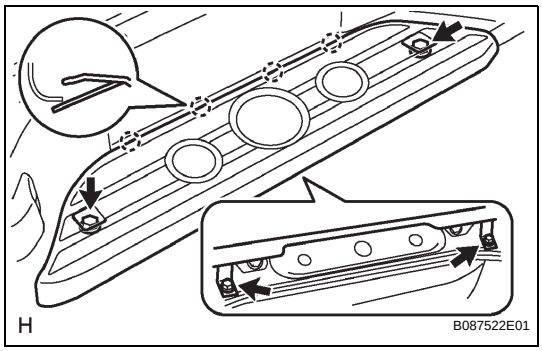


(2) Remove the 2 bolts.
(3) Remove the hitch ball.

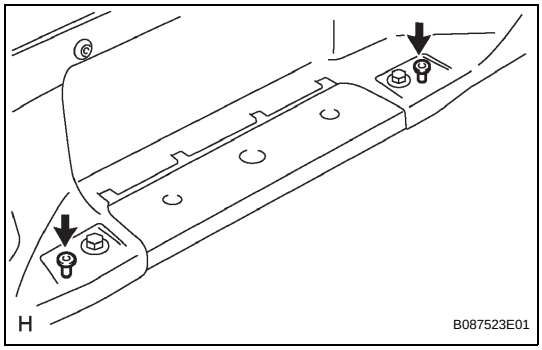


(b) Using a screwdriver with its tip in protective tape, disengage the 2 claws and remove the rear bumper cover lower.
HINT:
Follow the same procedures as for the opposite side.

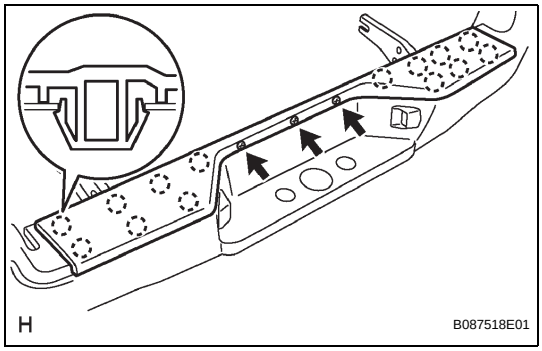
ET



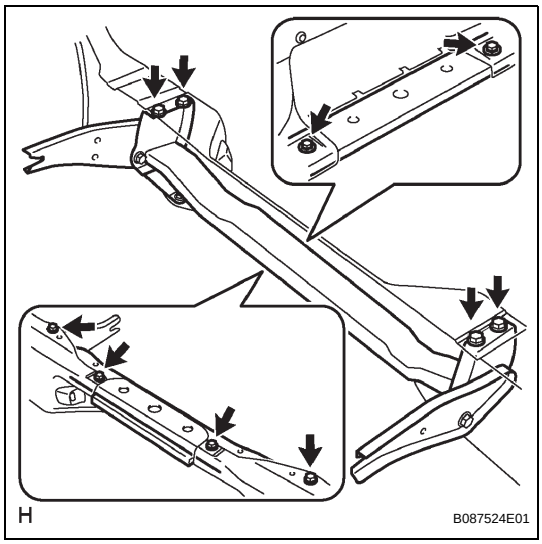
(c) Remove the 4 bolts.
(d) Disengage the 4 claws and remove the rear bumper cover.



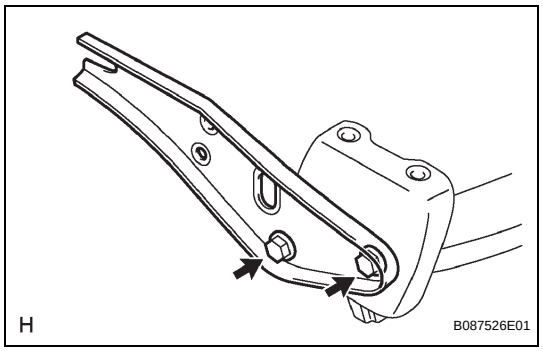
(e) Remove the 2 nuts from the rear bumper bar.



6. REMOVE REAR BUMPER PLATE
(a) Remove the 3 clips.
(b) Disengage the 14 claws and remove the rear bumper plate.



7. REMOVE REAR BUMPER BAR REINFORCEMENT SUB-ASSEMBLY (w/o Towing Hitch)
(a) Remove the 10 bolts and rear bumper bar reinforcement.



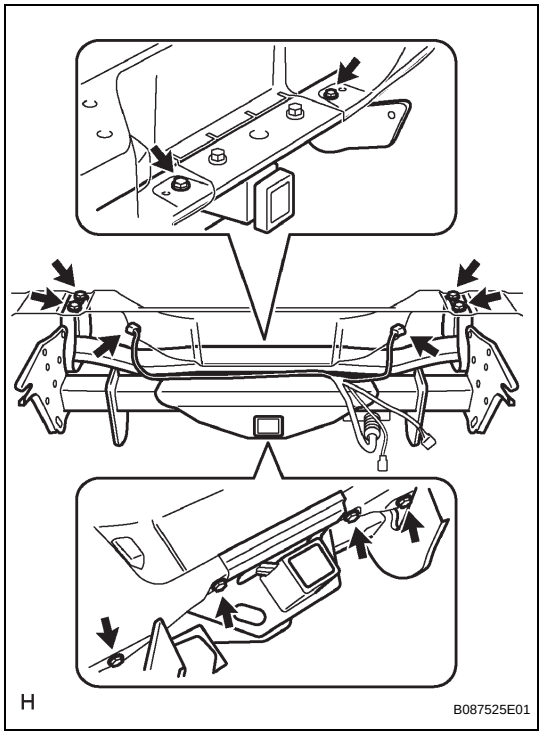
8. REMOVE REAR BUMPER ARM SUB-ASSEMBLY LH (w/o Towing Hitch)

(a) Remove the 2 bolts and rear bumper arm.

9. REMOVE REAR BUMPER ARM SUB-ASSEMBLY RH (w/o Towing Hitch)

HINT:

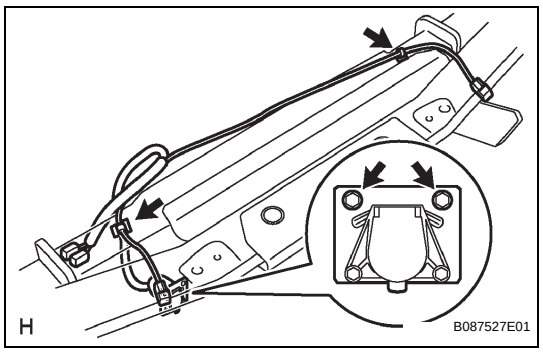
Follow the same procedures as for the rear bumper arm LH.



10. REMOVE RECEIVER HITCH BRACKET SUB-ASSEMBLY (w/ Towing Hitch)

(a) Disconnect the 2 license light connectors.

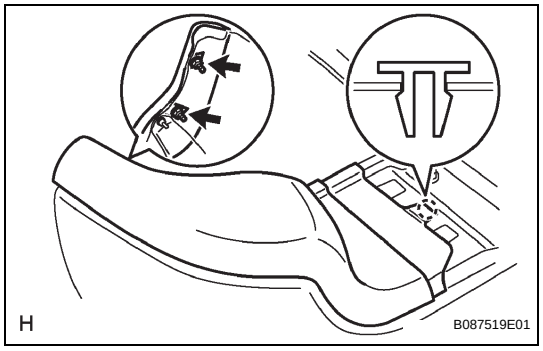
(b) Remove the 10 bolts and receiver hitch bracket.



11. REMOVE NO. 3 FRAME WIRE (w/ Towing Hitch)

(a) Using a clip remover, remove the 2 wire harness clamps.

(b) Remove the 2 bolts and No. 3 frame wire.



12. REMOVE REAR BUMPER PLATE LH

(a) Remove the 2 nuts.

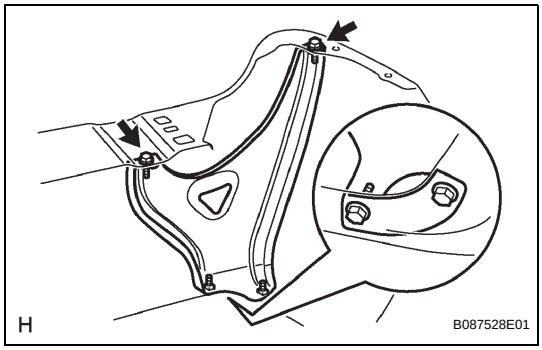
(b) Disengage the claw and remove the rear bumper plate.

13. REMOVE REAR BUMPER PLATE RH

HINT:

Follow the same procedures as for the rear bumper plate LH.

ET

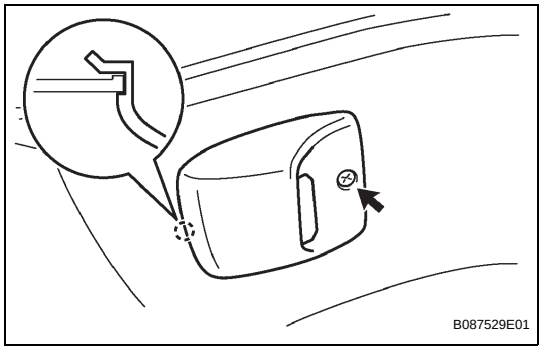


14. REMOVE REAR BUMPER BAR CORNER REINFORCEMENT LH

(a) Remove the 4 bolts and rear bumper bar corner reinforcement.

15. REMOVE REAR BUMPER BAR CORNER REINFORCEMENT RH

HINT:
Follow the same procedures as for the rear bumper bar corner reinforcement LH.

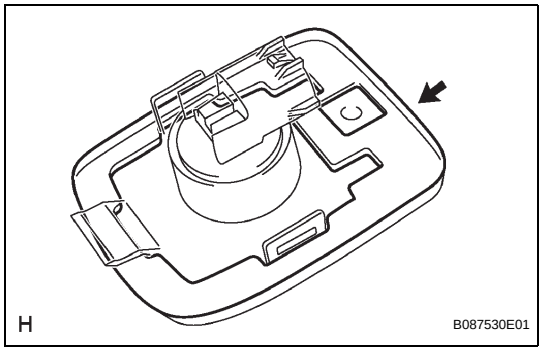


16. REMOVE LICENSE PLATE LIGHT ASSEMBLY

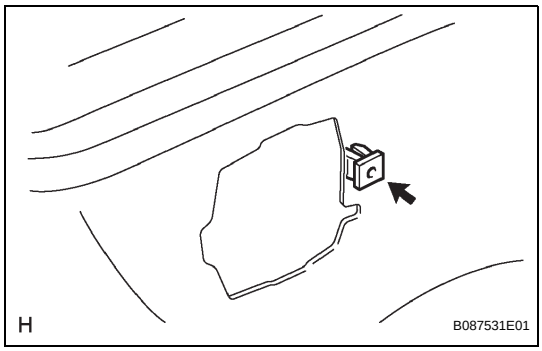
HINT:
Follow the same procedures as for the opposite side.

(a) Remove the screw.

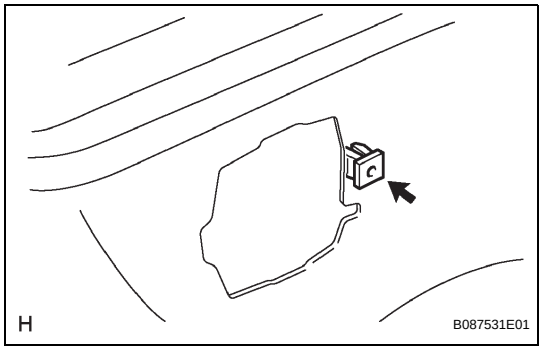
(b) Disengage the claw and remove the license plate light.



(c) Remove the bumper moulding mounting plate from the license plate light.



(d) Remove the nut from the rear bumper bar.

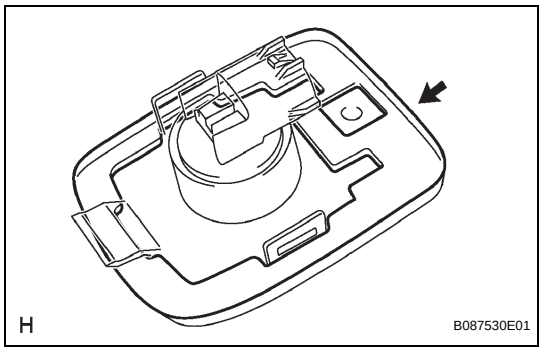


INSTALLATION

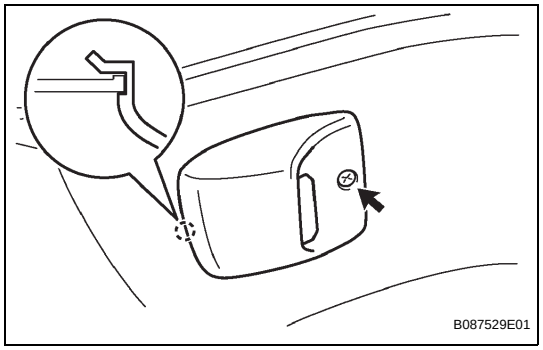
1. INSTALL LICENSE PLATE LIGHT ASSEMBLY

HINT:
Follow the same procedures as for the opposite side.

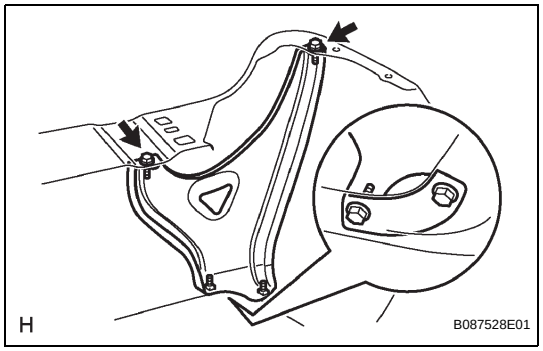
(a) Install the nut into the rear bumper bar.



(b) Install the bumper moulding mounting plate onto the license plate light.



(c) Engage the claw and install the license plate light.
(d) Install the screw.

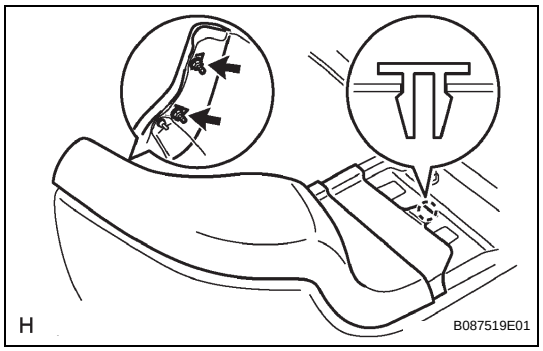


2. INSTALL REAR BUMPER BAR CORNER REINFORCEMENT LH

(a) Install the rear bumper bar corner reinforcement with 4 bolts.
Torque: 19 N*m (195 kgf*cm, 14 ft.*lbf)

3. INSTALL REAR BUMPER BAR CORNER REINFORCEMENT RH

HINT:
Follow the same procedures as for the rear bumper bar corner reinforcement LH.

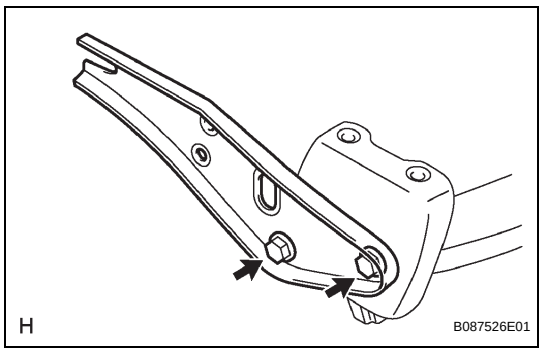


4. INSTALL REAR BUMPER PLATE LH

(a) Engage the claw and install the bumper plate.
(b) Install the 2 nuts.
Torque: 7.0 N*m (70 kgf*cm, 62 in.*lbf)

5. INSTALL REAR BUMPER PLATE RH

HINT:
Follow the same procedures as for the rear bumper plate LH.

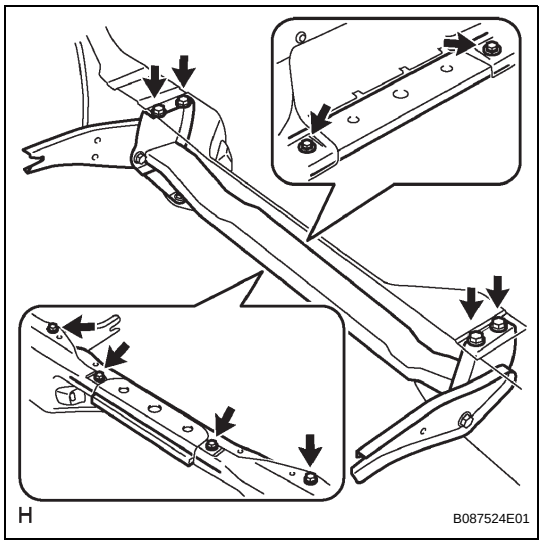


6. INSTALL REAR BUMPER ARM SUB-ASSEMBLY LH (w/o Towing Hitch)

(a) Install the rear bumper arm with the 2 bolts..
Torque: 19 N*m (195 kgf*cm, 14 ft.*lbf)

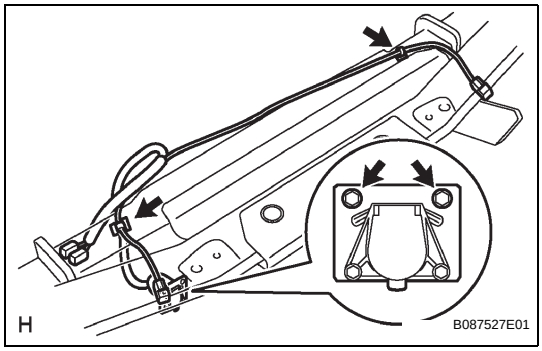
7. INSTALL REAR BUMPER ARM SUB-ASSEMBLY RH (w/o Towing Hitch)

HINT:
Follow the same procedures as for the rear bumper arm LH.



8. INSTALL REAR BUMPER REINFORCEMENT SUB-ASSEMBLY (w/o Towing Hitch)

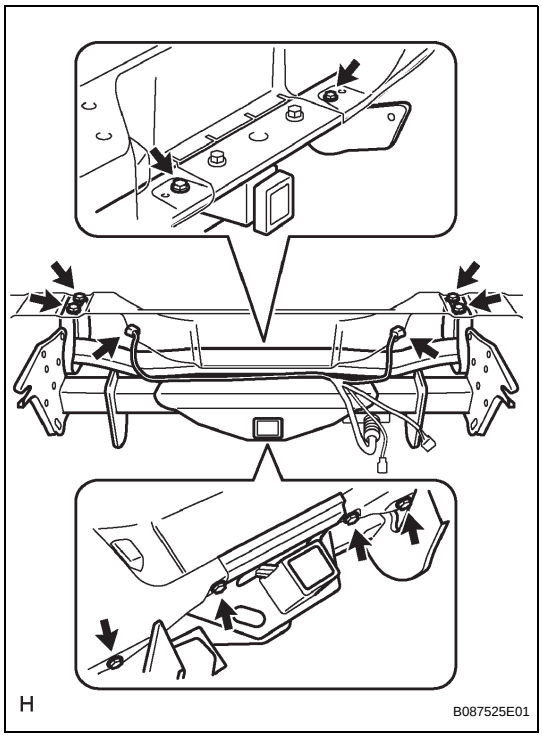
(a) Install the rear bumper bar reinforcement with the 10 bolts.
Torque: 19 N*m (195 kgf*cm, 14 ft.*lbf)



9. INSTALL NO. 3 FRAME WIRE (w/ Towing Hitch)

(a) Install the No. 3 frame wire with the 2 bolts.
Torque: 19 N*m (195 kgf*cm, 14 ft.*lbf)

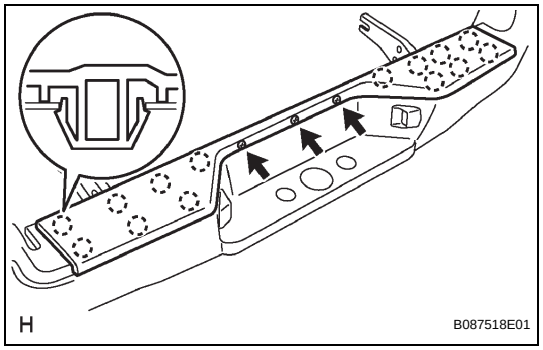
(b) Install the 2 wire harness clamps.



10. INSTALL RECEIVER HITCH BRACKET SUB-ASSEMBLY (w/ Towing Hitch)

(a) Install the receiver hitch bracket with the 10 bolts.
Torque: 19 N*m (195 kgf*cm, 14 ft.*lbf)

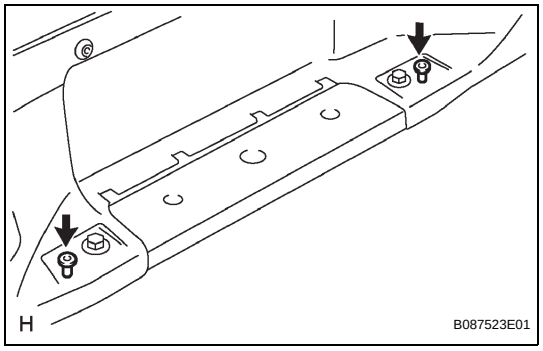
(b) Connect the 2 license light connectors.



11. INSTALL REAR BUMPER PLATE

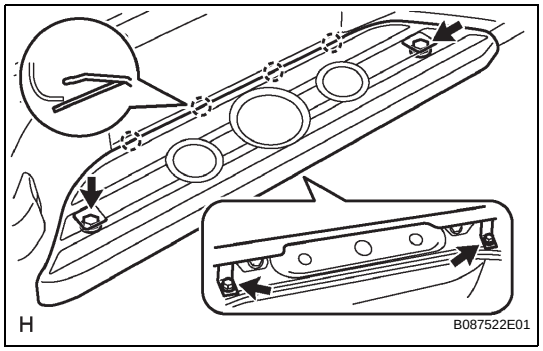
(a) Engage the 14 claws and install the rear bumper No. 1 plate.

(b) Install the 3 clips.



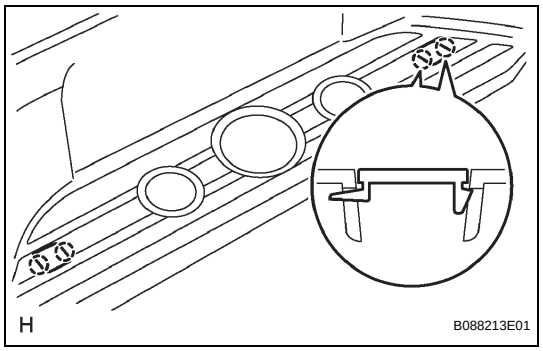
12. INSTALL REAR BUMPER COVER

(a) Install the 2 nuts into the rear bumper bar.

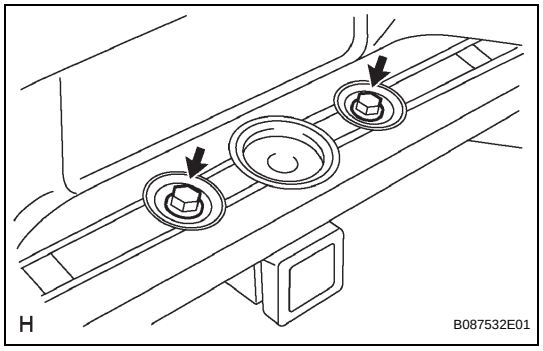


(b) Engage the 4 claws and install the rear bumper pad center.

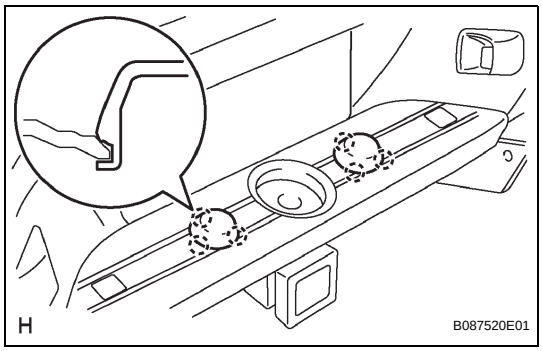
(c) Tighten the 4 bolts.



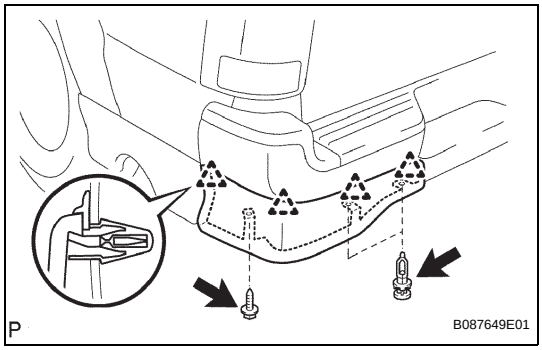
(d) Engage the 2 claws and install the rear bumper cover lower.
HINT:
Follow the same procedures as for the opposite side.



(e) w/ Towing Hitch:
(1) Install the hitch ball.
(2) Tighten the 2 bolts.

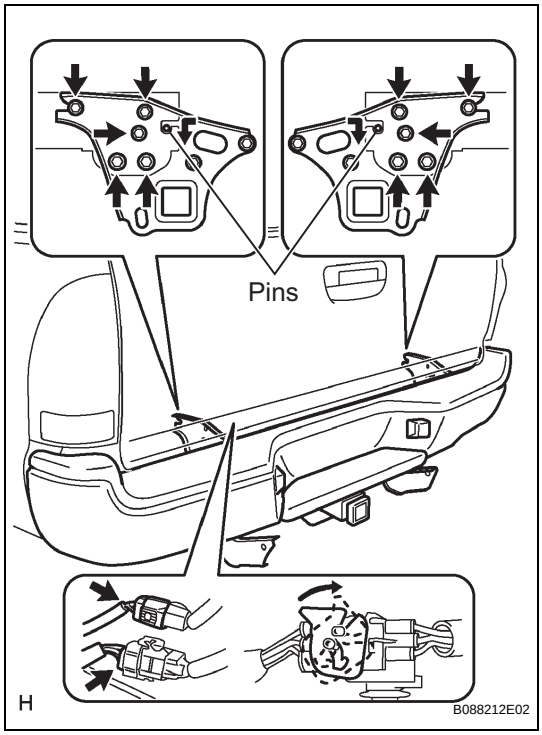


(3) Engage the 3 claws and remove the receiver hitch cap.
HINT:
Follow the same procedures as for the opposite side.



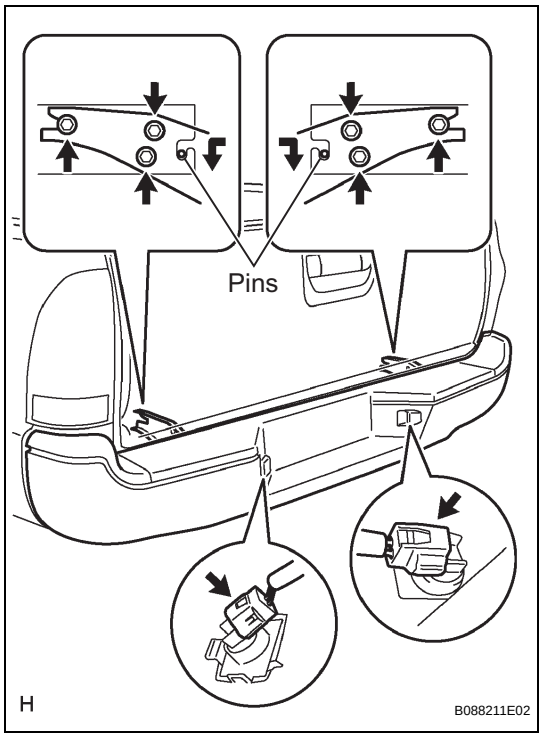
13. INSTALL REAR BUMPER SPOILER LH (for X-Runner)
(a) Engage the 4 clips and install the rear bumper spoiler.
(b) Tighten the screw.
(c) Install the 2 clips.

14. INSTALL REAR BUMPER SPOILER RH (for X-Runner)
HINT:
Follow the same procedures as for the rear bumper spoiler LH.



15. INSTALL REAR BUMPER BAR
(a) w/ Towing hitch:
(1) Engage the 2 pins and remove the rear bumper bar.
(2) Tighten the 8 bolts.
Torque: 90 N*m (920 kgf*cm, 67 ft.*lbf)
(3) Connect the 2 No. 3 wire frame connectors.

ET

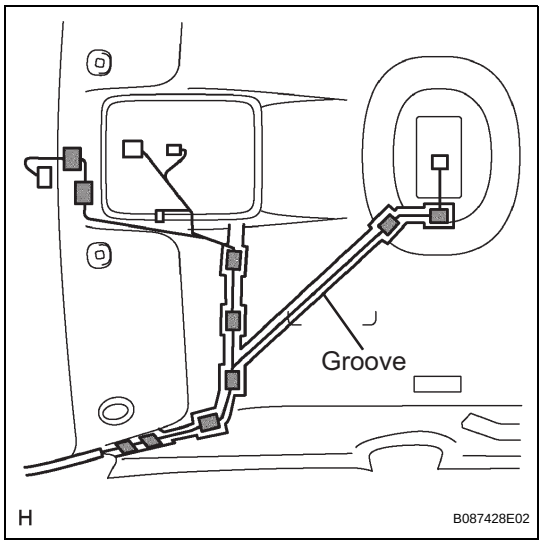


(b) w/o Towing hitch:
(1) Engage the 2 pins and install the rear bumper bar.
(2) Tighten the 6 bolts.
Torque: 90 N*m (920 kgf*cm, 67 ft.*lbf)
(3) Connect the 2 license lamp connectors.

16. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

INSTALLATION

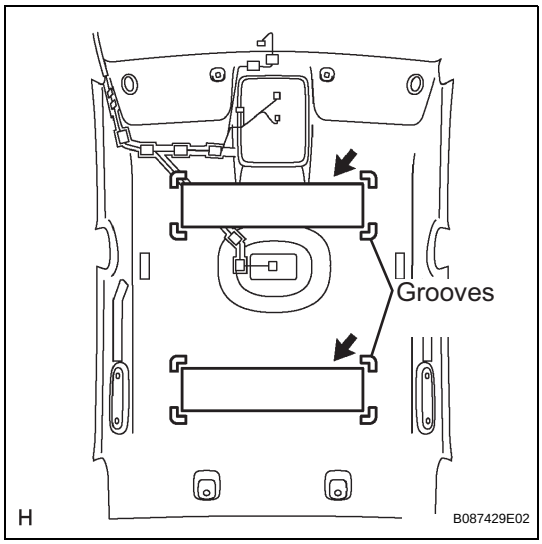
CAUTION:
Some of these service operations affect the SRS airbag system. Read the precautionary notices concerning the SRS airbag system before servicing (See page RS-1).



1. INSTALL ROOF WIRE

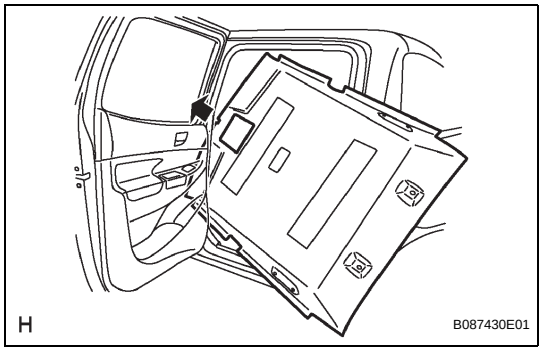
(a) w/ EC mirror:
  (1) Install the roof wire with 8 new tapes, as shown in the illustration.

(b) w/o EC mirror:
  (1) Install the roof wire with 8 new tapes, as shown in the illustration.



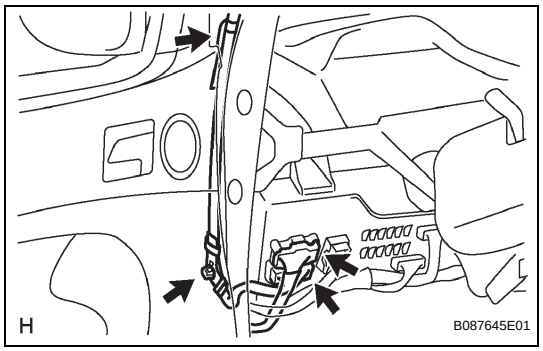
2. INSTALL ROOF HEADLINING PAD

(a) Install 2 new roof headlining pads onto the roof headlining.

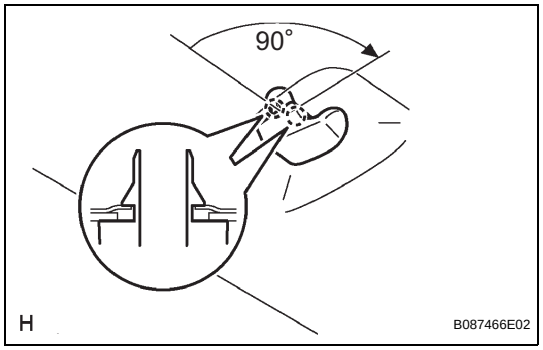


3. INSTALL ROOF HEADLINING ASSEMBLY

(a) Install the roof headlining into the vehicle.

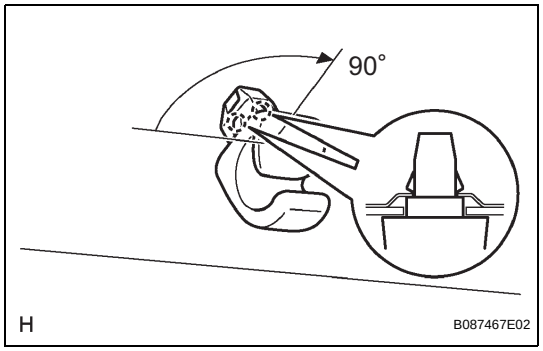


(b) Install the 2 wire harness clamps.
(c) Connect the roof wire connector.
(d) Connect the frame wire connector.



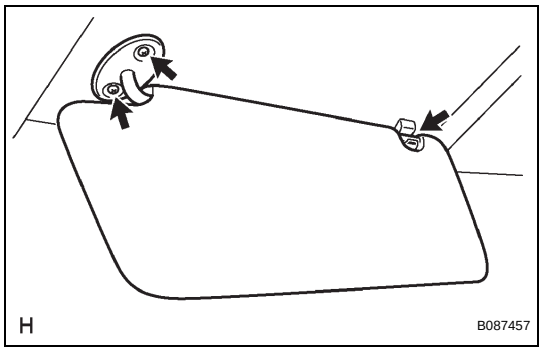
4. INSTALL COAT HOOK

HINT:
Follow the same procedures as for the opposite side.
(a) Turn the coat hook 90° clockwise and install it.



5. INSTALL VISOR HOLDER

HINT:
Follow the same procedures as for the opposite side.
(a) Turn the visor holder 90° clockwise and install it.

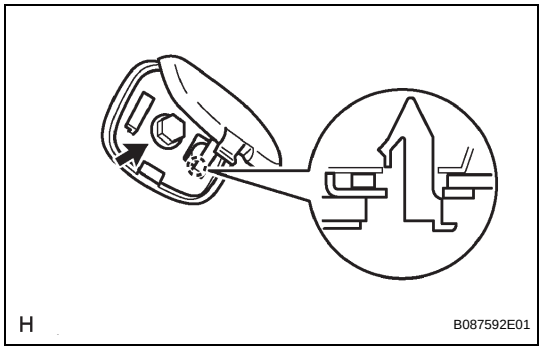


6. INSTALL VISOR ASSEMBLY LH

(a) Install the visor into the visor holder.
(b) Tighten the 2 screws.

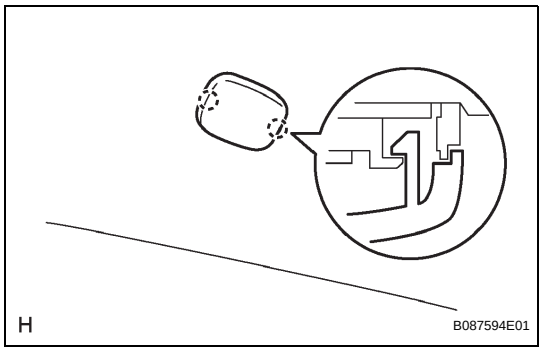
7. INSTALL VISOR ASSEMBLY RH

HINT:
Follow the same procedures as for the visor assembly LH.

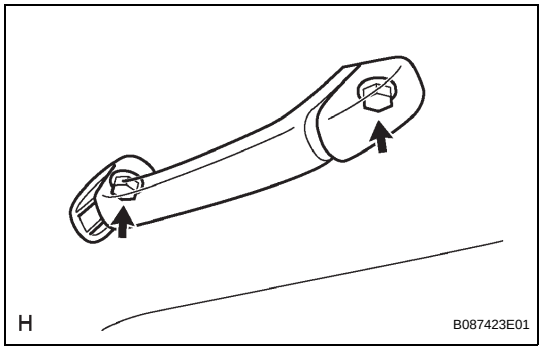


8. INSTALL ASSIST GRIP PLUG (w/ Curtain Shield Airbag)

HINT:
Follow the same procedures as for the opposite side.
(a) Engage the claw and install the assist grip plug.
(b) Tighten the screw.



(c) Engage the 2 claws and close the cover.

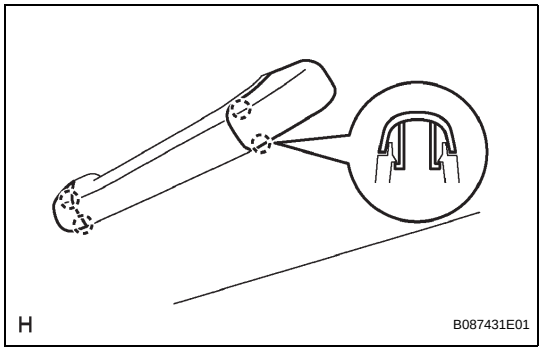


9. INSTALL ASSIST GRIP SUB-ASSEMBLY

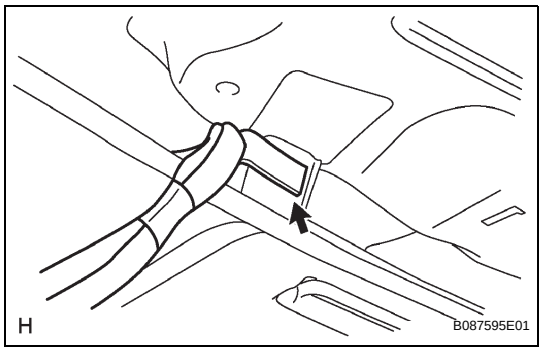
HINT:

Follow the same procedures as for the opposite side.

(a) Install the assist grip with the 2 screws.

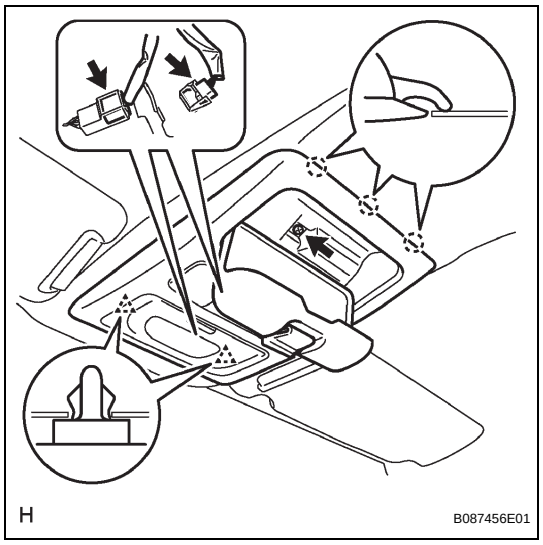


(b) Engage the 2 claws and close the cover.

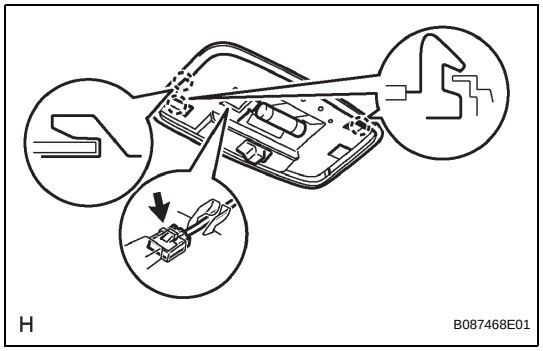


10. INSTALL ROOF CONSOLE BOX ASSEMBLY

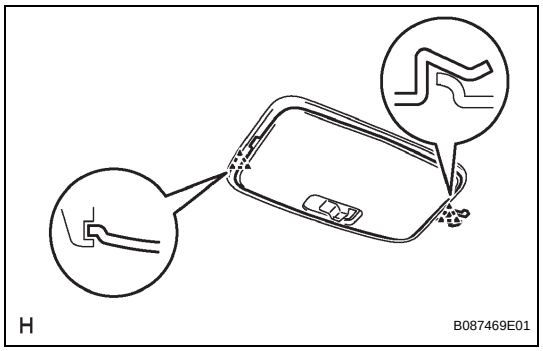
(a) Install the wire harness clamp.



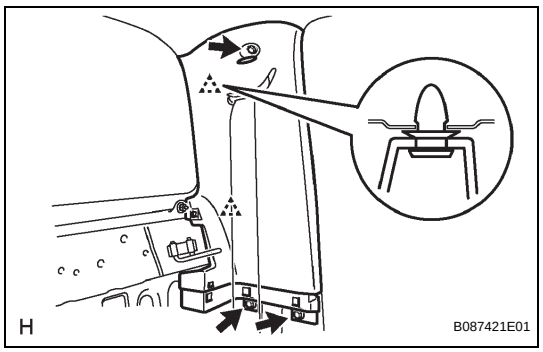
(b) Connect the accessory meter connector and map lamp connector.
(c) Engage the 2 clips and 3 claws and install the map lamp.
(d) Tighten the screw.



11. INSTALL ROOM LIGHT ASSEMBLY
(a) Connect the room light connector.
(b) Engage the 3 claws and install the room light.

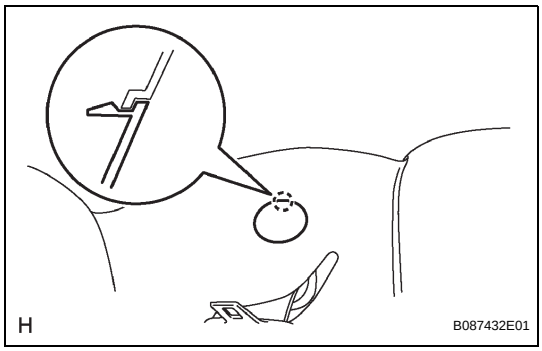


(c) Engage the 2 claws and install the room light lens.

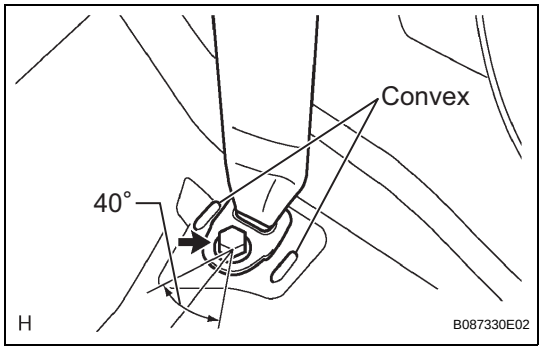


12. INSTALL QUARTER INSIDE TRIM BOARD LH
(a) Engage the 2 clips and install the quarter inside trim board.
(b) Tighten the 3 screws.

IR



(c) Engage the claw and close the cover.



(d) Install the floor anchor of the rear seat belt outer with the bolt.
Torque: 42 N*m (430 kgf*cm, 31 ft.*lbf)
NOTICE:
- **Make sure that the rear seat outer belt is oriented in the correct direction when installing.**
